<TARGET><BILL></BILL><SUBJECT>1-24-11 PRESENTATION DANIEL SULLIVAN, DEPARTMENT OF NATURAL RESOURCES</SUBJECT><COMM>SRES27</COMM></TARGET>

Alaska Department of Natural Resources

SENATE RESOURCES
FY12 OVERVIEW
JANUARY 24, 2011

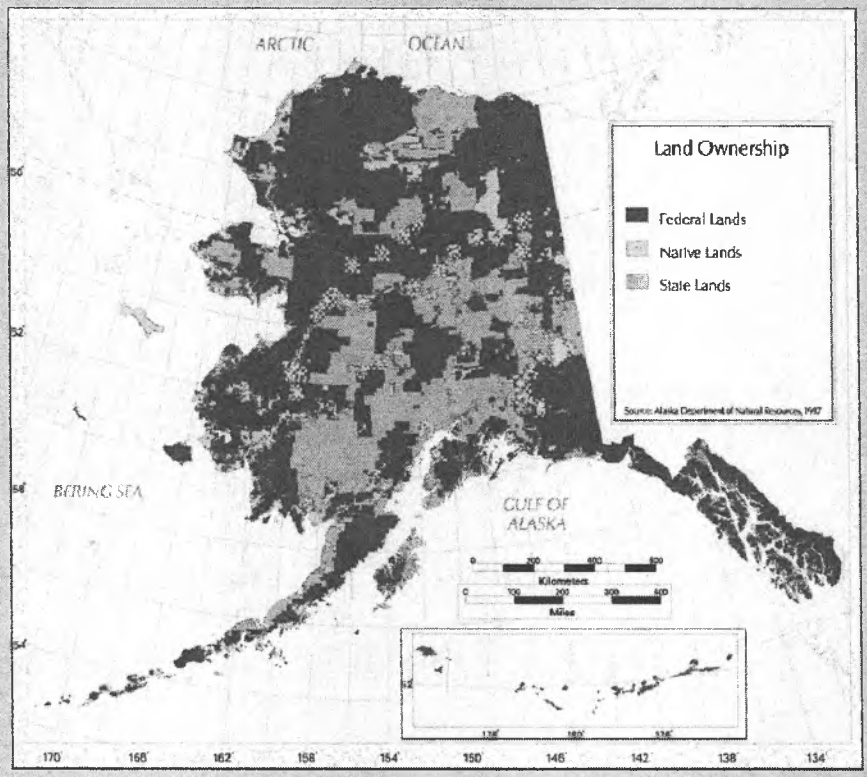
Who We Are and What We Do

- Article 8, Section 1 of the Alaska Constitution provides that "it is the policy of the State to encourage the settlement of its land and the development of its resources by making them available for maximum use consistent with the public interest."

- Article 8, Section 2 provides that the "legislature shall provide for the utilization, development, and conservation of all natural resources belonging to the State, including land and waters, for the maximum benefit of its people."

Department Mission

- Develop, conserve and enhance natural resources for present and future Alaskans



ALASKA DEPARTMENT OF NATURAL RESOURCES

What We Do

- DNR manages (1) the state's land – approximately 100 million acres of uplands, 60 million acres of tidelands, shore lands, and submerged lands, and 40,000 miles of coastline – and (2) the state's vast energy and natural resources

- State land use and the natural resources developed from state land are the primary source of state revenue

What We Do

- DNR also manages state parklands; conducts wildland fire suppression; and supports the agriculture and timber industries in Alaska

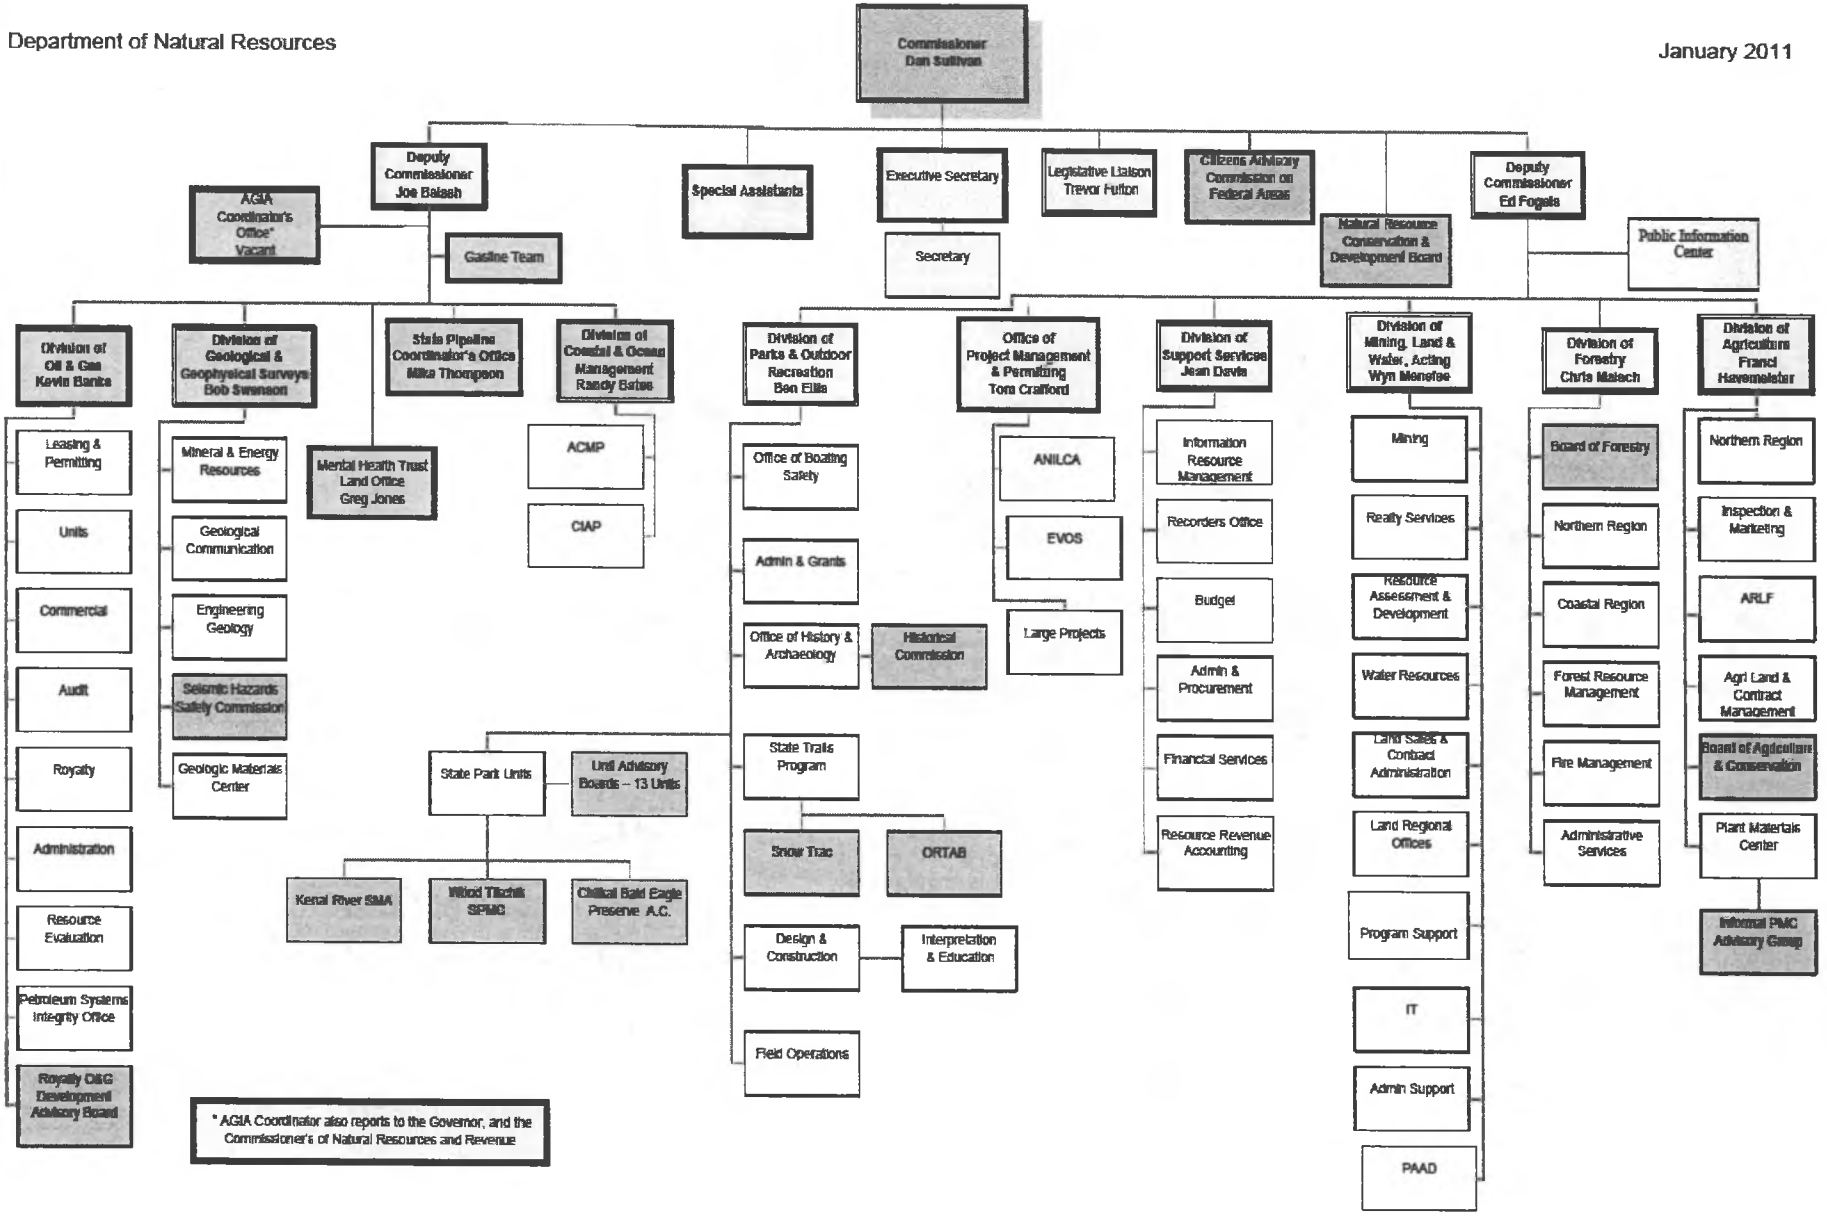
- Another important function of DNR is obtaining and providing the geologic, hydrologic, land records, and other information needed to manage and utilize the state's natural resources

Employees and Budget

- DNR currently employs about 1,100 Alaskans in full-time and seasonal positions, with main offices in Anchorage, Juneau, Fairbanks and Palmer, and regional offices throughout the state
- Our FY11 operating budget is $152.5 million, which includes funding for AGIA implementation
- Our FY12 operating budget request is $153.7 million, made up of:
  - 48% Unrestricted General Fund
  - 17% Designated General Fund
  - 23% Other funds including industry receipts
  - 12% Federal

Department of Natural Resources

January 2011



Divisions

- Oil and Gas

  Kevin Banks, Director

  105 full and part time budgeted positions

  10.82% of DNR's FY12 Operating Budget Request

  $16,624.5 budget request (all sources)

Divisions

- Mining, Land & Water

  Wyn Menefee, Acting Director

  207 full and part time budgeted positions

  15.27% of DNR's FY12 Operating Budget Request

  $23,481.2 budget request (all sources)

Divisions

- Forestry

  Chris Maisch, Director

  280 full and part time budgeted positions (does not include the hundreds of fire season crews)

  25.38% of DNR's FY12 Operating Budget Request

  $38,988.6 budget request (all sources)

Divisions

- Geological & Geophysical Surveys

  Bob Swenson, Director

  48 full and part time budgeted positions

  5.85% of DNR's FY12 Operating Budget Request

  $8,983.2 budget request (all sources)

Divisions

- Coastal & Ocean Management

  Randy Bates, Director

  33 full time budgeted positions

  3.05% of DNR's FY12 Operating Budget Request

  $4,691.7 budget request (all sources)

Divisions

- <u>Agriculture</u>

  Franci Havemeister, Director

  46 full and part time budgeted positions

  4.74% of DNR's FY12 Operating Budget Request

  $7,282.4 budget request (all sources)

Divisions

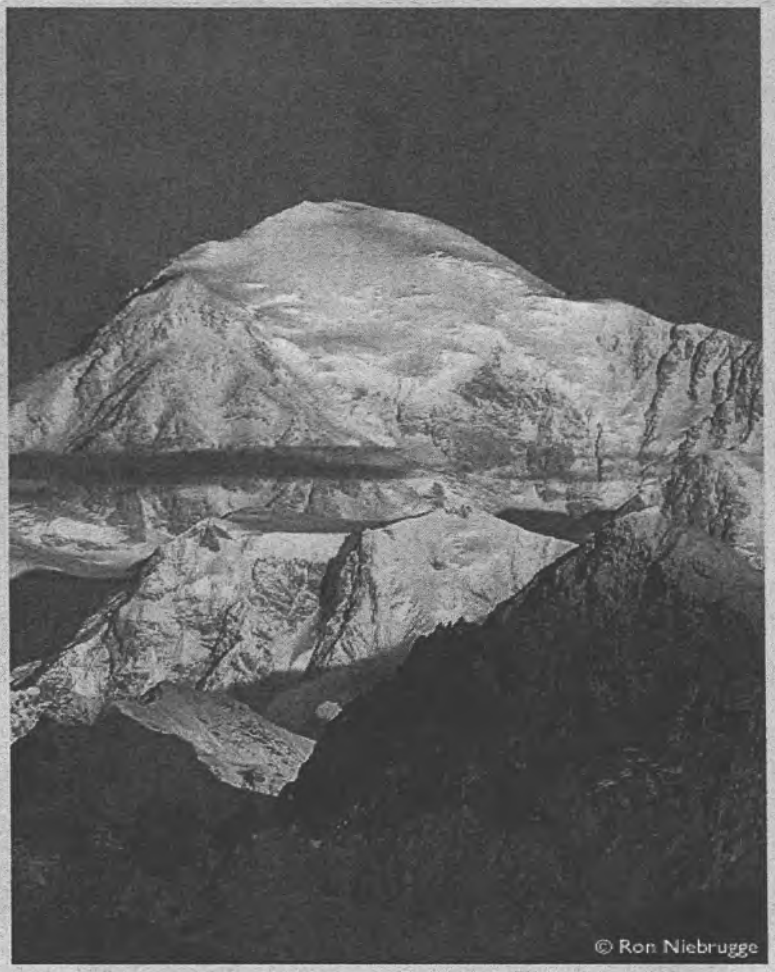
- Parks & Outdoor Recreation

  Ben Ellis, Director

  185 full and part time budgeted positions

  10.09% of DNR's FY12 Operating Budget Request

  $15,495.5 budget request (all sources)



Divisions

- Support Services

  Jean Davis, Director

  130 full and part time budgeted positions

  8.48% of DNR's FY12 Operating Budget Request

  $12,113.4 budget request (all sources)

Offices

- State Pipeline Coordinator's Office

  Mike Thompson, State Pipeline Coordinator

  31 full and part time budgeted positions

  5.07% of DNR's FY12 Operating Budget Request

  $7,789.2 budget request (all sources)

Offices

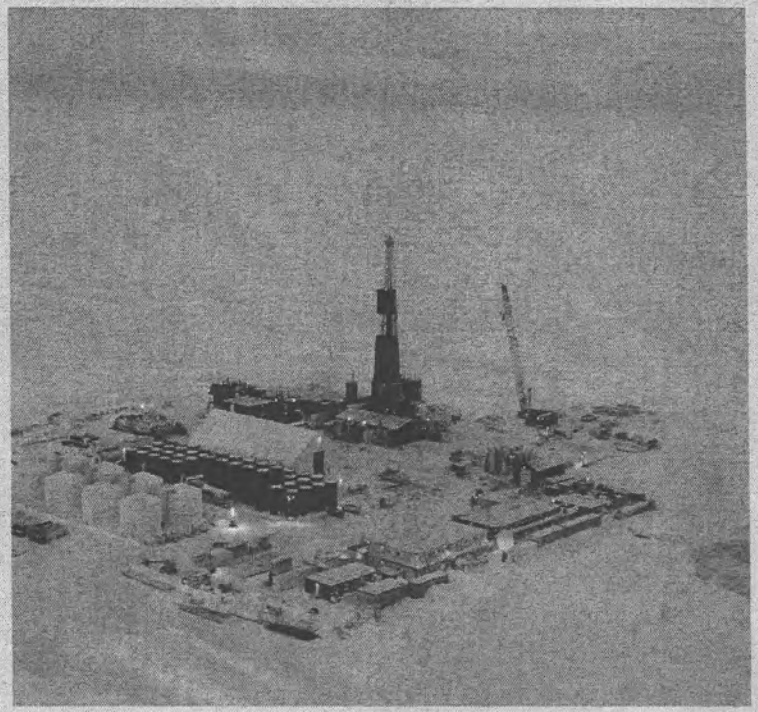
- Project Management & Permitting

  Tom Crafford, Director

  12 full time budgeted positions

  2.75% of DNR's FY12 Operating Budget Request

  $4,223.9 budget request (all sources)



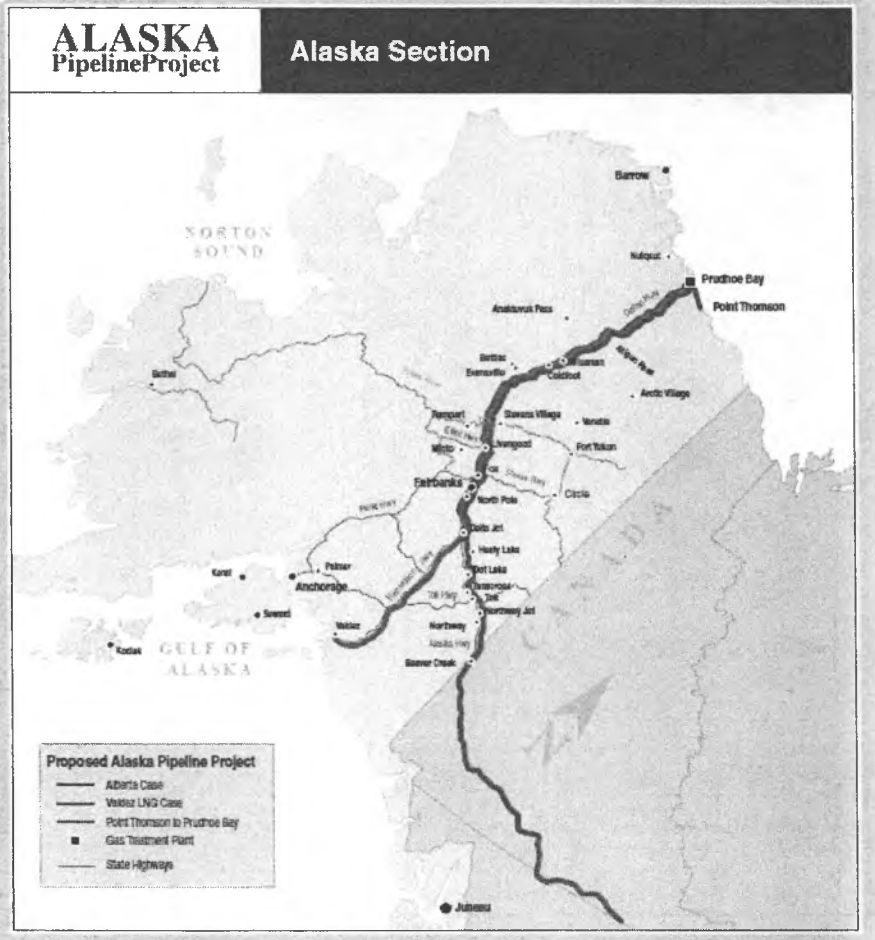
Offices

- <u>AGIA Coordinator's Office</u>

  9 full and part time budgeted positions

  2.32% of DNR's FY12 Operating Budget Request

  $3,563.3 budget request (all sources)



Offices

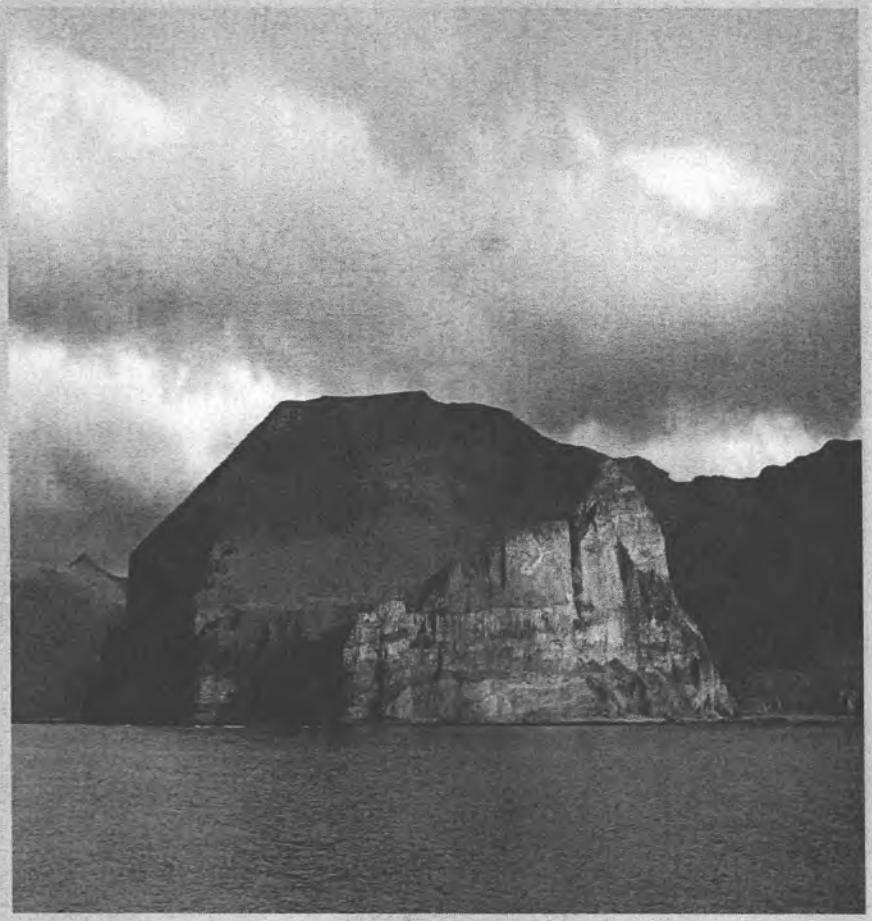
- Mental Health Trust Lands Office

  Greg Jones, Executive Director

  16 full and part time budgeted positions

  1.88% of DNR's FY12 Operating Budget Request

  $2,892.7 budget request (all sources)



Offices

- Office of the Commissioner

  Dan Sullivan, Commissioner

  9 full time budgeted positions

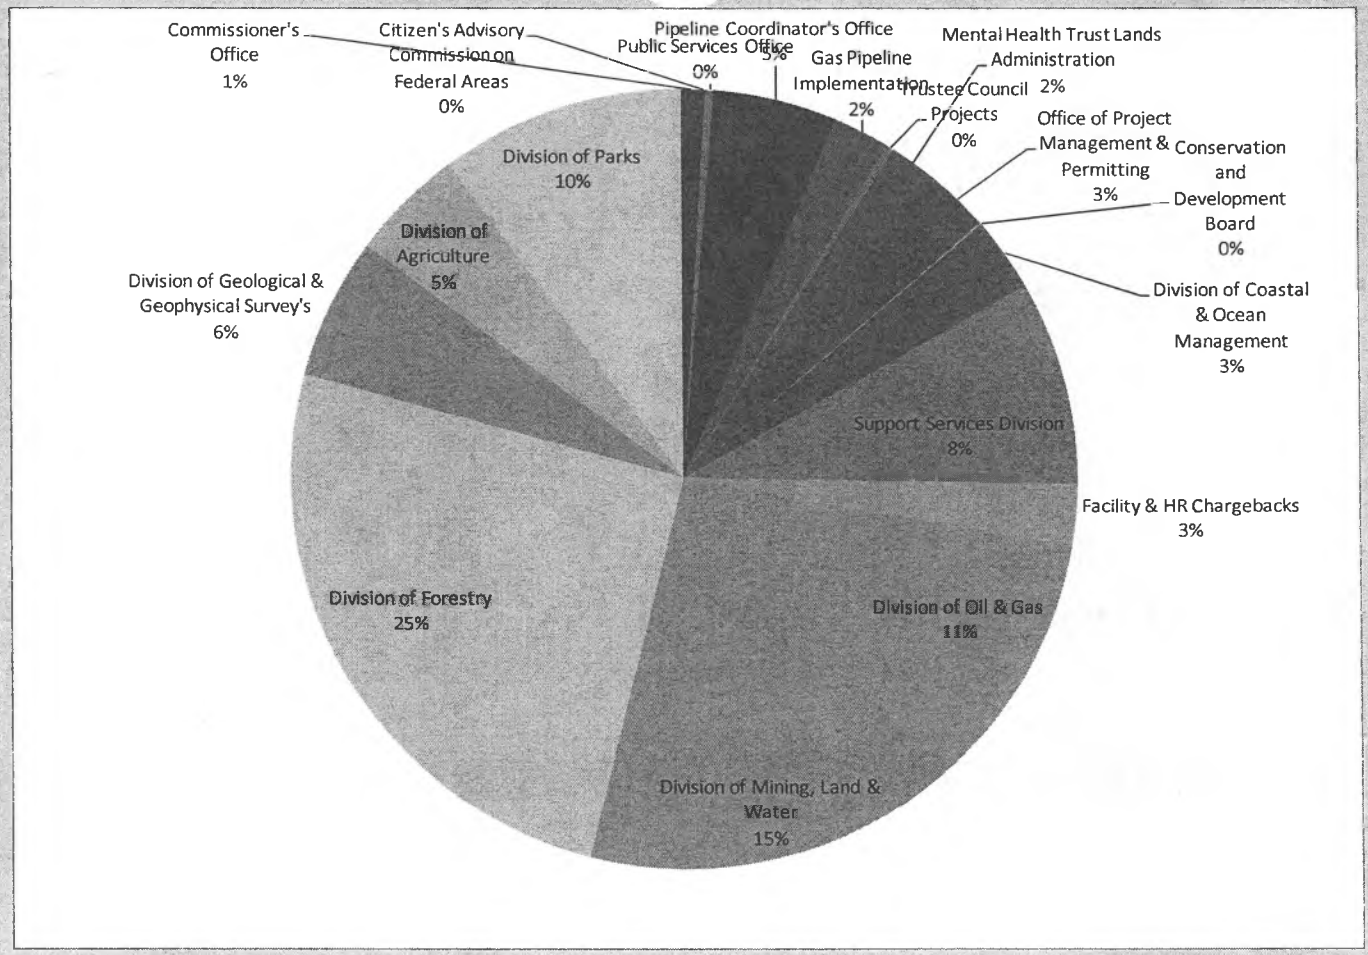
  0.79% of DNR's FY12 Operating Budget Request

  $1,221.1 budget request (all sources)

Boards and Commissions

- Natural Resource Conservation & Development Board (NRCDB)
- Citizen's Advisory Commission on Federal Areas (CACFA)
- Board of Agriculture and Conservation
- Board of Forestry
- Alaska Historical Commission
- Alaska Royalty Oil and Gas Development Board
- Seismic Hazards Safety Commission
- Outdoor Recreation Trails Advisory Board

FY12 Operating Budget - $153,746.7



Engagement Tour

- Meeting with key stakeholders
- What I'm hearing, seeing, learning
  - Challenges
  - Opportunities
  - Need for partnership

Challenges

- TAPS throughput
- Aging infrastructure
- High energy costs throughout the state
- Gas pipeline
- Cook Inlet energy
- Permitting efficiencies

DNR Specific Challenges & Solutions

- Permitting efficiencies & workload
- Federal land conveyance
- Litigation - defending permitting process
- Forest management
- Unlocking resources
- Publicizing resources
- Management challenges
- Retention / Recruitment
- Maintain budget & obtain increments
- Improve coordination
- Creative thinking & implementation

Opportunities – Alaska as a Storehouse

- North Slope: world class energy basin
- Massive mineral deposits
- Vast amounts of renewable resources
- New players looking to unlock our resource potential
- Ongoing innovation

Alaska as a Storehouse

- **Oil**: 43 billion barrels of undiscovered, technically recovery reserves; this does not include massive quantities of unconventionals (shale, heavy oil, etc.)
- **Gas**: 236 trillion cubic feet of undiscovered, technically recoverable reserves
- **Coal**: 17% of the world's coal resources; 2nd most in the world
- **Copper**: 6% of the world's copper resources; 3rd most in the world
- **Lead**: 2% of the world's lead resources; 6th most in the world

Alaska as a Storehouse

- **Gold**: 3% of the world's gold resources; 7th most in the world
- **Zinc**: 3% of the world's zinc resources; 8th most in the world
- **Silver**: 2% of the world's silver resources; 8th most in the world
- **Rare earth elements**: Alaska has over 150 occurrences, and one of N. America's most significant deposits
- **Timber**: Alaska has 17% of the nation's forestland

Importance of Partnership

- Stakeholders eager to form alliances
- Partnership moves projects forward
- Missing one key partner....

Federal Obstruction

- Projects delayed or derailed
- Opportunities foreclosed
- Jobs lost and investment climate chilled
- But we will redouble cooperation efforts

State at a Crossroads: Bright Future

- TAPS decline arrested
  - OCS's elephant fields placed on-line
  - ANWR and NPR-A open for development
  - Innovation leads to unconventional and heavy oil production
- North Slope gas brought on-line
- Mining production throughout the state
- Cook Inlet resurgence
- Renewable resources meet state's growing energy needs
- Rural Alaska: jobs up & energy costs down
- New markets for our resources
- Value added industries

State at a Crossroads: Bleak Future

- TAPS throughput decline accelerates
- Aging infrastructure failures hamper operations
- Major energy companies leave the state
- No gas pipeline
- Existing mines exhausted and no new mines brought on-line
- Crushing energy costs
- Importation of LNG to meet Railbelt energy needs
- Federal overreach transforms state into a national park
- State population declines

Disclaimer

Statements in this presentation including information provided in slides 17 and 19, as well as oral statements made by the officers or directors of Ormat Technologies, Inc., its advisors, affiliates or subsidiaries often will contain "forward-looking statements." Whenever you read or hear a statement that is not simply a statement of historical fact (such as when we describe what we "believe", "expect" or "anticipate" will occur, and other similar statements), you must remember that our expectations may not be correct, even though we believe they are reasonable. You should read and listen to these statements completely and with the understanding that actual future results may be materially different from what we expect, as a result of certain risks and uncertainties. For a complete discussion of the risks and uncertainties relating to the forward-looking statements in this presentation, please see "Risk Factors" as described in the Annual Report on Form 10-K report filed with the Securities and Exchange Commission on March 8, 2010.

We will not update these forward-looking statements, even though our situation will change in the future.

Ormat Brings Credibility

- A leader in geothermal power
- Owns and operates 538* MW worldwide
- Supplied approximately 1,300 MW to 24 countries
- Vertically integrated:
  - Explores, develops, engineers, manufactures, constructs, operates
- Employs 470 people in the U.S. ; >1,000 worldwide;

NYSE: "ORA"
Market Cap. : $1.39B**
LTM Revenues: ~$375M

ORMAT
GREEN ENERGY you can rely on

*As of December, 2010, including the 50 MW of North Brawley in California which operated at approx. 25 MW

5

Ormat's Commitment to Alaska

- >100 Remote Power Units
  - Serving remote gate valves
  - TransAlaska Pipeline
  - Since 1975
- First geothermal unit
  - Tested in 1979
  - University of Alaska Fairbanks
  - At Manley hot springs
- Approx. $5 million of Ormat equity invested in Mt. Spurr to date

Geothermal – Key Attributes

- Utilities' renewable energy of choice:
  - Base-load generation
  - Cost-competitive
  - Highly reliable; >>95% availability
  - Proven technology: ~10,000 MW deployed worldwide
- No fuel cost risk; Fixed long-term pricing
- Sustainable & environmentally friendly
  - Closed loop system with near zero emissions
  - No water consumption [Mt. Spurr plant will be air-cooled]
  - Minimal surface and visual impact
- Creates long-term, high-quality jobs

ORMAT
GREEN ENERGY you can rely on

COPYRIGHT © 2010 ORMAT. All rights reserved. This document contains information proprietary to ORMAT. Reproduction in any form without prior written permission is strictly prohibited.

Geothermal – Development Inhibitors

- Resources are scarce
- High upfront CAPEX and risk required in order to discover and confirm the resource

ORMAT
GREEN ENERGY you can rely on

COPYRIGHT © 2010 ORMAT. All rights reserved. This document contains information proprietary to ORMAT. Reproduction in any form without prior written permission is strictly prohibited.

Worldwide Deployment

- Approximately 11,000 MW deployed world-wide
- 24 nations have utility-scale geothermal generation
  - US is the world leader, with plants in CA, NV, HI, UT, ID
- Supportive policies have been key to success in all nations

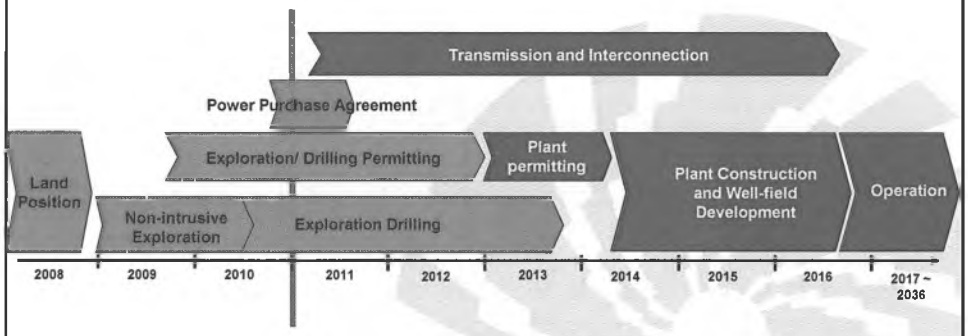
13

1. Mt. Spurr – Estimated Timeline



- 36,000 acres of state lands leased in October, 2008
- Non-Intrusive exploration conducted summer of 2009 and of 2010
- Two exploration core holes (~1,000 ft) drilled in September2010

ORMAT

GREEN ENERGY you can rely on

COPYRIGHT © 2010 ORMAT. All rights reserved. This document contains information proprietary to ORMAT. Reproduction in any form without prior written permission is strictly prohibited

14

Core Drilling

ORMAT
GREEN ENERGY you can rely on

COPYRIGHT © 2010 ORMAT. All rights reserved. This document contains information proprietary to ORMAT. Reproduction in any form without prior written permission is strictly prohibited

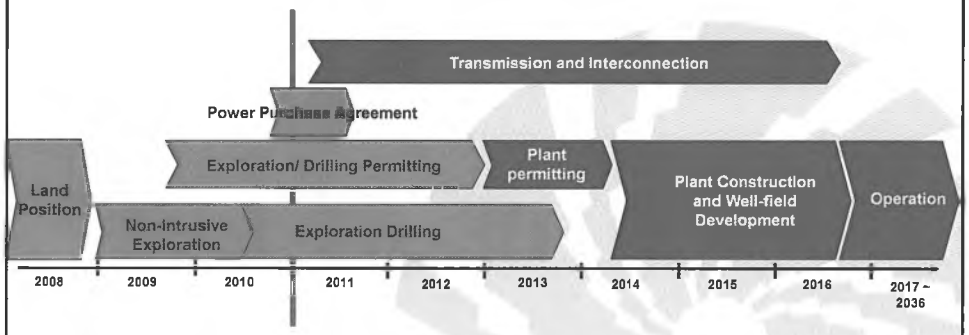
Encouraging Results to Date

- Shallow water shows mixing with hot geothermal fluids
- Evidence of multiple geologic faults that could be accommodating geothermal resources at depth
- Geochemistry indicating high temp resource at depth
- But, additional drilling is required in order to confirm the existence of a commercial geothermal resource at depth

ORMAT
GREEN ENERGY you can rely on

COPYRIGHT © 2010 ORMAT. All rights reserved. This document contains information proprietary to ORMAT. Reproduction in any form without prior written permission is strictly prohibited

Mt. Spurr – Expected Next Steps



- Additional, deeper, (up to 4,000 ft) core holes planned for summer 2011
- First full-size production well planned for 2012

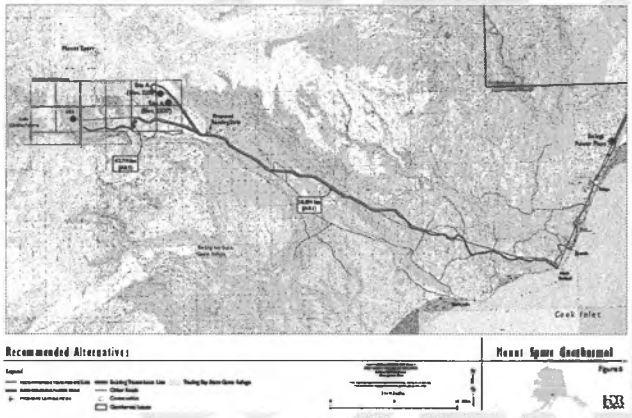
ORMAT

GREEN ENERGY you can rely on

COPYRIGHT © 2010 ORMAT. All rights reserved. This document contains information proprietary to ORMAT. Reproduction in any form without prior written permission is strictly prohibited

2. Infrastructure Needs

- ~40 miles of T-line to Chugach Electric's Beluga plant
  - Chugach plans to commence a detailed routing study in 2011
- ~25 miles of permanent access road
- $70 - $80m



ORMAT

GREEN ENERGY you can rely on

COPYRIGHT © 2010 ORMAT. All rights reserved. This document contains information proprietary to ORMAT. Reproduction in any form without prior written permission is strictly prohibited

3. Expected Amount of Power to Railbelt

- Estimated at 50~100 MW net
- At 95% availability: 416.1 ~ 832.2 GWh / year

ORMAT

GREEN ENERGY you can rely on

COPYRIGHT © 2010 ORMAT. All rights reserved. This document contains information proprietary to ORMAT. Reproduction in any form without prior written permission is strictly prohibited

4. Likelihood to Completion

- Technology-wise: Very likely
  - Practically no technology risk
  - Ormat has built dozens of plants worldwide, ~1300 MW
- Resource-wise: Likely
  - Preliminary geological analysis is encouraging; however
  - Significant exploration required to prove and size the resource
- Business-wise:
  - Need a Power Purchase Agreement
  - Need State commitment to build transmission line and access road

ORMAT

GREEN ENERGY you can rely on

COPYRIGHT © 2010 ORMAT. All rights reserved. This document contains information proprietary to ORMAT. Reproduction in any form without prior written permission is strictly prohibited

5. Permitting Roadblocks

- Area was studied by DNR and findings were published as part of the leasing process
- Ormat working with all relevant agencies (DNR, ADEC, AOGCC, USF&WS, etc.)
- All permits for the 2010 exploration and drilling campaigns received on time with no major issues
- No major challenges identified looking forward
  - Little to no impact on wildlife, water sources , wetlands, etc.

ORMAT
GREEN ENERGY you can rely on

COPYRIGHT © 2010 ORMAT. All rights reserved. This document contains information proprietary to ORMAT. Reproduction in any form without prior written permission is strictly prohibited

6. Project Endorsed by:

- All Railbelt utilities: ARCTEC and ML&P
- Nearest communities:
  - Tyonek
  - Kenai Peninsula Borough
  - Anchorage
- Environmental and renewable energy communities:
  - Cook Inletkeeper
  - Renewable Energy Alaska Project (REAP)
  - Homer Electric Association Members Forum (HEAMF)
  - Alaska Center for Appropriate Technology (ACAT)

ORMAT
GREEN ENERGY you can rely on

COPYRIGHT © 2010 ORMAT. All rights reserved. This document contains information proprietary to ORMAT. Reproduction in any form without prior written permission is strictly prohibited

7. Ormat Brings the Cash

- Sources of capital for exploration, development and construction:
  - Mostly Ormat equity
  - Awarded $2 million from the AEA Renewable Energy Grant Fund, round III, matched by $2.1 million
  - Recommended for an additional $2 million in round IV
- Ormat typically re-finances plants using term debt

ORMAT
GREEN ENERGY you can rely on

COPYRIGHT © 2010 ORMAT. All rights reserved. This document contains information proprietary to ORMAT. Reproduction in any form without prior written permission is strictly prohibited

8. Cost of Power to Utility(s)

- 12-13 c/kWh (in 2011 dollars), with 1.5% yearly escalation
- All green attributes will be conveyed to the off-taker(s)
- No additional integration costs to be incurred by utilities
- Price will be guaranteed for 25 years, regardless of fossil fuel costs

ORMAT
GREEN ENERGY you can rely on

COPYRIGHT © 2010 ORMAT. All rights reserved. This document contains information proprietary to ORMAT. Reproduction in any form without prior written permission is strictly prohibited

9. Legislative needs

- SB243 (reduction in geothermal royalties on state lands) passed in 2010 removed a major inhibitor
  - Cut the power to ratepayers by close to 1 c/kWh
- Additional incentives, e.g. a 30% refundable tax credit for geothermal exploration and development, are needed in order to get the cost down to utilities' expectations and enable reaching a Power Purchase Agreement
- Mechanisms will be put in place to make sure that all incentives are passed through to the ratepayer

ORMAT
GREEN ENERGY you can rely on

COPYRIGHT © 2010 ORMAT. All rights reserved. This document contains information proprietary to ORMAT. Reproduction in any form without prior written permission is strictly prohibited

9. Legislative needs (cont'd)

- $70-80 million direct appropriation to fund transmission line to Beluga and access road
  - This appropriation will be contingent on:
    - Ormat's success in confirming the geothermal resource
    - Signing a Power Purchase Agreement
- Additional funding to cost-share the expensive 2012 full-size drilling plan

ORMAT
GREEN ENERGY you can rely on

Presentation: Alaska Energy Report – Railbelt Large Hydroelectric

Mike Harper, Acting Executive Director, AEA

Bryan Carey, Tech engineer, Project Manager, AEA

Sara L. Fisher-Goad, Deputy Director – Operations, AEA

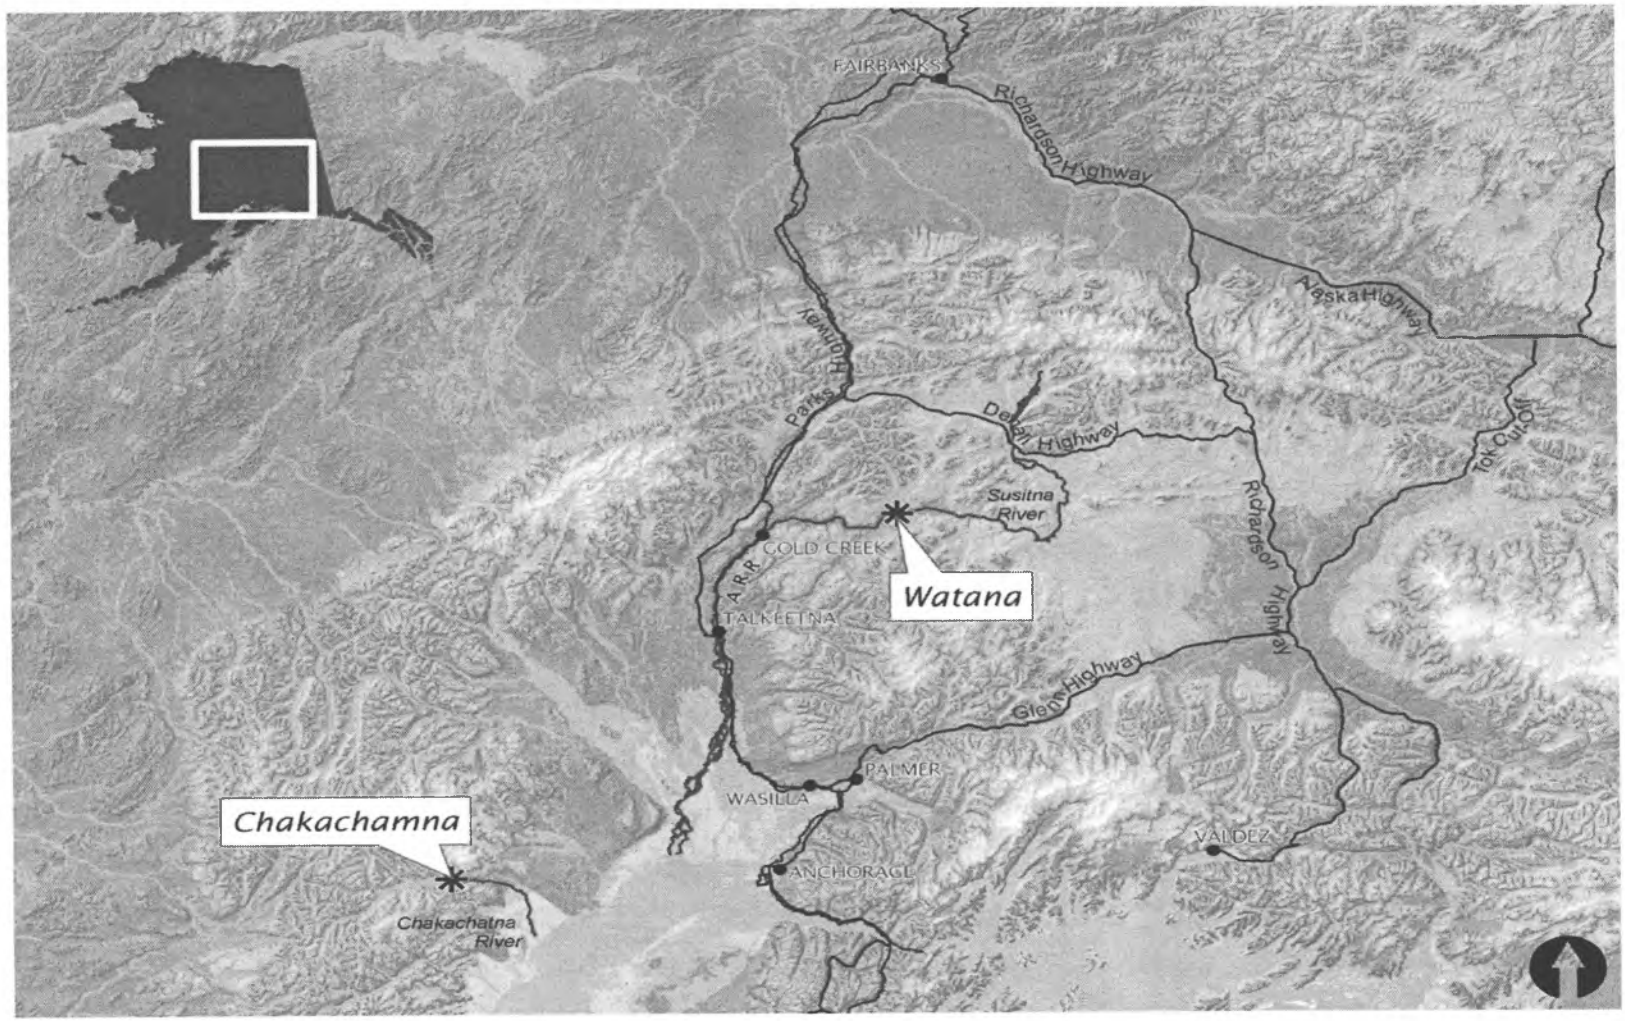
Railbelt Large Hydroelectric

Senate Resources Committee
& House Energy Committee

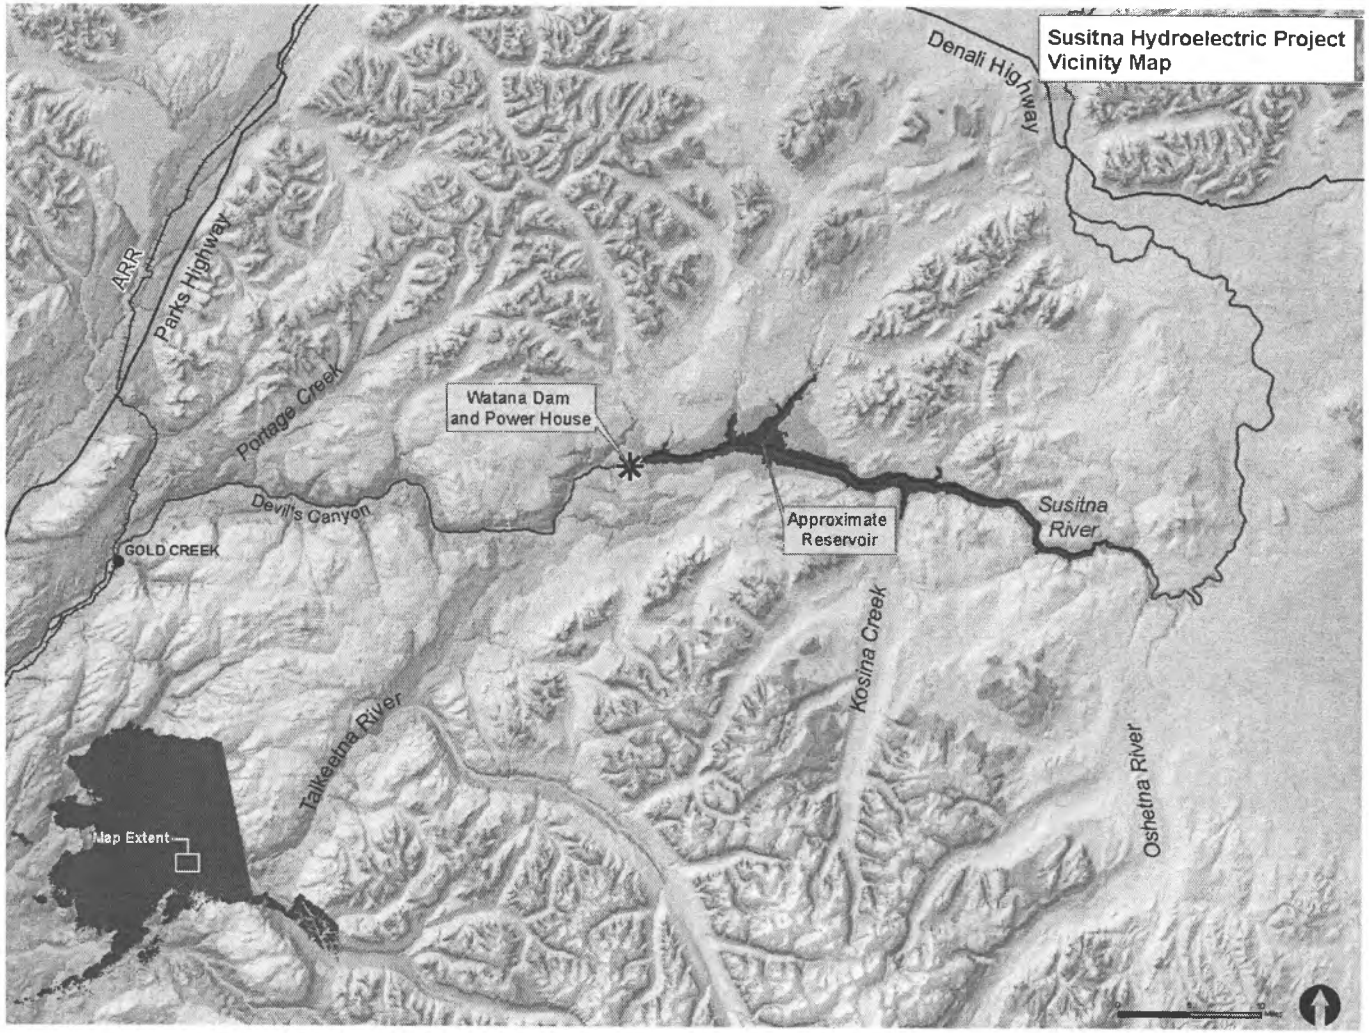
Prepared by Alaska Energy Authority 1 /25/2011

ALASKA ENERGY AUTHORITY

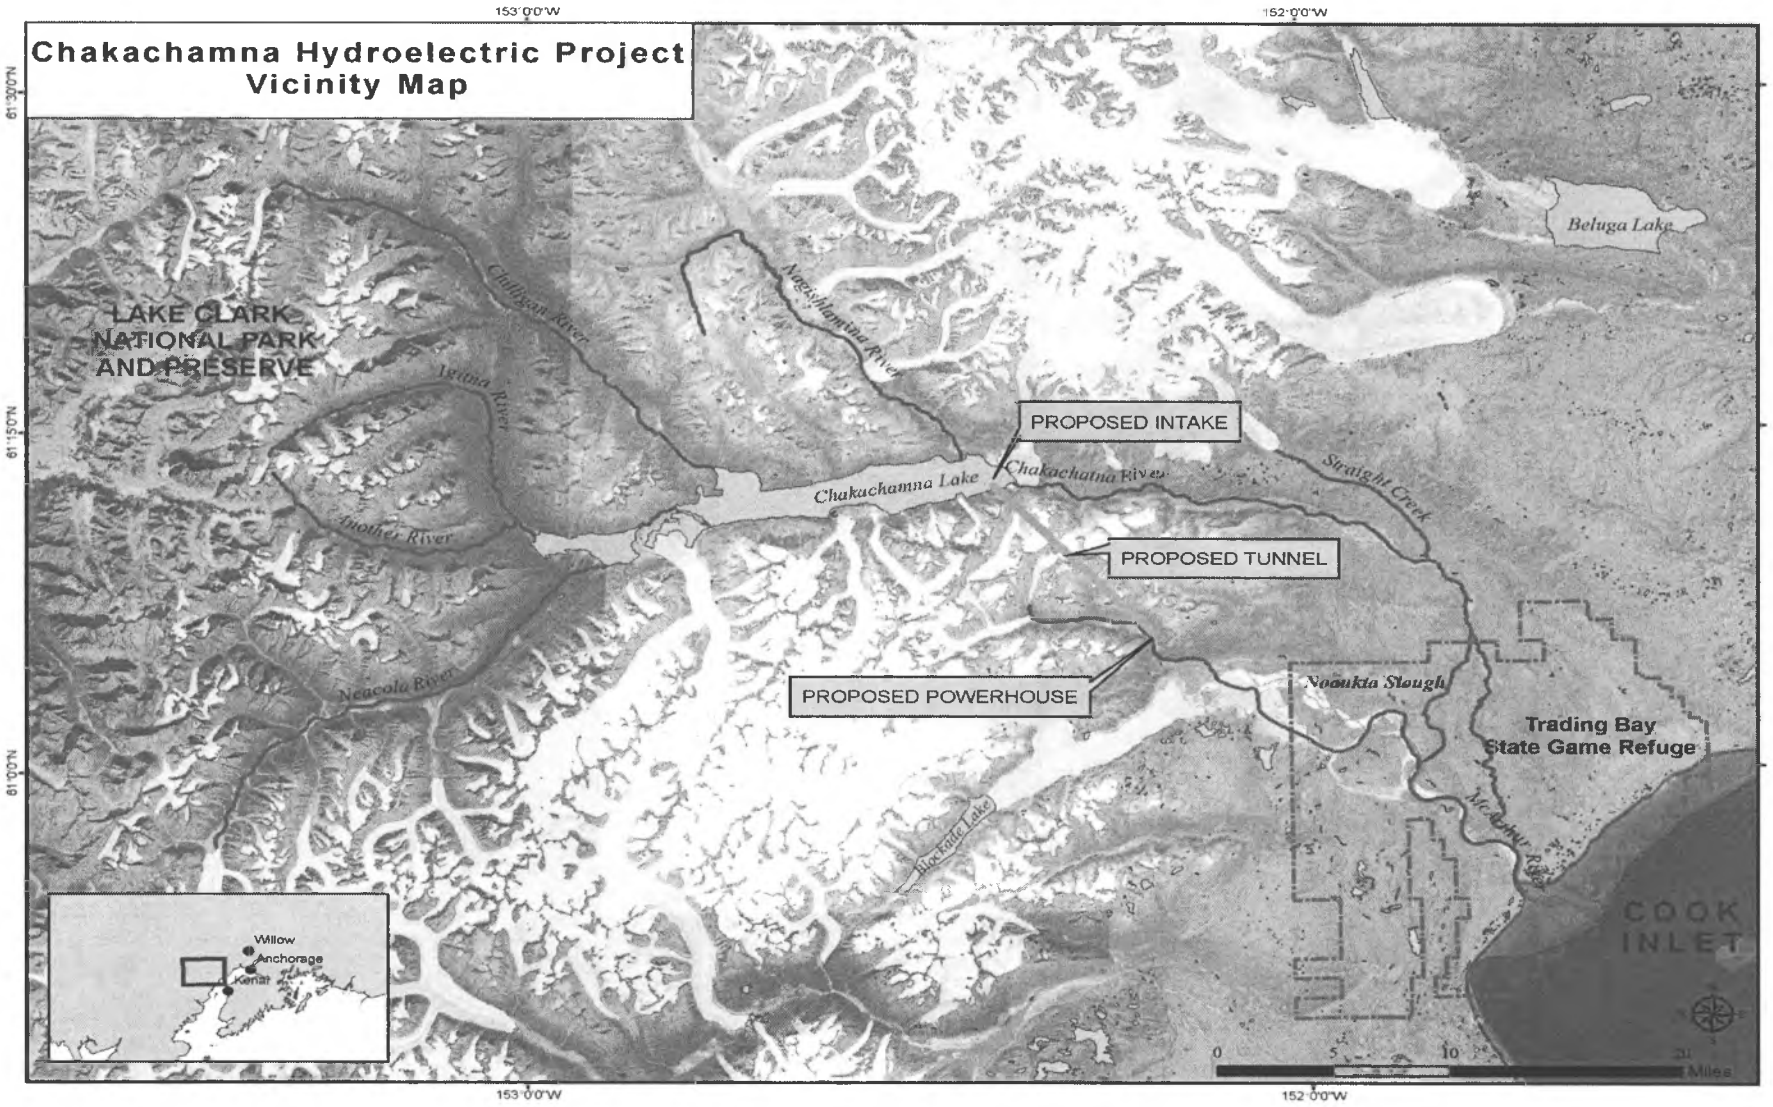
Railbelt Hydro Locations



WATANA VICINITY



CHAKACHAMNA VICINITY



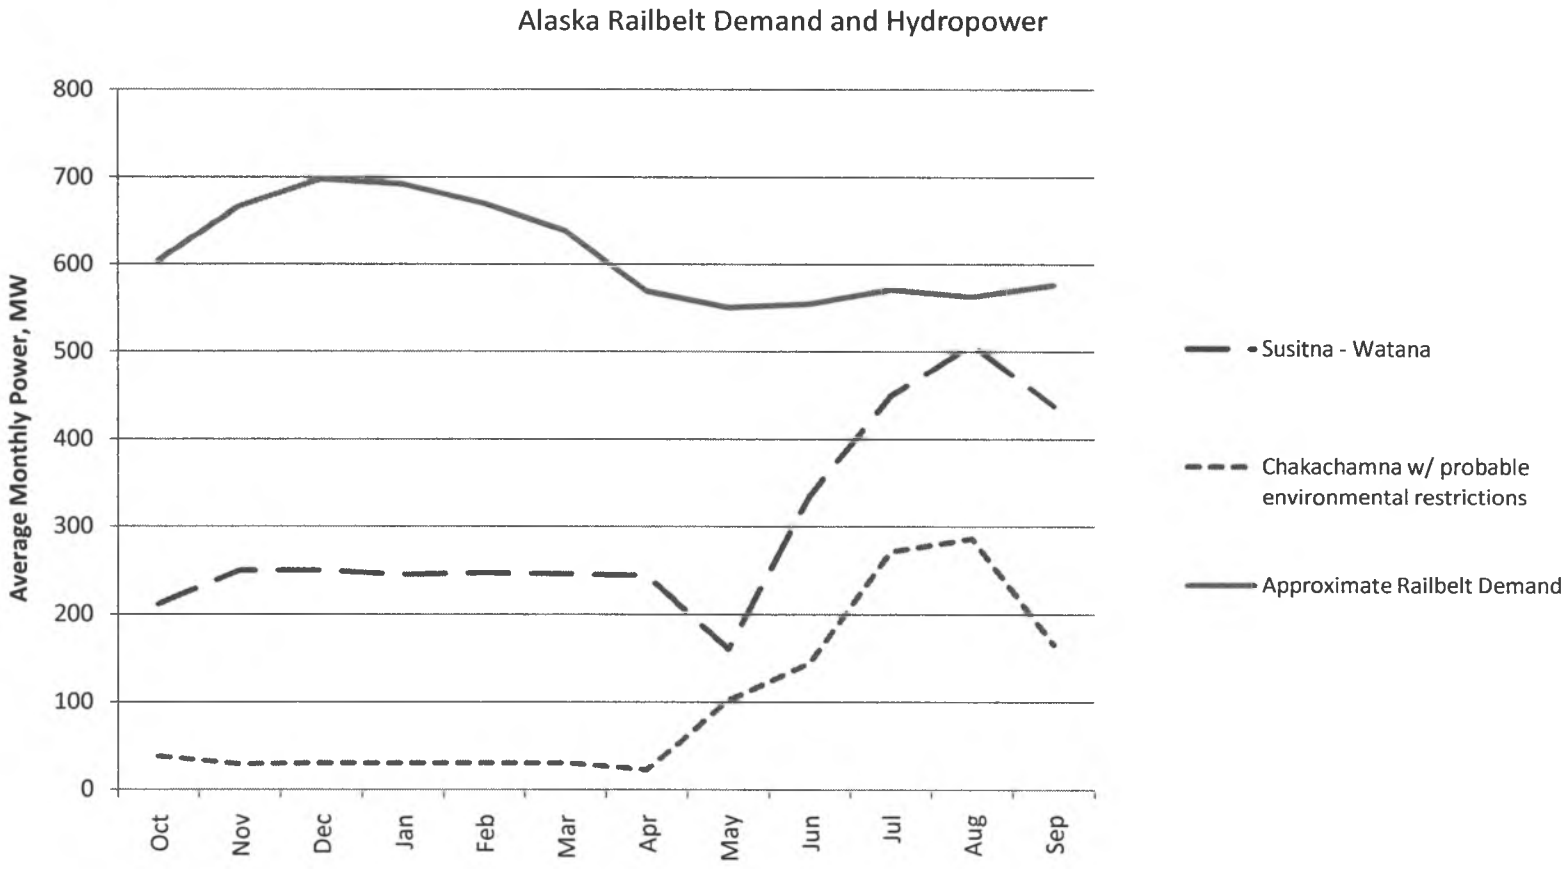
Environmental:

- Susitna
  - Reservoir 39 miles long & maximum of 2 miles wide
  - 30 miles above significant salmon
  - Some loss of wildlife habitat
  - Minimal fisheries impacts
- Chakachamna
  - Significant salmon populations travel through lake to National Park
  - Several species of fish use & spawn in lake (Lake Trout, Dolly Varden, White, Salmon suspected ..)
  - Diversion of water & change of habitat in State Game Refuge
  - Adult false attraction & outmigration concerns
  - May not be able to license under FERC

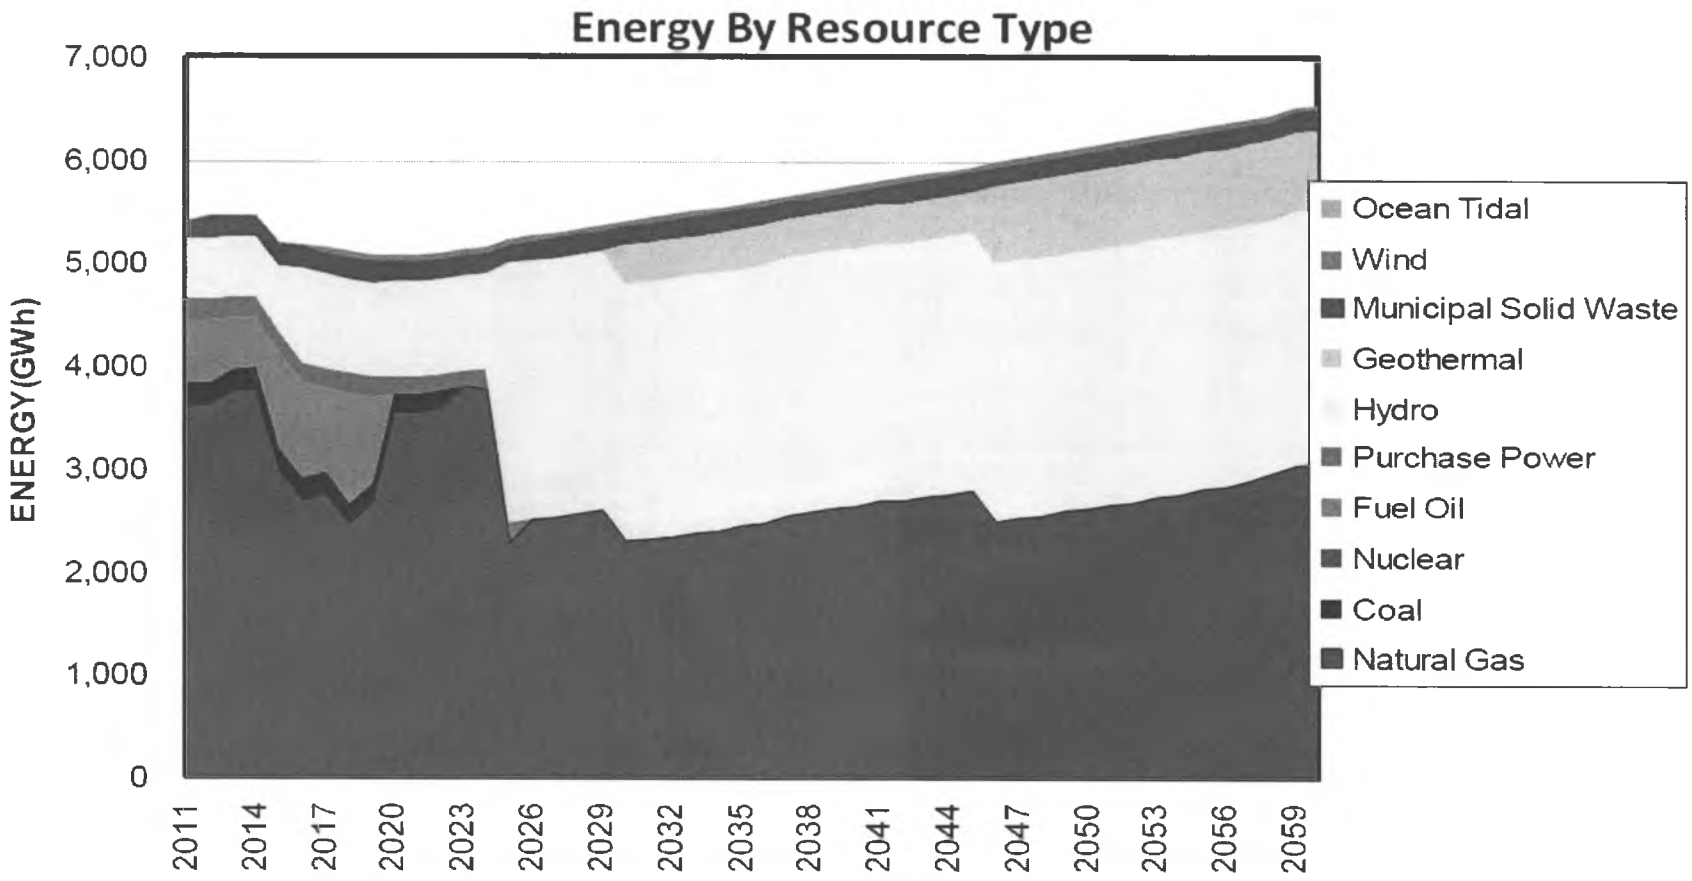
Energy:

- Susitna
  - Installed capacity 600 MW
  - Average energy 2600 GWhr/yr
  - About 50% of annual railbelt energy
- Chakachamna
  - Installed capacity ~300 MW
  - Average energy 860 – 1100 GWhr/yr
  - About 20% of annual railbelt energy

RAILBELT DEMAND



Railbelt Energy:



B&V RIRP
2009

Estimated Cost of Power:

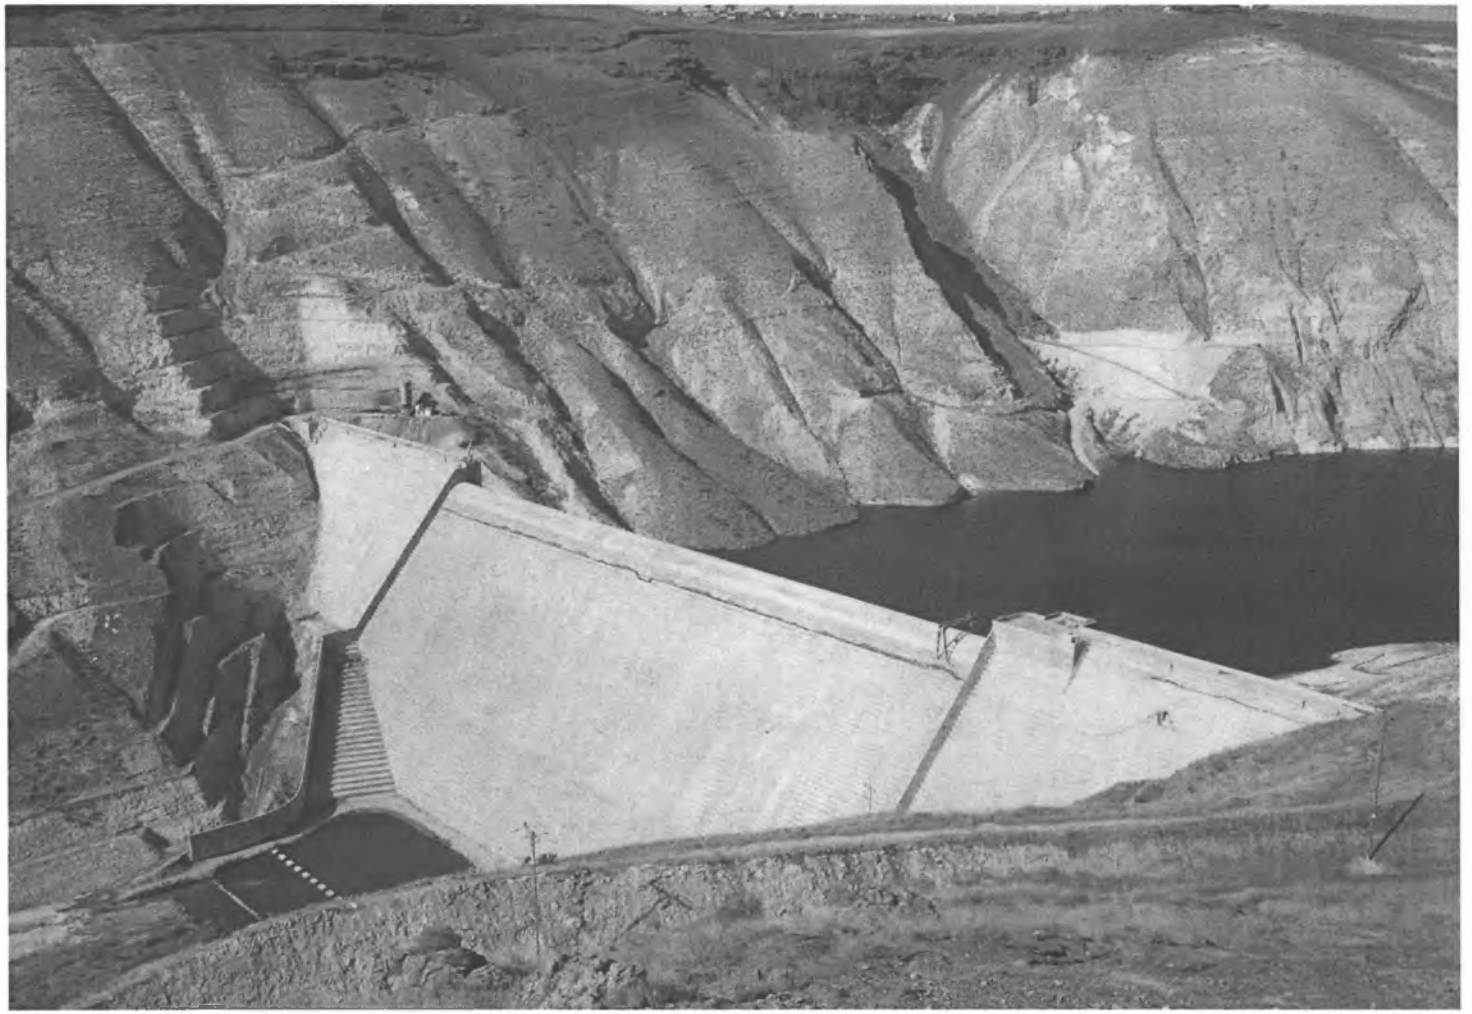
	Estimated Cost of Power Comparison					
Project	Estimated Construction Cost	Finance Amount (50%)	Rate	Term (years)	Annual Energy (GWhrs)	Cost per kWhr
Susitna Embankment	$4.5B	$2,250M	6%	30	2600	$0.063
Susitna RCC	$3.6B	$1,440M	6%	30	2600	$0.05
Chakachamna	$2.9B	$1,440M	6%	30	860	$0.12

Estimated cost does not include O&M and utility distribution costs.

Bradley Lake Hydroelectric

Example of embankment dam

Al Wehdah (Jordan) Hydroelectric



Example of a Roller Compacted Concrete (RCC) dam

Susitna Timeline:

- Licensing
  - 3.5 years - Prepare and file Final Application for License
  - 3 years – FERC Processing and follow-up
- Construction
  - 4.5 years Construction

11 years until startup

Susitna Next Steps:

- Tentative Public Meetings
  - Fairbanks - February 24
  - Talkeetna - February 28
  - Palmer - March 1
  - Anchorage – March 2
- Engineering & Environmental Studies
  - Mapping
  - Gap Analysis
  - Geotechnical
  - Working Groups
  - Land Owners
  - Access
  - FERC Preliminary Application Document
  - FERC Draft Study Plan
  - Evaluate dam and powerhouse type

Susitna Benefits

- Greater than 100 year life
- Expandable for future growth
- Predictable, secure, clean, low cost energy
- Provides dispatchable energy
- Investment in Alaska Infrastructure
- Alaskan jobs and funds stay in-state long term
- Hydro necessary to achieve States 50% renewable statewide energy policy
- State participation can make energy same cost as existing and lower in the long term.

Susitna Project	Susitna Hydroelectric Project, Low Watana Non-expandable Alternative
TBM	tunnel boring machine
TLP	Traditional License Process

Executive Summary

There are two proposed major hydroelectric projects in the Alaska Railbelt Region: the Susitna Hydroelectric Project, Low Watana Non-expandable Alternative (Susitna Project) and the Chakachamna Hydroelectric Project (Chakachamna Project). The purpose of this document is to identify which of these is most likely to successfully meet the long term energy needs of the railbelt at reasonable cost. This preliminary evaluation also considers the possibility to permit a project in its presently proposed configuration and to be able to do so in a reasonable time frame.

The 2010 AEA Regional Integrated Resource Plan (RIRP) is a 50-year long range plan that identifies combinations of generations and transmission capital improvement projects in the railbelt region (Black and Veatch 2010). The RIRP documented the need for a large amount of new annual generation for the railbelt within the next 10 to 15 years. The type of generation constructed will be influenced by declining Cook Inlet natural gas production, legislative environment, financing, and ability to permit or license and construct a project in a timely manner.

The 2010 Alaska legislature passed House Bill (HB) 306 which declares a State energy policy. This bill directs the State to receive 50 percent of its electrical generation from renewable and alternative energy sources by 2025. The only way to achieve this goal is for a new large hydroelectric project to be built in the railbelt region. The project sites, one on the Susitna River at Watana and one at Lake Chakachamna, are shown on Figure 1-1. The energy generated by one of these two projects would provide roughly one fourth (Chakachamna) to roughly one half (Susitna) of the current electrical energy demand.

Alaska Energy Authority received funding from the Alaska Legislature in 2010 for the preliminary planning, design, permitting and field work for the Susitna and Chakachamna Projects, as well as Glacier Fork Hydroelectric Project and other hydroelectric projects along the Railbelt. Most of the funds were allocated to the Susitna and Chakachamna Projects. There are a variety of alternatives on the Susitna River as documented in the HDR Report (2009). The Susitna Project chosen for this comparison is the Low Watana Non-expandable alternative. It was chosen because it offers a combination of greater winter storage capacity while still maintaining a low overall cost and low cost of power generated.

Permitting and licensing of a large hydroelectric project is regulated by the Federal Energy Regulatory Commission (FERC) and is a lengthy, complex and costly process. For this reason, the two projects must be evaluated at an early stage to determine if either has a fault that would prevent it from being licensed and constructed. As substantial research has already been done on each project, this document summarizes existing information on the projects, and uses this information for evaluation and comparison. Additional detailed information is available in the referenced documents. By using existing information to choose a primary project, resources can be concentrated on its development, with the goal of satisfying future railbelt energy demand and compliance with the legislative intent that the State receives 50 percent of its electric generation from renewable and alternative energy sources by 2025.

The ultimate goal of developing a project is to provide a cost-effective and long-term energy source to the railbelt region. Therefore, the cost, potential environmental impact, engineering issues and energy production potential of both projects were evaluated. This evaluation highlights key elements of each project that affect the cost of resulting energy, timeliness of energy contribution, and long term environmental and the projects' socioeconomic operational effects.

The results of this comparison show that the Susitna Project should be the Alaska's primary hydroelectric project; the Chakachamna Project should be considered as an alternative. Although the design, permitting and construction of the Susitna Project would cost approximately 50 percent more than it would for the Chakachamna Project the Susitna Project would produce more than twice the annual amount of energy as the Chakachamna Project. In addition, risk of cost overruns with the Chakachamna Project would be much greater than with the Susitna Project because of the extensive underground work required and its location in steep terrain.

The environmental impact of the Chakachamna Project would also be greater because it would require a cross-basin water transfer in a river system with salmon migration. Significant salmon runs travel to and through Lake Chakachamna. To allow enough environmental flow to protect fisheries, energy from the Project would have to be substantially reduced.

Additional conclusions that can be drawn from the comparison of the two projects include:

- As indicated above, in terms of energy production, the Susitna Project would produce more than two times the amount of the Chakachamna Project. The Susitna Project would have the added advantage of sufficient storage for significant energy production in the winter.

- The licensing, permitting and construction process for the Chakachamna Project would take roughly 3.5 years longer than for the Susitna Project because of the complex environmental studies required for the cross basin transfer and the time for the tunnel construction.

- The State would need to contribute substantial equity and be the licensee for either project. The ability to finance the projects is equal in either case.

- There are relatively less long term operational uncertainties for the Susitna Project.

- Both projects have some seismic risk; however the dams and powerhouses could be designed to withstand major seismic events as long as a fault does not pass through the structure. The Chakachamna Project has a relatively greater risk of damage to the power tunnel or fish passageway during a seismic event or volcanic eruption.

- The Susitna Project would be a larger construction project and have greater impacts on electrical rates than the Chakachamna Project along the railbelt and Statewide, in the form of lower rates in the long term.

- The Susitna Project would allow the State to achieve the State Energy policy goal of 50 percent renewable by 2025. The Chakachamna Project would not accomplish this goal by itself.

Overall, the Susitna Project would have a relatively lower cost of energy, fewer likely environmental effects, could start sooner, a reduced licensing/permitting schedule, less construction and long term operational risk, and greater positive impacts on the Alaskan economy than the Chakachamna Project.

A year of field studies at Lake Chakachamna would not be sufficient to determine an definitive environmental flow, would not predict project energy outcomes, or substantially change the economic factors that make the Susitna Project more desirable. Thus, Chakachamna Project field work should not proceed in 2011. Instead it may be prudent to perform some additional studies to confirm conceptual size optimization and cost.

Much of the information in this document came from reports prepared by HDR (HDR 2010), R&M Consultants/Hatch Associates Consultants (R&M Consultants/Hatch Associates Consultants 2010), and Seattle-Northwest Securities Corporation (SNW 2010). In addition, R&M Consultants/Hatch Associates provided Operational Uncertainty evaluation in Chapter 9. The referenced documents should be read for the full assumptions. Referenced documents and other important documents regarding these projects are available on the Alaska Energy Authority's Railbelt Large Hydro webpage.

Chapter 1

Project Descriptions

Each of the potential projects is described in the following section.

1.1 Susitna River Hydroelectric Project (Low Watana Non-expandable Alternative)

A two dam scheme was developed for the Susitna River Hydroelectric Project initially by the Corps of Engineers in the late 1970's for which a feasibility study was completed by Acres American Inc. for the Alaska Power Authority (APA) in 1982 (Acres 1982) and a license application was filed with FERC. An amended license was prepared in 1985 (Harza Ebasco 1985) and the project was cancelled in early 1986. Extensive site work including surveying, deep rock drilling as well as soil drilling and sampling was conducted at the Watana site. In addition environmental studies including fish and wildlife studies were conducted throughout the basin and included instream flow studies in the side channel sloughs downstream of Portage Creek.

In the two dam scheme developed in the Acres feasibility study (Acres 1982) the upper dam was at Watana (Figure 1-1) and was to be an 885 foot high earthfill embankment with a 1040 MW underground powerhouse. It was to be constructed first. The amended license (Harza Ebasco 1985) proposed to develop the project in three stages instead of two with an expandable 700 foot high embankment at Watana as the first phase with an installed capacity of less than 500 MW.

A number of hydroelectric generation alternatives were studied recently on the Susitna River (HDR 2009), of which the Low Watana Non-Expandable Alternative is the selected Susitna Project discussed in this document. The Low Watana Alternative, a 700 foot high dam with a 600 MW powerhouse was chosen because the best combination of winter storage, less environmental impact and low overall cost in addition to meeting the 50 percent renewable goal by 2025. The expandable version of a dam at this location was not chosen because it is more expensive initially relative to power output and the ultimate raised dam would have more environmental impacts related to terrestrial habitat as well as other technical challenges. The location of the Susitna Project as chosen for this review is the same location as the Watana dam in the two dam scheme as proposed in the 1980's (Acres 1982, Harza Ebasco 1985).

The Susitna Project would be located approximately half-way between Anchorage and Fairbanks. It would create a dam on the Susitna River at river mile 184 above the mouth of the Susitna River. The dam would be located within a steep sided river valley approximately 15 miles upstream of Devil's Canyon. The 700 foot high dam would have a 557 foot difference between tail water and maximum pond elevation, with a maximum pond level of 2014 feet. The reservoir would be 39 miles long and a maximum of 2 miles wide. Installed capacity would be 600 MW with the average annual generation determined to be 2600 GWhrs (HDR 2009). A final decision has not been made on the type of dam or the type of powerhouse (underground or surface) that would be used. The location of the Project is shown in Figure 1-1.

1.2 Chakachamna Hydroelectric Project

The Chakachamna Project was studied in detail in the 1980's as reported in the Bechtel report (Bechtel 1983). The project developed in that report consisted of an intake under the lake, and a 12 mile tunnel to an underground powerhouse on the McArthur River. At that location, the best alternative had a small regulating dam on the Chakachatna River and was estimated to produce 1,300 GWhrs of electricity annually although the report indicated that the maximum power could be generated by eliminating environmental flows and producing 1664 GWhrs of electricity annually with an installed capacity of 400MW. This latter alternative was identified to have adverse impacts on the fishery resources which use the Chakachatna River. Chapter 4 of this document; Preliminary Energy Estimate, further addresses the energy potential of the Chakachamna Project in light of environmental flows in the Chakachatna River.

The 1983 report (Bechtel 1983) also included an extensive environmental study which included environmental hydrology, aquatic biology, terrestrial vegetation and wildlife as well as human resources.

The Chakachamna Hydroelectric Project (Chakachamna Project) currently has a Preliminary Application before FERC (FERC No. 12660). In its Pre-Application Document (PAD) filed with FERC, the applicant, TDX Power described the Project to have 300 MW installed capacity and generate 1300 GWhrs hours of annual energy (TDX Power 2009).

The Chakachamna Project is located approximately 85 miles west of Anchorage at the south base of Mt. Spurr. Chakachamna Lake drains into the Chakachatna River, which flows downstream through a complicated system, ultimately flowing into Cook Inlet. That flow is partially joined to the McArthur River flow by way of the Noaukta Slough. The Chakachamna Project is essentially the same as the original scheme in the Bechtel study and involves diverting water from Chakachamna Lake through an 11 mile tunnel to an underground power plant near the McArthur River. The power plant would discharge its tailrace flow to the McArthur River and the flow would not rejoin the Chakachatna River until a point much further downstream, reducing flow in a portion of the Chakachatna River, and the Noaukta Slough and Middle River as well. The location of the Project is shown in Figure 1-1. The Project and vicinity are shown in Figure 1-2. The current scheme does not have a dam on the Chakachatna River as it exits the lake.

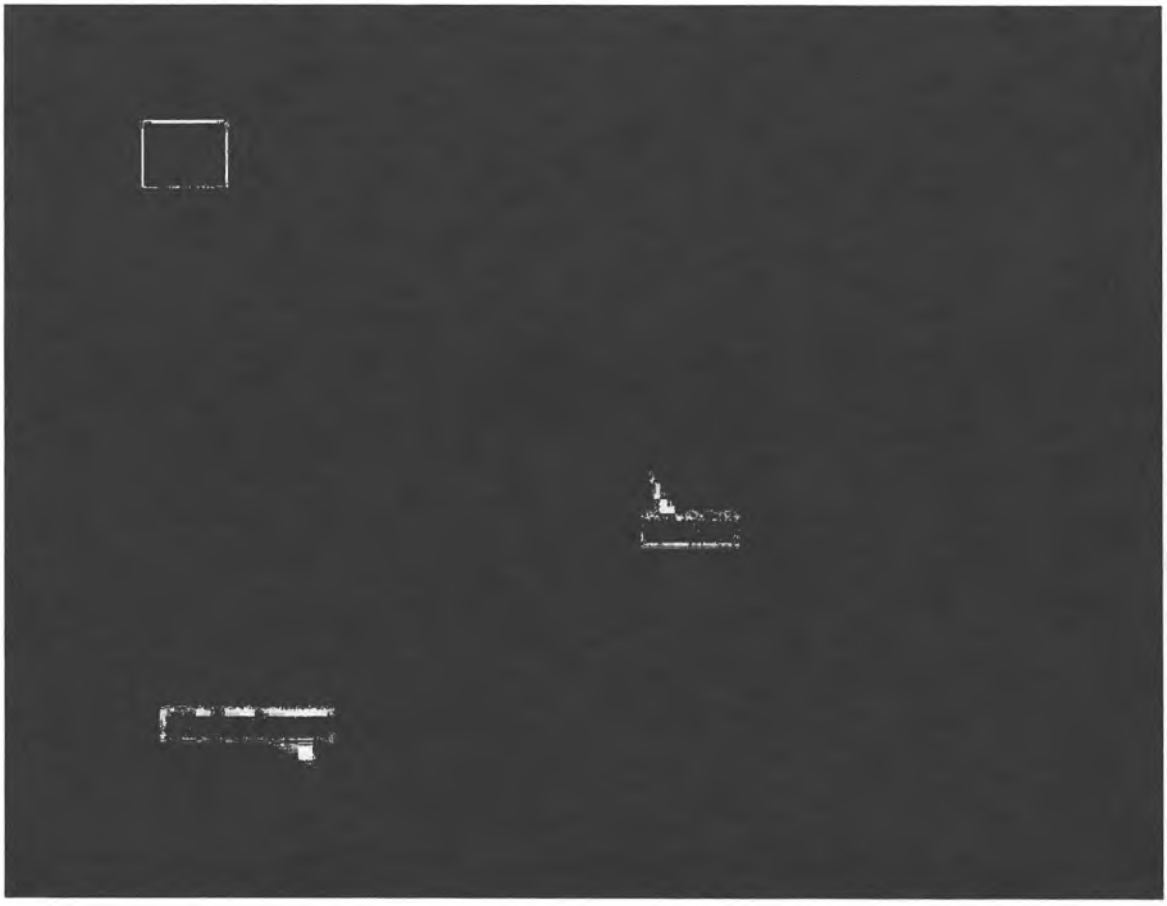

Figure 1-1 **Locations of the Susitna Project (Low Watana Alternative) and the Chakachamna Project**

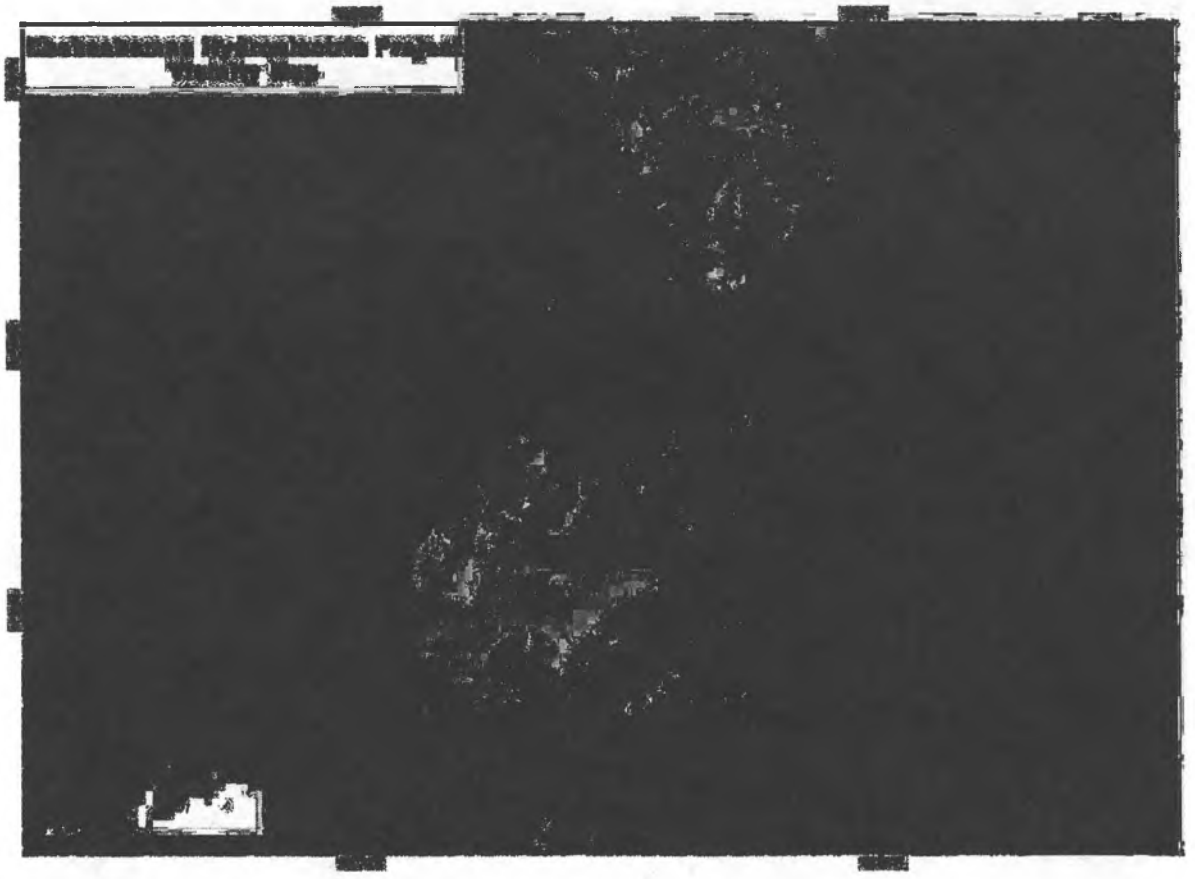

Figure 1-2 Vicinity of the Chakachamna Project

Chapter 2

Engineering Issues

Engineering issues associated with each potential project are discussed in the following section.

2.1 Access

2.1.1 Susitna Project

The Susitna Project could be accessed both from the Denali Highway by a new road and from Gold Creek (existing railroad bridge over the Susitna River) by a new rail line. Access via two modes of transportation provides the Project with advantages; the most significant of which is that the road could be built quickly, allowing early on site construction work. The rail link would allow materials from outside the State to be transported directly to the site by rail without having to off load to trucks.

2.1.2 Chakachamna Project

The Chakachamna site requires access from tidewater to the lake, the tunnel adits, and the McArthur River powerhouse location. Construction of a large dock to handle heavy equipment at Tyonek would be necessary. Access routes needed for construction and operation would be challenging. The construction access road could not cross the Trading Bay Game Refuge, and would therefore require crossing the braided Chakachatna River delta and wetland, as well as traversing high on steep mountain slopes to access the area near the lake

2.1.3 Access Comparison

Both projects would require roads and/or railroad to be constructed to handle very large and heavy equipment. Constructing access into both projects is likely to require two years. The advantages of access to the Susitna Project are that a major bridge is not required and that the routes cross less steep terrain compared to the Chakachamna Project. The bridge (or two) over the Chakachatna River will be large, expensive structure(s) with capacity to handle the heavy equipment. It is questionable whether a road built to handle heavy equipment could be constructed to the fish passageway location. If a road could not be constructed to handle a tunnel boring machine, drill and blast construction of the fish passageway would be required.

2.2 Transmission

2.2.1 Susitna Project

The Susitna Project would connect to the north-south intertie near Gold Creek. The cost of that transmission from the Susitna power plant to the intertie is included in the Susitna Project cost

estimate. A conceptual study of the transmission needs in the railbelt if the Susitna Project was constructed was completed by EPS (EPS 2009). Upgrades to the existing intertie and substations would be required to transmit energy to Anchorage and Fairbanks.

2.2.2 Chakachamna Project

The Chakachamna Project transmission costs were estimated in today's dollars based on the original 1980's scheme. The cost of the transmission from the power plant to the Beluga Power plant was included in the cost estimate. It is believed a triple circuit would be required for the segment of the powerplant to Beluga, as well as additional changes in the railbelt transmission system. If the Chakachamna Project was constructed, transmission upgrades from Beluga plant to the intertie and an upgrade of the intertie upgraded would likely be necessary.

2.2.3 Transmission Comparison

Transmission line construction beyond the two projects will be needed. Because the Susitna Project will be located centrally between Anchorage and Fairbanks, it will require less total length of new line construction, but because of the larger power output will require more actual circuits. Chakachamna Project will likely require some new line construction from Beluga to Anchorage and changes if energy is to be transmitted north to Fairbanks. Overall there is not a significant difference between the two projects due to transmission needs.

2.3 Geologic Hazards

2.3.1 Susitna Project

The design earthquake for the Susitna Project would likely be a based on consideration of a Denali fault event somewhere in the range of magnitude 8.0, a local crustal earthquake and a subduction zone earthquake with a magnitude of roughly 8.5. The original Project design considered all of these earthquakes in the design. Excellent recent data exist on the Magnitude 7.9, 2002 Denali fault earthquake. A review of the earthquake design requirements for a Susitna Project was made by R&M Consultants (R&M 2009).

Subsurface conditions at the Susitna Project site are well known due to considerable rock drilling in the 1980's at the site. At the time, it was considered feasible to construct both diversion tunnels, power tunnels and an underground powerhouse.

There have been recent earthfill dams designed for large earthquakes, the most significant being the Seven Oaks Dam in Orange County, California, which is designed for a magnitude 8 earthquake from a distance of 1.2 miles away.

2.3.2 Chakachamna Project

The design earthquake for the Chakachamna Project would likely be from the Castle Mountain fault, which is approximately 6 miles from the power plant location. Proximity to the fault would likely mean that smaller connecting faults would be encountered during tunneling, which

could cause delays and increased cost during construction. Subsurface geologic conditions along the tunnel alignment are not known. The frequency of any significant faulting and associated zones of fractured rock are not known, and could affect tunnel construction.

The Chakachamna Project also has other geologic hazards due to its proximity to Mount Spurr and Barrier Glacier. The most recent eruption at Mount Spurr was in 1992. If the volcano were to erupt again, ash fall and mud flows have the potential to block or partially block the powertunnel intake, fish passageway, or natural outflow of the lake. Facilities would need to be located or designed to minimize risk from an eruption. Also, at Lake Chakachamna, Barrier Glacier, which partially dams the lake, is a geologic risk. The glacier does not appear to be currently moving, is covered with debris, and has an ice core. A partial release of the lake occurred in 1971 when the outlet was eroded. The lake level dropped 10 to 15 feet. Facilities would need to be designed to accommodate a change in the glacier, which could cause the lake level to go up or down and substantially affect Project energy production and fish passage.

2.3.3 Geologic Hazards Comparison

Overall geologic hazards are somewhat greater at the Chakachamna site due to the close proximity of the castle Mountain fault and Mount Spurr.

2.4 Estimates of Probable Project Development Costs

A comparison of cost estimates for development of both project are provided in the following Section.

2.4.1 Susitna Project

2.4.1.1 Cost Estimate History

In 1982 to 1983, a detailed cost estimate to develop the complete Watana/Devil Canyon project was prepared. This estimate was revised in1985 to 1986, and again in March 2009. The latest estimate, prepared in November, 2009, is for a Low Watana Non-Expandable alternative. The estimate for this project in 2008 dollars is $4.5 billion as detailed in Table 2-1 below.

Table 2-1 Susitna, Low Watana Project Cost Summary

FERC Line #	Line Item Name	Low Watana (2008 Dollars Millions)
71A	Engineering, Environment, and Regulatory (7%)	$ 236
330	Land and Land Rights	$ 121
331	Power Plant Structure Improvements	$ 115
332.1-.4	Reservoir, Dams and Tunnels	$ 1,538
332.5-.9	Waterways	$ 590

Table 2-1 Susitna, Low Watana Project Cost Summary

FERC Line #	Line Item Name	Low Watana (2008 Dollars Millions)
333	Waterwheels, Turbines and Generators	$ 297
334	Accessory Electrical Equipment	$ 41
335	Misc Power Plant Equipment	$ 21
336	Roads, Rails and Air Facilities	$ 232
350-390	Transmission Features	$ 224
399	Other Tangible Property	$ 16
63	Main Construction Camp	$ 180
71B	Construction Management, 4%	$ 135
Total Subtotal		**$ 3,746**
Total Contingency		**$ 749**
Total (Millions of Dollars, rounded)		**$ 4,500**

2.4.2 Chakachamna Project

2.4.2.1 Cost Estimate History

In 1982, a detailed cost estimate was prepared for developing the Chakachamna Project. In 2008 and 2009, re-evaluations of this original estimate were made to take into account potential new alternative arrangements. In 2010, the detailed 1982 was updated with unit prices modified to be consistent with the estimated costs for the Susitna Project. The estimate for the Chakachamna Project in 2008 dollars is $2.9 billion, as detailed in Table 2-2 below.

Table 2-2 Chakachamna Project Cost Summary Table

FERC Line #	Line Item Name	Chakachamna (2008 Dollars Millions)
71A	Engineering, Environment, and Regulatory (7%)	$ 151
330	Land and Land Rights	$ 75
331	Power Plant Structure Improvements	$ 105
332.1-.4	Reservoir, Dams and Tunnels	$ 1,147
332.5-.9	Waterways	$ 123
333	Waterwheels, Turbines and Generators	$ 181
334	Accessory Electrical Equipment	$ 20

Table 2-2 Chakachamna Project Cost Summary Table

FERC Line #	Line Item Name	Chakachamna (2008 Dollars Millions)
335	Misc Power Plant Equipment	$ 15
336	Roads, Rails and Air Facilities	$ 172
350-390	Transmission Features	$ 232
399	Other Tangible Property	$ 0
63	Main Construction Camp	$ 90
71B	Construction Management, 4%	$ 86
Total Subtotal		**$ 2,400**
Total Contingency		**$ 480**
Total (Millions of Dollars, rounded)		**$ 2,880**

2.4.3 Cost Comparison

Although capital cost is greater for the Susitna Project, the evaluation in Chapter 9 will show that the cost to repay the financing of the project relative to energy production will be lower for the Susitna Project. Since the financing cost is a major portion of the energy cost, and since operation and maintenance and utility cost will be roughly equal regardless of the power source, overall, the Susitna Project cost per unit of energy will be relatively lower.

Detailed Susitna costs can be found at Susitna Hydroelectric Project Alternatives Design Report 2009 located on the AEA Railbelt Large Hydro webpage.

Detailed Chakachamna costs can be found at Susitna and Chakachamna – Preliminary Decision Document 2010 located on the AEA Railbelt Large Hydro webpage.

Chapter 3

Environmental Issues

Development of a hydroelectric project would face a variety of issues over the design lifetime. The design lifetime for a modern hydroelectric facility is anticipated to be greater than 100 years. The following discussion is not all inclusive but highlights the likely major areas of concern regarding both projects. Botanical and cultural resource issues are not discussed in this document since they have not been fully explored and tend to have less overall impact on whether a project is licensed and constructed.

3.1 Fisheries

3.1.1 Susitna Project

Fish resources have the highest potential to be impacted by the project. Most of the potential impacts would occur in the reservoir and the middle Susitna River downstream of the reservoir. There would be impacts due to changes in water quality, thermal regime, suspended sediment load, reservoir draw-down fluctuations, impoundment zone inundation, flow regime, and fish habitat. Not all impacts to fish populations would be negative. For example, an increase in winter water temperatures could lead to the enhancement of overwintering habitat and thus greater fish survival; however, the cooler spring water temperatures could slow fish growth.

The majority of the salmon production occurs in tributaries outside the area of anticipated effects. Devil Canyon acts as an effective passage barrier to upstream migration of salmon. Radio telemetry studies of Susitna drainage conducted by ADF&G (Yanusz et. al., 2007) observed no sockeye salmon moving above Portage Creek near the entrance to Devils Canyon. A few (less than 100) adult Chinook salmon have been observed above the Devil Canyon dam site (FERC Amend Nov 1985). Electrofishing surveys conducted by ADF&G in 2003 (Johnson, 2010) documented Chinook salmon rearing in Kosina Creek and the Oshetna River, both located above the Watana Dam site.

In the Watana impoundment zone, approximately 40 river miles of the Susitna River would be inundated and transformed into reservoir habitat. An additional 15 miles of four named tributary streams (including Kosina Creek) and numerous smaller unnamed tributaries and eight small lakes would be inundated. There are nine species of fish occurring in the proposed impoundment zones: Arctic grayling would lose approximately nine miles of spawning habitat and would not likely populate the impoundment zone (ENTRIX 1985). River habitat would be transformed into lake/reservoir habitat that may be occupied by a different array of fish species. Lake drawn down may limit spawning of species dependent upon these areas for reproduction. Table 3-1 shows the possible fisheries impact of the Susitna Project.

3.1.2 Chakachamna Project

Chakachamna Project has fish issues of concern to resource agencies. Since this document is a summary, only the three that most affect project economics and licensing ability will be discussed.

3.1.2.1 Lake Level Fluctuations

Chakachamna Lake and the surrounding tributaries support abundant salmon and freshwater fisheries resources. Five significant tributaries and numerous minor drainages empty from the surrounding mountains into Kenibuna and Chakachamna Lakes. Of these, the Chilligan and Igitna Rivers provide significant sockeye salmon spawning habitat. The lake tributary streams also provide habitat for Dolly Varden.

Studies in 1982 showed significant numbers of adult sockeye salmon milling along the north shore of Chakachamna Lake and spawning was suspected but not confirmed. Chakachamna Lake also provides habitat for resident lake trout, Dolly Varden, and round whitefish. Life histories of lake trout, Dolly Varden, and whitefish have not been investigated in Chakachamna Lake.

Under the proposed operational structure (base case), the lake level would fluctuate approximately 60 feet from the normal maximum pool elevation of 1,142 feet to the normal minimum pool elevation of 1,082 feet. If sockeye salmon spawn along lake shoals, it is likely that their spawning timing would coincide with the maximum pool elevation. The resulting eggs might subsequently be exposed and killed when the lake level drops to the minimum pool elevations in March or April. Similarly, lake trout spawning areas may be affected by the winter lake drop in lake level.

An additional impact relating to lake level drop is the potential for down-cutting of the channel between Kenibuna and Chakachamna Lakes and the fluvial fans of lake tributaries such as the Chilligan River. If down cutting occurs and as a result effects the level of Kenibuna lake (within Lake Clark National Park) then project can not be licensed by FERC. Down cutting may also effect fish passage into the tributaries particularly during periods of low lake level.

3.1.2.2 Reduced Flows into the Chakachatna River

The proposed operation of the Chakachamna Hydroelectric Project involves diverting a portion of the natural flow out of Lake Chakachamna to the powerhouse located in the McArthur River valley. In the base case, the average flow in the Chakachatna River will be reduced by approximately 50 to 80 percent from June through November.

The Chakachatna River provides a migration corridor, spawning habitat, and rearing habitat for salmon. The lower Chakachatna River splits into three branches: Middle River, which flows southeast to Cook Inlet, the Chakachatna River, which flows south and joins the McArthur River near its mouth, and a third braided section called Noaukta Slough which joins the middle part of the McArthur River. Hydrologic ties to the Chakachatna and McArthur rivers appear important in supporting the lower elevation wetlands north of Noaukta Slough and in the Trading Bay State

Game Refuge. Reduced river flow may cause floodplains, wetlands, and riparian habitats to dry. Drying of these wetland would effect fish populations in the Trading Bay State Game Refuge.

3.1.2.3 False Attraction

Transfer of water from Chakachamna Lake to the upper McArthur River may cause false attraction of adult salmon to the powerhouse tailrace during their spawning migration. The tailrace is proposed to be located approximately 15 miles up the McArthur River from the Noaukta Slough (Chakachatna River) confluence. The mixture of Chakachamna Lake water from the tailrace may confuse salmon migration and could prevent or delay the movement of salmon to spawning areas in Chakachamna Lake and its tributaries.

Critical months for salmon passage into and out of the lake occur between May and September, when a majority of the lake's discharge will be diverted to the upper McArthur River. Adult salmon return to their natal spawning areas by using olfactory cues (chemical "smells"). For Lake Chakachamna sockeye salmon, these cues are imprinted at the smolt stage when juvenile salmon migrate from spawning and rearing areas in the lake out the Chakachatna River to salt water. Because the majority of the Lake Chakachamna water is being discharged from the powerhouse into the McArthur River a substantial number of the adult salmon may be falsely attracted to the powerhouse in the McArthur River.

3.1 Wildlife Impacts

3.1.1 Susitna Project

There are currently no known listed endangered species in the project area. The most significant effect on wildlife would be on the species that live in the spruce forested valley walls. Impacts on each species would be different based on species abundance and use of the habitat; however, major threats common to most species have been identified. Downstream of the Watana reservoir there may be an increase in preferred moose browse, thus increasing the moose population (Harza Ebasco 1985b). The Susitna Project development would impact mink and otter in the middle river by increasing the winter turbidities which would reduce the value of the mainstem as feeding habitat. Open water in the winter would have a positive effect on mink and otter (Harza Ebasco 1985b). Other impacts to animals downstream of the reservoir would be negligible (Harza Ebasco 1985b).

A summary of the potential environmental impacts of the Susitna Project is provided in Table 3.1 below.

Table 3-1 Potential Environmental Impacts of the Low Watana Hydroelectric Project on the Susitna River

Impacts	Issues
Reservoir - Impacts	
River Habitat & Fisheries Impacts	Approximately 40 river miles of the main stem of the Susitna River and 15 miles of tributary streams will be converted from riverine to reservoir environment. Arctic grayling are the most abundant fish species in the impound zone and will have the greatest

	impacts with the loss of approximately nine miles of spawning habitat. A significant portion of lower Kosina Creek used by rearing Chinook salmon will be lost to inundation.
Fish passage	Fish passage may be blocked for a small number of Chinook salmon that travel above the site.
Drawdown impacts	The annual drawdown and refilling of the reservoir will affect an estimated 10 miles of river that will alternate between river and reservoir habitat.
Terrestrial Impacts	An estimated 20,000 acres of habitat will be flooded. Reservoir may alter traditional migration routes.
Downstream Impacts	
Flow change impacts to fish	Lower summer flows may reduce access to side channel fish habitats and reduce the amount of rearing habitat for salmonids. Increased winter time flows may provide more rearing habitat benefiting overwinter survival. Dampening of flows may alter streambed movement and affect side channel habitats.
Temperature impacts to fish	Lower than natural water temperatures in spring/early summer may cause a delay in the onset of favorable summer rearing conditions for salmonids. Warmer than normal fall water temperatures may extend the summer rearing period later into fall. Overwinter survival for salmonids may be benefited by warmer water temperatures and a delay in ice formation. Higher main stem discharges in winter may maintain higher rates of warm groundwater upwelling in side sloughs affecting incubation of salmon eggs.

3.1.2 Chakachamna Project

Wildlife impacts from the Chakachamna Project have not been studied in detail. Reduction of salmon traveling to Lake Chakachamna tributaries would reduce the food source for bears and eagle in Lake Clark National Park. Drying of Trading Bay State Game Refuge would potentially alter wildlife habitat effecting birds and mammals in the refuge.

Increased flow down the McArthur River may cause some increased flooding and wetlands south of Trading Bay State Game Refugee. The net effect of the changes in food source and habitat over a large area (Lake Clark NP, Trading Bay, and McArthur River) has not been studied.

3.2 Environmental Flow

3.2.1 Susitna Project

Environmental flow requirements are met by water being used for energy production passing through the generating units and then being released into the natural stream channel. The effect of environmental flows is to change the timing of the energy production but not necessarily the average annual amount of generation.

A preferred environmental flow regime in the 1980's was developed to have high late summer flows for maintenance of rearing habitat for Chinook salmon juveniles. However, peak summer flows would be reduced and winter flows (within limits) would be increased to generate more power. A comparison of the 1980 selected environmental flow and of the existing Susitna River flows are shown in Figure 3-1 below.

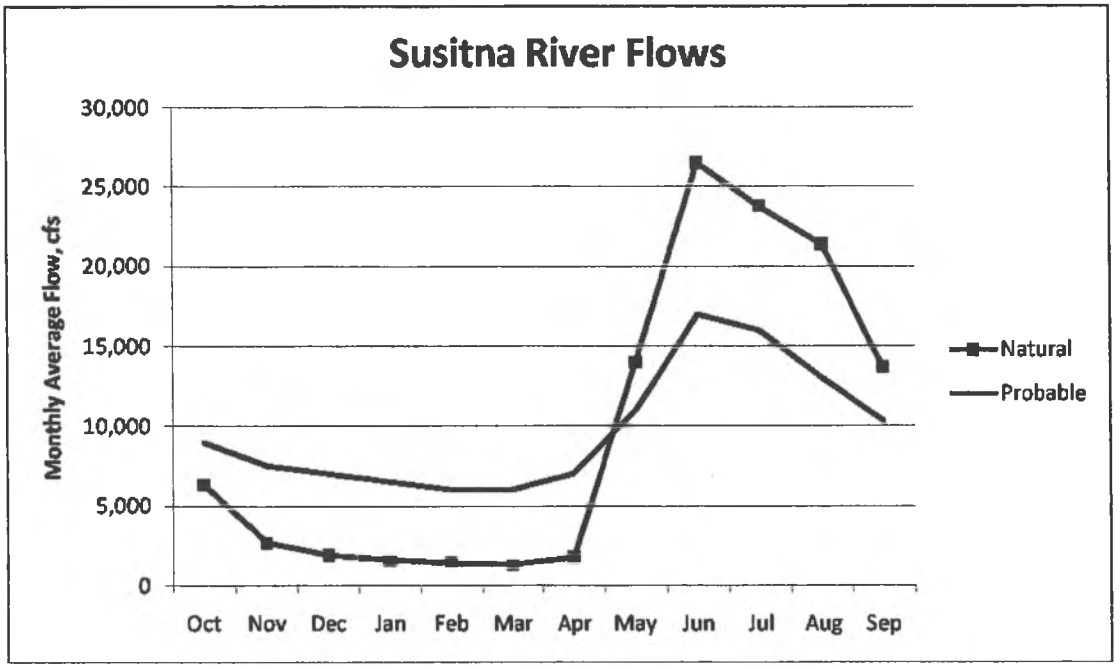

Figure 3-1. Susitna River monthly mean flow at Gold Creek.

3.2.2 Chakachamna Project

The preliminary environmental flow recommendations suggested for the Chakachatna River in the PAD are based on the Montana Method (Tennant 1972) as presented in the Bechtel report on the project in 1983. The Bechtel report assumed environmental flows during the months of April to September of 1094 cfs or lake inflow, whichever was less. During the months of October through March, the minimum environmental flow was assumed to be 365 cfs or lake inflow, whichever was less. These amounts of discharge are rated as "fair to degrading" flows in the Montana Method. This method was developed for and has primarily been used on rivers in the lower 48 states, which show little similarity to the glacially driven and highly seasonal flows of the Chakachatna River. Winter time flows using this method drop below historic average monthly flows, potentially resulting in freeze-out of spawning beds located outside the main river or in side channel areas. Summertime flows provided may not be sufficient to attract adult spawners confused by the discharges into the McArthur drainage or to provide for upstream passage through the canyon area located below Chakachamna Lake. Additionally, this environmental flow method does not take into consideration the groundwater hydrology feeding wetlands of the Trading Bay Game Refuge.

While it is outside of the scope of this document to complete the environmental flow analysis needed to adequately address all of the environmental issues in the Chakachamna watershed, Table 3-2 below provides an estimate of environmental flows that may be more likely to be viewed favorably by permitting agencies. It should be noted, however, that these flows have not been reviewed or endorsed by any permitting agencies. Determination of environmental flows for the project will ultimately be the result of a detailed analysis of instream flow data by conducted by a multiagency review team over a multi year time period.

Table 3-2 Estimate of Probable Environmental Flows

Month	Historic Natural Flow (cfs)	Base Case Flow (cfs)	Minimum Probable Flow (cfs)	Notes
October	2468	402	1,250	50% of mean monthly flow: provides water to Noaukta Slough to attract adult coho spawners and protect historic side channel spawning habitats.
November	1206	365	600	50% of mean monthly flow: provides water to Noaukta Slough to attract adult coho spawners and protect historic side channel spawning habitats.
December	813	363	600	75% of mean monthly flow: protects incubation in Chakachatna/Noaukta Slough spawning beds.
January	613	365	500	100% of mean monthly flow: protects incubation in Chakachatna/Noaukta Slough spawning beds.
February	505	357	500	100% of mean monthly flow: protects incubation in Chakachatna/Noaukta Slough spawning beds.
March	445	358	500	100% of mean monthly flow to protect incubation in Chakachatna/Noaukta Slough spawning beds.
April	441	582	500	100% of mean monthly flow: protects incubation in Chakachatna/Noaukta Slough spawning beds.
May	1042	1,094	750	75% of mean monthly flow: protects juvenile rearing in Chakachatna/Noaukta Slough areas and provides for outmigration of smolts from lake.
June	5,875	1,094	2,000	33% of mean monthly flow: provides water for outmigration of smolts from lake and feeds groundwater to Trading Bay Refuge wetlands.
July	11,944	1,421	4,000	33% of mean monthly flow: provides water to attract spawning adults to Chakachatna/Noaukta as opposed to McArthur, provides adequate flow for adult passage through canyon below lake outlet, and feeds groundwater to Trading Bay Refuge wetlands.
August	11,996	5,599	4,000	33% of mean monthly flow: provides water to attract spawning adults to Chakachatna/Noaukta as opposed to McArthur, provides adequate flow for adult passage through canyon below lake outlet, and feeds groundwater to Trading Bay Refuge wetlands.
September	6,042	2,164	2,000	33% of mean monthly flow: provides water to attract spawning adults to Chakachatna/Noaukta as opposed to McArthur, provides adequate flow for adult passage through canyon below lake outlet, and feeds groundwater to Trading Bay Refuge wetlands.

3.2.3 Environmental Flow Analysis

To evaluate the effect of increased minimum environmental flow requirements in the Chakachatna River and/or the effect of lake level fluctuations, two alternatives to the base case were also evaluated. Environmental issues surrounding project operations generally revolve around three main issues: 1) habitat affected by flows in the bypass reach; 2) upstream and downstream fish passage; and 3) habitat affected by lake level fluctuations. The alternatives to the Base case evaluated were:

- **Alternative #1 – Base case with probable environmental flow.** Alternative 1 is the same as the base case except that:
  - Environmental flow requirements are revised as described in Table 3-2 above.
  - The lake level fluctuations are not restricted.
- **Alternative #2 – Base case with probable environmental flow & minimization of lake fluctuation**. Alternative 2 is the same as the base case except that:
  - Environmental flow requirements are revised as described in Table 3-2 above.
  - The maximum lake level fluctuation would be 15 feet below the weir outlet.

A comparison of potential environmental impacts resulting from each alternative are presented in Table 3-3.

Table 3-3 Comparison of Potential Environmental Impacts Resulting from Chakachamna Lake Hydro Alternatives

Issue	Base Case	Alternative 1	Alternative 2
Lake Level Fluctuation			
Impacts to shoal spawning areas for sockeye salmon and lake trout	Significant impacts to incubating eggs due to draw down	Significant impacts	Least significant case but impacts may still occur
Access to inlet streams (Chilligan and Igitna) for sockeye spawners	Not likely to be impacted	Could be impacted due to drawn down	Not likely to be impacted
Adult salmon passage into lake	Minor to moderate, passage via natural outlet 87% of time	Significant, dependent upon using fish tunnel 91% of the time	Minor to moderate passage via natural outlet 87% of time
Smolt outmigration from lake	Unknown, smolts 100% dependent on fish passage tunnel	Unknown, smolts 100% dependent on fish passage tunnel	Unknown, smolts 100% dependent on fish passage tunnel
Chakachatna / McArthur Issues			
False attraction of Chakachamna sockey spawners to the McArthur powerhouse	Likely to occur	Least likely case but may still occur	Least likely case but may still occur
Noauktna Slough and Chakachatna side channel spawning and rearing habitats	Moderate impacts possible from winter freeze-out	Lower impacts than Base Case	Lower impacts than Base Case
Trading Bay Wildlife Refuge			
Groundwater fed wetland habitats	Moderate impacts	Lower impacts than Base Case	Lower impacts than Base Case

Under the Base Case and Alternative 1 the lake level would fluctuate approximately 60 feet from the normal maximum pool elevation of 1,142 feet to the normal minimum pool elevation of 1,082 feet. Spawning of adult salmon and Lake Trout may be effected and down cutting to tributaries may occur.

Lake level affects adult salmon passage into the lake in Alternative 1, where the natural outlet is not available to spawning adults 91 percent of the time. In this alternative, fish will be dependant upon using the two mile long fish passage tunnel. There is uncertainty whether fish will be willing to use the tunnel. In all cases the fish passage tunnel will be required for smolt outmigration.

In Alternative 2, the lake level is minimized to 15 feet below the outlet. While this amount of drawdown may exceed natural lake level fluctuation, it is the scenario offering the least impact to lake habitats.

For Chakachamna, limiting lake fluctuation (Alternative 2) to minimize the affect on upstream spawning will decrease the amount of runoff that can be captured, thereby decreasing the average annual generation. Figure 3-2 shows the post-project lake elevation by month for the base case and the two alternatives.

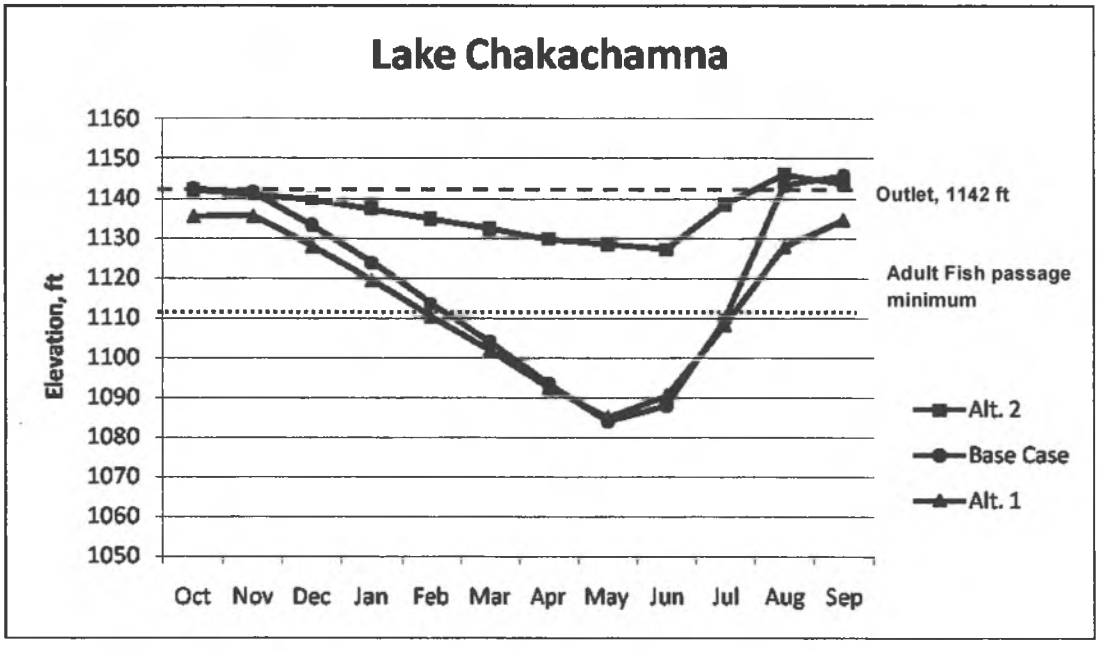

Figure 3-2 Chakachamna Lake Elevation by Month

Flows in the Chakachatna River during Project operation will be comprised of environmental flow releases and spill as shown in Figure 3-3. Since the powerhouse discharges return to the McArthur River, the net flows in the Chakachatna River are reduced in all cases.

Detailed Chakachamna environmental discussion can be found at Susitna and Chakachamna – Preliminary Decision Document, Environmental-Energy-Cost November 12, 2010 located on the AEA Railbelt Large Hydro webpage.

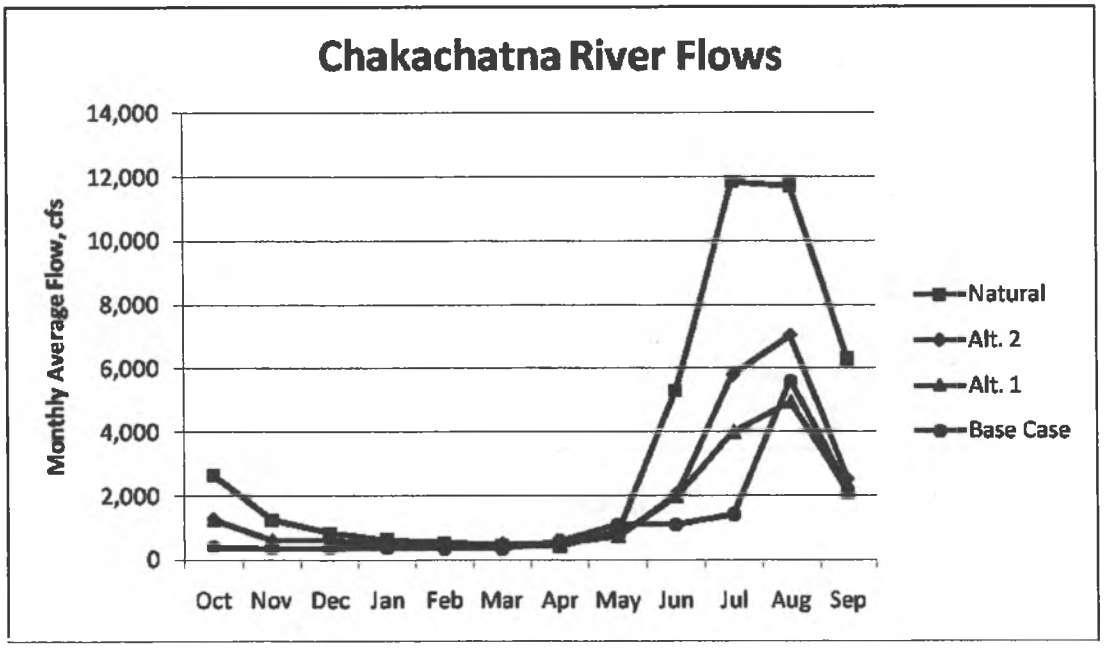

Figure 3-3 **Chakachatna River Flows (Downstream of Lake) by Month**

Chapter 4

Preliminary Energy Estimate

4.1 Evaluation of Average Annual Energy and Firm Winter Capacity

The amount of energy that can be produced from hydroelectric projects is a function of the amount of available water and, in the case of storage projects, how the available water can be regulated (systematically released). In addition to the average annual energy, the firm capacity attainable during winter months is of particular importance. For hydroelectric projects, the firm capacity is almost always lower than the installed generation capacity for a project. For the purposes of this study work, firm capacity is defined as:

"The amount of power the project can generate on a continuous basis from November 1 through April 30 with 98 percent reliability."

It should be noted that this is only one manner of regulation. The water can be regulated in a variety of different means in order to achieve other objectives, such as peaking, spinning reserve, or backup capacity. Major assumptions used to develop the estimates average annual energy and winter plant capacity are presented below.

4.1.1 Susitna Model Assumptions and Data Sources

This potential project consists of the construction of a large storage reservoir on the Susitna River at the Watana site with a 700-foot-high dam and a four-unit powerhouse with a total installed capacity of 600 MW. This "Low Watana non-expandable" alternative is described in detail in *Susitna Hydroelectric Project, Conceptual Alternative Design Report (*HDR Alaska 2009b).

4.1.2 Chakachamna Model Assumptions and Data Sources

This potential project consists of the inter basin transfer of water from a lake tap near the outlet of Chakachamna Lake through an approximately 10.8-mile-long tunnel to an underground powerhouse that would discharge to the McArthur River. The powerhouse would have a total generating capacity of 300 MW. The Base case (as proposed) and two alternatives were evaluated. Alternatives, described in Section 3.1.3, show how alternative operational constraints on the project would affect project energy. These alternatives are as follows:

- **Base Case** for analysis was the project as described in the PAD (TDX Power 2009). This project used environmental flow recommendations for the Chakachatna River based on the Montana Method (Tennant 1972).
- **Alternative #1 – Base Case with Probable Environmental Flow.** Alternative 1 is the same as the Base Case except that higher environmental flows are required.

- **Alternative #2 – Base Case with Probable Environmental Flow & Minimization of Lake Fluctuation.** Alternative 2 is the same as the Base Case except that higher environmental flows are required and lake level drop would be limited.

4.2 Results

Firm capacities and average annual energy estimates are presented in Table 4-1.

Table 4-1 Firm Capacity and Average Annual Energy Estimates

Alternative	98% Winter Capacity (MW)	Average Annual Energy Production (GWhrs)
Susitna	245	2,600
Chakachamna, Base Case	170	1,300
Chakachamna, Alternative 1	140	1,100
Chakachamna , Alternative 2	30	860

The energy distribution by month for each of the above alternatives is shown in Figure 4-1 below.

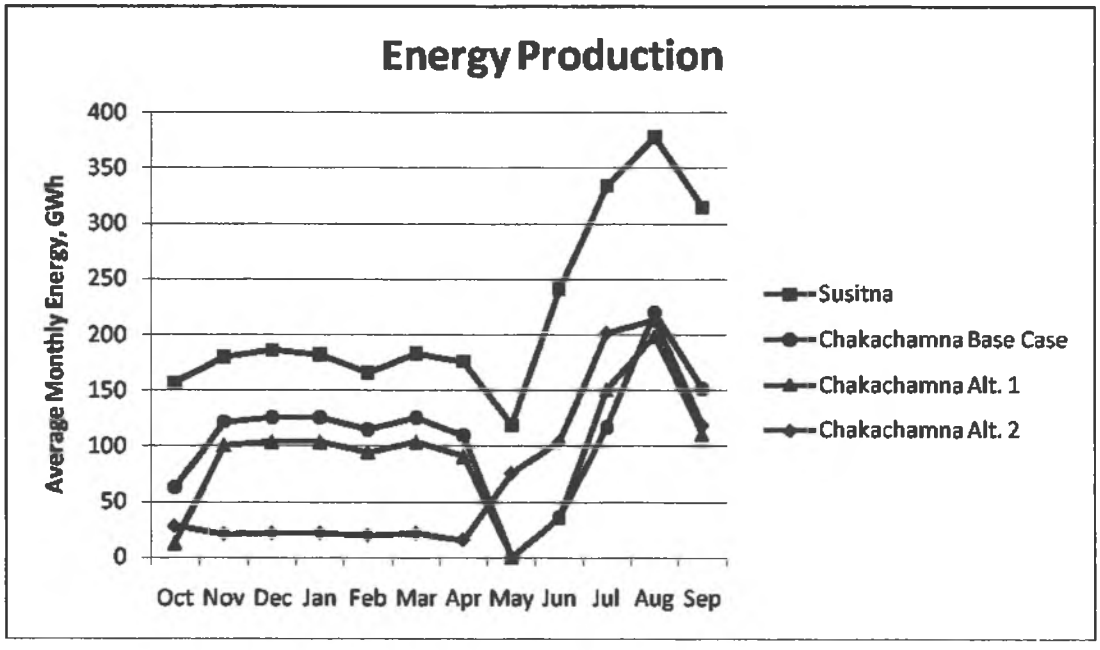

Figure 4-1 Energy Distribution by Month

As can be seen by these results, the firm winter capacity and average annual energy production estimates can vary significantly based upon the assumed environmental constraints placed upon the project. For the Chakachamna Project, increased environmental flow requirements (Alternatives 1 and 2) reduce the amount of water that is available for generation, thereby

lowering the annual energy. Reduced use of reservoir storage greatly limits the amount of energy that can be produced during the winter months (Alternative 2).

Detailed Chakachamna environmental discussion can be found at Susitna and Chakachamna – Preliminary Decision Document, Environmental-Energy-Cost November 12, 2010 located on the AEA Railbelt Large Hydro webpage.

For the Susitna Project, environmental flow requirements are met by water passing through the generating units and then being released into the natural stream channel. The effect of changed environmental flows is to change the timing of the energy production but not necessarily the average annual amount of generation.

Chapter 5 Permitting

5.1 Overview – Regulatory Processes

While pursuant to the Federal Power Act (FPA), the Federal Energy Regulatory Commission (FERC) has exclusive authority to issue licenses for most non-federal hydropower projects, there are several federal and state agencies that are authorized under several federal statutes to submit mandatory and recommended terms and conditions to be included in a FERC-issued license.

- **FERC's licensing process options** – Applicants may propose to use one of three options: the Integrated (ILP), Alternative (ALP), or Traditional (TLP). The default is the ILP, unless FERC approves use of either the ALP or TLP.
- **Pre-filing consultation** – extensive pre-filing meetings and exchange of information required.
- **Federal Energy Regulatory Commission – Application for License** required; Draft submitted for review & comments; Final filed.
- **Federal and State resource agencies consultation & terms & conditions** – File mandatory & recommended terms and conditions; most become License Articles and require compliance.
- **Numerous other State & Federal approvals & permits are required** – Applicants are required to provide evidence of consultation with agencies in an Application for License, and provide copies of permits and/or approvals.

Please also see R&M Consultants/Hatch Associates Consultants report (2010) for a detailed presentation of the various agencies and their authorities who would shape the content of any issued license.

5.2 Regulatory Issues – Chakachamna Project

TDX received its first Preliminary Permit on November 14, 2006. The purpose of a Preliminary Permit is to reserve priority to conduct studies for a period of three years, and if the effort results in filing an Application for License. A successive (second) permit was issued on February 25, 2010. This permit expires on January 31, 2013. FERC noted in issuing the permit that "a successive permit can warrant a greater standard of Commission oversight." "If the permittee fails to make significant progress toward developing a license application, the permit may be subject to cancellation."

On July 17, 2009, TDX filed its Notice of Intent to File an Application for License (NOI), Request to Use a Traditional Licensing Process (TLP), and Pre-Application Document (PAD). By letter dated July 27, 2009, FERC requested that they consider which licensing process it wishes to use and to refile its request noting that there would not be a need to refile the PAD. TDX met with FERC on August 5, 2009 to discuss the proceeding. On September 21, 2009, TDX requested to rescind its PAD. TDX stated that "this Project may be best served by an Integrated Licensing Process (ILP). TDX stated its intent to implement a field season in 2010 and to hold a study plan review and workshop in February 2010. TDX has a website for the Project and there is no evidence that work is proceeding as noted in their September 21, 2009, correspondence to the FERC. Nor has any further information been filed with the Commission. Under TDX's current development schedule, a third FERC Permit would be necessary.

5.2.1 Licensing Schedule

Once the pre-filing process restarts the schedule could be:

- Prepare and File Final Application for License – 4.5 years
- FERC Processing and License Issuance – 2.5 years

5.3 Regulatory Issues – Susitna / Low Watana Project

At present, there is no FERC Preliminary Permit in effect. While a FERC Permit is not required, it would be prudent for an entity representing the State to secure priority to study the Project. As discussed above, the Alaska Power Authority (APA), now known as AEA prepared and filed an application for license in February 1983. That application was withdrawn and APA revised the Project schedule to realize benefits identified with a three, as opposed to two-year construction schedule in 1985. In 1986, APA abandoned pursuit of a FERC license for numerous reasons, including financial feasibility.

In 2008, AEA began an update of the project, including preparation of the Railbelt IRP to evaluate the ability of the Susitna Project, and other resources, to meet long term demand in the Railbelt Region.

5.3.1 Licensing Schedule

Table 5-1 shows a Licensing, Engineering and Construction Schedule Comparison for the two projects. For the Susitna Project, based on information available at this time, the FERC schedule could be:

- Prepare and File Final Application for License – 3.5 years
- FERC Processing and License Issuance – 2 years

5.4 Total Project Development Timeline

Table 5-1 provides a Development Schedule Comparison for the two projects. Based on information available at this time, the comparative total schedule from start of the FERC process, in the case of the Chakachamna a restart of their pre-filing process, could be:

Table 5-1 Development Schedule Comparison

Major Task	Chakachamna	Susitna Low Watana
FERC Pre-filing Process	4.5 years	3.5 years
FERC Processing – DC	2.5 years	2.0 years
FERC Processing - Portland	2.0 years	1.0 years
Construction through Start up	5.5 years	4.5 years
TOTALS	**14.5 YEARS**	**11 YEARS**

Detailed Susitna and Chakachamna Licensing and permitting information is found at Susitna-Low Watana & Chakachamna Projects, Large Hydro Evaluation of Two Projects, Preliminary Decision Document, Environmental & Regulatory Issues November 14, 2010 located on the AEA Railbelt Large Hydro webpage.

Chapter 6

Development Schedule

The following tables (Table 6-1 and Table 6-2) show the major tasks associated with hydro project development, and the estimated preliminary schedule for completion for the Chakachamna Project compared to the estimated preliminary schedule for completion for the Susitna Project. Special considerations and assumptions for each are listed below.

Table 6-1 Considerations / Assumptions

Chakachamna Project	Susitna Project
▪ TBM est. 14-16 months to order and deliver to site ▪ 4.5 year pre-filing process assumes studies underway in 2011 (one year behind schedule in TDX PAD, 2009) ▪ 2.5 years for FERC Processing and License Issuance, and 5.5 year construction schedule based on PAD (Appendix 2-1) ▪ FERC-PRO processing and some procurement must be accomplished before field work can begin ▪ Longer construction schedule due to significant underground work, with higher risk profile and greater uncertainty ▪ Project "access" to require 2 yrs to construct ▪ Chakachamna has higher risk that the schedule to Project Startup will extend beyond 14.5 years.	▪ Significant, extensive and valid environmental studies performed in 1980's to be updated and used to develop FERC documents ▪ Significant geotechnical investigations performed previously ▪ FERC-PRO processing and some procurement must be accomplished before field work can begin ▪ More surface features and work carries more schedule certainty, less risk ▪ Project "access" to require 2 yrs to construct ▪ Engineering schedule based on "Low Watana Non-Expandable Development" (HDR, 2009) ▪ Susitna has lower risk that the schedule to Project Startup will extend beyond 11 years.

Table 6-2 Licensing, Engineering, and Construction Schedule Comparison

	Regulatory / Environmental Major Tasks			Engineering / Construction Major Tasks		
		Chakachamna	Susitna		Chakachamna	Susitna
Pre-License Issuance	Preliminary Permit Scoping Draft Application Final Application	4.5 yrs	3.5 yrs	Feasibility Engineering Design Specifications, Drawings & Bid Documents		
	FERC Processing (DHAC) License Order Issued	2.5 yrs	2 yrs			
Post-License Issuance	License & Permits Compliance			FERC Processing (Portland Regional Office) Procurement	2 yrs	1 yr
				Construction Testing & Commissioning Project Startup	5.5 yrs	4.5 yrs
Reg/Env Estimated Schedule		**7 yrs**	**5.5 yrs**	**Eng/Const Estimated Schedule**	**7.5 yrs**	**5.5 yrs**
				ESTIMATED TOTAL TO STARTUP	**14-15 years**	**11 years**

Chapter 7

Financial

Based on project risk for investors, the two projects, Susitna and Chakachamna, are similar. Project financing for either project, where the costs of the project is paid for solely by the sale of power produced from the project, is assumed to be unavailable. Without State participation these project are unlikely to proceed. State participation of whatever form it takes place will enable these projects to occur and lower the cost of the energy to ratepayers.

Large projects have financing that is structured on some amount of government participation. Government participation is normally required because of the following risks generally associated with large hydroelectric projects make project financing unattainable:

- **Timeline**: Project may take 10-20 years prior to first power sales. Private investors do not like to spend substantial funds for an extended time when the payoff is a long time or may not occur.
- **Licensing and Permitting Risk**: Significant funds can be spent only for the project to have long delays in licensing and in operation constraints placed on project.
- **Construction Risk**: Estimating the cost of a project many years out has risk of the prices changing for materials and labor. In addition, the demand for a product can change.

The "Bradley Model" has been discussed as a way that a new large hydroelectric facility can be financed for construction with State assistance. Licensed and constructed in the 1980's and early 1990's it is Alaska's largest hydroelectric project. Bradley Lake Hydroelectric Project (Bradley Project) is located southeast of Homer, Alaska and is a 125-foot high concrete faced rock filled gravity dam. The project has 126MW of installed capacity and produces approximately 9 percent of the railbelt's annual energy. The state paid for licensing and much of the cost of the project. Approximately 50 percent of the project's licensing and construction cost was paid by the State. The railbelt utilities purchase all the power for the projects and pay all the costs of the project (bond financing, Operations and maintenance). Once the debt service is retired then the utilities will continue to pay the State the same amount as the debt service.

Detailed information on State participation and Bradley financing is available at Hydroelectric Project Risk Analysis & the Bradley Lake Funding Model Summary Report, November 15, 2010 located on AEA's website at the Railbelt Large Hydro webpage.

Chapter 8

Cost of Power

The cost of power from the Susitna and Chakachamna Projects is addressed in this chapter. A simple calculation of the cost of power, which assumes 50 percent State equity in either project, a financing rate of 6 percent, and annual energy from sections above results in the generation costs shown in Table 8-1 below.

Table 8-1 Cost of Power Comparison

Project	Finance Amount (50%)	Rate	Term (years)	Annual Energy (GWhrs)	Cost per kWhr
Susitna	2,250,000,000	6%	30	2600	$0.063
Chakachamna Alt 1	1,440,000,000	6%	30	1100	$0.09
Chakachamna Alt 2	1,440,000,000	6%	30	860	$0.12

This simple table gives an idea of how the two projects compare in the cost of power. Interest during construction is excluded from this comparison.

The estimated construction cost of Chakachamna Alternative 1 would need to decrease by 30 percent to have a comparable cost of power with the Susitna Project. Or, assuming no changes in the cost the energy of the Chakachamna Project, annual energy would need to be 1600 GWhrs. This could only be achieved by having zero environmental flow.

An alternative way of analyzing cost comparisons is to estimate State contributions needed if generation costs are held at $0.06 kWhr. From this perspective, the State required contribution would be $2.35 B for the Susitna Project (2,600 GWhrs) and $1.96 B for the Chakachamna Project (1100 GWhrs) or $2.17 B (860 GWhrs). Assuming state participation would be based on providing $.06 cost per kWh, the Susitna project would cost 20% more than Chakachamna project Alternative 1; however, it will provide approximately 136% more energy and compared to Alternative 2, an 8% greater cost with 200% more energy.

Chapter 9

Operational Uncertainty

Table 9-1 presents a summary of the comparative operational uncertainties associated with developing the Chakachamna and Susitna Projects.

Table 9-1 Operational Uncertainties Issue Comparison

Issue and likelihood of occurrence within next 100 years	Chakachamna Project	Susitna Project
	Issue Notes/Requirements	**Issue Notes/Requirements**
Earthquake Risk		
Immediate damage due to fault movement Studies show 700-year return period for significant earthquakes (magnitude 6 to 7), last such earthquake approximately 650 years ago.	Castle Mountain fault, approximately 11 miles from the lake, magnitude 7+, displacements of up to 6 ft, only 4500 ft from powerhouse site. Infrastructure near the fault include; powerhouse and bridge over Chakachatna River. Power tunnel intersects numerous smaller faults. Seismic event may cause localized collapse in the fault zone if not lined. Lack of information about whether movement could occur on any of these smaller faults.	Castle Mountain Fault located 65 miles from powerhouse, intake, lake, magnitude 7+, Denali Fault located 45 miles , magnitude 8.0, Inter-plate subduction zone located 40 miles, magnitude 9.2 Dam could experience high seismic loads (known seismic zone, EQ design case should consider loading)
Secondary effects	Landslide and avalanche potential into lake and onto access road.	Potential landslides and avalanches along access roads.
Hydrological Risk		
Generation	USGS record at site 11 years of data, correlation with 4 streams. Understanding of the hydrology There is potential during events such as floods or glacial activity for down cutting of the glacial moraine at the end of the lake which could reduce head and storage in the project Smaller basin will cause greater deviations from average hydrological flow and energy generation. Drought (Not sure if needed, see above) Tunnel roughness may increase with time due to wear which will reduce generation.	USGS record at site 54 years of data on Susitna River. Understanding of the hydrology vis a vis climate change effects.
Climate Change		
Glacier recession	Increase in flows as the glaciers melt (>100 yrs), followed by reduced and more "flashy" flows at the project.	Increase flow for a period with glacier recession (>100 yrs) followed by decreased flow.
Volcanism		

Table 9-1 Operational Uncertainties Issue Comparison

Issue and likelihood of occurrence within next 100 years	Chakachamna Project	Susitna Project
	Issue Notes/Requirements	**Issue Notes/Requirements**
Effects on Project Facilities and Features	Mt Spurr is located immediately adjacent to the project, Redoubt volcano is approx. 50 miles to the west. Explosive eruption at Mt. Redoubt 2009 Previous eruption on Mt. Spurr was a side blowout. Debris flows similar to those that occurred in 1953 and 1992 eruptions of Crater Peak could dam Chakachatna River. The debris dams might erode progressively or may burst abruptly. Lava flows could dam the Chakachatna River and raise Chakachamna Lake. Large floods would be produced by surging and melting of glacial ice during an eruption. Glacier movement (melting at base) is probable. Ice flow on Barrier Glacier may surge, dam the lake, raise water level and erode through, typically below the glacier in material. Access road may become blocked or destroyed by mud or erosion (high flows in river from melting glacier or glacial dam breakout). Effects on river bridges from debris flow Ash effects on transmission Poison gas cloud could affect the powerhouse (unlikely with distance & powerhouse location) Communications may be disrupted by volcano.	Mt Wrangell is located to the more than a hundred miles to the East and is closer to Watana. Mt Wrangell is in a non-eruptive active state at present but with history of 9 reported possible eruptions since 1760, most recently 1930; steaming at present. Ash could reach the Watana project and transmission lines depending on wind conditions. Pyroclastic flows are unlikely to affect Watana due to distance and intervening terrain.
Tunnelling and Foundation Conditions		
Dam	Small structure on rock foundation. Material of the natural dam, believed to be moraine, could contain significant quantities of ice, lahar material, or volcanic ash that could affect the permanence of the natural dam.	Geotechnical exploration indicates favorable foundation conditions on bedrock. Foundation (permafrost). Melting permafrost in the rock could lead to increased permeability of foundation that may require additional grouting associated with project site.

Table 9-1 Operational Uncertainties Issue Comparison

Issue and likelihood of occurrence within next 100 years	Chakachamna Project	Susitna Project
	Issue Notes/Requirements	Issue Notes/Requirements
		River diversion tunnels. Large spillway.
Power tunnel(s)	Extensive underground construction will be expensive to shut down for inspection and repair if necessary. Very hard rock along tunnel alignment – more than 35,000 psi, which is extremely hard and could present difficulty for a tunnel boring machine resulting in slow progress.	Competent rock conditions for dam and tunnel construction, studies date to 1982. Very short power tunnel(s) – 1.0 mile max, and shallow and surface power tunnel, therefore less risk of delay in construction. Limited number of geotechnical fault zones to pass through, due to location and short length of tunnels, provided "Fingerbuster" and "Fin" zones are avoided.
Glacier Activity		
Dam and Intake	Unpredictability regarding the interaction of glaciers with the volcanic activity, including possible melting at the base of the ice that would cause glacial pulses or surges. An advance of Barrier Glacier at the Chakachamna Lake outlet, initiated by heat from below the ice, could dam the outlet and raise the lake level. When the ice nose decayed, a large volume of water would be released that could erode the lake outlet and lower the lake below its present level. There is potential during events such as floods, glacial activity for down cutting of the glacial moraine at the end of the lake which could reduce head and storage in the project. Lowering the lake would reduce the submergence of the power inlet below what is acceptable. Breakout in 1971 one of Alaska's largest recorded floods.	N/A
Powerhouse	Blockade Glacier has been identified as a source of outburst floods on McArthur River	N/A
Surging Glaciers	Four glaciers in the Chakachamna study area have been identified as surging glaciers. They include Pothole Glacier and Harpoon Glacier in the Nagishlamina River Valley and Capps Glacier on the eastern slope of Mt Spurr.	N/A

Table 9-1 Operational Uncertainties Issue Comparison

Issue and likelihood of occurrence within next 100 years	Chakachamna Project	Susitna Project
	Issue Notes/Requirements	**Issue Notes/Requirements**
Outburst Glaciers	Glacier damming of the Nagishlamina Valley by a surging glacier may result in outburst conditions at the outlet from Chakachamna Lake. A sudden influx of water into Chakachamna Lake could produce significant changes including lowering of the lake outlet.	N/A
Other		
Intake	Lake tap would need fish screens Volcano eruption may affect power tunnel intake.	N/A
Access Road	Landslide, avalanche danger part of the route.	Avalanche danger over a portion of the route.
Transmission Line	42 miles of new transmission line to Beluga Sub Station. Submarine cable across Cook Inlet subject to marine environment risks such as currents, scour, dragging anchors.	58 miles of new transmission line.
Operation & Maintenance		
Operations & Maintenance	Long tunnel intersecting numerous faults susceptible to rock-falls over time and maintenance requirements Rock entrained in tunnel flow could damage turbines Long tunnel has higher risk of collapse, blockage Long tunnel will require planned outages for inspection and maintenance over life of project, higher risk of interruption.	Multiple short tunnels allows for more regular inspection and maintenance without prolonged outages and impact to operations
Load Stability		
Powerhouse location with respect to load centers	Off the end of the railbelt load center, not easy to stabilize (brown-out/black-out).	Location between Anchorage and Fairbanks means project is closer to center of load, easier to stabilize grid using reactive potential.
Hydrological Risk - Water Shortage		
Drought	Small catchment mainly fed by meltwater from glaciers, which make this site more susceptible to water shortages and less dependable as a source of energy.	Catchment is less susceptible to drought.

Chapter 10

Summary and Conclusions

This document compared two large hydroelectric projects to determine which would better meet the needs of the railbelt population and the State of Alaska now and into the future. The following table shows a comparison summary of the two projects.

Table 10-1 Comparison Summary

Criteria	Susitna (Low Watana) Project	Chakachamna Project
Engineering (Cost)	$4.5B	$2.9
Environmental	Same basin, modified flows, little to no salmon present.	Cross basin drainage, substantial concern regarding fisheries and Trading Bay State Game Refuge.
Energy	2,600 GWhrs annual average. About 50% of existing railbelt annual electrical energy. Meets and exceeds State energy policy without other projects.	Most likely to be less than 1,100 GWhrs annual average. About 20% of existing railbelt annual electrical energy. Does not provide substantial winter power.
Start-up Date	Approximately 11 years	Approximately 15 years
Licensing/Permitting	Substantial site knowledge likely to reduce licensing/permitting delays.	Significant unknowns on environment, geology, and hydrology likely to slow process
Finance	Requires State financial support	Requires State financial support
Cost of Energy	Simple calculation using cost & energy numbers above, 50% State equity, and 6% interest yields $0.06 /khr	Simple calculation using cost & energy numbers above, 50% State equity, and 6% interest yields $0.09-0.12 /khr
Operational Uncertainty	Less long term operational risk from seismic. Central location helps to stabilize grid.	Greater long term operational risk from seismic events, volcano eruption, & glacial changes. Energy more variable on an annual basis. Harder to stabilize.
Notes	River system has potential to expand generation by going upstream, downstream, or raise dam height. Transmission lines could connect to other areas of the State.	

The Susitna Project would produce more energy and at a lower cost per MW. Historically the flow has varied little year to year so that the amount of energy can be better estimated. Most of the Project is anticipated to be above ground so that geotechnical unknowns that influence construction cost risk are minimized. Produced energy during summer would be greater than desired so that flows would remain high for salmon downriver. However, the reservoir area would give the Project the ability to still generate substantial power during the winter critical months.

The Chakachamna Project would not be able to divert flow as was used for estimating energy in the early 1980's. The reduced flow would have substantial effects on the Trading Bay State Game Refuge down river and would cause false attraction to return adult salmon so that they are not able to find their way to the lake. In addition, the smolt salmon in the lake need substantial outlet flow to enable them to find the exit to the lake. Drawing down the lake during the winter would cause mortality of shallow spawners and may prevent salmon from ascending up the rivers at the head of the lake during early summer. If the Project is operated to provide significant environmental flows and restrict the lake drawdown then the cost of energy increases significantly and would produce minimal energy during the critical winter months. Because of the complex two drainage system hydrology and rich fisheries determining the environmental flow and conditions will require many years and millions of dollars. The substantial number of multi-year studies would delay the licensing and start-up date.

The Susitna Project is thought to be a licensable project without a fatal flaw. Geotechnical information indicates bedrock is suitable for construction. Environmental information indicates that impacts would be minimal. The Chakachamna Project has many fisheries concerns that will restrict the Project operation, increase the cost, and decrease the energy output of the Project. Some of the issues may not be able to be mitigated.

The Susitna Project provides a lower cost per unit of energy, the least environmental impact, a greater total amount of energy, and the anticipated startup date is sooner.

Based on the projects economics and impacts Susitna Project (Low Watana non-expandable alternative) should be the primary Project to pursue with Chakachamna Project as the alternative.

Chapter 11

Recommendations

We recommend that field studies and engineering evaluations be conducted on the Susitna Project preparing for a Final Decision Document scheduled to be released on November 15, 2011. In addition, we also recommend that a FERC license application be initiated on January 1, 2012 for the selected Project. In order for the process to move forward it is recommended that a Preliminary Permit be filed with FERC for the selected Project by December 31, 2011.

Specific studies to be completed in 2011 include:

- A complete review of the 1985 Susitna environmental study plan and the conduct of critical studies from that plan. Changes to the river system and the environment need to be documented.
- Field work to verify Susitna environmental conditions.
- A detailed cost estimate of the Chakachamna Project including changes to the Project introduced by environment constraints such as downstream flow releases (size optimization).
- A final determination of the type dam to be used at the Susitna site and the access plan and a revised cost estimate of the overall scheme.
- Detailed engineering studies on transmission needs, design drawings, and geotechnical review.

It is anticipated based on the schedule discussion in preceding Section 6.0 that the data gathered in the 2011 field season can be used for both the primary and alternative project. The FERC Preliminary Permit for the Susitna Project should be filed by December 2011.

The Division of Oil and Gas …

manages lands for oil, gas, and geothermal exploration and development in a fair and transparent manner to maximize prudent use of resources for the greatest benefit of all Alaskans.

Mission Elements

Elements required to fulfill our mission under 38.05.180

- Maximize the economic and physical recovery of resources
- Maximize competition among explorers and developers
- Maximize use of Alaska's human resources in the development of the resources
- Encourage assessment of oil and gas resources and maximize the flexibility of issuing leases
    - Recognize varied geographical regions and costs of development
    - Minimize adverse impacts from exploration, development, production, and transportation activities

Elements required to fulfill our mission under 38.05.035

- Manage, inspect, and control state land, including any improvements, that belong to the state and are under the jurisdiction of the division

Net Oil Volume from State Leases

FY2010

Company	Barrels of Oil
1 ConocoPhillips	82,135,010
2 BP	62,591,253
3 Exxon	43,622,534
4 State of Alaska	25,620,845
5 Chevron/Unocal	4,968,278
6 Anadarko	4,680,339
7 Pioneer	2,226,816
8 ENI	983,621
9 XTO Energy	859,743
10 PEAO	658,097
11. Small producers (6)	167,876
Total	**228,554,412**

The Division of Oil and Gas manages the state's oil and gas resources with a budget of $14.3 million (FY 2011) and a staff of 95, consisting of highly specialized technical experts with many years of experience in the industry. The Division works in asset teams, pulling together the experts needed from different sections, in order to manage each different task or issue.

- Petroleum Geologists
- Petroleum Geophysicists
- Petroleum Engineers
- Commercial Analysts
- Petroleum Economists
- Biologists
- Attorneys
- Accountants
- Auditors

The Petroleum Systems Integrity Office (PSIO) relies on the Division for IT and administrative support but has its own budget.

Achievements in 2010

- Division-wide
- Resource Evaluation
- Leasing
- Unit Administration
- Royalty Accounting
- Audit
- Commercial
- PSIO

Achievements in 2010

Division-Wide

- Developed Draft Strategic Plan for Division in order to streamline processes, identify areas in need of improvement, and better focus our resources and energy in a changing investment and production climate.

Achievements in 2010

Resource Evaluation

- Building on the 2009 preliminary Cook Inlet gas supply study and updating the integrated engineering and geological analyses, Resource Evaluation is working closely in 2010-2011 with DOG Commercial Section to complete a comprehensive analysis of the investment costs that would be required to meet southcentral Alaska's future gas needs from Cook Inlet fields.

- Provided geological, geophysical, and engineering analysis in support for the Division's leasing and exploration licensing program and the Division's oversight of producing and prospective units and participating areas.

- Worked to ensure that the State receives all data sets from exploration wells, seismic surveys, and other geological and geophysical work in exchange for exploration tax credits under AS 43.55.023 and 43.55.025.

- Working in concert with DGGS to conduct complimentary and integrated analyses of oil and gas resource potential throughout the state, with greatest current emphasis on the Cook Inlet basin and North Slope Foothills. Through a separate initiative, Resource Evaluation is contributing integrated geological-geophysical analysis of resource potential in the Umiat–Gubik area and along the route of the proposed Roads to Resources Foothills West transportation corridor.

- Substantially progressed the understanding of Alaska's CO_2 sequestration capacity; evaluating strategies for ensuring State oversight of carbon sequestration if it were to be mandated by Federal government.

Achievements in 2010

Leasing

- Conducted five areawide lease sales in FY 2010, resulting in $11.3 million in bonus bids
- 495,326 acres leased, with 149 bids on 134 tracts, and 21 bidding groups participating
- Administered 1,495 leases covering nearly 4.5 million acres generating more than $6.1 million in rental income
- Processed more than 740 assignments of interests in oil and gas leases

Achievements in 2010

Unit Administration

- Staff managed 38 units producing from 78 participating areas with six new units approved in FY10
- Considered and issued 42 unit and PA decisions in FY10, including:
  - Four new PAs
  - Two unit expansions
  - Two PA expansions/contractions
  - Two unit terminations
- Currently working on a dozen unit actions in the pre-application phase, including four new units and at least five new PAs

Achievements in 2010

Royalty Accounting

- Collected $2,201 million in revenue (FY2010), including:
  - $1,237 million in royalty-in-value;
  - $913 million from royalty-in-kind oil sales, and
  - $21 million in the state's share of federal rents and royalties
  - $30 million in Net Profit Share Lease Payments
- Processed more than 20,580 production, royalty and NPSL reports
- Provided royalty and NPSL filing support to 23 active lessees

Achievements in 2010

Audit

- Audit Staff issued 12 state and federal audits during the past 12 months resulting in the collection of $17.6 million in additional revenue
- Audit claims in the amount of $33.9 million are currently outstanding
- Audit Staff have played an important role in addressing royalty valuation issues and providing support for Royalty Settlement Agreement reopeners
- The Audit Section has begun work to isolate and document audit processes

Achievements in 2010

Commercial

- Royalty Settlement Agreement re-opener analysis and negotiations support.
  - Completion of a limited re-opener agreement with Conoco-Phillips;
  - Marine capital cost model of an oil major for the purposes of royalty settlement agreement.
- Gas sales analysis and support.
  - Oversaw study of preliminary economics for a bullet line;
  - Oversaw completion of study on the impact of shale gas on gas prices in the lower 48;
  - Completion of regulations package governing North Slope Gas for shippers on an AGIA-licensed pipeline.
- Analysis of Pacific Energy's properties for bankruptcy filings.
- Analysis of the value of state right-of-ways for Liberty development.
- Cook Inlet ACES model developed for public distribution.
- Development of commercial terms for the CINGS storage lease
- Cook Inlet Natural Gas Production Cost Study.

- Completed "Gap Analysis" project and submitted identified gaps and proposed corrective actions to Natural Resources Subcabinet
- Coordinated with state and federal agencies regarding oil and gas facilities and activities in Alaska
  - Regular liaison meetings, incident notification e-mail cache and monthly reports
  - Conducted inquiry into recent integrity events and employee concern
  - Followed up with operators regarding past correcti

Feedback/Questions

Appendix: Oil and Gas Revenues and Activities in the Cook Inlet Region and on the North Slope.

North Slope Oil and Gas Activity 2010-2011
State of Alaska, Department of Natural Resources, Division of Oil and Gas, January 2011
North Slope Borough
Planning to drill exploration and development wells in their East Barrow, South Barrow, and Walakpa gas fields during 2011-2012.
Statoil
Granted permits to conduct a seismic survey in the Chukchi Sea.
Department of Interior
Placed hold on issuance of OCS drilling permits in wake of 2010 Gulf of Mexico spill. BOEMRE reviewing Shell's Beaufort Sea 2011 exploration plan for 1 well.
BP
Plan to put 3 Ugnu Fm wells on production in first quarter 2011at Milne Point Unit, using CHOPS technology (cold heavy oil production with sand)
Beaufort Sea
Conoco Phillips
Focusing 2010-2011 drilling on CD 1 & CD 2 opportunities because of U.S. Corp of Engineers CD-5 permit denial.
Corps has remanded some issues for reconsideration.
ENI
Nikaitchuq Unit first oil from Schrader Bluff OA sands January 2011.
Brooks Range Petroleum Corp
Tested Kuparuk in Sak River 1A well.
BP
Raven PA (within PBU) shut-in due to legal dispute with land owner over BP's use of Heald Point surface lease.
Shell
Granted permits to conduct shallow marine hazard and ice-scouring surveys and biological studies in the Chukchi and Beaufort Seas. Applied for drilling permit for single well at Sivulliq prospect in 2010.
Pioneer Natural Resources
Development drilling continues at Oooguruk Unit. Producing oil from Nuiqsut and Kuparuk PA's; applied for Torok PA.
Nikaitchuq
Beechey Point
Northstar
Oooguruk
Milne Point
Dewline
BP
Liberty ultra-extended reach drilling delayed for extensive engineering and design review of purpose-built rig.
Exxon
Drilled PTU-15 & 16 in 2010.
Plans pipeline to link Point Thomson to Badami. May begin construction in 2011 with completion in 2014.
Bear Tooth
Greater Mooses Tooth
Colville River
Kuparuk River
Prudhoe Bay
Duck Island
Liberty
Badami
BLM may designate wild lands within NPR-A as part of its Integrated Activity Plan for the area. Currently the area surrounding Teshepuk Lake is excluded from potential lease sales due to habitat concerns for migratory birds and caribou.
Continued year-round development drilling in Prudhoe, Kuparuk, Colville and Milne Point Units.
Arctic Fortitude
Brooks Range Petroleum
Applying to form Southern Miluveach Unit. Plans to drill north Tarn Prospect in 2011.
BP
Restarted Badami facilities November 2010. Transferred 4 Badami Leases to Savant Alaska & ASRC Exploration.
Arctic National Wildlife Refuge
National Petroleum Reserve - Alaska
Great Bear Petroleum, LLC
High bidder on 105 mostly contiguous lease tracts south of the Prudhoe Bay and Kuparuk River fields in the State's October 2010 North Slope areawide lease sale, acquiring the maximum allowable onshore state land position (500,000 non-unitized acres). The company targets oil production from Alaskan source-rock resource plays using advanced horizontal drilling and fracturing technology.
Savant
Testing B1-18A and B1-38 wells into the Badami Facility.
Anadarko/Suncor/BG
Chandler 1 well suspended for further testing.
Roads to Resources Program
Dept. of Transportation evaluating routes for a road connecting the Dalton Highway with Umiat. DNR to study surface and subsurface geology to identify exploration areas & potential geologic hazards.
Umiat
0 10 20 Miles
Wells Drilled 2010
Wells Permitted/Planned 2009-2011
Wells Drilled 2009
Wells Drilled 2008
Dalton Highway
Trans Alaska Pipeline
Alaska Seaward Boundary
Unit Boundaries
Map Location

North Slope Oil & Gas Activity 2010

- Badami Unit – BP/Savant
  - Savant Alaska, LLC drilled and completed 1 development well and 1 exploration well in 2010 (AOGCC). Restarted Badami facilities November 2010.
  - BP transferred 4 Badami leases to Savant Alaska & ASRC.

- Beechey Point Unit – Brooks Range Petroleum
  - Unit Formed in 2009. 2 exploration wells drilled in early 2010.
  - Tested Kuparuk Formation in Sak River#1A well.

- Colville River Unit – ConocoPhillips
  - 13 unit wells drilled and completed in 2010, 5 wells in Alpine PA and 8 wells in Fiord PA (AOGCC). 32 wells planned.
  - Increased drilling on state leases at CD1 and CD2 because of U.S. Corp of Engineers denial of CD5 (Alpine West satellite development permit. Corps has remanded some issues for reconsideration.

- Dewline Unit -- UltraStar
  - Applied for unit expansion in 2010. Second exploration well planned for 2012-2013.

- Kuparuk River Unit -- ConocoPhillips
  - Development drilling continues, 47 permitted unit wells (each lateral counts as a permitted well bore) completed in 2010 (AOGCC). 14 wells planned in 2011.
  - Kuparuk PA: 12 coiled tubing wells (44 laterals, AOGCC) completed in 2010.
  - Tarn PA: 3 grass root wells drilled and completed drilled in 2010 (AOGCC); PA expansion likely.

- Liberty (Federal Unit) – BP
  - Ultra-extended reach drilling delayed for extensive engineering and design review of purpose built rig.

North Slope Oil & Gas Activity 2010, continued

- Milne Point Unit – BP
  - 5 development sidetrack wells (7 total laterals) drilled and completed in 2010 (AOGCC). 4 wells planned in 2011, mainly in Kuparuk PA.
  - BP sanctioned the Ugnu CHOPS Pilot (Cold Heavy Oil Production with Sand); 3 wells to be put on production during first quarter 2011.

- Nikaitchuq Unit – ENI
  - Completed sealift of processing and utility modules in August, 2010.
  - AOGCC pool rules approved 2010 and PA application in progress for Schrader Bluff reservoir.
  - First production expected January 2011.
  - 2-3 wells planned in 2011.

- Oooguruk Unit – Pioneer
  - Development drilling continuing. 5 wells drilled and completed in 2010 (3 in Nuiqsut PA, 2 in Kuparuk PA), including 2 dual laterals (AOGCC).
  - Torok Formation produced 1,100 bbls/day in 2009; Pioneer applied for Torok PA in 2010, which could result in drill site expansion.
  - 3-4 wells planned in 2011.

- Prudhoe Bay Unit – BP
  - 50 permitted sidetracks and 8 grass roots wells drilled in 2010, with total of 66 laterals completed in 2010 (AOGCC).
  - 27 sidetracks and one new development well in Ivishak PA Q4 2010-2011.
  - Aurora PA: 1 producer, 1 injector wells Q4 2010.
  - Borealis PA: 4-5 wells planned for 2011-2012.
  - Polaris PA: 1 producer and 4 injectors planned for Q4 2010-2011.
  - Raven PA shut-in due to legal dispute with private landowner over BP's use of Heald Point surface lease.

North Slope Oil & Gas Activity 2010, continued

- Additional Activity – (Oil & Gas)

  - **Onshore State (and ASRC) Lands**
    - ExxonMobil drilled and tested 2 wells at Point Thomson field (PTU-15 and -16) in 2010. Plans pipeline to connect Point Thomson to Badami pipeline system; may begin construction in 2011 with completion in 2014.
    - Brooks Range Petroleum is applying for new Southern Miluveach Unit (52,000 acres) immediately west of the Kuparuk River Unit, with plans to drill North Tarn prospect in 2011.
    - Union (Chevron) relinquished or sold all but 4 of its 59 White Hills leases south of Kuparuk.
    - Great Bear Petroleum, LLC was high bidder on 105 mostly contiguous tracts south of Kuparuk and Prudhoe Bay Units in October 2010 North Slope areawide sale, acquiring the maximum allowed non-unitized land position (500,000 acre onshore limit). The company is targeting oil production from source-rock resource plays using advanced horizontal drilling and fracturing technology.
    - Teck-Cominco postponed drilling another shale gas exploration well at the Sakkan Unit in the far western North Slope. Project goal is to establish local fuel gas supply for Red Dog mine.
    - Anadarko, Suncor, and BG dropped 65 state leases in the southern North Slope Foothills , and suspended the Chandler 1 well near Gubik/East Umiat for further testing. The joint venture partnership retains a significant acreage position on state and ASRC lands in other parts of Foothills.
    - DNR (DOG and DGGS) is conducting integrated subsurface interpretation and geologic field work in the Umiat – East Umiat – Gubik area to gain better understanding of resource potential associated with DOT-led Roads to Resources Foothills West project; multi-year project started in 2010.

North Slope Oil & Gas Activity 2010, continued

- Additional Activity – (Oil & Gas)

  - **OCS**
    - Department of Interior placed a hold on issuance of OCS drilling permits in wake of 2010 Gulf of Mexico spill; State has challenged this in court as a de-facto drilling moratorium. DOI issued a decision to honor existing OCS leases in December, 2010.

    - Shell was granted permits to conduct shallow hazard surveys, ice-scour surveys, and biological studies in support of 2011 exploration plan in the Beaufort Sea OCS. Shell applied to BOEMRE for a permit to drill a single well at their Sivulliq prospect (former Hammerhead oil and gas discovery) in the eastern Beaufort Sea at Camden Bay.

    - Statoil obtained seismic permits and acquired a 3-D survey over its leases in the Chukchi Sea OCS.

  - **NPRA**
    - BLM may designate wild lands within NPR-A as part of its Integrated Activity Plan for the area. Currently the area surrounding Teshepuk Lake is excluded from potential lease sales due to habitat concerns for migratory birds and caribou.

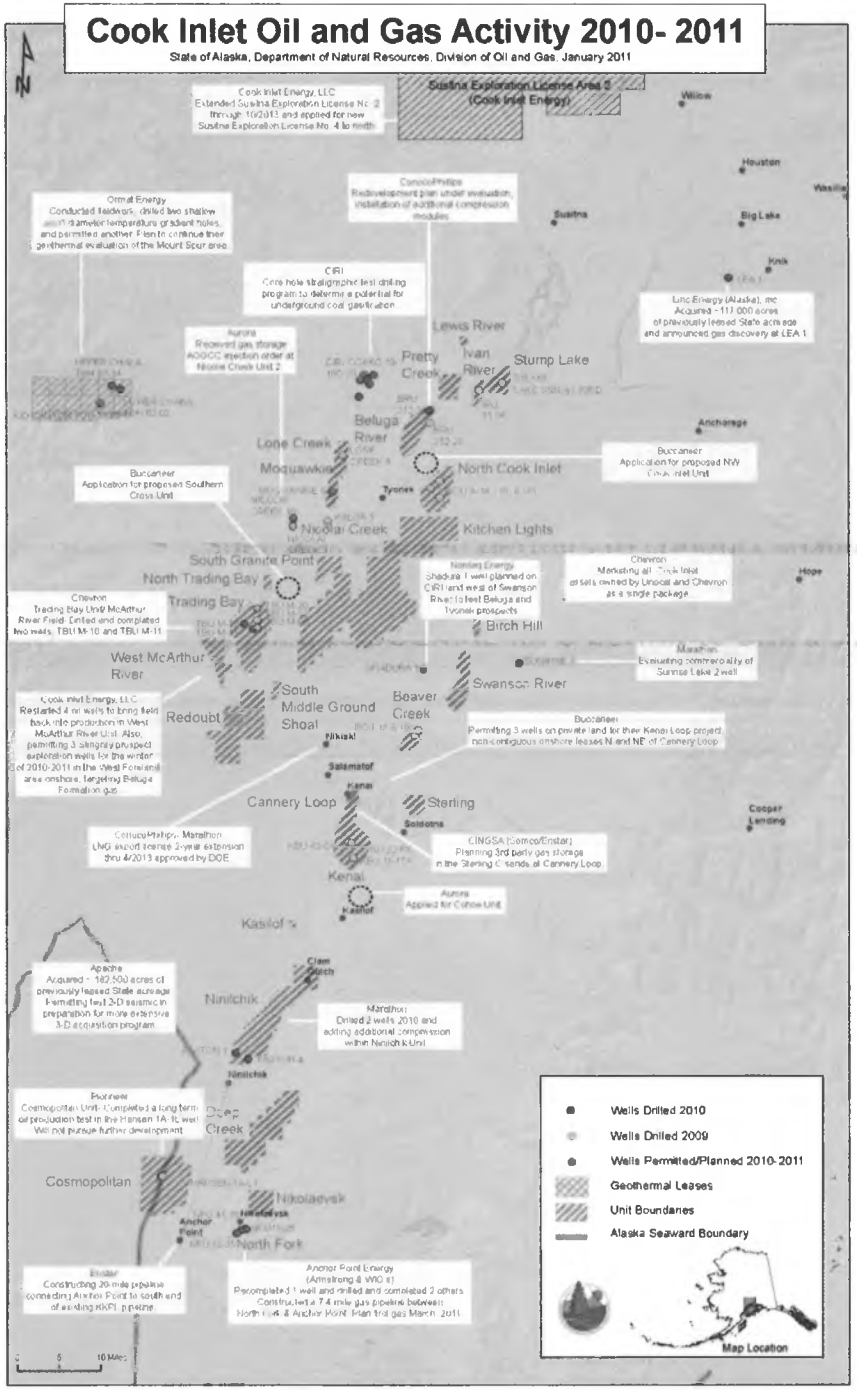
    - Talisman/FEX relinquished 11 leases in the North Slope Foothills and 19 leases in Beaufort Sea state waters adjacent to NPRA in Harrison Bay. The company is seeking to sell its interest in its remaining Foothills and NPR-A leases, including 3 suspended exploration wells in northwestern NPRA.

North Slope Planned Activity

Badami Unit: Two wells being tested to bring field back on line
Beechey Point Unit: Two exploration wells planned
Colville River Unit: 32 wells planned
Dewline Unit: Second Exploration well planned for 1st Quarter 2012
Kuparuk River Unit: 14 wells planned
Milne Point Unit: BP sanctioned the Ugnu Pilot "CHOPS" (Cold Heavy Oil Production with Sand); four wells planned.
Slope wide estimated heavy oil reserves (Ugnu) are 20 BBO.
Nikaitchuq Unit: Two - three wells planned
Oooguruk Unit: Three - four wells planned
PBU-Aurora: Two wells planned for 4th Q 2010; one for 2011
PBU-Borealis: Four to five wells planned 2011
PBU-Polaris: Drill one producer and 4 injection wells in 2011
PBU-Prudhoe IPA: 2010 plan to drill 1 new development well and 27 sidetracks
Sakkan Unit: one exploration well 2011
Northstar Unit: NS-08 tract op Kuparuk C sand commenced Nov. 2010.
Brooks Range Petroleum - North Tarn Well

Cook Inlet Oil and Gas Activity 2010- 2011

State of Alaska, Department of Natural Resources, Division of Oil and Gas, January 2011



Cook Inlet Oil & Gas Activity 2010

- Beluga River Unit – ConocoPhillips (Gas)
  - Drilled and completed one well, BRU 212-24T.
  - Redevelopment plan underway – installation of pad compression
- Cannery Loop Unit – Marathon (Gas)
  - Federal oil and gas lease AA-019230 segregated; lease and unit administration waived to the State of Alaska, effective March 26, 2010, terminating joint administrative responsibilities.
  - Gas storage lease/CINGSA issuance pending full RCA approval.
- Nicolai Creek Unit – Aurora Gas (Gas)
  - Applied for gas storage in Nicolai Creek Unit 2, withdrew their application.
  - AOGCC issued a storage injection order and aquifer exemption for Nicolai Creek Unit 2.
  - Expanded Unit, formed West Beluga and West Tyonek Pas
  - Drilled and completed a new gas well to the west, Nicolai Creek 11 in late 2009, currently in production.
- Ninilchik Unit – Marathon (Gas)
  - Drilled and completed two wells, Paxton 3 and Paxton 4.
  - Installing compression on all producing pads
- North Fork Unit – Armstrong (Gas)
  - Acquired 3D seismic program over unit March 2010
  - Drilled and completed two new gas wells, North Fork Unit 14-25 and North Fork Unit 32-35.
  - Re-completed SOCAL NFU 41-35 in gas zone, drilled 34-26.
  - Constructing a 7.4-mile gas pipeline between North Fork and Anchor Point , could be ready for operation in mid_February given approval of permit applications
  - First gas sales anticipated Mar 2011
  - Testing oil horizon
- Trading Bay Unit/ McArthur River Field– Chevron (Oil & Gas)
  - Drilled and completed two wells, TBU M-10 and TBU M-11.
- West McArthur River Unit – Cook Inlet Energy (Oil & Gas)
  - Cook Inlet Energy acquired in Dec. 2009
  - Workover on three wells
  - Restarted 4 oil wells to bring field back into production.
  - Current production: 778 barrels/day (November 2010)

Cook Inlet Oil & Gas Activity 2010 (continued)

- Additional Activity – (Oil & Gas)
  - Linc Energy Alaska, Inc. acquired Geo Petro summer 2010 and drilled LEA 1 discovery well. Announced success Oct. 2010, well results pending. Planning an exploration well in the Trading Bay area onshore
  - Marathon drilled Sunrise Prospect east of Swanson River field, Sunrise Lake 2. Encountered "zone of interest" and is evaluating results to "determine commerciality."
  - Nordaq Energy Partners planning exploration well, Shadura 1, from an ice road west of Swanson River field on CIRI acreage within the Kenai Wildlife Refuge. Targeting gas in the Beluga and the Tyonek formations.
  - ConocoPhillips and Marathon LNG export license' 2 year extension was approved by the DOE. Reauthorizes export to 4/13.
  - Enstar is extending the KKPL natural gas pipeline from Ninilchik to Anchor Point, allowing North Fork gas to reach market.
  - Chevron will open data room in 1Q 2011 for sale of all Cook Inlet assets. Target sale close by 7/1/11.

Cook Inlet Oil & Gas Activity 2010 (continued)

- Additional Activity – (Oil & Gas)
  - Apache acquired 182,500 acres of previously leased State acreage. Permitting 2-D seismic test in preparation for more advanced exploration. DCOM is issuing joint public notice this week announcing a 17-day comment period for the project.
  - Cook Inlet Energy, LLC, a wholly owned subsidiary of Miller Petroleum Inc., permitting 3 exploration wells (Stingray) for the winter of 2010-2011 in the West Foreland area onshore. Targeting Beluga Formation gas. Permits should be issued early 2011.
  - Buccaneer Alaska LLC applied for two proposed units, Northwest North Cook Inlet Unit and Southern Cross Unit. Currently organizing financing for a jack-up rig.
    - Buccaneer acquired 44,000 acres of previously leased State acreage on the east side of the Cook Inlet. With 5,760 acres acquired during the 2010 lease sale, total acreage is approximately 49,000 acres. Buccaneer plans to drill one exploration about 15 miles east of Anchor Point, late 2011. Permits issued pending posting of bond.
    - Buccaneer acquired 5,653 acres on the west side of Cook Inlet near the Nicolai Creek Unit. Buccaneer plans to drill one well in 2011.
    - Buccaneer is in the permitting process for drilling on Mental Health Trust Lands north of Kenai airport, and expected to drill in the next few months.
  - Aurora applied for one proposed unit, Cohoe Unit. Decision pending. Lease operations permit issued in late 2010.
  - Armstrong applied for North Fork draft unit expansion. Decision pending.
  - Escopeta hopes to bring jack-up into Cook Inlet under terms of POE. Permit will be issued following selection of rig. Fresh public review may be required due to beluga whale issue.

Additional Cook Inlet Activity 2010

- Cook Inlet Geothermal Energy and Coal Gasification
  - Ormat Energy conducted fieldwork, drilled two small diameter temperature gradient holes (Mt Spurr Lower Chakachatna River 62-02 and Mt Spurr Upper Chakachatna River 67-04). Planning to continue exploration next year.
  - CIRI drilled one stratigraphic test for coal gasification project, CIRI CC-06C-10.

1/31/11 OVERVIEW: CORA CAMPBELL, COMMISSIONER DEPARTMENT OF FISH & GAME

Official Business

Senate Resources Committee

Senator Joe Paskvan, Co-Chair
Room #115: 465-4907

Senator Tom Wagoner, Co-Chair
Room #427: 465-3792

Members:
Senator Bill Wielechowski, Vice-Chair
Senator Hollis French
Senator Lesil McGuire
Senator Bert Stedman
Senator Gary Stevens

Senate Resources Committee

Monday, January 31, 2011: 3:30pm – 5:00pm

Presentation: Cora Campbell, Commissioner
Department of Fish and Game

3:35PM / 4:20PM

January 31, 2011

1. **Call to order**

2. **Attendance at table** ALL THERE Thomas & Ged Madison
   a. **quorum to conduct business**

3. **order of business**
   a. **hear presentation from Cora Campbell, Commissioner of Department of Fish & Game**

Please turn off your cell phones – interferes with electronics in the room

4. **Ask Ms. Campbell to come up**

5. **Announce time to end meeting,**

   a. **next meeting Wednesday - same time – Larry Hartig - Commissioner of Department of Environmental Conservation**

6. **Gavel out**

Alaska Department of Fish & Game Overview

Senate Resources Committee

January 31, 2011

Mission Statement

- Based upon the Alaska State Constitution (Article 8) and Alaska Statutes (Title 16)
  - To protect, maintain, and improve the fish, game, and aquatic plant resources of the state, and manage their uses and development in the best interest of the economy and the well-being of the people of the state, consistent with the sustained yield principle.

ADF&G Core Services

- **Harvest Management**: provide opportunity to utilize fish and wildlife resources
- **Stock Assessment**: Ensure sustainability and harvestable surplus of fish and wildlife resources
- **Customer Service**: Provide information to all customers
- **Public Involvement**: Involve the public in management of fish and wildlife resources
- **State Sovereignty**: Protect the state's sovereignty to manage fish and wildlife resources
- **Habitat Protection**: Protect important fish and wildlife habitat during permit and project review

Commissioner's Office Responsibilities

- North Pacific Fishery Management Council
- Pacific Fishery Management Council
- Pacific States Marine Fisheries Commission
- Pacific Salmon Commission
- Exxon Valdez Oil Spill Trustee Council
- Federal Subsistence Board
- Western Association of Fish and Wildlife Agencies
- Association of Fish and Wildlife Agencies
- Alaska Migratory Bird Co-Management Council
- Pacific Flyway Council
- North Slope Science Initiative
- Alaska Ocean Observing System
- North Pacific Research Board
- UAF School of Fisheries and Ocean Sciences Advisory Council
- Polar Bear Range States
- US-Russia Treaty on Polar Bears
- Fisheries Excellence Committee of the Rasmuson Foundation
- UA-F Sea Grant Advisory Council
- International Porcupine Caribou Research Board
- Bering Sea Fisheries Advisory Board

Divisions of ADF&G

Commissioner's Office

Division of Commercial Fisheries

Division of Sport Fish

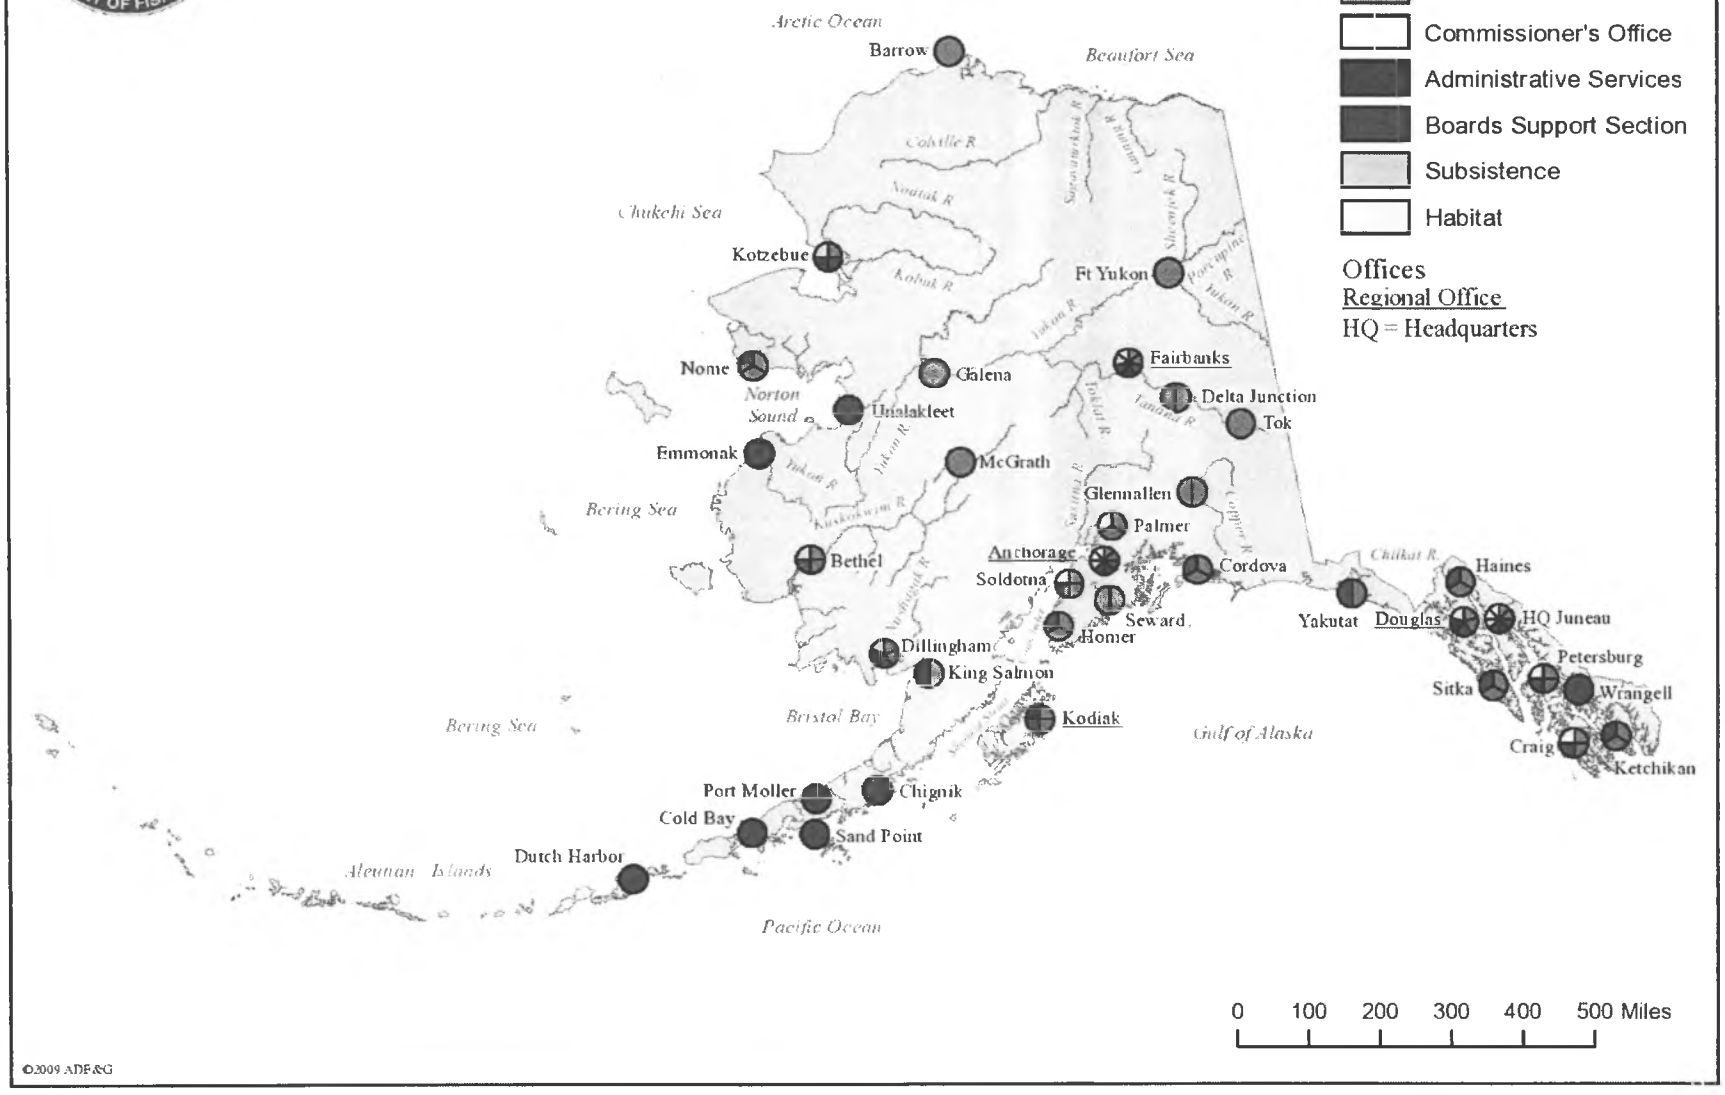
Independent Agencies

- Commercial Fisheries Entry Commission
- Exxon Valdez Oil Spill Trustee Council

Alaska Department of Fish and Game
Regional and Area Offices



©2009 ADF&G

Divisions of ADF&G

Commercial Fisheries

Acting Director Sue Aspelund

To protect, maintain, and improve the fish, shellfish, and aquatic plant resources of the state, consistent with the sustained yield principle, for the maximum benefit of the economy and the people of Alaska.

Divisions of ADF&G

Sport Fish

Director Charlie Swanton

To protect and improve the state's recreational fisheries resources.

Divisions of ADF&G

Wildlife Conservation

Director Corey Rossi

To conserve and enhance Alaska's wildlife and habitats and provide for a wide range of public uses and benefits.

Divisions of ADF&G

Subsistence

Acting Director Jim Simon

To scientifically quantify, evaluate and report information about customary and traditional uses of Alaska's fish and wildlife resources.

