SENATE EDUCATION COMMITTEE

Senators Kevin Meyer & Joe Thomas, Co-Chairs

Senate Bill 171

The legislature shall by general law establish and maintain a system of public schools open to all children of the State, and may provide for other public educational institutions.—Article VIII, Section 1 Alaska Constitution

Every Spring school districts around the state have the unenviable task of developing their budgets—sometimes without complete knowledge of the amount of funding they will receive for the next academic year.

SB 171 gives districts the ability to craft responsible and conservative budgets. It establishes a three-year plan of modest increases—lower than the inflation rate—so districts know the financial parameters they must work within as they plan for sustainability. Forcing districts to rely on unpredictable one year bumps in funding undercuts their ability to do long range, responsible financial and programmatic planning.

This provides districts with a three-year financial plan. Districts will know well in advance how to plan for the education of our children, how to staff the schools, and how to maintain fiscal security over time. Instead of working out whom to layoff each spring, they can budget over a longer period of time, knowing how much money they have to work with.

This additional annual amount added to the BSA allows schools to keep up with the rising cost of educating our children. When a student enters a school, we expect they will receive a quality education. They need an environment t conducive to learning—curriculum that meets high standards, a safe, warm building, reliable transportation to and from the facility, and the best teachers possible. Some students have special needs that must be met. If we are going to increase our graduation rates, we must reach out to at risk students.

Failure to increase the Base Student Allocation will lead to lay-offs at school district around the state, program and curriculum reductions, or result in more education costs being borne by local taxpayers.

Because of our unique conditions, delivery of a quality education is more expensive in Alaska than in other states. However, in comparison to other states we are spending less and less to educate our students. In 2009-2010 we ranked 22nd in the nation in per pupil spending. This additional annual amount added to the BSA allows schools to keep up with the rising cost of educating our children. The incremental increases represent less than two percent a year, which is below the current inflation rate.

Alaska must invest in its resources, and the education of our residents is one of the most important investments we can make.

We urge you to support SB 171, and vote for its passage.

Report of the Alaska Council of School Administrators (ACSA) FY13 Funding Review Committee - October 2011

Background
At the August meeting of the Alaska Association of School Administrators (AASA), Education Commissioner Mike Hanley asked district superintendents how much funding would be needed in FY13 to maintain current programs.

AASA/ACSA Executive Director Bruce Johnson suggested a joint project with the Alaska Association of School Business Officials (ALASBO) to study this question. The ALASBO Executive Board appointed the following ALASBO members to work with Bruce Johnson on this committee: Luke Fulp, Kodiak; Chad Stiteler, Anchorage; David Arp, Sitka; Yodean Armour, Klawock; and Amy Lujan, ALASBO Executive Director.

Process
With the help of Education and Early Development staff, budget templates pre-loaded with FY12 information were sent out to each school district, with a request for early estimates of FY13 budget needs. A commitment was made to the confidentiality of district data, due to the preliminary nature of the budget estimates. Using the ALASBO network, data was received directly from 48 of the 54 school districts. Estimates were created for the remaining districts.

Findings
Districts are expecting serious shortfalls in FY13, due to declining federal revenues as well as increased costs.

- health plan costs are expected to increase 7-15%, which is in line with industry estimates
- wage make up 47% of district budgets; many districts have negotiated agreements in place already for FY13; those entering negotiations anticipate modest increases
- energy costs have continued to increase; these higher costs also impact travel and shipping on all goods, from instructional supplies to food for school lunches
- overall expenses are forecast to increase due to inflation, which for the Anchorage CPI has averaged 2.7% since 1990
- the federal program for timber compensation to rural schools and communities (SRSCA) may not be reauthorized; this would reduce funding to schools and municipalities by $18.5 million, hitting 24 district budgets directly in some cases, and/or the ability of municipalities to provide local funding to school districts
- federal ARRA and Education Jobs Bill funding, which provided $35 million in unrestricted funding to be spent in FY12 and FY13, will be exhausted by the first quarter of FY13, resulting in program cuts in FY13 and FY14

State Funding Implications
While it is not expected that state funding can make up for all the reductions in federal funding, it is reasonable to expect that state funding can help districts deal with cost increases and ensure a continued quality educational program. The following estimates of funding needs are provided by this committee for guidance to achieve this goal.

- extending the FY12 grant provided by HB108 ($20 million) is critical to enabling districts to keep up with energy costs, in addition to the BSA increases suggested below
- a $320 BSA increase would enable districts to keep pace with expected cost increases, though it is possible that program cuts would be necessary, due to flat or declining local and federal revenues NOT funded by this BSA calculation
    - a $225 BSA increase would maintain the state's proportionate share of district funding, in relation to local and federal funding; however, program cuts would occur if local and federal revenues are flat or reduced

FAIRBANKS NORTH STAR BOROUGH SCHOOL DISTRICT
2012-13 SCHOOL YEAR

WHAT BUDGET ESTIMATES GIVE RISE TO THE DISTRICT'S SHORTFALL?

Revenue:	
Loss of state one-time energy funding	$ 2,137,890
Loss of unassigned fund balance [1]	229.820
Shortfall due to loss of revenue/financing sources	$ 2,367,710
Expenditure:	
Increased costs due to adding back in "jobs bill" teachers	$ 2,155,000
Increased costs for curriculum materials purchase	1,484,370
Increased subsidy to Pupil Transportation	1,246,990
Increased utility costs	335,700
Increased support for special education	2,433,170
Increased employee costs	3,852,150
Increased costs in other areas	722.290
Shortfall due to increased costs	$ 12,229,670
Estimated 2012-13 budget shortfall as of January	$ 14,597,380

BUDGET ASSUMPTIONS

- Student enrollments increase slightly and our military student population remains steady.
- The local contribution to education is flat funded, unchanged from the current year.
- The district loses $2.1m in one-time State energy funding provided for in the current year.
- The base student allocation amount (BSA) of $5,680 remains unchanged from the current year.
- The State continues to provide supplemental funding for retirement system contributions and the employer contribution rates remain unchanged from the current year.
- Pupil Transportation will continue to be funded at rates unchanged from the current year.

[1] The district had $ -0- unassigned audited fund balance at June 30, 2011. The district is estimating that with some additional foundation funding in the current year, along with savings from unfilled reserve teaching positions, that we will have $1.85m in fund balance available to supplement next year's budget. This can change depending on the high variability of current utility, health care, and other costs.

JUNEAU SCHOOL DISTRICT
CITY AND BOROUGH OF JUNEAU

FY 2013 Juneau School District Budget Information
January 17, 2012

HOW DID THE SCHOOL DISTRICT GET HERE?

Loss of one-time aid to school districts from the State of Alaska	$ 737,000
Elimination of federal jobs funding	460,000
Use of fund balance (reserve) last year	1,687,000
Grants expiring	865,000
Increased energy costs	221,000
Less indirect cost recovery from grants	207,000
Increased employee costs	900,000
Instructional and Technology needs	587,000
Other increases	123,445
	$5,787,445

WHAT THE DISTRICT KNOWS:

- The Governor of Alaska has not included any increase in the amount school districts receive as part of the funding formula.
- Utility rates will increase.

ASSUMPTIONS USED TO DEVELOP THE FY 2013 BUDGET:

- The Base Student Allocation (BSA) will remain at $5,680.
- JSD student enrollment will decrease by 26 students to 4,916 next year.
- Juneau students will continue to benefit from the same level of generous support from the City and Borough of Juneau.
- Pupil transportation will continue to be funded at the same level as FY 12 by the State of Alaska.

WHAT THE DISTRICT DOESN'T YET KNOW:

- What level of funding the Legislature will approve.
- Outcomes of the collective bargaining process.

DISTRICT: Yukon Koyukuk

Assumptions:

Revenues:

A City and Borough Appropriation remains unchanged from FY2012 to FY2013
B Misc Local Revenue remains unchanged from FY2012 to FY2013
C E-Rate reimbursement remains unchanged from FY2012 to FY2013
D Quality Schools is adjusted to reflect the decrease in enrollment, 34 intensive students, and the final ISER incre
E State of AK HB108 Allocation is reduced to zero assuming it will not be reauthorized
F Foundation is adjusted to reflect the decrease in enrollment, 34 intensive students, and the final ISER increase
G Federal Impact Aid remains unchanged from FY2012 to FY2013
H Federal Secure Rural Schools funding is reduced to zero assuming it will not be reauthorized

Expenditures:

I Salaries and related benefits are adjusted to account for current employees rolled into the FY2013 negotiated agreement scales. Health Insurance premiums remain unchanged from FY2012 to FY2013. Workers Compensation Insurance is increased by 12.5% and all others insurances (non-health) are increased by 2.5% based on estimates from agents
J Heating fuel costs are increased by $20,000 as fuel prices are currently forecasted to drop in FY2013. The increase is from the anticipation of using more diesel fuel vs. heating electricity. Electricity is increased by $15,035 to prepare for anticipated increases from the City Electric Department. The custodial contract is increased by 5% from FY2012
K School and Program discretionary budgets remain unchanged from FY2012 to FY2013
L Technology includes a $75,000 increase to continue the School Board's 5 year plan
M Activities budgets are set at the FY2012 budget process level (reduced by $50,000 from FY2011)

Note: The $1.29MM anticipated deficit for FY2013 equates to 14.26 full time certified teaching positons

HAINES BOROUGH SCHOOLS

P.O. Box 1289

Haines, Alaska 99827

December 13, 2011

Dear Honorable Governor Parnell,

In the FY2013 budget you just released, you call for "full funding" of education at $1.1 billion and for forward funding for FY2014 at $1.1 billion. Thank you for acknowledging the need for forward funding. That would be a tremendous assistance.

However, since the recommendation you made for the current fiscal year was also at $1.1 billion, if I'm not mistaken that would make three years of flat funding within the funding formula. Currently inflation is running around 3% as computed by the Anchorage CPI. For different rural communities that number might be somewhat higher. For Haines, with a budget of around $5.7 million, 3% would represent about a $170,000 increase in costs of goods and services. We are currently projecting just about that kind of increase in order to keep the student programs and staff in place for FY2013.

Haines was one of 12 districts in the state to make AYP this year. We were one of three districts where our students with special needs made AYP. We have been working hard to continually improve how we educate our students. We've instituted more vocational education classes, we are stressing more school to work connections, we are instituting more early elementary reading interventions, we are making sure our high school students have access to the classes they need to qualify for the Performance Scholarship (thank you for that) and we are giving more attention to helping our special education students do better. All this has resulted in an over all increase in our graduation rate of over 15% over the last four years. For 2010/11 our graduation rate was 88%.

The Haines Borough School District runs pretty lean. If we experience reductions in the amount of services our funding can cover we will immediately be cutting into the muscle that delivers services to our students. Our programs will immediately suffer and will be driven backwards. We need your support to make sure we will be able to continue the good work we have in place.

Governor, it is respectfully requested you add an amount to the funding formula that will cover the inflationary pressures on the costs of goods and services. Along with forward funding, that would mean volumes in our ability to: 1) retain our staff and not have to keep them on pins and needles about their next year's employment until June; 2) better plan and schedule for the next year; and 3) keep morale up, which helps our entire organization.

Thank you,

Carol Kelly

Carol Kelly, President
Haines Borough School Board

Overall Results

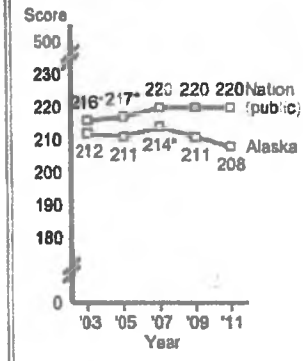
- In 2011, the average score of fourth-grade students in Alaska was 208. This was lower than the average score of 220 for public school students in the nation.
- The average score for students in Alaska in 2011 (208) was not significantly different from their average score in 2009 (211) and was not significantly different from their average score in 2003 (212).
- In 2011, the score gap between students in Alaska at the 75th percentile and students at the 25th percentile was 55 points. This performance gap was not significantly different from that of 2003 (55 points).
- The percentage of students in Alaska who performed at or above the NAEP *Proficient* level was 26 percent in 2011. This percentage was not significantly different from that in 2009 (27 percent) and was not significantly different from that in 2003 (28 percent).
- The percentage of students in Alaska who performed at or above the NAEP *Basic* level was 58 percent in 2011. This percentage was not significantly different from that in 2009 (59 percent) and was not significantly different from that in 2003 (58 percent).

Achievement-Level Percentages and Average Score Results

* Significantly different ($p < .05$) from state's results in 2011. Significance tests were performed using unrounded numbers.

NOTE: Detail may not sum to totals because of rounding.

Compare the Average Score in 2011 to Other States/Jurisdictions



¹ Department of Defense Education Activity (overseas and domestic schools)

In 2011, the average score in Alaska (208) was

- lower than those in 46 states/jurisdictions
- higher than that in 1 state/jurisdiction
- not significantly different from those in 4 states/jurisdictions

Average Scores for State/Jurisdiction and Nation (public)

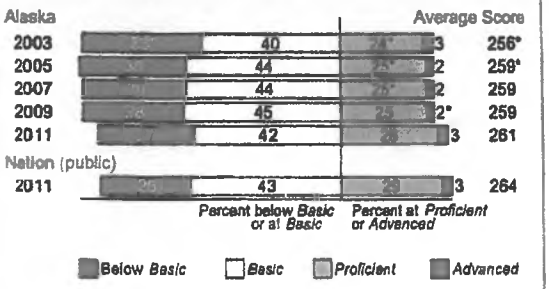
* Significantly different ($p < .05$) from 2011. Significance tests were performed using unrounded numbers.

Results for Student Groups in 2011

Reporting groups	Percent of students	Avg. score	Percentages at or above Basic	Percentages at or above Proficient	Percent at Advanced
Race/Ethnicity					
White	50	223	71	36	8
Black	4	206	42	10	3
Hispanic	6	212	60	24	5
Asian	6	199	45	14	1
American Indian/Alaska Native	23	175	20	5	1
Native Hawaiian/Pacific Islander	2	192	38	12	2
Two or more races	8	216	62	27	4
Gender					
Male	51	204	53	22	4
Female	49	212	62	29	6
National School Lunch Program					
Eligible	46	191	33	11	1
Not eligible	53	223	81	37	8

NOTE: Detail may not sum to totals because of rounding, and because the "Information not available" category for the National School Lunch Program, which provides free/reduced-price lunches, is not displayed. Black includes African American and Hispanic includes Latino. Race categories exclude Hispanic origin.

Score Gaps for Student Groups



- In 2011, Black students had an average score that was 17 points lower than White students. This performance gap was not significantly different from that in 2003 (17 points).
- In 2011, Hispanic students had an average score that was 12 points lower than White students. This performance gap was not significantly different from that in 2003 (17 points).
- In 2011, female students in Alaska had an average score that was higher than male students by 8 points.
- In 2011, students who were eligible for free/reduced-price school lunch, an indicator of low family income, had an average score that was 32 points lower than students who were not eligible for free/reduced-price school lunch. This performance gap was not significantly different from that in 2003 (32 points).

NOTE: Statistical comparisons are calculated on the basis of unrounded scale scores or percentages.

Overall Results

- In 2011, the average score of eighth-grade students in Alaska was 261. This was lower than the average score of 264 for public school students in the nation.
- The average score for students in Alaska in 2011 (261) was not significantly different from their average score in 2009 (259) and was higher than their average score in 2003 (256).
- In 2011, the score gap between students in Alaska at the 75th percentile and students at the 25th percentile was 46 points. This performance gap was not significantly different from that of 2003 (50 points).
- The percentage of students in Alaska who performed at or above the NAEP *Proficient* level was 31 percent in 2011. This percentage was greater than that in 2009 (27 percent) and was greater than that in 2003 (27 percent).
- The percentage of students in Alaska who performed at or above the NAEP *Basic* level was 73 percent in 2011. This percentage was not significantly different from that in 2009 (72 percent) and was greater than that in 2003 (67 percent).

Score Gaps for Student Groups

- In 2011, Black students had an average score that was 22 points lower than White students. This performance gap was not significantly different from that in 2003 (19 points).
- In 2011, Hispanic students had an average score that was 13 points lower than White students. This performance gap was not significantly different from that in 2003 (21 points).
- In 2011, female students in Alaska had an average score that was higher than male students by 11 points.
- In 2011, students who were eligible for free/reduced-price school lunch, an indicator of low family income, had an average score that was 28 points lower than students who were not eligible for free/reduced-price school lunch. This performance gap was not significantly different from that in 2003 (24 points).

NOTE: Statistical comparisons are calculated on the basis of unrounded scale scores or percentages.

The Honorable Bert Stedman, Co-Chair
The Honorable Lyman Hoffman Co-Chair
Finance Committee, Alaska State Senate
Alaska State Capitol
Juneau Alaska 99811.1182

Dear Senator Hoffman and Senator Stedman:

Thank you for recognizing the importance of an increase to the Base Student Allocation and for hearing SB171 Increase BSA Funding which will help provide a stable fiscal plan for Alaska's schools. Budget stability allows districts to plan educational programs with certainty, create efficiencies and promote public confidence in schools.

To improve student achievement the Juneau School District is focusing on three distinct areas:

- Professional development of teachers and staff
- Investment in appropriate instructional materials
- Renewed effort on supervision and evaluation of teachers and staff (adopted a new teacher evaluation process last May)

Several system-wide success stories have occurred in Juneau as a result of our investments:

- Graduation rates for Juneau students up to 87% and 86% at JDHS and TMHS
- Achievement in reading has climbed steadily for four years based on higher *national* standards, and math achievement has increased even more dramatically
- Energy and excitement are being generated by a new program that improves student organizational skills and encourages non-college bound students to consider studying for a variety of postsecondary options

These improvements to student achievement have occurred during recent years of significant budget cuts but we cannot guarantee we will continue to get these results while cutting staff. This year we are cutting approximately $5.8 million on top of the $4.1million (5.2%) we cut last year.

We appreciate one-time funding last year, the increase to the Career and Technical Education factor, and the continued support of the Legislature to fund our retirement system obligations. This funding is a significant contribution to our district. Without this support, our mission would even be more seriously hampered. However, retirement system funds do not hit the classroom, which is where we make gains in student achievement.

Knowing our funding level in advance of key staff contract deadlines and city budget deadlines would ensure we focus our limited time on student achievement instead of budget uncertainty.

Under the current funding, more than 65 of our school staff will lose their jobs. Our superintendent put that in perspective by asking us to picture a full size school bus filled with talented and hard working people, and then watch as that bus drives onto the ferry and out of our community, as these people seek employment elsewhere. This issue stretches well beyond the doors of our school district. The Juneau Economic Development Council estimates these job losses would result in a negative economic impact to Juneau of nearly $11.5 million

We would receive approximately $1.3 million under SB171, which would reduce the level of cuts to be made. Passage of SB171 would result in an overall reduction of $4.5 million (5.9%) instead of a reduction of $5.8 million (7.4%) without passage of the bill.

We support an established BSA increase in at least one, and preferably three, years ahead to provide sufficient time to prepare and submit budgets without spending unnecessary time and resources revising budgets based on legislative action after the local process has begun.

We believe this alone will help make us more effective and will promote public confidence in Alaska schools. Any increased funding to the Base Student Allocation can only help us improve our slow progress to ensure each student, every student in Juneau, achieves the academic success we know they can.

Sincerely,

Sally Saddler, President

Andi Story, Vice-President
Juneau School Board

Cc: The Honorable Dennis Egan
The Honorable Cathy Munoz
The Honorable Beth Kerttula
Juneau School Board
Glenn Gelbrich, Superintendent, Juneau School District

Dear Senators:
I am not able to testify on Senate Bills 139 or 171 tomorrow morning due to another commitment so I hope these comments can be entered into the record for your consideration.

First of all, I want to thank **all** of you for being such outstanding advocates for our public schools in Anchorage, and in the state. We sincerely appreciate your support, both financial and in so many other ways! We applaud your service by being on the Senate Education committee.

As you probably know, I have just released my preliminary budget to the public and to the School Board for their consideration. This budget will have two more public hearings on February 1 and February 9; the School Board will probably make some changes to my preliminary budget. After they complete their work, our budget is transmitted to the Municipality and the Assembly by March 5 which is required by our municipal charter. Our Assembly public hearing is scheduled for March 27 where they will set the upper limit of spending and the level of local contribution to the Anchorage School District. After that time, we have to wait until the legislature and the governor complete your work to determine the level of funding we will have access to. If an increase occurs, we revise our budget again, and reinstate what we can, and then we have to go back to the Assembly for permission to spend the funds if they exceed the already approved upper limit.

As you can imagine. This budget cycle undermines our credibility, and takes a great deal of time and energy to continually revise our budgets. The emotional turmoil on potentially impacted employees is destructive to their morale and ability to focus on their important work of educating our students, and doing their jobs.

We are making excellent use of the additional C and TE funds from SB 84 last year and encourage you to visit some of our high schools to see how these funds are being used to expand our career pathway programs. We would ask that you give serious consideration to expanding the flexibility for the use of these funds for at least middle schools and high schools (grades 6-12) so that we can support our career planning in the middle schools. We have had to recommend the deletion of our career guides in the middle schools for next year, and having the flexibility to use the C and TE funds for the middle grades would allow more expansion of our construction, health and pre-engineering academies.

I urge you to support the funding for the next three years as proposed by the Education Committee in SB 171. The years that we had advance notice of our funding increases as a result of the Education Funding Task Force which was co-chaired by Rep. Mike Hawker and Sen. Bert Stedman allowed us to plan and avoid our annual "guessing as to our funding" as I described above. All districts in the state benefitted from this funding and would urge you to reinstate a three year BSA increase that allowed us to compensate, at a minimum, for inflation and increased costs of doing our work.

Additionally, we are urging you to consider reinstating the COLA to the Pupil Transportation funding for all districts which provide pupil transportation. All districts are having to use their instructional revenue to pay the costs of their transportation contracts. Costs are going up for fuel, tires, repairs, and bus purchases.

Again, my sincere thank you for your long-standing support for education. Please let me know if you have any questions or concerns about these statements, or if you have a need for more information.

Sincerely,
Carol Comeau
Superintendent
Anchorage School District

FISCAL NOTE #1

STATE OF ALASKA
2012 LEGISLATIVE SESSION

BILL NO. SB 179

Analysis

This bill amends AS 44.41 by adding a new section requiring the Department of Public Safety (DPS), in cooperation with the Department of Military and Veterans' Affairs (DMVA), to develop and implement missing vulnerable adult response and notification plans using statewide and local radio and television broadcasters and newspaper publishers.

It is expected that DPS will implement the notification using DMVA's modernized emergency alert system, EMnet. This system is new and it is anticipated that it includes all the capabilities necessary to implement the missing vulnerable adult notification on a statewide or regional basis. Therefore, a zero fiscal note is being submitted.

SPONSOR STATEMENT

SENATE BILL 179-*"MISSING VULNERABLE ADULT RESPONSE PLAN"*

SB179 creates a new statewide alert system to help find vulnerable missing adults. The system, which is similar to the nationwide Amber Alert program, would help local law enforcement notify the public when a mentally or physically impaired Alaskan goes missing.

According to the Alaska Commission on Aging, there were approximately 7,785 Alaskans suffering from Alzheimer's Disease and related dementia in 2010, and that number is expected to grow to more than 17,000 by 2030. Alaska has the fastest growing senior population in the nation and we can't afford to ignore this problem any longer.

Recently, in Fairbanks, a 63-year-old woman suffering from Alzheimer's Disease froze to death after she became disoriented while driving, ran out of gas, and tried walking several miles to seek help. This incident and several others like it demonstrate the need for an alert system to assist in the search for missing vulnerable adults. When a vulnerable adult goes missing, his or her best chance of survival is if someone finds them within 24 to 48 hours.

The bill calls for the Department of Military Affairs to coordinate with Department of Public Safety to create and implement prompt response and notification plans that would use a voluntary network of statewide and local newspapers as well as radio and television stations to rapidly alert the public that a vulnerable adult is missing. The bill also calls for both departments to establish standards on what triggers an alert and when a vulnerable adult is officially considered missing. This legislation would ensure the search for Alaska's most vulnerable citizens happens a lot faster.

Currently, there are 28 states that have implemented or will implement Silver Alert programs, an increase of 10 states since the National Association of States United for Aging and Disabilities (NASUAD's) last report.

Session: (January – April)
State Capitol, Room #30, Juneau, AK 99801-1182 Phone: (907) 465-3822 · Fax: (907) 465-3756 · Toll Free: (800) 770-3822
Interim: (April – December)

A **Silver Alert** is a public notification system in the United States to broadcast information about missing persons - especially seniors with Alzheimer's Disease, dementia or other mental disabilities - in order to aid in their return.

Silver Alerts use a wide array of media outlets—such as commercial radio stations, television stations, and cable TV—to broadcast information about missing persons. Silver Alerts also use variable-message signs on roadways to alert motorists to be on the lookout for missing seniors. In cases in which a missing person is believed to have gone missing on foot, Silver Alerts have used Reverse 911 or other emergency notification systems to notify nearby residents of the neighborhood surrounding the missing person's last known location.

Supporters of Silver Alert point to America's growing elderly population as a reason to support new programs to locate missing seniors. Approximately 6 in 10 dementia victims will wander at least once, health care statistics show, and the numbers are growing worldwide, fueled primarily by Alzheimer's disease.[1] If not found within 24 hours, up to half of wandering seniors with dementia suffer serious injury or death.[2]

History

In December 2005, Oklahoma state Representative Fred Perry (R-Tulsa) announced his intention to introduce an "AMBER Alert for seniors," which he dubbed "Silver Alert."[3] In March 2006, the Oklahoma House of Representatives passed H.R. 1075, a resolution calling for a Silver Alert system to find missing seniors.[4] In response to this non-binding resolution, the Oklahoma Department of Public Safety added Silver Alert notifications to the statewide alerts sent to law enforcement agencies and the media for rapid distribution.[5] In April 2009, Governor Brad Henry signed legislation permanently establishing the Silver Alert program.[6]

In Georgia, public efforts to locate missing seniors increased following the April 2004 disappearance of Mattie Moore, a 68-year-old Atlanta resident suffering from Alzheimer's disease. Eight months after Moore's disappearance, her body was found 500 yards from her home.[7] The City of Atlanta created "Mattie's Call" to coordinate and support Metro Atlanta law enforcement, emergency management and broadcasters to issue an urgent bulletin in missing persons cases involving persons with Alzheimer's disease, dementia and other mental disabilities.[8] Legislation to create a statewide Mattie's Call program was enacted in April 2006.[9]

In Florida, Mary Zelter, an 86-year-old resident of Largo, drove away from her assisted living facility on Feb. 26, 2008 and never returned. Her body was found a week later 10 miles (16 km) away in the Intracoastal Waterway near a Clearwater boat ramp. Her submerged car was nearby. This tragedy prompted Pinellas County officials to create a Silver Alert pilot program that later grew into a statewide initiative.[10]

[edit] National growth

29 states and New York City[11] have Silver Alert or similar programs targeting missing seniors. More than 195 million people live in jurisdictions served by Silver Alert or a similar program.

20 states have missing senior recovery programs that are formally called "Silver Alert":

- Arkansas[12]
- Connecticut[13]
- Florida[14]
- Illinois[15]
- Indiana[16]
- Kansas[17]
- Louisiana[18]
- Maine[19]
- Maryland[20]
- Massachusetts[21]
- Mississippi[22]
- Nevada[23]
- New Jersey[24]
- North Carolina[25]
- Oklahoma[26]
- Rhode Island[27]
- South Carolina[28]
- Tennessee[29]
- Texas[30]
- West Virginia[31]

Additionally, 9 states have programs to help locate missing seniors that are not officially called "Silver Alert" but contain criteria similar to existing Silver Alert programs:

- Alabama, Missing Senior Alert[32]
- Delaware, Gold Alert[33]
- Colorado, Missing Senior Citizen Alert[34]
- Georgia, Mattie's Call[35]
- Kentucky, Golden Alert[36]
- New Hampshire, Missing Senior Citizen Alert[37]
- New York, Golden Alert[38]
- Ohio, Missing Adult Alert[39]
- Virginia, Senior Alert[40]

SILVER ALERT INITIATIVES IN THE STATES

11/9/2010

Protecting Seniors with Cognitive Impairments

Silver Alert Initiatives in the States

PROTECTING SENIORS WITH COGNITIVE IMPAIRMENTS

INTRODUCTION

In March 2009, NASUAD released a report that identified states that have a Silver Alert program, how they fund it, and how each administers the program. The report revealed that 18 states have a Silver Alert program, 14 states had pending legislation, and 18 states did not have legislation.

Several states have implemented Silver Alert programs since our last report. The following chart reflects the updated status of states across the country.

States with Silver Alert Programs		States with Pending Legislation	States Without Silver Alert Programs
Alabama *	Mississippi *	California	Alaska
Arizona	Missouri	Hawaii	Idaho
Arkansas **	New Hampshire	Massachusetts	Illinois
Colorado	New Jersey *	Pennsylvania	Iowa
Connecticut *	New Mexico		Maine
Delaware	North Carolina		Michigan
Florida	Oklahoma		Montana
Georgia	Ohio		Nebraska
Indiana *	Rhode Island		Nevada
Kansas *	South Carolina		New York
Kentucky	Tennessee *		North Dakota
Louisiana	Texas		Oregon
Maryland *	Virginia		South Dakota
Minnesota	West Virginia *		Utah
			Vermont
			Washington
			Wisconsin ***
			Wyoming

* State has legislation that went into effect since NASUAD's 2009 Report.
** Arkansas has a Memorandum of Understanding that establishes the Silver Alert Program.
*** Wisconsin governor vetoed legislation for a lack of funding.

States with Silver Alert Programs

Currently, there are 28 states that have implemented or will implement Silver Alert programs, an increase of 10 states since the NASUAD's last report. The following section provides a brief summary of the legislation that establishes the programs, the agencies administering the programs, and the program requirements for initiating an alert. The links below will provide you with further information on each state's Silver Alert program.

Alabama

The Alabama Missing Senior Citizen Alert Act (HB 33) went into effect on June 1, 2009. The purpose of this law is to provide immediate response to missing or lost seniors age 60 or older who are at risk of bodily harm or death and to gain the voluntary assistance of the broadcast media to help locate missing seniors. The Department of Public Safety, who administers this program, works collaboratively with other local and state law enforcement agencies, the Alabama Association of Broadcasters and licensed broadcasters in the state.

To view the legislation, please visit the following Web site.

http://www.dps.state.al.us/ABI/pdf/MissingSeniorAct.pdf

Arkansas

House Bill 2087, "An Act to Establish the 'Silver Alert System' for Adults Who Are Living with Dementia or Other Cognitive Impairment," was filed, but it never became law. However, in March 2009, the Arkansas State Police entered into a Memorandum of Understanding with the Arkansas Sheriffs' Association and the Arkansas Association of Chiefs of Police to host an Internet website that provides Arkansas broadcasters and news organizations a means to receive Arkansas Silver Alerts that are shared with the public. Silver Alerts are disseminated for missing persons 18 years of age or older who are living with dementia or other cognitive impairment.

To view the legislation, please visit the following Web site.

http://staging.arklea.state.ar.us/ftproot/bills/2009/public/HB2087.pdf

Connecticut

Substitute Senate Bill 451 went into effect July 1, 2009 establishing Connecticut's Silver Alert System. The Department of Public Safety's Missing Child Information Clearinghouse administers the program and notifies the public of missing persons 65 years of age or older and anyone 18 or over who has a mental impairment.

To view the legislation, please visit the following Web site.

http://search.cga.state.ct.us/dtSearch_cga.html

Indiana

Governor Mitch Daniels signed Senate Bill 307 to establish the Indiana Silver Alert, effective July 1, 2009. The Indiana Clearinghouse for Information on Missing Children and Missing Endangered Adults administers the program and works collaboratively with private organizations and law enforcement agencies in alerting the public of missing persons age 18 or older with mental illness, dementia, or other mental or physical incapacity.

To view the legislation, please visit the following Web site.

http://cspwin.com/ohsa/indexbrowser.3ulshttp%3A%2F%2Fwww.in.gov%2Fapps%2Flsa%2Fsession%2Fbillwatch%2Fbillinfo%3Fyear%3D2009%26session%3D1%26request%3Dgetbill%26doctype%3DSB%26docno%3D0307

Kansas

The Kansas Silver Alert Plan was implemented on July 30, 2009 following a resolution that called for the establishment of this senior alert system, but did not require it by law (SHL Resolution 2506). It is administered by the Kansas Bureau of Investigation, which collaborates with local law enforcement agencies and the media to alert the public of missing persons living with dementia or persons over age 65 with a medical or mental condition or one who is at risk of harming himself.

The following Web site provides the protocol and policies for the Silver Alert Plan.

http://www.ksag.org/page/attorney-general-establishes-silver-alert-protocol

Maryland

In October 2009, Maryland established its Silver Alert Program (HB 192) that is designed to alert the public about missing persons with cognitive impairments such as Alzheimer's or dementia. The Department of State Police administers the statewide program and works collaboratively with the State Highway Administration on this initiative.

You can view the bill by going to the following Web site.

http://mlis.state.md.us/2009rs/fnotes/bil_0002/hb0192.pdf

Mississippi

The Mississippi Silver Alert System Act of 2010 (HB 664) went into effect July 1, 2010. The Bureau of Investigation of the Department of Public Safety will be responsible for implementing the statewide alert system. The purpose of the Silver Alert System is to provide a tiered, rapid response system to notify the public about missing endangered adults age 18 or older with dementia or other cognitive impairments. The Bureau of Investigation will work with local law enforcement agencies and the Mississippi Highway Patrol Headquarters Communication Center to alert the public about missing persons.

You can view the bill by going to the following Web site.

http://billstatus.ls.state.ms.us/documents/2010/pdf/HB/0600-0699/HB0664PS.pdf

New Jersey

The Silver Alert System Act went into effect on December 22, 2009. The State Police administers the program and disseminates missing person information on people age 65 or older to broadcast media, the Department of Transportation, the New Jersey Highway Authority, the New Jersey Turnpike Authority, and the South Jersey Transportation Authority.

You can view the bill by going to the following Web sites.

http://www.njleg.state.nj.us/2008/Bills/A3000/2844_I1.HTM

http://www.njleg.state.nj.us/2008/Bills/S2000/1844_I1.HTM

Tennessee

The Tennessee Senior Alert Act went into effect on August 4, 2009. The Tennessee Bureau of Investigation administers the Silver Alert system that provides a statewide system for the rapid dissemination of information on missing persons age 18 or older who have dementia or other cognitive impairment.

You can view the bill by going to the following Web site.

http://www.capitol.tn.gov/Bills/106/Bill/HB0346.pdf

West Virginia

HB 2504 was signed into law by Governor Joe Manchin and went into effect on July 10, 2009 establishing the West Virginia's Silver Alert Plan. The State Police administers the program by providing alerts for cognitively impaired missing persons to broadcast media, the Department of Transportation, the Division of Highways, the West Virginia Turnpike Commission, and affected authorities. HB 2504 does not specify an age requirement of a cognitively impaired missing person.

You can view the bill by going to the following Web site.

http://www.legis.state.wv.us/Bill_Text_HTML/2009_SESSIONS/RS/BILLS/hb2504%20enr%20sub.htm

Pending Legislation

California

On December 22, 2008, Senators Alquist, Correa, and Oropeza introduced SB 38, a bill that would establish a missing senior person alert system. The bill specifies that a missing person would have to be 65 years of age or older and must have an impaired mental condition. As of August 27, 2009, there has been a second reading of the bill and it is currently being held in committee.

You can view the bill and its history by going to the following Web site.

http://www.legislature.ca.gov/cgi-bin/port-postquery?bill_number=sb_38&sess=CUR&house=B&author=alquist

Hawaii

Since January 2009, Hawaii legislators have introduced six bills that would establish a Silver Alert system in their state. However, it appears that SB2226 SD2 HD1 is the only bill that has received considerable action. It was introduced January 21, 2010 and, as of March 12, 2010, it passed the second reading as amended in HD 1 and was referred to the Committee on Judiciary without opposition. The bill specifies that the public alert would be made for missing senior citizens and defines a senior citizens as one who is 65 years of age or older.

You can view the bill and its history by going to the following Web site.

http://www.capitol.hawaii.gov/session2010/bills/SB2226_HD1_.pdf

http://www.capitol.hawaii.gov/session2010/lists/measure_indiv.aspx?billtype=SB&billnumber=2226

Massachusetts

H4344 (new draft of S322, H44, and H603) would establish a Silver Alert community response system to protect seniors. This Silver Alert system would be used to alert the public of missing adults with serious memory impairment such as Alzheimer's disease or other dementia. The last action recorded for this bill was on November 17, 2009 when the Joint Committee on Community Development and Small Business reported favorably on it and referred it to the House Committee on Ways and Means.

You can view the bill and its history by going to the following Web site.

http://www.mass.gov/legis/bills_house/186/ht04pdf/ht04344.pdf

http://www.mass.gov/legis/186history/h04344.htm

Pennsylvania

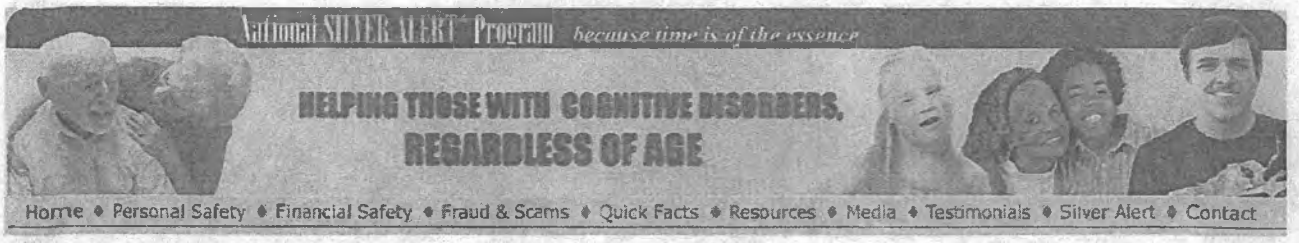
On March 5, 2009, the General Assembly of Pennsylvania referred HB 726 to Committee on Aging and Older Adult Services. HB 726, which is also referred to as the Silver Alert for Missing Senior Citizens Act, would establish a statewide alert system for notifying the public of missing persons age 65 or older who have an impaired mental condition and whose disappearance poses a credible threat to the senior citizens' health and safety. The Secretary of the Department of Aging is responsible for appointing a director to serve as the statewide coordinator of the alert system.

You can view the bill and its history by going to the following Web site.

http://www.legis.state.pa.us/cfdocs/billinfo/billinfo.cfm?syear=2009&sind=0&body=H&type=B&BN=0726

NASUAD will continue to monitor pending legislations.

Legislation That Did Not Pass



Nevada
According to the Nevada Silver Haired Legislative Forum, AB 4 that would establish a statewide Silver Alert system was referred to the Health and Human Services Committee and died on April 11, 2009 due to no further action being taken on the bill.

Vetoed Legislation

Wisconsin
Unfunded legislation to establish a Silver Alert program was vetoed by Governor Jim Doyle.

Silver Alert

Modeled after the Amber Alert, the Silver Alert is an emergency system in which law enforcement can broadcast regional or statewide alerts for missing seniors and/or other adults with Alzheimer's or other cognitive disorders.

A growing number of states are enacting laws that call for the development of the Silver Alert program and some have implemented their own notification systems.

Activation criteria varies from state to state, see list below for information on the Silver Alert program in your state.

Alabama	
Effective Date	March 25, 2009 AKA "Missing Senior Citizen Alert"
Administered By	Department of Public Safety
Age Requirement	Not specified

Fairbanks woman's death sheds light on harsh reality of living with Alzheimer's disease

by Dorothy Chomicz / dchomicz@newsminer.com
12.03.11 - 12:28 am

FAIRBANKS — When you are caring for a loved one with Alzheimer's, the possibility of that person wandering off is an ever-present worry. In fact, six out of 10 Alzheimer's patients will wander at some point, and many do so repeatedly, according to the Alzheimer's Association website (www.alz.org).

The situation becomes even more serious in places like Alaska, where severe weather conditions can spell death for someone who has wandered outside and is unprepared for the elements.

This danger was brought to reality this week when Bonnie L. Scott, a 63-year-old Fairbanks woman who suffered from Alzheimer's, became confused while driving an acquaintance home in Fairbanks and ended up 80 miles northeast on the Steese Highway.

Scott wandered away from her vehicle after running out of gas, and Alaska State Troopers were able to follow her footprints into the woods, where they found her body. She had died of exposure after walking by a manned Department of Transportation maintenance facility in which she could have found shelter and aid.

Most cases of wandering do not occur in vehicles and are instead instances of the individual simply walking out of the door while a caretaker is distracted or sleeping.

To minimize the risk of wandering, experts suggest making changes around the home, such as camouflaging exit doors by painting them the same color as the wall, and draping door knobs with same-color cloth.

Placing a mirror next to the door can also stop the potential wanderer — they either think there is someone else there, or they become distracted by their own reflection.

Extra door latches can be placed at the tops or bottom of doors, where they will not be noticed, and car keys should be kept hidden. Chimes or alarms can be placed on doors to alert the caregiver.

Since wandering is often caused by restlessness, fear or physical need, make sure that basics such as hunger, thirst and the need to use the toilet are all met regularly.

If it is physically possible, provide the individual with recreational opportunities such as short, supervised walks or get them to help with simple household chores. Reassure them if they feel agitated or fearful, and give them a routine to help them feel secure.

Even though caregivers are often tempted to keep a person's Alzheimer's a secret, it is important that neighbors and family members be told of potential wandering, and be provided with a good contact number. Always keep a current, clear photo of the individual on hand, and consider keeping one on file with your local police department.

Keep as much identification as possible on the person — place it in every coat, purse, pocket or wallet, and think about providing the person with an ID bracelet or necklace.

Since identification is only helpful once the person has been found, consider purchasing an electronic tracking device that can be used to locate them before tragedy occurs. According to the Alzheimer's Foundation of America website, a person with dementia "only stands a 50 percent chance of survival if they are not found within the first 24 hours."

Finally, do not leave the individual alone. Since it is virtually impossible for one person to keep an Alzheimer's sufferer in sight at all times, it is essential that the caregiver establish a support network that can help out and provide a break when needed.

Alzheimer's Resource of Alaska provides services, information and education to Alaskans dealing with Alzheimer's and has five offices statewide. They can be reached at their Fairbanks office at 452-2277, or visited at www.alzalaska.org.

Subject: FW: 27-LS1250\A - An Act relating to missing vulnerable adult prompt response and notification plans
Attachments: Silver Alert Updated Report_11-9-10.pdf

Celeste,

Per your request, and after review of the draft legislation, I am providing the following response from our Emergency Operations Section:

A portion of the Alaska Amber Alert Plan involves the local law enforcement agency and the Alaska State Troopers providing additional "emergency public information" to broadcast outlets to assist with the recovery effort. Most Sliver Alert plans revolve around that. Not using EAS, but notifying and providing information on the missing person, vehicle, etc, and the broadcast outlets voluntarily providing that information to their viewers/listeners. In many cases State DOTs or those who control highway signs would also post the information to the public, as well as the investigating law enforcement agency providing a BOLO alert in the state APSIN/NCIC systems.

Attached is a seven page report from the 2010 summary of States performed by the National Association of States United for Aging and Disabilities. The report is a summary of states that have plans, and the enabling legislation behind it. It doesn't speak to operational aspects.

From an EAS standpoint there is no event code that is designated for missing persons (adults), so we couldn't utilize EAS like we do for Amber alerts, which uses the special "Child Abduction Emergency" code.

We certainly could work with DPS on this plan, the same players from AST, DHS&EM, APD, and the Alaska Broadcasters Association could work out the plans that would be required by the bill/law.

So, to be clear, we have no issues on the draft legislation.

Please do not hesitate to contact me should you have any questions. Thank you.

Sincerely,

Mike O'Hare

alzheimer's association

8 February 2012

Senator Bill Wielechowski
Chairman, Senate State Affairs Committee
State Capitol Room 101
Juneau AK, 99801

Dear Senator Wielechowski:

On behalf of the Alzheimer's Association, I am pleased to extend our support for Senate Bill 179, sponsored by Senator Bettye Davis, which would address the need for a prompt response system when a vulnerable adult has gone missing. The Association supports creating a system that provides for dissemination of relevant information about missing individuals with Alzheimer's disease or a related dementia to appropriate law enforcement personnel.

An estimated six out of ten people with Alzheimer's disease will wander from their homes or caregiving facilities at some point during the disease process. Most people with dementia who wander are found within 1.5 miles of home, and 50 percent of individuals who wander risk serious injury or death if not found within the first 24 hours. Environmental dangers pose serious threats to people with Alzheimer's who are particularly vulnerable to succumb to natural elements such as weather, and who may lose their ability to remember when to eat or drink. An immediate response with emphasis on local searching is imperative once an individual with dementia is reported missing.

The Alzheimer's Association supports a comprehensive approach to constructing a notification, or "silver alert", system that addresses the needs of persons with dementia and their families. This approach includes first responder dementia training and coordinating search efforts between families, caregivers and local authorities. The system should be interoperable with existing programs, such as the MedicAlert and Safe Return program, which is a nationwide identification, support and enrollment program providing assistance to adult wanders and their families.

I appreciate the opportunity to comment on this issue and applaud Senator Davis for spearheading this effort.

With best regards,

Randi Chapman
Director, State Affairs
Alzheimer's Association

AGENET

Alaska Geriatric Exchange Network

An Association of Advocates and Service Providers for Older Alaskans

February 23, 2012

Senator Bert Stedman, Co-Chair Senate Finance Committee
State Capitol
Juneau, AK 99801-1182

Dear Senator Stedman,

AGENET, with over forty agency members that provide services to Older Alaskans, is requesting your support of SB179, which would establish a "Silver Alert" response system in the state of Alaska. This prompt response and notification system would be an effective way to assist in finding vulnerable older adults who may wander due to Alzheimer's disease or other dementias.

Today, more than 6,000 Alaskans have Alzheimer's disease or a related dementia. Wandering is a common behavior in people with dementia and up to 60% of people affected may wander, just once or on a recurring basis. Over the years, several cases of wandering in Alaska have resulted in injury or death because it took too long to find the person. In the harsh Alaska winter, a case of wandering has a higher probability of resulting in a poor outcome or even become rapidly fatal for the person involved.

Some programs in Alaska can educate families about wandering behaviors and can recommend strategies to keep the person as safe as possible. However, with the number of people currently affected and that number expected to double in the next 10 years, some of these cases of wandering are likely to occur. SB 179 outlines a strategy that would help find the person who wanders more quickly and hopefully avoid injury or death.

AGENET would like to express its support of SB 179 and urge you to hear this bill in the near future and move it on to the full body of the Senate. We understand that it has zero fiscal notes, because it uses the same system already used for "Amber Alerts."

Thank you for considering our request.

Sincerely,

Connie J. Sipe

Connie J. Sipe
President of AGENET

Subject: Support for SB 179, Missing Vulnerable Adult Prompt Response Plan

Dear Chair Hoffman & Chair Stedman:

The Alaska Commission on Aging (ACoA) is pleased to offer our support for SB 179 to establish a vulnerable adult prompt response and notification plan by the Department of Public Safety in cooperation with the Department of Military and Veterans' Affairs. Senator Bettye Davis, author of SB 179, addresses the problems of all vulnerable missing adults. The ACoA will focus on benefits we perceive for vulnerable older Alaskans from this legislation.

Wandering is one of the most significant personal safety risks faced by individuals with Alzheimer's disease and related dementia (ADRD). According to the Alzheimer's Association (2011), nearly 60% of people with Alzheimer's disease wander at some point during the course of their disease with approximately one-half of all wanderings resulting in personal injury if the person is not found within 24 hours. For an elder living in a rural and remote community, especially in the wintertime, getting lost has life and death consequences.

As part of our efforts to learn more about the needs of people with ADRD and their caregivers, the ACoA hosted two Community Forums at the Anchorage Senior Citizens Activities Center (December 2011) and at the Juneau Senior Center (February 2012). Both forums were well-attended with the majority of participants being family and professional caregivers. Improving public response services to reduce safety risks for persons with ADRD who wander was identified as a priority concern by the Forum participants. While Anchorage's "Project Lifesaver," administered by Search and Rescue is an effective program for individuals with Alzheimer's disease, this program is available in Anchorage only with limited programs of this kind available statewide.

The ACoA supports SB 179 to authorize the Department of Public Safety to work with the Department of Military and Veterans' Affairs to develop a missing vulnerable adult response plan that will improve the safety of vulnerable Alaskans, such as individuals with Alzheimer's disease and related dementia. Thank you for your support of this legislation. Please feel free to contact Denise Daniello, ACoA's executive director, by phone (465-4879) or email (denise.daniello@alaska.gov) should you have questions or require additional information.

Sincerely,

Sharon Howerton-Clark
Chair, Alaska Commission on Aging

Sincerely,

Denise Daniello

Why this fiscal note differs from previous version (if initial version, please note as such)

The CS changes the per pupil amounts for 2012 and places those amounts in Sec. 4 The CS adds per pupil amounts for 2013 in Sec. 4. The CS changes the effective date to FY2014 to begin using total district dollars for a funding mechanism at Sec. 1. The CS adds direction on department oversignt at Sec 2. (e.) The department has recalculated the annual cost estimates and added a pcn for pupil transportatin program oversight. FY2013 govenor's request was corrected to $62,202.7

Approved by: Mike Hanley, Commissioner — Date: 3/1/2012

(Revised 8/17/2011 OMB)

FISCAL NOTE

STATE OF ALASKA
2012 LEGISLATIVE SESSION

BILL NO. CSSB182(EDC)

Analysis

This bill, CSSB182, amends the amount of funding provided to districts through the pupil transportation funding formula at AS 14.09.010. The current program provides state funding for pupil transportation by assigning each participating district an individual per student factor, and then multiplying the factor by the current annual average daily membership (ADM) to arrive at each districts annual funding. The bill also directs the department to set regulation for oversight and support in achieving safe and cost-effective student transportation.

In section 4 the bill sets new per student rates for FY2012 and FY2013.

In section 1, the bill provides that beginning in FY2014 the funding will be distributed as a total dollar amount per district. The bill sets FY2014 funding at the amount districts will report as their year ended June 30, 2013 audited pupil transportation expenditures.

In section 1 the bill adds an annual Anchorage Consumer Price Index percentage increase each year.

Calculations Overview:

The fiscal note increase of $8.1 million for FY2012 was calculated by using the new per student amounts in for FY2012 multiplied by FY2012 projected ADM.

The fiscal note increase of $10.4 million for FY2013 was calculated by using the new per student amounts in for FY2013 multiplied by FY2013 projected ADM.

The fiscal note increase of $12.7 for FY2014 is calculated by estimating what districts will report as FY2013 expenditures; the FY2013 fiscal note funding was used as an estimate, actual expenditures could be different. Plus, a consumer price index was applied as set out in Section 1.

The fiscal note increases for FY2015 - 2018 were calculated by adding an estimated 3.2% consumer price index increase to the prior year funding.

The fiscal note adds one school finance specialist II position at a range 18 A for a cost of $95.3. This position is necessary to implement regulations and accountability measures as directed in section 2 part (e) of the bill.

Section 3 repeals the definition for ADM and district ADM in the old law.

The current annual cost of the pupil transportation program is $62,274.5 for FY2012; under CSSB182 the total program costs are estimated to be:

$70,377.8	FY2012
$72,557.6	FY2013
$74,879.5	FY2014
$77,275.6	FY2015
$79,748.5	FY2016
$82,300.4	FY2017
$84,934.0	FY2018

SENATE EDUCATION COMMITTEE

LETTER OF INTENT FOR SENATE BILL 182

It is the intent of the Senate Education Committee that the Department of Education and Early Development establish minimum standards for proposals and contracts entered into by school districts to provide pupil transportation services. It is also the intent of the Senate Education Committee that the minimum standards include (1) a standardized time frame for the issuance and acceptance of requests for proposals; (2) minimum terms of requests for proposals and contracts that take into account unique regional conditions, including climate patterns; (3) the opportunity for departmental review of the terms of the requests for proposals and contracts, before issuance, for consistency with statewide standards; (4) alignment of contract terms, by July 1, 2016, with statewide standards for the Anchorage, Fairbanks, Juneau, Kenai, Ketchikan, Kodiak, and Matanuska-Susitna areas; and (5) alignment of contract terms, when feasible, with statewide standards for all other areas of the state not covered in (4).

MEMORANDUM January 31, 2012

SUBJECT: Sectional Summary for SB 182 (Work Order No. 27-LS1283\M)

TO: Senator Kevin Meyer
Chair of the Senate Education Committee
Attn: Edra Morledge

FROM: Jean M. Mischel
Legislative Counsel

You have requested a sectional summary of the above-described bill.

As a preliminary matter, note that a sectional summary of a bill should not be considered an authoritative interpretation of the bill and the bill itself is the best statement of its contents. If you would like an interpretation of the bill as it may apply to a particular set of circumstances, please advise.

Section 1. Beginning in fiscal year 2013, modifies the funding provided by the state to school districts for pupil transportation to the amount reported by the district in fiscal year 2012, as adjusted for inflation under sec. 2 of the bill.

Section 2. Provides for an inflation adjustment to pupil transportation funding provided under sec. 1 of the bill.

Section 3. Repeals AS 14.09.010(b), which provided state funding for pupil transportation as a per student amount for each school district in the state.

Section 4. Provides a one year retrospective per student amount for each school district in the state for pupil transportation based on adjusted amounts to former AS 14.09.010(b) for the current school year.

RESOLUTION OF THE SITKA SCHOOL BOARD OF EDUCATION

Resolution No. 2012-03

A RESOLUTION SUPPORTING INCREASED FUNDING OF STUDENT TRANSPORTATION

The Sitka School Board resolves to urge the 27th Legislature to pass Senate Bill 182 which provides additional funding for student transportation in Fiscal Year 2012 and changes the funding mechanism for future fiscal years to reflect actual per pupil district transportation expenditures. While this bill will not significantly impact the Sitka School District, for most districts across the state, general fund dollars are being allocated away from the classroom in order to sustain student transportation expenses.

NOW, THEREFORE, BE IT RESOLVED that the **Sitka School Board** strongly endorses the passage of **Senate Bill 182** before the Alaska State Legislature that fund further funds student transportation.

Passed and Approved on March 6, 2012.

Lon D. Garrison, President

Subject: SB 182

To Whom it will make a difference:

As the father of three children who call Alaska home and who are schooled on the Kenai, as an educator employed by the KPBSD, and as a principal of one of the many small rural elementary schools that serve the children of the Greatland, it is my responsibility to encourage your support and active involvement in seeing that SB 182 be passed to support the very important transportation needs/shortfalls that we currently face.
You are certainly aware of how important transportation of students to and from school is to their regular attendance and how that in turn is directly related to their academic performance. We are currently anticipating a significant cut to our FY13 transportation options in the Kenai if we do not receive some financial help specific to our per student transportation costs. The proposed changes to transportation options for my school, McNeil Canyon Elementary(2004 National Blue Ribbon School), will be devastating for two of my most needy sub populations, English Language Learners and Students with Disabilities. These children and their families rely on the current transportation options to make sure that they can access the programs that allow them to succeed on the Standards Based Assessments. If the proposed transportation cuts are made, McNeil Canyon will no longer be able to ensure(their parents will not/cannot drive to drop-off or pickup) that all students have access to educational programming that has proven to be highly successful with those populations for more than fifteen years.
I urge you to move this very important legislation forward and ensure that students across our great State will have access to the educational programs that ultimately will benefit all of us.

Sincerely,

Principal, National Distinguished Principal '06

McNeil Canyon Elementary

Life is not...a journey to the grave with the intention of arriving safely in a pretty and well preserved body but rather.... we are meant to skid in broadside, thoroughly used up, totally worn out, and loudly proclaiming "WOW!! What a Ride!!"

Enjoy the ride!

Senate Bill 182
Senate Education Committee

Debbie V. Cary
P.O. Box 39317
Ninilchik, AK 99639

Dear Committee,
Thank you for taking the time to read my testimony. I urge you to fully fund the cost of transportation to the school districts, so we will not be forced to make cuts which will change our start and end times.

We all understand the need to be financially responsible but cutting education and or services to the students is unacceptable, so where do we make cuts? I don't know. I do know the proposed two tier bussing system for the lower Kenai Peninsula isn't the answer.

The question of pupil transportation is one that adversely affects many of our rural Alaskan communities. From how do I get my child to and from school while I continue to work, how do I provide child care before and after school, how will my child be able to participate in extra curricular activities but most importantly how will this change the academic performance of my child.

In my opinion Education must come first and the Kenai Peninsula proposal is wrong on so many basic levels.

First studies show a decrease in academic performance of adolescents as it relates to early start times. Our teenagers already show up to school in a sleep deprived state, so you say send high school students late and elementary school students earlier. My response is to say this would eliminate their ability to participate in extra curricular activities. I realize education has to be our focus and not sports but I would argue the reason so many high school students do well is to be eligible to participate in extra curricular activities.
There are scientific studies to support the fact sending adolescents to school in the early morning is not beneficial. According to studies conducted by the Center for Applied Research and Educational Improvement. "From the onset of puberty until late teen years, the brain chemical melatonin, which is responsible for sleepiness, is secreted from approximately 11 p.m. until approximately 8 a.m, nine hours later. This secretion is based on human circadian rhythms. In other words, typical youth are not able to fall asleep much before 11 p.m. and their brains will remain in sleep mode until about 8 a.m., regardless of what time they go to bed."

Safety has to be factored into any decision made to change our current start times. According to a Comparison of Young and Adult driver crashes, conducted for the years of 1991-1995 by Martha

Moore of Alaska Department of Health and Social Services P.O. Box 110616 Juneau, AK 99801 motor vehicle crashes are the leading cause of death to Alaskans between the ages of 16-20. This is obviously on old study and with the advancement in technology I am sure the numbers would be higher. According to the insurance industry most accidents occur in the dark hours, which we have a lot of here in Alaska. Our roads are barely plowed now, Department Of Transportation is not going to change their schedule to accommodate us. An earlier start time is only going to intensify a potentially dangerous problem for commuters, truck drivers, students and most importantly bus drivers who are transporting, our most precious natural resource, our children. Do you really want to put elementary age (Ninilchik is a k-12 school) children on dark roads in the middle of winter to catch a bus at 6:30 a.m.?

The economic impact on already struggling families while not directly related to education must be factored in for the simple fact that stress and econmic woe can causes increases in domestic violence and major discord of the family unit, in a state with such a high rate of domestic violence this can not be ignored. Parents are now going to worry about everything from childcare cost to the increased energy cost associated with starting households an hour earlier than normal.

The Kenai Peninsula team of Administrators actively tried to encourage more vendors to submit proposals in hopes of reducing cost. Last year they received one bid and the school board granted a one year extension at a cost of 750,000 from the general fund. The 750,000 should have gone directly into classrooms. Regardless of all efforts to attract additional vendors to the Kenai Peninsula, they once again received one proposal by the February 17th, 2012 cut off. So Yes the cost of transporting our students in this state, and particularly on the Kenai Peninsula, is going up, with the lower projected enrollments, higher number of special education students, the higher cost of fuel, insurance and employee compensation we all realize this reality.

Over the past twenty years I have sat back and watched the state cut funding and services to education. Up till now I have said nothing, now I am asking, Please don't continue this trend.

Alaska has a tract record of funding development of our natural resources, but on some fundamental level we have lost sight of the fact that our most precious and renewable natural resource is our children. It is our children who are going to solve the future problems of this great state so Invest in them, Educate them, Help them to aspire to be the best they can.

I implore you to fully fund the transportation contracts at the actual cost to the districts so we can maintain our current routes and level of service.

Respectfully,
Debbie V Cary

The Honorable Senator Joe Thomas
The Honorable Senator Kevin Meyer
Co-Chairs of Education Committee
State Capitol Building
Juneau, Alaska

March 28, 2012

Dear Senator Thomas and Senator Meyer,

During AASB's Spring Legislative Fly-in, local school board members testified eloquently about what their districts require in state support to continue providing a quality education to Alaska's public school students. I am writing this letter to summarize what many of them told the House Finance Committee and individual legislators this week.

The elected leaders who are most familiar with the operations of our 510 public schools statewide believe that they can best address the following budgetary challenges at home if the Legislature and Governor agree on a plan for K-12 education funding:

Personnel
School board members testified that salaries and benefits for their employees make up the largest part of their budgets, ranging from 76 percent in Wrangell to 87 percent in Fairbanks and Anchorage. Even with a modest increase ($125) to the Base Student Allocation, the seven largest districts are projecting the need to reduce their staffs by more than 200 positions next fall. Districts have negotiated in good faith with their employees and settled contracts at or below increases in the CPI. Just as in the private sector, school districts and employees are agreeing to share the cost of future increases in health insurance.

Energy
Alaskans statewide are experiencing the shock of fuel cost spikes, and school districts are no different. The smaller and more rural districts are suffering the biggest impacts, with Wrangell budgeting for a fuel bill that is 21 percent higher in the fall and Bristol Bay School District expecting a 12.8 percent increase in fuel costs. Mat-Su and Fairbanks are predicting costs will go up at least 7 percent in each district.

Transportation
A related budgetary concern for the largest school districts is the cost of transporting students from home to school and back. In particular, Mat-Su and Anchorage are devoting increasingly larger shares of their general fund budgets to transportation costs. A fix to the transportation formula envisioned in Senate Bill 182 would help many of our larger districts on the road system to devote instructional dollars to the classroom, instead of the bus system.

Health Insurance
Kodiak testified that its budget for health insurance has ballooned 110 percent since FY 2009. Anchorage is anticipating a 17.3 percent increase next year alone in premium payments on behalf of employees. Cordova and Wrangell employees now have a co-pay of approximately $200 a month each for health benefits.

These very real cost increases underscore the need for the Legislature and Governor to agree to a K-12 funding plan for FY 13 and beyond. We recognize these are reoccurring costs that require reoccurring revenue. An increase in the Base Student Allocation would be the most appropriate way to address them.

Sincerely,

Carl Rose
Executive Director

CC: The Honorable Senator Davis
The Honorable Senator French
The Honorable Senator Stevens

SB 187

<TARGET><BILL>SB 187</BILL><SUBJECT>SB 187</SUBJECT><COMM>SFIN27</COMM></TARGET>

Senate Finance

Alaska State Legislature * State Capital * Juneau, AK 99801-1182

Sponsor Statement
SB 187

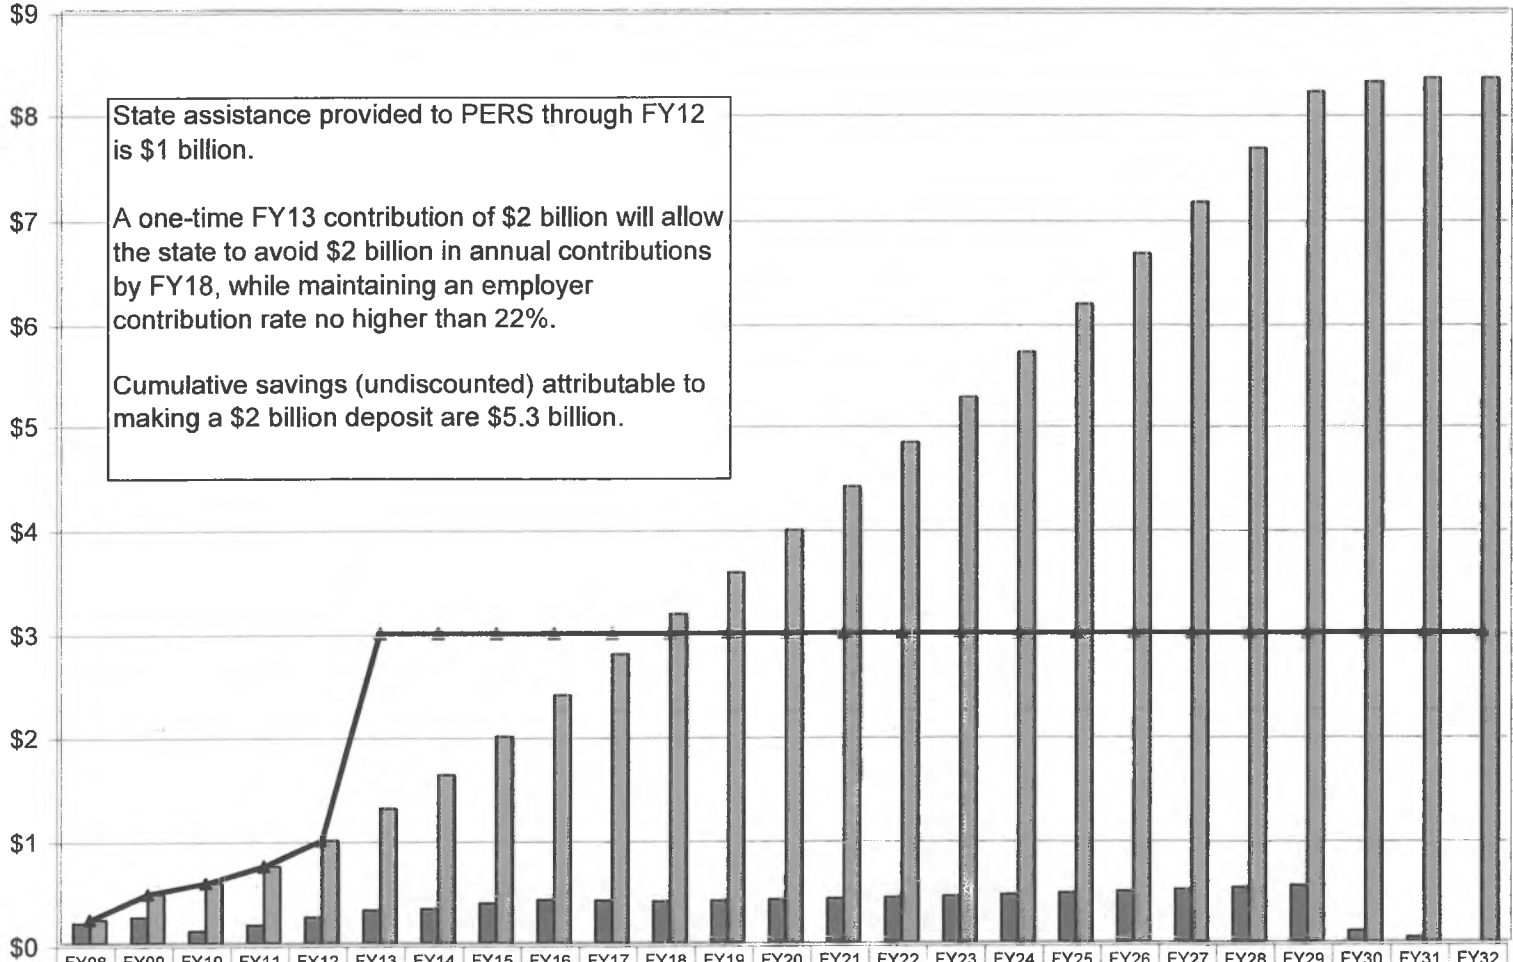
The main purpose of SB 187 is to put forward a plan to eliminate unfunded liabilities in our PERS system without paying hundreds of millions of dollars in annual state assistance to the trust fund.

Back ground:

In FY08 the State took action to address concerns of other political subdivisions to the State's managed public employee's retirement system. The solution involved three steps:

1. Adopting a shared cost system—meaning that liabilities, assets and payrolls were pooled and every participating employer paid a single contribution rate based on the blended experience of all participating employers.
2. Setting employer contribution rates at 22% of payroll.
3. Shifting costs (in excess of those covered by the 22% rate) to the State.

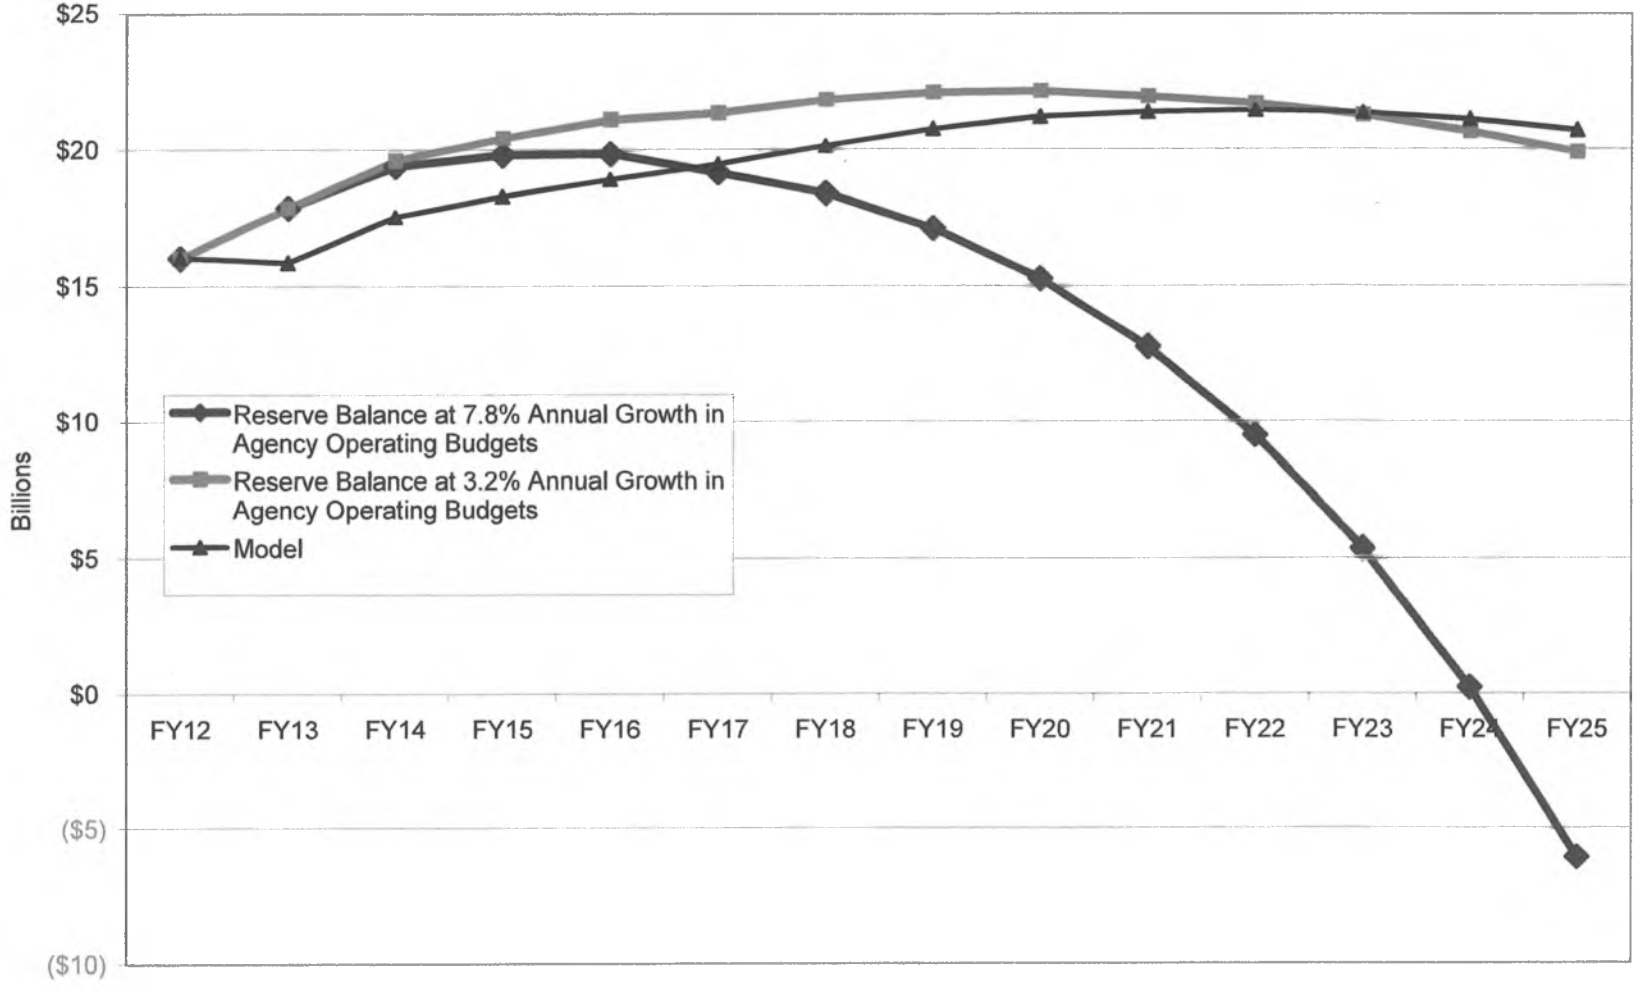
These actions did not reduce the total cost of PERS, they simply provided State financial assistance to the political subdivisions. Unforeseen at the time, four events attributed to putting the State into a situation of having to make escalating annual contributions to the Trust Fund to keep the fund assets in line with the accrued liabilities. First was the crash of the markets, second is the rising cost of health care, third was the extended life expectancy of our covered population, and finally, the Alaska Retirement Management Board recently lowered future investment expectations of the fund. The combination of these events has put state's assistance costs, which are the costs above the 22% rate spiraling upward at an unsustainable rate.



Reason SB 187 is needed:

State assistance to the PERS retirement system has grown from $108 million in FY10 to $165 million in FY11 to $242.million in FY12. FY13 costs are expected to be $307 million. The cost of state assistance is projected to continue to escalate—reaching a peak of $533 million annually before turning downward near FY30 as the number of beneficiaries' begins to decline.

SB 187 Pension Reserve:



SB 187 will create a separate reserve account that will supplement the PERS Trust Fund as needed to ensure the unfunded liability ratio is maintained at no less than 50% and that the state does not have to make escalating annual payments. A $2 billion dollar infusion in FY13 is projected to save the State $7.3 billion in annual payments over a 20 year period. It will bring the PERS Trust Fund back on track as it was originally intended, and the separate reserve fund will allow the State to re-coop its original investment of $2 billion dollars.

FISCAL NOTE

STATE OF ALASKA **BILL NO.** SB187
2012 LEGISLATIVE SESSION

Analysis

SB 187 establishes a pension reserve fund. This fiscal note outlines the estimated cost of managing the pension reserve fund based on the following assumptions:

-$2 billion initial appropriation into a separately managed fund
-Asset allocation of 41% Fixed Income, 27% Domestic Equity, 32% International Equity
-Earnings are not appropriated back to the pension reserve fund
-The ratio of assets to liabilities in the retirement trust funds do not go below 50% so no transfer from the reserve to the systems are made.

Note that this fiscal note includes all costs associated with managing this fund which is assumed to be sourced from the fund itself. However, the incremental budget request would only be for the additional services costs of $500,800. The remaining amount would not be a budget increase request as it relates to finite internal costs that are spread amongst all funds managed byTreasury.

MEMORANDUM February 3, 2012

SUBJECT: Pension reserve fund sectional summary
(SB 187; Work Order No. 27-LS1249\B)

TO: Senator Lyman Hoffman
Chair of the Senate Finance Committee
Attn: Tim Grussendorf

FROM: Dan Wayne
Legislative Counsel

You have requested a sectional summary of the above-described bill.

As a preliminary matter, note that a sectional summary of a bill should not be considered an authoritative interpretation of the bill. The bill itself is the best statement of its contents.

Section 1. Prevents money transfers from the proposed pension reserve fund money to the Public Employees' Retirement System from causing reductions in potential damage awards for wrongful or negligent conduct of third parties.

Section 2. Adds management of a proposed pension reserve fund to the primary mission of the Alaska Retirement Management Board.

Section 3. Adds duties related to management of the proposed pension reserve fund to the existing duties of the Alaska Retirement Management Board, including duties to annually make calculations, by independent actuarial assessment, related to the ratio of the value of the assets of the Public Employees' Retirement System of Alaska and the value of the assets of the proposed pension reserve fund, combined, to the total liabilities of the Public Employees' Retirement System of Alaska.

Section 4. Establishes a pension reserve fund, allows appropriations to the fund, and requires money appropriated to the fund to be spent on the past service liability of the Public Employees' Retirement System or returned to the general fund.

Section 5. Allows the Alaska Retirement Management Board to determine the percentage rate that employer contributions to the Public Employees' Retirement System are based on.

Section 6. Adds a requirement that, notwithstanding subsection (i), proposed in section 7 of the bill, the annual employer contribution rate may not be less than the rate sufficient to cover payment of employer contributions required for both the defined contribution plan of the Public Employee's Retirement System and for the teachers' and public employees' health reimbursement arrangement plan trust fund as required by the defined benefit plan of the Public Employees' Retirement System.

Section 7. Requires that the rate used to calculate employer contributions under section 5 of the bill may not exceed 22 percent when the assets of the Public Employees' Retirement System of Alaska and the pension reserve fund, combined, are equal to or greater than 60 percent of the total of that system's liabilities.

Section 8. Eliminates a reference to AS 39.35.280, in connection to retiree medical benefits, because AS 39.35.280 would be repealed by section 9 of the bill.

Section 9. Repeals AS 39.35.280, a law that requires the state to annually contribute money to the past service liability of the Public Employees' Retirement System in addition to the contributions the state makes to the system as an employer.

Section 10. This section would make the bill effective on June 30, 2012.

FISCAL NOTE #1

STATE OF ALASKA
2012 LEGISLATIVE SESSION

BILL NO. CSSB 192(RES)

Analysis

SB 192 modifies the computation of the progressive element of the production tax rate to arrive at higher tax rates when production tax value per barrel of oil equivalent is higher than $92.50. To understand the modification, a recap of the existing system is required.

"Production tax value" per barrel should not be confused with "price"; under the current production tax statute, production tax value is the netback value of oil less the operator's per barrel operating and capital costs. Currently, the tax rate under AS 43.55.011(e) starts at 25%; after production tax value per barrel exceeds $30, the tax rate increases 0.4% for every additional dollar until production tax value per barrel reaches $92.50. At that point the tax rate increase drops to 0.1% for each additional dollar. At $92.50, the production tax rate is 50%. After 20% capital credits are applied, the effective tax rate drops. (If capital costs per barrel are assumed to be $10 per barrel, then the effective tax rate would be around 48%.) The marginal tax rate, or the change in tax receipts divided by the change in profits, is around 86% when profits per barrel increase from $91.50 to $92.50. The high marginal tax rate is due to the increase in tax rate being applied against all the production tax value, not just the increment of profit generated by the one dollar increase in production tax value per barrel.

SB 192 amends AS 43.55.011(g) so that the tax rate continues to increase at 0.4% even when production tax value per barrel exceeds $92.50. At higher profit per barrel levels, SB 192 would increase average and marginal tax rates. If production tax value per barrel reached $110, the average production tax rate would be 57% rather than 51.75%. The marginal tax rate would be over 100% rather than 60%. For marginal tax rates exceeding 100%, a producer could increase after-tax profits by losing a dollar of before tax profits, either through incurring higher costs or forfeiting higher value.

All else equal, SB 192 will likely have an indeterminate negative impact on royalty revenue as it will make potential investments on the North Slope less attractive. Examining an investment in a project as a stand-alone venture (rather than an attempt to lower taxes due to the high marginal tax rates discussed above), SB 192 will lower the expected profitability of a project if a developer believes there is a possibility that during the project the production tax value per barrel will exceed $92.50. If an investor believes that it is likely oil prices will be at current levels or higher in the future, then for a potential conventional small satellite development using representative cost and production profiles, a third or more of the expected net present value of a project might be lost due to the higher tax rate.

FISCAL NOTE #2

STATE OF ALASKA
2012 LEGISLATIVE SESSION

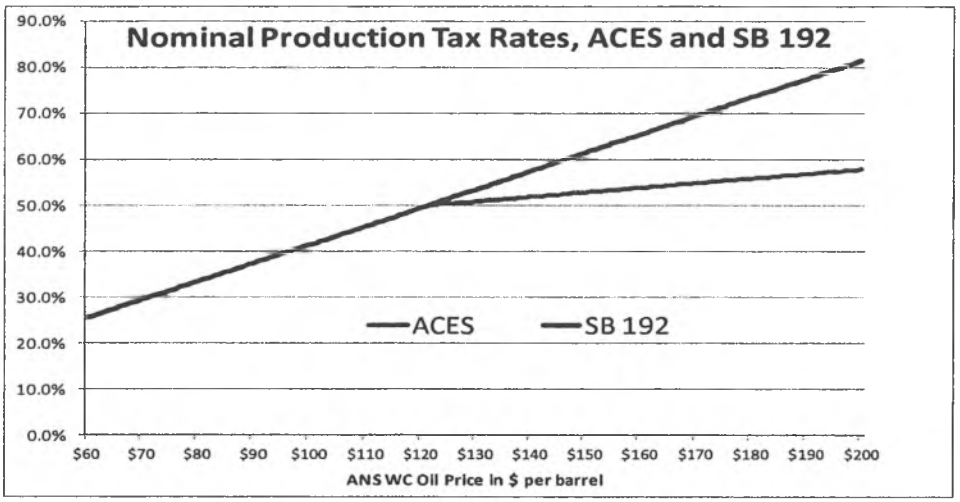
BILL NO. CSSB 192(RES)

Analysis

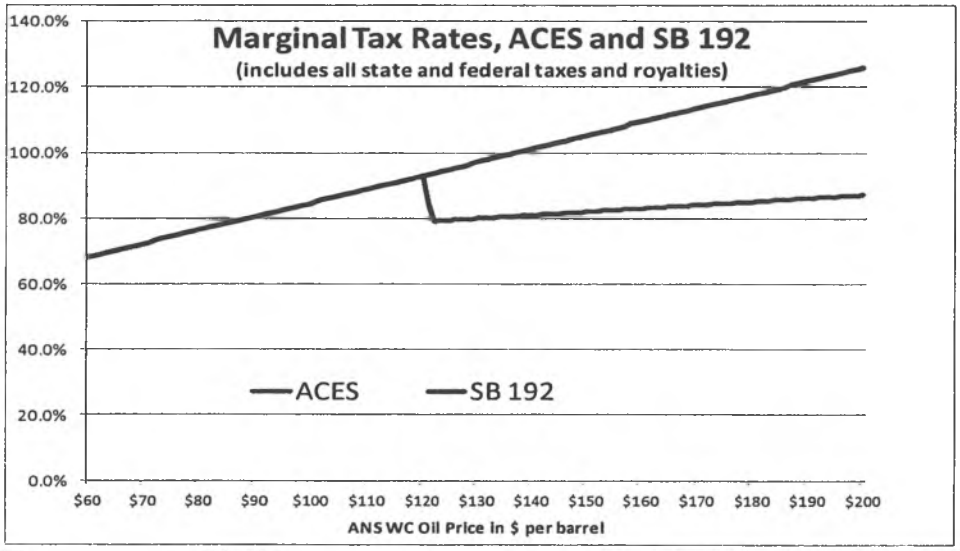
This bill makes a change to the progressive tax rate portion of the production tax at AS 43.55.011(g) by removing the second trigger of the progressive tax rate calculation that lowers the progressive tax rate to 0.1% on production tax values of $92.50 and greater. The bill also removes the statutory maximum tax rate of 75% under the production tax statutes. The bill retains the initial trigger of $30 in production tax value at which point the progressive tax rate is calculated as 0.4% per dollar increase in production tax value.

Given the Fall 2011 oil price, production, and lease expenditure forecast through FY 2017, the tax rate changes from this bill are not projected to have a direct revenue impact. The Fall 2011 forecast through the time period covered by this fiscal note (FY 2017) range from $106 per barrel to close to $110 per barrel for Alaska North Slope crude oil. Combined with anticipated production levels and lease expenditure projections, our forecast does not anticipate production tax values meeting or exceeding $92.50 per barrel. Therefore, based on our most recent forecast, the progressivity rate changes in this bill will not impact revenue expectations.

If oil prices were to increase, or if production were to increase with no corresponding increase in lease expenditures, production tax rates, and therefore revenue, could be increased from this bill. With current production levels, and current transport costs and lease expenditure levels, much of North Slope crude oil would be subject to a production tax increase at $120 - $130 per barrel (ANS WC) and above. Without a maximum production tax rate, tax rates could continue to escalate until they exceed 100%. Marginal government take exceeds 100% at approximately $140 per barrel, when holding all other assumptions constant. This means that at $140 per barrel, the government would take more than 100% of every dollar that the oil price increases.



The bill has an effective date of January 1, 2013.



The following two graphs show nominal production tax rates and marginal tax rates at a range of oil prices given current transport and lease expenditure assumptions for ACES (current law) and SB 192. Nominal production tax rates are the ACES statutory production tax rates as calculated by taxpayers; marginal tax rates are the rates that the government collects of each additional dollar that the oil price increases. The marginal tax rate graph includes all major federal and state taxes and royalties.

CSSB 192 (RES)

CS FOR SENATE BILL NO. 192(RES)

IN THE LEGISLATURE OF THE STATE OF ALASKA

TWENTY-SEVENTH LEGISLATURE - SECOND SESSION

BY THE SENATE RESOURCES COMMITTEE

Offered: 3/5/12
Referred: Finance

Sponsor(s): SENATE RESOURCES COMMITTEE

A BILL

FOR AN ACT ENTITLED

"An Act relating to the oil and gas production tax; relating to the minimum tax on oil and gas production; providing that the tax rate applicable to the production of oil as the average production tax value of oil, gas produced in the Cook Inlet sedimentary basin, and gas produced outside of the Cook Inlet sedimentary basin and used in the state increases above $30 shall be 0.35 percent multiplied by the number that represents the difference between that average monthly production tax value and $30, or the sum of 25 percent and the product of 0.1 percent multiplied by the number that represents the difference between that average monthly production tax value and $101.43, except that the total rate determined in the calculation may not exceed 35 percent; providing for an increase in the rate of tax on the production of gas as the average production tax value on a BTU equivalent barrel basis of gas produced outside of the Cook Inlet sedimentary basin and not used in the state increases above $30; relating to payments of the oil and

gas production tax; relating to the lease expenditures that may be deducted when determining production tax value; relating to the allocation of lease expenditures and adjustments to lease expenditures; relating to the availability of funds from the oil and gas production tax for appropriation to the community revenue sharing fund; providing for a reduction in production tax value for certain oil; relating to the duties of the Alaska Oil and Gas Conservation Commission; relating to a petroleum information management system; relating to the duties of the Department of Natural Resources, the Department of Revenue, and the Department of Labor and Workforce Development that relate to providing the Alaska Oil and Gas Conservation Commission with certain information relating to oil and gas; and providing for an effective date."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

* **Section 1.** AS 29.60.850(b) is amended to read:

(b) Each fiscal year, the legislature may appropriate to the community revenue sharing fund an amount equal to **the lesser of** 20 percent of the money received by the state during the previous calendar year under **both** AS 43.55.011(g) **and (p), or the difference between the amount of money received by the state during the previous calendar for oil and gas production subject to AS 43.55.011(f) and 25 percent of the production tax value determined under AS 43.55.160 for oil and gas production subject to AS 43.55.011(f) produced during the previous calendar year, except the difference may not be less than zero**. The amount **appropriated** may not exceed

(1) $60,000,000; or

(2) the amount that, when added to the fund balance on June 30 of the previous fiscal year, equals $180,000,000.

* **Sec. 2.** AS 31.05.030 is amended by adding a new subsection to read:

(n) The commission shall develop and maintain the petroleum information management system required under AS 31.05.031.

* **Sec. 3.** AS 31.05 is amended by adding a new section to read:

Sec. 31.05.031. Petroleum information management system. (a) The commission shall develop and maintain an electronic petroleum information management system to collect, secure, distribute, store, retrieve, and archive information related to oil and gas exploration, development, and production in the state. The purposes of the petroleum information management system are to improve the administration of the oil and gas production tax and to facilitate exploration, development, and production of oil and gas resources. The petroleum information management system shall be accessible by the public.

(b) To the extent the information is available and is not confidential, the petroleum information management system must include the following information:

(1) unit and joint operating agreements;

(2) state oil and gas exploration licenses and oil and gas leases;

(3) for exploration activities,

(A) exploration work programs and budgets;

(B) seismic data;

(C) drilling reports;

(D) logs;

(E) well tests;

(F) geological models and maps;

(4) for development activities,

(A) development plans with operating and capital expenditure projections;

(B) construction progress reports;

(C) drilling reports;

(D) reservoir characterization;

(5) for production activities,

(A) production work programs and budgets;

(B) oil and gas sales, revenue, and pricing;

(C) transportation agreements;

(D) production data;

(E) injection data;

(F) operating and capital expenditures;

(G) facility maps and studies;

(6) for abandonment of oil and gas wells, leases, and production and transportation facilities,

(A) abandonment plans and budgets;

(B) progress reports;

(7) for oil and gas related employment information,

(A) the number of resident and nonresident hires for each year;

(B) training opportunities; and

(8) other information the commission determines necessary and relevant to the oil and gas production tax and to the exploration, development, and production of oil and gas resources.

(c) The Department of Natural Resources, the Department of Revenue, and the Department of Labor and Workforce Development, in consultation with the commission, shall provide information described in (b) of this section that is not confidential and within each department's control to the commission for inclusion in the petroleum information management system. The information provided by a department under this subsection shall be in a form suitable for the commission to include in the petroleum information management system.

* **Sec. 4.** AS 31.05.093(c) is amended to read:

(c) The commission shall determine the regulatory cost charges levied under this section so that the total amount to be collected approximately equals the appropriations made for the operating costs of the commission under this chapter for the fiscal year. **For the purpose of determining the regulatory costs charges under this subsection, the operating costs for the petroleum information management system (AS 31.05.031) may not be included in the operating costs of the commission.**

* **Sec. 5.** AS 43.55.011(e) is amended to read:

(e) There is levied on the producer of oil or gas a tax for all oil and gas produced each calendar year from each lease or property in the state, less any oil and

gas the ownership or right to which is exempt from taxation or constitutes a landowner's royalty interest. Except as otherwise provided under (f), (j), (k), and (o) of this section, the tax is equal to the sum of

(1) the annual production tax value of the taxable oil and gas as calculated under AS 43.55.160(a)(1) multiplied by 25 percent; and

(2) the sum, over all months of the calendar year, of the tax amounts determined under

(A) subsection (g) of this section**; and**

(B) subsection (p) of this section.

*** Sec. 6.** AS 43.55.011(f) is repealed and reenacted to read:

(f) Except for oil and gas subject to (i) of this section and gas subject to (o) of this section, the provisions of this subsection apply to oil and gas produced from each lease or property within a unit or nonunitized reservoir that has cumulatively produced 1,000,000,000 BTU equivalent barrels of oil or gas by the close of the most recent calendar year and from which the average daily oil and gas production from the unit or nonunitized reservoir during the most recent calendar year exceeded 100,000 BTU equivalent barrels. Notwithstanding any contrary provision of law, a producer may not apply tax credits to reduce its total tax liability under (e) and (g) of this section for oil and gas produced from all leases or properties within the unit or nonunitized reservoir below 10 percent of the total gross value at the point of production of that oil and gas. If the amount of tax calculated by multiplying the tax rates in (e) and (g) of this section by the total production tax value of the oil and gas taxable under (e) and (g) of this section produced from all of the producer's leases or properties within the unit or nonunitized reservoir is less than 10 percent of the total gross value at the point of production of that oil and gas, the tax levied by (e) and (g) of this section for that oil and gas is equal to 10 percent of the total gross value at the point of production of that oil and gas.

*** Sec. 7.** AS 43.55.011(g) is amended to read:

(g) For each month of the calendar year for which the producer's average monthly production tax value under **AS 43.55.160(a)(2)(A) - (E) of a** [AS 43.55.160(a)(2) PER] BTU equivalent barrel of [THE] taxable oil and gas is more

than $30, the amount of tax for purposes of **(e)(2)(A)** [(e)(2)] of this section is determined by multiplying the monthly production tax value of the taxable oil [AND GAS] produced during the month**, gas produced during the month from a lease or property in the Cook Inlet sedimentary basin, and gas produced during the month from a lease or property outside the Cook Inlet sedimentary basin and used in the state** by the tax rate calculated as follows:

(1) if the producer's average monthly production tax value **under AS 43.55.160(a)(2)(A) - (E) of a** [PER] BTU equivalent barrel of [THE] taxable oil and gas for the month is not more than **$101.43** [$92.50], the tax rate is **0.35** [0.4] percent multiplied by the number that represents the difference between **the producer's** [THAT] average monthly production tax value **under AS 43.55.160(a)(2)(A) - (E) of a** [PER] BTU equivalent barrel **of taxable oil and gas** and $30; [OR]

(2) if the producer's average monthly production tax value **under AS 43.55.160(a)(2)(A) - (E) of a** [PER] BTU equivalent barrel of [THE] taxable oil and gas for the month is more than **$101.43** [$92.50], the tax rate is the sum of 25 percent and the product of 0.1 percent multiplied by the number that represents the difference between the **producer's** average monthly production tax value **under AS 43.55.160(a)(2)(A) - (E) of a** [PER] BTU equivalent barrel **of taxable oil and gas** and **$101.43** [$92.50], except that the sum determined under this paragraph may not exceed **35** [50] percent**;**

(3) for purposes of this subsection, the average monthly production tax value under AS 43.55.160(a)(2)(A) - (E) of a BTU equivalent barrel of taxable oil and gas is calculated by

(A) adding all of the monthly production tax values determined under AS 43.55.160(a)(2)(A) - (E); and

(B) dividing the sum calculated under (A) of this paragraph by the total amount, in BTU equivalent barrels, of

(i) taxable oil produced by the producer during the month;

(ii) taxable gas produced by the producer during the

month from a lease or property in the Cook Inlet sedimentary basin; and

(iii) taxable gas produced by the producer during the month from a lease or property outside the Cook Inlet sedimentary basin and used in the state.

*** Sec. 8.** AS 43.55.011 is amended by adding a new subsection to read:

(p) For each month of the calendar year for which the producer's average monthly production tax value under AS 43.55.160(a)(2)(F) and (G) of a BTU equivalent barrel of taxable gas is more than $30, the amount of tax on the production of gas for purposes of (e)(2)(B) of this section is determined by multiplying the monthly production tax value of the taxable gas produced during the month other than gas produced from a lease or property in the Cook Inlet sedimentary basin or gas produced outside the Cook Inlet sedimentary basin and used in the state by the tax rate calculated as follows:

(1) if the producer's average monthly production tax value under AS 43.55.160(a)(2)(F) and (G) of a BTU equivalent barrel of taxable gas for the month is not more than $101.43, the tax rate is 0.35 percent multiplied by the number that represents the difference between the producer's average monthly production tax value under AS 43.55.160(a)(2)(F) and (G) of a BTU equivalent barrel of gas and $30;

(2) if the producer's average monthly production tax value under AS 43.55.160(a)(2)(F) and (G) of a BTU equivalent barrel of taxable gas for the month is more than $101.43, the tax rate is the sum of 25 percent and the product of 0.1 percent multiplied by the number that represents the difference between the producer's average monthly production tax value under AS 43.55.160(a)(2)(F) and (G) of a BTU equivalent barrel of gas and $101.43, except that the sum determined under this paragraph may not exceed 35 percent;

(3) for purposes of this subsection, the average monthly production tax value under AS 43.55.160(a)(2)(F) and (G) of a BTU equivalent barrel of taxable gas is calculated by

(A) adding the monthly production tax value determined under AS 43.55.160(a)(2)(F) to the monthly production tax value determined under

AS 43.55.160(a)(2)(G); and

(B) dividing the sum calculated under (A) of this paragraph by the total amount, in BTU equivalent barrels, of the taxable gas produced by the producer during the month, other than gas produced from a lease or property in the Cook Inlet sedimentary basin or gas produced outside the Cook Inlet sedimentary basin and used in the state.

*** Sec. 9.** AS 43.55.020(a) is repealed and reenacted to read:

(a) For a calendar year, a producer subject to tax under AS 43.55.011(e) - (i) and (p) shall pay the tax as follows:

(1) an installment payment of the estimated tax levied by AS 43.55.011(e), net of any tax credits applied as allowed by law, is due for each month of the calendar year on the last day of the following month; except as otherwise provided under (2) of this subsection, the amount of the installment payment is the sum of the following amounts in (A) - (C) of this paragraph, less 1/12 of the tax credits that are allowed by law to be applied against the tax levied by AS 43.55.011(e) for the calendar year, but the amount of the installment payment may not be less than zero:

(A) the monthly production tax value for the month calculated under AS 43.55.160(a)(2)(B) multiplied by the sum of 25 percent and the tax rate calculated for the month under AS 43.55.011(g), added to the monthly production tax value for the month calculated under AS 43.55.160(a)(2)(G) multiplied by the sum of 25 percent and the tax rate calculated for the month under AS 43.55.011(p);

(B) the greater of

(i) 10 percent, under AS 43.55.011(f), of the gross value at the point of production of the oil and gas produced during the month from all leases or properties in the state that include land north of 68 degrees North latitude, other than oil and gas subject to AS 43.55.011(i) and gas subject to AS 43.55.011(o); or

(ii) the monthly production tax value for the month calculated under AS 43.55.160(a)(2)(A) multiplied by the sum of 25

percent and the tax rate calculated for the month under AS 43.55.011(g), added to the monthly production tax value for the month calculated under AS 43.55.160(a)(2)(F) multiplied by the sum of 25 percent and the tax rate calculated for the month under AS 43.55.011(p); and

(C) for each lease or property, for gas subject to AS 43.55.011(j), oil subject to AS 43.55.011(k), and gas subject to AS 43.55.011(o), the monthly production tax value for the month calculated under AS 43.55.160(a)(2)(C), (D), or (E), as applicable, multiplied by the sum of 25 percent and the tax rate calculated for the month under AS 43.55.011(g);

(2) an amount calculated under (1)(C) of this subsection for oil or gas produced from a particular lease or property may not exceed the product obtained by carrying out the calculation set out in AS 43.55.011(j)(1) or (2) or 43.55.011(o), as applicable for gas, or set out in AS 43.55.011(k)(1) or (2), as applicable for oil, but substituting in AS 43.55.011(j)(1)(A) or (2)(A) or 43.55.011(o), as applicable, the amount of taxable gas produced during the month for the amount of taxable gas produced during the calendar year and substituting in AS 43.55.011(k)(1)(A) or (2)(A), as applicable, the amount of taxable oil produced during the month for the amount of taxable oil produced during the calendar year;

(3) an installment payment of the estimated tax levied by AS 43.55.011(i) for each lease or property is due for each month of the calendar year on the last day of the following month; the amount of the installment payment is the sum of

(A) the applicable tax rate for oil provided under AS 43.55.011(i), multiplied by the gross value at the point of production of the oil taxable under AS 43.55.011(i) and produced from the lease or property during the month; and

(B) the applicable tax rate for gas provided under AS 43.55.011(i), multiplied by the gross value at the point of production of the gas taxable under AS 43.55.011(i) and produced from the lease or property during the month;

(4) any amount of tax levied by AS 43.55.011(e) or (i), net of any credits applied as allowed by law, that exceeds the total of the amounts due as installment payments of estimated tax is due on March 31 of the year following the calendar year of production.

* **Sec. 10.** AS 43.55.020(d) is amended to read:

(d) In making settlement with the royalty owner for oil and gas that is taxable under AS 43.55.011, the producer may deduct the amount of the tax paid on taxable royalty oil and gas, or may deduct taxable royalty oil or gas equivalent in value at the time the tax becomes due to the amount of the tax paid. If the total deductions of installment payments of estimated tax for a calendar year exceed the actual tax for that calendar year, the producer shall, before April 1 of the following year, refund the excess to the royalty owner. Unless otherwise agreed between the producer and the royalty owner, the amount of the tax paid under AS 43.55.011(e) - (g) **and (p)** on taxable royalty oil and gas for a calendar year, other than oil and gas the ownership or right to which constitutes a landowner's royalty interest, is considered to be the gross value at the point of production of the taxable royalty oil and gas produced during the calendar year multiplied by a figure that is a quotient, in which

(1) the numerator is the producer's total tax liability under AS 43.55.011(e) - (g) **and (p)** for the calendar year of production; and

(2) the denominator is the total gross value at the point of production of the oil and gas taxable under AS 43.55.011(e) - (g) **and (p)** produced by the producer from all leases and properties in the state during the calendar year.

* **Sec. 11.** AS 43.55.160(a) is amended to read:

(a) Except as provided in (b) of this section **and subject to an adjustment under AS 43.55.162**, for the purposes of

(1) AS 43.55.011(e), the annual production tax value of the taxable

(A) oil [AND GAS] produced during a calendar year from leases or properties in the state that include land north of 68 degrees North latitude is the gross value at the point of production of the oil [AND GAS] taxable under AS 43.55.011(e) and produced by the producer from those leases or properties, less the producer's lease expenditures under AS 43.55.165 for the

calendar year applicable to the oil [AND GAS] produced by the producer from those leases or properties, **and the portion allocated under (g) of this section of the producer's lease expenditures under AS 43.55.165 for the calendar year incurred to explore land that is not a lease or property, or to explore or develop a lease or property before commencement of commercial production of oil or gas from the lease or property, if that land or any part of the lease or property is located north of 68 degrees North latitude,** as adjusted under AS 43.55.170; [THIS SUBPARAGRAPH DOES NOT APPLY TO GAS SUBJECT TO AS 43.55.011(o);]

(B) oil [AND GAS] produced during a calendar year from leases or properties in the state outside the Cook Inlet sedimentary basin, no part of which is north of 68 degrees North latitude, is the gross value at the point of production of the oil [AND GAS] taxable under AS 43.55.011(e) and produced by the producer from those leases or properties, less the producer's lease expenditures under AS 43.55.165 for the calendar year applicable to the oil [AND GAS] produced by the producer from those leases or properties, **and the portion allocated under (g) of this section of the producer's lease expenditures under AS 43.55.165 for the calendar year incurred to explore land that is not a lease or property, or to explore or develop a lease or property before commencement of commercial production of oil or gas from the lease or property, if that land or lease or property is located outside the Cook Inlet sedimentary basin, and the land and all parts of the lease or property are not north of 68 degrees North latitude,** as adjusted under AS 43.55.170; [THIS SUBPARAGRAPH DOES NOT APPLY TO GAS SUBJECT TO AS 43.55.011(o);]

(C) oil produced during a calendar year from a lease or property in the Cook Inlet sedimentary basin is the gross value at the point of production of the oil taxable under AS 43.55.011(e) and produced by the producer from that lease or property, less the producer's lease expenditures under AS 43.55.165 for the calendar year applicable to the oil produced by the producer from that lease or property, **and the portion allocated under (g) of**

this section of the producer's lease expenditures under AS 43.55.165 for the calendar year incurred to explore land that is not a lease or property, or to explore or develop a lease or property before commencement of commercial production of oil or gas from the lease or property, if that land or lease or property is located in the Cook Inlet sedimentary basin, as adjusted under AS 43.55.170;

(D) gas produced during a calendar year from a lease or property in the Cook Inlet sedimentary basin is the gross value at the point of production of the gas taxable under AS 43.55.011(e) and produced by the producer from that lease or property, less the producer's lease expenditures under AS 43.55.165 for the calendar year applicable to the gas produced by the producer from that lease or property, **and the portion allocated under (g) of this section of the producer's lease expenditures under AS 43.55.165 for the calendar year incurred to explore land that is not a lease or property, or to explore or develop a lease or property before commencement of commercial production of oil or gas from the lease or property, if that land or lease or property is located in the Cook Inlet sedimentary basin,** as adjusted under AS 43.55.170;

(E) gas produced during a calendar year from a lease or property **in the state** outside the Cook Inlet sedimentary basin and used in the state is the gross value at the point of production of that gas taxable under AS 43.55.011(e) and produced by the producer from that lease or property, less the producer's lease expenditures under AS 43.55.165 for the calendar year applicable to that gas produced by the producer from that lease or property, **and the portion allocated under (g) of this section of the producer's lease expenditures under AS 43.55.165 for the calendar year incurred to explore land that is not a lease or property, or to explore or develop a lease or property before commencement of commercial production of oil or gas from the lease or property, if that land or lease or property is located outside the Cook Inlet sedimentary basin,** as adjusted under AS 43.55.170;

(F) gas produced during a calendar year from leases or

properties in the state that include land north of 68 degrees North latitude is the gross value at the point of production of the gas taxable under AS 43.55.011(e) and produced by the producer from those leases or properties, less the producer's lease expenditures under AS 43.55.165 for the calendar year applicable to the gas produced by the producer from those leases or properties, and the portion allocated under (g) of this section of the producer's lease expenditures under AS 43.55.165 for the calendar year incurred to explore land that is not a lease or property, or to explore or develop a lease or property before commencement of commercial production of oil or gas from the lease or property, if that land or any part of the lease or property is located north of 68 degrees North latitude, as adjusted under AS 43.55.170; this subparagraph does not apply to gas subject to AS 43.55.011(o);

(G) gas produced during a calendar year from leases or properties in the state outside the Cook Inlet sedimentary basin, no part of which is north of 68 degrees North latitude, is the gross value at the point of production of the gas taxable under AS 43.55.011(e) and produced by the producer from those leases or properties, less the producer's lease expenditures under AS 43.55.165 for the calendar year applicable to the gas produced by the producer from those leases or properties, and the portion allocated under (g) of this section of the producer's lease expenditures under AS 43.55.165 for the calendar year incurred to explore land that is not a lease or property, or to explore or develop a lease or property before commencement of commercial production of oil or gas from the lease or property, if that land or lease or property is located outside the Cook Inlet sedimentary basin, and the land and all parts of the lease or property are not north of 68 degrees North latitude, as adjusted under AS 43.55.170; this subparagraph does not apply to gas subject to AS 43.55.011(o);

(2) AS 43.55.011(g) **and (p)**, the monthly production tax value of the taxable

(A) oil [AND GAS] produced during a month from leases or properties in the state that include land north of 68 degrees North latitude is the gross value at the point of production of the oil [AND GAS] taxable under AS 43.55.011(e) and produced by the producer from those leases or properties, less 1/12 of the producer's lease expenditures under AS 43.55.165 for the calendar year applicable to the oil [AND GAS] produced by the producer from those leases or properties, **and 1/12 of the portion allocated under (g) of this section of the producer's lease expenditures under AS 43.55.165 for the calendar year incurred to explore land that is not a lease or property, or to explore or develop a lease or property before commencement of commercial production of oil or gas from the lease or property, if that land or any part of the lease or property is located north of 68 degrees North latitude,** as adjusted under AS 43.55.170; [THIS SUBPARAGRAPH DOES NOT APPLY TO GAS SUBJECT TO AS 43.55.011(o);]

(B) oil [AND GAS] produced during a month from leases or properties in the state outside the Cook Inlet sedimentary basin, no part of which is north of 68 degrees North latitude, is the gross value at the point of production of the oil [AND GAS] taxable under AS 43.55.011(e) and produced by the producer from those leases or properties, less 1/12 of the producer's lease expenditures under AS 43.55.165 for the calendar year applicable to the oil [AND GAS] produced by the producer from those leases or properties, **and 1/12 of the portion allocated under (g) of this section of the producer's lease expenditures under AS 43.55.165 for the calendar year incurred to explore land that is not a lease or property, or to explore or develop a lease or property before commencement of commercial production of oil or gas from the lease or property, if that land or lease or property is located outside the Cook Inlet sedimentary basin, and the land and all parts of the lease or property are not north of 68 degrees North latitude,** as adjusted under AS 43.55.170; [THIS SUBPARAGRAPH DOES NOT APPLY TO GAS SUBJECT TO AS 43.55.011(o);]

(C) oil produced during a month from a lease or property in the

Cook Inlet sedimentary basin is the gross value at the point of production of the oil taxable under AS 43.55.011(e) and produced by the producer from that lease or property, less 1/12 of the producer's lease expenditures under AS 43.55.165 for the calendar year applicable to the oil produced by the producer from that lease or property, **and 1/12 of the portion allocated under (g) of this section of the producer's lease expenditures under AS 43.55.165 for the calendar year incurred to explore land that is not a lease or property, or to explore or develop a lease or property before commencement of commercial production of oil or gas from the lease or property, if that land or lease or property is located in the Cook Inlet sedimentary basin,** as adjusted under AS 43.55.170;

(D) gas produced during a month from a lease or property in the Cook Inlet sedimentary basin is the gross value at the point of production of the gas taxable under AS 43.55.011(e) and produced by the producer from that lease or property, less 1/12 of the producer's lease expenditures under AS 43.55.165 for the calendar year applicable to the gas produced by the producer from that lease or property, **and 1/12 of the portion allocated under (g) of this section of the producer's lease expenditures under AS 43.55.165 for the calendar year incurred to explore land that is not a lease or property, or to explore or develop a lease or property before commencement of commercial production of oil or gas from the lease or property, if that land or lease or property is located in the Cook Inlet sedimentary basin,** as adjusted under AS 43.55.170;

(E) gas produced during a month from a lease or property **in the state** outside the Cook Inlet sedimentary basin and used in the state is the gross value at the point of production of that gas taxable under AS 43.55.011(e) and produced by the producer from that lease or property, less 1/12 of the producer's lease expenditures under AS 43.55.165 for the calendar year applicable to that gas produced by the producer from that lease or property, **and 1/12 of the portion allocated under (g) of this section of the producer's lease expenditures under AS 43.55.165 for the calendar year**

incurred to explore land that is not a lease or property, or to explore or develop a lease or property before commencement of commercial production of oil or gas from the lease or property, if that land or lease or property is located outside of the Cook Inlet sedimentary basin, as adjusted under AS 43.55.170**;**

(F) gas produced during a month from leases or properties in the state that include land north of 68 degrees North latitude is the gross value at the point of production of the gas taxable under AS 43.55.011(e) and produced by the producer from those leases or properties, less 1/12 of the producer's lease expenditures under AS 43.55.165 for the calendar year applicable to the gas produced by the producer from those leases or properties, and 1/12 of the portion allocated under (g) of this section of the producer's lease expenditures under AS 43.55.165 for the calendar year incurred to explore land that is not a lease or property, or to explore or develop a lease or property before commencement of commercial production of oil or gas from the lease or property, if that land or any part of the lease or property is located north of 68 degrees North latitude, as adjusted under AS 43.55.170; this subparagraph does not apply to gas subject to AS 43.55.011(o);

(G) gas produced during a month from leases or properties in the state outside the Cook Inlet sedimentary basin, no part of which is north of 68 degrees North latitude, is the gross value at the point of production of the gas taxable under AS 43.55.011(e) and produced by the producer from those leases or properties, less 1/12 of the producer's lease expenditures under AS 43.55.165 for the calendar year applicable to the gas produced by the producer from those leases or properties, and 1/12 of the portion allocated under (g) of this section of the producer's lease expenditures under AS 43.55.165 for the calendar year incurred to explore land that is not a lease or property, or to explore or develop a lease or property before commencement of commercial production of oil or gas from the lease or property, if that land or lease or property is located

outside the Cook Inlet sedimentary basin, and the land and all parts of the lease or property are not north of 68 degrees North latitude, as adjusted under AS 43.55.170; this subparagraph does not apply to gas subject to AS 43.55.011(o).

*** Sec. 12.** AS 43.55.160 is amended by adding new subsections to read:

(f) For purposes of (a) of this section, a lease expenditure is applicable to oil or gas produced from a lease or property, or to oil or gas produced from leases or properties in an area of the state, if the lease expenditure is

(1) a cost to explore, develop, or produce oil or gas from that lease or property, or to explore, develop, or produce oil or gas from one of those leases or properties in that area of the state, respectively; and

(2) incurred on or after the commencement of commercial production of oil or gas from the lease or property.

(g) For purposes of (a) of this section, a lease expenditure incurred during a calendar year to explore land that is not a lease or property, or to explore or develop a lease or property before commencement of commercial production of oil or gas from the lease or property, shall be allocated as provided in a regulation adopted by the department under AS 43.55.165(h) to and among oil, gas subject to AS 43.55.011(o), and gas not subject to AS 43.55.011(o) produced by the producer during that calendar year from leases or properties in the same area of the state as the land being explored or the lease or property being explored or developed, respectively.

(h) For purposes of (f) and (g) of this section, an area of the state is one of the following:

(1) land north of 68 degrees North latitude;

(2) land outside the Cook Inlet sedimentary basin not including any land north of 68 degrees North latitude; or

(3) the Cook Inlet sedimentary basin.

*** Sec. 13.** AS 43.55 is amended by adding a new section to read:

Sec. 43.55.162. Adjustment to production tax value for increasing oil production. (a) The production tax value of oil delivered to and transported by the Trans Alaska Pipeline System, as calculated under AS 43.55.160(a)(1)(A) and (B) and

AS 43.55.160(a)(2)(A) and (B), may be reduced by an amount determined by the department under this section.

(b) A producer shall report to the department the total adjusted amount of annual oil production and adjusted amount of the average daily statewide oil production delivered by the producer for transport to the Trans Alaska Pipeline System for both the calendar year immediately preceding the year for which the tax is being determined and the year for which the tax is being determined. The report shall be filed at the time the statement required under AS 43.55.030(a) is filed.

(c) When calculating the

(1) adjusted amount of the average daily statewide production under (b) of this section, the producer shall exclude from the calculation the days on which the rate of production is significantly reduced and the volume of production on those days for which the rate of production is significantly reduced; for the purposes of this paragraph, the rate of production is significantly reduced when the production of oil delivered by the producer to the Trans Alaska Pipeline System for the day is less than one-half of the average daily production for the year calculated by dividing the total oil production that is produced by the producer and delivered to the Trans Alaska Pipeline System for the year by the number of days in the year;

(2) adjusted amount of total annual oil production that is delivered by the producer to the Trans Alaska Pipeline System, the producer shall multiply the adjusted amount of average daily production determined under (1) of this subsection by the number of days in the applicable calendar year; and

(3) adjusted amount of total annual oil production that is delivered by the producer to the Trans Alaska Pipeline System for the year for which the tax is being determined under (2) of this subsection, the producer may not include the amount of production resulting from the purchase, merger, or other acquisition of another producer and any production attributable to the producer from a unit in which the producer did not participate in the calendar year immediately preceding the year for which the tax is being determined; however, the increased production that may not be included by a producer under this paragraph may be included in the adjusted amount of total annual oil production for the year when determining the amount by

which production increases in the next succeeding year.

(d) After receiving a report by the producer under (b) of this section, the department may reduce the production tax value determined under

(1) AS 43.55.160(a)(1)(A) and (B) by $10 for each barrel of oil delivered by the producer to the Trans Alaska Pipeline system during the year for which the tax is being determined that exceeds the adjusted total annual production for the calendar year immediately preceding the year for which the tax is being determined; and

(2) AS 43.55.160(a)(2)(A) and (B) by $10 for each barrel of oil delivered to the Trans Alaska Pipeline System for each month in the year for which the tax is being determined that exceeds 1/12 of the number of barrels by which the adjusted total annual production for the year for which the tax is being determined exceeds the adjusted total annual production for the calendar year immediately preceding the year for which the tax is being determined.

(e) The department shall notify the producer of the amount of tax reduction allowed as a result of a reduction in production tax value determined by the department under (d) of this section. At the request of the producer, the department may refund any amount due to the producer as a result of the reduction in production tax value or credit the amount of the tax reduction against the liability of the taxpayer for a tax due under this title.

(f) A tax reduction that results from a reduction in the production tax value under this section may not be considered when a producer is required to calculate and pay any amount due under AS 43.55.020(a). However, at the request of the producer, a credit allowed under (e) of this section may be applied against a payment due under AS 43.55.020(a) for a period after the department determines the amount of reduction in the production tax value.

(g) When determining the average monthly production tax value in AS 43.55.011(g), the average monthly production tax value shall be determined before applying any adjustment under (d) of this section.

(h) The department may adopt regulations specifying the information that must be included in the report filed by a producer under (b) of this section and other

regulations necessary for the administration of this section.

*** Sec. 14.** AS 43.55.165(h) is amended to read:

(h) The department shall adopt regulations that provide for reasonable methods of allocating costs between oil and gas, between gas subject to AS 43.55.011(o) and other gas, and between leases or properties in those circumstances where an allocation of costs is required to determine lease expenditures that are costs of exploring for, developing, or producing oil deposits or costs of exploring for, developing, or producing gas deposits, or that are costs of exploring for, developing, or producing oil or gas deposits located within different leases or properties. **When adopting a regulation for determining a reasonable method of allocating lease expenditures between the production of oil and the production of gas, the department shall, to the extent possible, provide for the allocation of lease expenditures in proportion to the gross value at the point of production for oil produced and gas produced.**

*** Sec. 15.** AS 43.55.170 is amended by adding a new subsection to read:

(d) The department shall adopt regulations that provide for reasonable methods of allocating the adjustments to a producer's lease expenditures in (a) of this section and the payments and credits described in (b) of this section between oil and gas, between gas subject to AS 43.55.011(o) and other gas, and between leases or properties in those circumstances where an allocation of costs is required to determine lease expenditures that are costs of exploring for, developing, or producing oil deposits, or costs of exploring for, developing, or producing gas deposits, or that are costs of exploring for, developing, or producing oil or gas deposits located within different leases or properties. When determining a reasonable method of allocating the adjustments to a producer's lease expenditures between the production of oil and the production of gas, the department shall consider allocating the adjustments in proportion to the lease expenditures allocated to the production of oil and the production of gas under regulations adopted by the department under AS 43.55.165(h).

*** Sec. 16.** The uncodified law of the State of Alaska is amended by adding a new section to read:

IMPLEMENTATION OF THE PETROLEUM INFORMATION MANAGEMENT SYSTEM; RECOMMENDATION FOR STATUTORY CHANGES. The Alaska Oil and Gas Conservation Commission shall develop and implement a work plan for the development of the petroleum information management system required by AS 31.05.031, enacted by sec. 3 of this Act, so that the system is operational before January 1, 2014.

* **Sec. 17.** The uncodified law of the State of Alaska is amended by adding a new section to read:

APPLICABILITY. The reduction in production tax value under AS 43.55.162, enacted by sec. 13 of this Act, applies to qualifying oil produced after December 31, 2012. In this section, "qualifying oil" means oil delivered to the Trans Alaska Pipeline System the production tax value of which is calculated under AS 43.55.160(a)(1)(A) and (B) and 43.55.160(a)(2)(A) and (B).

* **Sec. 18.** This Act takes effect January 1, 2013.

3.

CSSB 192 (RES) Sponsor Statement

Sponsor Statement
CSSB 192, Version E

Committee Substitute for Senate Bill 192 contains five significant additions to Alaska's oil and gas production tax statutes, to include the following:

- Lowers the Rate of Progressivity and the Cap on Progressivity
- Rewards Increased Production
- Establishes a Gross Minimum Tax
- Separates oil and natural gas for purposes of calculating the progressivity portion of the production tax (aka decoupling)
- Creates an Oil Information System

Lowers Progressivity

CSSB 192 lowers both the rate of progressivity and the cap on progressivity.

The legislation retains the original trigger of $30 in Production Tax Value (PTV), at which point the progressive tax rate is calculated at .35% per dollar increase in PTV up to 50% ($101.43). This is a reduction from the current progressivity rate of .4% to .35%.

At 50% Production Tax Value (i.e., $101.43), CSSB 192 adds a second trigger on the progressive tax rate calculation that lowers the progressive tax rate to .1% on PTV up to 60% ($201.43).

CSSB 192 adds a statutory maximum tax rate of 60% under the production tax statutes. This is a reduction in the maximum tax rate from 75%, as it is currently in ACES, to 60%.

The goal is to return the "upside potential" to industry at high oil prices.

Rewards Increased Production

The purpose of this provision is to reward companies that increase their North Slope production levels from one year to the next, helping to increase TAPS throughput. Companies which achieve this goal will earn an allowance on the oil they produce above the prior year.

The allowance reduces their Production Tax Value (or PTV) by $10 for the new barrels of oil produced. This allowance should not be confused with a tax credit or a lowering of tax rates. It is a reduction in the PTV used to calculate production tax.

Again, this allowance wouldn't influence the tax rate itself. It would not count as a lease expenditure and isn't part of the calculation that determines average profits per barrel.

Establishes a Gross Minimum Tax

This provision of the legislation will establish a production tax floor of 10% of the gross value of oil at the point of production for legacy fields in Alaska. The floor would apply only to fields which have already produced a billion barrels of oil and are still producing 100,000 barrels a day on average.

Prudhoe Bay and Kuparuk are the only fields that currently meet this definition.

ACES currently has a production tax floor. It is between 0-4%, depending on the price of oil, and can be brought even lower by credits. This means the state could actually owe companies production tax in a low price environment, when the state has a cash flow deficit and is struggling to pay for the most essential state services.

This provision is intended to alleviate concerns that the current floor does not adequately protect the state when oil prices are low. In fact, at prices as low as $70, the state may take in more with a 10% gross floor than it would with ACES.

This provision protects the state at low oil prices.

Decoupling

This provision separates oil and natural gas for purposes of calculating the progressivity portion of the production tax. Under this bill, the progressivity surcharges for oil and Cook Inlet and in-state gas would be calculated together, but distinctly from export gas, instead of the current practice on all oil and gas combined. The progressivity structure itself would be changed to conform with the rates set forth in this legislation.

Under current law, the tax rate is based on the combined BTU value of oil and gas. However, oil and gas can, and do, have vastly different values on a BTU basis. Currently, a BTU of oil is worth much more than a BTU of gas. Accordingly, once a major gas sale starts, overlaying the existing oil production, the BTU value of the combined oil and gas would be much lower than it was for oil alone. This has been referred to as the "dilution effect" and could cause a significant reduction in oil taxes as a result of a major gas sale. The existing tax structure, in conjunction with the inherent uncertainty of future oil and gas prices, exposes the state to significant financial risk were a major gas sale to occur. The structure also creates economic instability for entities looking to participate in the development and financing of a natural gas pipeline project in Alaska.

This legislation removes the dilution effect by having progressivity calculated distinctly for oil and gas. This will result in no reduction in oil taxes from a major gas sale.

As in current law, the bill gives the Department of Revenue the authority to adopt regulations to allocate costs between oil and gas, with the added instruction that a method based on relative BTU barrel of oil equivalents should be considered.

Oil Information System

Concerns have been raised about oil and gas information that is not available to legislative policy-makers and the public. While much of the information is confidential under law, there is a considerable amount that is public, but it is scattered among several agencies and can, at times, be difficult to find.

This provision in law will begin the process of making information more available to the policy-makers, public, and oil and gas companies who may be seeking to do business in Alaska's oil fields.

This provision of the legislation will require the Alaska Oil and Gas Commission (AOGCC) to develop an electronic Petroleum Information Management System that will contain public information currently gathered by the commission, as well as the Departments of Revenue, Natural Resources and Labor & Workforce Development.

The system will consolidate available, public oil and gas information that is currently scattered among several agencies for the purpose of the system improving the administration of the oil and gas production tax and to facilitate exploration, development, and production of oil and gas resources.

The information list that is in the legislation is taken from a 2007 Gaffney Cline report that provided an overview of how the acquisition, distribution and publication of oil company data is handled in other oil and gas producing regimes.

The legislation directs the departments that have control over the various aspects of the information to provide what is not confidential to the commission in a form suitable for distribution.

The legislation directs AOGCC to develop and implement the system.

The bill has an effective date of January 1, 2013.

MEMORANDUM March 9, 2012

SUBJECT: Sectional summary for CSSB 192(RES), relating to the oil and gas production tax (Work Order No. 27-LS1305\E)

TO: Senator Joe Paskvan
Co-Chair of the Senate Resources Committee
Attn: Jeff Stepp

FROM: Donald M. Bullock Jr. KG for DMB
Legislative Counsel

You have requested a sectional summary of the above-described bill.

As a preliminary matter, note that a sectional summary of a bill should not be considered an authoritative interpretation of the bill and the bill itself is the best statement of its contents. If you would like an interpretation of the bill as it may apply to a particular set of circumstances, please advise.

Section 1. Amends AS 29.60.850(b) to conform to the decoupling of certain gas production from oil production[1] for tax purposes and the repeal and reenactment of the minimum tax on certain oil and gas production.

Section 2. Amends AS 31.05.030 by adding a new subsection that requires the Alaska Oil and Gas Conservation Commission (AOGCC) to develop and maintain the petroleum information management system.

Section 3. Adds AS 31.05.031 to AS 31.05 to provide for the development and maintenance of the petroleum information management system. Describes the information to be included and requires the Department of Natural Resources, the Department of Revenue, and the Department of Labor and Workforce Development to work with AOGCC to include relevant information from each department in the

---

[1] Under the decoupling of oil and gas production in the bill, the progressive part of the tax rate is split so that the production of oil, gas in the Cook Inlet sedimentary basin, and gas produced outside of Cook Inlet and used in the state is subject to one set of rates, and all other gas production is subject to a different set of rates. See the amendments to AS 43.55.011(e) in sec. 5, AS 43.55.011(g) in sec. 7, and new subsection AS 43.55.011(g) in sec. 8 of the bill.

petroleum information management system. Provides that the petroleum information management system shall be accessible by the public.

Section 4. Amends AS 31.05.093(c) to exclude the operating costs for the petroleum information management system from the operating costs of AOGCC for the purpose of determining regulatory cost charges.

Section 5. Amends AS 43.55.011(e) to conform to the decoupling of the progressive part of the production tax on oil, gas produced in the Cook Inlet sedimentary basin, and gas produced outside of Cook Inlet and used in the state, from the progressive part of the production tax applicable to other gas.

Section 6. Repeals and reenacts AS 43.55.011(f) to set a minimum tax of 10 percent of the gross value at the point of production for certain areas with historical production of 1,000,000,000 BTU equivalent barrels of oil or gas and average daily oil and gas production for the most recent calendar year of more than 100,000 BTU equivalent barrels.

Section 7. Amends AS 43.55.011(g) to limit the application of the progressive tax under the subsection to oil, gas produced in the Cook Inlet sedimentary basin, and gas produced outside of the Cook Inlet sedimentary basin and used in the state. This section also changes the first level of the progressive tax to apply to an average production tax of not more $101.43 and lowers the tax rate for the first level to 0.35 percent for each dollar of average production tax value above $30. The second level is amended to apply to average production tax value of $101.43 or more and sets the maximum tax rate for the second level to 35 percent, a reduction from 50 percent.

Section 8. Adds a new subsection to AS 43.55.011 with the same tax rates in AS 43.55.011(g), but provides that those tax rates apply to gas not subject to tax under AS 43.55.011(g).

Section 9. Repeals and reenacts AS 43.55.020(a) to conform to AS 43.55.011(f) as repealed and reenacted in sec. 6 of the bill, the amendment to AS 43.55.011(g) in sec. 7 of the bill, and AS 43.55.011(p) in sec. 8 of the bill.

Section 10. Amends AS 43.55.020(d) to conform to the amendment to AS 43.55.011(g) in sec. 7 of the bill, and AS 43.55.011(p) in sec. 8 of the bill.

Section 11. Amends AS 43.55.160(a) by making the determination of annual and monthly production tax values subject to AS 43.55.162, a new section added by sec. 12 of the bill. Conforms the determination of production tax values to the amendment to AS 43.55.011(g) in sec. 7 of the bill, and AS 43.55.011(p) in sec. 8 of the bill.

Section 12. Amends AS 43.55.160 by adding three subsections to describe the allocation of lease expenditures to oil or gas production or exploration in different areas in the state.

Section 13. Adds a new section to AS 43.55 -- AS 43.55.162 -- that offers a producer a $10 a barrel reduction in production tax value for each barrel of oil delivered to the Trans Alaska Pipeline System that is above the base volume that is determined for the previous calendar year. The section also provides that the average monthly production tax value used for determining the tax rate under AS 43.55.011(g) shall be calculated before applying the reduction on production tax value allowed for increased production.

Section 14. Amends AS 43.55.165(h) to require the Department of Revenue to allocate lease expenditures between oil and gas production based on the gross value at the point of production of the oil and gas.

Section 15. Adds a new subsection to AS 43.55.170 that requires the Department of Revenue to adopt regulations that provide for reasonable methods of allocating adjustments to lease expenditures, payments, and credits between different categories of oil and gas production and between leases and properties.

Section 16. Adds a new section to uncodified law to require AOGCC to develop and implement a work plan for the development of the petroleum management system so that the system is operational before 2014.

Section 17. Adds a new section to uncodified law that states that the reduction in production tax value under AS 43.55.162 in sec. 13 of the bill applies to qualifying oil produced after December 31, 2012.

Section 18. Provides a January 1, 2013 effective date.

DOR's ACES Status Report: Galvin Letter to Gov. Parnell Jan. 14, 2010

State of Alaska

Department of Revenue

Commissioner's Office

SEAN PARNELL, GOVERNOR
333 Willoughby Avenue, 11th Floor
P.O. Box 110400
Juneau, Alaska 99811-0405
Phone: (907) 465-2300
Fax: (907) 465-2394

January 14, 2010

Honorable Governor Parnell,

Recently you requested a review of Alaska's oil and gas production tax, and recommendations for how the production tax could be improved. Enclosed for your review is analysis of Alaska's oil and gas production tax (otherwise referred to as "ACES"), which was compiled at my request by the Department of Revenue's technical staff. The ACES Status Report evaluates whether ACES is meeting its intended goals of providing a fair share of revenue to the state while encouraging investment in new oil and gas exploration and development activities.

Based on the report, I am recommending a collection of potential amendments to ACES and its associated Exploration Incentive Credit (EIC) program. The amendments are primarily intended to accomplish two things: 1. Further incentivize drilling and other production enhancing activities; and 2. Address a number of provisions of ACES that may keep explorers from enjoying the full intended value of the capital credit program.

The status report shows that ACES successfully allowed the state to share in the benefits of high oil prices while accommodating fluctuations in production costs and oil prices. ACES adjusted when oil prices tumbled and kept oil operations in Alaska highly profitable relative to other oil provinces. With respect to the impact that the new production tax has had on investment activity, the report is positive, but ultimately inconclusive. While the overall level of taxation increased with ACES, it distributed the impact of that tax burden in a way designed to incentivize investment in new exploration and development. Since ACES passed the legislature, overall spending on oil and gas activities on the North Slope has increased. However, given only two and a half years of experience, during which time oil prices climbed to $140 per barrel then plunged to under $30 per barrel, it would be premature to attribute the increased level of oil company investment to the success of ACES.

Oil taxes are clearly an important factor in industry investment decisions. However, it is misleading to isolate their influence from other key factors, such as world oil prices, geologic potential, access to land, resources and markets, costs of infrastructure and support services, and the legal and regulatory framework. As noted in the report, the true merit of Alaska's current fiscal system can only be determined when it is evaluated in conjunction with these other variables. The scope of the status report, and the limited timeframe since ACES passed, do not allow for such a comprehensive analysis and definitive conclusions.

In addition to documenting several promising trends in industry spending activity, the report notes a number of discrete policy issues associated with the production tax where improvement can be made. These warrant your consideration as potential amendments to the ACES framework.

1. **Increase Credits for All Well-Related Activity to 30%:** The Capital Credit and Exploration Incentive Credit (EIC) programs have been identified as influential in spurring exploration activities. However, the EIC program's 30% credits are only available to wells located more than 3 miles from all existing wells. The state has a significant interest in also incentivizing infill drilling and other well work that will increase oil production, particularly for heavy oil. I therefore recommend expanding the EIC program so that all expenditures related to drilling and well work that add new production or increase the efficiency of existing production will qualify for the 30% EIC credit under AS 43.55.025 regardless of a well's location relative to existing wells.

2. **Increase Access to Capital Credits for New Explorers:** Small producers are currently required to invest in new activities during subsequent years in order to obtain direct payment from the state for previously earned tax credits. This is not an issue for existing producers because they simply deduct credits from their current tax bill and do not need to seek direct payment from the state. Deleting this provision would make the tax credits more accessible to smaller explorers, level the playing field between new and existing operators, and eliminate an unfair double standard.

3. **Accelerate Capital Credit Usage**: Companies currently can only use half of their capital credits in the year they are earned, and the other half the following year. This is true whether the credits are applied against a tax liability or purchased by the state. Taxpayers would see increased value in the credits if they could apply the entire credit in the first year. In addition, this would ease the cost of administering these credits.

4. **Waive Interest on Late Tax Payments Due to Drafting of Regulations**: The ACES regulations, including those defining 'allowable lease expenditures' are being finalized this month. Under the statutes, these regulations are to be applied retroactively to various dates in 2007. To the extent additional taxes are due as a result of the application of the new regulations, such payments would be subject to interest and possibly penalties. While the department can waive penalties, it cannot waive interest charges. A statutory change is required in order to permit the waiver of interest.

I am confident you will find the ACES Status Report informative and interesting. Please consider my recommendations to improve the effectiveness and fair administration of ACES and the EIC program. I look forward to continuing to work with you to encourage additional oil and gas development while preserving Alaska's equitable share of oil and gas profits.

Sincerely,

Patrick S. Galvin
Commissioner

DOR's ACES Status Report: Jan. 14, 2010

Alaska's Clear and Equitable Share (ACES)
Status Report
Alaska Department of Revenue
January 14, 2010

Introduction

In November 2007, the Alaska Legislature passed House Bill 2001, known as Alaska's Clear and Equitable Share (ACES). ACES made modifications to the prior production tax called the Petroleum Profits Tax (PPT), enacted in 2006. The changes made first with PPT and later with ACES represented substantial production tax reform in that the basis of the tax shifted from the *gross value* to the *net value* of oil and gas production. The gross tax which had been in place prior to the PPT is generally referred to as the Economic Limit Factor (ELF).

This report was prepared at the request of the Commissioner of Revenue in order to evaluate whether ACES is meeting its intended goals of providing a fair share of oil and gas revenue to the state, and encouraging investment in the exploration and development of new oil and gas resources in Alaska.

Following are the key findings of this report:

1) State revenues under ACES in FY 2009 exceeded amounts which would have been generated under either the PPT or ELF systems. The crossover point at which ACES is projected to provide more revenue than ELF is $51 per barrel west coast price in FY 2010.

2) Activation of the progressive surcharge is estimated to occur when west coast sales prices reach $56 per barrel.

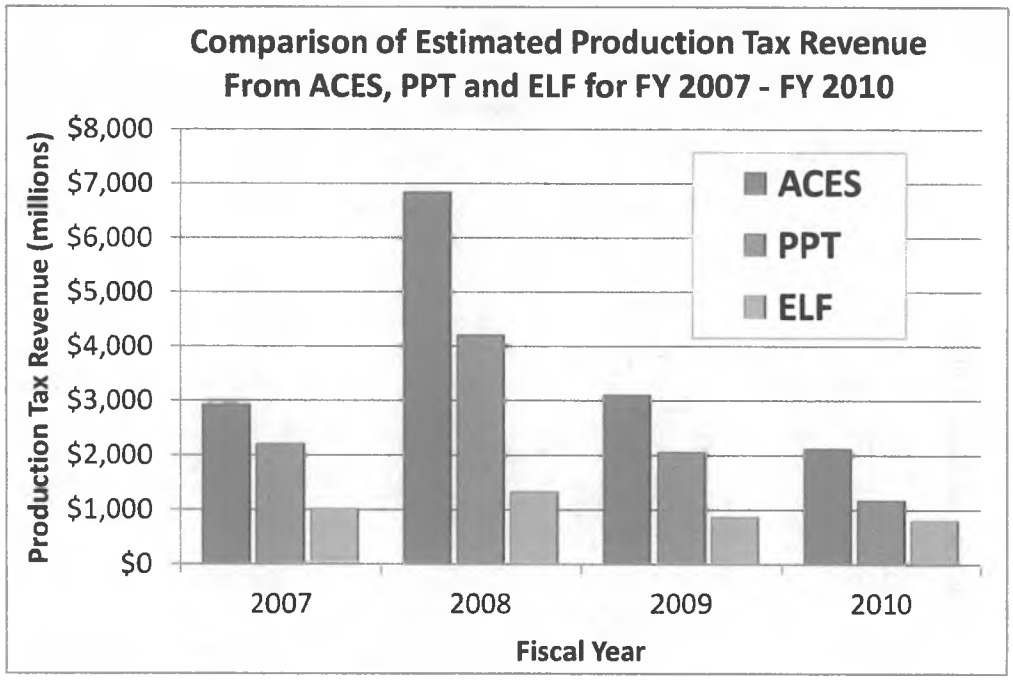
3) Capital spending on the North Slope totaled over $2.2 billion in FY 2009 an increase over FY 2008. This is nearly the highest level of capital spending in nominal dollars since oil production began in the state.

4) The impact of the production tax modifications on industry investment cannot be clearly determined due to the influence of other factors and given the limited timeframe during which ACES has been in place.

5) Operating costs have risen since the enactment of PPT and ACES, but the impact of these cost increases to state tax revenues was moderated by the "standard deduction" provision of ACES, which expired December 31, 2009.

6) Increased reporting requirements, particularly of forward looking expenditure information, has greatly enhanced the accuracy of the Department's revenue forecasting efforts.

7) The Department has made significant progress in implementing ACES regulations, but there will be challenges to both the department and taxpayers as the regulations are implemented. Preliminary audits of taxpayers under the new profits-based system (formerly PPT) have begun, consistent with the normal audit timeframe.



Comparison of Revenues under ACES, PPT and ELF

The net tax structure – first enacted under PPT (2006) and later with ACES (2007) – represents a significant change from the oil and gas tax structure used for much of Alaska's history. Under the earlier tax, known as the Economic Limit Factor (ELF), production tax was levied on oil and gas producing properties, regardless of whether operations were profitable. The current production tax structure requires companies to pay tax only when they are making profits from oil and gas production in the state. In addition, tax credits are provided for capital expenditures, with higher credits available for certain oil and gas exploration investments.

Since its enactment in 2007, ACES has generated more state revenue than would have been generated under either PPT or ELF. In FY 2008, a period of very high oil prices and profits, ACES generated $6.8 billion in production tax revenue, compared with $4.2 billion which would have been received under PPT and $1.3 billion which would have been received under ELF. In fiscal year 2009, during which west coast oil prices average $68.34, ACES generated just over $3.1 billion. This compares with roughly $2 billion that would have been generated under PPT and $858 million under the earlier ELF system.

Figure A compares revenue from ACES, PPT and ELF for FY 2007-2010. The FY 2009 revenues are preliminary. Estimates for FY 2010 are based on the Department's fall 2009 forecast of an average west coast oil price of $66.93 per barrel.

Figure A[1]

The progressive feature in ACES means that the state receives more production tax revenue when oil prices are high relative to underlying costs. Similarly, it significantly lessens the state's share of revenues when per-barrel margins decline. This effect was illustrated in 2008, when oil prices reached a high of $140 per barrel in July, bringing in $900 million in production tax for the month, and later plunged to below $30 per barrel in December, producing a total of $50 million in production tax for the month. Over the course of the full year, ANS crude oil averaged over $92 per barrel, resulting in five times more revenue than would have been realized under the ELF system.

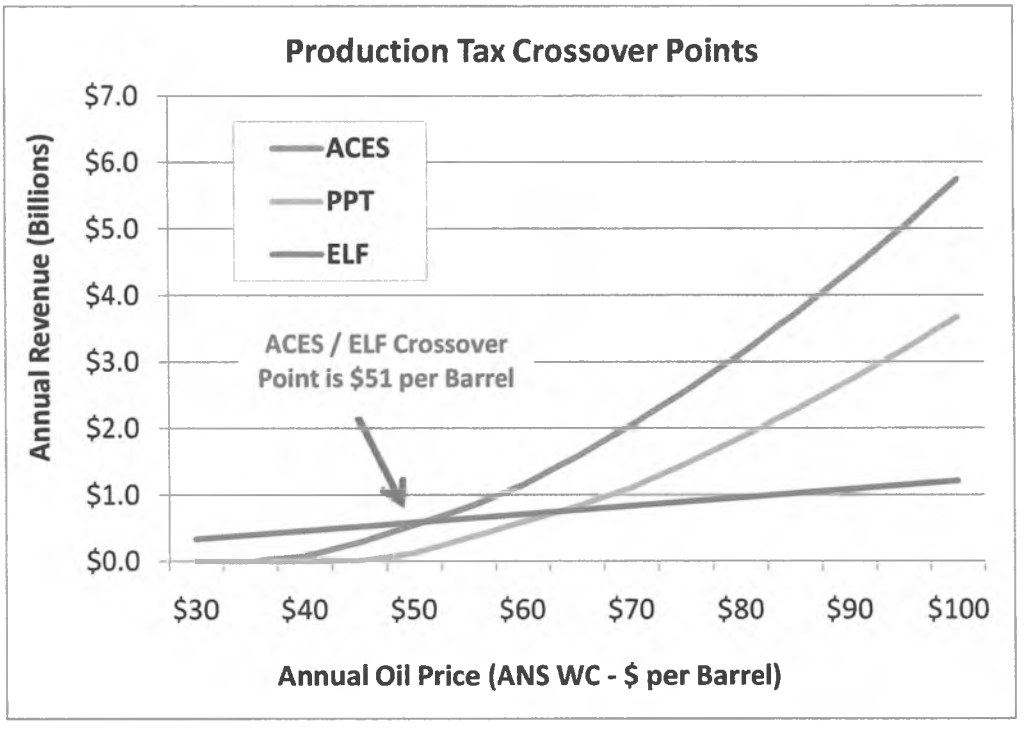


Figure B shows estimated revenues that would be received under ACES, ELF and PPT at various oil prices.[2] The oil price crossover point at which the state receives more revenue under ACES than the ELF system is roughly $51 per barrel. The crossover point has increased over prior

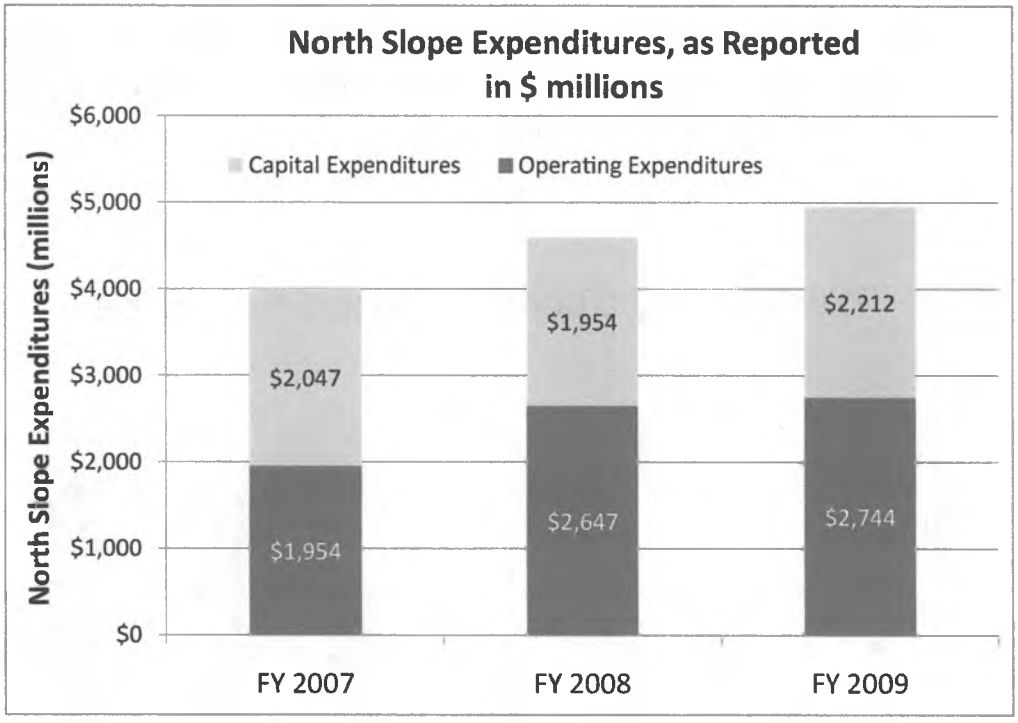
[1] Production tax revenue includes surcharges but does not include any settlements which go to the Constitutional Budget Reserve Fund. FY 2007 PPT revenue includes true-up payments for the period of April 2006 through December 2006. FY 2007 ACES revenue assumes similar true-up payments for comparison purposes. For FY 2007 - FY 2009, assumes actual data for oil price, production, costs and other variables. For FY 2010, assumes oil price, production, costs and other variables as of the fall 2009 forecast. Costs under PPT for FY 2010 for Prudhoe Bay and Kuparuk are based on aggregated company forecasts. For ACES only, assumes that standard deduction would apply for all of FY 2007-FY 2009 and first half of FY 2010. Actual tax revenue, as opposed to modeled revenue, is used for PPT in FY 2007 and ACES in FY 2008-FY 2009.

[2] This analysis assumes a constant oil price for the entire year, production of 655,000 barrels per day, deductible lease expenditures of $20 per barrel and transit costs of $6 per barrel.

years because lease expenditures, which are deductible under ACES, have increased since ACES was passed. It is expected that lease expenditures will decrease as costs decline in delayed response to the decline in oil prices from their 2008 levels.

Figure B[3]

Lease Expenditures



With the introduction of the net tax, it became necessary for the state to identify and forecast allowable lease expenditures for purposes of the tax calculation. Prior to the passage of PPT, the department had not been required to track or audit oil and gas production costs in Alaska. Some early cost data had been acquired directly from producing companies and through preliminary examination of federal tax returns. However, even during the debate over PPT, the state did not have access to comprehensive, Alaska-specific data that would enable policymakers to analyze the effects of the proposed tax over the life of a project. With much more information now being provided under the new tax structure, the department is developing a better understanding of oil and gas costs in Alaska, which will significantly benefit future policy deliberations.

[3] Assumes fixed operating and capital cost of $20 per barrel.

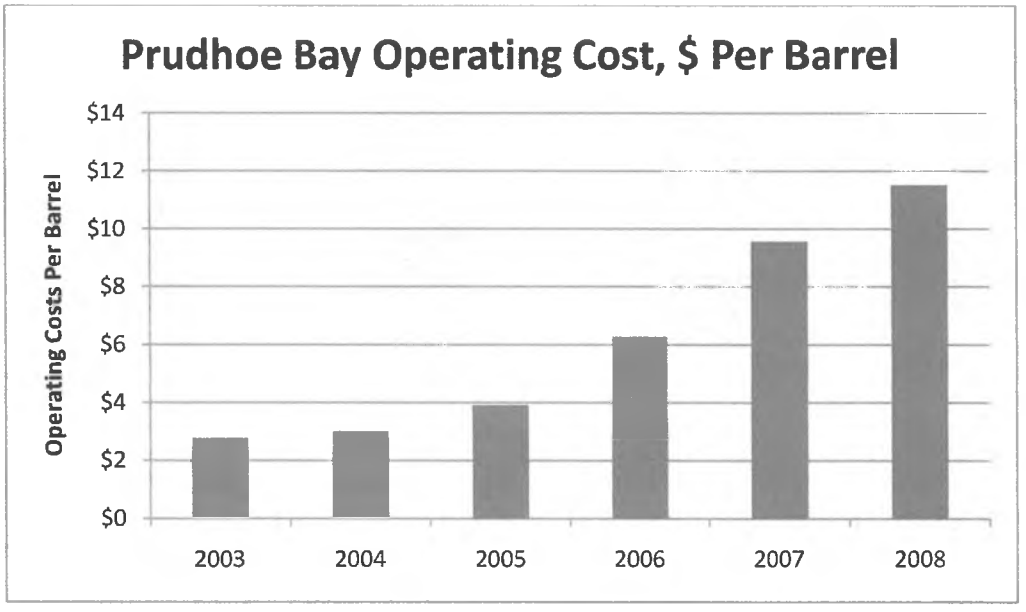
Lease expenditures fall into two general categories that constitute the major deductions under the ACES tax system. Operating expenditures are the costs to operate an oil or gas production facility on a day-to-day basis. These include labor, heat and light for the facilities, and some well work and minor equipment repairs. Capital expenditures are costs incurred to enhance or improve the reserve base, level of production, or facilities. Drilling is one of the most common forms of capital costs, as is facility construction or expansion.

Figure C shows the operating and capital expenditures, as reported on company tax returns and monthly reports, for their North Slope operations, from FY 2007 through FY 2009. Note that the graph represents all reported expenditures for all North Slope properties, regardless of whether or not they are subject to the "standard deduction" provisions of AS 43.55.165(j).

Figure C[4]

Operating Expenditures

Operating costs have risen significantly in recent years for the oil and gas industry worldwide. This has often been linked to the corresponding rise in oil prices beginning around 2002. Projects around the world that were once marginally economic have become viable, increasing the demand for limited supplies of engineering, procurement and construction services, as well



[4] Operating expenditures includes total reported costs, not standard deduction; FY 2007 estimated based on incomplete reporting

as raw materials. Cambridge Energy Research Associates (CERA) reports the upstream operating cost index rose for oil and gas field operations roughly 67% between 2002 and the end of 2008.[5] Meanwhile, the global capital cost index rose over 100% during the same period.[6]

Alaska-specific information obtained through public sources and shared in confidence during the Stranded Gas Development Act negotiations and through ACES reporting shows similar trends on the North Slope. Estimates of operating costs prior to PPT ranged from $3 to $5 per barrel. More recent information indicates that operating costs on the North Slope have doubled, and in some cases nearly tripled. Following the Prudhoe Bay corrosion incidents in 2006, operating expenditures on major repairs increased. However, since that time, the proportion of total operating expenditures directed to major repairs does not appear to have been a key driver in the growth of total operating expenditures.

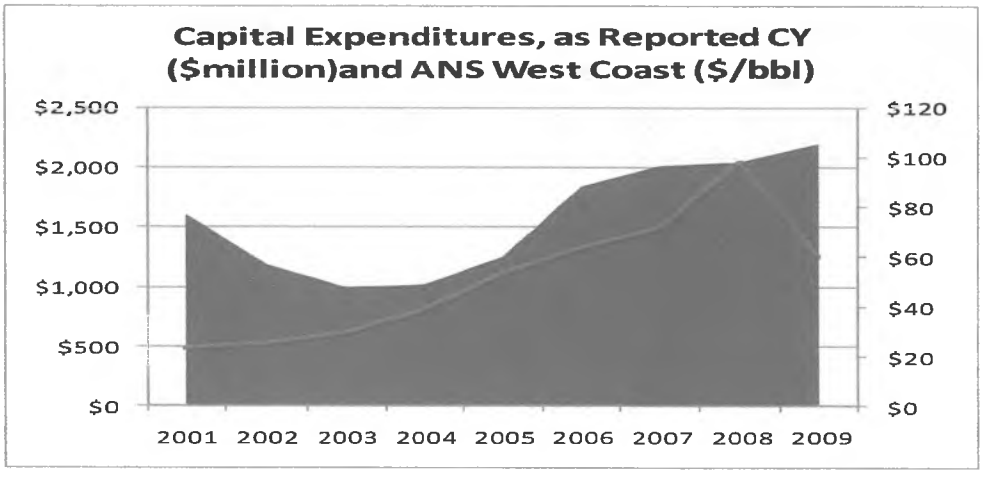
Figure D shows the upward trend in per-barrel operating costs at Prudhoe Bay from 2003 to 2008. The chart shows a dramatic increase over the six-year period, consistent with cost increases seen in the oil and gas sector worldwide.

Figure D

The recent downturn of the global economy has started to push operating costs back down again. In June of 2009, CERA reported that worldwide, operating costs had declined 8 percent

[5] IHS CERA Upstream Operating Cost Index (UOCI), http://www.ihsindexes.com (Accessed December 11, 2009)
[6] IHS CERA Upstream Capital Cost Index (UOCI), http://www.ihsindexes.com (Accessed December 11, 2009)

over the previous 6 months.[7] The most recent information reported to the department under the new ACES requirements shows this trend to also be developing on the North Slope.



Much of this change can once again be linked to recent trends in oil prices. Lower oil prices led to a slackening of worldwide project activity, driving down the costs of transportation and various consumables. Despite this correlation, however, operating costs have not fallen at the same rate as oil prices. While the department anticipates that per-barrel operating costs will continue to decline under the lower oil price forecast for FY 2009 and FY 2010, they are expected to remain relatively high compared with those from five or more years ago.

Capital Expenditures

Capital expenditures have also increased since PPT and ACES were enacted. While capital expenditures on pipeline repairs at Prudhoe Bay increased after the Prudhoe Bay corrosion incidents in 2006, the majority of growth in capital expenditures is attributable to drilling, seismic and other projects. As shown below, capital spending on the North Slope in CY 2009 was roughly twice the level in either 2003 or 2004. At least some of this increase is due to new development activities. Two major developments – Oooguruk and Nikaitchuq – have gone forward despite recent oil price setbacks. Development of the Point Thomson field is also underway.

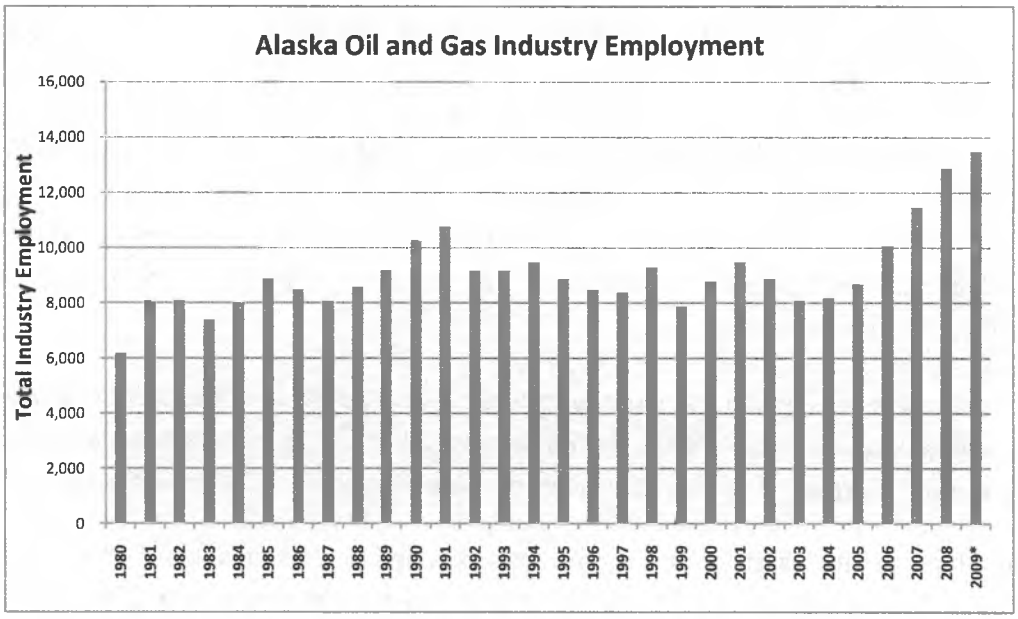
Figure E shows historical capital expenditures from CY 2001 to 2009 as reported by oil and gas producing companies operating on the North Slope.

Figure E

[7] IHS CERA: *"Period of Sustained Cost Escalation for Upstream Oil and Gas Facilities Comes to an End,"* June 5, 2009. http://www.cera.com/aspx/cda/public1/news/pressReleases/pressReleaseDetails.aspx?CID=10388 (Accessed December 11, 2009)

In order to forecast North Slope lease expenditures, the department receives forward looking spending projections from taxpayers, and also consults a variety of information sources, including unit forecasts, plans of development, and federal partnership returns. These data give the department significantly better insight into future development plans, as well as trends in operating and capital expenditures.

This information shows a variety of changes on the North Slope in the years ahead. There is continuing development of newer fields like Oooguruk, Nikaitchuq, and Point Thomson. Growth in capital expenditures at many major North Slope units (i.e. Prudhoe Bay, Kuparuk, Colville River and others) appear to slow slightly or decline in the next year or two and re-surge thereafter to the level of the recent past or higher. This trend is consistent with indicators of worldwide industry activity which show a dramatic drop in capital expenditures from the high levels experienced in 2008. This suggests that recent economic contraction may have caused some North Slope development projects to be delayed as producers hope to form a better idea of where the economy and oil prices may be headed.



It would be presumptuous to solely attribute the rise in expenditures to the success of the investment incentives found in ACES. Many factors beyond tax policy drive oil and gas investment decisions. However, one of Alaska's new explorers, Savant Alaska, stated in a recent Petroleum News article that ACES had assisted in their development efforts at Badami. "ACES was an important component for Savant in considering investment in Alaska. It definitely had its intended consequence with us." [8]

Industry Employment

Employment in the industry has also increased steadily since the implementation of PPT and ACES, with 2009 forecast to be the highest in state history. It is important to note that this occurred concurrent with a steady rise in the oil prices, which has generally shown a strong correlation with industry activity.

Figure F[9]

Flexibility of Tax Burden Evidenced

The increased revenues generated under ACES represent an increased tax burden on Alaska's oil and gas industry. However, there is evidence that ACES effectively adjusts that burden when oil prices drop and profit margins are squeezed. In 2009, a period of relatively low oil prices in comparison to recent years, 35 percent of ConocoPhillips total reported exploration and production profit in the first quarter of the year (Q1), 55 percent in Q2, and 36 percent in Q3, came from its Alaska operations, which only account for 12 percent of the company's worldwide production.[10]

ACES Structure and Tax Rate

The ACES tax consists of a base rate of 25% plus a progressive surcharge, which is triggered when a company's net profits — also known as "production tax value"— exceed $30 per barrel. Beyond this point, the base tax rate is increased by 0.4% for each additional $1 increase in per-barrel production tax value. Using current estimated transportation and production costs of roughly $26 per barrel, the surcharge would begin to be applied when west coast oil prices reach $56 per barrel. When the combined base rate and progressive surcharge reach 50%

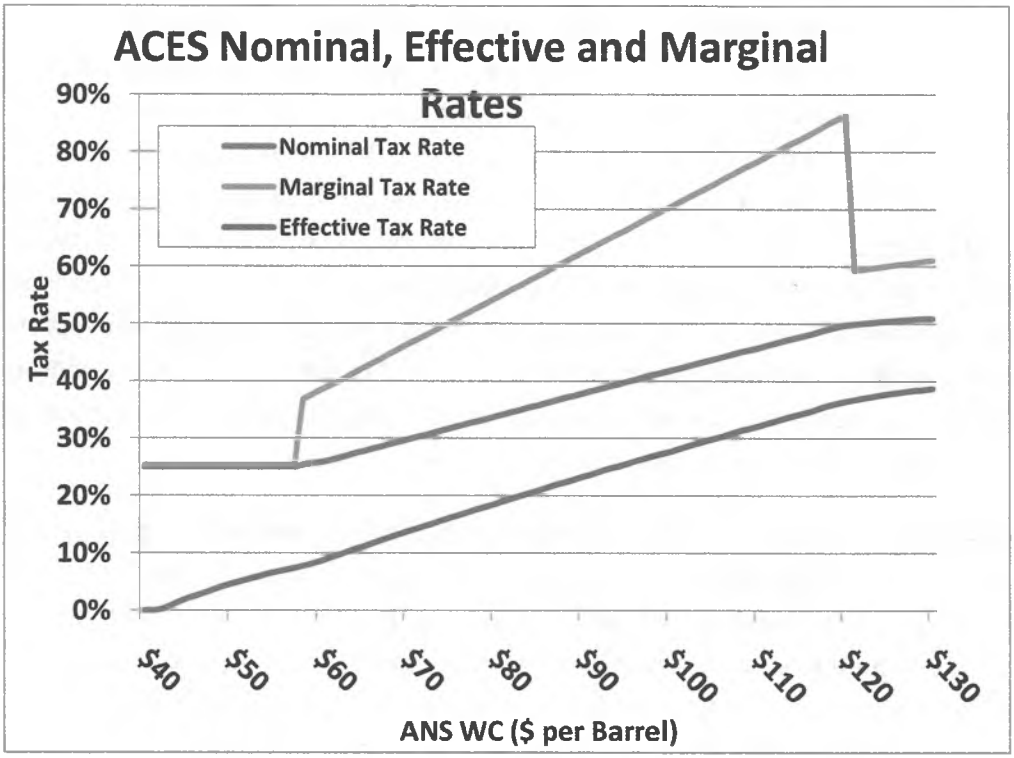
[9] Data from Alaska Department of Labor and Workforce Development, Research and Analysis Section (January 11, 2010). Includes nonagricultural wage and salary data and excludes the self-employed. *Estimates for 2009 are preliminary.

[10] ConocoPhillips, Form 10-Q Quarterly Reports Pursuant to Section 13 or 15(d) of the Securities Exchange Act of 1934, March 31, 2009, June 30, 2009 and September 30, 2009.

(approximately $92.50 per-barrel profit or $118.50 West Coast price) the progressive surcharge is lessened to 0.1% for each additional $1 increase in per-barrel production tax value. The maximum nominal tax rate is 75%, which would apply at a profit rate of $342.50 per barrel or $368.50 West Coast price.

As with any tax, ACES may be evaluated using a variety of different metrics, including "effective," "nominal" and "marginal" tax rate comparisons. While each of these can be helpful under the appropriate circumstances, each is also subject to certain limitations. It is important when using these metrics to understand their relative value and how they reflect upon the objectives of the tax system.

The "effective tax rate" is the share of the total gross taxable value at the point of production that is paid in production taxes after credits are applied. It is a good universal measure of the sharing of total petroleum value that can be compared to gross value-based tax systems.



The "nominal tax rate" is the statutory tax rate as applied to the net value of oil and gas production. It does not account for credits or other tax benefits which ultimately impact a company's bottom line. Under ACES, the nominal tax rate varies with the per-barrel profitability. In addition to a base tax rate of 25%, ACES levies a progressive surcharge that can raise the combined nominal tax rate to 75% at extreme price levels.

The "marginal tax rate" is the rate theoretically applied to each dollar increase in oil price. In the case of ACES, the marginal tax rate is 25% until per barrel profit reaches $30 per barrel (about $56 per barrel in west coast spot price under the current cost structure), at which point it increases for every additional dollar up to a marginal tax rate of 87% when the profit reaches $92.50 per barrel (about $118.50 per barrel on the west coast). Following this peak, the marginal tax rate drops off significantly as the profit level continue to rise. With a net based tax system, this metric shows a company the impact of making additional investment, because each dollar they invest is "subsidized" by the government based on the amount of marginal tax they have avoided paying on that dollar.

Each of these metrics has their limitations when considered in isolation from other metrics, or when only one data point on the curve is presented. For example, a marginal tax rate of up to 87% initially sounds excessive. However, at that same price level, the effective tax rate (the tax burden) is less than 40%. The marginal rate of 87% actually represents the state's "portion" of any new investment made at such high prices.

Figure G shows the nominal, effective and marginal tax rates under ACES using a wide range of west coast spot prices.

Figure G

Production Tax Administration and Implementation

The passage of ACES presented significant challenges for tax administration and implementation because it involved comprehensive structural changes to the tax on the heels of the prior year's legislative changes through PPT. These challenges are experienced both on the taxpayer and on the state side.

Tax Credit Successes and Difficulties

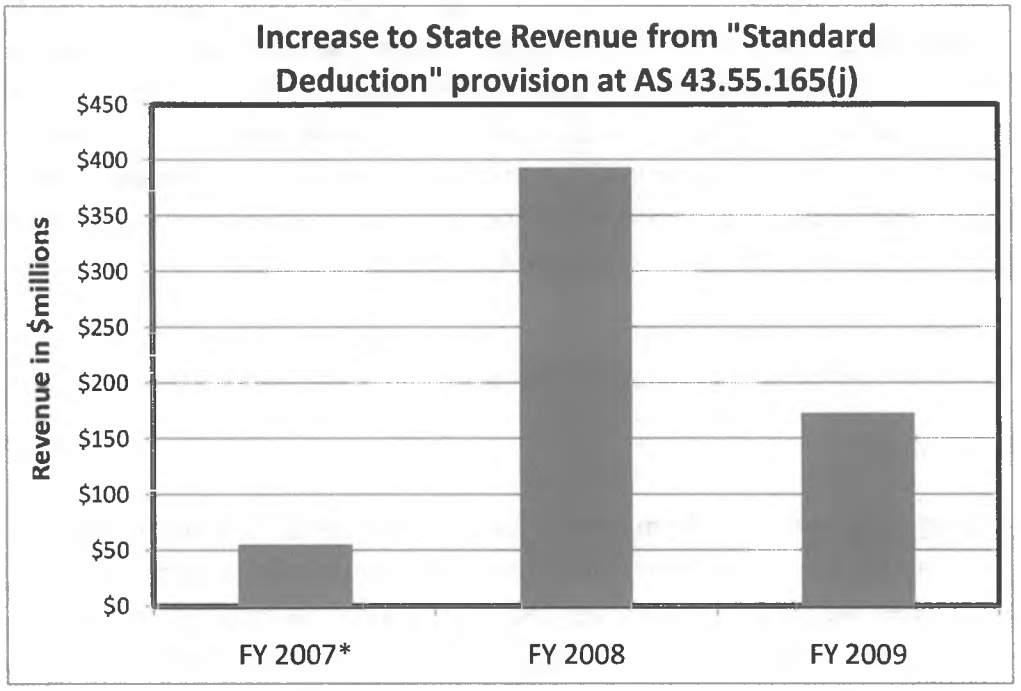
The increased spending levels reported earlier in this document, may be due in part to the expansion of capital and exploration credits provided under ACES for reinvestment in the state. Credits can be applied against tax liabilities, sold to other companies or, for companies producing less than 50,000 boe/day, can be purchased by the state. Nearly $550 million in credits were claimed in FY 2009. Approximately $193 million was paid to oil and gas companies

to purchase oil and gas tax credits, while an additional $350 million in tax credits were used to offset tax liabilities.

Some administrative difficulties have arisen due to the requirement that the 20% capital credit be spread out over two years. It has taken a substantial amount of time and resources to develop a database with which the division can track the issuance and staged application of these credits for each taxpayer. This detailed tracking was made necessary by the transferability and use of the credits, and some confusion by taxpayers and their transferees regarding how the credits could be applied. In addition, the two-year spread in the application of the capital credits diminishes their value to taxpayers who look for quick return of their investment dollars. Finally, one of the reasons for the two-year spread in credits was to assist the department in forecasting future revenues. However, the department has found that the information provisions in ACES have been extremely valuable and successful in improving the volume and quality of spending projection data provided to the department by operators. This forward looking spending information has been much more valuable to the revenue forecasting process than the two-year spread in credits.

The Department has also received feedback regarding the reinvestment requirements for new explorers. Under current law, companies generally receive a financial benefit of over 45 percent of exploration expenditures incurred in the state. However, a new entrant to Alaska (with no production to immediately apply the credit against) can only get full value for their expenditures by applying to the state for cash payment for their credits earned. In order to receive such a payment, the company must continue to make expenditures in future years. Although this provision was originally created to support new explorers, it appears to be a limiting factor for companies that have fewer financial resources and are only considering a single exploration investment. In application, this requirement creates a "double standard" where new entrants to Alaska are provided less value for their credits compared to incumbent companies.

"Standard Deduction" provision at AS 43.55.165(j)



The ACES tax reform made modifications to the deductibility of operating expenditures for certain fields on the North Slope. Alaska Statute 43.55.165(j) limited the deduction of operating expenditures at leases or properties that have produced a cumulative 1 billion barrels of oil and NGLs since the lease or property began oil production. The Prudhoe Bay Unit and the Kuparuk River Unit are subject to these provisions based on their cumulative production. The provision, coined the "standard deduction," limits the deduction of operating expenditures to the amount deducted on the first PPT returns, filed April 1, 2007, for calendar year 2006 expenditures, adjusted annually. This provision, which was effective through December 31,

2009, was intended to moderate the risk associated with adopting a profits based tax without substantial historical data on which to rely for future cost estimates.

Based on company-reported expenditure data, the provision has resulted in a substantially greater tax liability to the state during the time it has been in place. The total liability in FY 2008 was substantially larger than the liability for FY 2009 due to the higher tax rate in FY2008 because of higher net profits realized due to high oil prices.

Figure H shows the increased revenue to the state from the standard deduction from FY 2007 through FY 2009.

Figure H[11]

Regulations

The ACES tax included new restrictions and guidance on allowable lease expenditures, requiring complex regulations. The department has actively sought industry input on the structure of the regulations to ensure they continue to achieve their intended purposes, while avoiding undue burdens for either side. The process has included numerous public workshops pertaining to credit regulation, conforming regulatory changes required by ACES, lease expenditures, facility sharing costs and transportation costs. As a result, the regulation drafting process has been

[11] *Standard Deduction was only in place for half of FY 2007.

lengthy and complex. However, the regulations to define allowable lease expenditures are expected to be finalized this month.

Under the statute the regulations are retroactive to various 2007 dates. To the extent additional taxes are due, taxpayers would be required to pay interest on what would now be late tax payments. The department has discretion to waive any penalties for late payments. However, a statutory change would be needed in order for the department to provide a waiver from interest payments.

Reporting and Revenue Forecasting

ACES requires that companies exploring for or producing oil and gas in the state submit a monthly information report to the department. This report includes estimated data on production volumes, the value of the production, and the operating and capital expenditures related to production. The monthly report is used primarily by state economists to monitor company production and spending. Included with the monthly report is an estimate of taxes owed and credits earned. Twice annually, companies are asked to provide the department with forward-looking expenditure information, along with future production plans to aid the department in providing the legislature with state revenue forecasts.

These reports, in combination with the monthly information reports and the annual tax returns, have significantly enhanced the quality of the department's revenue forecasts.

Audit Compliance

The ACES legislation extended from three to six years, the period in which the department is required to assess production taxes owed. The extension was seen as necessary to assure proper tax assessments, particularly given the complexity of overlapping ELF, PPT and ACES tax laws. The new tax law also included funding for four new "Audit Masters" within the department. The department is still experiencing significant difficulties recruiting and filling audit positions. The department has successfully recruited three Audit Masters, and these individuals have been placed within sections of the Tax Division to assist with implementation and administration of the tax. The recruitment of the fourth Audit Master, and Oil and Gas Revenue Auditors is ongoing.

During 2008, the department's auditors began auditing tax returns that were submitted for calendar year 2006 under the PPT program.

Conclusion

The ACES production tax has been effective in allowing the state to share in the benefits of high oil profitability. It has also responded well to lower oil prices by reducing state tax burden on Alaska's oil and gas producers. Over $2 billion in new capital investment was reported in fiscal year 2009 reaching near-record levels. While these and other indicators suggest that the profits-based tax system has supported North Slope exploration and development, it would be misleading to suggest that ACES alone influences the level of investment. While tax is recognized as being an important factor in investment decisions, it is not the primary determinant. Long-term price forecasts, as well as the resources themselves, have proven to be much more significant drivers of industry activity.

The department is continuing to analyze ACES to identify opportunities to improve the tax framework in order to support additional exploration and development in the state, while not harming the state's revenue base.

The new reporting requirements under ACES are helping the department develop a better understanding of industry expenditures and activity, and have assisted in the state's revenue forecasting efforts. Development of new tax regulations is progressing, though several challenges remain for both the state and taxpayers. Numerous workshops have been held to solicit industry input and these will continue as the department continues to work through outstanding issues. In 2008, the production tax audit group began auditing taxpayers who submitted annual returns for CY 2006 under PPT.

Overall, the information reviewed by the department indicates that ACES is performing as expected when it was passed by the Legislature in 2007. The economic provisions are resulting in the revenue levels anticipated, and the investment incentives appear to distribute the increased tax burden in a fashion that continues to encourage reinvestment, though the experience with the credit program could be improved for new explorers. Challenges remain in the implementation by the department, but they are manageable and the department is positioned to meet those challenges.

Oil and Gas Production Tax
Status Report to the Legislature
Alaska Department of Revenue

January 18, 2011

Report Purpose

In August 2006, the 24th Alaska state legislature approved House Bill 3001, which represented a major restructuring of the state's oil and gas production tax. As part of the legislation, lawmakers asked that the Department of Revenue study the impact of the production tax changes on several criteria and produce a report on or before the first day of the 2011 legislative session on the findings of that study.[1] This report summarizes those findings.

Executive Summary

This report evaluates six elements of Alaska's production tax system since implementation of the Petroleum Profits Tax (PPT) in 2006 and Alaska's Clear and Equitable Share (ACES) in 2007. The six elements and our key findings with respect to each of them are described briefly below.

1. **Revenue Generation/Tax Rate** – State revenues under PPT and ACES exceeded the amount that would have been received under ELF for each of the four fiscal years since implementation of a net profits tax. Although the production tax rate under ACES may be as high as 75%, tax rates in each of the

[1] ***AS 43.55.180 Required Report.*** ***(a)*** *The department shall study*
(1) *the effects of the provisions of this chapter on oil and gas exploration, development, and production in the state, on investment expenditures for oil and gas exploration, development, and production in the state, on the entry of new producers into the oil and gas industry in the state, on state revenue, and on tax administration and compliance, giving particular attention to the tax rates provided under AS 43.55.011 , the tax credits provided under AS 43.55.023 - 43.55.025, and the deductions for and adjustments to lease expenditures provided under AS 43.55.160 - 43.55.170; and*
(2) *the effects of the tax rates under AS 43.55.011 (i) on state revenue and on oil and gas exploration, development, and production on private land, and the fairness of those tax rates for private landowners.*
(b) *The department shall prepare a report on or before the first day of the 2011 regular session of the legislature on the results of the study made under (a) of this section, including recommendations as to whether any changes should be made to this chapter. The department shall notify the legislature that the report prepared under this subsection is available.*

four years were much lower than the maximum rate.

The oil tax rate of 5% of the gross value at the point of production at AS 43.55.011(i) for private landowners has not raised any significant concerns that have been communicated to the Department of Revenue.

2. **Industry Investment** – Investment in the form of capital expenditures has increased in each of the four fiscal years since implementation of the net profits tax, however, it is unclear how much of the capital expenditures were drilling or well-related and how much were maintenance or facilities-related.

3. **Impact on Exploration, Development, and Production** – Exploration has generally increased from 2003, when the EIC credit was implemented, but has dropped off in 2010. Development continues in three relatively new North Slope projects, yet production continues to decline.

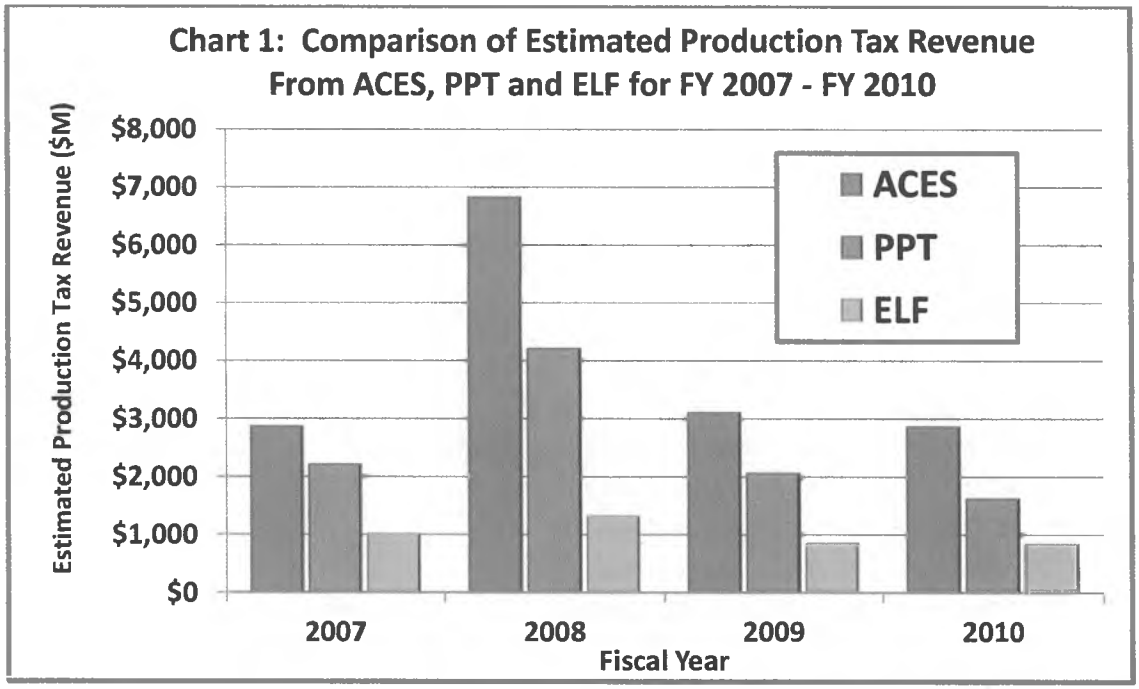
4. **Industry Employment and New Entrants** – Industry employment rose steadily from 2006 through 2009, but dipped slightly in 2010. The number of companies filing annual tax returns doubled between 2006 and 2009, indicating interest by companies that are either new or returning to the Alaska oil and gas industry.

5. **Use and Expansion of Tax Credits** – The amount of credits used has increased annually since 2006 and we expect the trend to continue as new credit programs were added in the 2010 legislative session.

6. **Tax Administration and Compliance** – The department continues to write regulations for the new tax system, and the first audits under the net profits tax have been completed. The department has, however, been hampered in its tax reporting and compliance efforts by the lack of a centralized database to house and manage the large volumes of oil and gas data it receives.

7. **Conclusions and Recommendations** – Based on the multiple changes to the tax laws over the past few years, drawing any conclusion about their effect on Alaska's investment climate is difficult. However, what is clear is that production continues to decline. The state should continue to monitor its competitiveness with other oil and gas jurisdictions worldwide and be prepared to change its tax structure as needed.

Overview



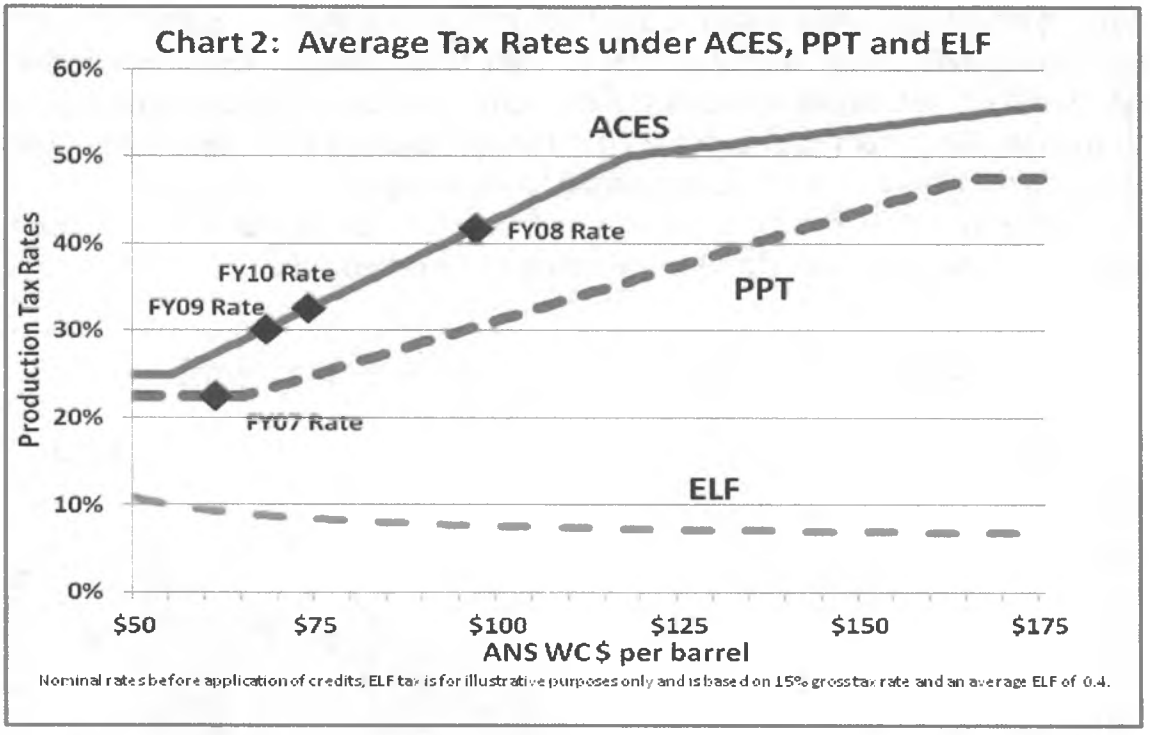
This report reviews and summarizes information gathered over the approximate five-year period since the implementation of the Petroleum Profits Tax (PPT) in 2006, and in 2007, Alaska's Clear and Equitable Share (ACES). The report covers six critical elements for evaluation and a section with conclusions and recommendations, as follows:

1. Revenue Generation/Tax Rate
2. Industry Investment
3. Impact on Exploration, Development and Production
4. Industry Employment and New Entrants
5. Use and Expansion of Tax Credits
6. Tax Administration and Compliance
7. Conclusions and Recommendations

Revenue Generation/Tax Rate

Both PPT and ACES have generated more production tax revenue for the State than would have been received under the previous production tax system, which used the Economic Limit Factor (ELF). In the one year that PPT was in place, FY 2007, the production tax totaled $2.2 billion. That year, the ANS West Coast oil price averaged $61.60 and production on the North Slope averaged 734,000 barrels per day. In contrast, the average oil price one year earlier, in FY 2006, was $62.12, production averaged 840,000 barrels per day, and the production tax under ELF totaled $1.2 billion--$1 billion, or 45% less than collected under PPT. It should be noted that PPT became effective on April 1, 2006, adding two months of tax collections to the FY 2007 total, making FY 2007 effectively a 14-month fiscal year. Regardless, the level of PPT collections above those that would have been collected under ELF, at least at moderately high prices, is significant.

In the three years that ACES has been in place, production tax revenues have increased to higher levels than under PPT. This is largely because ACES has higher base and progressivity tax rates than did PPT, and because one of the credits under PPT – the transition investment expenditure credit – was reduced substantially. The chart below shows production tax revenue collections under PPT and ACES as compared to how production tax revenue collections would have looked under two tax systems that were not in place during those years.



Production tax under both PPT and ACES is calculated on the net profits of oil and gas production, whereas ELF production tax was calculated on the gross profits of oil and gas production. Relative to taxes based on the gross value of production, net profit tax systems generally provide more tax revenue when oil prices are high and less tax revenue when prices are low. The progressive tax mechanism, designed to increase the total tax rate when per-barrel profit exceeds a pre-determined threshold, can increase the tax rate substantially. In addition to the progressive tax rate, the per-barrel profit level where the progressive tax is triggered is important. In the case of ACES, the progressive tax trigger is $30 net profit per barrel, whereas with PPT, the progressive tax trigger was $40 net profit per barrel.

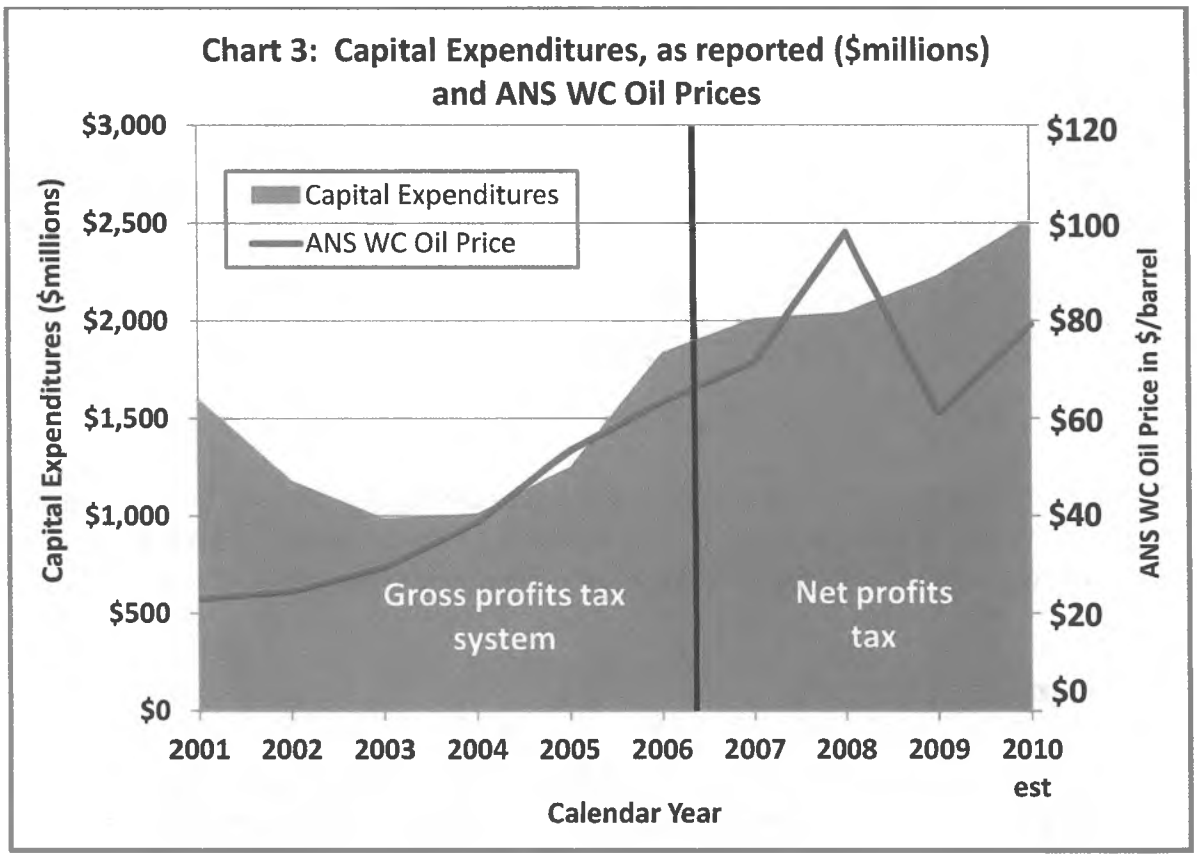
Alaska North Slope (ANS) oil prices over the past four fiscal years were high relative to previous fiscal years. ANS crude prices over the four fiscal years of 2007 through 2010 averaged about $75 per barrel compared to $42 per barrel for the fiscal years of 2003 through 2006. Under ACES, an average price of $75 per barrel would yield an average profit of $50 per barrel, producing a combined base and progressivity tax rate of 33% (25% + [($50-$30)*.004]). The tax under this scenario before credits would be $16.50 per barrel. In contrast, the tax rate under ELF of 15% of the gross value at the point of production, even if the ELF calculated to 1, would yield a production tax of $10.50 per barrel, assuming transport costs of $5 per barrel.

When oil prices are low, however, a net profits-based tax structure would likely provide less production tax revenue than a gross profits-based tax. For example, a tax of 15% on the gross value, regardless of profit, could create a loss for companies producing oil

if profits were equal to or less than the tax. Because PPT and ACES recognize the costs of production in their calculation, a company with no profit would not pay any production tax and would likely get tax credits to offset future tax liabilities. Low oil prices experienced late in the year 2008 and early 2009 generated tax liabilities for many companies operating on the North Slope that were lower than they would have been under the ELF system.

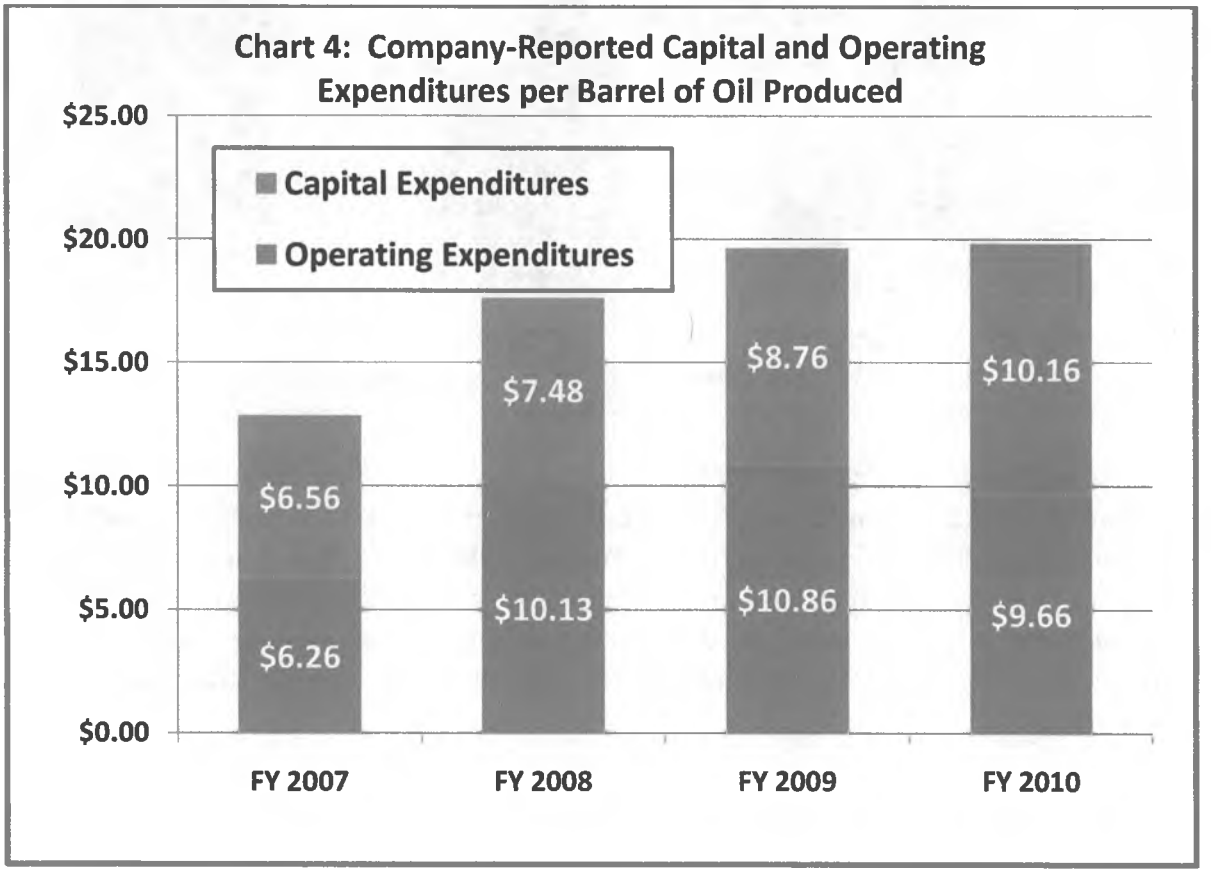
Chart 2 below shows the average tax rates of PPT, ACES and ELF under a range of oil prices. Also shown is the average tax rate in each of the years that a net profits tax has been in place.

The department was also asked to review the tax rate for oil produced from private land of 5% of the gross value at the point of production.[2] The department is not aware of any concerns expressed on behalf of industry or private landowners as to the fairness of this tax.



Industry Investment

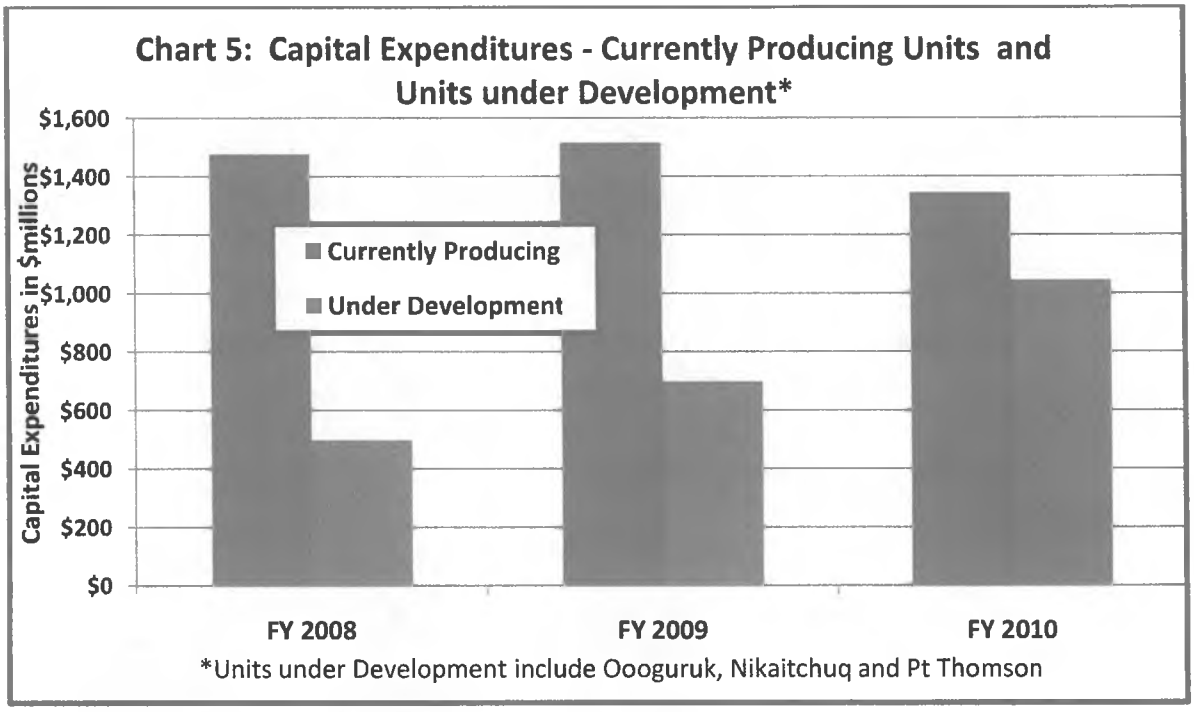
Investment is an important component in Alaska's oil and gas industry. Producing oil, especially in an arctic environment, requires substantial financial outlays before, during



[2] AS 43.55.011(i)

and after producing the oil. In massive oil fields such as Prudhoe Bay, which has been operating for more than 30 years, maintaining and upgrading equipment and facilities is key to continued undisrupted oil production. Companies must also invest in research and new technologies in order to achieve the maximum recoverability of petroleum from the reservoirs they have developed. Because the companies that invest in petroleum projects can and do operate in areas outside of Alaska and the country, Alaska oil projects must compete with other petroleum opportunities throughout the world for those investment dollars.

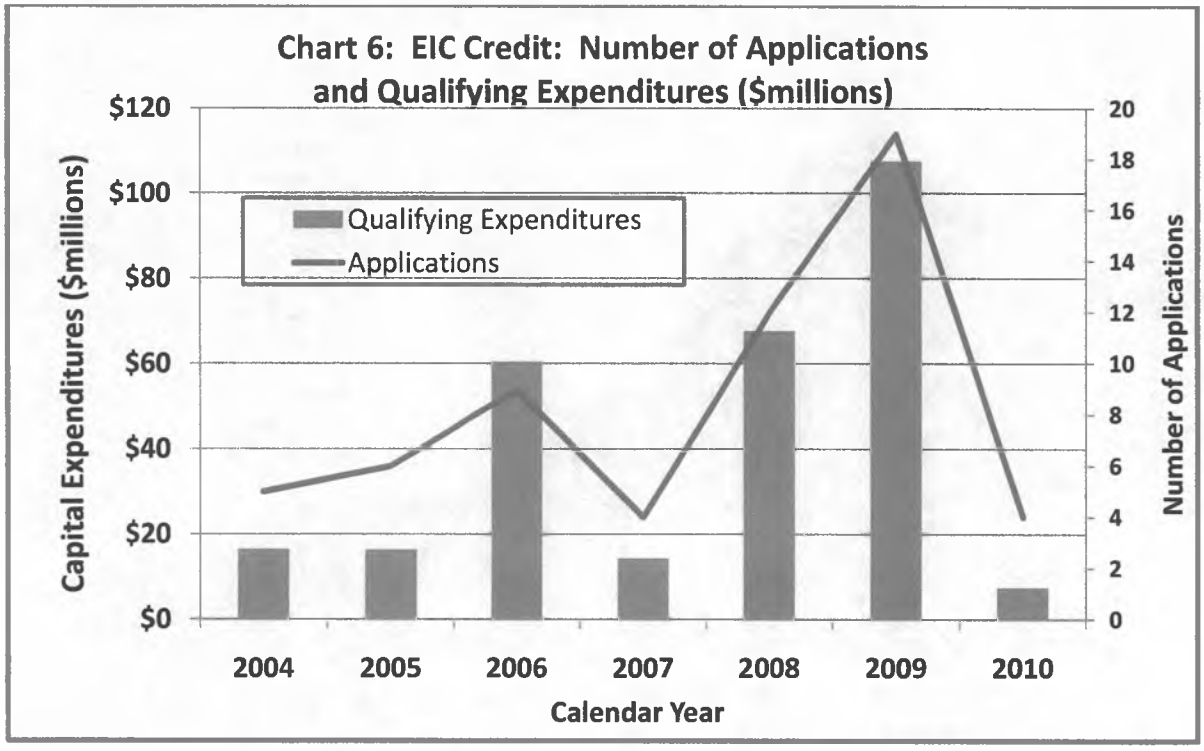
Industry investment is generally reflected in capital expenditures, as opposed to operating expenditures, which are normally considered day-to-day expenditures for producing oil and gas. Alaska's fiscal system, which gives credits for capital expenditures, theoretically encourages these types of investments. Our review of the past 10 years of data appears to bear this out. Chart 3 below shows company-reported data from tax filings from calendar year 2001 through calendar 2010 (estimated). While capital expenditures over the five-year period (2006 through 2010) since the implementation of a net profits tax with credits for capital expenditures have increased each year, we have limited data as to the nature of the expenditures.



In the context of petroleum basin operations, capital expenditures are generally an indicator of expanding production or enhancing or extending the life of facilities or equipment. Expenditures for drilling wells normally fall into the category of capital expenditures as do expenditures for building housing or processing facilities. The Department of Revenue has extremely limited data from which to determine the nature of the capital expenditure increases. Given the age of North Slope facilities and infrastructure, it is quite possible that much of the capital investment in currently producing properties such as Prudhoe Bay is to extend the life of the facilities or infrastructure. Production on the North Slope continues to decrease, with a 7% decline rate between FY 2009 and FY 2010. The end result is that capital expenditures per barrel of oil produced are rising, while operating expenditures per barrel have leveled off and even decreased somewhat, as shown in Chart 4 below.[3]

[3] The slight decline in capital expenditures per barrel between FY 2007 and FY 2008 can be explained by the fact that FY 2007 included 14 months of expenditures, due to the effective date of the tax change of April 1, 2006.

One trend that has been observed in annual capital expenditures figures is that the proportion of capital spending in units under development has been increasing relative to the total capital expenditures spent on the North Slope. Chart 5 below shows expenditures by currently producing units and units under development over the past three fiscal years.

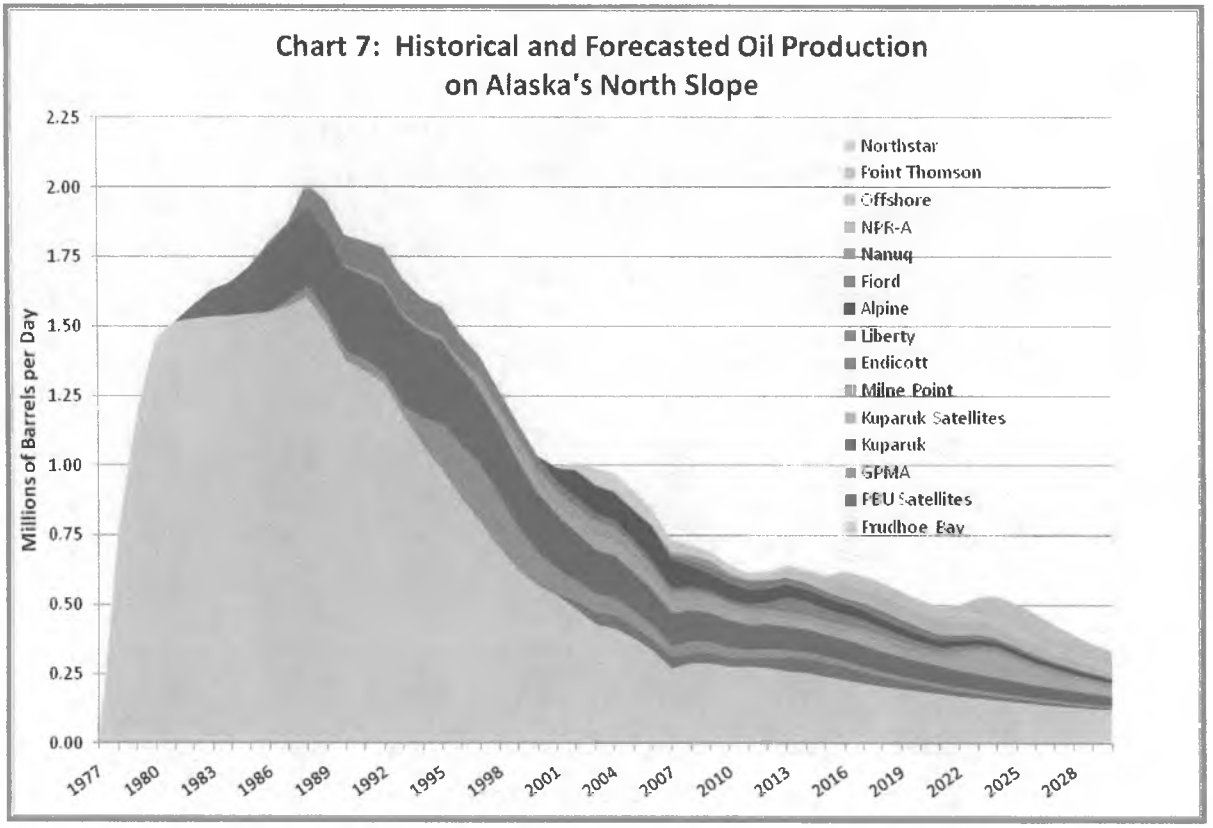


Capital expenditures also earn credits under the new production tax system. The credit system for capital expenditures on the North Slope does not distinguish between types of capital expenditures in existing units. The legislature in 2010 expanded the credit program in Cook Inlet to include an additional 20% credit (total of 40% credit) for lease expenditures related to wellwork. A credit increase of this nature may also prove beneficial to incentivize capital expenditures on drilling and increased wellwork on the North Slope.

Impact on Exploration, Development and Production

As discussed in the previous section, the net profits tax system includes credits for capital expenditures, without distinction as to the nature of the expenditure. The tax system also includes credits for exploration expenditures through its exploration incentive credit (EIC) at AS 43.55.025. This credit was implemented in 2003 and was expanded with the ACES tax changes. If a project meets certain exploration criteria, it may be eligible for 40% credit under the EIC program.

The department began receiving applications under the EIC program in 2004, and the number of applications and amount of qualifying expenditures has generally increased each year peaking in the winter of 2008/2009[4]. The number of applications for EIC credit decreased significantly in 2010, reflecting a decrease in activity for the winter of 2009/2010. Chart 6 shows the number of applications and the expenditures that qualify under the EIC program from 2004 through 2010.

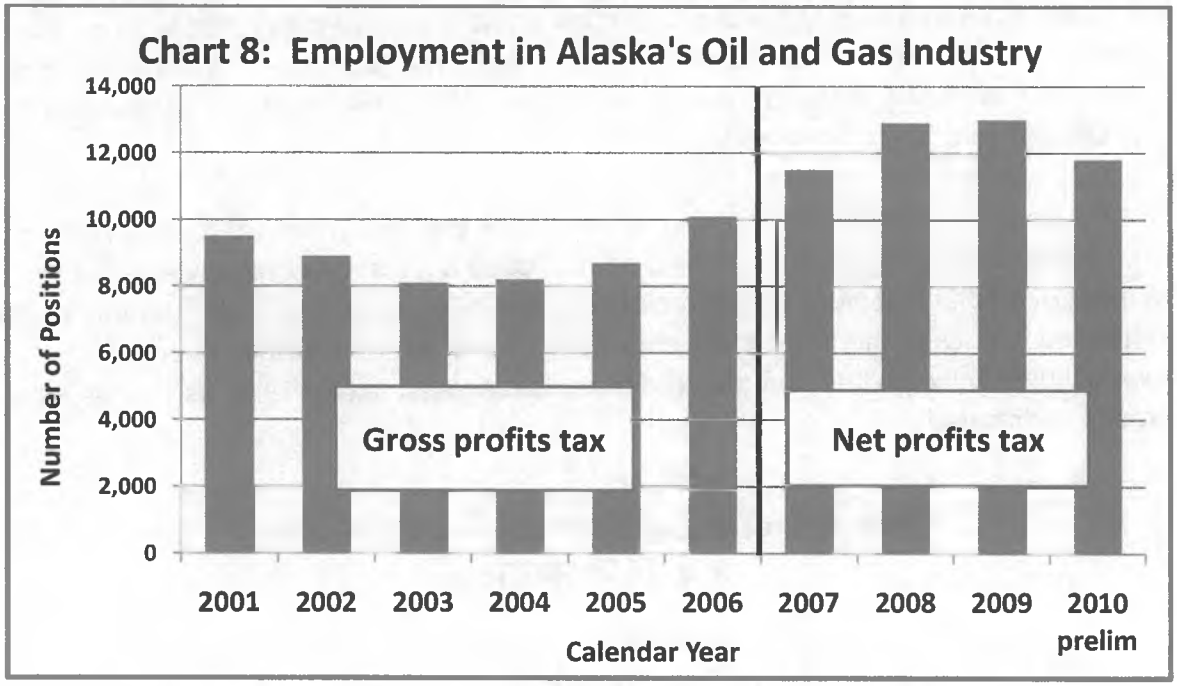


It is much more difficult to measure a tax system's impact on oil development and production from existing fields. The department's production forecasters twice annually create production profiles from limited information about an area's geology, drilling results, and other information exchanged in confidential discussions with operators. The compilation of production profiles for each North Slope field is a challenging task, employing the use of an engineering consultant, generally accepted engineering principles, and special software. The results of this compilation are subject to further revision as projects face delays that are typical in the petroleum industry such as reservoir challenges, permitting difficulties or lack of project funding.

New commercial developments on the North Slope include the Oooguruk Unit, which began production in 2009, and the Nikaitchuq Unit, which is expected to begin production in 2011. The Point Thomson Unit is also under development, expected to

[4] The sharp decrease in 2007 may be due to the tax change to the PPT, which at the time provided credit equal to the lower credit rate of the EIC program, without the reporting requirements.

begin production in 2015. Despite the addition of these developments, North Slope production continues to decline. From FY 2009 to FY 2010, oil production declined 7%; another 4% decline is projected between FY 2010 and FY 2011. Chart 7 below shows historical and projected oil production from the North Slope.

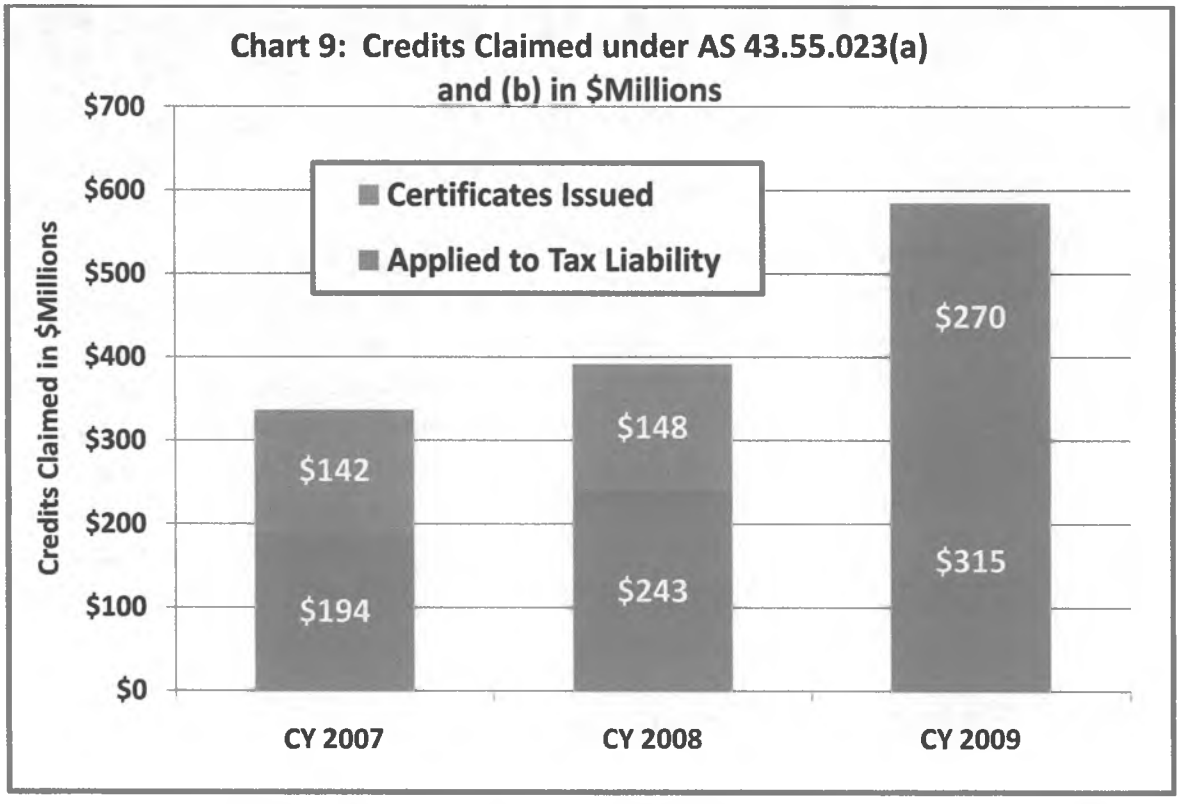


Industry Employment and New Entrants

Employment in the oil and gas sector is another important measure of the health of the oil and gas industry in Alaska. Although oil and gas employment is not the largest category in the state, it is among the most sought-after employment, due to high wages. The Alaska Department of Labor and Workforce Development (DOLWD) reports that in 2009, the average earnings for a person employed in the oil and gas extraction industry was close to $14,000 per month. These earnings are more than 3 times higher than the average earnings for all industries and government in the state of about $4,000 per month.

The department also reports number of employees by industry. Oil industry employment in the state includes jobs with duties that would fall into one of three categories: (1) oil and gas extraction; (2) drilling oil and gas wells; and (3) support activities for oil and gas operations. Officials at DOLWD acknowledge that the definition

is fairly narrow, leaving out important oil-related employment, such as jobs at Alyeska Pipeline Service Company and at refineries in the state. Employment in the oil and gas industry has increased in the years since PPT was implemented, although the department projects a slight decrease in 2010. These data are shown in Chart 8 below.



The state has seen new entrants into the Alaska oil and gas industry since the implementation of a net profits production tax. At the most recent lease sale held in October of 2010, a company new to Alaska successfully bid on over 100 tracts of oil and gas property. The steadily increasing number of production tax returns filed annually also indicates companies' new or renewed interest in Alaska's oil and gas opportunities. In 2006, the first year that filings were made under a net profits tax, there were 19 companies filing annual returns. In 2007, the number of companies filing production tax returns totaled 26, and in 2008, 36 companies filed annual production tax returns. The filing for 2009 increased only slightly from 2008, with 39 companies filing returns.

Use and Expansion of Tax Credits

Tax credits have played and continue to play an important role in the net profits production tax system. There are currently five credit programs specific to the oil and gas production tax, and each of the programs have had substantial interest, and in most cases, use from taxpayers. Alaska's tax credit programs are intended to steer spending to certain in-state activities.

The most widely used credits under the production tax system are the qualified capital expenditure credits at AS 43.55.023(a). Tax credits under this program may be applied to production tax to reduce a taxpayer's tax liability. If an oil and gas company has no tax liability, the credit may be carried forward, transferred to another company, or sold to the state. AS 43.55.023(b), credits for carried-forward net operating losses, are also widely used and may also be carried forward, transferred to another company, or sold to the state. Combined, these credits made up over 80% of the credits issued by the DOR Tax Division over the past three years.

Chart 9 below shows the total number of tax credits claimed under AS 43.55.023(a) and (b), categorized by the number of tax credits applied against a tax liability and the number of credits that were issued credit certificates for future use. We note that credits increased in each of the three years shown. The forecast for increased capital expenditures will translate to more credits applied against tax liabilities as well as more credits certificated.

Other credits include Small Producer/New Area Development credits (AS 43.55.024(a) and (c)) and Alternative Credit for Exploration (AS 43.55.025). These credits have seen less use than the credits under .023.

Credits have been expanded – both in credit rate and number of credits available – over the past year. The credit rate under the Qualified Capital Expenditure credit (AS 43.55.023) was increased for well lease expenditures relative to projects in Cook Inlet from 20% to 40%. Credit under the corporate income tax was also increased and extended (AS 43.20.043) for exploration and development of natural gas in Cook Inlet. The credit rate increased from 10% of qualified capital expenditures and qualified services to 25% of these costs and the credit program was extended from 2013 to 2016. For a complete listing of tax credits available against the production tax and other taxes, see the Fall 2010 *Revenue Sources Book*, at:
http://www.tax.alaska.gov/programs/documentviewer/viewer.aspx?2126f

Tax Administration and Compliance

The numerous changes associated with the shift from a tax on gross value to a tax on profits have been a challenge for the Department of Revenue in a few specific areas. The first order of business under a tax system with a new, different way of calculating the tax is to define the inputs. This has taken place over the past several years in the process of creating, vetting, and implementing regulations. The regulations writing process for the production tax change has been extraordinarily interactive with the taxpayers, incorporating their input in all phases of development. Although this process may have slowed the pace of development, it resulted in more clarity in a complex set of regulations. The regulations writing process continues to date.

The change to a production tax on net profits also posed challenges for the audit staff in the areas of hiring qualified auditors and training auditors for the new demands of the position. The department has had difficulties attracting qualified auditors under the state pay schedule. New and expanded credit programs have also added to their workload. Despite these challenges, the audit staff has completed most of the audits under the PPT system.

The greatest difficulties faced by the department since the implementation of a net profits production tax system are the collection, use, and storage of the huge amounts of data received monthly and annually. As an example, the department receives monthly information from each active oil and gas company regarding the amount of oil and gas produced, the amount spent in operating and capital expenditures, the amount of credits earned and used, and the payment submitted. The department also receives documents pertaining to petroleum sales and netback calculations, most of which are submitted in Adobe Acrobat pdf format, which is not a suitable format for data storage or use. Assembling this data in a useable format is time-intensive and subject to error, as the data are cut and pasted into spreadsheets manually. Further compilations and changes subject the data to additional error and distortion.

The department's access to and use of this important data would be substantially improved if the information were housed in a central database, with access provided to all users of the data. The department believes securing a database will assist in operating more efficiently and effectively as an interface with both taxpayers and the public.

Conclusions and Recommendations

A government's fiscal regime is just one element for oil and gas companies to consider when weighing options for where to invest. Many other elements, such as resource risk, political risk, environmental factors, and availability of labor and equipment, also play a part in companies' decisions about where to invest. It is very difficult to separate these factors in order to determine the extent to which a government's fiscal system influences investment choices.

While it is untenable to blame a tax system for the lack of industry investment, it is equally untenable to claim that the tax system is the reason increased activity or investment occurs. The past three years have seen dramatic swings in oil prices from a high of $134 per barrel to a low of $38 per barrel just 6 months later. An economic recession stifled investment and business activity in the United States and much of the developed world for over a year. The economic activity of the past three years may not have been the best benchmark by which to judge the impact of a tax system.

Nevertheless, it is prudent for state officials to monitor praise for and criticisms of its fiscal systems from both industry and the general population that they serve. High oil prices of recent years have swelled state bank accounts and some have suggested that the state is in the best financial position since statehood. Business periodicals and industry journals report that state is benefitting at the expense of a single industry – petroleum – and that the tax rate under ACES is too high and "takes away the upside" for the oil and gas producers. Criticism is often centered around the marginal tax rate under ACES, under which the government share of each additional dollar of profit may be as high as 93%.

State officials also make efforts to stay informed on the global oil and gas markets and opportunities in other jurisdictions, including how Alaska ranks competitively against them. Among the recent events in government taxation was the royalty modification undertaken by the Canadian province of Alberta. Studies conducted for the Alberta government showed that the royalty changes made in 2007, combined with the recession, the changes in natural gas markets, and other jurisdictions' efforts to attract investment, were making Alberta less competitive for limited petroleum investment

capital. The government responded to this information by changing its royalty structure in a way that the government's share of oil and gas profits would be lower.

The State of Alaska depends heavily on the oil industry, with more than 80% of its unrestricted revenue coming from oil taxes and royalties. State officials should continue to monitor the state's competitiveness in oil and gas opportunities, and be prepared to modify it as the need arises.

FAST Study
October 2010

State of Alaska

Department of Revenue

Comprehensive Plan and Feasibility Study

Alaska Department of Revenue Tax Division
RFP Number 2010-0400-9618

Executive Summary

Needs Assessment

The Alaska Department of Revenue's Tax Division (DOR/TAX) relies on a patchwork of 17 automated systems and over 100 manual "side-systems" to administer 22 tax programs.

- DOR/TAX manages over **$3 billion in Oil and Gas Tax revenue** using an eclectic mix of home-grown side-systems that include multiple databases and unsecured, unstable spreadsheets stretched well beyond their intended use. Storing sensitive taxpayer information in these databases and spreadsheets poses a high security risk.
- The 17 systems used to administer different taxes and functions have been pieced together over the past 15+ years without integration or an overall architecture. The systems do not scale to meet current needs and are inflexible and difficult to maintain. Since the initial development of the systems, many tax laws have changed and the systems have not changed accordingly.
- DOR/TAX constructed the current tax systems as silos of information pertinent to only the tax types they serve. This makes sharing data with other tax systems difficult, requiring customized interfaces, or manual processes. It also makes the business processes that have grown up around the systems duplicative and inefficient, and, in many cases, business processes which should be standard across tax types conflict between systems.
- The vast majority of the agency's business processes are manual. Many exist strictly to get information from one system, database, or spreadsheet to another or to reconcile information. The prevalence of manual processes significantly increases the probability of human error. DOR/TAX also uses manual processes for fundamental business purposes – for example, distributing shared taxes of over **$44 million to 124 communities** throughout Alaska in 2009.
- DOR/TAX employees spend a higher proportion of their time compiling, organizing, and reconciling data than actually auditing, examining, analyzing, forecasting, or managing tax programs.
- The limitations and inflexibility of existing systems impose a burden on taxpayers. Current reporting processes are inefficient and ineffective, and create unnecessary work and cost. As one taxpayer stated, "the Tax Division's inefficiency makes taxpayer interaction with the division inefficient."
- DOR/TAX cannot easily produce reports required by the legislature and policy makers because the current systems prevent timely, complete, and correct extraction of data. Reports can be inaccurate and misleading due to incorrect and incomplete data and human error.
- Because of the changing nature of the economy, Alaska may, in the future, need to adjust its state tax structure away from such a heavy reliance on Oil and Gas Taxes. The current capabilities of DOR/TAX make analysis of new opportunities, or investigation of competing alternatives, nearly impossible. Economic research capabilities of the current system rely on manual processes.

DOR/TAX Vision

DOR/TAX's vision is to "Efficiently use resources to promote compliance and fairly collect and accurately report the State's revenues." The DOR/TAX management team believes the single, most significant step it can take to achieve its vision is to procure and implement a modern integrated tax management system (ITMS).

ITMS implementations are complicated, high-risk projects. An effective mitigation strategy needs to focus on three key elements:

- Choosing a sound implementation approach
- Using an effective procurement process to select a strong solution and trusted business partner
- Carefully planning and managing the project to ensure successful delivery

Implementation Approach

Options available to states desiring to implement a modern, ITMS include the following.

- *Custom systems:* For many years, custom-built mainframe-based systems were the only option available to state revenue agencies. They remain an option today. A custom solution can provide a high degree of flexibility, especially if the agency is very satisfied with its existing business processes and does not want to adapt them to other solutions. Custom systems, however, pose a higher degree of implementation risk and, historically, have been a more costly option.
- *Transfer systems:* Transfer systems were a popular option from the mid-80s through to the early 2000s, offering the advantages of lower cost and lower risk. At least two vendors marketed and implemented transfer solutions. To our knowledge, there are no vendors actively marketing transfer system solutions for an ITMS in the US market today.
- *Commercial off-the-shelf (COTS) systems:* COTS solutions became an option for state tax agencies after the turn of the 21st century. They offer advantages of lower risk, reduced cost, and quicker deployment of proven "out-of-the-box" functionality. Today, there are at least five companies with COTS solution offerings for the US market.

Since 2000, COTS solutions have become the predominant option for an ITMS in state revenue agencies within the US. In the past decade, 21 out of 27 ITMS contract awards were for COTS solutions. In the past five years, 12 of 14 contract awards were for COTS solutions and two followed a custom approach.

DOR/TAX does not have to decide on the implementation approach at this time. DOR/TAX can construct the Request for Proposal to allow vendors to propose an ITMS using the vendor's desired approach. This technique encourages competition and allows DOR/TAX to select the system, and the approach, during the evaluation of bidders that best meets the needs of DOR/TAX.

Scope

The scope for an ITMS includes:

- Replacing all 17 official systems, various FoxPro and MS Access databases, and over 100 Excel spreadsheets in side-systems with one integrated system. Current legacy systems will be retired as the tax types they administer are integrated into the new system
- Migrating all 22 tax types to a new, ITMS
- Cleaning data and preparing data for conversion from existing legacy systems
- Training users and operators to fully utilize system functionality
- Implementing new e-filing opportunities for taxpayers, including Modernized e-File (MeF)
- Increasing compliance functions thereby enhancing non-filer, collections, and audit functionality
- Automating distribution of shared taxes after user approval
- Configuration meeting the State of Alaska and DOR's specific requirements and providing the ability to quickly adapt the tax types to the State's ever-changing tax laws and regulations
- Providing for data warehouse and integrated imaging capabilities
- Implementing streamlined business process changes to improve efficiency and effectiveness

Costs

While the number of taxpayers in a jurisdiction has some bearing on costs, the complexity of the taxes, desired functionality, and the number of tax programs are much more significant factors. A high volume of taxpayers can affect software and hardware scalability and performance, but the functionality needed to process and administer a tax is not materially affected by a large or small number of taxpayers.

A budget for an integrated tax system for a five year period is estimated to be $30 to $35 million, and DOR/TAX is requesting a budget of $35 million. This budget should be sufficient to attract a number of vendors offering a range of solutions to respond to an RFP, and it is within the industry standard range.

Estimated Project Costs—Five Year Period

Component	Amount – Low (millions)	Amount – High (millions)
Vendor Software and Services	$23.0	$27.0
Hardware	$1.375	$1.375
Project Operating Expenses	$1.325	$1.325
Maintenance and Support (2 years)	$4.0	$5.0
Total	$29.7	$34.7

For an ITMS project, one of the critical risk factors is inadequate funding. It is important to set a realistic level of funding, allowing multiple vendors to bid thereby providing competitively priced proposals for goods and services. Setting a budget too low may result in getting a system that does not meet the agency's needs. A jurisdiction also runs the risk of limiting the number of vendors that respond to an RFP or receiving attractively priced responses that carry high business and delivery risks.

Benefits

Benefits achievable through a modern ITMS align with DOR/TAX's vision. In many states, revenue collections resulting from increased compliance exceed the amount spent on a new ITMS within 2 or 3 years after implementation is complete.

Benefits of a modern ITMS include the following:

- *Improving efficiency* - by facilitating a consistency of operations across all tax types and functions and enabling the automation of high volume, routine tasks. An ITMS project will streamline business processes and align them with best practices while at the same time providing a means and a method to incorporate tax law changes rapidly and easily.
- *Promoting compliance* - through enhanced voluntary compliance as well as collection, audit, and discovery activities. An ITMS will make conducting business with DOR/TAX simpler and easier for taxpayers and enable DOR/TAX to provide taxpayers with accurate and complete information. It will also enhance collection management tools.
- *Increasing fairness* – everyone is paying the taxes they are legally required to pay. An ITMS will allow DOR/TAX to systematically identify and act on taxpayers who fail to file, improve audit selection, identify potential underreporting, and discover taxpayers that should be registered and paying taxes, but are not.
- *Accurate reporting* - through an ITMS that provides consistency of information across all tax types and functions. An ITMS will provide real-time access and query capability, and enhanced flexible reporting capabilities.

An ITMS also streamlines system maintenance by providing a single system with a common architecture and standard delivery platform.

Implementation Roadmap

- This study provides an implementation roadmap, offering DOR/TAX practical guidance as it prepares for procurement and plans for implementation of an ITMS. Key activities include:
- Preparing for procurement – activities before the RFP is issued
- Writing the RFP
- Preparing for the project with an emphasis on project management, change management, communication management, risk management, data preparation, and deciding on project location

Factors Leading to Success

In our experience, there are certain contributing factors that can greatly influence a project's outcome. Those that are within the influence of DOR/TAX are described in detail and fall within leadership support, staffing support, logistic support, and leadership support.

Summary

It is evident from the research, reviews, interviews, and analysis of the information there is a clear need for implementation of an ITMS in DOR/TAX. It is only through extensive and redundant data manipulation, the use of unsafe side-systems, and numerous hours spent cross checking and re-keying data that DOR/TAX is able to sustain the level of service they provide now.

II. Introduction

A. Background

For the past three years, the Alaska Department of Revenue's Tax Division has been investigating options to replace its patchwork of systems, databases, and spreadsheets that currently support the processing and collection of taxes. The agency staff and external consultants have prepared numerous analyses, studies, and documents to determine needs, identify options, and recommend the best approach for the Tax Division's future.

In July 2010, Alaska Department of Revenue's Tax Division (for the purposes of this report, DOR/TAX) issued a Request for Proposal (RFP) soliciting proposals for an unbiased study to determine the feasibility, scope, and estimated costs of a new Integrated Tax Management System (ITMS) to streamline revenue administration. Fast Enterprises, LLC (FAST) of Greenwood Village, Colorado was awarded the contract to perform this study. This report is one of the deliverables required of that contract.

B. Purpose and Scope

FAST worked with DOR/TAX to develop the scope of this study. The purpose of the study is to identify technology solutions supporting the overall vision of DOR/TAX.

The scope includes:

- Obtaining external stakeholder feedback, both to help DOR/TAX make sure its vision and mission are centered on the outcomes valued by stakeholders and to identify ways the agency can improve tax administration and the services it provides
- Assessing the gap between DOR/TAX's current state and its desired future state through a detailed technical, functional, and business process analysis
- Making recommendations on feasibility and scope, validating costs, and identifying benefits associated with an ITMS
- Identifying technical, business, and delivery risks, along with an implementation approach to minimize those risks
- Providing DOR/TAX with a roadmap based on practical guidance as it prepares for the procurement and plans for implementation of an ITMS

C. Methodology

FAST employed the five methods described below to perform this study.

1. External Stakeholder Interviews

DOR/TAX helped identify external stakeholders including a mix of taxpayers, association representatives, legislators and legislative staff, state agency personnel, and a local government representative. Twenty individuals participated in 14 interview sessions conducted in person and by telephone. Interviewees answered a consistent set of questions designed to obtain feedback about DOR/TAX and to provide input regarding the agency's vision and mission, ways to improve tax administration, and services delivered by the agency. Appendix A contains a list of stakeholder interview participants.

2. Gap Analysis

DOR/TAX's subject matter experts (SME) participated in 22 sessions to gather information about current systems and business processes. The sessions were organized by functional area. Participants discussed system constraints, limitations, desirable features, and functionality to increase effectiveness, streamline business processes, and improve productivity.

3. Management Team Workshops

Two sessions with DOR/TAX management reviewed and refined the agency's mission and vision statement and aligned its technology strategy with this vision. Stakeholder feedback and input was shared with the management team during the second session.

4. State Surveys

FAST reviewed and analyzed information previously collected by DOR/TAX about project costs, schedules, and user satisfaction and supplemented it with additional survey information about project scope, costs, and benefits.

5. Review of Prior Reports and Analysis

FAST reviewed many reports, studies, and analyses provided by DOR/TAX, including the following:

- Oil and Gas Tax System: Preliminary Requirements (October 18, 2007)
- Oil and Gas Tax System: Solutions Analysis (October 18, 2007)

III. DOR/TAX Mission and Vision

A clear statement of an organization's mission and vision is important to provide clarity of focus, both for employees working inside the organization and for those affected externally by the organization's day-to-day operations. A carefully-crafted statement is able to communicate an organization's core purpose and focus, and express its aspirations for the future. It also forms the foundation for a strategic approach that can position the organization to reach its goals.[1]

A. External Stakeholder Input

DOR/TAX desired contributions from external stakeholders to serve as an input for this study, and to provide validation prior to an annual review of its vision and mission statements. FAST interviewed 20 stakeholders including taxpayers, association representatives, legislators and legislative staff, state agency personnel, and a local government representative.

After sharing a copy of the previous mission and vision statements, the questions posed to stakeholders were:

- What is your general reaction to DOR/TAX's mission and vision?
- Is it appropriate?
- Does it look like they're focusing on the right things?
- Is anything missing?

Feedback centered on the four topics discussed in more detail below.

Clarity – Stakeholders noted the statements were "quite a blend of things" and that DOR/TAX could "tighten up their focus with fewer statements."

Compliance and Collections – The most frequent comment throughout all the interviews stressed placing an emphasis on compliance rather than increasing revenue collections. One stakeholder explained,

"Shouldn't [the Tax Division] just be trying to collect the correct amount that is due? Increasing compliance makes sense, but simply *increasing revenue collection* sounds like they're only out for money – even if taxpayers are already paying what they owe."

> ***"It's good they want to focus on efficiency because the Tax Division's inefficiency makes taxpayer interaction with the division inefficient."***

[1] The mission and vision statement shared with stakeholders can be found in Appendix C, along with the more detailed feedback shared with DOR/TAX.

Another observed,

> "Trying to move the compliance needle closer to 100% is important. But simply *increasing revenue* seems to communicate the wrong message."

Efficiency – Several stakeholders noted the importance of operating efficiently. One stakeholder said, "It's good they want to focus on efficiency because the Tax Division's inefficiency makes taxpayer interaction with the division inefficient."

Wise Use of Resources, Technology – There was a concern that emphasizing the maximum use of technology, sent the wrong message. One stakeholder commented, "The important thing is to use technology wisely and effectively."

Another explained,

> "It's not about arbitrarily using technology to the max – you use technology to improve customer service or increase the public's confidence in the Tax Division. Technology is a means to achieve the Division's goals."

Stakeholders also provided feedback on DOR/TAX's mission. DOR/TAX is not able to change its mission statement without approval of the Office of Management and Budget since mission statements are used to succinctly describe an agency's objectives.

B. DOR/TAX's Mission and Vision

Mission – Collect taxes, inform stakeholders, and regulate charitable gaming.

Vision – Efficiently use resources to promote compliance and fairly collect and accurately report the State's revenues.

C. Strategic Actions and Approach

To make significant progress in reaching its vision, DOR/TAX requires a strategic approach that addresses the fundamental tools at its disposal – people, processes, and technology. The DOR/TAX management team believes the single biggest barrier it faces today is its patchwork of aging, inflexible systems and, in some cases, the absence of any system to support tax administration. By necessity, manual processes are pervasive in the agency's operations, consuming its peoples' time and energy that should be focused on compliance and taxpayer service activities. The accurate collection and reporting of revenues is at risk by insecure side-systems and extensive reliance on manual processes.

An ITMS would help DOR/TAX achieve its vision by providing a state-of-the-art platform able to leverage technology in the future. Benefits achievable through a modern ITMS align with the components of DOR/TAX's vision.

Efficiency - by facilitating a consistency of operations across all tax types and functions and enabling the automation of high volume, routine tasks. An implementation project will streamline business processes and align them with best practices.

Promoting compliance - through enhanced voluntary compliance as well as collection, audit, and discovery activities. An ITMS will make conducting business with DOR/TAX simpler and easier for taxpayers and enable DOR/TAX to provide taxpayers with accurate and complete information. It will also enhance compliance by providing collection management tools.

Fairly collect - by making sure everyone is paying their fair share of taxes, allowing DOR/TAX to systematically identify and act on taxpayers who fail to file, improving audit selection, identifying potential underreporting, and helping discover taxpayers that should be registered and paying taxes, but are not.

Accurately report - through an ITMS that provides consistency of information across all tax types and functions with real-time access and query capability, and enhanced, flexible reporting capabilities.

With the exception of cash processing and booking liabilities, there is not an automated system to administer the state's Oil and Gas Production Tax.

All other processes for this tax type are performed manually.

IV. Gap Analysis: "As Is" and "To Be"

The gap analysis presented in this section results from DOR/TAX's current state as compared to the desired future state made possible with the procurement and implementation of an ITMS. The current state is determined through a variety of means including an inventory of DOR/TAX's existing systems, examining current functionality and business processes, and through interviews with external stakeholders. Limitations, constraints, and problems are identified and compared to the opportunities for improvement inherent in a modern ITMS.

A. Inventory of Existing Systems

DOR/TAX has 17 systems used to administer different aspects of its tax types and over 100 MS Excel spreadsheets that track information the systems do not capture. Since the initial development of the systems, many tax laws have changed and the systems have not changed accordingly. It is important to note that with the exception of cash processing and booking liabilities there is not an automated system to administer the state's oil and gas production tax. All other processes for this tax type are performed manually.

The current systems are difficult to modify and maintain and do not scale to meet current needs. The result is the creation of quasi-official "side-systems." Side-systems most often take the form of MS Excel spreadsheets and, in some cases, MS Access databases that are external to systems consistent with DOR's designated *Application Development Platform and Database Standard*.

TAX has 17 systems used to administer different aspects of its tax programs and over 100 MS Excel spreadsheets that track information the systems do not capture.

Well intentioned users create side-systems out of necessity to capture information needed to perform their jobs. Storing information in side-systems results in many problems including data duplication, inconsistent data, incomplete data, and loss of data. Additionally, side-systems introduce serious security risks.

Presented below is an inventory of the 17 systems DOR/TAX maintains and uses to perform their assigned duties. The tables below include important information as to the age of the system, if known, why the system does not meet the needs of DOR/TAX, and obtainable functionality and benefits if DOR/TAX replaces them with an ITMS.

1. PowerBuilder Applications

The Alaska IT Group (2008) concluded the tax applications built in PowerBuilder are not SOA standard (p. 3). The same study found the core infrastructure of the existing PowerBuilder solution to be

incomplete and lacking many features that would streamline and consolidate the business practices of DOR/TAX. A few of those features include non-filer identification, collections management tools, audit management tools, and refund tracking. PowerBuilder applications are not consistent with DOR's designated *Application Development Platform and Database Standard*.

Cash Processing System (CPS)	
Age	14 years
Purpose	• Used by the Accounting and Collections Department to process, verify, track and post payments for all tax and license types • Interfaces to TAS to apply payments to taxpayer account and liability
Limitation/Problem	• Important information not available, such as payment directions • Not all payments made to DOR can be reported on from CPS • CPS data must be combined with TAS data to create a full report • Certain payment information is only accessible by the Accounting and Collections Unit
An ITMS could	• Standardize payment functionality - view, direct, re-direct, reverse, allocate, and otherwise associate payments with accounts and taxpayers • Make finding and understanding payment information more straightforward and visible to users talking with taxpayers and solving complicated tax payment related issues • Provide complete payment information - including split payment directions, history of allocations, and automated bad check fee application • Automate tracking and reporting of payments • Allow input information to be available in multiple formats for reporting, analysis, and ad hoc queries

Tax Processing System (TAS)	
Age	15 years
Purpose	• Acts as the accounting backbone for almost all tax types – Except Oil and Gas Property – only Oil and Gas Tax payments appear in TAS • Used by almost all DOR/TAX users to research and apply payments • Tracks Cigarette Consumption liabilities • Manages Mining License, Electric, and Telephone Cooperative Taxes • Manages all Gaming Tax and License functions • Holds keyed refunds information
Limitation/Problem	• Does not include management of Oil and Gas Property Tax • Difficult to change and understand code • Return details separate from transaction details • Transaction sequence numbers hard to decipher • Hard to track down the return adjustment and tie the adjustment to resulting transaction • Assessment reports to taxpayers sometimes report incorrect information causing confusion and frustration • Audit assessment reports sometimes have to be posted by IT staff due to system anomalies and inconsistencies in TAS • Changes on account status must be done manually
An ITMS could	• Include detail information for Oil and Gas Property Tax • Allow ability to view all taxpayer financial information in one place • Allow communication with taxpayers about their total liability • Allow automatic offsets to other periods/accounts • Allow revenue distributions performed in-system • Provide refund and refund interest tracking mechanisms • Provide audit and collections assessments • Provide standardization and automatic billing • Allow automatic calculation of all types of interest • Allow audit adjustments to be made from an audit case • Allow input information to be available in multiple formats for reporting, analysis, and ad hoc queries • Allow for improved management tracking and system functions

Data Entry and Examination Excise (DEE)	
Age	8 years
Purpose	• Data entry and examination functionality for returns from Tobacco, Alcoholic Beverage, Fisheries, Commercial Passenger Vessel, Large Passenger Vessel Gaming, Tire Fee, Vehicle Rental, and Motor Fuel Claim for Refund
Limitation/Problem	• Originally developed as a training tool • Never designed for use in a production environment • Difficult to improve and correct • Only used to capture Oil and Gas Production Tax payments and liabilities
An ITMS could	• Integrate data entry and examination process into the same system as the financial information - no data transfer between DOR/TAX systems • Allow configurable rules for taxpayer and account information and return line items - the system can easily be modified to meet changing needs • Provide version control allowing users to make adjustments to the same copy of the return while keeping a history of who and when the changes were made • Allow for viewing/adjusting of amendments against original return • Allow management and control of workflow • Allow measurement and adjustment of line item rules to detect and deter fraud, improve processes, improve forms design • Allow input information to be available in multiple formats for reporting, analysis, and ad hoc queries

Data Entry and Examination (DEE) Motor Fuel/Corporate Income	
Age	12 years (Motor Fuel); 10 years (Corporate Income Tax)
Purpose	• Serves as the data entry and examination system for Motor Fuels and Corporate Income Taxes
Limitation/Problem	• Originally a transfer solution from Wyoming's Mineral Tax System • Programming guidelines were not always followed, creating a system both difficult to maintain, but also incapable of keeping up with the State's needs and legislation • Cannot change the line items on the return to adapt to legislation changes • Difficult to make adjustments to return values - sometimes have to create and re-key all information from the return to make the adjustment • Does not meet DOR/TAX's needs
An ITMS could	• Integrate data entry and examination process into the same system as the financial information - no data transfer between DOR/TAX systems • Allow configurable rules for taxpayer and account information and return line items - the system can be easily modified to meet changing needs • Provide version control allowing users to make adjustments to the same copy of the return while keeping a history of who and when the changes were made • Allow for viewing or adjusting of amendments against original return • Allow management and control of workflow • Allow measurement and adjustment of line item rules to detect and deter fraud, improve processes, and improve forms design • Allow input information to be available in multiple formats for reporting, analysis, and ad hoc queries

Alaskan Salmon Price Report (ASPR)	
Age	Unknown
Purpose	• Supports data entry and management for Fisheries Business Tax filers • Gathers information needed for public reports
Limitation/Problem	• Complicated for users to extract data from the system in desired formats
An ITMS could	• Allow viewing and reporting needs for this data from a standard template • Allow for scheduled reporting and automated transmission of reports through email, FTP, or other methods • Allow easy data comparison to other information in the system • Allow for forecasting and data analysis on the reported data • Allow for historical reporting and storage of previous reports • Allow for ad hoc query analysis and "on-the-spot" answers
Fish and Game Licensing Application	
Age	Unknown
Purpose	• Tracks the approval process and the license status for Fish and Game Licensing
Limitation/Problem	• Difficulty tracking if a taxpayer is in compliance, holding a current license when they file their returns - compliance data matching is difficult to perform and time consuming • Gaming licenses, returns, and stamp information reside in three different systems making it difficult to verify manufacturer licenses
An ITMS could	• Situations of concern could be automatically detected and flagged for user review and suspend or stop automatic processes from occurring if a taxpayer is not in compliance • Ability to check returns filed without a license and vice versa • Allow easy data comparison to other information in the system • Allow for forecasting and data analysis on the reported data • Allow for historical reporting and storage of previous reports • Allow for ad hoc query analysis and "on-the-spot" answers

Interest Engine for TAS	
Age	Unknown
Purpose	• Calculates the interest of debt owed to DOR/TAX
Limitation/Problem	• Cannot automatically calculate interest on credits, refunds, assessments, appeals, or collection cases • Users typically verify calculation provided by TAS in an MS Excel spreadsheet and in other interest calculation software
An ITMS could	• Streamline interest calculations for all functions in the system - interest automatically calculated within the system based on configurable rules • Ability to manually add interest, if needed • Allow input information to be available in multiple formats for reporting, analysis, and ad hoc queries
Unclaimed Property (UP) Viewer	
Age	Unknown
Purpose	• View images associated with submissions in the UP system
Limitation/Problem	• PowerBuilder does not meet state of Alaska IT standards
An ITMS could	• Provide ability to associate images with taxpayer, accounts, and refunds • Allow easy data comparison to other information in the system • Allow for on-line notifications and claims for UP to clear out backlogs and reduce inventory of unclaimed property • Allow input information to be available in multiple formats for reporting, analysis, and ad hoc queries
Travel Documents Image Viewer	
Age	Unknown
Purpose	• Assists DOR/TAX's Administrative Unit by archiving travel documents
Limitation/Problem	• Does not include active travel documents
An ITMS could	• Associate travel documents with system users, however, travel documents are normally handled by a State's Human Resources Division enterprise resource planning system and images are better integrated with internal business functions not related to taxpayers

2. Microsoft (MS) Access Application

MS Access is a program used by DOR/TAX with the State of Alaska's IT standards and is not consistent with DOR's designated *Application Development Platform and Database Standard*. There are many risks involved when using MS Access databases, including the lack of version control, history maintenance, and data integrity as well as a vulnerability to data corruption. Storing sensitive taxpayer information in these databases poses a high security risk.

Oil and Gas Production Tax	
Age	Unknown
Purpose	• Tracks Oil and Gas credits and Joint Venture billing
Limitation/Problem	• In 2009, tracked Oil and Gas credits worth over $310 million • Captures a lot of data - databases are currently exceeding 5GB and are difficult to access on user machines and to store/retrieve on network drives • Users accidentally override each other's data • Users make their own "copy" of the databases which are not updated when new information is added to the original database • High possibility of data corruption and loss of data • Provides low security control for data which contains sensitive taxpayer information
An ITMS could	• Provide a system architecture designed to handle large amounts of data • Provide version control to prevent loss of information • Provide one source of data available to all users • Prevent data from being lost and overridden • Provide for implementation security standards • Provide ability to capture and report on all data submitted by the taxpayer • Allow standardization of data submission • Allow input information to be available in multiple formats for reporting, analysis, and ad hoc queries

3. Web Applications

DOR/TAX has implemented three web applications which have expanded taxpayer self-service. Taxpayers now have the ability to file returns and license renewals, make payments, and submit additional information to DOR/TAX. The applications automate the receipt of information, so the staff does not have to enter the original data.

Unfortunately, the web applications reside on the same servers as the Permanent Fund Division's applications. DOR/TAX cannot make major changes between December and May due to the potential negative impact to the Permanent Fund Dividend applications.

The web applications built originally to allow the taxpayers to apply for licenses now perform additional functions. Since the initial implementation, the scope expanded to allow the web applications to accept return filings, payments, and additional information required from taxpayers. The applications stretch to provide accepting MS Excel spreadsheets for online filing, data submissions for the Economic Research Unit, and for providing information to the public. Unfortunately, the structure of the web applications lacks two important factors of good software, flexibility and scalability. When changes to existing services are required or taxpayers request new services the effort to perform those tasks is often excessive.

Online Tax Information System (OTIS)	
Age	3 years
Purpose	• Taxpayers use OTIS to submit tax returns and supporting information, make payments, and review a history of online transactions
Limitation/Problem	• Shares the same server as PFD – no changes between December and May • Online system was originally designed for part of the current functions - the system is not scalable to further additions and changes • For some tax types, the web application allows users to provide information in any format they would like which creates additional work for DOR/TAX to sort and standardize received data into a consistent format for analysis
An ITMS could	• Place online support for tax types on its own server allowing controlled changes as needed • Streamline and standardize data input to decrease taxpayer error • Streamline formats accepted from taxpayers to reduce workload • Allow input information to be available in multiple formats for reporting, analysis, and ad hoc queries

Online Permit and License (OPAL)	
Age	3 years
Purpose	• Taxpayers use OPAL to apply for licenses needed to conduct business and make payments for those licenses • Manufacturers and distributors use OPAL to fulfill requirements of filing monthly reports identifying pull-tab games and stamps
Limitation/Problem	• Shares the same server as PFD – no changes between December and May • Online system was originally designed for part of the current functions - the system is not scalable to additions and changes • For some tax types the web application allows users to provide information in any format they would like to, which creates additional work for DOR/TAX to sort and standardize received data into a consistent format for analysis
An ITMS could	• Place online support for tax types on its own server allowing controlled changes as needed • Streamline and standardize data input to decrease taxpayer • Streamline formats accepted from taxpayers to reduce workload • Allow input information to be available in multiple formats for reporting, analysis, and ad hoc queries
Public Reports and Queries - Online	
Age	Unknown
Purpose	• Used to obtain information on Alcoholic Beverage Licenses, Fisheries Business License, Gaming Distributors, Gaming Manufacturers, Gaming MBP, Gaming Operator, Gaming Permittee, Motor Fuel Qualified Dealer License, Municipalities Electing to Defer Motor Fuel Tax, Tobacco Approved for Sale and Importation and Tobacco Dealer License Query
Limitation/Problem	• Shares the same server as PFD – no changes between December and May • Only queries information in TAS – information residing in other systems and on Excel spreadsheets is not queried making most reports incomplete and inaccurate
An ITMS could	• Place online support for tax types on its own server allowing controlled changes as needed • Information and communications with taxpayers could be expanded with the possibility for two way communications allowing for web messaging and problem resolution with full tracking and history • Place all information in same database for complete and accurate reporting

4. Visual Studio C# Client Applications

Through careful design, implementation, testing, and deployment of applications, Visual Studio helps build very secure applications. The security technologies provided by .NET, the operating system, and web browsers are available to secure applications. The three applications below do not suffer from security concerns, but they do present more of a maintenance issue because they exist on a different platform from all other applications maintained by DOR/TAX. Integrating these applications onto one platform with other DOR/TAX applications would also reduce redundant data and the need to learn multiple systems.

Offtake Volume Reporting (OVR)	
Age	Unknown
Purpose	• Tracks well head production data submitted to DOR/TAX by Oil and Gas Production taxpayers • Provides Economic Research Unit with data for analysis and forecasting
Limitation/Problem	• Amount of data captured is limited because it requires manual entry into the OVR system - data may be contained in other systems • Time consuming for users to review and search for needed information
An ITMS could	• Allow information currently captured in separate systems or spreadsheets to be included in reports for OVR • Allow upload of EDI information provided to DNR to streamline filing Oil and Gas Royalty Reports and reduce taxpayer burden • Allow input information to be available in multiple formats for reporting, analysis, and ad hoc queries
Economic Monthly Report (EMR)	
Age	Unknown
Purpose	• Provides information for forecasting models used by the Legislature and Governor's office
Limitation/Problem	• Users must manually gather information, key and format it into MS Excel spreadsheets, upload it to EMR, and export into economic models
An ITMS could	• Streamline process by eliminating the need to gather data through separate methods and manipulating it outside the system • Use standard reporting tools to easily manipulate data • Allow input information to be available in multiple formats for reporting, analysis, and ad hoc queries

Gaming Stamp Manager	
Age	New
Purpose	• Tracks Gaming Tax pull-tab stamps from the time they are ordered by DOR/TAX through the time the game is played
Limitation/Problem	• Does not provide the ability for operators, permittees, or multiple beneficiary permittees (MBP) to file online • Cannot access this information from a taxpayer's Gaming Tax account • Allows duplicate pull-tab numbers to be entered
An ITMS could	• Expand the process to enable operators, MBP, and permittees filing information to be captured along with other information currently captured in one system • All information pertaining to a Gaming Tax account would be accessible from a single location within the system • Allow input information to be available in multiple formats for reporting, analysis, and ad hoc queries

5. Visual FoxPro Application

Visual FoxPro is a program used by DOR/TAX that does not comply with the State of Alaska's IT standards and is not consistent with DOR's designated *Application Development Platform and Database Standard*. There are many risks involved when using FoxPro databases, including the lack of version control, history maintenance, and data integrity as well as a vulnerability to data corruption. Application security when using Visual FoxPro is entirely dependent on locking users out of the application. Storing sensitive taxpayer information in these databases poses a high security risk.

Petroleum Property Tax	
Age	Over 10 years
Purpose	• Assists in the generation of Oil and Gas Property Tax assessments
Limitation/Problem	• In 2009, over $81 million in assessments processed through this application • Functionality similar to that of an MS Excel spreadsheet – users perform primarily work manually • Incomplete – lacking 40% of intended functionality • No IT staff experienced in Visual FoxPro • Minimal system documentation
An ITMS could	• Automate the assessment process using configurable rules designated by the users, statutes, and regulations • Include all needed functionality

	• One system platform to maintain for IT staff • Allow input information to be available in multiple formats for reporting, analysis, and ad hoc queries

6. Side-systems

Information that cannot be captured, manipulated, or compiled in the above systems is managed and maintained in MS Excel spreadsheets, referred to as "side-systems." The functionality utilized in MS Excel ranges from simple data capture of information to advanced manipulation of data exported from within the systems for reporting and tracking purposes.

There are risks involved when using MS Excel spreadsheets for DOR/TAX data. The data may contain sensitive taxpayer information which a spreadsheet cannot adequately secure. Manual capture and manipulation of data presents a high-risk of user error. There is no version control in spreadsheets and a risk of users overwriting each other's work if they are using the same spreadsheets.

In the article "Porting Mission-Critical Excel Workbooks to Web Applications," Mercer (2009) describes succinctly the issue DOR/TAX is experiencing today in the following paragraph:

> "Simply put, Excel is not the appropriate solution for reliable, efficient storage and processing of large amounts of data and it lacks the stability to do this in a safe way. If a user's machine were to lock up during a 20 minute long file opening procedure or aggregate calculation, this could mean the permanent destruction of said spreadsheet due to file corruption. Also, because these files often sit on users personal hard drives and not on managed servers, they often fall outside the net of the IT department's automated backup routines" (p. 3).

This same article makes mention of the limitations of integration for the future when using MS Excel by saying:

> "Excel is an application that plays very well with others. It will accept data in a number of different formats and convert that data to a spreadsheet format and vice versa. Because of these capabilities, many users often turn excel into a conduit for systems integration by using it to take data from certain systems, reformatting it and shipping it off to other systems. Although this is a perfectly acceptable use of Excel's capabilities, it is not a reliable long term systems integration strategy. This is especially true for mission critical systems, for which integrations will often require more advanced features such as record locking, batched transactions with rollback, message queuing, event logging, and scheduled processes" (Mercer, 2009, p. 4).

DOR/TAX pushes the use of MS Excel beyond Microsoft's intended use of the program and is using the program as a long term data storage tool because DOR/TAX does not have other tools available. There are better alternatives for mission-critical programs than relying on MS Excel workbooks within the marketplace. Mercer (2009) summarizes that by implementing one of those alternatives, "The gains in security, stability, and productivity are far from being negligible" (p. 5).

Two areas where MS Excel is the only tool available to management are: Revenue Sharing and Cigarette Tax Stamps Inventory Management.

DOR/TAX calculates Revenue Sharing (**$44 million** in 2009) by retrieving information from the main DOR/TAX database using Sybase InfoMaker queries. The Accounting and Collections Manager compiles bulk data into an MS Excel spreadsheet and manipulates the data to calculate the revenue sharing distributions. This complex process could be incorporated and automatically calculated within an ITMS. The system can populate revenue models, create online analytical processing (OLAP) cubes, and produce standard reports from integrated templates for review by the accounting staff before funds clear for distribution.

The Cigarette Tax Stamp Inventory which generates **$63 million** annually relies completely on MS Excel spreadsheets. An ITMS that includes an inventory module would provide tracking of inventory for comparison with returns information for better compliance.

7. Key Findings

To finance all state government operations, Alaska depends primarily on petroleum revenues. DOR/TAX manages the **$3 billion** Oil and Gas Production and Oil and Gas Property Tax programs using an eclectic mix of authorized and home-grown side-systems. These two programs rely heavily on unsecured, unstable MS Excel spreadsheets even though these programs bring in over **77% of *all* tax revenues**. MS Excel provides for management of return data and is the source of information for Oil and Gas Taxes. FoxPro and some very basic TAS functions supplement the MS Excel spreadsheets. Risks presented by relying on MS Excel and other side-systems for managing these critical revenue programs raises great concern within DOR/TAX.

DOR/TAX constructed the current tax systems as silos of information pertinent to only the tax types they serve because of needs during the time of tax implementation. There does not appear to be an overall architecture plan to the creation of the systems. The current systems make sharing data with other tax systems difficult, requiring custom interfaces or manual processes. DOR/TAX efficiencies are hampered and revenue dollars due the State may remain uncollected since taxpayer and tax data cannot be automatically compared across the different tax types.

> ***"...use of Excel's capabilities...it is not a reliable long term systems integration strategy."***

Tax systems that are designed as silos tend to enable the creation of business processes and rules that are "siloed." Processes that could be the same across the organization are not because they were developed by tax type rather than function. An ITMS would lend itself toward unified business rules and processes, thereby improving operational efficiencies.

B. Gap Analysis - Current vs. Future Business Processes

FAST examined DOR/TAX's current systems and evaluated the current processes. Below is an outline of each of the major processes, including Imaging and Archive, Entity, Returns, Taxpayer Accounting, Payments, Collections, Audit, Appeals, Refunds, Security, and Reporting as they are now, followed by an analysis of what is offered in a standard ITMS. The *Gap* section for each functional area compares the current and future states. Please refer to the business process flow diagrams contained in Appendix E for additional information.

1. Imaging and Archive

a) Current Tax System

DOR/TAX currently images returns, payments, and taxpayer correspondence. The only audit documents imaged are the Oil and Gas Corporate Income Tax documents. Return imaging occurs at different times in the returns handling process depending on the return type. For example, DOR/TAX images Corporate Income Tax returns before examination, whereas they image Charitable Gaming returns after examination. After imaging, paper copies of the documents are gathered and archived.

Main tasks performed in the imaging and archive processes include:

- Generating and printing sheet separators
- Reviewing images and making corrections to them
- Routing paper return documents to different units depending on type and status of the return
- Generating and printing box count sheets for archive boxes
- Obtaining approval from Records Officer to have box of documents archived
- Distributing archive box inventory lists

b) ITMS

An ITMS can provide easy access to images from within the application, providing side-by-side views of the data and the image. Captured images of filed returns can be displayed beside the data input screens, facilitating the data entry of return information. Rules can be set so the system will change focus and zoom in on different segments of the images as data entry operators complete the sections of the online data entry form. In some cases, the electronic copy of the document can replace the paper copy, alleviating the need to archive paper copies of documents.

Integrated imaging provides the following abilities:

- Rotate and correct images
- Create correspondence in the system rather creating, printing, and then imaging it
- Add notes to the image or annotate sections of the image
- Track image details such as date imaged, sequence number, and who imaged the document

An ITMS provides the capability to index images on-line individually or in bulk. DOR/TAX can apply an index to an image captured at the front end of processing, in a standardized process, in many ways to support their processing requirements. For example, DOR/TAX may wish to index an image by:

- Taxpayer
- Account
- Period
- Return
- Payment
- Collections case
- Audit case
- Other cases such as registrations and appeals

c) Gap

One major disadvantage to the current system is the lack of image support for all tax types. Currently, no image support exists for the tax types responsible for bringing in the most revenue to the state: Oil and Gas Production and Oil and Gas Property. Additionally, DOR/TAX does not have the capacity at this time to image Tobacco Licenses, Personal Consumption Cigarette Tax documents, or documents from Appeals. Implementing an imaging process to image documents as they come in the door would provide standardization and tracking of documents received by DOR/TAX.

2. Entity

a) Current Tax System

For the majority of tax types administered by DOR/TAX, the entity must first exist in TAS before any processing can begin. A taxpayer can register through DOR/TAX's online filing program, OTIS, or can send in a paper registration form to be keyed by someone in DOR/TAX. A taxpayer record can have multiple accounts/licenses, each with their own addresses. Even though the taxpayer can have multiple addresses, the Corporation Income Tax account address is selected by the TAS system as the default. An account has the ability to have both a Legal and DBA (Doing Business As) name.

It is difficult to edit taxpayer identification numbers. The tax agent must create a new entity and have the Accounting and Collections Unit transfer the correct returns and payments to the new entity or request the IT Unit make corrections behind the scenes. There is currently no way to validate or standardize addresses keyed by the taxpayer in OTIS, or when keyed directly into TAS. It is very difficult to track all entity and account data for reporting.

b) ITMS

An ITMS allows for consolidated taxpayer information where all attributes and account information for an entity can be accessed from one location.

Identities - An identity is a string of characters used to identify either a taxpayer or an account. An ITMS can automatically assign a unique taxpayer identification number and account identifier to all taxpayers and accounts, respectively. Multiple identities may be recorded for a taxpayer and are the most efficient means of searching for and locating either a taxpayer or an account. Identities for a taxpayer

can be maintained both at the taxpayer level and the account level. Taxpayer identities can be set to be masked for security purposes if required. Changes to identities and multiple identity types are often supported and available for use on correspondence as part of configuration.

Addresses - A taxpayer may have one or more addresses of various types (for example, location address or mailing address). All addresses for a taxpayer can easily be maintained from the taxpayer level, including military and foreign (non-US). In addition, taxpayers may have the same address type at different levels of their account, for example a mailing address can exist at the taxpayer level, and a different mailing address can be active for a specific tax account. The address type can be considered when issuing correspondence. Addresses are commence/cease dated, allowing the system to record official changes. An ITMS can also be interfaced with or include National Change of Address certification to provide for change of address information. Addresses entered can be verified using USPS Coding Accuracy Support System (CASS) to ensure the addresses entered are deliverable addresses.

Taxpayer and Account Creation - In an ITMS a taxpayer can be created with a submitted return, a taxpayer can register through on-line filing, or paper documents can be received and keyed for taxpayer creation. For Corporate Income Tax, the Modernized e-File (MeF) process can provide enough information to create a taxpayer if one does not exist.

In addition, an ITMS also provides the following capabilities:

- Configure multiple name, address, and contact types for each taxpayer and account
- View history of changes made to names, addresses, IDs, and contacts
- Allow correspondence to be mailed to different names and addresses based on the type of correspondence
- Configure site-specific attributes for each account and taxpayer type
- Associate related entities such as corporation to subsidiary corporation
- Provide easy access from accounts to the associated licenses
- Provide communication through flags or notes attached at various levels

Some tax types have no system at all, including the Oil and Gas Production Tax which brings in over $3 billion to the state annually.

c) Gap

An ITMS allows for consolidated taxpayer information with access to all attributes and account information from one location. Using CASS-certified address validation would allow DOR/TAX to receive a discount on postage and would lower the amount of correspondence returned due to invalid addresses. The ability to store multiple addresses, both at a taxpayer level and an account/license level,

and easily select (or let the system choose) the most appropriate address for certain types of correspondence reduces taxpayer confusion and time spent on taxpayer service.

Additionally, an ITMS provides the capability to present a taxpayer financial summary at a glance, view the entire taxpayer and all associated accounts, communicate between units within DOR/TAX about the taxpayer's status or account activity.

3. Returns

a) Current Tax System

Returns processing and examination is currently handled in multiple systems. Some tax types have no system at all, including the Oil and Gas Production Tax which brings in over **$3 billion** to the state annually.

The current return processes:

- Require keeping the return and payment together until the 3-day payment process is complete - examiners do not have access to the return during this time.
- Cannot store all of the required information from returns needed for reporting and analysis.
- Requires re-keying a substantial part of the return multiple times when making an adjustment to a return in the DEE systems.
- Legislative changes cannot be made to the Motor Fuels or Corporate Income Tax system without breaking the system, so new requirements are pushed into side-systems for implementation.
- Put imaging the return at the end of the process, meaning agents are working off of paper returns that can be easily misplaced or lost.
- Require a "Red Sheet" to be filled out for amended mining returns that gives instructions to the IT staff to correct the system behind the scenes.
- Require some returns go through system checks to look for problems; return stops for manual review on problem identification. Many of these checks are no longer necessary, but DOR/TAX cannot change the system to remove the invalid edit checks.
- Once DOR/TAX corrects a return, the taxpayer should receive the corrected information. Unfortunately, the information sent to the taxpayer cannot always be explained by DOR/TAX.
- Data Entry staff keys Oil and Gas Corporate Returns as Corporate Income Tax returns then users convert them back to Oil and Gas Corporate returns; if returns are misidentified then the funds show up in the wrong accounts receivable account.

b) ITMS

An ITMS provides a platform for easily adding and changing return rules and formats. If DOR/TAX determines new reporting requirements, or other conditions change which require new return formats, a modern ITMS allows the update of the return to capture and report on the additional information.

An ITMS provides the capability to:

- Easily configure return error rules for each return type – not just tax type.
- Easily configure fields and schedules for capture after satisfying validation and calculation rules.
- Display fields in the system like they appear on the paper return.
- Generate work tasks and easily assign and track returns that need correction or review.
- Easily change or edit information on a return once entered in the system.
- Log changes to the return, display changed field values, and provide an audit trail of who made the change and when it was changed.
- Allow users to easily amended returns within the application and show all versions of the return.
- Redirect a return (and/or payment) incorrectly applied to the taxpayer, account, or filing period without re-keying it.
- Receive the taxpayer's Federal return information with the state return through the standardized MeF program.
- Configure multiple file formats for taxpayers to provide return information in bulk - XML, import from MS Excel EDI, flat file, through FTP, web filing, or other electronic means.
- Easily track, identify, and action taxpayers with gap periods or non-filed returns.

c) Gap

The current tax systems present multiple procedures that perform, essentially, the same task. An ITMS can, at minimum, simplify and standardize the returns examination process resulting in fewer training hours, better taxpayer service, and faster turnaround time. An ITMS can gather processing statistics to analyze and tune return rules. DOR/TAX can then stop returns that need review and set tolerances to process automatically those that do not. Modern systems allow you to easily adapt to changing forms then capture and report on data from all schedules of a tax return. MeF capabilities allow DOR/TAX to obtain a taxpayer's federal return and the state return through a standard interface thereby requiring the taxpayer to file only once for both requirements. Amended returns could simply overlay the original and the system can calculate and adjust amounts to repost instead of having the examiner re-key the entire return for amended posting.

Legislative changes cannot be made to the Motor Fuels or Corporate Income Tax system without breaking the system, so new requirements are pushed into side-systems for implementation.

In addition to standardizing the returns workflow, an ITMS can present multiple tools to more efficiently manage that workflow. Reporting tools indicate how many returns are currently waiting for review and how many returns stop for each of the different, configurable, return suspension reasons. Reporting tools can also provide statistics on user efficiency including the number of returns worked and the dollar amount of adjustments made. These reports can range from a simple list in the system to automated emails of formal reports when a work list hits above a certain threshold.

4. Taxpayer Accounting

a) Current Tax System

In the current systems, all taxpayer accounting functions are performed manually and are primarily handled by the Accounting and Collections Unit. DOR/TAX performs many of the unit's calculations outside of the system using numerous Excel spreadsheets. DOR/TAX creates assessment letters manually using either a MS Word or MS Excel template. Sybase InfoMaker queries provide the basis for the distribution of shared taxes to municipalities and other stakeholders when the Accounting and Collections Manager manually embeds the results in Excel templates.

The main tasks performed by DOR/TAX include:

- Preparing and sending out bills to the taxpayer
- Sending copies of bills to imaging to attach to the taxpayer's account
- Performing adjustments and abatements
- Performing offsets of credits between tax periods and tax accounts
- Calculating penalties and interest including all refund interest
- Preparing and verifying distributions of shared taxes
- Working with IT to correct taxpayer records directly in the database when the current user interface prevents updates

b) ITMS

An ITMS can automate many of the manual processes currently done by the Accounting and Collections Unit.

An ITMS provides the capability to:

- Automatically generate assessment letters based upon a schedule and data contained in the system paying special attention to flags and other account attributes.
- Automatically calculate and apply consistently and fairly all penalties and interest based on configurable rules determined by DOR/TAX.
- Forecast penalty and interest amounts if DOR/TAX applied a hypothetical payment to an existing debt at a future date. Forecast payment plans and pay agreements.

- Provide a central location for all taxpayer information including taxpayer correspondence, assessment or credit changes, and notes clarifying the reasons for certain actions.
- Store "up-to-the-minute" information on all transactions and track revenue from a taxpayer's account to aggregate funds and funds to subsidiary general ledger accounts.
- Report balances of accounts receivables, payables, funds, and ledger accounts.
- Distribute revenue quickly, accurately, and automatically based upon configuration rules verified by examining pre-distribution information in reports, OLAP cubes, and queries.
- Generate a file processed by AKSAS to update automatically the general ledger for shared taxes fund accounting and subsidiary general ledger accounts adjustments.
- Create revenue models for forecasting, analysis, and economic research.
- Configure tax rates for each tax type, special rate periods for special circumstances, and court-ordered bankruptcy tax rates all through the on-line interface.
- Automatically offset debt on other accounts and periods based on rules determined by DOR/TAX – offsets can occur before billing or refunds to prevent sending out funds and then requesting the funds back from taxpayers.
- Offset refunds between taxes or intercept refunds (or PFD funds) automatically to pay liabilities.
- Adjust transactions with all transactions linked to the source transaction. Examples of adjustments include waivers, write-offs, protests, and petitions for relief.
- Reverse transactions that completely reverse a particular transaction from an account. The reversal transaction is associated with the original transaction to record the action. System can maintain history and provide who and when information for all transactions.
- Maintain filing periods and associate period attributes to taxpayers' accounts. Attributes provide the source for business rule configuration in returns or selection data for reports.
- Validate write-offs and write-off debts in bulk to retire uncollectable debts.
- Track offsetting credits and debits, adjust small balances, split transactions, and process external transactions.
- Participate in the IRS Corporate Taxpayer Offset Program that allows state agencies to intercept federal income tax refunds and apply them to delinquent state tax debt.

c) Gap

Alaska citizens from 5 municipalities, 13 boroughs, and 106 cities benefit from an accurate and correct distribution of the shared taxes managed DOR/TAX. Manual actions are responsible for ensuring DOR/TAX distributed shared taxes of over **$44 million,** to 124 communities throughout Alaska in 2009 (*Shared Taxes and Fees*, 2009). The current systems available to DOR/TAX offer only 48% of the capabilities available in a modern ITMS; only 3% of these take advantage of automation. Reducing tedious manual processes should allow for greater oversight and validation to ensure DOR/TAX distributes these critical funds accurately and efficiently.

In the current systems, DOR/TAX only sends bills when they first establish delinquency (excluding various collections notices discussed in the *Collections* section). Evidence from other jurisdictions indicates that the process of sending out a monthly bill increases revenue collection simply by keeping the debt fresh in the mind of the taxpayer - most taxpayers pay their bills when they receive reminders to pay, and when it is made easy for them. As an example, shortly after implementing their ITMS, the state of Montana saw a 39% increase in collections attributed, in part, to automatically sending account statements every month.

A full-featured ITMS provides a rich suite of functionality to maintain and report on taxpayer financial activity individually or en masse. By employing an ITMS, DOR/TAX could provide a better picture of the state of revenue with less manual effort and more precision.

5. Payments

a) Current Tax System

DOR/TAX accepts payments received through the mail, from walk-ins, from wire transfers, and from web applications. DOR/TAX follows different procedures for handling payments depending on whether they accept the payment in Juneau or Anchorage. There are four different internal applications, one external bank application, and many Excel spreadsheets used to track and process payment information.

The main payment tasks performed by DOR/TAX include:

- Manually keying payment information into CPS
- Reviewing the payment information in CPS - validated by three different people, by manually handling multiple documents
- Researching and applying payment information in TAS - often having to rely solely on the Accounting and Collections Unit for payment information
- Allocating single payments across multiple tax periods
- Depositing domestic checks to the bank through software provided by the bank
- Researching and analyzing accounts to figure out the amount of debt that should be credited

b) ITMS

An ITMS would streamline and simplify payment processing and maintenance. It would accept payments from all sources then use one system to process them. All payment information in the system would be accessible to all users with the proper security permissions. Information about payments entered into the system is available for reporting through numerous methods.

An ITMS provides the capability to:

- Secure payments manipulation to only users who should be able to make changes to the payments, but allow all users to view the payment information.

- Provide pending payments functionality to hold a payment until receipt of a return or posting of an audit, then automatically apply the payment upon receipt.
- Allow multiple payment types for more accurate payment application and better reporting
- Receive payment batches from multiple external sources for uploading payment information including electronic funds transfer, e-check, remittance processing, and credit card payments.
- Apply and direct payments to taxpayer accounts automatically. Allow payments to be split to different periods or accounts, either manually or automatically, according to configurable pay-off rules.
- Create payment batches on-line to process in the same manner as payment batches that are received from remittance processing machines. The same controls including batch validation are applied to batches processed using this function.
- Validate payment batches to ensure the batch has not yet processed, the batch is from a recognized data source, and the header information is consistent with the detail records
- Generate work tasks for batches and payments that cannot be processed automatically - queuing them for assignment, expedient tracking, correction, and resolution of issues
- Reverse a payment with a configurable reason to facilitate reporting and additional processing and then in the same transaction reverse all associated applicable transactions sourced from the payment
- Handle non-sufficient fund checks and notice of change files from banking institutions to debit taxpayer's accounts in order to recharge fees, add penalties, and reestablish tax liabilities as necessary
- Search for payment batches and individual payments using combinations of known information (e.g., check number, bank information, receipt date ranges, amount, or transaction number)
- Create processing documents to direct the payments not included in batches to multiple directions as necessary
- Track taxpayer banking information from checks received for payments
- Process ACH and IAT payments initiated by the taxpayer to debit the taxpayer's bank account
- Process change and correction files to update existing bank account information in the system or determine if specific ACH or IAT payments failed

c) Gap

Accepting payments is a critical part of any revenue agency. Currently all payments must be manually applied against a debt. An ITMS can automate this process. An ITMS can automate splitting a tax payment across multiple tax periods as well as multiple tax accounts. Payments can process differently depending on the payment source, e.g., a payment coming in without a return can hold waiting for a return, or a payment coming in with a bill can post immediately. DOR/TAX can report on different payment types separately or account for them differently. For example, DOR/TAX can designate a payment type to post to the Constitutional Budget Reserve Fund.

In the current systems, DOR/TAX only sends bills when they first establish delinquency (excluding various collections notices discussed in the *Collections* section). Evidence from other jurisdictions indicates that the process of sending out a monthly bill increases revenue collection simply by keeping the debt fresh in the mind of the taxpayer - most taxpayers pay their bills when they receive reminders to pay, and when it is made easy for them. As an example, shortly after implementing their ITMS, the state of Montana saw a 39% increase in collections attributed, in part, to automatically sending account statements every month.

A full-featured ITMS provides a rich suite of functionality to maintain and report on taxpayer financial activity individually or en masse. By employing an ITMS, DOR/TAX could provide a better picture of the state of revenue with less manual effort and more precision.

5. Payments

a) Current Tax System

DOR/TAX accepts payments received through the mail, from walk-ins, from wire transfers, and from web applications. DOR/TAX follows different procedures for handling payments depending on whether they accept the payment in Juneau or Anchorage. There are four different internal applications, one external bank application, and many Excel spreadsheets used to track and process payment information.

The main payment tasks performed by DOR/TAX include:

- Manually keying payment information into CPS
- Reviewing the payment information in CPS - validated by three different people, by manually handling multiple documents
- Researching and applying payment information in TAS - often having to rely solely on the Accounting and Collections Unit for payment information
- Allocating single payments across multiple tax periods
- Depositing domestic checks to the bank through software provided by the bank
- Researching and analyzing accounts to figure out the amount of debt that should be credited

b) ITMS

An ITMS would streamline and simplify payment processing and maintenance. It would accept payments from all sources then use one system to process them. All payment information in the system would be accessible to all users with the proper security permissions. Information about payments entered into the system is available for reporting through numerous methods.

An ITMS provides the capability to:

- Secure payments manipulation to only users who should be able to make changes to the payments, but allow all users to view the payment information.

- Provide pending payments functionality to hold a payment until receipt of a return or posting of an audit, then automatically apply the payment upon receipt.
- Allow multiple payment types for more accurate payment application and better reporting
- Receive payment batches from multiple external sources for uploading payment information including electronic funds transfer, e-check, remittance processing, and credit card payments.
- Apply and direct payments to taxpayer accounts automatically. Allow payments to be split to different periods or accounts, either manually or automatically, according to configurable pay-off rules.
- Create payment batches on-line to process in the same manner as payment batches that are received from remittance processing machines. The same controls including batch validation are applied to batches processed using this function.
- Validate payment batches to ensure the batch has not yet processed, the batch is from a recognized data source, and the header information is consistent with the detail records
- Generate work tasks for batches and payments that cannot be processed automatically - queuing them for assignment, expedient tracking, correction, and resolution of issues
- Reverse a payment with a configurable reason to facilitate reporting and additional processing and then in the same transaction reverse all associated applicable transactions sourced from the payment
- Handle non-sufficient fund checks and notice of change files from banking institutions to debit taxpayer's accounts in order to recharge fees, add penalties, and reestablish tax liabilities as necessary
- Search for payment batches and individual payments using combinations of known information (e.g., check number, bank information, receipt date ranges, amount, or transaction number)
- Create processing documents to direct the payments not included in batches to multiple directions as necessary
- Track taxpayer banking information from checks received for payments
- Process ACH and IAT payments initiated by the taxpayer to debit the taxpayer's bank account
- Process change and correction files to update existing bank account information in the system or determine if specific ACH or IAT payments failed

c) Gap

Accepting payments is a critical part of any revenue agency. Currently all payments must be manually applied against a debt. An ITMS can automate this process. An ITMS can automate splitting a tax payment across multiple tax periods as well as multiple tax accounts. Payments can process differently depending on the payment source, e.g., a payment coming in without a return can hold waiting for a return, or a payment coming in with a bill can post immediately. DOR/TAX can report on different payment types separately or account for them differently. For example, DOR/TAX can designate a payment type to post to the Constitutional Budget Reserve Fund.

DOR/TAX has provided many avenues for taxpayers to make payments. The current payment batch entry and validation principles should not be lost when implementing an ITMS but rather improved upon. Adding the functionality provided by an ITMS to the current processes would provide enhanced visibility, better reporting, and increased clarity for users working with taxpayer accounts.

6. Collections

a) Current Tax System

In the current systems, all collections processing is manual. A DOR/TAX technician identifies a potential collection case and forwards it to the collector either by email or on paper.

DOR/TAX performs the following tasks manually:

- Tracks all collections in MS Excel
- Creates and stores all correspondence on paper
- Tracks all collection staging dates in MS Excel
- Files and tracks all liens and levies in separate MS Excel spreadsheets from the collection case
- Creates and tracks all payment plan agreements on paper and in MS Excel
- Retrieves bankruptcy information from multiple sources even if not connected to a collection case

b) ITMS

An ITMS provides the capability to:

- Provide automatic collection creation and staging.
- Provide automatic detection of payments.
- Provide automatic issuance of correspondence.
- Provide system tracking of collection stage and status and predict next steps.
- Provide levy and lien filing and tracking tools to create, search for, view, add periods, set line stages, add lien letters, view lien histories, and perform lien extensions.
- Share lien information with outside agencies and release liens in en masse.
- Provide bankruptcy tools, including automatic notice of taxpayer bankruptcy, electronic claims creation, and special handling of bankruptcy accounts. Use Electronic Bankruptcy Notification (EBN) technology through a free service provided by the Bankruptcy Noticing Center which enables federal bankruptcy courts to send notices electronically instead of in paper form.
- Provide collections recovery tracking and reporting.
- Associate images, received correspondence, pictures, and evidence to collection cases.
- Provide workflow tracking, assignment, and reminders.
- Provide risk calculation to increase collections efficiency.
- Create correspondence within the system automatically or from user intervention.
- Provide communications and indication that an account is involved in collections.
- Track and report on collections activities and recoveries.

- Maintain payment agreements and enable forecasting of payoffs by installment amount, or frequency of payment, and then monitor the taxpayer activity to ensure the taxpayer honors the agreement according to configurable integration rules.
- Establish garnishments, add debt sources, correspond with garnishees, and add garnishment vouchers.

c) Gap

The current systems in place only provide 32% of the capabilities normally found in modern tax divisions and DOR/TAX must perform all of these functions manually. The manual actions ensure DOR/TAX collects approximately **$12.7 million** in unpaid revenues each year.

The capabilities of an ITMS can reduce the reliance on many manual collections processes allowing collectors to focus on cases that are more difficult. Automating collections processes will increase efficiency which will in turn bring in more potential revenue to the state in a timelier manner. A modern ITMS should provide the ability to use accurate data to increase fairness in automated collections actions. The system should provide the ability to track the amount of money collected using each specific collections action, thereby allowing DOR/TAX to determine which actions to concentrate on for maximizing revenue collection.

Because the process is currently manual, it is not impossible to tell how much revenue goes uncollected or quantify current opportunities in this area. Experience in other jurisdictions does, however, provide proof that compliance increases when agencies establish regular and consistent billing and follow up with the taxpayer regularly soon after establishing the debt.

DOR/TAX may not need all of the tools described above immediately to follow up on existing collection cases. However in interviews with users, they frequently mentioned how upstream manual processes in other areas prevent the posting of returns and payments. When those areas become more efficient because of an ITMS, there may be more of a need to increase compliance efforts and for collectors to have the tools available to handle the increased workload.

7. Audit

a) Current Tax System

Note: When considering auditing, we make a distinction between auditing a return as it processes through the system and auditing a taxpayer's filing history after the returns post. The returns processes and procedures considered above cover the return reviews and individual return or desk audits. This section considers the field audit, normally performed at the taxpayer's location, conducted after receiving more information than provided on the returns.

Audit selection: In the current systems, there are several ways to determine which accounts to audit. Some units select audits based on a specific credit, some work off an audit plan, and others leave audit

selection to an auditor's discretion. One constant across all tax types is that the auditing process is manual.

The main audit tasks performed by DOR/TAX include:

- Identifying which taxpayers to audit
- Contacting taxpayers
- Creating correspondence using MS Word
- Determining audit findings using MS Excel
- Tracking statutes of limitation using MS Excel using a different spreadsheet
- Tracking outstanding audits and audit stages using an MS Excel tracking spreadsheet
- Preparing Audit Adjustment Reports and Tax Adjustment Reports using MS Word
- Keying audit data into the appropriate system to post audit

b) ITMS

An ITMS can automate many of the above processes as well as provide extra functionality to make the entire audit process more efficient and fair.

An ITMS provides the capability to:

- Manage audits in progress and report on audit recovery results.
- Manage audit details, track the statute of limitations, consider transactions in previous periods, view previous audit information for the taxpayer, and report on audit sources.
- Create and maintain work papers that contain detailed or summary information prepared in the system or imported from other sources.
- Import previous return history automatically into work papers reducing audit preparation time and manual re-keyinging of returns used in the audit.
- Create templates for work papers to allow the auditor to store the data, statistical information, and calculations that result in audit findings and adjustments. The work papers may be complex, taking into account external audit data, or a simple recording of findings from an external audit mechanism.
- Configure and track work papers to share between tax types or unique to each tax type.
- Configure multiple layers for review of work papers and/or the entire audit to allow for peer and manager concurrence and approval while providing status tracking.
- Use timekeeping tools to help auditors track and report their time spent on the audit or in audit-associated training, office processes, or other related time.
- Manage reporting tools for audit selection basing the decision on internal data, previous audit data, external data, warehouse data, or other sources.
- Automatically create audit adjustment reports based on information in the work papers.
- Allow auditors to work from anywhere using downloaded information, remote connection, or standalone capability.

- Automatically issue correspondence based on audit selection or information stored in the audit record.
- Associate images, received correspondence, pictures, and evidence to audit cases.
- Provide workflow tracking, assignment, and reminders.
- Prevent or allow certain actions on a taxpayer's record while the audit is in progress or after an audit posts to a taxpayer's account.
- Lock payments received during the audit so the system applies the credit only to audit liabilities as instructed by the taxpayer.
- Provide for due process and retention of taxpayers' rights while ensuring audit details are available for review and the processing of appeals.
- Allow other users to identify when an account is under audit, who is performing the audit, and what periods are involved in the audit - even if they do not have the security to view any other audit details.

c) Gap

DOR/TAX audit coverage is limited because, in some units, auditors are so busy ensuring the input data is correct they never get time to perform audits. As other parts of an ITMS receive automation enhancements, auditing may become routine and auditors may have more time to perform audits to ensure compliance and increase taxpayer knowledge. When this happens, the current tools will be insufficient to ensure the selection for audit is fair and equitable. An ITMS can provide the necessary tools to perform audit selection fairly and conduct audits more efficiently. Reporting tools can base their inputs on work performed and allow managers to measure and monitor results and distribute the workload fairly to auditors. Improved data accessibility provided by an ITMS should help determine which accounts will make better audit candidates.

With increased efficiency in other functional areas and by using automated selection tools, DOR/TAX should be able to perform better audits and include additional compliance audits in their audit plans. Compliance audits can bring in new, currently uncollected revenue. Timekeeping tools will help DOR/TAX track auditor actions, determine the most effective actions, and increase training or improve processes in areas that need attention. An ITMS will ultimately provide auditors with the capability to focus on auditing instead of spending their time "herding data" like they have to with their current systems.

8. Appeals

a) Current Tax System

The DOR/TAX Appeals Unit is currently responsible for processing between 50 and 100 appeals a year. Appeals information is stored and tracked externally using MS Excel spreadsheets until DOR/TAX reaches a decision. Users post all decisions manually to the system and make any adjustments manually.

The main tasks performed by DOR/TAX include:

- Receiving and processing requests for appeals
- Logging appeals into an MS Excel spreadsheet and tracking them
- Retrieving supporting documentation for appeal
- Maintaining correspondence and discussion with the taxpayer
- Interacting with other divisions to make sure inappropriate contact does not happen while the appeal is ongoing – for example, mailing collection letters to the taxpayer

b) ITMS

An ITMS has the ability to track and maintain appeal information during the appeal review rather than as an additional task in the appeal process. Tracking all appeal information in one system can consolidate appeal information, reducing the effort to collect appeal documents.

An ITMS provides the capability to:

- Secure appeal information to prevent unauthorized users from viewing and editing.
- Easily identify accounts involved in appeals to prevent inappropriate contact even for users without the security to view the appeal.
- Track appeals stages, statuses, decisions, and resolutions including who performed the tasks and when the tasks were completed.
- Link appeal cases to taxpayers based on the rules configured for a given appeal type. The case can stand independently and need not be associated with a particular taxpayer, account, or to the exact transaction under appeal.
- Define the business activity of processing an appeal including the configuration of steps, stages, decisions, and actions taken to perform the activity.
- Manage appeal documents, correspondence, and associated information.
- Stop certain automatic and manual processes during the processing of an appeal.
- Report aggregate or individual, historical, process, and procedural information resulting from appeals for business process improvement.
- Associate images, received correspondence, pictures, and evidence to appeal cases.
- Provide workflow tracking, assignment, and reminders.
- Report activities to higher appeal authorities with full disclosure of information from a central location within the system for cases that cannot receive resolution within DOR/TAX.

c) Gap

The biggest advantage an ITMS has over the existing system is the ability to identify which accounts or returns are currently in appeals. An appeal flag can prevent certain automated processes on an account. An example of this might be to stop collection activity for an account that is under appeal. An ITMS can also secure appeal information so that only those involved in the appeal can view and edit appeal information.

9. Refunds

a) Current Tax System

The refund issuance process involves many different people from the Accounting and Collections Unit as well as the appropriate tax type staff. DOR/TAX creates correspondence for refunds outside the system and spends time manually reviewing documentation and keying information into TAS, AKSAS, or an MS Excel spreadsheet. The only automated processes performed in AKSAS occur once DOR/TAX hands off the refund to the Treasury Division for issuance.

The main tasks performed by DOR/TAX include:

- Reviewing paper documentation for each refund request to verify that a refund or credit is available to issue.
- Using MS Excel spreadsheets to track refund details not tracked in the system such as refund status, issued date, and warrant number. DOR/TAX must update the spreadsheet multiple times throughout the refund process.
- Manually offsetting other debt owed prior to refund issuance.
- Manually calculating and applying any refund interest owed to the taxpayer.
- Manually entering information into AKSAS.
- Manually downloading information from AKSAS after a refund issuance to update the DOR Tax system.
- Mailing refunds to the taxpayer with supporting documentation if the refund amount is $50,000 or more(the Treasury Division mails refunds under $50,000 directly).

b) ITMS

An ITMS can ensure refunds are paid accurately and on time. It can automate many of the manual research processes currently performed and interface with external accounting systems, such as AKSAS, to provide quick and accurate turnaround to the taxpayer.

An ITMS provides the following capability to:

- Automatically create files to be processed by AKSAS rather than users re-keying information
- Automatically create of refund requests based on configurable rules designated by DOR/TAX
- Configure refund review rules with separate rule set for different tax types
- Configure multi-level approval for refunds

- Send a refund out as either a paper check or direct deposit
- Add refund-level notes for additional documentation on an individual refund
- Automatically post of refund interest based on applicable rules
- Automatically offset debts on different accounts for the same taxpayer
- Secure refund approvals to only allow certain users to approve refunds
- Deter fraud by detecting the number of refund checks to the same address/bank account, stopping refunds for suspected fraudulent taxpayers, and alerting users to suspect activity

c) Gap

The current process for issuing refunds is manual and very inefficient. It involves moving paper and emailing between the source unit and Accounting and Collections Unit, sometimes multiple times for the same refund. It also involves manually calculating refund interest, offsetting money to other accounts on the taxpayer, and entering information into AKSAS. An ITMS can automate most of the current process as well as eliminate the need to track refunds in an external spreadsheet. Approvals can happen between different units, but issue research can happen within the system and each party involved can receive an alert when a refund-related action is necessary. Configurable refund interest and offsets rules can apply allowing automatic posting upon refund approval. Refund information can pass back and forth between an ITMS and AKSAS automatically without human intervention. An ITMS provides a more efficient refunds process with less manual intervention, less manual calculations, and a quicker turnaround for the taxpayer.

One way to control fraud is through checks and balances integrated into an ITMS with change points only allowed through tracked and approved modifications.

Refund fraud is a big industry concern in tax departments at all levels of government. One way to control fraud is through checks and balances integrated into an ITMS with change points only allowed through tracked and approved modifications. The current system lacks these controls.

10. Security

a) Current Tax System

In the current tax systems, security is handled on two different levels. The first level of security consists of a user name and password to log into the system. The second level of security is a position-level security. Each user is assigned to a specific position in the system. Each position possesses different permissions to perform different actions. In addition to those, there are some exceptions where a

function is locked down to one or two users. In this case, permissions are usually hard-coded in the application.

b) ITMS

An ITMS will provide built-in security functionality for the application that is configurable, flexible, and easily changeable from within the application.

An ITMS provides the capability to:

- Secure different areas of the system using configuration.
- Secure individual links and buttons in each area using configuration - allowing separation of duties.
- View which taxpayers a user has visited and the actions performed on that taxpayer.
- Allow certain users to view information on certain taxpayers.
- Secure all information within the system.
- Add and edit users along with the roles assigned to them.
- Terminate a user's ability to access the system.
- Transfer one user's security settings to another.

c) Gap

An ITMS can provide more robust security and greater flexibility than the current systems. An ITMS puts all taxpayer data behind the same security wall to protect sensitive, confidential taxpayer data.

11. Reporting

a) Current Tax System

The current reporting capabilities are, for the most part, manual. There are some pre-defined reports that can be requested from the IT staff, but those rely on the information stored in one of the systems. Often, all the information needed for a report is not captured in the systems but must be gathered from paper documents and MS Excel spreadsheets then combined with the information from the automated systems.

The DOR/TAX Annual Report takes five to six months to compile.

Limitations of the reporting processes include:

- Most reports are created through a very resource-intensive, manual process in which data must be gathered from multiple sources
- The DOR/TAX Annual Report takes five to six months to compile
- For requests from outside agencies, including the Legislature, tax agents must be taken away from their daily responsibilities to compile data from multiple sources, a process which can take anywhere from a day to a couple weeks

- Some data is not available, and some numbers are unreliable, making some requests for data impossible to fulfill
- Limited data is captured off the return making it necessary, at times, to locate all paper returns from multiple boxes currently in storage

b) ITMS

An ITMS can provide automated reporting capabilities that do not demand users' time allowing them to perform their assigned duties. Since an ITMS can easily be changed to capture additional or new information, those details can easily be incorporated into new reports.

An ITMS provides the capability to:

- Locate and associate data within the system
- Present data in multiple formats, lists, and formal reports and manipulate the way data is viewed
- Configure reports within the system
- Automatically generate reports - daily, weekly, monthly, annually, etc.
- Automatically deliver reports by email
- Generate reports in real-time
- Store generated reports for a designated period of time
- Generate a PDF version of a report
- Store all data in the same system

c) Gap

While DOR/TAX has some reporting capabilities, there is a large gap between the current process and what an ITMS can provide.

An ITMS equipped with robust reporting capabilities can alleviate the current reporting pains. With all data for all tax types in the same place, canned queries and reports can be developed for reports that need to be run on a consistent database. OLAP cubes can be used to pull in a large set of data and allow the user to manipulate that data until they get the information they need. Plain English querying tools can allow a user to write simple queries without a programming background. These tools can provide accurate numbers quickly, without the extraordinary effort currently required.

Limited data is captured off the return making it necessary, at times, to locate all paper returns from multiple boxes currently in storage.

C. External Stakeholder Input

1. Current State

Stakeholders were asked several questions to formulate external perceptions of the current state with respect to DOR/TAX. Specifically, stakeholders were asked about DOR/TAX's reputation and services they currently receive. In the context of providing information about improvements to tax administration and additional services they would like to see DOR/TAX provide, insight into the current operating environment was also obtained. This feedback is particularly useful in determining how the limitations of existing systems and business processes affect external stakeholders.

a) Tax Division's Reputation

Stakeholders were asked,

> "Based on your interactions with the Tax Division, are there a few words that aptly describe their general reputation?"

By far, the most frequent response was, "responsive." It was noted that agency staff are "helpful, knowledgeable, and pay a high attention to detail." One observed, "The Tax Division has a great reputation for being helpful when taxpayers call," and another one said, "I rate them very high. They're accessible and provide good information. In one word, they're outstanding."

The professionalism of staff was specifically lauded. "They are professional and competent" and DOR/TAX is able to "hire good people and hold onto them." One stakeholder noted, "It's important that auditors understand good accounting principles, and Tax Division auditors do. That's not true with other agencies."

Several stakeholders mentioned the high caliber of employees in the economic section, calling them "competent," "respected," and "professional," capable of producing a "high quality product," even though they "occasionally struggle with their forecasts" and "have limited capabilities due to the limitations of the Tax Division's systems."

Personal characteristics mentioned in the interviews included "honesty" and "integrity." Several taxpayers noted that DOR/TAX seems to have a "very personal relationship with the taxpayer" and the "quality of the relationship is different – better – than in other jurisdictions." "The Tax Division has an open line of communication and I don't want to see that change. Their customer service is good – employees are friendly and helpful."

Although the number of stakeholders interviewed was small, two very different opinions emerged about audit staff's knowledge of the industries they are auditing. One taxpayer was very complimentary, "The Tax Division's people are more knowledgeable about the industry than most tax agencies. This helps them understand the context with which they're interpreting and applying regulations. It's clear the Tax Division values training and provides training to their employees – they don't outsource the training process to the company being audited."

Another taxpayer had a very different perspective,

> "The Tax Division has lost a lot of expertise and they don't appear to be training their new people about the industry. Companies shouldn't have to provide industry training to auditors, although we've given them ample training sessions and tutorials. At some point, the Tax Division should be able to use this information to train their own people."

While DOR/TAX was lauded by some as being a "good listener," another noted, "they listen, but they don't seem to hear what you're saying. There are opportunities to interact, but sometimes you feel like you're talking to a brick wall." Similarly, one taxpayer felt as though DOR/TAX, "operates in a vacuum – they do things without involving us, without seeking our participation." Another taxpayer felt, "they need more of a business acumen, more of a business sense."

Two stakeholders described the DOR/TAX as "inflexible" and "rigid," but one added, "...maybe that's something you want in a tax agency." The other was less forgiving, "I have found their views to be rigid, and they don't try to understand your business. They don't have the empathy you might expect."

Numerous stakeholders noted DOR/TAX is "under resourced with technology" an observation confirmed in conversations with a DOR/TAX employee who revealed, "word is out – taxpayers know our systems are broken."

Another stakeholder who was quite positive in their overall assessment of DOR/TAX noted, "On the negative side, if they don't like something, they'll write a regulation to get their way." Yet another observed, "The Tax Division has good intentions, but they aren't able to provide timely information for us regarding regulations and new legislation."

One interviewee's comments focused on taxpayer service,

> "As a small business, knowing what we need for registration, forms, permits, etc. is hard, especially when you're going through it for the first time. When I tried to find out what I needed, my interaction was cold. They should strive to be more business-friendly, more customer friendly."

b) Current operating environment

Numerous stakeholders noted DOR/TAX is "under resourced with technology" an observation confirmed in conversations with a DOR/TAX employee who revealed, "word is out – taxpayers know our systems are broken." One stakeholder commented, "You can't call yourself professional if you don't have a system that supports the efficient collection of data."

> ***"We file reports – but it's not clear what they do with the information because when an auditor shows up, they ask for the same information again."***

By far, the most common and consistent message was directed to the limitations and inflexibility of existing systems that impose a burden on taxpayer reporting and severely limit information available to legislators, executive agencies, and local governments.

Taxpayers were vocal in expressing their concerns and complaints about the need for duplicative reporting and the way in which information is collected,

> "Sometimes the same information needs to be reported three different ways for different systems and different sections. There is a high level of redundancy of reporting."
>
> "Taxpayers are asked to repeatedly provide the same information. If it was possible for systems to share data internally, they could avoid duplicative reporting by taxpayers."
>
> "The Tax Division doesn't understand the needs of large taxpayers – they aren't able to collect information in an efficient and effective manner. They ask for everything in an MS Excel spreadsheet but, as a large taxpayer, that simply doesn't work. Their latest request is for a spreadsheet with 95 tabs. The Tax Division uses FoxPro, but FoxPro is outdated and needs to be replaced."
>
> "The Tax Division keeps asking for the same data in different ways and in different formats – auditors need it one way, economists need it another, etc. They should be able to put the data into one system and extract it for whoever needs it and for whatever purpose they need it. There has got to be a better way – and spreadsheets are not the answer. For a taxpayer to have to hire someone to input data into a spreadsheet is backwards and very inefficient. It creates a lot of unnecessary work and cost."
>
> "The current process is inefficient and ineffective. It requires taxpayers to provide the same information multiple times. It is clear Tax Division's existing systems cannot organize and

> retrieve information very well. When the agency needs information, they ask for it from the taxpayer rather than retrieving it from their systems. That seems very inefficient."
>
> "We file reports – but it's not clear what they do with the information because when an auditor shows up, they ask for the same information again. Apparently, it's easier for them to get the information from us than to retrieve it from their systems."

While taxpayers find it difficult to report data, consumers of information including the legislature, executive branch agencies, and local governments commented on limitations on the information available to them. One stakeholder noted,

> "With the new Oil and Gas Tax, it's been a real struggle to get information from the Tax Division in any detail, especially for credits. We'd like to know answers to questions like how many taxpayers have applied, what is the revenue effect of each, and so on."

The value of this type of information was reiterated by another stakeholder,

> "We're interested in getting more information about tax credits. There are a lot of them, and it would be nice to have more info – What are they? Who's using them? How much do they cost? Are they working?"

Inflexibility in the way data is gathered and stored limits the ability to report information in ways stakeholders find would be useful. One stakeholder shared a specific example,

> "We requested the agency to present revenue production by oil field. The response we received was that information is structured by company and not by geographical area."

For purposes of accurate budgeting, one stakeholder emphasized the importance of the information provided by DOR/TAX,

> "We want access to all the information we need to estimate revenues. We need a further break down of the information. They mean well and they're getting closer, but they're not there yet."

Another stakeholder agreed,

> "We would like to see information presented on more of a cash flow basis – currently we see revenue net of credits. We'd like to see the total value with amounts that break out the royalty values, the production base, and so on. That would give us a lot more information, both for forecasting and for policy purposes."

Another topic that surfaced in stakeholder interviews was the timeliness of regulations and tax forms,

> "The biggest issue is timeliness of regulations. It's difficult to operate without regulations, instructions, and definitions – you're not sure how to report and you can't understand nuances."

The lack of a stable Oil and Gas Tax return was also cited as a problem, "It is simply not clear what we're supposed to file."

While taxpayers were vocal in expressing the need for tax forms and more guidance, at least one stakeholder noted,

> "The Legislature gave the Tax Division a huge job with the new Oil and Gas Tax, and the tax is incredibly complicated. Industry wants them to be done with their regulations already and companies want different interpretations. This is something the legislature is watching closely and they know it's a hard job. I'd say to the Tax Division, *don't lose focus*."

One stakeholder also mentioned concerns with the audit process noting,

> "Some audits take a long, long time. Difficulties getting interpretations make the process even more drawn out and complicated."

2. Future State

One of the most significant aspects of planning for the future is taking into consideration the needs of external stakeholders.

To obtain stakeholder input, two questions were posed to interviewees:

- In your opinion, is there anything DOR/TAX should be doing to improve tax administration? Are there areas that should receive additional attention and focus?
- Are there additional services you would like to see DOR/TAX provide?

Responses to these questions are organized and summarized based on the topics that were raised in interviews including: system improvements, reporting, and information sharing; electronic filing; taxpayer services; and other issues.

a) System Improvements, Reporting, and Information Sharing

Both taxpayers who are required to report data to DOR/TAX and stakeholders who rely on information from the agency cited the value of having a more modern and robust way to store and retrieve information. Taxpayers mentioned their desire to see an increase in the efficiency of their interactions with the agency,

> "The Tax Division should be able to retrieve information from one system rather than require taxpayers to provide the same data many times."

> "They need an automated system so they don't have to ask for the same information multiple times. Taxpayers should be able to provide data once, and the agency should be able to slice and dice it anyway they need to."

> "They should be able to put the data into one system and extract it for whoever needs it and for whatever purpose they need it."

> "The Tax Division needs a system that can organize and retrieve information while protecting and safeguarding confidential taxpayer information."

Taxpayers also mentioned the importance of consistency and predictability in their interactions with the agency, "We want a stable platform, not something that keeps changing all the time."

One important characteristic repeatedly mentioned by those who rely on information and reports from the agency is the need for flexibility,

> "A nimble system would allow the Tax Division to be more responsive and not spend as much effort as they currently do producing information and reports."

> "Flexibility is king. Quickly adapting to change is important for new revenue streams."

> "Make changes easy to implement. If changes cannot be made quickly someone will make a 'side-system' to go around the automation. Necessity is the mother of invention. If the people maintaining the system cannot be responsive then someone will build a side-system."

> "Alaska updates its technology very infrequently. The Tax Division will need to be able to adapt to the future – the possibility of new tax types or changes to current taxes. The legislature will make revisions to the Corporate Income Tax, mining taxes, and so on in the future. Flexibility is important along with the ability to work with new data. The more tools they have for analysis of data the better."

"The Tax Division needs a system that can organize and retrieve information while protecting and safeguarding confidential taxpayer information."

New ways of presenting information was also described as an important enhancement,

> "As a big user of data, it would be nice to see the Tax Division move to more of an internet basis for reporting information rather than all paper and publications. I'd like to see more innovation in how information is displayed and communicated, along with the ability to slice and dice data so you can see details and trends."

> "A lot of what we see is very static. You can't drill down into the data. The agency could do a better job of presenting data."

Some of the agencies that receive information from DOR/TAX including local government expressed a desire for more comprehensive data sharing agreements so they could access better and more complete information. It was also mentioned that it would be nice if the economic resources of the DOR/TAX

could be made more accessible to other agencies in government to increase the sophistication of analysis that is currently not possible.

b) Electronic Filing

Improvements in electronic filing were cited frequently as a means to improve tax administration,

> "We work with many different jurisdictions and, in comparison, the Tax Division needs a better platform to ease electronic reporting. They don't seem to benchmark with other jurisdictions to see how well they're doing or how they can improve."

> "Our number one priority is EDI (*electronic data interchange*). Reporting on spreadsheets multiple times is frustrating and extremely inefficient."

> "I'd like to see a state-of-the-art online tax filing system that can minimize the time and effort it takes for taxpayers to file."

While large taxpayers spoke of the need for EDI, the desires of smaller taxpayers were different. The need for simplified filing in general was stressed, of which electronic filing was an important part. Options currently exist and it was noted, "Their progress towards on-line filing is good" and "They're more innovative than other departments when it comes to on-line filing and renewing permits." One stakeholder stated,

> "On-line filing for small taxpayers is a nice service. However, it should not be mandatory since not all small taxpayers have computers. Once it becomes mandatory, it stops being a service."

The requirement to file the same information with different agencies was also noted.

> "Much of the information filed is identical, but you have to complete two different forms for two different agencies. Isn't there a way to complete one form that satisfies both agencies?"

> "Because different agencies have different systems, you have to log on multiple times. It would be nice if all of your interactions with multiple agencies could be handled electronically in a single transaction. That seems to be the direction things are going."

c) Taxpayer Service

A number of improvements in taxpayer services were mentioned, starting with a diligent push to make it as easy as possible to conduct business with DOR/TAX.

> "They should work hard to make it easier to do business. Simplicity should be their focus. People don't like paying taxes, and you should make it as simple as possible."

When asked about new services, one stakeholder responded,

> "I'm not as interested in new services as just trying to provide the right level of services. The Tax Division has regulations, but not at the level that would be useful."

Another stakeholder made the same point,

> "We would welcome timely, precise, and clear regulations together with the opportunity to provide feedback on proposed regulations and forms. The tax system should be self-administering – but it can't be without timely, precise, and clear information for taxpayers."

According to one interviewee, "Their goal should be that taxpayers have all the information they need."

Access to regulations was also brought up as an important issue,

> "It should be easier to access regulations – they need to be easily accessible, not just in a thick binder. Active taxpayer education is important."

> "Efficiency of customer service is something to work on. Excellent customer service is more than being nice. It means having all the information a taxpayer needs in one place so they don't have to call back five times to get what they need."

Several other ideas to improve tax administration were mentioned in various interviews,

> "It's important that people receive a notice and a reminder of what they should pay. People have so many different obligations, and notifications and reminders are very helpful."

> "As a taxpayer, it would be nice to be able to get a preliminary view/ruling regarding your filings. They offer that on an advisory basis, but it would be helpful to have something you can rely on."

> "My company is a big believer in statistical sampling. The Tax Division seems a little resistant. The agency should be using modern, valid techniques for sampling that, in turn, impose less of a burden on taxpayers."

> "There should be an easier way for innovative ideas (especially by small companies) to flourish without getting stifled by regulations. There is a need for more flexibility when it comes to the licensing of new products and process types."

d) Other Issues

As interviewees talked about actions DOR/TAX could take to carry out its mission and vision, several discussion points surfaced,

> "Maybe the agency is already doing this, but they should be working on and thinking about tax reform ideas for the future. Our revenues are trending down, so hopefully they're thinking about sources and options other than oil and gas."

> "As tax administration issues bubble up, the Tax Division should be making the legislature aware of them. Their mission statement includes *informing stakeholders*. When issues come to the attention of the legislature, it means they didn't get satisfaction from the Tax Division and it would be helpful if they could be more proactive in letting us know about those issues."

> "One big concern is if there are enough resources for audit, especially with the new tax regime. It's important to make sure they have money for the auditors they need to make sure the state is not being cheated."

e) Valuable Service to Maintain

Another question asked of stakeholders was,

> "Are there valuable services the Tax Division provides that you want to make sure they continue providing in the future."

Sometimes as organizations shift their attention to new challenges, they may overlook the importance of current activities that are valued by their stakeholders. This question was meant to help identify those types of valued services.

Responses to this question included the following,

> "The Tax Division cannot be derailed from its primary mission which is compliance and the collection of tax dollars."
>
> "The Revenue Sources publication" and "Input for the 10-year forecast."
>
> "Accurate reporting including motor fuel data reporting."
>
> "They have open lines of communication, and they shouldn't give that up. Customer service is pretty good – they're responsive, friendly, and helpful, and that should not change."
>
> "The agency has a great web site and it's easy to find information. They need to keep that up."
>
> "Their ability to provide good customer service to applicants and taxpayers is good; they answer phones quickly."
>
> "We wouldn't want the Tax Division to change the quality of their relationship with us – they have a very personal relationship that is different than most agencies in other jurisdiction."
>
> "The most valuable service they provide today is communication and accessibility. The ability to call and talk to someone is great."
>
> "I'd like to see them continue holding workshops and meetings prior to adopting regulations. These allow dialog and opportunity to express opinions and concerns. This should be a standard of practice for any set of regulations they consider."
>
> "Providing rulings to taxpayers is an important service. The Tax Division does this today and, by law, they are advisory, not binding. While we would prefer binding rulings, we would not like to see agency give up this practice."
>
> "They do a fabulous job with charitable gaming. There are some complaints, but they have a solid set-up and I'd hate to see that change."

3. Key Findings

One of DOR/TAX's key assets is their personnel; they have a reputation for being responsive, professional, and competent.

However, stakeholders know that DOR/TAX is "under-resourced with technology." Systems' limitations and inflexibility impose a burden on taxpayer reporting and severely limit information available to legislators, executive agencies, and local governments.

Taxpayers were vocal in expressing their concerns and complaints about the need for duplicative reporting and the way in which information is collected. Current reporting processes are inefficient and ineffective and create unnecessary work and cost for taxpayers.

Both taxpayers who are required to report data to DOR/TAX and stakeholders who rely on information from the agency cited the value of DOR/TAX having a more modern and robust way to store and retrieve information. Inflexibility in the way data is gathered and stored limits the ability to report information in ways stakeholders find is essential. Desirable system characteristics included flexibility and the capability to access and present information differently.

Improvements in electronic filing were cited frequently as a means to improve tax administration. For some large taxpayers, the number one priority was identified as EDI (*electronic data interchange*). For smaller taxpayers, the need for simplified filing in general was stressed, of which electronic filing is an important part.

Taxpayers expressed a strong desire for the right level of taxpayer services, making it as simple as possible to report and pay taxes. The importance of timely, precise, and clear information for taxpayers was emphasized along with taxpayer education and convenient access to regulations.

Systems' limitations and inflexibility impose a burden on taxpayer reporting and severely limit information available to legislators, executive agencies, and local governments.

V. Integrated Tax Management System Project

A. Project Vision Statement

DOR/TAX project envisions an ITMS with the following attributes:

> **"Comprehensive**: incorporates all information and revenue management functions of the Tax Division;
>
> **Robust**: requires minimal changes to program code as new tax types are implemented and existing tax types are changed; and
>
> **Integrated**: includes information about all taxpayers that is accessible by all tax units and, through security controls, with other departments.
>
> The desired solution will help the Tax Division enhance revenue collections via standardized user interfaces and processes, increased data accuracy and integrity, user-friendly reporting tools, automated prompts for staff to take action, and a case management system to streamline investigations" (State of Alaska Department of Revenue Tax Division [ADOR/TAX], 2009, pp. 2-3).

A new system will allow DOR/TAX to "spend *less* time on:

- Manual processes that are often duplicative
- Maintaining spreadsheets
- Maintaining files
- Tracking taxpayers
- Tracking deadlines
- Reconciling data currently in various separate databases
- Researching whether taxpayers filed and paid in a timely manner
- Generating routine correspondence and communication with taxpayers from scratch
- Working to develop management systems lacking in the current environment
- Writing and executing specialized queries for extracting data" (ADOR/TAX, 2009, p. 3)

A new system will enable DOR/TAX to "spend *more* time on:

- Core, mission-critical functions
- Audits
- Investigations
- Research and analysis
- Appeals
- Pursuing non-filers
- Collecting monies owed to the state
- Developing and enhancing core skills in staff

- Applying better information to improve taxpayer service
- Improving revenue forecasting models
- Managing workloads efficiently
- Developing procedures and desk manuals for business continuity" (ADOR/TAX, 2009, p. 3)

B. Goals and Objectives

ADOR/TAX (2009) states "the goals and objectives for an ITMS project might include the following:

- Provide comprehensive tax revenue and information functionality to improve the efficiency and effectiveness of overall tax administration processes.
- Meet time and budget constraints.
- Eliminate the need for paper-based processes through automated entry and workflow of documents such as tax returns and information report filings.
- Eliminate redundant data collection and storage systems throughout DOR/TAX.
- Reengineer existing processes to maximize human and system resources.
- Fully document all business processes and eliminate redundant processes.
- Increase staff efficiency and direct focus to their primary duties.
- Facilitate the accurate calculation of taxes by eliminating problems associated with error-prone data entry and inconsistent application of business rules due to manual processes.
- Provide staff with access to self-service information based on their roles.
- Provide taxpayers with the ability of ecommerce with a modernized and fully functional web portal.
- Provide appropriate security to meet the requirements of all Federal and State laws regarding confidentiality and security of personal information.
- Regardless of the implementation strategy chosen, ensure that the State owns and maintains its revenue management system with as minimal support as possible from outside vendors.
- Ensure that the system is expandable to meet the needs of future tax types using State IT resources to the maximum extent possible" (p. 4)

For a complete discussion of scope, please refer to *Scope Management* in section *VII.*

C. Critical Risk Factors

ITMS projects are complicated, high-risk projects. It is important to identify critical risk factors so that a strategic approach, effective procurement process, and a well thought out implementation plan are in place to maximize the opportunities for success.

The greatest overall risk to DOR/TAX in its efforts to achieve its vision is to not proceed with the procurement and implementation of an ITMS.

Risks fall generally fall into three categories: (1) technology, (2) business, and (3) delivery risks.

1. Technology Risks

Technology risks are technical or performance limitations that endanger the project's success. Technology risks with a high level of importance and impact include:

- Recreating the "legacy trap" – committing to a solution not capable of meeting future needs; this risk speaks to concerns about obsolescence, flexibility, and expandability
- Opting for "cutting edge" but unproven technology
- Imposing technical requirements that needlessly limit the range of viable solutions that may be considered; for example, imposing Alaska-specific requirements that preclude consideration of solutions that have been successful elsewhere
- Inadequate assessment of solution capabilities, architecture compatibility, and system functionality
- Inadequate planning for future maintenance and support

2. Business Risks

Business risks are those impediments that prevent the organization from realizing the business benefits of the new technology. Business risks with a high level of importance and impact include:

- Inadequate resources are made available for the project
- A reluctance to change Alaska-specific business processes to take advantage of modern integrated tax solutions
- An insufficient emphasis is placed on training, thus staff is not able to effectively utilize the new technology

3. Delivery Risks

Delivery risks are those that affect project implementation. Delivery risks with a high level of importance and impact include:

- Using an unproven or out-dated implementation methodology
- Lack of top management commitment and involvement
- Ineffective or weak project management without clear oversight and decision-making authority
- Not dedicating the right people to the project including a sufficient number of business and technical resources
- A wavering focus on scope, deadlines, and budget
- Inadequate internal and external communications
- Insufficient staff involvement and buy-in; in Alaska, this risk has a geographic dimension due to the separation of staff in Anchorage and Juneau

An effective mitigation strategy needs to focus on three key elements: choosing a sound implementation approach (See *Alternative Approaches*); using an effective procurement process that results in the selection of a strong solution and trusted business partner (See *Preparing for Procurement*); and carefully planning and managing the project to ensure successful delivery (See *Project Management Plan*).

It is important to identify critical risk factors so that a strategic approach, effective procurement process, and a well thought out implementation plan are in place to maximize the opportunities for success.

D. Alternative Approaches

The modernization of an agency's tax administration is a complex and risky undertaking. The strategy an agency chooses as it goes through the modernization process has a significant impact on its chances of success and the cost and schedule of the project, as well as an array of ancillary issues such as system functionality and performance, user training, maintenance, and future system enhancement.

Options available to states desiring to implement a modern, ITMS include custom, transfer, and commercial off-the-shelf (COTS) systems. These approaches are defined as follows:

- *Custom Built System:* Building an application system specifically for a single customer. Normally, a custom system is designed and built from the ground up for a specific agency by in-house resources, vendor resources, or some combination of the two.
- *Transfer System:* Obtaining a system used in another jurisdiction and fitting it to meet another customer's needs. A transfer system in this context is software in use at one revenue agency that is transferred, installed, and adapted to meet the needs of another revenue agency.
- *COTS System:* Obtaining a ready-made package designed to be configured to meet the needs of many customers. COTS in this context is a software product developed by a third-party who controls its ongoing support and evolution. It is bought, licensed, or acquired for the purposes of integration into a revenue agency. A COTS product might not allow modification at the source code level, but normally includes customization mechanisms to allow for easy extension and tailoring to meet each agency's requirements.

1. Industry Trends in the State Revenue Market

There has been considerable evolution in the state revenue market for tax systems in the past three decades. In the 1970s and 1980s, custom systems were the only option. Systems were built in-house or by vendors, and they often addressed a specific functional area such as registration, returns processing, collections, or audit. Many of the legacy systems states are seeking to replace today are siloed, custom systems with limited functionality built on aging platforms.

The concept of an ITMS built on a single platform capable of supporting multiple tax programs and functions had significant technical and business advantages and revenue agencies started moving in that direction. Systems were self-built or built by IT service providers such as IBM, Andersen Consulting, and Unisys.

In the late 1980s, the "transfer system" concept became an option for state tax agencies. Transfer systems offered advantages of reduced cost and risk because the core system already existed and was in production operation elsewhere. The existing code of a transfer system provided a head start on development. The additional development activities focused on changing existing code and adding new code to meet different business and functional needs of another jurisdiction. Once a transfer system was completed, it retained many characteristics of a custom system – a system built to meet the requirements and needs of a specific jurisdiction. Like a custom system, the jurisdiction owned the code and was responsible for modifying and changing it, possibly with vendor assistance, as changes in legislation or business requirements dictated.

Transfer systems were a popular option from the mid-80s through to the early 2000s. At least two vendors marketed and implemented transfer solutions – CGI/AMS (Advantage Revenue) and Accenture, (TAS).

COTS became an option for state revenue agencies after the turn of the 21st century. A Gartner Industry Research report, *COTS Is Becoming a Viable Option for Tax and Revenue Agencies' Application Modernization*, (Gartner, 2008) notes,

> "Historically, tax and revenue agencies preferred to custom-build mainframe-based systems, because the early stages of the maturity of applications and application development approaches made it difficult to cost-effectively build commercial off-the-shelf products with sufficient architectural flexibility to adjust to the variety of regulatory and business needs" (p. 2).

COTS solutions offer advantages such as lower risk, reduced cost, and quicker deployment of proven "out-of-the-box" functionality. Rather than building from the ground up or rewriting or replacing another agency's code, development focuses on tailoring extensions through configuration to meet a jurisdiction's unique business requirements. With many business rules (such as tax rates, penalty and interest rules) being configurable, changes can be made quickly without the need to rewrite code. Similarly, new tax types can be configured in the solution just as existing taxes are configured during the implementation project.

The ownership model of a COTS solution differs from custom and transfer alternatives since the product code is proprietary – the jurisdiction has a license to use it but does not own it. The responsibility for keeping up with changes in technology and core functionality is delegated or outsourced to the COTS vendor. This can be seen as an advantage since adapting to evolving technology is a significant

undertaking and the ability to regularly refresh technology is appealing. However, some agencies view lack of source code ownership as translating to lack of control.

A COTS solution also offers agencies an upgrade path as new software versions and technology become available. Although upgrading to new versions still requires some work, it is less resource-intensive than a technology model that required the periodic replacement of legacy systems.

The different ownership models for custom and transfer solutions in comparison to COTS mean different life-cycle cost structures. A COTS system typically has lower implementation costs than custom or transfer solutions, and jurisdictions need to plan for on-going software maintenance costs to keep current with service packs and new versions of the software. Upgrading to a new software version may or may not require the assistance of the vendor depending on the capabilities of the in-house IT unit and the significance of the changes from version to version. Implementation costs for a custom or transfer system are typically higher than a COTS solution, and jurisdictions need to plan for periodically rewriting, re-platforming, or replacing the legacy system.

Since 2000, COTS solutions have become the predominant option for an ITMS in state revenue agencies within the United States. In thirteen contract awards between 2000 and 2005, nine were for COTS solutions, three were for transfer solutions, and only one was a custom build. In fourteen awards between 2006 and 2010, twelve were for COTS solutions and two followed a custom approach. One of the two was a project to rewrite legacy system COBOL code to Java (Maine). The other was a custom-build project which produced the prototype for a COTS product offering (South Carolina). There have been no transfer system implementations in the past five years.

Since 2000, COTS solutions have become the predominant option for an ITMS in state revenue agencies within the United States.

Table 1 lists the approaches states have taken in implementing an ITMS during the past ten years.

The dramatic shift towards COTS solutions in the state revenue market may be based on experiences some agencies have had with other approaches.

- In the early 1990s, the New Mexico Tax and Revenue Department initiated a project to modernize its computer systems by designing and building its own custom system that would integrate its tax types into a single business application. Nine years and $49 million later, only one tax program was in production and a second under development. In early 2001, New Mexico decided to halt further development and acquire an off-the-shelf package through a competitive procurement process.
- Mississippi started a custom project in the late 1990's, but the tax system never was completed. Attempts to go live with the first of the 38 taxes in 1997 and 1998 failed and a third version of the

tax system provided in January 1999 had so many defects that testing could not be completed. Mississippi currently has a procurement process in progress and is seeking a COTS solution.

- Montana abandoned a custom system project after spending $39 million. In 2003, the Montana Legislature directed the agency to shut down the project due to data integrity and stabilization issues, and an overall lack of confidence in the system. The department was instructed to find a replacement system with a proven track record in another state. The resulting RFP specified a COTS solution.

Table 1: State Approaches to ITMS (2000-2010)

Custom	Transfer	COTS
Maine	Arizona	Alabama
New York	Connecticut	Arkansas
South Carolina	Nevada	Colorado
		Florida
		Georgia
		Idaho
		Illinois
		Kentucky
		Louisiana
		Maryland
		Michigan
		Minnesota
		Montana
		New Mexico
		North Carolina
		North Dakota
		Ohio
		Utah
		Vermont
		West Virginia
		Wisconsin

There are currently state revenue agency procurement processes in progress in Massachusetts, Pennsylvania, Mississippi, Oklahoma, and California (Franchise Tax Board). The Pennsylvania, Mississippi, and Oklahoma RFPs specifically request responses for COTS solutions. The Massachusetts and California RFPs do not specify or restrict the type of solution so long as responses meet the state's requirements.

Today, there are at least five companies with COTS solution offerings for the US market:

- SAP (Tax and Revenue Management)
- Revenue Solutions, Inc. (RSI Premier)
- Fast Enterprises (GenTax)
- Oracle (Enterprise Taxation Management or ETM)
- Tata Consultancy Services (Tax Mantra)

To our knowledge, there are no vendors actively marketing transfer system solutions for integrated tax in the US market today. In the past there were two vendors who marketed and implemented transfer solutions – CGI/AMS (Advantage Revenue) and Accenture (TAS). Neither of these companies have marketed or bid these solutions in the past five years. CGI is currently implementing Oracle's ETM product in several states and Accenture is implementing the SAP revenue solution in one state and has bid the SAP solution in several other states.

Custom systems remain an option for state revenue agencies. A custom solution can provide a high degree of flexibility which may be important for an agency that is very satisfied with its existing business processes and does not want to adapt them to a COTS solution. Custom systems, however, pose a higher degree of implementation risk and, historically, have been a more costly option.

There are undoubtedly a large number of IT service companies, some with revenue agency experience and many without, which may be interested in the opportunity to develop a custom tax solution. Companies active in the revenue market include Accenture, Capgemini, CGI, Deloitte, IBM, PricewaterhouseCoopers, and Unisys but their level of interest in building a custom solution and, more specifically, their interest in the Alaska market, are not known. Also, there is little information available about recent state revenue agency experiences with custom ITMS solutions, particularly for states considered comparable to Alaska. If there is an interest in pursuing a custom solution and learning more about the vendor community as well as custom system pricing, DOR/TAX should consider issuing a Request for Information (RFI) specifically inviting responses from vendors interested in proposing a custom solution.

2. DOR/TAX Experience

DOR/TAX has previous experiences with custom and transfer solutions, both which did not produce the desired results.

a) Custom Systems

Three of the agency's existing systems, TAS, CPS, and DEE Excise, are custom built systems. DOR/TAX indicates that they provide insufficient functionality, and are complicated, expensive, and time consuming to modify and maintain. Not all data needed to track and report on tax types is collected causing information provided to be incomplete. In planning for an ITMS, DOR/TAX intends to replace all three systems.

b) Transfer Systems

One system DOR/TAX uses for two tax types was a transfer system called Data Entry and Examination Motor Fuel/Corp. The current version neither meets the needs of the Tax Division nor can it be enhanced.

In evaluating the transfer approach, the *TRIMS* (ADOR/TAX, 2009) report noted:

> "This option was attempted back in 2000 with the purchase of the state of Wyoming's Mineral Tax System, a third-party product from Computing Alternative, Inc. This project, involving the adaptation of the product for Alaska's Corporate Income Tax and Motor Fuel Tax types, was unsuccessful due to cost overruns, system instability, data integrity issues, and the inability to generate meaningful reports. All of these problems have contributed to an existing system that requires significant business process work arounds and that operates at a 'snail's pace.' In some instances, it is actually faster to manually process a return than utilize the system. In addition, this system 'crashed' a few years ago making it impossible to supply required reports to the Federal Highway Administration (FHWA) regarding motor fuel used on Alaska's highways. Our failure to report almost resulted in FHWA withholding federal highway funds from Alaska's Department of Transportation" (pp. 14-15).

3. DOR/TAX Research

In 2007 and 2008, a series of three reports were prepared for DOR/TAX by the Alaska Information Technology Group (AITG). The studies identified requirements for an Oil and Gas Tax revenue system, conducted a high-level assessment of two approaches to developing a new system (custom and COTS), and reviewed two COTS solutions.

In the *Oil and Gas Tax System: Solutions Analysis,* AITG (2007) identified business, functional, and system requirements and, based on the preliminary requirements gathering phase of the project concluded,

> "the DOR needs to develop or acquire a comprehensive flexible, computerized system to track, calculate, and report tax data, starting with the data associated with the oil and gas production tax" (p. 2).

In the second study, *Oil and Gas Tax System Solutions Analysis*, AITG (2007) further investigated two potential solutions, a custom and a COTS solution. They concluded both the custom and the COTS solution can meet the requirements, and

> "...careful evaluation of all available options should be considered before moving forward with a solution" (AITG, 2007, p. 23).

The third AITG study, *Oil and Gas Tax System: COTS Solutions Analysis* (AITG, 2008), further analyzed two COTS solutions. As a part of the study, five states were surveyed that had implemented custom and COTS solutions for Oil and Gas Taxes. The three custom solutions all took longer to complete than had been scheduled (timeframes were underestimated by 33% to 50%) while the two COTS projects were completed on time. On a scale of 1 to 10 with 10 representing high satisfaction, the custom systems received ratings from New Mexico, North Dakota, and Wyoming of 7, 8, and 5 respectively. The COTS systems received rating from Louisiana and Montana of 10. Louisiana and Montana indicated they would "select the same system if they were to implement a new system today" (AITG, 2008, p. 10). Two of the three states who chose custom solutions (New Mexico and Wyoming) were not satisfied with the outcome. New Mexico said they "would not build the same system today" (AITG, 2008, p.10). Wyoming indicated the system was not properly developed, and work-around solutions became standard business practices. The system was described as "just works" (AITG, 2008, p. 10). The study recommended that Alaska budget $20 million for the cost of implementing a COTS solution for Oil and Gas Taxes (AITG, 2008, p. 10).

ADOR/TAX (2009) produced *TRIMS* which evaluates five alternative strategies:

- "Maintain and upgrade the existing system and method of operation
- Transfer an existing system from another state
- Transfer and modify an existing system from another state
- Custom build a new system
- Acquire and implement a COTS product" (p. 10)

DOR/TAX evaluated each option in terms of cost, ability to satisfy requirements, business process impact, time, and risk.

The *TRIMS* (ADOR/TAX, 2009) report concluded acquiring and implementing a COTS product is the best recommendation for the TRIMS project. COTS systems are developed by businesses that specialize in state and local tax revenue systems. In terms of time, the COTS solution is capable of a faster

implementation because the initial phases of production are not spent building core framework. Risk is minimized when using a COTS solution and is primarily contingent upon selecting a vendor who is successful in managing solutions and who can provide technology updates. ADOR/TAX (2009, p. 21) states,

> "COTS solutions typically have been tested in the user community at large and are considered a proven solution. At its core, the software will provide a stable and proven framework, which requires some configuration to meet the business requirements."
>
> "A custom solution, on the other hand, has not yet been proven and the framework must be developed from scratch. Typical risks include poor performance or unworkable code, where some features do not work as intended. These risks are compounded by the number and complexity of the business requirements, the programming languages and platforms utilized, and the systems that need to be integrated."
>
> "Agencies are sometimes wary of the COTS approach because they fear that future changes to the product will not be under their control, or that a vendor may eventually abandon support for the product or go out of business altogether. This risk can be significantly mitigated by selecting a vendor with a proven, long-term track record in designing, delivering, and supporting a revenue management solution, not as a sideline but as the primary strategic focus of their product offering; and who has demonstrated a commitment to maintain currency with evolving industry-standard technology platforms."
>
> "All states participating in the Tax Division's 2008 survey indicated satisfaction with the performance and scalability of their COTS tax management system implementations."

Furthermore, ADOR/TAX (2009, p. 19) concluded,

> "Considering all evaluation criteria together – cost, satisfaction of requirements, business process impact, time, and risk – the COTS implementation strategy represents the highest probability for a successful TRIMS project outcome."
>
> "After careful internal research and analysis, the Tax Division recommends that it is in the best interest of the State for the Division to acquire a commercial off-the-shelf (COTS) system that can be configured to meet the needs of the Division, the State, and the taxpayers and stakeholders we serve."

4. Next Steps

- If DOR/TAX is interested in a custom solution, it should consider issuing a Request for Information (RFI) specifically inviting responses from vendors interested in proposing a custom solution for DOR/TAX. The RFI should request a company profile, information about the technology to be used, a system description, pricing and schedule information, the company's experience implementing similar systems in jurisdictions comparable to Alaska, and any other information DOR/TAX believes would be useful in evaluating the costs and benefits of further pursuing a custom solution
- If DOR/TAX is interested in a COTS solution, they should issue an RFP specifying that responses must propose a COTS solution. In recent years, this approach was used in Arkansas, Mississippi, and Oklahoma.
- If DOR/TAX is interested in either a COTS or transfer solution, it should issue an RFP specifying that responses must propose a COTS or transfer solution. In recent years, this approach was used in Utah.

VI. Costs and Benefits

This section provides high-level information about the cost components of an ITMS and presents a range of costs for DOR/TAX as it estimates and budgets an appropriate level of resources for a new system. FAST reviewed and analyzed information DOR/TAX previously gathered from other state tax agencies about costs and benefits of an ITMS and supplemented it with additional survey information. Potential benefits and various funding approaches are presented in this section.

For an ITMS project, one of the critical risk factors is inadequate funding. If project costs are underestimated, the desired scope of the project may not be delivered, or the project may go over budget. It is important to set a realistic level of funding, recognizing that major components of the project will be subject to bid with multiple vendors providing pricing proposals for goods and services.

A. Cost Components

Cost components for a tax system project generally fall into five categories:

- Software
- Implementation services
- On-going maintenance and support
- Hardware
- Project operating expenses

Vendor-related cost components include software and implementation services. For budgeting purposes, these two cost components may be bundled together. Once the project is complete, there will also be on-going software maintenance and support costs.

In addition, a project incurs hardware costs and internal project operating costs such as those related to project space, equipment, and travel. If agency staff members (business and technical) are "loaned" to the project, they do not usually represent additional, marginal costs for which a budget is requested. However, this is an aspect of a project that needs to be carefully managed since a significant number of agency staff will be committed to the project – many on a full-time basis. If additional project-related staff are requested, those costs should be included in the project's operating budget request.

1. Software

The major element of software costs is the integrated tax software itself. There will also be third-party software licensing expenses for operating systems and database support.

Vendors use different pricing models for software licensing. Variations include enterprise licenses with no functional or program-based restrictions, and restricted licenses that limit permitted uses to only tax types or functionality that is specifically in-scope. Some vendors price licensing based on the number of users or "seats" while others are not limited with respect to the number of users, desktops, servers, or

office locations. As vendors respond to the RFP, it is important to understand the basis for their software license pricing, and to have them specify license restrictions and limitations.

2. Implementation Services

Vendor services are usually the single largest cost component for an ITMS implementation project. DOR/TAX is planning a project to replace all 22 taxes, implement more aggressive e-filing, implement a complete Data Warehouse, and integrate imaging. Required services will include services for system configuration, development, testing, conversion, and training. Consulting services to meet a variety of other needs may be requested or proposed including those related to business process redesign and project management. Project management includes the vendor's project manager and, at the discretion of the agency, may also include an independent project manager who works on behalf of the agency.

3. On-going Maintenance and Support

Software maintenance costs provide for modification of the software after delivery to cover bug fixes, improve performance, or add functionality. Sometimes software maintenance takes the form of a "warranty period" beyond the implementation project. Software maintenance may or may not include access to future version enhancements. In the initial project budget, it may be desirable to provide for some level of maintenance beyond the implementation project. For example, if the project is expected to be implemented over a three-year timeframe, including all costs for a five-year period may be prudent so that on-going software maintenance are visible and can be factored in to reflect both project-related and post-project costs. On-going support services may include vendor resources necessary to supplement agency resources after the implementation project is complete.

4. Hardware

Major hardware costs include servers running the ITMS application, related databases, storage area network (SAN) capacity, developer workstations, and client workstations. This hardware supports the production, development, and testing environments. Hardware needs are usually site-specific since they depend on whether an agency's existing hardware meets the new solution's specifications. In addition, there may be network, cabling needs, etc. that would be unique to each site.

5. Project Operating Expenses

Project operating expenses consist of general overhead expenses necessary to support a project including project space, equipment, travel, and other internal costs necessary to support activities, such as training and testing. These expenses are typically site-specific and reflect the marginal costs over and above an agency's normal operating expenses. They will vary depending, for example, on whether there is existing agency space to accommodate a project office. For DOR/TAX, travel costs should include project related travel that will be necessary between Juneau and Anchorage.

B. Pricing Strategy for DOR/TAX

In setting a budget for a major IT project, a jurisdiction wants to be sure it is able to obtain the functionality, performance, and delivery it seeks at a fair price. For an ITMS project, one of the critical risk factors is inadequate funding. Setting a budget too low may result in getting a system that does not meet the agency's needs. A jurisdiction also runs the risk of limiting the number of vendors that respond to an RFP and receiving attractively priced responses that carry high business and delivery risks.

Two primary ways used by jurisdictions to get information helpful in setting a budget:

- Information from the vendor community
- Information from other states in the process of implementing or have implemented an ITMS

DOR/TAX has used both of these means. For the past three or more years, the agency has participated in events such as the Federation of Tax Administrators Technology Conference and Exhibition, met and consulted with vendors to understand their product offerings and pricing, seen demonstrations of multiple solutions, and has had an independent consulting firm analyze different software solutions. They have received confidential cost estimates from three COTS vendors. DOR/TAX has also formally and informally surveyed other states to get information about project costs and schedule, as well as user satisfaction.

A budget for an ITMS for a five year period is estimated to be **$30 to $35 million**, and DOR/TAX is requesting a budget of **$35 million**.[2] This budget should be sufficient to attract a number of vendors offering a range of solutions to respond to an RFP. The strategy is prudent in that it allows the forces of competition to work in Alaska's favor by encouraging competition and by inviting competitive RFP responses to ensure the state is able to select the best system at a fair price.

C. Integrated Tax Management System Budget

Budget information for an ITMS project is presented by cost component for a five-year period. In developing these estimates, it is assumed that an RFP would solicit responses from vendors for software, services, and maintenance and support for a five year period. Since the implementation project itself may take less than five years, the vendor would be required to include maintenance and support in its pricing from the end of the implementation project through the fifth year. For example, if a vendor proposed a 2½ year implementation project, they would include 2½ years of maintenance and support in their response. If a vendor proposed a four year implementation project, they would include one year of maintenance and support in their response.

This provides flexibility to the vendor to propose costs and a schedule that they believe to be realistic and feasible, while providing to DOR/TAX assurances the project will be completed within five years and that all maintenance and support costs are included for a five year period.

[2] Due to proprietary vendor information, FAST estimated the budget based on information from other states.

Faster implementations will include longer periods of maintenance and support while longer implementation projects will include a shorter period of maintenance and support. DOR/TAX may wish to specify the maximum amount of time it will consider for the duration of the implementation project itself, e.g. four years.

Also, it is important to realize this approach will invite differences in how different vendors allocate pricing between implementation services and maintenance and support.

1. Vendor Software and Services

A budget for vendor software and services in the range of **$23 to $27 million** is within industry norm. This amount takes into consideration the number of tax types to be implemented (22), the functionality in scope including a data warehouse, taxpayer on-line services, imaging integration, and the services of an independent project manager. In substantiating this estimate, primary reliance is placed on recent cost information (2007 – 2009) obtained from other states that have procured and are in the process of implementing an ITMS. Secondary reliance is placed on cost information from small states (population less than 3 million) that implemented an ITMS in prior years (2003 – 2006).

It is important to note this estimate does not take into consideration confidential price information DOR/TAX has obtained from multiple COTS vendors. DOR/TAX should validate the estimate by comparing it to the information they have obtained.

This estimate may not be reflective of costs for a custom solution. If DOR/TAX would like more information about vendors and potential costs of a custom solution, they should consider issuing a Request for Information (RFI) specifically asking for information from the vendor community about offerings and pricing.

2. Maintenance and Support

A budget of **$2.0 to $2.5 million** per year for on-going maintenance and support after the project is completed is within the industry norm. For purposes of total project estimates shown, it is assumed the implementation project will be completed within three years, so two years of maintenance and support costs are included. Note that a faster implementation may require a higher amount for maintenance and support (more years), while a longer implementation may require a lesser amount (fewer years).

3. Hardware

DOR/TAX has estimated hardware related costs to be **$1.375 million** including costs for acquisition, installation, and testing.

FAST independently reviewed DOR/TAX's hardware estimates and based on experience in other jurisdictions determined this estimate to be reasonable. During the RFP process, DOR/TAX should request vendors to specify hardware requirements specific to the proposed solution so that hardware costs can be more precisely determined for each solution.

4. Project Operating Expenses

DOR/TAX has estimated internal operating costs to be **$1.0 million**, including funds for project office space, travel, and training. In addition, **$325,000** is associated with system integrated testing.

5. Total Project Budget

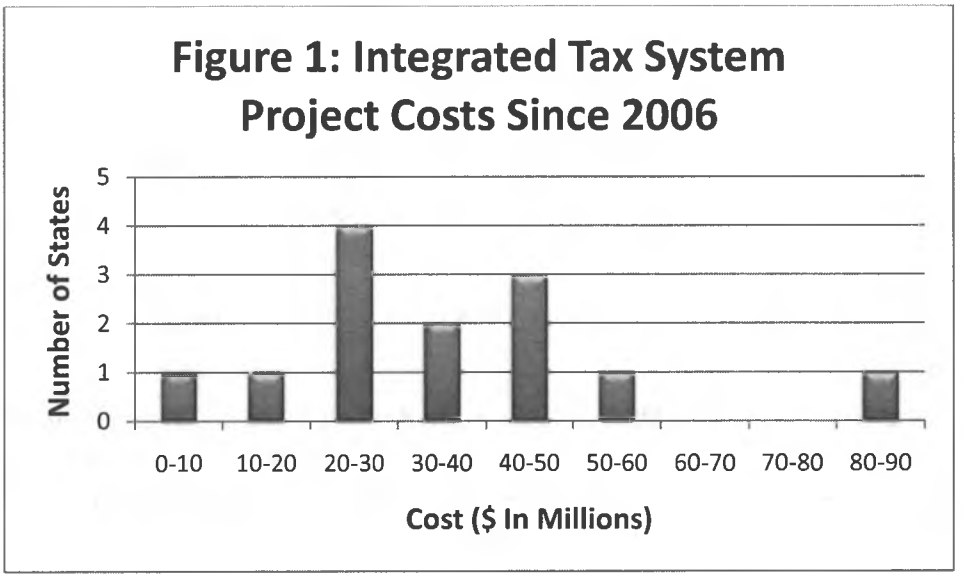

Table 2: Estimated Project Costs

Component	Amount – Low (millions)	Amount – High (millions)
Vendor Software and Services	$23.0	$27.0
Hardware	$1.375	$1.375
Project Operating Expenses	$1.325	$1.325
Maintenance and Support (2 years)	$4.0	$5.0
Total	$29.7	$34.7

D. Comparison Information from Other States

Since the year 2000, most state tax and revenue agencies (27 out of 50) have implemented or are in the process of implementing an ITMS. This provides a breadth of experience for DOR/TAX to draw from. The 27 states differ considerably in their population, total state revenues collected, tax structure, taxpayer base, and the complexity of individual tax types. There is also considerable variation in the scope of the tax system projects the states have undertaken.

Within the past five years, there have been 14 ITMS contract awards. Information obtained for 13 of the projects indicates system costs have ranged from **$8 million** to **$87 million**, with the six projects initiated since 2008 averaging **$43 million**. Figure 1 displays the range of costs for these 13 projects.

While this provides a "ballpark" indicator of total costs, individual state procurements are not perfectly comparable – the goods and services states choose to purchase often vary. Procurements typically involve software license and implementation services, while some may also include hardware, data warehouse and associated analytics, imaging, extended maintenance agreements, and/or extensive consulting services to address a variety of needs. Moreover, the scope of the implementations may range from a small number of taxes (1 to 4) to all of the tax types administered by the revenue agency (possibly 50 or more). For example, the two projects with costs under $20 million shown in the graph above involved the implementation of one tax with limited functionality (Michigan) and four taxes (Vermont). Given differences in project scope and the different vendors that may be involved, the duration of these projects also varies.

While the number of taxpayers in a jurisdiction has some bearing on costs, the complexity of the taxes, desired functionality, and the number of tax programs are much more significant factors. A high volume of taxpayers can affect software and hardware scalability and performance, but the functionality needed to process and administer a tax is not materially affected by a large or small number of taxpayers.

Generally, more recent procurements provide stronger indicators of current costs since they better reflect the current market. However, completed projects may provide better evidence of the benefits derived from an ITMS project since those jurisdictions have had the opportunity to establish a track record benchmarked against the performance of their legacy systems.

1. Comparison States – Small Populations

For purposes of providing additional comparative information related to small states, procurements in states with populations of less than three million during the last five years are examined in closer detail. This includes three states: Utah, Vermont, and Arkansas. To broaden the pool, procurements initiated since 2005 in states with a population of less than three million were also included, bringing in North Dakota and West Virginia. In addition, Montana is included in the comparison since Alaska often compares itself with Montana, both because of similar populations (less than one million) and because Montana, like Alaska, has a high dependence on severance taxes. Montana's project initiated in 2003, eight years before the potential start of an Alaska ITMS project.

Note: Information provided from other states is for the initial implementation project only. In some cases, additional tax types or functionality has been subsequently added. These additions are not included in the comparison since subsequent, incremental costs are harder to identify and track making comparisons are less reliable. Table 3 displays comparative summary information.

Table 3: Comparative Summary Information						
Inception Date	**State**	**2010 Population (000)**	**2008 Total State Tax Revenue* (Millions)**	**In-Scope Tax Types**	**Project Duration**	**Project Status**
2003	Montana	975	$2,457.0	53	48 mo.	Completed
2005	North Dakota	645	$2,312.1	19	24 mo.	Completed
2005	West Virginia	1,819	$4,881.9	42	42 mo.	Completed
2006	Utah	2,786	$6,109.3	26	37 mo.	Completed
2007	Vermont	622	$2,544.2	4	32 mo.	Completed
2008	Arkansas	2,889	$7,530.5	46	48 mo.	In-Progress
2011	Alaska	698	$8,424.7	22	--	Proposed
*Source: 2008 Annual Survey of State Government Finances, U.S. Bureau of Census						

Mississippi (population 2.952 million) is currently engaged in an ITMS procurement process. DOR/TAX should monitor the progress and results of this procurement since it is the first one involving a state with a population of less than 3 million since 2008. While a contract is yet to be awarded, it is worth noting that Mississippi received five vendor responses to their RFP.

Below is a short description of each of the six state projects.

a) Montana

In the late 1990's the Montana Department of Revenue chose a "design and build" (custom) strategy to modernize its many non-integrated and inflexible legacy systems. In 2003, after spending $39 million, the Montana Legislature directed the agency to shut down the project due to data integrity and stabilization issues, and an overall lack of confidence in the system. The department was instructed to find a replacement system with a proven record of accomplishment in another state.

Montana acquired a COTS solution and utilized a "proof of concept" approach, initially implementing six taxes over an 11-month period. Following the successful and on-time rollout of the first phase, subsequent phases brought 53 different tax types into production over the project's lifespan of 48 months.

b) North Dakota

The North Dakota project was a two-year, multi-phased project to convert most of the tax department's many aging computerized tax processing systems to a modern ITMS capable of quickly adapting to the state's frequently changing tax laws and regulations. The project replaced legacy tax systems designed 40+ years ago. Because legacy systems were limited by their age and effectiveness, the agency resorted to using supplemental tools such as MS Access and MS Excel to process and maintain significant elements of tax administration data.

North Dakota considered three alternatives for its modernization project:

- Migrating the existing systems to a modern hardware platform
- Designing and building a new system from scratch (custom development)
- Implementing a COTS solution

North Dakota elected a COTS approach in order to reduce risk, reduce cost, shorten the implementation schedule, take advantage of upgrades made to the core product, and enable the state to adapt quickly to future tax changes and business challenges. The project started in July 2005 and was completed in June 2007, bringing 19 taxes types into production during the four phases of the project.

c) West Virginia

As recently as 2006, the West Virginia State Tax Department used 23 out-dated operating systems to administer 42 different taxes. Separate systems created a segmented work environment for the department and led to inaccurate data and erroneous billings. They also inhibited good taxpayer service – tax service employees had to go into as many as nine different systems to answer a taxpayer's question. IT staff struggled with inflexible software tools and the department was able to make only limited changes to reflect new laws enacted by the legislature.

West Virginia started its ITMS project in 2005, implementing a COTS solution with the goals of enhancing tax collections, bringing the state tax administration into the 21st century, and providing taxpayers with the best possible service. Forty-two taxes rolled out over a 42-month project consisting of five phases. The state has been able to retire 20 of its legacy systems.

d) Utah

The Utah State Tax Commission administers over 40 major taxes and fees. Several of its largest taxes were administered using systems developed more than 20 years ago that were structured in silos containing one or more related tax types. The systems had grown increasingly complex, inflexible, and difficult to maintain. Facing the possible need to implement legislatively directed changes to the tax code, the Tax Commission feared it would be difficult, if not impossible, to implement changes using existing systems and technologies.

The Tax Commission's goal was to replace its core tax systems, and its RFP invited proposals for either COTS or transfer solutions. They selected a COTS solution and started the implementation project in April 2006. Imaging integration and several additional tax types were later added to the scope of the project including International Fuel Tax Agreement (IFTA) and International Registration Plan (IRP). As of September 2010, a total of 29 tax types have been implemented into production.

e) Vermont

Vermont undertook its ITMS project in 2007 based on the need to replace aging mainframe software applications with more modern and functionally rich software. Retirements of key mainframe developers reduced the department's ability to continue to maintain its older mainframe-based tax

systems which had evolved over a 30 year period. The agency also relied on PowerBuilder applications, built in the late 1990s, modified with customizations to provide functionality in support of business needs and statutory changes.

Vermont's strategy was to undertake a limited project (4 taxes), and expand it sometime in the future for full enterprise-wide use. This approach would allow the agency to consolidate processing on the new application by migrating remaining processing from legacy systems. Vermont selected COTS technology to leverage vendor support, better utilize internal IT capabilities, avoid technological obsolescence via upgrades, and reduce overall risk.

f) Arkansas

The Arkansas Division of Revenue's legacy tax systems consisted of four major tax systems plus a tax collection system designed and implemented between 1985 and 1993. Designed to support the reporting and collection of taxes, the systems did not have sufficient features to manage current tax laws. Reports requested from the legislature and executive branch agencies were very time consuming and difficult to produce. Given the age and architecture of the systems, they were difficult to manage and maintain, inflexible, and incapable of providing adequate support for tax section needs.

Arkansas issued an RFP seeking a COTS solution to replace their legacy systems. They started their 4-year project to implement 46 taxes in 2008. They have completed two of five scheduled phases and currently have 21 tax types in production. The project is scheduled to be completed by the first quarter of 2012.

2. Comparison of Scope and Component Costs

Table 3 compares the initial scope of ITMS projects in the six comparison states with the proposed scope for Alaska. In some cases, additional tax types and functionality were added into scope after the project was initiated.

Table 4: Comparison of Initial Scope

State	Data Warehouse	Taxpayer On-Line Services	Imaging	Other
Montana	Yes	No	No	--
North Dakota	Yes	No	No	Remote Support for Field Audits
West Virginia	Yes	Yes	Yes*	--
Utah	Yes	Yes	No	--
Vermont	No	No	No	
Arkansas	Yes	Yes	No	Remote Support for Field Audits and Collections
Alaska	Yes	Yes	Yes	--

*Integration with a preexisting imaging solution; excludes imaging system hardware and software

3. Vendor Software and Services

For purposes of this comparison, vendor software (including third-party software) and services are combined since a breakout between these two items was not obtained.

Table 4 compares vendor software and service costs for the ITMS projects in the six comparison states. They range from **$7.8 million** to **$27.0 million**. The number of tax/account types in scope range from 4 to 53, and the durations of the project ranged from 24 to 48 months. The functional scope also varies; five of the six include data warehouse functionality, three out of six include taxpayer on-line services, and only one out of the six includes imaging integration. Reasons for including or excluding certain functionality in a project's scope vary. For example, some agencies already have on-line taxpayer services functionality that they do not wish to replace. In other instances, cost constraints cause an agency to limit its scope.

While vendor software and services costs gathered from the six small states provide some helpful information, its use is limited by several factors. First, the data is somewhat old. The information from Arkansas is more than three years old relative to the potential start date of an Alaska project, and the information from Montana is eight years old. Second, the costs only relate to two COTS vendors. Today, there are at least four companies with COTS solution offerings for the US market, including SAP, RSI, FAST, and Oracle. A fifth vendor, Tata, has also responded to state RFPs in recent years with a proposed solution.

Table 5: Cost Comparison—Vendor Software and Services

State	Vendor Software and Services (millions)	Hardware (millions)	Inception Date	Tax / Account Types
Montana	$24.8	n/a	2003	53
North Dakota	$10.0	n/a	2005	19
West Virginia	$20.8	$1.5	2005	42
Utah	$22.5	n/a	2006	26
Vermont	$7.8	n/a	2007	4
Arkansas	$27.0	n/a	2008	46

a) Maintenance and Support

Average maintenance and support costs obtained for the six comparison states ranged from **$1.15 to $2.55 million** per year.

b) Hardware

Among the six comparison states, only West Virginia's project costs were inclusive of hardware for a total of **$1.5 million**. Many states are able to order hardware from pre-existing state contracts or may use separate procurements for hardware acquisition.

c) Project Operating Expenses

Project operating costs were not obtained from the comparison states since they tend to be based on factors and needs that are unique to each state.

E. Integrated Tax Management System Project Benefits

The benefits revenue agencies seek from a modern, ITMS generally fall into five categories:

- Increased compliance and the ability to collect revenues that are currently uncollected
- Operating efficiencies
- Enhanced taxpayer services
- More reliable data and improved reporting capabilities, both for external stakeholders and for internal management purposes
- Streamlining system maintenance through a unified technology platform

Below is a list of benefits DOR/TAX could expect to realize through an ITMS.

1. Increased Compliance

An ITMS is able to improve tax compliance by providing automated tools that enhance collection management, systematically identify and act on taxpayers who fail to file, improve audit selection, identify potential underreporting, and help discover taxpayers that not registered and paying taxes.

Currently, DOR/TAX does not have collection management tools that easily and quickly support the billing of underpayments and escalated actions to ensure payment. There is not a consolidated view of a taxpayer's accounts, so it is extremely cumbersome to determine if a taxpayer is current on all tax obligations, or may be due a refund for one tax yet have an outstanding balance for another. An ITMS would provide current and reliable accounts receivable information across all tax types, and enable DOR/TAX to support progressive actions to collect delinquent taxes, interest, and penalties.

Similarly, DOR/TAX does not currently have a means to identify systematically if a taxpayer has failed to file a tax return. Current, manual processes to detect non-filing are haphazard at best, and do not ensure timely identification and action. An ITMS would introduce the capability of determining if a taxpayer has failed to file an expected tax return and support rapid and automatic or employee-based actions to follow-up appropriately.

DOR/TAX auditors currently spend a high proportion of their time compiling, organizing, and reconciling data in preparation for an audit or examination. The manner in which the data is stored in numerous systems prevents easy retrieval of information. DOR/TAX must gather data from a variety of different

systems, databases, and spreadsheets, paper documents, and images of paper documents. Because it takes so long to prepare for an audit, fewer audits are completed and the audits that are performed take longer to complete.

Oftentimes, data cannot be retrieved and an agency employee will need to ask the taxpayer to provide it. This is time consuming and imposes a burden on the taxpayer. Current tools to analyze patterns of underreporting are limited to non-existent, and do not enable the agency to prioritize its audit resources effectively or focus its audit and examination activities on those areas of highest need. An ITMS would enable the agency to improve audit productivity and to target its audit coverage to maximize tax compliance.

DOR/TAX lacks tools to identify and pursue taxpayers that should be registered and paying taxes but are not. Modern data warehouse and discovery tools allow a tax agency to use internal and third-party data to discover potential non-filers and to follow-up appropriately through automatic or employee-based actions to ensure proper compliance and reporting.

2. Operating Efficiencies

DOR/TAX's current operating environment is characterized by a high degree of manual processes. Approximately 95% of the agency's business processes are manual, and many exist strictly to get information from one system or database into another or to reconcile information from multiple sources. DOR/TAX also uses manual processes for fundamental business purposes, for example, they distribute shared taxes of over **$44 million** to 124 communities throughout Alaska in 2009. Multiple systems and data sources create the need for multiple and diverse processes, contributing to organizational silos and the need for specialized knowledge to carry out various agency activities.

An ITMS would provide current and reliable accounts receivable information across all tax types, and enable DOR/TAX to support progressive actions to collect delinquent taxes, interest, and penalties.

A single, ITMS will present users with a consistent view of taxpayer information across all tax types and business functions. This facilitates a consistency of operations across the agency. This streamlines training, since employees use a common system with the same look and feel. Once employees know how to use the system, it is easier for them to learn other duties and take on new tasks since they are using tools and workflows that are already familiar to them.

An ITMS enables automation of high volume, routine tasks allowing agency staff to focus on resolving exceptions and engage in other value-added tasks such as compliance and taxpayer services. An implementation project involving a COTS solution will not only focus on installing new software, but it

also involves redesigning business processes so they are consistent with the software's capabilities. The implementation project will provide the opportunity to streamline agency business processes and align them with the best practices incorporated into the solution.

A new ITMS will provide immediate access to current and historical information regarding work in progress, including operational and management reports and ad hoc requests for information. This will allow managers to plan work and track performance and to redeploy resources as necessary to address high priority needs.

The availability of timely and meaningful information will provide DOR/TAX with a solid basis to develop and utilize a set of performance metrics that are clear, meaningful, realistic, and measurable, and that drive behavior that is consistent its mission, vision, and goals. By DOR/TAX's own admission, current performance measures are not very meaningful or current since they are limited to information that is pieced together and extracted from multiple systems.

3. Enhanced Taxpayer Services

Current systems do not provide a complete view of a taxpayer's file across tax types and functions. Since information is stored in various systems, databases, and spreadsheets, it does not lend itself to a timely or complete snapshot of a taxpayer's activities and status. Since data cannot be readily shared, taxpayers may be asked to report the same information multiple times in different formats to support the needs of different sections and purposes. Difficulty of retrieving information also means that an agency employee may ask the taxpayer to resubmit tax return information, since, from the employee's perspective, it is easier to get the information from the taxpayer than relying on the agency's systems. Limited e-government capabilities also present a burden, especially to large taxpayers.

An ITMS provides real-time access to taxpayer information. Since information is available for all taxes for which a taxpayer is liable, it provides a current and complete view of a taxpayer's file including all tax types, all historical information, and all business activities for the taxpayer. This allows an employee to provide accurate information to a taxpayer about their account or to answer a taxpayer's question without having to look up information from multiple sources. It also supports a "one-stop" experience for taxpayers since they do not need to shop around the agency to find an employee who has access to the information they are looking for. A real-time system allows taxpayer information to be updated regardless of a user's location.

Customer service is enhanced by additional taxpayer self-services via the Internet. This not only supports on-line filing and payment, but enables taxpayers to update contact information, look at previously filed tax information, or file an amended tax return. It would allow DOR/TAX to provide reminders to taxpayers about upcoming deadlines and offer a secure communication channel supporting the exchange of confidential taxpayer information.

Currently, some taxpayers are required to report tax information using complex spreadsheets. Especially for taxpayers who report large amounts of data, this imposes a substantial burden. A modern tax system enables the filing of tax information via Electronic Data Interchange (EDI) which is a structured means to transmit data from a taxpayer's system to the tax agency's system. This not only offers taxpayers tremendous efficiencies, but it reduces potential errors that can occur when data is transcribed from the taxpayer system into a spreadsheet.

An ITMS is able to store, maintain, and retrieve a large amount of data. This capability will enable DOR/TAX to simplify reporting requirements so that taxpayers do not have to report the same information multiple times. It will also allow employees access to the information they need without imposing on taxpayers to resubmit information they have already provided to the agency.

The availability of timely and meaningful information will provide DOR/TAX with a solid basis to develop and utilize a set of performance metrics that are clear, meaningful, realistic, and measurable, and that drive behavior that is consistent its mission, vision, and goals.

Currently, a substantial amount of DOR/TAX's employees' time is spent compiling, organizing, and reconciling data and on manual business processes. This distracts the agency from being able to focus its attention on value-added activities such as taxpayer services and compliance. One symptom is the level of information, instructions, and regulations available to taxpayers. For a tax system reliant on voluntary compliance, taxpayer information and education is an essential component of effective tax administration. Automation of high volume and routine tasks, together with the elimination of activities currently devoted to compiling, organizing, and reconciling data from disparate systems, databases, and spreadsheets, will enable DOR/TAX to refocus its attention on improving taxpayer services and compliance.

4. Enhanced Reporting Capabilities

A major issue repeatedly encountered while preparing this report is the lack of information about workload and day-to-day operating statistics indicating how much work DOR/TAX is accomplishing using current systems. The totals for current receivables, refunds outstanding, refund interest paid to date,

and total taxpayer balance could be obtained by DOR/TAX but only if someone is pulled away from their assigned duties to gather information from spreadsheets, paper documents, or information from images.

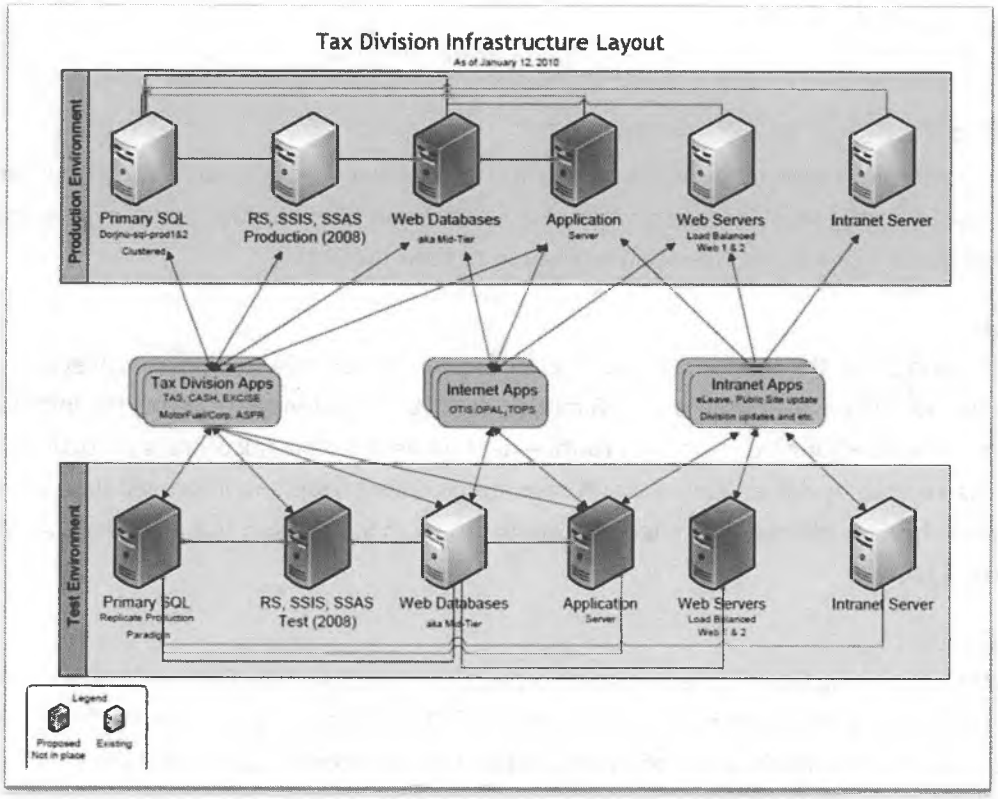
DOR/TAX cannot easily produce reports required by the legislature and policy makers because current systems prevent timely, complete, and correct extraction of data. Information is fragmented in 17 systems used to administer different aspects of its tax types, along with over 100 MS Excel spreadsheets, used in unofficial side-systems to track information other systems do not capture.

In order to provide accuracy in reporting, excessive hours are spent comparing, fixing, and formatting data manually prior to producing information for reports. Even with this exceptional effort, reports are often misleading or inaccurate due to incorrect, incomplete data, and, despite the best attempts of the professionals in TAX, human error. Current systems offer very limited reporting capabilities, but tools available are inflexible and oftentimes prevent the agency from producing information in the form and format desired by the OMB, the legislature, or the Governor's office.

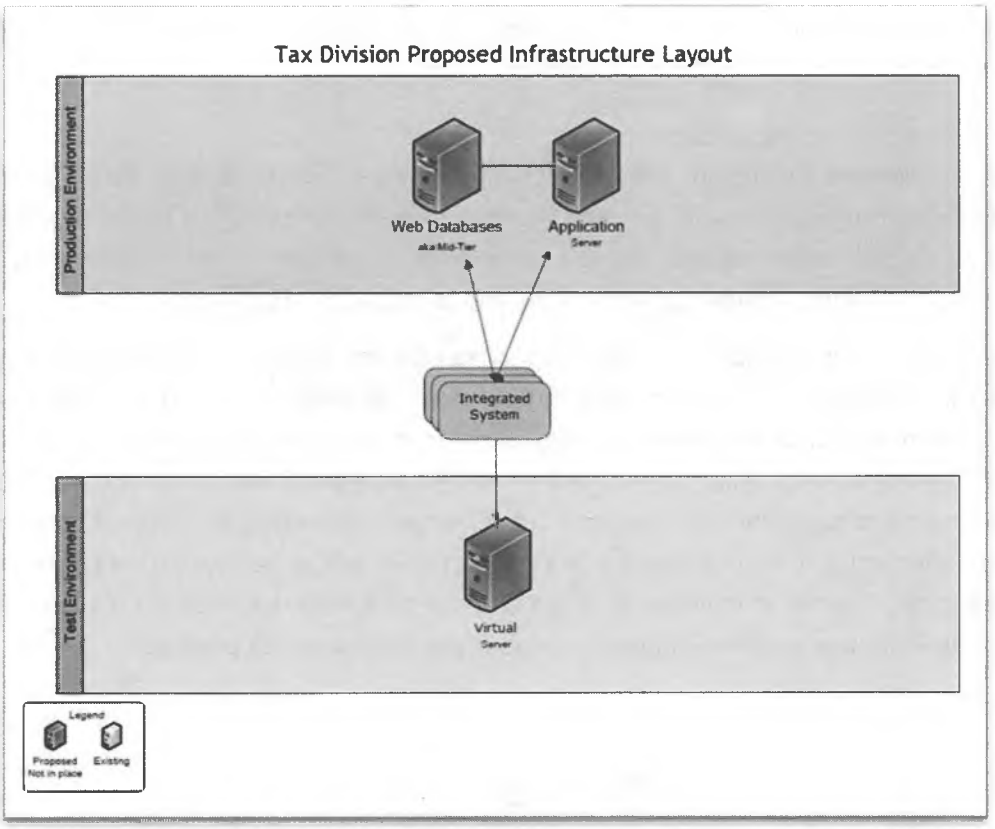
A modern ITMS provides an integrated solution with a consistency of information across all business activities. It ensures more reliable information and improved analytical capabilities with data collected, stored, and retrieved in a single database providing real-time access and query capability. It provides the ability to sort, group, and filter data, and to view it with customizable parameters, along with more advanced capabilities to visualize, analyze, drill-down, and manipulate information to meet a variety of reporting and analytical needs.

Modern systems not only support traditional, presentation-ready reports, but also provide online, ad hoc query capabilities. Systems exist for DOR/TAX to enable the agency to manage the day-to-day processes and to measure and monitor system performance, personnel achievements, and work load. DOR/TAX could benefit by moving personnel back to jobs defined in their personnel descriptions and away from data entry or manual number crunching. Systems are available to DOR/TAX that can capture data automatically and allow managers to work on exceptions, allow auditors to perform audits, and allow compliance agents to perform compliance activities. Reporting capabilities in an ITMS can support an enhanced and flexible view of a subset of the system's database and allow for faster, more accurate and more dependable forecasts, analysis, and response to stakeholders.

An ITMS further allows the collection of information and distribution through scheduled email to allow managers to stay connected at all times with the processes for which they are responsible. Alerts, executive dashboards, and user-created system queries place additional tools in the hands of managers, supervisors, auditors, and other personnel to allow more informed decisions and to enhance the management of a division's operations. FAST found many managers working without any of these common tools.



A data warehouse and OLAP cube capability extends information and analytic capabilities by enabling the loading, storage, and manipulation of DOR/TAX and third-party data. These tools leverage the



agency's ability to accumulate data from other government agencies and external sources to look for trends, improve forecasts, and increase compliance.

5. Streamlined System Maintenance

Multiple systems require a variety of skill sets for maintenance and development. An ITMS provides a single system with a common architecture and standard delivery platform. It is based on modern technology, so the skill sets needed to maintain and support the system are more closely matched with the education and training provided by universities and technical institutes today.

An upgrade to an ITMS would not only make users more efficient, it would also make technology maintenance more efficient. By being able to consolidate all of DOR/TAX's systems into one system, TAX is only responsible for maintenance of one group of servers, all using the same platform. Throttling can be used to move activity away from one server when service packs need to be applied or other maintenance needs to be performed. Dedicated development and testing environments can allow new development and testing to occur without affecting what users see in the production environment until it has passed testing. Server monitoring tools can give real-time statistics on server response times and be used to make sure the system is running as smoothly and efficiently as possible.

F. Benefits Realized in Other States

Benefits that have been reported by Montana, North Dakota, West Virginia, and Utah are summarized below. Vermont recently went into production and Arkansas' implementation is still in progress, so they have not yet reported benefits information attributed to their projects.

a) Montana

Between 2006 and 2008, the Montana Department of Revenue was able to increase collections from **$40 million to $58 million**, an increase of **$18 million** or 45%. The agency attributes the increase to streamlining and automating the pursuit of routine debt while directing tax officers to focus on complex, high-risk cases assisted by risk assessment and case management tools and improved data accuracy. During the same period, office audit collections increased from **$28 million** to **$41 million**, an increase of **$13 million** or 46%.

b) North Dakota

One year after completing their implementation project, the North Dakota Office of the State Tax Commissioner reported increased revenue collections of **$7.6 million**. They attributed the increase to better tools enabling the prioritization of collection cases and improved audit selection.

c) West Virginia

Prior to 2007, the West Virginia State Tax Department's Compliance Division averaged annual enforced collections of **$88.2 million**. Since 2008, the Division has averaged **$130.7 million** in annual enforced collections, an increase of 48%. The Division attributes the increases to the use of collection case management and risk assessment tools. Also, they have been able to refocus employees who previously performed manual non-revenue generating tasks on collection efforts.

The agency also implemented a new tax discovery program using its data warehouse, matching state records with the Federal Individual Master File (IMF). The program brought in **$460,000** in the first six months of operation.

d) Utah

The Utah State Tax Commission was able to increase individual income tax office audit assessments from **$18.5 million** in 2006 to **$28.6 million** in 2007, an increase of **$10.1** million or 55%. Recovery, as measured by assessments per hour, more than doubled, increasing from **$500** to **$1,010** per hour.

Withholding tax assessments directed at non-filers increased from **$5.5** million in 2006 to **$12.8** million in 2007, an increase of **$7.3** million or 133%. Recovery, as measured by assessments per hour, more than tripled from **$768** to **$2,312** per hour.

The Tax Commission attributes the increases to the use of analytical tools to select high-value audits. For both programs, the number of audits actually decreased between 2006 and 2007, but staff were able to focus their attention on more productive, high-value audits.

G. Funding Alternatives

Five different funding approaches are described for DOR/TAX consideration. While the most common model for public procurement is fixed price, other alternatives are available and some are being used for the procurement of an ITMS. Alternatives are briefly described below.

1. Fixed Price

A fixed price contract is one in which the price is preset and invariable, regardless of the actual costs incurred by the vendor. This approach is commonly used for public procurement in order to keep costs within a predetermined budget. The resources and hours that are required to complete the project may be greater or lesser than those originally estimated, but variations do not affect the amount paid to the vendor as long as the results (software, services, and artifacts, etc.) are delivered according to the terms of the contract. Changes in scope that mutually agreed on between the agency and the vendor may result in a change in the price.

2. Fixed Upper Limit, Time and Materials

This is a variation of the fixed price approach in which the vendor bills the client on a time and materials basis during the course of the project. If the hours and resources that are required to complete the project equal or exceed the original budgeted estimate, this approach is effectively equivalent to a fixed

price contract. However, if the required resources and hours are less than those budgeted, the project comes in under budget. The agency may have the option of investing the savings in additional functionality that may not have been in the project's original scope, or it may return the savings to the state. This approach was used by the state of Idaho in the procurement of its ITMS.

3. Proof of Concept

This is a cautious approach in which some aspect of a solution is tested on a pilot basis before a decision is made to proceed with the full project. For an ITMS project, it might mean putting a small number of taxes or some limited functionality into production before proceeding with the entire project. This approach is usually considered when there is a high degree of perceived risk and the jurisdiction is unwilling to fully commit funds until some element of success is demonstrated. Once the milestone has been reached and the jurisdiction is satisfied that the project's feasibility has been proven, the remainder of the project can proceed. If success is not demonstrated, the project can be abandoned or modified, and the jurisdiction's investment is minimized.

This approach was used by the state of Montana since the Department of Revenue's previous custom-build project was not successful and the legislature wanted to proceed with caution before fully funding another project. Five taxes were included in the proof of concept. Once they were successfully put into production within an eleven month period, the project continued with 47 additional taxes.

4. Benefits-based

A benefits-based project is one in which the procurement is funded from the additional revenues that are collected as a direct result of the project. The vendor is compensated as benefits are realized by the jurisdiction. This approach requires a well established baseline so that increases can be clearly measured.

Benefits-based projects will cost more since they entail greater risks on the part of the vendor. There are also cash flow considerations since the vendor will make investments up front but will not be compensated for them until sometime well into the project, or possibly even after the implementation is complete. However, there are advantages to this approach, particularly if budgets are tight and a project will not be authorized unless it is funded on this basis. The approach also ensures that benefits are received – if they are not, the jurisdiction does not pay the vendor for the project.

A number of different compensation models are possible. Compensation may be capped at a predetermined, fixed amount. Or, vendors may share in a revenue stream for the duration of the contract which means the greater the revenue stream, the greater the level of compensation. Compensation can be based on increased revenues, cost savings, or some combination of both. The agency's internal project-related costs are also taken into consideration and may be paid from the benefits received unless funding has been otherwise appropriated. It is important for the jurisdiction to plan for on-going system costs after the implementation project is complete and paid for.

To be successful, a strong partnership between the vendor and the agency is essential, and a mutual focus must be placed on achieving benefits. The agency needs to be prepared to step up and follow through on its commitment to increase revenues and/or achieve cost savings, recognizing there will be strong incentives on the vendor's part to generate benefits as early as possible. While a benefits-based project can produce other improvements such as enhanced taxpayer service, those will not be the primary focus of the project.

A jurisdiction will likely need explicit legal authority to authorize a benefits-based project.

This approach has been used by tax agencies in a number of jurisdictions both for compliance-related technology such as data warehouses and associated analytics, and for ITMS projects. States with benefit-based projects include Arizona, California, Hawaii, South Carolina, and Missouri.

5. Software as a Service

Software as a service is a relatively new concept sometimes called "software on demand" or a "hosted solution." Under this concept, the solution is deployed over the Internet via a web browser. Database and application servers are physically located at a vendor-maintained site. The vendor is responsible for managing and maintaining the server platforms and the application software, while the client is responsible for individual client workstations.

This option allows a jurisdiction to avoid upfront and ongoing hardware procurement and maintenance expenditures other than costs related to individual workstations. The vendor is responsible for procuring, managing, and maintaining the server platforms and application software, and for all server-side operations and activities such as day-to-day application and database software backup and recovery, database tuning, etc. The vendor provides support and maintenance for the deployed solution including new and revised documentation and defect repair, and addresses service pack analysis and installation as well as the installation and testing of new software versions.

One advantage of this approach is the opportunity for flexible pricing models such as subscription fees or charging per transaction. For example, the cost of hardware, software licensing, and configuration and implementation services, as well as on-going hosting, maintenance, and support could be included in a monthly, quarterly, or annual fixed subscription fee over the contract period (e.g. five years). This provides for stable and predictable payments over a period of time rather than having to finance a single lump sum upfront to cover the costs of a multi-year project.

VII. Implementation Roadmap

This section provides a roadmap for DOR/TAX as it prepares for an ITMS project. It focuses on activities leading up to two important milestones - the procurement process and the start of implementation. The selected business partner will work closely with DOR/TAX to plan many details of the implementation including the implementation methodology, project schedule, conversion approach, testing plan, and training approach. Nevertheless, this roadmap will identify factors contributing to a project's success irrespective of the chosen solution and business partner.

A. Preparing for Procurement: Activities Before the RFP Is Issued

1. Do Your Homework

As with any purchase, an understanding of the marketplace is critical to effective procurement of an ITMS. The rules associated with formal procurement processes often limit an agency's ability to carry out important research that is helpful to develop such an understanding. Some homework is in order before the issuance of an RFP imposes formal communication restrictions on the process.

Consider the following:

- Ask for vendor presentations and demonstrations
- Talk to (or visit) existing client sites:
- "Old" sites that have been in maintenance and support for a long period
- "New" sites that have only recently completed their initial implementation project
- "In progress" sites that are still working on their initial implementation project

As with any purchase, an understanding of the marketplace is critical to effective procurement of an ITMS.

2. Learn from Others

If there is a causal relationship between creating a good RFP procurement process and selecting a successful solution and business partner, then identifying states that have had a successful project and reviewing their RFP document and procurement process is useful. This will leverage the experience of others who have successfully procured and implemented an integrated tax solution.

Questions to ask about the procurement process include:

- Were there many vendor questions regarding the RFP?
- Could you have avoided those questions with further refinement of the RFP prior to issuance?
- How many amendments did you issue?
- In general, were you able to keep to your intended procurement schedule?
- Did you extend the due date? How many times? Why?

- Did the responses provide the information you expected?
- How difficult were the responses to evaluate?
- Was there a clear winner?
- Were there any appeals of the process or result?

Also, you can learn a great deal from those who have migrated taxes to production with an ITMS. Questions to ask about the implementation project include:

- Did implementation proceed smoothly?
- Was your implementation on time?
- Did your project stay within budget?
- Did the scope expand during the project and, if so, why?
- Were there any difficulties with the vendor/client relationship?
- Did you feel as though the vendor was consistently acting in your best interest?

Questions to ask about the ITMS solution include:

- Did it meet your needs at implementation?
- Was it flexible enough to change as your needs evolved?
- Is there any reason to think you would have to eventually replace it?
- Is the solution expanding beyond its original scope?
- Did any difficulties develop with the vendor/client relationship after the implementation project?

Topics to address when asking about their selected vendor include:

- Reputation (i.e., credibility, stability, longevity, management credentials)
- Technical support (scope and responsiveness)
- Willingness to negotiate changes and number of change requests needed
- Training support
- Ability to integrate technological changes into the ITMS product

3. Choosing a Funding Approach

Consider the pros and cons of using different funding approaches including:

- Fixed price
- Fixed upper limit, time and materials
- Proof of concept
- Benefits-based
- Software as a service

These funding approaches are described in section *VII. Funding Alternatives.*

4. Choosing the Type of Solution You Wish to Procure

Various options are available to DOR/TAX for an ITMS including custom, transfer, and commercial off-the-shelf (COTS) solutions. These alternatives are described in section *V. Alternative Approaches*. You should select the type(s) of solutions you want vendors to propose for DOR/TAX's consideration and evaluation.

- If DOR/TAX is interested in a custom solution, it should consider first issuing a Request for Information (RFI) specifically inviting responses from vendors interested in proposing a custom solution for DOR/TAX. The RFI should request a company profile, information about the technology to be used, a system description, pricing and schedule information, the company's experience implementing similar systems in jurisdictions comparable to Alaska, and any other information DOR/TAX believes would be useful in evaluating the costs and benefits of further pursuing a custom solution.
- If DOR/TAX is interested in a COTS solution, they should issue an RFP specifying that responses must propose a COTS solution. In recent years, this approach was used in Arkansas, Mississippi, and Oklahoma.
- If DOR/TAX is interested in either a COTS or transfer solution, they should issue an RFP specifying that responses must propose a COTS or transfer solution. In recent years, this approach was used in Utah.

B. Writing the RFP

It is often considered a "best practice" to contract for assistance in preparing the RFP. In order to avoid a conflict of interest, common procurement practices typically prohibit the company that assists in authoring an RFP from responding to that RFP.

While you will want to rely on the professional expertise of the firm you engage for RFP assistance, some general guidelines are provided for consideration.

1. Structure and Content

Consider the following general guidelines:

- Mandate a uniform structure for the response. This allows you to compare responses directly, topic by topic, in order to determine relative compliance, responsiveness, and merit.
- Minimize "essay" questions. Invitations to "describe" or "discuss" can lead to lengthy narratives that are time consuming and difficult to evaluate while the evaluations themselves can be difficult to quantify.
- State the agency's expectations and invite the vendor to concur or to propose and justify an alternative.
- Identify areas in which the agency has some flexibility and ask for the vendor's advice and recommendations – for example, the implementation schedule.

- When seeking a COTS solution, avoid prescribing implementation methodology. The approach to implementing a COTS product differs from custom development.
- Work the evaluation of an oral presentation and demonstration into the final score of the response.

2. Reference Sites

Consider the following:

- Request references from previous clients that are similar to your agency in size and project scope.
- Consider requesting contact information for all of the vendor's client sites – not only those sites that the vendor lists as "reference sites."
- As you check on references, do not limit your questions to pre-defined, fixed questions. Give yourself the flexibility to follow up on information provided by the reference contact.
- Participate in onsite visits to reference agencies and discuss their solution and implementation experiences.

3. Show and Tell

The DOR/TAX project manager must organize a competent and knowledgeable project team of functional and technical subject matter experts to participate in the contractual process (i.e., vendor analysis, vendor demonstrations, and evaluation of proposals.) The project manager must work closely with acquisition staff to ensure that each vendor demonstrates, and can provide examples and references, for services and work products that are consistent with contractual obligations proposed and responded to in the RFP.

Consider the following:

- Include an oral presentation and demonstration in the evaluation process. This will allow the agency to see the product and the proposed team first hand.
- Provide in advance a list of business functions to be demonstrated by the actual, proposed project staff.
- Allow time for questions and answers. In addition to allowing for clarification, this will allow you to evaluate the vendor staff with whom you may be working.
- Decide how much weight to place on product demonstrations in the final score – actual demonstrations may be more important than what a vendor writes or says about their product

Include an oral presentation and demonstration in the evaluation process.

4. Proposed Project Staff

Consider requesting resumes for key proposed staff such as project manager, application architect, training Lead, technical lead, and conversion lead. It is often difficult for a vendor to commit to, and provide resumes for, an entire project team. Consider the relative importance of experience and demonstrated success with the proposed solution in a tax agency vs. industry certifications (PMP, Microsoft, etc.).

5. Contract Terms

Consider the following:

- Include a sample contract. Ask for comments and suggested changes.
- Make terms and conditions reciprocal where appropriate (for example, relationship of parties, assignment, and confidentiality).
- Must all contractual issues be resolved at the time of the response submission? Alternatively, will the agency have the flexibility to negotiate the contact with the apparent successful vendor?
- Plan on entering into a long-term relationship with the vendor for software and services, such as ongoing software maintenance, new software releases, support, and other service

6. Financial Provisions

Consider the following:

- Deferred payment and bonding are forms of insurance. They increase costs to the agency, and it is important to ensure costs are not disproportionate to the benefit.
- Consider avoiding liquidated damages and indirect damages, and setting a reasonable limit on liability for direct damages.
- Liquidated damages and significant bond requirements can preclude some companies from even responding to an RFP.
- If a performance bond is necessary:
    - Subject only services to a bond; hardware, software license, and software maintenance should be excluded from bonding.
    - Stipulate that only a percentage of the service contract value be subject to bond – for example, 10% of the service contract value.
    - Tie the bond value to the value of the single phase of work in progress.
    - Permit the bond to take various forms (cash, letter of credit, surety).
- Consider a percentage holdback of payment until that phase of work is delivered successfully in lieu of a bond, but avoid combining a holdback with a bond – that is a form of double jeopardy with financial implications on the cost of the project.
- If a fixed price bid is being considered, avoid emphasis on consultant hours. Decide if the proposal needs to quantify project hours and require timesheets.

- Regardless of the funding model, consider a payment schedule that provides for progress payments based on project milestones.

7. Payment Schedule

Consider the following, especially for a COTS solution:

- Typical approach for one-time costs:
    - Initial license upon installation (for example, week two of the project)
    - Annual maintenance starts then and continues indefinitely
    - Services for each phase priced separately
- Two models for on-going costs:
    - Maintenance and support priced separately – lower initial cost, higher long term cost
    - Maintenance and support bundled - higher initial cost

8. Identifying requirements

When you are identifying requirements for a project, consider defining technical, functional, and management requirements.

a) Technical Requirements

Consider the following:

- When defining technical requirements, consider specifying that the solution is based on widely - used, non-proprietary, proven technology that has a solid history of upgradability.
- Consider whether you want to limit alternatives by specifying the programming language or other technical architecture components. There are many different and powerful technologies to choose from and this should not drive the business decision.

b) Functional Requirements

Consider the following:

- It is not feasible to develop an exhaustive list of detailed requirements across all the functional subject areas of an ITMS. Furthermore, it cannot be assumed that meeting every line item requirement in such a list – even if there are thousands – means that the solution is complete. The true measure of the completeness of an ITMS is the agency's ability to use it to administer tax without resorting to extensive manual processes, side-systems, and other software tools or products.
- The functional requirements list should be a yardstick by which solutions can be measured against one another. Therefore, express a reasonable number of requirements – enough to evaluate the solution but without exhaustively specifying it. Think in terms of 200-300 functional requirements not 2,000-3,000.

- Focus on business outcomes by clearly stating business requirements as a "what" without prescribing the "how."
- Avoid open-ended requirements such as open-ended requirements such as "including but not limited to" and "must meet all current and future standards."
- Avoid trying to eliminate your IT unit through requirements such as "must be able to change configuration without IT involvement" or "must be able to create report without IT involvement."

c) Management Requirements

Consider the following:

- Clearly mandate conformance with state law, department regulations, and oversight agency policy and practices.
- If you are implementing a COTS solution, be prepared to manage an iterative process with minimal formal signoffs and occasional "rework."
- Avoid specifying an implementation methodology, if you are implementing a COTS solution, most have methodologies that are designed for the product. Allow for alternative approaches, but make the vendor prove that the alternative has worked elsewhere.
- Decide whether to dictate the schedule, phases, and length of contract. If there is flexibility, allow the vendor to propose an approach.
- Limit paper deliverables to those required to know the project is on track and successful. Project integrity is often hindered when too much emphasis is placed on document development rather than system implementation.

9. Technical Platform

It is important that the platform be:

- Based on mainstream technology
- State-of-the-art and not at end-of-life
- Economical to acquire and maintain
- Pervasive in the industry to ensure availability of replacement parts and support resources
- Designed to meet the load and performance requirements of the solution

10. Functionality

Consider the following:

- Be precise about the meaning of "mandatory." Will not meeting a single mandatory requirement result in disqualification?

- For a COTS solution, the use of response categories for each function can assist by defining if the capability:
    - is in the base product and configurable "out-of-the-box" (requires no programming);
    - will be supported by site-specific (custom) programming;
    - will be supported in a future release of the product - should the new function be in beta test and demonstrable to qualify for this response?
    - is not directly supported by the product but will be supported through an interface to, or use of, other software; cannot or will not be supported.

11. Methodology

Ensure that the proposed methodology has been employed successfully (i.e. on time, on budget) to implement the proposed software for integrated tax administration for an agency of similar size and complexity.

Avoid an overly rigid scoring process. This can lead you to a vendor that looks good on paper but cannot substantiate its cost and experience claims.

12. Current Install Base

Require that the proposed solution has been in production for integrated tax administration for an agency of similar size and complexity for some minimum period of time, such as two full agency business cycles.

13. Vendor Record of Accomplishment

Require that the vendor and particularly the proposed key resources have implemented the proposed solution for integrated tax administration for an agency of similar size and complexity using the proposed methodology.

14. Vendor Financial Stability

Require that the vendor provide recent financial statements or other proof of stability.

15. Price

Consider a "best value" approach as an alternative to "low cost" when developing the scoring method. A best value approach is based on the combination of technical score and cost score.

16. Evaluation Approach

Avoid an overly rigid scoring process. This can lead you to a vendor that looks good on paper but cannot substantiate its cost and experience claims.

C. Alternate Method

The Oklahoma Tax Commission is using the Performance Information Procurement System (PIPS) in their current procurement process for an ITMS. PIPS is described as a "best value" selection and management process that can be used to purchase any type of product or service. The process provides clients with a tool to assist them in making an informed decision based on performance information and not based solely on price or marketing information. The process has a mechanism to document and manage the vendor/service during the project.

D. Preparing for the Project

1. Creating a Project Team

- Select a Project Champion - an agency executive or senior manager whose role is to promote the project both within and outside the agency including stakeholders who may be impacted by the changes. The Project Champion acts as the "cheerleader" for the project.
- Select a Project Sponsor - an agency executive who can provide high-level direction to the project and assume responsibility for approving all significant decision requests. The Sponsor also acts as the final level of issue resolution within the project.
- Establish a Steering Committee - comprised of senior user management and the project directors from both agency and vendor side. This committee assumes responsibility for deciding management, policy, and directional issues that affect the project, primarily from external sources. This committee should meet on a regular scheduled basis to discuss options, issues, and areas of concern. This forum also provides a venue to demonstrate new or upcoming project changes.
- Select a Project Communications Coordinator - Consider appointing a Project Communications Coordinator very early in project planning with the responsibility and authority to communicate the progress, needs, and accomplishments of the project. A critical task of this role is to inform staff and stakeholders of the project's progress and facilitate the flow of information for decision making. From time to time, the project Communications Coordinator will involve staff and other stakeholders to contribute.
- Consider an Independent Project Manager - An independent project manager can provide the link between the project stakeholders and vendors that will undertake the work. Additionally, the independent project manager will work with the vendor's project manager to form a team responsible for providing management of integration, scope, time, cost, quality, human resources, communication, and risks for the project.

2. Creating a Partnership Approach

In many implementations a "partnership approach" to project staffing is desired - some states have made this a requirement of the successful vendor. This approach helps ensure project success and incorporates good practices, into processes and plans and provides the basis for effective knowledge

transfer. The close day-to-day working relationship, between DOR/TAX and the vendor, should enable joint management and control of the project, manifested in several key areas:

- Support the open, unrestrained, and frequent exchange of information and ideas. This promotes efficient communication between the vendor's team and DOR/TAX representatives, stakeholders, and sponsors at the various organizational levels.
- Encourage direct participation by the DOR/TAX management team and stakeholders at meetings, status reviews, planning sessions, and via oversight activities.
- Invite the active participation and involvement of DOR/TAX managers in the measurement and control of risk and the resolution of problems and issues.
- Encourage active participation by DOR/TAX users in the development of testing plans, test material development, and actual testing to ensure we address actual user perspectives
- Ensure active participation by DOR/TAX technical staff (developers, support, and operations) in the installation of the environments and the development and configuration of the solution

DOR/TAX can begin planning and executing a data cleanup strategy immediately, even before an RFP has been issued and well before an implementation project begins.

DOR/TAX should require the successful vendor to align their working hours and holidays so the vendors are available to support DOR/TAX throughout the project. Additionally, because of its unique geographic location DOR/TAX should require the vendor to have a full time presence in the state during project implementation. Time lost due to fly-in/fly-out days prevents successful communication and does not provide responsive information exchange, effective executive oversight, or coordination with third-party vendors, user communities, or other stakeholders.

3. Preparing Data

Many revenue agencies contemplating a new ITMS are currently working with a suite of applications that are up to 30 or even 40 years old. Most of these applications outgrew their flexibility and expandability many years ago. Relaxed business rules representing the lowest common denominator of data edits may have resulted in inconsistencies, redundancies, and generally poor data quality overall.

The first step to prepare for conversion into a new system is to understand your data resource. The first step in doing that is to determine where to find the profound data resource knowledge. This may be in written documents but, all too often, written material is incomplete and out of date. Your best data resource information may come from your people.

DOR/TAX can begin planning and executing a data cleanup strategy immediately, even before an RFP has been issued and well before an implementation project begins.

Data cleanup should take a "work smarter, not harder" approach. Not all data needs to be cleaned - only the data that is likely to be converted. Two factors can help to determine what to clean:

- How old to convert, as governed by both statute and practicality?
- Which is the best source of redundantly held information?

Start by identifying the best sources, for example, where is the best address information, and cleaning the most current information in those sources. Automated means are preferable, but manual means may be necessary.

In addition to improving the data quality, the analysis needed to drive a cleansing process will be helpful in the conversion phase of a new system implementation. Time spent in reconnaissance is seldom wasted.

4. Determining the Location of the Project

One issue somewhat unique to DOR/TAX is that key employees needing to be involved in the day-to-day decision making during the implementation project are split between two locations, Juneau and Anchorage. This includes users who specialize in the same tax program and in some cases the same functional area. DOR/TAX needs to determine if the project staff will primarily be located in Anchorage, Juneau, or whether the project can operate with employees located in each of the two cities. The overriding issue to consider when making this decision is "What is the best location to ensure a successful project?"

When determining the project location, factors that should be taken into account include:

- Decision makers involved
- Staff buy-in to project decisions
- Interaction between project staff and system users
- Users and project staff needs for relocation or travel
- Communication capabilities between project staff at the two locations
- Strategy for knowledge transfer

VIII. Project Management Plan

This Project Management Plan (PMP) establishes the framework necessary for the execution of the procurement and configuration of a new ITMS for DOR/TAX. When fully populated, this framework for a PMP will outline the project scope, budget, configuration, resource requirements, and responsibilities necessary. This PMP will also outline the technical performance requirements for the management and control of the project from initiation through final delivery. The plan provides performance measurement criteria including major milestones. This PMP should be a living document subject to change as conditions warrant, or as project experience dictates.

A. Integration Management

1. Develop a Project Charter

DOR/TAX developed a project charter in 2008.[3]

2. Develop a Project Management Plan

This document serves part of that need as it begins to document the actions necessary to define, prepare, integrate, and coordinate a successful implementation of an ITMS.

3. Direct and Manage Project Execution

The process of tracking, reviewing and regulating the progress of the project to meet the objectives of DOR/TAX will be the responsibility of the project management team. DOR/TAX can make the team management selections mentioned in the previous section of this report before funding approval. DOR/TAX may also want to consider hiring an independent project manager.

Technology projects are high cost and high-risk endeavors. There are many examples of highly publicized failures. The successful projects have a number of things in common, one of which is a cohesive approach to overall project management.

Projects in Colorado, Idaho, Louisiana, Maine, Montana, North Dakota, and Utah employed an independent project manager with good results.

Projects in Arizona, New Mexico, West Virginia, and Wisconsin, have been successful without an independent project manager because the agency was able to dedicate and appoint talented resources from their own staff.

[3] Refer to the attached *Project Charter* for more information.

Some public sector agencies do not have personnel with proven project management skills or are unable to devote someone with the appropriate skills to the day-to-day details of coordinating a major technology implementation. Utilizing an independent project manager to provide professional project management services can add value to the overall execution and help ensure the success of an ITMS.

An independent project manager can provide a broader perspective from their exposure to similar projects. They can bring a working knowledge of proven project management methodologies and tools, system implementation strategies, and project risks. Hiring the right independent project manager with revenue system experience will bring an understanding of how ITMS implementations affect agency business processes, organizational structures, and resource requirements, enabling the project manager to help balance project needs with the continuing day-to-day activities of the agency.

A key benefit of using an independent project manager is the unfettered viewpoint they provide. They focus solely on the project, with no conflicting responsibilities within the agency. They have no organizational bias and are thus able to mediate controversial issues without fear of burning political or organizational capital. They are also independent of the system vendor, so they can provide an objective evaluation of status, help control project scope and manage change, and facilitate decision making. This independent viewpoint helps enable both the agency and the system vendor to focus on what they do best without distraction. Additionally, it facilitates the interaction between the agency's users and the vendor's project staff and provides an added level of confidence to outside stakeholders.

All projects involve change. Change management does not happen without a major change effort occurring in the organization.

4. Perform Integrated Change Control

All projects involve change. Change management does not happen without a major change effort occurring in the organization. Success of that change effort depends on a well-planned, well-executed, implementation program that prepares and enables stakeholders to utilize the new technology and adapt to the new work processes.

a) Sources of Change

Issues arising on the project normally take one of two forms, issues with differences in configuration and functionality or issues with and between personnel. Project management will concentrate on issue resolution at the lowest level and encourage open and effective communications between and within all levels.

The selected vendor should provide evidence of a method of managing changes to functionality in order to assist in scope management and provide a communication medium for the change. Subject matter

experts, team leads, and project managers must be empowered to devise solutions, present viable solutions for consideration, and make recommendations for change to ensure project success.

Not all people think alike. Expect differences in opinion, and celebrate the value different viewpoints bring to the project. Diversity of perspective can lead to a better result. It is only when the differences begin to adversely affect the project or take on a personal nature that intervention by the project management team becomes necessary. The vendor should strive to ensure all communications remain professional by providing team-building opportunities, learning opportunities, and issue resolution channels, thereby establishing a professional yet fun workplace early, and continually, throughout project execution.

b) Change Management Plan

DOR/TAX should ensure the successful vendor has a plan for both functional and/or configuration change management and business process change management.

The goals of a Change Management Plan are to:

- Facilitate the successful implementation of the ITMS
- Help DOR/TAX management anticipate issues, improve their change leadership skills, and manage risk related to the DOR/TAX staff's ability to adapt project-initiated changes
- Provide a framework for DOR/TAX to address the organizational changes resulting from this project

Normally, a project incorporates a Change Order process for situations in which the contemplated change will have a cost and schedule impact. Some non-cost and non-schedule decisions can be made informally by agency staff and management assigned to the project or within the executive oversight group. Between the two extremes of informal decisions and formal Change Orders, a Decision Request process can be helpful.

Specified in the Change Management Plan, Decision Requests are an established method of raising project scope problems, questions, or concerns in a timely, concise, and consistent way. Not all issues that come up during the project rise to the level of a Decision Request. The vast majority of issues will be resolved by the project team during the course of the project. For issues not resolved on the shop floor, a structured decision process with a Decision Request Form and associated procedures helps ensure the issues are presented to management in a complete and concise fashion. The issues are tracked through the decision-making process until resolved.

Additionally, a Decision Request Form helps ensure the team presents issues to decision makers in a complete and concise fashion. The form directs staff to include the issue origination date, the decision needed by date, and the project priority level. A Decision Request Form in conjunction with the Decision Request log tracks a decision from inception until resolution and serves as a historical archive for the project. When implementing a COTS product, for example, decision requests may take one of the following paths:

- Issue is determined a project issue
    - and is resolved internally by new, changed, or standardized business process.
    - and is resolved by a change in configuration (results in a Change Request).
    - and is resolved by a change to code (results in a Change Request).
- Issue is determined not a project issue and is resolved by changed communications.

Using change management techniques, communicated in a change management plan, DOR/TAX will be able to transform their current processes, technology, and work environment. With leadership forging the way, along with an involved group of stakeholders, an organization can manage and lead change effectively.

Human resource processes such as new organization design, job design, selection and performance management systems must be aligned with the future workplace to sustain lasting change. Technology can assist. In the course of preparing this project, it was noted that current performance metrics do not adequately provide clarity for managers nor do they provide adequate goals for the staff. The current performance measures are limited by the current technology.

These are ten common barriers to change which must be understood to successfully develop activities to avoid these challenges:

- Resistance to change
- Inadequate sponsorship
- Unrealistic expectations
- Poor project management
- Case for change not compelling
- Project team lacked skills
- Scope expansion
- No change management process
- No horizontal process view
- IT perspective not integrated

Employee resistance to change, inadequate sponsorship at the leadership levels, and the inability to manage expectations typically are the greatest challenge, especially if the overall program does not include strategies and actions to minimize these barriers. In addition, the lack of a developed case for change without a change leadership program makes it difficult for an organization to successfully transition.

The remaining barriers, team skills, scope expansion, no horizontal process view, and the IT perspective not integrated, are addressed through strong program and project management. A key message is that along with other important project areas, change is a significant component that must be planned and managed to successfully implement technology projects.

To obtain the goal of efficiency, DOR/TAX will need to build in transparency, create a flexible organization, and foster a culture that supports agency-wide teamwork, while maintaining individual accountability. To achieve this goal, DOR/TAX will need to review its organizational design and be open to job reclassification.

c) Business Process Reengineering

Installing an integrated tax solution is primarily a business process reengineering project. The solution incorporates and supports "best practice" tax administration, providing a suite of integrated tax functions that are designed to work together in a particular way. In addition to configuring the agency's business rules into the solution, the agency must "wrap itself around" those functions.

Throughout implementation and afterwards, opportunities for business process improvement (BPI) will surface. The new system will provide capabilities that were not previously available or it will simply take a different approach that supports streamlined business procedures. Occasionally, BPI opportunities will spawn or enable organizational changes – some of which may have been long contemplated and some which are newly devised.

While the agency should embrace these BPI opportunities, it is prudent to take a measured approach. Wholesale "boil the ocean" BPR and organizational change can actually hinder, or even endanger, an implementation project depending on an organization's capacity.

B. Scope Management

It is a natural tendency of internal stakeholders (and sometimes developers) to pile on additional requirements and enhancements that often substantially increase project risk, time, and/or cost. Effective control of the project scope involves collecting requirements, defining the scope, creating a work breakdown structure, verifying the scope, and controlling the scope. The independent project manager or state project manager in association with the vendor's project manager and the concurrence of the Project Steering Committee must have the ability to manage scope throughout the life of the project.

1. Collect Requirements

This report, combined with the previous research and studies performed by DOR/TAX since 2007 have provided a rich source of information that taken together can form the basis of the high level requirements for this project. The requirements will need further refinement, weighting, and revision for inclusion in a future RFP.

Requirements for a new tax system should include the following functional areas:

- Entity creation and maintenance
- Payment processing
- Returns processing
- Return issue / license renewal
- Non filer identification and processing
- Gap filer identification and processing
- Taxpayer transactions processing
- Refund processing

- Collections and compliance monitoring
- Taxpayer correspondence management
- Internet services for taxpayer self-service
- Integrated security
- Integrated reporting, OLAP cubes, analysis tools
- Integrated Imaging
- Revenue fund management
- Shared taxes processing
- Audit functionality and management
- Appeals case management
- Data capture and imaging support
- Integrated workflow management
- Data warehouse storage and management
- General case management
- Inventory management
- Interface capability

2. Define Scope

According to *In Search of Excellence in Project Management* (Kerzner, 1998), the scope statement becomes the basis for all future project decisions. Therefore, a clear understanding of project scope, its definition, and the manner in which scope changes would be implemented into the project is key to project success. Kerzner (1998) states, "Scope definition is extremely important to the success of any project" and "Scope 'creep' and scope 'leap' are often the root cause of project failure" (p. 13).

DOR/TAX defined the scope for this project in their *New Tax Revenue Management System: Project Charter* (ADOR/TAX, 2008) as follows:

> "A complete integrated tax processing software package, designed to support the Tax Division with the management of multiple taxes and licensing, and associated business and processing rules, with minimal changes to the program code – and meets state IT standards and federal (IRS) security standards. The package will support configuration covering almost all aspects of the system including returns, letters, penalty, interest, transactions (financial and non-financial) customer demographics, workflow, terminology and a robust user interface" (p. 5).

The scope of the ITMS project should contain the following components:

- Project management
- Implementation of the ITMS
- Implementation of hardware, software, and network infrastructure
- Conversion of legacy data
- Business process reengineering support
- Training of users, IT support staff, and management
- Documentation of site-specific procedures, processes and changed functions
- Post-implementation maintenance and support

The scope of the ITMS project should include all the functional activities for the following tax types:

- Oil and Gas Production
- Oil and Gas Conservations Surcharge
- Oil and Gas Property
- Corporate Income
- Tobacco
- Motor Fuel
- Alcoholic Beverages
- Commercial Passenger Vessel
- Large Passenger Vessel Gaming
- Vehicle Rental
- Tire Fee
- Mining License
- Fisheries Business
- Fishery Resource Landing
- Seafood Marketing
- Salmon Enhancement
- Seafood Development
- Dive Fishery Management
- Telephone Cooperative
- Electric Cooperative
- Gaming
- Estate

3. Create a Work Breakdown Structure (WBS)

Creating a WBS is the process of subdividing project deliverables and project work into smaller more manageable tasks. This report, building upon the previous work DOR/TAX performed, begins the process of creating a WBS by defining the objectives of the proposed ITMS project follows:

- Replacing all 17 official systems and over 100 MS Excel spreadsheets in side-systems, with one integrated system. Current legacy systems will be retired as the tax types they administer are integrated into the new system.
- Migrating all 22 tax types to a new ITMS better capable of serving the needs of Alaska's taxpayer base. The results of this project will provide for the technical and functional requirements of the identified taxes administered by DOR/TAX.
- Providing the ability to quickly adapt the tax types to the State's ever-changing tax laws and regulations
- Cleaning and preparing data for conversion from existing legacy systems
- Training users and operators to fully utilize system functionality
- Interfacing with current and new e-filing programs, including MeF
- Increasing compliance functions including non-filer, collections and audit
- Providing for data warehouse and integrated imaging capabilities
- Automatic distribution of shared taxes after user approval
- Configuration development that meets the State of Alaska and DOR's specific requirements while at the same time investigates potential process changes to improve efficiency and fairness.

Along with replacing the numerous MS Excel side-systems used to administer DOR/TAX's 22 tax types, work tasks during the project would also involve replacing and retiring existing legacy systems. TAX has identified the following systems for replacement with an ITMS:

- CPS
- TAS
- DEE Excise
- DEE Motor Fuel/Corp
- ASPR
- OTIS
- OPAL
- OVR
- EMR
- Fish and Game License Application
- Interest Engine for TAS
- UP Viewer
- Travel Document Image Viewer
- Oil and Gas Production Tax MS Access Databases
- Online Public Reports and Queries
- Gaming Stamp Manager
- Petroleum Property Tax Application

4. Verify Scope

DOR/TAX will perform this step when formally accepting the list of deliverables.

5. Control Scope

The project management team will control the scope by measuring, monitoring, and reporting on project metrics throughout the project. Project performance measures will assess the variance from the originally determined scope when requests for changes arise. When change happens, the project management team will update the associated project documents and stakeholders will receive communications that reflect the change.

The requirements documentation will form the basis for the scope. The team will use one or more of the following methods to track the variation from the base scope:

- Work completed vs. schedule
- Cost vs. budget
- Performance vs. expectations
- Open issues review
- Updated risk assessment

C. Time Management

1. Define the Activities

The WBS developed during scope development will aid in creation of the work packages necessary to accomplish the objectives envisioned. The project management team will perform this step during the initialization phase of the project.

2. Sequence of Activities

Once all the activities are known, the project management team will sequence the specific activities necessary for completion of the project. One of the important decisions to make for this type of project is which tax type(s) to implement first. This is a decision that will need inputs from the vendor, the independent project manager (if one is used) and the units involved. Factors that can influence the decision to implement one tax before the other are:

- Current processing capability
- Expected changes to legislation
- Current hardware limitations
- Due date for tax types
- Group readiness, or personnel availability, and impact on current group workload
- Other taxes implemented at the same time

3. Estimate Activity Resources and Durations

In finalizing the schedule during project initialization, the project management team will need to take into consideration the resources from the vendor and the user groups. These kinds of projects require

coordination with SMEs, project management, and developers to ensure testing, training and phases of implementation happen at specific points in the schedule.

4. Develop the Schedule

The project management team will develop an estimated project schedule prior to the project kick-off meeting. The schedule may be revised as situations dictate during implementation. However, projects tend to finish on time when the schedule is a driving factor and everyone is dedicated to meeting the schedule. The schedule will contain milestones for deliverables, wherever applicable. DOR/TAX developed a primary sample schedule in 2009 as a representative project schedule. Although envisioned as a 5-year plan, the project might be completed sooner depending on resources and requirements. DOR/TAX should allow the prospective bidder to propose a project schedule that meets the division's baseline criteria. The proposed schedule created by DOR/TAX is shown in the *TRIMS* (ADOR/TAX, 2009) report.

5. Control the Schedule

After the Project Management Team develops the project schedule depicting interrelationships of tasks and activities, milestones and durations the team will then implement the schedule and begin to manage and monitor the schedule to ensure project completion.

During implementation while reviewing progress reports and reports of other performance measures the Project Management team will forecast changes necessary to the schedule. When forecasts indicate a need to change, the team will assess those changes against both the schedule and the scope.

One of the best methods to ensure the control of the schedule is to ensure all stakeholders stay informed of issues relating to that schedule. In this instance, communication is the key to an effective schedule.

D. Cost Management

The cost section of this report provides alternatives, estimates, and comparisons for funding, costs, and methods used to pay for an ITMS project. When DOR/TAX and its funding authorities make those determinations, the project management team will be the key leaders to ensure the project stays within the budget. Some of the techniques the project management team will use to control costs are:

- Ensuring that all change requests are acted upon in a timely manner
- Managing changes when they happen
- Monitoring work performed

E. Quality Management

Providing a quality product on schedule and within budget is the primary objective of all team members. DOR/TAX must ensure the selected vendor has a plan for testing and metrics for quality control. DOR/TAX must measure quality by the degree in which the vendor meets the requirements and provide

feedback quickly and accurately. The project management team must insist on meeting project objectives in such a way as to:

- Prevent overworking the project team
- Provide enough time and resources to adequately detect errors early in the process

Quality principals from the *PMBOK Guide* (Project Management Institute [PMI], 2008) stress the following:

- Customer satisfaction: For this project, customer means all stakeholders including DOR/TAX users, managers, and taxpayers. The stakeholders must be able to notice a change for the better.
- Prevention over inspection: The vendor must employ quality methods, using verifiable tools and metrics to ensure they design and build a product with quality in mind.
- Continuous improvement: The selected vendor must learn and adapt and so must DOR/TAX. These projects are all about change and improvement of the current state. All changes should measure up to improvement.
- Management responsibility: Success in these types of projects depends heavily on management involvement. Even if DOR/TAX elects to hire an independent project manager, the management responsibility to provide quality people, quality advice, and prompt decisions to the project remains.

F. Human Resources Management

The processes described in this plan supplement existing regulations for establishing more detailed and specific relationships among stakeholders participating in this project.

1. Develop Human Resources Plan

In the 2008 project charter, DOR/TAX identifies specific individuals, the skills, and the roles necessary for the project. In some implementations, the personnel dedicated to the project change positions within the organization and their previous positions remain unfilled for the duration of the project. In other organizations, the people move back to their previous positions upon project completion.

Before the project begins, and before assigning personnel to the project DOR/TAX should determine:

- Who will project members report to?
- How will the assignment to the project affect positions?
- What happens when the project ends?

One of the most critical roles on an ITMS project team is the SME. These projects are often more of a business process redesign than a technology upgrade. That makes the expertise of a SME a valuable and essential resource worthy of close management. Some key considerations for SME management follow:

- Trust is an important selection criterion for a SME. Often the agency knows they selected the right person from the unit if it is painful to give them up for the project. The sacrifice of valuable

resources made during project execution will make a huge difference. The SME needs to be trusted to make good decisions and have the backing of their management in order to be successful.

- A SME's responsibility is to represent accurately their business units' needs to the Project Team, and to validate the deliverable. SMEs also carry information about the project back to their user community and assist with effective communications to other stakeholders. During each rollout, SMEs will test the product and perform tasks normally performed by the user community. SMEs are often the best source of feedback to the project team.
- SMEs should be co-located with other project team members to ensure day-to-day contact and effective knowledge transfer. SMEs co-located on to the shop floor often learn more about the agency and are exposed to all aspects of the system. Skills of SMEs often expand beyond their previous legacy job description.
- Often, at the close of a project, the SMEs receive recognition as system experts, and provide a very valuable resource to the agency. Proper planning, early in project implementation, for post-project usage of the SME's skills is essential to maintaining them as a resource long into the future.

2. Acquire Project Team

Another important consideration is the on-boarding of project team members. When team members join and leave the team has significant impact on the project and the implementation. Key members such as the project managers and leads should begin and end the project to maintain continuity throughout the implementation. SMEs can join the project and leave the project when it moves into areas outside their expertise. The human resources plan created by the project management team prior to the kick-off meeting should communicate to all stakeholders when the project will need certain members for the project.

3. Develop Project Team

Our experience has demonstrated co-location greatly facilitates involving business experts not otherwise assigned to the project in the discussions and decisions related to the new system. Co-location also facilitates team interaction, improves the competency of individuals, and enhances the project performance. DOR/TAX should also work with the selected vendor to:

- Ensure developers have or obtain the minimum qualifications for the technology used
- Establish conditions to allow effective knowledge transfer
- Provide numerous and varied opportunities for learning new processes and procedures

4. Manage Project Team

Effective communication will assist in managing team performance. Providing feedback, and being proactive when issues arise, will optimize team performance and help to ensure success. The project management team will establish project standards to influence the project team and set professional and ethical standards.

G. Communication Management

Effective and appropriate communication is the key to an efficient organization. Furthermore, effective communication is important to the successful delivery and completion for DOR/TAX because it helps to align everyone to a common goal. Throughout implementation, clear and timely communications will help ensure DOR/TAX has the information required to make informed decisions on the implementation. It will also help to ensure the user community not only adopts but also welcomes the new system.

Another purpose of communication planning is to ensure the core and extended project team members develop an effective communication strategy for affected stakeholders. Important to the project communication strategy is identifying key stakeholders, developing accurate and consistent messages, and delivering the messages effectively. Successful project team communication depends on all core and extended project members playing a role and taking personal responsibility in the messages they deliver.

Effective, comprehensive, and coordinated communication is also a fundamental component of sound project management. Accordingly, developing and executing a thorough communication plan is a critical success factor in implementing a new system.

DOR/TAX should ensure the selected vendor proposes a coordinated communication plan used to identify communication targets and sources, messages that will satisfy the informational needs of those targets, messages that DOR/TAX need to hear from its sources, and the most effective methods for delivering and receiving those messages.

H. Risk Management

According to the *PMBOK Guide* (PMI, 2008), project risk management comprises the processes concerned with identifying, analyzing, and responding to project risk. It includes maximizing the results of positive events and minimizing the consequences of adverse events.

The processes include:

- Determining risks likely to affect the project and documenting the characteristics of each
- Evaluating the risks and risk interactions to assess the range of possible project outcomes
- Defining enhancement steps for opportunities and responses to threats
- Responding to changes in risk over the course of the project

1. Identified Project Risks

When embarking on an integrated tax management project, DOR/TAX leaders will face several risks and challenges. One of the major risks to an implementation project is the desire to replicate exactly all functions previously performed in legacy systems. Working together the project manager team with the advice of the SMEs and the Team Leads can usually come to an agreed upon solution that provides the functionality necessary for users to be productive.

Other risks to the project include:

- Assisting managers of affected areas in balancing productivity while transitioning between legacy and the existing standalone applications to the new environment
- Finding the right way to involve everyone in the organization in the project
- Carefully monitoring and attending to the redirection needs
- Focusing on creating the new environment
- Defining the staffing requirements
- Developing and implementing policies to meet those needs
- Maintaining positive moral and helping the DOR/TAX staff transition from the legacy systems to the new ITMS

2. Risk Mitigation

To mitigate project risks, the project management team must develop a risk management plan as a subset of the project plan. The plan must identify and document the risks that are likely to affect the outcome of the project. The managers must also be able to evaluate and quantify each risk and assess the range of possible outcomes. In other words, the managers must be able to distinguish between high-risk problems and low-risk problems. In many cases, the risk may not warrant a response, but when the risk is significant, the managers must be able to develop a risk response plan and take the necessary actions to mitigate the risks in accordance with the risk management plan.

There are steps DOR/TAX can take during the procurement and planning stages to minimize risk. Among these are seeking a proven solution, seeking a proven vendor, seeking a proven approach and planning for risk management during the project.

a) Seeking a Proven Solution

Reviewing information technology implementations in general and tax systems in particular, the research history shows IT projects fail to meet expectations because the solution does not match the problem.

For an ITMS to qualify as "proven," consider the following requirements:

- The solution should be in production and operating for at least two complete fiscal business cycles (typically, two years).
- The solution should be in production at multiple tax agencies of similar size, complexity, and legislative framework.
- The solution should perform the core tax administration functions, including registration, returns processing, payment processing, accounting, refunds, collections, debt management, filing and payment compliance, audit, and revenue accounting.
- The solution should offer integrated supporting functions such as division-wide communications, security, workflow, imaging, correspondence, reporting, query, data analysis, data warehouse, data mining, leads management, and taxpayer self-service.

- The solution should perform the above functions for multiple tax types, including *all* of the major taxes and *most* of the minor taxes performed by DOR/TAX.
- The solution should be upgradable, extensible through configuration, and not at the end of its technological life-cycle.

b) Seeking a Proven Vendor and Approach

To qualify a proposing vendor as "proven," consider requiring the vendor has a proven record of accomplishment on multiple successful implementations using the proposed software for integrated tax administration and using the proposed implementation methodology.

c) Managing Risk during the Project

Project risks are uncertainties or vulnerabilities that may have an adverse effect on the project. Since every project carries some element of risk, it is important to manage risk proactively and through a well defined risk management process.

The risk management process seeks to minimize the impact of unplanned incidents on the project by:

- Identifying potential risks
- Analyzing risk characteristics
- Developing risk mitigation strategies
- Continuously tracking risks and mitigation strategies until danger has passed

The project's risk management plan should include the following:

- Roles and responsibilities of the participants
- Monitoring and control
- Escalation
- Risk analysis – a typical risk management matrix:
- Identification – What is the risk?
- Trigger – What is the event (if any) that could trigger the risk?
- Timeframe – When is the project exposed to the risk?
- Probability – How likely is the risk trigger to occur?
- Impact – What is the consequence of the risk?
- Severity Matrix – How will that consequence affect the project?
- Response Planning – What can be done to mitigate the risk?
- Contingency Planning – What can be done to recover from the consequence of the risk?

I. Implementation: Factors Leading to Success

In our experience, there are certain contributing factors that can greatly influence a project's outcome. Those that are within the influence of the agency are discussed below in terms of:

- Leadership support
- Staffing support
- Logistic support
- Technology support

1. Leadership Support

Activities in this area help leaders manage the change more effectively. Leaders must set focus and commitment, and create inspiration for people to change. Given that, leadership needs to commit to specific roles, responsibilities, and actions to lead the change initiative.

The following addresses leadership alignment and actions:

- Leadership alignment that ensures the leadership team embraces and commits to the vision of change - same goal, direction, and talk.
- Leadership action that focuses on encouraging the leadership team to develop tangible action plans and execute these plans to support change.
- Leadership management that sets direction, defines culture, and establishes structures and processes

As a result, it is critical to the success of the project that key decision-makers and top leadership remain engaged in the project through its completion.

The installation of an ITMS is a significant task. Inherent in any system change of this magnitude is a myriad of reactions to those changes within DOR/TAX. As a result, it is critical to the success of the project that key decision-makers and top leadership remain engaged in the project through its completion.

Leadership must make a clear and frequent message throughout DOR/TAX that the initiative is critical to the future success of the organization. At project kick-off and subsequent milestone events, DOR/TAX executives should deliver supportive acknowledgements to their employees. It is helpful for the leadership to discourage actions that undermine the project team's efforts such as unfounded negative comments.

In order to keep moving forward and on-track, DOR/TAX must make decisions timely. Our experience has shown that there must be a process in place for effective decision-making, and there needs to be

one person involved with the project who has authority to make decisions when there is a stalemate on a critical decision point.

One of the significant contributors to project failure is uncontrolled expansion of project scope. It is important for everyone to support fully the notion that the project's primary responsibility is to get the agreed-upon components of the project completed first.

Adherence to the project timeframe is imperative. DOR/TAX should communicate this expectation to everyone on the project and within the organization. Projects can stall for a number of reasons. Once the Project Management team allows a modification of the timeline, delays become inevitable. Project staff will generally respond and deliver when the leadership informs them there will be no tolerance for delays or missed milestones.

A new system provides an opportunity to adopt new best practice business processes. However, management must be open to new ideas and support the team through the change resistance that may occur. In some cases, those business practices are deeply ingrained in an agency and there can be significant resistance to change. There may even be situations where agencies have sponsored legislation because of legacy system limitations.

2. Staffing Support

It is vital that the project team has the staff it needs to operate. From experience, we have found that personnel involved in the project need to be free from their normal assignments, and that those assignments may need to be backfilled to eliminate the temptation of pulling team members off the project.

Three key factors in meeting adequate project staffing needs:

- Agency information technology staff should fully participate in the implementation
- Agency subject matter experts and users should participate at levels necessary to meet project deliverables and commitments
- Appropriate staff should be available to participate in a train-the-trainer training approach

Perhaps the most long lasting contribution to the success of the project for the organization to make is often the most painful. If you assign someone to the team and it hurts to release them, then you have usually selected the right person. Consider this an investment in your agency's future.

3. Logistic Support

Be prepared to provide accommodations for the project team with the following features:

- Office space - Ideally, the project team will have an office area that is co-located with agency staff. Although a separate workspace is acceptable, we have found that the co-location approach greatly facilitates involving business experts not otherwise assigned to the project in the discussions and decisions related to the new system.

- Worksite access - Project staff will likely require 24x7 access to the project worksite.
- Meeting space - The project team will need frequent access to meeting rooms.
- Workstations - Each project team member will need a workstation and connectivity.
- General office equipment - The project team will need the usual business office accessories.

4. Technology Support

For the most part, technology support will depend on the solution. The project team will need access to make changes to databases and application servers with the proper security to implement the ITMS solution and perform configuration as necessary. Local area network access, email access, and associated hardware support are often peripheral, yet essential, to project success.

APPENDIX B – External Stakeholder Interview Questions

Q1: Tell me about your interaction with the Tax Division – which areas of the agency do you typically interact with?

Q2: (Share Tax Division's Mission and Vision). What is your general reaction to the Tax Division's Mission and Vision? Is it appropriate? Does it look like they're focusing on the right things? Is anything missing?

Q3: Based on your interactions with the Tax Division, are there a few words that aptly describe their general reputation?

Q4: In your opinion, is there anything the Division should be doing to improve tax administration? Are there areas that should receive increased attention and focus?

Q5: Are there additional services you would like to see the Tax Division provide to taxpayers?

Q6: Are there valuable services the Tax Division currently provides that you want to make sure they continue providing in the future?

Q 7: Is there any other feedback you would like me to share with the Tax Division?

APPENDIX C – Mission and Vision External Feedback

TAX desired contributions from external stakeholders to serve as an input for this study, and to provide validation prior to an annual review of its vision and mission statements. FAST interviewed 20 stakeholders including taxpayers, association representatives, legislators and legislative staff, state agency personnel, and a local government representative. After sharing a copy of the previous mission and vision statements, the questions posed to stakeholders were:

- What is your general reaction to TAX's mission and vision?
- Is it appropriate?
- Does it look like they're focusing on the right things?
- Is anything missing?

General Reaction and Comments

Feedback ranged from the vision and mission "look straightforward and complete" to several comments noting that the statements are "quite a blend of things" and that TAX could "tighten up their focus with fewer statements." One stakeholder observed, "A focus on fairness, efficiency, and effectiveness would seem about right." Another stakeholder put it this way:

> "They're not focused on the wrong things, but where do they place their emphasis? If they're focused on too many different things, they can't effectively focus on their central purpose which is collecting taxes to fund government services."

Mission: Collect taxes, inform stakeholders, regulate charitable gaming

Several stakeholders noted that collecting all the revenues due the state is TAX's primary purpose and is properly prominent in the mission statement.

A few interviewees had questions about the phrase "inform stakeholders." Several seemed unsure exactly what the phrase intended to communicate, "Inform them about what?" Who do they mean when they say "stakeholders?" One noted, "*Inform stakeholders* seems a little weak – it's more important to cooperate and partner than to inform." Another observed, "Being a resource to other agencies in the executive branch and to the legislature is important – it might be nice to go beyond *inform.*" Another added, "They don't say anything about playing well with others in state government and getting along well with the legislature."

Increase revenue collections and compliance

The most frequent comment throughout all the interviews was directed to the statement "increase revenue collections."

One stakeholder explained,

> "I'm not sure what the Tax Division means when they say they're trying to increase revenue collections. Shouldn't they just be trying to collect the correct amount that is due? Increasing compliance makes sense, but simply *increasing revenue collection* sounds like they're just out for money – even if taxpayers are already paying what they owe."

Another observed, "Trying to move the compliance needle closer to 100% is important. Collecting all the revenues that are due and doing it efficiently and effectively is important, too. But simply *increasing revenue* seems to communicate the wrong message." Another interviewee mentioned that accuracy is important in saying, "Collecting the right amount – no more and no less – should be part of their focus."

Others added that TAX should emphasize the concepts of simplicity and clarity:

> "It's not just about collecting money from taxpayers – the agency's focus should be making it as easy as possible to pay what you owe. It's like going to the dentist – you want the experience to be as painless as possible."

And:

> "Clarity of tax application is also important. As a taxpayer, it's hard to know what to report and providing clear instructions is part of the job."

The public has confidence in the division's integrity, efficiency, and fairness

Several stakeholders noted the importance of operating efficiently. Stakeholders specifically reminded us of the need to report the same information many times and in many different ways to satisfy TAX's various systems. One stakeholder said, "It's good they want to focus on efficiency because the Tax Division's inefficiency makes taxpayer interaction with the division inefficient."

Customers receive excellent service

Many persons interviewed commented on the importance of good customer service. One clarified,

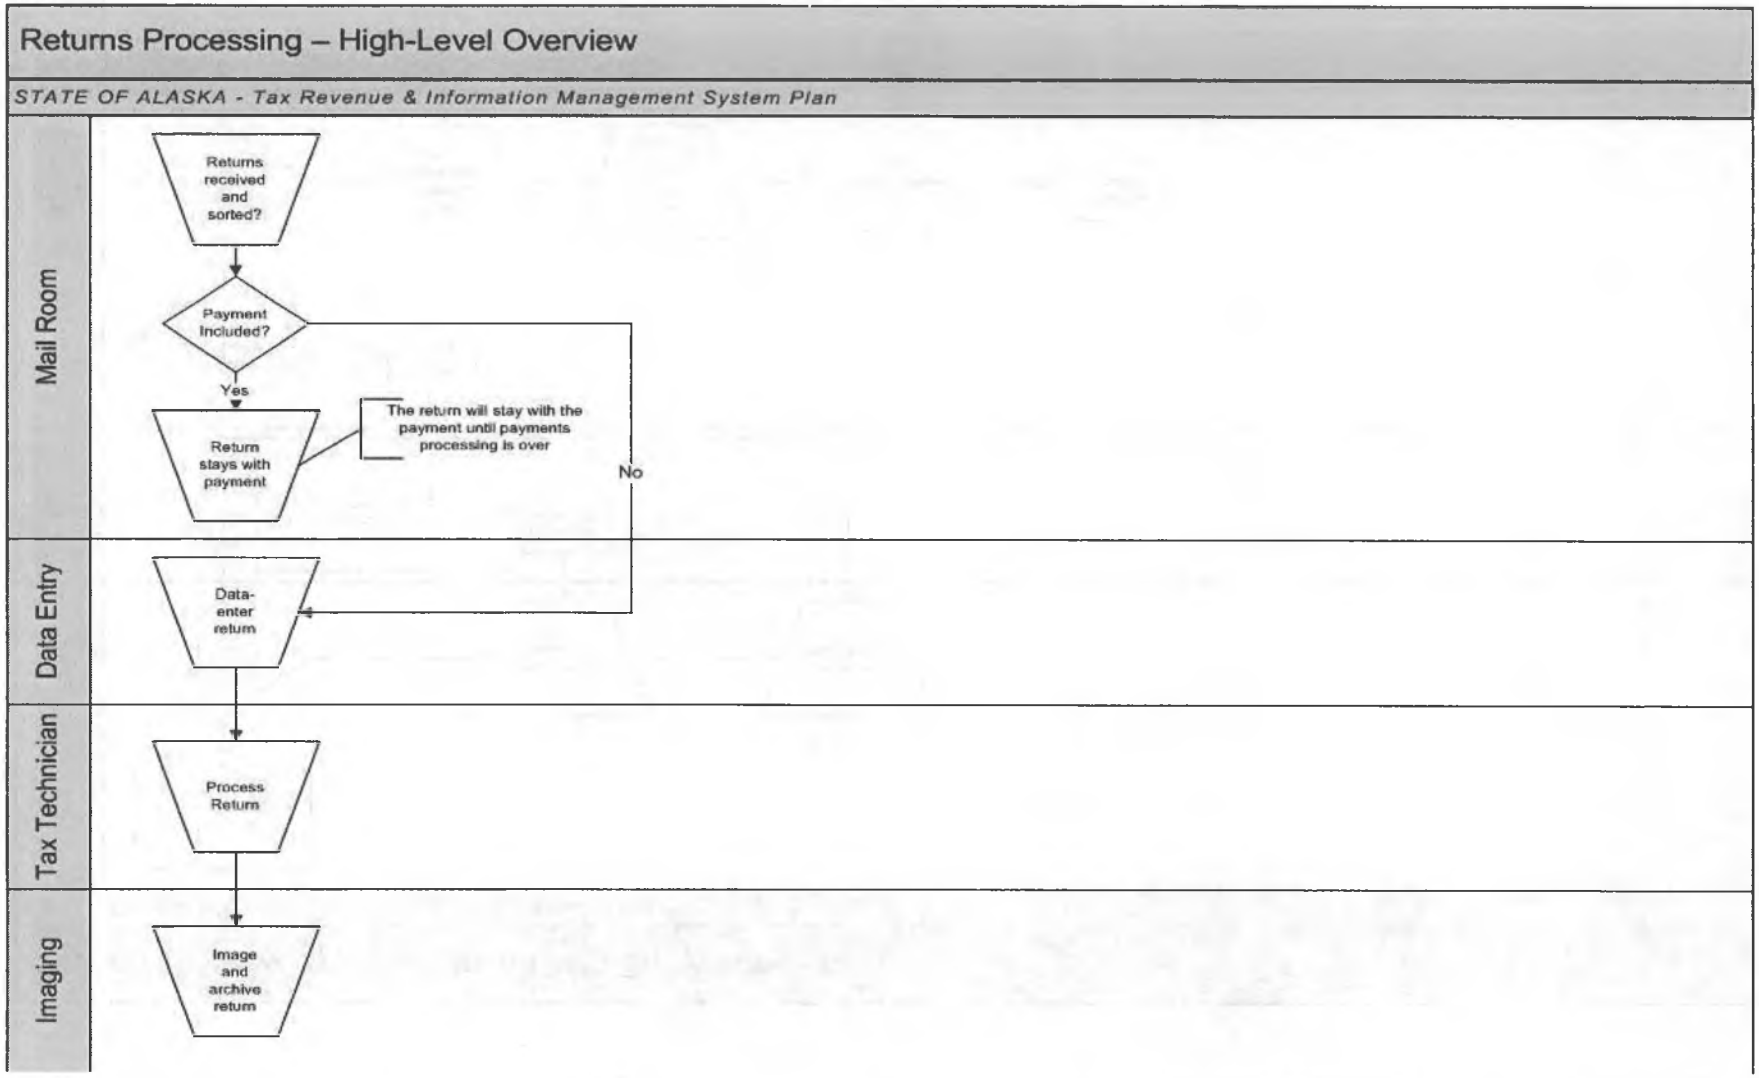
> "It's not just about friendly service. If you have to call up five times to get the information you need, it's nice to talk to a friendly voice five times. But efficient and competent service is important, too. They should be able to provide the information you need quickly and easily."