Divisions of ADF&G

Habitat

Director Kerry Howard

To protect Alaska's valuable fish and wildlife resources and their habitats as Alaska's population and economy continue to expand.

Divisions of ADF&G

Administrative Services

Director Kevin Brooks

Provides routine administrative services for the department and coordinates development of the annual operating and capital budget.

Divisions of ADF&G

Board Support Section

Executive Director Jim Marcotte

Ensures that the public process for the state's fish and wildlife regulatory system operates efficiently and effectively.

Independent Agencies

Commercial Fisheries Entry Commission

Bruce Twomley, Chairman

To control entry into Alaska's commercial fisheries to promote conservation of Alaska's fishery resources and economic health of commercial fishing.

Exxon Valdez Oil Spill Trustee Council

Elise Hsieh, Executive Director

To efficiently restore the environment injured by the Exxon Valdez oil spill to a healthy, productive ecosystem, while taking into account the importance of quality of life and the need for viable opportunities to establish and sustain reasonable standard of living.

2/02/11 PRESENTATION FOLLOW-UP TO ALASKA SUSTAINABLE ENERGY ACT

<TARGET><BILL></BILL><SUBJECT>2-02-11 PRESENTATION FOLLOW-UP TO ALASKA SUSTAINABLE ENERGY ACT</SUBJECT><COMM>SRES27</COMM></TARGET>

Mary Jackson

From: Jeff Stepp
Sent: Sunday, January 30, 2011 7:28 PM
To: Mary Jackson
Subject: SB 220 Follow-Up / Testimony

Hi Mary,

Here's an updated list of the folks who will be participating in the Alaska Sustainable Energy Act overview:

Opening remarks
Senator McGuire and Senator Wielechowski -- confirmed

Comments on the Implementation of SB 220
Gwen Holdmann, Executive Director, Alaska Center for Energy and Power (ACEP) -- confirmed

Comments on the Implementation of SB 220
Marilyn Leland, Executive Director, Alaska Power Association (APA) – confirmed

Comments on the Implementation of SB 220
Hannah Gustafson, Deputy Director, Renewable Energy Alaska Program (REEP) -- confirmed

Emerging Energy Technology Fund
Alaska Energy Authority (Sara L. Fisher-Goad and/or others) -- confirmed

Alaska Affordable Heating Program
Ron Kreher, Director, Office of Public Assistance, DHSS -- confirmed

Retrofitting of State Facilities
Joel St. Aubin, Chief of Statewide Public Facilities, DOTPF -- confirmed

Compressed Natural Gas Study
Diana Rotkis, Fleet Manager, DOTPF -- confirmed

The Feasibility of a Municipal Energy Improvements Financing Program
TBA, Department of Revenue – not confirmed

Standardized Methodology to Collect and Store Data
TBA, Office of Management and Budget – not confirmed

Obviously (!), each speaker will have to keep it short. I have told each of them that they'll just have a few minutes to present a few main points. It will be more like public testimony than the kind of detailed overviews we've been receiving.

If you have any other suggestions, please let me know!

Best,
JS

Governor Sean Parnell
STATE OF ALASKA

RECEIVED BY:
1/31/11 6pm
Office of the Chief Clerk

January 31, 2011

The Honorable Mike Chenault
Speaker of the House
Alaska State Legislature
State Capitol, Room 208
Juneau, AK 99801-1182

Dear Speaker Chenault,

In accordance with Ch. 83, SLA 10, Sec. 40, Page 25, Line 8, I am submitting the enclosed report to the Legislature regarding State energy programs and increasing coordination and efficiency of the State's energy programs and services.

To reach the State's energy policy goal of 50 percent electricity generated via renewable resources by 2025, our energy efforts and investments must be targeted and strategic. Conservation, weatherization, and energy efficiency are key components of our energy strategy as is our proposal to advance a large hydroelectric project in south central Alaska to supply much needed energy and jobs. Renewable energy fund grants will lower the cost of energy in rural Alaska and the integrated resources planning efforts will create the energy road map for south east Alaska.

I look forward to working with the Legislature to reach our energy policy goals.

Sincerely,

Sean Parnell
Governor

Energy Report to the Legislature

OFFICE OF THE GOVERNOR ENERGY REPORT. Not later than January 31, 2011, the Governor shall submit a report to the Legislature providing recommendations for how best to structure State energy programs and offices to increase the coordination and efficiency of the State's efforts and describing State energy services and programs in their entirety. The report must also include an examination of existing powers and duties and the structure of the Alaska Energy Authority and its board of directors, specifically analyzing the relationship between the Alaska Energy Authority and the Alaska Industrial Development and Export Authority.

Executive Summary

The State of Alaska has a variety of energy programs and initiatives. State and federal funding for both formula driven and competitive award programs has increased significantly in recent years. Several State departments and State corporations have roles to play in the coordination and delivery of energy related programs. Some State agencies' programs have a secondary focus on energy – primarily in the realm of resource management but also in infrastructure development and maintenance. It is in the State's interest for the Executive Branch to clarify and further define each agency's role and responsibility for certain Alaska energy programs and services.

Alaska's Constitution directs that natural resources be developed for the maximum benefit of the people. The 49th state is blessed with abundant resources – oil, gas, coal, timber, water, and wind. Necessarily, agencies with primary responsibility for the management of those resources must play a role in the provision of energy supplies where it is consistent with the larger constitutional and legislative direction. The roles and responsibilities of each agency need to be well understood and coordinated.

In recent years, the Alaska Energy Authority (AEA) has become a key agency for the planning of energy infrastructure and financing. While key improvements to AEA's authorizing statute are necessary at this time, there remains a need for continued coordination across multiple State agencies, corporations, and funding streams.

Policy development, legislative action, and implementation will need to be coordinated across departments if Alaska's energy future is to remain focused.

Recommendations to Change Structure

Changes to Services and Programs

Services and programs should be evaluated on their effectiveness in providing value to communities and residents of the state of Alaska. Reorganization of reporting structure should be implemented only if there is evidence supporting a reasonable expectation that program effectiveness will be improved.

AEA's powers should be changed to allow AEA to own new energy projects and to hire staff. The introduction of House Bill 103 and Senate Bill 42 allow the Legislature to consider these changes and accomplish the changes through passage of a bill.

House Bill 103 and Senate Bill 42 would authorize and allow AEA to move aggressively to pursue a large hydroelectric project (Susitna Dam) that would supply needed renewable energy to Interior and Southcentral Alaska. AEA could further the design, permitting, construction, and operation of the Susitna Dam project. This project is critical to Alaska reaching its energy policy target of generating 50 percent of its electricity through renewable energy by 2025.

The AEA managed Bulk Fuel Revolving Loan Fund and the Department of Commerce, Community and Economic Development (DCCED) managed Bridge Loan Fund should be merged into one program with two levels of service. Currently, the zero-percent Bridge Loan Program provides a disincentive for borrowers to increase their creditworthiness. AEA and DCCED are working to accomplish this merger.

A Commercial Energy Efficiency Loan program should be developed. Currently, the State has addressed needed energy efficiency programs for public buildings and residential homes. However, commercial buildings have energy efficiency upgrade needs as well, often in lighting. Providing loan funds specific to this need should be explored. DCCED, AEA, and the Alaska Industrial Development and Export Authority are developing options for an appropriate program.

Changes to Current Coordination Efforts

Currently, coordination efforts occur through meetings between agency personnel and the Office of the Governor, including, but not limited to, guidance from the Office of Management and Budget (OMB). Energy policy encompasses more than the annual budget and needs to be coordinated among the commissioners of the various agencies involved, the Governor's office, and the Legislature. The Energy Policy Coordinator (EPC) will provide additional focus and coordination for energy programs and policies that cross lines of several State agencies. The EPC will be the spokesperson for energy issues on behalf of the Governor and will work with commissioners, agency personnel, etc., to communicate with the Legislature.

The mission of the EPC is to help commissioners, staff, OMB, and the Governor's office ensure the State's energy resources and energy programs are devoted in a way that produce results which advance the State's energy policy priorities.

The EPC should further evaluate energy services and programs, measure their results, and make recommendations for any necessary changes beyond the recommended changes provided in this report. The EPC is an effective way to provide coordination between the various State energy programs and to communicate with the Legislature. The EPC will also be the mediator between agencies that have conflicting points of view or the appearance of duplicating efforts.

State Energy Programs and Offices

Description of Agency Coordination Efforts

For new policy initiatives in energy programs, the Office of the Governor plays a key role in the development of the new programs and planning. Agency personnel are, of course, charged with implementing authorized programs and efficiently using funds appropriated by the Legislature for programs.

Background and History of State Energy Office

In 1996, at the request of the United States Department of Energy (USDOE), the Governor designated AHFC as the lead agency for the USDOE State Energy Program (SEP). The SEP was the result of the USDOE's consolidation of two formula grant programs: 1) the State Energy Conservation Program managed by AHFC, and 2) the Institutional Conservation Program, managed by the former Department of Community and Regional Affairs, Division of Energy. In 1996, AHFC and Division of Energy, entered into a Memorandum of Agreement that delineated how SEP funds were to be managed and shared by AHFC and Division of Energy. The agreement stated that 60 percent of SEP funds would be transferred to the Division of Energy.

In 1999, the Department of Community and Regional Affairs was statutorily eliminated and the Division of Energy programs became the responsibility of AEA. After AHFC informed AEA that it would transfer no funds to AEA for the former Division of Energy programs, a new Memorandum of Agreement was signed by AHFC and AEA. The 2001 agreement delineated how SEP funds were to be managed and shared by AHFC and AEA. The agreement stated that 50 percent of SEP funds would be transferred to AEA.

During the 2008 Legislative Session and each subsequent session, the State of Alaska has created new energy programs and provided significant funds for various energy programs and initiatives. The federal government has also provided substantial funds, both formula driven and competitive awards, for energy programs.

Recent Coordination Efforts

The annual SEP allocation to Alaska has been approximately $300,000 during the past few years, although the allocation in FY2008 was $250,000. Half of the money is directly transferred from AHFC to AEA through a Memorandum of Agreement. Energy audits on schools and community buildings are the primary use of that funding. The other half of the money is used for educational programs sponsored by AHFC. These programs include workshops on energy efficiency for real estate professionals, builders, and homeowners, as well as paying for printing of various publications on energy efficiency and renewable energy. Additionally, funds supplement the Weatherization Assistance Program to reduce electrical use in eligible homes.

ARRA funds for 2009 totaled $28.232 million for the State energy program. Performance contracting on schools, State owned public buildings, and municipal buildings will use about two-thirds of the funding, with improvements to BEES, ARIS and AkWarm also being upgraded.

AHFC and AEA should, and are, updating their Memorandum of Agreement to memorialize both AHFC's and AEA's role in managing certain Alaska energy programs and to confirm the distribution of SEP funds. Similar to the process followed with ARRA funds, when circumstances arise that necessitate additional input, AHFC and AEA will coordinate efforts with the Office of the Governor to ensure the administration's priorities are carried out by the agencies.

Alaska Energy Authority

Examination of AEA Structure and Board of Directors

AEA was created by the Alaska State Legislature in 1976. AEA is a public corporation and a component unit of the State of Alaska. AEA's mission is to reduce the cost of energy in Alaska. The Board of Directors of the Alaska Industrial Development and Export Authority (AIDEA) is also the AEA Board of Directors. The AEA board of directors has seven members: five public members and the Commissioner of Revenue and the Commissioner of Commerce, Community and Economic Development. The five public members are appointed by the Governor, each of whom has expertise in private sector business or industry, or both, and possesses demonstrated leadership skills. The public members serve at the pleasure of the Governor for two-year terms.

AEA History

Throughout the 1980's, AEA worked to develop the State's energy resources as a key element in diversifying Alaska's economy. A number of large-scale projects were constructed; four of those projects were sold in 2002, and one was transferred to the City of Larsen Bay in the fall of 2010. The Bradley Lake Hydroelectric project together with the Alaska Intertie's 170 miles of transmission line help provide Interior Alaska with cheaper energy available in the Southcentral portion of the state. Pursuant to statute, on August 12, 1993, the board of directors of AIDEA, a public corporation and a political subdivision of the State, became the board of directors of AEA. AEA continues to exist as a separate legal entity. The corporate structure and operating assets of AEA were retained but the ability to have employees, and construct or acquire energy projects was eliminated. Among other things, AIDEA provides personnel services for AEA. On April 10, 2008, the board appointed a separate and independent AEA executive director who is an employee of AIDEA, but is not subject to supervision by AIDEA's executive director. Previously, the AEA and AIDEA executive directors were the same. There is no commingling of funds, assets, or liabilities between AIDEA and AEA and there is not responsibility of one of these entities for the debts or obligations of the other.

The 1993 legislation required AEA, to the maximum extent feasible, to enter into contracts with public utilities and other entities to carry out AEA duties respecting the ongoing operation and maintenance of the AEA owned operating assets; this has occurred with oversight responsibility retained by AEA.

Pursuant to legislation effective July 1, 1999, rural energy programs previously administered by the former Department of Community and Regional Affairs, Division of Energy, were transferred to AEA for administration, as part of a larger reorganization of State agencies. Several general energy programs primarily focused on rural energy issues moved to AEA. Rural energy programs were originally part of AEA prior to the reorganization that occurred in 1993.

During fiscal year 2008, legislation added energy development programs to AEA. AEA has developed the *Alaska Energy Pathway*, a guide for Alaskan communities to utilize local energy resources. AEA has also established the Renewable Energy Fund and Grant Recommendation Program.

AEA Current Programs and Projects

AEA - Rural Energy Infrastructure

Traditionally, State agencies will grant funds to a community or utility to build a project. However, many rural communities lack the necessary financial resources and technical expertise to manage and construct energy infrastructure upgrades. AEA's rural energy infrastructure program provides direct project management support to design and construct rural powerhouses and bulk fuel storage facilities. Under this project management model, AEA manages the federal grant or State appropriated project, hires a construction manager, provides project oversight, and bookkeeping services for locally hired labor.

Rural Power System Upgrades

Electricity provides for lighting, communications, heat, and power necessary to operate infrastructure that supports all other elements needed in any community to permit safe and healthy living conditions. In rural communities throughout Alaska, electricity is generated by a small local "system" (generation and distribution) using diesel fuel at a cost that is three to five times higher than that in urban parts of the state. Of 200 rural communities, approximately half are served by cooperatives or another form of utility that performs under a well-established organization. Others are served by very small entities, many which experience technical and administrative problems due to lack of economies of scale and/or lack of specialized skills in the community.

AEA manages powerhouse and electrical distribution upgrades that may include efficiency improvements, powerhouse upgrades or replacements, line assessments, lines to new customers, demand-side improvements, and repairs to generation and distribution systems. System upgrades to be funded may be identified through a variety of ways, including via technical assistance, advanced by the local community or directed by the Legislature.

Bulk Fuel Upgrades

Most rural Alaska communities receive fuel for heating, generation of electricity, vehicles, and other uses only during summer months when coastal areas and rivers are ice free. These communities typically store enough fuel to meet their needs for an entire winter. Many rural bulk fuel tank farms were constructed more than 20 years ago and are in poor condition. With substantial contributions from the Denali Commission, the bulk fuel upgrades program provides funding for the design/engineering, business planning, and construction management services to build code-compliant bulk fuel tank farms in rural communities.

In the early 1990's, many rural communities faced the very real threat that they would no longer be allowed to take delivery of fuel in bulk quantities because of the condition of their bulk fuel storage tank farms. The most common problems were the piping systems to, from, and within the tank farms. The AEA bulk fuel upgrade retrofit and revision program is funded with grants from the Denali Commission and State appropriations.

AEA Alternative and Renewable Energy Program and Projects

AEA's alternative and renewable energy program promotes the use of renewable resources as alternatives to fossil fuel-based power and heat, and measures to improve energy production and end use efficiency. In rural areas, the program may support developing local sources of coal and natural gas as diesel alternatives. The Alaska State Legislature created the Renewable Energy Fund

(REFund) in 2008, with the intent to appropriate $50 million annually for five years. The Legislature authorized AEA to manage the REF project application process, project evaluations, recommendations, completion of grant agreements, and disbursement of funds to grantees. In addition to managing the Renewable Energy Grant Fund and Recommendation Program, AEA is a technical resource for entities wanting to develop alternative and renewable resources. AEA staff is frequently called upon to participate in conferences, make public presentations regarding program areas, and provide technical advice and assistance.

Renewable Energy Program Areas

The Alaska Energy Inventory (cooperative project of AEA and Alaska DNR) consists of renewable and fossil resource data, energy supply and usage data, and other information useful for energy planning and development.

The Biomass Energy Program develops projects using wood, sawmill residue, and municipal wastes for energy; tests air emissions and performance of fish oil and diesel blends as fuel; assesses the viability of recovering fish oil from fish processing wastes.

The Geothermal Program supports projects such as the Chena Hot Springs power plant; organizes workshops and training sessions; coordinates State assistance in developing other potential projects such as Mt. Spurr on the Railbelt and Makushin in Unalaska.

The Small-scale Hydroelectric Program provides technical assistance through staff and contractors for hydro feasibility assessment; manages public funding for project construction.

The Ocean and River Energy Program evaluates technology and feasibility of converting wave motion, tidal and river flow into power in partnership with Alaska utilities and the Electric Power Research Institute.

The Wind Program assists utilities and communities in resource evaluation, training, environmental assessment, regional development, conceptual design and economic feasibility of rural wind-diesel systems; assists with Railbelt wind integration studies.

The Emerging Energy Technology Fund under AS 42.45.375 was established in 2010. AEA may make grants to eligible applicants for demonstration projects of technologies that have a reasonable expectation to be commercially viable within five years and that are designed to: 1) Test emerging energy technologies or methods of conserving energy; 2) Improve an existing energy technology; or 3) Deploy an existing technology that has not previously been demonstrated in Alaska. The statute provides for an advisory committee to assist AEA in the development of the program and review of potential projects to be funded. AEA is in the process of soliciting the first round of grant applications for this new program.

Examination of AEA and AIDEA Relationship

Since 1993, AIDEA staff members are responsible for administering AEA programs. In 1999, when the Department of Community and Regional Affairs (DCRA) was dissolved, AEA became responsible for former DCRA Division of Energy programs and certain DCRA staff became AIDEA employees. In 2008, the AIDEA and AEA by-laws were changed to allow the board of directors to hire an AIDEA employee as an AEA executive director who is a different person than

the AIDEA executive director. The AEA executive director serves at the direction of the AEA board of directors.

As mentioned earlier, Governor Parnell has introduced legislation (SB 42 and HB 103) to allow AEA to hire staff. The legislation allows for the transfer of certain AIDEA employees to AEA. AIDEA's and AEA's relationship has existed for over 17 years, and many employees have shared responsibilities to both organizations. For efficiency purposes, AIDEA and AEA will continue to share certain services and be located in the same building. A complete split of the two corporations is estimated to cost at least $2 million and certain staff expertise would be difficult to duplicate. SB 42 and HB 103 provide the most cost effective way for both agencies to continue to pursue their distinct missions and to benefit from shared services and staff.

Other State Programs

Oil and Gas – DNR, Revenue, Multi-Agency Gasline Team, ANGDA
The Department of Natural Resources (DNR) is the State agency charged with primary responsibility for the management of resources on State lands. Resources managed by the agency that have an impact on energy supplies and demands include oil and gas, forestry, minerals (especially coal), water (tides and rivers), geothermal, and the land below many areas with significant wind.

The management of these resources is guided by the Constitution and enabling statutes. Development of these resources provides contributions to the public, usually in the form of revenue to the treasury and funds being deposited in the Alaska Permanent Fund.

Many of these resources can provide energy when they are developed. However, most population centers in Alaska are not large enough to achieve the efficiencies of scale required to provide that energy at a low cost to the consumer. Often, an export market of some sort is required to achieve that efficiency, which energy is then also available to the local population in proximity to the development. A key focus of work for AEA has been, and will continue to be, to find ways for local populations to share in energy development.

Interests in development of State resources must be ordered and harmonized. This is done through the legislative process, which establishes the statutory and budgetary boundaries by which DNR may operate. The development of State policy as it relates to an Alaska North Slope (ANS) natural gas pipeline illustrates the principles involved.

The Alaska Gasline Inducement Act (AGIA) spells out statutorily what the Constitution requires. It seeks to maximize the chances that ANS natural gas resources are commercialized while minimizing the fiscal concessions achieved by lessees. It does so by advancing the development stage of the project with monetary incentives, but in return for commitments that the project be developed with particular State priorities in mind.

The original AGIA structure was developed and proposed by multiple State agencies with guidance and coordination provided by the Office of the Governor; it was adopted and approved by the

Legislature in 2007. The AGIA License provides for the delivery of gas within the state to be provided at reasonably low rates at destinations along the project's route.

The Alaska Natural Gas Development Authority (ANGDA) was created by the voters of Alaska through a 2002 General Election Ballot Initiative and is a public corporation. ANGDA is focused on getting North Slope natural gas to Alaskan communities as well as identifying feasible LNG opportunities for the State. With the support of the Legislature and the Administration, ANGDA started work in 2003 within the Alaska Department of Revenue (Revenue). Alaska Statute 41.41 contains the law for the establishment and functioning of the authority.

The Alaska Stand Alone Gas Pipeline (the "bullet line") is being planned as an in-state gas pipeline designed to provide long-term, stable supplies of natural gas from the North Slope to Fairbanks and the Cook Inlet areas, as well as other communities where practicable. In the spring of 2010, the Alaska Legislature and the Governor mandated that a group of industry professionals convene under the corporate banner of the Alaska Housing Finance Corporation for the specific purpose of developing, refining, and producing an in-state natural gas pipeline project plan by July 1, 2011. The focus of the pipeline project is to supply gas to Southcentral Alaska by 2016 to offset the projected supply decline.

The design of the Alaska Stand Alone Gas Pipeline addresses current market demand with the capacity to expand for future growth. The project design accommodates initial capacity of 500 million standard cubic feet per day (MMscfd) of clean-burning natural gas. The initial flow rate will be 250 to 500 MMScfd, and the line can be expandable to 1,000 MMscfd if needed. The project plan includes opportunity and options to export liquefied natural gas (LNG) and marked natural gas liquids (NGL) to the West Coast of the United States and/or Pacific Rim markets.

The Alaska Stand Alone Gas Pipeline Project is an independent project and is not contingent on any of the other projects under consideration and currently moving forward in Alaska. The Alaska Stand Alone Gas Pipeline Project was conceived as a smaller-diameter "bullet line" that could be built on a shorter timeline to specifically address the urgent needs in Alaska, particularly in the heavily populated areas in Fairbanks and the Cook Inlet region. In the event the large-diameter gas pipeline projects do not move forward, the project plan for the Alaska Stand Alone Gas Pipeline Project positions the State of Alaska for timely response to the energy issues presently facing the Interior and Southcentral areas of Alaska. Relative to larger projects, the "bullet line" is designed to advance quickly to construction on a shorter timeline.

Energy Efficiency – AHFC and AEA

AHFC

Meeting Alaska Building Energy Efficiency Standard (BEES) is required for all new residential homes built since 1992 in the state, and for community-owned buildings receiving AHFC financing. AHFC is responsible for BEES, provides technical assistance to the businesses in the housing industry, and maintains a list of individuals who are qualified to certify compliance with BEES.

AkWarm Energy Modeling Software – AkWarm software is trademarked and has been used by AHFC since 1996. This technology is an integral part of developing and improving AHFC's energy

programs. The software is continuously updated. Scheduled upgrades include electrical ratings, estimating electrical use from appliances, equipment, and lighting. An air conditioning component and improved user interface and reporting are planned improvements.

Alaska Retrofit Information System (ARIS) – ARIS collects data from AkWarm including: commercial benchmarking information; the Home Energy Rebate Program; census records; weatherization program; grants; zip codes; legislative districts; and borough and city tax records. ARIS is a required data input/collection and retention system for all AHFC programs. The program further allows program staff and researchers access to much of building/construction data, including location, size, type, fuel sources and costs, owner, and operators, and conveniently provides all of the data in one place, with table links between datasets established. ARIS will also now track information for public and commercial facilities receiving State lending or grant funding for all AHFC Programs.

Energy Ratings – AkWarm Certified Energy Raters are individuals who measure energy efficiency in a home using AkWarm and other diagnostic tools. For new construction, the home's energy rating may be used to help verify compliance with BEES and benefit the homebuilder or owner by qualifying Five Star and Five Star Plus homes, or existing homes requiring energy improvements, for a reduced interest rate reduction (see "Energy Efficiency Interest Rate Reduction Program" or "EEIRR," below). Energy ratings are also required for the Home Energy Rebate Program and Second Mortgage Program for Energy Conservation. With the AkWarm software improvements mentioned above, AHFC is working toward the addition of a sixth star for green building. AHFC maintains a list of energy raters by community. Over 60,000 home energy ratings have been completed in Alaska, one of the highest in actual number for any state in the country, regardless of population. Approximately 36,000 of those ratings were performed since April 2008. More than 100 raters are qualified in the state of Alaska.

Energy Efficiency Interest Rate Reduction Program (EEIRR) – AHFC offers interest rate reductions to homebuyers purchasing new homes with Five Star and Five Star Plus energy ratings. These ratings exceed BEES requirements. AHFC also offers rate reductions for energy improvements to older, existing home purchases. To date, AHFC has issued more than 10,000 loans under this program with a total value of nearly $1.8 billion.

Energy Efficiency Education and Workshops – There has been tremendous growth in the Weatherization Assistance Program, from 600 homes weatherized pre-2008 to now an average of 3,200 homes per year. Coupled with the addition of the Home Energy Rebate Program for up to 20,000 homes, energy-efficiency education has become a top priority for AHFC.

AHFC provides energy-related workshops, classes and seminars for homeowners, homebuyers, renters, builders, lenders, real estate professionals, and others. In FY2009, more than 5,000 Alaskans attended energy-efficiency classes offered through or funded by AHFC.

AHFC has embarked on training programs to bring up to 2,000 green jobs into energy-efficiency programs. Energy raters, weatherization assessors, crews, contractors, do-it-yourself homeowners, and the general public are being trained in weatherization installation techniques, building science, building auditing, energy modeling, combustion safety, moisture control and ventilation, and more. Training programs such as these are essential to achieving long-term energy efficiency goals.

With the implementation of the Alaska Energy Efficiency Revolving Loan Fund (AEERLF), new public facility energy audits and retrofits are being performed, requiring even more education for contractors, engineers, architects, and others. AHFC is developing education programs to fit these needs.

Home Energy Rebate Program – On April 5, 2008, legislation was signed authorizing the addition of $100 million to the Home Energy Rebate Program. This program is designed to rebate homeowners some of the costs of making energy-efficiency improvements to their home, regardless of income. An AkWarm energy rating performs both before and after improvement audits to determine eligible measures and maximum rebate amounts. Depending on the rating increase and actual receipts, a rebate of up to $10,000 is available for consumers. The program is further supplemented with other financial incentives, including the Second Mortgage Program (see below for description) for Energy Conservation. A $7,500 rebate is available for newly constructed Five Star Plus homes. Demand for the rebate program was sufficient for the Legislature to add an additional $60 million in September 2008. Since April 2008, AHFC has doubled the number of energy raters. Estimated average energy savings are about $1,500 per home per year, and more than 12,000 pounds of carbon dioxide per home has been prevented from entering the atmosphere.

Second Mortgage Program for Energy Conservation – The Second Mortgage Program for Energy Conservation was initiated in April 2008. Potential borrowers may apply to AHFC for financing to make cost-effective energy improvements on owner-occupied properties. Borrowers select from the list of energy upgrades included with the energy audit of their home, performed by an AkWarm-certified rater. All improvements must be completed within 365 days of loan closing.

Small Building Material Loan – AHFC provides direct financing for the renovation or completion of residential properties located in designated small communities; however, the project may include energy-efficient upgrades and renewable-energy systems and, therefore, would be eligible for these loans.

Energy Efficiency Conservation Block Grant (EECBG) – The EECBG is a new program to Alaska, launched in 2009. It will supplement the Energy Efficiency Education Program, ARIS, and AkWarm, aid in the development of a commercial audit program, establish a Village Waste Heat Recovery Project, and a municipal block grant for energy efficient retrofits.

Research Information Center – The Research Information Center (RIC) provides information, presentations, and technical assistance for AHFC energy programs. The RIC Library has thousands of online resources, books, fact sheets, videos, reports, catalogs, etc., available to all Alaskan residents on topics such as northern building, innovative housing construction, energy efficiency, renewable energy, sustainable technology, and much more. Information requests, library visits, educational presentations and web visits total approximately 20,000 annually.

Weatherization – The Low-Income Weatherization Assistance Program allows eligible low-income Alaskans to lower the cost of heating their homes. AHFC provides funds to nonprofit organizations and municipalities. To apply for the program, Alaskans contact the program provider for their area. The Weatherization Program has been in effect in Alaska for about 30 years using funding from a variety of sources. It has a highly developed, functioning infrastructure for effective delivery and is one of the most successful programs the State has ever offered to clients, providing immediate,

tangible benefits that are documented in energy savings and reductions in threats to health and safety commonly found in the home.

The Weatherization Program has a long history of performance in building a skilled workforce, processing applications, working with other agencies to provide needed services, identifying high priority clients and families, introducing new and effective products to the market, increasing the awareness of the HVAC industry, providing critical client education, assisting low- and moderate-income families to curb unnecessary expenditures in heating and utilities, and in providing healthy, safe living environments to the highest priority clients, including those with young children, the disabled, and senior citizens.

AEA

Diesel Generation Efficiency Program provides assistance in developing projects that use high efficiency generators and recover "waste heat" from diesel generators.

Energy Efficiency and Conservation Program focuses on reducing energy use in larger facilities such as schools, community buildings, water treatment plants, and commercial buildings. Current initiatives include the federally funded Energy Efficiency and Conservation Block Grants, the Village End Use Efficiency program, a building energy monitoring, pilot projects, and a statewide public education and outreach program.

AEA has recently launched a commercial energy audit program. Owners of eligible commercial buildings throughout Alaska may be reimbursed up to $6,500 for a qualifying energy audit. The program is funded by the American Recovery and Reinvestment Act, and is expected to provide up to 150 commercial energy audits. The Alaska Commercial Energy Audit Program will reimburse eligible applicants the cost of an energy audit up to a specified dollar limit on a per square foot basis. Eligible buildings are commercial buildings, including nonprofit owned, up to 125,000 square feet. Building tenants are not eligible, but may refer the building owner to the program.

Public Assistance – AEA, DHHS

The State of Alaska has energy assistance programs to help qualified Alaskan residents and community facility owners help defray high energy costs.

AEA Power Cost Equalization Program

AEA Power Cost Equalization (PCE) program provides economic assistance to electrical customers in rural areas of Alaska where the kilowatt-hour (kWh) charge for electricity can be three to five times higher than the charge in more urban areas of the state. PCE only pays a portion of approximately 30 percent of all kWh's sold by the participating utilities. Community facilities and residential customers are eligible for PCE reimbursements. PCE fundamentally improves Alaska's standard of living by helping small rural areas maintain the availability of communications and the operation of basic infrastructure and systems, including water and sewer, incinerators, heat, and light. AEA determines ratepayer and community facility eligibility, manages the program, and reimburses utilities for eligible PCE costs.

The Regulatory Commission of Alaska (RCA) determines utility eligibility and establishes the PCE rates that are used to calculate eligible PCE payments. PCE rates have a fuel cost and non-fuel cost component. The fluctuation in the PCE levels are primarily due to the change in a utilities fuel cost to produce electricity. Participating utilities are required to reduce each eligible customer's bill by the amount that the State pays for PCE.

Department of Health and Social Services (DHSS) – LIHEAP and AAHP

The Low-Income Home Energy Assistance Program (LIHEAP) is a federally-funded heating assistance program that helps households pay a portion of their winter heating costs. The program is limited to households with incomes at or below 150 percent of the federal poverty income guidelines. Several factors affect final eligibility and the household's benefit amount. These factors include the community the applicant resides in, how they heat their home, what type of dwelling they live in, the number of people living in the house, all residents' gross monthly income, and whether or not an elder, disabled individual, or child five years of age or younger lives in the home.

The Alaska Affordable Heating Program, a State-funded program for households with income between 151 percent and 225 percent of the federal poverty income guidelines, mirrors LIHEAP. Both programs use the same application form and eligibility criteria.

Qualified applicants receive one grant per year, payable to their fuel vendor. Applicants are notified about the status of their case through a notice of action. Applicants may designate a portion of their award be sent to their electric company. Applications are accepted from October 1 through April 30. Both programs are open to renters as well as homeowners.

Office of Management and Budget / Standardized Methodology to Collect and Store Energy Consumption and Expense Data (SB 220, Section 39)

The State of Alaska's facilities energy cost and consumption data will be collected and stored in a new web-based module in Alaska Housing Finance Corporation's Alaska Retrofit Information System (ARIS). The new module, estimated to cost $42,000, will be paid for with ARRA energy funds and will allow State employees to access the system via the internet.

State facility users will be able to enter basic data about their buildings. It will include electrical and other space/water heating fuel costs and usage, and demand charges. Also included will be size, type of building, occupancy, schedule, facility owner, contact, and other data. The system's reporting function will summarize data by such features as building, building type, energy usage, history, department, and geographic locations, allowing for the capability to prioritize facility energy efficiency retrofit opportunities.

DOT&PF Retrofitting of State Facilities

AS 44.42.067 requires the DOT&PF to retrofit at least 25 percent of all State of Alaska public facilities over 10,000 square feet no later than January 1, 2020. The milestones to accomplishing this include:

- Implementing a standardized method to collect energy consumption and cost data for facilities and generating Energy Use Indexes (AS 37.07.040 (12)).
- Identifying and prioritizing the least energy efficient facilities.
- Determining project scopes for energy retrofit work in those facilities that will meet net cost savings within 15 years.
- Working with the state agencies to arrange funding for the determined energy retrofit projects.
- Contracting with Energy Services Companies to perform energy performance contracts.
- Executing the energy retrofit projects and verifying the energy savings.
- Continuous monitoring of state energy consumption to be compared to levels of past years.

The DOT&PF is currently gathering utility bills from the past two years for all state-owned buildings that are over 10,000 SF. Several agencies have provided the information and the DOT&PF is generating Energy Use Indexes in order to prioritize the buildings from least to most energy efficient. This will be an ongoing process and will utilize the information gathered from the implementation of the standardized methodology for state agencies to collect and store energy consumption and expense data.

DOT&PF and the Alaska Energy Authority have collaborated on this approach to prioritizing facilities. Additionally, because completing the work as cost effectively as possible is essential, when commencing energy efficiency retrofit projects, the DOT&PF intends to group projects by geographic locations to the extent possible. This will assist in expediting project completions, reducing project costs, and maximizing project resources. However, it may mean one group of facilities includes multiple departments and multiple funding sources and that energy retrofits to facilities are not completed in exact order of their baseline EUIs

Concurrently, the DOT&PF has issued an RFP for Energy Performance Contracting and is negotiating with three Energy Service Companies (ESCOs). The three contracts are anticipated to be awarded February 2011.

Initial funding for energy efficiency retrofit projects will come from grant funding through the American Recovery and Reinvestment Act (ARRA). A total $10M has been allocated to this effort for state buildings. Once those funds are committed, funding of the energy retrofit projects will be through the Alaska Energy Efficiency Revolving Loan Fund Program administered by the Alaska Housing Finance Corporation and other potential sources.

Prior to 2010, the DOT&PF had previously completed energy retrofit projects under two phases of energy performance contracting across multiple facilities. The first phase of energy performance contracting, completed in 2006, resulted in energy cost avoidance of $365,991 in its first year. The second phase, completed in 2009, resulted in $793,395 of cost avoidance in its first year.

In additional, agencies have long been completing energy efficiency retrofit projects through conventional contracting means in their facilities utilizing deferred maintenance funding.

RCVD 2/2/11

MAG

Thank you for the opportunity to comment on the status of the Alaska Sustainable Energy Act, SB220. My name is Marilyn Leland and I am the Executive Director of the Alaska Power Association. APA is the statewide trade association that represents the electric utilities that supply power to about a half million Alaskans from Barrow to Unalaska, through the Interior and Southcentral and down the Inside Passage.

SB220 was a bill that APA actively supported last session. Having said that, though, there are a number of provisions in the bill that do not directly relate to the electric utilities, so I will be limiting my testimony to those portions that do. Also, in a number of cases, there are provisions that we supported, but I am not aware of the status of implementation and I am unable to comment on their status. Agencies, local governments and school representatives would be better able to address these provisions.

Looking at Section 1, we were pleased to see language that helps to remove barriers to the development of nuclear energy as an alternative technology in Alaska. This an important technology that needs to be considered for use here and I expect this language will help, however, I am not aware of any nuclear projects underway as a result of the new provisions.

Section 14 deals with the Emerging Energy Technology Fund. We believe that the inclusion of this section was very important. There is no silver bullet that is going to help everyone in Alaska solve their energy problems and I commend the legislature for creating this fund and including an advisory committee populated by experts in the science and engineering fields. The Alaska Power Association has a designated seat on that committee, which has been filled by Eric Eriksen, who is an engineer with Alaska Electric Light & Power in Juneau. The committee has had its initial organizing meeting at which the draft Request for Grant Applications was reviewed. That RFA was issued on January 7 with applications due March 2. Once the applications are received, I understand the advisory committee will meet again to review them and make recommendations on grant awards.

I want to mention one concern I have about the advisory committee. The bill does not allow a business or organization represented by a member of the advisory committee to receive a grant. While I understand the reasoning behind this provision, I think you should consider removing it. Alaska has a small pool of organizations and individuals who are qualified to serve on the committee and who have the technical ability to develop emerging technologies. Rather than simply prohibiting them from receiving the grants, I think it might be better to allow them

to apply for grants, but prohibit them from being involved in any way in the deliberations or voting on the recommendations for grant awards. We would only be hurting ourselves by not taking advantage of someone's expertise on the committee just because they may want to apply for a grant at some time.

Section 42 adds a provision allowing the Alaska Housing Finance Corporation to issue bonds in an amount not to exceed $250 million to make loans from the Alaska energy efficiency revolving loan fund. We believe this is an excellent provision, although I am not aware of the status of the expanded bonding capacity. AHFC would know.

You also asked where we think the legislature needs to focus now. At APA, we have developed a list of initiatives that we think the legislature should consider. They don't all relate to SB220, but I will summarize them for you:

- Develop an implementation plan for Alaska's energy policy authorized by HB306 last session. As I mentioned earlier, a lot of good work went into developing the policy. Now the state needs to actually do the work to make the policy succeed.

- Develop large-scale hydroelectricity for the Railbelt and develop renewable energy resources, hydro, geothermal and wind, for other regions of the state. A large hydroelectric project could meet the needs of as much as 75% of Alaska's population well into the future, but we need to not forget the communities that are not on the Railbelt. The state should be looking at developing viable renewable energy generation for those communities as well.

- Encourage the development of a Cook Inlet Gas Management Plan for continued gas delivery to Southcentral. Natural gas is critical to Southcentral and the economy statewide. Demand for natural gas in Southcentral is expected to exceed supply as early as 2013. The legislature and the Governor need to take a comprehensive view of the situation, develop policies and ensure coordinated actions.

- Fund the Renewable Energy Fund and the Power Project Loan Fund. The funds are the primary state sources of capital funding for renewable energy projects. Both funds have been woefully undercapitalized in recent years in light of the goals set forth in the state energy policy. Fund a minimum of $50 million annually for the Renewable Energy Fund as authorized and

properly capitalize the Power Project Loan fund at a level to support the goals set forth in Alaska's energy policy.

- Continue to fund the Power Cost Equalization Program. The very survival of many rural Alaska communities depends upon meaningful relief from the crippling cost of energy. The legislature should continue the PCE benefit at 100% for FY11 and fully fund PCE in the Administration's FY12 operating budget.

- Develop policy and legislation that expands funding for energy efficiency and conservation activities. Continue to support the highly successful programs of the Alaska Energy Authority and the Alaska Housing Finance Corporation for home energy audits, energy improvement rebates and weatherization. In addition, we encourage you to provide commercial energy audits for governments, schools and public institutions and offer energy efficiency and conservation block grants. A bill has already been introduced this session to expand the AHFC's energy efficiency program for commercial buildings. That bill is HB 36.

We have a number of successful projects and initiatives in Alaska. Just to name a few, there are Kotzebue Electric's wind farm; Kodiak Electric's Pillar Mountain Wind Farm and Terror Lake hydro project; Alaska Village Electric's wind generators in a dozen of their villages; Cordova Electric's hydro projects; Alaska Electric Light and Power's Snettisham and Lake Dorothy hydro projects; Alaska Energy Authority's Bradley Lake hydro and the newly-created Alaska Railbelt Cooperative Transmission and Energy Company that is poised to do great things in Southcentral. With the history of these successful projects, I am confident that we can do it again ... it's just going to take a lot of hard work, coordination between the state, the electric utilities and other interested parties and, of course, a lot of money. But we can do it!

In closing, I want to compliment you on all of the hard work that went into the development of SB220. It was an excellent beginning to what needs to be done to solve Alaska's energy problems, but we're not done yet.

Alaska Sustainable Energy Act

SB 220 (26th Alaska State Legislature)

Standardized Methodologies, Reports Due to the Legislature, and the Implementation of Processes

Not later than January 31, 2011, the Office of Management and Budget shall develop a standardized methodology to collect and store energy consumption and expense data.

Not later than January 31, 2011, the Governor shall submit a report to the legislature providing recommendations for how best to structure state energy programs and offices to increase the coordination and efficiency of the state's efforts and describing state energy services and programs in their entirety. The report must also include an examination of existing powers and duties and the structure of the Alaska Energy Authority and its board of directors, specifically analyzing the relationship between the Alaska Energy Authority and the Alaska Industrial Development and Export Authority.

Not later than January 31, 2011, the Department of Transportation and Public Facilities shall prepare a report containing the results of the study of the feasibility of using compressed natural gas to power vehicles in the state.

Not later than January 31, 2011, the Department of Revenue shall submit to the legislature a report and recommendations regarding the feasibility of a municipal energy improvements financing program.

Not later than one year after the effective date of this section, the Department of Transportation and Public Facilities, in consultation with the Alaska Energy Authority, shall adopt and implement a systematic process for prioritizing the retrofitting of state facilities for a long-term increase in energy efficiency and reduction of energy costs.

SB 220
ALASKA SUSTAINABLE ENERGY ACT

DEPARTMENT OF TRANSPORTATION & PUBLIC FACILITIES

AND

DEPARTMENT OF ADMINISTRATION

2010 PROGRESS REPORT
Submitted January 2011

EXECUTIVE SUMMARY

In accordance with AS 44.42.067(d), this is the FY11 Progress Report detailing the progress of the State of Alaska Department of Transportation and Public Facilities (DOT&PF) in reducing the state's energy consumption.

AS 44.42.067 requires the DOT&PF to retrofit at least 25 percent of all State of Alaska public facilities over 10,000 square feet no later than January 1, 2020. The milestones to accomplishing this include:

- Implementing a standardized method to collect energy consumption and cost data for facilities and generating Energy Use Indexes (AS 37.07.040 (12)).
- Identifying and prioritizing the least energy efficient facilities.
- Determining project scopes for energy retrofit work in those facilities that will meet net cost savings within 15 years.
- Working with the state agencies to arrange funding for the determined energy retrofit projects.
- Contracting with Energy Services Companies to perform energy performance contracts.
- Executing the energy retrofit projects and verifying the energy savings.
- Continuous monitoring of state energy consumption to be compared to levels of past years.

The DOT&PF is currently gathering utility bills from the past two years for all state-owned buildings that are over 10,000 SF. Several agencies have provided the information and the DOT&PF is generating Energy Use Indexes in order to prioritize the buildings from least to most energy efficient. Concurrently, the DOT&PF has received responses to the Request for Proposals for contracting with up to three Energy Service Companies (ESCOs).

Initial funding for energy efficiency retrofit projects will come from grant funding through the American Recovery and Reinvestment Act (ARRA). Once those funds are committed, funding of the energy retrofit projects will be through the Alaska Energy Efficiency Revolving Loan Fund Program administered by the Alaska Housing Finance Corporation and other potential sources.

Prior to 2010, the DOT&PF had previously completed energy retrofit projects under two phases of energy performance contracting across multiple facilities. The first phase of energy performance contracting, completed in 2006, resulted in energy cost avoidance of $365,991 in its first year. The second phase, completed in 2009, resulted in $793,395 of cost avoidance in its first year.

Facility energy efficiency retrofit projects have also been completed through conventional contracting means in multiple state facilities and are detailed in this report.

The DOT&PF is also coordinating with the Alaska Housing Finance Corporation (AHFC), the Alaska Energy Authority (AEA), and the Office of Management and Budget (OMB) to determine the method to collect energy data and catalog it for use by all state agencies.

TABLE OF CONTENTS

Executive Summary

1.0 Introduction **4**

2.0 Energy Consumption and Cost **5**

2.1 Methodologies of Utility Data Collection 5
2.2 Current Consumption and Cost 5
2.3 Past Consumption and Cost 7

3.0 Energy Use Indexes and Prioritization **10**

3.1 Project Prioritization **12**

4.0 Progress **13**

4.1 Energy Services Companies RFP 13
4.2 Completed Energy Efficiency Projects 13
4.2.1 Energy Performance Contract Projects 13
4.2.2 Individual Facility Energy Retrofit Projects 14

5.0 Relationships with Other Agencies **16**

Appendix A

FY2009 Energy Use Data
FY2010 Energy Use Data

1.0 INTRODUCTION

Senate Bill 220, known as the 'Alaska Sustainable Energy Act,'', was enacted into law in July 2010. The State of Alaska Department of Transportation and Public Facilities (DOT&PF), in consultation with the Department of Administration, present this FY11 progress report to the legislature. Progress in this report includes work completed in 2010 and prior.

The DOT&PF is in the process of collecting utility bill and energy information from all executive branch agencies. One-hundred and seventy-six (176) state-owned facilities are 10,000 square feet or more and fall into the facility definition of SB220[1]. To date, the DOT&PF has received utility information for over 70 facilities from different agencies including the Department of Administration, Department of Transportation and Public Facilities, Department of Education-Mt. Edgecumbe High School and Department of Labor-AVTEC. Other agencies are currently in the process of collecting utility data for their facilities and the DOT&PF is expecting to receive more information before the end of 2010.

Utility information provided by the other state agencies is being used to generate an Energy Use Indexes (EUI) for each building. The EUI, a comparable measure of energy used per square foot of building space, will assist the DOT&PF in prioritizing the facilities. The DOT&PF is working with the Alaska Energy Authority to develop the process for prioritizing the facilities with an eye towards the long-term increase in energy efficiency and reduction of energy costs. This process will be finalized and documented in the upcoming months.

The DOT&PF has long been aware that remodeling facilities to increase energy efficiency was an effective method to reduce energy costs. To date, the DOT&PF has already had two phases of energy savings performance contracting (ESPC), has completed remodels on existing facilities with the specific goal of saving on energy costs at those facilities, and always keeps energy efficiency at the fore-front of the design when working on every renovation and new facility project. The DOT&PF has received proposals for a new term agreement with Energy Service Companies for a third phase of energy savings performance contracting to assist in achieving the goals of SB220.

Subsequent sections of this report will provide details about current and past energy consumption and the associated costs of state facilities, Benchmarks/EUIs that have been calculated, the RFP for an Energy Services company that has been advertised, current and past construction projects focusing on energy efficiency, and the DOT&PF's relationship with other agencies.

[1] As determined from State of Alaska Risk Management 2008 Assets Property list.

2.0 ENERGY CONSUMPTION AND COSTS

As of December 2010, the DOT&PF does not have full utility data for all state-owned facilities. Tabular and graphical energy consumption and costs presented in this section include only the facilities the DOT&PF has been able to compile data for thus far. The state facilities comprising the information shown in this section are included in Appendix A.

2.1 Methodologies of Utility Data Collection

Current methods of storing and tracking utility data are varied across agencies and as of this date there is no standard or central point of collection. Methodologies range from utility information being centrally maintained at the agency level, being maintained at the department regional level, or being maintained at individual facilities.

The Office of Management and Budget (OMB) is currently coordinating with the Alaska Housing Finance Corporation, the Alaska Energy Authority and the DOT&PF in the development of standard methodology to collect future energy consumption and expense data for state facilities. In the interim, before it is developed and implemented, the DOT&PF is obtaining utility information directly from individual departments to compile the data.

2.2 Current Consumption and Cost

Table 1 below is a summary of the energy consumption and costs for FY 2010 of state-owned facilities 10,000 square feet or greater in size[2]. Energy units for electricity (kilowatt hours-kWh) and heating energy (therms) have been converted to the common energy unit of MMBtus (millions of Btus) to represent the profile of energy use for state facilities.

FY 2010	Consumption		Cost
Electrical Energy	24,311,633 kWh	82,976 MMBtus	$2,633,196
Heating Energy	1,026,944 Therms	102,694 MMBtus	$1,531,661
Total		**185,670 MMBtus**	**$4,164,857**

Table 1: FY 2010 Energy Consumption & Cost

Figures 1 and 2 graphically depict the energy usage profile between electrical and heating energy and electrical and heating costs respectively.

[2] Of available compiled data from State Facilities 10,000 square feet and over.

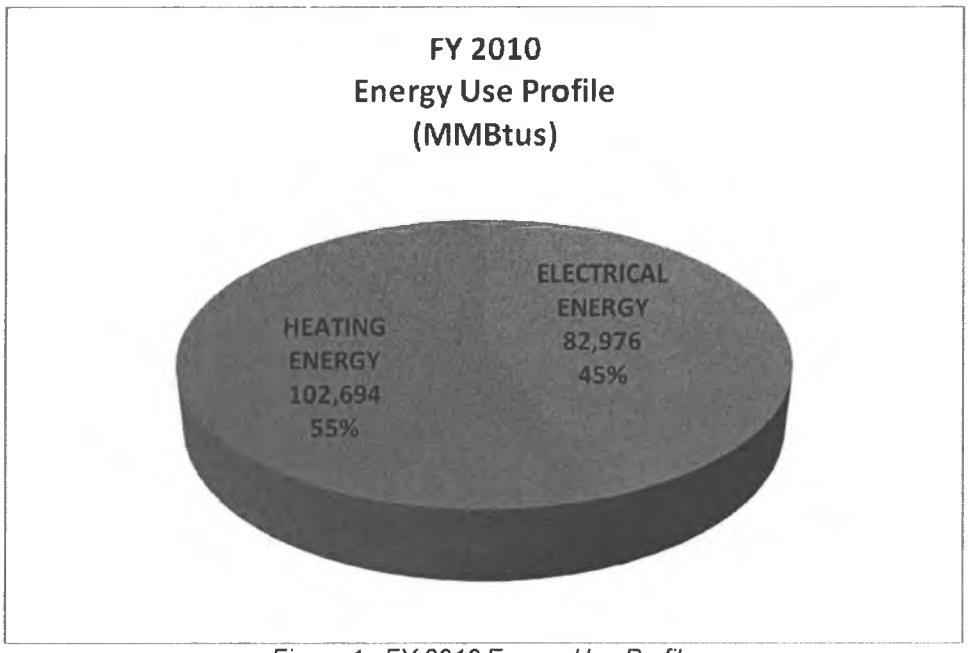

Figure 1: FY 2010 Energy Use Profile

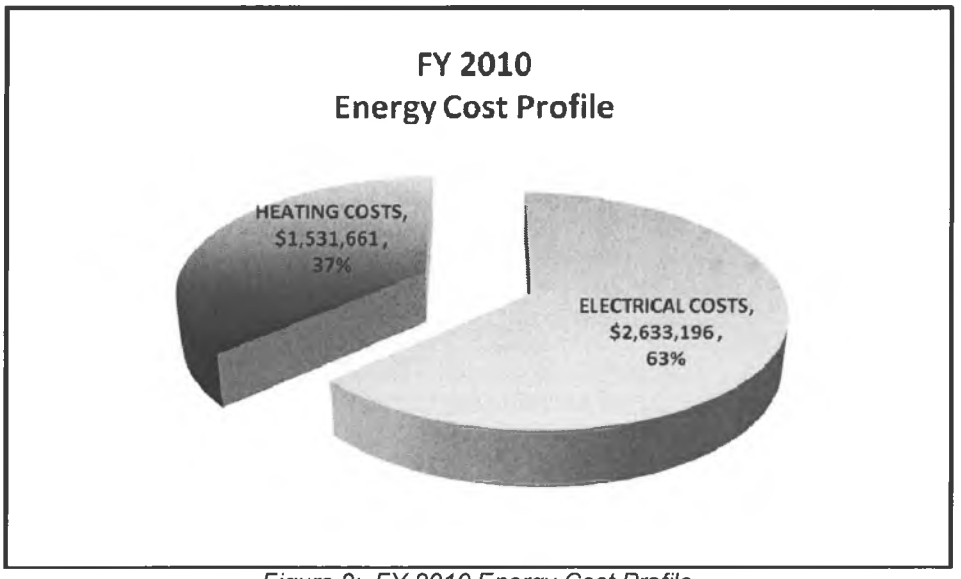

Figure 2: FY 2010 Energy Cost Profile

2.3 Past Energy Consumption and Cost

The following tables and graphs include comparative summaries of the energy consumption and costs for FY 2009 and 2010.

	Energy Consumption (MMBtus)		Cost $	
	FY 2009	FY 2010	FY 2009	FY 2010
Electrical Energy	87,039	82,976	$2,922,377	$2,633,196
Heating Energy	129,621	102,694	$1,798,736	$1,531,661
Total	**216,660**	**185,670**	**$4,721,113**	**$4,164,857**

Table 2: FY2009 & FY2010 Energy Consumption and Cost

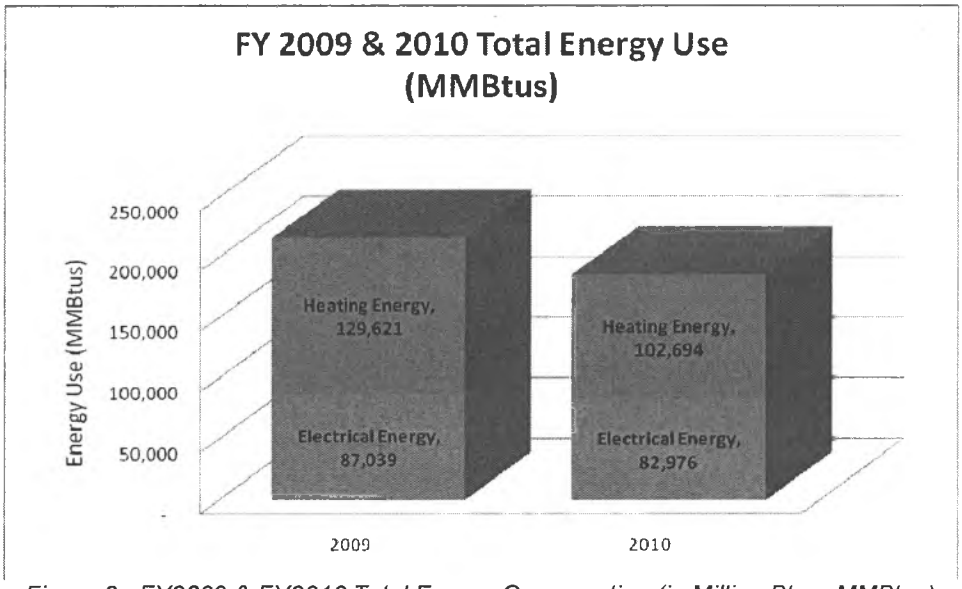

Figure 3: FY2009 & FY2010 Total Energy Consumption (in Million Btus -MMBtus)

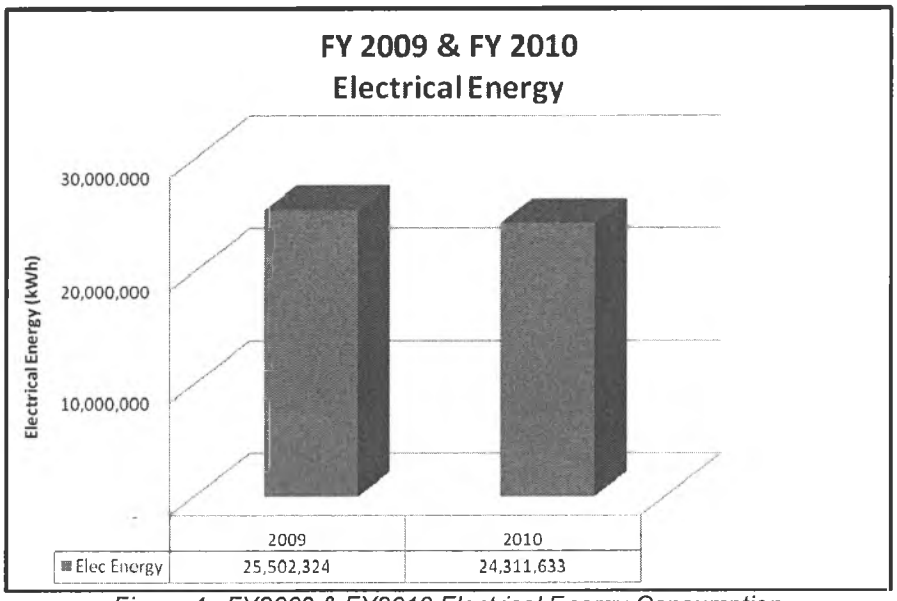

Figure 4: FY2009 & FY2010 Electrical Energy Consumption

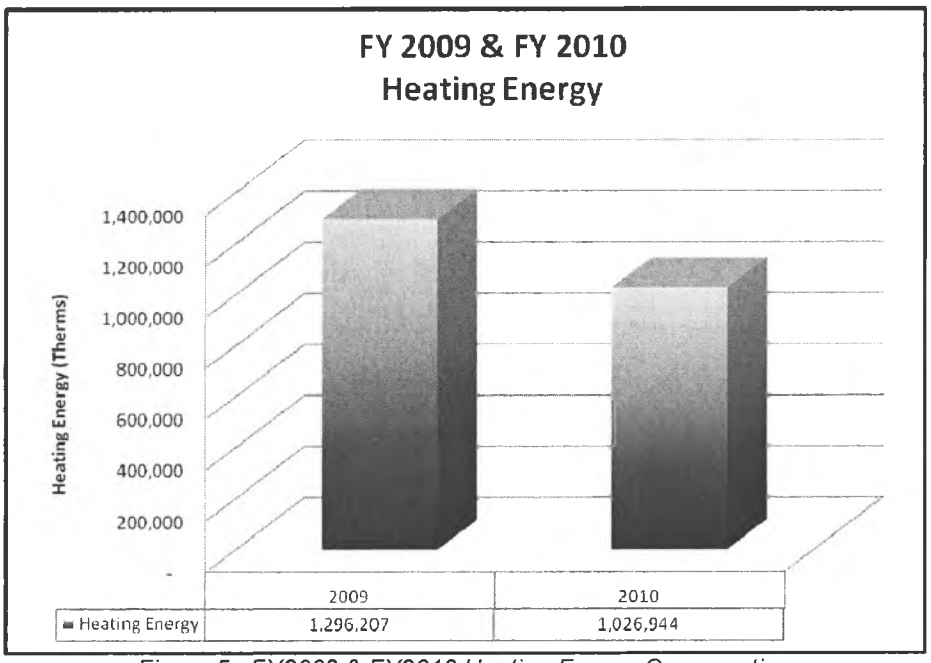

Figure 5: FY2009 & FY2010 Heating Energy Consumption

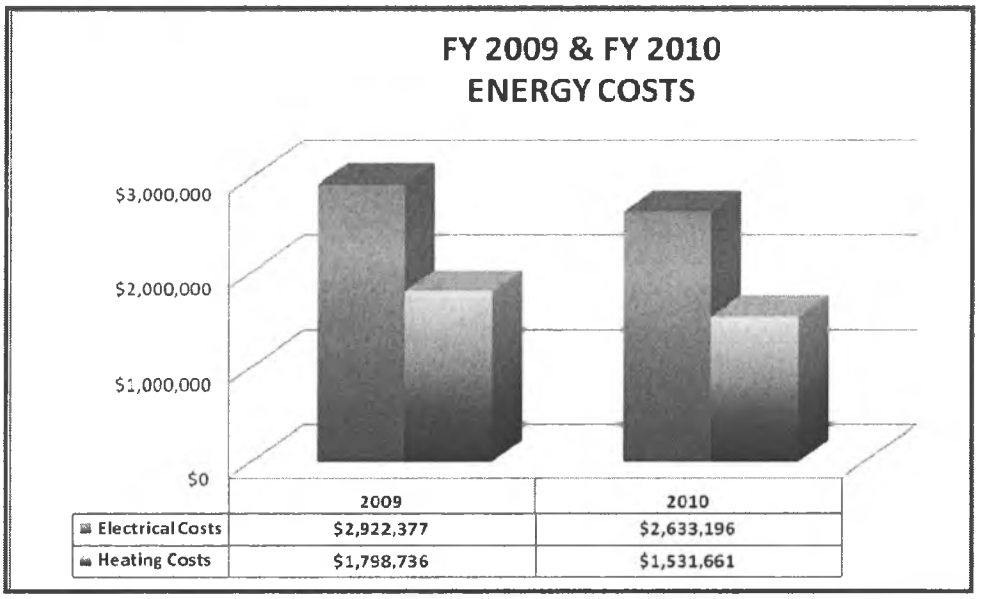

Figure 6: FY2009 & FY2010 Electrical and Heating Costs

3.0 ENERGY USE INDEXES

To determine current energy use of state facilities (over 10,000 square feet), the DOT&PF has begun collecting utility bills and other data from state agencies for their public facilities as defined in AS 44.42.067. The utility data is being used to generate Energy Use Indexes (EUIs), which will assist in determining comparative energy use and energy efficiency of the facilities.

The EUI is a calculated number representing the annual total of all energy used per square foot of building area, represented as thousand BTUs per square foot (kBTUs /sq.ft.). The total energy consumption for the building comprises the electrical power, natural gas, heating fuel oil, and, in some specific sites, propane used to operate the building.

The energy consumed is converted into BTUs and divided by the square footage of the building. The EUI can then be used to compare and rank all facilities. The larger the EUI, the more energy consumed per square foot. Different types of facilities will have different EUIs based on their operational function, equipment, space usage and occupancies. For example, a health care or laboratory facility, an office facility, and a parking facility will all have very different EUIs, ranging from highest to lowest respectively.

Table 3 shows typical units for measuring the energy consumption.

Energy Source	Category	Measured In Units of	
Electrical Consumption	Electricity	Kilowatt-hours	kWh
Electrical Demand	Electricity	Kilowatt	kW
Natural Gas	Heating	Thousand Cubic Feet	ccf
Heating Fuel Oil	Heating	Gallons	gal
Propane	Heating	Gallons	gal

Table 3: Typical Energy Units

The following Table 4 is a summary of the FY 2010 EUIs the DOT&PF has calculated to date. EUI data may be subject to change as missing utility information is gathered and compiled, data is verified and calculations are updated.

Table 4: FY 2010 Energy Use Indexes of Available Facilities

DEPT	BUILDING NAME	LOCATION	ENERGY USE INTENSITY (KBTUs / Sq.Ft.)

3.1 PROJECT PRIORITIZATION

The DOT&PF is working with Alaska Energy Authority in determining prioritization of the facilities. The current method is to establish baseline EUIs using the most recent years of utility data, and to sort the facilities beginning by the least energy efficient.

Priority will be given to facilities that are least energy efficient, though individual facility and department needs as well as the geographic locations of the facilities must also be considered.

Because completing the work as cost effectively as possible is essential, when commencing energy efficiency retrofit projects, the DOT&PF intends to group projects by geographic locations to the extent possible. This will assist in expediting project completions, reducing project costs, and maximizing project resources. However, it may mean one group of facilities includes multiple departments and multiple funding sources and that energy retrofits to facilities are not completed in exact order of their baseline EUIs.

4.0 PROGRESS

4.1 Energy Services Company RFP

A Request for Proposal (RFP) for a term agreement with up to three Energy Service Companies (ESCOs) was advertised in October 2010 and proposals are currently in review for selection. Selection of the qualified ESCOs is anticipated by early January 2011.

The ESCOs will perform investment grade energy audits, energy improvement projects and energy savings verification to state-owned facilities. Contracting with multiple ESCOs in the term agreement allows for competition for the energy retrofit projects and enables enough ESCOs to complete the foreseeable work load.

The ESCOs shall perform work in three phases:

- Phase I requires the completion of an investment grade audit and energy services proposal that identifies cost-effective recommended projects for the identified state facilities.
- Phase II requires the ESCOs to perform all management, engineering, design, construction, commissioning, and training necessary for the retrofit as identified in their energy services proposal.
- Phase III requires the ESCOs to measure and verify the guaranteed energy and water savings.

4.2 Completed Energy Efficiency Projects (FY06 – FY11)

Energy retrofit projects completed by the DOT&PF include two energy performance contracts performed across multiple facilities as well as energy efficiency retrofit projects at individual facilities.

The DOT&PF has completed construction of two phases of energy performance contracts at state facilities. The facilities and the reported annual monetary energy savings are shown in the tables below.

4.2.1 Energy Performance Contract Projects

Facility	Agency	Location	Project Scopes and Status:
Dimond Courthouse	DOA	Juneau	*Energy performance contract services with guaranteed energy savings were performed by Siemens.* *Construction was completed in 2006.* *Currently, Siemens is monitoring the energy improvements implemented during the construction work. They are nearing the end of their 3-year term of monitoring and guaranteed energy savings.*
Alaska Office Bldg	DOA	Juneau	
Court Plaza	DOA	Juneau	
Douglas Island Bldg	DOA	Juneau	
State Office Bldg	DOA	Juneau	
Aviation Bldg	DOTPF	Anchorage	
DOTPF Annex	DOTPF	Anchorage	
Public Safety Bldg	DPS	Anchorage	
Reported Annual Energy Savings		*2,881,786 kWh 13,324 Therms 94,324 Gal Fuel Oil*	
Reported Annual Avoided Cost		***$366,991***	

Table 5: Energy Performance Contract – Phase I

Facility	Agency	Location	Project Scopes and Status:
Anchorage Correctional Center	DOC	Anchorage	*Energy performance contract services with guaranteed energy savings were performed by Siemens.* *Construction was completed in 2010.* *Currently, Siemens is monitoring the facility improvement measures that were put in place during the construction work. This is the first year of performance evaluations and the energy savings this year were greater than what was guaranteed.*
Hiland Mt. / Meadow Creek Correctional Center	DOC	Eagle River	
Spring Creek Correctional Center	DOC	Seward	
Wildwood Correctional Center	DOC	Kenai	
Fairbanks Correctional Center	DOC	Fairbanks	
Lemon Creek Correctional Center	DOC	Juneau	
Anvil Mt. Correctional Center	DOC	Nome	
Yukon Kuskokwim Correctional Center	DOC	Bethel	
Reported Annual Energy Savings		*3,648,000 kWh 52,480 Therms 2,509 Gal Fuel Oil*	
Reported Annual Avoided Cost		***$793,295***	

Table 6: Energy Performance Contract – Phase II

4.2.2 Individual Facility Energy Retrofit Projects

The DOT&PF has also recently completed individual energy retrofit projects at the facilities shown in Table 7 below:

Facility	Agency	Location	Project Scopes and Status:
Anchorage Pioneer Home	DHSS	Anchorage	Energy efficiency lighting upgrade completed in 2010, including replacement of existing fluorescent lighting with energy efficient fluorescent lighting throughout the facility.
Mt. Edgecumbe H.S. Boys Dorm	DEED	Sitka	Energy efficiency lighting upgrade completed in 2010, including replacement of existing fluorescent lighting with energy efficient fluorescent and LED lighting throughout the facility.
Galena Snow Removal Equipment Bldg	DOT-NR	Galena	Energy efficiency upgrade completed in 2010, including upgrades of all lighting, heating, ventilation and building control systems throughout the facility.
Nome ARFF SREB	DOT-NR	Nome	Energy efficiency upgrades completed in 2009 including installation of lighting occupancy sensors and heating and ventilation upgrades.
Boney Courthouse	DOT-CR	Anchorage	Energy efficiency heating upgrade completed in 2008, including replacement of existing heating system with high-efficiency boilers.
ANC North Terminal	DOT-AIA	Anchorage	Energy efficiency lighting upgrade completed in 2008, including replacement of existing fluorescent lighting with energy efficient fluorescent lighting throughout the facility.

Table 7: Energy Retrofit Projects

5.0 RELATIONSHIPS WITH OTHER AGENCIES

The DOT&PF is coordinating with all state departments to collect data and utility information for state facilities over 10,000 square feet and to coordinate the energy retrofit projects at those facilities. The DOT&PF is also working closely with both the Alaska Housing Finance Corporation (AHFC) and Alaska Energy Authority (AEA); both close partners in the efforts to achieve the goals of SB220.

AHFC was the recipient of a $40 million grant from the American Recovery and Reinvestment Act of 2009 (ARRA), of which $10 million was allocated to energy efficiency upgrades in executive branch departments. AHFC has entered into a reimbursable services agreement with the DOT&PF for this amount. DOT&PF, with OMB's approval, has sub-allocated the ARRA funding based upon the square footage of building managed by a department.

Along with the ARRA funding, AHFC has created and will administer the Alaska Energy Efficiency Revolving Loan (AEERL) Fund Program. State agencies will be able to use the loan program to fund the energy efficiency retrofits. The loans are expected to be repaid by the savings the facility sees due to the improvements to the energy efficiency.

The DOT&PF is also working with the AEA to develop the method for prioritization of facilities for energy retrofits and to collect data for use in producing the Investment Grade Audits. SB 220 Section 46 requires the DOT&PF and AEA to work together to develop the method for prioritization of facilities.

AHFC, AEA and the DOT&PF are working together to gather data related to the energy efficiency of facilities throughout the state. AEA is primarily focused on private commercial and residential facilities, but will also be using the data the DOT&PF collects on state-owned facilities.

Both AEA's and AHFC's goal is to collect energy consumption data for facilities and residences throughout the state to determine total energy usage. The DOT&PF will assist in that effort by supplying the consumption data we collect for state-owned facilities.

Alaska Sustainable Energy Act: SB 220

Presentation to Senate Finance (3/25/10)

Product of the Senate Resources Committee and Senate Special Committee on Energy

Interim Field Hearings

- Tanana
- Fairbanks
- Ruby
- Kenai
- Anchorage
- Kenai
- Haines
- Ouzinkie

Reached out to:

- Renewable Energy Alaska Program
- Alaska Center for Energy and Power
- Alaska Federation of Natives
- Cold Climate Housing Research Center
- Commonwealth North
- Alaska Power Association
- Southeast Conference
- Many other organizations

Products:

State Energy Policy and Program Recommendations (50+ pages)

- Budgetary (Letter to Senate Finance Committee)
- Statutory (SB 220)

Hundreds of Comments Received

- Sifted through comments
- Met with stakeholders
- Reviewed plans & policies from other states
- Refined ideas with experts

SB 220 Goals

- Provide affordable and reliable energy for Alaskan families and businesses
- Stimulate private sector investment
- Produce long-term savings by maximizing energy efficiency
- Lead by example
- Promote innovation

Major Bill Components

- State Energy Policy
- Energy Efficiency Revolving Loan Fund
- Efficiency in Government
- Renewable Energy Tax Credit
- Emerging Energy Technology Fund
- Energy Loans for Businesses
- Alaska Affordable Heating Program

State Energy Policy

(Sections 2 & 3)

- High level goals
- Increase energy efficiency by 15% by 2020
- Generate 50% of electricity statewide using renewable energy by 2020

State Energy Policy

(Sections 2 & 3)

- Promote the development of nonrenewable energy resources, including natural gas, heavy oil, nuclear energy, coal, gas hydrates, etc...
- Support energy research, education and workforce development
- Maintain a fiscal regime that encourages private sector development

Nuclear Energy

(Sections 5, 6, 7, 8, 19 & 25)

- Levels playing field for nuclear energy.
- Removes requirement for Governor's approval of projects.
- Leaves in place requirement for municipal and DEC approval.
- Stringent federal permitting process.
- Enables nuclear projects to apply for funding from the Power Project Fund.

Energy Efficiency Revolving Loan Fund

(Sections 4 & 10)

- Authorizes AHFC to sell up to $250 million in bonds
- Leverages $18 million in federal stimulus funds
- 60% to retrofit state buildings and 40% to retrofit school and municipal facilities
- Fund should operate in perpetuity
- Could create hundreds or thousands of job as weatherization & home energy rebate program have (estimated at 2,500 jobs)

Leading By Example

(Sections 11, 12, 23, & 24)

- Retrofit at least 25% of state buildings by 2020. Shown to save at least 20% a year on energy costs.

- Could translate into $2.75[1] million/year since state spends roughly $55 million on heating & lighting.

1. [based on 25% of facilities being retrofitted

Pay-offs from Retrofitting

(Sections 10 & 23)

- State recently retrofit 8 state buildings
- Were guaranteed savings of at least $278,000/year by the contractor.
- In year 1, savings = $366,000
- In year 2, savings = $592,000
- Last year's savings = $571,000
- Savings alone from retrofitting 25 % of state buildings could cover the fiscal note for SB 220.

Leading By Example

(Sections 23, 11 & 22)

- Build all new state buildings to high efficiency standards.
- Use alternative energy for new public works, if viable and cost-effective.
- Purchase energy efficient appliances, equipment and vehicles.

Energy Efficiency Campaign

(Section 24)

- Tasks AEA and AHFC with educating Alaskans about low-costs ways to save energy.
- Not only help for individual households, but way to contain cost of building new power generation facilities. ($9 billion needed in Railbelt alone over next 50 years)
- Experts estimate between 8% and 50% can be saved through efficiency measures alone.
- Cheapest ways to meet energy needs.

Emerging Energy Technologies

(Section 18)

- With high energy costs, Alaska is perfect place to test emerging technologies.
- Can demonstrate technologies and reduce costs for local residents
- Potential to export technologies
- 25% of world's population lives without access to electricity – looking for new ways to energize

Emerging Energy Technologies

(Section 18)

- Would establish competitive grant program at AEA to foster innovation.
- Matched with federal funds from Denali Commission, DOE & private research dollars.
- Creates high-tech jobs and spurs investment in Alaska's economy.
- NY, CA, TX, MA, and others have funds.
- Alaska has potential in be world leader in emerging technologies, given our resources.

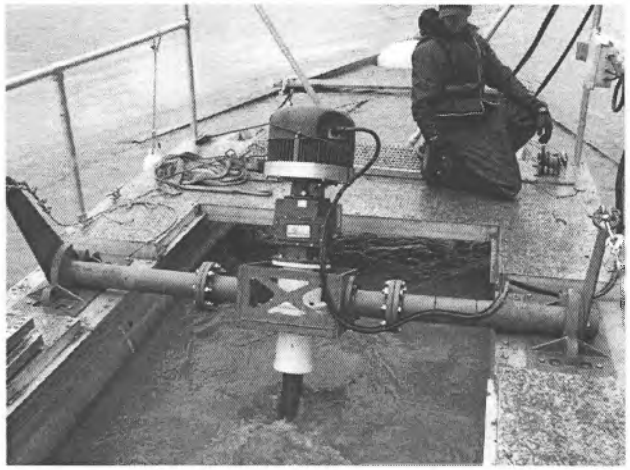
Emerging Technology Fund

(Section 18)

- In 2009, Denali Commission solicited proposals.
- 50 proposals totaling $29 million were submitted.
- 9 selected to receive $4 million in grants.
- Goal: To develop emerging technologies that have the potential for widespread deployment.

Example of EETF Project

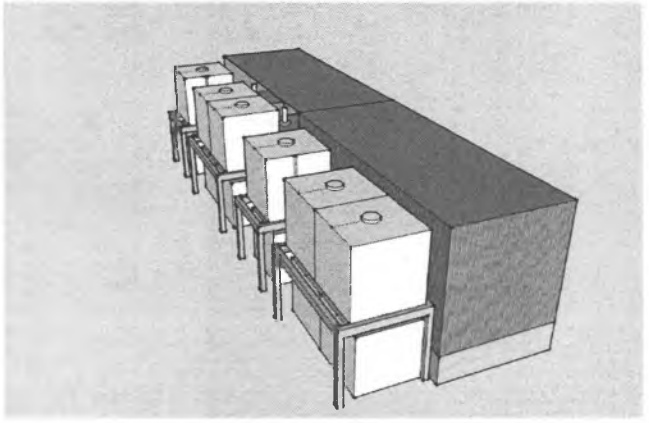
- Nenana Hydrokinetic Turbine: Ocean Renewable Power Corp.
- Tests whether power can be reliably and economically generated from the movement of the Nenana River.
- Alaska has significant hydrokinetic potential in both rivers and tidal basins.
- Most in-land communities are situated along navigable waterways, such as the Yukon and Kuskokwim, that could produce hydrokinetic energy.



Ruby Hydrokinetic Turbine
Alaska Center for Energy & Power

Example of EETF Project

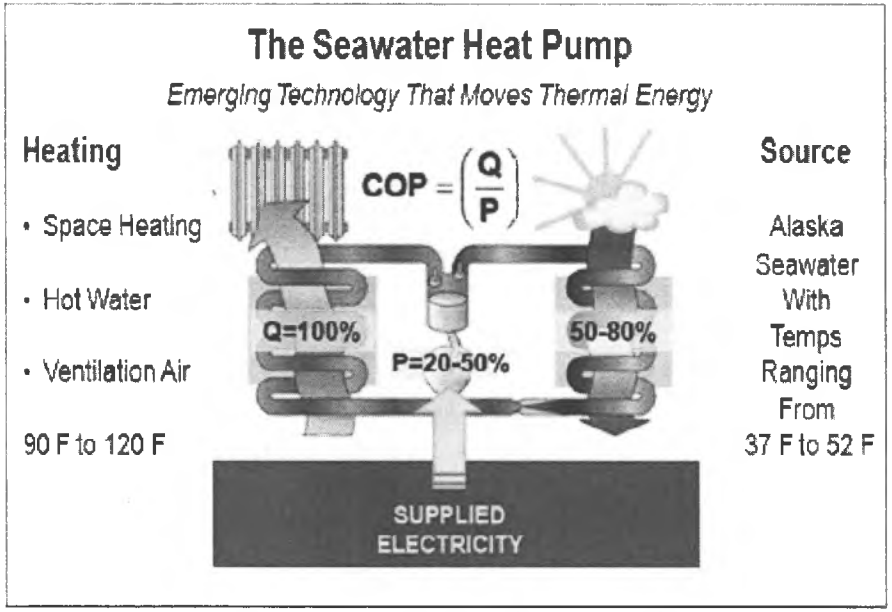
- Cordova Electric Cooperative: "Biogas digestor" technology
  - Widespread in India and China.
  - Microbes naturally break down organic feedstock to produce methane. Can be used for heating & cooking.
  - Will test use of various cold-loving microbes and compare efficiency for household scale projects.
  - Digestors could be used as a local, renewable energy source for Alaskan homes.



Source: freewheelings.com

Example of EETF Project

- Alaska SeaLife Center: Seawater Heat Pump
- Will pump seawater through a heat exchanger containing antifreeze which will boil and vaporize a refrigerant into a pressurized compressor.
- The condensed heat circulates into building at 120 degrees F.
- Technology successfully deployed in Norway and Sweden.



Source: Denali Commission

Renewable Energy Tax Credit

(Sections 20 & 21)

- Encourages investment by the private sector in renewable energy
- Supports the goal of generating 50% of electricity using renewable by 2025
- 25 states offer renewable energy corporate tax incentives; 5 states and the federal government offer production tax credits
- Only accrue once a project is in operation
- 15% tax refundable credit based on sales
- Capped at 10% of capital investment
- Sunsets January 1, 2018

Renewable Energy Tax Credit

(Sections 20 and 21)

- Calculating the credit, what do we need to know?
  1. What is the capital cost?
  2. What state/federal grants did the project receive?
  3. What is the cost per kilowatt-hour?
  4. What is the capacity factor?

Remember:

- There are 8760 hours in a year.
- 1 Megawatt/hr = 1000 Kilowatt/hrs
- $.01 KW/hr = $10 MW/hr

RETC: An Example

- A 5 MW Wind Farm
- CAPEX: $23.5 million
- Grants:
  - $2 million federal grant
  - $3.5 million renewable energy grant fund
- Capacity Factor: 20%
- Cost per KW/hr: $.38

RETC: An Example

- Step 1: Calculate gross electricity sales
  - 5 MW/hr x 8760 hrs/yr x 20% capacity factor = 8760 MW/yr
  - 8760 MW/yr x 1000 KW/MW x $.38 KW = $3,328,800 year
- Step 2: Calculate the annual credit
  - $3,328,800 x 15% = $499,320
- Step 3: Calculate the total allowable credit
  - CAPEX = ($23.5 mm - $2 mm - $3.5 mm = $18 mm) x 10% = $1.8 mm
- Step 4: How does it work in practice?
  - Year 1: $499,320 Year 2: $499,320 Year 3: $499,320
  - Year 4 ($1.8 - [$499,320x3]): $302,040 Year 5: $0

RETC: Transferable vs. Refundable

- **Transferable credits are:**
  - Approved by the Department.
  - Must be marketed and purchased.
    - Broker fees and demands of purchaser means less than full credit goes to the person receiving the incentive.
  - The cost to the state is the same. $1 in credit = $1 in forgone revenue.

- **Refundable credits are:**
  - Subject to Appropriation.
  - 100% of credit goes to the recipient.
  - Easier to administer.

Loans to Businesses

(Sections 26-33)

- Would provide loans of up to $50,000 for alternative energy systems and energy conservation improvements.
- Businesses must be primarily owned by Alaskans. Interest rate: prime, plus 1%. Minimum of 5%.
- Money can be used for insulation, thermal windows, furnace replacement, etc... Or on energy systems which are not dependent on oil or gas.

Affordable Heating Program

(Section 35-42)

- Objectives:
  - Make program more responsive to a family's actual heating costs.
  - Increase assistance as oil prices rise, need increases & the state enjoys a budget surplus.
  - Maintain statewide eligibility.
  - Use existing administrative structure.

How LIHEAP Works

(Section 35-42)

- Benefits are calculated by multiplying each applicant's "points" by the dollar per point available.
- Points are awarded based on household income; heating degree days in household location; type and size of house; presence of children, elderly or disabled in home.

Program refinement #1

(Sections 35-42)

- Link program eligibility to price of oil.
- Oil under $150/barrel = 225% of poverty level ($62,000 for a family of four).
- Oil over $150/barrel = 250% of FPL ($69,000 for a family of four).

Program Refinement #2

(Sections 35-42)

- Link program benefits to the price of oil
  - $130/point when crude is < $75/barrel
  - $140/point when crude is $75-$100/barrel
  - $150/point when crude is $100-$150/barrel
  - $165/point when crude is > $150/barrel
- This year points are valued at $115.
- Last year, points were valued at $220, which was bumped up to $316 by a special approp.

Program Details

(Sections 35-42)

- DHSS will pro-rate payments if appropriations are insufficient to cover full program cost.
- Payments go to fuel vendors, not households.
- Individuals must apply and qualify each year.
- Current federal appropriation is $28 million.
- Current state appropriation is $5 million.
- 20,191 households currently served.

Other Provisions

- Technical assistance for municipalities regarding energy codes and efficiency standards. (S.9)
- Standard methodology for energy consumption and expense date (S. 10)
- Expands purposes of the Southeast Energy Fund (S.14)

Other Provisions

- AEA facilitate organization and provide technical assistance for a statewide fuel cooperative (S.17)
- Develop a plan to coordinate & consolidate energy programs (S. 48)
- Study CNG vehicles (S.49)

Conclusion

- SB 220 not a panacea, but a step forward
- Proposes a variety of steps to stimulate private investment, lead by example, and promote efficiency and innovation.
- Other bills address instate gas, gas storage, gas-to-liquids, exploration incentives, O&G taxes, etc…
- Working closely with our House counterparts
- SB 220 is just a piece of the pie, leading Alaska to greater self-sufficiency and sustainability

House energy omnibus

- HB 305 = House energy omnibus bill
- House Energy Committee held extensive field hearings during the interim
- Assembled a stakeholder group
- High level of commitment to passage of a meaningful omnibus bill
- Just this week, the House unanimously passed HB 306, a declaration of state energy policy. Great 1st step.

2/04/11 OVERVIEW: LARRY HARTIG, COMMISSIONER, DEPARTMENT OF ENVIRONMENTAL CONSERVATION

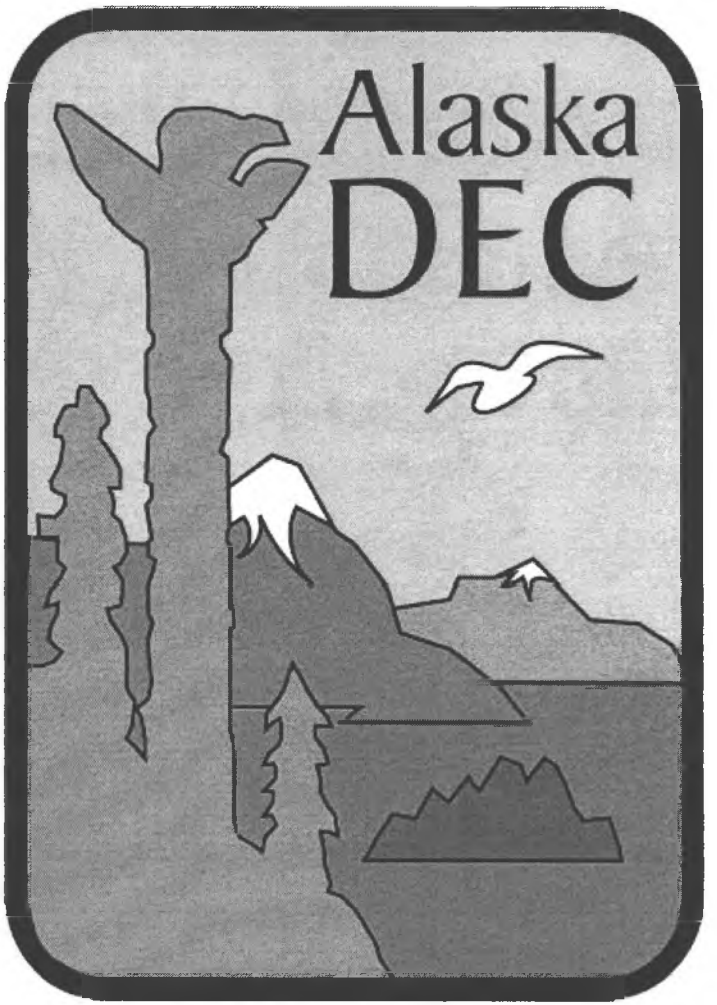
Presentation: Larry Hartig, Commissioner
Department of Environmental Conservation



Department of Environmental Conservation

Senate Resources Overview

Commissioner Larry Hartig

February 4, 2011

DEC's Mission

Protect human health and the environment.

Responsibilities & Functions

- Develop standards
- Issue permits
- Provide compliance and financial assistance
- Respond to spills of oil and other hazardous substances
- Safeguard the quality of food and seafood
- Operate the State Environmental Health Lab
- House the Office of the State Veterinarian
- Regulate pesticides and certain types of use
- Educate and assist the public
- Interact with our federal agency counterparts
- Investigate violations and enforce state law

Divisions

- Administration
- Air Quality
- Environmental Health
- Spill Prevention and Response
- Water Quality

Air Quality Division

*Mission: To **control air pollution in order to enhance the health, safety, and welfare** of the people of the state.*

Core Services:

- Issue air quality permits to facilities that release potentially harmful pollutants
- Provide compliance assistance and enforcement (inspections and operating report reviews)
- Community assistance to protect air quality
- Air quality assessments and monitoring
- Comment on federal air quality rulemakings with Alaska's perspective
- Develop, implement, and enforce plans to bring areas out of compliance with federal air quality standards back into compliance

Air Quality Division (cont.)

Programs:

- Air Permits Program
- Air Monitoring & Quality Assurance Program
- Air Non-Point & Mobile Sources Program
- Administrative Support Program

Air Quality Division cont.

Challenges:

- Federal Rules for Greenhouse Gas
- Fairbanks Air Quality
- Fugitive Dust

Initiatives:

- Gasline Permitting
- North Slope Cumulative Air Quality

Fairbanks Fine Particulate Matter ($PM_{2.5}$)

- EPA sets national human health – based air quality standards
- Fairbanks/North Pole area is exceeding the 24-hour standard for fine particulates (PM2.5)
- Air quality attainment plan is due to EPA in December 2012 ; Compliance deadline is 2014
- Potential human health and economic consequences to not meeting the standard, and the planning or compliance deadlines
- Plan and control options are controversial in community
    - -Non-attainment area is large in size
    - -Multiple sources of PM2.5 exist
    - -Home heating sources (wood and coal) are important contributors to non-attainment with PM 2.5 standard
    - -They are also important heating and energy sources given their relatively low-cost

Fairbanks Fine Particulate Matter ($PM_{2.5}$) (cont.)

- **On-going Borough efforts include:**
  - Voluntary wood stove/boiler change out program
  - Education on wood drying and good burning practices
  - Working with state and federal agencies on: researching other sources of PM 2.5 and potential mitigation options, investigating sources of wood supply and wood lot management options, investigating funding for change out and wood supply programs

- **On-going Air Quality Division efforts include:**
  - Coordinating planning efforts
  - Responding to local smoke complaints
  - Conducting public education
  - Assisting Borough on projects to characterize $PM_{2.5}$
  - Assisting with technical work for the air quality plan
  - Analyzing emissions, impacts, and controls for permitted sources (e.g. power plants)
  - Characterizing vehicle emissions at cold temperatures

Environmental Health Division

Mission: **To ensure safe drinking water, food, and sanitary practices.** Our goal is to provide businesses with clear standards so that they can protect our environment and provide safe food and drinking water to Alaskans.

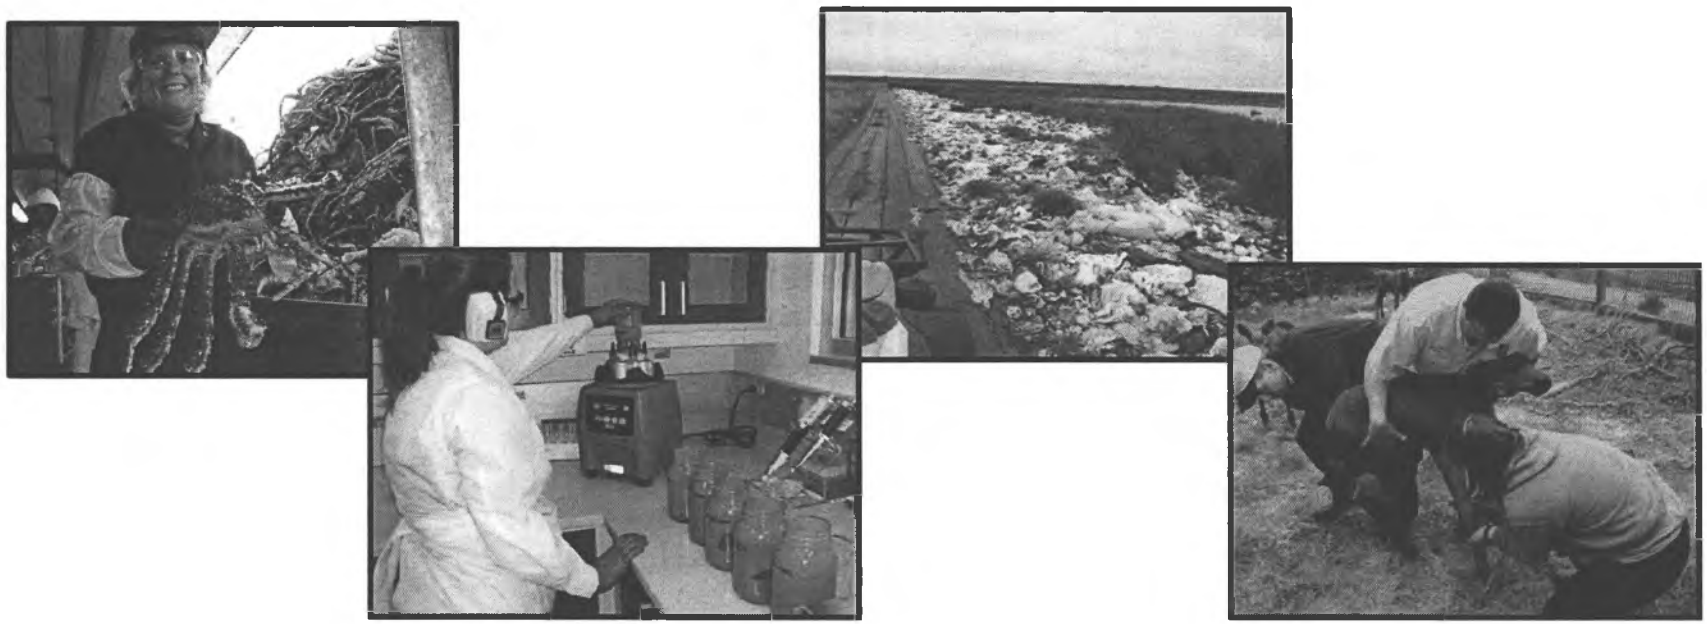
Core Services:

- Maintain state primacy for regulating public drinking water systems
- Enforce public water system (PWS) monitoring requirements for drinking water contaminants
- Review construction, installation, and operation plans and enforce engineering standards for PWS to protect public health and meet Safe Drinking Water Act requirements
- Assist PWS owners in identifying the sources of their drinking water and help them develop strategies to effectively protect those sources from contamination
- Provide technical and compliance assistance to PWS owners and operators, and the public

Environmental Health (cont.)

Programs:

- Drinking Water
- Pesticide Control
- Solid Waste Management
- Environmental Health Laboratory
- State Veterinarian



Environmental Health (cont.)

Challenges:

- High Risk Food Safety Inspections
- Solid Waste Landfills in Rural Alaska

Initiatives:

- Shellfish Pilot Program
- Deregulating Low Risk Small Business and Community Event Foods

Spill Prevention and Response Division

Mission: Protect public health and the environment through **prevention, preparedness and response to oil and hazardous substance releases.**

Core Services:

- Emergency Oil Spill Response
- Statewide Hazmat Response
- Drills and Exercises
- Government Oil Spill Response Plans
- Local Spill Response Agreements
- Disaster Response Coordination

Spill Prevention and Response (cont.)

Programs:

- Industry Preparedness
- Prevention and Emergency Response
- Contaminated Sites

GC 2 Pipeline Spill

Pipeline Inspections

Abandoned Drums

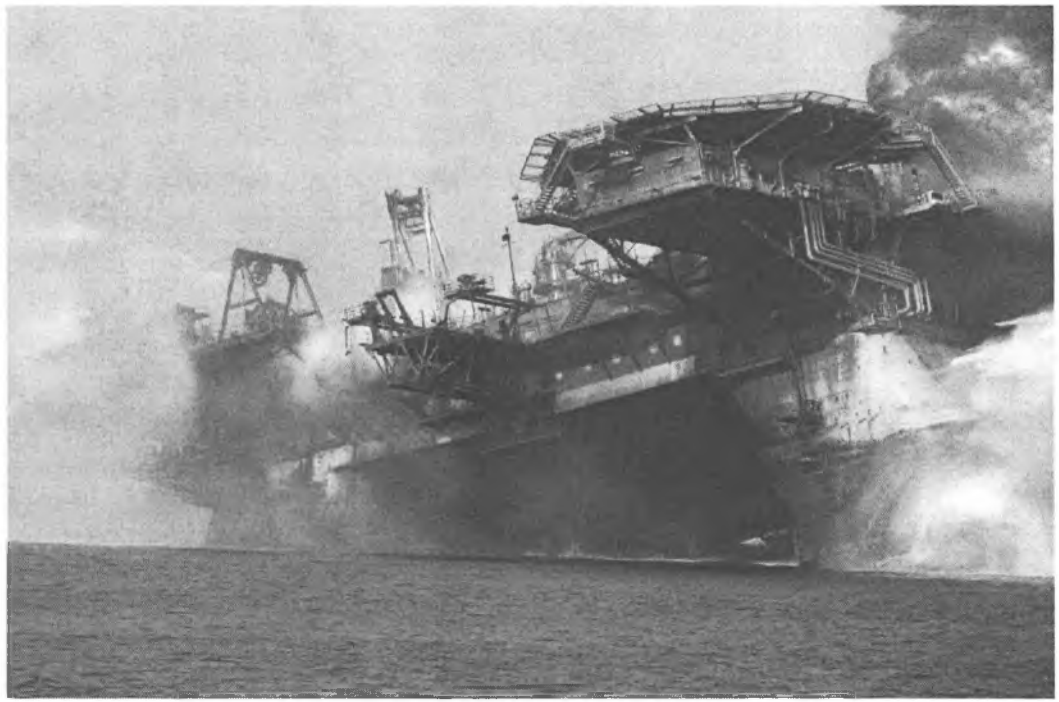
Spill Prevention and Response (cont.)

Challenges:

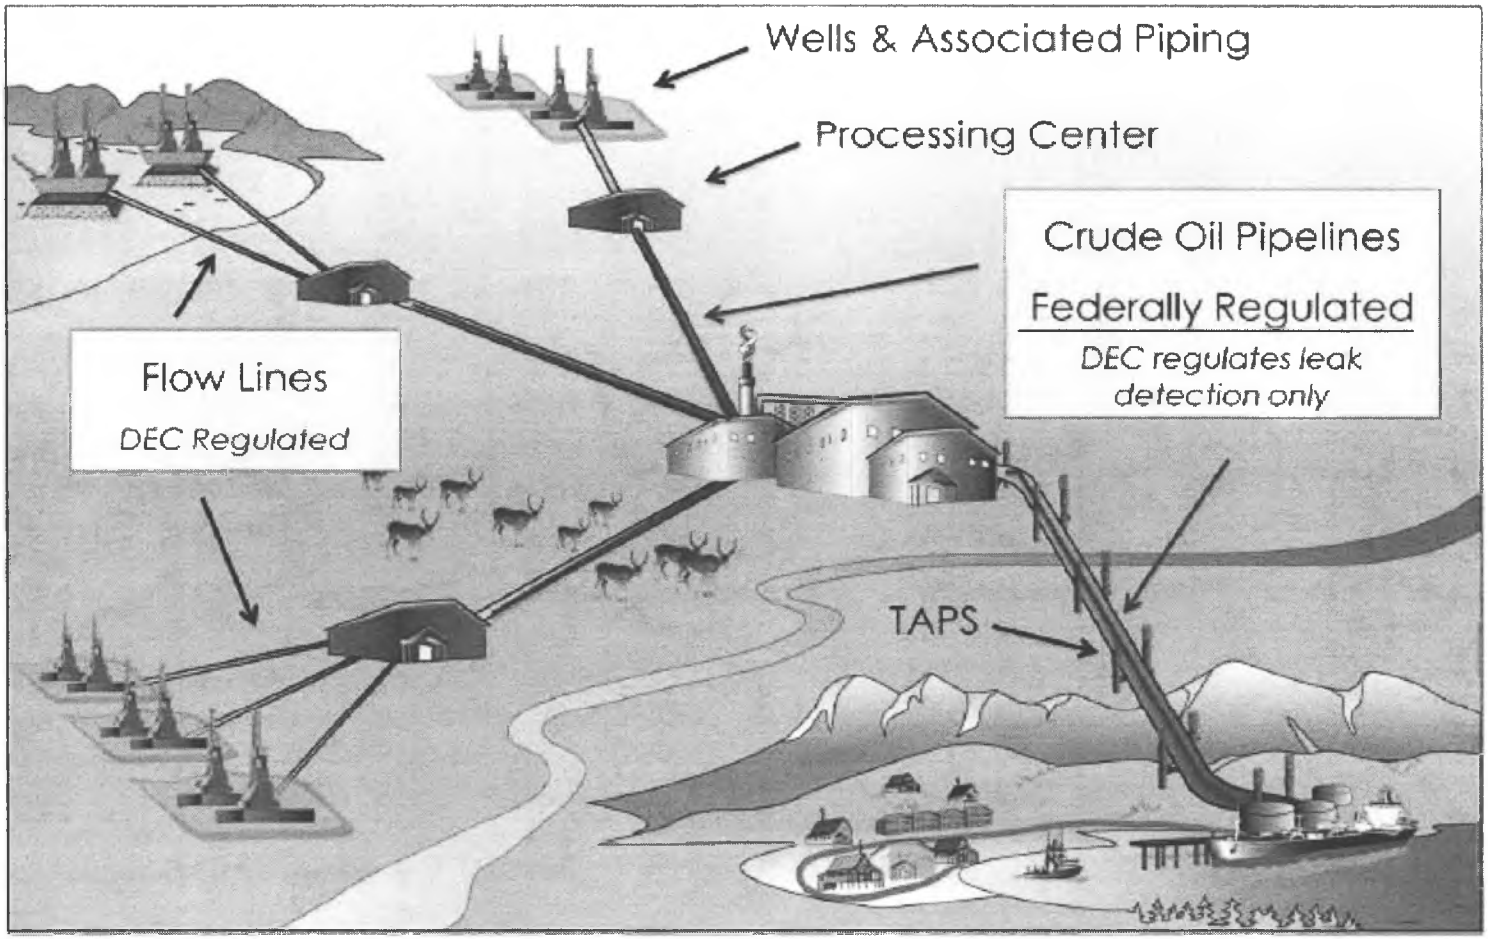
- Declining Prevention Account Balance
- Aging infrastructure and the possibility of more challenging operating conditions

Initiatives:

- Contaminated Site Identification for Gasline Work
- Aleutian Islands Risk Assessment
- Deepwater Horizon Lessons and Risk Assessment Work Plan



DEC Regulated Pipelines



North Slope Initiatives

- Completion of Spills Analysis of North Slope Pipelines
- Implementation of new regulations for North Slope flow lines
- New requirements for reporting key indicators of pipeline condition
- Benchmarking of spill trends to reduce the number and severity of spills
- Engineering review and field inspection of high risk flow lines
- Completion of audit and inspection procedures and protocols
- Best available technology evaluation for pipeline leak detection systems

Water Division

Mission:

All things water except:

Regulation of public drinking water systems - DEC, Environmental Health

Water quantity (water rights and in-stream flow reservations) - DNR

Programs:

- Facilities
- Water Quality

Water Division - Facilities

Facilities Programs:

- Municipal Grants and Loans
- Village Safe Water
- Operations Assistance

Facilities Core Services:

- Provide grants, loans and engineering assistance for drinking water, sewerage, and solid waste facilities
- Provide training programs for and certification of water and sewerage system operators
- Provide over-the-shoulder and emergency assistance to system operators in remote communities

Water Division – Water Quality

Water Quality Programs:

- Water Quality Standards, Assessment and Restoration
- Wastewater Discharge Permitting
- Compliance and Enforcement
- Cruise Ships
- Water Quality Monitoring

Core Services:

- Establish protective standards for water quality
- Improve water quality conditions where they are below public health or environmental standards
- Issue wastewater discharge permits to facilities and operations that release potentially harmful pollutants
- Ensure facility compliance with permit conditions
- Provide community assistance with the protection of water quality
- Develop user friendly public access to water quality data

Water Division (cont.)

Challenges:

- Declining Federal Funding in the Village Safe Water Program
- Completing and Maintaining Permitting Primacy
- Water Quality Standards

Initiatives:

- Gasline Permitting

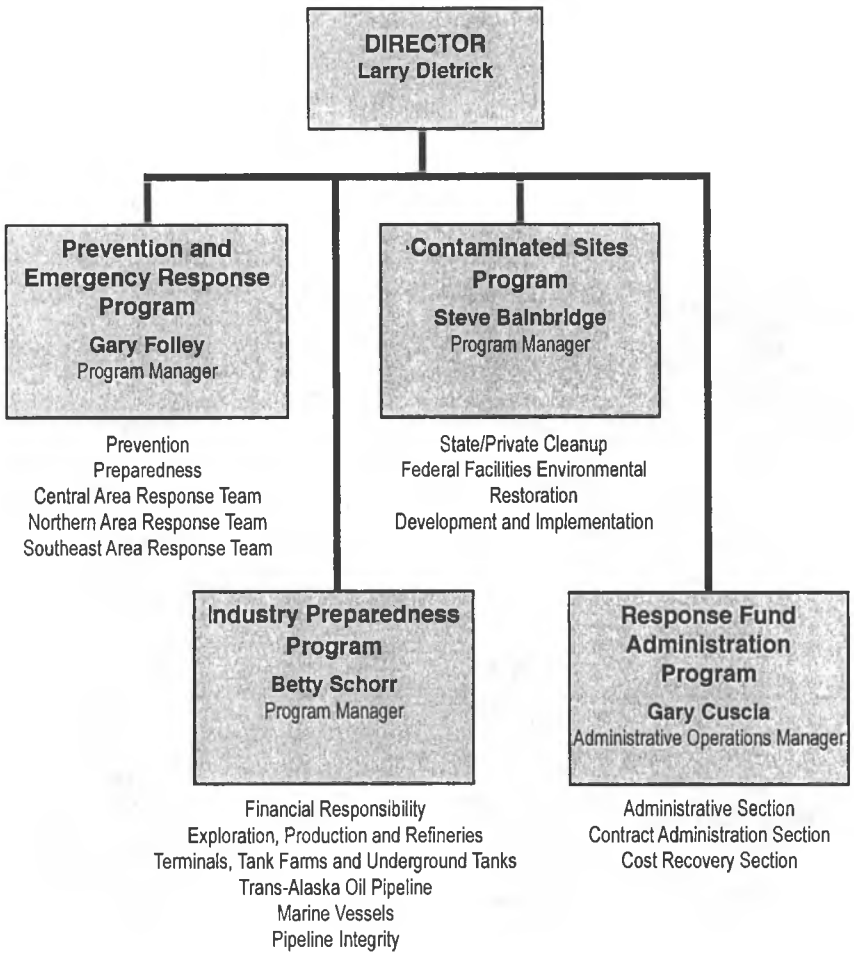
Division of Spill Prevention and Response

rev. June/2010



Alaska Department of Environmental Conservation

Spill Prevention and Response Handbook

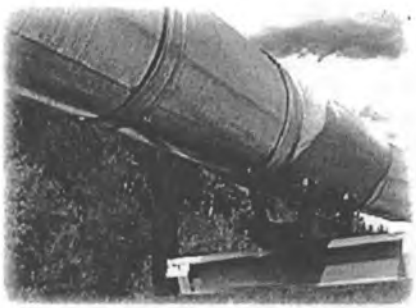
dec.alaska.gov/spar

Revised January 2011

Division Mission and Goals

Mission:

The mission of the Division of Spill Prevention and Response is to protect public safety, public health and the environment through prevention, preparedness and response to oil and hazardous substance releases.



Larry Dietrick, Director
Division of Spill Prevention and Response
Alaska Department of Environmental Conservation
410 Willoughby Ave., Suite 302
P. O. Box 111800
Juneau, AK 99811-1800
Phone (907) 465-5250
Fax (907) 465-5262
Email larry.dietrick@alaska.gov

dec.alaska.gov/spar

Goals:

Prevention

- Prevent spills from oil terminals, pipelines, tank vessels and barges, railroads, refineries, nontank vessels, oil exploration and production facilities, and underground storage tanks.
- Provide technical assistance to industry, the general public, and owners and operators in proper spill prevention and response methods.

Preparedness

- Verify that facility and vessel operators have adequate response resources through review and approval of oil discharge prevention and contingency plans, inspections, and spill response exercises and drills.
- Maintain and improve government spill response preparedness and response by coordinating with local communities and other state and federal agencies, pre-positioning response equipment for local use, maintaining statewide and regional spill response plans, and implementing an incident command system for spill response in Alaska.

Response

- Conduct emergency response to all significant spills to contain, control and reduce impacts and costs.
- Characterize and remediate acute and chronic health exposure risks due to hazardous substance releases.
- Mitigate the effects of oil and hazardous substance releases on the environment, and natural, biological and cultural resources.
- Reuse and redevelop contaminated properties through assessment, cleanup, monitoring or institutional controls.

Response Fund Management

- Recover the state's costs for responding to unauthorized releases.
- Ensure the long-term viability of the Prevention Account of the Oil and Hazardous Substance Release Prevention and Response Fund.

Prevention and Emergency Response

Program Mission:

The mission of the Prevention and Emergency Response Program is to protect public safety, public health and the environment by preventing and mitigating the effects of oil and hazardous substance releases and ensuring their cleanup through government planning and rapid response.

The program is Alaska's primary response organization for emergency response to oil and hazardous substance releases. The program's goals are to protect public health and the environment from the direct or indirect effects of spills, guard the safety of the people involved, undertake or confirm the satisfactory cleanup and mitigation of spill impacts and restoration of damages, and recover state-incurred costs to the Oil and Hazardous Substance Release Prevention and Response Fund.

dec.alaska.gov/spar/perp

Primary services:

- Lead the state's response to spills of oil and hazardous substances.
- Respond through area response teams in Anchorage, Fairbanks and Juneau.
- Implement the Incident Command System for large events and oversee spill cleanup by the responsible party or take over cleanup when a responsible party is not found or is incapable.
- Evaluate spill impact, ensure containment and cleanup, and recover cleanup and restoration costs from the responsible party.
- Plan, develop and coordinate a statewide hazardous materials response team capability.
- Provide full-time spill prevention, response and preparedness coverage of the North Slope.
- Serve as state contact for the federal Community Right-to-Know program.
- Participate in government and industry response drills and exercises.
- Prevent and reduce the occurrence of spills and hazardous substance releases from unregulated sources.
- Maintain the Federal/State Unified Plan and the 10 Subarea/Regional Contingency Plans for Alaska.
- Manage term contracts with spill response organizations.
- Integrate Alaska communities into a statewide response system through local response agreements.
- Train local personnel in at-risk areas throughout the state.
- Keep timely and accurate spill information.
- Enforce statutes and regulations relating to oil and hazardous substance spill reporting, cleanup and restoration of the environment.

Industry Preparedness

Program Mission:

The mission of the Industry Preparedness Program is to protect public safety, public health and the environment by ensuring that producers, transporters and distributors of crude oil and refined oil products prevent oil spills and are fully prepared materially and financially to respond and clean up spills.

The program ensures spill prevention and industry spill response readiness through inspections, drills, financial responsibility, and oil discharge prevention and contingency planning, along with registration of oil spill response action contractors. Regulated facilities include terminals and distributors of crude and refined oil products, marine tankers and barges that transport crude and refined oil products, oil pipelines, onshore and offshore oil exploration and production facilities, nontank vessels of more than 400 gross tons, the Alaska Railroad, and operators of underground storage tanks.

dec.alaska.gov/spar/ipp

Primary services:

- Review and approve oil discharge prevention and contingency plans.
- Conduct and participate in spill drills to verify by demonstration that regulated operators are in compliance with state response planning requirements.
- Inspect regulated facilities and vessels to provide assistance and to ensure that regulated operators employ the best available technology for spill prevention and response.
- Review and approve applications for proof of financial responsibility to ensure that regulated operators have the financial resources to respond to an oil spill and mitigate environmental damage.
- Register oil spill primary response action contractors identified in oil discharge prevention and contingency plans.
- Regulate and provide technical assistance and training to underground storage tank operators and owners to ensure proper tank operation and maintenance and basic spill prevention.
- Provide technical assistance and information to contingency plan applicants and the general public on spill prevention and response requirements.
- Oversee North Slope oil production facilities, including field inspections, compliance monitoring, and contingency plan review.
- Certify third-party underground storage tank inspectors and collect underground storage tank registration fees.

Contaminated Sites

Program Mission:

The mission of the Contaminated Sites Program is to protect public health and the environment by identifying, overseeing and conducting the cleanup, redevelopment and management of contaminated sites in Alaska.

The program oversees cleanup of all contaminated sites in Alaska. Many of these sites pose a high risk to human health or the environment due to a broad scope of different and multifaceted sources of contamination from industrial and operational activities. More than half of these sites are owned or cleaned up by federal agencies through agreements with the state. The program coordinates the cleanup of state-owned properties, and other sites that have no responsible party. State-incurred costs are recovered from the responsible parties. The program works with all parties to facilitate the reuse or redevelopment of contaminated properties.

Email steve.bainbridge@alaska.gov

dec.alaska.gov/spar/csp

Primary services:

- Identify, assess, rank, prioritize and track all contaminated sites in Alaska.
- Oversee the cleanup and long-term monitoring of these sites.
- Use term contractors to clean up state-owned, privately owned and orphan sites using a risk-based approach.
- Manage cleanup and provide regulatory oversight for military, federal agency, private party and state-owned contaminated sites.
- Provide regulatory oversight, technical assistance and policy development to Department of Defense and federal civilian agencies on environmental cleanup activities.
- Recover state costs for oversight or cleanup from responsible parties.
- Negotiate with responsible parties, private or federal, for funding agreements to provide effective cleanup of contaminated sites, including the use of Prospective Purchaser Agreements to encourage property reuse and redevelopment.
- Facilitate the reuse of contaminated sites by being responsive to people who want to put properties back into reuse, including state-owned sites, and maintain Brownfield efforts that leverage federal funding for eligible sites with no viable responsible party.
- Manage and close contaminated sites to ensure risk is appropriately controlled over time.
- Provide technical assistance to responsible parties of contaminated sites.

Response Fund Administration

Program Mission:

The mission of the Response Fund Administration is to manage the Oil and Hazardous Substance Release Prevention and Response Fund as a viable, long-term funding source for the state's core spill prevention and response initiatives and provide administrative support to division programs.

The program manages the Prevention and Response Accounts of the Oil and Hazardous Substances Release Prevention and Response Fund, including the recovery of state costs for responding to spills from the responsible party or other sources of funding if recovery from the responsible party is not possible. The program is responsible for tracking the receipt and expenditure of federal dollars for the cleanup of federal facilities, the preparation of the operating and capital budgets and overseeing the division's professional services contracting and procurement. In addition, the program assists division staff with human resource procedures and issues.

dec.alaska.gov/spar/rfa

Primary services:

- Provide leadership and accountability of all Response Fund Administration activities, support SPAR operations with quality financial analysis and provide budgetary services.
- Manage the Prevention and Response Accounts of the Oil and Hazardous Substance Release Prevention and Response Fund.
- Recover state costs for responding to spills.
- Track and report all operating and capital expenditures and fund source balances to program managers monthly.
- Recover state costs through negotiated agreements such as memorandums of agreement, memorandums of understanding and federal grants.
- Manage and coordinate the receipt and expenditure of federal dollars for the cleanup of federal facilities.
- Develop cost controls and standardize division contracts.
- Manage term contracts and issue Notices to Proceed.
- Provide guidance and assistance to other Spill Prevention and Response programs in general administrative functions such as budget preparation, expenditure tracking, human resources and procurement.
- Provide administrative and financial support during emergency spill response situations.
- Manage Reimbursable Services Agreements for the division.
- Prepare the biennial Response Fund Report.
- In the case of a major spill response, support the Finance Section within the Incident Command System.

Fairbanks Pipeline Company

Fairbanks Pipeline Company (FPC) is developing a fit-for-purpose natural gas pipeline system to deliver affordable gas from Prudhoe Bay to Interior Alaska. Its project development approach is market-based. *The size and operating pressure* of its pipeline will be economically designed to transport known gas volumes to Alaskan load centers such as Golden Valley Electric Association, Fairbanks Natural Gas, mines and Military bases contracted over a twenty-year term. FPC's pipeline system will begin operation in 2014.

FPC's pipeline does not have to wait for global and domestic gas prices to increase four-fold to become viable. Gas pipelines in the common lower-48 markets are typically installed in markets where the prices of competing gas supply sources vary by 1% to 5%. This long overdue Alaskan project will reduce current Alaskan wholesale energy prices by close to 50%. This unarguably demonstrates its project feasibility as well as its socio-economic benefits.

Project Funding

FPC's gas pipeline is not receiving State or Federal subsidies. Instead, Energia Cura's principle partners are underwriting the cost of its development. The partners' intent for funding this project's development is to expediently reduce energy costs by 50% and to contain the wealth generated from these savings within the state. Energia Cura is a consultancy headquartered in Fairbanks, Alaska providing a range of services and products to the power, oil & gas and mining industries. It currently operates and maintains Alaska's second largest pipeline system on a throughput basis.

The Open Season

Our project objective is to provide expedient economic relief to thermal markets located along Fairbanks Pipeline Company's primary and secondary pipeline corridors by 2014, by supplying affordable natural gas to ready and willing load centers using proven, economic pipeline transportation methods. Energia Cura conducted the non-binding open season on behalf of the Fairbanks Pipeline Company. Participation in this first phase of the open season process is non-binding for all partaking entities. The second phase of FPC's open season will conclude by acquiring commitments (binding condition precedent agreements) from Alaskan load centers to purchase bundled gas volumes at a predetermined price to include both the gas and its transportation. Consequently, FPC will acquire gas commodities at their source and retain custody of these commodities until custody is transferred to Clients at their plants' (load center) curb.

FPC's open season procedures follow international standards that identify market demand prior to its establishing the design of its pipeline system. Correspondingly, the design criteria for FPC's intrastate natural gas pipeline system will be based on its total gas volumes nominated through the NBOS. When this final design criteria is set in March, 2011, FPC will be able to credibly determine its final cost of service (COS) required to enter into negotiations for establishing condition precedent binding agreements. Negotiations with gas producers for the acquisition of gas commodities started in September and are expected to conclude by March, 2011. Since FPC's offering to Interior load centers is a "bundled service", the commodity fundamentals, (or the cost of the gas commodities), also need to be determined prior to entering into FPC's binding open season.

FPC may elect to proceed with its Project without holding a subsequent Binding Open Season (BOS). FPC may elect to initiate discussions with Interested Parties (IPs) submitting non-binding bids herein to execute Binding Condition Precedent Agreements more expediently than a BOS permits. The NBOS target groups include those IPs interested in securing firm, bundled natural gas service of >0.25 bcf per annum and NGL supplies > 10,000 gal/ per annum. At its sole discretion, and not on an unduly discriminatory basis, FPC may elect to consider requests received after the close of its NBOS period, which occurred at 8 a.m. GMT, on October 1, 2010, including valid appeals to modify initial non-binding bid offer(s). See Attached Nomination curve.

5904 Old Airport Way, Suite 134 Fairbanks, Alaska 99709 907-452-3466

Our consultancy division specializes in energy and process economics. We assist Clients in the acquisition of process fuel and/or feed-stocks through the use of hedge instruments, and in negotiating long-term power purchase, power sales agreements or co-generation agreements. In addition, we assist in the development, financing, and construction of industrial facilities, improvements, and/or additions by performing due-diligence from project inception, through start-up, and commissioning. We take pride in our unbroken record of completing projects on time, within budget and meeting Client expectations.

Our product division supplies industrial control systems and HMI applications to fossil and renewable fueled electrical generation plants, oil & gas production facilities, hazardous liquids/gas gathering pipelines, LACT facilities, transportation pipelines (including leak detection and SCADA), oil & gas metering/custody transfer facilities, product terminal & dispensing facilities, municipal water facilities and ore concentration plants. We offer both green-field and incremental upgrades. Because of the good will maintained with its Clients, Energia Cura usually offers to demonstrate its systems as they operate within their respective process environments.

Our services division provides technical and administrative support to assist Clients in operating and maintaining their industrial facilities in a safe, profitable and compliant manner. Energia Cura's service offerings range from providing technical support "as needed, where needed" to long-term, turnkey service agreements.

Our metrology division provides third-party measurement and custody transfer services including sampling, scheduling and administration of analytical assays, terminal acceptance, and load-rack meter/instrument calibration and repairs, and NIST/API compliant meter proving. Energia Cura owns and uses a Calibron P-25.C3.C1.D3 compact ballistic meter prover capable of proving meters with flowing conditions up to 2,500 GPM at .02% repeatability and a Sartorius weighing platform/indicator certified for legal gravimetric metrology with sensitivity in the range of 1/150,000 grams with an EC rating of Class II.

RECENTLY COMPLETED PROJECTS

- Distributed control system and HMI for an LM-6000 Combined Cycle Power Plant in North Pole, Alaska
- HMI application for the British Petroleum Flow-2 Metering Facility located on the North Slope of Alaska
- Control and automated water dispensing system for Water Wagon in Fairbanks, Alaska
- In-Line-Inspection (pigging) of the mid-line TAPS connection pipelines in North Pole, Alaska
- Construction of the new PSI Refinery Crude and Residual Pipelines in North Pole, Alaska
- HMI for the British Petroleum Endicott Metering Facility on the North Slope of Alaska
- ECDA and physical assessments of TAPS, mid-line connection pipelines in North Pole, Alaska
- Alaska Rail-Belt power and gas market studies for Doyon Ltd.
- Power generation plant sizing and preliminary engineering in Nenana, Alaska
- Construction of the PSI Refinery Metering and Quality-Bank sampling facility

ON-GOING PROJECTS

- Technical support for Ft. Wainwright and GVEA, NPEP power generation facilities
- Operation and maintenance of the PSI Refinery Metering and Quality-Bank sampling facility

CURRENT SERVICE AGREEMENTS

- Petroleum Pipeline System administration and O&M services for the Fairbanks GVEA Pipeline Systems
- North Pole Connection custody transfer accounting and administrative services at the TAPS Midline Connection
- Metrological services for the TAPS, North Pole connectors, and power plants in Alaska
- Audit support for USDOT hazardous liquids pipeline protocol inspections

Please contact us at 907-452-3466 or at asg@energiacura.com if we can assist you in any way.

General Experience

- *30+ years in project management, business development, financing, design, construction, and start-up of facilities serving the mining, oil & gas, power generation & defense (radar) industries*
- *Long-term management of power generation facilities, pipeline and utility systems*
- *Technical and industrial project development, construction, start-up, and operation*
- *Project feasibility assessment, capital financing, and management consultancy*
- *Commodity hedge management and contracting*
- *Energy auditing, process optimization, cost of service and tariff analysis*

Achievements

- *Capital planning, design, construction and timely start-up of the 16" GVEA ARC residual pipeline*
- *Development and implementation of tariff for the GVEA pipeline systems*
- *Capital planning, design, construction and timely start-up of the 8" PSI crude and ARC residual pipelines*
- *Development of 6.5 year hedge instrument program for power plant fuel feed-stocks at $14.32/Bbl resulting in $165MM in accumulated savings to Clients*
- *Negotiated consolidated connection & operating agreement between Alyeska Pipeline Service Company and GVEA Pipeline Division*
- *Successful completion of numerous power plant overhaul, re-powering, optimization, and green-field projects*

Alexander S. Gajdos

Mr. Gajdos is currently a managing partner of Energia Cura LLC providing services to industry as identified on Energia Cura's website page (attached). Prior to forming this company, he managed 201 Megawatts of power generation capacity and a pipeline transportation system located in Fairbanks, Alaska for Golden Valley Electric Association, Inc. with movements comprising approximately 30% of total flows running through the Trans-Alaska Pipeline System:

- 84,000,000 Bbls/year of ANS Crude Oil
- 58,000,000 Bbls/year of ARC residual oil

Power generation facilities previously managed by Mr. Gajdos include the following power plants:

- The 126 MW North Pole Combustion Turbine Power Plant
- The 32 MW Zehnder Combustion Turbine Plant
- The 32 MW Chena-6 Combustion Turbine & Diesel Plant

Before joining GVEA in 1990, Mr. Gajdos worked for RCA and GE for approximately 14 years. Mr. Gajdos was involved in developing business proposals to provide technical services to the US Department of Defense, US Joint Chiefs of Staff, and the US Air Force. Subsequent to successful award of these projects, Mr. Gajdos shared management responsibilities with project staff and was responsible for increasing revenues by developing and executing a severable work order program on a shared-savings basis. Some of his other endeavors include:

Project Experience

- Prime and General Contractor: PSI crude and residuum pipelines including the PSI Pigging and Metering Facilities.
- Project Manager: GVEA North Pole units # 1 and # 2 MS7001BR overhauls and regenerator retrofits in North Pole, Alaska.
- Project Manager: Negotiated the purchase and managed the rebuild and installation of Garrett regenerators at the GVEA North Pole Power Plant.
- Project Manager: Development, filing, and implementation of tariff for the GVEA pipeline systems and custody transfer facilities.
- Project Manager: Negotiated a Consolidated Connection & Operating Agreement for the North Pole Metering Facilities (between Alyeska Pipeline Service Co. and GVEA).
- Project Manager: Capital planning, finance, design, construction and start-up of the 16" GVEA ARC residual pipeline system.
- Project Manager: Capital planning, finance, design, construction, and start-up of the GVEA interconnection and pigging facilities.
- Project Manager: Construction and operation of various minimum attended radar facilities for the USDOD located in the Alaskan Bush.
- Owner Representative: Performed owner's due diligence on the construction of the TAPS North Pole Metering Custody Transfer Facility and GVEA's LM6000 combined cycle, naphtha-fired power plant.

Experience

- *25+ Years industrial process measurements and control.*
- *Energia Cura Owner/Partner, Industrial Instrumentation and Automation Specialists*
- *System Integration including control, communications & automation with a variety of legacy & contemporary instrumentation & controls*
- *Pipeline Leak Detection Systems – design, installation and operations*
- *Custody Transfer oil measurements, meter proving, pipeline terminal and rack loading*
- *Refinery plant balances, oil movements & storage, automated data reporting*
- *Direct digital process control, communications, and data acquisition systems*

Education

- *Tulane University, 1970*
- *B.A. Economics*
- *Minor: Math & Physics*

Achievements

- *Instrumentation instructor, Process Technology, Tanana Valley Community College*
- *Published technical papers with American Association for the Advancement of Science*

Measurement, Controls, Communications and Automation Technology

Mr. Chapman is currently an owner/partner of Energia Cura, LLC, principally responsible for the engineering & technical aspects of industrial process measurements and controls, metrology, instrumentation, and automation.

From 1996 through 2005, Mr. Chapman was the owner and sole proprietor of K&C Associates, specializing in industrial instrumentation for process control, flow measurement, automation and leak detection systems. Experience includes a variety of consulting and technical work for major oil producers, Alyeska, local refiners, GVEA, and local commercial companies in Fairbanks.

Mr. Chapman was employed by Alyeska Pipeline Company from 1981 through 1996, working at all TAPS facilities from Prudhoe Bay to Valdez. His many areas of expertise include process control, power generation and distribution, topping unit O&M, rack and marine terminal loading, oil movements and storage, and oil measurements for process control and custody transfer. Tom was responsible for a number of cost saving improvements, upgraded metering and control systems, and developed a reputation for his knowledge of custody transfer meter systems.

From 1976 – 1981 Mr. Chapman was employed by the Institute of Marine Science at the University of Alaska, Fairbanks. Prior to this, Mr. Chapman was employed by NOAA aboard a hydrographic survey ship working the Gulf of Alaska and Bering Sea.

Mr. Chapman also is an adjunct instructor with the *'Process Technology Program'* at the University of Alaska, Fairbanks, where he teaches industrial process instrumentation, measurements, control, and automation.

Project Experience

- Developed the control system communications architecture and graphic interface panels for a 60MW cogeneration facility in Fairbanks, Alaska. Also provided engineering and technical support during project design, as well as startup and initial plant O&M support. Responsibility included logic development and PLC network communications.
- Designed & developed graphic interface panels (HMI) for upgrades to BP crude oil measurement skids at Flow Station 2 and Endicott facilities in the Prudhoe Bay oil fields. Responsibility includes communications interface testing and development with the latest Emerson flow measurement equipment and software drivers.

Thomas R. Chapman

Measurement, Controls, Communications and Automation Technology

Project Experience (cont.)

- Contributed to design, development, implementation and startup of instrumentation and controls for Forest Oils crude oil and gas production facilities in Cook Inlet, Alaska. Areas of responsibility included a new off-shore platform (Osprey), heater/treater facilities at Kustatan & West Mac, and the interface with other producers at the Trading Bay facilities.
- Designed and installed a pipeline leak detection system, for the GVEA pipelines carrying crude and return oil between the local refineries and Alyeska TAPS.
- Designed and installed an automated fuel accounting and reporting system for public utility power generation facilities with 0.5% accuracy of daily accountable balances in excess of 200,000 gallons.
- Provide independent third-party oversight of crude oil custody transfer measurements and meter proving for Alyeska Pipeline, GVEA, and local Fairbanks refineries.
- Design and technical support for refinery meter integrity and security of product load rack facilities, including automation of product load report summaries and refinery material balances.
- Designed and managed the installation of the first digital controllers for TAPS pump stations, which was used as a template for upgrading all other active pump station control systems.
- Design and install the first automated, PLC controlled, potable water dispensing system, open 24/7 to the general public, for water distribution in Fairbanks.

Fairbanks company announces another open season for gas pipeline

by dermotcole
08.26.10 - 04:07 pm

The latest twist to the gas pipeline saga is an announcement today from Energia Cura of Fairbanks for an open season to see if there is enough demand to justify a "small bore" private natural gas pipeline that would supply communities between Prudhoe Bay and Eielson Air Force Base by 2014.

The Energia Cura webiste says the company has completed a variety of projects in the Fairbanks area, including power plant and pipeline work at North Pole. The company points to studies that show that there is potential for developing a project before either a bullet line to Southcentral or a large-diameter pipeline to Canada.

The principal partners of the company are Alexander Gajdos and Thomas Chapman.

Here is the press release from the company:

Energia Cura, a Fairbanks-based energy services and consulting company, announced today that it notified State Officials on August 18th of plans to advance Fairbanks Pipeline Company's efforts to provide affordable natural gas to Interior Alaska communities located between Prudhoe Bay and Eielson Air Force Base by 2014. The non-binding open season, administered by Energia Cura, starts today and lasts until Friday, October 1, 2010. The results of this initial inquiry will determine the future direction of the Fairbanks Pipeline Company's proposed small-bore, fit for purpose pipeline project.

FPC officials stated that this private line is the most expedient option yet identified for universally lowering the Interior's cost of electrical power, LNG sourced natural gas, and heating oil. They point out that this project's supply of affordable fuel to companies such as Golden Valley Electric Association, Fairbanks Natural Gas, and local refineries will save Interior enterprises and consumers close to $1.72 billion over the next twenty years. FPC officials stress that participation by all Interior communities is necessary to make this project a reality.

Company officials also state that FPC's project does not aim to compete with any of the larger pipelines now under consideration. The proposed small-bore gas

Fairbanks Daily News Miner

Another Alaska natural gas pipeline idea is pondered
by Christopher Eshleman/ceshleman@newsminer.com
09.03.10 - 12:13 am
FAIRBANKS — A Fairbanks company is gauging interest in a plan to connect to North Slope natural gas fields with a 10-inch diameter buried pipe. Energia Cura is soliciting input from potential customers under a nonbinding "open season" process that opened last week.

Co-owner Alex Gajdos said the firm's owners have been studying the idea for a decade and think a pipeline could be built for about $500 million within four years, provided the plan clears various hurdles.

Gajdos, a former employee for both Golden Valley Electric Association and the Regulatory Commission of Alaska, said the pipeline would be smaller and cheaper than alternatives being considered by state officials and major energy companies. He said a line carrying at least 12 billion cubic feet of gas annually — more than 10 times Fairbanks' current consumption — would avoid the need for multibillion-dollar investments to reach Anchorage.

A bullet pipeline plan drew favor with many state lawmakers last spring. But Gajdos said he expects natural gas prices to remain low, Cook Inlet gas development to increase and Anchorage to seek supplies closer to home. That would leave Fairbanks searching for energy options.

The proposed line would hug the Dalton and Elliott highways to Livengood, where a major gold mine is planned, to the northern edge of Fairbanks. Gajdos said it would then branch toward large customers such as power plants, oil refineries and military bases.

Gajdos and partner Tom Chapman wrote to state officials last month asking for help, as the line would require access to hundreds of miles of state highway rights of way. The company would offer the state a small slice of ownership interest in exchange. Gajdos estimates natural gas could reach the Fairbanks area at a wholesale price of about $10 per thousand cubic feet, less than half the retail price now, under conservative volume estimates.

Gajdos said state agencies have offered limited feedback but said potential investors appear interested. He said he's surprised no one's shopped his idea before. But he acknowledged the potential hurdles inherent in such a plan — a "squeeze play," as he puts it, given physical and economic constraints — and said he hopes policymakers will appreciate and support the plan's simplicity.

Gajdos said an eventual builder-owner could offer equity ownership to private investors

and also could consider options such as traditional financing and public ownership. He estimates a pipeline would represent, largely through reduced energy costs, at least a $1.72 billion value to the Fairbanks area across 20 years.

Gajdos acknowledged plenty of questions remain in the plan. The builder might not be interested in getting into the utility business, he said, which means questions about local distribution are unresolved. He said it remains unanswered whether a dedicated gas treatment plant would be needed on the North Slope. But Gajdos said he and Chapman have sunk personal savings into the plan and think it represents Fairbanks' best short-term energy option.

New effort to get gas to Interior led by Energia Cura of Fairbanks

After studying how to get reasonably priced energy to Alaska's Interior for 10 years, Fairbanks-based Energia Cura thinks there may now be enough demand to justify a small-bore, high-pressure gas line from the North Slope to the Fairbanks area.

The firm began a nonbinding open season Aug. 26 to see if there is enough interest to justify moving forward. The estimated annual volume for the line would be 12 billion cubic feet, some 33 million cubic feet per day. (The interstate projects proposed by Denali and TransCanada are based on volumes of about 4.5 billion cubic feet a day, an annual volume of some 1.6 trillion cubic feet.)

The Energia Cura nonbinding open season is being done on behalf of Fairbanks Pipeline Co.

Principles of both Energia Cura and Fairbanks Pipeline Co. are Alexander Gajdos and Thomas Chapman.

Operational by 2014

The issue Energia Cura is addressing is the cost differential Interior residents pay for energy, and the fact that large new enterprises proposed for the Interior face "significant, if not insurmountable barriers to entry" based on the cost of fuel, and uncertainty about fuel future availability, Gajdos said in a letter addressed to state and federal officials.

Another issue is timing: The FPC line could be operational by 2014, compared to 2026 at the earliest for an interstate line.

Energia Cura expects the current supply-demand imbalance in the natural gas market to continue for the next six and a half to 10 years and believes it will be 16 to 20 years before an interstate Alaska North Slope natural gas pipeline project makes natural gas available to Interior Alaska, Gajdos said.

In that time, Interior residents will spend "at least an additional $1.5 billion in avoidable outlays" for higher energy costs — and that's if an interstate line is operational by 2026 — it could be 2030 or later, he said.

The FPC project does not intend to compete with an interstate gas project or with a bullet line to Southcentral.

The intention, Gajdos said, is "to deliver affordable gas to Interior consumers and to the builders of the interstate systems until such point in time as they are placed in service." He said the intent is to design the FPC project to have residual value once a major line is in place.

If the North Slope to Cook Inlet bullet line is completed by 2020, "FPC will have already aggregated major Interior load increments into working service through its primary and secondary transmission segments" and FPC could interconnect north of Livengood with a gas line to Southcentral, Gajdos said.

But Gajdos questioned whether a line to Southcentral will actually be built.

Recent studies have indicated there may be large volumes of natural gas yet to be developed in Cook Inlet, he said, and with the last of the old gas sale contracts based on a stranded market set to expire at the end of this year, higher gas rates in recent contracts and state incentives for Cook Inlet development, "required investments will soon emerge" for additional drilling in the basin.

Interest in project

Gajdos said informal discussions with parties having a potential interest in a line from the North Slope to the Interior even raised the issue of whether the proposal to limit the line's "gas transmission capacity to match tangible and incontrovertible interest" was a wise one.

He said Energia Cura has run hydraulic simulations and done cost of service evaluations over the last decade and those studies have all shown that the project needs to be "precisely regimented to size FPC's delivery infrastructure to meet existing and/or guaranteed future demand" aggregating to "a specific minimum annual throughput."

If sufficient volumes are identified in the nonbinding open season, "FPC's fit-for-purpose approach will prove to be the most expedient and economic means for curtailing avoidable $1.5 billion in future outlays by Interior consumers to meet their challenging sub-arctic energy requirements."

"These sums," Gajdos said, "are far in excess of the installation capital and operating costs associated with FTP's proposed transmission systems."

The line pipe will be specified at higher pressure ratings than required for initial gas operations in order to accommodate modest growth with increased compression, he said.

Firms seeking investment opportunities have indicated they are interested in building segments of the pipeline in exchange for equity in the line, with four Alaska pipeline construction firms exploring in-kind or direct equity participation.

The proposal being discussed would have the firms build segments ranging from 112 to 150 miles, with overall construction management under a single firm.

Gajdos said that following closure of the nonbinding open season Oct. 1, and after FPC completes integrated hydraulic and cost of service simulations, the firm will approach the state for in-kind contributions including provision of Lidar data and right-of-way assignments adjacent to the state's Dalton and Elliott highway corridors.

In exchange, the state would be offered an equity position of 7.2 percent based on an industry average cost of right-of-way development.

Energia Cura proposing 10-inch main line

High-pressure line would run from Prudhoe Bay to Fox; high-pressure coiled tubing lines would connect to major load centers

Kristen Nelson

Petroleum News

Energia Cura, on behalf of Fairbanks Pipeline Co., began a nonbinding open season Aug. 26 to determine interest in a small-bore natural gas pipeline from the North Slope to Interior Alaska (see story in Sept. 5 issue of Petroleum News).

The company said its hydraulic simulations are based on a 443-mile 10-inch high-pressure line beginning near Pump Station 1 on the North Slope and ending in Fox, with an annual delivery of 12 billion cubic feet, less out-takes at connection points.

In its open season package Energia Cura noted a lack of distribution feeders to Interior Alaska's major load centers, indicated on a map as Fairbanks, Golden Valley Electric Association, Eielson Air Force Base, the North Pole refinery and Fort Wainwright.

The local natural gas utility, Fairbanks Natural Gas, delivers less than 1 bcf a year of re-gasified liquefied natural gas to residential and commercial customers using a 60-mile, low-pressure, plastic-pipe network.

Energia Cura said the Fairbanks Natural Gas system is capable of servicing residential and commercial loads, but "does not reach, nor can it handle the delivery volumes and pressures required to serve the Interior's major load centers."

The company plans to install high-pressure, coiled tubing feeder lines from its primary segments to service the Interior's industrial load centers, which could include points north of the Fox terminus, "depending on the best routes selected to connect the Interior's most significant load centers."

$500 million

Energia Cura partner Alex Gajdos said in a Sept. 8 release that the cost of the 10-inch line is estimated at $500 million and is projected to save Interior communities and businesses at least $1.72 billion in energy costs (electric, fuel oil and natural gas purchases) over 20 years.

The secondary transmission network of 5-inch high-pressure coiled tubing flowlines would have "moderate and discrete costs of service" based on the short distances needed to connect the Interior's

major load centers and FNG to the primary transmission segment.

Energia Cura said hydraulic and economic simulations project a price for transportation plus gas will be less than $10 per thousand cubic feet at the Fox terminus, based on 12 bcf per year, half of what is now paid by major load centers in the Interior and less than half of the $24 per thousand cubic feet residential rate for Fairbanks Natural Gas' LNG-sourced gas.

The base case for Fairbanks Pipeline Co. was completed after Energia Cura conducted a power evaluation study for a new gold mine proposed in Livengood, a mine with a prospective load of 2.8 bcf per year.

If volumes greater than 12 bcf a year were nominated in the nonbinding open season, the throughput cost would be lower; smaller quantities would result in a higher throughput cost.

Gas conditioning

Asked about gas conditioning, Gajdos told Petroleum News in an e-mail that one option would be to treat gas on the North Slope, return the 12 percent carbon dioxide content of the gas for sequestration and install compression.

Or, raw gas could be moved using existing 4,000 pounds per-square-inch discharge pressure, which would require no compression to be built.

He said that less than 10 percent of the targeted load centers require specification grade gas. Other uses — gas turbines, large furnaces and boilers, etc. — could use raw gas effectively, reducing the size of the gas treatment facility and allowing its construction near the terminus at Fox, avoiding North Slope construction costs.

The downside is that 12 percent of transmission capacity would be lost because CO2 would come down the line, and the ability to sequester that gas on the North Slope would be lost.

A treatment facility near Fox to treat only the 1 bcf per year used by Fairbanks Natural Gas for residential and commercial customers would mean that the 12 percent CO2 content of the gas would be released into the atmosphere, Gajdos said, either at the treatment plant or at the point of combustion for untreated gas, still "a vast improvement over the Interior's current rate of emissions resulting from its fixation on coal and distillates."

The 12 percent loss of capacity would also result in "significant impacts to our final cost of service."

Since volumes are small compared to the proposed interstate lines and the bullet line, smaller, more cost-effective, modular gas treatment equipment could be used than would be possible for the high-volume projects.

While treating gas on the North Slope would cost more, neither option is a deal buster, Gajdos said.

Because of the cost involved in evaluating the two treatment options fully they will not be evaluated until the conclusion of the nonbinding open season, but Gajdos said the evaluation of those costs "is highly prioritized and properly sequenced into our forthcoming and final hydraulic/economic simulations."

Fairbanks firm pushes lower-cost gas pipeline to Interior city

By Tim Bradner
Alaska Journal of Commerce

A small Fairbanks energy services and consulting company has launched a bid to build a $500 million, 10-inch natural gas pipeline from the North Slope to the Interior Alaska city.

Alex Gajdos, a partner in Energia Cura, said the pipeline could be in operation as early as 2014 and could deliver North Slope gas to a junction with local gas distribution lines for $10 per million cubic feet or less, including transmission and purchase of the gas.

Gajdos said that is about half what Interior residents pay for heating oil or natural gas now delivered as liquid natural gas by truck from Southcentral Alaska. He believes the project could be competitive with a 24-inch bullet gas pipeline being planned by a state corporation.

However, if a large-diameter pipeline from the North Slope to the Lower 48 proceeds, Energia Cura's would provide Fairbanks-area distribution lines that could deliver gas to major load centers, such as Golden Valley Electric Association's oil-fired power plant and the Flint Hills and Petro Star refineries in North Pole, or the existing small residential gas distribution system now owned by Fairbanks Natural Gas.

Energia Cura currently manages the 16-inch crude oil pipeline that delivers oil from the Trans-Alaska Pipeline System to GVEA's power plant and the refineries. It also does power plant consulting work, including the Fort Wainwright power plant owned and operated by Doyon Utilities, a private firm.

Gajdos worked previously for GVEA and General Electric Corp. With GVEA, he was project manager for construction of the pipeline that connects TAPS to the power plant and refineries.

Chapman was previously with Alyeska Pipeline Service Co. and the University of Alaska's Geophysical Institute.

Energia Cura's partners have been mulling the idea for a small-scale pipeline since 2006, Gajdos said. The effort went into high gear in July, when the company completed a study of energy options for a new gold mine being developed by International Tower Hills in Livengood, north of Fairbanks.

Energy options for the mine other than gas aren't that appealing. GVEA's electrical system could be extended north to Livengood, but with the energy situation as it is in the Interior, the utility may be pressed to meet new demand from the mine. Trucking diesel fuel up the Elliot Highway from Fairbanks for on-site power generation isn't an attractive option either.

However, the mine would be located on the route of the pipeline and would be a major customer.

Gajdos said his company's plan envisions no state subsidy, but he has made an offer to the state to take an equity position in the project in return for allowing the pipeline to be buried alongside the state-owned Dalton Highway from the North Slope. Building pipelines parallel to roads is common in Canada, and would reduce the capital cost of the 10-inch pipeline by about 7 percent, Gajdos said.

The state also would have to grant permission for the pipeline to use the Yukon River bridge on the Dalton Highway, but this is true for any of the proposed pipeline projects.

Gajdos said the company is also hoping to negotiate an arrangement with North Slope producers to tie the pipeline into the central gas facility in Prudhoe Bay, where gas is now extracted from crude oil and processed, thereby avoiding much of the cost of building a separate gas treatment plant.

"Our concept is that we will do this step-by-step rather than all at once with a 24-inch pipeline built to Anchorage" from the Slope, Gajdos said.

There isn't enough gas demand in Southcentral Alaska to justify the 24-inch line, which could cost from $6 billion to $12 billion to build. The existing utility demand in the Anchorage area can use only about half of the gas delivered though the 24-inch pipeline.

Cook Inlet also has existing gas production and although fields there are declining, the entry of major new industry players like Apache Corp. indicate that the industry believes the region has potential for new discoveries.

However, a low-cost smaller-diameter pipeline like that proposed by Energia Cura could serve a market of 12 billion cubic feet per day that has been identified in the Fairbanks area, Gajdos said.

By displacing higher-cost heating oil or trucked LNG, the project could save Interior consumers $1.7 billion in energy costs over 20 years, Gajdos said.

Once completed to the Fairbanks area, an extension could be built to serve other parts of the state, even the Donlin Creek gold project on the middle Kuskokwim River. The Donlin Creek partners, Barrick Gold and NovaGold Resources, are now studying a 320-mile, 12-inch gas pipeline from Cook Inlet to the mine, which would like to use gas to power mining operations.

The idea of building the pipeline from Fairbanks instead isn't far-fetched, Gajdos said.

"It's only 60 miles farther, and there are no mountain ranges to cross," unlike the route from the Anchorage area, he said.

Energia Cura would not be involved in a pipeline extension to Donlin Creek, however. That would be a separate project developed and owned by others.

In concept, the 10-inch pipeline could be extended to Southcentral Alaska, Gajdos said, but a more practical first step would be to generate power with gas in Fairbanks and send surplus power to Southcentral utilities down the existing electric intertie. The intertie is used to send surplus power from Southcentral north to Fairbanks, but with the declining gas reserves in southern Alaska, there has been little to share.

Except for power shipped north by GVEA's coal plant in Healy, the intertie is not currently in use.

Sending electricity from Interior to Southcentral Alaska would allow the remaining Cook Inlet gas reserves to be used for residential and commercial space heating.

Fairbanks firm says there's high interest for it to build a gas pipeline

by Christopher Eshleman / ceshleman@newsminer.com

Oct 18, 2010 | 2020 views | 25 | 6

FAIRBANKS — A Fairbanks firm says it's received strong interest as it looks to pipe natural gas from the North Slope to Fairbanks.

The company, Energia Cura, said Friday a market review gauging demand for natural gas from major energy consumers suggests demand could exceed 15 billion cubic feet per year.

That would represent an exponential increase in Fairbanks' natural gas supply.

Energia Cura co-owner Alex Gajdos said the review justifies a second stage, where the firm would re-run economic models and prepare to solicit estimates from design and construction firms.

The proposal, a buried pipe between the North Slope's vast gas fields and the greater Fairbanks area, would aim to feed major customers — power utilities, military bases or retail distributors, for example — who would also, under the firm's plan, hold equity in a line.

Gajdos said the company has contacted lawmakers to help review the prospect of working with state agencies to address permitting and right of way questions.

"The message were sending here is that the best value to Alaskans for Alaska North Slope gas monetization is to keep it in state," Gajdos said Monday.

The firm's proposed line would hug the Dalton and Elliott highways to Livengood, where a major gold mine is planned, and then reach toward the northern edge of Fairbanks or to North Pole.

Energia Cura says larger line possible

Company proposing small-bore natural gas line from North Slope to Interior says expanded line could allow for gas to Cook Inlet

Kristen Nelson

Petroleum News

Energia Cura believes its proposed 10-inch small-bore natural gas pipeline from Alaska's North Slope should be expanded to 18 inches and a flange provided at Livengood which would allow gas to be moved to Southcentral.

Beyond the flange, the line would drop down to 10 inches to serve Interior needs.

In an Oct. 28 letter to the Alaska Gasline Development Corp., Alexander Gajdos, a principal with Energia Cura, said expansion of the company's proposed line could be done "at a much lower capital cost" than building a 24-inch line from the North Slope to Cook Inlet.

A 24-inch bullet line from the North Slope to Southcentral is the project AGDC is working. The project team was established by the Alaska Legislature with House Bill 369 earlier this year work up a plan for an in-state natural gas pipeline. AGDC will present that project plan to the Legislature by July 1, defining a preferred reliable source of energy for Southcentral and Interior Alaska, with a startup date by the end of 2015.

Energia Cura is proposing a line just to Interior Alaska. It held a nonbinding open season and said after the open season closed in mid-October that it had received nominations in excess of 12 billion cubic feet per year (some 33

million cubic feet per day). The company said a volume of 12 bcf a year would allow it "to deliver natural gas to the Interior at less than half its current cost."

In excess of 19 bcf per year

Gajdos said in the letter to AGDC that to date Energia Cura has received nominations in excess of 19 bcf a year, or more than 52 million cubic feet per day.

He told AGDC that increasing the diameter of the small-bore line from 10 inches to 18 inches provides capacity to supply all Cook Inlet requirements for at least the next 25 years.

And the company's business model does not require state subsidies, he said.

Gajdos said that whether the state subsidizes Alaska North Slope natural gas or a pipeline to Cook Inlet markets, the state's "attainable retained wealth from development and sales of both CI and ANS gas will be compromised." He said the cost of a bullet line, recovered in tariffs, "will both drive gas prices well beyond those now set in current wholesale contracts and reduce the State's net benefit from extraction and sales of these resources"; he also said the proposed 24-inch diameter for the bullet line would be some 70 percent excess capacity over current Cook Inlet demands.

Third-generation GTL

Gajdos said third-generation gas-to-liquids technologies, such as those Royal Dutch Shell is using at its Pearl GTL plant in Qatar, may allow North Slope natural gas to be exported as liquids within the next decade.

"If the Pearl GTL plant confirms Shell's commercial assumptions that inspired its huge capital investment within the next five years, another decade and a half will most likely follow before a similar or more evolved plant can be made operational on Alaska's North Slope," Gajdos said.

The capital requirements for such a plant would be significant, he said, and the Shell plant is not estimated to begin operation until 2012.

But, he said, if a GTL plant could move North Slope natural gas to market as liquids, it would be at premium crude prices "where the energy in crude trades for 2.5 times the energy in gas today."

Gajdos said that third-generation GTL technology, like shale gas, "has the power to instigate another paradigm shift in natural gas economies."

Another perspective

Another perspective comes from David Gottstein, who told AGDC in a letter dated July that "any pipeline project is largely a combination of economics, logistics, finance and politics."

With Southcentral running out of natural gas, he said the alternatives are waiting for the producers to build a gas pipeline — and importing liquefied natural gas in the short term — or "deciding to build an incredibly inefficient bullet or narrow gauge gas pipeline that will saddle Alaskans with high energy costs for decades. While at the same time severely handicapping the prospects for an export project."

Gottstein recommended that the state invest enough money to get natural gas to an Interior hub in a large-diameter line. Oil and gas companies have to wait until they can fill a line before they commit to build, and he projects — based on uncertainty about both pricing and demand — that it could be five to 10 years before companies would actually fund a project.

The State of Alaska, he said, is the only entity in a position to invest money (specifically, "the $3 billion extra it would take to increase the size of a pipe from the North Slope to the Interior suitable for export capacity"), because the state makes most of its money from selling the resource rather than transporting it.

Energia Cura looking to buy Slope gas

Company behind Fairbanks Pipeline Co. project would negotiate with producers to purchase gas; also wants contract for processing

Kristen Nelson

Petroleum News

Of the various projects to move North Slope natural gas to consumers, Energia Cura's Fairbanks Pipeline Co. would be the first, with startup pegged for mid-2014.

This small-bore high-pressure line would run from the North Slope to North Pole in Interior Alaska, and estimates from the ongoing nonbinding open season suggest that the annual volume could exceed 19 billion cubic feet, some 53 million cubic feet per day.

Alex Gajdos and Thomas Chapman of Energia Cura are behind the project and are funding development work.

The goal is to bring affordable energy to Interior Alaska, and to do it with an Alaska-based company, thus keeping value from the project in the state, Gajdos told Petroleum News in a Dec. 14 interview.

The project was originally pegged at a 10-inch line, but when expressions of interest for gas from the line rose from some 12 bcf a year to 19 bcf a year in the continuing nonbinding open season, the line diameter was increased to 12 inches. The 10-inch line was almost precisely scaled to 12 bcf a year, Gajdos said, so the increase to 19 bcf was good news.

While going from 10 inches to 12 inches increases the capital cost for the pipe roughly 32 percent, he said, it increases the capacity 62 to 63 percent. The nonbinding open season has been extended, and Gajdos said Energia Cura is working with the state's congressional delegation to have Eielson Air Force Base at least look at using North

Slope natural gas.

Market the issue

With the Alaska Gasline Development Corp. looking at a bullet line from the North Slope to Southcentral, Energia Cura has proposed increasing the size of the line from the North Slope to Livengood to 18 inches, with a 10-inch line to North Pole running along the Elliott and Richardson highways.

Gajdos said while AGDC is proposing a 24-inch line from the North Slope, that project has to find large industrial users to justify the line.

An 18-inch line would be more than adequate for Cook Inlet's needs well into the future, he said.

With that 18-inch line installed as far as the Interior, with a flange, and combined with price collars established in a recent Cook Inlet gas contract, known costs to move natural gas from the North Slope to Cook Inlet and an established line running as far as Livengood, Southcentral Alaska can wait and watch, Gajdos said.

If there is upward pressure on the price ceiling for natural gas in Southcentral, costs to build the line from the Interior to Cook Inlet can be updated and the line to Cook Inlet could be built if justified.

Working with producers

Gajdos said he has begun talks with the North Slope's major producers about selling gas to the project, which would offer a bundled package of gas and transportation.

The cost of service is essentially what others call a tariff, he said, and includes the capital cost (the pipe) and the operating cost; the bundled cost would also include the gas.

"For a bundled service, which includes the commodity delivered to the curb, you have to include the gas," Gajdos said.

Energia Cura has had preliminary meetings with all of the majors, he said. The company proposes to buy natural gas and also wants the producers to provide compression and treatment facilities and recapture their investment for those services, and required margins, through commodity sales.

It would cost about the same for Fairbanks Pipeline Co. to build the North Slope facilities, but operation and maintenance on the North Slope would be very costly for FPC, while the North Slope producers could leverage their existing facilities and personnel to operate and maintain the compression and treatment facilities, Gajdos

said.

The capital cost for the pipeline portion of the project is about $716 million, he said.

A GTL future for North Slope gas?

Gajdos said he's been following with great interest the gas-to-liquids plant Shell is building in Qatar, a third-generation Fischer-Tropsch facility.

"This plant will be a major, major step forward" in commercial opportunities for GTL, he said.

And if the numbers are correct for Shell's Pearl plant — which should be known fairly soon as the plant goes into operation in 2012 — then "a small GTL plant up north … could defeat any of these other plans (for major gas pipelines)," Gajdos said.

GTL takes gas out of the gas economy because GTL is a liquid, increasing its value.

And it doesn't require infrastructure to transport it to tidewater or to the Canadian border — it makes use of the existing trans-Alaska oil pipeline, he said.

GTL would be injected into the line, along with the crude oil, and would increase the volume of middle cuts such as gasoline and fuel oil, which have the highest value, enhancing the overall value of the liquid moved through the line.

Local pipeline firm says it hasn't heard back from governor

by dermotcole

Energia Cura has named its proposed North Slope to Fairbanks pipeline the "Arctic Fox Pipeline," saying its is small, smart and quick, like the animal of the same name.

The Fairbanks Pipeline Company hopes to gets its pipeline running in three years and supply GVEA, mines, military bases and Fairbanks Natural Gas.

In a press release today, the company said it has presented details of the project to the governor's office, asking for a "due diligence review" as soon as possible.

"FPC has cautioned the Governor that delays in a natural gas pipeline will burden Alaskans, particularly Interior Alaskans, with continued unnecessary spending on high priced energy," the company said. "A response from the Governor's Office is still pending."

"We have substantiated the viability and profitability of an all-Alaska natural gas pipeline and we openly invite the public and our public officials to review our feasibility study and economic analysis," said Alex Gajdos, FPC co-founder. "We want our public officials to see that that there is a valid alternative to waiting for a big pipe. We can move gas to Alaskans now and prosper by owning the pipeline ourselves. We can get gas to Alaskans now."

Energia Cura names pipeline Arctic Fox

A proposed small gas pipeline from Alaska's North Slope to the state's Interior now has a name: The Arctic Fox Pipeline.

Energia Cura, a Fairbanks-based energy consulting firm and parent to Fairbanks Pipeline Co., said in a Feb. 2 statement that the line was named after Congressman Don Young, R-Alaska, commented that the proposed line would be small, smart and quick.

Energia Cura met with Young Dec. 27 to discuss the value of the line, which would be a small-diameter high-pressure line moving volumes of gas justified for Interior markets.

Energia Cura said it has also met with Mike Nizich, chief of staff to Gov. Sean Parnell, to reiterate a request for a due diligence review of the project and continues to meet with Alaska leaders and others in the industry.

"We have substantiated the viability and profitability of an all-Alaska natural gas pipeline and we openly invite the public and our public officials to review our feasibility study and economic analysis," said Alex Gajdos, FPC co-founder. "We want our public officials to see that that there is a valid alternative to waiting for a big pipe. We can move gas to Alaskans now and prosper by owning the pipeline ourselves. We can get gas to Alaskans now."

FPC said it will continue to provide its documents to interested parties and will continue to post detailed updates on the firm's website, www.fairbankspipelinecompany.com.

Energia Cura has constructed pipelines in Alaska and operates and maintains a pipeline system connecting the trans-Alaska pipeline system to both North Pole refineries.

2/14/11 PRESENTATION: ENERGIA CURA

<TARGET><BILL></BILL><SUBJECT>2-14-11 PRESENTATION ENERGIA CURA</SUBJECT><COMM>SRES27</COMM></TARGET>

ENERGIA CURA
5904 Old Airport Way, Suite 134, Fairbanks, Alaska 99709 - 907-452-3466

Fairbanks Pipeline Company

Fairbanks Pipeline Company (FPC) is developing a fit-for-purpose natural gas pipeline system to deliver affordable gas from Prudhoe Bay to Interior Alaska. Its project development approach is market-based. *The size and operating pressure* of its pipeline will be economically designed to transport known gas volumes to Alaskan load centers such as Golden Valley Electric Association, Fairbanks Natural Gas, mines and Military bases contracted over a twenty-year term. FPC's pipeline system will begin operation in 2014.

FPC's pipeline does not have to wait for global and domestic gas prices to increase four-fold to become viable. Gas pipelines in the common lower-48 markets are typically installed in markets where the prices of competing gas supply sources vary by 1% to 5%. This long overdue Alaskan project will reduce current Alaskan wholesale energy prices by close to 50%. This unarguably demonstrates its project feasibility as well as its socio-economic benefits.

Project Funding

FPC's gas pipeline is not receiving State or Federal subsidies. Instead, Energia Cura's principle partners are underwriting the cost of its development. The partners' intent for funding this project's development is to expediently reduce energy costs by 50% and to contain the wealth generated from these savings within the state. Energia Cura is a consultancy headquartered in Fairbanks, Alaska providing a range of services and products to the power, oil & gas and mining industries. It currently operates and maintains Alaska's second largest pipeline system on a throughput basis.

The Open Season

Our project objective is to provide expedient economic relief to thermal markets located along Fairbanks Pipeline Company's primary and secondary pipeline corridors by 2014, by supplying affordable natural gas to ready and willing load centers using proven, economic pipeline transportation methods. Energia Cura conducted the non-binding open season on behalf of the Fairbanks Pipeline Company. Participation in this first phase of the open season process is non-binding for all partaking entities. The second phase of FPC's open season will conclude by acquiring commitments (binding condition precedent agreements) from Alaskan load centers to purchase bundled gas volumes at a predetermined price to include both the gas and its transportation. Consequently, FPC will acquire gas commodities at their source and retain custody of these commodities until custody is transferred to Clients at their plants' (load center) curb.

FPC's open season procedures follow international standards that identify market demand prior to its establishing the design of its pipeline system. Correspondingly, the design criteria for FPC's intrastate natural gas pipeline system will be based on its total gas volumes nominated through the NBOS. When this final design criteria is set in March, 2011, FPC will be able to credibly determine its final cost of service (COS) required to enter into negotiations for establishing condition precedent binding agreements. Negotiations with gas producers for the acquisition of gas commodities started in September and are expected to conclude by March, 2011. Since FPC's offering to Interior load centers is a "bundled service", the commodity fundamentals, (or the cost of the gas commodities), also need to be determined prior to entering into FPC's binding open season.

FPC may elect to proceed with its Project without holding a subsequent Binding Open Season (BOS). FPC may elect to initiate discussions with Interested Parties (IPs) submitting non-binding bids herein to execute Binding Condition Precedent Agreements more expediently than a BOS permits. The NBOS target groups include those IPs interested in securing firm, bundled natural gas service of >0.25 bcf per annum and NGL supplies > 10,000 gal/ per annum. At its sole discretion, and not on an unduly discriminatory basis, FPC may elect to consider requests received after the close of its NBOS period, which occurred at 8 a.m. GMT, on October 1, 2010, including valid appeals to modify initial non-binding bid offer(s). See Attached Nomination curve.

SERVICES OFFERED

Project Development
Project Management
Process & Facility Management
Energy Management
Control & Automation Systems
Commodity Hedging
Metrology & CT Accounting

Our consultancy division specializes in energy and process economics. We assist Clients in the acquisition of process fuel and/or feed-stocks through the use of hedge instruments, and in negotiating long-term power purchase, power sales agreements or co-generation agreements. In addition, we assist in the development, financing, and construction of industrial facilities, improvements, and/or additions by performing due-diligence from project inception, through start-up, and commissioning. We take pride in our unbroken record of completing projects on time, within budget and meeting Client expectations.

Our product division supplies industrial control systems and HMI applications to fossil and renewable fueled electrical generation plants, oil & gas production facilities, hazardous liquids/gas gathering pipelines, LACT facilities, transportation pipelines (including leak detection and SCADA), oil & gas metering/custody transfer facilities, product terminal & dispensing facilities, municipal water facilities and ore concentration plants. We offer both green-field and incremental upgrades. Because of the good will maintained with its Clients, Energia Cura usually offers to demonstrate its systems as they operate within their respective process environments.

Our services division provides technical and administrative support to assist Clients in operating and maintaining their industrial facilities in a safe, profitable and compliant manner. Energia Cura's service offerings range from providing technical support "as needed, where needed" to long-term, turnkey service agreements.

Our metrology division provides third-party measurement and custody transfer services including sampling, scheduling and administration of analytical assays, terminal acceptance, and load-rack meter/instrument calibration and repairs, and NIST/API compliant meter proving. Energia Cura owns and uses a Calibron P-25.C3.C1.D3 compact ballistic meter prover capable of proving meters with flowing conditions up to 2,500 GPM at .02% repeatability and a Sartorius weighing platform/indicator certified for legal gravimetric metrology with sensitivity in the range of 1/150,000 grams with an EC rating of Class II.

RECENTLY COMPLETED PROJECTS

- Distributed control system and HMI for an LM-6000 Combined Cycle Power Plant in North Pole, Alaska
- HMI application for the British Petroleum Flow-2 Metering Facility located on the North Slope of Alaska
- Control and automated water dispensing system for Water Wagon in Fairbanks, Alaska
- In-Line-Inspection (pigging) of the mid-line TAPS connection pipelines in North Pole, Alaska
- Construction of the new PSI Refinery Crude and Residual Pipelines in North Pole, Alaska
- HMI for the British Petroleum Endicott Metering Facility on the North Slope of Alaska
- ECDA and physical assessments of TAPS, mid-line connection pipelines in North Pole, Alaska
- Alaska Rail-Belt power and gas market studies for Doyon Ltd.
- Power generation plant sizing and preliminary engineering in Nenana, Alaska
- Construction of the PSI Refinery Metering and Quality-Bank sampling facility

ON-GOING PROJECTS

- Technical support for Ft. Wainwright and GVEA, NPEP power generation facilities
- Operation and maintenance of the PSI Refinery Metering and Quality-Bank sampling facility

CURRENT SERVICE AGREEMENTS

- Petroleum Pipeline System administration and O&M services for the Fairbanks GVEA Pipeline Systems
- North Pole Connection custody transfer accounting and administrative services at the TAPS Midline Connection
- Metrological services for the TAPS, North Pole connectors, and power plants in Alaska
- Audit support for USDOT hazardous liquids pipeline protocol inspections

Please contact us at 907-452-3466 or at asg@energiacura.com if we can assist you in any way.

General Experience

- *30+ years in project management, business development, financing, design, construction, and start-up of facilities serving the mining, oil & gas, power generation & defense (radar) industries*
- *Long-term management of power generation facilities, pipeline and utility systems*
- *Technical and industrial project development, construction, start-up, and operation*
- *Project feasibility assessment, capital financing, and management consultancy*
- *Commodity hedge management and contracting*
- *Energy auditing, process optimization, cost of service and tariff analysis*

Achievements

- *Capital planning, design, construction and timely start-up of the 16" GVEA ARC residual pipeline*
- *Development and implementation of tariff for the GVEA pipeline systems*
- *Capital planning, design, construction and timely start-up of the 8" PSI crude and ARC residual pipelines*
- *Development of 6.5 year hedge instrument program for power plant fuel feed-stocks at $14.32/Bbl resulting in $165MM in accumulated savings to Clients*
- *Negotiated consolidated connection & operating agreement between Alyeska Pipeline Service Company and GVEA Pipeline Division*
- *Successful completion of numerous power plant overhaul, re-powering, optimization, and green-field projects*

Alexander S. Gajdos

Mr. Gajdos is currently a managing partner of Energia Cura LLC providing services to industry as identified on Energia Cura's website page (attached). Prior to forming this company, he managed 201 Megawatts of power generation capacity and a pipeline transportation system located in Fairbanks, Alaska for Golden Valley Electric Association, Inc. with movements comprising approximately 30% of total flows running through the Trans-Alaska Pipeline System:

- 84,000,000 Bbls/year of ANS Crude Oil
- 58,000,000 Bbls/year of ARC residual oil

Power generation facilities previously managed by Mr. Gajdos include the following power plants:

- The 126 MW North Pole Combustion Turbine Power Plant
- The 32 MW Zehnder Combustion Turbine Plant
- The 32 MW Chena-6 Combustion Turbine & Diesel Plant

Before joining GVEA in 1990, Mr. Gajdos worked for RCA and GE for approximately 14 years. Mr. Gajdos was involved in developing business proposals to provide technical services to the US Department of Defense, US Joint Chiefs of Staff, and the US Air Force. Subsequent to successful award of these projects, Mr. Gajdos shared management responsibilities with project staff and was responsible for increasing revenues by developing and executing a severable work order program on a shared-savings basis. Some of his other endeavors include:

Project Experience

- Prime and General Contractor: PSI crude and residuum pipelines including the PSI Pigging and Metering Facilities.
- Project Manager: GVEA North Pole units # 1 and # 2 MS7001BR overhauls and regenerator retrofits in North Pole, Alaska.
- Project Manager: Negotiated the purchase and managed the rebuild and installation of Garrett regenerators at the GVEA North Pole Power Plant.
- Project Manager: Development, filing, and implementation of tariff for the GVEA pipeline systems and custody transfer facilities.
- Project Manager: Negotiated a Consolidated Connection & Operating Agreement for the North Pole Metering Facilities (between Alyeska Pipeline Service Co. and GVEA).
- Project Manager: Capital planning, finance, design, construction and start-up of the 16" GVEA ARC residual pipeline system.
- Project Manager: Capital planning, finance, design, construction, and start-up of the GVEA interconnection and pigging facilities.
- Project Manager: Construction and operation of various minimum attended radar facilities for the USDOD located in the Alaskan Bush.
- Owner Representative: Performed owner's due diligence on the construction of the TAPS North Pole Metering Custody Transfer Facility and GVEA's LM6000 combined cycle, naphtha-fired power plant.

- *Published technical papers with American Association for the Advancement of Science*

Measurement, Controls, Communications and Automation Technology

Mr. Chapman is currently an owner/partner of Energia Cura, LLC, principally responsible for the engineering & technical aspects of industrial process measurements and controls, metrology, instrumentation, and automation.

From 1996 through 2005, Mr. Chapman was the owner and sole proprietor of K&C Associates, specializing in industrial instrumentation for process control, flow measurement, automation and leak detection systems. Experience includes a variety of consulting and technical work for major oil producers, Alyeska, local refiners, GVEA, and local commercial companies in Fairbanks.

Mr. Chapman was employed by Alyeska Pipeline Company from 1981 through 1996, working at all TAPS facilities from Prudhoe Bay to Valdez. His many areas of expertise include process control, power generation and distribution, topping unit O&M, rack and marine terminal loading, oil movements and storage, and oil measurements for process control and custody transfer. Tom was responsible for a number of cost saving improvements, upgraded metering and control systems, and developed a reputation for his knowledge of custody transfer meter systems.

From 1976 – 1981 Mr. Chapman was employed by the Institute of Marine Science at the University of Alaska, Fairbanks. Prior to this, Mr. Chapman was employed by NOAA aboard a hydrographic survey ship working the Gulf of Alaska and Bering Sea.

Mr. Chapman also is an adjunct instructor with the *'Process Technology Program'* at the University of Alaska, Fairbanks, where he teaches industrial process instrumentation, measurements, control, and automation.

Project Experience

- Developed the control system communications architecture and graphic interface panels for a 60MW cogeneration facility in Fairbanks, Alaska. Also provided engineering and technical support during project design, as well as startup and initial plant O&M support. Responsibility included logic development and PLC network communications.
- Designed & developed graphic interface panels (HMI) for upgrades to BP crude oil measurement skids at Flow Station 2 and Endicott facilities in the Prudhoe Bay oil fields. Responsibility includes communications interface testing and development with the latest Emerson flow measurement equipment and software drivers.

Fairbanks company announces another open season for gas pipeline

by dermotcole
08.26.10 - 04:07 pm

The latest twist to the gas pipeline saga is an announcement today from Energia Cura of Fairbanks for an open season to see if there is enough demand to justify a "small bore" private natural gas pipeline that would supply communities between Prudhoe Bay and Eielson Air Force Base by 2014.

The Energia Cura webiste says the company has completed a variety of projects in the Fairbanks area, including power plant and pipeline work at North Pole. The company points to studies that show that there is potential for developing a project before either a bullet line to Southcentral or a large-diameter pipeline to Canada.

The principal partners of the company are Alexander Gajdos and Thomas Chapman.

Here is the press release from the company:

Energia Cura, a Fairbanks-based energy services and consulting company, announced today that it notified State Officials on August 18th of plans to advance Fairbanks Pipeline Company's efforts to provide affordable natural gas to Interior Alaska communities located between Prudhoe Bay and Eielson Air Force Base by 2014. The non-binding open season, administered by Energia Cura, starts today and lasts until Friday, October 1, 2010. The results of this initial inquiry will determine the future direction of the Fairbanks Pipeline Company's proposed small-bore, fit for purpose pipeline project.

FPC officials stated that this private line is the most expedient option yet identified for universally lowering the Interior's cost of electrical power, LNG sourced natural gas, and heating oil. They point out that this project's supply of affordable fuel to companies such as Golden Valley Electric Association, Fairbanks Natural Gas, and local refineries will save Interior enterprises and consumers close to $1.72 billion over the next twenty years. FPC officials stress that participation by all Interior communities is necessary to make this project a reality.

Company officials also state that FPC's project does not aim to compete with any of the larger pipelines now under consideration. The proposed small-bore gas

Fairbanks Daily News Miner
September 3, 2010

Another Alaska natural gas pipeline idea is pondered
by Christopher Eshleman/ceshleman@newsminer.com
09.03.10 - 12:13 am
FAIRBANKS — A Fairbanks company is gauging interest in a plan to connect to North Slope natural gas fields with a 10-inch diameter buried pipe. Energia Cura is soliciting input from potential customers under a nonbinding "open season" process that opened last week.

Co-owner Alex Gajdos said the firm's owners have been studying the idea for a decade and think a pipeline could be built for about $500 million within four years, provided the plan clears various hurdles.

Gajdos, a former employee for both Golden Valley Electric Association and the Regulatory Commission of Alaska, said the pipeline would be smaller and cheaper than alternatives being considered by state officials and major energy companies. He said a line carrying at least 12 billion cubic feet of gas annually — more than 10 times Fairbanks' current consumption — would avoid the need for multibillion-dollar investments to reach Anchorage.

A bullet pipeline plan drew favor with many state lawmakers last spring. But Gajdos said he expects natural gas prices to remain low, Cook Inlet gas development to increase and Anchorage to seek supplies closer to home. That would leave Fairbanks searching for energy options.

The proposed line would hug the Dalton and Elliott highways to Livengood, where a major gold mine is planned, to the northern edge of Fairbanks. Gajdos said it would then branch toward large customers such as power plants, oil refineries and military bases.

Gajdos and partner Tom Chapman wrote to state officials last month asking for help, as the line would require access to hundreds of miles of state highway rights of way. The company would offer the state a small slice of ownership interest in exchange. Gajdos estimates natural gas could reach the Fairbanks area at a wholesale price of about $10 per thousand cubic feet, less than half the retail price now, under conservative volume estimates.

Gajdos said state agencies have offered limited feedback but said potential investors appear interested. He said he's surprised no one's shopped his idea before. But he acknowledged the potential hurdles inherent in such a plan — a "squeeze play," as he puts it, given physical and economic constraints — and said he hopes policymakers will appreciate and support the plan's simplicity.

Gajdos said an eventual builder-owner could offer equity ownership to private investors

and also could consider options such as traditional financing and public ownership. He estimates a pipeline would represent, largely through reduced energy costs, at least a $1.72 billion value to the Fairbanks area across 20 years.

Gajdos acknowledged plenty of questions remain in the plan. The builder might not be interested in getting into the utility business, he said, which means questions about local distribution are unresolved. He said it remains unanswered whether a dedicated gas treatment plant would be needed on the North Slope. But Gajdos said he and Chapman have sunk personal savings into the plan and think it represents Fairbanks' best short-term energy option.

Petroleum News – Vol 15 No 36 Week of September 05, 2010

New effort to get gas to Interior led by Energia Cura of Fairbanks

After studying how to get reasonably priced energy to Alaska's Interior for 10 years, Fairbanks-based Energia Cura thinks there may now be enough demand to justify a small-bore, high-pressure gas line from the North Slope to the Fairbanks area.

The firm began a nonbinding open season Aug. 26 to see if there is enough interest to justify moving forward. The estimated annual volume for the line would be 12 billion cubic feet, some 33 million cubic feet per day. (The interstate projects proposed by Denali and TransCanada are based on volumes of about 4.5 billion cubic feet a day, an annual volume of some 1.6 trillion cubic feet.)

The Energia Cura nonbinding open season is being done on behalf of Fairbanks Pipeline Co.

Principles of both Energia Cura and Fairbanks Pipeline Co. are Alexander Gajdos and Thomas Chapman.

Operational by 2014

The issue Energia Cura is addressing is the cost differential Interior residents pay for energy, and the fact that large new enterprises proposed for the Interior face "significant, if not insurmountable barriers to entry" based on the cost of fuel, and uncertainty about fuel future availability, Gajdos said in a letter addressed to state and federal officials.

Another issue is timing: The FPC line could be operational by 2014, compared to 2026 at the earliest for an interstate line.

Energia Cura expects the current supply-demand imbalance in the natural gas market to continue for the next six and a half to 10 years and believes it will be 16 to 20 years before an interstate Alaska North Slope natural gas pipeline project makes natural gas available to Interior Alaska, Gajdos said.

In that time, Interior residents will spend "at least an additional $1.5 billion in avoidable outlays" for higher energy costs — and that's if an interstate line is operational by 2026 — it could be 2030 or later, he said.

The FPC project does not intend to compete with an interstate gas project or with a bullet line to Southcentral.

The intention, Gajdos said, is "to deliver affordable gas to Interior consumers and to the builders of the interstate systems until such point in time as they are placed in service." He said the intent is to design the FPC project to have residual value once a major line is in place.

If the North Slope to Cook Inlet bullet line is completed by 2020, "FPC will have already aggregated major Interior load increments into working service through its primary and secondary transmission segments" and FPC could interconnect north of Livengood with a gas line to Southcentral, Gajdos said.

But Gajdos questioned whether a line to Southcentral will actually be built.

Recent studies have indicated there may be large volumes of natural gas yet to be developed in Cook Inlet, he said, and with the last of the old gas sale contracts based on a stranded market set to expire at the end of this year, higher gas rates in recent contracts and state incentives for Cook Inlet development, "required investments will soon emerge" for additional drilling in the basin.

Interest in project

Gajdos said informal discussions with parties having a potential interest in a line from the North Slope to the Interior even raised the issue of whether the proposal to limit the line's "gas transmission capacity to match tangible and incontrovertible interest" was a wise one.

He said Energia Cura has run hydraulic simulations and done cost of service evaluations over the last decade and those studies have all shown that the project needs to be "precisely regimented to size FPC's delivery infrastructure to meet existing and/or guaranteed future demand" aggregating to "a specific minimum annual throughput."

If sufficient volumes are identified in the nonbinding open season, "FPC's fit-for-purpose approach will prove to be the most expedient and economic means for curtailing avoidable $1.5 billion in future outlays by Interior consumers to meet their challenging sub-arctic energy requirements."

"These sums," Gajdos said, "are far in excess of the installation capital and operating costs associated with FTP's proposed transmission systems."

The line pipe will be specified at higher pressure ratings than required for initial gas operations in order to accommodate modest growth with increased compression, he said.

Firms seeking investment opportunities have indicated they are interested in building segments of the pipeline in exchange for equity in the line, with four Alaska pipeline construction firms exploring in-kind or direct equity participation.

The proposal being discussed would have the firms build segments ranging from 112 to 150 miles, with overall construction management under a single firm.

Gajdos said that following closure of the nonbinding open season Oct. 1, and after FPC completes integrated hydraulic and cost of service simulations, the firm will approach the state for in-kind contributions including provision of Lidar data and right-of-way assignments adjacent to the state's Dalton and Elliott highway corridors.

In exchange, the state would be offered an equity position of 7.2 percent based on an industry average cost of right-of-way development.

Energia Cura proposing 10-inch main line

High-pressure line would run from Prudhoe Bay to Fox; high-pressure coiled tubing lines would connect to major load centers

Kristen Nelson

Petroleum News

Energia Cura, on behalf of Fairbanks Pipeline Co., began a nonbinding open season Aug. 26 to determine interest in a small-bore natural gas pipeline from the North Slope to Interior Alaska (see story in Sept. 5 issue of Petroleum News).

The company said its hydraulic simulations are based on a 443-mile 10-inch high-pressure line beginning near Pump Station 1 on the North Slope and ending in Fox, with an annual delivery of 12 billion cubic feet, less out-takes at connection points.

In its open season package Energia Cura noted a lack of distribution feeders to Interior Alaska's major load centers, indicated on a map as Fairbanks, Golden Valley Electric Association, Eielson Air Force Base, the North Pole refinery and Fort Wainwright.

The local natural gas utility, Fairbanks Natural Gas, delivers less than 1 bcf a year of re-gasified liquefied natural gas to residential and commercial customers using a 60-mile, low-pressure, plastic-pipe network.

Energia Cura said the Fairbanks Natural Gas system is capable of servicing residential and commercial loads, but "does not reach, nor can it handle the delivery volumes and pressures required to serve the Interior's major load centers."

The company plans to install high-pressure, coiled tubing feeder lines from its primary segments to service the Interior's industrial load centers, which could include points north of the Fox terminus, "depending on the best routes selected to connect the Interior's most significant load centers."

$500 million

Energia Cura partner Alex Gajdos said in a Sept. 8 release that the cost of the 10-inch line is estimated at $500 million and is projected to save Interior communities and businesses at least $1.72 billion in energy costs (electric, fuel oil and natural gas purchases) over 20 years.

The secondary transmission network of 5-inch high-pressure coiled tubing flowlines would have "moderate and discrete costs of service" based on the short distances needed to connect the Interior's

major load centers and FNG to the primary transmission segment.

Energia Cura said hydraulic and economic simulations project a price for transportation plus gas will be less than $10 per thousand cubic feet at the Fox terminus, based on 12 bcf per year, half of what is now paid by major load centers in the Interior and less than half of the $24 per thousand cubic feet residential rate for Fairbanks Natural Gas' LNG-sourced gas.

The base case for Fairbanks Pipeline Co. was completed after Energia Cura conducted a power evaluation study for a new gold mine proposed in Livengood, a mine with a prospective load of 2.8 bcf per year.

If volumes greater than 12 bcf a year were nominated in the nonbinding open season, the throughput cost would be lower; smaller quantities would result in a higher throughput cost.

Gas conditioning

Asked about gas conditioning, Gajdos told Petroleum News in an e-mail that one option would be to treat gas on the North Slope, return the 12 percent carbon dioxide content of the gas for sequestration and install compression.

Or, raw gas could be moved using existing 4,000 pounds per-square-inch discharge pressure, which would require no compression to be built.

He said that less than 10 percent of the targeted load centers require specification grade gas. Other uses — gas turbines, large furnaces and boilers, etc. — could use raw gas effectively, reducing the size of the gas treatment facility and allowing its construction near the terminus at Fox, avoiding North Slope construction costs.

The downside is that 12 percent of transmission capacity would be lost because CO2 would come down the line, and the ability to sequester that gas on the North Slope would be lost.

A treatment facility near Fox to treat only the 1 bcf per year used by Fairbanks Natural Gas for residential and commercial customers would mean that the 12 percent CO2 content of the gas would be released into the atmosphere, Gajdos said, either at the treatment plant or at the point of combustion for untreated gas, still "a vast improvement over the Interior's current rate of emissions resulting from its fixation on coal and distillates."

The 12 percent loss of capacity would also result in "significant impacts to our final cost of service."

Since volumes are small compared to the proposed interstate lines and the bullet line, smaller, more cost-effective, modular gas treatment equipment could be used than would be possible for the high-volume projects.

While treating gas on the North Slope would cost more, neither option is a deal buster, Gajdos said.

Because of the cost involved in evaluating the two treatment options fully they will not be evaluated until the conclusion of the nonbinding open season, but Gajdos said the evaluation of those costs "is highly prioritized and properly sequenced into our forthcoming and final hydraulic/economic simulations."

Fairbanks firm pushes lower-cost gas pipeline to Interior city

By Tim Bradner
Alaska Journal of Commerce

A small Fairbanks energy services and consulting company has launched a bid to build a $500 million, 10-inch natural gas pipeline from the North Slope to the Interior Alaska city.

Alex Gajdos, a partner in Energia Cura, said the pipeline could be in operation as early as 2014 and could deliver North Slope gas to a junction with local gas distribution lines for $10 per million cubic feet or less, including transmission and purchase of the gas.

Gajdos said that is about half what Interior residents pay for heating oil or natural gas now delivered as liquid natural gas by truck from Southcentral Alaska. He believes the project could be competitive with a 24-inch bullet gas pipeline being planned by a state corporation.

However, if a large-diameter pipeline from the North Slope to the Lower 48 proceeds, Energia Cura's would provide Fairbanks-area distribution lines that could deliver gas to major load centers, such as Golden Valley Electric Association's oil-fired power plant and the Flint Hills and Petro Star refineries in North Pole, or the existing small residential gas distribution system now owned by Fairbanks Natural Gas.

Energia Cura currently manages the 16-inch crude oil pipeline that delivers oil from the Trans-Alaska Pipeline System to GVEA's power plant and the refineries. It also does power plant consulting work, including the Fort Wainwright power plant owned and operated by Doyon Utilities, a private firm.

Gajdos worked previously for GVEA and General Electric Corp. With GVEA, he was project manager for construction of the pipeline that connects TAPS to the power plant and refineries.

Chapman was previously with Alyeska Pipeline Service Co. and the University of Alaska's Geophysical Institute.

Energia Cura's partners have been mulling the idea for a small-scale pipeline since 2006, Gajdos said. The effort went into high gear in July, when the company completed a study of energy options for a new gold mine being developed by International Tower Hills in Livengood, north of Fairbanks.

Energy options for the mine other than gas aren't that appealing. GVEA's electrical system could be extended north to Livengood, but with the energy situation as it is in the Interior, the utility may be pressed to meet new demand from the mine. Trucking diesel fuel up the Elliot Highway from Fairbanks for on-site power generation isn't an attractive option either.

However, the mine would be located on the route of the pipeline and would be a major customer.

Gajdos said his company's plan envisions no state subsidy, but he has made an offer to the state to take an equity position in the project in return for allowing the pipeline to be buried alongside the state-owned Dalton Highway from the North Slope. Building pipelines parallel to roads is common in Canada, and would reduce the capital cost of the 10-inch pipeline by about 7 percent, Gajdos said.

The state also would have to grant permission for the pipeline to use the Yukon River bridge on the Dalton Highway, but this is true for any of the proposed pipeline projects.

Gajdos said the company is also hoping to negotiate an arrangement with North Slope producers to tie the pipeline into the central gas facility in Prudhoe Bay, where gas is now extracted from crude oil and processed, thereby avoiding much of the cost of building a separate gas treatment plant.

"Our concept is that we will do this step-by-step rather than all at once with a 24-inch pipeline built to Anchorage" from the Slope, Gajdos said.

There isn't enough gas demand in Southcentral Alaska to justify the 24-inch line, which could cost from $6 billion to $12 billion to build. The existing utility demand in the Anchorage area can use only about half of the gas delivered though the 24-inch pipeline.

Cook Inlet also has existing gas production and although fields there are declining, the entry of major new industry players like Apache Corp. indicate that the industry believes the region has potential for new discoveries.

However, a low-cost smaller-diameter pipeline like that proposed by Energia Cura could serve a market of 12 billion cubic feet per day that has been identified in the Fairbanks area, Gajdos said.

By displacing higher-cost heating oil or trucked LNG, the project could save Interior consumers $1.7 billion in energy costs over 20 years, Gajdos said.

Once completed to the Fairbanks area, an extension could be built to serve other parts of the state, even the Donlin Creek gold project on the middle Kuskokwim River. The Donlin Creek partners, Barrick Gold and NovaGold Resources, are now studying a 320-mile, 12-inch gas pipeline from Cook Inlet to the mine, which would like to use gas to power mining operations.

The idea of building the pipeline from Fairbanks instead isn't far-fetched, Gajdos said.

"It's only 60 miles farther, and there are no mountain ranges to cross," unlike the route from the Anchorage area, he said.

Energia Cura would not be involved in a pipeline extension to Donlin Creek, however. That would be a separate project developed and owned by others.

In concept, the 10-inch pipeline could be extended to Southcentral Alaska, Gajdos said, but a more practical first step would be to generate power with gas in Fairbanks and send surplus power to Southcentral utilities down the existing electric intertie. The intertie is used to send surplus power from Southcentral north to Fairbanks, but with the declining gas reserves in southern Alaska, there has been little to share.

Except for power shipped north by GVEA's coal plant in Healy, the intertie is not currently in use.

Sending electricity from Interior to Southcentral Alaska would allow the remaining Cook Inlet gas reserves to be used for residential and commercial space heating.

Fairbanks firm says there's high interest for it to build a gas pipeline

by Christopher Eshleman / ceshleman@newsminer.com

Oct 18, 2010 | 2020 views | 25 | 6

FAIRBANKS — A Fairbanks firm says it's received strong interest as it looks to pipe natural gas from the North Slope to Fairbanks.

The company, Energia Cura, said Friday a market review gauging demand for natural gas from major energy consumers suggests demand could exceed 15 billion cubic feet per year.

That would represent an exponential increase in Fairbanks' natural gas supply.

Energia Cura co-owner Alex Gajdos said the review justifies a second stage, where the firm would re-run economic models and prepare to solicit estimates from design and construction firms.

The proposal, a buried pipe between the North Slope's vast gas fields and the greater Fairbanks area, would aim to feed major customers — power utilities, military bases or retail distributors, for example — who would also, under the firm's plan, hold equity in a line.

Gajdos said the company has contacted lawmakers to help review the prospect of working with state agencies to address permitting and right of way questions.