The division maximizes the use of technology in its business processes; the division has online filing for each program it administers

Most stakeholders commented on the two vision statements addressing technology. There was concern that the statement implied using the latest technology just because it is new. "The important thing is to use technology wisely and effectively." The most frequent comment questioned the idea of *maximizing* the use of technology. One stakeholder explained:

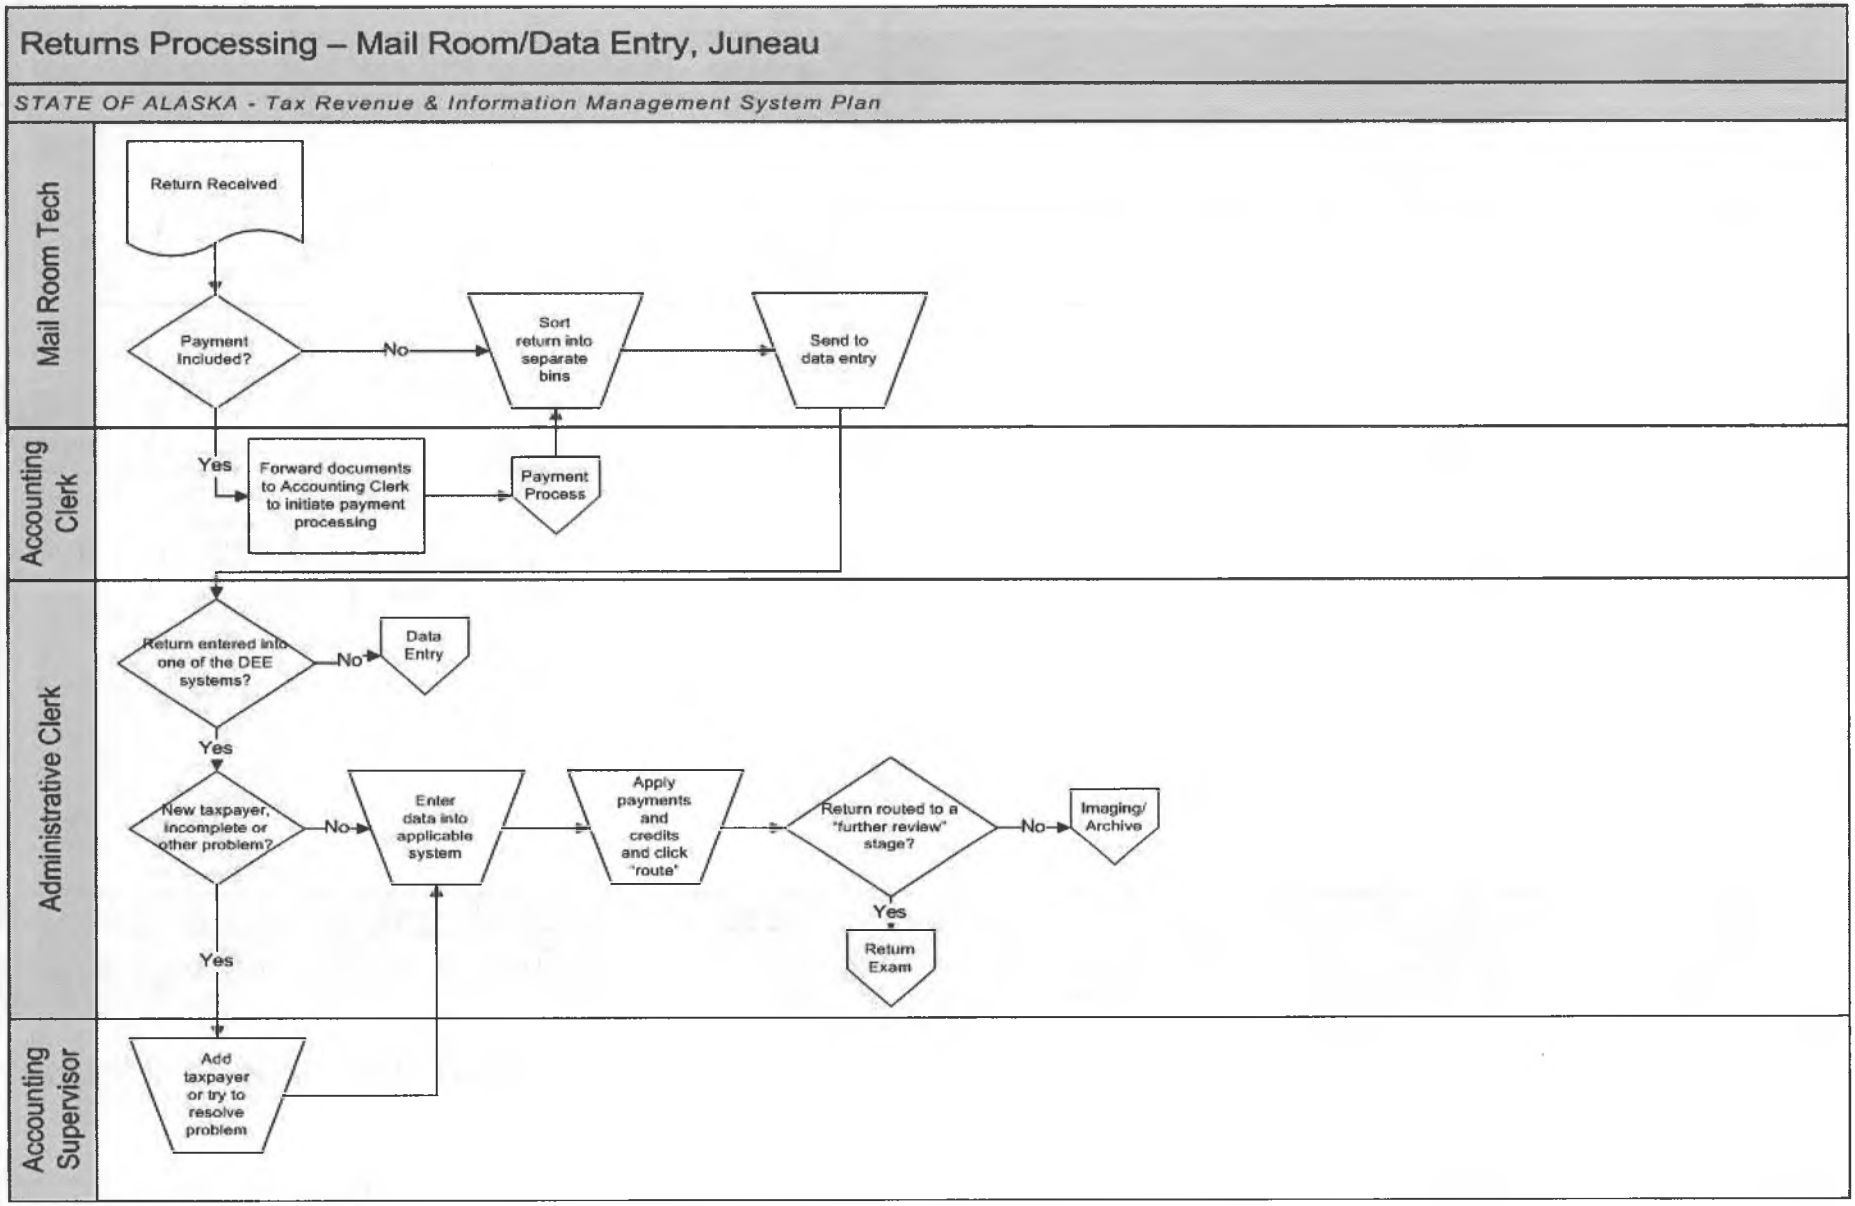
> "It's not about arbitrarily using technology to the max – you use technology to improve customer service or increase the public's confidence in the Tax Division. Technology is a means to achieve the division's goals."

Another person also highlighted this area and reiterated:



> "We don't want the Tax Division chasing all the latest technology just so they can have the new stuff. What's important to taxpayers is a stable platform, not something that is changing all the time."

Several thought the two technology statements were redundant and noted they both connected to efficiency. Several taxpayers also stated that they hoped TAX understood that online filing is more than just the ability to fill out a form on the Internet. Specifically, one person put it very simply:



> "The Tax Division needs a better platform to ease electronic reporting. What's needed is electronic data interchange."

February 28, 2011

Honorable Members of the
Alaska State Legislature

The Honorable Sean Parnell
Governor
State of Alaska

The Honorable Daniel R. Levinson
Inspector General
Office of the Inspector General
U.S. Department of Health and Human Services

We are pleased to transmit the Single Audit of the State of Alaska for the fiscal year ended June 30, 2010. The audit was conducted in accordance with auditing standards generally accepted in the United States of America; *Government Auditing Standards* issued by the Comptroller General of the United States, and complies with the federal Single Audit Act Amendments of 1996 and the related *OMB Circular A-133* issued by the U.S. Office of Management and Budget.

The report includes an opinion on the basic financial statements of the State of Alaska for FY 10, recommendations on financial and compliance matters, and required auditor's reports on internal controls and compliance, and the Schedule of Expenditures of Federal Awards.

The findings and recommendations included in this report are organized by department and include prior financial/compliance findings not fully corrected by the departments. Our FY 09 Single Audit contained 25 recommendations; this report presents a total of 30 recommendations, eight of which were presented at least in part last year. Included in this year's recommendations are four recommendations made to Alaska Housing Finance Corporation whose audit was performed by other auditors. With your active support and encouragement, we hope to continue seeing improvement in the implementation of these recommendations by the state agencies.

We would again like to acknowledge the professional assistance and cooperation of the Department of Administration's Division of Finance. The division has a strong professional commitment to excellence in the financial accounting and reporting for the State of Alaska. Its continued efforts towards resolving statewide accounting and reporting concerns are commendable.

We would also like to acknowledge the cooperation of all other state agencies involved during the conduct of this audit.

The dedicated staff of the Division of Legislative Audit remains committed to improving the financial accountability of the State of Alaska. Your active involvement is critical to improving that accountability. We are available to assist you in that effort.

Pat Davidson, CPA
Legislative Auditor

DEPARTMENT OF REVENUE

One recommendation was made to the Department of Revenue (DOR) in the *State of Alaska, Single Audit for the Fiscal Year Ended June 30, 2009*. Prior year Recommendation No. 2 is not resolved and is reiterated in this report as Recommendation No. 4.

No new recommendations have been made during the FY 10 statewide single audit.

Recommendation No. 4

DOR's commissioner should ensure staff within its Tax Division implement controls to improve the auditing of oil and gas severance tax revenues.

Prior Finding

In FY 08 and FY 09 significant deficiencies in controls were reported over the auditing of severance tax revenues by DOR's Tax Division. Control deficiencies included insufficient audit oversight, a lack of standard procedures to guide the audit process, inadequate reviews of audits, and untimely reviews and reconciliations of tax returns.

Title 43 of the Alaska Statutes gives DOR the authority to collect tax revenues for the State and to ascertain the correctness of such revenues. The department's main tool for ascertaining the correctness of severance tax revenues is its Tax Division audit section. There are no statutory requirements that DOR's tax auditors conduct their audits in accordance with industry audit standards such as those issued by the American Institute of Certified Public Accountants or the Government Accountability Office. Historically, DOR's audit section has relied upon standard audit programs and supervisor review and oversight to ensure that their audits are timely, accurate and that audit results can withstand the scrutiny of the administrative appeal process and, in some cases, litigation.

With the passage of PPT[2] and ACES[3] legislation, management's controls over the auditing of severance taxes deteriorated. The new laws are more complex to audit. The hiring and retention of experienced, competent audit staff has proven challenging. Delays in drafting PPT and ACES regulations have further disrupted the audit process.

Legislative Audit's Current Position

Significant control deficiencies continued over the auditing of oil and gas severance tax revenues in FY 10. A loss of experienced audit staff during FY 10 compounded the struggles that the audit section was already experiencing.

Our review of DOR's oil and gas severance tax audits and inquiries with DOR staff noted the following deficiencies:

- The division continues to conduct audits without developing standard processes including audit plans and procedures.
- A significant portion of an audit's methodology and results were insufficiently documented.
- The deficiencies in audit documentation forced the tax section to issue a less detailed report than what is issued as part of their standard report format.

[2] *Petroleum Profits Tax* (enacted in August 2006).
[3] *Alaska's Clear and Equitable Share* (enacted in November 2007).

- Audit supervisors did not review and approve audit methodology prior to audits being conducted.
- Audit supervisory reviews were limited, sporadically documented, and only conducted at the end of the audit.

Oil and gas severance taxes, totaling approximately $2.6 billion in FY 10, are a significant source of revenue for the State of Alaska. Insufficient internal controls over the auditing of severance tax revenue may result in the loss of revenue and increase the risk that tax revenue assessments will not hold upon appeal.

We recommend that DOR's commissioner take action to ensure that Tax Division management improves controls over the auditing of severance tax revenues. Specifically, standardized audit processes should be developed and implemented. Auditors also need more oversight and timely feedback during the audit process.

Agency Response – Department of Revenue

Item 1: *The division continues to conduct audits without developing standard processes including audit plans and procedures.*

Response: *We disagree. The division is, and has been, in the process of developing standard processes including audit plans and procedures. Development of standard processes is an ongoing project. As you are aware, the legislature significantly changed the way oil and gas production tax is calculated with the passage of the Petroleum Profits Tax (PPT) in 2006. In 2007, the legislature made further changes to the production tax through the passage of Alaska's Clear and Equitable Share (ACES) legislation. These two major pieces of legislation completely overhauled the production tax scheme and instituted a new tax credit program. The Division has worked diligently over the last four years to implement the changes while continuing to work on audits of tax returns filed under the previous tax structure. Implementation includes not only developing standard processes, but also drafting regulations, hiring and training new auditors, developing tax return forms, establishing tax credit audit and examination procedures, educating taxpayers, and various other duties that accompany the implementation of what is basically a new tax program. You are aware that the oil and gas production tax is administered without automated systems. This means that all processes are performed manually which further strains the Tax Division's limited resources. Although development of standard processes is not yet complete, this does not mean that the Division is not and has not been working on developing those processes.*

Item 2: *A significant portion of an audit's methodology and results were insufficiently documented.*

Response: We agree. The audit in question was started by a highly experienced individual who retired a few months after the audit was opened. The audit was then

transferred to another senior auditor who resigned his position before the audit was completed. The audit was transferred yet again to another senior auditor who had to quickly familiarize himself with all issues within the audit and complete the audit within a short period of time. As stated above, oil and gas production tax audits are conducted without the assistance of automated systems. All audit work, including transaction sampling and testing, is performed manually. Data for this particular audit included over 2 million documents with thousands of transactions per document. During the course of the audit, the auditors manually tested over 1 million transactions. The time it took to perform the manual testing caused the auditor to run out of time to complete proper documentation of audit findings prior to expiration of the statute of limitations. The Tax Division took the position that it was in the best interest of the state to issue the audit with insufficient documentation and with a less detailed audit report than to miss the statute of limitations and, in effect, issue no audit at all. The auditor was instructed to issue the audit, but continue to document audit findings and complete the audit report after the fact. The taxpayer was informed that it would receive a more comprehensive explanation of our adjustments at a later date.

Item 3: *The deficiencies in audit documentation forced the tax section to issue a less detailed report than what is issued as part of their standard report format.*

Response: *We agree. See explanation under Item 2, above.*

Item 4: *Audit supervisors did not review and approve audit methodology prior to audits being conducted.*

Response: *We agree, but disagree that this in an issue. It is not common practice for the Tax Division to approve audit methodology prior to audits being conducted. Audits are assigned to auditors based on their level of experience and their job class. Audits of the largest oil and gas production taxpayers are assigned to Oil and Gas Revenue Auditor IV's (OGRA IV). Under the class specifications, OGRA IV's "serve as lead auditor having complete responsibility for the largest oil and gas production tax . . . audits." The particular audit in question was assigned to an OGRA IV who was required to perform the audit with no day-to-day oversight. Audit methodology is at the auditor's discretion provided, however, that the end result is that the auditor has accurately evaluated tax liabilities. As stated previously in this letter, the Tax Division is still implementing what is essentially a new tax program and specific audit methodology has not yet been defined for these audits.*

Item 5: *Audit supervisory reviews were limited, sporadically documented, and only conducted at the end of the audit.*

Response: *We agree. Audit reviews in all programs are conducted at the end of audits. That is common practice in all audits in the audit profession. We also agree that supervisory reviews were limited and sporadically documented in some of the audits closed during the fiscal year. Again, this was due to the continual implementation of PPT, ACES and the new credit program. Implementation has put a strain on audit resources. Money requested to continue contract audits has been reduced which put further strain on our resources.*

However, management continually communicates with staff on tax issues via meetings and emails, and has discussions about the proper application of statutes and regulations. As a result of the poor documentation of the audit identified in issues 2 and 3, management has instituted the practice of meeting with the audit leads and team members on the largest audits at least once a month to discuss the progress of the audit and any issues that may have arisen that require management input.

The bulk of the findings in the audit report are attributable to:

- *staff turnover, particularly at the supervisory level;*
- *the inability to recruit senior level auditors at current pay levels, despite intensive recruitment efforts over the last two years; this means (1) less experienced auditors are working major audits, and (2) supervisors are having to spend time conducting complex audits, instead of using that time to supervise and developing audit manuals, processes and procedures; and*
- *lack of automated tax processing systems to manage and share information; this dramatically increases the amount of time needed to complete audits and review returns, and thus, siphons resources away from program development.*

As junior auditors in the Production Tax Audit Group gain experience, they will be able to take on more complex and higher volume audit work. This should relieve some of the resource strain, provided these auditors continue working for the Department once they reach senior levels. Over the last three years, great efforts have been made by the Department to obtain an automated tax processing system to manage and share information, but funding for this project has not yet been forthcoming.

Contact Person: *Ginger Blaisdell, Director*

State Tax Policy and Oil Production

The Role of the Severance Tax and Credits for Drilling Expenses

Ujjayant Chakravorty, Shelby Gerking, and Andrew Leach

9.1 Introduction

Although most energy-producing states have levied taxes on the value of oil, natural gas, and coal production for many years, changes in these taxes have become headline news as state governments grapple with budget shortfalls brought about by the current recession. For instance, Alaska has increased the severance tax on the value of its oil production and attempted to stimulate future production by allowing a credit against this tax for expenditures on capital items, including drilling rigs, infrastructure, exploration, and facility expansion (Alaska Department of Revenue 2008). In late 2008, California Governor Arnold Schwarzenegger proposed levying a 9.9 percent production tax on the value of most onshore oil production to help close a projected $24 billion budget deficit, but he subsequently reversed his position (Casselman 2009; Skelton 2009). The Pennsylvania legislature is considering a proposal to levy a 5 percent tax on the value of natural gas produced from the giant Marcellus shale deposit, but the bill is opposed by industry leaders who contend that it would result in 30 percent less drilling as well as revenue reductions to state and local governments totaling $880 million over the next decade (George 2009).

These measures, both enacted and proposed, raise a number of long-standing and important questions about the effects of state energy taxes that go well beyond their potential to provide a solid revenue base to support public services. Given the overlapping tax bases claimed by states and the federal government, to what extent do state energy tax increases result in lower collections of federal tax revenues, including the federal corporate income tax? Do state energy taxes restrict production and encourage "high-grading" of energy reserves and by how much? Do state taxes tilt the time path of energy production to the present or to the future? How do upstream

subsidies for exploration and development work together with downstream taxes on production to influence the levels and time paths of production and tax collections? What are the implications of these taxes for the long-run sustainable use of nonrenewable natural resources? The analysis in this chapter bears directly on these questions. It also serves as a basis to examine proposed changes in federal tax policy, including the elimination of the percentage depletion allowance and the expensing of intangible drilling costs.

We adapt the Hotelling model developed by Pindyck (1978) to examine how a state's taxes and subsidies at different stages of resource exploration and production alter the behavior of oil producers and thus impact on exploration activity, additions to the reserve base, and the production of energy. In our model, returns to exploration are subject to diminishing returns, and the cost of production is affected both by the level of reserves and the level of output. Producers located in a given state are assumed to produce only a small fraction of world output and therefore face an exogenously determined price of oil. We calibrate the model using data from U.S. oil fields to evaluate the effects of alternative tax and subsidy policies on drilling and production, on tax revenue accruing to states and to the federal government, as well as on the time path of drilling expenditures and resource production.

A key result from the calibrated model is that oil production is closely linked to the size of the reserve base and is relatively insensitive to changes in oil prices. This outcome, which is broadly consistent with experience in the U.S. oil industry over the past 50 years, leads to the conclusion that the severance tax has little effect on production levels and serves mainly to redirect rents earned in the oil industry to the public sector. Thus, increases in severance taxes or a reduction in the subsidies provided to the oil and gas industry may lead to rent taxation and therefore have only marginal effects on the drilling and production of oil and few adverse impacts in terms of national security and increasing U.S. dependence on foreign oil.

Prior simulation studies (Deacon 1993; Kunce et al. 2003) also have considered aspects of these issues, but a novel feature here focuses on effects of combining subsidies for exploration and development with taxes on the value of energy production. The rationale for subsidizing exploration and development is to expand the reserve base and ultimately to stimulate oil production in much the same way as an investment tax credit (see Chirinko 2000) might increase capital formation and boost output in manufacturing. As previously indicated, this type of tax policy has been adopted by Alaska, and it has been suggested as a model for other states (Headwaters Economics 2009). It may also bear on national energy tax policy in light of the interest in stimulating drilling for new reserves.[1] The simulations suggest that a drilling expense credit may cost more than the incremental severance tax revenue obtained, although such credits may be worthwhile concessions if a state's objective is to generate greater support for increasing the severance tax rate.

The remainder of the chapter is organized into six sections. Section 9.2 reviews the issue of oil taxation in twelve major oil-producing states in the United States. Section 9.3 summarizes findings from the literature regarding temporal economic effects of state energy tax policies. Section 9.4 describes the extended Pindyck (1978) model that is used as a conceptual basis for our tax policy simulations. Section 9.5 discusses the way in which the model was parameterized. Section 9.6 presents simulation results, and Section 9.7 concludes.

9.2 Overview of State Taxation of the U.S. Oil Industry

Key taxes on nonrenewable resource development levied by state and local governments can be divided into three main groups: taxes on production, property, and income. In its simplest form, the production or severance tax is levied on the gross value (or volume) of production of the resource as it is "severed" from the ground. The severance tax is the most widely adopted state tax specifically applying to the U.S. oil industry and will receive the most attention in the discussion. State and local governments also levy property taxes on the assessed (quasi market) value of equipment *above* ground and/or reserves *beneath* the ground. Income taxes are levied against the accounting net income of extraction firms. Although these taxes are generally aimed at extracting economic rents earned by producers from the sale of nonrenewable resources, their effects on production, exploration, and development can differ substantially (see Section 9.3). The discussion in this section briefly summarizes how these taxes are applied in major oil producing U.S. states and how they interact with each other and with other taxes on energy producers levied at the federal level. A more detailed

[1] At the Republican National Convention in 2008, Michael Steele, former Lieutenant Governor of Maryland and currently Chairman of the Republican National Committee, underscored his view that more exploration for energy resources is needed with his now famous line, "Drill, Baby, Drill." This sentiment was echoed by Republican Vice-Presidential nominee, Sarah Palin, who as Governor of Alaska, signed legislation granting a partial credit for drilling expenses against severance tax liabilities paid at an increased tax rate. For further details, see Ball (2008).

state-by-state survey of taxation and regulation of oil and gas production is available from the Interstate Oil and Gas Compact Commission (2007) and a more up-to-date survey can be constructed from a Lexis-Nexis search of state statutes. Hellerstein (1983) provides a useful discussion of the legal basis for state taxation of natural resources.

Table 9.1 presents data on oil production, nominal (legislated) oil severance tax rates, effective severance tax rates, and nominal corporate income tax rates for the twelve U.S. states that produced the most oil in 2007.[2]

As shown, production in these states ranged from a high of 397 million barrels in Texas to a low of 20 million barrels in Utah. Nominal severance tax rates varied widely across states as well. All states except California levied a severance tax against the value of production.[3] As mentioned earlier, California is considering whether to adopt such a tax. In Alaska and Montana, nominal tax rates can exceed 10 percent. Other tax code features reflect important interstate differences.[4] Severance taxes are generally levied against the "net value" of production, where each state has its own definition of this concept. Some states, such as Wyoming, tax the value of production at the wellhead (the top of the well), whereas others, like Utah, tax the value of production at the wellfoot (the bottom of the well), which in effect allows a deduction for lifting costs. Most states subtract royalty payments (computed as a percentage of gross value of production) for production on public land in computing net production value for determining severance tax liabilities (Louisiana does not). Public land royalties are relatively more important in Alaska, Colorado, New Mexico, Utah, and Wyoming than in other states owing to their large shares of publicly owned land. State energy tax codes are subject to frequent changes as well. For instance, Alaska now allows producers to take a credit against severance tax liabilities for capital expenditures used in exploration and development, whereas this feature was not available in 2007 and thus is not reflected in Table 9.1.

In New Mexico and North Dakota, the severance tax is actually the sum of two or more different levies on net production value. In Colorado, severance taxes are paid at graduated rates that depend on the gross income of operators, and in Alaska, Oklahoma, and Utah prevailing rates depend on the price of oil. In Colorado, Kansas, and Wyoming, local governments levy a substantial tax against the value of energy production. Although this tax is generally called a property tax by tax administrators, it is in

[2] The year 2007 is the most recent year for which effective tax rate data could be assembled (see discussion below).

[3] California does levy a property tax on reserves in the ground (see below).

[4] See footnotes to Table 9.1.

Table 9.1. *Oil production (in Mbbl) and tax rates for selected U.S. states, 2007*

State	Production	Severance tax: Nominal rate	Severance tax: Effective rate	Corporate income tax rate[o]
Alaska	263,595	12.25–15%[a]	12%	1.0–9.4%
California	216,778	None	None	8.84%
Colorado	23,237	2–5%[b]	0.7%	4.63%

Wyoming	54,130	4.0–6.0%[k]	5.3%	None

[a] Lower rate applies to fields in production less than 5 years; higher rate applies to fields in production more than 5 years.

[b] Rate depends on gross income of operator and excludes county ad valorem taxes at 4–10%.

[c] Excludes county ad valorem taxes of approximately 4%.

[d] Tax rate of 3.125% applies only to stripper well production.

[e] Rate applies to nonworking interest owners; working interest owners pay lower rates that vary by type of well.

[f] Rate is the sum of oil severance tax, oil school tax, and oil conservation tax; local ad valorem taxes at approximately 1.2% are excluded.

[g] Depends on the level of an oil extraction tax that varies by type of well; tax rate on stripper well production is 0%.

[h] Excludes ad valorem taxes that vary by county.

[i] Excludes county ad valorem levies and (small) state regulatory and conservation levies.

[j] Lower rate applies to first $13/bbl; higher rate applies above $13/bbl. Excludes county ad valorem levies; stripper well production is not subject to severance tax.

[k] Stripper well production taxed at 4%; other production taxed at 6%; excludes county levies at 5.9–7.7%.

[l] Effective rate is for oil and natural gas combined.

[m] Effective rate is for oil and gas combined.

[n] Insufficient information available.

[o] Tax rates depend on level of income before taxes for most states.

[p] This is the rate for a gross receipts tax that replaced the corporate income tax in 2007 (see Tax Foundation 2009a).

Sources: Production data from U.S. Department of Energy (2009b). Nominal severance tax rate data from Interstate Oil and Gas Compact Commission (2007). Effective severance tax rate data are authors' calculations (see text). State corporate income tax rate data from Tax Foundation (2009a).

effect a severance tax levied by local governments. Many states have granted innumerable exemptions and credits against state severance tax liabilities for special situations that may be encountered by operators. Production from stripper wells (wells that produce fewer than ten barrels per day), for example, is taxed at lower rates in some states than is production from better producing wells. Production from wells employing secondary or tertiary recovery methods is sometimes taxed at lower rates as well.

A further complicating feature in analyzing economic effects of state severance taxes is that states and the federal government levy other types of taxes on oil producers and tax bases interact, particularly at the state and federal levels. Except for Wyoming, all of the twelve states levy a corporate income or franchise tax that applies to oil producers. Nominal rates for this tax, taken from the Tax Foundation (2009a), are shown for each state in Table 9.1. State corporate income taxes often are levied on a similar base to that used in computing federal corporate income tax liabilities, but the state tax rates generally are lower than the top federal rates for this tax, which currently are in the 35 to 40 percent range (Tax Foundation 2009b). State corporate income tax payments are deductible against federal corporate income tax liabilities, and state and local production tax payments are deductible against both. In some states, federal corporate income tax payments are deductible in computing state corporation income taxes and in others it is not. Although local governments in most of the states utilize some form of a property tax on oil and gas extraction equipment, property taxes on reserves are levied only in relatively few states such as California and Texas.

State and local tax burdens on oil producers are endlessly compared in state tax commission and legislative hearings as industry representatives make their case for more favorable tax treatment. Yet, because of variations across states in the application of severance and other taxes, a comparison of nominal tax rates is not particularly useful. A judgment based on a comparison of nominal rates that one state's severance tax, for example, is higher than that in another state might easily be reversed once the potentially numerous exemptions, credits, incentives, deductibility, and other special features of tax law are accounted for. Instead, more meaningful comparisons across states can be obtained by computing effective tax rates expressed as the ratio of revenue collected from a particular tax to the value of production. The calculation of effective tax rates fully accounts for, without enumerating, state-specific aspects of tax treatment faced by producers and facilitates comparisons between states because the value of production is used as a common denominator.

Table 9.1 presents effective severance tax rates prevailing in 2007 for the twelve most important oil-producing states. Unfortunately, information regarding severance tax collections is neither available from a single source nor published in a common format. In consequence, data on severance tax collections needed for the numerators of the effective tax rates were obtained by searching state department of revenue reports available on the Internet and by directly contacting knowledgeable people in these agencies as questions arose. Estimates of the value of production in each state were obtained by multiplying production volumes by the average prevailing price per barrel of crude oil. State production volumes were obtained from the Energy Information Administration, U.S. Department of Energy (2009b). Average wellhead prices of oil in each state were taken from the American Petroleum Institute (2009). The price and production volume data exclude oil produced in the Outer Continental Shelf (OCS) that is not subject to state taxation. As shown in Table 9.1, among states that levy a severance tax, effective tax rates in 2007 vary from 0.7 percent in Colorado to 12 percent in Alaska. Because of the many special tax code features just discussed, these rates tend to be lower than corresponding nominal tax rates.

9.3 Prior Literature

A sizable literature deals with the economic effects of the three types of taxes discussed in the previous section. It may be useful to briefly describe this work before proceeding with the theoretical structure we assume in this chapter. Discussion is limited to intertemporal issues; thus, topics such as interstate tax shifting or "tax exporting" are ignored (Gerking and Mutti 1981; McLure 1969; Metcalf 1993). The severance tax is given the most detailed treatment because it has been widely adopted and because its effects are the focus of the simulations presented in Section 9.6.

9.3.1 Production Taxation

Hotelling's (1931) seminal analytic work considers a per unit severance tax in a model with an endogenous price (net of constant extraction costs) and the total exhaustion of fixed reserves. The severance tax is found to conserve the resource by extending the time it takes to exhaust the total pool. Herfindahl (1967) extends this result with a model that features an extraction cost function that depends on output. Under competition, the severance tax is shown to tilt production to the future (i.e., delay production), thereby

extending the life of the pool. The pool is fully exhausted at a postponed terminal period.

Burness (1976) reformulates the dynamic framework by including severance tax rates that vary over time. In this model, price is exogenous, reserves are fully depleted, and extraction cost depends only on output. The general proposition derived is that the severance tax will tilt production to the future if the tax rate is held constant or rises at a rate less than the discount rate. A severance tax that rises with the discount rate will not distort the time path of production. Conrad and Hool (1984) show that introducing varying grades of the resource into the model make no difference to this result.

Levhari and Leviatan (1977) allow for an extraction cost function that depends on both current and cumulative production so that as more of the resource is extracted over time, the more it costs to produce an incremental unit. Thus, in this model, the resource may not be fully exhausted. The effect of per unit severance taxation on time to exhaustion now is ambiguous. If the resource price is constant over time, terminal time is shortened and high-grading (removing ore of the highest grade while leaving lower grade ore in the ground) may occur. Nonetheless, if tax rates vary over time, then, as Heaps (1985) demonstrates, total recovery of the resource and the economic life of the resource can either increase or decrease but in opposite directions. Because these two effects of the tax work against each other, the net impact on depletion cannot be determined.

If resource quality varies across pools but is the same within a pool, Conrad (1978, 1981) shows that mine lives are shortened and lower-quality resource is left in the ground when a per unit severance tax is levied. Krautkraemer (1990) examines the effect of production taxation in a finite reserve model when resource quality varies within a given deposit. In addition to firms choosing the rate of extraction, they also choose the marginal grade cutoff at each point in time. A production tax induces high-grading at each instant of time and not just at the end of the production program. Interestingly, a production tax reduces total resource recovery and a low-grade resource left in the ground will not be extracted, even if at some point in the future the production tax is eliminated.

Uhler (1979) includes a brief examination, for the first time, of the effects of production taxation in a model of nonrenewable natural resource extraction with both production and exploration. The possibility of exploration means that the reserve base is no longer fixed. Also, when the model allows for exploration and reserve additions, the dynamics of the process become complex and equilibrium conditions no longer have closed form solutions.

Effects of production taxation, therefore, were examined with simulations. The model was parameterized for a small oil- and gas-producing region in Alberta, Canada. When a severance tax is imposed at a constant rate, operators decrease production and exploration in all periods while the endogenous price of the resource rises.

Deacon (1993) also simulates effects of severance taxation using the model developed by Pindyck (1978) and later applied by Yücel (1986, 1989). In Deacon's formulation, the oil industry is taken to be competitive, so the time path of the resource price is treated as exogenous. In the simulations, the resource price is assumed to rise in the early years of the production program, but at a rate less than the assumed 5 percent discount rate. Similar to the analytic results derived by Burness (1976) and others in models that abstracted from exploration, the application of an ad valorem severance tax tilts production to the future in comparison to a no-tax base case. Over the life of the program, however, the tax reduces output, implying that an important effect of the production tax is to induce high-grading. In addition, simulations show that a production tax reduces drilling in all periods and that drilling shuts down prematurely in comparison to the no-tax case.

Kunce et al. (2003) also simulate effects of production taxation using the Pindyck (1978) framework, but they parameterize the model for a single state (Wyoming) rather than the nation as a whole, as was the case in the Deacon (1993) study. They consider the effect of doubling the state's production tax on oil extraction in a setting where oil producers are assumed to be price takers. A key feature of this study was to embed the production tax in a broader tax system that allowed for interactive tax bases and tax shifting between the local, state, and federal governments. Simulations demonstrate that a hypothetical doubling of Wyoming's production tax leads to reduced drilling and reduced oil production in each subsequent period. Estimated production declines, however, are comparatively modest; the response of production with respect to the tax change turns out to be highly inelastic (−0.06). Thus, the main effects of the tax increase would be to rather dramatically increase Wyoming's severance tax revenue and to reduce federal corporate income taxes paid by producers.

9.3.2 Property Taxation

Taxation of property, specifically reserves, has received little attention in the literature on production from nonrenewable resources. One reason for this may be the practical complexity of levying such taxes. Nonetheless, Hotelling (1931) demonstrates that a constant percentage tax on the value of reserves

will induce firms to extract more rapidly as they attempt to "mine out from under the tax." Conrad and Hool (1981) show that a constant tax rate per unit of reserves encourages extraction of higher-grade resource in the early periods of the program, but the cutoff grades are lower, thus extending the life of the mine. The property tax is also examined by Heaps and Helliwell (1985) in a model that allows for new reserve investment. The tax is shown to tilt production to the present and to reduce investment in new deposits to avoid holding costs. Simulations by Gamponia and Mendelsohn (1985) show that a property tax on reserves results in tilting production to the present. Deacon (1993) obtains the same outcome in his simulation study and also confirms the Heaps and Helliwell (1985) result by showing that the property tax on reserves results in lower levels of drilling in the early years of the program.

9.3.3 Income Taxation

Burness (1976) analyzes a profits tax on a nonrenewable resource producer with fixed reserves and concludes that output trajectories will not change when the tax is applied at a constant rate. If the tax rate increases over time, however, firms will speed up depletion of the fixed reserve. Conrad and Hool (1984) model a progressive profits tax, finding that such a tax will not exhibit the neutrality of a flat rate profits tax with regard to the extraction path and grade selection. Deacon (1993) simulates a structure broadly similar to federal corporate income taxation with expensing of current and capitalized drilling costs. Simulated paths of extraction, drilling effort and reserves show little distortion from the no-tax base case. These results suggest that income taxation is the least distortionary among the three types of energy taxes imposed by U.S. states.

9.4 Conceptual Framework

We propose a simple dynamic model in the tradition of Hotelling (1931) and Pindyck (1978) with some modifications. The idea is to examine the producers' response when states or a social planner imposes a menu of taxes and subsidies on oil production. We consider three tax/subsidy instruments – a severance tax, a corporate income tax, and a subsidy on drilling expenditures. Producers choose the optimal amount of drilling (and therefore reserve additions) and production of oil to maximize profits.

The model is dynamic, with a known discount rate and no uncertainty. Resource producers face an output price of the commodity that is

exogenously determined. Ideally, output prices should be endogenously determined through the process of dynamic optimization, as in Pindyck (1978). However, because our goal is to examine the effect of various tax regimes under assumptions of alternative petroleum prices and a single U.S. state produces only a small fraction of world output, the exogenous price assumption may be a reasonable approximation. In any case, a partial equilibrium model with endogenous prices may leave too many factors that critically affect oil prices out of the model (e.g., international financial markets, world economic growth).

Let the output price of petroleum be given by $p(t)$ where the argument t denotes time. Then the social planner imposes a set of taxes $(1 - \alpha_p)$ such that the net price received by the producer is the fraction α_p times the price.[5] Thus, the production revenue accruing to producers of energy is given by $\alpha_p p q$ where q is the quantity of oil sold by the producer. We assume that whatever is extracted is sold – there is no storage.

Because we distinguish between production and exploration, we define reserves R at any given time t and the cumulative addition to the stock of petroleum given by x. The relationship between stocks and reserves is given by the differential equation

$$\dot{R}(t) = f(w, x) - q \tag{9.1}$$

That is, the change in reserves is equal to the addition in reserves net of production, as in Pindyck (1978). The function f represents the addition to reserves as a function of drilling effort w and cumulative additions to the stock x and we assume that $f_1 > 0$; $f_{11} > 0$; $f_2 < 0$ $f_{22} > 0$ and $f_{12} < 0$. More drilling effort (w) leads to higher reserve additions, but at a decreasing rate. Higher cumulative discoveries x cause current reserve additions to decline (at a decreasing rate). It is more difficult to add to the reserve base, the higher the discoveries made in the past. Finally, the marginal effect of reserve additions as a function of drilling decline with increases in cumulative stock. For convenience we assume that the stock of resource grows linearly with drilling effort. However, the cost of drilling increases in a convex fashion with drilling effort, given by $k(w)$ where $k'(w) > 0$; $k''(w) \geq 0$ and $k(0) = 0$. Finally, the total cost of extraction is given by $c(q, R)$ with $c_1 > 0$, $c_2 > 0$, $c_2 < 0$, $c_{22} > 0$ and $c_{12} < 0$.[6] That is, the total "lifting" cost increases with quantity produced – for instance,

[5] The tax parameter α_p and two other tax parameters to be defined momentarily are empirically specified in the next section.

[6] In Pindyck's (1978) original formulation, both average and marginal lifting costs depended on R but not on q.

as oil is extracted from greater depths – and it also decreases concavely with current reserves. This specification follows from the view that oil is produced using reserves (a form of capital) and nonreserve inputs (i.e., physical capital other than reserves and labor), so that extraction costs are positively related to output and negatively related to reserves. The cross-partial derivative c_{12} is assumed to be negative.

We introduce two other tax/subsidy parameters in this framework, namely, the portion $(1 - \alpha_c)$ of the production cost that is deductible in computing tax liabilities, so that the net production cost faced by firms is $\alpha_c c(q, R)$ and the part $(1 - \alpha_D)$ that is deductible by the firm, which implies that the net drilling cost payable by the firm is given by $\alpha_D k(w)$. The major goals in this chapter are to examine how the three different tax/subsidy policy instruments, given by α_p, α_c and α_D, affect drilling activity, reserve additions, and production, as well as to compare their corresponding revenue and welfare implications.

Finally, given a fixed discount rate $r > 0$ the social planner solves the following problem:

$$\underset{q,w,x,R}{Max} \int_0^{\infty} [\alpha_p p q - \alpha_c c(q, R) - \alpha_D k(w)] e^{-rt} dt \tag{9.2}$$

which is subject to the following equations:

$$\dot{x} = w \tag{9.3}$$

and

$$\dot{R} = f(w, x) - q \tag{9.4}$$

The current value Hamiltonian for this problem is

$$H = \alpha_p p q - \alpha_c c(q, R) - \alpha_D k(w) + \lambda w + \theta[f(w, x) - q] \tag{9.5}$$

so that the first-order conditions are given by

$$\alpha_p p \leq \alpha_c c_q + \theta \; (= \; iff \; q > 0) \tag{9.6}$$

$$\theta f_w \leq \alpha_D k_w - \lambda (= \; iff \; w > 0) \tag{9.7}$$

$$\dot{\lambda} = r\lambda - \theta f_x \tag{9.8}$$

$$\dot{\theta} = r\theta + \alpha_c c_R \tag{9.9}$$

along with transversality conditions not shown here. The co-state variable λ represents the shadow price of an additional unit of discovered oil. Note that the higher the cumulative discoveries, the lower the additions to reserves. Hence, the shadow price λ will be negative. The shadow price θ represents the discounted increment to profits resulting from the addition of one unit of reserves. Reserves decrease the cost of production and therefore θ should be positive.

An important implication of the model (see equation (9.6)) is that the firm will decide to produce ($q > 0$) if the discounted after-tax wellhead oil price net of marginal extraction costs exceeds the present value of future profits from an additional unit of reserves (θ).[7] Condition (9.7) equates the marginal benefits and costs of an additional well drilled. The benefits are in the form of an increase in reserve additions, which are given by the expression θf_w. The costs are twofold: the marginal cost of drilling net of drilling subsidies denoted by the term $\alpha_D k_w$ plus the negative effect on reserve additions from an addition to the cumulative resource stock given by λ.

Equations (9.8) and (9.9) give the time path of the derivatives for the two shadow prices λ and θ. The rate of increase in the shadow price λ has two components – the discount rate r and the fact that taking out a unit of resource increases the "cost" in the future through lower marginal reserve additions. Because f_x is assumed to be negative, the first term $r\lambda$ is negative and the second term $-\theta f_x$ is positive. At least initially the latter term is likely to be large because of the high value of reserve additions, in which case $\dot{\lambda}(t)$ is likely to be positive and the value of lambda, which is negative, will decline over time. In this model, then, additions to stock adversely impact reserve formation; hence, the interpretation is completely different than in the standard Hotelling model with no exploration activity. The extra cost of drilling is that it decreases the future benefit of drilling. The time path of the marginal value of a unit of reserve θ also increases at the rate of discount but is tempered by its effect on lifting costs – additions to reserves have the added benefit of helping reduce the cost of production, net of production subsidies. This is given by the negative term $\alpha_c c_R$.

In this chapter we do not focus on the analytics of this model, which is similar to the model developed by Pindyck with some key differences. The

[7] Notice that condition (9.7) differs from the corresponding condition derived by Pindyck (1978) in that marginal lifting costs increase with increases in q. Consequently, rather than producing at some maximum rate subject to constraints given by reserve levels, geology, and technology, the firm pays attention to how its lifting costs are affected by the level of output.

main difference is that his production costs are independent of reserves, whereas in our case, production costs decline with cumulative reserves. Moreover, here the focus is on the three tax/subsidy instruments, and we show how they play different roles in influencing production and drilling behavior by firms.

9.5 Calibration of the Simulation Model

Simulations from the model developed in the previous section are constructed based on estimates of the drilling cost, lifting cost, and reserve additions equations, specifying values for the tax/subsidy and other parameters.

9.5.1 Equation Estimates

Estimation of $k(w)$ and $f(w, x)$ are treated together because they are used to compute the marginal cost of reserve additions (k_w/f_w), a key relationship in the model described above. Drilling cost per foot is assumed to be linearly related to footage drilled, as shown in equation (9.10):

$$k(w)/w = \phi w + u \tag{9.10}$$

where ϕ is the parameter to be estimated and the disturbance term u is normally distributed. This specification ensures that the marginal cost of drilling is positive and increasing in footage drilled as long as $\phi > 0$. Using annual data for the United States from 1959 to 2007, with drilling cost per foot measured in year 2000 dollars and footage drilled measured in millions of feet, the least squares estimate of ϕ is 1.23 with t-statistic of 8.17.[8]

The production function for gross reserve additions is specified as

$$f(w, x) = A w^{\rho} e^{-\beta \cdot x} e^{v} \tag{9.11}$$

where A, ρ, and β are parameters to be estimated and the disturbance term e^v is assumed lognormally distributed with mean of unity and variance σ_v^2. Equation (9.11) is similar to the one describing the discovery process proposed by Uhler (1976) and later adopted by Pindyck (1978). The idea behind this equation is that the marginal product of drilling declines as footage drilled accumulates. Estimation of equation (9.11) used annual data from seven important oil-producing U.S. states (California, Kansas, Louisiana, New Mexico, Oklahoma, Texas, and Wyoming) for which complete information on the requisite variables was assembled for the period 1970–97.[9] Oil reserve additions are defined as extensions, new field discoveries and new reservoir discoveries in old fields. The footage drilled variable was defined as in equation (9.10) and the cumulative footage variable was created by adding year-by-year over the sample period for each state. After taking natural logarithms of equation (9.11) and with state-effects included, we obtain least squares estimates of $\rho = 0.95$ (t-statistic = 14.18) and $\beta = 0.000437$ (t-statistic = 1.37). The value of A (28.78) was selected so that the equation predicted U.S. reserve additions in 2007. This equation shows that the marginal product of drilling (f_w) decreases with footage drilled as well as with cumulative drilling, although the coefficient of cumulative drilling is insignificant at conventional levels.

Because data on oil extraction costs are weak, $C(q, R)$ could not be econometrically estimated. Instead, this equation was calibrated for the United States with a Cobb-Douglas functional form using methods described in Deacon (1993). Results show that if the output elasticity of nonreserve inputs is 0.35, then for 2007, $C/q = 458.1(q/R)^{1.86}$. The value of 458.1 is selected so that the right-hand side will predict average U.S. operating cost per barrel in 2007 of $7.56.[10] Note that the Cobb-Douglas form implies that extraction costs rise without limit as reserves approach zero and fall as production declines.

9.5.2 Specification of Tax/Subsidy Parameters

Values for the parameters α_j ($j = p, c, D$) were specified by choosing representative rates of state and federal taxes faced by oil producers and then inserting these values into equations (9.12) through (9.14).

$$\alpha_p = (1 - \tau_{us})(1 - \tau_s)(1 - \tau_r)(1 - \tau_p) + \tau_{us}(1 - \tau_r)\gamma \tag{9.12}$$

$$\alpha_c = (1 - \tau_{us})(1 - \tau_s) \tag{9.13}$$

$$\alpha_D = \{(1 - \tau_{us}\eta - (1 - \tau_{us})\delta)\} \tag{9.14}$$

In equations (9.12), (9.13), and (9.14), τ_{us} denotes the federal corporate income tax rate, τ_s is the state corporate income tax rate, τ_r denotes the royalty rate on production from public (state and federal) land, τ_p is the

[8] Data were taken from American Petroleum Institute (2009).

[9] Data were taken from American Petroleum Institute (various years).

[10] Data were taken from U.S. Department of Energy (2009a).

state severance tax rate, and δ represents the percentage of drilling costs that may be taken as a credit against state severance tax liabilities. This credit is a prominent tax code feature in Alaska. Also, γ represents the federal percentage depletion allowance weighted by the percentage of production attributable to eligible producers (nonintegrated independents), and $\eta = e + (1 - e)f$ denotes the expensed portion of current and capitalized drilling costs attributable to current period revenues for purposes of computing federal corporate income tax liabilities, where e is the percentage of current period drilling costs expensed for tax purposes and f is the present value of cost depletion deductions per unit of depletable expense (see Deacon 1993 for further details).

These equations do not capture all aspects of the tax code facing oil producers. Instead, they merely reflect important tax features and relationships between taxes affecting the oil industry in most states and at the federal level: (1) severance taxes are levied on the wellhead price of oil; (2) royalty payments for production on public land are deductible in computing state severance tax liabilities; (3) public land royalty payments, state severance taxes, and extraction costs are deductible in computing state corporate income tax liabilities; and (4) public land royalty payments, state severance taxes, and state corporate income taxes are deductible in computing federal corporate income taxes. Federal corporate income tax payments are adjusted because of the percentage depletion allowance and special treatment of drilling costs. These equations highlight interaction between tax bases and are more detailed than the corresponding treatment given by Moroney (1997) and Deacon et al. (1990). The equations incorporate the entire tax structure into the model, rather than simply analyzing one tax at a time as in Deacon (1993). Equations (9.12) through (9.14), however, ignore local taxes on the value of production as well as possible property taxes on reserves (levied by relatively few states). As noted in Section 9.2, state tax treatment of the oil industry is not uniform; the specification of the parameters α_j ($j = p, c, D$) would require reformulation to represent the tax structure of a particular state.

9.5.3 Values of Tax/Subsidy Parameters Used in Simulations

Four simulations of the model are considered in the following section. The base case simulation considers a situation in which no taxes are levied and no subsidies are allowed (No-tax Model A); the values for the tax parameters are $\alpha_p = 1$, $\alpha_c = 1$, $\alpha_D = 1$. The Low-tax Model B considers a situation in which the nominal severance tax rate is $\tau_p = 0.12$, the state corporate income tax rate is $\tau_s = 0.06$, and public land royalty payments as a fraction of total production value is $\tau_r = 0.09$. These choices for state corporate income tax and severance tax rates are broadly representative of actual nominal rates for these taxes (see Table 9.1). The public land royalty payment fraction is similar to actual values for oil-producing states in the western United States (Gerking 2005). At the federal level, the effective federal corporate income tax rate is set at $\tau_{us} = 0.30$. The current nominal depletion rate of 15 percent applies to about 60 percent of U.S. oil production; thus, $\gamma = 0.09$.[11] The expensed portion of current period drilling costs is approximately 40 percent for the industry, and the present value of depletion deductions for capitalized drilling cost can be approximated by $(q/R)/(r + (q/R))$, assuming that it is approximately 8 percent; therefore $\eta = 0.40 + (1 - 0.4)^*(0.08/(0.04 + 0.08)) = 0.8$. The parameter δ is set to zero. Thus, the tax policy parameters for Model B are $\alpha_p = 0.55$, $\alpha_c = 0.67$, $\alpha_D = 0.76$.

The High-tax Model C sets all taxes equal to their Model B values, except for the severance tax, which is set at $\tau_p = .25$. Hence, $\alpha_p = 0.47$, $\alpha_c = 0.67$, $\alpha_D = 0.76$. The Drilling Subsidy Model D sets all tax parameters equal to their Model C values, except that δ is set to 0.22, so that $\alpha_p = 0.47$, $\alpha_c = 0.67$, $\alpha_D = 0.61$.

9.5.4 Other Parameters

Each model uses a discount rate of $r = .04$, an oil price of $p = \$70$ per barrel, and is run for 110 periods at which point drilling all but ceases in the four models because it is no longer profitable. The initial value of reserves (R) was set to 20 billion barrels. This value approximates the quantity of proven reserves for the United States in 2007. The initial value of cumulative footage drilled was arbitrarily set to 2 billion feet, which is roughly equal to the cumulative footage for oil wells drilled in the United States in the past 30 years.

9.6 Discussion of Simulation Results

Results of simulations are obtained from solving the first-order equations of the model (equations (9.6) and (9.9)) after substituting values of the

[11] The percentage of production accounted for by nonintegrated independents was approximated by subtracting from unity the ratio of oil and natural gas liquids production by producers subject to USDOE financial reporting system (FRS) requirements to total oil and total natural gas liquids production. For 2007, this ratio was 0.612. Data were taken from U.S.Department of Energy (2009c, 2009d, 2009e).

Table 9.2. *Selected values from solutions for the four models: Year 1*

	Model A	Model B	Model C	Model D
Production in billions of barrels (q)	2.33	2.16	2.03	2.03
Drilled footage in millions of feet (w)	92.44	72.21	63.43	74.26
After-tax price per barrel received by producers ($\alpha_p P$)	\$70.00	\$38.50	\$32.90	\$32.90
After-tax marginal extraction cost of one additional barrel ($\alpha_c C_q$)	\$24.03	\$13.98	\$12.46	\$12.46
Reserve additions from drilling an additional million feet in billions of barrels (f_w)	0.0091	0.0092	0.0093	0.0092
Total reserve additions in billions of barrels (wf_w)	0.841	0.664	0.588	0.683
After-tax marginal cost of drilling one additional foot ($\alpha_D k_w$)	\$227.40	\$135.00	\$118.59	\$111.43
Beginning reserves in billions of barrels (R)	20	20	20	20
Ending reserves (R)	18.55	18.50	18.56	18.65
θ	\$45.80	\$24.50	\$20.50	\$20.50
λ	\$227.00	\$135.00	\$119.00	\$111.00

tax/subsidy parameters and specific equations for drilling costs (equation (9.10)), reserve additions (equation (9.11)), and lifting costs. Table 9.2 shows selected solution values for year 1 for the four models.

In year 1 for Model A, for example, solutions for the level of production and footage drilled are 2.3 billion barrels per year (6.4 million barrels per day) and 92.44 million feet, respectively. These values, together with initial reserves set to 20 billion barrels and $P = \$70$, imply that the marginal cost of extracting an additional barrel of oil is $c_q = \$24.03$ and the marginal cost of drilling an additional foot is \$227.40. Over the course of year 1, reserves fall because production exceeds reserve additions. The present value of future profits from an additional barrel of reserves is $\theta = \$45.80$ (see equation (9.6)), and the present value of drilling cost reductions from an additional unit of reserves is the negative of $\lambda = \$227$ (see equation (9.7)). Both of these two shadow prices steadily converge toward zero over time.

Values presented in Table 9.2 for Models B and C are interpreted similarly. In these two models, production and drilling are lower than in Model A, in part because the severance tax causes prices received by producers to fall disproportionately relative to extraction and drilling costs. In Model D, production is the same as for Model C because tax rates and initial values

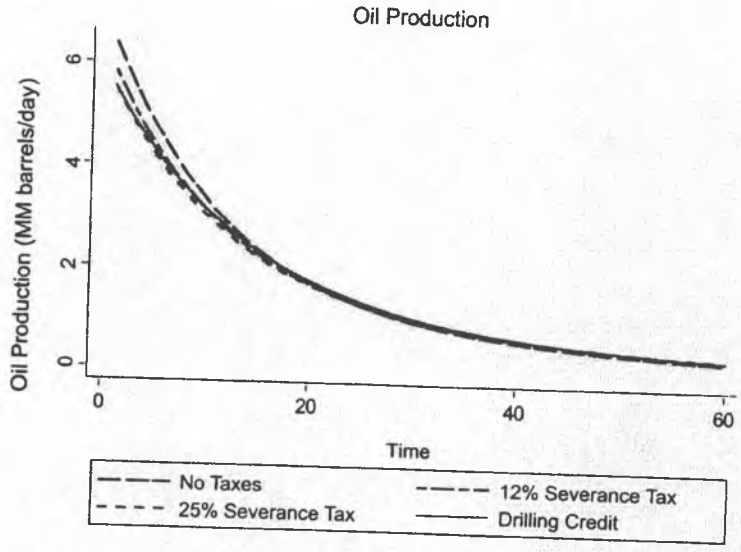

Figure 9.1. Oil production is quite insensitive to the tax structure in the U.S. case.

of reserves are the same, but footage drilled is higher because of the drilling expense subsidy. In all three models, the shadow values λ and θ converge toward zero over time, just as in Model A.

Figure 9.1 shows the time profile of oil production in millions of barrels per day for each of the four models.

In each model, production declines substantially over time. The no-tax case (Model A) shows the highest production rates. The introduction of taxes in Model B tilts production (slightly) to the future, as predicted by models of extraction from fixed reserves (see Section 9.4). Numerical calculations indicate that production rates for Model B are lower than for Model A until year 26, at which point production rates become higher for Model B than for Model A. In Model C, tilting of production to the future is more pronounced in comparison to Model A than it is for Model B because of the higher severance tax rate assumed. Production in Model C is lower in the early years of the program, but begins to exceed production in Model B by year 27. Introduction of the subsidy for drilling expenses tilts production back to the present in comparison with Model C. Model D production initially exceeds that for Model C, but is lower than that for Model C after year 48.

Figure 9.1 also shows that production is relatively insensitive to changes in tax rates and therefore to changes in prices received by operators. Cumulative production figures for the 110-year program period confirm this result (Table 9.3).

More specifically, comparing Model A with Model C, the arc elasticity of cumulative production with respect to a change in severance tax rates $((\Delta q/q)/(\Delta \tau_p/\tau_p))$ is only $(-1.4/38.7)(0.125/0.25) = -0.02$. This outcome implies that the arc elasticity of cumulative production with respect to a change in prices received by operators is $(-1.4/38.7)(56.7/-26.6) = 0.05$. Of course, these simple elasticity calculations are based on cumulative production totals and do not take the timing of production into account, but as shown in Figure 9.1, the time path of production does not differ greatly across the four models.

Oil production also would be insensitive to changes in the percentage depletion allowance rate (η) that can be used by nonintegrated independent producers in computing federal corporate income tax liabilities. As shown in equations (9.12) through (9.14), a reduction in either η or an increase in the severance tax rate τ_p lowers α_p while leaving α_c and α_D unchanged. In fact, given the values of the tax parameters used for Models B, C, and D, eliminating the percentage depletion allowance would have the same effect on production as a four percentage point increase in the severance tax. This parallel between changes in severance tax rates and the changes in the percentage depletion allowance may be of interest in light of the Obama Administration's proposal to eliminate the latter tax preference (see Krueger 2009). Of course, changes in the severance tax and changes in the oil depletion allowance will not have equivalent effects on the collection of other taxes at the state and federal levels.

Insensitivity of oil production to severance tax increases would be to some extent expected in these simulations because a key effect of the tax simply is to reduce industry profits. The assumed price of oil ($70/bbl) is relatively high by historical standards; thus, discounted profit is a relatively large percentage (80 percent) of discounted total revenue. In consequence, the array of taxes imposed in Model B can cut into profits without substantially altering drilling or production. Kunce et al. (2003) found somewhat greater responsiveness of oil production to changes in severance tax rates when setting P (P = $23) at a lower value than the one used in this study. In their simulations, which envision a lower ratio of profit to total revenue, the long-run elasticity of production to changes in the severance tax rate was −0.06.

Table 9.3. *Total drilling, production, tax collections, profits, and reserves for four models over the 110-year program*

	Model A no taxes	Model B 12% severance tax	Model C 25% severance tax	Model D 25% severance tax with drilling subsidy
Total production (in billions of barrels)	39.4	38.5	38.0	38.6
Total footage drilled (in billions of feet)	4.5	3.9	3.6	3.9
Discounted public land royalties (in billions of dollars)	$0	$131.0	$126.3	$129.3
Discounted severance tax Collections (in billions of dollars)	$0	$159.0	$319.2	$307.5
Effective severance tax Rate	0	0.109	0.228	0.212
Discounted state corporate income tax revenue (in billions of dollars)	$0	$60.9	$49.6	$50.8
Discounted federal corporate income tax revenue (in billions of dollars)	$0	$230.0	$182.5	$188.4
Discounted depletion allowance deductions (in billions of dollars)	$0	$119.2	$114.9	$117.7
Discounted pre-tax total revenue (in billions of dollars)	$1,544	$1,456	$1,403	$1,437
Discounted extraction costs (in billions of dollars)	$186.3	$151.8	$130.1	$133.0
Discounted drilling costs (in billions of dollars)	$125.6	$84.4	$68.3	$88.3
Discounted firm profits (in billions of dollars)	$1,231	$638	$527	$539
Beginning reserves (in billions of barrels)	20	20	20	20

In any case, the inelasticity of production with respect to severance tax and price changes suggests that severance tax collections computed as $s = \tau_p(1 - \tau_r)pq - \delta k(w)$ should increase roughly in proportion to changes in the tax rate when $\delta = 0$. As shown in Table 9.3, discounted (at 4 percent) severance tax collections over the 110-year program period total $159.0 billion for Model B and $319.2 billion for Model C. Effective severance tax rates for these two models are 0.109 and 0.228, respectively. These figures suggest that the arc elasticity of discounted severance tax collections with respect to a change in the effective tax rate is 0.95 (assuming unchanged royalty rates and oil prices). Model D, which includes the credit ($\delta = 0.22$) for drilling expenses, reflects smaller severance tax collections than Model C.

Table 9.3 indicates that severance tax rate increases result in lower collections of both state and federal corporate income taxes. Because of the deductibility of severance tax payments against these two taxes, discounted state corporate income tax collections fall from $60.9 billion in Model B to $49.6 billion in Model C, and discounted federal corporate income tax collections fall from $230.0 billion in Model B to $182.5 billion in Model C. Notice that the decline in federal corporate income tax collections is cushioned by declines in depletion allowance deductions ($119 billion to $114.9 billion) and in deductions for current and capitalized drilling costs. The value of these two deductions declines because both production and drilling are lower in Model D than in Model C. Also, discounted oil industry profits fall sharply when all taxes are imposed (compare Model A with Models B and C). In any case, the main effects of severance tax rate increases are to redirect (1) oil industry profits to the public sector and (2) tax payments from the federal level to the state level.

Although the specific way in which the model is parameterized may be responsible for the relative insensitivity of production to changes in oil prices and severance tax rates, results shown in Figure 9.1 and Table 9.3 are broadly consistent with U.S. experience over the past half-century. Figure 9.2 shows this by plotting total U.S. proven reserves (in billions of barrels), total U.S. production from proven reserves (in hundred millions of barrels), and the real price of crude oil (in year 2000 dollars).

Proven reserves stood at roughly 30 billion barrels from 1959 to1970, increased to nearly 40 billion barrels in 1971 with the discovery of oil in Prudhoe Bay, and then declined steadily thereafter to 20.9 billion barrels in 2007. Over this time period, production followed a similar pattern, remaining between 8 percent and 11 percent of reserves in each year; on average, production represented 9.2 percent of reserves with standard error

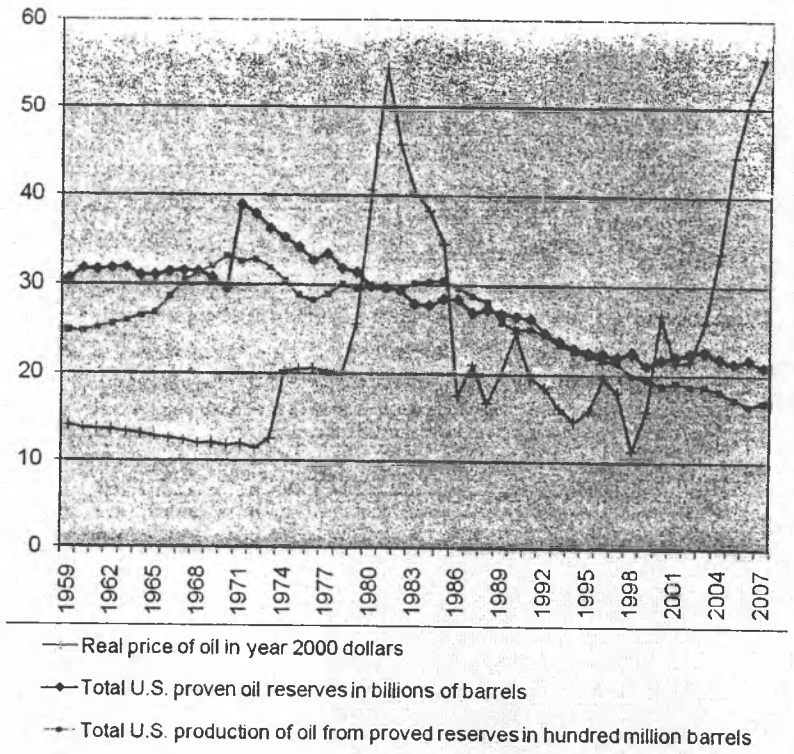

Figure 9.2. U.S. oil production has been insensitive to oil prices over the past 50 years.

of 1.34. Real crude oil prices, on the other hand, exhibited greater variability, but neither the spike in the late 1970s and early 1980s nor the price increase seen in recent years appears to have had much effect on production.

Drilling activity during the 110-year program shows greater percentage differences across the four models (see Figure 9.3 and Table 9.3) than were computed for production.

Model A has the most drilling in each year of the simulation period. Total drilling in Models B and C are lower by 13.3 percent and 20.0 percent, respectively, than in Model A, because the imposition of severance taxes reduces the future payoff from this activity. The effect of the 22 percent drilling expense credit in Model D is to increase drilling above the levels predicted for Model B, but still 13.3 percent below the level predicted for Model A. Total drilling over the 110-year simulation period (net of the starting value of 2 billion feet) is 4.5 billion feet for Model A, 3.9 billion feet for Model B, 3.6 billion feet for Model C, and 3.9 billion feet for Model D.

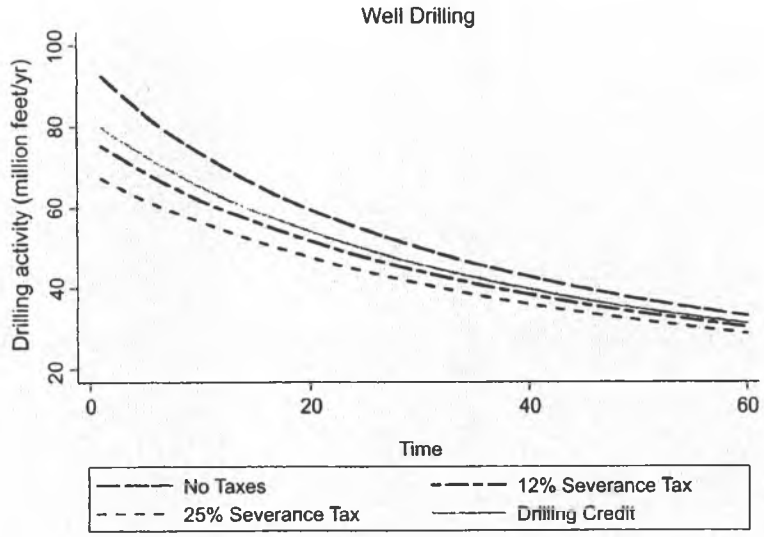

Figure 9.3. Drilling activity is more sensitive to the tax regime.

The figures presented in Table 9.3 imply that the long-run arc elasticity of footage drilled over the 110-year program with respect to the severance tax changes contemplated in Models B and C is −0.07. The corresponding price elasticity is 0.91. Thus, in percentage terms, drilling is more responsive to tax and price changes than is production. Figure 9.4 shows that these results are roughly consistent with the observed relationship between drilling footage and real oil prices (defined as in Figure 9.2) in the United States over the past 50 years.

As shown, drilling footage responds positively to changes in the real oil price, and a regression of the natural logarithm of footage drilled on the natural logarithm of the real price of crude oil yields a coefficient of the latter variable of 0.44 (t-statistic = 3.38). This estimate compares favorably with estimates produced by the simulation model.

Another perspective on the results for the time path of drilling and production can be obtained by focusing on the behavior of reserves. In all four models, initial reserves are set to 20 billion barrels. Drilling leads to annual reserve additions, and reserve additions are highest when more drilling is carried out. In consequence, reserve additions tend to be higher for Model A than for either Models B or C. Reserve additions also are higher for Model D than for Model B, again illustrating the effect of the drilling expense

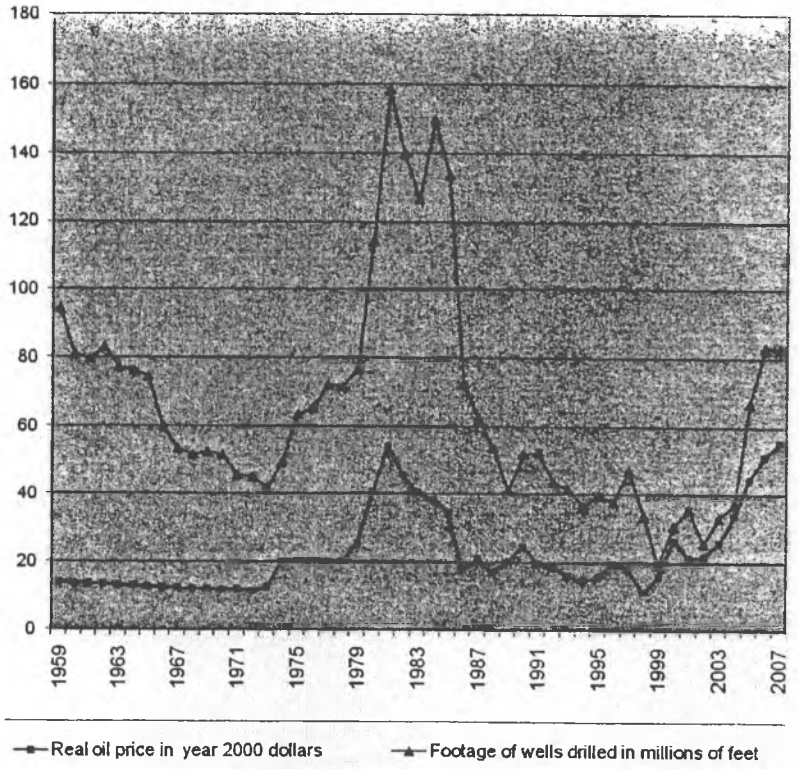

Figure 9.4. Price movements coincide with changes in footage of wells drilled.

subsidy. In all four models, however, annual reserve additions always are exceeded by annual production and thus reflect declining reserves over time. This outcome can be seen in Table 9.3 by comparing beginning reserves with the much smaller corresponding figures for ending reserves.[12] Moreover, this outcome is consistent with the previously discussed trends presented in Figure 9.2, which illustrate that U.S. proven reserves have declined by about 50 percent over the past half-century.

Table 9.3 presents additional information concerning the effect of the 22 percent drilling expense credit subsidy on drilling, production, reserves, and tax collections.[13] As discussed previously, the credit spurs drilling over

[12] The ending values for reserves reflect high-grading brought about by the severance tax, as discussed in the theoretical literature. For instance, ending reserves in Models B and C are 38 percent and 63 percent higher, respectively, than for Model A.

[13] Results presented below concerning effects of a drilling expense credit may also inform the current debate about the proposed elimination of the possibility to expense intangible

the life of the program, which adds to the reserve base and raises production (compare Models C and D). Discounted drilling expenditures rise by 29 percent ($20 billion), but because drilling expenditures rise at an increasing rate with footage drilled (see equation (9.10)), footage drilled rises by a smaller percentage (8 percent or 0.3 billion feet). The 0.6 billion barrel increase in production associated with the credit approximately offsets the effect on production of increasing the severance tax rate from 12 percent to 25 percent (compare Models B and D). Application of the credit results in 14 percent fewer remaining reserves at the end of the program (compare Models C and D) and roughly offsets the effect on ending reserves that results from the severance tax increase in Model C as compared with Model D.

The incremental production resulting from the drilling expense credit results in an increased present value of severance tax collections (gross of the credit) in Model D ($326.9 billion) as compared with Model C ($319.2 billion). Once the present value of drilling expense credits are subtracted, however, the net-of-credit present value of severance tax collections in Model D ($307.5 billion) ends up lower than in Model C by 3.7 percent, yet they are 93.4 percent higher in Model D than in Model B. Comparing Models D and C, $1.2 billion in lost severance tax revenue is regained through increased state corporate income tax collections; however, $5.9 billion in lost severance tax revenue is transferred to the federal government in the form of higher federal corporate income tax payments. In any case, the drilling expense credit results in a net loss in discounted state tax revenue of $10.5 billion. It costs about $17.50 in lost discounted state tax revenue (both severance tax and state corporate income tax) to produce an additional barrel of oil and about $35.00 of lost discounted state tax revenue to drill an additional foot. Additionally, each dollar of discounted state tax revenue lost because of the credit is associated with a $1.90 increase in drilling expenditures.

This outcome raises a question as to whether other public policy instruments, such as support for research to lower drilling costs or to increase finding rates, might spur drilling at lower cost to the state. Nonetheless, if a state's objective in granting the drilling expense credit is to gain support for increasing the severance tax rate from 12 percent to 25 percent, it is a relatively inexpensive concession. On the other hand, a state that expects the drilling expense credit to more than pay for itself through severance

drilling costs in computing federal corporate income tax liabilities. Both types of policies operate through α_D while leaving the other two tax parameters unchanged.

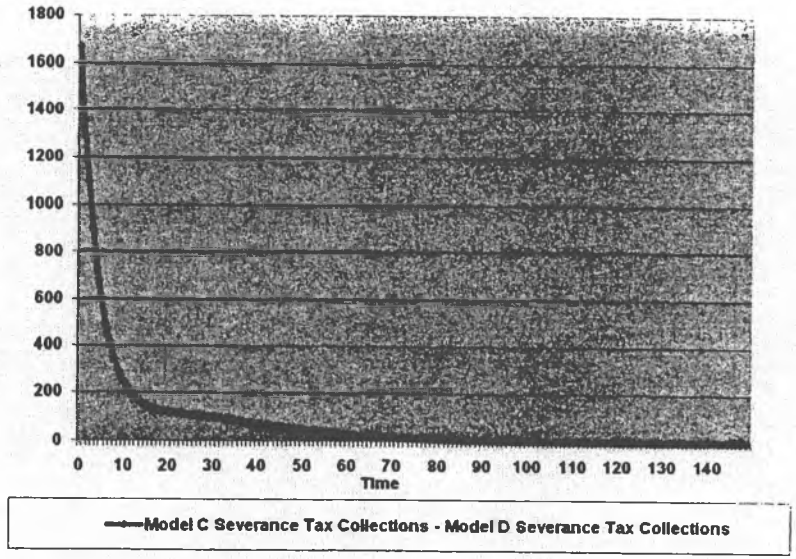

Figure 9.5. Discounted severance tax losses from the drilling expense credit accumulate over time.

tax collections will be disappointed because it simply generates too little incremental oil production. In fact, the drilling expense credit is not only cost-ineffective when evaluated over the entire program, it is cost-ineffective in each program year, as shown in Figure 9.5.

As can be seen from Table 9.2, the credit results in a 17 percent increase in drilling in year 1 (compare Models C and D), but no additional production and thus no additional revenue. Model D production begins to reflect the additional drilling in year 2 and exceeds that for Model C until year 48. During these years, severance tax losses in Model D compared to Model C are smaller than the value of the credit. As indicated, beginning in year 49, production in Model C is larger than that for Model D. Thus, in years 49 to 110, the loss in severance tax revenue in Model D compared to Model C exceeds the value of the credit.

A possible concern about these calculations is that they pertain to a model that is parameterized using U.S. oilfield data. In particular, one conjecture might be that a drilling credit might be financially more attractive in an area that has been less extensively explored, so that the marginal product of drilling in identifying new reserves would be higher. To check this idea, the simulation model was recalibrated by assuming that cumulative drilled footage prior to the start of the program was 500 million feet, rather than

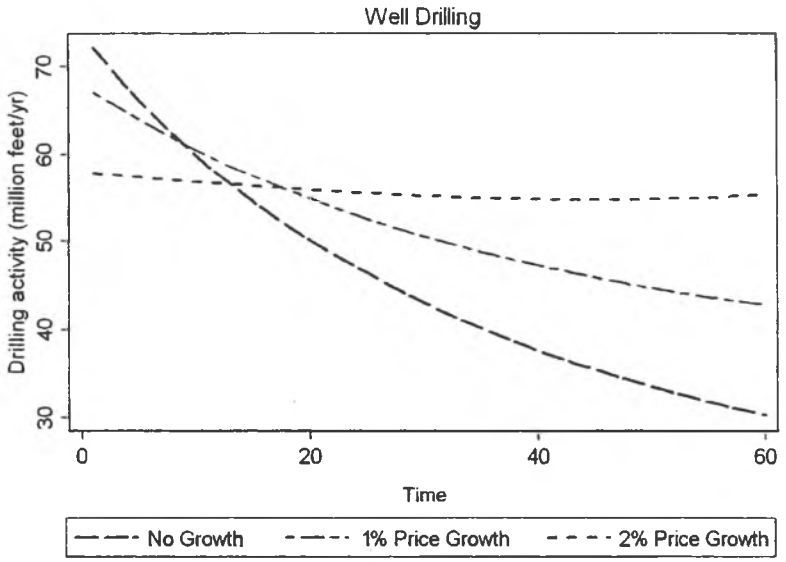

Figure 9.6. Oil drilling tilts to the future with exogenous growth in oil prices.

2 billion feet. This alteration roughly doubles the marginal product of drilling in identifying new reserves, which in turn stimulates drilling, reserve additions, and production. Therefore, Model C discounted severance tax collections are higher than those shown in Table 9.3. Model D discounted severance tax collections also are higher than in Table 9.3, but still lower than the comparable value for Model C. Thus, in both absolute and percentage terms, severance tax losses from the drilling expense credit are larger when cumulative footage drilled totals 500 million feet as compared with 2 billion feet.

It would also be of interest to construct a simulation using the actual path of oil prices over the last several decades. This price, however, exhibits sharp increases and decreases over time (see Figure 9.2), causing the simulation algorithm to break down. As a second choice, we performed a set of sensitivity analyses to reflect a forecast that oil prices will rise over time, at two exogenously given rates. Of course, with perfect foresight, prices cannot go up faster than the rate of discount, because then oil production will be postponed to the future. We thus assume exogenous growth rates in oil prices of 1 percent and 2 percent. As shown in Figure 9.6, drilling activity flattens out with a 2 percent growth in prices.

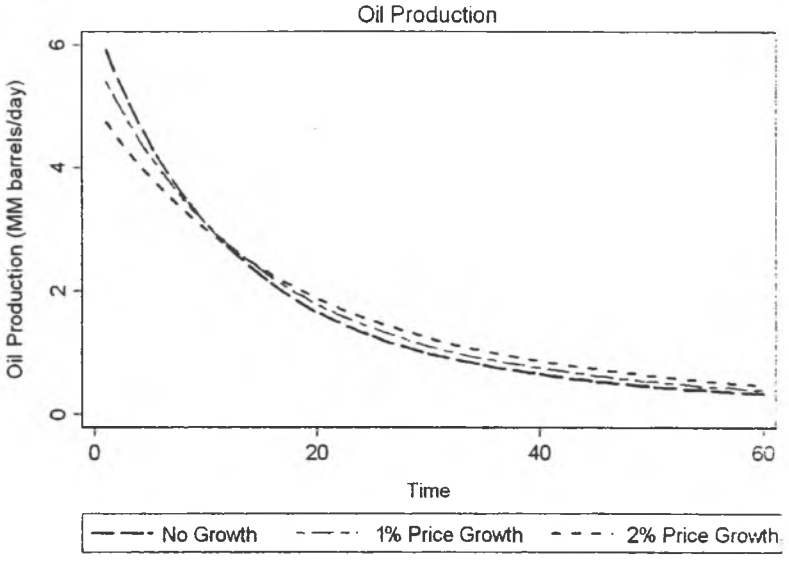

Figure 9.7. Oil production does not change appreciably with growth in oil prices.

However, oil production is relatively insensitive to oil price growth, as shown in Figure 9.7. This is because even though drilling activity shifts out to the future with an increase in prices, the decline in returns from cumulative drilling keeps production from leveling out in time. Production continues to fall, as in the case with constant prices. Figure 9.8 shows the change in reserve additions in the price growth scenario.

9.7 Concluding Remarks

This chapter described tax policies pursued by U.S. states that impact the oil industry. Three types of taxes are discussed: (1) the severance or production tax, (2) the property tax, and (3) the corporate income tax. The severance tax then is further analyzed in light of its widespread use in energy-producing states and its potential to generate revenues to support public services. The analysis is carried out using an adaptation of a conceptual model (Pindyck 1978) of exploration/development and production of exhaustible resources in which oil prices are taken as exogenous. This perspective is a useful simplification for an analysis of state taxes because no state produces enough oil to appreciably affect the world price. Simulations obtained from calibrating the model suggest that oil production volumes will be quite insensitive to

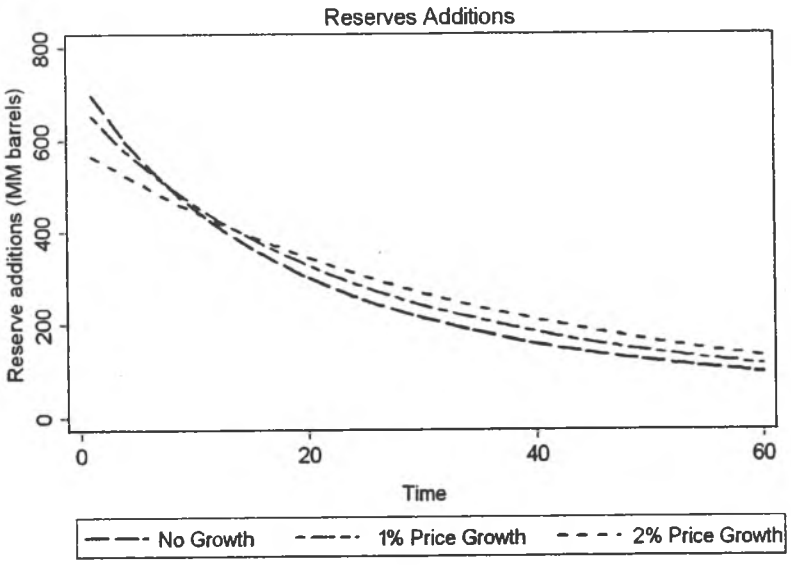

Figure 9.8. Reserve additions change only marginally with growth in oil prices.

price and severance tax rate changes. Thus, an increase in the severance tax rate is seen to generate proportionally more severance tax revenue, as its main effect is to redirect economic rents earned in the oil industry towards the public sector. An implication of this result turns out to be that the proposed elimination of the percentage depletion allowance, available to nonintegrated independent oil producers, may have much the same effect on production as a severance tax increase, although changes in the two types of tax measures may have quite different effects on the distribution of tax revenue between the state and federal levels of government.

Simulations based on the U.S. experience demonstrate that the credit for drilling expenses does turn out to increase drilling as intended. However, if the credit is applied in the United States, particularly in areas where a great deal of drilling has already occurred, its contribution to identifying new reserves may be rather limited. In other words, much of the continental United States has been extensively explored, so the chances of large oil discoveries probably are small. Simulations of the model show that the drilling expense credit does not generate enough incremental severance tax revenue to pay for itself. Additional work needs to be carried out to see whether alternative public policies to stimulate exploration and development might be more cost-effective as well as the extent to which the results presented continue to hold when the model is parameterized differently.

Effectiveness of Severance Tax Incentives in the U.S. Oil Industry

MITCH KUNCE mkunce@uwyo.edu
Department of Economics and Finance, University of Wyoming, Laramie, WY 82071-3985, USA

Abstract

This paper develops a dynamic empirical framework that can be used to test the effectiveness of state-level severance tax incentives in the U.S. oil industry. The framework embeds U.S. state-level panel data estimates into Pindyck's (1978) widely received theoretical model of exhaustible resource supply and can be applied to any of 20 states that produce significant quantities of oil. The model allows for interactions between taxes levied by different levels of government and for the first time addresses potential interstate differences in exploration costs, extraction costs, and reserve additions. In general, results show that severance tax incentives (in the form of tax rate reductions) substantially reduce state tax revenue collected, but yield moderate to little change in oil drilling and production activity. This outcome suggests that states should be wary of arguments asserting that large swings in oil field activity can be obtained from changes in severance tax rates.

Keywords: state taxation, nonrenewable resources

JEL Code: H71, Q32

1. Introduction

For roughly twenty years, major oil and gas producing states have granted severance tax exemptions, reductions, incentives, and credits to oil and gas producers for the purpose of stimulating exploration, field development, production, and job creation.[1] For example, to date 2000, Alaska, Kansas, and Louisiana have offered 13 such incentive programs, Texas has granted 12, Oklahoma 10, New Mexico 8, and Wyoming 8 (Interstate Oil and Gas Compact Commission, 2001). Incentive programs, generally, involve across the board cuts in nominal severance tax rates levied or discounts against existing severance tax liabilities for special situations faced by producers. The inherent tradeoff state governments must consider when offering incentives involves the potential loss of tax revenue for purported gains in exploration and production activity. A key question then arises: Are severance tax incentives effective in this regard? Surprisingly, very little empirical evidence exists regarding this question despite the heavy reliance on taxation of oil, gas, and/or coal production in many states to fund public goods.

This paper develops a dynamic empirical framework that can be used to test the effectiveness of state-level severance tax incentives in the U.S. oil industry. The framework embeds U.S. state-level panel data estimates into Pindyck's (1978) widely received theoretical model of exhaustible resource supply and can be applied to any of 20 states that produce significant

quantities of oil. The model allows for interactions between taxes levied by different levels of government and for the first time addresses potential interstate differences in exploration costs, extraction costs, and reserve additions. As shown, costs, reserve additions, and tax structures vary considerably across states. Thus, this adapted model is arguably superior to and more comprehensive than previous efforts to develop general econometric and/or simulation models of taxation and natural resource exploration and production. Specifically, Deacon et al. (1990) and Moroney (1997) focus only on one state (California and Texas, respectively), and estimate econometric equations that may not be entirely consistent with a dynamic profit-maximizing framework. Pesaran (1990) estimates an econometric model of offshore oil production in the UK that can be better justified theoretically, but does not consider the role of taxes and estimates of the shadow price of oil in the ground are not always positive. Favero (1992) adds taxes to Pesaran's analysis, but again, estimates of the shadow price of oil in the ground are sometimes negative, suggesting that the model overstates the impact of taxation on profit. The Pindyck based simulation studies conducted by Yücel (1989) and Deacon (1993) examine effects of various types of tax changes on exploration and production but do not consider interactions between tax bases claimed by different levels of government, as well as possible interstate differences in exploration costs, extraction costs, and reserve additions. Also, these studies are aimed mainly at assessing the generality of theoretical results obtained in more limited settings rather than analyzing possible outcomes of changes in state tax policies.

Use of the modeling framework developed here is illustrated by simulating effects of reductions in *existing* state severance tax rates. Thus, results presented have the advantage of showing potential effects of specific state tax policy changes. Examining optimal tax regimes is beyond the scope of this analysis. In general, results show that severance tax rate cuts substantially reduce state tax revenue collected, but yield moderate to little change in oil drilling and production activity. This outcome suggests that states should be wary of arguments asserting that large swings in oil field activity can be obtained from changes in severance tax rates.

The remainder of the paper is divided into four sections. Section 2 presents the theoretical model used in the study. Section 3 presents empirical estimates of the model's parameters. Key estimates are obtained using panel data from the 20 most important oil-producing states over the period 1970–2000. Section 4 presents simulation results showing how oil exploration, reserves and production in Wyoming vary in response to severance tax reductions. Although the model developed can be applied to any of 20 states that produce significant quantities of oil, Wyoming is singled out because the estimates developed are likely to be at least broadly representative of what would be obtained for other states. Moreover, focusing on Wyoming highlights the state's heavy reliance on energy production taxes to fund public services. Implications and conclusions of this analysis are drawn out in Section 5.

2. Conceptual Framework and Model

The analysis presented in this paper extends Pindyck's (1978) model of nonrenewable resource development to incorporate key aspects of federal, state and local taxes facing the U.S. oil industry. Because the theoretical model is familiar, discussion later in this

section is kept to a minimum. Perfectly competitive producers are assumed to maximize the discounted present value of future operating profits from the sale of resources. The firm's problem is to take known future output prices and taxes as given and then choose optimal time paths for exploration and production. This assumption parallels the basic tax competition models, reviewed by Wilson (1999), where governments commit to a tax regime and then perfectly competitive firms react treating the structure as exogenous.[2] Whereas the studies reviewed by Wilson model firms that are to some extent geographically mobile, firms extracting nonrenewable resources are tied to an immobile reserve base that represents the key component of their capital stock. In consequence, extractive firms view time, rather than space, as the most important dimension over which to substitute in response to changes in tax policy. Substitutions over time, of course, alter relative rates of exploration and production occurring at different locations. Yet, timing of activities is the most important aspect of the extractive firm's problem and information about location choice can be recovered as a by-product simply by comparing rates of development for particular reserves. A single firm is used to represent the industry, so the common pool problem and well spacing regulations are ignored (McDonald, 1994). For simplicity and because of data constraints discussed in the next section, exploration is defined to include resource development, although the two activities clearly are not the same (Adelman, 1990). The aim of exploration is to add to the reserve base, which in the model represents a form of immobile capital.

Institutional features of taxation facing oil producers are complex, however, incorporating these aspects into the model is not difficult conceptually and distinctly separates it from previous efforts mentioned in the introduction. Tax structures vary considerably among states and tax bases interact, particularly between the state and federal level. For example, among the eight states responsible for about 89% of 2000 U.S. oil production (Alaska, California, Kansas, Louisiana, New Mexico, Oklahoma, Texas, and Wyoming), all states except California levy severance taxes against the value of output. Severance taxes dominate other forms of local taxation in Alaska, Wyoming, and Louisiana. Most states do not levy property taxes on the value of reserves in the ground (Texas and California do). Most states treat royalty payments (computed as a percentage of gross value of production) for production on public land as deductible items in computing severance tax liabilities (Louisiana does not). Public land royalties are prominent in Alaska, New Mexico, and Wyoming due to the large shares of publicly owned land. Most states levy a corporate income tax that applies to oil operators (Wyoming and Texas do not). Also, states have granted innumerable exemptions and credits (which differ by state) against various tax liabilities for special situations that may be encountered by operators. Hence, effective rather than nominal rates are incorporated in the model developed below. Within states, counties apply their own mill levies to compute property taxes on above-ground and down-hole equipment at different rates. However, taxation of structures and equipment are usually less important than other sources of revenue and are not treated in the model below.

Regarding federal taxes, all incorporated producers file federal corporate income tax returns that allow deductions for various types of operating costs and for state and local tax payments. Independent producers (those without downstream refining or retail interests) are permitted to take a percentage depletion allowance, while major producers are allowed only cost depletion, which is significantly less generous. Both major and independent

incorporated producers can expense intangible drilling costs incurred on their federal corporate income tax returns. The fact that some smaller producers are not incorporated and may therefore face alternative state and federal tax treatment is not treated here.

The firm's maximization problem now becomes

$$\max_{q,w} \quad \Omega = \int_0^\infty [qp - C(q, R) - D(w) - \gamma R]e^{-rt}\, dt \tag{1}$$

subject to

$$\dot{R} = \dot{x} - q \tag{2}$$

$$\dot{x} = f(w, x) \tag{3}$$

$$q \geq 0, \quad w \geq 0, \quad R \geq 0, \quad x \geq 0 \tag{4}$$

where a dot over a variable denotes a time rate of change, q denotes the quantity of oil extracted measured in barrels, p denotes the exogenous market price per barrel net of all taxes, $C(q, R)$ denotes the total cost net of taxes of extracting the resource, which is assumed to depend on production (q) and reserve levels(R), $D(w)$ denotes total cost of exploration for additional reserves net of taxes, w denotes exploratory effort, γ denotes the net of all tax constant effective property tax rate on reserves, r denotes the discount rate which represents the risk-free real rate of long-term borrowing, x denotes cumulative reserve additions (discoveries), $f(w, x)$ denotes the production function for gross reserve additions ($\dot{x}$) which is assumed to depend on current exploratory effort (w) and cumulative discoveries (x), and $\dot{R}$ denotes reserve additions net of production (q).[3] In this formulation, the net-of-tax price per barrel is related to the wellhead (pre-tax) price (p^*) according to $p = \alpha_p p^*$, where α_p is a constant comprised of federal, state, and local effective tax rates such that $0 < \alpha_p < 1$. Correspondingly, $C(q, R) = \alpha_c C^*(q, R)$ and $D(w) = \alpha_D D^*(w)$, where α_c and α_D also are constants generated from effective tax rates and lie on the unit interval. A more complete discussion of the tax policy parameters follows below in Section 3.3.

The Hamiltonian for this problem is

$$H = qpe^{-rt} - C(q, R)e^{-rt} - D(w)e^{-rt} - \gamma Re^{-rt} + \lambda_1[f(w, x) - q] + \lambda_2[f(w, x)]. \tag{5}$$

Differentiating H with respect to R, q, x, and w yields the maximum principle conditions

$$\dot{\lambda}_1 = (C_R + \gamma)e^{-rt} \tag{6}$$

$$pe^{-rt} - C_q e^{-rt} - \lambda_1 = 0 \tag{7}$$

$$\dot{\lambda}_2 = -f_x(\lambda_1 + \lambda_2) \tag{8}$$

$$-D_w e^{-rt} + f_w(\lambda_1 + \lambda_2) = 0. \tag{9}$$

From equation (7), operators will produce if the discounted net-of-tax price exceeds discounted extraction costs. A severance tax decrease will increase the net-of-tax price which could affect the production decision. In equations (6)–(9), λ_1 is the discounted shadow price of the reserve state, λ_2 is the discounted shadow price of cumulative reserve additions, and letter subscripts represent partial derivatives. The shadow price of cumulative reserve additions, λ_2, is expected to be negative (and small relative to λ_1) for oil because current reserve

discoveries will increase the amount of exploration needed in the future. From equations (8) and (9), the term $(\lambda_1+\lambda_2)$ equals the discounted value of the marginal cost of adding another unit of reserves by exploration $[D_w/f_w]e^{-rt}$. Because $0 < \alpha_D < 1$, this net marginal cost is lower than in the pretax case.

The evolution of q is obtained by differentiating equation (7) with respect to time and setting the result equal to equation (6) to eliminate $\dot{\lambda}_1$. This yields

$$\dot{q} = \frac{-r(p - C_q) + \dot{p} - C_{qR}\dot{R} - (C_R + \gamma)}{C_{qq}}. \tag{10}$$

The optimal time path of w, can be determined using equation (7) and equation (9) to solve for λ_2, differentiating with respect to time to obtain an expression for $\dot{\lambda}_2$, equating the result to equation (8) and rearranging terms:[4]

$$\dot{w} = \frac{D_w[(f_{wx}/f_w)\cdot \dot{f} - f_x + \mathrm{r}] + (C_R + \gamma)f_w}{[-D_w(f_{ww}/f_w)]} \tag{11}$$

Equation (11) shows that the trajectory of exploratory effort is determined by a tradeoff between the cost of finding new reserves and the extraction cost savings this new level of reserves yields. As specified in this model, a severance tax incentive (rate decrease) could increase incentives to explore and enhance reserves due to the subsequent increase in the net-of-tax price. This effect is discussed in more detail in Section 4. The numerator of equation (10) emphasizes the role reserves play in the optimal extraction path. If reserves rise, marginal extraction costs fall, thus increasing production. While general suppositions such as these can be drawn analytically, the complexity of the dynamic process just described may be best examined with simulation as developed below.

Boundary conditions can be established by first assuming that $D_w/f_w = 0$ when $w = 0$ (see Pindyck, 1978, pp. 846–847). In this situation, when production ceases at some terminal time T, exploration ceases at the same time because it is of no further value. Also, $\lambda_2(T) = 0$ as long as there are no terminal costs associated with cumulative discoveries. In consequence, from equation (9), $\lambda_1(T) = 0$ implies that operating profit on the last unit of reserves extracted is zero, $p = C_q$. An alternative terminal state centers on the case where $D_w/f_w = \Phi > 0$, when $w = 0$. In this situation, production will continue after exploratory effort ceases. Let $T_1 < T$ denote the time when $w = 0$. If exploratory effort is zero, $f_x = 0$, hence $\dot{\lambda}_2(T_1) = 0$ and $\lambda_2(T_1) = 0$. From (7) and (9), $p - C_q = \lambda_1(T_1)e^{rt} = \Phi = D_w/f_w$ which indicates that exploration will stop just as $p - C_q$ approaches marginal discovery cost, Φ. These two alternative terminal conditions are discussed in the next section as well as in connection with the simulations presented in Section 4.

3. Estimation

As shown in equations (10) and (11), the evolutions of w and q are nonlinear functions of both the levels of these variables and the previously defined tax parameters. Estimating these equations directly poses certain econometric issues (see Pesaran, 1990) and it is unclear how information from the transversality conditions would be incorporated. In consequence, rather than attempt to obtain econometric estimates of these two equations directly, equations

for exploration costs (D^*), production of reserve additions (f), and extraction costs (C^*) are estimated and then substituted into the model along with estimates of the tax policy parameters α_p, α_c, α_D, and γ (see Yücel, 1989; Deacon, 1993 for similar treatments). Effects of severance tax changes then are obtained by simulation. State-specific estimates of equations for D^* and f are treated together in Section 3.1 because they are used to compute the marginal cost of reserve additions (D^*_w/f_w) which is a crucial function of the model described above. The equation for C^* is treated in Section 3.2 and the tax parameters are derived in Section 3.3. Key interstate differences regarding all estimates are highlighted throughout the discussion below.

3.1. Marginal Cost of Reserve Additions

The before-tax marginal cost of reserve additions (D^*_w/f_w) is computed from estimates of equations for drilling costs and for the production of reserve additions. Drilling costs are modeled in equation (12) as proportional to drilling effort.

$$D^*(w) = \phi w e^u \tag{12}$$

This approach ensures that the objective function (see equation (1)) represents a perfectly competitive firm ($D_{ww} = 0$). In equation (12), ϕ is the parameter to be estimated, and the disturbance term e^u is lognormally distributed with mean of unity and variance σ_u^2. Data by state and over time on labor, capital, and other primary inputs to drilling are unavailable, so the annual number of wells drilled in a state is used as a measure of drilling effort (w). Data on footage drilled also could be used as a measure of w (see Deacon, 1993). However, in the data set applied (see below) the number of wells drilled is positively correlated with total footage drilled (Pearson correlation = .98). Also, total drilling cost is approximately proportional to both footage and the number of wells, so to some extent the two variables measure the same thing. As discussed in Section 2, cumulative reserve discovery (x) appears as an argument in the production function for new reserves (see equation (13) below). A proxy for x can be constructed from available data (American Petroleum Institute, 1971) on the total number of wells drilled by state since 1859 (when the first oil well was drilled in Pennsylvania), whereas corresponding data on total footage drilled since that date are not available. Thus, use of number of wells as a measure of drilling effort simplifies the simulations presented in Section 4 and eliminates the need for arbitrary assumptions about historical average depth per well.

The production function for reserve additions is specified as

$$f(w, x) = A w^{\rho} e^{-\beta \cdot x} e^v \tag{13}$$

where A, ρ, and β are parameters to be estimated and the multiplicative disturbance e^v is assumed lognormally distributed with mean of unity and variance σ_v^2. The functional form selected for f is similar to the equation describing the discovery process proposed by Uhler (1976) and later adopted and estimated by Pindyck (1978) and Pesaran (1990). The idea behind this equation is that the marginal product of exploration declines as reserve discoveries cumulate. As previously discussed, data on cumulative reserve discoveries of oil are unavailable, so the cumulative number of wells drilled by state was used as a proxy.

As in the drilling cost function, the annual number of wells drilled is used as a measure of w.

Drilling cost and reserve production functions are estimated using annual data from 20 U.S. states for which complete information on wells drilled, drilling costs, reserve additions, and cumulative drilling could be assembled for the period 1970–2000.[5] Regarding costs, operators report the total cost (both tangible and intangible) of each well completed (including dry holes) via the Joint Association Survey on Drilling Costs.[6] Oil reserve additions are comprised of extensions, new field discoveries and new reservoir discoveries in old fields as defined by the U.S. Department of Energy, Energy Information Administration (DOE/EIA). The 20 states included in the data set accounted for 98.5% of the total U.S. oil production over 1970–2000.

Data sources, definitions, and sample means of variables used in the analysis are presented in Table 1. All nominal costs are converted to year 2000 dollars using the GDP deflator. Equations (12) and (13) were estimated in natural logarithms. An instrument for the natural logarithm of *WELLS* was used in equation (13) because w is an endogenous variable in the model presented in Section 2 and a Durbin-Wu-Hausman test (see Davidson and MacKinnon, 1993, pp. 389–393) rejected the exogeneity of w at the 5% level. An instrument for w was obtained by predicting the natural logarithm of the number of wells drilled from the one-way fixed-effects regression reported in Table 2. Time-specific effects tested insignificant at conventional levels. *PRICE* and *CWELLS* were included as explanatory variables because they are exogenous variables in the model. *PRICE2*, *CWELLS2*, and *PRICE*CWELLS* were included to account for non-linearities expected in light of relationships in the model. All estimated coefficients are significantly different from zero at conventional levels. The marginal effect of *WELLS* with respect to *PRICE* increases at a decreasing rate. The Pearson correlation between the actual values of *LN(WELLS)* and the corresponding predicted values, *LN(PREDWELLS)*, is 0.96.

Estimates of the drilling cost equation (12) are obtained by regressing the natural log of drilling costs minus the natural log of wells on dummy variables for states and years. This two-way fixed effects approach is a simple way to control for heterogeneity across states and over time. Examples of state-specific effects include geologic conditions, geographic remoteness of on-shore oil and gas resources, and whether drilling occurs in off-shore coastal waters (note that most states in the data set are landlocked). Time varying factors common to all states may include technological advancement and macroeconomic cycles. For this equation, each state-specific effect for a given year, conveniently, becomes the state-specific estimate of ϕ.

Estimates of equation (13) are obtained in a one-way fixed effects framework that yields common estimates of the slope coefficients across states and corrects for first-order serial correlation.[7] The one-way fixed effects estimation with correction for serial correlation is used for four interrelated reasons. First, this approach is a simple way to control for, yet avoid enumerating, unique aspects of states that affect reserve additions, but do not change over time. Second, time-specific effects are not jointly significant at conventional levels, making estimation in a two-way fixed effects framework unnecessary. Third, the random-effects specification, in which state-specific effects are treated as error components, is rejected by a Hausman (1978) test at the 5% level of significance. Moreover, conditional estimates of

the effects on reserve additions obtained from fixed-effects are thought to be of greater interest than corresponding unconditional estimates obtained using random effects. Fourth, the null hypothesis of no serial correlation is rejected at the 5% level, hence, the equation was re-estimated with correction for first-order serial correlation.

Table 3 reports estimates of the drilling cost equation for 8 major producing states. The 2000 state-specific estimates of ϕ have been corrected for the fact that the equation was estimated in logarithmic form (see Greene, 1997, p. 279). As shown, R^2 is 0.93 with state- and time-specific effects jointly significant under the appropriate F-test. State-specific estimates of ϕ test different from each other, except for Texas and Oklahoma, at the 5% level. Results suggest that total drilling costs increase with w and that constant marginal drilling

costs (D_w^*) differ substantially across the 8 states shown. Estimates of the reserve addition equation are shown in Tables 4 and 5. The coefficient of *LN(PREDWELLS)* is 0.56 and this estimate is significantly different from one and zero at conventional levels. The value of R^2 is 0.63 and the state-specific effects are jointly significant under the appropriate F-test. Also, the negative coefficient of *CWELLS*, though insignificant at conventional levels, suggests that reserve additions decline with the passage of time as new reserves become more difficult to identify. Table 5 shows the corrected state-specific intercept terms (A) for 8 major producing states. Results suggest that the marginal product of drilling (f_w) decreases with wells drilled and this marginal product would vary between states even if the number of wells drilled were the same in each.

Estimates of the two equations combined suggest that marginal cost of reserve additions (D_w^*/f_w) increases with drilling activity. As w increases, the marginal cost of drilling is constant, but the marginal product of drilling in finding new reserves (f_w) falls. Table 6 shows how pre-tax values of D_w^*, f_w, and D_w^*/f_w differ by state for 8 of the major producing states, assuming that the 2000 level of wells are drilled in each. Estimates of drilling cost per well (D_w^*) range from $132,907 in Kansas, where wells tend to be shallow, to $3,881,600 in Alaska, where the drilling experience is very different as compared to the lower 48 states. Marginal reserve additions from drilling (f_w) range from 11,051 barrels per well

in Kansas to 177,067 barrels per well in Alaska. Thus, while drilling a well in Alaska is markedly more expensive than in Kansas, Alaska experiences a greater payoff from these more costly exploration and development efforts. In fact, estimates of the marginal cost of reserve additions, D_w^*/f_w, reflect somewhat less variation across states than do estimates of either D_w^* or f_w, ranging from a low of \$11.24 per barrel in Louisiana to a high of \$21.92 in Alaska. Although relatively little variation in D_w^*/f_w would be expected when operators are familiar with costs and payoffs from drilling in alternative locations, values of the marginal cost of reserve additions are not expected to be equal across states. For example, aside from random factors introduced in estimation, variation in D_w^*/f_w between states could be due to differences in oil quality, transportation costs, as well as other factors that can cause wellhead prices of oil to differ across states

3.2. Extraction Costs

1970–2000. However, these data are of limited value for two reasons. First, cost estimates are not always disaggregated to the state level and cost estimates for other states may not be representative of all production. Second, through the mid-1980s, price controls on oil and/or gas distorted production incentives, making historical extraction costs difficult to compare with extraction costs in more recent years. As a compromise, following Deacon (1993), values of extraction cost parameters are calibrated for the following Cobb-Douglas function,

$$C(q, R) = \kappa q^{\varepsilon} R^{1-\varepsilon}, \tag{14}$$

where $\varepsilon = 1/\mu$, μ is the production share of non-reserve inputs, and κ is a constant that drives the production cost modeled to an average level of *lifting costs* representative of the 2000 DOA/EIA surveyed estimates described above. State-specific estimates for μ are established from the data on operating cost, drilling cost, production, reserve additions, and reserve levels described above (see Deacon, 1993 for specific calibration methods). [a]Calculated at 2000 levels for production and reserves, in year 2000 dollars. The EIA does not provide data for Alaska.

shows the pre-tax marginal extraction costs (C_q^*) and the non-reserve input shares (μ) for 7 major producing states. The DOE/EIA does not estimate lifting costs for Alaska. As shown, real marginal extraction costs range from a low of \$4.99 per barrel in Kansas to a high of \$9.11 per barrel in Louisiana. The Cobb-Douglas form for extraction costs insures that these costs will rise without limit as reserves approach zero. This condition implies that a positive level of reserves will remain at any terminal time, denoted T_1. Likewise, the functional form invokes a strictly positive level of production given any positive level of reserves. Thus, simulations reported in Section 4 are based on the second of the two alternative boundary conditions discussed in Section 2. This condition implies that production continues after incentives for further exploration vanish and that the terminal date for maximizing discounted operating profits must be set arbitrarily. This fixed program period could be interpreted as the producer's relevant planning horizon.

3.3. *Tax Policy Parameters*

For most states in most years, γ and $\alpha_j (j = p, C, D)$ can be specified by noting whether reserves are subject to a property tax (see text equation (1)) and then evaluating the following equations:

$$\gamma = \{(1 - \tau_{us})(1 - \tau_s)\tau_R\} \tag{15}$$

$$\alpha_p = \{(1 - \tau_{us})(1 - \tau_s)(1 - \tau_r)(1 - \tau_p) + \tau_{us}(1 - \tau_r)\delta\} \tag{16}$$

$$\alpha_c = \{(1 - \tau_{us})(1 - \tau_s)\} \tag{17}$$

$$\alpha_D = \{(1 - \tau_{us})(1 - \tau_s)\eta\} \tag{18}$$

The derivation of equations (15)–(18) can be found in Appendix A. In (15)–(18), τ_{us} denotes the federal corporate income tax rate, τ_s denotes the state corporate income tax rate, τ_R denotes the property tax rate on reserves weighted by the per unit assessed value, τ_r denotes the royalty rate on production from public (state and federal) land, τ_p denotes the production (severance) tax rate, δ denotes the federal percentage depletion allowance weighted by the percentage of production attributable to eligible producers (nonintegrated independents), and η denotes the expensed portion of current and capitalized drilling costs attributable to current period revenues. The parameter η is made up of two components: (1) the percentage of current period drilling costs expensed and (2) the estimated present value of cost depletion deductions for the capitalized portion of current and past drilling expenditures. Producers are allowed to expense costs associated with drilling dry holes along with certain intangible costs (e.g., labor and fuel) for completed wells as they are incurred. All direct (tangible) expenditures for completed wells must be capitalized then depleted over the life of the producing well.

This formulation captures several aspects of the U.S. tax structure as it applies to the oil industry. (1) Federal royalty payments are deductible in computing state production tax liabilities. (2) Federal royalty payments, state production taxes, state property taxes on reserves, extraction costs, and certain drilling costs (described above) are deductible in computing both state and federal corporate income tax liabilities. (3) State corporate income taxes are deductible against federal corporate income tax liabilities. As noted in

Section 2, state tax treatment of the oil industry is not uniform and there are a number of situations in which these equations would have to be modified. Notice that this treatment of taxes in the model highlights the interaction between tax bases and is more detailed than the corresponding treatment given by Moroney (1997) and Deacon et al. (1990). Also, the entire tax structure is incorporated into the model, rather than simply analyzing one tax at a time as in Deacon (1993).

All tax parameters in equations (15)–(18) are effective rather than nominal rates. States grant numerous credits and exemptions against taxes levied, so nominal rates generally overstate amounts actually paid. State and local data required for these effective rate calculations are neither available from a central source nor compiled in a common format, so they were obtained directly from tax officials in each state. Royalty rates are computed as the sum of state and federal royalty payments divided by the gross value of production. Production tax rates are computed as total production tax collections divided by the gross value of production net of public land royalties. At the federal level, data from Statistics of Income (U.S. Department of Treasury, 1999–2000) for the oil and gas sector show that federal corporate taxes paid averaged about 11% of *net operating* income in 2000. The ratio of the federal effective to marginal rate was also applied to each state's top marginal corporate income tax rate to obtain an effective estimate. The current nominal percentage depletion rate is 15% and it applies to each state's percentage of non-integrated producers. Also, the expensed portion of current period drilling costs is approximately 42% for the industry and the present value of depletion deductions for capitalized drilling cost can be approximated by $(q/R)/(r + (q/R))$, assuming that the ratio of production to reserves is constant (see U.S. Department of Commerce, Bureau of the Census, 2000; Deacon, 1993). The ratio of production to reserves (q/R) varies across states but the industry expense share (42%) applies to all states.

4. Simulation Results

The model presented in Section 2 can be simulated for any of the 20 oil-producing states to obtain responses of exploration and production to reductions in severance taxes. The discussion below focuses mainly on severance tax rate reductions in just one state, Wyoming, for four reasons. First, this approach substantially reduces the amount of institutional detail that must be presented. Second, despite the large interstate differences in costs, reserve additions, and tax structures shown above, changes in severance taxes turn out to have quite similar comparative effects in each of the major oil producing states. Therefore, estimates for Wyoming are likely to be broadly representative of what would be obtained for other states. Third, simulation results reported are based on the assumption that severance tax reductions in one state do not affect the wellhead price of oil seen by operators in other states. This assumption is warranted in view of the fact that oil prices are determined in a world market. Also, as shown below, tax rate cuts considered appear to lead to comparatively small changes in output, so cross border effects are unlikely to be important in any case. Finally, taxation of oil extraction is a long-standing, contentious public policy issue in Wyoming partly because of heavy reliance on energy production taxes to fund public services.

Simulations for Wyoming were performed using the estimates of equations (12) and (13), the calibrated production cost parameters ($\varepsilon = 2.93, \kappa = 150$) of equation (14), and the tax parameters ($\alpha_p = 0.72, \alpha_c = 0.89, \alpha_D = 0.75, \gamma = 0$ as derived in Appendix A. As shown, severance tax changes will affect the price tax parameter, α_p. The discount rate, r, was set at 4% to reflect the risk-free real rate of long-term borrowing and the future price path was fixed at $25.00 per barrel each year reflecting the real sample mean for all 20 states. Other price trajectories (rising or falling) were simulated, but the alternative paths have little or no effect on the comparative results presented below. The initial value of reserves and cumulative wells drilled are fixed to year-end 2000 levels at 561 million barrels and 39,993 wells, respectively. To obtain numerical solutions for the time paths of drilling, production, and reserves, difference equation approximations are derived for the time rates of change in production and exploratory effort (equations (10) and (11) and for the state variable evolution equations (2) and (3)). For example, the evolution of reserves, equation (2), is approximated by the difference, $R_{t+1} - R_t = f_t - q_t$. The model is solved recursively by iterating over the initial values of the control variables, q and w, until transversality conditions are satisfied. Under these base case conditions, exploratory effort approaches zero after approximately 40 years, thus the terminal time (T_1) is set to 40 periods. The Solver algorithm in Microsoft Excel was used to generate numerical solutions.

Before the simulation results are discussed, a historical analysis of Wyoming's oil experience is warranted. Figure 1 depicts the actual time paths of real price, wells drilled, production, and reserves for Wyoming from 1970–2000. In this figure, the vertical axis shows wellhead price (dotted line) in year 2000 dollars × 10, wells drilled (dashed line) in

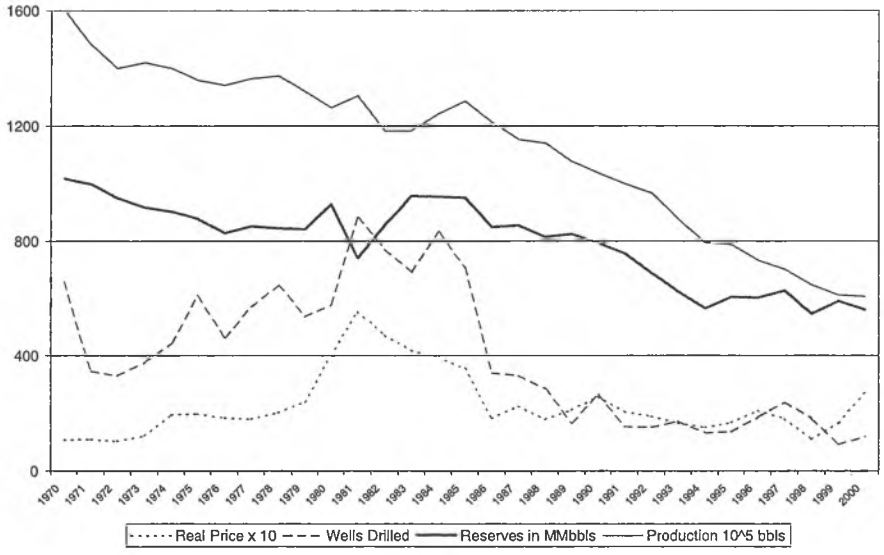

Figure 1. Wyoming oil 1970–2000.

total wells, production (solid line) in bbls $\times 10^5$, and reserves (bold line) in millions of barrels (MMbbls). In reviewing these data, several observations are noteworthy. Historical drilling appears sensitive to price. Oil wells drilled increased markedly during the high price period of the early 1980s. Extraction activity, however, appears to map the declining proved reserve level in the state. In fact, oil production continued to decline during the late 1970s and early 1980s even though real prices increased roughly 3 fold. As shown, the increased drilling effort of the early to mid 1980s failed to replenish the depleting oil reserves in the state.

As depicted in Figure 1, the low real prices for oil in the 1990's provided the oil industry incentive to lobby state legislatures for tax breaks intended to stimulate exploration and production. In 1999, both Wyoming and Oklahoma enacted oil producer recovery acts which lowered state level nominal severance taxes by approximately 25–35% on all oil production, provided that oil prices remain below a certain level.[8] Using this scenario as a back-drop, the comparative simulation below shows the results of a once-and-for-all reduction in Wyoming's effective severance tax on oil production by 2 percentage-points. Results presented have the advantage of showing how exploration and production might be expected to change over time in response to an *actual* constant policy change.

The solid lines in Figures 2–4 show the evolution of drilling, reserves, and production under the base case assumptions outlined above. Wells drilled fall steadily over time from

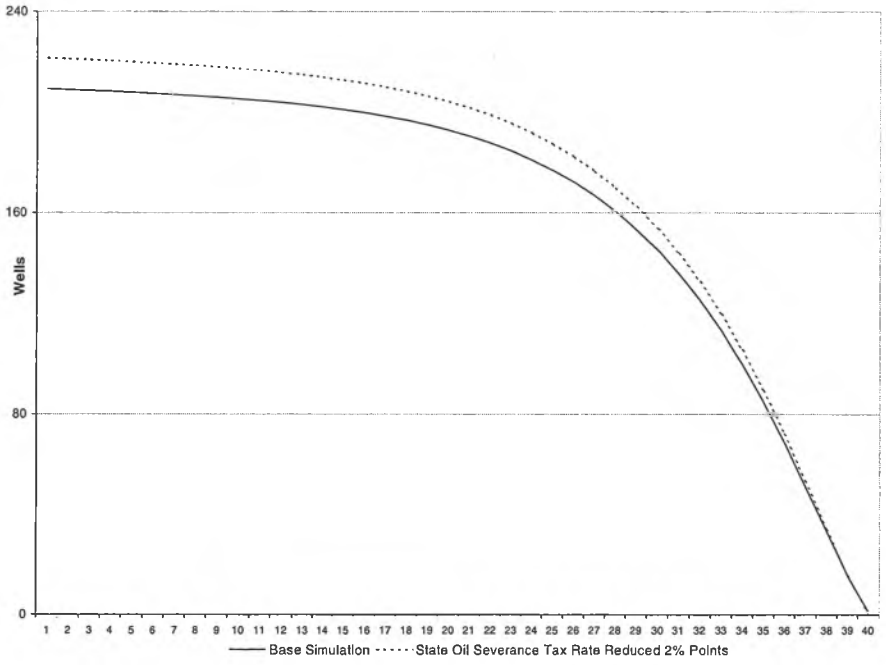

Figure 2. Wyoming oil (drilling).

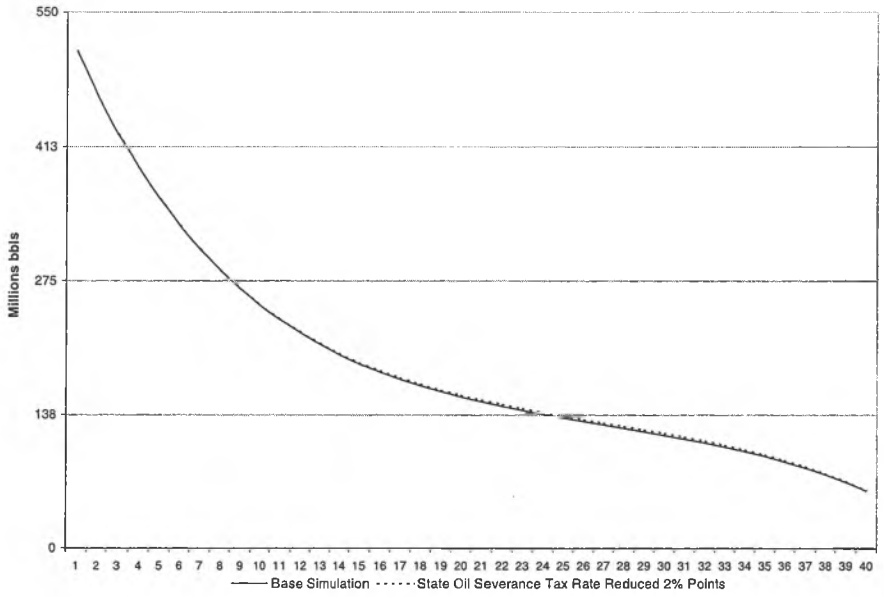

Figure 3. Wyoming oil (reserves).

209 in year 1 (2001) to 1 in year 40 (2040). Reserves also decline over this period from 510 MMbbls to 59 MMbbls with production declining from 59 MMbbls to 11 MMbbls. The dotted lines in these figures show the effects of a once-and-for-all reduction in the state oil severance tax by 2 percentage-points, which reduces the state effective rate from 5.8 to 3.8% and increases net-of-tax price by 40 cents (α_p increases by 0.016). As shown in Figure 2, the tax decrease increases drilling in the early years of the program when compared to the base simulation. Overall, drilling increases by 378 wells or 5.8% above the 40-year program base. With increased drilling in the early years, additional reserves are identified (15 million barrels more) and, as shown in Figure 3, proved reserves slightly rise in the out years.

Through the life of the program, the tax decrease results in increased production by about 14.9 million barrels, about 1.6% above the base solution. As Figure 4 depicts, this difference is roughly equal to the 15 million barrel increase in reserve additions that comes about because of the tax decrease. Also, the increase in output reflects a relatively low elasticity of production with respect to severance tax rate changes. Over the life of the program, this elasticity is approximately 0.05. Intuitively, while a decrease in the severance tax stimulates drilling activity, the additional drilling has a comparatively small effect on reserve levels. Given that over 63,000 wells (oil and gas) have been drilled in Wyoming to date 2000, prospects of a significant oil discovery are unlikely and the marginal product of drilling in finding new reserves is lower than in the past. As a consequence, reserve additions also respond inelastically to the severance tax decrease. Moreover, such small increases in

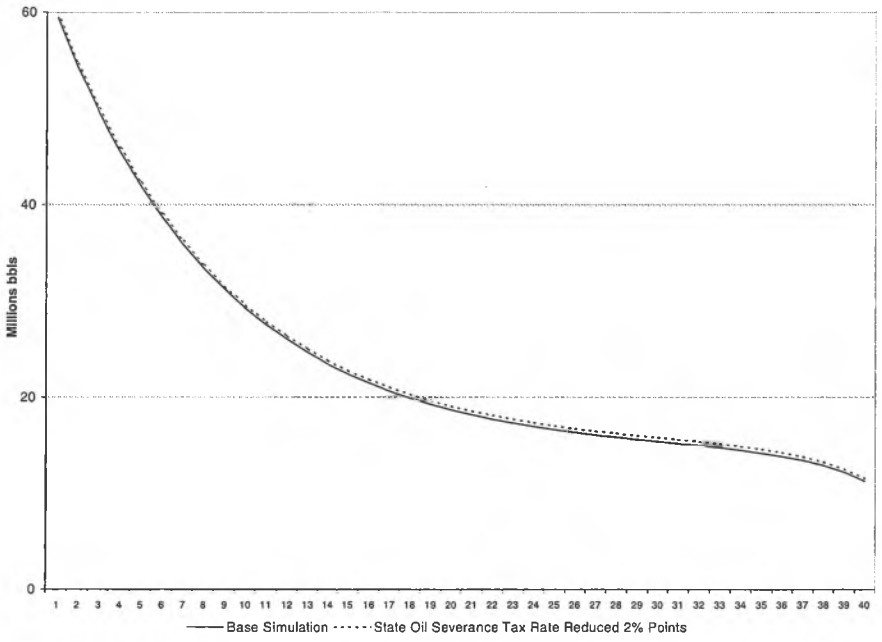

Figure 4. Wyoming oil (production).

net price (e.g., 40 cents per barrel) will unlikely affect production from existing wells and provides little incentive to reopen 'shut-in' wells.

The largest change associated with the 2 percentage-point reduction in state oil severance taxes is found in state production tax collections. Applying the discount rate of 4%, the tax change results in a decline in the present value of Wyoming *state* severance tax collections from $751 million to $498 million, a decline of over 33%. Alternatively stated, Wyoming would forego $669,312 in present value of severance tax revenue for each of the additional 378 wells drilled. Certainly, the incentive enhanced drilling effort may provide the state other forms of benefits (i.e., short-term rig employment and sales tax collections) but these additional benefits would have to be considerable in order to offset what appears to be an insurmountable loss of state tax revenue.

Because severance taxes are deductible in computing federal corporate income tax liabilities, tax payments to the federal government increase by $27 million (3.6% above the base case). Also, the 2 percentage-point severance tax decrease transfers state revenue to local governments because of the production stimulus. Discounted local production taxes increase by $12 million or 2% above the base case. The same can be said for discounted public land royalties which increase by 1.9% ($18 million) because of the increase in production. These results highlight the importance of the tax interactions described in Section 2 above.

The key result of this analysis is that oil reserve additions and production respond quite inelastically to reductions in severance tax rates. In the case at hand, a constant 2 percentage-point rate reduction increases overall simulated production by 1.6%—but decreases state severance tax revenue substantially in present value terms, by over 33%. This general outcome also applies to the other major oil producing states that levy a severance tax. In any case, oil-producing states should be wary of arguments promising large increases in oil exploration and production in response to cuts in severance tax rates.

5. Conclusions

This paper has adapted Pindyck's (1978) model of nonrenewable natural resource production to allow for an empirical test of the effectiveness of state oil severance tax incentives. Equations of the model are estimated econometrically from panel data on production, exploration and reserve additions for 20 states over the period 1970–00. The model is designed so that effects of changes in existing state severance tax rates on the evolution of exploration, reserves and production can be simulated into the mid-21st century. In general, results show that severance tax rate reductions result in a substantial loss of tax revenue, moderate increases in drilling, but little change in reserve additions and production. A key question regarding this general result is: Why does output of oil respond so grudgingly to changes in severance taxes? There appears to be four reasons why this is so. First, a reduction in severance taxes offers no *direct* stimulus for reserve exploration. A cut in the severance tax, as modeled, does nothing to directly stimulate reserve additions—operators get the future benefits of this tax incentive only if they drill *and only if they are successful.* In general, "upstream" incentives given at the beginning of the exploration-development-production process may provide a greater stimulus to production than "downstream" incentives given at the end of the process—e.g., cuts in severance taxes.

Second, operators do not see the full effect of state severance tax changes because of the many tax base and rate interactions at all levels. For example, severance taxes are deductible against federal corporate income tax liabilities. Therefore, when severance tax rates fall, federal corporate income tax liabilities rise and vice-versa. In fact, results herein suggest taxes should not be analyzed independently without reference to the entire tax structure applied by all levels of government; for example, a tax discount granted at one level may be partially offset by increased liabilities at another level. Therefore, operators do not receive the full value of tax reductions that may be granted by Wyoming and other states. Third, and in a related vein, a reduction in severance tax rates by 2 percentage-points has only a small impact on the net-of-tax price received by operators. The tax reduction simulated above increases the constant net-of-tax price by only 40 cents per barrel. This small increase cannot be expected to generate much in the way of *new* oil production.

Fourth, and most importantly, production of (as contrasted with exploration for) oil is driven mainly by reserves, not by prices, severance tax rates, or tax discounts. This is a basic fact of geology and is easily illustrated by reexamining Wyoming's own history of oil production. Since 1970, Wyoming oil reserves steadily declined from 1 billion barrels to 561 million barrels in 2000 (see Figure 1). In other words, despite much exploration over the past 31 years (over 12,300 wells drilled), production has drawn down reserves faster

than new discoveries have added to them. This implies that for states like Texas, Oklahoma, and Wyoming the prospect of major exploratory success is not particularly promising (see Moroney, 1997 for a similar analysis of Texas). Moreover, during the past 31 years, oil production declined from 160 million barrels in 1970 to 61 million barrels in 2000. In fact, oil production continued to decline during the late 1970s and early 1980s even though real (year 2000 dollars) oil prices rose by a factor of more than 3, from about $18/bbl. to more than $55/bbl. Thus, even comparatively large price increases are not expected to call forth much additional output.

The general conclusion that severance tax changes appear to be unimportant may be problematic to public officials in oil producing states hoping to stimulate local economic activity by lowering such rates. The prospect of modest increases in exploration and production comes at a considerable cost, the loss of substantial state tax revenue that must be offset. Rather, state officials may have the incentive to raise severance tax rates risking little in the way of loss to future oil field activity.

Appendix A

This appendix derives the (generalized) constant tax parameters numbered (15)–(18) in the text. Restating the producer's problem (bracketed terms in text equation (1)) accounting for all tax effects yields

$$\begin{aligned} & qp^* - qp^*\tau_r - qp^*(1-\tau_r)\tau_p - C^* - \eta D^* - \tau_R R - \tau_s[qp^* - qp^*\tau_r \\ & \quad - qp^*(1-\tau_r)\tau_p - C^* - \eta D^* - \tau_R R] - \tau_{us}\{qp^* - qp^*\tau_r - qp^*(1-\tau_r)\tau_p \\ & \quad - qp^*(1-\tau_r)\delta - C^* - \eta D^* - \tau_R R - \tau_s[qp^* - qp^*\tau_r \\ & \quad - qp^*(1-\tau_r)\tau_p - C^* - \eta D^* - \tau_R R]\}. \end{aligned} \tag{A.1}$$

Collecting terms from (A.1) gives

$$(1-\tau_{us})(1-\tau_s)[qp^* - qp^*\tau_r - qp^*(1-\tau_r)\tau_p - C^* - \eta D^* - \tau_R R] + \tau_{us}qp^*(1-\tau_r)\delta \tag{A.2}$$

which reduces to

$$\begin{aligned} & qp^*\{(1-\tau_{us})(1-\tau_s)(1-\tau_r)(1-\tau_p) + \tau_{us}(1-\tau_r)\delta\} - C^*\{(1-\tau_{us})(1-\tau_s)\} \\ & \quad - \eta D^*\{(1-\tau_{us})(1-\tau_s)\} - \tau_R R\{(1-\tau_{us})(1-\tau_s)\}. \end{aligned} \tag{A.3}$$

For a single barrel of q and R, (A.3) becomes

$$\alpha_p p^* - \alpha_c C^* - \alpha_D D^* - \gamma. \tag{A.4}$$

where

$$\gamma = \{(1-\tau_{us})(1-\tau_s)\tau_R\} \tag{A.5}$$

$$\alpha_p = \{(1-\tau_{us})(1-\tau_s)(1-\tau_r)(1-\tau_p) + \tau_{us}(1-\tau_r)\delta\} \tag{A.6}$$

$$\alpha_c = \{(1-\tau_{us})(1-\tau_s)\} \tag{A.7}$$

$$\alpha_D = \{(1-\tau_{us})(1-\tau_s)\eta\} \tag{A.8}$$

equate to equations (15)–(18) in the text.

Wyoming Tax Parameters

In developing a base simulation solution, equations (A.5)–(A.8) can be simplified because Wyoming does not have a state corporate income tax ($\tau_s = 0$) and does not levy a property tax against reserves in the ground ($\tau_R = 0$). For Wyoming, royalty rates are computed as the sum of state and federal royalty payments divided by the gross value of production and averaged 9.1% for oil in 2000. This percentage is higher than for other oil producing states because of the comparatively large share of Wyoming's production on public lands. Production tax rates are computed as total production tax collections divided by the gross value of production net of public land royalties. In Wyoming, there are both local and state levies against this net value of production. Local ad valorum taxes are based on the prior year's production value. The sum of the two average effective rates in 2000 totaled approximately 12.3% (local 6.5% and state 5.8%). Also, the current nominal percentage depletion rate of 15% applied to about 52% of Wyoming oil producers in 2000, thus $\delta = 7.8\%$. Also, the expensed portion of current period drilling costs is approximately 42% for the industry and the present value of depletion deductions for capitalized drilling cost can be approximated by $(q/R)/(r + (q/R))$, assuming that the ratio of production to reserves is constant (see Deacon, 1993). Wyoming's mean value of q/R was approximately 11% for the sample period, therefore $\eta = 0.42 + (1 - 0.42) * (0.11/(0.04 + 0.11)) = 0.84$. The base tax policy parameters for Wyoming are $\alpha_p = 0.72, \alpha_c = 0.89, \alpha_D = 0.75, \gamma = 0$.

Acknowledgments

This research is supported by an appropriation from the Wyoming Legislature (1999 Wyoming Session Laws, Chapter 168, Section 3). However, this paper may or may not reflect the views of public officials in the state. Thanks to John Livernois, editor John Wilson, and two anonymous referees for a number of constructive suggestions that improved this paper.

Notes

1. Severance or production taxes are typically ad valorem taxes levied on the net production value (or volume) of a resource as it is extracted from the ground or at the final point of sale.
2. Making tax rates endogenous to the problem considered here would be a logical and important extension of this research.
3. Pindyck's (1978) original specification of the extraction cost function is retained here in spite of the logical inconsistencies discussed by Livernois and Uhler (1987), Livernois (1987, 1988) and Swierzbinski and Mendelsohn (1989). These authors argue that Pindyck's extraction cost function is defensible when reserves are of uniform quality but in the presence of exploration, reserves must be treated as heterogeneous because the most accessible deposits are added to the reserve base first. They show that aggregation of extraction costs across heterogeneous deposits is not valid except under special circumstances. Another problem with this function is that extraction costs should be a function of γ. The extraction cost function derived from profit-maximization at a point in time subject to a production constraint would have γ as an argument because the reserve base is an input to oil and gas production. These complications are not treated in the analysis below because of severe data constraints on estimating the extraction cost function (see Section 3.2).

4. Equation (11) can be simplified by choosing a functional form for reserve additions such as the one used in Section 3 (see equation (13)). In this case, $(f_{xw}/f_w) \cdot f - f_x = 0$.
5. The Energy Information Administration and the American Petroleum Institute (2000) report annual production data for 31 states over this period, but data on reserve additions, cumulative drilling, and drilling costs are not available in all years for the 11 smallest producing states. The 20 states included are AK, AL, AR, CA, CO, IL, IN, KS, KY, LA, MI, MS, MT, ND, NE, NM, OK, TX, UT, and WY.
6. Major cost items are for labor, materials, supplies, machinery and tools, water, transportation, fuels, power, and direct overhead for operations such as permitting and preparation, road building, drilling pit construction, erecting and dismantling derricks/drilling rigs, drilling hole, casing, hauling and disposal of waste materials and site restoration. For additional details, see Joint Association Survey on Drilling Costs, Appendix A (1998).
7. Equation (13) was also estimated allowing for both state-specific intercepts and state-specific coefficients for ρ and β. This strategy was unsuccessful as it yielded mostly insignificant estimates of state-specific slope interactions.
8. Wyoming rescinded this legislation in 2000.

STATE TAXATION, EXPLORATION, AND PRODUCTION IN THE U.S. OIL INDUSTRY

Abstract

How do firms in nonrenewable resource industries respond to changes in state taxes? This paper employs state-specific estimates of Pindyck's (1978) widely cited model of natural resource supply to simulate effects of changes in state production (severance) tax policy on the timing of exploration and output by firms in the U.S. oil industry. The framework developed can be applied to any of 15 states that produce significant quantities of oil, and allows for interactions between taxes levied by different levels of government. Results of this study suggest that oil production is highly inelastic with respect to changes in production taxes. A production tax rate increase is shown to decrease early period exploration effort, affect little change in reserve additions and future production, and substantially increase discounted tax revenue. Policy implications of this outcome suggest that state officials may consider raising production tax rates as a way to increase revenue while risking little in the way of loss to future oil activity.

1. Introduction

How do firms in nonrenewable resource industries respond to changes in state taxes? It may be tempting to look for answers to this question in the empirical literature on effects of state taxation (see, for example, Bartik 1985, Helms 1985, Papke 1991, 1994, and Holmes 1998). These papers focus on firms with mobile capital that choose where to locate on the basis of factors affecting revenues and costs. This perspective, however, is not particularly relevant when looking at the behavior of firms extracting nonrenewable natural resources. Such firms cannot change location because they are tied to a geographically immobile reserve base that makes up a key component of their capital stock. On the other hand, extractive firms can and probably do alter the timing of their activities when state taxes and other public policies change. Yet, little is known about the extent to which they do this even though commercially valuable deposits of natural resources are found in most U.S. states and some states such as Texas, Oklahoma, Louisiana, Wyoming, and Alaska rely heavily on taxation of oil, gas, and/or coal production to fund public services.

This paper uses state-specific estimates of Pindyck's (1978) widely cited model of natural resource supply to simulate effects of changes in state production (severance) tax policy on the timing of exploration and output by firms in the U.S. oil industry. The framework developed can be applied to any of 15 states that produce significant quantities of oil, and allows for interactions between taxes levied by different levels of government. It is arguably superior to and more comprehensive than previous efforts to develop econometric and/or simulation models of taxation and natural resource exploration and production. For example, Deacon, DeCanio, Frech, and Johnson (1990)

and Moroney (1997) focus only on one state (California and Texas, respectively), and estimate econometric equations that may not be consistent with a dynamic profit-maximizing framework. Pesaran (1990) estimates an econometric model of offshore oil production in the UK that can be better justified theoretically, but does not consider the role of taxes. Simulation studies conducted by Yucel (1989) and Deacon (1993) examine effects of various types of tax changes on exploration and production, but do not consider interactions between tax bases claimed by different levels of government. Additionally, these studies do not allow for possible interstate differences in exploration and extraction costs and are aimed mainly at assessing the generality of theoretical results obtained in more limited settings (see, for example, Burness 1976, Conrad and Hool 1980, and Heaps 1985) rather than analyzing possible outcomes of changes in state tax policies.

Results of this study suggest that oil production is highly inelastic with respect to changes in production taxes so deadweight losses from altering these taxes are likely to be small. As a consequence, state officials may consider raising production tax rates as a way to increase revenue. It is worth noting in this context that because state production taxes are deductible against federal corporate income tax liabilities, increases in production tax rates increase state revenues partly at the expense of federal tax collections. These points are more fully discussed in Section 3 after developing the framework for the simulation model in the next section.

2. The Simulation Model

This section shows how Pindyck's (1978) model of nonrenewable resource development is adapted to simulate effects of state production tax changes. The

discussion begins with a brief overview of the Pindyck model and then discusses estimation of key equations and tax parameters.

Conceptual Model

The model assumes that perfectly competitive producers maximize the discounted present value of future operating profits from the sale of resources and because one such firm is chosen to represent the industry, the common pool problem and well-spacing regulations are not considered (see McDonald 1994 for discussion of these issues). The firm's problem is to take the future time path of output prices and taxes as given and then choose optimal time paths for exploration and production. This approach is similar to that taken in previously cited econometric studies of effects of changes in state tax policy on state economic growth and ignores the possibility that choices of tax bases and rates are endogenous (i.e., that governments consider the firm's objective function in choosing taxes that maximize community welfare). Also, the model defines exploration to include resource development, although the two activities clearly are not the same (Adelman 1990). The aim of exploration is to add to the reserve base, which as indicated in the introduction, is a form of geographically immobile capital.

The firm's maximization problem is

$$\max_{q,w} \Omega = \int_0^\infty [qp - C(q,R) - D(w) - \gamma R]e^{-rt}\,dt \tag{1}$$

subject to

$$\dot{R} = \dot{x} - q \tag{2}$$

$$\dot{x} = f(w,x) \tag{3}$$

$$q \geq 0, w \geq 0, R \geq 0, x \geq 0 \tag{4}$$

where a dot over a variable denotes a time rate of change, q denotes the quantity of oil extracted measured in barrels, p denotes the exogenous market price per barrel net of all taxes, $C(\cdot)$ denotes the total cost net of taxes of extracting the resource, which is assumed to depend on production (q) and reserve levels (R), $D(w)$ denotes total cost of exploration for additional reserves net of taxes, w denotes exploratory effort, γ denotes the net of all tax constant effective property tax rate on reserves, r denotes the discount rate which represents the risk-free real rate of long-term borrowing, x denotes cumulative reserve additions (discoveries), $f(\cdot)$ denotes the production function for gross reserve additions $(\dot{x})$, and $\dot{R}$ denotes reserve additions net of production (q).[1] In this formulation, the net-of-tax price per barrel is related to the wellhead (pre-tax) price (p^*) according to $p = \alpha_p p^*$, where α_p is a tax policy parameter such that $0 < \alpha_p < 1$. Correspondingly, $C(q,R) = \alpha_c C^*(q,R)$ and $D(w) = \alpha_D D^*(w)$, where α_c and α_D also are tax policy parameters that lie on the unit interval. These tax policy parameters are discussed more fully later on in this section.

Model Implementation

To implement the model, equations for exploration costs (D^*), production of reserve additions (f), and extraction costs (C^*) are estimated and then substituted into the model along with estimates of the tax parameters α_p, α_c, α_D, and γ. Effects of tax changes then are obtained by simulation. Estimates of the tax parameters are described first followed by discussion of estimates of equations for D^*, f, and C^*.

Tax Parameters

General considerations in developing estimates of the four tax policy parameters for major oil producing states are briefly outlined below and technical details are described in Appendix A. Among major oil producing states, tax structures vary considerably and tax bases interact, particularly between the state and federal level. For example, among the eight states responsible for about 89% of U.S. oil production (Alaska, California, Kansas, Louisiana, New Mexico, Oklahoma, Texas, and Wyoming), all states except California levy production taxes against the value of output. Production taxes dominate other forms of local taxation in Alaska, Wyoming, and Louisiana. Most states do not levy property taxes on the value of reserves in the ground (Texas and California do). Most states treat royalty payments (computed as a percentage of gross value of production) for production on public land as deductible items in computing severance tax liabilities (Louisiana does not). Public land royalties are prominent in Alaska, New Mexico, and Wyoming due to the large shares of publicly owned land. Most states levy a corporate income tax that applies to oil operators (Wyoming and Texas do not). Also, states have granted innumerable exemptions and credits (which differ by state) against various tax liabilities for special situations that may be encountered by operators. Within states, counties apply their own mill levies to compute property taxes on equipment at different rates. However, taxation of structures and equipment are usually less important than other sources of revenue and are ignored below.

Regarding federal taxes, all incorporated producers file federal corporate income tax returns that allow deductions for various types of operating costs and for state and local tax payments. Independent producers (those without downstream refining or retail

interests) are permitted to take a percentage depletion allowance, while major producers are allowed only cost depletion, which is significantly less generous. Both major and independent incorporated producers can expense intangible drilling costs incurred on their federal corporate income tax returns. The fact that some smaller producers are not incorporated and may therefore face alternative state and federal tax treatment is ignored.

The myriad of state-specific special features described above creates considerable complexity in tracking tax law over time. Rather than itemize tax code details, effective tax rates are used to translate dynamic tax policy into a tractable form. Effective rates can be expressed as the ratio of taxes (or royalties) collected from a particular tax to the value of production. Thus, the calculation of specific effective tax rates fully account for exemptions, incentives, different tax bases, and frequent changes in tax law both at the state and federal level. For a detail account of the taxation of the oil industry see Gerking, Morgan, Kunce, and Kerkvliet (2000), Chapter 2.

Marginal Cost of Reserve Additions

The before-tax marginal cost of reserve additions (D_w^* / f_w) is computed from estimates of equations for drilling costs and for the production of reserve additions. Drilling costs are assumed to be proportional to drilling effort as shown in equation (5)

$$D^*(w) = \phi w e^u \tag{5}$$

where ϕ is the parameter to be estimated and the disturbance term e^u is lognormally distributed with mean of unity and variance σ_u^2. The production function for reserve additions is specified as

$$f(w,x) = A w^{\rho} e^{-\beta \cdot x} e^{v} \tag{6}$$

where A, ρ, and β are parameters to be estimated and the disturbance e^v is assumed lognormally distributed with mean of unity and variance σ_v^2. Equation (6) is similar to the equation describing the discovery process proposed by Uhler (1976) and later adopted by Pindyck (1978) and Pesaran (1990). The idea behind this equation is that the marginal product of exploration declines as reserve discoveries cumulate.

Estimation used annual data from the 15 U.S. states for which complete information on variables needed could be assembled for the period 1970-98.[2] These states accounted for 96.5% of total U.S. oil production over this time period. Drilling costs are measured by total real costs (both tangible and intangible) of each well completed, including dry holes.[3] Nominal cost values were deflated using the 1995 GDP deflator. Oil reserve additions are defined as extensions, new field discoveries and new reservoir discoveries in old fields. The total number of wells drilled for each state since 1859 (when the first oil well was drilled in Pennsylvania) is used as a proxy for x. Data sources and sample means of variables used in the analysis are presented in Table 1.

Equation (5) and equation (6) were estimated in natural logarithms. Both equations used an instrument for the number of wells drilled because w is an endogenous variable in the model presented in Section 2. The instrument was obtained from the predicted values from a regression of the number of wells on cumulative drilling and the wellhead price as shown in Appendix A. Estimates of the drilling cost equation, equation (5), are obtained by regressing drilling cost per well on dummy variables for states and years. Coefficients of state and year dummies are jointly significant at the 1% level and the R^2 is 0.90. The idea behind using this approach is to get state- and time-specific estimates of ϕ. This parameter is expected to vary across states because of differences in

geologic conditions, geographic remoteness of on-shore oil resources, and whether drilling occurs in off-shore coastal waters (note that most states in the data set are landlocked). Time varying factors common to all states may include technological advancement and macroeconomic cycles. State-specific estimates of ϕ test different from each other, except Texas and Oklahoma, at the 5% level.

Estimates of equation (6), shown below in equation (7), allow for state-specific intercept terms (time-specific effects were jointly insignificant), common slope coefficients across states, and are corrected for first-order serial correlation (ρ =0.431).

$$\ln(ADDED\ RESERVES) = \ln A + \underset{(t)\ (5.33)}{0.69*\ln(PREDWELLS)} - \underset{(-1.37)}{0.000006*CWELLS}. \quad (7)$$

State-specific estimates of A are jointly significant at the 1% level and $R^2 = 0.40$.[4] These results show that the marginal product of drilling (f_w) decreases with wells drilled as well as with cumulative drilling, although the coefficient of cumulative drilling is insignificant at conventional levels.

Estimates of equations (5) and (6) combined show that the marginal cost of reserve additions (D_w^*/f_w) increases with drilling activity. As w increases, the marginal cost of drilling is constant, but the marginal product of drilling in finding new reserves (f_w) falls. Table 2 reports values of D_w^*, f_w, and D_w^*/f_w by state for seven major oil producing states. These estimates use 1998 values for numbers of wells drilled and cumulative drilling and are corrected for conversion from logarithms (see Greene 1997, p. 279). Estimates of D_w^* and f_w reflect considerable variation across the seven states. Estimates of marginal drilling cost range from $127,943 in Kansas to $1,218,758 in Louisiana. Marginal reserve additions from drilling (f_w) range from 7,460 barrels in Kansas to 64,862 barrels in Louisiana. Thus, while drilling in Louisiana is relatively

more expensive than in Kansas, Louisiana experiences a greater payoff from these more costly exploration and development efforts. Values of D_w^*/f_w for the seven states range from a low of $17.15 per barrel in Kansas to a high of $26.04 in Texas.

Extraction Costs

Because data on oil extraction costs are weak, $C(q, R)$ could not be econometrically estimated. Instead, this equation was calibrated for each state with a Cobb-Douglas functional form using methods described in Deacon (1993). Cost parameter calibration specifics are described in Appendix A. Results show that the 1998 marginal extraction costs range from a low of $4.89 per barrel in Kansas to a high of $8.81 per barrel in Louisiana. Additionally, the Cobb-Douglas form implies that extraction costs rise without limit as reserves approach zero and that a positive level of reserves will remain at any terminal time T. Thus, boundary conditions used in the simulations reported in Section 3 allow production to continue after incentives for further exploration vanish so that the terminal date for the exploration/production program must be set arbitrarily. This fixed program period could be interpreted as the producer's relevant planning horizon.

3. *Simulation Results*

The model presented in Section 2 can be simulated to obtain responses of exploration and production to changes in various types of taxes in any of 15 oil producing states. Simulations presented below focus on production tax changes in Wyoming. The production tax is the most important tax levied on the oil industry by oil producing states (see Section 2) and changes in production taxes turn out to have quite similar effects in all major oil producing states so results from one state are used to represent the others

(for results of tax changes in other major oil producing states, see Gerking, Kunce, Morgan, and Kerkvliet 2000). Also, simulations reported are based on the assumption that tax changes in one state do not affect the wellhead price of oil seen by operators in other states. This assumption probably is not unreasonable in view of the fact that oil prices are internationally determined and even the largest producing U.S. state (Texas) accounts for only a small percentage (4.2% from 1970-98) of world output.[5] Moreover, as shown below, tax changes considered lead to comparatively small changes in output, so these interstate effects are not likely to be important in any case.

Simulations for Wyoming were performed using the instrumental variable estimates of equations (5) and (6), the calibrated production cost function and the tax parameters, both derived in Appendix A. The discount rate, r, was set at 4% to reflect the risk-free real rate of long-term borrowing and the future price path was fixed at $23.00 per barrel each year reflecting the real sample mean for all 15 states. Other price trajectories were simulated, but the alternative paths have little or no effect on the comparative results presented below. The initial value of reserves and cumulative wells drilled were fixed to year-end 1998 levels at 550 million barrels and 40,439 wells, respectively. To obtain numerical solutions for the optimal time paths of drilling, production, and reserves, difference equation approximations are derived for the time rates of change in exploratory effort ($\dot{w}$), production ($\dot{q}$), and for the state variable evolution equations (2) and (3). For example, the evolution of reserves, equation (2), is approximated by the difference, $R_{t+1} - R_t = f_t - q_t$. The model is then solved recursively by iterating over the initial values of the control variables, q and w, until transversality conditions are satisfied. Under these base conditions, exploratory effort approaches zero

after approximately 40 years, thus the terminal time is set to 40 periods. The solver algorithm in Microsoft Excel was used to generate numerical solutions.

Before the simulation results are discussed, a historical analysis of Wyoming's oil experience is warranted. Figure 1 depicts the actual time paths of real price, drilling, production, and reserves for Wyoming from 1970-98. In this figure, the vertical axis shows price per bbl (dotted line) in \$1995 $\times$ 10, drilling (dashed line) in total wells, production (solid line) in bbls $\times$ 10^5, and reserves (bold line) in millions of barrels (MMbbls). In reviewing these data, several observations are noteworthy. Historical drilling appears sensitive to price. Total wells drilled increases markedly during the high price period of the early 1980s. Extraction activity, however, appears to map the declining proved reserve level in the state. In fact, oil production continued to decline during the late 1970s and early 1980s even though real prices increased 2 1/2 fold. The increased drilling experienced in the early to mid 1980s failed to replenish the depleting oil reserve in the state and production closely followed the reserve decline.

This apparent historical insensitivity of production to changes in price raises an interesting policy question: If severance tax changes are reflected in net price (as modeled in section 2), what are the effects of a severance tax increase? Many oil states, as previously described — including Wyoming, rely heavily on production taxes to fund local public goods and officials may have incentives to raise production taxes for the revenue. The inherent trade off to severance tax increases is the purported loss of economic activity generated by the industry within the state. To examine this, the first simulation conducted shows the effects of *doubling* Wyoming's effective state severance tax rate for the full 40-year program. Results detailing the simulated differences in the

timing of drilling, production, and discounted severance tax revenue for the full tax interaction model (outlined above) are presented in the top section of Table 3. Comparative individual program year results, divided into 10-year increments, show that doubling the state severance tax markedly decreases early period drilling. Drilling decreases by 19.4% in the first year of the simulated program and this difference converges to zero by year 40. Interestingly, 10 year fractional results show that 63.8% of the total 1208 well decrease occurs in the first 20 years of the program. Figure 2 graphically compares the effects of the tax increase (dotted line) to the base drilling solution (bold line). With less drilling in the early years of the program, fewer new reserves are identified and, as shown in Figure 3, future production of oil slightly diverges downward from the base solution. Production results presented in Table 3 show this gradual divergence — a 2.4% drop in year one falling to an 11.8% decline in year 40. Through the life of the program, doubling the state severance tax decreases total production by about 48 MMbbls or 5.7% below the base solution.

The largest change associated with doubling the state oil severance tax appears to come from discounted severance tax collections. As shown in Table 3, the tax increase results in an increase in the present value of Wyoming severance tax collections from $609 million to $1165 million, an increase of over 91%. The majority (87.6%) of this $556 million increase occurs in the first half of the simulated program due to the relatively small production loss generated by the tax increase and discounting. Because severance taxes are deductible in computing federal corporate income tax liabilities, discounted tax payments to the federal government decrease by $60 million or about 11% below the base simulation. Also, the severance tax increase transfers local government

revenue to the state because of the production decline. Discounted local production taxes decrease by $34 million or 5% below the base solution. The same can be said for discounted public land royalties which decrease by 4.6% ($50 million) because of the decrease in future production.

The tax interactions described above highlight a key feature of the model developed here — oil producers do not face the full effect of an increase in the severance tax rate. As shown, tax base and rate interactions partially offset the pure-effect of the severance tax rate increase. To illustrate this clearly, counterpart simulations were conducted where all tax effects, other than state level production tax rates, were effectively *zeroed out*. The lower section of Table 3 presents the counterpart Wyoming results. When all tax interactions are ignored, doubling the state severance tax decreases relative drilling by 32.8% and production by 11.2%, a decrease in activity roughly 2 times larger than found in the full tax interaction model examined above. Timing effects are similar to the full tax interaction model results. Because the severance tax increase now invokes a larger production loss, discounted state severance taxes increase by 83% as compared to the 91% increase in the full tax interaction model. Analyzing taxes individually appears to overstate the affects on exploration and production by ignoring potential offsets and tax base interactions. These results suggest that taxes should not be analyzed independently without careful reference to the entire tax structure applied by all levels of government.

General results of this study suggest that oil production is highly inelastic with respect to changes in production taxes. This inelastic response may provide incentives for state officials to substantially increase these taxes risking little in the way of reduced

industry activity while gaining much needed tax revenue. State severance tax increases clearly reduce the net price faced by producers but it is reserves, not net price, that drives production in this industry. Moreover, the effects of increased state severance taxes are partially offset by reduced tax collections by all other levels of government.

4. Conclusions

This paper has adapted Pindyck's (1978) model of nonrenewable natural resource production to take account of taxation at the federal and state-local government levels. Equations of the model are estimated from panel data on production, exploration and reserve additions for 15 states over the period 1970-98. The model is designed so that effects of changes in existing state production tax rates on the timing and evolution of exploration and production can be simulated into the mid-21st century. Results of this study suggest that oil production is highly inelastic with respect to changes in production taxes. A production tax rate increase is shown to decrease early period exploration effort, invoke little change in reserve additions and subsequently future production, and substantially increase discounted tax revenue. Policy implications of this outcome suggest that state officials may consider raising production tax rates as a way to increase revenue while risking little in the way of loss to future oil activity.

Endnotes

[1]Pindyck's (1978) original specification of the extraction cost function is retained here in spite of the logical inconsistencies discussed by Livernois and Uhler (1987), Livernois (1987), and Swierzbinski and Mendelsohn (1989). These authors argue that Pindyck's extraction cost function is defensible when reserves are of uniform quality but in the presence of exploration, reserves must be treated as heterogeneous because the most accessible deposits are added to the reserve base first. They show that aggregation of extraction costs across heterogeneous deposits is not valid except under special circumstances. Another problem with this function is that extraction costs should be a function of γ. The extraction cost function derived from profit-maximization at a point in time subject to a production constraint would have γ as an argument because the reserve base is an input to oil and gas production. These complications are ignored in the analysis below because of severe data constraints on estimating the extraction cost function.

[2] The Energy Information Administration and the American Petroleum Institute report annual production data for 31 states over this period, but data on reserve additions, cumulative drilling, and drilling costs are not available in all years for the 16 smallest producing states. The 15 states included in the panel are Alaska, Alabama, California, Colorado, Kansas, Louisiana, Michigan, Mississippi, Montana, North Dakota, New Mexico, Oklahoma, Texas, Utah, and Wyoming.

[3] Major cost items are for labor, materials, supplies, machinery and tools, water, transportation, fuels, power, and direct overhead for operations such as permitting and preparation, road building, drilling pit construction, erecting and dismantling derricks/drilling rigs, drilling hole, casing, hauling and disposal of waste materials and site restoration. For additional details, see Joint Association Survey on Drilling Costs, Appendix A (1998).

[4] Corrected (see Greene 1997, p. 279) state-specific intercept terms (and t-statistics) for 7 major producing states are: CA 0.17(2.01), KS 0.06(1.06), LA 0.57(2.21), NM 0.19(1.68), OK 0.07(1.94), TX 0.01(1.11), WY 0.29(2.03). Equation (6) was also estimated allowing for both state-specific intercepts and state-specific coefficients for ρ and β. This strategy was unsuccessful as it yielded mostly insignificant estimates of state-specific slope interactions.

Appendix A

Tax Policy Parameters

For most states in most years, γ and α_j *(j=p,c,D)* can be specified by noting whether reserves are subject to a property tax (see text equation (1)) and then evaluating equations (A.1)-(A.4).

$$\gamma = \{(1-\tau_{us})(1-\tau_s)\tau_R\} \tag{A.1}$$

$$\alpha_p = \{(1-\tau_{us})(1-\tau_s)(1-\tau_r)(1-\tau_p)+\tau_{us}(1-\tau_r)\delta\} \tag{A.2}$$

$$\alpha_c = \{(1-\tau_{us})(1-\tau_s)\} \tag{A.3}$$

$$\alpha_D = \{(1-\tau_{us})(1-\tau_s)\eta\} \tag{A.4}$$

A derivation of equations (A.1)-(A.4) can be found in Gerking, Morgan, Kunce, and Kerkvliet (2000), Appendix C. In (A.1)-(A.4), τ_{us} denotes the federal corporate income tax rate, τ_s denotes the state corporate income tax rate, τ_R denotes the property tax rate on reserves weighted by the per unit assessed value, τ_r denotes the royalty rate on production from public (state and federal) land, τ_p denotes the production (severance) tax rate, δ denotes the federal percentage depletion allowance weighted by the percentage of production attributable to eligible producers (nonintegrated independents), and η denotes the expensed portion of current and capitalized drilling costs attributable to current period revenues. η is made up of two components: (1) the percentage of current period drilling costs expensed and (2) the estimated present value of cost depletion deductions for the capitalized portion of current and past drilling expenditures. Producers are allowed to expense costs associated with drilling dry holes along with certain intangible costs (e.g., labor and fuel) for completed wells as they are incurred. All direct

(tangible) expenditures for completed wells must be capitalized then depleted over the life of the producing well. In the illustration at hand, equations (A.1)-(A.4) can be simplified because Wyoming does not have a state corporate income tax ($\tau_s=0$) and does not levy a property tax against reserves in the ground ($\tau_R=0$).

This formulation captures several aspects of the U.S. tax structure as it applies to the oil industry. (1) Federal royalty payments are deductible in computing state production tax liabilities. (2) Federal royalty payments, state production taxes, state property taxes on reserves, extraction costs, and certain drilling costs (described above) are deductible in computing both state and federal corporate income tax liabilities. (3) State corporate income taxes are deductible against federal corporate income tax liabilities. As noted in text section 2, state tax treatment of the oil industry is not uniform and there are a number of situations in which these equations would have to be modified. Notice that this treatment of taxes in the model highlights the interaction between tax bases and is more detailed than the corresponding treatment given by Moroney (1997) or Deacon, DeCanio, Frech, and Johnson (1990). Also, the entire tax structure is incorporated into the model, rather than simply analyzing one tax at a time as in Deacon (1993).

All tax parameters in equations (A.1)-(A.4) are effective rather than nominal rates. States grant numerous credits and exemptions against taxes levied, so nominal rates generally overstate amounts actually paid. State and local data required for these effective rate calculations are neither available from a central source nor compiled in a common format, so they were obtained directly from tax officials in each state (see Gerking, Morgan, Kunce, and Kerkvliet 2000, Chapter 2). In developing the *base*

solution for Wyoming, royalty rates are computed as the sum of state and federal royalty payments divided by the gross value of production and averaged 9% for oil in the late 1990s. This percentage is higher than for other oil producing states because of the comparatively large share of Wyoming's production on public lands. Production tax rates are computed as total production tax collections divided by the prior year's gross value of production net of public land royalties. In Wyoming, there are both local and state levies against this one-year-lagged net value of production. The sum of the two average effective rates in the late 90's totaled approximately 11.9% (local 6.7% and state 5.2%). At the federal level, data from Statistics of Income (U.S. Department of Treasury, 1997-1998) for the oil and gas sector show that federal corporate taxes paid averaged about 10% of *net operating* income in 1998. Also, the current nominal percentage depletion rate of 15% applied to about 58% of Wyoming oil producers in 1998, thus δ = 8.7%. Also, the expensed portion of current period drilling costs is approximately 40% for the industry and the present value of depletion deductions for capitalized drilling cost can be approximated by $(q/R)/(r+(q/R))$, assuming that the ratio of production to reserves is constant (Deacon 1993). Wyoming's mean value of q/R was approximately 8% for the sample period 1996-1998, therefore $\eta = 0.40 + (1 - 0.4)*(0.08 / (0.04 + 0.08)) = 0.8$. The base tax policy parameters for Wyoming are $\alpha_p = 0.73$, $\alpha_c = 0.90$, $\alpha_D = 0.72$, $\gamma = 0$.

Estimate of an Instrument for WELLS

An instrument for the natural logarithm of *WELLS* was used as an explanatory variable in estimating both text equations (5) and (6) with *CWELLS* entering equation (6) as the proxy for x. Instrumental variable estimation is appropriate because w is an endogenous variable in the model presented in Section 2. An instrument for w was

obtained by predicting the natural logarithm of the number of wells drilled from the one-way fixed-effects regression reported in Table A.1. Time-specific effects tested insignificant at conventional levels and $R^2 = 0.91$. *PRICE* and *CWELLS* were included as explanatory variables because they are exogenous variables in the model. *PRICE2, CWELLS2,* and *PRICE*CWELLS* were included to account for non-linearities expected in light of relationships in the model (see Table 1 for descriptions). All estimated coefficients are significantly different from zero except the interaction term *PRICE*CWELLS*. The marginal effect of *WELLS* with respect to *PRICE* increases at a decreasing rate. The Pearson correlation between the actual values of ln*(WELLS)* and the corresponding predicted values, ln*(PREDWELLS)*, is 0.96.

Table A.1
Construction of Instrument ln*(PREDWELLS)*

Explanatory Variable	***Coefficient*** (t-statistic)
PRICE	0.064 (6.49)
PRICE2	-0.45E-3 (-2.90)
CWELLS	-0.22E-4 (-5.19)
CWELLS2	0.15E-10 (4.17)
*PRICE*CWELLS*	0.18E-7 (1.51)

Extraction Cost Function

Direct operating (lifting) cost for oil by region at depths of 2,000, 4,000, 8,000, and 12,000 feet are available from annual cost index studies published by the DOE/EIA

for the period 1970-1998. However, these data are of limited value for two reasons. First, cost estimates are not always disaggregated to the state level and cost estimates for other states may not be representative of all production. Second, through the mid-1980s, price controls on oil and/or gas distorted production incentives, making historical extraction costs difficult to compare with extraction costs in more recent years. As a compromise, following Deacon (1993), values of extraction cost parameters are calibrated for the following Cobb-Douglas function,

$$C(q, R) = \kappa q^{\varepsilon} R^{1-\varepsilon} , \qquad \text{(A.5)}$$

where $\varepsilon = 1/\mu$, μ is the production share of non-reserve inputs, and κ is a constant value that drives the production cost modeled to an average level of *lifting costs* representative of the 1998 DOA/EIA surveyed estimates described above. State-specific estimates for μ are established from the data on operating cost, drilling cost, production, reserve additions, and reserve levels described above (see Kunce, Gerking, and Morgan 2001 for specific calibration methods). Marginal extraction costs per barrel using 1998 data for 7 major producing states are: CA \$6.12, KS \$4.89, LA \$8.81, NM \$6.27, OK \$6.89, TX \$6.71, and WY \$6.43. The 1998 calibrated oil production cost parameters for Wyoming are $\varepsilon = 2.93$ and $\kappa = 141$.

Gas and Water Handling Constraints handout

Gas and Water Handling Constraints On Alaska's North Slope
Excerpts from Articles and Reports, 1989-2011

Background Information

1989 Revenue Sources Book
Alaska Department of Revenue

> "The vast majority of Alaska production will continue to come from the now declining Prudhoe Bay field ... The decline in Prudhoe Bay production is now expected to be much more rapid than assumed in our Spring forecast. This reflects a more serious gas handling constraint. As more and more gas is produced with each barrel of oil, the amount of gas which must be re-injected back into the Prudhoe Bay field has increased substantially. Since it is anticipated that there will need to be more production downtime due to field and TAPS maintenance, the gas handling constraint will limit the ability to keep average annual oil production from falling. Installation of additional gas handling equipment, GHAX1 (gas handling and expansion 1), is scheduled to start late in 1990. A second expansion is in the planning stages. Once in place, the ability to re-inject up to 5.1 bcf/day of gas production will slow the rate of decline in oil production."

A Production Optimization System for Western Prudhoe Bay Field, Alaska
By D.A. Barnes, K. Humphrey, and L. Muellenberg of BPX America
Paper prepared for presentation at the 65th Annual Technical Conference and Exhibition of the Society of Petroleum Engineers held in New Orleans, LA, Sept 23-26, 1990.

> "For almost a decade the Prudhoe Bay field on the North Slope of Alaska has produced at a yearly average offtake rate of 1.5 million stock tank barrels of oil per day. As the reservoir depletes and field gas-oil ratios (GORs) increase, gas handling constraints make it difficult to achieve oil rate targets."

With Prudhoe Bay in Decline, What's Next for Alaska?
By James M. Davis (Senior Vice President for Exploration and Land) & Jerry R. Pollock (Manager, Prudhoe Bay Engineering) of ARCO Alaska, Inc.
Oil & Gas Journal, August 3, 1992

> "By any definition, Prudhoe Bay is declining and will continue to decline ... To accountants, Prudhoe decline began during 1988 when the field was no longer able to make its maximum allowable rate of 1.5 million b/d of oil. To engineers, the decline

began long before that ... Unfortunately, adding more wells can't keep the oil production rate up forever. We're already past the point where drilling can stave off a falling oil rate ... As the field matures, the production facilities reach their maximum capacities to handle produced water and gas. Wells with falling oil rates and increasing produced water or gas volumes have to be shut-in. Total field oil production drops."

Prudhoe Bay: Development History and Future Potential
By D.J. Szabo, BP Exploration (Alaska) Inc. and K.O. Meyers, ARCO Oil and Gas
Paper prepared for presentation at the SPE 1993 Western Regional Meeting, Anchorage, AK, 26-28 May 1993.

"Prudhoe Bay is seen by many as a mature oil field on an inevitable and irreversible decline ... The field's oil production capacity dropped below 1.5 MMSTB/D in 1988 *officially* signaling the start of decline. The onset of decline was a direct result of limited gas handling capacity as opposed to limited oil production capacity."

Alaskan North Slope Focus Shifts from Wildcats to Cutting Production Costs
Oil & Gas Journal, June 6, 1994

"Liquids production at Prudhoe Bay is constrained by the ability of field operators to process and reinject associated natural gas. Since 1988, the field's production has declined to 1.1 million b/d from 1.6 million b/d of hydrocarbon liquids. Installation of additional gas handling capacity will temporarily stem the decline in the near term and slow the rate of decline in the years ahead."

Prudhoe Bay Field: Facility Consolidations Pave the Way for an Economic Future
By K.D. Eager, BP Exploration; M.D. Briscoe, ARCO Alaska; R.A. Bolduc, Exxon
Paper prepared for presentation at the 1998 SPE Annual Technical Conference and Exhibition held in New Orleans, LA, 27-30 Sept 1998.

"The Prudhoe Bay Field on Alaska's North Slope has produced for twenty-one years. Prudhoe's gas and water production rates are at historic highs, but the oil production rate has declined to less than one-half of the peak rate achieved in the 1980s. As a result, significant excess oil treating capacity exists, with water and gas handling capacity constraining the current oil production rate. The owners of the Prudhoe Bay Unit developed a major facility consolidation plan in 1997 designed to rationalize this excess oil treating capacity while preserving existing gas and water handling capacity. The reconfigured facilities are expected to provide sufficient capacity at a lower cost to

accommodate projected oil, water and gas production rates over the remaining life of the Prudhoe Bay Field."

Optimization of Production from Mature Fields
By P. Wang & K. Aziz of Stanford University and M.L. Litvak of BP, USA
17th World Petroleum Congress, September 1 - 5, 2002, Rio de Janeiro, Brazil

"Oil production in the Prudhoe Bay and Kuparuk River fields is constrained by the gas handling limits of the surface facilities."

2003 Oil and Gas Report (for the period ending December 31, 2002)
Alaska Department of Natural Resources (Tom Irwin, Commissioner)
Division of Oil and Gas (Mark Myers, Director)

"From the beginning of Prudhoe Bay production, dissolved gas and water were separated from the crude oil and injected back into the reservoir. Over time the reservoir's proportion of both gas-and-water to oil increased. Eventually, oil production was constrained by the rate at which the separating plants could process gas and water."

North Slope of Alaska Facility Sharing Study
Prepared for Division of Oil & Gas, Alaska Department of Natural Resources
By Petrotechnical Resources Alaska, May, 2004

"The North Slope processing facilities have specific design capacity limits, indicating the amount of oil, water and gas which can be handled by the facility. If the handling capacity of one of these streams is reached for a given facility, it limits the overall production output from that facility. While some facilities may be producing below capacity for oil, they are often limited due to capacity constraints on total water production or gas production."

Alaska Oil Forecast Shaky
By Kristen Nelson, Petroleum News
Week of November 18, 2007

"While new oil is an issue in maintaining production levels, there are also issues at existing fields, where [Dudley] Platt said facilities expansion may be needed. He said the large facilities are 'maxed out on how much gas they can handle and they're getting

close to being maxed out on how much water they can handle. ... If they don't expand their facilities to handle that, the oil production will continue to go down.'"

Optimized EOR Design for the Eileen West End Area, Greater Prudhoe Bay
By M.N. Panda, SPE, Petrotechnical Resources of Alaska; J.G. Ambrose, BP Alaska; G. Beuhler, TNK-BP; and P.L. McGuire, BP Alaska
Copyright 2009, Society of Professional Engineers

"Eileen West End (EWE) initially was developed in the same style as Prudhoe Bay. To accomplish this, excess produced gas from Prudhoe Bay was injected into the EWE gas caps with a hope that the reservoir would produce with effective gravity drainage in a manner similar to that of Prudhoe Bay. Conductive faults and shale barriers, however, led to unexpected early gas breakthrough. High gas/oil ratios reduced the oil production rate, leading to a reduced recovery factor from the field."

New Developments in Upstream Oil and Gas Technologies
Hearing before the Committee on Energy and Natural Resources, United States Senate
Testimony by Kevin Banks, Director, Division of Oil and Gas, Alaska Dept of Natural Resources
May 10, 2011

"With the exception of development of heavy oil resources known to exist around the Prudhoe Bay, Kuparuk, and Milne Point fields, and potential resource plays (like the Bakken in North Dakota) that may exist on the North Slope on State controlled lands, the natural field declines cannot be replaced without access to production from Federal lands and the OCS. There are no known conventional resources on State or Native lands that are likely sufficient to replace the decline in the existing production rates."

Memo to Senator Joe Paskvan
From DNR Division of Oil and Gas
Re: North Slope Facilities Expansion
June 8, 2011

"... it is our belief that additional gas and water handling capacity investments will be necessary in some cases for continuing operation of maturing fields, development and expansion of satellite reservoirs, and to allow for facilities sharing with other new developments outside of current Units."

Executive Summary

Facility sharing is critical for the future of the oil and gas industry on the North Slope. This study was commissioned by the Alaska Department of Natural Resources, Division of Oil and Gas to address issues associated with processing facility sharing agreements for future North Slope activity. The goals are: to characterize the existing facilities, their current throughput, and their theoretical capacities; to identify the needs and desires of independent producers and North Slope facility owners and operators; to describe how facility access is managed in other oil and gas provinces; and to develop guidelines for facility access on the North Slope. Exploration and drilling activities are not addressed in this study. Only issues related to facility sharing and availability of space in pipelines are addressed in this report.

Petrotechnical Resources of Alaska (PRA) prepared this report by: compiling existing facilities data from BP Exploration (Alaska), ConocoPhillips Alaska, and ExxonMobil; identifying capacity issues; surveying independent oil companies; reviewing existing facility sharing agreements; and preparing guidelines for third-party access to facilities.

While many North Slope processing facilities have spare capacity for oil, water, or gas handling, most facilities have reached capacity for handling at least one of these components. A summary of facility constraints and excess capacities at the field level includes:

1. Alpine currently meets capacity for oil, gas, and water injection, and planned facilities expansions likely will be filled by Alpine satellite development (Fjord, Nanuk, etc).
2. Badami is in warm shutdown, and theoretically has space available up to design capacities,
3. Endicott currently has spare oil capacity, but water and gas are at capacity limits,
4. Kuparuk currently has spare oil capacity, but water, total liquid and gas are at capacity limits,
5. Milne Pt. has oil and gas capacity available through 2015, water capacity until 2011,
6. Northstar has capacity available in oil and water handling, and will reach gas capacity by 2006,
7. Lisburne Production Center is currently at or near both gas and water capacity,

8. Prudhoe Bay facilities have room for oil, but gas production is at capacity limits and water handling is at or approaching capacity limits in all facilities.
9. Pipeline capacity for Alpine is full; Kuparuk, Milne Pt, Northstar, and Lisburne/ Pt. Mac are nearly full; and Badami, Endicott, and Prudhoe Bay have pipeline capacity available.

The reference facility sharing agreement suggested herein by PRA is based largely on Ballot No. 255 for Kuparuk, which has served as the standard for several subsequent North Slope facility sharing agreements. The PRA reference agreement includes examples of potential costs associated with facility access.

Only Kuparuk River, Prudhoe Bay, Lisburne, and Endicott production facilities have existing facility sharing and services agreements addressing satellite production. The existing facility sharing agreements, while created with only unitized production in mind, are de-facto templates for recent access negotiations. The joinder agreement (Appendix D) between Winstar and the Kuparuk River Unit is an example of the use of Ballots 255, 255A, and 260 for the Kuparuk River Unit allowing for third-party satellite production.

The guiding principles from the United Kingdom (U.K.) Code of Practice and Alberta's Jumping Pound formula have much in common with the existing North Slope facility sharing agreements. However, the U.K. and Alberta contracts provide for regulatory interdiction as needed to resolve disputes between negotiating parties, although emphasis on a cooperative approach to facility sharing has been successful in negating the need for government interdiction. Existing agreements between unit partners on the North Slope present the starting point for new third-party facility sharing agreements, and an understanding of these agreements will aid potential third-party producers in negotiating new agreements.

A survey of 15 independent oil companies currently interested in Alaska oil and gas exploration indicates that their primary concerns regarding access to existing facilities include: backout calculations, access fee methodology, timeliness of access negotiations, insurance requirements, and operatorship issues.

The report concludes that: 1. Interested parties should be able to negotiate an acceptable agreement and negotiations should be initiated as early as prospect maturity allows; 2. Development and communication of a process for facility access which is fair and

transparent will help to resolve any lack of trust, and create opportunity for expanded resource development; 3. Potential third-party producers need to provide operators with a well thought-out development plan and crude characteristics to support any request for facility access; 4. Facility operators need to communicate the backout methodology and terms, and respond to requests for access costs in a timely manner; 5. It must be recognized that backout is a valid concept , representing real lost or deferred barrels to the facility owners, for which reasonable compensation is justified; 6. Agreement must be reached on a simplified backout methodology for fields without a detailed dynamic plant model; and 7. The State of Alaska has options to help defray the impact of backout fees, and this may prove to be a decisive factor in the success of North Slope facility sharing.

North Slope of Alaska
Facility Sharing Study

Introduction

The State of Alaska, the North Slope operators and the companies having or seeking to purchase leases on the North Slope all recognize the need for business cooperation and efficient use of resources to maintain a vibrant North Slope oil and gas industry. The continued and increased production of North Slope crude oil and gas is a goal of all parties. This study addresses issues associated with the processing facility sharing agreements for future North Slope activity. The study characterizes existing facilities and their processing potential, identifies the needs and desires of independent oil and gas companies and North Slope facility owners and operators, and lays the groundwork for designing a template for successful facility access on the North Slope of Alaska which benefits all parties involved.

PRA believes that there is mutual benefit to the facility owners and third-party producers in adopting reasonable terms for facility access which are equitable and understandable. In other mature basins, such as the North Sea, facility owners offer an "Indicative Tariff", or ballpark figure for facility access cost to interested producers. A survey of interested independent oil and gas explorers was undertaken to gather their issues and concerns about the future development in Alaska (Appendix A). The North Slope operators responded to facility information and data request (Appendix B). PRA compiled these various data and information in preparation for this report.

The list of deliverables provided is:

- Definition of existing facilities and design capacity for: Alpine, Badami, Endicott, Kuparuk, Milne Point, Northstar, Pt Mac/Lisburne, and Prudhoe Bay Fields.
- Identification of constraints and excess capacity for: Alpine, Badami, Endicott, Kuparuk, Milne Point, Northstar, Pt Mac/Lisburne, and Prudhoe Bay Fields.

- Identification of facilities currently operating at capacity and areas that may need higher capacity based on satellite exploration activity.
- Compilation and communication of the North Slope facility owners/operators perspective on facility sharing.
- Assessment of facility sharing and back-out costs including a negotiation strategy template, and a review of facility sharing agreements in other places.
- Compilation and communication of the current Independent oil companies' perspective on facility sharing.

The issue of facility sharing is critical for the future of the oil and gas industry on the North Slope. A successful facility sharing agreement must provide a solution that is mutually satisfying to all parties. The existing owners and operators, the Independent producers looking to be active on the North Slope, and the State of Alaska all have a vested interest in seeing a process that enhances the oil and gas industry.

Potential producers have the burden of exploring and bringing the crude to the surface, negotiating a facility sharing agreement for the processing of their fluids, and transporting or establishing a custody transfer agreement at the outlet of the facility. The exploration and drilling activities have their own significant challenges, which are not addressed in this study. Only facility sharing issues and transportation issues, as they relate to availability of space in pipelines and tankers, are addressed in this report.

The PRA team analyzing and reviewing this study included the following individuals:

Cathy Foerster	Reservoir Engineer
Robert Kaltenbach	Facility Specialist/Cost Analyst
Jan MacDonald	Reservoir Engineer/Commercial Analyst
Chantal Walsh	Petroleum Engineer
Tom Walsh	Project Manager/Geophysicist
Pete Stokes	Petroleum Engineer/Business Consultant
Chris Livesey	Geologist

A tremendous amount of data and support to this study was provided by the North Slope Facility Owners and Operators: BP Exploration (Alaska) Inc., ConocoPhillips Alaska, Inc., and ExxonMobil. Additionally, the following Independent Oil companies submitted valuable insight and ideas to this evaluation: Winstar, Talisman, Alaska Venture Capital Group, Kerr McGee, and DevonCanada.

Guiding Principles for Facility Sharing Practices

Facility sharing is a key component in the future viability of the oil and gas industry on the North Slope and in order for successful sharing to take place, real mutual benefit to all parties must be demonstrated. Given the complexity of the business drivers represented by the parties, demonstration of mutual benefit is not a trivial exercise and it is helpful to define a basic set of guiding principles for facility sharing on which all parties can agree. Below is a list of guiding principles compiled from oral and written communication from a cross-section of contributors to this study, including facility owner and operator companies, potential third-party producers, and State of Alaska government officials.

The facility sharing process must:

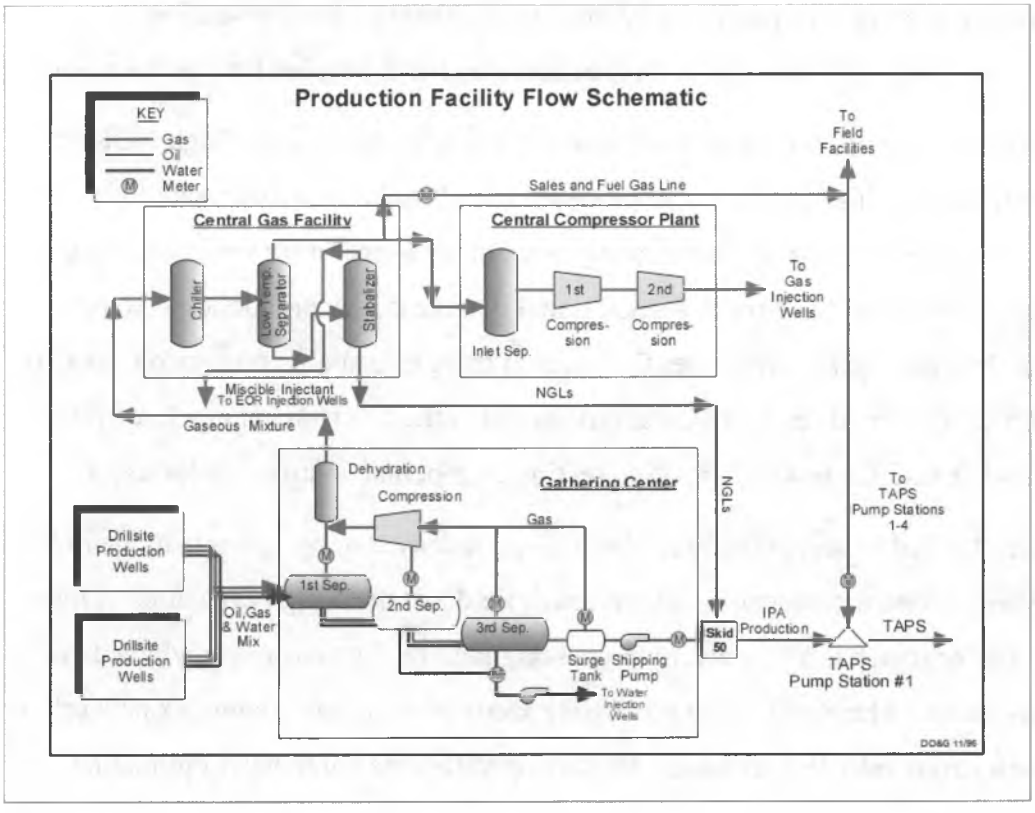
- Be fair, equitable, and understandable to all parties
- Result in net increase in production, improve resource conservation, and reduce waste
- Not result in any new government regulation
- Preserve and promote operational integrity
- Preserve the integrity of unit rights/obligations, and tax partnerships
- Reduce financial and operational risk
- Introduce no significant adverse impact to existing production
- Provide timely access to indicative fee structure for bona fide inquirers
- Create a level playing field for all producers, where the "best" barrels are produced
- Allow for resolution of conflicts
- Compensate the facility owners for their historical capital costs and lost or deferred production
- Provide equitable sharing of ongoing costs among all users

Physical Considerations

Potential producers are faced with the burden of exploring for oil and gas, bringing it to the surface, processing their fluids either with their own facilities or negotiating a facility sharing agreement, and transporting or establishing a custody transfer agreement at the outlet of the facility. If the third party producers build their own processing facilities, the product stream will need to tie into a pipeline for transportation. The common carrier pipelines will accept the production as long as it meets their specifications.

The North Slope processing facilities have specific design capacity limits, indicating the amount of oil, water and gas which can be handled by the facility. If the handling capacity of one of these streams is reached for a given facility, it limits the overall production output from that facility. While some facilities may be producing below capacity for oil, they are often limited due to capacity constraints on total water production or gas production. In this case, additional production can be introduced into the facility by backing out existing wells, such as those with high GOR or WOR, and processing third party production of oil with lesser amounts of water and/or gas. The facility-owner's production volume that is deferred due to the introduction of third party processing is referred to as "backout" or "backout volume". Compensation for this backout volume is an item of particular interest in negotiating a facility sharing agreement. The method of calculating this backout volume is detailed later in the report.

Where facilities are producing at peak oil handling capacity, backing out high GOR or WOR oil will not result in additional oil production, and backout costs for satellite producers would be prohibitive. Additionally, the pipelines necessary for transporting the produced fluids must have room for additional volume if new production is to be introduced. It is essential to remember that, even if there is available processing capacity in the facilities, there must be room for additional oil in the downstream pipeline system to accommodate satellite production. (See section on pipeline volume and forecasts.)



The first step toward understanding the North Slope facility sharing issues is to identify the processing infrastructure associated with each field and the design capacities of these facilities. The next step is to review, by processing facility, the constraints which drive the capacity limits. The North Slope processing facilities represent a complex network of systems with strong interdependencies. Facility operators are continually optimizing

production parameters to maximize sales oil volume and minimize cost, managing individual well production for hundreds of wells to match plant specifications and pipeline and tanker capacities. To understand how and where third party oil can be processed, all of these factors need to be considered.

North Slope Overview

There are eight primary operating areas on the North Slope of Alaska that currently process North Slope oil and gas (See Figure 1). These eight facilities are: Alpine, Badami, Endicott, Kuparuk, Milne Point, Northstar, Point McIntyre/Lisburne, and Prudhoe Bay. Northstar and Endicott are on man-made islands. Generally, the facilities consist of oil/gas/water separation, gas dehydration/compression/reinjection, water treatment/reinjection, and in some cases, NGL production. For a generic process flow diagram, see Figure 2. Individual facility process flow diagrams are shown in Figures 3 – 8. Oil is transported from each of the facilities into common carrier pipelines. The design capacities of each specific facility are shown below and compared with their current operating conditions. The forecast shows whether it is likely or unlikely that any new satellite production would incur backout costs.

Figure 2 **Generic Facility Flow Diagram**

Alpine

There is currently one producing pool (Alpine Participating Area) in the Colville River Unit (CRU). The major components of the basic facilities used by the CRU are: Alpine Processing Facility, Two Drillsites (CD-1 and CD-2), Alpine Pipeline, Seawater Treatment Plant (STP) pipeline, (Under a special agreement, STP supplies waterflood water to the CRU), the Alpine Main Camp, Spill Response Center, Warehouse, Airstrip, diesel supply line, roads and pipelines, and one Class 1 non-hazardous waste disposal well.

Oil processing at Alpine consists of 2 stages of 3-phase separation and a dehydrator to remove water to sales oil quality. Produced water is re-injected into injection wells at drillsite CD-1 (Colville Delta-1). Produced gas is compressed (through four stages) and flows into the gas injection header system. Gas is taken and mixed with indigenous natural gas liquids (NGLs) to form miscible injectant (MI). The MI is distributed to water-alternating-gas (WAG) injection wells at CD-1 and CD-2. Injection water consists of produced water and seawater from the Seawater Treatment Plant (STP).

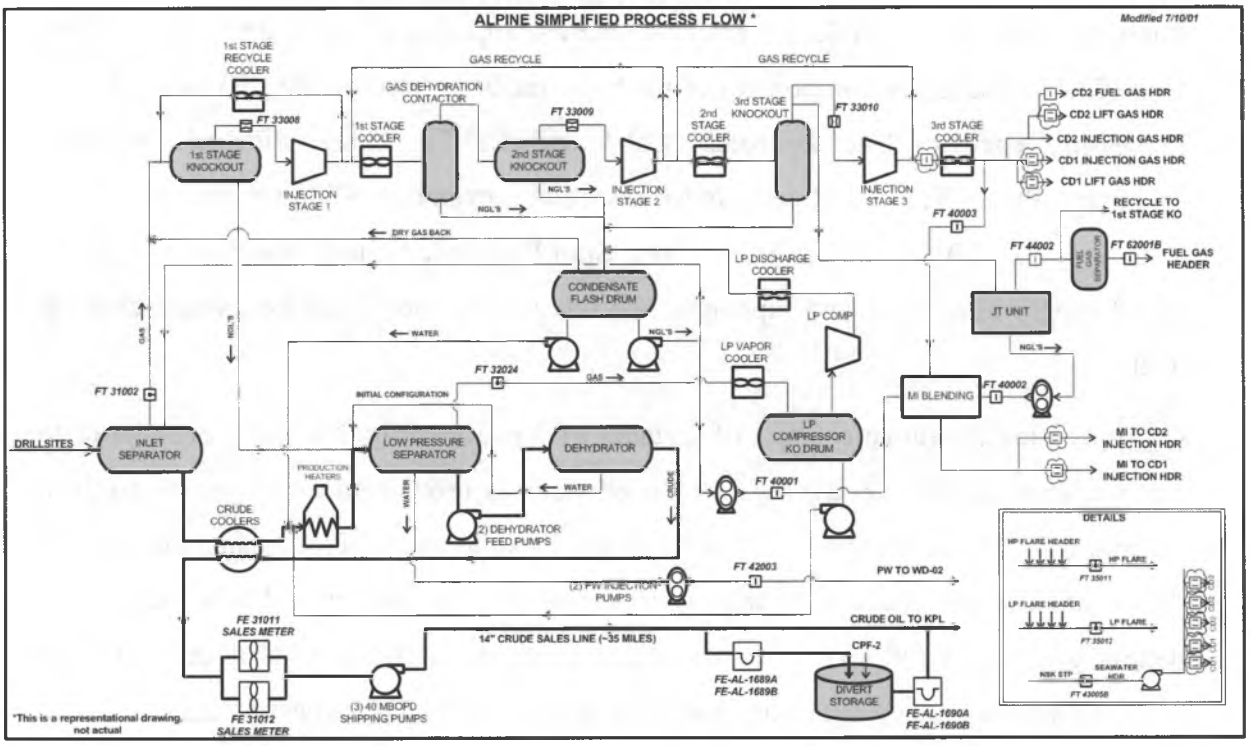


Table 1 depicts the 2003 production vs. original design capacity of the facility, along with the planned expansion capacity for late 2004 and 2005.

Table 1 Alpine Facility Operation vs. Capacity

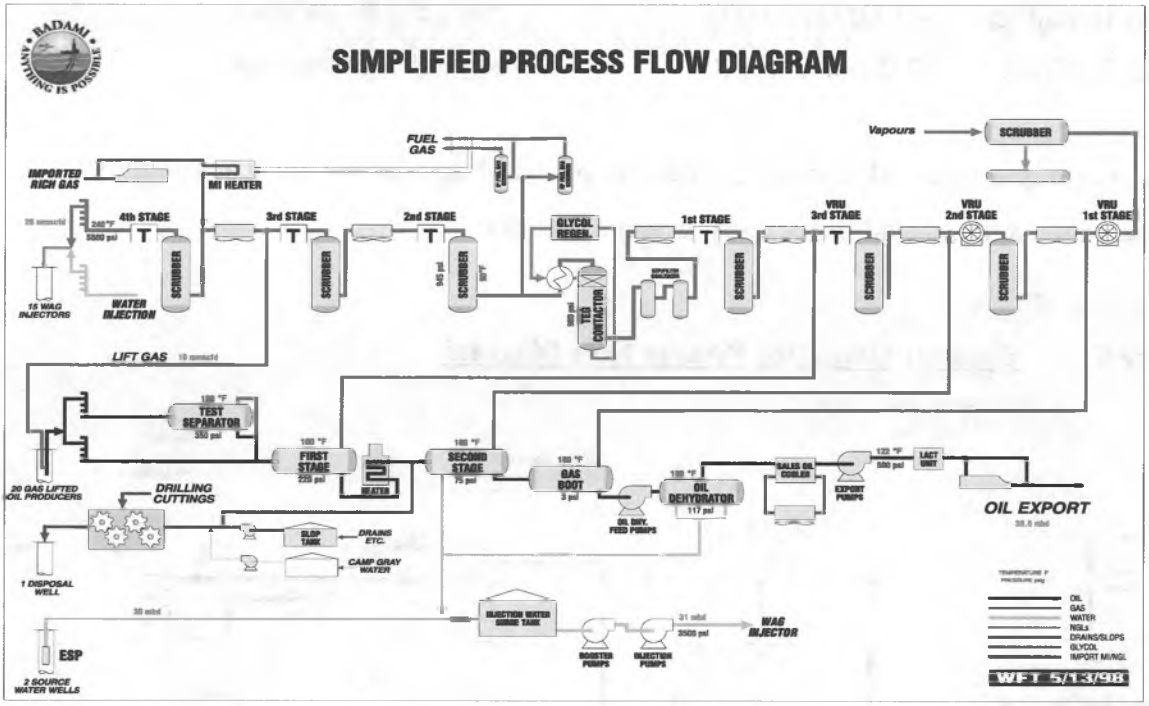
Stream	2003 Oper/design	ACX-1 Design Late '04	ACX-2 Design '05	Units
Oil Production:	100,000/83,000	110,000	140,000	bopd
Gas Handling:	120/130	160	180	mmscfd
Water Handling:	4,000/10,000	100,000	100,000	bwpd
Water Injection:	80,000/80,000	140,000	140,000	bwpd

At this time, the Alpine Processing Facility has no spare capacity for new production. Alpine currently meets processing capacity for oil, gas, and water injection. Facilities expansions are planned for 2004 and 2005; however, it is likely that Alpine satellite development (Fjord, Nanuk, etc.) will offset most of the expanded capacity.

Figure 3 **Alpine Simplified Process Flow Diagram**

Badami

The Badami Field is currently in a warm shutdown. The production facilities consist of multi-stage oil/water/gas separation, water injection, gas treatment, compression and injection, and oil export facilities. A WAG injection and lift gas system are also in place at Badami.



Access to the Badami facilities is by barge, ice road, rolligon, or air. Peripherals are an airstrip, a dock, a Class 1 non-hazardous waste disposal well, a grind-and-inject disposal well, and a source for electricity.

Table 2 **Badami Facility Operation vs. Capacity**

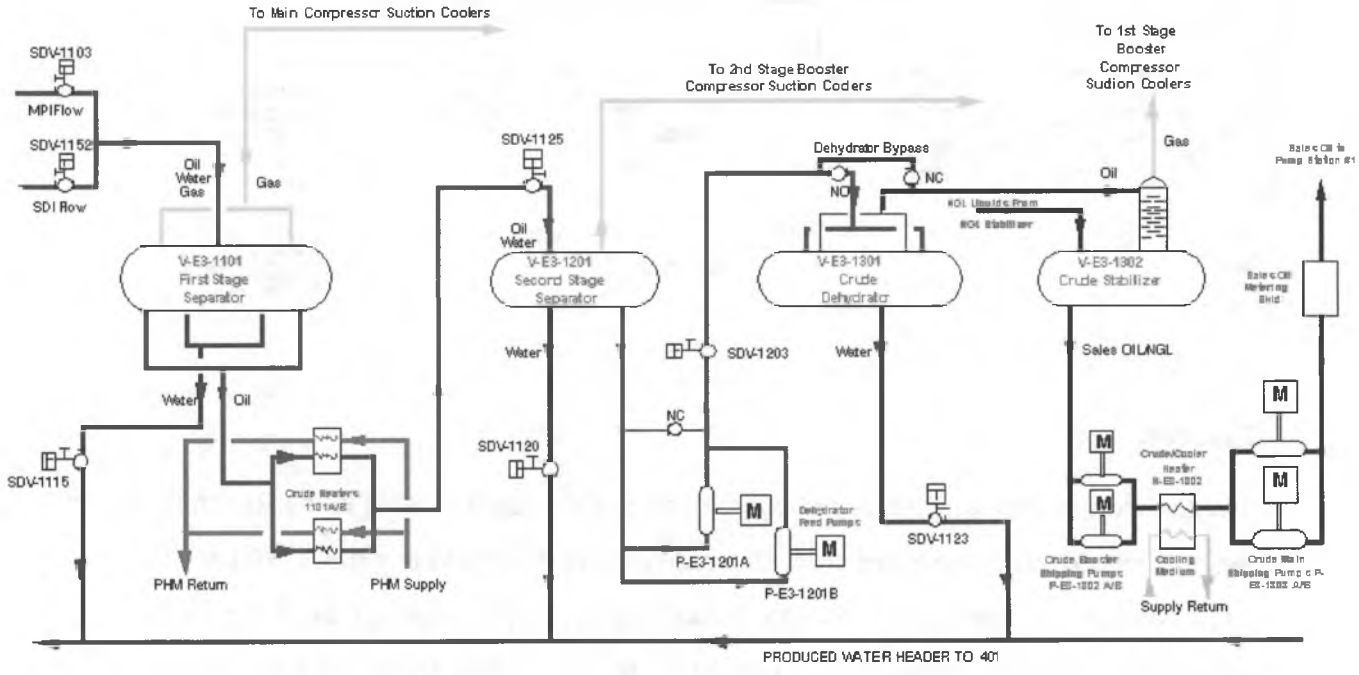
Stream	Operation/Capacity	Units
Oil Production:	0/35,000	bopd
Gas Handling:	0/25	mmscfd
Water Handling:	0/12,000	bwpd
Water Injection:	0/30,000	bwpd

Since Badami is in warm shutdown, there is theoretically space available up to the capacities shown. There may be additional costs associated with startup but there should not be any backout charges for processing here.

Figure 4 **Badami Simplified Process Flow Diagram**

Endicott

The Endicott facility consists of two man-made gravel islands located in the Beaufort Sea. Produced gas is separated from the crude oil and processed to remove NGLs. The NGL volumes are injected into the dry oil sales line subject to capacity available with existing pipeline vapor pressure specifications. NGLs not sold are blended to create a miscible injectant (MI) that is used in a water-alternating-gas enhanced oil recovery project. Any residual gas is reinjected into the reservoir to provide pressure support, used for fuel, or routed to the gas lift system to provide artificial lift. Produced water is treated before being reinjected into the reservoir. Seawater can also be treated before being injected.



Endicott's two gravel islands are connected to each other, and linked to land by a gravel causeway.

Table3 **Endicott Facility Operation vs. Capacity**

Stream	Operation/Capacity	Units
Oil Production:	~25,000/115,000	bopd
Gas Handling:	~455/455	mmscfd design
Water Handling:	~210,000/225,000	bwpd design estimate.
Water Injection	~245,000/245,000	bwpd design estimate.

There currently is spare oil capacity at Endicott, but water and gas are at capacity limits. Any new production would likely result in some backout.

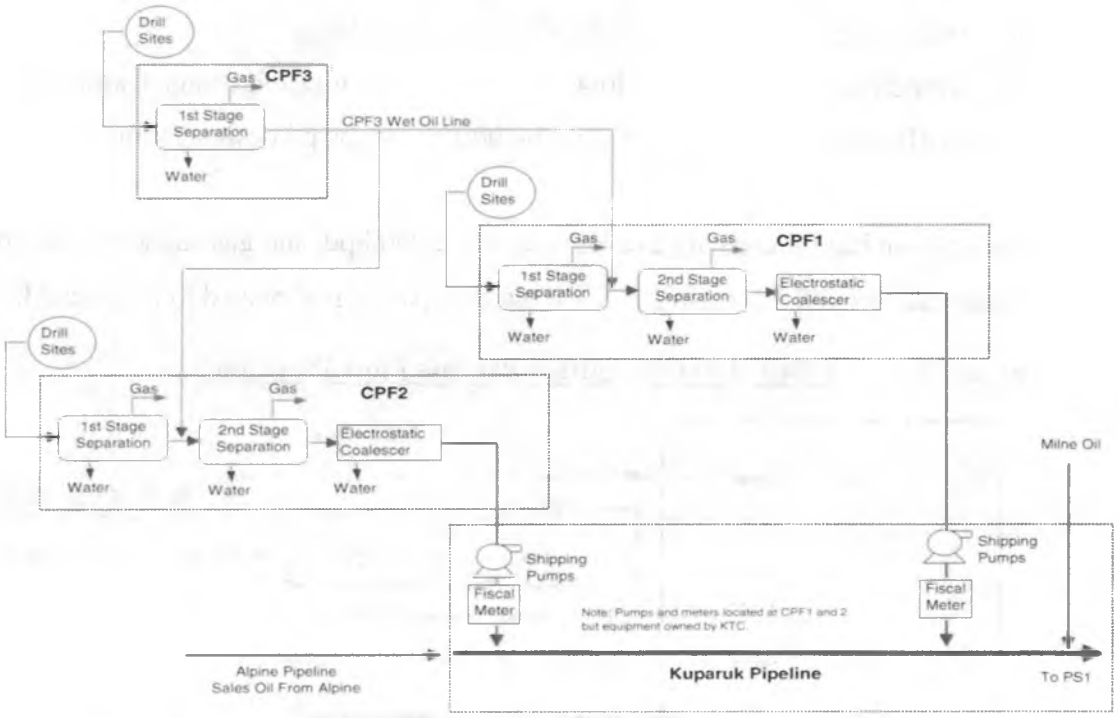
Figure 5 **Endicott Simplified Process Flow Diagram**

Kuparuk

The Kuparuk facilities consist of three Central Processing Facilities (CPF).

The production facilities consist of multi-stage oil/water/gas separation, water injection, gas treatment, compression and injection, and oil export facilities. There is a seawater treatment plant designed to prepare seawater for waterflood operations.

Access to Kuparuk is by a gravel spine road. Other facilities include a construction camp, spill response center, industrial center, warehouse, airstrip, topping plant and



roads. There are four Class 2 non-hazardous waste disposal wells within the Kuparuk River Unit.

Table 4 Kuparuk facilities Operation vs. Capacity

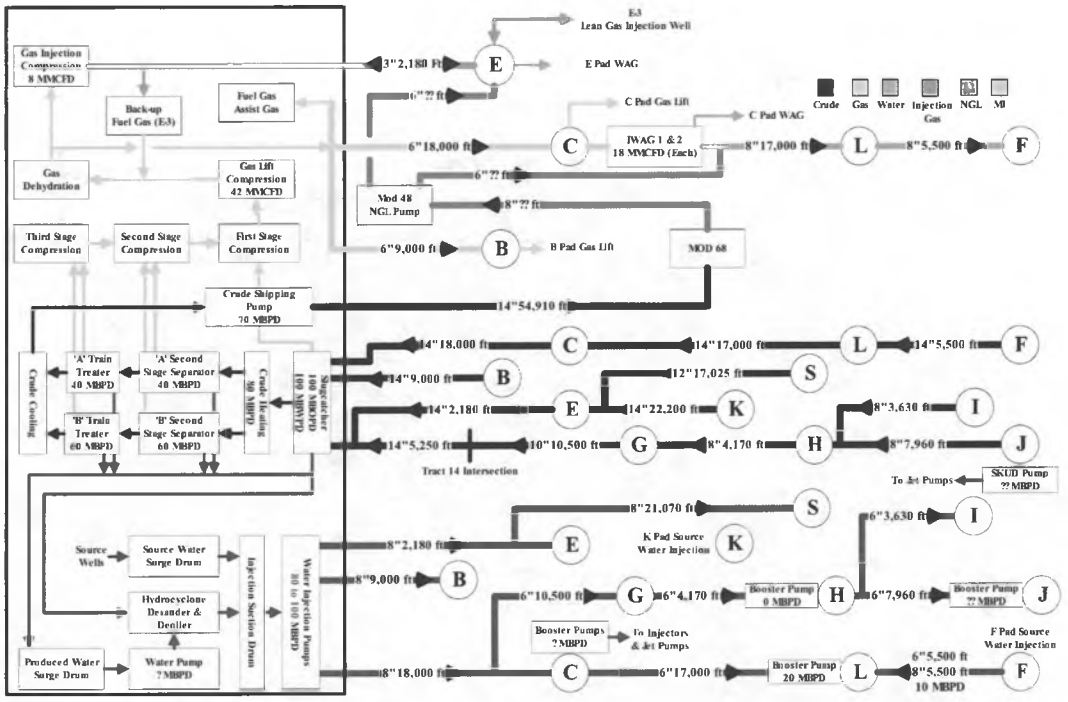
Stream	CPF-1	CPF-2	CPF-3	Units
Oil Production	105,000/170,000	120,000/160,000	50,000/85,000	bopd
Gas Handling	200/200	260/260	150/150	mmscfd
Water Handling	250,000/250,000	250,000/250,000	100,000/125,000	bwpd
Water Injection	250,000/250,000	300,000/300,000	150,000/220,000	bwpd

There currently is spare oil capacity, but water, total liquid and gas production are at capacity limits. New production would result in backout.

Figure 6 Kuparuk Simplified Process Flow Diagram

Milne Point

The Milne Point Unit consists of a Central Facility Plant (CFP) and 12 producing / injecting well pads. The production facility is designed to separate oil, gas and water. After the gas is produced, it is compressed for gas injection and gas lift in the reservoir. After processing, all of the produced water is injected into the reservoir. Artificial lift at the Milne Point Field is a mix of ESPs, jet pumps and some gas lift, with ESPs being the most prevalent. Two pipelines transport liquids to and from Milne Pt. (NGL northbound, and oil southbound).



A permanent camp facility for up to 306 personnel is available. MPU currently utilizes ~40% of the space most of the time (~110 personnel). Transportation to and from Milne is by gravel road.

Table 5 **Milne Point Facility Operation vs. Capacity**

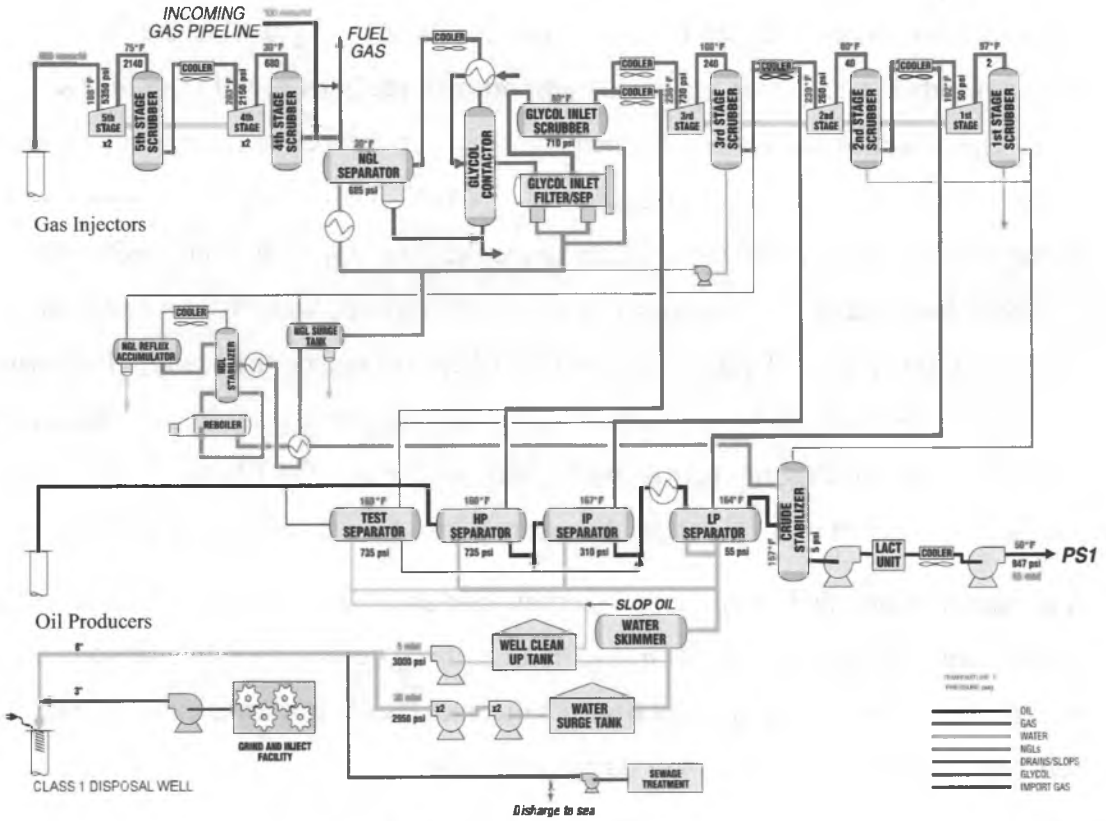
Stream	Operation/Capacity	Units
Oil Production:	~58,000/75,000	bopd
Gas Handling:	~40/42	mmscfd design estimate.
Water Handling:	~47,000/80,000	bwpd design estimate.

Milne Point has oil capacity available up to 12,000 bpd, and gas capacity available up to 2 mmscfd through 2015. In 2011, the water capacity is expected to be reached.

Figure 7 **Milne Point Simplified Process Flow Diagram**

Northstar

The Northstar facilities are on Seal Island, located 6 miles offshore of the Point Storkerson area in the Alaskan Beaufort Sea. Seal Island is a gravel island of approximately 5 acres. Two pipelines transport hydrocarbons to and from the Northstar Unit. The pipelines include one 10-inch common carrier pipeline from Seal Island to Pump Station No. 1 to transport the sales oil to TAPS. The second 10-inch pipeline is to import gas from the Central Gas Facility in the Prudhoe Bay Unit. The production facility is designed to separate oil, gas and water. Produced water is processed and disposed of into a Class 1 waste disposal well (there are two on the island). Following dehydration and NGL removal, produced gas is injected into the reservoir. Sales oil is cooled to Northstar export pipeline specification and shipped to TAPS. At the Pump Station No. 1 end of the export line, the sales oil is re-heated to TAPS specifications.



A permanent camp facility for up to 74 production and drilling personnel is also installed on the island. Multiple modes of transport are utilized depending on the season: an ice road during winter; barge, hovercraft and helicopter transport during summer; and helicopter and hovercraft transport during broken ice.

Table 6 Northstar Facility Operation vs. Capacity

Stream	Operation/Capacity	Units
Oil Production:	~65,000/77,000	bopd
Gas Handling:	~410/500-555	mmscfd design estimate.
Water Handling:	~7,500/30,000	bwpd design estimate.
Combined Water and Oil limit	~70,000/85,000	bfpd design estimate

Northstar will have capacity available in oil and water handling but is expected to reach gas capacity by 2006.

Figure 8 **Northstar Simplified Process Flow Diagram**

Point McIntyre/Lisburne

The Lisburne Production Center (LPC) consists of multi-stage oil/water/gas separation, water injection, gas treatment, compression and injection, NGL production facilities, and oil export facilities. The LPC also generates electric power.

The Pt. Mac/Lisburne facility has no camp. It houses personnel at the nearby Prudhoe Bay Main Construction Camp. Access to and from Point McIntyre/Lisburne is by gravel roads.

Table 7 **Pt. McIntyre/Lisburne Facility Operation vs. Capacity**

Stream	Operation/Capacity	Units
Oil Production:	~60,000/205,000	bopd
Gas Handling:	~375/470	mmscfd design
Water Handling:	~140,000/160,000	bwpd design estimate

The facility is currently at or near both gas and water capacity. New production would result in some backout.

Prudhoe Bay

The Prudhoe Bay facilities, the largest on the slope, consist of six separate major production processing centers with a central power station, central gas processing facility, central compressor (injection) facility, two operating centers, a central seawater treatment plant, a topping plant, and a plant to grind and inject drill cuttings. There is one grind-and-inject well, and three Class 2 non-hazardous waste disposal wells. The production facilities consist of multi-stage oil/water/gas separation, water injection, gas treatment, compression and injection, NGL production and oil export.

The main housing facilities for the Prudhoe Bay Field are the Eastern Operating Camp (EOC), the Western Operating Area Camp (BOC), and the Main Construction Camp (MCC). In addition to these, there are a number of support camps throughout the field. The PBU area can accommodate up to 963 people. (This figure does not include accommodations in Dead Horse.)

Table 8 **Prudhoe Bay Facility Operation vs. Capacity**

Stream	**Operation/Capacity**	**Units**
Oil Production:	~487,000/1,660,000	bopd
Gas Handling:	~8,700/8,700	mmscfd design estimate.
Water Handling:	~1,720,000/1,720,000	bwpd design.

There is room for oil, but gas production is at capacity limits and water handling is at or approaching capacity limits in all facilities. New production would result in some backout.

Projected Production and Pipeline Constraints/ Excesses

The following describes current and forecasted oil production for North Slope facilities. These numbers are for trend and probable outcomes and should not be taken as exact. The information was provided by the producers, with the exception of Endicott, Lisburne and Prudhoe, which were taken from the State of Alaska 2003 Revenue Source Book. Any new permits or emissions restrictions have not been addressed in this report. These rates are used for forecasting the pipeline usage. Also shown on the first row of the table are current pipeline capacities.

Table 9 **North Slope Pipeline Capacities and Projected Field Production**

MBPD Year	Badami Pipeline	Endicott Pipeline	Milne Pt. Pipeline	Alpine Pipeline	Kuparuk Pipeline	NorthStar Pipeline	TAPS Pipeline
Current Capacity	**35**	**100**	**65**	**100**	**400**	**65**	**1400**
2003	0	29	51	98	361	62	994
2004	0	30	52	99	359	68	997
2005	0	29	53	98	364	60	982
2006	0	27	57	103	376	50	968
2007	0	25	58	117	390	40	954
2008	0	24	59	117	379	32	923
2009	0	22	59	104	367	27	878
2010	35	56	59	86	338	20	852
2011	50	70	58	71	322	17	824
2012	48	66	57	60	300	15	775
2013	38	55	56	51	290	12	734
2014	31	47	56	44	273	10	691
2015	27	42	55	38	267	9	663

(a) Badami includes projected Liberty throughput

(b) Endicott includes Badami and Liberty throughput

(c) Kuparuk includes Alpine and Milne Pt. throughput

Before entering the oil and gas exploration and development business, a potential producer should consider the process required to transport hydrocarbons from the North Slope to market. Currently there are three market options for North Slope production: sales at the production facility, sales in Alaska, and sales on the West Coast. Sales at the production facility trigger no transportation issues for the producer, as the custody

transfer is at the outlet flange of the facility. The other two options will entail the use of one or more of the Common Carrier Pipelines in Alaska. These pipelines are regulated by State and Federal Commissions. These pipelines will not discriminate between shippers, but will prorate volumes if pipeline capacity is exceeded. Crude oil product must meet certain specifications to be accepted by the pipeline.

The pipeline specifications for the oil delivery to PS1 are as follows:

- Maximum basic sediment and water (BS&W) content of 0.35%
- Minimum delivery temperature of 105° F to prevent paraffin deposition
- Maximum delivery temperature of 142° F
- Maximum True Vapor Pressure of 14.2 psia

The existing TAPS system can handle more than 1.4 million barrels of oil a day. Alyeska Pipeline Services Company is currently evaluating a plan to redesign TAPS to transport approximately 1 million bpd, expandable up to about 1.14 million bpd with drag reducing agent.