"The message were sending here is that the best value to Alaskans for Alaska North Slope gas monetization is to keep it in state," Gajdos said Monday.

The firm's proposed line would hug the Dalton and Elliott highways to Livengood, where a major gold mine is planned, and then reach toward the northern edge of Fairbanks or to North Pole.

Energia Cura says larger line possible

Company proposing small-bore natural gas line from North Slope to Interior says expanded line could allow for gas to Cook Inlet

Kristen Nelson

Petroleum News

Energia Cura believes its proposed 10-inch small-bore natural gas pipeline from Alaska's North Slope should be expanded to 18 inches and a flange provided at Livengood which would allow gas to be moved to Southcentral.

Beyond the flange, the line would drop down to 10 inches to serve Interior needs.

In an Oct. 28 letter to the Alaska Gasline Development Corp., Alexander Gajdos, a principal with Energia Cura, said expansion of the company's proposed line could be done "at a much lower capital cost" than building a 24-inch line from the North Slope to Cook Inlet.

A 24-inch bullet line from the North Slope to Southcentral is the project AGDC is working. The project team was established by the Alaska Legislature with House Bill 369 earlier this year work up a plan for an in-state natural gas pipeline. AGDC will present that project plan to the Legislature by July 1, defining a preferred reliable source of energy for Southcentral and Interior Alaska, with a startup date by the end of 2015.

Energia Cura is proposing a line just to Interior Alaska. It held a nonbinding open season and said after the open season closed in mid-October that it had received nominations in excess of 12 billion cubic feet per year (some 33

million cubic feet per day). The company said a volume of 12 bcf a year would allow it "to deliver natural gas to the Interior at less than half its current cost."

In excess of 19 bcf per year

Gajdos said in the letter to AGDC that to date Energia Cura has received nominations in excess of 19 bcf a year, or more than 52 million cubic feet per day.

He told AGDC that increasing the diameter of the small-bore line from 10 inches to 18 inches provides capacity to supply all Cook Inlet requirements for at least the next 25 years.

And the company's business model does not require state subsidies, he said.

Gajdos said that whether the state subsidizes Alaska North Slope natural gas or a pipeline to Cook Inlet markets, the state's "attainable retained wealth from development and sales of both CI and ANS gas will be compromised." He said the cost of a bullet line, recovered in tariffs, "will both drive gas prices well beyond those now set in current wholesale contracts and reduce the State's net benefit from extraction and sales of these resources"; he also said the proposed 24-inch diameter for the bullet line would be some 70 percent excess capacity over current Cook Inlet demands.

Third-generation GTL

Gajdos said third-generation gas-to-liquids technologies, such as those Royal Dutch Shell is using at its Pearl GTL plant in Qatar, may allow North Slope natural gas to be exported as liquids within the next decade.

"If the Pearl GTL plant confirms Shell's commercial assumptions that inspired its huge capital investment within the next five years, another decade and a half will most likely follow before a similar or more evolved plant can be made operational on Alaska's North Slope," Gajdos said.

The capital requirements for such a plant would be significant, he said, and the Shell plant is not estimated to begin operation until 2012.

But, he said, if a GTL plant could move North Slope natural gas to market as liquids, it would be at premium crude prices "where the energy in crude trades for 2.5 times the energy in gas today."

Gajdos said that third-generation GTL technology, like shale gas, "has the power to instigate another paradigm shift in natural gas economies."

Another perspective

Another perspective comes from David Gottstein, who told AGDC in a letter dated July that "any pipeline project is largely a combination of economics, logistics, finance and politics."

With Southcentral running out of natural gas, he said the alternatives are waiting for the producers to build a gas pipeline — and importing liquefied natural gas in the short term — or "deciding to build an incredibly inefficient bullet or narrow gauge gas pipeline that will saddle Alaskans with high energy costs for decades. While at the same time severely handicapping the prospects for an export project."

Gottstein recommended that the state invest enough money to get natural gas to an Interior hub in a large-diameter line. Oil and gas companies have to wait until they can fill a line before they commit to build, and he projects — based on uncertainty about both pricing and demand — that it could be five to 10 years before companies would actually fund a project.

The State of Alaska, he said, is the only entity in a position to invest money (specifically, "the $3 billion extra it would take to increase the size of a pipe from the North Slope to the Interior suitable for export capacity"), because the state makes most of its money from selling the resource rather than transporting it.

Energia Cura looking to buy Slope gas

Company behind Fairbanks Pipeline Co. project would negotiate with producers to purchase gas; also wants contract for processing

Kristen Nelson

Petroleum News

Of the various projects to move North Slope natural gas to consumers, Energia Cura's Fairbanks Pipeline Co. would be the first, with startup pegged for mid-2014.

This small-bore high-pressure line would run from the North Slope to North Pole in Interior Alaska, and estimates from the ongoing nonbinding open season suggest that the annual volume could exceed 19 billion cubic feet, some 53 million cubic feet per day.

Alex Gajdos and Thomas Chapman of Energia Cura are behind the project and are funding development work.

The goal is to bring affordable energy to Interior Alaska, and to do it with an Alaska-based company, thus keeping value from the project in the state, Gajdos told Petroleum News in a Dec. 14 interview.

The project was originally pegged at a 10-inch line, but when expressions of interest for gas from the line rose from some 12 bcf a year to 19 bcf a year in the continuing nonbinding open season, the line diameter was increased to 12 inches. The 10-inch line was almost precisely scaled to 12 bcf a year, Gajdos said, so the increase to 19 bcf was good news.

While going from 10 inches to 12 inches increases the capital cost for the pipe roughly 32 percent, he said, it increases the capacity 62 to 63 percent. The nonbinding open season has been extended, and Gajdos said Energia Cura is working with the state's congressional delegation to have Eielson Air Force Base at least look at using North

Slope natural gas.

Market the issue

With the Alaska Gasline Development Corp. looking at a bullet line from the North Slope to Southcentral, Energia Cura has proposed increasing the size of the line from the North Slope to Livengood to 18 inches, with a 10-inch line to North Pole running along the Elliott and Richardson highways.

Gajdos said while AGDC is proposing a 24-inch line from the North Slope, that project has to find large industrial users to justify the line.

An 18-inch line would be more than adequate for Cook Inlet's needs well into the future, he said.

With that 18-inch line installed as far as the Interior, with a flange, and combined with price collars established in a recent Cook Inlet gas contract, known costs to move natural gas from the North Slope to Cook Inlet and an established line running as far as Livengood, Southcentral Alaska can wait and watch, Gajdos said.

If there is upward pressure on the price ceiling for natural gas in Southcentral, costs to build the line from the Interior to Cook Inlet can be updated and the line to Cook Inlet could be built if justified.

Working with producers

Gajdos said he has begun talks with the North Slope's major producers about selling gas to the project, which would offer a bundled package of gas and transportation.

The cost of service is essentially what others call a tariff, he said, and includes the capital cost (the pipe) and the operating cost; the bundled cost would also include the gas.

"For a bundled service, which includes the commodity delivered to the curb, you have to include the gas," Gajdos said.

Energia Cura has had preliminary meetings with all of the majors, he said. The company proposes to buy natural gas and also wants the producers to provide compression and treatment facilities and recapture their investment for those services, and required margins, through commodity sales.

It would cost about the same for Fairbanks Pipeline Co. to build the North Slope facilities, but operation and maintenance on the North Slope would be very costly for FPC, while the North Slope producers could leverage their existing facilities and personnel to operate and maintain the compression and treatment facilities, Gajdos

said.

The capital cost for the pipeline portion of the project is about $716 million, he said.

A GTL future for North Slope gas?

Gajdos said he's been following with great interest the gas-to-liquids plant Shell is building in Qatar, a third-generation Fischer-Tropsch facility.

"This plant will be a major, major step forward" in commercial opportunities for GTL, he said.

And if the numbers are correct for Shell's Pearl plant — which should be known fairly soon as the plant goes into operation in 2012 — then "a small GTL plant up north … could defeat any of these other plans (for major gas pipelines)," Gajdos said.

GTL takes gas out of the gas economy because GTL is a liquid, increasing its value.

And it doesn't require infrastructure to transport it to tidewater or to the Canadian border — it makes use of the existing trans-Alaska oil pipeline, he said.

GTL would be injected into the line, along with the crude oil, and would increase the volume of middle cuts such as gasoline and fuel oil, which have the highest value, enhancing the overall value of the liquid moved through the line.

Energia Cura has named its proposed North Slope to Fairbanks pipeline the "Arctic Fox Pipeline," saying its is small, smart and quick, like the animal of the same name.

The Fairbanks Pipeline Company hopes to gets its pipeline running in three years and supply GVEA, mines, military bases and Fairbanks Natural Gas.

In a press release today, the company said it has presented details of the project to the governor's office, asking for a "due diligence review" as soon as possible.

"FPC has cautioned the Governor that delays in a natural gas pipeline will burden Alaskans, particularly Interior Alaskans, with continued unnecessary spending on high priced energy," the company said. "A response from the Governor's Office is still pending."

"We have substantiated the viability and profitability of an all-Alaska natural gas pipeline and we openly invite the public and our public officials to review our feasibility study and economic analysis," said Alex Gajdos, FPC co-founder. "We want our public officials to see that that there is a valid alternative to waiting for a big pipe. We can move gas to Alaskans now and prosper by owning the pipeline ourselves. We can get gas to Alaskans now."

Energia Cura names pipeline Arctic Fox

A proposed small gas pipeline from Alaska's North Slope to the state's Interior now has a name: The Arctic Fox Pipeline.

Energia Cura, a Fairbanks-based energy consulting firm and parent to Fairbanks Pipeline Co., said in a Feb. 2 statement that the line was named after Congressman Don Young, R-Alaska, commented that the proposed line would be small, smart and quick.

Energia Cura met with Young Dec. 27 to discuss the value of the line, which would be a small-diameter high-pressure line moving volumes of gas justified for Interior markets.

Energia Cura said it has also met with Mike Nizich, chief of staff to Gov. Sean Parnell, to reiterate a request for a due diligence review of the project and continues to meet with Alaska leaders and others in the industry.

"We have substantiated the viability and profitability of an all-Alaska natural gas pipeline and we openly invite the public and our public officials to review our feasibility study and economic analysis," said Alex Gajdos, FPC co-founder. "We want our public officials to see that that there is a valid alternative to waiting for a big pipe. We can move gas to Alaskans now and prosper by owning the pipeline ourselves. We can get gas to Alaskans now."

FPC said it will continue to provide its documents to interested parties and will continue to post detailed updates on the firm's website, www.fairbankspipelinecompany.com.

Energia Cura has constructed pipelines in Alaska and operates and maintains a pipeline system connecting the trans-Alaska pipeline system to both North Pole refineries.

2/14/11 PRESENTATION: LARRY PERSILY, FEDERAL COORDINATOR, ALASKA NATURAL GAS TRANSPORTATION PROJECTS

<TARGET><BILL></BILL><SUBJECT>2-14-11 PRESENTATION LARRY PERSILY, FEDERAL COORDINATOR, ALASKA NATURAL GAS TRANSPORTATION PROJECTS</SUBJECT><COMM>SRES27</COMM></TARGET>

Larry Persily
Federal Coordinator, Alaska Natural Gas Transportation Projects

Testimony before Senate Resources Committee – Feb. 14, 2011

Thank you for the opportunity to appear today. I'd much prefer to testify before a state Senate committee than a U.S. Senate committee — they have no sense of humor in Washington.

I'm here to tell you that a North Slope natural gas pipeline is possible, but to turn that into probable will take the right market conditions, investors willing to risk tens of billions of dollars — and state involvement.

The right market conditions could come as the nation's electric utilities convert from coal to cleaner-burning natural gas. More demand would drive the need for more supply, and that gives Alaska gas a chance.

If investors see demand building, if they see higher prices for gas in the decades ahead, Alaska has a chance to compete against shale gas.

At some point, Alaskans will need to decide how much they want the pipeline and what is fair for the state — measured not just by how much wealth they expect from the state's share of natural gas resources but what our state would look like without any wealth to share.

The North Slope has thrived on oil, only oil and nothing but oil for 34 years, but it's not going to continue thriving without a way to get gas to market, too. A gas pipeline serving the huge North American market would make Alaska a much more attractive option for the tens of billions of dollars needed to maintain the aging oil pipeline, pump more oil from older fields and explore for new reservoirs.

Add up the investment dollars, the goods and services bought in Alaska, the jobs, tax and royalty revenues, and a gas line can help provide a strong economy for decades to come. It's not just about counting the last tax dollar; it's about a state with a future or a state running out of oil money.

I know Alaskans are frustrated with the pace of gas line development. The reality is that big projects always take longer than expected.

While waiting for the results of the two gas pipeline open seasons that closed just six and four months ago, our office decided it would be helpful for people to have some numbers to ponder, some policy issues to consider as they look at the state's fallback option of underwriting a small in-state gas line.

The report we issued last week had been under way about as long as the open seasons. It was not intended to pick a fight with the in-state line. Our purpose was to promote discussion,

maybe to stir things up just a bit so that Alaskans would know their choices, the costs and the options so that when the time comes they would make the best decision for the state's future.

The direct and indirect benefits to the state and its residents of a large-volume North Slope natural gas pipeline to serve in-state and Lower 48 markets would be substantial.

Tax and royalty revenues would be significantly higher than from a small in-state gas line; a large-volume mainline to Lower 48 markets would spur increased investment in new oil and gas exploration in Alaska; and the pipeline tariff for gas deliveries within Alaska would be substantially less with the economies of scale of a large pipeline.

Our report reviews the opportunity cost to the state of a potential subsidy of a small in-state line vs. the option of possibly applying the same amount of state leverage to a larger mainline project.

If state financial involvement could mean the difference as to whether the mainline is ever built, the state would be far better off committing the equivalent investment in some form or another toward the mainline project rather than as an in-state pipeline subsidy.

Our report determined that even if you could sign up large-volume industrial customers to justify building an in-state pipeline carrying 500 million cubic feet of gas per day from Prudhoe Bay to Southcentral Alaska, the state would have kick in an estimated $4.2 billion toward construction costs to end up with gas at the end of the pipe equivalent to the $7-plus per 1,000 cubic feet that ENSTAR paid on average for Cook Inlet gas last month.

That analysis makes several assumptions, including that you paid producers $2 per 1,000 cubic feet for the gas, and that the state subsidy came as a one-time grant to help cover construction costs.

If Southcentral utilities were willing to pay 25 percent to 30 percent more than they did last month, the state could reduce that subsidy to about $2 billion.

In terms of revenue to the state, an in-state line at 500 million cubic feet a day would generate an estimated $326 million a year in royalty, production tax, property tax and corporate income tax revenue to the state. That assumes private ownership of the line, no change in state tax rates, and gas worth $2 per mcf at the wellhead.

We took those same assumptions and looked at a line carrying 4.5 billion cubic feet of gas per day, mostly to Lower 48 markets plus whatever is needed to meet in-state demand. That project could generate $2.3 billion a year in public revenues, though keep in mind that assumes no change in the state's tax rates — a debatable assumption, given the tight economics of the project and the likelihood that the state would need to do something with its tax structure to help the project.

The North Slope gas line has a chance, but the economics are tight — and risky. If Alaskans believe in a better future with a pipeline, bringing gas to Alaskans while creating jobs

and billions of dollars in new public revenues, it's time (while waiting for the open-season results) to start looking at what the state can do to help move the project's economics in favor of construction.

Not a subsidy or an open-ended financial incentive with nothing in return. Rather, sitting down with all of the parties to look at the problems and find answers.

The federal coordinator's office is willing to help.

Thank you.

Opportunity Cost and Comparison of Subsidizing an In-State Gas Pipeline vs. the Benefits to Alaska of a Mainline to the Lower 48 States

By Roger Marks, oil and gas economics consultant
February 2, 2011

Prepared for the Office of Federal Coordinator
Alaska Natural Gas Transportation Projects

I. Summary

The direct and indirect benefits to the State of Alaska and its residents of a large-volume North Slope natural gas pipeline to serve in-state and Lower 48 markets would be substantial. Tax and royalty revenues would be significantly higher than from a small in-state-only gas pipeline; a large-volume mainline to Lower 48 markets would spur increased investment in new oil and gas exploration in Alaska; and the pipeline tariff for gas deliveries within Alaska would be substantially less with the economies of scale of a mainline. This paper reviews the opportunity cost to the state of a potential subsidy of a small in-state gas line vs. the option of possibly applying the same amount of state leverage to a larger mainline project.

II. Introduction

Many people fear that Southcentral Alaska is running out of natural gas for residential and commercial heating and electrical generation. For decades the sole source of gas has been Cook Inlet fields. Large volumes of gas from these original fields have been withdrawn, depleting the reservoirs, and it is uncertain whether sufficient new reserves will be discovered and produced on a schedule to meet the region's needs for later this decade and past 2020. Cook Inlet gas production peaked in 1996 at an average 610 million cubic feet per day (mmcf/d). By 2009, average daily production was down to 380 million cubic feet.[1]

In an attempt to ensure future gas supplies, the Legislature has adopted several tax incentives to promote additional Cook Inlet exploration and development, including tax and regulatory incentives to promote development of gas storage facilities to allow utilities to buy and hold gas for peak winter needs. ENSTAR, the Southcentral gas utility, is moving ahead to develop a natural gas storage facility, which it expects could be in operation by late 2012. Southcentral

[1] State of Alaska Department of Natural Resources, Division of Oil and Gas, "Alaska Oil & Gas Report," November 2009, p. 26.

utilities also are looking into importing foreign LNG to meet demand — if even on a short-term basis — until new Cook Inlet fields can come online or a pipeline is built to deliver North Slope gas to Southcentral.

Regardless of the success of Cook Inlet exploration and development efforts, North Slope gas is seen by many as a potential long-term gas supply to meet Alaska's in-state needs. Although large-volume Lower 48 customers would be needed to provide the significant financial underpinning for a large-diameter North Slope gas pipeline to serve Lower 48 markets ("mainline"), it is expected that any such mainline would include off-takes for smaller spur lines to serve Alaska customers, eliminating the need for Southcentral to rely solely on Cook Inlet gas while also allowing the expansion of gas distribution elsewhere in Alaska.

Because of the significant economies of scale realized with pipeline transportation, the cost of shipping gas consumed in Alaska would be relatively low on a mainline that moves most of its gas to Lower 48 markets. Federal law requires mileage-based tariffs for Alaska customers on a pipeline serving Lower 48 markets, providing in-state users with low tariffs on their small volume of gas, with the larger customers at the end of the line paying most of the project costs. Alaskans need to understand, however, that applies only to the shared cost of the mainline; Alaska gas buyers would have to pay the entire cost for any local spur lines.

The amount of North Slope gas that would be consumed in Alaska would be relatively low compared to gas shipped out of state. A mainline — as proposed by the Alaska Pipeline Project (TransCanada and ExxonMobil) and Denali (ConocoPhillips and BP) — would carry 4.5 billion cubic feet per day (bcf/d). In 2008, about 208 mmcf/d was consumed in Southcentral either as space heat or for power generation,[2] less than 5 percent of the flow from the proposed mainline. That total does not include two large industrial consumers: The Agrium fertilizer manufacturing plant at Nikiski, which shut down in 2008, or the ConocoPhillips/Marathon gas liquefaction plant at Nikiski, which has significantly cut back its production in recent years and has just two years left on its federal LNG export license.

Though the Cook Inlet gas distribution network does not reach Fairbanks, it is assumed that the state's second largest city and other smaller towns along the Railbelt would tap into a North Slope mainline or spur line, if offered the opportunity. Without new, large-volume industrial or manufacturing customers, it is estimated that 260 mmcf/d of natural gas would be consumed in the Railbelt the first five years of a North Slope pipeline (heating and power generation), and 290 mmcf/d in years 10-15.[3] It is unknown how much of that demand would be supplied by existing or new Cook Inlet gas fields and how much might come from the North Slope.

---

[2] State of Alaska Department of Natural Resources: 43 bcf for power generation and 33 bcf for gas utilities.

[3] Northern Economics, "In-State Gas Demand Study Volume 1: Report prepared for TransCanada Alaska Company, LLC," January 2010, p. ES-2.

Although many Alaskans talk hopefully of large-volume in-state industrial and manufacturing customers to boost in-state demand for natural gas, no such committed customers exist at this time and the economics are challenging. The combination of the cost of new gas (at a higher cost than gas from the Cook Inlet legacy fields over the past five decades) and a North Slope pipeline tariff would impose high feedstock costs on any industrial buyer. (At least two proposed mining projects have expressed interest in buying gas for their electrical power needs). Depending on the customer's distance from the mainline or existing Southcentral distribution grid, the additional tariff on a small-volume spur line could be substantial.

Meanwhile, two project development teams — Alaska Pipeline Project and Denali — have held open seasons to measure shippers' interest in contracting for long-term capacity in a North Slope pipeline to serve Lower 48 markets. Bid results could come in early 2011, though significant economic hurdles remain before any developer would proceed to project sanction. Both teams estimate the earliest gas could flow would be 2020.

Because of the uncertainty of a mainline to Lower 48 markets and accompanying spur line(s) to serve in-state customers, many Alaskans are pushing for construction — perhaps with state financial backing — of an exclusively in-state gas line, also called the bullet line or Alaska stand-alone pipeline, to meet Alaska's gas needs sooner than waiting for a mainline. The proposal is for a small-diameter, small-volume pipeline from the North Slope to serve Fairbanks, the Matanuska Valley, Anchorage and the Kenai Peninsula — with the option of possibly liquefying and shipping Alaska LNG overseas.[4]

Because of the high costs of Arctic construction and the economies of scale involved in pipeline transportation, it is assumed for this analysis that an in-state line would need to carry at least 500 mmcf/d in order to bring down the tariffs to within sight of reasonable levels, and even then the costs would be high. The Alaska Gasline Development Corporation, created by the 2010 Legislature to develop a business plan for an in-state line, is focusing on a 500 mmcf/d line, assuming there will be large, in-state industrial customers or expanded LNG exports to carry much of the load beyond the demand for residential and commercial heating and power.

A capacity of 500 mmcf/d is a maximum threshold at this time for an in-state line involving state support. Anything more and the state could face a treble damages claim from TransCanada Corporation under a provision of the state-issued Alaska Gasline Inducement Act (AGIA) license that the company holds for development of a mainline. The statute (AS 43.90.440) says the state would owe the AGIA licensee three times its project development expenses, "If, before the commencement of commercial operations, the state extends to another person preferential royalty or tax treatment or grant of state money for the purpose of facilitating the construction of a competing natural gas pipeline project in this state." State support of a pipeline of less than 500 mmcf/d capacity would not trigger the damages provision in statute.

[4] The economic problems of purchasing and transporting gas for feedstock to supply a price-competitive LNG export plant would be challenging, in addition to securing federal authorization to export Alaska gas.

Regardless of the capacity of an in-state pipeline, it is not clear how much North Slope gas actually would be needed to meet local demand because of the unknown of continued Cook Inlet production. It would depend in great part on how much new gas is discovered and produced in Cook Inlet. Currently, the state estimates Cook Inlet economically recoverable gas resources at 2.4 trillion cubic feet (tcf), with an active exploration program:[5]

All fields: Proved, developed, producing	0.9 tcf
All fields: Probable	0.3 tcf
Additional from existing fields: High confidence	0.4 tcf
Additional from existing fields: Lower confidence	0.6 tcf
All fields: Higher-risk contingent reserves	0.3 tcf
Total	2.4 tcf

However, these reserves will require a high degree of exploration success, and an estimated investment of $2 billion to $3 billion to develop.[6]

As we stated, the tariff for an in-state line would be high. The Alaska Gasline Development Corporation (AGDC) issued a July 1 report: "Alaska Stand Alone Gas Pipeline Project Update and FY 2010 Deliverables". The AGDC report's base-case tariff estimate to Southcentral consumers for a 500 mmcf/d pipeline from the North Slope to Fairbanks, with a 450 mmcf/d pipeline from Fairbanks to Southcentral, would be $8.65 per million Btus (mmBtu) (about 1,000 cubic feet). This is based on a $7.4 billion cost[7] and assumes large-volume industrial or export customers to almost double the pipeline capacity from what would be needed solely for in-state electrical generation and heat. We have verified the tariff estimate with detailed segment modeling. That includes pipeline and gas treatment capital and operating costs, but does not include the price of the gas itself or the cost of the local distribution system. The AGDC report estimates Southcentral local distribution costs at $1.11/mmBtu; Fairbanks local distribution costs would be higher because of the expense of building a new gas distribution system in the community.

---

[5] State of Alaska Department of Natural Resources, Division of Oil and Gas and Division of Geological & Geophysical Surveys, "Preliminary Engineering and Geological Evaluation of Remaining Cook Inlet Gas Reserves," December 2009.

[6] Petrotechnical Resources Alaska, "Cook Inlet Gas Study – An Analysis for Meeting the Natural Gas Needs of Cook Inlet Utility Customers," prepared for ENSTAR Natural Gas Company, January 2010.

[7] The AGDC report estimates the total project cost at $7.8 billion, but for this analysis we have removed the natural gas liquids extraction component, as explained at the top of Page 5. That results in a capital cost of $7.4 billion.

And while the AGDC report included 58 cents/mmBtu as a natural gas liquids (NGL) extraction cost to Southcentral consumers, we have excluded those costs here because it is possible a large share of those liquids could be extracted for other customers, who would then likely cover those costs.

With local distribution costs of $1.11/mmBtu, the total transportation cost to Southcentral customers would be $9.76/mmBtu, exclusive of the cost of the gas. Even before adding the cost of the gas, $9.76 is about 22% more than what Southcentral customers paid for natural gas deliveries in October 2010.

Because the tariff is so high, some legislators and many Alaskans have suggested that the state partially subsidize construction of the in-state line. Dan Fauske, CEO of the Alaska Housing Finance Corp., parent company of the AGDC, has been upfront in his public presentations that the line would require significant state investment to bring the tariff to affordable levels, and that it would be up to elected officials to make that policy decision.[8]

The purpose of this analysis is to examine what the amount of such a subsidy might be, and what the opportunity cost of the subsidy might be when compared to the benefits to the state and its residents of the mainline and accompanying in-state spur line(s).

III. Pipeline Configuration for In-State Line

Using the AGDC report, the estimated capital cost for a 500 mmcf/d in-state line is $7.4 billion, including the pipeline and gas treatment plant. This does not include the purchase price of the gas or local distribution costs. The $7.4 billion, per the report, equates to a levelized nominal tariff of $8.65/mmBtu, including depreciation, capital recovery, operating costs and taxes. The $7.4 billion total does not include NGL extraction facilities. It also does not include cost overruns, which are always a risk on big projects.

The base case operates as follows: 500 mmcf/d of Prudhoe Bay gas exits the gas treatment plant and goes to Fairbanks; 50 mmcf/d of gas (methane/ethane) with a 1,035 Btu/cf content is removed for Fairbanks consumers; the line then carries 450 mmcf/d to Southcentral.

Southcental pays for its share (based on volume of gas) of the pipe to Fairbanks (excluding the short spur line required to move the gas the final miles from the line into Fairbanks), plus the entire pipe from Fairbanks to Southcentral.

[8] For example, see Anchorage Daily News, "State would be on the hook for some gas pipeline costs," Aug. 9, 2010, or Alaska Journal of Commerce, "State pursues customers for proposed bullet gasline," Sept. 17, 2010.

The detailed capital costs are as follows (in billions of 2010 dollars):

Gas treatment plant	$2.5
Pipeline North Slope to Fairbanks	$3.0
Spur line to Fairbanks	$0.1
Pipeline Fairbanks to Southcentral	$1.8[9]
Total	$7.4

IV. The Subsidy

The cost of North Slope gas at the wellhead is assumed for this analysis to be $2/mmBtu nominally. An approximate current consensus forecast among industry analysts as to where Lower 48 gas prices could settle after 2020 is about $7/mmBtu. A $2/mmBtu wellhead price in Alaska equates to $7/mmBtu gas in the Lower 48, after subtracting a rough estimate of total gas treatment and transportation costs from the North Slope.[10]

The $2/mmBtu at the North Slope wellhead is a plausible minimum acceptable price to producers, representing a reasonable value for in-state gas sales where a third-party is purchasing the gas on the North Slope for a fixed price and the producers assume neither firm transportation nor market risk.

Adding $2 at the wellhead to the estimated AGDC tariff produces a cost of gas delivered to Southcentral utilities at $10.65/mmBtu, before any local distribution costs.

To analyze a possible one-time subsidy of capital costs to reduce the pipeline tariff for Alaska customers, we calculated from our modeling that about 25% of the AGDC's in-state line tariff is non-capital (operating costs and ad valorem property taxes, assuming private ownership of the pipeline). We presumed that 25% portion would not be subsidized, leaving the capital part of the tariff, $6.49/mmBtu (0.75 X $8.65), as the maximum possible subsidy target.

We assumed the subsidy would be structured to result in a gas price for Southcentral consumers similar to what they would be paying for Cook Inlet gas. Most Cook Inlet gas supply contracts are indexed to Lower 48 gas prices, with a time lag to average out the highs and lows. Lower 48 prices were very high in recent years but have come down quite a bit since. They peaked at $13.68/mmBtu in July 2008, but were in the $3.50/mmBtu range at the start of November 2010. The cost of Cook Inlet gas delivered to ENSTAR, the area's largest consumer utility, averaged $8.69/mcf in 2010 and $7.12/mcf in January 2011.

---

[9] The pipeline from Fairbanks to Southcentral follows the Railbelt. The AGDC report concluded this was less expensive than a route through Glennallen.

[10] The $5/mmBtu transportation charge consists of a $3.50/mmBtu cost from Prudhoe Bay to Alberta per the Alaska Pipeline Project or Denali cost estimates, and the current tariff of about $1.50/mmBtu on existing pipelines from Alberta to the Lower 48.

Accordingly, we assumed $7/mmBtu delivered to utilities as the subsidy target. At $7, the price is less than what Southcentral utilities paid during 2007-2009 but perhaps more than what prices will be in the near-term if Lower 48 markets remain oversupplied and prices low.

Another variable is that the anticipated option of commercial gas storage in Cook Inlet in late 2012 could reduce the need for short-notice, high-priced peaking gas in the winter, but those storage costs would be substantial and utilities would need to pass on the costs to their customers. Those added costs, however, would apply only to the gas injected and withdrawn from storage, not all of a utility's gas purchases for the year.

Also, in the event Southcentral utilities begin to import liquefied natural gas (LNG), depending on how world LNG markets evolve, those prices could exceed $7/mcf or, at times of competitive pricing, could be less than $7/mcf.

To bring down the cost of North Slope gas through a 500 mmcf/d in-state line to $7 delivered to utilities would require a subsidy of $3.65/mmBtu ($10.65 delivered cost - $3.65 savings from a construction subsidy = $7 gas, plus local distribution). This represents 56% of the capital component of the tariff ($3.65 out of $6.49). A 56% reduction in the capital cost of the project would require a subsidy covering $4.2 billion of the estimated $7.4 billion construction estimate.

Any cost overruns on the in-state line would increase the required subsidy.

Of course, a state subsidy could take other forms, such as no-interest loans or an ongoing subsidy of natural gas prices to consumers, but for the sake of this analysis we assumed a one-time state subsidy of construction costs to reduce the investment components embedded in the tariff.

The market dynamics for energy costs are much different between Fairbanks and Southcentral. Whereas Southcentral is paying $7/mmBtu for natural gas energy, most consumers in Fairbanks are using heating oil priced off crude oil, resulting in prices near $20/mmBtu.

There is some gas service in Fairbanks; the gas is liquefied at a small plant in the Matanuska Valley and trucked to Fairbanks, where it sold at $23.35/mcf in October 2009, more than three times the price of Southcentral. Accordingly, the in-state line would be relatively more valuable to Fairbanks than Southcentral.

However, most of the gas from the in-state line would be destined for Southcentral, and sharing the costs with Southcentral would greatly reduce gas costs to Fairbanks. While there is no question that Fairbanks has high energy costs, and those problems warrant attention, Southcentral consumption would anchor the in-state line. Thus this analysis focuses on the dynamics of the subsidization surrounding Southcentral energy markets.

To help understand how the variables for the price of gas delivered to Southcentral utilities and the price of gas paid to producers on the North Slope could affect the estimated subsidy, Table 1 shows what the subsidy would need to be at North Slope wellhead gas purchase prices of $1 to

$3 and Cook Inlet delivered gas prices of $5 to $9. Again, our base case is a $2 North Slope purchase price and a $7 Cook Inlet delivered price to utilities.

TABLE 1
REQUIRED SUBSIDY (500 mmcfd line)
($billions)

		Cook Inlet Gas Price ($/mmBtu)				
		$5.00	$6.00	$7.00	$8.00	$9.00
North Slope Gas Purchase Price ($/mmBtu)	$1.00 :	$5.3	$4.2	$3.0	$1.9	$0.7
	$2.00 :	$6.4	$5.3	$4.2	$3.0	$1.9
	$3.00 :	$7.6	$6.4	$5.3	$4.2	$3.0

An even smaller 250 mmcf/d in-state line — a project that assumes no large industrial or export customers — would cost $6 billion with a $14.12/mmBtu tariff. With a $2 gas purchase cost and a target price of $7 Cook Inlet, the subsidy would come to $5.2 billion, about 24 percent more than the 500 mmcf/d line.

However, instead of a billion-dollar-plus subsidy to prop up the economics of an in-state line, perhaps the state could try leveraging the same amount of money in some form to boost the economic viability of the larger mainline (which could include a spur line from the mainline, near Fairbanks, to Southcentral). This contribution could be, for example, in the form of property tax relief during construction, low-interest long-term financing, production tax incentives, an actual capital infusion — or a combination of any or all of the above. The purpose would be to reduce the project's risk with the goal of securing a construction commitment from project sponsors.

Just one example: As a direct capital contribution, the same $4.2 billion that would be needed to reduce the tariff on a 500 mmcf/d in-state line to bring about $7/mmBtu gas to Southcentral would reduce the tariff on the mainline by $0.37/mmBtu. Over 25 years that would add over $15 billion in pre-tax undiscounted cash flow to the project and return large benefits to the state through increased production tax and royalty revenues on larger volumes and a higher wellhead value for the gas. But, as stated, there are other ways the state could consider leveraging its participation with the goal of securing a project commitment.

If state financial involvement could mean the difference as to whether the mainline is ever built, the state would be far better off committing the equivalent investment toward the mainline project rather than as an in-state pipeline subsidy. The most profitable measure of how the state would be better off is through much greater public revenues (taxes and royalties). In addition, the heavier demand for gas by a larger pipeline would do much more to spur increased oil and gas exploration and production on the North Slope than a smaller in-state line, which would not pull enough gas from the North Slope to require any exploration for new reserves.

Of course, the economic viability of the mainline is dependent upon investors believing that long-term market conditions will justify the risks associated with the multibillion-dollar construction project. Certainly, today's short-term market outlook and current gas prices are not sufficient to make the project feasible, and it's unlikely that any state financial assistance or fiscal terms could overcome long-term, low-price market conditions. But if at some time North Slope producers and investors believe in a long-term natural gas market of higher prices and growing demand, state financial assistance or a restructured tax regime could make a meaningful contribution to the project's economics.

V. Revenue Estimates: In-State Line vs. Mainline

There are four state oil and gas revenue streams: royalties, production tax, property tax and corporate income tax. The estimated revenue numbers in this analysis are based on the following assumptions:

- 500 mmcf/d for the in-state line.
- 4.5 bcf/d for the mainline, with an off-take to serve Fairbanks and a 450 mmcf/d spur line from Fairbanks to Southcentral. The additional capital cost for the pipeline capacity for the in-state gas is considered *de minimis*.
- All gas for the in-state line comes from Prudhoe Bay.
- The mainline gets 1.1 bcf/d from Point Thomson and the balance from Prudhoe Bay.
- The wellhead value at Prudhoe Bay is $2/mmBtu.
- The transportation deduction between Prudhoe Bay and Point Thomson is $0.22/mcf.
- The gas delivered to customers has a Btu content of 1,035/cf.
- Because the details of the final disposition of NGLs with an in-state line and a mainline are unknown, for simplicity we assume neither project includes marketing of the heavier NGLs (propane plus C4+). Though certainly the NGLs would be marketed, leaving them out of both projects (in-state and mainline) maintains equality in this analysis.

Royalties

For royalties we assume the following in this analysis:

- The Prudhoe Bay royalty rate is 12.5%.
- The Point Thomson royalty rate is 15%.
- Under these assumptions, we get an annual royalty to the state of $47 million with the in-state line and $527 million with the mainline. At least 25 percent of this would go to the Alaska Permanent Fund.[11]

Production (Severance) Tax[12]

For the production tax we assume the following for this analysis:

- All gas produced and consumed in the state as fuel is subject to an 18 cents/mcf tax, as provided for in state statute as a benefit to in-state consumers.
- Any gas sold out of state is subject to the higher production tax rate (25% of net value) for such gas sales, as defined in state statute (ACES).
- In-state gas sales total 500 mmcf/d in both scenarios (in-state line and mainline).
- 250 mmcf/d of in-state gas is assumed to be used for residential and commercial heat/power and is taxed at the lower rate. The other 250 mmcf/d of in-state gas is assumed to be used for industrial/manufacturing. Of this, half (125 mmcf/d) is assumed to be for fuel and subject to the lower rate, and half (125 mmcf/d) is assumed not to be fuel, perhaps LNG or fertilizer for export. In total then, 375 mmcf/d of the in-state gas is assumed to be used for fuel and taxed at the lower rate, and 125 mmcf/d is assumed to be taxed at the higher rate.
- Oil and gas have been decoupled for the production tax.[13]
- There are no incremental costs to produce gas. The upstream costs will be deductible against the oil and so incrementally no costs are allocated to gas. Hence the net value of the gas is the same as the gross value. (With decoupling of the production tax in state statute, there likely would have to be some allocation of field costs between oil and gas. But for the purpose of this analysis, and for the sake of simplicity, we assumed all of the costs will be attributed to ongoing oil production. To the extent

[11] Leases issued before 1979 have a 25% Permanent Fund contribution rate. Leases issued after 1979 have a 50% rate. Prudhoe Bay and Point Thomson were both leased before 1979.

[12] This assumes the current production tax rate. However, it is not improbable the law would be changed before mainline construction.

[13] Under the production tax the progressivity element is based on the per-unit value of oil and gas combined on a Btu basis. Because oil and gas have such disparate Btu values, it is possible that a major gas sale could decrease overall production taxes from what they were solely with oil. We assume the legislature will fix this prior to a major gas project.

some upstream costs are allocated from oil to gas, gas taxes would be less and oil taxes would be more.)

Thus we get an annual production tax of $57 million for the in-state line and $901 million for a mainline project.

Property Tax

The property tax is 20 mills (2%) assessed annually on the state-determined valuation of the investment. Oil and gas pipeline property (such as steel pipe and equipment) is subject to the tax as soon as it enters the state and during construction, which may be several years before it enters service. The in-state line (assuming it is privately owned) could pay over a half-billion dollars in property tax before it enters service; the mainline nearly $1.1 billion. While the tax is important for communities in dealing with the inevitable social and economic impacts during construction, these large up-front costs depress the economic feasibility of the project.

In addition, given that the property tax is based on cost, it exacerbates the negative impact of a cost overrun; not only are costs higher, but so are property taxes.

Per the AGDC report, the capital cost of the in-state line would be $7.4 billion. This would amount to $175 million (with inflation) in property tax in the first year of pipeline operation. Approximately 50% of this would go to the North Slope Borough, 10% to the Fairbanks North Star Borough, 20% to the Matanuska-Susitna Borough, 5% to the Municipality of Anchorage, and the remaining 15% would go to the state, based on the physical location of the pipeline, compressor stations and gas treatment plant.

Per the Alaska Pipeline Project's open-season documents, the mid-price range for the Alaska portion of the mainline and North Slope gas treatment plant are $11.3 billion each ($22.6 billion) in 2010 dollars, or about $29 billion in nominal dollars. In addition, a 500 mmcf/d spur line from Fairbanks to Southcentral would cost $1.8 billion (this analysis assumes a spur line to Southcentral, developed by someone other than the mainline project sponsors). This would equate to $622 million (with inflation) in property taxes in the first year of mainline pipe operations. Approximately 60% of this would go to the North Slope Borough, 5% would go to the Fairbanks North Star Borough, and the remaining 35% would go to the state. Property taxes also would be owed to the municipalities and state on any privately owned spur lines off the mainline, but we did not calculate those estimates.

State Corporate Income Tax

There are two net-income streams generated. First, there is the return on equity in the pipeline. This starts high and decreases as the unrecovered investment declines each year. Second, there is the net-income tax on the production of the gas after deducting severance and property taxes. Since the return-on-equity component on the pipeline is relatively modest, it's expected that the state corporate income tax take on the gas would be worth far more than on the pipeline itself.

Though income is subject to worldwide apportionment under state law (allocating a percentage of business activity to Alaska), we have modeled the tax as if Alaska was a stand-alone entity. Though simplistic, it is easier for this analysis and still indicative of the relative state take. The tax rate of 9.4% was applied to the income.

We estimated state corporate income tax in year one at $47 million for the in-state line and $283 million for the mainline. Those estimates include the income tax on the pipeline and the gas.

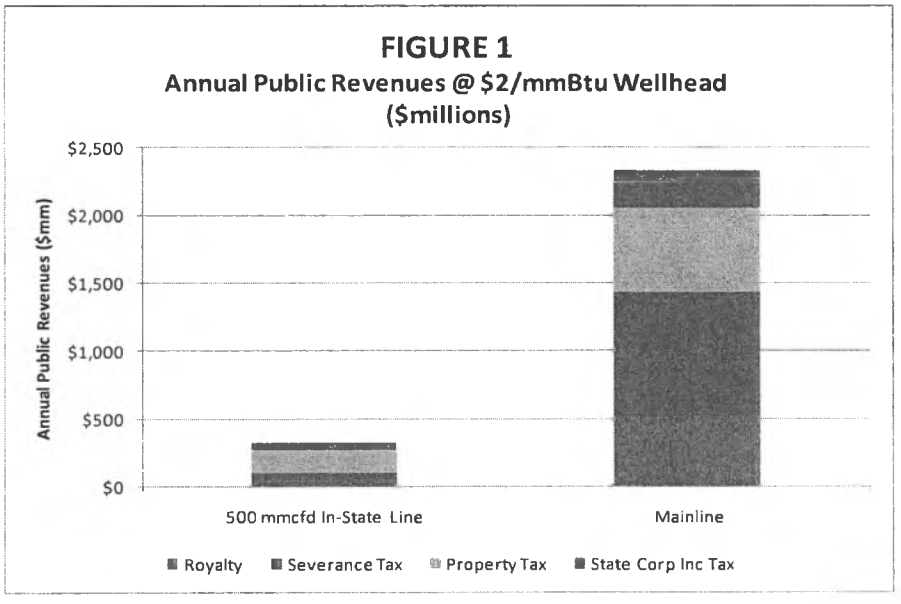
Summary

Table 2 summarizes the difference in public revenues between the in-state line and the larger mainline to serve Lower 48 markets.

Table 2
Annual Public Revenues @ $2/mmBtu Wellhead
($millions)

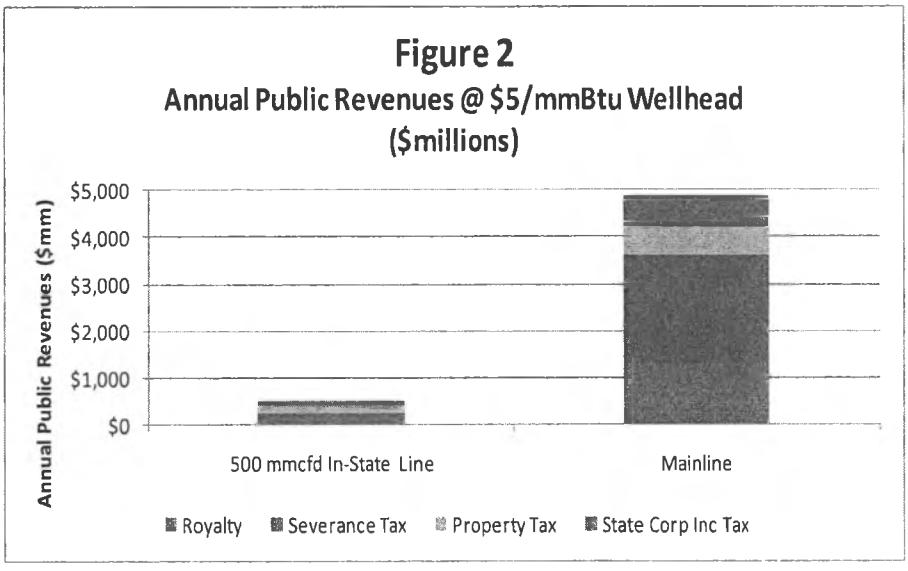
	500 mmcfd	
	In-State Line	Mainline
Royalty	$47	$527
Severance Tax	$57	$901
Property Tax	$175	$622
State Corp Inc Tax	$47	$283
TOTAL	$326	$2,333

Figure 1 illustrates these differences graphically.



Again, these are predicated on a $2 wellhead price, which equates to Alaska gas selling for about $7 in the Lower 48. At higher prices the spread in state revenues between the in-state line and mainline widens further. One reason is that the production tax for in-state gas is fixed in statute at 18 cents/mcf regardless of price, while the production tax rate on gas sold out of state increases as the value of the gas rises. For example, at a $5 wellhead price ($10 Lower 48 price), the in-state line would pull in $502 million a year in total taxes and royalties, while the mainline would generate ten times more at $4.9 billion.

These differences are shown in Figure 2.



For a smaller 250 mmcf/d pipeline, at a $2/mmBtu wellhead value, the relative revenue estimates would be $208 million for the in-state line vs. $2.2 billion for a 4.5 bcf/d mainline (with an additional 250 mmcf/d going to Southcentral). At a $5/mmBtu wellhead the figures are $267 million vs. $4.4 billion, respectively.

VI. Cost of Gas to Southcentral with a Spur Line off the Mainline

Finally, what would the price of gas be to Southcentral consumers with a mainline and off-takes to supply Fairbanks and Southcentral? The gas would realize major economies of scale traveling with the large volume of gas as far as Fairbanks — about half the total journey within Alaska.

With the mainline, the cost of gas would be the sum of four elements: purchase price of the gas (we will assume again that the purchase price of gas is $2), the tariff on the gas treatment plant (GTP), the tariff on the mainline between the North Slope and Fairbanks (or wherever the spur line taps into the mainline), and the tariff on the spur line between Fairbanks and Southcentral.

Per the Alaska Pipeline Project's open-season documents, the mid-point 20-year negotiated tariff for the GTP is $1.41/mmBtu and the in-state portion of the mainline is $0.78/mmBtu, for a total of $2.19.[14] Add in the cost of gas presumed at $2 for this analysis, and deliveries to the Fairbanks off-take could be as low as $4.19/mmBtus, before local distribution costs to consumers.

The estimated capital cost for a 450 mmcf/d spur line between Fairbanks and Southcentral is $1.8 billion. This equates to a tariff of $2.56/mmBtu. Again, the lack of economies of scale on a costly pipeline to move a relatively small amount of gas makes this an expensive segment. This

[14] TransCanada Alaska Co., "Open Season Plan Documents Submitted in Connection with Request for Commission Approval of Detailed Plan for Conducting an Open Season: Volume I of III," FERC Docket No. PF09-11-001, p.10.

would result in a total gas cost to Southcentral utilities of $6.75, or $0.25 lower than our 2020 base price and much less than the unsubsidized cost of $10.65 for a small in-state line. The state certainly could assist in the finances of the spur line to lower the tariff, or use the significant tax and royalty revenues from a mainline to assist residents with their energy costs.

VII. Conclusion

Pipeline economics are significantly affected by economies of scale. Tariffs on smaller-diameter pipelines will be much higher than on large ones, and these differences become increasingly exaggerated with the long pipelines necessary in Alaska. It is difficult to predict significant industrial demand for North Slope natural gas, and it also is unclear how much indigenous Cook Inlet production will endure to meet most or much of local demand in the years ahead.

It will require a significant state subsidy to bring down the cost of gas on an in-state line to reasonable levels; the opportunity costs of such a subsidy are not trivial. An alternative to the in-state line subsidy could be state financial participation toward enhancing the economic feasibility of a pipeline to the Lower 48 that also would bring affordable gas to the Railbelt. The public benefits of such a mainline would dwarf the in-state line:

- Taxes and royalties would be much higher.
- The larger volumes would promote increased North Slope exploration.
- And because of the economies of scale, consumers would get gas priced similarly to a heavily subsidized in-state line.

If the point of an in-state line subsidy is simply to provide lower-cost energy to Alaskans, there are other alternative subsidies that could provide energy at low prices. For example, developing additional hydroelectric power for the Railbelt would free up limited Cook Inlet gas supplies for space heat. Of course, hydro power would not produce any royalty or production tax payments to the state, nor prompt increased investment in North Slope oil and gas exploration. Estimated North Slope gas resources may exceed 100 trillion cubic feet in conventional exploration targets, with that much more possible in unconventional gas hydrates, shale and coal bed methane.[15] In the absence of a major gas line, there has not been a reason to explore for these reserves.

Finally, there is the risk of proceeding with an in-state gas pipeline and having the mainline built later. At that time a large portion of the in-state pipeline project would be redundant, resulting in economic inefficiencies.

[15] National Energy Technology Laboratory, "Alaska North Slope Oil and Gas: A Promising Future or an Area in Decline," DOE/NETL-2009/1385, April 8, 2009.

2/23/11 ANNUAL MINING INDUSTRY BRIEFING

<TARGET><BILL></BILL><SUBJECT>2-23-11 ANNUAL MINING INDUSTRY BRIEFING</SUBJECT><COMM>SRES27</COMM></TARGET>

Annual Mining Industry Briefing
for
Joint House/Senate Resources Committees

February 23, 2011

Today's Agenda

- Historical context — Steve Borell
- Status of Alaska's surface mines — "
- Status of underground mines — Mike Satre
- Review of selected projects pending — Steve Borell

Historical Context

1. **From late 1800s until World War II** - mining was Alaska's largest industry with the most jobs.

2. **From World War II until 1989** - effectively no lode (versus placer) mining in Alaska!

3. **From 1989 to Present** – continued steady growth.

Today – 6 large mines in Alaska; much exploration.

The Question: Why so little mining today?

Mining History Since WW II

At Start of World War II

- Presidential order closed all gold mines
- Needed miners and equipment for war effort

After World War II

- Some placer mining resumed
- Limited lode **exploration** resumed as metal prices allowed
- **Excess base metal production capacity in world**
- **Gold price fixed - but cost of wages and supplies continued to increase**
- Prudhoe Bay, ANCSA (44m ac), ANILCA (104m ac)
- Land and regulatory uncertainty

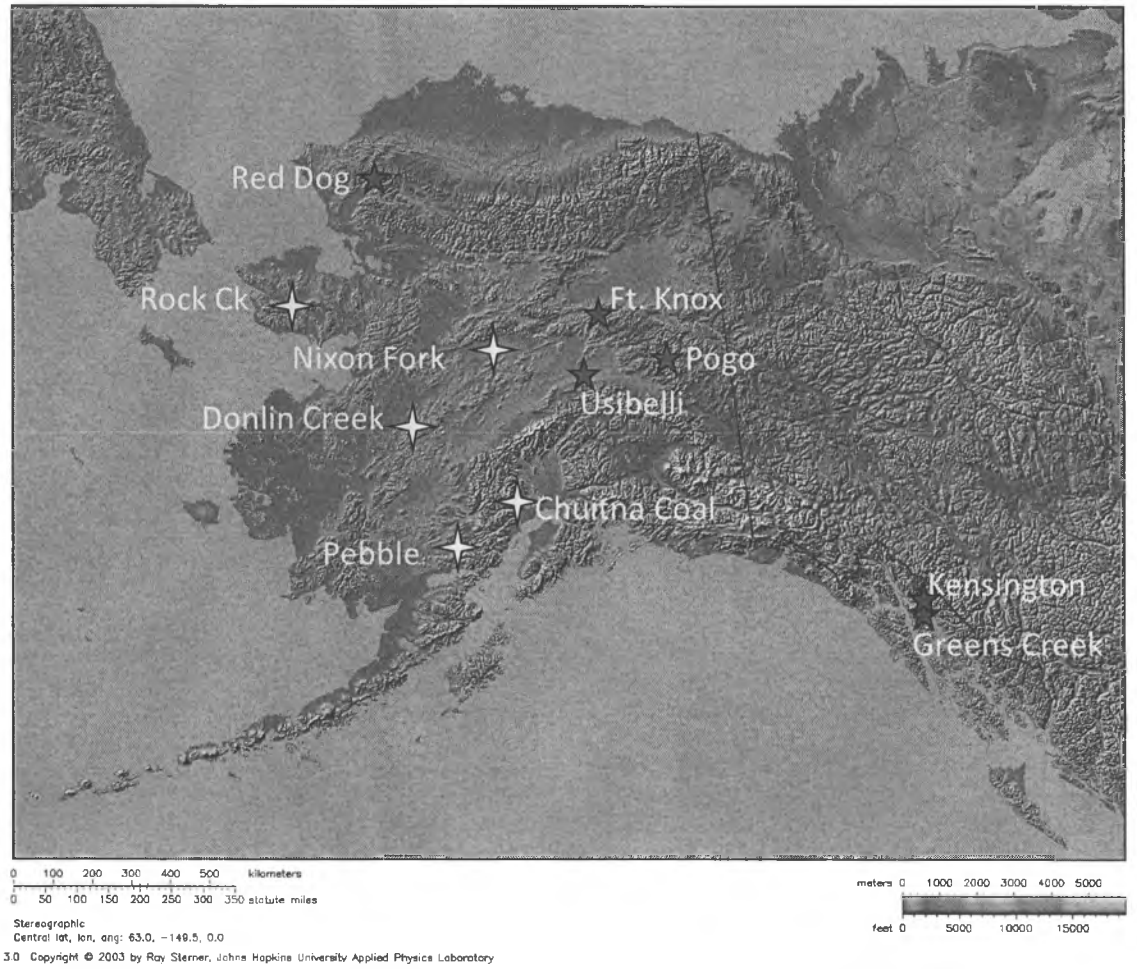
From World War II to1989

- Effectively no lode/hardrock mining, some placer mining, some coal mining
- In 1989 Greens Creek & Red Dog began operating
  - **Proved to the world that a major mine could be permitted in Alaska!**
  - **Proved that all Alaska was not in a Park!**

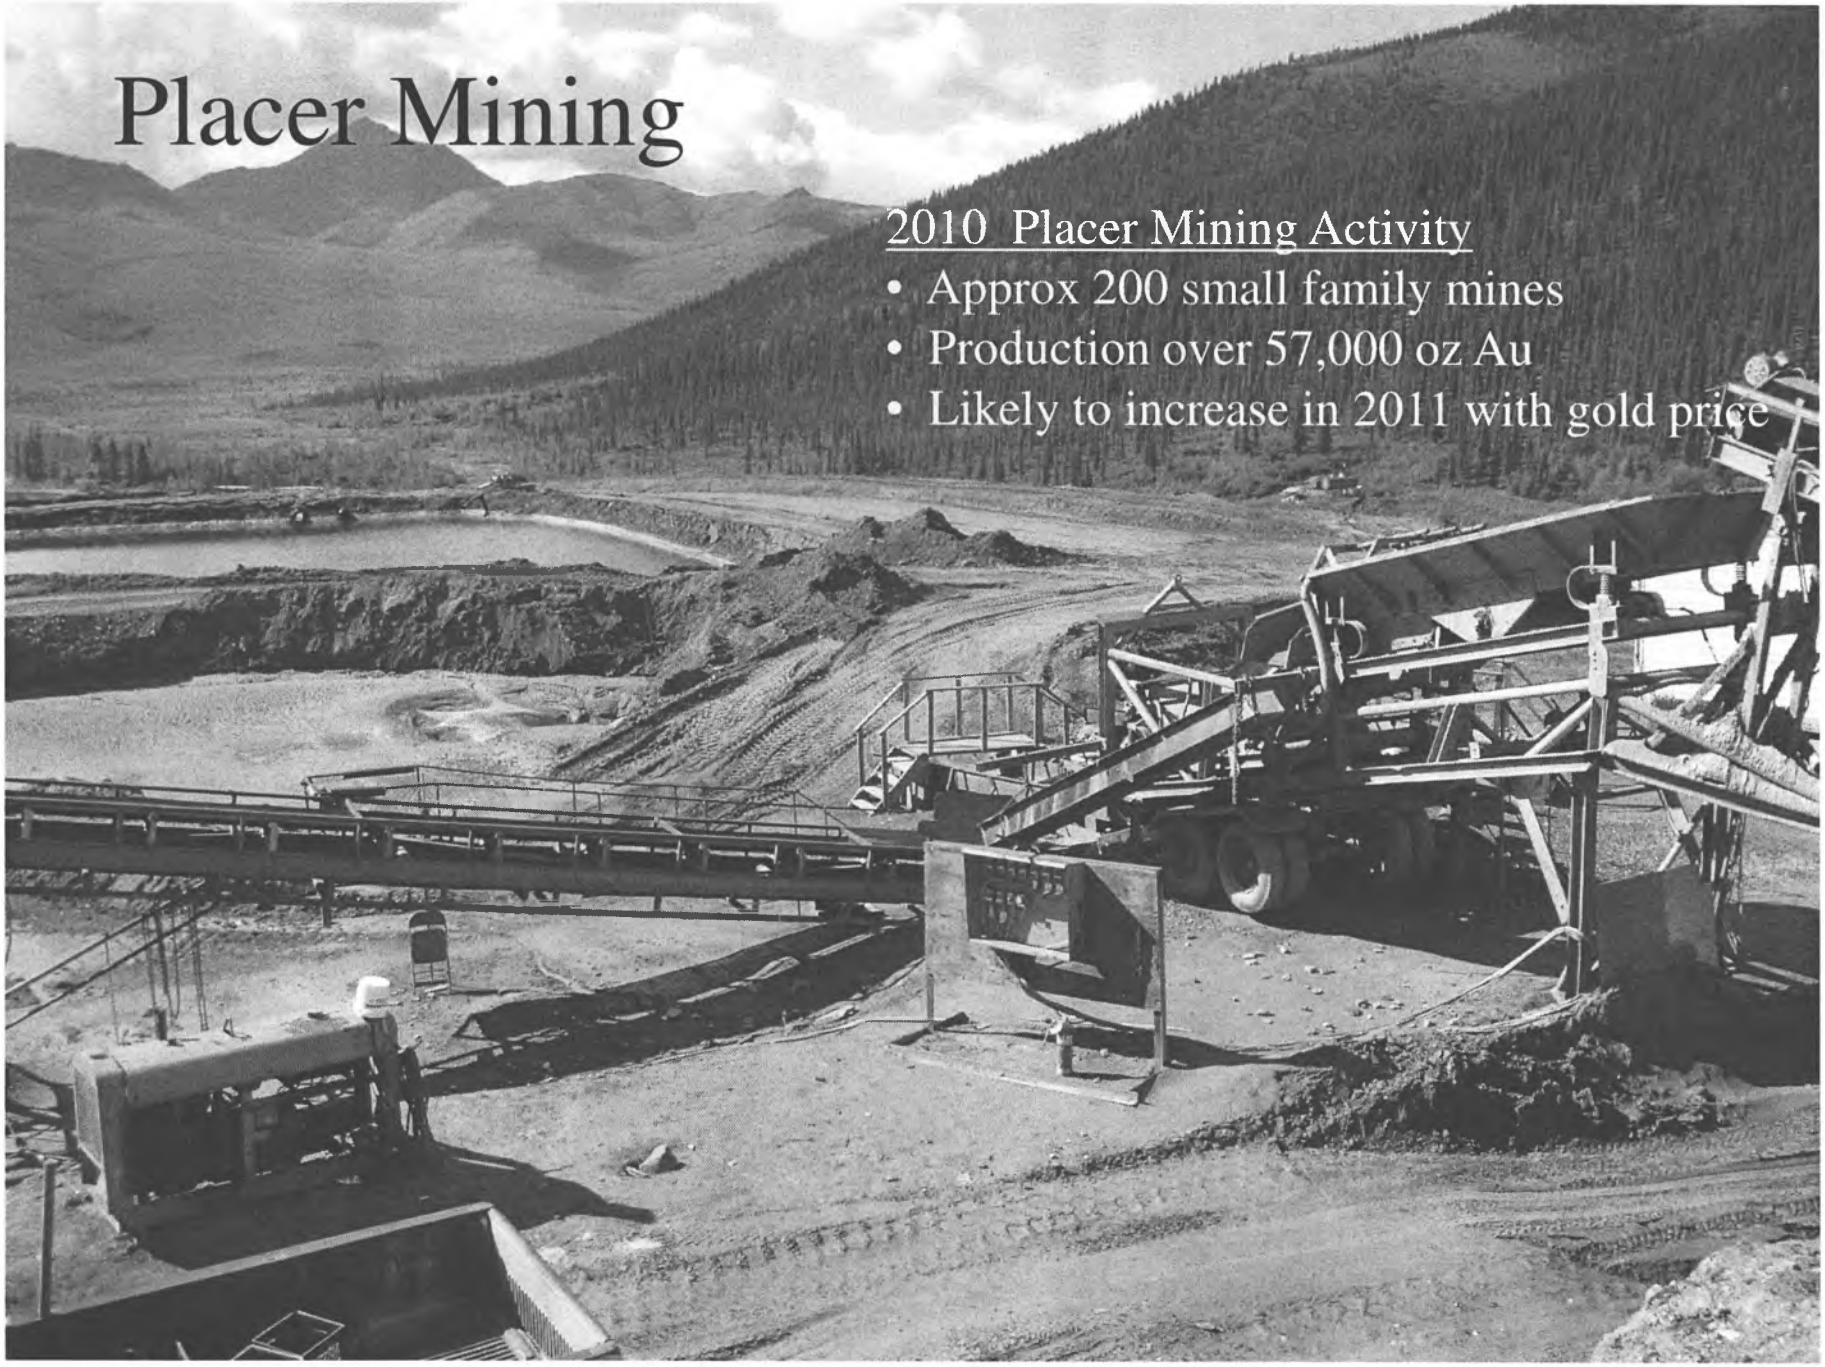
Alaska Major Mines and Projects

★ **Producing mine**

✦ **Developing and major exploration projects**



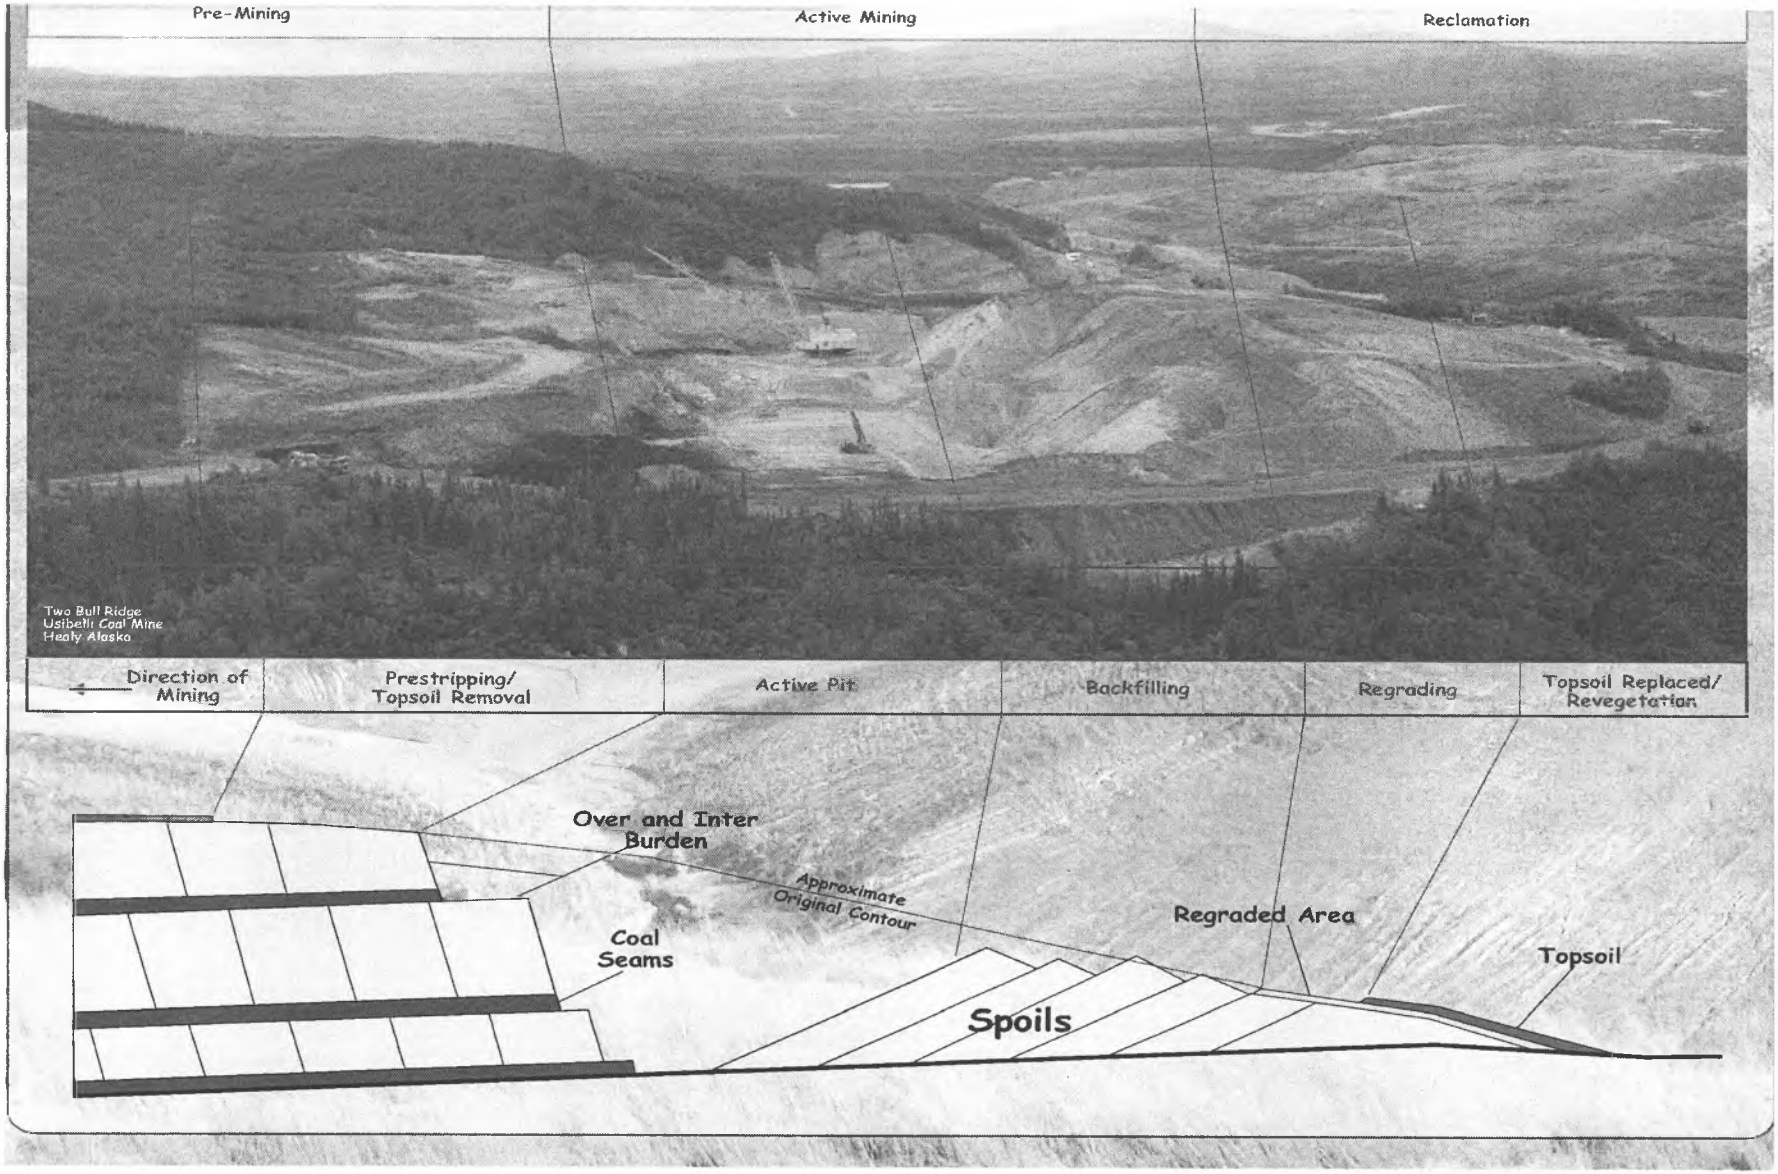
Placer Mining



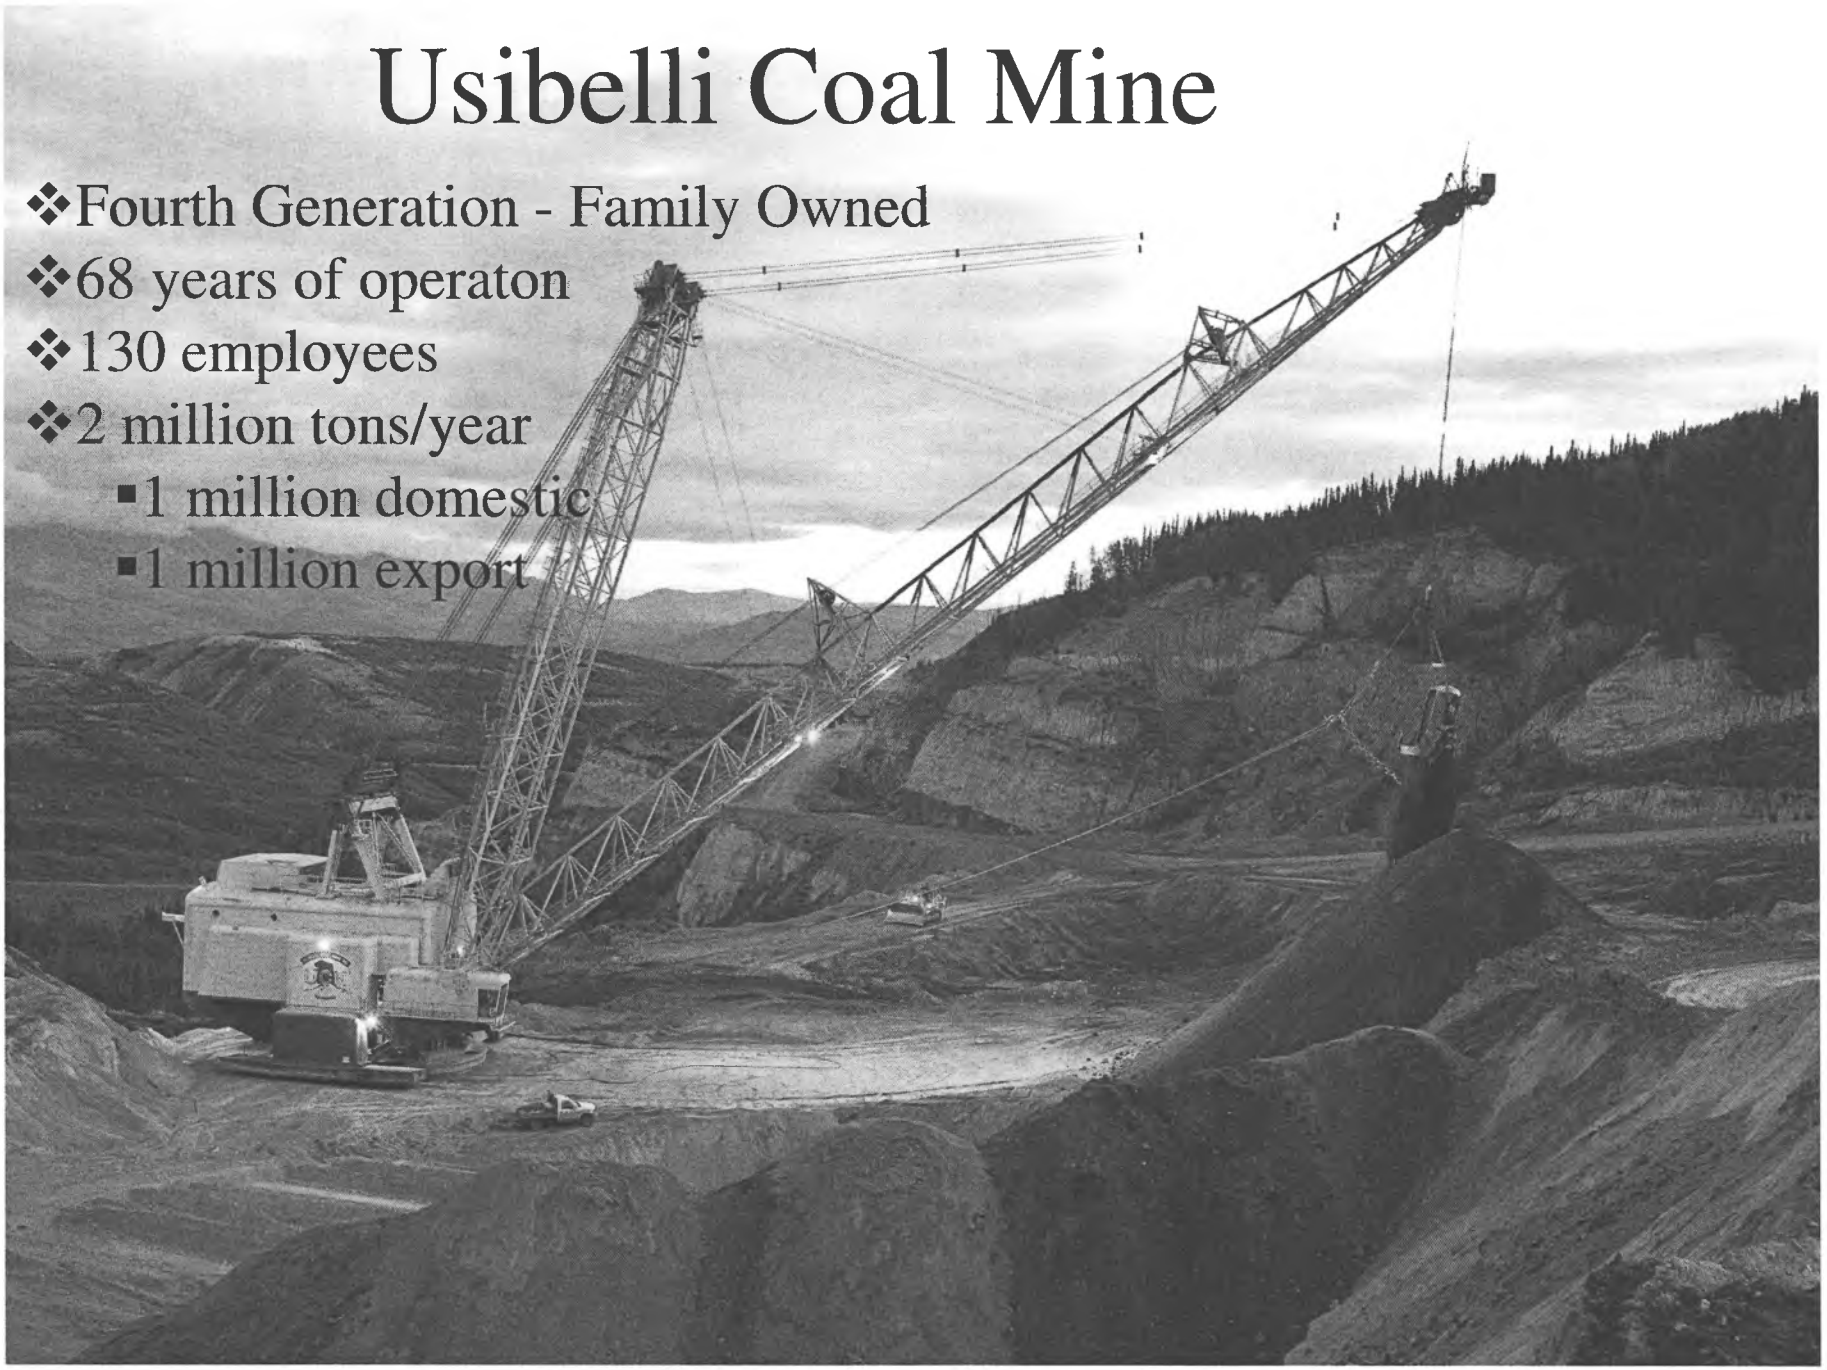
2010 Placer Mining Activity

- Approx 200 small family mines
- Production over 57,000 oz Au
- Likely to increase in 2011 with gold price

Usibelli Coal Mine

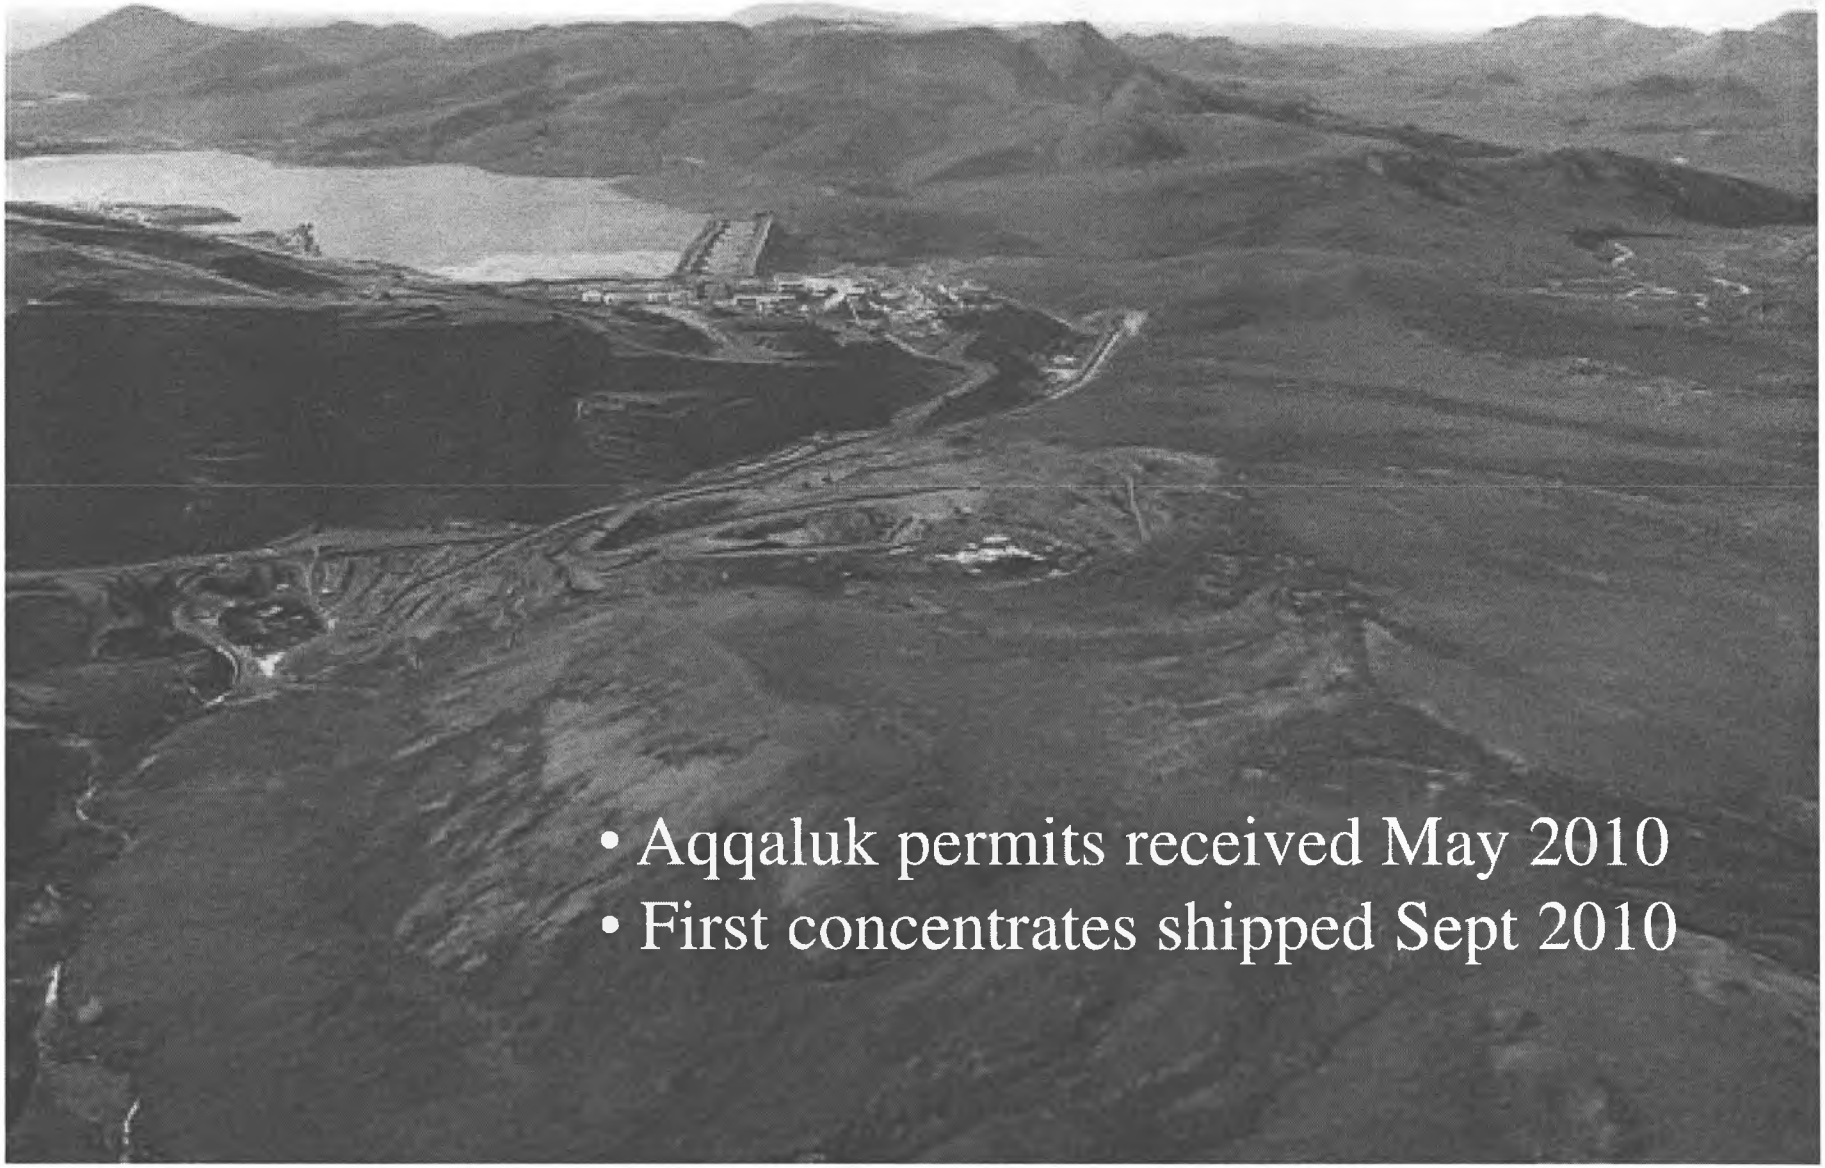


Usibelli Coal Mine



- Fourth Generation - Family Owned
- 68 years of operaton
- 130 employees
- 2 million tons/year
  - 1 million domestic
  - 1 million export

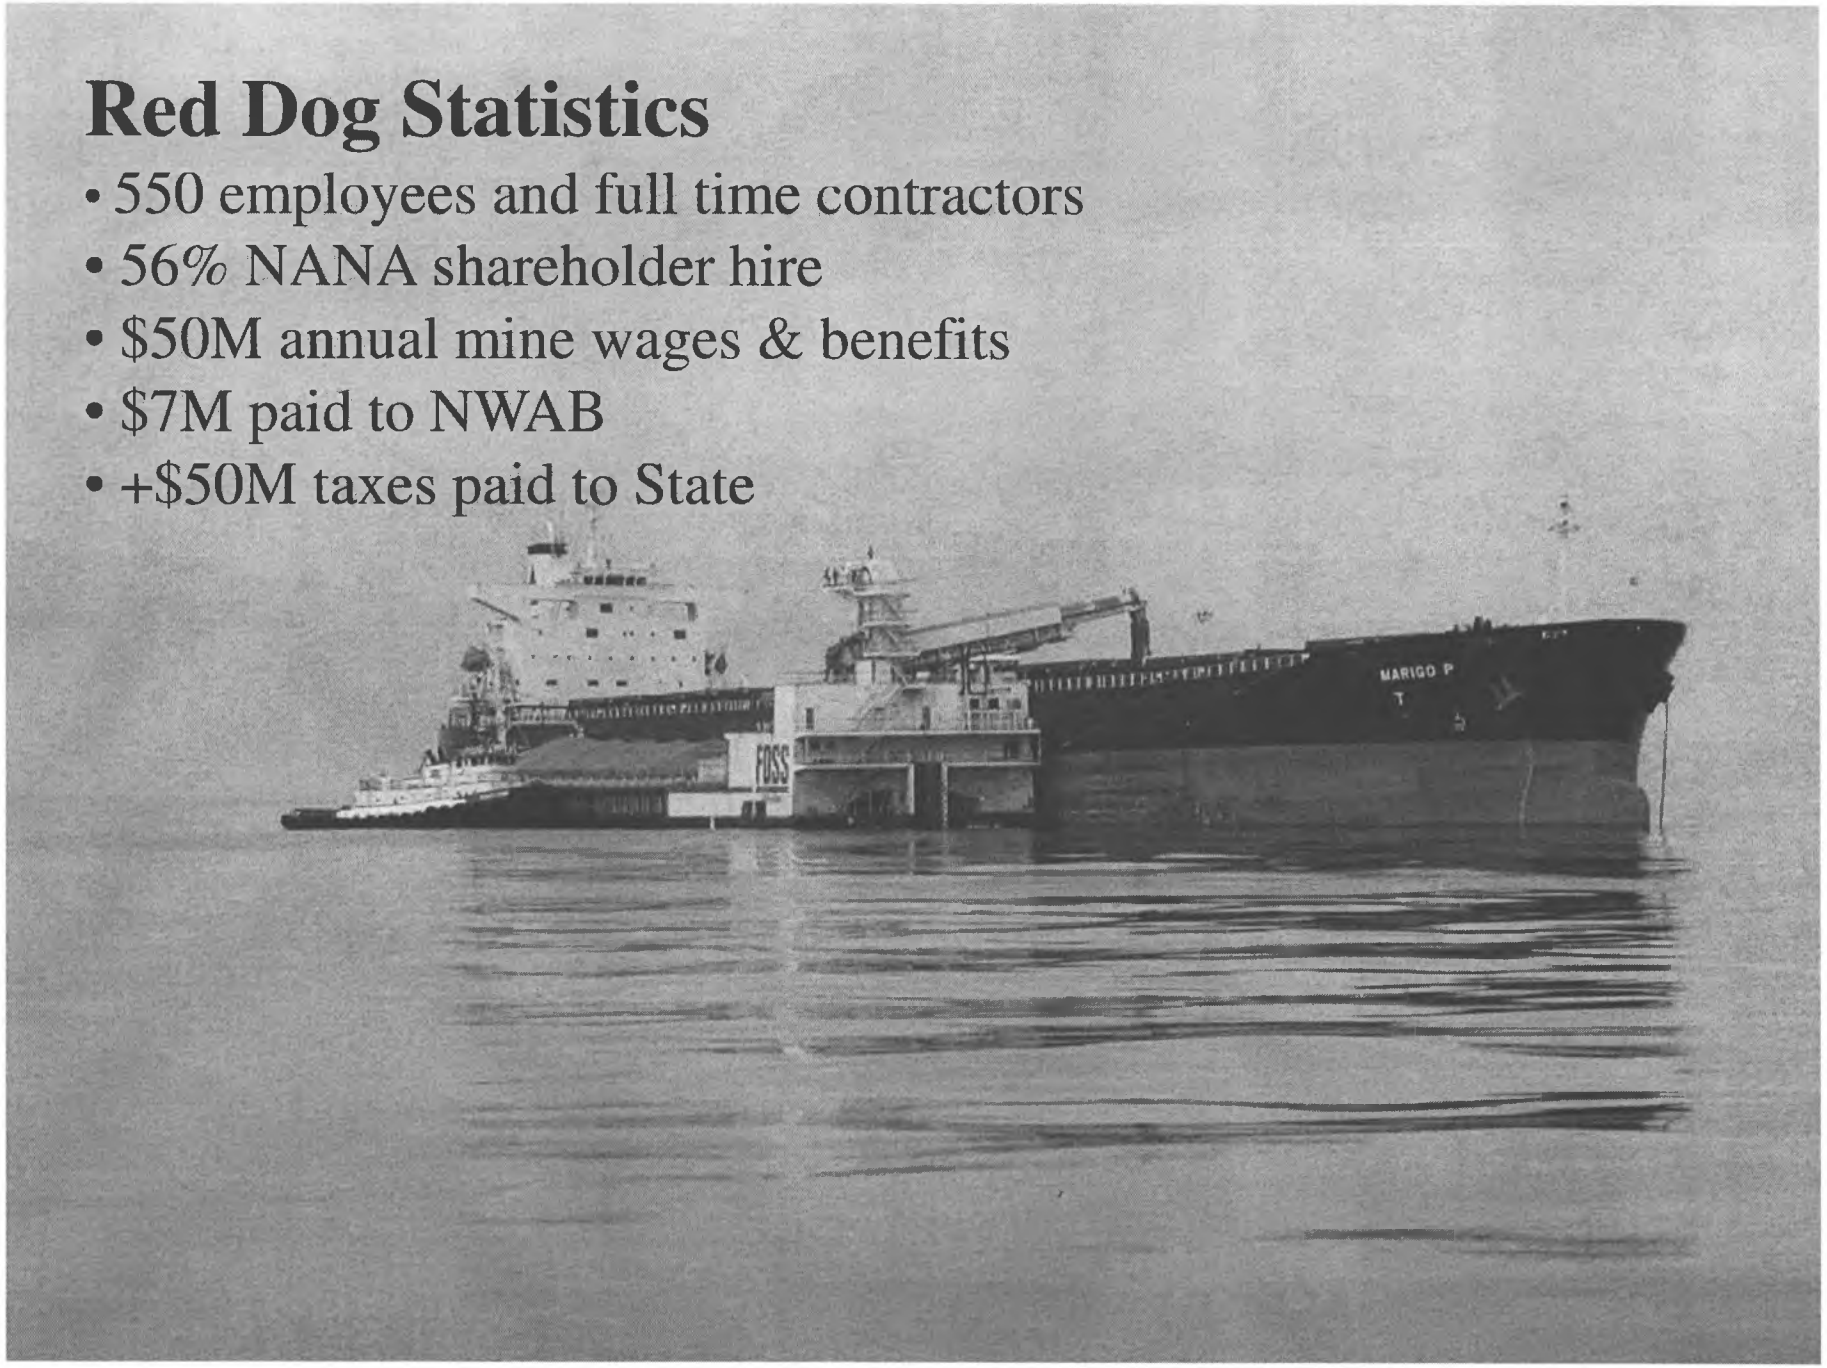
Red Dog Mine



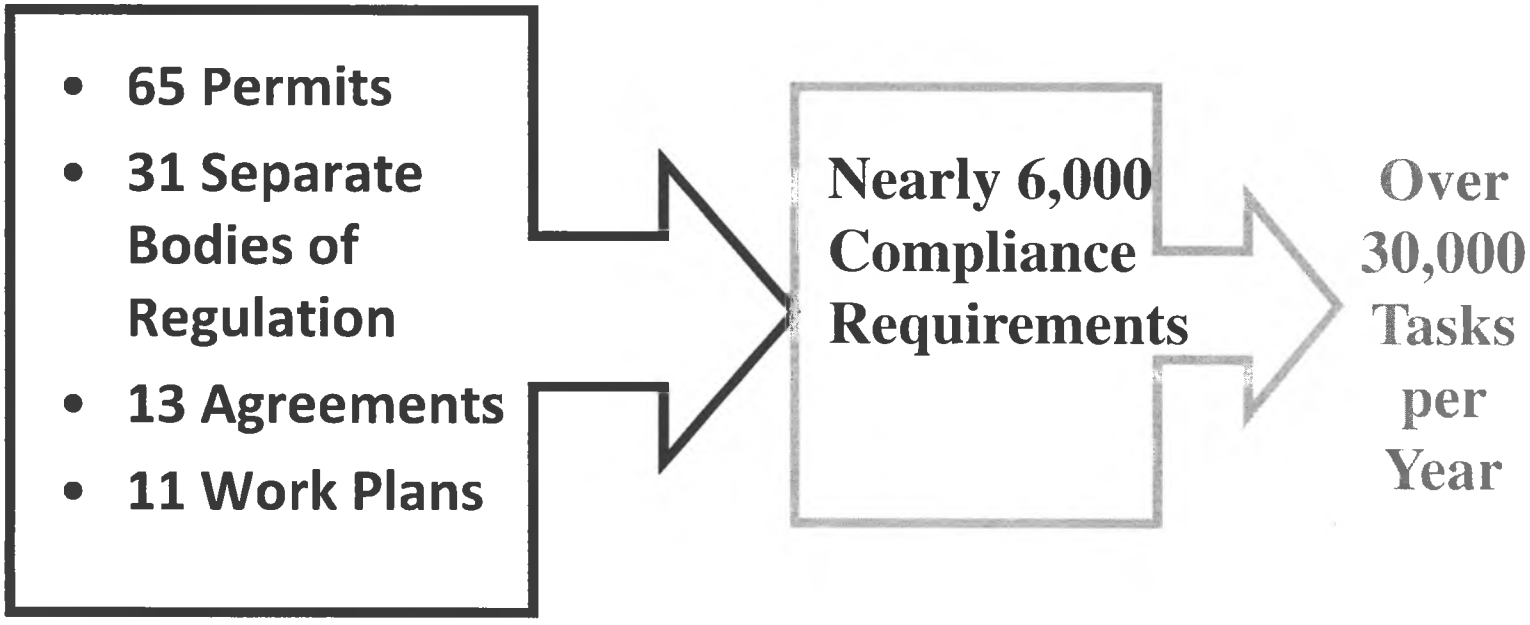
- Aqqaluk permits received May 2010
- First concentrates shipped Sept 2010

Red Dog Statistics

- 550 employees and full time contractors
- 56% NANA shareholder hire
- $50M annual mine wages & benefits
- $7M paid to NWAB
- +$50M taxes paid to State

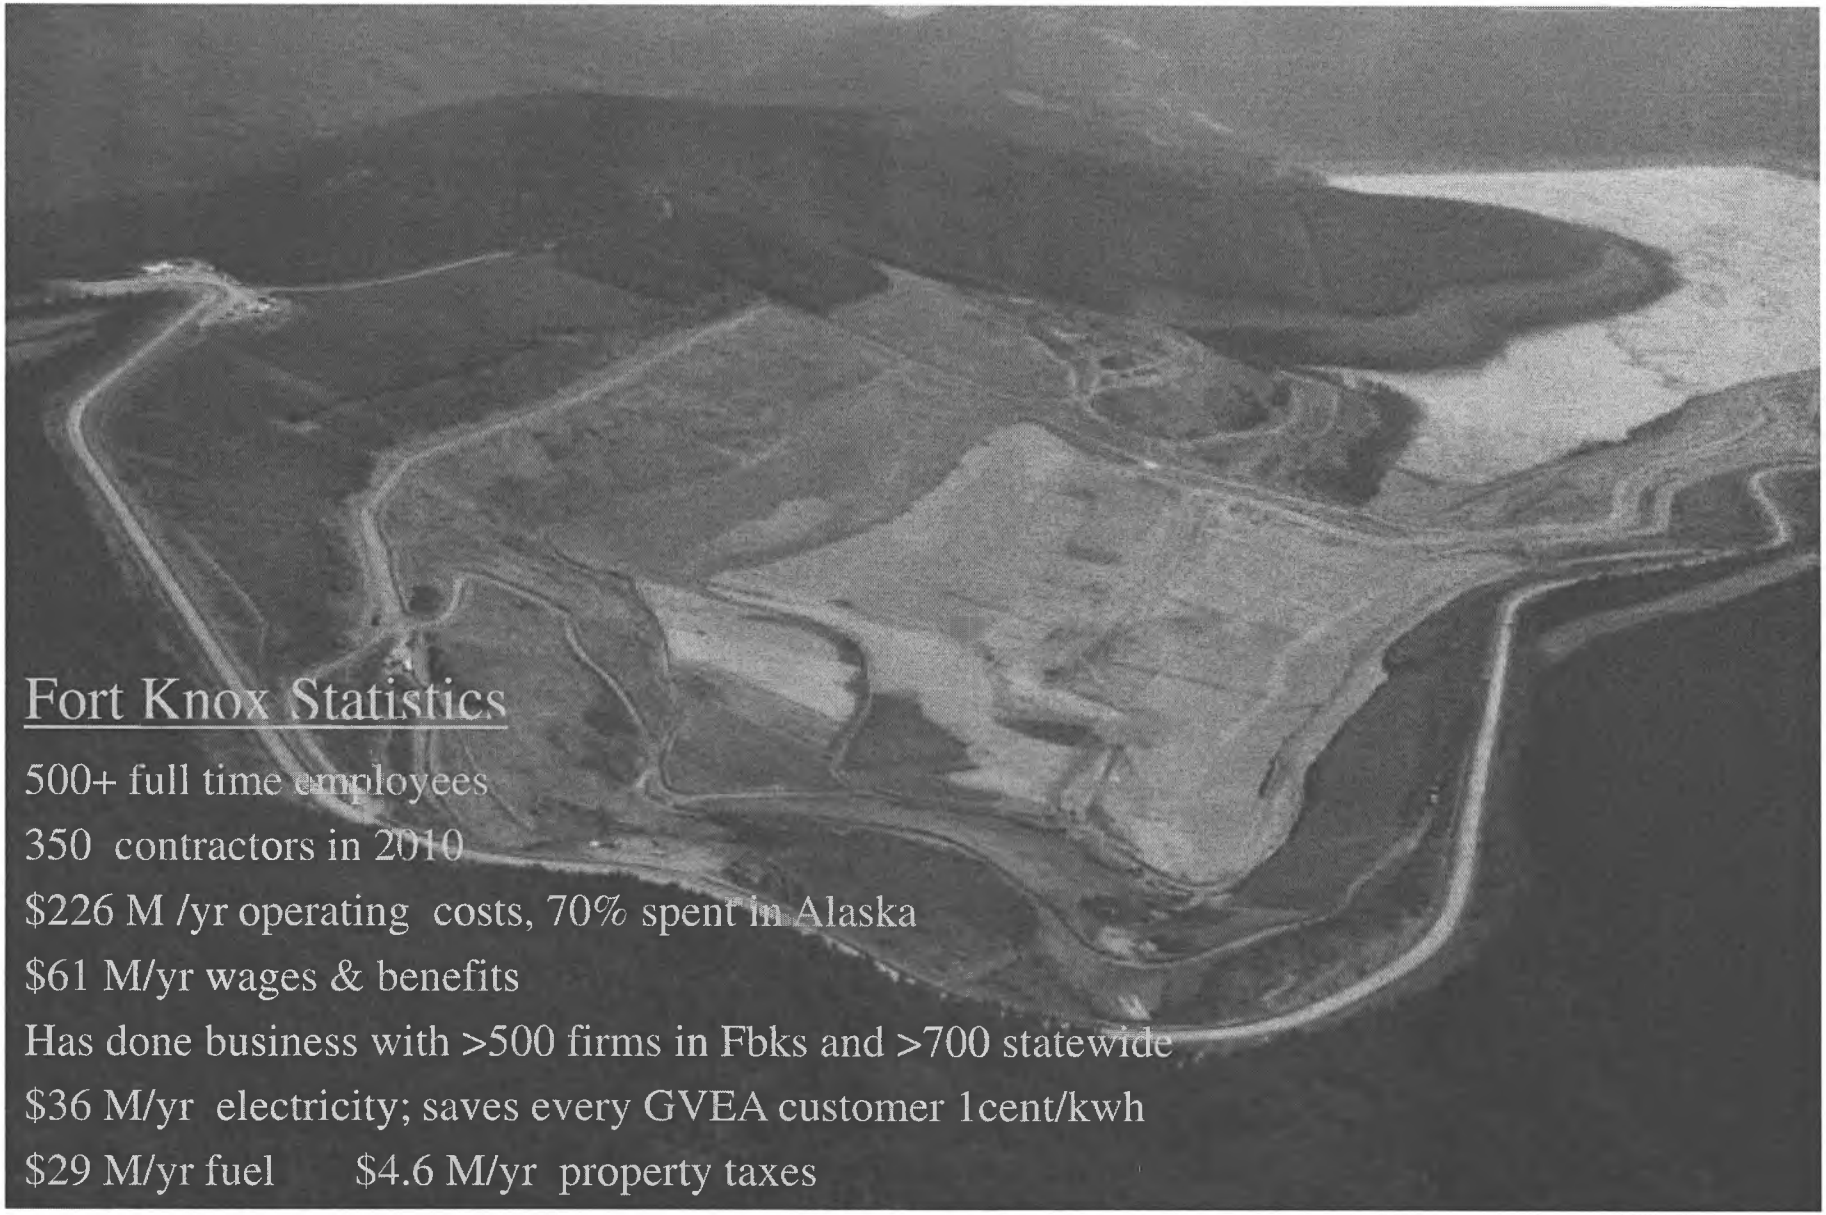


Red Dog Legal and Other Environmental Requirements

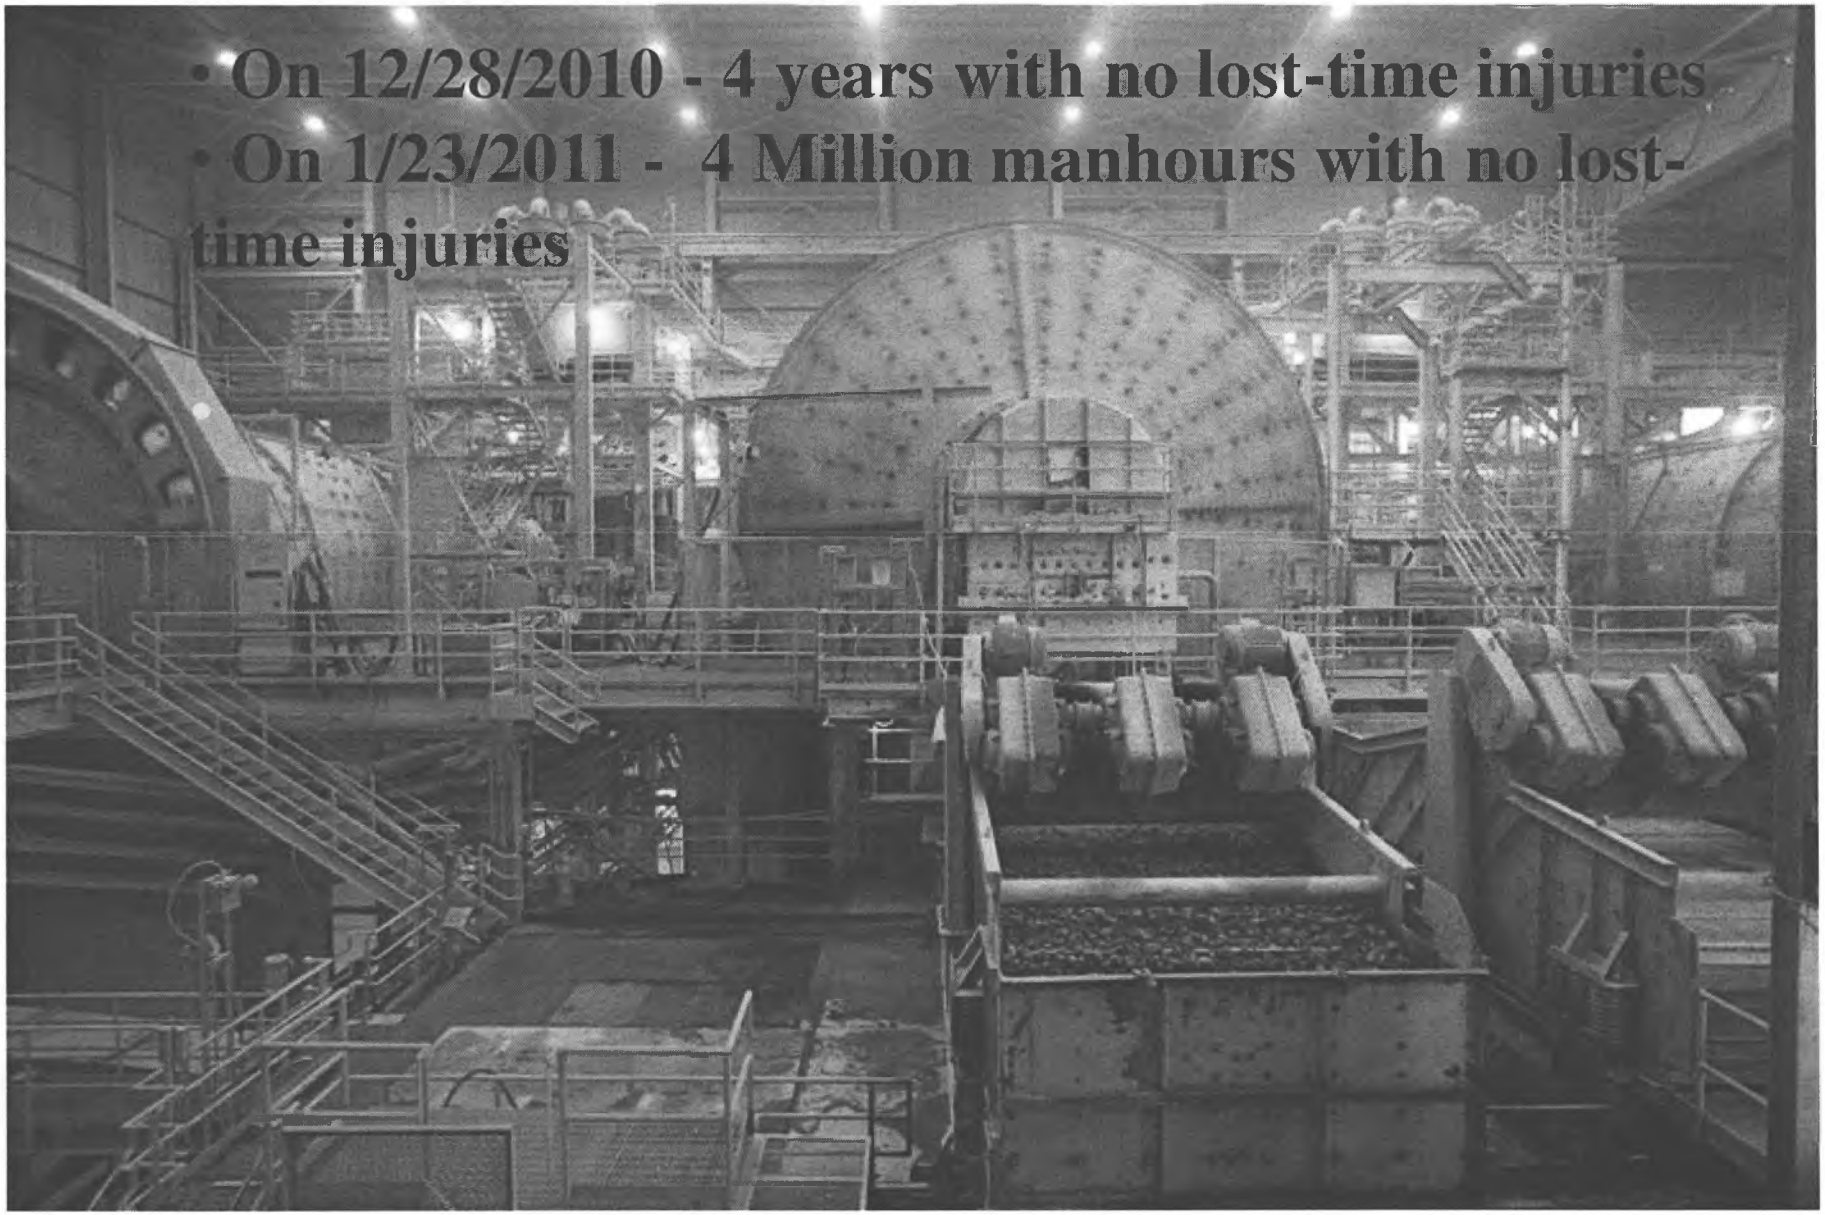


Fort Knox Mine

KINROSS Fort Knox

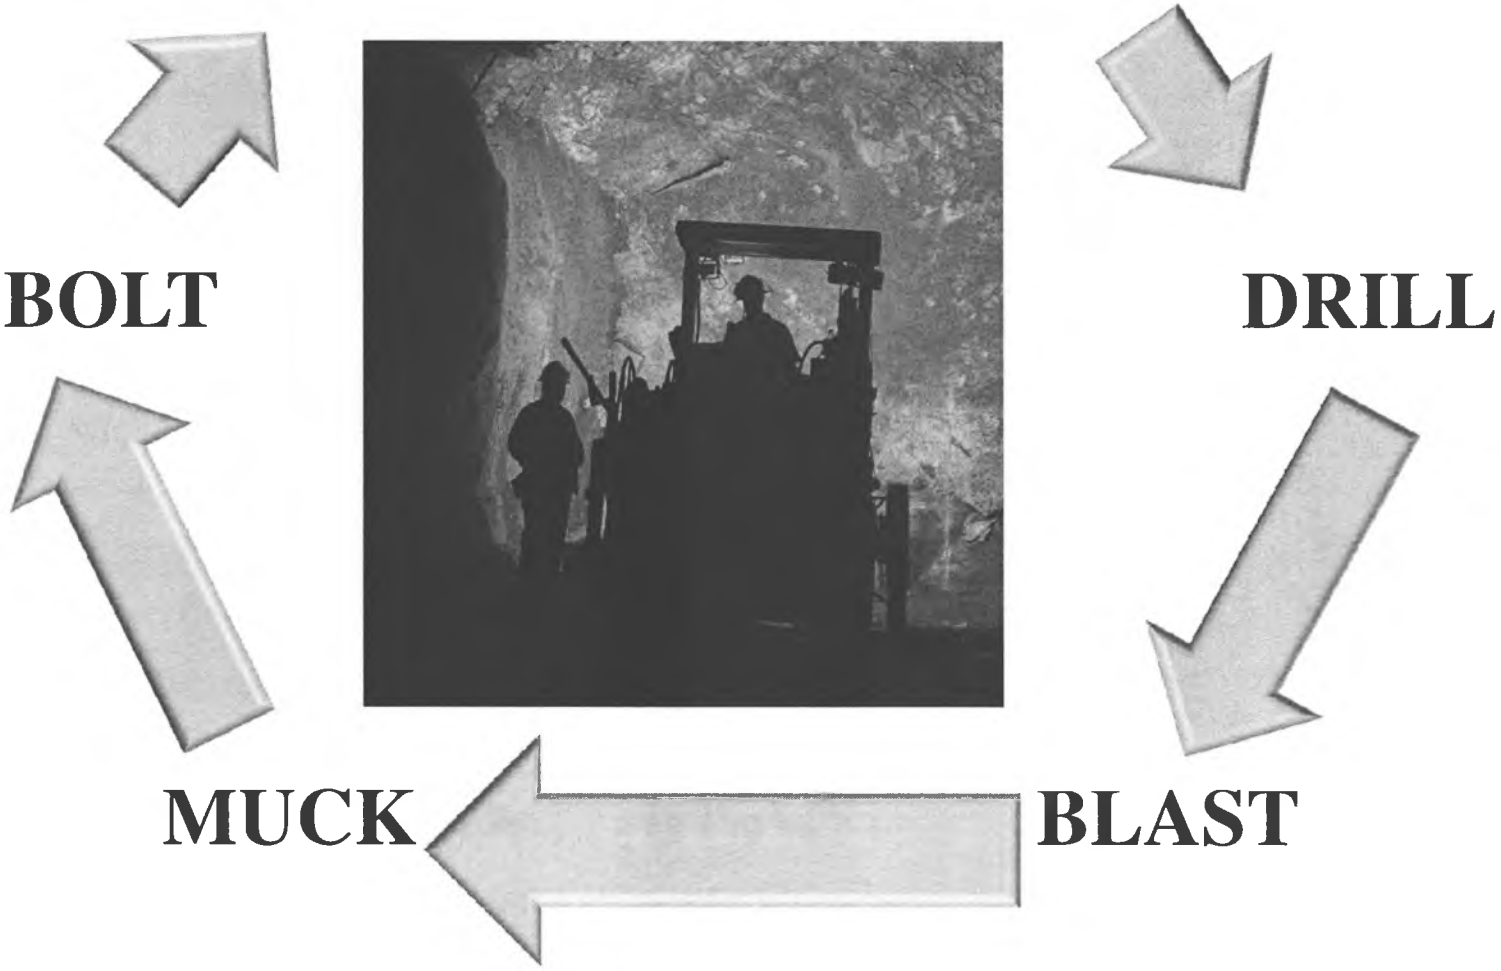


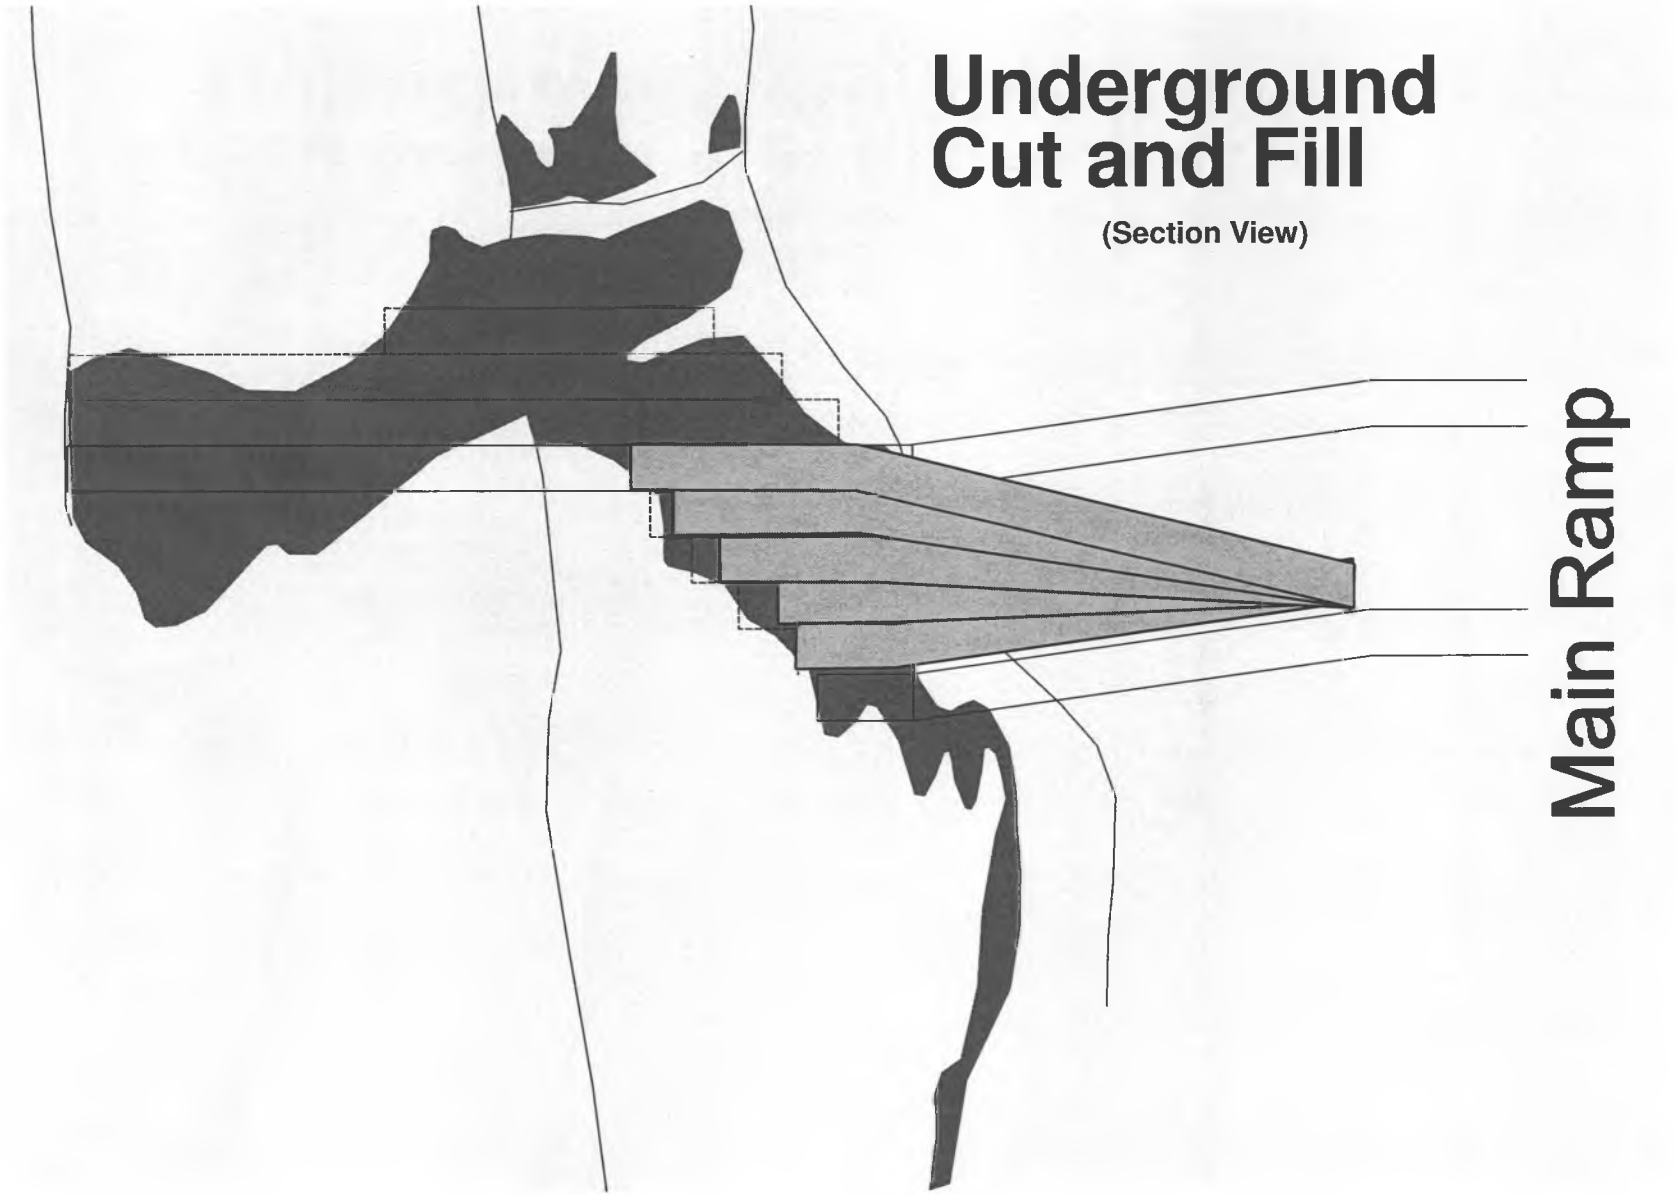
Fort Knox Safety Milestones



Basic Underground Mining Cycle

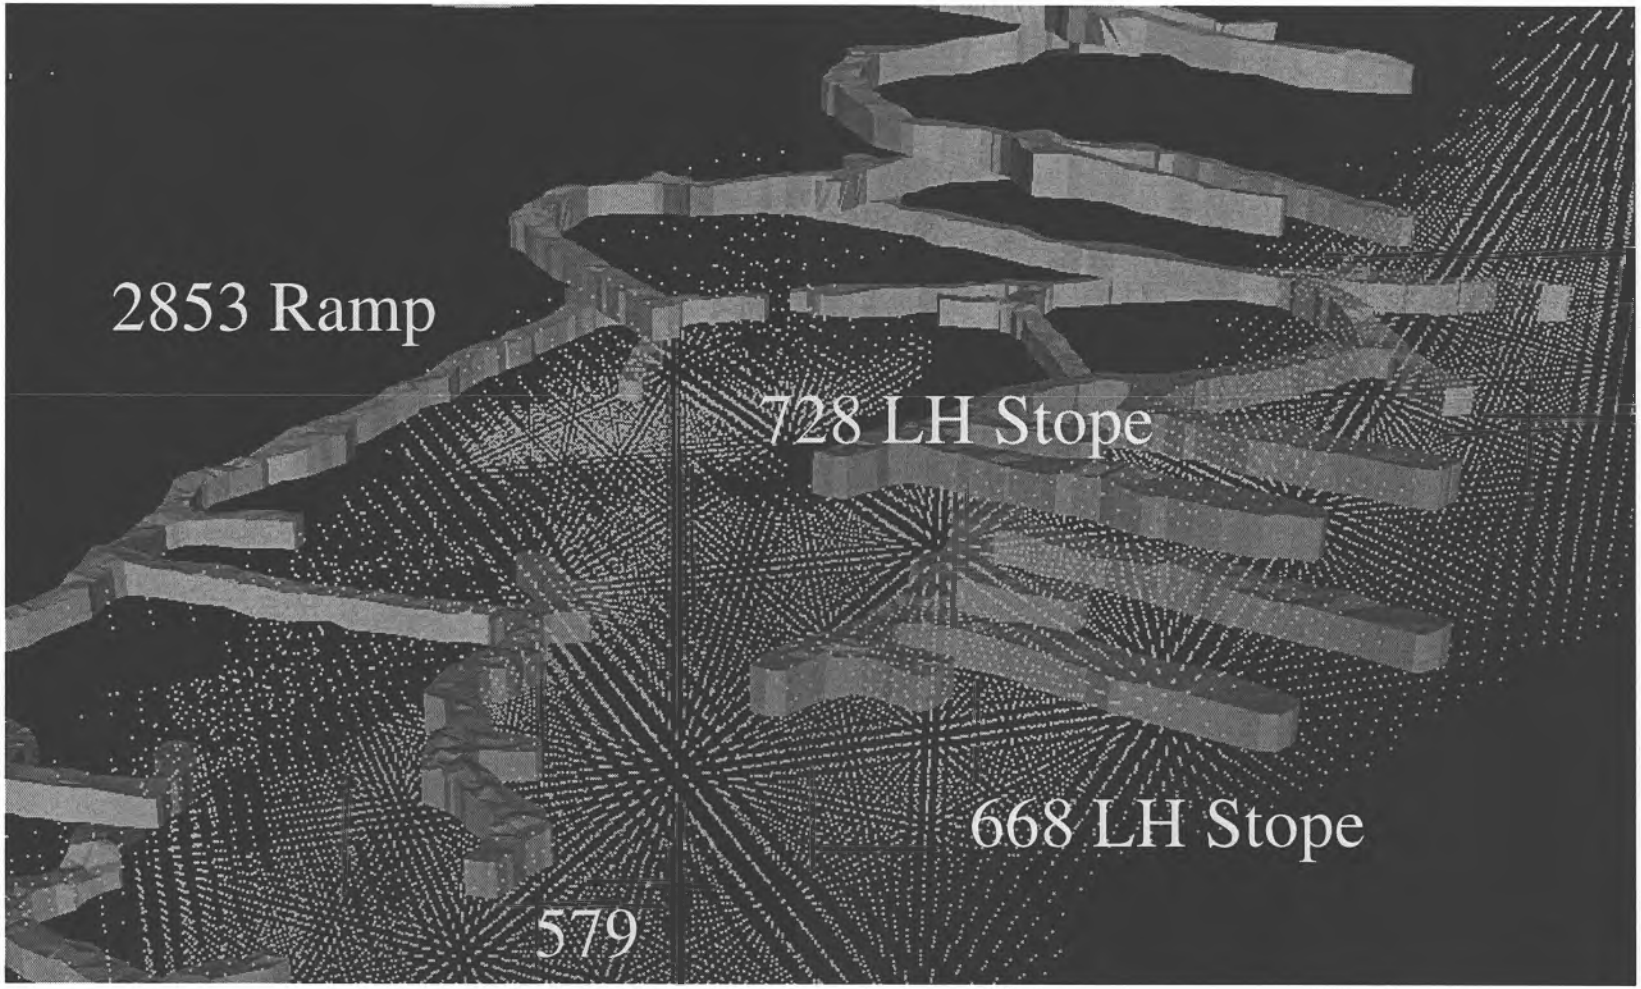
Geology + Engineering Control





Underground
Cut and Fill
(Section View)
Main Ramp

Underground Longhole



Hecla Greens Creek Mine

"At a Glance"

- **18 miles south of Juneau on Admiralty Island**
- **High-grade polymetallic orebody**
  - **Silver, zinc, lead and gold**
- **UG mine with surface concentrator**
  - **(2,250 tpd)**
- **Producing three concentrates + dore'**
  - **Zinc, lead and bulk**
- **20 years of production**
  - **Current 10 year mine life**

Hecla Greens Creek Mine

Economic Impact

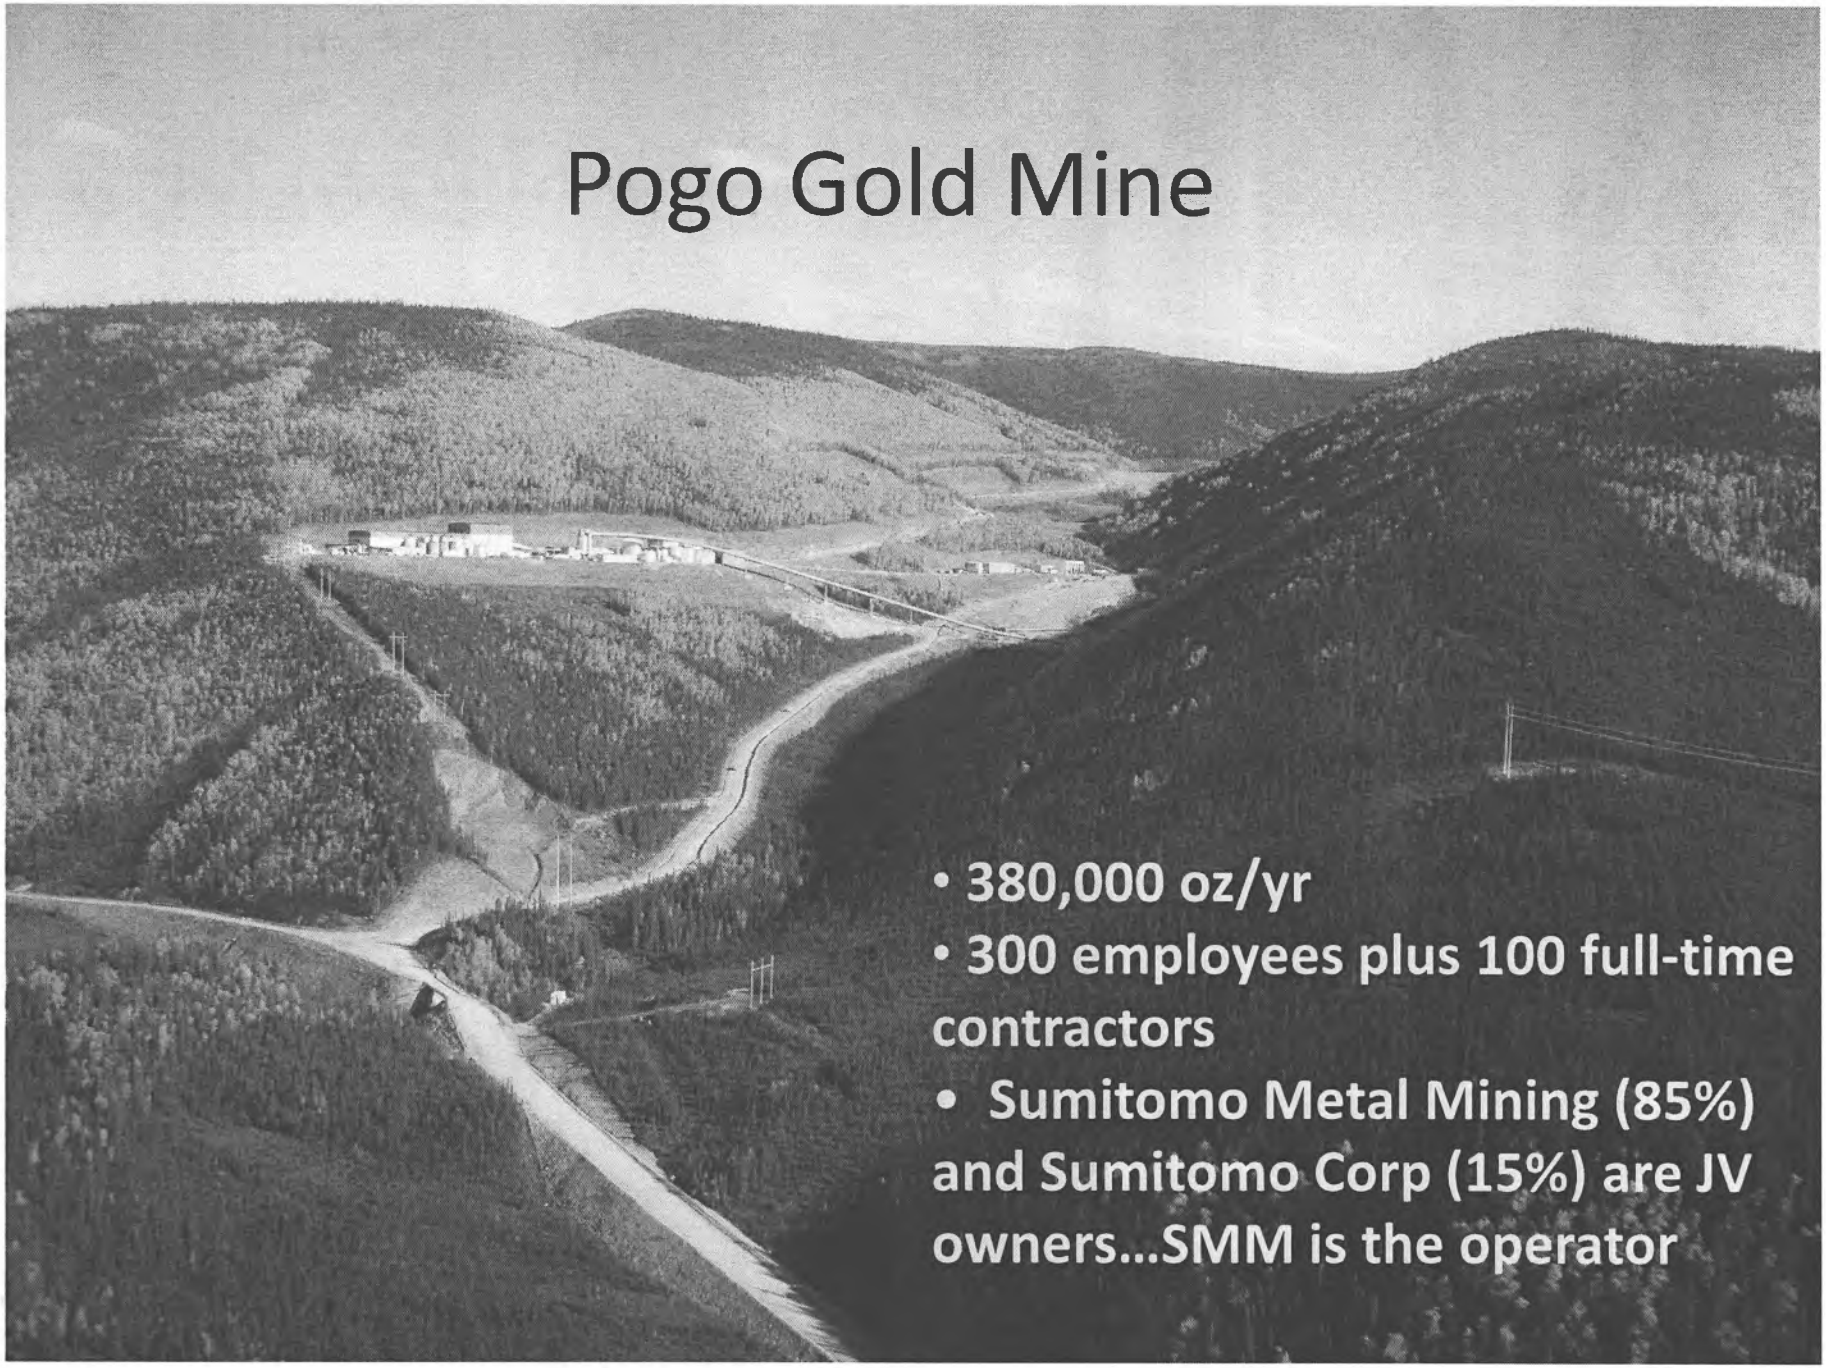
- **340 Employees**
  - **530 total direct and in-direct jobs**
- **Largest private sector employer in Juneau**
- **>$42M in pay and benefits**

Hecla Greens Creek Mine

Tailing Expansion

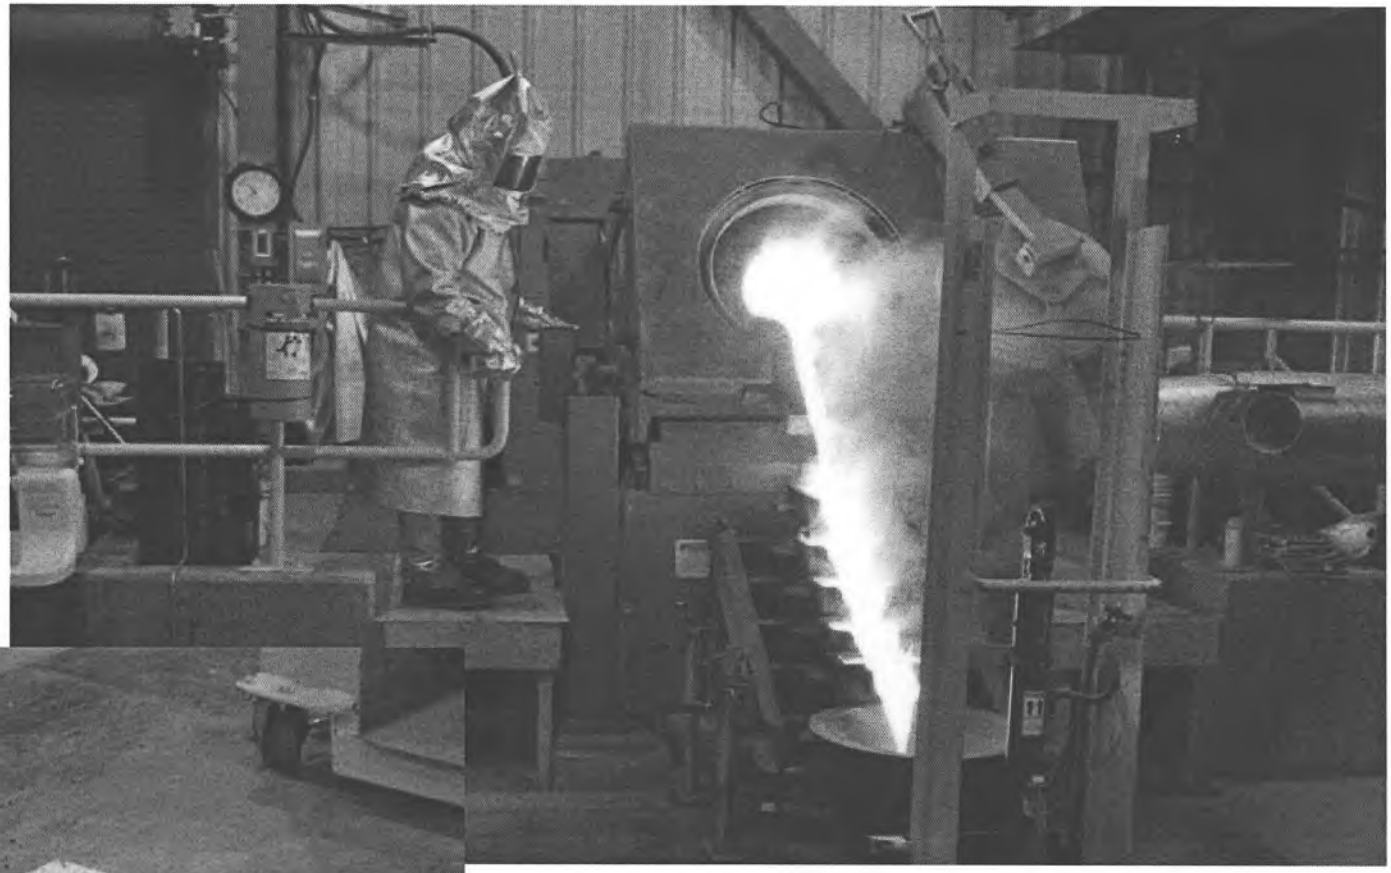
- **NEPA process initiated to add ~30-50 years of tails storage capacity**
- **Proposal will expand the site by ~200 acres**
- **Construction to start in 2012 pending favorable EIS and ROD from Forest**

Pogo Gold Mine

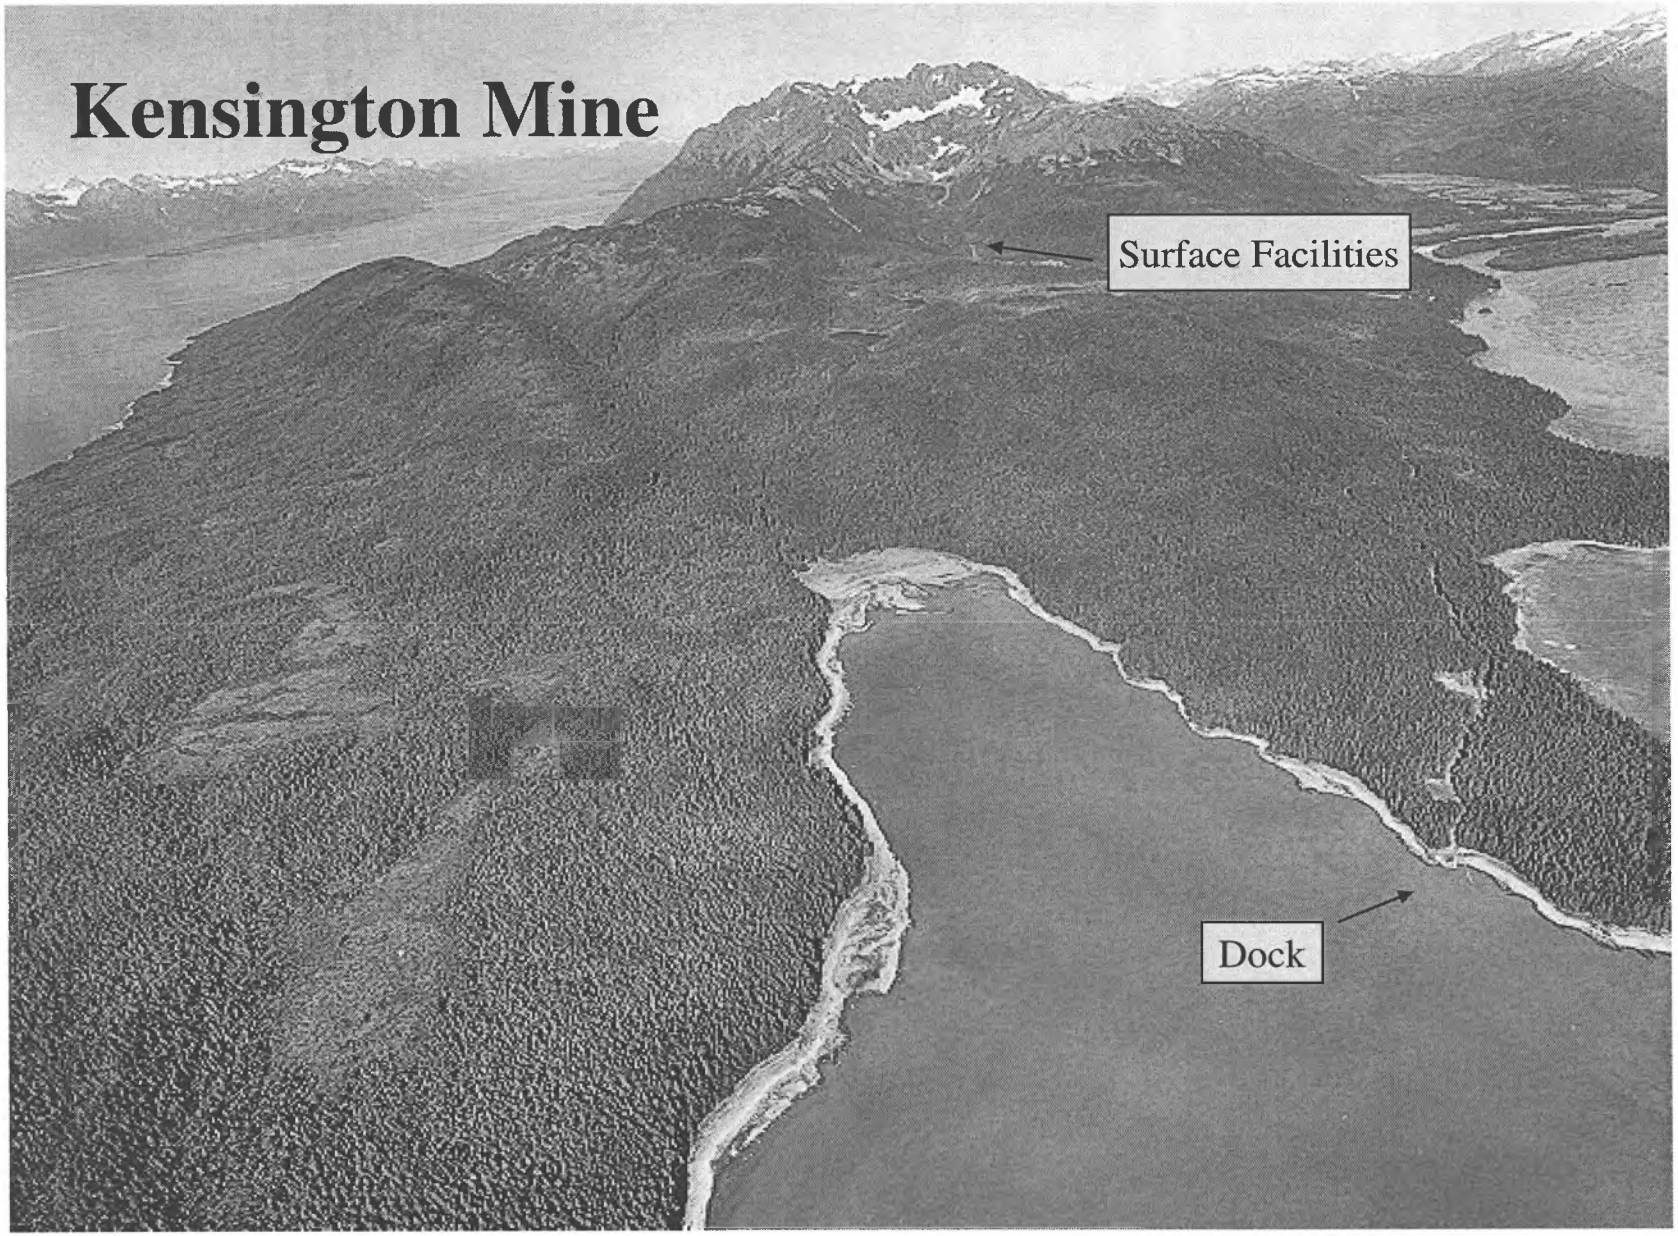


- 380,000 oz/yr
- 300 employees plus 100 full-time contractors
- Sumitomo Metal Mining (85%) and Sumitomo Corp (15%) are JV owners…SMM is the operator

Pogo Gold Mine



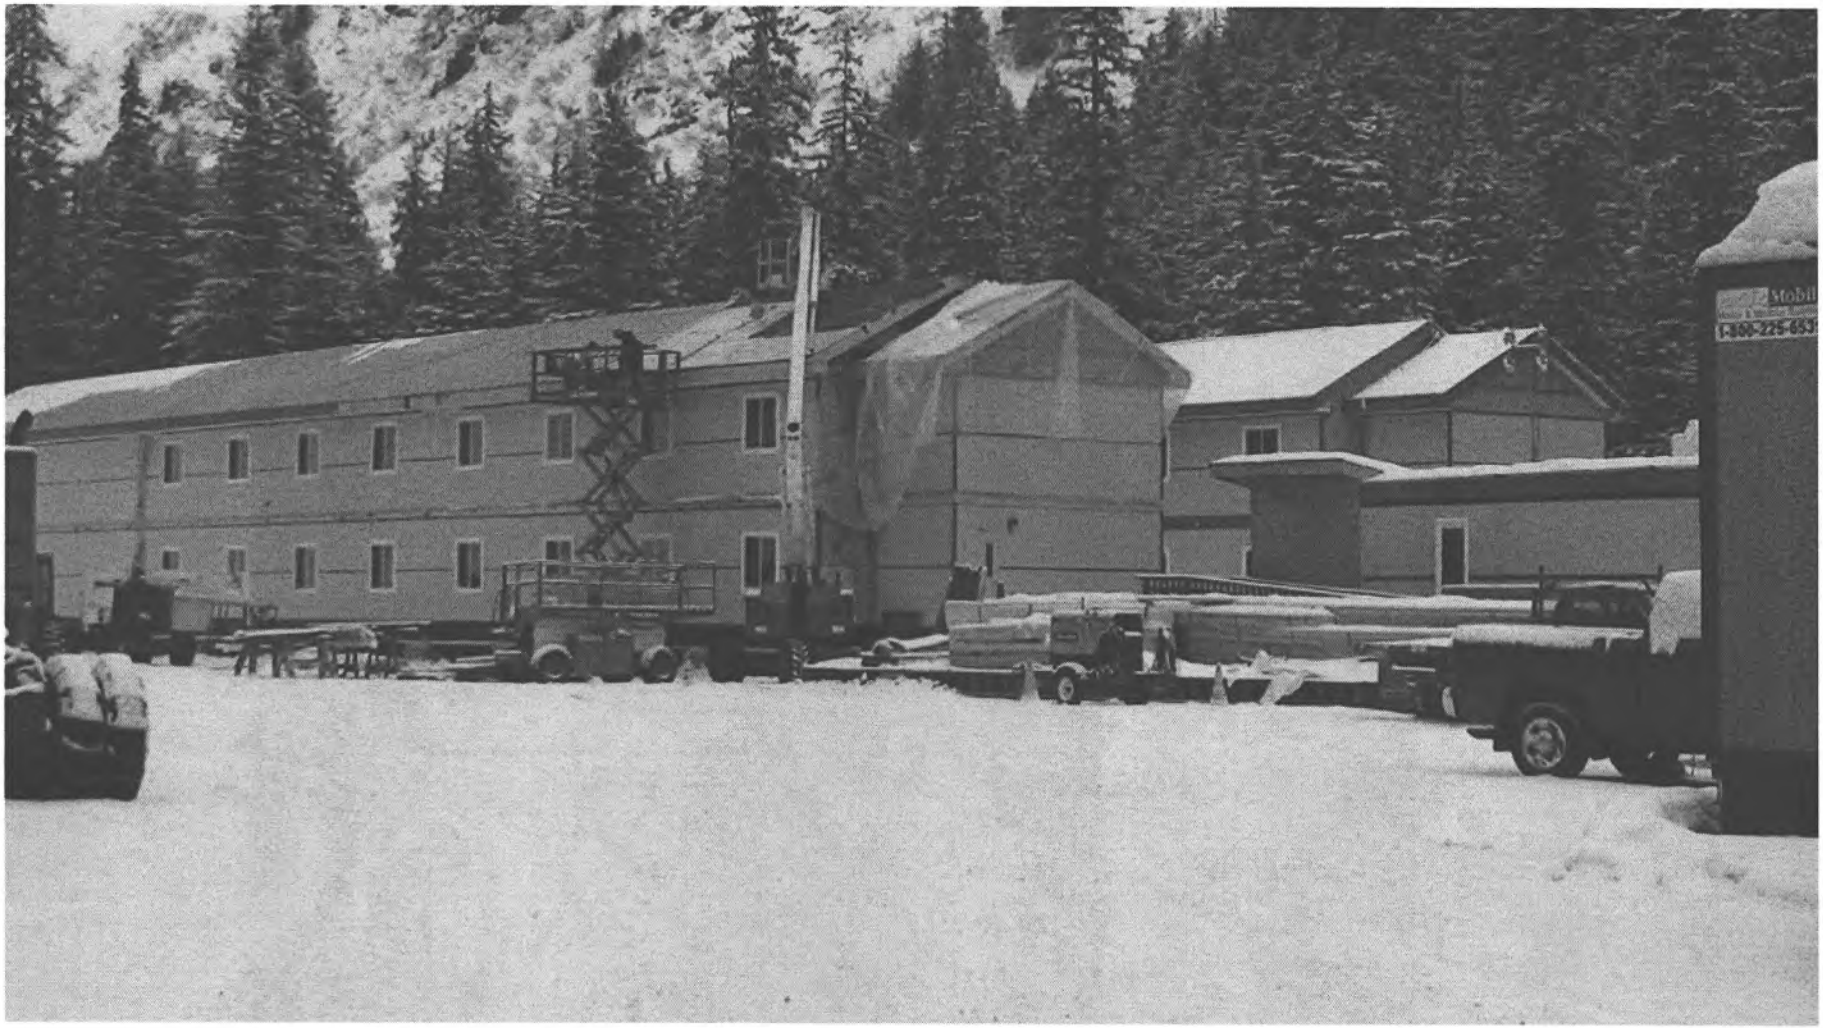
- Focus on safety and environmental performance
- Mine reserves are through 1st Qtr 2017
- On-going exploration to expand ore reserves and mine life



Kensington Mine
Surface Facilities
Dock

Kensington Gold Mine
Began operating July 2010
200 employees
125,000 oz/yr - Ongoing exploration
$25M/yr annual payroll
2nd largest Juneau employer by payroll
$9.3M/yr purchases local goods & services
Several million in local tax revenues

Limited On-site Accommodations



RDC Board at Lower Slate Lake

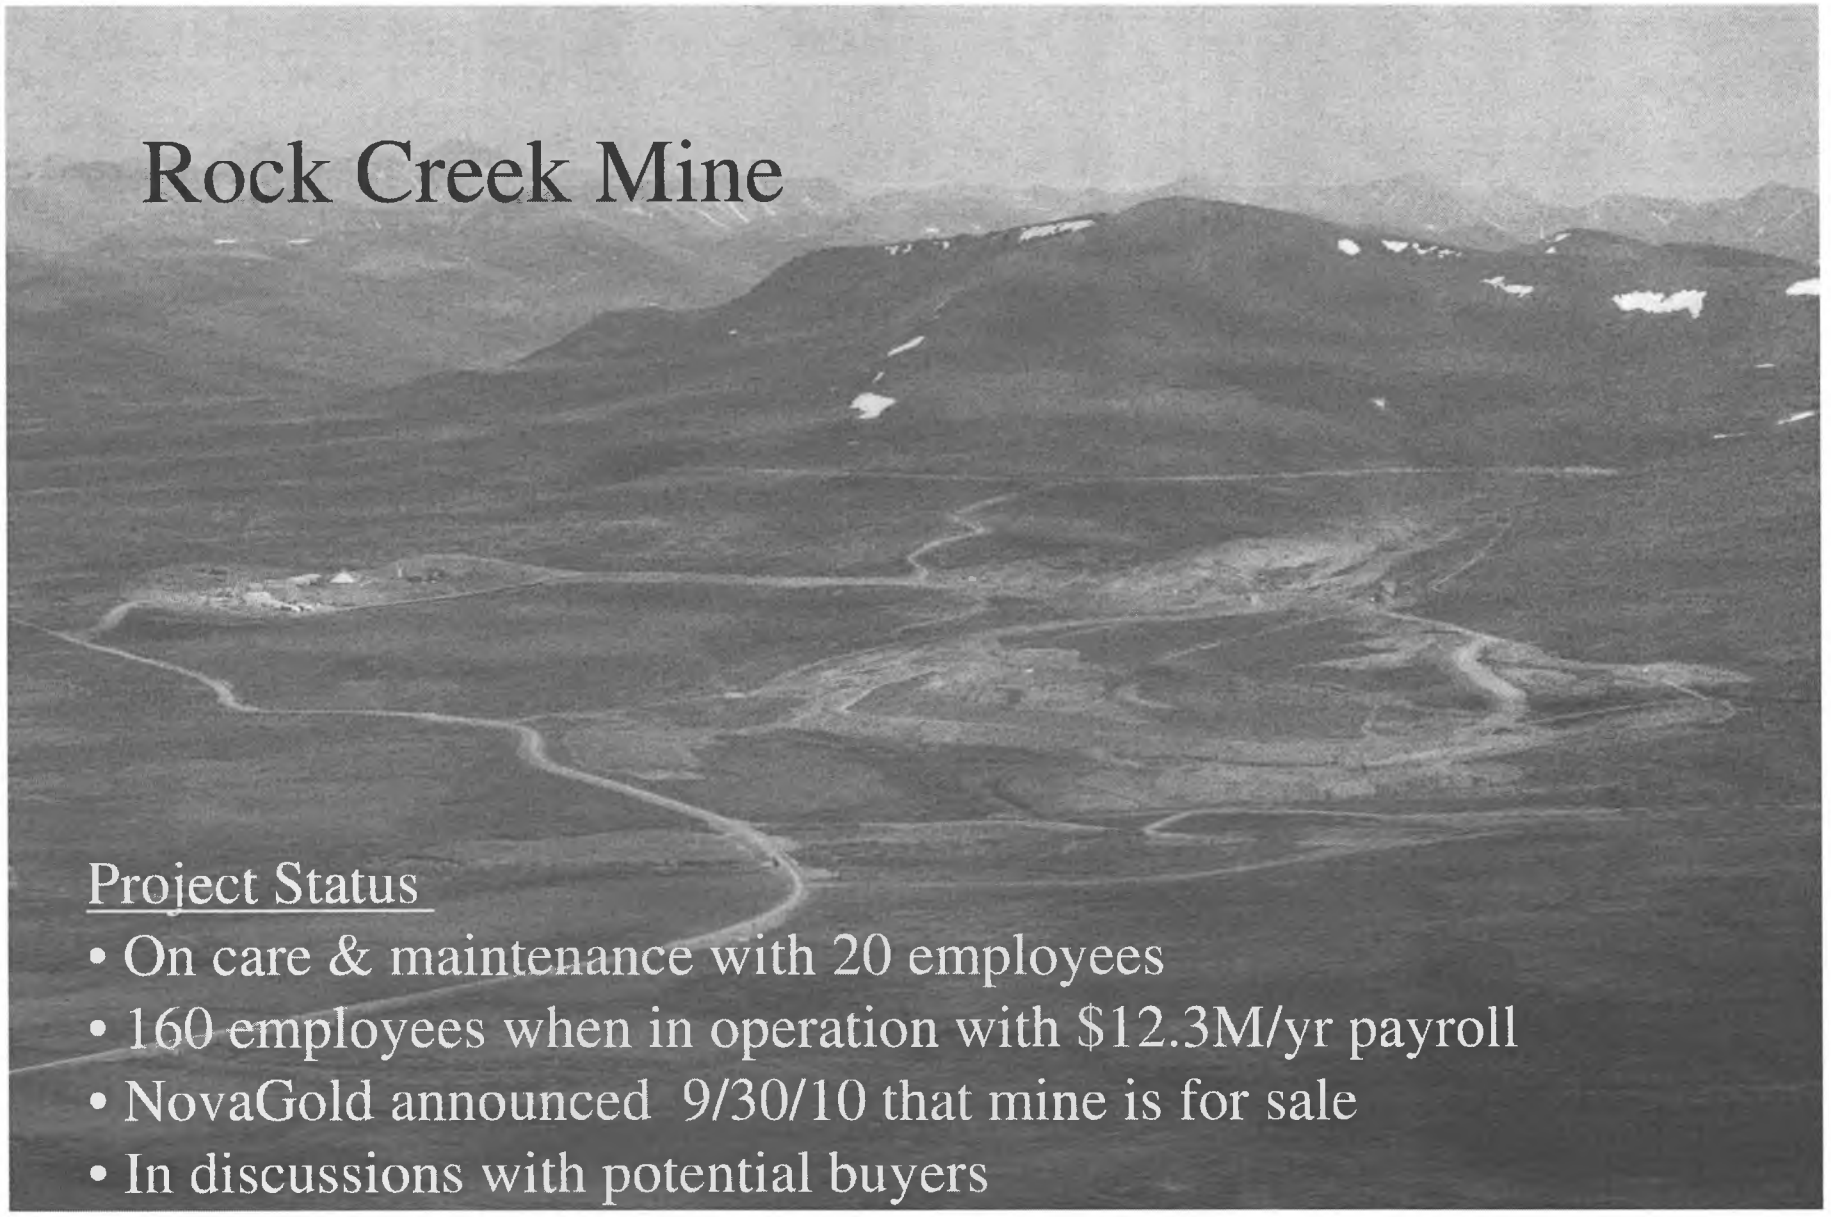
Mines in Idle Status

- **Nixon Fork - Fire River Gold**
- **Rock Creek - Alaska Gold/ NovaGold**

Nixon Fork Mine

Project Status

- Exploration drilling, facility upgrades, mine engineering/design
- Expect to restart production mid-2011
- 40 jobs in 2010 , 100 jobs by end of 2011



Rock Creek Mine
Project Status
• On care & maintenance with 20 employees
• 160 employees when in operation with $12.3M/yr payroll
• NovaGold announced 9/30/10 that mine is for sale
• In discussions with potential buyers

Projects in Advanced Exploration and Permitting

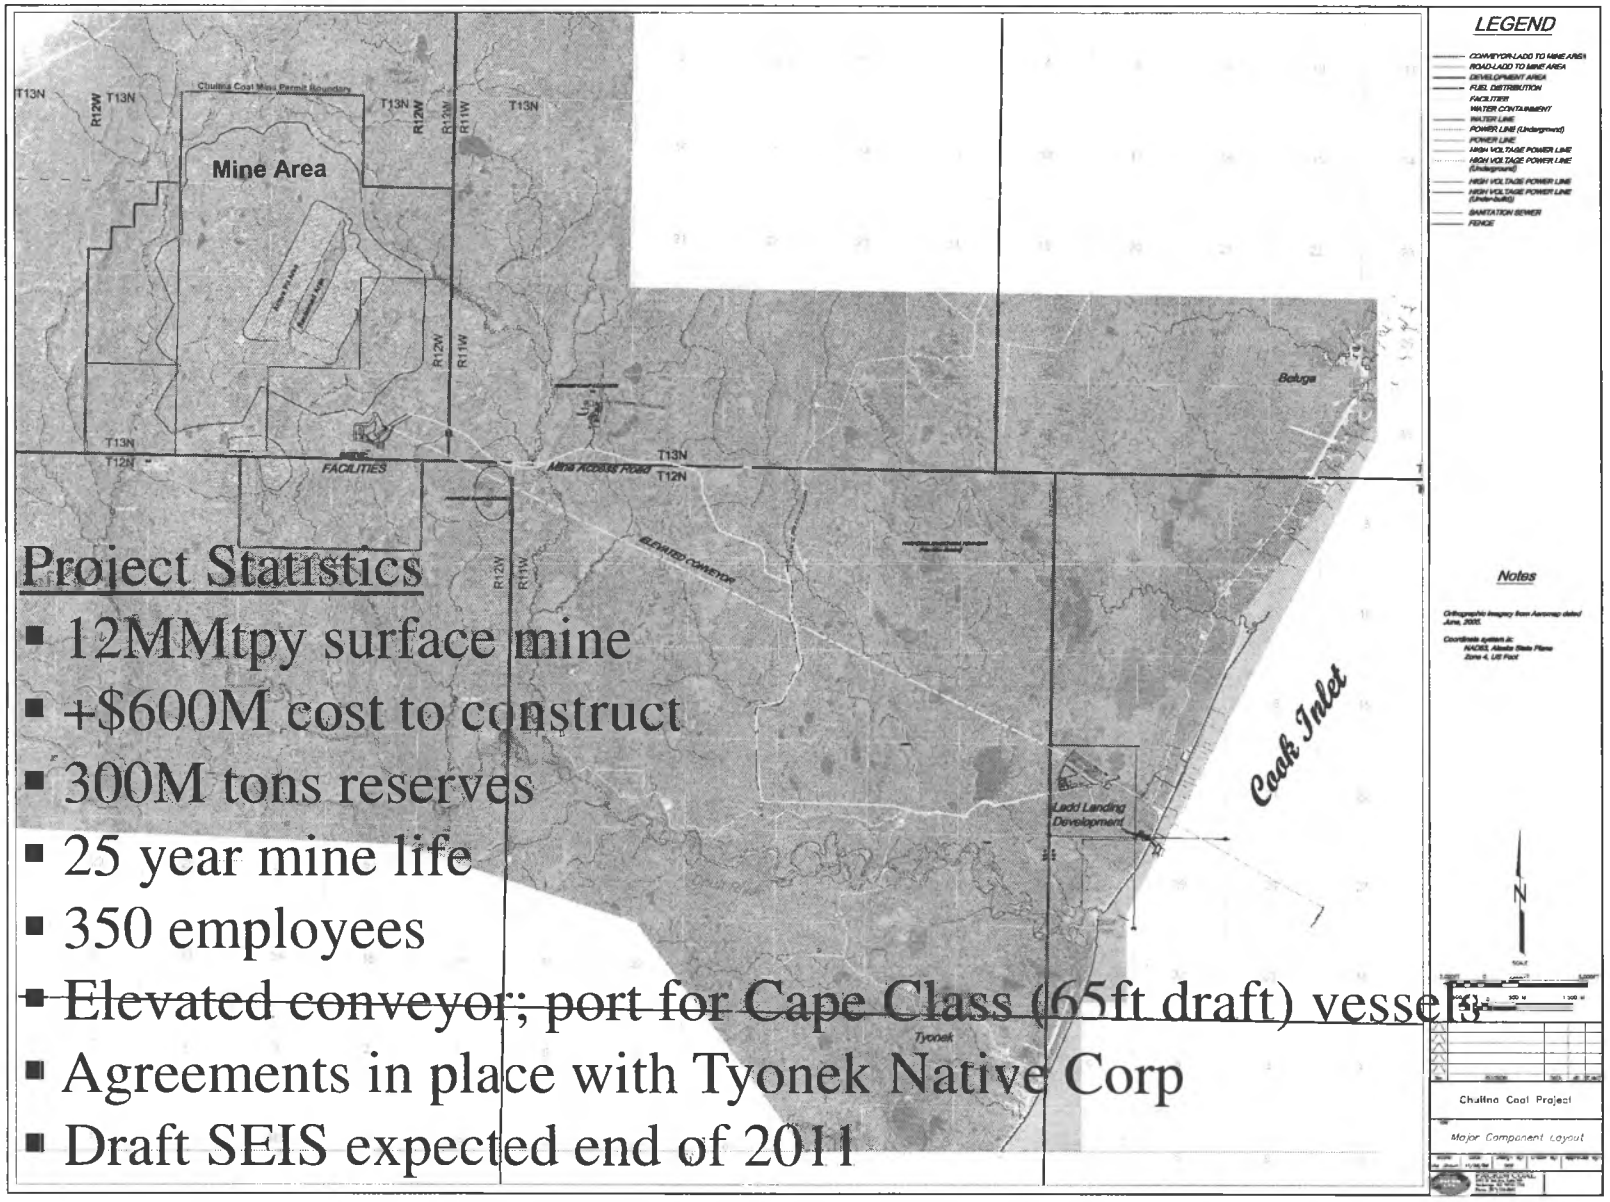
Advanced Permitting

1. Chuitna Coal PACRIM Coal

Advanced Exploration/Pre-permitting

2. Donlin Creek Barrick/NovaGold JV
3. Pebble Partnership NDM/Anglo American JV

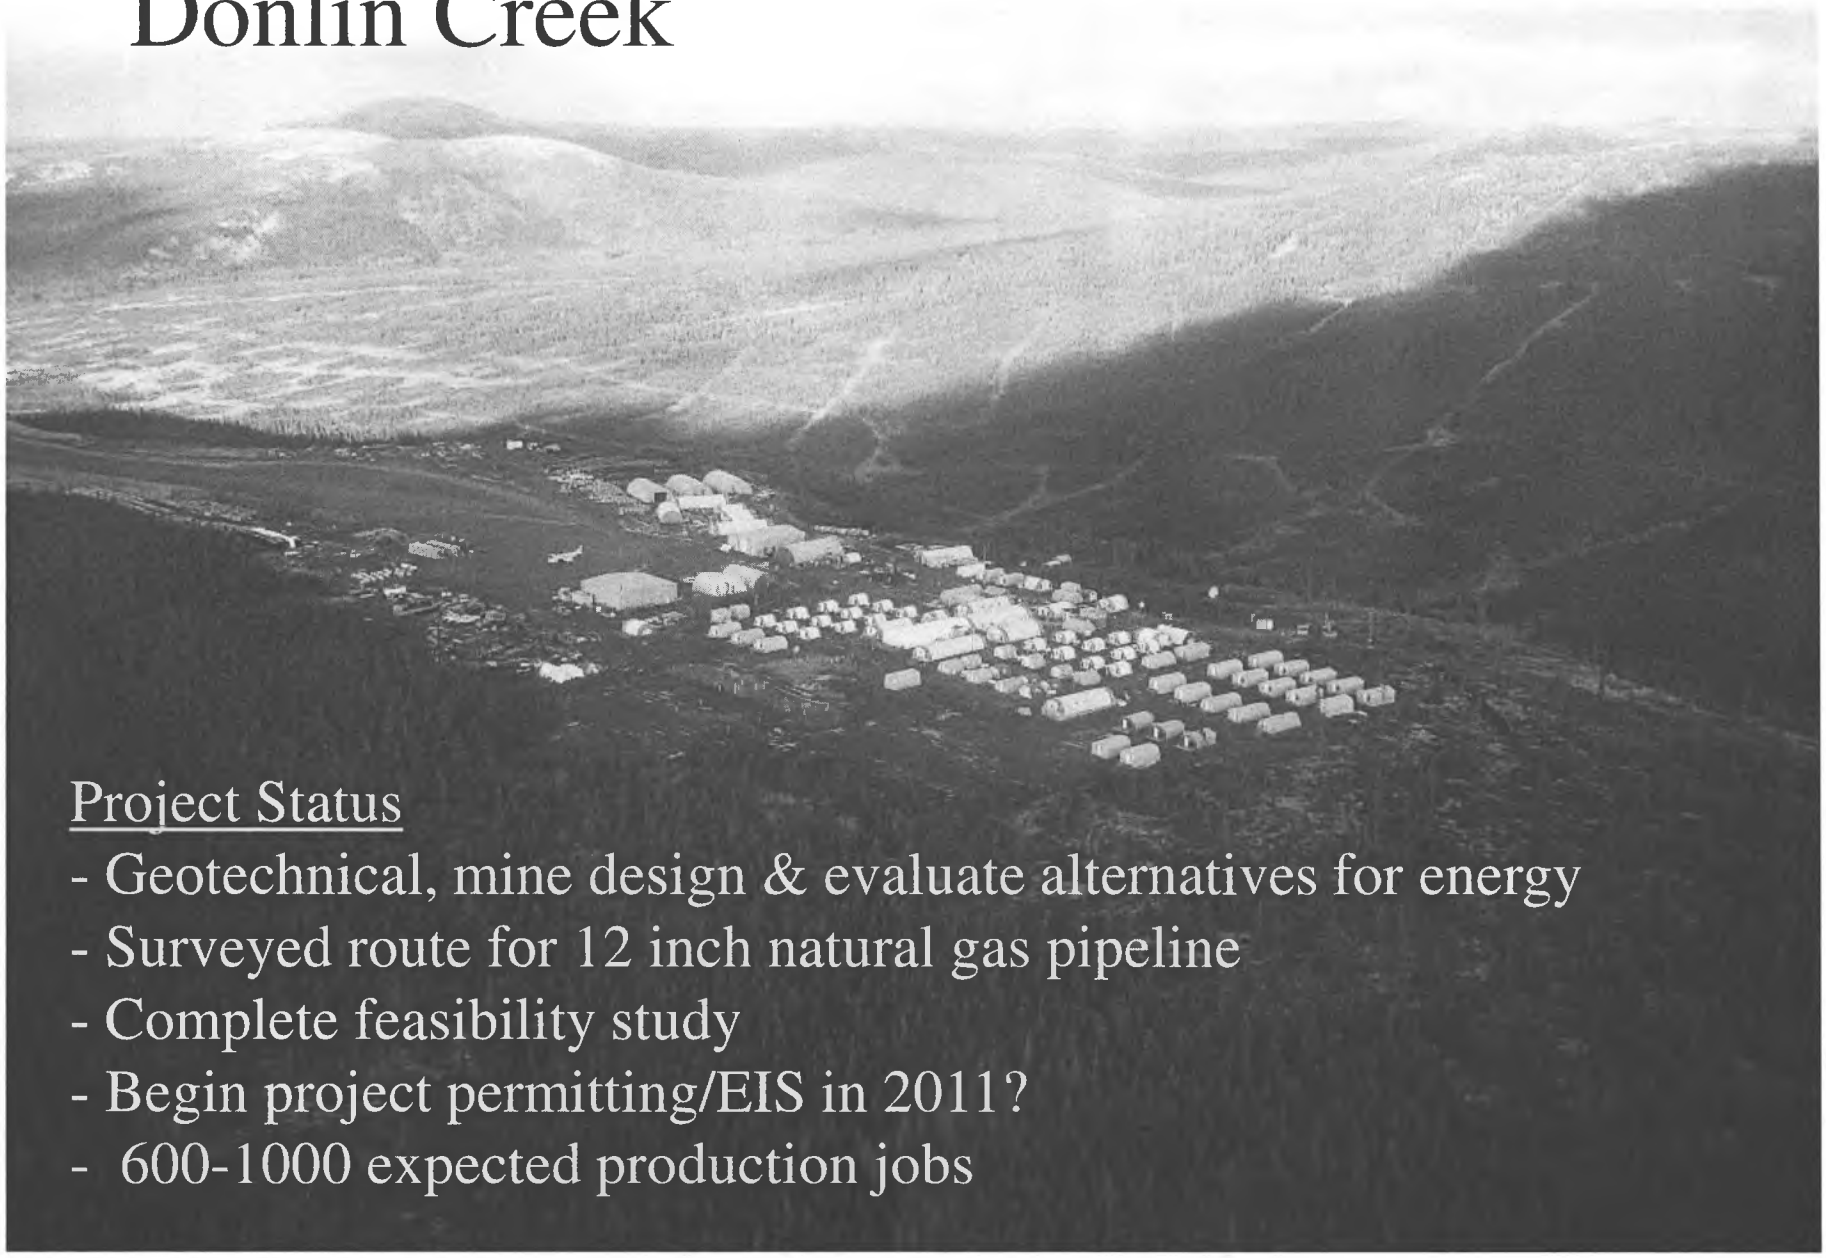
Chuitna Coal Project



Project Statistics

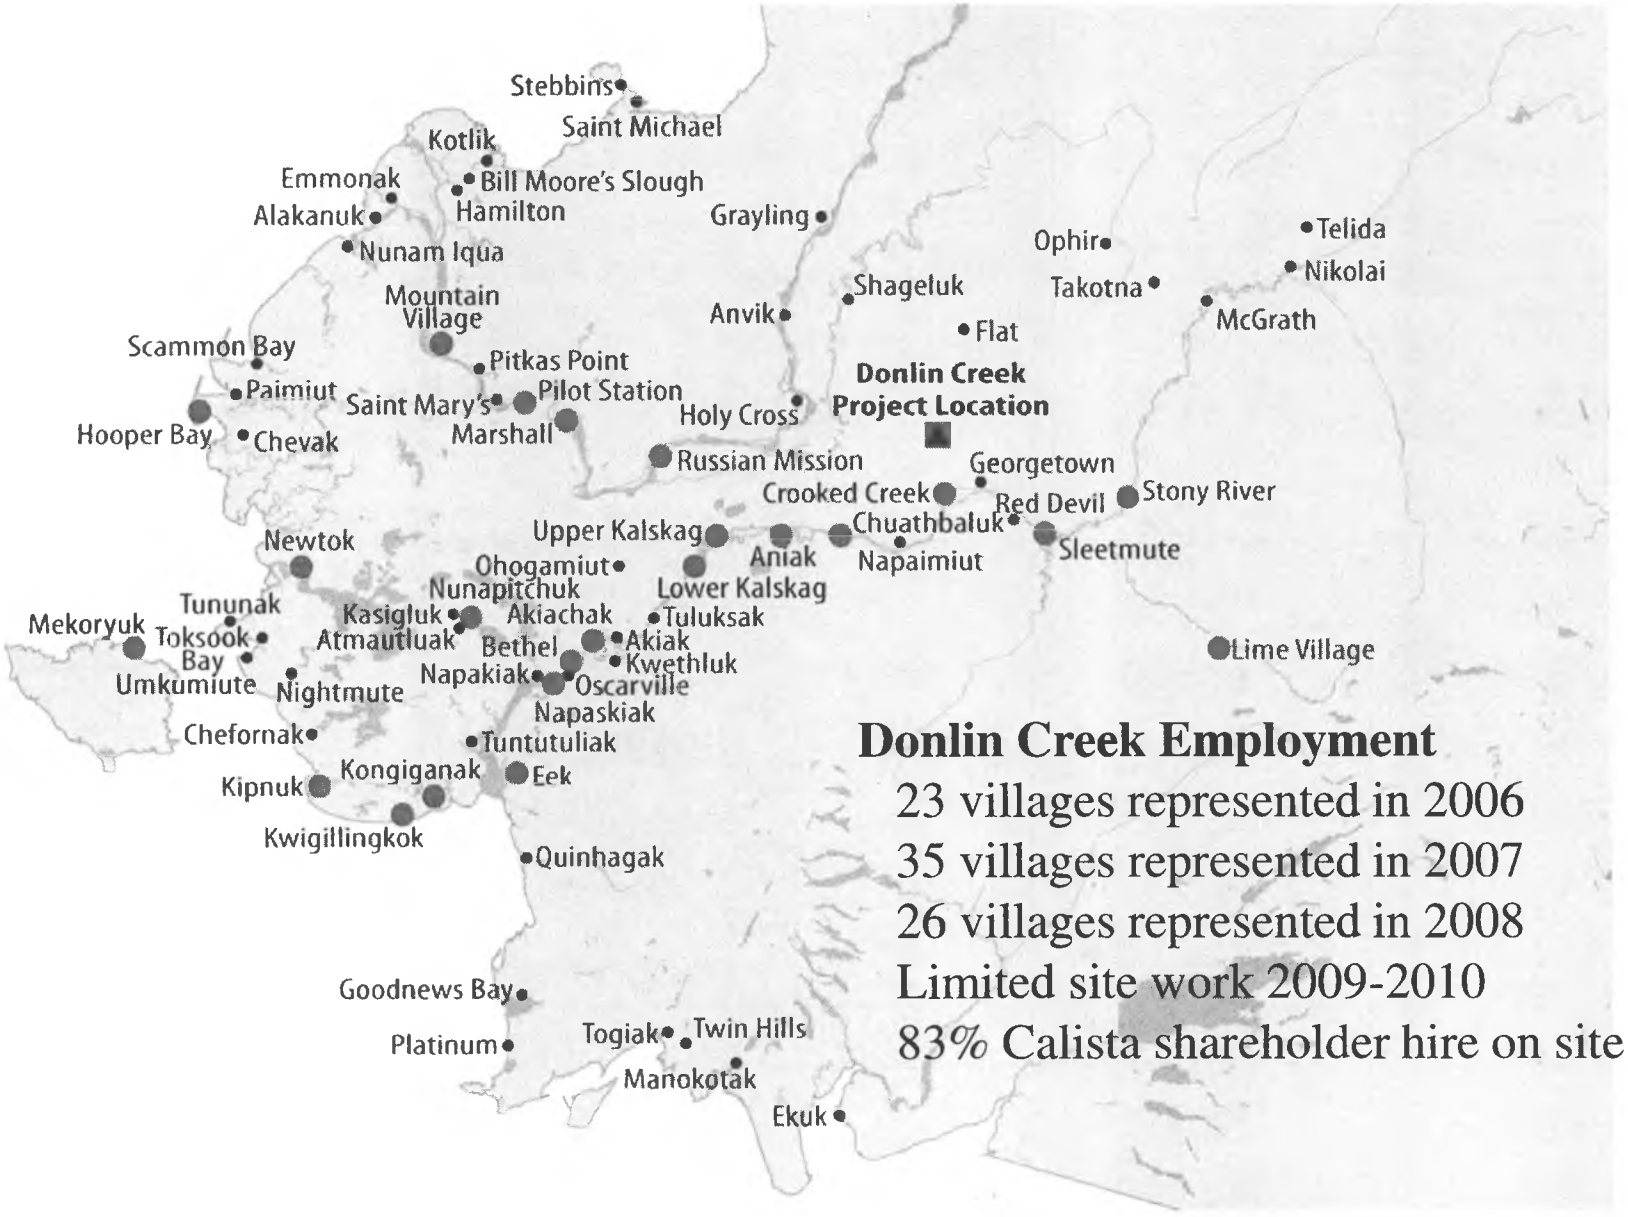
- 12MMtpy surface mine
- +$600M cost to construct
- 300M tons reserves
- 25 year mine life
- 350 employees
- ~~Elevated conveyor; port for Cape Class (65ft draft) vessels~~
- Agreements in place with Tyonek Native Corp
- Draft SEIS expected end of 2011

Donlin Creek



Project Status

- Geotechnical, mine design & evaluate alternatives for energy
- Surveyed route for 12 inch natural gas pipeline
- Complete feasibility study
- Begin project permitting/EIS in 2011?
- 600-1000 expected production jobs



Donlin Creek Employment

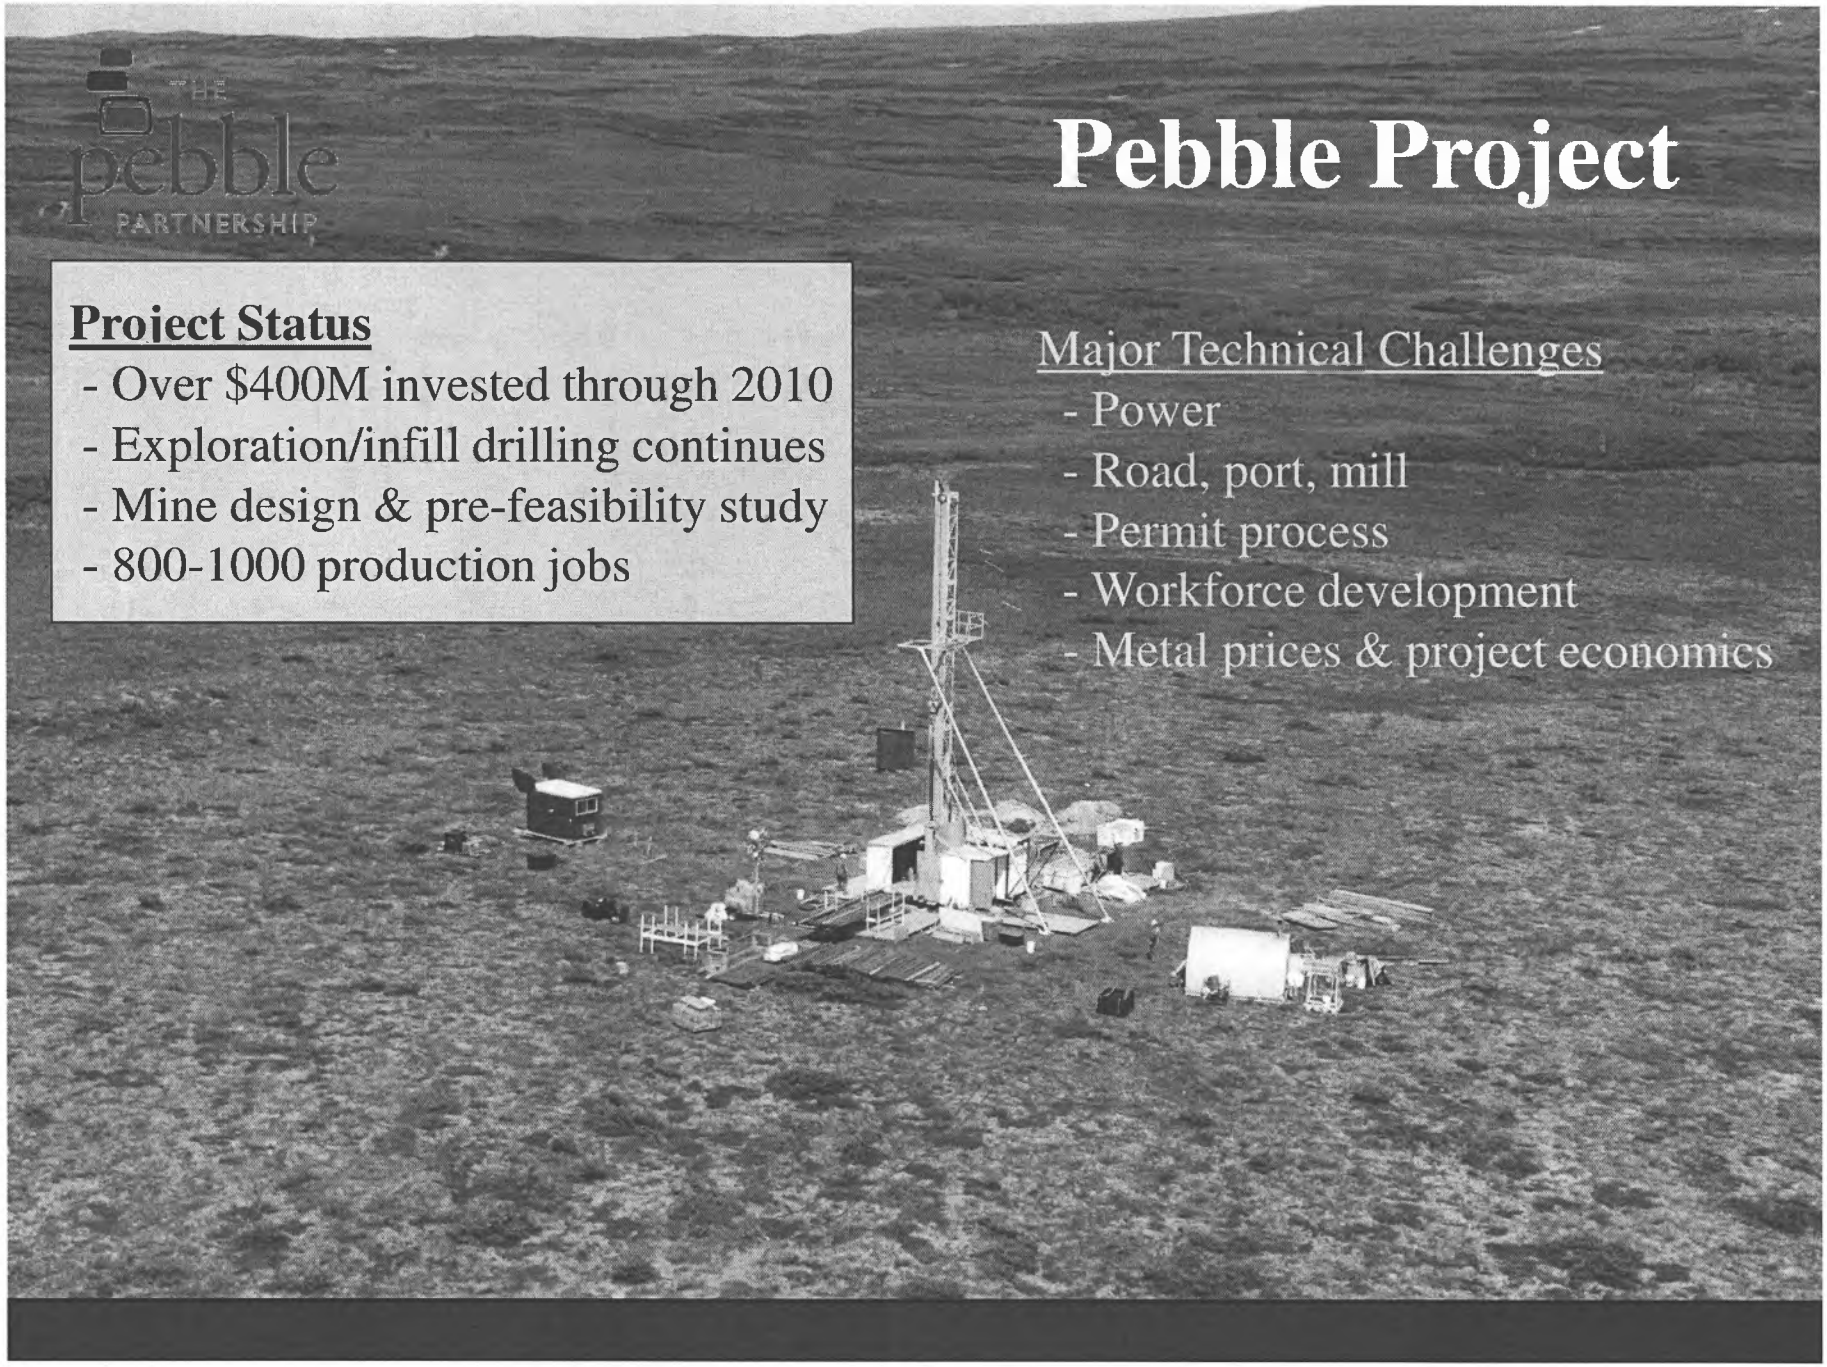
23 villages represented in 2006

35 villages represented in 2007

26 villages represented in 2008

Limited site work 2009-2010

83% Calista shareholder hire on site



THE pebble PARTNERSHIP
Pebble Project
Project Status
- Over $400M invested through 2010
- Exploration/infill drilling continues
- Mine design & pre-feasibility study
- 800-1000 production jobs
Major Technical Challenges
- Power
- Road, port, mill
- Permit process
- Workforce development
- Metal prices & project economics

Drill Site Reclamation

After drill removed

After one year

Pebble – Environmental Baseline Studies

- Surface Water
- Water Quality
- Groundwater
- Geochemistry

>50 independent consulting firms
>500 contractors
>$120 million expended to date

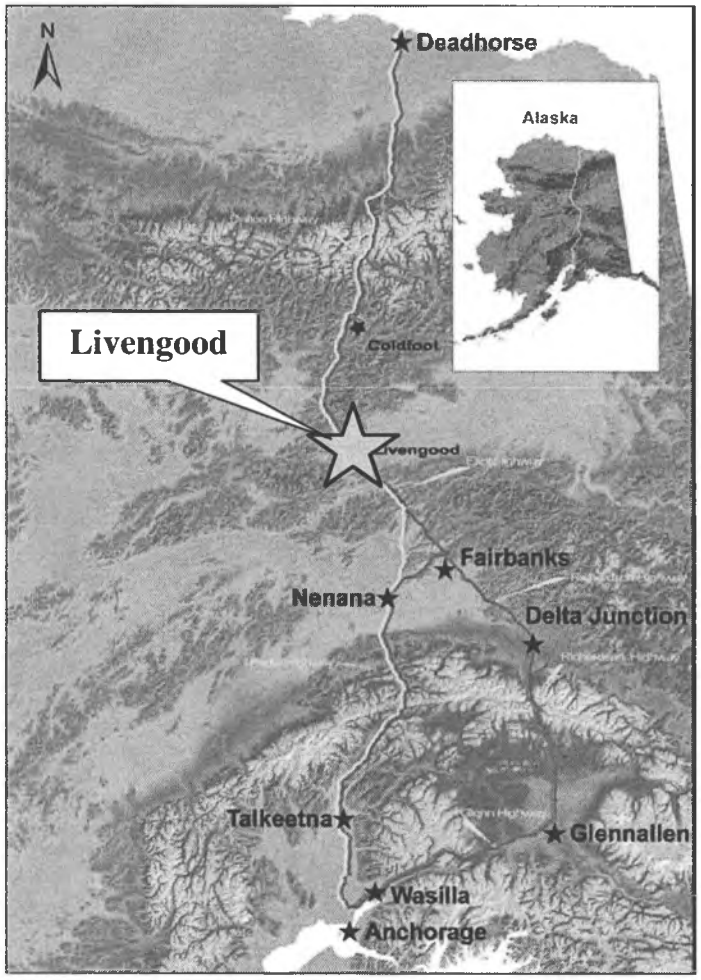
Major Exploration Projects

- 24 projects spent >$1 million each in 2010
- Expect higher number in 2011

Four Example Projects

- Livengood - International Tower Hill Mines
- Niblack - Heatherdale Resources
- Arctic – NovaGold Resources
- Palmer - Constantine Resources

Livengood Gold Project Highlights



Gold Deposit

Indicated Resources of 10.9Moz @ 0.83 g/t Au & Inferred Resources of 2.4Moz @ 0.79 g/t Au (0.5 g/t cutoff). (June 2010)

Geometry of deposit supports low-cost bulk tonnage mining

Favorable infrastructure

All weather paved highway, 70 miles north of Fairbanks

Potential natural gas pipeline - would help project

Project Status

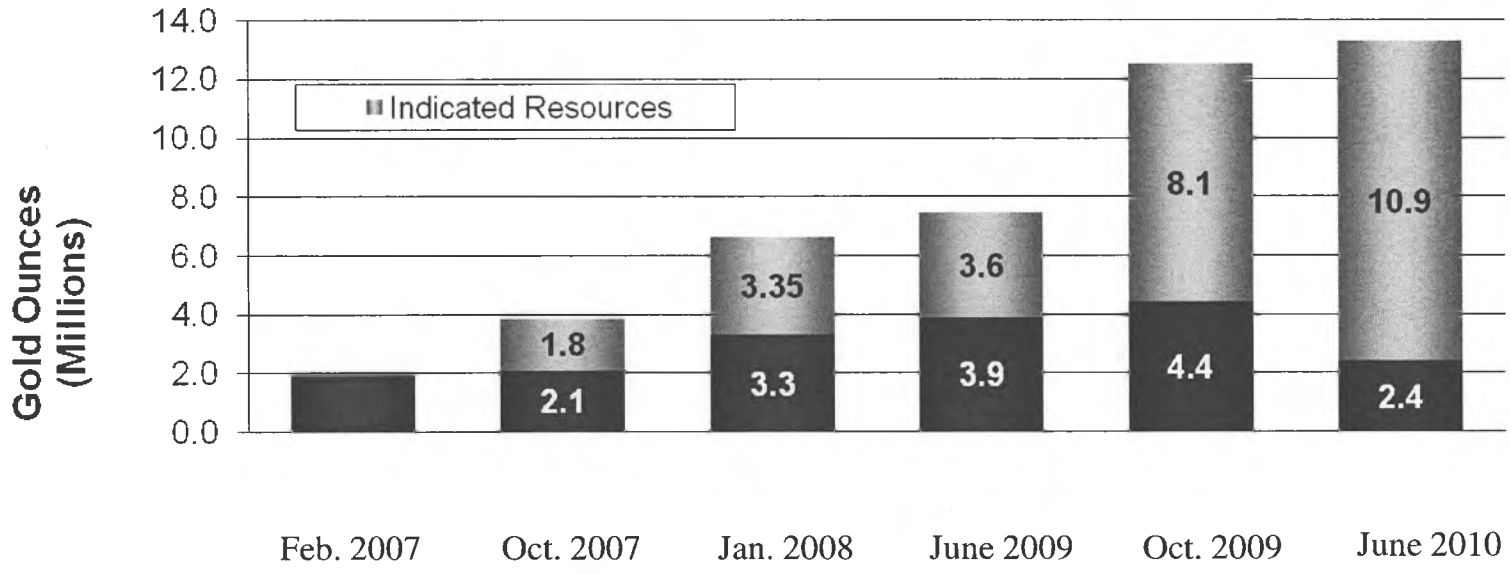
+100 persons on site for drilling, environmental, and engineering work

Over $50 million spent in past 3 years

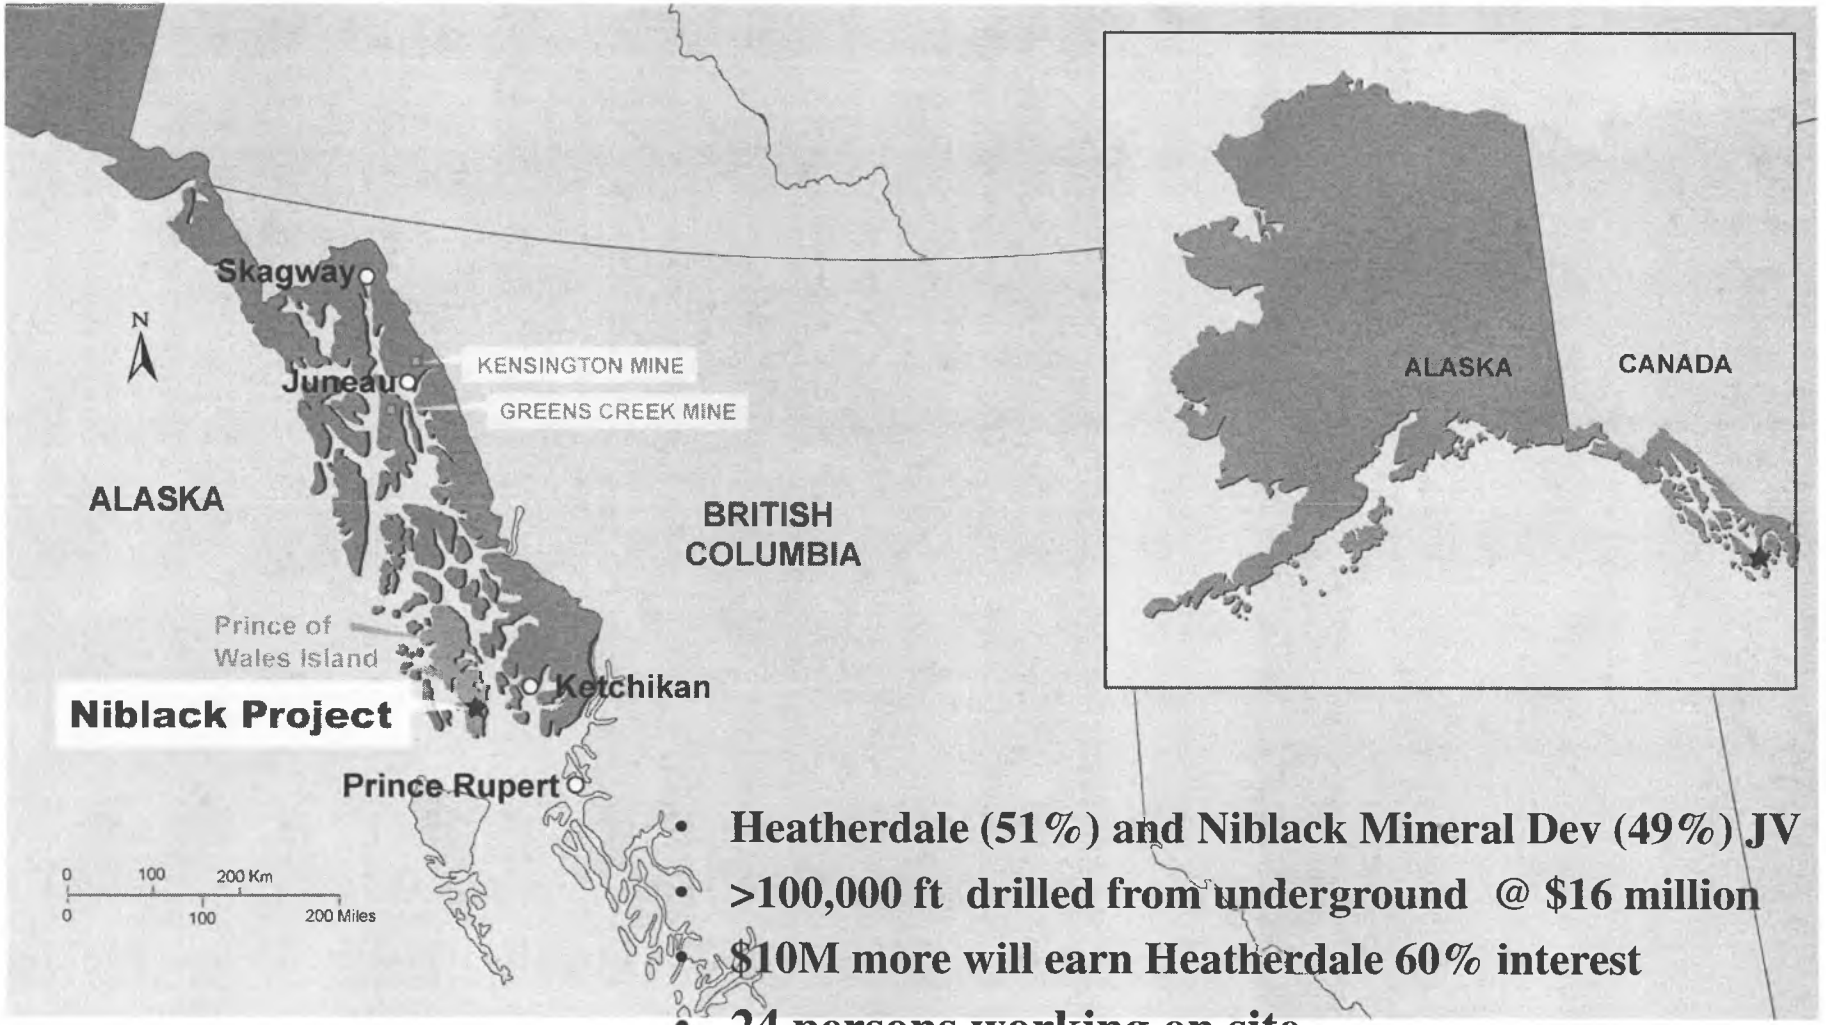
TALONGOLD
Alaska Inc. A SUBSIDIARY OF ITH

INTERNATIONAL TOWER HILL MINES LTD

Livengood Resource Growth

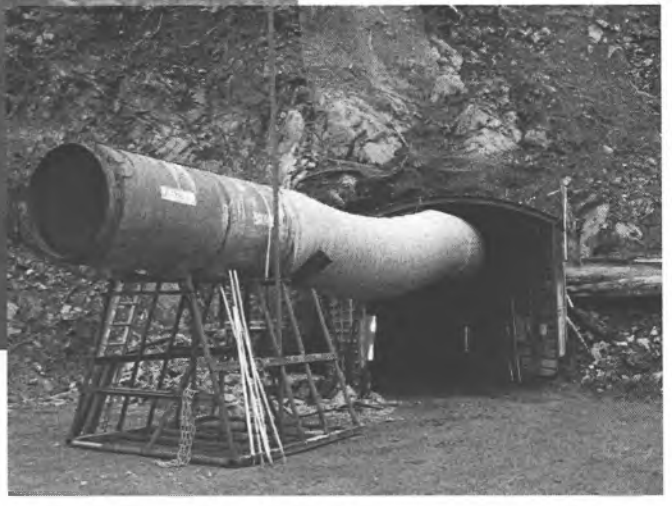


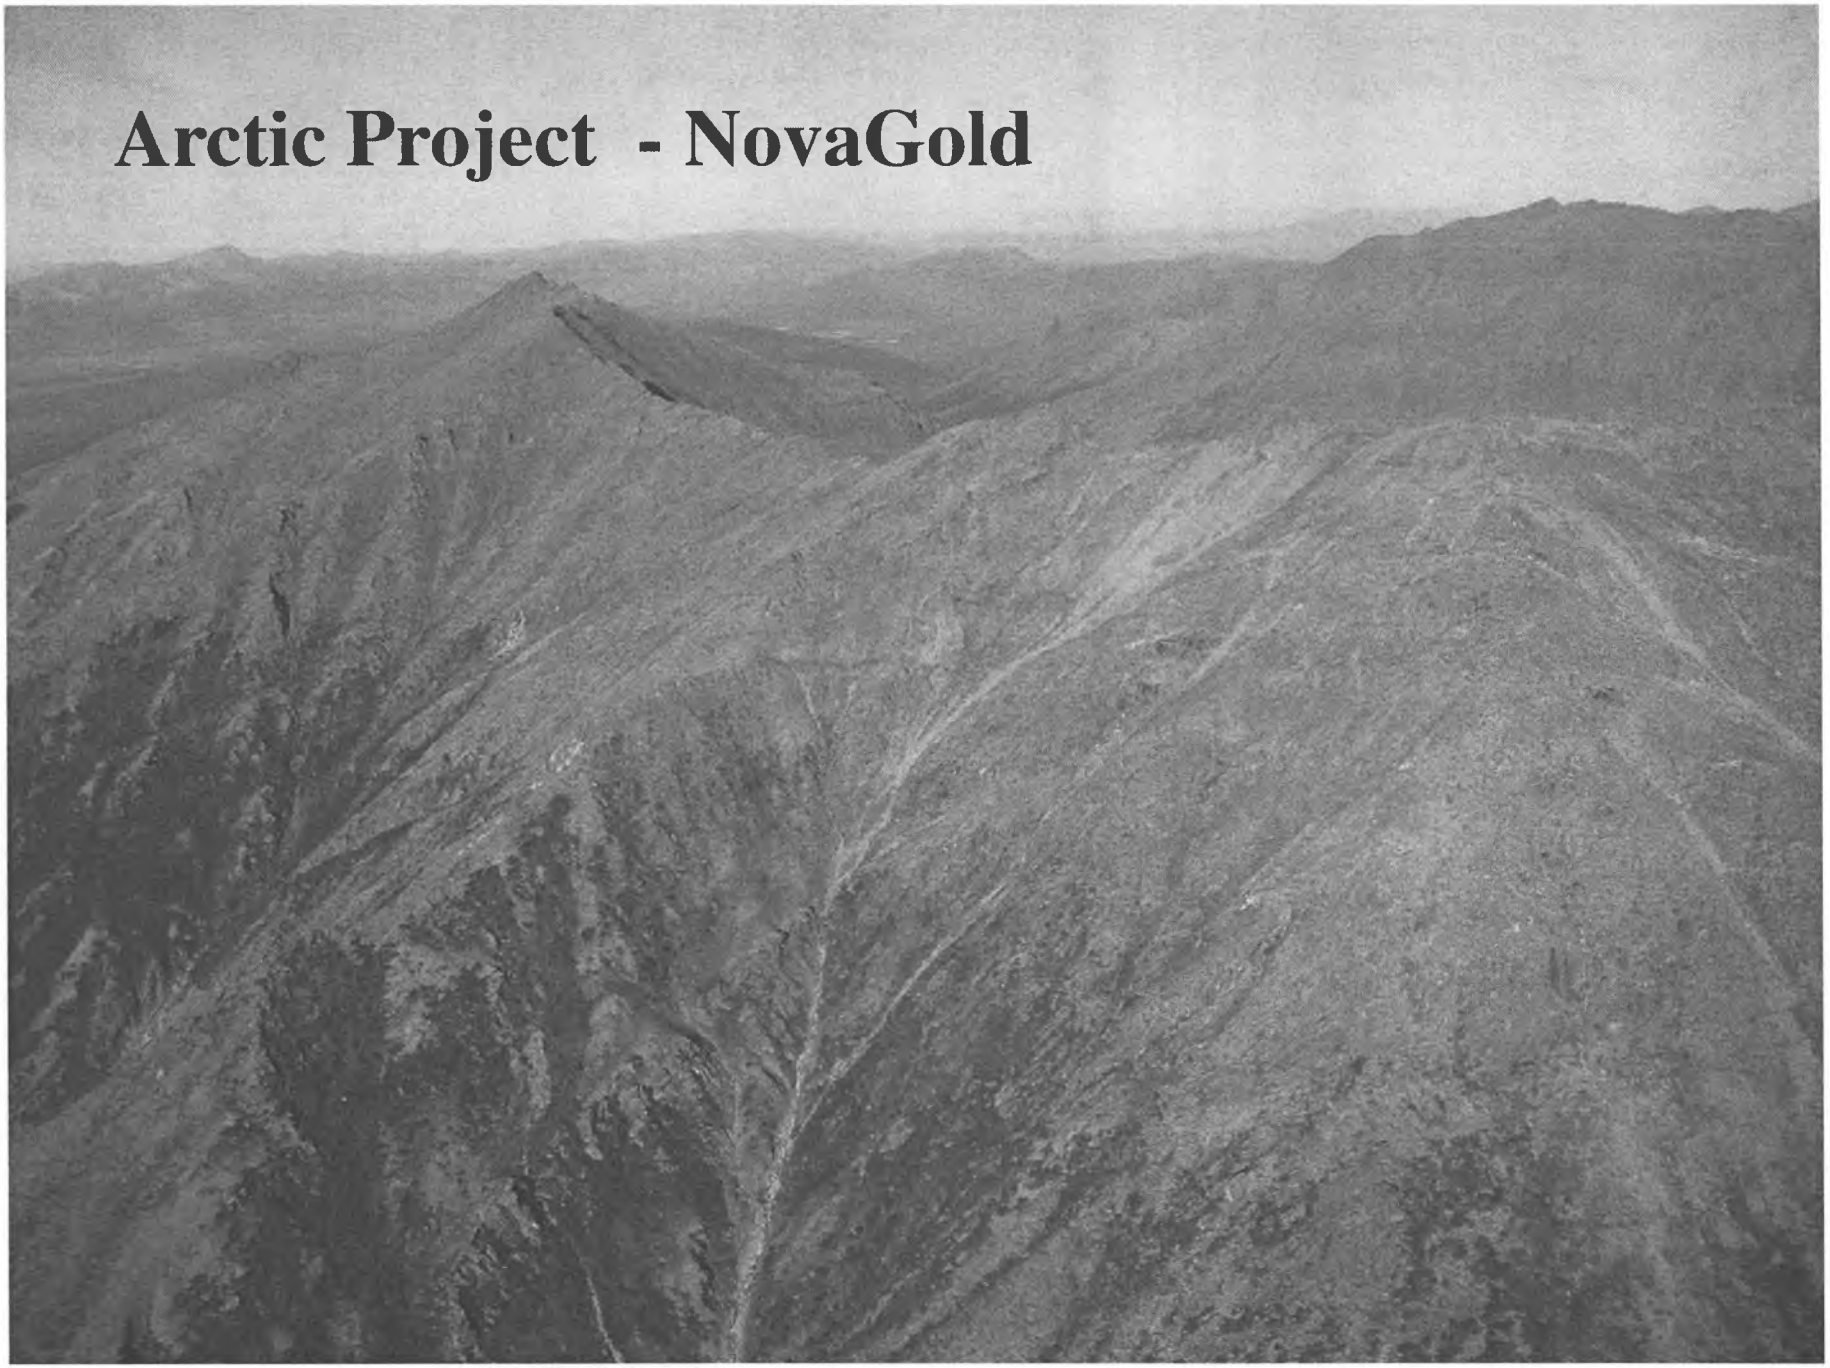
HEATHERDALE
RESOURCES LTD.



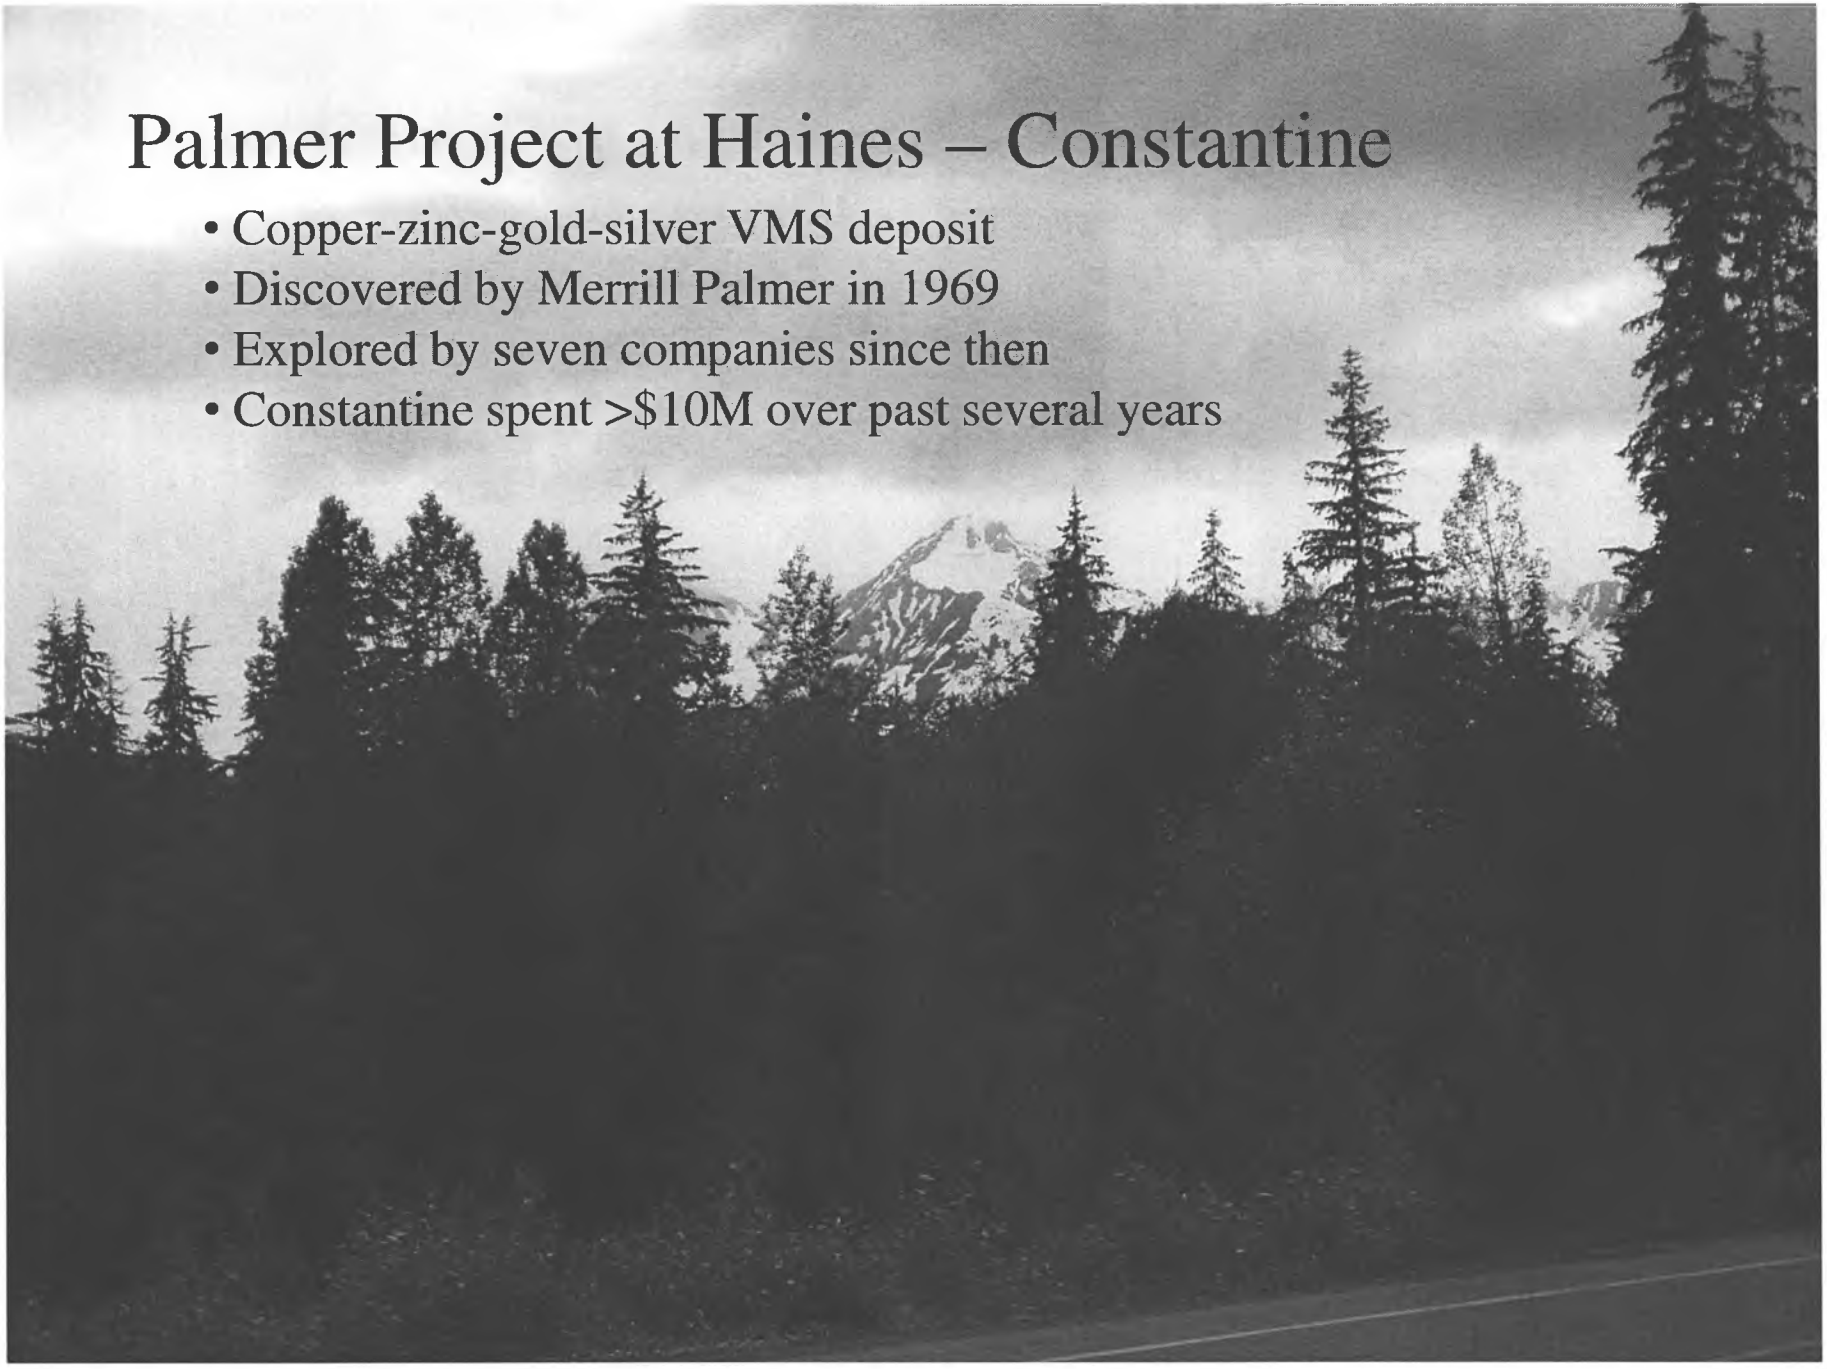
- **Heatherdale (51%) and Niblack Mineral Dev (49%) JV**
- **>100,000 ft drilled from underground @ $16 million**
- **$10M more will earn Heatherdale 60% interest**
- **24 persons working on site**
- **$50 million invested through 2010**

Niblack Project





Arctic Project - NovaGold



Palmer Project at Haines – Constantine
• Copper-zinc-gold-silver VMS deposit
• Discovered by Merrill Palmer in 1969
• Explored by seven companies since then
• Constantine spent >$10M over past several years

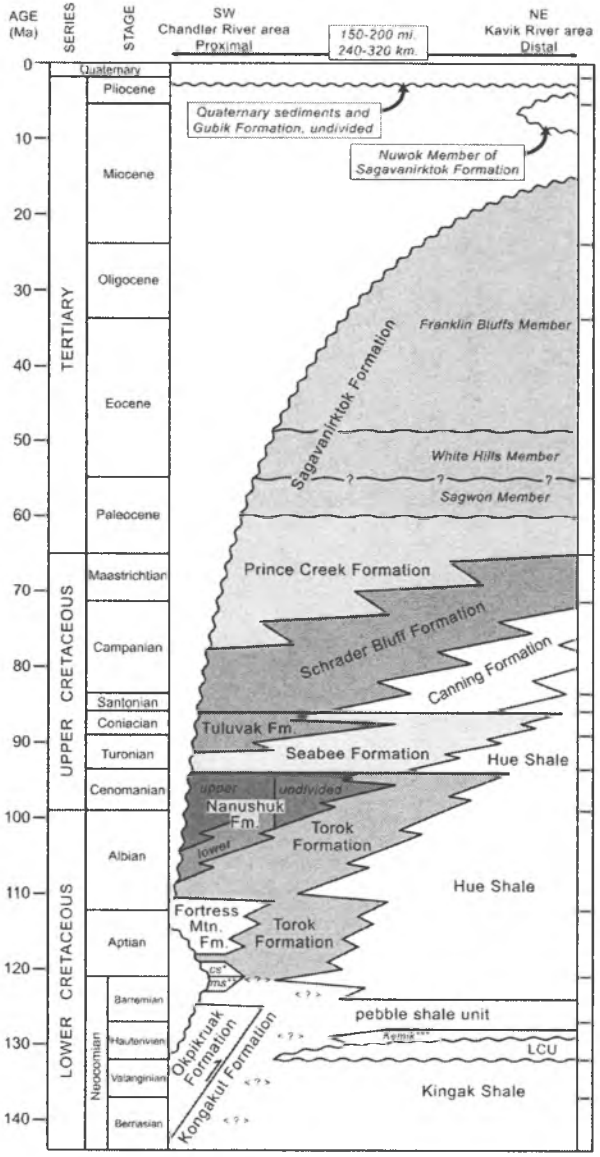
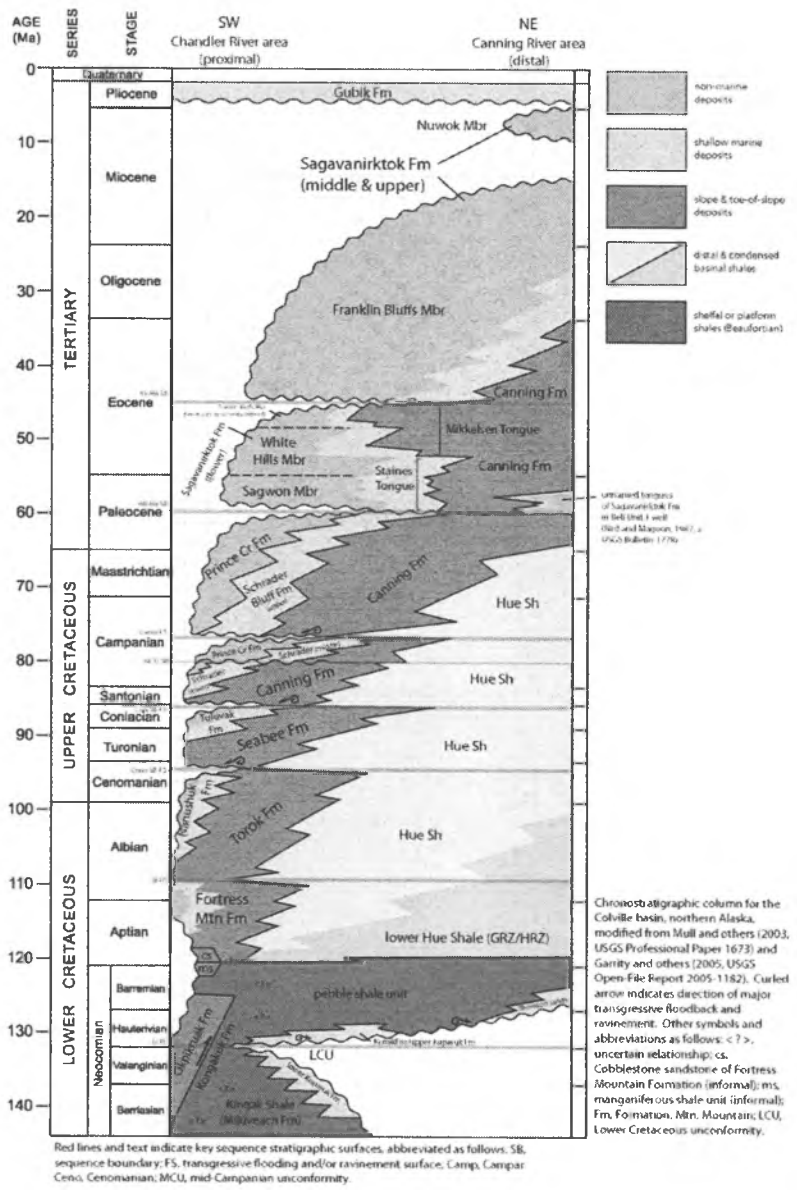
Revising and Codifying Stratigraphic Nomenclature

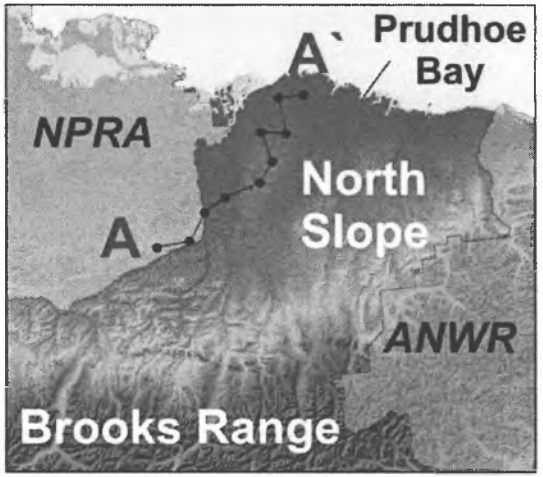




Chronostratigraphic column for the Colville basin, northern Alaska, modified from Mull and others (2003, USGS Professional Paper 1673) and Garrity and others (2005, USGS Open-File Report 2005-1182). Curled arrow indicates direction of major transgressive flooding and ravinement. Other symbols and abbreviations as follows: < ? >, uncertain relationship; cs, Cobblestone sandstone of Fortress Mountain Formation (informal); ms, manganiferous shale unit (informal); Fm, Formation; Mtn, Mountain; LCU, Lower Cretaceous unconformity.

Red lines and text indicate key sequence stratigraphic surfaces, abbreviated as follows: SB, sequence boundary; FS, transgressive flooding and/or ravinement surface; Camp, Campanian; Ceno, Cenomanian; MCU, mid-Campanian unconformity.

Merging Surface and Subsurface Data



- nonmarine undifferentiated
- shallow marine to proximal shelf ss.
- distal shelf ss. to sltst.
- toe-of-slope turbidites (sand-prone)
- shelf to slope mudst. to sltst.
- condensed or bentonitic sh.

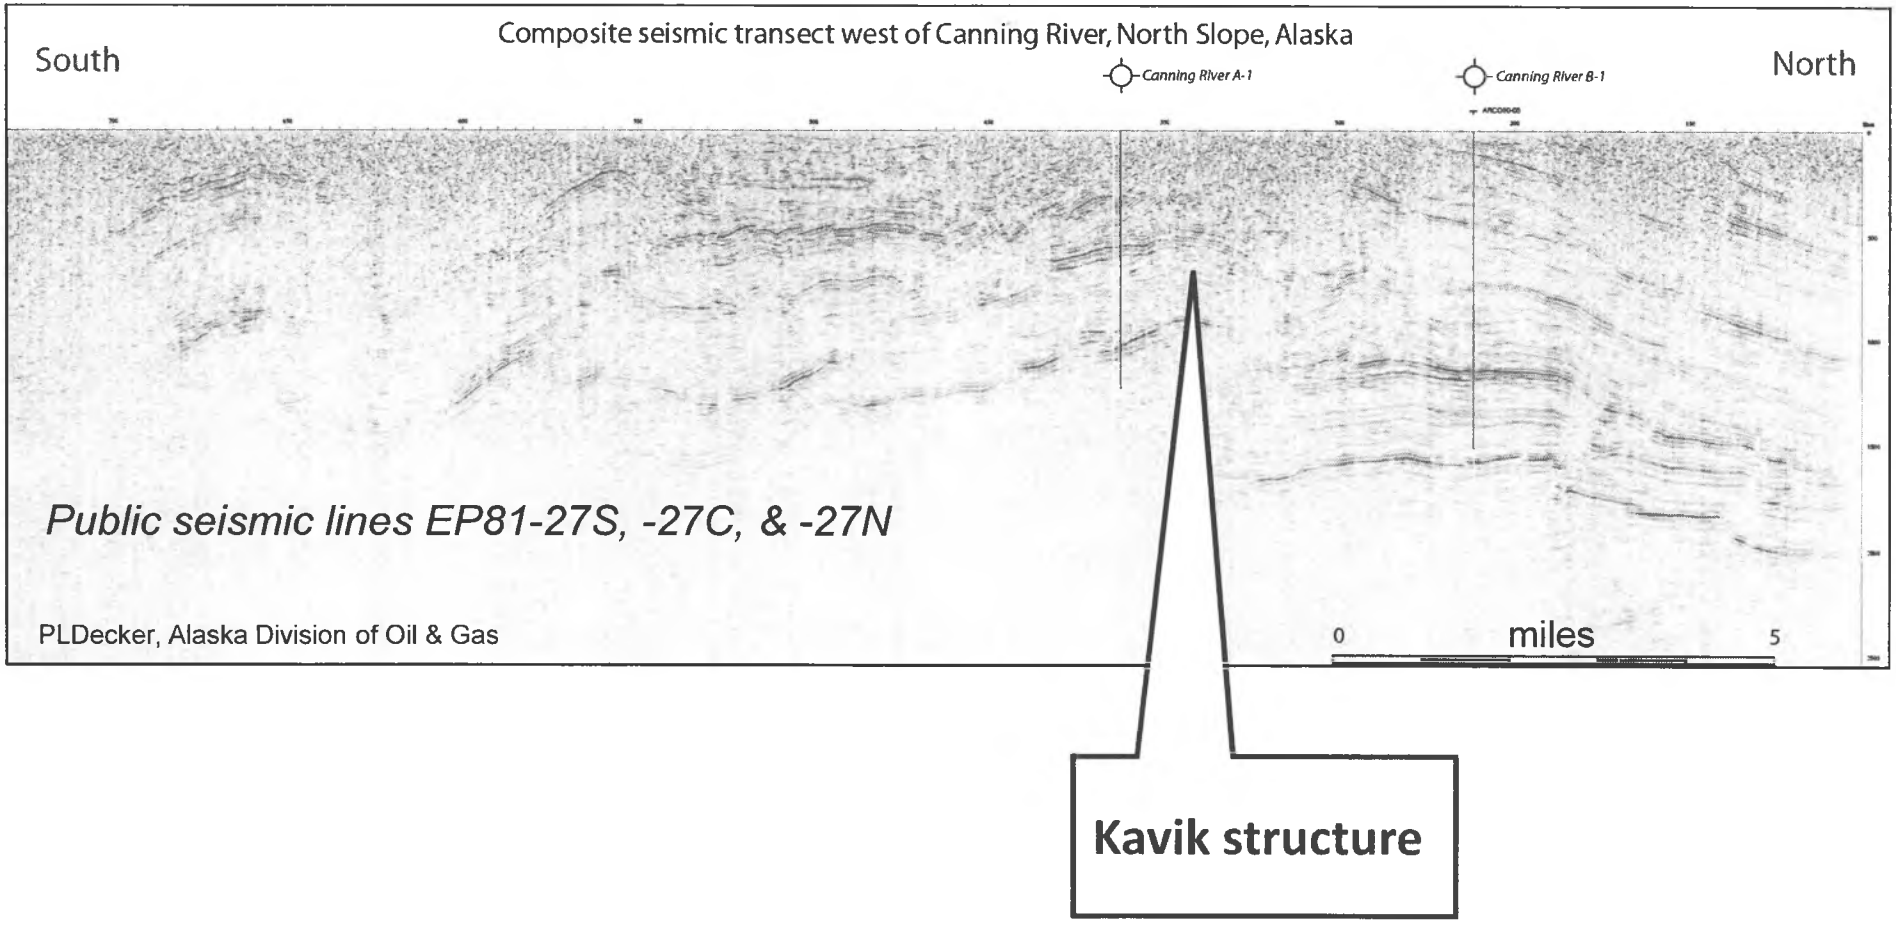
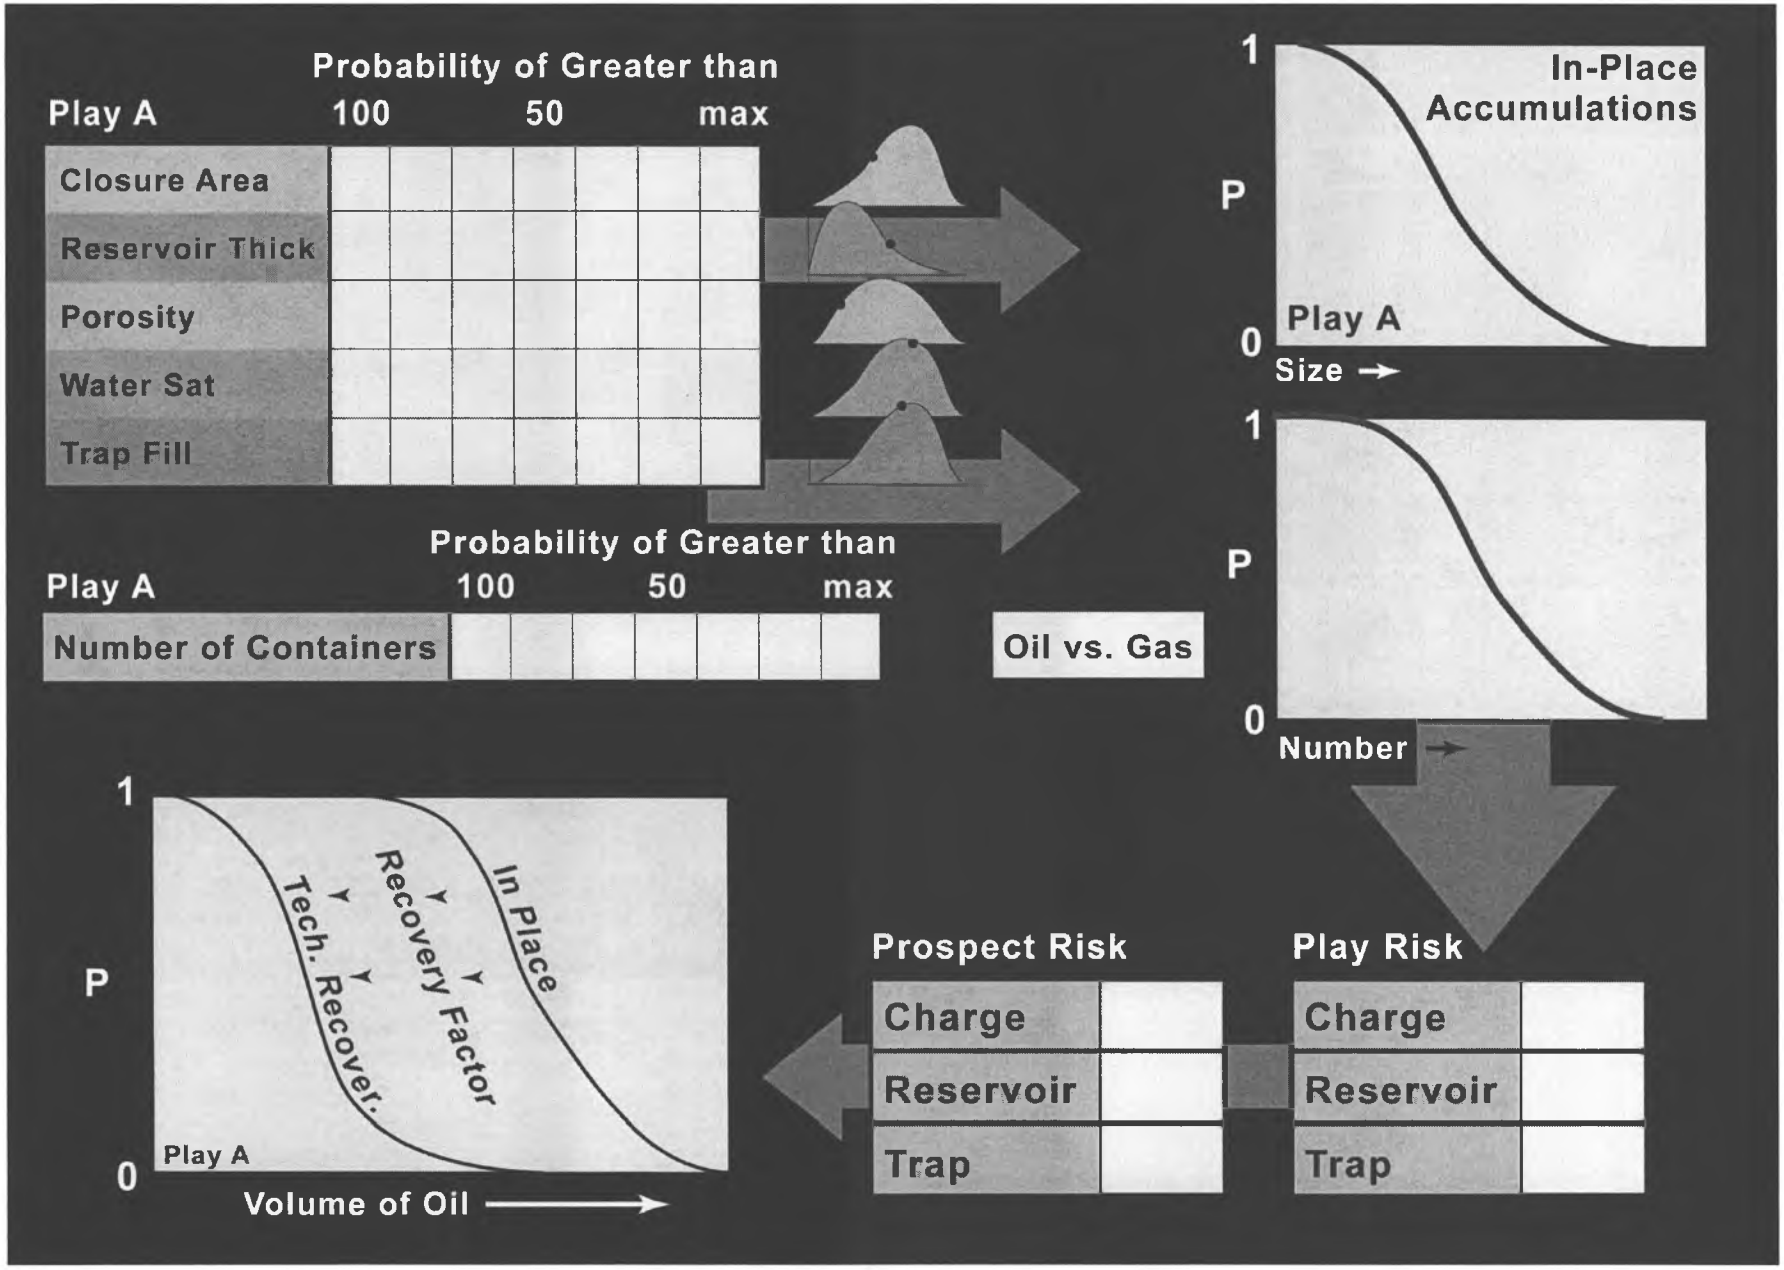
Seismic Interpretation

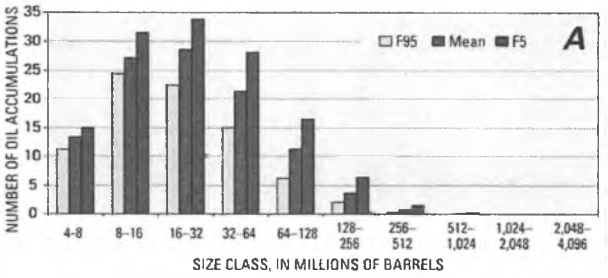


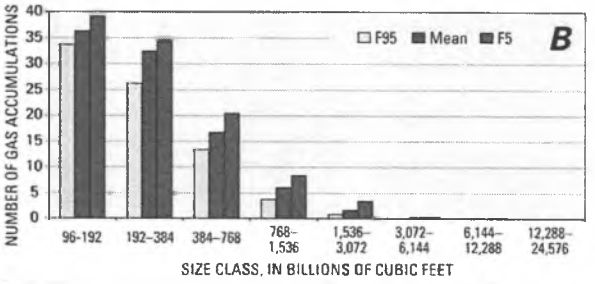
USGS Assessment Methodology – Geologic Basis



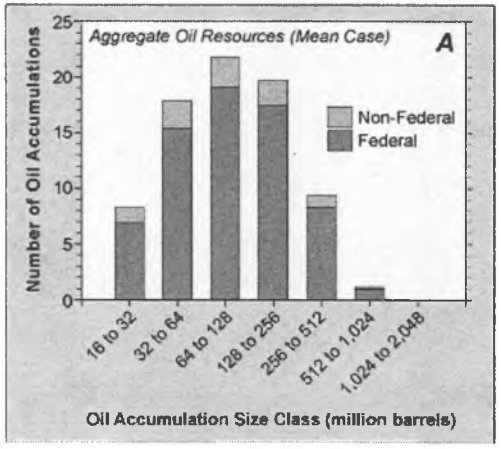
Undiscovered Mean Field Size Distributions - USGS

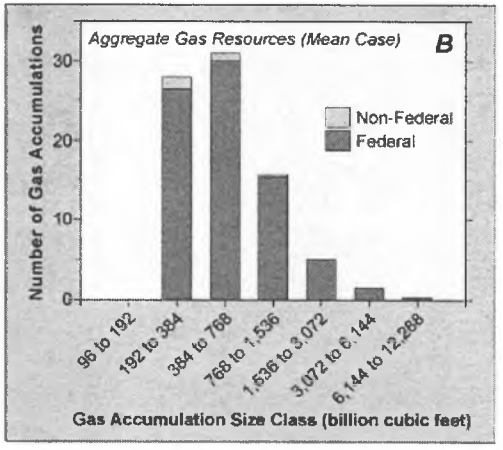
State Lands: ~1 undis-covered oil accumulation > 250 MMBO recoverable. ~ 2 undis-covered gas accumulations > 1.5 TCF recoverable.



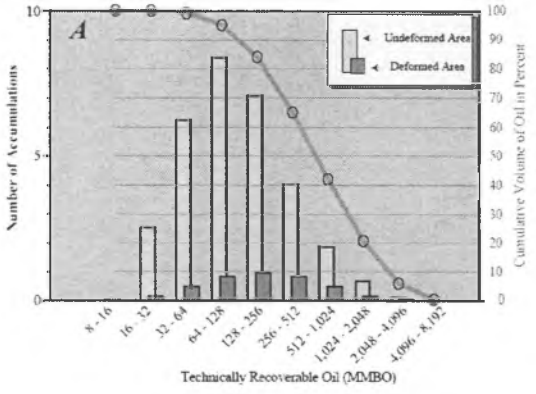


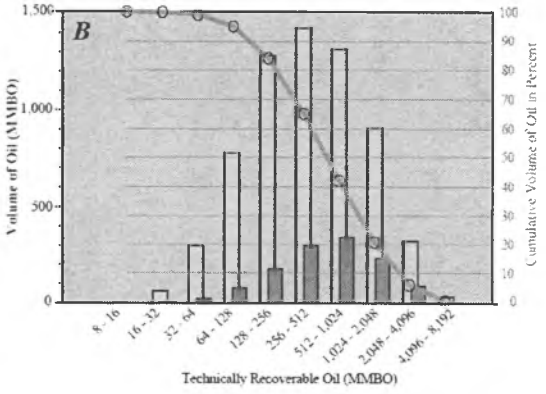
NPRA: ~11 undiscovered oil accumulations > 250 MMBO recoverable. ~7 undiscovered gas accumulations > 1.5 TCF recoverable.



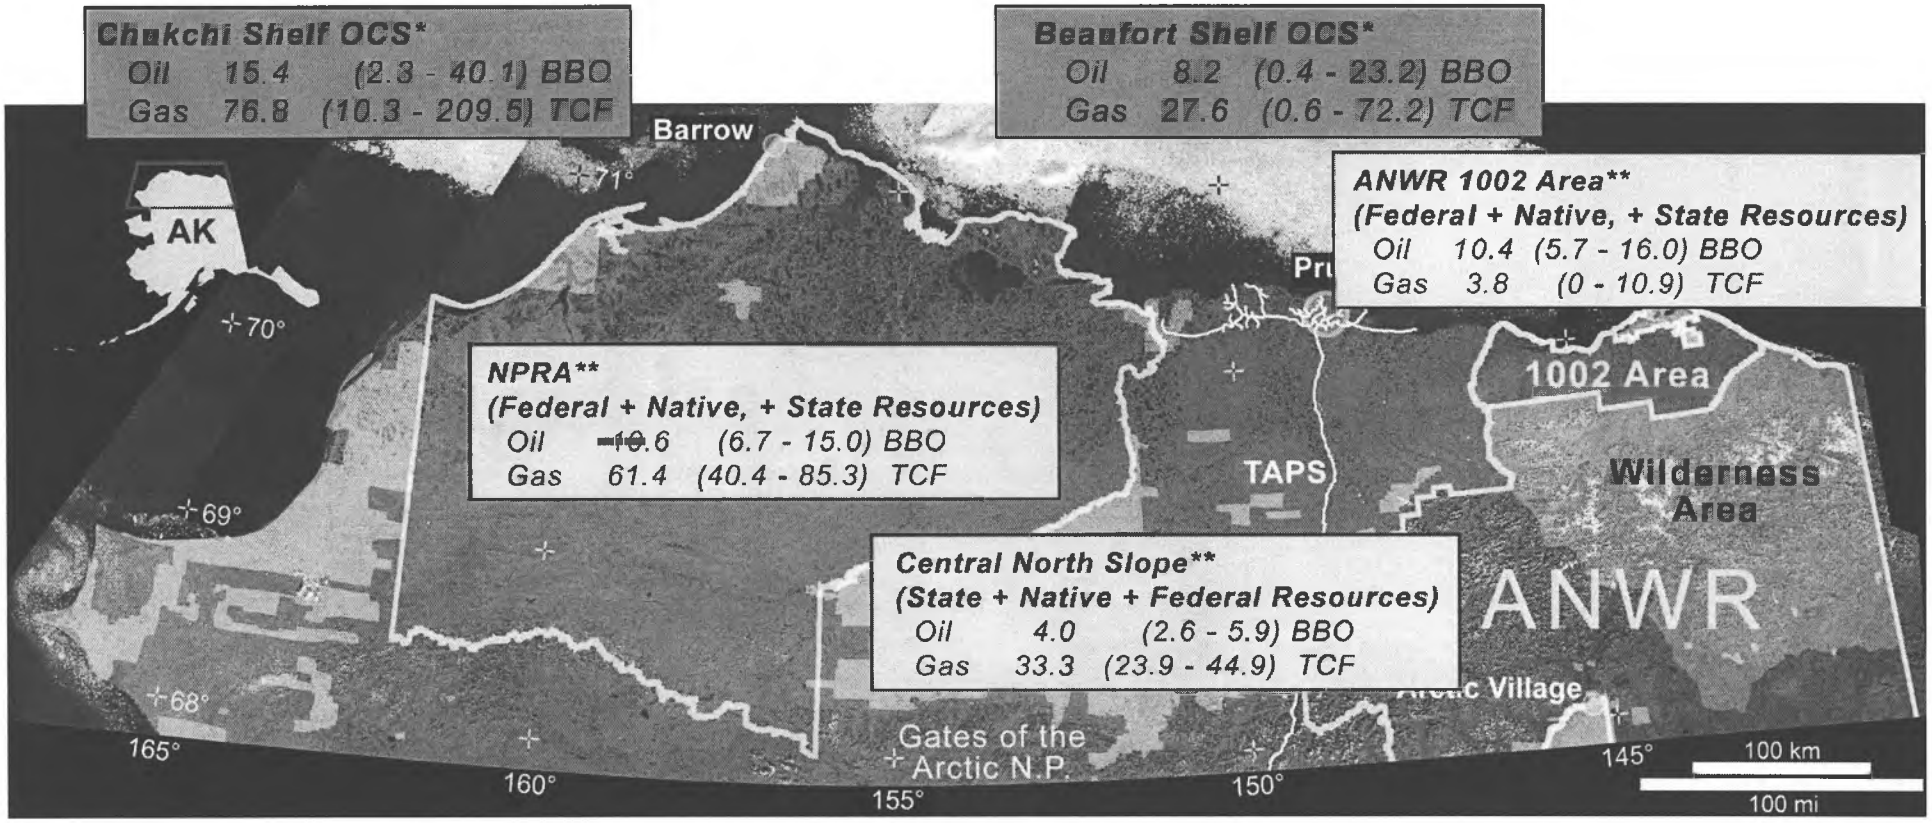


ANWR 1002: ~9 undis-covered oil accumulations > 250 MMBO recoverable (~65% of estimated total recoverable oil volume); gas resource not shown.





USGS Potential for Undiscovered Petroleum in Arctic Alaska



* Oil includes crude oil + natural gas liquids
Gas includes nonassociated + associated gas

** Oil includes crude oil only
Gas includes nonassociated gas only

Sandpiper	12	
FEX NPRA	300 – 400(?)	
Total Alaska/Beaufort	**1,299 – 1,984**	**600**

Various sources.

Other North Slope and Arctic OCS

Undeveloped Resource Estimates

- Ugnu (Kuparuk/Milne Point area)
  - Up to 20 billion barrels of ***heavy*** oil in-place
  - BP conservatively estimates that roughly 10 percent may be recoverable, 2 billion barrels
- Burger (Chukchi Sea)
  - 31 million to 1.7 billion barrels of condensate in-place
  - 8 to 27 TCF natural gas in-place

Source-Reservoired Oil Resources
Alaskan North Slope

Paul L. Decker, Petroleum Geologist

Alaska Department of Natural Resources, Division of Oil and Gas

February, 2011

Unconventional resources

Distinguished from conventional resources by

- **lower geologic risk…** hydrocarbons are almost certainly present everywhere within the play fairway

BUT

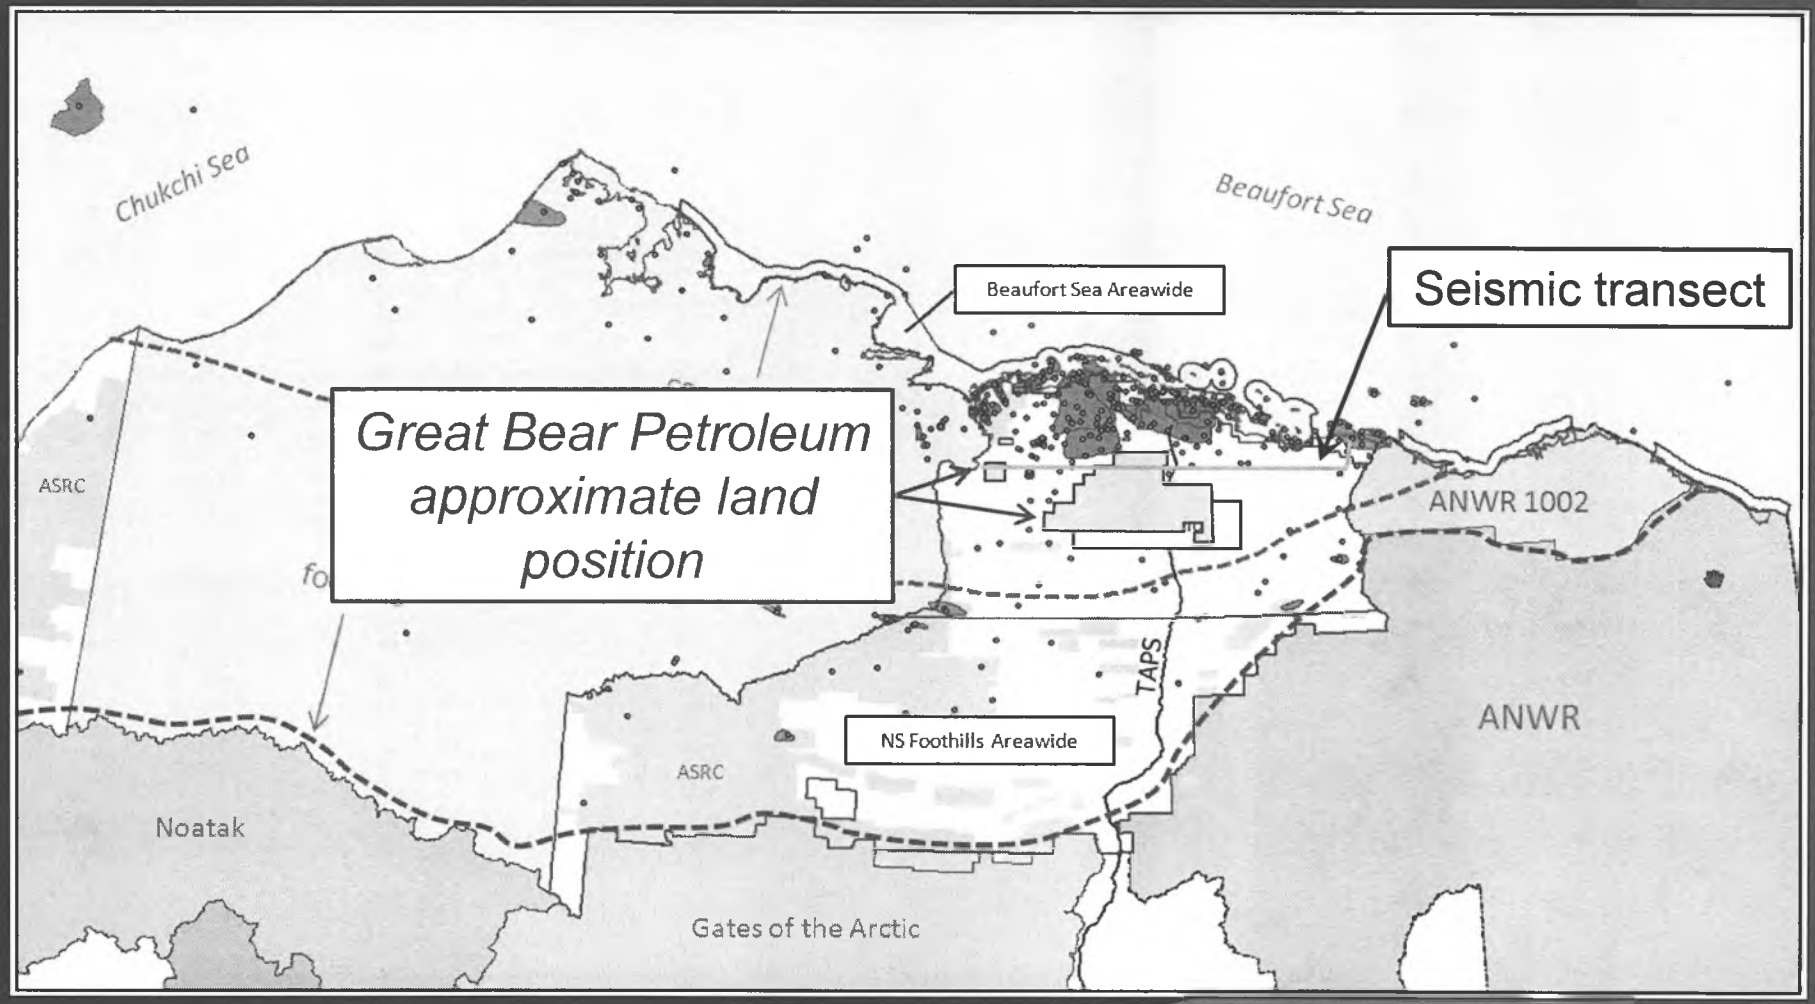
- **higher engineering risk…** not sure the resource will be recoverable everywhere (massive stimulations must succeed)

Unconventional terminology

Some terms are more specific than others

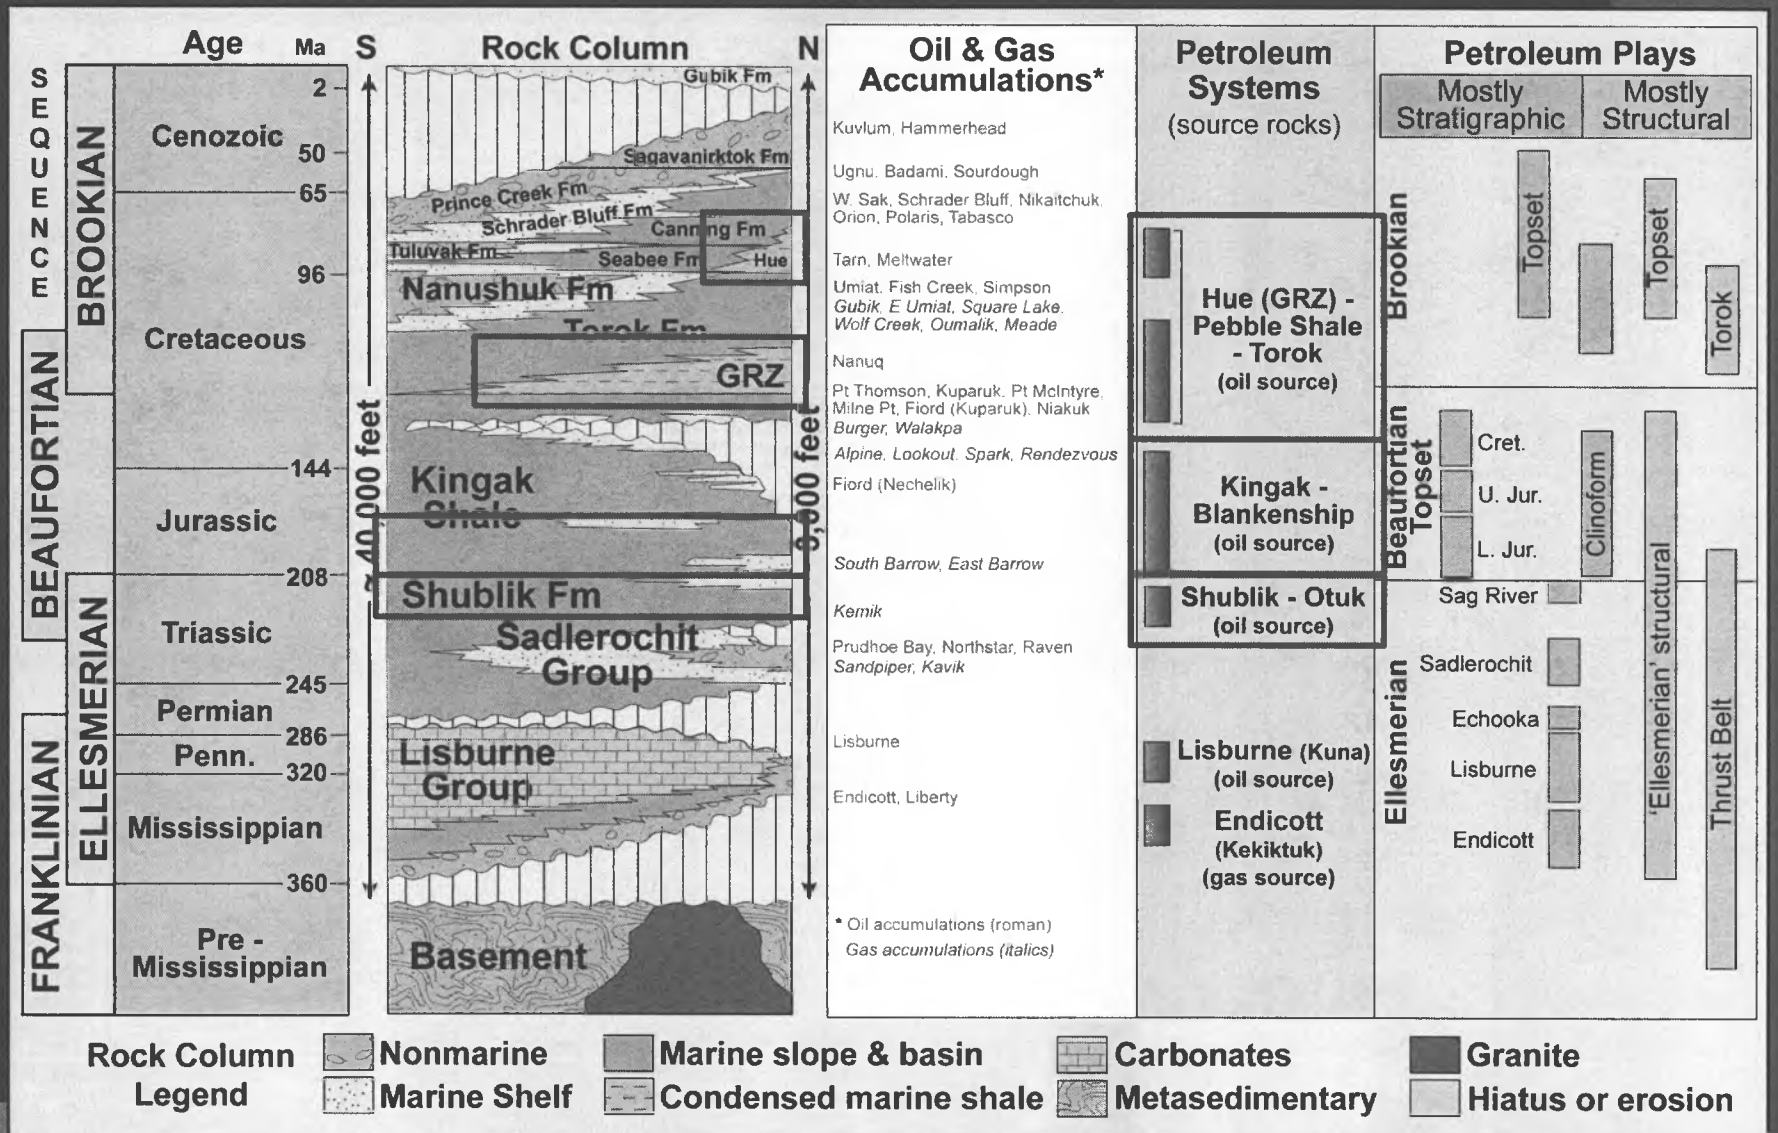
- Resource plays
- Continuous accumulations
- Basin-centered accumulations
- Technology reservoirs
- Tight oil / gas
- Shale gas / shale oil (≠ oil shale)
- Source-reservoired oil / gas
  - ✓ *Source = Reservoir = Trap*

North Slope Region



North Slope Petroleum Systems

3 prolific source rock intervals

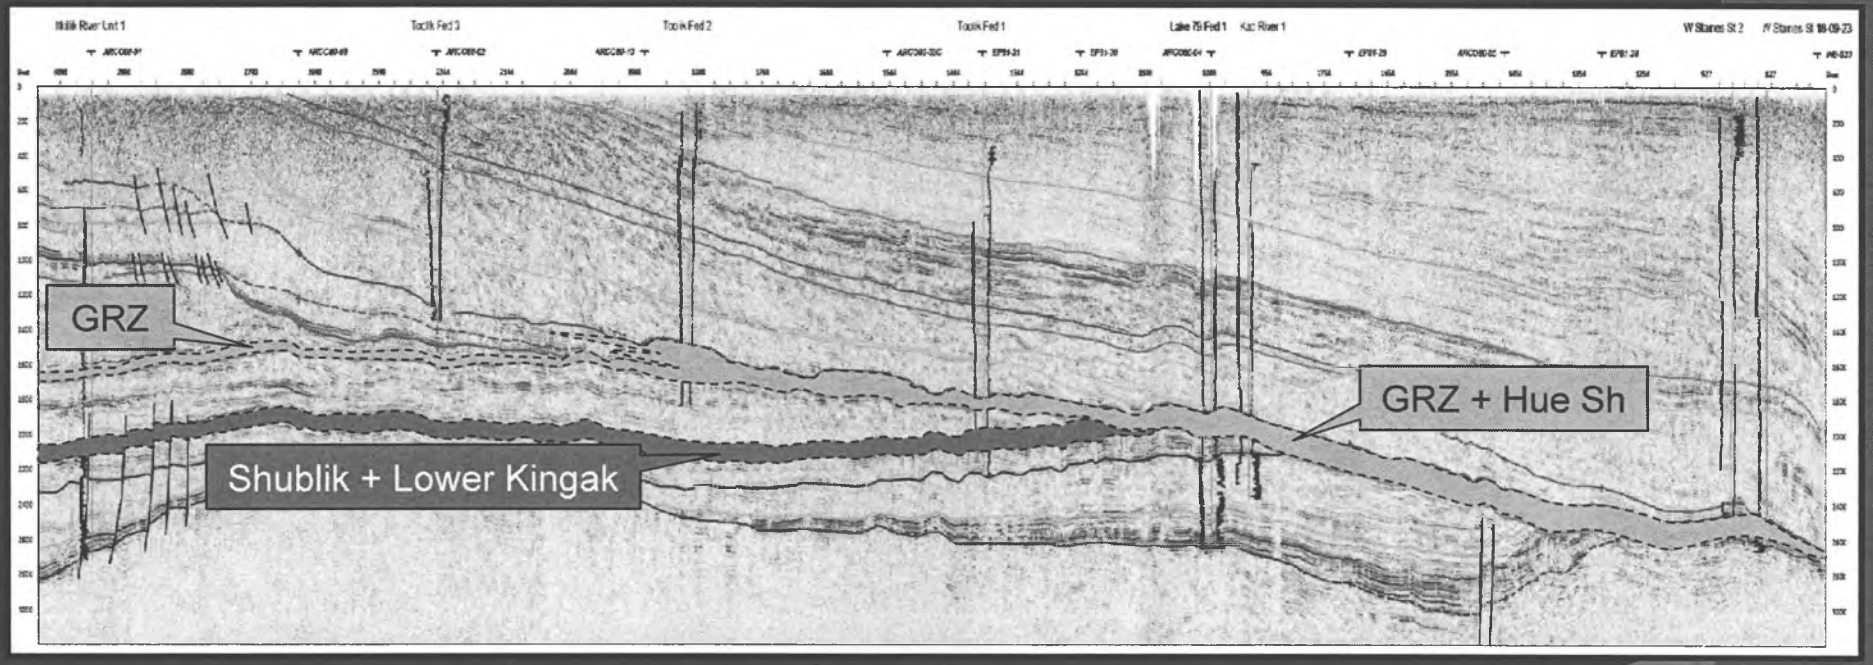


Modified by Alaska Division of Oil and Gas staff from Ken Bird and David Houseknecht (U.S. Geological Survey), personal communication, 2002

Central North Slope Seismic Transect

Public Seismic Line ARCO 80-07& 80-06

West *Total length ~120 miles* East



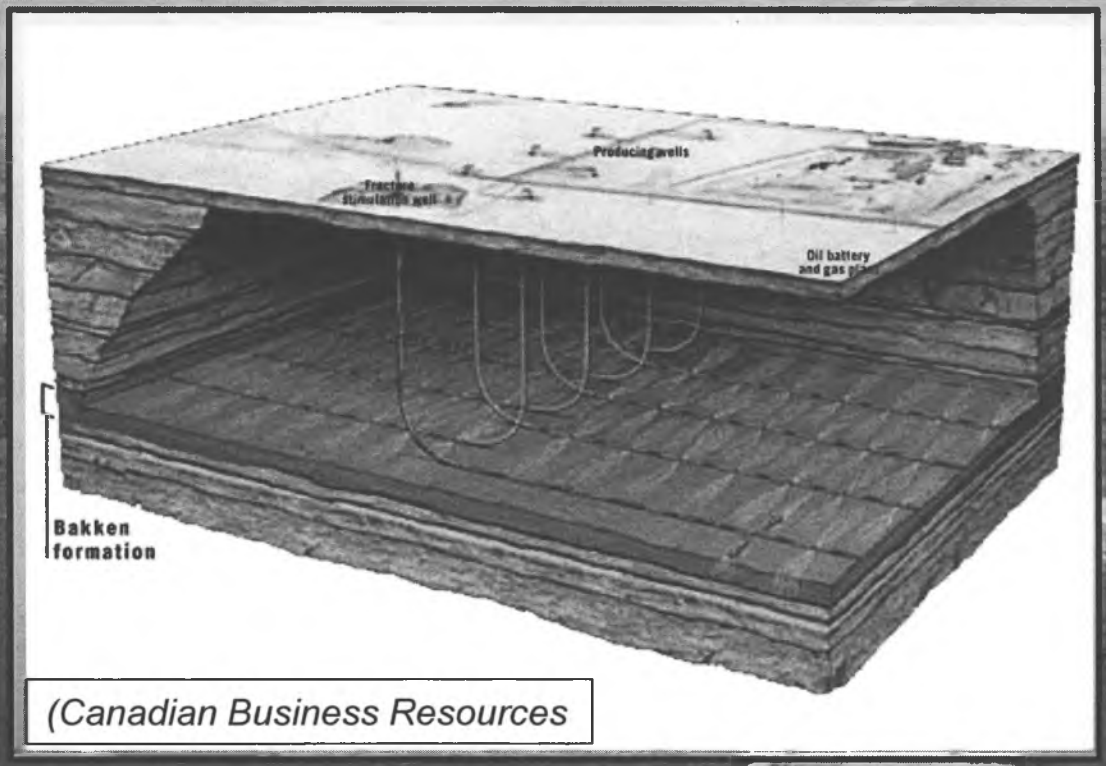
- GRZ-Hue Sh at ~8,000 – 13,000 ft depth
- Shublik + Lower Kingak at ~10,000 ft depth

(Decker, unpublished data, 2010-11)

Key Geologic Factors -- Shale Resource Plays

- **Organic Geochemistry**
  - Total Organic Carbon content (richness)
  - Hydrogen Index (oil-prone, gas-prone, or inert kerogen types)
  - Oil properties (gravity, in-situ viscosity, wax & asphaltene content, etc.)
- **Thermal and Tectonic History**
  - Thermal maturity (immature → oil window → gas window → supermature)
  - Stress-strain history (# of phases of natural fracturing, etc.)
  - Current stress regime (determines orientation of artificial fractures and whether natural fractures are propped open)
- **Petrophysics**
  - Porosity (void space between grains, within grains, and in fractures)
  - Permeability (how connected are pore spaces?)
  - Relative Permeability (oil, gas, water – which flows more readily?)
- **Geomechanics** -- Is the rock brittle enough to create and sustain fractures?
  - Cement content and types (carbonate, silica, sulfides, etc.)
  - Grain content and types (silt, sand, fossil debris, etc.)
  - Layering (thickness and mechanical contrast)

Close Well Spacing, Many Pads



(Canadian Business Resources

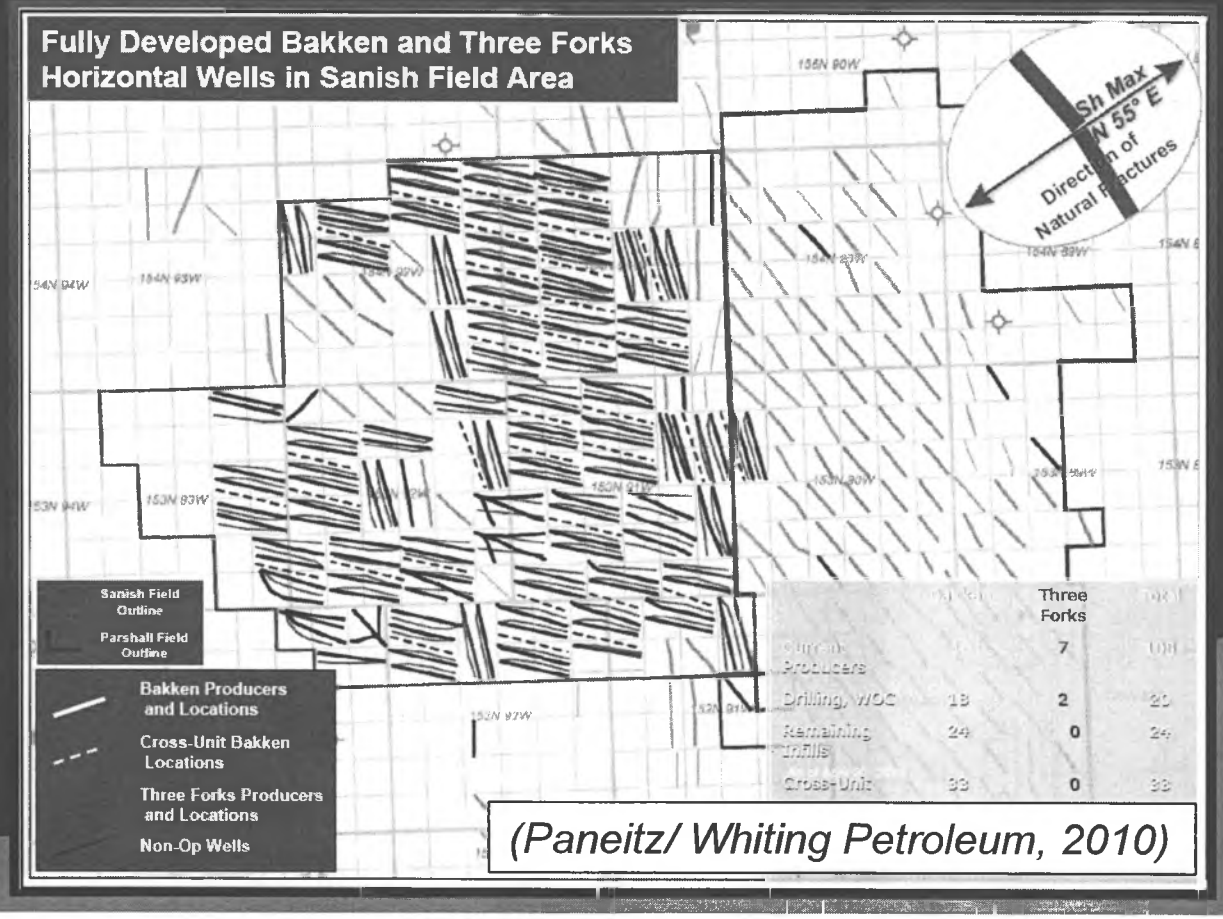
70 acres total surface impact (14 pads, 5 acres each) → 17,920 acres of subsurface development (2 mile-long laterals on each side of road times 7 miles length times 640 acres/mi²)

(courtesy Lynn Helms NDIC, DMR, 2011)

Close Well Spacing, Many Pads

Infrastructure-intensive development

- Bakken Shale — 640 acres/well (Sanish & Parshall Fields)
- Eagle Ford Shale — 125-140 acres/well (EOG plans)
- North Slope ? — 120-060 acres/well (Great Bear estimates)



Frac FAQs

- How do they work?

  Fluid (water + sand + additives for gelling and gel-breaking, etc.) is pumped into an isolated part of the borehole under increasing pressure. When the fluid pressure exceeds the rock strength, the formation fractures and the sand-rich fluid shoots out into the growing cracks. The sand props the fractures open after the frac fluid flows back into the wellbore.

- How much water do they use?

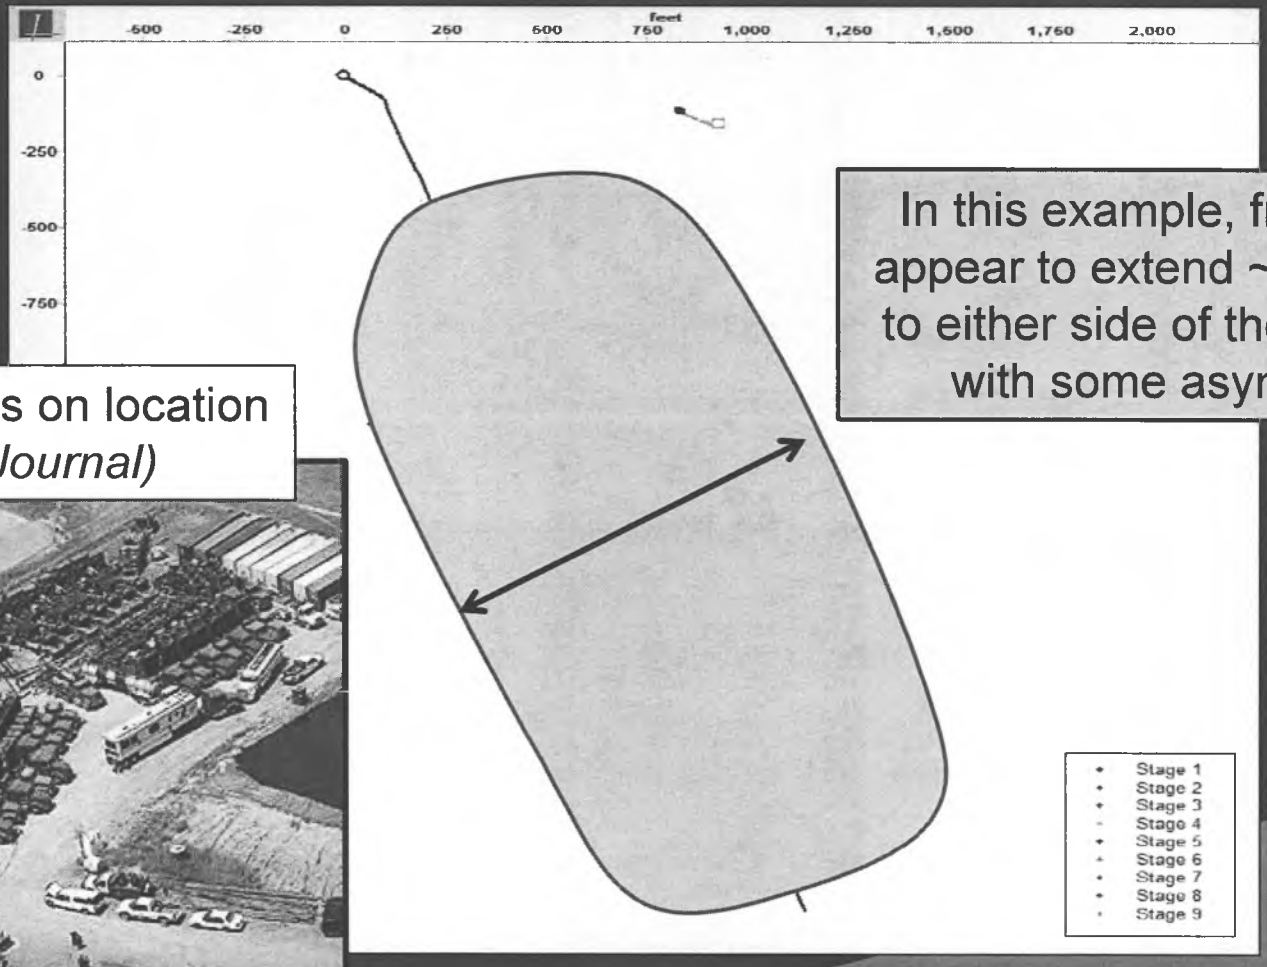
  Frac jobs for horizontal producers in L48 shale plays consume 1 to 5.5 million gallons of water (and millions of pounds of sand) per well, depending on rock properties, number of stages pumped, etc.

- What are the environmental risks?

  Contamination of fresh water aquifers with hydrocarbons and/or frac fluids can occur where the hydrocarbon target and aquifer are not sufficiently separated. ***THIS SHOULD BE AVOIDABLE!***

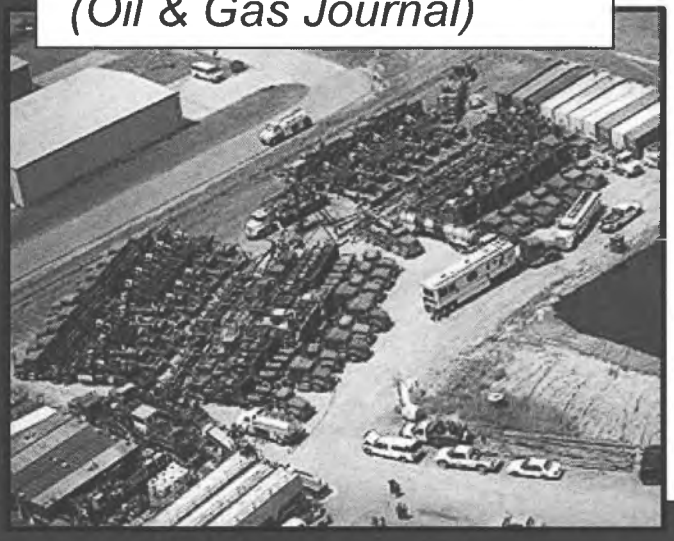
Frac Jobs

Where are the fractures and how far do they extend?



In this example, frac wings appear to extend ~450-550 ft to either side of the wellbore with some asymmetry

34 frac trucks on location
(Oil & Gas Journal)



Microseismic map of 9-stage hydraulically fractured horizontal well *(Bello, 2009)*

Single well flow rate over time

Overpressure	Yes	Locally	?	Probably	Locally

(compiled from various sources, Decker, 2011)

Summary

- Many variables impact productivity of source-reservoired oil and gas
  - Organic geochemistry
  - Thermal and tectonic history
  - Petrophysics
  - Geomechanics
  - Drilling and completion practices
- Development of North Slope shale oil will likely depend on
  - Successful exploration drilling, data gathering to establish geological favorability
  - Successful production pilot project(s)
  - Lowering drilling and operating costs
  - All-season roads for year-round surface access to new areas
  - More hydraulic frac crews
  - Sufficient water supplies for frac make-up fluid
  - Factual understanding and operator transparency regarding frac practices

2/26/11 PRESENTATIONS: CALISTA REGION ALTERNATIVE ENERGY UPDATE AND GREAT BEAR PETROLEUM

<TARGET><BILL></BILL><SUBJECT>2-26-11 PRESENTATIONS CALISTA REGION ALTERNATIVE ENERGY UPDATE AND GREAT BEAR PETROLEUM</SUBJECT><COMM>SRES27</COMM></TARGET>

Calista Region

Alternative Energy Update

Nuvista Light & Electric Cooperative

2011

George Paul Guy, Nuvista Cooperative Chair

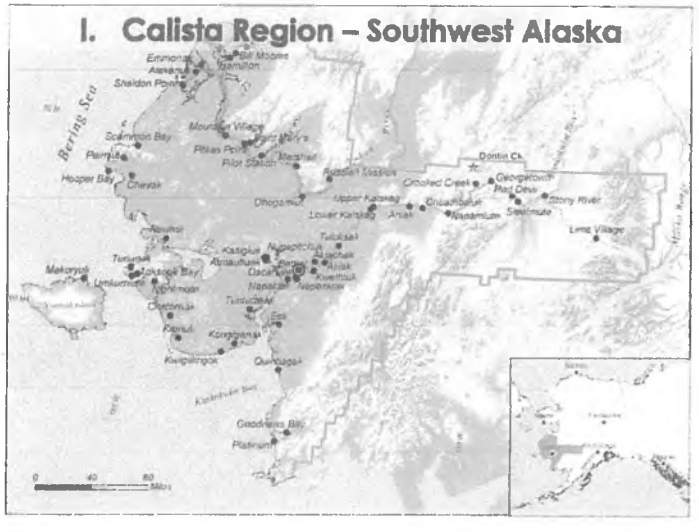
Andrew Guy, Calista President/CEO

Christine Klein, COO

Outline

I. Who We are
II. Energy: Where We've Been & Found
III. Potential Alternative Energy Solutions
IV. Forward to the Next Steps

I. Calista Region – Southwest Alaska



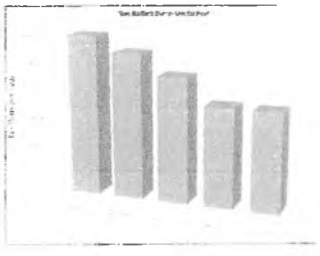
I. Nuvista Cooperative Formation

Non-profit established 1995:

- Utility Cooperative
- Common Goal: to reduce electrical costs to residents
- Assess high cost of power, demands and find alternatives
- Organized as a cooperative to function as a future regional Generation & Transmission utility

- Association of Village Council Presidents (AVCP)
- Yukon Kuskokwim Health Corporation (YKHC)
- AVCP Regional Housing Authority (AVCP-RHA)
- Calista Corporation
- Chaninik Wind Group
- Middle Kuskokwim Electric
- Lower Yukon Representative

I. Region Energy Situation



Diesel

- Region primary home heating fuel, ranges $6.14 to $9.50/gallon
- Fuel deliveries by barged 1-2X year
- 50% of family incomes go to home heating, now grown to 75% income
- Families having to choose between food vs. heating

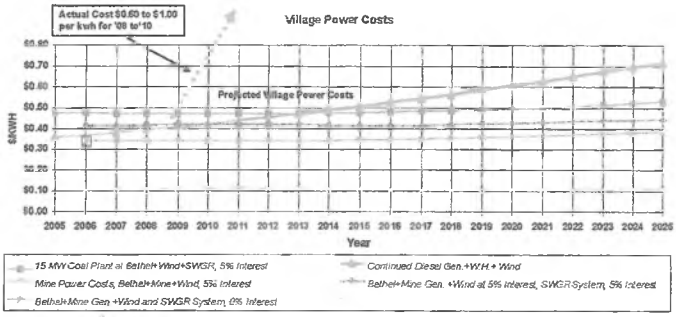
Electricity

- Region small independent village diesel generators
- Household use is 50% Natl Average
- Cost $0.52 to $1.00 per kilowatt hour
- Escalating cost of energy
- PCE cannot keep up

II. Where We've Been

- Over 21 Energy Studies, Data, and Reports since '75.
- >41 largely independent aged diesel power generator plants
- Village generators use >20 million gallons of diesel year
- Transmission lines needed
- 65Mw electrical demand for Bethel +14 villages by 2020
- Coal & Hydropower listed repeatedly as feasible options
- Energy costs escalating

II. Electric Cost Projections (2002)

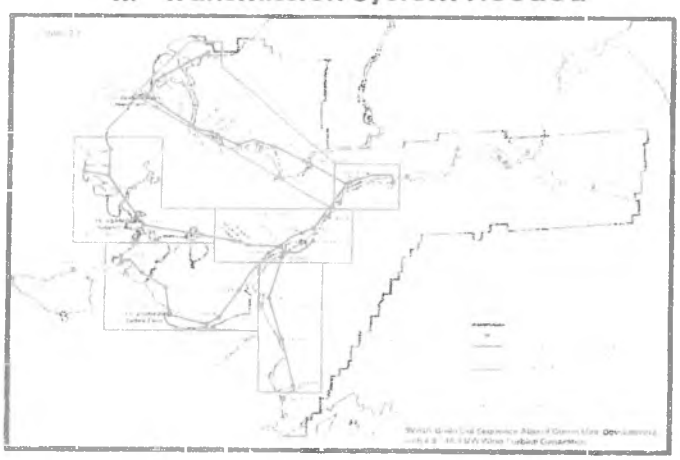


II. Found Energy Needs Varied

Region Villages Vary:

- Diverse Village options
- Conservation Underway but not the complete solutions
- Some Coastal Villages proceed w/ wind generation but there's limited application in region
- Some villages have small needs
- ***One size doesn't fit all!***
- Sub-region Bethel +13 villages 65Mw electrical needs by 2020

II. Transmission System Needed



II. Energy Alternatives Considered

Alt. Energy Type	*Cost to Construct*	*Cost to Operate*	*Use Cost per Kw*	*Capacity to Demand 65kw*	*Public Perception*	*Likelihood or Feasibility*
Diesel (do nothing)	Existing	High	High	Same	-	Existing
Geothermal	High	Low	-	None	Positive	Small
Wind Power	Medium	Low	Low	Low	Positive	Limited
Hydropower	High	Medium	Medium	High	Neutral	High to Medium
Coal Power Plant	High	Medium	Low	High	Negative	Medium to Low
Nuclear Power	Low	Low	Low	High	Very Negative	Poor to None

III. Future - Remaining Candidates

- **Wind Turbines**
  Variable – region precedent, low power production capacity, augments needs, does not work for all areas of region.
- **Coal Power Plant**
  Bethel 15-60 Mw Plant - negative public perception, would provide the cheapest and greatest energy capacity.
- **Hydroelectric Power**
  Kisaralik River – 3 sites Yukon Delta National Wildlife Refuge
  Chikuminuk Lake - in Wood Tikchik State Wilderness park, could provide clean, mid cost, proven alternative energy.

III. Remaining Hydroelectric Sites

III. Hydroelectric Feasibility Findings

Site	Distance miles	Head ft	Generating Capacity (MW)	Year Around Seasonal	Average Annual Energy (GWh)	Projected 2022 Demand GWh	Useable Energy 2022 GWh
Chikuminuk Lake - Allen River Outfall	118	91	13.4	Y	89.3	64.9	65+
Kisaralik - Upper Falls	70	149	27.7	S	89.5		39.7
Kisaralik - Lower Falls	62	122	34.1	S	128.3		46.9
Kisaralik - Golden Gate	57	78	27.0	S	95.3		38.8

IV. Moving Forward & Ahead

Selection of Option(s):

- Nuvista Team & Stakeholders Reviewed latest Findings
- Board Unanimous Decision made to move ahead with request for Hydropower Design Feasibility for Bethel Area.
- Hydro option of Chikuminuk Lake has year around capability to supply ¼ region's population, 13 villages, and displace diesel

A. Bethel Area Sub-Region

Complete plan and project(s) underway to educe energy cost, and integrate those with the larger Region-Wide plan

B. Region-Wide Alternative Energy Plan

Begin a comprehensive region wide alternative energy plan that integrates the work already done and underway to guide future development

IV. Preferred Alternative

Site	Construction Cost in 2010 dollars	Design Cost	Total Project Cost	Estimated 20 year Cost/ Kwh	Meets Bethel Sub-Region 2020+ Demand?
Chikuminuk Lake Outfall	$361.7 M	$81.3 M	$483 M	$0.70-0.58	Yes
Kisaralik Upper Falls	$386.4 M	$92.6 M	$479 M	$0.70-0.65	No
Kisaralik Lower Falls	$329.5 M	$78.5 M	$408 M	$0.70-0.65	No
Kisaralik Golden Gate	$305.5 M	$72.5 M	$378 M	$0.70-0.65	No

IV. Current and Next Tasks

- Complete Hydroelectric Feasibility Study - 1/2011
- Nuvista Board Decision to Proceed Ahead - 1/2011
- Hiring Project Manager to develop scopes, lead public process, oversee work - 4/2011
- Complete Public Hearings and Preferred Alternative designs Spring – Fall 2011
- Start a Comprehensive Region wide Alternative Energy Plan
- Initiate Federal FERC and ROW Processes

IV. Action: Energy Capital Request

Hydroelectric Energy Tasks	Lead Agency	Schedule	Funding	Cost (millions)
1a Detailed Feasibility Assessment, Permitting, Engineering Plans, Licensing	Nuvista, FERC	2011 2014	State	$5.88M
1b Preliminary Design, Site Field Investigations, Specifications	Nuvista AEA	2011 2016	State	$11.75M **$17.6M**
2. Transmission rights-of-ways, and land easements	Nuvista DOI/BLM	2012-20 15	DOI	$7.83M
3. Final Designs, Permits, Mods, and Construction Oversight	Nuvista AEA	2016 2018+	AEA Bonds	$35.25M
4. Construction	TBD	2018 2021	AEA Bonds	$391.7 M

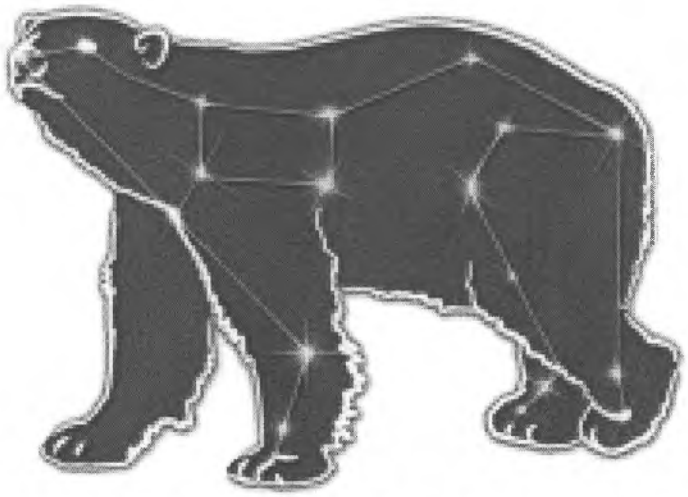
IV. FY2012 Capital Request

Region: Calista/AVCP Southwest Alaska

Project: Chikuminuk Hydroelectric Alternative Energy

Scope: Complete Detailed Feasibility Report, Site Field Investigations, Reconnaissance, Hydrologic Monitoring, Surveys, Permitting, Engineering Plans, FERC Licensing, and Specifications

Cost: **$17,630,000.**



Great Bear Petroleum LLC

Corporate Presentation

Alaska State Capital: Juneau

26th February, 2011

Introducing Great Bear Petroleum

Disclaimer

- Great Bear Petroleum LLC (the "Company") has prepared this presentation for the sole purpose of providing preliminary background, strategic, financial and other information to enable interested parties to review the business activities and objectives of the Company. It is not intended as an offer, invitation, solicitation or recommendation with respect to the purchase or sale of any securities.

- This presentation and its contents is made available in confidence and may not be reproduced or disclosed to third parties or made public in any way without the prior express written permission of the Company.

- The Company and its respective managers, members, officers, employees or agents do not make any representation or warranty, express or implied, as to or endorsement of, the accuracy or completeness of any information, statements, representations or forecasts contained in this presentation, and such parties do not accept any liability for any statement made in, or omitted from, this presentation.

- Before acting in reliance on any information contained in this presentation, such parties should conduct their own investigation and analysis in relation to the Company and should check the accuracy, reliability and completeness of the information contained in this presentation and obtain independent and specific advice from appropriate professional advisers. This presentation does not purport to be an exhaustive compilation of the information presented or that a prospective investor may require.

- This presentation contains forward-looking statements within the meaning of Section 27A of the U.S. Securities Act of 1933, as amended, and Section 21E of the U. S. Securities Exchange Act of 1934, as amended. These forward-looking statements are based on management's expectations, estimates, projections and assumptions. These forward-looking statements include, but are not limited to, the plans, objectives and projections of the Company's management for future operations, performance, business strategy, returns, budgets, financial position, costs, production, projections of investment returns, reserves, cash flows, valuations and potential revenues. These statements are not guarantees of future performance and involve certain risks and uncertainties, which are difficult to predict. Actual future results and trends may differ materially from what is forecast in forward-looking statements due to a variety of factors.

- All forward-looking statements speak only as of the date of this presentation or, in the case of any document referenced, the date of that document. All subsequent written and oral forward-looking statements attributable to the Company or any person acting on the Company's behalf are qualified by the cautionary statements in this section. The Company does not undertake any obligation to update or revise its forward-looking statements to reflect events, circumstances or changes in expectations after the date of this presentation.

Introducing Great Bear Petroleum

Executive Summary

- Alaska focussed. A proven, world class oil and gas province with 3 mature prolific source rocks: Shublik, Kingak, Hue/HRZ.
- Deep understanding of Alaskan geology and its petroleum systems.
- Great Bear is pursuing what it believes is the most significant emerging resource play in North America.
- 500,000 acres with P50 potential of approximately 2 billion barrels of oil and 12 Tcf of gas.
- Work program will employ proven drilling and completion technologies which are already present in-State.
- Productivity expected to significantly exceed that of analogous South Texas Eagle Ford Shale.
- Targeting near term oil production accessing existing infrastructure.
- Longer term gas resource development tied to broader industry North Slope gas development strategy.
- Supportive State Government.

Great Bear is the leading unconventional resource player on the North Slope and one of the largest in North America.

Great Bear Petroleum LLC

Introducing Great Bear Petroleum

The Team to Deliver

Ed Duncan

B.S., M.A., D.B.A.

President and Chief Operating Officer

- Began his career working regional exploration plays in North Alaska
- Mapped, leased and named the Kuvlum prospect in Camden Bay, planned and managed wellsite operations on the Kaktovik -1 well in the ANWR and mapped and leased the Pt McIntyre field leases
- Over 30 years of experience as a Petroleum Geoscientist and Business Development Manager involved in the evaluation of new business across many of the world's petroleum provinces
- Member of the American Association of Petroleum Geologists

Karen Bryant Duncan

BBA, J.D.

VP – Corporate, General Counsel and Secretary

- A practicing lawyer in the State of Texas since 1987
- Worked at large national law firms for most of her career, achieving partner status
- Over a decade of in-house experience working as corporate counsel for publicly traded corporations
- Karen's expertise covers corporate, securities and oil & gas law

Ryan Moynagh

LLB, MBA, CFA, LIFA

VP – Finance and CFO

- Independent strategic and commercial advisor to oil & gas sector
- Former Investment Banker in Merrill Lynch's Energy & Power Group, based in New York, London and Singapore
- Graduated first-in class in Law and Accounting (First Class Honours), Queens University
- Wharton Business School Executive MBA graduate

Robert Rosenthal

BSc, MSc

VP – New Ventures

- Over 30 years experience in the global oil and gas industry
- Career in Alaska spans nearly 20 years
- Directly involved in discoveries of approx. 1 billion barrels of reserves as world class source rocks
- Responsible for the implementing BP's new exploration strategy in 1990
- Drilled first ever Caney/Woodford well

Mario Traviati

BSc, MSc

VP – Business Development & Investor Relations

- Former head of Energy Research Asia Pacific at Merrill Lynch
- Excellent contacts at senior levels with governments and corporates across Asia-Pacific, the Sub-Continent & the Middle East
- Formerly an Explorationist with Woodside Petroleum which discovered the vast resources of the North West Shelf

Unconventional Reservoirs Explained

CONVENTIONAL RESERVOIRS

"These are reservoirs that are capable of natural flow and will produce economic volumes of oil and gas without special recovery techniques."

UNCONVENTIONAL RESERVOIRS

"These are reservoirs that cannot be produced at economic flow rates or that do not produce economic volumes of oil and gas without assistance from stimulation treatments or special recovery processes and technologies."

Great Bear Petroleum LLC

North Alaskan Technical Case

This is More Than a Theory

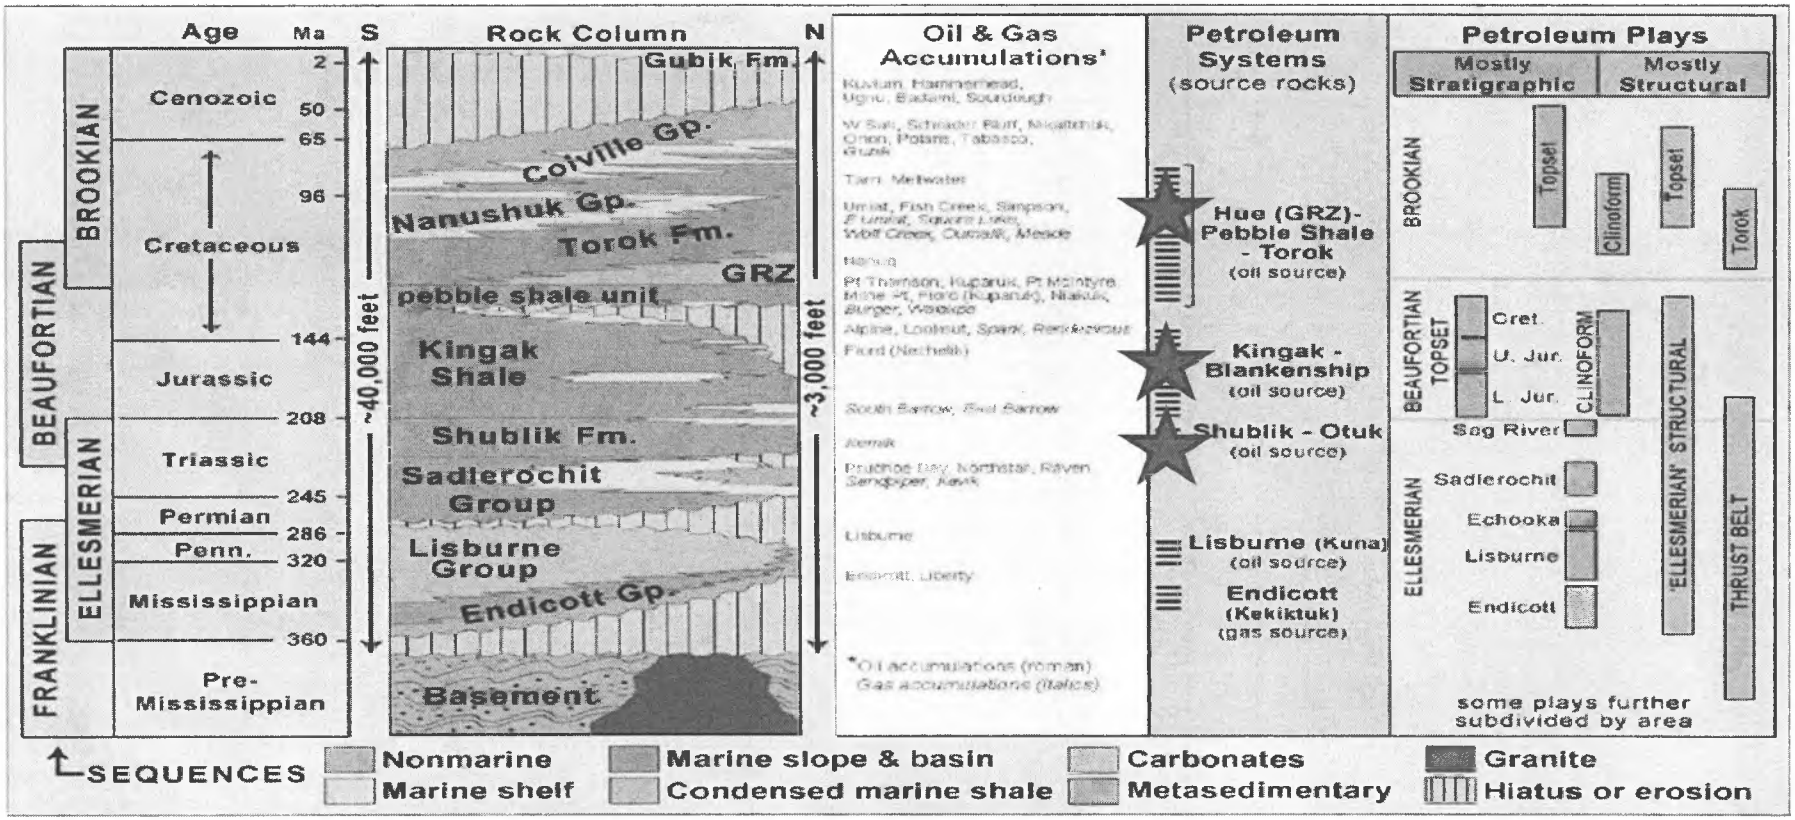
- Conventional exploration has provided a large technical database in support of our thesis.
- Approx. 150 exploration wells have been drilled through the targeted source rocks in North Alaska.
- Cores, sidewall cores, cuttings and outcrop of the target formations have already been evaluated.
- Great Bear has incorporated extensive technical data into its geological model.
- Great Bear has a deep understanding of the shales – this is not speculation, but science.
- Estimates of oil generated from our targeted source rocks approaches 1 trillion barrels of oil equivalent.
- Approximately 100 billion BOE in place has already been discovered just north of our acreage.
- Basin modeling from multiple sources suggests less than 20% of generated product migrates to trap. The balance remains in the source rock. THIS IS OUR TARGET!
- Great Bear's geoscience team will apply proven technologies already utilized in other North American shale plays to unlock the potential of its leases.

Great Bear has been able to access a wealth of existing data that supports our thesis.

Great Bear Petroleum LLC

North Alaskan Technical Case

3 Prolific Source Intervals



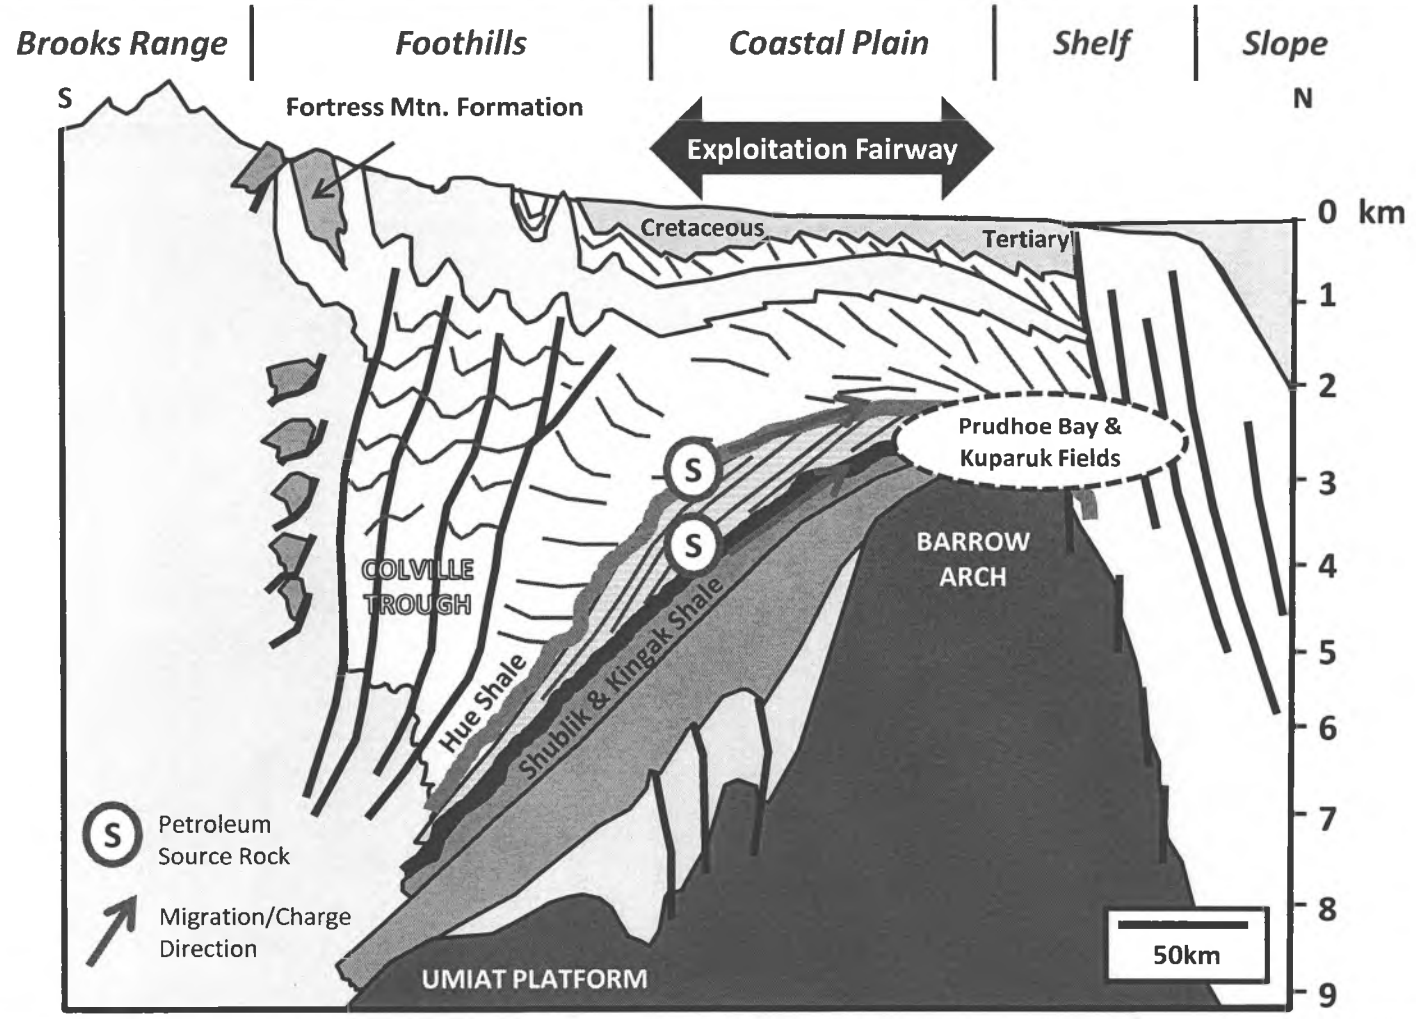
Individually, these source rocks have the potential to deliver a successful unconventional resource play. Collectively, these source rocks through extraordinary quality, common regional distribution, shared burial history and their stacked nature create the opportunity for an unsurpassed resource play volumetric outcome.

Great Bear Petroleum LLC

North Alaskan Technical Case

North Slope - Structural Cross Section

- Petroleum system of North Alaska has:
  - 3 world class source rocks
  - 3 resource play targets
- All 3 source rocks are "co-located"
- All 3 source rocks are mature for oil & gas within Great Bear's focus fairway



Source: Modified From Bird & Bader (1987)

Great Bear Petroleum LLC

Our Vision

Great Bear Petroleum LLC

Our Vision

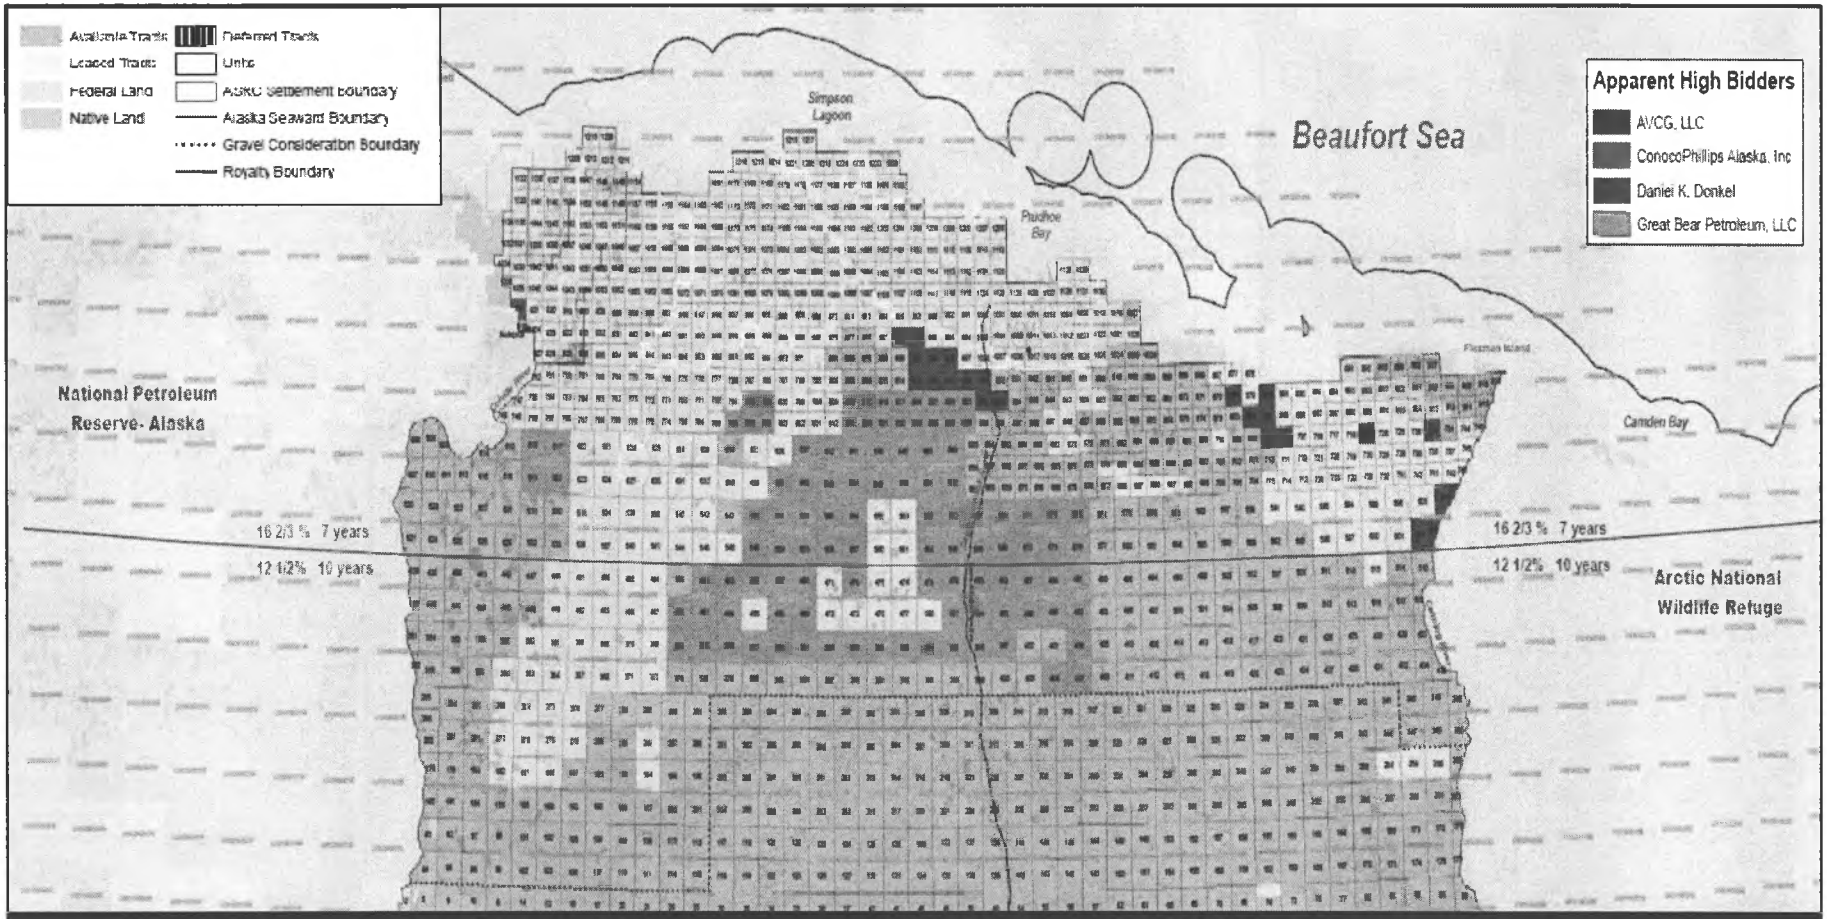
To Be the Leading Unconventional Oil & Gas Producer in Alaska

- Great Bear is leading the industry toward **development of unconventional oil and gas** resources from known, prolific source rocks on the North Slope.
- Development of this resource can secure the energy and economic future of Alaska for the next 50+ years by reversing the State's oil production decline.
- Great Bear is targeting an aggressive program employing proven drilling and completion technologies developed in the Lower 48. Phase One would support **200 wells per year for 15 years** starting 2013.
- Successful development will deliver near-term oil production into TAPS, with forecast **minimum steady state oil production of approximately 150,000 barrels of oil per day** with a significantly higher peak production rate.
- Longer term North Slope gas development strategy, which may include LNG exportation.
- We are singularly focused on Alaska business development.
- We are committed to operating in a safe, environmentally responsible manner and desire to be recognized as a great corporate citizen by the State and the communities where we do business.

Great Bear Petroleum LLC

Our Vision

Great Bear Has Targeted the Heart of the Resource Play

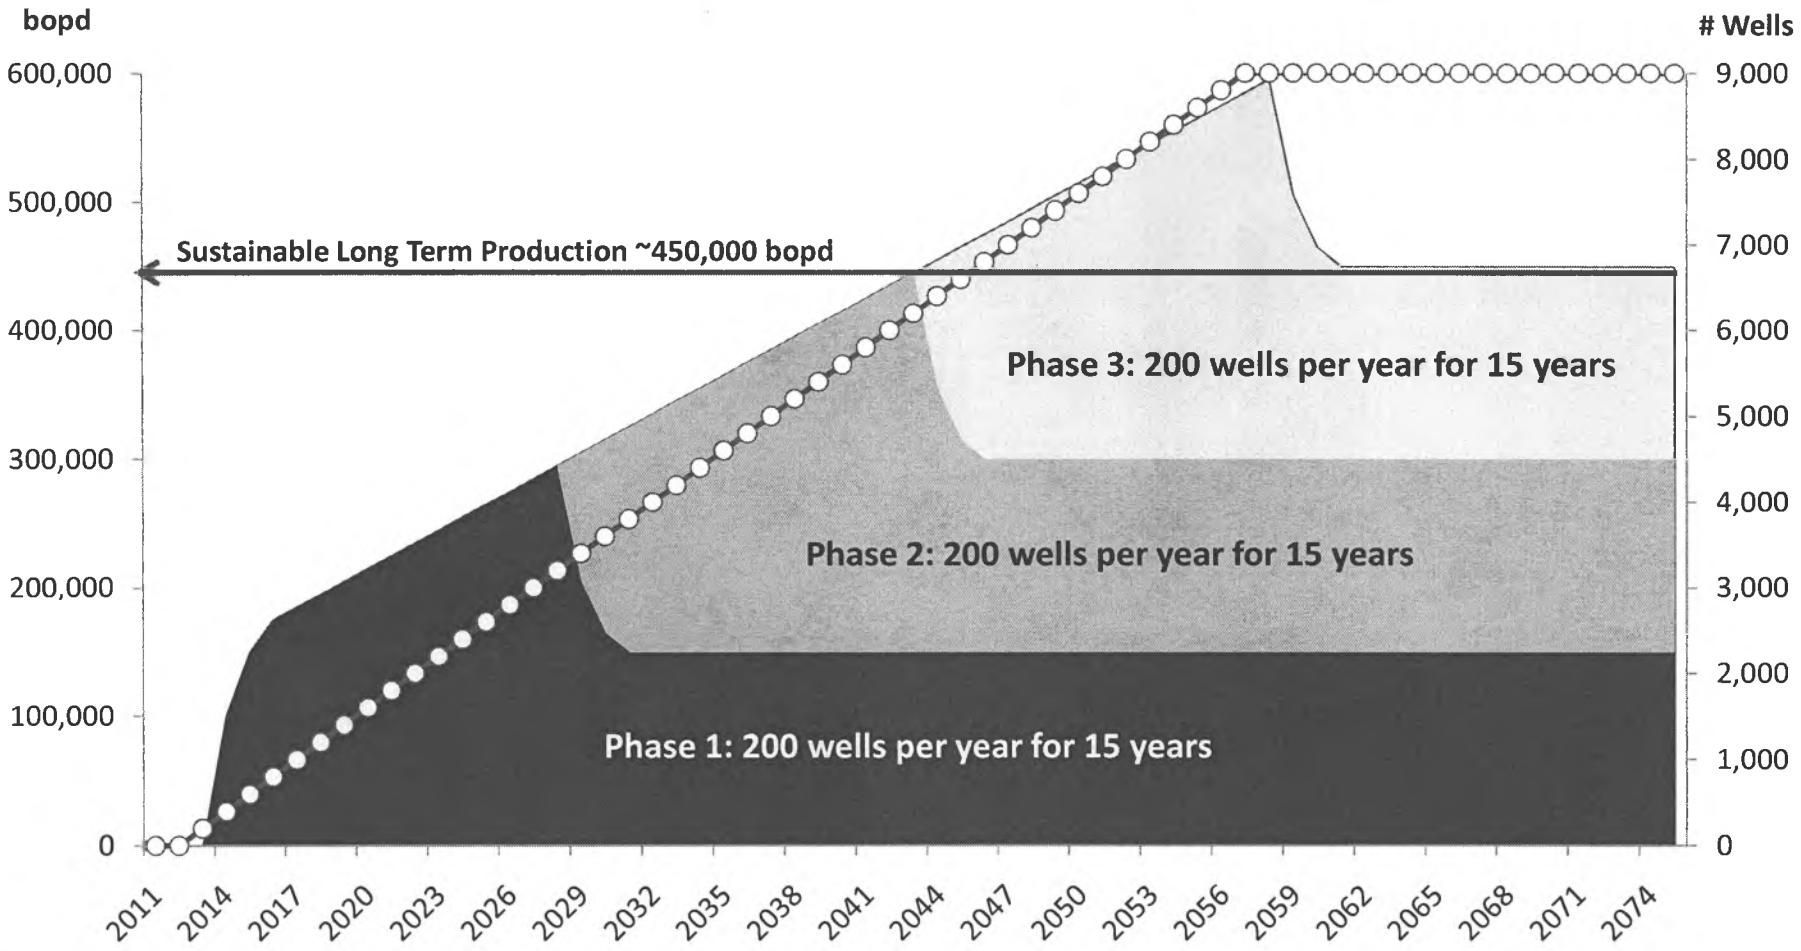


Great Bear is targeting unconventional oil and gas from the source rocks beneath the North Slope providing a long term strategy for Alaska.

Great Bear Petroleum LLC

Our Vision

Potential Oil Production Profile



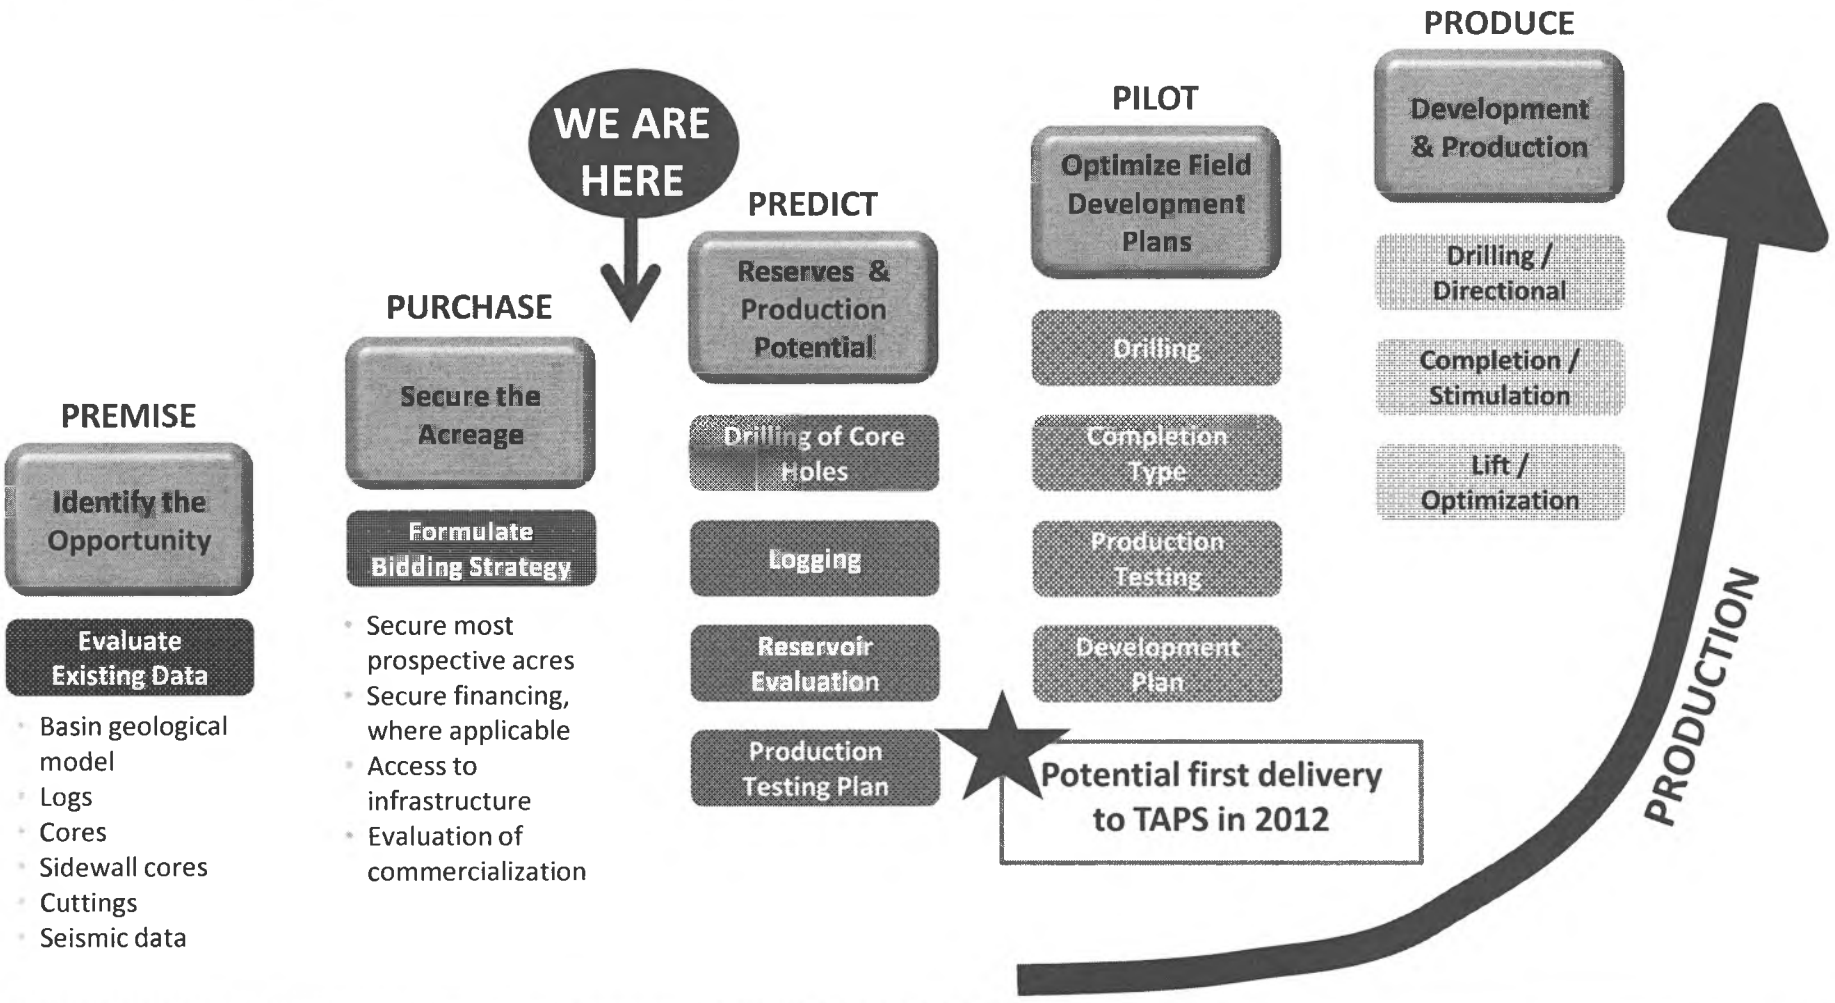
Assumptions:

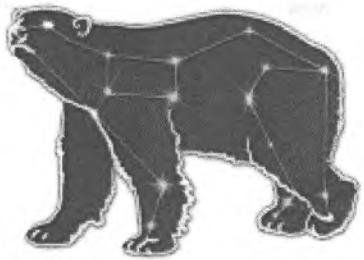
Each Drilling Phase: 200 wells per year over 15 years, commencing 2013. EUR per well 700,000 bbls.
Wells average 500 bopd for year 1, 250 bopd year 2, 125 bopd year 3 then held steady at 50 bopd.
Year round "roads to resources" access for operations.

Great Bear Petroleum LLC

Our Vision

Project Development Timeline





Great Bear Petroleum LLC

The Challenges Ahead

Great Bear Petroleum LLC

The Challenges Ahead

We Believe Alaska's Future Lies With Unconventional Hydrocarbon Sources

- The easy conventional oil has already been found.
- Remaining large volume potential is in **unconventional plays**, e.g. heavy oil, shale oil & gas, CBM.
- Costs will continue to rise on per barrel basis and economic returns will decline due to
  - Field sizes getting smaller
  - Challenging operating environment
  - Exploration for new play types becoming riskier
  - Identified plays such as "shallow heavy oil" and "oil and gas shale" are expensive
- **The ability to deliver unconventional resources to market rests primarily on commercial risk rather than technical risk factors.**
- Discovery and development of Alaska's remaining potential would be significantly enhanced by improvements in Alaska's fiscal terms.

Great Bear Petroleum LLC

The Challenges Ahead

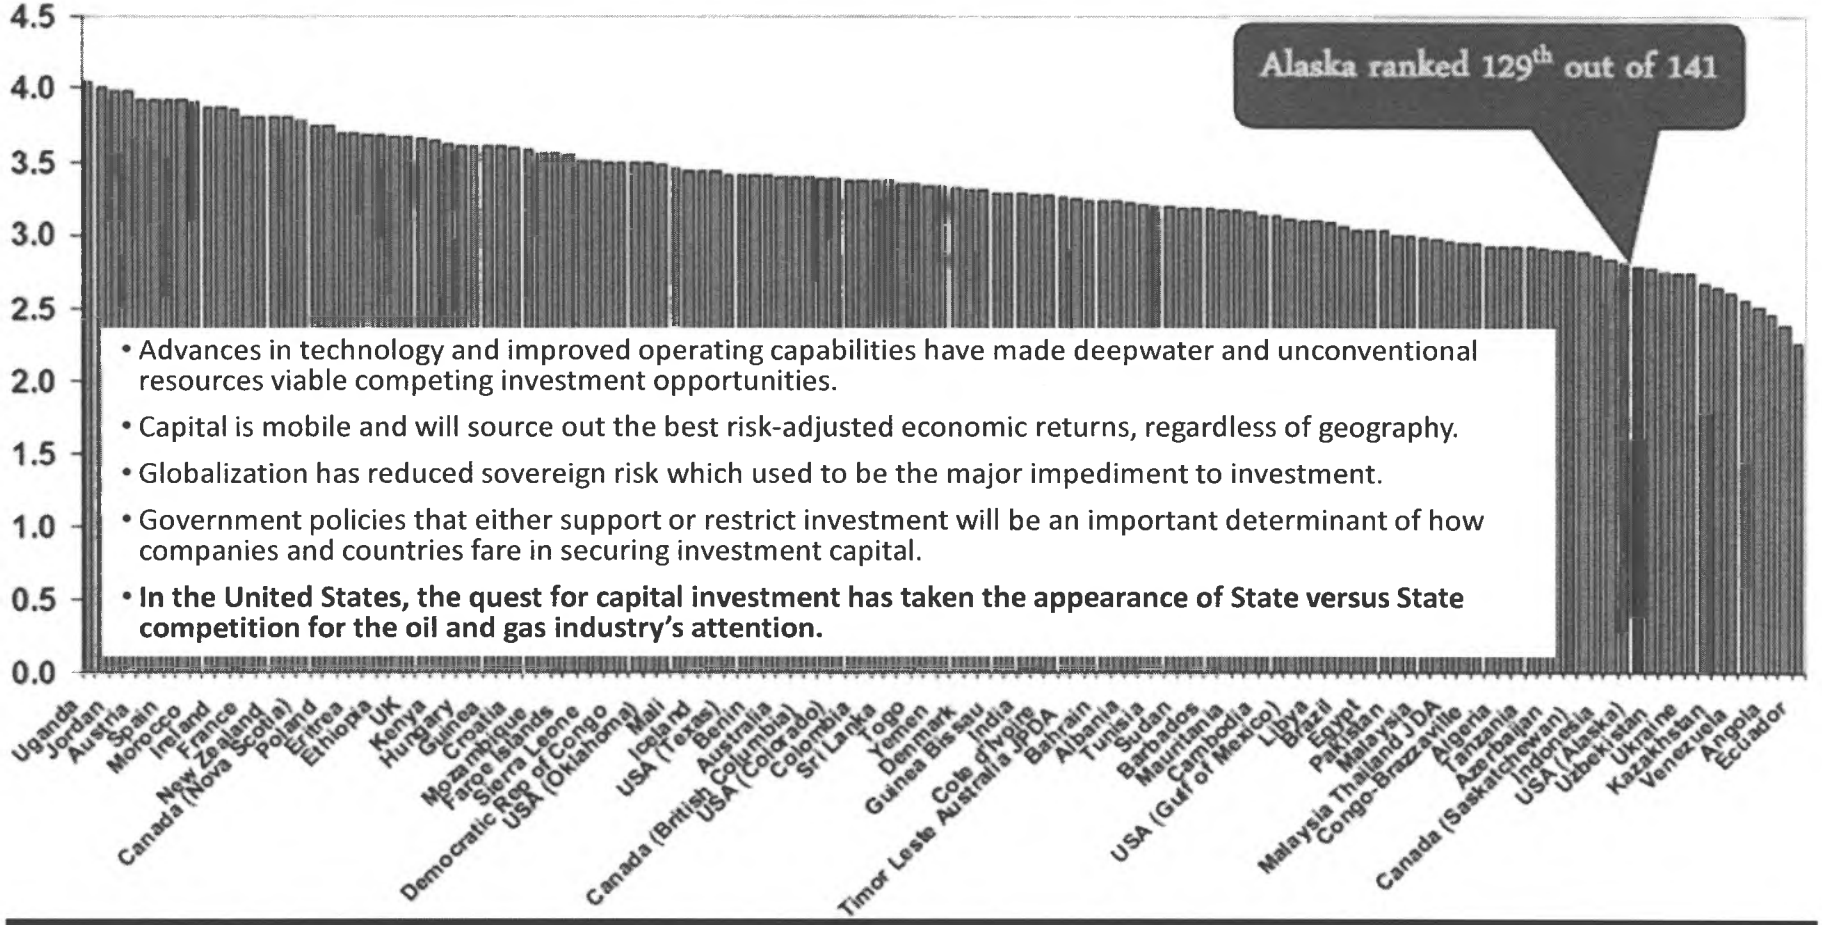
Ability to Execute – Operational Considerations

- Access challenges may impede full scale development – "roads to resources" enabling 365 day a year operations.
- Access to infrastructure, pipelines, water disposal facilities.
- Must have strong industry contractors and equipment dedicated to the North Slope.
- Lease strategy targeted acreage around Trans-Alaska Pipeline for early liquids production – can we access TAPS at reasonable tariff rates?

Great Bear Petroleum LLC

The Challenges Ahead

Ability to Execute – Commercial Considerations



- Advances in technology and improved operating capabilities have made deepwater and unconventional resources viable competing investment opportunities.
- Capital is mobile and will source out the best risk-adjusted economic returns, regardless of geography.
- Globalization has reduced sovereign risk which used to be the major impediment to investment.
- Government policies that either support or restrict investment will be an important determinant of how companies and countries fare in securing investment capital.
- **In the United States, the quest for capital investment has taken the appearance of State versus State competition for the oil and gas industry's attention.**

Alaska is competing both domestically and internationally for investment capital.

CASE STUDY: Bakken Shale

Huge Positive Impact on North Dakota Economy

- Largest "continuous" oil accumulation ever assessed by USGS with estimated mean recoverable oil reserves: 3.7 bn bbls
- Potential huge upside in a second oil-rich shale reserve (Three Forks) that lies below Bakken Shale
- North Dakota has since surpassed Louisiana as 4th largest oil producing state in U.S.
- A recent North Dakota University study identified substantial positive impact from oil & gas development
  - Nearly 13,000 new jobs created between 2005-2009
  - Direct economic impact grew from US$1.3bn in 2005 to US$4.9bn in 2009
  - No. of active wells rose from 3,391 in 2005 to 4,190 in 2009.
  - Each new well has an estimated US$3mn annual impact and creates 47 new jobs
- Lowest unemployment rate in the nation (3.6%)
- Forecast budget surplus of US$1bn in June 2011
- State estimated to collect over US$2bn in oil taxes during the next budget period (Jul 2011-Jun 2013)

Location Map of Bakken Shale

Dear Senators:

It is with pleasure that the City of Kenai welcomes you to our community. As a resource development state, the importance of your work on behalf of the citizens of Alaska cannot be overstated, we appreciate your dedication.

During your Committee meeting, should any of you require the use of an office, computer, small conference room with teleconference capabilities, etc., we would be happy to accommodate your needs.

Thank you for your past efforts in considering legislation that has incentivized the Cook Inlet Basin for oil and gas exploration and development. Within one-half mile of Kenai's City Hall, two drill rigs are working. Additionally, a natural gas transmission pipeline is being constructed that will deliver 10mcf of gas daily to the system beginning in December of this year.

In closing, thanks for being here, and let us know if we can assist you during your visit.

Sincerely,

CITY OF KENAI

ALASKA NATURAL GAS
TRANSPORTATION PROJECTS
OFFICE OF THE FEDERAL COORDINATOR

Oct. 7, 2011

Senator Lesil McGuire
Alaska State Legislature
716 W. 4th Avenue, Suite 430
Anchorage, AK 99501-2133

Dear Senator McGuire:

As I read (and have re-read) your letter of August 9, I looked to the fact that a key element of the federal Alaska Natural Gas Pipeline Act of 2004 (which created this office) was a presumption "that a public need exists to construct and operate the proposed Alaska natural gas transportation project" to make North Slope gas available to markets in the Lower 48. But Congress also understood that Alaska consumers need access to North Slope gas as well. To that end, the act included language requiring that the project also address in-state needs. To help make the project feasible, the act authorizes generous federal financial assistance through a multibillion-dollar loan guarantee.

The Alaska Legislature's approval in 2007 of the Alaska Gasline Inducement Act was consistent with the objectives of the federal act, and signaled the state's willingness to materially assist in developing the project envisioned by Congress — and long envisioned by Alaskans.

When the Alaska Legislature sent HB 369 to the governor in April 2010, it marked a shift by the state to a more aggressive approach to securing in-state access to North Slope gas. You were a co-sponsor of that bill and, as you note in your letter — and as you have repeatedly pointed out in various legislative deliberations — nothing in that legislation directs a shift against the objectives established by Congress or the state's longstanding goal of a large-diameter gas line to serve out-of-state markets. To the contrary, HB 369 directs that the plan for development of an in-state natural gas pipeline be "compatible but not competitive" with the project envisioned by Congress to bring North Slope gas to the larger North American market.

As the Alaska Gasline Development Corp. July 1 report stated, the larger pipeline project envisioned by Congress would likely bring natural gas to Fairbanks and Anchorage at "significantly lower cost" than the far smaller in-state project analyzed by AGDC. And, as ADGC stated, its project was never intended to compete with a large-diameter pipeline. In accordance with the mandate of House Bill 369, the smaller in-state project analyzed by AGDC is being developed "as a fallback."[1]

[1] AGDC Report, p. 3-12.

The report concludes that the in-state pipeline could conceivably be designed, financed and built by the private sector, but acknowledges that "in all probability [that] will not happen," at least not in the timeframe envisioned.

State involvement may be the answer, the report said. AGDC correctly notes that a larger state financial commitment to the project than the almost $400 million presumed in the report might be required to move the in-state gas line to actual construction. AGDC interviewed officials with 11 North American pipeline companies to get their opinions of the project. Without identifying who said what, AGDC reported the following comments:

- The state could demonstrate its faith in the project "by assuming some of the transportation commitment risk and backstop a shortfall in capacity if it exists after an open season." The report states that 20-year shipping commitments for 100 percent of the pipeline capacity will be needed to secure attractive financing.

- Acknowledging the risk that the actual pipeline costs could greatly exceed the planning estimates, the best way to mitigate the risk would be to develop a tariff structure that recovers all costs, including any overruns, from the pipeline users. Most of the pipeline companies said they would be reluctant to accept the risk of construction cost overruns, "and many expressed the opinion that the State of Alaska should participate through both a capital subsidy, if necessary, and through firm transportation bids of royalty gas to help guarantee capacity."

- "Most of the builder/owner/operators said that the State of Alaska needs to wholly subsidize the project development costs before a successful open season," the report said. (This is similar to the $500 million in cost reimbursement the state pledged to AGIA licensee TransCanada to help cover development costs of the larger pipeline.)

- The report also warns that more state financial involvement may be necessary: "It is important to note that preliminary feedback from potential builder/owner/operators indicates that their appetite for certain risks is very limited. If that feedback is confirmed through the process of selection and negotiation with a builder/owner/operator, then more state involvement will be necessary to complete the project."

The July AGDC report suggests that a backstop commitment by the state of up to $7.5 billion might necessary to move the in-state project forward.

You asked whether the Office of the Federal Coordinator had considered potential synergies between the TransCanada/ExxonMobil larger pipeline (AGIA) and the smaller in-state line (AGDC). More specifically, you asked if we could identify any financial means or other ways in which the state's efforts to meet the need for gas within Alaska could be combined with the state's concurrent efforts to promote a major pipeline into North American markets, thereby improving the odds of success for both.

The answer, hopefully, is yes. Alaska needs both projects, and both projects are linked by the same source of gas; the same daunting economic hurdles; and much of the same engineering, permitting, routing and timing issues. They are especially linked by the reality that each project makes the other one more economically and politically attractive to Alaska. The lowest-cost gas for Alaskans would come from tapping into the economies of scale of the larger pipeline. And the money to help pay for that in-state distribution system could come from the public revenues that would be earned from a large-volume pipeline taking Alaska gas to market.

The Federal Coordinator's office is sponsoring a public forum on the questions raised in your letter to help people look at the issue, consider the options and the benefits of state financial involvement in a gas line. The forum is scheduled for 5:30 to 7 p.m. Tuesday, Oct. 18, at the University of Alaska Anchorage Fine Arts Recital Hall. We have contracted with Gavel-to-Gavel for a live video stream on the web and later rebroadcast on statewide television.

We will have a report available at the forum, setting out the issues and presenting some options for Alaskans to consider.

I offer the services of our office to assist you and your colleagues and the governor as you work toward finding the best answer to Alaska's energy and fiscal future.

Sincerely,

Larry Persily
Federal Coordinator

SENATOR LESIL MCGUIRE

August 9, 2011

Mr. Larry Persily
Office of the Federal Coordinator
Alaska Natural Gas Transportation Projects
1717 H Street NW, Suite 801
Washington, D.C. 20006

Dear Mr. Persily, Larry

Thank you for the work you have done to ensure federal cooperation and assistance for a large-diameter pipeline to move Alaska North Slope gas to Lower 48 markets. As you know, the Alaska Gasline Development Corporation (AGDC) recently released a plan for the Alaska Stand Alone Pipeline (ASAP) project which included preliminary cost estimates, financing alternatives and an assessment of environmental, market and technical issues for an in-state line. Over the next few months the Alaska State Legislature and the Governor will be reviewing this report and considering what, if any, actions need to be taken to further the project while, at the same time, working on the Alaska Pipeline Project (APP) licensed under the Alaska Gasline Inducement Act (AGIA).

As policymakers evaluate the ASAP report and continue to monitor progress on APP, there will be a tendency for some to continue to pitch one project against the other. Doing so ignores the cooperative operating environment in which both are currently being developed. I fear that if Alaskans characterize the projects as competing prospects we could miss opportunities to fully develop North Slope gas and thereby minimize the benefits of gas development to Alaskans and our nation.

As you are well aware, it was I who insisted on the inclusion of language that directed the AGDC to prepare a plan that was "compatible not competitive" with the AGIA project. I fought for this language because I felt that it was important to avoid costly litigation that could cause unnecessary delays for both projects and because I truly believe that the two efforts, if developed in concert, could complement each other and ensure gas deliveries to Alaskans and the Lower 48 states.

Has the Office of the Federal Coordinator (OFC) generally considered potential synergies between the APP and ASAP projects? More specifically, has your office identified or could you identify financial means or other ways in which the State of Alaska's efforts to meet the need for gas within Alaska could

To: Tom Wright
Cc: Dan Fauske; Michael Rocereta; Daryl Kleppin
Subject: Response to ANGDA Cook Inlet Alternatives email

Tom,
Our commercial guys have addressed the most glaring issues that we have with the data:

- In the ANGDA analysis, the only ASAP tariff which is correct is for the 500 mmscfd case. ANGDA estimated the ASAP tariffs for the 250 and 167 mmscfd cases. ANGDA doubled the 500 mmscfd ASAP tariff to get their estimated ASAP tariff for the 250 mmscfd case. Similarly, they tripled the 500 mmscfd ASAP tariff to get their estimated ASAP tariff for the 167 mmscfd case. These assumptions are considerably (~50%) higher than ASAP tariffs for the 250 mmscfd case. ASAP did not publish tariffs for a 167 mmscfd case. **Conclusion**: The ANGDA calculation of ASAP CI natural gas prices for the 250 and 167 mmscfd cases are significantly overstated.
- For the LNG import from Canada, ANGDA used "proprietary estimates" for LNG plants, shipping, etc. which seem low and AGDC has no way of validating. Similarly, for LNG import from the North Slope ANGDA used "order of magnitude" costs estimates which (according to the AACE methodology) have significant uncertainty (-50% to +200%). This makes any detailed comparisons using their pricing highly speculative. Note: the Sahkalin LNG import gas price appears reasonable.
- ANGDA also compares an ASAP "bullet line" tariff to the spur line tariffs from Glenallen and Delta Junction. These comparisons are not relevant. AGDC acknowledges that, if you built a big gas pipeline to Valdez or Alberta, ASAP would become a spur line and the tariffs would be significantly lower.
- Not sure of the reference to the heating cost/value of white birch. This not a realistic option for supplying power and heat to the majority of Alaska residents.

Let me know if you need anything else.

ALASKA NATURAL GAS
TRANSPORTATION PROJECTS
OFFICE OF THE FEDERAL COORDINATOR

State fiscal options to help move Alaska gas

The goal of this paper is to ask: What could the state do to help the economics of a large-volume natural gas pipeline from the North Slope to out-of-state markets, combined with a smaller in-state line to serve Alaska's energy needs? And should the state do anything? We identify several fiscal options, but do not suggest these are the only ones that might help put a gas pipeline into Alaska's future.

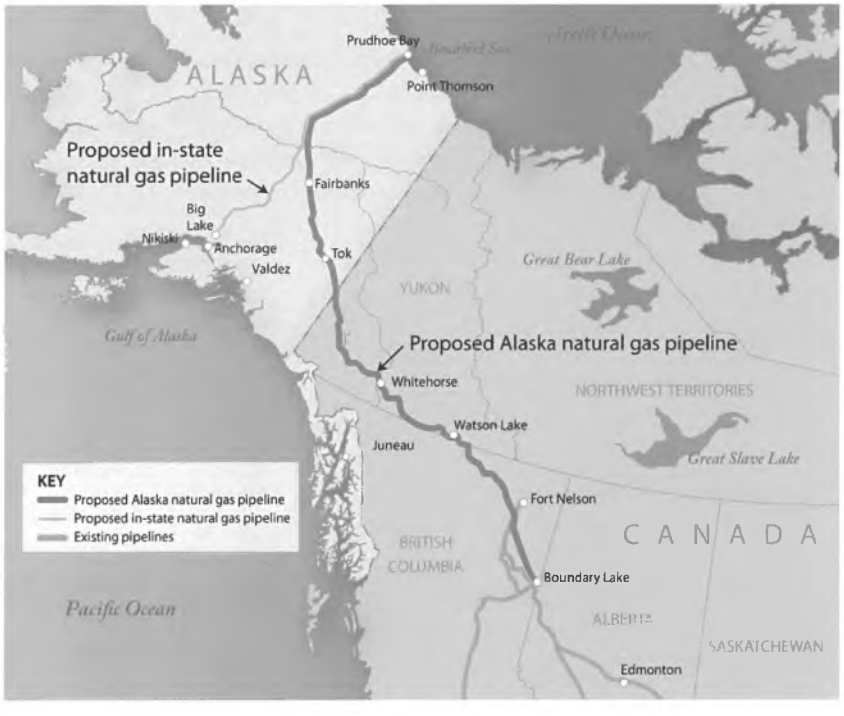
The rewards of state financial involvement with any Alaska gas delivery system could be large: Public revenue from selling the state's stranded gas resources, jobs for Alaskans, and long-lasting low natural gas prices for Alaska homeowners, businesses and utilities thanks to the economies of scale that will greatly reduce transportation costs to in-state markets.[1] Moreover, entry to the worldwide market for North Slope gas promises to improve oil and gas exploration economics and prolong the life of the trans-Alaska oil pipeline.

Certainly, stability of gas supply for Alaskans is essential for any project, especially one with state dollars invested. Southcentral residents and businesses worry that Cook Inlet production could fall short of meeting local needs in the years ahead, and Fairbanks would love to see affordable gas break the economic stranglehold that costly diesel has on its economy. Those concerns have prompted renewed interest in a smaller in-state line to meet local needs if a big pipeline is not going to happen.

While the Alaska Gasline Inducement Act (AGIA) of 2007, which is helping to partially fund development expenses for the larger pipeline to out-of-state markets, requires off-take points along the line for Alaska deliveries, it does not create or fund any mechanism to build and operate a spur line(s) for in-state distribution. The Alaska Gasline Development Corp. (AGDC), created by House Bill 369 in 2010 and partially funded for its initial project development costs, could fill that role if the Legislature and governor so choose.

There would be benefits to planning an out-of-state line and in-state spur to coincide with the same

ALASKA GAS PIPELINE PROJECTS



[1] The July 2011 report by the Alaska Gasline Development Corp. analyzing an in-state pipeline estimated the gas treatment plant and pipeline tariff at $5.63 per million Btu, assuming there are customers for 100 percent of the gas. Because of economies of scale, the tariff on the much larger TransCanada/ExxonMobil project, for example, would be less than half that amount to pipe gas to Fairbanks. The bigger project would require a spur line to serve Southcentral, so the tariff to move gas to Anchorage would be higher than the cost to the Fairbanks area, but likely still less than $5.63.

in-service date. Construction and mobilization efforts could be coordinated, along with scheduling and labor needs. Perhaps more importantly, decisions on the two lines are linked politically and economically for the state.

But could coordinated state assistance get both a large gas line and an in-state delivery system built? A detailed examination of economics, markets and financing strategies would be useful if the state wants to seriously consider its options.

However, there are risks to state financial participation. This background paper identifies some of the risks associated with selected approaches the state could take to help move North Slope gas to Alaska consumers *and* key out-of-state markets, but it does not identify every risk or every potential reward. Markets create their own uncertainties. For example, companies spent almost $10 billion in the past decade building or expanding liquefied natural gas import terminals at U.S. ports because they thought the nation was running short of gas. They guessed wrong.

Federal encouragements

If the state of Alaska decides to provide further assistance with a gas pipeline, it will find itself aligned with federal policy.

Congress, through passage of the Alaska Natural Gas Pipeline Act of 2004 and other legislation, committed the federal government to assist an Alaska gas line project. The 2004 legislation created the Office of Federal Coordinator to oversee federal agency permitting, and also set out an expedited schedule for the Federal Energy Regulatory Commission to prepare the project's environmental impact statement.

In addition, Congress has:

- Authorized a federal loan guarantee to cover much of the project debt (up to $21 billion, as of 2011), which would reduce the cost of borrowing for construction, thereby reducing the debt service payments and pipeline tariff. A lower tariff means a higher "netback" value for the gas as it leaves the ground at North Slope fields, providing more revenue for the producers and the state.
- Provided for accelerated tax depreciation for the pipeline in Alaska, allowing the owners a faster payback on their huge upfront construction cost. Based on current cost estimates for the more than 700 miles of pipe in Alaska, the tax break could reduce the pipeline tariff by an estimated 6 cents per thousand cubic feet (mcf).
- Granted a tax credit for the Prudhoe Bay gas treatment plant, projected by TransCanada/ ExxonMobil to cost as much as $12 billion. The credit could reduce the estimated tariff by 11 cents per mcf.

Assuming the accelerated depreciation and gas treatment plant tax credit reduce the tariff by 17 cents, and adding in the potential savings from a $21 billion federal loan guarantee (estimated at 10 cents to 15 cents per mcf), the reduction in shipping costs from the federal incentives could total $450 million to $550 million a year (close to a 10 percent savings on shipping costs). The tax incentives and loan guarantee, however, are available only for a project that serves U.S. Lower 48 markets.

Alaska paradox: Robust finances, precarious economy

If Alaska wasn't so wealthy, the resources to invest in or assist with a gas line wouldn't be available, and this discussion would be of little more than academic interest.

No state in the union, and only a few sovereign nations, can boast the per-capita financial assets accumulated by Alaska. As of June 30, 2011, the state held $55.5 billion (over $78,000 for every resident) in the Alaska Permanent Fund, Constitutional Budget Reserve Fund and other savings accounts. If Alaska truly wants a gas line(s) to become a reality, it likely has the means to help make it so.

Living on the economic edge

A recent study by Scott Goldsmith of the University of Alaska Anchorage Institute of Social and Economic Research found that half of all Alaska jobs are due to a single industry — petroleum — either directly from that industry or through state outlays financed by petroleum royalties and taxes.[2] North Slope oil

[2] Scott Goldsmith, "Alaska's Petroleum Industry: Transformative, But is it Sustainable?" Presentation sponsored by Northrim Bank, Anchorage, April 2011.

production peaked at 2 million barrels per day in fiscal year 1988 and since then has declined every year but one. Between FY 2009 and 2010, output dropped 7 percent. There is little evidence to suggest the trend will soon reverse.

The state has been protected from the economic effects of this decline by rising oil prices, which as of Oct. 12 stood at $110 per barrel for North Slope crude. However, many Alaskans remember that as recently as December 1998 Alaska oil briefly sold below $9 per barrel. The unbalanced and precarious oil-dependent state of Alaska's economy lends urgency to the discussion of what the state might do to sustain the economy, monetize the stranded gas assets on the North Slope and help lower energy costs for a significant share of residents.

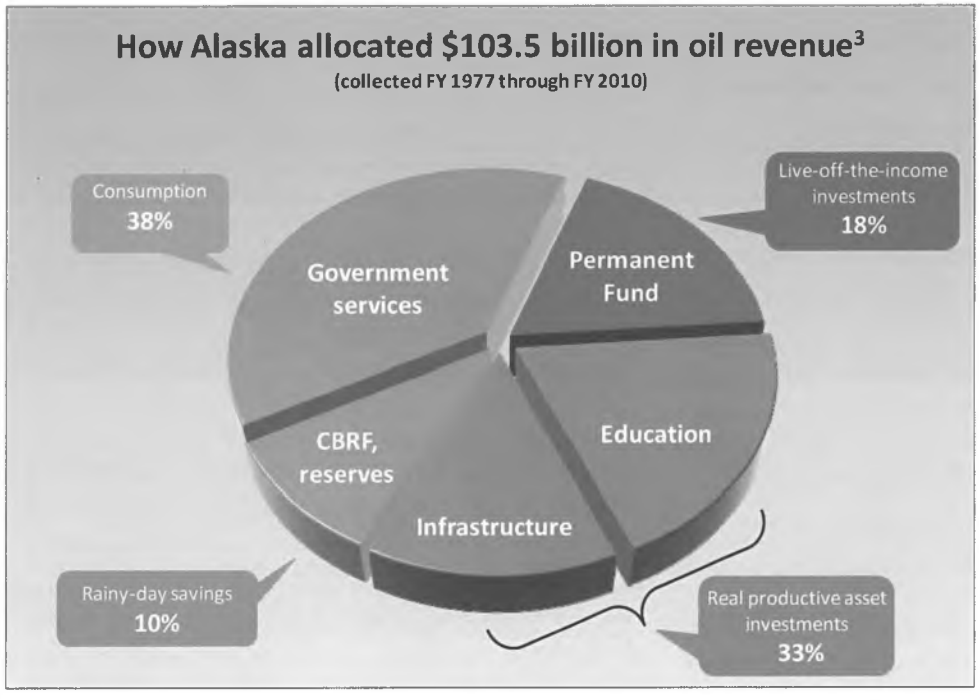
Finding the right balance

There are three distinct ways any individual or organization can use savings to help secure its economic future:

- Live-off-the-income: Put the savings in financial investments with the goal of eventually living wholly or partially off the earnings.
- Rainy-day savings: Place the money in safe, short-term investments to cover emergencies or budget shortfalls.
- Invest in real productive assets: Put the savings in non-financial investments that increase future productivity. For Alaska, these include transportation (roads, ports, harbors and airports), energy projects, other infrastructure, education and job training.

The first two kinds of investments usually go out of state. The third generates real assets in Alaska.

How to deploy the state's billions in financial assets has been a continuing issue for Alaskans. Since 1977, when North Slope crude first flowed down the trans-Alaska pipeline, the state has collected $103.5 billion in oil revenue. About 62 percent has been saved or invested. But as the chart shows, only 33 percent ($34.5 billion) was invested in productive assets including infrastructure and education. Thirty-eight percent was neither saved nor invested; it has been consumed in the form of government services. Eighteen percent has been channeled into the Alaska Permanent Fund, where it supports the state's unique and hugely popular live-off-the-income program, the Permanent Fund dividend. And 10 percent has been allocated to three "rainy-day" accounts, including $10.3 billion in the Constitutional Budget Reserve Fund.



[3] This chart was prepared by Gregg Erickson based on published data from the Alaska Department of Revenue (DOR), Legislative Finance Division (LFD) and the Alaska Permanent Fund Corp. (APFC). Small discrepancies in additive subtotals are due to rounding.

DOR data shows the state received $103.5 billion from oil. The infrastructure investment total ($14.2 billion) is from LFD's historical general fund capital budget data series, plus an estimated $3 billion appropriated to capitalize the Alaska Housing Finance Corp., Alaska Industrial Development and Export Authority and other smaller endowments. Permanent Fund investment income and other investment earnings on oil revenue are not included.

Education investment of $20.4 billion was calculated as a percentage of total general fund operating spending as compiled by LFD to approximate spending through the Department of Education and University of Alaska.

Options for state fiscal assistance to a gas line

The options discussed here were chosen to illustrate broad categories of approaches the state could take to financially assist with a gas pipeline project(s). No development means no revenue and no public benefits for Alaska, so state financial assistance leading to a pipeline that otherwise wouldn't be built is a plus.

1. Provide direct subsidies

The direct-subsidy model familiar to Alaskans is the 2007 Alaska Gasline Inducement Act (AGIA). Under AGIA, the state established a list of "must-have" conditions for a pipeline developer. These included the licensee's acceptance of financing and rate-setting methodologies to produce lower tariffs, a commitment to expand pipeline capacity as needed, adoption of local-hire policies, the opportunity for in-state delivery of gas at reasonable costs, and acceptance of a timeline for submitting a project application to the Federal Energy Regulatory Commission (FERC).

In return, the state agreed to provide the AGIA licensee up to $500 million to help offset the developer's initial design and permitting costs. The state awarded the license to TransCanada in 2008. As part of the deal, TransCanada agreed to submit a project application to FERC by October 2012. If FERC determines that the application is complete, federal law requires a decision by the commission late summer 2014.

By making the subsidy available early in the development process, when risks are highest and potential payouts are the most distant, the state's $500 million provides a clear benefit to project economics. Another advantage is that the state knows from the outset the maximum size of its financial commitment.

This design and permitting subsidy, while moving the project ahead in the risky, early years when it lacks contracted customers, is only one piece of the puzzle to lock in a gas line. The AGIA subsidy will get you a building permit for the pipeline, but without customers and financing there will be no pipeline.

ExxonMobil in 2009 signed up as a partner on the project, and in 2010 TransCanada/ExxonMobil held an open season to solicit bids from potential customers. Though the developer received several bids, it has yet to announce any signed shipping deals on a pipeline to move 4.5 billion cubic feet of gas per day into North America markets.

It appears the AGIA subsidy, by itself, is insufficient to make the gas line a reality. The project is high-centered, waiting for a push from the market and maybe the state to move it forward.

The state could build on the AGIA model by offering a substantial direct subsidy in return for further commitments by the licensee, including commitments to proceed to actual construction. But this could prove very costly to the state, in that it's likely any pipeline developer would require significant sums of state dollars to start ordering steel pipe for a project lacking enough shippers to pay the mortgage. And though a bold move, a direct state cash subsidy cannot change market economics or guarantee the state a positive return on its money.

2. Make equity investment

The state agency created and directed by the Legislature in 2010 to develop a plan for a smaller in-state gas line recommended in its July 2011 report that state ownership of the project would produce the lowest tariffs for moving gas down the line. The Alaska Gasline Development Corp. ran the numbers assuming the state would borrow 100 percent of the estimated $7.5 billion needed for construction. The cost of borrowing money using the state's solid credit rating would be less than what a private owner would expect for a return on its equity investment in the project. Lower cost of capital means a lower tariff. The AGDC analysis calculated that state borrowing to pay the entire in-state pipeline project cost could drop the tariff at least 25 percent from the cost of private ownership — and maybe more if the Internal Revenue Service agreed to let the Alaska Railroad Corp. issue tax-exempt bonds for the project.

But there are risks to the state. Adding the gas line debt to the state's existing debt "would make Alaska's percentage of debt compared to gross domestic product three times any other state," the AGDC report said.[4] State financing of the project "may result in a downgrade of the state's (credit) ratings, depending on the rating agencies' views of the risks and reliability" that pipeline revenues could cover the bond payments, the report added. A downgrade would boost the cost of

[4] Alaska Gasline Development Corp., "Alaska Stand-Alone Gas Pipeline Project Plan," July 1, 2011, pages 4-10.

future borrowing not just for the state, but for school districts and municipalities, too. And borrowing so much money could hinder the state's ability to borrow for other needs in the years ahead, such as for schools or roads. AGDC in its report acknowledged those risks and said it would strive to convince rating agencies that the state could handle the debt.

Another risk would be if tariff revenues were insufficient to cover the pipeline debt payments and operating expenses. If that happened, the state would be liable to cover any shortfall.

The costs of such a potential subsidy are significant. If the state is ready to take such a $7-billion-plus financing risk for the small pipeline, it is worth considering the potential of incurring the same size risk to assist a much larger line to serve out-of-state markets *and* the smaller spur line moving what is needed to meet Alaska's needs. The public benefits of marrying large-pipeline economies of scale and a spur pipeline supplying in-state needs would be gas delivered to Alaskans at the lowest cost while also producing much greater tax and royalty revenue. Under the state's existing tax and royalty structure, public revenues would be **seven times higher** under such a combination than from a stand-alone, smaller in-state gas line.

There also are questions with even partial state ownership of a gas line: Is it a conflict for the state to be both an owner and a regulator? Would politics interfere with pipeline business decisions? Worth asking and worthy of debate.

3. Defer or amend property taxes

The most straightforward of pipeline incentives, and one often discussed in the past, would be to defer or eliminate the substantial property taxes assessed on the project during construction. Property taxes are estimated at $1.1 billion (2010 dollars) during the years of construction, before the pipeline generates any revenue. In addition, under the current property tax structure, construction cost overruns will add to the tax bill — adding up to more cash outflow for shippers.

Past proposals were designed to help project economics by eliminating the heavy front-end loading effect of the state's property tax structure. Because property taxes are paid through the pipeline tariff, any property tax relief will benefit shippers and boost the value of the gas. That's a plus for the project, which needs to attract shippers. Most property tax revenue goes to municipalities, however, so the state likely would need to consider providing offsetting aid to municipalities to cover their actual costs of public services during construction.[5]

In addition to considering tax deferrals during construction, the state could look for a solution to annual battles over what is the taxable value of the pipeline — battles that have consumed millions of dollars and decades of legal fights over the taxable value of the trans-Alaska oil pipeline. For example, rather than assessing the replacement cost or depreciated value of the gas line each year, the state could look at assessing property taxes on the basis of flow down the line. Less flow, less value, less in taxes; or, as long as the line stays full, the taxes stay full, too (perhaps with an inflation escalator). Under the current system, even if the line stays full it would drop in value over the years, knocking down municipal property tax revenues.

4. Defer production taxes

Besides taxing the actual pipeline's value, the state levies taxes on gas production. The state take from its current profits-based production tax on natural gas is expected to be lower than its tax revenue from oil — natural gas is less profitable per Btu than crude oil, after deducting transportation costs. But the

State options

1. Provide direct subsidies
2. Make equity investment
3. Defer or amend property taxes
4. Defer production taxes
5. Modify rules on royalty switching
6. Add to federal loan guarantee
7. Finance construction overruns
8. Take share of shipping commitments

[5] See Information Insights Inc., "*Stranded Gas Development Act Municipal Impact Analysis.*" Prepared for the *Alaska* Department of Revenue, November 2004.

production tax on gas still would be significant for a 4.5 bcf/day pipeline (hundreds of millions of dollars a year, or even a billion-plus, depending on gas prices) and, in fact, would exceed the state's royalty take from gas production. The major North Slope producers, even if they do not own the pipeline, would provide the financing through the tariff they would pay for moving their gas down the line. Any deferral of production taxes during the early years of the project would allow the producers quicker recovery of their investment, thereby lessening their risk if gas prices are depressed at the outset of deliveries. Less risk makes a project more attractive to them. Similarly, back-end loading of tax rates would allow the companies to recover their investment in the early years, with the state waiting for its bigger payday in later years. If the state expects to be cash rich with oil dollars when the gas line starts flowing, Alaska may be in a good position to defer its gas production tax receipts until later.

5. Modify rules on royalty switching

Royalty rates and terms are set by contract when a company and the state sign an oil and gas lease. One term that producers have expressed concerns about is the state's ability to switch frequently and with short notice between taking its royalty share of production in kind (actual ownership of the gas) or in value (letting the producer sell the gas and send a check to the state). The producers believe that could create problems if pipeline capacity does not accompany the switch. They worry that they, as pipeline capacity holders, might not have gas to move when a switch occurs or, alternatively, that they could have state royalty gas to move but lack sufficient capacity rights to transport the gas. This is addressed, in part, in the Alaska Gasline Inducement Act, but may require further consideration to reduce the misalignment risk to producers, which could mean the state taking on some of the risk — trying to lessen the risk to investors to entice them to commit to the project.

6. Add to federal loan guarantee

Congress in 2004 authorized an $18 billion loan guarantee for an out-of-state line. Indexed for inflation to 2011, that guarantee could backstop almost $21 billion of debt.[6] Back in 2004, the amount looked adequate to cover the entire amount a pipeline owner would borrow for construction. That no longer is the case. The pipeline's estimated cost has escalated, and now the guarantee might cover just two-thirds of the debt.

An additional loan guarantee by the state could raise the total to cover the higher construction cost estimate. Whether that would make *the* difference, given the unfavorable gas market, is not clear. But it would further lessen the risk to investors and lower the pipeline tariff, making the project more attractive to shippers and the gas more valuable to the state.

7. Finance construction overruns

Cost-overrun financing by the state (such as a "soft-second" mortgage) is another option.

The risk of construction overruns on such a massive project is real, and the threat to project economics is just as real. The profit left for producers after paying transportation costs could be thin, especially in the early years. Adding the cost of construction overruns to the initial tariff would hurt, and that worries the companies that must sign 20-year binding contracts to ship gas down the line regardless of market conditions.

The problem of paying for potential overruns has hung over a North Slope gas line for decades. One option would be for the state to step in and offer financing to cover some or all of any overruns, structuring the debt to be repaid only after the first lenders are paid (much like a soft-second mortgage on a home gets repaid only after the homeowner pays off the first mortgage, thereby avoiding two payments at the same time). While such a financing plan would stretch out debt payments on the project, that may be preferable to crushing debt payments in the early years. The state could lend money directly for the construction costs, or guarantee the debt taken on by other lenders.

8. Take share of shipping commitments

Signing a firm transportation shipping commitment is another option for the state.

Open seasons, like the one held last year by TransCanada/ExxonMobil, are designed to elicit interest from potential gas shippers that would later commit to firm transportation shipping contracts.

[6] Bill White, "Federal loan guarantee helps pipeline finances," Office of the Federal Coordinator, May 22, 2011. http://www.arcticgas.gov/federal-loan-guarantee-helps-pipeline-finances

Under the contracts, the shipper commits to pay the tariff regardless whether it ships the gas or can sell it downstream for enough to cover the tariff and other costs. The shipping contract is a key element in assuring lenders that their money will be paid back even if market conditions or gas supplies don't materialize as expected.

As a royalty owner of approximately one-eighth of North Slope gas, and as the recipient of production tax revenue, the state could consider taking its royalty gas in kind and also taking its production tax in kind (instead of a check from the producers) and signing shipping commitments equal to its share of the gas flow. This would clearly transfer risk (commodity price and project cost-overrun risk) from the producers to the state. How big a risk would the state be taking if it did that, and could such a commitment make a difference in getting a line built? The answers are unknown at this time, but it would boost the producers' expected rate of return by lowering their liability for having to cover all of the shipping costs. That could help tip the balance on a pipeline.

ALASKA GASLINE DEVELOPMENT CORP. GAS FOR ALASKANS

Alaska Gasline PORT AUTHORITY

Issues of risk

Given the longstanding concern over the state's unbalanced and unsustainable economy, why hasn't Alaska chosen to invest more of its oil revenue in long-term, productive assets to take up the slack when the state feels the pinch from declining oil? The question is important because the risks of shifting resources to infrastructure and the historical impediments to making such a shift are likely to come up as Alaskans consider whether to provide state assistance to a gas line.

Competition for state funds

A decision to assist a gas line will mean less money is available for other state spending. But many constituencies that depend on state funding worry that throttled-down state spending is imminent anyway, caused by declining oil production. Other big infrastructure projects also could compete with a gas line for state financial assistance. For example, supporters of state assistance for the proposed Kink Arm crossing want the state to guarantee funding that would enable private investors to meet bond payments even if toll revenues fall short of expectations.

Some recipients of state money are likely to view even a highly contingent, potential future commitment of state gas line assistance as a potential threat to their funding — the state has only so much cash and credit to go around.

Doubts about success

Is there any assurance that state assistance will achieve its intended result? Critics of the state's promise to provide assistance to TransCanada under AGIA say the project is uneconomic and assert that reimbursing TransCanada for the remainder of the state's $500 million obligation won't be enough to get the project built. Why throw more money at the project when there is no hope, they say.

The honest answer is that no such assurance is possible. This concern can be allayed if the assistance is structured so that potential costs to the state come late in the project, after major risks are past. Unfortunately, state assistance is likely to have the greatest leverage on a project if it comes early, when risks are greatest.

Doubts about need

Underlying the doubts about success are doubts about need. The current abundance of shale gas in North American markets and the significant build-up of new liquefaction projects to serve the Asia-Pacific LNG market suggest that conditions in 2011 are not favorable for an immediate project commitment on a $30 billion to $50 billion capital investment. However, any number of plausible developments could quickly and substantially improve the economic prospects for a gas line project.

Doubts about the need for assistance can be allayed, however, if the state financial involvement — be it a loan, loan guarantee, equity investment or tax deferral

— includes contingent provisions to recapture the value of state assistance. The owners profit, the state profits, and everyone should try to live happily ever after.

Regional balance

State assistance, if successful in getting the project(s) built, would add a stream of natural gas revenue to the state treasury, improve the prospect for finding additional oil and gas resources, and likely prolong the life of the trans-Alaska oil pipeline. These outcomes benefit every state resident more or less equally, but other benefits, including reduced energy costs and construction employment, would be concentrated in areas along the pipeline route. Achieving political and popular consensus on state assistance may require inducements, such as investments for regions distant from the pipeline project.

Bill Egan, the state's first governor, proposed creation of a state ferry system principally to serve the Southeast Panhandle, but he was careful build support for this idea by linking it to a proposal for a smaller ferry system to serve Southcentral ports and, most importantly, for the state's first four-lane, limited-access freeways to reduce traffic congestion in Anchorage and Fairbanks.

Why is it important?

Alaska is in the envious position of having the cash and solid credit rating that other states — and the federal government — lack. Congress likely has done all it will do to help the gas line, and it's not surprising that even global oil and gas companies are hesitant about signing binding contracts that put them on the collective hook to pay $150 billion or more to ship gas 10, 20, 30 years into the future when natural gas prices are unpredictable.

Accepting the premise that a large out-of-state natural gas pipeline and an in-state line would be good for Alaska, the question is: Can the state help make it happen and, if so, what could the state do to help?

The best answer would be state financial participation that tips the scale toward construction of a large gas line out of state along with an in-state delivery system to help meet Alaskans' energy needs for decades to come.

Alaska Department of Revenue

Cook Inlet Production Tax Structure

- **Production Tax is lower of ACES and ELF**
  - **ELF ceiling limits production tax liability**
  - **ELF on oil production is zero, so no production tax paid on oil**
  - **ELF ceiling generally limits tax on gas to an average of $0.177 per mcf**

Sample Tax Calculation on Cook Inlet Gas

ACES TAX CALCULATION	
Taxable mcf/day	20,000
Days per month	30
Total taxable mcf	600,000
Wellhead value in $/mcf	$5
Wellhead value in $/month	$3,000,000
Total opex	$125,000
Total capex	$20,000
Production tax value (PTV)	$2,855,000
Taxable gas in BTU eq barrels	100,000
PTV per BTU eq barrel	$28.6
Base tax rate	25%
Progressive tax rate	0
ACES tax before credits	**$713,750**

ELF TAX CEILING CALCULATION	
Taxable mcf/day	20,000
Days per month	30
Total taxable mcf	600,000
ELF tax limit per mcf	$0.177
ELF tax ceiling	**$106,200**

Production Tax Payable is Lower of ACES tax and ELF tax ceiling - ELF Tax ceiling provides tax benefit of more than $600,000!!

Cook Inlet Oil and Gas Incentives

- **Production Tax Credits**
  - **Qualified capital expenditure credit**
  - **Carry-forward loss credit**
  - **Well lease expenditure credit**
  - **Small Producer credit**
  - **Alternative credit for exploration**
  - **Jack-up rig credit**
  - **Gas storage facility credit**

Cook Inlet Oil and Gas Incentives

- **Credits under AS 43.55.023**
  - **Section (a)(1) 20% credit for qualified capital expenditures (excluding well lease expenditures)**
  - **Section (a)(2) 20% for qualified capital expenditures (except for well lease expenditures) incurred in connection with G&G exploration or exploration well, requires data**
  - **Section (b) 25% carried forward annual loss credit.**

Cook Inlet Oil and Gas Incentives

- **Credits under AS 43.55.023 (cont'd)**
  - **Section (l)(1) 40% credit for well lease expenditures which are intangible drilling costs.**
  - **Section (l)(2) 40% for well lease expenditures incurred in connection with G&G exploration or exploration well**

Cook Inlet Oil and Gas Incentives

- **Credits under AS 43.55.024**
  - **Section (c) Small Producer Credit**
  - **Up to $12 million based on average daily production.**
  - **Production under 50 mbd, eligible for 100% pro-rated to zero from 50 to 100 mbd.**
  - **Credit can only be applied against tax liability.**
  - **Cannot be carried forward**

Cook Inlet Oil and Gas Incentives

- **Credits under AS 43.55.025**
  - **Alternative tax credit for oil and gas exploration commonly referred to as "Exploration tax Credit"**
  - **30% or 40% credit for G&G exploration or drilling an exploration well based on certain conditions**
  - **Requires data be given to DNR**

Cook Inlet Oil and Gas Incentives

- **Credits under AS 43.55.025**
  - **Section (l) Cook inlet Jack-up Rig credit**
  - **Eligible to the first three unaffiliated persons using the same jack-up rig that drill an offshore exploration well**
  - **Credit of 100% / 90% / 80% respectively of up to $25 million of exploration expenditures**
  - **50% of credit to be repaid if exploration activity credited results in sustained production**

Cook Inlet Oil and Gas Incentives

- **Credits under AS 43.20.046**
  - **Cook Inlet Gas Storage credit applicable against the State Corporate Income Tax**
  - **Credit equal to $1.50 per mcf of working gas storage capacity up to lesser of $15 million or 25% of start-up**
  - **Storage facility must have working gas storage capacity of at least 500 million cubic feet and withdrawal capacity of 10 million cubic feet per day**

Overview of Cook Inlet Production Tax Structure and Incentives

Questions?