These are only guidelines for capacity since the addition of drag reducing agent and operational variation can change the overall capacity. If the amount of production exceeds the capacity, the pipeline operators will reduce each producer's rate on a prorated basis until capacity is met. Therefore, new production going into a pipeline that is at capacity will cause a reduction in existing production so that all producers can ship their product. This production will not increase or decrease the total quantity, just redistribute the production allocated to each producer.

Each pipeline has a group of owners that will transport fluids for a per barrel charge (tariff). Transportation must be coordinated from point of production to market and may involve several pipelines and different shippers. TAPS will transport the product to the Port of Valdez. The product must be tanker transported from Valdez to the interstate market.

Figure 9 is a map of the North Slope pipelines and TAPS. Figures 10 - 16 are timelines of the pipeline capacity and potential excess shipping space. These figures are based on production profiles as shown in the State of Alaska 2003 Revenue Book and on information provided by producers.

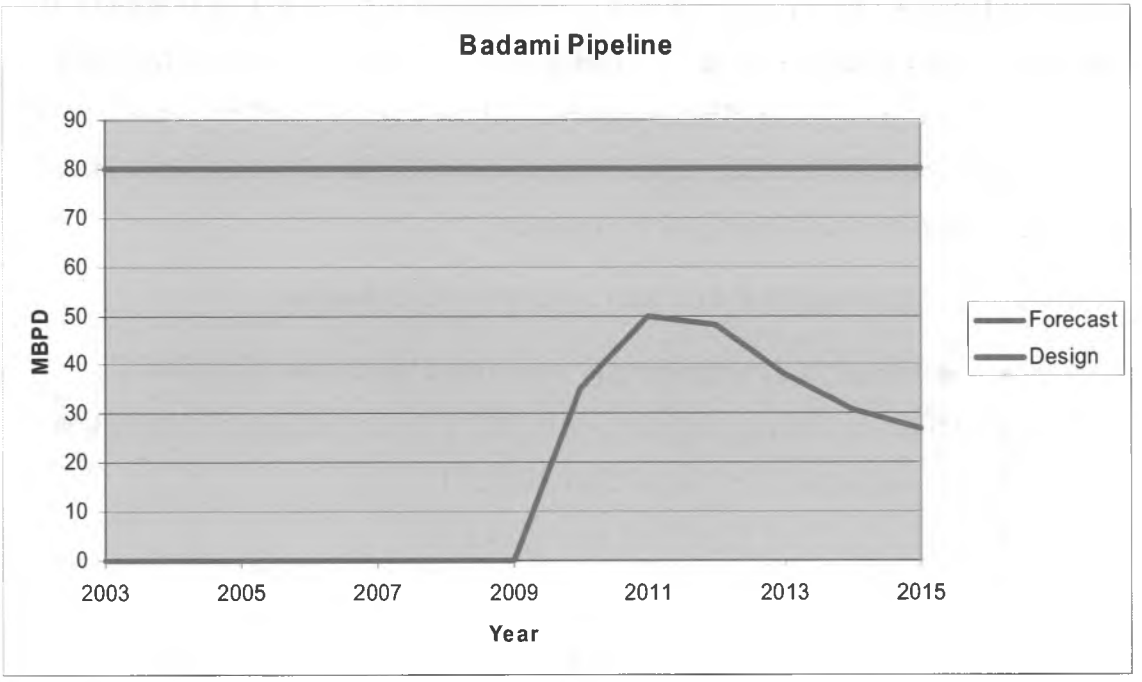


Figure 10

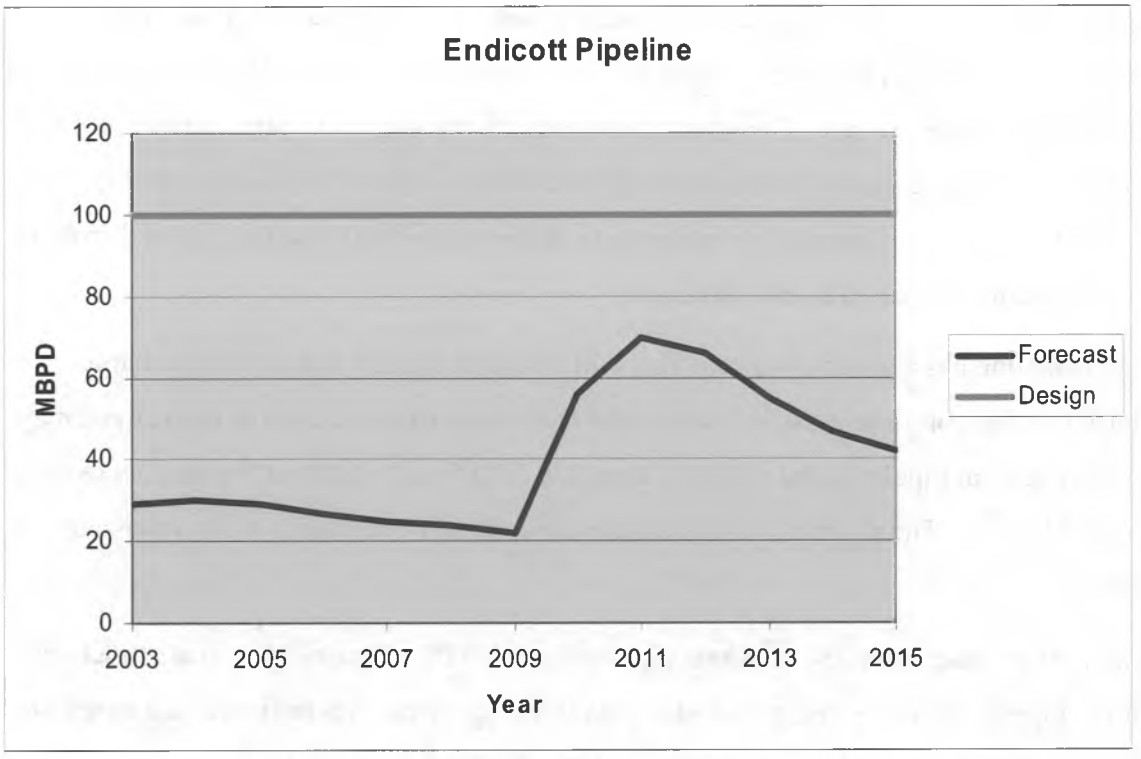

Figure 11

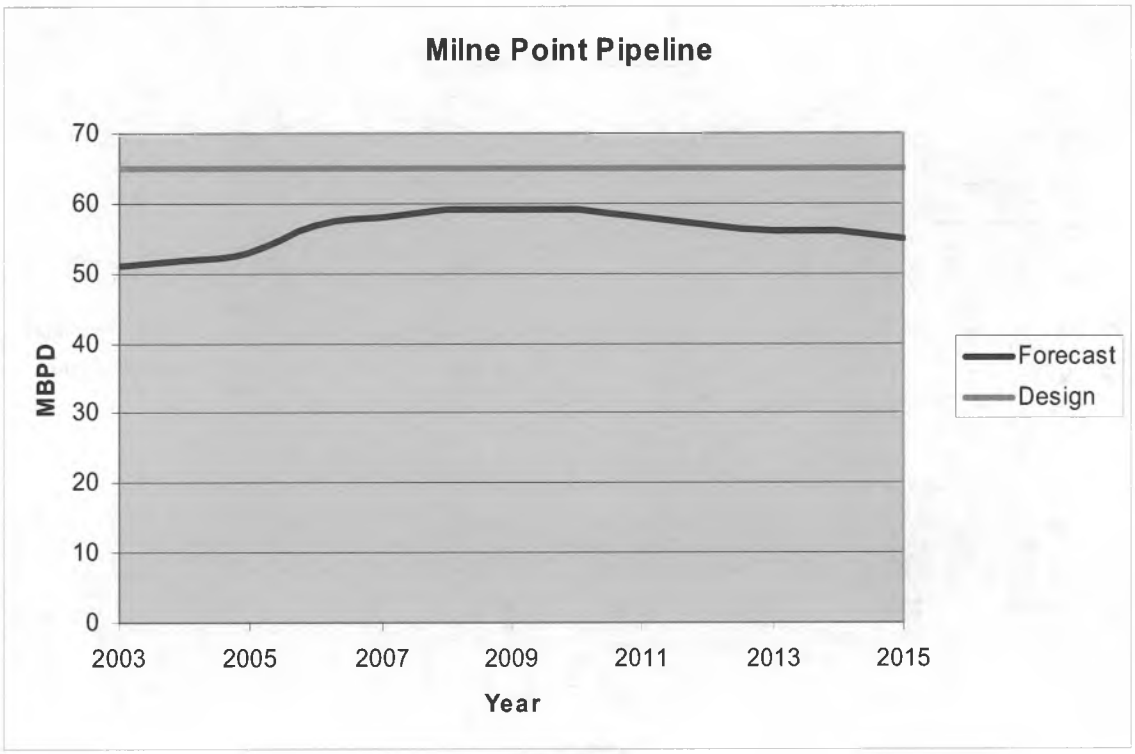

Figure 12

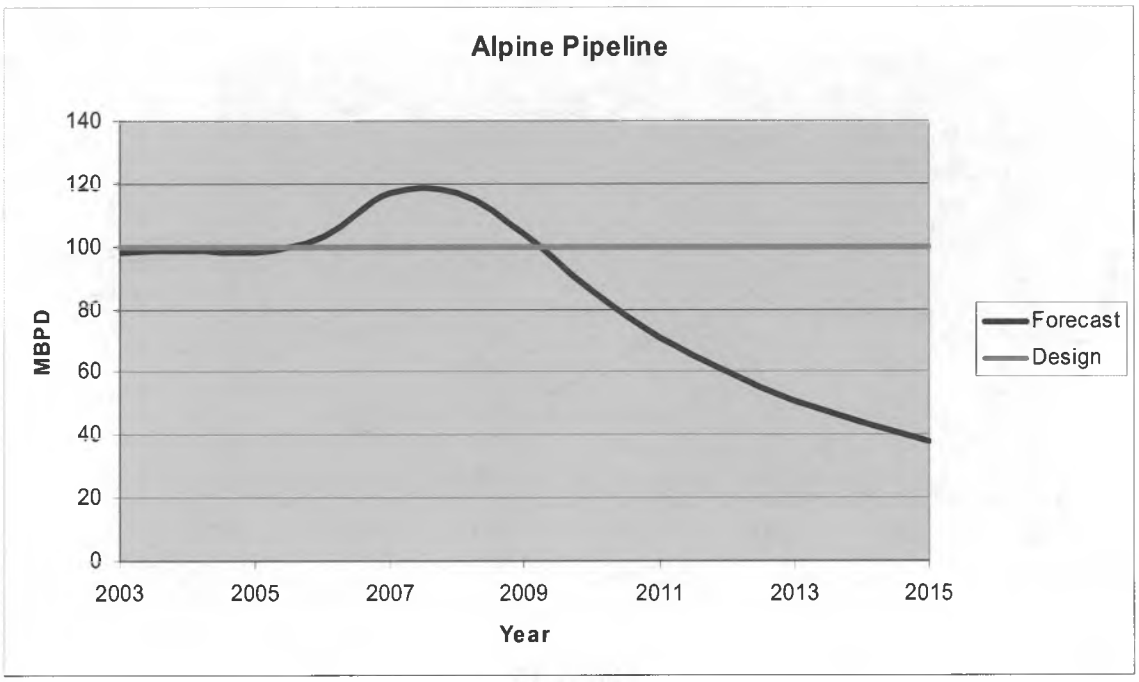

Figure 13

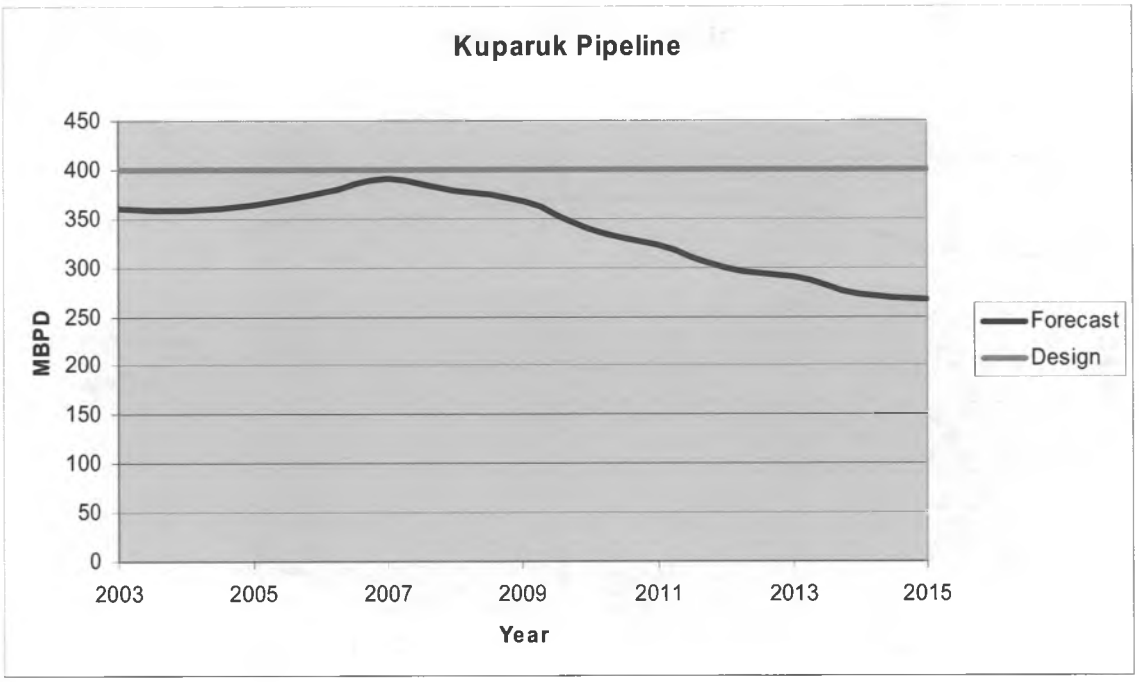

Figure 14

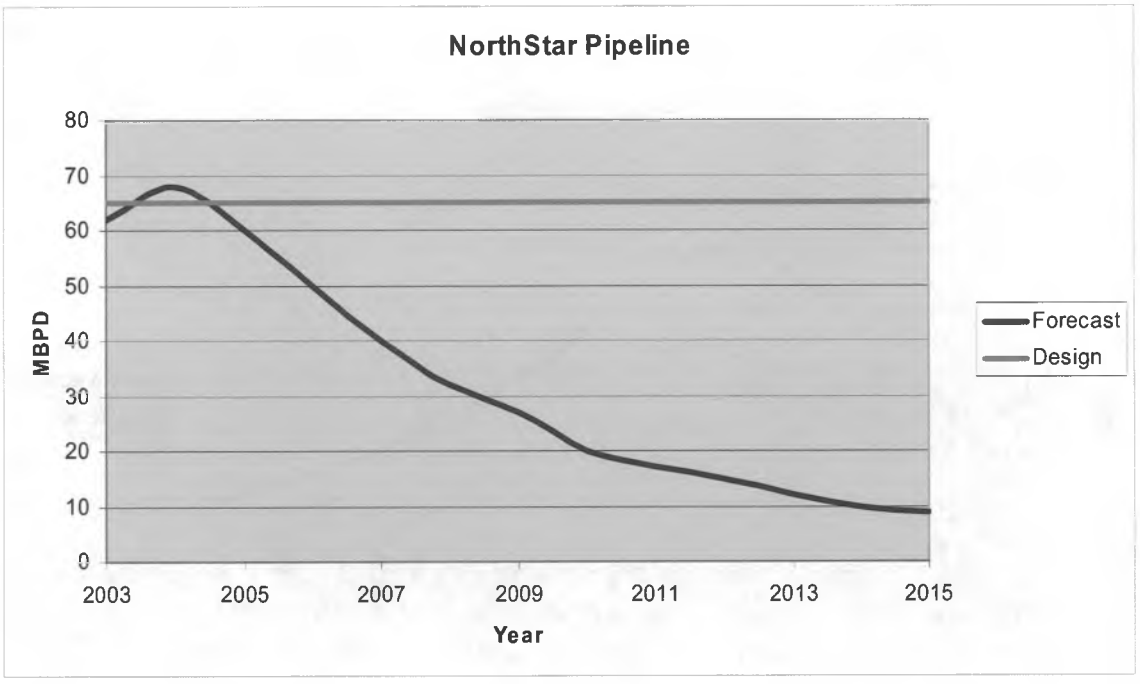

Figure 15

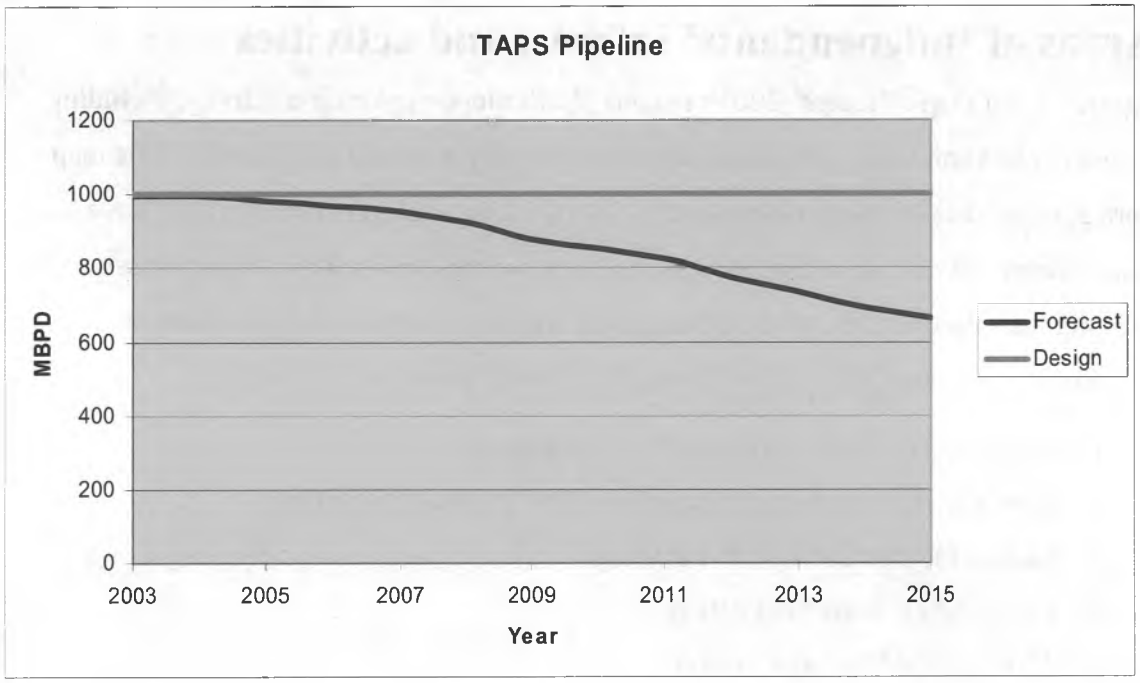

Figure 16

Table 10 illustrates the processing streams for which excess capacity is available, which streams are constrained, whether a backout calculation is likely, and status of pipeline capacity for each of the North Slope fields.

Table 10 **Facility and Pipeline Capacity/Constraint Summary**

Facility	Capacity Available for:	Constrained Stream	Backout	Pipeline
Alpine	none	oil, gas, water	likely	Full
Badami	oil, gas, water	none	not likely	Not Full
Endicott	oil	gas, water	likely	Not Full
Kuparuk	oil	gas, water	likely	Near Full
Milne Point	oil, gas, water	water 2011	maybe	*
Northstar	oil, gas, water	gas 2006	maybe	Near Full
Pt. Mac/Lis	oil, water,	gas	likely	Near Full
Prudhoe Bay	oil	gas, water	Certain	Not Full

- Feeds into Kuparuk Pipeline and dependent upon space there.

Areas of Independents' interest and activities

Figure 17 is a map of recent (2001-present) North Slope exploration activity, including recent exploration wells, unit boundaries, and recently acquired state leases. This map portrays the areas of interest expressed by North Slope explorers through their lease acquisitions and drilling activities, and indicates the areas most likely to put pressure on existing infrastructure. Some of the activities which, given successful exploration programs, will potentially impact the facility sharing landscape include:

1. Pioneer/Armstrong Oooguruk Unit evaluation
2. Kerr-McGee/Armstrong Nikaitchuq 2004 Exploration drilling
3. ConocoPhillips 2004 NPRA drilling
4. Pioneer 2004 lease acquisition
5. AVCG 2004 lease acquisition
6. Ultrastar 2004 lease acquisition

Pioneer and Armstrong partnered in 2003 to drill 3 exploration wells in the Oooguruk Unit northwest of KRU (yellow leases). They have announced a discovery in the Nuiqsut Fm., and are evaluating options for development of this discovery. This potential development could impact KRU facilities and/or the Kuparuk Pipeline.

Kerr-McGee and Armstrong drilled two wells (Nikaitchuq #1&2) northwest of MPU in 2004, and have announced a discovery in the Sag River Fm. Potential development here could impact MPU facilities, the Milne Point Pipeline, and the Kuparuk Pipeline.

ConocoPhillips has drilled a number of discovery wells to the west of CRU, all of which figure to impact the Alpine facilities, Alpine Pipeline, and Kuparuk Pipeline.

Pioneer acquired tracts in the 2003 North Slope and Beaufort Sea Areawide Lease Sales in the Hemi Springs area, as well as north of PBU, east of Northstar, and west of Kuparuk. Successful exploration programs associated with these lease acquisition could impact numerous production facilities.

AVCG added to their lease position in 2003 with acquisitions east and south of CRU, north of PBU, and west of KRU. They are considering stand-alone processing

options at this time, which would limit the facility impact to common carrier pipelines.

UltraStar Exploration added new leases to their portfolio in 2003 around Badami, and north of PBU, and successful drilling of their prospects could impact Badami, Pt. McIntyre/Lisburne and/or PBU facilities.

Most of the activity shown on the map is focused around existing facilities, with the exception of SWEPI and Unocal's lease acquisitions some 50 miles south of KRU, and Total's drilling nearly 50 miles west of CRU.

A critical constraint will be available processing and pipeline capacity to the west and north of KRU. Alpine satellites, NPRA, and the Oooooguruk and Nikaitchuq discoveries will all place significant pressure on the Kuparuk and Alpine pipelines. However, with enough new production potential realized, additional pipeline capacity may be justified.

Facility Sharing Negotiation Specifics

Guideline for Negotiation Strategy Template

PRA has put together a guideline for a facility sharing agreement based largely on Ballot No. 255 for Kuparuk. This guideline deals with the technical and accounting aspects and not the legal provisions of an agreement. All parties are advised to obtain legal counsel to protect their rights and limit their liabilities.

This guideline's purpose is to illustrate the anticipated components of a possible agreement and the expected ranges of costs associated with key components. It is not intended to be all inclusive. Every actual agreement will have its own particulars and be specific to that situation. The key to an agreement is to establish fair terms for utilizing existing infrastructure that provide third party owner(s) improved economics to develop and produce from nearby fields or other commercial paying reservoirs while compensating infrastructure owners for their existing investment, risk taking and operations. The facility owners have incurred substantial risk and invested large capital in their facilities. The third party owners can benefit from avoiding construction time,

permits (possibly) and risk of delays by using existing facilities. All parties can benefit by increased production and operations.

Any specific numbers in this guideline are for illustrative purposes and indicate possible ranges and are not intended to be fixed or binding on any party.

Facility Sharing Agreements Should Include the following provisions:

1. **Identification of Facility Owners**

This provision identifies the facility owners and their intentions.

2. **Identification of Third Party Owners**

This provision identifies the third party owners and their intentions.

3. **Definitions of Terms**

This provision defines terms of substance to this agreement for clarity.

4. **Definition of Facilities**

This provision defines facilities that are and are not included in this agreement.

5. **Definition of Third Party Facilities**

This provision defines facilities that are third party sole responsibility.

6. **Standards of Produced Fluids**

This provision defines fluid compatibility and physical limitations.

7. **Priorities Governing Production Processing**

This section states that the facility sharing agreement will maximize the total oil production. It sets priorities and defines impacts of operations. In order to maximize oil production, high GOR, high WOR wells will be curtailed first regardless of ownership. Wells of the facility owner could be shut-in or curtailed, thereby decreasing the facility owner's total production. The volume not produced by the facilities owners is "backed out" to make room for the third party production. To compensate the owners for this backout, the backout volume is calculated via a process described in more detail later in this report, and transferred to the facility owners from the third party owners. This backout volume is used to adjust the fee-appropriate volumes for the third. In other

words, the third party owners do not pay fees on the barrels they must give up as backout compensation

8. Produced Water and Seawater

Facility owners will provide to each third party a volume of water, for water injection, that is equal to the volume of water delivered to the facilities by the third party production facilities.

9. Excess Water Volumes

To the extent that additional produced water or seawater volumes are available and desired, facility owners will provide third party facilities with water volumes in excess of their water production where needed to maximize and optimize field development. A fee may apply for this excess volume.

10. Facility Access Fees

The facility owners will be compensated for their investment and ongoing costs incurred to provide facilities and processing of the third party fluids.

Capital Access Fee

This fee compensates the facility owners on an adjusted per barrel processed basis for their past capital investment. This fee recognizes that the facility owners have invested large sums in the past for the equipment and facilities that are available to the third party. Generally this fee would have a depreciation component and a rate of return component.

Capital Access Fee Surcharge

This fee compensates the facility owners for capital costs incurred after third party processing begins. This would apply if the third party did not participate in a joint capital project but the third party benefits from the project. This fee could be a per barrel charge and apply in capital increments. For example: a capital access fee of $0.025 per barrel imposed following each $25 million increment of cumulative gross amounts expended on joint capital projects and excess routine field CAPEX.

Abandonment Fee

This fee compensates facility owners for future abandonment costs that will be incurred during the abandonment of the facilities.

Abandonment Fee Surcharge

This fee is to cover abandonment costs for capital added after third party processing begins.

11. Accounting

For purposes of determining volumes of third party oil processed through facility equipment, the volumes specified in the monthly production and injection reports filed with the Alaska Oil and Gas Conservation Commission will be used less any adjustments caused by backout. Allocation among the owners will be determined by the parties.

12. Operating and Maintenance Costs

The facility owners incur operating and maintenance costs for all of the facilities and drillsites. The costs for any facilities not benefiting the third party facilities or production shall be excluded from the calculations.

Plant Liquid Processing Fee

The per-barrel fee shall be determined by dividing the O&M costs by the volume of total liquid production (oil plus water) processed in the facilities. The O&M costs can include total plant labor, direct operating costs and allocated field support costs which are attributed to gross liquid processing operations but do not include any O&M costs not benefiting the gross liquid processing operations.

Plant Gas Processing Fee

The per-mcf fee shall be determined by dividing the O&M costs by the volume of total gas production and lift gas processed in the facilities. The O&M costs can include total plant labor, direct operating costs and allocated field support costs which are attributed to gross gas processing operations but not include any O&M costs not benefiting the gross gas processing operations. The fee shall be applied to the allocated volume of fuel gas, flare gas, take-in-kind, shrinkage and lost gas attributable to third party fluids.

Common Drillsite

The per barrel fee shall be determined by dividing the O&M costs by the volume of total liquid production (oil plus water) processed in the facilities. The O&M costs can include total drillsite labor, direct operating costs and allocated field support costs which are

attributed to all drillsite operations but shall exclude charges for operations which do not benefit the third party production. The fee shall be applied to third party gross liquid production (oil plus water) processed through the facilities less any adjustments.

Water Fee

The per-barrel fee shall be determined by dividing the O&M costs by the total make-up water volume made available and used for injection in all reservoirs. The O&M costs can include total labor, direct operating costs and allocated field support costs which are attributed to seawater treatment plant operations and associated pipelines which carry seawater to the injection plants. This fee shall be applied to each barrel of make-up water injected into the third party reservoir.

Ad Valorem Tax Fee

The annual ad valorem taxes chargeable to the third party shall be determined by multiplying the total annual ad valorem taxes by the third party adjusted gross liquid production (oil plus water) processed in the facilities divided by the total liquid production (oil plus water) processed in the facilities.

13. Accounting

The fees for liquid and drillsite shall be applied to third party's gross liquid production (oil plus water) processed through the facilities less any adjustments.

14. Fluids Associated with Backout Oil

The adjusted backout volumes have an associated volume of water and gas. These volumes of water shall be the gross third party water production times the adjusted third party backout volume divided by the gross third party oil production. The gross third party gas production times the adjusted third party backout volume divided by the gross third party oil production is the associated gas volume.

15. Determination of Costs and Volumes

The costs shall be based on the actual booked costs and actual volumes of fluids processed. The third party volumes shall be those specified in the production and injection reports filed by the operator with the Alaska Oil and Gas Conservation Commission.

16. Routine Field Capex Share

Routine field CAPEX shall be allocated to the third party owners on third party's gross liquid production (oil plus water) processed through the facilities less any adjustments divided by the total liquid production processed through the facilities.

17. Joint Capital Projects

A joint capital project may be proposed by either the facility owners or the third party owners. The percentage voting and procedure for proposing the projects can be negotiated by the parties and set forth in this agreement. All construction and modifications shall be owned solely by the facility owners.

18. Volume Adjustments

Backout

There will be a volume adjustment to reflect a backout of production from the facility owners' production caused by the introduction of third party production. This volume would be further adjusted to account for quality, royalty, and tax. **See separate write up on Backout Methodology Guidelines.** This adjustment will transfer the processing fees to the receiving party for the backout volumes.

Quality

The differences in the characteristics of the oil production from the facilities and the oil production from the third parties will be recognized and compensated with a quality adjustment. These differences could be caused by API gravity differences, compositional differences and impurities. The compensation will be a transfer of barrels between the parties. The exact procedure and calculation would be negotiable after the determination of the Quality effect. A quality adjustment factor (QAF) will need to be established for each stream and agreed to by the parties. The QAF volume is equal to the gross oil production for the stream (adjusted for royalty and tax) times the QAF for the stream minus the QAF average divided by the QAF average. The QAF average is the total of each stream's gross oil production times its QAF divided by the sum of the gross oil production for all streams. If the resulting QAF volume is positive, the stream will receive barrels, if negative, the stream will deliver barrels. The methodology can be

simple, such as based on API gravity ratios, or can be more complex, such as based on component value.

Tax and Royalty

Backout is considered a financial transaction; thus the value of the backed out oil is transferred to the receiving party while the delivering party retains the reserves for booking purposes and payment of royalties and severance taxes. To calculate the net backout share allocated to each party, the backout volume is adjusted for severance tax and royalty to keep the receiving parties whole on an after severance tax and royalty basis. The net backout volume will equal the backout volume calculated using a processing facility dynamic model, times one minus the royalty, times one minus the ELF, times the severance tax rate.

Adj.BO=BO{1-Royalty}x{1-ELF}x{SEVTAX}.

For example: If 100 barrels is the calculated backout volume, the adjusted volume would be: first, 100 times (1-.125 Royalty) equals 87.5 barrels; second, 87.5 times (1- (0.15 severance tax rate times .9 ELF)) equals 75.68 barrels. This way the delivering party pays the Royalty and Tax and the receiving party gets the barrels royalty and Tax free.

Allocation and Metering

Third party owners shall pay for all metering investments required for processing their fluids. Facility operator will prepare and maintain all information necessary for the filing of any reports required by governmental regulatory authorities relating to volume, quality, and disposition of produced fluids.

The unit operator will conduct well tests or metering as required for the allocation of production and provide information to all parties. This information will be that necessary for the third party to file any reports required by government regulatory authorities relating to volume, quality, and disposition of produced fluids.

19. Gas Supply

Each third party owner shall be obligated to supply gas to satisfy gas consumed during third party operations and utilized in the facilities for processing the third party production. Third party owners shall be responsible for fuel gas consumed by its equipment and a proportionate share of the fuel gas used in the facilities.

20. Gas Use and Reinjection

Any gas not used and consumed shall be taken in kind, reinjected into the third party reservoir or injected into the facility owners' (FO) reservoir. The gas injected into the FO reservoir will be considered indigenous to the FO reservoir and no compensation for the gas will be given.

21. Warehouse Sharing

The third party facilities will be permitted to use facility materials for a percentage each year. The exact material and costs will be negotiated.

22. Legal and Accounting Rights

The agreement would have several provisions maintaining each party's various legal rights, indemnity and auditing procedures.

Example of Potential Costs

Although each case will have its own specifics, as an example of potential costs, a third party would expect to pay fees for KRU such as those shown below:

Table 11 **Example of potential costs**

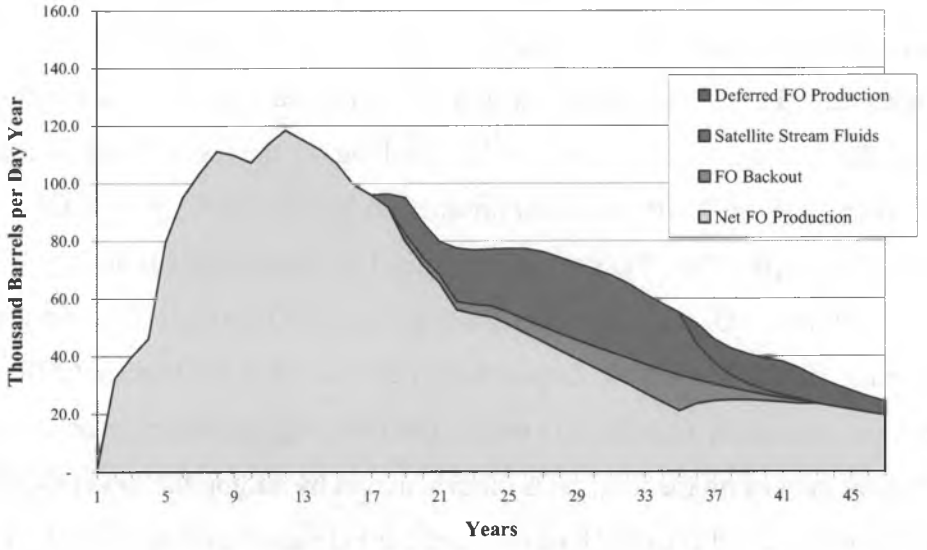
Fee	**Typical range**	**Per**
Capital Access	$1.00-1.80	BBL Oil
Abandonment	$0.10-0.20	BBL Oil
Plant Liquid	$0.09-0.15	BBL Liq.
Plant Gas	$0.03-0.6	MCF
Drill Site	$0.11-0.15	BBL Liq.
Excess Water	$0.04-0.07	BBL Ex.Wtr.
Ad Valorem	$0.10-0.16	BBL Liq.

Possible ranges of Backout:

Backout could range from as low as 2% to as high as 50%. The PBU satellites range from 2% to 6%. The KRU satellites range from 3% to 30% with an average of 9%.

Backout Methodology Guidelines

The following procedures are guidelines for a hypothetical methodology for determining the impact of backout fluids in facility sharing agreements. It is not intended to be all inclusive and areas may be subject to negotiation for a specific agreement. Kuparuk Ballot 255A is generally followed as this guideline. This methodology is detailed, complex and heavily dependent on a detailed dynamic plant model. Presently, only the KRU and PBU facilities have such a model in place. Other facilities would have to develop such a model, make use of existing less sophisticated models or negotiate a method for determination of backout volumes. See Backout Methodology Alternatives Section.



The owners of the existing processing facilities shall be designated as "FO" and the owners of the stream of fluids to be introduced into the facilities shall be designated as "SO". The term backout fluid means that volume of FO oil that will be deferred due to the limitations of the facilities if the SO fluids are processed.

The concept of backout is real, and it represents actual deferred or lost production, resulting in measurable loss of revenue to the facility owner. Backout only exists when the facilities are constrained in some manner, causing the combined streams to be larger than the capacity of the facilities. This is remedied by backing off the less efficient wells, such as those with high GOR or WOR, in lieu of production from lower GOR or WOR wells. In a simplified example, if the FO stream generates 100 mmscfd of gas and the facilities can handle 120 mmscfd, while the SO stream generates 30 mmscfd, then the gas handling is the limiting factor. For efficient operation of the facilities, the highest GOR wells would be backed out, likely from the FO wells, thus reducing the overall production for the FO but actually increasing the total sales oil production by adding the lower GOR SO oil. This reduction in FO oil is called backout, and the FO must be compensated for their lost or deferred production. This reduction volume is theoretically deferred until production in the far future. The effect of this time delay in production is financial and physical. The wells may not produce as efficiently when returned to service, the prices of oil will be different, today's value of the barrel will be discounted by the time delay of production and the facilities may be uneconomical to operate thereby not recovering all

of the barrels. These situations are not easy to define, and an overall modification factor can be negotiated to account for variance in these unknowns.

Figure 18 illustrates the impacts of backout on the production profile. Hypothetical facility owner (FO) production in thousands of barrels per day is shown in light blue. Satellite stream (SO) operator production (dark blue) begins in year 18 and is accompanied initially by modest rates of backout (grey). Over time backout increases as satellite stream fluids GOR increases, in this example to a peak of about 35% of FO gross production. Eventually satellite production ramps down and shuts in. In period 36, toward the end of field life, FO deferred production is re-established (magenta). In this illustration FO deferred production is less than cumulative backout, indicating that a portion of cumulative backout is not recovered. Thus, in addition to lost time value of money, FOs forego production due to backout.

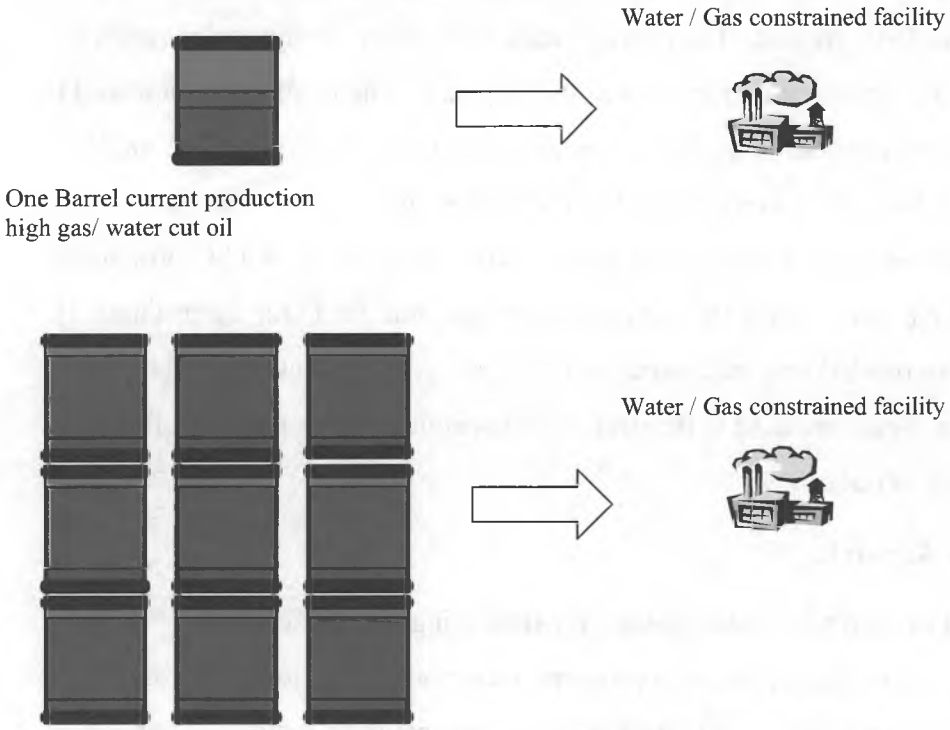


Figure 18 **Hypothetical Backout Illustration**

Backout can be caused by limitations in any or all of the following areas: oil handling, oil transmission, gas handling, gas treating, gas re-injection, water handling, water treating, water injection, electrical generation and pipeline proration. Figure 19 portrays the basic concept of backout, whereby a high GOR and WOR barrel of oil is backed out of the production stream to allow for multiple barrels of low GOR and WOR satellite oil

to be produced. The backed out barrel does have value, if produced, but it is relatively small in relation to the satellite barrels.

Figure 19 Backout concept

Application of General Backout Concepts:

- The backout calculations will be performed monthly.
- The basis of the calculations will be the average monthly allocated production and injection for that month (at the well level) as filed by the operator with the AOGCC.
- To the extent possible, the backout calculations will make use of logic that follows the optimization logic used in actual field operations.
- Adjustments will be made to account for any joint capital project participation by all parties.
- Changes in methodology will be made as appropriate to ensure the results reasonably reflect production adjustments.
- The operator shall be responsible for preparing the backout calculations.

Gas and Produced Water Backout:

This calculation is the first-order factor in calculating total backout, and it is based on plant gas handling and produced water capacity limits, as well as the relative GOR and WOR of the FO and SO streams. The operator uses a computer simulation program to model the day to day processing operations at the facilities. The results are compared to actual operations and calibration modifications are made to the model until the model results match actual operations to within 5%. Then the program is run with its optimization components to determine the basis for the calculations. All SO production is "turned off" in the calculations and the production potential for FO is determined. If there are more than one SO stream, a series of runs are made with one stream at a time "turned off". The results are used to determine the backout oil and the water oil ratio (WOR) of the backed out oil.

Water Injection Backout:

The operator will have to have methodology for simulating the impacts of reduced/increased water injection rates on the reservoir and production. This information will determine the relationship of oil rate backed out as a result of reduced water injection. Additional adjustments will be made to account for compressibility effects in the reservoir and to minimize possible double counting of backed out production. The WOR is used to determine the water injection backout for each SO stream.

Electrical Power Backout Calculations:

If electrical power generation capacity becomes a constraint to production, it is likely that high water cut wells being lifted with electric submersible pumps would be shut in to free up electrical capacity. It is also likely that these wells would be FO wells. To account for this possibility, a backout amount will be calculated.

The operator will verify each month whether any electrical power related production deferrals events occurred. If not, this calculation is not necessary. If an event occurred, causing lower FO production, the electrical power-related backout volume and the amount of power necessary to avoid this backout will be estimated. The total amount of electrical power used directly by the SO will be tabulated and adjusted for any funded electrical joint capital projects. The backout volume would be allocated according to the

SO usage. If the power necessary to avoid the backout is greater than the total SO usage, then the impact of this calculation is to lower the total calculated backout.

Proration Adjustment Backout Calculations:

Production impacts caused by common carrier or marine capacity prorations are to be shared by the FO and the SOs in percentages proportional to their gross share of pipeline volume. If no proration events occurred for the month, then no calculation will be made.

If there are proration impacts, a table of the **actual** production and the **estimated** production losses (actual proration) will be constructed for each stream. The difference between the target proration and the actual proration is the theoretical adjustment. If the number is negative, the stream will receive barrels and if positive, the stream will deliver barrels. For example, if the FO production rate is 100,000 bopd, and the SO production rate is 20,000 bopd, and a proration event calls for combined rate to be reduced to 60,000 bopd, then the FO rate would be prorated to 50,000 bopd, while the SO rate would be prorated to 10,000 bopd. However, if operational considerations dictate that one or the other stream does not reduce to the prorated value, the difference between that stream's actual production, and the prorated value triggers a backout calculation.

Modification Factor:

The parties will negotiate a further backout modification factor. Each stream's net backout shall be multiplied by the modification factor.

Backout Methodology Alternatives

Several facilities may not have a detailed dynamic plant model to simulate their facility operation. In that case, each facility will have to decide to either develop such a detailed model or devise an alternative method using their existing models to calculate backout. Each of these alternatives has associated costs that would be borne by all parties. Some suggested possibilities are:

- Gather information of shut-in and curtailed wells based on GOR and WOR and determine a theoretical production if these wells were not

curtailed. Prorate this number or an adjusted amount to the third parties for barrel delivery after royalty and tax.

- Hire an independent processor to simulate the field once a year and agree on a representative percentage to be applied throughout the year.
- Use a graph of the KRU or PBU satellite situation based on API, WOR and GOR to estimate the backout percentage.
- As long as the pipelines are not at capacity, the State of Alaska could consider implementing a program that takes the backout barrels from royalty barrels or a portion thereof.

Commercial Considerations

Commercial Framework

The concept and practice of facility sharing is not new to the North Slope of Alaska. Development of satellite fields within and adjacent to existing unit production has required unit operators and owners to create agreements allowing for processing of satellite production through existing or expanded facilities. Kuparuk River, Prudhoe Bay, Lisburne, and Endicott production facilities provide for access to satellite production through facility sharing and services agreements. The other North Slope units have not developed such agreements.

The existing facility sharing agreements were not created with non-unit production in mind, but they are de-facto templates for recent negotiations. The joinder agreement (Appendix D) between Winstar and the Kuparuk River Unit is an example of the use of Ballots 255, 255A, and 260 for the Kuparuk River Unit for third-party production.

Existing North Slope Facility Sharing agreements

The North Slope has a number of existing agreements in place for access to processing facilities. The fields that have not entered into infrastructure access agreements are: Alpine, Badami, Milne Point, and Northstar. There are agreements for Kuparuk (Ballots

255, 255A and 260), Endicott, and Prudhoe Bay/Pt Mac/Lisburne. These are summarized below:

Kuparuk

A series of ballots establishing facility access to the Kuparuk Participating Area (KPA) are 255, 255A and 260. These agreements provide for the processing of a third party's satellite fluids (oil, water and gas), as well as access to injection water, electricity and some common drillsite operations. The ballots offer 'modified available capacity access' and do not provide for 'firm capacity access' to the process facilities. This modified available capacity is based on the principle that the best wells will be produced to maximize facilities oil throughput, regardless of ownership. Therefore, assuming the facilities are operating at full utilization, available capacity for any party is a function of their well stream quality. Third parties pay for this facility access based on their satellite's actual utilization of the facilities.

Ballot 255 is the overriding ballot addressing the main principles of the sharing agreement, Ballot 255A is a detailed description of the methodology for the backout calculation, and Ballot 260 provides access to ancillary services. Ballots 255 and 255A are included in the appendix (E and F).

Ballot 255 Summary:

- Satellites pay a capital access fee to compensate KPA owners for investments made to put the process and related facilities in place. This fee is paid on a per-barrel- of-oil basis.
- The Satellites also pay a fee (on a per barrel-of-oil basis) to cover future process facility abandonment costs.
- Satellites pay fees to cover the satellite's proportional share of fluid processing and other common operation costs. These costs are determined yearly and based on actual costs and production from the previous year.

- Satellites compensate the KPA owners for deferred production in the event KPA production is 'backed-out' or restricted by satellite production. Backout is calculated according to the methodology described in Ballot 255A.
- An oil quality adjustment is made to account for the differences in the characteristics of KPA and satellite oil. The quality adjustment is determined monthly and paid in barrels at Pump Station 1. If satellite crude is superior to KPA crude, the satellite receives net barrels from the KPA. If satellite crude is inferior to KPA crude, then the KPA receives net barrels from the satellite.
- Satellite owners must provide sufficient and timely information regarding the Satellite plan of development and operation to enable the unit operator and KPA owners to assess the demands and impacts the satellite may have on KPA equipment, production and future operations.
- Satellite owners may install and operate their own wells and equipment. Satellite owners are responsible for any and all efforts and direct costs associated with satellite construction, permitting, maintenance, operation, taxes, royalty and abandonment.
- The unit operator is responsible for operating all KPA process facilities, pipelines and all wells on KPA drillsites as well as controlling the rate of production into the facilities. Either the unit operator or a sub-operator will be responsible for operating satellite equipment.
- Fluids must be compatible with KPA equipment. Satellite owners are responsible for any costs to bring satellite fluids into compatibility.
- In the event of competing demands for process capacity, the unit operator will strive to maximize total oil production through unit facilities. The best wells will be produced, the worst wells will be shut-in or curtailed, regardless of ownership. In the event that KPA production is deferred by this optimization of total oil production, KPA owners will be kept whole and compensated through the backout provisions.

- Satellite owners may propose KPA capacity expansions to meet their production requirements. The KPA and various satellite owners will pay for such capacity expansions in accordance to their relative benefit.

Ballot 260

Ballot 260 provides access to a wide range of services on an ad-hoc, as available, basis. Some of the key services included in the document are:

- Mobile and non-mobile equipment
- Emergency fire response
- Spill response
- Waste management
- Camp services
- Materials
- Solid oily waste management

Endicott:

Endicott has two facility sharing agreements (FSA) in place for Eider and Sag Delta North satellites and is a receiving entity under the IPA (Initial Participating Area) Ballot Agreement 98-202: Authorizing Use of IPA Equipment and IPA Services. These agreements provide for the development of the satellites using the Endicott facilities to process fluids. The general terms of the FSAs are outlined below and a summary of the IPA Ballot Agreement 98-202 is provided in the Prudhoe Bay Unit (PBU) and Pt. Mac/Lisburne section.

Endicott FSAs Summary:

- Describes scope of satellite operations and equipment needs
- Provides access to Endicott facilities for operations, gathering and treating of production

- Determines the satellite responsible for paying for any facility modifications
- Establishes fees for various services provided
- Establishes equipment access, O&M, abandonment, excess power, and make-up water fees
- Establishes fees for additional processing operations as applicable
- Sets production capacity priority based on competitive WOR/GOR if capacity limited
- Provides backout calculation for production and value adjustment for crude quality differences
- Provides fuel in-kind calculation

PBU and Pt. Mac/Lisburne:

There are three primary categories of facility sharing agreements relating to PBU facilities and services. First, there are a number of agreements that relate to operations of the Lisburne Production Center. Second, there are agreements related to processing PBU satellite production in facilities originally developed to produce the main Prudhoe reservoir ("IPA Facilities") (Ballot 97-196). Third, there is an agreement authorizing third-party sharing of certain equipment and services ("IPA Equipment and Services") (Ballot 98-202). The PBU Owners also have entered into agreements that address the use of specific equipment.

A summary of these categories of agreements follows:

1. Lisburne Production Center Agreements

The Lisburne Production Center (LPC) was developed to process production from the Lisburne Reservoir. In the early 1990s, agreements were developed to address what is called the Greater Pt. McIntyre Area ("GPMA"). These agreements allow the Pt. McIntyre, Niakuk, West Beach and North Prudhoe reservoirs ("Sharing PAs") to be processed through the LPC with Lisburne production, and for sharing between the IPA

Owners and the owners of the participating areas within the GPMA of certain support facilities, electrical power, vertical support members, source water and other facilities and services.

2. Facility Sharing Authorization Agreement (Ballot 97-196)

This agreement provides for the development of a Facility Sharing Agreement (FSA) for each satellite field under which production fluids from that satellite could be processed through the use of IPA Production Equipment. There are currently no FSAs with parties external to the Prudhoe Bay Unit.

Owners of a satellite seeking access to IPA facilities must provide specific information regarding the plans for development and operation of the satellite to enable the IPA owners to evaluate demands and impacts that regular production from the satellite will have on IPA production equipment and services, field development plans, and production levels. This information includes:

(i) The scope and timing of Satellite development, including location of Satellite well pads and facilities, projected number and timing of Satellite wells to be drilled on each well pad, and identification of specific facilities for which access, modification, use or tie-in is proposed;

(ii) Projections of satellite production to be delivered to IPA production equipment, the quantities of "returned" gas (gas lift, fuel or injection) and satellite produced water to be made available by the IPA owners to the satellite, all on a year-to-year basis;

(iii) Description of electrical power, gas, make-up water or other IPA production equipment and services for use by the satellite; and

(iv) Description of the stratigraphic horizon and areal extent for the portion of the satellite reservoir proposed for development with compositional descriptions and producing characteristics (e.g. temperatures and pressures) of the anticipated satellite production.

Based on this information, the IPA owners may enter into an FSA that will specify appropriate terms and conditions including:

Facility Sharing Analogs

The concept of Facility Sharing is a growing consideration in mature oil and gas basins around the world. Aside from the examples mentioned above on the North Slope, publicly available information pertaining to facility sharing agreements in other countries exists. Understanding these agreements is useful when negotiating future agreements for the North Slope. In general, the guiding principles from both the United Kingdom (U.K.) Code of Practice and Alberta's Jumping Pound formula are aligned with the existing North Slope facility sharing agreements. Both Alberta and the Offshore U.K. have mature oil and gas basins where the facility sharing concept has proven beneficial for operators, third party producers, and the government. Both examples reviewed provide for regulatory interdiction as needed to resolve disputes between negotiating parties, although the UK Code of Practice has not had to rely on the government intervention process to date. Emphasis on a cooperative approach to facility sharing has been successful in negating the need for government interdiction. Both facility sharing approaches outlined below are proven starting points for successful negotiations. Existing agreements between unit partners on the North Slope present the obvious starting point for new facility sharing agreements, and the highly cooperative approach adopted in the United Kingdom sets a good example for expanding these existing agreements to meet the needs of an expanding group of potential producers.

UK Offshore Infrastructure Code of Practice

The United Kingdom's "Indicative Tariff" Code of Practice for offshore oil and gas infrastructure is a cooperative industry document on the rules and procedures governing third party access to these facilities. This document provides a framework for easy, fair and non-discriminatory access to offshore oil and gas facilities. The process is supported by the oil and gas industry. It is not mandated or enforced by a government agency, however if a dispute over access does arise, there is a government body that has the legal authority to settle the differences. The framework for third party facility access is a combination of the Offshore Infrastructure Code of Practice for conducting commercial negotiations and the legal backstop of appealing to the UK Secretary of State for Trade and Industry to settle disputes over access. The real strengths of the system are the

Owners and the owners of the participating areas within the GPMA of certain support facilities, electrical power, vertical support members, source water and other facilities and services.

2. Facility Sharing Authorization Agreement (Ballot 97-196)

This agreement provides for the development of a Facility Sharing Agreement (FSA) for each satellite field under which production fluids from that satellite could be processed through the use of IPA Production Equipment. There are currently no FSAs with parties external to the Prudhoe Bay Unit.

Owners of a satellite seeking access to IPA facilities must provide specific information regarding the plans for development and operation of the satellite to enable the IPA owners to evaluate demands and impacts that regular production from the satellite will have on IPA production equipment and services, field development plans, and production levels. This information includes:

(i) The scope and timing of Satellite development, including location of Satellite well pads and facilities, projected number and timing of Satellite wells to be drilled on each well pad, and identification of specific facilities for which access, modification, use or tie-in is proposed;

(ii) Projections of satellite production to be delivered to IPA production equipment, the quantities of "returned" gas (gas lift, fuel or injection) and satellite produced water to be made available by the IPA owners to the satellite, all on a year-to-year basis;

(iii) Description of electrical power, gas, make-up water or other IPA production equipment and services for use by the satellite; and

(iv) Description of the stratigraphic horizon and areal extent for the portion of the satellite reservoir proposed for development with compositional descriptions and producing characteristics (e.g. temperatures and pressures) of the anticipated satellite production.

Based on this information, the IPA owners may enter into an FSA that will specify appropriate terms and conditions including:

i) The specific O&M fee, capital access fee, abandonment fee, backout, and volume adjustment factor (VAF) as well as fees for use of IPA area equipment and IPA services in support of subsurface satellite operations, additional processing operations and satellite drilling and construction activities, and fees for make-up water, additional electrical power or other items.

a) The O&M fee is to reimburse the IPA owners for the satellite's proportionate share of the IPA production equipment and services producing costs for base processing operations.

b) The capital access fee is to reimburse the IPA owners for investment in IPA production equipment.

c) The abandonment fee is to reimburse the IPA owners for a satellite's proportionate share of the estimated future abandonment costs for IPA production equipment accessed by that satellite.

d) Backout is the estimated volume of IPA oil that cannot be produced during a specified time period because of the processing of satellite produced fluids through IPA Production Equipment. The Satellite is responsible for keeping the IPA whole on deferred production by reimbursing the IPA for backout with a volume of satellite production.

e) VAF is a volume adjustment to a satellite's oil volume that reflects, among other things, the differences in physical quality, compositional differences and handling considerations of produced fluids from the IPA and satellites.

(ii) Incorporation of specific terms and conditions which address any issues raised by the information provided above including the commercial terms required for any satellite modification, joint equipment or additional services requested.

(iii) Scope and timing of development (including all satellite modification and joint equipment requirements), range of rates for satellite production and reservoir boundaries for which use of IPA production equipment and services will be allowed.

3. Ballot Agreement Authorizing Use of IPA Equipment and IPA Services (Ballot 98-202)

This agreement authorizes the use of certain IPA area equipment and services (not including oil and gas processing equipment) by other units/participating areas (receiving entities), establishes terms of compensation for use of IPA area equipment and services, and defines the allocation of liability between IPA owners and the receiving entities with respect to the use of IPA equipment and services.

IPA equipment and services under Ballot 98-202 are intended to be for incidental use of receiving entities. Use of IPA area equipment and services for other than incidental use would be subject to a separate agreement negotiated on a case-by-case basis. (Incidental use means use of equipment and services by a receiving entity that is in excess of the IPA owners' needs at the time of such use and that is insubstantial when compared to the IPA owners' use of such equipment or services.)

Equipment and Services include:

A) Mobile & non-mobile equipment
B) Airport shuttle bus services
C) Sewage disposal
D) Production lab
E) Wellhead services
F) Hot water plant
G) West Dock staging area
H) Drum disposal
I) Halon support services
J) Camp services
K) Projects & construction
L) Overhaul & rotating equipment
M) Scheurle trailer
N) Investment recovery
O) Flow measurement
P) Miscellaneous services
Q) Mukluk Pad
R) CTD work platform
S) Security checkpoint

4. Specific Equipment: Grind and Inject Plant Operating Agreement (IPA Ballot 97-201)

This agreement allows authorized parities to use the Grind and Inject Plant to dispose of drilling waste for a fee.

Facility Sharing Analogs

The concept of Facility Sharing is a growing consideration in mature oil and gas basins around the world. Aside from the examples mentioned above on the North Slope, publicly available information pertaining to facility sharing agreements in other countries exists. Understanding these agreements is useful when negotiating future agreements for the North Slope. In general, the guiding principles from both the United Kingdom (U.K.) Code of Practice and Alberta's Jumping Pound formula are aligned with the existing North Slope facility sharing agreements. Both Alberta and the Offshore U.K. have mature oil and gas basins where the facility sharing concept has proven beneficial for operators, third party producers, and the government. Both examples reviewed provide for regulatory interdiction as needed to resolve disputes between negotiating parties, although the UK Code of Practice has not had to rely on the government intervention process to date. Emphasis on a cooperative approach to facility sharing has been successful in negating the need for government interdiction. Both facility sharing approaches outlined below are proven starting points for successful negotiations. Existing agreements between unit partners on the North Slope present the obvious starting point for new facility sharing agreements, and the highly cooperative approach adopted in the United Kingdom sets a good example for expanding these existing agreements to meet the needs of an expanding group of potential producers.

UK Offshore Infrastructure Code of Practice

The United Kingdom's "Indicative Tariff" Code of Practice for offshore oil and gas infrastructure is a cooperative industry document on the rules and procedures governing third party access to these facilities. This document provides a framework for easy, fair and non-discriminatory access to offshore oil and gas facilities. The process is supported by the oil and gas industry. It is not mandated or enforced by a government agency, however if a dispute over access does arise, there is a government body that has the legal authority to settle the differences. The framework for third party facility access is a combination of the Offshore Infrastructure Code of Practice for conducting commercial negotiations and the legal backstop of appealing to the UK Secretary of State for Trade and Industry to settle disputes over access. The real strengths of the system are the

adherence to a timeline for the negotiation and the support from all parties to have a practical means of an early understanding of the availability and the approximate costs of bringing and processing hydrocarbons in existing facilities.

The owners maintain an up-to-date database on their offshore infrastructure. When a potential user requests this data, the owner has 10 days to respond with the requested data as well as an indication of the probable tariff. If interested in proceeding, the user formally contacts the owner and provides specifics as to the kind of hydrocarbon composition and specifications, along with the development strategy. Within 30 days, or a mutually agreed-upon timetable, the owner must reply to the prospective user with a detailed technical response to the specifics of the requested facility use. If the request from the user fits with the available access from the owners, the negotiations continue with another 30 day clock. The parties may agree in the process of these final negotiations to substantially change the standard terms they started with. The UK Department of Trade and Industry (DTI) website is a valuable source of information, and the Code of Practice can be found on their website: http://www.og.dti.gov.uk/regulation

The self-maintained database of the infrastructure owners is expected to include the following data:

a. Technical description: Hydrocarbon entry specification, pressure regimes/compressor curves at entry and exit, dehydration regime, process diagrams and other operating conditions;

b. Operational capability including measures of past performance and reliability. Planned changes affecting operational capability should be indicated;

c. Services that can be provided;

d. Indicative price of services;

e. Indicative forecast of available capacity normally for 5 years ahead, but for a longer period for significant infrastructure; and

f. Pertinent general contract terms: lifting procedures, ownership, priorities, system allocation principles, substitution terms, voting rights, etc.

Although this information does not constitute an offer capable of acceptance, it provides to the user the indicative terms, which can be used as a yardstick as negotiations progress toward settlement.

The prospective third-party user is expected to provide the following specific information on the service requested:

a. Production profiles;
b. Compositions;
c. Start-up date;
d. Broad outline of development concept;
e. Hydrocarbon specification (such as H2S, CO2, gravity etc).

While this 1996 offshore infrastructure code of practice is a working process for facility owners and potential third party users, it is still an evolving procedure. In 1998, the Petroleum Act was instigated to provide an appeal process for the Secretary of State to settle disputes over access. Further to this, in the spring of 2001, the UK Department of Trade and Industry responded to allegations that access to infrastructure was still a commercial barrier to oil and gas development with a study on the effectiveness of the voluntary Infrastructure Code. The results of the study found that although it is not necessary to replace or update the existing code, it is imperative to continue to check on its effectiveness at least every three years. At this time, even though the code is not a perfect system, it is still supported by the industry. Clearly this voluntary arrangement, in combination with a legal backstop for the governing body to step in to provide a means to settle disputes over access, is recognized as crucial for their continued offshore oil and gas development. Currently, Work Groups formed by the DTI are preparing a proposal to amend the Infrastructure Code of Practice with the key changes being:

- Allowing for the Secretary of State to become automatically involved in an infrastructure access request if insufficient progress is being made after a certain period (to be determined) and allowing the Secretary to set a tariff.
- Allowing for the provision of more information and transparency.

It is expected that this proposal will be published in May 2004.

There are no published examples of how the Code of Practice has worked, as these negotiations for infrastructure terms are confidential. Per the Code, indicative tariff offers are reported to the DTI, which are then published.

The Secretary of State, to date, has not been asked to formally intervene to set tariffs or enforce access. Operators have preferred to work out agreements among themselves rather than taking the risk of government intervention using methodology that is not clearly defined. The Secretary's office has participated informally in cases to move negotiations along when companies complain.

Alberta's Facility Sharing Agreement, the Jumping Pound Formula

Alberta Canada also has an industry-agreed-upon voluntary guideline for calculating oil and gas processing tariff ranges. The access to infrastructure is agreed to be an open and non-discriminatory access, in facilities where capacity is available. The Jumping Pound methodology is based on an industry-derived formula. The formula was developed for a case decided by Canada's National Energy Board (NEB) for the processing tariff charged at a gas processing plant at Jumping Pound in 1990.

The Alberta Jumping Pound Formula (JP 90/ 95) was developed jointly by a number of industry organizations as a guideline for parties to use in negotiating fair and reasonable fees on an everyday basis and to assist in dispute resolution. The Alberta Energy and Utilities Board (EUB) supported the initiative but did not play a major role in the development of the actual formula. The formula was developed to determine the components which form any tariff rate for oil and gas processing at plants, e.g. rate of return, rate base and range, operating costs, plant capacity, and special fee considerations. The two documents describing the JP 90/95 formula are *Gas Processing Fee, Jumping Pound 1990 (Jp-90), January 1990*, and *Joint Industry Task Force Report On Processing Fees JP-95, April 15, 1996*, which have some general examples of cases.

The calculation for the fee establishing the calculated return on the capital investment for the Jumping Pound Formula uses the original cost of the facilities as the Capital Base, depreciated in a straight line over the life of the project (normally set at 20 years). A return on capital is established as 15% before tax rate of return on the capital, and is

allocated among the owners of the facility as a capital allowance. Based on these costs, the fee for the facility access is prorated per total throughput. Additionally, there is a component of the formula that accounts for the sharing of the operating costs of the facility. This component is generally also prorated on a production basis.

Although the formula is used voluntarily by the industry as a starting place for negotiations on facility access, the key to Alberta's facility sharing practice is the regulatory board's legal power to ensure a third party gains access to infrastructure.

Where disputes on processing fees cannot be resolved on a voluntary basis, there is provision in the Alberta Oil and Gas Conservation Act (OGCA) for a party to apply to the EUB to set the fees. When the EUB has receives an application and determines that it is complete, a public hearing is scheduled to consider the application. The EUB has stated that, if application is made to the EUB to set processing fees, it will use the Jumping Pound Formula, unless there were compelling opposing reasons. The EUB gets very few applications requesting the setting of processing or transportation fees (one or two a year, typically), and has not yet set any such fees. All applications requesting fee-setting were withdrawn while the applications were being processed. The EUB encourages parties to continue negotiations or mediations in parallel with filing an application with the EUB. Typically once a EUB hearing date is set these negotiations or mediations result in resolution as the opposing party often does not want to be drawn into the regulatory arena through the public hearing process. Although the EUB has not yet set any fees, it remains prepared to do so.

The Alberta law dealing with third party access is set out in Part 9 of the OGCA. Disputes on access may result from a number of issues - volumes, delivery points, fees, drainage issues. The application requirements are set out in EUB Guide 65. (The OGCA and Guide 65 are available on the EUB web site www.eub.gov.ab.ca.) If the EUB approves an application, access is granted by means of an order which declares a party to be a common carrier (access to a pipeline), common processor (access to a gas processing plant), or common purchaser (access to market). An order can simply be a declaration; for example, Company XYZ is a common processor of gas from the Pipestone Viking F Pool. Additional direction can also be included to give effect to the order; for example, the order can allocate production among producers in a pool (a usual provision), specify the delivery point, or set out the fees. Usually an order does not deal

with all of these issues; the nature of the dispute that resulted in the application being filed with the EUB determines which issues are addressed. When a party is declared to be a common carrier, processor, or purchaser the OGCA requires it to treat parties without discrimination within the limitations of the order (within a pool, typically).

The EUB has no data to know how widely JP90/95 is used as a benchmark, as the vast majority of companies who want capacity in facilities they do not own (whether processing plants or pipelines) are able to privately negotiate satisfactory voluntary arrangements, and the matter does not come before the EUB. There is no requirement to file contracts that result from these negotiations.

Independent Oil Companies' Perspectives

PRA surveyed 15 independent oil companies currently interested in Alaska oil and gas exploration to get their perspective on facility access and to identify their needs in creating a template for negotiating access. Five of the companies contacted responded to the survey, and others provided feedback through informal discussions, including open discussions during a meeting of independent oil companies hosted by Alaska Governor Frank Murkowski in Juneau in December of 2003.

The questions asked of these companies are listed in Appendix A.

The key areas identified as concerns and issues are:

- Backout calculations;
- Capital access fee methodology;
- Timing of negotiations;
- Insurance requirements;
- Operatorship;
- Trust and access to supporting information.

Summary of Independent Company Concerns:

Backout calculations

manner. The operators recognize that a business opportunity exists for establishing a formal agreement with fair terms for processing third party production volumes in existing infrastructure.

In the State's view, expressed in the CHARTER FOR DEVELOPMENT of the Alaskan North Slope, the Commissioner of Natural Resources possesses the statutory, regulatory and contractual authority to require working interest owners to provide other producers access to production and other facilities, on terms that are non-discriminatory, just and reasonable. Under the Charter for Development, the Commissioner may require access whenever necessary to

1. maximize the economic and physical recovery of the State's oil or gas resources,
2. maximize competition among parties seeking to explore and develop the resources,
3. minimize the adverse effects of exploration, development, production and transportation activity,
4. or otherwise to protect the best interests of the State.

Also, as stated in the CHARTER FOR DEVELOPMENT of the Alaskan North Slope, BP and ConocoPhillips take no position on the State's view. BP and ConocoPhillips commit that they will not unreasonably withhold their voting support as facilities owners for allowing nearby satellites to have access to existing unit facilities on reasonable commercial terms.

Recent history indicates that the owners and operators are willing to negotiate access.

PRA compliments the commitments stated above and makes the following recommendations:

1. Nearly all of the existing facilities have the potential for developing or a precedent for facility sharing agreements. The Independent producers should expect to be able to negotiate an acceptable agreement. The negotiations should be initiated by independent producers as early as possible.

2. The largest obstacle to successful negotiations is a lack of trust. Development and communication of a process for third-party facility access which is fair and transparent will help to resolve this lack of trust, and create opportunity for expanded resource development.

3. The Independents need to provide operators with a well thought out development plan with as many crude characteristics as possible.

4. The most critical technical issue is the calculation of the backout volumes. The operators need to communicate the backout methodology and be able to respond to requests in a timely manner.

5. The Independents need to recognize backout is a valid concept, representing real lost or deferred barrels to the facility owners.

6. Both parties need to be ready to compromise on the backout methodology to simplify the calculations for fields without a detailed dynamic plant model.

7. The State of Alaska has shown interest in investigating methods to defray the backout impacts to the Independent producers, and this should be continued.

8. Significant positive progress has been made through the compilation of this report, and further investigation and communication should be energetically pursued to assure continuation of this progress.

Information Request for CPAI Operated Fields

- What are the maximum capacities, current and forecast throughput of oil, water and gas, and constraints on production facilities, from transportation pipeline to drill site level?
  - Are there any "quick wins" to increase available capacity?
- What are the opportunities and constraints associated with input oil quality?
  - What are the input specification requirements for the processing plants?
  - How leveraging is oil quality on processing and transportation costs?
- What agreements are currently in place which would impact facilities access?
  - Could you provide a summary description and/or copies of these agreements?
- If you were to design a template to offer facilities access, what would be the key components?
- How would you rank potential access opportunities for the ConocoPhillips operated fields?

Robin Brenna & Craig Richards Presentation to Senate Resources Committee

Senate Resource Committee Presentation
By Robin O. Brena and Craig W. Richards

February 6 – February 8, 2012

Introduction

Decision Following Trial De Novo, Case No. 3AN-06-8446 CI
(2007-2009 Tax Years Consolidated) Assessed Valuations of the Trans Alaska Pipeline System (December 30, 2011)
("Gleason Decision")

Robin O. Brena—Counsel for the Fairbanks North Star Borough and Lead Counsel for the Municipalities in the 2007-09 Assessed Valuations Case for TAPS

Craig W. Richards—Counsel for the City of Valdez and Co-Counsel for the Municipalities in the 2007-09 Assessed Valuations Case for TAPS

Mr. Brena and Mr. Richards are testifying as to their own personal opinions as Alaskan residents and are not representing any client or being paid for their testimony.

Introduction
Robin O. Brena

Mr. Brena is a life-long Alaskan who grew up in Skagway. He has received a Masters of Business Administration ("MBA") and a Doctor of Jurisprudence ("JD") from the Willamette University and a Master of Laws in Real Property ("LL.M.") from the University of Miami. He has been the Chairman of the Real Estate Section of the Alaska Bar Association, Chairman of the Estate Planning and Probate Section of the Alaska Bar Association, and has taught Advanced Business Law at the University of Alaska.

Mr. Brena is the owner of Brena, Bell & Clarkson, P.C., an Anchorage law firm that emphasizes oil and gas, public utilities, tax assessment, real estate, commercial, regulatory, and telecommunications law. Representative current and prior clients in the oil and gas and tax assessment areas of practice are Fairbanks North Star Borough; Anadarko Petroleum Corp.; City of Valdez; Tesoro Corporation; Aurora Gas, LLC; Aurora Power Resources, Inc.; Murphy Exploration (Alaska) Inc.; Cook Inlet Energy, LLC; Agrium Inc.; Nabors Alaska Drilling, Inc.; Doyon Drilling, Inc.; Doyon Parker Joint Venture; Nordic-Calista Services No. 1; and Parker Drilling, Inc.

Mr. Brena has been involved in several major tax assessment cases in Alaska involving drilling rigs, an oil refinery, tankers, and pipelines. He has also been involved in the many of the major pipeline regulatory cases before the Federal Energy Regulatory Commission ("FERC"), the Regulatory Commission of Alaska ("RCA"), and the Washington Utilities and Transportation Commission ("WUTC") involving the Trans-Alaska Pipeline System ("TAPS"), Cook Inlet Pipeline System ("CIPL"), Cook Inlet Gas Gathering System ("CIGGS"), Kenai Pipeline Company ("KPL"), Olympic Pipeline, and Enstar.

Mr. Brena represented the Fairbanks North Star Borough and was the lead counsel for the Municipalities before the Honorable Judge Gleason in the ad valorem case concerning TAPS for the 2007-09 tax years.

Introduction
Craig W. Richards

Mr. Richards grew up in Fairbanks, Alaska, where he graduated from West Valley High School in 1993. He studied finance as an undergraduate at the University of Virginia, and holds a *Juris Doctor* from Washington & Lee University and a MBA from Duke University.

Mr. Richards practices law with Bill Walker and Joe Levesque at Walker & Levesque, LLC in Anchorage, Alaska. His practice focuses on finance, tax, municipal, and oil and gas law. Mr. Richards has been involved with numerous oil and gas taxation disputes, including those relating to TAPS and the tankers that call at Valdez. Through his representation of the Alaska Gasline Port Authority, as well as other clients, he has spent many years working on an LNG project to Valdez. He has also been actively involved in the proposal to truck North Slope gas to interior Alaska, and the proceedings related to the termination of the Point Thomson Unit. The firm also acts as bond counsel on TAPS' refinancings.

Mr. Richards, along with Mr. Walker, represented the City of Valdez before the Honorable Sharon Gleason in the recent de novo trial relating to the 2007 – 2009 assessed value of TAPS.

Introduction

1. This is a consolidated appeal of the State Assessment Review Board ("SARB" or "Board") Decisions of the 2007, 2008, and 2009 assessments of the Trans Alaska Pipeline System ("TAPS") for ad valorem tax purposes under AS 43.56. SARB assessed the value of TAPS for 2007 at $4.588895312 billion, for 2008 at $6.154447972 billion, and for 2009 at $9.045892 billion.

Gleason Decision ¶ 1

Introduction

599. [F]or the reasons expressed herein, this Court finds that as of January 1, 2007, 2008, and 2009, the "full and true value" of the Trans Alaska Pipeline System, "with due regard to the economic value of the property based on the estimated life of the proven reserves of gas or unrefined oil then technically, economically, and legally deliverable into the transportation facility" is $8.941 billion for 2007, $9.644 billion for 2008, and $9.249 billion for 2009.

Overview

546. Brent Eyre, on behalf of the Municipalities, employed a discounted cash flow income approach to value the integrated economic unit of which TAPS is a part at $40.2 billion in 2007, $44.2 billion in 2008, and $50.4 billion in 2009. Dr. James Smith, on behalf of the Owners, testified that Mr. Eyre's unit value of the integrated ANS enterprise should be reduced by slightly less than 10% for each year, for a value of $36.4 billion in 2007, $41.1 billion in 2008, and $46.0 billion in 2009.

Gleason Decision ¶ 546

Overview

Integrated Value of the ANS Unit

	Comparison of Valuation Results, Before and After Corrections (all values in $ billions)			
		Jan 1, 2007	Jan 1, 2008	Jan 1, 2009
	Results Reported by Mr. Eyre			
Eyre	System	$40.159	$44.208	$50.439
	TAPS	$8.812	$9.611	$10.688
	Results Obtained from Corrected Model			
Smith	System	$36.401	$41.079	$46.000
	TAPS	$0.259	$0.645	$2.555

TO-07-433 (Dr. Smith Chart)

Market Structure

Integrated Operations with Market Power

Concentrated Market Power Integrated Value of the Unit

- **Shows ANS unit will generate roughly $36 - $50 billion in discounted cash flow value**
- **Current Value of Parts of the Unit Substantially Less than $36 - $50 billion**
  - Taxable upstream assets, most valued on RCNLD, assessed at between $8-$10 billion for 2007 to 2009 [2007-2009 Trial Tr. 13040 (Greeley)]
  - Even under Dr. Smith's calculations, a $13 billion TAPS value leaves between $13 billion and $26 billion in unallocated unit value for non-taxable property
    - Includes intangibles (if any), leases, certain locally assessed property, etc. [*See* AS 43.56.020; AS 43.56210(5)(B)]
- **Unit Income is Sufficient to Justify:**
  - Billions in capital investment above the over $2 billion annual capital investment already anticipated in the integrated model
  - Replacing TAPS at $20+ billion
  - A $13+ billion TAPS value

Market Structure

- Barriers to Competitive Entry

Market Structure

Integrated Operations with Market Power

- Integrated Operations
- Market (ANS Basin) Dominance by Big 3
- Limited Competition

Market Structure

Integrated Operations with Market Power

69. The TAPS Owners did not and could not have independently financed the original construction of TAPS and they do not independently finance substantial improvements to TAPS. Instead, the affiliated production companies have financed TAPS' construction. And the evidence at trial demonstrated that all significant funding decisions for TAPS are not made by the TAPS Owners, but by the affiliated parent corporations or upstream producer affiliates of each Owner.

Gleason Decision ¶ 69

Market Structure

Integrated Operations with Market Power

70. As of the lien dates, the parent companies of the three largest owners of TAPS (BP, ConocoPhillips, and ExxonMobil) had a combined 95% ownership interest in TAPS. These same three parent companies also had a combined total in excess of 96% of the estimated production on the North Slope. This close correlation between estimated production and ownership interest in TAPS is expected to remain in place for the foreseeable future. . . . [E]ach of the five TAPS Owners has an affiliate with oil to be transported on TAPS.

Gleason Decision ¶ 70

Market Structure

Integrated Operations with Market Power

71. Each Owner's affiliated producer has an economic incentive to nominate its ANS production to its affiliated TAPS Owner. As explained by Charles Coulson, the President of BP Pipelines:

> There has been a strong pattern of shippers on TAPS nominating their barrels to affiliated pipeline companies. There are a variety of reasons for this behavior, but mostly it can be understood by thinking about integrated corporate economics. When an upstream affiliate ships barrels in its pipeline affiliate's space, it pays the published tariff rate to the pipeline affiliate, and no money leaves the corporate family.

Gleason Decision ¶ 71

Market Structure

Integrated Operations with Market Power

114. In the case of TAPS, AS 43.56.060(e)(2)'s reference to "economic value" and not "market value" is consistent with the reality that there is no market for TAPS as a standalone investment based solely on its tariff income. Even if there might be a buyer of TAPS based solely on its tariff income, the evidence at the trial de novo conclusively demonstrated that a TAPS Owner would not sell its interest in TAPS without the assurance that its affiliated oil from the Alaska North Slope could be shipped to market. . . .

Gleason Decision ¶ 114

Market Structure

Integrated Operations with Market Power

124. [F]or the evidence persuasively demonstrates that ANS producers would rebuild TAPS at a cost of billions of dollars to transport ANS petroleum products to market if TAPS was not in existence as of the lien dates. And the producers would replace TAPS not for the tariff income they might realize, but to monetize the approximately 7 to 8 billion barrels of proven reserves that were at the ANS as of the lien dates.

Gleason Decision ¶ 124

Market Structure

Integrated Operations with Market Power

549. As in the 2006 tax year litigation, the Court finds again that tariff income is not the primary driver of the economic value of TAPS under AS 43.56. As SARB has held, and as this Court has previously discussed in these findings, TAPS was not built or operated for tariff income, but to monetize the vast ANS reserves of the producer oil companies by bringing those reserves to market. In this regard Mr. Coulson, the President of BP Pipelines (Alaska) Inc. and the Chairman of the Owners' Committee for TAPS at the time, testified as follows:

> Q: It's fair to say that TAPS was built by the producers?
>
> THE WITNESS: Yes.
>
> Q. And it's fair to say that TAPS was built - that the economic driver was the integrated economics of bringing the Alaska North Slope oil to market?
>
> THE WITNESS: As I understand the history of TAPS, and indeed of most basin-opening developments, it's usually the resource owner that has to make the infrastructure development happen because of the risks associated with an undertaking like that.
>
> Q. And the reason that the resource owner takes those risks is in order to monetize the resource and bring it to market, correct?
>
> THE WITNESS: Yes.

Gleason Decision ¶ 549

Market Structure

Integrated Operations with Market Power

551. [T]he Owners' reliance upon the tariff income approach fails to recognize that TAPS was built, is operated, and would be replaced at an estimated cost of approximately $19 billion if it were not in existence, not because of a desire to realize tariff income, but because of the overwhelming economic value arising from its highly integrated use for transporting ANS production to market.

Gleason Decision ¶ 551

Market Structure

Integration – North Dakota

Testimony of Mr. Barry E. Sullivan (Munis' witness)

Q. And do you have a ... comparative sense between the TAPS system and other systems with regard to access for that independent shipper?

A. [I]n North Dakota, there's a new field called the Bakken field and it's ... a fairly hot area of exploration and development.

There's Enbridge Pipeline in the Bakken that has about 180 different shippers, and there are numerous marketers operating within that area that will buy and sell oil for you....

That contrasts with the situation on the North Slope where ... the producers themselves, the Big 3, do not sell oil at the North Slope and you can't buy oil at Pump Station 1 and transport it on TAPS. The policy of the Big 3 is to sell delivered oil in delivery markets.

Tesoro is the only shipper that's been able to buy North Slope oil and ship it on the TAPS system. So I think there's a big contrast between the way that the North Slope market works and other producing regions in North America.

2007-2009 Trial Tr. 8562-63

Market Structure

Integration – Gulf of Mexico

Testimony of Mr. Barry Sullivan (Munis' witness)

[I]f you compared what's happened in the North Slope of Alaska to the offshore Gulf of Mexico, which ... began, real exploration, probably back in the 1960s... you could look at the Gulf of Mexico today and it is an extremely competitive and well-explored area with numerous production companies and probably hundreds of different owners and producers that contrasts dramatically with what's happened in the North Slope.

And you don't have the level of competition on the North Slope that should be there after 35 years.

And I believe part of that is the vertical -- part of that can be caused by the vertical integration of the TAPS Carriers and their ownership of TAPS.

2007-2009 Trial Tr. 8556-58

Market Structure

Integrated Operations with Market Power

Testimony of Mr. Michael J. Remsha (Owners' witness)

Q. Okay. It is very simple. Let me go back to my hypothetical. Do you believe that the TAPS Owners would sell me TAPS for $20 billion for the expressed purpose of shutting it down?

A. Most likely not.

Q. Why not?

A. Because they want to be able to have the opportunity to take oil from the North Slope and bring it to market.

2007-2009 Trial Tr. 692

Market Structure

Stages of Development

  - Tariff Provisions
    - Restrictions on New Shippers
    - Tankage Penalties
- Transportation by Tankers

Market Structure

Barriers to Competitive Entry

561. Historically, regulatory disputes concerning TAPS' tariff rates have most often been resolved by settlement among the parties rather than by a substantive determination by FERC or the RCA. The settlement that has governed TAPS' tariff rates for the majority of the time it has been in service has been the TAPS Settlement Agreement ("TSA"). The TSA contained a complex and unique rate methodology referred to as the TSM. Both the State and the TAPS Owners supported the TSA. An Explanatory Statement by the State of Alaska and the Department of Justice in support of the settlement stated, "Alaska and DOJ believe that as a settlement, the tariff stream produced by the TSM is a fair and reasonable attempt to achieve a tariff profile that will encourage economically efficient exploration of North Slope petroleum resources."

Gleason Decision ¶ 561

Market Structure

Barriers to Competitive Entry

562. The RCA found that under the TSM, between 1977 and 1996, the TAPS Owners collected, in 1997 dollars, $13.5 billion more than would have been collected under the current rate methodology used by the RCA to set rates on TAPS. Nevertheless, the TSM was approved by FERC.

The Life of TAPS
Price of ANS Crude Oil

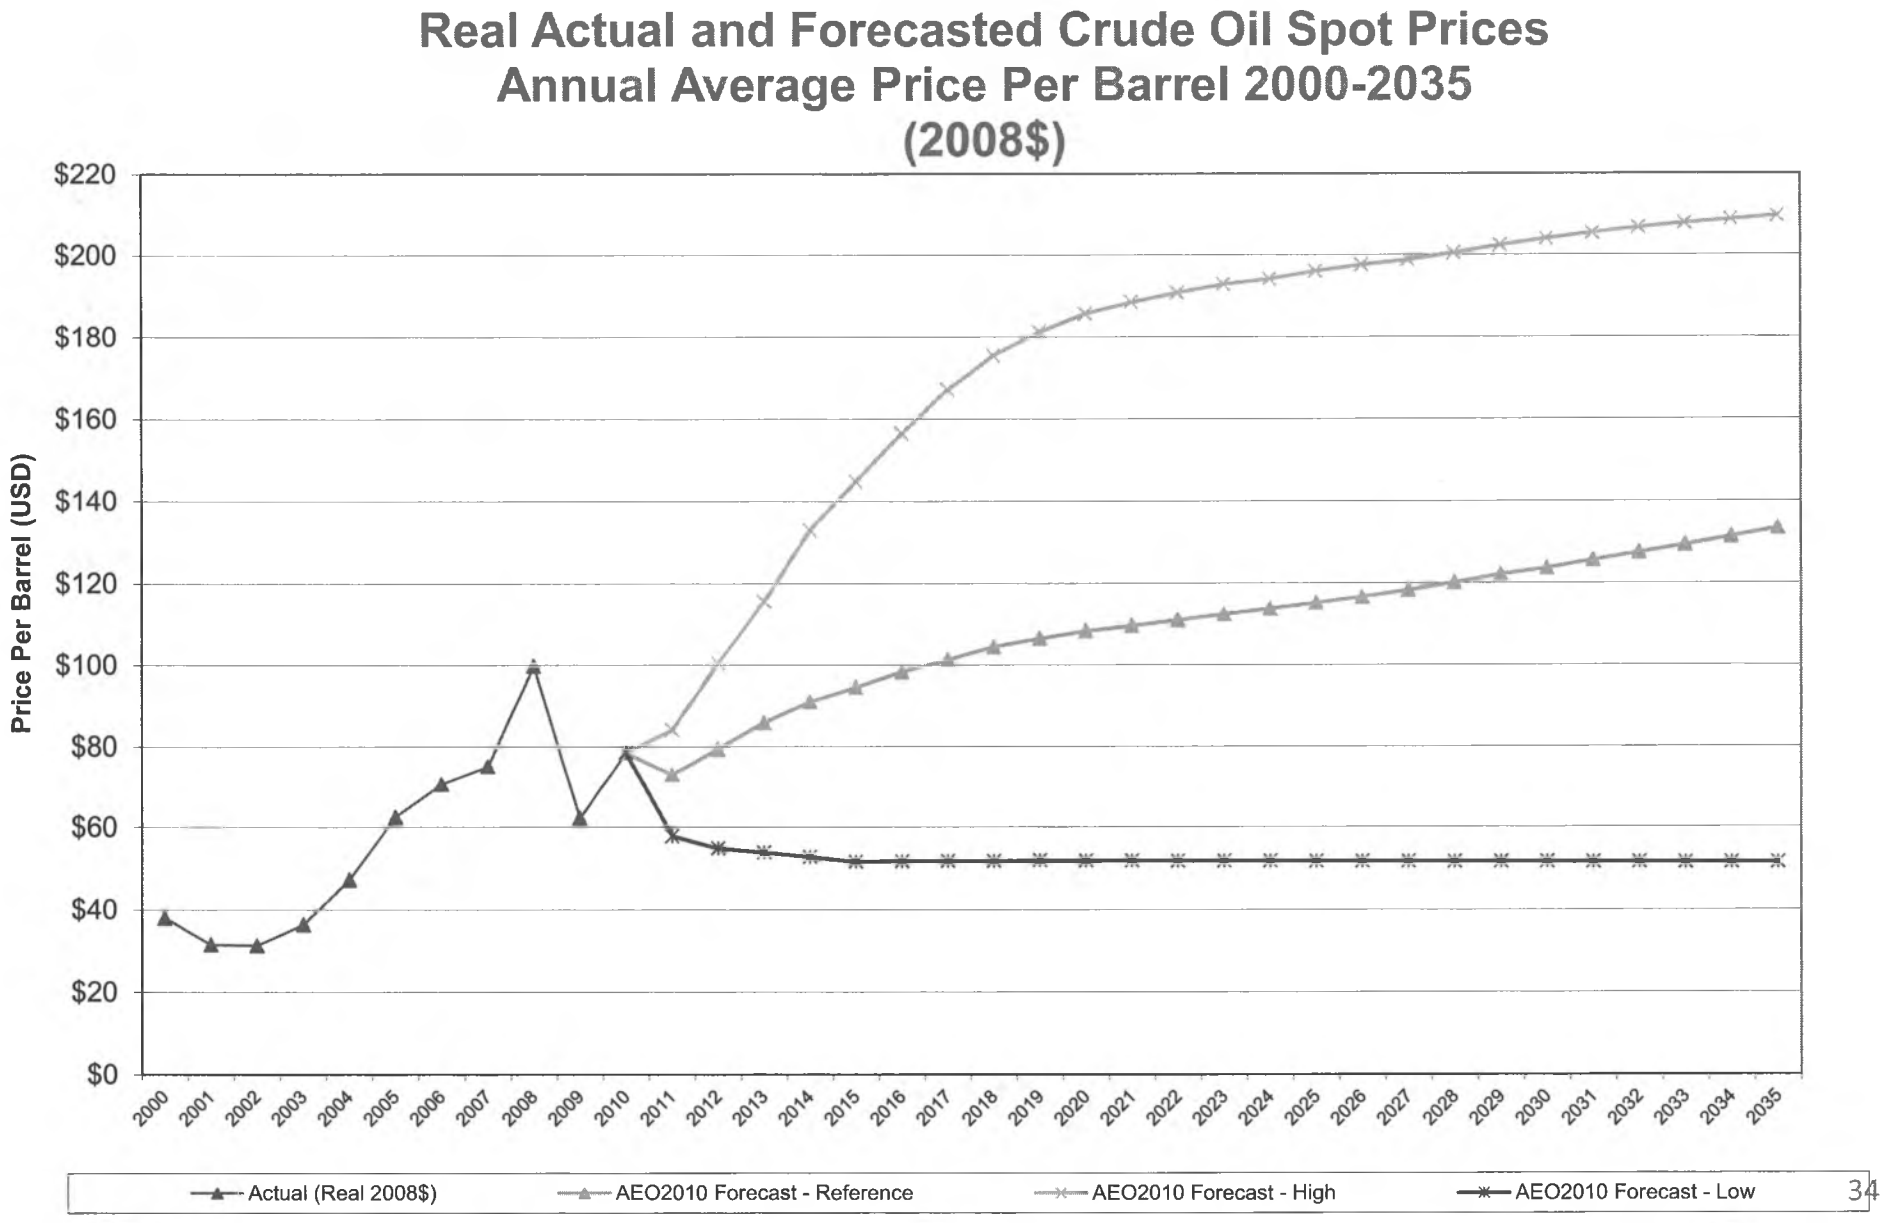
The EIA Price Forecasts Support Increasing Per Unit Throughput Value

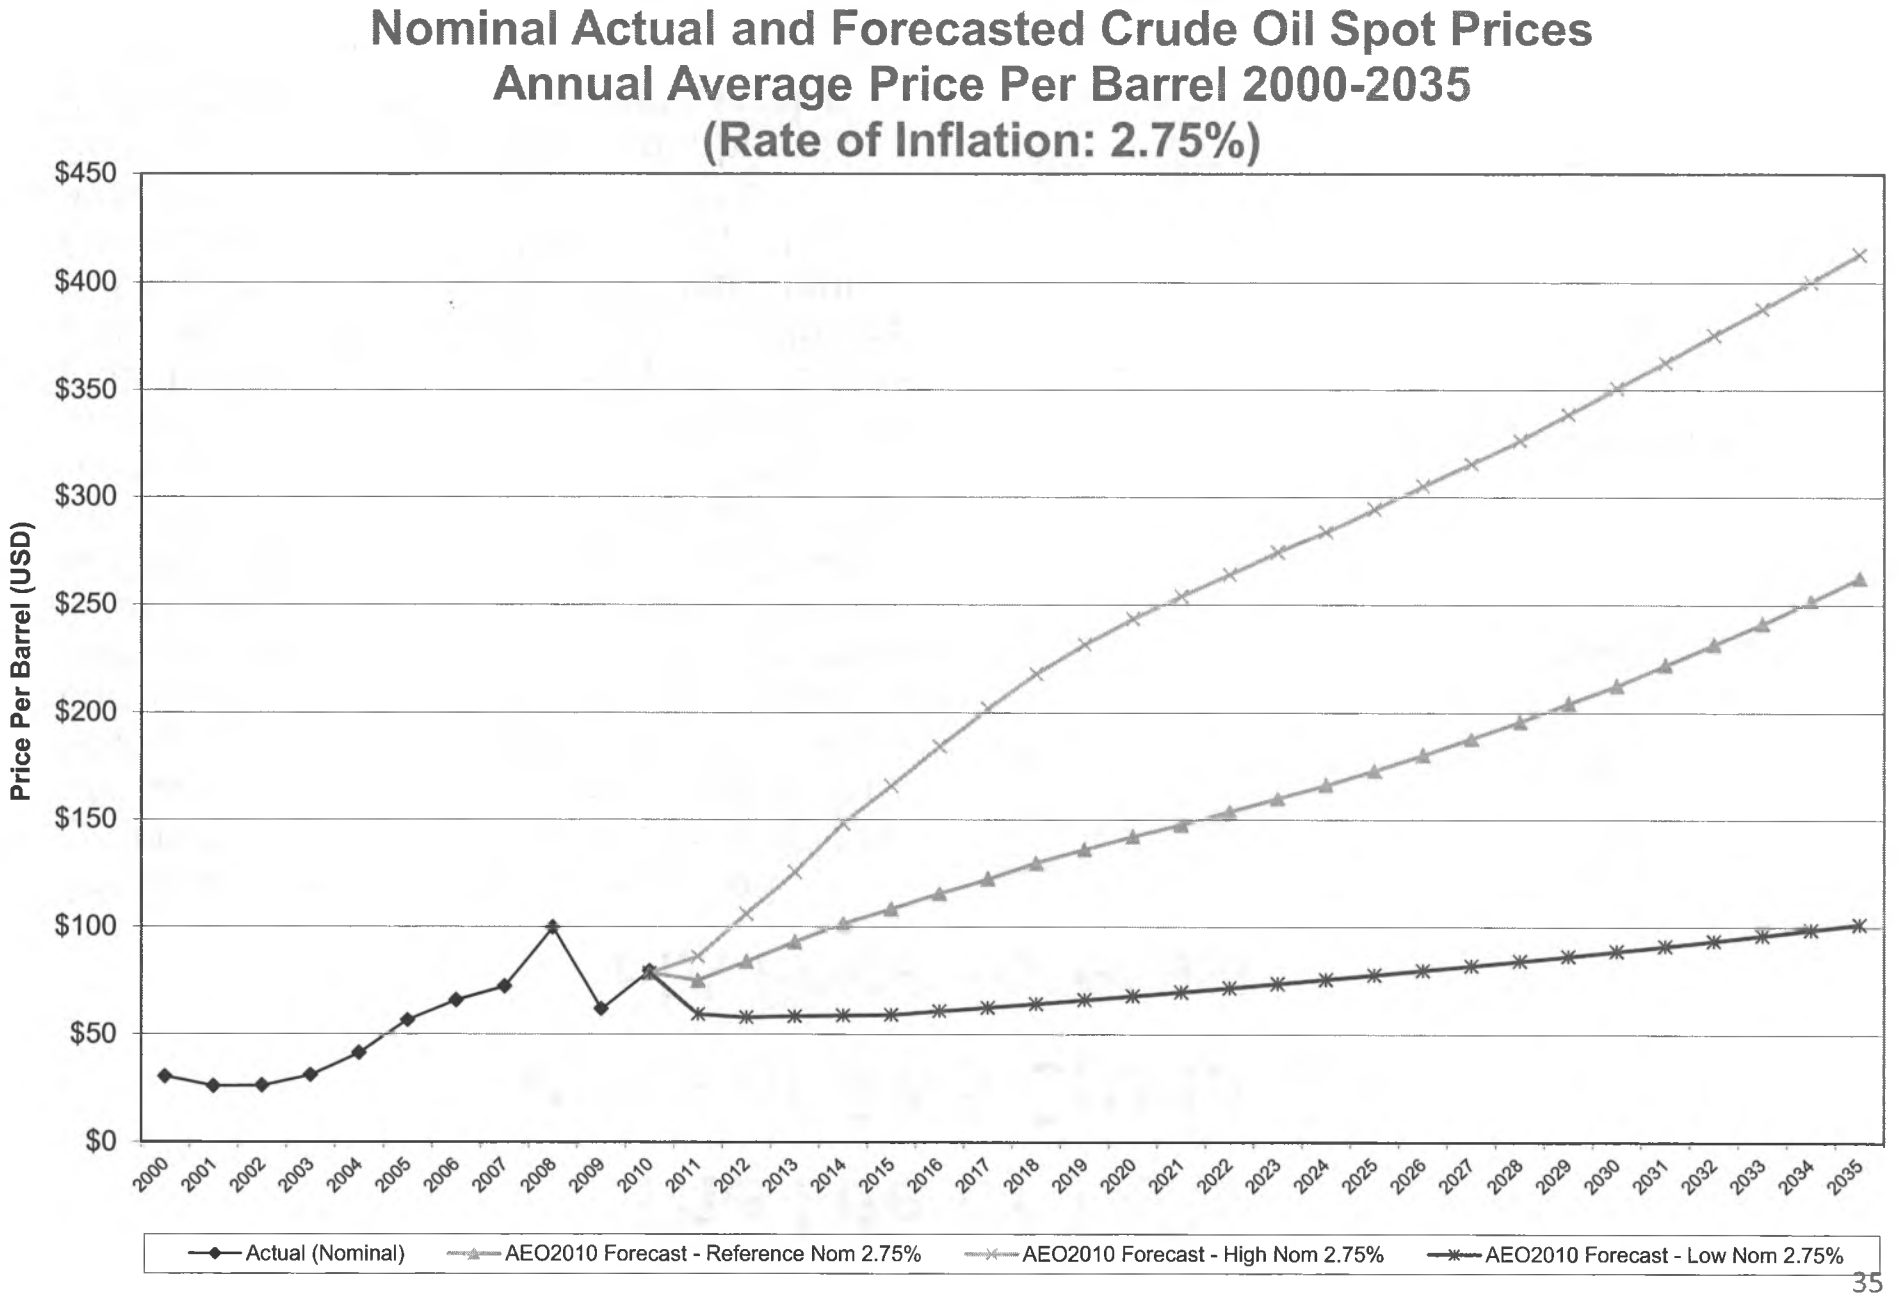
- The Energy Information Administration (EIA) collects and publishes historic information and makes short- and long-term price forecasts
- Price Trends are up with increasing world demand.
- Since adopting NEMS in 1994, virtually all the future reference price forecasts post 1999 have underestimated actual crude prices
- Turning points follow crises, spare capacity, and worldwide demand/supply

The Life of TAPS



Price of ANS Crude Oil

480. Mr. Platt relied upon the U.S. Department of Energy's Energy Information Administration ("EIA") price forecast, which forecasted real market price growth for each of the three assessment years at approximately 1% per annum. Based on the evidence presented at trial, this Court finds that reliance on that forecast was reasonable. Oil prices during the three assessment years were volatile, such that the forward-looking projections made by the EIA during that period varied considerably. Yet the highest oil price forecasted by the EIA for calendar year 2011 during the assessment years was $74.08 per barrel, while the actual price of oil on October 18, 2011 was $113 per barrel. Mr. Platt also explained that due to the highly progressive nature of Alaska's production tax, oilfield economics at high real oil prices are not materially affected by price variations. Overall, this Court found Mr. Platt's production forecast and economic testing to be persuasive.

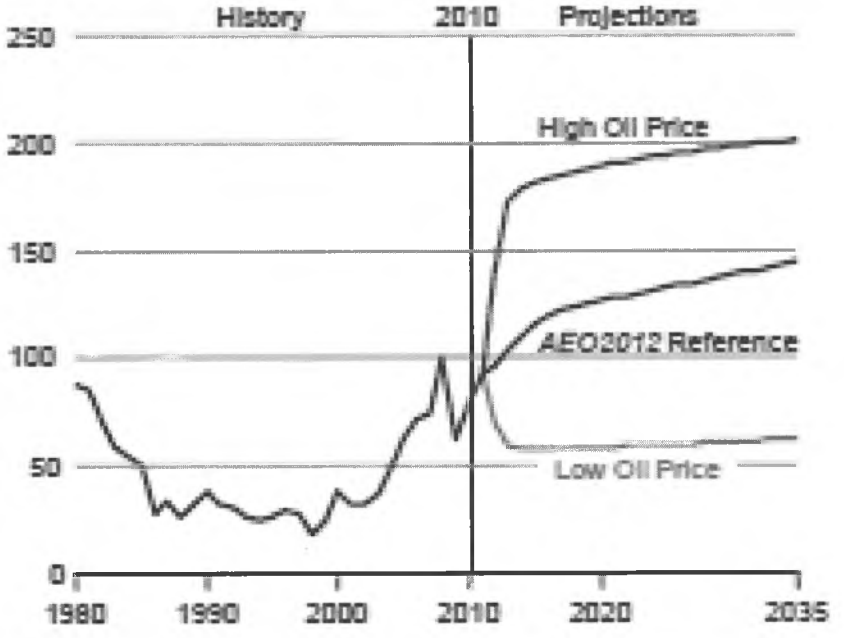


Gleason Decision ¶ 480

The Life of TAPS

Price of ANS Crude Oil

The Life of TAPS, Price of ANS Crude Oil



The Life of TAPS

Price of ANS Crude Oil

EIA Price Forecast

Prices for crude oil in 2011 remained generally in a range between $85 and $110 per barrel. In 2011, WTI prices were lower than Brent prices because of pipeline capacity constraints that prevented complete arbitrage between WTI and Brent prices. Real imported sweet crude oil prices (2010 dollars) in the AEO2012 Reference case rise to $120 per barrel in 2016 (Figure 5) as pipeline capacity from Cushing, Oklahoma, to the Gulf Coast increases, the world economy recovers, and global demand grows more rapidly than the available supplies of liquids from producers outside the Organization of the Petroleum Exporting Countries (OPEC). In 2035, the average real price of crude oil in the Reference case is about $145 per barrel in 2010 dollars, or about $230 per barrel in nominal dollars.

Figure 5. Average annual world oil prices in three cases, 1980-2035 (real 2010 dollars per barrel)

http://www.eia.gov/forecasts/aeo/er/pdf/0383er(2012).pdf

The Life of TAPS

Reserves and Throughput

- Judge Gleason's Decision as to the Life of TAPS is Based on a Limited Definition of Proved Reserves Only and Does Not Consider Probably, Possible, or Speculative Categories
- Proven Reserves Were 9.6 Billion Barrels (1977) and are 7-7.8 Billion Barrels (2007-09) / Approximately 16 Billion Barrels Produced
- Value of Reserves Has Increased Substantially / Life Linked to Value (Increase of $10 Barrel = 5.5 Years for TAPS)
- Internal Information / Financial Information Support Longer Life for TAPS

The Life of TAPS
Reserves and Throughput

In August 2007, DOE and the National Energy Technology Laboratory (NETL) Reported "Economically Recoverable" Reserves at High Prices and With Natural Gas Development*

	(2005-2050) Billion Barrels
Total	35-36
Without ANWR 1002	29.5
Without ANWR 1002 and Chukchi Sea	19.5
Without ANWR 1002, Chukchi Sea and Beaufort Sea	15.5
Without ANWR 1002, Chukchi Sea, Beaufort Sea, and No Natural Gas Development	9.5

THE LIFE OF TAPS - Reserves and Throughput

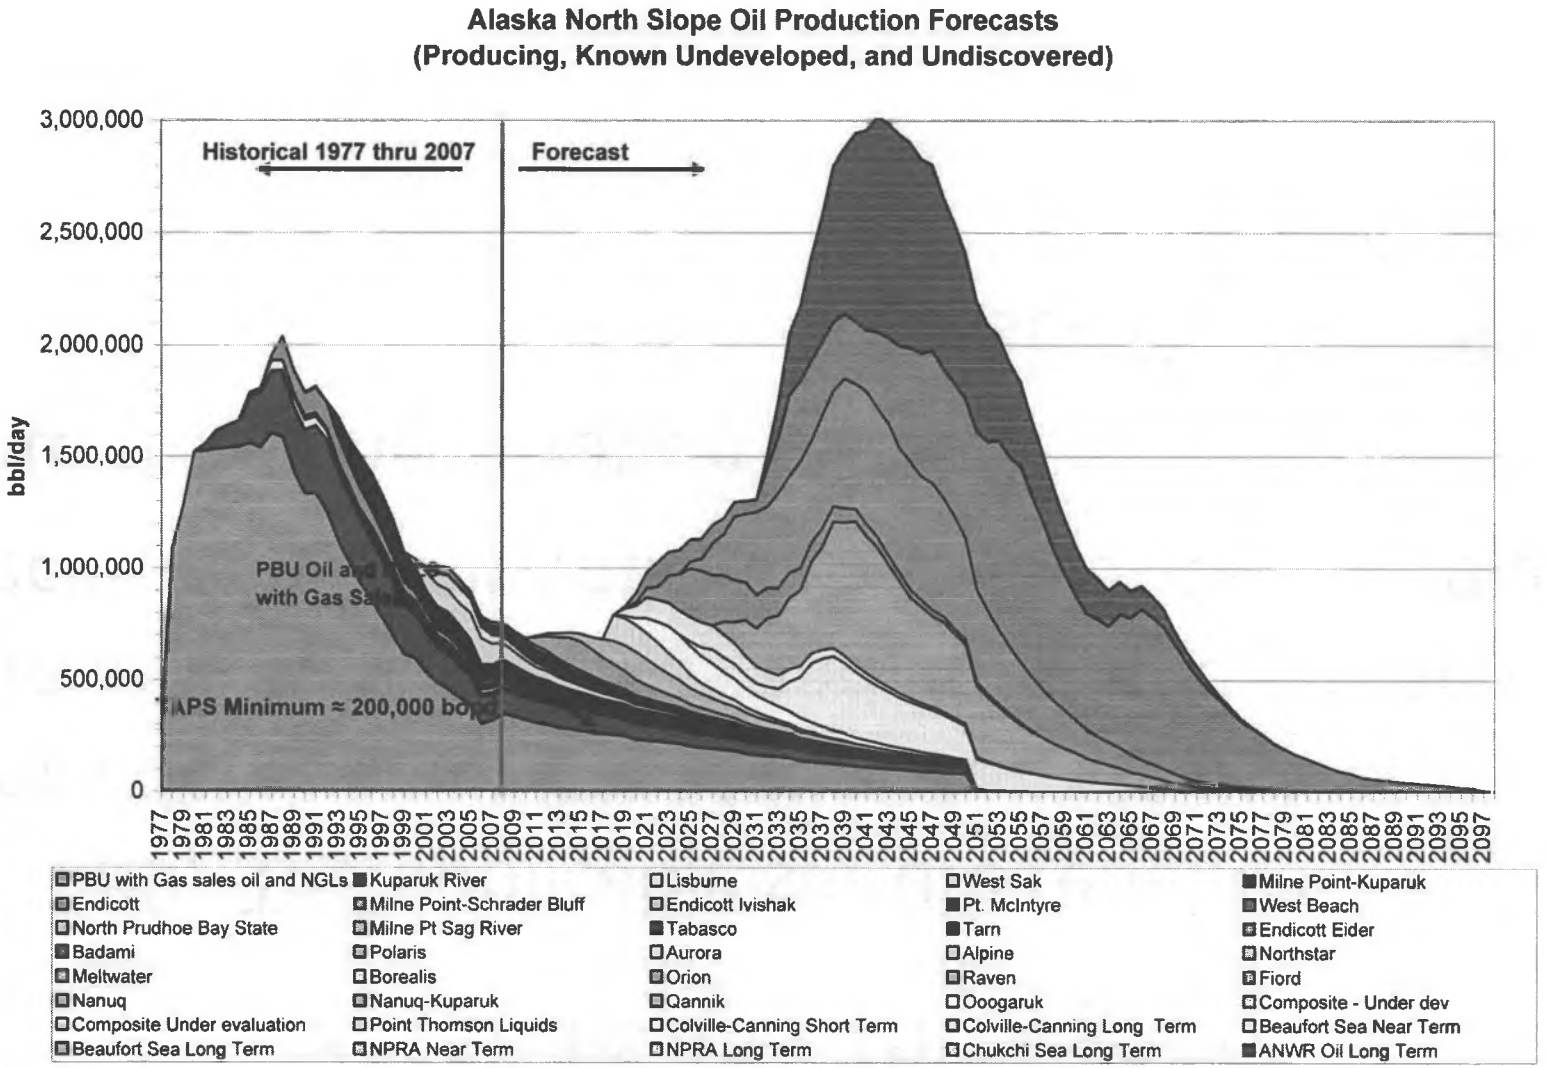

Figure 3-55. Alaska North Slope historical and forecast oil production from producing fields, known undeveloped fields, and undiscovered fields.

MUN7-0014 at 10 (Hite)

The Life of TAPS

Reserves and Throughput

439. The applicable statute requires consideration of the "estimated life of the proven reserves of gas and unrefined oil then technically, economically and legal deliverable into the transportation facility."

Gleason Decision ¶ 439

The Life of TAPS

Reserves and Throughput

465. Dudley Platt is one of the preeminent production forecasters in the state, although he is not a petroleum engineer. He began making oil production forecasts for the State of Alaska in 1989. Mr. Platt prepared a production forecast for the Department every year through 2009. This Court relied on Mr. Platt's production forecast to determine TAPS' end-of-life in the 2006 tax year trial.

Gleason Decision ¶ 465

The Life of TAPS

Reserves and Throughput

468. Decline curve analysis is one component in the determination of the economic life of ANS proven reserves? Mr. Platt's forecast incorporated a decline curve analysis at the pool level, as opposed to a well-by-well analysis used by both the Owners' and Department's witnesses? Mr. Platt persuasively testified that, based on his experience working in the oil industry, long-range production forecasters do not use decline curves on a well-by-well basis? Mr. Van Dyke explained that well-by-well analysis can work well for a small lease in Kansas with four wells, but not for a field with 1,000 wells that are regularly being turned on and off: "it's not the best approach to use a well-by-well method as compared to the pool - a pool level method to forecast production." Decline curve analysis at the well level requires subjective analysis of highly variable historic data to estimate future production rates for each well.

Gleason Decision ¶ 468

The Life of TAPS

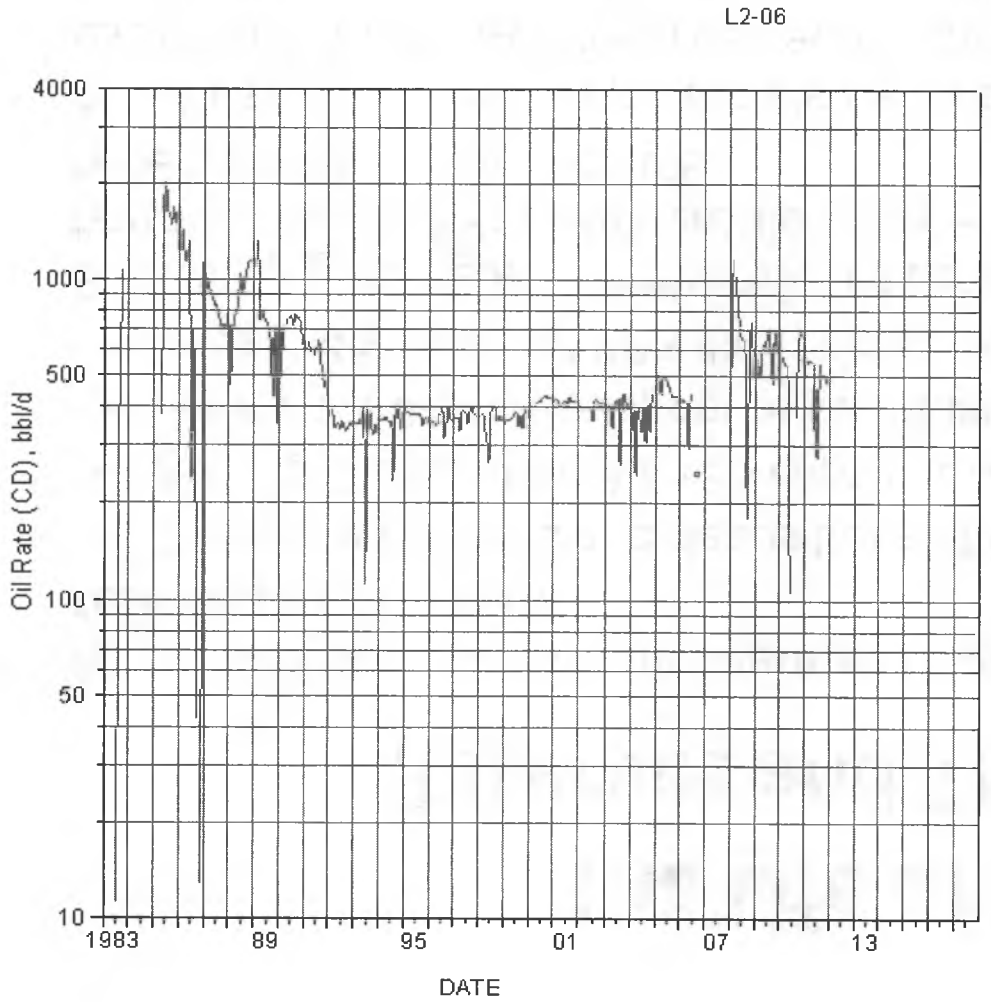
Reserves and Throughput

501. Overall, this Court finds that Mr. Molli's Fall 2010 forecast, and the Assessor's adjustments to that forecast for each tax year, are considerably less reliable than the production forecast prepared by the Municipalities' witness Dudley Platt.

Gleason Decision ¶ 501

The Life of TAPS

Reserves and Throughput



Pool v. Well-by-Well Forecasting

- In 2009 DOR changed from a pool to a well-by-well forecasting methodology
- "[A] pool based analysis is generally preferable to a well-based analysis." [Gleason Decision ¶ 471]
  - Not relied on by industry
    - Fine "for a small lease in Kansas with four wells, but not for a field with 1,000 wells that that are regularly being turned on and off . . ." [Gleason Decision ¶ 468]
    - Good modeling does not look at wells on a standalone basis
  - Backward looking
    - Requires "subjective analysis of highly variable historic data to estimate future production rates for each well." [Gleason Decision ¶ 494]
    - Often difficult to determine future performance of wells based on just historic data
      - Starts and stops, increasing production, etc.
      - DOR has historic data; it does not know of the story of each well
  - Not holistic, failing to reflect:
    - Industry estimates of oil in place or total recovery
    - Dynamic interaction of physical forces within reservoir, including interaction of wells
    - New projects and wells
      - Thus assumptions must be made about impacts on existing wells and new wells
  - When AS 43.56 enacted, DOR's opinion was "it could be done more accurately on a field basis, as one well could dry up immediately." [Gleason Decision ¶ 470]

The Life of TAPS

Reserves and Throughput

Example of Lisburne Well

For other examples of wells that are difficult to forecast – see Platt Examples in documents provided

The Life of TAPS
Reserves and Throughput

- Municipalities pursued all avenues to get actual field models and reserves information
  - Discovery requests and depositions of Owners
  - Argued Owners had Rule 34 control over production affiliate information
  - Served third-party subpoenas on affiliate producers
  - Sought discovery of BP's data rooms for attempted 2010 sale
- Ended up getting a "patchwork" of reserves and production forecasts from primarily BP; Court would not permit production of BPXA's reserves economic models
- Most useful produced materials related to BPPA's transportation cost estimates for BPXA's reserves economics model
- The BPXA reserves and production estimates in BPPA's possession confirm the reasonableness of:
  - The total barrels recovered under Mr. Platt's forecast
  - The estimated end-of-life of Prudhoe Bay field determined by Mr. Platt and as reflected in the Prudhoe Bay Royalty Trust 10-K filings

The Life of TAPS

Reserves and Throughput

492. The internal reserves and long term production forecasting information that was made available through discovery was not reviewed by two of the Owners' reserves witnesses, Mr. Hartz or Mr. Marks, and only cursorily reviewed by Mr. Hoolahan (and not synthesized into his analysis). Further, Mr. Hoolahan did not have representatives of the Owners or their affiliated producers review his reserves estimates to provide feedback. This is despite the fact that the internal reserves information presented at trial was substantially different from Mr. Hoolahan's conclusions. The fact that none of the Owners' reserves experts meaningfully addressed the BP internal reserves information at trial had a substantial negative impact on the weight this Court accorded to their testimony.

Gleason Decision ¶ 492

The Life of TAPS

Reserves and Throughput

495. The determination of the estimated proven reserves should be assessed in light of the evidence available to, and presented by, each of the parties. The Owners did not persuasively rebut the Municipalities' evidence regarding proven reserves, including information contained in filings by the BP Royalty Trust and the confidential reserves information produced in discovery.

Gleason Decision ¶ 495

The Life of TAPS

Reserves and Throughput

BP Royalty Trust End-of-Life

- The BP Prudhoe Bay Royalty Trust is a publicly traded trust that has a royalty interest in certain BP production
- Each year BPXA provides the Trust and their auditors, Miller and Lents, Ltd., with reservoir, production and other information
- In the past the Trust's 10-K included BPXA's opinion as to the end-of-life of Prudhoe
- "BP Alaska expects continued economic production from Prudhoe Bay field at a declining rate through 2075." [MUN7-4072 at 13]

The Life of TAPS

Reserves and Throughput

502. BP Exploration (Alaska), an affiliated company of one of the taxpayers in this case, BP Pipelines, provides SEC reserves information on the Prudhoe Bay field each year to the BP Prudhoe Bay Royalty Trust. The information is audited by an independent oil and gas consultant, Miller and Lents, before submission to the SEC. The Trust's SEC filing for year-end 2005, using the SEC's heightened "reasonable certainty" standard for proven reserves, represented that "BP Alaska expects continued economic production [from Prudhoe Bay] at a declining rate until the year 2065 ... ." In the year-end 2006, 2007 and 2008 SEC 10-K filings, BP represented continued economic production at Prudhoe Bay until 2062, 2075 and 2049, respectively. The 2049 economic end-of-life calculation for December 31, 2008 was based on the price of oil on that date of $44.60, while the December 31, 2006 economic end-of-life date was based on an oil price of $61.06. Both of these amounts were considerably below the average price of oil during those years and its predicted future price. The 2007 filing was based on the price of oil on December 31, 2007 of $96.01.

Gleason Decision ¶ 502

The Life of TAPS
Reserves and Throughput

503. The following chart sets out the assumed end-of-life in the Prudhoe Bay Royalty Trust SEC filings and as calculated by each of the parties' experts.

Comparison of Prudhoe Bay End-of-Life Determinations

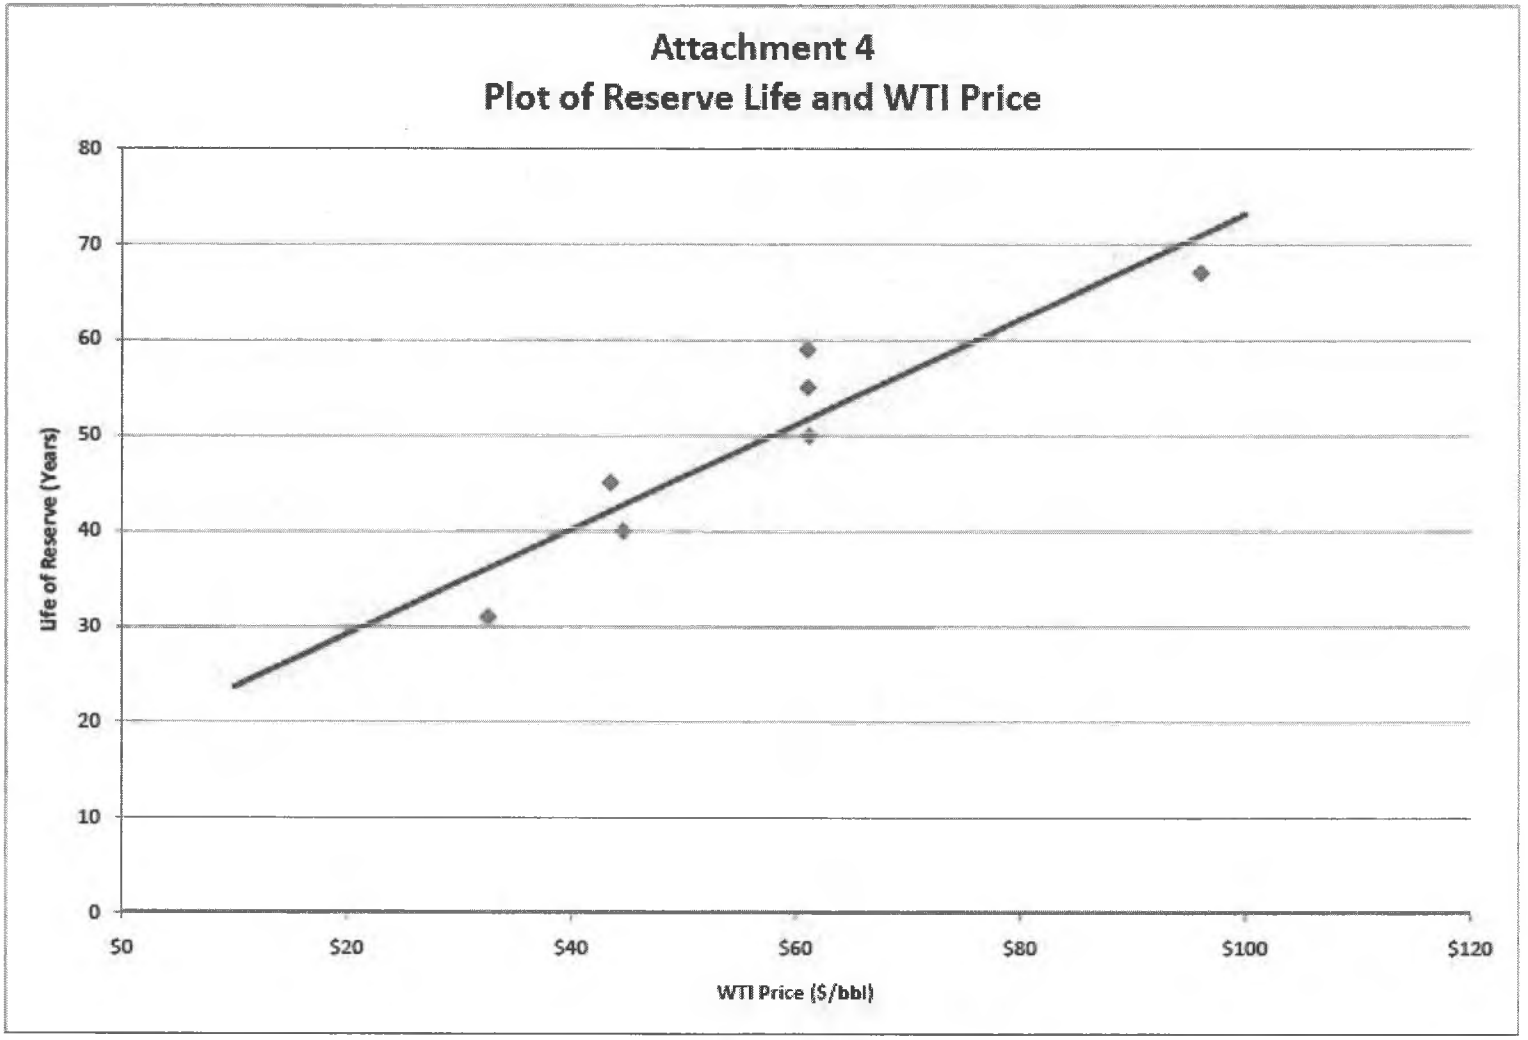
	CY 2007	CY 2008	CY 2009
PB Royalty Trust	2062[837]	2075[838]	2049[839]
Muni @ 100,000 bbl/d	2067[840]	2066[841]	2068[842]
Muni @ Economic Limit	2075[843]	2075[844]	2075[845]
SOA @ 150,000 bbl/d	2040[846]	2040[847]	2040[848]
SOA @ Economic Limit	2043[849]	2044[850]	2053[851]
Hoolahan – Initial	2026[852]	2033[853]	2021[854]
Hoolahan – Corrected	2046[855]	2053[856]	2032[857]

Gleason Decision ¶ 503

The Life of TAPS

Reserves and Throughput

BP Royalty Trust End-of-Life



- The estimated end-of-life has varied each reporting year based on the price of oil
- From as low at 2049 in 2009 to as high as 2075 in 2008
- There is a strong correlation that for every $10 increase in oil prices, the economic life of Prudhoe Bay increases about 5.5 years [MUN7-0001 at 15-16 (Cicchetti)]

The Life of TAPS
Reserves and Throughput

24. I prepared a chart and some simple regressions in Attachment 4 to show the relation between economic life and WTI prices that BP relies upon in its various recent SEC 10-K filings. I plotted the relationship between the estimated life of the Prudhoe Bay reserves and WTI year-end prices. In particular, I found that for every $10 increase in year-end WTI prices, the economic life of Prudhoe Bay increases about 5.5 years. (See the linear regression in Attachment 4.)

MUN7-0001 at 15-16 (Cicchetti)

The Life of TAPS
Reserves and Throughput

MUN7-0001 at 121 (Cicchetti)

The Life of TAPS

Reserves and Throughput

506. With Point Thomson removed from Mr. Platt's corrected reserves estimates for 2007 and 2009, the total proven reserves for each of the lien dates is as follows:

2007 7.812 billion barrels

2008 7.759 billion barrels

2009 7.077 billion barrels

Gleason Decision ¶ 506

The Life of TAPS

Reserves and Throughput

- ANS will continue to economically produce oil, as demonstrated by BP, through 2075 based only on proved reserves

  – Assuming a minimal mechanical capacity of 100,000 bbl/d, the Court found the end-of-life of TAPS given current proved reserves is at least 2066. [Gleason Decision ¶ 505]

- Life of the ANS is even longer when production from heavy oil, ANWR, OCS, and other non-proved sources is considered

The Life of TAPS
Minimum Throughput

- Hydraulic Limit (None)
- Mechanical Limit (Less than 50,000 BPD)
- Operational Concerns (Solutions)
  - Temperature, Wax, Pigging, etc.
  - No Pipeline has Shut in Economic Production
  - Value of Oil Behind Pipe Dominates Solutions
    - 300,000 BPD to 100,000 BPD = 2 Billion of Proved Reserves
    - Engineering Solutions to Low Flow is Pennies / Value of Transporting Oil to Market is Dollars
  - Engineering Solutions Are Apparent

The Life of TAPS
Minimum Throughput

- **Alaska law doesn't contemplate a mechanical limit**
  - AS 43.56.060(e)(2) and 15 AAC 56.110(c) state life of operating pipelines to be "based on the estimated life of the proven reserves"
- **Economic life of other taxable pipelines in Alaska based on life of proven reserves, not a mechanical limit** [2007-2009 Trial Tr. 11565 (Hoffbeck)]
- **Common sense and expert testimony demonstrate no otherwise economic pipeline has shut in at 100,000, 50,000 BPD or below** [2007-2009 Trial Tr. 5130-31 (Riordan); Tr. 8266-68 (quoting Coulson Deposition); Tr. 11895 (Remsha)]
  - Proof is in the Tasting—No pipeline in the history of man has shut-in economic production due to pipeline operational concerns (Example: CIPL)
- **BP has identified engineering solutions to operate TAPS at ultra low flows**
  - Heating gets you to 70,000 BPD; below that options like fluid injection (to get flow rates up) will be identified as needed [MUN7-3020 at 8]
  - "When coupled with the fact that there is a practical limit to the number of heater locations be added, 50,000 BPD to 70,000 BPD is probably the [low flow] limit to [point source heating] due to wax deposition and pigging concerns. Further reduction in flow will require investigation of other options that maintain higher flow velocities, such as seawater commodity supplementation." [MUN7-3020 at 8]
- **Thus state law, Alaska tax practice for other pipelines, industry experience, and BP's own reserves booking contemplate no identifiable mechanical limit**

The Life of TAPS

Minimum Throughput

401. The Municipalities' expert Dr. Jerry Modisette testified that there is no hydraulic or mechanical minimum throughput limit because the pipeline will be within pressure constraints at flows down to zero and the pump rate can also go down to zero through reducing pumps, throttling, and recirculation. Former Alyeska Chief Operating Officer Dan Hisey concurred that there is no hydraulic or mechanical minimum throughput limit on TAPS. The Owners' expert, Ulli Pietsch, also testified that there is no hydraulic or mechanical reason that TAPS cannot operate down to 50,000 bbl/d. The inquiry therefore turns to whether there is an operational constraint that would prevent TAPS from transporting oil at some minimum capacity limit.

Gleason Decision ¶ 401

The Life of TAPS

Minimum Throughput

Testimony of Mr. Ulli Pietsch (Owners' Witness)

Q. I'm going to make this very simple. I want to ask you questions. I'm going to ask you questions in three buckets: Hydraulically, mechanically, and operationally.

A. Okay.

* * *

Q. So there is no reason that TAPS cannot hydraulically operate at a teaspoonful a day, correct?

A. Correct.

* * *

Q. Is there any mechanical reason, that assuming a proper recirculation system is in place, that TAPS cannot operate at 50,000 barrels a day?

A. No.

* * *

Q. Okay. So hydraulically and mechanically, there is no reason that TAPS, as it currently exists, cannot operate down to 50,000 barrels a day, assuming recirculation?

A. Correct.

2007-2009 Trial Tr. 2022-25

The Life of TAPS

Minimum Throughput

404. BPPA analyst John Haines testified at the trial in this case. In an email dated November 5, 2004, Mr. Haines stated:

> Momentum is starting to grow around booking more reserves based on an updated view of TAPS' minimum achievable rates ... Lastly, when TAPS rates reach 100 MBD [100,000 bbl/d] we stop. Our consultant thinks we can probably operate TAPS below this minimum rate, but we didn't want to push it any further at this time.

Gleason Decision ¶ 404

The Life of TAPS
Minimum Throughput

409. In its initial year-end 2004 reserves submission to the BP London office, which was scheduled a couple of months before the JTG Study was concluded, BP Exploration and BP Pipelines personnel determined "an effective TAPS minimum throughput level of 150,000 bbl/d at 2053," using "conservative assumptions." The report added:

> In the case of GPB [Greater Prudhoe Bay] and KRU [Kuparuk River Unit] (the biggest contributors to the reserves adds) each of these fields were still cash flow positive at 2064 (end of our tariff profile). The reserves coordinators arbitrarily chose to cut-off life at the earlier dates (2053 for GPB and 2047 for GKA) just to give themselves some future cushion.

Gleason Decision ¶ 409

The Life of TAPS

Minimum Throughput

406. In 2004, BP Pipelines retained JTG Technology Consortium to conduct a study to revisit the minimum throughput limit on TAPS, The 308-page JTG report was completed in 2005 ("JTG Study") and concluded that "the low flow limit of the existing 48-inch TAPS pipeline was determined to be a PS [Pump Station] 1 rate of 135 MB/day [135,000 bbl/d]."

Gleason Decision ¶ 406

The Life of TAPS

Minimum Throughput

408. BPPA and its affiliates relied upon the JTG Study's conclusion of a 135,000 bbl/d low-flow limit to create tariff profiles that BP then used to report its reserves for several years to the SEC.

Gleason Decision ¶ 408

The Life of TAPS

Minimum Throughput

412. BP Pipelines failed to provide the 2005 JTG Study in discovery for the 2006 ad valorem tax year proceedings. That study would have supported the Municipalities' position in that litigation that TAPS could operate down to 150,000 bbl/d or less, and may well have resulted in the Court finding a minimum capacity limit lower than the 200,000 bbl/d that this Court applied for that assessment year.

Gleason Decision ¶ 412

The Life of TAPS

Minimum Throughput

414. In 2010, BP Pipelines retained Phil Carpenter, a subject matter expert who was also used extensively by Alyeska in its Low Flow study, to determine whether TAPS could operate at levels below the 135,000 bbl/d threshold put forth in the 2005 JTG Study. At trial, Mr. Haines of BP Pipelines explained:

> The JTG study ... essentially had two different paths that you could live with ... One path was you would throw investments at TAPS and eventually the south leg would die at a rate of 135. You would start a railroading apparatus at that point. ... the south leg always died first because of the extraction of oil at Fairbanks at the Fairbanks refinery ... Except if you wanted to throw another $3 billion at the problem and replace the north leg with a replacement 20-inch line ... [so as to be able to transport down to 45,000 bbl/day] ... And the economic hurdle of paying for that $3 billion of replacement line investment created a very large stair-step in the economic profile, the granularity I was talking about.

Gleason Decision ¶ 414

The Life of TAPS

Minimum Throughput

415. In a May 19, 2010 email, Mr. Haines provided Mr. Carpenter with a copy of the 2005 JTG Study and explained:

> You probably want to start with the executive summary. As we discussed on the phone, our reserves reporting relied on a 'low oil Price' scenario and a 'high oil price scenario.' These are identified in the report as Scenario 2 and Scenario 3. What we are looking for in your work effort is some sort of intermediate solution that could be used to extend the limit beyond 135 MBD [135,000 bbl/d] (Scenario 2), but would not have a $3 billion hurdle that would allow us to get down to 45 MBD [45,000 bbl/d]. In other words, something for a "middle oil price" scenario.

Gleason Decision ¶ 415

The Life of TAPS

Minimum Throughput

416. A June 11, 2010 email from Mr. Carpenter contained a list of over a dozen low throughput options he had analyzed. On June 15, 2010, Mr. Haines responded back that:

> I've had a chance to talk to our upstream reserves guys, and they advise that Option 2 (run cold and sweep with freeze suppressant) sounds like it might be pushing things too far, because it requires achieving a level of confidence in the physics of the problem - a level of "proof" that our study will not be capable of fully defining. So, they agree we can drop it from the list ....

Mr. Haines then discussed the various other options, concluding:

> From a pragmatic viewpoint, it seems to me that item 1 (heaters) may be exactly what we're looking for (in terms of finding a sure-fire way to bridge between the 135 MBD [135,000 bbl/d] endpoint and the large capital cost of replacing the north leg). I say this because if we can find a way to lower the endpoint from 135 MBD [135,000 bbl/d] to say something in the range of 100 MBD [100,000 bbl/d] or less, that kind of solution would probably act to close the gap our reserves guys are seeking.

Gleason Decision ¶ 416

The Life of TAPS

Minimum Throughput

418. Consistent with that opinion, on July 20, 2010, Mr. Carpenter circulated a draft of the 2010 Carpenter Study: "The analysis concluded that point source heating of the oil is the best solution for operation of 100,000 [bbl/d]." Mr. Haines' response to the draft stated:

> Thanks for the updated report. This is shaping up nicely, and is exactly the "fit for purpose" product we were looking for. ... Probably the most significant edits we've made to your most recent draft involved turning on the railroad when the PS-1 rate hits 140 MBD [140,000 bbl/d] (and turning off the south leg), and running the north leg down to 70 MBD [70,000 bbl/d]. This means some of the south leg heaters will likely not be installed at rates below 140 MBD [140,000 bbl/d] (because of laminar flow issues).

Gleason Decision ¶ 418

The Life of TAPS

Minimum Throughput

420. The 2010 Carpenter Study did not foreclose lower throughput levels below its conclusions, acknowledging that other technologies apart from point source heating "may eventually offer better solutions with fewer unknowns, lower throughput limits and lower shutdown risk, but these options are less developed and well understood at this time." The Study stated that "50,000 [bbl/d] to 70,000 [bbl/d] is probably the limit for [the point source heating] approach due to wax deposition and pigging concerns. Further reduction in flow will require investigation of other options that maintain higher flow velocities, such as seawater commodity supplementation."

Gleason Decision ¶ 420

The Life of TAPS

Minimum Throughput

422. In the fall of 2010, BPPA used the lower minimum throughput determinations from the Carpenter Study in its transportation tariff calculations. Those calculations, in turn, were provided to BP Production forecasting personnel who then used that information to book BP's proven reserves in 2010. That BP relied upon the Carpenter Study's 100,000 to 70,000 bbl/d low flow estimate to book its reserves is compelling evidence that these figures may be reasonably relied upon by this Court to determine the assessed value of TAPS.

Gleason Decision ¶ 422

The Life of TAPS

Minimum Throughput

The Studies: Alyeska LoFIS

- The Alyeska Low-Flow Impact Study (LoFIS) was limited in scope: "Flow volumes of less than about 350,000 BPD subject TAPS operations and pipeline integrity to greater degrees of uncertainty that require investigation and study beyond that accomplished through the LoFIS. Measures to mitigate these issues utilizing the existing 48-inch pipe at throughputs below 350,000 BPD have not been determined at the date of this report."

  [Executive Summary of LoFIS Final Report (public version, June 15, 2011) at 3]
- Mr. McDevitt's deposition and trial testimony confirmed that the LoFIS team was subject to a 300,000 bbl/d limit. [2007-2009 Trial Tr. 10975-82] Mr. Haines also confirmed the limitation. [2007-2009 Trial Tr. 11404]

The Life of TAPS

Minimum Throughput

Alyeska Cannot Show A 300,000 bbl/d Limit

- Mr. McDevitt stated at trial that it was not possible for TAPS to operate under 300,000 bbl/d, but later changed his answer to "highly unlikely" when asked in the context of BP's booking practices. [2007-2009 Trial Tr. 11025-27, 11093]
- Mr. Carpenter was a subject-matter expert for water transport, hydraulic size formation and heat transfer in the Alyeska LoFIS team while he conducted his study for BP. [2007-2009 Trial Tr. 10960-61]
- Mr. Riordan testified that he did not know for a fact that the existing facility cannot operate at 100,000 bbl/d. [2007-2009 Trial Tr. 5129]

The Life of TAPS

Minimum Throughput

430. This Court finds the JTG and Carpenter studies, which were conducted by TAPS' largest Owner for the specific purpose of evaluating the ability of TAPS to operate at throughputs well below 300,000 bbl/d and relied upon by BP for booking its proven reserves, to be far more persuasive than the LoFIS study in determining TAPS' minimum throughput capacity.

Gleason Decision ¶ 430

The Life of TAPS

Minimum Throughput

431. At trial, the Municipalities' expert Dr. Jerry Modisette persuasively opined why he had determined that TAPS could operate at 100,000 bbl/d. Indeed, Dr. Modisette asserted TAPS could operate at far lower throughputs than that, particularly if the oil were recirculated through the pumps so as to raise its temperature - a project Alyeska is planning to try this winter.

Gleason Decision ¶ 431

The Life of TAPS

Minimum Throughput

432. With regard to the low-flow operational issues identified in the Alyeska study, including water dropout and corrosion, ice formation within the crude oil, ice lenses or frost heaves in the soil, and wax precipitation and deposition, the weight of the evidence at trial persuaded this Court that it is more likely than not that there will be engineering solutions to mitigate these problems on TAPS at throughputs down to 100,000 bbl/d or less.

Gleason Decision ¶ 432

The Life of TAPS

Minimum Throughput

The Operational Issues Can Be Mitigated

The Life of TAPS

Minimum Throughput

434. The August 2010 Larkspur Study estimates approximately $2 billion in undiscounted costs for heating TAPS so as to be able to transport 100,000 bbl/d. This is based on the 2010 Carpenter Study's use of substantial redundancy resulting in 70% excess heating capacity. Thus, the actual cost could well be considerably lower. However, even Larkspur's estimated expense is self-evidently economic in light of the value of TAPS' proven reserves, The Court was persuaded by Mr. Hisey's testimony that even if the heating and other mitigation measures cost upwards of hundreds of millions of dollars in the coming decades, it would still be economical to make such investments to keep TAPS operating at and below 100,000 bbl/d "to move North Slope crude oil and keep that transportation base available for future fields, future production."

Gleason Decision ¶ 434

The Life of TAPS

Minimum Throughput

437. This Court finds the conclusions reached in the 2005 JTG study, together with the opinions reached in the 2010 Carpenter Study and Larkspur Study, as well as the opinions of Dr. Modisette and Mr. Hisey, to be more credible and persuasive than Mr. McDevitt's opinion on TAPS' minimum throughput capacity.

Gleason Decision ¶ 437

The Life of TAPS

Minimum Throughput

438. For the foregoing reasons, and after careful consideration of all of the evidence presented at trial, this Court finds it more likely than not that TAPS can effectively transport throughputs at least down to a minimum flow rate of 100,000 bbl/d.

Gleason Decision ¶ 438

The Life of TAPS
Minimum Throughput
Maximum Limit of 100,000 BPD

- Mr. Hisey testified that even hundreds of millions of dollars in heating and other low flow mitigation efforts are economic to keep TAPS operating at and below 100,000 bbl/d [2007-2009 Trial Tr. 9000]
- Dr. Modisette testified that the Texaco Cal 20 pipeline uses more heating per unit than the worst case heating scenario for TAPS [2007-2009 Trial Tr. 9061-63]
- No witness was aware of a pipeline that shut in production for operational reasons when it was flowing economic oil [2007-2009 Trial Tr. 674 (Remsha); Tr. 5130-31 (Riordan); Tr. 8266-68 (quoting Coulson deposition); Tr. 9218 (Malvick); Tr. 11090 (McDevitt); Tr. 11895 (Remsha)]

- The Department Overuses Taxpayer Confidential Designations
- Department Will Not Agree to a Joint Administrative Agreement

Access to Information

491. SARB observed the following in its Certificate of Determination for the 2007 assessment year:

> The Board also found that the Owners failed to take advantage of the opportunity to provide the Division with persuasive data to challenge the reserves estimates or throughput projections used by the Division if the Owners have such data. The Board found that the Owners chose not to the [sic] share information that the Owners and their parent companies possess regarding throughput and proven reserves with the Division or the Board and instead chose to present evidence and testimony from outside experts who did not have access to the information the Owners possess that was not already in the public record, and who lacked adequate direct experience with, or expertise about, the TAPS or the Alaska North Slope reserves.

Gleason Decision ¶ 491

Access to Information

5. AS 43.56.080 grants the Division certain investigative powers when assessing AS 43.56 properties, including the power to "enter any premise necessary for the investigation during reasonable hours," to "examine property and appropriate records," and to compel owner representatives "to appear for examination under oath by the department." There was no persuasive evidence presented at the trial de novo that the Division has ever exercised these powers with respect to the valuation of TAPS.

Gleason Decision ¶ 5

Access to Information

6. The Division broadly interprets what it considers "taxpayer confidential" information under applicable statutes and will not disclose such information to the Municipalities specifically or to the public generally. The Division considers all information that it receives from a taxpayer as "taxpayer confidential," even if it does not contain the particularities of a taxpayer's business affairs and is obtainable from the public domain. As a result, the Division did not provide the Owners' new replacement cost study by Stantec Consulting, Inc. ("Stantec") to the Municipalities.

Gleason Decision ¶ 6

Access to Information

7. AS 43.56.060(g) provides that "[t]he department may enter into agreements with a municipality for the cooperative or joint administration of the assessing authority conferred on the department by this section." The North Slope Borough previously had such an agreement with the Department. The City of Valdez and Fairbanks North Star Borough have never been parties to joint assessment agreements with the Department.

Gleason Decision ¶ 7

Access to Information

8. In its 2010 decision, SARB expressed its concerns regarding the Division's assessment practices:

> The Board believes that it is time for the Division to address the problems created by the way it handles taxpayer confidential information in the assessment process. The Division's failure to provide interested parties with the information on which the assessment was made in time to allow those parties meaningful input in the determination of the property's assessed value, before that determination is subject to limited review of an appeal before the Board, has the potential to throw the fundamental fairness of the AS 43.56 assessment process into question. The Board believes that, due to the Division's current practices with regard to the use of taxpayer confidential information in its AS 43.56 assessments, that process is close to broken and is headed in the wrong direction.

This Court concurs with the Board's observations in this regard.

Gleason Decision ¶ 8

Access to Information

Information at DOR Level

- History of TAPS Valuation
- DOR Process
- Access to Taxpayer Information
- Treatment of Taxpayer Information
- Consequence of Lack of Access to Information

Access to Information

History of TAPS Valuation

- DOR relying on TSM based rates lead the assessments falling from over $8 billion in the mid-1980s to $2.75 billion in 2001 [Gleason Decision ¶ 30]
- For decades the valuation of TAPS was a negotiated process that largely excluded the Municipalities
- The Municipalities fully engaged the process for the 2005 assessment

Access to Information

Observation About DOR's Process

- Key DOR staff are fair, dedicated, and highly competent
- The SARB has also been balanced and diligent
- However the DOR process–as related to information relied on in the taxation process–is close to broken. [Gleason Decision ¶ 8]

Access to Information

Access to Confidential Information

- Taxing authorities typically compel information
  - DOR can subpoena information, depose taxpayer representatives, and investigate property and records [AS 43.56.080; AS 29.45.130; AS 43.55.040(a)]
- DOR policy is to work cooperatively with industry, so it does not exercise these powers [Gleason Decision ¶ 8]
- Thus, DOR relies on information that a taxpayer volunteers or that is publicly available

Access to Information
Taxpayer Information

- The Alaska Public Records Act, AS 40.25.110, requires State documents to be subject to public examination

- Exception exists under AS 40.25.100(a) for tax information "that discloses the particulars of the business or affairs of a taxpayer" in which case the "information shall be kept confidential except when . . . required in an official investigation [or proceeding]"

- AS 43.05.230(a) also makes it unlawful to "divulge the amount of income or the particulars set out or disclosed in a report or return" except in conjunction with "investigations or proceedings"

Access to Information

Taxpayer Information

DOR narrowly reads taxpayer confidentiality statutes, denying public access to:

- All information provided by taxpayers
  - Non-sensitive correspondence, hypothetical studies, publicly available information, etc.
- Information provided for its production forecasting, which is a budgeting function [2007-2009 Trial Tr. 8813-14, Tr. 10874-877]
- The Municipalities
  - AS 43.56.060(g) allows for joint administration of taxes
  - North Slope Borough had such an agreement until recently

Access to Information

Consequence of Information Access

- Industry acts to prevent the best information from harming its position on taxes
  - Low flow documents
  - Royalty trust statements removed
  - BP Pipelines no longer participating in reserves function [2007-2009 Trial Tr. 11480]
  - As a matter of policy DOR does not compel the production of useful information
- DOR does not make publicly available taxpayer information in its possession
- Result–DOR and Legislature do not have access to information necessary to be informed about oil and gas tax issues in Alaska

Access to Information
Source Materials

- Alaska Statutes

Conclusion

- Open Access to Facilities
- Reasonable Transportation Rates
- Minimize Barriers to Entry
- Sound Tax Policy
  - Recognizes Market Structure
  - Recognizes Specific Behavior and Participants Most Likely to Be Impacted by Tax Incentives
  - Recognizes Stage of Development of Basin

THANK YOU

16.

X. RECONCILIATION AND CONCLUSION 211

I. PROCEDURAL BACKGROUND

1. This is a consolidated appeal of the State Assessment Review Board ("SARB" or "Board") Decisions of the 2007, 2008, and 2009 assessments of the Trans Alaska Pipeline System ("TAPS") for ad valorem tax purposes under AS 43.56. SARB assessed the value of TAPS for 2007 at $4.588895312 billion, for 2008 at $6.154447972 billion, and for 2009 at $9.045892 billion.[1]

2. SARB's 2006 assessment of TAPS was also appealed to this Court. After a de novo trial of over five weeks in 2009, this Court issued an Amended Decision Upon Reconsideration Following Trial De Novo on October 26, 2010, ("Amended Decision") with respect to that tax year, which concluded that the assessed value of TAPS for 2006 was $9.977 billion. That decision is currently on appeal to the Alaska Supreme Court.

3. The appeal to this Court of the 2007 through 2009 tax years culminated in a non-jury trial that began on September 6, 2011 and lasted approximately nine weeks.[2] Thousands of pages of exhibits and extensive deposition testimony were admitted into the record, together with the trial testimony of the parties' many witnesses. The administrative record for each of the SARB proceedings in 2007 through 2009 was also submitted to the Court.[3] And the parties have each filed extensive proposed Findings of Fact and Conclusions of Law that altogether total approximately 900 pages. Based on all the

---

[1] The three SARB decisions can be found in the trial exhibits at MUN7-0234 (2007), MUN7-0235 (2008) and MUN7-0236 (2009).

[2] *See* AS 43.56.130(i).

[3] Pursuant to the Court's Order Re Motion to File Expert Reports and Admit the SARB Record (July 26, 2011) at 6, the SARB record and hearing transcript for each of these years was admitted into the court record. *See also* Appellate Rule 609(b)(2).

evidence in the record, the arguments of counsel, the parties' proposed findings, and upon consideration of the applicable law, this Court is now entering the following Findings of Fact and Conclusions of Law.[4]

4. AS 43.56.010 *et seq.* are the statutes governing the ad valorem taxation of oil and gas property in Alaska. The statute provides for such property to be centrally assessed each year by the Tax Division ("Division") within the Department of Revenue ("Department"), based on a lien date of January 1. Taxpayers and affected local governments have the right to appeal the Division's assessed valuation to SARB, which is created within the Department. These parties then have a right to appeal from SARB to the Superior Court in the form of a trial de novo pursuant to AS 43.56.130. The TAPS Owners,[5] the Fairbanks North Star Borough, and the City of Valdez appealed SARB's 2007 decision to this Court. These parties, as well as the North Slope Borough, appealed SARB's 2008 and 2009 decisions to this Court. The three years were consolidated for purposes of trial. The Department and SARB are appellees in each of the three appeals.[6] The Municipalities have asserted to this Court that TAPS' assessed value should be $13.689 billion for 2007, $14.804 billion for 2008, and $14.422 billion for 2009.[7] The Owners have asserted that TAPS' assessed value should be $1.1 billion for 2007, $1.2 billion for 2008, and $1.3 billion

[4] This Court is cognizant of Civil Rule 52(a)'s specification that the Court "shall find the facts specifically and state separately its conclusions of law thereon." But for ease of comprehension of a decision with this number of issues and level of complexity, this Court has not segregated the conclusions of law, but instead notes that instances in which this Court is interpreting the law, as opposed to making factual findings, should be clear from the context of this decision. *See* Civil Rules 92, 94.

[5] The Owners of TAPS are BP Pipelines (Alaska) Inc., ConocoPhillips Transportation Alaska, Inc., ExxonMobil Pipeline Company, Koch Alaska Pipeline Company, and Unocal Pipeline Company (hereinafter "Owners").

[6] AS 43.56.040.

[7] Municipalities' Proposed Findings of Fact and Conclusions of Law ¶ 893.

for 2009.[8] The Department did not present an opinion of value for TAPS at the trial de novo for the three tax years at issue.[9]

5. AS 43.56.080 grants the Division certain investigative powers when assessing AS 43.56 properties, including the power to "enter any premise necessary for the investigation during reasonable hours," to "examine property and appropriate records," and to compel owner representatives "to appear for examination under oath by the department."[10] There was no persuasive evidence presented at the trial de novo that the Division has ever exercised these powers with respect to the valuation of TAPS.[11]

6. The Division broadly interprets what it considers "taxpayer confidential" information under applicable statutes and will not disclose such information to the Municipalities specifically or to the public generally.[12] The Division considers all information that it receives from a taxpayer as "taxpayer confidential," even if it does not contain the particularities of a taxpayer's business affairs and is obtainable from the public domain.[13] As a result, the Division did not provide the Owners' new replacement cost study by Stantec Consulting, Inc. ("Stantec") to the Municipalities.

---

[8] TO-07-0004.0138.

[9] The Department indicated that it did not render opinions of value at the trial de novo

> because in doing so it would be rendering a supplemental assessment for each of the years in question, which, in turn would trigger a new round of administrative action and appeals for each tax year rather than a single and definitive presentation in a de novo context before the court.

Department's Proposed Findings of Fact and Conclusions of Law ¶ 6.

[10] AS 43.56.080.

[11] *See* Greeley Dep. at 209 (June 6, 2011).

[12] *See* AS 40.25.100(a); AS 43.05.230(a).

[13] Tr. 10875-77 (Bales).

7. AS 43.56.060(g) provides that "[t]he department may enter into agreements with a municipality for the cooperative or joint administration of the assessing authority conferred on the department by this section."[14] The North Slope Borough previously had such an agreement with the Department. The City of Valdez and Fairbanks North Star Borough have never been parties to joint assessment agreements with the Department.[15]

8. In its 2010 decision, SARB expressed its concerns regarding the Division's assessment practices:

> The Board believes that it is time for the Division to address the problems created by the way it handles taxpayer confidential information in the assessment process. The Division's failure to provide interested parties with the information on which the assessment was made in time to allow those parties meaningful input in the determination of the property's assessed value, before that determination is subject to limited review of an appeal before the Board, has the potential to throw the fundamental fairness of the AS 43.56 assessment process into question. The Board believes that, due to the Division's current practices with regard to the use of taxpayer confidential information in its AS 43.56 assessments, that process is close to broken and is headed in the wrong direction.[16]

This Court concurs with the Board's observations in this regard.

9. The procedural inadequacies at the agency level have by and large been remedied on appeal to this Court due to the applicability of the civil discovery rules, albeit at considerable expense and delay.

10. This Court interprets the phrase "proved at the hearing" of subsection (f) of AS 43.56.130 to permit a party to introduce new evidence at the trial de novo. As a result, while

---

[14] AS 43.56.060(g).

[15] 2007 SARB Tr. 0137-0138 (Greeley).

[16] MUN7-0237 at 39.

the SARB hearings have each lasted a few days, the consolidated trial de novo before this Court for the 2007 through 2009 tax years' assessments lasted approximately nine weeks.

11. Nearly all the witnesses at the trial testified as experts or as hybrid fact and expert witnesses, and extensive expert reports were prepared. Their qualifications were set out in detail in their testimony and are not restated in this decision. In the 2006 tax year litigation, expert reports for all of the parties were admitted into evidence by stipulation of the parties. For the three tax years now at issue, the Owners maintained a hearsay objection to the admission of most of the expert reports, including most of the reports prepared by their own experts. In a July 26, 2011 "Order re Motion to File Expert Reports and Admit the SARB Record," this Court stated that Evidence Rule 803(23) could be an applicable exception to the hearsay rule for these reports in this proceeding. Over the objection of the Municipalities and the Department, the Owners were permitted to maintain their objection to the admission of most of the expert reports under Rule 803(23), including their own experts reports, while nonetheless seeking admission of their own reports.[17] During and after trial, most of the expert reports were admitted into the record.[18] However, given the extensive dispute between the parties with respect to most of the expert reports, this Court has minimized its consideration of those reports. Any expert report that was admitted over objection of any party has not been relied upon or considered by this Court in determining

[17] *See* Order re Expert Reports (Oct. 24, 2011).

[18] *See* Order Re Owners' Motion to Admit Exhibits (Nov. 29, 2011).

the assessed value of TAPS for the three years in question, excepting only those specific pages of reports identified in this decision.[19]

12. The proceedings surrounding these three tax years have been considerably more contentious than those held with respect to the 2006 tax year. Several hundred pretrial motions were filed and determined. This Court issued an Order Re Department of Revenue's Motion for Preclusion of Issues and Municipalities' Motion to Bar Relitigation on August 8, 2011 ("Collateral Estoppel Order"). That Order would have applied the doctrine of collateral estoppel so as to preclude the relitigation of many of the determinations reached by this Court in the 2006 tax year proceeding to the current tax years, while preserving each party's right to seek to introduce newly discovered evidence "that purports to demonstrate changed facts such that application of collateral estoppel would not be warranted."[20] However, for reasons that this Court strived to fully explain on record at trial on September 13 and 19, 2011, that Order was vacated and the trial de novo then proceeded with respect to all pending issues.[21]

13. The length of the trial proceeding was not primarily due to the fact that three years were heard at one time. Indeed, very little trial time was spent focusing on the differences between the three lien years. Rather, the evidence focused on each of the substantive issues applicable to all three tax years. Each of the parties presented a considerably more technical and in-depth analysis of many of the issues identified in the 2006 tax year proceeding.

---

[19] There have been multiple occasions in recent months that this Court has reviewed expert reports for other purposes, such as to determine whether a motion to preclude testimony should be granted, or whether certain trial testimony fell within the scope of opinions discussed in the report. *See* Evidence Rule 104.

[20] Collateral Estoppel Order at 4.

[21] Tr. 2906-08 (Court).

14. Pursuant to this Court's August 25, 2011 Order Re Remaining Pretrial Issues and Amended Order Of Presentation, this Court heard testimony and evidence from each of the parties by topic area presented in the following order:

a. Appraisal Theory
b. Replacement Cost New (including contingency)
c. Economic/Regulatory/Contractual Issues
d. Mechanical Capacity – both upper and lower
e. Reserves/North Slope Production Forecasts
f. Appraisal/Valuation of TAPS

II. LEGAL STANDARDS

A. Taxation Authority

15. "The Alaska Constitution empowers the legislature to prescribe valuation standards."[22] "The legislature chose to define those standards broadly, requiring that property be assessed 'at its full and true value.'"[23]

16. AS 43.56.010 *et seq.* became law in 1973. These statutes provide that property used for oil and gas exploration, production, and pipeline transportation would not be valued for assessment purposes by municipalities under AS 29.45; instead these types of properties would each be uniformly and centrally assessed by the State.[24]

17. AS 29.45.080(b) provides that "[a] municipality may levy and collect a tax on the full and true value of taxable property taxable under AS 43.56 as valued by the Department of Revenue . . . ."

---

[22] *Fairbanks N. Star Borough Assessor's Office v. Golden Heart Utils., Inc.*, 13 P.3d 263, 267-68 (Alaska 2000). *See also* Alaska Const., art. IX, § 3.

[23] *Golden Heart Utils.*, 13 P.3d at 267-68.

[24] *Minutes* at 50, 54, H. Fin. Comm., 8th Leg., 1st Spec. Sess. (Oct. 22, 1973); *Minutes* at 76, H. Fin. Comm., 8th Leg., 1st Spec. Sess. (Oct. 24, 1973); S.J. at 81-82, 8th Leg., 1st Spec. Sess. (Nov. 3, 1973); Amended Decision ¶ 15.

18. AS 43.56.060(e)(2) provides in relevant part:

> The full and true value of taxable property used or committed by contract or other agreement for pipeline transportation of gas or unrefined oil or in the operation or maintenance of facilities for the pipeline transportation of gas or unrefined oil is: . . .
>
> (2) determined on each January 1 thereafter with due regard to the economic value of the property based on the estimated life of the proven reserves of gas or unrefined oil then technically, economically, and legally deliverable into the transportation facility[.]

19. The Department of Revenue's implementing regulation for the statute provides:

> [T]he full and true value of pipeline property in operation is its economic value based upon the estimated life of proven reserves of the gas or oil then technically, economically and legally deliverable into the transportation facility. Economic value is determined by the use of standard appraisal methods such as replacement cost less depreciation, capitalization of estimated future net income, analysis of sales, or other acceptable methods. The valuation may include any item contributing to value including capitalized interest.[25]

This regulation has been in place since 1975 and in this precise form since 1982.

20. The implementing regulation differs slightly from the statute, as the regulation provides that "the full and true value of pipeline property in operation *is* its economic value based on the estimated life of proven reserves ..." (Emphasis added). If a statute and a regulation conflict, the provisions of the statute control.[26]

21. Each year, as part of the ad valorem assessment process, the property owners file a rendition with the Department identifying all taxable property.[27] There has been no

---

[25] 15 AAC 56.110(c)

[26] *State v. Kenaitze Indian Tribe*, 83 P.3d 1060, 1064-1065 (Alaska 2004).

[27] The renditions filed by the TAPS Owners for each of the applicable years can be found in the SARB record as follows: 2007 R. 001076 – 1087; 2008 R. 003989 – 4036; 2009 R. 003528 – 3618.

claim or appeal point raised that the property identified in the TAPS Owners' renditions is not taxable under AS 43.56.060(e)(2). Nor does this Court find that there is any escaped property.[28] Accordingly, this Court finds that all property included in the 2007, 2008, and 2009 Owners' renditions is taxable under AS 43.56.060(e)(2).

B. Standard of Review and Burden of Proof

22. This Court has previously determined in the 2006 tax year proceeding, and again holds, that the appellants bear the burden of proof to demonstrate by a preponderance of the evidence that an adjustment from SARB's assessed value is warranted pursuant to the standard in AS 43.56.130(f): "The only grounds for adjustment of assessed value is proof of unequal, excessive, or improper valuation or valuation not determined in accordance with the standards set out in this chapter."[29]

23. This Court will accord deference to SARB's interpretation of the statutory premise of value established by the Legislature in AS 43.56.060(e)(2) because the legal interpretation of that statute "implicates agency expertise or the determination of fundamental policies within the scope of the agency's statutory functions."[30] The Board, in

---

[28] Tr. 13063 (Greeley).

[29] *See* Amended Decision ¶ 20. In addition, a party could present a constitutional challenge to an administrative determination. *Id.* ¶ 20 n.9.

[30] *See Bullock v. State, Dept. of Comm. Affairs,* 19 P.3d 1209, 1213-14 (Alaska 2001) (applying "highly deferential" reasonable basis standard of review to the Department of Revenue's statutory interpretation regarding AS 43.56 property). *See also Storrs v. State Med. Bd.*, 664 P.2d 547, 552 (Alaska 1983) *cert. denied*, 464 U.S. 937 ("Statutory construction adopted by those responsible for administering a statute should not be overruled in the absence of 'weighty reasons.'"). In contrast, if the interpretation of a statute does not involve agency expertise, such that the "agency's specialized knowledge and experience would not be particularly probative as to the meaning of the statute," then this Court is to interpret the statute under the substitution of judgment standard, and "adopt the rule of law that is most persuasive in light of precedent, reason, and policy." *Williams v. Abood*, 53 P.3d 134, 139 (Alaska 2002). *See also* Sutherland § 66.4 at 48 (3rd ed. 2003) ("One of the most significant aids of construction in determining the meaning of revenue laws is the administrative interpretation given such acts by the agency that is responsible for its administration and enforcement.").

turn, has accorded deference to the Division in this regard. And yet this Court is cognizant that the volunteer Board had only a few days of testimony each year to consider the value of TAPS, whereas this Court had nine weeks of trial together with extensive pretrial motion practice. But having studied each of SARB's decisions for the three applicable tax years and the preceding years, this Court has found the Board's analysis, and particularly its discussion of appraisal theory, to be quite helpful in determining the assessed value of TAPS.

24. The Alaska Supreme Court has accorded broad discretion to taxing authorities in determining the valuation method.[31] The appellants must prove that the selected method was based on a fundamentally wrong principle of valuation.[32]

25. As to the application of appraisal methodology and all other issues that were not before the Board, this Court has engaged in original fact finding, and applied a preponderance of the evidence standard to determine whether SARB's assessed values resulted in unequal, excessive, or improper valuations.

26. In evaluating the evidence, the Court has considered Civil Pattern Jury Instruction 02.23:

> The evidence should be evaluated not only by its own intrinsic weight but also according to the evidence which is in the power of one party to produce and of the other party to contradict. If weaker and less satisfactory evidence is offered when it appears that stronger and

more satisfactory evidence was within the power of one party to produce, the evidence should be viewed with caution.

C. History of Ad Valorem Tax Assessments of TAPS

27. SARB is a five-member board created within the Department. Its sole purpose is hearing appeals from assessed value determinations made by the Division under AS 43.56.[33] Each member of SARB is appointed by the Governor, confirmed by the Legislature, and must be knowledgeable of assessment procedures.[34] In its 2007 TAPS determination, SARB stated it "is designed to provide a balanced expert review of oil and gas production property valuation issues."[35]

28. Prior to 2001, there were no administrative or court proceedings addressing the value of TAPS. Instead, the Division prepared a valuation based on consideration of both the income and cost approaches, with the income approach the more dominant in the analysis. Then the Division would meet with the Owners, typically in an out-of-state hotel conference room, and TAPS' assessed valuation would be determined in a negotiated settlement reached between the Division and the TAPS Owners with little, if any, participation by the Municipalities.[36]

29. In 2001, the Division valued TAPS at $2.75 billion. Both the Owners and the Municipalities appealed that determination to SARB. There, each party "relied most heavily

---

[33] AS 43.56.040.

[34] AS 43.56.040.

[36] MUN7-0234 at 4; Tr. 12419-12420 (Hoffbeck).

on projected TAPS tariff income data in setting their valuation estimates."[37] SARB stated in its 2009 Certificate of Determination:

> Because there had never been a replacement cost study for the TAPS, the 2001 cost value estimates had to be calculated based on the original cost of the TAPS. Having to adjust these original costs forward so many years made the valuations based on the original costs a very poor indicator of the 2001 value of the TAPS.[38]

30. In 2001, SARB concluded, based upon the evidence then available, that the Division's assessed value of $2.75 billion should be increased to $3.017 billion.[39]

31. From 2002 through 2004, the assessed valuation of TAPS remained at $3.017 billion as the result of negotiated agreements between the Division, the Owners and the Municipalities.[40]

32. In 2005, the Division set a $3 billion assessed valuation for TAPS.[41] In so doing, the Division relied primarily on the Replacement Cost New Less Depreciation ("RCNLD") approach because it had received updated replacement cost study information from both the Owners and the Municipalities.[42] In addition, "uncertainty about future tariff rates in 2005 led the Division to question whether the income approach using a capitalized estimated future tariff income stream still provided the most complete and reliable estimate of the value of TAPS."[43]

[41] MUN7-0234 at 8.

[42] MUN7-0234 at 8.

[43] MUN7-0234 at 8.

33. Both the Owners and the Municipalities appealed the Assessor's 2005 determination to SARB.[44] After a three-day hearing, the Board agreed with the Division that the value of TAPS could not be accurately measured by the tariff income approach because the uncertainty of future tariff rates and other factors caused the value of future tariff income streams to understate the full and true value of TAPS.[45] SARB also concluded that neither the Owners nor the Municipalities had proven that the Division's $3 billion assessed value was "unequal, excessive, improper or otherwise contrary to the standards set out in AS 43.56," even though the Board found that it was "at the low end of an acceptable value range."[46]

34. Both the Owners and the Municipalities appealed the 2005 SARB Decision to the Superior Court. However, by stipulation of the parties, the appeals were dismissed.

35. In 2006, the Division relied on the same basic data and RCNLD methodology as it had in 2005, and determined that the assessed value of TAPS was $3.641 billion.[47]

36. The parties appealed the Division's 2006 assessment to SARB.[48]

37. SARB adjusted the 2006 assessed value from $3.641 billion to $4.3062718 billion.[49] The Owners, as well as the Fairbanks North Star Borough and City of Valdez, appealed to this Court. A five week trial de novo was held in the fall of 2009. Thereafter, this Court issued a 170-page decision in 2010 that relied on the cost approach to valuation

[49] MUN7-0234 at 10.

and set the assessed value of TAPS for 2006 at $9.977 billion.[50] That Decision is presently on appeal to the Alaska Supreme Court.[51]

38. In 2007, the Division determined TAPS' assessed value was $4.578 billion.[52] Both the Owners and the Municipalities appealed to SARB. After a hearing, SARB concluded that the 2007 assessed value of TAPS was $4.588895312 billion.[53]

39. In its 2007 Decision, SARB held that the term "economic value" in AS 43.56.060(e)(2) "means more than the value obtained using a simple willing buyer, willing seller, open market model."[54] SARB reasoned:

> Often there is no open market for oil and gas transportation pipelines in production as stand alone properties. Often there is no willing buyer or a willing seller for an Alaska pipeline at [a] price that would reflect the pipeline's value. Attempts to create a model based on a willing buyer and willing seller may overstate or understate the value of such a pipeline because its value is often more closely tied to the economic life of [the] oil field it serves than its value in a theoretical open market without reference to the oil fields it serves. Hence Alaska Statute 43.56.060(e)(2) requires an assessed valuation based on the pipeline's economic value with due consideration given to the reserves the pipeline serves in estimating that economic value.[55]

40. In its 2007 Decision, SARB critiqued "the Division's frequent use of the term conservative in reference to some of its assumptions and estimates."[56] The Board added that "the object of an assessor valuing property under Alaska Statute 43.56.060(e)(2), is to make the best estimate of value, that is, to determine the pipeline's most likely value based

on the available evidence, not to make a conservative estimate of value, or the lowest estimate of value within an acceptable range of possible values."[57]

41. In 2008, the Division determined that the assessed value of TAPS was $7.16589746 billion.[58] The parties appealed to SARB. There, the Owners asserted that TAPS' assessed value should be $800 million; the Municipalities argued that TAPS' assessed value should be set no lower than $12 billion.[59] SARB agreed with the Division that "the Pro Plus cost study [advanced by the Municipalities] was generally more detailed and more reliable than the current and previous Mustang cost study."[60] However, SARB did not accept the Pro Plus contingency estimate of 25%.[61] The Board concluded that the increased reliability of the Pro Plus study should have resulted in the contingency going down, not up, and it therefore set the contingency at 5%.[62]

42. After adjusting the contingency percentage, SARB concluded that the assessed value of TAPS in 2008 was $6.15447972 billion.[63] SARB commented that an assessed value may increase from year to year due to the availability of more reliable data, "even if the actual value of the property did not change."[64]

43. By 2009, the Municipalities and the Department had received significant materials through the discovery process in the 2006 case before this Court.

[61] MUN7-0235 at 19-20.

[62] MUN7-0235 at 19-20.

[63] MUN7-0235 at 26.

[64] MUN7-0235 at 25.

44. In 2009, the Division accepted and relied upon the Municipalities' Pro Plus study but reduced the contingency from 25% to 10% and the owners' costs from 10% to 5%, and valued the property at $7.71506816 billion.[65] Both the Owners and the Municipalities appealed to SARB.

45. Before SARB in 2009, the Owners asserted that TAPS' value was less than $1 billion; the Municipalities argued that TAPS' assessed valuation should be set no lower than $12 billion.[66] SARB found that the Pro Plus witnesses had provided full support for a 25% contingency and owners' costs of 10%.[67] Accordingly, SARB adjusted the Division's value for these two items to result in an assessed valuation of $9.0458952 billion.[68]

46. In each of the 2007 through 2009 assessments of TAPS, both the Division and SARB concluded that:

a. after due consideration of the income and sales approaches, the cost approach was most applicable to value TAPS;

b. TAPS was a special use or special purpose property; and

c. the assessed value was based on the best cost studies then available to the Division and SARB, which in 2007 was comprised of a trended version of an older Mustang cost report, in 2008 was comprised of a Pro Plus pipeline replacement cost based on a cost-estimated "Spread 6" and factored for Spreads 1-5, combined with a Mustang Valdez marine terminal ("VMT")

[68] MUN7-0236 at 18.

replacement cost estimate, and in 2009 was comprised of a full Pro Plus pipeline and VMT cost estimate.[69]

47. In 2010, the Division valued TAPS at $9.20346143 billion.[70] The Owners presented a new cost study prepared by Stantec.[71] At the ensuing 2010 SARB hearing, the Owners asserted that TAPS was worth no more than $1.4 billion. The Municipalities asserted that TAPS' assessed valuation should be set at $11.8 billion.[72] The Board adjusted the Assessor's calculation of ad valorem taxes during construction and the economic end-of-life for TAPS, with a resultant valuation of $9,638,669,398.[73] That determination is presently on appeal to this Court, but a trial date has not yet been scheduled.

48. In 2011, the Division valued TAPS at $7.9329798 billion.[74] The Owners and Municipalities appealed that valuation to SARB. The Board found that the Division's valuation was improper because it failed to give this Court's decision in the 2006 TAPS appeal proper weight in making an economic end-of-life calculation.[75] After making this adjustment to the Division's valuation, the Board determined that the 2011 assessed valuation of TAPS was $8,671,720,679.[76] That determination is also on appeal to this Court.

[74] MUN7-0238 at 2.

[75] MUN7-0238 at 19.

[76] MUN7-0238 at 34.

49. The Board's Certificates of Determination for 2010 and 2011 reflect careful consideration of this Court's rulings from the 2006 tax year to the years at issue before the Board, thereby according some degree of predictability of outcome in this complex and highly contentious process. However, this Court has not accorded weight to the Board's findings regarding the assessed value of TAPS in those subsequent years given the Owners' observation that to do so creates a degree of circularity that could impact the nature of this trial de novo for the 2007 through 2009 tax years.

50. James Greeley became the State Petroleum Property Assessor in 2007. No disparity or inequality in valuation methodology among AS 43.56 pipelines has been demonstrated during the lien years. There is no basis in the record to support a claim that the 2007, 2008, or 2009 TAPS assessment violates the equal protection clause under either the state or federal Constitution, or is otherwise impermissibly discriminatory.

51. The Court found in the 2006 tax year proceedings that the Department did not abruptly and without notice change its policy to consider the cost approach for the first time in 2005.[77] This Court again so finds with respect to the 2007 through 2009 tax years.

52. The Department's use of the cost approach does not constitute a "de facto regulation." The applicable regulation has expressly permitted reliance on a cost approach for over three decades.[78]

53. The record does not support a claim that the 2007, 2008, or 2009 assessment violates the due process clause of either the state or federal Constitution.

---

[77] See Amended Decision ¶ 63.

[78] 15 AAC 56.110(c).

III. DESCRIPTION OF THE PROPERTY

A. Ownership

54. As of January 1 for each of the three tax years at issue, TAPS was owned by BP Pipelines (Alaska) Inc. (46.9%), ConocoPhillips Transportation Alaska, Inc. (28.3%), ExxonMobil Pipeline Company (20.3%), Koch Alaska Pipeline Company (3.1%), and Unocal Pipeline Company (1.4%).[79] Alyeska Pipeline Service Company ("Alyeska") is the operating agent for the Owners.[80]

55. TAPS is physically a single pipeline, but there are effectively five different pipelines because each TAPS Owner has an undivided ownership interest in TAPS. This ownership structure permits each individual Owner to use its portion of TAPS as part of the vertically integrated business operations of that Owner's affiliates. Each TAPS Owner maintains a separate tariff and each accepts nominations to its undivided ownership interest.[81]

56. Each Owner's entitlement to a portion of the pipeline's capacity or "space" is established under the Amended Capacity Settlement Agreement ("ACSA"), which together with the TAPS Operating Agreement provides that each Owner's share of pipeline capacity is equal to the pipeline ownership percentage multiplied by TAPS' capacity, which for each of the lien years was 1.1 million bbl/d.[82]

[82] MUN7-0001 at 982-83 (Coulson).

B. Physical Description

57. TAPS is an 800-mile long, 48-inch diameter crude oil pipeline system that crosses three mountain ranges and over 800 rivers and streams during its traverse from the Alaska North Slope ("ANS") oil fields to the Valdez Marine Terminal ("VMT").[83] TAPS consists of the right-of-way, pipe, pumps, tanks, tanker loading facilities and associated equipment.[84] Approximately 420 miles of the 800-mile pipeline are aboveground and supported by 39,000 pairs of Vertical Support Members ("VSMs").[85] TAPS is the only pipeline transporting crude oil from the ANS, and is therefore a basin-opening transportation system. As of each lien date, there was no other viable transportation alternative to carry significant quantities of oil from the ANS to market.[86]

58. TAPS' taxable property includes only the tangible real and personal property from Pump Station 1 through the VMT and does not include intangible property, marine tankers, refineries, ANS proven reserves, ANS crude oil, ANS exploration property, or any property that is upstream of Pump Station 1.[87]

C. Original Construction and Strategic Reconfiguration

59. Construction of TAPS began in 1974 and was completed in the summer of 1977. It required 515 federal permits and 832 state permits.[88] There were 14 airfields of varying lengths built to support the construction of TAPS.[89] The construction workforce

---

[83] MUN7-0001 at 965 (Coulson).

[85] MUN7-0001 at 520, 547, 549.

[86] Tr. 8916 (Cicchetti); MUN7-01 at 3767 (Coulson).

[87] Tr. 529 (Remsha); Tr. 12903 (Greeley).

[88] MUN7-0001 at 502.

[89] MUN7-0001 at 484.

totaled approximately 70,000 employees, with a peak number of 28,000 employees working in October 1975.[90] At the time of its construction, TAPS was the largest privately funded construction project in U.S. history.[91] Before construction began, the estimated cost was set at $863 million. However, when finally completed in 1977, the final cost of TAPS was nearly ten times greater, at approximately $8 billion.[92]

60. The initial design capacity for TAPS in August 1970 was 600,000 barrels per day ("bbl/d") of throughput.[93] In July 1974, the design capacity was increased to 1.2 million bbl/d.[94] And soon after it was again adjusted to 1.42 million bbl/d.[95]

61. "Pursuant to an agreement among the TAPS carriers dated March 29, 1979, the Owners have utilized a chemical drag reduction known as 'DRA' to increase throughput in excess of TAPS' 1.42 million [bbl/d] design capacity."[96]

62. After the use of DRA was implemented, TAPS was able to transport 2.1 million bbl/d at its peak production in 1988. After peaking in the late 1980s, throughput on TAPS has gradually reduced. As of the January 1, 2007, 2008, and 2009 lien dates, the Department of Revenue estimated production of ANS crude oil and natural gas liquids ("NGLs") at 740,000 bbl/d for fiscal year 2007, at 731,000 bbl/d for fiscal year 2008, and at 691,000 bbl/d for fiscal year 2009.[97]

---

[90] MUN7-0001 at 489.

[91] MUN7-0001 at 965 (Coulson).

[92] MUN7-0001 at 488.

[93] MUN7-0215 at 11. *See also* Tr. 7058 (Ray).

[94] MUN7-0215 at 62.

[95] TO-07-0179.0130. *See also* MUN7-0001 at 2026.

[96] TO-07-0190.0001 (FERC Order Approving Agreement, issued May 15, 1998).

[97] MUN7-0018 at 13, 20, 27. *Cf.* TO-07-0004 at 78, 111, 126.

63. The first oil began to flow through TAPS on June 20, 1977. The first tanker of crude oil left the VMT on August 1, 1977. At that time, ANS proven reserves were estimated at approximately 9.6 billion barrels. As of January 1, 2007, over 15 billion barrels of oil had been transported through TAPS.[98]

64. TAPS' design capacity of 1.42 million bbl/d has not been changed, except that a strategic reconfiguration ("SR") project of the pumps has been undertaken over the past several years. In that project, some of the original Legacy pumps have been taken out of service and others have been replaced with new variable speed pumps. The current physical capacity of the operating pumps on TAPS is 1.1 million bbl/d.[99] The mechanical capacity of those pumps is 760,000 bbl/d. Adding DRA to the oil increases the ability of the upgraded SR pumps to transport up to 1.1 million bbl/d. Alyeska has described the goal of SR as follows: "to position TAPS for more effective operation while maintaining or enhancing safety, operational integrity and environmental performance. The new system is modular and scalable and will provide flexibility for future increases or decreases in throughput."[100]

65. Jeff Ray of ExxonMobil Pipeline Company testified that the Owners are not currently maintaining 1.1 million bbl/d of physical capacity because two of the DRA injection sites can only use an older form of DRA. However, Mr. Ray also indicated that those two sites could be quickly modified to be able to use the newer DRA for "probably a couple million dollars," which would then bring the physical capacity to 1.1 million bbl/d.[101] Accordingly, this Court finds that TAPS' physical capacity during each of the lien years,

[101] Tr. 7049-51 (Ray).

including its SR pumps and with DRA, was 1.1 million bbl/d. The design capacity of the mainline pipe and the VMT remained at 1.42 million bbl/d during each of the lien years.

D. Limited-Market Property

66. TAPS is a limited-market property because there is a very limited market for the purchase and sale of any ownership interest in TAPS. When interests in TAPS have changed hands, the buyers have purchased those interests as part of a broader transaction that has included the buyers' use of TAPS to transport ANS product to market. Each of the Owners has a right of first refusal should any other Owner elect to sell its interest in TAPS.[102]

67. TAPS' limited market or market participants are best defined as the shippers on TAPS – the ANS producers. It is these producers that would pay for TAPS, or if hypothetically TAPS did not exist as of the assessment dates, would pay to build or replace TAPS.[103]

E. Special-Purpose Property

68. TAPS is also a special-purpose property. It was specifically designed, constructed, and adapted for its particular use – to move affiliated crude oil from the ANS to Valdez. The ANS represents about 15% of the U.S. domestic crude oil production and TAPS is the only viable means of transporting that oil to market.[104]

F. Integrated Economics

69. The TAPS Owners did not and could not have independently financed the original construction of TAPS and they do not independently finance substantial

[102] Tr. 11355-56 (Podwalny); Tr. 11903 (Remsha).

[103] Tr. 11978 (Remsha); Tr. 12798 (Greeley).

[104] MUN7-0001 at 410; Tr. 8206-07, 8211 (Cicchetti).

improvements to TAPS. Instead, the affiliated production companies have financed TAPS' construction. And the evidence at trial demonstrated that all significant funding decisions for TAPS are not made by the TAPS Owners, but by the affiliated parent corporations or upstream producer affiliates of each Owner.[105]

70. As of the lien dates, the parent companies of the three largest owners of TAPS (BP, ConocoPhillips, and ExxonMobil) had a combined 95% ownership interest in TAPS.[106] These same three parent companies also had a combined total in excess of 96% of the estimated production on the North Slope.[107] This close correlation between estimated production and ownership interest in TAPS is expected to remain in place for the foreseeable future.[108] One of the other two TAPS Owners, Unocal, has an affiliate (Chevron) with substantial ANS production. The other TAPS Owner, Koch Alaska Pipeline Company, has an affiliate whose contract with the State provides it with oil for delivery to the largest refinery connected to TAPS (Flint Hills). Thus, each of the five TAPS Owners has an affiliate with oil to be transported on TAPS.[109]

71. Each Owner's affiliated producer has an economic incentive to nominate its ANS production to its affiliated TAPS Owner. As explained by Charles Coulson, the President of BP Pipelines:

> There has been a strong pattern of shippers on TAPS nominating their barrels to affiliated pipeline companies. There are a variety of reasons for this behavior, but mostly it can be understood by thinking about integrated corporate economics. When an upstream affiliate

[105] *See, e.g.*, Tr. 2708-09 (Falcone)

[106] Tr. 8550 (Sullivan). *See also* MUN7-0001 at 983 (Coulson).

[107] Tr. 8551 (Sullivan); MUN7-0001 at 971 (Coulson).

[108] MUN7-0001 at 984 (Coulson); Tr. 9272-74 (Platt).

[109] MUN7-0001 at 984 (Coulson).

> ships barrels in its pipeline affiliate's space, it pays the published tariff rate to the pipeline affiliate, and no money leaves the corporate family.[110]

72. In addition to serving as President of BP Pipelines, Mr. Coulson is Vice President of BP Shipping US. He explains, "those two roles allow me to manage BP's midstream assets here in Alaska."[111] Mr. Coulson's paycheck is from BP Exploration (Alaska), Inc. ("BPXA"); BP Pipelines does not maintain any bank accounts.[112] Accordingly, the TAPS tariffs that BP Pipelines collects are not paid to it but to another BP affiliate.[113] And if Alyeska proposed that the Owners expend money for a large project on TAPS, Mr. Coulson testified that BP would assess whether it fits with "what we want to do in Alaska corporately,"[114] with funding determinations for TAPS made by BP's upstream executive group.[115]

73. And yet while four of the five Owners are vertically integrated oil companies, there is no evidence that they operate collusively together as an economic unit or in concert with other producing or refining entities as an economic unit. Likewise, the proven reserves owned by an affiliate of one TAPS Owner are not integrated with the proven reserves of an affiliate of another TAPS Owner or with the proven reserves of an unaffiliated producer.[116]

G. Unique Regulatory Status

74. TAPS is a regulated pipeline, regulated by both the Regulatory Commission of Alaska ("RCA") and the Federal Energy Regulatory Commission ("FERC").

75. During the first several years of TAPS' operation, the amount of the tariff was in litigation. In 1985, the Owners and the State entered into the TAPS Settlement Agreement ("TSA"). For the next two decades, the tariffs were based on the TAPS Settlement Methodology ("TSM") and were not evaluated under the just and reasonable standard.[117] The TSM front-end loaded the recovery of the initial cost of TAPS to such a degree that the original investment was largely recovered by the late 1990s – decades before any reasonable estimate of the end of TAPS' economic life.[118]

76. The TSM also allowed an accelerated recovery of return in the form of an allowance per barrel. The RCA held that the TSM resulted in $9.9 billion (nominal dollars) or $13.5 billion (1997 dollars) more than would otherwise have been permitted under traditional cost of service regulation.[119] The higher tariffs during that time also resulted in lower production tax liability for the affiliated producers.

77. The TSA expired in 2005. Since then, there has been considerable litigation before FERC and the RCA with respect to the TAPS tariffs.

IV. PREMISE OF VALUE

78. A premise (or standard) of value is included in all assessments and appraisals of property.[120]

79. The statutory premise of value in AS 43.56.060(e)(2) was interpreted by this Court in the Amended Decision.[121] Although this Court vacated the August 8, 2011 Collateral Estoppel Order for the 2007 through 2009 tax years and allowed the parties to present additional evidence and arguments regarding the premise of value at the trial de novo, this Court has not been persuaded that the conclusions reached by this Court in the Amended Decision regarding the premise of value should be abandoned, but has determined that they should be further refined as discussed herein. Further, this Court has also more thoroughly studied the legislative history of the statute as discussed below.

80. The terms "economic value" and "full and true value" have no generally accepted definitions in the appraisal profession.[122]

81. Different concepts of value arise from economic principles, including the concepts of value in exchange and use value.[123] Value is never a fact but always an opinion of worth at a given time in accordance with a definition of the standard of value.[124]

82. Value in exchange is also referred to as market value.[125] This concept generally is expressed as the amount that a willing buyer will pay and a willing seller will

[125] *The Appraisal of Real Estate* at 23.

accept, in an arm's length negotiation, to transfer the property, with both buyer and seller being knowledgeable about the property.[126] Market value is a transactional-based concept.[127]

83. "Use value is the value a specific property has for a specific use. In estimating use value, the appraiser focuses on the value the real estate contributes to the enterprise of which it is a part without regard to the highest and best use of the property or the monetary amount that might be realized from its sale."[128] "If a property's current use is so specialized that there is no demonstrable market for it but the use is viable and likely to continue, the appraiser may render an opinion of use value if the assignment reasonably permits a type of value other than market value. Such an estimate should not be confused with an opinion of market value."[129]

84. Market value and use value can be the same value if the highest and best use of the property is its current use.[130]

85. Use value is distinct from investment value. "Investment value is the value of a property to a particular investor based on that person's (or entity's) investment requirements. In contrast to market value, investment value is value to an individual, not necessarily value in the market."[131] *The Appraisal of Real Estate* describes investment value as a "subjective"

[131] *The Appraisal of Real Estate* at 28-29.

type of value, and this Court has not interpreted the applicable statute as creating an investment value standard.

86. The Legislature's references in AS 43.56.060(e)(2) to "full and true value" and "economic value," along with its omission of the terms "open market," "willing seller and willing buyer," and "the estimated price that the property would bring in an open market," reflect an intent to accord flexibility to the Division and SARB when valuing pipeline property, particularly unique pipeline property like TAPS.[132]

87. That the Legislature could have required, but chose not to require, that the premise of value for pipeline property be a market value standard, lies in its omission of the terms "open market" and "willing seller and willing buyer" to describe the premise of value for such property – in contrast to its use of those terms for other property such as exploration property under AS 43.56.060(c).[133]

88. That AS 43.56.060(e) does not mandate a market value standard for the valuation of pipeline properties is fully supported by the legislative history.

89. In October 1973 two parallel bills, HB 1 and SB 1, were introduced by Governor Egan during a special session of the Alaska Legislature.[134] A version of HB 1 was

---

[132] The rule of statutory construction that where a form of conduct, the manner of its performance and operation, and the persons and things to which it refers is expressly designated, there is an inference that all omissions should be understood as exclusions clearly is applicable here. *See, e.g.*, Norman J. Singer and J.D. Shambie Singer, 2A *Sutherland Statutory Construction* § 47:23 at 417 (7th ed. 2007) ("The force of the maxim is strengthened where a thing is provided in one part of the statute and omitted in another.") (citation omitted). *See also Ranney v. Whitewater Engineering*, 122 P.3d 214, 218-19 (Alaska 2005); *Croft v. Pan Alaska Trucking, Inc.*, 820 P.2d 1064, 1066 (Alaska 1991) (explaining that application of this principle of statutory construction "is particularly compelling where, as here, the scheme is purely statutory and without a basis in the common law"). *Cf.* Owners' Proposed Findings of Fact and Conclusions of Law ¶ 29. The parenthetical referencing of Sutherland's 6th Edition that is set forth in that proposed finding could not be located in that treatise.

[134] H.J. at 4-6, 8th Leg., 1st Spec. Sess. (Alaska 1973) (letter from William A. Egan introducing HB 1); S.J. at 4-5, 8th Leg., 1st Spec. Sess. (Alaska 1973) (letter from William A. Egan introducing SB 1).

ultimately passed by the Legislature as the oil and gas property taxation statutes, AS 43.56.010 *et seq.*[135]

90. At the time of the special session, pipeline construction was imminent. Other bills had been introduced the previous year but failed to make it out of committee.[136] The 1973 legislative history demonstrates a tangible awareness of the time constraints imposed by the special session.[137]

91. Likely as a function of this time pressure, committee discussions of HB 1 were not always precise. On occasion, they blurred distinctions between methods of valuation, standards of valuation, depreciation bases, and types of property.

92. Much of the discussion surrounding HB 1 focused on the destination of the tax revenue and concerns about the creation of new "pipeline boroughs." The legislative history of AS 43.56.060 is not extensive, but what does exist is indicative of a legislative intent to give assessors the tools and flexibility so as to permit assessed valuations to be increased over time, as warranted.[138]

---

[135] Specifically, a Senate Free Conference Committee substitute for a Senate Finance Committee Substitute for a House Finance Committee substitute for HB 1 was enacted. S.J. at 129.

(Alaska 1973) (Nov. 3, 1973) (Committee Report on Senate CS for CS for HB 1) ("There is no doubt also that we could produce a better bill if we had more time . . .") [2007 R. 9845]; *Minutes* at 139, S. Finance Comm., 1st Spec. Sess. (Alaska 1973) (Nov. 8, 1973) ("Sen. Palmer noted the effect of [the assessment] section was several years down the line, and he thought it would be more expedient to accept the House version at this time.") [2007 R. 9861]; *Minutes* at 10, S. Free Conference Comm., 1st Spec. Sess. (Alaska 1973) (Nov. 10, 1973) (Rep. Freeman presented the Committee's options as "deadlock" or "accept[ing] the mediocre bill before them"; within an hour, the Committee adopted the bill version that became the statute.) [2007 R. 9871].

[138] *See, e.g.*, *Minutes* at 21, H. Finance Comm., 8th Leg., 8th Leg., 1st Spec. Sess. (Alaska 1973) (Oct. 20, 1973) ("Mr. Condon, Assistant Attorney General, answered that with respect to production property, the value would be less using that approach. With respect to the pipelines, they use actual cost depreciation on an annual straight line allowance with no inflation factor. He said their pipeline formula would tend to lead to higher valuation.") [2007 R. 9708]; *Minutes* at 22, H. Finance Comm., 1st Spec. Sess. (Alaska 1973) (Oct. 20, 1973) ("Mr. Fink said valuations of this type of property seem difficult. He asked whether they couldn't take advantage of increased value.") [2007 R. 9710].

93. The Owners assert that at the time AS 43.56.060 was drafted, "economic value" was consistent with "market value" and that "the term economic value was at least partially familiar to legislators as being a reference to an assessment methodology using an income stream."[139] The Court finds this argument unavailing. In support of this assertion, the Owners cite to a sentence in a memorandum by a fiscal analyst to the Speaker of the House of Representatives dated October 17, 1973, prior to the House taking up HB 1.[140] The sentence reads: "Various methods and factors can be considered in arriving at assessed value including actual cost and the economic value or income stream the line is capable of producing."[141] The memo makes no reference to market value.[142]

94. AS 43.56.060 contains different definitions of "full and true value" for different types of property. In general terms, it specifies market value for exploration property, use of replacement cost less depreciation for production property, and economic value for transportation (pipeline) property.

95. In its original form, HB 1 set forth three approaches for the three types of property. Language that was not retained in the bill as finally enacted into AS 43.56.060 is italicized:

- Exploration property was to be assessed using market value: "the estimated price which the property would bring in an open market and under the then prevailing market conditions in a sale between a willing seller and a willing

---

[139] Owners' Proposed Findings of Fact and Conclusions of Law ¶¶ 26, 35.

[140] R. 9922-23.

[141] R. 9922-23.

[142] R. 9922-23.

buyer both conversant with the property and with prevailing general price levels."[143]

- Production property was to be assessed "on the basis of *actual cost* less depreciation based on *units of production*."[144]

- Transportation property was to be assessed "with due regard to the economic *life* of the property based on the estimated life of the proven reserves of gas or unrefined oil then technically, economically and legally deliverable into the transportation facility."[145]

96. The assessment of production and transportation property received most of the attention in legislative deliberations. The minutes reflect that Attorney General John Havelock was actively involved with earlier versions of the bill,[146] was present at many of the House and Senate committee meetings, and the majority of the committees' valuation questions were directed to him.

97. HB 1 was referred to the House Finance Committee on October 17, 1973.[147] The House Finance Committee substitute ("HFCS") was adopted by the House on October 29, 1973.[148]

98. The House Finance Committee minutes indicate that the Committee considered and rejected both a market value approach and a reliance on the pipeline's value for rate regulation purposes for assessing transportation property.

[146] *See, e.g.*, 2007 R. 9541 (Attorney General Havelock answering questions about HB 59, a predecessor bill, before the House Resources Committee earlier in 1973) (specific date unavailable).

[147] H.J. at 4, 8th Leg., 1st Spec. Sess. (Alaska 1973) (Oct. 17, 1973) [2007 R. 9903].

[148] H.J. at 58, 8th Leg., 1st Spec. Sess. (Alaska 1973) (Oct. 29, 1973) [2007 R. 9911].

99. The minutes also indicate that the Committee considered an actual cost valuation and a units-of-production depreciation method. At a hearing, Homer Burrell, then Director of the Division of Oil and Gas, asked the Committee, "How can you determine the full and true value of a $4 billion installation." One representative indicated that "the actual cost of construction conceivably could be the full and true value. Original construction costs could be used, and appreciated or depreciated accordingly." Mr. Burrell responded: "this apparently allows for inflation and deflation but that is all. When the oil is gone, [the pipeline] is worthless, although it still could be appraised at $4 billion. Units of production tie [the pipeline] to its economic life, but its physical life must be considered also." Mr. Burrell indicated that the uncertainty lay with whether the pipeline's physical life would be shorter or longer than its economic life. He added, "units of production depreciation covers the pipeline as long as there is oil going through it."[149]

100. When the subject of market value was raised, Attorney General Havelock's response was focused on production property:

> Mr. Fink referred to the method of valuation. He noted they had heard testimony and a good argument made for value of property at fair market value as opposed to their method. He wondered whether the method would make much difference.
>
> Mr. Havelock replied it would be a considerable change. The fair market value method would introduce an element of uncertainty in property that doesn't have a fair market value. He said the question was whether they were going to valuate production equipment on fair market value and create considerable uncertainty because there was not the same kind of market in production facilities. He asked how they would figure fair market value excluding intangibles that would go into the price. He didn't think the fair market value was appropriate,

[149] *Minutes* at 50, H. Finance Comm., 8th Leg., 1st Spec. Sess. (Oct. 22, 1973) [2007 R. 9735].

> and added that from the industry point of view it would give uncertainty because it would depend on the assessor.[150]

101. The House Finance Committee also discussed reliance on the pipeline's value for regulatory purposes, or "the ICC approach," so named after FERC's predecessor agency, the Interstate Commerce Commission.[151] The Committee minutes indicate that the approach was dismissed by Attorney General Havelock:

> Mr. Malone asked if it wouldn't simplify things if they just used the valuation placed on the pipeline for return by ICC. Mr. Havelock said no . . . Mr. Malone thought it would simplify the State's assessment procedure and put it on a parity with the tarrif [sic]. Mr. Havelock didn't think the State's problem was that complex.[152]

102. In this regard Larry Eppenbach, Deputy Commissioner of the Treasury, stated:

> Mr. Fink asked whether Mr. Eppenbach thought the value of the pipeline would go down over fifty years. Mr. Eppenbach believed ICC will reduce valuation from time to time and not increase it. . . . Mr. Eppenbach said that every indication they got was that ICC would reduce the value.[153]

103. Thus, the legislative history supports a conclusion that the House specifically considered and rejected an assessed value standard equal to the pipeline's value for rate-making purposes.

104. During the same legislative session at which HB 1 was introduced, an alternate bill, HB 9, was introduced to the House on October 22, 1973 and referred to the

---

[150] *Minutes* at 21, H. Finance Comm., 8th Leg., 1st Spec. Sess. (Alaska 1973) (Oct. 20, 1973) [2007 R. 9708].

[151] *Minutes* at 21, H. Finance Comm., 8th Leg., 1st Spec. Sess. (Alaska 1973) (Oct. 20, 1973) [2007 R. 9708].

[152] *Minutes* at 23-24, H. Finance Comm., 8th Leg., 1st Spec. Sess. (Alaska 1973) (Oct. 20, 1973) [2007 R. 9711-12].

[153] *Minutes* at 22-24, H. Finance Comm., 8th Leg., 1st Spec. Sess. (Alaska 1973) (Oct. 20, 1973) [2007 R. 9710-12].

House Finance Committee.[154] HB 9 addressed exploration, production, and transportation property together in a single provision, and provided that the full and true value of all three types of property would be "the estimated price which the property would bring in an open market and under the then prevailing market conditions in a sale between a willing seller and a willing buyer both conversant with the property and with prevailing general price levels."[155] The House Finance Committee minutes do not reflect any discussion of HB 9, suggesting that the House was not interested in a unilateral market value approach to value the three different types of property.

105. After its adoption by the House on October 29, 1973, HFCS was sent to the Senate Finance Committee, which produced a committee substitute ("SFCS") that was forwarded to the Senate on November 8, 1973.

106. SFCS contained the final language for the ad valorem assessment of transportation property that appears in AS 43.56.060(e). It trimmed down HFCS by removing the "replacement cost" component added by the House, and substituted "economic value" for "economic life" for transportation property.[156] The following excerpts from the Senate Finance Committee minutes are informative:

> Referring to sub-section (2), page 5, line 7, Sen. Groh said the House version used replacement costs less depreciation versus the original version which used actual costs. Sen Palmer said this approach was used in the Kenai borough and it appeared satisfactory. Sen. Palmer moved the adoption of the House version. Sen. Groh noted there was

[154] H.J. at 25, 8th Leg., 1st Spec. Sess. (Alaska 1973) (Oct. 22, 1973). Another bill, HB 10, was introduced October 25, 1973, and adopted the assessment language of HFCS wholesale. H.J. at 34, 8th Leg., 1st Spec. Sess. (Alaska 1973) (Oct. 25, 1973); H.B. 10, 8th Leg., 1st Spec. Sess. (Alaska 1973) (offered Oct. 25, 1973) [2007 R. 9635-37].

[155] H.B. 9, 8th Leg., 1st Spec. Sess. (Alaska 1973) (offered Oct. 22, 1973) [2007 R. 9629].

[156] Senate CS for CS for HB 1, S. Finance Comm., 8th Leg., 1st Spec. Sess. (Alaska 1973) (offered Nov. 8, 1973) (emphasis added) [2007 R. 9667].

> a substantial difference between Kenai and a $4.5 billion pipeline, and the committee discussed which version should be adopted. Sen Lewis moved to replace the word "replacement" with "actual." Sen. Ray said fair market value would be more appropriate. Sen. Groh referred to the motion made by Sen. Lewis [to change "replacement" to "actual"], and Sen. Palmer asked that the record show the vote on this now was no commitment to the future. The motion passed by a vote of 4 to 3.
>
> . . .
>
> Sen. Groh asked if there were any other suggestions regarding CSHB 1, and Sen. Ray said there were still problems with actual versus replacement costs. After discussion, Sen. Palmer noted the effect of this section was several years down the line, and he thought it would be more expedient to accept the House version at this time. Mr. Havelock said the Governor's version had different language, and the House version would not produce as much revenue. Sen. Palmer moved to rescind the committee's previous action [replacing "replacement" with "actual"]; upon vote the motion was accepted by a vote of 4 to 3. Sen. Butrovich moved and asked unanimous consent to adopt the Governor's wording ["with due regard to the economic life of the property"] in this section, and then amended his motion to include substituting "economic value" for "economic life." No objection, so ordered.[157]

107. Although the details of this deliberative process are difficult to discern, what can be gleaned from this otherwise opaque account is that the Senate Finance Committee did not seriously consider a market value approach, as it was mentioned only in passing and not voted upon.[158]

108. Based on this Court's review of the legislative history, an ICC-based or regulatory valuation was not discussed in the Senate.

---

[157] *Minutes* at 138-39, S. Finance Comm., 8th Leg., 1st Spec. Sess. (Alaska 1973) (Nov. 8, 1973) [2007 R. 9860-61].

[158] *Minutes* at 138-39, S. Finance Comm., 8th Leg., 1st Spec. Sess. (Alaska 1973) (Nov. 8, 1973) [2007 R. 9860-61] ("Sen. Ray said fair market value would be more appropriate.").

109. The bill then went to a Free Conference Committee.[159] There, the House attempted to negotiate a return to "replacement cost" instead of "economic value" for the valuation of pipeline property in exchange for other concessions, but was unsuccessful.

110. The legislative history demonstrates that the House had a preference for valuing transportation property using an explicit "replacement cost" approach, while the Senate preferred an apparently less restrictive "economic value" approach, which Attorney General Havelock had advised Legislators would produce more revenue, and in the end, the Senate prevailed on this issue.

111. In its closing argument at the trial de novo before this Court, the Department stated that the legislative history, taken as a whole, "demonstrates some likelihood that the Legislature was fully cognizant of a willing buyer/willing seller standard when it enacted 43.56.060(e)(2)."[160] This Court agrees and further finds that the Legislature was also cognizant that the pipeline would be valued by the ICC for rate making purposes, and did not adopt such a premise for ad valorem tax purposes.

112. The Owners assert that the "Alaska tax system will not function properly if a pipeline valuation methodology is adopted that does not take governmentally established tariff levels into account."[161] They maintain that because the production tax is computed after the deduction of pipeline tariffs, "TAPS property tax value must take into account actual tariff income."[162] To do otherwise, the Owners maintain, "whipsaws North Slope producers

---

[161] Owners' Proposed Findings of Fact and Conclusions of Law ¶ 787.

[162] Owners' Proposed Findings of Fact and Conclusions of Law ¶ 786.

and pipeline transportation companies, taxing pipeline companies as if they received high tariff income but taxing producers as if they incur low tariff expense."[163]

113. But this Court finds that valuing the pipeline without exclusive reliance on the tariff income does not result in taxing the pipeline companies as if they received a high tariff income. Rather, an assessed valuation that exceeds the net present value of the projected tariff income stream recognizes that the value of the pipeline exceeds that tariff income stream. This Court has previously determined, and again holds, that "the term 'economic value' as set forth in AS 43.56.060(e)(2) does not mandate, as a matter of law, the exclusive reliance on the regulated tariff income to value TAPS."[164]

114. In the case of TAPS, AS 43.56.060(e)(2)'s reference to "economic value" and not "market value" is consistent with the reality that there is no market for TAPS as a stand-alone investment based solely on its tariff income. Even if there might be a buyer of TAPS based solely on its tariff income, the evidence at the trial de novo conclusively demonstrated that a TAPS Owner would not sell its interest in TAPS without the assurance that its affiliated oil from the Alaska North Slope could be shipped to market. At trial, the Owners' appraisal expert Michael Remsha was asked if he believed that the TAPS Owners would sell TAPS to a "rich sheikh from Saudi Arabia"[165] for $20 billion "for the expressed purpose of shutting [TAPS] down."[166] Mr. Remsha replied that the Owners would "[m]ost likely not" sell

their interests in TAPS at that price under those circumstances, "[b]ecause they want to be able to have the opportunity to take oil from the North Slope and bring it to market."[167]

115. Highest and best use generally considers the most probable use that is physically possible, legally permissible, financially feasible, maximally productive, and results in the highest value.[168] The purpose of a highest and best use analysis is to evaluate alternative uses to assist the appraiser in determining the use which creates the highest value of the property.

116. A highest and best use analysis is not required to be made when valuing property under non-market value standards, including a use value standard, because a use value appraisal is literally valuing the current use.[169] Nonetheless, a highest and best use analysis can be helpful in considering the full and true value of TAPS. "The highest and best use of special-use property as improved is probably the continuation of its current use if that use remains viable."[170] The highest and best use of TAPS is its current use – the transport of ANS oil to market.[171] This use is physically possible, legally permissible, and maximally productive. TAPS would not provide maximum value on a standalone basis.

117. The fee simple interest, as an analytical tool, includes the full bundle of rights subject only to the four powers of government: police power, escheat, eminent domain, and taxation.[172] The taxable property does not include any external interest held by third parties

[172] *The Appraisal of Real Estate* at 122.

who are not TAPS Owners, including any alleged "Shippers' interests."[173] When valuing TAPS for ad valorem tax purposes, the only interests that are valued are the TAPS Owners' undivided fee simple property interests in TAPS' taxable property. The right of a shipper to transport crude oil in a common carrier pipeline does not transfer a portion of the pipeline owner's fee simple property interest to that shipper.[174]

118. TAPS is a regulated common carrier pipeline and must accept and transport tendered oil for transportation without discrimination.

119. The Owners have asserted that the government regulation of the rates for transport on TAPS is a form of police power that diminishes the value of TAPS.[175] Regulation may diminish the value of the regulated property.[176] But as several witnesses testified at the trial, regulation may also have no effect on a property's value or increase its value.[177] This Court has previously held and again finds that an assessment must consider the extent to which the exercise of police power or any other governmental power impacts the value of the particular property being assessed. The Owners presented Professor Swain, Mr. Tegarden, and Mr. Marchitelli as theory witnesses, none of whom offered an opinion on whether regulation resulted in an increase or decrease in TAPS' ad valorem value, but indicated that the effects of rate regulation had to be taken into account.[178]

---

[173] Tr. 12204-05 (Marchitelli).

[174] Tr. 12205-08 (Marchitelli). *Cf.* Tr. 12915-17 (Greeley).

[175] In this regard, the Owners appear to substantially misquote the definition of police power from *The Appraisal of Real Estate* in their proposed findings. The definition from that text does not identify either "income restrictions" or "rate regulations" as forms of police power. *Compare* Owners' Proposed Finding ¶ 789 *with The Appraisal of Real Estate* at 122.

[176] *Wash. Gas Light Co. v. Baker*, 188 F.2d 11, 19 (D.C. Cir. 1950) (citing *Fed. Power Comm'n v. Hope Natural Gas Co.*, 320 U.S. 591, 601 (1944)).

[177] Tr. 447 (Swain); Tr. 10318-10320 (Tegarden); Tr. 12258 (Marchitelli).

[178] Tr. 449 (Swain); Tr. 10318-10320 (Tegarden); Tr. 12261:25-12262:14 (Marchitelli).

120. Assuming, without deciding, that rate regulation is a form of police power, it does not alter the premise of value for TAPS, nor does it require that TAPS be valued for ad valorem tax purposes at the net present value of its projected tariff income. Rather, it requires the assessor to consider whether and to what extent rate regulation impacts the value of TAPS. Under a cost approach to valuation, this issue can be determined when addressing the degree of any economic obsolescence caused by rate regulation.

121. FERC and the RCA do not have jurisdiction to determine the proper value of TAPS for state ad valorem tax purposes. Their valuations of TAPS for purposes of establishing a tariff do not inform this Court as to the value of TAPS for ad valorem tax purposes under AS 43.56.060(e)(2).[179]

122. In 2007, SARB addressed the Owners' assertion that the assessed value of TAPS cannot exceed the value of its regulated tariff income stream.[180] The Board found that "[a] regulated tariff does not produce an income that would capture the current economic value of the pipeline."[181] Further, SARB concluded that "uncertainty about future tariff rates makes any valuation based on the capitalization of future tariffs very unreliable."[182]

123. SARB correctly concluded that tariff income is not the appropriate determinant of the full and true value of TAPS in the applicable tax years.[183] Mr. Hoffbeck's observations

---

[179] *See Tenn. Gas Pipeline Co. v. Town of Hudson*, 766 A.2d 672, 675-76 (N.H. 2000) (holding that replacement cost method, not net book cost method, was the proper method for valuing the pipeline company's FERC-regulated property).

[180] MUN7-0234 at 13.

[181] MUN7-0234 at 13.

on Mr. Mark's testimony that the bulk of the physical assets that are being valued in this case are no longer included in TAPS' rate base demonstrate that a tariff-based approach would fail to value all of TAPS.[184] Case law throughout the nation makes clear that, even under a market value standard, courts do not typically equate net book earnings with value for ad valorem tax purposes.[185]

124. As in the 2006 matter, this Court finds that Mr. Podwalny's description of TAPS as a non-investment property within each Owner's integrated system is consistent with the statute and best supports the Division's and SARB's determination with respect to the economic value of TAPS.[186] To the extent that there is a market for TAPS, it is the ANS producers (or an integrated refinery operation such as Koch). For the evidence persuasively demonstrates that ANS producers would rebuild TAPS at a cost of billions of dollars to transport ANS petroleum products to market if TAPS was not in existence as of the lien dates. And the producers would replace TAPS not for the tariff income they might realize, but to monetize the approximately 7 to 8 billion barrels of proven reserves that were at the ANS as of the lien dates.

---

[184] Tr. 1241-22 (Hoffbeck).

[185] *See Tennessee Gas Pipeline Co. v. Town of Hudson*, 766 A.2d 672, 675-676 (N.H. 2001); *Polk County v. Tenneco, Inc.*, 554 S.W.2d 918, 922-23 (Tex. 1977) (concluding that the net book value did not measure the market value for the entire pipeline's property); *Boston Edison Co. v. Board of Assessor of Watertown*, 439 N.E.2d 763, 766-67 (Mass. 1982) (net book cost of property does not set an upper limit on the property's value for location taxation); *Appeal of Public Serv. Co. of N.H.*, 471 A.2d 1182, 1185-86 (N.H. 1984) (rejecting the taxpayer's argument that evidence demanded a finding that net book value was an appropriate measure of market value for all of utility's property); *Public Service Co. of N.H. v. Town of Ashland*, 377 A.2d 124, 125-26 (N.H. 1977) (holding that even though net book value provides the "rate base" upon which plaintiff's rate of return is calculated, the value of the property for tax purposes and the value for rate making purposes need not be the same); *Public Services Co. v. New Hampton*, 136 A.2d 591, 597 (N.H. 1957) (holding that value of property for tax purposes and its value for rate making purposes need not be the same).

[186] Amended Decision ¶ 91.

125. For the reasons set out above, this Court finds that SARB's determinations for the three tax years at issue, which strived to determine the full and true value of TAPS based on the economic value of its continued use in transporting ANS proven reserves to market, has not been demonstrated to constitute a fundamentally wrong principle of valuation.[187]

V. THE OWNERS' MAINTENANCE OF TAPS' CAPACITY OF 1.1 MILLION BBL/D WITH UPWARD SCALABILITY TO 2.1 MILLION BBL/D

126. TAPS' current design capacity is 1.42 million bbl/d.[188] However, some of the original Legacy pumps have been taken out of service and new SR pumps are being installed at four pump stations. The current upgraded pumps are able to transport up to 1.1 million bbl/d on a yearly average with a maximum of 1.14 million bbl/d during winter months.[189] With additional modular pumps, TAPS' current physical capacity can be increased. For example, Mr. Falcone indicated that if two additional pump stations were added, TAPS could transport 1.5 million bbl/d.[190]

127. Although TAPS cannot immediately transport 2.1 million bbl/d, the evidence persuasively establishes that with sufficient lead time, TAPS as currently configured is able to transport any volume up to 2.1 million bbl/d, should the need arise, with the installation of additional pumps and use of DRA.

---

[187] Amended Decision ¶ 92.

[188] Tr. 7367 (Falcone); MUN7-0215 at 258.

[189] Tr. 7139-7143 (Ray).

[190] Tr. 2730 (Falcone).

128. DB-180 is an Alyeska document that evidences the design basis for TAPS. DB-180 indicates at four places that a throughput range for TAPS is 300,000 to 2.1 million bbl/d.[191] DB-180 also references the maximum or ultimate throughput of 2.1 million bbl/d in an additional four places in the document.[192] Thus, there are eight different places in DB-180 that specifically refer to a 2.1 million bbl/d standard as the maximum throughput of TAPS.

129. In accordance with the requirements of DB-180, the mainline pipe is currently maintained at a 2.1 million bbl/d throughput standard.[193] The evidence at trial persuasively demonstrates that neither the mainline 48-inch pipe nor any other part of TAPS is maintained based upon the current throughput or DOR forecasts for future production, but is instead maintained for considerably higher potential throughputs.[194]

130. Any proposed design change to DB-180 must be approved by the Joint Pipeline Office.[195] No evidence was introduced to demonstrate that DB-180's design criteria have been changed.[196] The Court finds that DB-180 continues to be the controlling document with regard to the design basis for TAPS, and that document sets forth 2.1 million bbl/d as the maximum throughput capacity.[197]

[196] Tr. 7061-62 (Ray).

[197] MUN7-9023 at 209, 217, 239, 262, 268, 343.

131. The evidence at trial demonstrated that the current mechanical capacity of TAPS is 760,000 bbl/d and that with DRA, TAPS is currently physically able to transport 1.1 million bbl/d.[198]

132. In the Amended Capacity Settlement Agreement ("ACSA"), "TAPS Capacity" is a defined term that represents the "Pipeline's capacity set forth on Exhibit C."[199] In turn, "Exhibit C" sets forth the "TAPS Capacity Table" that establishes 1.1 million bbl/d as the "TAPS Capacity" after January 1, 2004 until the Agreement expires at the end of 2011.[200] An Owner's right to transport its percentage ownership share is based upon "Actual Daily Pipeline Capacity" which, in turn, is based upon "TAPS Capacity" as defined in "Exhibit C."[201] Exhibit C indicates "All volumes are in barrels."[202] The associated TAPS' Operating Agreement specifies that a barrel is "42 U.S. standard gallons at 60° Fahrenheit."[203]

133. The ACSA discussed "flow improvement" allocation as:

> [T]he allocation among the Owners of flow improvement that exceeds TAPS Capacity, whether achieved through the use of a drag reducing agent or through other means; provided, however, that such flow improvement shall be exclusive of any Capacity Cushion and shall be allocated only to the extent that it exceeds TAPS Capacity . . . .[204]

The concepts of flow and "flow improvement" with respect to TAPS are concepts related to

---

[198] Tr. 7137-39 (Ray). This Court was unpersuaded by Mr. Ray's testimony that TAPS' current capacity is only 870,000 bbl/d because the Owners would need to spend approximately two million dollars to upgrade DRA injection sites before TAPS could carry 1.1 million bbl/d. *See* Tr. 7049-51 (Ray).

[199] MUN7-0215 at 213.

the flow of oil[205] – which is related to physical capacity, not nominating capacity.

134. This Court finds that as between the Owners, a primary function of the ACSA was to resolve the nominating dispute among them. But the State was also a party to the agreement. Upon consideration of all the evidence, this Court is not persuaded by the Owners' assertion that the ACSA should be read to concern only a nomination process. A right to transport up to an ownership percent of 1.1 million bbl/d would have little meaning without the actual ability to transport those same barrels.

135. The Owners assert that the ACSA could only address nominating issues because FERC approved the ACSA pursuant to § 5(1) of the Interstate Commerce Act, and "Section 5(1) of the ICA applies to the ACSA only to the extent the ACSA provides for a 'pooling' arrangement that allocates pipeline capacity on a basis other than each TAPS Owner's percentage ownership share."[206] Yet the FERC order approving the ACSA does not expressly deem the agreement to constitute a pooling arrangement; rather, FERC stated it is approved "even if the Amended CSA is deemed to be a pool."[207]

136. The Owners' current reading of the ACSA is similar, if not identical, to the "mechanical capacity" position of certain of the Owners that was compromised away when all Owners reached agreement through the ACSA. The "mechanical capacity" position was that each Owner could only transport its ownership share of TAPS' current mechanical capacity.[208]

---

[205] Tr. 7080-81 (Ray).

[206] Owners' Proposed Findings of Fact and Conclusions of Law ¶ 631.

[207] TO-07-0190.0008. In the FERC order approving the ACSA, the Commission also stated, "We concluded that the [TAPS] Quality Bank agreement was no more a pool than the joint operation of TAPS itself. We believe that the same reasoning is applicable to the Amended CSA." TO-07-0190.0007.

[208] Tr. 7062-63 (Ray).

137. The conduct of the Owners after execution of the ACSA further demonstrates that the parties intended for TAPS to have a physical capacity of 1.1 million bbl/d (with 1.14 million bbl/d capacity for winter flow rates). As held by the Alaska Supreme Court, the parties' conduct after entering into a contract is probative of intent. Conduct is a better indicator of intent than is testimony.[209] The Owners used a design basis for the SR project from 300,000 to 1.14 million bbl/d with upward scalability to 2.1 million bbl/d.[210] The SR project is not yet complete, but the Owners plan to complete it.[211] The Court finds that the Owners would not continue to spend over $700 million on SR to provide a capacity to transport up to 1.14 million bbl/d with upward scalability to 2.1 million bbl/d if such capacity and upward scalability were neither required nor desirable. The Alaska Supreme Court has held that "evidence that both parties made substantial investments in the plant supports a conclusion they each intended to retain the items in which they invested[.]"[212]

138. Also instructive to this Court were the Owners' representations to the RCA when seeking to abandon pump stations as part of their SR efforts. In that process, the Owners made a verified representation to the RCA:

> After completion of [Strategic Reconfiguration], TAPS will be able to transport up to 1.14 million barrels per day. Moreover, should there be any additional oil fields brought on line that would cause throughput to exceed the 1.14 million barrels per day figure, the design of the remaining TAPS pump stations will be modular and

Wirum*, 625 P2d. 866, 870 (Alaska 1981) (conduct during performance can be admissible extrinsic evidence but opinions expressed during litigation regarding parties' intent do not establish an issue of fact regarding the parties' reasonable expectations at the time they entered into the contract).

[210] Tr. 9198-99 (Malvick).

[211] Tr. 7140 (Ray).

[212] *North Pac. Processors*, 112 P.3d at 585 (citations omitted).

will allow current and increased throughput capability within 36 months by the addition of modular units[.][213]

139. AS 42.06.290(a) states that "[a] pipeline carrier may not abandon or permanently discontinue use of all or any portion of a pipeline or abandon or discontinue any service rendered by means of a pipeline . . . without the permission and approval of the commission[.]" Such approval may only occur "after due notice and hearing, and a finding by the commission that continued service is not required by public convenience and necessity."[214]

140. The RCA granted the Owners the right to abandon several pump stations based upon the representations of the Owners that they would maintain the capacity to transport 1.14 million bbl/d[215] and their representation "that should North Slope production ever exceed the 1.14 million barrels per day, the design of the remaining operating pump stations will allow for increased throughput capability within 36 months by adding modular units to those pump stations."[216] The RCA order also noted that the TAPS Owners had represented that the abandonment of those several pump stations "will not interfere with the TAPS' ability to accommodate current or future throughput requirements, and will have no impact on the stipulated capacity requirements under the Amended Capacity Settlement Agreement."[217] In a footnote, the RCA noted that the "TAPS carriers stated that the Amended Capacity Settlement Agreement provides a stipulated aggregate capacity of 1.1

[217] MUN7-0219 at 12-13.

million barrels per day for the years 2004 forward."[218] The Court finds that the Owners' representations to the RCA are consistent with this Court's reading of DB-180 and the ACSA. In the 2010 Amended Decision, this Court interpreted the ACSA to require the Owners to maintain a physical capacity of 1.1 million bbl/d. This Court again finds that the weight of the evidence presented at the trial of the 2007 through 2009 tax years supports that contractual interpretation of the ACSA. During the lien years the Owners had a legal duty to maintain TAPS' physical capacity to transport up to 1.1 million bbl/d with upward scalability should new fields be developed.

VI. CHOICE OF VALUATION METHOD

141. All parties agree and every appraiser testified that in appraising a property, appraisers typically consider three generally recognized approaches to value: the cost approach, the income approach, and the comparable sales approach.[219] The cost approach is based upon a principle of substitution.[220] This principle provides that a prudent buyer will not pay more for an existing property than the cost of acquiring a substitute property of equivalent utility.[221] The principle of substitution assumes replaceability without undue delay.[222] Under the income approach, "value is indicated by a property's earning power, based on the capitalization of income."[223] Under the comparable sales approach, "value is indicated by recent sales of comparable properties in the market and other supporting

[222] *The Appraisal of Real Estate* at 380.

[223] *The Appraisal of Real Estate* at 130.

transactional information."[224] All parties fully litigated the issue of whether the cost, income, and sales comparison approaches are reliable indicators of value for TAPS in the 2007, 2008, and 2009 trial de novo.

142. The applicable statute and regulation require an assessment that captures the "economic value" of TAPS within the context of the ANS proven reserves. TAPS' economic value derives from its use in providing primarily affiliated transportation and market access for an entire oil region. Since 2005 through the lien years at issue, SARB has repeatedly held that the cost approach best captures the full economic value of TAPS consistent with AS 43.56.060(e)(2).[225]

143. The unique nature of TAPS as a limited-market and special-purpose property supports SARB's use of the cost approach as the only reliable indicator of value.[226] TAPS was specifically designed, constructed, and adapted to its particular use – to move affiliated ANS crude oil from the North Slope to Valdez.[227] A property with this unique function is properly valued under the cost approach.

144. Owners' expert Roger Marks recognized that if the tariffs are zero, it would be appropriate to value TAPS using the cost approach.[228] Mr. Marks also acknowledged that the Owners would probably operate TAPS even if it had no tariff income.[229]

145. The cost approach is particularly reliable when a property is first built or when

[228] Tr. 7852-55 (Marks).

[229] Tr. 12170 (Marks).

it undergoes a substantial renovation.[230] At the time of the 2007, 2008, and 2009 valuations of TAPS, the $700 million SR project was underway to upgrade TAPS.[231]

146. The extensive cost studies presented by both the Municipalities and Owners further support reliance on the cost approach.

147. An income approach based solely upon tariff income is not reliable for valuing an integrated, special-purpose property that has been adapted to a specific use for which the income stream is not the economic driver or basis for the property's construction and continued use.[232]

148. In its 2009 Decision, SARB explained its rejection of the tariff-based income approach as follows:

> The fact that the TAPS produces a tariff income in addition to transporting oil would not justify reliance on an income approach, as opposed to the generally applied cost approach, because oil transportation, not the TAPS tariff income stream, is the motivation for ownership of the TAPS.[233]

149. The sales comparison approach is generally not reliable for valuing limited-market properties or special-purpose properties such as TAPS when there are no comparable sales, or when the sales that do exist are not comparable because the subject property has been adapted to a particular use at a particular location.[234]

---

150. In addition, the sales comparison approach is not generally used for valuing properties that are integrated with other properties because each sale has to be substantially adjusted to reflect only the portion of the integrated enterprise being valued.[235]

151. The standard treatise for machinery and technical specialties ("MTS") states:

> The income approach to value is not widely used today by most MTS appraisers; the reasons given include the difficulty in determining income that can be directly related to a specific asset, the concern over the reliability of income forecasts, and the multitude of variables involved in this valuation approach. . . . The sales comparison approach is not feasible when the subject property is unique.[236]

152. Other courts have similarly held that regulated pipelines should not be valued for ad valorem purposes under either the income or comparable sales approach.[237]

153. The Division and SARB considered all three of the primary approaches to valuation before determining that the Replacement Cost New Less Depreciation ("RCNLD") approach was appropriate.[238] Based upon the evidence presented at the trial de novo, this Court finds that reliance on the cost approach is appropriate to determine the "full and true" value of TAPS for 2007, 2008, and 2009.

VII. THE COST APPROACH

154. There are three starting points for the application of the cost approach: original cost, reproduction cost, or replacement cost.[239] The use of original cost, either in nominal dollars or indexed to current dollars, is a limited but useful indicator of the cost to build TAPS today. TAPS cost approximately $8 billion to build in 1977 dollars – an amount that the Division calculated as equal to $23.4 billion for 2009 based upon trending the original cost using Marshall & Swift.[240] SARB noted the $19.8 billion Pro Plus RCN compared favorably to the original trended cost for that lien year.[241]

155. Reliance on a trended original cost as the basis for valuing TAPS is not warranted because TAPS' original design has been substantially updated and a trended original cost would not capture the value of the asset in place as of the lien dates.

156. A reproduction cost is the cost to replicate an exact duplicate or replica of what is in place, which could include substantial obsolescence.[242]

157. A replacement cost analysis replaces TAPS' current equivalent utility based on modern design, materials, and construction techniques.[243] The Owners and the Municipalities both presented replacement cost new ("RCN") estimates to the Board and to this Court in the de novo trial, although as discussed herein the Municipalities' RCN was far more similar to the existing TAPS than the RCN presented by the Owners.

[242] *The Appraisal of Real Estate* at 385.

[243] *The Appraisal of Real Estate* at 385-86; Tr. 580 (Remsha).

A. Replacement Cost New

158. RCN is "the current cost of a similar new property having the nearest equivalent utility as the property being appraised, as of a specific date."[244] It has also been defined as "the estimated cost to construct, as of the effective date, a substitute for the [property] being appraised using contemporary materials, standards, design, and layout."[245]

159. In an *Appraisal Journal* article titled *Replacement of What?* that was relied upon by Mr. Hoffbeck at trial, Donald Treadwell opined that:

> The selection of an appropriate replacement model in the cost approach is critical to the appraisal. The use of a replacement model that is significantly different from the subject may challenge implicit assumptions concerning the extent of functional and economic obsolescence incurred by components of the subject.[246]

160. RCN estimates fall along a continuum from a complete redesign to a near reproduction.[247] This Court finds that the concerns raised in the Treadwell article and discussed by Mr. Hoffbeck in the context of the historical examples of redesign persuasively demonstrate why it is important to use the correct replacement property and then adjust the RCN using the tools set out in the appraisal literature such as functional and economic obsolescence adjustments to arrive at the value of the subject property.

161. This Court finds that the evidence does not support the Assessor's apparent assertion that at least some components of the Pro Plus estimate may be reproduction estimates. Rather, the Pro Plus estimate replaced the utility of TAPS, but utilized modern and current design, materials and construction techniques in its design, work plan, and

[247] Tr. 12773 (Greeley).

estimate. And, as further discussed herein, the Assessor's placement of the Stantec design as somewhere in the middle of the continuum between a redesign and a reproduction is not supported by the evidence.

1. A Summary of the Cost Studies

162. In 2007, SARB relied on Mustang Engineering's 2006 RCN trended forward one year, which estimated a replacement cost of $8,276,423,150.[248] At the de novo trial, no party supported the Mustang cost study.

163. Before SARB in 2007, the Owners also presented evidence on a 30-inch pipeline study prepared by Mustang.[249] The conceptual design basis assumptions included: 850,000 bbl/d maximum flow with the use of DRA, X-100 pipe, and seven pump stations.[250] SARB did not rely upon this 30-inch pipeline study in its 2007 decision.[251]

164. In 2008, the Municipalities first presented the Pro Plus study to SARB.[252] The Department and the Board relied upon the Pro Plus RCN cost estimate of $17.02 billion.[253] For that year, Pro Plus adjusted the original cost of the VMT for superadequacy, inflation-trended the revised cost, and accepted Mustang's numbers for several items that they had insufficient information to independently estimate.[254] The estimate was made before any significant discovery had been obtained by the Municipalities.

165. By 2009, Pro Plus had received new information from discovery in the 2006 de novo tax case and had added the expertise of an engineering firm specializing in marine terminals. Before SARB, Pro Plus estimated the RCN of the entire system, including the VMT, at $21.1 billion in 2009.[255] After some adjustment, SARB found that the RCN was $19.805 billion.[256]

166. Also before the Board in 2009 was a hydraulic analysis conducted by Mustang Engineering on behalf of the Owners.[257] The hydraulic analysis assumed a 42-inch pipeline from Prudhoe Bay to Valdez at "the current flow rate of 1 million bbl/d."[258] Mustang concluded that "[t]o obtain a flow rate of 1 MMBOPD [million bbl/d], the 42-inch system requires a full complement of 12 pump stations. There is virtually no capacity over 1 million bbl/d in the 42-inch pipeline."[259] Mustang also conducted a cost analysis between the 42-inch and 48-inch line and concluded that

> [w]hen comparing the base 48" system with a potential 42" system, the 42" system would require an approximate increase in investment, due to the higher horsepower requirements, of $275MM and an approximate decrease due to saving pipe material and installation costs of $150MM. The net investment cost difference is an increase of $125MM for installation of a 42" line versus a 48" line. This rough estimate does not include the additional operating costs for 12 pump stations, as opposed to 6, or spare parts costs (included in the program management fees).[260]

[258] 2009 R. 10343.

[259] 2009 R. 10345.

[260] 2009 R. 10345.

167. In evaluating the Stantec 30-inch pipeline, this Court has accorded some weight to the opinion of the Owners' experts in 2009 before SARB that a 42-inch pipeline was inadequate to transport throughput of over 1 million bbl/d.

168. The Owners first presented the Stantec cost study to SARB in 2010. The Owners presented a similar Stantec cost study to SARB in 2011.

169. In both 2010 and 2011, SARB held that reliance on the Stantec 30-inch pipeline for valuing TAPS "would have been improper" because "costing a hypothetical property that is so different from the existing property, to measure obsolescence, is an extreme and inappropriate use of this appraisal technique."[261]

170. In its Amended Decision, this Court relied upon the Pro Plus RCN and found that as of January 1, 2006, a replacement pipeline with utility equivalent to TAPS would cost approximately $18 billion to replace.[262]

171. At the trial de novo before this Court for the current tax years, the Municipalities presented the Pro Plus cost studies which estimated the cost to replace TAPS' equivalent utility in 2007 at $19.606 billion, in 2008 at $21.471 billion, and in 2009 at $21.263 billion.[263] The Owners presented the Stantec cost studies estimating the cost to replace TAPS with a 30-inch pipeline at $9.352 billion in 2007, $9.702 billion in 2008, and $9.721 billion in 2009.[264]

---

[264] TO-07-0021 at 8; TO-07-0023 at 8; TO-07-0025 at 8. The Stantec figures do not include interest during construction and ad valorem taxes, which were computed by American Appraisal.

172. Pro Plus used a design criteria of 1.1 million bbl/d maximum throughput for all three lien years with a 48-inch diameter pipe size.[265]

173. Stantec used a 30-inch pipeline with a design basis of 900,000 bbl/d for 2007, 800,000 bbl/d for 2008, and 750,000 bbl/d for 2009.[266]

174. The following chart compares some of the design parameters of the existing TAPS, the Pro Plus RCN, and the Stantec RCN:

	TAPS	Pro Plus RCN	Stantec RCN
Diameter:	48"	48"	30"
Maximum Capacity of Mainline Pipe:	2.1 million bbl/d	2.1 million bbl/d	Unknown – no more than 1.1 million bbl/d
Maximum Pressure:	1,180 psi	1,180 psi	2,158 psi
Velocity at 1.1 million bbl/d:	10 ft/s	10 ft/s	15 ft/s
Number of Miles Aboveground:	420	420	629
Vertical Support Members:	Dual-pile	Dual-pile	Mono-pile
Thermosyphons:	Inside VSMs	Inside VSMs	Freestanding
Aboveground Pipe Support Spacing:	60 ft.	60 ft.	90 ft.

2. The Stantec Hypothetical Pipeline Is Not an Acceptable Comparison Property to TAPS for Ad Valorem Tax Purposes

175. The parties extensively litigated whether this Court should adopt the Stantec 30-inch pipeline or the Pro Plus 48-inch pipeline as the basis for the RCN calculation for the 2007, 2008, and 2009 tax years. The Municipalities presented evidence and argued that the Stantec 30-inch pipeline is too different from the existing TAPS such that it cannot provide a reasonable basis for determining the full and true value of TAPS. They further argued that the Stantec 30-inch pipeline is premised on an inappropriate appraisal technique and as a practical matter, it will not be able to operate within reasonable design parameters.

176. The Owners presented extensive engineering testimony in support of the Stantec RCN. They also rely on Mr. Hisey and Mr. Greeley's testimony to support their 30-inch pipeline design. Mr. Hisey testified that a 48-inch pipeline would likely not be the optimal design for a new pipeline if TAPS' throughput was projected not to exceed 900,000 or 700,000 bbl/d. But Mr. Hisey also testified that the optimal size for a pipeline that would be similar to and have the same utility as the existing TAPS would be a 48-inch pipeline. In that regard, he stated "the 30-inch design would not be the right design for any of the operating years . . . in question, 2007, 2008, and 2009 . . . I cannot assess how you call it a similar design to the existing facility; no, it's not similar at all."[267]

177. Although it appeared that the Assessor Mr. Greeley testified that he would choose the Stantec RCN over the Pro Plus RCN, the Department's counsel stated in closing that Mr. Greeley was not choosing between the two cost studies.[268] Regardless, this Court

---

[267] Tr. 5052, 6457-58 (Hisey).

[268] Tr. 6809 (Greeley); 8461 (Johnson).

gives little weight to Mr. Greeley's testimony regarding the Stantec cost study since he demonstrated a lack of knowledge about key components of that study.[269]

178. None of the approximately twenty experts testifying in the RCN section of this case could identify a single crude oil pipeline that had been built with each of the characteristics of Stantec's 30-inch pipeline design.

179. Mr. Hoffbeck identified certain criteria to determine whether a proposed replacement property should be used as the starting point in a cost approach, which this Court has found helpful to consider:

a. whether there are legal restrictions that would make the proposed property unacceptable, and if so whether there is a likelihood they can be removed;

b. whether the proposed replacement property is of similar quality and like utility to the subject property;

c. whether the replacement property is an appropriate application of appraisal theory for use in the assessment process;

d. whether the design will operate as specified;

e. whether the design captures all direct and indirect costs associated with the construction of the replacement property, and if not, whether the estimate can be adjusted to reflect all of those costs; and

f. whether the replacement property is similar enough to the subject property to permit the accurate identification and quantification of obsolescence.[270]

---

[269] For example, Mr. Greeley was unable to answer questions regarding the amount of horsepower required for the pumps in Stantec's cost study, or whether all three trains of pumps need to be running at 1.1 million bbl/d. Tr. 6962-6970 (Greeley). In addition, Mr. Greeley testified that he "looked at the equipment rates that were used for the construction of the Valdez Marine Terminal;" however, Stantec did not determine equipment rates, but rather its equipment costs are based on a percentage of direct labor. *Compare* Tr. 13000-13003 (Greeley) *with* Tr. 2496-97 (Rein).

[270] Tr. 11523-11554 (Hoffbeck).

a. Legal Restrictions

180. The TAPS Owners have commited to the RCA to maintain and expand TAPS' existing capacity if needed in the future. The Stantec design is inconsistent with these commitments and resultant RCA order and would require RCA approval.[271] This Court finds such approval improbable. The RCA would have to determine that the abandonment of TAPS' current 1.1 million bbl/d capacity and its upward scalability above that throughput is in the public interest – a finding likely to be challenged by existing and future stakeholders seeking to expand and optimize Alaska North Slope development.[272]

181. The Stantec RCN pipeline also does not meet the design specifications for the existing property as found in Alyeska's DB-180.[273] The DB-180 under the Design Criteria Section 4.3.2 specifies that:

> TAPS is designed to transport crude oil from Prudhoe Bay to Valdez, Alaska. Throughput range for the system is .3 to 2.1 MMSBPD [million bbl/d] under steady conditions of operations, although it should be noted that this may require installation of short term DRA injection facilities at various locations to reach the high end of this range.[274]

The General Hydraulic Criteria and Considerations Section of DB-180 states:

> [t]he mainline and facilities of the trans-Alaska pipeline system shall be designed to transport crude oil or other hydrocarbons from Prudhoe Bay, Alaska at nominal rates to Valdez, Alaska between 0.3 to 2.1 MMSBPD [million bbl/d]. Hydraulic design criteria shall apply to the mainline, mainline facilities, and connection facilities throughout this range of design mainline unless otherwise specified.[275]

---

[271] AS 42.06.290(a).

[272] Tr. 11526 (Hoffbeck).

[273] Tr. 4466 (Steindoff); Tr. 5170 (Riordan); Tr. 3391-92 (Annett).

[274] MUN7-9023 at 209; Tr. 4956, 4985, 4989-90, 5055-56, 6445 (Hisey).

[275] MUN7-9023 at 217; Tr. 5056-19 (Hisey).

DB-180 also states that, "[t]he mainline pumps at the designated pump stations are required to pump from 0.3 to 2.1 MMSBPD [million bbl/d]."[276] The piping systems are also "maintained to sustain maximum operating conditions up to 2.1 million barrels per day under all operating conditions allowed per *49 CFR 195, Transportation: Transportation of Hazardous Liquids by Pipeline*."[277] Although TAPS cannot currently transport 2.1 million bbl/d, if the pump stations that have been ramped down are brought back on line and DRA injection sites upgraded, then TAPS can transport 2.1 million bbl/d.

182. While Mr. Riordan of Alyeska suggested that DB-180 could be unilaterally changed by the Owners without following the formal process outlined in the DB-180, the evidence at trial persuaded the Court otherwise.[278] The DB-180 clearly provides that the Joint Pipeline Office ("JPO") must approve any change or variance of the TAPS design basis criteria set forth in DB-180.[279] And while Mr. Hisey, former Chief Operating Officer for Alyeska, acknowledges that editorial changes, such as naming buildings, are made to the DB-180 without regulatory approval, he could not recall any specific change to the DB-180 related to capacity or throughput that was made without regulatory approval.[280]

183. Further, as discussed above, this Court has again concluded that the Amended Capacity Settlement Agreement required the TAPS Owners to maintain at least 1.1 million bbl/d capacity during the lien years.

[280] Tr. 4988-89 (Hisey).

184. The Owners failed to establish by a preponderance of the evidence that the existing RCA requirements and the DB-180 design basis would permit the Stantec 30-inch pipeline to be built as a replacement for TAPS.[281]

b. The Stantec Design Is Not of Similar Quality and Like Utility

185. A replacement property should be "a similar new property having the nearest equivalent utility as the property being appraised."[282]

186. Utility in the appraisal context is not necessarily limited to how the property is currently being used.[283] The Owners' lead appraiser, Mr. Remsha, acknowledged that a 30-inch pipeline and 48-inch pipeline have "quite different utility from each other."[284] "By definition, utility is any aspect of the property that would create a desire for ownership. It's significantly different from the concept of usefulness, which is how it is currently being used."[285] Mr. Hoffbeck persuasively testified that TAPS' utility is more than its ability to ship oil at the current throughput levels[286] – it also includes TAPS' flexibility and upward scalability.

187. TAPS is 48 inches in diameter; the Stantec RCN is 30 inches. Mr. Remsha indicated that he has never before used a different diameter replacement pipe than the subject property for an RCN.[287]

---

[281] Tr. 822 (Podwalny).

[282] *Valuing Machinery and Equipment* at 44.

[283] Tr. 1060 (Hoffbeck).

[284] Tr. 12502 (Remsha).

[285] Tr. 1061 (Hoffbeck).

[286] Tr. 11532 (Hoffbeck).

[287] Tr. 579, 12506 (Remsha).

188. Mr. Remsha acknowledges that the design capacity for TAPS as of the lien dates was 1.42 million bbl/d.[288] Yet American Appraisal based their RCN on a pipe that could not meet that design capacity of TAPS, no matter how much DRA is used.[289]

189. At Stantec's 1.1 million bbl/d case, the 30-inch pipeline will be operating over 15 feet per second ("ft/s").[290] For Stantec's 2007 case, the velocity will be 12.7 ft/s; for the 2008 case, the velocity will be 11.3 ft/s; and for the 2009 case, the velocity will be 10.6 ft/s.[291]

190. The current TAPS, as well as the Pro Plus RCN, will operate at velocities of less than 10 ft/s for throughputs of up to 1.1 million bbl/d.[292] In defending the high velocities in their design, Alyeska engineer Joe Riordan testified that TAPS' velocities "approach[ed] 12 feet per second" when throughput was at its very highest at 2.136 million bbl/d.[293] However, TAPS was built with robust engineering to transport 2.1 million bbl/d at high velocities for temporary periods of time. In contrast, the Stantec design is built only to the minimum specifications necessary to transport the throughput for each of the lien years at issue. Moreover, at 2007 throughputs and at 1.1 million bbl/d, the Stantec RCN is designed to operate at velocities well above the maximum ever attained on TAPS' 48-inch mainline pipe.

---

[288] Tr. 534, 12506-07 (Remsha).

[289] Tr. 2086 (Pietsch).

[290] Tr. 4489 (Steindorff) (relying on MUN7-1182).

[291] Tr. 4489, 4504-07 (Steindorff) (relying on MUN7-1182).

[292] Tr. 4489, 4506-07 (Steindorff).

[293] Tr. 1594 (Riordan).

191. In comparing existing and planned pipelines ranging from 30 inches to 42 inches in diameter, the highest velocity is 7 ft/s.[294] The evidence persuasively demonstrates that the high velocities in Stantec's RCN exceed industry standards for crude oil pipelines and may cause surge pressure issues.[295]

192. TAPS was constructed and is operated at typical pressures for North American pipelines. DB-180 requires that the TAPS' internal design pressure be between 700 psi and 1180 psi, depending on the grade of pipe.[296] Similarly, Pro Plus's design operates at 1,180 psi.[297]

193. The Stantec 30-inch pipeline operates at far higher pressures than TAPS or a typical long-distance crude oil pipeline.[298] Stantec's design operates at 2,158 psi – approximately twice the pressure of the existing TAPS.[299]

194. There is no evidence in the record of a long-distance crude oil pipeline operating at such high pressures in North America.[300]

---

[294] Tr. 4489 (Steindorff) (relying on MUN7-1182).

[295] Tr. 4489-90, 4504-07 (Steindorff) (relying on MUN7-1182). DB-180 requires that the surge pressure rises do not exceed the internal design pressure by more than 10%. MUN7-9023 at 156.

[296] MUN7-9023 at 156, 174.

[297] Tr. 4469 (Steindorff).

[298] Tr. 3802-03 (Ellwood); Tr. 2032-34 (Pietsch); Tr. 2971-73 (Ziehr); Tr. 5152 (Riordan); Tr. 4469-70 (Steindorff); Tr. 4953-54 (Hisey); MUN7-0009 at 4-5; MUN7-0029.

[299] Tr. 4469 (Steindorff).

[300] Tr. 2035-36 (Pietsch) ("Q. Has any 30-inch high pressure crude oil pipeline ever been demonstrated to operate in the world? A. At what we designed the pressure? No."); Tr. 2032-34: 18 (Pietsch) ("Q. Are you aware of any cross-country crude oil pipeline that operate at over 2000 psi? A. No"; "Q. Are you aware of any long-distance cross-country crude oil pipeline that operates at 1500 psi? A. I'd say no"); Tr. 2972 (Ziehr) ("Q. In fact, you are not aware of any pipeline in the world that's a cross-country crude oil pipeline that operates 1400 psi, correct? A. Personally not aware of it, correct"); Tr. 2971 (Ziehr) (acknowledging that his company had never built a cross-country crude oil pipeline anywhere that operated above 1480 psi); Tr. 5152 (Riordan) ("Q. Have you ever done a project—a cross country pipeline project at these kinds of pressures in the past? A. No, sir"); Tr. 3116-17 (Meyer) ("Q. Are you aware of any ... long-distance crude oil pipeline in the world that operates above 1480? ... A. I am not.").

195. Through cross-examination of a Pro Plus expert, the Owners referred to one example of a high-pressured crude oil pipeline, the 30-inch Endymion. However, the Endymion is a 90-mile subsea pipeline that has an entirely different design related to the external water pressure on the underwater pipe.[301] This Court does not find this subsea pipeline to be similar to TAPS.

196. The operation of a pipeline at higher operating pressures is not as operationally or environmentally safe as the operation of a pipeline at lower operating pressures.[302] Operation at higher pressure also requires greater horsepower and has less of a safety margin than operation at lower pressures.[303]

197. The Stantec design does not have equivalent utility to TAPS with respect to operating pressure.

198. At any given throughput level a 30-inch pipeline will require more horsepower than a 48-inch pipeline due to frictional loss.[304] For example, at a flow rate of 800,000 bbl/d, the 30-inch pipeline requires approximately 110,000 horsepower while the 48-inch pipeline requires approximately 58,000 horsepower.[305]

199. The Stantec 30-inch pipeline would require more DRA than a 48-inch pipe at any given throughput.[306] Very large amounts of DRA are necessary to attempt to reach 1.1 million bbl/d throughput.[307] This is substantially different from the existing TAPS.

---

[301] Tr. 3941-42 (Ellwood). Mr. Riordan acknowledged that the Endymion is not a cross-country pipeline. Tr. 5155 (Riordan).

[302] Tr. 4960-62 (Hisey).

[305] Tr. 4472-75 (Steindorff); MUN7-0008 at 24.

[306] Tr. 5063 (Hisey).

200. The aboveground portions of TAPS' mainline pipe are supported on dual-pile vertical support members ("VSMs") with thermosyphons integrated into the design to maintain the appropriate ground temperature. VSMs are a unique method for supporting aboveground pipe in areas where there is concern that the warm crude oil pipeline would thaw the permafrost, causing settlement that may result in loss of support for the pipeline.[308] Thermosyphons help maintain the tundra in a frozen state as necessary. The aboveground VSMs on TAPS are in a zig-zag pattern to accommodate pipe expansion and contraction, as well as seismic activity which they have successfully withstood.

201. Unlike TAPS, the aboveground portion of Stantec's 30-inch line is supported almost entirely by single or mono-pile VSMs.[309] While there are mono-pile VSMs on the Alaska North Slope and at Valdez, the evidence persuasively demonstrates that mono-pile VSMs have never been proven to support long-distance crude oil transmission pipelines or pipelines in warm permafrost zones.[310]

202. The mono-pile VSMs that have found limited use have not been integrated with thermosyphons to maintain ground temperatures.[311] One of the Owners' experts, Mr. Carson, testified that he is unaware of the use of thermosyphons with mono-pile supports

---

[307] MUN7-1553.

[308] MUN7-0008 at 15.

[309] TO-07-0021 at 10.

[310] Tr. 3115 (Meyer) ("Q. Are you familiar with any cross-country crude oil pipelines built on monopiles that ... has not been built into frozen ground. A. On monopiles, no, I am not. Q. Anywhere in the world today? A. I am not"); Tr. 4466 (Steindorff) ("The unproven technology and the application thereof is in the form of the mono-piles and the thermosyphons. We know of no long-distance, cross-country pipeline of any size that's on mono-piles. I don't think anybody's given us an example yet"); Tr. 4483-84 (Steindorff); Tr. 4973-74 (Hisey) (Stantec's mono-pile design has not been tested with the size of line and conditions that would be required for the 800 mile pipeline from Pump Station 1 to Valdez, unlike the original TAPS' VSM design which was subject to full scale testing for an extended period of time, to ensure adequate lateral support, so that if the pipeline moves, it will not affect the loading on the VSM"); Tr. 6454-66 (Hisey).

[311] Tr. 3803-05, 3816-18 (Ellwood); Tr. 3202-03 (Carson).

anywhere in the world.[312] He testified that he would do full scale testing of the technology for at least a season or two in the field before relying on it for a project like the replacement of TAPS.[313] Likewise, Mr. Ellwood testified that he knows thermosyphons work and he knows mono-piles work, but he has never seen this combination supporting a major oil pipeline in a warm permafrost region.[314] In addition, pipeline operations could be impacted because there is no mechanical protection for the freestanding thermosyphons in the Stantec RCN.[315]

203. The thermosyphon study used in the Stantec replacement estimate was prepared by John Zarling, who was not a witness at trial.[316] Dr. Zarling's files were not provided to opposing counsel in discovery, nor had they been provided to the trial witnesses sponsoring the Stantec thermosyphons, Dr. Meyer and Mr. Carson of Michael Baker.[317] Thus, Mr. Carson could not tell the Court whether Dr. Zarling's analysis was correct,[318] and the Owners did not persuasively establish that the thermosyphon approach proposed for the Stantec 30-inch pipeline study is reliable.[319]

204. This Court finds that Michael Baker's mono-pile VSM design at 90-foot spacing does not provide the same level of pipe support and redundancy as the existing dual-pile

---

[312] Tr. 3210 (Carson).

[318] Tr. 3209 (Carson).

[319] Tr. 3200-3202 (Carson).

supports at 60-foot spacing on TAPS.[320] Evidence was presented that the smaller the diameter of the pipe, the closer the necessary spacing becomes.[321] And yet Stantec has proposed to increase the spacing from 60 feet to 90 feet for its 30-inch pipeline. The Owners' experts, Dr. Meyer and Mr. Carson, testified that if two adjacent supports failed, the Stantec pipeline would touch the ground.[322] Dr. Meyer acknowledged that the existing TAPS design requires that the pipe remains suspended in the event of two adjoining VSM failures.[323]

205. The Stantec pipeline design work by Michael Baker also deviates from DB-180 for geometry changes, wind loading, and temperature differentials.[324]

206. Over two hundred more miles of the Stantec 30-inch pipeline are aboveground and supported by VSMs than on the current TAPS.[325] The evidence persuasively showed that there are more safety risks and reliability issues for an aboveground pipeline.[326]

207. The decision to build the majority of the pipeline aboveground was not made by the Owners' structural engineer experts (Dr. Meyer and Mr. Carson) who were hired to design the VSMs, but rather by the Owners' hydraulics expert, Mr. Pietsch.[327] Dr. Meyer and Mr. Carson were told that the majority of the pipeline needed to be built aboveground so as to aid Mr. Pietsch's hydraulics and heat transfer.[328]

---

[320] Tr. 4466, 4484 (Steindorff); Tr. 3128 (Meyer).

[325] Tr. 3198 (Carson); TO-07-0021 at 10 (stating "[m]ajor portions (approximately 629 miles) of the pipeline are constructed aboveground using Vertical Support Members (VSM)"). *Cf.* MUN7-0001 at 490.

[326] Tr. 3801 (Ellwood).

[327] Tr. 3118 (Meyer).

208. Michael Baker's report "Aboveground Pipeline Verification" provides several pipe configurations, including 90-degree bends. These bends are needed in the Stantec design to take up the growth/shrinkage of the pipeline as it expands and contracts with changes in temperature.[329]

209. Mr. Pietsch indicated that he did not account for the 90-degree bends in his simulations and acknowledged that the use of 90-degree bends would affect the simulation results since every bend carries a pressure drop in the oil.[330]

210. For the foregoing reasons, this Court finds that the Stantec pipeline, including the mono-pile VSMs and thermosyphon design, is of lower or lesser quality than the current design on TAPS.

211. A work pad is an area built up with additional fill and stabilized to provide a site on which to perform work.[331] Pro Plus and Stantec disagree on whether gravel or ice should be utilized for the work pad on that portion of the right-of-way located north of the Brooks Range.[332]

212. Use of ice pads could complicate the construction of a new pipeline, as it would eliminate the ability to perform any construction during a significant portion of the year where neither ice nor snow would be available to construct roads or pads.[333]

---

[328] Tr. 3118-19 (Meyer). Mr. Rein, the primary witness on the Stantec RCN, testified that he was unaware that Mr. Pietsch had decided the percentage of the Stantec pipeline that would be aboveground. Tr. 5304 (Rein).

[329] TO-07-013 at 12-14.

[330] Tr. 2030-32 (Pietsch); Tr. 6668 (Ellwood).

[331] Tr. 3862 (Ellwood); MUN7-0008 at 7.

[332] *Compare* MUN7-0008 at 14 *with* TO-07-0021 at 21.

[333] Tr. 6484 (Tise).

213. The continuing utility of an ice pad is far less than the utility of a granular work pad. Alyeska has continued to maintain the gravel work pad for over 30 years for contingency purposes and for oil spill response. It is also useful to deploy personnel, heavy equipment, and materials for maintenance purposes.[334]

214. The fact that Stantec will not have a granular work pad adjacent to all of the 800-mile pipeline means that the Stantec RCN is of lesser utility than TAPS in this regard.

215. In the Keystone Canyon area, Michael Baker selected a different route for the Stantec RCN from the current route, placing the 30-inch pipeline along the highway. Although this new route could cause disruptions to the community and traffic and safety issues for the public during construction,[335] this Court finds that the Stantec proposed re-route would provide the same or similar utility as the current TAPS route.

216. Dr. Hite, an expert witness for the Municipalities, persuasively testified that large quantities of technically and economically recoverable oil exist in the Beaufort and Chukchi Seas, the Alaska National Wildlife Refuge, the National Petroleum Reserve Alaska, and the Central North Slope. Dr. Hite cited to a number of sources to support his testimony, including a federal evaluation and assessment of oil resources in Arctic Alaska that estimates there are potentially 30.85 billion barrels of economically recoverable oil available for shipment down TAPS.[336]

---

[334] Tr. 1243-45 (Baldridge).

[335] Tr. 5797 (Karlik); Tr. 3860-62 (Ellwood); Tr. 4165 (Tise); Tr. 4471-72 (Steindorff).

[336] Tr. 9613-26 (Hite); MUN7-001 at 4226.

217. Dr. Hite persuasively testified that if production within the National Petroleum Reserve-Alaska, the Chukchi Sea, and the Beaufort Sea were brought online, ANS production could total 1.5 million bbl/d.[337]

218. Although the potential recoverable oil reserves identified by Dr. Hite are not proven reserves, Dr. Hite's testimony is relevant in determining TAPS' utility and what constitutes an appropriate replacement property that is reflective of TAPS' utility. This is best reflected by the fact that the TAPS Owners are maintaining upward scalability of TAPS so as to be able to transport increased throughputs.

219. Stantec's pump station design is based on the assumption that the throughput rates during the lien years are the maximum throughputs.[338] The Owners' hydraulics expert Mr. Pietsch indicated that his 1.1 million bbl/d simulations for the Stantec RCN "were not the design plan rates. They were what I would call a maximum capacity test."[339] Mr. Pietsch added, "To me, maximum capacity is the highest...the system can flow at."[340]

220. Mr. Pietsch also performed a tank utilization study for the VMT, but testified that the maximum volume he used to determine tank utilization was 739,000 bbl/d.[341]

221. This Court finds that for the purposes of determining TAPS' value under the RCNLD method, a proposed replacement pipeline (before depreciation) must have an upward and downward flexibility to transport levels of throughput that is similar to the existing pipeline. Stantec's design significantly narrows the broad range of operating

---

[337] Tr. 9629-31(Hite).

[338] Tr. 5317 (Pietsch) (Stantec pipeline could not transport 2.1 million bbl/d; "It is designed for the throughputs that are used for each tax year.")

capacities and conditions of the current TAPS, and thus does not have flexibility in throughput levels that is similar to the current TAPS.[342] It is not of similar quality and like utility to the existing TAPS.

c. Appraisal Theory

222. Under the cost approach, the goal is to estimate the cost of a new property with equal utility to the subject property, not a new plant with new utility.[343] When as a factual matter, the physical plant, the capacity, the operations, and the capabilities of a hypothetical plant are different from the subject property, it does not give sufficient guidance on how to value the existing subject property.[344] This is particularly true where the components of the subject property all contribute to the value of the property.

223. Other tribunals have found that a substitute property cannot be so dissimilar from the asset being valued that it does not represent a reasonable substitute. For example, in *American Crystal Sugar Company v. County of Polk,* the Minnesota Tax Regulation Division addressed whether it was proper appraisal practice under the cost approach to rely upon a cost study utilizing a hypothetical property with a substantially different design and capacity.[345] The taxpayer argued that if the property were replaced, the building would be vastly different, but its expert appraiser could not identify any current

---

[343] *The Appraisal of Real Estate* at 385; *Valuing Machinery and Equipment* at 44; Tr. 580 (Remsha); *American Crystal Sugar Co. v. County of Polk*, 2009 WL 2431376 at 21 (Minn. Tax Regular Div. 2009); *Fire Ins. Exch. v. Superior Court of Los Angeles*, 10 Cal. Rptr. 3d 617, 635 (Cal. App. 2d 2004); *Xerox Corp. v. Board of County Commissioners*, 87 P.3d 189, 192 (Colo. Ct. App. 2003) (holding that the cost approach is essentially an estimate of the cost of replacing the subject property with a new property that is equivalent in function and utility).

[344] *American Crystal Sugar Co. v. County of Polk*, 2009 WL 2431376 at 21 (Minn. Tax Regular Div. 2009).

[345] 2009 WL 2431376 at 18 (Minn. Tax Regular Div. 2009).

sugar beet plant that incorporated all of the modern design features that he proposed.[346]

The Minnesota tax division found that:

> As a factual matter, under the Petitioner's cost approach, the physical plant, the capacity, the operations and the capabilities of the hypothetical plant are completely different [than what exists]. While the hypothetical plant may be an ideal standard, it does not give us sufficient guidance in how to value [the existing property] as it stands.[347]

The tax division further explained:

> Under the cost approach we seek to value the building of a new plant with equal utility, not new utility. This would be like asking an appraiser to value a modest three bedroom house and getting back an appraisal on a ten bedroom mansion because that is what the owner would really want to build.[348]

Like the taxpayer in *American Crystal Sugar Company v. County of Polk,* the Owners' cost study is based on a hypothetical property that has very different capacity, operations, and capabilities than what currently exists on TAPS.

224. The Ohio Tax Board in *General Motors v. Cuyahoga County Board of Revision* reached a similar conclusion:

> Appellant has failed to demonstrate that its theoretical Greenfield model is, in fact, an "equal" substitute for this facility. Its characteristics vary substantially. It is much smaller. This, in our view, limits its flexibility for adaptation of other uses. It is less likely to be adaptable to shifts in future production requirements because of this limited size. Less space is available for storage or other ancillary needs. Its utility is not "equivalent."[349]

---

[346] 2009 WL 2431376 at 18 (Minn. Tax Regular Div. 2009).

[347] 2009 WL 2431376 at 19 (Minn. Tax Regular Div. 2009).

[348] 2009 WL 2431376 at 19 (Minn. Tax Regular Div. 2009).

[349] *General Motors v. Cuyahoga County Board of Revision,* 1995 WL 38387 *13 (Ohio Bd. Tx. App. 1995).

225. The Owners have referenced *Chevron U.S.A., Inc. v. City of Perth Amboy*[350] and assert that it is more on point than *American Crystal*. The Perth Amboy refinery was a fully integrated crude oil refinery until mid-1983 with a rated capacity of 168,000 bbl/d that processed a range of crude oils and produced a range of finished products.[351] After mid-1983, it became a 60,000 bbl/d refinery of heavy crude producing only one product: asphalt.[352] The New Jersey Tax Court held in 1988 that the property was correctly valued as an asphalt plant, as it could not return to full operations without a substantial investment – at a minimum, approximately $80 to $100 million.[353]

226. Unlike the Perth Amboy refinery, which had been an asphalt plant for five years at the time of the Tax Court's decision, TAPS' capacity and utility are unchanged – it is not currently a 30-inch, high pressure pipeline on mono-pile VSMs with freestanding thermosyphons.

227. A replacement property that does not incorporate all of the utility of the existing facility assumes that market participants do not place a value on all of the capabilities of the existing facility. But here, the evidence persuasively demonstrates that value has been placed on all of the capabilities of the existing facility including the ability of the 48-inch pipe to transport up to 2.1 million bbl/d of throughput. In effect, the Owners would redefine the subject property which is TAPS to instead constitute a pipeline that only transports the current throughput, with limited upward scalability. In this Court's view, such an approach is

---

[350] 10 N.J. Tax 114 (N.J. Tax Ct. 1988), *superseded by Chevron U.S.A. v. City of Perth Amboy*, 11 N.J. Tax 480 (N.J. Super. App. Div 1989).

[351] *Perth Amboy*, 10 N.J. Tax at 118.

[352] *Perth Amboy*, 10 N.J. Tax at 118.

[353] *Perth Amboy*, 10 N.J. Tax at 147.

inconsistent with appraisal theory and would result in a fundamentally improper valuation of TAPS. Instead, under appraisal theory, the statute's directive to accord "due regard" to the proven reserves and the current throughput should be addressed in the context of depreciation, and specifically economic obsolescence, of the subject pipeline.

228. Mr. Greeley, the State Assessor, testified that he had no specific knowledge of any cross-country pipeline in Alaska being valued by the Department based on a replacement cost new redesign that used a different diameter pipe than existed in the subject property.[354]

229. AS 43.56.060(e) directs that a pipeline be assessed "with due regard to the economic value of the property based on the estimated life of the proven reserves."[355] Under standard appraisal theory, this statutory language does not warrant nor require that the existing property's upward scalability be ignored.[356] Rather, the RCN should be based upon TAPS' actual design capacity. The fact that TAPS has upward scalability to carry throughputs of up to 2.1 million bbl/d enhances the pipeline's value. The Stantec design does not adequately incorporate this upward scalability.

d. The Stantec Design Is Unproven and Unknown

230. For many of the same reasons that this Court concluded that the Stantec design is not of similar quality and like utility to TAPS, the Court was not persuaded that the Stantec 30-inch pipeline design is physically possible and capable of being safely and effectively operated. The Stantec hypothetical 30-inch pipeline is, in part, based upon the

---

[354] Tr. 6851-52 (Greeley). *See also* Tr. 12679 (Greeley); Tr. 6905 (Goodwin) (testifying that common carrier pipelines in Alaska are not valued based on redesign studies).

[355] AS 43.56.060(e)(2) (emphasis added).

[356] *See generally Valuing Machinery and Equipment* at 99-100.

application of design criteria that are unproven for cross-country pipelines, including its high pressure and its mono-pile VSMs without internal or integrated thermosyphons.[357]

231. A proposed replacement property should actually exist or be based on a proven design and technology for a particular environment, rather than based on an untested concept that does not have the same capability or utility as the existing subject property.[358] This Court found Mr. Connolly's testimony regarding this topic to be particularly persuasive.[359]

232. When Stantec decided to use a 30-inch pipe for their cost estimate, they gave no consideration to a 1.1 million bbl/d throughput capacity.[360] That higher capacity was added several months later.[361]

233. Stantec uses six pump stations for its 2007 RCN, based on a design capacity of 900,000 bbl/d. It has five pump stations at the 750,000 bbl/d case for 2009.[362] To transport 1.1 million bbl/d, Stantec adds a seventh operating station.[363] This variation in pump stations for different throughputs is an indication that the Stantec design has minimal flexibility.[364] Mr. Hisey testified, "The 30-inch line that's running at or near its maximum design capacity, in my mind, wouldn't have much flexibility left. There wouldn't be much

---

[357] Tr. 4646-48 (Steindorff).

[364] Tr. 4472-77 (Steindorff)

room for error. There wouldn't be much room for catch-up, either on day-to-day basis or a long-term basis."[365]

234. The Stantec design as proposed requires 80% drag reduction from DRA in order to be able to transport 1.1 million bbl/d.[366] Mr. Pietsch's initial simulation in November 2009 based on a lower design capacity assumed 50%-65% drag reduction was reasonable. But in December 2010, Mr. Pietsch increased that to 80% drag reduction after acknowledging that there was not enough horsepower in the pumps to transport 1.1 million bbl/d if only 65% drag reduction was achieved.[367]

235. Mr. Pietsch utilized 80% drag reduction in his 1.1 million bbl/d simulation but acknowledged that he does not know of any other cross-country crude oil pipeline that operates with over 50% drag reduction effectiveness.[368] Although Mr. Pietsch had authored papers on DRA reduction, he was not aware of any published literature using that high of a level of drag reduction.[369] The maximum DRA reduction that he has ever seen for a crude oil pipeline was a simulation of the original TAPS Legacy pumps at 60%.[370]

236. Stantec relied on a promotional ConocoPhillips web page regarding a DRA product that indicated an 80% drag reduction could be attained. But the 80% drag reduction advertised on the web page is for an unspecified light crude and does not indicate pipe diameter or velocity (both of which could affect DRA performance).[371]

---

[365] Tr. 4960 (Hisey).

[366] Tr. 2076-81 (Pietsch); Tr. 5148-49 (Riordan); Tr. 8078-80 (Modisette); Tr. 3865-66 (Ellwood), Tr. 4492-94 (Steindorff).

[367] Tr. 2076-79 (Pietsch); Tr. 8078-80 (Modisette).

[368] Tr. 2079 (Pietsch).

[369] Tr. 2079 (Pietsch).

[370] Tr. 2080 (Pietsch).

[371] Tr. 8103-07 (Modisette).

237. Dr. Modisette persuasively testified that there would be significant degradation of the DRA in the Stantec pipeline caused by the shear stress at the wall due to the higher flow velocity in the 30-inch pipeline.[372]

238. This Court was not persuaded that the requisite levels of drag reduction could be achieved on the Stantec pipeline.

239. Mr. Steindorff and Mr. Ellwood relied upon exhibit MUN7-1182, which lists seven pipelines with flow rates between 450,000 bbl/d and 1.0 million bbl/d, to support their opinion that the Stantec 30-inch pipeline design cannot effectively transport the actual throughputs during the lien years or the design criteria for TAPS.[373] All of these pipelines have a larger diameter than the Stantec pipeline. Consistent with these findings, several witnesses testified that they do not know of a 30-inch pipeline anywhere in the world today that operates in excess of 500,000 bbl/d.[374]

240. Mr. Pietsch acknowledged that he has never simulated a 30-inch diameter pipeline that was actually constructed in which the design capacity was 1.1 million bbl/d, 900,000 bbl/d or 700,000 bbl/d.[375] He has never before simulated a 30-inch crude oil pipeline that had one half the 1.1 million bbl/d flow rate of what he simulated in this case – i.e. 550,000.[376] Further, Mr. Pietsch did not know of a 30-inch crude oil pipeline anywhere in

---

[372] Tr. 8113-14 (Modisette).

[373] Tr. 6664-65 (Ellwood) (testifying that he relied upon exhibits MUN7-1196 to MUN7-1199, which include the underlying data for MUN7-1182); Tr. 4454-55 (Steindorff).

[375] Tr. 2029, 2072 (Pietsch).

[376] Tr. 2029, 2031-32 (Pietsch).

the world that was operating at 1.1 million bbl/d.[377] And he acknowledged that Stantec's ability to transport any throughput above 1.1 million bbl/d would be very limited.[378]

241. Mr. Pietsch also indicated that he had not done a simulation to show that the Stantec Valdez Terminal could operate at 1.1 million bbl/d.[379]

242. Many of the Owners' witnesses expressed absolute confidence in the design of the Stantec RCN. But this Court was left unpersuaded that the high level of confidence that was expressed was supported by the evidence. In this regard, the Court notes that the very high level of confidence with the 30-inch Stantec design was in direct contrast to the markedly pessimistic testimony by the Owners' witnesses about the ability of TAPS to operate below 300,000 bbl/d.

243. The Owners failed to persuade this Court that the Stantec design could operate as designed. Rather, this Court finds its design is unproven and unknown.[380]

e. The Stantec Design Does Not Capture All Costs

244. An RCN cost estimate should include all of the indirect and direct costs necessary to actually engineer and construct the replacement property. This Court was not persuaded that the Stantec RCN adequately captured all those costs. To cite one example, Stantec's study is not close to final bid, yet it has a contingency of less than 4%.

---

[377] Tr. 2029-30 (Pietsch).

[378] Tr. 2086 (Pietsch)

[379] Tr. 2093 (Pietsch).

[380] Tr. 11541 (Hoffbeck).

f. The Stantec Design Does Not Permit Adequate Quantification of Obsolescence

245. This Court finds that using an RCN with a smaller design capacity in order to take into account the obsolescence inherent in a subject property which is not using all of its capacity would result in over-counting of depreciation if that same obsolescence is also deducted from the reduced sized RCN in the depreciation stage of the cost analysis.[381]

246. Additionally, adopting an RCN that is markedly dissimilar to the actual property being assessed and is instead designed based only on projected throughputs during each lien year would substantially increase the costs associated with determining the value of TAPS each year, since such an approach would likely require a new RCN each year with each increase or decrease in the throughput. In this regard, Mr. Hoffbeck's explanation of Mr. Treadwell's analysis is persuasive: the complications associated with a property redesign for a replacement cost study should be avoided. Instead, any obsolescence in the subject property may and should be cured with obsolescence adjustments to an RCN of similar quality and like utility to the subject property.[382]

247. The Stantec team has had extensive experience working in Alaska and other cold climates, as well as with Alyeska. Overall, this Court finds that the team effectively and capably undertook the task they were charged to undertake – to design a pipeline that appears to meet the minimum operating standards possible for crude oil transportation at the lowest cost, based on a design capacity determined from average daily throughput for each of the lien years. But, as explained in the above findings, that hypothetical pipeline is not an appropriate RCN to use to determine the assessed value of TAPS.

---

[381] Tr. 11543-54 (Hoffbeck).

[382] Tr. 1056 (Hoffbeck).

248. Alyeska employee Joe Riordan's loyalty and commitment to his employer was established beyond a reasonable doubt. And Mr. Riordan was very helpful to this Court in explaining some of the fundamentals of pipeline design and operations. And yet Mr. Riordan played a very active role in the development of the Stantec cost study. Indeed, he described himself as the "director" over the "cast" of experts for the Stantec RCN.[383] This Court finds it more likely than not that Mr. Riordan's extensive involvement in many aspects of the Stantec RCN constrained the experts from forming independent opinions and resulted in an effort to minimize the overall cost of the Stantec RCN even if not technologically justifiable.

249. Stantec's RCN uses a 30-inch pipeline with physical properties, operations, design capacity, and capabilities that are completely different from the existing TAPS. It so deviates from the existing TAPS that it can not serve as a reasonable proxy in a replacement cost new study. In addition, its unproven design, including its high operating pressures, high velocities, high operating costs, and design issues related to the VSMs and freestanding thermosyphons make it more likely than not that such a pipeline would never be built – which is perhaps best demonstrated by the fact that there is no existing pipeline in the world that bears any reasonable approximation to the Stantec design.

250. For the above-stated reasons, the Court finds that Stantec's 30-inch pipeline is not an appropriate replacement pipeline to use as the basis for the application of the cost approach.

---

[383] Tr. 1557, 1562 (Riordan).

3. The Pro Plus RCN

a. The Pro Plus Experts

251. The Pro Plus replacement cost estimate was prepared by pipeline and marine terminal engineers, contractors, and cost estimators with extensive experience, including engineer Gerald Steindorff, pipeline design expert John Ellwood, estimating and construction specialists Earl Tise and M. Kieth Phillips, and engineers Stan Lloyd and Jerry Baker, who specialize in marine facilities.[384] Each witness's qualifications were discussed on record in detail.

252. The Pro Plus experts have a combined total of over 250 years of hands-on experience in engineering, project management, estimating, and construction of pipelines and terminal facilities.[385] They have collectively estimated, managed and constructed several thousands of miles of cross-country pipeline in rugged terrain.[386] With the exception of Mr. Baker, all of the Pro Plus experts testified before this Court. Mr. Phillips testified by perpetuated video deposition.

253. In addition, Dr. Jerry Modisette conducted hydraulic modeling to analyze the viability of the Pro Plus and Stantec pipeline designs. Dr. Mark Cronshaw addressed the RCN contingencies.

b. The Pro Plus Design

254. The Pro Plus design is a 48-inch diameter pipeline that is of similar quality and like utility to the existing TAPS.

---

[384] Phillips Dep. 28.

[385] Tr. 4459-60 (Steindorff); Tr. 4076 (Ellwood).

[386] *See* Tr. 4080-8 (Tise); Tr. 3688-96, Tr. 3701 (Ellwood); Tr. 4460 (Steindorff); Phillips Dep. 71 (Aug. 22, 2011).

255. Pro Plus states that its design basis is 1.1 million bbl/d with upward scalability.[387] This is essentially the same design basis as the existing TAPS pumps.[388] But this Court finds that the Pro Plus 48-inch mainline pipe and VMT are comparable to the design capacity of the existing TAPS, which is 1.42 million bbl/d.[389]

256. Pro Plus's dual-pile VSM design is identical to the existing pilings and provides the necessary level of safety and protection against thawing of the permafrost as the existing facility.[390] Pro Plus spaces the VSMs at approximately 60 foot intervals, per DB-180 requirements.[391]

257. Pro Plus used floating roof tanks instead of the existing fixed roof tanks at the VMT. This Court finds that the Pro Plus VMT design is of similar quality and like utility to the existing TAPS.

258. Like TAPS, Pro Plus's pumps have three trains installed side by side, one pump per train.[392] The pumps are in parallel operation.[393] Pro Plus's operating stations each have the same installed horsepower as on the TAPS SR pumps.[394] However, Pro Plus has five operating stations, whereas the existing TAPS has four that have or will get the new SR pumps. Like the TAPS' SR pumps, the Pro Plus pumps have variable speed drive.[395]

[395] Tr. 4472 (Steindorff).

Like TAPS, at each station, Pro Plus has three 6500-horsepower units. At lower throughputs, one set of pumps is unnecessary and serves as a spare.[396]

259. Pro Plus uses a granular work pad along most of the length of the pipeline.[397] A granular work pad provides the ability to work in multiple seasons, reduces the risk of non-completion, and provides summer access for continued maintenance of TAPS and contingency purposes.[398] Mr. Baldridge, an Alyeska employee, testified to the utility and benefit of TAPS having the current work pad.[399] The Court finds that Pro Plus's use of granular work pads is reasonable, and that the continued benefit of the existing work pads on TAPS would not be captured in an RCN of TAPS that used predominantly ice roads.

260. Pro Plus used the existing route of TAPS with some minor realignments – about three tenths of a mile – to facilitate directional drilling at some of the river crossings and in the Fairbanks area to avoid the buildup area that did not exist when the original route was selected.[400] The Court finds that Pro Plus's route has the same utility as the current route and the slight deviations are reasonable.

261. The Owners established that Pro Plus's estimate did not include all of the essential components for a pipeline from PS 1 to Valdez – for example, the Pro Plus estimate did not include safety flares at PS 1.[401] But the goal of an RCN estimate is for

comparison purposes to an existing property. It is not intended to be a fully detailed, comprehensive cost estimate.

c. The Pro Plus Cost Estimate

i. Direct Costs

262. In preparing pipeline construction estimates, costs are identified as direct and indirect. The Pro Plus estimate categorizes the following direct costs: Survey, Pipeline Material, Pipeline Installation, Pump Station Facilities, Pump Station Installation, Meter Station Facilities, Meter Station Installation, Valdez Marine Terminal, and Pipeline Systems.[402] Pro Plus estimated the direct costs at $11.4 billion for 2007, $12.5 billion for 2008, and $12.4 billion for 2009.[403]

a) Pipeline Materials

263. The Pro Plus RCN utilizes many of the original quantities for TAPS to determine the necessary pipeline material. Pipe diameter, wall thickness, grade, and lengths used are those described in the "Alyeska Facts" booklet.[404] The line pipe estimate includes the 48-inch pipe used to transport crude oil, the 8-inch and 10-inch pipe used to transport fuel gas, and the 18-inch pipe used for the VSM:

> [W]e have carefully reviewed these quantities, sizes, etc. and have concluded they are still the most appropriate for the 1.1 million barrel per day design flow used as the basis for the RCN estimates. Maintaining the pipe diameter, wall thickness, etc. the same as the original design should not be confused with the use of modern versus 1970's materials. The estimated costs presented herein are based on up to date material specifications, steel pipe manufacturing process, coatings, welding processes, etc. Utilizing the same diameter and wall thickness for the pipe provides the same functionality as the

[402] MUN7-0008 at 1628; Tr. 3726-27 (Ellwood); Tr. 4634-35 (Steindorff).

[403] MUN7-0008 at 1628.

[404] MUN7-1103.

> existing facilities while minimizing costs through use of modern materials and construction methods.[405]

The Alyeska Facts book is updated regularly and contains one of the best public sources of the actual materials in place on TAPS.

264. The Pro Plus team then developed C-plans, which Mr. Ellwood and Mr. Tise explained are used to generate "a take-off of things that needed to be included in the [Pro Plus] estimate," such as the contours and grades of the terrain, the number of flume pipes, the river and road crossings, and the placement of valves.[406] As an example, referencing Aerial Maps 27 and 28 of the C-Plans, Mr. Tise testified:

> I used that to indicate that we left the pipeline above ground at mile 12 1/2; and if you will look at Aerial Map 28, you will see that below mile 53 – in fact, I think we carried it as 53 1/2. But you will notice that the pipelines come from belowground to above ground. So it's been 40 miles of pipe belowground.[407]

265. After some study, Pro Plus adopted the above and below ground configurations on the existing TAPS.[408] Mr. Tise calculated the number of miles of above and below ground pipe for each section, indicating the mile where the pipe transitions from above to below ground,[409] then used the Alyeska Atlas to verify his takeoffs.[410]

266. For the VSMs, Mr. Ellwood and Mr. Steindorff testified that they used information provided by the Joint Pipeline Office ("JPO") to determine the amount of steel

needed for the VSMs and then calculated the weight of that steel and obtained budgetary quotes to fabricate the VSMs.[411]

267. Pro Plus utilized the same grade of line pipe as the existing TAPS – X-65 and X-70, with wall thicknesses of .462 inches and .562 inches.[412]

268. The Owners critiqued Pro Plus's choice of X-65 and X-70 grade steel instead of the X-80 grade that was used in the Stantec cost estimate.[413] X-80 grade has a greater yield strength and would have been necessary for the higher pressure on Stantec's 30-inch pipe.[414] But Mr. Steindorff persuasively testified that X-65 and X-70 grade steel are the most appropriate and most economical choice for the 48-inch pipeline.[415] A thinner, higher grade pipe could cause problems with the 48" pipe such as ovality, buckling and bending.[416] The evidence also demonstrates that X-65 and X-70 are commonly used steel strengths in modern pipelines.[417]

269. Mr. Steindorff provided a detailed explanation on how Pro Plus derived the materials costs of its 48-inch mainline pipe.[418] Pro Plus estimates that a 48-inch mainline pipe would cost $1,791 per ton for 2007, $2,548 for 2008, and $2,033 per ton for 2009.[419]

---

[411] Tr. 3798, 3869-70 (Ellwood); Tr. 4449 (Steindorff); MUN7-1109. Pro Plus had this information regarding the steel members before the 2006 ad valorem tax matter and it was incorporated into the study presented to this Court. Tr. 3870 (Ellwood).

[419] Tr. 6599 (Steindorff); MUN7-0008 at 44, 575, 1107.

Pro Plus solicited quotes directly from several North American mills (rather than obtaining them as Michels Canada did from pipeline distributors for Stantec).[420]

270. Logistically, Pro Plus railed the pipe to Seattle for transport by barge and rail to Valdez and Fairbanks to double-jointing yards.[421] From the double-jointing yards, the pipe would be trucked to stockpiles along the right-of-way for use by the pipeline contractor.[422]

271. At trial, Pro Plus indicated that its materials estimates should not have included a line item for insulation of the work pad, which they had estimated at approximately $34 million per year.[423]

b) Pipeline Installation

272. Pro Plus relied upon numerous documents to determine the costs for the pipeline installation, together with their expertise and experience. These documents included the Alyeska Contingency Plan ("C-Plan") drawings, Alyeska Facts booklet, TAPS ROW Map Atlas, Google Earth, and the Alyeska alignment sheets (G-100 Drawings).[424]

273. The Owners' experts particularly criticized Pro Plus's productivity rates, labor rates, and equipment rates.

274. Productivity rates can be impacted by several factors, including weather, terrain, time of year, start and completion dates, environmental restrictions, contractor availability, and the availability of labor and equipment.[425]

---

[420] Tr. 6599-6600 (Steindorff) (relying on MUN7-1105).

[425] Phillips Dep. 37, 39, 40, 43, 44, 46, 47, 51, 52.

275. Mr. Tise discussed in detail how March Charts and crew-up sheets were created and utilized by Pro Plus to determine pipeline installation costs.[426] He explained how the C-Plans assisted in the determination of the progress rate in each section. For example, utilizing page 125 of the C-Plans,[427] Mr. Tise stated:

> [i]f you can look at the contours, you can see how close they are together, being in that section, it's going uphill from just below Pump Station 12. And from experience, I know that those grades are 30 percent to 70 percent; and I know that they were also – more than half of them were rock. So that helped in crewing-up, seeing how much progress we could get. And then if you look above Pump Station 12, you notice that it's flat. So we have designations from flat to mountain, of about six of them, that just increase in the degree of difficulty ... This section was about 147 miles. And we came up with how much of it was flat, how much of it was rolling, and so forth to come up with progress rates.[428]

276. The Owners' experts argue that Pro Plus's productivity rates for welding are too low, and therefore affect the overall construction schedule. However, based on the evidence presented, this Court finds that the welding rates do not control the pace of the Pro Plus RCN construction project.[429] Mr. Ellwood persuasively testified that "[i]n a pipeline job, the whole operation must move only as fast as the slowest crew. And in our view, what we call putting the pipe in the ditch or, in this case on the VSMs, in places will control the pace for the most of this project."[430]

---

[426] Tr. 4147-50, 6529-30 (Tise); MUN7-1115; MUN7-1116;Phillips Dep. 23-24; Tr. 3747-48 (Ellwood); Tr. 4147-48 (Tise); Tr. 4449 (Steindorff); MUN7-1115; Phillips Dep. 23-24, 25-26, Tr. 3749-50 (Ellwood), Tr. 4147-48 (Tise); MUN7-1115.

[429] Phillips Dep. 37-39; Tr. 3740 (Ellwood).

[430] Tr. 3740 (Ellwood).

277. In determining the productivity rate, Pro Plus also considered the shortage of pipeliners during the lien years due to extensive pipeline construction activity in the United States during that time.[431] Given that shortage and the remote and isolated location of Alaska, Mr. Tise testified that in the lien years,

> [y]ou're not going to get the A team and you're not going to get the B team; they're all already working ... the journeymen hours are for those three years [It's] more than any three-year – back ... to 1965. Even including the years that [TAPS] was being built, you've already exceeded the man-hours for those years by about 300 percent ....[432]

278. In addition, Pro Plus took into account that 420 miles of the pipeline will be above-ground and that those portions will take longer to install because the pipe has to fit into all the VSM supports through challenging terrain.

279. Regardless of what work sets the pace for the pipeline construction, this Court finds that Pro Plus's overall welding rates are reasonable.[433] Pro Plus estimates approximately 50 joints per day.[434] As Mr. Phillips explained, the welders will have to achieve 75 joints on some days in order to achieve an average of 50 joints per day because there will be days in which none or very little welding is achieved due to weather, delays in the other crews, or equipment failures.[435]

280. Pro Plus's estimate includes the cost of automatic welding for sections 1, 3, 4, and 5 and manual welding for sections 2 and 6.[436] Pro Plus assumed that because manual

---

[434] Phillips Dep. 52-53.

[435] Phillip Dep. 52-54.

[436] Phillips Dep. 56-57, 62; Tr. 4462 (Steindorff).

welding would be needed in difficult constructions areas in sections 2 and 6 -- specifically in Atigun Pass and Thompson Pass[437] -- manual welding should be used in each of those entire sections.

281. This Court found the Owners' critique on this issue persuasive. That is, this Court was unpersuaded that because of the challenges presented by Atigun Pass and Thompson Pass, the entire two spreads that encompassed those passes should be manually welded.[438] But overall, this Court finds that Pro Plus's productivity rates are reasonable.

282. The majority of the experts acknowledged that the owners, contractors, and unions would negotiate and enter into a project labor agreement for the construction of a pipeline system and marine terminal of the length, size, and complexity of TAPS.[439] Mr. Ellwood persuasively testified that before committing the billions of dollars needed to build a pipeline, a project labor agreement would be needed to provide some certainty to the labor situation.[440]

283. An owner that was contemplating the building of a new TAPS would want to assure predictability, labor certainty, and a "no-strike" condition to assure the completion of the project.[441] Contractors would need to know the rates they would have to pay their labor

---

[437] Tr. 4462-63 (Steindorff).

[438] Phillips Dep. 59-60.

[439] Tr. 3751 (Ellwood); Phillips Dep. 73-74; Tr. 2994 (Ziehr); Tr. 5427 (Jens); Tr. 6159 (Bock); Tr. 5656 (Sherman); Tr. 5801 (Karlik); Tr. 4938 (Dotson) (indirectly); TO-07-0021 at 0700; Tr. 4427 (Steindorff).

[440] Tr. 3751 (Ellwood).

[441] Phillips Dep. 86; Tr. 3751 (Ellwood).

force prior to bidding the project. The unions would want to ensure their members obtain adequate wages, benefits, and living and working conditions.[442]

284. This Court finds that the evidence persuasively showed that a labor agreement for constructing TAPS would start with the Pipe Line Contractors Association ("PLCA").[443] The PLCA negotiates wages, benefits, working conditions, and other terms with the four main pipeline trades (Journeyman, Laborers, Teamsters, and Operators) and publishes the labor rates for each state annually.[444] However, no labor rate has been published by the PLCA for Alaska during the years at issue in this litigation.[445]

285. Pro Plus's estimate tries to determine what the outcome of the PLCA negotiation would have been.[446] Pro Plus did not call any local Alaska labor unions to determine their current rates, even for those trades that are not covered by the PLCA.[447] Labor rates from local unions typically are lower than PLCA rates.[448]

286. Pro Plus's estimate assumes that all workers doing similar work will be paid the same regardless of the location of their assignments.[449] For example, Pro Plus assumes that a crane operator working on the pipeline and a crane operator working at the VMT would both receive the same wages because the project labor agreement would be negotiated to cover all workers. At least with respect to work at the VMT, this Court was not

---

[448] Tr. 4497 (Steindorff).

[449] Phillips Dep. 87-89; Tr. 4426-27 (Lloyd).

persuaded that this assumption was reasonable. Rather, more likely than not a worker who was expected to stay in camps and operate cranes at remote locations along the pipeline route would expect and obtain a higher wage than a crane operator who would be residing in Valdez for the duration of his employment on the project.

287. The Pro Plus study utilized the published PLCA rates for California for each year and added approximately 15% as a likely incentive to get workers to Alaska for the job.[450] Pro Plus also added double time for Sundays and included four hours wages per day when the worker was off-duty (paid only when the worker returned to the job).[451] Pro Plus experts testified that the remote location, the camp and weather conditions, and the worker's isolation from their families warranted these adjustments to the labor rates that would be negotiated for the construction of TAPS.[452]

288. Pro Plus did not include any per diem or welder rig rates;[453] had they done so, their estimated rates estimated would have been higher.[454]

289. Relying on a comparison of a Lower 48 journeyman rate with the Alaska journeyman rate during construction of TAPS in the 1970's, Mr. Tise noted that the increase in wages for Lower 48 journeymen working in Alaska for construction of TAPS was between 19 – 28%.[455] That range is higher than the rate utilized by Pro Plus, which added 15% to the California rates.[456]

290. The Owners hired Hawk Consultants LLC ("Hawk") to critique the RCN estimate prepared by Pro Plus for the 2007 to 2009 lien years. The Hawk experts did not present a comprehensive critique of the Pro Plus estimate, but only looked at certain limited topics. And each Hawk expert only reviewed his assigned portion of the Pro Plus estimate and did not read any depositions of Pro Plus experts or their transcripts either before this Court in the 2006 litigation or before SARB in 2009, 2010, or 2011.[457]

291. Jeff Sherman was one member of the Hawk team who looked at labor rates. Of note, Mr. Sherman's overall production cost per mile for the welding crew (which would have necessarily included all of those factors) was very close to that of Pro Plus's estimate.[458] Mr. Sherman calculated that the Pro Plus cost per mile for their welding crew was $98,712.[459] Hawk's cost per mile was $98,907.[460]

292. Overall, this Court finds that Pro Plus's rates for the four PLCA trades are reasonable, including its use of the California base rate with 15% markup, except that this Court was persuaded by the Owners' experts that the use of Sunday double time and compensation at the rate of four hours per day on off dates would, more likely than not, not be included within a project labor agreement.

293. Pro Plus determined the wage rates for the remaining trades and the salaried staff by adjusting from the PLCA rates. But this Court was persuaded by Mr. Sherman's testimony that the labor rates used for the non-PLCA trades and the salaried staff in the Pro Plus estimate are generally too high. While some upward adjustment to those wages from

---

[457] Tr. 5637 (Sherman).

[458] Tr. 5677 (Sherman).

[459] Tr. 5676-77 (Sherman).

[460] Tr. 5676-77 (Sherman). *See also* TO-07-0044.0075; Tr. 5715-16 (Sherman).

Alaska labor rates is warranted due to the fact that a project of this magnitude will necessarily increase the cost of labor and due to the remoteness of the work, overall this Court finds that Pro Plus's adjustment overcompensated for these factors for the non-PLCA trades and the salaried staff.

294. To determine equipment rates, Pro Plus used bids from previous big-inch, cross-country pipelines information from Caterpillar Company, and prices for 2007, 2008, and 2009 from PipeLine Machinery, a pipeline rental/sales company in Houston.[461]

295. Hawk consultant witnesses criticized the Pro Plus cost estimate for having equipment on site for the full duration of the construction. Mr. Ellwood testified that it is necessary to have equipment for the duration of the project because in many of the construction sites equipment will not be available, particularly on short notice.[462] Pro Plus testified that there is a limited amount of construction equipment available for rent in Alaska. For example, Mr. Tise testified that in 2008, there was no 594 sideboom in Alaska to rent.[463] Contractors also do not want to rely upon small-scale dealers to service their needs so they will not rent locally.[464] Equipment rented out of state entails additional cost to winterize it and transfer it to Alaska.[465] But this Court was persuaded by the Hawk experts that there appears to be at least some instances where the Pro Plus estimate had included too much or too many days of equipment in its estimate.

---

[461] Phillips Dep. 31, 93-98; Tr. 4162-64 (Tise); MUN7-1118.

[463] Tr. 6529 (Tise).

[464] Tr. 4024 (Ellwood).

[465] Tr. 3775 (Ellwood).

296. Pro Plus applied a mark-up of 15% of the subcontract amount for a handling fee.[466] Hawk Consultants assert that this percentage is too high.[467] This Court was persuaded that a 15% handling fee for handling the subcontracts in this case is too high, and that 10% would be a more appropriate amount -- the same amount that Pro Plus applied to owner's costs, which has somewhat comparable oversight responsibilities.

297. Mr. Tise and Mr. Steindorff provided detailed explanations on how Pro Plus derived their pipeline camp cost estimates.[468] They also explained their reliance on the budgetary quote from International Camp Sales and Services, Inc., and the additional costs that were not included in that bid such as transportation to the site, erection costs, commissioning costs, and single man sleepers.[469] While the original TAPS construction had 29 camps, Pro Plus reduced the number of camps necessary to 6 larger camps and a total of 13 camp locations. The total camp capacity is 10,750 beds.[470] Pro Plus has anticipated in its RCN that "the peak manpower will be approximately one-third of the peak manpower during the initial construction."[471]

298. While the Owners' experts from Hawk critiqued the Pro Plus pipeline camp estimates, the Stantec estimates were higher. For example, in 2009, Stantec estimated

---

[471] MUN7-0008 at 17

camp costs at $1.6 million,[472] while Pro Plus estimated camp costs for that year at approximately $1.4 million.[473]

299. For these reasons, the Court finds that the Pro Plus experts adequately demonstrated that their cost estimate for the pipeline camps is reasonable.

300. Pro Plus included a line item for miscellaneous expenses that will be incurred by the contractor totaling 40% of direct labor for each lien year.[474] Within the miscellaneous expenses, Pro Plus includes 20% of direct labor for small tools and consumables.[475] Mr. Phillips and Mr. Tise testified that 20% of direct labor for small tools and consumables is typical for contractors.[476] But based on the totality of the evidence presented at trial on this issue, this Court finds these amounts should be no more than 10% of direct labor. Pro Plus has also accounted for the cost of safety orientation, environmental orientation, background checks, physicals, and administrative work related to turnovers within the 40%, and Pro Plus has assumed that these costs will be 15% of direct labor costs.[477] With respect to these items, this Court also found Hawk's analysis persuasive, and concludes that these expenses should total no more than 10% of labor costs. Pro Plus also calculated that the contractors will incur 5% of direct labor costs for unscheduled overtime. But this Court finds that including this as a separate entry in addition to the 30% adjustment that Pro Plus identifies

[477] Phillips Dep. 96-98

for "weather equipment labor" entails a significant risk of double counting.[478] With these adjustments, this Court finds that the total miscellaneous expenses should be no more than 20% of direct labor.

301. Pro Plus's estimate also includes a 30% contractor's risk for "weather equipment labor."[479] Typically this cost is embedded in the contractors' bids, and the owner does not know the exact percentage utilized in the contractor's bid.[480] In a project of this size and scope, the contractor will assume a certain amount of risk associated with weather, equipment, and labor in its bid.[481] But this Court found persuasive the Owners' assertion that Pro Plus's estimate of this amount is too high. Given the other concerns separately identified with respect to the over-estimation of equipment usage and staff and non-trade wage rates, no more than 25% should be allocated for contractor's risk in the Pro Plus bid, an amount comparable to the overall contingency that has also been included in the Pro Plus cost estimate.

c) Pump Station Facilities

302. Pro Plus's estimated costs of the pump and meter stations are based on the design specified in the "Alyeska Facts" booklet, the "Pipeline Oil Discharge Prevention and Contingency Plan" ("C-Plan"), and the Design Specification for the SR project currently being implemented, along with modern design and construction techniques common to the industry.[482] Budgetary quotes were obtained for major equipment and material.[483] For other

[481] Phillips Dep. 100-103.

[482] Tr. 4460-61 (Steindorff).

items, Pro Plus relied on estimates based on previous project experience and a historical database.[484]

303. The 2007 "Alyeska Facts" booklet states that there are six pump stations that were then currently operating: Pump Stations ("PS") 1, 3, 4, 5, 7 and 9. Of these, PS 5 is a relief station that does not contain mainline pumps.[485] PS 7 currently has the original Legacy pumps. The 2007 Facts book does not include PS 7 as one of the pump stations that is scheduled for the strategic reconfiguration (SR) pump upgrades.[486] In an order dated April 6, 2005, the RCA concluded that "pump stations 7 and 12 are no longer necessary for future TAPS operation."[487] However, PS 7 is the location of Alyeska's current recirculation project to increase the heat of the oil without the cost of acquiring a heater.[488]

304. The Pro Plus cost estimate generally follows SR and DB-180 and the SNC Lavalin Study with respect to the pumps, tanks, fuel gas line, power generation, and maintenance systems.[489] But the Pro Plus cost estimate differs by designing PS 7 to have the newer SR pumps and by adding pig launchers and receivers to further simplify pipeline operations.[490] The existing PS 7 does not contain any SR pumps as of the respective lien dates, nor is there any electric utility tie-in to PS 7.[491] Upon consideration of all the evidence, this Court finds Pro Plus's inclusion of PS 7 with SR pumps in its RCN was not

[491] Tr. 1200 (Baldridge).

unreasonable, and that the difference between the Pro Plus RCN and the existing TAPS in this regard is best addressed in determining depreciation.

305. Pro Plus's design did not include a PS 12, although that station may be necessary to the cold restart operations of TAPS. Given that TAPS has not ever used PS 12 for cold restart, the omission of this pump station from the Pro Plus RCN was reasonable. In any event, if PS 12 was required it would increase the cost of the RCN.[492]

306. Pro Plus created schematics, process flow diagrams, and conceptual layout plans for the pump station facilities.[493] The Owners' experts criticized Pro Plus for not including certain items in their process flow diagram.[494] But the process flow diagram was created to show the main flow of the crude oil; it was not intended to show auxiliary systems and minor piping.[495]

307. Owners' expert Mr. Riordan persuasively testified that the majority of the pipeline in the Pro Plus pump station was 48 inches which was unnecessary and costly.[496] Instead, smaller diameter piping can be used within the pump stations.

308. The Pro Plus installation costs of the pump stations are based on modular construction and developed utilizing the same "crew up" methodology that Pro Plus used for the pipeline installation. Mr. Ellwood and Mr. Tise persuasively testified that the "crew-up"

---

method is used by contractors for facility work because it provides detailed information, such as the equipment, manpower, and the duration required for the work.[497]

309. A comparison of Pro Plus's direct cost estimate for pump stations with Stantec's is helpful.[498] In 2007, Stantec's estimate for the direct cost of pump stations is $812,871,643 for its 900,000 bbl/d throughput design. The additional cost for the 1.1 bbl/d throughput totals $415,044,990, for a total cost of approximately $1.2 billion.[499] Pro Plus's estimate of the total direct cost for all the pump station facilities, including installation and materials, is comparable at $1.0245540 billion for the 2007 lien year.[500]

310. Apart from the concerns identified as stated above (including those identified with respect to pipeline installation that would be applicable here as well), based on the evidence presented at the de novo trial, this Court is persuaded that overall Pro Plus's cost estimate for pump stations resulted in a proper valuation.

d) Valdez Marine Terminal

311. Lloyd Engineering performed the estimating work for the VMT portion of the Pro Plus estimate. Mr. Lloyd estimated the terminal facilities taking into account the relationship between the terminal, the pipeline minimum and maximum capacities, pipeline shut down allowance, the weather in Valdez, and berth availability for the tanker fleet.[501]

[501] MUN7-0008 at 25-26.

The evidence demonstrated that the Pro Plus VMT design matches the flexibility of the 48-inch pipeline design and maintains the current flexibility of TAPS.[502]

312. Mr. Lloyd estimated a lay berth and two loading berths in the Pro Plus VMT.[503] The Owners critique the inclusion of the third lay berth. However, the evidence convincingly shows that the existing third berth is used and useful to TAPS and should be maintained. For example, in a December 2008 application to the RCA to decommission berths 1 and 3 for crude off loading purposes, the Owners stated that they intend "to continue using Berth 3." They added that:

> [a]part from loading crude oil, "Berth 3 is currently and frequently used and useful as a layover berth in various circumstances, as for example, when Hinchinbrook Entrance is closed due to adverse weather conditions in the Gulf of Alaska, for crew member medical evacuations, for vessel repairs, or in support of oil spill drills.[504]

313. Alyeska employee Tom Stokes agreed that the third berth has been used occasionally at the VMT, such as when the VMT was forced to close down and the pipeline was required to go into proration because of bad weather.[505]

314. The Court finds that two loading berths and one lay berth should reasonably be considered part of the existing useful property as of each of the lien dates and included in the RCN.

315. The Pro Plus cost studies advanced for the years 2007 through 2009 use floating roof tanks, unlike the 2006 study.

---

[502] Tr. 4477, 6451-52 (Lloyd). Mr. Stokes, Alyeska employee, testified that there is no minimum throughput limitation for the existing VMT to function. Tr. 3453 (Stokes). Mr. Stokes further testified that none of the projects that are currently being considered at the VMT would impact the throughput or the availability of the facility. Tr. 3453 (Stokes).

[503] Tr. 4355-56 (Lloyd); MUN7-9020; MUN7-1522 at 6.

[504] MUN7-1522 at 6.

[505] Tr. 3459-60 (Stokes). *See also* Allen Dep. at 26 (discussing bad weather in Valdez disrupting operations).

316. As in the 2006 ad valorem tax matter, Mr. Lloyd indicated that his VMT estimate is based on a 1.1 million bbl/d throughput. But he also considered new information as to the lower flow rates possible on the pipeline.[506] In order to match the range of capacity of the pipeline, Mr. Lloyd changed his estimate to utilize internal floating roof tanks.[507] Properly designed floating roof tanks will provide greater flexibility for throughputs of less than 1.1 million bbl/d.[508]

317. Mr. Lloyd testified that he maintains his concerns about using internal floating roof tanks in a severe seismic zone.[509] As in the 2006 appeal, he again looked to the 2003 Tank Consultant, Inc. ("TCI")/Nyman Report.[510] These were consultants hired by Alyeska to evaluate the use of floating roof tanks at the VMT; their report has not been updated. Mr. Lloyd accounted for the cautions expressed in the TCI/Nyman report by limiting the operating volume of the tanks to approximately 430,000 barrels versus the stated capacity of 510,000 barrels in each of the existing tanks.[511]

318. But with the decreased tank volume, the needed number of tanks increased from the 15 tanks in operation at TAPS during the lien years to 18, including one spare.[512] Mr. Lloyd's estimate provided sufficient storage for 6.6 days of throughput at 1.1 million bbl/d, with a total capacity of 7,222,000 barrels.[513] The total capacity of the existing 15 tanks is 7,650,000 barrels.[514]

[512] Tr. 4365-67 (Lloyd); Tr. 3454 (Stokes) MUN7-0008 at 31-32. *See also* MUN7-1519.

319. Mr. Stokes of Alyeska testified that during 2007 through 2009 there were 15 tanks in service at the VMT. He also confirmed that currently only 13 tanks are in actual use, with the two additional tanks undergoing cleaning and inspection.[515] A total of 18 tanks were originally constructed at the VMT. Mr. Stokes agreed that the additional three out-of-service tanks provide more flexibility to the Owners should a reason to put them back into service arise.[516]

320. This Court finds that the Pro Plus tank design is a reasonable replacement for the existing TAPS tank design, and is reflective of the design capacity of the existing VMT, which is at least 1.42 million bbl/d. In fact, the existing VMT handled throughputs of 2.1 million bbl/d when all of its 18 tanks were in operation.

321. Pro Plus has estimated 10 million cubic yards of excavation will be needed to construct the VMT site.[517]

322. Mr. Lloyd testified about the excavation work when the VMT was originally constructed. He explained that "the amount of material excavated in the Terminal had escalated from a planned 4 million cubic yards to approximately 15 million cubic yards."[518] In any modern Greenfield development of the VMT site, the same soil conditions would be present as existed during the original construction.[519] As in the 2006 de novo trial, Mr. Lloyd persuasively testified at the current proceeding that it would be essential to fill behind

[519] Tr. 4381-82 (Lloyd).

Jackson Point.[520] Overall, this Court was persuaded that Pro Plus's estimated 10 million cubic yards of excavation is reasonable.

323. The Owners also critique Mr. Lloyd's VMT cost estimate because of the methodology of crewing up the work instead of using a "process estimation" methodology. Process estimation determines the building materials necessary, then uses an estimating manual to determine the man-hours for each item.[521] It is a common way for engineers to cost projects.[522] But Mr. Ellwood indicated the approach that Pro Plus used was commonly used by contractors, and that process estimation on the VMT was problematic because it is a one of a kind, unique property.[523] On balance, this Court was not persuaded that Pro Plus's use of the crew-up method for estimating the cost of the VMT was unreasonable.

324. Pro Plus has estimated that the clearing and grading at the VMT would take 310 days.[524] But this Court found persuasive Hawk's observation that this crew needs to be "done and gone to make the terrain available for other crews."[525] And this Court concurred with Hawk's critique regarding the VMT camp. 450 days for VMT camp installation would appear excessive, while 78 workers at the camp, including 16 truck drivers and 24 laborers, as well as 28 pick-up trucks also appears excessive.[526] Yet it bears noting that Hawk's revised estimate for the direct costs for the VMT totaled $1.3 billion.[527] In contrast, Stantec's

[527] TO-07-0044.0021

cost estimate for the VMT was higher – at 1.693 billion – even though Stantec had fewer tanks and far less proposed excavation.[528]

ii. Indirect Costs, Including Contingency

325. "Indirect costs are percentages that might be applied to all or some portion of the direct costs."[529] The indirect costs applied by Pro Plus include (1) project and construction management, engineering, and inspection, (2) owners' costs, (3) ad valorem taxes and interest during construction, and (4) contingency. Each of these items is typically calculated as a percentage of direct costs associated with a project.

326. In 2006, the Division did not include any program manager costs in its RCN estimate.[530] In its 2006 assessment, SARB determined there should be a program manager profit of 3% of direct costs.[531] Beginning in 2008, SARB adopted a project management fee of 7.5% that included construction management, engineering, and inspection in addition to the project management fee.[532] The Pro Plus cost estimate for the 2006 tax year and adopted by this Court in the Amended Decision included an allowance of 7.5% of its direct costs for all project management costs.[533]

[531] Amended Decision ¶ 328.

[532] Amended Decision ¶ 328; MUN7-238 at 18 ($701,220,443/$9,349,605,900 = 7.5%).

[533] Amended Decision ¶ 333.

327. For tax years 2007 to 2009, Pro Plus again estimated program management costs at 7.5% of direct costs.[534] The Court again finds that a project management fee of 7.5% is appropriate.

328. In 2008, SARB reduced Pro Plus's estimation of owners' costs from 10% to 5%.[535] Mr. Ellwood, at the 2009 SARB hearing, testified why 10% was the appropriate allowance for these costs.[536] In 2009, the Board agreed 10% was appropriate, stating that "[t]he Board found particularly persuasive the testimony from the Municipalities' witnesses on the importance, in a project like the TAPS, of having personnel from the owners to shadow contractor personnel and closely monitor the ongoing construction work in order to limit delays and cost-overruns."[537]

329. In this Court's Amended Decision for the 2006 tax year, Pro Plus's proposed owners' costs of 10% of direct costs were likewise adopted.[538]

330. In these proceedings, Pro Plus continues to maintain that 10% of direct costs appropriately measures owners' costs.[539] The Court finds the percentages reasonable for the 2007 to 2009 tax years.

331. A replacement TAPS would be subject to ad valorem taxes during construction ("AVTDC").[540] In the 2006 tax year trial, the "Pro Plus team used Mr. Greeley's method of

---

[534] Tr. 3741 (Ellwood). Stantec similarly estimated engineering costs at 5% of direct construction costs for the main pipeline, and 12% for the pump stations and terminals. TO-07-0025.0684.

[539] Tr. 3741-42 (Ellwood). Stantec used a figure of 9% for owners' costs. Tr. 3274 (Fiske); TO-07-0025.684.

[540] AS 43.56.060(e)(1); 15 AAC 56.110(b)(1).

calculating the ad valorem tax that had also been accepted by SARB."[541] The Court adopted that method as appropriate for determining the assessed value of TAPS for the 2006 tax year.[542]

332. In 2010, SARB determined that the Assessor's calculation required certain refinements to comply with Alaska law under 15 AAC 56.110(b)(1).[543]

333. In Alaska, the "full and true value" of an oil pipeline during construction is determined by the "actual cost incurred or accrued with respect to the property as of the date of assessment."[544] The regulation that implements this portion of the statute explains how certain costs should be taxable as incurred, such as construction machinery, while those that relate to the entire project should be prorated over the time taken to complete the entire project.[545]

334. Pro Plus's AVTDC computation provided a breakdown between the two categories of costs – those that the regulation requires be accrued and those that are taxable as incurred – for each tax year.[546] Based upon that breakdown, and applying the accrual schedule found in the example in 15 AAC 56.110(b)(1) over a seven year construction period, Pro Plus calculated the AVTDC at $657,521,600 for 2007, $721,816,800 for 2008, and $713,929,600 for 2009.[547] This Court finds that Pro Plus's method is consistent with the applicable regulation.

---

[541] Amended Decision ¶ 348 (internal citation omitted).

[542] Amended Decision ¶ 352.

[543] MUN7-0237 at 30-32.

[544] AS 43.56.060(e)(1).

[545] 15 AAC 56.110(b)1)

[546] MUN7-0008 at 39, 57, 588, 1119.

[547] MUN7-0008 at 56, 587, 1118.

335. For the 2006 tax year, the Court previously concluded that Pro Plus's methodology for the inclusion of interest during construction ("IDC"), calculated based upon a percentage of project spending spread over a seven-year period and assuming 100% debt financing at a cost of 6%, was appropriate for determining the assessed value of TAPS.[548] Consistent with that approach, Pro Plus's estimate for 2007, 2008 and 2009 included $1,949,285,100, $2,134,744,500, and $2,114,060 for IDC, respectively.[549] This Court finds that Pro Plus's method to calculate interest during construction is reasonable.

336. It is standard practice to include a contingency in a cost estimate to account for uncertainty about the actual cost. The Municipalities' expert Dr. Mark Cronshaw stated that the Association for the Advancement of Cost Engineering ("AACE") defines contingency as "an amount added to an estimate to allow for items, conditions, or events for which the state, occurrence, or effect is uncertain and that experience shows will likely result, in aggregate, in additional costs."[550] The appropriate amount of contingency depends on the desired level of certainty that the actual cost of a project will not exceed the estimated cost.[551] As Dr. Cronshaw testified in the 2006 trial and again in these proceedings, a standard approach to determine contingency is the P50 or 50% level of confidence (i.e., the contingency amount that – when added to the base estimate – makes it equally likely that the project will actually cost more or less than the estimate).[552]

---

[548] Amended Decision ¶¶ 350, 352.

[549] MUN7-0008 at 55, 586, 1117.

[550] Tr. 4675 (Cronshaw).

[551] Tr. 4684-85 (Cronshaw).

[552] Tr. 4695; 4699-4700 (Cronshaw). *See also* Tr. 3637-38 (Allison); Amended Decision ¶ 353.

337. In the 2006 trial, the Court determined a 25% contingency was appropriate.[553] In 2007, the Department used an 8% contingency, which appears to have been adopted by SARB.[554] In 2008, the Division reduced Pro Plus's proposed contingency factor from 25% to 20%. On review to SARB, the Board concluded that the contingency factor should be no more than 5%.[555] In 2009, the Division used a 10% contingency factor, which the Board rejected as improper and instead employed a 25% contingency.[556] This was in response to the additional information provided to SARB by Dr. Cronshaw and the Pro Plus team, which SARB found constituted the "most persuasive" evidence before the Board.[557] SARB held "It was clear to the Board that based on their careful assessment of these risks, the 25% contingency factor in the 2009 Pro Plus cost study was justified."[558]

338. Dr. Cronshaw relied upon the AACE in preparing his opinion in this case. As explained by Dr. Cronshaw:

> AACE describes five classes of estimate. Class 5 is a preliminary cost estimate that has a very wide range because of substantial uncertainty. Class 1 is a control estimate that's usually prepared for financial control purposes during a project, so after the detailed engineering has been completed and so on. And class 3 is something between.[559]

A conceptual study would have a relatively high contingency because the detailed design basis, engineering, and permitting would not yet have occurred, while a budgetary estimate

[559] Tr. 4719 (Cronshaw).

would employ a lower contingency if a detailed cost estimate had been prepared.[560] The Pro Plus team determined that the RCN project would appropriately be labeled somewhere between a Class 3 and a Class 4.[561]

339. The contingencies estimated by the parties in this case were substantially different. Experts for both the Municipalities (Dr. Mark Cronshaw) and the TAPS Owners (Mr. Jerald Allison) ran Monte Carlo analyses to model the uncertainty associated with the project to arrive at a contingency estimate for the TAPS RCN.

340. From his Monte Carlo analysis, Dr. Cronshaw concluded that contingencies of 36%, 39%, and 37% are the appropriate amounts for a P50 case for the Pro Plus study for years 2007, 2008, and 2009.[562]

341. The Court finds Dr. Cronshaw presented a comprehensive and well-documented contingency analysis consisting of extensive materials that were admitted into the record. He also carefully followed the recommended procedures of the AACE. Dr. Cronshaw verified the reasonableness of his Monte Carlo analysis by comparing his findings with the recommended AACE ranges.[563] Although the AACE ranges apply strictly only to process facilities, the fact that Dr. Cronshaw's analysis was within the ranges provides a check on the reasonableness of his conclusions.[564] Additionally, as discussed below, Dr.

[563] Tr. 4720 (Cronshaw).

[564] Tr. 4720 (Cronshaw).

Cronshaw verified his analysis by comparing the contingency with cost overruns from numerous actual projects, including TAPS' projects, further validating his results.[565]

342. Although Dr. Cronshaw determined a substantially higher contingency was appropriate, Pro Plus, based on the experience and consensus of the team, chose a 25% contingency.[566] Mr. Ellwood expressed his confidence in the number chosen by the Pro Plus team: "We think that's a very reasonable number. We have had many, many discussions amongst the team about what to do, and we have checked that number against what other corporations do; and we're all, I think, entirely comfortable with it. I know I am."[567] Dr. Cronshaw estimated that Pro Plus's use of a 25% contingency meant there would be at least an 84% chance that the actual cost of the project would exceed Pro Plus's final cost estimate.[568]

343. The contingency adopted by Stantec for its 30-inch hypothetical pipeline, as calculated by Mr. Allison through his Monte Carlo analysis, was 3.3%, 3.4%, and 3.5% for tax years 2007, 2008, and 2009, respectively.[569]

344. At a theoretical level it appears that a major difference between the Stantec contingency and the Pro Plus contingency is that Stantec concluded the project had little or no uncertainty due to it being an estimate to build a replacement for TAPS as of fixed dates in the past.[570] Stantec concluded that because much was known about TAPS today due to

it already having been constructed, there was minimal uncertainty in such items as the labor rates and the cost of obtaining such items as permits for construction, thus a contingency of approximately 3.5% was appropriate.[571] Yet the Stantec design is substantially different from the existing line with its smaller diameter, higher pressure line, single support VSMs and DRA with 80% drag reduction. Further, the Stantec design relies on freestanding thermosyphons and an extensive use of ice roads, both of which also differ from the original design and construction.[572] As Dr. Cronshaw concluded, "it seems curious to assert that the contingency for that different design [Stantec] would be much lower because one knows something about the existing 48" line."[573]

345. Mr. Allison's trial testimony on this topic conflicted with his deposition testimony.[574] At trial Mr. Allison was asked, "[T]he fact that this was a replacement cost new was not a significant part of the debate in terms of the elicitation, was it?"[575] Mr. Allison responded:

> No, as a matter of fact, I think – I don't think that's correct. I think we did talk about that this is a replacement cost new . . . we talked about that the fourth quadrant is considerably smaller for an RCN . . . I know we talked about it when we discussed the fourth quadrant.[576]

But counsel then repeated the identical question that had been asked to Mr. Allison at his deposition. There, Mr. Allison, reading from his deposition testimony at trial, stated: "The fact that it was a replacement project had no impact on how the elicitation was done and

how the number was derived whatsoever . . . ."[577] On redirect, later at trial, counsel for the Owners asked Mr. Allison, "Did you explain, in your deposition, what you think the typical range of contingency is for a replacement cost estimate?"[578] Inexplicably, Mr. Allison responded: "My recollection is that I would have expected it to be less than what it would be for a normal construction process."[579] Mr. Allison did not attempt to explain why his deposition testimony directly contradicted his testimony at trial.

346. An additional example of Mr. Allison's unreliability as a witness was evidenced when he testified regarding a typical range for contingency. On direct he was asked, "Do you have in mind the typical range of contingency that you would expect for a replacement cost new estimate?"[580] Mr. Allison responded: "Probably somewhere between 2 and 5 percent . . . ."[581] But on cross, counsel read a similar question asked of Mr. Allison during his deposition: "What would you think the typical range of contingency is for a replacement cost estimate in a study of the level and detail of the Stantec study?"[582] Mr. Allison testified at his deposition (as read at trial): "My answer is: I don't have an opinion on a range of percentage estimate that would be correct, right, typical, or anything else for a replacement project because I've never done comparative studies and I've never read – anybody that did comparative studies."[583]

[583] Tr. 3660 (Allison).

347. Because of his inconsistent sworn statements, this Court finds Mr. Allison was not a credible witness. Rather, this Court concurs with Dr. Cronshaw's observation that Stantec's contingency was unreasonably low, particularly for a project at the conceptual stage only.[584]

348. Carlton Karlik also testified for the Owners about the appropriate contingency to be used in a TAPS RCN analysis. He testified that with an RCN, there is much less unknown about a project than a Greenfield original construction project, thus less risk is involved, and hence a lower contingency is appropriate.[585] However, Mr. Hisey testifying for the Municipalities asserted that even a completed project carries a contingency of 2% to 3% to account for remaining unknowns such as startup, completion and potential litigation costs.[586] To that end, Mr. Hisey testified that he has reviewed hundreds, if not thousands, of Alyeska funding authorizations ("AFEs"), and he has never seen a construction AFE with a contingency in the 3% to 4% range.[587]

349. Moreover, Charles Coulson, the President of BP Pipelines (Alaska) testified at his deposition in this case that he was unsure of the standard contingency for TAPS projects.[588] But before FERC, Mr. Coulson testified that a 30% contingency at the outset of a project would be "normal." Before FERC he also testified, "When you get down to the

[588] MUN7-0001 at 3879.

execute phase of a particular project, where the engineering design is completed, you'd expect the contingency to be much lower, five or ten percent in some cases."[589]

350. As in the 2006 tax year trial, Mr. Karlik did not determine a specific contingency.[590] Instead he testified for the Owners that a range of 5% to 10% contingency was typical when doing a replacement cost new estimate (versus an original construction estimate).[591] But based on the totality of evidence presented on contingency, the Court again finds Mr. Karlik's testimony unpersuasive.[592]

351. Dr. Cronshaw thoroughly validated the reasonableness of the Pro Plus team's 25% contingency. In addition to performing his Monte Carlo analysis and comparing the range of his calculations to the AACE literature (as discussed above), he looked at cost overruns experienced by other megaprojects and at TAPS' specific projects.

352. Dr. Cronshaw testified regarding the MacKenzie Valley Project. In 2004, the project presented its cost estimate to the National Energy Board in Canada of $3.8 billion, with a 28% contingency.[593] By 2005, after project expenditures of $600 million,[594] the estimate had grown to $7.8 billion, nearly doubling the estimate from the previous year.[595]

353. Additional examples offered by Dr. Cronshaw in support of his opinion included the Nord Stream Pipeline in the Baltic Sea.[596] There, the cost estimate was €5 billion in

[596] MUN7-0010 at 44, Tr. 4726 (Cronshaw).

2005, rising nearly 50% to €7.4 billion in 2008.[597] Another example was the BTC pipeline from Azerbaijan to Turkey which was reported to have an expected 30% cost growth from its original estimate to nearly $3 billion.[598] While some of the cost overruns in the above mentioned projects may be attributable to changes in scope, overall these examples supported Dr. Cronshaw's opinion that historically, large-scale projects experience notable cost growth.

354. Regarding the Denali Gasline, after $135 million had been invested to develop a cost estimate, Mr. Coulson indicated the contingency for the project was "in the neighborhood of 30%."[599]

355. Dr. Cronshaw persuasively opined that TAPS' own projects also support a 25% contingency as the minimum appropriate contingency to achieve a proper assessed valuation of TAPS. Dr. Cronshaw referred to an Aerospace Corporation report dated July 1977 which indicated that as of mid-1974, the expected cost to complete TAPS was $4.088 billion.[600] By that point, significant components of the project were already in place: the pipe had been purchased, haul roads had been constructed, project labor agreements had been signed, the Federal "Alaska Pipeline Act" had been passed, contractors such as Bechtel and Fluor had been retained, and other key contracts had been assigned.[601] Three years later, in 1977, the actual project cost was $7.815 billion – nearly double the 1974 estimate.[602]

[601] MUN7-2554 at 47-48; Tr. 4731 (Cronshaw).

[602] Tr. 4731 (Cronshaw).

356. Another real-world example supporting a contingency substantially higher than that offered by the Owners relates to SR. As part of discovery, the Owners provided certain AFEs related to the Owners' budgetary approval of SR of TAPS. In March 2004, the Owners authorized SR in the amount of $233 million (after $10 million had already been spent on engineering).[603] In 2005, Alyeska prepared supplemental AFEs seeking approval of an additional $168.2 million to complete SR.[604] Then, in 2007, Alyeska submitted supplemental AFEs for additional expenditures that raised the cost of completing SR to $696 million, or about a 185% cost overrun.[605] Moreover, the 2007 supplemental AFE included an 18.5% contingency – after much of the SR had already been completed and substantial cost overruns already incurred.[606] In reviewing the AFEs, Dr. Cronshaw also noted that the extensive cost overruns were not attributable to a change in scope but rather design development issues.[607]

357. Dr. Cronshaw also referred to a 2005 Fluor Cost Study to support his opinion that a 25% contingency is reasonable. The study was prepared for the Owners for FERC ratemaking proceedings to set out the cost for the dismantling and removal of TAPS. The 2005 Fluor updated cost estimate included a 25% contingency which Fluor stated: "is consistent with the contingency factor used in the 1983 estimate."[608] Alyeska later prepared

a 2007 update to the Fluor study which also used a 25% contingency for all but a few cost categories (e.g., the contingency for the VMT was 22%).[609]

358. A 2010 study of the cost of heaters to operate TAPS at declining throughput levels prepared by Larkspur Associates, LLC ("Larkspur") for BP Pipelines also validates a contingency of no less than 25%. The study was a detailed estimate of the cost of all the heater facilities by location along the pipeline that may be necessary to operate TAPS down to 100,000 bbl/d. As to contingency, the report stated,

> The conceptual estimates include contingency at 40 percent based on an accuracy range of +35% / -20% as reviewed and determined based on AACE published documentation (see attached). Based on the process information and quantities presented, estimate approach and experience of the project team we recognize that there has been very little design work done to date to reflect a lower percentage or a tighter accuracy range.[610]

359. Larkspur further supported its 40% contingency by noting that although the project was in an early stage, there was a significant amount of known cost information: "Based on the approach used in developing the costs which are based on a significant amount of historical project information and current actual cost information we believe the estimates are between a Class 3 – 4 as published by AACE."[611] The Pro Plus team also considered its TAPS' RCN a Class 3 to 4 project, yet utilized a lesser contingency of 25%.[612]

360. The Larkspur study also points out that, "Several sites (MP 31, MP 39, MP 75, MP 178, MP 211, MP 629) not currently corresponding to an existing pump station or

---

[609] MUN7-2568 at 17; Tr. 4740-41 (Cronshaw).

[611] MUN7-3044 at 19.

[612] Tr. 4717-19 (Cronshaw).

developed site location are required . . . ."[613] The study specifically refers to those sites as "Greenfield."[614] But where heater facilities are costed for installation at existing sites the study calls them "Brownfield."[615] Yet for both Greenfield and Brownfield locations, Larkspur uses the same 40% contingency.[616] This is at odds with Mr. Karlik's unsupported assertion that "RCN estimates require less contingency than Greenfield new ventures."[617]

361. These validations, in addition to Dr. Cronshaw's rigorous Monte Carlo modeling and associated analysis, fully persuade the Court that the 25% contingency employed by Pro Plus is reasonable for a RCN of TAPS. Further, based upon the evidence presented at the trial de novo, the Court finds that a contingency of less than 25% would result in an improper valuation of TAPS for the three years at issue.

4. Conclusion of the RCN of TAPS

362. Both the Owners and the Municipalities submitted extensive cost studies and provided detailed testimony regarding each of the proposed replacement TAPS.

363. For the reasons set forth above, this Court has concluded that the Stantec pipeline is not an appropriate design to use as the basis for the application of the cost approach in the valuation of TAPS.

364. Overall, the Pro Plus RCN is an appropriate RCN to use as the basis for the application of the cost approach. Throughout this litigation, Pro Plus experts have strived to

thoroughly answer questions posed by the Court and on cross-examination.[618] Conversely, the Stantec experts were unable to answer numerous questions about the details of their cost estimate on cross-examination.[619]

365. Overall, this Court finds that the Pro Plus cost estimates are reliable. However, as set forth above, this Court has identified several concerns with the Pro Plus cost estimates. It is neither necessary nor feasible to make a precise adjustment in the Pro Plus RCNs to account for each of these concerns – the goal of an RCN, in any event, is to arrive at an estimate of the cost of replacing TAPS with a modern day equivalent of similar quality and like utility – not a precise amount. But this Court does find that some adjustment to the Pro Plus RCN is warranted to account for the concerns that have been identified in the preceding findings. Based upon this Court's consideration of all the evidence, the Court finds that a 10% reduction in Pro Plus's RCN cost estimates for each of the lien years is warranted to arrive at amounts that this Court has determined would better reflect the estimated cost to replace TAPS in each of the lien years with a new pipeline transportation system of similar quality and like utility.

366. The Owners asserted that the RCNs should be compared to the cost estimates that were prepared for the Denali pipeline and Trans Canada gas pipeline project. But due to confidentiality restrictions, no witness was able to provide detailed testimony to this Court about either of those cost estimates. As a result, this Court did not accord weight to either of

[619] *See, e.g.*, Tr. 3314-15, 3327-28, 3329-30, 3331-32, 3330, 3337-38, 3341-42, 3359, 3363-64 (Fiske); Tr. 2511-16, 2516-18, 2520-22, 2532-33, 2538, 2541, 2542, 2543 (Rein).

those cost estimates, while recognizing that, had confidentiality issues been addressed, the information in those estimates could have been quite helpful for comparison purposes.

367. The 2007, 2008 and 2009 RCN cost estimates advanced by Pro Plus were $19.606 billion for 2007, $21.471 billion for 2008, and $21.263 billion for 2009. Reducing each of these amounts by 10% results in the following determinations by this Court of the Replacement Cost New for TAPS for each of the tax years at issue:

2007	$17.645 billion
2008	$19.324 billion
2009	$19.137 billion

B. Depreciation

1. Methods of Calculating Depreciation

368. Once the RCN is determined, the appraisal analysis requires a calculation of the amount of depreciation. "Depreciation is the difference between the contributory value of an improvement and its cost at the time of appraisal."[620] The three types of depreciation traditionally recognized by appraisers are physical deterioration, functional obsolescence, and economic obsolescence.[621] The traditional definitions of these terms are:

> *Physical deterioration* is the loss in value or usefulness of a property due to the using up or expiration of its useful life caused by wear and tear, deterioration, exposure to various elements, physical stresses, and similar factors.
>
> *Functional obsolescence* is the loss in value or usefulness of a property caused by inefficiencies or inadequacies of the property itself, when compared to a more efficient or less costly replacement property that new technology has developed.

---

[620] *The Appraisal of Real Estate* at 391.

[621] *Valuing Machinery and Equipment* at 43; *The Appraisal of Real Estate* at 391-92; Tr. 11251-52 (Podwalny).

> *Economic obsolescence* (sometimes called "external obsolescence") is the loss of value of a property by factors external to the property. These may include such things as the economics of the industry; availability of financing; loss of material and/or labor sources; passage of new legislation; changes in ordinances; increased cost of raw materials, labor, or utilities (without an offsetting increase in product price); reduced demand for the product; increased competition; inflation or high interest rates; or similar factors.[622]

369. The three principal methods for estimating depreciation are: (1) the market extraction method; (2) the economic age-life method; and (3) the breakdown method.[623] The market extraction method and the economic age-life method are the primary methods used by most appraisers to estimate the total depreciation in a property; each is "applied to the whole property and are easier to understand and use."[624]

370. In its simplest form, the economic age-life method considers all three forms of depreciation using a single calculation.

371. The market extraction method relies upon the availability of comparable sales from which depreciation can be extracted.[625] In the case of TAPS, direct comparable sales information is not available, so that method is not appropriate.[626]

372. The breakdown method of depreciation calculates each form of depreciation (physical, functional, and economic) separately.[627] The breakdown method "is primarily used when the appraisal assignment requires that each form of depreciation be accounted

---

[627] *The Appraisal of Real Estate* at 424.

for in the appraisal report,"[628] and is "used when the market extraction and economic age-life methods cannot be applied."[629] The Owners' appraiser Michael Remsha used this method.

373. The Court was not persuaded by Mr. Remsha's application of the breakdown method to depreciate TAPS. Mr. Remsha opined that TAPS was 60% physically depreciated each of the tax years at issue.[630] As part of his calculation, and despite new SR pumps being installed during the lien years, he concluded that the weighted chronological age of TAPS' pumps was 29 years, and that their entire service life was 35 years – such that the newly installed pumps had only 6 years of life remaining by his calculations during each of the three lien years.[631] Given the recent $700 million in SR investment, Mr. Remsha's determinations in this regard were not credible.

374. Mr. Remsha also quantified an inutility penalty for TAPS based upon a projection of future inutility of the 30-inch Stantec pipeline.[632] But during the lien years, the 30-inch Stantec pipeline would be operating well over any reasonable maximum capacity for a 30-inch pipeline such that use of a future projection of unused capacity based on the maximum design capacity that Stantec asserted for its 30-inch pipeline is unwarranted. Moreover, the 30-inch pipeline is quite different from TAPS and may not reasonably be used as a standard to determine TAPS' depreciation.

375. Another concern with Mr. Remsha's approach is that with his breakdown method, TAPS is worth more when he assumed it could no longer transport oil below a

---

300,000 bbl/d throughput than it would be worth if it could transport oil down to 200,000 bbl/d.[633] This illogical result indicates a major flaw in Mr. Remsha's depreciation methodology.

376. For the foregoing reasons, this Court did not apply the breakdown method to depreciate TAPS.

377. In addition to the standard depreciation approaches, this Court also considered the use of a units-of-production method to depreciate TAPS. This method is more typically employed in depreciation for accounting purposes, not appraisal depreciation.[634] "This method places emphasis on the total units to be produced and the rate of production. It takes into consideration the service life of an asset and thereby permits exhaustion of natural resources to be taken into account."[635] The units-of-production approach has also been termed "the life-of-the-reserves" depreciation methodology because the valuation is "based on the estimated reserves of the system rather than the calendar years that those reserves are estimated to be in production."[636]

378. The Municipalities assert that "unit-of-production depreciation would not consider reserves growth and tend to overstate depreciation."[637] Yet the applicable statute directs valuation "based on the estimated life of the proven reserves of gas and unrefined oil

[637] Municipalities' Proposed Findings of Fact and Conclusions of Law ¶ 611.

then technically, economically, and legally deliverable into the transportation facility"[638] – not valuation based on future oil and gas that may become proven reserves at some time in the future, but are not proven reserves as of the valuation date. Particularly where this Court has determined that the RCN should include the full utility of the TAPS' 48-inch pipeline's ability to transport up to 2.1 million bbl/d, the units-of-production approach might better capture the full degree of obsolescence that the property currently has by incorporating the proven reserves as of the lien dates into the valuation more precisely than the economic age-life method.

379. Roger Marks noted that the units-of-production approach had been used under the TAPS Settlement Methodology for TAPS' tariffs for many years, and that under that methodology the original rate base was fully depreciated by the end of the 1990s.[639] In his view, extending TAPS' economic life for additional decades on a straight line basis using the economic age-life method would effectively take "most of those previously depreciated costs and deem . . . them un-depreciated again, which again, reduces the RCN adjustment and increases the ad valorem tax."[640] This argument was not persuasive to the Court, as the "value" of the asset for rate-making purposes is not related to its "full and true value" as defined by AS 43.56.060(e) for ad valorem tax purposes.[641] This Court was more persuaded by Mr. Marks' additional argument that "depreciation depicts . . . the decline of the service potential... and the argument for units of production economically is that . . . for an asset like a pipeline, it more accurately mirrors...how the asset was used over its

[638] AS 43.56.060(e)(2)

[639] Tr. 12127, 12147 (Marks).

[640] Tr. 12147 (Marks).

[641] *See also* Municipalities' Proposed Findings of Fact and Conclusions of Law ¶ 603.

life . . . ."[642] Thus, the approach recognizes that the economic value of TAPS was considerably higher in 1988, when the average daily throughput was over 2 million bbl/d,[643] than it will be in 2070, when the Municipalities estimate that total ANS production of current proven reserves will be less than 100,000 bbl/d.

380. Under a units-of-production approach, in the event that additional reserves are proven on the ANS in the future, then the value of TAPS for ad valorem tax purposes would increase based upon those additional reserves.

381. This Court finds that the legislative history, while inconclusive, indicates that the Legislature was aware of the units-of-production approach and did not specifically reject it when valuing pipeline property for ad valorem tax purposes. For example, at an October 1973 House Finance committee meeting, Homer Burrell addressed each of the sections of HB1. His description of the depreciation method for pipeline property appears to be a units-of-production approach:

> Pipeline and pipeline equipment. [It] is depreciated on the economic life except in the event the physical life is different. Taking a $4 billion installation as the cost with production high in the initial years, it would decrease rather steeply and then level off as production levels off. It will depreciate to probably half value during the first ten years, and is to the oil companies' advantage. However, if more oil is discovered (assuming the pipeline has an unlimited physical life) the line would again increase and flatten out, depending on how much oil is discovered.[644]

[642] Tr. 12151 (Marks).

[643] TO-07-0004.0027.

[644] *Minutes* at 50, H. Finance Comm., 8th Leg., 1st Spec. Sess. (Oct. 22, 1973) [2007 R. 9736]. In an ensuing paragraph of the minutes, Mr. Burrell is quoted as stating "the pipeline is not depreciated on units of production but on straight line." From the context of that statement, however, it appears that he was referring there to the use of straight line depreciation that is explicitly referenced in the second portion of the statute that would apply only in the event that "too much line is built and oil is depleted" – i.e., "when the production rate is low." *Id.* at 9736. *Cf.* Municipalities' Proposed Finding ¶ 606.

382. AS 43.56.060(e)(2) explicitly directs the use of "straight line depreciation" only for those pipelines that have an economic life that is materially shorter than the estimated physical life. Arguably, this demonstrates that the Legislature was well aware of the concept of straight line depreciation and decided not to mandate its use for pipelines in operation such as TAPS.

383. The total barrels of oil transported on TAPS from the date of the pipeline's inception up to each of the lien dates was as follows:[645]

January 1, 2007: 15,278,153,140

January 1, 2008: 15,548,315,190

January 1, 2009: 15,805,814,856

384. Based on this Court's conclusion that the proven reserves on the ANS are between 7 and 8 billion barrels during the lien years, as discussed herein, a units-of-production deprecation methodology would result in a determination that TAPS was currently approximately two-thirds depreciated during the lien years.

385. While this Court has given careful consideration to a units-of-production approach, this Court finds that the Division and SARB should be accorded the first opportunity to consider its potential applicability to the depreciation of TAPS. The approach is not necessarily a standard appraisal methodology.[646] And it is clear that the economic age-life analysis applied by the Division and the Board during each of the lien years is a standard methodology. Stated differently, this Court does not find that the Board's lack of

[645] TO-07-0004 at 260, 338, 408.

[646] *See* 15 AAC 56.110(c).

reliance on a units-of-production deprecation methodology constituted a fundamentally wrong principle of valuation.

386. The economic age-life method was used by the Division and SARB for the lien years at issue, with additional depreciation deductions for functional and external obsolescence.[647] The Court also applied a modified economic age-life method for the 2006 lien year.[648]

387. In the economic age-life method, depreciation is estimated by calculating the ratio between the effective age of the property and its economic life expectancy using the following formula:

[Effective Age / Total Economic Life] x Total Cost = Depreciation.[649]

388. Economic useful life is the "estimated period of time that a new property may be profitably used for the purpose for which it was intended."[650] In estimating a property's economic life, "[a]ll aspects of a property and its market, including the quality and condition of the construction, the functional utility of the improvements, and market and locational externalities must be considered."[651] "An improvement's total economic life begins when it is built and ends when the improvement no longer contributes value for the use to which it was originally intended and is no longer the highest and best use of the underlying land."[652]

[647] MUN7-0234 at 6.

[648] Amended Decision ¶¶ 386, 421.

[649] *The Appraisal of Real Estate* at 420; *Valuing Machinery and Equipment* at 81-82. *See also* Amended Decision ¶ 380.

[650] *Valuing Machinery and Equipment* at 565.

[651] *The Appraisal of Real Estate* at 413.

[652] *The Appraisal of Real Estate* at 412.

389. In the case of TAPS, AS 43.56.060(e)(2) requires the Court to determine its economic value based upon the estimated life of the proven reserves that are then technically, economically, and legally deliverable into the pipeline as of the lien date. Thus, under the statute, these proven reserves serve as a proxy for the economic life of the pipeline for ad valorem tax purposes.

390. The economic age-life method is "limited in that [it] typically reflect[s] a straight line pattern of depreciation."[653] As explained in *The Appraisal of Real Estate*, "this method assumes that every building depreciates on a straight-line basis over the course of its economic life. The straight-line pattern is only an approximation of the total depreciation of a property at a specific point in time."[654]

391. The economic age-life method requires a determination of the "life of the line" – meaning the precise year in the future that TAPS will no longer transport proven reserves. Without a scaling adjustment, the approach can lead to an overestimation of the value of pipeline property that transports declining proven reserves. By way of example, the Municipalities' appraiser Mr. Podwalny assumed that TAPS' economic end-of-life on January 1, 2007 would be December 31, 2067.[655] Based on that assumption, and using the Pro Plus RCN, he determined that the value of TAPS was $12.893 billion as of that lien date.[656] But in their proposed Findings, the Municipalities advocate an end-of-life date for TAPS of 2075 – eight years later than Mr. Podwalny had assumed.[657] Making just that one change adjusts

---

[653] *The Appraisal of Real Estate* at 421.

[654] *The Appraisal of Real Estate* at 421.

[655] MUN07-0035 at 28.

[656] MUN07-0035 at 51.

[657] Municipalities' Proposed Findings of Fact and Conclusions of Law ¶ 893.

the value of TAPS to $13.689 billion – an increase of nearly $800 million– or approximately 6% – over Mr. Podwalny's valuation based solely on this eight year adjustment over 50 years off into the future. In the Court's view, this demonstrates that an exclusive reliance on straight-line economic age-life depreciation without scaling does not accord "due regard to the economic value of the property based on the estimated life of the proven reserves."[658] This is particularly true when it is undisputed that oil reservoirs typically have long tails of production, meaning that their production typically falls off fairly sharply after several years and then continues at a relatively low rate of production for many, many years thereafter.

392. This Court finds that SARB's reliance on the economic age-life method with appropriate modifications to include all functional and external obsolescence was not the application of a fundamentally wrong principle of valuation. Further, application of that methodology has been fully supported by the extensive evidence presented to this Court at the trial de novo.

2. Life of the Line

393. Application of the economic age-life method to depreciate TAPS requires a determination of TAPS' minimum throughput capacity, as well as a determination of the estimated life of the remaining proven reserves on the ANS.

a. Minimum Throughput Capacity

394. AS 43.56.060(e)(2) requires the Court to consider the estimated life of proven reserves "technically, economically, and legally deliverable *into* the transportation facility." (emphasis added) The statute does not expressly require the Court to consider the

[658] AS 43.56.060(e)(2).

transportation facility's hydraulic, mechanical, or operational capacity to transport all of those proven reserves.

395. The Municipalities argue that consideration of the pipeline's ability to transport all of those reserves that are deliverable is "an exhaustive and unnecessary exercise."[659] They also assert that the Legislature's use of proven reserves as the proxy for the economic life of TAPS tends to understate the actual economic life of TAPS, and that to impose an additional minimum throughput limit would compound this understatement of the pipeline's actual economic life. The Municipalities also assert that common sense and expert testimony demonstrate no otherwise economic pipeline has shut down at 100,000 bbl/d, 50,000 bbl/d, or below.[660] At trial, many expert witnesses testified they were unaware of any pipeline that had suspended transportation service for oil that was otherwise economic to produce due to mechanical, hydraulic or operational limitations of the pipeline.[661]

396. Randy Hoffbeck, the former Assessor, testified that TAPS has been the only pipeline in Alaska that has been assessed using a minimum throughput capacity determination.[662] All other pipelines use the economic life of the proven reserves to determine the pipeline's value, without regard to the hydraulic, mechanical, or operational characteristics of the pipeline.[663]

[662] Tr. 11565 (Hoffbeck).

[663] Tr. 11565 (Hoffbeck).

397. The Assessor has interpreted the statute to require a minimum throughput determination.[664] In this regard, the Assessor testified that "the idea is that it is not a reserve that can't get transported to market and it won't get delivered to the facility if the facility can't transport it as of the lien date."[665] The Owners concur that a determination should be made as to TAPS' minimum throughput capacity for ad valorem tax purposes.[666] SARB has adopted this approach during each of the lien years.

398. This Court finds that SARB's interpretation of the statute to require a minimum throughput determination is reasonable and will be applied by this Court. There is likely a minimum throughput level at which point crude oil will no longer be transportable on TAPS. Thus, an owner of a pipeline may seek to demonstrate by a preponderance of the evidence that there is a specified minimum throughput limit that impacts the amount of proven reserves that are technically deliverable into the pipeline as of the lien date.

399. In 2006, the Assessor determined that the minimum throughput of TAPS was 200,000 bbl/d or less, which the Board adopted for subsequent tax years and this Court also adopted in its Amended Decision for the 2006 tax year.[667]

400. At the trial for the 2007 through 2009 tax years, the Assessor advanced 150,000 bbl/d as TAPS' minimum throughput.[668] The Owners have asserted that TAPS will be unable to transport oil "when TAPS throughput at Pump Station 1 reaches between

[667] MUN7-0233 to MUN7-0238; Amended Decision ¶¶ 389 – 390.

[668] Tr. 8717-20 (Greeley).

350,000 and 300,000 barrels per day."[669] The Municipalities have asserted that if a minimum throughput limitation is applied, that "more likely than not, TAPS will operate at least until flow becomes laminar (non-turbulent) at 40,000 to 50,000 bbl/d."[670]

401. The Municipalities' expert Dr. Jerry Modisette testified that there is no hydraulic or mechanical minimum throughput limit because the pipeline will be within pressure constraints at flows down to zero and the pump rate can also go down to zero through reducing pumps, throttling, and recirculation.[671] Former Alyeska Chief Operating Officer Dan Hisey concurred that there is no hydraulic or mechanical minimum throughput limit on TAPS.[672] The Owners' expert, Ulli Pietsch, also testified that there is no hydraulic or mechanical reason that TAPS cannot operate down to 50,000 bbl/d.[673] The inquiry therefore turns to whether there is an operational constraint that would prevent TAPS from transporting oil at some minimum capacity limit.

402. When an upstream oil production company books its proven reserves to the Securities Exchange Commission ("SEC"), it needs to perform an economic analysis to determine the financial feasibility of bringing the oil to market. One determinant in this process is the projected tariff rate to transport the oil on TAPS. In making that determination, an upstream ANS producer needs to make an assumption about TAPS' minimum throughput capacity so that the cost of transportation per barrel can be computed. The effect of a lower throughput capacity increases the total amount of proven reserves

[672] Tr. 8825-26 (Hisey).

[673] Tr. 2024-25 (Pietsch).

expected to be transported through TAPS, thereby decreasing the tariff on a per-barrel basis and extending the economic life of the oil fields.

403. Until approximately 2004, BP used 300,000 bbl/d as the minimum throughput capacity of TAPS for purposes of booking its Alaska North Slope SEC reserves.[674] At that point, BP began to consider whether the new variable speed pumps and recirculation piping associated with SR would permit the adoption of a substantially lower limit (and thus the booking of more reserves).

404. BPPA analyst John Haines testified at the trial in this case. In an email dated November 5, 2004, Mr. Haines stated:

> Momentum is starting to grow around booking more reserves based on an updated view of TAPS' minimum achievable rates . . . Lastly, when TAPS rates reach 100 MBD [100,000 bbl/d] we stop. Our consultant thinks we can probably operate TAPS below this minimum rate, but we didn't want to push it any further at this time.[675]

405. **[CONFIDENTIAL – SEE SEALED ENVELOPE.]** [redacted]

[redacted]

[redacted]

[674] MUN7-4406; MUN7-3046 at 1.

[675] MUN7-9094 at 1, 2 (confidentiality waived on record at Tr. 11421).

406. In 2004, BP Pipelines retained JTG Technology Consortium to conduct a study to revisit the minimum throughput limit on TAPS. The 308-page JTG report was completed in 2005 ("JTG Study") and concluded that "the low flow limit of the existing 48-inch TAPS pipeline was determined to be a PS [Pump Station] 1 rate of 135 MB/day [135,000 bbl/d]."[677]

407. The 135,000 bbl/d minimum throughput level set forth in the 2005 JTG Study was to be achieved with the addition of heat, although the study also allowed for other necessary modifications such as additional booster pumps, scraper trap valves, and piping for pigging.[678] Ulli Pietsch, the Owners' hydraulics expert in this trial, conducted the pressure and temperature simulations for the JTG Study.[679]

408. BPPA and its affiliates relied upon the JTG Study's conclusion of a 135,000 bbl/d low-flow limit to create tariff profiles that BP then used to report its reserves for several years to the SEC.[680]

[redacted]

[677] MUN7-3000 at 6.

[678] MUN7-3000 at 33, 75, 80.

[679] Tr. 2043-44, 2046 (Pietsch).

[680] Tr. 11413-17 (Haines).

409. In its initial year-end 2004 reserves submission to the BP London office, which was scheduled a couple of months before the JTG Study was concluded, BP Exploration and BP Pipelines personnel determined "an effective TAPS minimum throughput level of 150,000 bbl/d at 2053," using "conservative assumptions."[681] The report added:

> In the case of GPB [Greater Prudhoe Bay] and KRU [Kuparuk River Unit] (the biggest contributors to the reserves adds) each of these fields were still cash flow positive at 2064 (end of our tariff profile). The reserves coordinators arbitrarily chose to cut-off life at the earlier dates (2053 for GPB and 2047 for GKA) just to give themselves some future cushion.[682]

410. The JTG Study contained an alternative rail option that envisioned building a $3 billion 20-inch replacement pipeline from the North Slope to Fairbanks, and then using rail to transport the oil from Fairbanks to tidewater. That approach would allow reserves to be booked down to 45,000 bbl/d, if justified by high oil prices.[683]

411. **[CONFIDENTIAL – SEE SEALED ENVELOPE.]** [redacted]

[681] MUN7-9094 at 8.

[682] MUN7-9094 at 8 (confidentiality waived on record at Tr. 11425).

[683] Tr. 11411 (Haines); MUN7-3046 at 1.

[redacted]

412. BP Pipelines failed to provide the 2005 JTG Study in discovery for the 2006 ad valorem tax year proceedings.[685] That study would have supported the Municipalities' position in that litigation that TAPS could operate down to 150,000 bbl/d or less, and may well have resulted in the Court finding a minimum capacity limit lower than the 200,000 bbl/d that this Court applied for that assessment year.[686]

413. In closing arguments to this Court, Owners' counsel asserted that the 2005 JTG Study was consistent with a 200,000 bbl/d limit south of Fairbanks because the study has a range of 200,000 to 135,000 bbl/d as the minimum limit, apparently referring to a North Pole off-take alternative scenario in the study.[687] This position is not supported by the evidence; the JTG Study unambiguously states that "the low-flow limit of the existing 48" TAPS pipeline was determined to be a PS [Pump Station] 1 rate of 135 MB/Day [135,000 bbl/d]."[688] And whatever the Owners' position as to how the 2005 JTG Study should be interpreted, the Owners' failure to bring that study forward resulted in the other parties, SARB, and this Court not being able to consider it until its production in the proceedings for the 2007 to 2009 tax years.

414. In 2010, BP Pipelines retained Phil Carpenter, a subject matter expert who was also used extensively by Alyeska in its Low Flow study, to determine whether TAPS could operate at levels below the 135,000 bbl/d threshold put forth in the 2005 JTG Study. At trial, Mr. Haines of BP Pipelines explained:

---

[685] Tr. 13580-81 (Mahoney).

[686] Amended Decision ¶ 122.

[687] Tr. 13580-81 (Mahoney).

[688] MUN7-3000 at 6, 7.

> The JTG study . . . essentially had two different paths that you could live with . . . One path was you would throw investments at TAPS and eventually the south leg would die at a rate of 135. You would start a railroading apparatus at that point. . . . the south leg always died first because of the extraction of oil at Fairbanks at the Fairbanks refinery . . . Except if you wanted to throw another $3 billion at the problem and replace the north leg with a replacement 20-inch line . . . [so as to be able to transport down to 45,000 bbl/day] . . . And the economic hurdle of paying for that $3 billion of replacement line investment created a very large stair-step in the economic profile, the granularity I was talking about.[689]

415. In a May 19, 2010 email, Mr. Haines provided Mr. Carpenter with a copy of the 2005 JTG Study and explained:

> You probably want to start with the executive summary. As we discussed on the phone, our reserves reporting relied on a 'low oil price' scenario and a 'high oil price scenario." These are identified in the report as Scenario 2 and Scenario 3. What we are looking for in your work effort is some sort of intermediate solution that could be used to extend the limit beyond 135 MBD [135,000 bbl/d] (Scenario 2), but would not have a $3 billion hurdle that would allow us to get down to 45 MBD [45,000 bbl/d]. In other words, something for a "middle oil price" scenario.[690]

Thus, the 2010 Carpenter Study was undertaken by BP Pipelines to obtain a minimum throughput level below 135,000 bbl/d that did not have a "$3 billion hurdle" associated with it that could be used for purposes of BP booking its proven reserves.[691]

416. A June 11, 2010 email from Mr. Carpenter contained a list of over a dozen low throughput options he had analyzed.[692] On June 15, 2010, Mr. Haines responded back that:

> I've had a chance to talk to our upstream reserves guys, and they advise that Option 2 (run cold and sweep with freeze suppressant) sounds like it might be pushing things too far, because it requires

---

[689] Tr. 11410-11 (Haines).

[690] MUN7-3046 at 1.

[691] Tr. 11411 (Haines); MUN7-3046 at 1.

[692] MUN7-3046 at 30.

> achieving a level of confidence in the physics of the problem – a level of "proof" that our study will not be capable of fully defining. So, they agree we can drop it from the list . . . .[693]

Mr. Haines then discussed the various other options, concluding:

> From a pragmatic viewpoint, it seems to me that item 1 (heaters) may be exactly what we're looking for (in terms of finding a sure-fire way to bridge between the 135 MBD [135,000 bbl/d] endpoint and the large capital cost of replacing the north leg). I say this because if we can find a way to lower the endpoint from 135 MBD [135,000 bbl/d] to say something in the range of 100 MBD [100,000 bbl/d] or less, that kind of solution would probably act to close the gap our reserves guys are seeking.[694]

417. On June 28, 2010 Mr. Carpenter provided Mr. Haines with a "status update on the low flow work" in which he opined:

> . . . I am beginning to think that it looks surprisingly good for ultra low flow below 100,000 [bbl/d]. . . Heating needs actually go down with decreasing flow after a certain point. In addition to heaters, the primary upgrades required are oil separation facilities in Valdez (which could rely to great extent on the existing tank system) plus a water treatment plant. Other upgrades would be safety upgrades required to deal with an extended pipeline shutdown. This option is particularly interesting because it also offers the possibility of shipping heavy viscous crude oil that may be coming down the line in the future. It does not currently appear that there are any downstream side effects.[695]

418. Consistent with that opinion, on July 20, 2010, Mr. Carpenter circulated a draft of the 2010 Carpenter Study: "The analysis concluded that point source heating of the oil is the best solution for operation of 100,000 [bbl/d]."[696] Mr. Haines' response to the draft stated:

---

[693] MUN7-3046 at 29.

[694] MUN7-3046 at 29. *See also* Tr. 11449-50 (Haines).

[695] MUN7-3052 at 1.

[696] MUN7-3056 at 6 (BP Pipeline interlineations omitted).

> Thanks for the updated report. This is shaping up nicely, and is exactly the "fit for purpose" product we were looking for. . . . Probably the most significant edits we've made to your most recent draft involved turning on the railroad when the PS-1 rate hits 140 MBD [140,000 bbl/d] (and turning off the south leg), and running the north leg down to 70 MBD [70,000 bbl/d]. This means some of the south leg heaters will likely not be installed at rates below 140 MBD [140,000 bbl/d] (because of laminar flow issues).[697]

419. The final version of the 2010 Carpenter Study was dated August 16, 2010 and concluded that TAPS could effectively operate down to throughputs between 100,000 bbl/d and approximately 70,000 bbl/d.[698] To operate at those throughputs, the study concluded that "[p]oint source heating of the oil (via heaters located at various intervals along the pipeline) is currently the best solution for enabling operations down to low throughput."[699]

420. The 2010 Carpenter Study did not foreclose lower throughput levels below its conclusions, acknowledging that other technologies apart from point source heating "may eventually offer better solutions with fewer unknowns, lower throughput limits and lower shutdown risk, but these options are less developed and well understood at this time."[700] The Study stated that "50,000 [bbl/d] to 70,000 [bbl/d] is probably the limit for [the point source heating] approach due to wax deposition and pigging concerns. Further reduction in flow will require investigation of other options that maintain higher flow velocities, such as seawater commodity supplementation."[701]

421. On August 23, 2010, Larkspur issued the companion report to the Carpenter Study. The Larkspur Study details the location, estimated cost, and timing (based upon flow

---

[697] MUN7-3051 at 1.

[699] MUN7-3020 at 6. *See also id.* at 8 (laminar flow at "about 50,000 BPD").

[700] MUN7-3020 at 7.

[701] MUN7-3020 at 8.

rates) of the heaters necessary to operate all of TAPS down to 100,000 bbl/d.[702] Together with the Carpenter Study, the Larkspur Study demonstrates that the TAPS Owners are already considering the expenditure of significant resources to transport daily throughputs on TAPS far below the 300,000 to 350,000 bbl/d minimum throughput limit that the Owners are advancing in this case.

422. In the fall of 2010, BPPA used the lower minimum throughput determinations from the Carpenter Study in its transportation tariff calculations. Those calculations, in turn, were provided to BP Production forecasting personnel who then used that information to book BP's proven reserves in 2010.[703] That BP relied upon the Carpenter Study's 100,000 to 70,000 bbl/d low flow estimate to book its reserves is compelling evidence that these figures may be reasonably relied upon by this Court to determine the assessed value of TAPS.

423. At trial, the Owners maintained that TAPS' minimum throughput limit is much higher. They referred to the extensive work done on the 2011 Alyeska Low Flow Impact Study ("LoFIS"), as testified to by Alyeska employee Pat McDevitt, in support of their position that TAPS has an operational lower capacity limit of 300,000 to 350,000 bbl/d.[704] Mr. Carpenter, who prepared the BP Pipelines 2010 study for reserves purposes, was also a

---

[702] MUN7-3044; MUN7-3045. Thus, although BP Pipelines edited the final version of the 2010 Carpenter Study to reflect BP Pipelines' preference to "turn on" the North Pole Refinery, and thus assumes a limit of 140,000 bbl/d on the South leg, Larkspur's work is consistent with Mr. Carpenter's original analysis that did not distinguish between the low flow limits on the North and South legs.

[703] Tr. 11415-17 (Haines).

[704] Tr. 10751 (McDevitt).

core member of the Alyeska LoFIS team, with subject matter expertise in water transport, hydraulic size formation, and heat transfer.[705]

424. The LoFIS was an $11 million study by Alyeska that reviewed many potential low-flow issues – including water dropout and corrosion, ice formation within the crude, wax deposition, and potential pipe displacement due to ice lenses in the soil. The public version of the Low Flow Study expressly concluded that "[f]low volumes of less than about 350,000 BPD subject TAPS operations and pipeline integrity to greater degrees of uncertainty that require investigation and study beyond that accomplished through the LoFIS. *Measures to mitigate these issues utilizing the existing 48-inch pipe at throughputs below 350,000 BPD have not been determined at the date of this report.*"[706] Similarly, Mr. Haines testified that Mr. Carpenter and Larkspur "concluded that [TAPS] could run down to lower levels than what I understood the Alyeska team was currently examining," and that 300,000 bbl/d was the "lower range of [the LoFIS] effort."[707] This was also consistent with Mr. McDevitt's testimony that the purpose of LoFIS was "to look at TAPS' low flow down to 300,000 bbl/d".[708] This Court finds, based on the evidence presented at trial, that the LoFIS was primarily limited to studying operating challenges with throughputs down to 300,000 bbl/d and not below that level.[709] Its focus was not to determine TAPS' minimum throughput capacity.

[709] Tr. 10975-82 (McDevitt); Tr. 11404 (Haines).

425. While the LoFIS discussed many potential problems at lower throughputs and recommended further study for solutions, it did not establish by a preponderance of the evidence that TAPS cannot operate below 300,000 bbl/d. Although Pat McDevitt, the project manager for LoFIS, testified that it is "not possible" for TAPS to operate below 300,000 bbl/d, this Court found that testimony, when considered with all of the other evidence at trial presented on this topic, to be completely unpersuasive.[710] Mr. McDevitt declined to present himself as a subject matter expert in any of his areas of concern.[711] Furthermore, no other expert made an absolute statement as to TAPS' minimum capacity. For example, Alyeska engineer Joe Riordan testified that he did not know for a fact that TAPS could not operate at 100,000 bbl/d.[712] This Court concurs with the Department's assertion that in the case of Mr. McDevitt, "it is difficult to separate advocacy from engineering analysis that has been fully vetted and tested."[713]

426. Mr. McDevitt did not clearly articulate a specific reason why TAPS would cease to operate at any particular capacity level, but instead articulated a number of operational concerns that have not yet been fully studied.[714] For example, when asked for the primary reason why TAPS would be unable to operate below 300,000 bbl/d, he indicated low velocity pigging could constrain TAPS' operation at low flows.

[712] Tr. 5129 (Riordan).

[713] Department's Proposed Findings of Fact and Conclusions of Law ¶ 202.

[714] Tr. 11027-28 (McDevitt).

427. Pigging becomes more critical as the oil slows and the temperature of the oil decreases, because wax precipitation and deposition increase.[715] This wax deposition is primarily addressed through increased pigging of the pipeline. The August 2010 Carpenter Study used a 7-day pigging schedule with approximately 20 pigs in the pipeline for its 70,000 bbl/d scenario.[716] Mr. Carpenter nonetheless recognized that "pipeline scraper and inspection pig viability at low flow is a considerable concern at very low flow,"[717] and recommended that "Alyeska and/or its Owners implement a long-term research and development program to implement mission critical pigs."[718] But over one year after that report was issued, Mr. McDevitt testified at trial that he was unaware of any conceptual engineering work underway at Alyeska to address these pigging issues, and was unaware of any pig manufacturer that had been contacted for the purpose of designing, developing or testing low velocity pigs for TAPS.[719]

428. As noted above, BP pipelines provided extensive comments on a July 20, 2010 draft of Mr. Carpenter's Study. One exchange related to Alyeska's low flow work. BP Pipelines commented that:

> Recognizing that your work here goes beyond (and has a somewhat different focus than) the [Alyeska] Low Flow team's work, we want to ensure that everything said in this report would not contradict the work done by the Low Flow team or be in conflict with what their report might say when it is issued in 3Q. In particular, we've been picking up some recent rumors that the Low Flow team's optimism about achieving very low throughput rates has started to wane a little in

[715] Tr. 10918 (McDevitt).

> recent months, but we don't know if there's any merit to this. So, we were hoping you could bring us up to speed on Friday.[720]

Mr. Carpenter responded: "I think that your concern is valid. The primary concerns are (1) the ability to pig the line at very low flow and (2) the impact of shutdowns and slowdowns on oil temperature and wax accumulation."[721] Another drafting note by BP Pipelines stated:

> Phil, I'm wondering whether you could develop a list of the additional heaters required to get down to say 70-80,000 [bbl/d]. This way we could get a sense of how impractical the number of heaters is getting to be as the rate goes below 100 MBD [100,000 bbl/d]. If it looks like maybe 3 or 4 more heating stations will do the job, then perhaps it is still within the range of being economic. I know this says nothing about the ability to pig at such low rates, or whether wax sedimentation is insurmountable. I guess what I'm trying to say is – is there any room to move this number lower without pushing the boundaries of good engineering judgment? Or, is 100 [100,000 bbl/d] about the limit of how low you think TAPS can go with point heating.[722]

Mr. Carpenter's response was:

> My biggest concern with ultra flow and heating is the ability to pig and the potential for wax sedimentation/sludge accumulation in laminar flow. I've refined my numbers a bit and right now the laminar flow limit in the north end is about 70,000 [bbl/d], which probably eliminates that sludge issue but does not solve the pig issue.[723]

429. Thus, while Mr. Carpenter expressed concerns with pigging, he was sufficiently confident the "pig issue" could be solved that he concluded TAPS could operate at the "70,000 [bbl/d] benchmark" discussed in his report.[724]

430. This Court finds the JTG and Carpenter studies, which were conducted by TAPS' largest Owner for the specific purpose of evaluating the ability of TAPS to operate at

[723] MUN7-3056 at 8.

[724] MUN7-3020 at 10.

throughputs well below 300,000 bbl/d and relied upon by BP for booking its proven reserves, to be far more persuasive than the LoFIS study in determining TAPS' minimum throughput capacity.

431. At trial, the Municipalities' expert Dr. Jerry Modisette persuasively opined why he had determined that TAPS could operate at 100,000 bbl/d. Indeed, Dr. Modisette asserted TAPS could operate at far lower throughputs than that, particularly if the oil were recirculated through the pumps so as to raise its temperature – a project Alyeska is planning to try this winter.[725]

432. With regard to the low-flow operational issues identified in the Alyeska study, including water dropout and corrosion, ice formation within the crude oil, ice lenses or frost heaves in the soil, and wax precipitation and deposition, the weight of the evidence at trial persuaded this Court that it is more likely than not that there will be engineering solutions to mitigate these problems on TAPS at throughputs down to 100,000 bbl/d or less.[726]

433. Heating the pipeline will likely be a major component of any low-flow mitigation approach. Mr. Malvick stated that Alyeska is currently studying and planning for heating TAPS via installation of point source heaters, enhanced recycling of crude at pump stations, bringing Pump Station 7 back into service as a heating station, enhanced pipeline insulation, and waste heat recovery at Pump Stations 3 and 4.[727] As of the time of trial in late 2011, Alyeska and the Owners had not yet purchased any heaters for TAPS.[728]

---

[725] Tr. 9014-15 (Modisette).

[726] *See, e.g.*, Tr. 8961-62 (Hisey).

[727] Tr. 1969, 1974, 1978-80 (Malvick).

[728] Tr. 1828-29 (Riordan).

434. The August 2010 Larkspur Study estimates approximately $2 billion in undiscounted costs for heating TAPS so as to be able to transport 100,000 bbl/d.[729] This is based on the 2010 Carpenter Study's use of substantial redundancy resulting in 70% excess heating capacity.[730] Thus, the actual cost could well be considerably lower. However, even Larkspur's estimated expense is self-evidently economic in light of the value of TAPS' proven reserves. The Court was persuaded by Mr. Hisey's testimony that even if the heating and other mitigation measures cost upwards of hundreds of millions of dollars in the coming decades, it would still be economical to make such investments to keep TAPS operating at and below 100,000 bbl/d "to move North Slope crude oil and keep that transportation base available for future fields, future production."[731]

435. As noted above, Mr. Haines used the 2010 Carpenter Study and the Larkspur Study as the basis for TAPS' minimum throughput capacity in developing the per barrel transportation tariffs that BP relied upon to book its proven reserves.[732] At the trial de novo, Owners' counsel asked Mr. Haines what weight he would give the 2010 Carpenter Study today if he were to determine TAPS' minimum throughput capacity, after Alyeska's $11 million low flow study had been completed.[733] Mr. Haines testified:

> It seems to me that if I had to sit back and do tariffs again, I would be – have to give a lot of weight to – to the one that seems to me to be – have more depth behind it and engineering facts, and that would have to be – I would have to seriously weight what I saw with – with the Alyeska result.[734]

---

[729] MUN7-3045 at 2.

[730] MUN7-3020 at 29-31.

[731] Tr. 9000 (Hisey).

[732] Tr. 11474-75 (Haines).

[733] Tr. 11484 (Haines).

[734] Tr. 11485-86 (Haines).

Thus, Mr. Haines did not say that he believed the 2010 Carpenter Study was inaccurate, presented incorrect information, or was improper to rely upon to book reserves in the past or future, but only that he would "seriously weigh" the Alyeska opinions presented at trial by Mr. McDevitt.

436. The Owners did not seek to have Mr. Carpenter testify at trial, notwithstanding the Court's specific indication during trial that a motion could be brought to do so.[735]

437. This Court finds the conclusions reached in the 2005 JTG study, together with the opinions reached in the 2010 Carpenter Study and Larkspur Study, as well as the opinions of Dr. Modisette and Mr. Hisey, to be more credible and persuasive than Mr. McDevitt's opinion on TAPS' minimum throughput capacity.

438. For the foregoing reasons, and after careful consideration of all of the evidence presented at trial, this Court finds it more likely than not that TAPS can effectively transport throughputs at least down to a minimum flow rate of 100,000 bbl/d.

b. Proven Reserves

i. The Definition of Proven Reserves

439. The applicable statute requires consideration of the "estimated life of the proven reserves of gas and unrefined oil then technically, economically and legal deliverable into the transportation facility."[736]

440. Various definitions of the term "proven reserves" have been advanced by the parties and considered by this Court during the course of these proceedings.[737] For the

[735] Tr. 11505 (Court); Alaska Civil Pattern Jury Instruction 02.23.

[736] AS 43.56.060(e)(2).

2006 tax year, this Court declined to further define proven reserves beyond the statutory language, and held that the statute required an estimation of the total proven reserves, and then a determination made as to which of those proven reserves were deliverable to the pipeline as of the valuation date.[738]

441. In an order issued on August 16, 2011, this Court again declined to create a more refined definition of "proven reserves" than is set forth in the statute, and again held that the statutory phrase "then technically, economically and legally deliverable" provides a further restriction on the amount of proven reserves that can be considered in determining the full and true value of TAPS.[739]

442. In their proposed findings, the Owners urge this Court to adopt a requirement that reserves be proven to a level of "reasonable certainty" before they can be considered as "proven reserves" for ad valorem tax purposes. They cite to the Securities and Exchange Commission ("SEC") definition, which effective January 1, 2010, provides as follows:

> Proved oil and gas reserves are those quantities of oil and gas, which, by analysis of geoscience and engineering data, can be estimated with reasonable certainty to be economically producible—from a given date forward, from known reservoirs, and under existing economic conditions, operating methods, and government regulations—prior to the time at which contracts providing the right to operate expire, unless evidence indicates that renewal is reasonably certain, regardless of whether deterministic or probabilistic methods are used for the estimation. The project to extract the hydrocarbons must have commenced or the operator must be reasonably certain that it will commence the project within a reasonable time.[740]

---

[737] *See* Owners' Mot. for Rule of Law on Meaning of Proven Reserves within AS 43.56 (May 27, 2011); Municipalities' Opp'n to TAPS Owners' Mot. for Rule of Law on Meaning of Proven Reserves within AS 43.56 (June 29, 2011); 2007 R. 3541- 3561; Tr. 9705-06 (Van Dyke).

[738] *See* Order re TAPS Owners' Motions of May 27, 2011 at 2, n. 3 (Aug. 16, 2011).

[739] *See* Order re TAPS Owners' Motions of May 27, 2011 at 2 (Aug. 16, 2011).

[740] 17 CFR § 210.4-10 (effective 2010); Owners' Proposed Findings of Fact and Conclusions of Law ¶ 698.

443. The Owners note that publicly traded companies listed on the U.S. stock exchange must report their proven reserves using this SEC definition.[741] They assert that "[t]he SEC rules provide for a consistent and reliable industry understanding of the term and the meaning of 'proven reserves' for booking those reserves for financial reporting and for public disclosures."[742] They argue that this standard should be adopted by this Court for the ad valorem assessment of TAPS, as it reflects "current technical understanding of the term as used in the United States."[743]

444. In effect, the Owners' urge the adoption of a heightened burden of proof so as to require that the reserves be proven to a level of "reasonable certainty" before they can be considered in the ad valorem assessment of TAPS.

445. A 1965 Society of Petroleum Engineers' ("SPE") definition of "proved reserves" in effect when AS 43.56 was enacted read as follows:

> Proved Reserves–The quantities of crude oil, natural gas and natural gas liquids which geological and engineering data demonstrate with reasonable certainty to be recoverable in the future from known oil and gas reservoirs under existing economic and operating conditions. They represent strictly technical judgments, and are not knowingly influenced by attitudes of conservatism or optimism.[744]

446. There is a similarity between AS 43.56.060(e)(2) and the 1965 SPE definition for "proved reserves," and it is possible that Legislators considered the SPE definition when drafting the ad valorem tax statutes.[745] And yet, as this Court has previously noted, the Legislature did not articulate any particular confidence level in the statutory definition of

[741] Tr. 9867-68 (Hoolahan).

[742] Owners' Proposed Findings of Fact and Conclusions of Law ¶ 697.

[743] Owners' Proposed Findings of Fact and Conclusions of Law ¶ 702.

[744] 2007 R. 3546.

[745] *See* 2007 R. 3534.

"proven reserves" for ad valorem tax purposes, such as proven by a "preponderance of the evidence" or "reasonable certainty."[746]

447. "Preponderance of the evidence is the general burden of persuasion in civil cases."[747] On occasion, such as with civil statutes that are quasi criminal in nature, the Alaska Supreme Court has established a higher burden. But in this tax case, and in the absence of a clear legislative articulation of a heightened standard, the preponderance of the evidence standard should control.

448. Moreover, no persuasive justification has been demonstrated here for creating a heightened burden of proof for ad valorem tax purposes. Government reporting agencies such as the SEC require a heightened burden of proof from oil producers that the reserves they are asserting as proven have actually been ascertained to a degree of reasonable certainty. That heightened burden, however, is imposed upon the entities that have full access to the data they are required to submit, and is intended for investors to be able to rely upon in formulating investment decisions.

449. The history of this case demonstrates that it has been exceedingly difficult for the Municipalities to obtain any proven reserves information from the Owners and their affiliates. Only a limited amount of reserves information has been made available to the Municipalities – and certainly not due to a lack of effort on their part both before the trial court and on repeated petitions for review to the Alaska Supreme Court. To require a

[746] *See* Amended Decision ¶ 396.

[747] *Fernandes v. Portwine*, 56 P.3d 1, 6 (Alaska 2002) (citing *Addington v. Texas*, 441 U.S. 418, 423 (1979) (the burden in typical civil cases is preponderance of the evidence); *Spenard Action Comm.*, 902 P.2d at 775 (the general civil standard is preponderance of the evidence); *Cavanah v. Martin*, 590 P.2d 41, 42 (Alaska 1979) ("The standard of proof in civil cases is proof by a preponderance of the evidence."). *See also* AS 43.05.435(1) (in tax appeals heard by administrative law judge, the judge shall "resolve a question of fact by a preponderance of the evidence, or if a different standard of proof has been set by law for a particular question, by that standard of proof.").

heightened burden of proof of the proven reserves from the Municipalities when they have been unable to obtain all of the proven reserves information they have so vigorously sought from the Owners and their affiliates could result in an ad valorem valuation that is not a "full and true value" of the pipeline. This Court finds it more likely that a construction of the statute "that rigidly adopted the petroleum industry's concept of proved reserves would lead to impermissible inequities in tax assessment."[748]

450. The Owners also cite to AS 01.10.040(a) in urging the adoption of the SEC definition. This statute provides that "[t]echnical words and phrases and those which have acquired a peculiar and appropriate meaning, whether by legislative definition or otherwise, shall be construed according to the peculiar and appropriate meaning."[749] But the record demonstrates that in addition to the reserves information that an oil producer provides to the SEC using the government's reporting standards, an oil producer also maintains its own proprietary reserves information, which can be based on a variety of different economic and other assumptions from the SEC requirements.[750] The record establishes that the term "proven reserves" has not acquired a peculiar or appropriate meaning. Accordingly, this Court finds that for ad valorem tax purposes under AS 43.56, reserves must be proven by a preponderance of the evidence, and not by any heightened standard.

451. The word "then" preceding "technically, economically and legally deliverable into the transportation facility" in AS 43.56.060(e)(2) imposes a temporal restriction that

---

[748] *Maples v. Kern County Assessment Appeals Bd.*, 103 Cal. App. 4th 172, 196 (Cal. Ct. App. 2002). *See also* Municipalities' Proposed Findings of Fact and Conclusions of Law ¶¶ 677, 678.

[749] Owners' Proposed Findings of Fact and Conclusions of Law ¶ 691.

[750] Tr. 9718-24 (Van Dyke).

requires that for proven reserves to be included in the valuation analysis of TAPS, they must be technically, economically, and legally deliverable as of the valuation dates each year.

452. This Court interprets the requirement that the oil be "technically" deliverable into the pipeline to mean that the technology exists as of the lien date for the oil to be deliverable to the pipeline. This Court again finds that the existence of pipeline and production facilities to a particular field as of the lien date is not a prerequisite for those reserves to be considered technically deliverable under the statute, so long as the technology exists for the oil to be deliverable to the pipeline as of the lien date.[751] This finding is consistent with many definitions of the term "proven reserves," including those adopted by the SEC and the SPE, which distinguish between proved developed reserves and proved undeveloped reserves.[752] Reserves that do not have infrastructure in place are still considered proven, but are categorized as proved undeveloped.[753]

453. Further, as previously discussed in this decision, this Court adopts the Board's interpretation of the statutory provision that reserves be "technically deliverable ... into the transportation facility" to permit a pipeline owner to prove by a preponderance of the evidence that a pipeline has a minimum throughput capacity.

454. This Court finds that the "legally deliverable" requirement is satisfied so long as the totality of the circumstances demonstrate that it is reasonable to assume that all necessary permits and licenses to allow for the extraction of proven reserves from a given

---

[751] *See* Amended Decision ¶ 401.

[752] Tr. 9872 (Hoolahan).

[753] Tr. 10084 (Hoolahan).

pool will be granted or renewed, and there exist no legal prohibitions against delivering those reserves to TAPS as of the lien date.

455. In the case of the Point Thomson Unit ("PTU"), the Department of Natural Resources had terminated the unit as of November 2006, so reserves from the PTU should not be included in the proven reserves as of the January 1, 2007 lien date because of the legal prohibition on development. In December 2007, the Superior Court reversed the unit termination decision and remanded the matter back to the agency for further proceedings. Thus, the PTU should be included as legally deliverable proven reserves as of the January 1, 2008 lien date.[754] But as of the January 1, 2009 lien date, the unit had again been terminated by the agency, and the appeal to the superior court was pending. Thus, the PTU should not be included in the proven reserves analysis as of that date. The PTU satellites have been included as proven reserves in all three of the lien years since no persuasive evidence was presented that they were included within the agency's unit termination decisions.

456. This Court was completely unpersuaded by the testimony of the Owners' witness Jack Hartz that the "legally deliverable" provision set forth in the statute includes only those quantities of oil that are contained in reservoirs for which the producers, as of the lien date, have every permit and license necessary to allow immediate extraction and delivery of crude oil to TAPS.[755] Such an approach would result in an improper valuation of the pipeline.

---

[754] *See ExxonMobil v. State*, Superior Ct. Case No. 3AN-06-13751 CI.

[755] Tr. 10143-45 (Hartz).

457. Natural gas liquids ("NGLs") produced at Prudhoe Bay that are contractually committed for shipment to Kuparuk would not be legally deliverable to TAPS.[756] However, the Owners failed to present sufficient evidence as to the amount of such reserves.[757]

458. To be economically deliverable, the anticipated price for a barrel of oil to be delivered to market must exceed the cost of its production, including the cost of transportation. Each party performed an economic analysis of the proven reserves for this proceeding.

459. Thus, so long as oil in each of the three categories of ANS production established by the Department of Revenue – producing, under development, and under evaluation – was economically, technically, and legally deliverable into TAPS as of the lien date, as proven by a preponderance of the evidence, that oil should be included when estimating the economic life of TAPS for ad valorem tax purposes.

460. This is consistent with the testimony of experts in this case and before SARB that "technically, economically, and legally" are common elements of proved reserves definitions,[758] and that their determination of "proven reserves" would not have been materially different had the "technically, economically, and legally" language been absent.[759] That is because each of these three requirements are explicitly or implicitly contained in most, if not all, definitions of proved reserves.

463. The parties also presented some evidence of reserves information that has been made publicly available through various government agencies. This included a Department of Energy Report dated August 2007 which estimated that the remaining

[redacted]

economically recoverable oil from existing fields on the ANS was between 6 and 7 billion barrels as of December 31, 2004.[770]

464. The Owners' appraiser Michael Remsha did not rely upon the Owner's reserves expert Shaun Hoolahan's proven reserves estimates, but instead used the Department of Revenue's throughput projections to which he applied a discount. His discounted remaining throughput projections as of the lien dates ranged from 2.0 billion barrels to 6.2 billion barrels.[771]

ii. The Municipalities' Production Forecasts and Reserves Estimates Generally Provide a Reliable Basis for Determining TAPS' Estimated Proven Reserves

465. Dudley Platt is one of the preeminent production forecasters in the state, although he is not a petroleum engineer. He began making oil production forecasts for the State of Alaska in 1989.[772] Mr. Platt prepared a production forecast for the Department every year through 2009.[773] This Court relied on Mr. Platt's production forecast to determine TAPS' end-of-life in the 2006 tax year trial.[774]

466. Mr. Platt used a comprehensive "lease sale to abandonment" approach to his forecasting in which he considered lease acquisition, unitization and field development, and how multiple pools produce using evolving technologies and numerous reservoir drive mechanisms to common surface facilities.[775]

---

[773] MUN7-0238 at 21.

[774] Amended Decision ¶ 398.

[775] Tr. 9343-48 (Platt).

467. Mr. Platt also testified that he relies upon reports filed by the producers with the Alaska Oil & Gas Conservation Commission in determining what proved reserves are technically recoverable.[776] Those reports detail not only industry estimates regarding the quantities of oil in place, but also industry estimates regarding the amounts of oil recoverable using established methods of extraction.[777] These estimates are based on standard industry techniques, including seismic mapping, computer simulation, and exploratory drilling.[778] The evidence at trial demonstrated that the estimates of the economic life of Prudhoe Bay reported by the BP Prudhoe Bay Royalty Trust ("Royalty Trust") to the SEC correlate well with Mr. Platt's economic models when he used the SEC fixed price for comparison purposes.[779]

468. Decline curve analysis is one component in the determination of the economic life of ANS proven reserves.[780] Mr. Platt's forecast incorporated a decline curve analysis at the pool level, as opposed to a well-by-well analysis used by both the Owners' and Department's witnesses.[781] Mr. Platt persuasively testified that, based on his experience working in the oil industry, long-range production forecasters do not use decline curves on a well-by-well basis.[782] Mr. Van Dyke explained that well-by-well analysis can work well for a small lease in Kansas with four wells, but not for a field with 1,000 wells that are regularly being turned on and off: "it's not the best approach to use a well-by-well method as

---

[782] Tr. 9431-32 (Platt).

compared to the pool – a pool level method to forecast production."[783] Decline curve analysis at the well level requires subjective analysis of highly variable historic data to estimate future production rates for each well.[784]

469. **[CONFIDENTIAL – SEE SEALED ENVELOPE.]** [redacted]

[redacted]

[redacted]

470. The legislative history of AS 43.56 supports the use of a pool forecasting methodology. At a 1973 Finance Committee hearing on the bill, "Mr. Heier asked if the Division of Oil & Gas could furnish the state assessor's office projections well by well as to future productions. Mr. Burrell [of the Division] said it could be done more accurately on a field basis, as one well could dry up immediately."[786]

471. Based on the evidence presented at trial, this Court finds that for determining the economic life of TAPS, a pool-based analysis is generally preferable to a well-based analysis.

472. One of the components of a decline curve analysis is the "b-factor." Mr. Platt, on a pool basis, and Mr. Molli, on a well-by-well basis, both used b-factors to depict the rate at which oil production declines over the life of the projection. Mr. Platt was criticized for his use of b-factors greater than the value of 1.0 for several pools because some theorists maintain that b-factors must fall between the value of zero and one, and may never be greater than the value of one.

[783] Tr. 9764 (Van Dyke).

[784] Tr. 9425-28 (Platt); Tr. 9429-32 (Platt); Tr. 9356 (Platt).

[redacted]

[786] *Minutes* at 50, H. Finance Comm., 8th Leg., 1st Spec. Sess. (Oct. 22, 1973) [2007 R. 9736].

473. A b-factor greater than 1.0 projects infinite production over an infinite period of time.[787] Yet Mr. Molli acknowledged at trial that when a b-factor of .5 is used it takes approximately two billion years for production to converge to close to zero.[788] Thus, whether a b-factor assumption models a pool or well that produces for two billion years or forever is not significant, because forecasters use economic tests to terminate production at some point several decades in the future – long before two billion years.[789]

474. **[CONFIDENTIAL – SEE SEALED ENVELOPE.]** [redacted]

475. Mr. Platt used b-factors for Prudhoe Bay of 1.0 for 2009, and 1.054 for both 2008 and 2007.[792]

476. Witnesses for both the Department and the Owners asserted that Mr. Platt had overestimated short-term production. But Mr. Platt persuasively testified that the major reason for that over-estimation was due to short-term interruptions in production and the

[792] SOA7-12 at 5.

delay of ANS fields and projects coming online, such that the oil he forecasted will eventually be recovered.[793]

477. Mr. Platt's economic testing assumed that a pool will stop producing oil during the first year that the costs for extracting the oil from that pool exceed the revenue generated from the sale of that oil.[794] He also assumed that operating costs would remain flat over the life of a given field. In reality, real operating costs typically decrease over the economic life of the field.[795]

478. Economic testing of reserves also requires forecasting the future price of oil. There are several methods: (1) "point in time" forecasting, which uses the price of oil on a specific date as the price for all future oil sales;[796] (2) basing the price on historical data over an established time period;[797] and (3) setting prices based upon a forward-looking forecast.[798]

479. Until 2010, the SEC required producers to use "point-in-time" forecasting using the price of oil on the last trading day of the relevant calendar year as the price for all future sales.[799] For investors, such an approach permits a meaningful comparison among different companies. But this Court finds that the historical "point in time" method of price forecasting for ad valorem tax purposes results in substantial year-to-year volatility of economic end-of-

---

life estimates. The SEC ameliorated the volatility of this approach to some degree when it amended its regulations in 2010 to use the monthly average price of oil during the prior year instead of December 31.[800] The Court finds it more reasonable for the purposes of economic testing under AS 43.56.060(e)(2) to use a historical average of prices or credible forward-looking oil price forecasts.

480. Mr. Platt relied upon the U.S. Department of Energy's Energy Information Administration ("EIA") price forecast, which forecasted real market price growth for each of the three assessment years at approximately 1% per annum.[801] Based on the evidence presented at trial, this Court finds that reliance on that forecast was reasonable. Oil prices during the three assessment years were volatile, such that the forward-looking projections made by the EIA during that period varied considerably. Yet the highest oil price forecasted by the EIA for calendar year 2011 during the assessment years was $74.08 per barrel, while the actual price of oil on October 18, 2011 was $113 per barrel.[802] Mr. Platt also explained that due to the highly progressive nature of Alaska's production tax, oilfield economics at high real oil prices are not materially affected by price variations.[803] Overall, this Court found Mr. Platt's production forecast and economic testing to be persuasive.

iii. The Forecasts and Reserves Estimates Offered by the Owners' Witnesses were not Persuasive

481. The Owners presented economist Roger Marks to testify with respect to proven reserves. Mr. Marks' testimony regarding the reserves estimates he derived from

[802] Tr. 9565-67 (Platt). *See also* Tr. 10039-40 (Hoolahan).

[803] Tr. 9565-66 (Platt).

the oil producers' SEC filings was not persuasive.[804] His testimony was at odds with Mr. Van Dyke's testimony regarding the SEC filings by the BP Prudhoe Bay Royalty Trust. This Court found Mr. Van Dyke's testimony to be considerably more persuasive, in large part because Mr. Van Dyke correlated his findings with the BPXA confidential reserves information and also referred the Court specifically to the precise language and numbers in the SEC filings that informed his analysis.[805]

482. Petroleum engineer Shaun Hoolahan presented production forecasts and reserves estimates on behalf of the Owners. For a number of reasons, this Court found his conclusions to be unpersuasive.

483. Unlike all the other production forecasts presented in this case, Mr. Hoolahan's reports do not specify the expected amount of oil production each year for each of the fields over the projected life of that field. Instead, that information is set out in aggregated charts that are imprecise.

484. Mr. Hoolahan testified whether his estimated production had been higher or lower than the actual production for the past few years. But the testimony did not include the amount of production he had estimated, but simply indicated whether his prediction had been too high or too low.[806] Without knowing the amounts he had predicted to compare to actual production, the analysis was unpersuasive.

---

[804] Tr. 10391-93 (Marks).

[805] Tr. 9727-33 (Van Dyke). The testimony there refers to MUN7-4072 (excerpts of the BP Royalty Trust SEC filings), which was admitted as MUN7-0001 at tab 58, p. 2006. At closing arguments, Owners' counsel distributed and referred to various pages from what appeared to be SEC 10-k 2008 filings from ConocoPhillips.

[806] *See generally* T0-07-0007 at 103-119.

485. Mr. Hoolahan testified that he used only publicly available information to perform his initial analysis.[807] The reason for this is not clear, given that the record in this case demonstrates that at least one of the TAPS Owners, BPPA, has had access to ANS reserves information through its affiliate. Mr. Hoolahan acknowledged that he had insufficient information for a proper assessment of proved undeveloped reserves.[808] He later augmented his report with information he received from the Department's expert Mr. Molli to increase his proven undeveloped estimates.[809]

486. Mr. Hoolahan assumed five years of new wells from the date of each assessment. After that, he assumed that no new wells would be drilled on the ANS.[810] This restrictive assumption is not reasonable, based upon this Court's review of all the evidence.

487. Mr. Hoolahan used what he termed a "cut-cum" methodology on a well-by-well basis to assess ANS reserves, which is shorthand for water cut vs. cumulative oil.[811] Although this Court has been presented with considerable amounts of complicated technological information during this case, and has strived and in large part succeeded in understanding it, this Court found Mr. Hoolahan's lengthy explanation of the methodology that he used to determine ANS reserves to be virtually incomprehensible. Additional efforts by this Court to try to understand Mr. Hoolahan's methodology by reviewing his reports were also unsuccessful, particularly because no actual production estimates by year or other data was provided except in conclusory form and imprecise charts.

---

[807] Tr. 10074 (Hoolahan).

[808] Tr. 10072 (Hoolahan).

[809] Tr. 10074 (Hoolahan).

[810] Tr. 9930-31 (Hoolahan).

[811] Tr. 9877-78, 9961 (Hoolahan).

488. Mr. Hoolahan indicated that he allowed his forecast to be guided by Mr. Hartz's restrictive interpretation of the term "legally deliverable."[812] And he testified that he had analyzed only 12 of the 36 pools on the ANS because of time constraints.[813] These limitations further impacted the reliability of Mr. Hoolahan's estimates.

489. Mr. Hoolahan asserted that his results were comparable to Mr. Molli's results. However, Mr. Hoolahan was comparing his P2 case, which consisted of both proved and probable reserves, to Mr. Molli's proved reserves, and only after Mr. Hoolahan made a number of adjustments to Mr. Molli's calculations. This Court was not persuaded that Mr. Hoolahan's results were comparable to Mr. Molli's results.

490. Since ANS producers have access to field-specific information, internal industry information is very likely to assist forecasters in attaining the most reliable estimates regarding future ANS production and the volume of proven reserves that are likely to flow into TAPS during its economic life.[814] But the Owners have chosen not to offer into evidence or have their witnesses meaningfully review any internal reserves estimates and related documentation. This is despite the fact that a number of BP Pipelines and BP Exploration internal documents that were received through discovery were moved into evidence and discussed by the Municipalities' witnesses in their testimony at trial.

491. SARB observed the following in its Certificate of Determination for the 2007 assessment year:

> The Board also found that the Owners failed to take advantage of the opportunity to provide the Division with persuasive data to challenge

---

[812] Tr. 10070 (Hoolahan).

[813] Tr. 10070-71 (Hoolahan).

[814] Tr. 10450-51 (Molli).

> the reserves estimates or throughput projections used by the Division if the Owners have such data. The Board found that the Owners chose not to the [sic] share information that the Owners and their parent companies possess regarding throughput and proven reserves with the Division or the Board and instead chose to present evidence and testimony from outside experts who did not have access to the information the Owners possess that was not already in the public record, and who lacked adequate direct experience with, or expertise about, the TAPS or the Alaska North Slope reserves.[815]

492. The internal reserves and long term production forecasting information that was made available through discovery was not reviewed by two of the Owners' reserves witnesses, Mr. Hartz or Mr. Marks, and only cursorily reviewed by Mr. Hoolahan (and not synthesized into his analysis).[816] Further, Mr. Hoolahan did not have representatives of the Owners or their affiliated producers review his reserves estimates to provide feedback.[817] This is despite the fact that the internal reserves information presented at trial was substantially different from Mr. Hoolahan's conclusions. The fact that none of the Owners' reserves experts meaningfully addressed the BP internal reserves information at trial had a substantial negative impact on the weight this Court accorded to their testimony.

493. The failure of the Owners (and the Department) to address the confidential data provided in discovery is further demonstrated by the fact that neither party has submitted any proposed findings that require confidentiality.

494. The Owners maintain that any deficiency in this regard was remedied by the Department's access to and reliance upon highly confidential proven reserves information in

---

[815] MUN7-0234 at 15.

[816] Tr. 10162 (Hartz); Tr. 10403 (Marks); Tr. 10062 (Hoolahan).

[817] Tr. 10077 (Hoolahan).

the preparation of its forecasts.[818] This argument is unpersuasive. Having had the opportunity to compare the limited confidential data that the Department has received from the producers with the confidential reserves information that was received from BPXA in discovery, this Court is fully persuaded that the best available reserves information in this case is BPXA's confidential documentation with respect to those fields in which it has an interest, and not the documents produced to or maintained by the Department.[819]

495. The determination of the estimated proven reserves should be assessed in light of the evidence available to, and presented by, each of the parties.[820] The Owners did not persuasively rebut the Municipalities' evidence regarding proven reserves, including information contained in filings by the BP Royalty Trust and the confidential reserves information produced in discovery.

iv. The Department's Production Forecasts and Reserves Estimates Are Unreliable

496. Petroleum engineer Frank Molli performed a production forecast for the Department. The Assessor, Mr. Greeley, then made various adjustments to the forecast and also applied an economic test to it.

497. The Court finds that although Mr. Molli considered the three categories of proven reserves, his well-by-well analysis and methodology failed to capture significant barrels of oil that should be properly included in forecasts for each of the assessment

---

[818] Owners' Proposed Findings of Fact and Conclusions of Law ¶ 719.

[819] *See, e.g., Department's Proposed Findings of Fact and Conclusions of Law* ¶ 24 ("In the 2007 through 2009 assessments, the assessor sought information from the TAPS Owners and, as to reserves and production forecasting information related to their affiliate ANS producers, received very little.")

[820] Alaska Civil Pattern Jury Instruction 02.23

years.[821] Mr. Molli also did not save all of the data necessary to permit a complete review of his work product.[822] And Mr. Molli did not prepare a forecast for each assessment year,[823] but rather presented his forecast from the Fall 2010 Revenue Sources Book, which the Assessor then adjusted backwards for each of the three lien years.[824]

498. Consistent with his critique of Mr. Platt's use of b-factors over 1.0, Mr. Molli testified that he adjusted all of his b-factors to be no greater than 1.0.[825] But at trial Mr. Molli was unable to articulate why he had set his b-factors at 1.0 as opposed to within the range prescribed by the authorities he relied on: "So why did you arbitrarily adjust your b factors greater than 1 down to 1 rather than .7?", Mr. Molli responded "That's a good question. I just left them at 1."[826]

499. Mr. Molli did not attempt to incorporate BPXA's internal forecasts into his analysis or use them to validate the reasonableness of his results.[827] As with the Owners' experts, Mr. Molli's failure to do so had a substantial negative impact on the weight this Court accorded to his reserves analysis.

500. Mr. Greeley, without Mr. Molli's input, adjusted the data contained in Mr. Molli's forecast to retroactively produce proxy forecast figures for the three lien years.[828] Mr.

---

[821] Tr. 9757-59 (Van Dyke) (confidential).

[822] Tr. 10472-43 (Molli) (confidential); Tr. 10543-45 (Molli).

[823] Tr. 10532 (Molli).

[826] Tr. 10550 (Molli).

[827] Tr. 10533-35 (Molli).

[828] Tr. 10446 (Molli); Tr. 10587-88 (Greeley).

Greeley does not have a background in reservoir engineering or production forecasting.[829] Mr. Greeley's reports did not explain the methodology he used to retroactively create the proxy forecasts for the assessment years, nor did he sufficiently explain that methodology at trial.[830]

501. Overall, this Court finds that Mr. Molli's Fall 2010 forecast, and the Assessor's adjustments to that forecast for each tax year, are considerably less reliable than the production forecast prepared by the Municipalities' witness Dudley Platt.

v. Conclusions on the Proven Reserves

502. BP Exploration (Alaska), an affiliated company of one of the taxpayers in this case, BP Pipelines, provides SEC reserves information on the Prudhoe Bay field each year to the BP Prudhoe Bay Royalty Trust.[831] The information is audited by an independent oil and gas consultant, Miller and Lents, before submission to the SEC.[832] The Trust's SEC filing for year-end 2005, using the SEC's heightened "reasonable certainty" standard for proven reserves, represented that "BP Alaska expects continued economic production [from Prudhoe Bay] at a declining rate until the year 2065 . . . ."[833] In the year-end 2006, 2007 and 2008 SEC 10-K filings, BP represented continued economic production at Prudhoe Bay until 2062, 2075 and 2049, respectively.[834] The 2049 economic end-of-life calculation for December 31, 2008 was based on the price of oil on that date of $44.60, while the

504. **[CONFIDENTIAL – SEE SEALED ENVELOPE.]** [redacted]

505. Using a 100,000 bbl/d minimum throughput limitation, this Court finds that the total proven reserves as determined by the Municipalities is the best available estimate as of each of the lien dates except that this Court will remove the production forecast for Point Thomson for 2007 and 2009, for the reasons expressed above. For 2007, subtracting Point Thomson reserves from the Municipalities' reserves calculations results in an end-of-life of 2065 for that year. Because of the timing of Point Thomson production in the 2009 forecast, removing that unit from the production forecast does not affect the end-of-life calculation for 2009 – it remains at 2068.[863] For 2008, as noted above, the end-of-life based on a 100,000 bbl/d minimum capacity is 2066.

506. With Point Thomson removed from Mr. Platt's corrected reserves estimates for 2007 and 2009, the total proven reserves for each of the lien dates is as follows:

2007	7.812 billion barrels[864]
2008	7.759 billion barrels[865]
2009	7.077 billion barrels[866]

3. Application of the Economic Age-Life Method

a. TAPS' Effective Age

507. The first step in the application of the economic age-life method requires a determination of the effective age of the property. An effective age estimate should consider

[863] MUN7-4306 at 6; MUN7-4309 at 6.

[864] MUN7-4306 at 6 (8.198 less .386 = 7.812).

[865] MUN7-4313 at 6.

[866] MUN7-4309 at 7 (7.362 less 284.6 = 7.0774).

the condition and utility of the property. If a property has received typical maintenance, its effective age and its actual age may be the same.[867]

508. TAPS began transporting oil in the summer of 1977. Thus, as of the lien dates its actual age was between 30 and 32 years.

509. TAPS is well-maintained. In 2001, the Owners asserted in the right-of-way renewal application that "TAPS' physical life is considered virtually unlimited given the execution of appropriate surveillance, maintenance, repair, and replacement programs."[868] This Court finds that with continued prudent management of the pipeline and with routine investment in heaters should they be required, TAPS' physical life will extend for the duration of its projected economic life.

510. In recent years Alyeska has undertaken SR of the pumps. Alyeska also completed an upgrade of the ballast water treatment facility at the VMT during the lien years.[869] Such extensive renovations and upgrading of TAPS have a significant positive effect on the physical condition of TAPS.[870]

\\

[867] *The Appraisal of Real Estate* at 412.

[868] MUN7-8511 at 5 (Owners' Right of Way Renewal Application).

[869] Tr. 3450 – 3456 (Stokes).

[870] *See The Appraisal of Real Estate* at 414.

511. Based on the foregoing, this Court will make a one-year adjustment to the actual age of TAPS as of each lien date to arrive at its economic age, for the same reasons such an adjustment was made in the 2006 tax year proceeding.[871] With that one-year adjustment, the economic age-life depreciation percentage for TAPS for each year is:

2007: (2007 – 1977.5 – 1.0) / (2065 – 1977.5) = 28.5 / 87.5 = 32.57%

2008: (2008 – 1977.5 – 1.0) / (2066 – 1977.5) = 29.5 / 88.5 = 33.33%

2009: (2009 – 1977.5 – 1.0) / (2068 – 1977.5) = 30.5 / 90.5 = 33.70%

512. This Court finds that using this effective age for TAPS reasonably captures all physical deterioration associated with the asset.

b. Additional Functional Obsolescence

513. Functional obsolescence is defined as obsolescence "caused by a flaw in the structure, materials, or design of the improvement when compared with the highest and best use of the most-effective functional design requirements at the time of appraisal."[872]

514. The use of an appropriate replacement cost study eliminates "many, but not all, forms of functional obsolescence such as superadequacies and poor design."[873] One measure of the functional obsolescence arising out of excess capital costs is the "difference between the reproduction cost and replacement cost."[874]

515. The Pro Plus replacement cost studies resolve much of TAPS' functional obsolescence associated with excess capital costs. Evidence of this may be found by comparing the Pro Plus cost study to TAPS' trended original reproduction cost based upon a

---

[873] *The Appraisal of Real Estate* at 386.

[874] *Valuing Machinery and Equipment* at 88.

construction index such as Marshall and Swift.[875] SARB made such a comparison in 2009 and considered it a "valuable indicator."[876] Specifically, SARB noted that the Division's calculation of a $23.4 billion for 2009 based upon trending the original cost of TAPS using Marshall & Swift "compares favorably" with the $19.8 billion Pro Plus RCN adopted by SARB for that lien year.[877]

516. Functional obsolescence may also arise from the need to expend excess operating and capital expenses for the subject property compared with the most economical similar new property that has the equivalent utility.[878]

517. The 2007, 2008, and 2009 Pro Plus RCN cost studies propose a replacement pipeline that is very similar to what TAPS is likely to look like when the pipeline SR is complete.[879] Therefore, SARB reasonably relied on the projected costs in the actual SR pipeline plan to determine the necessary capital expenditures as well as excess operating costs to measure and calculate the current functional obsolescence.[880] SARB tax-adjusted these projected SR costs and discounted them to arrive at the following present value amounts as of each lien date of the functional obsolescence associated with completion of pipeline SR and the ballast water treatment facility projects: $242,639,688 in 2007,

---

[875] MUN7-0227 at 8 ("The Department relied on its policy of consistently applying the Marshall and Swift annual petroleum cost index to update original costs for all oil and gas properties in Alaska, which it has done for more than 30 years.")

[877] MUN7-0236 at 31 n.10.

[878] *Valuing Machinery and Equipment* at 88.

[879] However, the Pro Plus RCN has one more upgraded pump station than is currently planned on TAPS, which this Court has considered through scaling below.

[880] 2009 R. 124-25. These figures were derived from the Alyeska Long Term Plan.

$228,384,344 in 2008, and $250,150,655 in 2009.[881] The Court adopts these costs and finds that they would not otherwise be captured through the economic age-life methodology.

518. The Owners assert that additional adjustments for functional obsolescence are required to reflect excess operating costs and excess capital costs associated with TAPS when compared with the 30-inch Stantec pipeline.[882] However, as detailed above, this Court has found that the 30-inch Stantec RCN pipeline is not a proper replacement property for TAPS. Therefore, a comparison of the operating costs between the existing TAPS and the Stantec RCN is not a proper measure of TAPS' functional obsolescence.

519. The Owners have also included the future costs of heaters as a functional obsolescence deduction. But to date, the Owners have made no decision as to the number, type, or manufacturer of heaters nor have any bids to acquire and install heaters been requested.[883] While some amount of heaters seem likely to be required at some indeterminate point in the future, heaters were not required at all for the operation of TAPS during the lien years or today. The Owners failed to establish by a preponderance of the evidence that a functional obsolescence deduction for the future cost of heaters was warranted during the lien years. The cost, timing, and precise needs are too speculative to be considered when determining the economic value of TAPS from 2007 to 2009.

520. The Owners also seek functional obsolescence deductions for projected costs to replace the ballast water treatment facility, install internal floating roofs on the crude oil

[883] TO-07-0004 at 75.

storage tanks, and modify the vapor recovery systems at the VMT.[884] But the evidence at trial was inconclusive as to whether this list of projects would ever be sanctioned or built. Steven Schudel of Alyeska explained the status of potential reconfiguration at the VMT. He indicated that Alyeska was studying its options and awaiting an EPA ruling before determining how to proceed.[885] He testified that option one "would retain the existing facilities and then you do whatever upgrades you have to do to comply with the [as yet un-promulgated EPA] regulations."[886] This Court finds that an adjustment for functional obsolescence for additional projects that may or may not be undertaken at the VMT is unwarranted for the 2007 to 2009 tax years.

521. This Court finds persuasive the Board's determination on this issue in 2007, when the Owners put forward a list of proposed adjustments for functional obsolescence due to alleged inefficiencies in TAPS. In rejecting those adjustments, the Board held:

> The Board concluded that, as of the assessment date, the timing and need for changes to the TAPS that form the basis for the Owners' claims for the need to account for additional obsolescence due to low flow conditions and other factors are too speculative to require an additional downward adjustment to the TAPS value. The further that possible impacts on value of the TAPS are pushed out into the future, the less these future contingencies, such as adding additional reserves to future throughput or incurring additional costs, are likely to impact current value. The Board agreed with the Municipalities and the Division that an assessor should generally wait at least until a property owner has definite plans to incur specific costs before the assessor gives those projected costs much weight in making an estimate of value.[887]

---

[884] *See, e.g.*, T0-07-.0004.0076 (valuation as of Jan. 1, 2009).

[885] Tr. 1349-1351 (Schudel).

[886] Tr. 1350 (Schudel).

[887] MUN7-0234 at 19-20. *See also* Amended Decision ¶ 433.

522. This Court also notes that appraisal theory directs that curable items of functional obsolescence be deducted from the RCN before the age-life ratio is applied to the RCN, and not after.[888]

c. Additional Economic Obsolescence

523. Economic obsolescence, or external obsolescence, is the loss of value of a property caused by factors external to the property.[889]

i. Scaling

524. This Court applied an economic age-life depreciation analysis in the 2006 tax year, and also held that an additional $932 million of depreciation for economic obsolescence was warranted. Specifically, this Court held that "[w]hile TAPS is required to have a design capacity of at least 1.1 million bbl/d, the fact that capacity is not all being used to transport affiliated oil reduces the utility and value of TAPS as of the lien date."[890]

525. When depreciating using the economic age-life method, this Court continues to find that application of scaling to TAPS is warranted because the economic age-life method would not otherwise capture all of the depreciation in TAPS that is attributable to its current superadequacy in relation to the proven reserves that are presently available to be transported on TAPS. Thus, while this Court has determined that an RCN must be of equivalent utility to TAPS – both in terms of the ability of the post-SR pumps to transport 1.1 million bbl/d and in terms of the 48-inch pipeline's and VMT's ability to handle capacities of up to 2.1 million bbl/d – that determination does not mean that this Court must or should disregard the fact that during the lien years, the throughput on TAPS was far less than those

[888] *The Appraisal of Real Estate* at 422.

[889] *Valuing Machinery and Equipment* at 67. *See also The Appraisal of Real Estate* at 391-92.

[890] Amended Decision ¶ 439.

capacity levels such that the economic value of TAPS was less that it would have been had TAPS been transporting 2.1 million bbl/d during the lien years. Not to apply a scaling factor in these circumstances would result in an improper valuation of TAPS, particularly since the statute directs that economic value be determined with due regard to proven reserves, and not probable or potential reserves.

526. The Municipalities also assert that scaling physical facilities based upon capacity that is not obtainable without the additional expense of DRA is not appropriate. They assert that to do otherwise would scale the capacity created by DRA, which is an operating expense rather than a capital item. Thus, they assert that if scaling is applied now or in the future, it should only be calculated based only upon TAPS' actual mechanical capacity of 760,000 bbl/d.[891]

532. This Court has given careful consideration to the appropriate application of scaling to TAPS so as to account for its economic obsolescence that results from its underutilization during the lien years. SARB has applied the scaling approach utilized by the Division in each of the lien years. Under that approach, an underutilization ratio was obtained by dividing the average daily throughput into the legally required capacity of 1.1 million bbl/d, using a scale factor of .45. The basis for the scale factor is found in a BP-generated analysis.[892]

533. Neither of the appealing parties met their burden of proof that the .45 scaling factor employed by the Division and accepted by the Board was improper.

---

[891] Municipalities' Proposed Findings of Fact and Conclusions of Law ¶ 791.

[892] *See* 2009 R. 6505-06.

534. This Court has discussed in detail when addressing the appropriate RCN to apply to TAPS that to be of equal utility to TAPS, an RCN must include the same design capacity that is currently specified for the pipeline and the VMT – 1.42 million bbl/d. Thus, while Pro Plus has asserted that its design basis for its RCN is 1.1 million bbl/d, the evidence demonstrates that capacity is derived from the number of installed pumps. The Pro Plus RCN 48-inch mainline pipe has the same capacity as the existing TAPS 48-inch pipeline, and the actual tank capacity at the existing TAPS VMT is comparable to the Pro Plus VMT, which is a design capacity of 1.42 million bbl/d. While this Court does find merit in the Municipalities' assertion that scaling to the 2.1 million bbl/d capacity achieved with DRA would be inappropriate, a scaling adjustment for underutilization of the 48-inch pipe and the VMT based on TAPS' existing capacity of 1.42 million bbl/d is warranted. The Division and SARB's use of 1.1 million bbl/d design as the denominator for those components of TAPS resulted in an improper valuation.

535. With respect to the pumps, the Municipalities have asserted that scaling, if used at all, should be based against the mechanical capacity of the existing TAPS of 760,000 bbl/d. But given that the Pro Plus RCN has one more SR pump station than the existing TAPS, this Court finds that scaling the pumps to a 1.1 million bbl/d capacity is warranted.[893]

536. The other applicable inputs to make this scaling deduction are as follows:

- Using the Pro Plus RCN, an average of approximately 8.7% of the direct costs are associated with the pump stations and meter stations during the three lien

[893] *See generally* TO-07-0063.

years. The balance of the costs, or 91.3 %, is associated with the 48-inch mainline pipe and the VMT.

- The DOR projected throughput for TAPS during each of the lien years was as follows:[894]

  2007 – 740,000 bbl/d

  2008 – 731,000 bbl/d

  2009 – 691,000 bbl/d

- A scaling factor is an exponential calculation, and thus results in less of a reduction than would occur with a percentage adjustment. Applying a .45 scaling factor to the above figures would result in the following additional percentage adjustments to the RCN after application of the additional functional obsolescence and the economic age-life calculation:

2007	Pipeline & VMT	25.4%
	Pump Stations	16.3%
2008	Pipeline & VMT	25.8%
	Pump Stations	16.8%
2009	Pipeline & VMT	27.7%
	Pump Stations	18.9%

ii. No Additional Economic Obsolescence Adjustment Is Warranted

532. The Owners assert that a significant additional economic obsolescence adjustment is warranted because TAPS is a regulated pipeline, and the effects of that regulation lower the pipeline's value.[895] But they have produced no credible evidence that

[894] MUN7-0018 at 13, 20, 27.

[895] TO-07-0004 at 70-71.

establishes that the regulated status of TAPS has had any impact on the economic value of TAPS. This Court finds that TAPS would operate in much the same manner regardless of its regulated status. Tariff income that the Owners earn for shipping another producer's oil is in addition to the primary value that TAPS has for each Owner – the shipment of that Owner's affiliated oil.

527. The evidence persuasively demonstrated that TAPS was profitable as of each of the lien dates, and that it would be reproduced if it did not presently exist. There were over seven billion barrels of proven reserves remaining on the North Slope as of each lien date for 2007, 2008, and 2009 – an amount comparable to the estimated 9.6 billion barrels of proven reserves when TAPS began operation in 1977. The New York Supreme Court, Appellate Division has held that "[w]hile an allowance for economic obsolescence may be made when the property is not worth the reproduction cost, depending upon the earning capacity after production, it cannot be made in these circumstances where petitioner is profitable and the property would be reproduced. That petitioner is a regulated [pipeline] utility does not alter this conclusion."[896]

528. The Owners' appraisal experts used what is termed an income shortfall method in an effort to calculate the percentage return differential between the projected tariff rate and a hypothetical unregulated rate, which was then discounted to present value.[897] Using this approach, the Owners' appraisal expert, Mr. Remsha of American Appraisal, concluded that the income shortfall due to a buyer's inability to reset the rate base and collect a higher return is approximately $1,030,000,000 in 2007, $845,000,000 in 2008, and

[896] *Tenneco, Inc. v. Town of Cazenovia,* 104 A.D.2d 511, 514 (N.Y. App. Div. 1984).

[897] TO-07-0004 at 86, 115, 130.

$730,000,000 in 2009.[898] Terming that amount to constitute economic obsolescence, American Appraisal concluded that the value of TAPS under the RCNLD approach was identical to the value it concluded under the income approach of $1.1 billion for 2007, $1.2 billion for 2008, and $1.3 billion for 2009.

529. This Court rejected this same application of an income shortfall method in the 2006 tax year proceeding that was advanced then by the Owners' expert appraiser, Ms. Spletter.[899]

530. Mr. Remsha acknowledged that if economic obsolescence in the form of income shortfall is applied, it makes no difference whether the RCN is $10 billion or $100 billion – the RCNLD would be identical using the income shortfall approach.[900] Similarly, he testified that it did not matter whether the Pro Plus cost study or the Stantec cost study was used, the RCNLD would be the exact same result. Other appraisers persuasively testified that the effect of applying an income shortfall method is to eliminate the independent value of the cost approach by altering it to an income approach.[901]

531. Aside from the conceptual circularity of the income shortfall approach, its particular application to TAPS is inappropriate for the same reasons that this Court has rejected the tariff income approach.[902] Since tariff income is not a driver of the economic

[902] *See* Tr. 12365-66 (Goodwin).

value of TAPS, its application to the cost approach is inappropriate. Mr. Eyre's testimony with regard to this topic was particularly helpful to the Court.[903]

532. The Owners did not present any new law or facts different from the 2006 tax year proceeding to support their use of a capitalized income shortfall method. This Court finds, as it did in the 2006 matter, that such a method should not be applied to determine economic obsolescence of TAPS.[904]

533. The Western State Association of Tax Administrators ("WSATA") Appraisal Handbook rejects the income shortfall method:

> A few appraisers attempt to measure obsolescence by comparing a company's actual earnings with the theoretical earnings that should have been achieved by the company with the assets on hand if they were earning a fair return on cost. This method is an improper variation of method often used for individual properties, where it can be demonstrated that the subject property is not technologically capable of producing as much operating income (cash flow) as new replacement property. When used to compare company earnings with theoretical company earnings, the method simply forces the cost approach to agree with the capitalized earnings approach.[905]

The WSATA Appraisal Handbook has wide acceptance by the approximately 35 states that do unit valuations and has undergone a comprehensive peer review process.[906]

\\

[904] Amended Decision ¶¶ 462-64.

[905] WSATA Appraisal Handbook at 31 (Aug. 1989).

[906] Tr. 11123-24, 11141-44 (Eyre).

534. Several appellate courts have also recognized that the income shortfall method is circular.[907] As the New Jersey Supreme Court explained in *Transcontinental Gas Pipe Line Corp. v. Bernards Township*, a depreciated regulated pipeline has a value distinct from its tariff income that derives from its use:

> Under the cost approach as it applies to special purchase property, the costs of a third person in acquiring the property is not the relevant inquiry; the very reason the cost approach is being utilized is that the property is so uniquely suited to its current use and user that a market sale to a third person is not an accurate indication of its value. Rather, the determination made in applying the cost approach is how much would a prudent person pay to replace the property. Since the people with the greatest interest in replacing special purchase property are the people for whom it was designed and built, and, in addition, are the people who must assume the cost of property taxation, the relevant question to ask in applying the cost approach to utility property is how much the ratepayers would pay to replace the property.[908]

535. In *Transcontinental*, the New Jersey Supreme Court also held:

> The purposes of FERC regulation and ad valorem property taxation are drastically different: FERC is primarily concerned with ensuring that investors receive an adequate return on the property that has been invested. For such purposes, the original value of the property invested is an appropriate measure of value. For property tax purposes, however, it is necessary to determine the present cost of replacing the property. Under the cost approach, this is assumed to be the value of the property to the ratepayers, reflecting increases in construction costs, the current demand of consumers, availability and cost of alternate energy sources, and other factors. FERC's regulatory system reflects these factors only as of the time an asset enters the rate base; it makes no attempt to update them until an asset's functional lifespan is reached and it is eventually replaced at

[907] *See United Tel. Co. of Nw., Inc. v. Dep't of Revenue*, 770 P.2d 43, 51 (Or. 1989) ("[a]djusting one approach to make it rely on the result or the same indication of value as another approach effectively eliminates a relevant perspective from consideration); *Delta Air Lines, Inc. v. Dep't of Revenue*, 984 P.2d 836, 849 (Or. 1999); *Tenneco*, 104 A.D.2d at 514 ("It appears then that [the taxpayer's expert's] concept of economic obsolescence is nothing more than an attempt to convert the RCNLD approach into an income capitalization approach. This is not permissible."); *see also Tenn. Gas Pipeline Co.*, 766 A.2d at 675-76; *Transcont'l. Gas Pipe Line Corp. v. Bernards Twp.*, 545 A.2d 746, 763 (N.J. 1988).

[908] *Transcont'l. Gas Pipe Line*, 545 A.2d at 758 (citations omitted). *See also* Amended Decision ¶ 459.

> current costs. Since depreciated original cost fails to reflect the value of all of the interests in utility property and undervalues those it does recognize, we decline to accept it as a true measure of a utility property's worth.[909]

536. Similarly, the Montana State Tax Appeal Board ("STAB") rejected the analysis of one of the Owners' experts in this case: "STAB rejected [Thomas] Tegarden's income shortfall approach because, among other reasons, it failed to account for income from properties that PacifiCorp had purchased with deferred income taxes" in 2005.[910] STAB also rejected the income shortfall method for its inaccuracies.[911] In 2011, the Montana Supreme Court found that the STAB was entitled to deference regarding its determination that there was no economic obsolescence when the owners' entire case for economic obsolescence was premised on the income shortfall method.[912]

537. An income shortfall adjustment is not appropriate for determining the full and true value of TAPS during the lien years at issue. The Owners failed to establish that the Division and SARB erred in refusing to apply the income shortfall method to determine economic obsolescence. Rather, if the income shortfall method was applied based on tariff income, the RCNLD valuation would no longer reflect the "full and true" economic value of TAPS as a critical component of the integrated ANS production and transportation system.

538. The record does not support the proposition that the regulatory status of TAPS negatively affects its economic value. Instead, the Court is fully persuaded that TAPS would continue to operate in much the same fashion as it does today whether it was subject to

---

[909] *Transcont'l. Gas Pipe Line*, 545 A.2d at 760 (citations omitted). *See also* Amended Decision ¶ 460.

[910] *See Pacific Corp. v. State*, 253 P.3d 847, 848, 854-55 (Mont. 2011).

[911] *Pacific Corp. v. State*, 253 P.3d at 855.

[912] *Pacific Corp. v. State*, 253 P.3d at 854-55.

regulation or not. Each Owner's affiliated producer would be likely to continue to transport its oil on its affiliated pipeline space and would continue to pay the costs associated with such transportation. The record supports the proposition that the regulatory status of TAPS may positively shape its economic value. For example, the regulation of TAPS permits the Owners to share the costs associated with the operation of TAPS and realize a profit from independent shippers.[913] Dr. Cicchetti referred to this profit opportunity as the "icing on the cake."[914] Further, the regulatory status of TAPS also increases the value of each integrated enterprise by permitting each producer to deduct the tariff rate when calculating its royalty and production taxes to the State of Alaska.[915]

539. This Court has given careful consideration to the fact that TAPS is regulated by both FERC and the RCA, and has concluded that the Owners have failed to demonstrate that the value of TAPS for purposes of ad valorem property taxation under AS 43.56 is negatively impacted by either its regulatory status or its current or projected tariff income. No additional adjustment for economic obsolescence is warranted.

C. RCNLD Conclusion of Value

540. This Court has found that the replacement cost new estimate of value for TAPS is $17.645 billion in 2007, $19.324 billion in 2008, and $19.137 billion in 2009. Then functional obsolescence that is not captured under the economic age-life depreciation is deducted in the amount of $242,639,688 for 2007, $228,384,344 for 2008, and $250,150,655 for 2009, as well as the value of the land and ROW of $194 million each year.

---

[913] Tr. 8299-8301 (Cicchetti).

[914] Tr. 8300 (Cicchetti).

[915] Tr. 8252-53 (Cicchetti); Tr. 7721-23 (Toof).

From there, economic age-life depreciation based on an end-of-life calculation is applied of 32.57% for 2007, 33.33% for 2008, and 33.70% for 2009. Then an additional deduction for economic obsolescence based on scaling is made in the amount of $2.856 billion for 2007, $3.152 billion for 2008, and $3.338 billion for 2009. Then the value of the land and the right-of-way are added back. The result is a total RCNLD of $8.941 billion for 2007, $9.644 billion for 2008, and $9.249 billion for 2009.

VIII. THE INCOME APPROACH

A. The Integrated Income Approach to the Valuation of TAPS

541. The income approach determines the value of a property based upon the expected future benefits to its owner.[916] The principle of anticipation is fundamental to the income approach.[917]

542. The income approach is generally used in valuing commercial business and properties that are bought and sold by investors because of the income they generate. The approach values the entire business entity. The income approach is not widely used by machinery and equipment appraisers because of "the difficulties in determining income that can be directly related to a specific asset, the concern for reliability of income forecasts, and a multitude of variables involved in this valuation approach."[918]

---

[916] *Valuing Machinery and Equipment* at 159-60, 571.

[917] *The Appraisal of Real Estate* at 446.

[918] *Valuing Machinery and Equipment* at 159-60.

543. Since 2005 the Division and SARB have considered the income approach for TAPS multiple times, but have rejected it each time as an unreliable indicator of economic value.[919]

544. When applying the income approach to a property that is a part of an integrated economic enterprise, an appraiser may consider the income generated by the entire integrated economic enterprise and then allocate a portion of that income and the resulting value back to the part of the integrated enterprise for which a value is to be determined.[920] This integrated income approach is a form of unit valuation which is defined as the "evaluation of a group of integrated assets that are functioning as an economic unit."[921] Standard appraisal practice allows a unit to be composed of regulated and non-regulated properties.[922]

545. When deciding the proper unit to value, appraisers look at the integrated use of the business property.[923] In particular, an appraiser looks to the physical, functional, and economic integration of the properties to determine the proper unit.[924] In the case of TAPS, its integration with upstream properties makes the proper unit to value one that is composed of upstream and midstream Alaska properties.[925]

546. Brent Eyre, on behalf of the Municipalities, employed a discounted cash flow income approach to value the integrated economic unit of which TAPS is a part at $40.2

[919] Tr. 12417-18 (Hoffbeck).

[920] Tr. 11123 (Eyre).

[921] Tr. 11125 (Eyre).

[922] Tr. 11125 (Eyre).

[923] Tr. 11128 (Eyre).

[924] Tr. 11128-29 (Eyre).

[925] Tr. 11128-31, 11134 (Eyre).

billion in 2007, $44.2 billion in 2008, and $50.4 billion in 2009.[926] Dr. James Smith, on behalf of the Owners, testified that Mr. Eyre's unit value of the integrated ANS enterprise should be reduced by slightly less than 10% for each year, for a value of $36.4 billion in 2007, $41.1 billion in 2008, and $46.0 billion in 2009.[927]

547. A commonly used factor for allocating unit value is invested cost, wherein the invested cost of the property subject to assessment is divided by the total amount of invested costs in the unit as a whole.[928] After adjusting invested costs for inflation, Mr. Eyre determined that the allocated value of the whole unit to TAPS was approximately $8.8 billion (21.9%) in 2007, $9.6 billion (21.7%) in 2008, and $10.7 billion (21.2%) in 2009.[929]

548. This Court was not persuaded that the integrated income approach should be relied upon to determine the economic value of TAPS for the lien years at issue, particularly where, as here, a comprehensive replacement cost new study has been accepted as modified by the Court, such that a considered application of the cost approach can be relied upon. The integrated income approach is more dependent upon volatile assumptions related to reserves, oil prices, and allocation than the cost approach. However, Mr. Eyre's valuation is a useful frame of reference and supports the assessed valuation of TAPS as determined by this Court for the lien years at issue. It also demonstrates that the tariff income approach advocated by the Owners fails to capture all elements of TAPS' economic value.

B. The Tariff Income Approach Does Not Capture the Full and True Value of TAPS Under AS 43.56.060(e)(2)

549. As in the 2006 tax year litigation, the Court finds again that tariff income is not the primary driver of the economic value of TAPS under AS 43.56. As SARB has held, and as this Court has previously discussed in these findings, TAPS was not built or operated for tariff income, but to monetize the vast ANS reserves of the producer oil companies by bringing those reserves to market.[930] In this regard Mr. Coulson, the President of BP Pipelines (Alaska) Inc. and the Chairman of the Owners' Committee for TAPS at the time, testified as follows:

> Q: It's fair to say that TAPS was built by the producers?
>
> THE WITNESS: Yes.
>
> Q. And it's fair to say that TAPS was built - that the economic driver was the integrated economics of bringing the Alaska North Slope oil to market?
>
> THE WITNESS: As I understand the history of TAPS, and indeed of most basin-opening developments, it's usually the resource owner that has to make the infrastructure development happen because of the risks associated with an undertaking like that.
>
> Q. And the reason that the resource owner takes those risks is in order to monetize the resource and bring it to market, correct?
>
> THE WITNESS: Yes.[931]

550. The evidence also demonstrated that each Owner's interest in TAPS is a component of an integrated economic enterprise.[932]

---

[930] Tr. 7729-30 (Toof); Tr. 8931 (Grasso) ("[T]he Owners aren't in the market to build a pipeline for its tariff income, but to get the – but to monetize the reserves on the North Slope."); Tr. 8482 (Brown); Tr. 8546-47 (Sullivan); Tr. 8249-50 (Cicchetti). *See also* Amended Decision ¶¶ 94, 471, 478.

[932] Tr. 8249-65 (Cicchetti); Tr. 8539-40; 8546-8547 (Sullivan); Tr. 8891-92, 8934 (Grasso).

551. In contrast to Mr. Eyre's approach, which considered the income from the entire integrated economic enterprise, the Owners assert that the tariff income from TAPS, and only that income, is the appropriate proxy to capture the entire economic value of TAPS.[933] The Owners' reliance upon the tariff income approach fails to recognize that TAPS was built, is operated, and would be replaced at an estimated cost of approximately $19 billion if it were not in existence, not because of a desire to realize tariff income, but because of the overwhelming economic value arising from its highly integrated use for transporting ANS production to market.[934]

552. The Owners' position that the tariff income is a primary driver of the economic value of TAPS is at odds with the extensive system of crude oil pipelines on the ANS that are fully integrated with North Slope production and fully maintained but have no tariff income associated with their operation.[935]

553. In valuing TAPS for ad valorem purposes, the Department applied the cost approach without any reliance on the tariff income from 1977 to 1985, and then beginning again in 2005 to date.[936] In 2001, the Department used a tariff-based income approach. For all the other years in between, the record suggests that the Department apparently relied upon a negotiation process that considered different valuation approaches including the tariff income approach, but many details of those negotiations have not been made available to this Court by either the Department or the Owners.[937]

[937] Tr. 6816-17 (Greeley); MUN7-0234 at 4; Tr. 12419-20 (Hoffbeck).

554. The unique ownership structure of TAPS, the almost complete dependency of TAPS Owners on their affiliated and parent companies to build, operate, and improve TAPS, the use of TAPS by each Owner as part of its vertically integrated enterprise, and the history of ownership interests in TAPS all indicate that tariff income is not determinative of the economic value of TAPS.[938] The sheer magnitude of the economic value realizable from the use of TAPS to monetize ANS reserves makes it far more likely than not that TAPS would continue to operate much as it does today or in 2007, 2008, or 2009, even if there was no tariff income at all.[939]

555. The tariff income approach incorrectly assumes that there would be a hypothetical buyer interested solely in the tariff income of TAPS to whom the TAPS Owners would agree to sell their interests. But the sales of ownership interests in TAPS have been to buyers that subsequently used TAPS as part of their integrated operations.[940] The weight of the evidence demonstrates that there is not nor ever has been a market for TAPS based on its tariff income.[941] This is not unexpected considering the economic realities of developing isolated crude oil fields in Alaska. This Court finds that the tariff income approach proposed by the Owners is based on a fundamentally wrong premise of value, as it assumes that there is a willing buyer and a willing seller of TAPS based solely on its tariff income as a stand-alone investment.

---

[938] Tr. 8255-57 (Cicchetti).

[939] Tr. 12170 (Marks) (in response to the question of whether the TAPS Owners would operate TAPS even if they were not allowed tariff recovery, Mr. Marks responded, "I believe they would.").

[941] Tr. 8891 (Grasso); Tr. 8547 (Sullivan) (tariff income is not the driver of investments; access to the ANS reserves is the driver of TAPS investment decisions); MUN7-0001 at 3766-3767 (Coulson Dep.) (in response to the question whether Mr. Coulson was aware of any pipeline in Alaska that was built by a nonproducer, Mr. Coulson responded, "I am not aware of any.").

556. Tariff income is a regulatory, not an economic construct that has little place in determining the economic value of a pipeline used primarily for affiliated transportation.[942] Likewise, the value determination of TAPS for ratemaking purposes is not the same as the value determination of TAPS for ad valorem tax purposes.

557. Several other courts have recognized the distinction between ratemaking and the determination of a property's value for ad valorem taxation purposes, both with respect to pipeline properties,[943] as well as other types of properties.[944] As the New Jersey Supreme Court in *Transcontinental Gas Pipe Line Corp. v. Bernards Township* explained:

---

[942] Tr. 8293-8294 (Cicchetti).