ARCTEC UPDATE

Joe Griffith, President, ARCTEC
October 20, 2011

Railbelt Energy Plan

- Southcentral Power Project
- Eklutna Generation Station
- Battle Creek
- Tx projects

- Bradley Lake Project Management Committee
- Eklutna Operating Committee
- Alaska Intertie Agreement
- Legislative efforts
- Independent gas explorers
- Enstar
  - Cook Inlet Natural Gas Storage Alaska
- LNG importation
- Crisis plans & exercises

ARCTEC
ALASKA RAILBELT COOPERATIVE TRANSMISSION & ELECTRIC COMPANY

Fuel Situation Alternatives

- Cook Inlet exploration
- AGIA spur
- Bullet line
- LNG import, foreign or N. Slope supply
- Propane
- Diesel – last resort

ARCTEC
ALASKA RAILBELT COOPERATIVE TRANSMISSION & ELECTRIC COMPANY

Gas Situation – Electric Utility Viewpoint

- Important to our members
  - Our members take the hit
  - Gas Shortage = rolling blackouts
  - Electricity runs everything
    - Grease for the economy
    - Heat for businesses and homes
    - Gas station fuel pumps (no fuel for generators)
    - Traffic control
    - Communication systems
    - And so much more…

ARCTEC
ALASKA RAILBELT COOPERATIVE TRANSMISSION & ELECTRIC COMPANY

Gas Situation – Electric Utility Viewpoint

- Challenge different than that of Enstar
- A quick solution is needed
- Can't wait on $7-$10B ASAP line
  - Without export – Electrics and Enstar are the market
- Cook Inlet supply preferred
  - We need to drill
  - Permits must be issued
  - Least expensive option
- LNG importation will happen

ARCTEC
ALASKA RAILBELT COOPERATIVE TRANSMISSION & ELECTRIC COMPANY

Fuel Situation

Comparison of Cook Inlet Retail Energy Prices ($/mmbtu)			
ASAP Flowrate (mmscfpd)	500	250	167
ASAP Bullet Line tariff	$9.63	$15.26	$20.89
Current Cook Inlet Gas Cost	$6.84		
Fuel Oil	$26.58		
White Birch ($250/cord)	$12.32		
LNG Import			
From Sakhalin	$16		
From Canada	$13 - $15		
From North Slope	$12		
$80/bbl WTI Oil Price Assumed For Comparison		*Heinze ANGDA 08/09/11*

Alaska Senate Resources: Cook Inlet Meeting

October 20th, 2011

Marathon Oil

Marathon Oil – A Strong New E&P Company

Marathon has a rich history

1887

TODAY

Marathon Oil Corporation

- New Logo – Same Commitment to Safe, Clean, Responsible Operations
- Marathon E&P in Alaska since 1955 (Pre-Statehood)

Marathon Oil

Recent Positive Actions for Oil & Gas Development in CI

- Cook Inlet Tax Incentives
- RCA Process Improvements
- Regulatory Permitting Streamlining
- SE Alaska Gas Market Conditions

Marathon Oil

Current Activities & Investments

- Primary objective is meeting our contractual gas sales commitments
  - Requires high reliability of production
  - Firm plans for investment in maintenance and new equipment
- Recognize future opportunity to capture additional resource & sales
  - Plan to invest in existing well inventory
  - Plan to invest in new wells to test deeper and unproven targets
- Gas Storage
  - Investments in gas storage at our Kenai Gas Field since 2004
  - Plan to continue investing in and utilizing this asset

Marathon Oil

Other Investments

- People
  - > 90% of Alaska based staff are Alaskans
  - Current openings for several technical professionals
- Safety & Environmental
- Community
  - Continue active investment and engagement in our local community

Marathon Oil

ASAP Project Implications

- Need to Strike a Balance between 2 Key Objectives
  - Meet SE Alaska Energy Demand
  - Encourage a vibrant Cook Inlet (CI) Exploration & Production Environment
- Investment in Exploration & Development require Certainty of Market
- ASAP Implications / Uncertainties for CI E&P
  - Impact on current local consumption market (~90 BCF/yr)
    - Line requires long term gas sales contracts
    - These contracts could tie up all the un-contracted future local market
  - Will the small envisioned capacity of ASAP limit potential industrial gas market?
  - What impact will ASAP have in market price for gas in the CI?
  - A lack of a robust industrial gas market coupled with a tied-up local gas market will provide a low incentive for meaningful CI Natural Gas E&P investment

Marathon Oil

Apache

Introduction

APACHE CORPORATION

October 20, 2011

APACHE: STRONG AND INDEPENDENT

APACHE IS ONE THE LARGEST INDEPENDENT PRODUCERS WITH OPERATIONS IN SIX NATIONS ACROSS FIVE CONTINENTS

- YE 2010 proved reserves: 3 billion barrels of oil equivalent
- 1Q2011 production of 732,000 boe/day
- 4,500 employees worldwide
- US$45 billion market capitalization
- Member S&P 100, S&P 500
- No. 206 in Fortune 500

Apache

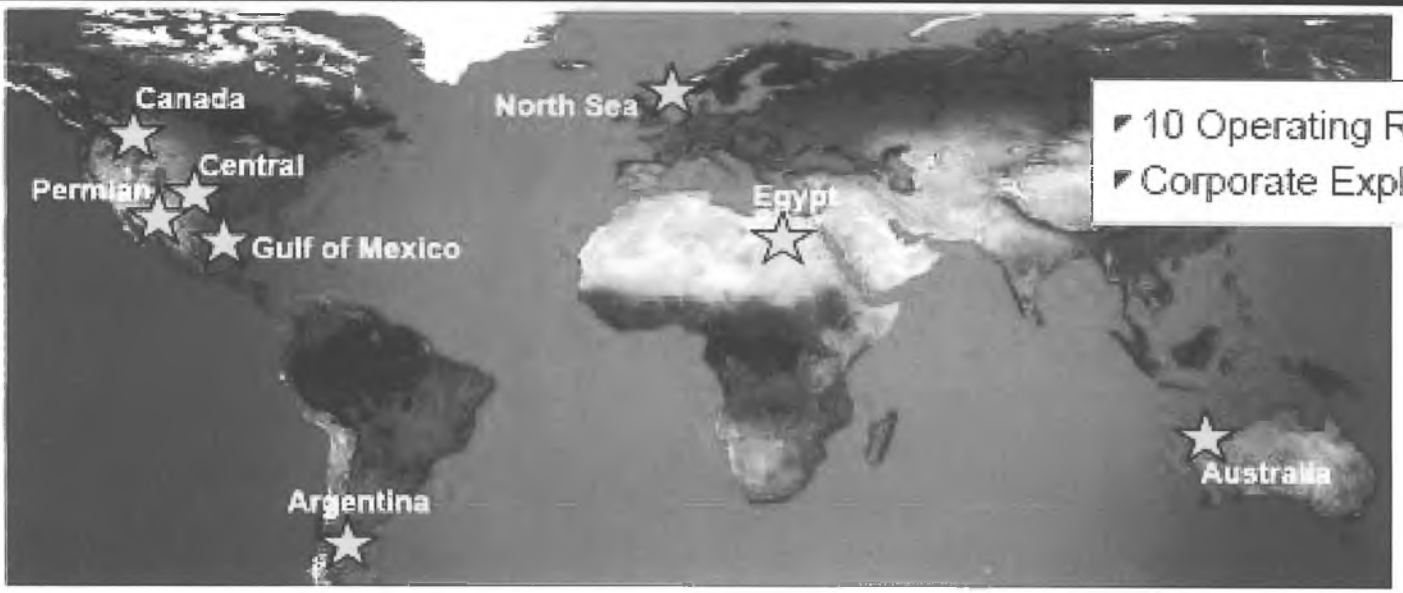
SIGNIFICANT POSITION IN EACH FOCUS AREA

- Largest producer in Egypt's Western Desert
- Apache-EnCana joint venture is largest producer in Canada's Horn River Basin
- 4th-largest producer in Gulf of Mexico; No. 1 in shallow water
- 2nd-largest producer in Texas
- 7th-largest in Argentina
- 3rd-largest in UK North Sea
- 3rd-largest in Australia's Carnarvon Basin

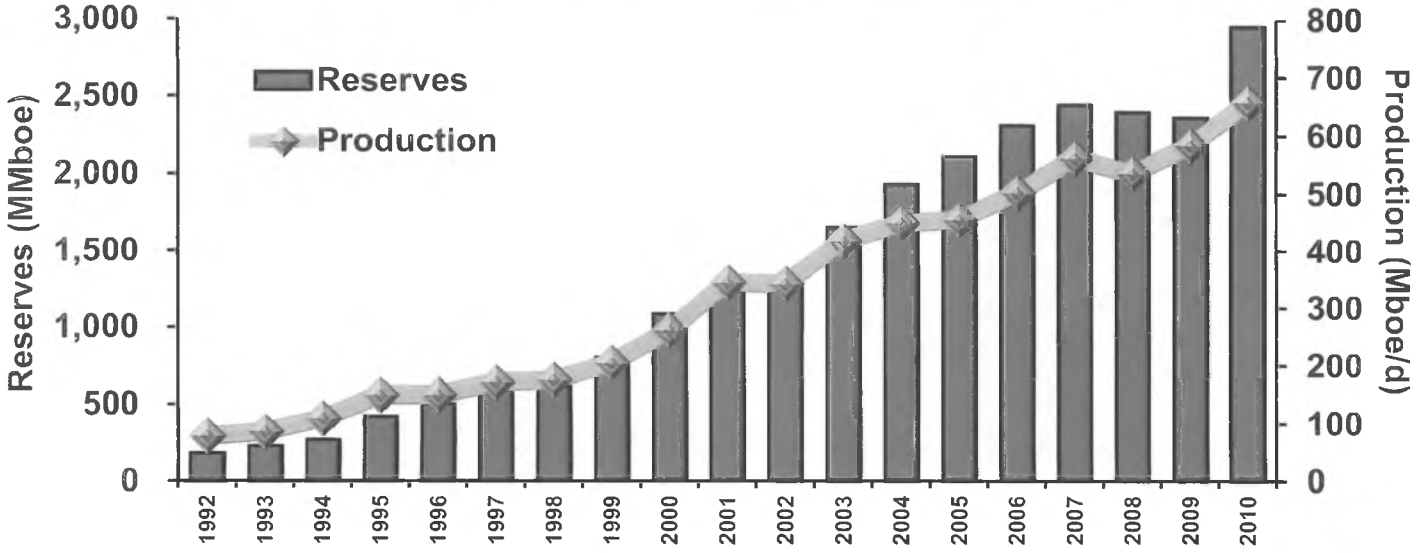
MISSION AND CORE STRATEGIES

- Apache's mission is to grow a profitable global exploration and production company in a safe and environmentally responsible manner for the long-term benefit of our shareholders
- Our core strategies support this mission:
  - *Portfolio of core areas that provide geological and geographical diversity and a balanced commodity mix*
  - *Decentralized decision-making with centralized management and incentive systems – reward performance*
  - *Specialized technical support for regional units*
  - *Global exploration group assessing potential new core areas*
  - *Conservative capital structure*
  - *Rate of return focus*
  - *Innovative, value-driven approach to growth opportunities*

Apache 56 Years of Growth



- 10 Operating Regions
- Corporate Exploration Team



NEW VENTURES: COOK INLET

- Apache has become the largest acreage holder in Cook Inlet with more than 800,000 acres
- Oil targets focus
- Limited 3D seismic in the Basin to date
- Extensive 3D seismic survey to commence 2011
- Multi-year Program for 3D seismic; plan to operate year round
- Covers both onshore and offshore acreage
- Cook Inlet is a primary focus for Apache with plans to operate for many years

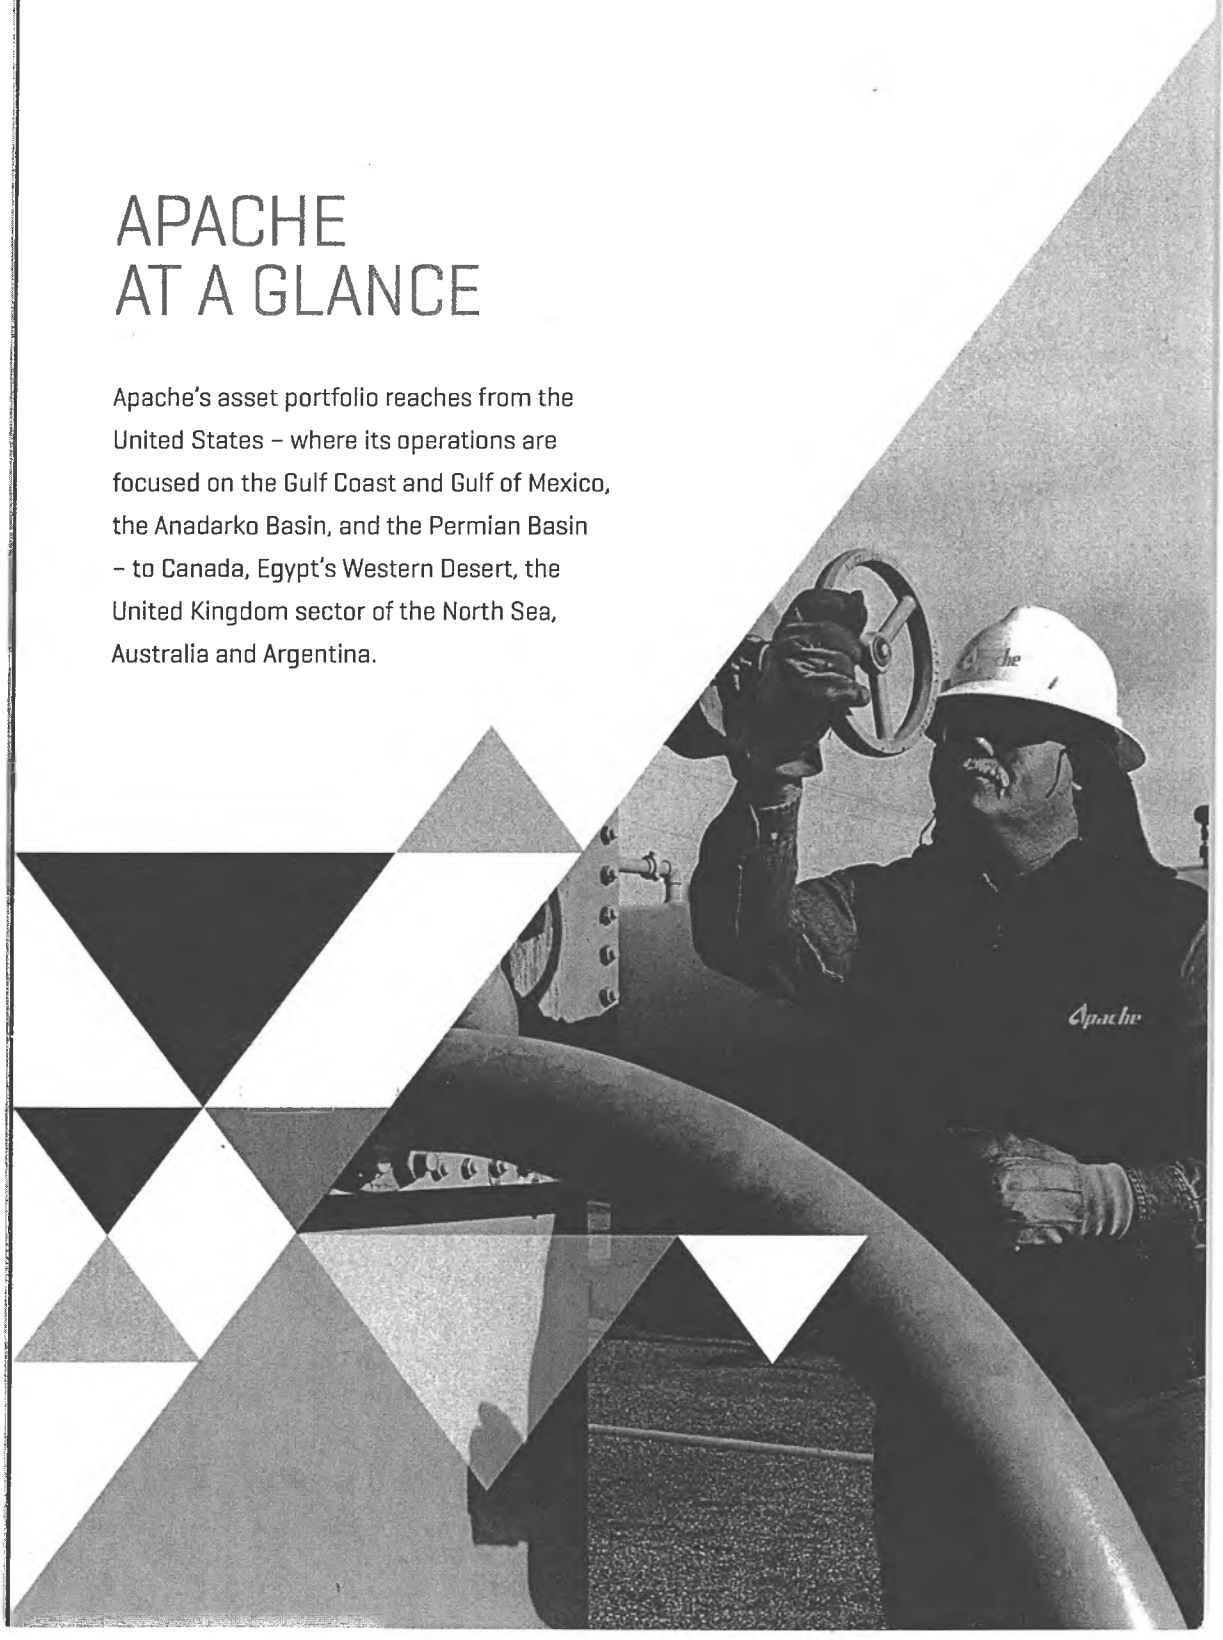
THANK YOU.

QUESTIONS?

APACHE AT A GLANCE

Apache's asset portfolio reaches from the United States – where its operations are focused on the Gulf Coast and Gulf of Mexico, the Anadarko Basin, and the Permian Basin – to Canada, Egypt's Western Desert, the United Kingdom sector of the North Sea, Australia and Argentina.

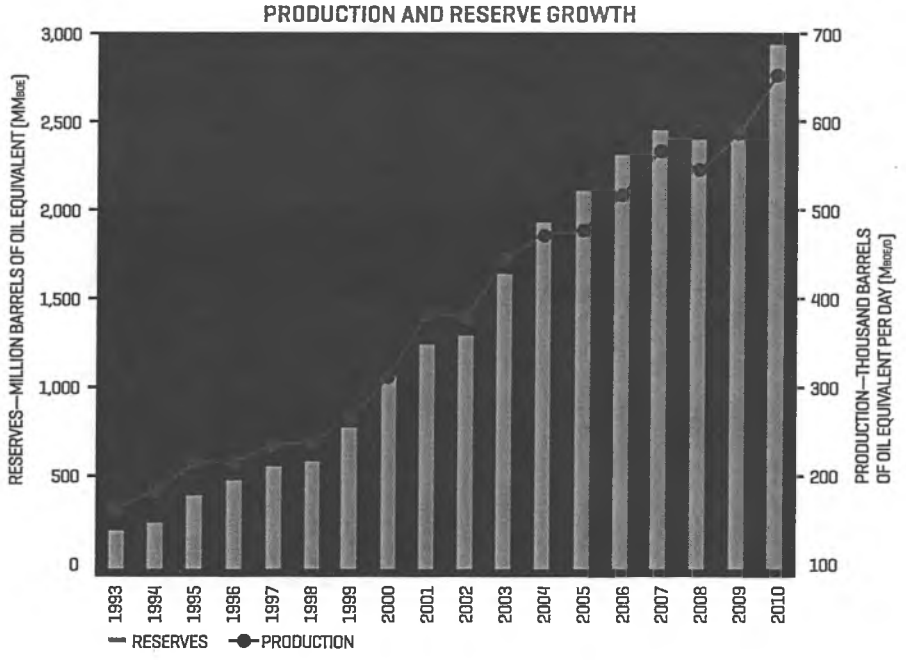


PERFORMANCE HIGHLIGHTS

Apache is a growth company and believes it can grow economically through acquisitions or drilling.

Apache's portfolio strategy has enabled the company to continue to grow throughout commodity cycles. During the past 10 years, the company has invested nearly US$57 billion, approximately 64 percent on exploration and development and 36 percent on acquisitions that enhance critical mass in core areas or establish new operating regions. These investments fueled an 11 percent compounded annual growth rate for reserves and 10 percent for production over the past decade. Apache currently has an inventory of discoveries that will deliver significant future growth, including the Horn River shale gas development in Canada and the Julimar and Reindeer discoveries in Australia.

Apache's strong balance sheet and cash-flow generating capability provide flexibility to further growth from its core drilling program, pursue larger exploration prospects and execute opportunistic acquisitions. Apache's cash flow is underpinned by balanced oil and natural gas production because experience shows that prices for the two commodities rarely move in parallel.



2010 ACQUISITIONS

In 2010, Apache strengthened its global portfolio through a series of transactions that provided additional production and reserves and – more important – significant running room for future growth.

- Apache added quality assets in the Permian Basin and the Gulf of Mexico shelf and gained a strong foothold in the GoM deepwater through the Mariner Energy merger. A separate transaction with Devon Energy Corporation brought additional acreage, infrastructure and production in the Gulf shelf.
- With the acquisition of BP's oil and gas operations in the Permian Basin, Apache solidified its position among the largest producers in one of North America's leading oil-producing regions.
- The company acquired essentially all of BP's upstream natural gas business in western Alberta and British Columbia.
- Apache purchased four under-worked development leases and one exploration concession in Egypt's Western Desert from BP.

DIVERSE OPERATING CAPABILITIES

Apache's global portfolio requires the capacity to operate on a large scale in a range of environments.

The environments where Apache thrives include harsh winters in northern British Columbia and Alberta; searing deserts of Egypt; severe summers in West Texas; offshore in the Gulf of Mexico, the North Sea and Western Australia; and environmentally sensitive areas such as coastal wetlands in Louisiana and marine sanctuaries offshore Australia.

Apache operates significant assets in all areas, including the Forties Field in the North Sea with production of up to 60,000 barrels of oil per day; the Qasr Field in Egypt's Western Desert with gross daily output of 540 million cubic feet of gas and 22,000 barrels of oil; the Permian Basin with net daily output of 66,000 barrels of oil equivalent; and the Van Gogh oil field in Australia, with a floating production, storage and offloading vessel with capacity to process 60,000 barrels of oil per day. Apache is operator of the proposed Kitimat liquefied natural gas project in British Columbia with first production targeted for 2015.

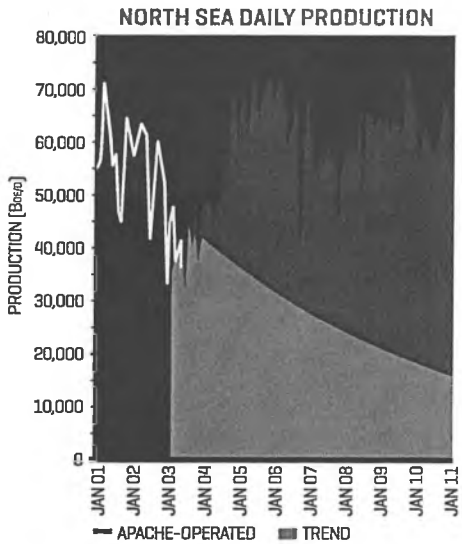
CASE STUDY: NORTH SEA FORTIES FIELD—MATURE ASSET MANAGEMENT

STRATEGY

- Increase production and reduce per-unit operating costs by upgrading facilities to remove production bottlenecks and reduce field downtime.
- Increase production output by drilling new wells identified with 4-D seismic.

RESULTS AFTER EIGHT YEARS OF OWNERSHIP

- Invested US$3.2 billion to upgrade facilities and drill new wells.
- Increased production and maintained output at levels 100 percent above trend expected at time of acquisition.
- Lifting cost declined 39% to US$8.03 per barrel.



CASE STUDY: UNCONVENTIONAL RESOURCES FUEL GROWTH IN ARGENTINA

STRATEGY

- Employ advanced seismic, drilling and well completion technologies to develop abundant resources across 5 million acres in Austral, Neuquén, Cuyo and Noroeste basins.
- Focus on opportunities in unconventional reservoirs eligible for higher Gas Plus pricing.

RESULTS AND PROSPECTS

- 72 Neuquén Basin wells producing approximately 85 MMcf per day under the Gas Plus program with average price approaching $5 per Mcf.
- Drilling South America's first horizontal well targeting shale formations.
- First modern 3-D seismic identified previously untapped structures in Cuyo Basin, a proven oil-producing province.

CULTURE OF RESPONSIBILITY

Individual initiative and sense of responsibility drive Apache's operations; they also infuse our environmental, health and safety programs.

Apache is committed to being a good corporate citizen by operating in a safe and environmentally responsible manner throughout the world and by building enduring relationships with the communities where it operates through commitments to education, civic improvement and rewarding careers.

HEALTH AND SAFETY

Apache employees understand their personal responsibility for ensuring safe and environmentally responsible operations. The company has established high standards to assure workers have the knowledge to do their jobs correctly, as well as comply with regulations and take environmental considerations into account. The company also makes sure that facilities are designed properly and well maintained, and develops plans to respond to extraordinary events.

IN THE COMMUNITY

Apache builds enduring relationships with the communities in which we operate through our commitments to environmental stewardship, sustainable development, education and civic improvement. Our emphasis on education is reflected in support for Fund for Teachers, which has enabled more than 4,000 teachers to travel the world to enrich the experiences they bring to their classrooms; Ucross Foundation, an artist-in-residence program in Wyoming; and Springboard — Educating the Future, which funded construction of 201 schools for young girls in poor rural villages in Egypt. We support important cancer research in the United States, the United Kingdom and Australia.

APACHE-FUNDED SCHOOL FOR YOUNG GIRLS IN RURAL EGYPT

CASE STUDY: RESPONSIBLE SHALE DEVELOPMENT IN CANADA

CHALLENGE

How to tap natural gas from the abundant deep shale reservoir of the Horn River Basin in British Columbia while sustaining the fragile ecosystem.

STRATEGY

Apache develops new and improved methods for drilling and hydraulic fracturing. Multi-well drilling pads permit Apache to drill up to 16 horizontal wells tapping as many as 2,000 acres of a deep shale reservoir from a single surface location, vastly minimizing the impact to the surrounding environment. The Debolt Water Treatment Plant enables Apache to extract saltwater from formations well below drinking water aquifers for use in hydraulic fracturing in shale formations. Water is recovered and reused in a sustainable cycle that minimizes the use of surface water.

RESULTS

Apache is substantially reducing its environmental footprint on the pristine wilderness of the Horn River Basin. By operating in a safe and environmentally responsible manner, the company is protecting the area's delicate ecosystem and fresh water supplies.

Apache's experience in Horn River and unconventional plays in the United States provide the technical foundation for operations in emerging unconventional plays in Argentina's Neuquén province.

AT A GLANCE

Established in 1954, Apache Corporation has grown to become one of the world's top independent oil and gas exploration and production companies with US$43 billion in total assets as of year-end 2010.

Apache's growth and progress results from a diverse team of committed people who share Apache's values of integrity, hard work and respect for others. The company provides its employees with the latest technology and empowers them to make the decisions to fuel its growth. Apache stretches the limits of what's possible through determination, adaptability, discipline, a sense of urgency and a long-term perspective.

Apache's critical mass of exploration acreage, cash-generating production and financial flexibility enables the company to explore for new resources, acquire properties with upside potential and exploit mature fields with new investment and more efficient operations to facilitate future growth.

As Apache has grown, it has continued its commitment to the highest standards of safe and environmentally responsible operations. The company participates in many programs that improve the quality of life in our communities and foster creativity.

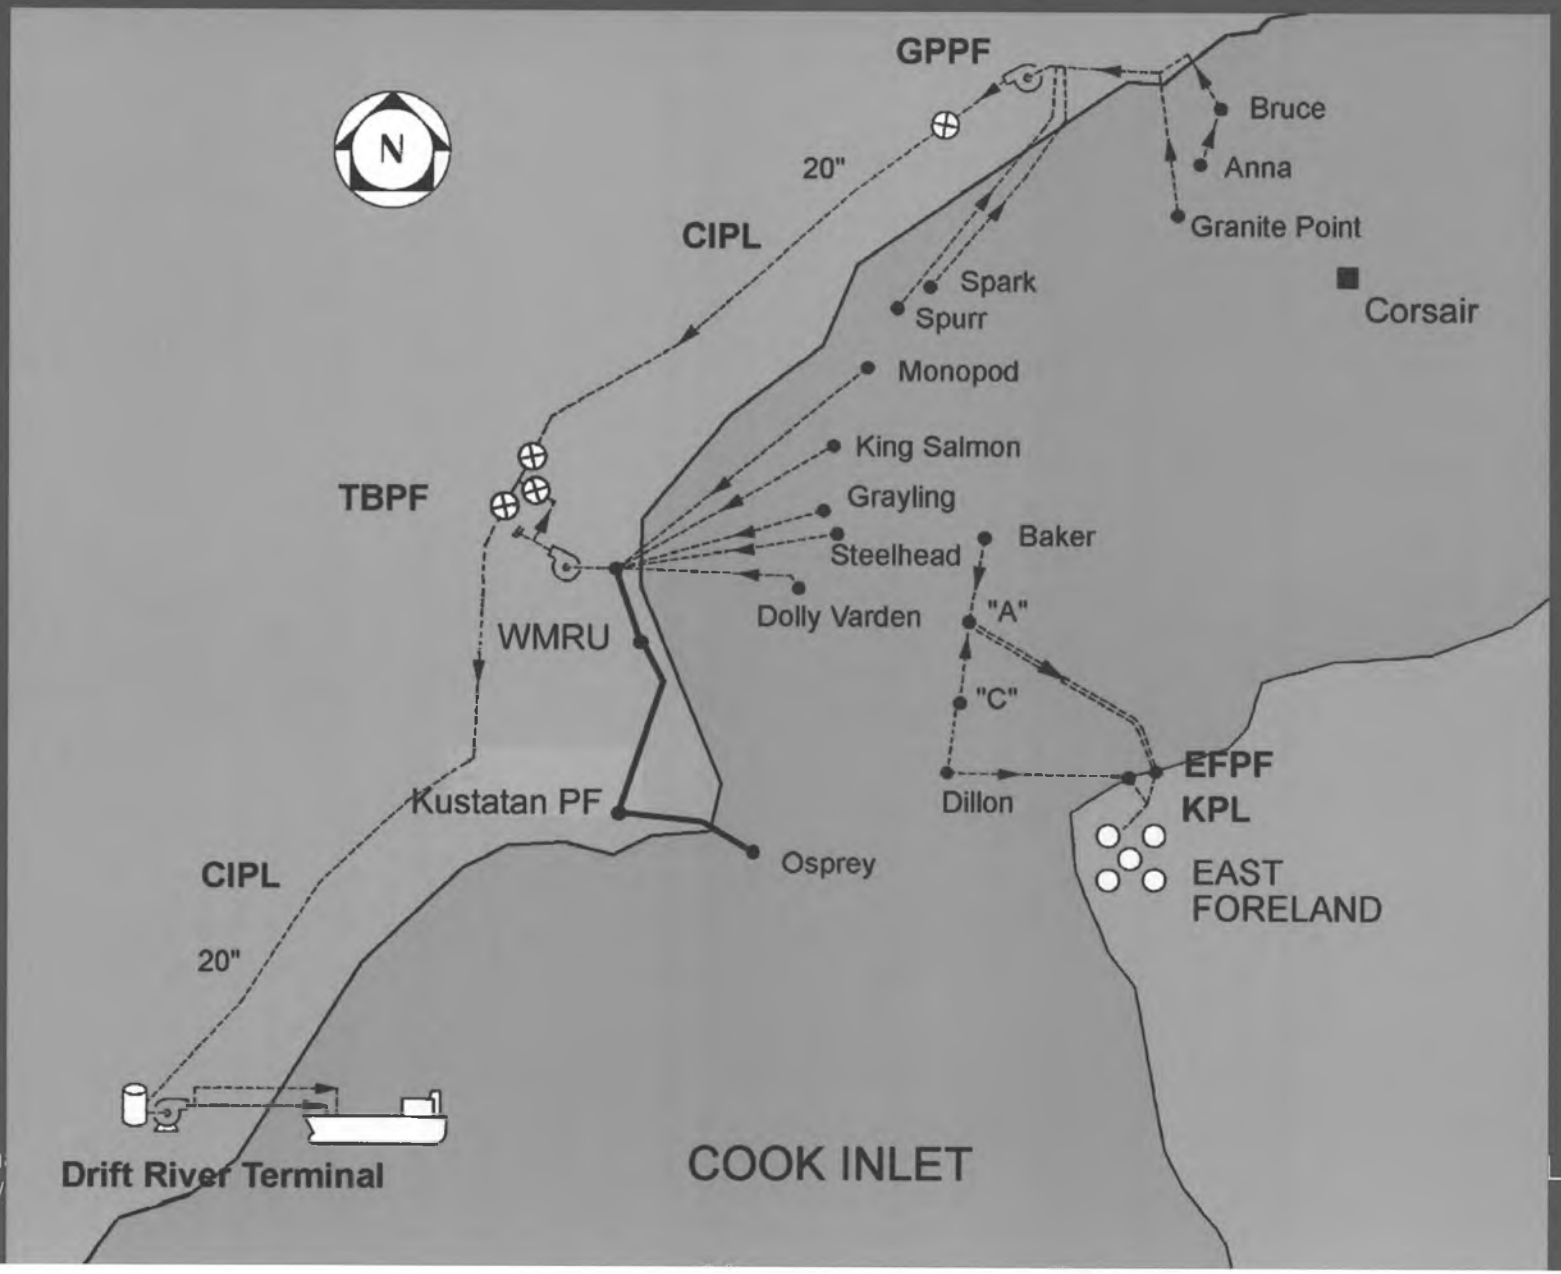
Gas Development Presentation

- **Cook Inlet Background**
- **Cook Inlet Design Criteria**
- **Development Options**
  - Outrigger Caisson
  - Subsea
  - Two-Deck Platform
  - Three-Deck Platform
- **Pipelines**
- **Economics**

KLU #1 Location



Environmental Conditions

- **Waterdepth MLLW:** 100 feet
- **Tides:** 30 feet
- **Surface current*:** 10.5 feet per second
- **Bottom current:** 5.3 feet per second
- **Ice thickness*:** 34-inch
- **Wave height*:** 28 feet
- **Earthquake:** API RP2A Zone 4
- **Temperature - air:** minus 40º F (minimum)
- **Temperature – water:** 28 º F (minimum)

* One hundred-year occurrence

Field Development Assumptions

If Gas Only

- Gas Wells: 5
- Initial Production Rate: 50 MMCF/d

If Oil and Gas

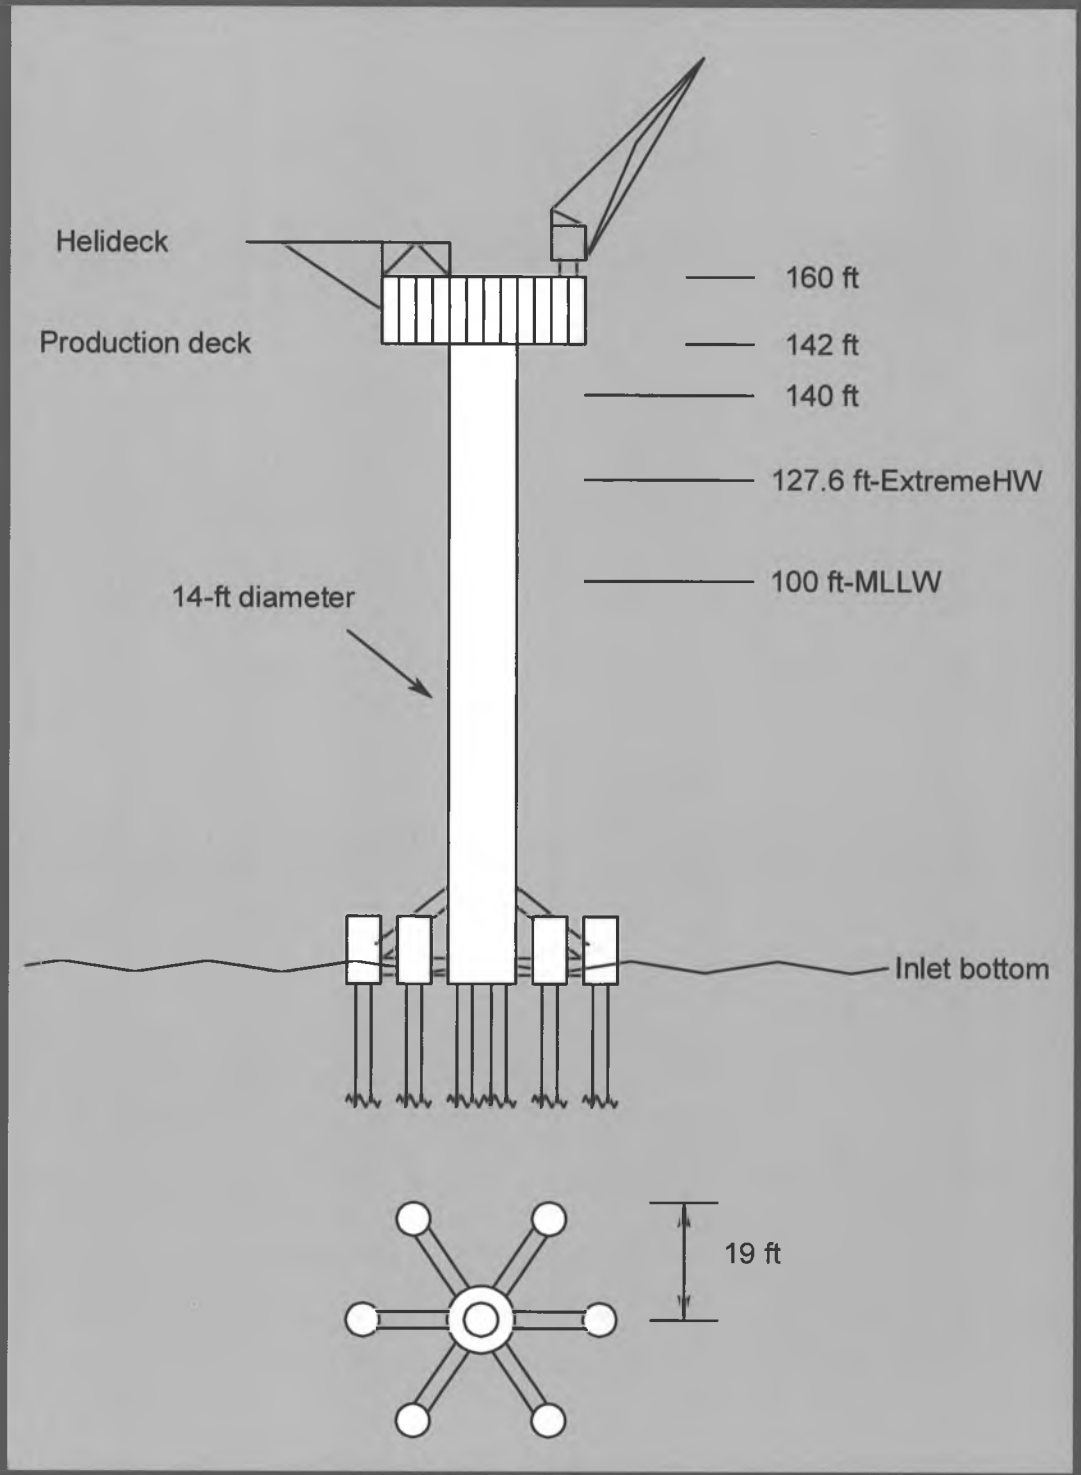
- Gas Wells: 5 Oil Wells : 12
- Initial Production Rate:
- 50 MMCF/d and 12,000 BOPD

Development Options

1. Outrigger Caisson
2. Subsea
3. Two-Deck Platform
4. Three-Deck Platform

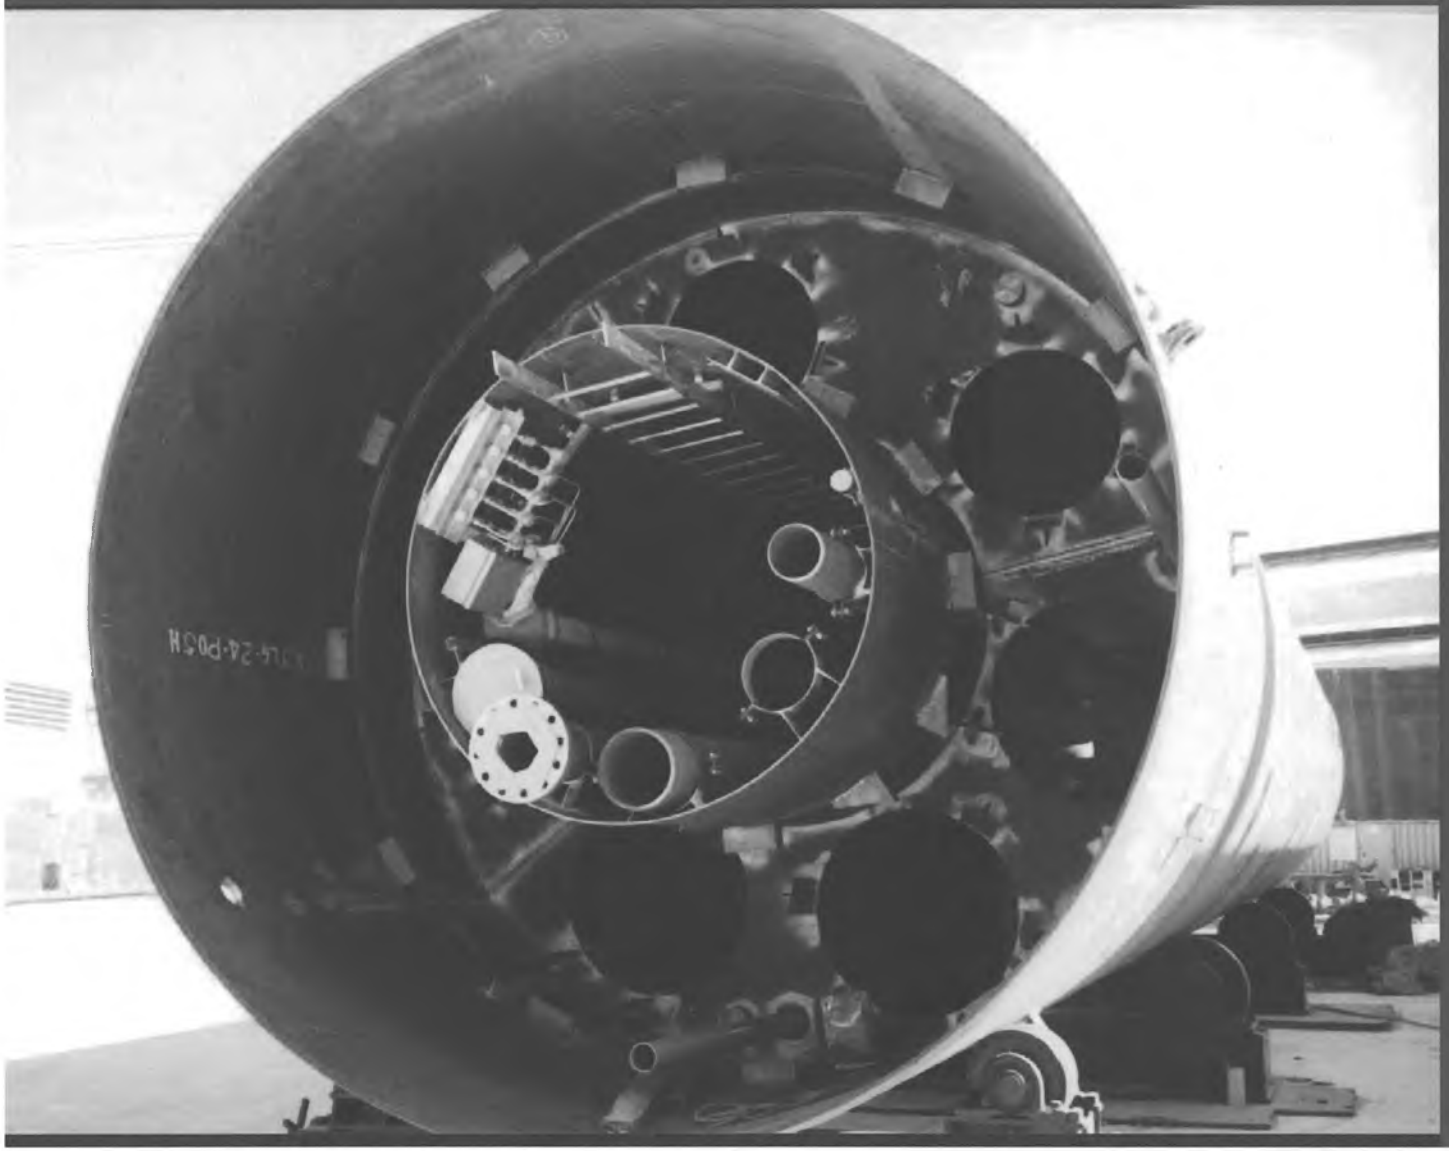
KLU #1
Caisson Platform Development

- **Outrigger caisson platform**
  - Six well capability
  - Deck with heliport
  - Emergency quarters
- **Pipeline to Tyonek Platform or to shore**
  - Single 10-inch gas pipeline
- **Umbilical to Kitchen Lights**
  - Power, methanol and controls



Self-installing outrigger caisson platform concept for six wells

Cross-Section of Platform Osprey Leg

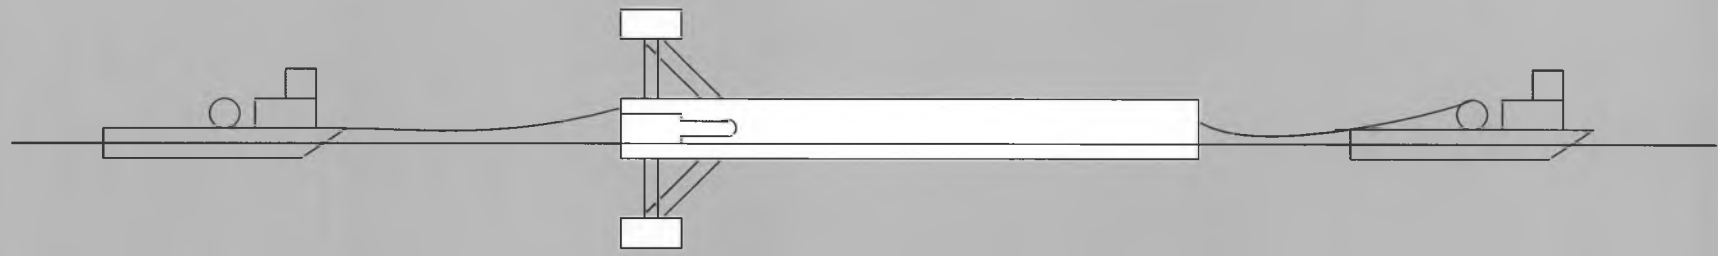


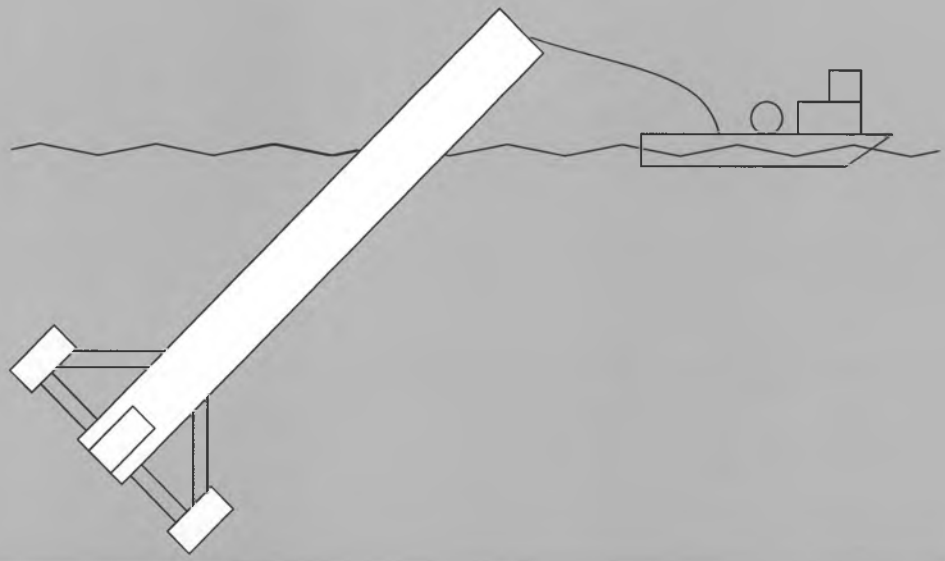
Kitchen Lights caisson will be identical to Cook Inlet platform legs

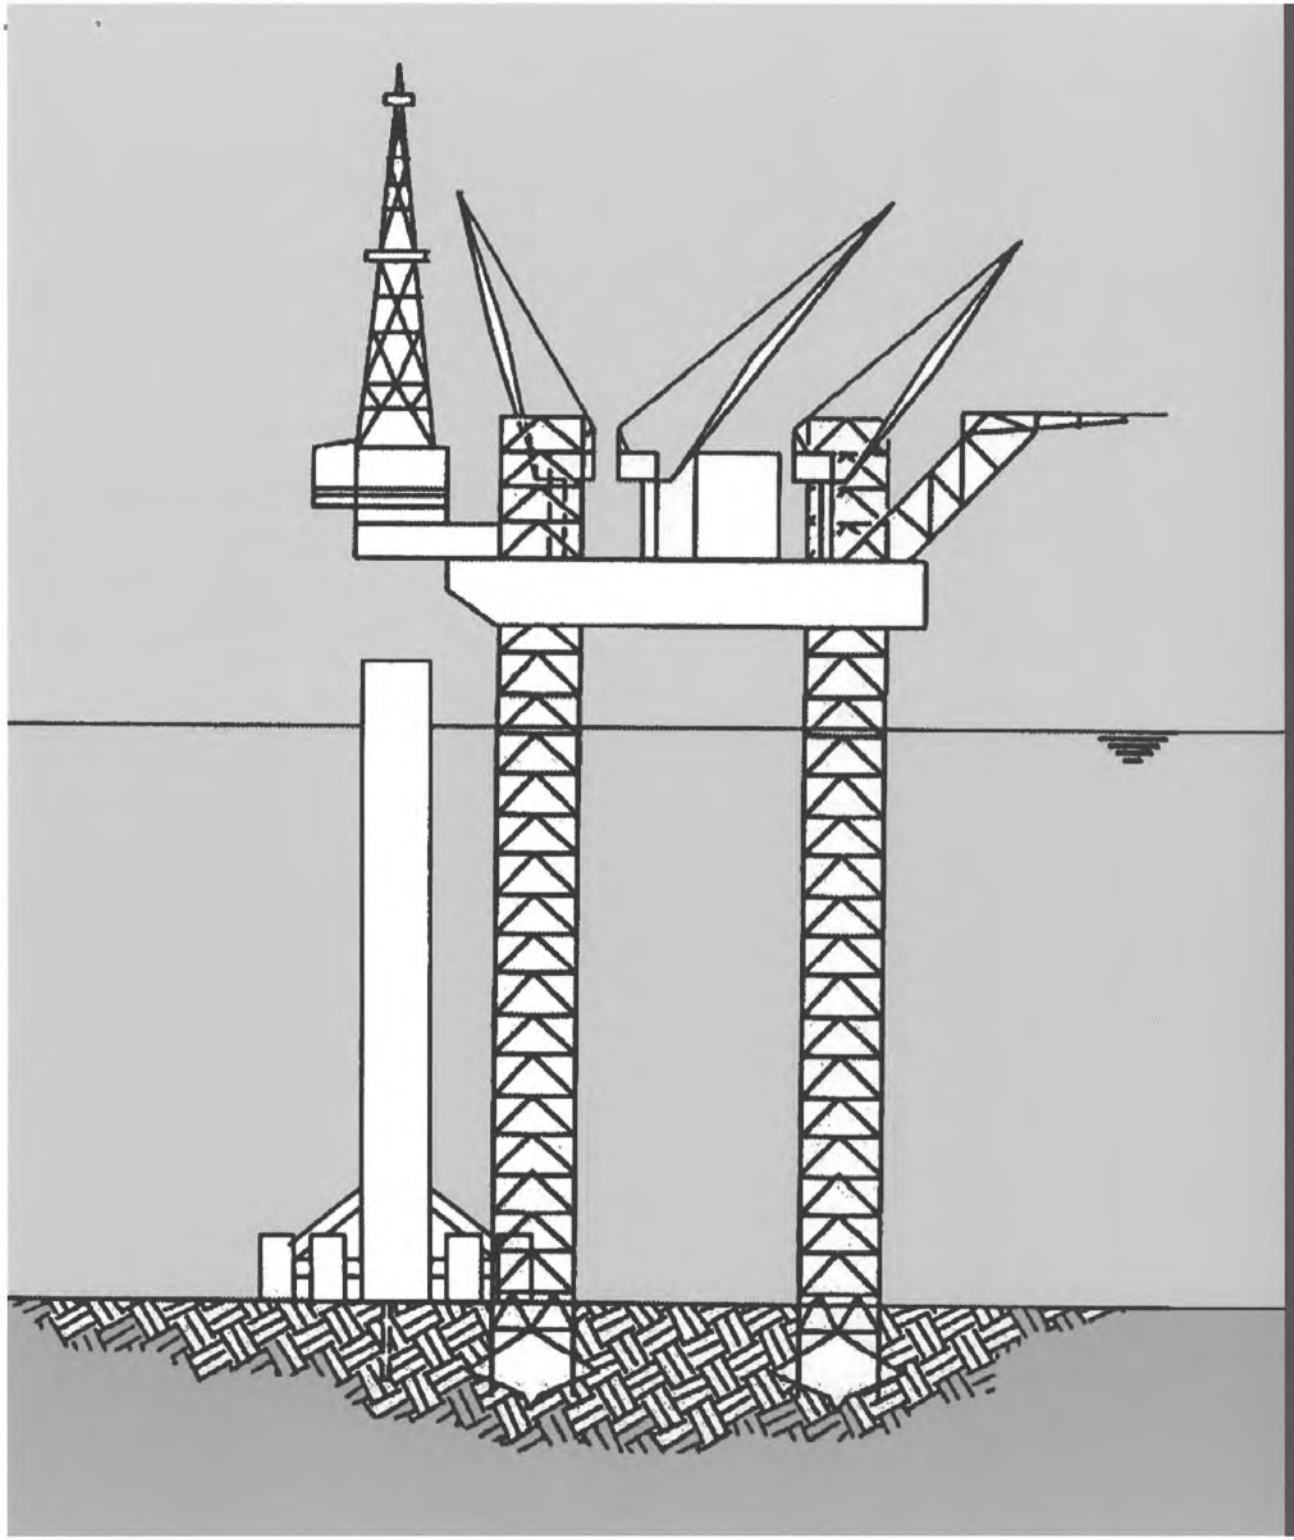
Fabrication & Transportation

- **Fabricate caisson structure**
  - Anchorage
  - Vancouver, Washington
  - SF Bay area
- **Tow caisson to Cook Inlet**

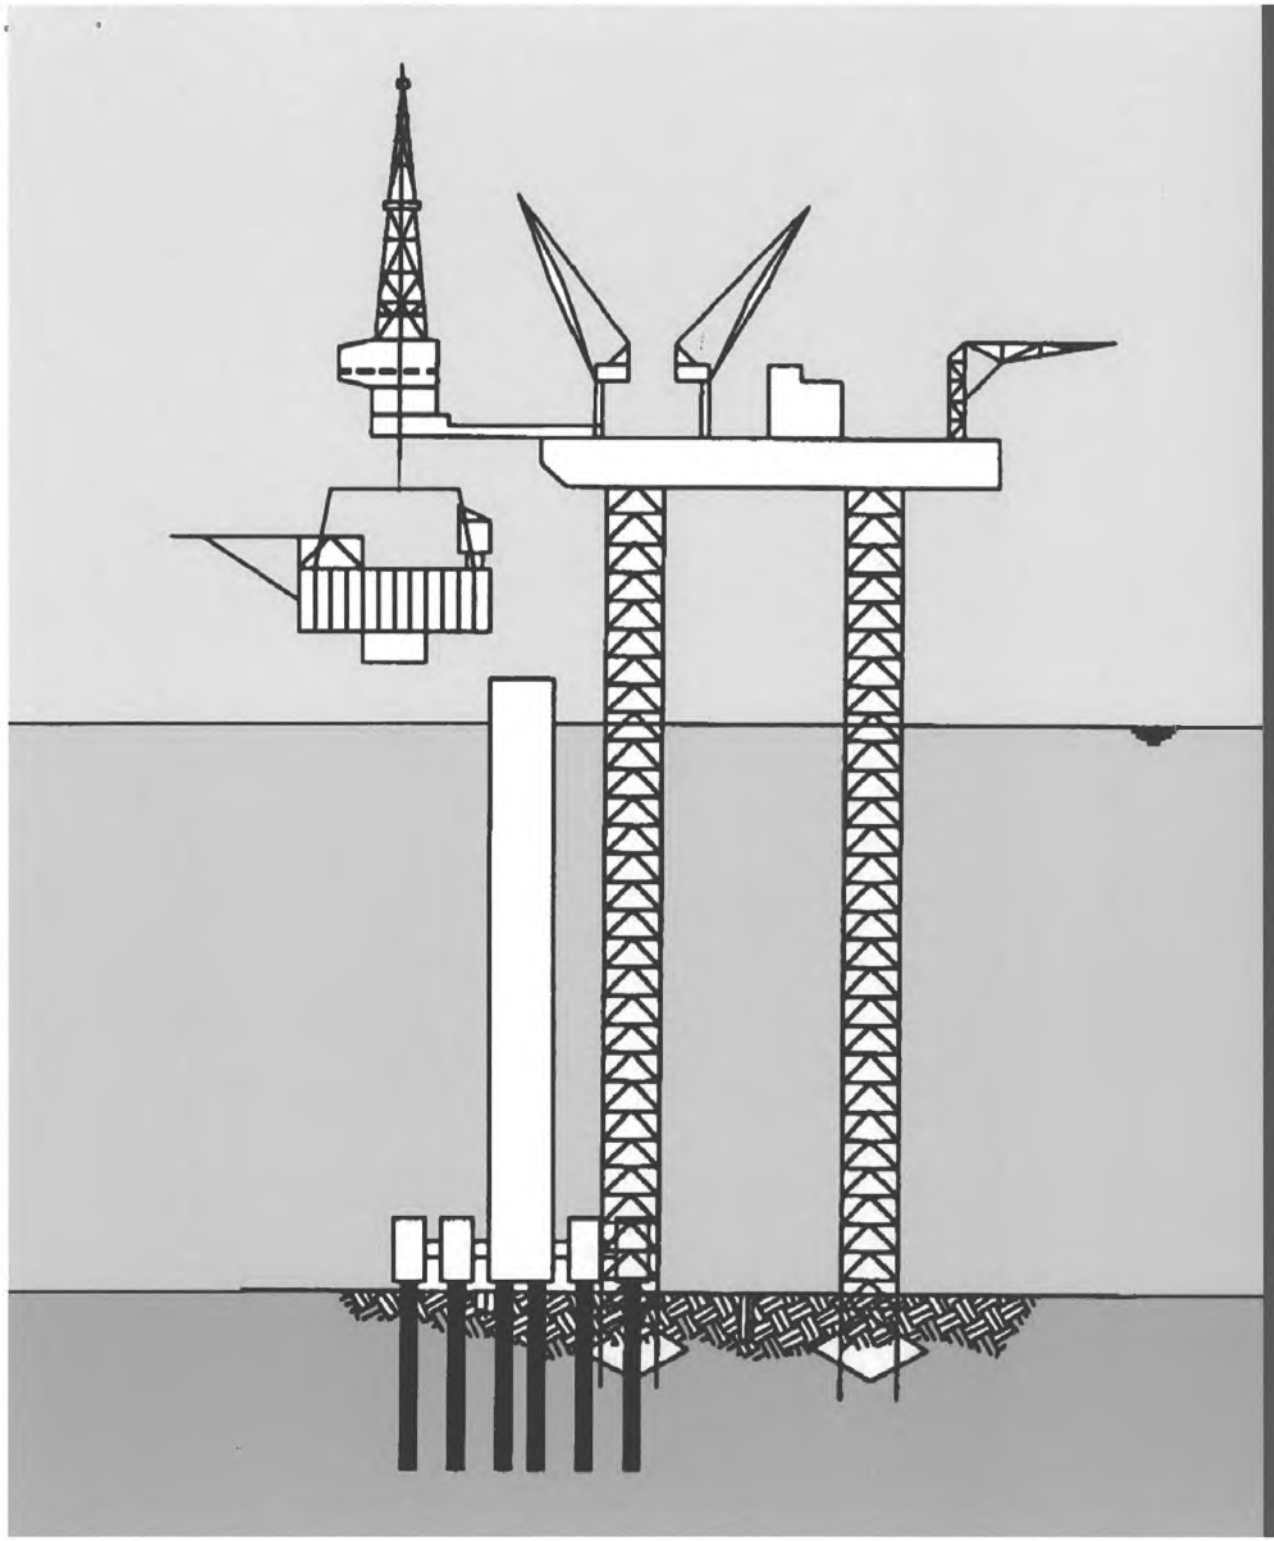
Installation Procedure







After upending the caisson is set on bottom and jack-up drilling unit moves onto location



Assuming the well is successful the jack-up unit is used to drive piles and install the deck .

Annulus of caisson is filled with grout

Outrigger Caisson Platform

- **Advantages**
  - No derrick barge needed for installation
  - Minimum cost
  - Short timeline to production
- **Disadvantages**
  - Has not been done in Cook Inlet
  - Jack-up needed for well intervention (summer)

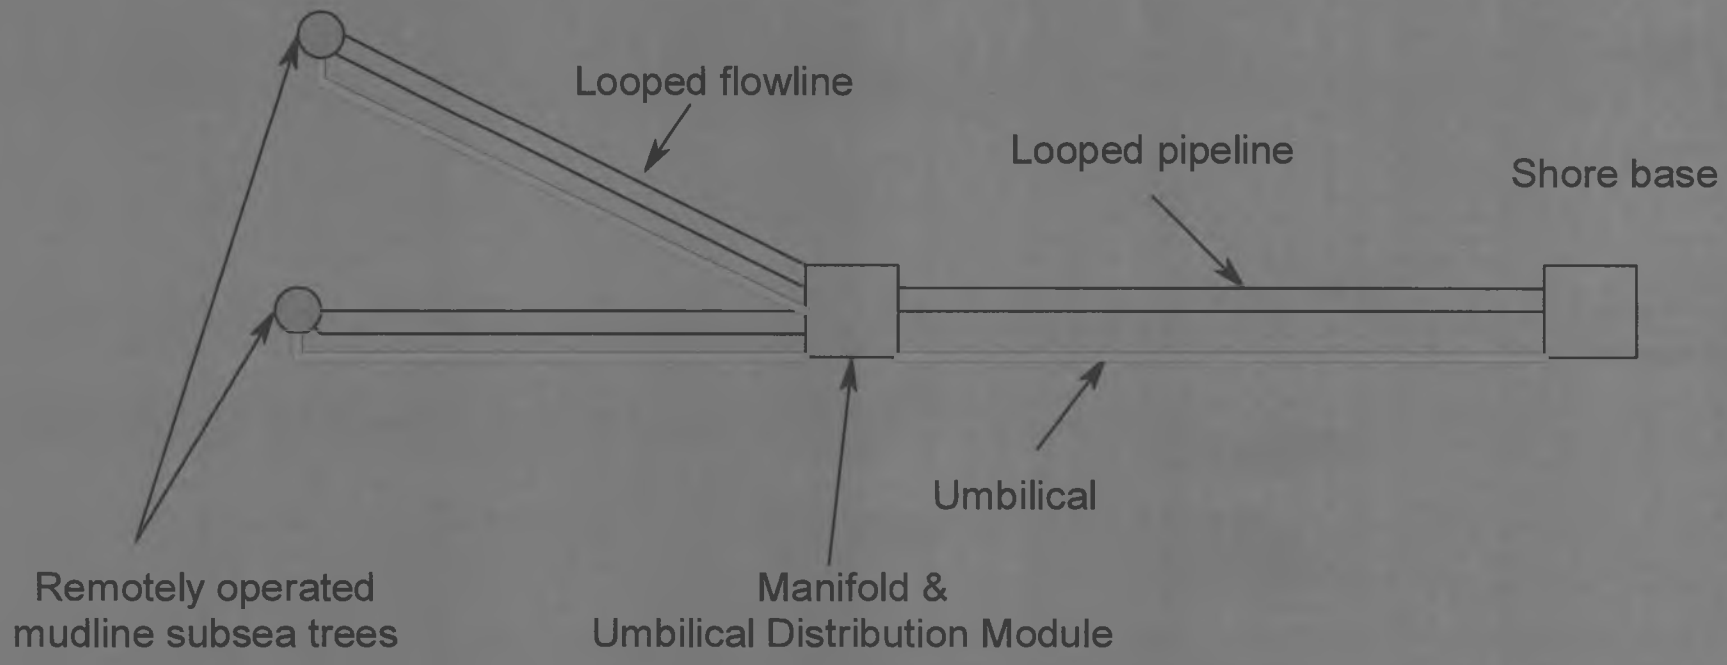
Development Options

1. Outrigger Caisson
2. **Subsea**
3. Two-Deck Platform
4. Three-Deck Platform

Kitchen
Subsea Development

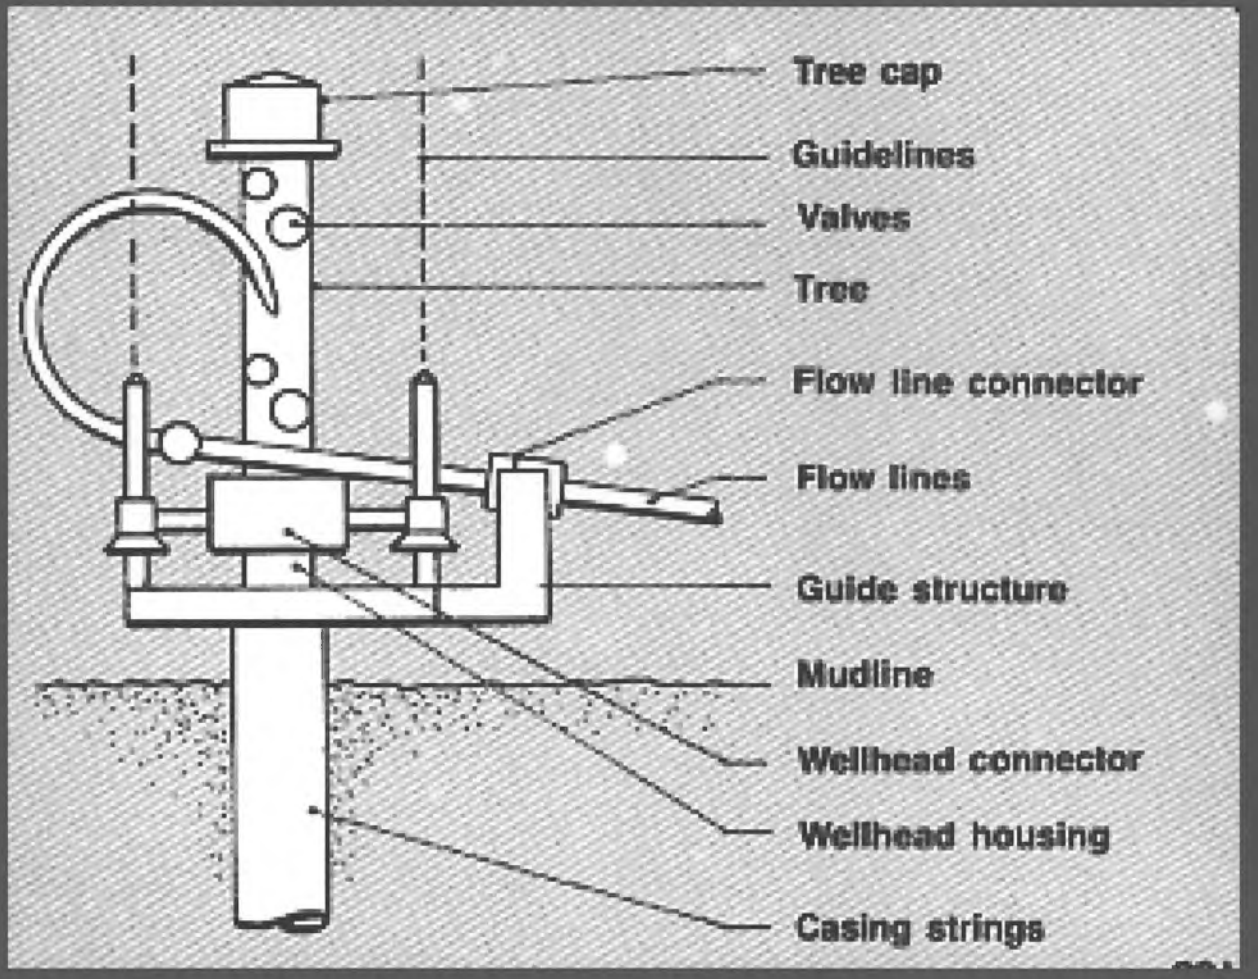
- **Subsea Wells**
  - Individual wells with flowlines to subsea manifold, or,
  - Six well template
- **Pipelines to Tyonek Platform or to East Forelands Prod. Facility**
  - Dual pipelines (for pigging)
- **Umbilical to Kitchen Lights**
  - Power, methanol and controls

Multiple Individual Wells



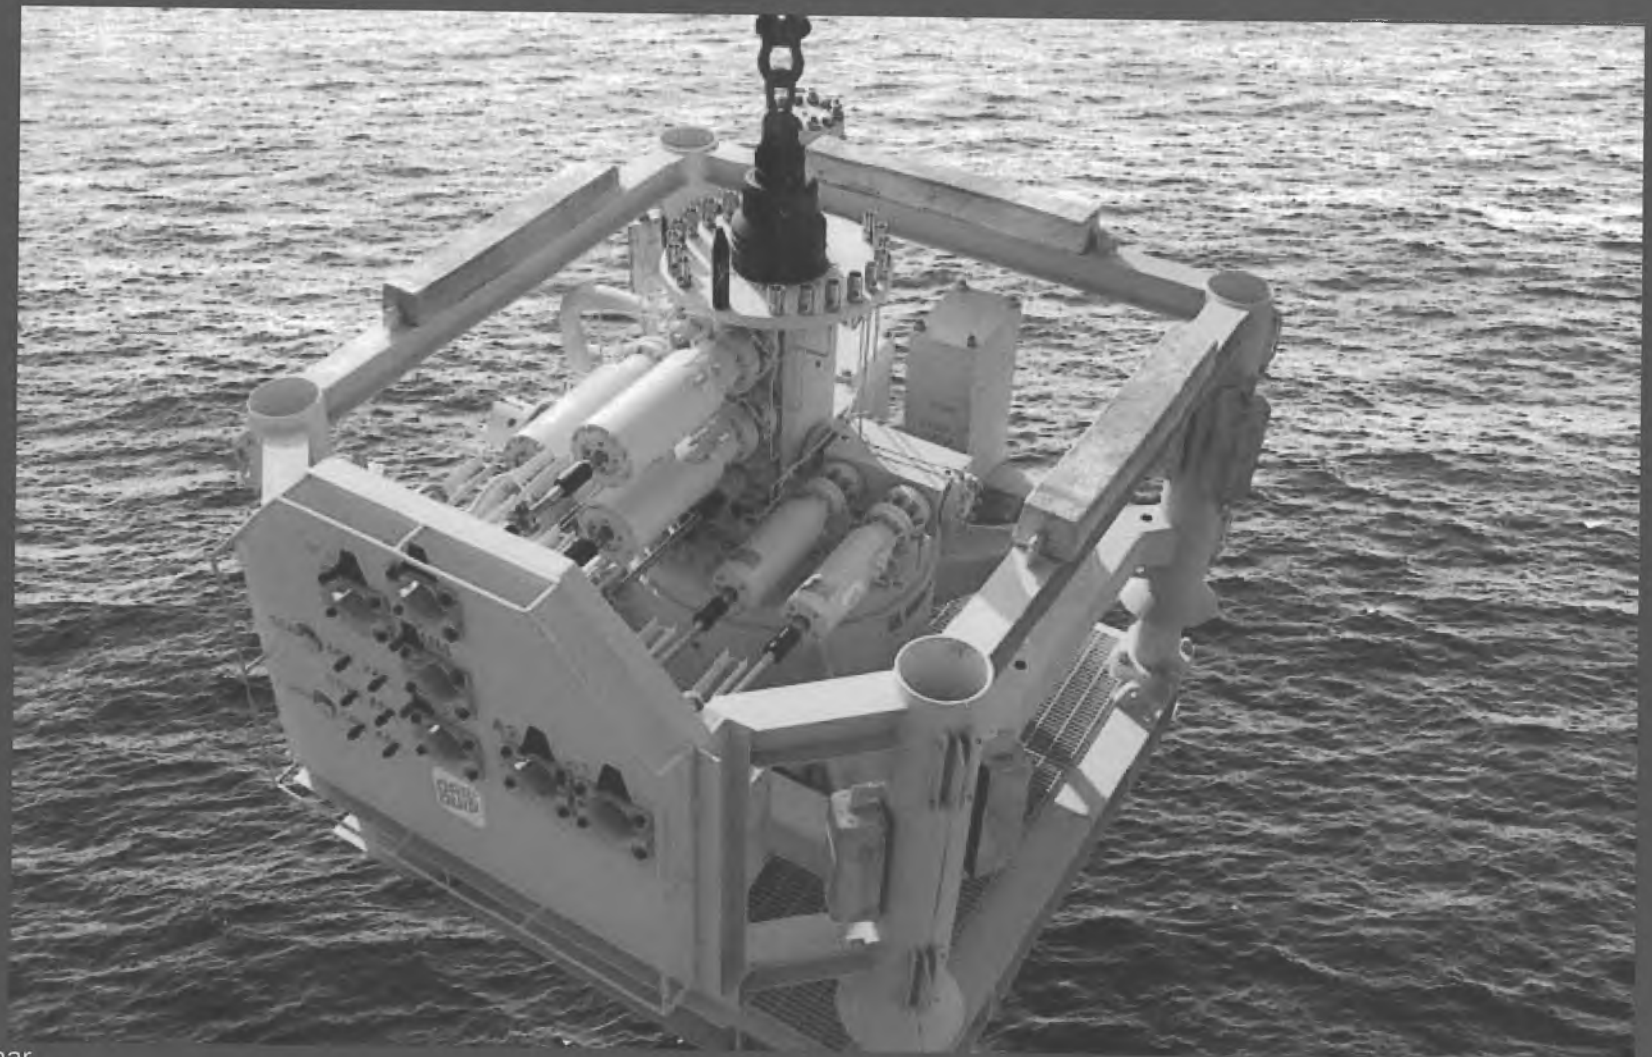
Multiple subsea wells schematic

Individual Subsea Well Completions

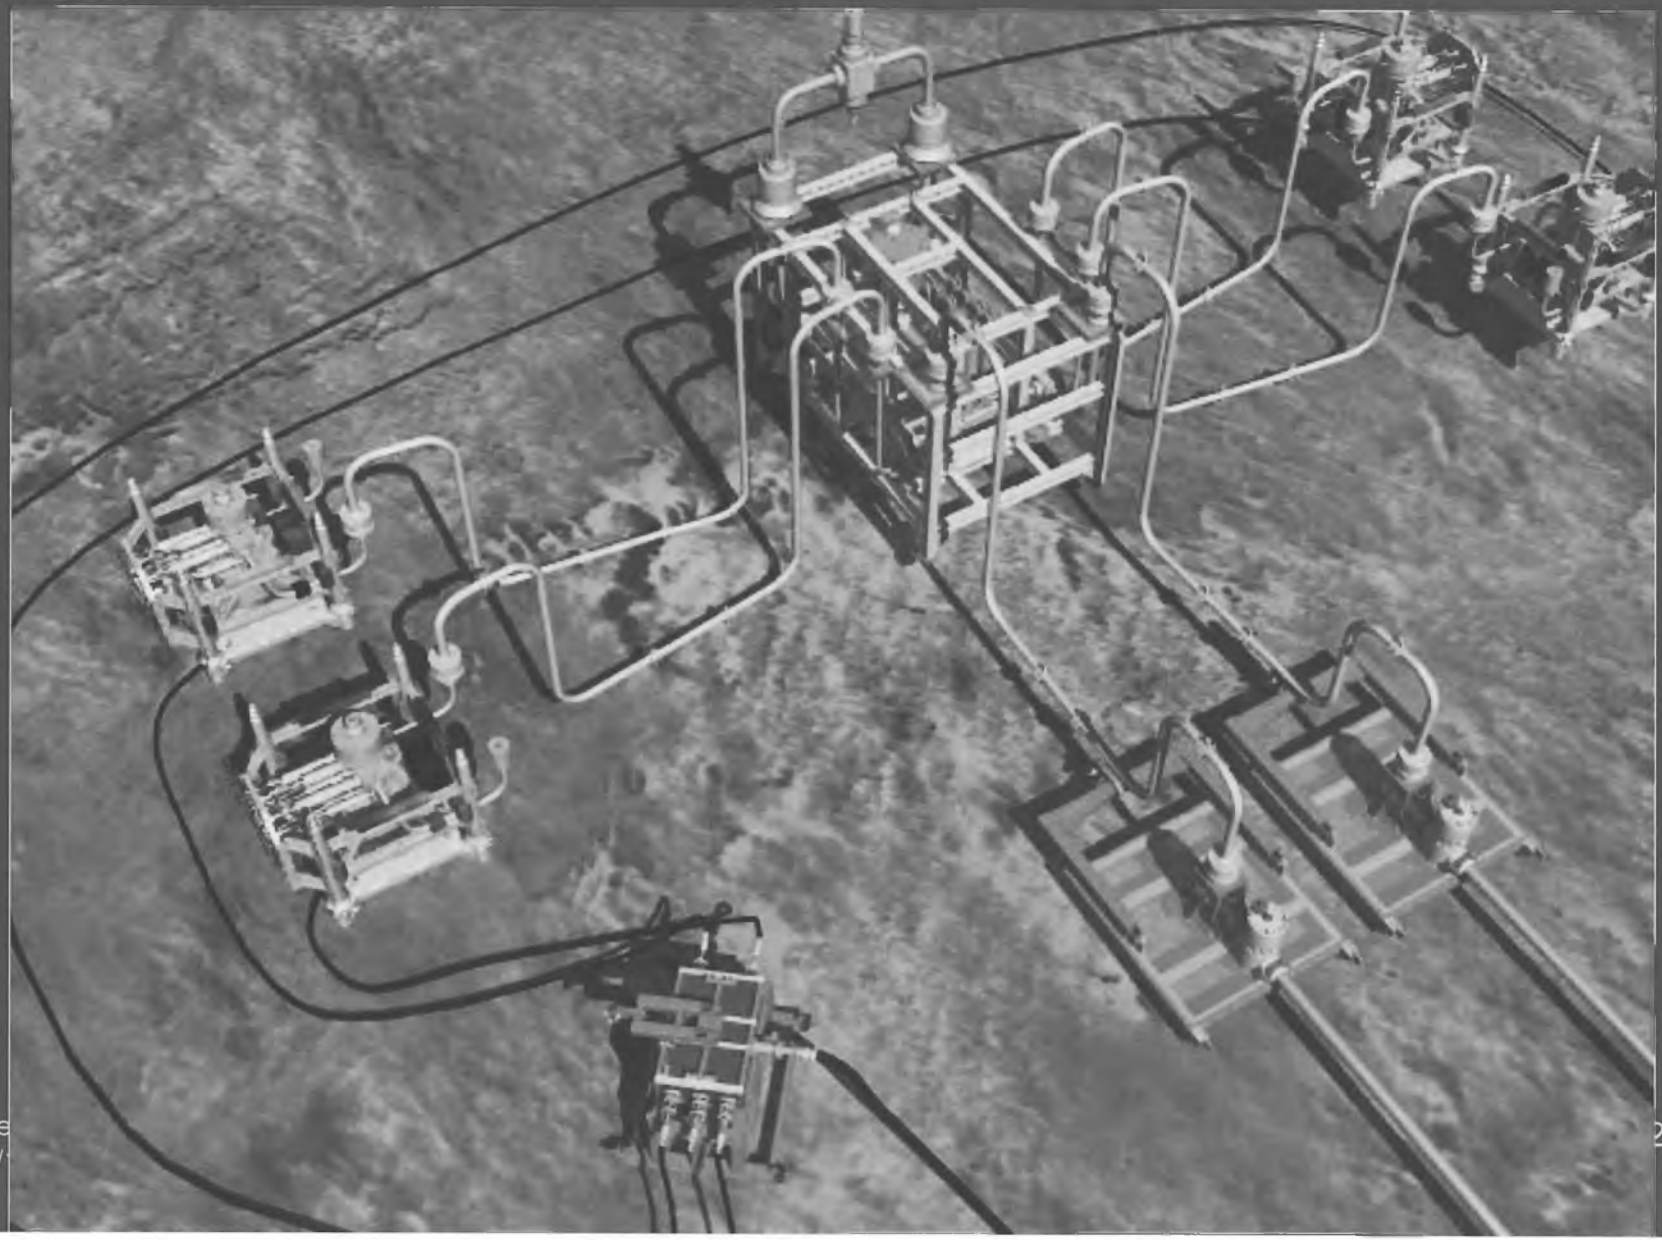


Subsea hookup performed by divers and/or guideline system

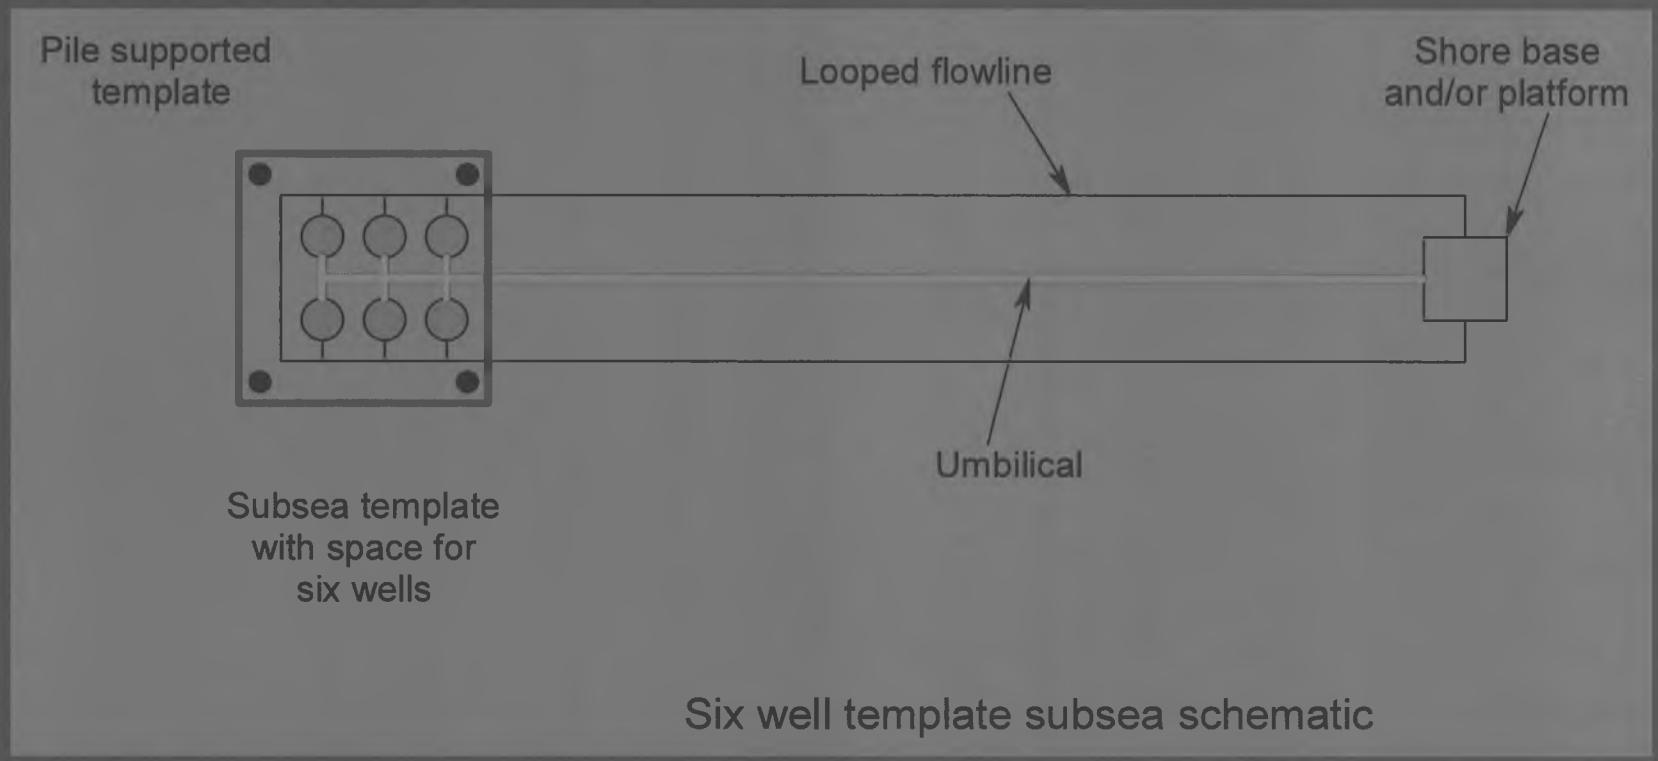
Wellhead Example



Tree and Manifold Layout

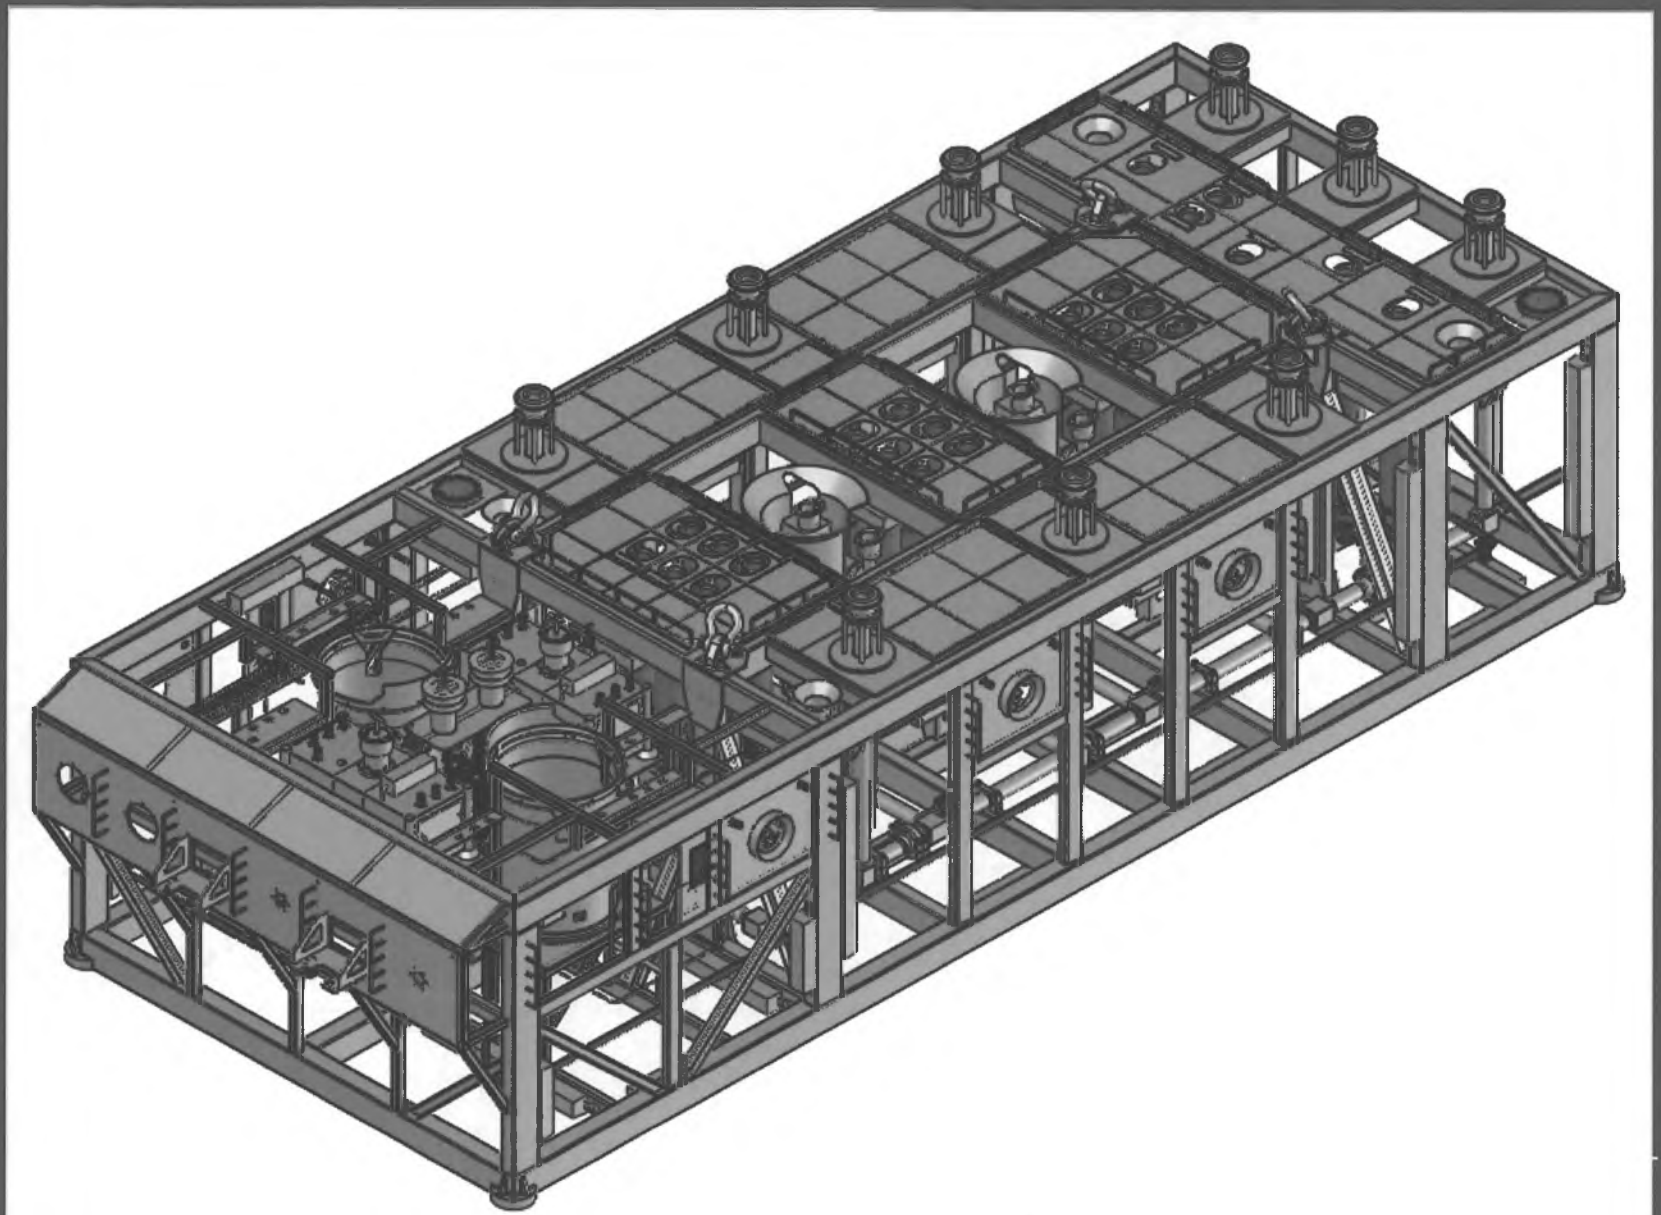


Six Well Subsea Template

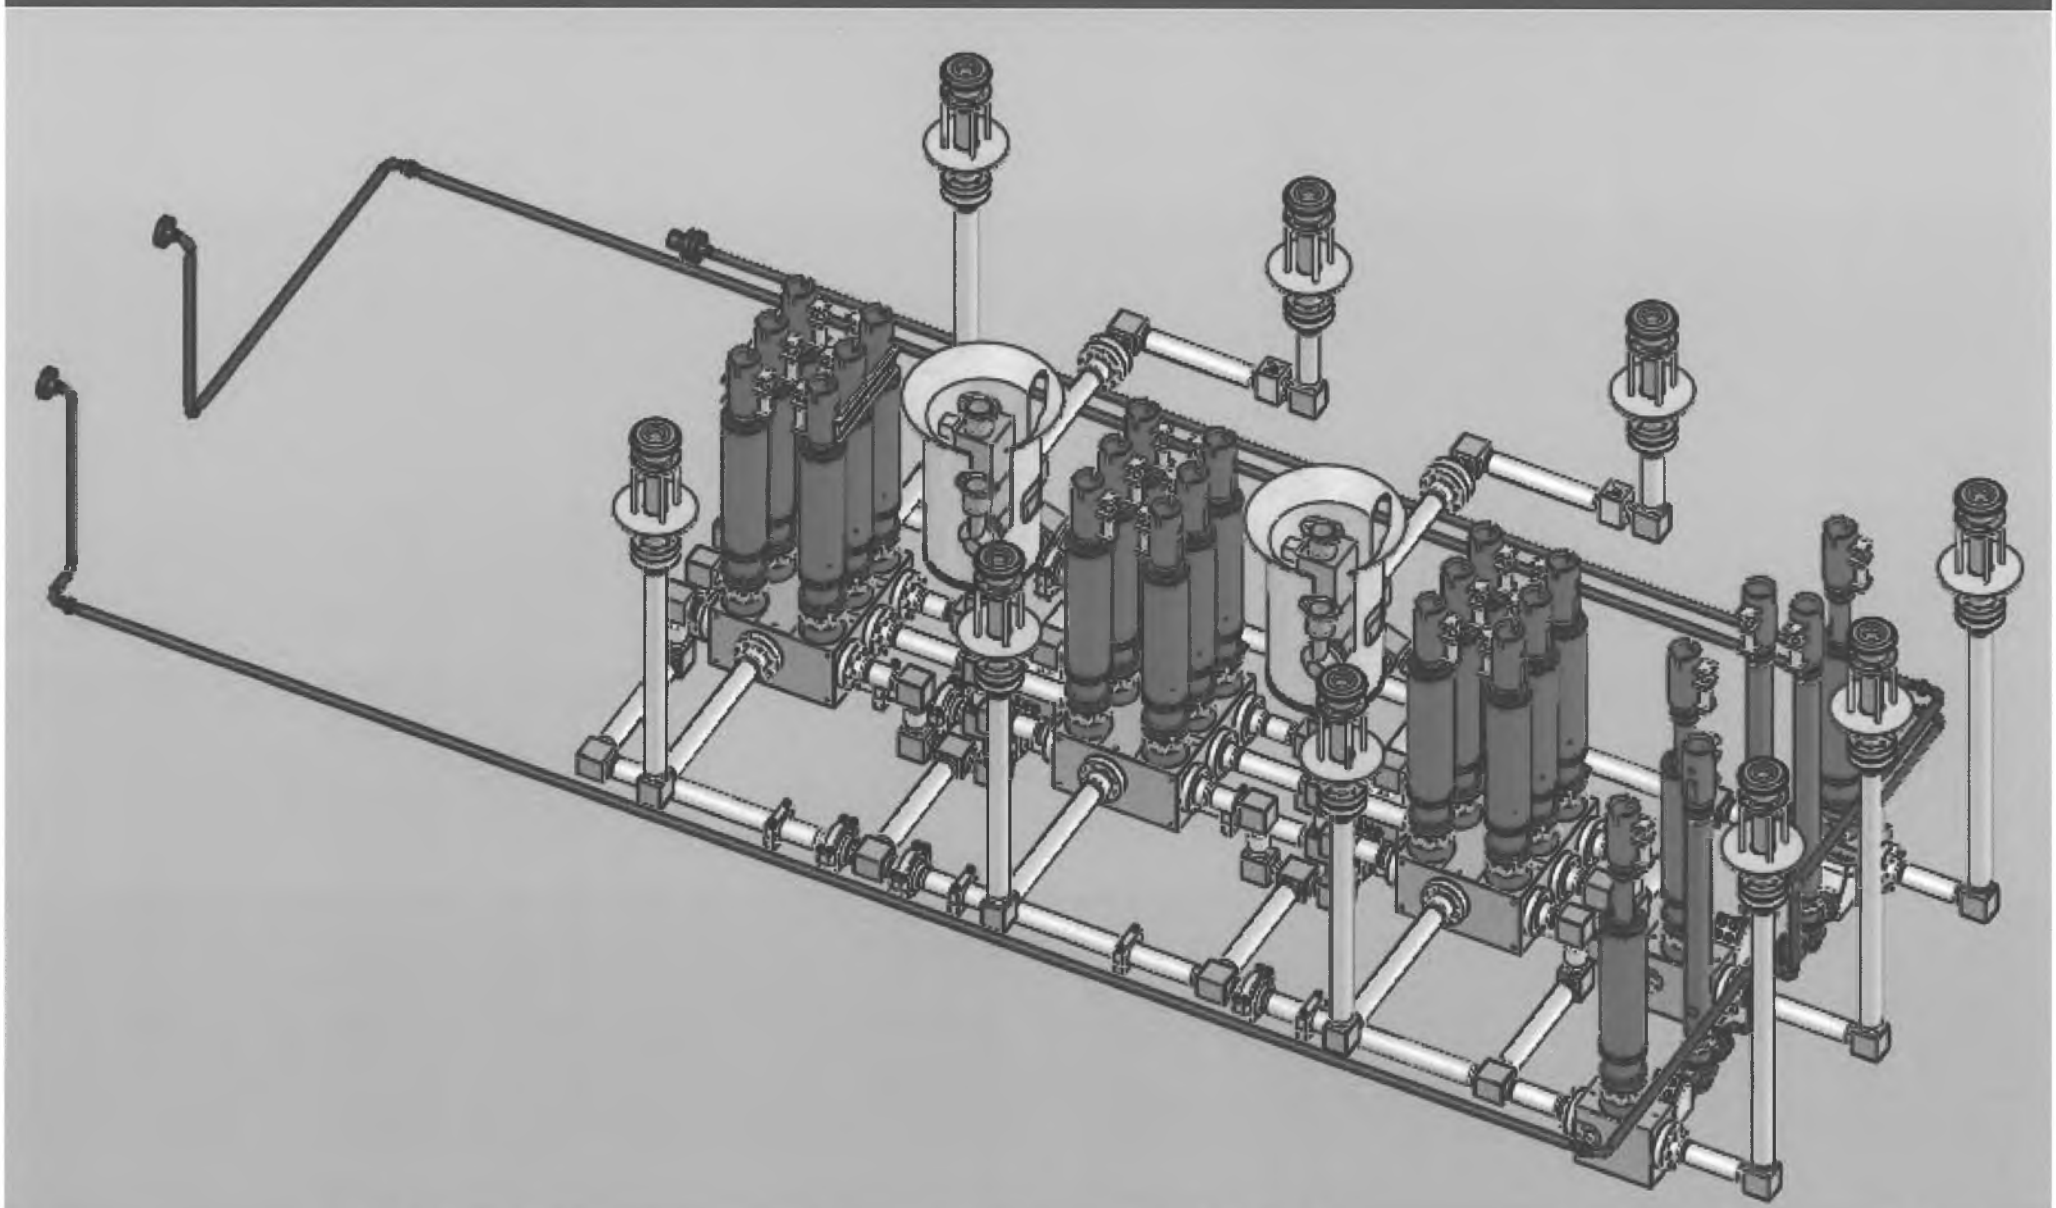


Six well template subsea schematic

Six-Well Tempalte Example



Template Example Schematic



Subsea Development

- **Advantages**
  - No derrick barge needed for installation
  - Short timeline to production
- **Disadvantages**
  - Has not been done in Cook Inlet
  - Complicated hook-up using divers
  - Jack-up needed for well intervention (summer)

Development Options

1. Outrigger Caisson
2. Subsea
3. **Two-Deck Platform**
4. Three-Deck Platform

belmar
3/12/08

Escopeta KLU - 26

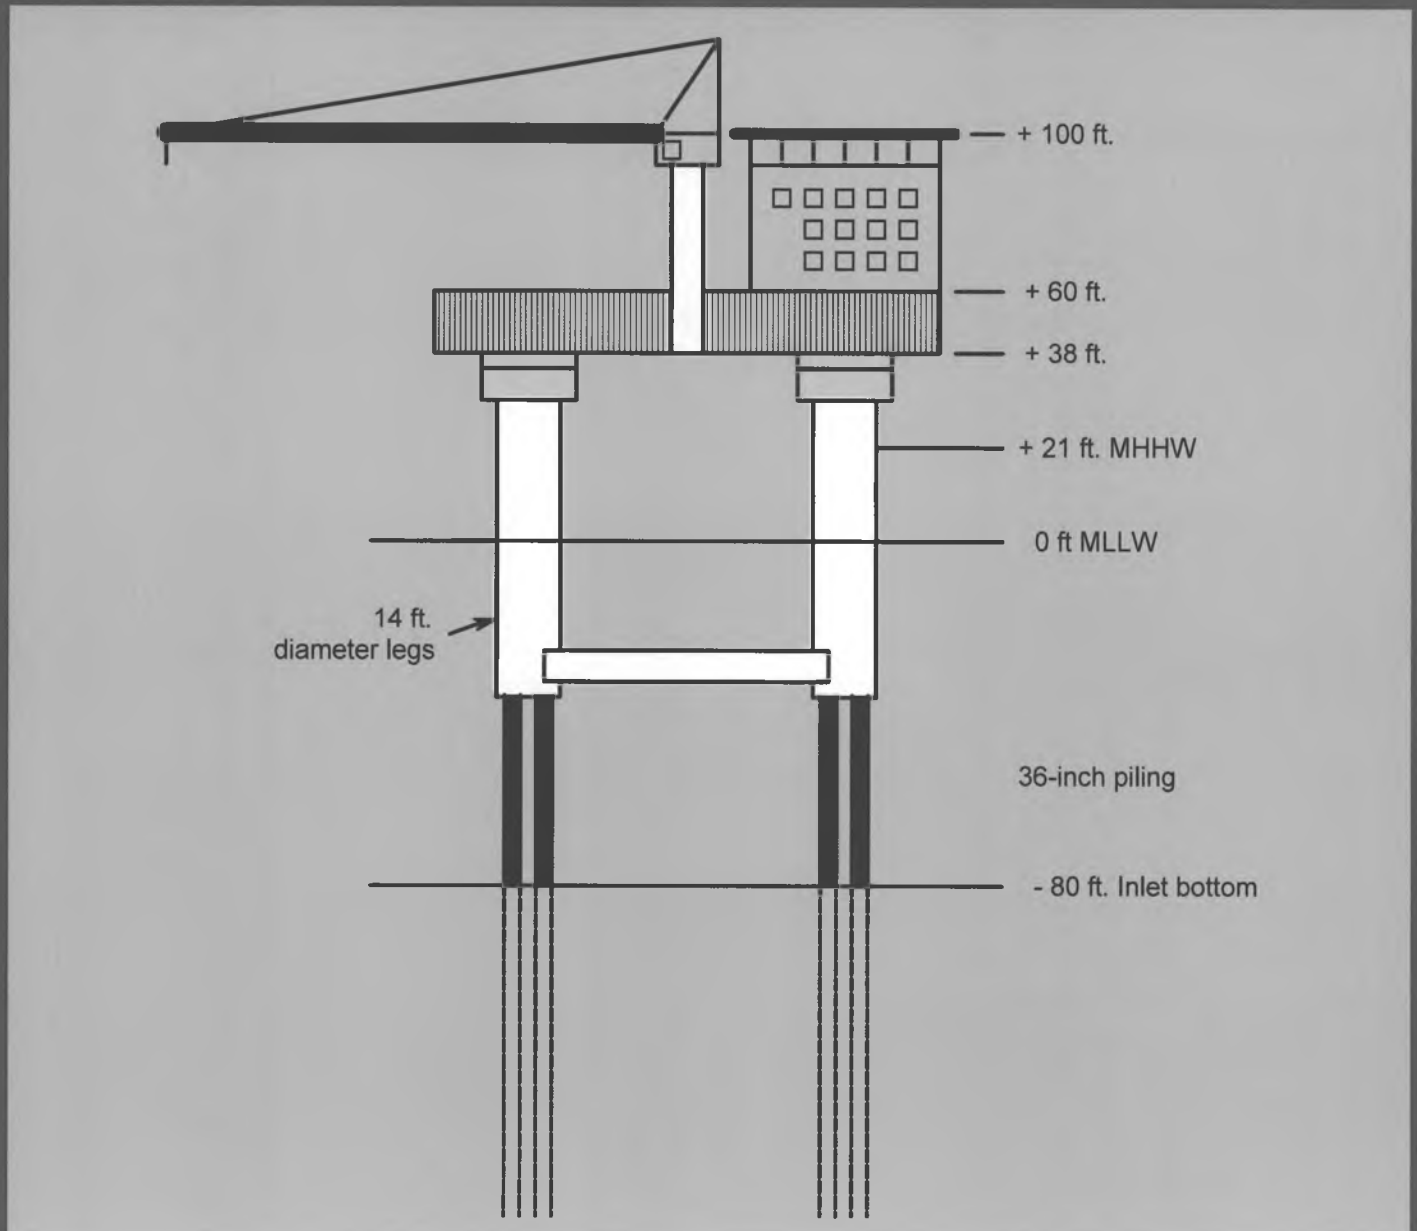
Kitchen
Two-Deck Development

- **Platform**
  - 28-well capacity
- **Pipelines to East Forelands Prod. Fac.**
  - Wet oil and gas pipelines
- **Water Injection Pipeline from EFPF**
  - Produced water and make-up water
- **Umbilical cable from EFPF**
  - Power, methanol and controls

Kitchen Application

- **Osprey Concept Limitation**
  - Tower floatation requirement
- **Deeper Water Concept**
  - Columns only needed in tidal (ice) zone
  - Different installation method

"Deep" Water Two-Deck Platform



Two-Deck Platform

- **Advantages**
  - No derrick barge needed for installation
- **Disadvantages**
  - Has not been done in this water depth in Cook Inlet
  - No space for production facilities
  - Cost

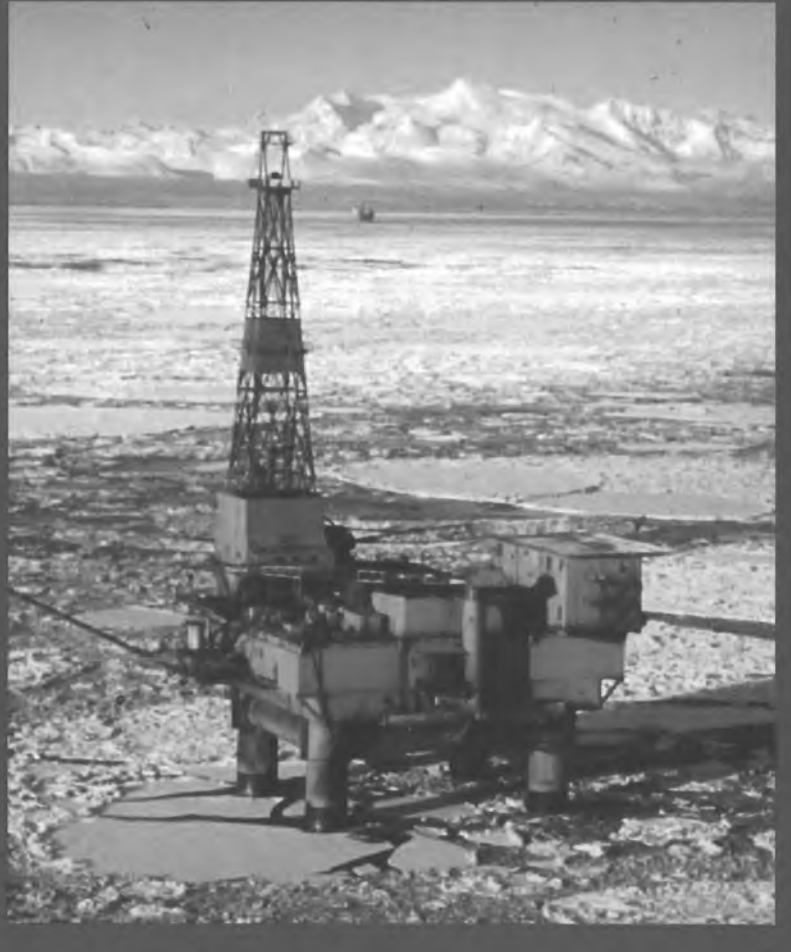
Development Options

1. Outrigger Caisson
2. Subsea
3. Two-Deck Platform
4. Three-Deck Platform

Kitchen
Three-Deck Development

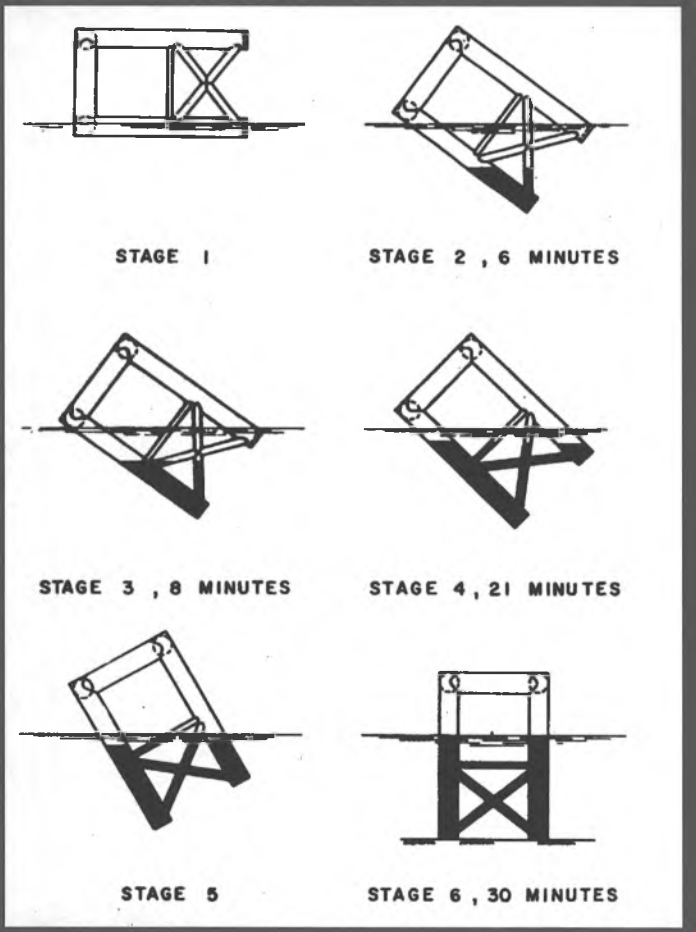
- **Platform**
  - 32-well capacity
- **Pipelines to East Forelands Prod. Fac.**
  - Clean oil and treated gas pipelines
- **Umbilical cable from EFPF**
  - Power, methanol and controls

Three-Deck Cook Inlet Platform



- Platform “C”
- Installed 1967
- 68 ft MLLW
- 32 well capacity
- Leg diameter – 15.5 ft
- Tower – 1,450 ton
- Deck – 2,000 ton
- Piling – 2,200 ton

Upending, April 1967



Installing Decks

Three-Deck Cook Inlet platform

- **Advantages**
  - Proven design
  - Design adaptable to size requirements
  - Space for production and water injection equipment
- **Disadvantages**
  - Requires derrick barge for installation
  - Expensive

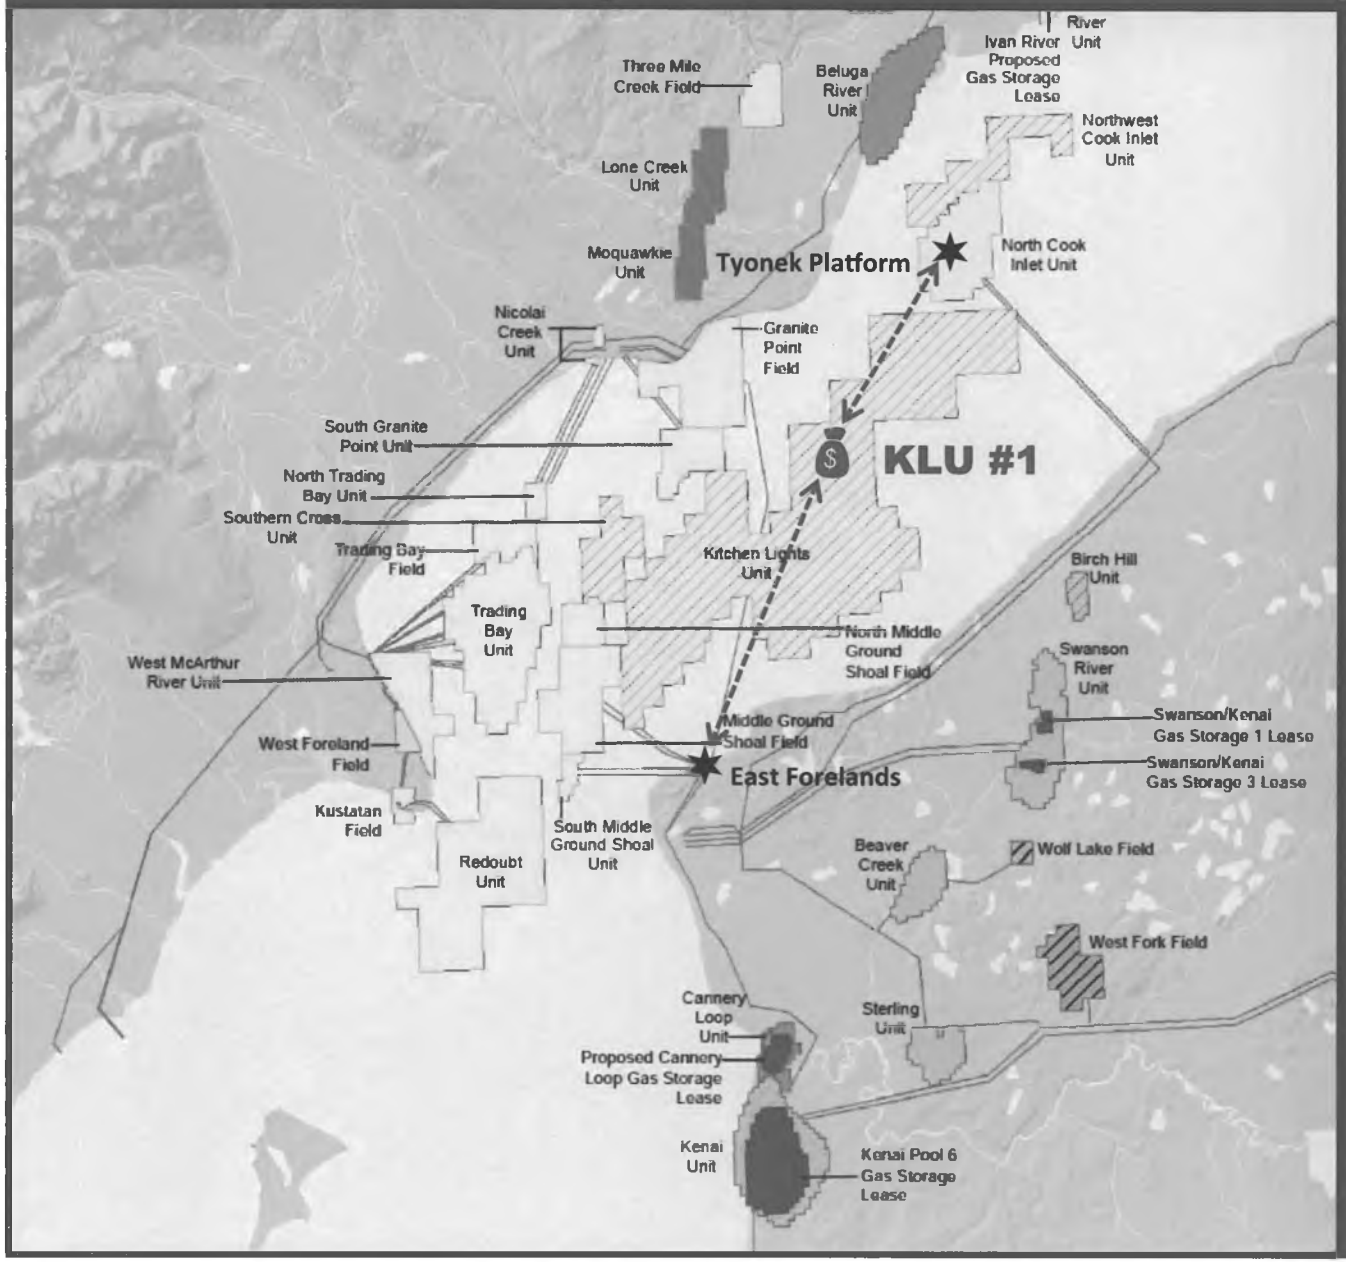
Gas Development Pipeline(s)

- **Gas pipeline, 10-inch, from Kitchen Lights to:**
  - Tyonek platform (about 12 miles), or to
  - East Forelands Production Facility (about 15 miles)
  - Anticipated production 50 MMCF per day
  - Dual and looped pipelines are needed for the subsea case to provide pigging capability
- **Umbilical to Kitchen Lights Unit**
  - Power
  - Methanol
  - Controls

Gas & Oil Development Pipelines

- **Gas and oil pipelines, 10 and 8-inch, from Kitchen to:**
  - New Shore Facility (about 8 miles), or to
  - East Forelands Production Facility (about 15 miles)
  - Anticipated production 50 MMCF/d and 12,000 BOPD
  - Dual and looped pipelines are needed for the subsea case to provide pigging capability
- **Umbilical to Kitchen Lights**
  - Power
  - Methanol
  - Controls

Gas Pipeline Route Options



In this option Kitchen gas will be transported to the Tyonek Platform or the EFPF

Umbilical cable is routed to the Kitchen Lights

Capital Costs
(based on five gas wells and pipeline option 2)

Development Option	Capital Cost (includes wells, structure, pipelines and facilities) $ Millions
Outrigger Caisson	134
Subsea Template	173
Two-Deck Platform	168
Three-Deck Platform	210

Capital Costs
(based on five gas and twelve oil wells)

Development Option	Capital Cost (includes wells, structure, pipelines and facilities) $ Millions
Outrigger Caisson	**NA**
Subsea Template	**NA**
Two-Deck Platform	**422**
Three-Deck Platform	**426**

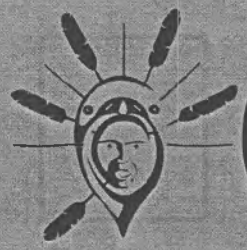
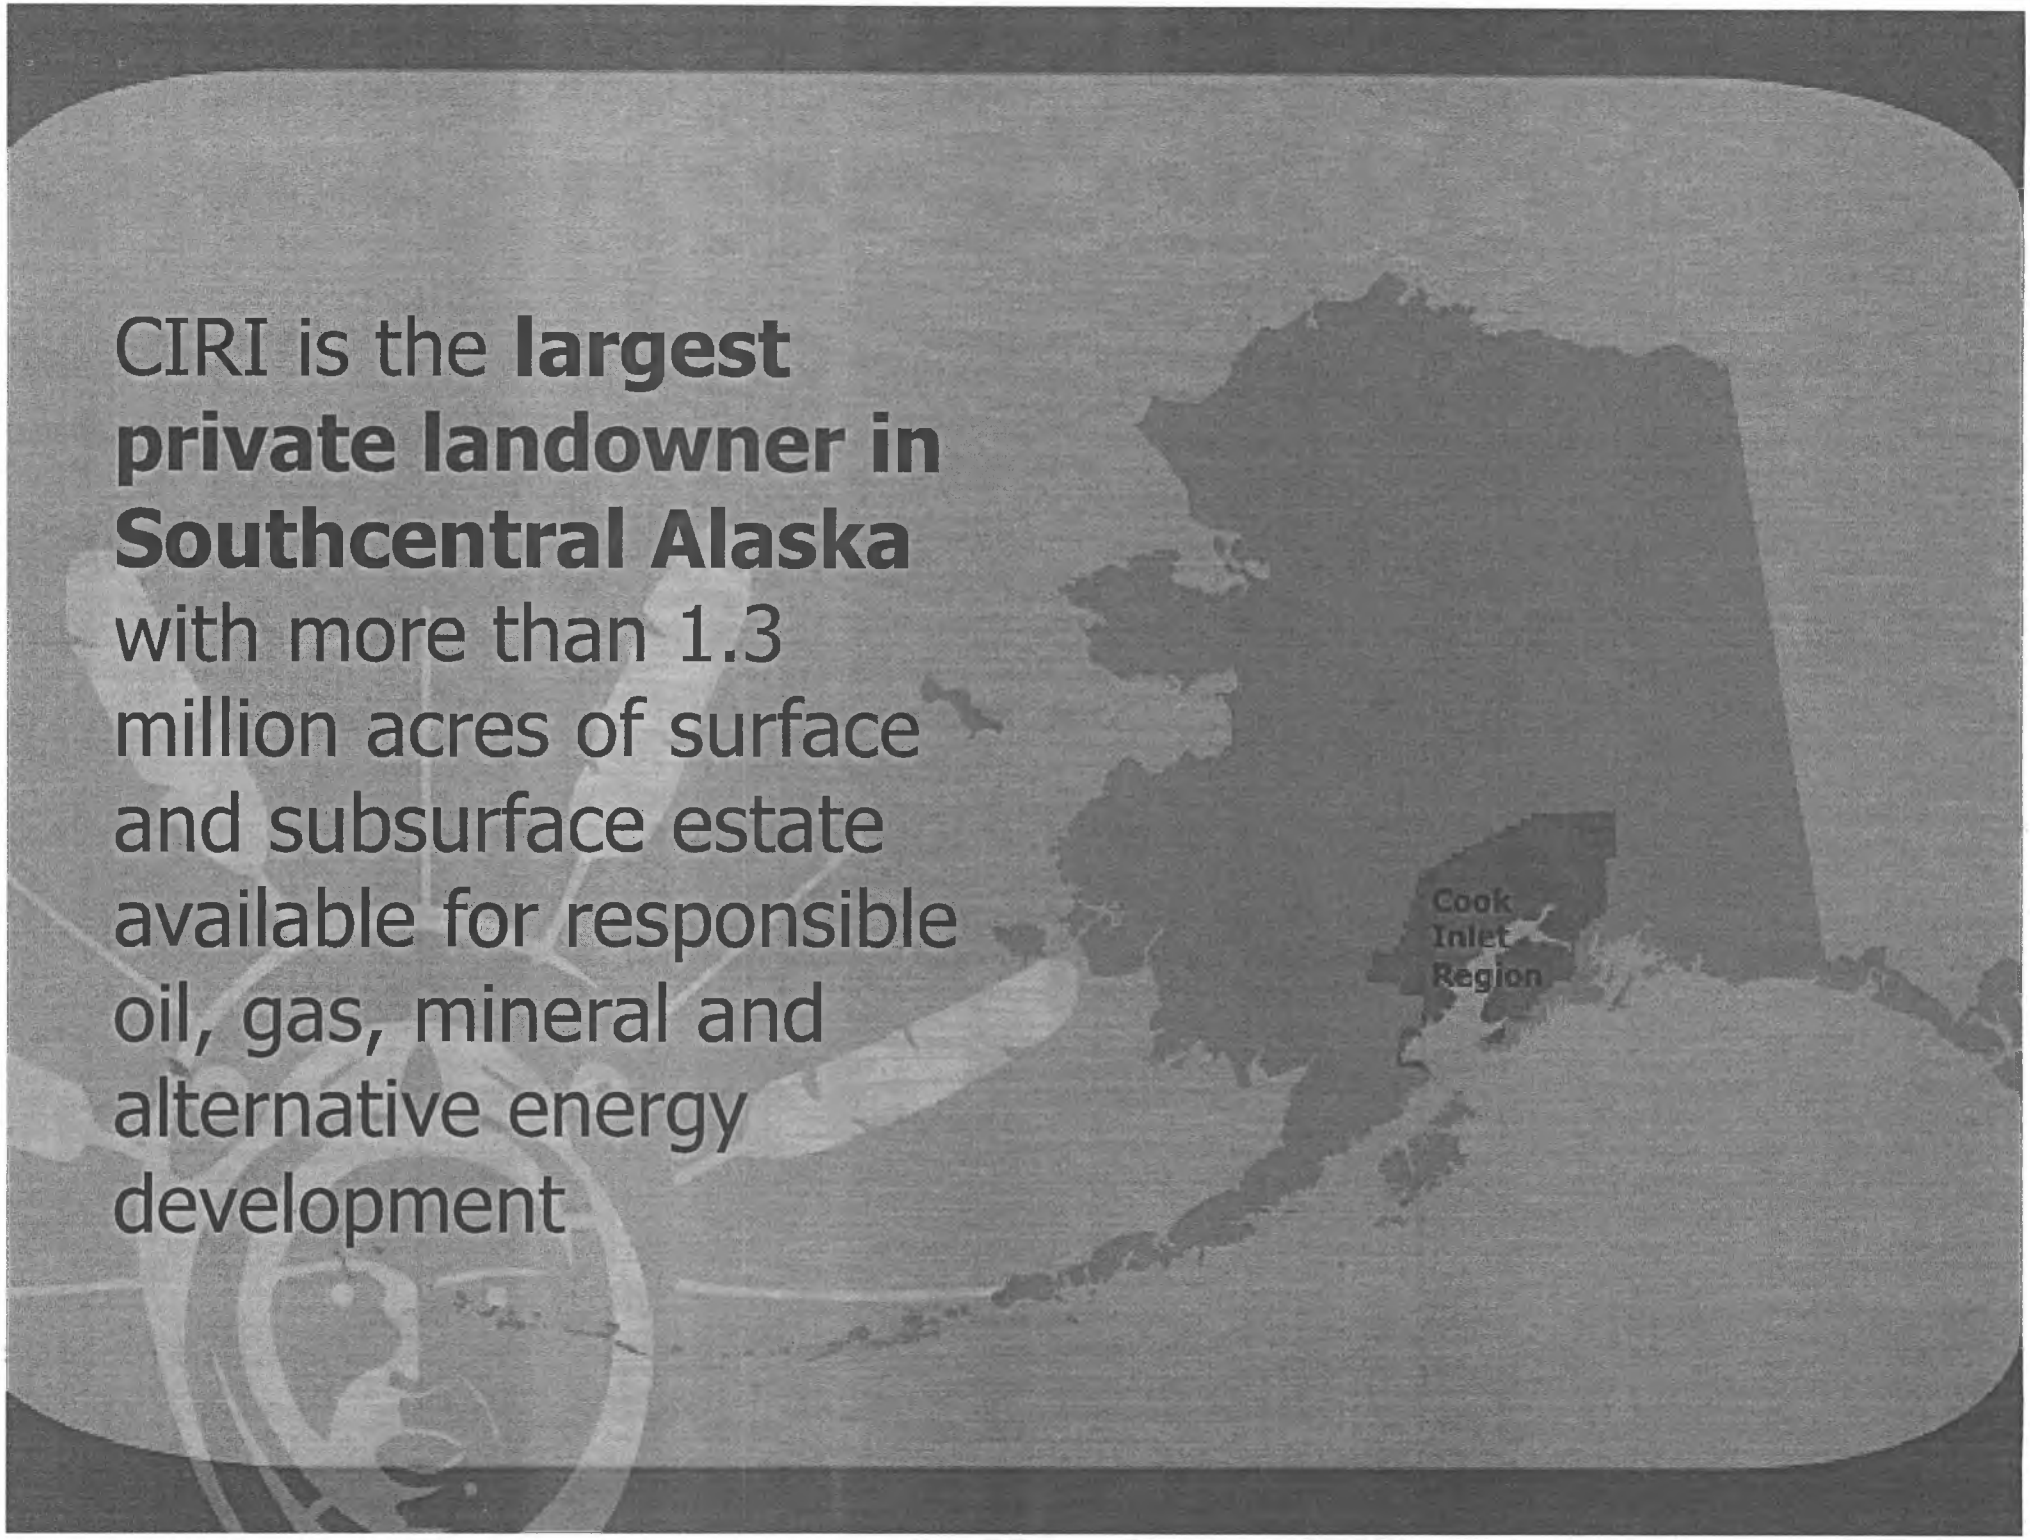
CIRI
Alternative energy solutions for Alaska
Stone
HORN RIDGE
Fire Island
Wind LLC



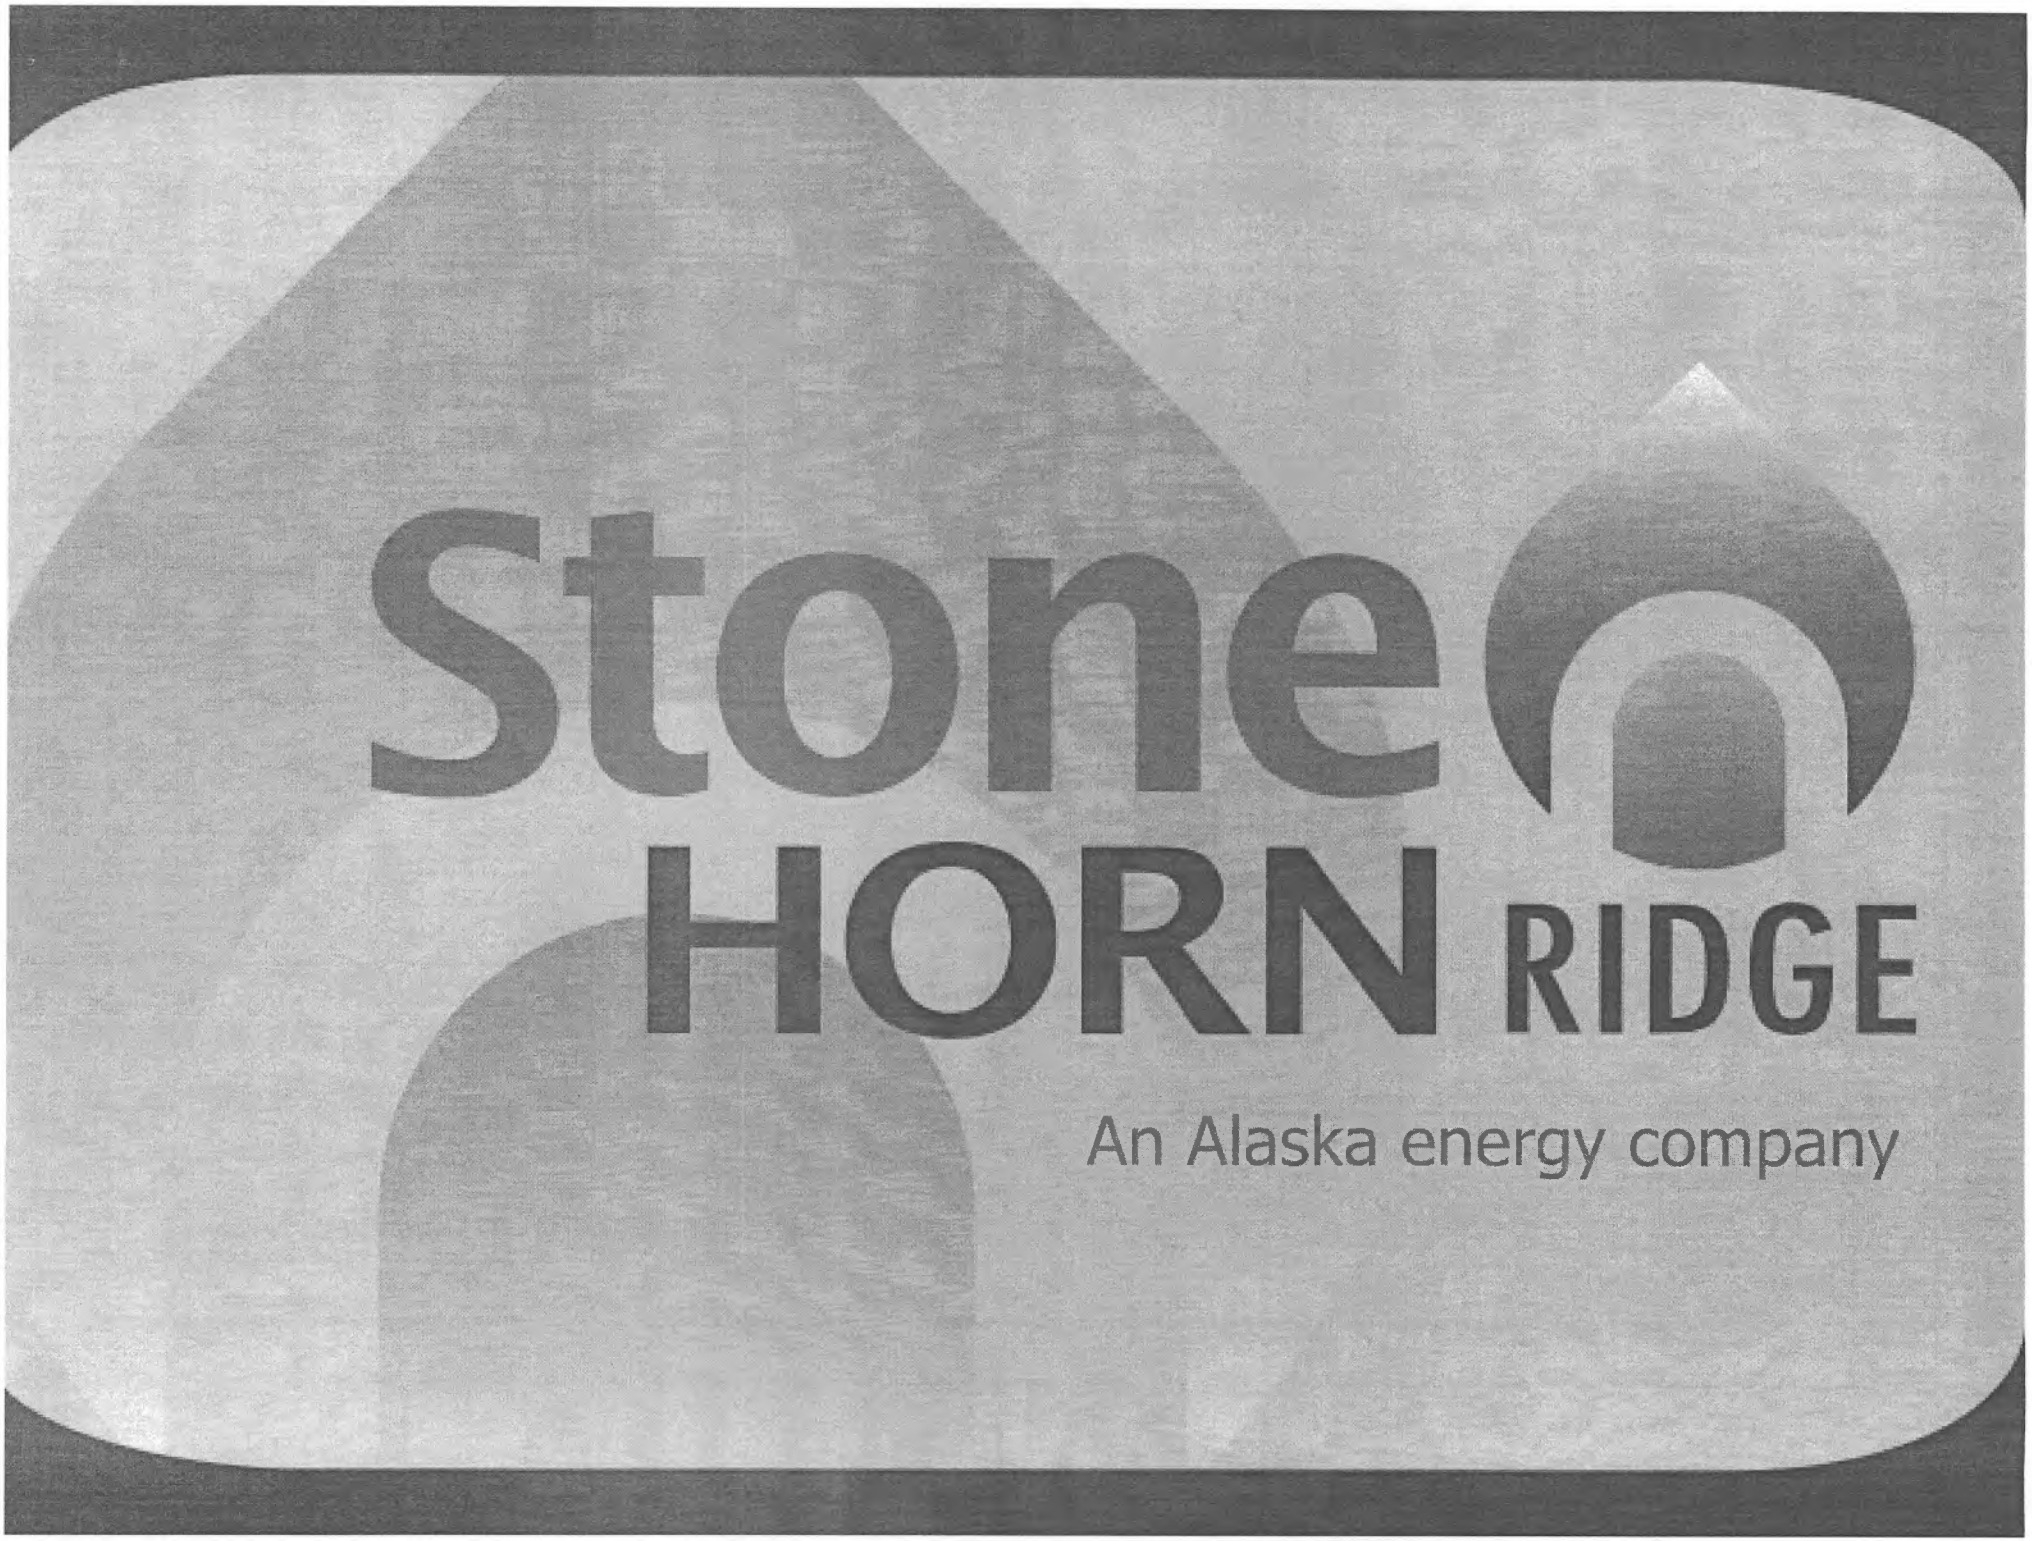
CIRI

An Alaska Native corporation with diverse business interests:

- Energy and resource development
- Oilfield and heavy construction services
- Real estate development and management
- Environmental remediation services
- Tourism and hospitality



CIRI is the **largest private landowner in Southcentral Alaska** with more than 1.3 million acres of surface and subsurface estate available for responsible oil, gas, mineral and alternative energy development
Cook Inlet Region



Stone
HORN RIDGE
An Alaska energy company

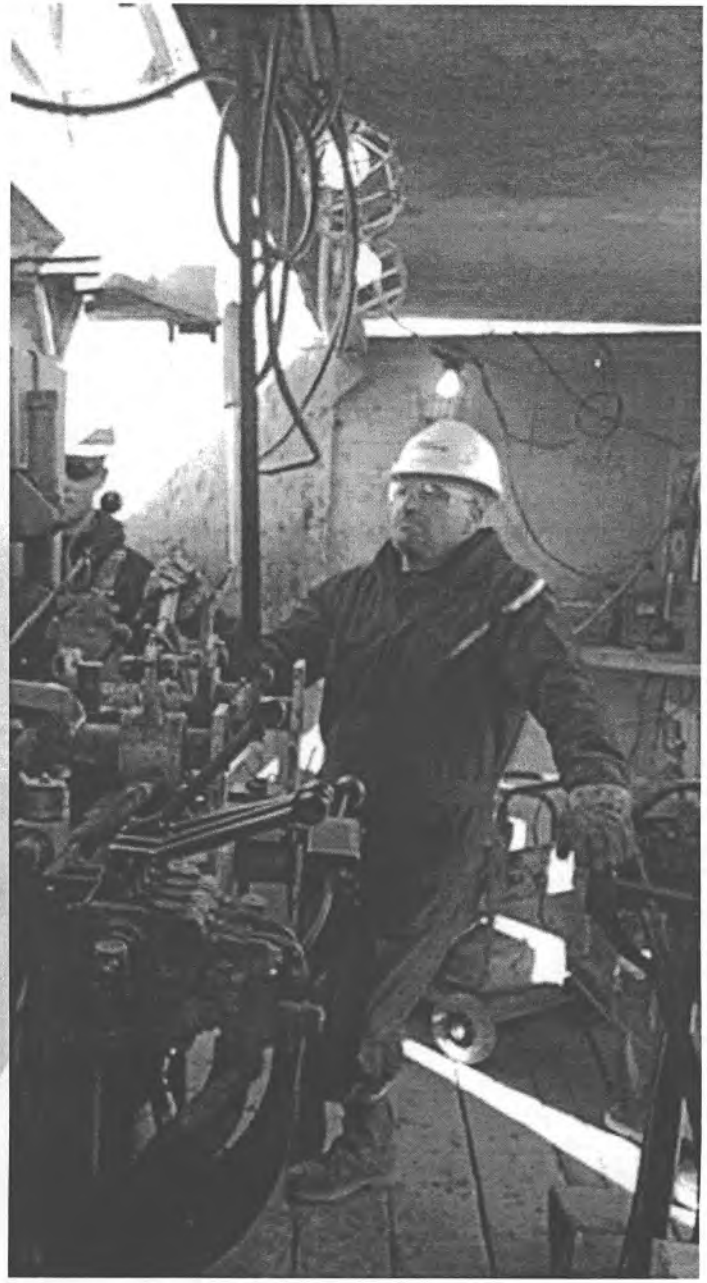
Stone Horn Ridge

- Alaska energy company developing underground coal gasification (UCG) project
- Joint venture of CIRI and Laurus Energy, a Houston-based UCG technology company
- UCG technology provided by license from Ergo Exergy

Stone HORN RIDGE

UCG: Proven, Clean Technology

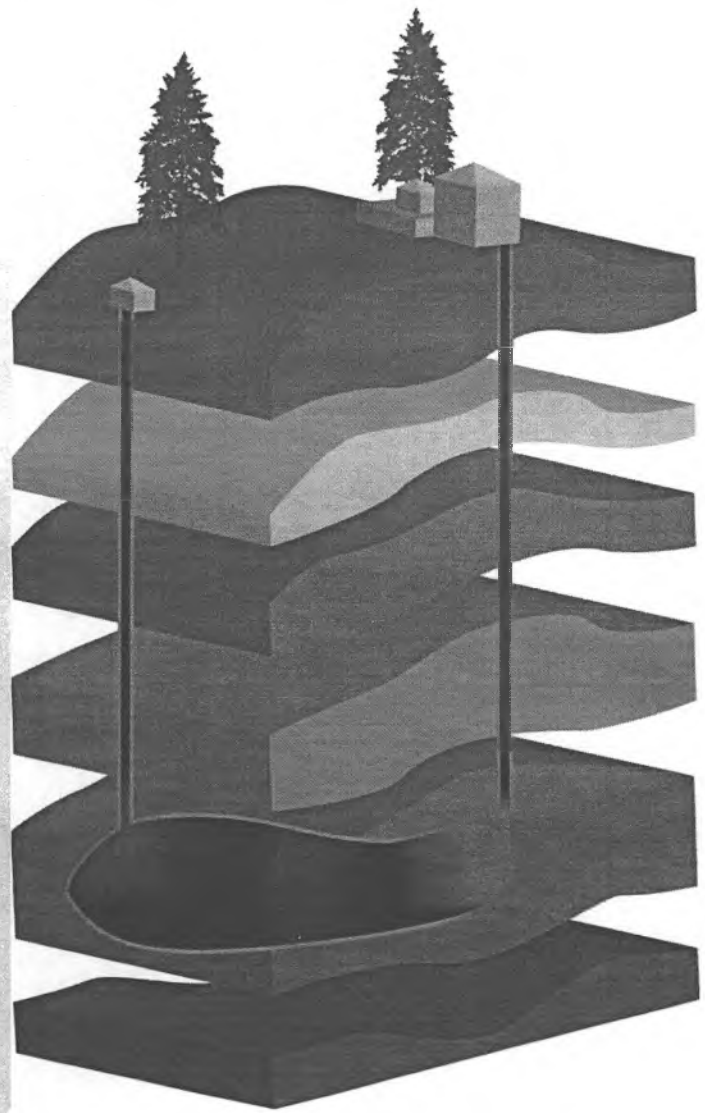
- UCG is a proven technology that converts coal "in situ" to produce syngas
- Process occurs below impermeable rock layers isolated from freshwater aquifers
- Eliminates most environmental and safety risks associated with conventional coal mining, handling, transport and waste
- More than 50 test and commercial projects completed worldwide



Stone HORN RIDGE

UCG Process

- Drill two wells and create a connection between the wells
- At one well, inject an oxidant such as air or oxygen
- Start a combustion reaction
- Heat and pressure gasify coal and drive other reactions
- Second well produces syngas to surface for cleanup and use



Stone HORN RIDGE

Southcentral Alaska Energy

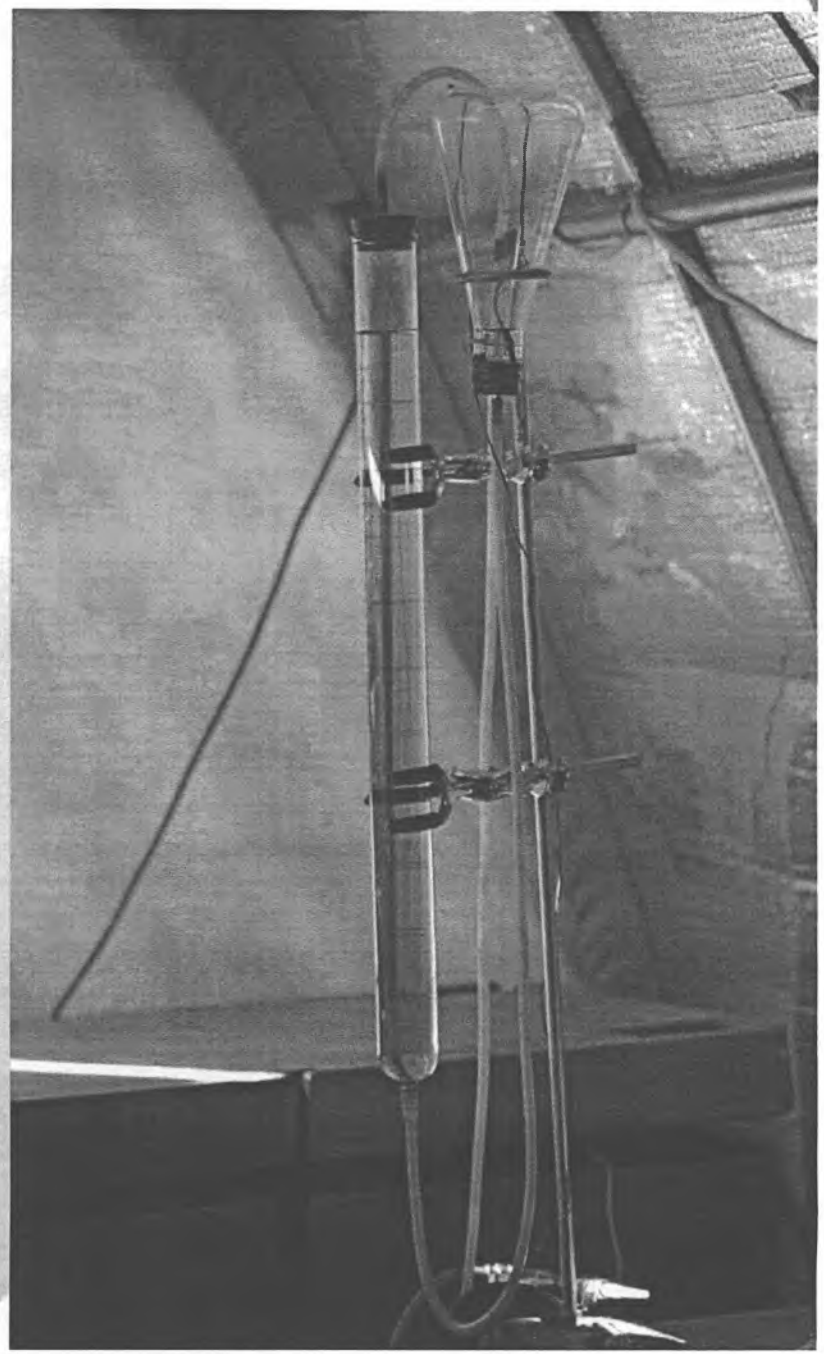
- Produce energy for local use and export
- CIRI core drilling confirmed significant commercial coal reserves
- Favorable geology for UCG development
- Global-scale coal resource
- Tidewater location
- Local energy market need

Stone HORN RIDGE

Uses for Syngas

UCG-produced syngas can be:

- Used to generate electricity
- Upgraded via methanation into synthetic natural gas (methane) for local use and export
- Used as feedstock to produce:
  - clean liquid fuels
  - fertilizer
  - other petrochemical products



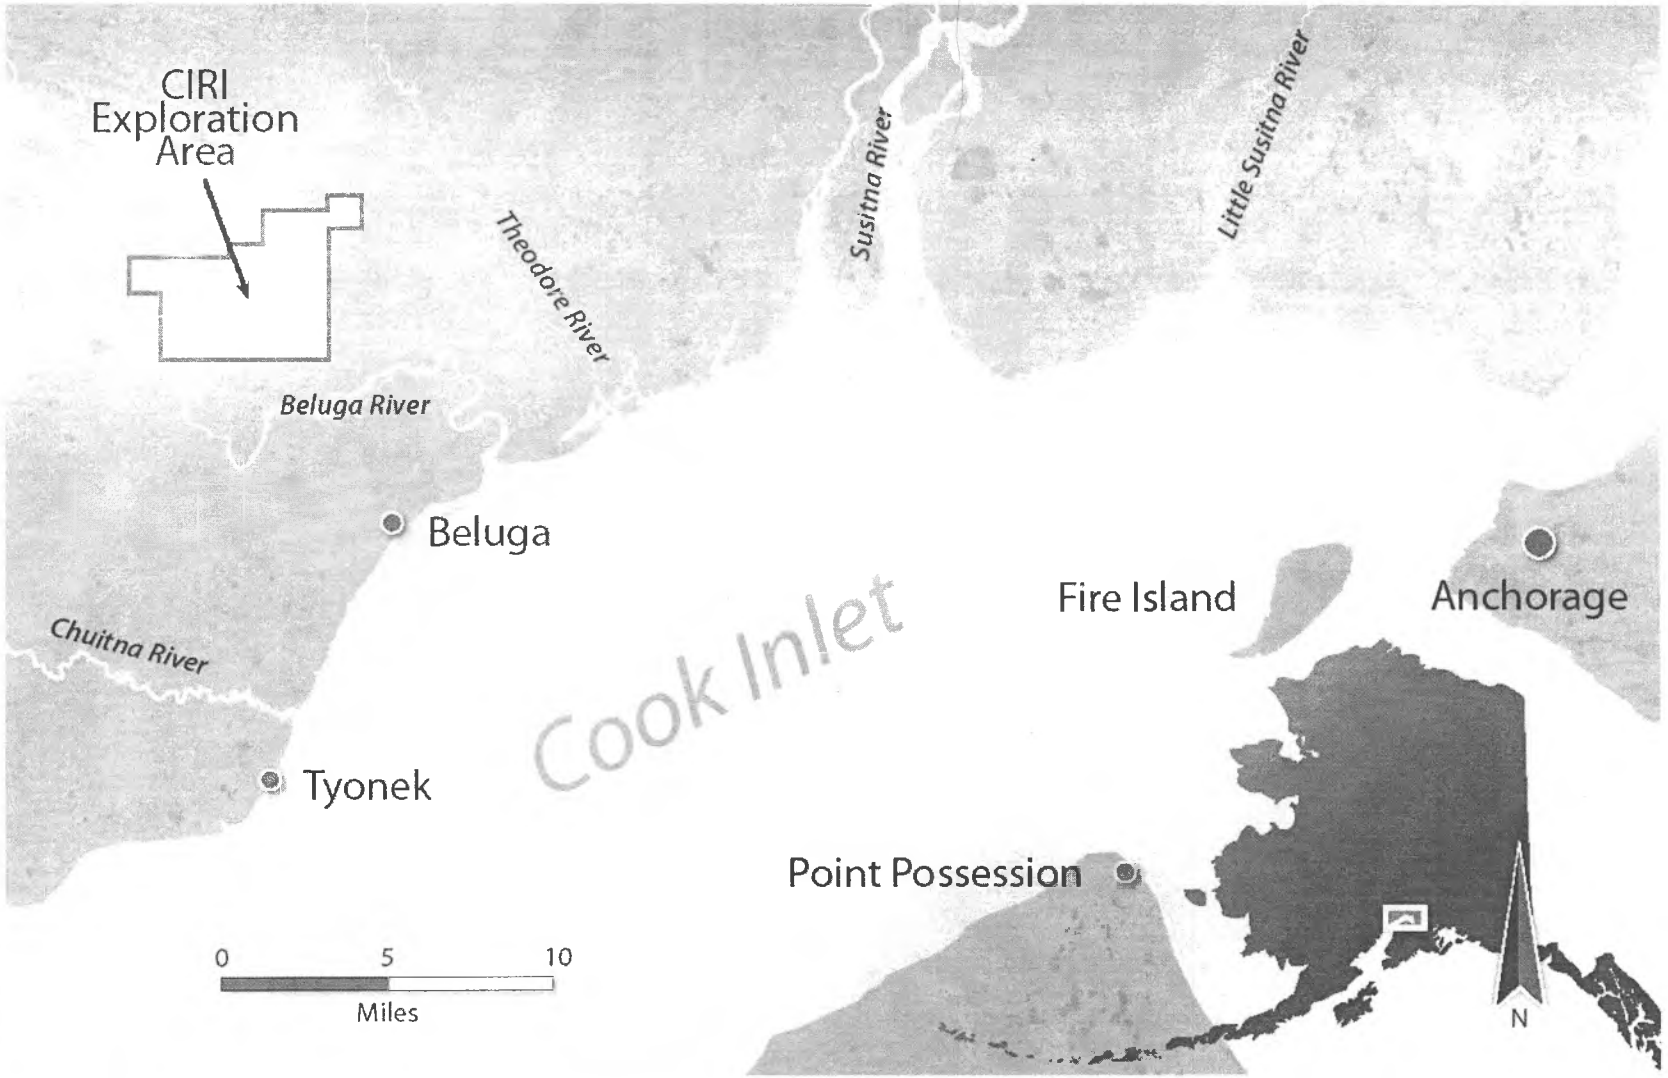
Stone HORN RIDGE

Stone Horn Ridge Project

- Project located on CIRI land
- significant commercial coal reserves confirmed
- Multiple coal seams confirmed more than 650 feet deep, below impermeable rock layers and isolated from freshwater aquifer
- Ongoing study, modeling, testing and monitoring

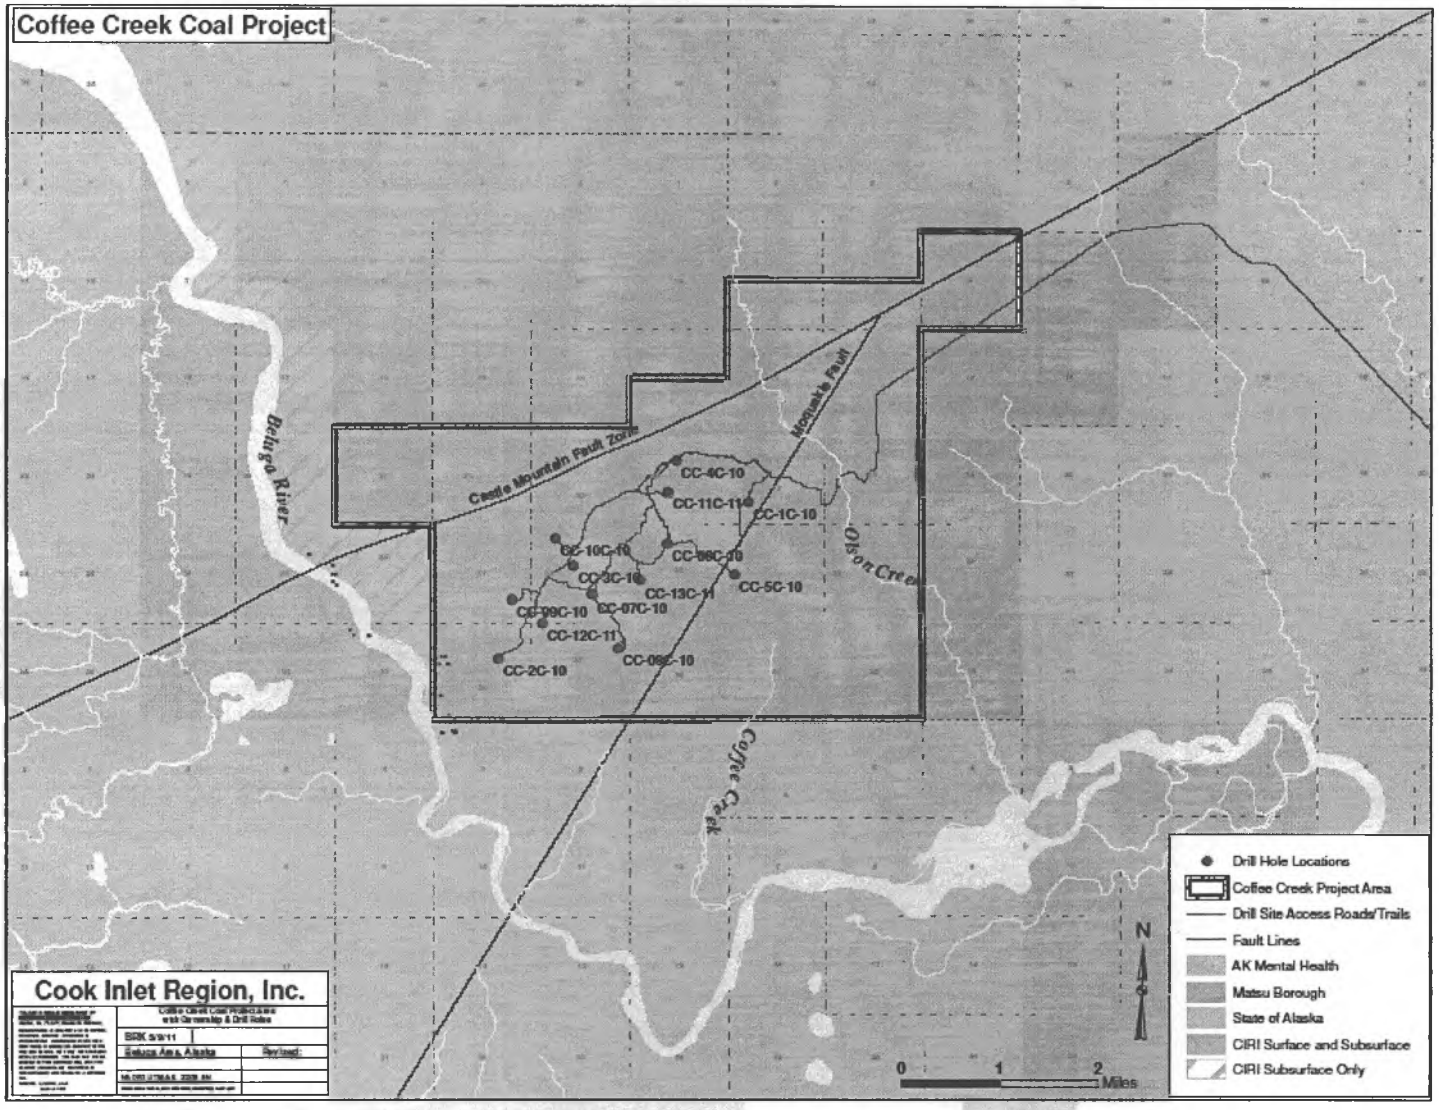
Stone HORN RIDGE

Stone Horn Ridge site



Stone HORN RIDGE

Stone Horn Ridge site



Stone HORN RIDGE

Stone Horn Ridge Project History

- UCG resource and geological evaluation of CIRI lands
- 13-hole core drilling and wire line data program
- Formed Stone Horn Ridge LLC
- Preliminarily validated commercial UCG resource and appropriate geology for development
- Concept engineering and costing of large scale surface facility
- Geological, rock mechanics and hydrogeological modeling

Stone Horn Ridge

Responsible Development

Stone Horn Ridge will only develop a UCG facility after a deliberate, thoughtful process

- Performing all due diligence, environmental risk assessment and necessary permitting
- Committed to developing carbon capture and management program
- Consistently seeking input from community, environmental and technical interests

Stone HORN RIDGE

Project Updates

Next Steps

- Shallow, high-resolution seismic
- Complete model of underground geology
- Initiate permitting process and baseline environmental data collection
- Design site characterization drilling program
- Initiate commercial operations and syngas production as soon as 2015

Stone HORN RIDGE

Disclaimer

Statements in this presentation including information provided in slides 14, 15, 19 and 20 as well as oral statements made by the officers or directors of Ormat Technologies, Inc., its advisors, affiliates or subsidiaries often will contain "forward-looking statements." Whenever you read or hear a statement that is not simply a statement of historical fact (such as when we describe what we "believe", "expect" or "anticipate" will occur, and other similar statements), you must remember that our expectations may not be correct, even though we believe they are reasonable. You should read and listen to these statements completely and with the understanding that actual future results may be materially different from what we expect, as a result of certain risks and uncertainties. For a complete discussion of the risks and uncertainties relating to the forward-looking statements in this presentation, please see "Risk Factors" as described in the Annual Report on Form 10-K report filed with the Securities and Exchange Commission on February 28, 2011.

We will not update these forward-looking statements, even though our situation will change in the future.

Outline

- Introduction to:
  - Ormat Technology, Inc
  - Geothermal power
  - The Mt. Spurr geothermal project
- Project status and timeline
- Costs, matching funds and overall funding plan
- Local support
- Amount and cost of power supplied to Railbelt
- Economic and environmental impact

ORMAT

COPYRIGHT © 2011 ORMAT. All rights reserved. This document contains information proprietary to ORMAT. Reproduction in any form without prior written permission is strictly prohibited.

Ormat Brings Credibility

- A leader in geothermal power
- Owns and operates 553* MW worldwide
- Supplied approximately 1,370 MW to 24 countries
- Vertically integrated:
  - Explores, develops, engineers, manufactures, constructs, operates
- Employs approx. 500 people in the U.S. ; >1,100 worldwide
- Publicly traded on the NYSE ("ORA")

* Including the 50 MW of North Brawley in California, which operates at approx. 30 MW

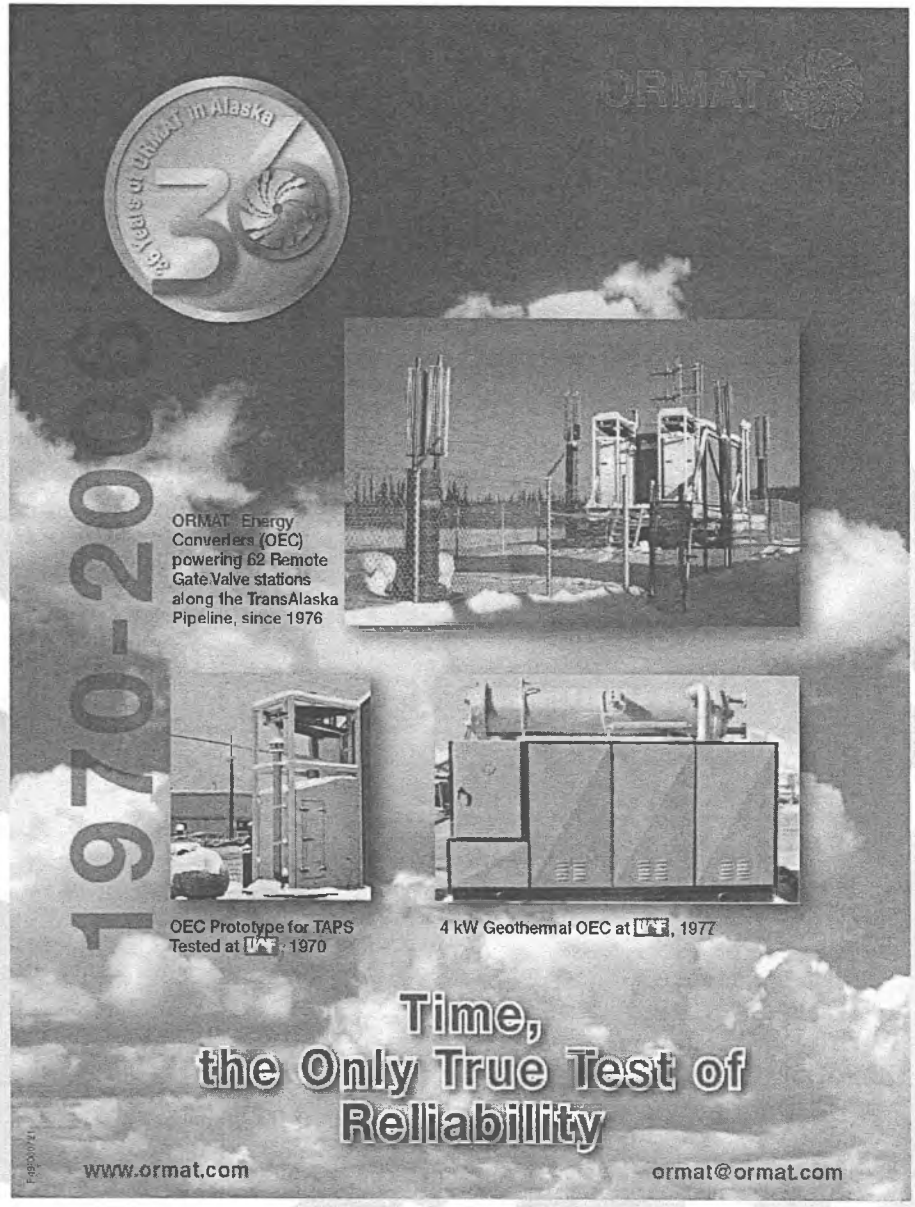
Ormat's Commitment to Alaska

- >100 Remote Power Units
  - Serving remote gate valves
  - TransAlaska Pipeline
  - Since 1975
- First geothermal unit
  - Tested in 1979
  - University of Alaska Fairbanks
  - At Manley Hot Springs
- Approx. $5 million of Ormat equity invested in Mt. Spurr to date



ORMAT

GREEN ENERGY you can rely on

Geothermal – Key Attributes

- Utilities' renewable energy of choice:
  - Base-load generation
  - Cost-competitive
  - Highly reliable; >95% availability
  - Proven technology: ~11,000 MW deployed worldwide
- No fuel cost risk; Fixed long-term pricing
- Sustainable & environmentally friendly
  - Closed loop system with near zero emissions
  - No water consumption [Mt. Spurr plant will be air-cooled]
  - Minimal surface and visual impact
- Creates long-term, high-quality jobs

ORMAT

GREEN ENERGY you can rely on

COPYRIGHT © 2011 ORMAT. All rights reserved. This document contains information proprietary to ORMAT. Reproduction in any form without prior written permission is strictly prohibited.

Geothermal – Development Inhibitors

- Resources are scarce
- High upfront CAPEX and risk required in order to discover and confirm the resource

ORMAT

GREEN ENERGY you can rely on

Worldwide Geothermal Deployment

- Approximately 11,000 MW deployed world-wide
- 24 nations have utility-scale geothermal generation
  - US is the world leader, with plants in CA, NV, HI, UT, ID
- Supportive policies have been key to success in all nations

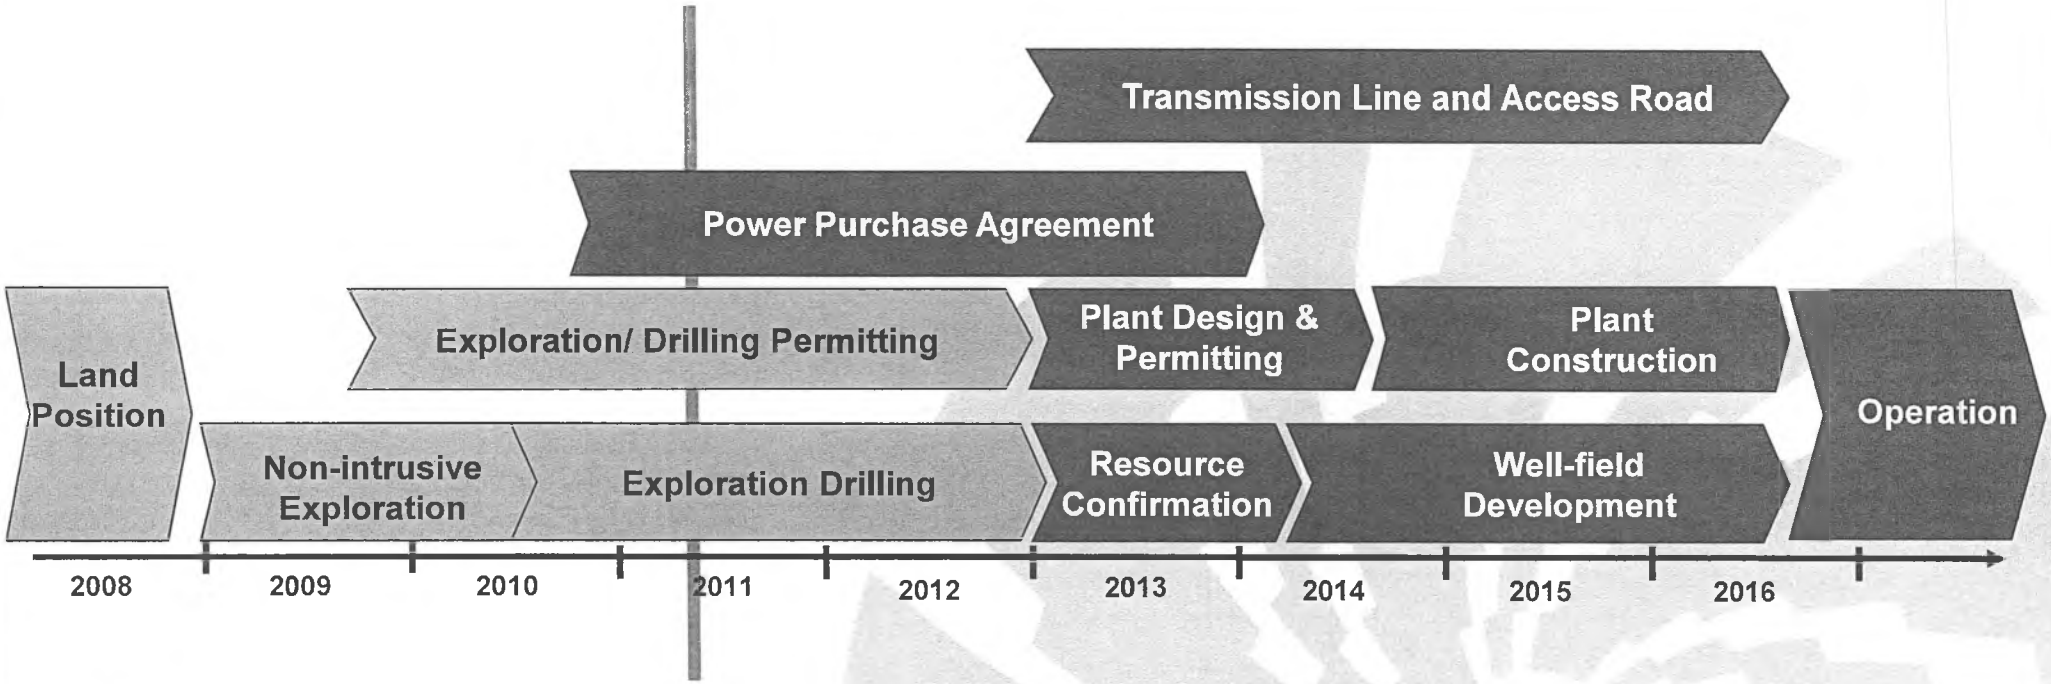
Mt. Spurr – Status & Estimated Timeline



- 36,000 acres of state lands leased from DNR in October 2008
- Non-intrusive exploration conducted summer of 2009 and of 2010
- Two exploration core holes (~1,000 ft) drilled in September 2010
- One deep exploration core hole (~4,000 ft) drilled during summer of 2011

ORMAT

GREEN ENERGY you can rely on

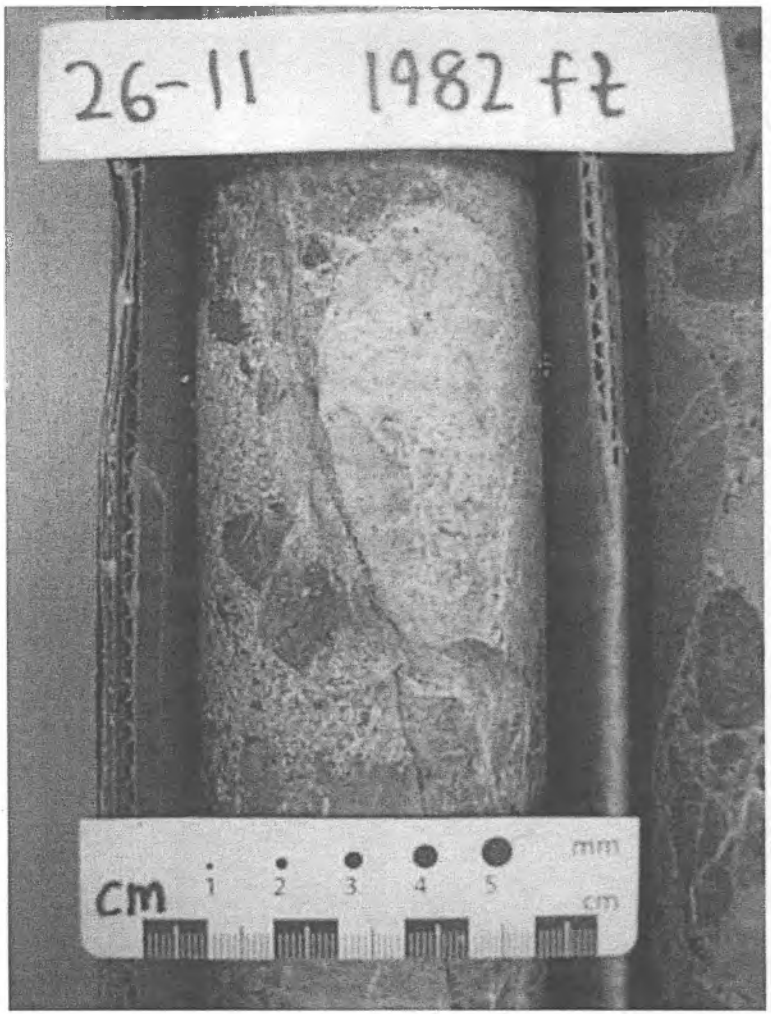
Core Collected – Donated to DNR/DGGS



ORMAT

GREEN ENERGY you can rely on

COPYRIGHT © 2011 ORMAT. All rights reserved. This document contains information proprietary to ORMAT. Reproduction in any form without prior written permission is strictly prohibited.

Results to Date

- Results from the 2009-2010 exploration and drilling work were encouraging as to the potential existence of a geothermal resource at commercial depths

- Results from the 2011 deep core hole were less encouraging, as the rock type encountered was not a good reservoir rock and the temperatures measured were colder than expected

ORMAT

GREEN ENERGY you can rely on

COPYRIGHT © 2011 ORMAT. All rights reserved. This document contains information proprietary to ORMAT. Reproduction in any form without prior written permission is strictly prohibited.

Status and Next Steps

- Ormat is currently analyzing the results and updating the 3-D geological model
- All data is being shared with the State (DNR/DGGS, AOGCC) and Ormat is in discussion with these agencies to get thoughts and ideas
- Next step is to update the exploration plan, and may include recommendation to rotary drill a deeper exploration well

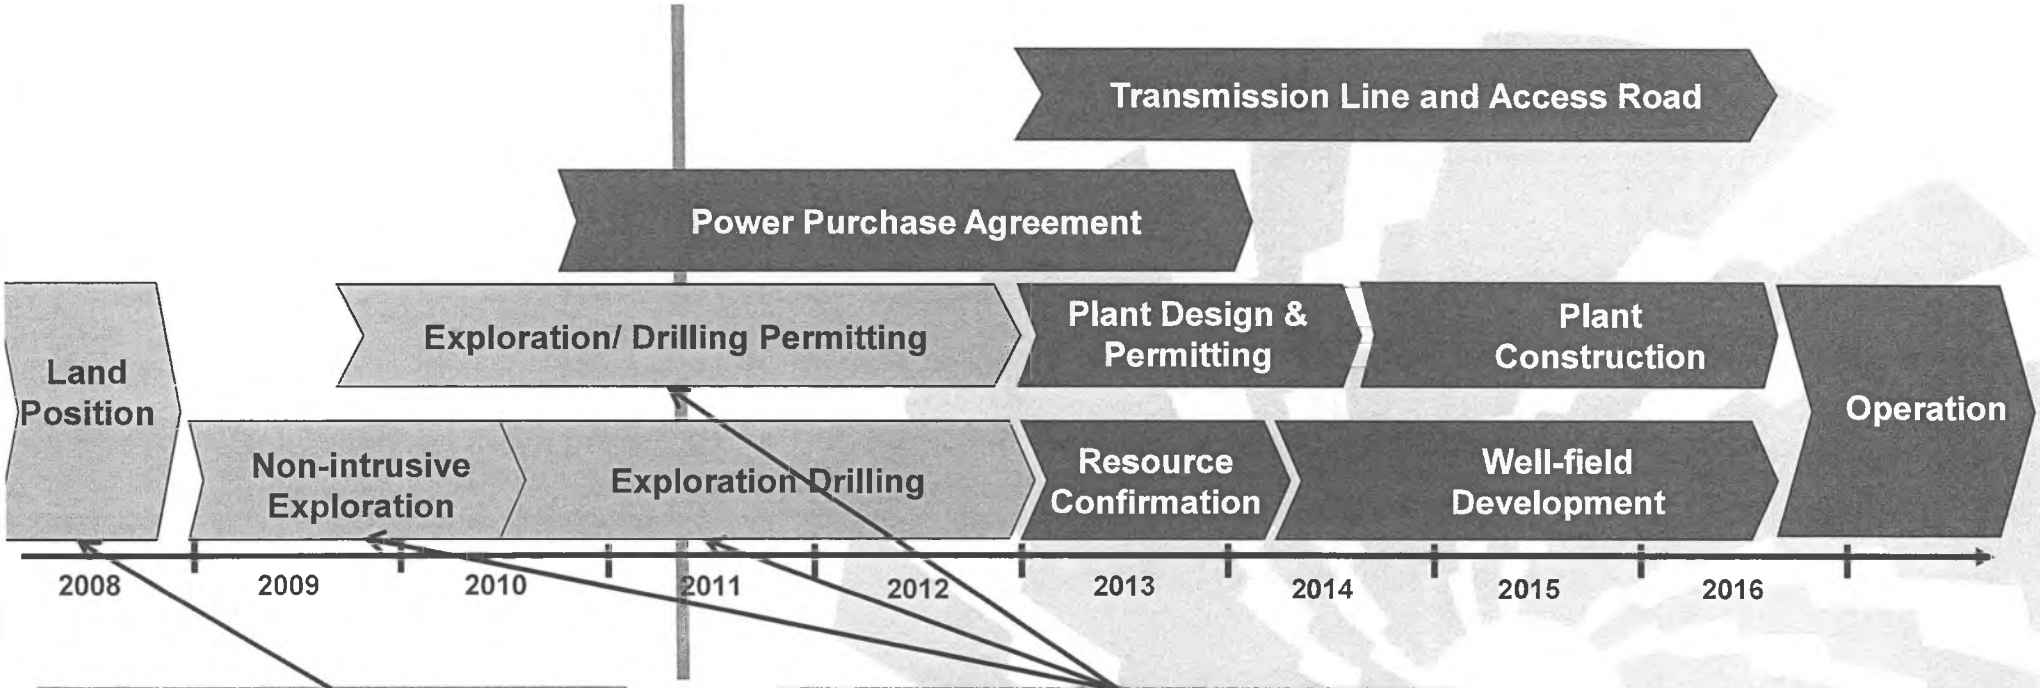
Sources of Funding So Far



Ormat

~$3.5 million bonus payment;
~$100,000 annual rent

Ormat and AEA (round III)

Ormat: ~ $3 million*
AEA: ~$2 million + 17 mil.

* $2.1 million as matching funds per the grant agreement and the rest outside it

ORMAT

GREEN ENERGY you can rely on

COPYRIGHT © 2011 ORMAT. All rights reserved. This document contains information proprietary to ORMAT. Reproduction in any form without prior written permission is strictly prohibited.

Energy to the Railbelt

- Capacity estimated at 50~100 MW net, average. Target is:
  - ~50 MW in 2016
  - Expand to ~100 MW in 2019
- Near-term solution, bridging the gap to longer-term mega-solutions, e.g. Suisitna/Watana hydro and/or gas pipeline
- At 95% availability: 416~832 GWh/year

ORMAT

GREEN ENERGY you can rely on

COPYRIGHT © 2011 ORMAT. All rights reserved. This document contains information proprietary to ORMAT. Reproduction in any form without prior written permission is strictly prohibited.

Cost of Power to Railbelt Utilities

- Estimated at ~12 c/kWh
- Fixed price, not coupled with fossil fuels
- Geothermal is a baseload 24/7 resource, therefore utilities will not incur any integration costs
- Price is higher than current avoided costs (5-10 c/kWh), however:
  - Is comparable to other alternatives, e.g. Suisitna/Watana
  - Railbelt utilities' avoided costs are likely to go up with the continued depletion of Cook Inlet gas reserves

ORMAT

GREEN ENERGY you can rely on

Local Support

- From nearest communities:
  - Tyonek:
    - Cooperative agreement with Tyonek Native Corporation (TNC) in place
    - TNC provided Ormat with letters of recommendation
  - Kenai Peninsula Borough
    - Mayor provided Ormat with letters of recommendation
  - Anchorage
    - Mayor provided Ormat with letters of recommendation

- Environmental and renewable energy communities:
  - Cook Inletkeeper
  - Renewable Energy Alaska Project (REAP)

ORMAT

GREEN ENERGY you can rely on

Regional Priority and AEA Vetting

- Project supported by all 6 Railbelt utilities, separately and via ARCTEC, as a potentially viable near term solution
- Identified by the AEA-sponsored 2010 Railbelt Integrated Resource Plan as a beneficial component in the Railbelt's generation portfolio
- Selected by AEA for round III and IV of the Renewable Energy Fund Grant (REFG)

ORMAT

Economic Impact

- Alaska's 100 MW of geothermal power could:
  - Provide 50 long term high paying jobs
  - Provide more than 100 construction jobs
  - Impact >200 local vendors
  - Fuel local economy with >$850 million over 30 years

ORMAT

GREEN ENERGY you can rely on

COPYRIGHT © 2011 ORMAT. All rights reserved. This document contains information proprietary to ORMAT. Reproduction in any form without prior written permission is strictly prohibited.

Environmental Impact

- Alaska's 100 MW of geothermal power could annually:
  - Save ~6,000,000 MMBTU of depleting Cook Inlet natural gas
  - That's roughly the equivalent of Anchorage's entire residential heating consumption
  - Avoid emission of ~320,000 tons of CO_2*

*Calculated for natural gas, assuming 53 Kg of CO_2 per MMBtu (DOE/EIA http://www.eia.doe.gov/oiaf/1605/coefficients.html)

Summary – Mt Spurr Benefits

- Clean, reliable, field-proven, base-load power to the Railbelt
- Significant relief in Cook Inlet natural gas consumption
- Significant contributor towards 50% renewables by 2025
- Provides long-term price stability
- Near-term solution, bridging the gap to longer-term mega-solutions, e.g. Suisitna hydro and/or gas pipeline
- Provides high quality, long term green jobs

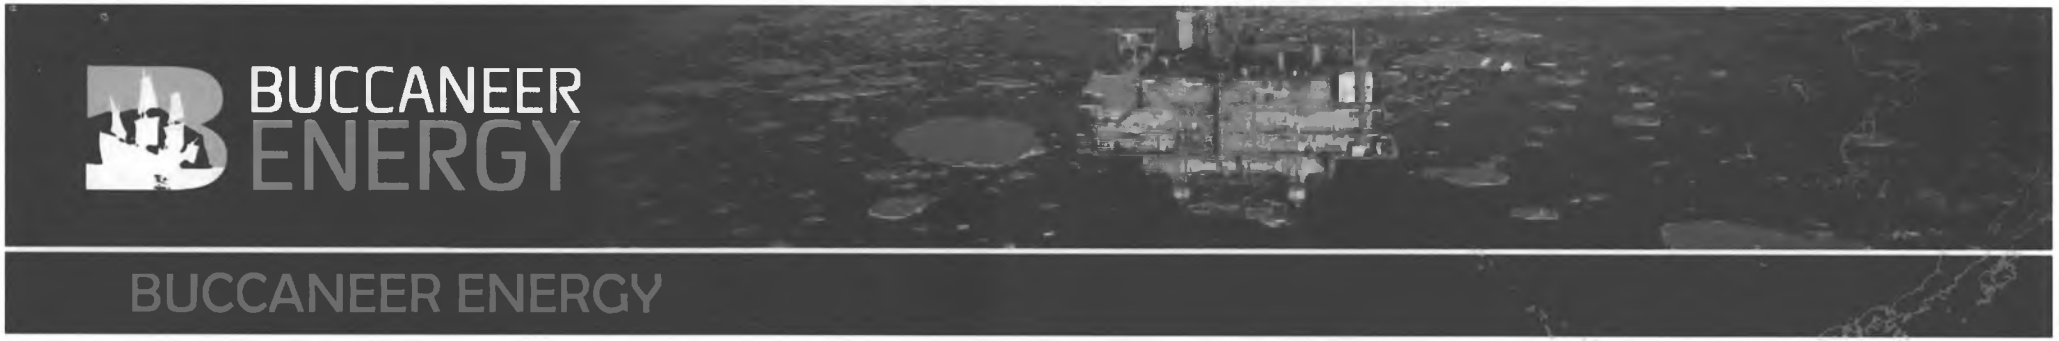
DISCLAIMER

- **Securities Disclaimer**
  This presentation is for informational purposes only and does not constitute an offer or sell, or solicitation to purchase, any securities. Such Offer can be made only through proper subscription documentation and only to investors meeting strict suitability requirements. Any failure to comply with these restrictions may constitute a violation of applicable securities laws.

- **Forward Looking Statements**
  Various statements in this presentation constitute statements relating to intentions, future acts and events. Such statements are generally classified as "forward looking statements" and involve known and unknown risks, uncertainties and other important factors that could cause those future acts, events and circumstances to differ materially from what is presented or implicitly portrayed herein. The company gives no assurances that the anticipated results, performance or achievements expressed or implied in these forward looking statements will be achieved.

- **Reserves and Values**
  All reserves and valuations are presented for informational purposes and are not guaranteed or warranted by Buccaneer in any way. Anyone interested in a purchase or transaction involving one of the subject properties is encouraged to obtain independent professional verification and base their purchase decisions on their own analysis and their 3rd party input.

- **Competent Persons Statement**
  Information pertaining to Lee County project contained in this report were compiled by Gary Rinehart, BS in Geology from University of Oklahoma and who has had more than 35 years experience in petroleum geology. Mr Rinehart has consented to the inclusion in this report of the technical matters and information herein in the form and context in which it appears.
  Information contained in this report pertaining to the Alaskan projects was reviewed by Dr. Vijay Bangia, PhD in Petroleum Engineering from the University of Tulsa, who has over 30 years experience including employment by Shell Oil Company, Union Texas Petroleum, Burlington Resources and Renaissance Alaska. Dr. Bangia has approved the inclusion in this report of the technical matters and information herein in the form and context in which it appears.



Buccaneer was founded on two core principles:

- Minimize risk
  - Enlisting local talent
  - Acquiring majority positions in projects
  - Managing all operations
  - No "Big E" – stacked pay
- Maximize opportunity
  - Fast track development opportunities
  - Special incentives
    - ✓ Favorable regulatory environment
    - ✓ Strong commodity market

BUCCANEER ENERGY

BUCCANEER - OPERATING OVERVIEW & CORE FOCUS

Alaska
Unique Environment & Opportunity

- Alaska is energy-friendly and in great need of a supply solution
- Cook Inlet: One of the last under-explored frontiers in US
- Unique local fiscal regime with tremendous economic incentive for exploration

Alaska - Onshore

- Kenai Loop development -- Establish production & Cash flow (December 2011); 3P reserves: 51.6BCF
- Firm off-take agreement with Enstar for 31BCF (as of April 2012)
- West Nikolai Creek and West Eagle prospects onshore gas weighted prospects

Alaska - Offshore

- Leases in Cook Inlet Alaska State waters
- Southern Cross 2P Reserves: 12.7 MMBOE (78% oil) + P50 Resource: 14.7 MMBOE (75% oil)
- North West Cook Inlet P50 resource: 49.4 MMBOE

Endeavour
Jack-Up Rig

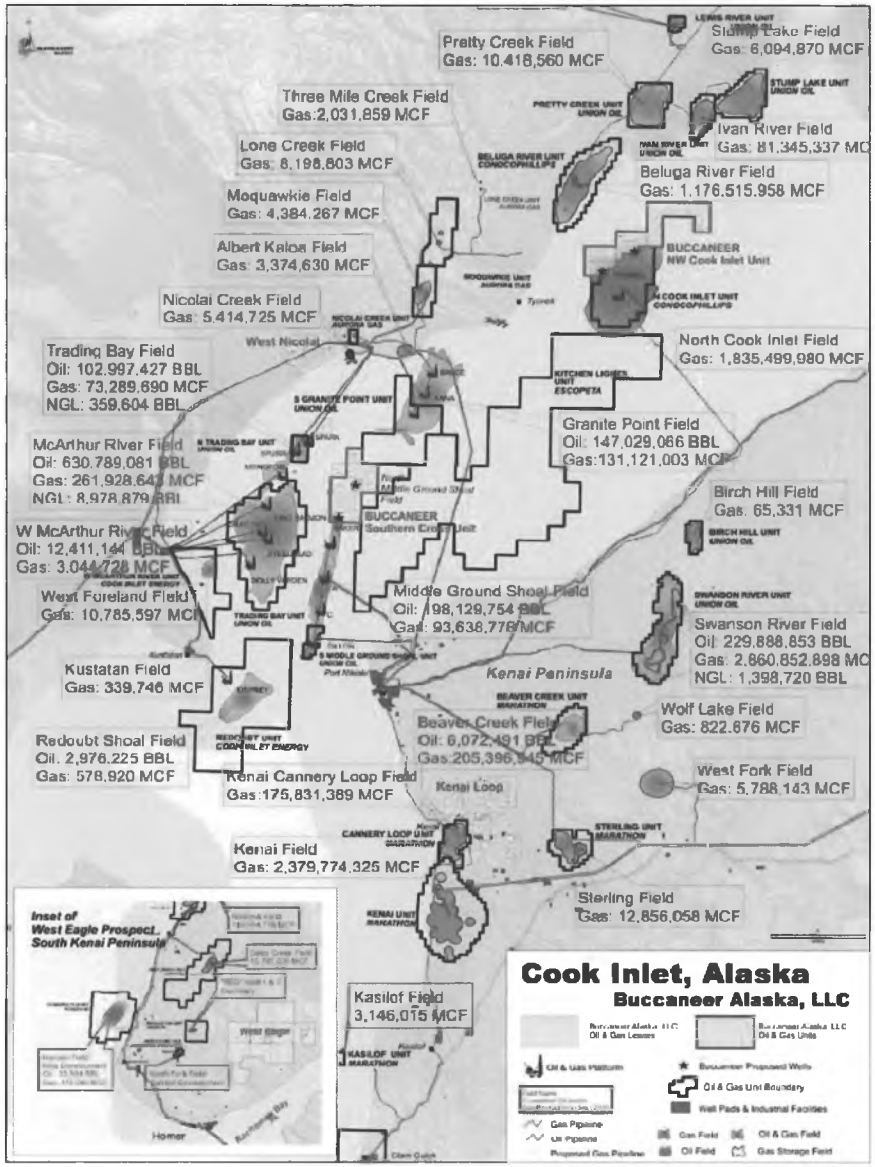
- Strategic asset for Cook Inlet that unlocks Alaskan offshore value by giving ability to access recently unreachable assets
- Agreements executed / finalizing acquisition (Projected 11/2011)

U.S. - Lower 48

- GoM shallow-water gas: Pompano, Swordfish & Big Fish Package -- high potential reserves
- Lee County, Central TX – onshore oil
- Potential near term cash flow

BUCCANEER ENERGY

WHY ALASKA & THE COOK INLET?