[943] *See Questar Pipeline v. Utah State Tax Comm'n*, 850 P.2d 1175, 1178 (Utah 1993) (property tax appraisers of gas pipelines were within their rights when, after taking the consequences of FERC rate regulation into consideration, they did not alter their final opinions when adopting a method of valuation inconsistent with the FERC rate base value); *Transcont'l. Gas Pipe Line Corp.*, 545 A.2d 746 (1988) ("Courts in other states have long recognized a definite distinction between the valuation of public utility property for ratemaking purposes, determined pursuant to statutes applicable thereto, and the valuation of the same property pursuant to different statutes for ad valorem tax purposes.") (internal quotations omitted); *Mich. Wis. Pipe Line Co. v. Iowa State Bd. of Tax Rev.*, 368 N.W.2d 187, 191-192 (Iowa 1985) (board of tax review did not err in failing to set property tax of gas pipeline in a manner consistent with its FERC rate base even when evidence was offered that FERC rate base determined value for sales of comparable pipelines); *Mobil Pipeline Co. Rohmiller*, 522 P.2d 923, 936-937 (Kan. 1974) ("This issue, the regulations of earnings computed on a 'rate base,' was the major thrust of the public utility in attacking the assessment of its Kansas property in *Northern Natural Gas Co. v. Dwver*, [492 P.2d 147 (Kan. 1971)]. The Court there recognized a definite distinction between the valuation of public utility property for rate making purposes, determined pursuant to statutes applicable thereto, and the valuation of the same property pursuant to different statutes for ad valorem tax purposes.").

[944] *Matter of Long Island Lighting Co. v. Assessor for Town of Brookhaven*, 246 A.D.2d 156, 165 (N.Y. App. Div. 1998) ("[W]e note that we have previously held that a utility's rate base is an inappropriate factor to consider in the assessment of specialty property."); *S. Bell Tel. & Tel. v. Markham*, 632 So.2d 272 (Fla. Dist. Ct. App. 1994) (appraiser must consider effects of government regulation, *i.e.*, the rate base that controls earnings, under the controlling statute, but such regulation need not be determinative of property tax value), *Cent. Me. Power v. Town of Moscow*, 649 A.2d 320, 325 (Me. 1994) (The limit on return that an owner of dam utility property may earn on its investment because of its rate base is a factor that should be taken into account in valuation but is "emphatically not automatically determinative of the facility's just valuation" for property tax purposes.); *Consumers Power Co. v. Big Prairie Twp.*, 265 N.W.2d 182 (Mich. Ct. App. 1978) (the ad valorem assessing tax tribunal did not err in utilizing the adjusted depreciated reconstruction-cost method in assessing a dam rather than using the depreciated net cost value used by the FPC for ratemaking purposes), *superseded by statute; Pub. Serv. Co. of N.H.*, 377 A.2d at 125-126 ("[E]ven though net book value (original cost less depreciation) provides the rate base upon which plaintiff's rate of return is calculated, the value of the plant for tax purposes and the value for rate-making purposes need not be the same.") (internal quotations omitted); *Town of Barnet v. New England Power Co.*, 296 A.2d 228 (Vt. 1972) ("Fair market value should not rely upon one criterion and the values shown by the various methods of valuation

> [T]he fact that FERC's regulatory scheme includes a value determination for its own [ratemaking] purposes does not bind municipalities to that figure for the purpose of ad valorem property taxation.[945]

558. For the foregoing reasons, this Court finds that a valuation of TAPS based upon its tariff income would not capture the full and true value of TAPS.

C. Tariff Income Is Not a Reliable Indicator of Economic Value

559. Even if tariff income was relevant to determining the economic value of TAPS, the projected future tariff income advanced by the Owners has not been demonstrated to be sufficiently reliable to determine the economic value of TAPS.

560. Under rate regulation, an owner is entitled to recover operating costs, a return of investment through a depreciation deduction, and a reasonable return based on unrecovered investment. Essentially, the return or profit from the tariff income is based entirely upon the unrecovered investment or rate base. In the case of TAPS, several experts testified that the original investment in TAPS has already largely been fully recovered through accelerated depreciation.[946] Accordingly, the current return under the tariff income approach does not accurately reflect the economic value associated with the original investment in TAPS, as there is virtually no rate base or return under the tariff income approach associated with the majority of the existing TAPS' facilities.[947] For

---

should be weighed and not averaged by the board. The bases of valuation for taxation purposes and for rate-making have been uniformly recognized as different.") (citations omitted).

[945] 545 A.2d 746, 758 (N.J. 1988) (citation omitted); *County of Wayne v. Mich. State Tax Comm'n*, 682 N.W.2d 100, 126 (Mich. 2004); *Tenn. Gas Pipeline Co. v. Town of Hudson*, 766 A.2d 672, 675-676 (N.H. 2000) (holding that replacement-cost method, not the net-book-cost method, was the proper method for valuing the pipeline company's FERC-regulated property). *See also* Amended Decision ¶ 81.

[946] Tr. 1212 (Marks) (testifying that "by the mid 90s it shows about 95 percent of TAPS had been depreciated under TSM. By the late '90s, essentially 100 percent of TAPS had been depreciated under TSM"). *See also* Tr. 7715-16 (Toof); Tr. 12421-22 (Hoffbeck); Tr. 12689-88 (Goodwin).

[947] Tr. 12687-88 (Goodwin).

example, the original investment associated with the mainline pipe and VMT is almost fully recovered, such that there is little to no rate base associated with the economic contribution of either the mainline pipe or the VMT to the ongoing operations of TAPS.[948] The current return on TAPS only reflects the additional investment associated with recent capital expenditures on TAPS such as the SR project.[949] Thus, an income approach based on tariff income as advanced by the Owners would result in TAPS not being taxed at its full and true value.[950]

561. Historically, regulatory disputes concerning TAPS' tariff rates have most often been resolved by settlement among the parties rather than by a substantive determination by FERC or the RCA.[951] The settlement that has governed TAPS' tariff rates for the majority of the time it has been in service has been the TAPS Settlement Agreement ("TSA"). The TSA contained a complex and unique rate methodology referred to as the TSM. Both the State and the TAPS Owners supported the TSA. An Explanatory Statement by the State of Alaska and the Department of Justice in support of the settlement stated, "Alaska and DOJ believe that as a settlement, the tariff stream produced by the TSM is a fair and reasonable attempt to achieve a tariff profile that will encourage economically efficient exploration of North Slope petroleum resources."[952]

---

[948] Tr. 12421-22 (Hoffbeck); Tr. 12687-88 (Goodwin).

[949] Additions to the property used by a carrier to provide service will increase the rate base, the return on the rate base, and consequently the tariff income. In the case of TAPS, although the TAPS Owners made additional capital expenditures for TAPS in the SR project, the prudency of those expenditures is being challenged in the current joint rate proceeding before FERC and the RCA, and the rate effect of the SR expenditure is at this time unknown.

[950] Tr. 12421-12422 (Hoffbeck); Tr. 12687-12688 (Goodwin).

[951] *See, e.g.*, Tr. 8933 (Grasso).

[952] TO-07-0031.0119.

562. The RCA found that under the TSM, between 1977 and 1996, the TAPS Owners collected, in 1997 dollars, $13.5 billion more than would have been collected under the current rate methodology used by the RCA to set rates on TAPS.[953] Nevertheless, the TSM was approved by FERC.[954]

563. Settlements are approved by FERC under a fair and reasonable standard and in the public interest standard and not under a just and reasonable standard.[955] FERC may also approve black-box settlements under which the rate is known but not the methodology used to calculate the rate.[956] One of the Owners' regulatory experts, Dr. Toof, acknowledged that "settlement rates are a beast unto themselves."[957]

564. In 2005 and 2006, after the TSM had expired, FERC set just and reasonable rates under the Opinion No. 154-B methodology for 2005 of $1.92 and for 2006 of $2.02.[958] Under FERC doctrine, however, the last "clean rate," meaning the last unprotested TSM rate for 2004, was used as the floor for refunds for 2005 and 2006.[959] That rate was from $3.00 to $3.20.[960] The TAPS Owners also filed for rate increases in 2007 and 2008, which were

resolved under a "black-box" settlement.[961] The TAPS Owners' filed rates for 2009 and 2010 are currently under litigation at FERC.[962]

565. The Owners have tried to predict future tariffs for the next several decades in order to determine the net present value of that tariff income stream to apply in this ad valorem tax case. The Owners presented the testimony of former FERC Commissioner Suedeen Kelly in support of their position that the FERC Opinion No. 154-B methodology is straightforward and can be used to predict net cash flow over the long term and that settlement rates on TAPS would not vary significantly from what would result under Opinion No. 154-B.[963] However, Ms. Kelly did not opine as to what future tariffs this Court should apply under a tariff-based income approach. And although Ms. Kelly served as a FERC Commissioner, she had never been in a FERC hearing room on a TAPS matter.[964] Ms. Kelly is currently an attorney whose law firm represents ExxonMobil Corporation[965] and acknowledged that she was not an expert in ad valorem tax matters. At trial, in response to a question from the Court, Ms. Kelly answered that FERC could have abandonment authority over oil pipelines, but she subsequently corrected that testimony and stated that FERC had no such authority.[966]

---

[961] Tr. 8933 (Grasso). The TSA required the TAPS Owners to file yearly rates using the TSM. Tr. 7647 (Toof). The TSM ended in 2008. Tr. 7668 (Toof). The TAPS Owners have each filed for multiple rate increases in 2009 and 2010. *See* Tr. 8890-91 (Grasso). This process of filing multiple rate increases is known as "pancaking." Amended Decision ¶ 492.

[962] Tr. 7667 (Toof).

[963] Tr. 7211, 7212, 7216 (Kelly).

[964] Tr. 7287-89 (Kelly)

[965] Tr. 7258 (Kelly).

[966] Tr. 7179-80, 7298-7303 (Kelly).

566. Ms. Kelly had no knowledge of how rates established under the TSM would compare to rates established under Opinion No. 154-B.[967] Ms. Kelly did not know the specifics of the TAPS Owners' 2007-2010 rate filings at FERC and was not aware of the TAPS SR proceeding pending at FERC.[968] Based on the foregoing, this Court was not persuaded by Ms. Kelly's testimony regarding FERC rate setting, including Opinion No. 154-B methodology and its application to determine TAPS' tariffs.

567. This Court was also unpersuaded by Dr. Toof's testimony that TAPS' tariffs have been stable and predictable.[969] Dr. Toof has never sponsored an Opinion No. 154-B revenue requirement before the FERC.[970] Dr. Toof has never prepared a rate filing and does not consider himself a rate of return expert.[971] Although Dr. Toof in the TAPS' FERC rate case took the position that the TSM produced just and reasonable rates, Presiding Judge Cintron, the Commission, and the Court of Appeals for the D.C. Circuit all disagreed with Dr. Toof's position on this issue.[972]

568. This Court finds that the regulatory status of TAPS is so unique that the projection of future tariffs for it would be less reliable and less predictable than for other regulated pipelines.[973] When asked "Is there any crude oil pipeline in the United States that

---

[967] Tr. 7295-96 (Kelly).

[968] Tr. 7296-98 (Kelly).

[969] Tr. 7681 (Toof).

[970] Tr. 7704 (Toof).

[971] Tr. 7705-06 (Toof).

[972] Tr. 7706 (Toof).

[973] Tr. 8539-8540 (Sullivan).

is in the unique regulatory status of TAPS [and the pipelines that feed into TAPS] before the FERC?" Dr. Toof responded, "They are carved out as an entity unto themselves."[974]

569. Mr. Grasso demonstrated the instability of the TAPS tariff by noting that the Owners recently filed testimony with FERC in support of their own filed rates that supported different rates than they had originally filed. Mr. Grasso explained:

> To further - what I would say to undermine the stability of the 154-B, in 2009 the Owners filed tariff rates at the FERC between $4.01 and $4.10. That case, as you know, is now subject to a proceeding called the SR proceeding, strategic reconfiguration, of which a 154-B cost-of-service is one component.
>
> Two years after the fact of 2009, testimony's [sic] filed in January of 2011 by the Owners to support their rates. Well, in January 2011, the rate that's supported for 2009 is $3.88. So two years after the fact, when rates were filed and collected at the $4.10 range, they're supporting $3.88.
>
> So, historically, it's tough to hit the mark using 154-B.[975]

570. This Court critiqued the TAPS Owners in the 2006 tax year proceeding for failing to advance a rate expert to support the Owners' tariff income assumptions.[976] In this case, the Owners again did not advance an expert who could support their specific tariff income assumptions. Regulatory Economics Group, LLC. ("REG") performed the cost-of-service calculations for American Appraisal,[977] which American Appraisal used to value TAPS based on the tariff income approach. But no witness from REG testified at trial. The Owners' rate experts at trial, Ms. Kelly and Dr. Toof, did not review or support REG's rate model or the rate calculations produced under that model.

---

[974] Tr. 7715 (Toof).

[975] Tr. 8891-92 (Grasso).

[976] Amended Decision ¶ 488.

[977] TO-7-0004.0102.

571. The REG rate calculations that American Appraisal used are not reliable. An example is the rate calculations for 2009. As discussed earlier, the TAPS Owners' FERC rate filings for 2009 ranged from $4.01 to $4.10 per barrel, and the rate advocated by the expert for the Owners in the 2009 FERC rate case is $3.88 per barrel. But in this ad valorem tax case, the Owners are proposing far lower rates of $3.07, $3.40, $3.03, and $3.25 per barrel on January 1, 2009.[978] The lower the projected tariff, the lower the net present value of the income stream.

572. Regulatory rate models are not intended to be used to predict future cash flows. Consistent with that reality, Dr. Toof declined to predict the outcome of the current TAPS' rate proceedings before FERC and the RCA.[979]

573. In sum, the evidence at trial persuasively demonstrated that TAPS' tariffs do not provide a stable or predictable foundation upon which to base the economic value of TAPS.[980]

574. SARB has repeatedly found that tariff income alone does not capture the economic value of the pipeline. As SARB explained in its 2007 Decision:

> The value of a pipeline's tariff income stream is generally only a portion of the value of the pipeline. That portion is the value of the original investment, plus capital expenditures and a reasonable return on these outlays of capital, which make up the tariff rate base. The tariff regulatory process attempts to ensure that shippers pay the pipeline owners only once for the capital costs through their tariff payments. . . . The tariff is based on depreciated capital costs, not current market value as a stand-alone property or the pipeline's current value as part of an economic unit. A regulated tariff does not

[978] TO-07-0004.0195; TO-07-0004.0208; TO-07-0004.0219; TO-07-0004.0232.

[979] Tr. 7740-41 (Dr. Toof acknowledged that at his deposition he had declined to predict the outcome of the strategic reconfiguration case pending at FERC and the RCA, since he "was not in the prediction business.").

[980] Tr. 8884-91 (Grasso).

produce an income that would capture the current economic value of the pipeline.[981]

575. For all the foregoing reasons, and consistent with the determinations made by many other courts, this Court finds that the Owners have failed to demonstrate that the Division and SARB's use of the RCNLD approach and its rejection of a tariff income approach was unreasonable and unsupported by the record. Instead, the record clearly demonstrates that the use of the RCNLD methodology to value TAPS for ad valorem tax purposes is a fundamentally sound valuation determination.

IX. THE COMPARABLE SALES APPROACH

576. The third primary approach to valuation is the comparable sales approach. "In the sales comparison approach, the appraiser develops an opinion of value by analyzing closed sales, listings, or pending sales of properties that are similar to the subject property."[982]

577. The sales comparison approach is most reliable when there is an active market providing a sufficient number of sales of comparable property that can be independently verified through reliable sources.[983] The "important concepts are 'active market' and 'verifiable information.'"[984] The sales comparison approach "is not feasible when the subject property is unique" or "if an active market for that property does not exist."[985]

[982] *The Appraisal of Real Estate* at 297.

[983] *Valuing Machinery and Equipment* at 122.

[984] *Valuing Machinery and Equipment* at 122.

[985] *Valuing Machinery and Equipment* at 122.

578. It is uncontested that TAPS is a unique, limited-market and special purpose property.[986]

579. As explained by the Minnesota Supreme Court:

> Because the [property] is specially adapted to a unique use and will not readily be sold to another user, the very nature of special purpose property is such that market value cannot readily be determined by the existence of an actual market, and therefore other methods of valuation, such as reproduction cost, must be resorted to . . . . Usually . . . comparable sales are not available for a [property] that is special use property. Nor is the income approach always directly relevant. Thus, where the owner is less interested in the income the property will generate than in occupying a [property] uniquely suited for the owner's special type of business, the reproduction cost minus depreciation method has been held to be appropriate for determining the market value of a [property], rather than an income approach.

Fed. Reserve Bank of Minneapolis v. State, 313 N.W.2d 619, 622 - 624 (Minn. 1981) (quotations omitted).

580. *The Appraisal of Real Estate* specifies that a proper "market analysis and highest and best use analysis are fundamental to the sales comparison approach."[987]

581. The record demonstrates that sellers of an interest in TAPS sell when they no longer have an integrated use for TAPS. Similarly, the record demonstrates that buyers of an interest in TAPS buy only when they have an integrated use for TAPS.[988] In short, the purchase and sale of interests in TAPS have been driven by each oil producing company's integrated economics rather than by tariff income.[989]

[989] Tr. 12682 (Goodwin).

582. Mr. Sullivan, on behalf of the Municipalities, persuasively discussed the fundamental differences between the transfer of pipeline interests in Alaska and the pipeline markets in the Lower 48.[990] He noted that there is only one independent shipper on TAPS after 34 years of operation.[991] He compared the market dynamics of the ANS and TAPS with two major oil producing basins in the Lower 48, the North Dakota basin and the Gulf Coast basin. He explained that in those Lower 48 markets, the pipelines are not owned or dominated by affiliates of the oil producers. Instead there are hundreds of independent producers, shippers, and marketers in each of those basins.[992] The Court was persuaded that comparing sales from different markets with fundamentally different market drivers than those existing in Alaska or for TAPS is not helpful in framing the economic value of TAPS.

583. Other courts have recognized that the absence of comparable sales and a meaningful income stream typically result in the use of the cost approach for limited-use and special-purpose property.[993]

584. As with the tariff income approach, the sales comparison approach has been repeatedly considered but determined not to be a reliable approach for determining the economic value of TAPS by both the Division and SARB. Thus, in 2007, SARB held that "there was no comparable property or representative sales of partial interests to make a reliable comparable sales valuation of the TAPS."[994] And in 2009 SARB found as follows:

> The 2009 comparable sales value estimates could not be relied on due to the same problems that these valuations have suffered from since they were first considered in the 2001 TAPS assessment. There are no other pipeline properties that are similar enough to the TAPS to obtain an accurate assessed value from sales. The historical partial sales of the TAPS were not arms-length transactions and were not independent of other transactions between the buyer and seller. Grossing up small partial sales creates distortions in the values obtained.[995]

At trial, the Assessor agreed that the sales comparison approach should not be relied on by this Court due to a lack of comparables, and the partial interest sales of TAPS were old and uninformative.[996]

585. At trial, the Owners' appraiser Michael Remsha sponsored a sales comparison approach on behalf of the Owners for the years at issue.[997] But Gary Loke and not Mr. Remsha was the appraiser for American Appraisal that did the work and drafted the relevant parts of the appraisal associated with the sales comparison approach.[998] Mr. Loke was not offered by the Owners as a witness at trial. Mr. Remsha indicated he personally did not

investigate or verify the sales that were used in the sales comparison approach.[999] Mr. Remsha indicated Mr. Loke would have been the best person to answer questions about American Appraisal's sales comparison approach.[1000]

586. For a sales comparison approach to be helpful, the sales need to be compared with the subject and "[i]f the comparable sale is not identical to the subject, the selling price of the comparable *must* be adjusted to indicate what the selling price of the comparable would have been if the comparable had been identical to the subject."[1001] There are several elements of comparability that must be considered when adjusting the selling price of the comparable back to the subject including age, condition, capacity, features, location, motivation of the parties, price, quality, time of sale, and type of sale.[1002]

587. Mr. Loke looked at fourteen Lower 48 pipeline sales, and used an earnings multiples analysis to project value to TAPS based on these sales. He did not make any other adjustments so as to compare these properties to TAPS.

588. With regard to these fourteen transactions, American Appraisal did not speak with the seller or buyer, or otherwise independently verify or confirm the transaction details.[1003] This failure to verify was the case even where BP was a party to the transaction.[1004] Mr. Loke did not know whether any of the fourteen sales transactions were due to merger and acquisition regulatory requirements.[1005] Mr. Loke was apparently

unaware that Transaction No. 14 was between related parties until he learned of that detail from comments made by Mr. Connolly at his deposition.[1006]

589. Of the fourteen sales transactions considered, only four were deemed by Mr. Loke to be relevant as an indicator of value for TAPS.[1007] The sales prices of the four selected transactions ranged from a high of $2.4 billion to a low of $158 million.[1008] Mr. Loke did not consider any of the four selected sales to be limited market properties and, as noted above, made no adjustments to those sales in an effort to reflect comparability with TAPS.[1009]

590. Mr. Loke testified that he had a "very challenging time" finding public domain information with regard to transfers of fractional TAPS' interests.[1010] He relied on information that he received from counsel for the Owners, but acknowledged that obtaining information in this manner was not a standard or common practice.[1011]

591. One of the Owners' other appraisal experts, Thomas Tegarden, testified at trial that he "would agree there is a lack of comparable sales."[1012]

592. The weight of the evidence presented at the trial de novo demonstrates that there are no comparable sales that inform the economic value of TAPS.

X. RECONCILIATION AND CONCLUSION

593. USPAP does not require reliance upon any particular method of appraisal. Instead, it provides as follows:

> In developing a real property appraisal, an appraiser must reconcile the quality and quantity of data available and analyzed within the approaches used, and reconcile the applicability or suitability of the approaches used to arrive at the conclusion(s).[1013]

594. The record before this Court reflects that the Division and SARB carefully considered each of the three major approaches to value, as well as the fact that TAPS is a regulated pipeline. No party has demonstrated that reliance on the cost approach was improper, or unsupported by the record, or constituted a "clear adoption of a fundamentally wrong principle of valuation."[1014]

595. This Court has also carefully considered each of the three approaches to value – the cost approach, the income approach, and the sales approach. Based upon all of the evidence presented to this Court over the course of the nine-week trial de novo concerning the assessed value of TAPS from 2007 to 2009, this Court will rely solely on the cost approach for the 2007, 2008, and 2009 assessments.

596. For the reasons discussed in Section VII of this decision, this Court relies on the Pro Plus cost study for the valuation for TAPS, as adjusted herein.

597. This Court has been presented with considerably more evidence than was before either the Division or SARB, including extensive cross-examination of all of the experts and other witnesses, and has concluded that in certain respects, SARB's 2007, 2008, and 2009 valuation of TAPS resulted in an improper valuation of TAPS, particularly

[1013] USPAP Standard 1-6.

[1014] *See N. Star Alaska Hous. v. Bd. of Equal.*, 778 P.2d 1140, 1144 n.7 (Alaska 1989).

with regard to the amount of the RCN, the amount of the scaling adjustment, and the lower limit of TAPS' capacity. Also, evidence at trial persuasively demonstrated that the life of TAPS based on its proven reserves and incorporating its minimum capacity throughput limitations as of the lien dates for 2007, 2008, and 2009 is at least until 2065.

598. Based on the foregoing, the following is a summary of this Court's determination of the assessed value for TAPS as of January 1, 2007, 2008 and 2009,[1015] set forth in millions of dollars:

Jan.1, 2007	Jan. 1, 2008	Jan. 1, 2009	
$17,645	**$19,324**	**$19,137**	**Replacement Cost New (RCN)**
($194)	*($194)*	*($194)*	*Less Land & ROW*
($243)	*($228)*	*($250)*	*Less Additional Functional Obsolescence*
$17,208	**$18,902**	**$18,693**	**RCN Less Land & ROW & Additional FO**
($5,605) *32.57%*	*($6,300)* *33.33%*	*($6,300)* *33.70%*	*Less Economic Age-Life Depreciation*
$11,603	**$12,602**	**$12,393**	**RCN Less Economic Age-Life Depreciation**
($2,691)	*($2,968)*	*($3,134)*	*Less Scaling of Pipe and VMT*
($165)	*($184)*	*($204)*	*Less Scaling of Pumps*
$8,747	**$9,450**	**$9,055**	**RCN Less All Depreciation**
$194	*$194*	*$194*	*Plus Land & ROW*
$8,941	**$9,644**	**$9,249**	**TOTAL RCNLD (in millions)**

[1015] The Court's Amended Decision ¶ 509, as well as SARB's decisions in 2007 and 2008, *see, e.g.*, MUN7-0236 at 13, 15, had deductions for certain non-taxable assets and the Valdez Terminal Office building. Because those assets were not included in the Pro Plus Study, the adjustments are no longer necessary.

The primary reasons for the variations from year to year are due to market changes in the estimates made by Pro Plus in its RCN for the cost of steel and labor rates as of each of the lien dates.

599. This matter concerns the assessed valuation of TAPS as of January 1, 2007, 2008, and 2009. It is before the Superior Court pursuant to a specific statute that accords to taxpayers and affected municipalities the right to a trial de novo before the Superior Court of an administrative determination of the value of pipeline property.[1016] Pursuant to that statute, this Court conducted a non-jury trial lasting approximately nine weeks in the fall of 2011. For the reasons expressed herein, this Court finds that as of January 1, 2007, 2008, and 2009, the "full and true value" of the Trans Alaska Pipeline System, "with due regard to the economic value of the property based on the estimated life of the proven reserves of gas or unrefined oil then technically, economically, and legally deliverable into the transportation facility"[1017] is $8.941 billion for 2007, $9.644 billion for 2008, and $9.249 billion for 2009.

ENTERED at Anchorage, Alaska this 30th day of December 2011.

Edward B. Deakin is the Distinguished Enterprise Professor in the University of North Texas in Denton, Texas. He directs the Institute of Petroleum Accounting. He is on leave from the position of the Price Waterhouse Centennial Professor of Accounting at the University of Texas at Austin that also held professorships at Stanford University and the University of Kuwait. Professor Deakin has published more than fifty articles and books in the area of petroleum accounting. He has served as Editor, and Trustee of the Financial Accounting Standards Advisory Council, and has advised several committees of the U.S. Congress. He has also served as a member of private consulting firms and the Financial Accounting Standards Board.

SUMMARY

Total Profit. The oil industry received an estimated $42.6 billion in profit from production and transportation activities in Alaska from 1969 through 1987. The $42.6 billion represents amounts accruing to producers after accounting for all expenses, including exploration, lease acquisition and income taxes, and allowing for recovery of investment costs (depreciation). The main section of this report presents details of profit for each calendar year. The technical section of this report describes each component of the profit, investment and cash flow elements. Below is a summary statement.

Total Alaska Oil Profit
1969 through 1987
(billions of dollars)

Revenues:		
Production revenues	$ 97.6	
TAPS revenues	33.7	
Total Revenues		**$131.3**
Expenses:		
Depreciation	12.1	
Operating Expenses	9.1	
Exploration Expenses	4.1	
Overhead	.8	
Interest	7.5	
Royalty	11.8	
Severance Taxes	10.4	
Property Taxes	3.5	
State Income Taxes	3.6	
Windfall Profit Taxes	6.4	
Federal Income Taxes	19.4	
Total Expenses		88.7
Profit		**$ 42.6 Billion**

Profit per barrel: $6.59

Alaska North Slope (ANS) production contributed $29.1 billion to profit, with $27.8 billion of this amount attributable to Prudhoe Bay and $1.3 billion

attributable to Kuparuk. TAPS provided $12.4 billion. Production in Alaska other than ANS production added $1.1 billion in profit. (Lisburne is included with Prudhoe Bay and Milne Point with Kuparuk. Endicott did not have significant production until after 1987. Alaska production other than ANS production is at Cook Inlet).

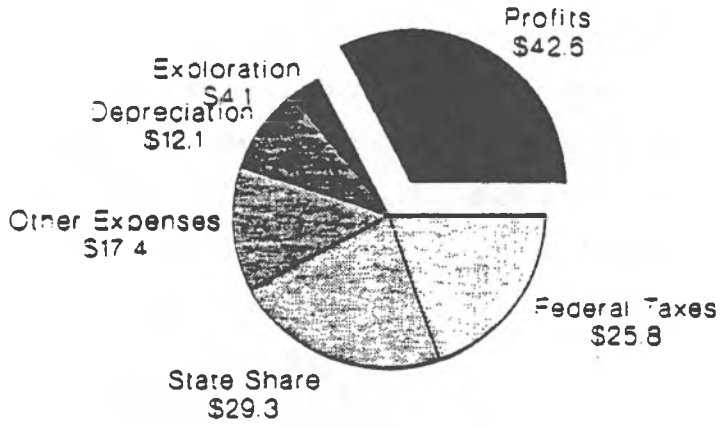
Shares. The $42.6 billion in after-tax profit that accrued to the oil industry compares to $29.3 billion in State of Alaska receipts from oil industry activities during this period. During the same period, Federal government receipts were $25.8 billion from these activities.

Investment. From 1969 through 1987, the industry invested $25.0 billion in ANS development costs and for TAPS. $13.1 billion of this represents the initial costs of Prudhoe Bay and TAPS. Of the $25.0 billion investment, $11.6 billion has been recovered through depreciation charges ($6.6 billion from Prudhoe, $1.0 billion from Kuparuk and $4.0 billion from TAPS).

Rates of Return on Investment. Cash flows from all Alaska investments from 1976 through 1987, assuming no debt, total $61.3 billion ($41.8 billion of profit plus $12.0 billion of depreciation plus $7.5 billion of interest[1]). Comparing these cash flows to the investment amounts over time implies that the after-tax rate of return on Alaska investments has been 29.7% from 1976 through 1987. Assuming that 75% of the initial investment was borrowed, an assumption that is indicated by available data, the rate of return on the investment is 43.7% after tax.

---

[1]Interest is added back under the assumption of no debt because there would be no interest expense if the entire project were funded with equity. This analysis incorporates all ANS investments prior to 1976 into 1976 and 1977. A more detailed timing of these investments was beyond the scope of this study. As indicated in the technical discussion, the effects of this assumption create minimal changes in the results.



These rates of return compare to the long run rate of return on the New York Stock Exchange of 10% *before* tax. [*Wall Street Journal* (February 20, 1989)] The prime rate peaked at 21.5% *before* tax in 1982, but that was an exceptional year. During this period, a prime rate of 10% to 18% *before* tax was more typical. Using an average effective tax rate of 36%, which approximates the tax rate observed in this study, the equivalent after-tax return on the New York Stock Exchange is 6.4%. The equivalent peak prime rate after an effective tax rate of 36% is 13.76%.

Reinvestment of Alaska Cash Flows. Subsequent to the initial investment for Prudhoe Bay field and TAPS, the industry invested $15.8 billion for ANS development and exploration throughout Alaska from 1978 through 1987. This includes $3.9 billion in exploration expenses which are not included in the analyses of profits from individual fields. The reinvestment rate has been 27.8% of cash flows received during this period.

Seventy-five sources of data about Alaska oil operations were researched to develop this report. Although details do not exist on each and every data item, the information available in the references is sufficient to develop a reasonably accurate picture of industry profit. A study of the data suggests that the actual profit number could be as low as $41 billion or as high as $47 billion. The estimate reported here is at the conservative end of this range.

Figure 1 graphs the relationship among the revenues, expenses and profit for all Alaska oil production and transportation activities.

Figure 1
Revenues, Expenses and Profit
All Alaska Oil Activities
(billions of dollars)

The $42.6 billion in profit is what the producers received after accounting for all expenses, including exploration, lease acquisition, and after allowing recovery of the costs of investments in Alaska oil activities related to the useful lives of the investments.[1]

From 1977 through 1987, virtually all of these profits were earned from the Alaska North Slope (ANS). ANS production contributed $29.1 billion to profit, with $27.8 billion of this amount attributable to Prudhoe Bay. Total production profit for the Prudhoe Bay field is given in Table 2.

---

[1] Details of how the profit estimates were obtained are provided in the technical discussion. Some of the amounts could not be readily determined from publicly available data or the data were ambiguous. In these situations, a conservative approach was taken. As a result, this report gives a low-end estimate of oil industry profits. Throughout this report, the sum of the individual numbers may not add to identical totals due to rounding.

Oil Industry Profit in Alaska: 1969-1987
Overview

How profitable is the oil industry in Alaska? This is a question of major significance to the State of Alaska and to its residents because the State's share of the revenues from oil production and transportation activities are a primary factor in determining the State's General Fund revenues as well as the additions to the Permanent Fund. This report looks at available information on industry activities in Alaska to derive a picture of the profit attained from these activities. The results of the study indicate that the oil industry received $42.6 billion in after-tax profit from 1969 through 1987 from oil production and from TAPS. The components of this profit estimate are given in Table 1:

Table 1

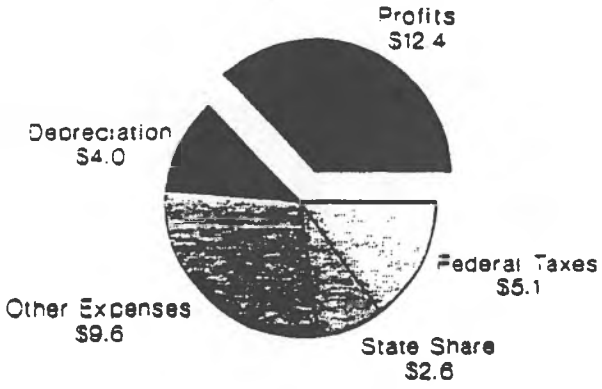
a. Less than $1 million.

TAPS PROFIT



The Trans-Alaska Pipeline System (TAPS) is owned by the Prudhoe Bay producers in approximately the same proportion as their ownership interest in the Prudhoe Bay field. Profit from TAPS, therefore, accrues to the same producers. Table 8 shows the overall revenues, expenses and profit for TAPS from 1978 through 1987.[2]

Table 8
Total Estimated TAPS Profit
(billions of dollars)

Revenue	$ 33.7
Expenses:	
Depreciation	4.0
Operating and Administrative	3.8
Interest	5.8
Property Taxes	1.7
State Income Taxes	.9
Federal Income Taxes	5.1
Profit	**$12.4 Billion**
Profit per barrel: $2.41	

The distribution of these items are shown in Figure 4.

Figure 4
TAPS Revenues, Costs and Profit
(billions of dollars)

[2]The one-half year of activity during 1977 when TAPS started does not have a significant effect on the results. Data from that year are unavailable.

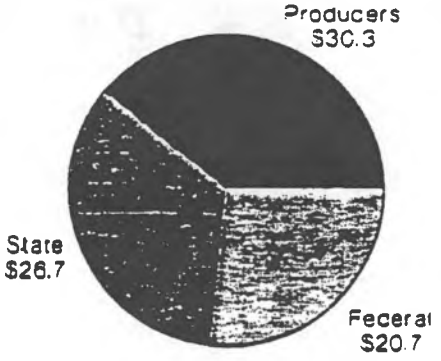
SHARES



At the super-giant Prudhoe Bay field, producers earned $27.8 billion. The State received $23.8 billion from Prudhoe Bay and the Federal government received $18.9 billion. This is shown visually in Figure 5. The nearby giant Kuparuk field added $1.3 billion to producer profit, $1.2 to the state and $0.6 billion to the Federal government's revenues.

Figure 5
Shares
Prudhoe Bay Production
(billions of dollars)

The sharing from all production in Alaska between 1969 and 1987 is shown in Figure 6, with $30.3 billion to the producers, $26.7 billion to the State and $20.7 billion to the Federal government.

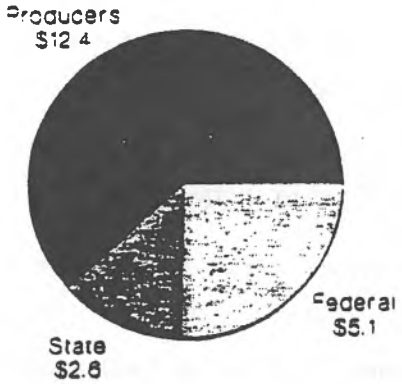


Figure 6
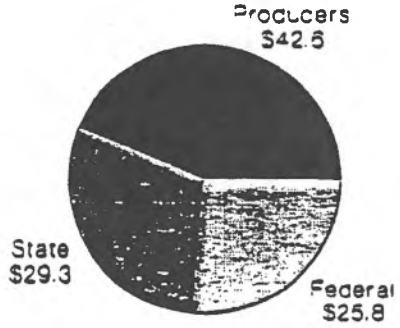
Shares
All Alaska Production
(billions of dollars)

Confidential Pursuant to
APUC Order P-97-4(22)



TAPS profit of $12.4 billion went to the producers, $2.6 billion went to the State through property and income taxes and $5.1 billion went to the Federal government through income taxes. This distribution is shown in Figure 7.

Figure 7
TAPS Shares
(billions of dollars)

A summary of the distribution for all Alaska oil operations is shown in Figure 8. The $42.6 billion in after-tax profit that accrued to the oil producers compares to $29.3 billion in State of Alaska receipts from oil industry activities during this period. During the same period, Federal government receipts were $25.8 billion from these activities. Figure 8 shows the relationship between industry profit and the state and federal receipts from oil industry revenues.

Figure 8
Shares
All Alaska Production and Transportation
(billions of dollars)

ADDITIONAL BENEFITS OF ANS OIL

ANS producers receive profits from Alaska oil outside of Alaska which provides an additional bonus beyond what it would cost if they had to purchase imported oil. An additional profit of approximately $0.7 billion went to the producers through the operation of the U.S. Department of Energy crude oil entitlements program. Producers are believed to earn additional profit through the refining of ANS crude because, among other things, they have access to a secure source of crude oil. If they did not have the ANS crude, it would be necessary for them to acquire crude from foreign sources.

Others estimate that profits on tanker operations and trans-Panama shipment activities added between $.25 and $1.00 profit per barrel of ANS crude produced. These additional profits would have been received on the nearly 6 billion barrels of ANS production. These added profits are not included in the $42.6 billion of total oil industry profit in Alaska covered in this report.

INVESTMENTS MADE ON THE ALASKA NORTH SLOPE

Figure 9 shows the relative amounts of money invested in projects to produce ANS crude. The greatest investment was $9.4 billion in TAPS. The total investment to date in Prudhoe Bay was $8.7 billion. This includes the waterflood project and the miscible gas injection project as well as infield drilling. The investment in Kuparuk was $4.3 billion which includes amounts for the newly installed waterflood project that had not been in operation during the period of this study. Milne Point cost $575 million. Endicott and Lisburne each cost approximately one billion dollars. As of the end of 1987, Milne Point had been shut in, while Endicott and Lisburne had just begun operations too recently to have a significant impact on the revenue numbers reported here. The investments made in Cook Inlet during this period were not significant relative to the ANS investments during this period.

Figure 9
ANS Investments
(billions of dollars)

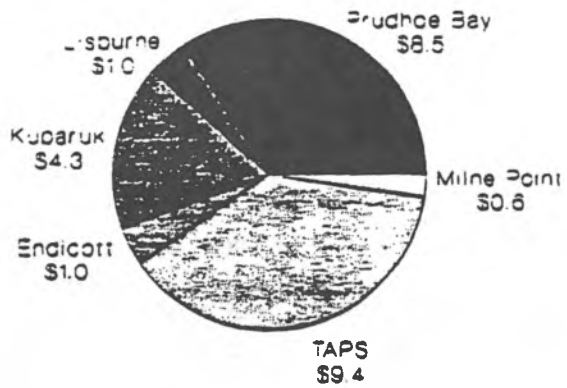


Table 10 shows the timing of the investments in Prudhoe Bay and other ANS projects together with an estimate of the timing of the investment in TAPS. These investment timings are based on information from the producers and may not be exact.

Table 10
ANS Investments
(millions of dollars)

Year	*Project*	*Amount*
1987	Prudhoe gas	$ 720
1987	Kuparuk waterflood	900
1987	Endicott	1,000
1986	Lisburne	1,000
1985	Prudhoe gas plant	720
1984	Milne Point	570
1983	Prudhoe waterflood	2,000
1981	Kuparuk	3,400
1981	Prudhoe drilling	1,100
1980	Prudhoe drilling	250
1979	Prudhoe drilling	250
1977	Prudhoe*	1,850
1977	TAPS*	4,700
1976	Prudhoe*	1,850
1976	TAPS*	4,700
Total		**$ 25,015**

*These amounts were spent over the period 1969 through 1977, with the majority of the funds spent later in the construction phase of the project.

Cash flows can be related to these investments to compute a rate of return on the investment in Alaska. Assuming the entire investment was made with equity funds, cash flows are deemed equal to profit plus depreciation and interest. A schedule of these "all-equity" cash flows is shown in Table 11.

Table 11
All-Equity Cash Flows
(millions of dollars)

		---Cash Flows---		Net
Year	*Investment*	*Production*	*TAPS*	*Cash Flow*
1987	2,620	3,542	1,675	2,597
1986	1,000	2,793	2,518	4,311
1985	720	4,719	2,106	6,105
1984	570	5,512	2,687	7,629
1983	2,000	4,770	2,511	5,281
1982	0	4,321	2,365	6,686
1981	4,500	4,168	2,158	1,826
1980	250	3,764	2,172	5,686
1979	250	3,673	2,211	5,634
1978	0	1,151	1,771	2,922
1977	6,550	655	0	-5,895
1976	6,550	0	0	-6,550

The equivalent rate of return earned on this stream of cash flows after tax is 29.7%.

As it happened, a substantial portion of the investment was financed with borrowed monies. The 1978 Sohio annual report to shareholders indicated that 75% of the company's funds were from debt. In this case, the investments in 1976 and 1977 as shown in Table 11 would be $1,638 net each year. This is 25% of the investment outflows in those years. The remainder would have been financed with debt. Interest expense would be incurred on this debt and the debt would have to be repaid. The cash flow data in Table 12 is the profit plus depreciation. These cash flows include a deduction for interest expense. Assuming that all of the cash flows were used to pay of the debt as quickly as possible, the loan repayment would have consumed all of the cash flows in 1978

through 1979 and all but $2,131 million in 1980. The net cash flows in each year are shown in column 4 of Table 12.[3]

Table 12
Cash Flows with 75% Borrowing
(millions of dollars)

		----Cash Flow----		Net Cash
	Investment	*Production*	*TAPS*	*Flow*
1987	2,620	3,350	1,525	2,255
1986	1,000	2,610	2,078	3,688
1985	720	4,536	1,695	5,511
1984	570	5,364	2,117	6,911
1983	2,000	4,620	1,932	4,552
1982	0	4,150	1,717	5,867
1981	4,500	4,150	1,477	1,127
1980	250	3,754	1,452	2,131
1979	250	3,506	1,440	0
1978	0	903	925	0
1977	6,550	478	0	-1,160
1976	6,550	0	0	-1,637

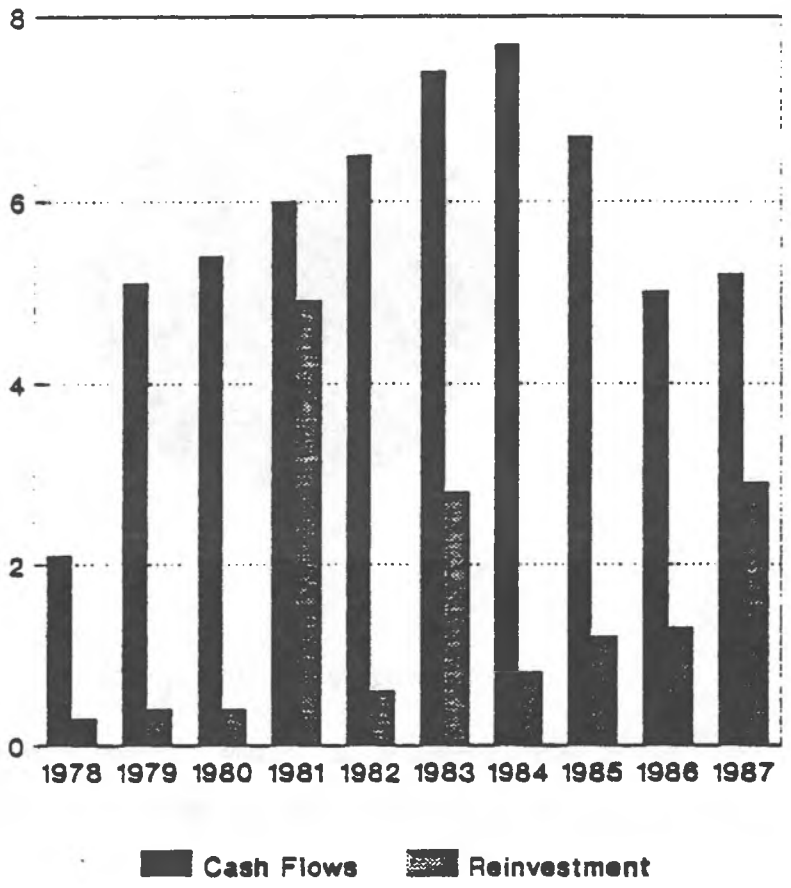
The rate of return implied from the stream of cash flows shown in Table 12 is 43.7%.

REINVESTMENT OF ALASKA PROFIT

A question of importance to Alaska is what happens to the profit earned from oil activities in Alaska. It has been necessary for the industry to make certain investments to maximize production from the Prudhoe Bay field. Initial investments are shown in 1976 and 1977 in Table 10. Reinvestments are shown in Table 10 for the years 1978 through 1987. In addition, the industry has reinvested through exploration.

Reinvestments shown in Table 10 are added to exploration expenses to obtain total reinvestments for the period 1978 through 1987. These reinvestments are shown in the first column of Table 13. For the years 1978

[3]Loan repayments took place over a longer time period, but it is not feasible within this project to determine actual repayment dates for ANS investment-related debt. This model assumes earlier repayment, but also includes the later interest costs reported by the producers. The net effect of this is to understate the rate of return.



through 1987, these reinvestments are compared to cash flows received from Alaska oil operations. These cash flows are equal to profit plus depreciation and exploration expenses. They are shown as the third and fourth columns in Table 13. Each year's ratio of reinvestment to cash flows is shown in the last column of Table 13.

Table 13
Reinvestment and Reinvestment Flows
(millions of dollars)

	Re-	*—Cash Flows—*			*Reinvestment*
Year	*investment*	*Production*	*TAPS*	*Total*	*Ratio*
1987	2,908	3,638	1,525	5,163	56.32%
1986	1,288	2,898	2,078	4,976	25.88%
1985	1,234	5,050	1,695	6,745	18.30%
1984	828	5,622	2,117	7,739	10.70%
1983	2,818	5,438	1,932	7,370	38.24%
1982	647	4,797	1,717	6,514	9.93%
1981	4,919	4,569	1,477	6,046	81.36%
1980	426	3,930	1,452	5,382	7.92%
1979	424	3,680	1,440	5,120	8.28%
1978	274	1,177	925	2,102	13.04%

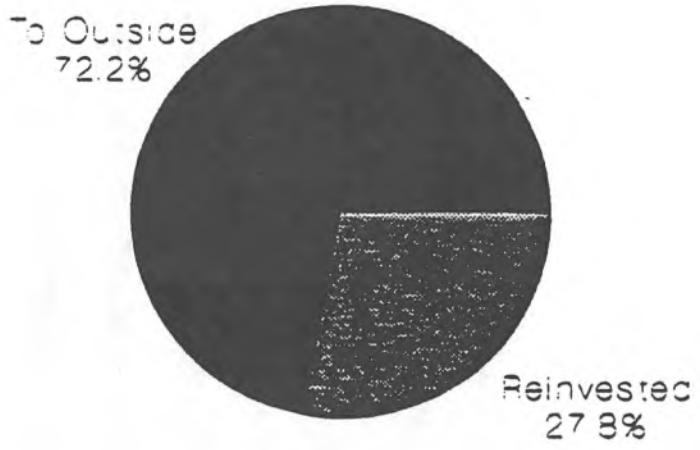


Table 13 indicates that 27.8% of the cash flows from oil and gas industry activities in Alaska was reinvested in Alaska. The reinvestment is shown graphically in Figure 10.

Figure 10
Reinvestment in Alaska by Years
(billions of dollars)

The relationship between the percentage of funds reinvested in Alaska oil projects and those which flow outside is shown in Figure 11.

Figure 11
Overall Reinvestment of Oil Industry Flows
(percentage)

HOURLY PROFIT RATE

Looking at these profits as an hourly earnings number may bring the amounts into better perspective. After-tax profits have been earned by the producers at the rate of $463,144 per hour, twenty-four hours per day for each day of the first ten and one-half years of ANS production.

SENSITIVITY OF ESTIMATES

Where possible, the different assumptions used to develop these profit estimates were studied in more detail to see how sensitive the profit estimates were to the different assumptions. When in doubt, a conservative approach was taken. A total of $7.5 billion in potential profit increases related to assumptions

that were resolved in favor of conservatism was ignored. By contrast, a total of $.6 billion in potential profit decreases related to assumptions were also ignored.

After considering the impact of all potential adjustments due to the assumptions used in the report, the range of profit estimates runs from a minimum of $41 billion to a maximum of $47 billion. The $42.6 billion reported here is at the low end of this range.

Technical Discussion

The profit estimates reported in this report were developed from publicly available information about oil industry activities in Alaska. Although a substantial amount of information exists about oil industry activities in Alaska, a complete picture of profit from Alaska activities is not published in any known reference. Assembling a report on oil industry profit requires gathering information from a number of different sources, piecing together an overall picture of profit and cross-checking the estimate obtained in this manner with other data sources. In the end, the profit estimate should be quite close to the actual results.

Throughout this report the terms "approximate" and "estimate" appear quite frequently. These terms are necessary because public data do not exist which would enable one to compute Alaska profit precisely. The approach taken here, when there are questions about amounts, is to take the conservative approach. The profit reported then will represent the low end of the range. This section of the report provides details on how the pieces of the puzzle were assembled and how the resulting profit estimates were cross checked. After all of this, some questions still remain. The effect of these remaining questions is covered in Section III of this technical discussion.

APPROACH TO MEASURING ALASKA OIL COMPANY PROFIT

In its most fundamental form, profit is the amount that is left over from revenues after paying all expenses including income taxes and an allowance for the cost of the initial investment. In accounting terms, estimation of profit becomes more complex because accountants must relate revenues to expenses that occur in different times. Accounting profits therefore are based on an

analysis of transactions that took place in the past with appropriate adjustments to determine the profit attributable to a specific period of time. In this report, profit from Alaska oil industry activities are estimated over the period 1969 through 1987.[1]

Alaska oil producers earn profit from the production, transportation and sale of crude oil. The primary sources of these profits are production from Prudhoe Bay field on the Alaska North Slope (ANS) and TAPS.

A company engaged in Alaska oil activities can estimate its own profit rather readily by extracting transaction data from its own books and by making appropriate adjustments. To make such an estimate from the outside is much more complex because a significant portion of company data is kept private. Hence, it is necessary to identify that information which is public and piece together a picture of the profitability of Alaska oil operations. This task requires obtaining as much information as possible and then making assumptions about the missing data and, where possible, cross-checking the results with other public data sources. This is the process followed to develop the profit estimates reported here.

For example, Standard Oil Company of Ohio (formerly Sohio, now BP America) includes a section in its corporate annual report that states its profit from Alaska oil production operations. (See Appendix A for an example of this disclosure.) If every other producer obtained the same revenues per barrel of crude oil and incurred the same costs to produce that oil, one could project from the Sohio data to all Alaska production. However, this approach cannot be used because it is widely known that Sohio sells most of its ANS crude on the U.S. Gulf Coast whereas other producers sell their crude oil on the U.S. West Coast.

[1] See Financial Accounting Standards Board, *Statement of Financial Accounting Concepts No. 3*, Pars. 12 and 56 - 62 for a comprehensive discussion of profit concepts.

Prices in the two markets differ. According to Barclay's de Zoete Wedd (1988), U.S. West Coast prices are about $1 lower than the Gulf Coast, but it costs about $2.45 more to ship a barrel of crude oil to the Gulf Coast. To obtain revenues for all producers, it is necessary to adjust Sohio revenues by taking account of the differences in crude oil values. This is one of the many adjustments necessary to obtain an estimate of profit.

The more assumptions that need to be made, the more questions that will arise about the profit number that is obtained. However, there are alternate sources of information that can be used to compare a significant portion of the data used to compute profit. To the extent that these alternate sources are consistent, the computed profits will be more reliable. The most important item in the profit equation is revenue. Fortunately, estimates of producers can be checked against Alaska severance tax collections. For most of the period covered by this report, the Alaska severance tax is stated as 15% of the value of producers' production, subject to certain adjustments. This implies that for production subject to the 15% rate, an amount equal to 15% of production revenue should approximate the reported severance tax collections by the State of Alaska. Similar comparisons can be made for production subject to other severance tax rates.

In addition, the estimate included in this report is not the only estimate of oil industry profit in Alaska. Financial analysts and others have, from time to time, estimated profit from Alaska oil industry activities. (See Appendices B and C for examples.) The numbers reported here have been checked, to the extent possible, with other data sources.

Not all of the numbers can be checked and many of the alternate information sources use different bases for reporting their data. The last part of section III of

Confidential Pursuant to
APUC Order P-97-4(22)

this report discusses the effects that substantial questions raised by the estimation process are likely to have on the total estimated profit. As noted in this report, most of the effects are quite small. This is an unavoidable problem. Indeed, it is very likely that producers are unable to estimate their own profits down to the last cent because of the assumptions that they make in developing their profit numbers. The point is that the estimate developed here is, on balance, consistent with other estimates of profits earned in Alaska. Indeed, the total effect of questions about alternate treatments is that the profit reported here is on the conservative side. One may perhaps argue that total profit is $2 billion higher or lower than this estimate, but such a debate should not detract from the validity of the overall picture presented here.

The first part of this report develops estimated revenues from production activities, essentially the gross receipts from operations. This report focuses on the revenues that accrue to the producers, net of royalty. This is defined as "working interest revenue." To calculate working interest revenue, it is necessary to know production and the value of each barrel of production. Those matters are discussed in Section I under "Production Revenues".

Section II covers the expenses that must be deducted from revenues to obtain profit for this project. These expenses include depreciation, severance taxes, operating expenses, windfall profit taxes, exploration expenses, overhead and interest. Each of these items is discussed in turn. Both the State of Alaska and the U.S. government levy taxes on income as defined in their laws. These are expenses for accounting purposes and are also presented in Section II. Royalties are eliminated from revenues reported by oil and gas producers. In Section III, royalties are included as a separate line item to determine both the working interest (producers') revenues and total revenues.

Confidential Pursuant to
APUC Order P-97-4(22)

The third section of the report gives the detailed statements of profit for Prudhoe Bay, Kuparuk and all Alaska production. This section also includes a discussion of the sensitivity of the profit estimates to cost estimates, missing data, various allocations, and other factors on the profit estimates.

The fourth section of the report shows the profit earned from TAPS. Here it is reasonable to rely extensively on Sohio Pipeline Company's disclosures. Other data sources generally confirm the Sohio Pipeline information.

Each part of this technical discussion is designed to provide further detail about the way the data presented in the report was developed. To the extent possible, the report follows accounting practices and conventions that enable one to obtain a reasonable estimate of the profitability of Alaska's oil industry activities. The resulting estimates give an accurate, although not exact, picture of the profitability of Alaska's oil industry operations.

Profit has been estimated for Prudhoe Bay, Kuparuk, all Alaska production and TAPS. After making all of the calculations and cross-checking available data, total oil industry profit in Alaska is estimated as $42.6 billion. This includes $27.8 billion from Prudhoe Bay, $1.3 billion from Kuparuk and $12.4 billion from TAPS. An additional $1.1 billion was earned elsewhere in Alaska.

After looking at the effects of all of the estimates made on reported profit, a range within which the actual number is likely to fall can be developed. The low end of this range is $41 billion and the high end is $47 billion. The estimated profit of $42.6 billion reported here is in the low end of this conservative estimated range.

Finally, reported profit is based on public information which was available at the time this report was written. It is entirely possible that data not available

could affect the analysis. Any such data would be welcomed to advance the goal of obtaining a more precise estimate of Alaska oil industry profit.

I. PRODUCTION REVENUES

PRODUCTION ESTIMATES

Production estimates for crude oil and natural gas were obtained from different data sources and compared. Since the foundation of reported profit depends on production estimates, it is important to note how the estimates compare. Moreover, each company's reported accounting data are based on its production estimates. Thus, the production data are needed for making certain computations from company reports. The estimates for crude oil are discussed first in this section, followed by the estimates for natural gas.

Crude Oil. Production estimates were obtained from the corporate annual reports of Arco, Sohio and BP America, the Alaska Oil and Gas Conservation Commission Statistical Series, DeGolyer and MacNaughton's *20th Century Petroleum Statistics* (1987) and the *International Petroleum Encyclopedia*, as well as from the *U.S. Energy Statistics Sourcebook* (1988). As shown below, the estimates provided by each of these sources differ with respect to the time periods covered, the level of detail and the volumes of production.

The producers' corporate annual reports present production information in terms of barrels per day of production. The data as reported by each company are shown in Table I-1.

Arco presented separate information on the production from Prudhoe Bay, Kuparuk and Lisburne for the years 1980 through 1987. From 1978 on, Sohio/BP presented data for all of its Alaska operations. Prior to 1982, virtually all of Sohio/BP's production was from the Prudhoe Bay field. These data facilitated obtaining production estimates for each of those fields.

Table I-1
Company Net Production Data
(000 barrels per day)

	------Arco Reports------			
Year	*Prudhoe*	*Kuparuk*	*Lisburne*	*Sohio/BP*
1987	324.9	122.0	15.0	827.2*
1986	306.9	109.9	4.1	706.4#
1985	304.9	94.9	8.5	699.7
1984	326.1	71.7	8.9	617.9
1983	336.4	69.9	10.0	594.8
1982	292.4	61.8	na	676.6
1981	275.5	2.1	na	698.2
1980	274.7			696.4
1979	248.6**			590.8
1978	213.3**			506.8
1977	213.3**			143.8
1976	78.4**			
1975	27.9**			

* BP America data.
# Sohio data. BP America reported 781.4 thousand barrels per day.
** Arco's total Alaska production.

The data reported in Table I-1 were converted to an annual number by multiplying the daily figures by 365. The company statistics were then divided by the company's proportionate share in production to arrive at an estimate of total production based on each company estimate. Adjustments were made for the 1982 redetermination of each company's Prudhoe Bay share of production. The estimates of total Prudhoe Bay production based on Arco's and Sohio/BP's corporate disclosures are in the first two columns of Table I-2, below. The estimates of total Kuparuk production based on Arco's corporate disclosures are in the first column of Table I-3, below. The corporate disclosures give the company's working interest production (net of royalty).

The Alaska Oil and Gas Conservation Commission provides gross production by field for all years covered by this study. The *International Petroleum Encyclopedia* reports gross production from major fields by year. However, the *Encyclopedia* is not complete. In certain years it does not show all fields.

The DeGolyer and MacNaughton statistics are based on the U.S. Department of Energy reports and show gross production from Alaska. They do not show production from specific fields.

The *U.S. Energy Statistics Sourcebook* data show total ANS production for 1981 through 1987 and total Alaska production for prior years. An assumed 1/8 royalty interest was deducted from this number to arrive at an estimate of ANS working interest production. Production from Kuparuk and Lisburne (based on Arco's disclosures) were deducted to arrive at an estimate of Prudhoe Bay production. These data are in Column 3 of Table I-2.

The estimates presented under each method differed. To test the different estimates for reasonableness, TAPS and Kuparuk pipeline throughputs were analyzed. This analysis is based on the assumption that all of Kuparuk production (including royalty oil) should equal the Kuparuk pipeline throughput. TAPS throughput should be comprised of Kuparuk, Lisburne, and Prudhoe Bay crude, including royalty oil. Deducting Kuparuk, Lisburne and Prudhoe Bay royalty oil should give the working interest production from Prudhoe Bay.

Annual total TAPS throughput for 1982 through 1987 was obtained from the Arco annual report. Similar data for 1980 to 1981 were obtained from the Sohio report. Royalty interests as well as Lisburne and Kuparuk production were deducted from total TAPS throughput to obtain an estimate of Prudhoe Bay production. The results of this analysis are shown in Column 5 of Table I-2.

In addition to these estimates, data on total production from Prudhoe Bay, including royalty, were presented in the *International Petroleum Encyclopedia*. These data were available for 1983, 1984, 1985, and 1987. Royalty of 1/8 was deducted from gross production to obtain another estimate of Prudhoe Bay working interest production for comparison purposes.

Confidential Pursuant to
APUC Order P-97-4(22)

The sources that provided reasonably complete data series included Arco, Sohio/BP, the *U.S. Energy Statistics Sourcebook*, the Alaska Oil and Gas Conservation Commission statistics and the analysis of pipeline throughput. The estimated working interest production from Prudhoe Bay based on each of these different estimates is shown in Table I-2. After reviewing the data and the different levels of complexity required for each alternate estimate, it appears that the Alaska Oil and Gas Conservation Commission (AOGCC) statistics provided a reasonable, conservative and consistent data series over the period covered by this report.

Annual Production Estimates: Prudhoe Bay
Net of Royalty
(000,000 barrels per year)

Year	*Arco*	*Sohio/BP*	*U.S. Energy Data Sourcebook*	*AOGCC Statistics*	*Pipeline Throughput Analysis*
1987	544.5	592.0	507.3	500.8	520.9
1986	500.1	508.8	493.6	494.5	493.8
1985	496.8	503.9	497.8	498.5	497.3
1984	531.4	467.5	492.1	491.9	489.6
1983	547.4	458.6	487.3	490.8	486.1
1982	492.7	490.0	489.2	489.2	488.4
1981	493.4	480.8	486.7	485.8	495.0
1980	527.7	479.6	517.7	486.0	479.1
1979	na	406.9	447.4	409.9	na
1978	na	349.0	392.5	348.0	na
1977	na	99.1	148.1	100.9	na

For 1977 through 1986, production estimates used for computing Prudhoe Bay profit are based on the AOGCC statistics shown in Table I-2. The 1987 estimate used the AOGCC estimate for Prudhoe Bay plus Arco's estimate for Lisburne. The production number chosen was neither the highest nor the lowest for all years. It is generally believed that the AOGCC estimates are reliable and acceptable estimates of field production.

Kuparuk production estimates are based on 7/8 of Kuparuk pipeline throughput as reported by Arco. The 7/8 number reflects the net working interest

Confidential Pursuant to
APUC Order P-97-4(22)

production. The *International Petroleum Encyclopedia* also reported estimated production from Kuparuk. The *International Petroleum Encyclopedia* data were adjusted to reflect a 1/8 royalty interest. The AOGCC reported Kuparuk production was adjusted to reflect a 1/8 royalty interest also. These different annual working interest production estimates for Kuparuk are reproduced in Table I-3.

Table I-3
Annual Production Estimates: Kuparuk
Net of Royalty
(000,000 barrels per year)

Year	*Arco*	*International Petroleum Encyclopedia*	*AOGCC Statistics*
1987	90.4	87.1	89.6
1986	87.2	na	82.2
1985	70.3	69.6	69.7
1984	40.2	32.6	40.4
1983	38.3	34.0	34.9
1982	28.4	na	28.6
1981	na	na	.1

The Arco data are slightly higher for most of the years of Kuparuk production. Since the differences are minor, the Arco production data were used for Kuparuk. The very small production from Milne Point and Endicott would be included with Kuparuk. However, the amounts are too small to affect the analysis.

Lisburne production was reported by Arco at 14.4 million barrels in 1987. The *International Petroleum Encyclopedia* and the AOGCC reported this production at 14.3 million barrels in 1987. This amount has been included with Prudhoe Bay production in subsequent analysis.

For 1981 through 1987 and for years prior to 1978, other Alaska production was reported separately in the *U.S. Energy Statistics Sourcebook.* These data were used for comparison for those periods. For 1978 through 1980, other Alaska production was estimated as the difference between total Alaska production as reported in the *U.S. Energy Statistics Sourcebook* and ANS

production as computed in the two tables above. The results gave significantly higher estimates of other Alaska production during those three years. It was not possible to ascertain the reasons for the difference between these data and the AOGCC data. The two series of working interest production estimates for non-ANS production reproduced in Table I-4.

Table I-4
Non-ANS Production Estimates
Net of Royalty
(millions of barrels)

Year	*AOGCC Statistics*	*U.S. Energy Statistics Sourcebook*
1987	14.3	14.1
1986	15.4	15.4
1985	14.8	14.8
1984	19.3	19.2
1983	21.7	21.7
1982	24.0	24.0
1981	27.1	27.2
1980	31.7	98.1
1979	37.5	91.4
1978	43.8	87.1
1977	49.1	61.4
1976	58.6	55.5
1975	63.0	61.1
1974	63.2	61.8
1973	64.0	63.3
1972	64.4	63.8
1971	69.0	70.0
1970	73.2	73.2
1969	65.0	64.7

The Alaska Oil and Gas Commission statistics were used for purposes of non-ANS production in this report. The differences between AOGCC and an approach based on the Energy Statistics Sourcebook appears significant only in the years 1977 through 1980. During that period, the AOGCC data appear more reliable because the significant increase in production indicated for 1978 - 1980 by the *U.S. Energy Statistics Sourcebook* cannot be confirmed from other sources. It appears that this increase is a statistical fluke. In other years the two

data series track one another closely. It is unlikely that the differences in other years would have any substantial effect on the results.

Natural Gas. Estimation of natural gas production was simplified because there were fewer data sources. BP/Sohio provided information about gas production in their annual reports. All of Sohio's gas production was on the North Slope, and most of that was produced from Prudhoe Bay for use in production operations. Estimates of natural gas production in column 1 of Table I-5 are based on these data. The *U.S. Energy Statistics Sourcebook* provided data on total Alaska natural gas production. This data series is gross of royalty. Adjusting the *U.S. Energy Statistics Sourcebook* data for a 1/8 royalty and deducting the Sohio-based estimate of ANS production gives an estimate of ANS natural gas working interest production and other Alaska natural gas working interest production. The non-ANS production data computed by this method are reported in column 3 of Table I-5. These estimates were compared with AOGCC data and with data reported by the U.S. Department of Energy. The differences were not significant.

1969			44.5

REVENUE ESTIMATES

Production data multiplied by the price per unit of production gives gross revenues. The question is how to obtain an accurate estimate of the price per barrel of ANS crude oil given that the oil is disposed of at different prices.

There are several estimates of ANS per barrel revenue which must be considered when preparing a total revenue estimate. The approach used here was based primarily on the weighted average of the reported per barrel prices given in the producers' corporate annual reports. Adjustment was made to reflect the transportation and quality differences between Kuparuk and Prudhoe Bay crude. These adjustments were based on information provided by Salomon Brothers and Barclay's.

The first set of data used were the reported per barrel prices for crude oil obtained from the annual reports of Sohio and Arco as well as the *U.S. Energy*

Statistics Sourcebook. These data are presented in columns 1 through 3 respectively of Table I-6. In 1988, Barclay's produced a report on BP which, among other things, detailed revenues at Pump Station 1 for 1985 through 1987. This information is included in column 4 of Table I-6 for comparison.

Estimates given in Table I-6 are based on overall production. It is necessary to disaggregate the data for Prudhoe Bay and for Kuparuk. Given that Arco reported production for both fields, and that its per barrel revenue is, effectively, a weighted average of the prices from these two fields, it is possible to disaggregate the prices if the difference between the two prices is known. The difference between the Prudhoe Bay price and the Kuparuk price would be due to the Kuparuk pipeline tariff and a quality differential between the two fields.

Table I-6
Per Barrel ANS Revenue Data
(Pump Station #1)

Year	*Sohio*	*Arco*	*Sourcebook*	*Barclay's*
1987		$ 10.95	$ 10.84	$ 10.74
1986	$ 7.38	6.43	6.45	6.76
1985	16.92	16.81	16.98	17.83
1984	17.78	17.11	17.91	
1983	17.73	17.31	17.69	
1982	19.97	19.08	19.92

1972			3.17	
1971			3.01	
1970			2.90	
1969			na	

According to Barclay's, the Kuparuk pipeline tariff is $1.00 per barrel. Barclay's also estimated that the quality differential is $.50. For the years 1982 and 1983, these estimates are consistent with other sources. Therefore, the

Confidential Pursuant to
APUC Order P-97-4(22)

Kuparuk price should be $1.50 per barrel less than the Prudhoe Bay price for 1982 and 1983. In 1984, the new Kuparuk pipeline was brought on stream and a new pipeline tariff established. *Petroleum Intelligence Weekly* (February 1988) and other sources indicate that the price difference between Prudhoe Bay and Kuparuk for 1982 and 1983 should equal $.95 per barrel. In later years the difference declines. The $.95 per barrel differential together with the average per barrel ANS price data were used to construct estimates of the price of crude oil for each field.

The formula for generating these estimates is developed as follows. For 1984 through 1987, Arco's average per barrel price:

$$\frac{P_{Kuparuk} \times (X - \$0.95) + P_{Prudhoe} \times X}{\text{Total Production}}$$

Where P = Production for each field and
X = Price for Prudhoe Bay

Using the formula for 1987, for example, gives the following price estimates:

$\frac{122.0 \times (X - \$0.95) + 324.9 X}{446.9}$	=	10.95
X (Prudhoe Bay Price)	=	11.21
X - $ 0.95 (Kuparuk Price)	=	10.26

Similar estimates are obtained for each other year when Kuparuk was in production.

The amounts reported in Table I-6 and the field prices obtained from the calculations discussed above provide a starting point for determining the final estimate. The per barrel revenue amounts for Arco are widely believed to be greater than for Sohio because a greater portion of Arco's ANS crude is disposed of on the U.S. West Coast and, therefore, avoids the extra cost of the longer marine voyage and trans-Panama shipment.[2] The realizations for Exxon are

[2]See Barclay's de Zoete Wedd (1988), *Petroleum Intelligence Weekly* (Feb. 1, 1988) and Salomon Brothers (1987) for discussions of the differences in dispositions.

also believed to be somewhat greater than for Sohio because Exxon's dispositions occur almost exclusively on the U.S. West Coast. For these reasons, the per barrel data given in Table I-6 probably understate actual realizations. This belief is confirmed by reports by financial analysts such as Salomon Brothers and *Petroleum Intelligence Weekly* who use higher realization prices for Arco's ANS crude.

As a result of all these factors, it appeared that the revenue number needed to be adjusted for the greater proportion of dispositions on the West Coast by producers other than Arco and Sohio. Examination of price differentials for West Coast and Gulf Coast dispositions as well as cost differences suggests that, conservatively, crude oil disposed of on the West Coast should have a value that is approximately $1 per barrel greater on the North Slope than crude oil disposed of elsewhere. Because public data are limited on the precise value of each North Slope company's crude oil, the revenue here is based on the assumption that Arco and Sohio's average disposition prices were as reported in their 10-K's and that other producers obtained an average of $1 more per barrel for their crude. The difference is presumed due to Arco's netback method. The results are more consistent with outside analysts' observations and tie more closely to the State's reported severance tax collections. The Alaska Department of Revenue's report of revenue sources states that severance tax collections totalled $10.2 billion over the period 1969 through 1987. The analysis in this report gives a total severance tax collection of $10.4 billion. The amounts are within a 2.3% margin of error.

Estimates of total revenue for Prudhoe Bay were calculated by using a weighted average price for Prudhoe Bay crude oil. It was assumed that 51% of Prudhoe Bay crude was sold at the price reported by Sohio and 21% at the price calculated for Arco. The remaining 28% of Prudhoe Bay production was

Confidential Pursuant to
APUC Order P-97-4(22)

assumed to have been sold at a price that was $1 per barrel greater than that reported by Arco. This approximates the dispositions indicated in other information sources.[3] Data were available to make these calculations for the years 1980 through 1986. In 1987, Sohio was no longer in existence as a separate entity. Its successor, BP America, did not report weighted average ANS crude prices. Dividing BP America's Alaska revenues by its ANS production gives a substitute estimate. For 1978 and 1979, data limitations required use of Sohio's prices. The 1977 average price was based on the *U.S. Energy Statistics Sourcebook* because other data were not available. Comparing all of the different estimates across time, it does not appear that using different base estimates will have a significant effect on the results.

An alternate method for computing Prudhoe Bay revenue is to take Sohio's price per barrel times total production. This should provide a lower overall estimate since Sohio's price realizations are expected to be lower due to their additional transportation costs.[4] The weighted-average revenue estimate used in this report is 1.19% greater over the eleven-year production history. Given that Sohio's prices are expected to be lower, this lends further support to the assertion that the estimate used in this report is reasonably close, and probably somewhat conservative, relative to the actual revenue realized.[5]

---

[3]It may be possible to derive more accurate estimates of revenue. Examination of public and private data sources indicated in the list of references suggests that the resulting revenue estimates will be somewhat greater than those reported here.

[4]The per barrel prices reported in the 10-K are different from what one would expect given that Sohio's transportation costs downstream of Valdez are higher than the costs for Arco. The reasons for this discrepancy are unknown. The *Sourcebook* data series and the Barclay's data suggest that the per barrel numbers used here are not consistently the highest nor the lowest. Moreover, the different series are usually within a few cents per barrel of each other. At best, it appears that the data are approximately consistent. It is not possible to obtain an exact estimate of these revenues.

[5]Indeed, on a weighted average basis over the life of ANS production, an estimate using Sohio's price alone should be approximately 7% lower than actual realizations.

Kuparuk revenue was based on the calculated Kuparuk price per barrel times the production estimate for Kuparuk. The Kuparuk price was estimated by taking the weighted average Prudhoe Bay price and deducting $0.95 per barrel for the years 1984 through 1987 and deducting $1.50 per barrel for 1982 and 1983. The results conform to the prices reported in such other sources as *Petroleum Intelligence Weekly*, Salomon Brothers and Barclays de Zoete Wedd (1988).

For 1977 through 1987, price data for non-ANS crude was obtained from DeGolyer and MacNaughton's *20th Century Petroleum Statistics* (1988), which is derived from U.S. Department of Energy statistics. The DeGolyer and MacNaughton data report Tier I and Tier II prices, but do not indicate how much crude was sold under either price level. For lack of any available data, it has been assumed that 1/2 was Tier I and 1/2 was Tier II. Prior to 1977, the composite published Alaska prices are directly available from the *U.S. Energy Sourcebook*. Other Alaska crude oil revenue was based on the AOGCC production data times the prices obtained from DeGolyer and MacNaughton for 1978 through 1987 and from the *Sourcebook* for prior years. There does not appear to be a substantial difference between the estimates obtained under other methods not described here.

A summary of the estimated revenues realized for Prudhoe Bay (including Lisburne), Kuparuk (including Milne Point) and all other Alaska crude oil production is provided in Table I-7. These revenue data are net of royalty. In Section III, an adjustment is made to add royalty to these revenues and then to deduct it as an expense.

Table I-7
Crude Oil Revenue Data
(millions of dollars)

Year	*Prudhoe*	*Kuparuk*	*Other Alaska*	*Total*
1987	$5,695	$ 942	$ 232	$6,869

Natural Gas. Natural gas price estimates were available for Arco for the years 1983 through 1987. Sohio presented natural gas price data for 1977 through 1986. These numbers were used to estimate revenues from natural gas on the North Slope for the years when Prudhoe Bay was in production. The numbers are relatively close in amount. A weighted average was used for the years when both Arco and Sohio published these data. The assumption was that the Arco price was attributable to 76% of the production, the Sohio price was attributable to 24%, and the missing data are proportional to these numbers. Separate data were not available for Kuparuk.

Other Alaska gas prices were based on the *U.S. Energy Sourcebook* unit prices and are shown in column 3 of Table I-8. All of the unit price data are given for comparative purposes in Table I-8.

na. Not available.

Multiplying the unit price data from Table I-8 times the production data from Table I-5 gives an estimate of total revenues. The revenue estimates for natural gas are given in Table I-9.

A comparison of Table I-9 with Table I-7 shows that natural gas revenues are not significant in dollar terms for the Alaska North Slope. Hence, the inability to subdivide ANS natural gas revenues between Prudhoe Bay and Kuparuk will not have a meaningful effect on the analysis. By contrast, natural gas revenues are significant for the remainder of Alaska. In some years they account for more than one-half of the reported revenues.

Combining natural gas revenues from Table I-9 with the crude oil revenues reported in Table I-7 yields the total revenue estimates for each major area in Alaska. These estimates are shown in Table I-10. It is these revenue estimates that form the basis for the profit analysis which follows. To obtain profit, it is necessary to deduct expenses incurred to earn the revenues reported in this section. Estimation of these expenses is the next topic in this report.

II. PRODUCTION EXPENSES

Production expenses fall into nine major categories: depreciation, severance taxes, operating expenses, windfall profit taxes, exploration costs, overhead, interest, state and federal income taxes. Federal income taxes, severance taxes and depreciation are larger in amount relative to the other expenses. Overhead, interest and state income taxes are relatively low. The ability to estimate each of these cost categories accurately varies. The most difficult to estimate are overhead and interest. Fortunately, these are relatively small in amount. Severance taxes and depreciation are relatively easy to estimate. Federal income tax estimates depend on several assumptions. The effect of the assumptions on reported profit is tested later in this technical discussion.

Each of the expense categories and the method of determining the expense is discussed in this section.

DEPRECIATION

Depreciation represents a pro rata share of the initial cost of the investment in drilling, lease acquisition, production facilities and other similar costs over the periods or products that benefit from those investments. Depreciation expense also includes a provision for future dismantlement of the facilities and for restoration of the affected sites. Unlike most other expenses, depreciation does not require a current outlay of cash; it is a current accounting for a prior or an anticipated outlay.

There were three company sources for estimates of depreciation on the Alaska North Slope: (1) BP America's 1987 annual report, (2) Sohio's annual reports from 1977 to 1986, and (3) Arco's 10-K's. In addition, the public data reported here were compared to Alaska property tax information. The results

suggest that use of private data would tend to support the findings reported here. The data and the limitations of the data from each source is addressed in turn.

In its 1987 Annual Report, BP America provided an estimate of its 1986 and 1987 Alaska depreciation which, when divided by its Alaska production, gave a per barrel depreciation amount. However, when BP purchased the outstanding shares of Sohio, it paid a premium over the book value of the assets of Sohio. BP added this premium to its asset base and depreciated this premium along with the cost of the assets. As a result, BP America's Alaska depreciation reflects not only a portion of the costs actually incurred in Alaska, but an additional amount which reflects payments to Sohio shareholders. This latter amount was not part of the cost to acquire oil producing facilities in Alaska. Rather, it reflects BP's purchase of shares from Sohio stockholders. The amortization of this cost is not a cost of operating BP America's Alaska properties, but rather is a transfer payment.[6] As a result, BP America's depreciation numbers overstate amortization of the costs incurred in Alaska and would understate profit.

In its annual reports for 1981 to 1986, Sohio provided a per barrel total production cost amount with and without depreciation. Subtracting the reported production costs without depreciation from production costs with depreciation yields the depreciation per barrel for Alaska production.

Certain of Arco's 10-K reports stated its depreciation charge for Alaska production activities as a total dollar amount. Dividing these amounts by each year's Alaska production volumes gave an estimate of Arco's per barrel Alaska depreciation. This is referred to below as the Arco production-based estimate.

---

[6]See Barclay's de Zoete Wedd 1988 report on British Petroleum, p. 4, for the reasons why BP was willing to pay a premium for the remaining outstanding shares of Sohio.

Arco's 10-K also gave its Alaska producing property plant and equipment. When these amounts were divided by Arco's proved reserves each year, an alternate estimate of per barrel depreciation was obtained. This is referred to as Arco's reserve-based estimate. These are composite estimates for all Alaska production, so that adjustments are necessary to obtain estimates for crude oil for each significant field. The alternate estimates are given in Table II-1.

Table II-1
Unit Depreciation Data
($ per equivalent barrel)

			Arco	
Year	*BP America*	*Sohio*	*Production*	*Reserves*
1987	$ 2.83		$ 2.21	2.49
1986	2.26	$ 2.15	2.56	2.62
1985		1.51	2.47	2.47
1984		1.34	1.65	2.17
1983		1.14	1.81	1.92
1982		1.11	1.56	1.73
1981		1.07	1.30	1.23
1980		1.05		.96
1979		.90		
1978		.84		

These depreciation numbers reflect a weighted average of both Kuparuk and Prudhoe Bay. It is generally recognized that Prudhoe Bay depreciation is lower than Kuparuk. For example, Barclay's de Zoete Wedd (1988) reported Prudhoe Bay depreciation in 1987 at $2.00 per barrel and Kuparuk at $3.80. If Barclay's estimates are correct, and assuming that Arco's depreciation is approximately equal to Sohio's, Arco's 1987 weighted average depreciation per barrel should equal:

$$\frac{\$3.80 \times 122 + \$2.00 \times 340}{122 + 340} = \$2.475$$

where 122 and 340 represent Arco's daily average production from Kuparuk and Prudhoe Bay (plus Lisburne) fields as shown in Table I-1, above. Based on this calculation, $2.475 should be the weighted average per barrel depreciation shown in Arco's annual reports. However, Table II-1 suggests that Arco's

weighted average depreciation is about $2.21 to $2.49. Averaging these two estimates gives $2.35, which is probably the best estimate of Arco's North Slope production depreciation available from Arco's financial statements.[7] This suggests that the $3.80/$2.00 estimates of depreciation for each field are too high.[8]

Given that Sohio's weighted average depreciation number for 1986 was $2.15 and that was an average of the lower-depreciation Prudhoe Bay and the higher-depreciation Kuparuk, it is likely that Arco's 1986 Prudhoe Bay depreciation was no more than $2.15 per barrel. This amount is slightly higher than the Barclay's estimate. Presumably, Sohio's depreciation for Prudhoe Bay alone would be lower than $2.15, so the basis used here could result in an understatement of profit. Assuming Prudhoe Bay depreciation is $2.15 per barrel, then we can solve for Kuparuk using the equation:

$$462 \times \$2.35 = 122\ X + 340 \times \$2.15$$

$$X = \underline{\$2.91}$$

This equation states that Arco's weighted average depreciation per barrel ($2.35) should equal the Kuparuk production times the unknown depreciation for Kuparuk plus the estimated $2.15 per barrel depreciation for Prudhoe Bay. The result suggests a $2.91 per barrel depreciation estimate for Kuparuk.

If Kuparuk depreciation is $2.91 per barrel, then Prudhoe Bay depreciation per barrel for the years when Kuparuk and Prudhoe Bay were both in production is as given in Table II-2, below. The numbers in Table II-2 should be compared

---

[7]Salomon Brother's financial analysis of Arco's operations states that Arco's Alaska depreciation is lower than Sohio's. This is the opposite of the data from the financial statements. Public data are not available which would enable us to resolve this disparity. The data in this report are based on the higher estimate from the 10-K's, even though this may overstate depreciation and understate profit.

[8]Salomon Brothers Inc. reported an estimate of $1.60 per barrel 1985 depreciation for Prudhoe Bay and $1.75 for 1987. They reported 1985 Kuparuk depreciation at $3.75 per barrel and 1986 at $3.55 This confirms the suggestion that Barclay's Prudhoe Bay depreciation is too high. The effects of alternate depreciation estimates on the reported profit for each field are discussed in Section III.

with other sources. For example, *Petroleum Intelligence Weekly* estimated Prudhoe Bay depreciation at $2.25 in 1987, $2.17 in 1986 and $1.53 in 1985. Salomon Brothers estimated Arco's Prudhoe Bay depreciation at $1.80 in 1987, $1.75 in 1986 and $1.60 in 1985.

Table II-2
Estimated Prudhoe Bay Depreciation
($ per barrel)

Year	*Amount*
1987	$ 2.15
1986	2.25
1985	1.75
1984	1.44
1983	1.29
1982	1.19
1981	1.05
1980	.98
1979	.78
1978	.73
1977	.38

These data are higher than Sohio's reported weighted average depreciation charges, but appear more reasonable than the Barclay's numbers. The numbers are lower than Arco's weighted average, which is consistent with expectations. Moreover, they are higher than the Salomon Brothers numbers. In brief, depreciation based on these numbers is a "middle-of-the-road" approximation.

Since depreciation expense for each field was computed using a weighted average based on working interest production from each field, total depreciation for both fields taken together will be approximately the same. That is, Prudhoe Bay might be assigned too much depreciation as a result of this process, but that will be offset by lower depreciation charges to Kuparuk. The "bottom-line" effect of this is discussed in Section III.

Prior to the start of Kuparuk production, depreciation estimation is simplified. For each of the years 1978 through 1981, a weighted average of the reported per-barrel depreciation numbers for Arco and Sohio was used. There was one

estimate of Sohio's depreciation each year. There were three Arco estimates in 1981, two in 1980, and one for each of 1978 and 1979. It was assumed that Sohio's depreciation number was applicable to 72% of field production and Arco's to 28%. This ratio reflects Sohio's 53% of overall production to the total production for which depreciation data are available (53% Sohio; 21% Arco). It is assumed that the missing data equals a weighted average of the available data.

For 1977, the only depreciation estimate was that based on Arco's production. Lacking any alternate estimate, it was used for that year. Since production in that year was relatively low, it is unlikely that changing the estimate by a reasonable amount will have a substantial effect on the results.

Per-barrel depreciation estimates for Prudhoe Bay are reported in Table II-2, above. Kuparuk depreciation is estimated at $2.91 per barrel. Although this estimate of Kuparuk depreciation is lower than that reported by some of the financial analysts discussed above, Barclay's reports that Kuparuk had an original estimated 1.9 billion barrels of recoverable crude oil. Given estimated investment in Kuparuk of $4.3 billion a depreciation charge of $2.28 per barrel (i.e. $4.3 billion/1.9 billion) is indicated. The $2.91 per barrel estimate may result in understatement of Kuparuk profit.

Total depreciation for each field is the product of crude oil production times the per-barrel amount. For non-ANS production, gas is converted to equivalent barrels using the standard 6 mcf of gas = 1 bbl. crude oil energy content ratio. It was assumed that non-ANS depreciation per barrel was 1/3 of ANS per-barrel depreciation. Use of this assumption yields total depreciation amounts that are relatively close to what one would expect given non-ANS investment and production levels. Total depreciation amounts for each year are presented in

SEVERANCE TAXES

Severance taxes are levied on the gross value of production which accrues to producers (i.e., working interest production). In Alaska, prior to 1981 severance taxes were 12.25% of production. Subsequent to 1981, the amount was revised to 15% of production (except that it remained 12.25% for the first five years of a field's commercial production). An economic limit factor is applied to production from each field which causes the actual severance tax to be lower than the statutory rate. The 1981 Legislation suspended the application of the economic limit factor at Prudhoe Bay until mid-1987. Prior to 1981, it was estimated that the severance tax on Prudhoe Bay production averaged approximately 11%. From 1982 to mid-1987, the Prudhoe Bay severance tax was estimated at 15%. From the middle of 1987 on, the Prudhoe Bay severance

tax was estimated at 12.25%.[9] Severance taxes on Kuparuk production have been estimated to range between an effective rate of 8% and 9%. A 9% rate was used for this study for Kuparuk. Recent severance tax returns suggest that by 1987 the economic limit factor reduced severance taxes on non-ANS Alaska production to close to zero. The effect of changes in the non-ANS depreciation amounts does not have a meaningful impact on reported profit.

To determine profit from oil producing activities, it is necessary to deduct severance taxes from revenues. Severance taxes are not reported separately for Alaska production in the annual reports of the producers. Therefore, the effective severance tax rates were applied to revenues reported here to obtain estimated severance tax expense for 1977 through 1987 for each field. For prior years, Alaska Department of Revenue reported collections were used as the severance tax expense. This amount corresponds closely to the expense that would be estimated if the statutory rate were applied to the production values.

The Alaska Department of Revenue reports severance tax collections from oil production in Alaska. Over time, severance tax expense as deducted to compute profit should tend to equal severance tax collections by the state. There is one significant wrinkle in this comparison. In 1975, the State levied a reserves tax which was allowed as a later credit against severance tax due later. The amount of the reserves tax was $493.7 million. This tax was considered a credit against severance tax payments due. Thus, when comparing severance tax collections to recorded expense, it is necessary to include this $493.7 million as a collection.

The estimated severance taxes for Prudhoe Bay, Kuparuk, non-ANS, and the total expense are summarized in Table II-4. These amounts are compared to

[9]Effective severance tax rates are based on *Petroleum Intelligence Weekly* (February 1, 1988).

Confidential Pursuant to
APUC Order P-97-4(22)

severance tax collections, including the reserves tax, as reported by the Department of Revenue. The results of the comparison indicate that the estimates are quite close to collections as they should be over time.[10]

* Reflects differences due to reserves tax included in 1976 and 1977 collections but credited against later liabilities.

#Alaska revenue data are reported on a fiscal year basis. Company expense data are reported on a calendar year basis. This difference can affect some of the comparisons.

It is likely that some of non-ANS production during 1977 through 1987 incurred a severance tax liability. However, the amounts are too low to affect the analysis. Total severance tax expense reported in the analysis of profit is $10,441 million. Total actual tax collections amount to $10,206 million. The difference is 2.3%. It is possible that this difference is due to overstatement of effective severance tax rates or the delay between the time when severance

[10]Expense should exceed collections because collections are reported when received by the Alaska Department of Revenue and expenses are reported when the related production occurs.

Confidential Pursuant to
APUC Order P-97-4(22)

taxes are due and when they are collected. The difference may also be due to the revenue estimates used. In any event, it is unlikely that the differences will have a significant effect on the results of the analysis.

OPERATING EXPENSES

Operating expenses are those costs which are necessary to continue production from an oil or gas field. They include well workover costs, fuel, maintenance and similar items. Information on these costs for the years 1980 to 1986 is available in the corporate annual reports of Sohio. Financial analyst reports include estimates of operating expenses as determined through meetings with company officials as well as based on their evaluation of operating costs.

For this report, operating expenses reported by Sohio were analyzed first. Sohio reports operating expenses combined with production taxes, windfall profit taxes and its net profits interest payments to BP America. It was necessary to separate production and windfall profit taxes from Sohio's reported data since these taxes are reported on another line in this income statement. The net profits interest payments to BP America would be an expense to Sohio, but a revenue item to BP America. This is a transfer payment between two field owners. The transfer payment needs to be cancelled when estimating income for the total project.

Net profits interest payments were reported in the notes to Sohio's financial statements. Severance taxes were estimated using the effective severance tax rates times the reported revenues. Windfall profit taxes were reported on a per-barrel basis in Arco's annual reports. These estimates were used to obtain an estimate of Sohio's windfall profit taxes. As described below, the resulting estimated windfall profit tax expense was lower than the reported windfall profit

tax collections by the U.S. Internal Revenue Service. As a result, the estimates of operating expenses may be higher than actual.

Table II-5 summarizes Sohio's reported production expenses, the computed estimates of severance and windfall profit taxes and the net profits interest payments to BP. The last column of Table II-5 is estimated operating expenses for the ANS based on the Sohio data.

Table II-5
Sohio's Operating Expenses
(millions of dollars)

Year	*Production Costs*	*Severance and Windfall Profit Taxes*	*Net Profits Interest*	*Operating Expenses*
1986	$ 727	$ 271	$ 44	$ 412
1985	1,216	680	108	428
1984	1,113	649	36	428
1983	1,021	699	0	322
1982	1,685	1,199	92	394
1981	2,550	2,030	153	367
1980	1,181	862	145	174

The resulting operating expenses were analyzed to see if they were mathematically related to revenues or production. It appeared that the operating expenses were not related to revenues and were only weakly related to production levels. Regression analysis, a statistical technique used to compare two sets of data (such as operating expenses and revenues), found no relationship between the numbers. This leads to the suggestion that these expenses are fixed costs. Further study of the expenses showed that they increased when the Prudhoe Bay waterflood project was installed and when the gas reinjection recovery program was installed. This further supports the suggestion that these costs are fixed with respect to annual production and revenues.

The best available overall estimate of production costs, then, is based on the relationship of Sohio's interest in Prudhoe Bay field. Thus, total ANS operating

expenses are estimated as equal to Sohio's operating expenses divided by Sohio's interest in Prudhoe Bay field. These expenses were subdivided between Prudhoe Bay and Kuparuk based on relative revenues from each field. Admittedly, this may misstate the precise relationship since operating expenses are not a function of annual revenues. However, there are no other direct operating expense data sources available publicly from the companies. The results of the calculations used for this estimate are presented in Table II-6.

Totals	**$5,820**	**$ 837**	**$7,038**

Production costs for 1987 and for 1977 through 1979 were estimated based on an approximate relationship between revenues and these costs. Given the lack of other company data on these costs, reliance on revenues is one way available to approximate the operating expenses for the missing years.[11] There is a significant increase in the estimated operating expenses between 1980 and

[11] Although production costs are not related to revenues mathematically, there are relatively few options available for estimating costs attributable to each field. Since production costs are low relative to revenues, it is probable that the effect on reported profit is minor.

RTSXMB 519730

APUC Order P-97-4(22)

1981. This is probably due to the differences in windfall profit taxes included in the Arco data used to derive the windfall profit tax number and the Sohio data used as a basis for operating costs before deducting windfall profit taxes. As noted in the section on windfall profit taxes, Arco-based windfall profit tax numbers result in an expense that is lower than when using the I.R.S. collection data. It is possible that the use of Arco windfall profit tax numbers in the operating cost computation overstates operating costs with a resulting understatement of profit.

Other analysts such as *Petroleum Intelligence Weekly* and Salomon Brothers estimate that operating costs amount to an average of $1 per barrel of ANS crude oil production. *International Petroleum Finance* estimates operating costs at $.91 per barrel. The results here average $1.08 per barrel. Therefore, even though the expense number is calculated based on a number of assumptions, the outcome of the calculations follows closely, and conservatively, the costs indicated by other observers.

For 1984 to 1986, the operating costs per barrel for the Prudhoe Bay field should be greater than in prior years due to installation of the waterflood program. Since the method used here is based on a combined operating cost for Prudhoe Bay and for Kuparuk, it is probable that the costs for Kuparuk are somewhat overstated during 1984 to 1986 and the costs for Prudhoe Bay are understated by a like amount. The results could be a shifting of profit from Kuparuk to Prudhoe Bay in the amount of up to $100 million over the six-year period of Kuparuk operations. It does not appear that this is a significant amount relative to the profit for each field.

Production costs also include property taxes. Company data do not show the property taxes in Alaska separate from other production costs. Therefore, it is necessary to use alternate sources. Barclay's estimated Prudhoe Bay property

taxes at $.50 per barrel and Kuparuk at $.30. Non-ANS was estimated at $.25. The results were compared to Department of Revenue data and are comparable.

Production costs, net of property taxes, are obtained by deducting the property tax collections from the production costs reported in Table II6. Table II-7 shows the Alaska and municipal property taxes for the areas covered in this report. Table II-8 gives the production expenses net of property taxes.

WINDFALL PROFIT TAXES

The Crude Oil Windfall Profit Tax Act of 1980 levied a tax on the "windfall profit from a barrel of crude oil." The windfall profit was defined as the difference between the base price (essentially the price before oil price decontrol) and the selling price. The tax was in effect until 1988 although crude oil price declines rendered the effective amount of the tax at zero for years after 1985. In addition, ANS fields outside the Sadlerochit reservoir were exempt from the tax.

There are two primary sources of data concerning the windfall profit tax on Alaska crude oil production. The first is Arco's reported windfall profit tax per barrel of Alaska crude oil production. The second is the U.S. Internal Revenue Service *Statistics of Income Bulletin* which reported the aggregate windfall profit tax collections on ANS crude oil as a separate line item. Arco's per barrel windfall profit tax statistics are reproduced in Table II-9.

Table II-9
Windfall Profit Tax per Barrel
Arco Annual Report Data
($ per barrel)

Year	*Amount*
1985	$ .05
1984	.11
1983	.42
1982	1.59
1981	4.80
1980	2.03

To obtain the total windfall profit tax attributable to Prudhoe Bay, the Arco per barrel numbers were multiplied by field production. In addition, the Arco per barrel numbers were multiplied by the ratio of the all-company average field price to the Arco reported field price. This latter adjustment is designed to reflect the fact that other producers sold their ANS crude for a price that was different than that reported by Arco.[12]

Estimates of non-ANS crude windfall profit taxes were constructed by estimating the windfall profit on this crude and multiplying by a composite windfall profit tax rate. It was assumed that 1/2 of the crude was taxed at the 70% rate for old oil and 1/2 was taxed at a 30% rate. The base price was estimated as equal to the 1979 Cook Inlet price reported by DeGolyer and MacNaughton, adjusted for inflation for 1980 through 1985. The per barrel numbers obtained by this method were as follows in Table II-10:

Table II-10
Non-ANS Windfall Profit Tax
($ per barrel)

1985	$ 0.00
1984	1.42
1983	2.58
1982	5.46
1981	9.42
1980	1.91

[12]See Production Revenue section for further detail on this issue.

These per barrel amounts were multiplied by reported non-ANS production from column 1 of Table I-4 to obtain total windfall profit taxes for other Alaska production.

Estimated windfall profit taxes for Prudhoe Bay field and for all of Alaska are reproduced in column 1 of Table II-11. The computed amounts were compared to the reported collections from the *Statistics of Income Bulletins* shown in column 2 of Table II-11.

Table II-11
Windfall Profit Tax Expense
(millions of dollars)

Year	*Estimated for Prudhoe Bay*	*U.S. Internal Revenue Service ANS Collections*	*All Alaska*
1985	$ 26	$ 39	$ 39
1984	57	211	235
1983	215	426	475
1982	827	1,375	1,491
1981	2,487	3,089	3,314
1980	1,006	797	861
Totals	**$4,618**	**$5,937**	**$6,415**

Table II-11 shows that the U.S. Internal Revenue Service reported higher ANS windfall profit tax collections than those obtained using the Arco data adjusted for estimated price differences among the producers. The possibilities for these discrepancies are two-fold. First, the Arco-based revenue estimates may be too low as noted in the section on Production Revenue. Second, Arco may have had available to it adjustments to the windfall profit tax arising from the net income limitation provisions of the tax act. This part of the Act stated that windfall profit should not exceed 90% of the net income per barrel based on statutory computational rules. The net income limitation provision would not have been captured in the Internal Revenue Service data.

Column 3 of Table II-11 is the sum of the U.S. Internal Revenue Service reported ANS windfall profit tax collections plus the windfall profit taxes estimated for non-ANS production.

The difference between the two data sources is $1.3 billion. In the interest of providing a more conservative estimate of profit from Alaska oil operations, the higher figures of the Internal Revenue Service are used as the basis for Alaska windfall profit taxes.

EXPLORATION EXPENSES

Exploration expenses represent the costs incurred in finding new oil and gas deposits as well as certain costs incurred in defining an existing deposit. Data were not available to assign exploration costs to specific fields during this period. Moreover, there are few data series which overlap, so comparisons across estimates are not possible.

The U.S. Bureau of the Census provides data on Alaska oil industry exploration expenditures for 1978 to 1982 through its *Current Industrial Surveys.* The American Petroleum Institute *Joint Association Survey* provided the 1984 estimate of exploration expenditures. Both of these sources separated offshore expenditures from onshore. Presumably, the offshore expenditures were in Federal waters. These are the best sources of exploration expenditure data available, but they only were available for the years indicated.

For years prior to 1978, it was estimated that exploration expenditures totalled $25 million per year. This amount was compared to exploration drilling data obtained from the Alaska Oil and Gas Conservation Commission. The AOGCC provides numbers of wells drilled. The estimated exploration expenditures in 1969 to 1977 provided here would have financed the levels of drilling indicated by the AOGCC.

APUC Order P-97-4(22)

T-33000167

For 1983 and for 1985 to 1986 it was assumed that exploration costs equalled double the amount that Sohio reported as Alaska exploration expenses. It was assumed that 1987 exploration equaled 1986, although this is a conservative estimate. Comparing the amounts provided to the AOGCC drilling statistics indicates that these amounts would have easily financed the exploration activities reported by the AOGCC. Table II-12 shows the estimates of exploration expenses included in determining Alaska oil industry profit.

OVERHEAD AND INTEREST EXPENSES

Overhead expenses are those that by their very nature cannot be traced directly to a particular activity. These costs are common to all activities in the company. The generally accepted accounting procedure is to allocate these costs to each activity that benefits from the cost on some basis that reflects either benefits received or cause-and-effect.[13] Frequently, as here, allocations are made in more than one step. Here, the first step is to allocate company overhead to Alaska operations. The second step is to allocate overhead to each field in Alaska.

[13]See, for example, E. Deakin and M. Maher, *Cost Accounting 2nd. ed.* (1987), pp. 96 - 101. This topic has been addressed in detail by the former U.S. Cost Accounting Standards Board. The Cost Accounting Standards Board methodology is followed as closely as possible based on available data.

Sohio is the only producing company operating in Alaska from which sufficient data were available to make an allocation of overhead to Alaska activities based on assets and on revenues. In its corporate annual reports, Sohio presents segment information which, among other things, states Sohio's "Corporate and other" expenses. This line item was used as a proxy for the overhead cost.

To allocate this overhead, a two-factor formula was used. The two factors are value of crude production in Alaska to all company sales, and oil and gas property in Alaska to all Sohio property plant and equipment other than property plant and equipment related to the company's "corporate and other" activities.

Sohio data were available for 1977 through 1986. In 1987, BP America succeeded Sohio as a result of BP's buyout of the minority interest in Sohio. This purchase was accounted for by adding the extra funds paid to Sohio shareholders in excess of the book value of the assets received being attributed to the book values of the Sohio assets acquired. In effect, BP increased the accounting-based cost of its Alaska assets by a proportional amount of its payment to Sohio shareholders. This payment did not increase the actual costs expended in Alaska. Rather, it represented a transfer from BP to the former Sohio shareholders. As a result, the 1987 data necessary to perform the allocation would be affected by the amount of this transfer payment. Since this payment would result in attributing costs disproportionately to the actual costs incurred in Alaska, 1987 overhead was estimated by taking 1986 overhead and adding 4.5% for inflation.

A third factor commonly used in these formulas is payroll. These data are not publicly available. If the payroll data were available, the resulting allocation would be lower than that reported here because Sohio has proportionately fewer

Confidential Pursuant to
APUC Order P-97-4(22)

employees in Alaska than the average of its assets and sales. The allocation method here used the value of Alaska production relative to total company sales. This ratio includes sales that have not been made to third parties. If third-party sales only were included, the allocation of overhead to Alaska operations would be lower than that reported here.

The result of this calculation is the first step in the allocation of Sohio overhead to all Alaska operations. Dividing the resulting allocation by Sohio's proportionate share in the Prudhoe Bay field yields an estimate of the total overhead attributable to Alaska by all producers. This is based on the assumption that other producers have a similar overhead structure to Sohio's and that the Prudhoe Bay ratio is a reasonable basis for estimating overall overhead. More complex allocations which include estimates of Kuparuk production have insignificant effects on the reported allocation.

To allocate to Prudhoe Bay and Kuparuk, overhead allocated to Alaska was subdivided in proportion to the revenues reported for Prudhoe Bay and Kuparuk. The original data used for the allocations and the results are give in Table II-13.

Table II-13
Overhead Allocations
(millions of dollars)

Totals				**$ 681**	**$ 94**	**$ 830**

Confidential Pursuant to
APUC Order P-97-4(22)

This allocation assumes that overhead is proportional between Kuparuk and Prudhoe Bay. Such an assumption would usually be consistent with general accounting practices.

For lack of any data on the subject it was assumed that overhead for non-ANS activities was proportional to the revenues for those activities.[14] To obtain total overhead attributable to Alaska, the Prudhoe Bay and Kuparuk overhead were increased proportionately by the ratio of total Alaska production revenues to Prudhoe Bay and Kuparuk revenues. For years prior to 1977, overhead was estimated as a percentage of revenues based on the revenue percentage over the years 1977 through 1987. Overhead in each of the years prior to 1977 averaged less than $150,000.

Although these allocations are subjective and complex, they suggest that the overhead amounts are not so highly significant as to have a material effect on estimated profit. Aggregate overhead over the period of ANS production is estimated at $830 million. This is on the order of 2% of total profit. Even major changes in this number will have a minor effect on total profit.

To test one aspect of a source of variation in the overhead allocations, a composite estimate based on Arco's reported corporate and other expense using a two-factor formula was calculated. For most of the period at issue, Arco did not report its Alaska assets separately in its annual reports. These data were obtained from its SEC Form 10-K, Schedule VI.[15] Arco's total assets were obtained from its annual report segment disclosures. Total revenues were

---

[14]Non-ANS overhead accounts for approximately 10% of the total overhead reported here. Similarly, non-ANS production is a small portion of total production in Alaska. In addition, as noted for the ANS, overhead is a small portion of overall costs and revenues. The effect of misstatements of the overhead will not have a significant impact on this analysis.

[15]In 1980 and 1981, Arco reported Alaska producing property plant and equipment in its annual report. The amounts were $1,087.7 million and $1,451.1 million respectively. The company reported Alaska property in its 10-K schedule for the same years as $1,789.2 million and $2,273.5 million respectively. The differences are substantial which suggests that the two series may not be comparable.

obtained from the annual report, but Alaska revenues had to be estimated by multiplying reported per barrel prices by reported Alaska production. Assuming that Arco accounted for 21% of Alaska activities and Sohio 51%, weighting the two overhead estimates gave a composite amount of $1,233 million over the period 1977 - 1987.

A second test of overhead variation is to construct an estimate using a payroll factor in the allocation formula. If Alaska payroll is assumed equal to 5% of each company's payroll, estimated overhead attributable to Alaska is $357 million over the period 1977 through 1987. The overhead amount included in the reported profit estimate is midway between these two numbers. Over the same period, the overhead estimate in this report averages 16.1¢ per barrel.

Interest expense was handled in a similar manner. Again, interest costs were based on data from Sohio's corporate annual reports because that was the only readily available source.[16]

Net interest expense for Sohio was reported in Sohio's segment disclosures in its annual reports or on the face of its income statements for 1977 through 1986. Since interest costs are related to the investment in assets rather than to sales, allocations of interest to Alaska were based on the ratio of property plant and equipment in Alaska to total company property plant and equipment. The result of this apportionment was the estimated interest expense attributable to Alaska.

The second step of the interest allocation required producing an estimate of interest attributable to Alaska by all producers. This was based on dividing

[16]Arco reports some of the data required for this calculation, but the data are reported in different places which may not be consistent as noted in the overhead allocation discussion. It appears that Arco and Exxon experienced a lower overall rate of interest than Sohio. Therefore, Arco's and Exxon's interest costs should be lower than Sohio's. The amounts involved are small relative to the total reported income.

Sohio's assumed Alaska interest expense by its proportional interest in the Prudhoe Bay field. As with the overhead allocation, the results were not particularly sensitive to further refinement. The estimated total Alaska interest expense was subdivided between properties based on depreciation expense. This is more appropriate than sales because depreciation is considered more closely related to assets than to sales. Sohio's total company interest and assets and the resulting estimated interest allocations to the Kuparuk and Prudhoe Bay fields are given in Table II-14.

Table II-14
Interest Allocations
(millions of dollars)

	—Sohio Data—		*——Allocated to——*		
Year	*Net Interest*	*Assets*	*Prudhoe*	*Kuparuk*	*Total*
1987			$ 146	$ 32	$ 192
1986	$ 242	$14,006	139	32	183
1985	299	16,468	141	33	183
1984	242	16,421	119	20	148
1983	254	15,181	119	21	150
1982	300	14,347	139	20	171
1981	46	13,096	17		18
1980	22	8,306	10		11
1979	357	7,927	156		167
1978	458	8,107	203		247
1977	246	7,578	117		177
Totals			**$ 1,306**	**$ 159**	**$ 1,675**

The "net interest" column is Sohio's total corporate interest expense net of interest income. The "assets" column is Sohio's total assets less those designated as assets devoted to "corporate" (i.e., overhead) activities. Sohio's portion of net interest expense was allocated to Alaska based on the formula apportionment. The result was "factored up" to reflect an approximation of the total interest expense incurred by all Alaska producers.

For years prior to 1977, average estimated interest expense allocable to Alaska was less than $200,000 per year.

APUC Order P-97-4(22)

STATE INCOME TAXES

The State of Alaska levies an income tax on the income derived from oil and gas production operations in the State. During the 1977 - 1981 period, this tax was based on a direct measure of the income earned in the state. The statutory tax rate was 9.4% until 1981 when it rose to 11% for that year. Subsequent to 1981, the tax was levied using an indirect method referred to as modified formula apportionment. The latter tax is based not on a direct computation of the revenues accrued less expenses attributable to Alaska, but rather is based on a measure of the proportion of certain Alaska activities to overall company activities. The computed proportion is multiplied by overall company income to derive an estimate of income attributable to Alaska. *Petroleum Intelligence Weekly* suggests that the effective tax rate under this methodology is approximately 3%. As shown in Table II-15, a comparison of tax expense computed at the 3% rate is reasonably close to tax collections.

Individual company data on the Alaska income tax liability is not publicly available. The estimate of Alaska income tax is obtained by multiplying computed Alaska income by the effective tax rates for the periods at issue. The results are reported in Table II-15.

Prior to 1977			150	150
Totals	**$2,479**	**$ 60**	**$ 2,741**	**3,461**

*Alaska revenue data are reported on a fiscal year basis. Company expense data are reported on a calendar year basis. This difference can affect some of the comparisons. The collections include TAPS income taxes which are estimated to total $900 million.

The estimates differ from collections in part because of differences in the timing of when receipts are received by the State and when the expenses are reported on the income statements. Over the period 1969 through 1987, reported collections totalled $3.5 billion. The income statements here indicate total expenses of $3.6 billion, including the $.9 billion for TAPS. The differences are within a 5% margin of error.

FEDERAL INCOME TAXES

The U.S. government levies taxes on corporate income at statutory rates that ranged from 34% to 48% over the period 1969 through 1987. Under Federal rules, taxable income is net of state income taxes. Certain credits and deductions are allowed in the Federal taxing scheme which reduce the effective tax rates. It has been estimated that during the 1969 through 1980 period, the effective tax rates for oil companies averaged on the order of 29% (*Oil and Gas Journal*, (September 16, 1985), p. 76). This estimate was used for the 1969 to 1976 period.

Confidential Pursuant to
APUC Order P-97-4(22)

For Alaska oil income after the start-up of Prudhoe Bay, this estimated Federal rate is unlikely to reflect actual Federal taxes. The taxes currently payable divided by estimated taxable income gives a number referred to as the effective tax rate. One important factor which results in a difference between statutory rates and effective rates is the Federal tax rules designed to provide an incentive to new investment like TAPS and tangible equipment on the North Slope. For example, an investment tax credit equal to 10% of the cost of tangible equipment was in effect during most of this period. This credit would serve to reduce Federal taxable income. That the effective tax rates were lower for Alaska producers may be seen by examining effective tax rates for these producers during the 1977 through 1986 period.

Effective tax rates for the major ANS producers were obtained from their corporate annual reports. The effective rate is the current Federal tax payments divided by reported net income. This information, as available, is reproduced in Table II-16.

Table II-16
Effective Federal Tax Rates

Year	*Arco*	*Sohio*	*Exxon*
1986	-55.49	-52.44	na
1985	40.94	41.53	23.18
1984	33.22	26.56	29.16
1983	19.68	31.60	33.81
1982	17.08	39.06	25.38
1981	16.23	36.41	23.93
1980	16.16	39.37	33.35
1979	12.30	11.22	35.29
1978	6.34	1.34	38.28
1977	na	10.19	na

It is widely presumed that Sohio's financial data was driven almost exclusively by its Alaska operations.[17] For this reason, Sohio's effective tax rates would tend to reflect the actual tax liability for Alaska oil operations during

[17] A review of Sohio's corporate annual reports from 1978 through 1986 indicate that over 90% of its profit arose from its Alaska activities.

the 1977 - 1986 period. Many oil companies, including the ANS producers, wrote-off substantial amounts from losing operations. The significant write-offs taken in 1986 resulted in negative Federal taxes for Alaska oil producers who accounted for most Alaska activities. Therefore, a zero effective Federal rate was used in 1986.

Although financial accounting standards for a company require that recognition be given currently to the possibility that some income tax benefits may need to be paid back to the government in the future, it appears from a review of the effective tax rates in Table II-16 that in this industry, the payback period continues to be deferred indefinitely. Use of current effective tax rates for the purposes of this study reflects better the economic consequences to the company of these investments than the use of statutory rates. In future years as tax benefits decline, these producers may be required to pay taxes in excess of the statutory rate.

With the merger of Sohio into BP, the assumption that Sohio's activities reflect Alaska closely would no longer hold. In addition, beginning in 1987, the tax law reduced many of the incentives for new investment. As a result, actual taxes are probably closer to the statutory rate. Therefore, the 34% statutory rate was used for 1987.

The Federal income tax expense used to estimate Alaska oil production income is reproduced in Table II-17.

These data were obtained by multiplying revenues from Table I-10 less expenses (covered in Tables II-3 (depreciation), II4 (severance taxes), II-6 (operating expenses), II-11 (windfall profit tax), II-12 (exploration expenses), II-13 (allocated overhead), II-14 (allocated interest), and II-15 (state income taxes)) by the related effective tax rates.

Confidential Pursuant to
APUC Order P-97-4(22)

Over the entire period 1969 through 1987, Federal income taxes as shown in this report are 32.0% of estimated taxable income. This is higher than the 29% effective rates in the *Oil and Gas Journal* study. The net effect is that the estimates in this report are conservative and may tend to understate actual income.

Table II-17

III. PRODUCTION PROFIT

The result of all of the calculations in Sections I and II is to generate a statement which indicates the profit earned from oil and gas production in Alaska. This part of the report is divided into three parts: (1) profit for Prudhoe Bay, (2) Kuparuk and (3) all production in Alaska.

Table III-1
Profit from Prudhoe Bay Production
(millions of dollars)

1983 - 1987:

	1987	*1986*	*1985*	*1984*	*1983*

APUC Order P-97-4(22)

Total profit over the eleven year production history of the Prudhoe Bay field are estimated as shown in Table III-2. The profit statements in Table III-1 are based on the producers' interest in the production. This is standard accounting practice, but the methodology excludes royalty interests which are important for the State of Alaska. Royalty interests have been estimated as equal to 1/7 of the producers' working interest less a gathering charge of $.63 per barrel. The state royalty is added to the producers' revenue to obtain revenues before royalty as shown in Table III-2.

Table III-2
Total Prudhoe Bay Production Profit
1977 through 1987
(billions of dollars)

Production Revenue	$ 83.5
Less Expenses:

a. Less than $1 million

RTSXMB 519752

Confidential Pursuant to
APUC Order P-97-4(22)

Total industry profit from production for the years 1969 through 1987 are shown in Table III-6, below. State royalty was computed in the same manner as for the Prudhoe Bay field.

Table III-6
Total Alaska Production Profit
1969 through 1987
(billions of dollars)

Production Revenue	$ 97.6
Less Expenses:	
Depreciation	8.1
Operating Expenses	5.3
Exploration Expenses	4.1
Overhead	.8
Interest	1.7
Royalty	11.8
Severance Taxes	10.4
Property Taxes	1.8
State Income Taxes	2.7
Windfall Profit Tax	6.4
Federal Income Taxes	14.3
Profit	**$ 30.2 Billion**

Profit per barrel: $4.96

As stated throughout the report, this is the best estimate available of Alaska oil industry production profit. There are, however, some questions concerning the profit numbers which are necessary to understand the possible range within which the actual profit number might fall.

Revenue Issues. As noted in Section I, revenues have been estimated based on a weighted average of all producers. The resulting revenue amount is 1.19% greater than that which would be obtained using Sohio's data alone. The question is what effect would using estimated realizations have on the reported profit numbers. Over the production history of the Alaska North Slope, approximately 50% of ANS crude was sold on the U.S. West Coast where net realizations are approximately $1.40 greater than sales on the Gulf Coast

Confidential Pursuant to
APUC Order P-97-4(22)

(Barclay's, 1988, p. 3). West Coast sales have been made almost entirely by producers other than Sohio. Under this assumption, revenues would increase by $1.8 billion with a resulting increase in after-tax profit of $ 1.0 billion. This was determined by taking the estimated average realization of $17.68 for Sohio and adding the extra value of West Coast sales for 50% of production. This step indicates that this approach would yield an additional average realization of $.37 per barrel over all 4.8 billion barrels of working interest production.

A second issue related to revenues is the 1986 Arco severance tax settlement. Arco paid $243 million in this settlement. Assuming that Arco's annual report data were based on its original pricing methodology, and that the severance tax rate was 15%, this would imply that the Arco revenue data which was used in this analysis understated revenues by $1.6 billion. After allowing for 15% severance tax, 3% Alaska income tax and 34% effective Federal income tax, the net profit effect is a $.8 billion increase. Part of the settlement may have been interest, but it is also likely that the settlement rate was less than 15%. If the net effect of these two factors is to offset each other, as expected, the profit increase suggested here is supported.

An additional revenue issue is the 1988 $171 million settlement on income taxes by Arco. The extent to which this settlement affected revenues and expenses is not public information. Presumably there would be an addition to the relevant items in the Arco income statements if those statements had been prepared on the basis which Arco used for its Alaska income tax. To the extent that the financial statements relied on here are the same as that used in the tax return, profit would be understated.

Confidential Pursuant to
APUC Order P-97-4(22)

It should be noted with respect to both of these settlements with Arco that they are not final settlements. The outcome of ongoing litigation and its effect on profit estimates cannot be ascertained at this time.

Depreciation Expense. For the Prudhoe Bay field, the per barrel depreciation estimates used amounted to $2.15 in 1987, $2.25 in 1986 and $1.75 in 1985. *Petroleum Intelligence Weekly* (February 1, 1988) estimates Prudhoe Bay depreciation at $2.25, $2.17 and $1.53 for those years, respectively. On average for those years, this suggests that the depreciation estimates reported here may be too high by approximately $.07 per barrel. If this is the case, depreciation for Prudhoe Bay may be overstated by $336 million over the eleven-year production history. After a 3% Alaska income tax and a 34% estimated Federal income tax, this would imply that profit is understated by $217 million.

As noted in Section II, other sources have estimated Kuparuk depreciation at up to $3.80 per barrel, which is $.89 per barrel more than the average estimate included in this report. If these other estimates are correct, this would imply that Kuparuk depreciation needs to be increased by $307 million. This would decrease Kuparuk after-tax profit by approximately $198 million.

Operating Costs. This report indicates that operating costs, including property taxes were $1.08 per barrel over the life of Prudhoe Bay field. *International Petroleum Finance* estimates these costs at $.91 per barrel. *Petroleum Intelligence Weekly* estimates the costs at approximately $1.03 per barrel. This suggests that the estimate in this report may be between $.05 and $.17 per barrel greater than other estimates. At $.05 per barrel, after-tax profit would increase by $153 million and at $.17 the effect would be a $522 million increase in profit.

Windfall Profit Taxes. Based on Arco's estimates, total Prudhoe Bay windfall profit tax would equal $4.6 billion. Using the U.S. Internal Revenue Service data, windfall profit tax collections for the ANS totalled $5.9 billion. The latter number was used even though the net income limitation provisions of the tax act may have served to reduce the expense. On the other hand, the data reported by Arco would have been before any settlement of audit differences. The indicated range for windfall profit tax expense is, therefore, $1.3 billion before tax and an estimated $ .8 billion after tax, subject to possible adjustments as a result of settlements. Profit reported here may, therefore, be too low by up to $ .8 billion.

Overhead. As noted in Section II, overhead included in this report was estimated at $ .8 billion for the period of Prudhoe Bay production. Had a weighted average based on Arco's and Sohio's data been used in a two-factor allocation, overhead would have increased by $ .4 billion, which translates into an approximately $ .3 billion after tax decrease in profit compared to the amounts reported here.

On the other hand, using a three-factor formula for estimating overhead based on the Arco/Sohio composite results in overhead of $ .4 billion, which is $ .4 billion less than the amount used in this report. This would imply that profit had been understated by $.3 billion after tax.

Interest Expense. Analysis of the interest costs of Arco and Sohio suggests that the differences attributable to this factor amount to less than $50 million. Since adequate data are not available and since the amount is low relative to the total profit, this analysis has not been pursued further.

Federal Income Taxes. The estimated effective tax rate for Alaska oil production for this report is 32.1%. This is equal to the $14.2 billion in income taxes divided by pre-tax income of $44.3 billion. If the Federal income taxes had

been based on the estimated 29% effective tax rate for the industry, income taxes would have decreased by $1.0 billion, with a corresponding decrease in reported profit to producers.

Using the effective tax rates for the primary Alaska oil producers given in Table II-16, the unweighted average current effective tax rate is 26.3% for 1978 to 1985. The rate is negative in 1986. Had the Federal income taxes in this report been based on the average effective rate for the producers over this eight-year period, the amount would have been $11.5 billion, which is $2.7 billion less than that included in this report. This amount would pass directly through as an increase in profit of $2.7 billion.

Summary. The questions raised in this section cannot be resolved without additional data. For this reason, the effect of the different assumptions on profit are summarized so that one can adjust the results according to their own interpretation of the data. The effect of each assumption is given in Table III-7.

Table III-7
Effect of Assumptions on Profit
(billions of dollars)

Item	Increase in Profit	Decrease in Profit
Use of West Coast prices	$ 1.0	
Arco severance tax settlement	.8	
Outside Prudhoe depreciation estimates	.2	
Outside Kuparuk depreciation estimates		$ .3
Use of *Petroleum Intelligence Weekly* operating costs	.2	
Use of *Petroleum Finance* operating costs	.5	
Use of Arco windfall profit tax data	.8	
Composite two-factor overhead		.3
Three-factor overhead	.3	
39% Federal tax rate	1.0	
Composite company rate	2.7	
Total increases	$ 7.5	
Total decreases		$ 0.6

Confidential Pursuant to
APUC Order P-97-4(22)

A review of these alternative estimates indicates that the profit reported here is within a reasonable range of actual profit and is probably on the conservative side.

Confidential Pursuant to
APUC Order P-97-4(22)

IV. TAPS PROFIT

GENERAL METHODOLOGY

A review of data sources on the Trans Alaska Pipeline System indicates that the annual reports filed by Sohio Pipeline Company reflect quite closely a .3334 interest in pipeline revenues and expenses. This occurs in part because nearly 100% of Sohio Pipeline Company's activities are related to TAPS. Effective tax rates were used to estimate Federal income taxes for the reasons stated above. Sohio Pipeline Company reports were available for 1978 through 1987. Due to the short production period in 1977, the pipeline probably broke even or had such a small profit or loss that it would not affect the results.[18] For 1985 through 1987, Sohio Pipeline Company provided a separate statement of TAPS revenues, costs and profit. Most of the costs were incurred jointly through Alyeska and, thus, would be shared by all pipeline owners *pro rata*. The remaining expenses appear quite close to those indicated by other observers as appropriate for TAPS in total. Operating data in Table IV-1 represent the information reported in the Sohio Pipeline Company annual reports divided by .3334. Alaska income tax estimates were based on an effective rate of 9.4% during 1978 to 1981 and an effective rate of 3% thereafter. The Federal rate was estimated in the same manner as for production.

The amounts reported in Table IV-1 were compared to other sources. Property taxes were compared to the Alaska Department of Revenue's *Revenue Sources* reference. The amounts are quite similar.

---

[18] 1977 throughput would have been approximately 28% of 1978 throughput. This would imply revenues of $690 million. Operating and administrative expenses are estimated at one-half of 1978. Depreciation would probably have been proportional to throughput. Property taxes would have been the same as in 1978. Interest expense would be approximately $236 million for an estimated before-tax loss of $20 million, which is not significant relative to other revenues and expenses.

Table IV-1
TAPS Profit Projected from Sohio Pipeline Co.
(millions of dollars)

1983 through 1987:

	1987	*1986*	*1985*	*1984*	*1983*
Revenues	$2,765	$3,080	$3,578	$3,926	$3,899
Expenses:					
Operating and Administrative	255	343	247	387	483

Property Taxes	147	164	168	171	165
Interest	150	440	411	570	579
Alaska Income Taxes	56	53	72	69	63
Federal Income Taxes	633	0	993	609	669
Profit	**$1,174**	**$1,716**	**$1,325**	**$1,614**	**$1,382**

1978 to 1982:

	1982	*1981*	*1980*	*1979*	*1978*
Revenues	$3,896	$3,605	$3,554	$2,963	$2,394
Expenses:					
Operating and Administrative	498	474	435	330	381
Depreciation	549	507	591	495	417
Property Taxes	168	171	168	174	174
Interest	648	681	720	771	846
Alaska Income Taxes	61	167	154	112	54
Federal Income Taxes	795	645	645	102	9
Profit	**$1,178**	**$ 961**	**$ 842**	**$ 980**	**$ 513**

Arco reported TAPS depreciation in its 10-K's for 1981 through 1987. The amounts were factored to reflect 100% depreciation for TAPS as shown in Table IV-2. The amounts for depreciation obtained in this manner were 38% lower than the amounts obtained from the Sohio analysis. Over the life of TAPS, the depreciation estimate is based on a weighted average of the Sohio and Arco depreciation data. The weighted average is based on Arco's 22% interest in TAPS and Sohio's 33% interest. The method assumes that the missing data are equivalent to the weighted average of the data that are available. The resulting depreciation expense number is $700 million lower than it would have been using the Sohio data alone.

Confidential Pursuant to
APUC Order P-97-4(22)

Table IV-2
Arco-based TAPS Depreciation Estimates
(millions of dollars)

Year	*Arco 10-K*	*Estimated Total*
1987	$ 60.0	$ 272.3
1986	60.0	272.3
1985	60.0	272.3
1984	60.0	272.3
1983	58.9	267.7
1982	57.3	260.5
1981	80.4	365.5

Reducing the depreciation estimate increases taxable profit and income taxes. Alaska income tax was increased by $34 million based over the life of TAPS. Federal income tax was increased by $204 million over the same period. Apportioning the depreciation adjustment over the life of TAPS to date results in the schedule of TAPS profit shown in Table IV-3.

Table IV-3
TAPS Profit
(millions of dollars)

1983 through 1987:

Profit per barrel	**$2.42**	**$2.15**	**$1.95**	**$2.49**	**$1.64**

Estimates of revenues and expenses included in this report were compared to information provided in connection with the TAPS settlement methodology. It appears from comparison with the data available to us that the revenue estimates here are approximately $400 million greater than indicated by the TAPS settlement data. The alternate estimates of operating and administrative expenses for 1978 to 1984 are within approximately $50 million. The estimates of Federal income taxes are lower in this report because the other sources used the statutory rate for tax expense purposes. Since the long-run relationship between before-tax profit and tax expense shows that the statutory rate overstates actual tax outlays, the effective rate is used in this income computations.

TAPS settlement data from Deloitte Haskins and Sells indicate that operating expenses average $.58 per barrel. The estimate in this report is $.64 per barrel. The Deloitte Haskins and Sells data indicate depreciation of $.59 per barrel. Before the Arco adjustment, the estimate in this report was $.80 per barrel. After the Arco adjustment, the estimate here is $.68 per barrel. The Federal income

tax allowance indicated from the Deloitte Haskins and Sells (DH&S) analysis of TAPS costs is $.75 per barrel. The estimate in this report is $.86 per barrel. The expense estimates used in the profit estimates reported here are consistently higher than those indicated by DH&S. Thus, profit reported here is lower than would be indicated using the DH&S data.

Barclay's de Zoete Wedd (1988) estimate cash costs of $.65 per barrel for TAPS. This would include operating and administrative costs plus property taxes. The estimate of these costs in this report is $.92 per barrel. Barclay's de Zoete Wedd estimates depreciation at $.80 per barrel, which is the same as used here after accounting for the Arco adjustment.

Petroleum Intelligence Weekly estimated that pipeline profit was $2.18 per barrel in 1985, $.64 per barrel in 1986 and $.53 per barrel in 1987. The estimates used in this report are $.75, $.94 and $.60 for each of those years respectively. Over the three-year period, they estimate a total profit of $6.1 billion. The profit reported here is $4.2 billion before the depreciation adjustment.

For the years 1983 through 1987, Arco reported the net income after tax of Arco Pipeline Inc., which holds Arco's interest in TAPS. Assuming that all of the income of Arco Pipeline is related to TAPS (which appears to be the case),[19] TAPS income for each of these years projected from the Arco Pipeline data would be $1.3 billion, $1.3 billion, $1.5 billion, $1.4 billion and $1.4 billion for a total over the five-year period of $6.9 billion. The estimate based on Sohio data is $7.2 billion. A weighted average estimate of profit based on 21.4% Arco ownership and 33.34% Sohio ownership gives a profit estimate for the four-year period for which both data series are available of $7.1 billion, which is within 2% of the estimate reported here.

---

[19] TAPS income so completely dwarfs income from other pipelines that substantially all the income is attributable to TAPS.

Each of the sources which has looked into TAPS revenues, profit and costs has developed varying profit estimates. It appears that the adjusted profit indicated in Table IV-3 represent a "middle-of-the-road" estimate. Over the period of TAPS operation, estimated total profit is as follows in Table IV-4:

Table IV-4
Total Estimated TAPS Profit

V. OTHER INFORMATION

Downstream Profit. The profit data which have been developed in this report do not include any profits earned beyond Valdez. It has been reported elsewhere that producers may earn between $.25 and $1.00 per barrel in profits on tanker and trans-Panama canal shipping operations. These profits serve to reduce the net cost of Alaska oil landed on the U.S. West and Gulf Coasts.

There is some evidence that U.S. West Coast prices are lower because of Alaska oil production than they would be without Alaska production. This occurs because prices of crude oil on the U.S. West Coast tend to average $1.00 per barrel less than prices on the U.S. Gulf Coast. If imported crude oil had to be substituted for Alaska crude on the U.S. West Coast, prices there would be at least equal to prices on the U.S. Gulf Coast. Indeed, a substantial argument can be made that prices on the U.S. West Coast would be greater than Gulf Coast prices because shipping costs for imported crude oil would be greater f.o.b. the West Coast than the Gulf Coast. Thus, there can be additional refining profits from Alaska crude which have not been included in this analysis.

These downstream profit issues are beyond the scope of this project. They do indicate, however, that the producer's economic benefits of Alaska oil production extend beyond the profit obtained within the boundaries of the State of Alaska.

Shares. The revenues from Alaska oil and gas production and transportation go to pay for costs incurred in those activities, state taxes and royalties, federal taxes and profit to the producers. The shares of revenues received by the producers, state and federal governments are itemized in Table V-1.

Percentages	**43.6%**	**30.0%**	**26.4%**

* Includes local property taxes.

Profit as an Hourly Rate. Forty-two billion dollars is a significant number and one that is difficult to put in perspective. Relating the number to an hourly rate over 10.5 years of production (91,980 hours at 24 hours per day, 365 days per year) gives a rate of $463,144 profit received after tax.

Return on Investment. It is also possible to relate profit received by Alaska producers to the investment made in TAPS and production activities. This analysis is referred to as return on investment. The analysis compares cash flows to investments.

Investment in TAPS was an estimated $9,400 million in 1975 to 1977. The initial investment in Prudhoe Bay was an estimated $3,700 million.[20] Over time, this investment was increased as a result of infield drilling, the waterflood project and the gas miscible fluid project. The estimated total accumulated investment in Prudhoe Bay is $8,700 million. As of 1987, the investment in Kuparuk is estimated to total $4.3 billion. This includes a portion of the waterflood project which was being installed in 1987 - 1988. The investment is Milne Point was

[20]Some of these expenditures were made as early as 1969. However, more precise dates are not available for these outlays. If the $900 million in 1969 lease bonuses is accounted for as a 1969 outlay, the rate of return (assuming no debt) drops to 28.1%. Alternatively, this analysis placed no value on the ANS properties for cash flows received after 1987. Assuming that these cash flows are worth $10 billion, the rate of return (assuming no debt) increases to 31.1%. Similary adjustments would be required to the returns assuming debt.

Confidential Pursuant to
APUC Order P-97-4(22)

$575 million. Lisburne had an estimated investment cost of $1,000 million and Endicott an estimated project cost of $1,000 million. A summary of the estimated investments in the ANS is given in Table V-2. These amounts are based on estimates in Arco's and Sohio's annual reports and compared to other estimates.

Table V-2
Investment Schedule
(millions of dollars)

Year	*Prudhoe*	*TAPS*	*Other ANS*	*Total*
1987	$ 720		$1,900	$2,620
1986			1,000	1,000
1985	720			720
1984			570	570
1983	2,000			2,000
1982				0
1981	1,100		3,400	4,500
1980	250			250
1979	250			250
1978				0
1977	1,850	4,700		6,550
1976	1,850	4,700		6,550

Assuming 100% equity investment, cash returns on these investments would be equal to the reported profit numbers plus depreciation and interest. This is based on the fact that if one invested 100% equity, one would incur no interest costs. Column 1 of Table V-3 shows the production profit from Table III-5. Column 2 of Table V-3 is the depreciation on production. Column 3 is the sum of profit plus depreciation. Column 4 is the interest costs. Adding the profit plus depreciation from column 3 and the interest from column 4 gives the "all-equity cash flows" from production shown in column 5 of Table V-3.

The same process was followed for TAPS which yields the data in the fifth column of Table V-4.

Table V-5
All-equity Cash Flows
(millions of dollars)

		---Cash Flows---Net		
Year	*Investment*	*Production*	*TAPS*	*Cash Flow*
1987	$2,620	$3,542	$1,675	$2,597
1986	1,000	2,793	2,518	4,311
1985	720	4,719	2,106	6,105
1984	570	5,512	2,687	7,629
1983	2,000	4,770	2,511	5,281
1982	0	4,321	2,365	6,686
1981	4,500	4,168	2,158	1,826
1980	250	3,764	2,172	5,686
1979	250	3,673	2,211	5,634
1978	0	1,151	1,771	2,922
1977	6,550	655	0	-5,895
1976	6,550	0	0	-6,550

The equivalent rate of return earned on this stream of cash flows after tax is 29.7%.

According to the Sohio annual report of 1978, approximately 75% of the investment was financed with debt. In this case, the investments in 1976 and 1977 as shown in Table V-2 would be $1,638 million net each year. This is 25% of the investment outflows in those years. The remainder would have been financed with debt. Interest expense would be incurred on this debt and the debt would have to be repaid. The cash flow data from columns 3 of Tables V-3 and V-4 is the profit plus depreciation. These cash flows include a deduction for interest expense. These cash flow numbers are shown in column 2 and 3 of Table V-6. Assuming that all of the cash flows were used to pay off the debt as quickly as possible, the loan repayment would have consumed all of the cash flows in 1978 through 1979 and all but $2,131 million in 1980. The net cash flows in each year are shown in column 4 of Table V-6.

Table V-6
Cash Flows with 25% Equity
(millions of dollars)

		—Cash Flow—		Net Cash
	Investment	*Production*	*TAPS*	*Flow*
1987	$2,620	$3,350	$1,525	$2,255
1986	1,000	2,610	2,078	3,688
1985	720	4,536	1,695	5,511
1984	570	5,364	2,117	6,911
1983	2,000	4,620	1,932	4,552
1982	0	4,150	1,717	5,867
1981	4,500	4,150	1,477	1,127
1980	250	3,754	1,452	2,131
1979	250	3,506	1,440	0
1978	0	903	925	0
1977	6,550	478	0	-1,160
1976	6,550	0	0	-1,637

The rate of return implied from the stream of cash flows shown in Table V-6 is 43.7%.

REINVESTMENT RATIOS

A question of interest is the extent to which cash flows from Alaska oil and gas operations are reinvested in Alaska. Reinvestment is defined as investments in ANS projects subsequent to the initial investment in Prudhoe Bay and TAPS plus exploration costs. These amounts are shown in column 1 of Table V-7. The relevant cash flows for reinvestment analysis are the production cash flows plus exploration costs and the cash flows from TAPS. Interest costs are deducted in determining these cash flows. The production amounts are shown in the last column of Table V-3. The production cash flows are shown in column 2 of Table V-7 and the TAPS cash flows are shown in column 3 of Table V-7. The total cash flows are shown in column 4 of Table V-7. The last column of Table V-7 is the ratio of reinvestment to the cash flows.

Confidential Pursuant to
APUC Order P-97-4(22)

Table V-7
Reinvestment Ratios
(millions of dollars)

Year	Re-investment	----Cash Flows---- Production	TAPS	Total	Reinvestment Ratio
1987	$2,908	$3,638	$1,525	$5,163	56.32%
1986	1,288	2,898	2,078	4,976	25.88%
1985	1,234	5,050	1,695	6,745	18.30%
1984	828	5,622	2,117	7,739	10.70%
1983	2,818	5,438	1,932	7,370	38.24%
1982	647	4,797	1,717	6,514	9.93%
1981	4,919	4,569	1,477	6,046	81.36%
1980	426	3,930	1,452	5,382	7.92%
1979	424	3,680	1,440	5,120	8.28%
1978	274	1,177	925	2,102	13.04%
Totals	$15,766			$57,157	

The data from Table V-7 indicate that the ANS producers are reinvesting approximately 27.8% of their cash flows in Alaska.

Appendix A
Sohio's 1982 Annual Report Disclosure

Supplementary Information on Oil and Gas Exploration, Development and Production Activities

This section provides information required by Statement of Financial Accounting Standards No. 69 (FASB 69), Disclosures about Oil and Gas Producing Activities, which was issued in November 1982. FASB 69 aims to establish a comprehensive set of disclosures for oil and gas producing activities that replaces disclosures formerly required by either the Financial Accounting Standards Board (FASB) or the Securities and Exchange Commission (SEC), or both.

Three general disclosure areas comprise the information in this section. The first area provides historical information about costs and revenues, including the Company's aggregate recorded investment in oil and gas properties, annual costs incurred and a separate statement of the results of operations for producing activities. The second area contains the Company's petroleum engineers' quantity estimates for proved oil and gas reserves and the major factors causing changes in these reserve estimates. The final area of disclosure represents our compliance with the FASB's requirement to assign a monetary value to proved reserve quantities and changes therein using a standardized formula.

The Company has provided additional commentary throughout this section that is important for a proper understanding of the nature of the data provided and its inherent limitations.

Results of Operations for Producing Activities

The following summarizes the "Results of Operations for Producing Activities" as defined by FASB 69, for the years ended December 31, 1982, 1981 and 1980. As required, financing costs are not included in this statement. Income taxes are included in the results, but were computed under FASB guidelines using statutory tax rates, while considering the effects of permanent differences and tax credits relating to oil and gas producing activities.

NOTES:

* *The Alaskan crude price is a weighted average of the prices received for sales on the West and Gulf Coasts; Gulf Coast sales normally fetch around $1/barrel more than those on the West Coast. We assume 1/3 of sales are made on the West Coast with the balance on the Gulf.*

\+ *Tanker freight is again a weighted average of the rate for deliveries from Valdez to the West and Gulf Coasts. Because shipping costs to the Gulf Coast are normally some $0.40/barrel higher, sales on the West Coast are more profitable to BP despite the fact that the crude oil commands a lower price than on the Gulf (see Section 5 below). In 1989 we have assumed that tanker costs rise by around $0/barrel due to an increase in the use of expensive to operate Jones Act vessels (see Section 5), partly offset by a 70,000 barrel/day increase in shipments by pipeline from the West to Gulf Coasts (which is some 60¢/barrel cheaper than transport by ship via Panama).*

Appendix D

Alaska Oil Industry Development Time Line

1954 - BLM issues 272 oil and gas leases.

1957 - Swanson River oil discovered.

1962 - Cook Inlet oil discovered (Middle Ground Shoals)

1965 - Three additional Cook Inlet oil fields discovered (Granite Point, McArthur River, Trading Bay)

1967 - Prudhoe Bay oil is discovered. With over 10 billion barrels of reserves, it is a "super-giant" and the largest oil field in North America.

- Middle Ground Shoals, Granite Point and Trading Bay begin production.

1969 - Prudhoe Bay lease sale.

- Kuparuk River oil discovered. With a billion barrels of reserves it is a "giant" and is second only to Prudhoe Bay as the most productive field in the United States and Canada.

1977 - Prudhoe Bay oil Begins flowing to Valdez through Trans-Alaska Pipeline System (TAPS).

1978 - Endicott oil discovered.

1985 - Milne Point begins production.

1986 - Lisburne begins production.

- Kuparuk production peaks at 300,000 barrels per day.

1987 - Endicott begins production.

- Milne Point shuts down.

1. Executive Overview

1.1 THE RECOMMENDATION

The Alaska Business Unit recommends rebuilding 4 of the remaining TAPS pump stations by replacing aging mainline Avon Rolls Royce direct drive turbine pumps with high efficiency turbine electrical generators and electrical pumps; and replacing existing facility housing with "non-occupied structures" that require less maintenance. Electrifying the TAPS pump stations, coupled with lifecycle control replacement, will allow automation and reduce manpower at Pump Stations 1, 3, 4 and 9. Electrifying all of the pump stations translates to an annualized Operating & Maintenance cost savings of $44mm (gross) by 2008 and will allow TAPS to forego more than $114m in expense and $44m Capital (gross) in costly upgrades to the aging Avons, associated facilities and their enclosure buildings over the next 10 years.

The BP Capital request is as follows:

$ million	Gross Project	BP Net
Capital Requested for Sanction	$172	$81
Engineering Tolerance	20	9
Reference Value for Sanction	192	90

1.2 THE HISTORY OF THE TRANS ALASKA PIPELINE SYSTEM and TAPS Overview

The discovery of a giant crude oil field at Prudhoe Bay on the North Slope of Alaska in 1968 began a period of unprecedented petroleum industry activity in the state. Construction work associated with the Prudhoe Bay discoveries included installation of production facilities on the North Slope and an 800-mile pipeline from the oil fields to a marine tanker loading facility in the city of Valdez. This pipeline system, marine loading facility, and ship escort and vessel response system (SERVS) are collectively called the Trans-Alaska Pipeline System (TAPS).

Based on forecasted production and recovery lifecycles of the North Slope fields, the original anticipated economic life of TAPS was 25 years. However, due to enhanced recovery techniques, revised reserve volumes, and development of new fields, TAPS is now being positioned to operate for another 30 years.

To support this operational commitment, Alyeska Pipeline Service Company (Alyeska) and the TAPS Owners have initiated a redesign of the pipeline pump stations and control systems. The Valdez Marine Terminal and SERVS are also being studied, but these studies are not as advanced as the pipeline. Preliminary engineering for the pipeline pump station redesign was completed in 2003 and the TAPS Owners are evaluating the results.

TAPS was originally designed for a 1.5mmbopd throughput (excluding Drag Reducing Agents) and has been operated for 25 years using personnel to monitor pipeline and pump station operations. Although this practice has worked well, it is no longer cost effective. Current technology used by other pipelines all over the world includes electronic monitoring and control systems that are more efficient and reliable.

The pipeline reconfiguration project is a proposal to utilize those technologies to enhance TAPS operational efficiency. This "proven technology" will reduce future operating costs and maximize

efficiency far into the future. None of these changes compromise safety or operational integrity. In fact, safety, operational integrity, and environmental performance will be enhanced with Strategic Reconfiguration.

Background for Pump Station Strategic Reconfiguration (SR)

For several years, Alyeska has been engaged in engineering studies to identify ways to improve operational efficiency through technology upgrades, increased use of automation, and reduction of infrastructure to minimize transportation costs and extend the economic life of the pipeline and North Slope oil fields. This will be accomplished through equipment upgrades and the resulting reductions in Operations and Maintenance (O&M) costs.

The SR pipeline study was formalized in 2001 when an Alyeska Reconfiguration Studies team and TAPS Owners planning team jointly examined eleven proposed alternatives. The initiative was complete in January 2002 with a recommendation of two strategies for further study, electrification and hybrid (see following page). A third option, direct drive turbines, was later added to the list.

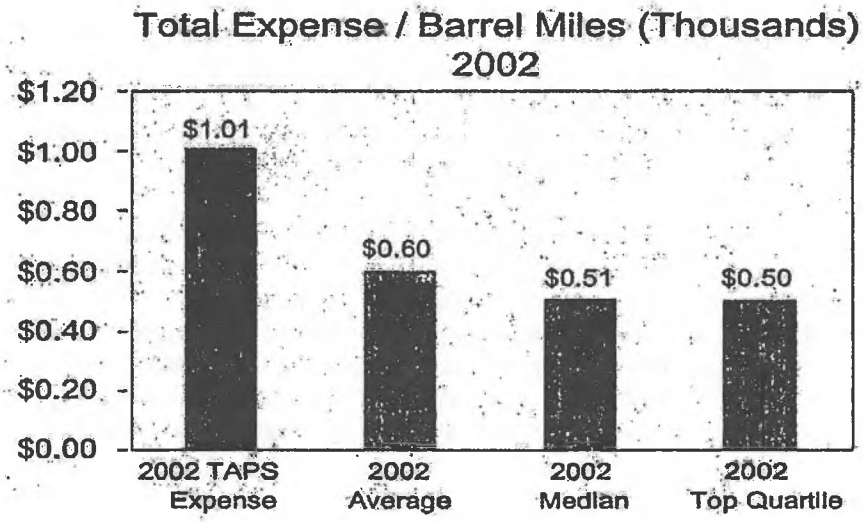
Electrification is the installation of electrically driven crude oil pumps at certain pump stations combined with increased automation and upgraded control systems. It includes a dramatic reduction of utility systems and associated facility infrastructure and allows un-staffing of pump stations.

The hybrid option strategy was an attempt to make best use of existing equipment while achieving the SR objectives of simplified infrastructure and reduced O&M costs. It consists of automation of existing crude pump drive packages and utility systems and includes the same upgraded control systems that would be installed for electrification. This option does not have capacity flexibility to accommodate future throughput changes and has been abandoned as an alternative.

The direct drive turbine option, a variation of the electrification theme using gas turbines instead of electric motors, incorporates many of the same concepts but is mechanically more complex and slightly less reliable. At the current stage of engineering, adopting this alternative implies expensive engineering and construction delays and therefore this alternative was abandoned.

Costs for each option were compared to an inertia case, which consists of the current practice of maintenance and equipment lifecycle replacement. This is the status quo case and subjects Alyeska to the lowest operating reliability and highest ongoing O&M expense of any alternative.

TAPS Construction History and Reliability



One of the first challenges in developing the North Slope fields was creating a transportation system to move the vast reserves of the Sadlerochit field in Prudhoe Bay to market. Engineers decided a large-diameter pipeline from the North Slope to a marine tanker loading facility at an ice-free port was the answer. Alyeska Pipeline was created to construct, operate and maintain TAPS for the Owner companies. Originally eight in number, TAPS Owners are now BP Pipelines (Alaska), Phillips Transportation Alaska, ExxonMobil Pipeline Co., Williams Alaska Pipeline Co. (whose interest is currently under a purchase agreement with Koch) and Unocal Pipeline Co.

Despite many engineering, political, and regulatory hurdles and a cost of more than $8 billion, construction of TAPS was completed in June 1977. The first oil left Pump Station 1 on June 20, 1977 and the tanker *ARCO Juneau* steamed out of the Valdez marine terminal laden with Alaska North

Slope (ANS) crude on August 1 that same year. Since then, more than 14 billion barrels of ANS crude have been transported through the pipeline, with throughput peaking in 1988 at nearly 2.1 million barrels per day. Current throughput is relatively stable at just under 1 million barrels per day.

While reliability throughout the history of TAPS has averaged well above 99 percent, other pipelines have achieved this same reliability through the use of modern technology and automation. Due to steadily increasing regulatory oversight, aging of the system, increase in personnel costs and inherent inefficiencies in original design, TAPS has risen in cost per barrel mile to lead its U.S. large pipeline peers in the transportation cost category.

The chart below shows how TAPS compares to other large pipelines based on benchmark data obtained from the Association of Oil Pipelines (AOPL).

Preliminary engineering studies indicated the electrification option is the only alternative satisfying the project objectives of reliability, efficiency and cost-versus-savings. Direct drive turbines is the next best alternative, but has slightly reduced reliability and savings coupled with increased on-going maintenance. The hybrid case did not meet project objectives. Recommended implementation strategies for pipeline electrification are outlined as follows.

- Power generation upgrades, electrification and automation of Pump Stations 1, 3, 4 & 9.
- Consider removal, retirement and disposal of all above grade unused equipment and facilities at Pump Stations.
- Install control and communication modules at Pump Stations.

Electrification satisfies the following objectives established under Strategic Reconfiguration:

- Maintains safety and operational integrity.
- Improves operational efficiency and environmental performance.
- Shows highest economic rate of return with the least economic risk.
- Allows unstaffing of pump stations through remote control capabilities.
- Is scalable to future throughput requirements.
- Will maintain required reliability through use of technology rather than on-site staff.
- Is proven technology currently in use in the industry.

Pump Station Reconfiguration-Electrification Major Project Milestones

- Workforce plan approved – 4Q2003
- OSCP amendments approved – 4Q2003
- SCADA upgrade complete – 4Q2004
- Communications module installation complete – 4Q2005
- PS control systems upgrade complete – 4Q2005
- PS1, 3, 4 & 9 electrification complete – 4Q2005

Methodology for Project Savings/Cost Determination

Alyeska used a rigorous methodology for the development of project scope and determining costs/savings. A strategic plan, developed by Alyeska's Planning Team, was adopted by Alyeska management and the TAPS Owners. This process resulted in two options for which conceptual design was completed: electrification/automation and inertia. Third party validation confirmed the cost and concept of each option and identified electrification/automation as the best choice. From this work, 2003 long range planning assumptions were defined and used as the basis for company-wide planning.

The Alyeska organization and the SR project team then embarked on parallel paths while working toward a common goal. The project team formalized project scope, completed preliminary engineering, developed an operations philosophy and finalized project costs. Simultaneously, company managers identified staffing requirements, major maintenance that could be eliminated, and determined project savings. Benchmarking with industry peers and verification by cross-functional groups within the company validated outcomes and identified additional savings opportunities and other synergies. Final assurance included executive review, approval and commitment.

1.3 Electrification: Old versus New

Although electrifying pump stations sounds complex, it is really a straightforward solution to achieve the project objectives of efficiency, cost reduction and extension of economic life of the system. This section compares facilities and process equipment installed on TAPS now to post-electrification and discusses changes to Alyeska's O&M philosophy.

Description of TAPS

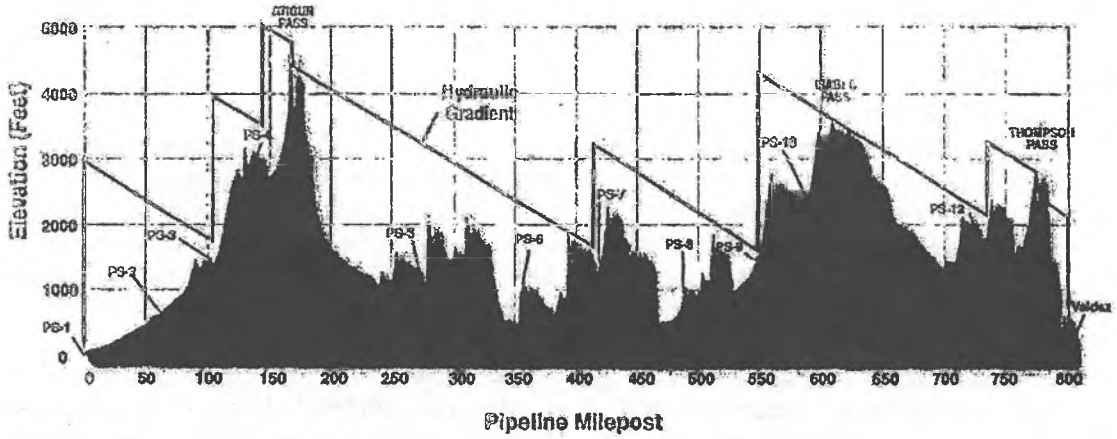
TAPS is a crude oil transportation system that begins at PS1, the gathering and storage center for all North Slope producers, and terminates at a marine terminal storage and tanker loading facility located in Valdez on the shores of Prince William Sound. The 48-inch pipeline is 800 miles long, crosses three major mountain ranges, 34 major rivers and achieves a maximum elevation of 4,379 feet at Atigun Pass located 166 miles south of PS1. Of the 800 miles, 420 are above ground and 380 are buried, with 62 RGVs installed to reduce spill volumes in the event of a breach in the pipe.

Twelve pump stations are designed into the system although not all are active pumping stations. PS5 is a relief and reinjection station while PS11 is installed with mainline isolation valves only as its additional pumping capacity was never required. Of the remaining ten stations with pumping

Critical Energy Infrastructure Information

quantities of Drag Reducing Agent (DRA) were injected upstream. However, DRA is expensive and operating PS7 is more economical to meet horsepower and maximum operating pressure requirements at current flow rates.

As North Slope production began to drop off in the mid-1990's, full pipeline design capacity was no longer needed. As a result, five pump stations are currently off line in a stand-by configuration called rampdown. PS8 & 10 were ramped down in 1996, PS2 & 6 in 1997, and PS12 in 2003.



Pump Driver Package: Old Vs. New

The pump driver package installed on TAPS is a reliable but dated Avon gas turbine coupled to either a Byron-Jackson or United centrifugal pump. PS1, 3, and 4 drivers use natural gas as a fuel source while PS7 & 9 use liquid turbine fuel.

Each station with pumping capability has three such drive packages installed with the exception of PS2 & 7, which have two. During peak throughput in the late 1980's there were no spare drivers on TAPS; every installed unit was needed to meet horsepower requirements for the high flow rates. Although dependable over the years, these drive packages and appurtenances are complex and labor intensive to operate and maintain to the standards required on TAPS.

Electrification will replace the existing pump driver packages with skid-mounted electric motors and modern centrifugal pumps. The engineered design is very flexible and allows for many of these skids to be installed in parallel to accommodate throughput rates up to system capacity of over 2 million barrels per day (Mbpd). Initially, three of these driver packages will be installed at PS1, 3, 4 & 9; this configuration supports throughput up to 1.12 Mbpd. Adding two more skids at each location will provide 1.5 Mbpd capacity. Taking units off-line will allow reduced throughput rates in the several hundred thousand barrel/day range while remaining within acceptable equipment operating parameters. Variable frequency drives (VFD) will be installed for control of the motors; replacement motor control centers (MCC) will handle power distribution.

Trans Alaska Pipeline System
Elevation Profile

Power Generation: Old Vs. New

Due to the remoteness of TAPS, most pump stations need to generate their own electrical power. This is currently accomplished with various numbers of skid-mounted 450 kilowatt Garrett and 800 kilowatt Solar turbine generator packages. Due to obsolescence and age of equipment, it is increasingly difficult to maintain these generator sets. Under electrification, PS1 has the option to tie into the existing North Slope grid for power needs or self generate. Power generation at PS3 & 4 will be accomplished with modern skid-mounted turbine generators while PS9 will purchase power from a local utility. There will be no change at PS7.

PS1, 3 & 4 use processed natural gas received from North Slope producers for general fuel needs such as mainline pump drivers, power generation and facility heating. Following reconfiguration, this fuel gas will still be used for primary power generation.

Process Control: Old Vs. New

Critical Energy Infrastructure Information

Critical Energy Infrastructure Information

Telecommunications: Old Vs. New

Critical Energy Infrastructure Information

Fire Systems: Old Vs. New

Fire detection and suppression is particularly important on TAPS due to remote facility locations. Fire systems currently installed at the pump stations include various combinations of smoke, gas and flame detectors that initiate suppression actions and equipment shutdowns; flooding agents include water, halon and foam. Many of these systems are designed around occupancy requirements of a staffed facility and will not be needed following reconfiguration.

Maintaining these systems has become particularly problematic in recent years because original pipeline design included large enclosed process areas (see photo). Fire codes have changed since TAPS was engineered. This has created compliance issues that can be more effectively resolved with new equipment.

Critical Energy Infrastructure Information

Housing, Utilities and Staffing: Old Vs. New

Even though some remote control capabilities are designed into TAPS, the pump stations are currently staffed 24 hours a day, 365 days a year due to equipment monitoring requirements, remote control system deficiencies, and oil spill response needs. This necessitates the pump stations to operate and maintain a wide range of life support utility systems such as potable water, wastewater, heating and ventilation, waste disposal, food preparation appliances, and vehicle refueling and maintenance. The extreme Arctic conditions under which these systems operate make maintenance difficult and expensive.

Additionally, field staffing requires a large infrastructure for such things as living quarters, office space, telephone and data systems, and a materials supply network. Remote airports are required, emergency evacuation must be considered, medical care provided and even such things as mail and package delivery accomplished. In essence, a typical pump station is equivalent to a small city with a resident population of 40 – 50 with peaks as high as 130 during busy project seasons.

With the application of new technology, that can be changed. The top photo below shows an aerial view of Pump Station 3 in its current configuration. Contrast that to the photo underneath, which is what PS3 could look like after SR and possible later removal of unused equipment when approved by Owners and regulators. It is easy to see the impact of Strategic Reconfiguration to installed infrastructure and facilities. There will be fewer buildings in use, simplified communications and process control, upgraded pump/driver packages, and no assigned staff. A reduction of approximately 15 percent of the total current workforce is possible because of the reduced workload.

New Technology – Less Infrastructure – Same Throughput

Critical Energy Infrastructure Information

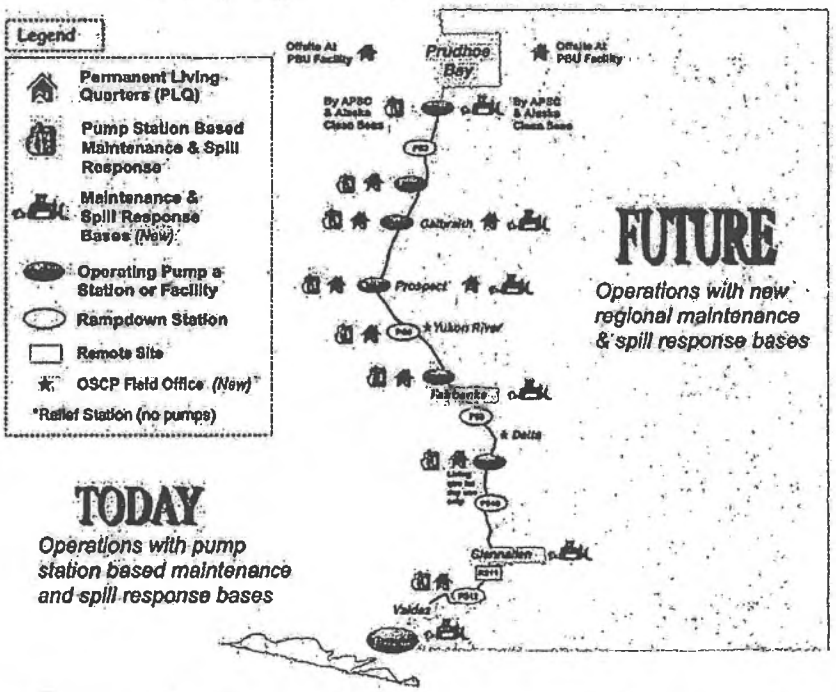
Strategic Reconfiguration represents a 30-year leap in technology. This new technology requires far less infrastructure, and operating facilities are greatly simplified.

At top left is an aerial view of PS3 in its current configuration. Note the large number of buildings, interconnecting hallways, and outlying support facilities. Because pump stations are currently staffed around the clock, on-site housing is required, creating the need for life support systems such as water and wastewater treatment, heating, food preparation, trash incineration, fire suppression, vehicle maintenance and additional power generation.

By implementing modern technology, the need for full-time staff is eliminated. This means the decommissioning or removal of housing units, reduction of utility systems, and elimination of support facilities.

The lower photo depicts PS3 post-reconfiguration; as can be seen, the changes are significant. TAPS-wide, at least 75 buildings could be decommissioned and 27 more could be simplified. Removing work from the system provides significant, sustainable cost reductions.

Synergies: OSCP/Support Services/Maintenance



Although pipeline SR as a stand-alone concept is strictly a technology driven solution to achieve efficiency and cost savings, there are several other business considerations that, when combined with SR implementation, will produce increased operating and business efficiencies. These synergies are outlined below.

- Oil Spill Contingency Plan (OSCP) amendments accommodate unstaffing of remote facilities while maintaining and/or improving response capabilities using regional response bases and additional pre-deployed equipment. Although the total number of staff in the field will be reduced, the number of initial responders will not change.

- Operations philosophy changes as a result of electrification allow elimination of all operation technician functions as well as a greatly reduced infrastructure of buildings, services, and field-based support groups.

- Maintenance philosophy changes allow centralized dispatch for scheduled maintenance. This approach creates efficient use of personnel while supporting OSCP amendments and ongoing Right-of-Way (ROW) maintenance.

TAPS Maintenance and Spill Response

- The scalability of the electrification solution accommodates a wide range of future increases or decreases in throughput and allows those changes to be accomplished at a much lower cost.

Critical Energy Infrastructure Information

Details of the design can be found in the Preliminary Engineering Design Report:

Prelim Eng Main Doc.pdf

2. Business Case

2.1 Strategic context and Business Objectives for the Alaska Business Unit

As described in the Pump Station Electrification Appraise FM of March 2003, Alaska's role in BP's portfolio is to provide a stable production base and cash flow to fuel growth elsewhere in the business while improving margins and returns. Driving cost savings in TAPS is a key element in delivering margin improvement of BP's North Slope production.

Over the past three years the TAPS Owners and Alyeska have studied a number of potential business efficiency opportunities. Preliminary engineering studies confirmed that Pump Station Electrification is the single largest driver of pipeline cost improvement and efficiency. Preliminary engineering studies have also confirmed electrifying and automating all 4 pump stations will allow Alyeska to eliminate over 285 full time positions, many of those in field locations where wage and locations premiums are very high. Currently, remote crews at these pump stations require expensive catering, transportation and other costly support services systems. Eliminating these positions translates to an annualized expense savings improvement of over $41mm gross (+$16mm net BP) by 2007 over APSC 2003 Base O&M.

2.2 Project Economics

Assumptions:

Electrification was modelled against a "Base/Inertia Case". The Base Inertia Case assumes continued use of the Avon-driven pumps, normal upgrades to remaining facilities and a reasonable allowance for continued operational improvement. In 2012 O&M is increased by $4m annually to account for expected higher annual maintenance caused by turndown effects.

The Electrification case assumes self generation at PS 1, 3 & 4. It assumes GVEA power is supplied via the existing power grid to PS 9.

The Electrification case assumes that beginning about 2009 the APSC annual License to Operate Capital will decrease about $6m under the Base/Inertia Case due to reduced Corporate Projects. This reduction is consistent with the capital funding expected in the APSC Long Range Plan and matches the BP estimate for Non-Pump Station related capital projects after electrification.

The Electrification Case assumes P[Highly Confidential Material Redacted] Savings and P[Highly Confidential Material Redacted] Capital. It also assumes [Highly Confidential Material Redacted] of the annual O&M savings accrue starting in 2006, with full savings in 2007. It assumes some buildings at the reconfigured pump stations can be abandoned in place.

[Highly Confidential Material Redacted] Inflation was applied to O&M and Capital costs. Throughput was assumed to be declining at a [Highly Confidential Material Redacted] annual rate (and used to calculate fuel savings).

BP's equity in TAPS is 46.9% and our throughput share is assumed to average [Highly Confidential Material Redacted] over the period of evaluation. This is a cost reduction investment hence there is no sensitivity to oil price.

Sources of Value:

BP value is manifested in improved wellhead netback prices due to reduced tariffs. Summary economics are presented in the table below.

Summary Economics (Electrification vs. Base Case)

	Sanction Capital (Net) $m	Past Savings Thru '03 Gross (Net) $m
Midstream	81	32 (12.7)
Upstream	–	–
AKHU	81	32 (12.7)

Highly Confidential Material Redacted

Highly Confidential Material Redacted

Financial Impact (Electrification vs. Base Case) $m

Alaska BU	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
Tariff Change ($/bbl)	$0.00	$0.05	$0.06	($0.09)	($0.10)	$0.00	($0.05)	($0.12)	($0.21)	($0.36)
Opex Savings	1.8	4.3	11.9	24.3	23.8	24.1	21.5	22.3	20.5	27.6
Incremental Capex *	(47.4)	(48.3)	2.6	2.6	1.2	3.7	2.8	2.5	2.8	4.6
Post Tax Cash Flow	(37.4)	(44.3)	13.9	25.4	15.7	16.9	17.8	18.8	16.9	23.5
RCOP Impact	1.1	1.2	6.9	17.5	16.8	19.0	16.4	17.2	15.2	21.4
Net Income Impact	0.6	0.6	4.3	11.2	10.7	12.2	10.5	11.0	9.7	13.7
NI/boe	$0.01	$0.01	$0.05	$0.14	$0.12	$0.13	$0.12	$0.15	$0.15	$0.23

* Incremental Capex includes life cycle replacement expenditures.

PS 1 and PS 9 Power Options

Optimizing the investment and commercial terms for power purchases at PS 1 and PS 9 are key drivers of value. At PS 9 Golden Valley Electric Association (GVEA) will provide commercial power through a utility grid. Delivery of power to PS 9 will require GVEA to upgrade their transmission system. GVEA will pass on that cost to APSC either through an installation fee or through a rate premium. Negotiating the cost of this upgrade into the power rate saves $10.6m gross in CAPEX. At PS 1, sharing power with the Prudhoe Bay Central Power Facility could save $16m gross in CAPEX. The recommended target case assumes PBU will provide no power since the PBU Owners have failed to deliver a Memorandum of Understanding for Power Costs.

Expected Value "Base Case" for Subsequent Value Tracking

Details of the expected Value Case are presented below. Electrification investment spending occurs primarily in 2004 and 2005.

Table 2. Investment Profile

APSC Investment Profile (APSC Gross CAPEX)	2004	2005	2006	2007	2008	2009
Inertia Base Case Capex	53.8	61.3	60.4	59.2	59.3	60.0
Elect Investment Case Capex (21mW, no LB CAPEX)	147.0	176.1	58.0	54.0	58.0	57.0
Net Incremental Investment	93.2	114.8	-2.4	-5.2	-1.3	-3.0

Savings delivery is best tracked on a gross APSC basis. The case below assumes that the Incremental O&M Savings is deliverable through electrification. Note that the underlying performance improvement is about $41m.

Table 3. Savings

APSC Gross Spending/Savings Profile	2004	2005	2006	2007	2008
Inertia Case	451.9	480.3	471.6	420.4	403.2
Electrification Case (17 mW, no LB CAPEX)	447.2	456.2	426.3	355.3	343.3
Avoided Major Maintenance	4.6	23.9	21.5	18.4	18.7
Incremental Annualized O&M Savings	-0.1	-0.1	-23.9	-46.6	-41.3

2.3 Principal Commercial Risks

Regulatory: Any major change in TAPS facilities requires Joint Pipeline Organization (JPO) and Alaska Department of Environmental Compliance (ADEC) approval.

The JPO has been supportive of the project and has confirmed through its own benchmarking exercise that TAPS electrification will better align the operation with other North American pipeline systems in terms of facilities and operations. The Argonne Benchmarking Study is attached:

JK001.pdf

Conditional approval was received from both agencies as of December 31, 2003.

JPO Finding of No Significant Environmental Impact:

Fonsi.pdf

JPO Notice to Proceed with Stipulations:

03-009RN.pdf

ADEC approved the OSCP on December 31 with "Specified Conditions". The "conditions" have no impact on project economics or schedule.

ADEC OSCP Approval:

JK001.pdf

RCA Issues:
We have considered the risk that the Regulatory Commission of Alaska (RCA) will exert approval authority over the proposed facility changes. The Owners have worked to mitigate this risk by clarifying to the RCA the separate nature of Electrification and the decision to remove ramped down facilities. Additionally, BP has prepared a legislative solution in case the RCA seeks to intervene. Should the RCA move to disallow Electrification cost recovery on intrastate shipments, such costs would be rolled over to our interstate tariff for recovery hence there should be minimal impact to value.

Dismantlement, Removal and Restoration:
Costs associated with dismantlement, removal and restoration (DR&R) of the affected stations (1, 3, 4 & 9), estimated at $10m ($4.7 m BP net), are excluded from the economics. These costs are

deemed discretionary, as the associated structures can be abandoned in-place until such time as the TAPS Owners move forward with a sanctioned DR&R project. There remains a minimal regulatory risk that the TAPS Owners could be challenged to remove idle equipment from TAPS.

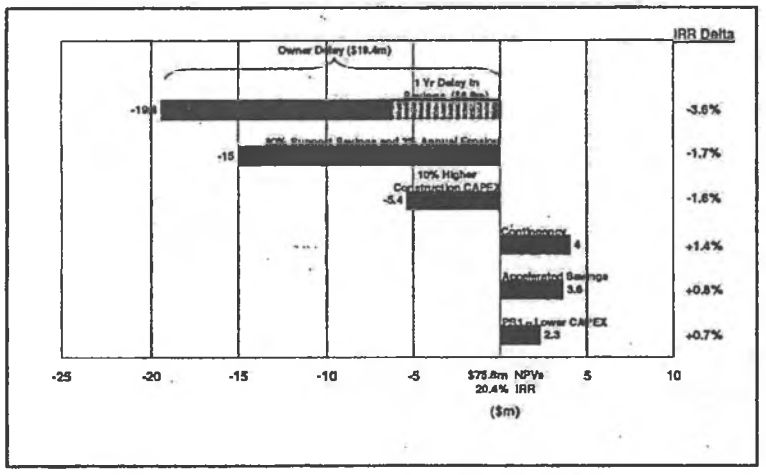
Sanction/Schedule/Governance: Achieving sustainable savings from manpower reductions requires executive will. Given our governance role through the Owners Committee, BP is well positioned to ensure the proper focus and incentives are in place to assure delivery. As indicated in the graph below, a delay in delivering costs savings by one year could result in significant BP NPV loss. The Alyeska President is firmly committed to achieving and sustaining projected cost reductions with many of the organizational realignment activities already underway in anticipation of sanction.

Management of Change: Assuring successful cutover to new operating facilities is an important factor for staff and regulatory support. We do not have a robust transition plan in place today. However, Alyeska has appointed a senior leader with single point accountability to create a comprehensive MOC plan. Additionally, BP will elevate MOC focus to the Owners Committee to ensure executive ownership.

Project Cost Management: Cost and scope control are critical considerations for delivery. Extra measures are in place to ensure that the project is ring-fenced from other project spending to avoid scope-creep or inappropriate time-writing to the project. APSC has appointed a commercial leader to manage project logistics, SCM and provide robust cost controls. BP will require transparency in monthly project financial reports to the TAPS Owners.

Higher Grid Power Costs – The cheapest source for electrical power at PS 1 is spare capacity from the Prudhoe Bay Unit Central Power Station, however only about 4 MW are available. The PBU Working Interest Owners have failed to deliver requested commercial terms to APSC. As a result, the project assumes all PS 1 power will need to be self-generated.

Savings Delivery – About 50% of the anticipated savings is derived from the reduction in the support organization due to fewer field-operating personnel and less anticipated engineering support. Achieving these savings requires a major manpower severance program and careful management of change to ensure that operating integrity is not sacrificed. It is also important to ensure that all expected savings are captured. Roles and accountabilities in the re-organization have been defined. A severance plan has been created.



Other Risks-Alyeska has created the following detailed risk mitigation plans to assure operating integrity and safety including:

Safety Management Plan
Environmental Management Plan
Workforce Reduction Plan
Critical Skill Retention Study and Plan
Project Execution Plan
Quality Management Plan

Technical Risk Issues and Track Record – The technology to automate and electrify pump stations is not new, virtually all of Alyeska's peers in the recent AOPL Pipeline benchmarking study have automated pump stations. The primary driver of cost difference between TAPS and AOPL comparator Pipelines is driven by this lack of automation.

2.4 Economic Sensitivities

Below is a summary of value adding options/Economic Sensitivities and their impact on project economics:

Sensitivities & Value Adding Options / Delivery Risks

- Owner Delay – Delay would result in loss of value due to opportunity loss, addition of mandatory life cycle spend that had been previously deferred, loss of accelerated federal tax depreciation benefits, and additional project team cost.
- Under-delivery of Savings and Erosion – Executive will is required to deliver and sustain projected cost savings. Management commitments and governance processes are in place to assure delivery.
- Capital Cost Overrun – Adequate FEL has been performed and project management systems are in place.
- Contingency/ Value Engineering – Delivery of project contingency capex savings through ongoing value engineering processes.
- Accelerated Savings – Early delivery of organization opex savings pre-startup.
- PS1 Lower Capex (PBU Power Purchase) – Option to purchase part of Pump Station 1 power requirement from PBU.

2.5 Key Project Milestones and Schedule Overview

Milestones

BP SET Approval	February 2004
TAPS Owner Approval	March 2004
Award of Major Contracts	April 2004
Facility foundation work	Summer 2004
Remote Communication Module tie-in	Summer 2004
Module Shipment and connection	Spring 2005
Start-up and Testing	October 2005
Commissioning	December 31, 2006

Project Schedule Overview

The project is operating on a tight schedule in order to meet fire system commitments and to obtain tax benefits by December 31, 2004. Realizing organizational savings as quickly as possible is leveraging.

Delay of the project will result in lost O&M savings, lost tax benefits, increased major maintenance costs (including fire and gas system upgrades), and increased program management costs. The unfavorable impacts of a one-year delay are estimated in the range of $40 million to $60 million.

Key deliverables are as follows. See the attached project schedule for additional details.

AFE Approval	March 1, 2004
Authorize equipment manufacture	March 1, 2004

Tie-ins (2), RD Comm. Modules	Summer 2004
PS 4, PS 5, PS 7 & PS 9 foundations	Summer 2004
Major equipment in fabrication shops	Fall 2004
Module piling at PS 1 & PS 3	Winter 2005
Module shipment, start interconnect	Spring 2005
Mechanical Completion	October to December 2005
Startup and Commissioning	November 2005 to Jan 2006

3.0 Execute Phase Planning

3.1 Project Execution Strategy and Plan

The project execution plan outlines the purpose of the project, the organization of the project management, and is composed of sub-plans in safety, Construction, Procurement, Environment and Quality Management.

It defines the project scope, describes the physical changes in the facilities, describes the "Project Success Factors" and sets project cost targets.

The execution plan also defines the roles and accountabilities for project personnel. Details of the Project Execution Plan can be found in the attached document:

Project_Execution_Plan.pdf

3.2 HSE Management and Issues

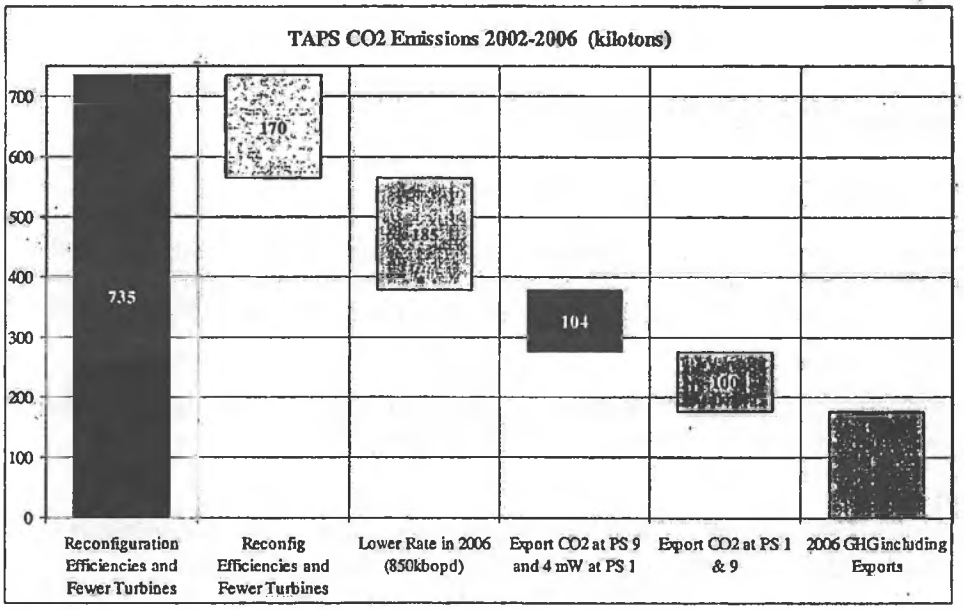
HSE Planning and Strategy

A complete Environmental Management Plan was developed for Pump Station Electrification that describes the permitting and compliance management processes required for executing the Pipeline Electrification Project. It is included below:

PEP HSE p8-10 .pdf

An Environmental Assessment (EA) was also completed and is provided in the Reference Documents. The EA concluded that Pump Station Electrification project will significantly reduce the environmental impact of the TAPS System.

Env Mgt Plan Rev 0 DRAFT Nov 7...



A complete Safety Management Plan has been created for the project including a preliminary HAZOP, Safety Integrity Level analysis and Risk Assessment. The details of the HAZOP are included in the following document:

Hazop.pdf

Emissions Reductions

This project will significantly reduce the physical footprint of TAPS pump stations, eliminate about 50% of the current TAPS CO_2 emissions and improve safety by reducing manpower in the field where historically the highest "recordable incident" rates have occurred.

A significant reduction in air emissions will occur when the Rolls Royce Avon turbines are eliminated:

These modeled Carbon Dioxide reductions were estimated using an APSC fuel consumption model.

3.3 Contracting Strategy

During Preliminary Engineering a contracting and procurement strategy was developed for the execution phase of this project. The details of that plan can be found in the following document:

PEP Contracting Strategy p28-35.pdf

Contracting Plan - SRP 10.02.0...

3.4 Execution Organization

The project organization developed to execute the final design and construction of the Reconfigured Pump Stations was developed in the Preliminary Engineering phase. Organization charts representing those organizations can be found in the following document:

PEP Exe Org Exhibit 1-2-3 p65-67.pdf

4.0 "Operate Phase" Planning

4.1 Redefining the operating organization:

The shift to automated pump stations requires addressing 3 groups of operating personnel, the pump station operators, pump station maintenance personnel and pump station oil spill support. The pump station operators will be replaced by telemetry and station controls. They are eliminated from the future organization.

Oil Spill response will be regionalized as described below. No significant reduction in OSCP staff will occur however they will be redeployed along the line.

4.2 Oil Spill Plans

Since construction, TAPS utilized Oil Spill Responders and equipment staged at operational Pump Stations along TAPS. De-manning the pump stations requires redefining the oil spill contingency plan to be able to provide the same level of oil spill response by responders now based in Regional Oil Spill Centers rather than at the pump stations. ADEC and the JPO have

Critical Energy Infrastructure Information

The details of the Regionalized Oil Spill Plan can be found in the attached document:

(Insert Oil Spill Plan)

The new plan has no reduction in spill responder staff, and no net reduction in response time for the secondary responders. The relocation of staff to urban centers and a transition of some of the staff to urban work schedules will reduce costs.

Both the JPO and ADEC have conditionally approved the Regional Oil Spill Plan despite public criticism from an APSC Maintenance Supervisor. That criticism was directed at training, supervisor/worker ratios, initial response capabilities and equipment staging locations. Both

APSC and the JPO seriously considered the issues raised and many were either addressed by APSC internally or addressed by the JPO in their conditional approval letter.

4.3 Regionalized Maintenance

Pump Station maintenance personnel will also be re-deployed through a "regionalization". Maintenance Centers will be located at Prudhoe Bay, Galbraith, Prospect, Fairbanks, Delta, Glenallen and maintenance staff will be withdrawn from the Pump Stations.

5.0 Assurance:

Throughout 2003 APSC, and their contractors (SNC-Lavalin and Hinz), undertook a series of peer reviews with the TAPS Owners and other appropriate oversight groups. These included three BP "No Wreck Reviews" (June, October and January 2004), two IPA FEL reviews (November and January 2004), a "Value Engineering" challenge session (December 2003) and five cost review/challenge sessions. Those assurance activities are described below and documented in Section 8 (Reference Documents).

5.1 Value Engineering

Value Engineering Overview
A Value Engineering Study was completed for Alyeska Pipeline Services Company (APSC) on the Strategic Reconfiguration Project, Pump Station Electrification and Control System Automation scope, for the Trans Alaska Pipeline System (TAPS).

The initial Value Engineering Study was completed on November 5th, 6th and 7th, 2003. The Preliminary Engineering Design phase of the project has been completed and the project team is working on a transition engineering phase pending project approval by the TAPS Owners.

The objectives of the VE Study were to:

A. Identify cost saving opportunities and improvements to the value of the design.
B. Select the minimum scope necessary to reduce operating costs by de-manning pump station facilities.
C. Do so without compromising reliability, availability, safety and system integrity goals established for this project.

Value Engineering Key Results
The VE team prepared 56 idea proposals and based on the proposal evaluations made recommendations to APSC Project Management. Of the 56 idea proposals produced, 8 idea proposals were deferred for further evaluation during detailed engineering, 27 were rejected and 21 were accepted.

The successful implementation of these 21 idea proposals could result in a total savings of $18,033,000.

The detailed Value Engineering Report:

VE Final Report.doc

5.2 No Wrecks

At the request of BP, APSC held a series of "No Wreck" reviews in the BP format with "No Wreck" tools as guides to facilitate peer discussion of the Electrification Project.

Three "No Wreck Reviews" were held, one in June 2003 to get an early view on project status and to ensure that key risks were identified and addressed in the Preliminary Engineering Studies. This meeting identified gaps associated with operations integration and important risks associated with regulatory issues (Regulatory Commission of Alaska).

The second "No Wreck" was held in October 2003 and meant to determine how close the project was to sanction and to identify gaps to close before 1Q 2004 sanction reviews began. This review helped to more clearly define the TAPS Owner expectations around risked costs, Value Engineering, and the separation of the project from other ongoing reconfiguration activities.

A final "No Wreck" was held in January 2004 as a final test to determine if the project had adequately addressed the October No Wreck feedback and to prepare a forum in which technical experts could review the preliminary engineering studies and if appropriate endorse the project.

A summary of the final Jan 2004 "No Wreck" feedback:

TAPS One pager .doc

5.3 Head of Discipline (HOD) Review and TVP Endorsement

Concurrent with the final "No Wreck Review" technical endorsements were received from EPTG Operations, Energy Efficiency, HSE, EPTG rotating equipment specialists, EPTG electric motor specialists and EPTG Projects. Those endorsements are included in the document above. Detailed feedback from the HOD Reviewers is included in the Powerpoint presentation below:

TAPS Review Peer Feedback.ppt ...

5.4 IPA

Two IPA reviews were held. The first was in November 2003 when very little formal documentation for the project existed and again in January, 2004, after virtually all of the Preliminary Engineering documentation was complete.

The January IPA review revealed an FEL Index of 5.0 . That FEL index level is consistent with well planned major projects and benchmarks very favorable versus other successful BP Major Projects.

IPA Final Report
2.16.04.pdf

Subject: Gene Therriault response to my distribution of the Alaska Digest article

Please find below Gene Therriault response to my distribution of the Alaska Digest article. Following Gene's response is my reply to Gene (in blue)

Jim

Dear Jim:

On July 12 you e-mailed a copy of a column written by Brad Keithley with the following comment from yourself:

> "I have attached, for your information, an article I copied from the Alaska Dispatch. After reading this article I hope you question, as I do, the focus that some of Alaska's political leaders have on building a gas line for the purpose of

exporting Alaska gas. State gas revenue is not going to replace the revenue the state receives from oil production. Business as usual is not working".

I believe Mr. Keithley's column suffers from a fundamental lack of understanding of the geology, engineering and economics of energy production on the North Slope of Alaska. In order to provide a more complete picture of what the administration is doing to encourage oil and gas development in Alaska, I offer the following information.

Despite the suggestion to the contrary, Governor Parnell is focused on future oil and gas development in Alaska. However unlike oil, North Slope natural gas requires a new pipeline to be constructed in order for the reserves to be commercialized. This infrastructure is critical for development of our gas reserves and for long term production of oil on the North Slope.

Like many world class basins, the North Slope has a large endowment of both oil and natural gas. In basins of this magnitude, production of oil is typically initiated first because it generates a higher rate of return on investment than gas. Over time natural gas becomes a more important economic component of the field as the easiest and least costly oil is produced. Finally, when the gas is monetized, it benefits from the infrastructure investments that have already been amortized and helps to carry a portion of the ongoing operation and maintenance costs of the fields. This sharing of infrastructure lowers the exploration and development risk for additional oil and gas to be produced from the field. This increases the economic value of marginal oil fields and extends the life of existing but declining oil fields. Two examples of this trend are the Gulf of Mexico Shelf and the Western Canadian Sedimentary Basin

The suggestion that Governor Parnell is backing efforts to access our natural gas resources on the North Slope just to fill the state treasury and in doing so has miscalculated the revenue that gas will produce is false. A natural gas pipeline benefits all Alaskans as well as the North Slope producers. In addition to state revenue, the pipeline will provide residents with access to a long term supply of reasonably priced energy as well as employment opportunities. The revenue stream from a large diameter pipeline was modeled three years ago and determined to be significant. Under expected prices scenarios, a North Slope gasline delivering 4.5 BCF of natural gas and natural gas liquids per day is projected to produce an average total annual revenue after tariffs of more than $10 billion for the state, producers, and the federal government to split. The states revenue share alone will be in the billions of dollars per year.

The volumetric component of this operation is critical to keep in mind not only for the potential revenue stream but perhaps more importantly because shipping costs per unit

drop significantly as the volume transported goes up. In addition, as gas production increases, it will carry a larger portion of the existing operating costs relieving the economic pressure on remaining oil that exists in harder to produce formations and smaller less economic fields. In order to maximize the economics of a gasline project to the upstream owners (highest wellhead value), the transportation tariffs and processing costs need to be minimized. This is done in large part by maximizing the volume and BTU value of the gas transported which creates very beneficial economies of scale and much lower tariffs.

The beneficiaries of increased gas production and lower transportation costs will not only be the producers and the state treasury. Individual Alaskans will also benefit as the cost of the providing natural gas energy in-state goes down delivering more affordable fuel and a lower cost feed stock for value added processing. Decreasing the cost of transportation and processing through creation of a high volume operation will also lower the barrier to entry for natural gas production from new discoveries and previously discovered but undeveloped fields. If companies know they will be able to get either resource to market, they are more likely to drill wells.

Today, companies put off drilling certain exploration wells if they believe they are more likely to find natural gas than oil. Extending the life of older oil fields and improving the economics for new developments and discoveries including viscous oil means that more oil will flow through TAPS, slowing or reversing oil decline and extending the life of the pipeline. All of this activity will result in trucking jobs, maintenance jobs, exploration jobs and countless other jobs associated with expansion of activity on the North Slope. These are the economics Governor Parnell is striving to achieve by linking our world class natural gas resources to the market. In short, development of natural gas means development of more oil.

It appears that one of the main objectives of Mr. Keithley's piece is to strike at the validity of the ACES oil and gas tax. He mounts this challenge by suggesting that as a result of passing the ACES tax in 2007 ConocoPhillips has now experienced its first summer season in 40 years with no active onshore exploration. What Keithley fails to disclose is that ConocoPhillips did have onshore activity planned for the 2010 summer season; however, this activity was curtailed when the US Army Corps of Engineers failed to issue the necessary permits for a new river crossing of the Colville River. This permit difficulty has been widely reported in the press including the August 1, 2010 Petroleum News which carried the following statement:

> ConocoPhillips next planned step-out from Alpine, the CD5 or Alpine West development, lies in the extreme east of the National Petroleum Reserve-Alaska. This development has been stymied by a refusal by the U.S. Army Corps of

Engineers to allow the construction of a bridge across the Nigliq Channel of the Colville River.

Mr. Keithley also fails to acknowledge that as a net profit tax mechanism coupled with investment credits, ACES taxes less profitable fields at a lower rate and provides incentives for encouraging their development. The article also does not mention the increased tax credits and deductions that Governor Parnell won in legislation he proposed this year (nor the ones he proposed that the Legislature did not approve) that have increased the incentives to invest in new development in Alaska.

Major producers like ConocoPhillips and BP have reported strong profits from their Alaskan operations under the ACES system. For example, in 2009, ConocoPhillip's Alaska activity accounted for 12% of its worldwide production but 29% of its corporate profits. In addition, the August 1, 2010 edition of the Petroleum News recently detailed ConocoPhillip's current year earnings and concluded that "ConocoPhillips' exploration and production activities continue to be more profitable in Alaska than across the Lower 48".

Keithley also makes the assertion that smaller, more nimble oil and gas exploration and production companies do not have the resources, financial, technical or managerial strength to develop projects in Alaska. However, he does not address the success of companies like Pioneer Resources, Armstrong or Anadarko Petroleum in our state.

Finally, the Chukchi and Beaufort Sea portions of the OCS have both proven large oil and gas discoveries and significant potential for world class discoveries. Governor Parnell has been and remains a strong and vocal advocate in Washington DC for increased access to these areas for exploration and development. It was the unfortunate spill in the Gulf that has lead to a deferral of this activity by the Secretary of Interior. This deferral has delayed multibillion dollars of planned investments offshore of the North Slope by Shell and others.

I hope this message provides useful information as you engage in discussions on Alaska's oil and gas future. Having previously worked as a Deputy Director for the Alaska Division of Oil and Gas as well as past employment with ConocoPhillips Alaska, I believe Governor Parnell understands the balance that must be struck to encourage full development of North Slope's potential while protecting the shareholder rights of the Alaska citizens.

Please consider forwarding this message to the distribution list that you sent the Brad Keithley column to. If you would like a clean copy as a word document, please let me know and I will send it to you.

Gene Therriault
Senior Policy Advisor on In-state Energy

Dear Gene and Gary,

The reason I sent out the AD article was to demonstrate that Alaska's natural gas is not going to replace the value, to state government, of Alaska's crude oil production. The simple truth is that natural gas has a dollar value of on a btu equivalent basis of 1/8 or less of that of crude. In other words Gary's old "Bridging the Gap" model does not work. The discussion we are having and the political leaders (McGuire, Ramras and company) I am talking are those that are proposing to build a in-state bullet line from the North Slope to Cook Inlet for the purpose of reducing Anchorage's energy shortage and exporting the balance. That is business as usual and in case you haven't notice, business as usual is not working. I would be more than happy to discuss this in more detail and if I had your distribution list I would include them on my reply.

Subject: Document1

I have attached, for your information, an article I copied from the Alaska Dispatch. After reading this article I hope you question, as I do, the focus that some of Alaska's political leaders have on building a gas line for the purpose of exporting Alaska gas. State gas revenue is not going to replace the revenue the state receives from oil production. Business as usual is not working.

Revenue Source Book re: ANS Production Decline handout

Revenue Sources Books, Alaska Department of Revenue
Excerpts re: North Slope Production Decline, 1988 - 1994

October 1988 Revenue Sources

"It is important to emphasize that the North Slope producers, while not agreeing on the exact date, have concluded that North Slope production will commence to decline in either FY 89 or FY 90."

Spring 1989 State Revenue Forecast

"Alaskan production is expected to fall to about half its present levels by the later 90's ... Therefore, only a combination of budget cuts, more efficient programs, and new revenues will allow the State to move into the 90s without significant disruptions in public services ..."

Fall 1989 Revenue Sources Book

"The fall in oil production means that the inevitable decline in the huge Prudhoe Bay field has started sooner than we predicted ... This forecast assumes that production from the Prudhoe Bay field will continue to fall steadily, and will drop to less than half its present level in less than 10 years."

"Some observers may believe that exploration will discover another Prudhoe Bay. Prudhoe Bay is the largest oil field in North America, and finding such a 'supergiant' is extremely rare."

"The State of Alaska is standing on a precipice. Only a combination of budget cuts, more efficient programs, and new revenues will keep the State from falling a long way ..."

"The decline in production from the Prudhoe Bay field is a central issue for Alaska ... The decline in Prudhoe Bay production is now expected to be much more rapid than assumed in our Spring forecast."

Spring 1990 Revenue Sources Book

"The bad news for Alaska's revenue outlook is that oil production is falling (the second year in a row) and Trans Alaska Pipeline tariffs are going up. Expensive repairs to the pipeline will raise the cost of shipping Alaskan oil and reduce the wellhead value on which our taxes and royalties are figured ... We need to confront the fact that Alaska's oil production in a dozen years will be one-fourth the present level. Unless production increases four fold, or the price for oil quadruples (to $80), we are at the precipice ... The decline in production from the Prudhoe Bay field is a central issue for Alaska."

Fall 1990 Revenue Sources Book

"The success of recent projects to increase production from all existing North Slope oil fields, and the prospect of new production, will postpone serious decline in Alaska production for a couple more years. However, barring discovery of new reserves, production will begin to fall dramatically. This forecast assumes that production will fall to half of current levels within 12 years ... Statewide oil production is expected to decline 10% to 12% through 1995 and 50% by the year 2003."

Fall 1991 Revenue Sources Book

"Oil production from the North Slope continues to decline as the mammoth Prudhoe Bay field and the other smaller fields are depleted. This problem is not going away and the farther the decline curve is projected into the future, the bigger the problem becomes."

Spring 1992 Revenue Sources Book

"The long-term revenue outlook is dominated by the depletion of petroleum reserves of the Prudhoe Bay oil field ... Despite the start of the irreversible decline at the Prudhoe Bay field this year, continued success in reservoir management in all fields will hold statewide production decline throughout fiscal year 1995 to less than 9% total (3% per year)."

Fall 1993 Revenue Sources Book

"Summer maintenance on the North Slope, installation of the GHX-2 facility at Prudhoe Bay and the start-up of the West Beach, Point McIntyre and North Prudhoe Bay State fields have slowed the decline of ANS production ... Field enhancement, the addition of three new North Slope satellite oil fields and the prospect of a commercial find in Cook Inlet should keep the decline in Alaska production from four to five percent per year through 1999."

Spring 1994 Revenue Sources Book

"The Prudhoe Bay field, which accounts for two-thirds of Alaska statewide production, is in irreversible decline."

"With Prudhoe Bay in Decline, What's Next for Alaska?"
Aug.3, 1992

OIL&GAS JOURNAL
International Petroleum News and Technology

WITH PRUDHOE BAY IN DECLINE, WHAT'S NEXT FOR ALASKA?

By James M. Davis (Senior Vice President for Exploration and Land) & Jerry R. Pollock (Manager, Prudhoe Bay Engineering) of ARCO Alaska, Inc.

August 3, 1992

Anchorage

Almost every day, it seems, someone is mentioning Prudhoe Bay-its development activities, the direction of its oil production, and more recently its decline rate.

Almost as frequently, someone is mentioning the number of companies abandoning exploration in Alaska.

The state faces a double-edged dilemma: decline of its most important oil field and a diminished effort to find a replacement for the lost production.

ARCO has seen the Prudhoe Bay decline coming for some time and has been planning for it. We have reduced staff, and ARCO and BP Exploration are finding cost-effective ways to work more closely together through such vehicles as shared services.

At the same time, ARCO is continuing its high level of Alaskan exploration.

This article will assess the future of Prudhoe Bay from a technical perspective, review ARCO's exploration plans for Alaska, and suggest what the state can do to encourage other companies to invest in this crucial producing region and exploratory frontier.

THE PRUDHOE DECLINE

By any definition, Prudhoe Bay is declining and will continue to decline.

Our calculations show the field decline rate will average 8-10%/year through the year 2000. Year to year the rate may be more or less than 8-10% because projects such as the GHX-2 gas handling facility will serve to offset the field's natural decline.

To accountants, Prudhoe decline began during 1988 when the field was no longer able to make its maximum allowable rate of 1.5 million b/d of oil. To engineers, the decline began long before that.

When Prudhoe first met its maximum allowable production rate in 1979, it took only 218 wells to produce 1.5 million b/d. By 1988 it took 916 wells -- some producers, some injectors -- to produce the same amount. Well production had declined by a factor of four, dropping from 7,000 b/d/well initially to less than 1,700 b/d/well.

In other words, to keep production up, the number of wells had to be quadrupled. Between 1979 and 1988, 700 wells were drilled at a cost, including related facilities, of more than $3.5 billion.

Facility and basic infrastructure improvements also were made, costing about $9 billion. This includes installation of the central gas facility and the seawater treatment plant.

These outlays were in addition to an original $9 billion invested to put Prudhoe Bay on line. Investment to date in Prudhoe totals about $22 billion.

Investment in new wells, facilities, and infrastructure enabled Prudhoe to produce at 1.5 million b/d of oil for 9 years -- 3 years longer than originally forecast, longer than anyone ever thought possible.

FINITE RESERVES

Unfortunately, adding more wells can't keep the oil production rate up forever. We're already past the point where drilling can stave off a falling oil rate. Oil reserves are finite.

Today it takes 1,100 wells, each averaging about 1,200 b/d, to make the current field rate of 1.3 million b/d of oil.

The cost of drilling these wells has not gone down, but production benefits have. That's why we are trying so hard to control costs and to recognize and account for those costs we cannot control -- such as taxes and regulatory compliance costs. All additional costs hurt future investment opportunities.

Water production, effectively nil for the first few years of field life, now exceeds 1 million b/d. By 2000, water production is expected to exceed 1.5 million b/d.

Gas production is more than three times what it was initially -- currently about 5.2 bscfd. GHX-1 helped raise the field gas handling capacity to that level. Following installation of GHX-2 in 1994, gas production will increase again, to 7.5 bscfd, enabling us to produce the higher GOR wells.

But there is an economic limit to adding facilities.

As the field matures, the production facilities reach their maximum capacities to handle produced water and gas. Wells with falling oil rates and increasing produced water or gas volumes have to be shut-in. Total field oil production drops.

The number of wells is going up, and the volumes of water and gas that have to be handled from each well are also going up. These are the three main items that tend to drive costs up in Prudhoe Bay.

Though field oil rates continue to fall, costs per barrel -- including capital investments and operating expenses -- keep on rising.

Profitability is being eroded by the effects of declining production. We are seeing more projects at Prudhoe that have marginal economic returns. We need to find more cost-effective means to do our work so we can keep investing in new projects to develop new reserves.

That's why we're sharing field services with our co-operator, BP Exploration, and why we've entered into an era of partnering with vendors and contractors.

INVESTMENT PLANS

Future development investments fall broadly into four categories: enhancing productivity of existing wells, drilling additional development wells, expanding existing facilities to handle increasing amounts of produced water and gas, and improving and implementing technologies to enhance oil recovery.

Of the field's total production rate, about 85,000 b/d of oil results from ongoing remedial well work.

Each year for the next 5 years we plan 50 fracture jobs, 300 chemical treatments, 200 nonrig workovers, 85 rig workovers, and 35 sidetrack replacement wells. Well work is expected to cost about $600,000/day for the next 5 years -- about $1 billion for the period.

In development drilling, 250-400 additional wells are planned for Prudhoe Bay field through the end of this decade, costing a total of $1-1.5 billion. Currently there are three development drilling rigs working in Prudhoe, and we hope to sustain this level of activity through 2000.

This level of development drilling is expected to increase field recovery by about 175 million bbl.

Prudhoe Bay field's first major gas handling expansion project, GHX-1, was installed in late 1990. By yearend 1990, GHX-1 was contributing about 100,000 b/d of oil to the field rate. Additional GHX-1 gas compressor upgrades remain in progress.

Field production did not increase 100,000 b/d in 1991 when compared with 1990. The field rate was essentially flat year to year. GHX-1 with its 100,000 b/d additional rate merely offset the decline from the rest of the field.

Our largest project under way is the second major phase of gas handling expansion, called GHX-2.

This $1.4 billion project enables wells that are producing high gas volumes to continue producing oil. In addition, GHX-2's gas handling process is designed to recover natural gas liquids from produced gas. The NGLs will be shipped by the pipeline and sold along with the oil.

GHX-2 is also expected to contribute 100,000 b/d of production by 1995, again helping to offset the 8-10%/year field decline.

Taken together, GHX-1 and GHX-2 are expected to boost field recovery by about 800 million bbl over the life of the field. Work on GHX-2 has begun at Prudhoe Bay.

EOR work received a boost recently when the Alaska Oil and Gas Conservation Commission approved the operators' request to double what already is the world's largest miscible injection EOR project. Planned expansions will increase recovery by 150-220 million bbl. Facility modifications being implemented with GHX-2 are an integral part of these projects.

These four projects -- well work, drilling, GHX-2, and EOR -- total $3.54 billion in planned investments during the next several years. We hope that more projects can be added to this list over time.

FUTURE PRODUCTION

Prudhoe Bay was found with 22 billion bbl of oil in place. Recovery of 9.6 billion bbl of oil from the field was initially forecast back in 1977.

However, continued development has increased expected recovery to more than 12 billion bbl of oil.

We've already produced about 7.5 billion bbl of oil, leaving about 4.5 billion bbl of reserves and 10 billion bbl in place as a target for the future, an incentive for new projects and improving technology. Still, investment decisions are getting tougher.

With the reality of Prudhoe's declining production, sustaining Alaska's oil production and revenues will require opening up new fields and new areas for exploration.

New reserves need to be brought on line on the North Slope if the TransAlaska Pipeline's rate is to be maintained.

New fields would help Prudhoe Bay by lowering transportation costs from where they otherwise would be -- and perhaps even extend Prudhoe's productive life.

EXPLORATION OVERVIEW

For these reasons, and in view of the fact that more than 85% of the state's income comes from royalties and taxes on oil production, it is disturbing to see that the Alaskan rig count ended 1991 at its lowest level in 17 years. There is not much promise of improvement in 1992.

If Alaska and the Alaskan oil industry are to remain healthy over the long term, we must continue to explore for new sources of oil -- and we must be successful.

In terms of exploration, ARCO plans to spend $600 million in Alaska during the next 5 years. In 1992, we expect to see 15-25 exploration wells drilled in the state, with ARCO participating in 75-80% of them.

In Cook Inlet last year, ARCO and its partner Phillips Petroleum Co. announced an oil discovery at the Sunfish prospect. A jack up rig is drilling a follow-up well to further evaluate the discovery.

Last winter ARCO operated five drilling rigs on exploration prospects, the most activity of any company in Alaska.

This included the BLT well north of Anchorage, which found natural gas but did not flow at commercial rates -- a real disappointment to us. The BLT was a unique well for Alaska in that the mineral ownership included private land.

The local economy benefitted from 37 local people who were employed at the rig site and more than $1.5 million spent locally for services and supplies.

ARCO and partners also drilled the Cabot prospect in federal waters off Barrow, the third western Beaufort Sea exploratory well.

We recently completed a four well exploration program in the Colville area, west of Kuparuk on the North Slope.

ARCO has completed negotiations in putting together a group of companies to drill an exploratory well this summer at the Kuvlum prospect in the eastern Beaufort. ARCO will hold the largest interest in the group of six companies.

ARCO is the only company active in the interior basins. We have an agreement with Doyon in the Nations River basin, near the Canadian border, where we have completed extensive geological studies and seismic and other geophysical studies.

We are researching new drilling systems for work in this area that are less costly and have less impact on the environment. We are looking for a partner to help us drill the prospects that have been identified.

This exploratory activity is aimed at preserving ARCO's future in Alaska.

COMPETITION NEEDED

Other oil companies, including many that do not have production in Alaska, have announced in recent months they are giving up their exploration efforts in the state and intend to invest their exploration dollars in foreign countries.

This is disturbing news because it is in both the state's interest and ARCO's interest that Alaska maintain an aggressive exploration program, with a vigorous service industry supporting it.

Why does ARCO want competition in Alaska?

First: Given the high cost of exploration and the low chance of commercial success, we need partners to share the risk. Onshore, it costs $5-10 million to drill a single well. Offshore, the cost can range from $20 million to $50 million or more.

The only way to stay within a reasonable budget and still participate in a significant number of wells is to team up with other companies.

Second: Because of the way land is traditionally leased, in relatively small blocks, companies must form partnerships to create a leasehold large enough to justify an exploratory well.

While we need such partnerships, coming to agreement on when a well will be drilled, and how costs and production will be shared, is difficult, especially if the companies have differing views of Alaska.

Third: A single company cannot alone support a viable service industry.

Now to a key question: Why is Alaska, like the U.S. in general, losing the battle for exploration capital?

Uncertainty over taxation and regulation is one of the reasons the industry is exploring less in Alaska and the Lower 48 and investing those dollars overseas.

Lack of access to land -- in particular large blocks of land -- is another.

And in Alaska the lack of exploration success on the Outer Continental Shelf is yet another reason.

Industry has spent $10 billion exploring the Alaskan OCS through 1990, including 75 dry holes. More than $6.5 billion of that went for lease sale bonuses and rentals. Only $3 billion went for actual drilling costs.

The majority of companies conducting Alaskan OCS exploration have had little participation in onshore drilling.

Given the record of dry holes offshore, it should come as no surprise that these companies are reassessing their positions and looking elsewhere.

AIRCO'S PLANS

Why isn't ARCO taking its exploration dollars out of the state?

Two good reasons: We are exploring onshore as well as offshore. And we have had exploration success.

Since the late 1980s we have had an exploration program balanced between the onshore and the offshore. With the lack of success in the OCS, ARCO, unlike some of its competitors, was able to easily redirect efforts onshore.

Over the past 4 years, ARCO has invested more than 250 man-years in basic regional studies of Alaska. This summer marks the 37th consecutive year that ARCO has had geologic field parties in Alaska. No other company matches that record.

We believe these investments give us an edge over our competitors. This understanding has led us to aggressively invest in both state and federal acreage.

In addition, our people live and work in Alaska and are able to communicate routinely and in a timely way with state agencies. But the most important reason ARCO maintains an aggressive exploration program in Alaska is that ARCO has had exploration success.

We made the discovery at Swanson River in 1957 that helped achieve statehood for Alaska. We also discovered the Prudhoe Bay, Kuparuk River, Lisburne, and Point McIntyre fields. Last fall we announced the Sunfish discovery in Cook Inlet.

We believe that Alaska offers a resource base that is as prospective as anywhere in the world, especially in view of continually evolving technology. If we didn't, we would not be Alaska's most active explorer.

COMPETING COUNTRIES

But Alaska competes with countries that offer a business environment compatible with the exploration process and that encourage exploration.

Those countries grant concessions on large contiguous blocks of acreage. Exploration rights are valid for a period appropriate to the process. Stipulations are known up front, including terms of operations, environmental requirements, and development requirements.

In addition, partnerships are known ahead of time as they are developed prior to joint bidding for the concessions.

Of course there are work requirements. But no company bids on these types of concessions unless it plans to conduct activities.

So what can the state do to reverse the trend to overseas investment?

For one thing, the state must be a strong advocate of a stable and truly area-wide OCS lease sale program in Alaska.

The state should also support the opening of the Arctic National Wildlife Refuge Coastal Plain -- not only for the bonuses it would receive but also because a good discovery in ANWR would also justify construction of a pipeline to connect with the TransAlaska Pipeline and perhaps open up added opportunities.

The state also must do more to entice explorers back to Alaska and onshore. While the state has done a good job in allowing access to state lands and has provided reasonable stability in administrative processes, there is room for improvement.

We see a continual escalation of permitting requirements. Each additional permit is more stringent in its stipulations.

The value of this escalation is doubtful, both from an environmental perspective and certainly from a cost/benefit viewpoint. As an example, it recently took 3 years to permit a new drill pad in Kuparuk field.

There is also opportunity to streamline the permitting process. More than time is lost in the maze of paperwork. ARCO employs 35 people full time, and others spend part of their time to handle the permits required to drill about a dozen exploratory wells each year, as well as for development projects. If some of those people could be redirected to identifying exploration prospects, we could have a much better chance of finding the reserves that both Alaska and ARCO need.

EXPLORATION UNITS

Another way the state could help is in actively encouraging the formation of exploration units.

The exploration unit concept is a powerful way for the state to level the playing field in competition with other countries. It allows the combining of tracts with different expiration dates and different owners into a unit held together beyond individual lease expiration dates, as long as expected work is done.

We see the current process of forming units becoming more burdensome. What should take a week for administrative review by the state is now taking many months.

We are happy to hear that the state is now considering a form of the concession arrangement. The state and native corporations could and should work together in the interior basins to offer large blocks of land for exploration.

The completion of the state's land selections, which the Department of Natural Resources has identified as a top priority, offers a unique opportunity to aid the exploration process.

Lands can be selected to preserve access to prospective oil and gas resources and for transportation corridors for pipelines, if exploration is successful.

It would be difficult to restore Alaska to previous high levels of exploration activity. But with these improvements, the state can at least stem the tide of retreating exploration dollars.

Such new life to Alaskan exploration is essential as production from the old giant Prudhoe Bay continues its long, steady decline.

Responses to Additional Questions

RESPONSE OF KEVIN R. BANKS TO QUESTION FROM SENATOR BINGAMAN

Question 1. As a regulator for Alaska—do you feel that there are adequate safety and oil spill prevention and mitigation technologies available for E&P operators and drillers in the advent that a blowout or some other type of oil spill should occur onshore in arctic areas?

Answer. Since the Exxon Valdez oil spill, oil spill response planning and equipment staging and availability have improved dramatically. As a direct result of the State's oil spill response program outlined in AS 46.04.200, the Alaska Department of Environmental Conservation, (ADEC) develops, annually reviews, and revises, as necessary, the State Oil and Hazardous Substance Contingency Plans (Unified Plan and Subarea Contingency Plans). These plans address all oil and gas related contingency planning activity in the state. The Unified plan is a coordinated and cooperative effort by government agencies and was written jointly by the Alaska Department of Environmental Conservation, the U.S. Coast Guard and the U.S. Environmental Protection Agency. The Unified Plan is then divided into 10 Subarea Contingency Plans (SCP) that concentrate on issues and provisions specific to that region or subarea.

As identified in the Unified Plan, ADEC, as the State of Alaska's lead agency for responses to oil and hazardous substance spills, has developed a network of response equipment packages positioned in at-risk areas throughout the state.

ADEC also requires that all municipalities, operators of facilities and private owners be able to respond to spills and must itemize all spill response equipment required in their respective spill response contingency plans. Through the Unified Plan and the Subarea Contingency Plans, the ADEC has a comprehensive list of spill response equipment available to be deployed throughout the state.

In the North Slope subarea specifically, BPXA, ConocoPhillips Alaska and other companies operating in the North Slope oilfields have a substantial amount of spill response equipment, as identified in their respective contingency plans. In the event of a spill in this area, the industry spill response cooperative, Alaska Clean Seas, would provide much of the required response equipment and personnel. Industry equipment would also be utilized, especially when the company is identified as the responsible party for the spill.

While appropriate response equipment is staged throughout Alaska and the North Slope, due to its vastness and sometimes extreme weather conditions, there is always the logistical challenge of getting the right piece of equipment to the right location at the right time.

RESPONSES OF KEVIN R. BANKS TO QUESTIONS FROM SENATOR MURKOWSKI

Question 1. As you are aware, there has been a strong effort to find new sources of oil to keep the Trans-Alaska Pipeline System operating at sound levels. With Prudhoe Bay, Alaska has a super-enhanced oil recovery operation because so much gas is being re-injected into that huge field.

a. Can you address how Prudhoe was originally estimated to be maybe one third its size or less, and how much greater the recovery has been as technology has advanced?

Answer. A reference to Alaska Department of Natural Resources (DNR) report from January 1982—TAPS start up was June 1977—estimated that the Prudhoe

Bay, Sadlerochit reservoir in 1980 contained 7.8 billion barrels of recoverable oil. (DNR January 1982. Historical and Projected Oil and Gas Consumption) The most recent report published by DNR says that by the end of 2009, the Prudhoe Bay Unit produced 12.6 billion barrels of oil and still had remaining reserves of 2.4 billion- a total of 15 billion (DNR 2010 Annual Report). Total production to date from all of the fields on the North Slope exceeds 16 billion barrels.

This growth of the Prudhoe Bay field over time can be attributed to two causes: technological advances in recovery methods, and the fact that as drilling progresses, additional reserves were added with discovery and development of over-and underlying horizons, and around the periphery of the field.

Question 1b. Can you describe the progress that has been made, through the use of modern technologies, in shrinking the footprint for drilling areas, roads, and other facilities?

Answer. In my written submission to the committee I provided several examples that show how the drilling technologies, including especially the use of extended reach drilling has significantly reduced the size of drill sites on the surface and the number of drill sites required to reach the oil reservoirs underground. To illustrate the point, one of the earliest drill sites built in the in the 1970's at Prudhoe Bay (DS-1), covered 65 acres of tundra. Well spacing, the distance between the well heads on the site, was 160 feet. Each early Prudhoe Bay drill site could accommodate 25-30 wells. These wells could be deviated from vertical only about a mile.

The Alpine field (the Colville River Unit) is a recent example of how far the technology has advanced to reduce the industry's onshore footprint. The typical Alpine drill site is only 13 acres and supports 54 wells. Extended reach drilling means that the wells can reach four miles from vertical and intercept 50 square miles of the reservoir from a single location on the surface. Alpine is also the first oil field on the North Slope that is not supported by a year-round road. During the winter, the operator builds an ice road to the central Alpine facility and equipment is staged there for summer work. Operations during the summer months are supported by air.

Question 2. Is it fair to say that the technologies born in Alaska have grown out of necessity? In other words, has the combination of strict environmental laws and the economic considerations of not wanting to drag many new rigs and new equipment that great of a distance caused a natural inclination to make the most of seismic data, shrink footprints, reach further from one pad, and try to squeeze as much from one well as possible?

Answer. Yes, it is fair to say that these technologies have been born out of necessity. We would add that the driving forces behind technological advancements reflect regulatory insistence and industry commitment to maximize economic benefit and recovery while minimizing the development footprint. It has been necessary to engineer the development of smaller fields at reduced costs, adopting more innovations to increase recovery efficiency, both at the level of individual wells and entire fields.

The fact that the in-place oil volumes in several of the North Slope's largest fields (Prudhoe Bay, Kuparuk, and the various heavy oil reservoirs) are so enormous means that the economic return associated with increasing total recovery by even 1-2% is worth major investments in new technologies that make that additional recovery feasible. On the other hand, many of the North Slope's smaller fields face major economic challenges that were mitigated in large part by technological advances and efficiencies that originated in the giant fields nearby.