- Majors out / Independents In
  - Buccaneer (April 2010)
  - Apache (June 2011)
  - Hilcorp (July 2011)
- Local gas shortage
  - Brownout warnings
  - Plans to import LNG
- Under-explored basin (USGS study)
  - Estimated 600 MMBO & 19 TCF gas
  - Last major gas discovery: 1979
- Cash incentives (ACES)
  - 45% - 65% tax rebates
  - Special Jack-Up Rig rebates
- Premium Natural Gas Prices
  - 50-100% premium to Lower 48
  - Negotiated directly with end users

BUCCANEER ENERGY

LOW HANGING FRUIT

The Cook Inlet has a long and successful history of exploration and production, but much remains untapped

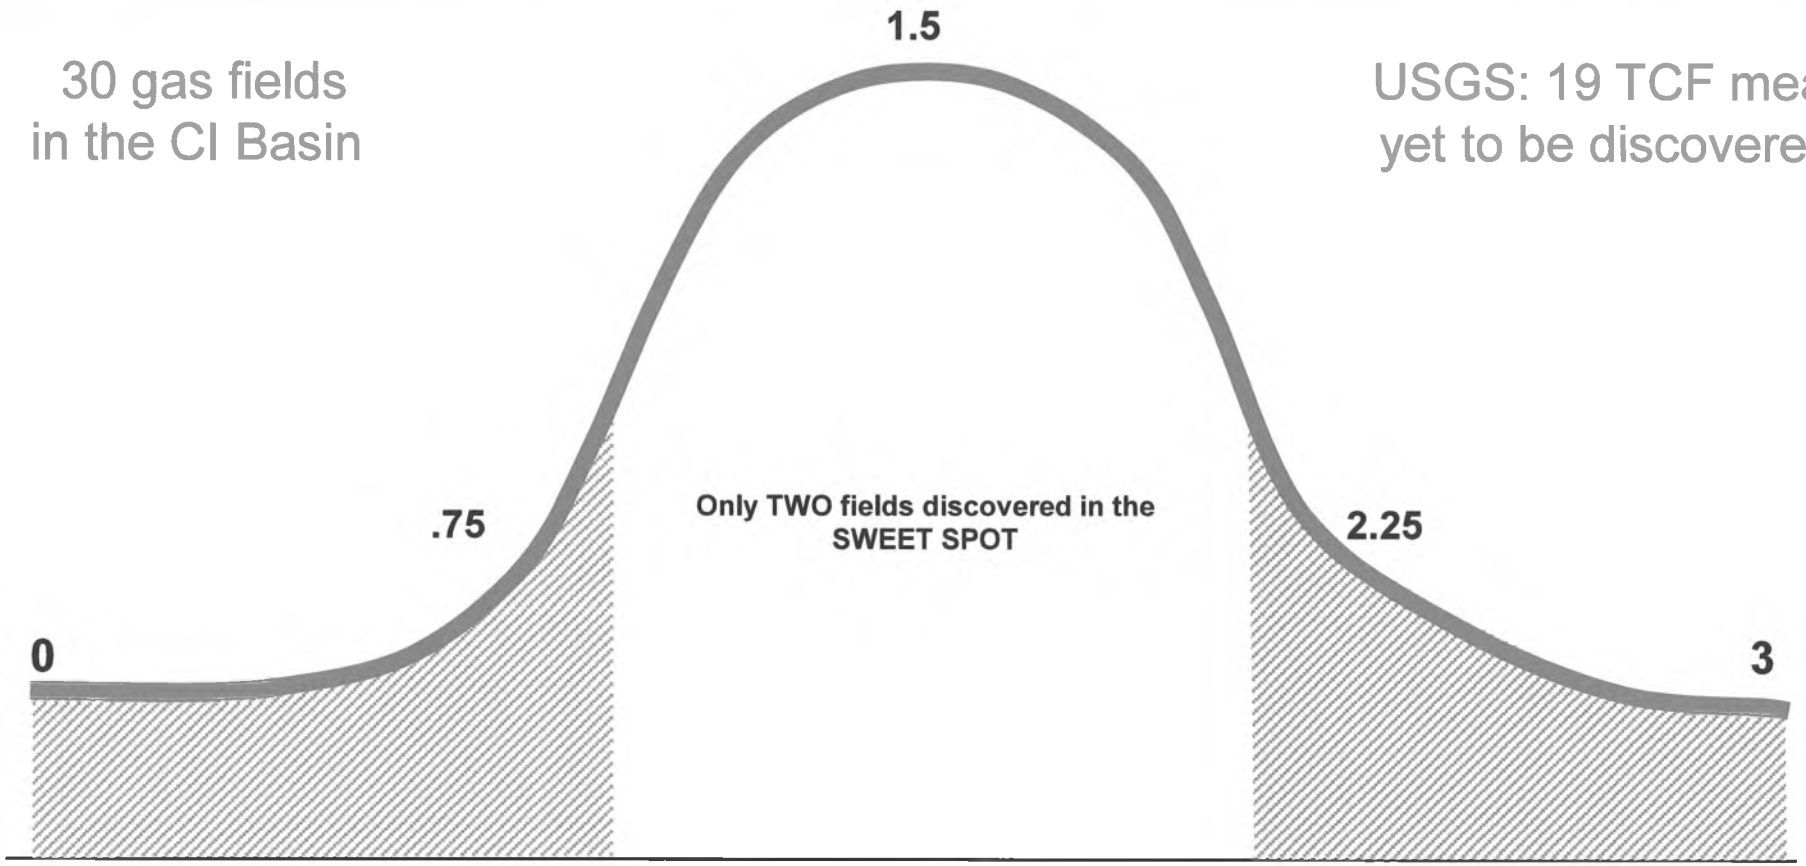
- First gas discovery in Cook Inlet Basin: 1958 – since then, 7.8 TCF of gas produced
- Gas was first encountered in the Cook Inlet basin during exploration for oil in 1950s, then considered stranded
- 1995 USGS study: estimate mean of 2.14 TCF of gas
- 2011 USGS study: estimate 19 TCF of gas and 600 MMBO – includes undiscovered, technically recoverable gas resources, and includes both unconventional and conventional resources
- 1994 was the last time a Jack-Up Rig was in the Cook Inlet
- Last major gas discovery date in Cook Inlet basin, prior to Buccaneer Kenai Loop #1, was over 10 years ago

BUCCANEER ENERGY

THE SWEET SPOT – COOK INLET GAS FIELDS

30 gas fields in the CI Basin

USGS: 19 TCF mean yet to be discovered



Cumulative Production - TCF

BUCCANEER ENERGY

BUCCANEER'S PROVEN SUCCESS – KENAI LOOP / ONSHORE

HIGHLIGHTS – KENAI LOOP #1 WELL

- Leased, permitted and successfully drilled within 9 months
- 100% working interest / 82.0% Net Royalty Interest (NRI); 9,308 Acres
- Adjacent to Marathon's Cannery Loop Field - 175 BCF Produced (22 MMBOE)
- Pipeline construction begins October 2011; production to commence December 2011

GAS SALES CONTRACT APPROVED – ENSTAR

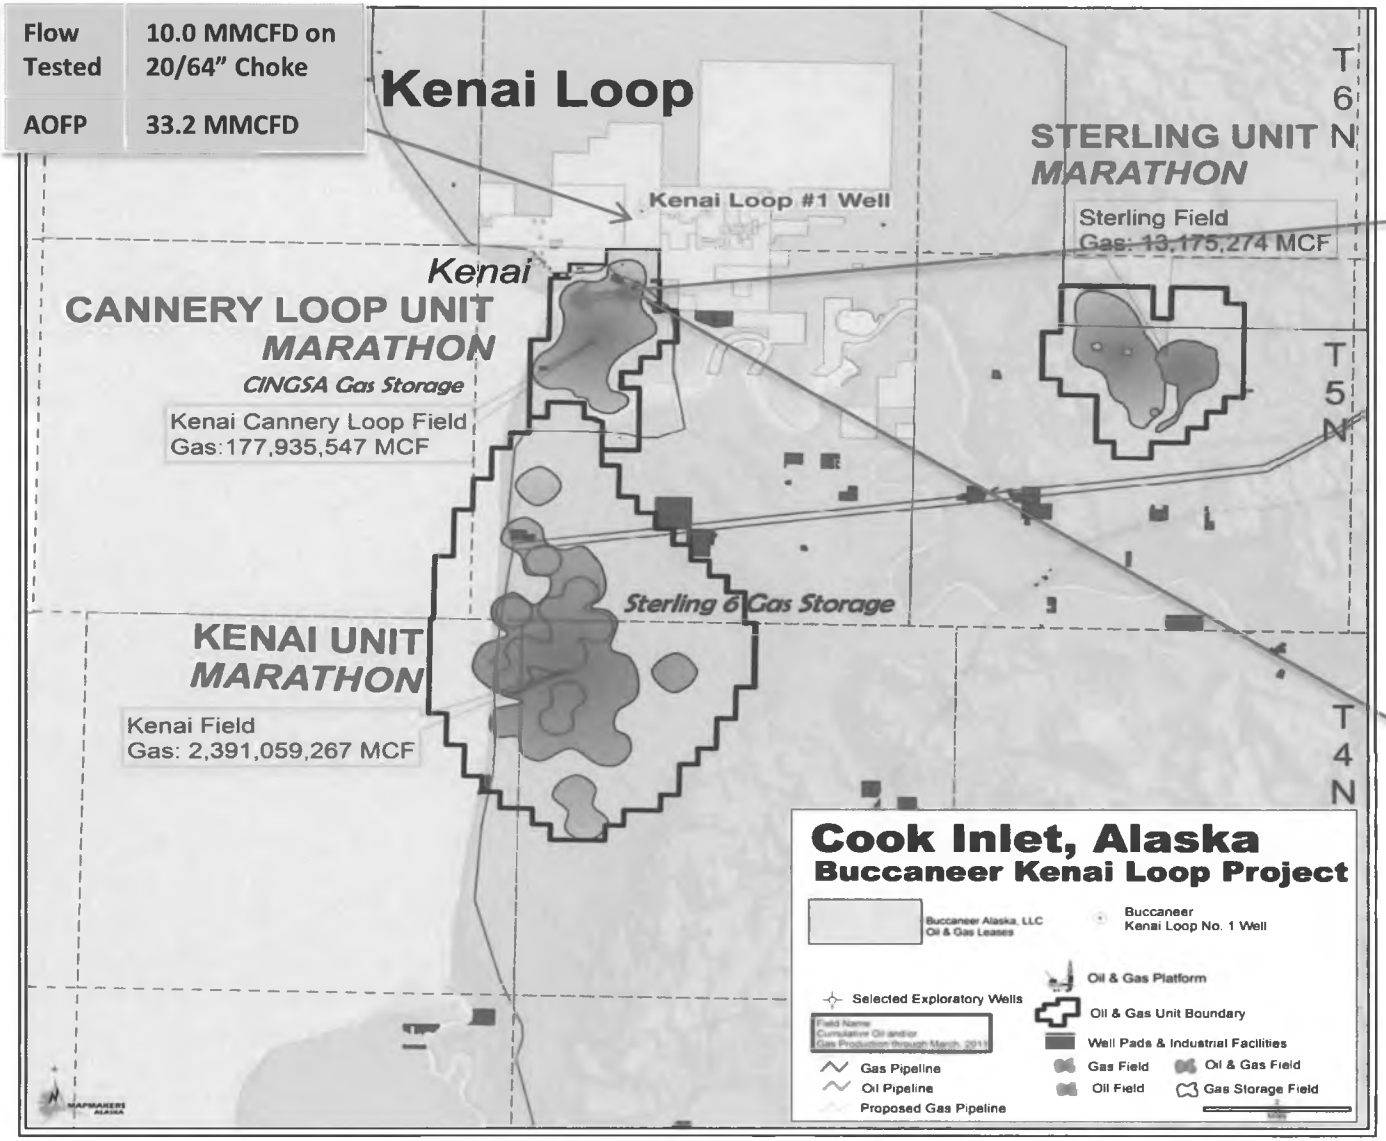
- Firm price and minimum volume of 5.0 MMCFD commences April 2012
- Annual net weighted average price of $6.24 / MCF
- Deliverability of up to 15.0 MMCFD

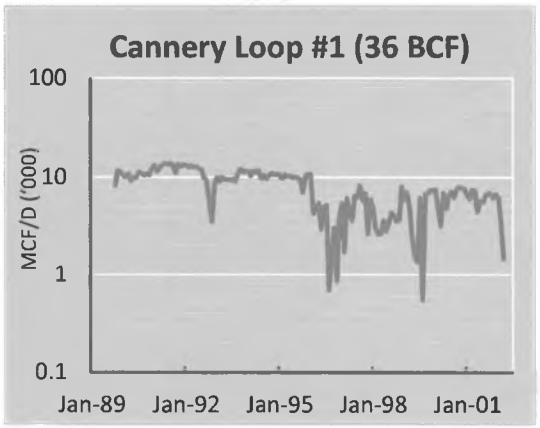
KENAI LOOP – DRILLING & DEVELOPMENT COSTS		
	GROSS – US$	NET of ACES Rebate
Total Cost to Production KL # 1	$12.4 MM	$5.0 MM
Additional Wells Cost to Production	$10.5 MM	$4.2 MM

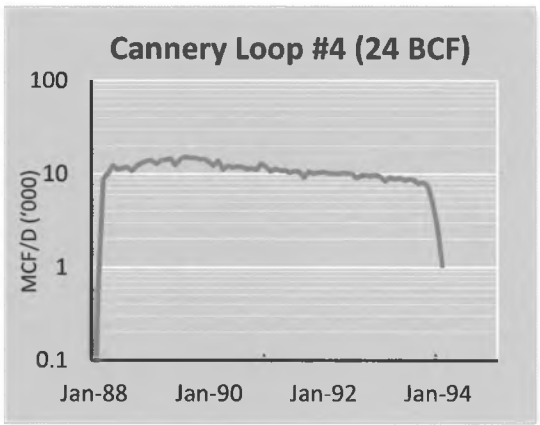
BUCCANEER ENERGY

PROVEN SUCCESS – KENAI LOOP / ONSHORE

Flow Tested	10.0 MMCFD on 20/64" Choke
AOFP	33.2 MMCFD

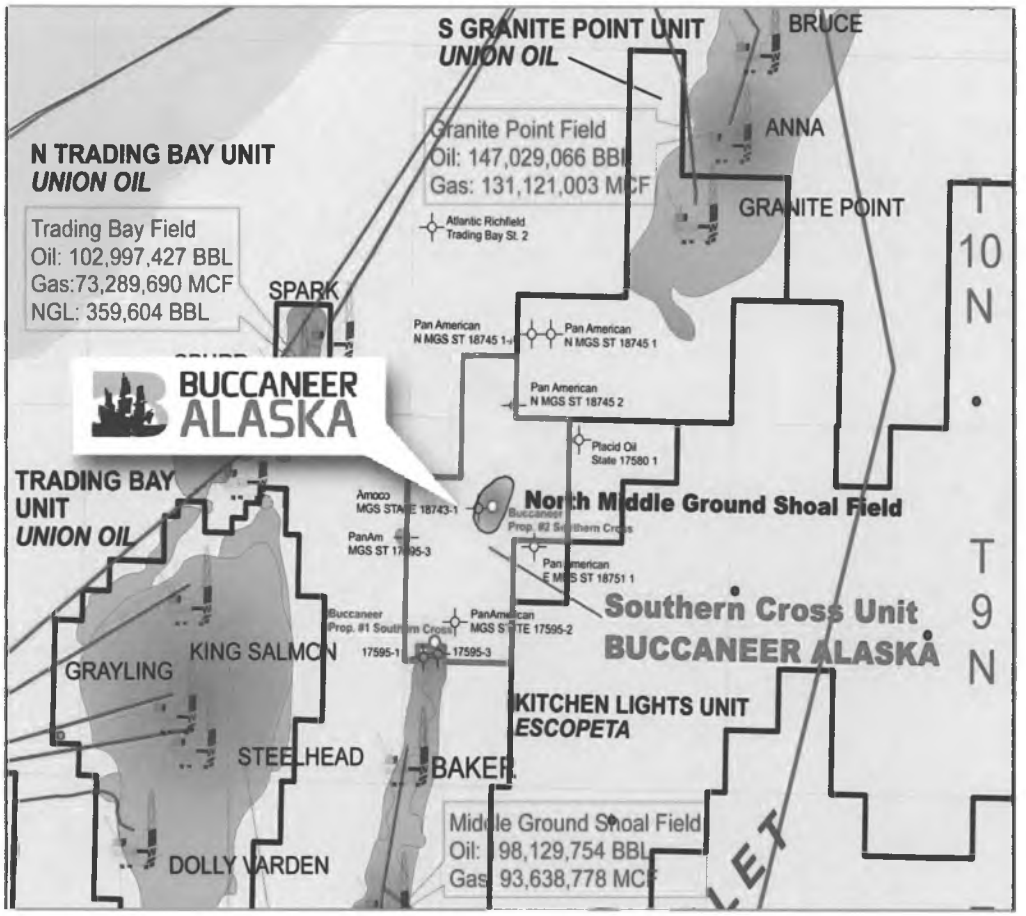






BUCCANEER ENERGY

SOUTHERN CROSS / OFFSHORE

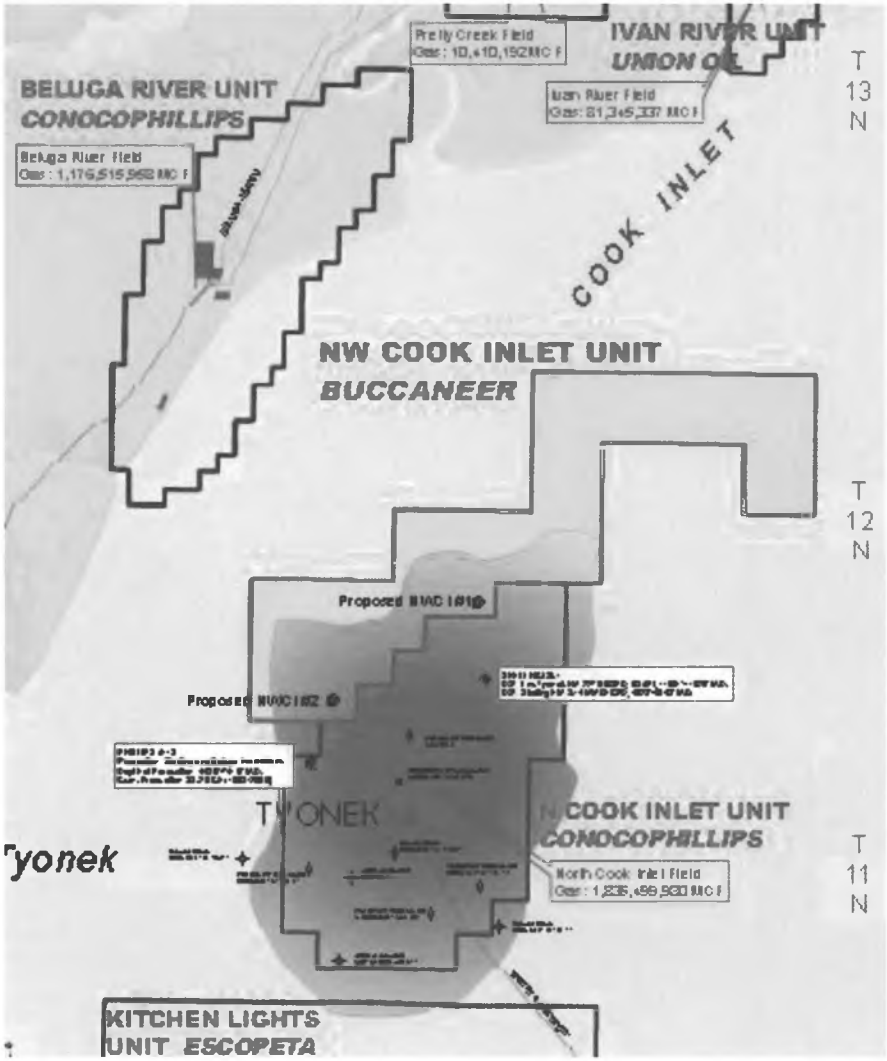


SOUTHERN CROSS UNIT

- 100% working interest/80.0% NRI
- Netherland Sewell booked reserves & resource
- 2P Reserves: 12.7 MMBOE (78% oil) + P50 Resource: 14.7 MMBOE (75% oil)
- Multiple pay sands and on Structure twin historical well which tested gas; was not developed
- Deeper Tyonek and Hemlock oil potential - 90' Drill Stem Test in 1960's well
- Chevron's (Hilcorp) Baker Platform ~ 1.5 miles south
- Projected Ops Costs < $10.00 / BOE

BUCCANEER ENERGY

NORTH WEST COOK INLET / OFFSHORE

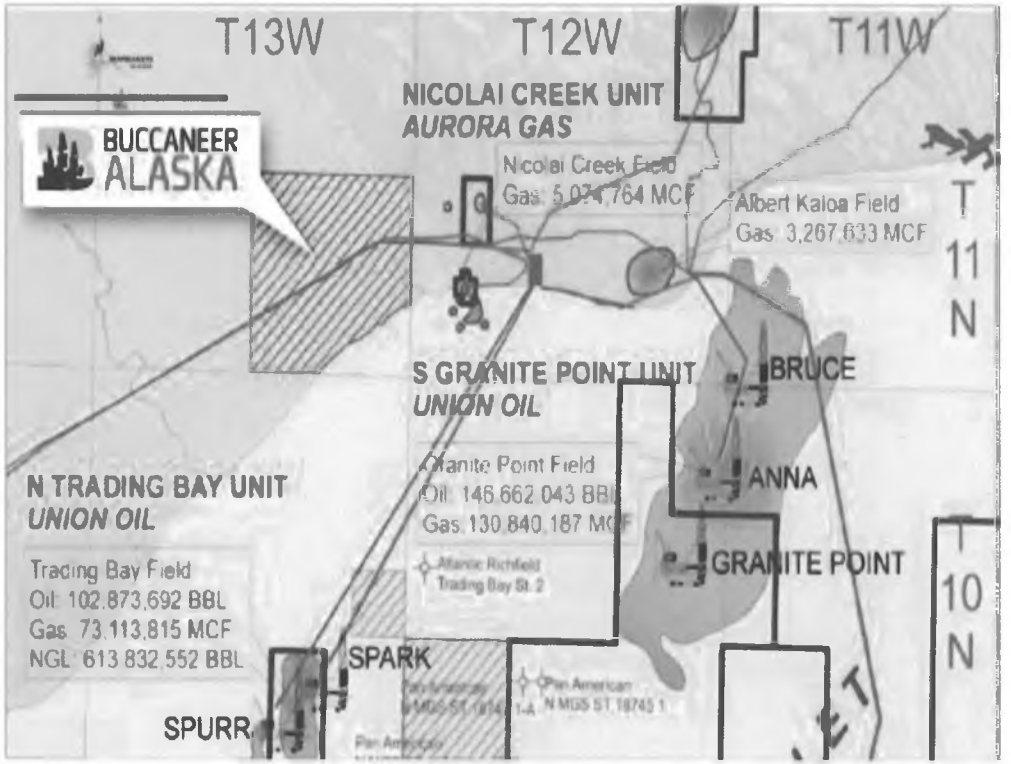


NORTH WEST COOK INLET

- 98.0% working interest/79.0% NRI
- Netherland Sewell P50 resource 49.4 MMBOE
- Adjoins ConocoPhillips field that has produced 1.8 TCF (225 MMBOE)
- Well drilled < 1 mile from lease boundary produced 88 BCF 11 MMBOE) (Phillips # A-13)
- Deeper oil opportunity 5 previous wells tested oil in Lower Tyonek & Hemlock which were never produced
- Shell well most northerly, tested at 2,270 BOPD from Lower Tyonek ~1 mile from lease boundary

BUCCANEER ENERGY

W. NICOLAI / ONSHORE

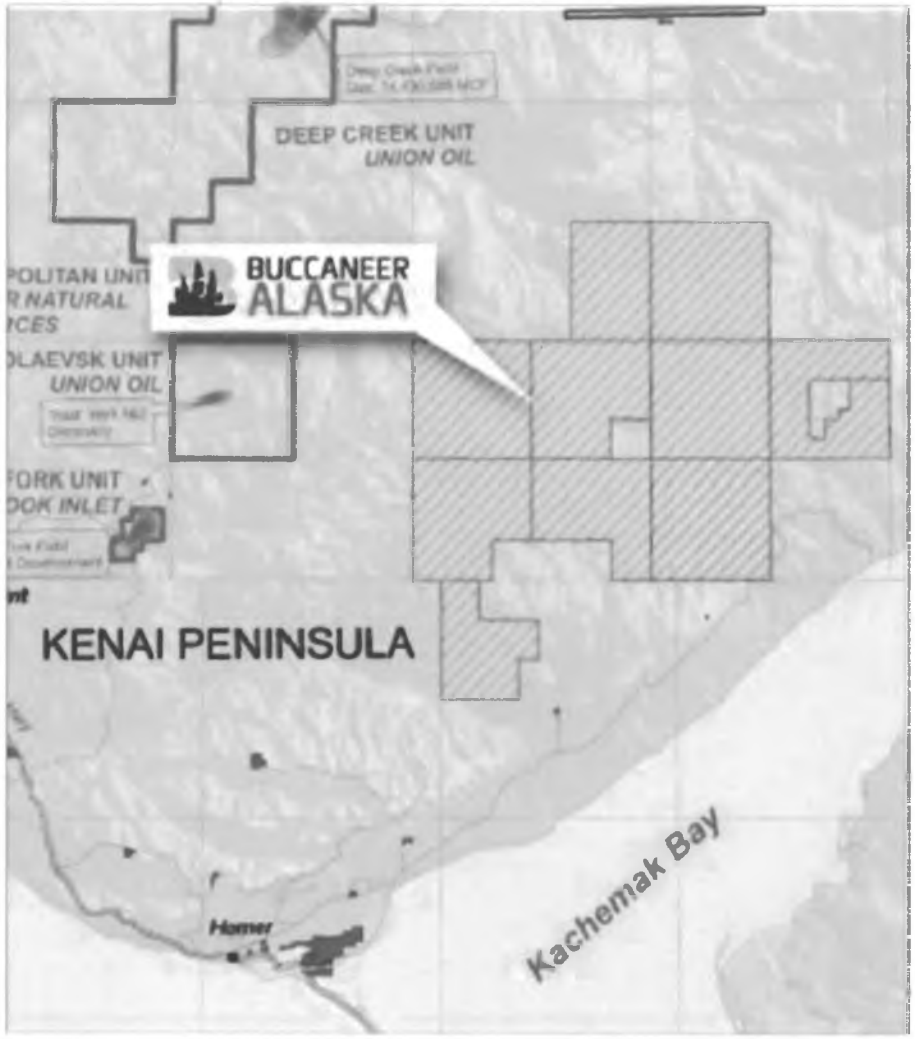


W. NICOLAI

- 4,952 acres; 100% working interest/84.5% NRI
- Shallow multiple stacked pay zones
- Defined gas prospect
- Roads, pipeline and infrastructure approx. 2 miles away – tie into existing sales line
- Acquiring seismic & reprocessing

BUCCANEER ENERGY

WEST EAGLE / ONSHORE



WEST EAGLE

- 49,808 acres; 100% working interest/80% NRI
- Down structure wells had gas & oil pay
- Infrastructure being built to area by Armstrong
- Acquiring seismic & reprocessing

BUCCANEER ENERGY

DEVELOPMENT SCHEDULE

	2H 2011	1H 2012	2H 2012	1H 2013	2H 2013	1H 2014	2H 2014
Kenai Loop - Gas	Pipeline Facilities Commence Production	3D Seismic Development Drilling Production		Production			
Southern Cross – Gas/Oil		Drilling			Pipeline Facilities		Commence Production
Northwest Cook Inlet – Gas/Oil			Drilling		Drilling Pipeline Facilities		Commence Production
W. Nicolai - Gas			Drilling		Commence Production		
W. Eagle – Gas/Oil			Drilling		Commence Production		

BUCCANEER ENERGY

EXTRACTING THE VALUE: JACK – UP RIG ACQUISITION

Kenai Offshore Ventures (KOV) Ownership & Partners

- 50/50 JV with Ezion Holdings (Singapore listed)
- AIDEA owns 100% Preferred Equity
- $86.5 million to acquire, modify & mobilize
- Purchase Agreement executed with Transocean to acquire Endeavour

Acquisition Status

- Joint Ownership Agreement with AIDEA executed
- Senior Debt Facility Term Sheet Executed – Moving To Final Documentation
- Finalizing modification budgets and scheduling with Asian shipyard

Endeavour
The Spirit of Independence

BUCCANEER ENERGY

SELECTING THE RIG CONTRACTOR

Archer Drilling, LLC

- Project manage the shipyard modifications to the jack-up rig
- Manage the mobilization process from Singapore to the Cook Inlet
- Operate and market the rig in the Cook Inlet and the Chukchi Sea

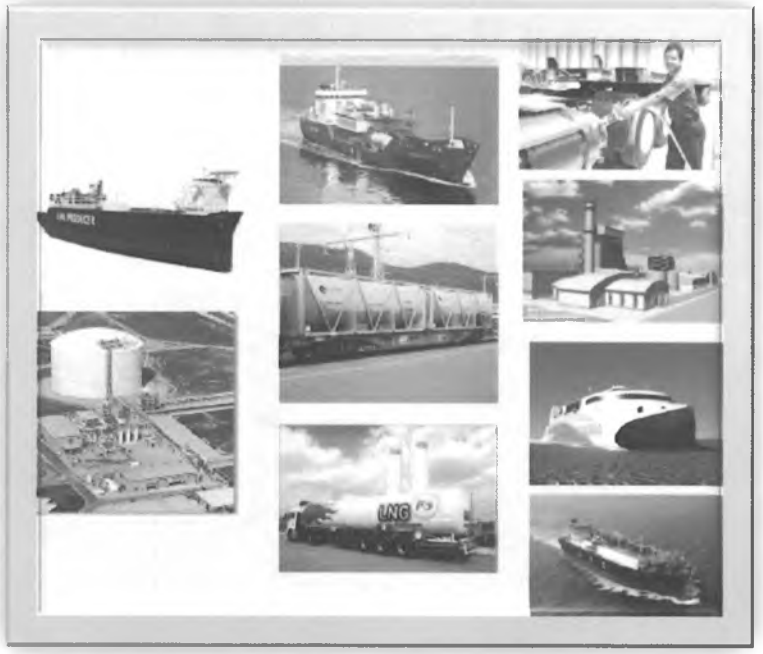
Why Archer?

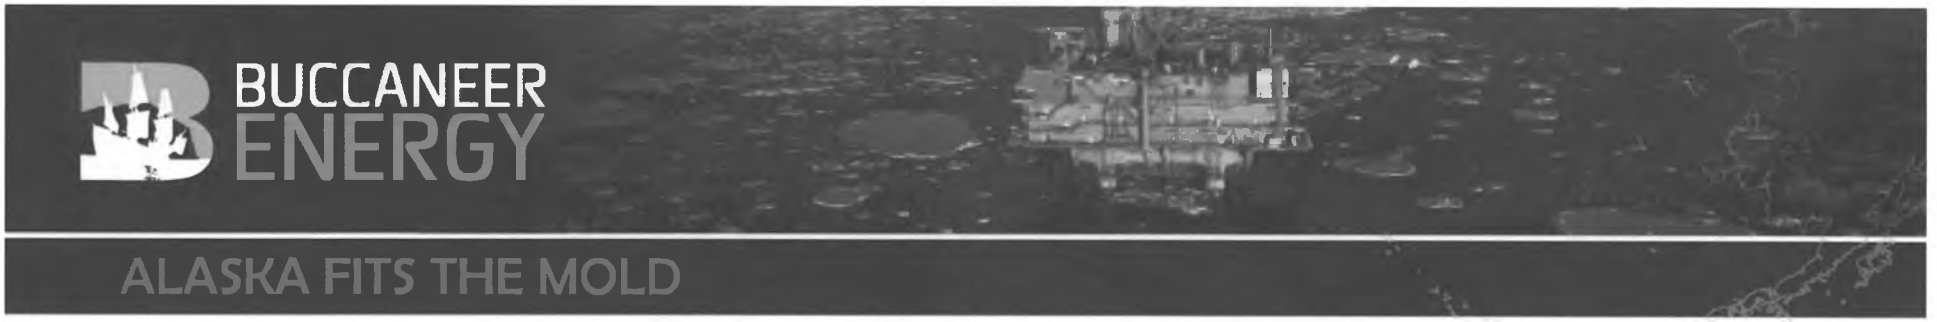
- Currently operating over 100 rigs globally
- Extensive experience operating in harsh environments
- Extensive engineering capabilities
- Very familiar with the LeTourneau 116 Class jack-up rig
- Excellent safety record

BUCCANEER ENERGY

MARKET EXPANSION

- Increased drilling in the Cook Inlet will increase:
  - Gas reserves
  - Gas production in the near term
- Increasing the gas market in Alaska will fuel enthusiasm for continued drilling.
- LNG increasing role in various applications to expand the gas market.





Back to the founding principles:

- Minimize risk
  - Enlisted local talent: Stellar management and assets
  - Acquired majority positions in projects: Kenai Loop
  - Managing operational control: Buccaneer Alaska
  - No "Big E" – stacked pay: Cook Inlet

- Maximize opportunity
  - Fast tracked development opportunities: Kenai Loop #1 – from permitting to production in 9 months
  - Benefited from special incentive: Favorable regulatory environment; strong commodity market; ACES incentives

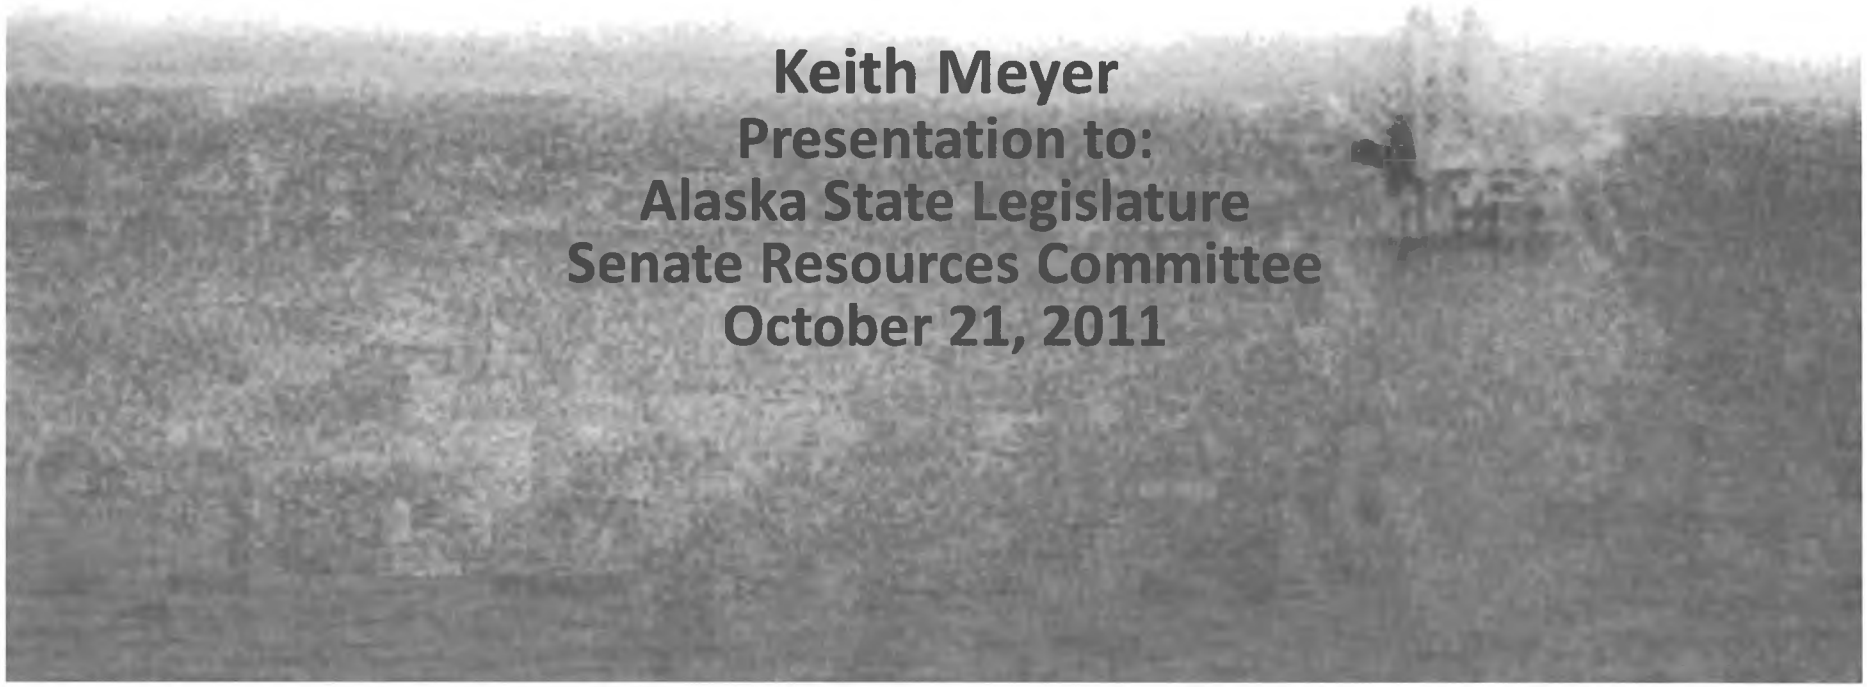
LNG Alaska



Keith Meyer
Presentation to:
Alaska State Legislature
Senate Resources Committee
October 21, 2011

Overview

- Introduction
- Perspective on Cook Inlet gas supply
- Supply push/demand pull
- Changing LNG industry
- Three strategic pillars
- Employment and Trade
- Conclusion

Introduction

LNG Alaska

- **LNG Alaska is an alliance** between LNG Central and Buccaneer Alaska.
- **Objective:** To increase the market reach of Alaskan natural gas through improved LNG production and delivery infrastructure.

Perspective on Cook Inlet Gas

- The decline of Cook Inlet gas has become the scape goat for justifying many alternative energy projects.
  - ***"WHEREAS supplies of natural gas are precipitously declining in Cook Inlet…"*** (ARCTEC resolution authorizing participation in pipeline open season from the north.)
  - ***"Limited and declining Cook Inlet gas deliverability"*** (Black & Veatch study supporting the hydro project.)
  - ***"Our only option to solve with certainty our gas supply needs is through the importation of LNG and we see no way around that,"*** Dan Helmick, manager of regulatory affairs for Anchorage Municipal Light & Power.
- Implications:
  - Cook Inlet gas is **starting from a point of negative public perception**.
  - Somewhat of a self-fulfilling prophecy – fear of no gas chases demand away, which leads to lack of interest to develop more gas.
  - Increased demand will bring supply development.

Supply Push/Demand Pull

- Cook Inlet gas producers will commit supply to a market expansion program.
- Creating sustainable demand will sustain new supply development in the Cook Inlet.
- Enabling Solution: **LNG Alaska**
  - New, efficient, modular liquefaction.
  - Expanded LNG use within the state.
    - ✓ Trucks, rail, and barge deliveries.
    - ✓ Remote storage and revaporization at select locations.
    - ✓ Fuel terminals for truck and marine use.
  - Continued potential for LNG exports.
  - Option for LNG imports.

LNG Alaska is Infrastructure

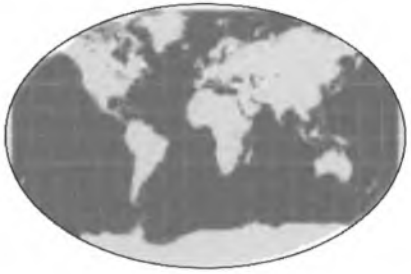
LNG Alaska is infrastructure - capable of liquefying natural gas (LNG), transporting the LNG to in-state markets, and providing export for access to global markets.

LNG Alaska

LNG Production **LNG Transport** **LNG Delivery**

Changing LNG Industry

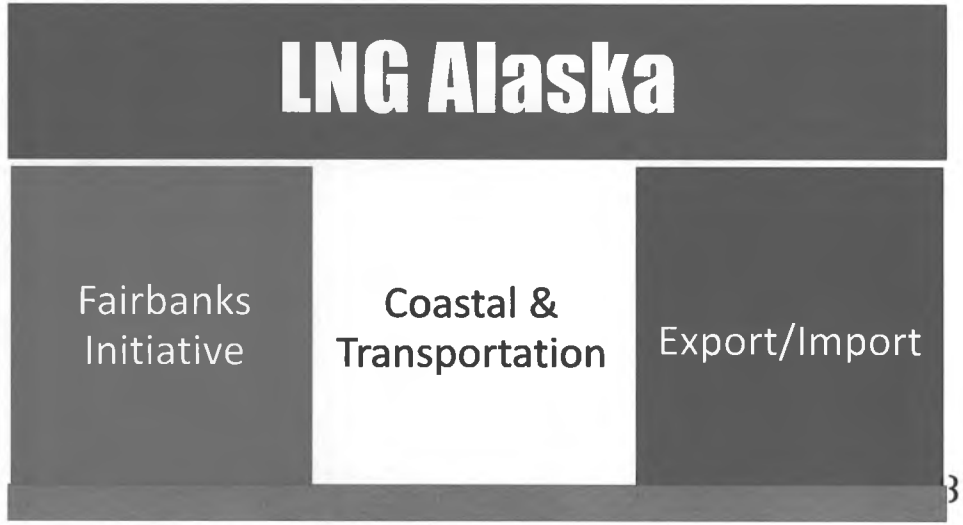
- 22 nations now import LNG – double from just 10 years ago; 30 floating regas facilities planned.
- "Mid-scale" LNG facilities (the size of Kenai, at 1.6 Million tons per year) are now modular and manufactured in factories – including fully contained units in a floating application.
- LNG is now being used as a transportation fuel in road, off-road, and marine applications.
  - Emission reduction and cost savings.
  - Norway shifting to gas fueled transportation.
  - Cruise ships and freighters adding LNG fuel capability.



Three Strategic Pillars

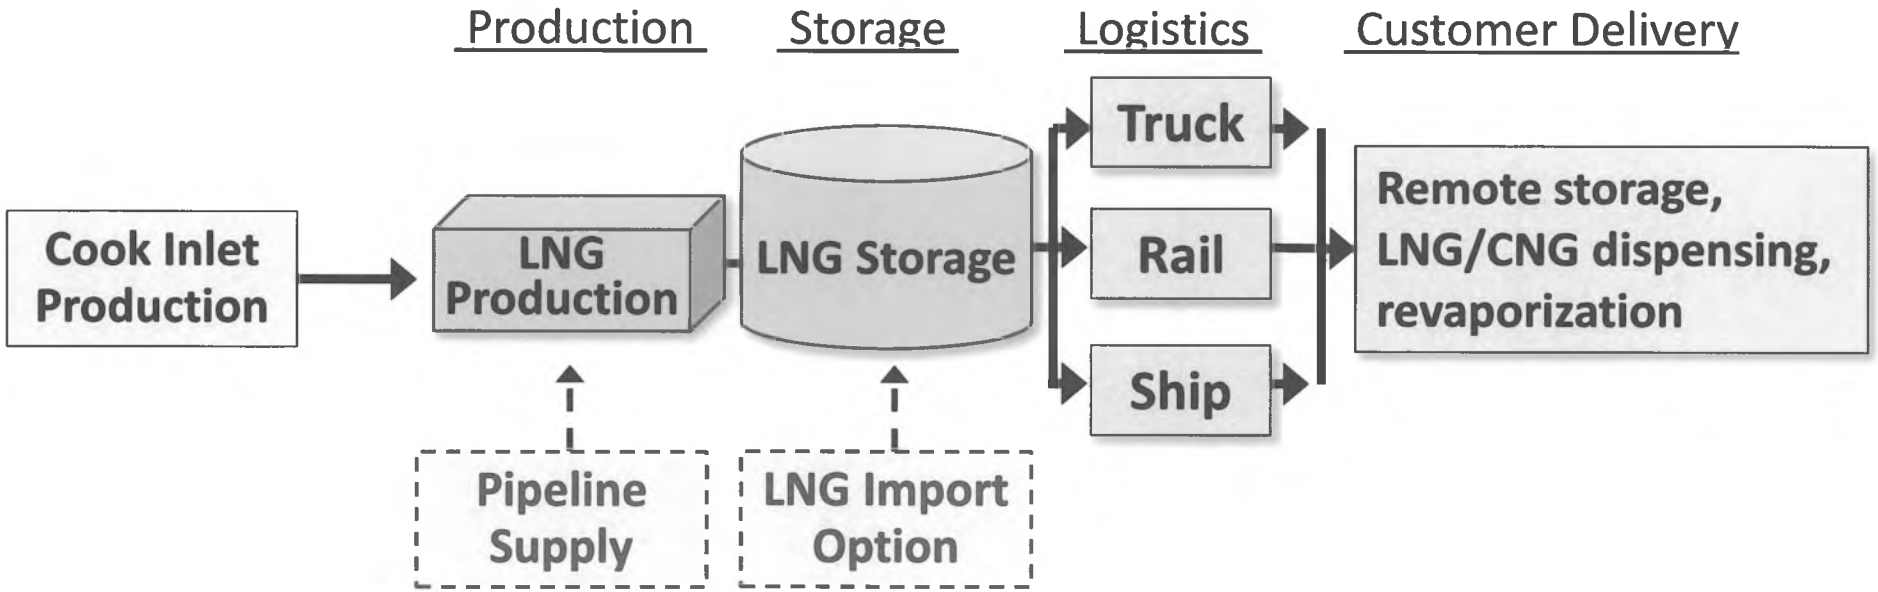
- The **LNG Alaska** program is built on a foundation of three strategic pillars:
  - **1. Fairbanks Initiative** - LNG from the south for power generation and fuel oil displacement.
  - **2. Coastal and Transportation Initiative** - LNG by barge to select coastal towns as a cheaper and cleaner replacement for diesel fuel; fuel for the Alaskan Marine Highway and other transportation markets.
  - **3. Export/import Initiative** - exports of LNG as well as imports if needed.

Although each of the pillars has viability on a stand-alone basis, together they form a stronger and complimentary foundation.



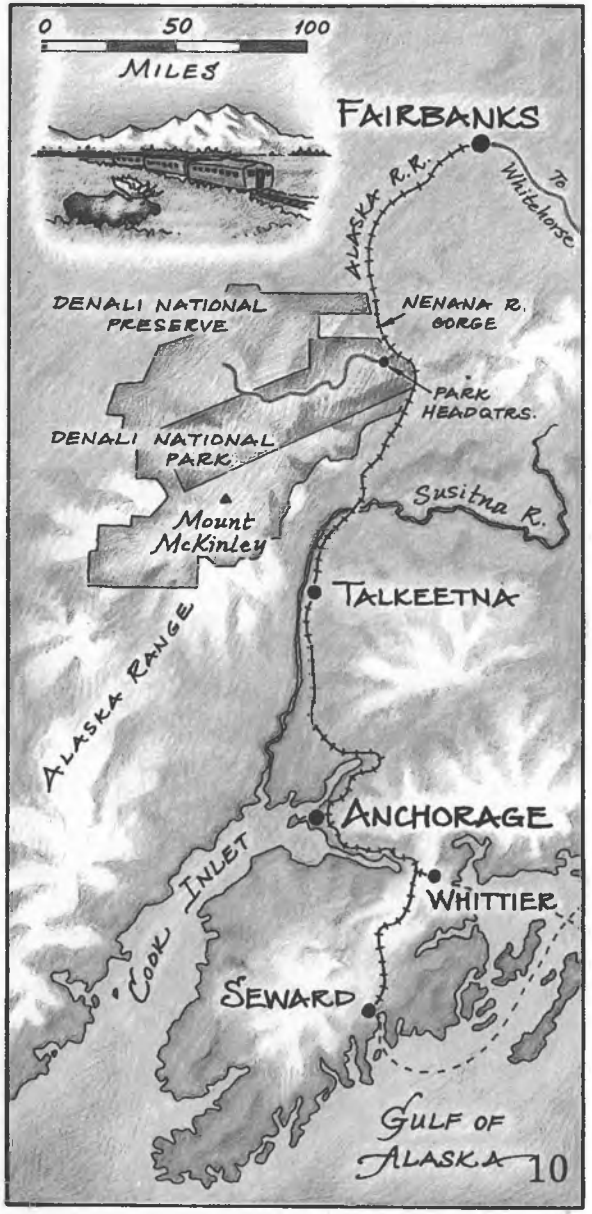
Reliable Infrastructure

- Cook Inlet production is liquefied and stored, then moved by truck, rail, and ship to customer delivery points for use as LNG or revaporized to natural gas.
- The infrastructure investment can be used with pipeline supply or even imported LNG for **long term reliability**.



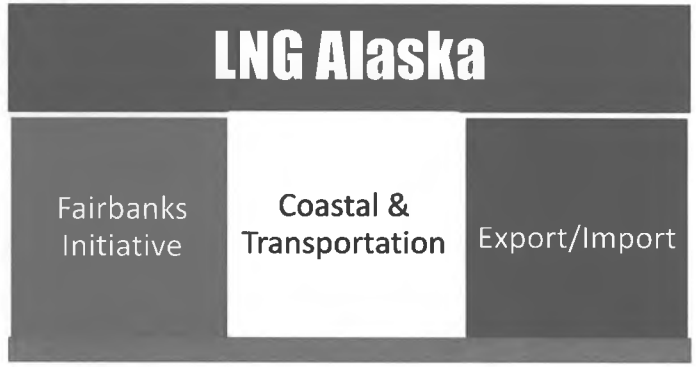
Fairbanks Initiative

- Fairbanks and the Railbelt Region is an important market for the **LNG Alaska** plan.
- Railbelt Region is considering multiple options to address energy supplies and costs.
- **LNG Alaska** can deliver LNG to Fairbanks cheaper and more reliably than a northern alternative.
- A mid-scale LNG facility in the south can be built and operated at a lower cost than in the north; delivery costs are less and more reliable (road and/or rail);
- Supporting legislation has been enacted (such as Senate Bill 42 establishing the Railbelt Energy Fund to help with studies and grants for power projects).



Coastal & Transportation

- The Coastal region has two primary target markets for an LNG/gas market expansion program:

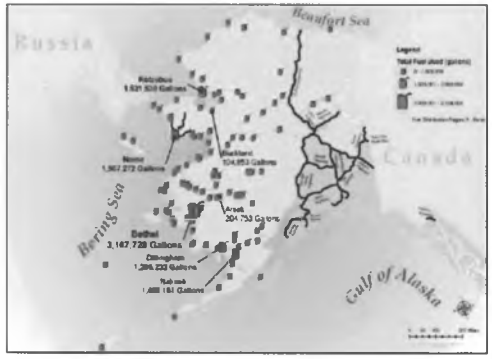


- Power generation:
  - Target diesel fired power plants on coastal cities accessible by barge.
  - Seven to ten cities with power demand large enough to justify effort.
  - Some potential for the Denali Commission to assist with studies and potentially funding. (Federal-State partnership for cost shared infrastructure.)
- Transportation Fuel
  - Initial focus on large marine market, then large trucks
  - Primary target: Alaska Marine Highway System

Coastal: Power Generation

- Power generation in coastal and rural Alaska is largely fueled by local and imported diesel fuel.
- The high price of fuel ($30/MMBtu) and power has been a contentious issue for western Alaskans.
- The Norwegian conversion from oil to gas is a good example applicable to Alaskan coastal towns.

	Gallons/yr (MM's)		Gal/d	Gas Equivalent	
Target Towns	Diesel	LNG	000's	Bcf	MMcf/d
Bethel	7	12	33.1	0.905	2.48
Kotzebue (Red dog mine)	16	28	75.6	2.069	5.67
Other	10	17	47.2	1.293	3.54
	33	57	155.9	4.3	11.7



Source: Map developed by Alaska Map Company with 2006 PCE information on utility fuel consumption

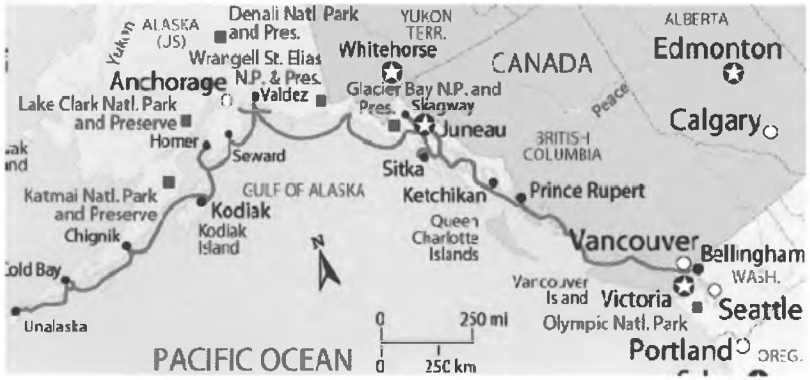
Target: Transportation

- LNG is a growing transportation fuel for on-road, off-road, and marine use.
- On road users are typically large trucks; off-road markets are typically mining vehicles.
- Marine applications include tugboats, workboats, and ferries.
- **The Alaska Marine Highway System would be an ideal demand because of its large load and scheduled route.**

Source: Map developed by Alaska Map Company with data from USGS and Alaska DNR.

Alaska Marine Highway

- Alaska Marine Highway fleet is old.
- State commissioned study to design fuel-efficient vessels to replace aging fleet.
- Dual fueled diesel/LNG marine engines have been in operations for years and meet 2014 emissions requirements (mandatory for U.S. and Canada).
- **Perfect opportunity** for the State of Alaska to use dual-fueled LNG vessels as the new class of clean, energy efficient, Alaska class ferries for the modern Alaska Marine Highway.



Export/Import Potential

- Modularized LNG allows expansion of the facility to fit market demands.
- The existing export facility at Kenai would make a good "staging area" for the **LNG Alaska** plan, but may not be readily available.
- An alternative site with marine access will be investigated.
- The marine jetty and storage tanks can be used for imports for supply reliability.

LNG Alaska

Fairbanks Initiative	Coastal & Transportation	Export/Import

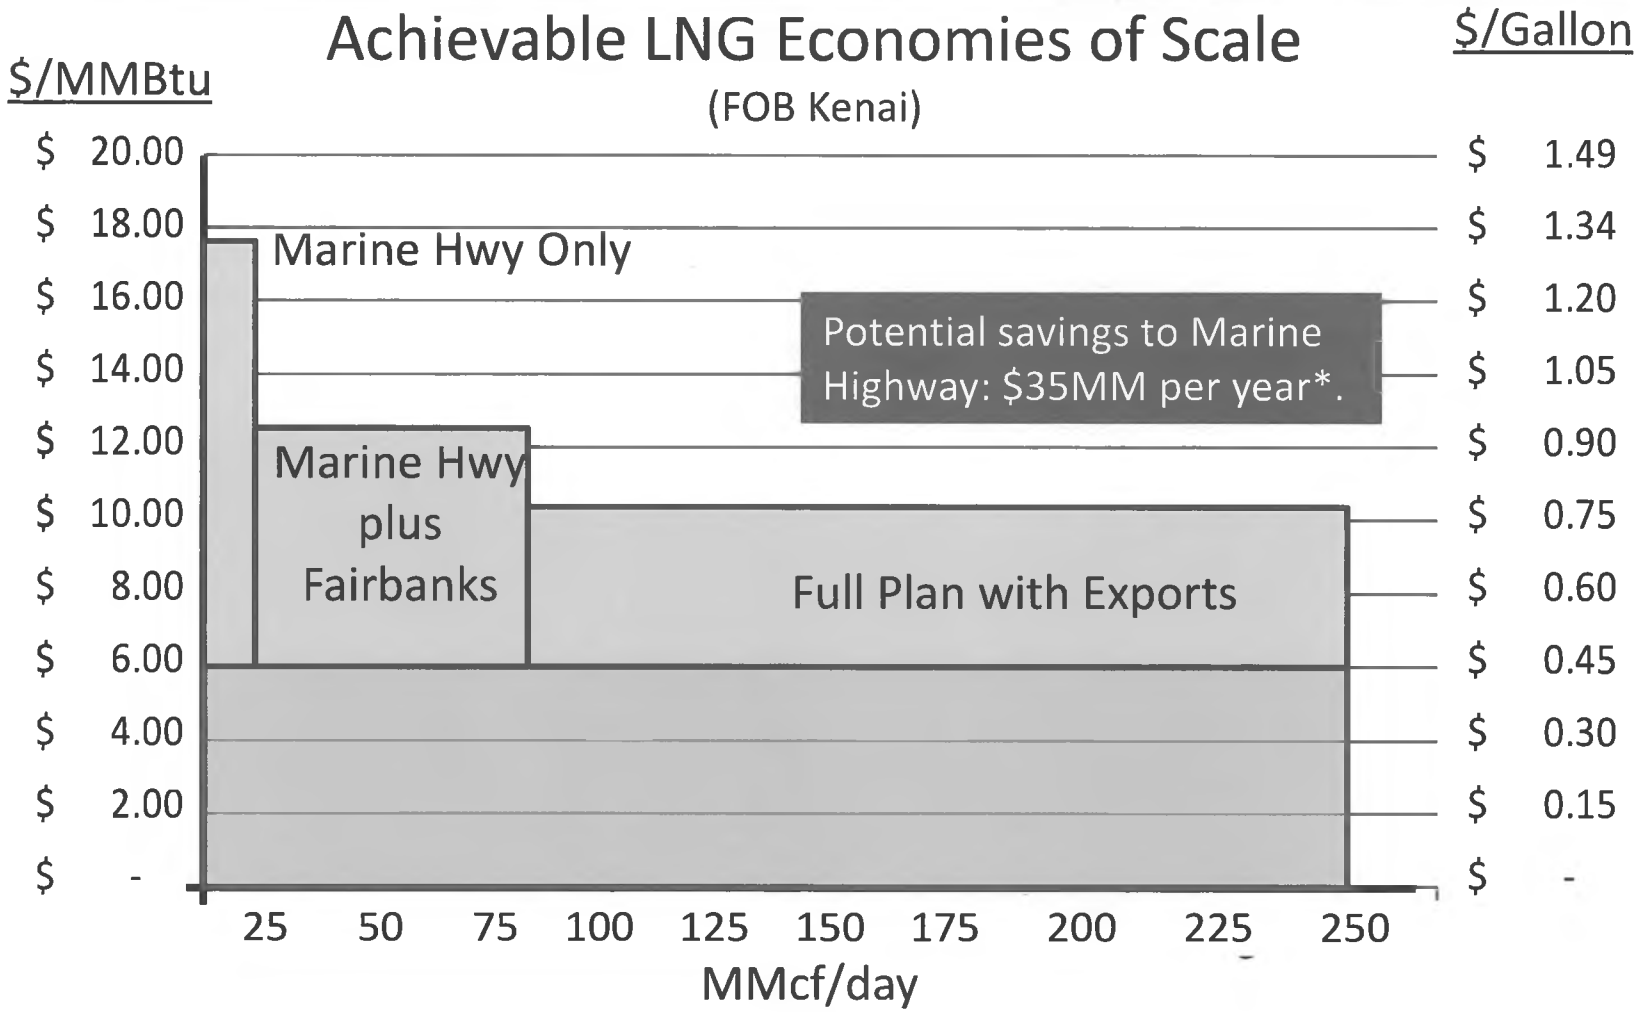
Kenai Export Terminal, Alaska
Photo courtesy of CH-IV International. http://ch-IV.com

Employment & Trade

- **LNG Alaska** will help create jobs in the energy sector:
  - Increased Cook Inlet natural gas production activities.
  - LNG delivery operations.
  - LNG vehicle conversions and maintenance facilities.
  - Expanded natural gas distribution facilities.
- **LNG Alaska** will be beneficial from a trade standpoint.
  - Reduce imports of refined products.
  - Continued/increased international exports.

Economies of Scale

The **LNG Alaska** plan can result in significant fuel cost savings for Alaska customers.



*Based on Alaska Marine Hwy Annual report stating 25 MM gal diesel at $100 MM cost.

Conclusion

- Alaska has significant gas potential in the Cook Inlet.
- Creating natural gas demand and market access will encourage gas production activities.
- Alaska's domestic gas reserves can be used to displace imported refined products, reduce pollution, and reduce the cost of energy to consumers.
- The **LNG Alaska** program will expand the gas market, help create jobs in the energy sector, and be beneficial to trade.
- Alaska has the necessary legislation and incentives in place to help accelerate the **LNG Alaska** program.
- **LNG Alaska** is ready to work with the state to implement a clean, and reliable natural gas expansion program.

Appendix - LNG Experience

Keith Meyer receiving the industry's first "LNG Company of the Year Award" in Rome, Italy 2007.

- Keith Meyer, LNG Central CEO.
- 30 years experience in international energy development, including gas pipelines, gas storage, power generation, LNG, petrochemicals, biofuels; international LNG and gas sales.
- Former Chairman Flex LNG; floating liquefaction.
- Former President Cheniere LNG, developer largest LNG receiving terminal in western hemisphere.
- Originator and co-patent holder of electronic LNG cargo slot bidding system (lnggateway.com).
- Former Vice President Trunkline LNG, receiver of Nigeria's first LNG cargo delivered; largest U.S. spot cargo importer.
- Rice University course instructor; frequent guest speaker and advocate to reduce gas flaring

1/18/12 PRESENTATION DEVELOPING ALASKA'S HEAVY OIL RESOURCES

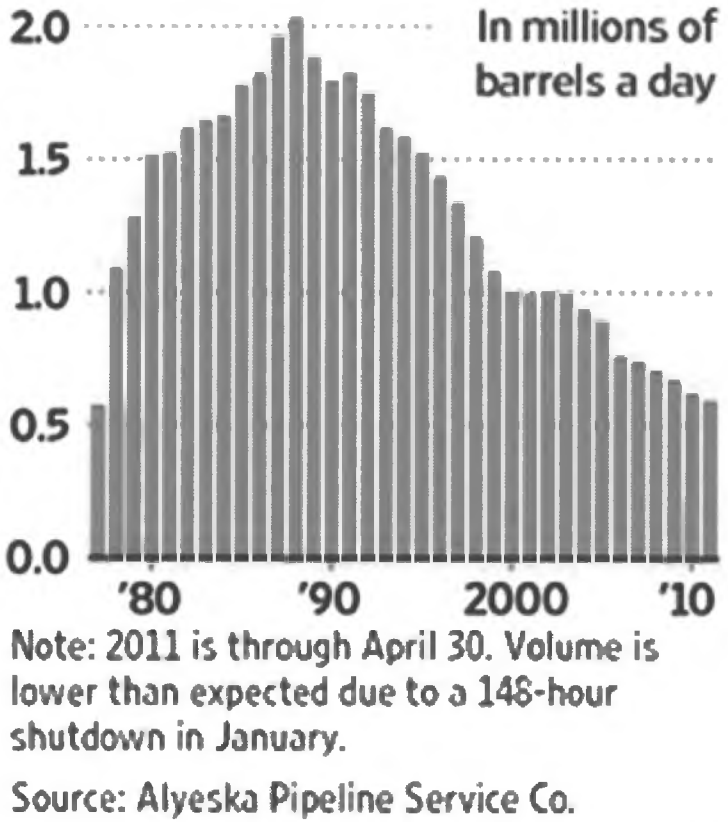
<TARGET><BILL></BILL><SUBJECT>1-18-12 PRESENTATION DEVELOPING ALASKA'S HEAVY OIL RESOURCES</SUBJECT><COMM>SRES27</COMM></TARGET>

Developing Alaska's Heavy Oil Resources

Stephen Yarbro

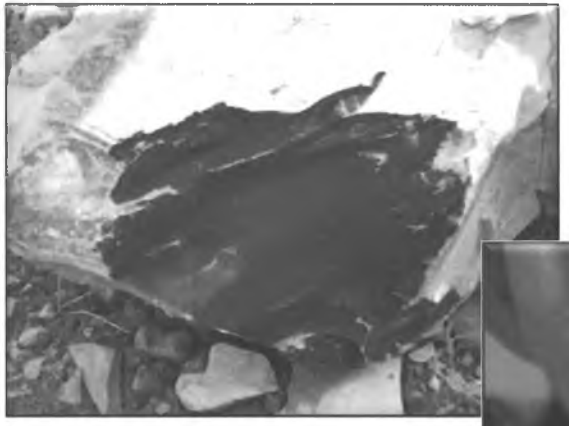
"UNLOCKING THE POTENTIAL"

Decreasing Conventional Oil Production Impacts The Trans-Alaska Pipeline



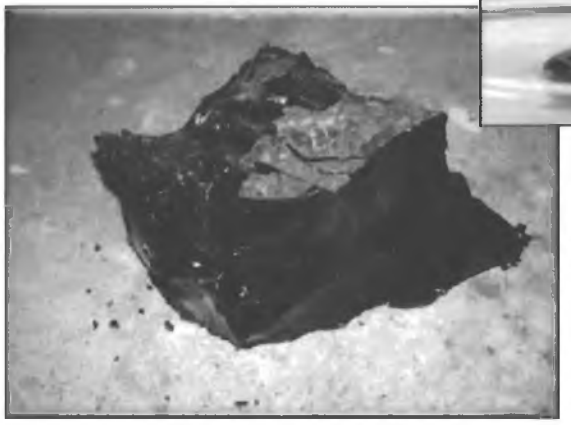
- Harder to find conventional oil
- Drilling is expensive
- Sense of urgency

Globally, 9 to 13 TRILLION barrels of Heavy Oil Assets, but -



Shale

Heavy Oil

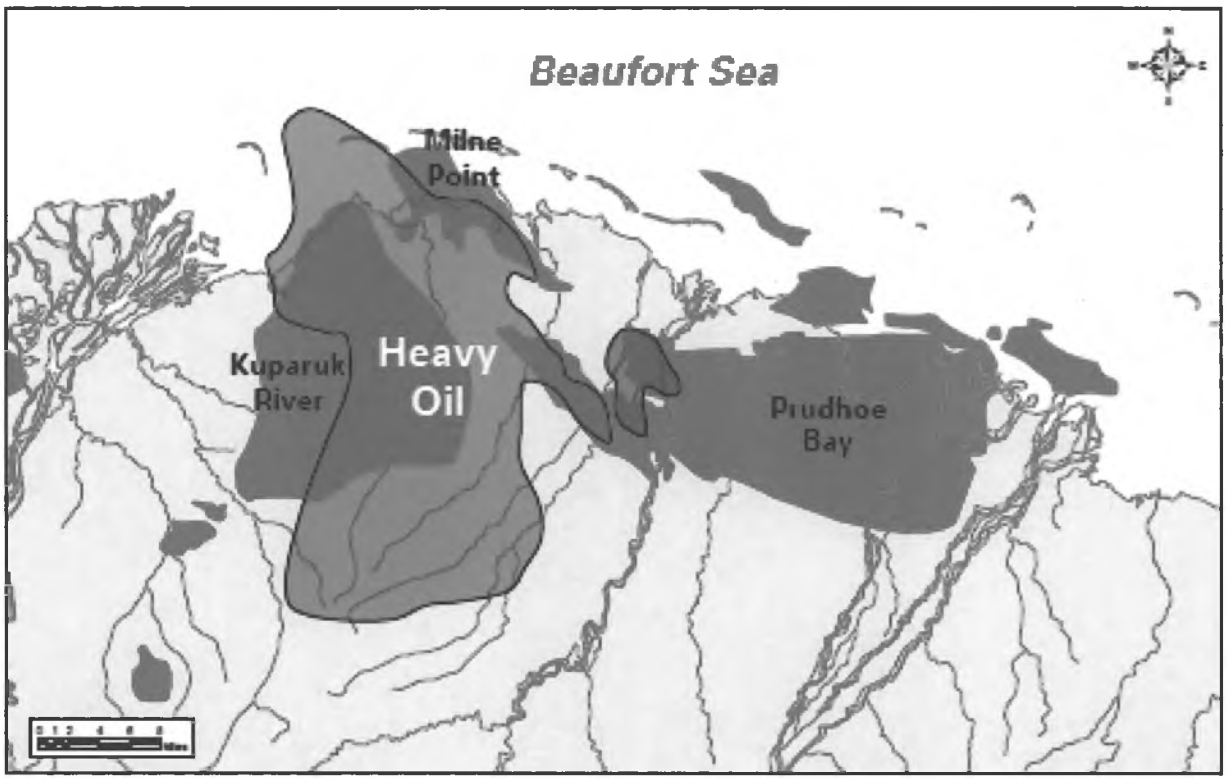


Bitumen

Oil Sands

- **Hard to transport**
- **Sells for $10 to $20 LESS than light crude**
- **Only 1 out of 4 US refineries can process heavy oil**

Heavy Oil Fields in Alaska



- 24 to 33 Billion Bbl Oil Total
- Schrader Bluff/West Sak
  - 12 Bbbls Oil
- Ugnu
  - 12 to 18 Bbbls Oil

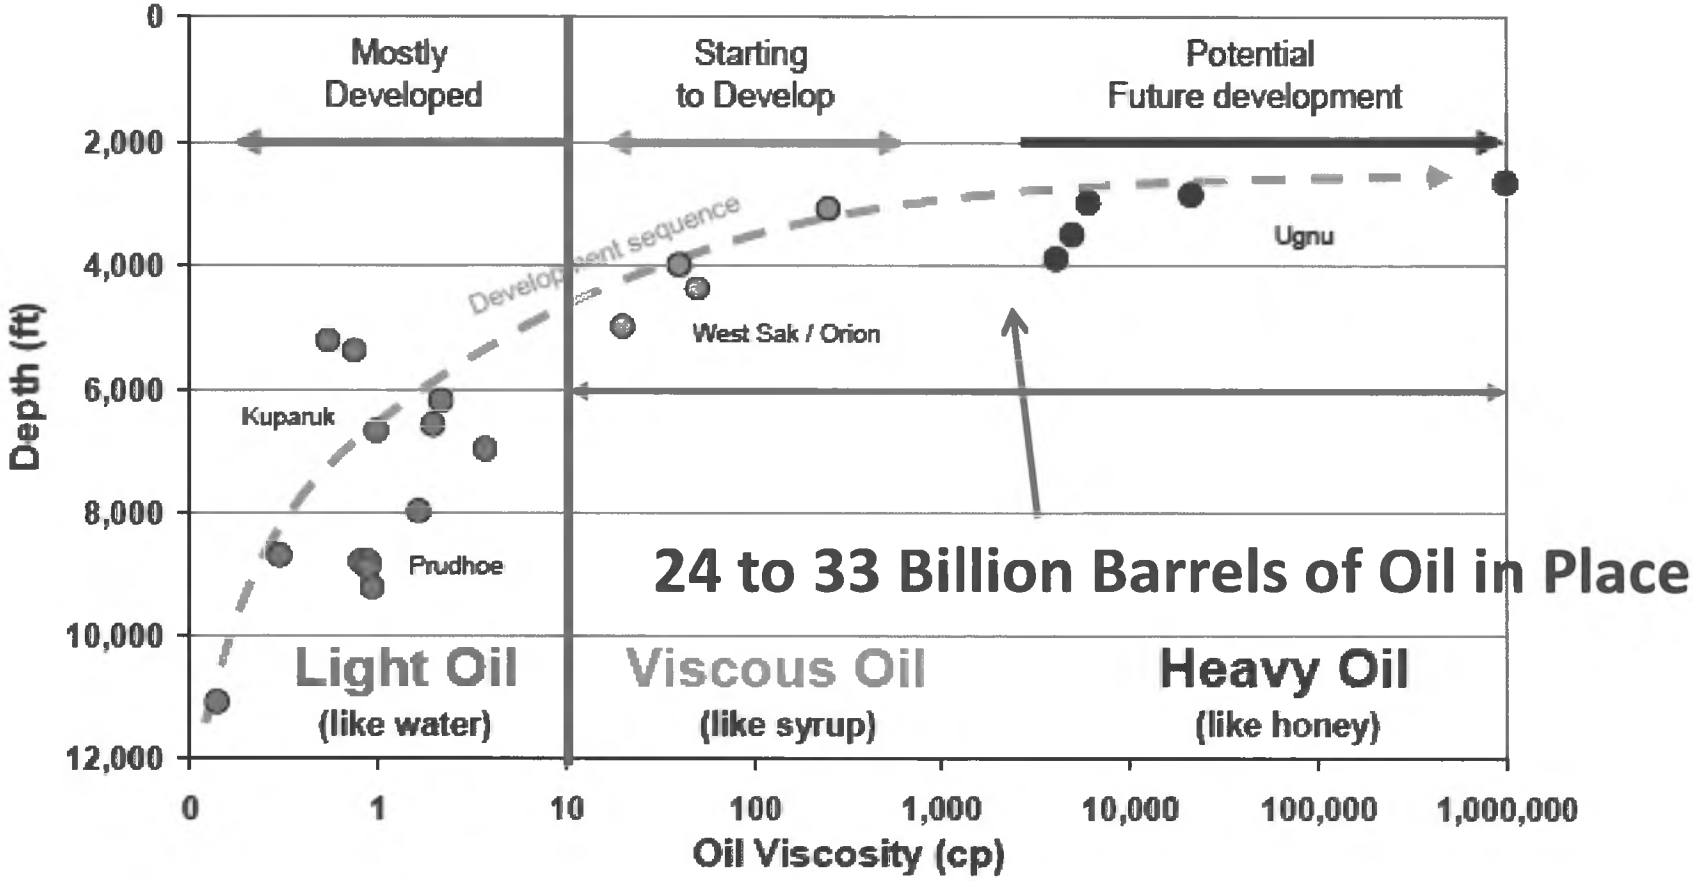
Heavy oil is fairly shallow within 5000 ft. and on-land
Does not require off shore drilling.

Source: www.aoga.org

Important Issues with Heavy Oil

- High viscosity flows very slowly: difficult to transport and wells produce at lower rates than light oil wells
  - Developments require lots of wells
  - Thermal techniques (e.g. steam) may be required for recovery but energy balance and environmental foot print are factors
- Heavy oil is depleted in hydrogen relative to light oil
  - Fewer refined products are derived from heavy oil
  - Heavy oil without upgrading sells at a lower price on the market

Physical Traits of Alaskan Heavy Oil



Barrier to development: The high viscosity prevents transport in the Trans-Alaska Pipeline

Source: www.aoga.org

SuperCritical Water Extraction and Refining (SCWER)

+

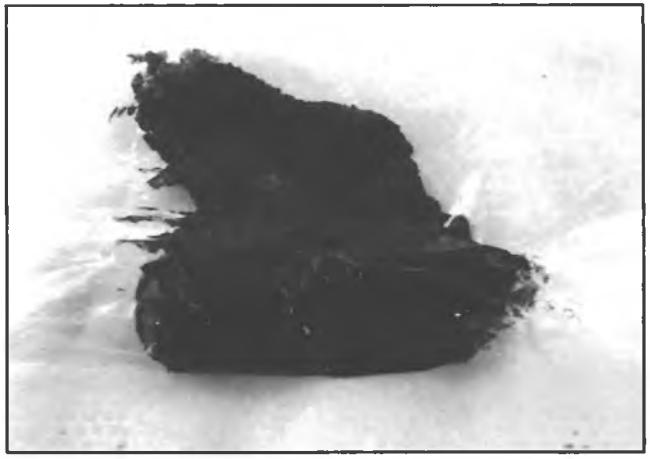
=

Heavy Oil Water Light crude

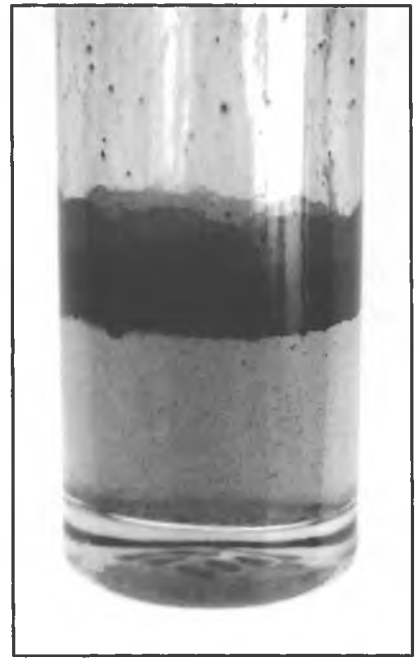
Use the **unique** properties of water at high temperatures and pressures to **make heavy oil into lighter, <u>less viscous crude</u>**

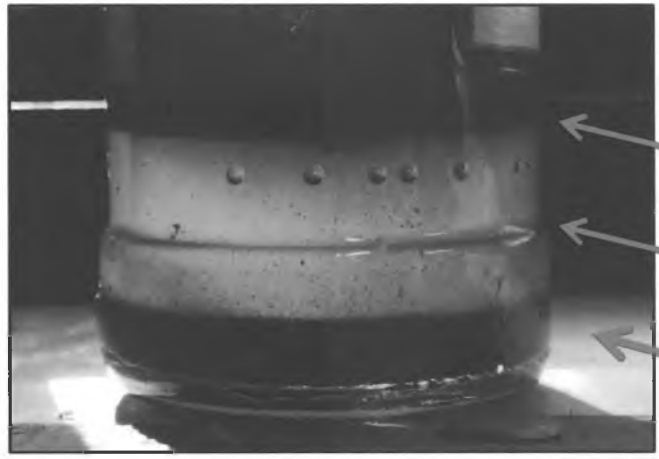
Actual Results with Asphalt/Sand

Asphalt Sample
(With Sand Fibers)



Product Oil
and Water



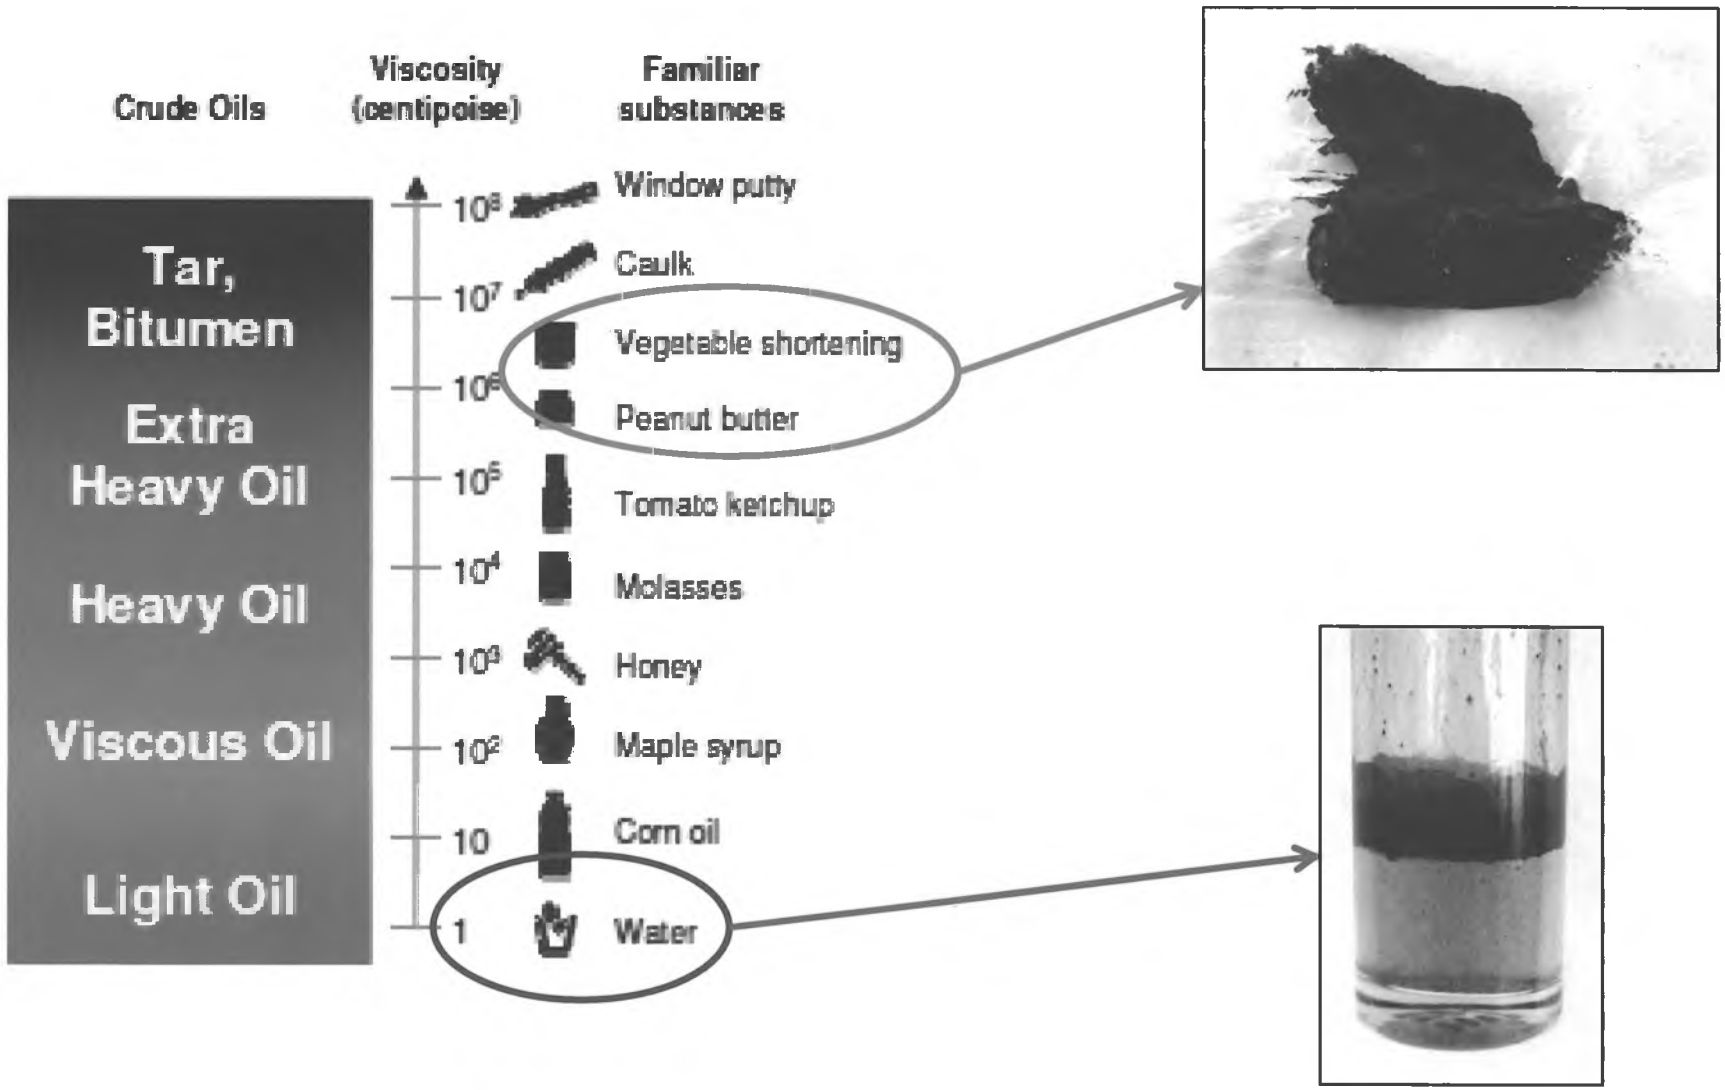


Upgraded Oil

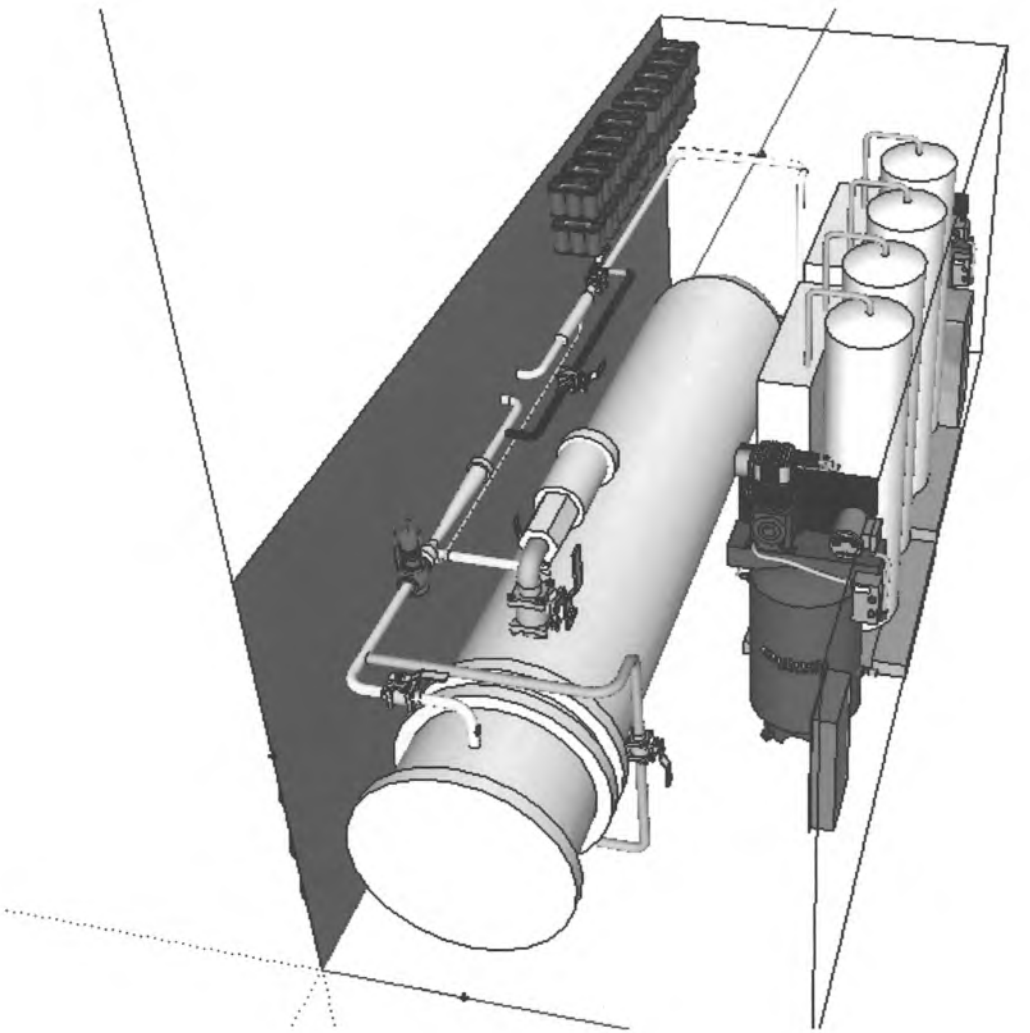
Water/Additives

Sand Particles

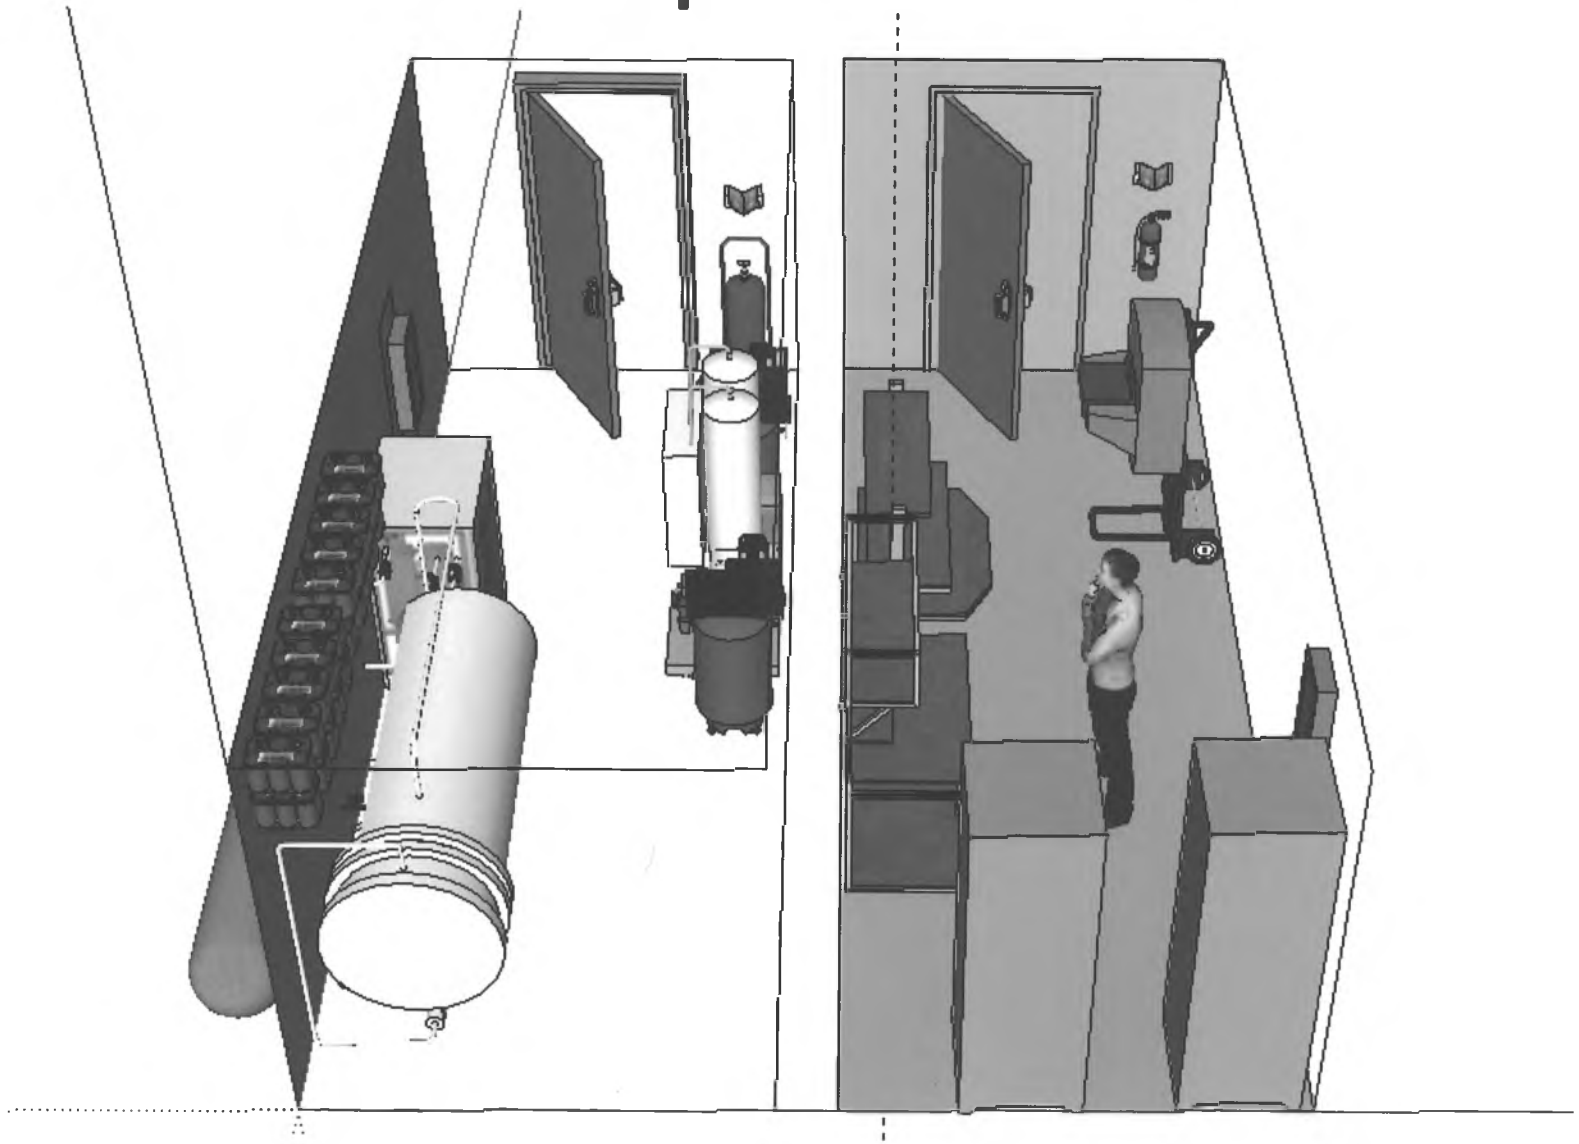
SCWER Processing Reduces Viscosity



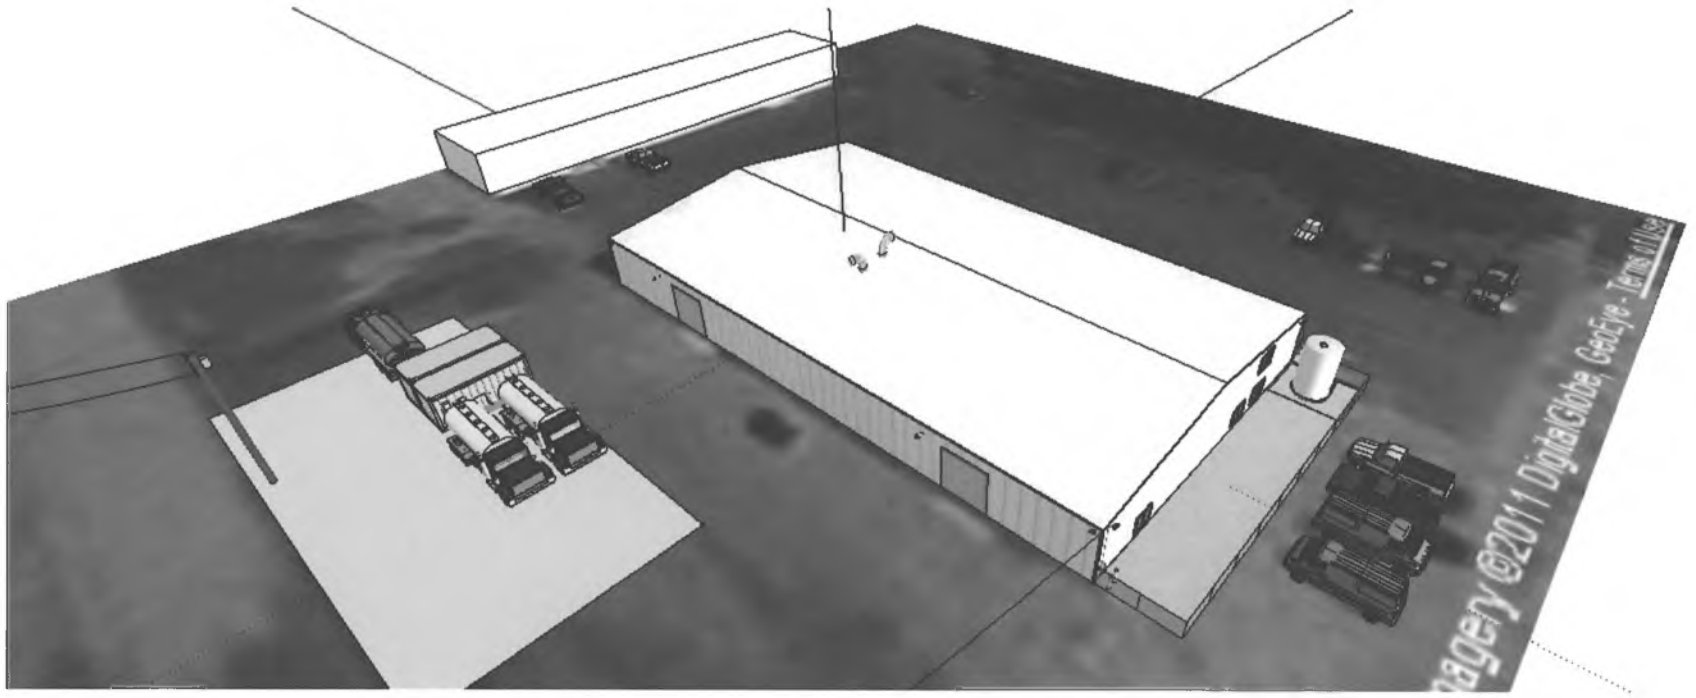
The SCWER Process uses Conventional Equipment



SCWER Pilot Process in Modular Transportainers



SCWER Pilot Located at Fairbanks Pipeline Training Center



Path Forward and Collaboration

- Develop collaboration with University of Alaska and Fairbanks Pipeline School
- Build and test 5 bbl/day unit
  - Leverage technical expertise with Alaska oil production at University of Alaska
  - Integrate with pipeline operations experience at Fairbanks Pipeline Center
- Use industrial experience gained from 5 bbl/day unit to build industrial unit (25 bbl/day) for North Slope production field trials

How SCWER adds Value

- Reduce the viscosity to allow transportation through conventional pipelines without additional heating, refining or solvent addition
- Increase the value of heavy crude with low API gravity (8 to 14) to a higher value crude (>20° API). This can increase the value per barrel of product oil by $20 or more
- Process oil assets that were not financially feasible before, opening up new opportunities for profitable development

Positive Impact for Alaska

- Continue to provide 12% or more of US oil from Alaskan oil fields.
- Maintain and perhaps increase revenue from operating the Trans-Alaskan Pipeline
  - Maintain steady supply of jobs with the pipeline, oil field development, oil production and new jobs associated with SCWER processing
  - Maintain revenue stream for the state
- Alaska has vast 'unconventional oil' reserves which can ensure revenue for the State of Alaska for the foreseeable future, but the viscous, difficult to transport crude needs additional processing to be viable.

The Management Team

- Stephen Yarbro, Heavy Oil Solutions/SNT Ventures, LLC
  - 27 years of process engineering, design and operations experience
  - Past experience at Phillips Petroleum Co.
- Mr. Gerry Myers, Heavy Oil Solutions
- Ms. Michelle Hoeft, Heavy Oil Solutions
- Important relationships for success
  - University of Alaska Petroleum Development Laboratory
  - Fairbanks Pipeline Training Facility

SCWER can provide more oil for the Trans-Alaska Pipeline

- Reduce the viscosity from 'honey' to 'water'
- Integrates with on-site equipment
- Leverages investment in conventional pipelines, trucks, refineries
- Design based on industrially proven technologies
  - Supercritical water oxidation of industrial waste
  - Standard Petrochemical equipment
  - Standard commodity chemicals

1/25/12 OVERVIEW: DANIEL SULLIVAN, COMMISSIONER, DEPARTMENT OF NATURAL RESOURCES

<TARGET><BILL></BILL><SUBJECT>1-25-12 OVERVIEW DANIEL SULLIVAN, COMMISSIONER, DEPARTMENT OF NATURAL RESOURCES</SUBJECT><COMM>SRES27</COMM></TARGET>

State's opportunities are great in 2012

By Dan Sullivan

January 1, 2012

Fairbanks Daily News-Miner

As we ring in the New Year, it is a good time to reflect on the past year and anticipate what lies ahead in 2012. From the Department of Natural Resources' perspective, 2011 was a promising year for responsible resource development — Alaska's most vital economic sector. This underpins our optimism for the coming year.

First, we defined the most critical economic issue facing our state — the declining oil flow through the trans-Alaska pipeline system. To arrest the decline, Gov. Parnell set an ambitious goal to increase production to 1 million barrels per day within a decade and outlined a five-part strategy to increase our competitiveness and attract the billions of investment dollars needed to achieve this goal.

Increasing oil production starts with meaningful oil tax reform when the Legislature convenes again Jan. 17. If the Legislature passes meaningful tax reform, companies have indicated they will commit many billions of dollars in new investment — money that will bring new oil and jobs from our legacy fields.

Second, our strategy to increase oil production is beginning to bear fruit with new projects under way. The upcoming North Slope exploration season will be one of the most active in years. Our December North Slope lease sale brought the state nearly $21 million from various companies and investors. These included new players targeting shale oil and world-class companies such as Shell, ConocoPhillips and Repsol staking out new positions on state land. New exploration means jobs now and new production in the coming decade.

Third, we are seeing signs of a Cook Inlet renaissance. In June, spurred by tax and investment incentives and a U.S. Geological Survey study that showed substantial estimates of oil and gas, the state received the highest number of Cook Inlet lease sale bids in 28 years. New players — such as Apache, Hilcorp, Armstrong, Linc, Buccaneer, and Nordaq — are pursuing opportunities in this region.

Fourth, we are seeing cause for optimism in the mining sector. The latest figures show mineral exploration investment in Alaska exceeded $260 million in 2010, accounting for about one-third of all exploration in the country. Exploration was broad-based, with spending on 34 Alaska projects each exceeding $1 million. Longtime operations such as Red Dog, Fort Knox and Greens Creek have shown that responsible mining comes with high wages and positive economic and social impacts on entire regions.

On Sept. 30, we hosted a sold-out Alaska Strategic and Critical Minerals Summit in Fairbanks. The 250 guests included Gov. Parnell, who laid out the state's strategy to increase mineral development; other government leaders; scientists; mining executives; investors, and foreign

government representatives. The discussions were lively, new connections were made, and many left the summit with great hope that an opportunity has opened to expand Alaska's mining industry, promote our economy, and enhance national security through the development of rare earth elements.

And, fifth, we saw signs in 2011 that the federal government was finally starting to back away from its hard-line, anti-development policy in Alaska, which in 2009 and 2010 could only be described as hostile. We need the federal government as a partner in responsible resource development, not an obstacle.

This is all good news for Alaskans. We are a resource development state — when this sector of the economy thrives, so do most others. The framers of the Alaska Constitution knew the state's resource wealth would play the critical role in spurring private-sector activity, so they enshrined the policy of making our natural resources "available for maximum use" in Article 8, Section 1 of the Alaska Constitution.

But Alaska still faces significant challenges. We must reverse the TAPS throughput decline. Oil production is booming in other hydrocarbon basins, but not here. We must make Alaska more competitive, especially through tax reform.

We must redouble our efforts to work to commercialize North Slope gas. We must address in-state needs, including exorbitant energy costs in Interior and rural Alaska, and maximize the value of our gas resources for future generations. And, we must continue to encourage resource development while safeguarding the environment.

Striking that balance is not always easy, but the state has a proven record of doing it well.

None of these challenges are new to Alaska, but they are surmountable. Indeed, Alaska's opportunities in 2012 clearly outweigh the challenges, due in large measure to our vast resources. By working together and capitalizing on the successes of 2011, Alaskans can move toward increased opportunity, economic well-being, and healthy communities. Let's get to work.

Dan Sullivan is commissioner of the Alaska Department of Natural Resources.

LIBRARY

Briefing Note: One Million Barrels a Day within 10 Years

I. SETTING AMBITIOUS GOALS

An important part of public policy leadership is setting ambitions, compelling visions and goals that citizens and policy makers of the state can unite behind and support. In the realm of social policy, Governor Parnell has done this with the "Choose Respect" campaign and its goal to eradicate Alaska's epidemic levels of sexual abuse and domestic violence.

In the realm of economic policy, the TAPS throughput decline is the most urgent and critical issue facing our state. The Governor is addressing this issue by laying out the vision and goal of increasing TAPS throughput to one million barrels per day within 10 years. The Secure Alaska's Future strategy was designed to support this goal.

II. THRESHOLD ISSUE

The threshold issue for policy makers is whether Alaska has a hydrocarbon basin large enough to meet the one-million-barrels–a-day goal. We believe we do. By any measure, the North Slope of Alaska remains a world-class energy basin, estimated by the USGS to hold about 40 billion barrels of oil and 236 trillion cubic feet of natural gas. In addition, the North Slope has tens of billions of barrels of unconventional resources such as heavy, viscous, and shale oil. Despite its vast potential, the North Slope is still relatively underexplored, with approximately 500 exploration wells drilled. In Wyoming, for example, comparable in size to the North Slope, more than 19,000 exploration wells have been drilled.

Continued oil production decline need not be the fate of our great state. Throughput declines can be reversed. There are examples of other major hydrocarbon basins, such as the North Sea and areas of Texas and North Dakota, where production declines have been reversed as a result of a combination of changes in government policy, increased investment, sustained high oil prices, enhanced recovery, and technological innovation.

III. SECURE ALASKA'S FUTURE—FIVE-PART STRATEGY

The Governor's goal of increasing TAPS throughput to one million barrels per day within 10 years is strongly supported by the Administration's five-part strategy to arrest the decline—"Secure Alaska's Future—Oil." This strategy consists of the following main components.

1. Enhance Alaska's global competitiveness and investment climate (the cornerstone being meaningful tax reform)
2. Ensure the permitting process is structured and efficient
3. Facilitate and incentivize the next phases of North Slope resource development
4. Unlock Alaska's full resource development potential through partnerships with key stakeholders
5. Promote Alaska's resources and positive investment climate to world markets

Over the past year, we have been relentlessly implementing all aspects of this plan. We need the support of and action from the Legislature to fulfill all elements of this important strategy.

IV. POSSIBLE ROADMAP TO ONE MILLION BARRELS

The Governor's goal of one million barrels will require tens of billions of dollars of additional private sector capital investment in Alaska. Improved cooperation between industry, state and federal policy makers is also necessary. We believe there is a general sequencing of development opportunities on the North Slope that can get us to one million barrels within a decade. There are many scenarios, but one example would be the following, where each preceding development builds upon earlier developments:

In 2-5 years:

- Increased infield production from legacy fields
- Development of smaller pools of conventional oil (Oooguruk, Nikaitchuq)(the North Slope is estimated to have "dozens" of such untapped fields ranging from 25 million to 350 million barrels)
- Production from the eastern North Slope, including Point Thomson, which will create economies of scale to explore and develop the eastern North Slope

In 4-7 years:

- Production from shale, viscous and heavy oil plays coming online in substantial quantities (Alaska is endowed with billions of barrels of unconventional resources)
- Development of northeast NPR-A (CD-5 and other satellite fields)
- Development of near offshore (Liberty, etc.)

In 7-10 years:

- Exploration and production from ANWR and other eastern North Slope state and federal lands

In 10 years and beyond:

- Development of OCS (Chukchi and Beaufort)
- Commercialization of North Slope gas, which will lead to additional oil discoveries

V. MANY VARIABLES AFFECTING SUCCESS

Getting to one million barrels of oil per day within a decade is an ambitious goal. It will not be easy. Nevertheless, it is a goal that has garnered broad-based public support and is worth striving for. Whether or not the state can achieve this goal will depend on several factors, some of which we as a state have more control over than others.

We will need significant increases in the level of sustained private sector capital investment. Reforming our tax system is critical in this regard as is a continued high price range for oil. Ideally, this investment will come from all types of companies – legacy producers and other super-majors,

as well as medium and small companies. Similarly, increased and new production will likely need to come from a variety of resource development plays on the North Slope – legacy fields, smaller pools of conventional oil, unconventional oil plays, and federal on-shore and offshore lands. It will also be critical for the federal government to fully support Alaska's one-million-barrels-per-day goal and encourage development and access to federal lands, such as NPR-A, the OCS, and ANWR. Federal policies that continue to prohibit or cause unreasonable delays in exploration and development will significantly undermine this state goal. Indeed, without the federal government as full partners in development and increased access to federal lands, meeting the one million barrels-per-day goal will be very difficult. And lastly, we will need a timely, certain, and predictable permitting process with regard to both state and federal land.

State of ALASKA

Department of Natural Resources

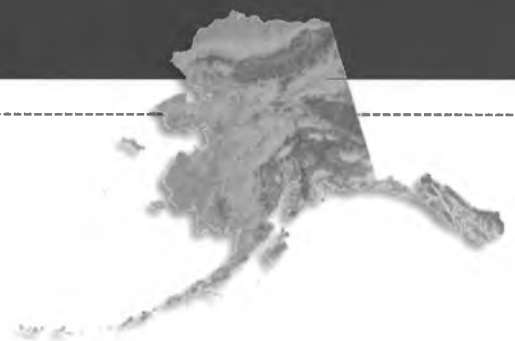
Senate Resources Committee

DNR Overview

January 25, 2012

Commissioner Daniel S. Sullivan
Alaska Department of Natural Resources
www.dnr.alaska.gov

AGENDA

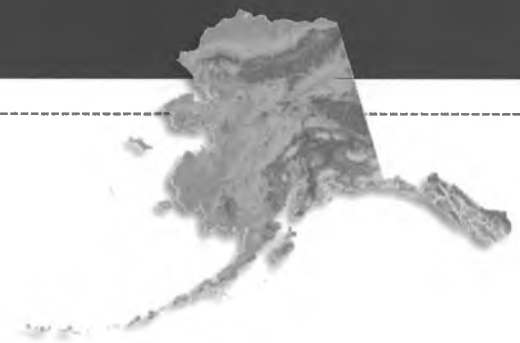


PART I: DNR Overview

PART II: Looking Back on 2011-A Promising Year

PART III: 2012 Opportunities & Challenges

Part I



DNR OVERVIEW

State *of* Alaska

Department of Natural Resources

Article 8, Section 1 of the Alaska Constitution provides:

- *"It is the policy of the State to encourage the settlement of its land and the development of its resources by making them available for maximum use consistent with the public interest."*

DNR Mission Statement:

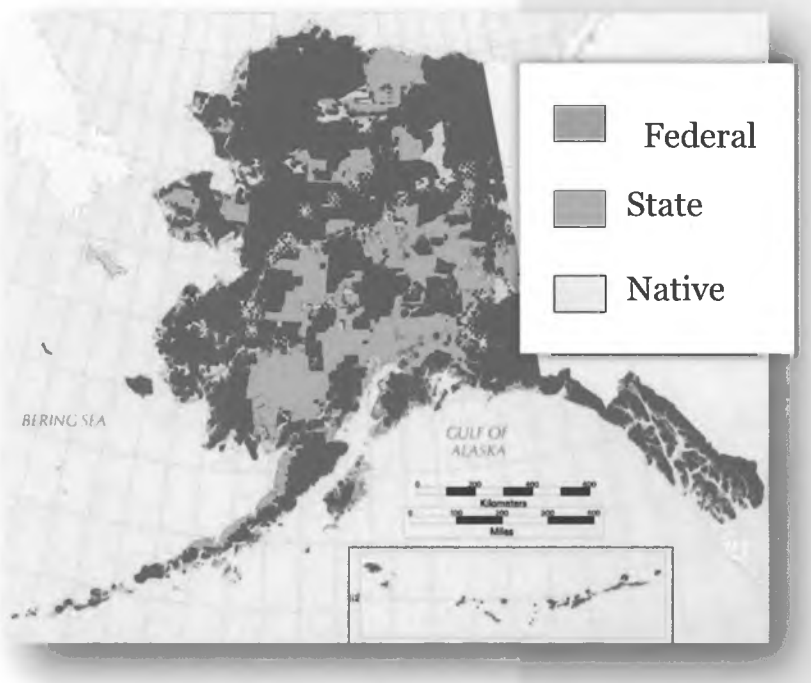
- *Responsibly develop Alaska's resources by making them available for maximum use and benefit consistent with the public interest.*

DNR Core Services:

1. Foster responsible commercial development and use of state land and natural resources, consistent with the public interest, for long-term wealth and employment
2. Provide access to state lands for public and private use, settlement, and recreation
3. Ensure sufficient data acquisition and assessment of land and resources to foster responsible resource development
4. Mitigate threat to the public from natural hazards by providing comprehensive fire protection services on state, private, and municipal lands, and through identifying significant geological hazards

State *of* Alaska

Department of Natural Resources



Land Ownership

- *Federal Land:* More than 200 million acres
- *State Land:* Approx. 100 million acres of uplands, 60 million acres of tidelands, shore lands, and submerged lands, and 40,000 miles of coastline
- *Native Corporation Land:* 44 million acres

DNR:

- Manages one of the largest portfolios of oil, gas, minerals, renewable resources, water, and land in the world
- Manages all oil and gas fields on state land, including two of the largest oil and gas fields in North America
- Oversees all activities that occur on state land

State *of* Alaska

DNR Has 7 Divisions

1. **Division of Agriculture (DoA)**
   - Franci Havemeister, Director
   - Promotes and encourages development of an agriculture industry in Alaska

2. **Division of Forestry (DoF)**
   - Chris Maisch, Director
   - Serves Alaskans through forest management and wildland fire protection

3. **Division of Geological & Geophysical Surveys (DGGS)**
   - Bob Swenson, Director
   - Determines the potential of Alaskan land for production of metals, minerals, fuels, and geothermal resources, the locations and supplies of groundwater and construction material, and the potential geologic hazards to buildings, roads, bridges, and other installations

State *of* Alaska

DNR Has 7 Divisions

4. **Mining Land and Water**
   - Brent Goodrum, Director
   - Provides for the appropriate use and management of Alaska's state owned land and water, aiming toward maximum use consistent with the public interest

5. **Oil & Gas**
   - Bill Barron, Director
   - Responsible for the leasing of state lands for oil, gas, and geothermal exploration

6. **Parks & Outdoor Recreation**
   - Ben Ellis, Director
   - Provides outdoor recreation opportunities and conserves and interprets natural, cultural, and historic resources for the use, enjoyment, and welfare of the people

7. **Support Services**
   - Jean Davis, Director
   - Provides client-focused, efficient and cost-effective financial, budget, procurement, information technology and recording services to DNR and the public

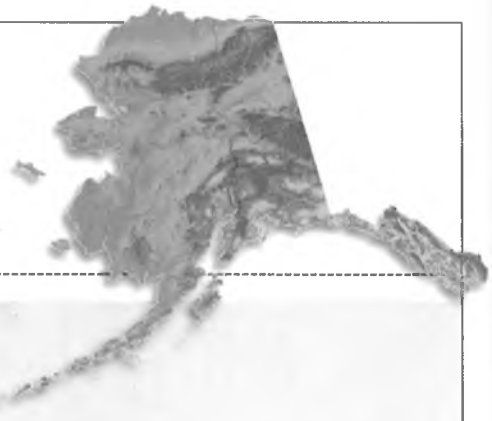
State *of* Alaska

DNR Offices

- **Gas Pipeline Project Office**
  - Kurt Gibson, Director
  - Monitors efforts by the Alaska Pipeline Project (APP) to design, develop, construct and operate a 48-inch natural gas pipeline to commercialize North Slope natural gas
- **Office of Project Management & Permitting**
  - Tom Crafford, Director
  - Coordinates the review of larger scale projects in the state
- **State Pipeline Coordinator's Office**
  - Mike Thompson, State Pipeline Coordinator
  - Issues leases of state land for pipeline rights-of-ways and implements the state's policy set forth in Alaska Statute (AS) 38.35.010 concerning the development, use, and control of a pipeline transportation system within the state

Alaska *as a* Storehouse

Hydrocarbons



North Slope

USGS estimates that Alaska's North Slope has more oil than any other Arctic nation

- **OIL:** Est. 40 billion barrels of conventional oil *(USGS & & BOEMRE)*
- **GAS:** Est. 236 trillion cubic feet of conventional natural gas *(USGS)*

- Alaska has world-class unconventional resources, including tens of billions of barrels of heavy oil, shale oil, and viscous oil, and hundreds of trillions of cubic feet of shale gas, tight gas, and gas hydrates

Cook Inlet

USGS estimates that significant undiscovered volumes of hydrocarbons remain to be found in the Cook Inlet:

- 19 trillion cubic feet of natural gas
- 600 million barrels of oil
- 46 million barrels of natural gas liquids
- In June 2011, the State of Alaska received the highest number of Cook Inlet lease sale bids in 28 years, totaling more than $11 million

Compared to most basins, Alaska is relatively underexplored, with 500 exploration wells on the North Slope, compared to Wyoming's 19,000.

Alaska *as a* Storehouse

Strategic & Critical Minerals

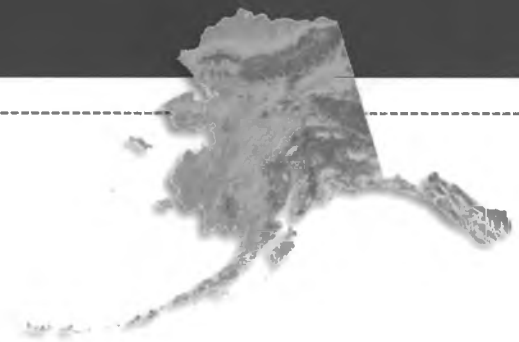
The State of Alaska Ranks in the *Top Ten in the World* for Important Minerals, Including:

- **Coal**: 17% of the world's coal; *2nd most in the world*
- **Copper**: 6% of the world's copper; *3rd most in the world*
- **Lead**: 2% of the world's lead; *6th most in the world*
- **Gold:** 3% of the world's gold; *7th most in the world*
- **Zinc:** 3% of the world's zinc; *8th most in the world*
- **Silver:** 2% of the world's silver; *8th most in the world*

USGS estimates

According to the USGS, Alaska has over 70 occurrences of Rare Earth Elements (REE).

Part II

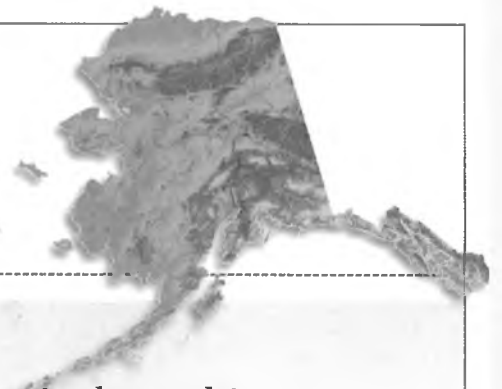


LOOKING BACK ON 2011—

A Promising Year

TAPS

Arresting Throughput Decline



- TAPS has transported over 16.3 billion barrels of oil and natural gas liquids since June of 1977. Production peaked at 2.2 million barrels per day in the late 1980s, representing 25% of U.S. domestic production
- Today, TAPS is producing ~ 600,000 barrels per day, representing about 12% of U.S. domestic production
- The State of Alaska is actively seeking investment in exploration and development of conventional and unconventional resources on state and federal land, onshore and offshore
- TAPS has plenty of capacity for increased throughput
- Federal officials are interested in making this a national priority

Declining oil through TAPS is the most critical economic issue facing our state.

Secure Alaska's Future: *Oil*

The State of Alaska's Comprehensive Strategy to Increase TAPS Throughput to One Million Barrels/Day

I. Enhance Alaska's global competitiveness and investment climate

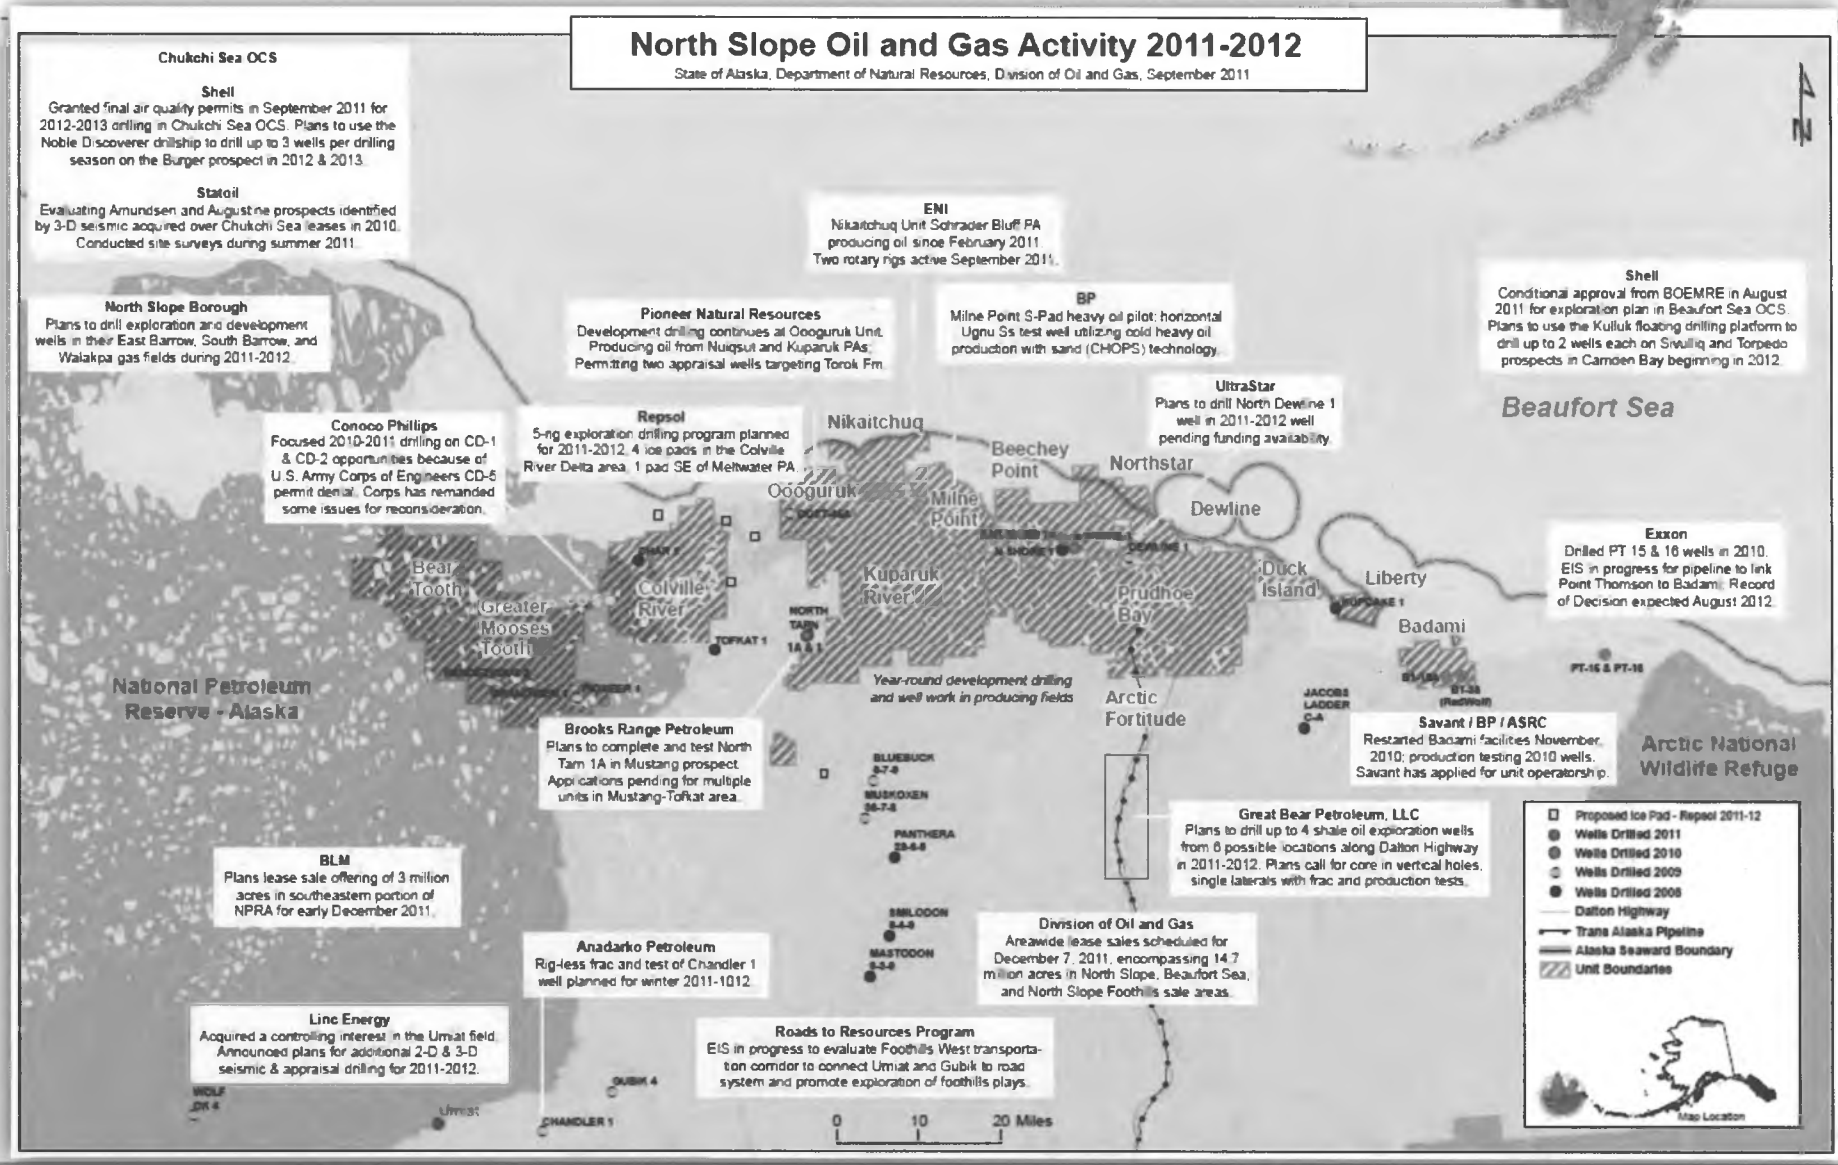
II. Ensure the permitting process is structured and efficient

III. Facilitate and incentivize the next phases of North Slope development

IV. Unlock Alaska's full resource development potential through partnerships with key stakeholders

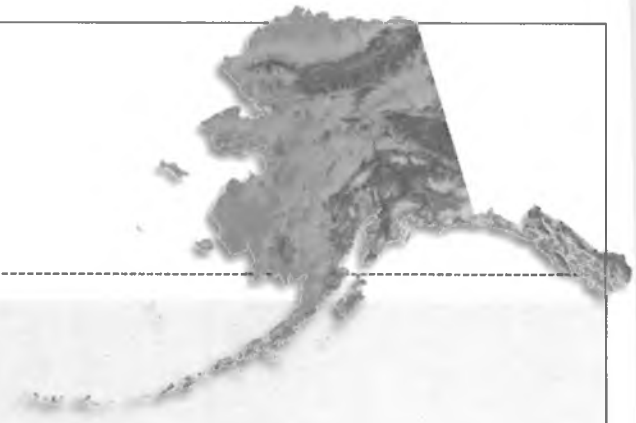
V. Promote Alaska's resources and positive investment climate to world markets

North Slope *Recent & Proposed Activity*

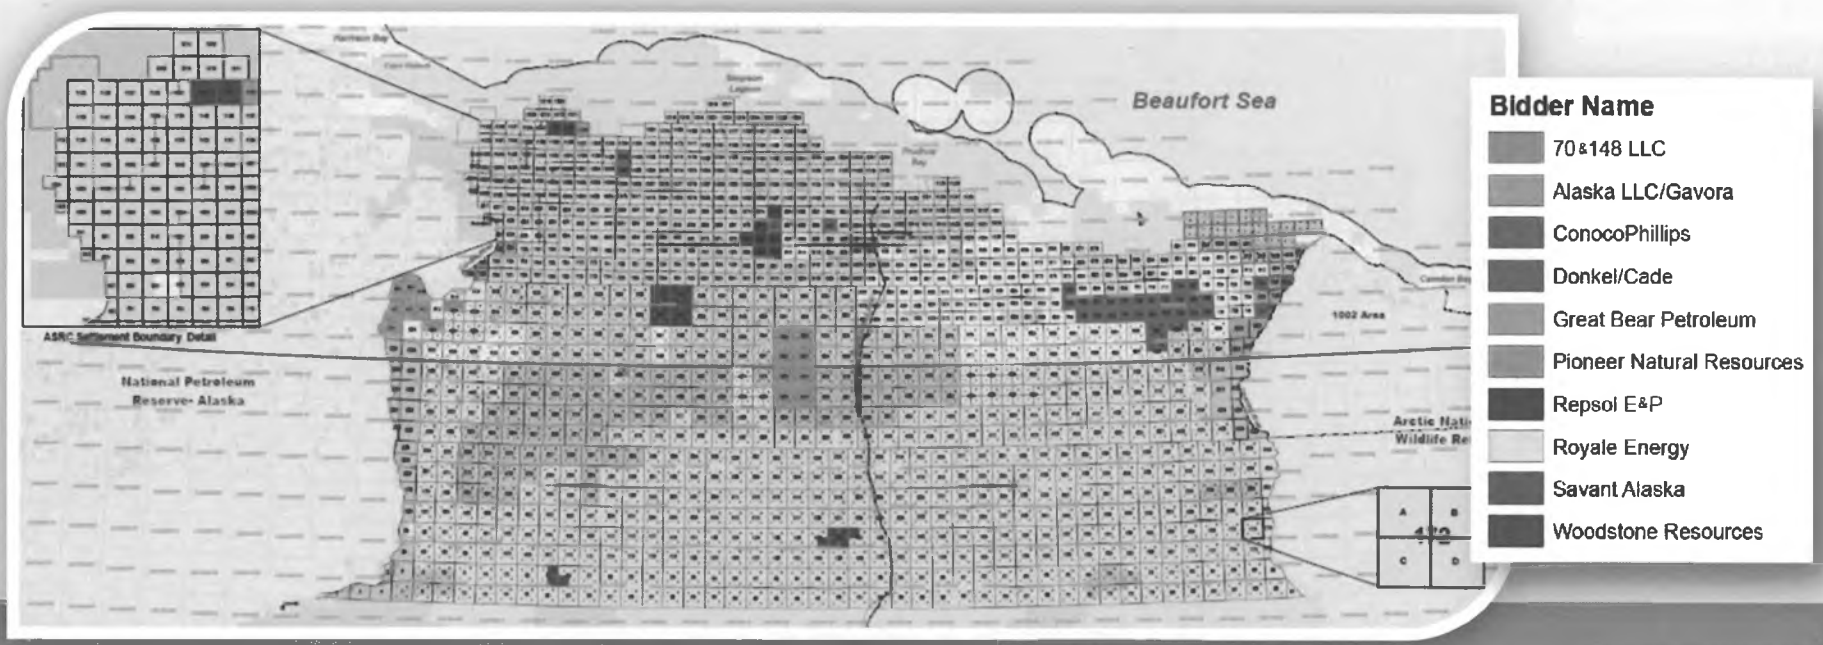


NS & Beaufort Sea

December Lease Sale



- Nearly $21 million from various companies and investors
- Included new players targeting shale oil
- Attracted world-class companies such as Shell, ConocoPhillips, and Repsol, who are staking out new positions on state land
- New exploration means jobs now and new production for decades to come
- State needs billions of dollars in new investment to meet the Governor's one-million-barrels-a-day goal



Cook Inlet Renaissance

In June 2011, the State of Alaska received the highest number of Cook Inlet lease sale bids in 28 years, totaling more than $11 million.

Cook Inlet Estimates

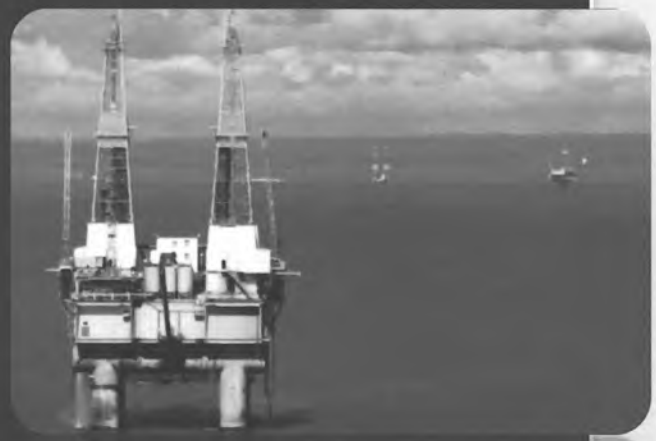
Significant undiscovered volumes of hydrocarbons remain to be found in the Cook Inlet (*USGS*):

- 19 trillion cubic feet of natural gas
- 600 million barrels of oil
- 46 million barrels of natural gas liquids

Cook Inlet Lease Sale Results

- In June 2011, the State of Alaska received the highest number of Cook Inlet lease sale bids in 28 years, totaling more than $11 million
- Total tracts sold: 109
- Total high bonus bids: $11,125,063.80

Cook Inlet Renaissance



Wall Street Journal, August 27, 2011: *"New Energy Estimate Breathes Life Into a Declining Alaskan Oil Field"*

Recent Cook Inlet Activity

- New players investing: Apache, Hilcorp, Armstrong, Linc, Buccaneer, Nordaq, Escopeda
- Significant exploration activity: 8 new exploration wells, one jack-up rig (and one—*possibly two*—on the way), and companies shooting 3-D seismic over large areas of the basin
- 3 new gas supply contracts with utilities
- New gas storage project
- State continues to focus on safe, responsible development and operations

Strategic & Critical Minerals

Recent Mining Activity

The value of mineral production from Alaska totaled an estimated $2.9 billion in 2009 and $3.1 billion in 2010.

- Alaska has six lode producing mines, including one of the world's largest zinc mines, the world's 5th largest silver mine, and 4 major gold mines
- ***Red Dog***: one of the world's largest zinc mines, produced over 593k tons of zinc, 121k tons of lead, and 6.7 million ounces of silver in 2010
- ***Greens Creek***: world's 5th largest silver mine, produced over 7.2 million ounces of silver, 68k ounces of gold, and 75k tons of zinc in 2010
- ***Pogo***: produced 383k ounces of gold in 2010
- ***Fort Knox***: produced 350k ounces of gold in 2010
- ***Usibelli***: produced over 2 million tons of low sulfur coal in 2010
- Two new gold mines came online in 2010: Kensington and Nixon Fork

Strategic & Critical Minerals

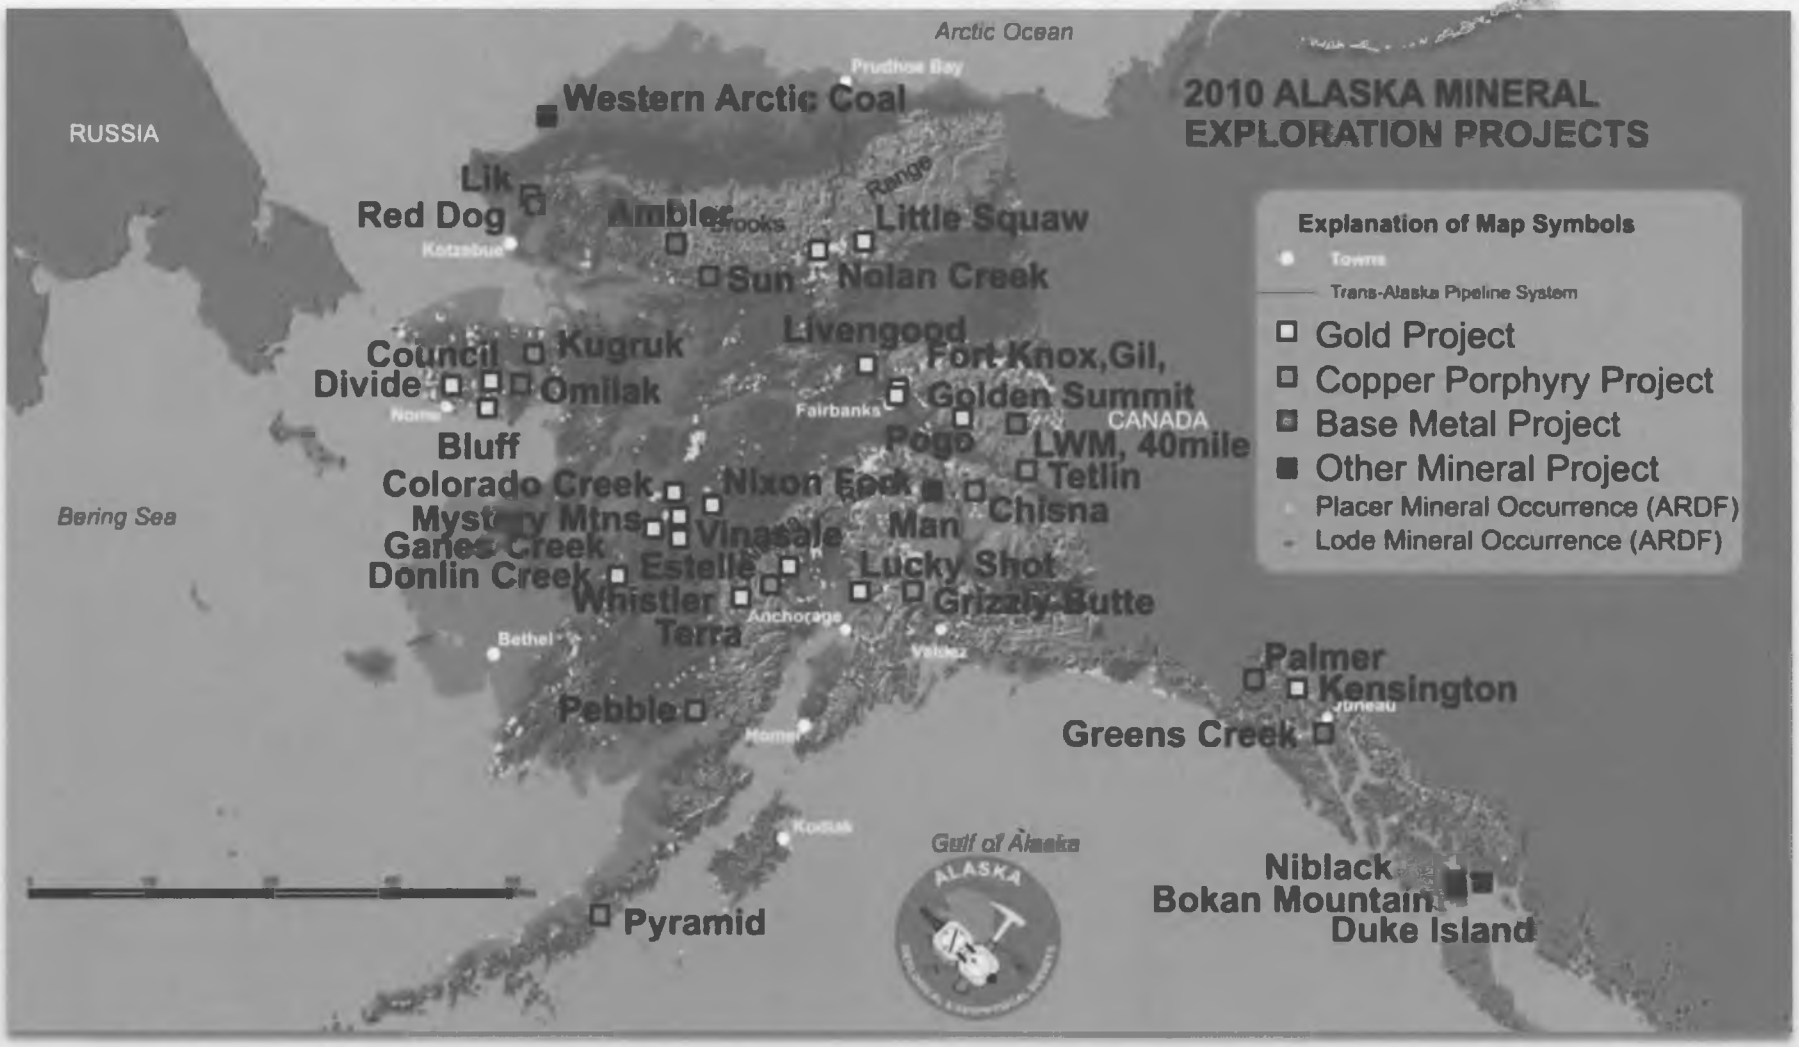
Recent Mining Activity

In 2010, mineral exploration investment in Alaska totaled $264 million - accounting for about one-third of the total spent on exploration in the U.S.

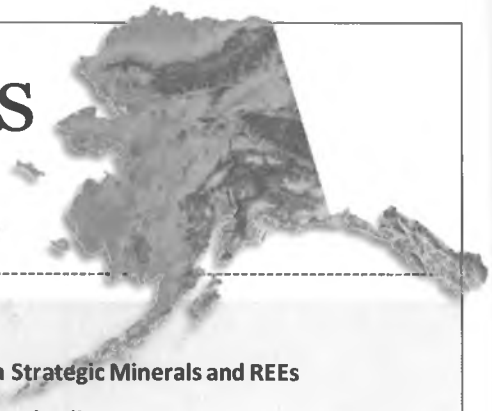
- **Advanced exploration projects:**
  - ***Pebble:*** ~ 80.6 billion pounds of copper, 107.4 million ounces of gold, and 5.6 billion pounds of molybdenum
  - ***Bokan Mountain*****:** enriched in yttrium, dysprosium, and critical heavy Rare Earth Elements
  - ***Donlin:*** ~ 42.3 million ounces of gold
  - ***Money Knob*****:** ~20.6 million ounces of gold
  - ***Niblack*****:** ~7.3 million tons of polymetallic (copper, gold, silver, and zinc) volcanogenic massive sulfide project
- 34 exploration projects spent over $1 million in 2010
- 2011 Nome offshore mineral (gold) lease sale received over $7.6 million in winning bids for 84 tracts on approximately 24,000 acres

Strategic & Critical Minerals

Recent Mining Activity



Alaska Strategic & Critical Minerals Summit, *Fairbanks, 9-30-11*



OPENING REMARKS

Welcome Remarks: Mayor Jerry Cleworth, *City of Fairbanks*, and **Mayor Luke Hopkins**, *Fairbanks North Star Borough*

Day's Overview: Dan Sullivan, *Commissioner, DNR*

PRESENTATIONS: Strategic Minerals—A Global Perspective

General Joe Ralston, *Vice Chairman of The Cohen Group and Former NATO Commander/Supreme Allied Commander, Europe*

Jeff Doebrich, *Acting Program Coordinator, U.S. Geological Survey, Mineral Resources Program*

Jonathan Price, *State Geologist and Director, Nevada Bureau of Mines and Geology*

Jack Lifton, *Founding Principal of Technology Metals Research, LLC, and Consultant, Author, and Lecturer*

KEYNOTE ADDRESS

The Honorable Governor Sean Parnell

Networking Break & Press Conference

LUNCHEON ADDRESS

Honorable U.S. Senator Lisa Murkowski

PRESENTATIONS: Alaska's Strategic Mineral Wealth and Potential

Bob Swenson, *DGGS, DNR*

Dwight Bradley, *Research Geologist, U.S. Geological Survey, Minerals Program, Alaska Science Center*

Jim Barker, *Alaska Project Manager, Ucore Rare Metals, and Former Physical Science Supervisor with the U.S. Bureau of Mines*

PRESENTATIONS: University of Alaska Research on Strategic Minerals and REEs

The Honorable Lieutenant Governor Mead Treadwell

Mark Myers, *Vice Chancellor of Research, UAF*

Dan White, *Associate Vice Chancellor of Research, UAF*

Rajive Ganguli, *Department Chair, Mining & Geological Engineering, UAF*

AFTERNOON ADDRESS

Michael Silver, *President and Chairman of the Board, American Elements*

ROUNDTABLE DISCUSSION: Moving Forward on Strategic Mineral Exploration, Development, and Processing in Alaska

Moderator: Dan Sullivan, *Commissioner, DNR*

The Honorable U.S. Representative Don Young

Susan Bell, *Commissioner, Alaska Department of Commerce, Community, and Economic Development, and Vice-Chair of AIDEA*

Steve Borell, *Executive Director, Alaska Miners Association*

Jim McKenzie, *President and CEO, Ucore Rare Metals*

Ken Peak, *President, Contango Ore*

Curtis Freeman, *President, Avalon Development*

Matt Ganley, *Vice President, Resources and External Affairs, Bering Straits Native Corporation*

Closing Remarks: Ed Fogels, *Deputy Commissioner, DNR*

Reception and Investor Networking at the *Museum of the North*

VIDEO ADDRESS: The Honorable U.S. Senator Mark Begich

Agriculture

2011 Overview of Accomplishments

Division continues to be very busy promoting and encouraging development of the agriculture industry in Alaska

- Worked to increase the demand for Alaska grown products
- Explored new marketing ventures to promote Alaska Grown program
- Formed partnership with commerce for agricultural tourism
- Provided support and promotion to 33 Farmers Markets throughout the state, which continue to grow in popularity
- Continued to update the division's long-range plan
- Excited about a burgeoning peony export program in Alaska
- ARLF continues to revolve and is successful
- Sold 202 acres of state agricultural land this year, which is a good figure

Farm to School Program

- Developed a "School Garden Food Safety" Guidelines
- Completed a product feasibilty study and local product recipe book
- Contributed to the national movement
- Worked with 55% of school districts statewide

Parks & Outdoor Rec.

2011 Overview of Accomplishments

Serves the Alaska public through outdoor recreation, educational programming, and access to public lands

- Provided direct public service through a highly successful volunteer program—in 2011, 462 volunteers collectively donated nearly 70,000 hours to support state parks
- Instituted new initiatives to increase visitation and interest: "Arts in the Parks" and "First Day Hike"
- Built new public use cabins statewide
- Oversaw successful grant programs that support community efforts in historic preservation, recreation and trails
- Provided research necessary to support state's claims to submerged lands under navigable waters and for right-of-ways on historic trails across federal lands

The Alaska Boating safety program is a model for the U.S.

- 299 classes taught in 2011=6,570 students
- Since its inception, 19 kids' lives have been saved as a result of the "kids don't float" life jacket loaner program

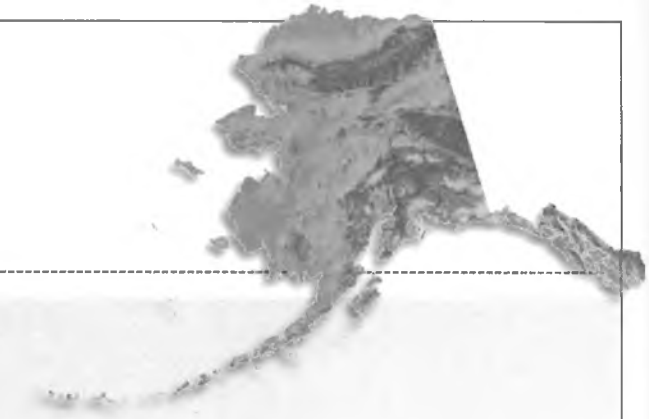
Timber Resources

Alaska has 17% of the nation's forest land

- The Governor's initiative to double the size of the Southeast State Forest (first est. in 2010) was successful with the help of the legislature (*now approx. 50,000 acres total*)
- Alaska Timber Jobs Task Force was established by Administrative Order 258 to advise the Governor on specific actions he can take to grow and revitalize the state's timber industry
  - An example would be the increased use of woody biomass for space heating in schools and other public buildings (*Tok* and *Delta*)
- 69 individual timber sales statewide, totaling 30.9 million board feet –on target for local job creation and community support
- Director Maisch is now a member of the National Assoc. of State Foresters (NASF) Executive Board

Wildland Fires

2011 Season & Wildland Fire Academy



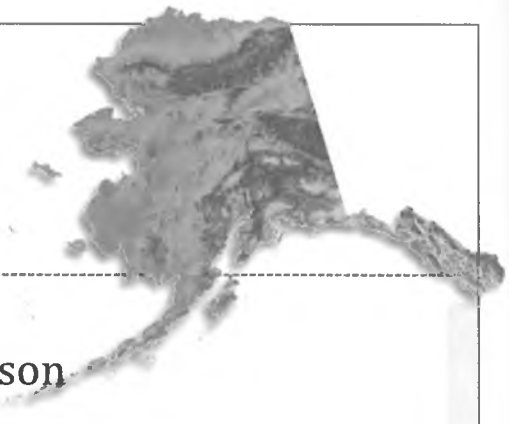
2011 Wildfire Season

- Between April 1 and Sept. 12, there were *511 fires*
  - 365 were 1 acre or less
  - Largest: 54,217 acres (East Volkmar DAS)
  - 373 were human-caused (25,234.8 acres)
  - 138 were lightening-caused (267, 783 acres)
- Payroll for Alaskan EFF (mostly rural-based)crews in 2011 was $7.7 million, which contributes to local communities
- Air tankers were deployed to Lower-48 for 3 months

Wildland Fire Academy

- 2011 Interior Wildland Fire Academy was held in Tok on June 11th; 33 graduates came from across Alaska

Less Hostile Federal Government in 2011?



- In 2011, we saw signs that the federal government was finally starting to back away from its hard-line, anti-development policies in Alaska
- We are actively involved in ongoing engagement with federal agencies
- We are still frustrated by mixed messages and delay tactics; progress feels like 2 steps forward, 1 step back
- CD-5
  - Fed 2010 decision was a shocker; since then, the permit has been pending
  - Permit was finally approved this fall, with an alternative that supports the best interests of the state
- EIS for Point Thomson
  - Recently issued by Corps of Engineers
  - Places emphasis on ANWR's proximity to the project and implies that the state should manage its adjacent lands as if they are part of the refuge
  - This is a serious overreach and an attempt by the USFWS to regulate oil and gas activities on state lands

Part III

2012

OPPORTUNITIES & CHALLENGES

Building on 2011 Progress

It Was a Good Year for Alaskans

- Progress and achievements in 2011 are good news for Alaskans
- We are a resource development state—when this sector of the economy thrives, so do most others
- The framers of the Alaska Constitution knew the state's resource wealth would play a critical role in spurring private sector activity and so enshrined the policy of making Alaska's natural resources ***"available for maximum use"*** in Article 8, Section 1

TAPS Throughput Decline

An Urgent Issue

- Alaska has many opportunities, in large measure due to our abundant natural resource wealth
- **But we still face significant challenges**
  - *We must arrest <u>TAPS throughput decline</u>*
    - This is an *<u>urgent</u>* issue
    - Governor Parnell has laid out an aggressive 5-part strategy to increase production
    - Oil production is booming in other hydrocarbon basins, but not here
  - *We must make Alaska more competitive, especially through <u>meaningful tax reform</u>*

Commercializing NS Gas

Comparative Advantages of AK LNG

- Huge conventional resources next to existing infrastructure
- Massive resource potential: area is underexplored; unconventional resources
- Liquid-rich gas
- Longstanding tradition of exporting to Asia—40 years of LNG exports to Japan
- Stable investment and political climate
- Geo-strategic portfolio diversification
- World-class businesses already investing
- Trained workforce
- Close proximity to markets
- Cost competitive

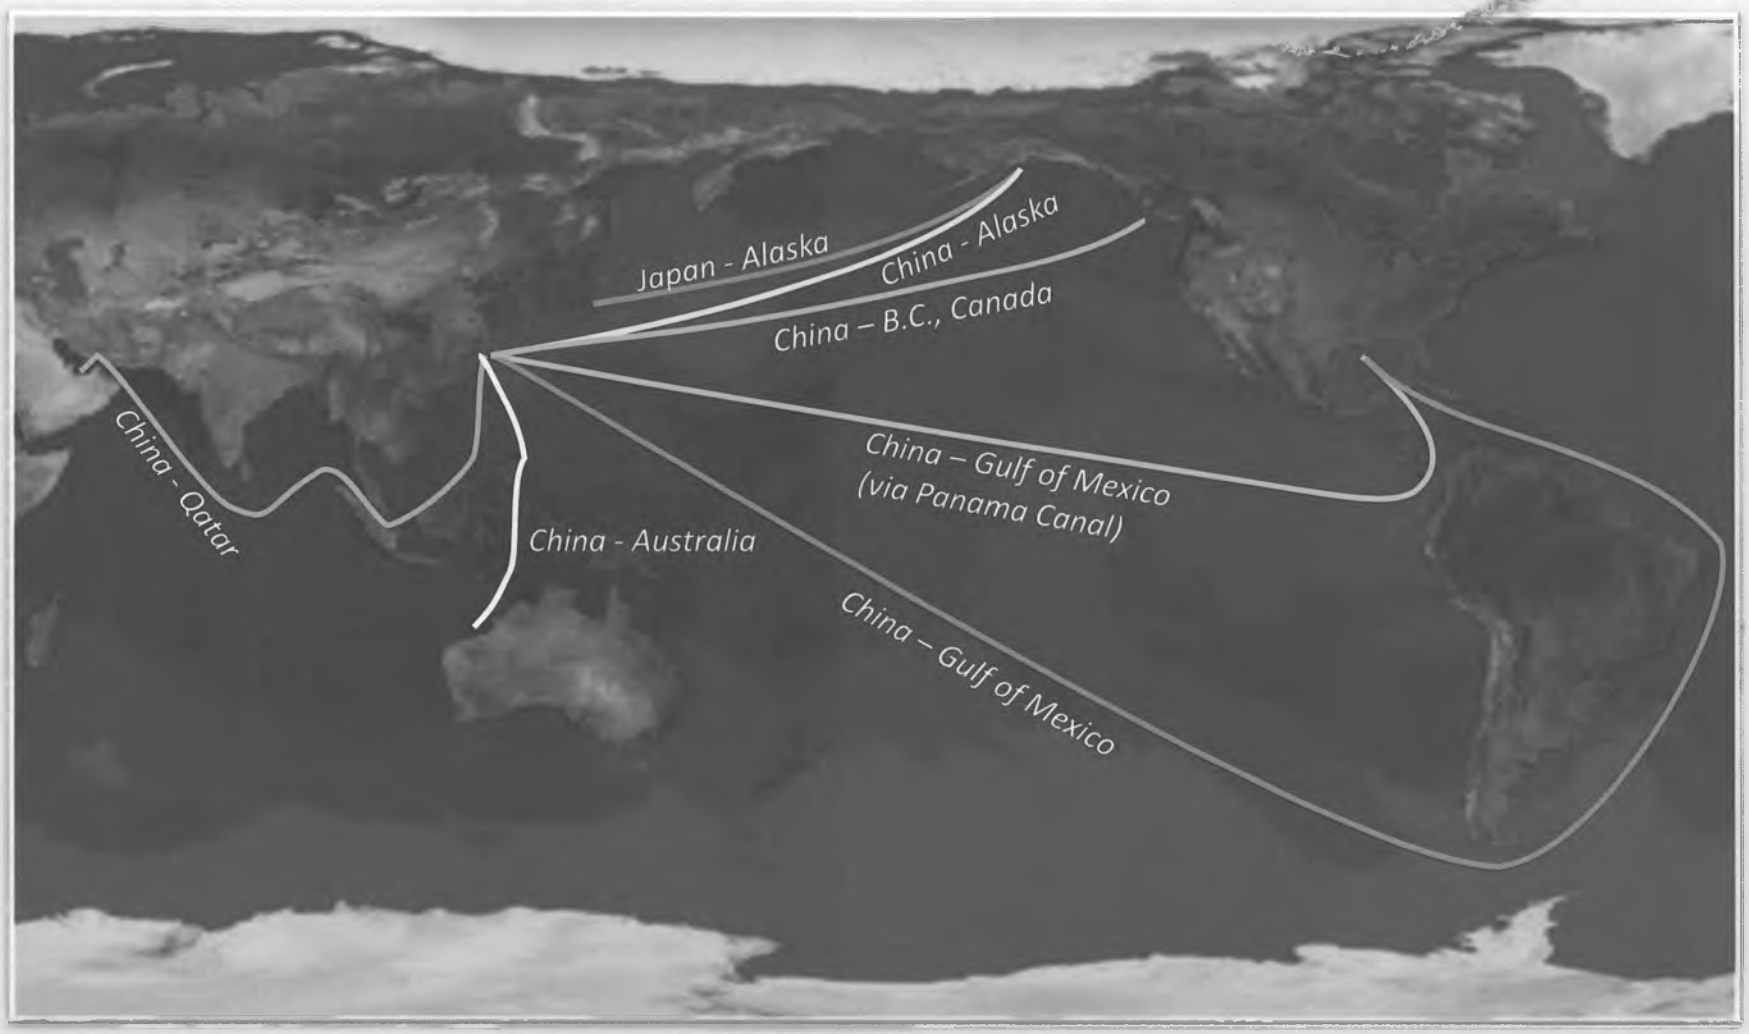
Changes in market demand has led the State of Alaska to shift its focus to exporting LNG to Asia

"Alaska eyes LNG pipeline to Pacific Rim" Financial Times, 11/6/11

"If market demand for gas has truly shifted from the Lower 48 to Pacific Rim markets, then the state of Alaska should be ready to shift along with that. And we are."
– Gov. Parnell, 10/2/11

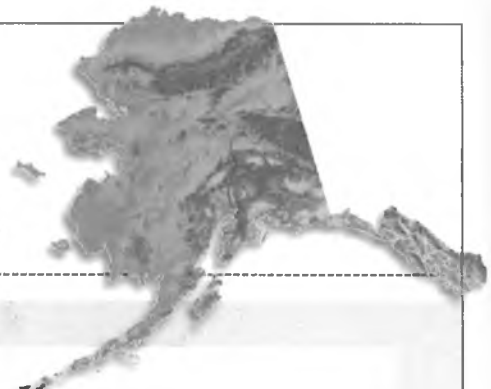
Commercializing NS Gas

Proximity of Alaska LNG to Asia



Commercializing NS Gas

Key Principles & Roadmap



Key principles for any project

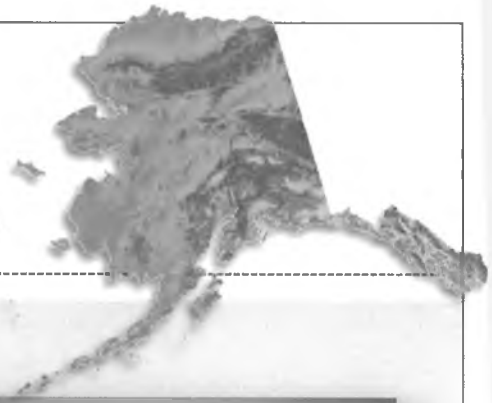
- Gas to address Alaska's in-state needs for abundant supplies of low-cost energy and economic growth
- Gas that will maximize the value of the state's massive resource base through high-volume and export markets
- A project that incentivizes exploration and investment in continued oil and gas development

Governor's Roadmap to Gasline

1. Resolve Point Thomson
2. Align during the first quarter of 2012
3. Two projects—under AGIA and AGDC—complete discussions by third quarter of 2012 determining what potential exists to consolidate projects
4. Harden numbers on an Alaska LNG project by the third quarter of 2012, and identify a pipeline project and associated work schedule
5. If milestones are met, the 2013 Legislature takes up gas tax legislation designed to move the project forward

Responsible Development

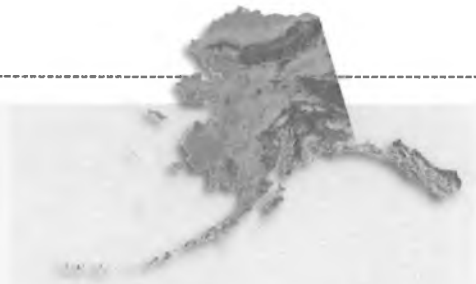
Striking a Balance



- *We must continue to encourage resource development while safeguarding the environment*
  - The State of Alaska has an exceptional record of responsibly developing our resources while protecting the environment
  - Oil and gas development in Alaska is conducted in a safe and responsible manner with some of the most stringent standards in the world

Striking the balance is not always easy, but the state has a proven record of doing it well

In Conclusion



- Many challenges and opportunities
- Opportunities far outweigh the challenges, in large measure due to our abundant natural resource wealth
- Partnerships are key: public, stakeholders, legislature, private sector, Administration

Thank you

1/27/12 PRESENTATION: BRYAN BUTCHER, COMMISSIONER, DEPARTMENT OF REVENUE

<TARGET><BILL></BILL><SUBJECT>1-27-12 PRESENTATION BRYAN BUTCHER, COMMISSIONER, DEPARTMENT OF REVENUE</SUBJECT><COMM>SRES27</COMM></TARGET>

What if Oil Production went to 300,000 b/d in FY13?

If Production was 300,000 barrels per day* …

Projected GF Unrestricted Revenue would be:	$3,900,000,000
Projected FY13 budget is:	$6,430,000,000
Budget to Revenue Shortfall would be:	$2,530,000,000

This magnitude of shortfall could be made up by:

- Every Alaska resident paying the state $3,500
- Or a statewide sales tax of up to 38%
- Or a statewide flat income tax of up to 14%

*Assumptions used in this analysis:
Fall 2011 oil price forecast assumption of $109.47 for FY13
Tariff assumed to be $10 per barrel
Marine costs assumed to be $4 per barrel
Lease expenditures assumed to be 75% of forecast FY13 expenditures
Credits assumed to be 75% of forecast credits taken against tax liability
Corporate income tax assumed to be 75% of forecasted CIT
Sales tax of approximately 15% would raise approximately $1 billion
Income tax of 5.6% of federal adjusted gross income would raise approximately $1 billion

Production Forecast – Improvements in Methodology

- Created standardized reporting forms for production forecasting information.
- Petroleum Engineer and Petroleum Economists compiled the forecast information from electronic reports rather than interpreting data provided by operators in various formats.
- Compliance and standardization improved with regard to reported downtime.
- Production forecasting requires consideration of each project's geology, development plans, production profiles, decline curves and timing.
- Department uses extensive well and field specific data acquired from producers, AOGCC, and DNR.
- New field development is very important in mitigating decline rates.
- Current engineering consultant is a member of the Society of Petroleum Evaluation Engineers (SPEE)
- Forecast included estimating decline curves for thousands of producing wells

2/01/12 PRESENTATION: STATE TAX POLICY AND OIL PRODUCTION BY SHELBY GERKING

<TARGET><BILL></BILL><SUBJECT>2-01-12 PRESENTATION STATE TAX POLICY AND OIL PRODUCTION BY SHELBY GERKING</SUBJECT><COMM>SRES27</COMM></TARGET>

Senate Resources Committee
February 1, 2012

Today, the Senate Resources Committee welcomes Dr. Shelby Gerking to present research that appears in Chapter 9 of this book, *U.S. Energy Tax Policy*. The chapter, co-authored by Dr. Gerking, is titled "State Tax Policy and Oil Production: The Role of the Severance Tax and Credits for Drilling Expenses."

The book was just published in 2011.

I have read two other research papers authored or co-authored by Dr. Gerking:

- "Effective Tax Rates on Oil and Gas Production: A Ten State Comparison (dated 2005)"

- "State Taxation, Exploration, and Production in the U.S. Oil Industry (dated 2001)"

As Dr. Gerking notes in his research, "Alaska has increased the severance tax on the value of its oil production and attempted to stimulate future production by allowing a credit against this tax for expenditures on capital items, including drilling rigs, infrastructure, exploration, and facility expansion."

While Alaska has not been the sole focus of Dr. Gerking's research, he has tracked the changes in our tax policy over the past decade. His research on state tax policy and oil production is, obviously, relevant to important issues before this committee and, indeed, the State of Alaska.

I am pleased that he is joining us, via teleconference, from The Sunshine State. Welcome, Dr. Gerking. Thank you for participating in this important legislative hearing.

[Gerking response]

For starters, please identify yourself for the record and tell the Committee about your educational background, professional work experience and, especially, your research and experience regarding state tax policy and oil production.

[Gerking response]

I understand that you have testified extensively before State legislatures. Can you please tell the Committee more about those experiences and the sort of information that you have provided other State Legislatures.

[Gerking response]

Thank you. Please proceed with your presentation.

V I T A
SHELBY GERKING

Work Address:

e-mail: Shelby.Gerking@bus.ucf.edu

Home Address:
443 Valley Stream Drive
Geneva, Florida 32732
Tel: (407) 349-9093

Personal:

Age 65, married, one child

Education:

B.A.	Economics, Indiana University, 1968
M.B.A.	University of Washington, 1970
M.A.	Economics, Indiana University, 1972
Ph.D.	Economics, Indiana University, 1975

Teaching and Research Fields:

Environmental and Natural Resource Economics
Regional Economics
Econometrics and Statistics

Academic Positions:

University of Central Florida, Galloway Professor, Department of Economics, 2001- present

Tilburg University, Professor, Department of Economics/Tilburg Sustainability Center, 2011-present

University of Alberta, Adjunct Professor, Department of Rural Economy, 2009-present

Free University of Amsterdam, Visiting Professor, Department of Spatial Economics, Fall 2007.

Tilburg University, Extramural Fellow of CentER, 2006 - 2011

University of Wyoming, Professor, Department of Economics and Finance, 1982 - 2001

Tilburg University, Visiting Fellow, Center for Economic Research (CentER), 1999-2000

University of Wyoming, Chair, Department of Economics and Finance, 1996 - 1999

University of Wyoming, Assistant to the President for Economic Development Coordination and Planning, 1988 - 1992.

University of Economics, Vienna, Austria, Visiting Scholar, Spring, 1985

University of Wyoming, Director, Institute for Policy Research, 1980 - 1984

University of Wyoming, Associate Professor, Department of Economics, 1978 - 1982

Indiana University, Visiting Assistant Professor, Department of Economics, 1977 - 1978

Arizona State University, Assistant Professor, Department of Economics, 1974 – 1978

Publications:

Books:

Estimation of Stochastic Input-Output Models: Some Statistical Problems. Leiden, The Netherlands: Martinus Nijhoff Social Sciences Division, 1976.

Frontiers in Environmental Economics, eds. Henk Folmer, Landis Gabel, Shelby Gerking, and Adam Rose. London: Elgar Publishing, 2001.

Articles:

"Input-Output as a Simple Econometric Model," The Review of Economics and Statistics, LVIII, No. 3 (August 1976), 274-82. (Reprinted in Input-Output Analysis, eds. Heinz Kurz, Christian Lager and Erik Dietzenbacher. London: Elgar Publishing, 1997).

"On the Use of Covariance Analysis in Regional Forecasting," Journal of Regional Science, XVI, No. 2 (August 1976), 261-68.

"Reconciling 'Rows Only' and 'Columns Only' Regional Coefficients in an Input-Output Model," International Regional Science Review, I, No. 2 (Fall 1976), 30-46.

"Minimum Variance Sampling in Input-Output Analysis," Review of Regional Studies, VII, No. 1 (Spring 1977), 59-80. (With S. Pleeter).

"An Example of the Dependence of Control Solutions on Estimation Technique: Theil's Anti-Depression Policy for the U.S. in the 1930s," Public Finance, XXXIII, No. 1 (February 1978), 33-41. (With W. J. Boyes).

"A Liquidity Trap in the Market for Foreign Exchange: The Case of Mexico," International Economic Review, XIX, No. 2 (October 1978), 777-786. (With W. J. Boyes).

"A Short-Term Forecasting Model for Second Home Construction," Regional Studies, XIII, No. 6 (June 1979), 259-67.

"Reconciling Reconciliation Procedures in Input-Output Analysis," International Regional Science Review, IV, No. 1 (Fall 1979), 23-36.

"Reconciling Reconciliation Procedures in Input-Output Analysis: Reply," International Regional Science Review, IV, No. 1 (Fall 1979), 38-40.

"Input-Output as a Simple Econometric Model: Reply," The Review of Economics and Statistics, LXI, No. 4 (November 1979), 623-26.

"Energy Scarcity: A Theoretical Analysis of Substitution and Technical Change," Review of Regional Studies, IX, No. 3 (Winter 1979), 61-80. (With W. D. Schulze).

"Illegal Immigration: Key Issues for Government Policy," Social Science Quarterly, LXI, No. 1 (June 1980), 71-85. (With J. H. Mutti).

"The Role of Functional Form in Estimating Elasticities of Housing Expenditure," Southern Economic Journal, XLVII, No. 2 (October 1980), 287-302. (With W. J. Boyes).

"What Do We Know About Benefits of Reduced Mortality From Air Pollution Control?," American Economic Review (Papers and Proceedings), LXXI, No. 2 (May 1981), 228-34. (With W. D. Schulze).

"Are Regional Share Effects Constant Over Time?," Journal of Regional Science, XXI, No. 2 (May 1981), 163-74. (With J. L. Barrington).

"Possibilities for the Exportation of Production Taxes: A General Equilibrium Analysis," Journal of Public Economics, XVI, No. 2 (November 1981), 233-52. (With J. H. Mutti).

"Bifurcation and the Time Pattern of Impacts in the Economic Base Model," Journal of Regional Science, XXI, No. 4 (December 1981), 451-67. (With A. M. Isserman).

"The Wyoming Economy: Historical Trends and Projections," Southwestern Review of Management and Economics, II, No. 4 (Fall 1982), 37-55. (With J. Merrifield).

"Factor Rewards and the International Migration of Unskilled Labor: A Model with Capital Mobility," Journal of International Economics, XIV, No. 2 (May 1983), 367-80. (With J. H. Mutti).

"Compensating Differences and Interregional Wage Differentials," The Review of Economics and Statistics, LXV, No. 3 (August 1983), 483-87. (With W. Weirick).

"Changes in Income Distribution and Welfare from Greater Immigration of Unskilled Workers," European Economic Review, XXIII, No. 1 (September 1983), 103-116. (With J. Mutti).

"Multinational Corporations and Discriminatory Investment Controls," Weltwirtschaftliches Archiv, CXIX, No. 4 (1983), 649-62. (With J. Mutti).

"Tribute to William H. Miernyk," International Regional Science Review, Vol. VIII, No. 3 (December 1983), 185-87. Also appeared in a special symposium issue of Socio-Economic Planning Sciences, XVIII, No. 5 (December 1984), 303-304.

"Systematic Assessment Error and Intrajurisdiction Property Tax Capitalization: Comment," Southern Economic Journal, LI, No. 3 (January 1985), 886-890. (With M. Dickie).

"Estimating Evaluations of Safety From Labor Market Data: A New Measure of Risk," Seminarberichte der Gesselschaft fur Regionalforschung, XXII (November/December, 1985), 81-108 (With D. Gegax and W. Schulze).

"An Economic Analysis of Air Pollution and Health: The Case of St. Louis," The Review of Economics and Statistics, LXVIII, No. 1, (February 1986), 115-121. (With L. Stanley). (Reprinted in Environmental Economics: A Reader, eds. Anil Markandya and Julie Richardson. London: St. Martin's Press, 1992).

"A Note on Measuring the Elasticity of Substitution of Wages for Municipal Infrastructure: A Comparison of the Survey and Wage Hedonic Approaches," Journal of Environmental Economics and Management, XIII, No. 3, (September 1986), 269-276. (With R. Cummings, W. Schulze and D. Brookshire).

"Regional Labor Market Analysis," in Handbook of Regional and Urban Economics, (eds.) Peter Nijkamp and Edwin Mills, Amsterdam: North-Holland, 1986, 543-580. (With A. M. Isserman, C. A. Taylor, and U. Schubert).

"The Economic Evaluation of Job Safety: A Methodological Survey and Some Estimates for Austria," Empirica, 1986, 53-67. (With P. Weiss and G. Maier).

"Market Transactions and Hypothetical Demand Data: A Comparative Study," Journal of the American Statistical Association, LXXXII, No. 397, (March 1987), 69-75. (With M. Dickie and A. Fisher).

"Interregional Wage Differentials: An Equilibrium Perspective," Journal of Regional Science, XXVII, No. 4 (November 1987), 571-86. (With M. Dickie).

"Regional Labour Market Modelling: A State of the Art Review," in Regional Labour Markets, (eds.) Manfred M. Fischer and Peter Nijkamp, Amsterdam: North-Holland, (1987), 53-94. (With U. Schubert, C. Taylor, and A. Isserman).

"The Marginal Value of Job Safety: A Contingent Valuation Study," Journal of Risk and Uncertainty, I, No. 2, (June, 1988), 185-200. (With W. Schulze and M. de Haan). (Reprinted in Environmental Economics: A Reader, eds. Anil Markandya and Julie Richardson. London: St. Martin's Press, 1992).

"Benefits of Reduced Morbidity from Air Pollution Control: A Survey," in Valuation Methods and Policy Making in Environmental Economics, (eds.) Hendrik Folmer and Ekko van Ierland, Amsterdam: North-Holland, 1989. (With M. Dickie).

"Interregional Wage Differentials: A Survey," in Migration and Labor Market Efficiency, (eds.) Jouke van Dijk, Hendrik Folmer, Henry Herzog, Jr., Alan M. Schlottmann, Dordrecht: Kluwer Academic Press (1989), 111-146. (With M. Dickie).

"The Economics of Traffic Accidents on Austrian Roads," Empirica, XVI, No. 2 (1989), 177-92. (With G. Maier and P. Weiss).

"Measuring Effects of Industrial Location and State Economic Development Policy: A Survey," in Industry Location and Public Policy, (eds.) Alan Schlottmann and Henry Herzog, Knoxville, TN: University of Tennessee Press, (1991), 31-56. (With William Morgan).

"Health Benefits of PMP Control: The Case of Stratospheric Ozone Depletion and Skin Damage Risks," in Persistent Pollutants: Economics, Toxicology, Decisionmaking, (eds.) J.B. Opschoor and D.W. Pearce, Dordrecht: Kluwer Academic Press (1991), 65-76. (With M. Dickie and M. Agee).

"Valuing Reduced Morbidity: A Household Production Approach," Southern Economic Journal, LVII, No. 3 (January 1991). 690-702 (with M. Dickie).

"Willingness to Pay for Ozone Control: Inferences from the Demand for Medical Care," Journal of Environmental Economics and Management, XXI, No. 1 (July, 1991), 1-17. (with M. Dickie).

"Perceived Risk and the Marginal Value of Safety," The Review of Economics and Statistics, LXXIII, No. 4 (November 1991), 589-96. (with D. Gegax and W. Schulze).

"Measuring Productivity Growth in U.S. Regions: A Survey," International Regional Science Review, XVI, No. 1 and 2 (1994), 155-185 (reprinted in Modern Classics in Regional Science: Volume 4, eds. Kenneth J. Button and Peter Nijkamp, Cheltenham, UK, Edward Elgar Publishing, 1996).

"Formation of Risk Beliefs, Joint Production, and Willingness to Pay to Avoid Skin Cancer," The Review of Economics and Statistics, LXXVIII, No. 3 (August 1996), 451-63 (with M. Dickie).

"Optimal Institutional Arrangements for Pollution Control," Journal of Regional Analysis and Policy, XXVI, No. 1 (October 1996), 113-31, (with J. List).

"Averting Behavior and Urban Air Pollution," Land Economics, LXXIII, No. 3 (August 1997), 340-58 (with B. Bresnahan and M. Dickie).

"Genetic Risk Factors and Offsetting Behavior: The Case of Skin Cancer," Journal of Risk and Uncertainty, XV, No. 1 (October 1997), 81-97 (with M. Dickie).

"Income and Environmental R&D: Empirical Evidence from OECD Countries," Environment and Development Economics II, No. 4 (October 1997), 505-15. (with R. Komen and H. Folmer).

"Interregional Wage Disparities, Relocation Costs, and Labor Mobility in Canada," Journal of Regional Science, XXXVIII, No. 1 (February 1998), 61-88 (with M. Dickie).

"State Fiscal Structure and Economic Development Policy," Growth and Change, XXIX, No. 2 (Spring 1998), 131-45 (with William Morgan).

"Valuing Public Health Damages Arising from War," in The Environmental Consequences of War: Legal, Economic and Scientific Perspectives, (eds.) Jay Austin and Carl Bruch, Cambridge: Cambridge University Press, 2000. (with M. Dickie).

"Educational Contributions, Academic Quality, and Athletic Success," Contemporary Economic Policy, XVIII, No. 2 (April 2000), 248-58 (with T. Rhoads).

"Regulatory Federalism and Environmental Protection in the United States," Journal of Regional Science, XXXX, No. 3 (August 2000), 453-71. (with J. List). (reprinted in The Political Economy of Environmental Regulation, (ed.) Robert N. Stavins, Cheltenham, UK, Edward Elgar Publishing, 2004 and in Environmental Economics: Critical Concepts in the Environment, (eds.) Chuck Mason and Erwin Bulte, London, UK, Routledge Publishing, 2007.)

"Spatial Economic Aspects of the Environment and Environmental Policy," in Frontiers in Environmental Economics, (eds.) Henk Folmer, Landis Gabel, Shelby Gerking, and Adam Rose, London: Elgar Publishing, 2001. (with J. List).

"Anti-Suppressants and the Creation and Use of Non-Survey Regional Input-Output Models," in Perspectives in Regional Science, (eds.) Ronald E. Miller and Michael Lahr, Amsterdam: Elsevier, 2001 (with A. Isserman and T. Pickton).

"Kennisexternaliteiten in Nederland (Knowledge Externalities in the Netherlands)," Economisch Statistische Berichten 4289 (2001), 14-17 (with D. van Soest and F. van Oort).

"Environmental Policy and the Timing of Drilling and Production in the Oil and Gas Industry," in Recent Advances in Environmental Economics, (eds.) John A. List and Aart de Zeeuw, London: Elgar Publishing, 2002 (with M. Kunce and W. Morgan).

"Effects of Environmental and Land Use Regulation in the Oil and Gas Industry Using the Wyoming Checkerboard as an Experimental Design," American Economic Review, XCV, No. 5 (December 2002), 1588-1593 (with M. Kunce and W. Morgan).

"Foreign Direct Investment: Agglomeration Economies and Returns to Promotion Expenditures," Review of Regional Studies, XXXIII, No.1 (July 2003), 63-74. (with S-H Kim and T. Pickton).

"Parents' Valuation of Latent Health Risks to Their Children," in Risk and Uncertainty in Environmental Economics, (eds.) Justus Wesseler, Hans-Peter Weikard, and Robert Weaver, Cheltenham, UK: Elgar Publishing, 2003. (with M. Dickie).

"State Taxation, Exploration, and Production in the U.S. Oil Industry," Journal of Regional Science, XLIII, No. 4 (November 2003), 749-770. (with M. Kunce, W. Morgan, R. Maddux).

"Environmental and Land Use Regulation in Nonrenewable Resource Industries: Implications from the Wyoming Checkerboard," Land Economics LXXX, No.1 (February 2004), 75-93. (with M. Kunce and W. Morgan).

"What Determines the Success of States in Attracting SBIR Awards?" Economic Development Quarterly, XVIII, No. 1 (February 2004), 81-90. (with A. van der Vlist and H. Folmer).

"Knowledge Transfer and the Location of New ICT Firms," International Journal of Entrepreneurship and Innovation Management, IV, No.1 (2004), 11-19. (with D. van Soest and F. van Oort).

"Do Causes of Environmental Problems Affect Hicksian Equivalent Surplus? Evidence from the Field," Economics Letters, LXXXV, No. 2, (November 2004), 157-62. (with E. Bulte, J. List, and A. de Zeeuw).

"Dynamic Information Externalities and Employment Growth in the Netherlands," in Learning from Clusters: A Critical Assessment from an Economic-Geographical Perspective (eds.) Ron A. Boschma and Robert C Klosterman, Dordrecht, The Netherlands: Springer Verlag, 2005 (with F. G. van Oort and D. P. van Soest).

"The Effect of Varying the Causes of Environmental Problems on Stated WTP Values: Evidence from a Field Study," Journal of Environmental Economics and Management, XXXXVIIII, No. 2 (March 2005), 330-342. (with E. Bulte, J. List, and A. de Zeeuw). (Among most cited articles published in Elsevier's economics and finance journals, 2005-2009.)

"Valuing Children's Health: Parental Perspectives," in Economic Valuation of Environmental Health Risks to Children, (ed.) Pascale Scarpecci, OECD: Paris, 2006 (with Mark Dickie).

"Risk Perception, Valuation, and Policy: Introduction," Environmental and Resource Economics, XXXIII, No.3 (March 2006), 267-71. (with G. W. Harrison).

"Spatial Impacts of Agglomeration Externalities," Journal of Regional Science, XLVI, No.5 (December 2006), 881-900. (with D. P. van Soest and F. G. van Oort).

"Altruism and Environmental Risks to Health of Parents and their Children," Journal of Environmental Economics and Management, LIII, No. 3 (May 2007), 323-41. (with M. Dickie).

"Environmental and Land Use Regulation in Nonrenewable Resource Industries: Implications from the Wyoming Checkerboard: Correction," Land Economics, LXXXIII, No. 2 (May 2007), iii. (with W. Morgan).

"Effects of Environmental and Land Use Regulation in the Oil and Gas Industry Using the Wyoming Checkerboard as an Experimental Design: Retraction," American Economic Review, IIIC, No. 3 (June 2007), 1032. (with W. Morgan).

"Decentralization and Environmental Decision-Making," in Decentralization and Land Policies (eds.) Gregory K. Ingram and Yu-Hung Hong, Boston, MA, Lincoln Institute of Land Policy (2008).

"What Explains the Increased Utilization of Powder River Basin Coal in Electric Power Generation?" American Journal of Agricultural Economics, XC, No. 4 (November 2008), 933-950. (with Stephen F. Hamilton).

"Family Behavior: Implications for Health Benefits Transfer from Adults to Children," Environmental and Resource Economics, LXIII, No. 1 (May 2009), 31-43 (with Mark Dickie) (Special issue on household behavior and environmental policy).

"SO_2 Policy and Input Substitution under Spatial Monopoly," Resource and Energy Economics, XXXII, No. 3, (August 2010), 327-340. (with Stephen F. Hamilton).

"State Tax Policy and Oil Production: The Role of the Severance Tax and Credits for Drilling Expenses," in U. S. Energy Tax Policy (ed.) Gilbert Metcalf, Cambridge: Cambridge University Press, 2011 (with Ujjayant Chakravorty and Andrew Leach).

"Perceptions of Health Risk and the Smoking Decisions of Young People," Health Economics, forthcoming (with Raman Khaddaria).

"Andy Isserman and the Early Years of the *International Regional Science Review*," International Regional Science Review, forthcoming.

Grants:

"Development of Procedures for Predicting Water Quality Responses to Land Use Measures in the Salt River Basin," Granting Agency: Eisenhower Consortium. Contract Period: September 1, 1976 to August 31, 1978 (Co-Principal Investigator).

"Demand for Second Homes in the Salt River Basin," Granting Agency: Eisenhower Consortium. Contract Period: December 1, 1976 to November 30, 1978 (Principal Investigator).

"Methods Development for Estimation of Benefits of Environmental Improvements," Granting Agency: Environmental Protection Agency. Contract Period: October 29, 1976 to October 28, 1979 (Investigator).

"Methods Development for Estimating Benefits of Environmental Improvements," Granting Agency: Environmental Protection Agency. Contract Period: May 9, 1980 to October 28, 1980 (Investigator).

"Assessing Revenue Adequacy and Capital Facility Needs of Wyoming Local Governments," Granting Agency: Wyoming Department of Economic Planning and

Development. Contract Period: September 30, 1980 to January 15, 1981 (Principal Investigator).

"An Emergency Energy Conservation Plan for Wyoming," Granting Agency: Wyoming Department of Economic Planning and Development. Contract Period: January 16, 1981 to February 28, 1982 (Principal Investigator).

"The Economic Impact of Grand Teton National Park on Teton County, Wyoming," Granting Agency: National Park Service Research Center, University of Wyoming. Contract Period: May 1, 1981 to April 30, 1982 (Principal Investigator).

"Methods Development in Measuring Benefits of Environmental Improvements," Granting Agency: Environmental Protection Agency. Contract Period: June 9, 1981 to June 8, 1983 (Project Director).

"Development of Research Plan for Consortium on Energy Impacts," Granting Agency: Exxon, USA, Mobile Corporation, Gas Research Institute, Amoco Minerals, Inc., Getty Oil Corporation, Gulf Oil Corporation. Contract Period: February, 1982 to December, 1982 (Vice-Chairman, Research Program Committee).

"Recomputing County Specific Assessment Ratios for Certain Types of Property in Wyoming," Granting Agency: Wyoming State Legislature. Contract Period: May 1, 1983 to October 31, 1983 (Principal Investigator).

"Experimental Methods for Assessing Environmental Benefits," Granting Agency: U.S. Environmental Protection Agency. Contract Period: September 1, 1983 to September 30, 1984 (Project Director).

"Improving Accuracy and Reducing Costs of Environmental Benefit Assessments," Granting Agency: U.S. Environmental Protection Agency (via subcontract from University of Colorado). Contract Period: October 1, 1984 to August 30, 1987 (Principal Investigator).

"Potential Intrastate Air Travel for Wyoming State Employees," Granting Agency: Office of the Governor of Wyoming. Contract Period: September 15, 1985 to January 31, 1986 (Principal Investigator).

"Cooperative Industry/University of Wyoming Research Program," Granting Agency: National Science Foundation (University/Industry Cooperative Research Centers Program). Contract Period: October 1, 1986 - September 30, 1991 (R. E. Ewing, Project Director, S. Gerking, Evaluator).

"Economic Development and Diversification Strategies for Wyoming," Granting Agency: Wyoming Legislature and the University of Wyoming. Contract Period: July 2, 1986 to June 30, 1987 (Principal Investigator).

"Improving Environmental Benefit Assessments: Application Studies and Methods Development," Granting Agency: U.S. Environmental Protection Agency. Contract Period: October 1, 1987 to September 30, 1988 (Principal Investigator).

"Enhancement and Coordination of Energy Research: A Plan for Wyoming," Granting Agency: U.S. Department of Energy. Contract Period: October 1, 1991 - September 30, 1992 (Investigator).

"Environmental Research and Development Plan for Wyoming," Granting Agency: U.S. Environmental Protection Agency. Contract Period: October 1, 1991 - May 31, 1992 (Investigator).

"Knowledge Transfer to Stimulate Production of Wyoming Natural Gas," Granting Agency: National Science Foundation. Contract Period: July 15, 1994 - June 30, 1996 (Co-Principal Investigator).

"Public Costs and Benefits of Economic Development," Granting Agency: Wyoming Department of Commerce. Contract Period: April 1996 - August 1996 (Principal Investigator).

"Economic Impacts of the Wyoming Travel Industry," Granting Agency: Wyoming Travel Commission. Contract Period: July 1, 1995 – June 30, 2001 (Principal Investigator).

"Analysis of External Cost Adjustment Factors for Wyoming K-12 Education Finance," Granting Agency: Wyoming Legislative Service Office. Contract Period: June 1, 1999 – July 31, 1999 (Principal Investigator).

"Mineral Tax Incentives and Mineral Production: An Interstate Analysis," Granting Agency: Wyoming Legislative Service Office. Contract Period: July 1, 1999 – June 30, 2004 (Principal Investigator).

"Environmental Risks to Children's Health: Parents' Risk Beliefs, Protective Behavior and Willingness to Pay," Granting Agency: USEPA. Contract Period: April 1, 2001—December 31, 2005 (Co-principal Investigator).

"Willingness to Pay to Reduce Asthma Episodes for Adults and Children," Granting Agency: USEPA. Contract Period: October 1, 2002-September 30, 2007 (Co-Principal Investigator).

"A Consistent Framework for Valuing Latent Morbidity and Mortality Risks to Adults and Children," Granting Agency: USEPA. Contract period: November 1, 2004-October 31, 2008 (Co-Principal Investigator).

"Morbidity Valuation, Benefit Transfer and Family Behavior," Granting Agency: USEPA. Contract period: April 1, 2007-March 31, 2011 (Co-Principal Investigator).

"Fischer-Tropsch Synthesis, Combustion/Emission Characteristics and Economic Impact of Synthetic Jet Fuels," Granting Agency: NASA. Contract Period: January 1, 2007-June 30, 2008 (Co-Principal Investigator).

Other Papers and Documents:

Some Statistical Problems in Estimating Stochastic Input-Output Models, unpublished Ph.D. dissertation, Indiana University, 1975.

"Linear Programming and the Value of Resources," Arizona Business, XXII (July, 1975), pp. 17-24. (With others).

Environmental Baseline Studies for Crow-Indian Coal Leases Socio-Economic Report. Prepared for Westmoreland Resources under the direction of Mountain West Research, Inc., 1975. (With others)

Arizona's Economy Yesterday, Today and Tomorrow. Tempe, Arizona: Bureau of Business and Economic Research, 1976. (With others).

"Development of Procedures for Predicting Water Quality Responses to Land Use Measures in the Salt River Basin," Eisenhower Consortium Report, Rocky Mountain Forest and Range Experiment Station, Ft. Collins, Colorado, 1976. (With others).

"The Demand for Second Homes in Northeastern Arizona," Eisenhower Consortium Report, Rocky Mountain Forest and Range Experiment Station, Ft. Collins, Colorado, 1977. (With others).

"Some Economics of Air Pollution-Induced Chronic Illness," Experiments in Air Pollution Epidemiology, Washington, D.C., USEPA, 1980.

"Effects of Air Pollution and Environmental Variables on Offered Wages," Experiments in Air Pollution Epidemiology, Washington, D.C., USEPA, 1981.

"Assessing Revenue and Capital Facility Needs in Wyoming Local Governments," University of Wyoming: Institute for Policy Research, 1981. (With A. Bryson, S. Nyhus, and J. Merrifield).

"Emergency Energy Conservation Act Management Plan for Wyoming," University of Wyoming, Laramie: Institute for Policy Research, 1981. (With A. Bryson, S. Nyhus, and J. Merrifield).

"Incidence of a Mineral Severance Tax: The Case of Kansas," University of Wyoming, Laramie: Institute for Policy Research, February, 1981. (With J. Mutti and W. Morgan).

"Exportation of State Taxes: A Comparative Analysis." University of Wyoming, Laramie: Institute for Policy Research, February, 1982. (With J. Mutti and W. Morgan).

"Analysis of the Long-Term Impacts and Benefits of Grand Teton National Park on the Economy of Teton County, Wyoming." University of Wyoming, Laramie: National Park Service Research Center, May, 1982. (With J. Merrifield).

"Proposed Plan for a Research Program on the Impacts of Intermountain Energy Development," Consortium on Energy Impacts, October, 1982. (With Others).

"An Economic Analysis of Air Pollution and Health: The Case of St. Louis," Volume VI of Methods Development in Measuring Benefits of Environmental Improvements, U.S. Environmental Protection Agency, Final Report, Cooperative Agreement #CR808893-01-0, July, 1983. (With L. R. Stanley and W. N. Weirick).

"Analyzing Property Tax Assessments in Wyoming: An Assessed Value/Sales Price Ratio Study," Institute for Policy Research, University of Wyoming, Laramie, October, 1983. (With G. Arnott and M. Schilling).

"Wyoming's Near Term Economic Outlook: Modest Growth for the 1980's," Institute for Policy Research, University of Wyoming, Laramie, Wyoming, 1983. (With S. T. Mast and S. E. Atkinson).

"Laboratory Experimental Economics as a Tool for Measuring Public Policy Values," Volume II of Experimental Methods for Assessing Environmental Benefits, U.S. Environmental Protection Agency, Final Report, Cooperative Agreement #CR-811077-01-0, September, 1984. (With others).

"Valuing Safety: Two Approaches," Volume IV of Experimental Methods for Assessing Environmental Benefits, U.S. Environmental Protection Agency, Final Report, Cooperative Agreement #CR-811077-01-0, September, 1984. (With others).

"Estimating Benefits of Reducing Community Low-Level Ozone Exposure: A Feasibility Study," Volume III of Experimental Methods for Assessing Environmental Benefits, U.S. Environmental Protection Agency, Final Report, Cooperative Agreement #CR-811077-01-0, September, 1984. (With others).

"Estimating Benefits of Reducing Community Low-Level Ozone Exposure," Volume III of Improving Accuracy and Reducing Costs of Environmental Benefit Assessments,

U.S. Environmental Protection Agency, Final Report, Cooperative Agreement #CR812054-01-1, September, 1985. (With others).

The Accuracy of Marginal Value of Safety Measures: Evidence from a National Sample of American Workers," Volume VI of Improving Accuracy and Reducing Costs of Environmental Benefit Assessments, U.S. Environmental Protection Agency, Final Report, Cooperative Agreement #CR812054-01-1, September, 1985. (With others).

"Forecasting Oil and Gas Employment and Electricity Use in Wyoming," Enhanced Oil Recovery Institute, University of Wyoming, Laramie, Wyoming, October, 1985. (With R. E. Ewing).

"Production and Taxation in Wyoming's Energy Industry: The Case of Crude Oil, Natural Gas, and Carbon Dioxide," Enhanced Oil Recovery Institute, University of Wyoming, Laramie, Wyoming, January, 1986. (With R. E. Ewing).

"Potential for Commercial Air Travel by Wyoming State Employees," Institute for Policy Research, University of Wyoming, Laramie, January, 1986. (With A. Weber).

"Value of Symptoms of Ozone Exposure: An Application of the Averting Behavior Method," in Improving Accuracy and Reducing Costs of Environmental Benefit Assessments, U.S. Environmental Protection Agency, Final Report, Cooperative Agreement #CR812054-01-2, September, 1986. (With others).

"Reconciling Averting Behavior and Contingent Valuation Benefit Estimates of Reducing Symptoms of Ozone Exposure," in Improving Accuracy and Reducing Costs of Environmental Benefit Assessments, U.S. Environmental Protection Agency, Cooperative Agreement #CR812054-01-2, February, 1987. (With others).

"Economic Development and Diversification Strategies for Wyoming," Institute for Policy Research, University of Wyoming, Laramie, Wyoming, July, 1987. (With S. K. Yost).

"Valuing Morbidity: An Overview and State of the Art Assessment," in Improving Accuracy and Reducing Costs of Environmental Benefit Assessments, U.S. Environmental Protection Agency, Cooperative Agreement #CR812054-01-2, December, 1987. (With others).

"Historical Profile of the University of Wyoming Enhanced Oil Recovery Institute," National Science Foundation, University/Industry Cooperative Research Program, January, 1988.

"Stratospheric Ozone Depletion, Skin Damage Risks, and Protective Action," in Improving Environmental Benefit Assessments, U.S. Environmental Protection

Agency, Cooperative Agreement #CR-814647-01-0, October, 1989. (With M. Dickie and M. Agee).

Professional Service:

Editorships:

Associate Editor, Journal of Regional Science, 1996 - present.

Guest Editor (with Stephen C. Sheppard and Andrew M. Isserman) symposium issue in honor of Roger Bolton, International Regional Science Review, July, 2009.

Editorial Board member, International Review of Environmental and Resource Economics, 2006-present.

Editorial Board member, Letters in Spatial and Resource Economics, 2006-2010.

Guest Editor (with G.W. Harrison and J.A. List) for symposium issue on risk perception, valuation, and policy, Environmental and Resource Economics XXXIII, No.3, March 2006.

Editorial Board member, International Yearbook in Environmental Economics, 1995-2005.

Editorial Board member, International Regional Science Review, 1986 - present.

Editorial Council member, Journal of Environmental Economics and Management, 1989 - 1991.

Editorial Board member, Growth and Change, 1988 - 1993.

Co-Editor, International Regional Science Review, 1979 - 1986.

Guest Editor for a symposium issue in honor of William H. Miernyk, Socioeconomic Planning Sciences, XVIII, No. 5, (1984).

Advisory Editor, Wyoming Quarterly Update, 1981 - 1984.

Government Service (federal/international):

Greek Ministry of Education, External reviewer for the Archimedes III research program (2010-present)

European Commission, European Research Council, Advanced Grants Panel, 2008-2013.

U.S. Environmental Protection Agency, Science Advisory Board Council on Clean Air Compliance Analysis, 2006-2012.

U.S. Environmental Protection Agency, STAR and GRO Fellowships "Economics" Review Panel, 2005-2007.

Special Reviewer, Social Sciences and Population Study Committee, National Institute of Child Health and Human Development, June, 1983.

Visiting Staff Member, Los Alamos Scientific Laboratory, 1981 - 82.

Member, Special Study Committee on International Migration, National Institute of Child Health and Human Development, March, 1980.

Judge, Ph.D. Dissertation Competition, sponsored jointly by Regional Science Association and Economic Development Administration, Fall, 1979.

Government Appointments (Wyoming):

Tax Reform 2000 Committee, 1997-1999.

Experimental Program to Stimulate Competitive Research (EPSCoR) Steering Committee, 1985-1995.

Economic Development and Stabilization Board, 1988-1993.

Science, Technology and Energy Authority, 1989-1993 (Executive Director).

Science Advisor, Governor's Office, 1993-1994.

Member, Peacekeeper Modeling Task Force, University of Wyoming representative, April, 1983 - September, 1984.

Other Service:

Co-Chair, Local Arrangements Committee for Miami meeting, North American Regional Science Council, November 2011

Member, Program Committee, Annual Meetings of the European Association of Environmental and Resource Economists, 2007, 2009, 2011, 2012

Member, Program Committee, Annual Meetings of the Association of Environmental and Resource Economists, 2011, 2012

Member Program Committee, World Congress of Environmental Economists, 2010

Councillor, Regional Science Association, International, 1986 – 1988

Senate Resources Committee
Wednesday, February 1
Dr. Shelby Gerking: State Tax Policy and Oil Production

DRAFT DRAFT DRAFT DRAFT

Introduction:

1. Please tell the Committee about your educational background, professional work experience, and, especially, your research and experience regarding state tax policy and oil production.

2. I understand that you have testified extensively before State legislatures. Can you please tell the Committee more about those experiences and the sort of information that you have been asked to provide.

State Tax Policy and Oil Production:

1. On the first page of the chapter titled, State Tax Policy and Oil Production, you present some interesting questions to the reader. Can you please elaborate briefly on a few of these:

    a. "To what extent do state energy tax increases result in lower collections of federal tax revenues?" For the folks following this issue, does a decrease in state taxes increase federal tax revenues? What is the net gain/loss for the taxpayer?
    b. "Do state taxes tilt the time path of energy production to the present or future?" Why is the answer to this question important to policy makers? What are the pros and cons for Alaska?
    c. "How do upstream subsidies for exploration and development work together with downstream taxes on production to influence the levels and time paths of production and tax collections?" This sounds important. Please elaborate.
    d. "What are the implications of these taxes for the long-run sustainable use of nonrenewable natural resources?" What should we be thinking about here?

2. Key result (page 306): "Oil production is closely related to the size of the reserve base and is relatively insensitive to changes in oil prices. This outcome, which is broadly consistent with experience in the U.S. oil industry over the past 50 years, leads to the conclusion that the severance tax has little effect on production levels and serves mainly to redirect rents earned in the oil industry to the public sector. Thus, increases in severance tax rates or a reduction in the subsidies provided to the oil and gas industry may lead to rent taxation and therefore have only marginal effects on the the drilling and production of oil ..."

Help us better understand

a. As you can imagine, this is not the message we are hearing from the oil industry and their advocates. Can you help us understand this better?

3. The State of Alaska offers generous credits to the oil and gas industry and we have several bills currently before the legislature to expand tax credits. Please elaborate on the statement that, "a drilling expense credit may cost more than the incremental severance tax revenue obtained, although such credits may be worthwhile concessions if a state's objective is to generate greater support for increasing the severance tax rate."

4. You note that, "State and local tax burdens on oil producers are endlessly compared in state tax commission and legislative hearings as industry representatives make their case for more favorable tax treatment."

   a. This sounds familiar to the members of this committee and, indeed, all Alaskans. Can you please comment on the pros and cons of such comparisons?
   b. Besides the comparison of effective tax rates, what other economic indicators should be considered (e.g., IRR, ROI, etc.)? Which are most important to the investor?

5. You cited a study that found, "the response of production with respect to the tax change turns out to be highly inelastic (-0.06)." This is a very important concept for Alaskans to understand. Please explain.

6. Can you please help us understand Table 9.2 on page 322?

7. Can you please help us understand Figure 9.1 on page 323?

8. I am interested in a statement on page 330: "This outcome raises a question as to whether other public policy instruments, such as support for research to lower drilling costs or to increase finding rates, might spur drilling at a lower cost to the state." Please elaborate. Do you have examples from other states?

9. As a refresher to those of us who studied statistics many years ago, can you please give us a very brief review of "credibility" and "validity"? Respectfully, how can we be sure that this chapter, State Tax Policy and Oil Production, is relevant to Alaska?

Senate Resources Committee
Supplemental Questions
February 1, 2012

Effective Tax Rates on Oil and Gas Production: A Ten-State Comparison

Please talk about "property taxes on oil and gas reserves." Example.

"Taxes on reserves provide operators with strong incentives to accelerate production at times when oil and gas prices are rising, as they attempt to reduce the extent of their tax liability." If boosting throughput in the Trans Alaska Pipeline System (TAPS) is the highest priority of the State, might this be a "strong incentive" to boost throughput?

"The myriad of exemptions, incentives, different tax bases, special features and frequent changes in tax laws, at both the State and Federal government levels, create considerable complexity in understanding and tracking tax law over time." This does not seem to stop such state-to-state comparisons. Why?

Why do you say that, *"ranking states in terms of their total or cumulative tax burden on the oil and gas extraction industry is not particularly fruitful and may be misleading"?* Don't companies use the "cumulative tax burden" when deciding where to invest?

State Taxation, Exploration, and Production in the U.S. Oil Industry (2001)

What is meant by the *"optimal time path for exploration and production"?*

"The aim of exploration is to add to the reserve base, which is a form of geographically immobile capital." What is the significance of this concept?

In another paper of you co-authored in 2001 – State Taxation, Exploration, and Production in the U.S. Oil Industry – it was reported that, *"Analyzing taxes individually appears to overstate the effects on exploration and production by ignoring potential offsets and tax base interactions. These results suggest that taxes should not be analyzed independently without careful reference to the entire tax structure applied by all levels of government."* Please explain.

In the same 2001 study, you conclude that, *"General results of this study suggest that oil production is highly inelastic with respect to changes in production taxes. This inelastic response may provide incentives for state officials to substantially increase these taxes risking little in the way of reduced industry activity while gaining much needed tax revenue. State severance tax increases clearly reduce the net price faced by producers, but it is reserves, not net price, that drives production in this industry. Moreover, the effects of increased state severance taxes are partially offset by reduced tax collections by all other levels of government."* Please explain.

Senate Resources Committee

State Tax Policy and Oil Production

Dr. Shelby Gerking

Introduction

- **Nominal (legislated) severance tax rates**
- **Effective tax rates**
  - **(dollars collected)/(value of production)**

Table 9.1. *Oil production (in Mbbl) and tax rates for selected U.S. states, 2007*

State	Production	Severance tax		Corporate income tax rate[o]
		Nominal rate	Effective rate	
Alaska	263,595	12.25–15%[a]	12%	1.0–9.4%
California	216,778	None	None	8.84%
Colorado	23,237	2–5%[b]	0.7%	4.63%
Kansas	36,490	4.33%[c]	3.0%[l]	4.0–7.35%
Louisiana	76,651	3.125–12.50%[d]	9.4%	4.0–8.0%
Montana	34,829	15.1%[e]	8.6%	6.75%
New Mexico	58,831	7.1%[f]	7.5%[m]	4.8–7.6%
North Dakota	45,058	5.0–11.5%[g]	–[n]	2.6–7.05%
Oklahoma	60,952	7.0%[h]	6.9%	6.0%
Texas	396,894	4.6%[i]	3.1%	1.0%[p]
Utah	19,520	3.0–5.0%[j]	2.4%	5.0%
Wyoming	54,130	4.0–6.0%[k]	5.3%	None

What is the effect of a change in the severance tax rate or a change in incentives to find new reserves?

- Oil Production
- Drilling Activity
- Severance Tax Collections

Simulation Model

- Based on Hotelling (1931) and Pindyck (1978)
- Profit maximization over time
  - Revenues earned by
    - Production from existing reserves
    - Exploration for new reserves
  - Costs
    - Drilling costs
    - Operating costs

Simulation Model (cont.)

- Key features
  - Compares costs to the amount produced
  - Accounts for interaction between state and federal tax collections
- Uses U.S. data on production, costs, proven reserves, federal and state corporate tax rates, etc. and discount rate of 4%
  - Not a model of a particular state
  - Not a model of Alaska

Four Scenarios

- Severance Tax Rate = 0% (Model A)
- Severance Tax Rate = 12% (Model B)
- Severance Tax Rate = 25% (Model C)
- Severance Tax Rate = 25% with credit of 22% of drilling costs against severance tax liabilities (Model D)

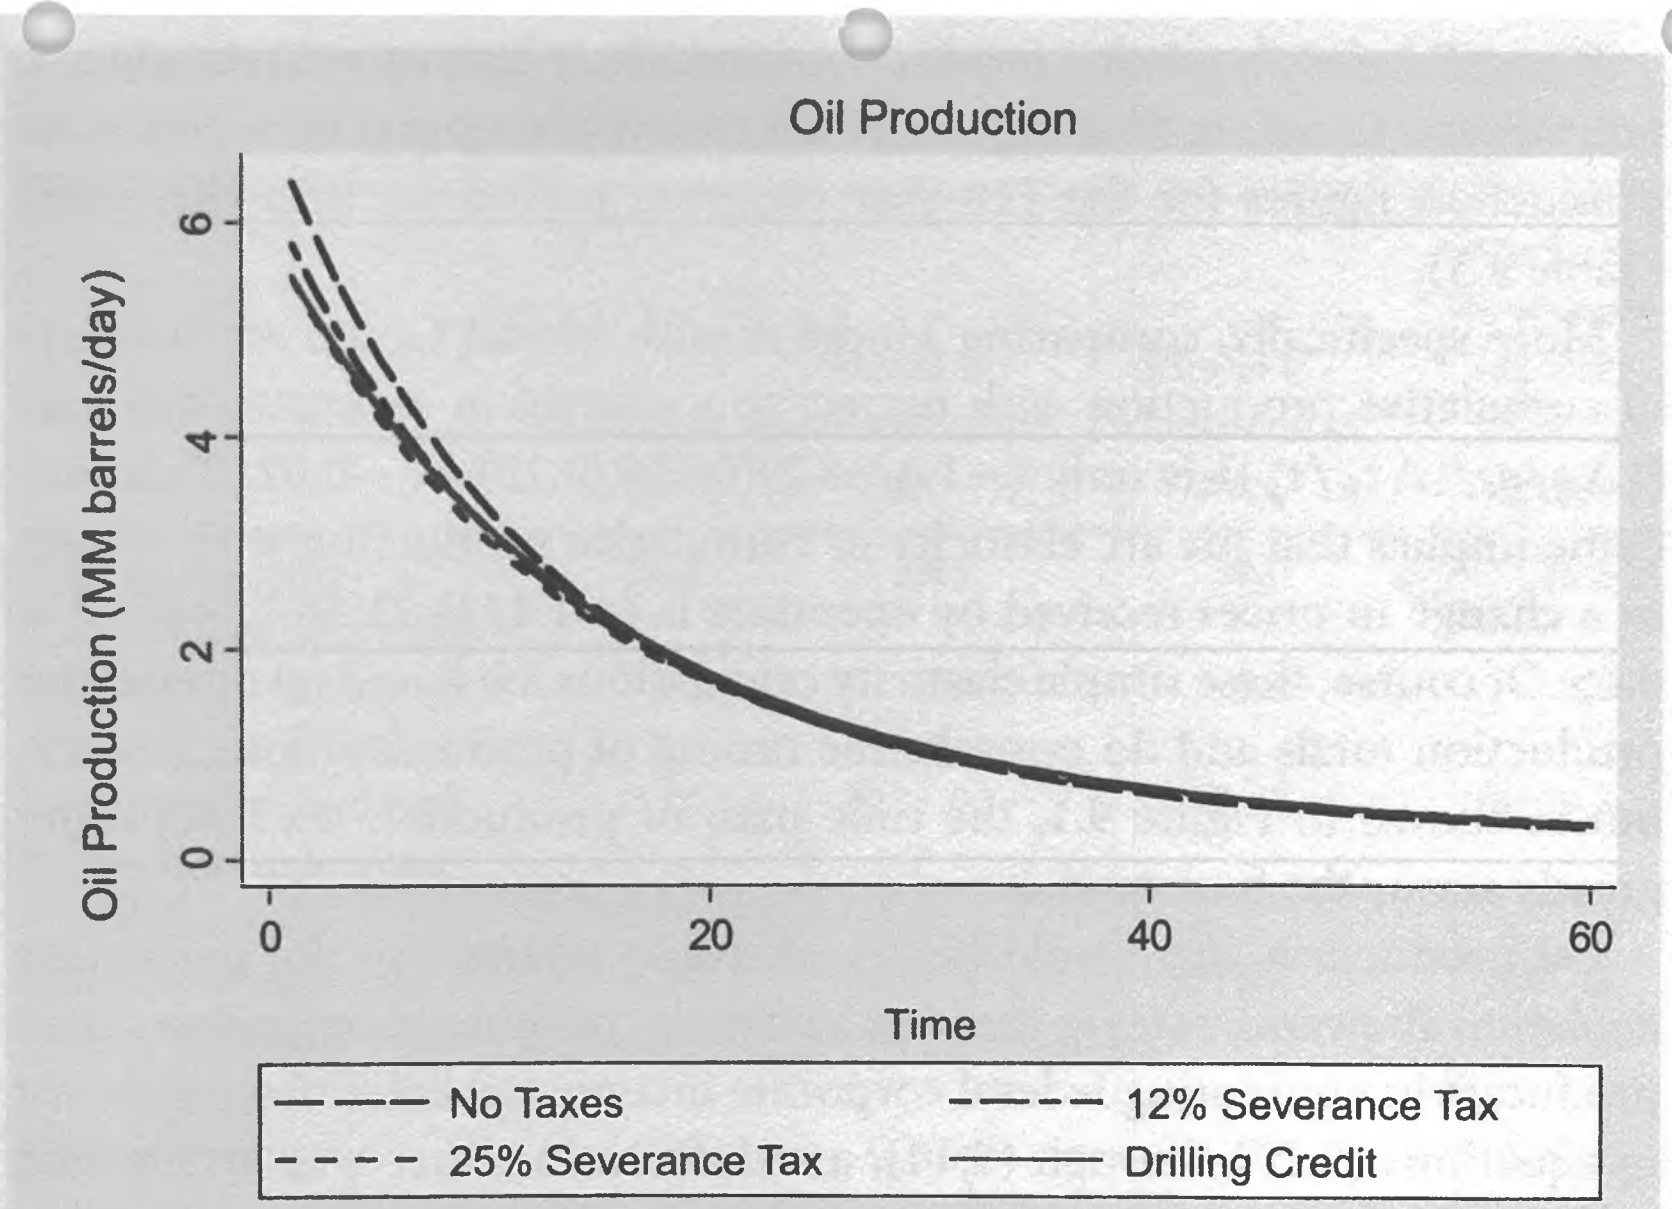

Figure 9.1. Oil production is quite insensitive to the tax structure in the U.S. case.

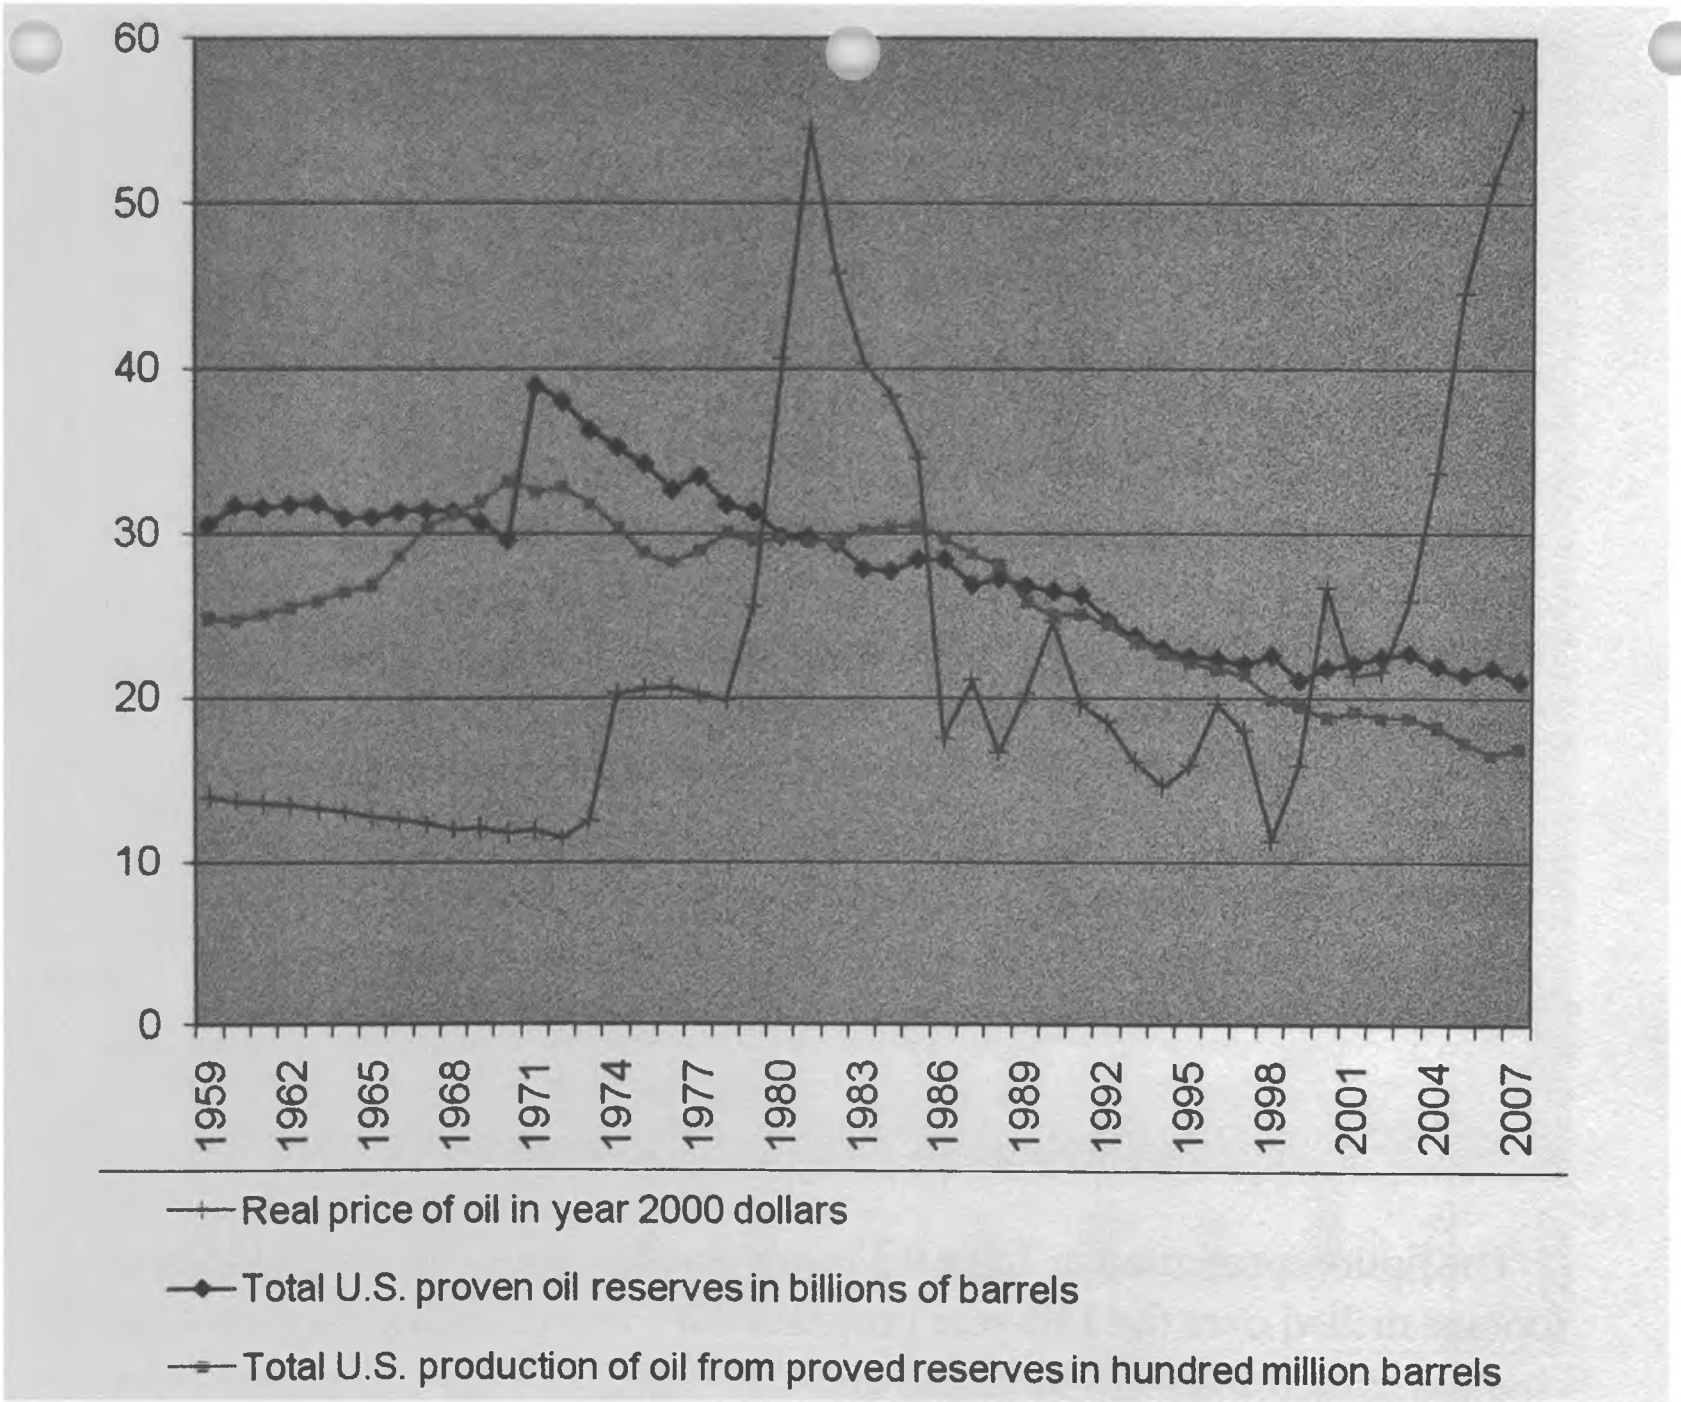

State Tax Policy and Oil Production

TABLE 9.3.

TOTAL DRILLING, PRODUCTION, TAX COLLECTIONS, PROFITS, AND RESERVES FOR FOUR MODELS OVER THE 110-YEAR PROGRAM

	Model A no taxes	Model B 12% severance tax	Model C 25% severance tax	Model D 25% severance tax with drilling subsidy
Total production (in billions of barrels)	39.4	38.5	38.0	38.6
Total footage drilled (in billions of feet)	4.5	3.9	3.6	3.9
Discounted public land royalties (in billions of dollars)	$0	$131.0	$126.3	$129.3
Discounted severance tax Collections (in billions of dollars)	$0	$159.0	$319.2	$307.5
Effective severance tax Rate	0	0.109	0.228	0.212
Discounted state corporate income tax revenue (in billions of dollars)	$0	$60.9	$49.6	$50.8
Discounted federal corporate income tax revenue (in billions of dollars)	$0	$230.0	$182.5	$188.4
Discounted depletion allowance deductions (in billions of dollars)	$0	$119.2	$114.9	$117.7
Discounted pre-tax total revenue (in billions of dollars)	$1,544	$1,456	$1,403	$1,437
Discounted extraction costs (in billions of dollars)	$186.3	$151.8	$130.1	$133.0
Discounted drilling costs (in billions of dollars)	$125.6	$84.4	$68.3	$88.3
Discounted firm profits (in billions of dollars)	$1,231	$638	$527	$539
Beginning reserves (in billions of barrels)	20	20	20	20

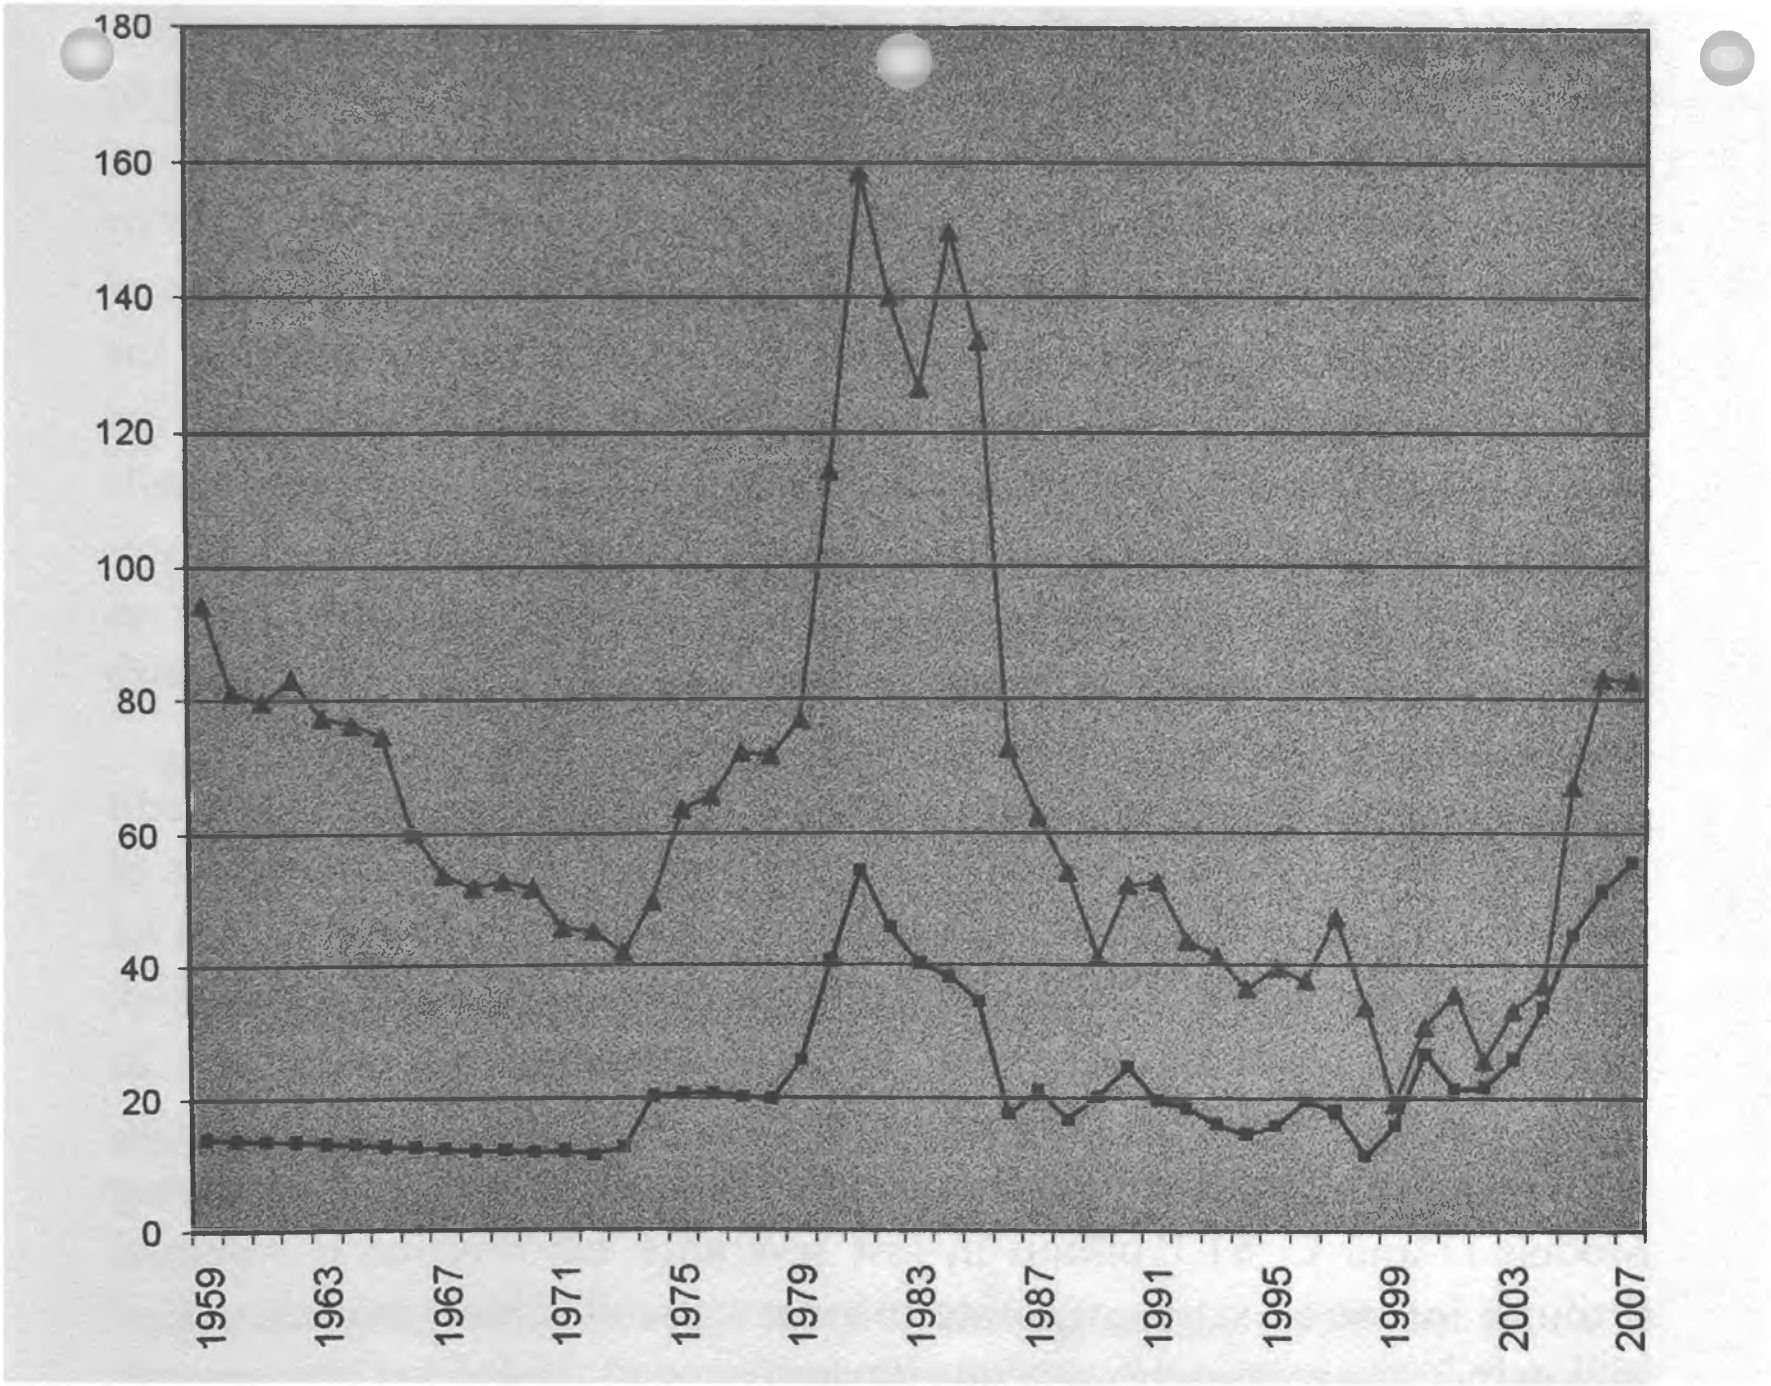

Figure 4. Price movements coincide with changes in footage of wells drilled.

State Tax Policy and Oil Production

still – but it is still clear that in the absence of such an alternative policy, a higher gas tax would clearly boost economic efficiency.

State Tax Policy and Oil Production

The Role of the Severance Tax and Credits for Drilling Expenses

Ujjayant Chakravorty, Shelby Gerking, and Andrew Leach

9.1 Introduction

Although most energy-producing states have levied taxes on the value of oil, natural gas, and coal production for many years, changes in these taxes have become headline news as state governments grapple with budget shortfalls brought about by the current recession. For instance, Alaska has increased the severance tax on the value of its oil production and attempted to stimulate future production by allowing a credit against this tax for expenditures on capital items, including drilling rigs, infrastructure, exploration, and facility expansion (Alaska Department of Revenue 2008). In late 2008, California Governor Arnold Schwarzenegger proposed levying a 9.9 percent production tax on the value of most onshore oil production to help close a projected $24 billion budget deficit, but he subsequently reversed his position (Casselman 2009; Skelton 2009). The Pennsylvania legislature is considering a proposal to levy a 5 percent tax on the value of natural gas produced from the giant Marcellus shale deposit, but the bill is opposed by industry leaders who contend that it would result in 30 percent less drilling as well as revenue reductions to state and local governments totaling $880 million over the next decade (George 2009).

These measures, both enacted and proposed, raise a number of long-standing and important questions about the effects of state energy taxes that go well beyond their potential to provide a solid revenue base to support public services. Given the overlapping tax bases claimed by states and the federal government, to what extent do state energy tax increases result in lower collections of federal tax revenues, including the federal corporate income tax? Do state energy taxes restrict production and encourage "high-grading" of energy reserves and by how much? Do state taxes tilt the time path of energy production to the present or to the future? How do upstream

subsidies for exploration and development work together with downstream taxes on production to influence the levels and time paths of production and tax collections? What are the implications of these taxes for the long-run sustainable use of nonrenewable natural resources? The analysis in this chapter bears directly on these questions. It also serves as a basis to examine proposed changes in federal tax policy, including the elimination of the percentage depletion allowance and the expensing of intangible drilling costs.

We adapt the Hotelling model developed by Pindyck (1978) to examine how a state's taxes and subsidies at different stages of resource exploration and production alter the behavior of oil producers and thus impact on exploration activity, additions to the reserve base, and the production of energy. In our model, returns to exploration are subject to diminishing returns, and the cost of production is affected both by the level of reserves and the level of output. Producers located in a given state are assumed to produce only a small fraction of world output and therefore face an exogenously determined price of oil. We calibrate the model using data from U.S. oil fields to evaluate the effects of alternative tax and subsidy policies on drilling and production, on tax revenue accruing to states and to the federal government, as well as on the time path of drilling expenditures and resource production.

A key result from the calibrated model is that oil production is closely linked to the size of the reserve base and is relatively insensitive to changes in oil prices. This outcome, which is broadly consistent with experience in the U.S. oil industry over the past 50 years, leads to the conclusion that the severance tax has little effect on production levels and serves mainly to redirect rents earned in the oil industry to the public sector. Thus, increases in severance taxes or a reduction in the subsidies provided to the oil and gas industry may lead to rent taxation and therefore have only marginal effects on the drilling and production of oil and few adverse impacts in terms of national security and increasing U.S. dependence on foreign oil.

Prior simulation studies (Deacon 1993; Kunce et al. 2003) also have considered aspects of these issues, but a novel feature here focuses on effects of combining subsidies for exploration and development with taxes on the value of energy production. The rationale for subsidizing exploration and development is to expand the reserve base and ultimately to stimulate oil production in much the same way as an investment tax credit (see Chirinko 2000) might increase capital formation and boost output in manufacturing. As previously indicated, this type of tax policy has been adopted by Alaska, and it has been suggested as a model for other states (Headwaters Economics 2009). It may also bear on national energy tax policy in light of the interest in stimulating drilling for new reserves.[1] The simulations suggest that a drilling expense credit may cost more than the incremental severance tax revenue obtained, although such credits may be worthwhile concessions if a state's objective is to generate greater support for increasing the severance tax rate.

The remainder of the chapter is organized into six sections. Section 9.2 reviews the issue of oil taxation in twelve major oil-producing states in the United States. Section 9.3 summarizes findings from the literature regarding temporal economic effects of state energy tax policies. Section 9.4 describes the extended Pindyck (1978) model that is used as a conceptual basis for our tax policy simulations. Section 9.5 discusses the way in which the model was parameterized. Section 9.6 presents simulation results, and Section 9.7 concludes.

9.2 Overview of State Taxation of the U.S. Oil Industry

Key taxes on nonrenewable resource development levied by state and local governments can be divided into three main groups: taxes on production, property, and income. In its simplest form, the production or severance tax is levied on the gross value (or volume) of production of the resource as it is "severed" from the ground. The severance tax is the most widely adopted state tax specifically applying to the U.S. oil industry and will receive the most attention in the discussion. State and local governments also levy property taxes on the assessed (quasi market) value of equipment *above* ground and/or reserves *beneath* the ground. Income taxes are levied against the accounting net income of extraction firms. Although these taxes are generally aimed at extracting economic rents earned by producers from the sale of nonrenewable resources, their effects on production, exploration, and development can differ substantially (see Section 9.3). The discussion in this section briefly summarizes how these taxes are applied in major oil producing U.S. states and how they interact with each other and with other taxes on energy producers levied at the federal level. A more detailed

[1] At the Republican National Convention in 2008, Michael Steele, former Lieutenant Governor of Maryland and currently Chairman of the Republican National Committee, underscored his view that more exploration for energy resources is needed with his now famous line, "Drill, Baby, Drill." This sentiment was echoed by Republican Vice-Presidential nominee, Sarah Palin, who as Governor of Alaska, signed legislation granting a partial credit for drilling expenses against severance tax liabilities paid at an increased tax rate. For further details, see Ball (2008).

state-by-state survey of taxation and regulation of oil and gas production is available from the Interstate Oil and Gas Compact Commission (2007) and a more up-to-date survey can be constructed from a Lexis-Nexis search of state statutes. Hellerstein (1983) provides a useful discussion of the legal basis for state taxation of natural resources.

Table 9.1 presents data on oil production, nominal (legislated) oil severance tax rates, effective severance tax rates, and nominal corporate income tax rates for the twelve U.S. states that produced the most oil in 2007.[2]

As shown, production in these states ranged from a high of 397 million barrels in Texas to a low of 20 million barrels in Utah. Nominal severance tax rates varied widely across states as well. All states except California levied a severance tax against the value of production.[3] As mentioned earlier, California is considering whether to adopt such a tax. In Alaska and Montana, nominal tax rates can exceed 10 percent. Other tax code features reflect important interstate differences.[4] Severance taxes are generally levied against the "net value" of production, where each state has its own definition of this concept. Some states, such as Wyoming, tax the value of production at the wellhead (the top of the well), whereas others, like Utah, tax the value of production at the wellfoot (the bottom of the well), which in effect allows a deduction for lifting costs. Most states subtract royalty payments (computed as a percentage of gross value of production) for production on public land in computing net production value for determining severance tax liabilities (Louisiana does not). Public land royalties are relatively more important in Alaska, Colorado, New Mexico, Utah, and Wyoming than in other states owing to their large shares of publicly owned land. State energy tax codes are subject to frequent changes as well. For instance, Alaska now allows producers to take a credit against severance tax liabilities for capital expenditures used in exploration and development, whereas this feature was not available in 2007 and thus is not reflected in Table 9.1.

In New Mexico and North Dakota, the severance tax is actually the sum of two or more different levies on net production value. In Colorado, severance taxes are paid at graduated rates that depend on the gross income of operators, and in Alaska, Oklahoma, and Utah prevailing rates depend on the price of oil. In Colorado, Kansas, and Wyoming, local governments levy a substantial tax against the value of energy production. Although this tax is generally called a property tax by tax administrators, it is in

[2] The year 2007 is the most recent year for which effective tax rate data could be assembled (see discussion below).

[3] California does levy a property tax on reserves in the ground (see below).

[4] See footnotes to Table 9.1.

Table 9.1. *Oil production (in Mbbl) and tax rates for selected U.S. states, 2007*

State	Production	Severance tax		Corporate income tax rate[o]
		Nominal rate	Effective rate	
Alaska	263,595	12.25–15%[a]	12%	1.0–9.4%
California	216,778	None	None	8.84%
Colorado	23,237	2–5%[b]	0.7%	4.63%
Kansas	36,490	4.33%[c]	3.0%[l]	4.0–7.35%
Louisiana	76,651	3.125–12.50%[d]	9.4%	4.0–8.0%
Montana	34,829	15.1%[e]	8.6%	6.75%
New Mexico	58,831	7.1%[f]	7.5%[m]	4.8–7.6%
North Dakota	45,058	5.0–11.5%[g]	–[n]	2.6–7.05%
Oklahoma	60,952	7.0%[h]	6.9%	6.0%
Texas	396,894	4.6%[i]	3.1%	1.0%[p]
Utah	19,520	3.0–5.0%[j]	2.4%	5.0%
Wyoming	54,130	4.0–6.0%[k]	5.3%	None

[a] Lower rate applies to fields in production less than 5 years; higher rate applies to fields in production more than 5 years.

[b] Rate depends on gross income of operator and excludes county ad valorem taxes at 4–10%.

[c] Excludes county ad valorem taxes of approximately 4%.

[d] Tax rate of 3.125% applies only to stripper well production.

[e] Rate applies to nonworking interest owners; working interest owners pay lower rates that vary by type of well.

[f] Rate is the sum of oil severance tax, oil school tax, and oil conservation tax; local ad valorem taxes at approximately 1.2% are excluded.

[g] Depends on the level of an oil extraction tax that varies by type of well; tax rate on stripper well production is 0%.

[h] Excludes ad valorem taxes that vary by county.

[i] Excludes county ad valorem levies and (small) state regulatory and conservation levies.

[j] Lower rate applies to first $13/bbl; higher rate applies above $13/bbl. Excludes county ad valorem levies; stripper well production is not subject to severance tax.

[k] Stripper well production taxed at 4%; other production taxed at 6%; excludes county levies at 5.9–7.7%.

[l] Effective rate is for oil and natural gas combined.

[m] Effective rate is for oil and gas combined.

[n] Insufficient information available.

[o] Tax rates depend on level of income before taxes for most states.

[p] This is the rate for a gross receipts tax that replaced the corporate income tax in 2007 (see Tax Foundation 2009a).

Sources: Production data from U.S. Department of Energy (2009b). Nominal severance tax rate data from Interstate Oil and Gas Compact Commission (2007). Effective severance tax rate data are authors' calculations (see text). State corporate income tax rate data from Tax Foundation (2009a).

effect a severance tax levied by local governments. Many states have granted innumerable exemptions and credits against state severance tax liabilities for special situations that may be encountered by operators. Production from stripper wells (wells that produce fewer than ten barrels per day), for example, is taxed at lower rates in some states than is production from better producing wells. Production from wells employing secondary or tertiary recovery methods is sometimes taxed at lower rates as well.

A further complicating feature in analyzing economic effects of state severance taxes is that states and the federal government levy other types of taxes on oil producers and tax bases interact, particularly at the state and federal levels. Except for Wyoming, all of the twelve states levy a corporate income or franchise tax that applies to oil producers. Nominal rates for this tax, taken from the Tax Foundation (2009a), are shown for each state in Table 9.1. State corporate income taxes often are levied on a similar base to that used in computing federal corporate income tax liabilities, but the state tax rates generally are lower than the top federal rates for this tax, which currently are in the 35 to 40 percent range (Tax Foundation 2009b). State corporate income tax payments are deductible against federal corporate income tax liabilities, and state and local production tax payments are deductible against both. In some states, federal corporate income tax payments are deductible in computing state corporation income taxes and in others it is not. Although local governments in most of the states utilize some form of a property tax on oil and gas extraction equipment, property taxes on reserves are levied only in relatively few states such as California and Texas.

State and local tax burdens on oil producers are endlessly compared in state tax commission and legislative hearings as industry representatives make their case for more favorable tax treatment. Yet, because of variations across states in the application of severance and other taxes, a comparison of nominal tax rates is not particularly useful. A judgment based on a comparison of nominal rates that one state's severance tax, for example, is higher than that in another state might easily be reversed once the potentially numerous exemptions, credits, incentives, deductibility, and other special features of tax law are accounted for. Instead, more meaningful comparisons across states can be obtained by computing effective tax rates expressed as the ratio of revenue collected from a particular tax to the value of production. The calculation of effective tax rates fully accounts for, without enumerating, state-specific aspects of tax treatment faced by producers and facilitates comparisons between states because the value of production is used as a common denominator.

Table 9.1 presents effective severance tax rates prevailing in 2007 for the twelve most important oil-producing states. Unfortunately, information regarding severance tax collections is neither available from a single source nor published in a common format. In consequence, data on severance tax collections needed for the numerators of the effective tax rates were obtained by searching state department of revenue reports available on the Internet and by directly contacting knowledgeable people in these agencies as questions arose. Estimates of the value of production in each state were obtained by multiplying production volumes by the average prevailing price per barrel of crude oil. State production volumes were obtained from the Energy Information Administration, U.S. Department of Energy (2009b). Average wellhead prices of oil in each state were taken from the American Petroleum Institute (2009). The price and production volume data exclude oil produced in the Outer Continental Shelf (OCS) that is not subject to state taxation. As shown in Table 9.1, among states that levy a severance tax, effective tax rates in 2007 vary from 0.7 percent in Colorado to 12 percent in Alaska. Because of the many special tax code features just discussed, these rates tend to be lower than corresponding nominal tax rates.

9.3 Prior Literature

A sizable literature deals with the economic effects of the three types of taxes discussed in the previous section. It may be useful to briefly describe this work before proceeding with the theoretical structure we assume in this chapter. Discussion is limited to intertemporal issues; thus, topics such as interstate tax shifting or "tax exporting" are ignored (Gerking and Mutti 1981; McLure 1969; Metcalf 1993). The severance tax is given the most detailed treatment because it has been widely adopted and because its effects are the focus of the simulations presented in Section 9.6.

9.3.1 Production Taxation

Hotelling's (1931) seminal analytic work considers a per unit severance tax in a model with an endogenous price (net of constant extraction costs) and the total exhaustion of fixed reserves. The severance tax is found to conserve the resource by extending the time it takes to exhaust the total pool. Herfindahl (1967) extends this result with a model that features an extraction cost function that depends on output. Under competition, the severance tax is shown to tilt production to the future (i.e., delay production), thereby

extending the life of the pool. The pool is fully exhausted at a postponed terminal period.

Burness (1976) reformulates the dynamic framework by including severance tax rates that vary over time. In this model, price is exogenous, reserves are fully depleted, and extraction cost depends only on output. The general proposition derived is that the severance tax will tilt production to the future if the tax rate is held constant or rises at a rate less than the discount rate. A severance tax that rises with the discount rate will not distort the time path of production. Conrad and Hool (1984) show that introducing varying grades of the resource into the model make no difference to this result.

Levhari and Leviatan (1977) allow for an extraction cost function that depends on both current and cumulative production so that as more of the resource is extracted over time, the more it costs to produce an incremental unit. Thus, in this model, the resource may not be fully exhausted. The effect of per unit severance taxation on time to exhaustion now is ambiguous. If the resource price is constant over time, terminal time is shortened and high-grading (removing ore of the highest grade while leaving lower grade ore in the ground) may occur. Nonetheless, if tax rates vary over time, then, as Heaps (1985) demonstrates, total recovery of the resource and the economic life of the resource can either increase or decrease but in opposite directions. Because these two effects of the tax work against each other, the net impact on depletion cannot be determined.

If resource quality varies across pools but is the same within a pool, Conrad (1978, 1981) shows that mine lives are shortened and lower-quality resource is left in the ground when a per unit severance tax is levied. Krautkraemer (1990) examines the effect of production taxation in a finite reserve model when resource quality varies within a given deposit. In addition to firms choosing the rate of extraction, they also choose the marginal grade cutoff at each point in time. A production tax induces high-grading at each instant of time and not just at the end of the production program. Interestingly, a production tax reduces total resource recovery and a low-grade resource left in the ground will not be extracted, even if at some point in the future the production tax is eliminated.

Uhler (1979) includes a brief examination, for the first time, of the effects of production taxation in a model of nonrenewable natural resource extraction with both production and exploration. The possibility of exploration means that the reserve base is no longer fixed. Also, when the model allows for exploration and reserve additions, the dynamics of the process become complex and equilibrium conditions no longer have closed form solutions.

Effects of production taxation, therefore, were examined with simulations. The model was parameterized for a small oil- and gas-producing region in Alberta, Canada. When a severance tax is imposed at a constant rate, operators decrease production and exploration in all periods while the endogenous price of the resource rises.

Deacon (1993) also simulates effects of severance taxation using the model developed by Pindyck (1978) and later applied by Yücel (1986, 1989). In Deacon's formulation, the oil industry is taken to be competitive, so the time path of the resource price is treated as exogenous. In the simulations, the resource price is assumed to rise in the early years of the production program, but at a rate less than the assumed 5 percent discount rate. Similar to the analytic results derived by Burness (1976) and others in models that abstracted from exploration, the application of an ad valorem severance tax tilts production to the future in comparison to a no-tax base case. Over the life of the program, however, the tax reduces output, implying that an important effect of the production tax is to induce high-grading. In addition, simulations show that a production tax reduces drilling in all periods and that drilling shuts down prematurely in comparison to the no-tax case.

Kunce et al. (2003) also simulate effects of production taxation using the Pindyck (1978) framework, but they parameterize the model for a single state (Wyoming) rather than the nation as a whole, as was the case in the Deacon (1993) study. They consider the effect of doubling the state's production tax on oil extraction in a setting where oil producers are assumed to be price takers. A key feature of this study was to embed the production tax in a broader tax system that allowed for interactive tax bases and tax shifting between the local, state, and federal governments. Simulations demonstrate that a hypothetical doubling of Wyoming's production tax leads to reduced drilling and reduced oil production in each subsequent period. Estimated production declines, however, are comparatively modest; the response of production with respect to the tax change turns out to be highly inelastic (-0.06). Thus, the main effects of the tax increase would be to rather dramatically increase Wyoming's severance tax revenue and to reduce federal corporate income taxes paid by producers.

9.3.2 Property Taxation

Taxation of property, specifically reserves, has received little attention in the literature on production from nonrenewable resources. One reason for this may be the practical complexity of levying such taxes. Nonetheless, Hotelling (1931) demonstrates that a constant percentage tax on the value of reserves

will induce firms to extract more rapidly as they attempt to "mine out from under the tax." Conrad and Hool (1981) show that a constant tax rate per unit of reserves encourages extraction of higher-grade resource in the early periods of the program, but the cutoff grades are lower, thus extending the life of the mine. The property tax is also examined by Heaps and Helliwell (1985) in a model that allows for new reserve investment. The tax is shown to tilt production to the present and to reduce investment in new deposits to avoid holding costs. Simulations by Gamponia and Mendelsohn (1985) show that a property tax on reserves results in tilting production to the present. Deacon (1993) obtains the same outcome in his simulation study and also confirms the Heaps and Helliwell (1985) result by showing that the property tax on reserves results in lower levels of drilling in the early years of the program.

9.3.3 Income Taxation

Burness (1976) analyzes a profits tax on a nonrenewable resource producer with fixed reserves and concludes that output trajectories will not change when the tax is applied at a constant rate. If the tax rate increases over time, however, firms will speed up depletion of the fixed reserve. Conrad and Hool (1984) model a progressive profits tax, finding that such a tax will not exhibit the neutrality of a flat rate profits tax with regard to the extraction path and grade selection. Deacon (1993) simulates a structure broadly similar to federal corporate income taxation with expensing of current and capitalized drilling costs. Simulated paths of extraction, drilling effort and reserves show little distortion from the no-tax base case. These results suggest that income taxation is the least distortionary among the three types of energy taxes imposed by U.S. states.

9.4 Conceptual Framework

We propose a simple dynamic model in the tradition of Hotelling (1931) and Pindyck (1978) with some modifications. The idea is to examine the producers' response when states or a social planner imposes a menu of taxes and subsidies on oil production. We consider three tax/subsidy instruments – a severance tax, a corporate income tax, and a subsidy on drilling expenditures. Producers choose the optimal amount of drilling (and therefore reserve additions) and production of oil to maximize profits.

The model is dynamic, with a known discount rate and no uncertainty. Resource producers face an output price of the commodity that is

exogenously determined. Ideally, output prices should be endogenously determined through the process of dynamic optimization, as in Pindyck (1978). However, because our goal is to examine the effect of various tax regimes under assumptions of alternative petroleum prices and a single U.S. state produces only a small fraction of world output, the exogenous price assumption may be a reasonable approximation. In any case, a partial equilibrium model with endogenous prices may leave too many factors that critically affect oil prices out of the model (e.g., international financial markets, world economic growth).

Let the output price of petroleum be given by $p(t)$ where the argument t denotes time. Then the social planner imposes a set of taxes $(1 - \alpha_p)$ such that the net price received by the producer is the fraction α_p times the price.[5] Thus, the production revenue accruing to producers of energy is given by $\alpha_p p q$ where q is the quantity of oil sold by the producer. We assume that whatever is extracted is sold – there is no storage.

Because we distinguish between production and exploration, we define reserves R at any given time t and the cumulative addition to the stock of petroleum given by x. The relationship between stocks and reserves is given by the differential equation

$$\dot{R}(t) = f(w, x) - q \tag{9.1}$$

That is, the change in reserves is equal to the addition in reserves net of production, as in Pindyck (1978). The function f represents the addition to reserves as a function of drilling effort w and cumulative additions to the stock x and we assume that $f_1 > 0$; $f_{11} > 0$; $f_2 < 0$ $f_{22} > 0$ and $f_{12} < 0$. More drilling effort (w) leads to higher reserve additions, but at a decreasing rate. Higher cumulative discoveries x cause current reserve additions to decline (at a decreasing rate). It is more difficult to add to the reserve base, the higher the discoveries made in the past. Finally, the marginal effect of reserve additions as a function of drilling decline with increases in cumulative stock. For convenience we assume that the stock of resource grows linearly with drilling effort. However, the cost of drilling increases in a convex fashion with drilling effort, given by $k(w)$ where $k'(w) > 0$; $k''(w) \geq 0$ and $k(0) = 0$. Finally, the total cost of extraction is given by $c(q, R)$ with $c_1 > 0$, $c_2 > 0$, $c_2 < 0$, $c_{22} > 0$ and $c_{12} < 0$.[6] That is, the total "lifting" cost increases with quantity produced – for instance,

[5] The tax parameter α_p and two other tax parameters to be defined momentarily are empirically specified in the next section.

[6] In Pindyck's (1978) original formulation, both average and marginal lifting costs depended on R but not on q.

as oil is extracted from greater depths – and it also decreases concavely with current reserves. This specification follows from the view that oil is produced using reserves (a form of capital) and nonreserve inputs (i.e., physical capital other than reserves and labor), so that extraction costs are positively related to output and negatively related to reserves. The cross-partial derivative c_{12} is assumed to be negative.

We introduce two other tax/subsidy parameters in this framework, namely, the portion $(1 - \alpha_c)$ of the production cost that is deductible in computing tax liabilities, so that the net production cost faced by firms is $\alpha_c c(q, R)$ and the part $(1 - \alpha_D)$ that is deductible by the firm, which implies that the net drilling cost payable by the firm is given by $\alpha_D k(w)$. The major goals in this chapter are to examine how the three different tax/subsidy policy instruments, given by α_p, α_c and α_D, affect drilling activity, reserve additions, and production, as well as to compare their corresponding revenue and welfare implications.

Finally, given a fixed discount rate $r > 0$ the social planner solves the following problem:

$$\underset{q,w,x,R}{Max} \int_0^{\infty} [\alpha_p p q - \alpha_c c(q, R) - \alpha_D k(w)] e^{-rt} dt \tag{9.2}$$

which is subject to the following equations:

$$\dot{x} = w \tag{9.3}$$

and

$$\dot{R} = f(w, x) - q \tag{9.4}$$

The current value Hamiltonian for this problem is

$$H = \alpha_p p q - \alpha_c c(q, R) - \alpha_D k(w) + \lambda w + \theta[f(w, x) - q] \tag{9.5}$$

so that the first-order conditions are given by

$$\alpha_p p \leq \alpha_c c_q + \theta \; (= \; iff \; q > 0) \tag{9.6}$$

$$\theta f_w \leq \alpha_D k_w - \lambda (= \; iff \; w > 0) \tag{9.7}$$

$$\dot{\lambda} = r\lambda - \theta f_x \tag{9.8}$$

$$\dot{\theta} = r\theta + \alpha_c c_R \tag{9.9}$$

along with transversality conditions not shown here. The co-state variable λ represents the shadow price of an additional unit of discovered oil. Note that the higher the cumulative discoveries, the lower the additions to reserves. Hence, the shadow price λ will be negative. The shadow price θ represents the discounted increment to profits resulting from the addition of one unit of reserves. Reserves decrease the cost of production and therefore θ should be positive.

An important implication of the model (see equation (9.6)) is that the firm will decide to produce $(q > 0)$ if the discounted after-tax wellhead oil price net of marginal extraction costs exceeds the present value of future profits from an additional unit of reserves (θ).[7] Condition (9.7) equates the marginal benefits and costs of an additional well drilled. The benefits are in the form of an increase in reserve additions, which are given by the expression θf_w. The costs are twofold: the marginal cost of drilling net of drilling subsidies denoted by the term $\alpha_D k_w$ plus the negative effect on reserve additions from an addition to the cumulative resource stock given by λ.

Equations (9.8) and (9.9) give the time path of the derivatives for the two shadow prices λ and θ. The rate of increase in the shadow price λ has two components – the discount rate r and the fact that taking out a unit of resource increases the "cost" in the future through lower marginal reserve additions. Because f_x is assumed to be negative, the first term $r\lambda$ is negative and the second term $-\theta f_x$ is positive. At least initially the latter term is likely to be large because of the high value of reserve additions, in which case $\dot{\lambda}(t)$ is likely to be positive and the value of lambda, which is negative, will decline over time. In this model, then, additions to stock adversely impact reserve formation; hence, the interpretation is completely different than in the standard Hotelling model with no exploration activity. The extra cost of drilling is that it decreases the future benefit of drilling. The time path of the marginal value of a unit of reserve θ also increases at the rate of discount but is tempered by its effect on lifting costs – additions to reserves have the added benefit of helping reduce the cost of production, net of production subsidies. This is given by the negative term $\alpha_c c_R$.

In this chapter we do not focus on the analytics of this model, which is similar to the model developed by Pindyck with some key differences. The

[7] Notice that condition (9.7) differs from the corresponding condition derived by Pindyck (1978) in that marginal lifting costs increase with increases in q. Consequently, rather than producing at some maximum rate subject to constraints given by reserve levels, geology, and technology, the firm pays attention to how its lifting costs are affected by the level of output.

main difference is that his production costs are independent of reserves, whereas in our case, production costs decline with cumulative reserves. Moreover, here the focus is on the three tax/subsidy instruments, and we show how they play different roles in influencing production and drilling behavior by firms.

9.5 Calibration of the Simulation Model

Simulations from the model developed in the previous section are constructed based on estimates of the drilling cost, lifting cost, and reserve additions equations, specifying values for the tax/subsidy and other parameters.

9.5.1 Equation Estimates

Estimation of $k(w)$ and $f(w, x)$ are treated together because they are used to compute the marginal cost of reserve additions (k_w/f_w), a key relationship in the model described above. Drilling cost per foot is assumed to be linearly related to footage drilled, as shown in equation (9.10):

$$k(w)/w = \phi w + u \tag{9.10}$$

where ϕ is the parameter to be estimated and the disturbance term u is normally distributed. This specification ensures that the marginal cost of drilling is positive and increasing in footage drilled as long as $\phi > 0$. Using annual data for the United States from 1959 to 2007, with drilling cost per foot measured in year 2000 dollars and footage drilled measured in millions of feet, the least squares estimate of ϕ is 1.23 with t-statistic of 8.17.[8]

The production function for gross reserve additions is specified as

$$f(w, x) = A w^{\rho} e^{-\beta \cdot x} e^{v} \tag{9.11}$$

where A, ρ, and β are parameters to be estimated and the disturbance term e^{v} is assumed lognormally distributed with mean of unity and variance σ_v^2. Equation (9.11) is similar to the one describing the discovery process proposed by Uhler (1976) and later adopted by Pindyck (1978). The idea behind this equation is that the marginal product of drilling declines as footage drilled accumulates. Estimation of equation (9.11) used annual data from seven important oil-producing U.S. states (California, Kansas, Louisiana, New Mexico, Oklahoma, Texas, and Wyoming) for which complete information on the requisite variables was assembled for the period 1970–97.[9] Oil reserve additions are defined as extensions, new field discoveries and new reservoir discoveries in old fields. The footage drilled variable was defined as in equation (9.10) and the cumulative footage variable was created by adding year-by-year over the sample period for each state. After taking natural logarithms of equation (9.11) and with state-effects included, we obtain least squares estimates of $\rho = 0.95$ (t-statistic = 14.18) and $\beta = 0.000437$ (t-statistic = 1.37). The value of A (28.78) was selected so that the equation predicted U.S. reserve additions in 2007. This equation shows that the marginal product of drilling (f_w) decreases with footage drilled as well as with cumulative drilling, although the coefficient of cumulative drilling is insignificant at conventional levels.

Because data on oil extraction costs are weak, $C(q, R)$ could not be econometrically estimated. Instead, this equation was calibrated for the United States with a Cobb-Douglas functional form using methods described in Deacon (1993). Results show that if the output elasticity of nonreserve inputs is 0.35, then for 2007, $C/q = 458.1(q/R)^{1.86}$. The value of 458.1 is selected so that the right-hand side will predict average U.S. operating cost per barrel in 2007 of $7.56.[10] Note that the Cobb-Douglas form implies that extraction costs rise without limit as reserves approach zero and fall as production declines.

9.5.2 Specification of Tax/Subsidy Parameters

Values for the parameters α_j ($j = p, c, D$) were specified by choosing representative rates of state and federal taxes faced by oil producers and then inserting these values into equations (9.12) through (9.14).

$$\alpha_p = (1 - \tau_{us})(1 - \tau_s)(1 - \tau_r)(1 - \tau_p) + \tau_{us}(1 - \tau_r)\gamma \tag{9.12}$$

$$\alpha_c = (1 - \tau_{us})(1 - \tau_s) \tag{9.13}$$

$$\alpha_D = \{(1 - \tau_{us}\eta - (1 - \tau_{us})\delta)\} \tag{9.14}$$

In equations (9.12), (9.13), and (9.14), τ_{us} denotes the federal corporate income tax rate, τ_s is the state corporate income tax rate, τ_r denotes the royalty rate on production from public (state and federal) land, τ_p is the

[8] Data were taken from American Petroleum Institute (2009).

[9] Data were taken from American Petroleum Institute (various years).

[10] Data were taken from U.S. Department of Energy (2009a).

state severance tax rate, and δ represents the percentage of drilling costs that may be taken as a credit against state severance tax liabilities. This credit is a prominent tax code feature in Alaska. Also, γ represents the federal percentage depletion allowance weighted by the percentage of production attributable to eligible producers (nonintegrated independents), and $\eta = e + (1 - e)f$ denotes the expensed portion of current and capitalized drilling costs attributable to current period revenues for purposes of computing federal corporate income tax liabilities, where e is the percentage of current period drilling costs expensed for tax purposes and f is the present value of cost depletion deductions per unit of depletable expense (see Deacon 1993 for further details).

These equations do not capture all aspects of the tax code facing oil producers. Instead, they merely reflect important tax features and relationships between taxes affecting the oil industry in most states and at the federal level: (1) severance taxes are levied on the wellhead price of oil; (2) royalty payments for production on public land are deductible in computing state severance tax liabilities; (3) public land royalty payments, state severance taxes, and extraction costs are deductible in computing state corporate income tax liabilities; and (4) public land royalty payments, state severance taxes, and state corporate income taxes are deductible in computing federal corporate income taxes. Federal corporate income tax payments are adjusted because of the percentage depletion allowance and special treatment of drilling costs. These equations highlight interaction between tax bases and are more detailed than the corresponding treatment given by Moroney (1997) and Deacon et al. (1990). The equations incorporate the entire tax structure into the model, rather than simply analyzing one tax at a time as in Deacon (1993). Equations (9.12) through (9.14), however, ignore local taxes on the value of production as well as possible property taxes on reserves (levied by relatively few states). As noted in Section 9.2, state tax treatment of the oil industry is not uniform; the specification of the parameters α_j ($j = p, c, D$) would require reformulation to represent the tax structure of a particular state.

9.5.3 Values of Tax/Subsidy Parameters Used in Simulations

Four simulations of the model are considered in the following section. The base case simulation considers a situation in which no taxes are levied and no subsidies are allowed (No-tax Model A); the values for the tax parameters are $\alpha_p = 1$, $\alpha_c = 1$, $\alpha_D = 1$. The Low-tax Model B considers a situation in which the nominal severance tax rate is $\tau_p = 0.12$, the state corporate income tax rate is $\tau_s = 0.06$, and public land royalty payments as a fraction of total production value is $\tau_r = 0.09$. These choices for state corporate income tax and severance tax rates are broadly representative of actual nominal rates for these taxes (see Table 9.1). The public land royalty payment fraction is similar to actual values for oil-producing states in the western United States (Gerking 2005). At the federal level, the effective federal corporate income tax rate is set at $\tau_{us} = 0.30$. The current nominal depletion rate of 15 percent applies to about 60 percent of U.S. oil production; thus, $\gamma = 0.09$.[11] The expensed portion of current period drilling costs is approximately 40 percent for the industry, and the present value of depletion deductions for capitalized drilling cost can be approximated by $(q/R)/(r + (q/R))$, assuming that it is approximately 8 percent; therefore $\eta = 0.40 + (1 - 0.4)^*(0.08/(0.04 + 0.08)) = 0.8$. The parameter δ is set to zero. Thus, the tax policy parameters for Model B are $\alpha_p = 0.55$, $\alpha_c = 0.67$, $\alpha_D = 0.76$.

The High-tax Model C sets all taxes equal to their Model B values, except for the severance tax, which is set at $\tau_p = .25$. Hence, $\alpha_p = 0.47$, $\alpha_c = 0.67$, $\alpha_D = 0.76$. The Drilling Subsidy Model D sets all tax parameters equal to their Model C values, except that δ is set to 0.22, so that $\alpha_p = 0.47$, $\alpha_c = 0.67$, $\alpha_D = 0.61$.

9.5.4 Other Parameters

Each model uses a discount rate of $r = .04$, an oil price of $p = \$70$ per barrel, and is run for 110 periods at which point drilling all but ceases in the four models because it is no longer profitable. The initial value of reserves (R) was set to 20 billion barrels. This value approximates the quantity of proven reserves for the United States in 2007. The initial value of cumulative footage drilled was arbitrarily set to 2 billion feet, which is roughly equal to the cumulative footage for oil wells drilled in the United States in the past 30 years.

9.6 Discussion of Simulation Results

Results of simulations are obtained from solving the first-order equations of the model (equations (9.6) and (9.9)) after substituting values of the

[11] The percentage of production accounted for by nonintegrated independents was approximated by subtracting from unity the ratio of oil and natural gas liquids production by producers subject to USDOE financial reporting system (FRS) requirements to total oil and total natural gas liquids production. For 2007, this ratio was 0.612. Data were taken from U.S.Department of Energy (2009c, 2009d, 2009e).

Table 9.2. *Selected values from solutions for the four models: Year 1*

	Model A	Model B	Model C	Model D
Production in billions of barrels (q)	2.33	2.16	2.03	2.03
Drilled footage in millions of feet (w)	92.44	72.21	63.43	74.26
After-tax price per barrel received by producers ($\alpha_p P$)	$70.00	$38.50	$32.90	$32.90
After-tax marginal extraction cost of one additional barrel ($\alpha_c C_q$)	$24.03	$13.98	$12.46	$12.46
Reserve additions from drilling an additional million feet in billions of barrels (f_w)	0.0091	0.0092	0.0093	0.0092
Total reserve additions in billions of barrels (wf_w)	0.841	0.664	0.588	0.683
After-tax marginal cost of drilling one additional foot ($\alpha_D k_w$)	$227.40	$135.00	$118.59	$111.43
Beginning reserves in billions of barrels (R)	20	20	20	20
Ending reserves (R)	18.55	18.50	18.56	18.65
θ	$45.80	$24.50	$20.50	$20.50
λ	$227.00	$135.00	$119.00	$111.00

tax/subsidy parameters and specific equations for drilling costs (equation (9.10)), reserve additions (equation (9.11)), and lifting costs. Table 9.2 shows selected solution values for year 1 for the four models.

In year 1 for Model A, for example, solutions for the level of production and footage drilled are 2.3 billion barrels per year (6.4 million barrels per day) and 92.44 million feet, respectively. These values, together with initial reserves set to 20 billion barrels and $P = \$70$, imply that the marginal cost of extracting an additional barrel of oil is $c_q = \$24.03$ and the marginal cost of drilling an additional foot is $227.40. Over the course of year 1, reserves fall because production exceeds reserve additions. The present value of future profits from an additional barrel of reserves is $\theta = \$45.80$ (see equation (9.6)), and the present value of drilling cost reductions from an additional unit of reserves is the negative of $\lambda = \$227$ (see equation (9.7)). Both of these two shadow prices steadily converge toward zero over time.

Values presented in Table 9.2 for Models B and C are interpreted similarly. In these two models, production and drilling are lower than in Model A, in part because the severance tax causes prices received by producers to fall disproportionately relative to extraction and drilling costs. In Model D, production is the same as for Model C because tax rates and initial values

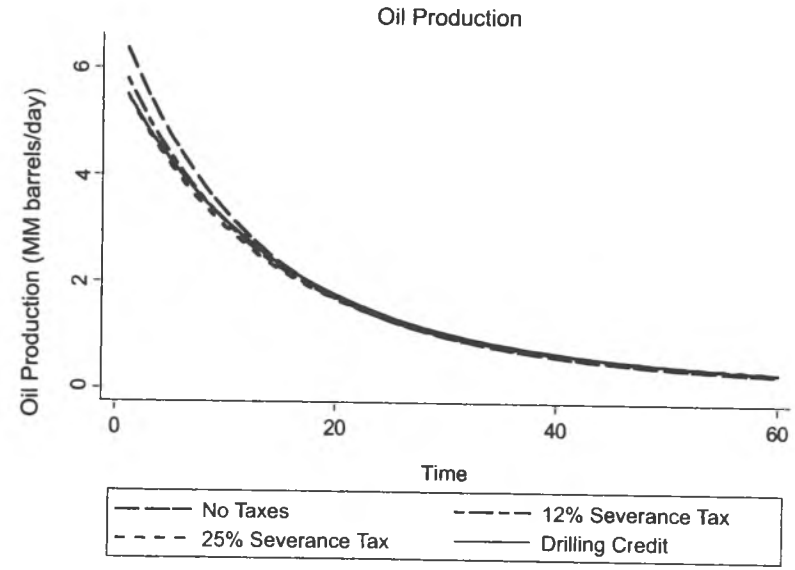

Figure 9.1. Oil production is quite insensitive to the tax structure in the U.S. case.

of reserves are the same, but footage drilled is higher because of the drilling expense subsidy. In all three models, the shadow values λ and θ converge toward zero over time, just as in Model A.

Figure 9.1 shows the time profile of oil production in millions of barrels per day for each of the four models.

In each model, production declines substantially over time. The no-tax case (Model A) shows the highest production rates. The introduction of taxes in Model B tilts production (slightly) to the future, as predicted by models of extraction from fixed reserves (see Section 9.4). Numerical calculations indicate that production rates for Model B are lower than for Model A until year 26, at which point production rates become higher for Model B than for Model A. In Model C, tilting of production to the future is more pronounced in comparison to Model A than it is for Model B because of the higher severance tax rate assumed. Production in Model C is lower in the early years of the program, but begins to exceed production in Model B by year 27. Introduction of the subsidy for drilling expenses tilts production back to the present in comparison with Model C. Model D production initially exceeds that for Model C, but is lower than that for Model C after year 48.

Figure 9.1 also shows that production is relatively insensitive to changes in tax rates and therefore to changes in prices received by operators. Cumulative production figures for the 110-year program period confirm this result (Table 9.3).

More specifically, comparing Model A with Model C, the arc elasticity of cumulative production with respect to a change in severance tax rates $((\Delta q/q)/(\Delta \tau_p/\tau_p))$ is only $(-1.4/38.7)(0.125/0.25) = -0.02$. This outcome implies that the arc elasticity of cumulative production with respect to a change in prices received by operators is $(-1.4/38.7)(56.7/-26.6) = 0.05$. Of course, these simple elasticity calculations are based on cumulative production totals and do not take the timing of production into account, but as shown in Figure 9.1, the time path of production does not differ greatly across the four models.

Oil production also would be insensitive to changes in the percentage depletion allowance rate (η) that can be used by nonintegrated independent producers in computing federal corporate income tax liabilities. As shown in equations (9.12) through (9.14), a reduction in either η or an increase in the severance tax rate τ_p lowers α_p while leaving α_c and α_D unchanged. In fact, given the values of the tax parameters used for Models B, C, and D, eliminating the percentage depletion allowance would have the same effect on production as a four percentage point increase in the severance tax. This parallel between changes in severance tax rates and the changes in the percentage depletion allowance may be of interest in light of the Obama Administration's proposal to eliminate the latter tax preference (see Krueger 2009). Of course, changes in the severance tax and changes in the oil depletion allowance will not have equivalent effects on the collection of other taxes at the state and federal levels.

Insensitivity of oil production to severance tax increases would be to some extent expected in these simulations because a key effect of the tax simply is to reduce industry profits. The assumed price of oil ($70/bbl) is relatively high by historical standards; thus, discounted profit is a relatively large percentage (80 percent) of discounted total revenue. In consequence, the array of taxes imposed in Model B can cut into profits without substantially altering drilling or production. Kunce et al. (2003) found somewhat greater responsiveness of oil production to changes in severance tax rates when setting P (P = $23) at a lower value than the one used in this study. In their simulations, which envision a lower ratio of profit to total revenue, the long-run elasticity of production to changes in the severance tax rate was −0.06.

Table 9.3. *Total drilling, production, tax collections, profits, and reserves for four models over the 110-year program*

	Model A no taxes	Model B 12% severance tax	Model C 25% severance tax	Model D 25% severance tax with drilling subsidy
Total production (in billions of barrels)	39.4	38.5	38.0	38.6
Total footage drilled (in billions of feet)	4.5	3.9	3.6	3.9
Discounted public land royalties (in billions of dollars)	$0	$131.0	$126.3	$129.3
Discounted severance tax Collections (in billions of dollars)	$0	$159.0	$319.2	$307.5
Effective severance tax Rate	0	0.109	0.228	0.212
Discounted state corporate income tax revenue (in billions of dollars)	$0	$60.9	$49.6	$50.8
Discounted federal corporate income tax revenue (in billions of dollars)	$0	$230.0	$182.5	$188.4
Discounted depletion allowance deductions (in billions of dollars)	$0	$119.2	$114.9	$117.7
Discounted pre-tax total revenue (in billions of dollars)	$1,544	$1,456	$1,403	$1,437
Discounted extraction costs (in billions of dollars)	$186.3	$151.8	$130.1	$133.0
Discounted drilling costs (in billions of dollars)	$125.6	$84.4	$68.3	$88.3
Discounted firm profits (in billions of dollars)	$1,231	$638	$527	$539
Beginning reserves (in billions of barrels)	20	20	20	20

In any case, the inelasticity of production with respect to severance tax and price changes suggests that severance tax collections computed as $s = \tau_p(1 - \tau_r)pq - \delta k(w)$ should increase roughly in proportion to changes in the tax rate when $\delta = 0$. As shown in Table 9.3, discounted (at 4 percent) severance tax collections over the 110-year program period total $159.0 billion for Model B and $319.2 billion for Model C. Effective severance tax rates for these two models are 0.109 and 0.228, respectively. These figures suggest that the arc elasticity of discounted severance tax collections with respect to a change in the effective tax rate is 0.95 (assuming unchanged royalty rates and oil prices). Model D, which includes the credit ($\delta = 0.22$) for drilling expenses, reflects smaller severance tax collections than Model C.

Table 9.3 indicates that severance tax rate increases result in lower collections of both state and federal corporate income taxes. Because of the deductibility of severance tax payments against these two taxes, discounted state corporate income tax collections fall from $60.9 billion in Model B to $49.6 billion in Model C, and discounted federal corporate income tax collections fall from $230.0 billion in Model B to $182.5 billion in Model C. Notice that the decline in federal corporate income tax collections is cushioned by declines in depletion allowance deductions ($119 billion to $114.9 billion) and in deductions for current and capitalized drilling costs. The value of these two deductions declines because both production and drilling are lower in Model D than in Model C. Also, discounted oil industry profits fall sharply when all taxes are imposed (compare Model A with Models B and C). In any case, the main effects of severance tax rate increases are to redirect (1) oil industry profits to the public sector and (2) tax payments from the federal level to the state level.

Although the specific way in which the model is parameterized may be responsible for the relative insensitivity of production to changes in oil prices and severance tax rates, results shown in Figure 9.1 and Table 9.3 are broadly consistent with U.S. experience over the past half-century. Figure 9.2 shows this by plotting total U.S. proven reserves (in billions of barrels), total U.S. production from proven reserves (in hundred millions of barrels), and the real price of crude oil (in year 2000 dollars).

Proven reserves stood at roughly 30 billion barrels from 1959 to1970, increased to nearly 40 billion barrels in 1971 with the discovery of oil in Prudhoe Bay, and then declined steadily thereafter to 20.9 billion barrels in 2007. Over this time period, production followed a similar pattern, remaining between 8 percent and 11 percent of reserves in each year; on average, production represented 9.2 percent of reserves with standard error

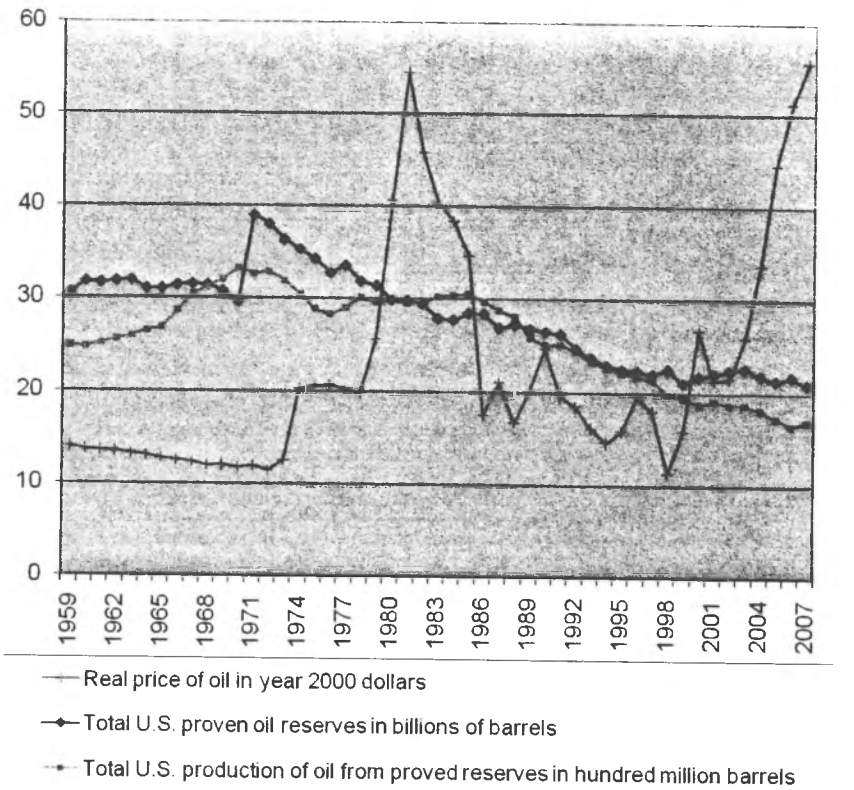

Figure 9.2. U.S. oil production has been insensitive to oil prices over the past 50 years.

of 1.34. Real crude oil prices, on the other hand, exhibited greater variability, but neither the spike in the late 1970s and early 1980s nor the price increase seen in recent years appears to have had much effect on production.

Drilling activity during the 110-year program shows greater percentage differences across the four models (see Figure 9.3 and Table 9.3) than were computed for production.

Model A has the most drilling in each year of the simulation period. Total drilling in Models B and C are lower by 13.3 percent and 20.0 percent, respectively, than in Model A, because the imposition of severance taxes reduces the future payoff from this activity. The effect of the 22 percent drilling expense credit in Model D is to increase drilling above the levels predicted for Model B, but still 13.3 percent below the level predicted for Model A. Total drilling over the 110-year simulation period (net of the starting value of 2 billion feet) is 4.5 billion feet for Model A, 3.9 billion feet for Model B, 3.6 billion feet for Model C, and 3.9 billion feet for Model D.

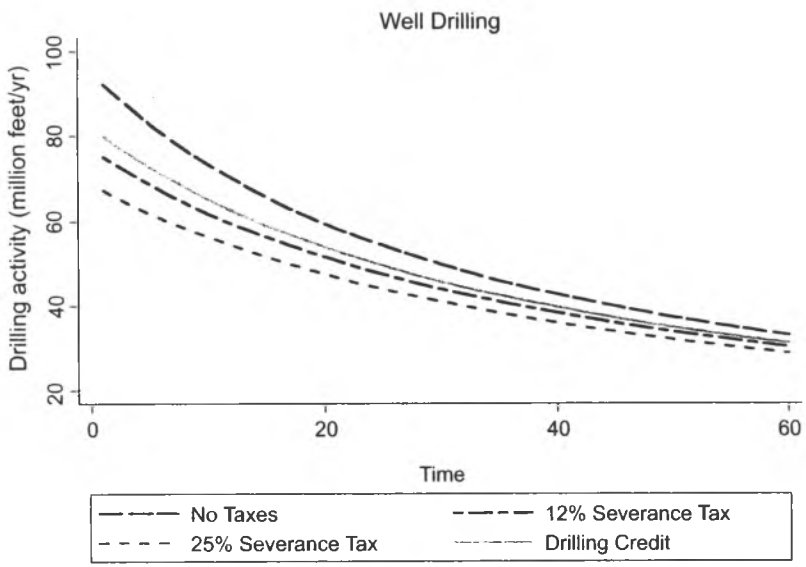

Figure 9.3. Drilling activity is more sensitive to the tax regime.

The figures presented in Table 9.3 imply that the long-run arc elasticity of footage drilled over the 110-year program with respect to the severance tax changes contemplated in Models B and C is −0.07. The corresponding price elasticity is 0.91. Thus, in percentage terms, drilling is more responsive to tax and price changes than is production. Figure 9.4 shows that these results are roughly consistent with the observed relationship between drilling footage and real oil prices (defined as in Figure 9.2) in the United States over the past 50 years.

As shown, drilling footage responds positively to changes in the real oil price, and a regression of the natural logarithm of footage drilled on the natural logarithm of the real price of crude oil yields a coefficient of the latter variable of 0.44 (t-statistic = 3.38). This estimate compares favorably with estimates produced by the simulation model.

Another perspective on the results for the time path of drilling and production can be obtained by focusing on the behavior of reserves. In all four models, initial reserves are set to 20 billion barrels. Drilling leads to annual reserve additions, and reserve additions are highest when more drilling is carried out. In consequence, reserve additions tend to be higher for Model A than for either Models B or C. Reserve additions also are higher for Model D than for Model B, again illustrating the effect of the drilling expense

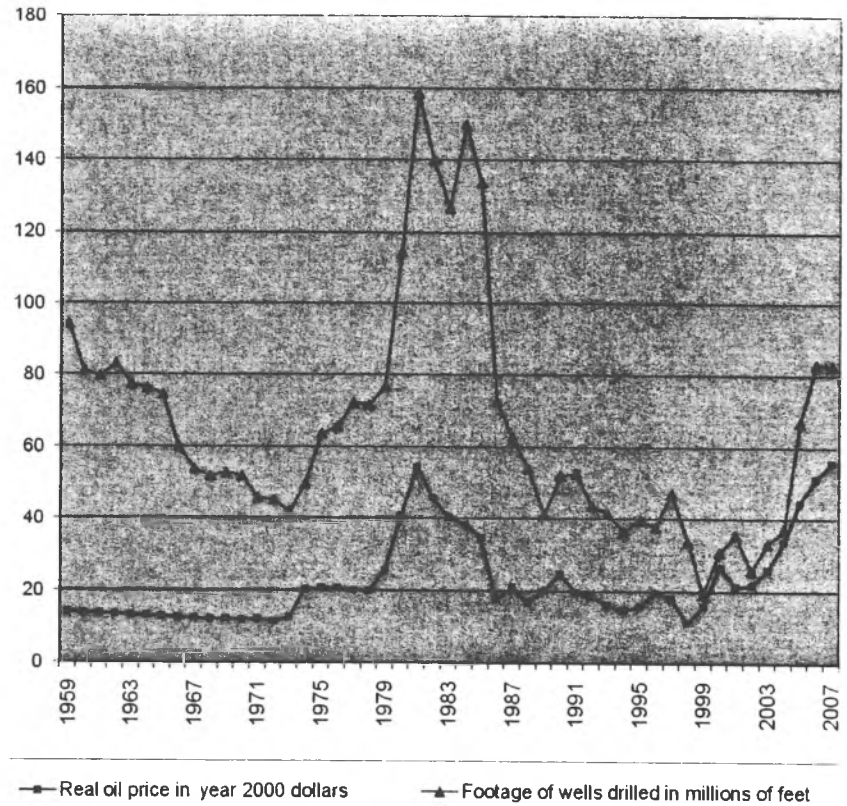

Figure 9.4. Price movements coincide with changes in footage of wells drilled.

subsidy. In all four models, however, annual reserve additions always are exceeded by annual production and thus reflect declining reserves over time. This outcome can be seen in Table 9.3 by comparing beginning reserves with the much smaller corresponding figures for ending reserves.[12] Moreover, this outcome is consistent with the previously discussed trends presented in Figure 9.2, which illustrate that U.S. proven reserves have declined by about 50 percent over the past half-century.

Table 9.3 presents additional information concerning the effect of the 22 percent drilling expense credit subsidy on drilling, production, reserves, and tax collections.[13] As discussed previously, the credit spurs drilling over

[12] The ending values for reserves reflect high-grading brought about by the severance tax, as discussed in the theoretical literature. For instance, ending reserves in Models B and C are 38 percent and 63 percent higher, respectively, than for Model A.

[13] Results presented below concerning effects of a drilling expense credit may also inform the current debate about the proposed elimination of the possibility to expense intangible

the life of the program, which adds to the reserve base and raises production (compare Models C and D). Discounted drilling expenditures rise by 29 percent ($20 billion), but because drilling expenditures rise at an increasing rate with footage drilled (see equation (9.10)), footage drilled rises by a smaller percentage (8 percent or 0.3 billion feet). The 0.6 billion barrel increase in production associated with the credit approximately offsets the effect on production of increasing the severance tax rate from 12 percent to 25 percent (compare Models B and D). Application of the credit results in 14 percent fewer remaining reserves at the end of the program (compare Models C and D) and roughly offsets the effect on ending reserves that results from the severance tax increase in Model C as compared with Model D.

The incremental production resulting from the drilling expense credit results in an increased present value of severance tax collections (gross of the credit) in Model D ($326.9 billion) as compared with Model C ($319.2 billion). Once the present value of drilling expense credits are subtracted, however, the net-of-credit present value of severance tax collections in Model D ($307.5 billion) ends up lower than in Model C by 3.7 percent, yet they are 93.4 percent higher in Model D than in Model B. Comparing Models D and C, $1.2 billion in lost severance tax revenue is regained through increased state corporate income tax collections; however, $5.9 billion in lost severance tax revenue is transferred to the federal government in the form of higher federal corporate income tax payments. In any case, the drilling expense credit results in a net loss in discounted state tax revenue of $10.5 billion. It costs about $17.50 in lost discounted state tax revenue (both severance tax and state corporate income tax) to produce an additional barrel of oil and about $35.00 of lost discounted state tax revenue to drill an additional foot. Additionally, each dollar of discounted state tax revenue lost because of the credit is associated with a $1.90 increase in drilling expenditures.

This outcome raises a question as to whether other public policy instruments, such as support for research to lower drilling costs or to increase finding rates, might spur drilling at lower cost to the state. Nonetheless, if a state's objective in granting the drilling expense credit is to gain support for increasing the severance tax rate from 12 percent to 25 percent, it is a relatively inexpensive concession. On the other hand, a state that expects the drilling expense credit to more than pay for itself through severance

drilling costs in computing federal corporate income tax liabilities. Both types of policies operate through α_D while leaving the other two tax parameters unchanged.

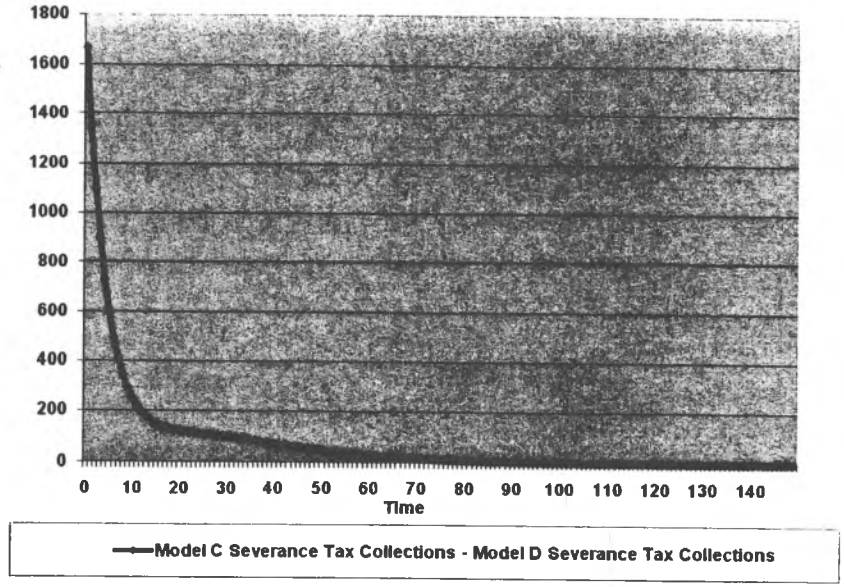

Figure 9.5. Discounted severance tax losses from the drilling expense credit accumulate over time.

tax collections will be disappointed because it simply generates too little incremental oil production. In fact, the drilling expense credit is not only cost-ineffective when evaluated over the entire program, it is cost-ineffective in each program year, as shown in Figure 9.5.

As can be seen from Table 9.2, the credit results in a 17 percent increase in drilling in year 1 (compare Models C and D), but no additional production and thus no additional revenue. Model D production begins to reflect the additional drilling in year 2 and exceeds that for Model C until year 48. During these years, severance tax losses in Model D compared to Model C are smaller than the value of the credit. As indicated, beginning in year 49, production in Model C is larger than that for Model D. Thus, in years 49 to 110, the loss in severance tax revenue in Model D compared to Model C exceeds the value of the credit.

A possible concern about these calculations is that they pertain to a model that is parameterized using U.S. oilfield data. In particular, one conjecture might be that a drilling credit might be financially more attractive in an area that has been less extensively explored, so that the marginal product of drilling in identifying new reserves would be higher. To check this idea, the simulation model was recalibrated by assuming that cumulative drilled footage prior to the start of the program was 500 million feet, rather than

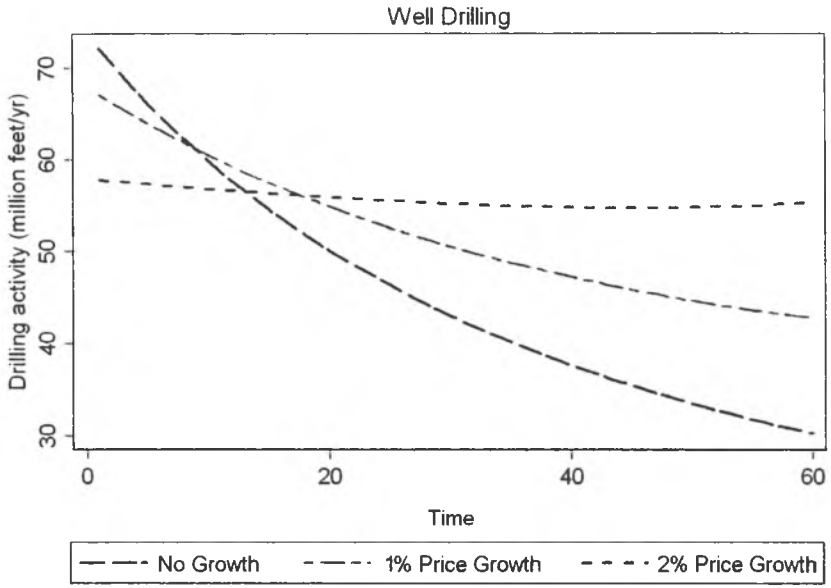

Figure 9.6. Oil drilling tilts to the future with exogenous growth in oil prices.

2 billion feet. This alteration roughly doubles the marginal product of drilling in identifying new reserves, which in turn stimulates drilling, reserve additions, and production. Therefore, Model C discounted severance tax collections are higher than those shown in Table 9.3. Model D discounted severance tax collections also are higher than in Table 9.3, but still lower than the comparable value for Model C. Thus, in both absolute and percentage terms, severance tax losses from the drilling expense credit are larger when cumulative footage drilled totals 500 million feet as compared with 2 billion feet.

It would also be of interest to construct a simulation using the actual path of oil prices over the last several decades. This price, however, exhibits sharp increases and decreases over time (see Figure 9.2), causing the simulation algorithm to break down. As a second choice, we performed a set of sensitivity analyses to reflect a forecast that oil prices will rise over time, at two exogenously given rates. Of course, with perfect foresight, prices cannot go up faster than the rate of discount, because then oil production will be postponed to the future. We thus assume exogenous growth rates in oil prices of 1 percent and 2 percent. As shown in Figure 9.6, drilling activity flattens out with a 2 percent growth in prices.

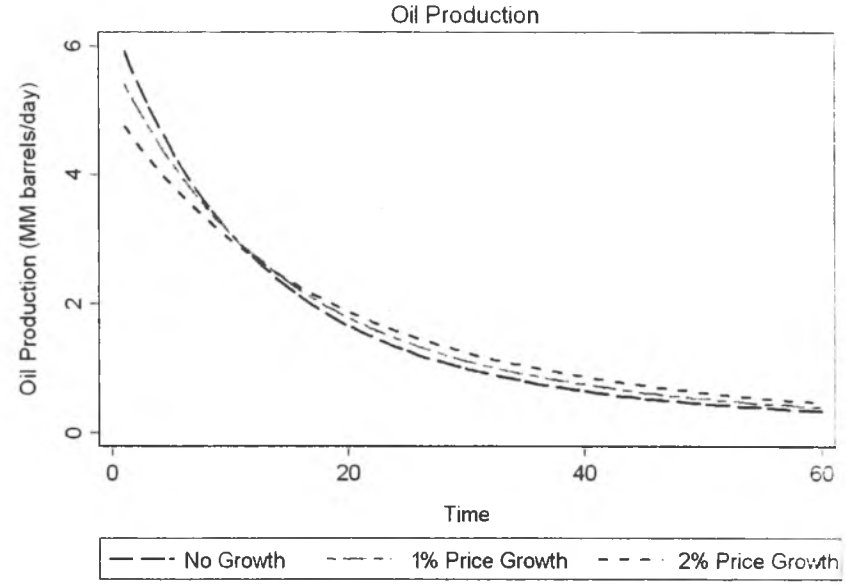

Figure 9.7. Oil production does not change appreciably with growth in oil prices.

However, oil production is relatively insensitive to oil price growth, as shown in Figure 9.7. This is because even though drilling activity shifts out to the future with an increase in prices, the decline in returns from cumulative drilling keeps production from leveling out in time. Production continues to fall, as in the case with constant prices. Figure 9.8 shows the change in reserve additions in the price growth scenario.

9.7 Concluding Remarks

This chapter described tax policies pursued by U.S. states that impact the oil industry. Three types of taxes are discussed: (1) the severance or production tax, (2) the property tax, and (3) the corporate income tax. The severance tax then is further analyzed in light of its widespread use in energy-producing states and its potential to generate revenues to support public services. The analysis is carried out using an adaptation of a conceptual model (Pindyck 1978) of exploration/development and production of exhaustible resources in which oil prices are taken as exogenous. This perspective is a useful simplification for an analysis of state taxes because no state produces enough oil to appreciably affect the world price. Simulations obtained from calibrating the model suggest that oil production volumes will be quite insensitive to

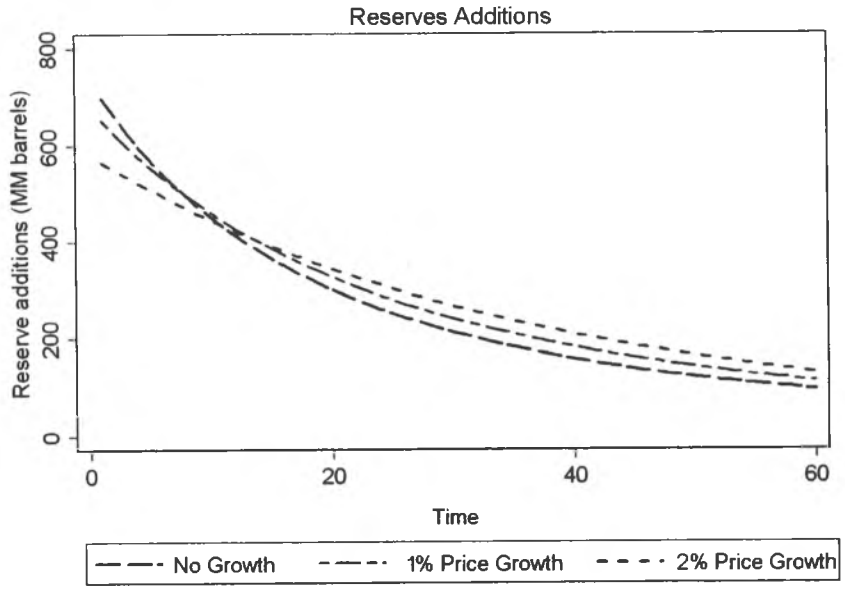

Figure 9.8. Reserve additions change only marginally with growth in oil prices.

price and severance tax rate changes. Thus, an increase in the severance tax rate is seen to generate proportionally more severance tax revenue, as its main effect is to redirect economic rents earned in the oil industry towards the public sector. An implication of this result turns out to be that the proposed elimination of the percentage depletion allowance, available to nonintegrated independent oil producers, may have much the same effect on production as a severance tax increase, although changes in the two types of tax measures may have quite different effects on the distribution of tax revenue between the state and federal levels of government.

Simulations based on the U.S. experience demonstrate that the credit for drilling expenses does turn out to increase drilling as intended. However, if the credit is applied in the United States, particularly in areas where a great deal of drilling has already occurred, its contribution to identifying new reserves may be rather limited. In other words, much of the continental United States has been extensively explored, so the chances of large oil discoveries probably are small. Simulations of the model show that the drilling expense credit does not generate enough incremental severance tax revenue to pay for itself. Additional work needs to be carried out to see whether alternative public policies to stimulate exploration and development might be more cost-effective as well as the extent to which the results presented continue to hold when the model is parameterized differently.

EFFECTIVE TAX RATES ON OIL AND GAS PRODUCTION:
A TEN STATE COMPARISON
DRAFT (28 APR 05)

1. Overview

The purpose of this report is to compare taxation of the oil and gas industry in ten major producing states: (1) Alaska, (2) California, (3) Colorado, (4) Kansas, (5) Louisiana, (6) New Mexico, (7) Oklahoma, (8) Texas, (9) Utah, and (10) Wyoming. In 2003, production of oil and gas varied considerably across these states. As shown in Table 1, Texas is the nation's leading state in both oil and gas production.

Table 1: Production of oil and natural gas for top producing states: 2003[a]

STATE	PRODUCTION OF NATURAL GAS (IN BCFs)	PRODUCTION OF CRUDE OIL (in thousands of barrels)
Alaska	456	355,582
California	323	250,000
Colorado	978	21,109
Kansas	384	33,944
Louisiana	1,225	90,111
New Mexico	1,493	66,130
Oklahoma	1,483	65,356
Texas	4,911	405,801
Utah	265	13,096
Wyoming	1,470	52,407

[a] Source: Energy Information Administration, U.S. Department of Energy, www.eia.doe.gov.

Utah produces the smallest quantities of oil and gas among the ten states listed.

Additionally, among major oil and gas producing states, tax structures vary considerably and tax bases interact, particularly between the state and federal level. For example, among the ten states listed in Table 1, all states except California levy severance

taxes against the value of production. Severance taxes dominate other forms of state/local taxation of oil in Alaska, Oklahoma, Texas, Wyoming, and Louisiana. Conservation taxes, levied by virtually all energy producing states on the value of production, are included in the analysis below but revenues generated by such taxes generally are relatively small. All of the ten states levy a corporate income tax that applies to oil and gas producers except for Wyoming and Texas. In some states, the federal corporate income tax liability is deductible in computing state corporation income taxes and in others it is not. While local governments in most of the states utilize some form of a property tax on oil and gas extraction equipment, property taxes on oil and gas reserves are levied only in California, Kansas, Texas, and Utah. Taxes on reserves provide operators with strong incentives to accelerate production at times when oil and gas prices are rising, as they attempt to reduce the extent of their tax liability. Most states treat royalty payments (computed as a percentage of gross value of production) for production on public land as deductible items in computing severance tax liabilities (Louisiana does not). Public land royalties are relatively more important in Alaska, Colorado, New Mexico, Utah, and Wyoming than in other states due to their large shares of publicly owned land. Also, states have granted innumerable exemptions and credits (which differ by state and year) against various tax liabilities for special situations that may be encountered by operators.

The myriad of exemptions, incentives, different tax bases, special features and frequent changes in tax laws, at both the state and federal government levels, create considerable complexity in understanding and tracking of tax law over time. Rather than itemize tax code details, economists have a simple and straightforward way of dealing

with taxes that does not require a comprehensive understanding of each state's tax law or an itemization of specific tax incentives. This method involves computation of what are called effective tax rates. Effective tax rates can be expressed as the ratio of taxes (or royalties) collected from a particular tax to the value of production. Thus, the calculation of effective tax rates fully account for all tax incentives granted against all types of taxes faced by oil and gas industry as well as the fact that different states compute tax liabilities based on values at different points in the production/distribution chain. Also, use of a common denominator (value of production at the wellhead) makes it easier to compare tax burdens between states, and for a given state, makes it possible to simply add effective property tax, severance tax, and royalty rates together if desired.

Effective rates are computed in this study for all types of taxes and royalties, except for state corporate income taxes. State corporate income taxes differ from other forms of state taxation of oil and gas, because production costs and other expenses are deductible items in determining liabilities. Because data on such costs are unavailable, only nominal state corporate income tax rates are presented.

Data on state severance taxes, state and local property taxes, and royalty payments for production on state lands are not available from a single source nor are they published in a common format. In consequence, these data were obtained by searching through state agency annual reports available on the internet and by directly contacting knowledgeable people in these agencies as questions arose. Information regarding nominal state corporate income tax rates was obtained from the Tax Foundation for the year 2003. Data on federal royalty payments from oil and gas production on federal lands, which consists of onshore mineral leases, Indian mineral leases, and leases on military

lands and National Petroleum Reserve Lands were obtained from the U.S. Department of the Interior, Minerals Management Service. The Energy Information Administration, U.S. Department of Energy publishes annual data on oil and gas production volumes together with average wellhead prices of oil and gas in each state. These data exclude oil and gas produced in the Outer Continental Shelf (OCS) that is not subject to taxation by states. Use of the Department of Energy data permits the wellhead value of production of oil and gas to be determined from a common source for each state in each year. These value of production figures are used as the denominators in making the effective tax rate calculations.

One aspect of data collection for state and local taxes was to ensure that the year of production matched to the year of valuation of tax liabilities or collection of tax revenue. In several states, state severance and/or local ad valorem tax collections are based on the previous year's production. Additionally, in the case of Wyoming, Texas and Louisiana adjustments were made to the tax revenue data to account for several large tax protests or appeals. In the latter two states, tax revenue is reported in the year of the legal settlement rather than adjusting revenue for the year in which the tax liability was generated. Accordingly, the data were adjusted to reflect the latter concept. In the case of Wyoming, tax revenue from tax protest and appeal settlements is assigned to the year the tax liability was created. Adjustments for tax protests and appeals were not possible for the state of Alaska and to some extent represent a potential source of error (probably small) in computing effective tax rates for all states.

Tax administration procedures created problems in several states with respect to being able to obtain tax data, particularly information on local property tax liabilities.

Property taxes are administered at the local government level, but in most states, at least in recent years, the state government has had an increasing amount of oversight. The oversight takes various forms from establishing property tax assessment procedures or assessing the property directly to collecting information and reporting statewide values of assessed property by category, including oil and gas extraction equipment, and average statewide mill levies for non-municipal property. This development makes it easier to compute effective property tax rates today as compared with earlier years when local assessor's offices were the only source of these data in many states.

2. Tax Rate Measurement in each State

The general aspects of the tax structure for each of the ten major producing states as it applies to oil and gas are outlined below for the years 2001-2003. The tax structures differ by state depending on the particular taxes employed and the base for each tax. The taxes relevant to oil and gas and selected additional data collection issues are discussed for each state below.

Alaska. Alaska has a state corporation income tax, a severance tax and a property tax on capital improvements and equipment. The federal corporation income tax is not deductible in computing state corporation income tax liabilities. Royalties from production on public lands are deductible in computing the severance tax. The state has an alternative minimum specific severance tax of $.80 per barrel or oil. In consequence, when the ad valorem tax falls below $.80/bbl., the specific tax is used. Most of the tax revenue and royalty information is available on the internet at www.revenue.state.ak.us. An explanation of the data was obtained from officials at the Alaska Department of Revenue, Oil and Gas Audit Division.

California. The focus of the tax analysis for California is oil since California is not a major gas producing state. At the state level the key tax on the oil industry is the corporation income tax; the federal corporate income tax is not deductible. There is no severance tax in California, although there is a conservation tax of $0.05/ bbl of production. The property tax is administered at the county level and includes surface property, equipment and the estimated value of mineral reserves. Since there are no statewide tax revenue data on oil property, information from Kern County, which accounts for seventy percent of oil production in California, was used to represent the state-wide average. A time series of the estimated property tax expressed in cents per barrel of oil produced was obtained from the Chief Appraiser, Oil and Gas Division of Mineral Rights, Kern County. Total state property tax revenue was estimated by multiplying the property tax per barrel times the total number of barrels of oil produced in California. Royalty information relating to production on public lands was obtained from the California State Lands Commission. The royalty rate for production on state lands is about eighteen percent with a floor of one sixth. However, California produces relatively little oil from state lands. Also, this floor can be reduced if it can be demonstrated by a study that it is economically feasible for old wells to continue production if the royalty rate is reduced. California's taxation of oil and gas differs substantially from the tax treatment applied in other states. Thus, California taxes on oil and gas should be compared to those levied in other states with caution.

Colorado. The state of Colorado levies a severance tax on the value of oil and gas produced. Tax rates range from 2%-5% depending on gross income from oil and gas sales of the producer. Local governments also levy a property tax on the value of land,

improvements and other property used in the production of oil and gas. Oil and gas land is valued differently than other classes of Colorado property subject to property taxation. Rather than being appraised according to its market value, the value of land producing oil and gas is calculated as a percentage of the sale price obtained for the product at the wellhead. The percentage of the sale price subject to taxation depends on whether the production is classified as primary or secondary. Working and/or royalty interest owners in Colorado are permitted take a credit of 87.5% of property taxes against their state severance tax liabilities. This means that the local property tax generates considerably more revenue than does the state severance tax. Data were taken from published records of the Colorado Department of Revenue, the Colorado Department of Local Affairs (Property Tax Division), Colorado Oil and Gas Conservation Commission, and the Colorado State Land Board. Comparatively little oil and gas production in Colorado occurs on state property, so state royalties account for only a small percentage of total public revenue generated by oil and gas activity.

Kansas. In Kansas, the key taxes at the state level are a severance tax on oil and gas production and a corporation income tax. Royalties from production on public lands are not deductible in computing severance tax liabilities. Royalties from production on state lands are unimportant, amounting to less than $80 thousand annually. A local property tax is levied on royalty, working interest, itemized equipment, and reserves in the ground. The Kansas Department of Revenue, Mineral Tax Bureau provided data on severance taxes. Property tax information was obtained from the Kansas Department of Revenue, Mineral Tax Division. Additional information was obtained from the Kansas Corporation Commission and from the Kansas Geological Survey.

Louisiana. The state of Louisiana levies a severance tax on the value of oil and the volume of gas production. Louisiana also levies a corporation income tax. Royalties from production on public lands are not deducted in computing severance tax liabilities. The federal income tax is deductible in computing state corporate income tax liabilities. The property tax is levied on oil and gas wells and surface equipment, and it is administered at the parish (country) level. The State Department of Revenue, Severance Tax Division provided the severance tax information. The Louisiana Tax Commission provided information about property tax collections. These data were used to calculate property tax liabilities for oil and gas combined. Information on royalties and production of oil and gas on state lands was provided by the State of Louisiana, Department of Natural Resources, Technology Assessment Division.

New Mexico. The state of New Mexico levies a number of separate production taxes on oil and gas, referred to as oil and gas extraction taxes. The taxes consist of the Oil and Gas Severance Tax, Oil and Gas Emergency School Tax, Oil and Gas A*d Valorem* Production Tax, and the Oil and Gas Production Equipment Tax. The revenues collected are reported for oil and gas combined. An additional tax is levied on natural gas, the Natural Gas Processors Tax. For purposes of the analysis here the separate taxes are combined to form one production tax whose effective tax rate is total tax collections per year divided by the annual value of production. The New Mexico Taxation and Revenue Department, Oil and Gas Division provided information concerning severance taxes. Royalties from production on public lands are deductible in establishing valuation for the production taxes. Information on royalties from production on state lands also was obtained from the New Mexico Taxation and Revenue Department. There is no separate

property tax on oil and gas equipment. Equipment is taxed through the Oil and Gas Production Equipment Tax mentioned above. Additionally, the state of New Mexico levies a corporation income tax. Federal corporate income tax liabilities are not deductible in computing the state tax liability.

Oklahoma. The state of Oklahoma levies a severance tax on oil and gas production, and a corporate income tax is applied. Royalties from production on public lands are deductible in computing severance tax liabilities, but federal corporate taxes are not deductible in the computation of state corporate income tax liabilities. The severance tax is levied in lieu of a property taxes, although a property tax is levied on equipment if a well is shut in for 13 consecutive months or more. In any case, the property tax generates little revenue and is ignored in the effective tax rate calculations. Severance tax revenue data were obtained from the Oklahoma Tax Commission. Data are reported for oil and gas combined. The Oklahoma Tax Commission provided the information to calculate the value of production from public lands, and the Commissioner of the Land Office provided the data on oil royalty and gas royalty from production on school lands in directly useable form.

Texas. The state of Texas levies a state severance tax on oil and gas production, and a property tax is levied at the local level on the estimated present value of minerals in the ground as well as structures and equipment. Severance tax revenue for oil and natural gas reported separately were obtained from published reports of the Railroad Commission of Texas and the Texas Comptroller of Public Accounts. The state does not levy a corporate income tax. Royalties from public lands are deductible in computing severance tax liabilities. In addition to a school property tax, counties and special districts levy

property taxes. School property tax revenue is available for oil and gas combined on an annual basis. At the recommendation of officials at the Texas Taxpayer and Research Association, school tax revenue was grossed up by five eighths to approximate total oil and natural gas property tax revenue statewide. This total was allocated between oil and gas based on the estimated gross value of oil reserves relative to gas reserves (price of oil, or gas, times the estimated volume of reserves, by year).

Royalties from production on state lands are allocated to The Permanent School Fund which was established to provide investment income to support public education for students in grades K-12, and the Permanent University Fund which has a similar purpose for public higher education in Texas. The data were obtained from the administrators of these funds.

Utah. The State of Utah levies a severance tax on oil and gas production at the state level. For oil, the tax rate is 3% of value of the first $13 per barrel and 5% of value above $13. For natural gas, the tax rate is 3% of value up to the first $1.50 per mcf and 5% of value above $1.50 per mcf. Information regarding severance tax collections on oil and gas combined was taken from the Annual Reports of the Utah Tax Commission. Severance tax collections on oil production then were separated from those on natural gas production using supplementary data on net taxable values furnished by the Commission. These supplementary data also contained information regarding royalties paid for production on federal, state, and tribal lands. Production of oil and gas on state land is relatively unimportant, but production from federal and tribal lands is much more prominent. Property taxes charged against oil and gas extraction and the value of reserves in the ground are taken from tables showing the total of such taxes charged against various

classes of property presented in the Utah Property Tax: Annual Statistical Reports for 2001, 2002, and 2003. Additional information on the Utah tax structure for oil and gas is available in the History of the Utah Tax Structure, compiled by the Utah Tax Commission. Utah levies a corporate income tax at the rate of 5%.

Wyoming. The state of Wyoming levies a severance tax on oil and gas production and a production tax is levied at the local level, too (the local *ad valorem* production tax). In Wyoming, royalty payments from production on state and federal lands are deductible in computing production tax liabilities. Data on royalty payments from production on state lands were obtained from the State Land Office. Additionally, a local government property tax is levied on oil and gas equipment, including drilling rigs, oil and gas well equipment, gathering lines and tank batteries. Total property tax liabilities were estimated by year by multiplying the total statewide assessed valuation for oil and gas equipment combined by the average statewide mill levy for all purposes (not including municipality levies). The total estimated property tax liability for oil and gas equipment combined was portioned between oil and gas based on the annual value of oil production and natural gas production in Wyoming. The average effective property tax rate on equipment is expressed as the ratio of the estimated tax liability for oil (or gas) equipment to the value of oil (or gas) production. Wyoming does not levy a state corporation income tax. The tax data were obtained from the Wyoming Department of Revenue. The average effective tax rate is expressed as the ratio of taxes collected to total value of production for both the state severance tax and the local *ad valorem* tax.

3. Comparison of Effective Rates of Oil and Gas Taxation

State tax structures are compared based on effective rates of taxation. These

effective rates fully account for all tax incentives that have been granted to oil and gas operators in each state. Thus, the effective rates calculated generally are lower than the nominal rates of tax that would prevail if no incentives had been granted. Effective rates were computed annually for the period 2001-2003 and are shown in Table 2. Effective tax rates for oil and gas are presented for those states that provide separate collections information. Federal royalty information was available from the U.S. Department of Interior, Minerals Management Service only for the year 2001. In the case of production and property taxes, and state and federal royalties, the effective tax rate is the ratio of tax collections or liabilities to gross value of production.

Comparisons of the effective tax rates highlight the substantial differences in the tax structures of the energy producing states, and in the relative importance of production on public lands. Beginning with oil, Table 2 shows that Wyoming relies on state and local production taxes as major sources of oil revenue. Royalties from production on public lands are a major revenue source for the federal government, as a large share of Wyoming's oil and gas production is on federal land. State production and local property taxes are the major revenue sources in Texas. In the case of Louisiana, state production taxes and royalties from production on state lands and waters are the important sources of revenue. Louisiana also levies a state corporation income tax. In Oklahoma, the state production tax is most important. Oklahoma also levies a state corporate income tax. Property and production taxes are major revenue sources in Kansas and a corporate income tax is levied. The state production tax and royalties from production on state lands are most important in Alaska, and a corporate income tax exists. In California the property tax on reserves is most important and a corporation tax is levied. Royalties from

production on state lands have diminished in importance in California over the past 20 years. In New Mexico, production taxes and royalties from production on both federal and state lands are important, and a corporation income tax exists. In Colorado, the property tax is most important and the state levies a corporate income tax. Utah's effective severance tax rates on oil and gas production are in the 3.5%-4% range and the state levies a 5% corporate income tax.

Another useful perspective is a comparison of each source of revenue across states. Regarding production taxes, the effective taxes are highest in Alaska, Wyoming (state and local combined) and Louisiana, all with effective tax rates in excess of ten percent in 1997. Effective rates are lowest in Colorado, Utah, Kansas, and Texas. California does not levy a production tax on oil and gas. In 2003, effective property tax rates were highest in Colorado (4.7%), Kansas (5.4%), and California (3.4%). The highest effective tax rates on operating profits of the oil and gas extraction industry, and industry in general, are levied in Alaska and California. Again, Texas and Wyoming do not levy corporation income taxes. The key factor determining effective royalty rates is the volume of production on public lands. In 2003, Alaska (9.3%), and Louisiana (4.6%) had the highest effective state royalty rates. In 2001, the highest effective federal royalty rate occurs in Wyoming (7.1% for oil and 9.1% for gas) followed by New Mexico (5.0% for oil and 9.6% for gas) and Utah (4.4% for oil and gas combined).

The tax structures for natural gas are quite similar to oil, although nominal production tax rates differ between oil and gas in some states. Notable differences occur in Louisiana in which the severance tax is levied on the value of oil production, but on the quantity of gas produced. State corporate income tax rates are the same for natural gas

and oil.

A comparison of effective rates by tax across states shows a pattern somewhat similar to oil. In 2003, Wyoming (state and local combined) and Texas had the highest effective tax rates on natural gas production, 10.1% and 8.1%, respectively. Effective state royalty rates were highest in Louisiana and New Mexico, and federal rates were highest in Wyoming, Utah, and New Mexico, reflecting the importance of production on public lands in these states.

Extending the comparisons of taxes among the energy producing states further, to the point of ranking states in terms of their total or cumulative tax burden on the oil and gas extraction industry, is not particularly fruitful and may be misleading. The three types of taxes, production, property and income, have different effects on production, exploration and development. Moreover, extraction, exploration and development costs differ among the energy producing states, too. Stated differently, state and local taxes are but one element affecting decisions to produce, explore and develop nonrenewable resources and should not be considered in isolation from other key factors.

One form of inter-state tax comparison, called hypothetical tax bill studies, is based on a profile of a hypothetical firm, producing a certain amount of product, generating a given amount of sales revenue with specified capital, labor and other costs. Hypothetical tax bills are calculated for this firm based on the tax structures of different states in which the firm might locate. There are several important problems associated with such studies. First, the analysis assumes that all costs except taxes are the same across states, and normally this is an incorrect assumption, particularly in the case of oil and gas exploration, development and production. Second, such studies assume that the

firm uses the same factor inputs in the same proportions, such as capital and labor, irrespective of the geographic location. Stated differently, it is assumed that the production function is fixed and identical irrespective of where the firm locates. Again, this is usually an incorrect assumption, particularly since production costs differ across locations. Finally, the hypothetical firm seldom exists, and it is misleading to infer tax or other costs for other plant or firm profiles different from the hypothetical firm created for the tax comparison.

STATE TAXATION, EXPLORATION, AND PRODUCTION IN THE U.S. OIL INDUSTRY

Abstract

How do firms in nonrenewable resource industries respond to changes in state taxes? This paper employs state-specific estimates of Pindyck's (1978) widely cited model of natural resource supply to simulate effects of changes in state production (severance) tax policy on the timing of exploration and output by firms in the U.S. oil industry. The framework developed can be applied to any of 15 states that produce significant quantities of oil, and allows for interactions between taxes levied by different levels of government. Results of this study suggest that oil production is highly inelastic with respect to changes in production taxes. A production tax rate increase is shown to decrease early period exploration effort, affect little change in reserve additions and future production, and substantially increase discounted tax revenue. Policy implications of this outcome suggest that state officials may consider raising production tax rates as a way to increase revenue while risking little in the way of loss to future oil activity.

1. Introduction

How do firms in nonrenewable resource industries respond to changes in state taxes? It may be tempting to look for answers to this question in the empirical literature on effects of state taxation (see, for example, Bartik 1985, Helms 1985, Papke 1991, 1994, and Holmes 1998). These papers focus on firms with mobile capital that choose where to locate on the basis of factors affecting revenues and costs. This perspective, however, is not particularly relevant when looking at the behavior of firms extracting nonrenewable natural resources. Such firms cannot change location because they are tied to a geographically immobile reserve base that makes up a key component of their capital stock. On the other hand, extractive firms can and probably do alter the timing of their activities when state taxes and other public policies change. Yet, little is known about the extent to which they do this even though commercially valuable deposits of natural resources are found in most U.S. states and some states such as Texas, Oklahoma, Louisiana, Wyoming, and Alaska rely heavily on taxation of oil, gas, and/or coal production to fund public services.

This paper uses state-specific estimates of Pindyck's (1978) widely cited model of natural resource supply to simulate effects of changes in state production (severance) tax policy on the timing of exploration and output by firms in the U.S. oil industry. The framework developed can be applied to any of 15 states that produce significant quantities of oil, and allows for interactions between taxes levied by different levels of government. It is arguably superior to and more comprehensive than previous efforts to develop econometric and/or simulation models of taxation and natural resource exploration and production. For example, Deacon, DeCanio, Frech, and Johnson (1990)

and Moroney (1997) focus only on one state (California and Texas, respectively), and estimate econometric equations that may not be consistent with a dynamic profit-maximizing framework. Pesaran (1990) estimates an econometric model of offshore oil production in the UK that can be better justified theoretically, but does not consider the role of taxes. Simulation studies conducted by Yucel (1989) and Deacon (1993) examine effects of various types of tax changes on exploration and production, but do not consider interactions between tax bases claimed by different levels of government. Additionally, these studies do not allow for possible interstate differences in exploration and extraction costs and are aimed mainly at assessing the generality of theoretical results obtained in more limited settings (see, for example, Burness 1976, Conrad and Hool 1980, and Heaps 1985) rather than analyzing possible outcomes of changes in state tax policies.

Results of this study suggest that oil production is highly inelastic with respect to changes in production taxes so deadweight losses from altering these taxes are likely to be small. As a consequence, state officials may consider raising production tax rates as a way to increase revenue. It is worth noting in this context that because state production taxes are deductible against federal corporate income tax liabilities, increases in production tax rates increase state revenues partly at the expense of federal tax collections. These points are more fully discussed in Section 3 after developing the framework for the simulation model in the next section.

2. The Simulation Model

This section shows how Pindyck's (1978) model of nonrenewable resource development is adapted to simulate effects of state production tax changes. The

discussion begins with a brief overview of the Pindyck model and then discusses estimation of key equations and tax parameters.

Conceptual Model

The model assumes that perfectly competitive producers maximize the discounted present value of future operating profits from the sale of resources and because one such firm is chosen to represent the industry, the common pool problem and well-spacing regulations are not considered (see McDonald 1994 for discussion of these issues). The firm's problem is to take the future time path of output prices and taxes as given and then choose optimal time paths for exploration and production. This approach is similar to that taken in previously cited econometric studies of effects of changes in state tax policy on state economic growth and ignores the possibility that choices of tax bases and rates are endogenous (i.e., that governments consider the firm's objective function in choosing taxes that maximize community welfare). Also, the model defines exploration to include resource development, although the two activities clearly are not the same (Adelman 1990). The aim of exploration is to add to the reserve base, which as indicated in the introduction, is a form of geographically immobile capital.

The firm's maximization problem is

$$\max_{q,w} \Omega = \int_0^\infty [qp - C(q,R) - D(w) - \gamma R]e^{-rt}\, dt \tag{1}$$

subject to

$$\dot{R} = \dot{x} - q \tag{2}$$

$$\dot{x} = f(w,x) \tag{3}$$

$$q \geq 0, w \geq 0, R \geq 0, x \geq 0 \tag{4}$$

where a dot over a variable denotes a time rate of change, q denotes the quantity of oil extracted measured in barrels, p denotes the exogenous market price per barrel net of all taxes, $C(\cdot)$ denotes the total cost net of taxes of extracting the resource, which is assumed to depend on production (q) and reserve levels (R), $D(w)$ denotes total cost of exploration for additional reserves net of taxes, w denotes exploratory effort, γ denotes the net of all tax constant effective property tax rate on reserves, r denotes the discount rate which represents the risk-free real rate of long-term borrowing, x denotes cumulative reserve additions (discoveries), $f(\cdot)$ denotes the production function for gross reserve additions ($\dot{x}$), and $\dot{R}$ denotes reserve additions net of production (q).[1] In this formulation, the net-of-tax price per barrel is related to the wellhead (pre-tax) price (p^*) according to $p = \alpha_p p^*$, where α_p is a tax policy parameter such that $0 < \alpha_p < 1$. Correspondingly, $C(q,R) = \alpha_c C^*(q,R)$ and $D(w) = \alpha_D D^*(w)$, where α_c and α_D also are tax policy parameters that lie on the unit interval. These tax policy parameters are discussed more fully later on in this section.

Model Implementation

To implement the model, equations for exploration costs (D^*), production of reserve additions (f), and extraction costs (C^*) are estimated and then substituted into the model along with estimates of the tax parameters α_p, α_c, α_D, and γ. Effects of tax changes then are obtained by simulation. Estimates of the tax parameters are described first followed by discussion of estimates of equations for D^*, f, and C^*.

Tax Parameters

General considerations in developing estimates of the four tax policy parameters for major oil producing states are briefly outlined below and technical details are described in Appendix A. Among major oil producing states, tax structures vary considerably and tax bases interact, particularly between the state and federal level. For example, among the eight states responsible for about 89% of U.S. oil production (Alaska, California, Kansas, Louisiana, New Mexico, Oklahoma, Texas, and Wyoming), all states except California levy production taxes against the value of output. Production taxes dominate other forms of local taxation in Alaska, Wyoming, and Louisiana. Most states do not levy property taxes on the value of reserves in the ground (Texas and California do). Most states treat royalty payments (computed as a percentage of gross value of production) for production on public land as deductible items in computing severance tax liabilities (Louisiana does not). Public land royalties are prominent in Alaska, New Mexico, and Wyoming due to the large shares of publicly owned land. Most states levy a corporate income tax that applies to oil operators (Wyoming and Texas do not). Also, states have granted innumerable exemptions and credits (which differ by state) against various tax liabilities for special situations that may be encountered by operators. Within states, counties apply their own mill levies to compute property taxes on equipment at different rates. However, taxation of structures and equipment are usually less important than other sources of revenue and are ignored below.

Regarding federal taxes, all incorporated producers file federal corporate income tax returns that allow deductions for various types of operating costs and for state and local tax payments. Independent producers (those without downstream refining or retail

interests) are permitted to take a percentage depletion allowance, while major producers are allowed only cost depletion, which is significantly less generous. Both major and independent incorporated producers can expense intangible drilling costs incurred on their federal corporate income tax returns. The fact that some smaller producers are not incorporated and may therefore face alternative state and federal tax treatment is ignored.

The myriad of state-specific special features described above creates considerable complexity in tracking tax law over time. Rather than itemize tax code details, effective tax rates are used to translate dynamic tax policy into a tractable form. Effective rates can be expressed as the ratio of taxes (or royalties) collected from a particular tax to the value of production. Thus, the calculation of specific effective tax rates fully account for exemptions, incentives, different tax bases, and frequent changes in tax law both at the state and federal level. For a detail account of the taxation of the oil industry see Gerking, Morgan, Kunce, and Kerkvliet (2000), Chapter 2.

Marginal Cost of Reserve Additions

The before-tax marginal cost of reserve additions (D_w^* / f_w) is computed from estimates of equations for drilling costs and for the production of reserve additions. Drilling costs are assumed to be proportional to drilling effort as shown in equation (5)

$$D^*(w) = \phi w e^u \tag{5}$$

where ϕ is the parameter to be estimated and the disturbance term e^u is lognormally distributed with mean of unity and variance σ_u^2. The production function for reserve additions is specified as

$$f(w, x) = A w^{\rho} e^{-\beta \cdot x} e^v \tag{6}$$

where A, ρ, and β are parameters to be estimated and the disturbance e^{v} is assumed lognormally distributed with mean of unity and variance σ_v^2. Equation (6) is similar to the equation describing the discovery process proposed by Uhler (1976) and later adopted by Pindyck (1978) and Pesaran (1990). The idea behind this equation is that the marginal product of exploration declines as reserve discoveries cumulate.

Estimation used annual data from the 15 U.S. states for which complete information on variables needed could be assembled for the period 1970-98.[2] These states accounted for 96.5% of total U.S. oil production over this time period. Drilling costs are measured by total real costs (both tangible and intangible) of each well completed, including dry holes.[3] Nominal cost values were deflated using the 1995 GDP deflator. Oil reserve additions are defined as extensions, new field discoveries and new reservoir discoveries in old fields. The total number of wells drilled for each state since 1859 (when the first oil well was drilled in Pennsylvania) is used as a proxy for x. Data sources and sample means of variables used in the analysis are presented in Table 1.

Equation (5) and equation (6) were estimated in natural logarithms. Both equations used an instrument for the number of wells drilled because w is an endogenous variable in the model presented in Section 2. The instrument was obtained from the predicted values from a regression of the number of wells on cumulative drilling and the wellhead price as shown in Appendix A. Estimates of the drilling cost equation, equation (5), are obtained by regressing drilling cost per well on dummy variables for states and years. Coefficients of state and year dummies are jointly significant at the 1% level and the R^2 is 0.90. The idea behind using this approach is to get state- and time-specific estimates of ϕ. This parameter is expected to vary across states because of differences in

geologic conditions, geographic remoteness of on-shore oil resources, and whether drilling occurs in off-shore coastal waters (note that most states in the data set are landlocked). Time varying factors common to all states may include technological advancement and macroeconomic cycles. State-specific estimates of ϕ test different from each other, except Texas and Oklahoma, at the 5% level.

Estimates of equation (6), shown below in equation (7), allow for state-specific intercept terms (time-specific effects were jointly insignificant), common slope coefficients across states, and are corrected for first-order serial correlation (ρ =0.431).

$$\ln(ADDED\ RESERVES) = \ln A + \underset{(t)\ (5.33)}{0.69*\ln(PREDWELLS)} - \underset{(-1.37)}{0.000006*CWELLS}. \quad (7)$$

State-specific estimates of A are jointly significant at the 1% level and $R^2 = 0.40$.[4] These results show that the marginal product of drilling (f_w) decreases with wells drilled as well as with cumulative drilling, although the coefficient of cumulative drilling is insignificant at conventional levels.

Estimates of equations (5) and (6) combined show that the marginal cost of reserve additions (D_w^*/f_w) increases with drilling activity. As w increases, the marginal cost of drilling is constant, but the marginal product of drilling in finding new reserves (f_w) falls. Table 2 reports values of D_w^*, f_w, and D_w^*/f_w by state for seven major oil producing states. These estimates use 1998 values for numbers of wells drilled and cumulative drilling and are corrected for conversion from logarithms (see Greene 1997, p. 279). Estimates of D_w^* and f_w reflect considerable variation across the seven states. Estimates of marginal drilling cost range from $127,943 in Kansas to $1,218,758 in Louisiana. Marginal reserve additions from drilling (f_w) range from 7,460 barrels in Kansas to 64,862 barrels in Louisiana. Thus, while drilling in Louisiana is relatively

more expensive than in Kansas, Louisiana experiences a greater payoff from these more costly exploration and development efforts. Values of D_w^*/f_w for the seven states range from a low of $17.15 per barrel in Kansas to a high of $26.04 in Texas.

Extraction Costs

Because data on oil extraction costs are weak, $C(q, R)$ could not be econometrically estimated. Instead, this equation was calibrated for each state with a Cobb-Douglas functional form using methods described in Deacon (1993). Cost parameter calibration specifics are described in Appendix A. Results show that the 1998 marginal extraction costs range from a low of $4.89 per barrel in Kansas to a high of $8.81 per barrel in Louisiana. Additionally, the Cobb-Douglas form implies that extraction costs rise without limit as reserves approach zero and that a positive level of reserves will remain at any terminal time T. Thus, boundary conditions used in the simulations reported in Section 3 allow production to continue after incentives for further exploration vanish so that the terminal date for the exploration/production program must be set arbitrarily. This fixed program period could be interpreted as the producer's relevant planning horizon.

3. Simulation Results

The model presented in Section 2 can be simulated to obtain responses of exploration and production to changes in various types of taxes in any of 15 oil producing states. Simulations presented below focus on production tax changes in Wyoming. The production tax is the most important tax levied on the oil industry by oil producing states (see Section 2) and changes in production taxes turn out to have quite similar effects in all major oil producing states so results from one state are used to represent the others

(for results of tax changes in other major oil producing states, see Gerking, Kunce, Morgan, and Kerkvliet 2000). Also, simulations reported are based on the assumption that tax changes in one state do not affect the wellhead price of oil seen by operators in other states. This assumption probably is not unreasonable in view of the fact that oil prices are internationally determined and even the largest producing U.S. state (Texas) accounts for only a small percentage (4.2% from 1970-98) of world output.[5] Moreover, as shown below, tax changes considered lead to comparatively small changes in output, so these interstate effects are not likely to be important in any case.

Simulations for Wyoming were performed using the instrumental variable estimates of equations (5) and (6), the calibrated production cost function and the tax parameters, both derived in Appendix A. The discount rate, r, was set at 4% to reflect the risk-free real rate of long-term borrowing and the future price path was fixed at $23.00 per barrel each year reflecting the real sample mean for all 15 states. Other price trajectories were simulated, but the alternative paths have little or no effect on the comparative results presented below. The initial value of reserves and cumulative wells drilled were fixed to year-end 1998 levels at 550 million barrels and 40,439 wells, respectively. To obtain numerical solutions for the optimal time paths of drilling, production, and reserves, difference equation approximations are derived for the time rates of change in exploratory effort ($\dot{w}$), production ($\dot{q}$), and for the state variable evolution equations (2) and (3). For example, the evolution of reserves, equation (2), is approximated by the difference, $R_{t+1} - R_t = f_t - q_t$. The model is then solved recursively by iterating over the initial values of the control variables, q and w, until transversality conditions are satisfied. Under these base conditions, exploratory effort approaches zero

after approximately 40 years, thus the terminal time is set to 40 periods. The solver algorithm in Microsoft Excel was used to generate numerical solutions.

Before the simulation results are discussed, a historical analysis of Wyoming's oil experience is warranted. Figure 1 depicts the actual time paths of real price, drilling, production, and reserves for Wyoming from 1970-98. In this figure, the vertical axis shows price per bbl (dotted line) in \$1995 $\times$ 10, drilling (dashed line) in total wells, production (solid line) in bbls $\times$ 10^5, and reserves (bold line) in millions of barrels (MMbbls). In reviewing these data, several observations are noteworthy. Historical drilling appears sensitive to price. Total wells drilled increases markedly during the high price period of the early 1980s. Extraction activity, however, appears to map the declining proved reserve level in the state. In fact, oil production continued to decline during the late 1970s and early 1980s even though real prices increased 2 1/2 fold. The increased drilling experienced in the early to mid 1980s failed to replenish the depleting oil reserve in the state and production closely followed the reserve decline.

This apparent historical insensitivity of production to changes in price raises an interesting policy question: If severance tax changes are reflected in net price (as modeled in section 2), what are the effects of a severance tax increase? Many oil states, as previously described — including Wyoming, rely heavily on production taxes to fund local public goods and officials may have incentives to raise production taxes for the revenue. The inherent trade off to severance tax increases is the purported loss of economic activity generated by the industry within the state. To examine this, the first simulation conducted shows the effects of *doubling* Wyoming's effective state severance tax rate for the full 40-year program. Results detailing the simulated differences in the

timing of drilling, production, and discounted severance tax revenue for the full tax interaction model (outlined above) are presented in the top section of Table 3. Comparative individual program year results, divided into 10-year increments, show that doubling the state severance tax markedly decreases early period drilling. Drilling decreases by 19.4% in the first year of the simulated program and this difference converges to zero by year 40. Interestingly, 10 year fractional results show that 63.8% of the total 1208 well decrease occurs in the first 20 years of the program. Figure 2 graphically compares the effects of the tax increase (dotted line) to the base drilling solution (bold line). With less drilling in the early years of the program, fewer new reserves are identified and, as shown in Figure 3, future production of oil slightly diverges downward from the base solution. Production results presented in Table 3 show this gradual divergence — a 2.4% drop in year one falling to an 11.8% decline in year 40. Through the life of the program, doubling the state severance tax decreases total production by about 48 MMbbls or 5.7% below the base solution.

The largest change associated with doubling the state oil severance tax appears to come from discounted severance tax collections. As shown in Table 3, the tax increase results in an increase in the present value of Wyoming severance tax collections from $609 million to $1165 million, an increase of over 91%. The majority (87.6%) of this $556 million increase occurs in the first half of the simulated program due to the relatively small production loss generated by the tax increase and discounting. Because severance taxes are deductible in computing federal corporate income tax liabilities, discounted tax payments to the federal government decrease by $60 million or about 11% below the base simulation. Also, the severance tax increase transfers local government

revenue to the state because of the production decline. Discounted local production taxes decrease by $34 million or 5% below the base solution. The same can be said for discounted public land royalties which decrease by 4.6% ($50 million) because of the decrease in future production.

The tax interactions described above highlight a key feature of the model developed here — oil producers do not face the full effect of an increase in the severance tax rate. As shown, tax base and rate interactions partially offset the pure-effect of the severance tax rate increase. To illustrate this clearly, counterpart simulations were conducted where all tax effects, other than state level production tax rates, were effectively *zeroed out*. The lower section of Table 3 presents the counterpart Wyoming results. When all tax interactions are ignored, doubling the state severance tax decreases relative drilling by 32.8% and production by 11.2%, a decrease in activity roughly 2 times larger than found in the full tax interaction model examined above. Timing effects are similar to the full tax interaction model results. Because the severance tax increase now invokes a larger production loss, discounted state severance taxes increase by 83% as compared to the 91% increase in the full tax interaction model. Analyzing taxes individually appears to overstate the affects on exploration and production by ignoring potential offsets and tax base interactions. These results suggest that taxes should not be analyzed independently without careful reference to the entire tax structure applied by all levels of government.

General results of this study suggest that oil production is highly inelastic with respect to changes in production taxes. This inelastic response may provide incentives for state officials to substantially increase these taxes risking little in the way of reduced

industry activity while gaining much needed tax revenue. State severance tax increases clearly reduce the net price faced by producers but it is reserves, not net price, that drives production in this industry. Moreover, the effects of increased state severance taxes are partially offset by reduced tax collections by all other levels of government.

4. Conclusions

This paper has adapted Pindyck's (1978) model of nonrenewable natural resource production to take account of taxation at the federal and state-local government levels. Equations of the model are estimated from panel data on production, exploration and reserve additions for 15 states over the period 1970-98. The model is designed so that effects of changes in existing state production tax rates on the timing and evolution of exploration and production can be simulated into the mid-21st century. Results of this study suggest that oil production is highly inelastic with respect to changes in production taxes. A production tax rate increase is shown to decrease early period exploration effort, invoke little change in reserve additions and subsequently future production, and substantially increase discounted tax revenue. Policy implications of this outcome suggest that state officials may consider raising production tax rates as a way to increase revenue while risking little in the way of loss to future oil activity.

Endnotes

[1]Pindyck's (1978) original specification of the extraction cost function is retained here in spite of the logical inconsistencies discussed by Livernois and Uhler (1987), Livernois (1987), and Swierzbinski and Mendelsohn (1989). These authors argue that Pindyck's extraction cost function is defensible when reserves are of uniform quality but in the presence of exploration, reserves must be treated as heterogeneous because the most accessible deposits are added to the reserve base first. They show that aggregation of extraction costs across heterogeneous deposits is not valid except under special circumstances. Another problem with this function is that extraction costs should be a function of γ. The extraction cost function derived from profit-maximization at a point in time subject to a production constraint would have γ as an argument because the reserve base is an input to oil and gas production. These complications are ignored in the analysis below because of severe data constraints on estimating the extraction cost function.

[2] The Energy Information Administration and the American Petroleum Institute report annual production data for 31 states over this period, but data on reserve additions, cumulative drilling, and drilling costs are not available in all years for the 16 smallest producing states. The 15 states included in the panel are Alaska, Alabama, California, Colorado, Kansas, Louisiana, Michigan, Mississippi, Montana, North Dakota, New Mexico, Oklahoma, Texas, Utah, and Wyoming.

[3] Major cost items are for labor, materials, supplies, machinery and tools, water, transportation, fuels, power, and direct overhead for operations such as permitting and preparation, road building, drilling pit construction, erecting and dismantling derricks/drilling rigs, drilling hole, casing, hauling and disposal of waste materials and site restoration. For additional details, see Joint Association Survey on Drilling Costs, Appendix A (1998).

[4] Corrected (see Greene 1997, p. 279) state-specific intercept terms (and t-statistics) for 7 major producing states are: CA 0.17(2.01), KS 0.06(1.06), LA 0.57(2.21), NM 0.19(1.68), OK 0.07(1.94), TX 0.01(1.11), WY 0.29(2.03). Equation (6) was also estimated allowing for both state-specific intercepts and state-specific coefficients for ρ and β. This strategy was unsuccessful as it yielded mostly insignificant estimates of state-specific slope interactions.

Appendix A

Tax Policy Parameters

For most states in most years, γ and α_j $(j=p,c,D)$ can be specified by noting whether reserves are subject to a property tax (see text equation (1)) and then evaluating equations (A.1)-(A.4).

$$\gamma = \{(1-\tau_{us})(1-\tau_s)\tau_R\} \tag{A.1}$$

$$\alpha_p = \{(1-\tau_{us})(1-\tau_s)(1-\tau_r)(1-\tau_p) + \tau_{us}(1-\tau_r)\delta\} \tag{A.2}$$

$$\alpha_c = \{(1-\tau_{us})(1-\tau_s)\} \tag{A.3}$$

$$\alpha_D = \{(1-\tau_{us})(1-\tau_s)\eta\} \tag{A.4}$$

A derivation of equations (A.1)-(A.4) can be found in Gerking, Morgan, Kunce, and Kerkvliet (2000), Appendix C. In (A.1)-(A.4), τ_{us} denotes the federal corporate income tax rate, τ_s denotes the state corporate income tax rate, τ_R denotes the property tax rate on reserves weighted by the per unit assessed value, τ_r denotes the royalty rate on production from public (state and federal) land, τ_p denotes the production (severance) tax rate, δ denotes the federal percentage depletion allowance weighted by the percentage of production attributable to eligible producers (nonintegrated independents), and η denotes the expensed portion of current and capitalized drilling costs attributable to current period revenues. η is made up of two components: (1) the percentage of current period drilling costs expensed and (2) the estimated present value of cost depletion deductions for the capitalized portion of current and past drilling expenditures. Producers are allowed to expense costs associated with drilling dry holes along with certain intangible costs (e.g., labor and fuel) for completed wells as they are incurred. All direct

(tangible) expenditures for completed wells must be capitalized then depleted over the life of the producing well. In the illustration at hand, equations (A.1)-(A.4) can be simplified because Wyoming does not have a state corporate income tax ($\tau_s=0$) and does not levy a property tax against reserves in the ground ($\tau_R=0$).

This formulation captures several aspects of the U.S. tax structure as it applies to the oil industry. (1) Federal royalty payments are deductible in computing state production tax liabilities. (2) Federal royalty payments, state production taxes, state property taxes on reserves, extraction costs, and certain drilling costs (described above) are deductible in computing both state and federal corporate income tax liabilities. (3) State corporate income taxes are deductible against federal corporate income tax liabilities. As noted in text section 2, state tax treatment of the oil industry is not uniform and there are a number of situations in which these equations would have to be modified. Notice that this treatment of taxes in the model highlights the interaction between tax bases and is more detailed than the corresponding treatment given by Moroney (1997) or Deacon, DeCanio, Frech, and Johnson (1990). Also, the entire tax structure is incorporated into the model, rather than simply analyzing one tax at a time as in Deacon (1993).

All tax parameters in equations (A.1)-(A.4) are effective rather than nominal rates. States grant numerous credits and exemptions against taxes levied, so nominal rates generally overstate amounts actually paid. State and local data required for these effective rate calculations are neither available from a central source nor compiled in a common format, so they were obtained directly from tax officials in each state (see Gerking, Morgan, Kunce, and Kerkvliet 2000, Chapter 2). In developing the *base*

solution for Wyoming, royalty rates are computed as the sum of state and federal royalty payments divided by the gross value of production and averaged 9% for oil in the late 1990s. This percentage is higher than for other oil producing states because of the comparatively large share of Wyoming's production on public lands. Production tax rates are computed as total production tax collections divided by the prior year's gross value of production net of public land royalties. In Wyoming, there are both local and state levies against this one-year-lagged net value of production. The sum of the two average effective rates in the late 90's totaled approximately 11.9% (local 6.7% and state 5.2%). At the federal level, data from Statistics of Income (U.S. Department of Treasury, 1997-1998) for the oil and gas sector show that federal corporate taxes paid averaged about 10% of *net operating* income in 1998. Also, the current nominal percentage depletion rate of 15% applied to about 58% of Wyoming oil producers in 1998, thus δ = 8.7%. Also, the expensed portion of current period drilling costs is approximately 40% for the industry and the present value of depletion deductions for capitalized drilling cost can be approximated by $(q/R)/(r+(q/R))$, assuming that the ratio of production to reserves is constant (Deacon 1993). Wyoming's mean value of q/R was approximately 8% for the sample period 1996-1998, therefore $\eta = 0.40 + (1 - 0.4)*(0.08 / (0.04 + 0.08)) = 0.8$. The base tax policy parameters for Wyoming are $\alpha_p = 0.73$, $\alpha_c = 0.90$, $\alpha_D = 0.72$, $\gamma = 0$.

Estimate of an Instrument for WELLS

An instrument for the natural logarithm of *WELLS* was used as an explanatory variable in estimating both text equations (5) and (6) with *CWELLS* entering equation (6) as the proxy for x. Instrumental variable estimation is appropriate because w is an endogenous variable in the model presented in Section 2. An instrument for w was

obtained by predicting the natural logarithm of the number of wells drilled from the one-way fixed-effects regression reported in Table A.1. Time-specific effects tested insignificant at conventional levels and $R^2 = 0.91$. *PRICE* and *CWELLS* were included as explanatory variables because they are exogenous variables in the model. *PRICE2, CWELLS2,* and *PRICE*CWELLS* were included to account for non-linearities expected in light of relationships in the model (see Table 1 for descriptions). All estimated coefficients are significantly different from zero except the interaction term *PRICE*CWELLS*. The marginal effect of *WELLS* with respect to *PRICE* increases at a decreasing rate. The Pearson correlation between the actual values of ln*(WELLS)* and the corresponding predicted values, ln*(PREDWELLS)*, is 0.96.

Table A.1
Construction of Instrument ln*(PREDWELLS)*

Explanatory Variable	***Coefficient*** (t-statistic)
PRICE	0.064 (6.49)
PRICE2	-0.45E-3 (-2.90)
CWELLS	-0.22E-4 (-5.19)
CWELLS2	0.15E-10 (4.17)
*PRICE*CWELLS*	0.18E-7 (1.51)

Extraction Cost Function

Direct operating (lifting) cost for oil by region at depths of 2,000, 4,000, 8,000, and 12,000 feet are available from annual cost index studies published by the DOE/EIA

for the period 1970-1998. However, these data are of limited value for two reasons. First, cost estimates are not always disaggregated to the state level and cost estimates for other states may not be representative of all production. Second, through the mid-1980s, price controls on oil and/or gas distorted production incentives, making historical extraction costs difficult to compare with extraction costs in more recent years. As a compromise, following Deacon (1993), values of extraction cost parameters are calibrated for the following Cobb-Douglas function,

$$C(q, R) = \kappa q^{\varepsilon} R^{1-\varepsilon} \ , \qquad \text{(A.5)}$$

where $\varepsilon = 1/\mu$, μ is the production share of non-reserve inputs, and κ is a constant value that drives the production cost modeled to an average level of *lifting costs* representative of the 1998 DOA/EIA surveyed estimates described above. State-specific estimates for μ are established from the data on operating cost, drilling cost, production, reserve additions, and reserve levels described above (see Kunce, Gerking, and Morgan 2001 for specific calibration methods). Marginal extraction costs per barrel using 1998 data for 7 major producing states are: CA \$6.12, KS \$4.89, LA \$8.81, NM \$6.27, OK \$6.89, TX \$6.71, and WY \$6.43. The 1998 calibrated oil production cost parameters for Wyoming are $\varepsilon = 2.93$ and $\kappa = 141$.

DNR North Slope Facility Access Pilot Study

May 2004

Presentation to Alaska Senate Resources Committee

February 3, 2012

Thomas P. Walsh

PRA

Petrotechnical Resources Alaska

Project Overview

- Study commissioned by Alaska Department of Natural Resources, Division of Oil and Gas in 2004
- "Facility sharing is critical for the future of the oil and gas industry on the North Slope"
- Delivery of final report in May, 2004

PRA
Petrotechnical Resources Alaska

Motivation

- Avoid regulation of facilities access
- Develop fair and equitable sharing process for North Slope Facilities
- Achieve mutual benefit for all parties

PRA
Petrotechnical Resources Alaska

Project Goals

- Characterize the existing facilities
- Tabulate their current throughput
- Quantify theoretical capacities
- Identify, quantify, and market excess capacity

PRA
Petrotechnical Resources Alaska

Project Goals (cont'd)

- Disseminate information to encourage hydrocarbon development on the North Slope.
- Identify needs and desires of:
  - Independent explorers and producers
  - North Slope facility owners/operators
- Describe how facility access is managed in other oil and gas provinces
- Develop guidelines for facility access on the North Slope

PRA
Petrotechnical Resources Alaska

Parties impacted by issues

- Major Oil Companies currently producing and operating on the North Slope.
- Potential third-party producers attempting to explore and develop on the North Slope.
- State of Alaska.

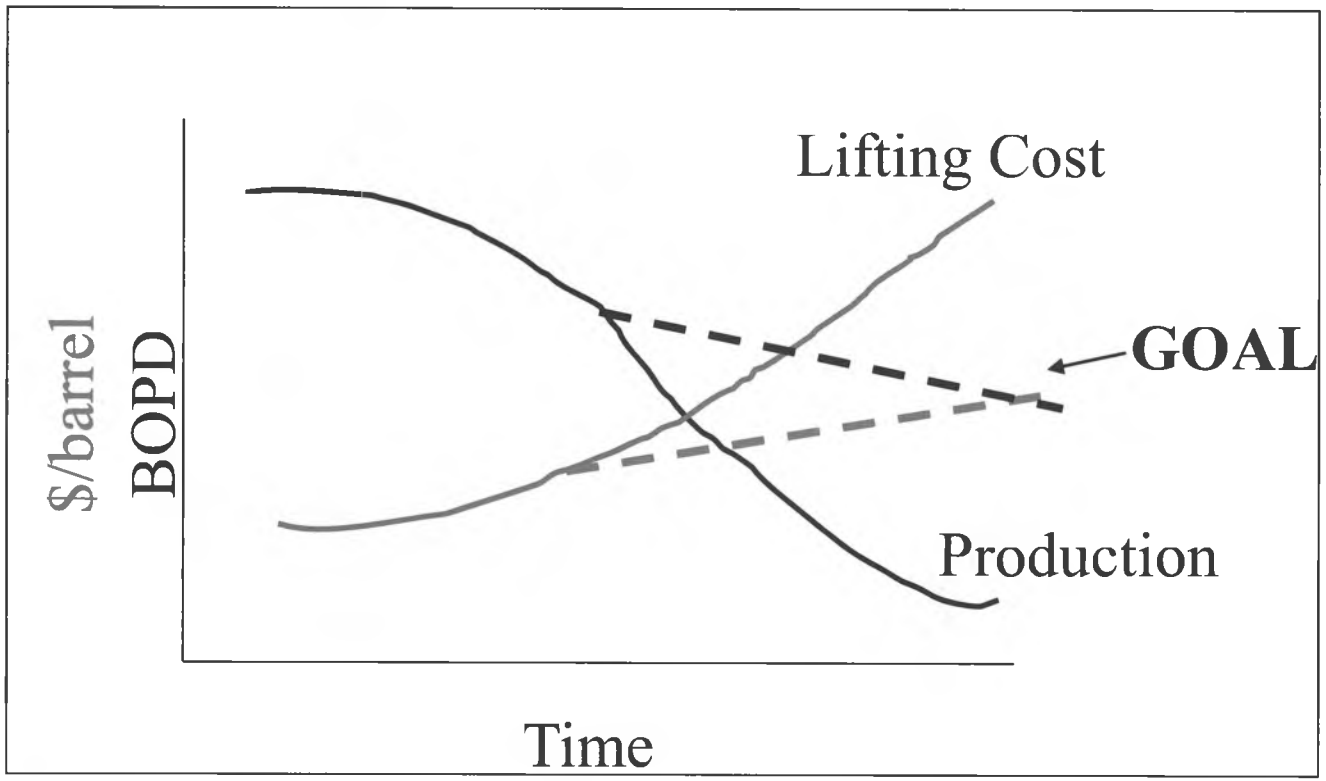
PRA
Petrotechnical Resources Alaska

Benefits

- Mitigate North Slope Oil decline by including Independents.
- Educate independents; remove myths and perceptions.
- Reduce unit operating and transportation costs.
- Extend economic field life for mature fields.
- Accelerate new field development.
- Maximize resource exploitation.
- Minimize waste/footprint.

PRA
Petrotechnical Resources Alaska

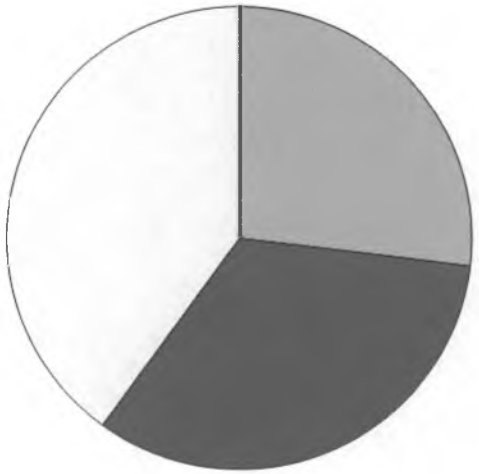
Benefit



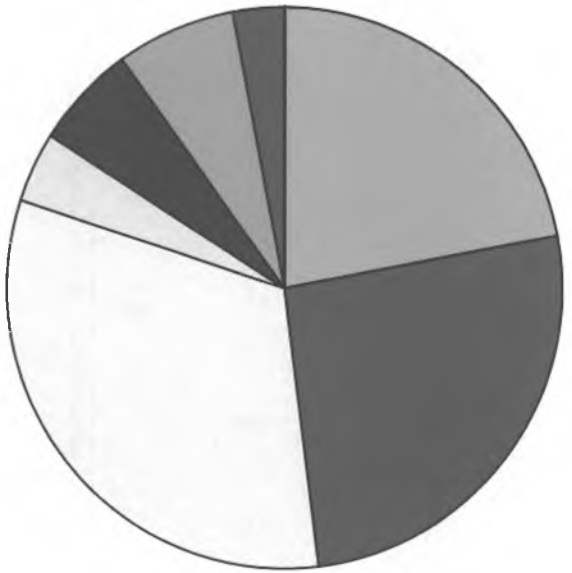
Petrotechnical Resources Alaska

A bigger pie

Today's North Slope Production



Future Production



PRA
Petrotechnical Resources Alaska

Challenges

- Overcome unaligned interests.
- Address system dynamics.
- Maintain high standard of operational integrity.
- Reconcile conflicting asset valuations.

  Ad Valorem vs replacement

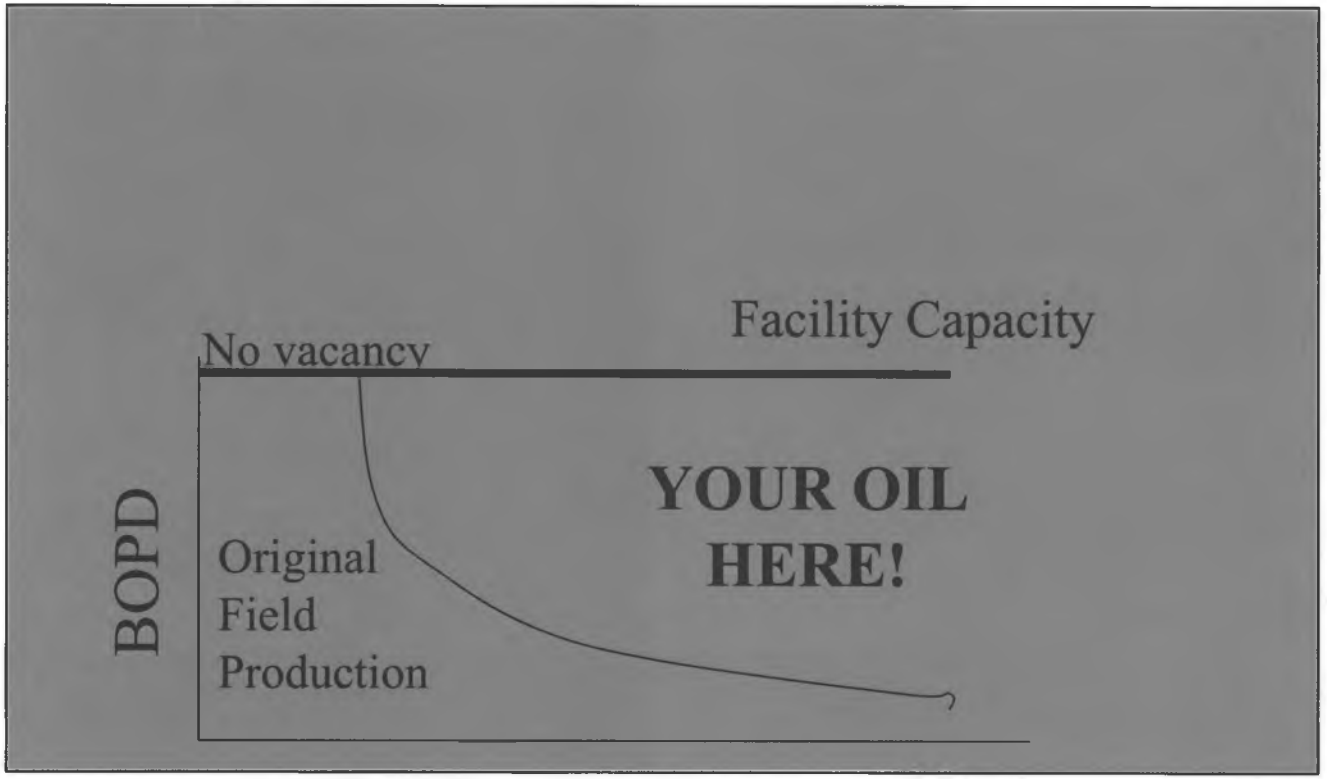
PRA
Petrotechnical Resources Alaska

Questions to the Operators

- What are the benefits to WIOs?
- What do you want potential third-party producers to know?
- Where is existing or future excess capacity?
- What is the process and cost of gaining access?

PRA
Petrotechnical Resources Alaska

Future Production?



Petrotechnical Resources Alaska

PRA
Petrotechnical Resources Alaska

TAPS Specs

The pipeline specifications for the oil delivery to PS1 are as follows:

- Maximum basic sediment and water (BS&W) content of 0.35%
- Minimum delivery temperature of 105° F to prevent paraffin deposition
- Maximum delivery temperature of 142° F
- Maximum True Vapor Pressure of 14.2 psia

TAPS is a common carrier pipeline, and does not discriminate against shippers, but will prorate if capacity exceeded.

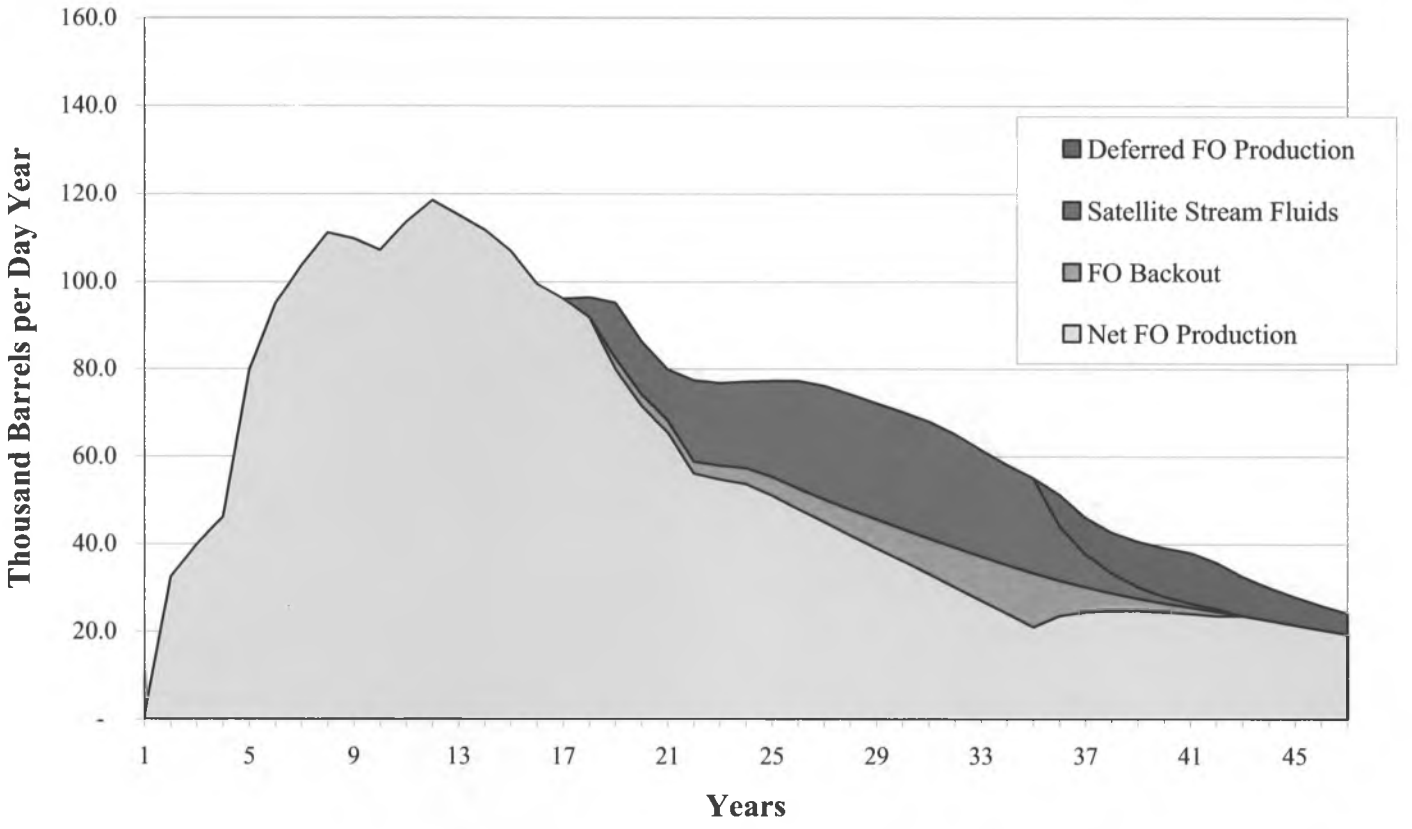
Table 10 Facility and Pipeline Capacity/Constraint Summary

•Feeds into Kuparuk Pipeline and dependent upon space there.

Facility	Capacity Available for:	Constrained Stream	Backout	Pipeline
Alpine	none	oil, gas, water	likely	Full
Badami	oil, gas, water	none	not likely	Not Full
Endicott	oil	gas, water	likely	Not Full
Kuparuk	oil	gas, water	likely	Near Full
Milne Point	oil, gas, water	water 2011	maybe	*
Northstar	oil, gas, water	gas 2006	maybe	Near Full
Pt. Mac/Lis	oil, water,	gas	likely	Near Full
	oil	gas, water	Certain	Not Full

PRA
Petrotechnical Resources Alaska

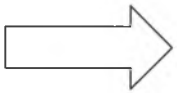
Hypothetical Backout Profile



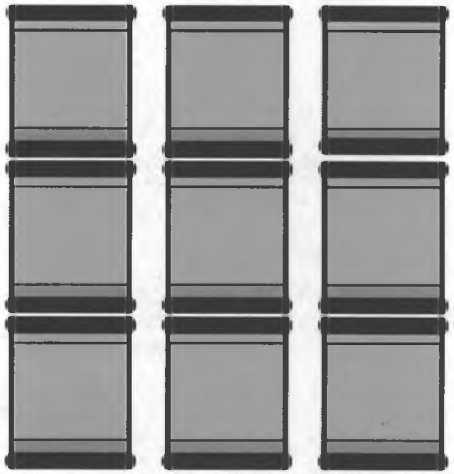
PRA
Petrotechnical Resources Alaska

Backout Concept

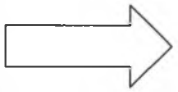
Water / Gas constrained facility



One Barrel current production
high gas/ water cut oil



Water / Gas constrained facility



Nine Barrels potential satellite production
low gas/ water cut oil

PRA
Petrotechnical Resources Alaska

Summary

•Facility Owners and Independents are generally supportive of facility sharing

•Value of facility sharing is dependent on proximity of production to processing,
characteristics of oil to be processed, specific constraints of target facility, etc.

•Means and motivation exist to implement facility sharing agreements, and at least two examples available

•Not all cases will fit

•No oil currently being "held-up" due to facility sharing issues

•More transparency and more discoveries would be helpful

PRA
Petrotechnical Resources Alaska

Acknowledgments

- Bob Kaltenbach, Chantal Walsh, Cathy Foerster, Tom Walsh, Jan MacDonald, Pete Stokes, Chris Livesey and Will Nebesky

- Bill Van Dyke

- A tremendous amount of data and support to this study was provided by the North Slope Facility Owners and Operators: BP Exploration (Alaska) Inc., ConocoPhillips Alaska, Inc., and ExxonMobil. Additionally, the following Independent Oil companies submitted valuable insight and ideas to this evaluation: Winstar, Talisman, Alaska Venture Capital Group, Kerr McGee, and DevonCanada.

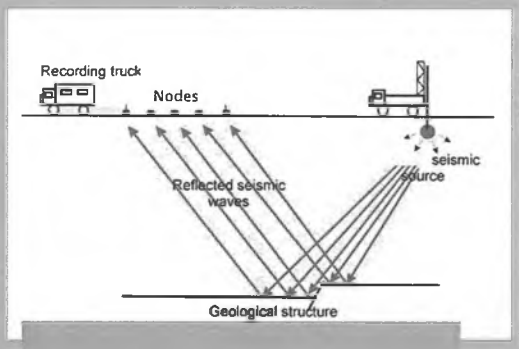
New Technologies

- Nodal technology
- Heavy Oil – CHOPS
- Gas Cap Water Injection

Nodal Technology

State of the Art Technology

- Recording Impact is Minimized:
  - Size and weight is up to 9X less
  - No cables on land minimizing impact to vegetation and wildlife = Footprint minimized
  - Time in area of operation is reduced
- Autonomous: There is no communication between any of the components.
- Cable-Free Operation: Each unit is 100 percent free of external cables/wireless.
- Reliability: The absence of any external cables provides the units with extraordinary field reliability.
- Continuous Recording: Each node begins acquiring data, recording continuously and locally storing the data onto internal FLASH memory until retrieved.
- Self Contained: Each unit contains all of the elements and technologies needed to sense, acquire, digitize, filter and store the seismic data.



Operation:
The sound waves that are generated are sent deep into the subsurface. When they reflect back to the surface, they are captured by geophones and recorded by a computer.

An image of the subsurface, called a seismic profile, is created. This profile allows geologists to predict where oil and natural gas deposits may be located. An **"Ultra-sound"** of the earth is created.

Deploying land nodes

Apache Cook Inlet November 2011

- Marine (Wireless) Nodes deployed in the Cook Inlet from vessels made and rigged in Alaska....and manned by Alaskan crews.
- The nodes are tethered to each other with rope and retrieved within 15 days.
- The nodes are rated to 700 meters of water depth.
- Minimizes Tidal influence
- Nodes Rest on the Seabed providing higher quality data
- Sound waves are produced using compressed air
- Multi vessel acquisition permits a larger "acquisition area" in a shorter period of time

Deploying and Retrieving nodes (data)

Downloading seismic information and recharging

Prudhoe Bay Unit, Ivishak Reservoir Gas Cap (GCWI)

- Water Injection into the gas cap of the Ivishak reservoir was begun in late 2002 to maintain reservoir pressure and increase oil reserves.
- In 2001, the Prudhoe Bay Unit Working Interest Owners (WIO) testified to AOGCC that approximately 200 million Barrels additional recovery would result from the project.
- Average pressure decline was approximately 25-35 psi per year before GCWI.
- Since the start of GCWI, the reservoir pressure has increased by approximately 100 psi (approximate increase of 12 psi per year).

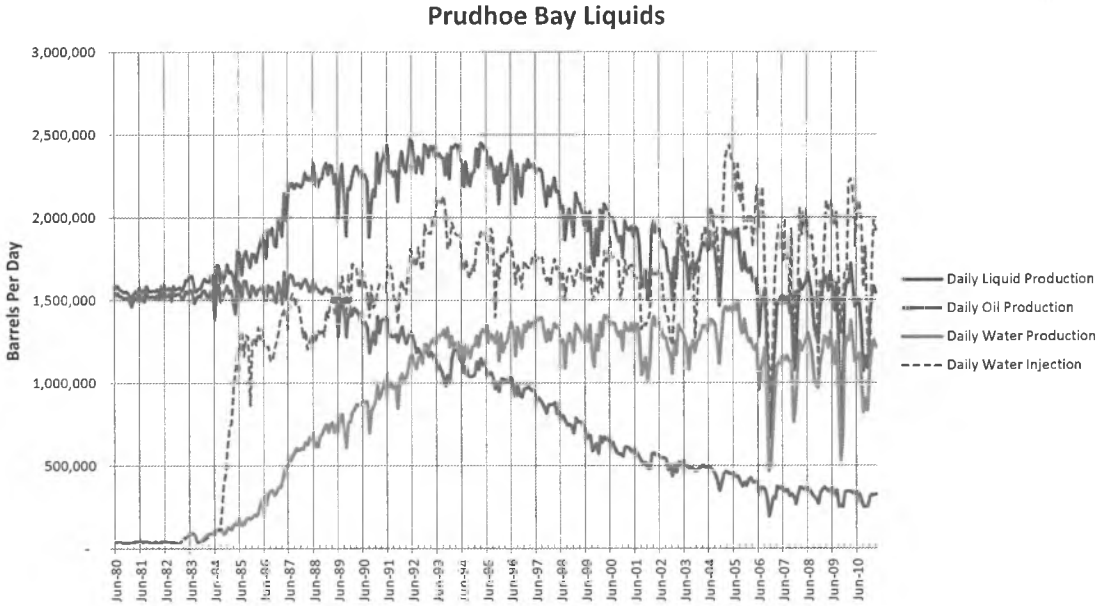
Appendix

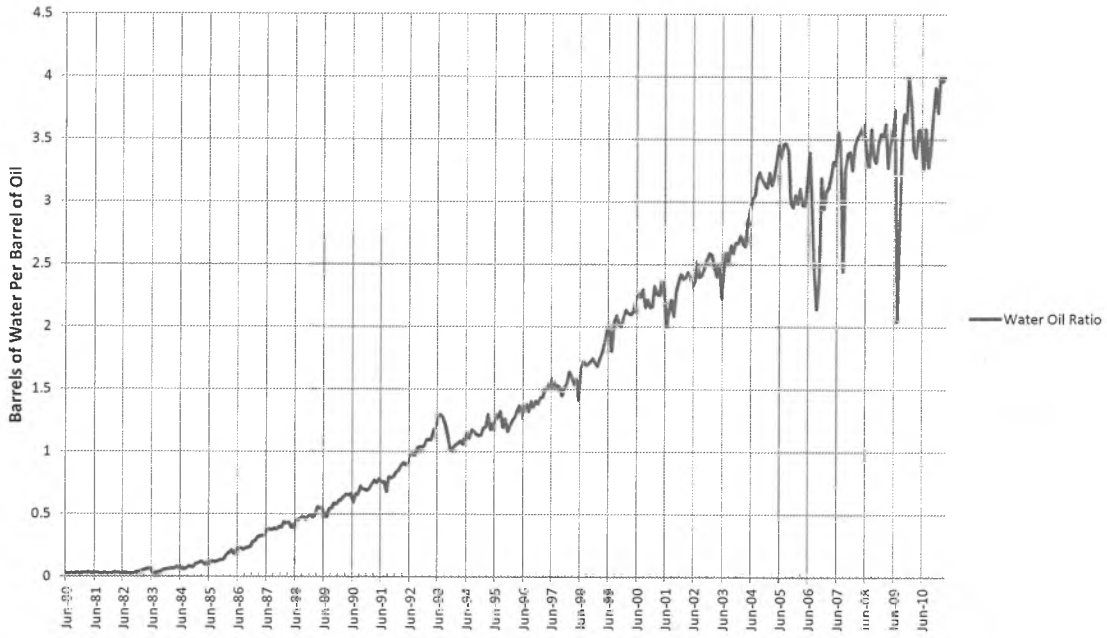
- Annotated slides of Prudhoe Bay and Kuparuk River units production history data relevant to expansion of gas processing and water handling facilities.

Prudhoe Bay Unit



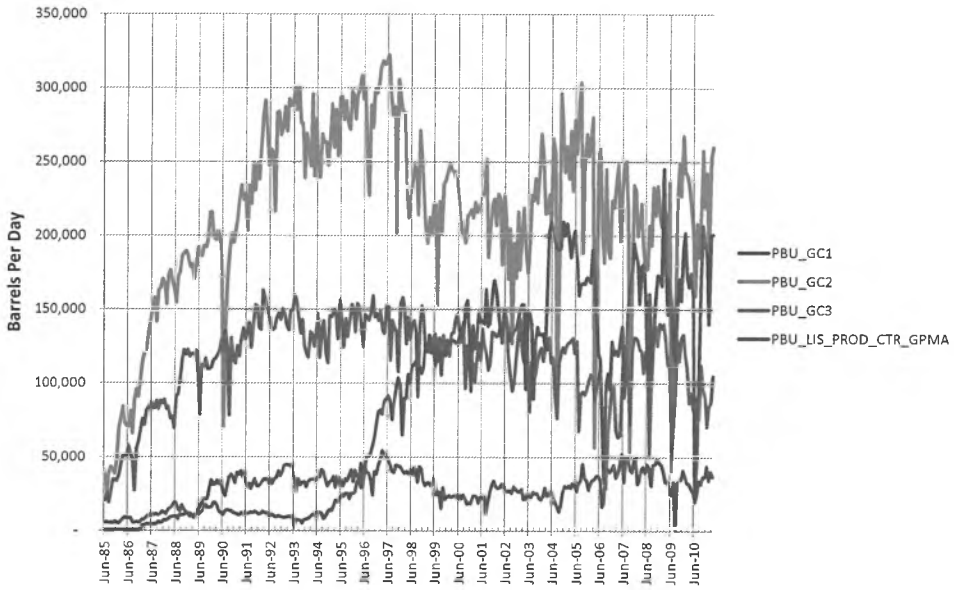
- Liquid throughput has declined considerably since the mid 90's due to oil rate decline
- Lisburne, Pt. McIntyre, Niakuk production into LPC began in 1997, increasing oil rates and water handling capacity.
- Western Satellite development after 1999 helped stem Prudhoe decline.
- Gas cap water injection began in '02, considerably increasing utilization of seawater injection capacity, and helped to stem decline with stabilized reservoir pressures

Prudhoe Bay Water Oil Ratio



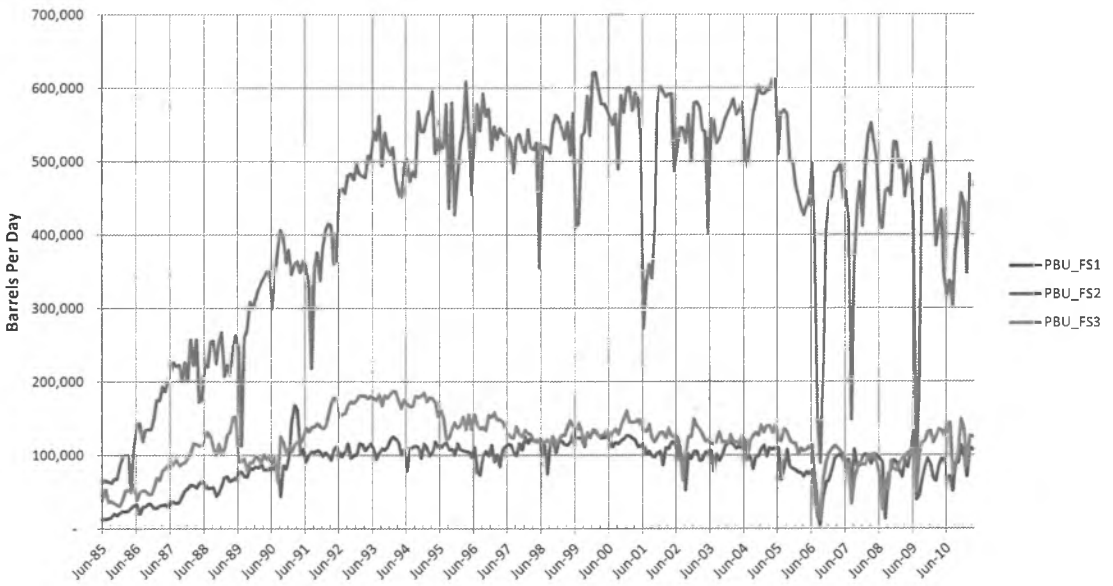
- The water oil ratio has reached 4:1 at Prudhoe with continued waterflood maturity.

Prudhoe Water Production by Gathering Center and LPC



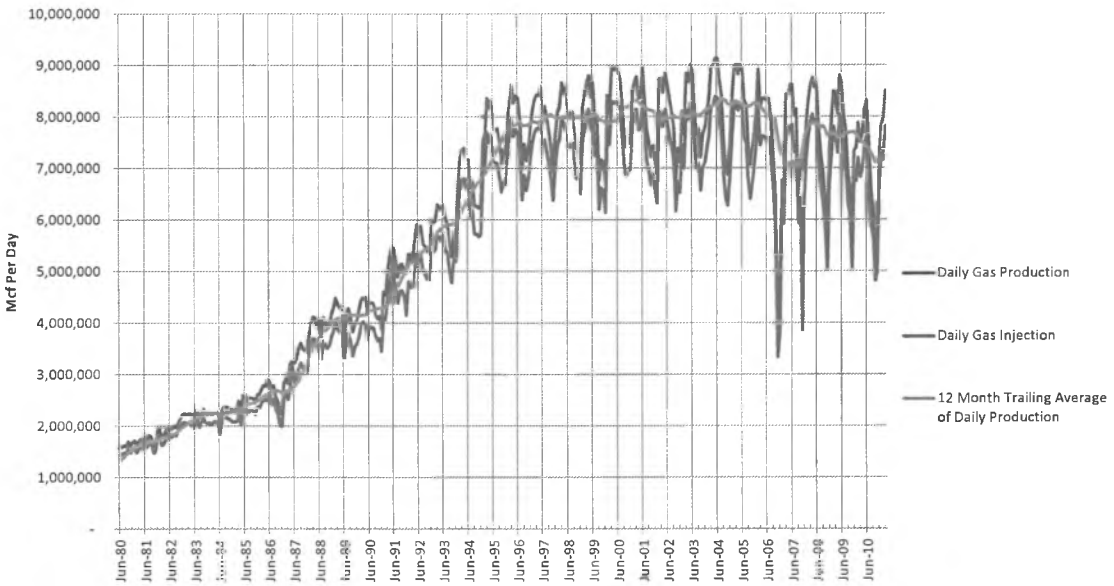
- GC1 is nearer the gas cap and has less waterflood injection, so water production is lower.
- Expansion in water injection pumping capacity at LPC in 2004.