The following are examples of some of the many technologies that have been created or refined in developing the major oil fields of the North Slope:

Technology	Impact
Extended reach drilling	Dramatically fewer surface pads needed to access reservoir.
Horizontal/designer wells	Improves reservoir drainage relative to vertical wells.
Coiled tubing drilling	Reduces noise, fuel consumption, emissions, cost, surface area.
Multi-lateral drilling	Drains more of reservoir per surface well location.
Grind-and-inject	Zero surface discharge of drilling wastes.
Reservoir modeling	Models oil-in-place, drainage, injection, pressure, etc. in 3-D over time.
WAG, MWAG, MI, etc.	Enhanced oil recovery methods, beyond simple waterflooding.
Gas cap water injection	Stabilizes reservoir pressure, increasing oil recovery.
Gravity survey surveillance	Monitors movement of reservoir fluids over time.
3-D and 4-D seismic	Sharper imaging of reservoir compartments, fluid movements, etc..
BrightWater EOR treatments	Improves waterflood efficiency by blocking off thief zones.
Low-salinity water injection	Liberates oil molecules bound to clay particles in the reservoir rock.
Heavy oil extraction methods	Several different methods in development to enhance recovery, depending on reservoir temperature, oil viscosity, etc..

a. Would the other witnesses like to comment on the Alaska experience and how it's allowed operations elsewhere to advance?

Question 3. Some have suggested that the Trans-Alaska Pipeline System is perfectly capable of operating soundly until mid-century, even with no access to federally controlled oil deposits. As one of the State's leading oil experts, can you describe the throughput decline of TAPS and what it will take to maintain its operation through that point in the future?

Answer. TAPS was originally designed to move about 1.5 million barrels per day. Throughput peaked at 2.03 million barrels per day in 1988-a rate achievable with the application of drag reducing agents and other improvements. Throughput has declined in all but two years since 1988. Current throughput is about 0.6 million barrels per day. Most forecasts show continued decline into the future.

The TAPS line has already begun to be impacted by lower throughput. During the shut-down in January 2011 (leak at Pump Station No. 1), there was concern about being able to restart the line due to the temperature. TAPS will have some material operational issues as the flow rate reaches 0.3 million barrels per day. The operational issues are primarily related to the temperature of the crude as it moves through the pipeline. With less flow and without mitigating investments, the temperature may fall below 32 F. Lower temperatures may allow ice to form inside the pipeline that could damage equipment and cause possible frost heaving on buried sections of the pipeline route. Lower temperatures will also lead to more build-up of wax on the inside of the pipeline, and increase the viscosity of the crude moving in TAPS.

More than 99% of TAPS throughput comes from fields on State or Native lands or from State waters. Production from Federal lands and the OCS today amounts to less than two thousand barrels per day.

With the exception of development of the heavy oil resources known to exist around the Prudhoe Bay, Kuparuk, and Milne Point fields, and potential resource plays (like the Bakken in North Dakota) that may exist on the North Slope on State controlled lands, the natural field declines cannot be replaced without access to production from Federal lands and the OCS. There are no known conventional resources on State or Native lands that are likely sufficient to replace the decline in the existing production rates.

Conoco-Phillips and Anadarko want to expand the Alpine field by developing a new drill site (CD-5). New production would come from State, Native, and Federal lands (~60 miles west of TAPS). This development is on hold awaiting permits from the Corps of Engineers to allow construction of a bridge over the Colville River. The permit was first requested in 2005. Development in the National Petroleum Reserve Alaska (NPRA) can only proceed once the Alpine bridge over the Colville River is complete. Thankfully, the Administration has proposed having lease sales in the NPRA annually. We hope that these sales will be accompanied by a willingness of federal agencies to allow permits for development (e.g., CD-5 project) and that lands with high resource potential (e.g., north of Teshekpuk Lake) can be made available for leasing with appropriate environmental safeguards.

There are current plans to develop an oil and gas field on State lands at Point Thomson (Miles east of TAPS). Development at Point Thomson has also been delayed due to Corps of Engineers permitting issues. Development of resources at Point Thomson would extend the feeder lines for TAPS about 30 miles east of the Badami field. This would lessen development costs and could lead to development in this relatively unexplored area. It is also at the boundary to ANWR and the 1002 area.

Question 4. Can you talk about the new technologies we're hearing about in terms of allowing for development of an area where the law doesn't currently allow for conventional access? In other words, are there applications for this technology that would provide an opportunity to extract resources from the 1002 area subsurface without having any permanent or significant impacts on the surface area?

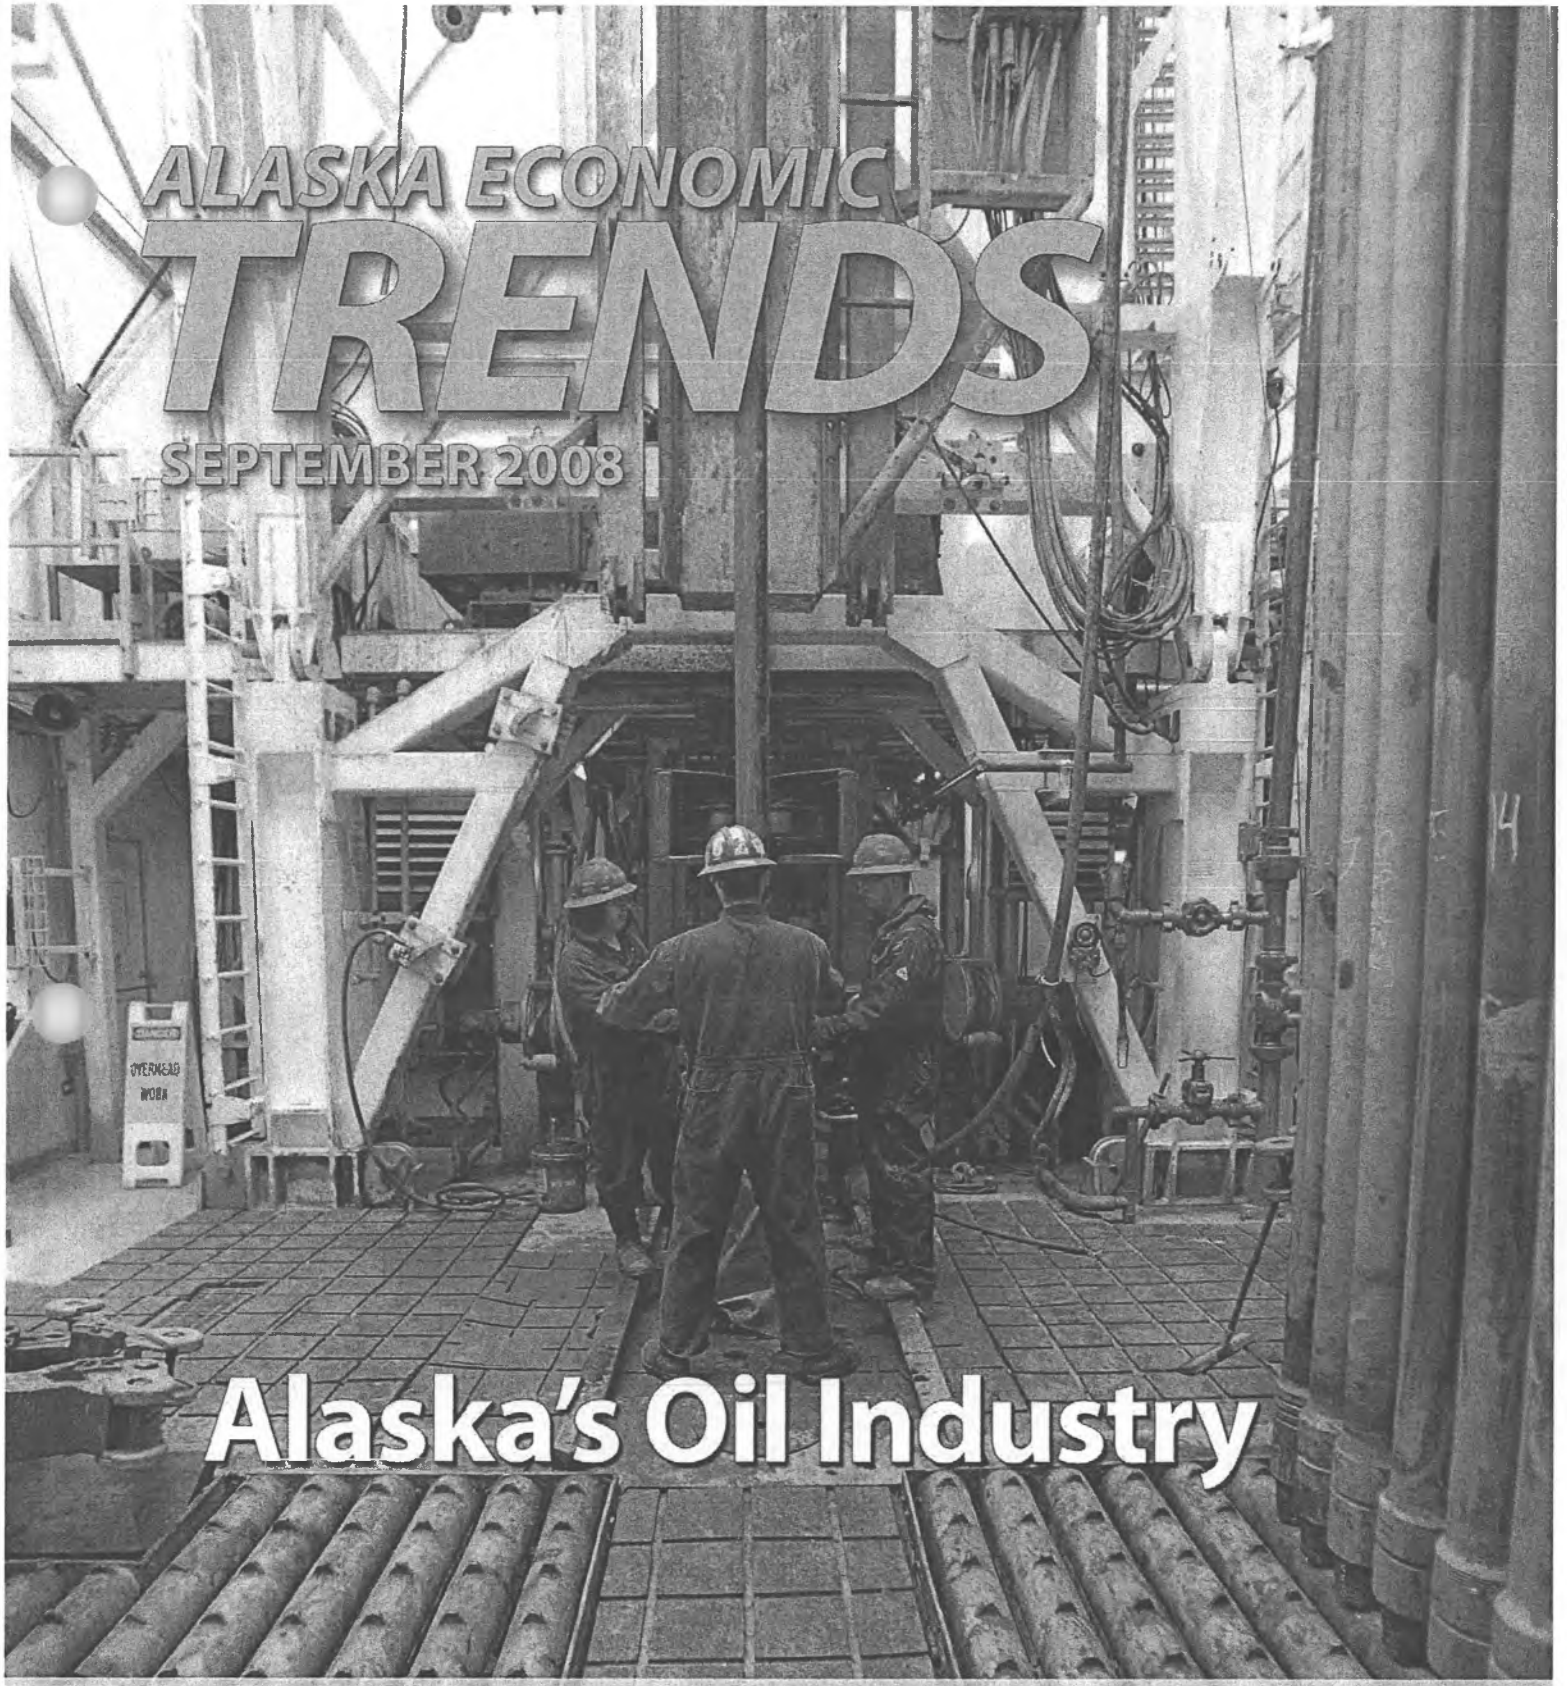
Answer. Although it remains unclear how far, if at all, the Sourdough or Pt. Thomson reservoirs discovered on State leases near the Canning River delta might extend beneath the 1002 area, there is the potential that extended reach drilling could at least partially develop these reservoirs. Without more detailed subsurface data on these and other prospects along ANWR's western border and along the coastline adjacent to state submerged waters, it will not be possible to accurately evaluate how much of these reservoirs would benefit from extended reach drilling techniques. Three-dimensional seismic acquisition and near-vertical exploration and delineation drilling would have to occur inside the 1002 area. These activities can be conducted in the winter with zero or minimal permanent surface impact. Allowing these activities would help answer the question of whether how much oil extended-reach production wells drilled from outside ANWR would be economically viable.

RESPONSES OF THOMAS DAVIS TO QUESTIONS FROM SENATOR BINGAMAN

Question 1. Are there recent advances that will help reduce the footprint of seismic activities in environmentally sensitive areas, both in terms of active seismic data acquisition and passive?

Answer. Yes, major advances have occurred with the advent of wireless seismic technology and increased sensitivity and numbers of seismic sensors. Wireless recording systems now leave only human footprints in terms of placement of recording systems. The weight and power consumption of these wireless recorders is such that a person can carry several devices and plant them in environmentally sensitive areas provided they are accessible to humans. There has been recent experimentation with dropping these devices from helicopters as well, but retrieval remains an issue. These devices can record up to a month without being serviced. They contain GPS receivers and the clocks in the devices are synchronized and are highly accurate. The devices can be placed in active recording mode to record generated sources from hydraulic vibrators, weigh drops, or dynamite, for example. They can also be placed in continuous recording mode when the intention is to record passively the natural seismicity or induced seismicity, for example, from drilling or completion operations.

Question 2. Have there been any recent advances in downhole seismic instrumentation that allows an operator to see further into the formation from the wellbore to areas that may not have been adequately imaged using conventional 2-or 3-Dimensional seismic data?



a) Or to areas that cannot be accessed at the surface due to environmental sensitivities?

b) In other words, is there a borehole version of conventional seismic?

Answer. Yes, major advances have occurred in downhole seismic recording technology as well. We have developed capabilities to record with borehole arrays of receivers spanning different intervals and within different wells. The closer we can

Alaska's Resources Provide Economic Opportunity

By Governor Sarah Palin

Alaska's natural resources have painted our past and present economic landscape, and our future depends on wise management of Alaska's resource bounty.

Currently, oil revenues provide 88 percent of the state general fund. Thanks to oil revenues, wise Alaskans created the Permanent Fund that has returned about $15 billion in dividends to Alaskans.

Energy generates more than a quarter of the state's gross state product and its riches trickle down through every pocket of the state's economy. Yet the energy industry employs only 4 percent of Alaska's workers, even with a 34 percent growth since 2000 to about 12,000 jobs in June 2008.

Most of Alaska's oil jobs are concentrated in the industry's production and management centers. More than half, 58 percent, are employed on the North Slope, followed by 21 percent in Anchorage. Of the remainder, 10 percent are on the Kenai Peninsula, 7 percent in the Fairbanks North Star Borough, 2 percent in Valdez and 2 percent elsewhere in the state.

Last November, with the hard work of our Legislature, we adopted legislation that ensured a fair share of our oil's value for Alaska and Alaskans. With current higher oil prices, the state's revenue from oil taxes could reach $10 billion to $14 billion this fiscal year.

Our Legislature recently agreed that we must help Alaska families get through the tough winter ahead by sharing the state's oil resources with a one-time, special payment of $1,200 to each Alaskan eligible for the 2008 Permanent Fund Dividend.

But our longer-term prosperity will come from a gasline. With the Legislature's Aug. 1 decision to award the Alaska Gasline Inducement Act license to TransCanada, we can finally look ahead to bringing Alaska's natural gas from the North Slope to our homes, businesses and fellow Americans in the Lower 48.

We are one of the most resource-rich regions in the world. Yet, as we take advantage of our tremendous economic opportunities, we must address the large percentage of nonresidents and an emerging workforce skills gap as a high number of workers approach retirement.

The Alaska Department of Labor and Workforce Development's AGIA Training Plan is a roadmap that will help enhance Alaska's existing training programs so that Alaskans are provided opportunities to acquire or upgrade skills in preparation for gasline jobs. This time we won't rely on imported workers.

Strong partnerships are being created – within state government between the Department of Labor, Alaska Department of Education and Early Development and the entire University of Alaska system, along with other training providers, business and industry. Our efforts have resulted in numerous system improvements, including construction academies in a number of communities that train both Alaska youth and adults for jobs in the construction industry, expansion of the allied health and engineering programs at the University of Alaska, and the Alaska Career Ready Program in the Department of Education and Early Development.

We will continue our efforts to fund vocational, career and technical education that begins in our schools, relevant job training and apprenticeship opportunities to mentor new workers, among other critical needs.

Our natural resources – including our human resources – must be responsibly developed to ensure that Alaska's future is in capable hands.

Alaska's Oil Industry

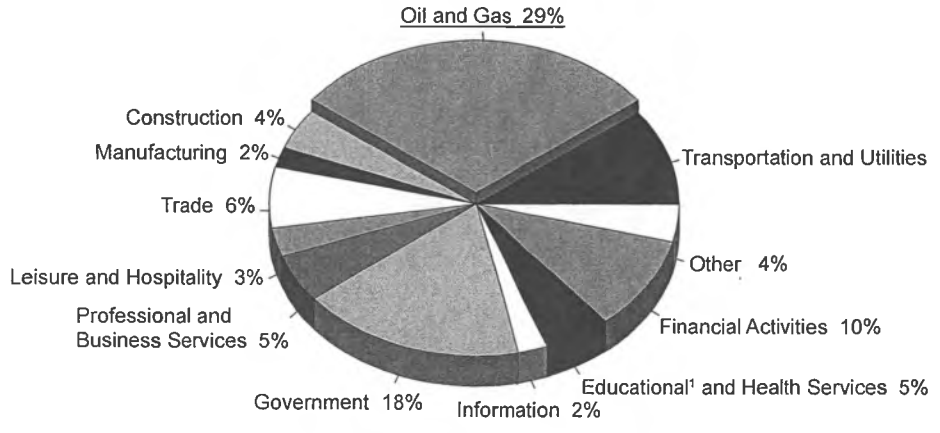
By Neal Fried,
Economist

Producing a third less oil but providing a record number of jobs

There's little doubt that the discovery of oil in Prudhoe Bay transformed Alaska's economy far beyond anyone's imagination. With as much as a third of the state's current economic activity somehow tied to oil, it certainly deserves a prominent place on Alaska's economic stage.

Part of the prosperity of Alaska's oil industry is defined by the direct jobs it creates around the state. The number of jobs isn't large, but they're some of the most sought-after jobs in Alaska. They require a highly skilled work force and their wages are the highest in the state. Aside from the lure of big paychecks, oil industry jobs have a bit of romance to them too – the excitement of discovery and the brawny work environment.

All that might partly explain why many Alaskans are relentless in their efforts to create more opportunities in the oil industry, whether it's a new discovery, developing the Arctic National Wildlife Refuge or building a gas pipeline. However, this article will focus on past and current employment trends in the industry to explain why its work force reached record levels in 2008, 20 years after oil production peaked.



A relatively small employer with a big roar

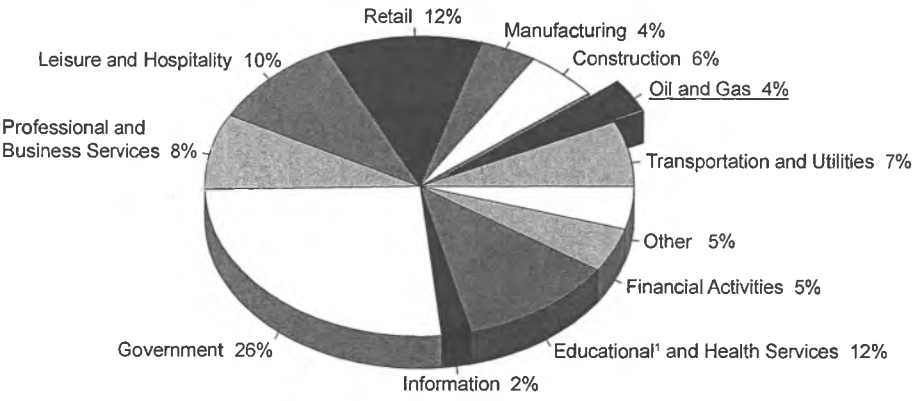
Oil revenue makes up 88 percent of the state general fund's unrestricted revenue. The stream from oil revenue could reach $10 billion to $14 billion this fiscal year,[1] according to some estimates.

The Alaska Permanent Fund, made possible by oil, has dispersed roughly $15 billion in dividends since it began giving them in 1982. On a local level, the oil industry is often one of the largest property taxpayers. It generates more than a quarter of the state's gross state product.[2] (See Exhibit 1.) There are many other ways oil showers down on Alaska's economy as well.

But given all of that, the oil industry still isn't a very big direct employer.

1 A Large Slice of Alaska's Gross State Product
Alaska, 2006

[1]Private education only
Source: U.S. Department of Commerce, Bureau of Economic Analysis



[1] The current fiscal year is fiscal year 2009, which runs from July 1, 2008, to June 30, 2009.
[2] Gross state product for Alaska is a measurement similar to the gross national product, though it's limited to the production that takes place within the state's borders. It's the sum of value added from all industries in the state.

In this article, direct oil and gas industry employers are defined as oil producers and oil field service companies – firms such as ASRC Energy Services, ConocoPhillips, CH2M Hill, Doyon Drilling, Peak Oilfield Services Company, Halliburton and Kuukpik Drilling. In technical terms, they fall into three groups: oil and gas extraction, drilling oil and gas wells, and support activities for oil and gas operations.[3]

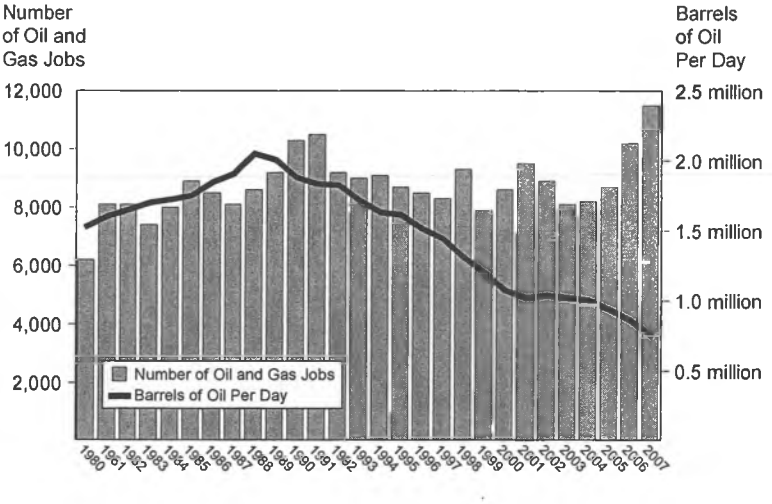
Using that relatively narrow definition, oil and gas employment (referred to as oil industry employment for the rest of this article) in June stood at 12,600.

Oil Industry Employment – Small But Mighty 2

Alaska's wage and salary employment, 2007

[1]Private education only
Source: Alaska Department of Labor and Workforce Development, Research and Analysis Section

Those jobs represent 4 percent of all wage and salary employment in Alaska, based on 2007 average annual employment numbers. (See Exhibit 2.)



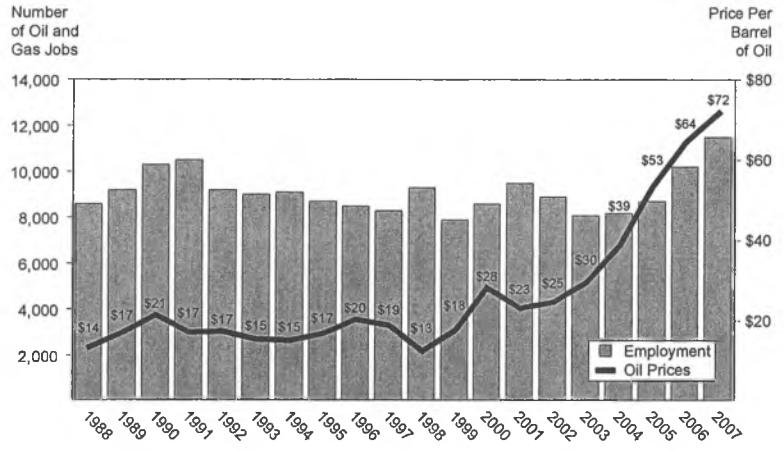
If the narrow oil industry employment definition were broadened to include pipeline transportation – mostly Alyeska Pipeline Service Co. – and petroleum refineries and other downstream operations, the share would be slightly higher.

Because the oil industry's average wage is more than twice the statewide average wage, its payroll impact is more impressive. Alaska's oil industry payroll in 2007 added up to $1.3 billon, which represented 9 percent of all wage and salary payroll. If pipelines and downstream operations such as refineries are included, the share grows to nearly 11 percent.

Another recent example of the oil industry's influence on wages is reflected in payroll growth. Between 2006 and 2007, the oil industry's payroll grew by 18.8 percent. The total state payroll grew by 5.8 percent, the largest increase since 2000.

Less Oil Production But More Jobs 3

Alaska, 1980 to 2007



Sources: Alaska Department of Labor and Workforce Development, Research and Analysis Section; and Alaska Department of Revenue, Tax Division

There are certainly thousands of other direct jobs that service the oil industry but aren't categorized as jobs with oil industry employers. Out of the more than 9,000 jobs in Prudhoe Bay in 2007, more than 1,500 weren't with oil industry employers.

For example, NANA Management Services is one of the larger employers in Prudhoe Bay. Its

4 Oil Prices Impact Industry Employment
Alaska, 1988 to 2007

Source: Alaska Department of Revenue, Tax Division; and Alaska Department of Labor and Workforce Development, Research and Analysis Section

decade have had a powerful effect on employment levels.

Examples include the widespread use of horizontal drilling, ultra extended-reach drilling, 3-D and 4-D seismic surveys, drill bit sensors and other advancements that reduced the number of wells that need to be drilled.

According to the Federal Reserve Bank of Dallas, the national oil and gas industry was the leader in productivity gains throughout the 1990s and continues to be an above-average performer. In other words, the oil industry has been able to perform more work using fewer workers.

employment falls into the four categories of catering, accommodations, facilities management and construction.

Other direct jobs associated with oil industry activity but not categorized as oil industry employment include those for security, transportation, engineering and logistic employers, among others.

Alaska's oil industry employment first peaked in 1991

For most of the past 15 years, Alaska's oil industry employment levels have fluctuated from year to year, with an overarching declining trend accompanied by periods of recovery. (See Exhibit 3.) Oil production peaked in 1988, and shortly after that, oil industry employment peaked in 1991 at 10,700. It wouldn't be until 2006 that the 10,000 barrier would be broken again.

Nationally, oil industry employment had peaked nearly a decade earlier in 1982, a testament at the time to the relative youth of Alaska's oil industry.

Other factors aside from production levels and prices explain the changing size of the oil industry's work force, both nationally and in Alaska. Dramatic improvements in technology in the last

Therefore, a decline in employment – nationally and in Alaska – wasn't always tied to a decline in production. The major oil producers also increasingly began using contractors, consultants, outside suppliers and temporary workers to perform many tasks, instead of adding to their permanent staff. That meant that both gains and losses in the industry weren't always captured among the oil industry employers.

One of the largest contractions in Alaska's oil industry work force took place from 1991 to 1992. BP, along with other oil industry employers and contractors, went through a period of major restructuring and consolidation in response to declining oil prices. The downsizing cost the industry 1,300 jobs – a record one-year loss.

Weak oil prices and other factors buffeted the industry again in 1995, when Atlantic Richfield Co. made major cuts to the size of its work force.

By 1998, employment in Alaska's oil patch began to recover with the development of the Alpine, Tarn and Badami fields, the drilling at West Sak, and preliminary work at North Star, Liberty and other fields.

Oil prices plunged from nearly $19 per barrel in 1997 to $13 in 1998 and record job losses followed. (See Exhibit 4.) For the first time since 1983, Alaska's oil industry employment fell be-

low 8,000 and the losses reverberated throughout the state's economy.

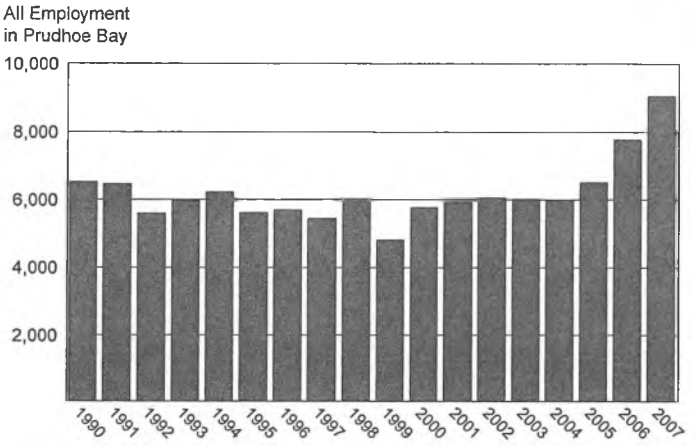
Finally, in 2000, recovery kicked in and by 2001, oil industry employment reached a 10-year high, nearly 2,000 jobs higher than the industry's nadir in 1999. The near concurrent development of both the Alpine and North Star oil fields were the two major reasons for the upswing in activity. What gave the oil industry's employment numbers some extra loft was the construction of large oil modules in Kenai and Anchorage. Before that, they were built in the Lower 48 or overseas.

The year 2000 marked a historic event: Alaska's largest oil industry employer and discoverer of Prudhoe Bay, Atlantic Richfield, disappeared from the scene when it sold its assets to BP and ConocoPhillips. The sale was a signal to many observers that Alaska's oil industry was moving into its very "mature" stage of development, and – barring any major field discoveries, the opening of ANWR for exploration or construction of a gas line – the industry's employment trajectory was most likely on a permanent downward sloping curve.

Oil industry employment climbs to new record

The following four years appeared to reinforce that view. With most of the work completed on the North Star and Alpine fields, oil industry employment began to fall steeply in 2001 and then hover at the 8,000 level through 2004. What made that peculiar was the fact that the price of oil was recovering nicely from its 2001 low of $23 a barrel to $39 in 2004. Even so, it appeared as if Alaska's oil work force was entering an era of stagnation and enduring decline.

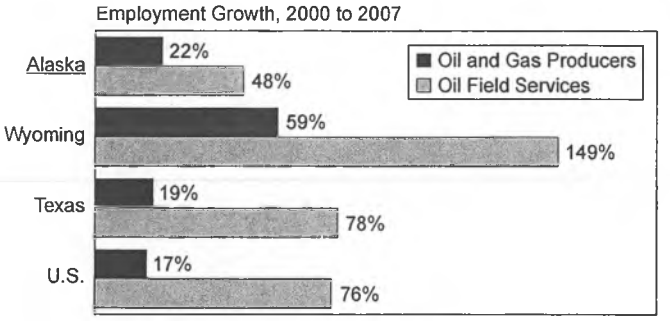
Finally, and possibly due to four years of above-average oil prices that by 2005 had more than doubled from the 2001 low, the oil industry began to stir again in 2005.



Unlike many earlier recoveries, this one wasn't tied to one or two projects. Instead, there were a lot of smaller ones: continued work on heavy oil in West Sak, an increase in the production of viscous oil, the repair of Prudhoe Bay production wells, work around Alpine, the building of new connecting pipelines, and the continued development of a number of satellite fields.

Then in early 2006, a section of BP's pipeline sprung a leak. It eventually turned out to be the largest oil spill in the North Slope's history.

Soon afterward, BP discovered additional corrosion problems, forcing the company to shut down the pipeline for a short period.



The spill and corrosion led BP to spend more than $260 million in 2007 and 2008 to replace 16 miles of pipeline in Prudhoe Bay and up-

grade the company's facilities. Undoubtedly, that helped turbo-charge Prudhoe Bay employment numbers in late 2006 and early 2007. (See Exhibit 5.)

In fact, the University of Alaska's statewide construction forecast for 2007 predicted that construction dollars tied to oil industry activity would grow by 30 percent, single-handedly keeping overall statewide construction spending in the black that year.

Oil-related construction represented 38 percent of all construction dollars in 2007, compared to 28 percent in 2004. In a similar vein, the Alaska Department of Revenue estimates that capital expenditures made by the oil industry on the North Slope nearly doubled between 2004 and 2007.

The growing list of independent producers and other new players was another contributing factor to the upswing in activity. Shell Oil, for example, returned to the state in 2005; the company brought two drilling ships to drill four wells in the Beaufort Sea in 2007. Shell's plans were shelved due to permitting problems, but the company continues to work on the project. It has also launched plans for other offshore drilling programs.

In fact, Shell was the largest bidder in the 2008 Chukchi lease sale that netted $2.7 billion, making it the highest lease bid in Alaska's history. The surprise wasn't just the dollar amount; it was also its location. The leases are 50 miles offshore and hundreds of miles from any onshore infrastructure. Such an investment could possibly be ushering in a new kind of oil development in Alaska.

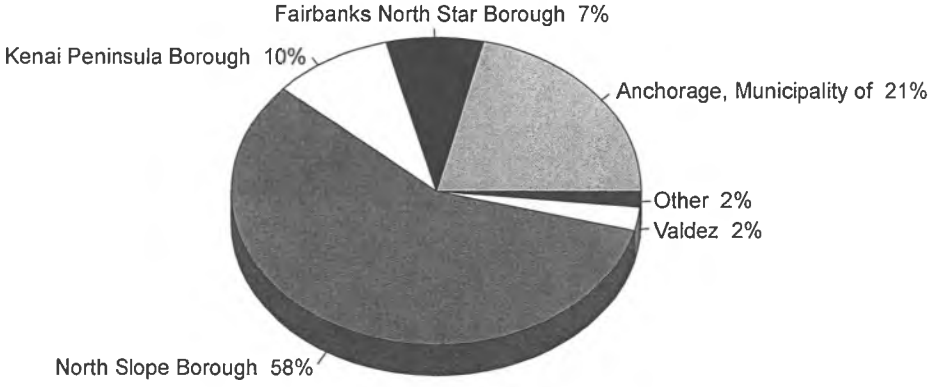
Another example of a newcomer that's mixing things up in the industry is Pioneer Natural Resources. The company, with its minor partner, Eni Petroleum, made North Slope history when it finished the $500 million-plus development of its offshore Oooguruk project in June. That made Pioneer the first independent to operate a producing oil field on the North Slope.

Other independents, newcomers and companies that have returned to the North Slope are either pursuing development in Alaska or have plans to do so. Those include FEX, Brooks Range Petroleum, Pacific Energy Resources, Statoil-Hydro and Petro Canada.

All that new activity is reflected in the oil industry's employment numbers. By 2006, oil industry employment reached near-record levels, and by 2007, the industry's employment zoomed past the 11,000 mark for the first time in history.

Another record was set last January when oil industry employment surpassed the 12,000 mark. It has remained at those new lofty levels through the first half of this year.

It's not unusual that most of that growth came from the oil field services side of employment and not the producers. (See Exhibit 6.) Typically, most of the changes in the level of oil industry employment come from the oil field service side of the industry. The producers, however, also grew – particularly BP.



BP's employment in 2000 was 1,018. By 2006 it reached 1,508 and it continued to grow. Some of BP's growth resulted from the company buying up Atlantic Richfield's assets. However, who would have thought that 20 years after oil production peaked in Alaska, the state's oil industry work force would reach new record-levels and oil would again become one of the fastest-grow-

ing industries in the state? (See Exhibits 3 and 7.)

Most of the work force is on the North Slope, in Anchorage and on the Kenai Peninsula

Nearly 90 percent of Alaska's oil industry employment is concentrated in three areas: Anchorage, and the North Slope and Kenai Peninsula boroughs. (See Exhibits 8 and 9.) The latter two are where all of the oil is produced; Anchorage is the state headquarters for many oil industry players.

Where the Oil and Oil-Related Jobs Are 8
Alaska, 2007

Note: This exhibit includes oil and gas, refinery, urea and pipeline employment.
Source: Alaska Department of Labor and Workforce Development, Research and Analysis Section

Not surprisingly, the North Slope has the largest concentration of the oil industry's work force. Nearly half the North Slope's wage and salary employment stems from the oil industry.

Alaska's mature oil province, the Kenai Peninsula Borough, is home to oil and gas production, pipeline transportation, a liquid natural gas facility[4] and an oil refinery. The borough also had a urea-ammonia fertilizer plant that used natural gas as its feedstock, but it closed in late 2007.

Combined, all those players represent 7 percent of the Kenai Peninsula Borough's wage and salary employment. Alone, the oil industry represents 5 percent. Because oil industry wages are more than twice the borough's average wage, the oil industry is responsible for 12 percent of the borough's wage and salary payroll.

In Valdez, most direct oil industry employment is tied to transporting oil from the North Slope through the trans-Alaska oil pipeline. Alyeska Pipeline Service Co. is the single-largest employer. SERVS[5] is also a large employer. According to a recent Alaska Oil and Gas Association study, oil-related activity in 2007 generated nearly a quarter of Valdez's employment and more than a third of its payroll.

Although direct oil industry employment in the Fairbanks North Star Borough is relatively small, it's one of the North Slope's major logistic and supply centers. The same study attributes 3,250 jobs in Fairbanks to oil-related employment – 5.5 percent of the borough's wage and salary employment.

Fairbanks is also home to two oil refineries; Valdez has one.

A commuter work force

Although most jobs in the oil industry are concentrated in specific geographic areas, its work force is drawn from all around Alaska and the rest of the United States. That's particularly true for the North Slope, where only a few of the oil industry workers are North Slope residents.

After Anchorage residents, Matanuska-Susitna Borough residents and then Kenai Peninsula Borough residents form the second- and third-largest groups of Alaska residents who are North Slope workers, according to the 2000 Census. And there's little reason to believe that's changed since then. There's probably no area in the state that doesn't send some of its labor force to work somewhere in Alaska's oil fields.

[4] Also called an LNG facility

[5] SERVS is an acronym for Ship Escort/Response Vessel Systems. SERVS is an Alyeska subsidiary but the employment for SERVS and Alyeska is counted separately.

As far as the oil industry's importance to the economies of different states, there's little doubt Alaska ranks first. (See Exhibit 12.) However, a person wouldn't guess that by looking at the size of Alaska's oil industry work force.

Alaska produced 15 percent of the nation's domestic oil supply in 2007 but employed only 3 percent of the U.S. oil and gas work force. (See Exhibit 13.) Texas produced 75 percent more oil than Alaska the same year but its oil industry work force was 195,000 strong – 17 times as large as Alaska's. (See Exhibit 11.)

For example, in the Mat-Su Borough, where no oil industry exists, about 6 percent of the borough's working population commutes to the North Slope to work. That's not surprising because Mat-Su's average wage for all industries is a third lower than the state's average oil industry wage.

A different twist on that story is the fact that the Kenai Peninsula Borough, which has the second-highest concentration of oil industry jobs within its boundaries – the North Slope has the highest – also exports many of its residents to work in the oil industry elsewhere in the state.

Number of nonresidents in the industry grows

Over the past decade, between 25 percent and 31 percent of Alaska's oil industry workers have been nonresidents (see Exhibit 10), and wages paid to nonresidents in the industry have grown from $243 million to $328 million. The year 2006 was a record year for the number and percentage of nonresidents in the industry.

How does Alaska compare to other oil-producing states?

Since 1979, Alaska has been the nation's No. 2 oil-producing state. If federal offshore production is included, Alaska ranks third behind Louisiana. (See Exhibit 11.)

It's not just among the big producing states where that imbalance exists. In New Mexico, for instance, oil production in 2007 was less than a quarter as large as Alaska's but New Mexico's oil industry work force was more than 3,000 larger. Many of the states mentioned produce more gas than Alaska. (The gas work force is included in the employment numbers.) More on that later.

But that doesn't explain most of the difference. There are a host of reasons that explain Alaska's much-smaller oil industry work force, in light of its tremendous production.

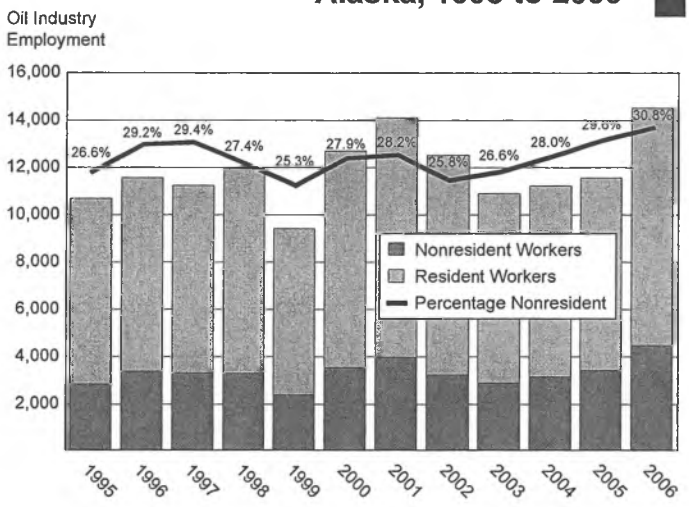
One big reason is simply that Alaska's oil fields enjoy large economies of scale. Prudhoe Bay, which is still responsible for 36 percent of the state's oil production, is the largest oil field in the nation and doesn't need a huge work force to produce its oil. Other fields on the North Slope, such as Kuparuk – the nation's second-largest – and Alpine, Milne Point and Liberty, keep company with the nation's larger oil fields. In fact, 14 of the nation's 100 largest oil fields are in Alaska.

In Texas, Oklahoma, Wyoming and other oil-producing states, some oil is produced from very small fields. There are 400,000 marginal fields or stripper wells operating in the U.S. and

a stripper well produces 10 barrels of oil or less per day. In many of the states, there are literally thousands of families and small companies engaged in producing oil and gas – something nearly totally absent in Alaska.

The U.S. Census Bureau in 2006 identified 65 oil and gas establishments in Alaska, versus 754 in Wyoming, 1,305 in Oklahoma and 6,472 in Texas.

Another example of the difference between Alaska and other states is the number of wells being drilled. The Baker Hughes rig count for July was four for Alaska versus 923 in Texas. Even the count in Montana was higher than Alaska's. If Alaska's oil fields weren't as remote, employment in Alaska's oil patch would be considerably higher. Oil fields now considered marginal or simply noneconomic would be economic in a less remote environment.



Alaska is also less likely to be home to an oil industry headquarters or regional center, which also cuts into the size of its oil industry work force.

That's also true for many of the oil field service companies and contractors. Other functions, such as corporate, research and sometimes exploration, take place outside Alaska. For example, Houston alone is home to more than 85,000 oil and gas industry workers who are serving Texas' needs but also the rest of the nation's and the world's.

Yet, there are a group of firms in Alaska that are homegrown and have their headquarters in the state. They include companies such as ASRC Energy Services (the largest oil industry employer in the state), AES-Houston Contracting Company, Peak Oilfield Service Company, Udelhoven Oilfield System Services, Doyon Drilling and others. Just recently, Arctic Slope Regional Corporation announced it would no longer just be an oil service contractor – it would get involved in exploration and oil production as well.

But what is also true is that nearly all Alaska's oil industry work force is in the state solely to produce oil and gas in Alaska, not to provide

12 An Outsized Effect on Alaska
Alaska and other states, 2006

[1]The percentages in this exhibit are estimates only. Due to the unavailabilty of Bureau of Economic Analysis detail, an assumption of support mining activities was made. The oil and gas contribution for the states, with the exception of Alaska, may be slightly too high.
Source: U.S. Department of Commerce, Bureau of Economic Analysis

their services elsewhere in the country or world. There are of course exceptions. Some Alaska-based firms have taken their arctic and other types of expertise and performed work Outside, but they're the exception.

Not only does Alaska have a considerably smaller oil extraction work force, it also has a smaller transportation infrastructure and fewer downstream operations, such as refineries. (Texas' refinery capacity is 4.6 million barrels per day compared to Alaska's 375,000.) And while Alaska has an 800-mile pipeline and a number of smaller ones, its pipelines don't compare to the thousands of miles of pipelines that snake through other states.

Alaska refineries for the most part only service local demand, which is relatively small. One exception is the jet fuel the state's refineries process for the huge international cargo fleet operating out of Anchorage. Alaska's refineries include Flint Hills and Petro Star in Fairbanks, Tesoro in Kenai, Petro Star in Valdez and two very small refineries on the North Slope.

Until recently, Alaska had only two downstream operations other than refineries, and that number was whittled down to one when Agrium's Kenai Peninsula fertilizer plant closed last year, as mentioned earlier. The only player now is ConocoPhillips' liquid natural gas facility on the Kenai Peninsula, which exports its product to Japan.

Among America's energy producers, Alaska is among the slow-growers

Alaska obviously isn't the only state or country enjoying the resurgence in oil industry activity – oil at $100-plus a barrel does wonders for the industry. Although a record number of oil and gas industry workers are currently working in Alaska's oil fields and the oil industry is now one of the most dynamic in the state, Alaska is growing more slowly compared to most other oil and gas producing states.

Oil industry employment in the rest of the U.S. began to grow in 2004, two years before it started to grow in Alaska. Between 2000 and 2007, employment in the U.S. grew by 44 percent versus 34 percent for Alaska. In contrast, employment in Wyoming more than doubled (113 percent) and in Texas it grew by 49 percent over the same period.

There are probably a number of reasons for Alaska's less-robust growth. One certainly is its remoteness and associated costs. However, there are other reasons. In all other energy-producing states, there are far more players in the industry and they come in all different sizes, which probably makes them more nimble – whereas Alaska is dominated by a handful of large companies that tend to move more slowly in a changing environment.

Another big reason for the difference is the role natural gas is playing in the upswing in employment activity. Unfortunately, there's no current method to separate oil from gas-related employment.

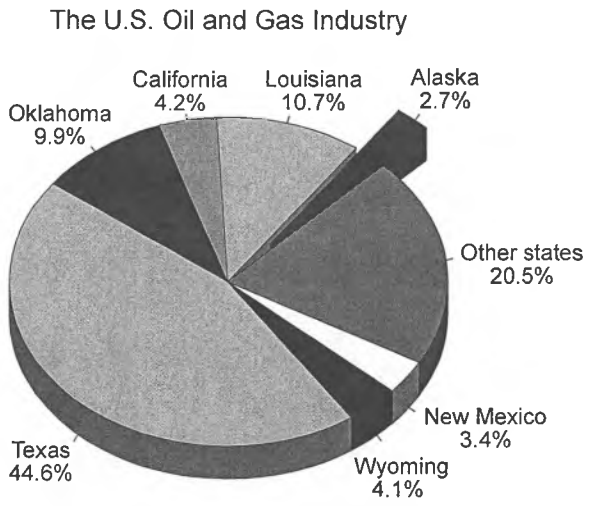
While oil production in many states and the nation as a whole has been in decline since the mid-1970s, that hasn't been the case for natural gas production. In fact, nationally, natural gas production in 2007 reached its second-highest level in 27 years. Probably the only reason it was higher in the early 1980s was because gas production was often a byproduct of oil exploration.

A natural gas boom is taking place in many parts of the country, particularly in the Rocky Mountain states, and New Mexico, Oklahoma and Texas. Natural gas production in the past decade has doubled in Colorado and Montana, and has more than doubled in Wyoming, now one of the nation's largest natural gas producers.

Most current growth in Wyoming's oil and gas work force is tied to the production of gas, although oil production has also edged up in the past two years.

Nearly all Alaska's natural gas production has been in Cook Inlet. It peaked in 1996 and has gradually declined.

High earnings are its big attraction



It's a well-known fact that wages in Alaska's oil industry are an outlier on the high side. The average annual wage for an oil industry job in 2007 was $108,538. (See Exhibit 14.) That's nearly two and a half times more than the statewide average of $43,524.

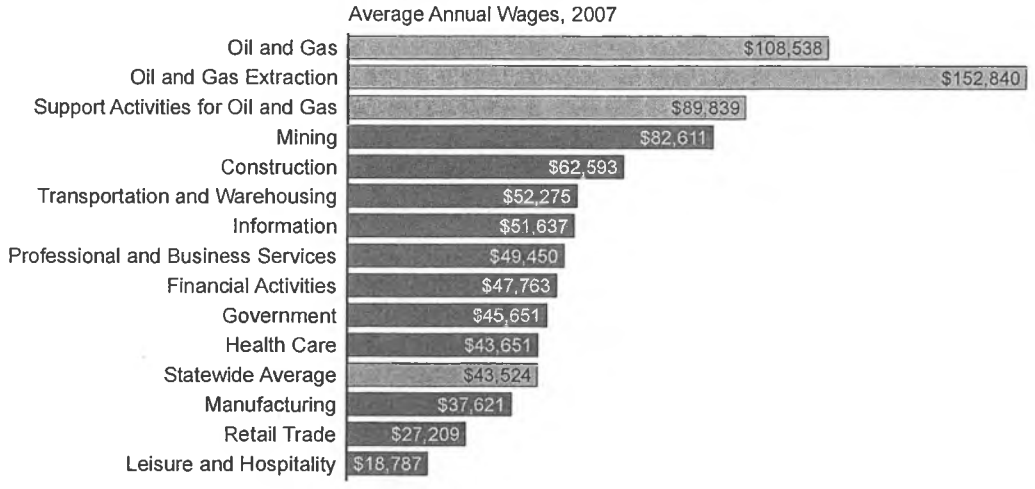
There are several reasons for the difference in pay, but what factors weigh heavier and which are less important isn't clear. Certainly, the profitability of the industry plays a role. The level of the required skills and experience, along with the demanding work schedules, are also factors.

Overtime, mostly stemming from shift schedules on the North Slope or on Cook Inlet platforms, plays a big role too. The most common shifts are week on/week off or two weeks on/two weeks off. Remote-based employees often work 84 hours a week, which means 40 hours of straight time and 44 hours of overtime.

Other reasons for the higher pay include the remote work site settings, the hazards of some occupations, and the extreme climate workers encounter on Alaska's oil fields. Workers' prolonged periods of separation from their families are definitely a factor in the equation. Longer tenure in the industry is also reflected in hourly pay rates.

A Small Share of the Nation's Jobs 13
Oil and gas employment, 2007

Sources: U.S. Department of Labor, Bureau of Labor Statistics; the labor market information Web sites for California, Louisiana, New Mexico, Oklahoma, Texas and Wyoming; and Alaska Department of Labor and Workforce Development, Research and Analysis Section



Wages in oil producer companies tend to be higher than those in oil field or drilling support firms – the average annual wage for the producers was $152,840. And more job security usually exists with the producers. Work in oil field or drilling support companies often tends to be more project-orientated, which explains to some degree their more volatile employment levels. Annual wages among the non-oil industry employers in the oil patch are considerably below the annual wages for both the oil producer companies and the oil field or drilling support companies.

Big stuff must happen to keep these numbers positive

Employment in the oil industry has waxed and waned over time, but after oil production peaked, it was logical to believe that the labor force in the industry would generally follow oil production's declining trend. There were periods with flurries of activity to help stem the production decline, and employment would rally for a while, but further declines followed.

Yet in 2007, record oil prices, an oil spill and other activity pushed employment to record

14 Oil Industry's Wages Are Highest in Alaska
Alaska, 2007

Source: Alaska Department of Labor and Workforce Development, Research and Analysis Section

highs, all while oil production continued to decline. However, it's probably clear that without other major developments or discoveries, the higher employment numbers will be temporary and those numbers will resume the broader downward trend.

There are ventures on the horizon, though, that might stem future losses and propel the oil industry to new heights, launching the state into a new oil and gas epoch. It all started with Cook Inlet, then moved on to Prudhoe Bay. Alaska could now be on the threshold of a new era by becoming one of the nation's largest gas producers.

Employment Scene

By Dan Robinson,
Economist

Two economic indicators, two different story lines

Alaska's seasonally adjusted unemployment rate rose two-tenths of a percentage point in July to 6.9 percent. June's preliminary rate was revised down one-tenth of a percentage point to 6.7 percent.

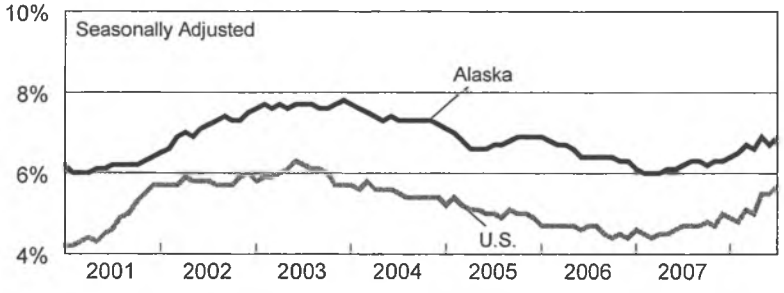
After steadily rising for most of 2007 and the first part of 2008, the state's rate has bounced around over the last four months and has not revealed a clear trend. For its part, the U.S. rate continued its gradual climb, rising two-tenths of a percentage point in July to 5.7 percent, a full percentage point higher than in July 2007.

Similar trends for Alaska and U.S. unemployment rates

The Alaska and U.S. rates have followed the same broad trends since at least 2001. (See Exhibit 1.) The national recession in the early part of the 2000s drove the U.S. rate from a low point of 4.2 percent to a high of 6.3 percent. After a lag of several months, Alaska's rate followed a similar course, rising from 6 percent to almost 8 percent between 2001 and 2003.

After the recession ended, the U.S. rate steadily fell until it reached a low point of 4.4 percent in early 2007. Alaska's rate fell by roughly the same margin and bottomed out at 6 percent in early 2007. Since then, both the U.S. and Alaska rates have climbed as the nation has likely entered another recessionary period.

Looking just at unemployment rates, it may be tempting to conclude that Alaska's economy follows the same business cycles as the nation, and that both economies are currently in the midst of a slowdown. The rates seem to suggest that when the nation's economy is thriving Alaska's is doing likewise and that recessions afflict both economies during roughly the same time periods.



Job growth tells a different story

But unemployment rates can be a complicated economic indicator, and although they provide important information about the percentage of the labor force looking for work, they shouldn't be seen as a simple barometer of an economy's health – especially at the state level.

A more simple and straightforward tool for assessing the health of an economy is the rate of growth in payroll jobs. Unlike unemployment rates, which over the short term can rise as an economy strengthens and fall as an economy weakens, an increase in payroll jobs almost always equates to economic growth and a decline in the payroll job count almost always means economic distress.

At the national level, the pattern of payroll job growth and loss is generally a reverse image of the rising and falling of the unemployment rate. For example, the U.S. economy registered job losses during the 2001-2002 recession as the unemployment rate climbed, and is showing losses again in 2008 as the unemployment rate has pushed upward. (See Exhibits 1 and 2.)

2 Payroll Employment, Alaska and U.S.
January 2001 to July 2008

Sources: Alaska Department of Labor and Workforce Development, Research and Analysis Section; and U.S. Department of Labor, Bureau of Labor Statistics

But Alaska's payroll numbers over those same years bear little resemblance to the state's pattern of rising and falling unemployment rates. Unlike the up-and-down U.S. payroll numbers, Alaska's data show consistent, moderate growth in payroll employment[1] with little apparent relationship to trends in the unemployment rate. (See Exhibits 1 and 2.)

Reconciling the two indicators

All this begs the question of how unemployment rates can rise in Alaska without payroll jobs falling as they nearly always do for the nation. The most likely explanation is that Alaska's unemployment rates over the 2001 to 2008 period have been driven more by a slosh of workers back and forth to the state from neighboring states than by changes in Alaska's ability to sustain and increase its count of payroll jobs.

As separate and distinct from the rest of the U.S. as Alaska can seem, it's important to remember that workers from other states can freely move to Alaska in search of employment and that Alaskans can freely move to other states when opportunities beckon.

The flow of workers to and from the U.S. is a much more regulated affair, with immigration laws and regulations limiting movement. With a more static labor pool, the nation generally sees corresponding changes in unemployment rates and payroll employment: when unemployment rates show a sustained upward trend, payroll jobs are usually falling and vice versa.

As a state with a highly seasonal, resource-based economy – and a climate that's not for everyone – Alaska has a particularly fluid resident population. About 6 percent of residents are new to the state each year and roughly that percentage also leave.

The number of people who migrate to Alaska – whether seasonally or with the intention of staying longer and making Alaska their home – is affected by the relative health of their home economies. If good jobs are plentiful locally, a person is less likely to look to Alaska for employment.

The same is true of Alaskans weighing the pros and cons of leaving the state for employment-related reasons. If the U.S. is in the midst of a recession, an Alaskan in search of work is less likely to leave the state than when the U.S. economy is strong and jobs are easier to come by.

Consequently, the number of unemployed workers and the unemployment rate in Alaska appear to have risen and fallen more in response to the rising and falling of the U.S. economy than to changes in the state's ability to generate job growth, which has been remarkably consistent for more than two decades.

It's important to recognize, though, that there are other possible explanations for why Alaska's unemployment rate could have been up and down during periods of relatively consistent payroll job growth. As noted, the rate is a compli-

[1] The jagged line of the graphed Alaska data also show the difficulty of seasonally adjusting numbers in a state where seasonal patterns are dramatic and occasionally shift due to the timing of fish harvesting and, less frequently, changes in weather patterns. The much smoother seasonally adjusted data for the U.S. reveal a more predictable seasonality, both in terms of the timing of seasonal movements and the magnitude of the movements. Because of Alaska's unruly seasonal patterns, the seasonally adjusted data aren't as reliable in interpreting changes from one month to the next as they are for the U.S. The seasonally adjusted data for Alaska are still useful, though, because over a period of several months they reveal changes in underlying trends more effectively than unadjusted data can.

cated indicator. Even assuming no migration to and from Alaska, the unemployment rate would change as the state's existing population moved in and out of the labor force.[2]

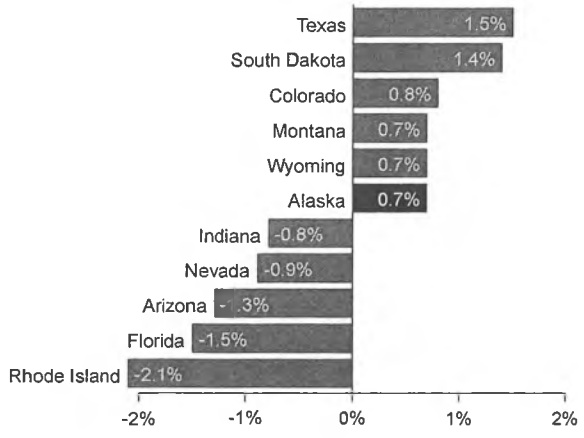
Job growth states benefiting from oil and gas boom

Through the first seven months of 2008, 28 of the 50 states registered a decline in payroll jobs and the nation as a whole lost more than 450,000 jobs.

On a percentage basis, the state with the biggest loss was Rhode Island with a 2.1 percent drop, followed by Florida, Arizona, Nevada and Indiana. (See Exhibit 3.)

Bucking the national trend are Texas and several other states that are benefiting from strong growth in the oil and gas industry. Alaska is tied with Montana and Wyoming for the fourth-highest growth rate in the country so far in 2008.

Nationwide, the natural resources and mining sector, which includes the oil and gas industry in addition to coal mines and other mining employers, has added about 40,000 jobs so far in 2008.



Payroll data follow seasonal trends

July and August are Alaska's peak employment months and the unadjusted payroll numbers show the expected seasonal increase. The net gain from June to July was 3,600 jobs as most of the state's seasonal employers shifted into their highest gears.

Seafood processing employment jumped by an estimated 5,800 in July and the construction and accommodations industries both added 600 jobs. Those additions more than compensated for the large seasonal decline in local government (-5,200) as public schools let out for the summer.

Alaska Doing Better than Most States 3

Payroll job growth in 2008,[1] highs and lows

[1] December 2007 to July 2008
Source: U.S. Department of Labor, Bureau of Labor Statistics

Job growth mostly in Anchorage/Mat-Su and Northern regions

Nearly all the state's over-the-year job growth was in the Anchorage/Mat-Su and Northern regions. (See Exhibit 6.) Growth in the Northern region is obviously driven by oil and gas, but so is much of the Anchorage/Mat-Su growth.

The oil companies' job counts in Anchorage have grown by an estimated 300 over the year and high levels of activity for the industry have stimulated growth in a variety of other industries. The Mat-Su Borough's growth continues to come predominately from its connection to Anchorage's job market.

A dramatic range of unemployment rates in July

July unemployment rates throughout the state ranged from a high of 26.8 percent in the Wade Hampton Census Area to a low of 1.5 percent in the Bristol Bay Borough. (See Exhibit 5.) Local unemployment rates were generally higher over the year, following the statewide trend. The only exception big enough to be of consequence was the North Slope Borough, which had a 4.7 percent rate in July compared to 6.0 percent in July 2007.

[2] To be counted as unemployed, a person must be actively seeking work. So when a retired person decides to go back to work and starts looking for a job or a student who has recently graduated begins a job search, the number of unemployed people rises even though the population hasn't changed. The labor force, which is the universe from which the unemployment rate is calculated, consists of two parts: 1) those people who aren't working but actively seeking work, and 2) those people who are working (there are some exceptions where people are counted as employed even though they aren't working -- people on paid leave, for example).

A Safety Minute

A Focus on Crane Safety

Serious crane accidents across the country are making news this construction season. One occurred in July when a crane tipped over and crushed a bystander during a steeple-mounting ceremony in Oklahoma. In the past several months, accidents in Nevada, New York, Florida and Texas have claimed the lives of workers and bystanders.

"These crane accidents illustrate the importance of crane and jobsite safety," said Labor Commissioner Click Bishop. "In Alaska we haven't had a crane-related fatality for several years and I intend to keep it that way with a proactive safety effort. We ask ail employers who use cranes to review crane lifting and safety policies, check cranes for mechanical integrity, and ensure crane operators are qualified and use appropriate safety procedures."

While there's no state requirement for crane operator certification, Alaska's Occupational Safety and Health regulations require employers who use cranes to ensure every operator has appropriate training, knowledge and experience, and is physically fit to operate a crane. It's the employer's responsibility to adequately inspect and maintain the crane and rigging.

It's also critical for employers to ensure that employees assisting with the lift are properly trained – including signaling, load limits and rigging techniques – and are aware of the hazards of operating a crane.

"I ask that all employers, safety professionals, crane operators and other concerned Alaskans stand by me and make sure that 'we all go home safely tonight,'" Bishop said.

For help with crane standards in Alaska, employers should contact the Alaska Department of Labor and Workforce Development's Alaska Occupational Safety and Health Consultation and Training Section at (800) 656-4972. The section is within the department's Labor Standards and Safety Division.

Employer Resources

Workers' Compensation Requirements

The Alaska Workers' Compensation Act requires all employers with one or more employees in Alaska to have workers' compensation insurance, unless the employer has at least 100 employees and has been approved as a self-insurer.

Employers purchase workers' compensation insurance from commercial insurance carriers. Once employers have insurance, they're required to post in their workplaces an Employer's Notice of Insurance, which insurance companies provide. Employers must also submit proof of insurance to the Workers' Compensation Division, the administrative arm of the Workers' Compensation Board.

Executive officers of for-profit corporations are required to have workers' compensation insurance unless they choose to waive coverage by filing a waiver with the division.

If employers are unable to obtain insurance coverage from a commercial carrier, they can purchase insurance through a state-assigned risk pool. And if employers feel their insurance premium is incorrectly calculated, they can request arbitration.

For more information or forms, call the Workers' Compensation Division at (907) 465-2790 or visit the division's Web site. Go to the Alaska Department of Labor and Workforce Development Web site at labor.alaska.gov. Under "Division Links" on the left, click on "Workers' Compensation." Then under "Quick Links" on the right, click on "Employer Information." For the Employer's Notice of Insurance form, under "Quick Links," click on "Forms."

Why this fiscal note differs from previous version (if initial version, please note as such)

The committee substitute has added a provision to create a petroleum information management system. The Division of Oil and Gas develops, stores, and maintains much of the information identified for inclusion in the system.

Prepared by: William C. Barron, Director — Phone: 907-269-8800
Division: Division of Oil and Gas — Date/Time: 3/13/12 4:00 PM
Approved by: Daniel Sullivan, Commissioner — Date: 3/13/2012
Department of Natural Resources

(Revised 11/18/2011 OMB)

Analysis

Sections 2 and 3 amend AS 31.05 by adding a new section (AS 31.05.031) which requires the Alaska Oil and Gas Conservation Commission (AOGCC) to develop and maintain an electronic petroleum information management system (PIMS) to archive state oil and gas information. The system will only include non-confidential information identified in this bill and other information AOGCC determines "necessary and relevant" to oil and gas exploration, development, and production. The Division of Oil and Gas (DOG) collects and maintains much of the information and materials listed in the proposed bill.

DOG will be a major contributor to the petroleum management system - likely designing, developing, and maintaining the system and associated materials. DOG currently houses the following information on: 1) unit and joint operating agreements, 2) state oil and gas exploration licenses and oil and gas leases, 3) exploration activities including seismic data, drilling reports, logs, geological models and maps, 4) development activities including development plans minus expenditure projections and reservoir characteristics, 5) facility maps and studies, and 6) abandonment plans and progress reports. DOG will conceivably have a role in contributing other information AOGCC deems "necessary and relevant" to oil and gas exploration, development, and production. DOG stores and maintains more than 40 years of information from Alaska's oil and gas activities. We find the directives in the proposed bill to initiate a significant undertaking by our department and others involved in supplying the requested information.

The committee substitute calls for providing information "in a form that is suitable for the commission to include in the petroleum information management system." Without sufficient knowledge of what will be construed to be "suitable" for the commission, it is assumed our information will need to re-integrated into new formats compatible with a sophisticated system easily navigated by the public. The AOGCC and DOG data collection and management systems are different in scale and scope, and synchronizing the systems will take considerable resources. In some cases, information could be linked or transferred to the PIMS site quickly; however, the information requested in the bill will demand extensive time and resources to adapt, redact, and restructure records and materials before inclusion in the PIMS.

Developing and maintaining a petroleum information management system will not likely provide any more information to the public than is currently available from our division. Non-confidential oil and gas information is currently available on DOG's website or upon request in electronic and hard copy formats. We estimate the proposed bill will initially require eight new FTEs with supporting costs and lease space expense in the division and funds necessary to hire contractors for information technology work.

The division would need five new natural resources specialists (2 NRS II and 3 NRS III) with one administrative assistant (range 12) and two analysts (range 20) for IT functions during build-out starting in FY13. In addition to staff increases, supporting costs and leased space, approximately $75,000 in funding for software, licenses, and back-up systems is needed in FY 13. After the system build-out and population, we should be able to maintain the system with 4-5 FTEs. We project roughly $75,000 for IT contract services in FY13 and FY 14, $35,000 in FY15, and potentially no funds thereafter. Since we are not forecasting additional state revenue for these sections of the proposed bill, the significant costs incurred in developing and maintaining a new location for DOG information results in a negative fiscal impact to the state for years to come.

Storage for DOG seismic data (2-3 terrabytes) is too large to be stored in existing storage and therefore the division anticipates needing to contract with an electronic storage provider which could cost hundreds of thousands of dollars annually. This could happen as soon as the start of the system in FY 2013 and would be triggered by the need to segregate and store existing data within DNR. The Division has not yet formally priced this cost of data storage but DNR internal IT managers estimate a significant cost.

Analysis Continued

CSSB192(RES) will also have impacts on oil production which impacts royalty revenue tracked by DO&G. Section 6 imposes a hard minimum tax (a minimum tax that cannot be reduced by credits) of 10% on production from large legacy fields (cumulative production over a billion barrels and current production over 100,000 barrels a day). Currently, the only fields that would qualify are the Prudhoe Bay and Kuparuk Units. Section 6 would substitute this tax for a minimum tax of 4% (when the West Coast ANS price exceeds $25 per barrel) on the gross value at the point of production for the North Slope. This minimum can be reduced by credits.

The proposed hard minimum tax on production tax value at the Prudhoe Bay and Kuparuk Units will tend to discourage investment by Unit owners if those owners perceive the possibility of the minimum tax applying. If the minimum tax applies then the owners lose the tax benefits associated with the ability to deduct additional spending in both fields. All else equal, this will have an indeterminate negative impact on royalty revenue at Prudhoe Bay and Kuparuk.

Section 7 lowers the rate of increase in the production tax rate from 0.4% to 0.35% per dollar of production tax value per barrel above $30 until the total tax rate (the base 25% plus the index based or progressive rate) equals 50%.

This bill also requires a separate production tax value per barrel calculation for gas sold outside the State. Section 14 would have the Department of Revenue issue regulations allocating costs to exported gas based on the gross value at the point of production for that gas versus that of other oil and gas production. Requiring a separate production tax value per barrel calculation for gas sold outside the State will have an indeterminate impact on royalty revenue. This impact will depend upon the anticipated relative profitability on a per unit basis of oil and gas production from the North Slope a decade or more from now.

FISCAL NOTE

STATE OF ALASKA **BILL NO.** CS SB 192 (RES)
2012 LEGISLATIVE SESSION

Analysis

The revenue impact of this bill is indeterminate.

This bill makes several changes to the oil and gas production tax system. Each of the major changes, along with its potential revenue impact, is discussed below.

1. **Makes changes to the progressive surcharge.** The "progressive surcharge" applies when the Production Tax Value (PTV) of all oil and gas produced in the state exceeds $30 per barrel of oil equivalent (BOE). Under current law, the surcharge is 0.4% per $1 of PTV between $30 and $92.50 per BOE, and it is 0.1% per $1 of PTV between $92.50 and $342.50 per BOE, for a maximum surcharge rate of 50%. The surcharge rate is not bracketed: it applies to the entire PTV, not just the incremental value. Under this bill, the surcharge rate is changed to 0.35% per $1 of PTV between $30 and $101.43, plus 0.1% per $1 of PTV between $101.43 and $201.43, for a maximum surcharge rate of 35%. The surcharge rate continues to apply to the entire PTV, not just the incremental value. The effective date of this provision is January 1, 2013. Under Fall 2011 forecast assumptions, this change would reduce revenue by $125 million in FY 2013, $230 million in FY 2014, and approximately $200 million per year in FY 2015- FY 2018.

2. **Creates a $10 per barrel allowance for production increases**. This provision of the bill creates an allowance, by effectively reducing the production tax value by $10 per barrel, for each barrel sent down the Trans Alaska Pipeline System (TAPS) by a company above their prior year level. The allowance is applicable only against the base tax rate of 25% and therefore the monetary value to the company is $2.50 per barrel. The allowance is calculated and refunded by the Department independent of the tax and progressivity calculation and therefore does not impact the tax and progressivity rates applied. Under the Fall 2011 production forecast, several companies would receive this allowance in certain years during the time horizon of this fiscal note, but the total tax revenue impact (and therefore benefit to producers) is less than $25 million total for all companies for all years.

3. **Implements a 10% gross minimum tax for units with over 1 billion barrels cumulative production and over 100,000 barrels per day production in the most recent year**. This provision of the bill creates a minimum tax of 10% of gross value for certain units, and deductions and credits cannot reduce the net tax for those units below 10% of gross value. Currently, the only units for which this provision would apply would be Prudhoe and Kuparuk. Under Fall 2011 revenue forecast assumptions, this provision would result in a tax increase for certain companies in certain years during the time horizon of this fiscal note, increasing state revenue by less than $25 million per year. At lower oil prices, this provision would result in a significant increase in revenue to the state, amounting to over $400 million per year increased revenue at a $40 oil price.

As part of the minimum tax language, this bill makes changes to the calculation of the community revenue sharing fund provision at AS 29.60.850. This bill changes the calculation of the community revenue sharing fund appropriation to be the lesser of 20% of the progressivity for oil and gas for the previous year or the difference between the amount of revenue received under the minimum tax and 25% of the production tax value for oil and gas subject to the minimum tax in the previous year. The bill retains the maximum appropriation provisions. This provision, as currently written, increases the complexity of the calculation, but will likely not materially impact the amount of revenue appropriated.

4. **Provides for a new petroleum information management system, to be implemented by the Alaska Oil and Gas Conservation Commission (AOGCC)**. This provision of the bill provides for a new information management system for publicly available oil and gas information, to be operational before January 1, 2014. The only responsibility of the Department of Revenue would be to provide certain information to AOGCC on a regular basis. These responsibilities could be implemented using existing resources.

5. "Decouples" Some Oil and Gas for Progressivity. This bill separates some oil and natural gas for purposes of calculating the progressivity portion of the production tax under AS 43.55 (also known as "decoupling"). Currently, all oil and gas are combined for purposes of calculating a single progressivity rate. Under this bill, two progressivity rates would be calculated. The first progressivity surcharge would be based on oil, Cook Inlet gas, and gas used in state. The second progressivity surcharge would be calculated based on gas other than Cook Inlet gas and gas used in state. The bill instructs the Department of Revenue , to the extent possible, to provide for the allocation of lease expenditures in proportion to the gross value at the point of production for the oil and gas produced.

Analysis Continued

For purposes of the tax calculation, exploration expenditures and development expenditures for non-producing leases or units would be allocated within geographic areas based on the gross value at the point of production of existing oil and gas production.

There would be minimal revenue impact during the time period included in this fiscal note as gas that is produced in Cook Inlet or used in state is not impacted by this bill. Small amounts of gas sales that would be decoupled prior to a major gas sale are expected to impact revenue to the state by less than $10 million per year.

Under the current ACES system without the separate progressivity calculations, the state may receive less tax revenue with oil production and major gas sales, compared to oil production alone. This effect is due primarily to lower value gas diluting the progressivity surcharge on higher value oil under a combined tax. Under this bill, once major North Slope gas sales begin, exported gas will be subject to the separate progressivity calculation. Our modeling suggests that under this bill, and with addition of major gas sales to oil production, state revenue would be equal to or higher than revenue with oil only.

Additionally, this provision would generally increase tax revenue to the state, compared to the current tax system with a combined progressivity calculation, from major gas sales along with oil production. The amount of tax revenue increase is primarily dependent on oil and gas price and volume assumptions, along with some minor assumptions regarding expenditures and tariffs, but could be in excess of $1 billion per year.

Costs to Implement

With the change in tax structure with decoupling, the department will need to develop comprehensive regulations. Significant regulations work would also be required to implement the other provisions of this bill, with some interrelations between the various provisions of the bill. The Department would require an additional $495,000 for regulatory work and public participation in regulations for the package of regulations. With passage of this bill in the 2012 legislative session, the workshop and public forum process would likely begin in the summer or fall of 2012, and the majority of the regulation costs would be incurred in FY 13.

Specific costs for each major regulation project include the following:
$75,000 for contracted professional services for regulation consulting.
$270,000 for regulations costs including Department of Law, public notice and registry.
$150,000 for public forums for education of taxpayers and public participation, including preparation materials and legal support, and possibly travel.

In addition to the one-time costs, the provisions of this bill will require two additional positions to handle the increased complexity of the tax law created by this legislation, in particular the increased workload associated with the gross floor, additional production allowance, and reporting requirements of this bill. The positions would be an Oil and Gas Revenue Auditor IV (Range 24) and a Tax Technician III (Range 14), at an annual cost of $235,200.

FISCAL NOTE

STATE OF ALASKA
2012 LEGISLATIVE SESSION

BILL NO. CSSB192

Analysis

The AOGCC, an independent quasi-judicial State agency, is the State's permitting and regulatory authority over hydrocarbon and geothermal wells. The Commission's duties include ensuring the maximum recovery of hydrocarbon and geothermal resources, preventing hydrocarbon and geothermal waste, ensuring well safety, and protecting underground sources of drinking water and correlative rights. Given the nature of the Commission's duties and responsibilities, apart from support personnel, it is staffed by expert petroleum engineers and petroleum geologists. Because its expertise is so carefully tailored to its statutory duties and responsibilities, the Commission functions well and Alaska has an unrivaled record with regard to well safety and production.

Section 3 of the committee substitute for SB 192 seeks to effectuate a substantial change in the AOGCC by requiring the Commission to establish, operate and maintain an electronic petroleum information management system comprised of available and non-confidential information. The vast majority of the information the Commission must include in the petroleum information management system has nothing to do with the Commission's mission or function – "unit and joint operating agreements," exploration licenses and leases, "work programs and budgets," "development plans," operating and capital expenditures and projections, "oil and gas sales, revenue and pricing," transportation agreements, abandonment plans and budgets, resident and non-resident hiring information, training opportunities, and other information "the commission determines necessary and relevant to the oil and gas production tax and to the exploration, development, and production of oil and gas resources." Much of this information is currently already gathered and maintained by other state agencies or is not available to any state agency.

After careful review and consideration of Section 3, the AOGCC is of the view that Section 3 radically changes the AOGCC's longstanding role as the State's petroleum technology and geology experts and jeopardizes the Commission's ability to discharge its primary duties and responsibilities in those realms. The Commission has neither the expertise nor the infrastructure to construct, maintain and operate information management systems, computer systems, and the gathering of information on other subjects not related to the safe, efficient production of hydrocarbon resources from wells. Implementation of Section 3 will create – at a substantial fiscal outlay – an additional distinct state bureaucracy within the AOGCC which duplicates functions currently performed by other state agencies.

The AOGCC's non-confidential information is already publically available on its website. Other agencies are currently working to provide similar web availability of their data. Once those agencies do so, the information will be far more readily accessible to the public on those websites and at a substantially reduced cost.

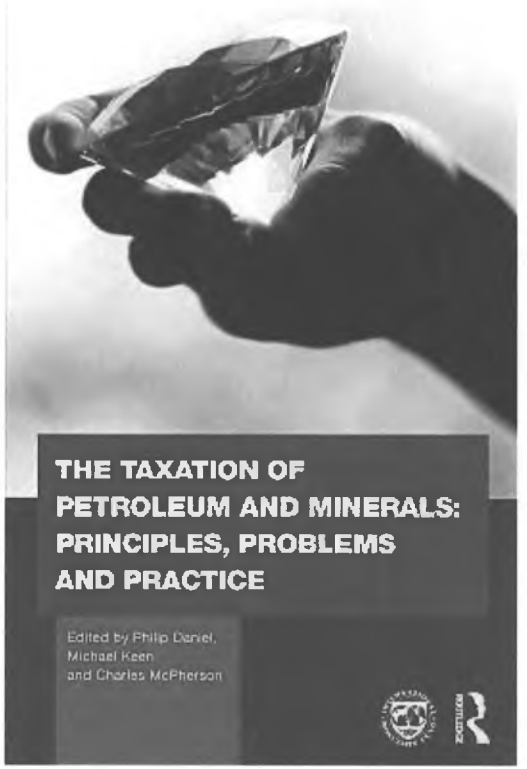
CSSB 192 Oil & Gas Production Tax Rates

Presentation by Senator Paskvan

March 13, 2012

Committee Substitute for Senate Bill 192 (RES)

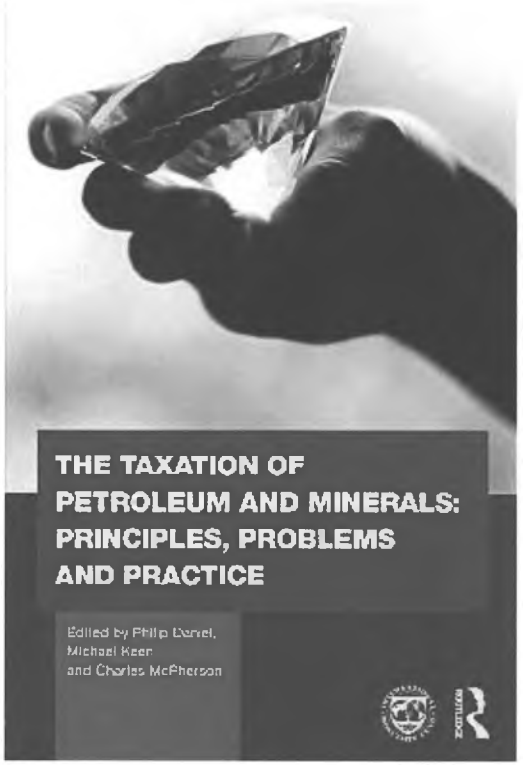
Oil and Gas Production Tax Rates



Senate Finance Committee
Tuesday, March 13

CSSB 192(RES) Overview

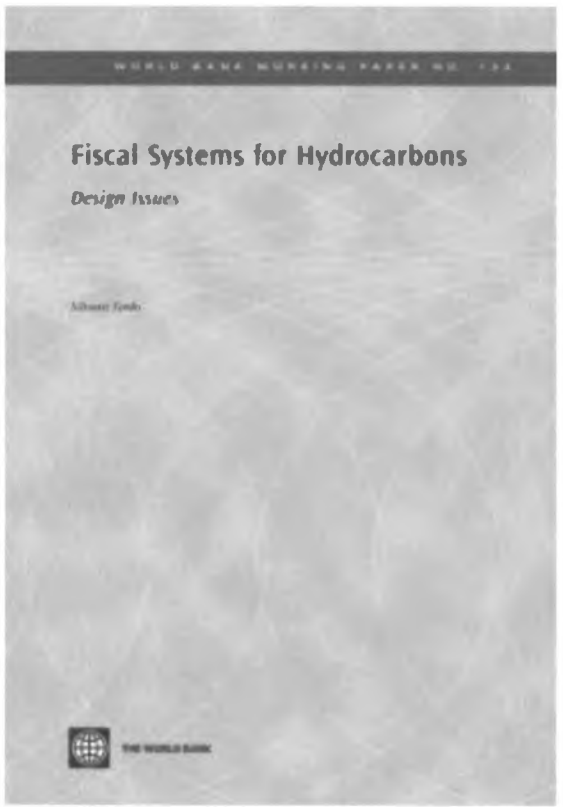
- Intro: Alaska is an Owner State
- Summary of DOR Reports
- Lessons Learned
- Basic Petroleum Economics
- DOR's "Facts To Begin the Conversation"
- CSSB 192(RES): Rationale and Overview
- Optimism for Alaska's Future



Alaska is an Owner State

"There are few areas of economic policymaking in which the returns to good decisions are so high – and the punishment of bad decisions so cruel – as in the management of natural resources wealth."

From the Preface, page ii

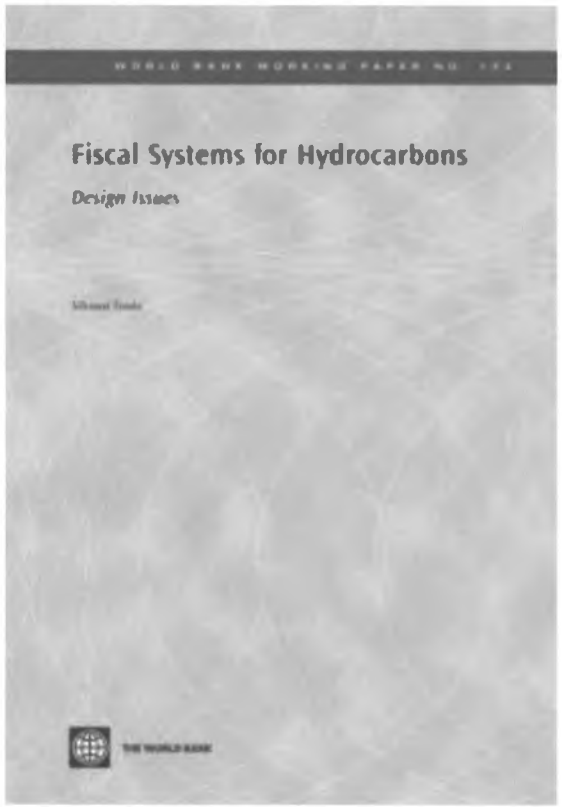


Alaska is an Owner State

"The central objective in designing petroleum fiscal regimes is easily stated. It is to acquire for the state in whose legal territory the resources in question lie, a fair share of the wealth accruing from the extraction of that resource, whilst encouraging investors to ensure optimal economic recovery of the hydrocarbon resources. How to achieve this balance is a subject of enduring controversy."

From Chapter 4 Petroleum Fiscal Regimes: Evolution and Challenges (page 89)

Alaska is an Owner State



Chapter 5: Designing Efficient Fiscal Systems

Although the host government and the investor may share one common objective – the desire for the project to generate high levels of revenue – their other objectives are not entirely aligned:

Host governments aim to obtain the maximum value (not volume) for their countries over time in terms of net receipts for treasury. Their goal is to maximize the wealth from their natural resources and, at the same time, attract foreign investment. Host governments also have development and socioeconomic objectives, such as job creation, transfer of technology, and development of local infrastructure.

Alaska is an Owner State

Chapter 5: Designing Efficient Fiscal Systems (continued)

Oil companies aim to ensure that the return on capital is consistent with the risk associated with the project and with the strategic objectives of the corporation.

"Meeting the Challenge"

Bob Bartlett, Alaska Constitutional Convention

Where such vast resources potential exists one need not be clairvoyant to foresee an influx of interests wanting to develop these resources …

This moment will be a critical one in Alaska's future history. Development must not be confused with exploitation at this time. The financial welfare of the future state and the well-being of its present and unborn citizens depend upon the wise administration and oversight of these developmental activities.

Two very real dangers are present. The first, and most obvious, danger is that of exploitation under the thin disguise of development. The taking of Alaska's mineral resources without leaving some reasonable return for the support of Alaska governmental services and the use of all the people of Alaska will mean a betrayal in the administration of the people's wealth.

The second danger is that outside interests, determined to stifle any development in Alaska which might compete with their activities elsewhere, will attempt to acquire great areas of Alaska's public lands in order NOT to develop them until such time as, in their omnipotence and the pursuance of their own interests, they see fit. If large areas of Alaska's patrimony are turned over to such corporations the people of Alaska may be even more the losers than if the lands had been exploited. (November 8, 1955)

ACES Status Report

Alaska Department of Revenue (January 14, 2010)

Letter from DOR Commissioner Galvin to Gov Parnell:

- "The ACES Status Report evaluates whether ACES is meeting its intended goals of providing a fair share of revenue to the state while encouraging investment in new oil and gas exploration and development activities."
- "The status report shows that ACES successfully allowed the state to share in the benefits of high oil prices while accommodating fluctuations in production costs and oil prices. ACES adjusted when oil prices tumbled and kept the oil operations in Alaska highly profitable relative to other oil provinces."
- "Since ACES passed the legislature, overall spending on oil and gas activities on the North Slope has increased. However … it would be premature to attribute the increased level of oil company investment to the success of ACES."

ACES Status Report

Alaska Department of Revenue (January 14, 2010)

Letter from DOR Commissioner Galvin to Gov Parnell (cont):

"Oil taxes are clearly an important factor in industry investment decisions. However, it is misleading to isolate their influence from other key factors, such as world oil prices, geologic potential, access to land, resources and markets, costs of infrastructure and support services, and the legal and regulatory framework. As noted in the report, the true merit of Alaska's current fiscal system can only be determined when it is evaluated in conjunction with these other variables."

ACES Status Report

Alaska Department of Revenue (January 14, 2010)

ACES Structure and Tax Rate (page 9 – 11):

"As with any tax, ACES may be evaluated using a variety of different metrics, including 'effective,' 'nominal,' and 'marginal' tax rate comparisons. While each of these can be helpful under the appropriate circumstances, each is also subject to certain limitations. It is important when using these metrics to understand their relative value and how they reflect upon the objectives of the tax system …"

"The 'marginal tax rate' is the rate theoretically applied to each dollar increase in oil price … With a net based tax system, this metric shows a company the impact of making additional investment, because each dollar they invest is 'subsidized' by the government based on the amount of marginal tax they have avoided paying on that dollar … For example, a marginal tax rate of up to 87% initially sounds excessive. However, at that same price level, the effective tax rate is less than 40%. The marginal rate of 87% actually represents that state's 'portion' of any new investment made at such high prices."

ACES Status Report

Alaska Department of Revenue (January 14, 2010)

Conclusion (page 15):

"Overall, the information reviewed by the department indicates that ACES is performing as expected when it was passed by the Legislature in 2007. The economic provisions are resulting in the revenue levels anticipated, and the investment incentives appear to distribute the increased tax burden in a fashion that continues to encourage reinvestment, though the experience with the credit program could be improved for new explorers. Challenges remain in the implementation by the department, but they are manageable and the department is positioned to meet those challenges."

Production Tax Status Report to the Legislature by DOR (January 18, 2011)

From the Executive Summary (pages 1 – 2)

- **Industry Investment** – Investment in the form of capital expenditures has increased in each of the four fiscal years since implementation of the net profits tax, however, it is unclear how much of the capital expenditures were drilling or well-related and how much were maintenance or facilities-related.
- **Impact on Exploration, Development, and Production** – Exploration has generally increased from 2003, when the EIC credit was implemented, but has dropped off in 2010. Development continues in three relatively new North Slope projects, yet production continues to decline.
- **Industry Employment and New Entrants** – Industry employment rose steadily from 2006 through 2009, but dipped slightly in 2010. The number of companies filing annual tax returns doubled between 2006 and 2009, indicating interest by companies that are either new or returning to the Alaska oil and gas industry.

Production Tax Status Report to the Legislature by DOR (January 18, 2011)

From the Executive Summary (cont.)

- **Use and Expansion of Tax Credits** – The amount of credits used has increased annually since 2006 and we expect the trend to continue as new credit programs were added in the 2010 legislative session.
- **Tax Administration and Compliance** – The department continues to write regulations for the new tax system, and the first audits under the net profits tax have been completed. The department has, however, been hampered in its tax reporting and compliance efforts by the lack of a centralized database to house and manage the large volumes of oil and gas data it receives.
- **Conclusions and Recommendations** – Based on the multiple changes to the tax laws over the past few years, drawing any conclusion about their effect on Alaska's investment climate is difficult. However, what is clear is that production continues to decline. The state should continue to monitor its competitiveness with other oil and gas jurisdictions worldwide and be prepared to change its tax structure as needed.

Production Tax Status Report to the Legislature by DOR (January 18, 2011)

Conclusion and Recommendations (Pages 14 – 15):

"A government's fiscal regime is just one element for oil and gas companies to consider when weighing options for where to invest. Many other elements, such as resource risk, political risk, environmental factors, and availability of labor and equipment, also play a part in companies' decisions about where to invest. It is very difficult to separate these factors in order to determine the extent to which a government's fiscal system influences investment choices.

"While it is untenable to blame a tax system for the lack of industry investment, it is equally untenable to claim that the tax system is the reason increased activity or investment occurs. The past three years have seen dramatic swings in oil prices from a high of $134 per barrel to a low of $38 per barrel just 6 months later. An economic recession stifled investment and business activity in the United States and much of the developed world for over a year. The economic activity of the past three years may not have been the best benchmark by which to judge the impact of a tax system …

"… State officials should continue to monitor the state's competitiveness in oil and gas opportunities, and be prepared to modify it as the need arises."

Comprehensive Plan and Feasibility Study by FAST Enterprises, LLC (October, 2010)

Excerpts from the Executive Summary

The Alaska Department of Revenue's Tax Division (DOR/TAX) relies on a patchwork of 17 automated systems and over 100 manual "side-systems" to administer 22 tax programs.

- DOR/TAX manages over $3 billion in Oil and Gas Tax revenue using an eclectic mix of home-grown side-systems that include multiple databases and unsecured, unstable spreadsheets stretched well beyond their intended use. Storing sensitive taxpayer information in these databases and spreadsheets poses a high security risk.

- The 17 systems used to administer different taxes and functions have been pieced together over the past 15 years without integration or an overall architecture. The systems do not scale to meet current needs and are inflexible and difficult to maintain. Since the initial development of the systems, many tax laws have changed and the systems have not changed accordingly.

Comprehensive Plan and Feasibility Study by FAST Enterprises, LLC (October, 2010)

Excerpts from the Executive Summary (continued)

- DOR/TAX employees spend a higher proportion of their time compiling, organizing, and reconciling data than actually auditing, examining, analyzing, forecasting, or managing tax programs.

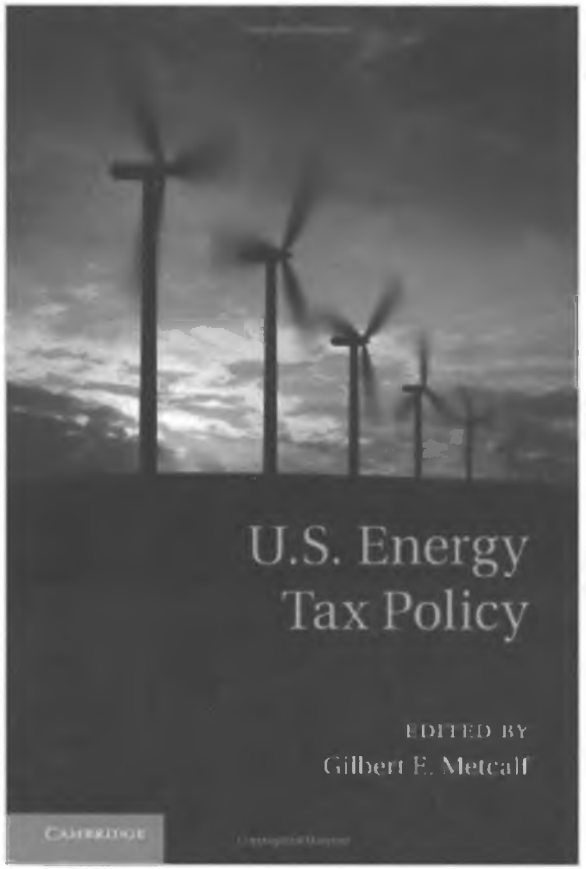
- The limitations and inflexibility of existing systems impose a burden on taxpayers. Current reporting processes are inefficient and ineffective, and create unnecessary work and cost. As one taxpayer stated, "the Tax Division's inefficiency makes taxpayer interaction with the division inefficient."

- DOR/TAX cannot easily produce reports required by the legislature and policy makers because the current systems prevent timely, complete, and correct extraction of data. Reports can be inaccurate and misleading due to incorrect and incomplete data and human error.

Department of Revenue Additional Information

Single Audit of the State of Alaska (Feb 28, 2011)

- Recommendation: "DOR's commissioner should ensure staff within its Tax Division implement controls to improve the auditing of oil and gas severance tax revenues."
- Legislative Audit's Current Position: "Significant control deficiencies continued over the auditing of oil and gas severance tax revenues in FY10. A loss of experienced audit staff during FY10 compounded the struggles that the audit section was already experiencing."



Decision Following Trial De Novo: 2007, 2008, and 2009 Assessed Valuations of the Trans Alaska Pipeline System (December 30, 2011)

- "The Department's Production Forecasts and Reserves Estimates are Unreliable" (page 170)

U.S. Energy Tax Policy (2011)

(Chapter 9) State Tax Policy and Oil Production:

The Role of the Severance Tax and Credits for Drilling Expenses

Introduction

"Although most energy-producing states have levied taxes on the value of oil, natural gas, and coal production for many years, changes in these taxes have become headline news as state governments grapple with budget shortfalls brought about by the current recession. For instance, Alaska has increased the severance tax on the value of its oil production and attempted to stimulate future production by allowing a credit against this tax for expenditures on capital items, including drilling rigs, infrastructure, exploration, and facility expansion (Alaska Department of Revenue 2008)."

By Ujjayant Chakravorty, Shelby Gerking, and Andrew Leach

State Tax Policy and Oil Production:
The Role of the Severance Tax and Credits for Drilling Expenses

Questions about the effects of state energy taxes, for example:

- Do state taxes tilt the time path of energy production to the present or to the future?
- Do upstream subsidies for exploration and development work together with downstream taxes on production to influence the levels and time paths of production and tax collections?
- What are the implications of these taxes for the long-term sustainable use of nonrenewable natural resources?

State Tax Policy and Oil Production:
The Role of the Severance Tax and Credits for Drilling Expenses

Key Finding #1:

- "Oil production is closely linked to the size of the reserve base and is relatively insensitive to changes in oil prices. This outcome, which is broadly consistent with experience in the U.S. oil industry over the past 50 years, leads to the conclusion that the severance tax has little effect on production levels (p. 306)."

State Tax Policy and Oil Production:

The Role of the Severance Tax and Credits for Drilling Expenses

Key Finding #2

- "The simulations suggest that a drilling expense credit may cost more than the incremental severance tax revenue obtained, although such credits may be worthwhile concessions if a state's objective is to generate greater support for increasing the severance tax rate (p. 307)."

Additional Research

"Effectiveness of Severance Tax Incentives in the U.S. Oil Industry" (Mitch Kunce, International Tax and Public Finance, 2003)

- "In general, results show that severance tax rate cuts substantially reduce state tax revenue collected, but yield moderate to little change in oil drilling and production activity. This outcome suggests that states should be wary of arguments asserting that large swings in oil field activity can be obtained from changes in severance tax rates."

Additional Research

"State Taxation, Exploration, and Production in the U.S. Oil Industry" (Mitch Kunce et al, Nov 26, 2001)

- "Results of this study suggest that oil production is highly inelastic with respect to changes in production taxes."

Gas and Water Handling Constraints

"While new oil is an issue in maintaining production levels, there are also issues at existing fields, where [Dudley] Platt said facilities expansion may be needed. He said the large facilities are 'maxed out on how much gas they can handle and they're getting close to being maxed out on how much water they can handle. … If they don't expand their facilities to handle that, the oil production will continue to go down.'"

"Alaska Oil Forecast Shaky"
By Kristen Nelson, Petroleum News
Week of November 18, 2007

Gas and Water Handling Constraints

North Slope of Alaska Facility Sharing Study

Prepared for Division of Oil & Gas, Alaska Department of Natural Resources

By Petrotechnical Resources Alaska, May, 2004

"The North Slope processing facilities have specific design capacity limits, indicating the amount of oil, water and gas which can be handled by the facility. If the handling capacity of one of these streams is reached for a given facility, it limits the overall production output from that facility. While some facilities may be producing below capacity for oil, they are often limited due to capacity constraints on total water production or gas production."

Gas and Water Handling Constraints

1989 Revenue Sources Book
Alaska Department of Revenue

"The vast majority of Alaska production will continue to come from the now declining Prudhoe Bay field … The decline in Prudhoe Bay production is now expected to be much more rapid than assumed in our Spring forecast. This reflects a more serious gas handling constraint. As more and more gas is produced with each barrel of oil, the amount of gas which must be re-injected back into the Prudhoe Bay field has increased substantially. Since it is anticipated that there will need to be more production downtime due to field and TAPS maintenance, the gas handling constraint will limit the ability to keep average annual oil production from falling. Installation of additional gas handling equipment, GHAX1 (gas handling and expansion 1), is scheduled to start late in 1990. A second expansion is in the planning stages. Once in place, the ability to re-inject up to 5.1 bcf/day of gas production will slow the rate of decline in oil production."

Gas and Water Handling Constraints

A Production Optimization System for Western Prudhoe Bay Field, Alaska

By D.A. Barnes, K. Humphrey, and L. Muellenberg of BPX America

Paper prepared for presentation at the 65th Annual Technical Conference and Exhibition of the Society of Petroleum Engineers held in New Orleans, LA, Sept 23-26, 1990.

"For almost a decade the Prudhoe Bay field on the North Slope of Alaska has produced at a yearly average offtake rate of 1.5 million stock tank barrels of oil per day. As the reservoir depletes and field gas-oil ratios (GORs) increase, gas handling constraints make it difficult to achieve oil rate targets."

Gas and Water Handling Constraints

Prudhoe Bay: Development History and Future Potential

By D.J. Szabo, BP Exploration (Alaska) Inc. and K.O. Meyers, ARCO Oil and Gas

Paper prepared for presentation at the SPE 1993 Western Regional Meeting, Anchorage, AK, 26-28 May 1993.

"Prudhoe Bay is seen by many as a mature oil field on an inevitable and irreversible decline … The field's oil production capacity dropped below 1.5 MMSTB/D in 1988 *officially* signaling the start of decline. The onset of decline was a direct result of limited gas handling capacity as opposed to limited oil production capacity."

Gas and Water Handling Constraints

Prudhoe Bay Field: Facility Consolidations Pave the Way for an Economic Future

By K.D. Eager, BP Exploration; M.D. Briscoe, ARCO Alaska; R.A. Bolduc, Exxon

Paper prepared for presentation at the 1998 SPE Annual Technical Conference and Exhibition held in New Orleans, LA, 27-30 Sept 1998.

"The Prudhoe Bay Field on Alaska's North Slope has produced for twenty-one years. Prudhoe's gas and water production rates are at historic highs, but the oil production rate has declined to less than one-half of the peak rate achieved in the 1980s. As a result, significant excess oil treating capacity exists, with water and gas handling capacity constraining the current oil production rate. The owners of the Prudhoe Bay Unit developed a major facility consolidation plan in 1997 designed to rationalize this excess oil treating capacity while preserving existing gas and water handling capacity. The reconfigured facilities are expected to provide sufficient capacity at a lower cost to accommodate projected oil, water and gas production rates over the remaining life of the Prudhoe Bay Field."

Gas and Water Handling Constraints

Prudhoe Bay Field: Facility Consolidations Pave the Way for an Economic Future
By K.D. Eager, BP Exploration; M.D. Briscoe, ARCO Alaska; R.A. Bolduc, Exxon

Paper prepared for presentation at the 1998 SPE Annual Technical Conference and Exhibition held in New Orleans, LA, 27-30 Sept 1998.

(Continued)

"Oil production rates are projected to continue to decline in the future. In developing the field development and management plans for 2000 and beyond, the PBU Working Interest Owners recognize the need to reduce lifting cost commensurate with the decline in oil production to maintain an economic asset for as long as possible. The Prudhoe Bay Facility Optimization Project will play an important role in achieving reduced lifting costs."

Gas and Water Handling Constraints

Optimization of Production from Mature Fields
By P. Wang & K. Aziz of Stanford University and M.L. Litvak of BP, USA
17th World Petroleum Congress, September 1 - 5, 2002, Rio de Janeiro, Brazil

"Oil production in the Prudhoe Bay and Kuparuk River fields is constrained by the gas handling limits of the surface facilities."

2003 Oil and Gas Report (for the period ending December 31, 2002)
Alaska Department of Natural Resources (Tom Irwin, Commissioner)
Division of Oil and Gas (Mark Myers, Director)

"From the beginning of Prudhoe Bay production, dissolved gas and water were separated from the crude oil and injected back into the reservoir. Over time the reservoir's proportion of both gas-and-water to oil increased. Eventually, oil production was constrained by the rate at which the separating plants could process gas and water."

Gas and Water Handling Constraints

Q: Does DNR agree that oil throughput at Prudhoe Bay is constrained by the ability of field operators to process and re-inject associated natural gas?

A: Yes, gas processing is a significant constraint in Prudhoe Bay. While new wells could be drilled with lower GOR's, other high GOR wells have to be shut-in because of the gas processing limitation.

Q: As of the early 1990's, does DNR agree that Prudhoe Bay was past the point where well drilling could stave off a falling oil rate?

A: Yes. The Prudhoe Bay Unit WIO had a very aggressive drilling program in 1986-1992. In addition, a major gas handling expansion (GHX-1) occurred in the late 1980s which helped stem decline. Significant delay in the production plateau would have been difficult.

Expanded Basic Petroleum Economics

Course Level: Basic

About The Course:

- Could you answer the following three questions for your next project:
  - What will it cost?
  - What is it worth?
  - Will it earn sufficient profit?
- Before undertaking any project, these questions should be answered.

Source: PetroSkills 2012 Training Guide

Example

- Estimates of drilling cost per well range from $132,907 in Kansas, where wells tend to be shallow, to $3,881,600 in Alaska, where the drilling experience is very different as compared to the lower 48 states.
- Marginal reserve additions from drilling range from 11,051 barrels per well in Kansas to 177,067 barrels per well in Alaska.
- Thus, while drilling a well in Alaska is markedly more expensive than in Kansas, Alaska experiences a greater payoff from these more costly exploration and development efforts.

(Source: "Effectiveness of Severance Tax Incentives in the U.S. Oil Industry," 2003, page 573 – 574)

Will it earn sufficient profit?

"Oil Industry Profitability in Alaska 1969 through 1987"

The oil industry received an estimated $42.6 billion in profit from production and transportation activities in Alaska from 1969 through 1987 … Alaska North Slope (ANS) production contributed $29.1 billion to profit, with $27.8 billion of this amount attributable to Prudhoe Bay and $1.3 billion attributable to Kuparuk. TAPS provided $12.4 billion. Production in Alaska other than ANS production added $1.1 billion in profit.

Shares. The 42.6 billion in after-tax profit that accrued to the oil industry compares to $29.3 billion in State of Alaska receipts from oil industry activities during this period. During the same period, Federal government receipts were $25.8 billion from these activities (page I and II).

(Source: "Oil Industry Profitability in Alaska 1969 through 1987," Prepared for the Department of Revenue, State of Alaska, by Edward Deakin, Distinguished Enterprise Professor and Director, Institute of Petroleum Accounting, University of North Texas, March 15, 1989.)

Will it earn sufficient profit?

"Oil Industry Profitability in Alaska 1969 through 1987"

Additional Benefits of ANS Oil

ANS Producers receive profits from Alaska oil outside of Alaska which provides an additional bonus beyond what it would cost if they had to purchase imported oil. An additional profit of approximately $0.7 billion went to the producers through the operation of the U.S. Department of Energy crude oil entitlement program. Producers are believed to earn additional profit through the refining of ANS crude because, among other things, they have access to a secure source of crude oil. If they did not have the ANS crude, it would be necessary for them to acquire crude from foreign sources.

Others estimate that profits on tanker operations and the trans-Panama shipment activities added between $.25 and $1.00 profit per barrel of ANS crude produced. These additional profits would have been received on the nearly 6 billion barrels of ANS production. These added profits are not included on the $42.6 billion of total oil industry profit in Alaska covered in this report (page 13).

These downstream profit issues are beyond the scope of this project. They do indicate, however, that the producer's economic benefits of Alaska oil production extend beyond the profit obtained within the boundaries of the State of Alaska (p. T-70).

(Source: "Oil Industry Profitability in Alaska 1969 through 1987," Prepared for the Department of Revenue, State of Alaska, by Edward Deakin, Distinguished Enterprise Professor and Director, Institute of Petroleum Accounting, University of North Texas, March 15, 1989.)

Will it earn sufficient profit?

"Oil Industry Profitability in Alaska 1969 through 1987"

Hourly Profit Rate

"Looking at these profits as an hourly earning number may bring the amounts into better perspective. After-tax profits have been earned by the producers at the rate of $463,144 per hour, twenty-four hours per day for each day of the first ten and one-half years of ANS Production (page 19)."

(Source: "Oil Industry Profitability in Alaska 1969 through 1987," Prepared for the Department of Revenue, State of Alaska by Edward Deakin, Distinguished Enterprise Professor and Director, Institute of Petroleum Accounting, University of North Texas, March 15, 1989.)

Will it earn sufficient profit?

Lord John Browne, Chief Executive, BP

Address to shareholders (April 15, 2004)

- "In periods of high oil prices such as the one we find ourselves in today, the group generates significant 'excess free cash flow' after capital expenditure and dividends. Rather than using this cash to reduce debt … we are committing to return … 100 percent of this excess free cash flow to our investors, for as long as oil prices remain above $20 a barrel, all other things being appropriate (*Sarah Takes on Big Oil*, page 16)."

Will it earn sufficient profit?

"Alaska's role in BP's portfolio is to provide a stable production base and cash flow to fuel growth elsewhere in the business while improving margins and returns."

Sidenote:

"Over the past three years the TAPS Owners and Alyeska have studied a number of potential business efficiency opportunities … Preliminary engineering studies have also confirmed electrifying and automating all 4 pump stations will allow Alyeska to eliminate over 285 full time positions, many of those in field locations where wage and locations premiums are very high. Currently, remote crews at these pump stations require expensive catering, transportation and other costly support services systems. Eliminating these positions translates to an annualized expense savings improvement of over $41mm gross (+16mm net BP) by 2007 over APSC 2003 Base O&M."

(Source: BP, Alaska Business Unit, Mid-Stream Alaska, Trans-Alaska Pipeline Pump Station Electrification, 2004, Page 13)

Will it earn sufficient profit?

Gene Therriault,

Senior Policy Advisor on In-State Energy, Parnell Administration

Email Correspondence, August 2, 2010

"Major producers like ConocoPhillips and BP have reported strong profits from their Alaskan operations under the ACES system. For example, in 2009, ConocoPhillips' Alaska activity accounted for 12% of its worldwide production but 29% of its corporate profits. In addition, the August 1, 2010 edition of Petroleum News recently detailed ConocoPhillips current year earnings and concluded that "ConocoPhillips' exploration and production activities continue to be more profitable in Alaska than across the Lower 48.'"

Will it earn sufficient profit?

BP Prudhoe Bay Royalty Trust (BPT)

"In the past 10 years, BPT has earned a total return of 2,248%. A $5,000 investment just 10 years ago would be worth $117,400 right now … To give you an idea of how strong a return that is, integrated oil giant Chevron returned 231% over the same period. That would have turned $5,000 into $16,550. Not bad, but nowhere near what BP Prudhoe Bay Royalty Trust did.

"And those royalties are on top of capital gains. BPT's share price gained 667% during the past 10 years thanks to rising oil prices, while Chevron's stock price went up only 137%.

"The thing is, BPT not only beat Chevron... it beat out just about every major oil company over the same period. And that's only part of the equation. Go back a few more years, and the major oil and gas companies aren't even in BPT's league.

"BPT has generated total returns of 5,089% since 1990 -- beating the "big" names in the oil and gas industry. Chevron ... Exxon ... Shell ... you name it."

(Source: Seeking Alpha website, "BP Prudhoe Bay Royalty Trust: Why Worry About This High Yielder?," January 25, 2012)

Will it earn sufficient profit?

Oil Prices Began to Climb to All-Time Highs Starting Mid-2000s

Chapter 7: Evaluating fiscal regimes for resource projects: An example from oil development

"The unprecedented rises in the internationally traded prices of crude oil and natural gas (petroleum) between 2002 and 2008, and the sudden fall after July of 2008, have concentrated attention once again on how petroleum revenues are shared between owners of the resource in the ground (usually governments) and the companies that extract the petroleum (page 187)."

Oil Prices Began to Climb to All-Time Highs Starting Mid-2000s

Fiscal Regimes in a Volatile Oil Price Era: What Options Exist for Balancing the Interest of the Resource Country and Investor Company?

By Humphrey Onyeukwu, SPE, Centre for Energy, Petroleum, Mineral Law and Policy, University of Dundee

Paper presented at the CPS/SPE International Oil and Gas Conference, Beijing, China, June 2010

"The challenge of a fiscal policy in a volatile price oil era is ensuring a high share of value is secured for the Government. At the same time, the fiscal policy strives to encourage the exploration of these valuable resources without harming the commercial interest of the oil companies. Price volatility fundamentally alters the sharing formula; it is therefore imperative for a correct balance to be achieved between the competing state interests and the oil companies. The question becomes how equilibrium can be achieved in a petroleum fiscal system design, which guarantees a suitable government take and avoids the negative effect of instability and re-negotiation of fiscal terms."

TAPS Throughput Continues Steady Decline

Revenue Sources Book (October, 1988)

Alaska Department of Revenue

"It is important to emphasize that the North Slope producers, while not agreeing on the exact date, have concluded that North Slope production will commence to decline in either FY 89 or FY 90."

TAPS Throughput Continues Steady Decline

Revenue Sources Book (Fall 1989)
Alaska Department of Revenue

"The fall in oil production means that the inevitable decline in the huge Prudhoe Bay field has started sooner than we predicted ... This forecast assumes that production from the Prudhoe Bay field will continue to fall steadily, and will drop to less than half its present level in less than 10 years."

"Some observers may believe that exploration will discover another Prudhoe Bay. Prudhoe Bay is the largest oil field in North America, and finding such a 'supergiant' is extremely rare."

"The State of Alaska is standing on a precipice. Only a combination of budget cuts, more efficient programs, and new revenues will keep the State from falling a long way ..."

"The decline in production from the Prudhoe Bay field is a central issue for Alaska ... The decline in Prudhoe Bay production is now expected to be much more rapid than assumed in our Spring forecast."

TAPS Throughput Continues Steady Decline

Revenue Sources Book (Spring 1992)

Alaska Department of Revenue

"The long-term revenue outlook is dominated by the depletion of petroleum reserves of the Prudhoe Bay oil field ... Despite the start of the irreversible decline at the Prudhoe Bay field this year, continued success in reservoir management in all fields will hold statewide production decline throughout fiscal year 1995 to less than 9% total (3% per year)."

TAPS Throughput Continues Steady Decline

Revenue Sources Book (Spring 1994)

Alaska Department of Revenue

"The Prudhoe Bay field, which accounts for two-thirds of Alaska statewide production, is in irreversible decline."

TAPS Throughput Continues Steady Decline

With Prudhoe Bay in Decline, What's Next for Alaska?

By James M. Davis (Senior Vice President for Exploration and Land) & Jerry R. Pollock (Manager, Prudhoe Bay Engineering) of ARCO Alaska, Inc.

Oil & Gas Journal, August 3, 1992

"By any definition, Prudhoe Bay is declining and will continue to decline…

"To accountants, Prudhoe decline began during 1988 when the field was no longer able to make its maximum allowable rate of 1.5 million b/d of oil. To engineers, the decline began long before that …

"Unfortunately, adding more wells can't keep the oil production rate up forever. We're already past the point where drilling can stave off a falling oil rate. Oil reserves are finite. …

"As the field matures, the production facilities reach their maximum capacities to handle produced water and gas. Wells with falling oil rates and increasing produced water or gas volumes have to be shut-in. Total field oil production drops."

TAPS Throughput Continues Steady Decline

Hearing before the Committee on Energy and Natural Resources, United States Senate

New Developments in Upstream Oil and Gas Technologies: Testimony by Kevin Banks, Director, Division of Oil and Gas, Alaska Department of Natural Resources (May 10, 2011)

"With the exception of development of heavy oil resources known to exist around the Prudhoe Bay, Kuparuk, and Milne Point fields, and potential resource plays (like the Bakken in North Dakota) that may exist on the North Slope on State controlled lands, the natural field declines cannot be replaced without access to production from Federal lands and the OCS. There are no known conventional resources on State or Native lands that are likely sufficient to replace the decline in the existing production rates."

TAPS Throughput Continues Steady Decline

Senate Resources Committee, March 1, 2012

Testimony by Scott Jepsen, Vice President, External Affairs, ConocoPhillips Alaska

CO-CHAIR PASKVAN asked if Alaskans should expect to see 1 million barrels a day from state lands in conventional oil with the $5 billion investment over the next 10 years.

MR. JEPSEN said the 1 million barrels a day is a good aspirational goal, but he didn't think they could get there. It would probably take some other types of technologies than what is in the state right now. He hoped shale oil pans out and Great Bear plus some offshore help. State lands have potential, but he didn't know where they would see the upside in terms of getting to that 1 million barrels a day.

Other Oil Producing Regions Enjoying Production and Employment Booms

Resurging North American Oil Production and the Death of the Peak Oil Hypothesis

"The transfer of technology that caused the surge in natural gas production is transforming the outlook for oil production in the U.S. The unrelenting increase in oil rig count has been driven by two major forces: the sustained, high price of the commodity and the promise of improved oil production using the technology that has transformed the gas sector.

"Advances in the use of horizontal drilling and hydraulic fracturing have unlocked vast reserves of hydrocarbons originally trapped in highly dense shale rocks. The two shale oil plays that have benefited most from this transformation so far are the Bakken and Eagle Ford."

Other Oil Producing Regions Enjoying Production and Employment Booms

Alaska Economic Trends: Alaska's Oil Industry
September, 2008

"Dramatic improvements in technology in the last decade have had a powerful effect on employment levels.

"Examples include the widespread use of horizontal drilling, ultra extended-reach drilling, 3-D and 4-D seismic surveys, drill bit sensors and other advancements that reduced the number of wells that need to be drilled (page 6)."

Other Oil Producing Regions Enjoying Production and Employment Booms

Alaska Economic Trends: Alaska's Oil Industry
September, 2008

"According to the Federal Reserve Bank of Dallas, the national oil and gas industry was the leader in productivity gains throughout the 1990s and continues to be an above-average performer. In other words, the oil industry has been able to perform more work using fewer workers (page 6)."

Other Oil Producing Regions Enjoying Production and Employment Booms

Alaska Economic Trends: Alaska's Oil Industry September, 2008

How does Alaska compare to other oil-producing states?

"As far as the oil industry's importance to the economies of different states, there's little doubt Alaska ranks first. However, a person wouldn't guess that by looking at the size of Alaska's oil industry work force

"Alaska produced 15 percent of the nation's domestic oil supply in 2007 but employed only 3 percent of the U.S. oil and gas work force … (page 10)."

Other Oil Producing Regions Enjoying Production and Employment Booms

How does Alaska compare to other oil-producing states? (cont)

"There are a host of reasons that explain Alaska's much-smaller oil industry work force, in light of its tremendous production.

"One big reason is simply that Alaska's oil fields enjoy large economies of scale. Prudhoe Bay is the largest oil field in the nation and doesn't need a huge work force to produce its oil …

"In Texas, Oklahoma, Wyoming and other oil-producing states, some oil is produced from very small fields. There are 400,000 marginal fields or stripper wells operating in the U.S. and a stripper well produces 10 barrels of oil or less per day. In many of the states, there are literally thousands of families and small companies engaged in producing oil – something nearly totally absent in Alaska."

Other Oil Producing Regions Enjoying Production and Employment Booms

Technology advances (see slide 62) lead to more drilling and more jobs in the new, unconventional (i.e., shale) oil plays in North Dakota and Texas.

At the same time, technology advances (see slides 69 and 70) lead to fewer wells and fewer jobs in the mature, conventional oil plays on Alaska's North Slope.

Competition is High – Many Other Areas To Invest Around the World

- ANS is a world class basin
- Vertical Integration of BP, ConocoPhillips, and ExxonMobile
- Transition from majors only to mid-majors and independents
- Growth of NOCs limits "areas to invest"
- Concept of immobile capital

CSSB 192(RES) Overview

CSSB 192(RES)
Rationale and Overview

- Preserves Industry-Friendly Components of ACES
- Reduces the Rate and Cap of Progressivity
- Rewards Increased Production
- Establishes a Gross Minimum Tax
- Separates oil and natural gas for purposes of calculating the progressivity portion of the production tax
- Creates an Oil Information System

CSSB 192(RES)

Preserves Industry-Friendly Components of ACES

- Preserves Deductions of Capital Expenditures, Operating Expenditures, and Transportation Costs (i.e., net profits tax)
- Preserves Tax Credits
- Preserves Royalty Rate
- Preserves Royalty Modification

CSSB 192(RES)

Reduces the Rate and Cap of Progressivity

- Retains the original trigger of $30 in Production Tax Value (PTV); at which point the progressive tax rate is calculated at .35% per dollar increase in PTV up to 50% ($101.43);

- At 50% ($101.43), the CSSB 192 adds a second trigger on the progressive tax rate calculation that lowers the progressive tax rate to .1% on PTV up to 60% ($201.43);

- Adds a statutory maximum tax rate of 60% under the production tax statutes.

CSSB 192(RES)

Rewards Increased Production

- Companies that increase their North Slope production levels from one year to the next will earn an allowance on the oil they produce above the prior year.
- The allowance reduces their Production Tax Value (or PTV) by $10 for the new barrels of oil produced. This allowance should not be confused with a tax credit or a lowering of tax rates.
- It is a reduction in the PTV used to calculate production tax.

CSSB 192(RES)

Establishes a Gross Minimum Tax

- This provision of the legislation will establish a production tax floor of 10% of the gross value of oil at the point of production for legacy fields in Alaska. The floor would apply only to fields which have already produced a billion barrels of oil and are still producing 100,000 barrels a day on average.
- This provision is intended to alleviate concerns that the current floor does not adequately protect the state when oil prices are low. In fact, at prices as low as $70, the state may take in more with a 10% gross floor than it would with ACES.
- As consultants have told us, ACES needs to be durable in a wide range of price environments. This provision helps achieve that goal and protects the state at the downside.

CSSB 192(RES)

Separates oil and natural gas for purposes of calculating the progressivity portion of the production tax

- This legislation separates oil and natural gas for purposes of calculating the progressivity portion of the production tax.
- Under current law, the tax rate is based on the combined BTU value of oil and gas. However, oil and gas can, and do, have vastly different values on a BTU basis. Currently, a BTU of oil is worth much more than a BTU of gas. Accordingly, once a major gas sale starts, overlaying the existing oil production, the BTU value of the combined oil and gas would be much lower than it was for oil alone.
- This legislation removes the dilution effect by having progressivity calculated distinctly for oil and gas. This will result in no reduction in oil taxes from a major gas sale.

CSSB 192(RES)

Creates an Oil Information System

- Concerns have been raised about oil and gas information that is not available to legislative policy-makers and the public. While much of the information is confidential under law, there is a considerable amount that is public, but it is scattered among several agencies and can, at times, be difficult to find.
- This provision in law will begin the process of making information more available to the policy-makers, public, and oil and gas companies who may be seeking to do business in Alaska's oil fields.
- Alaska Oil and Gas Commission (AOGCC) will be required to develop an electronic Petroleum Information Management System that will contain public information currently gathered by the commission, as well as the Departments of Revenue, Natural Resources and Labor & Workforce Development.
- The legislation directs the departments that have control over the various aspects of the information to provide what is not confidential to the commission in a form suitable for distribution.

"For someone new to the state or for a company that does not already have a large production base ... credits for capital investment and the credit for net operating losses are very advantageous."

Savant Resources, 2009

- **The State of Alaska pays up to 40% of exploration costs**
- **Tax increases and decreases with oil prices and level of investment: The more you invest, the less tax you pay**
- **Lower taxes for Cook Inlet and in-state gas use**
- **Credit for capital investments, plus a 25% credit for net losses**

Alaska is successfully encouraging investment from companies that are new to the state, with the number of petroleum companies doing business in the state almost doubling between 2006 and 2008.

Legacy producers on the North Slope are investing in their own assets, leaving room for new players, as evidenced by Pioneer's Oooguruk (production started in 2008) and ENI's Nikaitchuq (expected to start production in 2010).

The past two years of lease sales on the North Slope successfully leased a total of 1,276,207 acres, all to smaller companies.

"[T]he state has been a good partner for new explorers."

Abstract

The Prudhoe Bay Field on Alaska's North Slope has produced for twenty-one years. Prudhoe's gas and water production rates are at historic highs, but the oil production rate has declined to less than one-half of the peak rate achieved in the 1980's. As a result, significant excess oil treating capacity exists, with water and gas handling capacity constraining the current oil production rate. The owners of the Prudhoe Bay Unit ("PBU") developed a major facility consolidation plan in 1997 designed to rationalize this excess oil treating capacity while preserving existing gas and water handling capacity. The reconfigured facilities are expected to provide sufficient capacity at a lower cost to accommodate projected oil, water and gas production rates over the remaining life of the Prudhoe Bay Field.

This paper describes the Prudhoe Bay Surface Facility Optimization Project, from conceptual engineering initiatives in 1996, through preliminary engineering, economic justification, attainment of support from operations personnel and approval by the working interest owners of the Prudhoe Bay Field. Technical challenges and the challenges of projecting benefits associated with the consolidations were resolved through networking and technical discussions throughout the BPX, ARCO and Exxon world-wide organizations. The ultimate approval of the plan by the PBU Working Interest Owners is a clear example of teamwork and information sharing on a global scale.

Introduction

The Prudhoe Bay Field first produced oil in June, 1977. Daily production reached a plateau between 1979 and 1989 at 1.6 million barrels of oil and condensate. The field has since declined to a total daily production rate of 750 thousand barrels (combined oil, condensate, and natural gas liquids "NGLs"). Production to date has been approximately 9.5 billion barrels of liquid hydrocarbons with significant additional remaining reserves. During the field's development, gas production has increased to a current annual average of 7.5 BCFD with funded projects planned to increase gas offtake to about 8.3 BCFD. Gas production is expected to remain stable into the foreseeable future. Currently, produced gas is stripped of saleable components and either reinjected for gas cycling and pressure maintenance or consumed as fuel in operations on Alaska's North Slope. Daily water production is currently 1.3 million barrels and is expected to remain relatively stable for the foreseeable future.

The field was developed with six large oil separation facilities, three ARCO operated Flow Stations (Eastern Operating Area, EOA) and three BPX operated Gathering Centers (Western Operating Area, WOA). Each facility was designed with a nominal oil handling capacity of 330 to 360MBD. Current oil production rates at the facilities range from a low of 75MBD to a high of 180MBD. Oil production rates are projected to continue to decline in the future. In developing the field development and management plans for 2000 and beyond, the PBU Working Interest Owners recognize the need to reduce lifting cost commensurate with the decline in oil production to maintain an economic asset for as long as possible. The Prudhoe Bay Facility Optimization Project will play an important role in achieving reduced lifting costs.

Opportunity for Consolidations Identified

Figure 1 highlights the forecast oil production rate with the capacity of separation facilities in the WOA. The three existing WOA facilities each have four separation trains for a total of 12 trains. Expected oil production will be less that the capacity of one separation facility within several years. The situation in the EOA is similar.

In 3Q 1996 a small team consisting of members from BP, ARCO, and Exxon was chartered with the goal of developing possible scenarios to decommission facilities no longer required to maintain projected

production rates. The team was to use as a starting point, the various ideas, studies and informal proposals circulating within the Operator's organizations. If economic scenarios were developed, the team was to complete conceptual studies and develop plans for moving the concepts into preliminary engineering. Team members were based in Alaska and the United Kingdom. Some outside contractor and operations resources were utilized for short periods during the conceptual phase.

Project Development

The team investigating facility decommissioning and consolidation opportunities rationalized the various proposals into a single preliminary engineering proposal during the second half of 1996. In late 1996, the PBU Working Interest Owners funded a preliminary engineering study focused on field wide consolidation. A combined operator, owner, and contractor team conducted the study.

The overall objective of the preliminary engineering study was to evaluate and justify economically the decommissioning of under-utilized crude oil processing equipment that is excess to current and future needs. Boundary conditions were established for the team requiring the reconfigured facilities to have the ability to handle and produce crude oil, condensate, gas, water, NGLs, and miscible injectant ("MI") at rates no lower than the existing facilities could handle and produce with projected Prudhoe Bay Field oil, gas, and water production rates. Further, the proposed facility configuration could not compromise safety, reliability, and product quality, and should maintain the ability to accommodate known potential future new developments.

Preliminary Engineering

Existing Facilities. Prudhoe Bay wells are located on centralized gravel pads and directionally drilled to reservoir targets. Local manifolds at the well pads route the flow to common flowlines. Flowlines route the flow to the six separation facilities.

As shown in Figure 2, Prudhoe Bay's installed separation facilities utilize three stages of separation in a parallel high pressure/low pressure scheme. Production from high-pressure wells is separated in two phase 1st stage separators at 650 psig (HP separators). Production from low pressure wells is separated in large three phase separators/slug catchers at 170 psig (LP separators). The oil/water outlet from the 1st stage HP separators is combined with the oil outlet from the 1st stage LP separators in two phase 2nd stage separators at 80-110 psig, where additional gas is removed. The oil outlet from the 2nd stage separators is routed into oil dehydrators where remaining water is removed via electrostatic grids at 50-60 psig. Remaining gas is removed in the final 3rd stage separators (or stock tanks) at slightly higher than atmospheric pressure. Fluid composition and temperature leaving the facility is important because NGLs are blended into the crude oil stream downstream of the 3rd stage separators for transportation through the Trans Alaska Pipeline System and the operating procedures call for maximizing the volume of NGLs blended.

Figure 3 is a simplified process flow diagram of the produced water handling facilities at a typical Prudhoe Bay separation facility. Produced water removed in the LP separators and the oil dehydrators is combined in water skim tanks. Oil is removed from the produced water in the skim tanks via internal design and residence time, providing water quality sufficient for reservoir reinjection. Water from the skim tanks is routed to booster and injection pumps for injection into the producing intervals while excess volumes are injected into a higher non-producing formation. Several of the separation facilities were equipped with further water treatment facilities, generally gas flotation cells ("GFCs"). The GFCs proved difficult to optimize, and their use has been discontinued at all but one separation facility as better upstream separation operation and better overall optimization achieved sufficient water quality.

Figure 4 is a simplified process flow diagram of the gas compression and dehydration facilities at a typical Prudhoe Bay separation facility. The majority of gas (500-1900 MMSCFD per separation facility) is produced through high pressure wells and is separated in the 1st stage HP separators at 650psig. Gas separated at lower pressures is treated, compressed, and mixed with the high pressure gas stream. The majority of this gas is separated in the 1st stage LP separators at 170 psig (approximately 600 MMSCFD per separation facility) and compressed in the Low Pressure System 'LPS' compressors. Relatively small volumes of gas are separated in the 2nd stage separators (roughly 30 MMSCFD per separation facility) at approximately 80 psig and compressed in Intermediate Pressure 'IP' compressors. An even smaller volume of gas is separated in the 3rd stage separators (under 20 MMSCFD per facility) at slightly above atmospheric pressure and compressed in the Stock Tank Vapor 'STV' compressors that discharge into the IP compressors.

The combined high pressure gas stream is routed directly to local gas dehydration facilities within the separation centers. Once dehydrated to -40F, gas is routed to the Central Gas Facility for NGL and MI extraction. Residue gas from the Central Gas Facility is then compressed in the Central Compression Facility for reinjection into the reservoir gas cap.

Production Forecasts. The three major owner companies initially established a single consensus

production forecast for use in preliminary engineering. This was accomplished by using the higher of the three companies' production forecasts for each separation facility and pressure system. The projected production capacities then served as lower limits for acceptable facility capacity. During preliminary engineering, the project team developed capacity tables for each major equipment item in each consolidated and receiving facility. The projected capacities were compared to the production forecasts to develop pinch point tables that identified limiting equipment and feasible consolidation timing.

Development of planned consolidation scope. Initial studies aimed at eliminating under-utilized equipment recognized that the separation facilities had considerable excess oil processing capacity while operating at near design limits for water and gas handling. Further discussion and study identified that the bulk of fluids were separated in the 1st stage HP and LP separators. Thus, if water and gas could continue to be processed at each facility while transporting partially processed "fizzy oil" from the outlet of the 1st stage separators to a centralized oil processing center, large parts of some facilities could be decommissioned. This concept led the study team to conclude that four of the six separation centers could eventually be converted into partial processing facilities while maintaining two full processing facilities.

Preliminary Engineering focused on determining how to apply the partial-processing concept to the existing Prudhoe Bay separation facilities. The concept can be summarized as follows:

1. Maintain first stage separation at all six separation facilities.
2. Use existing idle or converted cross country flowlines to transport partially processed "fizzy oil" from the outlet of first stage separators at partial processing facilities to the inlet of second stage separators at full processing facilities for final processing.
3. Decommission second and third stage separators, dehydrators/treaters, and the IP and STV gas compression systems in partial processing facilities.
4. Decommission related utility systems, some water treatment facilities, and all other equipment identified as no longer necessary.

Figure 5 provides a simplified schematic of the post consolidation arrangement for one of the sending and receiving facility combinations (figure is simplified to one production train at each facility). Figure 6 depicts the overall final consolidation plan ultimately recommended by the team.

Under the proposed plan consolidations would proceed as follows:

1. The first phase in 1998 will convert Gathering Center 3 to a partial processing facility, routing its oil to Flow Station 3 for final processing.
2. The second phase, planned for 2000, will convert Flow Station 2 to a partial processing facility, routing its oil to Flow Station1. Water from both facilities will be processed at Flow Station 2.
3. The third phase will consolidate Gathering Centers 1 and 2. The timing and direction of this consolidation could be impacted by the development of satellite reservoirs located near these processing facilities. This consolidation could occur as early as 2000, or as late as 2003. If Gathering Center 2 is used for processing most satellite fluids, then Gathering Center 1 will be converted to a partial processing facility, with its oil used to fill remaining Gathering Center 2 capacity with excess oil routed to Flow Station 3 via Gathering Center 3. If Gathering Center 1 is used for processing most satellite fluids, then Gathering Center 2 will be converted to a partial processing facility and its oil will be routed to Gathering Center 1 for final processing.
4. The fourth phase of consolidation. Planned for 2004, will convert Flow Station 3 to a partial processing facility, routing its oil and the partially processed oil from Gathering Center 3 into Flow Station 1.
5.

Preliminary Engineering Challenges. As preliminary Engineering progressed, significant bottlenecks were identified at the proposed receiving facilities in dehydrator water handling and in the IP and LP gas compressors. Design assumptions used to develop consolidation concepts originally assumed the 1st stage HP and LP separators would remove 97% of the entrained gas and the 1st stage LP separators would remove 80% of the water. These assumptions, particularly with relation to water separation, later proved to be limiting.

With 80% of the water assumed to be removed at the sending facility, the receiving facilities' oil dehydrators/treaters' capacity was determined to be insufficient under most scenarios when the facility received fizzy oil from more than one partial processing facility. This capacity limitation would delay extensive consolidation by 5 or more years. Capacity comparisons showed that reliable separation of 90% water (rather than the initial assumption of 80% separation) in the 1st stage LP separators would overcome the water handling capacity bottlenecks at the receiving facility.

The team set out to determine whether it was reasonable to assume reliable 90% water separation in the 1st stage LP separators was achievable. Field testing of the existing facilities demonstrated that water

separation was better than 95% in clean (solids free) vessels, but only 75-85% in dirty (solids filled) vessels. Considerable support was enlisted to validate the high separation efficiency assumptions. Laboratory bottle testing was completed to determine theoretical oil-water separation limits based on fluid composition and modeling was completed in the UK to determine theoretical separator capability. A world-wide survey of ongoing operations was used to determine separation efficiency at other, similar operations. Finally, ongoing testing was used for several months to validate performance of clean separators and to validate feasibility of using on line solids removal with sand jet systems to maintain clean vessels.

Based on this work, the team accepted higher water separation assumptions as the design basis for later consolidations when two partial processing facilities would be sending fizzy oil to a single full processing center. Another mitigating factor was that the intervening years between the first and second consolidation to a full processing facility allowed time to test separator performance and validate design basis assumptions. Given the importance of the water separation assumptions to the proposed consolidations, as well as the ongoing savings associated with avoiding periodic vessel cleanouts, the PBU Working Interest Owners approved installation of on-line solids removal sand jetting systems in all 1st stage LP separators not already so equipped.

Capacity constraints in the receiving facilities were also encountered in handling the gas produced off of the 3rd stage separators. The capacity of the STV gas compression systems is utilized at or near its installed capacity to keep the vapor pressure of the final oil stream as low as possible to allow the maximum possible blending of NGLs downstream of the separation facilities. Routing partially processed crude oil from sending to receiving facilities would require that all of the gas entrained in the fizzy oil be handled in the receiving facility's STV and IP gas compressors. In some cases the existing capacity of the STV and IP gas compressors were used as limits that deferred the planned facility consolidation dates. In other cases, economic solutions were developed to accelerate consolidation timing.

In the case of the first consolidation, GC-3 into FS-3, a modification was proposed to reduce the amount of entrained gas in the fizzy oil stream as much as possible. This modification would route the oil outlet of the 1st stage HP separators (flashed at 650-670 psig) through the LP 1st stage separators (flashed at 150 psig). It was also proposed to compress other very low pressure gas streams from tank sweep gas, gas dehydration stripping gas, and other small sources through a new gas compressor which would discharge into the first stage LP separators. The resulting fizzy oil stream leaving GC-3 would have a low enough volume of entrained gas that the existing IP and STV gas compression capacity at FS-3, the receiving facility would be sufficient without modification.

Project Justification

Benefits Development. Benefits associated with the proposed consolidations were projected using the following techniques:

1. A bottoms up approach was utilized to develop projected direct and indirect cost savings. Savings in maintenance costs for each equipment item were projected based on eight years of historical data. The operations representatives on the team estimated savings associated with a reduced number of operations personnel. Indirect savings associated with reduced requirements for personnel support costs such as transportation, living quarters, meals and training, were estimated based on incremental changes in these costs. The bottoms-up approach provided the foundation for justification of the program.
2. The total direct and indirect savings were compared to the total operations and maintenance budgets as a reasonableness check. The direct savings estimates were not changed based on this comparison, but the estimated reduction in indirect costs was increased. It was assumed that the magnitude of the consolidations would allow for a larger reduction in personnel support costs than estimated on an incremental basis.
3. Benchmarking within BP's world-wide operations was utilized to further validate the estimated savings in direct costs. This approach uses a detailed comparison of equipment in service with known performance in other assets, makes adjustments for local productivity, and allows a close approximation of operations and maintenance costs of in service equipment.

Facility Reliability. Another area of analysis during project justification was projecting the future reliability of consolidated facilities. With consolidated facilities, planned or unplanned events at a receiving facility would impact production from the upstream partial processing facility, while failures of equipment removed from service at a partial processing facility would be eliminated. The team developed a detailed history of all production impacts at all Prudhoe Bay separation facilities for the previous eight years and used that as a basis for projecting future facility reliability. An analysis was completed of each production-impacting event to determine whether the proposed consolidations would eliminate, leave neutral, or increase the magnitude of a similar event in the future. The projections made using this method, with reasonable uncertainty bands, were used in analysis of the proposed consolidations.

Attention will be given to mitigating possible production impacts as the planned consolidations are engineered and implemented.

Workforce and Owner Support.

Workforce Support. Both of the operators encountered organizational and cultural challenges in estimating the benefits associated with the proposed facility consolidations. This resulted from operating cultures that had largely focused on growth and development of new reserves for some twenty years. While both operators had made significant strides to reduce field manpower and lifting costs since 1990, there had not been significant decommissioning of facilities to accompany decline.

Attaining full workforce support of the planned consolidations is an ongoing challenge and is being fostered through a broad communication and implementation plan. An important aspect of the implementation effort has been ensuring that people who are affected by changes understand what is intended and have input to the process. A small, behind the scenes team has been used extensively during the first phase implementation to foster work force support. The team has used the following tools to help develop support:

1. Workshops
2. Informal Meetings
3. Posters (A series of high level communications posters explaining what, why, how, when, etc.)
4. Newsletters and other intranet communications
5. "Townhall" meetings (presentations to large groups of staff)
6. Toolbox meetings at the start or end of workdays with operations staff
7. Assigning staff to the project design and implementation teams to foster knowledge transfer and communication.

Owner Sanction and Project Go-Ahead. Following completion of preliminary engineering in 1997, the Prudhoe Bay Working Interest Owners endorsed the facility consolidation plan as proposed. The first phase, consolidation of Gathering Center 3 into Flow Station 3, was funded and implementation is underway. The phased nature of the consolidation plan will allow validation of estimated implementation costs, estimated production impacts, estimated benefits, and operability assumptions before proceeding with additional phases. The plan is also flexible to accommodate possible satellite reservoir developments. Future consolidations will be authorized and funded to accomplish remaining portions of the plan as economic development plans for each affected facility are completed.

Several smaller projects identified during the study are also being implemented during 1998. These projects, mostly implemented in the WOA, include the decommissioning of a single oil treating train from service at Gathering Center 1 and Gathering Center 2, the installation of on-line solids removal at Gathering Center 1 and Gathering Center 2, the decommissioning of gas flotation cells and related equipment at Gathering Center 2 and Gathering Center 3 and the elimination of other minor equipment.

Lessons Learned

1. There is benefit to 'taking the long view' when developing new oil field infrastructure. It may be possible to incorporate features into original facility designs that could lower full-life costs by allowing efficient consolidation of facility infrastructure as a field's production declines.
2. It may be possible to reduce operating costs or extend field life in mature fields by consolidating under-utilized equipment and/or utilizing idle equipment in a way it was not originally contemplated, but for which it is suitable.
3. Facility infrastructure consolidation represents significant change in how a field is operated. Organizational resistance to such change is to be expected and may require a significant culture shift to successfully capture the associated benefits. In the case of Prudhoe, the focus on development and expansion has been expanded to include consolidating and elimination of equipment where economic.
4. Communicating early, openly, and frankly about options and eventualities is essential to securing work force acceptance and support of change.
5. Approaching the development of consolidation plans, designs, and justification with an integrated owner, operator, and engineering contractor team is crucial to success. A team approach with common goals and objectives is the most effective means of developing support for a complex program.
6. Early and frequent involvement of the individuals who ultimately will sanction the project in significant decisions is instrumental in obtaining project approval in a timely manner.

Practices that Contributed to Project Success

The project team was staffed from the beginning of the preliminary engineering phase with representatives from both operator's operations, maintenance, and construction organizations. This proved to be instrumental in securing operations endorsement of design and performance assumptions, isolation and decommissioning methods, safety considerations, fire protection, and other areas. During later phases of the preliminary design effort, representatives from the previously selected construction contractor assigned staff to the project to assist in developing detailed

construction strategy, layouts, and detailed, target-costed cost estimates. As the project has progressed from preliminary design towards 3Q 1998 installation and operation, cost estimates completed during preliminary engineering have proved to be generally valid and there have been only minor disagreements with operations and maintenance organizations regarding project details, implementation, and operation.

All of the participants in the conceptual and preliminary engineering phases of the project utilized global resources to validate assumptions, solve technical challenges, and provide design assurance. ARCO, BPX, and Exxon provided technical assistance from research centers in Dallas, London, and Houston to solve challenges around multiphase flow in regimes not previously modeled, separator performance capability, chemical compatabilities, and other areas. Operations input was provided from worldwide networks at both ARCO and BP, including input from Gulf of Mexico, North Sea, and Middle East operations. Operations input was instrumental in increasing operator confidence regarding water separation performance and assumptions. Contractor staff utilized consultant resources to solve challenging multiphase flow problems. Finally, a peer assist process was used at several points in the design process to validate and improve assumptions related to project design and cost, project benefits, production impacts, cost estimates, and project schedules. That process brought worldwide experience to a single location for concentrated, facilitated reviews and problem solving sessions (generally concentrated to 1-3 days).

Summary

The Prudhoe Bay owners are now proceeding with the first phase of a new multi-year facility consolidation plan. With successful implementation of the initial phase, the planned consolidations can continue for another 5-7 years and will result in a flexible, optimized, lower cost operation that will support long term development of the field. Teamwork, communications, and willingness to change were instrumental in developing and sanctioning the consolidation program.

Acknowledgments

The authors would like to thank all those who have contributed to this paper, especially co-workers at Nana-Colt Engineering, ARCO Alaska, Inc., BP Exploration, and Exxon Company, USA.

This paper reflects the views of its authors and does not necessarily reflect the views of ARCO Alaska, Inc., and/or BP Exploration (Alaska), Inc., and/or Exxon Company, USA.

SUBJECT: Oil and Gas Briefing Paper

FROM: Mark Myers
Director

Jim,

Thank you for last week's the opportunity to provide some input to you , the Governor and the Lieutenant Governor last week. As you requested during the meeting, I am attaching a short oil and gas issues paper. Obviously, a short paper only scratches the surface of some very complex and difficult issues that are key to the Governor's goal of increasing production. We at the Division would welcome the opportunity to provide you with a longer and more detailed briefing. A more detailed briefing would take about two hours and could be accomplished on short notice, subject to your availability.

I am emailing this package, however I also send a hard-copy that includes a Gas Pipeline Supply map generated by the Division in September, 2002.

Again, thank you for the opportunity to provide suggestions to you on oil and gas policy.

Meeting the Governor's Goal
Increasing Oil & Gas Production by Three Percent Per Year

Division of Oil and Gas
January 2, 2002

Oil production from the main reservoirs in Alaska's largest producing fields is dropping by approximately 10% per year. Production from satellite fields, increased development of heavy oil resources, and the development of Pt Thomson will in the short term offset this decline, but, these alone will not be sufficient to meet the Governor's goal of increasing oil and gas production by three percent per year in 2005 and later years. To meet the Governor's goal, a significant number of new oil and gas fields will need to be discovered and brought on line. We at DNR believe that the geologic potential exists on the North Slope and Beaufort Sea for the discovery of sufficient reserves to meet the goal. However, for that to be accomplished there must be a dramatic increase in the number of exploratory wells drilled in the near future and new discoveries must be rapidly delineated and developed (See attached graph). The State can and should play an important role in stimulating this new wave of exploration.

Mergers and market concentration on the North Slope have created a non-competitive environment in which three majors have a near monopoly that gives them a large competitive advantage in exploration, development, production, and transportation. It is this uneven playing field that has raised the barrier to new entrants, from smaller independents through large integrated majors. As long as these majors invested sufficient capital for exploration and development activities, the State accepted the consequences of the oligopoly. Since the existing majors no longer are willing to invest sufficient resources on exploration or development, the State must look elsewhere. The State must look beyond the existing majors to the new wave of independents and remaining majors. This situation parallels the experience in other oil and gas basins worldwide, several of which have successfully made this transition.

Independent oil and gas companies are bullish on Alaska and prepared to explore and drill as long as certain barriers to entry can be diminished. The State can help reduce those barriers to entry. Oil and gas companies make their investment decisions based on their evaluation of the geologic potential of an area, economics, and their tolerance for risk. Independents are excited about Alaska's geologic potential. However, they are concerned about the near-monopoly on access to facilities, the high cost of TAPS pipeline transportation, the uncertainty of access to a gas pipeline, the timeliness and certainty of permitting, and access to data. The State can address these concerns and make for a more competitive environment at the same time. Accordingly, the administration may want to consider one or more of the following potential courses of action, each of which is relatively low cost:

1. Streamline permitting.

2. Provide easy and expanded access to data critical to the evaluation of oil and gas prospects.

3. Require that fees to existing underutilized facilities by just and reasonable.

4. Sell a portion of the State's royalty gas to guarantee exploration in the North Slope Foothills.

5. Assure a lower pipeline tariff for explorers by leaving a portion of the in-state oil market to those without an ownership interest in TAPS, selling only enough royalty oil to assure in-state refiners access to affordable crude.

6. Stop defending TSM-based TAPS tariffs and consider actions that may encourage those without an ownership interest in TAPS to challenge the interstate tariff.

Additionally, if the State chooses to offer financial incentives, it may want to target those financial incentives to accomplish the Governor's three percent goal. Specifically, it may want to:

1. Condition any incentives for the construction of a gas pipeline on the granting of access to that gasline on terms more typically akin to oil pipelines than gas pipelines.

2. Condition any incentives targeted at existing fields on the granting of access to facilities under cost-sharing terms deemed reasonable by the State (e.g. use utility rate-making principles).

3. Limit any program of exploration incentive credits by time and volume, and to fields a specified distance from existing areas of production.

Several of the low cost and subsidized means of providing for a more competitive environment, and hence more production, are discussed below.

1. Selling Royalty Gas to Foothills Explorers.

The Foothills area is a gas-prone region. It will not be explored by those seeking oil alone, and it will not be explored absent access to a gas pipeline in sufficient volumes to allow for commercial development. To acquire a commercially viable quantity of space in the gas pipeline, the Foothills explorers must commit to pipeline capacity in an initial "open-season" for the pipeline, which will be conducted shortly after an initial decision to build the pipeline is announced. During the open season, the Foothills explorers will be required to sign contracts obligating them to pay for pipeline space for a period as long as twenty-five years, regardless of whether they are successful in finding gas to fill that space. Companies will make this type of commitment only if they are certain they will have access to gas to ship. The State can provide that certainty by offering to sell a portion of its Prudhoe Bay and Pt. Thomson royalty gas to Foothills explorers, who could then carry the royalty gas in their pipeline capacity until such time as they have enough of their own Foothills gas to fill the pipeline capacity they must pay for.

Following competitive bidding, DNR, Anadarko, and EnCana agreed on terms for the sale of royalty gas to Anadarko and EnCana, though the contracts will not become effective unless this administration chooses to prepare a final best interest finding in favor of the sale and the legislature approves the sale this legislative session. Under the proposed contracts, Anadarko and EnCana offer to pay the State as much as it would receive for its gas if left in-value with the Prudhoe Bay and Pt. Thompson producers, plus an upfront premium of $350,000, a premium of

$2 million for every five years of purchases, and a per/MCF premium of $0.02 in years 1-5, $0.04 in years 6-10, $0.06 in years 11-15, etc. They also commit to spend not less than $50 million on exploration in the Foothills, and to local hire, local training, a preference for in-state gas use, and a preference for in-state gas processing. Northern Economics concluded that the State would be bettered by $6.4 billion if the royalty sale proceeds and the explorers are successful in the Foothills; net benefits to the State would be lower in the event of exploration failure.

To capture the benefits of sale of royalty gas to Anadarko and Encana, the administration must issue a final best interest finding in favor of the sale within the next month, and must submit the proposed sale to the legislature for approval in the 2003 legislative session.

2. The TAPS Tariff – Making It Just and Reasonable

On November 27, 2002, the Regulatory Commission of Alaska issued a decision in which it concluded that the intrastate TAPS tariff exceeded just and reasonable rates by $9.9 billion (20%) from 1977-1996, and by 57% from 1997-2000. The rationale provided by the RCA extends, logically, to interstate tariffs, which apply to 90% of Alaska's North Slope oil, though the matter has yet to be brought before FERC.

Explorers—indeed all without an ownership interest in TAPS—would be well served by a TAPS tariff limited to just and reasonable rates. If the RCA decision is projected into the future and applied to both intrastate and interstate barrels, it could improve company economics by $1-2/bbl. This difference is substantial, and apt to be decisive for a number of potential new projects. However, the State needs to act to maximize the benefits of the RCA decision.

While there may be legal impediments that limit or prevent the State from sharing in the benefits of the RCA decision when it comes to calculating royalties and production taxes on existing production, the State should nonetheless support lower tariffs for independents, in-state refiners, and anyone willing to invest new capital in exploring remote regions of Alaska. To this end, the administration may want to consider the following:

a. *Sell royalty oil to the in-state market, but only in such volumes as to assure the availability of the in-state market to those without an ownership interest in TAPS.* Until such time as there is a successful challenge to the interstate tariff, a lower tariff will be available only to the in-state market, which totals 90,000-100,000 b/d. Companies such as Forest Oil, Murphy, Anadarko, and Chevron-Texaco currently have North Slope production, but no ownership interest in TAPS. Their production levels should be totaled, and the State should consider not competing against them for that volume of the in-state market. The State's restraint in its royalty oil sales will send the clear message that it is intent on improving the economics for new players and minority interests. And while the State's royalty income will be somewhat diminished by its failure to monopolize the higher-value, in-state market, perhaps that is appropriate given the State's historic role in creating tariffs recently adjudged too high.

b. *Stop defending the TAPS Settlement Agreement and TAPS Settlement Methodology.* While the State historically defended the TSM, it did so before a regulatory body had adjudged the consequent rates as grossly excessive. Given the RCA's decision, it is time to

stop defending the TSM. Arguably, there will be a further cost to stopping—to "losing"—due to the interstate make-up provisions of the TAPS Settlement Agreement, but that cost is no greater than 10% of the total of excess tariffs paid under the TSM. Moreover, the Carriers will appeal the RCA decision with or without State participation; hence, the State will obtain any alleged advantages of a reversal of the RCA decision regardless of whether it participates in an appeal.

c. *Examine ways to encourage a challenge to the TAPS interstate rate.* While the terms of the TAPS Settlement Agreement may prevent the State from appearing before FERC in support of lowers tariffs, the State might be able to create an incentive for another party to undertake the task and costs of such a proceeding. For example, if legal, perhaps the State could sell a portion of its royalty oil to an interstate shipper on price terms that would share the benefits of a decrease in FERC-approved tariffs.

3. Conditioning Incentives for the Construction of a Gas Pipeline.

The State may want to consider conditioning any incentives for the construction of a gas pipeline on the granting of access to that gasline on terms more typically akin to oil pipelines than gas pipelines.

Pipeline regulation is an artifact of Lower 48 practices and the prior regulation of natural gas prices. As a consequence, different rules and practices prevail for oil and gas pipelines, though there is little pragmatic difference between a single ANS oil pipeline and a single ANS gas pipeline in the absence of pipeline regulation. Nonetheless, TAPS has been regulated as a common carrier, and consequently potential shippers can obtain pipeline space on relatively short notice and for short periods of time; in the event of excess demand for pipeline space, pipeline capacity is prorated among all. Conversely, the federal government will regulate an Alaska gas pipeline as a contract carrier. Parties wishing pipeline space sign contracts obligating them to pay for that space years before pipeline construction begins; commitments to space may extend for 15-25 years. Consequently, access may be denied for 15-25 years, or may be limited to expansion capacity, which itself is too limited in volume and too uncertain in timing as to warrant exploration risk and expense.

While the State could not normally dictate that a gas pipeline be a common carrier, or something more akin to a common carrier, it can condition the grant of pipeline incentives on improved terms for access. The national energy bill considered by Congress this year included certain terms intended to improve access; that bill may or may not become law in the next year, and if it does, the access terms may or may not remain intact. The State may want to consider conditioning any pipeline incentives—such as a property tax holiday—on access terms equal to or stronger than those included in the national energy bill.

4. Streamline Permitting

Three major permitting issues need to be resolved. Permits must be issued in a timelier manner, permit requirements must be consistent with stipulations and mitigation measures supported by science and engineering data, and the process for the permit applicant must be clear, efficient, and reliable. There are multiple different models and organizational structures that could be used to accomplish these goals, all of which have advantages and disadvantages. These alternatives

will not be discussed in this briefing paper. However, there are several key improvements that should be made independent of organizational structure.

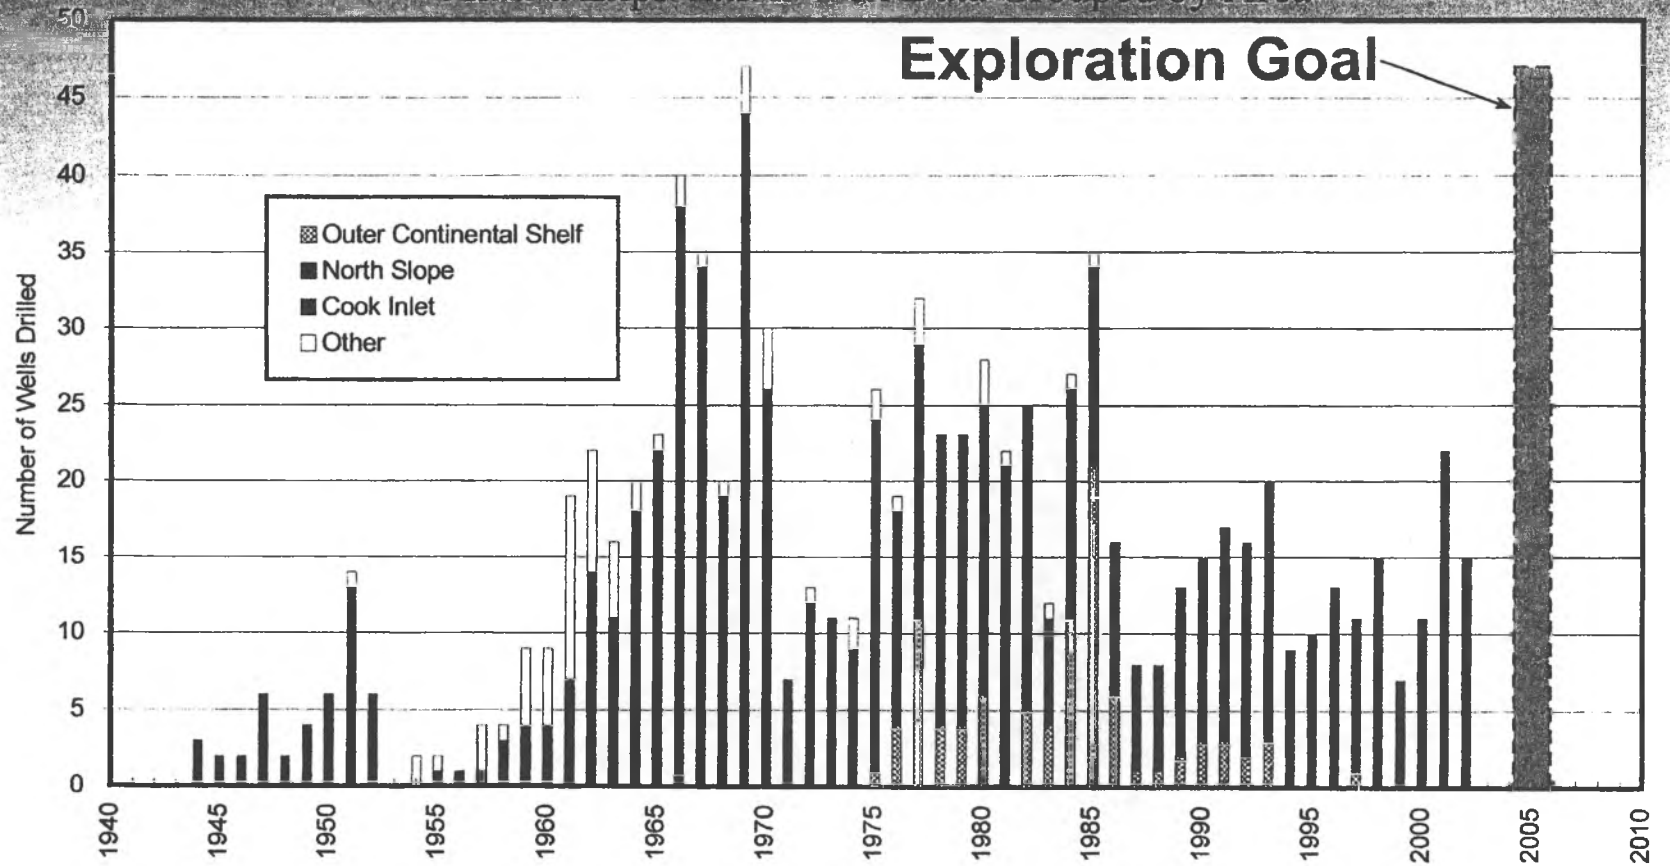
The current permitting system does a poor job of analyzing and managing risks. Many of the issues involving oil and gas permits revolve around mitigating very low risk but high impact events, such as large spills or well blowouts at a remote location. In order to properly assess and mitigate these events, the state needs a higher level of technical expertise in the permitting agencies. For example, DEC would be well-served by having an experienced drilling engineer on staff. Additionally, risk management issues often cross agency lines of responsibility but are poorly understood or communicated between agencies. It is imperative that division and department managers, directors and commissioners have the technical knowledge, policy coordination and willingness to work together to achieve the common goal of timely and environmentally responsible permitting of oil and gas projects. Given the reality of limited staffs and funding, it is also extremely important that managers are constantly prioritizing work and deadlines based on the larger best interest of the state. Finally, the state should be aggressive in pursuing and encouraging the use of newly developed technology that can both decrease risk and environmental footprint. This support must be institutionalized within the regulatory regime. Anadarko's Arctic Platform and well-capping are two such examples of this new technology.

One of the significant inefficiencies in the permitting process is overlap and redundancy of standards and agency requirements. For example, past delays in oil and gas project permitting has been caused by the inefficient interaction between ACMP and ADEC's air quality permitting and contingency spill plan approval processes. A possible solution for this and other redundancies is to reinterpret the regulatory requirements to avoid separate agency determinations under the same standard.

From a Division of Oil and Gas perspective, our greatest historical problems with permitting have come from delays caused by internal agency elevations on lease sales or exploration licenses. Many of these delays are the result of conflict between the Southcentral Region of the Division of Habitat and Restoration of the Department of Fish and Game and DNR. These internal elevations have in some cases delayed the issuance of leases or licenses for more than a year. From the Division's perspective, the Division of Habitat and Restoration has often used the process as a negotiating tool to gain concessions and to extend their authority beyond that justified by current statutes and regulations. These politically-motivated elevations must be eliminated. Elevations should only occur when the elevating agency can support their concerns with solid scientific and other factual data. The elevation process should not be used as a standard interagency negotiating tool with the associated effect of creating long delays in projects and leasing.

5. Access to Data

Independent oil and gas companies and newly involved major oil companies lack data crucial to their evaluation of the North Slope and other basins. This data includes seismic, well log and core data. The State should do all it can to assist in making this data readily available. In addition the State—possibly in conjunction with USGS--should expand and focus geological research and publication-in order to provide baseline non-confidential information to industry. Specifically, the State should require that seismic data be made public 10 –15 years after it is



acquired or require that it be made available for purchase at low cost through a brokerage system. The State should continue its effort to create a WEB-based system for downloading publicly available well log data. The State should require that a 1/3 section of each core be given to the State, instead of the current core chips every foot. This standard is used in Canada with great success. This data would become public information on the same schedule as currently used for well data. Furthermore, the State's current core facility is entirely inadequate. The State should build or lease a new facility, which would also contain the publicly available well and seismic database. This facility could be built in conjunction with the United States Geologic Survey, United States Department of Energy, Bureau of Land Management, Minerals Management Service and/or the University of Alaska. I am pursuing your suggestion that we investigate the seafood processing facility to determine its feasibility as a core facility.

6. Access to Remote Areas For Oil and Gas Exploration and Development

As exploration and development activities move away from established core areas that can be reached through the existing infrastructure or with relatively short length ice roads, different methods will need to be used for physical access. Given significant variations in terrain, climate, biological and cultural environment, and the geology of these remote exploration sites, no single method will be used for access.

The State can improve access by encouraging the development of new lighter weight drilling rigs that are more readily transportable by air or rolligon, eliminating the need for some ice roads. Other technologies that should be encouraged are the use of removable mats for temporary roads and Anadarko's elevated arctic platform. Finally, the State should evaluate the need for new and improved roads to remote areas, new airstrips, and remote exploration and equipment storage pads (insulated ice, mat, or gravel). Any decision on roads and airstrips should target the areas of highest oil and gas potential and should consider the needs of local communities. The State will need to address complaints that new roads may increase cumulative environmental impacts and will face strong opposition from environmental organizations and others opposed to oil and gas exploration in ANWR and other remote areas.

In Order to Increase Alaskan Oil Production the Number of Exploration Wells Drilled per Year Must Dramatically Increase.

Number of Alaskan Exploration Wells Drilled per Year

mep 01/03

Oil and Gas Consolidation

Two options: Create a Department of Oil and Gas/Department of Energy: or strengthen the DNR Division of Oil and Gas (DO&G)

Department of Oil and Gas or Department of Energy Approach

Positives:

- Direct access to Governor, and Cabinet.
- Some efficiency gains if the Alaska Oil and Gas Conservation Commission (AOGCC), most permitting functions, some of Department of Law's (DOL), Department of Community and Economic Development's and DO&G's functions are consolidated.
- Department would have higher public visibility and potentially a more unified approach when dealing with industry and the federal government on oil and gas issues than do the various divisions.
- A new and separate department may have the ability to create an exempt workforce at near industry salaries that would allow the state to recruit and retain highly-skilled experts throughout the Department

Negatives:

- Will require substantial legislation with new regulations and long period of reorganization
- A substantial part of the efficiency gain would come from combining the AOGCC and the DO&G. This will be opposed by industry, which prefers an independent AOGCC
- Will place in separate Departments the surface ownership responsibilities that are currently under the Division of Mining, Land and Water (DMLW) and the subsurface responsibilities under DOG
- Substantial consolidation of oil and gas permitting into a single Department will require duplication of permitting staff for non-oil and gas permitting (mining, timber, infrastructure, fishing, manufacturing etc), which would presumably need to remain in the current agencies.

Recommendations to Strengthen the Existing Oil and Gas Structure Within DNR

- Permitting: Expanded use of large mine coordinator model with respect to oil and gas exploration and development permitting

- Move Habitat Division of the Department of Fish and Game and the Division of Governmental Coordination into DNR.

- Return royalty audit authority to the Division of Oil and Gas and recruit a very experienced and highly motivated auditor with an industry background to lead the audit group.

- Create a research section within the Division of Oil and Gas to include focused geoscience and engineering research, and commercial studies.

- State Geologist position should be in Anchorage. To the extent that Division of Geological and Geophysical Surveys (DGGS) Energy Section stays independent of DO&G, its research effort should place a higher-emphasis on applied basin analysis in support of exploration and development. Under this option, DGGS should have at least one position in Anchorage filled with an experienced petroleum geoscientist.

- Increase joint research efforts with the United States Geological Survey, Department of Energy and University of Alaska on projects that have significant impact to commercial oil and gas development

- In order to accelerate the process of bringing new production on line, increase DOG staffing in unitization, leasing and permitting.

- Full funding of DO&G to fill existing vacant positions (reservoir engineer, permitter/inspector and accounting technician

- Rebuild the Royalty Accounting system so that it integrates better with other key state systems and can be used more efficiently and effectively for commercial analysis in advance of audits and royalty reopeners.

- Build or lease a modern core facility to replace the inadequate facility at Eagle River. The facility should contain an oil and gas well log library. This facility will create a one-stop data center for independents. Advocate for funding support from DOE, USGS, MMS, NSF, universities, and industry.

- Increase funding for outside experts with respect to commercial issues including facilities access, gasline and royalty reopeners.

- Increase very focused promotional efforts toward attracting new companies to Alaska beyond AAPG and NAPE.

- Create a more positive attorney-client relationship with the Department of Law, particularly with respect to policy decisions and direction.

INCREASING PRODUCTION AND REVENUE – DIVISION OF OIL AND GAS						
				Impact Timing/ Duration		
No.	Category	Item	Action	Short	Medium	Long
1.	Increase Exploration Access & Activity	Seismic Data	Released to public after reasonable time		X	
			Fed/ State seismic data sharing		X	
		Well Data	Limit confidential Period		X	
			Fed/ State well data sharing		X	
		Basic Research	More emphasis on basic Oil & Gas basic geologic & geophysical research		X	
			Increased federal funding		X	
			Acquire specific expertise		X	
			Reprioritization of DGGS effort		X	
			Public access to basic research - Locate effort in Anchorage to facilitate industry-government relationship;		X	
			DOE grant for digital Log, Mapping, & Lease Sale data	X		
			Modern core data public repository		X	
			Better coordination with USGS, MMS, DOE, and BLM	X		
		Increase outreach to Independents.	Engage in technical discussions; provide information, data, advice	X		
		Facilities	Study cost & cost-sharing; Report findings	X		
			Facilitate reasonable published commercial facility access fees; Regulate if necessary	X	X	

No.	Category	Item	Action	Short	Medium	Long
			Study ways to pool equipment (rigs, spill prevention & cleanup)		X	
			Use Unitization Authority proactively to protect correlative rights, state's interests, and enhance competition.	X		
		Pipelines & Other Transportation	Assure reasonable access to contract carrier & other transportation. (See also Pipeline in section 4, above)	X	X	
2.	Incentives	Federal Incentives	EOR / Heavy Oil Tax Credit; OCS Royalty Reduction		X	
			Section-29 Credits for Coal Bed Methane		X	
			Gasline price floor credit (state royalty share included)		X	
			Oil/Gas exploration tax credit for Foothills / Interior Basins.		X	
		State Incentive	EIC credits for exploration; make it focused & discretionary [Caution: impact of state credits are dampened by federal tax deductibility]	X		
			EOR credit external to unit if in state's interest; revise royalty reduction statutes	X		
			Increase chargeable acreage cap in specific areas with specified conditions	X		
			EIC to be non-transferable and used only in field of exploration	X		

No.	Category	Item	Action	Short	Medium	Long
3.	Permitting	Process/Administration	Streamline; quicker; coordinated; better risk management;	X		
			Education & awareness	X		
			Progressive leadership	X		
			High technical expertise		X	
			Scientific management		X	
			Better state-fed-local coordination	X		
			Extend tundra travel and winter drilling seasons	X		
			Emphasis on creative efficient solutions – not problems	X		
			Assure timely permits and reasonable Permit Terms (E.g., PTU $150 million per year revenue gain)	X		
		Stipulation & Mitigation Measures	Stop Authority Creep; Limit Elevation	X		
			Justify stipulation with data/ evidence (where's the beef?)		X	
		Federal Acreage	Encourage development of known, undeveloped fields – Liberty, Hammerhead, Kuuvlum.		X	
4.	Unitization	Exploration & development requirements	More aggressive; Tougher commercial & work-commitment terms upon unitization.	X		

No.	Category	Item	Action	Short	Medium	Long
5.	Leasing	Accelerate lease issuance	Eliminate current one-year delay	X		
		Work Commitments	Areas near infrastructure – short terms and/or work commitments	X		
			Areas with no infrastructure – apply work commitments	X		
		Exploration Licensing	Modify Licensing; more emphasis on Shallow Gas; more discretion to DNR commissioner	X		
		Lease Sale Policy	Higher minimum bids; use reservation prices to assert option to reject bids	X		
			More leasing coordination with Native Organizations & Fed	X		
			Increase lease rental rates			
6.	Infrastructure	State-built basic infrastructure	Roads, Transportation & Communication Systems			
7.	Federal Revenue Sharing	NPRA	Reallocate revenues to state general fund			
		ANWR	90/10 per Statehood Act v. 50/50 as proposed in legislation			
8.	State Taxes	Production Tax	Tax Rate– Modify (statute)			
		ELF	Add progressive price term			
		ELF	Modify definition of "Field" (Administrative)			
		Property Tax	Modify allocation between boroughs and state Gen Fund.			
		Tax Audit	Make audit more thorough and aggressive; increase field work			

No.	Category	Item	Action	Short	Medium	Long
9.	State Royalty	Audit Authority	Change from DOR to DNR	X		
		NPSL's	Examine cost allocation methodologies to be certain they are appropriate and equitable		X	
		Process & Admin	Make more thorough & timely	X		
			Increase skill level		X	
			Accelerate Electronic Reporting	X		
		Re-openers	Capture Full Value; pro-active monitoring of markets & costs		X	
			Increase analysis of data		X	
			Increase support from legal and outside experts	X		
			Increase in-house training	X		
			Fund Legal support through DNR budget	X		
			Redistribute royalty revenue away from Perm Fund (Repeal Chp.13 to pre-1979 status)		X	
10.	General Commercial	Conflict of interest	Enforce standards w/ outgoing employees	X		
		RIK Oil and Gas	Maximize	X

This paper was prepared for presentation at the SPE 1993 Western Regional Meeting to be held in Anchorage, Alaska, 26-28 May 1993.

This paper was selected for presentation by an SPE Program Committee following review of information contained in an abstract submitted by the author(s). Contents of the paper, as presented, have not been reviewed by the Society of Petroleum Engineers and are subject to correction by the author(s). The material, as presented, does not necessarily reflect any position of the Society of Petroleum Engineers, its officers, or members. Papers presented at SPE meetings are subject to publication review by Editorial Committees of the Society of Petroleum Engineers. Permission to copy is restricted to an abstract of not more than 300 words, illustrations may not be copied. The abstract should contain conspicuous acknowledgment of where and by whom the paper is presented. Write Librarian, SPE, P. O. Box 833836, Richardson, TX 75083-3836, U.S.A. Telex, 163245 SPEUT.

ABSTRACT

Prudhoe Bay Field is the largest producing field in North America. Prudhoe Bay is currently expected to yield at least 25% more reserves than estimated at field start up. This paper briefly describes the history of the field and some of the key developments that have taken place which have contributed to improved recovery efficiency. These incremental developments have resulted from a process of continuous surveillance, interpretation of field performance, management of multiple reservoir mechanisms, efficient utilization of the gas resource, and exploitation of the existing field infrastructure.

There are four dominant recovery processes currently at work in Prudhoe Bay; Gas Cap Expansion/Gravity Drainage, Waterflood, Miscible Flood, and Gas Cycling. Continuous management of these processes and analysis of field performance leads to identification of attractive targets for further development. Major components of the current field development plan are described in this paper.

Prudhoe Bay is seen by many as a mature oil field on an inevitable and irreversible decline. The major Owners in Prudhoe Bay continue to pursue incremental developments to mitigate decline and supplement proved reserves. Unit technical studies are typically done in multi-company, multi-disciplinary work teams. The pooling of resources in this manner has enabled efficiency gains and has promoted the sharing of ideas and best practices. The current view of potential future development targets and some of the opportunities under consideration for development of these targets are discussed.

Reference and illustrations at end of paper

INTRODUCTION

Prudhoe Bay field was discovered in early 1968 by ARCO and Exxon with the drilling of the Prudhoe Bay State #1 well. A confirmation well was drilled by BP Exploration in 1969. The next 8 years saw frenetic activity as ARCO, BP, Exxon and other companies with lease holdings in the vicinity worked to delineate the reservoir, resolve equity participation, put together an initial plan of development, and design and construct the initial infrastructure.

Prudhoe Bay came on stream in June of 1977, rapidly ramping up production until the field's maximum allowable rate was reached in 1979 at 1.5 MMSTB/D. This plateau rate was maintained until 1988. The current production rate from the field is approximately 1.15 MMSTB/D.

In late 1992 the 8 billionth barrel of liquids was produced from Prudhoe Bay. Pertinent Prudhoe Bay facts are listed in Table 1.

GEOLOGICAL SETTING

The Prudhoe Bay Field is a combination structural and stratigraphic trap. A regional cross section representative of the Alaskan North Slope is shown in Figure 1. (Ref 1). The Unitized intervals are of Triassic age and include the Sag River Formation, Shublik Formation, and the Sadlerochit Group. The most important interval is the Ivishak Sandstone of the Sadlerochit Group which contained more than 95% of

the unitized original liquids in place and accounts for the vast majority of proven and potential reserves. The Geological setting has been described in detail (Ref. 1, 2, 3).

RESERVOIR CHARACTERIZATION

Reservoir character plays an important role in the selection of reservoir processes to be applied for efficient depletion of the reservoir and interpretation of field performance for management and optimization.

The Owners' understanding of reservoir character and its influence on reservoir performance has evolved through time. (Ref 4) For example, in early 1992 after fully two thirds of the expected recoverable reserves had already been produced from Prudhoe Bay, the Owners embarked on an ambitious two year study to better describe the lower most and poorest quality section of the reservoir. This effort is in support of ongoing performance analysis and depletion studies aimed at identifying effective means to improve ultimate recovery from the interval. (Ref. 5) Stochastic modeling techniques have been successfully applied to advance our ability to interpret field performance and predict future behavior. (Ref. 6) Today the reservoir description toolbox contains methods for developing a lithology based deterministic sand/shale description, stochastic methods for generating multiple realizations of interwell reservoir character that honor observed well data, and a wide range of field surveillance data with which to condition the various plausible reservoir descriptions developed. Reservoir descriptions are routinely generated for input to reservoir simulation models using these tools. We have learned that close interaction between reservoir describers and reservoir modellers is necessary to ensure the description is fit for purpose. (Ref. 7)

Reservoir description is also critical for characterization of the remaining targets enabling definition of incremental development potential.

FLUID DISTRIBUTION

The Prudhoe Bay reservoir was saturated at discovery and had a large gas cap in direct communication with the oil rim. This fan-shaped reservoir dips at 1 to 2 degrees from Northeast to Southwest. There is a very large associated aquifer. The gas cap directly overlies approximately two thirds of the oil rim.

A variable thickness but areally extensive zone of relatively low API gravity crude is found at the oil/water contact. This zone is termed the Heavy Oil Tar (HOT). The HOT plays an important role in reservoir performance acting as a partial barrier to water influx.

In addition to the oil target in the oil rim, there are significant liquid resources in place in the original gas cap. The condensate yield of gas cap gas at original conditions was approximately 30 STB/MMCF. The gas cap also contains a significant amount of "relict" oil. This oil exists in the liquid phase at very low saturations and is a remnant of the saturation and geological history of the reservoir.

An approximate distribution of original liquids in place is given in Figure 2.

A schematic cross-section illustrating the initial fluid distribution is shown in Figure 3.

DEVELOPMENT OVERVIEW

The initial development plan for Prudhoe Bay envisioned 500 or more wells on nominal 160 acre spacing. The area under the initial gas cap would be depleted by gravity drainage, while the peripheral areas downdip from the GOC would be subject to a waterflood due to anticipated inefficient pressure support from the gas cap.

The initial development plan also anticipated gas sales starting up within 5 years of first oil production. Gas sales for other than local fuel have not materialized to date and as a result field development planning has been modified accordingly. Gas sales prospects are discussed briefly later in this paper.

Maximum allowable oil offtake rate was set at 1.5 MMSTB/D for the field. Condensate and Natural Gas Liquids could be produced in addition to the "black oil". The maximum allowable offtake rate was specified by the Alaska State Oil and Gas Conservation Commission (AOGCC) based on testimony by the Owners and consultants contracted by the AOGCC.

The oil column was in excess of 400 feet thick in the heart of the reservoir. Early development wells were completed with a minimum of 100 feet of standoff to the Gas Oil Contact (GOC) and 50 feet of standoff to the Water Oil Contact (WOC). Initial well capacities were often in excess of 20 MB/D.

At field start up in June 1977, 63 wells were available for production. Development drilling has continued unabated since then. The total number of development wells drilled to date is greater than 1100. Drilling is a key component of many incremental reservoir development projects. Virtually all of the reservoir is developed on nominal 80-acre spacing today. There are plans to drill up to 300 more wells by the end of the

decade associated with various improved recovery projects.

Aside from drilling, two major projects dominate the development history of Prudhoe Bay; waterflood and produced gas handling capacity expansions.

A brief description of each of these major projects gives insight to the range of development studies that have been undertaken since field start up.

Waterflood Development

Development optimization studies have continued from before startup through present day. In the early stages of field depletion a major effort was undertaken to define the appropriate scope and timing for the planned waterflood. Early in field life reservoir performance data was gathered providing insight into the effectiveness of primary depletion in various parts of the reservoir. The operators used this early performance data to optimize the scope of the waterflood project. Ultimately it was agreed among the PBU Owners that the waterflood would cover the majority of downdip areas beyond the extent of the original gas cap and the Eastern "Flow Station 2" area of the field.

Key parameters in defining waterflood scope were reservoir character, aquifer strength, production performance, the timing of gas sales, and water sources.

Key components of the installed waterflood infrastructure include a sea water treatment plant with a design capacity of 2 MMBW/D of water, two water injection plants (one on each side of the field to boost injection pressure) and several miles of seawater distribution lines with diameters ranging from 6 to 40 inches. By mid 1984, the water distribution network and sea water treatment plant were installed and commissioned. The seawater treatment plant was commissioned with a daily capacity of 1.5 MMBW/D.

Seawater injection commenced in the fall of 1984 into the North West Fault Block (NWFB), Eastern Peripheral Wedge Zone (EPWZ), and the Flow Station 2 (FS-2) areas of the field. The Western Peripheral Wedge Zone (WPWZ) came on line in mid-1985. The major waterflood areas are shown in plan view in Figure 4.

Since waterflood start-up, a considerable amount of attention has been applied to the management of the floods and interpretation of performance results. (Ref. 8, 9) Many unexpected challenges have arisen and been dealt with. Reservoir character has been a dominant factor in waterflood performance as expected. The challenges varied in the different areas of the waterflood. High permeability contrast in "single zone" targets, poor injectivity/productivity, and vertical barriers providing effective isolation have all been encountered. In spite of the challenges, waterflood performance has exceeded all expectations. Ultimate recovery by waterflood is expected to be in excess of 50% in all the major flood areas. Supplementing the strong waterflood performance is an ongoing Miscible Gas flood which will ultimately affect the entire waterflood area.

The applicability of EOR techniques was under study even before the waterfloods started up. At Prudhoe Bay, the Owners found themselves in the position of having to process a large stream of produced gas with no commercial market. The gas was reinjected into the gas cap to provide pressure support, but it was recognized early on that there was a captive source for a hydrocarbon miscible injectant. Recognition of this resource provided incentive for the Owners to develop a comprehensive EOR program. Unit studies led to a pilot Miscible Injection project with start up in 1982, the Flow Station 3 Injection Project (FS3IP). The large scale Prudhoe Bay Miscible Gas Project (PBMGP) started up in 1987. Further expansions to the PBMGP were certified in 1992. Details of the process selection and initial design have been described in detail. (Ref. 10, 11, 12)

The latest certification covers the entire waterflood area including prospective waterflood expansion targets adjacent to the current floods. Ultimately more than 130 injectors may be converted to water-alternating-gas (WAG) injectors. The volume of MI available for the PBMGP is expected to peak near 700 MMSCF/D upon completion of the Gas Handling Expansion Phase 2 project in 1994. A map of the current extent of the PBMGP and future expansion areas is shown in Figure 5.

Manufacture of MI for the PBMGP is part of a comprehensive project that also enables extraction of NGL's from separator off gas. The Central Gas Facility (CGF) is the key facility component of this project. It was installed in 1986 and was expected to process 3 BCF/D of separator off-gas to produce up to 50 MB/D of NGL for blending with the crude stream into the Trans Alaska Pipeline System (TAPS) as well as 250 MMCF/D of Miscible Injectant (MI) for the PBMGP. CGF modifications made since the plant started up allow 5.5 BCF/D of gas to be processed, yielding approximately 70 MB/D of NGL and 400 MMCF/D of miscible injectant.

Gas Handling Capacity/Gas Cycling

The initial plan of development called for installed gas handling capacity of more than 2 BCF/D. This design was predicated on a larger waterflood than was ultimately implemented and the expectation of an early gas sale.

As the reservoir matured and the prospect of gas sales in the near future dimmed, it became apparent that the gas handling capacity of the field would become a limiting factor in field production. Free gas production became more and more difficult to avoid in the Gravity Drainage area. (Ref. 13)

Through a series of incremental steps involving facility debottlenecking, compressor upgrades, pipeline upgrades, and installation of the CGF the gas handling capacity of the field was increased from 2.4 BCF/D in 1986 to approximately 3.9 BCFD by 1988.

Installation of the CGF and associated increases in Field Gas Offtake (FGO) offered the Operators increased flexibility to further optimize the recovery of gas cap condensate, gas cap relict oil, and residual oil from behind the encroaching gas front in the gravity drainage area by managing the distribution of field gas offtake.

The success of historical gas offtake increments in boosting field production and reserves led to further optimization efforts. A significant increment in facilities would be required to increase gas handling capacity further. The prospect of large capital expenditures required a detailed assessment of the reservoir benefits that would flow from increases in gas handling. The reservoir benefits of a gas handling expansion have been characterized as "Black Oil" or separator liquid recovered as a result of being able to produce wells at higher Gas - Oil Ratios (GOR's), "Vapor Phase" or additional separator liquids recovered as a result of cycling additional gas through the reservoir which displaces condensate laden rich gas and vaporizes residual oil, relict oil, and retrograde condensate, "NGL" which is liquids recovered at the CGF by processing a greater volume of separator off-gas, and "EOR" which is oil recovered as a result of manufacture and application of a larger volume of miscible injectant in the miscible floods. After developing a more thorough understanding of the nature of the reservoir benefits, and a considerable amount of facilities engineering study and optimization, the Unit agreed to the funding and implementation of the Gas Handling Expansion 1 project (GHX-1) in 1987. This project was implemented in late 1990 increasing the field gas offtake from an annual average of 3.9 BCF/D to 5.5 BCF/D. In 1990, the Owners agreed to a second GHX project (GHX-2) which will be implemented in two stages beginning in 1993 with an increase in peak FGO capacity of 1.3 BCF/D in the Western Operating Area (WOA) of the field. The second phase for installation in 1994 will increase peak FGO capacity by a similar amount in the Eastern Operating Area (EOA). Upon completion of GHX-2 total field gas offtake capacity will be 7.5 BCF/D annual average.

Understanding the reservoir benefits of gas handling expansions has led to more emphasis on the management of the gas cycling process and awareness of the "compositional" nature of the reservoir. Estimates of remaining reserves suggest that the expected future production from Prudhoe Bay can be attributed in approximately equal thirds to continued black oil production from the gravity drainage area of the field, continued production from the waterflood/ EOR areas, and vapor borne liquids - condensate, NGL, and vaporized relict and residual oil recovered as separator liquids primarily from gravity drainage area wells.

THE INTEGRATED SYSTEM

Prudhoe Bay has evolved through time to an extensive facility infrastructure fully integrated with the reservoir processes to optimize recovery. This "System" is depicted schematically in Figure 6. Bottlenecks in the system dictate the field's production capacity.

Many of the projects implemented in Prudhoe Bay represent the largest of their kind in the world. Integration between projects is extremely important and adds another dimension to the complexity of developing incremental opportunities. Any perturbation in the integrated facility/reservoir system needs to be fully understood and its impacts on the existing developments, both competitive and synergistic, need to be quantified and accounted for.

Learning to identify what and who needs to be involved in assessment of a development opportunity has been one of the significant advances in being able to maximize the value captured from the Prudhoe Bay resource.

HISTORICAL PERFORMANCE

Prudhoe Bay cumulative production had exceeded 8 billion barrels of liquids by the end of 1992. Historical production performance is shown in Figure 7.

The field's oil production capacity dropped below 1.5 MMSTB/D in 1988 "officially" signaling the start of decline. The onset of decline was a direct result of limited gas handling capacity as opposed to limited oil production capacity. GOR's have continued to rise in the field as the reservoir and in particular the gravity drainage process has matured. Aggressive well workover and stimulation programs and ongoing field development programs have been able to mitigate the overall rate of production decline, holding it to an average of approximately 5% per year over the last 5 years. The field's underlying "base" decline rate is difficult to ascertain given the pace of wellwork and in-

cremental development activity. Individual well declines vary widely, but on a regional basis tend to average in the 15% to 25% per year range.

RESERVES GROWTH

The success of the ongoing field development program has translated into reserves growth of more than 25% since field start up. Prior to field start up, the Operators' estimate of recoverable reserves was 9.6 BSTB. Today recoverable hydrocarbon liquid reserves are expected to approach or even exceed 12 BSTB.

Estimated ultimate recovery of liquids from Prudhoe Bay is approaching 50% of estimated original in place liquid volumes. Projected recovery factors in this range may suggest limited upside associated with incremental development. A closer look at reservoir performance on a regional basis reveals some very attractive development opportunities. In some sections of the reservoir, projected recovery factors are in excess of 60% while in others, projected recovery factors are significantly below average. Analysis of the relative maturity or success of reservoir processes helps define the most attractive targets for incremental development.

CAPTURING INCREMENTAL VALUE

Reservoir Surveillance

An extensive surveillance program was implemented during the early stages of development which is still maintained. This program includes open and cased hole logs, core acquisition, production and injection logs, repeat formation tester (RFT), pressure, chemical and radioactive tracer, and detailed production data. This data has proved critical to the interpretation of field performance, management of the reservoir for optimum depletion, and as a basis for defining incremental developments.

Reservoir surveillance methods have evolved through time driven mainly by demands of the complex data set we are working with and facilitated by advances in technology for managing and visualizing the data captured.

The key to our reservoir surveillance effort is a numeric "static" model of the reservoir. The static model is a volumetric model with a framework created from "hard" well and seismic data. All hard data recovered from specific wells is hung on this framework. The static model also contains digital versions of maps of virtually all mappable parameters which have been created from the available hard data. Mapped surfaces are stored on a very fine grid which can be interrogated at any point in space to get an interpretation of the reservoir and fluid character.

Base input data for all reservoir models and most other reservoir studies is derived from the static model.

The static model also allows us the flexibility to update the "tank" with observations of present day fluid contacts so that a "current" picture of the reservoir's attributes can be output or displayed for any section of the reservoir under study.

In Prudhoe Bay, the fact that multiple mechanisms can be active in any part of the reservoir complicates interpretation of surveillance data and makes predictions of future performance difficult. Throughout the life of the field, variations in offtake distribution have caused lateral fluxes to vary in direction, magnitude, and composition. Complexities like this demand that multiple tools and in most cases, a multidisciplinary team are required to interpret field performance.

Reservoir description is one of the key controls on reservoir performance, interpreting reservoir behavior, and predicting future performance. The description of the Prudhoe reservoir has evolved over the years. In the early days of field production, having a good handle on reservoir description was not critical since for the most part wells were completed in relatively homogeneous, high quality sands, and it was adequate to have a feel for the position of any large, correlatable reservoir events. Any anomalies in well performance or fluid movement could be reconciled with a relatively primitive reservoir description.

The dependence of reservoir performance on reservoir character has been amplified as the field has matured. It is not surprising that the regions of the reservoir holding the most potential for further exploitation are the more complex and/or lower quality reservoir zones.

Reservoir Management

Reservoir management is a broad topic which will be defined here as the integration of available information on reservoir performance, facility infrastructure, and predicted future performance to maximize the value of the asset.

Prudhoe Bay presents a considerable challenge in reservoir management because of the complexities of the reservoir and facility constraints.

Effective reservoir management will lead to capture of maximum value from the asset with the currently installed infrastructure and reservoir processes. It will also enable the identification of opportunities for in-

cremental developments. Day to day operations are managed by region - with the major regions being the Gravity Drainage and Waterflood/ EOR areas.

In the gravity drainage area, the primary producing constraint is gas handling capacity, therefore the basic reservoir management strategy is to maximize daily oil rate within gas handling constraints and without jeopardizing long-term reservoir performance. Producing characteristics of the gravity drainage area have been described in Ref. 13.

In the waterflood /EOR flood areas, the basic reservoir management strategy is the same, but the guidelines applied are specific to the waterflood/EOR mechanisms. The overall objective is to mature the oil recovery process as rapidly as possible with a minimum of produced water and maximum efficiency of the available miscible injectant.

The supply of miscible injectant is finite, being dictated by the CGF gas processing capacity. Efficient use of the available MI is critical for maximizing the economic value of the EOR flood. Novel methods for monitoring EOR flood response and efficiently distributing the available MI to target EOR flood patterns have been implemented. (Ref. 14, 15, 16)

Development Opportunities

A discussion of future development opportunities requires a description of the expected nature of the reservoir fluid distribution at the end of field life with the current development plan. Background on the reservoir description that is dictating where those resources will reside is also required.

An integrated understanding of reservoir character, reservoir performance, facility capacities and limitations, and reservoir management objectives allows the Owners to identify opportunities for capturing incremental value. These opportunities can involve optimization of reservoir processes, implementation of new/improved reservoir processes, facility debottlenecking and expansions or changes in reservoir management guidelines.

Large increases in facility capacity are prohibitively expensive and at this time appear unwarranted. There are expected to be opportunities for improved recovery from the reservoir through incremental developments, optimization of existing processes or improvements in reservoir management strategy.

A look at the reservoir with the approximate fluid distribution at the present time gives an indication of the character of potential development targets in Prudhoe Bay.

Targets that have been identified for future development include:

Zone 1. Zone 1 is probably the largest "conventional" development target. Development of Zone 1, the lowermost reservoir interval, has lagged the other zones in the reservoir because of its relatively poor quality and consequent inability to compete hydraulically with the other zones in multi-zone completions. Until recently, development of Zone 1 as a stand-alone target wasn't competitive with other development opportunities. In the gravity drainage area of the field, the gravity drainage process is expected to be relatively inefficient in Zone 1. Poor vertical and lateral connectivity will result in a significant oil "Pad" at the base of the oil column which we will be unable to produce at competitive GOR's. Recovery from this zone may be enhanced by drilling on denser well spacing, the application of non-conventional (horizontal or very high angle wells at 85 to 95 degrees), and possibly by implementing a waterflood. Unit technical work predicts a target of up to 1.5 BSTB oil in place in Zone 1 at the end of field life if no further development occurs. This potential development target is actively being addressed from several aspects by multi-company, multi-disciplinary work teams.

The only waterflood/EOR flood area with significant oil in place in Zone 1 is the northern part of the FS-2 area. The depletion maturity of Zone 1 lags the other intervals in this flood primarily due to poor reservoir quality which impedes the ability of Zone 1 to compete hydraulically in production and injection. Dedicated Zone 1 waterflood development was begun in this area in 1991 with a successful in-fill drilling program. Further dedicated Zone 1 development is planned for 1994.

Waterflood/EOR Areas. Performance of the water and miscible floods has been outstanding in aggregate, generally exceeding all early expectations. Pattern by pattern and regional performance analysis helps identify areas that are performing relatively poorly. Anomalous performance may be due to several factors including reservoir quality, reservoir structure, pattern geometry, flood rate, etc. Kwan discussed some of the techniques used for identification of anomalous waterflood behavior in Ref. 9. Exceptional performance in parts of the waterflood/EOR flood area has raised expectations for the entire flood and has heightened the Operator's awareness of opportunities which may be available. In 1991 a Unit technical team recommended a novel program to redevelop a portion of the NWFB waterflood/EOR flood area. This project would increase the well density from nominal 80 acre to 60 acre spacing and convert the existing inverted 9-spot flood pattern to a line drive. This program, termed High Viscous to Gravity

Ratio Flooding (HVGR), was expected to improve recovery in the target area from 62% to 66%! (Ref. 17)

A systematic program of Pattern Size Reduction (PSR) is ongoing in the WPWZ waterflood/EOR area to improve flood performance in an area that has lagged behind the field average. (Ref. 18)

Peripheral Development. Development of the periphery of the field, both down-dip and up-dip, has lagged behind the more productive heart of the field due to relatively thin LOC, relatively low productivity, and expectations of difficulty in competing for facility capacity due to either high water cut or high GOR. The target in the up-dip periphery is Zone 1 which has been discussed. In the down-dip periphery the target is upper Zone 4, another relatively low quality interval. The greatest challenge in this part of the reservoir is achieving a completion that will sustain flow at economic rates.

In both the up-dip and down-dip periphery, the application of high angle well technology promises to unlock more reserves. In both cases the reservoir thickness is not sufficient for successful fracturing and the productivity gains achievable with high angle wells present an opportunity to capture the reserves. In 1992, 13 wells were drilled in peripheral areas targeting less than 75 feet of oil column. Continuing advances in drilling technology are providing the opportunity for cost-effective development in the periphery.

Gravity Drainage Area. The gravity drainage process is very efficient in PBU however it is a time-dependent process. Unit studies indicate that the residual oil saturations in the depleted part of the GD area will be between 20% and 30% at the end of field life. This residual oil represents a target of 3 - 4 billion barrels of oil that is well defined in terms of location and character and is readily accessible through the more than 600 wellbores that are expected to have been drilled in the GD area by the end of field life.

Selective infill drilling may access reserves isolated structurally, or otherwise inefficiently depleted. Increasing well density to 40-acre spacing over the entire area cannot be justified at this time, but advances in drilling technology which would enable more efficient wells or less expensive wells could change this outlook.

Further increases in gas handling capacity are currently not being contemplated, but remain a possibility under more favorable economic conditions.

Enhancing the gas cycling process by managing lean gas sweep may allow some of the GD residual oil to be recovered through vaporization.

Potential Future Opportunities

The Owners are continuing to identify development opportunities in the field. The opportunities do not become a part of the Unit Field Development Plan until technical studies have been completed to assess their viability and the Owners reach consensus on the project. There are several opportunities which are currently under study. Potential projects include:

Pressure Management. This project would involve injecting a large volume of water into the gas cap area to mitigate the rate of pressure decline in the reservoir. Increased reservoir pressure over the remaining life of the field could yield incremental oil reserves through enhanced inflow performance throughout the field, improved vaporization efficiency, displacement of rich gas cap gas to producing wells, and reduced shrinkage. Risks associated with this project include potential impairment of the gravity drainage process by unfavorable water flux, potential impairment of gas recovery, and potential water handling problems.

40-acre Infill Drilling. The reservoir is currently developed on nominal 80-acre spacing. Studies are ongoing to define the potential for adding to the reserve potential by increasing the well density. The work is focused on the gravity drainage area. Attractiveness will depend on reservoir character. There is potential for more than 200 locations if the reservoir benefits can be defined with reasonable certainty and if drilling and tie-in costs can be reduced substantially.

Fieldwide HVGR. This project would extend the concept applied in the NWFB HVGR project to the rest of the waterflood/EOR areas. Success of HVGR is dependent upon reservoir character and sufficient MI availability. As many as 150 new wells may be required to address all the potential target areas. Controlling facility and drilling costs will be critical to the viability of this project.

Gas Sales. The gas resource in Prudhoe Bay is large. Recoverable dry gas for sale is expected to be in excess of 20 trillion cubic feet after accounting for estimated North Slope fuel usage.

To date, produced gas has been reinjected into the reservoir to enhance oil production in the absence of a gas sale. Gas reinjection benefits oil production by helping to maintain reservoir pressure, cycling through the reservoir and vaporizing residual oil and condensate, and by supplying the components to make the hydrocarbon miscible injectant used in the EOR flood.

Gas sales will have an impact on oil production. The most immediate effect would be an increase in the rate of reservoir pressure decline. The amount of gas cir-

culating through the reservoir will be reduced and the amount of Miscible Injectant that can be made will also be reduced. Counteracting these losses, gas sales may prolong the economic life of the oil rim resulting in incremental oil recovery. Quantification of these reservoir impacts is largely a function of the timing and rate of gas sales.

The Owners are continuing to assess the opportunity for gas sales and the potential impacts of a gas sale on ongoing development. However, reservoir management is only one challenge among many which must be addressed to realize commercialization of the gas resource.

Other Targets

Other targets include the "minor reservoirs" which were unitized along with the Ivishak, but which have been relatively unattractive compared to ongoing Ivishak development. There are plans to drill the first dedicated Sag River producing wells in the 1993 drilling program. Improved drilling and completion technology is a key to unlocking more of this resource.

At the end of field life, more than 12 Billion barrels of hydrocarbon liquids are expected to be left in the reservoir. This is oil that is unrecoverable using processes and knowledge available to us today. This target is one that attracts a great deal of attention from the Owners who are continuously investing in Research and Development to try and identify means to unlock more of the resource. Capturing only 10% of this target represents more than a billion barrels of oil - far more than any recent field discovery in the United States.

Prudhoe Bay development has provided an integrated infrastructure hub on the North Slope. There are several small discoveries in the vicinity of Prudhoe Bay which are uneconomic as stand-alone developments. It may be feasible to develop these pools if capacity in Prudhoe Bay facilities becomes available. The Prudhoe Bay Owners are investigating options for development of some of these pools.

CAPTURING DEVELOPMENT OPPORTUNITIES

Unit Process

The process for reaching consensus on future development opportunities in the Unit has evolved through time and is far more efficient today than it was just a few years ago. A large part of this improvement can be attributed to recent emphasis on development of a consensus Unit Depletion Plan.

Unit Depletion Plan. In early 1992 representatives of the Major Owners met to identify and work through barriers to a consensus Unit Depletion Plan. A prioritized list of key technical issues that would need to be addressed was agreed and Unit teams put in place to address them. All Owners recognized that further development would be impaired if Unit consensus could not be achieved on these or any other technical issues that may arise. It was agreed that the most efficient means of achieving technical consensus would be to form work teams with representation from all the major Owners and consensus work plans. Also, the Owners may need different levels of technical support on the various issues and work plans have to accommodate (within reason) the needs of all companies on each issue. Finally, and perhaps most importantly, the Owners realized an opportunity to minimize duplication of effort, to share best practices, and to build a healthier work environment through cooperation. The Depletion Plan Elements now represent the key opportunities being addressed in the Unit at this time. This will ultimately result in the capture of more value for all the Prudhoe Bay Owners.

Work Process

The entire petroleum industry has been evaluating business processes recently. Various terms have been used to describe these efforts to simplify and streamline processes, provide higher quality products, and empower employees to identify and implement improvements. "Process Evaluation Teams" and "Continuous Improvement Process Teams" typically identify significant opportunities for process efficiency improvement through improved communication. This was true in Prudhoe Bay as well. An "assembly line" process for working up development opportunities had prevailed historically whereby Geoscientists would work up the reservoir description for an area of the reservoir, the Reservoir Engineers would develop a scheme for improving recovery from the reservoir, the Facilities Engineers would design and build a facility to accommodate the new project, the commissioning team would install the project on the North Slope and then they would hand it over to the Operations people to manage. We all know that if each of these steps is carried out independently, there is a high probability that the project will be sub-optimum. Considerable animosity can also be experienced along the way as specifications are not understood or are not reasonable or appropriate.

Placing emphasis on who the customers are for the product to be delivered and who the suppliers of input to each stage of the process has helped overcome inefficiency in the work process. In practice multi-disciplinary teams are set up at the outset, common

goals and objectives are agreed, and workplans are established which accommodate continuous feedback between disciplines throughout the project.

SUMMARY

Efficient development of additional reserves has been achieved in Prudhoe Bay Field.

A thorough understanding of reservoir mechanisms and reservoir description facilitated by working in multi-disciplinary teams supported by a comprehensive surveillance program is required for development of a major oil field like Prudhoe Bay.

Effective management of a large resource like that available in Prudhoe Bay can yield attractive incremental development opportunities as the field matures.

ACKNOWLEDGEMENTS

The Authors would like to thank the Prudhoe Bay Unit Owners for permission to publish this paper. Thank you to the BPX Information Resource Center for searching out the myriad of Prudhoe Bay historical references. Special thanks to Betty Haire for collating the manuscript, generating the graphics and making this paper presentable.

The observations and opinions expressed in this paper are those of the authors and are not necessarily shared by the Prudhoe Bay Unit Working Interest Owners.

HISTORICAL PRODUCTION (Annual Average Rates)

OPTIMIZATION OF PRODUCTION FROM MATURE FIELDS

P. Wang, Khalid Aziz — Stanford University, USA

M. L. Litvak — BP, USA

Abstract

In many mature fields, the production of oil, gas, and water is facility constrained. For such fields, optimal use of existing surface facilities is the key to increasing well rates and/or reducing production costs. Here we propose solution procedures for such nonlinearly constrained production optimization problems. The objective function of the optimization problem is oil or gas production from the field. Production is subject to multiple flow rate constraints at separators, pressure constraints at specific nodes of the gathering system, total gas-lift volumes, and maximum velocity constraints for pipelines. The control variables are the well rates, gas-lift rates, and well allocations to flow lines.

The problem is formulated as a mixed integer nonlinear optimization problem and is solved by a heuristic nonlinear optimization method. The optimization algorithm is coupled with models for multiphase fluid flow in the reservoir and surface pipeline network in a commercial reservoir simulator+.

The proposed procedure was tested in a Gulf of Mexico oil field and a published example, and then applied to the Prudhoe Bay field in the North Slope of Alaska. Results demonstrate the effectiveness and business value of the developed tools.

Introduction

In some mature fields, oil production is constrained by the gas and/or liquid handling capacities of surface facilities. While facility expansion may be an option to increase rates, it may not be the optimal choice. An economic alternative is to make optimal use of existing production facilities. In this study, we address the following operational decisions to enhance production:

1. How to control well rates with chokes?
2. How to distribute available lift-gas among specified wells?
3. How to route fluids by switching well connections to flow lines?

These operational decisions are constrained by multiple capacity constraints in production facilities and wells, along with velocity constraints in flow lines to avoid excessive corrosion/erosion.

Various aspects of the gas-lift optimization problem have been studied by Kanu et al.[1], Buitrago et al.[2], Nishikiori et al.[3], and Martinez et al.[4] using various optimization techniques, i.e., the equal-slope method, a Quasi-Newton method, and a genetic algorithm. Fang and Lo[5] proposed a linear programming model to optimize lift-gas subject to multiple nonlinear flow rate constraints. In these studies various gas injection scenarios were evaluated using gas-lift performance curves for individual wells, ignoring interactions among wells. Dutta-Roy et al.[6] analysed a gas-lift optimization problem with two wells sharing a common flow line. They pointed out that when flow interactions among wells are significant, nonlinear optimization tools are needed. They applied a Sequential

Quadratic Programming (SQP) method to a linearly constrained gas-lift optimization problem with 13 wells and showed the advantages of their method.

Oil production in the Prudhoe Bay and Kuparuk River fields is constrained by the gas handling limits of surface facilities. Barnes et al.[7] presented the Western Production Optimization Model (WPOM) for the Prudhoe Bay field. This model maximizes oil production while minimizing the need for gas processing. Their model allocates the oil rate and gas rate to surface facilities and wells based on the "incremental GOR" concept, which produces the next incremental barrel with the lowest GOR. Litvak et al.[8] built an integrated reservoir and gathering system model of the Prudhoe Bay field, and employed some heuristic methods to allocate well connections to manifolds. Gas-lift rates were allocated based on gas-lift tables of gas-liquid ratio, liquid well rate and water cut. Lo et al.[9] developed a linear programming (LP) model that allocates well rates subject to multiple facility constraints. This LP model was then used as a screening tool to evaluate development opportunities at the Kuparuk River field. Stoisits et al.[10,11] applied a neural network to determine optimal allocation of lift-gas to wells subject to multiple gas constraints in the same filed. The neural network was trained by results obtained from nodal analysis[++] simulations. In 1997, Stoisits et al.[12] addressed the production optimization problem at Kuparuk River field using a genetic algorithm. In their study, the decision variables were production well status (shut-in or open) and incremental GOR for drill sites. A neural network model was used for the surface pipeline network.

In most commercial reservoir simulators[13,14], rate constraints on facilities are handled sequentially by ad hoc rules. For example, first, gas constraints are considered at the lowest predictive well management (PWM) level. Ad hoc rules based on the gas-oil ratio of production wells are applied to scale well rates and meet the gas constraint. Then, water, liquid, and oil rate constraints at the lowest PWM level are sequentially handled and the procedure is repeated for the next PWM level, etc. Furthermore, gas-lift optimization is usually considered separately from well rate optimization using, for example, the following approach. First, lift-gas rates are determined for specified wells based on their gas-lift performance curves or other information. Then, these lift-gas rates are scaled using some rules to match constraints on total amount of available gas. A number of such procedures are available in commercial reservoir simulators. In some cases, these procedures may not yield the optimal solution. Also, using such approaches, it is difficult to determine how much of the gas handling capacity should be used for gas-lift and what portion should be allocated for other purposes.

In summary, available literature does not provide robust procedures for the simultaneous optimization of well rates, lift-gas rates, and well connections. Either only a part of the problem is addressed, or ad hoc rules are used that lead to sub-optimal operations. Hence, it is necessary to design approaches that can simultaneously optimize all control variables subject to all constraints. In the approach presented here, different control variables are optimized using different algorithms, yet these algorithms can be combined together in a flexible manner to optimize all control variables simultaneously. The optimization tools are tested on a synthetic case based on an oil field in the Gulf of Mexico (GoM) and on a published example, and then successfully applied to the Prudhoe Bay oil field.

Proposed Methodology

Description of the Optimization Problem

The type of constraints considered in this study include the following: minimum pressure at the bottomholes and/or tubingheads of production wells; maximum/minimum oil, gas, water, and/or liquid flow rate in production wells; minimum pressure at the inlet/outlet of flow lines; maximum oil, gas, water, and/or liquid handling capacities of surface facilities; maximum fluid velocities in pipelines to mitigate excessive erosion/corrosions; and maximum amount of gas available for gas-lift at different PWM levels. The objective is to increase the short-term oil production by allocating well rates and lift-gas rates.

In some fields, well connections to separation facilities can be switched. On such fields, the optimization algorithm should also guide the operator on when and how to switch well connections so that the production facility is fully utilized.

In summary, we wish to optimize well production rates, lift-gas rates, and connections to the separation facilities in a way that maximizes total oil/gas production subject to applicable constraints. This problem is formulated as a mixed integer optimization problem:

$$\text{maximize} \quad \sum_{i}^{n_w} \sum_{p=o,g} w_{p,i} q_{p,i}(x,y), \tag{1a}$$

$$\text{subject to} \quad c_j(x,y) \le 0, \quad j = 1,\ldots,m, \tag{1b}$$

$$y \in \Omega_{wc} \tag{1c}$$

where n_w is the number of production wells; $w_{p,i}$ is the weighting coefficient for $q_{p,i}$, the flow rate of phase p from well i; c_j represents the jth constraint; x is the continuous decision variable, namely, the well rates and the lift-gas rates; and y is an integer variable indicating well connections; Ω_{wc} represents the domain of feasible well connections.

Overall Methodology

A commercial compositional simulator[15] that can simultaneously simulate multiphase fluid flow in reservoirs, well tubing strings, and surface pipelines was used. The gathering system had a tree-like structure without loops. Flow line junctions are modeled as nodes of the tree. Each node can have any number of input connections but only one output connection. A link represents sequentially connected flow devices (pipeline, choke, etc.). Two nodes can be connected by a link or a flow device. The pressure and rate constraints are imposed on either wells or nodes. Well bottomhole and/or tubinghead pressure constraints are considered (See Litvak et al[16] for details).

The optimization tools are combined with the solution procedure for modeling flow in the coupled reservoir and gathering system in the following manner (Step 1–5 define one outer iteration of the coupling procedure):

1. Start with pressure and fluid compositions in reservoir gridblocks calculated in the previous outer iteration. Use well lift-gas rates and well connections from the previous outer iteration as initial guesses.

2. For well i, perform the following operations:

   a. Switch well i from its current output connection to a new feasible output connection.

   b. Determine well production rates from pressure drop calculations in well tubing strings and surface pipeline network system subject to pressure constraints in wells and nodes16. These rates are used as additional maximum well constraints in Step 2(c).

   c. Invoke optimization tools to redefine well rates and lift-gas rates to maximize the objective function (1a) subject to flow rate and velocity constraints. (These optimization tools are described in the next section).

   d. Repeat Step 2(a)–2(c) for all feasible output connections of well i. Define the output connection that produces the maximum objective function value as the best output connection of well i.

   e. Decide if well i should be switched to the new connection as determined in 2(d), based on operational rules.

3. Select a new well and repeat Step 2.

4. Based on user selected criteria, repeat Steps 2 and 3 until convergence.

5. Determine active constraints in wells and nodes. Linearize multiphase fluid flow equations for well tubing strings and the surface pipeline network system (numerical derivatives are used). Add these equations to the linearized fluid flow equations for reservoir gridblocks.

6. Solve the linearized system of equations, and repeat Steps 1 to 6 until convergence of outer iteration.

7. March to the next time step.

In Step 2 to 4 only a small portion of the domain of feasible well connections is considered, this is referred to in this work as the partial enumeration method. Step 2(e) and (4) are rule based and operational policies can be enforced at these stages. In the current implementation, the user may define the maximum total number of well reconnections allowed and the flow rate threshold for well switching.

The optimization tools used in Step 2(c) for well rates and lift-gas rates allocation can be invoked without performing well connection optimization.

Optimization Tools Used for Well Rates and Lift-Gas Rates Allocation

Three methods with increasing robustness but decreasing efficiency are used for the allocation of well rates and lift-gas rates in Step 2(c) of the overall methodology: a linear programming method, a separable programming method, and a genetic algorithm. Various techniques were developed to provide flexibility in handling problems of different sizes and complexity.

Let $q_{p,i}^{\max}$, $p = o, g, w$, be the well rates for well i from step 2(b). The linear programming (LP) method scales these rates to satisfy flow rate and velocity constraint. Assume that the water cut and gas liquid ratio of each well is constant. Then any flow rate between 0 and $q_{p,i}^{\max}$ can be

expressed as $\alpha_i q_{p,i}^{\max}$, where $\alpha_i \in [0,1]$ is the rate-scaling factor of well i. Consequently, the objective function and the constraint functions in problem (1) are linear functions of α_i. Hence problem (1) with fixed well connections becomes a linear programming problem, which can be solved by either the simplex method[17] or the interior point method[18]. In this study, we use the simplex method, because the optimal solution from the simplex method is always an extreme point of the feasible region.

The separable programming (SP) method extends the work of Fang and Lo[5]. In this method, we take the well header pressure from the previous optimization iteration as the minimum pressure constraints on that well head and perform nodal analysis to obtain a gas-lift performance curve for each well. Besides, the relationship between the oil flow rate and the formation gas or water flow rate can also be approximated by piecewise linear curves. Hence the lift-gas, formation gas, or water flow rate can be regarded as functions of a single variable (the oil flow rate of that well). And problem (1) with fixed well connections becomes a separable programming problem. An SP problem can be reformulated as a linear programming problem or a mixed integer programming problem[18].

In the SP method, the gas-lift performance curves and inflow performance curves are obtained by ignoring interactions among wells. This is reasonable when the flow through well chokes is critical (reaches sonic velocity) or the pressure drop across tubing strings is dominant. However, there are cases when flow interactions cannot be ignored. In such cases, We need to evaluate gas-lift performance by rigorous simulation. Consequently a nonlinear optimization algorithm has to be employed. Currently we use a genetic algorithm for its robustness and ease of use. In the genetic algorithm, we take the lift-gas rate as the decision variable, and evaluate the performance of a lift-gas distribution scenario in the following manner. First, we perform rigorous facility simulation with the allocated lift-gas subject to the pressure constraints. Then the LP method is used to scale the well rates if certain flow rate or velocity constraints are violated, and assign the optimal function value from the LP method as the fitness of the corresponding lift-gas distribution. Other aspects of the genetic algorithm can be found in Goldberg[19].

Applications

In this section, we first test the LP method and the partial enumeration method on a synthetic case based on an oil field in the Gulf of Mexico (GoM). Then we applied the SP method to a published gas-lift example. Finally we applied the developed tools to the giant Prudhoe Bay field in the North Slope of Alaska.

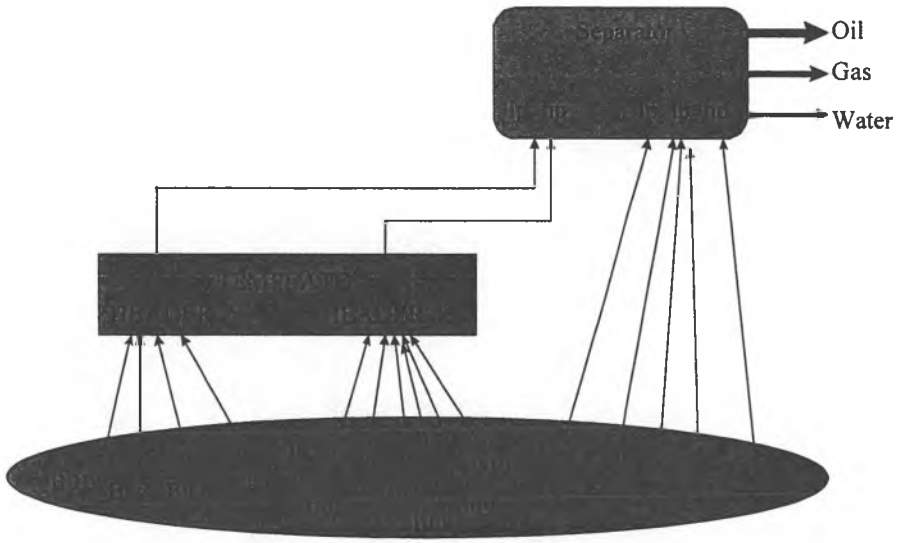
Gulf of Mexico Oil Field Example

An integrated reservoir and surface pipeline network model has been built for one of the Gulf of Mexico oil field. Our test example is based on this reservoir.

Five production wells, A1–A5, are tied to a 40-slot conventional fixed-leg platform. Ten production wells were drilled from a 10-slot subsea template and connected to the platform by two 22000 feet long pipelines. On the platform, a three-stage separator processes the produced fluids. Wells A1–A5 can be tied to any stage of the separator. Wells B1–B10 can be connected to either the

low-pressure stage or the high-pressure stage of the separator. Figure 1 illustrates the production system.

For evaluation purposes, we impose two hypothetical constraints on the gathering system. The separator has a maximum of 30 MMSCF/D gas handling capacity and a maximum of 5000 STB/D water handling capacity. Moreover, the separator cannot receive gas from either pipeline at a rate more than 12 MMSCF/D. Our job is to maximize the oil production by selecting appropriate well rates and well connections.



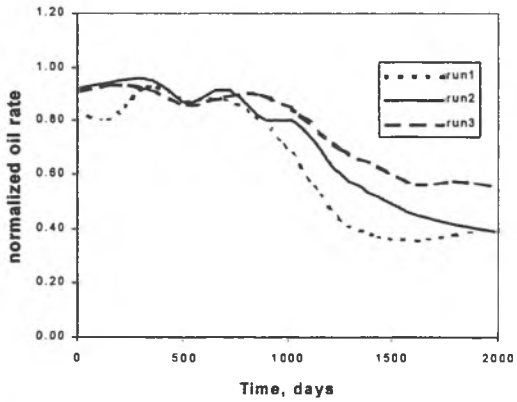


Figure 1: Gulf of Mexico oil field gathering system

We made three predictive runs using a commercial simulator. Each run predicts the oil production for about five years. In the first run, we sequentially checks flow rate constraints and scale the well rates. In the second run, we apply the LP method to select the well rates. In the third run, we apply the partial enumeration method with the LP method to optimize the well rates and well connections simultaneously. The results are plotted in Figure 2–6.

run1: scale well rates sequentially.

run2: scale well rates using LP method

run3: optimize well rates and well connections

Figure 2: Normalized total oil rate

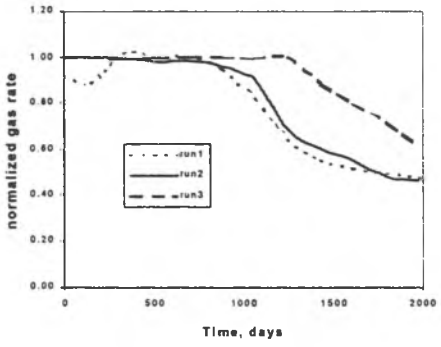

Figure 3: Normalized total gas rate

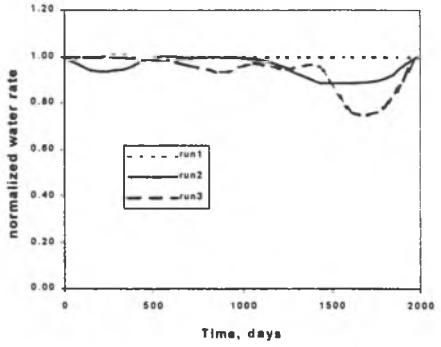

Figure 4: Normalized total water rate

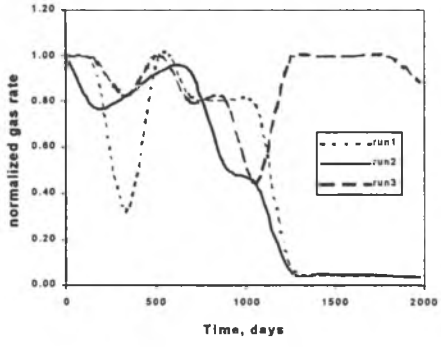

Figure 5: Normalized gas rate at HEADER_Y

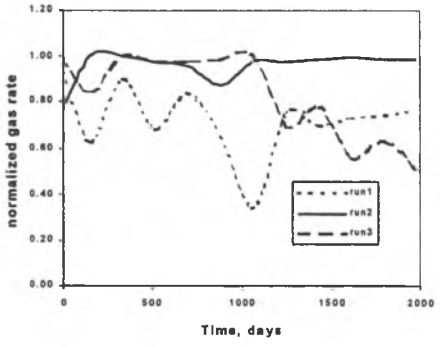

Figure 6: Normalized gas rate at HEADER_Z

The well rates are normalized by some fixed oil, gas, and water rates. Figure 2 shows that run2 can produce at a much higher rate than run1. Run3 is even better. Over five years, run1 predicts 11.2% more oil than run1, and run3 shows 18.9% more oil than run1. The excellent performance of run2 and run3 can be explained by Figure 4–6. As shown in Figure 4, the oil production in run1 is always limited by the water rate constraint. This is due to the fact that the procedure in run1 first scales the highest GOR wells to meet gas constraints, and then scale the highest water cut wells to meet water constraints. This results in a suboptimal solution. Run2 checks all constraints simultaneously; as a consequence, it scales well rates differently. This fact is demonstrated in Figure 6, where most of the time production in run2 is limited by the gas constraint on HEADER_Z, while that is not the case for run1. The fact that run3 outperforms run2 can be explained as follows. At later times, without well switching, most of the producing capacity of HEADER_Y is wasted, while HEADER_Z is constrained by gas rate. The algorithm in run3 identified this imbalance and a high GOR well was switched from HEADER_Z to HEADER_Y.

A Gas-lift Optimization Example

This example is from Buitrago et al2. The problem is to optimize oil production from a set of 56 wells with 225,000 MSCF/D of available gas (Gas-lift performance data are presented in Buitrago et al2). Some of these wells can not flow without gas-lift. Buitrago et al[2] solved the problem by both the Equal-Slope method and the Ex-In method, a stochastic algorithm that calculates the descent direction heuristically. In this study, we solve this problem by the SP method. For wells that can not flow without gas-lift, their gas-lift performance curves are not concave. Thus we introduce an integer variable for each such well, and formulate the gas-lift optimization problem as a mixed integer problem. The problem is then solved by the branch and bound method[20], which reduces the mixed integer problem to a sequence of linear programming problems.

Table 1 compares the performance of the SP method with the Equal-slope method and the Ex-In method. Results for the Equal-Slop method and the Ex-In method are taken from Buitrago et al[2]. The SP method outperformed both the Equal-Slope method and the Ex-In method for this example.

	Equal-Slope	Ex-In	Separable Programming		
			(1)	(2)	(3)
Gas-lift Volume (MSCF/D)	22,508	20,454	22,500	14,175	17,040
Oil Rate (STB/D)	21,265	21,790	22,632	21,265	21,790

Table 1: Gas-lift allocation results obtained from different methods

(1) Allocate all available lift-gas of 22500 MSCF/D

(2) Minimize lift-gas use for oil rate of 21265 STB/D

(3) Minimize lift-gas for oil rate of 21790 STB/D

To demonstrate the efficiency of the SP method, we applied it to other problems created by cloning the 56-well example discussed above. For example, in the second case, we have 560 wells and 22,5000 MSCF/D injection gas available. All computations were performed on a Sun-Enterprise 5500 machine with 4GB of RAM and 2GB of swap space. The second row of Table 2 shows the computational time (wall clock time). The third row of Table 2 shows the number of LP problems solved in the process of solving the mixed integer programming problem. Clearly, the SP method is very efficient for this problem.

Number of Wells	56	560	3360
Wall Clock Time (second)	0.27	3.06	140.29
Number of LP problem solved	5	6	40

Table 2: Computational time for the SP method on various problems

Application to Prudhoe Bay Oil Field

Litvak et al[8] has a good description of the Prudhoe Bay Field. The following short description is extracted from this paper.

> "Production wells are tied to 22 well pads in the Western Operating Area (WOA) and 16 drill sites in the Eastern Operating Area (EOA). Most production wells can be switched between high and low-pressure headers at the well pad manifolds. Gas-lift is used in some production wells with high water cut. Gas-lift wells can be tied only to low-pressure headers. Well chokes are installed in well pad manifolds.
>
> The production stream from individual well pads and drill sites is sent without any separation to three gathering centers in the WOA and to three flow stations in EOA. Well pads and drill sites are tied to separator banks through high pressure and/or low-pressure flow lines. Each gathering center and flow station has four three-stage separator banks. Separator banks can operate in high pressure or low-pressure mode with first separation stage pressure of about 670 psig and 150 psig, respectively.
>
> Separator off-gas is routed from the gathering centers and flow stations to the central gas facility where natural gas liquids and miscible injectant are extracted. The natural gas liquids are then blended with the oil stream coming from the separators. The miscible injectant is used in the enhanced oil recovery project. The lean gas, after compression in the central compression plant, is reinjected into the gas cap for pressure maintenance."

The oil production in the Prudhoe Bay field is constrained by the gas handling capacity. To maximize oil production without expansion of existing gas handling capacity the developed optimization tools have been applied. Well connections to high pressure or low pressure flow lines as well as well production rates are selected to maximize total oil production from the field subject to the gas and water constraints in gathering centers and velocity constraints in flow lines. Integrated reservoir and surface pipeline network model has been applied. The optimization system is applied on a daily basis. The performance of the partial enumeration method is verified by two approaches by optimizing well connections and well rates in the WOA. In the first approach, we start with the partial enumeration method from six randomly generated well connection configurations. In the second approach, we use a genetic algorithm to solve the same problem. Their convergence histories are shown in Figure 7. All the partial enumeration runs converge to approximately the same oil well rate after 300 function evaluations. The genetic algorithm also converges to approximately the same oil well rate after 600 generations. Each generation takes 10 function evaluations. Hence, in this case the partial enumeration method outperforms the genetic algorithm.

To demonstrate the advantage of optimizing the well connections and well rates simultaneously, we present two optimization runs for the whole Prudhoe Bay field. In the first run, we optimize well rates only using the LP method. In the second run, we optimize well rates and well connections simultaneously by the combined use of the partial enumeration method and the LP method. All other aspects of these two runs are same. Results show that the second run improves oil production by 2.55% compared to the first run, which is significant for this large field. On an IBM RS6000 computer, a typical simultaneous optimization run takes about 850 seconds.

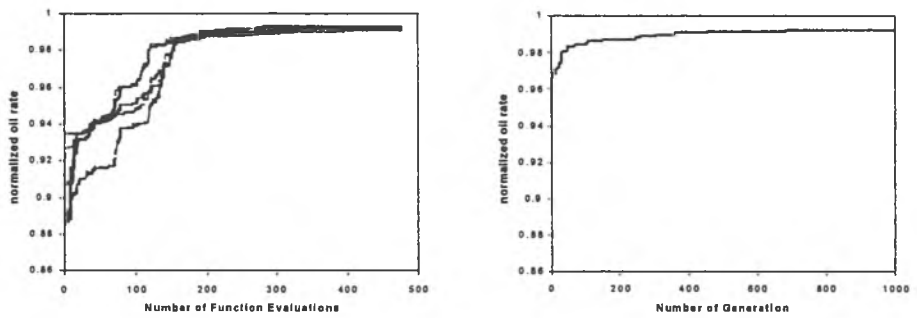

Figure 7: Convergence history of the partial enumeration method (Left); Convergence history of the genetic algorithm (Right). The oil well rate is normalized by a fixed oil rate.

Discussion

The production optimization problem addressed is nonlinearly constrained with discrete decision variables. It is difficult to design a solution procedure that is both robust and computationally feasible. We have proposed a unique approach for the efficient optimization of the entire system. This is accomplished by optimizing continuous variables and discrete variables using different optimization algorithms. For example, by the combined use of the partial enumeration method and the LP method, we can optimize well connections and well rates simultaneously, even for large production systems as in the Prudhoe Bay field.

Our approach is also flexible. According to the problem characteristics and time available for optimization, different rates allocation procedure can be used during the well connection optimization. A more rigorous but time consuming rates allocation method may be employed after the well connections are optimized.

There are some limitations of our approach. For gas-lift optimization problems, the LP and SP method is efficient, but it can not handle the interactions among wells. The genetic algorithm is robust but inefficient. It is desirable to have an efficient algorithm that can also handle flow interactions. In addition, we only optimize short-term oil production based on static reservoir conditions. We have not considered reservoir dynamics during the optimization step. We are currently investigating the impact of decisions based on this approach on long term oil recovery.

Conclusions

1. A mixed integer programming model is formulated to optimize well rates, gas-lift allocations, and well connections subject to multiple constraints. A partial enumeration method for well connection optimization and several tools for gas-lift optimization are developed.
2. The optimization tools are incorporated in a commercial code. The approach presented can be used for production control or reservoir development.
3. The optimization tools were successfully tested and applied to a mature oil field.

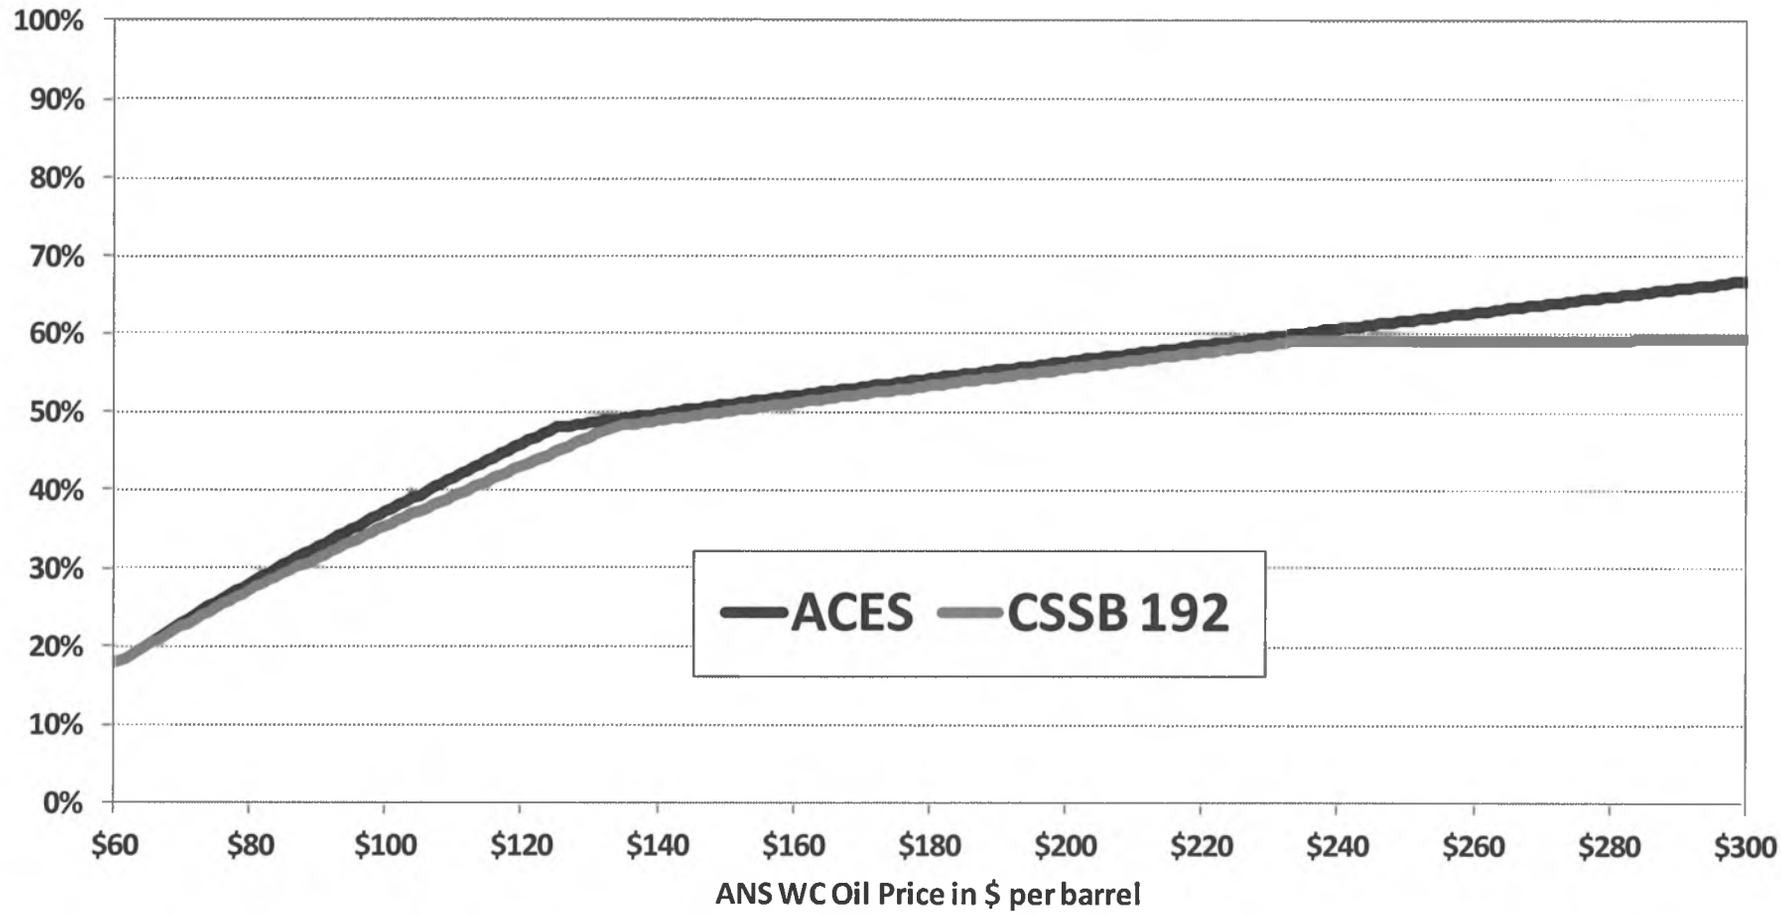
Department of Revenue Comments on CSSB 192 March 14, 2012

Presentation to the
Senate Finance Committee
Department of Revenue 3-14-12

Presentation Organization

- DOR position on bill and individual components of bill
- Comparison to ACES and CS HB 110 (FIN)
- Suggested improvements to bill

Components of CSSB 192



- Progressive surcharge
- Allowance for production increases
- Gross minimum tax
- Petroleum information system
- Decoupling some oil and gas

CS SB 192

Changes to progressive surcharge

1. Changes the progressivity rate over $30 / barrel production tax value from 0.4% to 0.35%
2. Changes the trigger point that slows the rate of progressivity to 0.1%, from $92.50 to $101.43 / barrel production tax value
3. Changes the maximum production tax rate from 75% to 60% (would apply over $201.43 / barrel production tax value)
4. Based on our Fall 2011 forecast, reduces revenue by $125 million in FY 13, $230 million in FY 14, and $200 million / year in FY 15.

Effective Production Tax Rates: ACES and CSSB 192 (progressivity only)

Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl.

Progressive Surcharge

- Changes do not do enough to provide a meaningful change that would influence investment decisions.
- The biggest benefit from this provision comes at very high prices, from the change in maximum tax rate.
- Suggestions:
  - Keep the lower maximum tax rate; consider a 50% cap on maximum rate.
  - Consider a bracketed approach, so that higher rates apply only to additional profit and not to the first dollar of profit.
  - Or, consider further reductions in slope of progressivity to provide a meaningful change.

Allowance for production increases

- Describe allowance
- Revenue impact
- Examples
- Does not create an incentive that would alter an investment decision
- Does increase complexity for DOR and taxpayers
- Suggestion: New field incentives, or provide allowance by means of a credit

CS SB 192

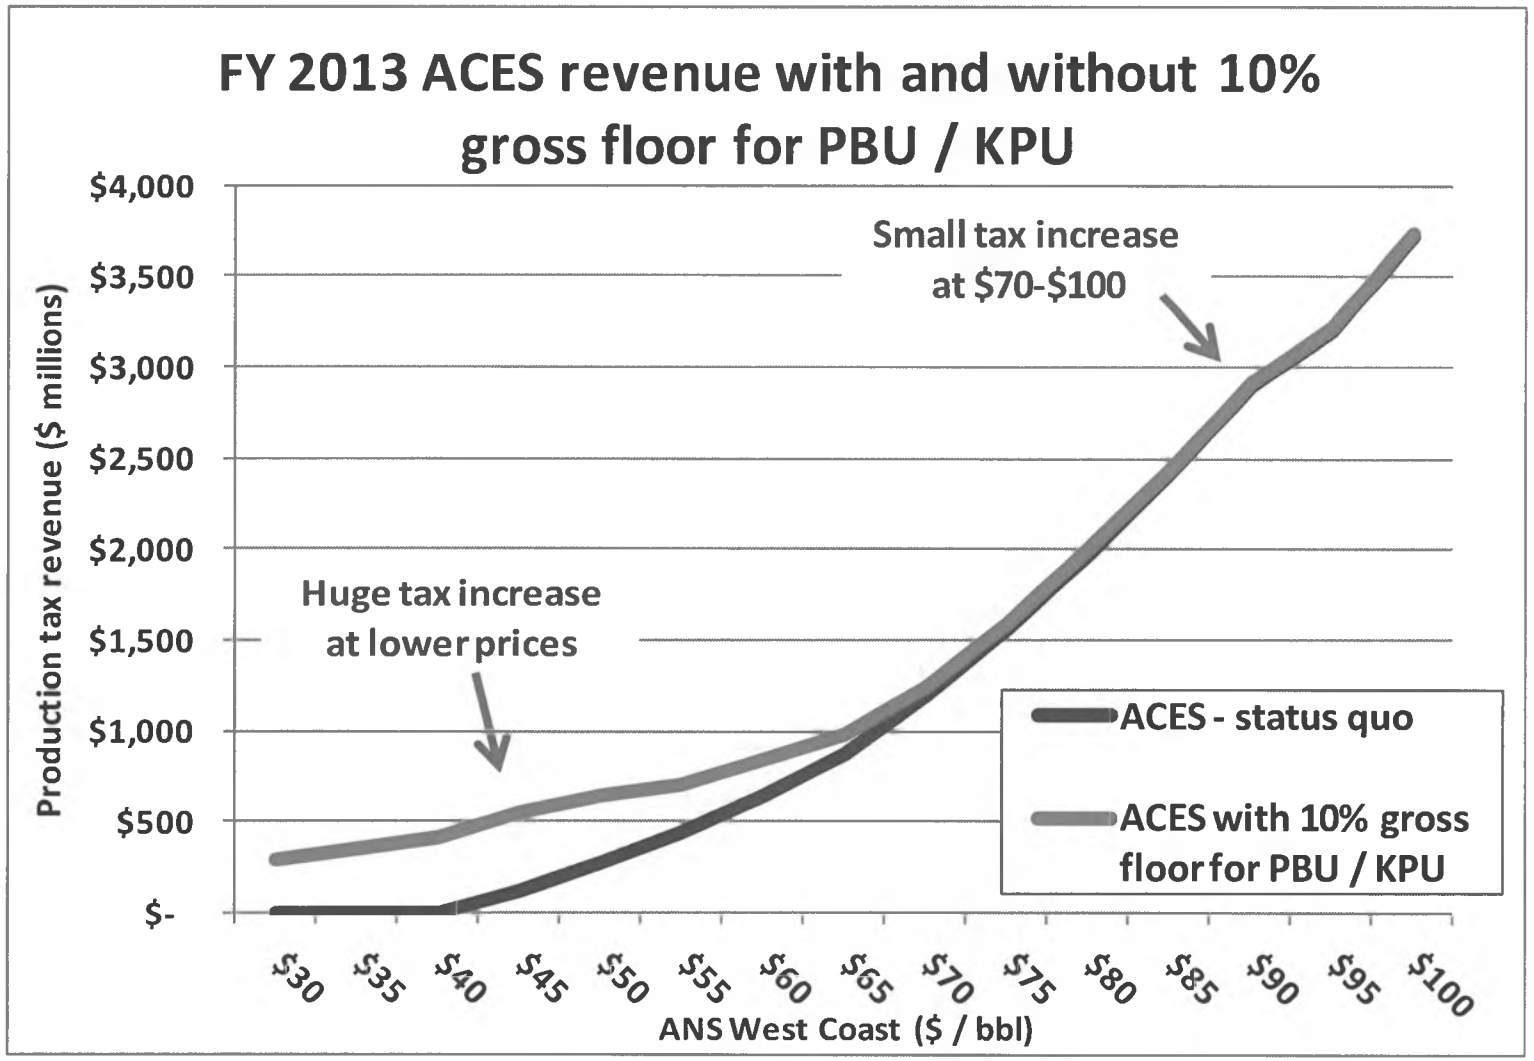
Allowance for production increases

- Allowance for each additional barrel sent down TAPS, over prior year's level.
- Effectively reduces PTV by $10 per additional barrel, only for the base rate of 25% = $2.50 per additional barrel.
- Not part of production tax calculation; benefit is calculated and refunded by DOR.
- Based on our Fall 2011 forecast, reduces revenue by less than $25 million total for all companies, for all years.

Allowance for production increases: Example

- Major producer with 200,000 barrels per day
- Invests $1 billion per year to achieve modest decline rate in legacy fields
- Invests an additional $5 billion to develop several marginal fields and in-field projects in legacy fields
- Increases production 5% to 210,000 barrels per day, and maintains that level for several years.
- First year benefit is $9.1 million
- Benefit in following years is ZERO

Allowance for production increases



- Allowance does not provide a meaningful change that would influence investment decisions.
- A very small benefit, for only one year, with no benefit for maintaining production.
- Mechanism requires DOR to track and calculate the benefit.
- Suggestions:
  - Consider replacing this incentive with reduced tax rates for new fields or incentives for in-field development.
  - If this concept is furthered, use a credit as the mechanism as it would be easier to administer.
  - If this concept is furthered, acknowledge that maintaining production would be a significant accomplishment for some producers.

CS SB 192

Gross Minimum Tax

- 10% gross minimum tax for certain fields
- Applies only to units with over 1 billion barrels cumulative production and over 100,000 barrels per day in most recent year
- Effectively applies only to Prudhoe and Kuparuk
- "Hard floor" – credits cannot be used to reduce tax for these fields below 10% of gross value.
- Also changes community revenue sharing provisions
- Based on our Fall 2011 forecast, increases revenue by less than $25 million per year.
- At $40 / barrel, increases revenue by over $400 million per year.

Gross Minimum Tax vs. Status Quo

Community Revenue Sharing

- This bill impacts appropriations to the community revenue sharing fund
- Currently 20% of revenue from progressivity
- Would change to lesser of:
  - 20% of progressivity revenue, or
  - Difference between 25% of PTV from fields subject to 10% minimum tax, and minimum tax for those fields.
- Maintains existing limit on revenue sharing: $60 million or the amount that brings fund balance to $180 million.
- Increases complexity of the calculation, but not likely to materially impact the amount of revenue appropriated.
- If this change ever would make a difference it would be to the detriment of municipalities.

Gross Minimum Tax

- Provision will impact some companies at current prices.
- Provision creates a substantial tax increase at lower prices (<$60 / barrel).
- Creates a disincentive to investment in Prudhoe and Kuparuk, Alaska's most important fields.
  - Including development drilling, expansions such as new pads and facilities, and heavy oil development
- Mechanism requires DOR to track and calculate the benefit.
- Suggestions:
  - Remove this provision as it represents a tax increase.
  - If this concept is furthered, allow credits to be applied against minimum tax so there is still some incentive to invest at lower prices.
  - If this concept is furthered, consider removing the change to community revenue sharing language.

CS SB 192

Petroleum Information System

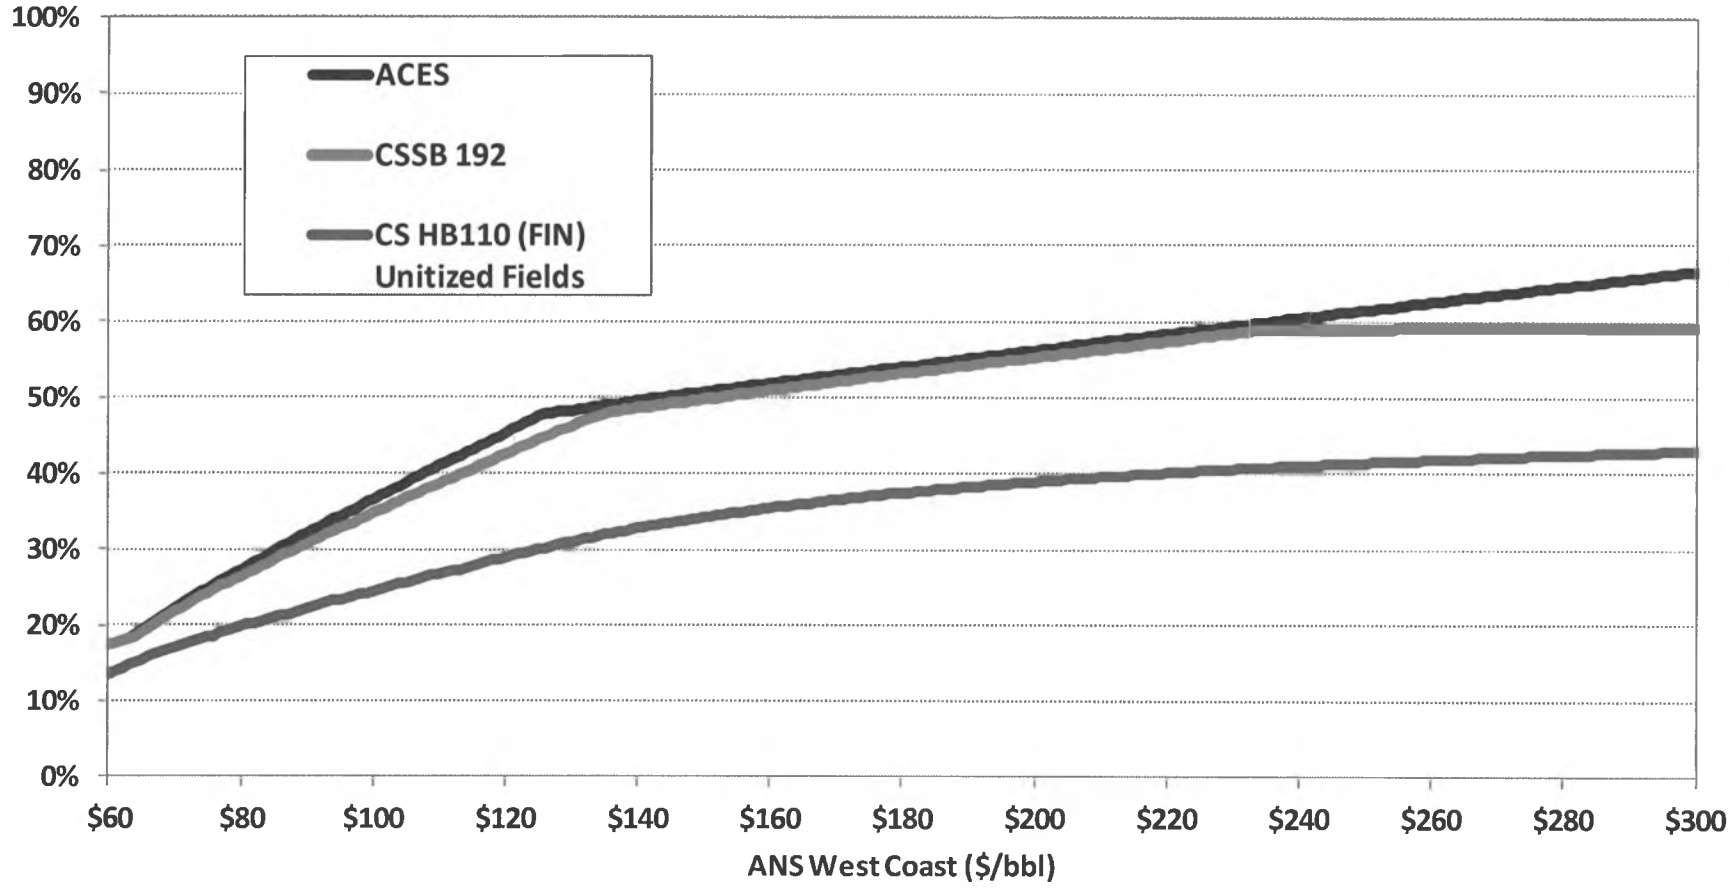
- New information system to be implemented by AOGCC.
- Operational before January 1, 2014.
- Suggestions:
  - Consider need in context of DOR efforts to make more information available.
  - Defer to AOGCC on challenges with this provision.

CS SB 192

Decoupling Some Oil and Gas

- Identical to SB305
- Creates 2 separate progressivity calculations:
  1. Oil, Cook Inlet gas, and gas used in state
  2. Gas other than Cook Inlet and used in state

- Allocates lease expenditures based on Gross Value



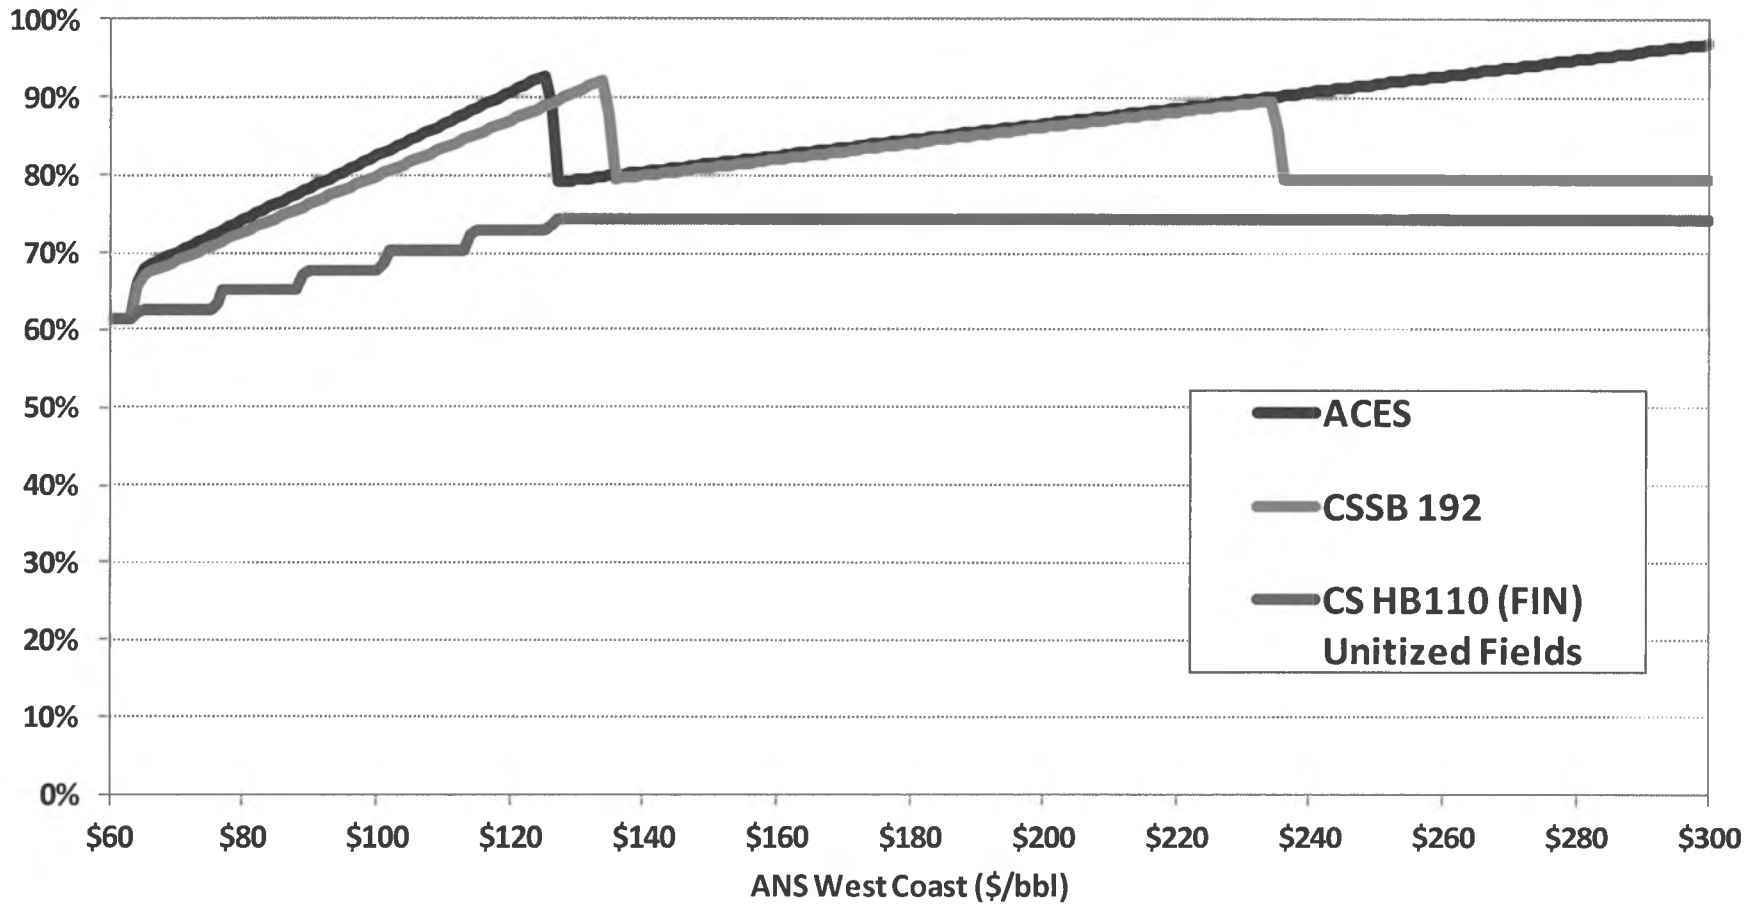
- Revenue impacts:
  - Less than $10 million / year prior to major gas sale
  - Could increase revenue by over $1 billion / year with major gas sale

Comparison to ACES and CS HB 110 (FIN)

Key Revenue provisions of ACES, CSSB 192, and HB 110

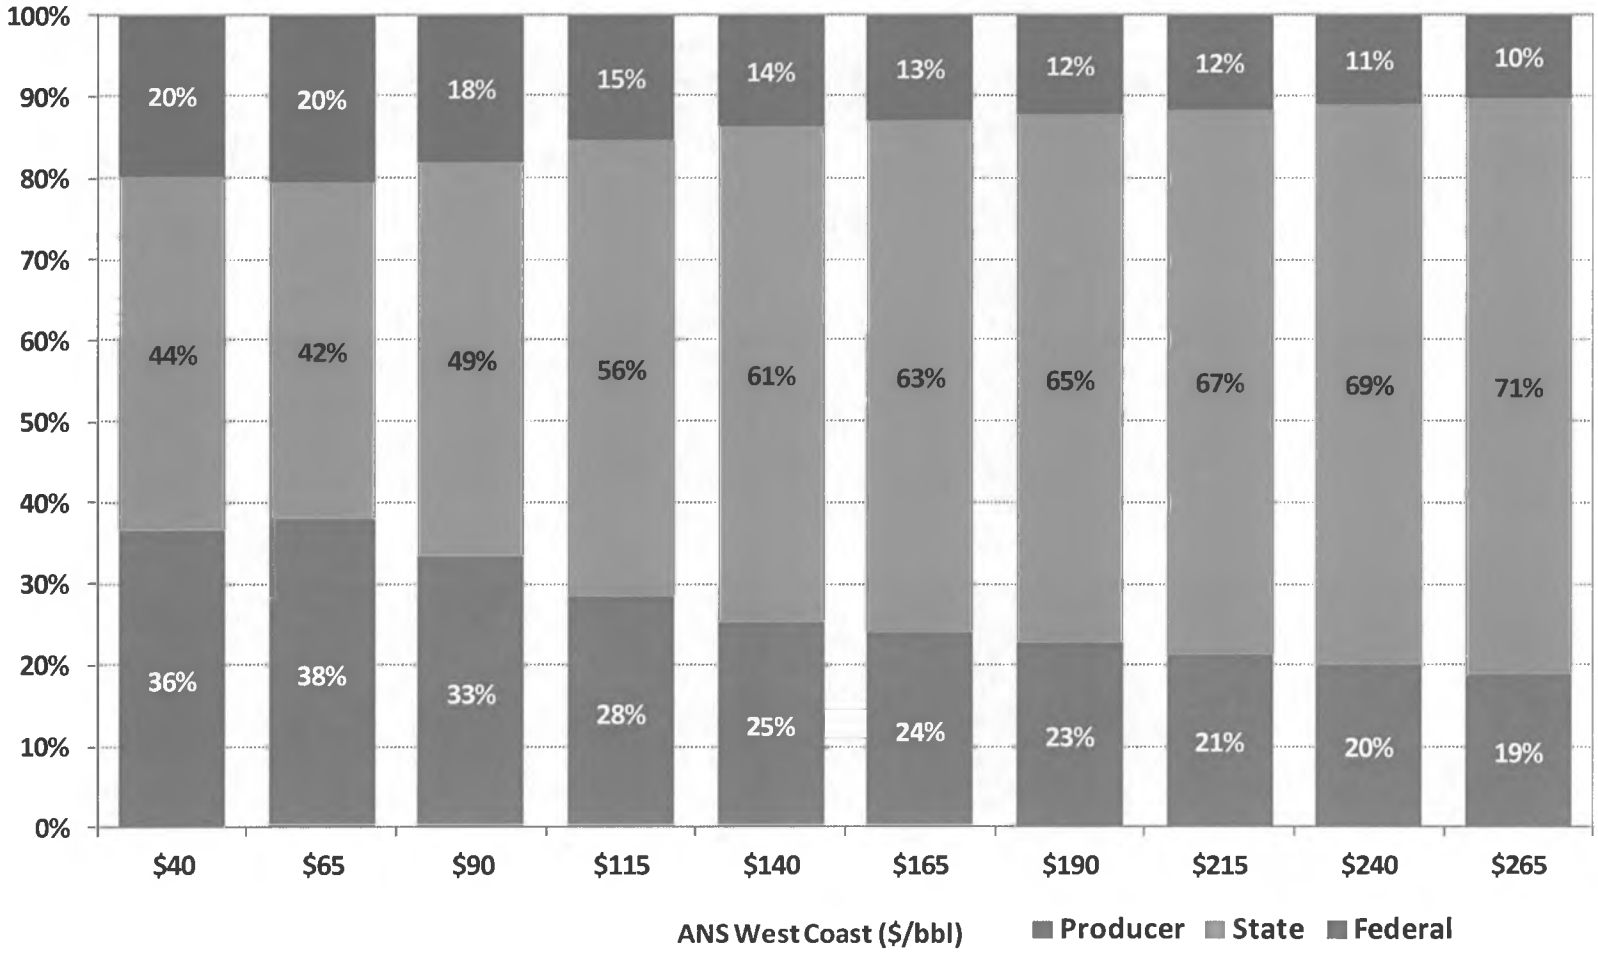
	ACES	CSSB 192	CS HB 110 (FIN)
Progressivity (based on PTV per barrel)	Not bracketed, rate applies to entire PTV $30 to $92.50: 0.4% per $1 $92.50 to $342.50: 0.1% per $1	Modifies ACES structure. $30 to $101.43: 0.35% per $1 $101.43 to $201.43: 0.1% per $1	Bracketed, rate applies only to incremental value $30 to $42.50: 27.5% total tax rate $42.50 to $55: 32.5% total tax rate, etc
Maximum tax rate	75%	60%	50%
New production incentives	Existing credits	$10 / barrel allowance for increased production	Lower tax rate for new fields, in-field drilling credits, extends sunset for small producer and exploration credits
Minimum tax	Ranges from 4% of gross for prices >$25 to zero for prices <$15, credits allowed.	Increases tax to 10% gross for PBU/KPU, no credits allowed.	Existing provisions

Effective Production Tax Rates: ACES, CS SB 192, CS HB 110 (FIN)



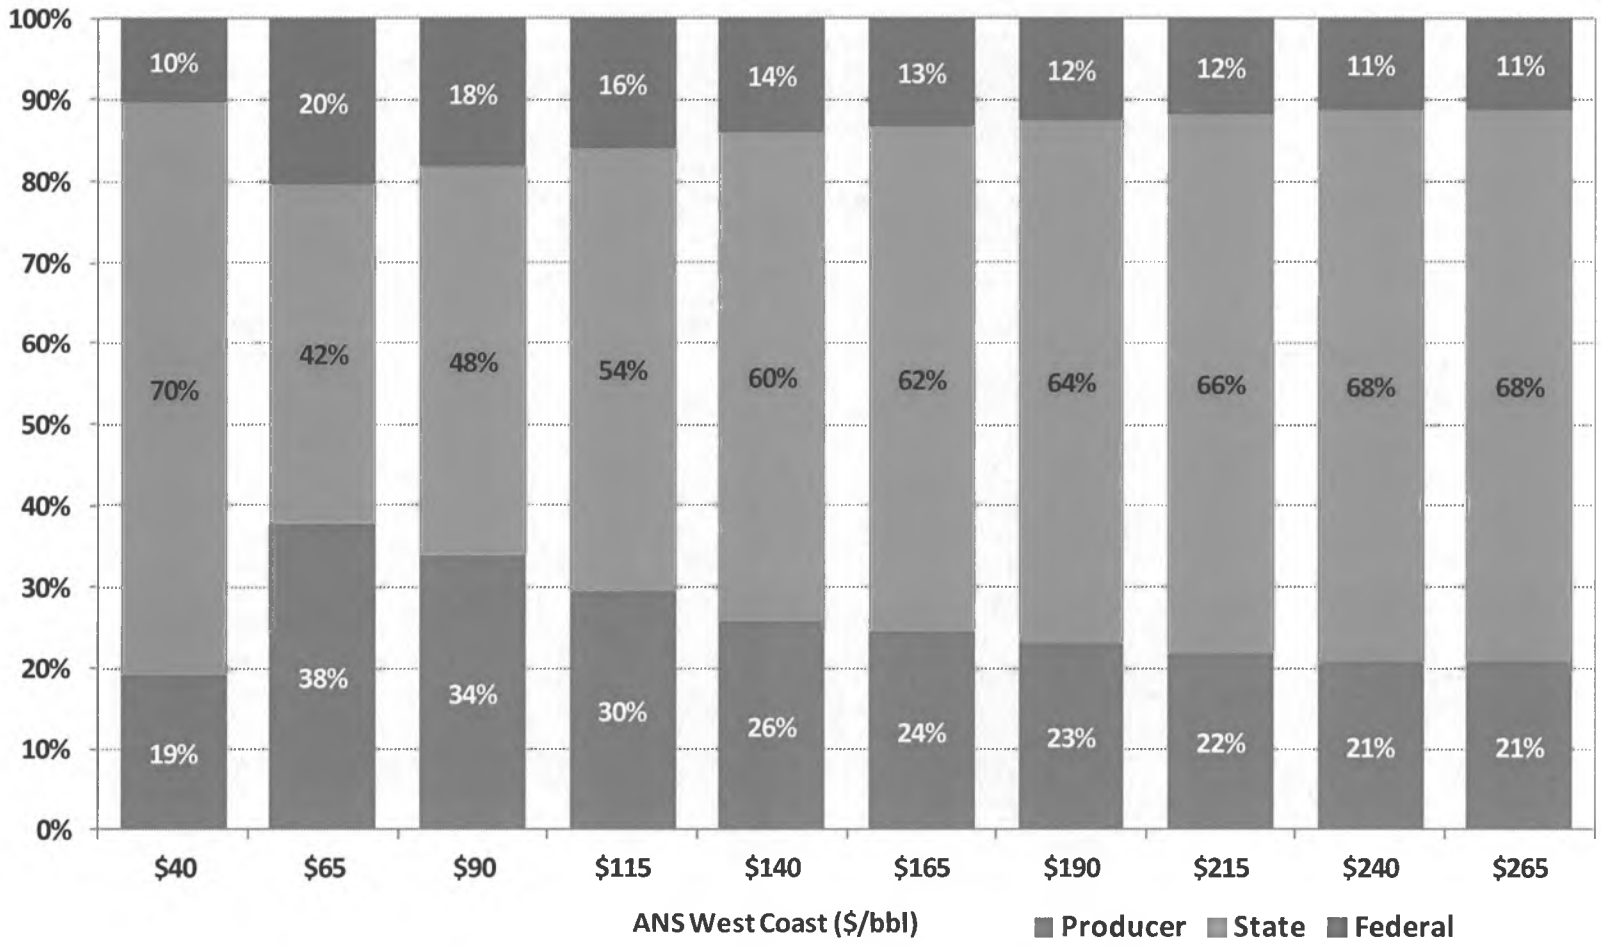
Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl.

Effective Production Tax Rates: ACES, CS SB 192, CS HB 110 (FIN) Impact of 10% gross tax



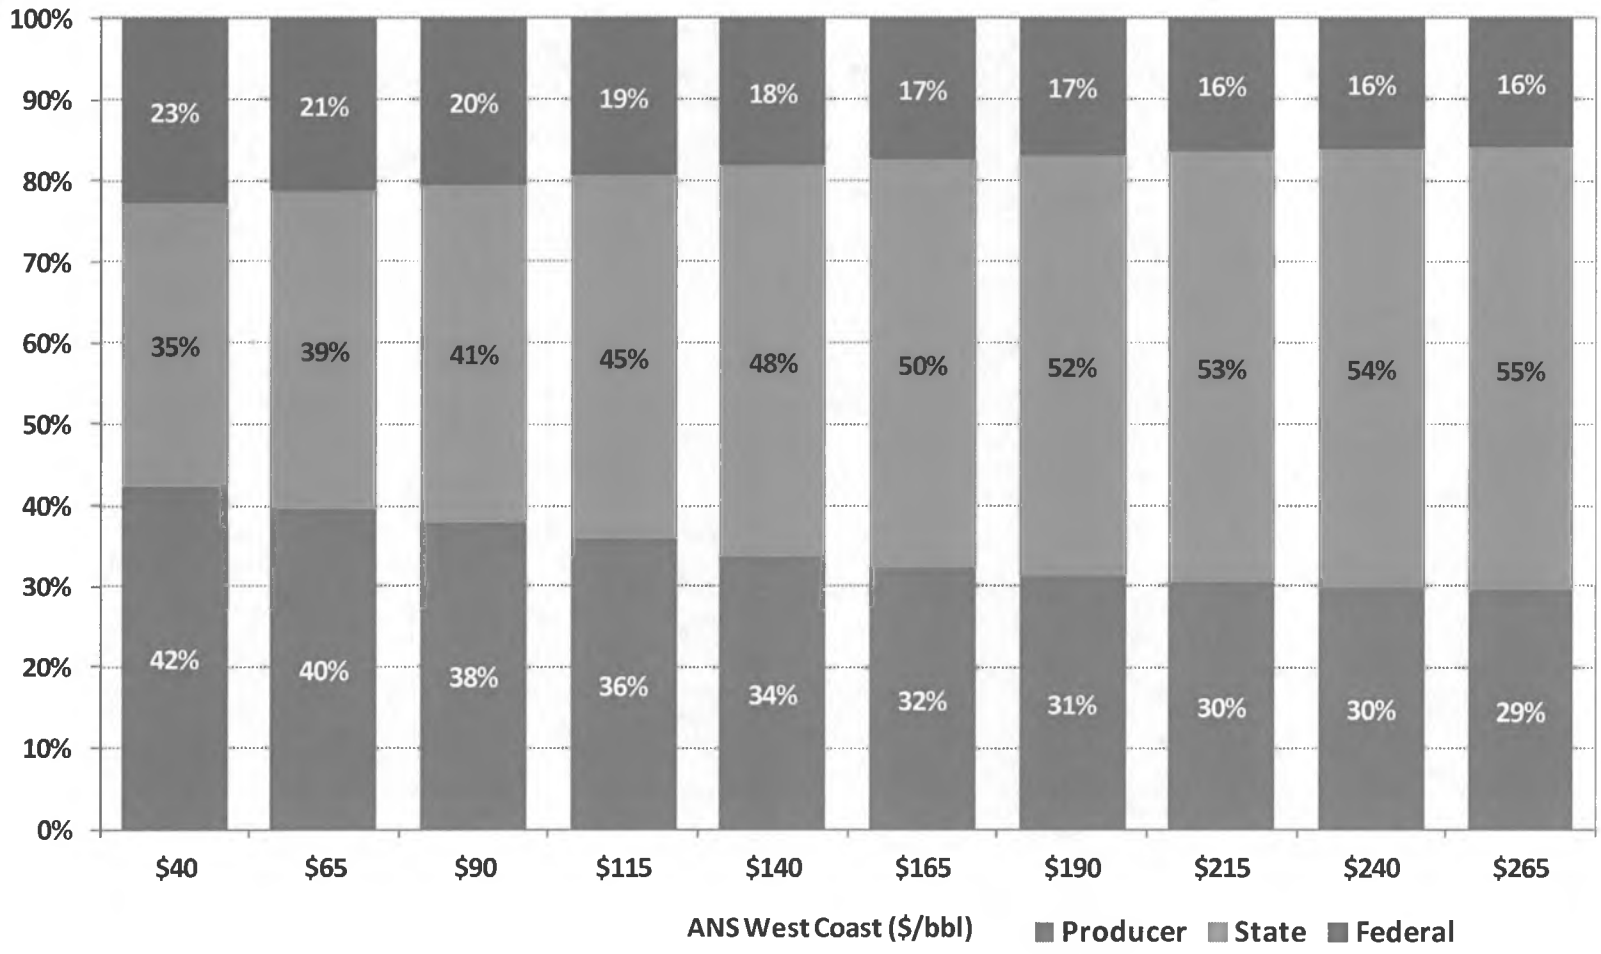
Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl.
Assumes that 80% of production is impacted by 10% gross minimum tax with no credits allowed against gross tax.

Marginal Government Take: ACES, CS SB 192, CS HB 110 (FIN)



Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl.

Share of Profit under ACES



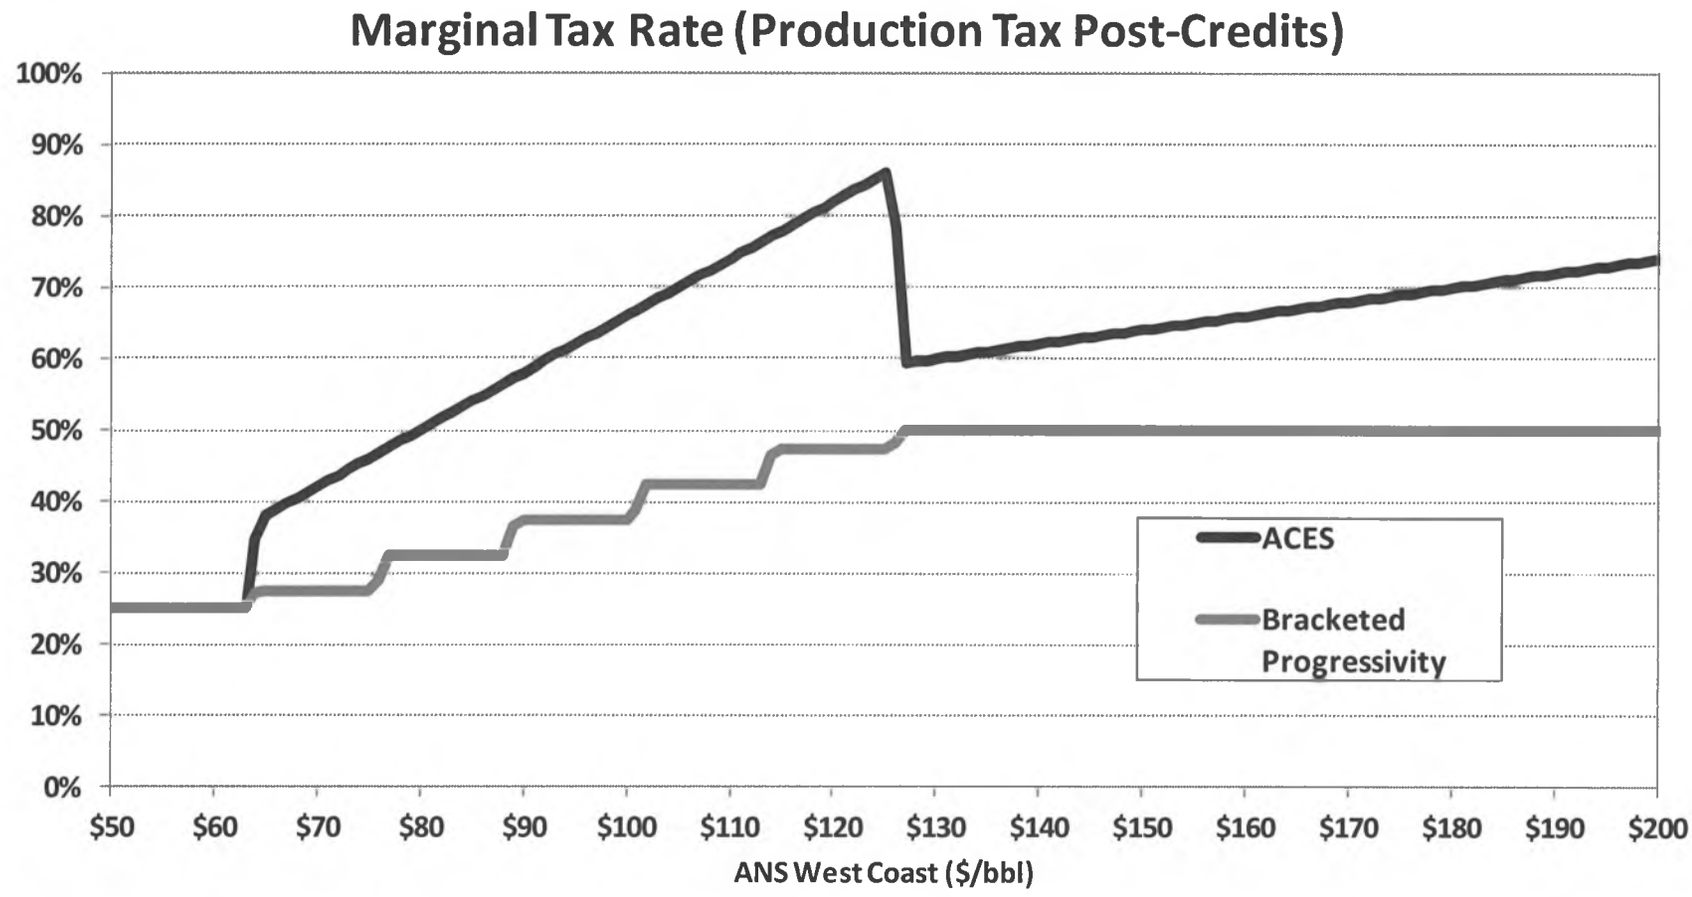
Profit defined as total gross value of all oil produced, less transportation costs and lease expenditures.
Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl.

Share of Profit under CSSB 192

Profit defined as total gross value of all oil produced, less transportation costs and lease expenditures.
Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl.
Assumes that 80% of production is impacted by 10% gross minimum tax with no credits allowed against gross tax.

Share of Profit under CS HB 110 (FIN)

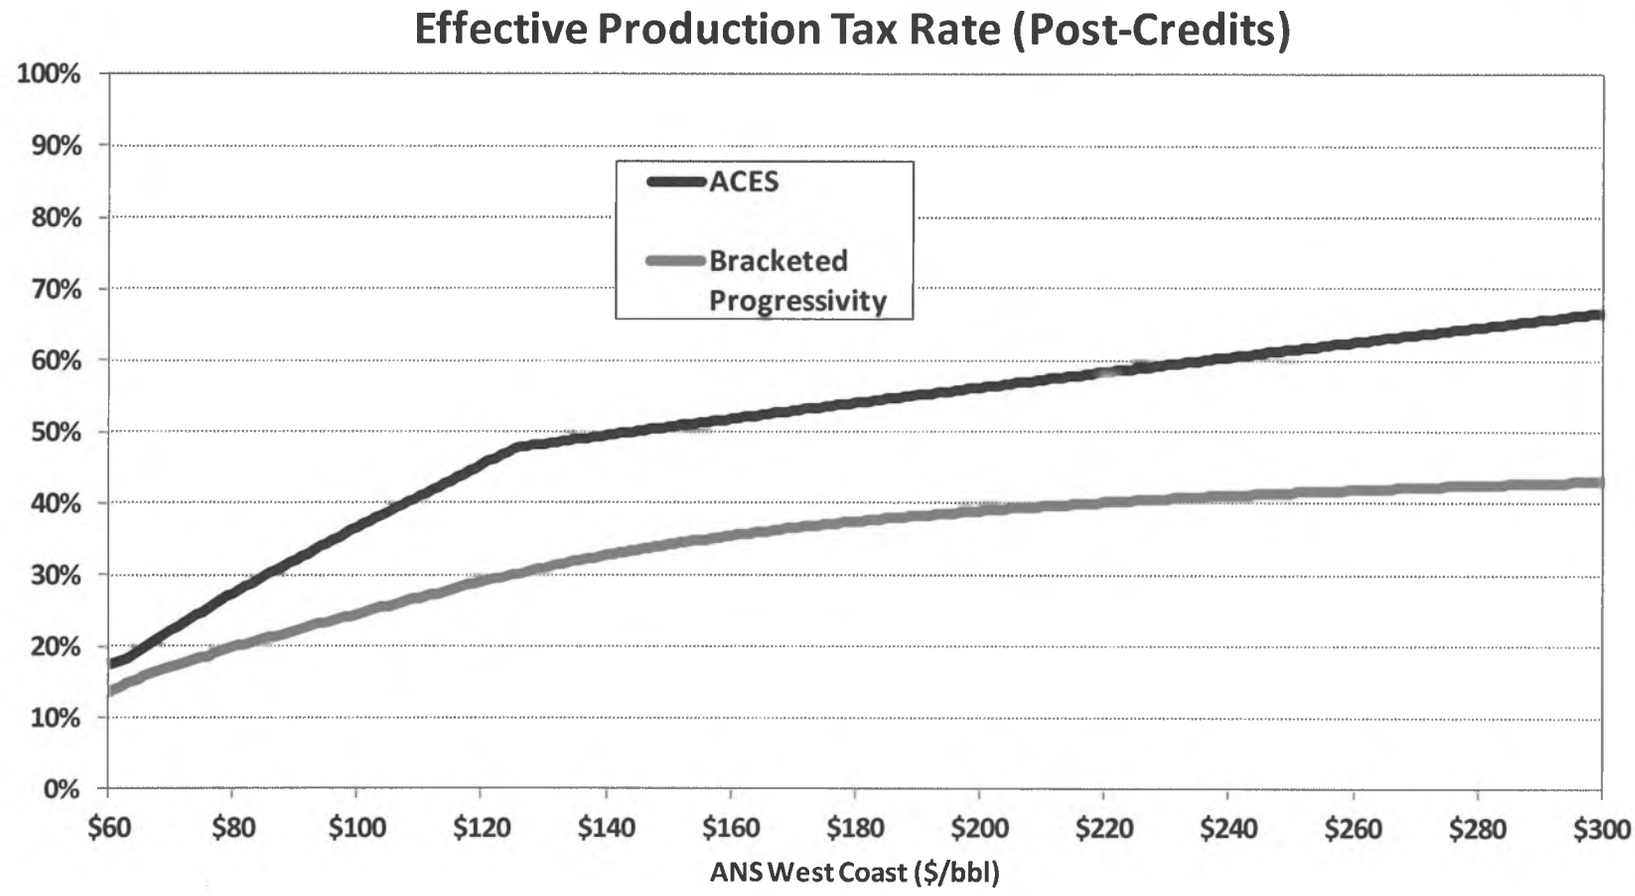
Profit defined as total gross value of all oil produced, less transportation costs and lease expenditures.
Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl.



Suggested improvements

- Bracketed progressivity
- Lower cap on progressivity
- Reduced tax for new fields
- Increased credits for in-field drilling

Bracketed progressivity

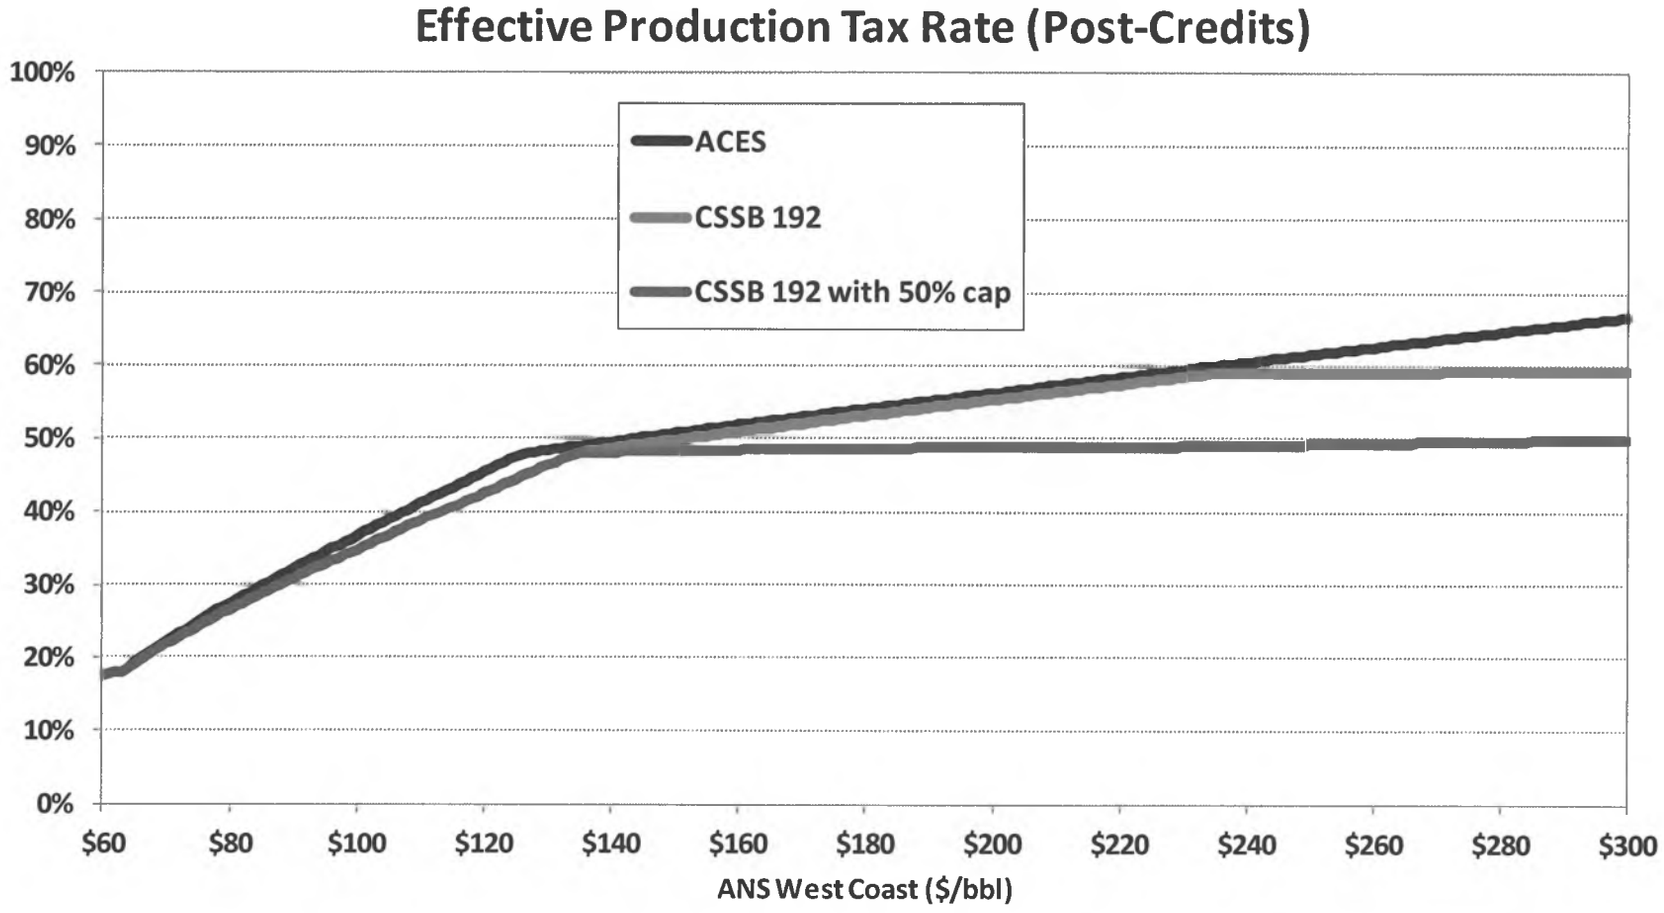


- ACES and CSSB 192 apply progressive tax rate to the entire production tax value
- Tax on the first $1 of value can vary from 25% to 75% (ACES) or 60% (CSSB 192)
- Bracketed approach applies progressive tax only to the incremental value
  - Similar to how income tax brackets work…
- Other jurisdictions with price progressive systems use a bracketed approach
- Companies have committed $5 billion under this tax change

Bracketed progressivity

Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl.

Bracketed progressivity

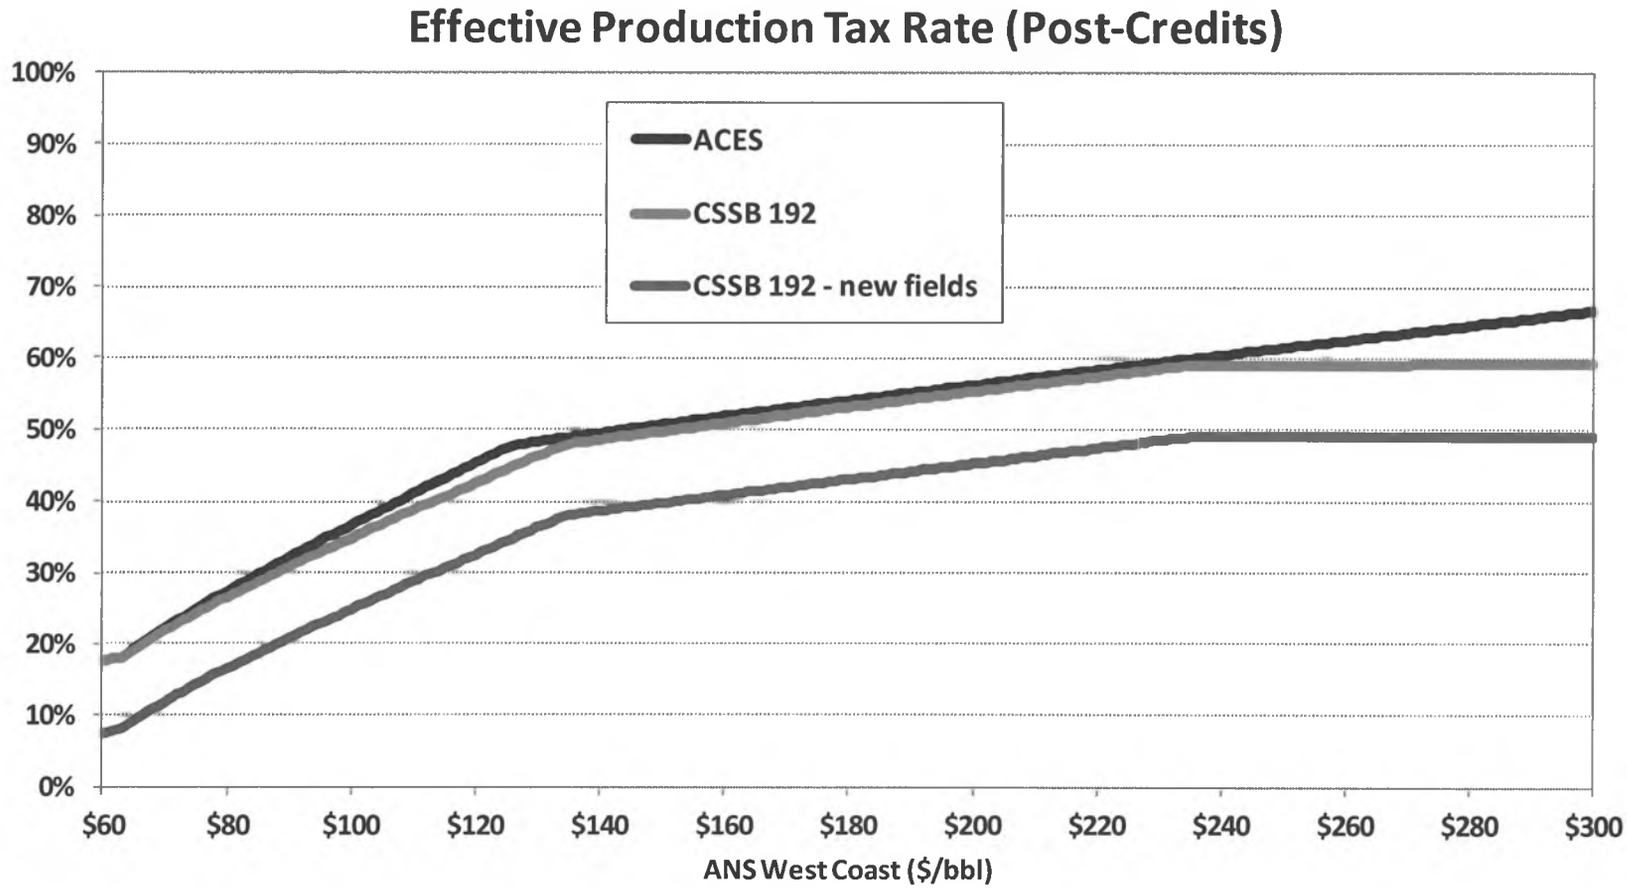


Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl.

Lower cap on progressivity

- Part of a bracketed or non-bracketed approach
- Provides the "upside potential" companies need to make investments attractive at higher prices.
- 60% cap in CSSB 192 would only apply at prices over ~$240 / barrel
- 50% cap in CSSB 192 would apply at prices over ~$140 / barrel

Lower cap on progressivity

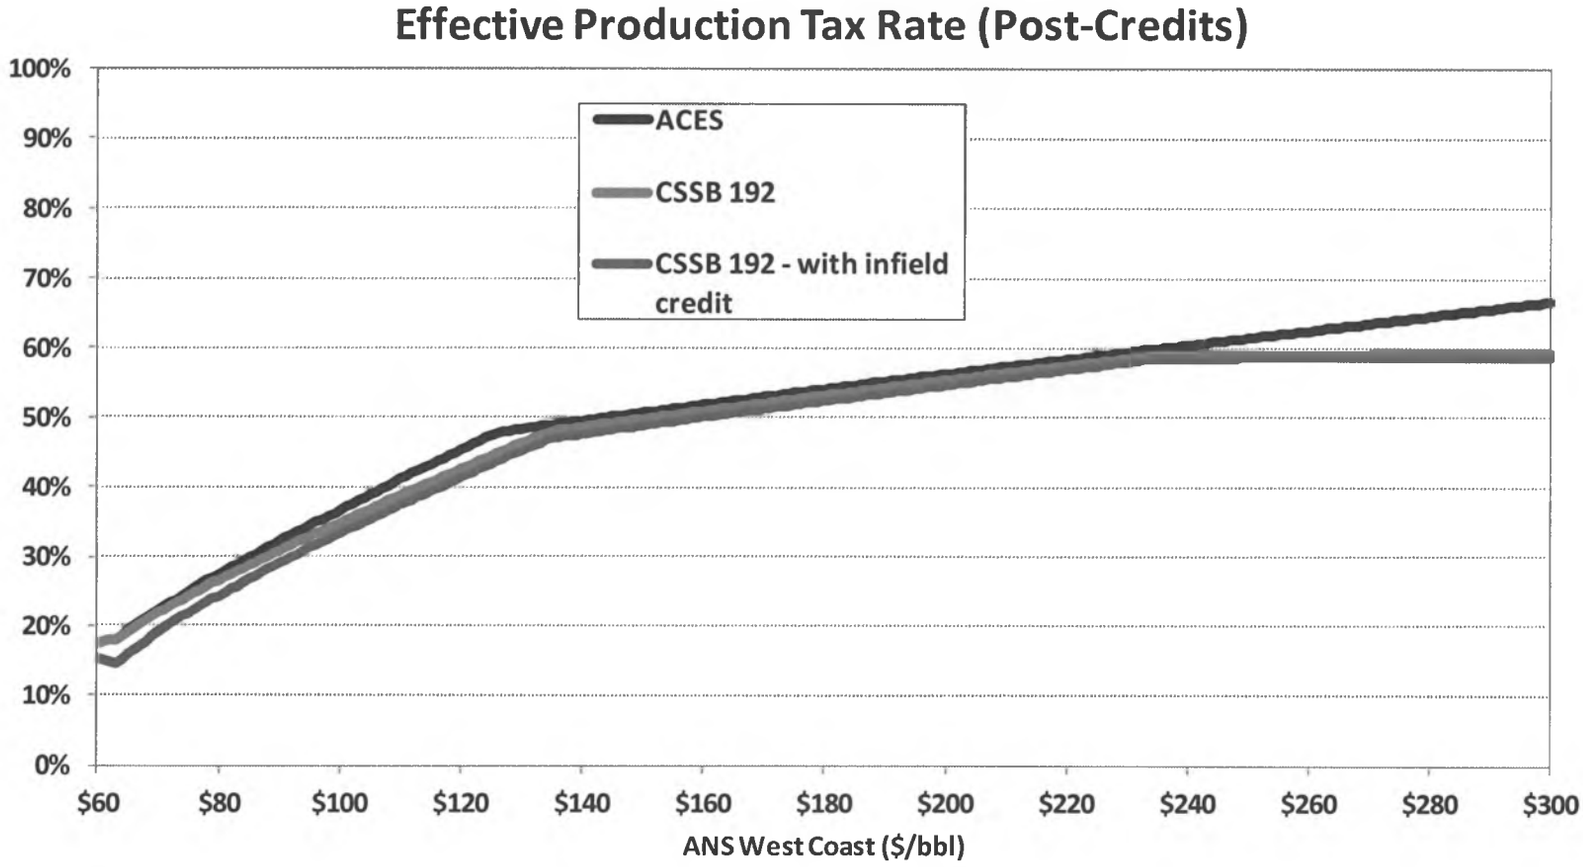


Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl.

Reduced tax for new fields

- Provide a lower tax rate to incentivize new fields over the life of the project.
- No fiscal impact for many years
- Would apply primarily to production that is not even in our current forecast – the state has "nothing to lose"

Reduced tax for new fields

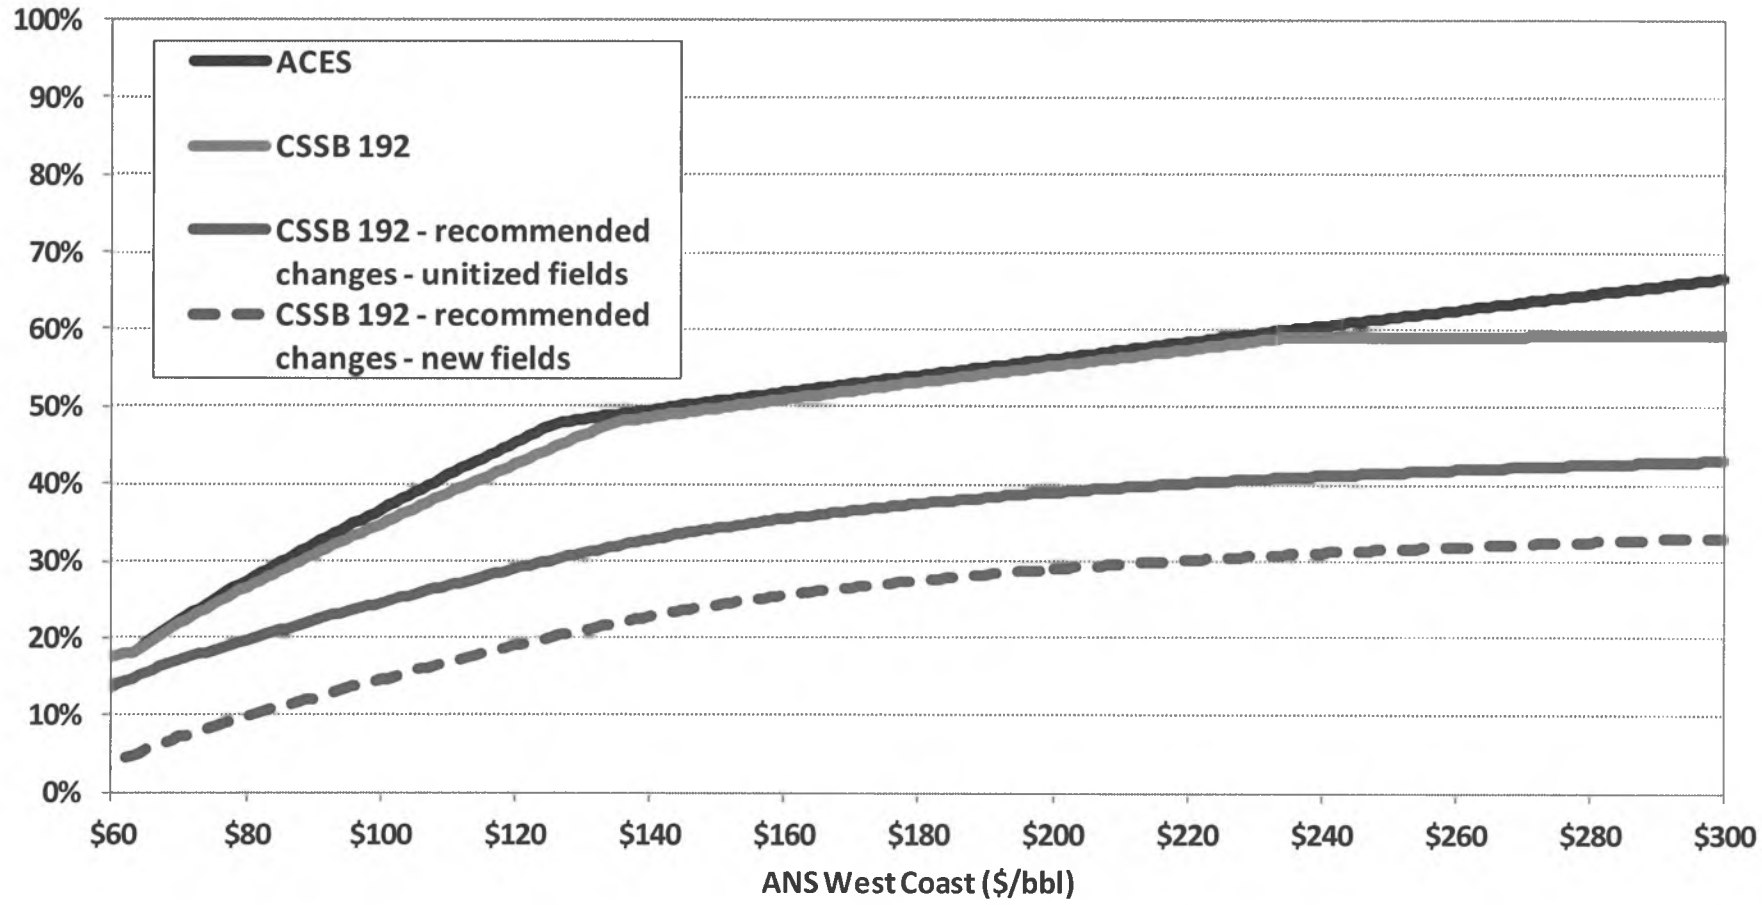


Example reduces all tax rates by 10% for "new fields"

Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl.

Increased credits for in-field drilling

- Existing 40% credit for well-related lease expenditures outside North Slope.
- Recommend extending credit to include North Slope.
- Makes in-field development work more attractive to companies.
- Improves economics of developing new North Slope fields, and increasing production from existing fields.



Increased credits for in-field drilling

Example assumes that 50% of qualified capital expenditures qualify for higher 40% credit

Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl.

Summary: Effective Production Tax Rates: ACES, CS SB 192, CS SB 192 with recommended changes

Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl.

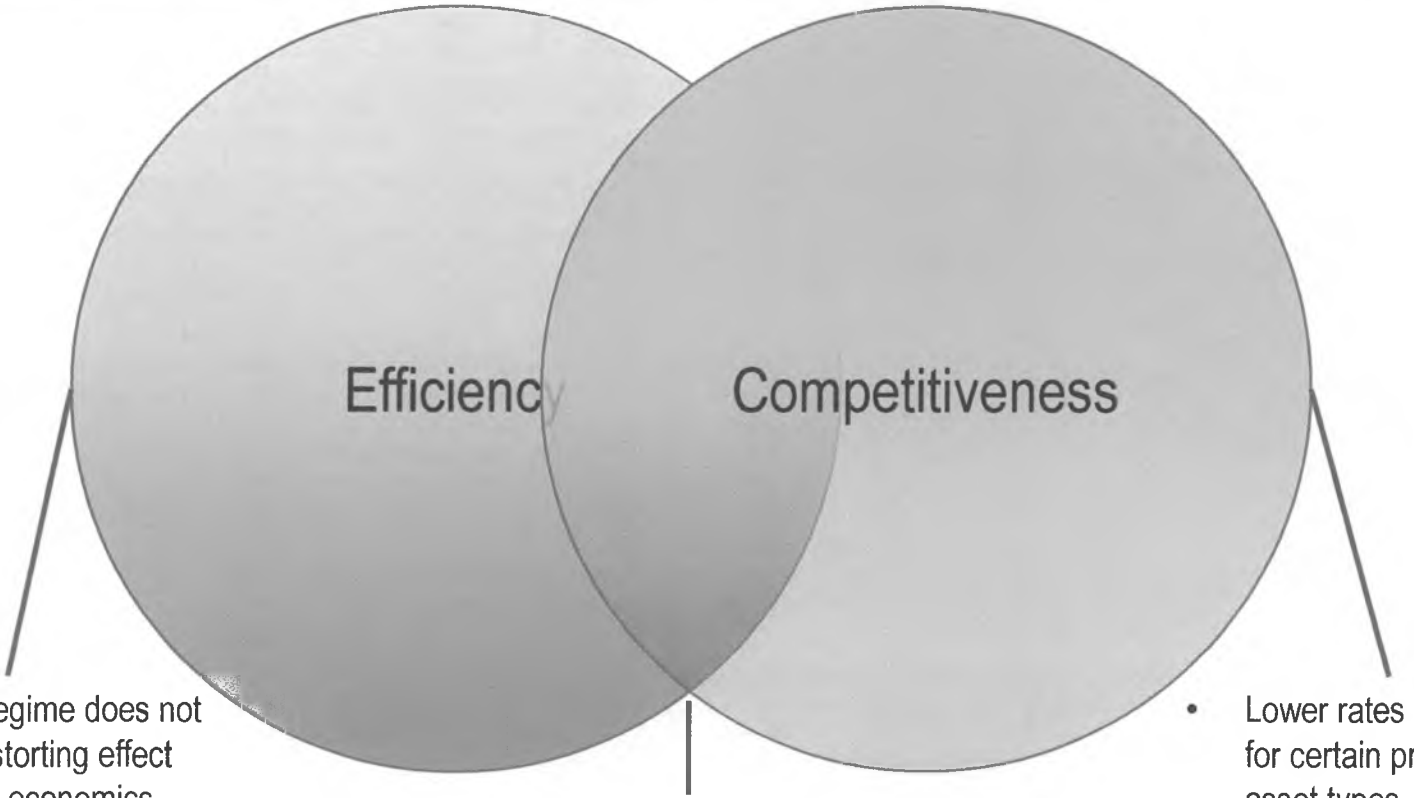
Discussion Slides: Alaska Senate Finance Committee

March 15, 2012

Gerald Kepes
Partner and Head of Upstream & Gas
PFC Energy

PFC Energy



Background – Key Fiscal Terms Concepts

PFC Energy

Fiscal Regime Design: Finding the Intersection of Efficiency and Competitiveness

- Fiscal regime design is fundamentally about maximizing State revenues, subject to two important constraints
  - **Efficiency:** Not distorting investment choices, or preventing marginal investments that would otherwise have been made
  - **Competitiveness:** There is a global market for upstream dollars

Fiscal Regime Design: Finding the Intersection of Efficiency and Competitiveness

- Efficient regime does not have a distorting effect on project economics
- If rates are too high, other jurisdictions could be more successful in attracting capital as a result

- Regime does not distort investment
- Rates are internationally competitive, given fundamental attractiveness of the opportunity

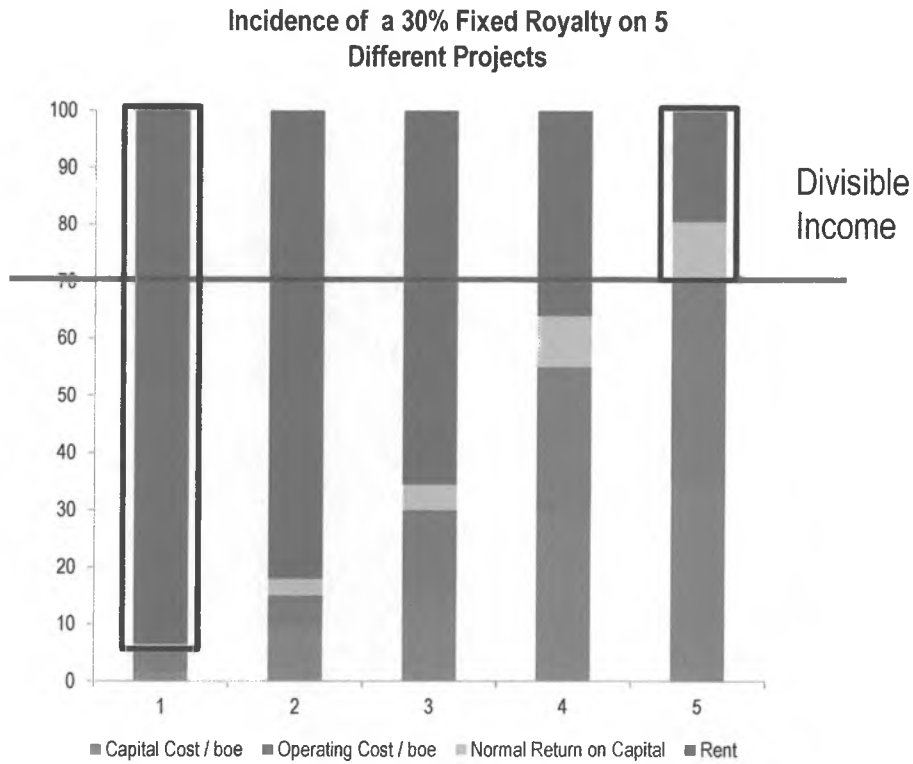
- Lower rates may mean for certain projects or asset types, the regime is highly internationally competitive

PFC Energy

Relative Government Take (Definition)

$$\textbf{Relative Government Take} = \frac{\text{Government Take}}{\text{Divisible Income}}$$

Divisible Income equals Gross Revenues less costs, including capex and transportation costs.

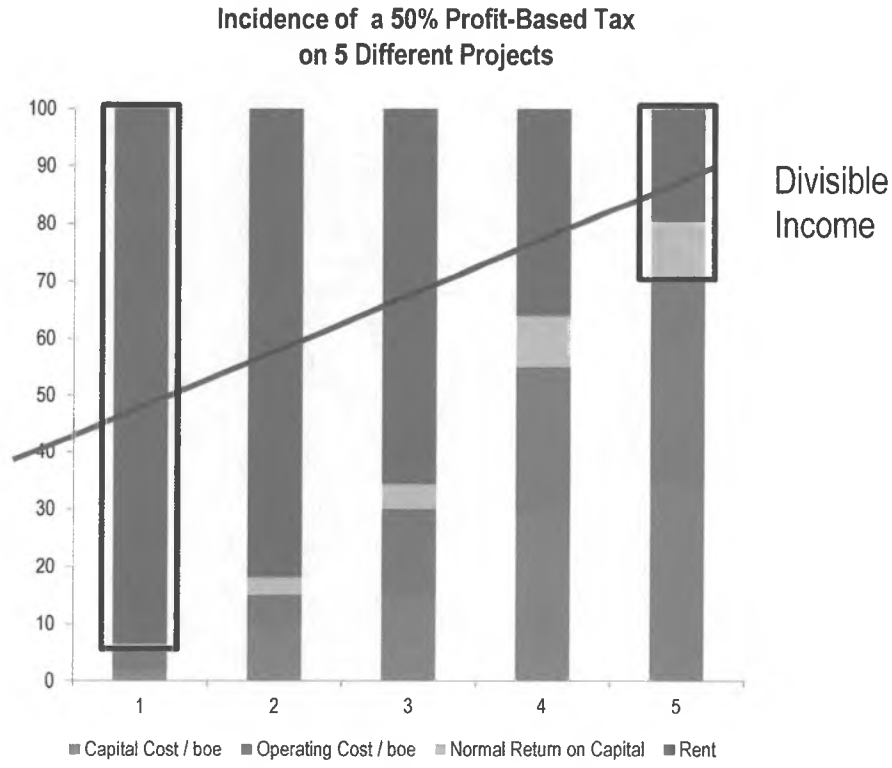


Government Take includes all payments the government mandates in its function as a sovereign:

- Royalties
- Land rental fees, property taxes
- Production taxes
- Income taxes

Government Take does not include amounts the government earns via a direct equity stake

Fixed Royalty Systems: Inefficient, But Potentially Highly Competitive

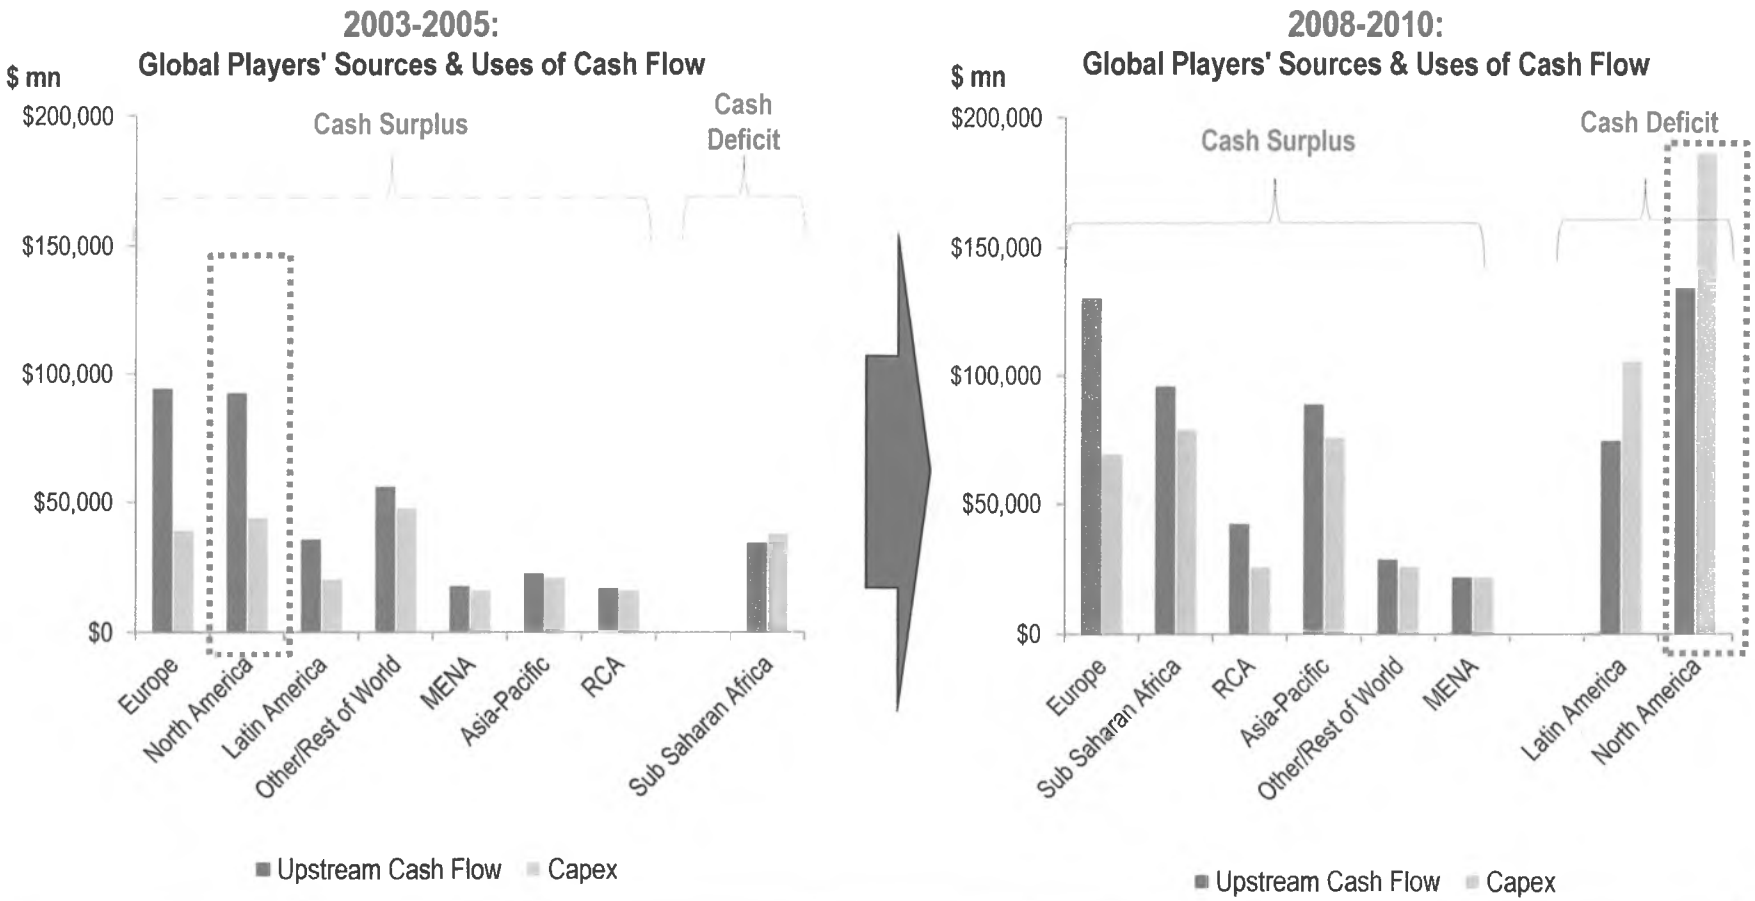


- Given varying project costs, and varying prices, fixed percentage royalty systems are **inefficient** because they distort investment, making previously economic projects uneconomic at a given price
  - Government Take from a fixed royalty system can be very high when costs are high or prices are low – 100% in the example of project 5
- In high price environments, however, fixed royalty systems can be very competitive
  - Government Take can be very low when prices are high, or costs are low – only ~33% in the example of project 1

PFC Energy

Profit-Based Fiscal Systems: More Efficient, But May Be Less Competitive

- A Profit-Based fiscal system may be
  - A contractual arrangement, such as a Production Sharing Contract
  - A tax which applies to revenues less costs
- Such systems can be capable of **raising greater revenue**, while **reducing inefficiency**
  - In low oil price environments, or high cost environments, Profit-Based Systems are less likely to make marginal projects non-economic
- By capturing more rent in high oil price environments, or low cost environments, however, they may also not compete with royalty regimes
  - Projects 1 and 2 would be significantly more attractive to undertake under a royalty regime

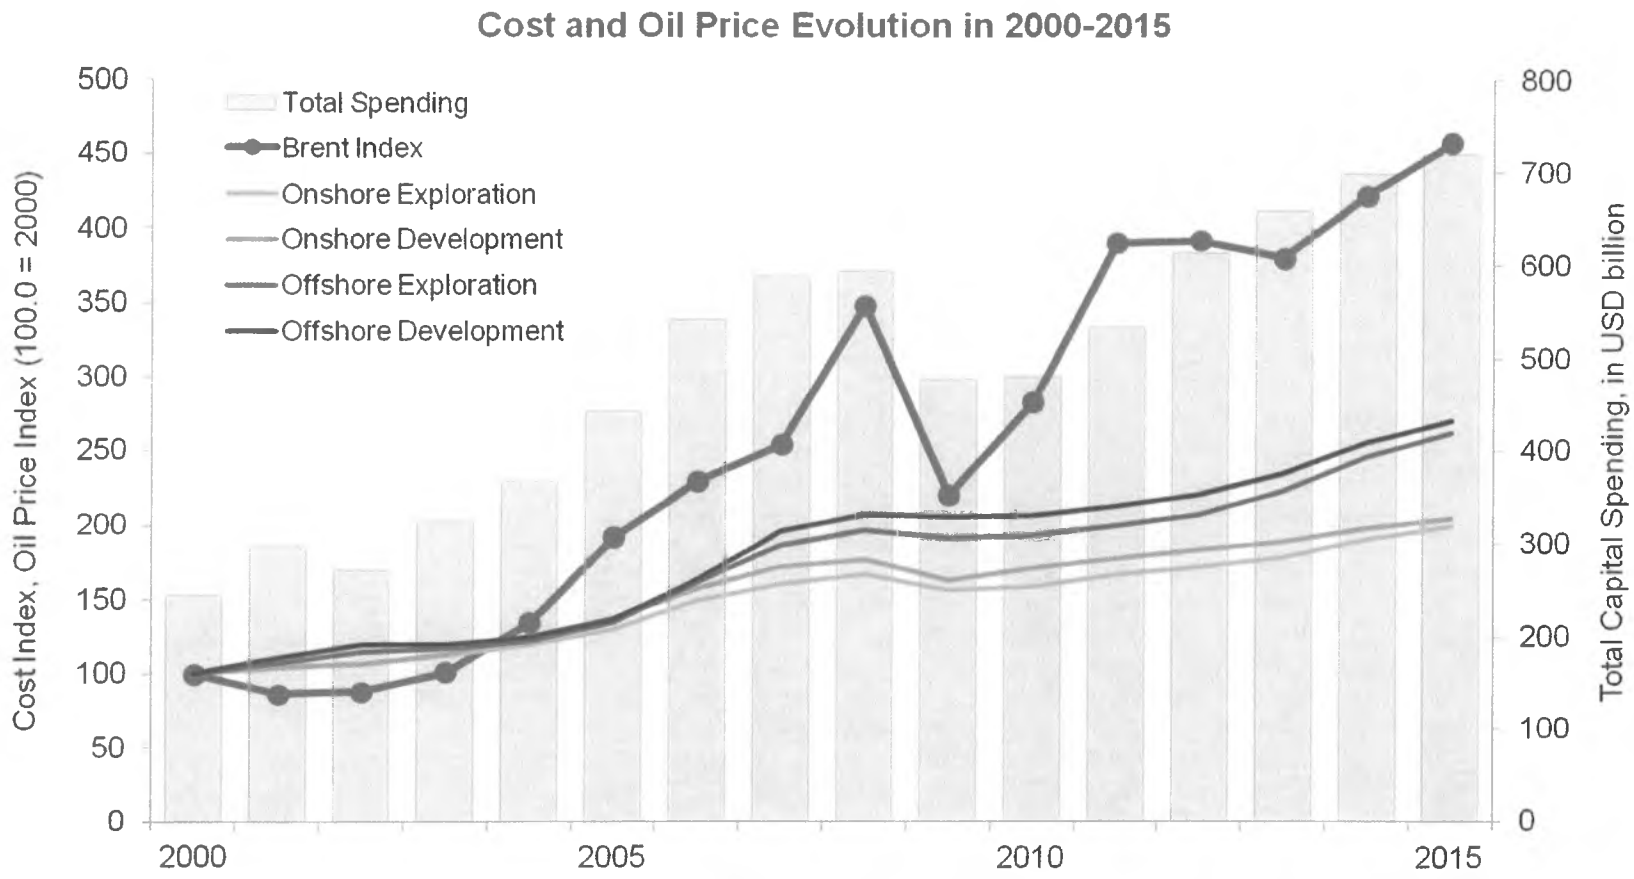


PFC Energy

Alaska's Oil & Gas Competitive Context

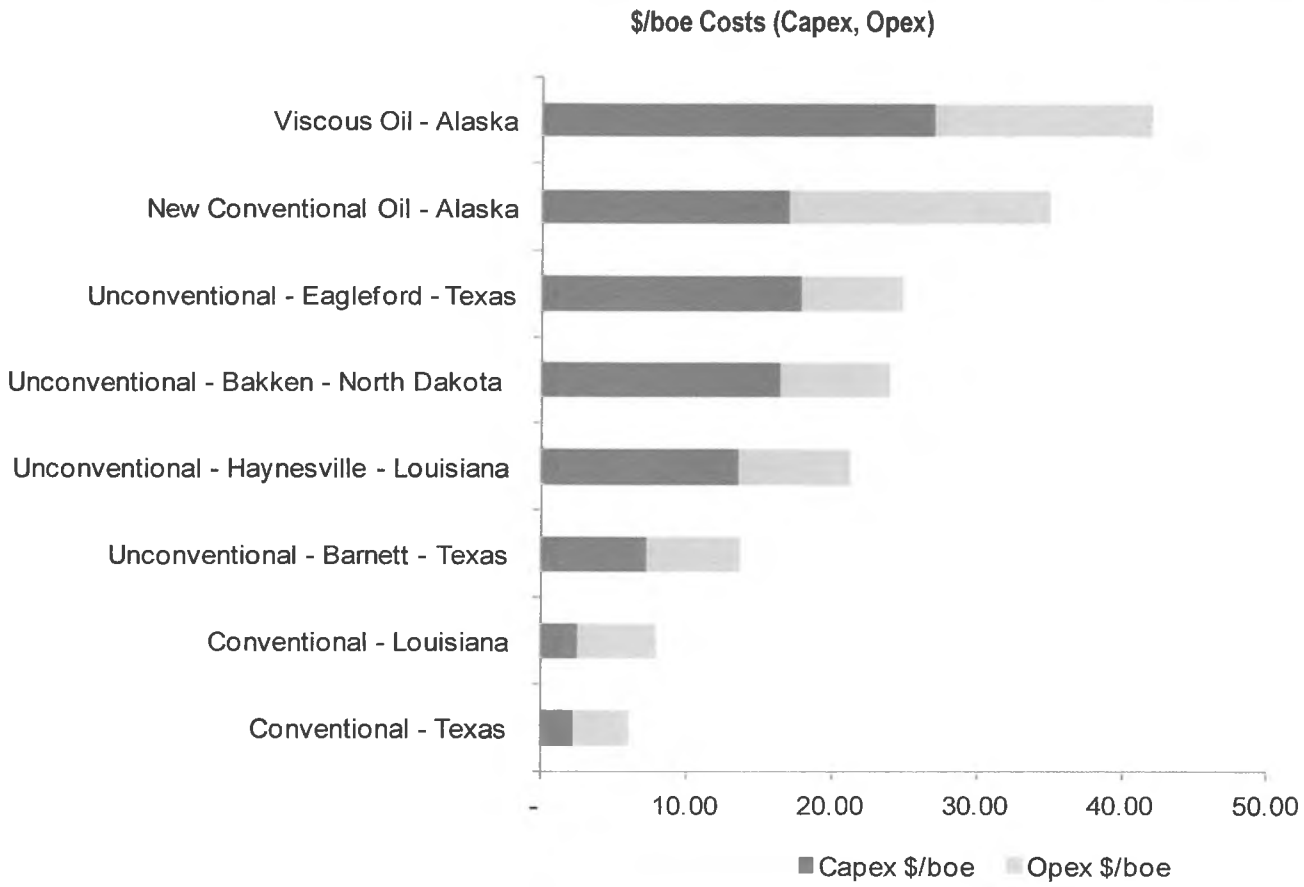
PFC Energy

Fixed-Royalty Jurisdictions in US Lower 48 Are A Key Competitor to Alaska for Investment Dollars



It is now an exception not to be targeting unconventionals in North America as a major growth platform.

PFC Energy



All eyes on the price .. But what about cost…

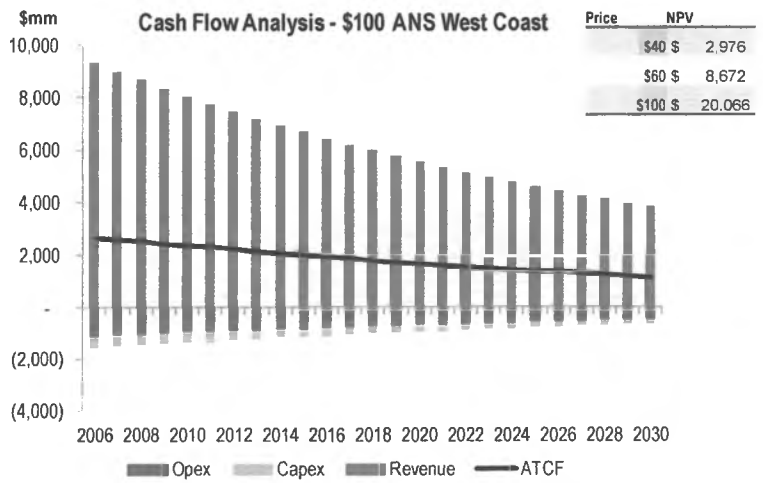
- Overall spending in the industry is mostly driven by Oil Prices, no so much by costs.
- Costs in 2015 expected to increase x2.5 times from 2000 standards …. Oil prices will increase 450%

PFC Energy

Alaska's Days of "Easy Oil" Are Gone: High Costs and High Government Take Present Challenges

Costs are significantly higher in Alaska than the Lower 48 – even compared to unconventionals. Meanwhile, Alaska's Government Take has risen significantly over recent years, meaning new project economics can be very challenging

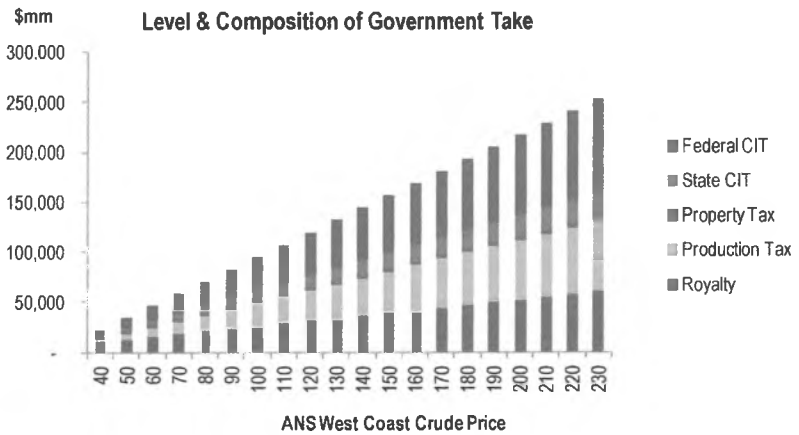
PFC Energy



Evolution of the ACES fiscal regime

PFC Energy

Cost Assumptions Underlying Fiscal Analysis



- Two key forms of analysis have been undertaken on project economics and government take levels in this presentation
- **Existing Producer** Analysis examines the economics of the fiscal regime for an existing producer, producing 200 mb/d in 2012, with a 6% annual production decline rate, and with the following costs:
  - $12/ flowing bbl operating expenditure
  - $5/ flowing bbl maintenance capital expenditure
- **New Development** Analysis examines the development-forward lifecycle economics of the fiscal regime for the development of a new 10 mb/d development for a producer without existing base production. Assumed costs are:
  - $17/ flowing bbl operating expenditure
  - $17/bbl reserves development capital expenditure
  - $1/ flowing bbl maintenance capital expenditure

ACES – Effective as a Harvest Area Fiscal Regime

- ACES appears to work well as a "harvest" regime
  - Existing **mature fields remain profitable**, including capital work required to achieve ~6% decline (renewal capex)
  - **Maximum 'rent'** extracted from a declining production base is captured for the state
- ACES inhibits the development of new projects and resources that might help stem or even reverse the decline
  - ACES is **not progressive with regard to costs**, so high government take applies even to very high cost projects
  - Existing system of capital credits etc appears to do more to encourage 'renewal capex' than it does new production spending
  - Progressivity can have a major **detrimental impact on breakeven prices** for high-cost projects at current oil prices

PFC Energy

Options to Spur New Developments

Approach	Implementation Options	Advantages	Disadvantages
Uniform lowering of Government Take	•Bracketing •Reduced Base Rate •Increased Progressivity Thresholds •Reduced Progressivity Rates •Progressivity Caps	•Does not require increased complexity •May present opportunities for simplification	•Incentivizing new high cost resources through this method alone requires giving substantial 'rent' back to producers on the mature producing assets
Differentiation between old and new production	•Allowance for New Oil •Switching in part away from Net Profits taxation to Gross Revenue Taxation, to enable different tax rates for different production streams without separate cost accounting and tax returns •Use of some combination of definitions for incremental production, ie base decline rate, regulator-agreed new programs, new areas	•Allows significant reductions in Govt Take on new and costlier developments (including heavy oil etc) without requiring significant reductions on the mature producing assets	•Administrative difficulties around definitions of 'new production'
Enhancements to cost progressivity of ACES	•Changes to allowable cost deduction or credits mechanism etc to provide greater 'uplift' for high capital and operating costs, while restricting negative Production Tax in marginal cases •Enhancements to royalty relief	•Does not require structural change away from ACES	•Increases already high complexity and opacity •May exacerbate problem of poor cost control incentives •Increases likelihood of unintended consequences •Likely less significant impact than new production differentiation

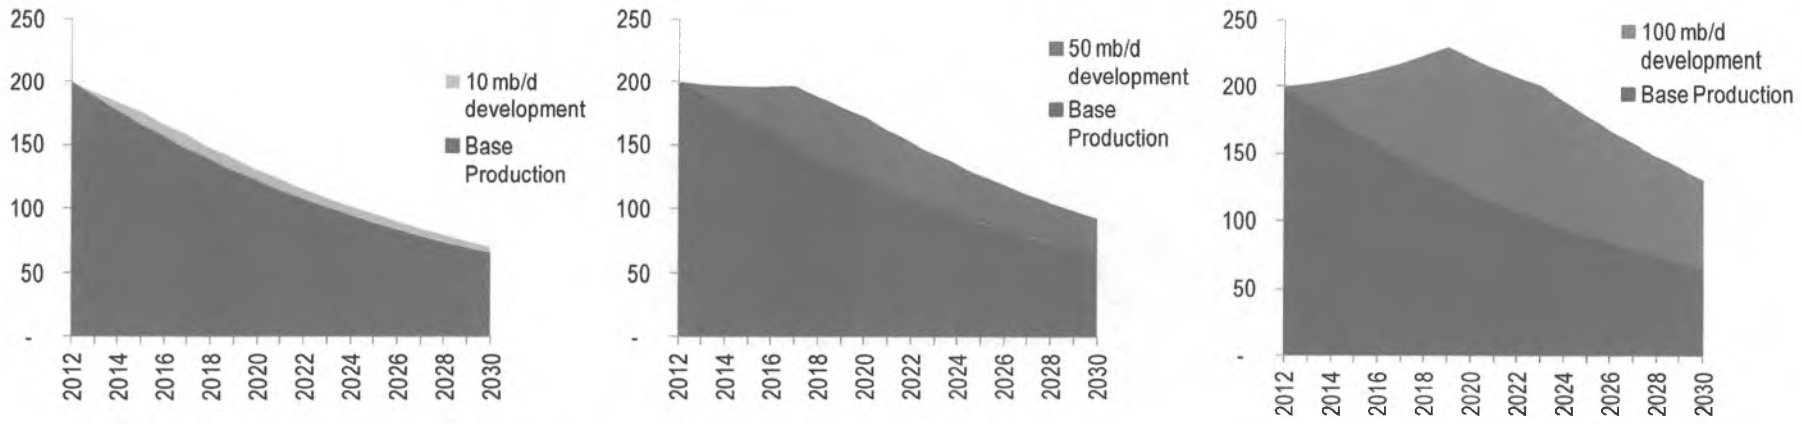
Progressivity Impact on New Development Project Economics

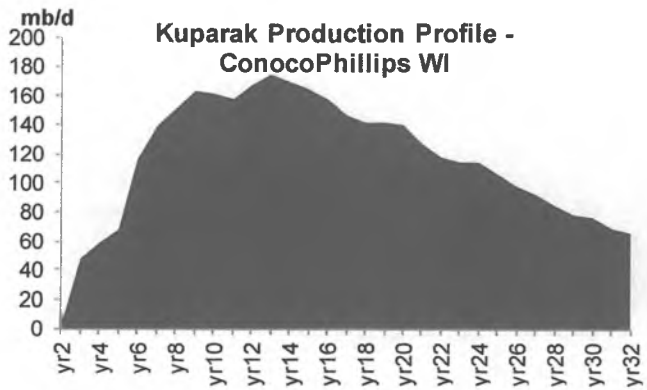
ACES v Predecessor Regimes (Actual & Proposed)



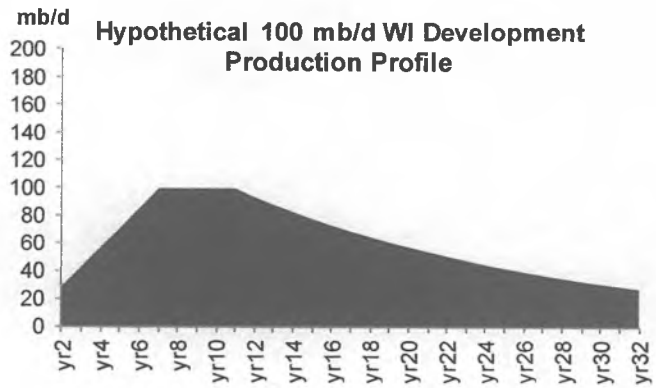
ACES & CSSB 192 v Bracketed Amendments

PFC Energy

New Oil Allowance:
Incremental Production on a Declining Base



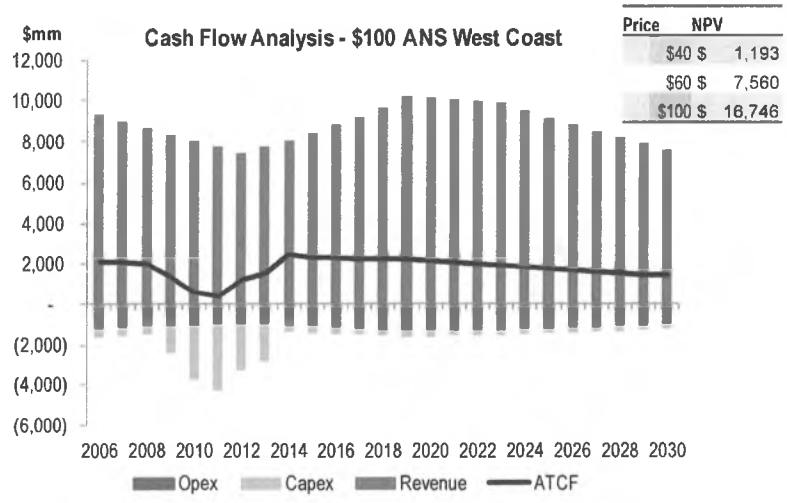
- Central to understanding the impact of the "allowance for 'new oil'" is an understanding of the impact of new source production on a company's total production volumes, when that new source production is added to a declining base portfolio
  - The charts below assume a 6% decline rate for an existing North Slope producer currently producing 200 mb/d, and examine hypothetical new source projects that peak at 10mb/d, 50 mb/d and 100 mb/d respectively(on a working interest basis)
  - Given the pace at which such projects typically reach peak production, only the100 mb/d peak production new source development is actually capable of adding production that is incremental to prior years' volumes



PFC Energy

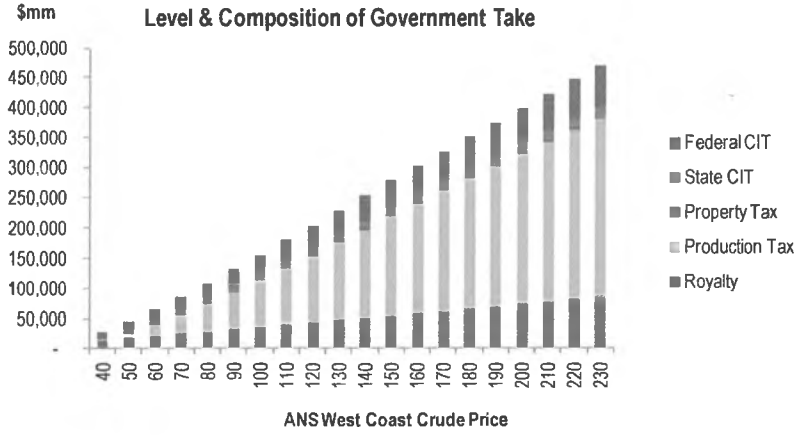
A Hypothetical 100 mb/d (Working Interest) development

- A new source development that produced 100 mb/d at peak for a working interest partner would be a very significant new development. By way of comparison, Kuparak, the second largest field in North America, peaked at ~320 mb/d gross production
  - This represented **working interest production** to ConocoPhillips (the operator and majority shareholder) of **170 mbo/d**
  - Kuparak took 11 years (from 1981 to 1992) to reach this peak level of production
- Since it would take a development on the scale of 100 mb/d (working interest) to achieve "new oil" for an existing producer under the terms of the amendment, a development of this size has been modeled in the following analysis
  - A 7 year ramp-up to peak production has been assumed
  - Such a development would likely eclipse today's production from Kuparak (122 mb/d gross, 66mb/d working interest to the majority shareholder)
  - It is important to note that this is a significantly more aggressive new-source production profile than is currently foreseen in recent statements by the major operators on their current development pipelines, even in the most optimistic circumstances



PFC Energy

Assumptions



- The following analysis assumes
  - A 6% base portfolio decline, in the case of a producer currently producing 200 mb/d
  - Costs for the base production portfolio of:
    - $12/ flowing bbl operating expenditure
    - $5/ flowing bbl maintenance capital expenditure
  - Costs for the 100 mb/d (working interest) New Development project of:
    - $13/ flowing bbl operating expenditure
    - $13/bbl reserves development capital expenditure
    - $1/ flowing bbl maintenance capital expenditure
  - These costs are deliberately somewhat lower than the previously referenced 10 mb/d new development, since the hypothetical development modeled is significantly larger, and thus likely to have somewhat lower costs on a $/bbl basis

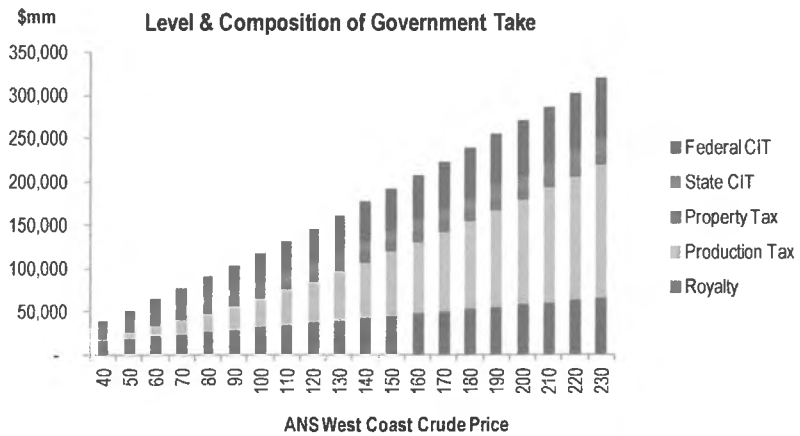
Oil / Gas Decoupling



- Under ACES, production tax value is assessed on a combined BTU-equivalent basis for both oil and gas production
  - So long as no major gas export project is under development, this has no impact
  - In the event of the development of a major gas export project, however, when gas prices are significantly lower than oil prices, this could lead to significant reductions in Government Take
- CSSB 192 includes a provision to de-couple the calculation of production tax value on North Slope gas sold out-of-state, in order to eliminate this impact of gas production
  - The impact of the decreased government take without decoupling is only pronounced with very low gas prices, and very large gas production
  - In order to illustrate the impact at the extreme, the following analysis thus assumes a $1/mcf net-back sale price for North Slope gas, and a 2018 1bcf/d gas project. Under less extreme scenarios, the difference with and without decoupling would be significantly less

PFC Energy

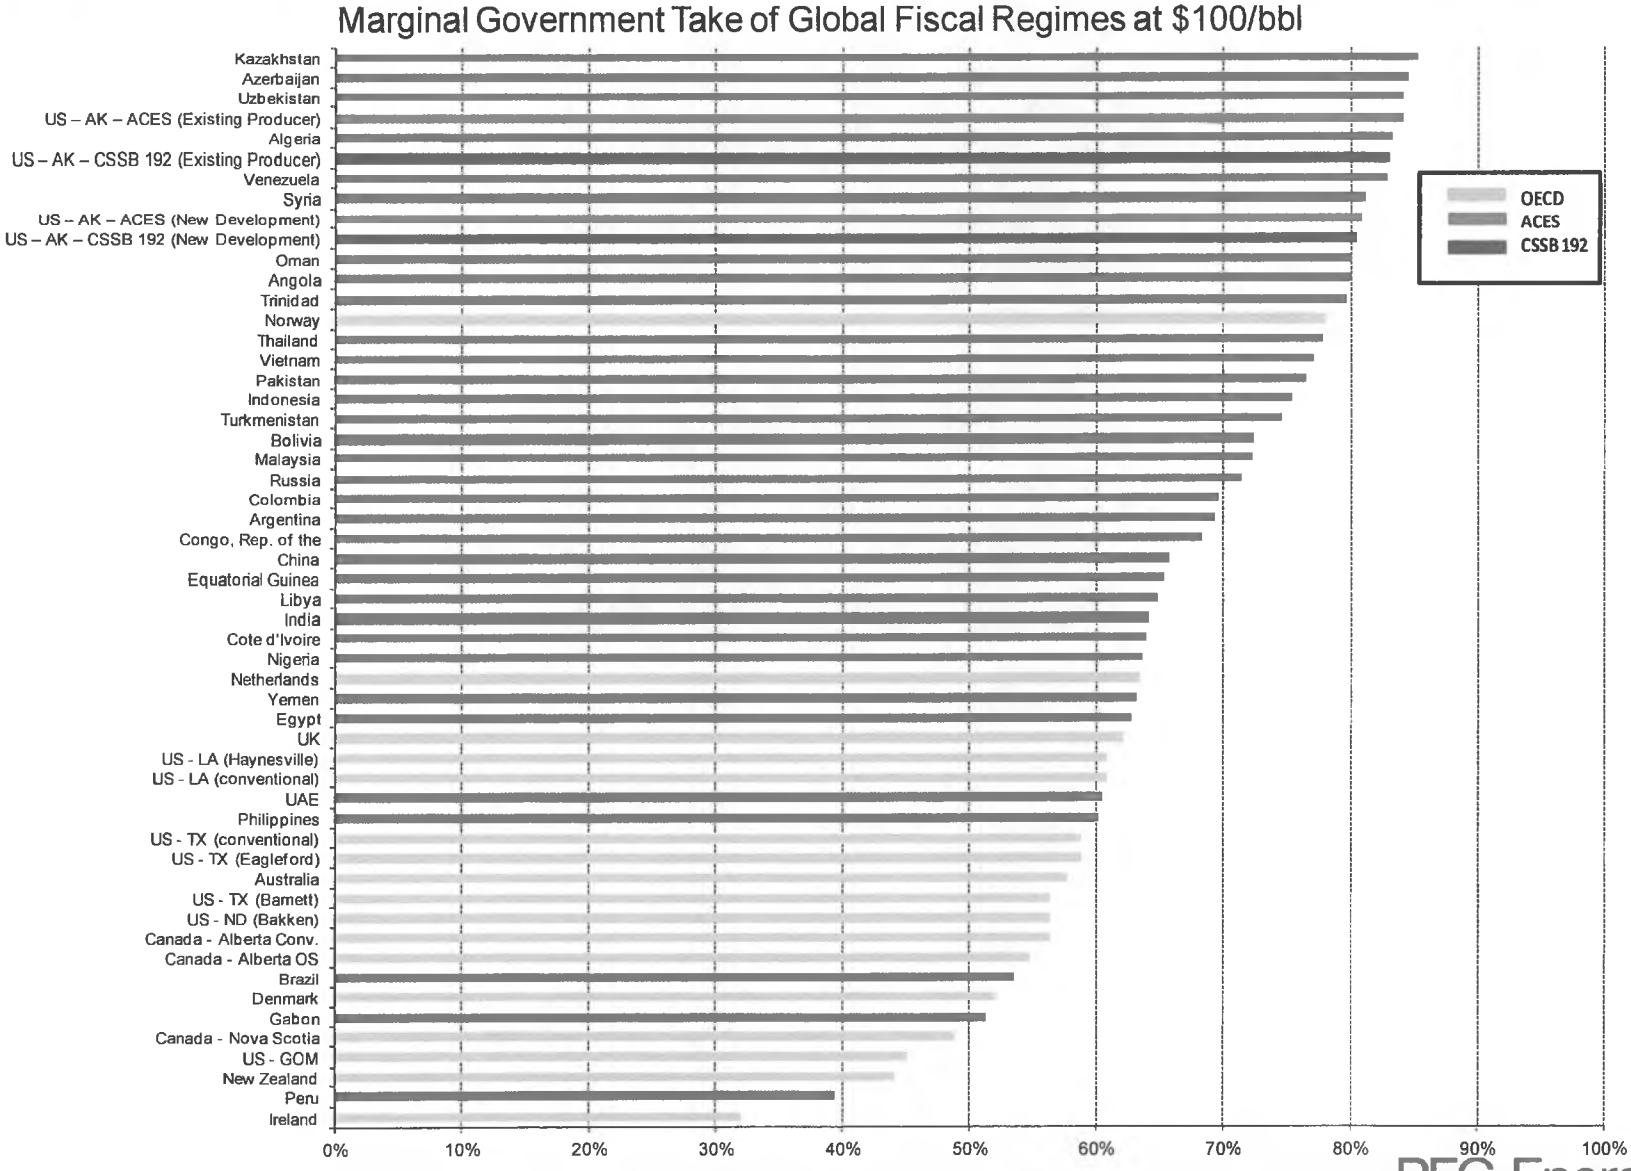
Regime Competitiveness: Relative Government Take



PFC Energy

Conclusions – Changes to Progressivity, Overall Government Take, and Oil/Gas Decoupling

- CSSB 192 uses two key mechanisms to reduce government take relative to ACES
  - A reduction in the rate of progressivity that applies above $30/bbl Production Tax Value (PTV) from a 0.4% increase for each one dollar increase in PTV, to a 0.35% increase
  - A reduction in the maximum rate of production tax, from 75% at $342 PTV, to 60% at $202 PTV
- The impact of the reduction in the progressivity coefficient on overall levels of government take and on project economics is limited to around a single percentage point of government take at $100 ANS crude
- The impact of the 60% maximum rate for production tax is more significant, but only at very high oil prices.
  - On a current-year basis, government take under CSSB 192 would be significantly lower than under ACES only at ANS crude oil prices above $230
  - On a project-lifecycle basis, that threshold may be lower, as a result of the impact of bracket-creep (since progressivity thresholds are specified in nominal terms) – but the impact on project economics at likely price levels remains negligible

Conclusions – New Oil Allowance

- Even under highly aggressive assumptions regarding the potential for a new-source development for a given company, the impact of the $10 allowance for "new oil" is almost undetectable
  - In the context of both a development by an existing producer, and a development by a new producer, Relative Government Take changes only by fractions of a percentage point, at most
  - For an existing producer, portfolio NPV rises by only a tenth of a percentage point
  - For a new producer, the impact on project value is greater, but remains insignificant in the context of a $10 billion capital development
- The major reason for this is because rather than providing an ongoing allowance for new-source production, the amendment provides an allowance only for production that, in a given year, is incremental to the previous year's production
  - For an existing producer with declining base production, only a very large development is capable of producing "new oil" under this development at all
  - Even for a new producer, the value of the allowance remains highly limited
- An allowance which was instead provided for new-source production could potentially have a greater impact, however adequately defining such new-source production could be difficult in practice, particularly in an environment where most new production will come from existing areas

Global Strategy & Portfolio Overview of Major Alaska Producers

PFC Energy

BP: Company Overview

Strategic Signature

- BP is a global integrated company, with production in 16 countries and upstream operations in an additional 10 countries.
- In 2010, total global production averaged ~3,773 mboe/d, making it the second largest company in the peer group (superseded by ExxonMobil (~4,450 mboe/d). The Russia & Central Asia (RCA) and North America regions accounted for ~55% of 2010 production.
- BP recorded a 4.5% drop in production in 2010 over 2009, reflecting the impact of asset sales, the post-Macondo slowdown in US GOM deepwater activity, and continued decline from the company's deepwater and mature shallow water assets.
- Much of the post-Macondo portfolio rationalization program (targeting $30 bn in asset sales including mid/downstream assets) has been completed. The result is a pared down and more focused geographic portfolio.
- BP expects growth of 1%-2% per annum through 2015. BP's growth strategy is three-pronged based on Deepwater Basins, Global Gas, and Giant Oilfield Development. BP's deepwater position is based on operations in the US GOM, Angola, Egypt and Brazil. The Global Gas position is principally comprised of US, Trinidad & Tobago, and North Sea. Giant oil fields are dispersed throughout the global portfolio. Based on PFC Energy projects, growth is unlikely before 2015.
- The growth strategy above includes ~$20 bn net investment commitment to 16 projects sanctioned over 2010-2011. This is expected to curb ROCE performance for the coming 2-3 years.
- With the burden of the Macondo oil spill and reparations continuing through the mid-term, BP will be hard pressed to outperform its peers on any key metrics, leaving the company open to calls for more radical restructuring.

BP Global Production Portfolio - 2010

Canada: modest conventional production, with future potential tied to oil sands

Russia: BP's largest producing country (963 mboe/d), representing ~26% of 2010 output. Substantial long term growth potential. Continued interest in Russia (and Arctic) expansion, despite limitations arising from the TNK-BP joint venture.

US: 2nd largest producing country, with core **deepwater** area. Activity slowed post-Macondo, yet expect strong future growth. **Onshore L48** is key gas area (~22% of 2010 global output), with focus on unconventionals. **Alaska** potential tied to commercialization of Prudhoe Bay resources.

UK: Declining position from mature offshore assets. High-value operating area, generating large cash flows.

Trinidad & Tobago: Core gas producing area tied to Atlantic LNG.

Argentina: onshore & shallow water assets (held by PAE) were to be sold to Bridas, but transaction failed in 4Q:11.

Angola: Sole presence in SSA is Angola deepwater. High growth from 2002-2009, now challenged with start-up of several unsanctioned projects

Iraq: Development of Rumailia oil field

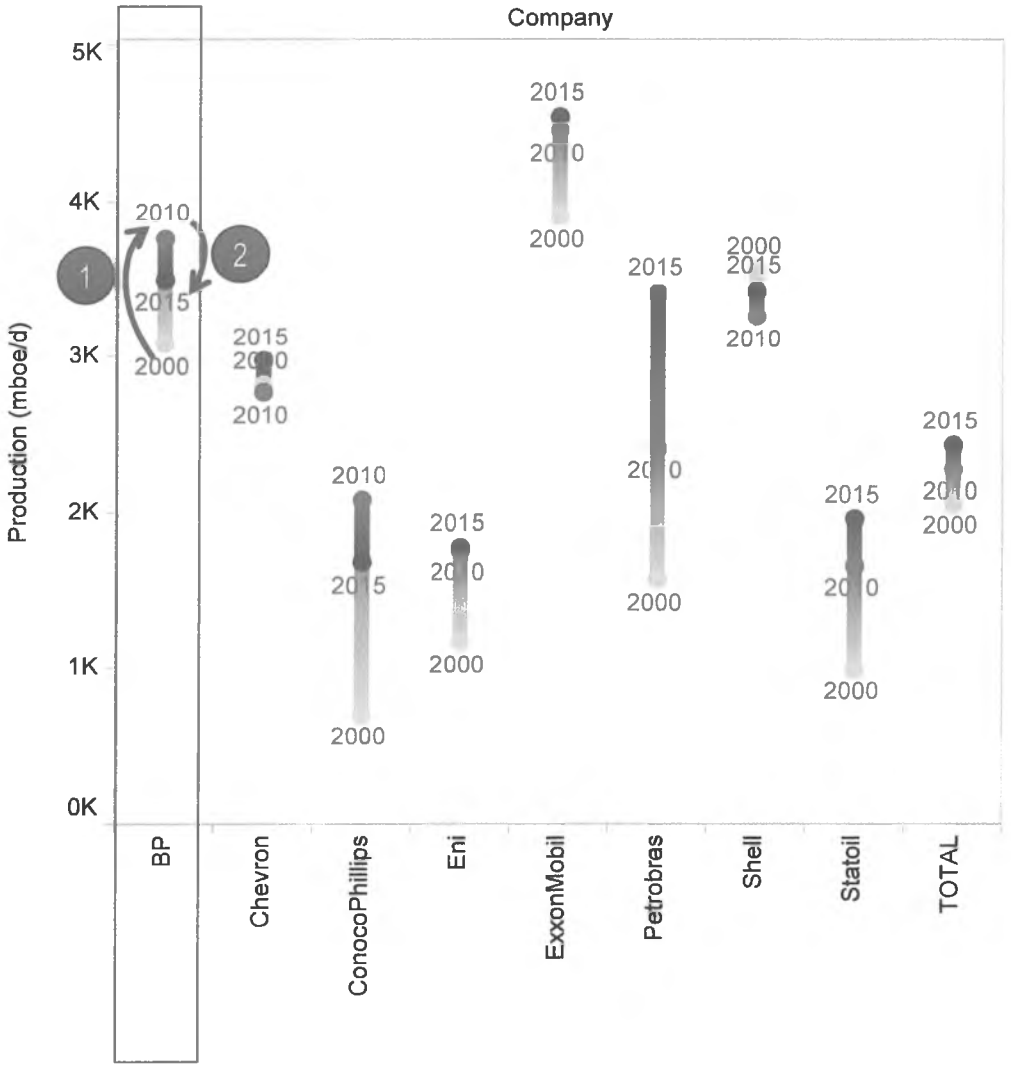
Azerbaijan: Participation in 2 large-scale projects: Azeri-Chirag-Guneshli & Shah Deniz.

UAE: Core position through equity affiliates, though concession are being re-negotiated



India: 2011 Partnership with Reliance for exploration in shallow and deepwater.

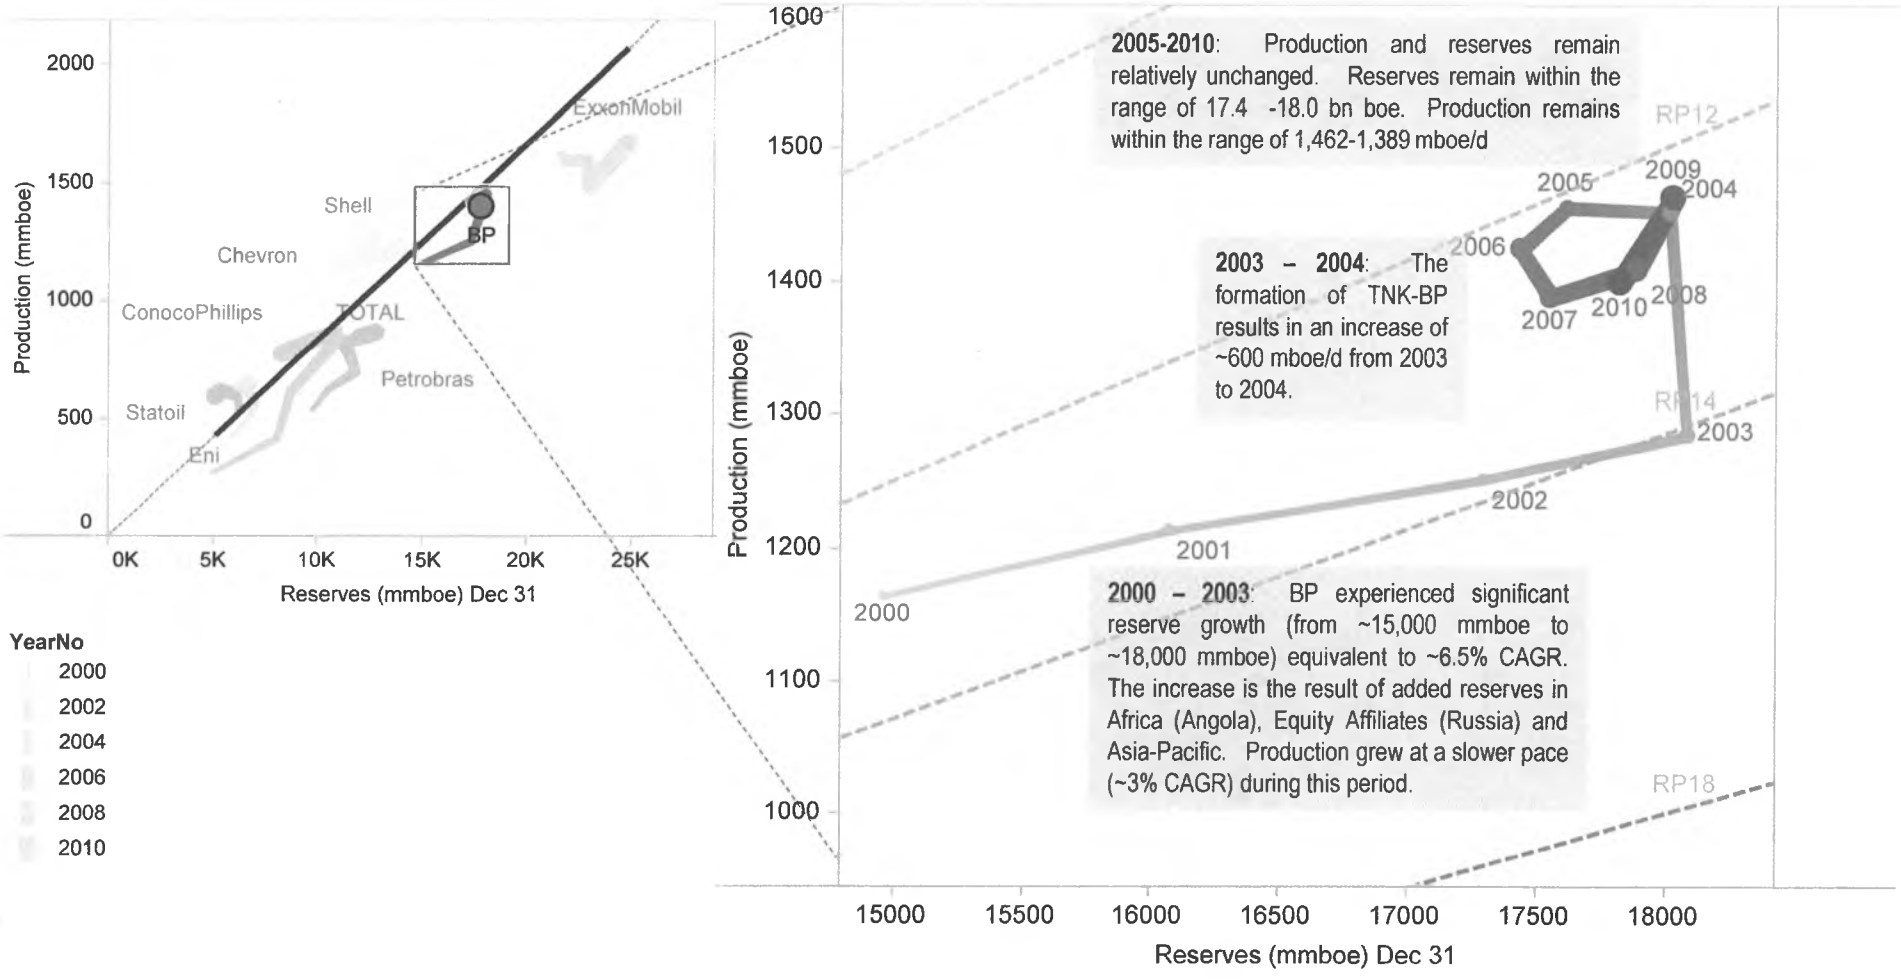
Australia and **Indonesia** are key gas producing areas tied to investments in LNG.

PFC Energy

Total Portfolio Evolution: BP vis-à-vis the Competition

Production (mboe/d) in 2000, 2010 and 2015 (PFC Forecast): BP and Peers

In 2010, BP was the second largest producer of the peer group. Yet, from 2010 to 2015, BP and COP are the only two companies to experience a reduction.



1. **2000-2010:** Production increases from ~3,080 mboe/d to ~3,780 mboe/d due to addition of Russia (~960 mboe/d), Trinidad & Tobago (~250 mboe/d) and Angola (~170 mboe/d). This expansion offsets declines from Europe (~660 mboe/d and North America ~350 mboe/d) .

2. **2011-2015:** BP's production is expected to decline from 2000-2015, due mostly to the post-Macondo asset divestiture program, combined with curbed activity in the GOM deepwater.

PFC Energy

Global Production:
Evolution of the Portfolio

Asia Pacific: Relatively small producing area (~6% of 2010 output). Production largely from offshore Australia and Indonesia with lesser volumes from China. Partnership with Reliance (India) creates exploration opportunities. Focus on deepwater and CBM. Divested assets in Pakistan and farmed down in Vietnam.

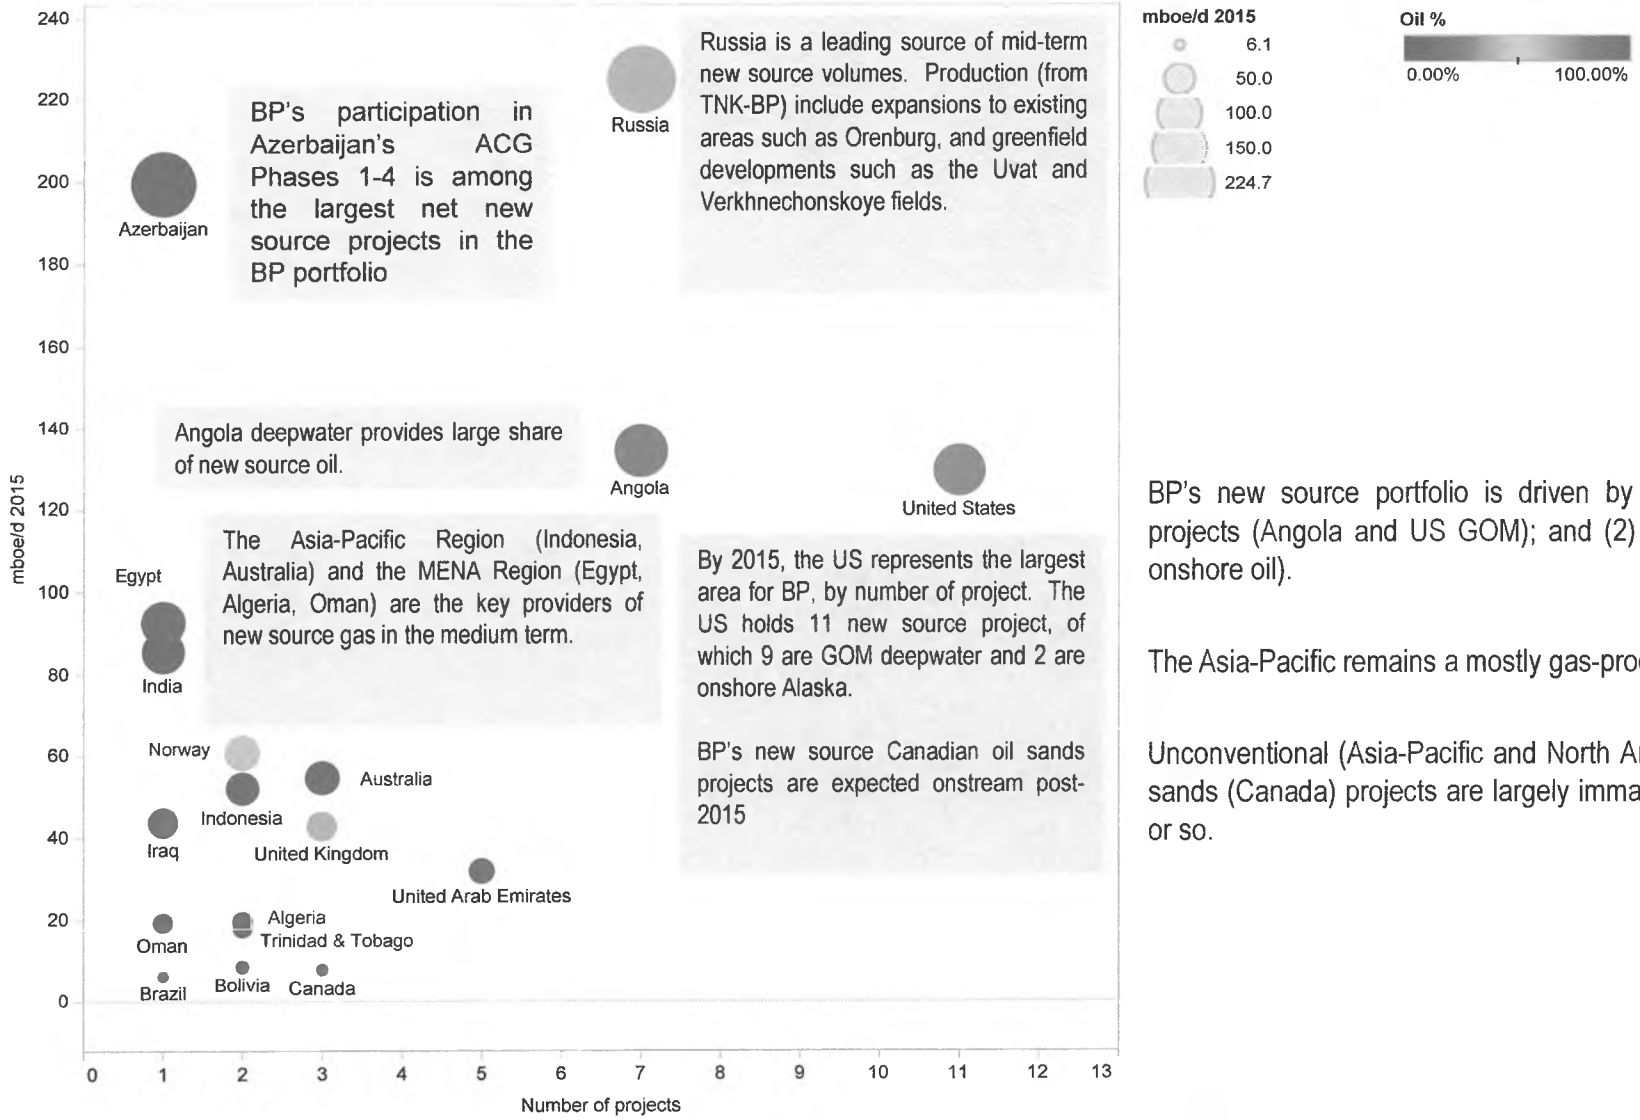
Europe: Mature and generally declining production position in the UK and Norway, mostly in shallow waters. Exploration and development projects are ongoing, often leveraging BP's existing infrastructure and assets in the region.

Latin America: Growth driven by shallow water gas developments in Trinidad & Tobago. Focus on onshore gas commercialization in Bolivia. Failed to sell Argentine assets (held through PAE) to Bridas in 2011. Brazil deepwater offers mid- to long-term potential from newly acquired deepwater acreage.

Middle East & North Africa: Position built from collaboration with NOCs (Adma-Opco, GUPCO, Sonatrach, LNOC, etc.). Substantial new source growth expected from Iraq, Egypt deepwater, offshore Oman. Exploration opportunities in Jordan.

North America: Second largest production region & largest cash flow generator. Deepwater GOM holds significant growth potential after years of investment. US L48 portfolio is material, yet declining, source of gas, with a growing emphasis on shale gas. Additional future growth from Canadian oil sands.

Russia & Central Asia: Principally comprised of TNK-BP venture created in 2003, now BP's largest source of production, characterized as long-life, slow decline output. In Azerbaijan, production is from large-scale ACG and Shah-Deniz. The Region is the largest source of new source volumes through 2015.



Sub-Saharan Africa: Operates only in the Angola deepwater play, which quickly emerged as a key oil-producing country. BP has collaborated with operators TOTAL (Block 17) and Chevron (Block 15). In the future, development of BP-operated blocks 31 and 18 is expected to reverse the recent decline in production.

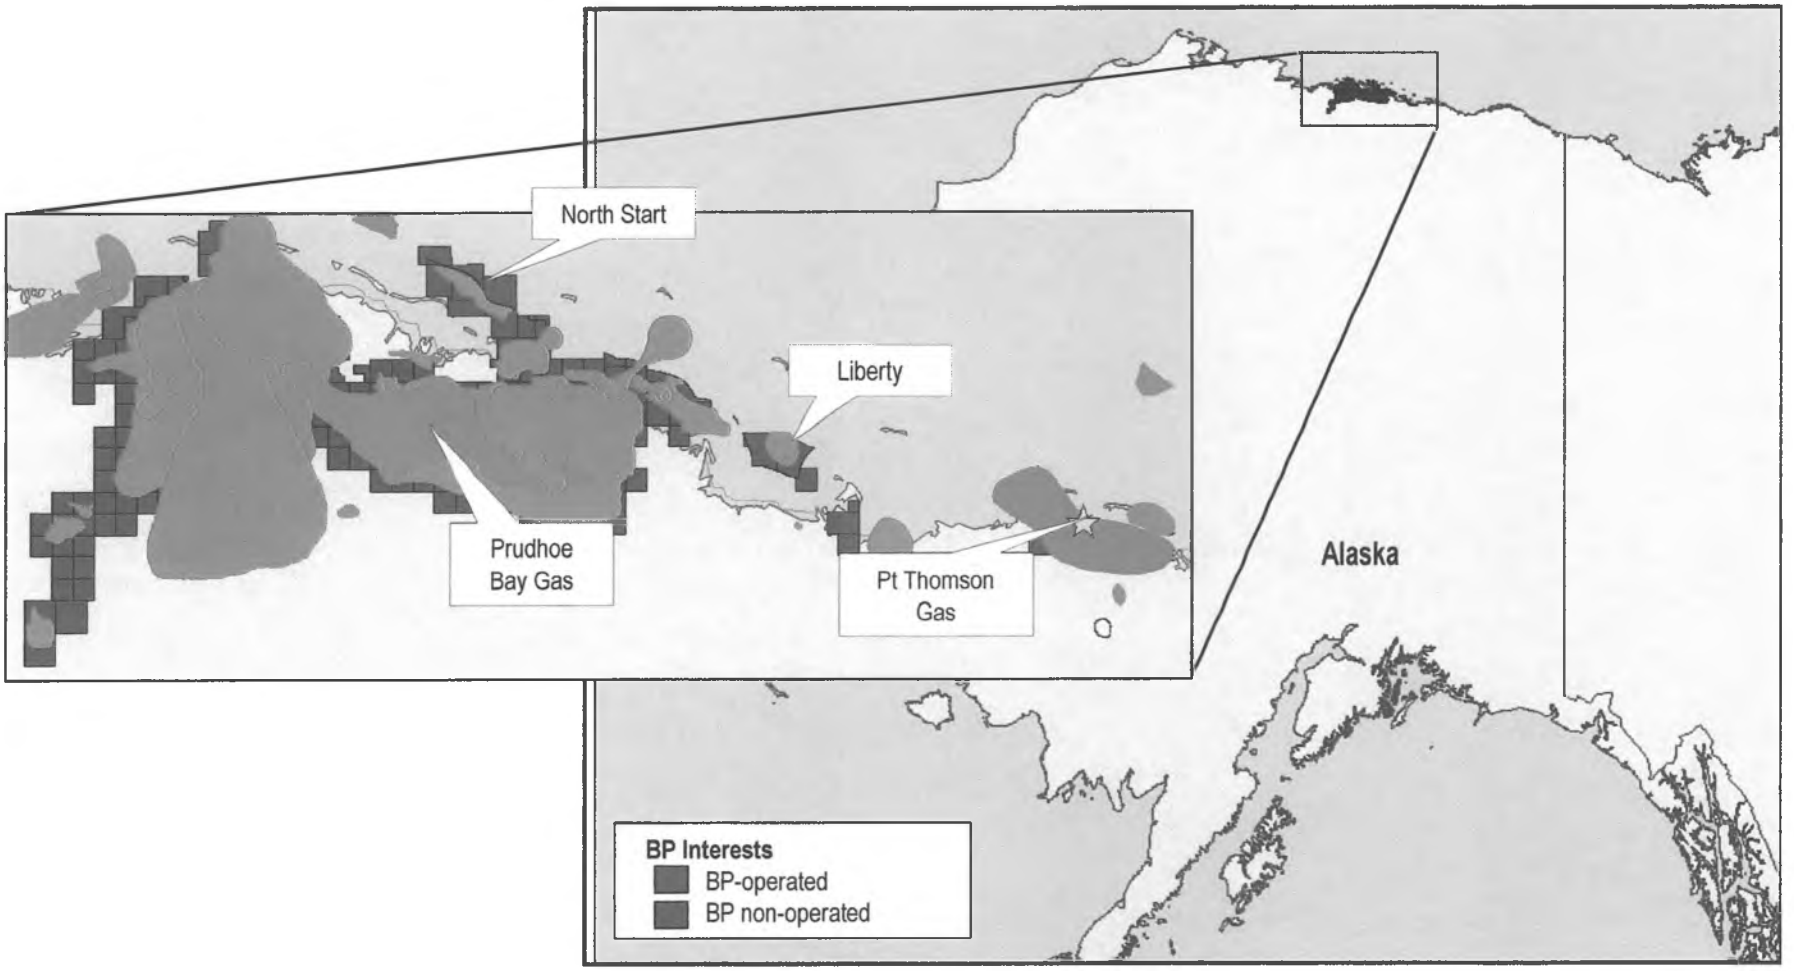
PFC Energy

Global Production:
Country Growth Project Analysis

BP: New Source Production – Number of Projects by 2015 Production and Oil/Gas Split



BP's new source portfolio is driven by (1) Deepwater projects (Angola and US GOM); and (2) Russia (mostly onshore oil).

The Asia-Pacific remains a mostly gas-production area.

Unconventional (Asia-Pacific and North America) and oil sands (Canada) projects are largely immaterial until 2020 or so.

PFC Energy

BP in Alaska

PFC Energy

BP Alaska Activity & PFC Energy Assessment

Alaska Designation	Activity	PFC Energy Assessment
Harvest Area	• Most of BP's assets are located on the **North Slope**, where production volumes have generally declined because of the maturity of the asset base and/or gas infrastructure constraints. Liquid production has declined from ~224 mboe/d in 2006 to ~166 mboe/d in 2010, while gas production has fallen from ~67 mmcf/d to ~46 mmcf/d over the same period. • BP's largest source of production is the **Greater Prudhoe Area** (26% w.i., operated), covering ~150,000 acres with more than 1,000 active wells. Gas resources are currently stranded because of the lack of pipeline capacity to southern markets. BP and ConocoPhillips had teamed up to propose a new natural gas pipeline (**Denali**) to run from Prudhoe Bay through western Canada to US markets. However, in May 2011, the partners announced that plans for the pipeline had been terminated, citing the lack of long-term purchase contracts. The proposed pipeline would have accommodated 4 bcf/d of natural gas. • BP and partners are moving forward with the development of gas liquids on the ~8 tcf **Point Thomson** field (32% w.i., non-operator). The gas cycling project is expected to produce ~10 mb/d of liquids; first production is targeted for 2014. Full field development awaits gas transport infrastructure. • In the **Beaufort Sea**, BP has suspended work on the extended-reach drilling program on the **Liberty** oil field (100% w.i.), pending revision of project design and schedule. • BP is also seeking to develop viscous (**Kuparuk**) and heavy (**Milne**) oil resources on the North Slope.	**Current production volumes are modest and declining, yet significant potential lies in the long-term commercialization of Prudhoe Bay and Point Thomson gas resources. Cancellation of the Denali gas pipeline proposal leaves BP as a potential supplier to an alternative pipeline-export option, should one be approved and developed.**

PFC-Identified Challenges

- Re-establish its operator profile in the global deepwater: While its competitors extend their commitments to global LNG, unconventional shale gas exploitation, and oil sands development in order to drive future portfolio growth, BP has deepened its commitment to the global deepwater play, despite the ongoing fallout from the Macondo oil spill. Expansion of its US GOM lease holdings (through the Devon portfolio acquisition), entry into the Brazil deepwater, and a material commitment to the K-G Basin deepwater play in India, together with phased field development offshore Angola and West Nile Delta in Egypt, positions BP as arguably the premier deepwater player in the Global Player peer group. BP will be under the spotlight regarding its future conduct and performance throughout the global deepwater basins.
- Resolve shareholder relationship issues within the TNK-BP JV: Accounting for ~26% of total worldwide production in 2010 (and ~36% of total worldwide oil production), the TNK-BP position is absolutely core to the BP portfolio from a volumetric perspective. However, the unsuccessful attempt to partner with Rosneft in the Russia Arctic raises concern over how much value TNK-BP can continue to create for BP. With TNK-BP now focused on international expansion, must BP settle for lower returns from what has until now been a highly lucrative position?
- Complete the portfolio rationalization process: The strength of the global asset transactions market prompted BP to expand its divestiture program from an initial $20 bn to $30 bn, divesting large swaths of its portfolio deemed non-Core and/or non-aligned with the company's growth focus. While the company did not plan on the depth of portfolio rationalization undertaken to date, this is a rare opportunity to high-grade asset holdings with the blessing of shareholders and analysts alike. BP is expecting to complete the divestiture process by end-2011.
- Determine a path forward in the Brazil deepwater: Having secured Brazil government approval to acquire the Devon asset portfolio, BP has established a foothold in the Brazil deepwater, with potentially the largest operated pre-salt portfolio outside Petrobras. The next step is to determine the appropriate approach to growth in the pre-salt play. With legislation now in place granting NOC Petrobras a minimum 30% w.i. and operatorship in all unlicensed pre-salt acreage, this may be another case of executing a strategic alliance (similar to that secured with Reliance in India and proposed with Rosneft in the Russia Arctic).
- Accelerate development of US Onshore unconventional gas resource: BP received a very competitive price for the Permian Basin and Western Canada conventional gas assets sold to Apache (totaling ~75 mboe/d of production and ~340 mmboe of reserves, equivalent to ~$24.60/boe of reserves in the ground or ~$109,000/flowing boe of production). This is particularly so given what is shaping up to be an extended period of gas price weakness in the North America market. To make up for lost volumes, BP may look to accelerate production from its ~10 tcf of reserves in the Woodford, Fayetteville, Haynesville, and Eagle Ford shale gas plays.
- Accelerate development of BP's oil sands leases: BP has built up a material oil sands lease portfolio in Western Canada, including 50% w.i. in the Sunrise in situ development project (sanctioned in November 2010), a 75% w.i. in the Terre de Grace in situ project (secured in March 2010 from Value Creation for ~$900 mn), and 50% w.i. in the Kirby in situ oil sands leases (with the other 50% divested to Devon in March 2010). Full development of these projects could represent 500-600 mbo/d of stable, long-life oil production, complementing the "Giant Oil Fields" growth platform and providing a portfolio buffer against the steep decline production profiles associated with deepwater developments.

ConocoPhillips: Company Overview

Strategic Signature

- Following two years of corporate net income losses, steep decline in its share price, and a persistently high debt-to-capital ratio, in March 2010 ConocoPhillips announced a new strategic pathway, directing proceeds from a ~$15 bn asset and joint venture divestment program to reduce its debt-to-capital position, increase near-term shareholder returns, shift further out of the downstream, and position the company for future growth from a smaller but higher-value portfolio position.
- Since the announcement of the 2010-2012 Restructuring Plan, ConocoPhillips has executed on ~$7 bn in asset sales, divested its entire 20% equity interest in LUKOIL, and directed proceeds from these sales to debt reduction and share repurchase. In July 2011, ConocoPhillips announced the next step in its restructuring: the creation of two separate corporate entities, Downstream and a pure play, E&P.
- With production in 15 countries and upstream operations in an additional 7 countries, ConocoPhillips' most recent guidance suggests production reaching a low of ~1.5 mmboe/d in 2012, recovering to 1.64-1.69 mmboe/d by 2015. The company will rely on a large, diversified upstream portfolio positioned heavily in OECD countries (namely the US, Canada, Australia, UK, and Norway, which accounted for ~72% of worldwide production in 2010).
- Growth of 0.5% per annum from 2012 through 2015 is forecast to come from Global Gas/LNG, SAGD Oil Sands, and Unconventional developments. However, as ConocoPhillips now stands to compete with the Independent, non-integrated oil & gas companies, the company's future strategy remains uncertain.

ConocoPhillips Global Production Portfolio - 2010

Russia: LUKOIL sale leaves ConocoPhillips with modest production from its two joint ventures in Russia (Polar Lights Company and Naryanmarneftegaz). Regional production is forecast to drop from 21% of worldwide production in 2009 to a projected 3% in 2011.

Canada: Among the largest natural gas producers in Canada. Three **SAGD oil sands** developments—Christina Lake, Foster Creek, and Surmont—have added long-life production volumes to ConocoPhillips' portfolio.

US: Largest producing country, with **core L48** production where **liquid-rich areas** (Eagle Ford) will be prioritized over gas assets. Declining mature assets in Alaska could be offset by prospective deepwater volumes in long-term.

UK and Norway: Region characterized by **mature, declining assets**; satellite projects planned to offset regional base declines.

China: Modest offshore production from Bohai Bay.

Qatar: **Qatargas 3** (onstream in 2010) is key driver to regional gas growth.

Nigeria: Interests in six onshore assets, serving as feedstock to **Nigeria LNG** Trains 4-6.

Australia: **APLNG** Phase 1 sanctioned in 2011; longer-term upside in Australia could stem from assets in the Browse Basin or Timor Sea (e.g. Greater Sunrise).

Algeria: Onshore oil field production; additional volumes from El Merk (EMK) expected for 2012 start-up.

Libya: Legacy onshore Waha concession; above ground conflict will delay new source oil projects.

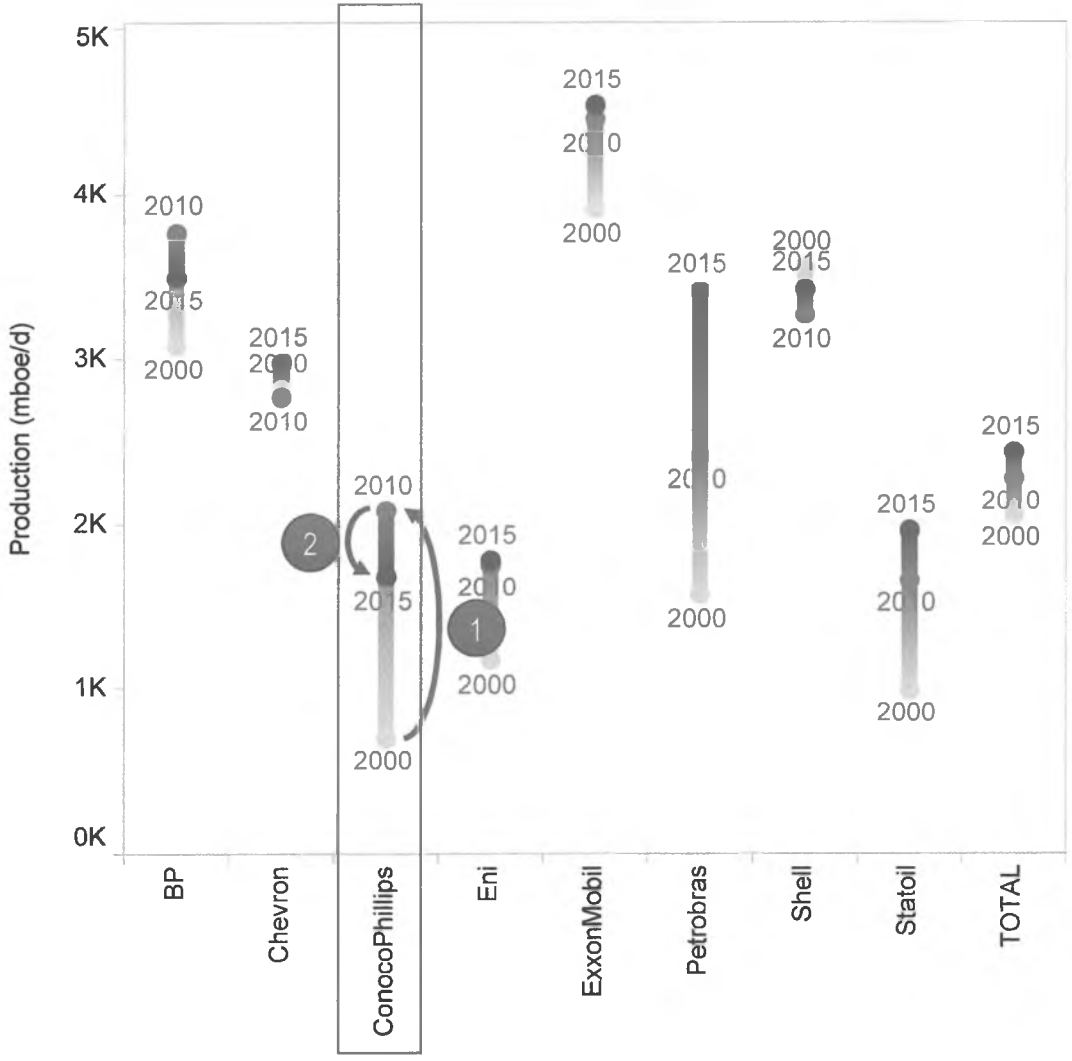
Vietnam: Continued development of mature Cuu Long Basin; **potential divestment target**.



Malaysia: Development of **deepwater** fields (Gumusut-Kakap and Kebabangan) will bring Malaysia into ConocoPhillips' producing country portfolio.

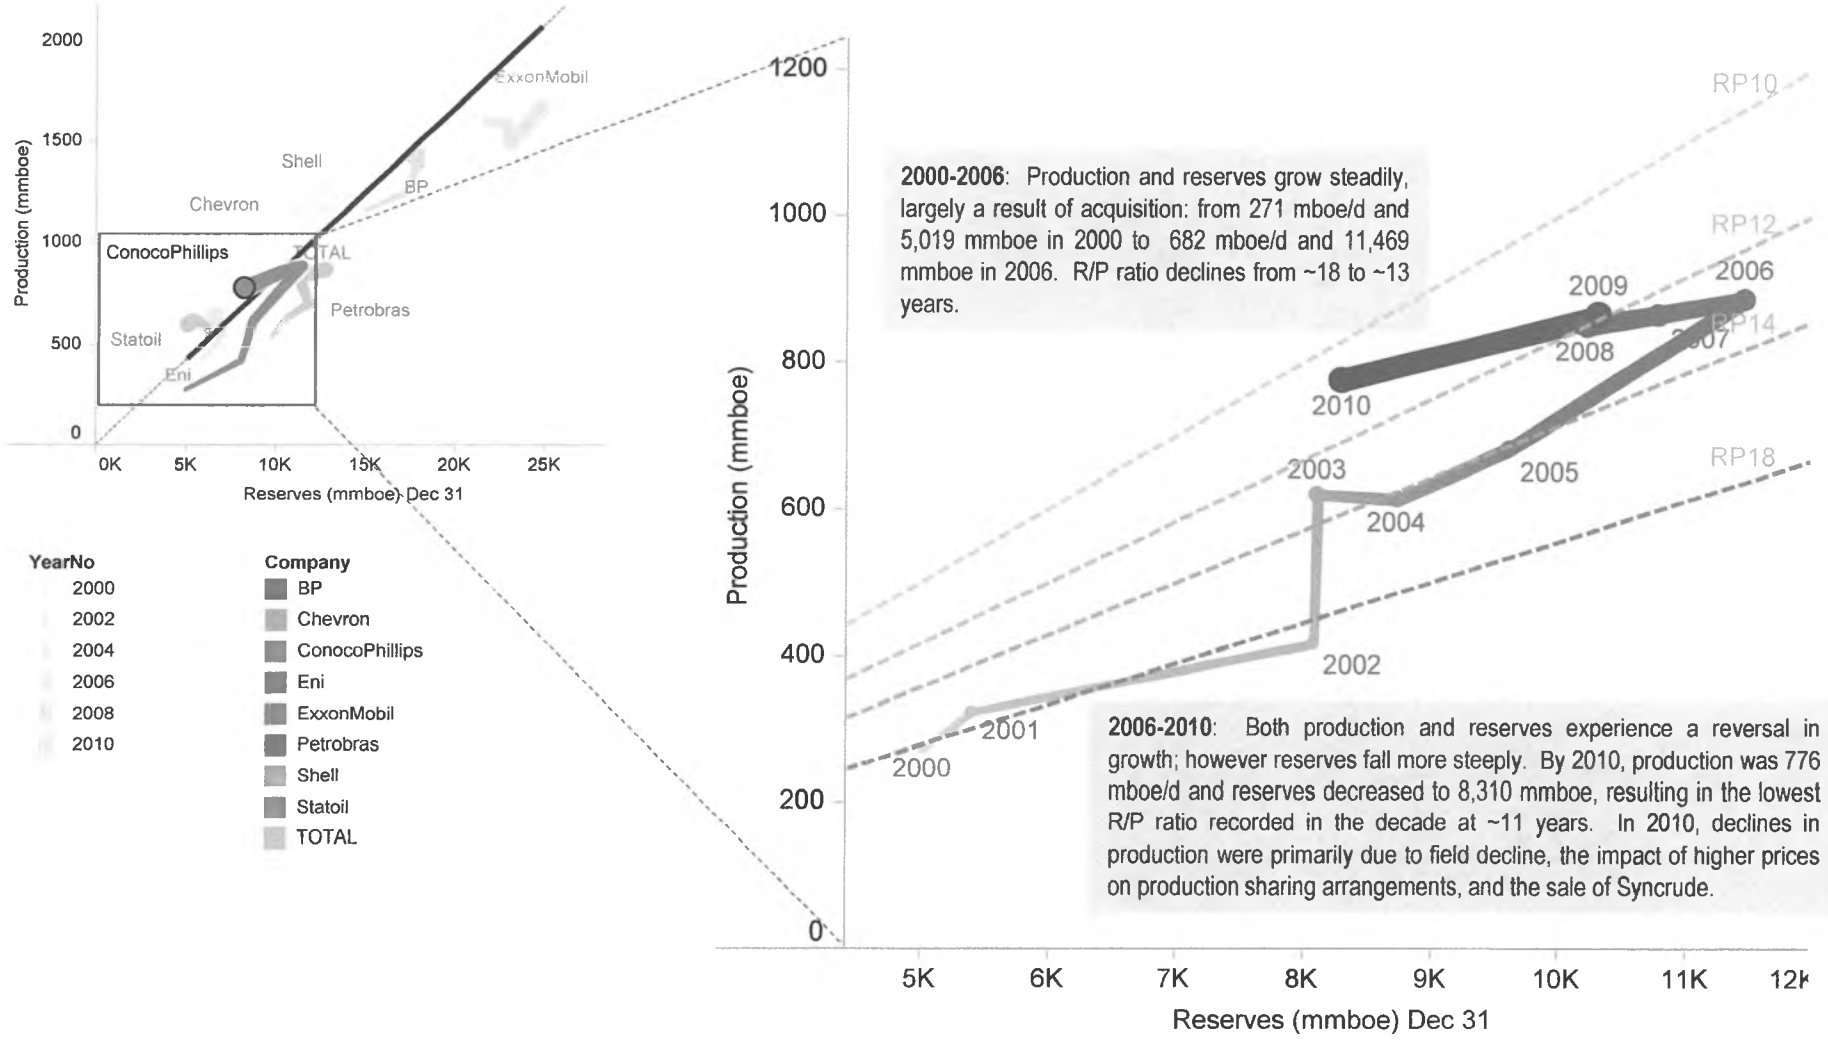
Indonesia: Largest contributor to Asia-Pacific production; ongoing development of **Corridor PSC** and **South Natuna Block B**.

PFC Energy

Total Portfolio Evolution:
ConocoPhillips vis-à-vis the Competition

Production (mboe/d) in 2000, 2010 and 2015 (PFC Forecast): ConocoPhillips and Peers

ConocoPhillips' 2010-2012 Restructuring Plan will see the company become the largest of the Independent, non-integrated international oil & gas companies, compared to its former position as the third-smallest of PFC Energy's expanded Global Player peer group.



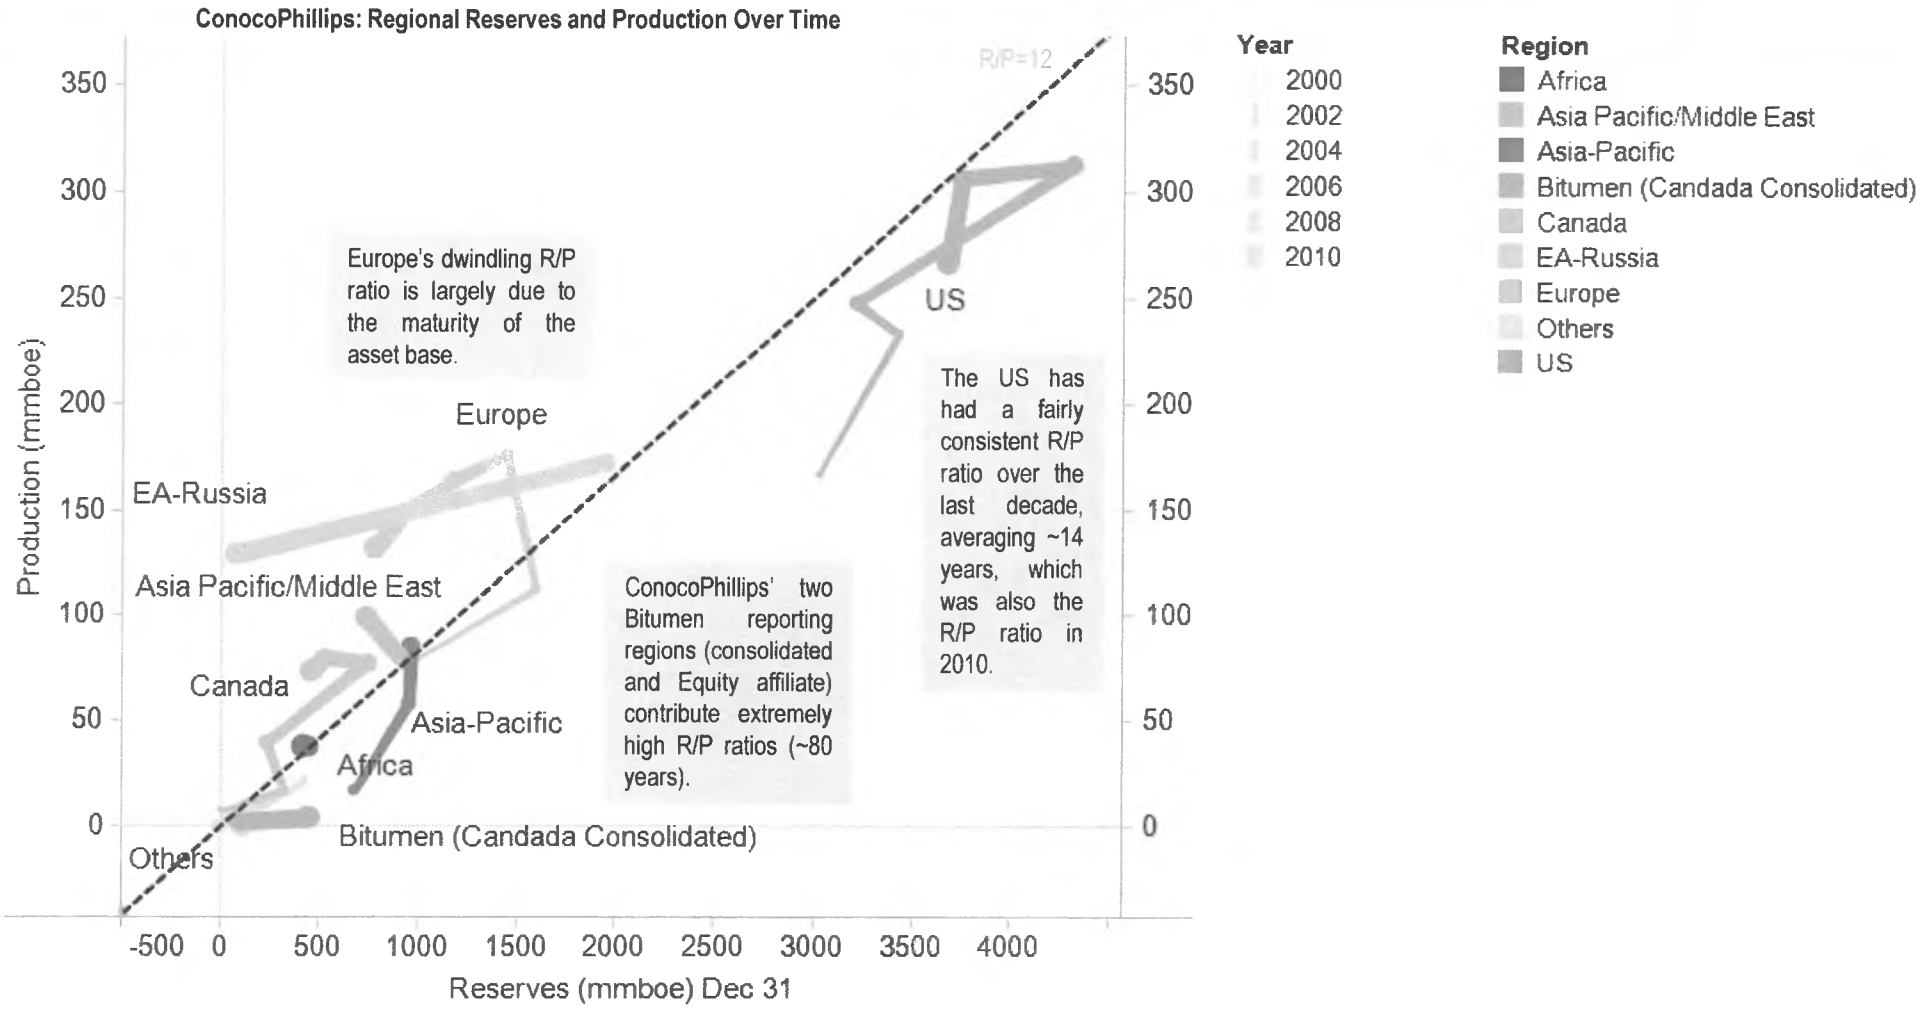
1. **2000-2010:** Production increases largely driven by the merger of Conoco and Phillips in the beginning of the decade (growing volumes from 698 mboe/d in 2000 to 1,082 mboe/d in 2002) and the Burlington Resources purchase in 2006 (growing volumes from 1,824 mboe/d in 2005 to 2,358 mboe/d in 2006). The gradual acquisition of a 20% stake in LUKOIL was a key driver to mid-decade growth.

2. **2011-2015:** ConocoPhillips's production is expected to decline from 2010-2015, due to the company's intensive asset divestiture program (the initial ~$15 bn asset and joint venture divestment program was expanded in 2011 when ConocoPhillips announced it would shed an additional $5 bn-$10 bn in non-Core assets by end-2012). Volumes are forecast to decline from ~2,078 mboe/d in 2010 to ~1,674 mboe/d in 2015.

PFC Energy

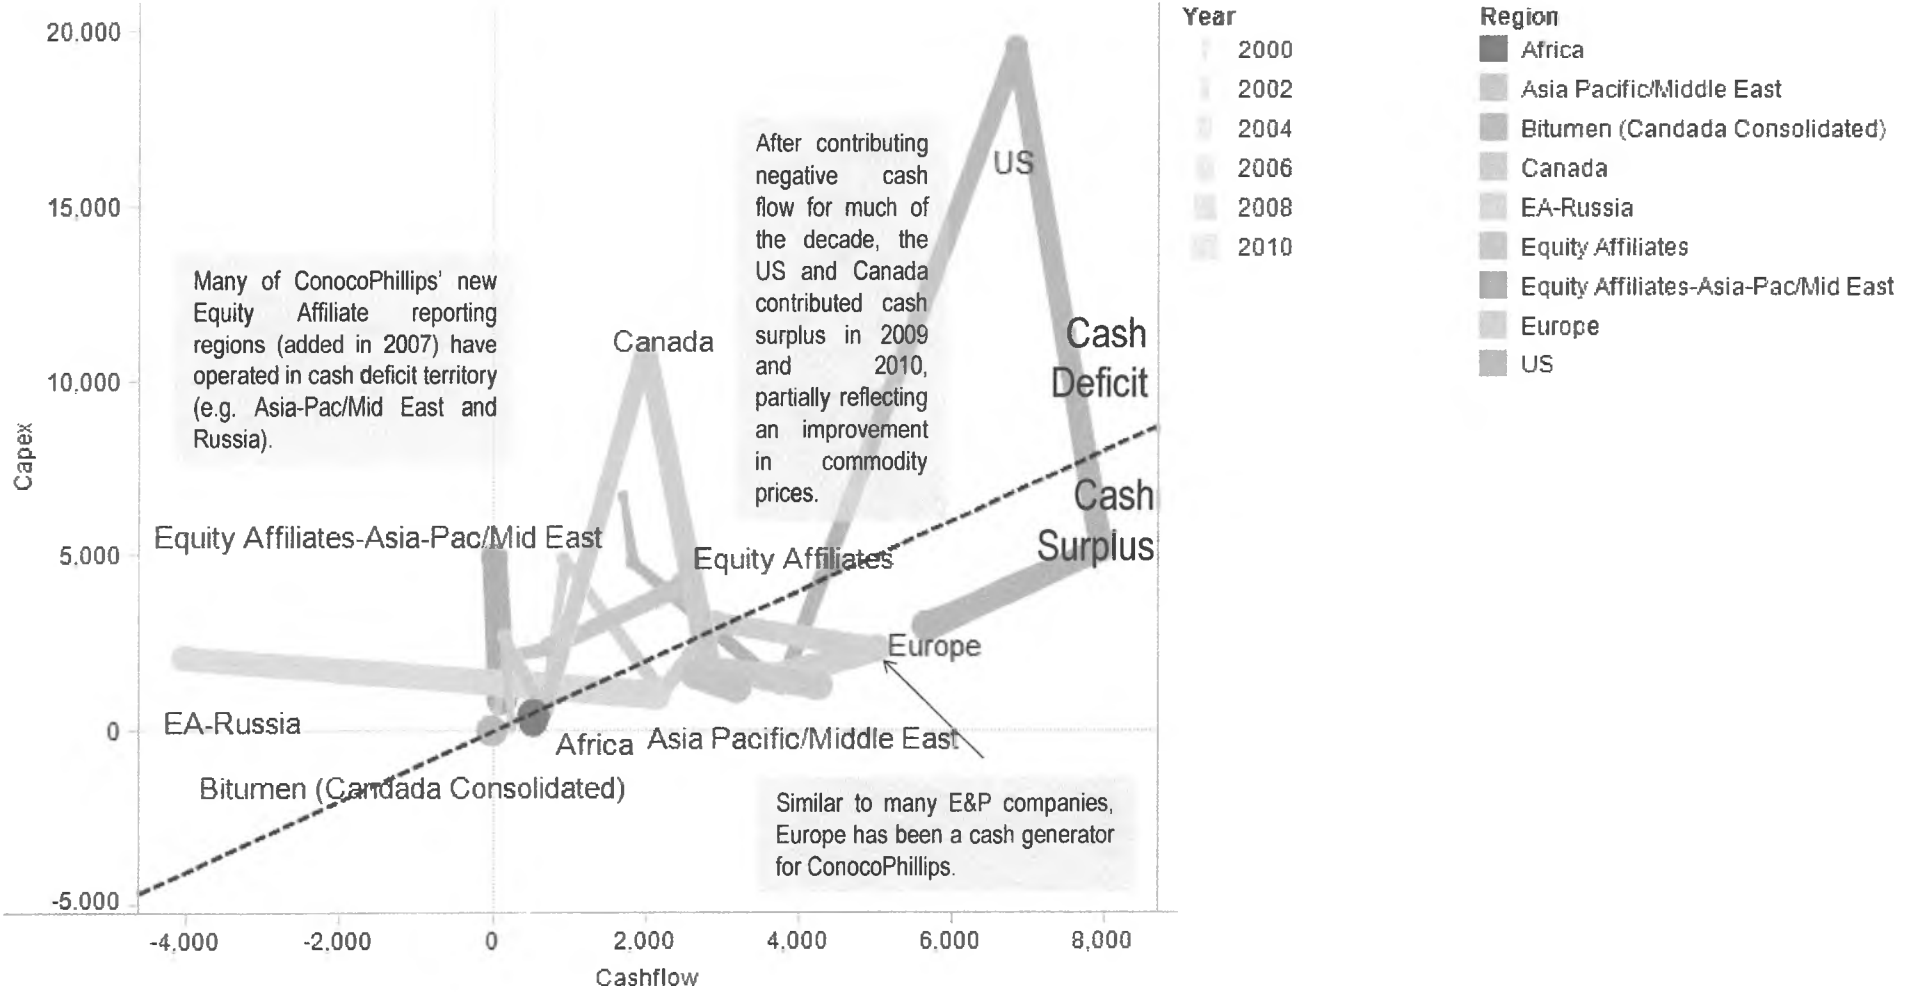
Reserves and Production:
ConocoPhillips vis-à-vis the Competition

Reserves and Production (mmboe) 2000-2010: ConocoPhillips and Peers



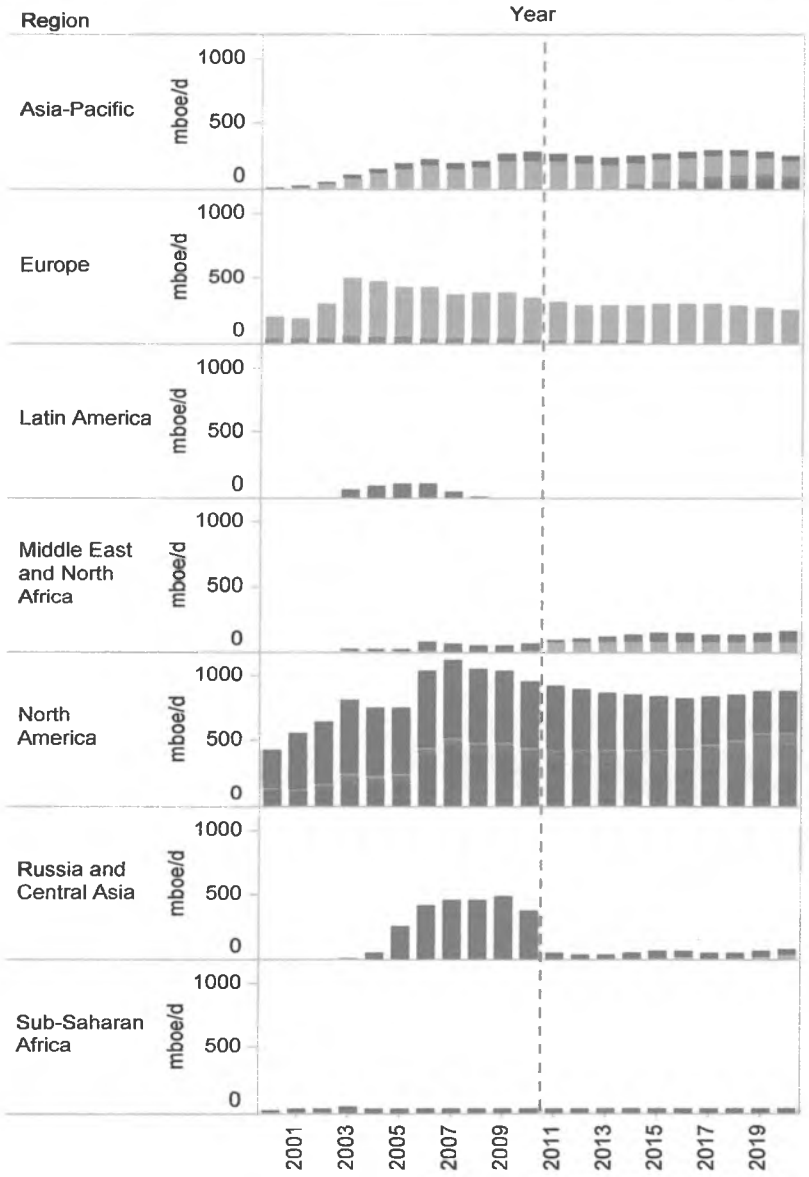
2000-2006: Production and reserves grow steadily, largely a result of acquisition: from 271 mboe/d and 5,019 mmboe in 2000 to 682 mboe/d and 11,469 mmboe in 2006. R/P ratio declines from ~18 to ~13 years.

2006-2010: Both production and reserves experience a reversal in growth; however reserves fall more steeply. By 2010, production was 776 mboe/d and reserves decreased to 8,310 mmboe, resulting in the lowest R/P ratio recorded in the decade at ~11 years. In 2010, declines in production were primarily due to field decline, the impact of higher prices on production sharing arrangements, and the sale of Syncrude.



PFC Energy

Reserves and Production:
ConocoPhillips Intra-Portfolio Performance



PFC Energy

How the Portfolio is Financed: Sources and Uses of Cash

PFC Energy

Global Production:
Evolution of the Portfolio

Asia Pacific: Project queue 14 projects deep makes Asia-Pacific the largest development pipeline in all of ConocoPhillips' portfolio. Region estimated to occupy 20% of 2011 upstream capex. New projects in both legacy countries (Indonesia, Vietnam) are being complimented by start ups in Malaysia (Gumusut-Kekap, Kebabangan) and Australia (APLNG).

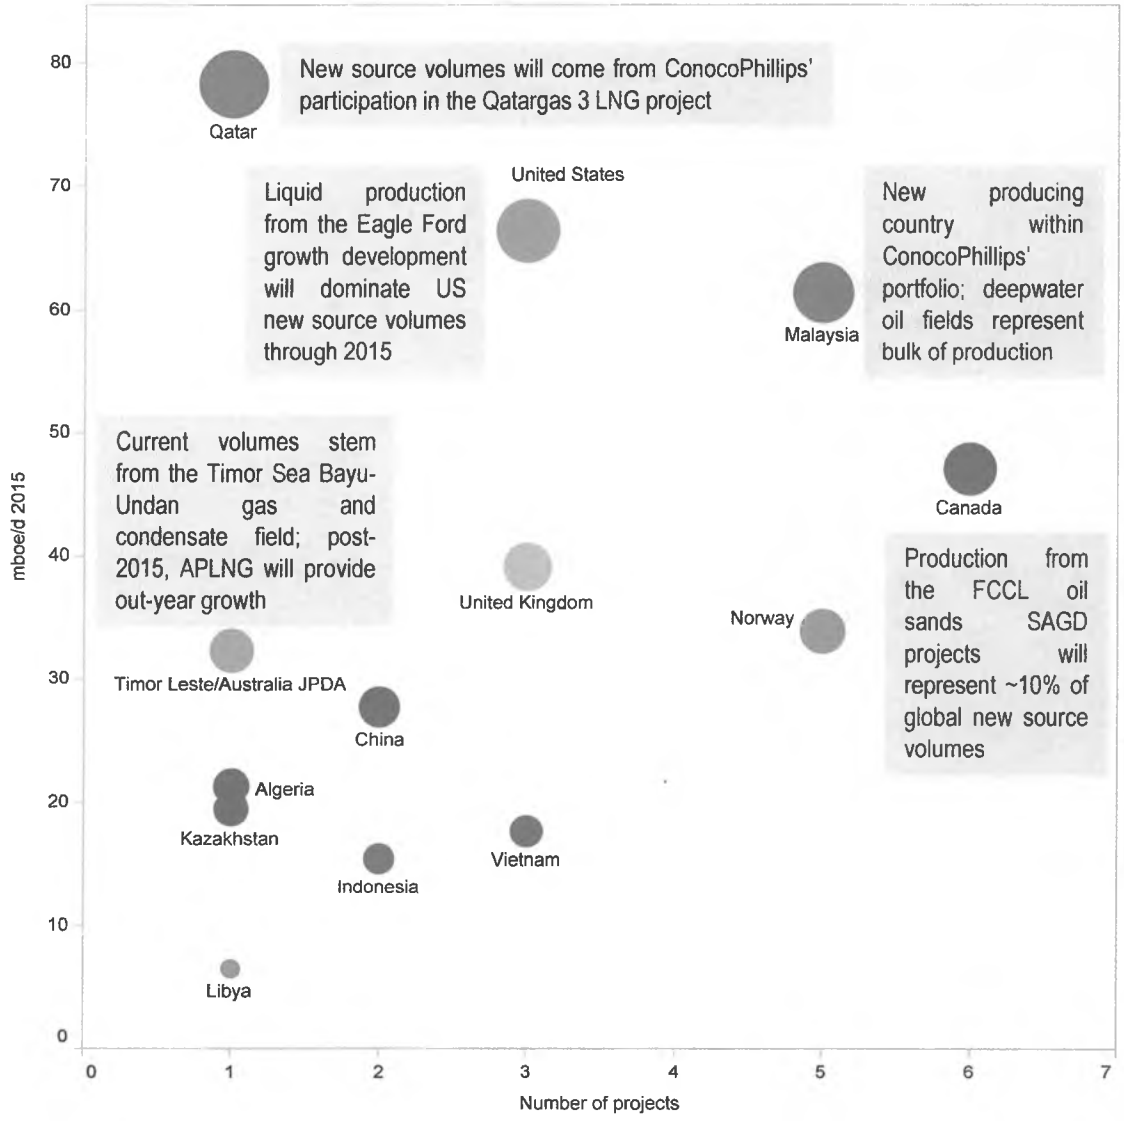
Europe: Mature and generally declining production position in the UK and Norway, mostly in shallow waters. Satellite projects poised to somewhat offset base declines.

Latin America: After reaching historic peak production in 2005, volumes fell to zero in 2009. The Latin America portfolio, largely acquired through the Burlington transaction, has never been a material part of ConocoPhillips' global operations. With no new volumes anticipated in the portfolio, a complete exit from the region could be likely.

Middle East & North Africa: Future growth is largely tied to the Qatargas 3 LNG project and El Merk (EMK) in Algeria. Longer-term growth is poised to stem from Libya (as yet unsanctioned joint NC 98 and North Gialo developments) assuming a timely re-commencement of upstream activities.

North America: Largest production region & cash flow generator. New growth initiatives focus on exploitation of Eagle Ford shale liquids and Canadian oil sands (Christina Lake, Foster Creek, and Surmont), which are projected to reverse the decline in Canadian production by 2014 and deliver medium- and long-term volume growth.

Russia & Central Asia: LUKOIL sale leaves ConocoPhillips with only modest production from its two joint ventures in Russia and few growth opportunities within the remaining portfolio. The sole growth asset is an 8.4% stake in the Kashagan field, which continues to face major challenges.



Sub-Saharan Africa: Onshore assets serve as feedstock to Nigeria LNG Trains 4-6. Longer-term upside tied to feedstock for the yet-to-be-sanctioned Brass LNG plant, while 2011 re-positioning in Angola could provide exploration opportunities critical to securing new source ventures for long-term growth.

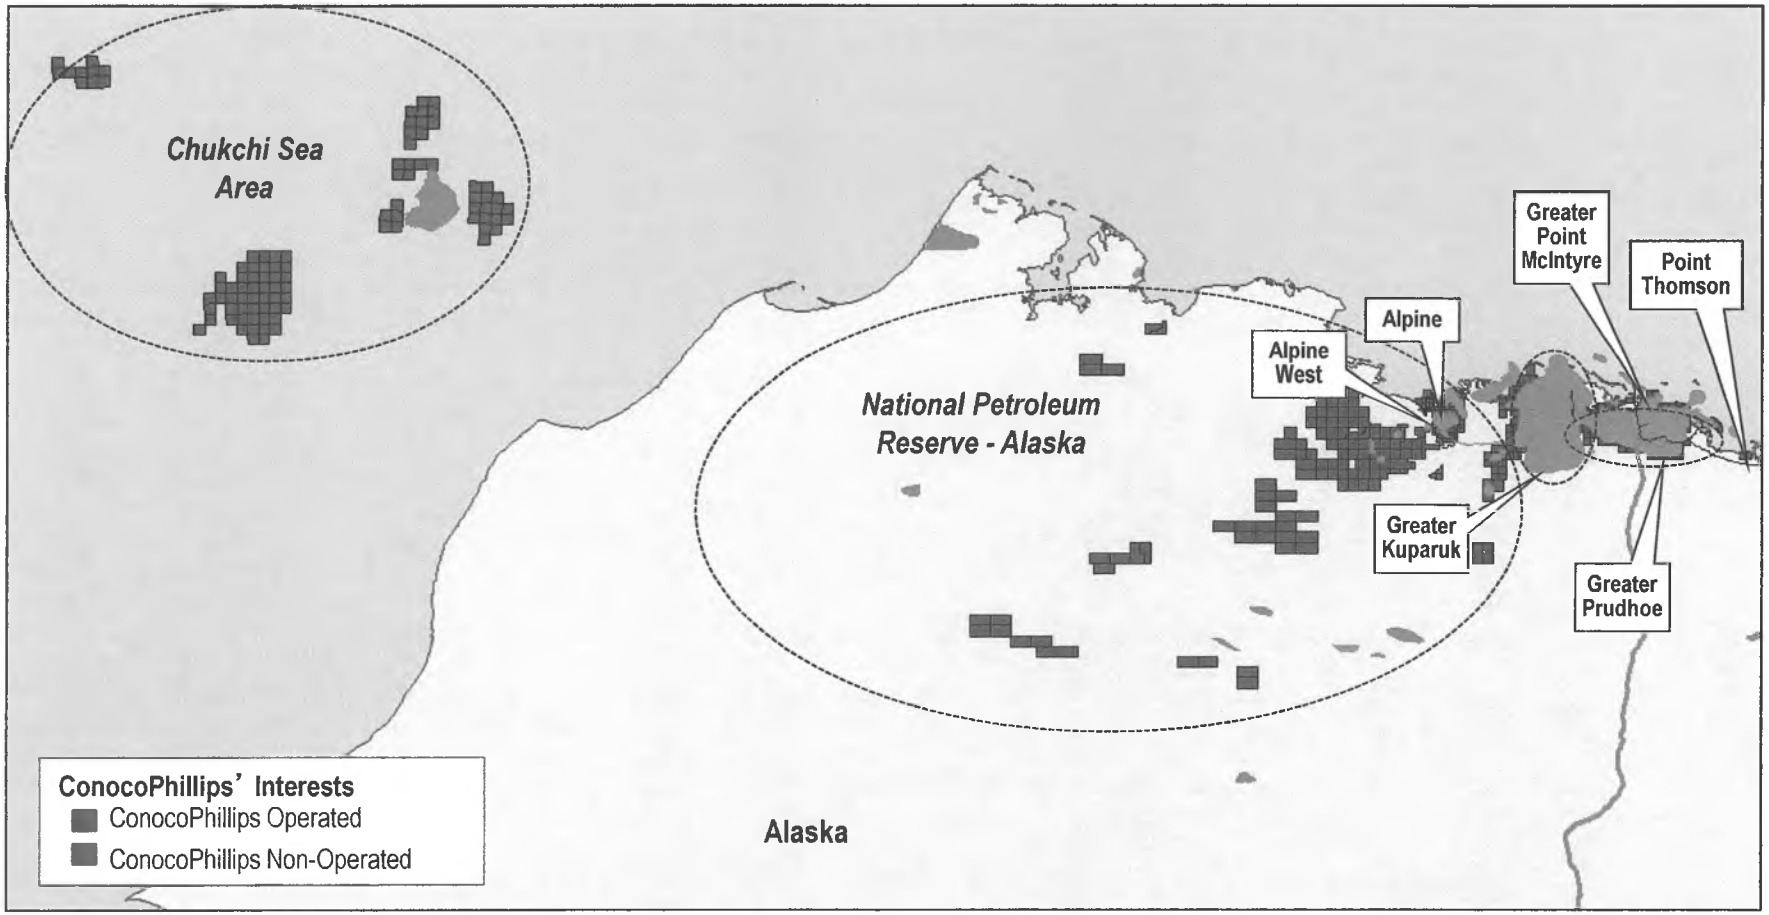
Global Production:
Country Growth Project Analysis

ConocoPhillips: New Source Production – Number of Projects by 2015 Production and Oil/Gas Split



ConocoPhillips's new source portfolio is driven by (1) Shallow water gas production (Qatar); (2) Canadian SAGD Oil Sands Developments; and (3) US Unconventional production (Eagle Ford).

Deepwater projects, sourced mainly from the Asia-Pacific region (Malaysia) and the US GOM deepwater (mostly non-operated positions), will ramp up steadily over the decade; by 2020 deepwater is poised to represent 7% of global volumes (compared to ~2% in 2010).

ConocoPhillips **Alaska Activity & PFC Energy Assessment**

Alaska Designation	Activity	PFC Energy Assessment
Core Area	• ConocoPhillips' assets in Alaska are legacy assets acquired from Arco Alaska in 2000 and include the Greater Prudhoe Area, Greater Prudhoe Bay Area, Greater Kuparuk Area, Western North Slope, and Cook Inlet Area. The company's largest producing area in Alaska is the Greater Prudhoe Area, a collection of mature, long-life fields. Production from the mature Alaska portfolio has been in slow decline since 2004. In 2010, net production from Alaska averaged 230 mb/d of oil and 82 mmcf/d of gas, accounting for ~21% of US production. • ConocoPhillips and BP have been joint proponents of the **Alaska Gas Pipeline** (or **Denali Pipeline**), intended to accelerate commercialization of Prudhoe Bay gas through Western Canada and into US markets. In 2010, the partners officially withdrew their support for the proposed project, in response to continued US gas price weakness and absence of buyer commitments. This places substantial uncertainty around further commercialization of ConocoPhillips' Alaska gas resources. • Activity in the ConocoPhillips-operated Greater Kuparuk Area (GKA), has recently focused on development of viscous oil resources. The GKA, located 40 miles west of Prudhoe Bay on the North Slope, includes the Kuparuk field and its satellites: West Sak, Tarn, Tabasco, Meltwater, and Palm. Heavy oil resources **West Sak** and **Ugnu** (52.2% w.i., operated) are potential projects currently in the appraisal phase. Expected gross peak production is ~23 mboe/d.	As Alaska's largest oil and gas producer, ConocoPhillips holds a leading position in the region. Although the company continues to target smaller projects within the GKA (West Sak and Ugnu) and NPR-A (Alpine West, Greater Moose's Tooth unit and Fiord West), ConocoPhillips will ultimately need expanded access to Asia gas markets in order to reverse the downward production trend in Alaska.

COP Alaska Activity & PFC Energy Assessment

Alaska Designation	Activity	PFC Energy Assessment
Core Area	• In the Western North Slope, ConocoPhillips faces regulatory challenges surrounding project development in the NPR-A region. In order to offset declines at the **Alpine** field (78% w.i., operated) and its three satellites, Nanuq, Fiord, and Qannik, ConocoPhillips is exploring development of additional satellite fields in the adjacent NPR-A, an area that requires distinct permit approval. **Alpine West** (or **CD-5**), a proposed Alpine satellite project, has been significantly delayed due to local opposition and regulatory barriers. Most recently, in early 2010, the U.S. Army Corps of Engineers denied a permit for a bridge that would provide access to the CD-5 site, a move that will further delay the project (originally planned for 2012) and several additional developments that would depend on the infrastructure. Other possible projects on the NPR-A include the **Greater Moose' s Tooth** unit and **Fiord West**, which are both in appraisal phases. • While ConocoPhillips has three primary gas fields in the Alaska region–the North Cook Inlet, Beluga River, and Point Thomson–**Point Thomson** (5% w.i., non-operated) remains the only potential new source development. In 2010, development activities continued with the drilling of two appraisal wells. First production of gas liquids is anticipated in 2014. Longer-term growth potential lies in commercialization of the gas reserves, which is in turn dependent on construction of a long-distance gas trunk line. • In 2010, ConocoPhillips and Statoil engaged in an asset swap wherein ConocoPhillips sold a 25% w.i. in 50 of its **Chukchi Sea** leases to Statoil in exchange for financial payment and a 50% w.i. interest in 16 Statoil-operated Gulf of Mexico leases, as well as Statoil' s 25% w.i. in five additional GOM leases already operated by ConocoPhillips. All of the involved GOM blocks are in the emerging Lower Tertiary play. ConocoPhillips plans to begin exploratory drilling on its Chukchi acreage in 2013.	

PFC-Identified Challenges

- Competing as a "Pure Play" E&P Company: The separation of ConocoPhillips into two, stand-alone Upstream and Downstream entities is scheduled to be finalized in 1H:2012. The ~85% of total portfolio value residing in E&P assets will thereby become the largest "pure play" E&P Independent, a competitor landscape position the company held uncomfortably prior to the Burlington Resources acquisition in 2006. Can ConocoPhillips Upstream compete successfully in the Independent's space by delivering either leading shareholder returns or leading production growth? Or has it simply re-established its original dilemma—too large to compete with the faster moving International Independents, and too small to compete with the Global Players? And if so, does it survive?
- Re-Establishing a Value Proposition: ConocoPhillips' new strategic focus on Sustained Value Generation is intended to re-establish the company's competitive advantage in the E&P space. In the near-term, the 2010-2013 Restructuring Plan will deliver a smaller company with limited medium-term production growth and improved, but unlikely to be leading, ROCE and financial performance. Clearly, the cannibalization of the company's assets and recycling of proceeds to shareholders in order to shore up share valuation and total shareholder returns is a stop-gap strategy at best. Given continuing financial and operational challenges (ROCE, production cost, upstream net income, etc.), ConocoPhillips may struggle to deliver a value proposition that will compete successfully in either the Global Player or International Independents peer group.
- Improving Operational Performance: While showing improvement in finding and development costs, ConocoPhillips ranks at or near the bottom of the expanded Global Players peer group in net income/boe, production costs/boe, and Upstream ROCE. The current portfolio high-grading has already delivered Upstream ROCE improvement (from 7% in 2009 to 10% in 2010) and should deliver improvement in operational metrics; both Syncrude and the LUKOIL holdings were arguably underperforming positions. With long lead time, large scale, capital intensive developments like Qatargas 3, Jasmine, Kashagan Phase 1, and Surmont poised to deliver material production and cash flow, ConocoPhillips should see the flow-through benefits in terms of more competitive ROCE and operational metrics.
- Delivering Production Growth: The share repurchase program accompanying portfolio rationalization under the Restructuring Plan is projected to deliver ~3% growth in per share production in 2010 and 2011. However, physical volumes will decline in absolute terms over the 2010-2011 period—by ~208 mboe/d in 2010 from 2009 levels, and a further ~360 mboe/d in 2011 from 2010. The only region poised to deliver higher production volumes in 2020 versus 2010 is the relatively minor MENA region, projected to reach ~177 mboe/d in 2020 versus 72 mboe/d in 2010. New source volumes in Canada and the North Sea will struggle to offset mature asset declines, delivering flat production in the core North America and Europe regions, while the LUKOIL sell-down will dampen what was once considered a core driver of future growth for the company. While boasting a 10 bn boe resource base, it is not clear how ConocoPhillips will deliver the promised surge in organic growth over the 2015-2020 period from its captured portfolio—although the enhanced capex spend in the Eagle Ford play is a good starting point. Barring a material acquisition (certainly not out of the question), the company will be looking to its exploration portfolio to deliver a medium term "engine of growth".

ExxonMobil: Company Overview

Strategic Signature

- ExxonMobil is the largest global integrated company (volumes averaged ~4,450 mboe/d in 2010), with production in 21 countries and upstream operations in an additional 20 countries.
- ExxonMobil has long adhered to a growth strategy based on scale, basin dominance, and execution excellence, which has required the company to seek continuous access to investment opportunities of adequate size and materiality.
- In 2010, faced with the commissioning of the final elements of the company's Qatar project portfolio (the final four approved LNG trains at RasGas and Qatargas, and Phase 2 of the Al Khaleej gas project), declining production in Europe and Asia-Pacific, and already holding a considerable stake in the Canadian oil sands, ExxonMobil took an aggressive move into unconventional shale gas exploitation.