Prudhoe Water Production by Flow Station



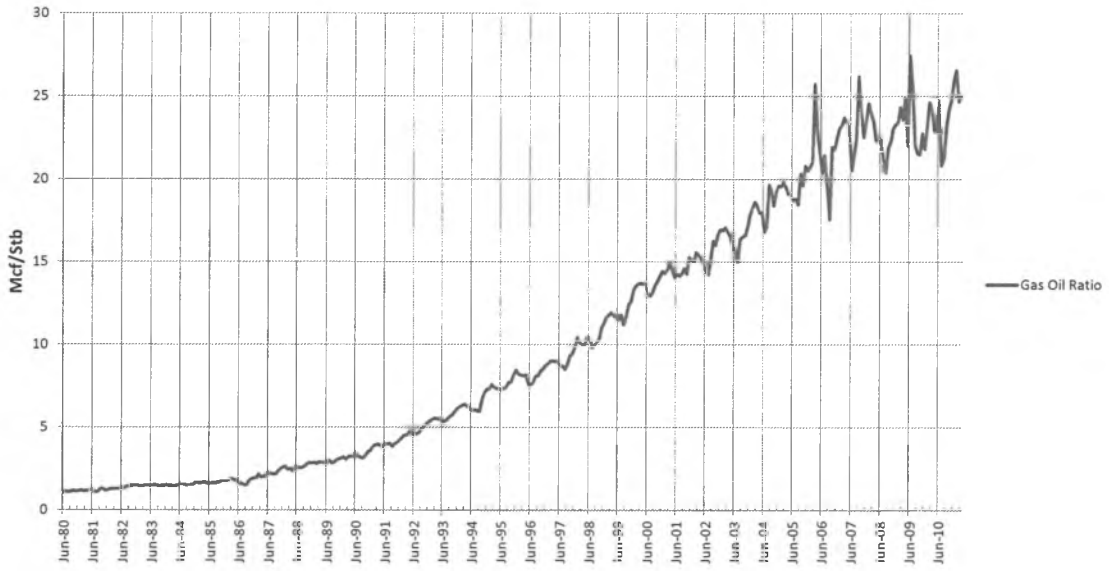
- Flow Station 2 is largely a waterflood area reflected in the higher water production rates

Prudhoe Bay Gas



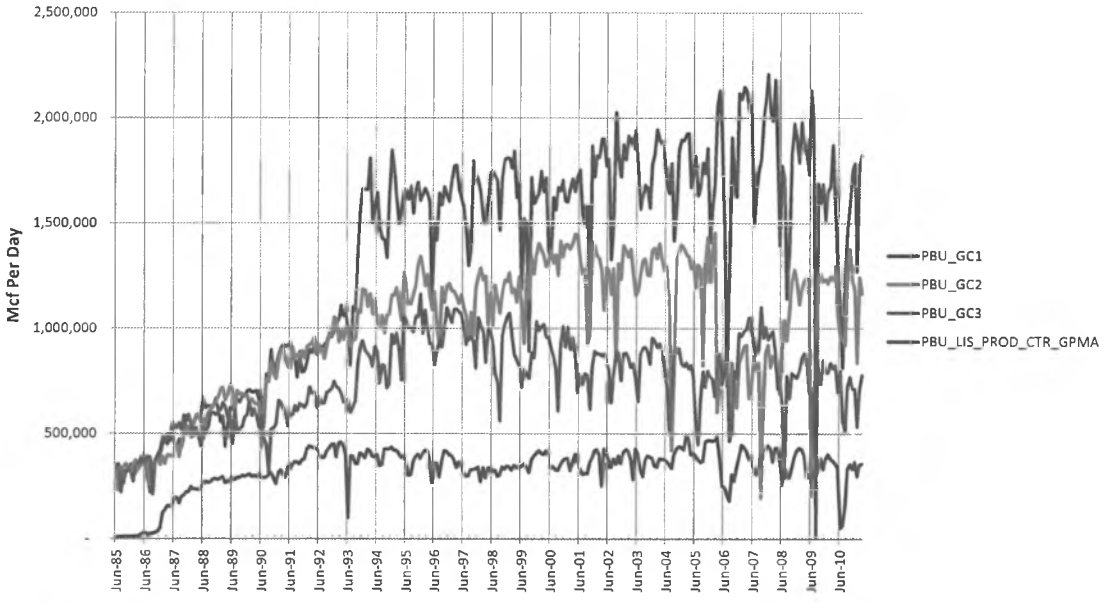
- Gas Handling Expansion – Greater Prudhoe Bay
  - CGF 1987 - Gas handling increased from +/- 4.2 BCFD from +/- 2.7 BCFD. NGL processing allows for sales into TAPS and use in miscible gas injection.
  - GHX1 1990 - gas handling increased from +/- 4.2 BCFD from +/- 5.7 BCFD
  - GHX2 1995 – gas handling increased from +/-5.7 BCFD to +/- 8.0 BCFD
- Total Prudhoe Bay gas throughput has fallen in recent years. 2006-2007 reduction due to 2006 corrosion and shutdown issues. The reductions after 2008 may be due to increased shut-downs for repair and line replacement after the 2006 shut-down.

Prudhoe Bay Gas Oil Ratio



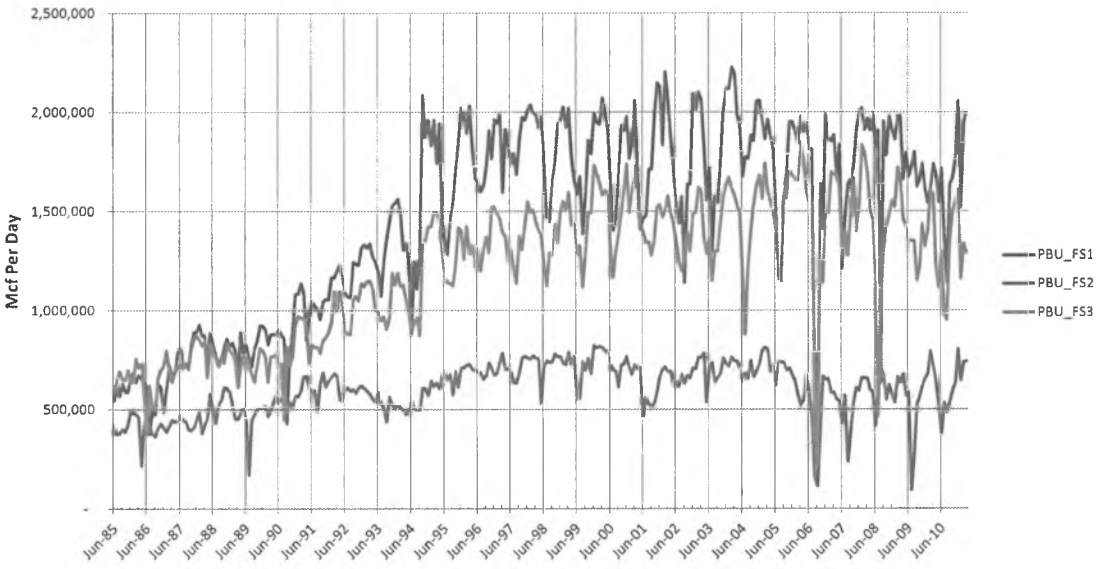
- Average GOR is approaching 25,000 cubic feet per barrel, but this ranges widely among different parts of the field, even more so among individual wells.

Prudhoe Gas Production by Gathering Center and LPC



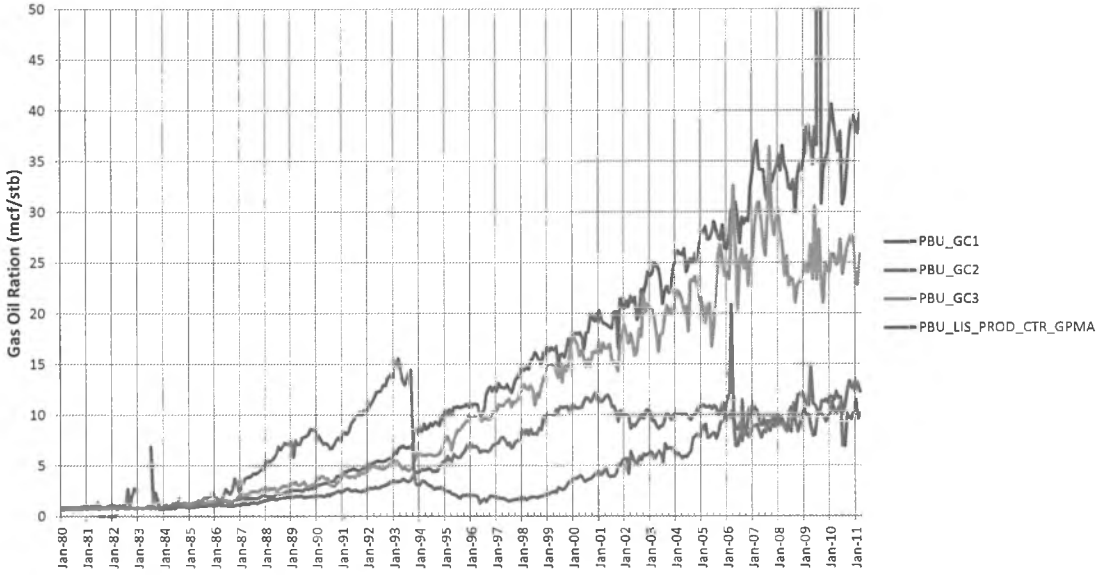
- GC2 was the main facility affected by the 2006 shutdown issues.

Prudhoe Gas Production by Flow Station



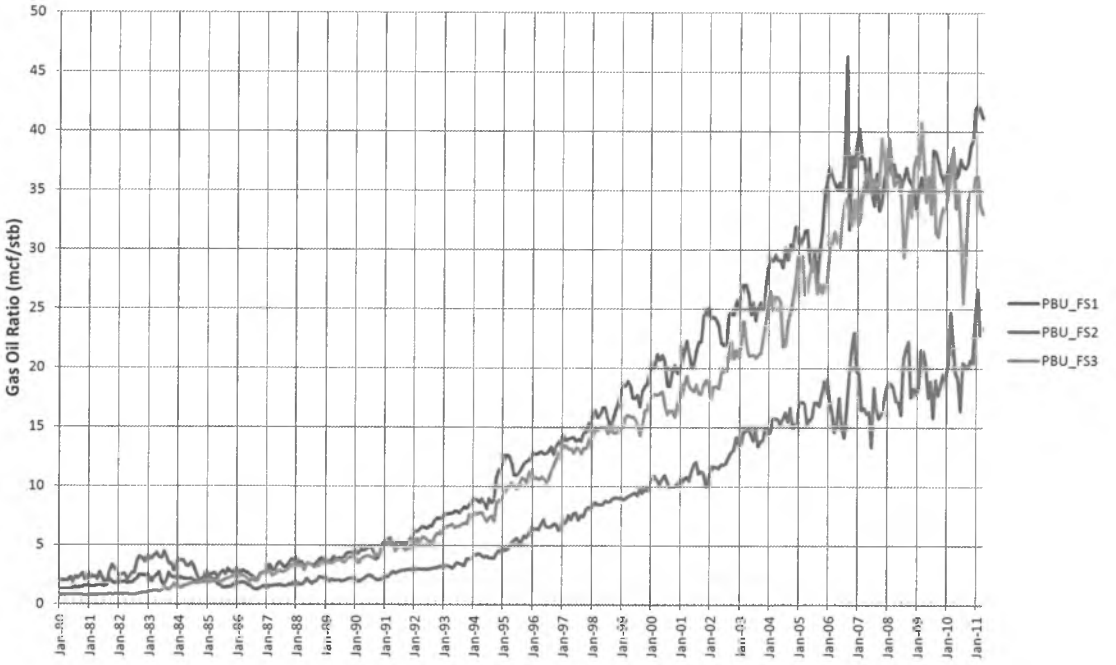
- FS3 gas production has dropped recently, indicating the possibility of spare capacity.
- FS1 and FS2 remain near their peak production

Prudhoe Bay Gas Oil Ratio by Gathering Center and LPC



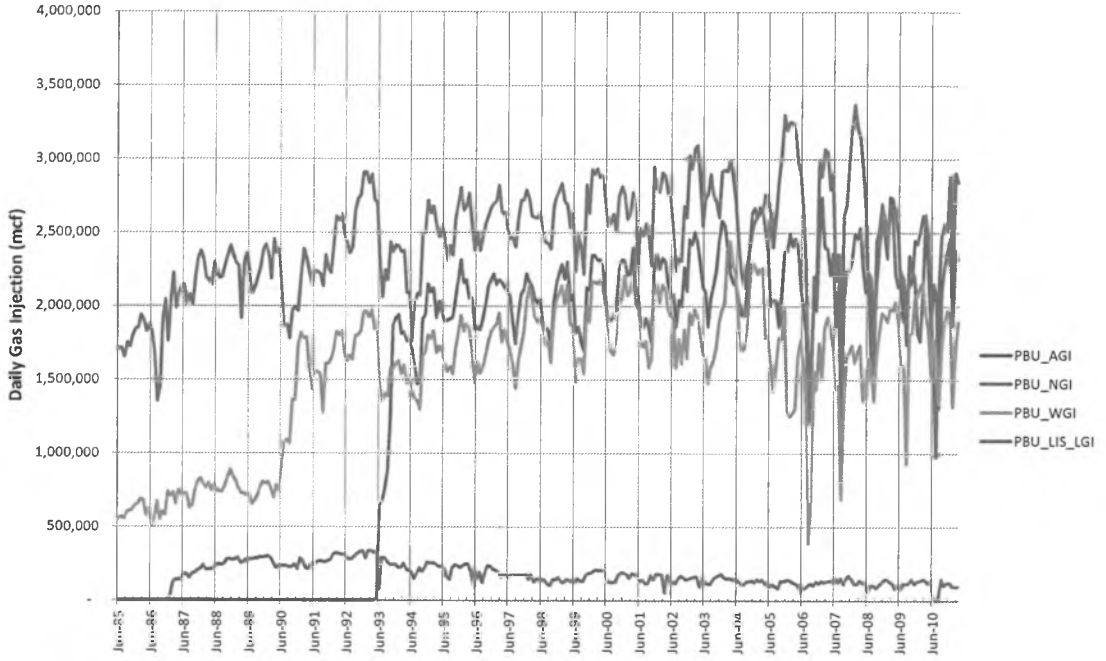
- Average GOR at GC2 and LPC is lower than other gathering centers.
- GC2 leveling of GOR starting in 1999 is a result of western satellite development.
- Gas partial processing plant being considered for GC2 may be needed for efficient continued development of the western satellites (less oil backout when new wells are brought on line)
- LPC gas handling increase may improve oil rates and allow for additional drilling and facilities sharing with developments outside of PBU

Prudhoe Bay Gas Oil Ratio by Flow Station



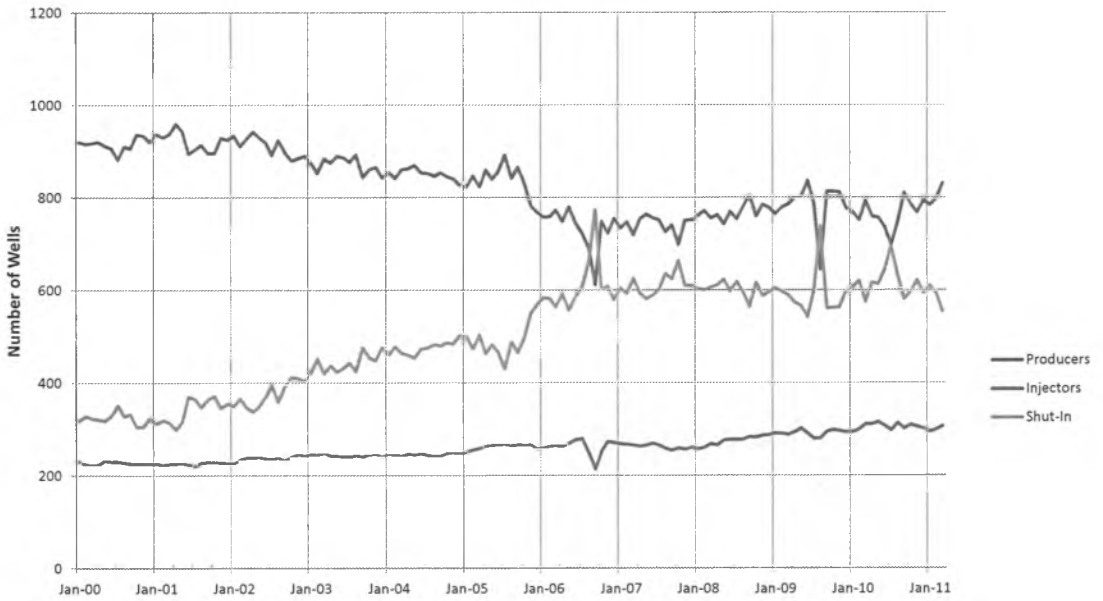
- FS2 has lower GOR as it is largely a waterflood area and further from the gas cap

Prudhoe Bay Gas Injection by Facility



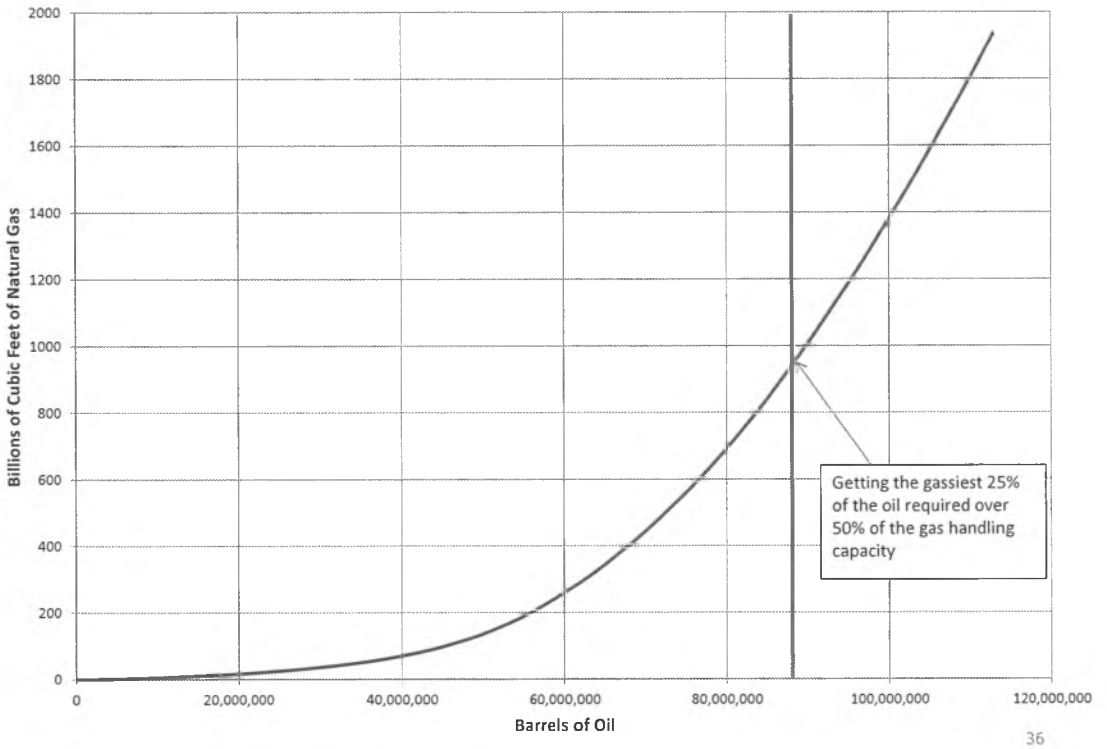
- This plot does not reflect MI injection.
- Lisburne LGI gas cap injection reduction is due to gas compression use by Pt. McIntyre. Pt. McIntyre gas injection is not shown on the graph.

Prudhoe Bay Well Count

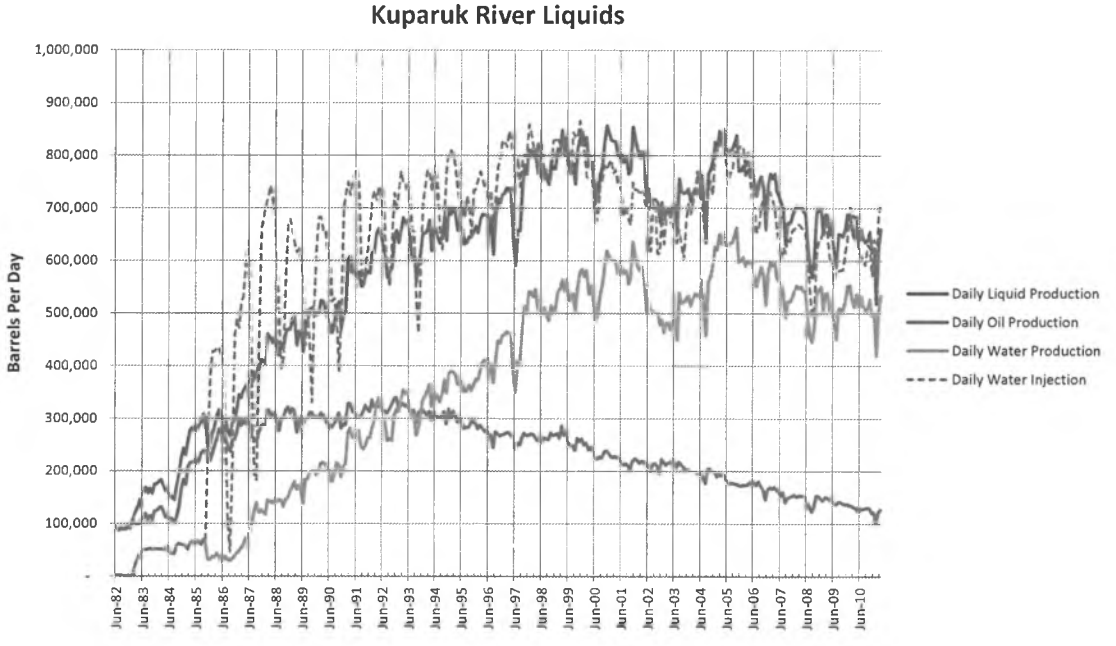


- Significant increase in shut-in wells due to mechanical integrity problems, increasing gas rates, conversion to water and MI injection, and the 2006 shut-down/corrosion problems

Cumulative Gas vs Cumulative Oil in Prudhoe Bay (2010)

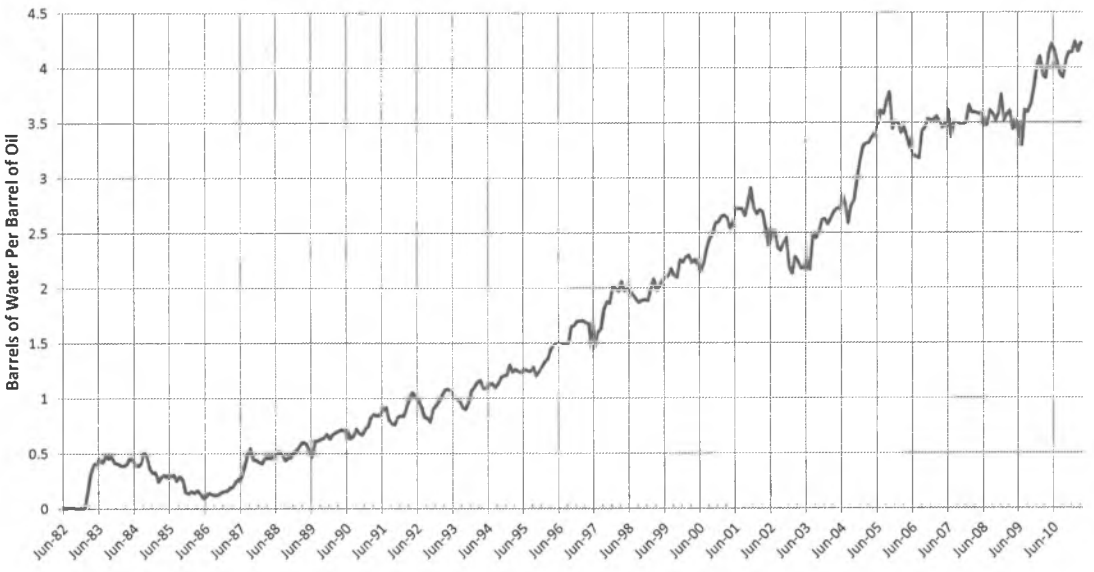


Kuparuk River Unit



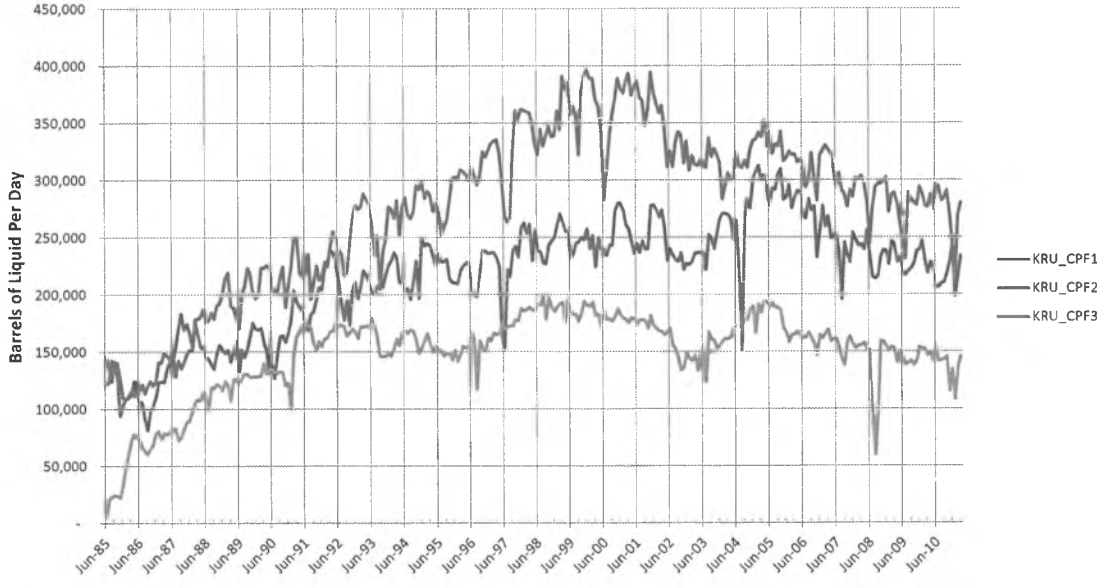
- Current field wide water production is well below former peaks which indicates spare capacity
- Water production correlates strongly to water injection as it should in a late stage waterflood
- Current facility constraints would most likely be around integrity of all steel components

Kuparuk River Water Oil Ratio



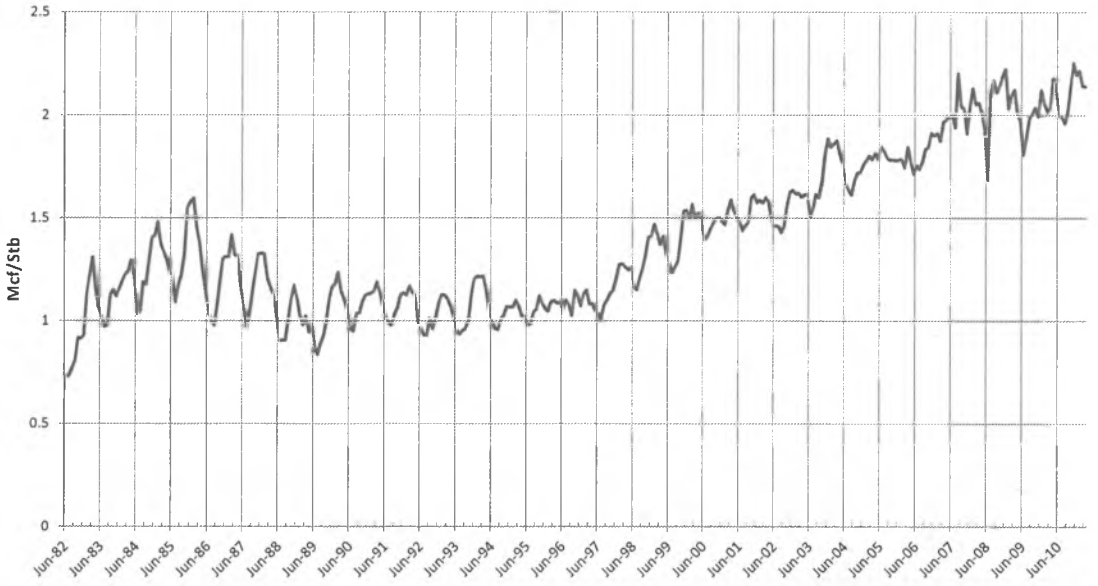
- The water oil ratio has recently exceeded 4:1 which corresponds to an 80% water cut
- It is not uncommon to see water cut for an individual well reach 95%+
- The dip seen in '02-'04 is due to a successful EOR program utilizing imported NGL from PBU

Kuparuk River Liquid Production by Cental Processing Facility



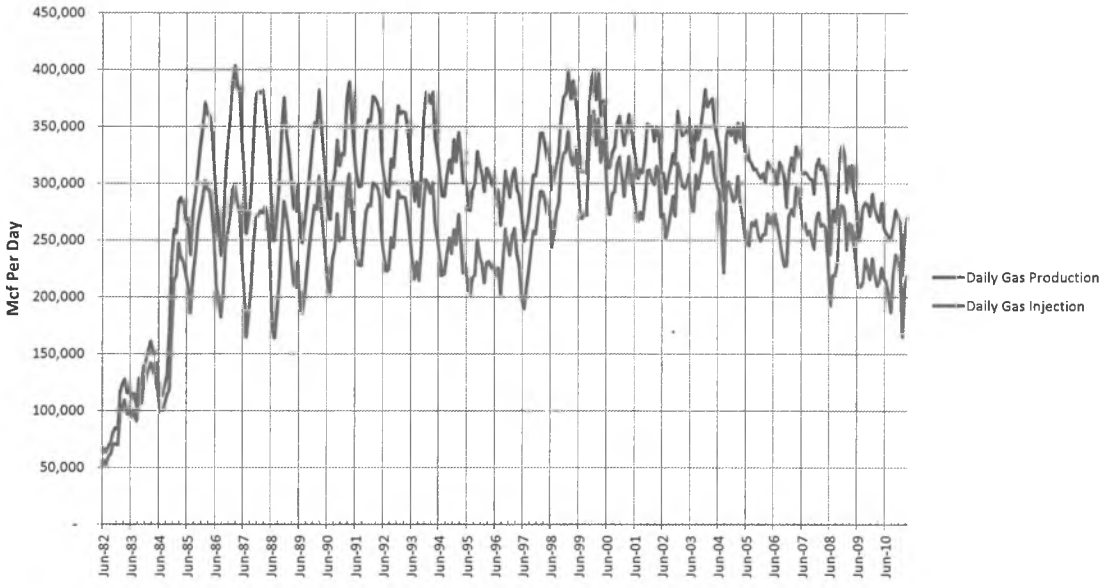
- Central Processing Facilities number one and two are likely not running at full capacity, number three may be
- If the quality of the produced oil changes in a way that it takes longer to separate from water, then it is possible that daily separation capacity could drop

Kuparuk River Gas Oil Ratio



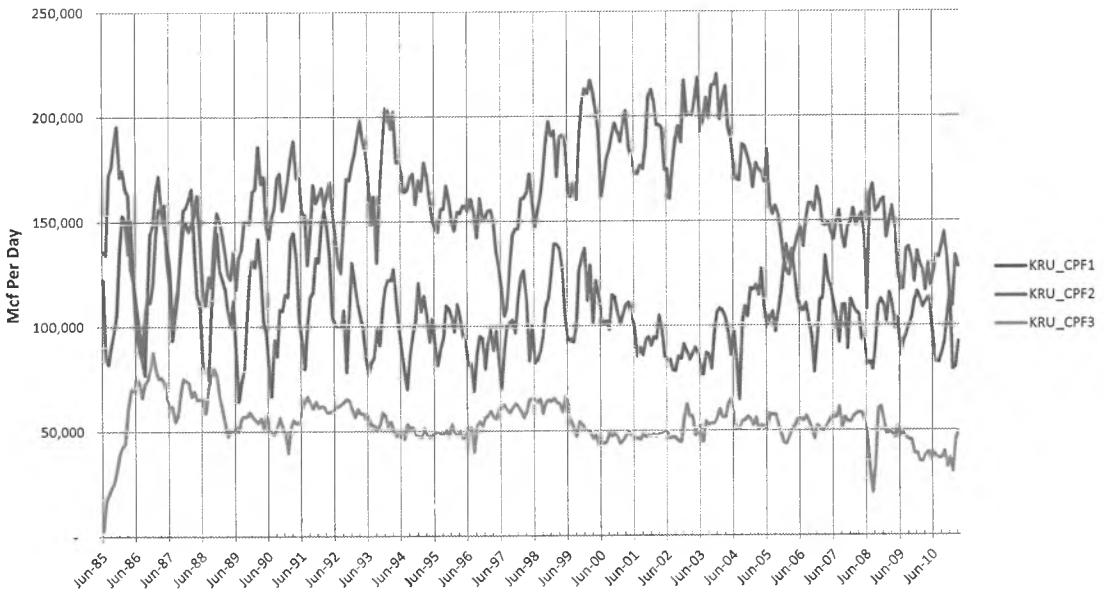
- The low gas oil ratio is what should be expected from an undersaturated reservoir such as Kuparuk
- It follows that there is no reason for GOR to increase significantly in the future unless a major secondary EOR (gas based) is pursued

Kuparuk River Gas



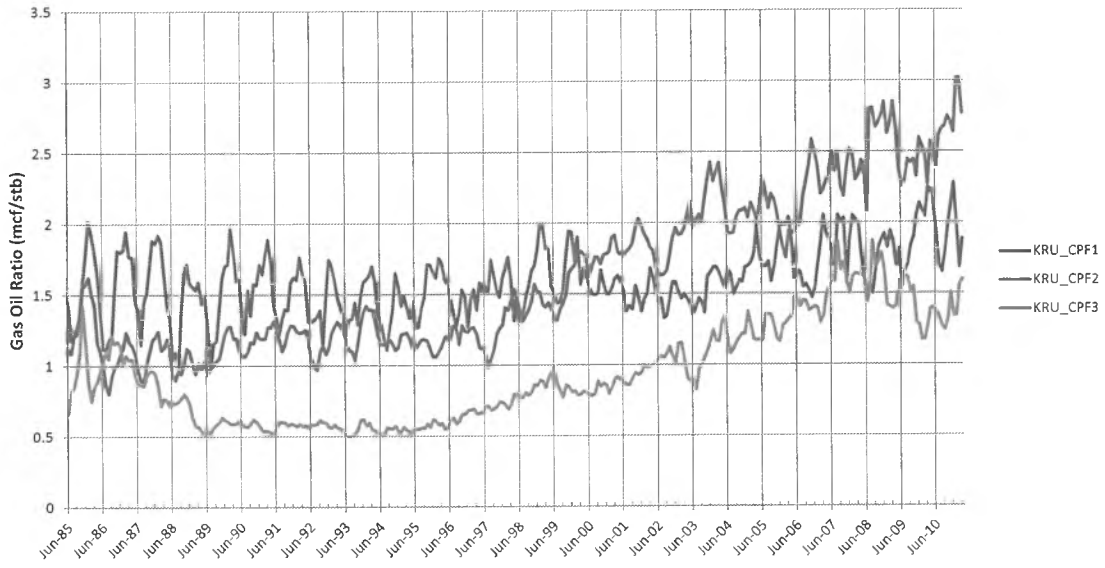
- Gas production and consequently gas injection has steadily declined over the last decade
- ConocoPhillips plans on importing gas to the field in the near future to maintain optimum producing conditions
- Field-wide there is spare capacity for gas, but there could be constraints at a specific facility

Kuparuk River Gas Production by Central Processing Facility

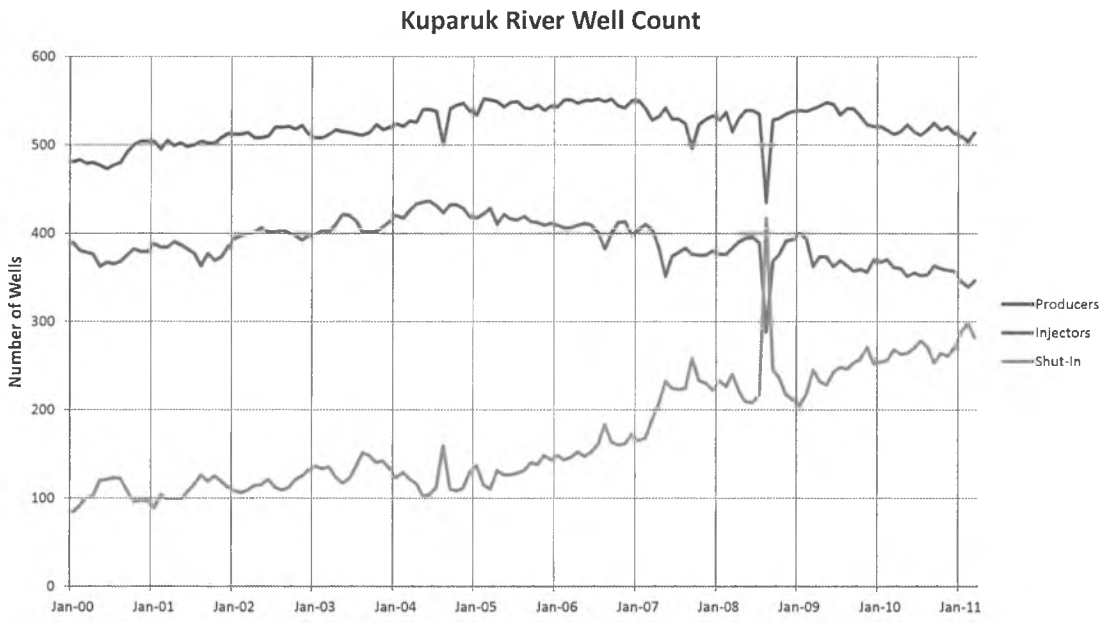


- It appears that all three facilities are not currently operating at peak capacity
- CPF2 underwent an expansion project in 2002
- The expansion project increased oil production for approximately a two year period

Kuparuk Gas Oil Ratio by Central Processing Facility



- GOR behavior by facility indicates that CPF2 could have the largest issue with gas constraints if oil production were to increase



- Shut-in wells have been climbing steadily since 2005 due to casing integrity and mature patterns
- The total well count has climbed during this time as new wells are being drilled for field expansion

From: **DNR Division of Oil and Gas**

Re: **North Slope Facilities Expansion**

Enclosed is a document summarizing facilities expansion at Prudhoe Bay and Kuparuk, as requested by e-mail from you to Commissioner Sullivan. We have distilled most of your questions down to three basic issues addressed in this response.

1) Current and historical facilities (gas, water, and liquid handling) capacity
2) Effect upon oil production of increasing gas-oil ratios and water cut, and the impact of gas- and water-handling expansions
3) Are increases in gas- and water-handling limits required to increase North Slope oil recovery?

We are limiting this summary to major larger scale processing projects at the Prudhoe Bay Unit (emphasis upon Sadlerochit Initial Participating Area and Western Satellites) and the Kuparuk River Unit. There are also public documents which provide more thorough descriptions of capacities that may be of use to you.[1,2,3] You also requested information on horsepower and investments. It would take a bit more time to track public information down on these items.

While we do not have sufficient public information to quantify the oil production benefits of future gas and water handling capacity investments, it is our belief that additional gas and water handling capacity investments will be necessary in some cases for continuing operation of maturing fields, development and expansion of satellite reservoirs, and to allow for facilities sharing with other new developments outside of current Units. These investments are unlikely to be as massive as that for such items as the Prudhoe Gas Handling expansions and Seawater Injection and Treatment plants; rather smaller, more localized projects, debottlenecking, and upgrades are anticipated within the nearby infrastructure of the major Units.

We hope this is useful to you. If you have questions or need further information, please let us know.

North Slope Facilities Capacities and Expansions

The summary below addresses capacity limits for processing units within the Prudhoe Bay Unit and Kuparuk River Unit. Specifically we address the following aspects:

1) Current and historical facilities (gas, water, and liquid handling) capacity
2) Historical production volumes, the effect upon oil production of increasing gas-oil ratios and water cut, and the impact of gas and water handling expansions
3) Additional gas and water handling limits needed to increase North Slope Oil recovery

Figures illustrating historical production are provided in a separate PowerPoint file as an appendix.

Prudhoe Bay Unit

The current oil processing capacity of both the IPA facilities and the LPC is mainly limited by the amount of associated gas that can be processed and injected, however there are some limits on water handling. In other words, some of the processing capacities cannot be used because of the inability to process and inject the increasingly higher quantity of gas that is produced with the oil and water. Although efforts to shut off gas have been effective in some wells, in general higher GOR wells must be shut in with each additional new well addition. So, these new wells will "back-out" oil due to shut-in of other Prudhoe wells. The effects of this back-out vary by major processing facilities as outlined below. The following summarizes facilities capacities for the major facilities at Prudhoe Bay.

Current Prudhoe Bay capacities

The following table summarizes publicly available oil, gas, and water handling capacities for the major facilities at Prudhoe Bay. While the sum of gas production capacity at the flow stations may be as high as 10 BCF/D, the rated compression capacity at the Central Gas Facilities limits overall gas production to 8.7 BCF/D. [1]

Table 1

The capacity of each major facility is shown in the following table. However, in actual operations, the capacity of a single facility for a given component cannot be viewed in isolation and instead must be viewed in the context of the overall PBU system and other factors, such as weather and TAPS pro-rations. As such, rarely, if ever, can the capacity of more than one component (oil, water, or gas) be achieved simultaneously.

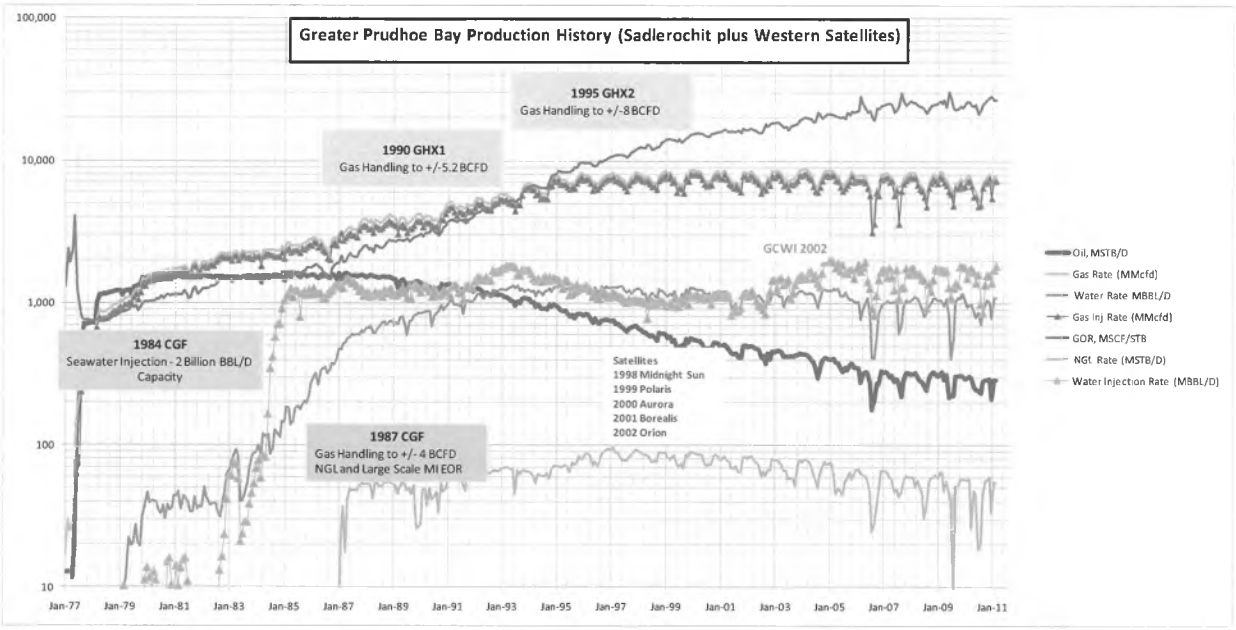
Facility	Oil Capacity MBD	Water Capacity MBD	Gas Capacity MMSCF	Gas Lift Gas Compression Capacity MMSCF
FS-1	360	130	2800	
FS-2	360	650	1150	
FS-3	360	240	1350	460
GC-1	330	150	2600	900
GC-2	250	300 *	1070	
GC-3	**	250	1100	
LPC	205	160	470	
CGF			8700	

* PW Tank currently out of service limits water to ~230 MBWPD
** GC-3 oil processing equipment was taken out of service; must consider GC-3 and FS-3 as single entity for oil processing capacity considerations

[1] ConocoPhillips Alaska Publication; *"Facilities Limits"*; initial publication 2002, updated 1/6/2010; (http://www.conocophillipsalaska.com/facilityaccess/FacilityLimits.asp)

Production and Major Facilities Expansion History

The following summarizes production history and major facilities capacity additions within the Greater Prudhoe Bay area (Sadlerochit plus Western Satellites – excludes Greater Point McIntyre). It should be noted that many smaller facilities and infrastructure expansions have occurred over time to accommodate new wells and drillsites, however major gas handling expansion has not occurred after 1995 with GHX2 addition.



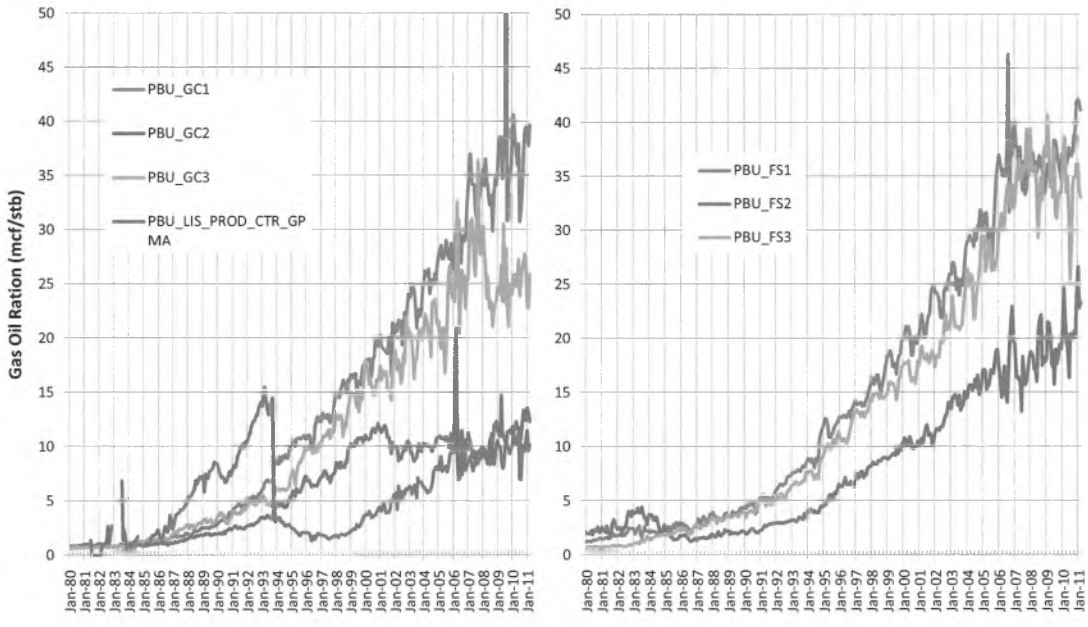
- 1983 - Major Seawater Injection Plant and Seawater Treatment Plant; 2 Billion Barrels per day injection capacity – $2 Billion
- Gas Handling Expansion – Greater Prudhoe Bay
  - CGF 1987 - Gas handling increased from +/- 2.7 BCFD to +/- 4.2 BCFD. NGL processing allows for sales into TAPS and use in miscible gas injection.
  - GHX1 1990 - gas handling increased from +/- 4.2 BCFD to +/- 5.7 BCFD
  - GHX2 1995 – gas handling increased from +/-5.7 BCFD to +/- 8.0 BCFD
- 2002 - Gas Cap Water Injection
  - Seawater is being injected into the Prudhoe Bay Ivishak gas cap to stabilize reservoir pressure.
  - Approximate incremental recovery 150-200 MMSTB (per AOGCC testimony)
- Greater Prudhoe Bay Western Satellites - (Note – Excludes GPMA)
  - Midnight Sun (1997), Polaris (production start date: 1999), Aurora (2000), Borealis (production start date: 2001), Orion (production start date: 2002), Put River (production start date: 2008).

Prudhoe Bay Future Opportunities/Needs

We do not have sufficient publicly available information to quantitatively address the oil production benefits of future gas and water handling capacity investments. However, investments in additional gas and water handling may be necessary to realize efficient and economic oil recovery: 1) for development and expansion of satellite reservoirs, 2) for facilities sharing with other new developments outside of current units, and 3) for acceleration and increased oil rates in the maturing fields. These investments are unlikely to be as massive as that for such items as the Prudhoe Gas Handling expansions and Seawater Injection and Treatment plants; rather smaller more localized projects, debottlenecking, and upgrades are anticipated within the nearby infrastructure of the Prudhoe Bay Unit.

An example of a gas expansion opportunity being considered by the Prudhoe Bay Owners includes a "Gas Partial Processing Plant" which would be placed upstream of Gathering Center 2 at a Z Pad (western portion of the Prudhoe Bay Unit). Currently, the existing GORs are low at GC2 relative to other processing facilities because the facility has not been upgraded with sufficient gas processing capability. As a result, the oil rate benefit from drilling new wells in that part of the field is significantly reduced because even moderate GOR wells have to be shut-in to accommodate the new production. The proposed gas partial processing plant would partially separate gas from incoming production Drill Pads Z, W, L, and V, then dehydrate and compress the gas for use in local gas lift. Such a plant should significantly improve the economics of new western region drilling and is a key component required for a new I Pad viscous oil development. Our very rough calculation suggests that approximately 400 MMSCF/D added gas processing could allow for about 15,000-35,000 STB/D additional oil rate (range depends upon new well and drillsite developments).

Prudhoe Bay Gas Oil Ratio Comparison by Major Processing Facility



Kuparuk River Unit

Kuparuk River facilities were built and sized for the Kuparuk Participating Area, which is the main PA in the Kuparuk River Unit. Peak liquid throughput was roughly 800,000 barrels of liquid per day. This throughput was achieved both in the late 1990s-early 2000s as well as the 2004-05 period when NGL imports were ended. Peak water production was reached during the 2004-05 liquids peak with 650,000 barrels of water per day. Water injection peaked in the late 1990s, equaling the liquid production rate at the time which was 800,000 barrels per day. Gas production peaked at 400,000 MCF per day in 2002, coinciding with the last gas handling expansion at Kuparuk. These peaks aren't necessarily hard limits, nor can we be 100% certain they can be achieved again in the future. As equipment ages it may lose some capacity so those peaks may no longer be obtainable, but they provide a good guideline for what was possible to achieve with functioning equipment.

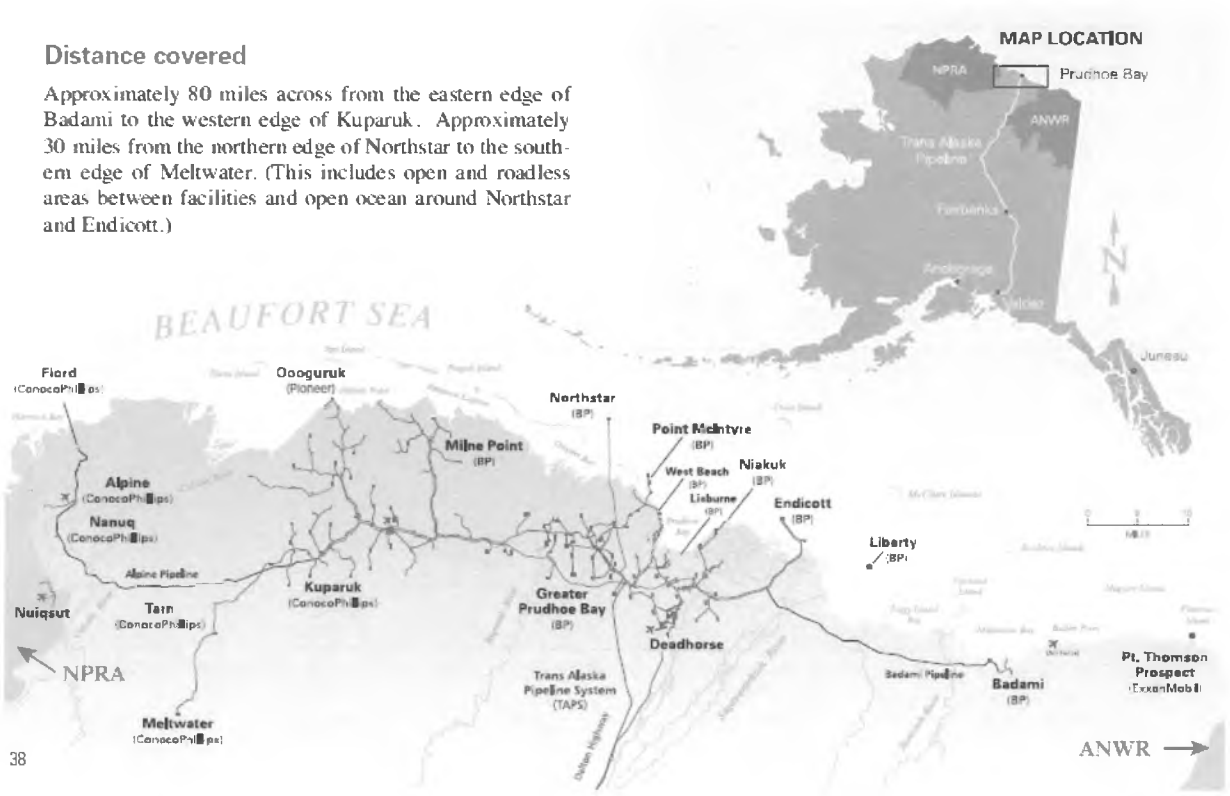
As any field matures it is likely to encounter an increased amount of gas and water per barrel of oil. If the current facilities in a field were not designed for the amount of liquid and gas being produced then wells with high GOR and high water cut may need to be shut-in, curtailing production. A facilities expansion would only increase recovery rate if there were shut-in wells to bring online or new wells that could be drilled to produce into the new facilities. In general there will be some tradeoff between how much oil can be gained by increasing facilities and how much those facilities cost. A balance must be achieved in both the initial sizing of facilities as well as any decision to expand facilities later. Kuparuk River facilities were sized in a way where it did not need to expand to deal with increasing GOR and water cut. It is possible to design facilities large enough to not have to be expanded, but that it may not always be optimal.

In some cases new facilities may be necessary to increase North Slope production. There is no question that new oil will need to be processed somewhere, the question is whether that should be somewhere in existing facilities or at a new facility. This comes down to an economic decision of whether it is cheaper to build new or pay to put production through an existing facility. At Kuparuk there is little need to expand facilities for current operations, but if any new satellites were to be brought in, or a new EOR project was undertaken then facilities would likely need to be expanded to accommodate increased volumes. Similarly, the size of a new development will have a lot to do with the decision to rent space or build new. If the development is of a size where it can easily fit into available space, that may be the cheaper option, but if that development is large enough to pay for its own facilities then it is probably optimal to build new and not deal with the expenses and logistical issues of running multiple developments through a single set of facilities.

North Slope Fields Map

Distance covered

Approximately 80 miles across from the eastern edge of Badami to the western edge of Kuparuk. Approximately 30 miles from the northern edge of Northstar to the southern edge of Meltwater. (This includes open and roadless areas between facilities and open ocean around Northstar and Endicott.)



See BP Alaska, Inc; *"BP in Alaska"*; 2009; (http://www.bp.com/liveassets/bp_internet/globalbp/STAGING/global_assets/downloads/A/abp_wwd_alaska_bp_in_alaska_2009.pdf)

Introduction

Decision Following Trial De Novo, Case No. 3AN-06-8446 CI
(2007-2009 Tax Years Consolidated) Assessed Valuations of the Trans Alaska Pipeline System (December 30, 2011)
("Gleason Decision")

Robin O. Brena—Counsel for the Fairbanks North Star Borough and Lead Counsel for the Municipalities in the 2007-09 Assessed Valuations Case for TAPS

Craig W. Richards—Counsel for the City of Valdez and Co-Counsel for the Municipalities in the 2007-09 Assessed Valuations Case for TAPS

Mr. Brena and Mr. Richards are testifying as to their own personal opinions as Alaskan residents and are not representing any client or being paid for their testimony.

Introduction

Robin O. Brena

Mr. Brena is a life-long Alaskan who grew up in Skagway. He has received a Masters of Business Administration ("MBA") and a Doctor of Jurisprudence ("JD") from the Willamette University and a Master of Laws in Real Property ("LL.M.") from the University of Miami. He has been the Chairman of the Real Estate Section of the Alaska Bar Association, Chairman of the Estate Planning and Probate Section of the Alaska Bar Association, and has taught Advanced Business Law at the University of Alaska.

Mr. Brena is the owner of Brena, Bell & Clarkson, P.C., an Anchorage law firm that emphasizes oil and gas, public utilities, tax assessment, real estate, commercial, regulatory, and telecommunications law. Representative current and prior clients in the oil and gas and tax assessment areas of practice are Fairbanks North Star Borough; Anadarko Petroleum Corp.; City of Valdez; Tesoro Corporation; Aurora Gas, LLC; Aurora Power Resources, Inc.; Murphy Exploration (Alaska) Inc.; Cook Inlet Energy, LLC; Agrium Inc.; Nabors Alaska Drilling, Inc.; Doyon Drilling, Inc.; Doyon Parker Joint Venture; Nordic-Calista Services No. 1; and Parker Drilling, Inc.

Mr. Brena has been involved in several major tax assessment cases in Alaska involving drilling rigs, an oil refinery, tankers, and pipelines. He has also been involved in the many of the major pipeline regulatory cases before the Federal Energy Regulatory Commission ("FERC"), the Regulatory Commission of Alaska ("RCA"), and the Washington Utilities and Transportation Commission ("WUTC") involving the Trans-Alaska Pipeline System ("TAPS"), Cook Inlet Pipeline System ("CIPL"), Cook Inlet Gas Gathering System ("CIGGS"), Kenai Pipeline Company ("KPL"), Olympic Pipeline, and Enstar.

Mr. Brena represented the Fairbanks North Star Borough and was the lead counsel for the Municipalities before the Honorable Judge Gleason in the ad valorem case concerning TAPS for the 2007-09 tax years.

Introduction
Craig W. Richards

Mr. Richards grew up in Fairbanks, Alaska, where he graduated from West Valley High School in 1993. He studied finance as an undergraduate at the University of Virginia, and holds a *Juris Doctor* from Washington & Lee University and a MBA from Duke University.

Mr. Richards practices law with Bill Walker and Joe Levesque at Walker & Levesque, LLC in Anchorage, Alaska. His practice focuses on finance, tax, municipal, and oil and gas law. Mr. Richards has been involved with numerous oil and gas taxation disputes, including those relating to TAPS and the tankers that call at Valdez. Through his representation of the Alaska Gasline Port Authority, as well as other clients, he has spent many years working on an LNG project to Valdez. He has also been actively involved in the proposal to truck North Slope gas to interior Alaska, and the proceedings related to the termination of the Point Thomson Unit. The firm also acts as bond counsel on TAPS' refinancings.

Mr. Richards, along with Mr. Walker, represented the City of Valdez before the Honorable Sharon Gleason in the recent de novo trial relating to the 2007 – 2009 assessed value of TAPS.

Introduction

1. This is a consolidated appeal of the State Assessment Review Board ("SARB" or "Board") Decisions of the 2007, 2008, and 2009 assessments of the Trans Alaska Pipeline System ("TAPS") for ad valorem tax purposes under AS 43.56. SARB assessed the value of TAPS for 2007 at $4.588895312 billion, for 2008 at $6.154447972 billion, and for 2009 at $9.045892 billion.

Gleason Decision ¶ 1

Introduction

599. [F]or the reasons expressed herein, this Court finds that as of January 1, 2007, 2008, and 2009, the "full and true value" of the Trans Alaska Pipeline System, "with due regard to the economic value of the property based on the estimated life of the proven reserves of gas or unrefined oil then technically, economically, and legally deliverable into the transportation facility" is $8.941 billion for 2007, $9.644 billion for 2008, and $9.249 billion for 2009.

Gleason Decision ¶ 599

Overview

546. Brent Eyre, on behalf of the Municipalities, employed a discounted cash flow income approach to value the integrated economic unit of which TAPS is a part at $40.2 billion in 2007, $44.2 billion in 2008, and $50.4 billion in 2009. Dr. James Smith, on behalf of the Owners, testified that Mr. Eyre's unit value of the integrated ANS enterprise should be reduced by slightly less than 10% for each year, for a value of $36.4 billion in 2007, $41.1 billion in 2008, and $46.0 billion in 2009.

Gleason Decision ¶ 546

Overview

Integrated Value of the ANS Unit

	Comparison of Valuation Results, Before and After Corrections (all values in $ billions)			
		Jan 1, 2007	Jan 1, 2008	Jan 1, 2009
Eyre	Results Reported by Mr. Eyre			
	System	$40.159	$44.208	$50.439
	TAPS	$8.812	$9.611	$10.688
Smith	Results Obtained from Corrected Model			
	System	$36.401	$41.079	$46.000
	TAPS	$0.259	$0.645	$2.555

TO-07-433 (Dr. Smith Chart)

Market Structure

Integrated Operations with Market Power

Concentrated Market Power Integrated Value of the Unit

- **Shows ANS unit will generate roughly $36 - $50 billion in discounted cash flow value**
- **Current Value of Parts of the Unit Substantially Less than $36 - $50 billion**
  - Taxable upstream assets, most valued on RCNLD, assessed at between $8-$10 billion for 2007 to 2009 [2007-2009 Trial Tr. 13040 (Greeley)]
  - Even under Dr. Smith's calculations, a $13 billion TAPS value leaves between $13 billion and $26 billion in unallocated unit value for non-taxable property
    - Includes intangibles (if any), leases, certain locally assessed property, etc. [*See* AS 43.56.020; AS 43.56210(5)(B)]
- **Unit Income is Sufficient to Justify:**
  - Billions in capital investment above the over $2 billion annual capital investment already anticipated in the integrated model
  - Replacing TAPS at $20+ billion
  - A $13+ billion TAPS value

Market Structure

- Barriers to Competitive Entry

Market Structure

Integrated Operations with Market Power

- Integrated Operations
- Market (ANS Basin) Dominance by Big 3
- Limited Competition

Market Structure

Integrated Operations with Market Power

69. The TAPS Owners did not and could not have independently financed the original construction of TAPS and they do not independently finance substantial improvements to TAPS. Instead, the affiliated production companies have financed TAPS' construction. And the evidence at trial demonstrated that all significant funding decisions for TAPS are not made by the TAPS Owners, but by the affiliated parent corporations or upstream producer affiliates of each Owner.

Gleason Decision ¶ 69

Market Structure

Integrated Operations with Market Power

70. As of the lien dates, the parent companies of the three largest owners of TAPS (BP, ConocoPhillips, and ExxonMobil) had a combined 95% ownership interest in TAPS. These same three parent companies also had a combined total in excess of 96% of the estimated production on the North Slope. This close correlation between estimated production and ownership interest in TAPS is expected to remain in place for the foreseeable future. . . . [E]ach of the five TAPS Owners has an affiliate with oil to be transported on TAPS.

Gleason Decision ¶ 70

Market Structure

Integrated Operations with Market Power

71. Each Owner's affiliated producer has an economic incentive to nominate its ANS production to its affiliated TAPS Owner. As explained by Charles Coulson, the President of BP Pipelines:

> There has been a strong pattern of shippers on TAPS nominating their barrels to affiliated pipeline companies. There are a variety of reasons for this behavior, but mostly it can be understood by thinking about integrated corporate economics. When an upstream affiliate ships barrels in its pipeline affiliate's space, it pays the published tariff rate to the pipeline affiliate, and no money leaves the corporate family.

Gleason Decision ¶ 71

Market Structure

Integrated Operations with Market Power

114. In the case of TAPS, AS 43.56.060(e)(2)'s reference to "economic value" and not "market value" is consistent with the reality that there is no market for TAPS as a standalone investment based solely on its tariff income. Even if there might be a buyer of TAPS based solely on its tariff income, the evidence at the trial de novo conclusively demonstrated that a TAPS Owner would not sell its interest in TAPS without the assurance that its affiliated oil from the Alaska North Slope could be shipped to market. . . .

Gleason Decision ¶ 114

Market Structure

Integrated Operations with Market Power

124. [F]or the evidence persuasively demonstrates that ANS producers would rebuild TAPS at a cost of billions of dollars to transport ANS petroleum products to market if TAPS was not in existence as of the lien dates. And the producers would replace TAPS not for the tariff income they might realize, but to monetize the approximately 7 to 8 billion barrels of proven reserves that were at the ANS as of the lien dates.

Gleason Decision ¶ 124

Market Structure

Integrated Operations with Market Power

549. As in the 2006 tax year litigation, the Court finds again that tariff income is not the primary driver of the economic value of TAPS under AS 43.56. As SARB has held, and as this Court has previously discussed in these findings, TAPS was not built or operated for tariff income, but to monetize the vast ANS reserves of the producer oil companies by bringing those reserves to market. In this regard Mr. Coulson, the President of BP Pipelines (Alaska) Inc. and the Chairman of the Owners' Committee for TAPS at the time, testified as follows:

> Q: It's fair to say that TAPS was built by the producers?
>
> THE WITNESS: Yes.
>
> Q. And it's fair to say that TAPS was built - that the economic driver was the integrated economics of bringing the Alaska North Slope oil to market?
>
> THE WITNESS: As I understand the history of TAPS, and indeed of most basin-opening developments, it's usually the resource owner that has to make the infrastructure development happen because of the risks associated with an undertaking like that.
>
> Q. And the reason that the resource owner takes those risks is in order to monetize the resource and bring it to market, correct?
>
> THE WITNESS: Yes.

Gleason Decision ¶ 549

Market Structure

Integrated Operations with Market Power

551. [T]he Owners' reliance upon the tariff income approach fails to recognize that TAPS was built, is operated, and would be replaced at an estimated cost of approximately $19 billion if it were not in existence, not because of a desire to realize tariff income, but because of the overwhelming economic value arising from its highly integrated use for transporting ANS production to market.

Gleason Decision ¶ 551

Market Structure

Integration – North Dakota

Testimony of Mr. Barry E. Sullivan (Munis' witness)

Q. And do you have a ... comparative sense between the TAPS system and other systems with regard to access for that independent shipper?

A. [I]n North Dakota, there's a new field called the Bakken field and it's ... a fairly hot area of exploration and development.

There's Enbridge Pipeline in the Bakken that has about 180 different shippers, and there are numerous marketers operating within that area that will buy and sell oil for you....

That contrasts with the situation on the North Slope where ... the producers themselves, the Big 3, do not sell oil at the North Slope and you can't buy oil at Pump Station 1 and transport it on TAPS. The policy of the Big 3 is to sell delivered oil in delivery markets.

Tesoro is the only shipper that's been able to buy North Slope oil and ship it on the TAPS system. So I think there's a big contrast between the way that the North Slope market works and other producing regions in North America.

2007-2009 Trial Tr. 8562-63

Market Structure

Integration – Gulf of Mexico

Testimony of Mr. Barry Sullivan (Munis' witness)

[I]f you compared what's happened in the North Slope of Alaska to the offshore Gulf of Mexico, which ... began, real exploration, probably back in the 1960s... you could look at the Gulf of Mexico today and it is an extremely competitive and well-explored area with numerous production companies and probably hundreds of different owners and producers that contrasts dramatically with what's happened in the North Slope.

And you don't have the level of competition on the North Slope that should be there after 35 years.

And I believe part of that is the vertical -- part of that can be caused by the vertical integration of the TAPS Carriers and their ownership of TAPS.

2007-2009 Trial Tr. 8556-58

Market Structure

Integrated Operations with Market Power

Testimony of Mr. Michael J. Remsha (Owners' witness)

Q. Okay. It is very simple. Let me go back to my hypothetical. Do you believe that the TAPS Owners would sell me TAPS for $20 billion for the expressed purpose of shutting it down?

A. Most likely not.

Q. Why not?

A. Because they want to be able to have the opportunity to take oil from the North Slope and bring it to market.

2007-2009 Trial Tr. 692

Market Structure

Barriers to Competitive Entry

561. Historically, regulatory disputes concerning TAPS' tariff rates have most often been resolved by settlement among the parties rather than by a substantive determination by FERC or the RCA. The settlement that has governed TAPS' tariff rates for the majority of the time it has been in service has been the TAPS Settlement Agreement ("TSA"). The TSA contained a complex and unique rate methodology referred to as the TSM. Both the State and the TAPS Owners supported the TSA. An Explanatory Statement by the State of Alaska and the Department of Justice in support of the settlement stated, "Alaska and DOJ believe that as a settlement, the tariff stream produced by the TSM is a fair and reasonable attempt to achieve a tariff profile that will encourage economically efficient exploration of North Slope petroleum resources."

Gleason Decision ¶ 561

Market Structure

Barriers to Competitive Entry

562. The RCA found that under the TSM, between 1977 and 1996, the TAPS Owners collected, in 1997 dollars, $13.5 billion more than would have been collected under the current rate methodology used by the RCA to set rates on TAPS. Nevertheless, the TSM was approved by FERC.

The Life of TAPS
Price of ANS Crude Oil

The EIA Price Forecasts Support Increasing Per Unit Throughput Value

- The Energy Information Administration (EIA) collects and publishes historic information and makes short- and long-term price forecasts
- Price Trends are up with increasing world demand.
- Since adopting NEMS in 1994, virtually all the future reference price forecasts post 1999 have underestimated actual crude prices
- Turning points follow crises, spare capacity, and worldwide demand/supply

The Life of TAPS

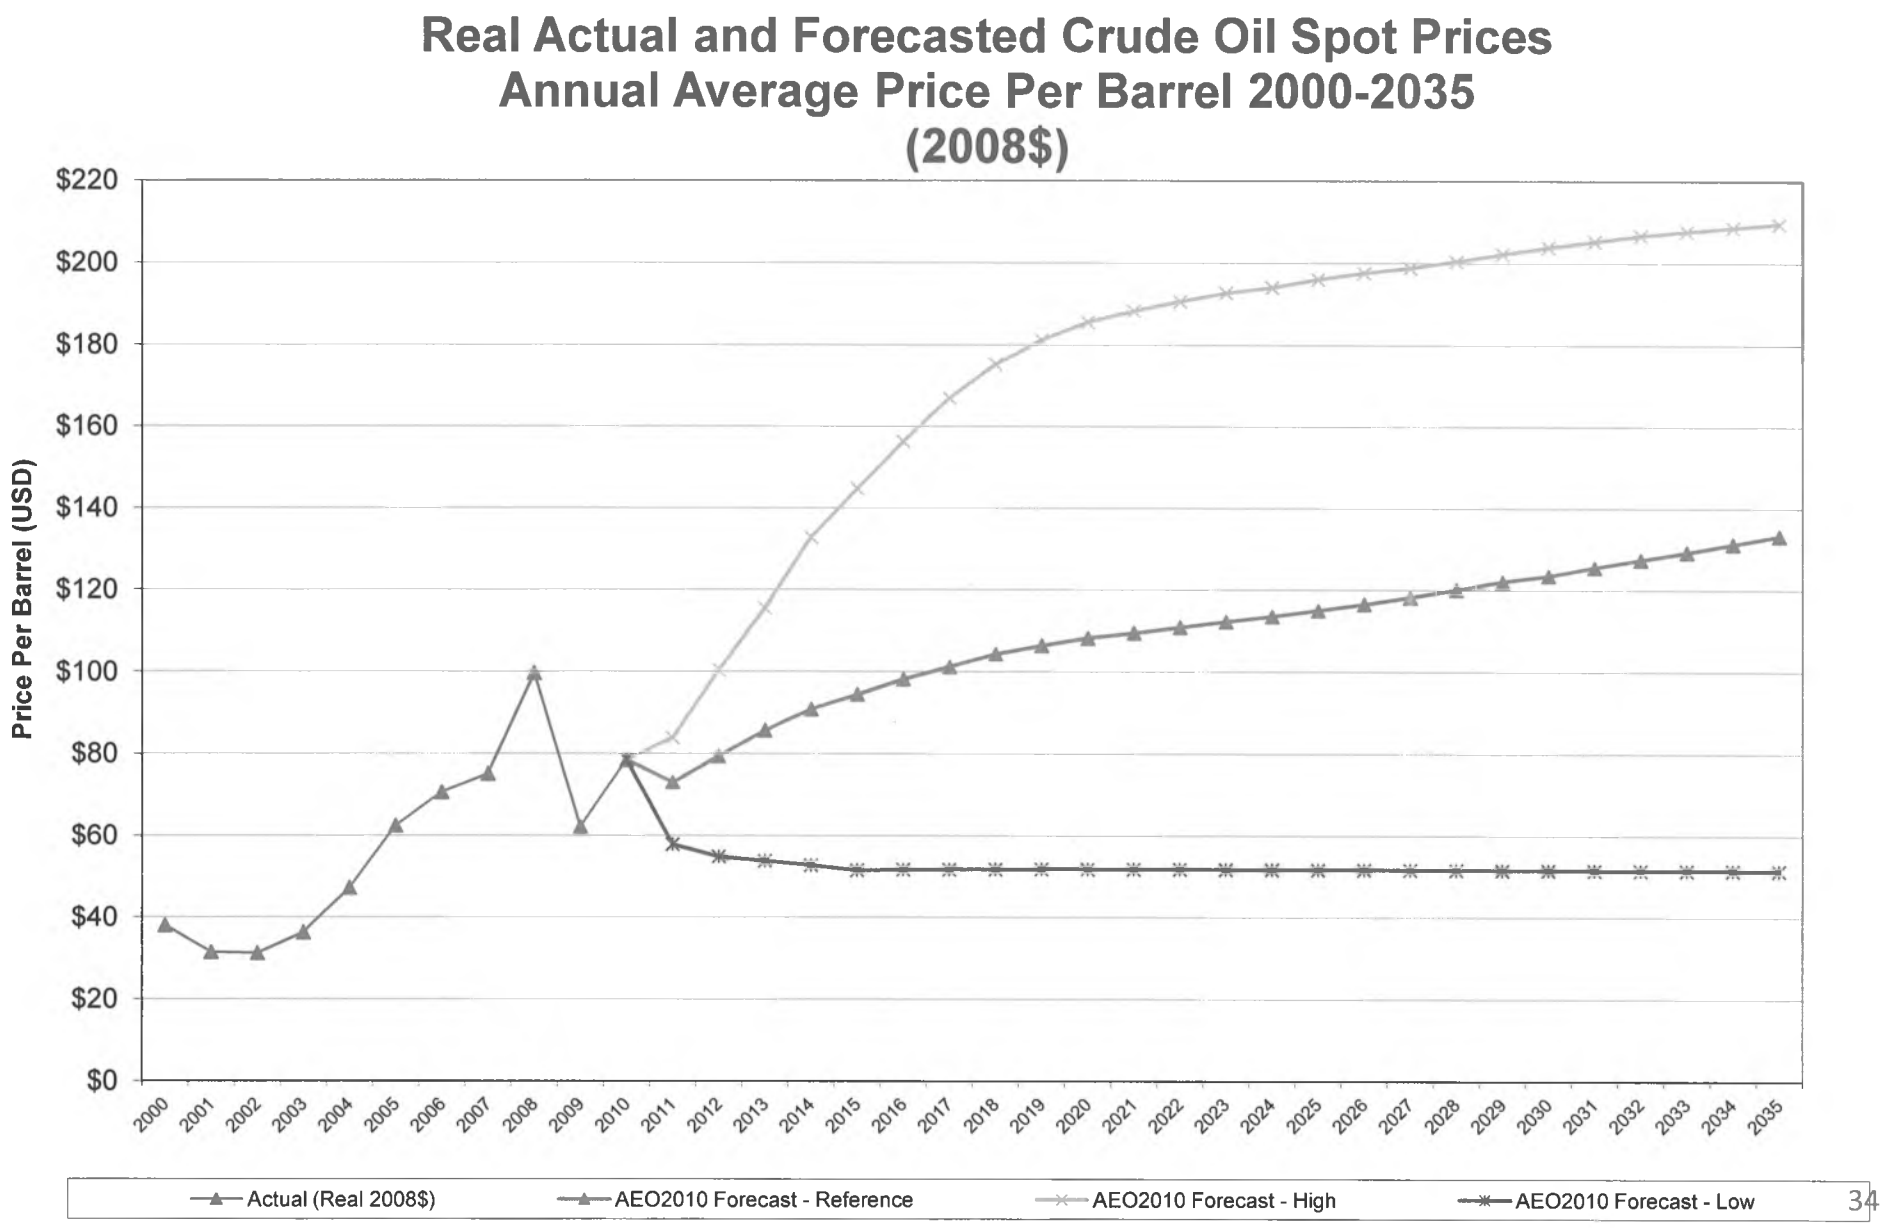
Price of ANS Crude Oil

480. Mr. Platt relied upon the U.S. Department of Energy's Energy Information Administration ("EIA") price forecast, which forecasted real market price growth for each of the three assessment years at approximately 1% per annum. Based on the evidence presented at trial, this Court finds that reliance on that forecast was reasonable. Oil prices during the three assessment years were volatile, such that the forward-looking projections made by the EIA during that period varied considerably. Yet the highest oil price forecasted by the EIA for calendar year 2011 during the assessment years was $74.08 per barrel, while the actual price of oil on October 18, 2011 was $113 per barrel. Mr. Platt also explained that due to the highly progressive nature of Alaska's production tax, oilfield economics at high real oil prices are not materially affected by price variations. Overall, this Court found Mr. Platt's production forecast and economic testing to be persuasive.

Gleason Decision ¶ 480

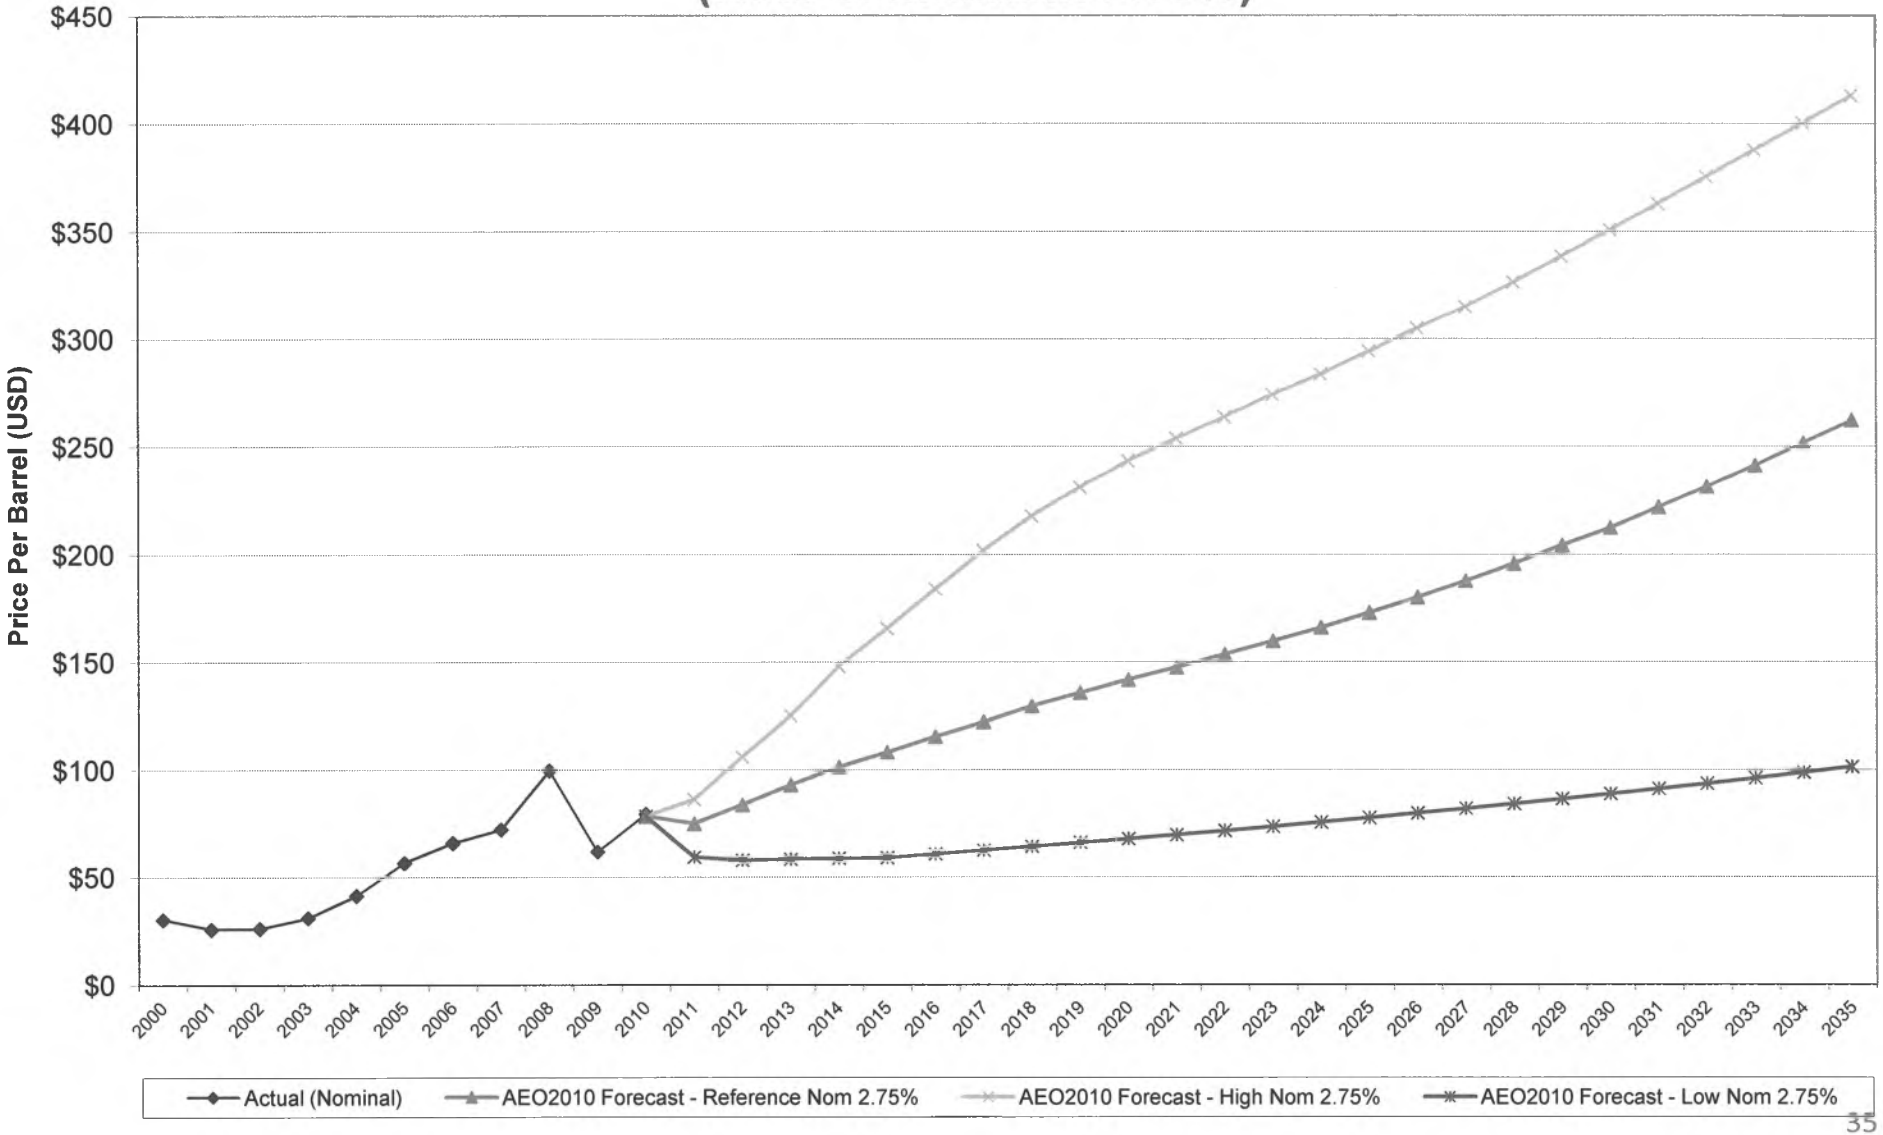
The Life of TAPS

Price of ANS Crude Oil



The Life of TAPS, Price of ANS Crude Oil

Nominal Actual and Forecasted Crude Oil Spot Prices
Annual Average Price Per Barrel 2000-2035
(Rate of Inflation: 2.75%)



The Life of TAPS

Price of ANS Crude Oil

EIA Price Forecast

Prices for crude oil in 2011 remained generally in a range between $85 and $110 per barrel. In 2011, WTI prices were lower than Brent prices because of pipeline capacity constraints that prevented complete arbitrage between WTI and Brent prices. Real imported sweet crude oil prices (2010 dollars) in the AEO2012 Reference case rise to $120 per barrel in 2016 (Figure 5) as pipeline capacity from Cushing, Oklahoma, to the Gulf Coast increases, the world economy recovers, and global demand grows more rapidly than the available supplies of liquids from producers outside the Organization of the Petroleum Exporting Countries (OPEC). In 2035, the average real price of crude oil in the Reference case is about $145 per barrel in 2010 dollars, or about $230 per barrel in nominal dollars.

Figure 5. Average annual world oil prices in three cases, 1980-2035 (real 2010 dollars per barrel)

THE LIFE OF TAPS - Reserves and Throughput

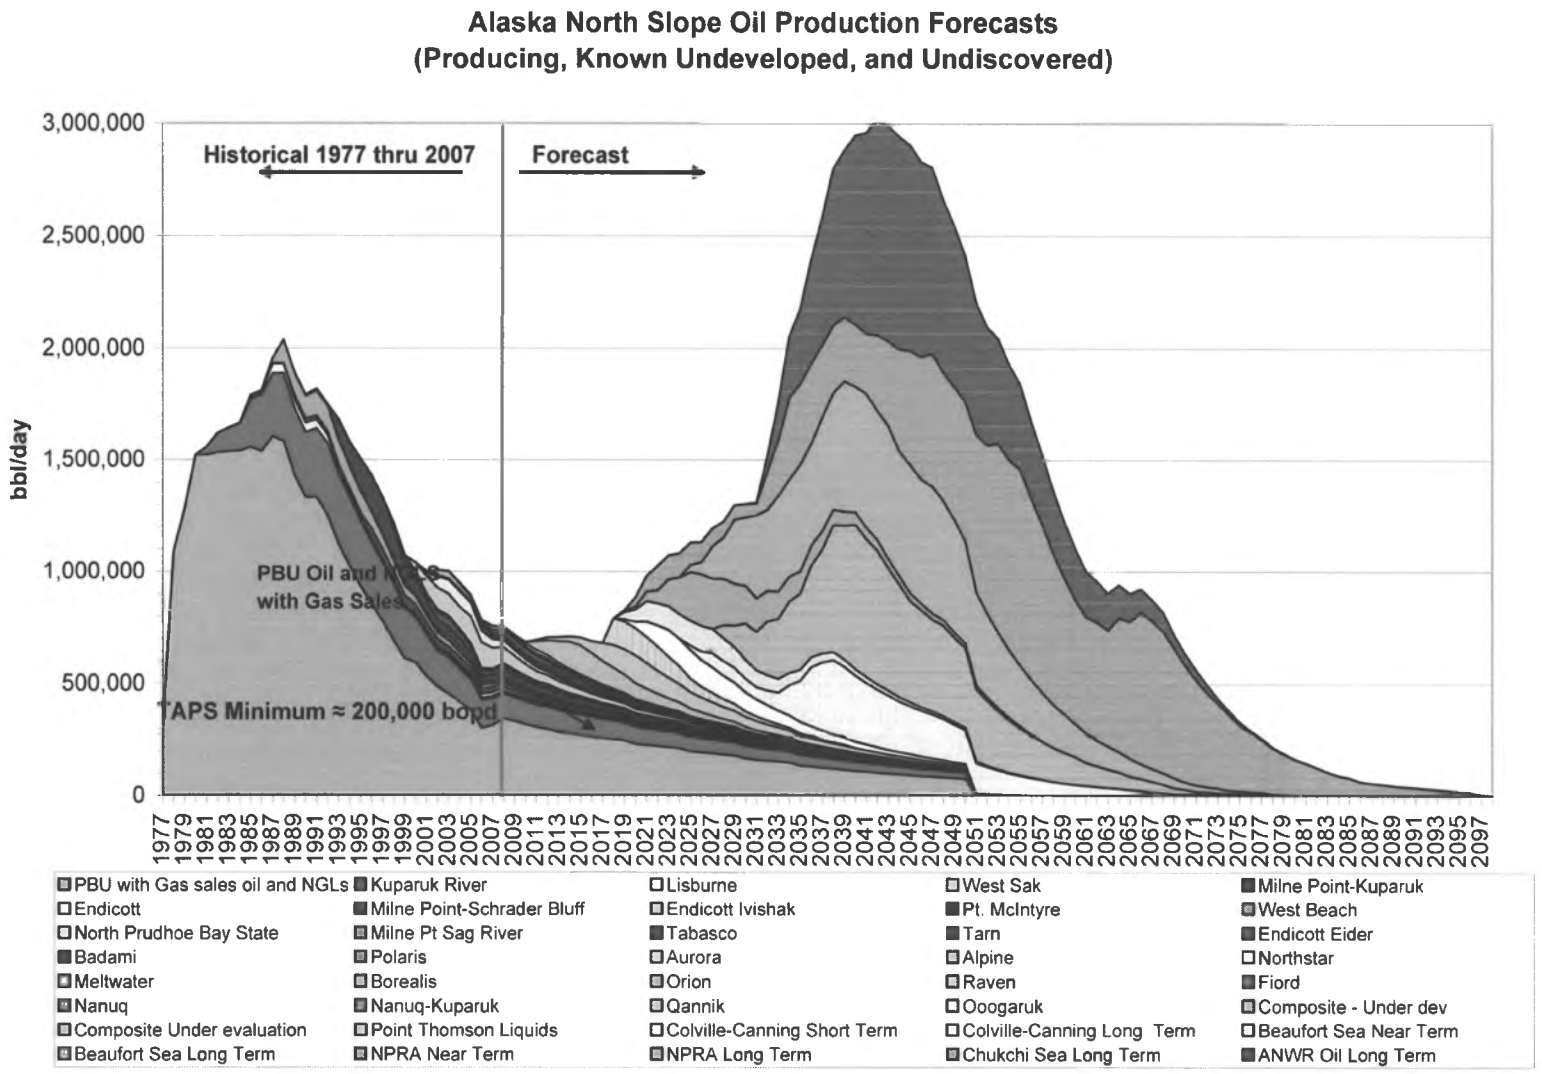

Figure 3-55. Alaska North Slope historical and forecast oil production from producing fields, known undeveloped fields, and undiscovered fields.

MUN7-0014 at 10 (Hite)

The Life of TAPS

Reserves and Throughput

439. The applicable statute requires consideration of the "estimated life of the proven reserves of gas and unrefined oil then technically, economically and legal deliverable into the transportation facility."

Gleason Decision ¶ 439

The Life of TAPS

Reserves and Throughput

465. Dudley Platt is one of the preeminent production forecasters in the state, although he is not a petroleum engineer. He began making oil production forecasts for the State of Alaska in 1989. Mr. Platt prepared a production forecast for the Department every year through 2009. This Court relied on Mr. Platt's production forecast to determine TAPS' end-of-life in the 2006 tax year trial.

Gleason Decision ¶ 465

The Life of TAPS

Reserves and Throughput

468. Decline curve analysis is one component in the determination of the economic life of ANS proven reserves? Mr. Platt's forecast incorporated a decline curve analysis at the pool level, as opposed to a well-by-well analysis used by both the Owners' and Department's witnesses? Mr. Platt persuasively testified that, based on his experience working in the oil industry, long-range production forecasters do not use decline curves on a well-by-well basis? Mr. Van Dyke explained that well-by-well analysis can work well for a small lease in Kansas with four wells, but not for a field with 1,000 wells that are regularly being turned on and off: "it's not the best approach to use a well-by-well method as compared to the pool - a pool level method to forecast production." Decline curve analysis at the well level requires subjective analysis of highly variable historic data to estimate future production rates for each well.

Gleason Decision ¶ 468

The Life of TAPS

Reserves and Throughput

501. Overall, this Court finds that Mr. Molli's Fall 2010 forecast, and the Assessor's adjustments to that forecast for each tax year, are considerably less reliable than the production forecast prepared by the Municipalities' witness Dudley Platt.

Gleason Decision ¶ 501

The Life of TAPS

Reserves and Throughput

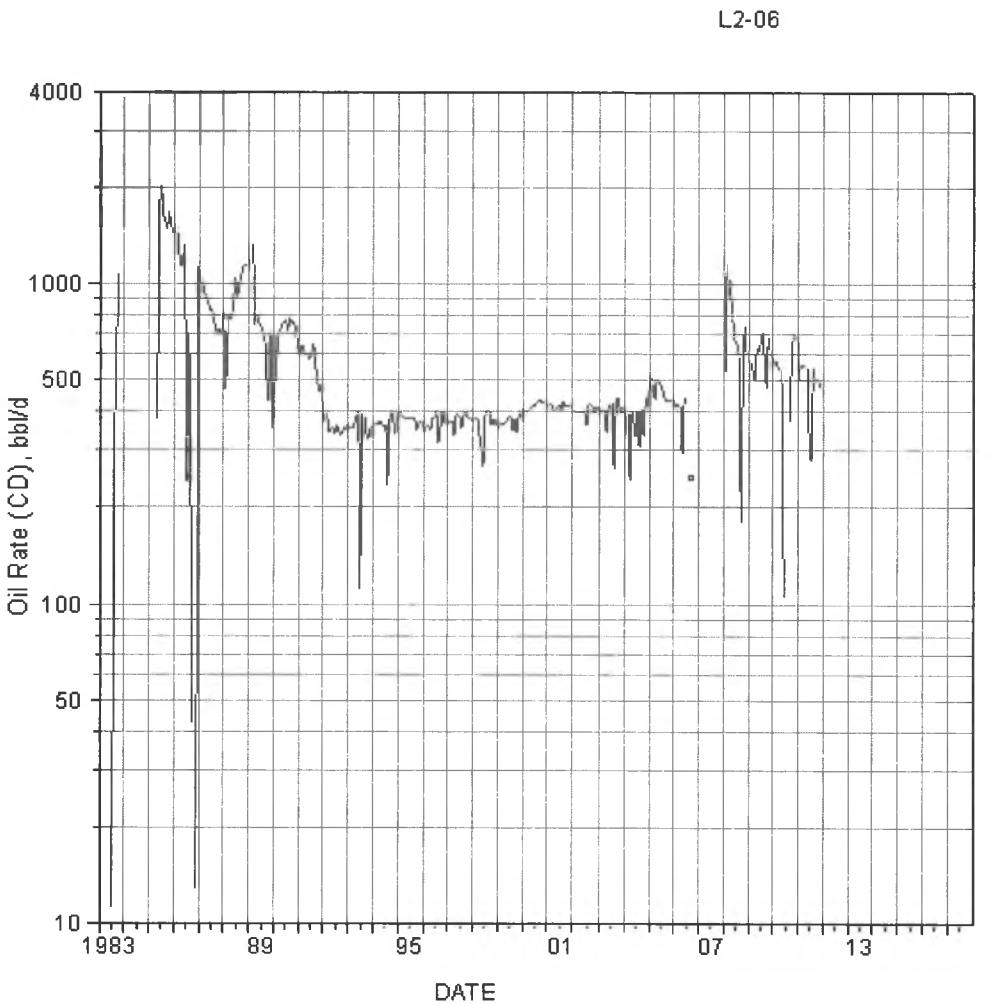
Pool v. Well-by-Well Forecasting

- In 2009 DOR changed from a pool to a well-by-well forecasting methodology
- "[A] pool based analysis is generally preferable to a well-based analysis." [Gleason Decision ¶ 471]
  - Not relied on by industry
    - Fine "for a small lease in Kansas with four wells, but not for a field with 1,000 wells that that are regularly being turned on and off . . ." [Gleason Decision ¶ 468]
    - Good modeling does not look at wells on a standalone basis
  - Backward looking
    - Requires "subjective analysis of highly variable historic data to estimate future production rates for each well." [Gleason Decision ¶ 494]
    - Often difficult to determine future performance of wells based on just historic data
      - Starts and stops, increasing production, etc.
      - DOR has historic data; it does not know of the story of each well
  - Not holistic, failing to reflect:
    - Industry estimates of oil in place or total recovery
    - Dynamic interaction of physical forces within reservoir, including interaction of wells
    - New projects and wells
      - Thus assumptions must be made about impacts on existing wells and new wells
  - When AS 43.56 enacted, DOR's opinion was "it could be done more accurately on a field basis, as one well could dry up immediately." [Gleason Decision ¶ 470]

The Life of TAPS

Reserves and Throughput

Example of Lisburne Well



For other examples of wells that are difficult to forecast – see Platt Examples in documents provided

The Life of TAPS
Reserves and Throughput

- Municipalities pursued all avenues to get actual field models and reserves information
  - Discovery requests and depositions of Owners
  - Argued Owners had Rule 34 control over production affiliate information
  - Served third-party subpoenas on affiliate producers
  - Sought discovery of BP's data rooms for attempted 2010 sale
- Ended up getting a "patchwork" of reserves and production forecasts from primarily BP; Court would not permit production of BPXA's reserves economic models
- Most useful produced materials related to BPPA's transportation cost estimates for BPXA's reserves economics model
- The BPXA reserves and production estimates in BPPA's possession confirm the reasonableness of:
  - The total barrels recovered under Mr. Platt's forecast
  - The estimated end-of-life of Prudhoe Bay field determined by Mr. Platt and as reflected in the Prudhoe Bay Royalty Trust 10-K filings

The Life of TAPS

Reserves and Throughput

492. The internal reserves and long term production forecasting information that was made available through discovery was not reviewed by two of the Owners' reserves witnesses, Mr. Hartz or Mr. Marks, and only cursorily reviewed by Mr. Hoolahan (and not synthesized into his analysis). Further, Mr. Hoolahan did not have representatives of the Owners or their affiliated producers review his reserves estimates to provide feedback. This is despite the fact that the internal reserves information presented at trial was substantially different from Mr. Hoolahan's conclusions. The fact that none of the Owners' reserves experts meaningfully addressed the BP internal reserves information at trial had a substantial negative impact on the weight this Court accorded to their testimony.

Gleason Decision ¶ 492

The Life of TAPS

Reserves and Throughput

495. The determination of the estimated proven reserves should be assessed in light of the evidence available to, and presented by, each of the parties. The Owners did not persuasively rebut the Municipalities' evidence regarding proven reserves, including information contained in filings by the BP Royalty Trust and the confidential reserves information produced in discovery.

Gleason Decision ¶ 495

The Life of TAPS

Reserves and Throughput

BP Royalty Trust End-of-Life

- The BP Prudhoe Bay Royalty Trust is a publicly traded trust that has a royalty interest in certain BP production
- Each year BPXA provides the Trust and their auditors, Miller and Lents, Ltd., with reservoir, production and other information
- In the past the Trust's 10-K included BPXA's opinion as to the end-of-life of Prudhoe
- "BP Alaska expects continued economic production from Prudhoe Bay field at a declining rate through 2075." [MUN7-4072 at 13]

The Life of TAPS

Reserves and Throughput

502. BP Exploration (Alaska), an affiliated company of one of the taxpayers in this case, BP Pipelines, provides SEC reserves information on the Prudhoe Bay field each year to the BP Prudhoe Bay Royalty Trust. The information is audited by an independent oil and gas consultant, Miller and Lents, before submission to the SEC. The Trust's SEC filing for year-end 2005, using the SEC's heightened "reasonable certainty" standard for proven reserves, represented that "BP Alaska expects continued economic production [from Prudhoe Bay] at a declining rate until the year 2065 ... ." In the year-end 2006, 2007 and 2008 SEC 10-K filings, BP represented continued economic production at Prudhoe Bay until 2062, 2075 and 2049, respectively. The 2049 economic end-of-life calculation for December 31, 2008 was based on the price of oil on that date of $44.60, while the December 31, 2006 economic end-of-life date was based on an oil price of $61.06. Both of these amounts were considerably below the average price of oil during those years and its predicted future price. The 2007 filing was based on the price of oil on December 31, 2007 of $96.01.

Gleason Decision ¶ 502

The Life of TAPS
Reserves and Throughput

503. The following chart sets out the assumed end-of-life in the Prudhoe Bay Royalty Trust SEC filings and as calculated by each of the parties' experts.

Comparison of Prudhoe Bay End-of-Life Determinations

	CY 2007	CY 2008	CY 2009
PB Royalty Trust	2062[837]	2075[838]	2049[839]
Muni @ 100,000 bbl/d	2067[840]	2066[841]	2068[842]
Muni @ Economic Limit	2075[843]	2075[844]	2075[845]
SOA @ 150,000 bbl/d	2040[846]	2040[847]	2040[848]
SOA @ Economic Limit	2043[849]	2044[850]	2053[851]
Hoolahan – Initial	2026[852]	2033[853]	2021[854]
Hoolahan – Corrected	2046[855]	2053[856]	2032[857]

Gleason Decision ¶ 503

The Life of TAPS

Reserves and Throughput

BP Royalty Trust End-of-Life

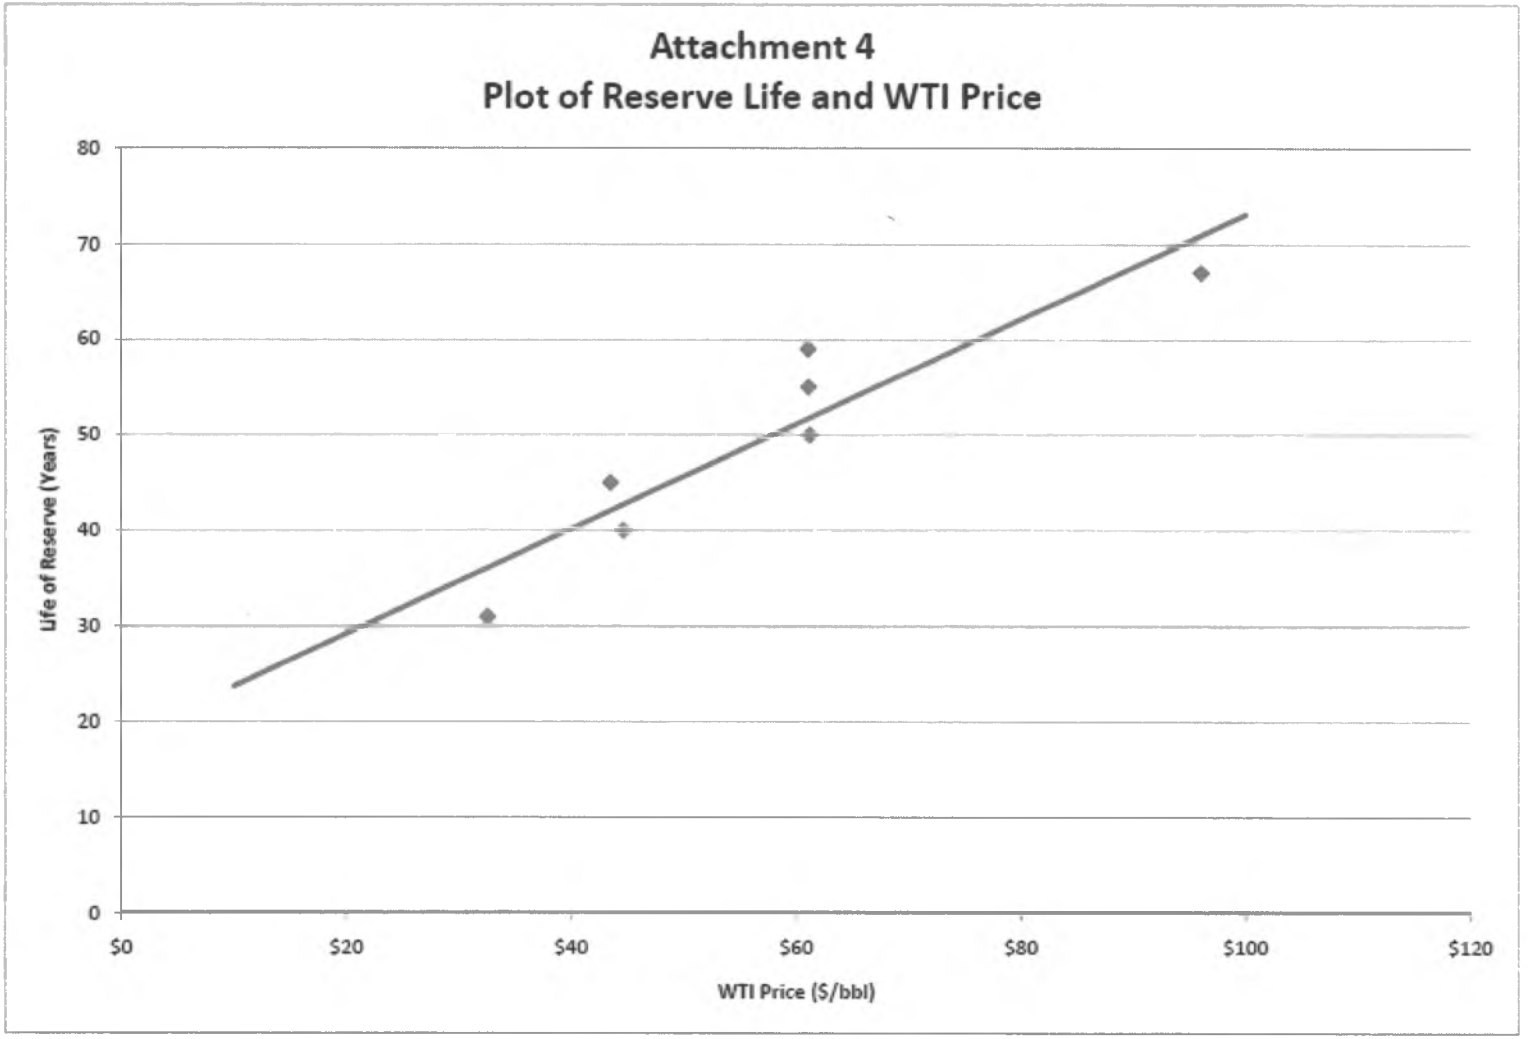
- The estimated end-of-life has varied each reporting year based on the price of oil
- From as low at 2049 in 2009 to as high as 2075 in 2008
- There is a strong correlation that for every $10 increase in oil prices, the economic life of Prudhoe Bay increases about 5.5 years [MUN7-0001 at 15-16 (Cicchetti)]

The Life of TAPS
Reserves and Throughput

24. I prepared a chart and some simple regressions in Attachment 4 to show the relation between economic life and WTI prices that BP relies upon in its various recent SEC 10-K filings. I plotted the relationship between the estimated life of the Prudhoe Bay reserves and WTI year-end prices. In particular, I found that for every $10 increase in year-end WTI prices, the economic life of Prudhoe Bay increases about 5.5 years. (See the linear regression in Attachment 4.)

MUN7-0001 at 15-16 (Cicchetti)

The Life of TAPS
Reserves and Throughput



MUN7-0001 at 121 (Cicchetti)

The Life of TAPS

Reserves and Throughput

506. With Point Thomson removed from Mr. Platt's corrected reserves estimates for 2007 and 2009, the total proven reserves for each of the lien dates is as follows:

2007 7.812 billion barrels

2008 7.759 billion barrels

2009 7.077 billion barrels

Gleason Decision ¶ 506

The Life of TAPS

Reserves and Throughput

- ANS will continue to economically produce oil, as demonstrated by BP, through 2075 based only on proved reserves

  – Assuming a minimal mechanical capacity of 100,000 bbl/d, the Court found the end-of-life of TAPS given current proved reserves is at least 2066. [Gleason Decision ¶ 505]

- Life of the ANS is even longer when production from heavy oil, ANWR, OCS, and other non-proved sources is considered

The Life of TAPS
Minimum Throughput

- Hydraulic Limit (None)
- Mechanical Limit (Less than 50,000 BPD)
- Operational Concerns (Solutions)
  - Temperature, Wax, Pigging, etc.
  - No Pipeline has Shut in Economic Production
  - Value of Oil Behind Pipe Dominates Solutions
    - 300,000 BPD to 100,000 BPD = 2 Billion of Proved Reserves
    - Engineering Solutions to Low Flow is Pennies / Value of Transporting Oil to Market is Dollars
  - Engineering Solutions Are Apparent

The Life of TAPS
Minimum Throughput

- **Alaska law doesn't contemplate a mechanical limit**
  - AS 43.56.060(e)(2) and 15 AAC 56.110(c) state life of operating pipelines to be "based on the estimated life of the proven reserves"
- **Economic life of other taxable pipelines in Alaska based on life of proven reserves, not a mechanical limit** [2007-2009 Trial Tr. 11565 (Hoffbeck)]
- **Common sense and expert testimony demonstrate no otherwise economic pipeline has shut in at 100,000, 50,000 BPD or below** [2007-2009 Trial Tr. 5130-31 (Riordan); Tr. 8266-68 (quoting Coulson Deposition); Tr. 11895 (Remsha)]
  - Proof is in the Tasting—No pipeline in the history of man has shut-in economic production due to pipeline operational concerns (Example: CIPL)
- **BP has identified engineering solutions to operate TAPS at ultra low flows**
  - Heating gets you to 70,000 BPD; below that options like fluid injection (to get flow rates up) will be identified as needed [MUN7-3020 at 8]
  - "When coupled with the fact that there is a practical limit to the number of heater locations be added, 50,000 BPD to 70,000 BPD is probably the [low flow] limit to [point source heating] due to wax deposition and pigging concerns. Further reduction in flow will require investigation of other options that maintain higher flow velocities, such as seawater commodity supplementation." [MUN7-3020 at 8]
- **Thus state law, Alaska tax practice for other pipelines, industry experience, and BP's own reserves booking contemplate no identifiable mechanical limit**

The Life of TAPS

Minimum Throughput

401. The Municipalities' expert Dr. Jerry Modisette testified that there is no hydraulic or mechanical minimum throughput limit because the pipeline will be within pressure constraints at flows down to zero and the pump rate can also go down to zero through reducing pumps, throttling, and recirculation. Former Alyeska Chief Operating Officer Dan Hisey concurred that there is no hydraulic or mechanical minimum throughput limit on TAPS. The Owners' expert, Ulli Pietsch, also testified that there is no hydraulic or mechanical reason that TAPS cannot operate down to 50,000 bbl/d. The inquiry therefore turns to whether there is an operational constraint that would prevent TAPS from transporting oil at some minimum capacity limit.

Gleason Decision ¶ 401

The Life of TAPS

Minimum Throughput

Testimony of Mr. Ulli Pietsch (Owners' Witness)

Q. I'm going to make this very simple. I want to ask you questions. I'm going to ask you questions in three buckets: Hydraulically, mechanically, and operationally.

A. Okay.

* * *

Q. So there is no reason that TAPS cannot hydraulically operate at a teaspoonful a day, correct?

A. Correct.

* * *

Q. Is there any mechanical reason, that assuming a proper recirculation system is in place, that TAPS cannot operate at 50,000 barrels a day?

A. No.

* * *

Q. Okay. So hydraulically and mechanically, there is no reason that TAPS, as it currently exists, cannot operate down to 50,000 barrels a day, assuming recirculation?

A. Correct.

2007-2009 Trial Tr. 2022-25

The Life of TAPS

Minimum Throughput

404. BPPA analyst John Haines testified at the trial in this case. In an email dated November 5, 2004, Mr. Haines stated:

> Momentum is starting to grow around booking more reserves based on an updated view of TAPS' minimum achievable rates ... Lastly, when TAPS rates reach 100 MBD [100,000 bbl/d] we stop. Our consultant thinks we can probably operate TAPS below this minimum rate, but we didn't want to push it any further at this time.

Gleason Decision ¶ 404

The Life of TAPS
Minimum Throughput

409. In its initial year-end 2004 reserves submission to the BP London office, which was scheduled a couple of months before the JTG Study was concluded, BP Exploration and BP Pipelines personnel determined "an effective TAPS minimum throughput level of 150,000 bbl/d at 2053," using "conservative assumptions." The report added:

> In the case of GPB [Greater Prudhoe Bay] and KRU [Kuparuk River Unit] (the biggest contributors to the reserves adds) each of these fields were still cash flow positive at 2064 (end of our tariff profile). The reserves coordinators arbitrarily chose to cut-off life at the earlier dates (2053 for GPB and 2047 for GKA) just to give themselves some future cushion.

Gleason Decision ¶ 409

The Life of TAPS

Minimum Throughput

406. In 2004, BP Pipelines retained JTG Technology Consortium to conduct a study to revisit the minimum throughput limit on TAPS, The 308-page JTG report was completed in 2005 ("JTG Study") and concluded that "the low flow limit of the existing 48-inch TAPS pipeline was determined to be a PS [Pump Station] 1 rate of 135 MB/day [135,000 bbl/d]."

Gleason Decision ¶ 406

The Life of TAPS

Minimum Throughput

408. BPPA and its affiliates relied upon the JTG Study's conclusion of a 135,000 bbl/d low-flow limit to create tariff profiles that BP then used to report its reserves for several years to the SEC.

Gleason Decision ¶ 408

The Life of TAPS

Minimum Throughput

412. BP Pipelines failed to provide the 2005 JTG Study in discovery for the 2006 ad valorem tax year proceedings. That study would have supported the Municipalities' position in that litigation that TAPS could operate down to 150,000 bbl/d or less, and may well have resulted in the Court finding a minimum capacity limit lower than the 200,000 bbl/d that this Court applied for that assessment year.

Gleason Decision ¶ 412

The Life of TAPS

Minimum Throughput

414. In 2010, BP Pipelines retained Phil Carpenter, a subject matter expert who was also used extensively by Alyeska in its Low Flow study, to determine whether TAPS could operate at levels below the 135,000 bbl/d threshold put forth in the 2005 JTG Study. At trial, Mr. Haines of BP Pipelines explained:

> The JTG study ... essentially had two different paths that you could live with ... One path was you would throw investments at TAPS and eventually the south leg would die at a rate of 135. You would start a railroading apparatus at that point. ... the south leg always died first because of the extraction of oil at Fairbanks at the Fairbanks refinery ... Except if you wanted to throw another $3 billion at the problem and replace the north leg with a replacement 20-inch line ... [so as to be able to transport down to 45,000 bbl/day] ... And the economic hurdle of paying for that $3 billion of replacement line investment created a very large stair-step in the economic profile, the granularity I was talking about.

Gleason Decision ¶ 414

The Life of TAPS

Minimum Throughput

415. In a May 19, 2010 email, Mr. Haines provided Mr. Carpenter with a copy of the 2005 JTG Study and explained:

> You probably want to start with the executive summary. As we discussed on the phone, our reserves reporting relied on a 'low oil Price' scenario and a 'high oil price scenario.' These are identified in the report as Scenario 2 and Scenario 3. What we are looking for in your work effort is some sort of intermediate solution that could be used to extend the limit beyond 135 MBD [135,000 bbl/d] (Scenario 2), but would not have a $3 billion hurdle that would allow us to get down to 45 MBD [45,000 bbl/d]. In other words, something for a "middle oil price" scenario.

Gleason Decision ¶ 415

The Life of TAPS

Minimum Throughput

416. A June 11, 2010 email from Mr. Carpenter contained a list of over a dozen low throughput options he had analyzed. On June 15, 2010, Mr. Haines responded back that:

> I've had a chance to talk to our upstream reserves guys, and they advise that Option 2 (run cold and sweep with freeze suppressant) sounds like it might be pushing things too far, because it requires achieving a level of confidence in the physics of the problem - a level of "proof" that our study will not be capable of fully defining. So, they agree we can drop it from the list ....

Mr. Haines then discussed the various other options, concluding:

> From a pragmatic viewpoint, it seems to me that item 1 (heaters) may be exactly what we're looking for (in terms of finding a sure-fire way to bridge between the 135 MBD [135,000 bbl/d] endpoint and the large capital cost of replacing the north leg). I say this because if we can find a way to lower the endpoint from 135 MBD [135,000 bbl/d] to say something in the range of 100 MBD [100,000 bbl/d] or less, that kind of solution would probably act to close the gap our reserves guys are seeking.

Gleason Decision ¶ 416

The Life of TAPS

Minimum Throughput

418. Consistent with that opinion, on July 20, 2010, Mr. Carpenter circulated a draft of the 2010 Carpenter Study: "The analysis concluded that point source heating of the oil is the best solution for operation of 100,000 [bbl/d]." Mr. Haines' response to the draft stated:

> Thanks for the updated report. This is shaping up nicely, and is exactly the "fit for purpose" product we were looking for. ... Probably the most significant edits we've made to your most recent draft involved turning on the railroad when the PS-1 rate hits 140 MBD [140,000 bbl/d] (and turning off the south leg), and running the north leg down to 70 MBD [70,000 bbl/d]. This means some of the south leg heaters will likely not be installed at rates below 140 MBD [140,000 bbl/d] (because of laminar flow issues).

Gleason Decision ¶ 418

The Life of TAPS

Minimum Throughput

420. The 2010 Carpenter Study did not foreclose lower throughput levels below its conclusions, acknowledging that other technologies apart from point source heating "may eventually offer better solutions with fewer unknowns, lower throughput limits and lower shutdown risk, but these options are less developed and well understood at this time." The Study stated that "50,000 [bbl/d] to 70,000 [bbl/d] is probably the limit for [the point source heating] approach due to wax deposition and pigging concerns. Further reduction in flow will require investigation of other options that maintain higher flow velocities, such as seawater commodity supplementation."

Gleason Decision ¶ 420

The Life of TAPS

Minimum Throughput

422. In the fall of 2010, BPPA used the lower minimum throughput determinations from the Carpenter Study in its transportation tariff calculations. Those calculations, in turn, were provided to BP Production forecasting personnel who then used that information to book BP's proven reserves in 2010. That BP relied upon the Carpenter Study's 100,000 to 70,000 bbl/d low flow estimate to book its reserves is compelling evidence that these figures may be reasonably relied upon by this Court to determine the assessed value of TAPS.

Gleason Decision ¶ 422

The Life of TAPS

Minimum Throughput

The Studies: Alyeska LoFIS

- The Alyeska Low-Flow Impact Study (LoFIS) was limited in scope: "Flow volumes of less than about 350,000 BPD subject TAPS operations and pipeline integrity to greater degrees of uncertainty that require investigation and study beyond that accomplished through the LoFIS. Measures to mitigate these issues utilizing the existing 48-inch pipe at throughputs below 350,000 BPD have not been determined at the date of this report."

  [Executive Summary of LoFIS Final Report (public version, June 15, 2011) at 3]
- Mr. McDevitt's deposition and trial testimony confirmed that the LoFIS team was subject to a 300,000 bbl/d limit. [2007-2009 Trial Tr. 10975-82] Mr. Haines also confirmed the limitation. [2007-2009 Trial Tr. 11404]

The Life of TAPS

Minimum Throughput

Alyeska Cannot Show A 300,000 bbl/d Limit

- Mr. McDevitt stated at trial that it was not possible for TAPS to operate under 300,000 bbl/d, but later changed his answer to "highly unlikely" when asked in the context of BP's booking practices. [2007-2009 Trial Tr. 11025-27, 11093]
- Mr. Carpenter was a subject-matter expert for water transport, hydraulic size formation and heat transfer in the Alyeska LoFIS team while he conducted his study for BP. [2007-2009 Trial Tr. 10960-61]
- Mr. Riordan testified that he did not know for a fact that the existing facility cannot operate at 100,000 bbl/d. [2007-2009 Trial Tr. 5129]

The Life of TAPS

Minimum Throughput

430. This Court finds the JTG and Carpenter studies, which were conducted by TAPS' largest Owner for the specific purpose of evaluating the ability of TAPS to operate at throughputs well below 300,000 bbl/d and relied upon by BP for booking its proven reserves, to be far more persuasive than the LoFIS study in determining TAPS' minimum throughput capacity.

Gleason Decision ¶ 430

The Life of TAPS

Minimum Throughput

431. At trial, the Municipalities' expert Dr. Jerry Modisette persuasively opined why he had determined that TAPS could operate at 100,000 bbl/d. Indeed, Dr. Modisette asserted TAPS could operate at far lower throughputs than that, particularly if the oil were recirculated through the pumps so as to raise its temperature - a project Alyeska is planning to try this winter.

Gleason Decision ¶ 431

The Life of TAPS

Minimum Throughput

432. With regard to the low-flow operational issues identified in the Alyeska study, including water dropout and corrosion, ice formation within the crude oil, ice lenses or frost heaves in the soil, and wax precipitation and deposition, the weight of the evidence at trial persuaded this Court that it is more likely than not that there will be engineering solutions to mitigate these problems on TAPS at throughputs down to 100,000 bbl/d or less.

Gleason Decision ¶ 432

The Life of TAPS

Minimum Throughput

The Operational Issues Can Be Mitigated

Hisey Chart	Mitigation Measures Available															
	Water			Heat			Pigging						Chemical Treatment

The Life of TAPS

Minimum Throughput

434. The August 2010 Larkspur Study estimates approximately $2 billion in undiscounted costs for heating TAPS so as to be able to transport 100,000 bbl/d. This is based on the 2010 Carpenter Study's use of substantial redundancy resulting in 70% excess heating capacity. Thus, the actual cost could well be considerably lower. However, even Larkspur's estimated expense is self-evidently economic in light of the value of TAPS' proven reserves, The Court was persuaded by Mr. Hisey's testimony that even if the heating and other mitigation measures cost upwards of hundreds of millions of dollars in the coming decades, it would still be economical to make such investments to keep TAPS operating at and below 100,000 bbl/d "to move North Slope crude oil and keep that transportation base available for future fields, future production."

Gleason Decision ¶ 434

The Life of TAPS

Minimum Throughput

437. This Court finds the conclusions reached in the 2005 JTG study, together with the opinions reached in the 2010 Carpenter Study and Larkspur Study, as well as the opinions of Dr. Modisette and Mr. Hisey, to be more credible and persuasive than Mr. McDevitt's opinion on TAPS' minimum throughput capacity.

Gleason Decision ¶ 437

The Life of TAPS

Minimum Throughput

438. For the foregoing reasons, and after careful consideration of all of the evidence presented at trial, this Court finds it more likely than not that TAPS can effectively transport throughputs at least down to a minimum flow rate of 100,000 bbl/d.

Gleason Decision ¶ 438

The Life of TAPS

Minimum Throughput
Maximum Limit of 100,000 BPD

- Mr. Hisey testified that even hundreds of millions of dollars in heating and other low flow mitigation efforts are economic to keep TAPS operating at and below 100,000 bbl/d [2007-2009 Trial Tr. 9000]
- Dr. Modisette testified that the Texaco Cal 20 pipeline uses more heating per unit than the worst case heating scenario for TAPS [2007-2009 Trial Tr. 9061-63]
- No witness was aware of a pipeline that shut in production for operational reasons when it was flowing economic oil [2007-2009 Trial Tr. 674 (Remsha); Tr. 5130-31 (Riordan); Tr. 8266-68 (quoting Coulson deposition); Tr. 9218 (Malvick); Tr. 11090 (McDevitt); Tr. 11895 (Remsha)]

The Life of TAPS

Minimum Throughput Economics of Continued Operation

Forecast Year	Platt Production Rate Range (barrels/day)	Stranded Oil Volume Over Applicable Forecast Range	Average EIA Real Oil Price Forecast Over Applicable Time Period (per bbl)	Total Value of Stranded Oil
2009				
	300,000 to 100,000	2.0 billion bbl	$169.06	**$338,120,000,000**
	200,000 to 100,000	1.2 billion bbl	$177.25	$212,700,000,000

Access to Information

- Relevant Statutes
- Department Will Not Use Subpoena Power
- The Department Overuses Taxpayer Confidential Designations
- Department Will Not Agree to a Joint Administrative Agreement

Access to Information

491. SARB observed the following in its Certificate of Determination for the 2007 assessment year:

> The Board also found that the Owners failed to take advantage of the opportunity to provide the Division with persuasive data to challenge the reserves estimates or throughput projections used by the Division if the Owners have such data. The Board found that the Owners chose not to the [sic] share information that the Owners and their parent companies possess regarding throughput and proven reserves with the Division or the Board and instead chose to present evidence and testimony from outside experts who did not have access to the information the Owners possess that was not already in the public record, and who lacked adequate direct experience with, or expertise about, the TAPS or the Alaska North Slope reserves.

Gleason Decision ¶ 491

Access to Information

5. AS 43.56.080 grants the Division certain investigative powers when assessing AS 43.56 properties, including the power to "enter any premise necessary for the investigation during reasonable hours," to "examine property and appropriate records," and to compel owner representatives "to appear for examination under oath by the department." There was no persuasive evidence presented at the trial de novo that the Division has ever exercised these powers with respect to the valuation of TAPS.

Gleason Decision ¶ 5

Access to Information

6. The Division broadly interprets what it considers "taxpayer confidential" information under applicable statutes and will not disclose such information to the Municipalities specifically or to the public generally. The Division considers all information that it receives from a taxpayer as "taxpayer confidential," even if it does not contain the particularities of a taxpayer's business affairs and is obtainable from the public domain. As a result, the Division did not provide the Owners' new replacement cost study by Stantec Consulting, Inc. ("Stantec") to the Municipalities.

Gleason Decision ¶ 6

Access to Information

7. AS 43.56.060(g) provides that "[t]he department may enter into agreements with a municipality for the cooperative or joint administration of the assessing authority conferred on the department by this section." The North Slope Borough previously had such an agreement with the Department. The City of Valdez and Fairbanks North Star Borough have never been parties to joint assessment agreements with the Department.

Gleason Decision ¶ 7

Access to Information

8. In its 2010 decision, SARB expressed its concerns regarding the Division's assessment practices:

> The Board believes that it is time for the Division to address the problems created by the way it handles taxpayer confidential information in the assessment process. The Division's failure to provide interested parties with the information on which the assessment was made in time to allow those parties meaningful input in the determination of the property's assessed value, before that determination is subject to limited review of an appeal before the Board, has the potential to throw the fundamental fairness of the AS 43.56 assessment process into question. The Board believes that, due to the Division's current practices with regard to the use of taxpayer confidential information in its AS 43.56 assessments, that process is close to broken and is headed in the wrong direction.

This Court concurs with the Board's observations in this regard.

Gleason Decision ¶ 8

Access to Information
Information at DOR Level

- History of TAPS Valuation
- DOR Process
- Access to Taxpayer Information
- Treatment of Taxpayer Information
- Consequence of Lack of Access to Information

Access to Information

History of TAPS Valuation

- DOR relying on TSM based rates lead the assessments falling from over $8 billion in the mid-1980s to $2.75 billion in 2001 [Gleason Decision ¶ 30]
- For decades the valuation of TAPS was a negotiated process that largely excluded the Municipalities
- The Municipalities fully engaged the process for the 2005 assessment

Access to Information

Observation About DOR's Process

- Key DOR staff are fair, dedicated, and highly competent
- The SARB has also been balanced and diligent
- However the DOR process–as related to information relied on in the taxation process–is close to broken. [Gleason Decision ¶ 8]

Access to Information

Access to Confidential Information

- Taxing authorities typically compel information
  - DOR can subpoena information, depose taxpayer representatives, and investigate property and records

    [AS 43.56.080; AS 29.45.130; AS 43.55.040(a)]
- DOR policy is to work cooperatively with industry, so it does not exercise these powers [Gleason Decision ¶ 8]
- Thus, DOR relies on information that a taxpayer volunteers or that is publicly available

Access to Information
Taxpayer Information

- The Alaska Public Records Act, AS 40.25.110, requires State documents to be subject to public examination

- Exception exists under AS 40.25.100(a) for tax information "that discloses the particulars of the business or affairs of a taxpayer" in which case the "information shall be kept confidential except when . . . required in an official investigation [or proceeding]"

- AS 43.05.230(a) also makes it unlawful to "divulge the amount of income or the particulars set out or disclosed in a report or return" except in conjunction with "investigations or proceedings"

Access to Information

Taxpayer Information

DOR narrowly reads taxpayer confidentiality statutes, denying public access to:

- All information provided by taxpayers
  - Non-sensitive correspondence, hypothetical studies, publicly available information, etc.
- Information provided for its production forecasting, which is a budgeting function [2007-2009 Trial Tr. 8813-14, Tr. 10874-877]
- The Municipalities
  - AS 43.56.060(g) allows for joint administration of taxes
  - North Slope Borough had such an agreement until recently

Access to Information

Consequence of Information Access

- Industry acts to prevent the best information from harming its position on taxes
  - Low flow documents
  - Royalty trust statements removed
  - BP Pipelines no longer participating in reserves function [2007-2009 Trial Tr. 11480]
  - As a matter of policy DOR does not compel the production of useful information
- DOR does not make publicly available taxpayer information in its possession
- Result–DOR and Legislature do not have access to information necessary to be informed about oil and gas tax issues in Alaska

Access to Information
Source Materials

- Alaska Statutes

Conclusion

- Open Access to Facilities
- Reasonable Transportation Rates
- Minimize Barriers to Entry
- Sound Tax Policy
  - Recognizes Market Structure
  - Recognizes Specific Behavior and Participants Most Likely to Be Impacted by Tax Incentives
  - Recognizes Stage of Development of Basin

THANK YOU

Information Used for Internal Decisions

The complete version of the last three field development plans, for each field, provided to the working interest owners.

The resource support package for each field.

All authorization for expenditures ("AFE"), or proposed AFEs that are for amounts over $25 million and that were drafted in the last three years.

All annual and quarterly strategic and budget reporting documents (e.g., strategic planning unit and group financial outlooks), for the last two years, for each producer's Alaska operations.

All financial analysis and internal planning documents relating to heavy or viscous oil drafted in the last two years, including each producer's long term budget plan and production forecast for heavy oil and viscous oil development.

A list of all projects made uneconomic by ACES, including the financial analysis supporting that conclusion.

What know Gwen / Mulp 10-K's

Information Developed for Regulatory Purposes

Everything provided to the BP Prudhoe Bay Royalty Trust or its auditors for yearend 2010 and 2011.

The last two yearend review packages for each field.

Information Provided to Potential Purchasers

In 2010, after the Gulf well blowout, BP considered selling its Alaska assets. BP set up electronic data rooms containing the documents about its Alaska operations that were necessary for potential purchasers to conduct their due diligence reviews. It would require little effort for BP to allow the Legislature access to those data rooms.

Provided to the Senate Resources Committee by Craig Richards and Robin Brena (2/8/2012)

Bradford (Brad) G. Keithley | Partner

Brad Keithley is a partner and co-head of the Oil & Gas practice at Perkins Coie. He is based in the firm's Anchorage and Washington, D.C. offices. Prior to joining Perkins Coie, Brad was a partner for 18 years with the global law firm of Jones Day, based primarily in the firm's Dallas and Houston offices, and before that was senior vice president and general counsel of Arkla, Inc., at the time the third largest gas company in the United States (and now part of CenterPoint Energy Inc.). Brad started his career as an attorney advisor in the Office of the General Counsel to the Secretary of the Air Force, after which he joined and became a partner with Hall, Estill, Hardwick, Gable, Collingsworth & Nelson, in Tulsa, Oklahoma.

Throughout his career, Brad's practice has been concentrated in the areas of oil & gas regulation, commercial transactions and litigation. His clients have included major oil & gas companies, oil & gas pipelines, large and medium independents, as well as major consumers of natural gas. During the last ten years, Brad's practice has focused primarily on matters related to Alaska oil & gas, international and U.S. LNG issues, matters related to oil & gas exploration, and development and production on U.S. federal lands and waters. Brad is a past co-chair of the Institute of Energy Law's Annual Oil & Gas Law Conference and was a founding co-chair of the Institute's Annual Law of LNG Conference.

Perkins Coie | Legal Counsel to Great Companies

Judge Gleason's Decision: An Alternate Perspective

Bradford G. Keithley
Partner & Co-Head, Oil & Gas Practice
Perkins Coie LLP

August 9, 2012

Disclaimers

- The opinions expressed here are entirely my own; not speaking on behalf of any client
- Not involved in the case, but monitored the case and have studied the decision closely because of its potential impact on Alaska
- Not here to challenge or dispute the logic or conclusion of the opinion

Agenda

- Background
- What the decision says
- What the decision doesn't say
- The implications for the future

Background of the Case

- State court dispute over the valuation of TAPS for property tax purposes
- Parties: Alyeska v. the North Slope Borough, Fairbanks North Star Borough and Valdez (and the Alaska Dep't of Revenue)
- Life of TAPS is relevant to TAPS economic value and accumulated depreciation
- Decision subject to appeal to the Alaska Supreme Court

What the Decision Says

- Judge Gleason found that the value of TAPS for property tax purposes was $8.94 B (2007), $9.64 (2008), $9.24 (2009)
- In the course of determining those values, concluded that "the life of TAPS based on its proven reserves and incorporating its minimum capacity throughput limitations as of … 2007, 2008 and 2009 is at least until 2065."
- Based on her conclusion that TAPS can continue to accommodate flows as low as 70,000 bbl/d

What the Decision Doesn't Say

- The decision doesn't say anything about current or reasonably foreseeable production levels
  - The decision simply says that the production tail will continue longer
- The decision also doesn't say anything about the effect of declining production on the state's economic well being
  - The decision doesn't speak to state revenue

The Implications

- Joe Balash has it right …
  - "Deputy Natural Resources Commissioner Joe Balash said *a 300,000-barrel a day throughput scenario … would be a 'disaster*,' because at that level, the state budget would be in a 'dire deficit.'"
    - Becky Borher (AP), Fairbanks Daily News-Miner, Jan. 8, 2012 (17 paragraphs into the story).
- To paraphrase James Carville from the 1992 Presidential campaign
  - In Alaska, "It's the production rate …"
  - … not the reserve life

Current ANS Production Forecast

Figure 4-11. Alaska North Slope Production, FY 2011 and Forecasted FY 2012-2021[1] (million barrels per day)

Fiscal Year	Currently Producing	Percent Change from Prior Yr.	Under Development	Under Evaluation	Total ANS	Percent Change from Prior Yr.
2011	0.603	(6.3%)	0.000	0.000	0.603	(6.3%)
2012	0.548	(9.1%)	0.026	0.001	0.574	(4.7%)
2013	0.485	(11.6%)	0.069	0.001	0.555	(3.3%)

Shell sees oil lows of $70 in 2012 volatility

Oil giant reports 54% jump in 2011 profits despite tough final quarter

BY EMILY GOSDEN, THE TELEGRAPH FEBRUARY 2, 2012

Recommend | Tweet 0 | +1 0 | Comment 0 | ShareThis

STORY | PHOTOS (1)

Shell's chief executive, Peter Voser, outlined an aggressive long-term growth strategy, focused on 'upstream' exploration and production. He said the strategy would help Shell ride out volatility and increase cash flow by up to 50pc over the next four years. It would spend

Other Consequences of the Decision

- Increases TAPS rates
  - Roughly 25% of current TAPS rates are to recover ad valorem taxes; increased taxes, increased rates
- Decision disproportionately benefits NSB, Fairbanks and Valdez; hurts State
  - Increased TAPS rates reduce royalty and production taxes
- Significant additional tax hike on industry
  - Reinforces perception of unpredictable and litigious Alaska business environment

Conclusion

- Judge Gleason's Decision …
  - … says nothing about which decline curve Alaska is on
  - … at most, the decision merely says that the tail end of the decline curve may be extended longer than some have previously forecast
- In short, the person that turns the lights off on Alaska's economy can stay a few more years, but the remainder will have left long before

The Art of Taxation

"The art of taxation consists in so plucking the goose as to get the most feathers with the least hissing."

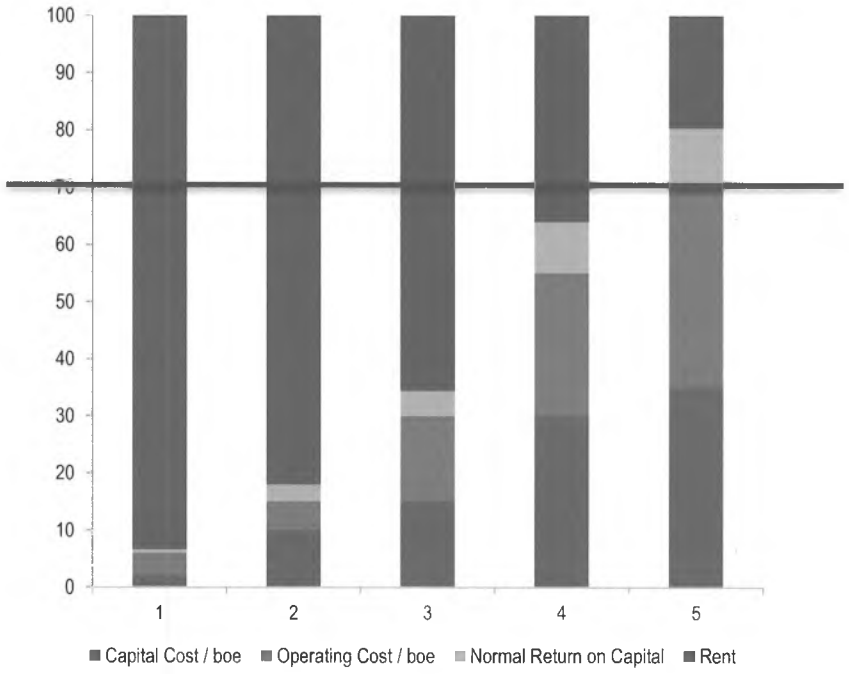
Jean Baptiste Colbert - Economist and Minister of Finance under King Louis XIV of France, 1619

…or, in more contemporary terms

- The art of taxation consists in maximizing revenues, subject to two important constraints
  - **Efficiency:** Not distorting investment choices, or preventing marginal investments that would otherwise have been made from occurring
  - **Competitiveness:** Ensuring that in the real world, which is characterized by limited capital with competing uses

Efficiency: Conclusions on a Fixed Percentage Royalty

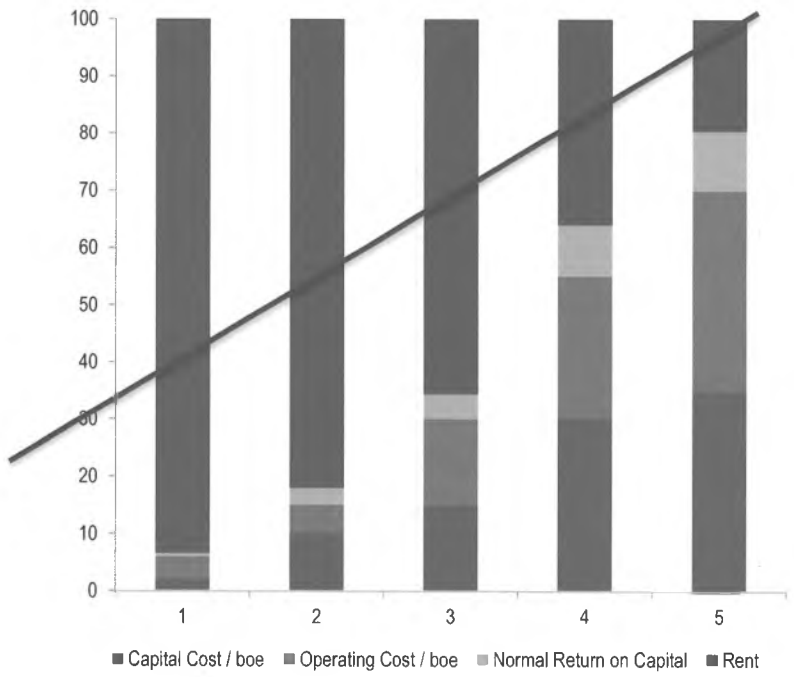
- The fixed royalty is **inefficient** because it distorts investment, making previously marginal projects uneconomic at a given price
- It is highly **regressive** with regard to both price and cost, because Relative Government Take falls as prices rise, and as costs fall
- This also increases **sovereign risk** – since when prices rise, governments will be tempted to set a new rate, even though investments have been made on the basis of the current one
- It has only one major strength – it is very **simple to administer**, requiring knowledge of only 2 variables - production and price



PFC Energy

Efficiency: Targeting Economic Rent

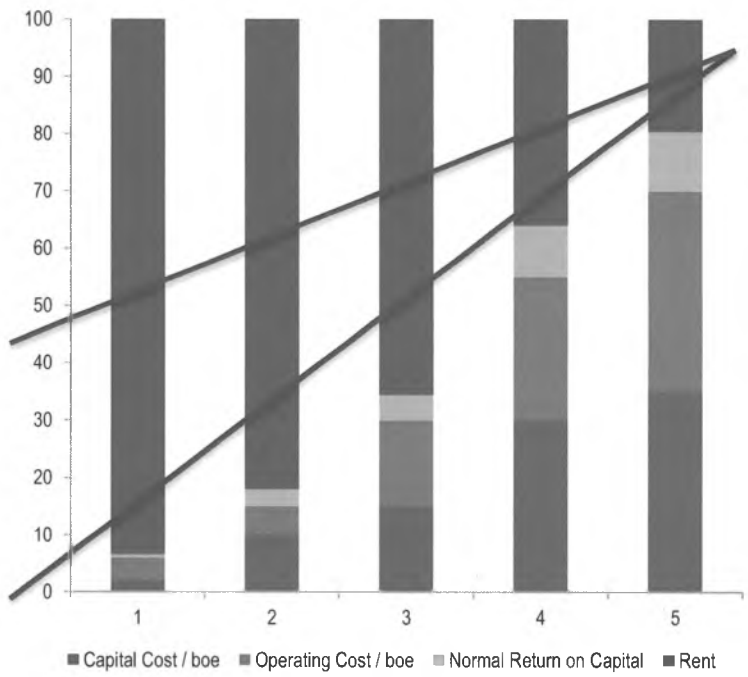
- What we would like to do instead is to tax the red bars – the Economic Rent – directly
- That way, we could *pluck more feathers*, with less *hissing*
- What are the different ways, over time, that governments have attempted to do this?



PFC Energy

Progressivity

- Progressivity may be used for a range of different purposes in a fiscal regime
  - In some cases, used to counterbalance the inherent regressivity of other elements of the regime
  - In other cases, a deliberate policy to not only a steady share of the rents, but to capture ever more as economics improve
- Implemented properly (ie taxing only economic rents), both of these approaches can be efficient – ie non-distorting of relative investment opportunities at the margin
- Regimes that use both high levels of relative government take, in addition to high progressivity to capture most or all of the upside of high price environments are will not necessarily, however, be competitive



PFC Energy

Different Implementations of Progressivity: Production Levels

- One of the earliest and still commonest metrics used to progressively increase rates of government take for projects that produce more economic rent has been the use of sliding scales for the split of profit oil or the setting of a royalty, based on levels of production, as is the case in Vietnam's PSC fiscal system
- Brazil similarly applies a production-level-based windfall profits tax in its tax-royalty system
- Such systems are almost always bracketed, so the higher rate applies only to production above a given threshold
- Production-based progressivity uses production levels as a proxy for profitability – and it is an imperfect proxy at best
  - The Vietnam example here attempts to improve here by setting different tiers, based on project cost
  - British Columbia, Canada uses a combination of Price and Production Quantity in its progressive Royalty rate

Vietnam Fiscal Terms			Pre-2010	Post-2010 with Incentives	Post-2010 without Incentives	Deepwater/ Frontier
Oil Royalty		mb/d				
	<=	20.00	8%	7%	10%	6%
	>20 <=	50.00	10%	9%	12%	8%
	>50 <=	75.00	10%	11%	14%	8%
	>75 <=	100.00	15%	13%	19%	10%
	>100 <=	150.00	20%	18%	24%	15%
	>150		25%	23%	29%	20%
Gas Royalty		mmcf/d				
	<=	176.55	0%	1%	2%	0%
	>176.55 <=	350.00	5%	3%	5%	3%
	>350		25%	6%	10%	6%
Cost Oil Limit			35%	35%	35%	50%
Cost Gas Limit			60%	60%	60%	70%
Profit Oil Split to Gov.		mb/d				
	<=	75.00	50%	50%	50%	50%
	>75 <=	100.00	55%	55%	55%	55%
	>100 <=	150.00	60%	60%	60%	60%
	>150		70%	70%	70%	70%
Profit Gas Split			50%	50%	50%	50%
Corporate Tax Rate		32%				

PFC Energy

Different Implementations of Progressivity: Price

- A number of regimes are progressive explicitly on price
- This approach is particularly common in setting "windfall profits" taxes
- China and Venezuela both use a price-progressive windfall profits tax to capture progressive shares of economic rent in high price environments
- Such systems are almost always bracketed, taxing only profits resulting from the higher price bracket at the higher rate
- Alaska's ACES system is an exception to this rule

Thresholds for Venezuela's Windfall Profits Tax

Oil Price	Rate
< $40	0%
$ 40 - $70	20%
$ 70 - $90	80%
$ 90 - $100	90%
> $100	95%

PFC Energy

Different Implementations of Progressivity: Cost Recovery

- A more sophisticated approach to targeting economic rent more directly is for a regime to be progressive using the extent to which a project has recovered its costs as a metric by which to set the tax or profit sharing rate
- Malaysia's current PSC model, introduced in 1997, uses "R-Factor", the ratio of cumulative revenues to cumulative costs, to set its profit split and its cost limit
- Once a project has recovered its costs, profit share to the IOC is progressively reduced

Malaysia Fiscal Terms						
Oil Royalty	10%					
	R Factor					
1997 PSC Parameters	R<=1.0	R<=1.4	R<=2.0	R<=2.5	R<=3.0	R>3
Cost Oil/Gas Limit	70%	60%	50%	30%	30%	30%
Unutilized Cost Oil/Gas Split (below TH'	0%	80%	70%	60%	50%	40%

PFC Energy

Different Implementations of Progressivity: Rates of Return

- Similarly, some regimes seek to target "super-profits" more directly by linking progressivity to the Internal Rate of Return (IRR) that a project has accomplished by any point in time
  - Angola's PSC regime uses IRR to set the profit oil split
    - Onshore and Shallow Water

IRR	Contractor's Share
< 20%	60%
20 – 25%	50%
25 – 30%	40%
> 30%	30%

    - Deepwater

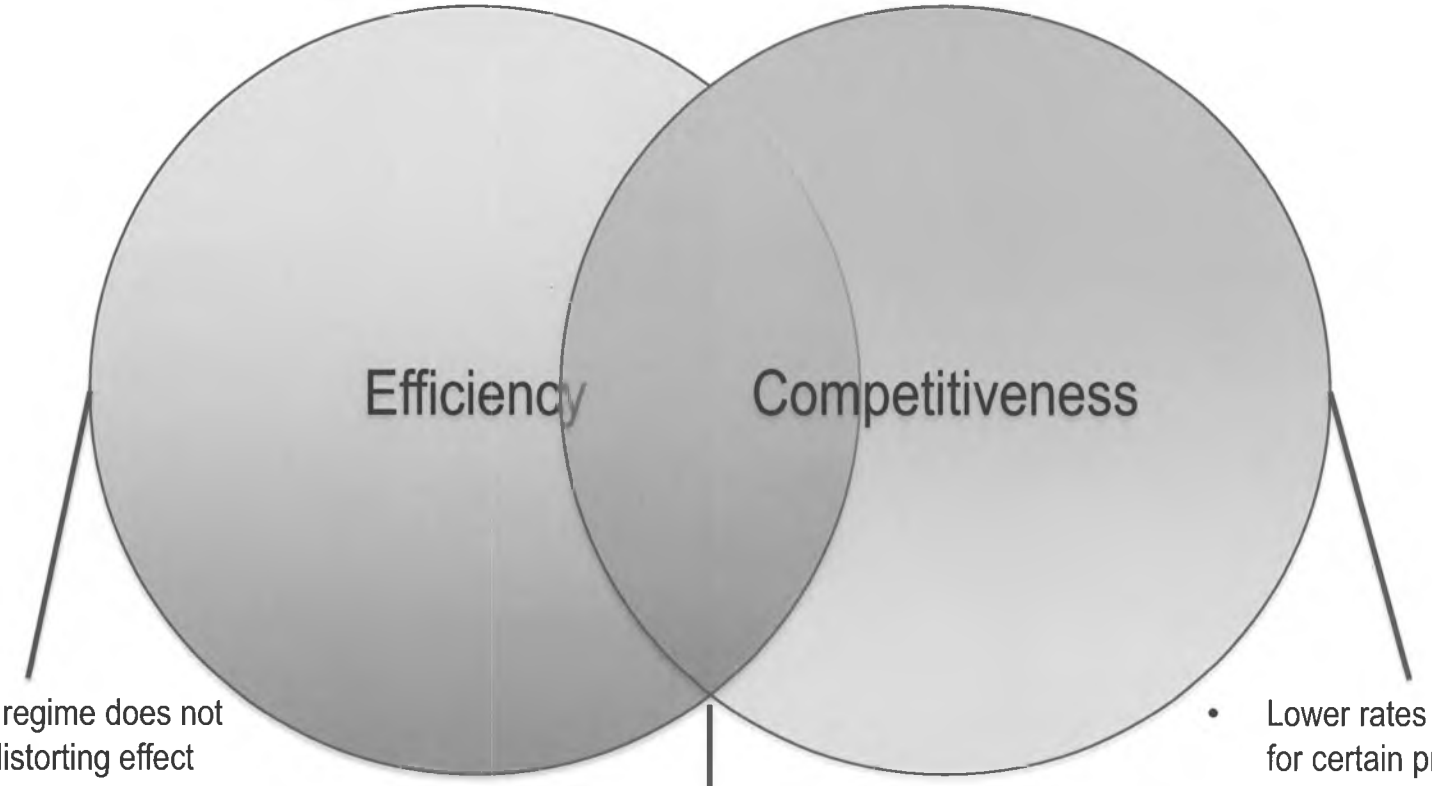
IRR	Contractor's Share
< 15%	80%
15 – 25%	60%
25 – 30%	40%
> 30%	20%

PFC Energy

Different Implementations of Progressivity: Taxing Rent Directly

- Many of these regimes are highly complex, and use highly imperfect proxies for targeting economic rent
- Australia's Petroleum Resource Rent Tax, by contrast, is unusual in being both very simple in design, and in seeking to tax economic rent directly
- The tax seeks to replicate the economics of a 40% direct participation by the state, by taxing net cashflow at a rate of 40%
- All losses, however, are carried forward indefinitely, and maintain present value since they are inflated each year by a rate similar to the corporate cost of capital
- The ultimate economics are as if government is paying a 40% share of the cost of development, and taking a 40% share of the resulting cashflow
- With no royalty, and no other taxes in the system other than Corporate Income Tax, this is one of the simplest fiscal designs anywhere, but also one of the most efficient – because it taxes rent directly

Finding the Intersection



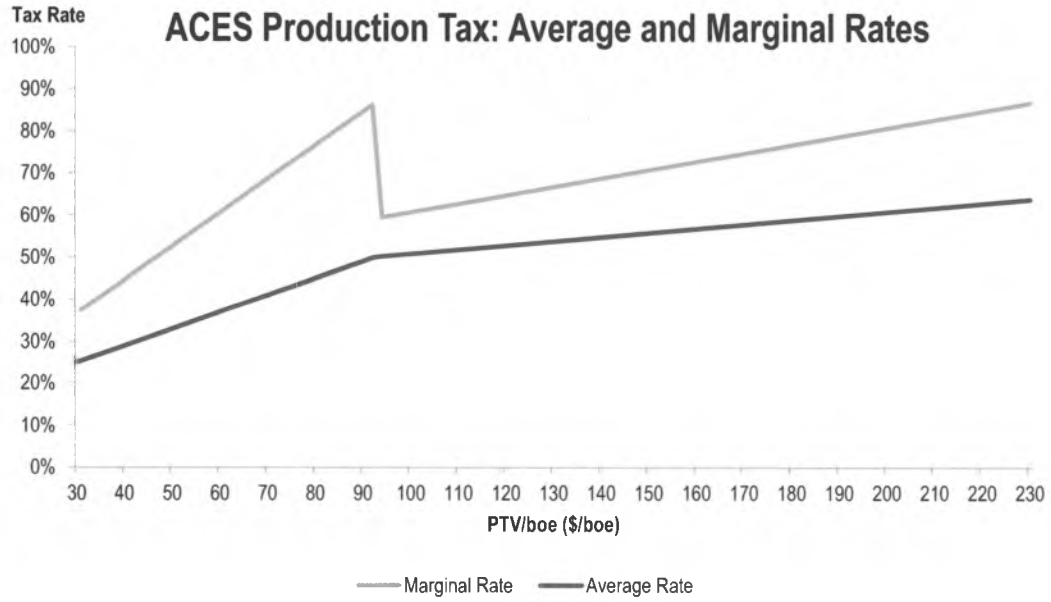
- Efficient regime does not have a distorting effect on project economics
- But rates are too high, and other jurisdictions are more successful in attracting capital as a result

- Regime does not distort investment
- Rates are internationally competitive, given fundamental attractiveness of the opportunity

- Lower rates may mean for certain projects or asset types, the regime is highly internationally competitive
- But distorting structure means certain otherwise marginal projects are unviable

PFC Energy

Average vs Marginal Rates



- It is average or effective rates, not marginal rates that drive project economics at a given price level
- Marginal rates remain, however, a useful metric for understanding key aspects of a regime
- The **difference between marginal and average** rates enable us to understand **how progressive a regime** is on a comparative basis
- Marginal rates represent the combination of high average rates with high progressivity
- In a profit-based system, high marginal rates may create perverse incentives with regard to cost control, encouraging "gold-plating"

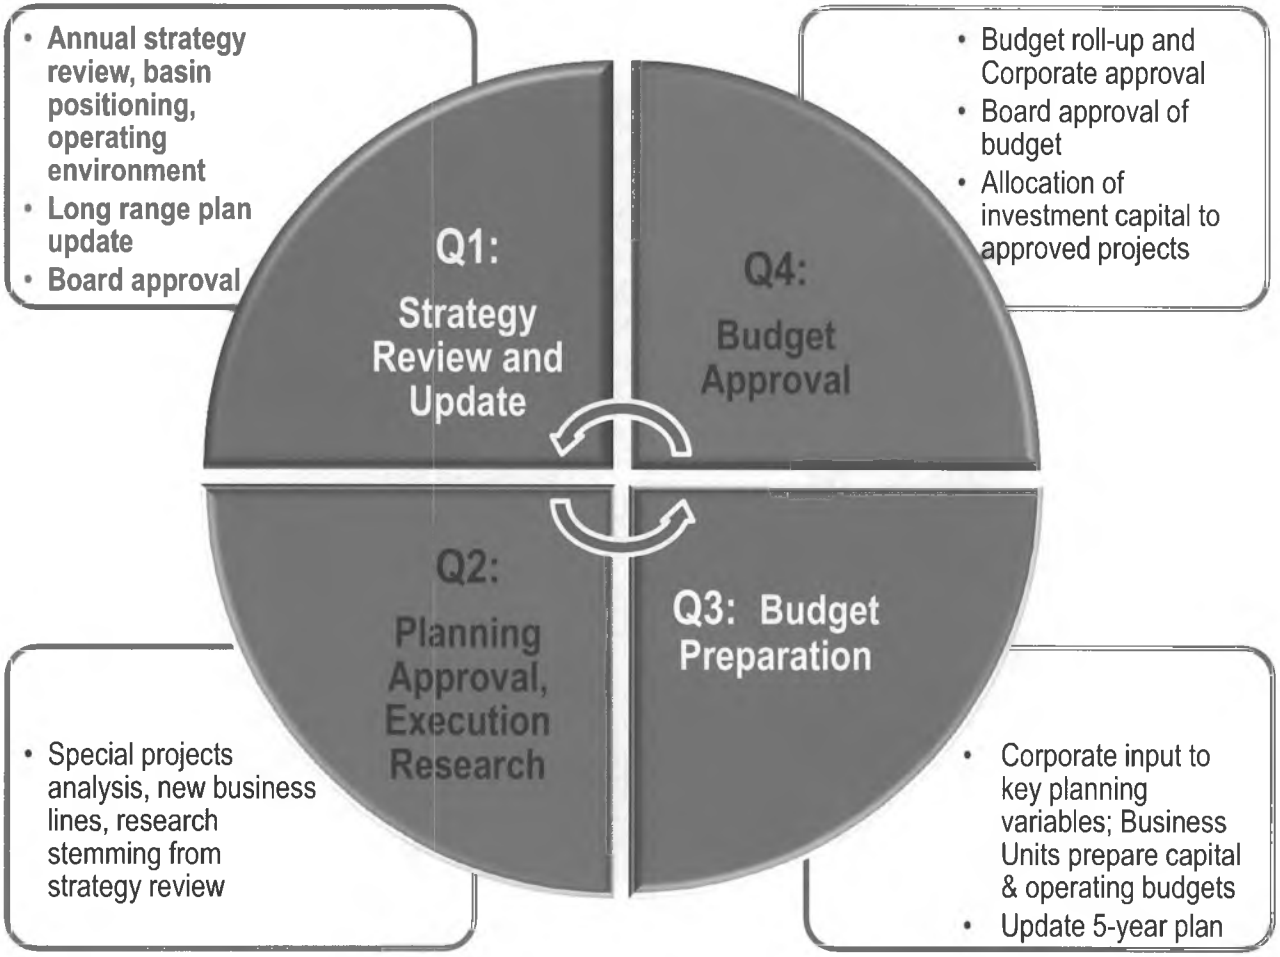
IOC Decision Making: Capital Allocation, Budget and Long-Range Planning

Points to Address: Discussion of Company Behaviors and Decision Making

- Key considerations for companies in making investment decisions, including decisions on whether to develop particular resources in the near term or postpone development
- Key metrics including ROCE, NPV, IRR, consideration of asset metrics versus portfolio metrics, and differences between integrated vs non-integrated companies

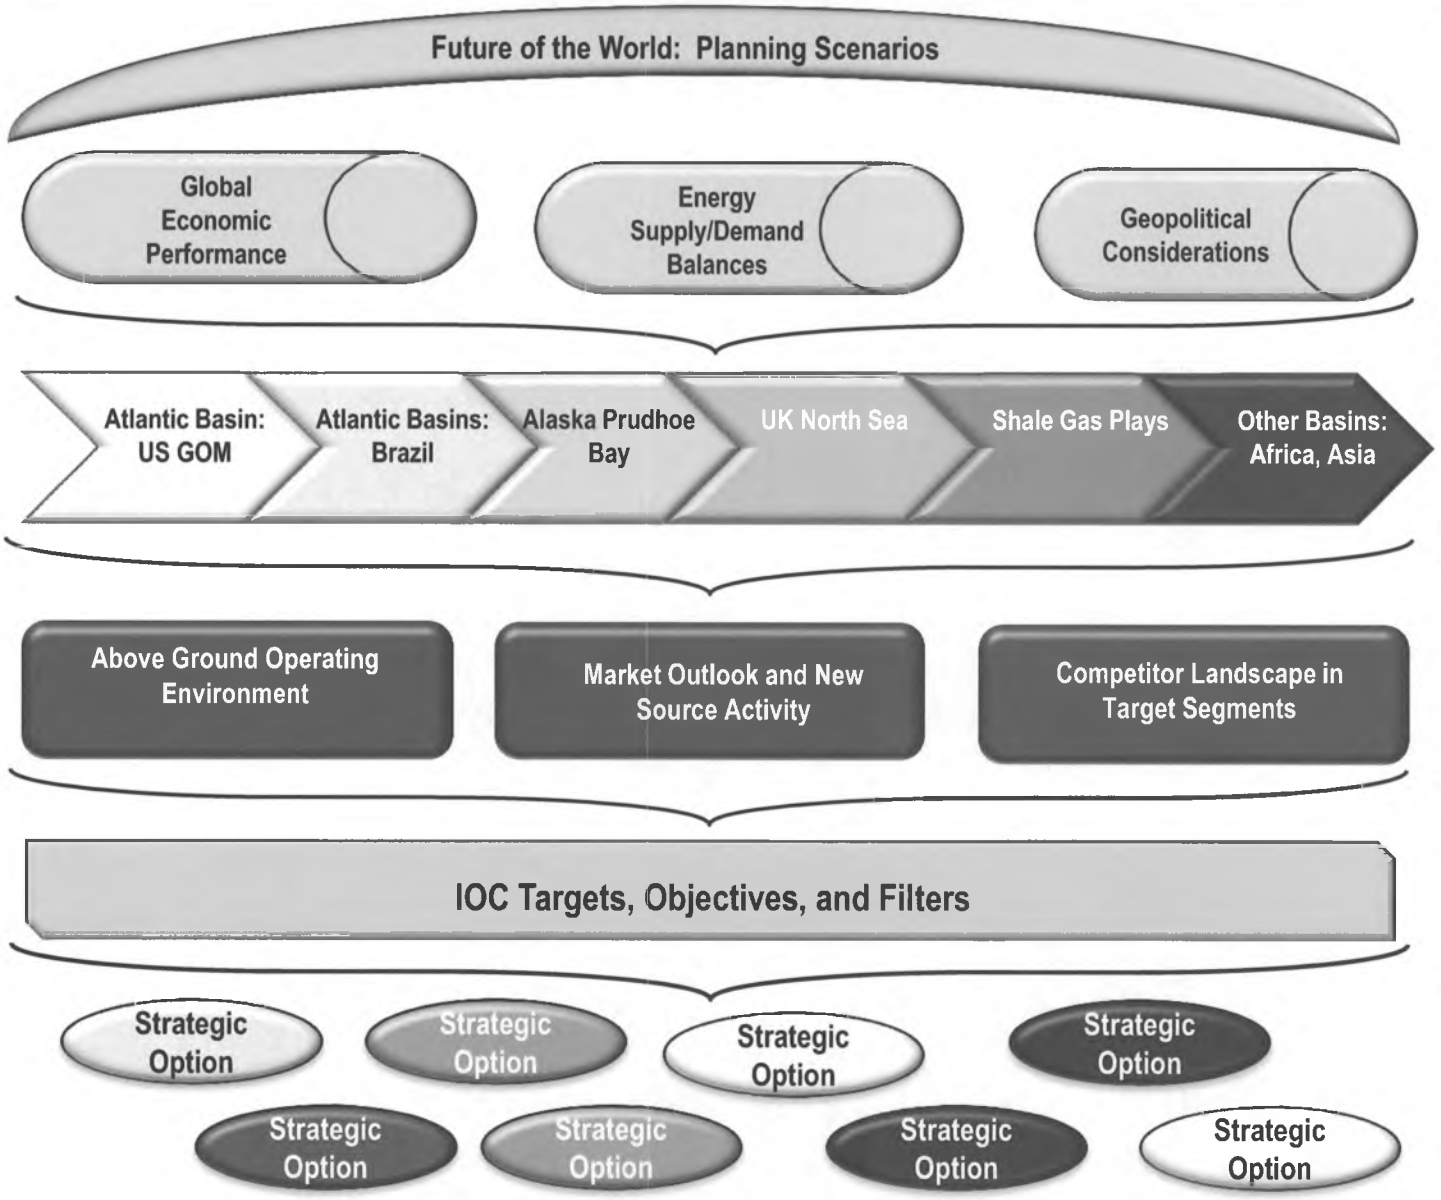
Annual Planning Cycle

Oil and gas companies follow a standardized process linking the annual Budget cycle to the Long Range Plan and corporate Strategy



PFC Energy

Strategy, Planning and Positioning



External Planning Environment: Identifying key uncertainties and forcing factors that will impact company Strategy and Long Run Planning

Preferred Operating Regions and Basins

Above ground risk, Potential "No Go" Geography

Blockers, Enablers, Gaps, Logjams; Determine materiality "Size of the Prize"

Identify Filters for Option Selection

Strategic Options: Robust across scenarios, Consistent with Objectives and Filters

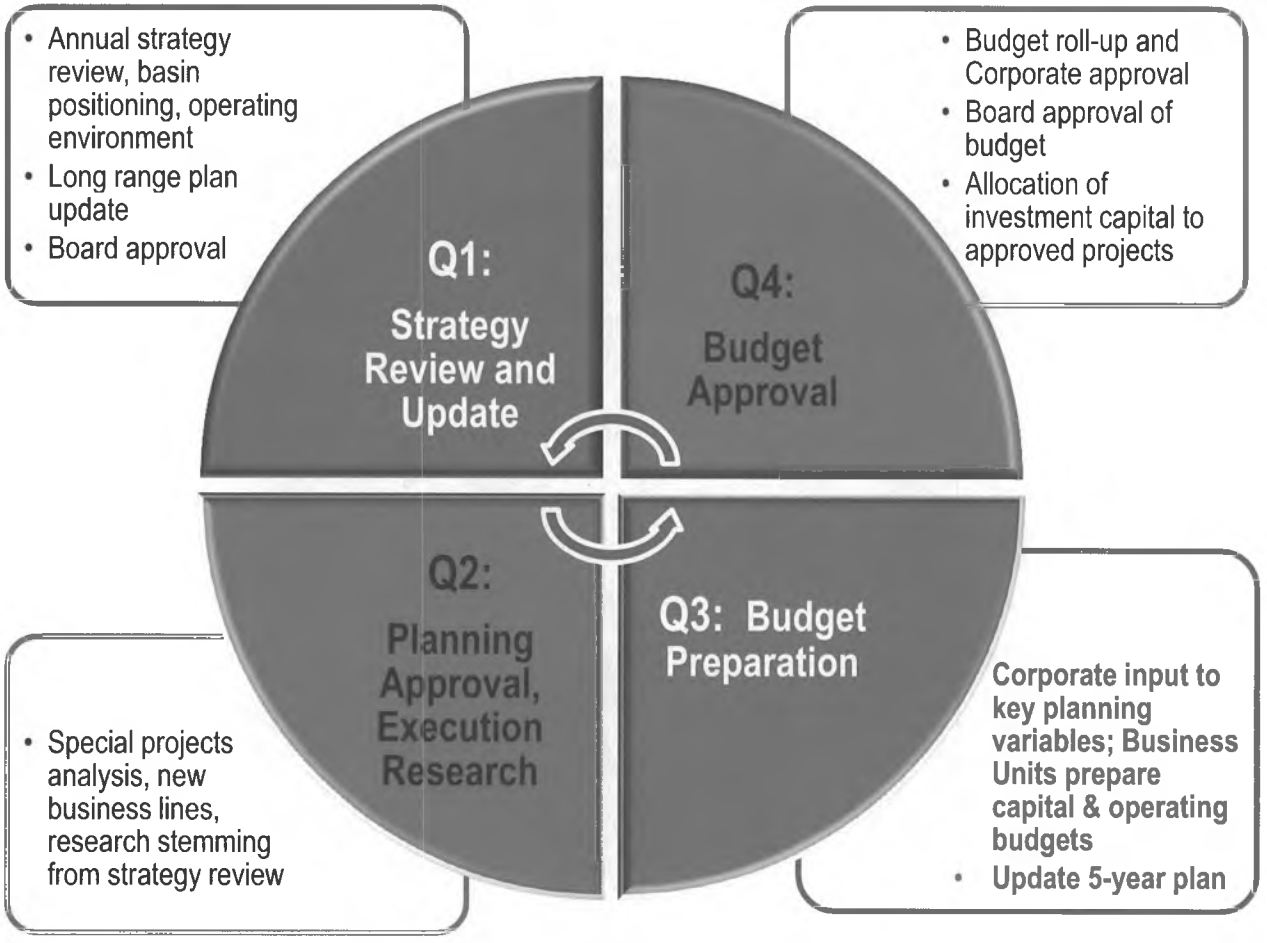
Annual Planning Cycle



PFC Energy

Attracting Capital: The Project Approval Process

- Materiality, total capex exposure, full-cycle economics/metrics, are all considerations in determining whether an IOC will position, or continue to invest, in a particular asset, basin, country.
- Each project is is disaggregated into "discrete investment decisions", in the form of Project Approval Requests (PARs), creating a natural *stage-gate* for capital approval and allocation.
  - A PAR can extend beyond a single fiscal year budget, depending on scope of the work program. Represents ***non-discretionary*** capex at the start of the budget year
  - Each PAR has one or a series of associated AFEs for a specific activity or capex element
  - Sum of AFEs for a calendar year = ***capital Budget***
- Each stage-gate creates an opportunity for the Company to continue, amend, suspend, or exit/divest

Asset Modelling and Decision Process: Materiality and Total Capex Exposure

Upstream Financial Metrics: Measuring Performance

- **Growth** .. Ability to manage the "top line."
  - CAGR in Production and Reserves relative to target
  - Quality of growth .. Where, how, consistent or not
  - Plowback Rate. .. To show relative growth intentions between different regions

- **Profitability** .. Ability to manage the "bottom line."
  - Upstream Cash flows
  - Upstream Net Income
  - Upstream Production Costs

  } Absolute and "per boe" basis

- **Efficiency** .. Ability to manage capital.
  - Upstream ROCE
  - Finding costs, F&D costs, Replacement Costs

- **Cash Flow** .. Ability to manage investment/re-investment in the portfolio.
  - Financial Strategy (debt targets, debt/capital ratio, dividend requirements)
  - Self-financing nature of portfolio (free cash flow versus capex: regional and global)

- **Risk** .. Ability to manage a diversified portfolio.
  - Financial Risk: Debt-to-Capital ratio, financial flexibility
  - New Source Risk: thinner margin barrels dominating new source volumes

PFC Energy

Project Selection and Decision Metrics

Energy companies employ a variety of Benchmarks or Metrics to rank investment opportunities and to allocate financial capital. Some of the more common include:

- Pay-out period; length of time required to recoup financial capital being placed at risk. Simplest selection metric, important to firms with scarce capital resources. No reference to project value after pay-out
- Internal Rate of Return; discount rate at which PV of costs = PV of revenues
- Net Present Value; PV of costs less PV of revenue flows (using discount rate reflecting cost of capital, cost of borrowing, or other);
  - NPV/boe; incorporates concept of investment efficiency
  - NPV/Investment; incorporates assessment of return to the investment dollar. Also referred to as **PVPI**
- Recycle Ratio: Netback or profit per boe divided by F&D cost per boe. A measure of project or corporate profitability
- Discounted and Undiscounted Net Cash Flow Profiles; measure of availability of free cash flow for follow on or alternative investments
- Maximum Negative Cash Flow Exposure; useful in situations where access to financial capital is an issue. What is the maximum exposure being undertaken by the firm
- Net Booked Reserves; contribution of the projects to corporate value (based on bookable reserves, amongst other measures)
- Capex/boe; cost per barrel of production capacity. Burdens the projects by the cost of infrastructure, facilities, etc. Tends to favor less complex, more mature capex alternatives

Project Metrics: Net Present Value

- **Net Present Value (NPV)**: The estimated value of a project when all future net cash flows are discounted to the present at an appropriate rate (the "discount factor"). If NPV > 0, then the project is expected to deliver a return greater than the cost of development, including a return on capital invested (accounted for in the discount rate).
- Advantages:
  - **Time value at corporate rate included**
  - **Can be calculated exactly**
  - **Can accommodate risk**
    - **NOTE: Above ground risk incorporated through discounting of costs and/or revenue flows, *NOT* through use of alternative discount rates**
  - **Useful for valuing properties**
  - **Discount rate reflects corporate preference for opportunity cost of investment capital (e.g., market interest rate, cost of equity capital, weighted average cost of capital (debt and equity))**
- Disadvantages:
  - **Difficult to rank projects. Significantly different capital and expenditure profiles can deliver the same NPV, due to the effect of discounting.**
    - **E.g., very large cash flows in a future time period can have the same "present value" as small cash flows in forward years. This may not, however, have the same impact and value for the company treasury**

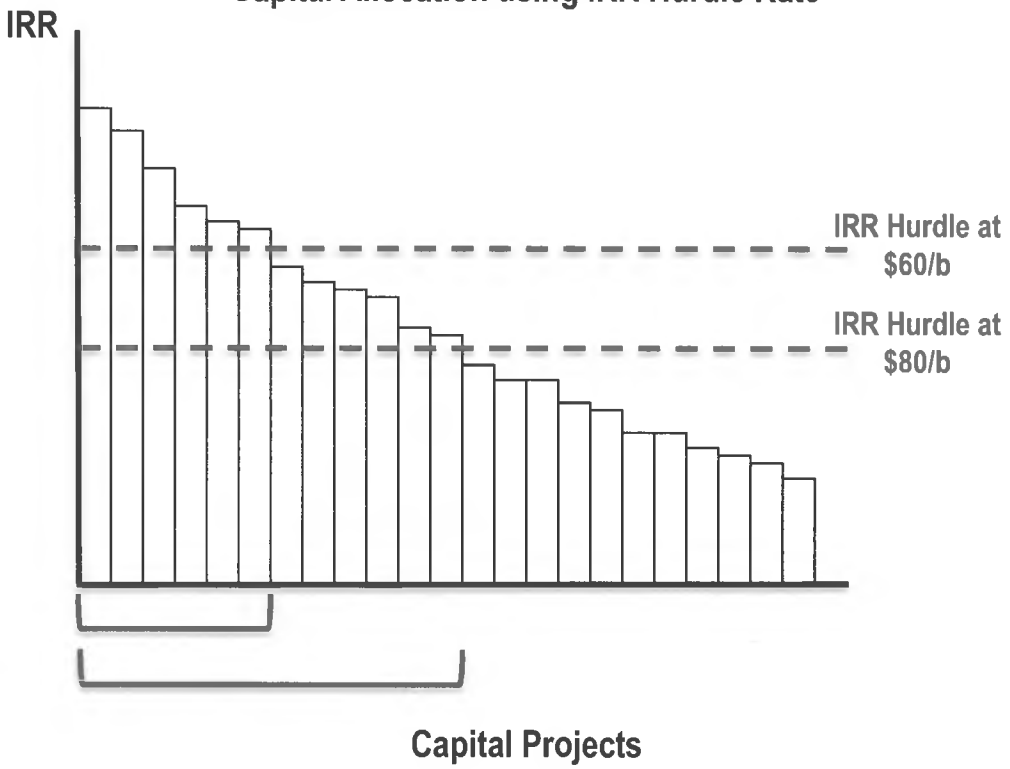
Project Decision Variables: Internal Rate of Return

- **Internal Rate of Return (IRR)**: The discount rate that equates all future cash inflows to outflows at a point in time (usually the present)
- Advantages:
  - **Easy to understand.**
  - **Incorporates time value**
  - **Can be compared to a required minimum (or hurdle rate)**
  - **Independent of magnitude of cash flows.**
- Disadvantages:
  - **Multiple rates of return are possible in cases of material cash flow volatility (e.g., large positive and negative swings over project life); uncomfortable for decision makers looking for unique decision criteria**
  - **Doesn't measure absolute worth of the project**
  - **Not useful for ranking discrete projects**
  - **Implicit assumption that interim cash flow is invested at calculated IRR (issue for high return projects) => overstates the true project value**

Capital Allocation: IRR Hurdle Rate

- Eligible projects ranked by IRR:
  - **Eligibility based on series of discrete project metrics within each PAR**
  - **Metrics change at each stage of the project cycle, as risks are addressed and estimates become more certain**
  - **Examples:**
    - **NPV10 > 0**
    - **PVPI > 1.3**
    - **Payback < 3 years**
- Corporate establishes a "hurdle" IRR number. Projects with IRR's in excess of the hurdle rate attract budget capital, while those below the hurdle rate are not funded

Capital Allocation using IRR Hurdle Rate

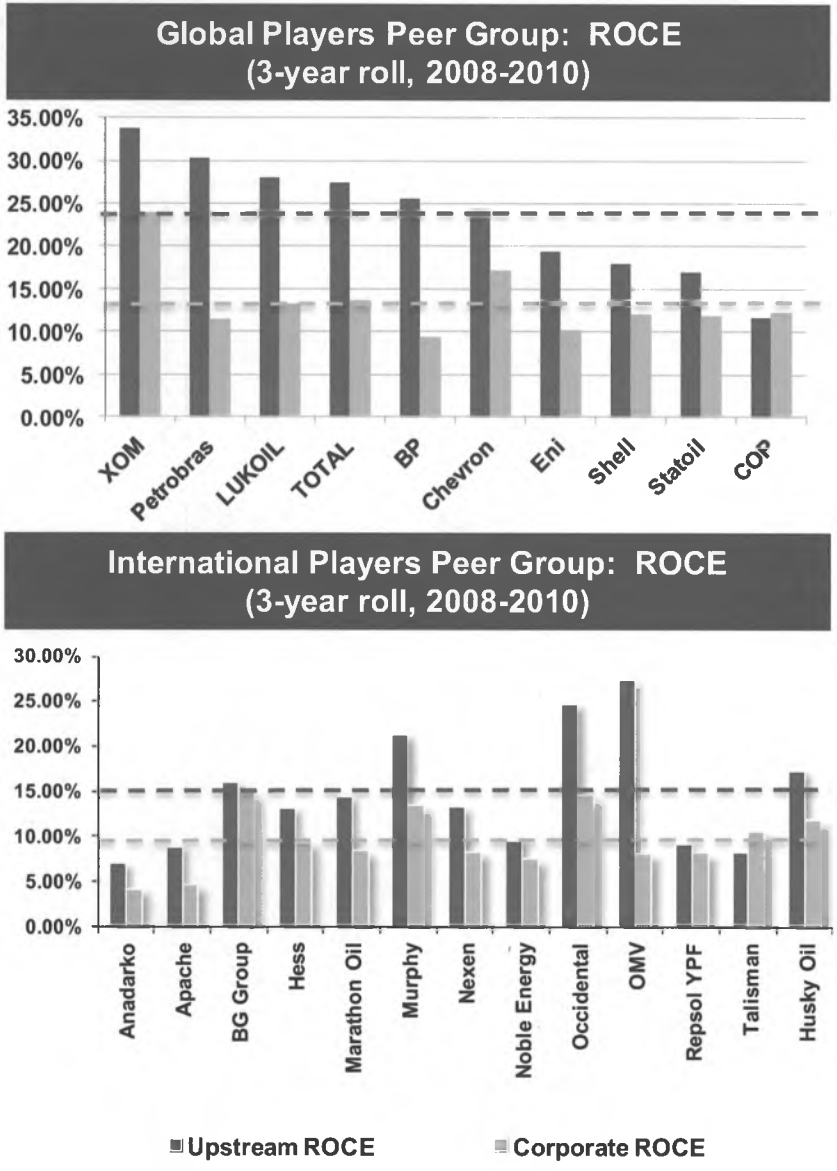


- Issues with IRR Hurdle Rate:
  - **Increase in free cash flow (due to, say, rise in energy prices) => increased capital budget => lower Hurdle rate in order to undertake additional projects => reduce overall portfolio quality and lower efficiency of capital employed. Evidenced in *cycles of value destruction* within the industry**
  - **Gaming the system: Project managers have an incentive to overstate the "size of the prize" or understate costs, in order to attract investment capital to proposed projects**
  - **IRR ranking does not speak to *materiality* => equivalent IRR's can have substantially different capex and revenue profiles**

PFC Energy

Portfolio Efficiency: Return on Capital Employed (ROCE)

- **Return on Capital Employed**:
  - ROCE = [(Net profit before interest and taxes) / (Gross Capital employed)] x 100
  - Where:
    - Gross capital employed = Fixed assets + Investments + Current assets OR
    - Gross capital employed = Share Capital + General & Capital Reserves + Long term loans
    - (+) Correlation with production, commodity prices
    - (-) Correlation with upstream spending
  - Indicates how well management has used the investment made by owners and creditors into the business. The higher the return on capital employed, the more efficient the firm is in using its funds. Time series analysis will reveal whether the profitability of the company is improving or eroding

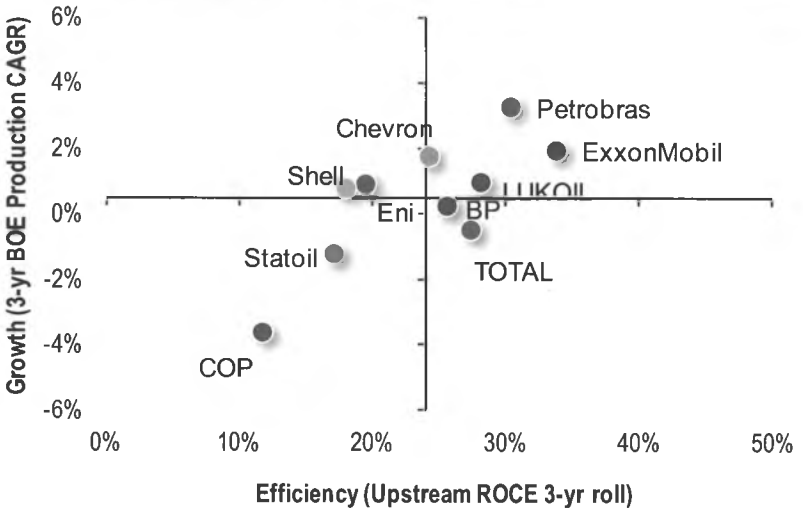


PFC Energy

Portfolio Efficiency: Return on Capital Employed (ROCE)

- **Issues with ROCE:**
  - Major capital project investments increase the denominator in advance of revenue (profit) impacts in the numerator => *penalizes the IOC for major capital investment undertakings*
    - Explains in part why it is unusual to find companies with high ROCE and growth metrics
  - Once in place, the scale of major capital project investments tend to deliver superior ROCE performance => *bias toward large asset portfolios*
    - Exception is deepwater developments, where high, short plateaus and steep production declines can result in highly volatile ROCE outcomes
  - Depreciation creates bias in favor of mature portfolio: More mature the asset base, the lower the denominator and the higher the ROCE (all else being equal)

Global Players Peer Group: Growth v Efficiency



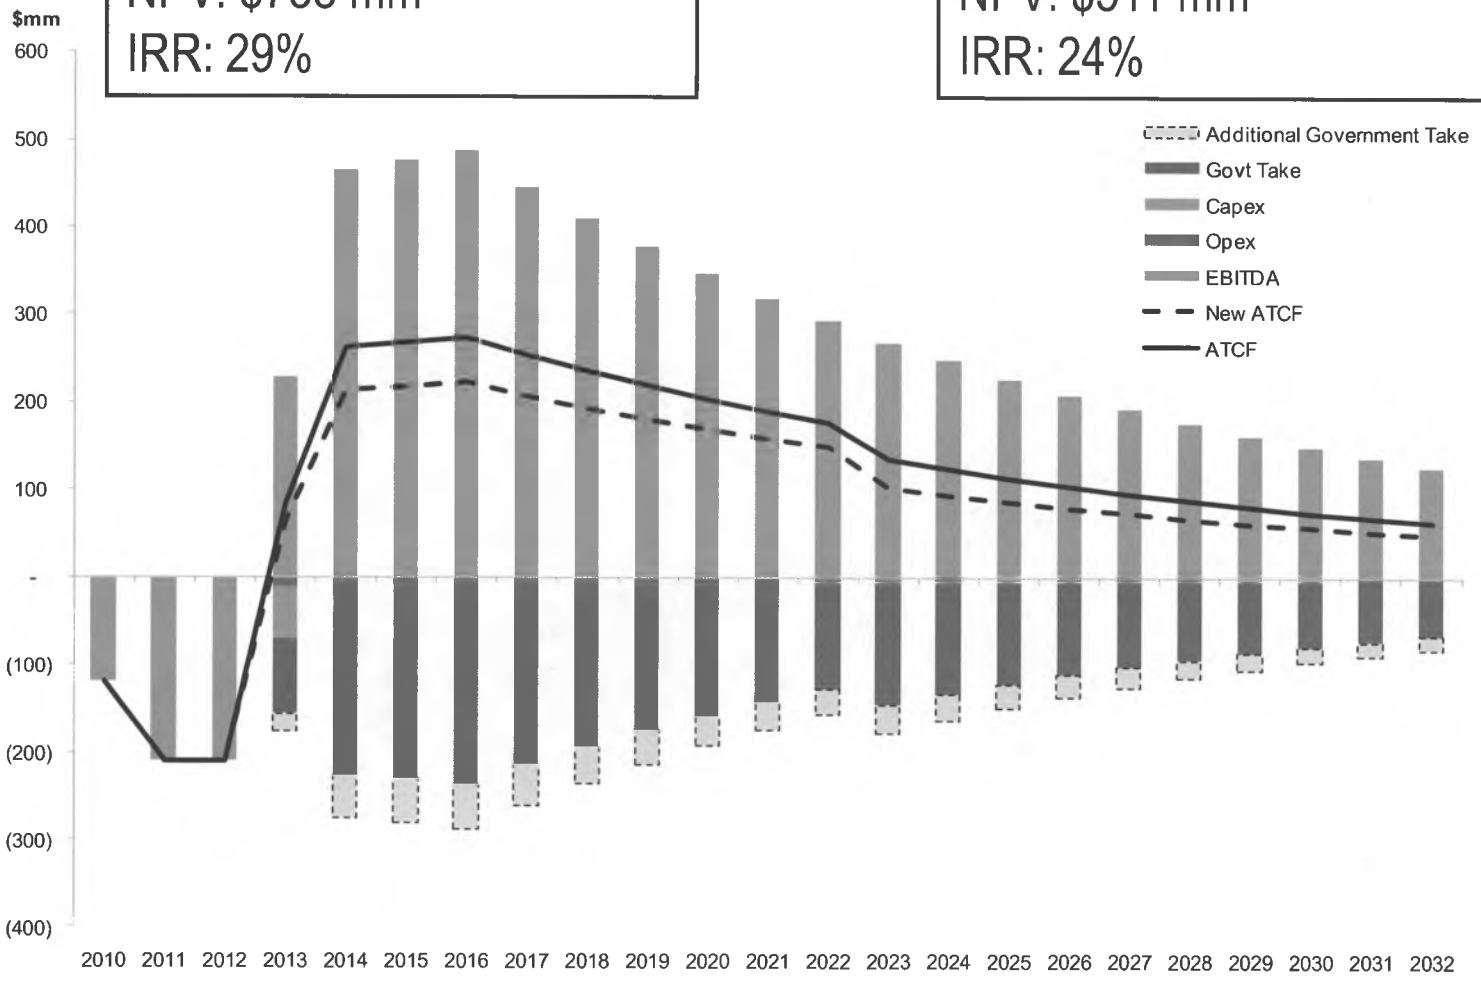
PFC Energy

Fiscal Changes Impact Project Economics

Example: Increase In UK Supplementary Ring Fence Charge

Supp. Profits Tax of 20%
50 mmboe field
NPV: $738 mm
IRR: 29%

Supp. Profits Tax of 32%
50 mmboe field
NPV: $511 mm
IRR: 24%

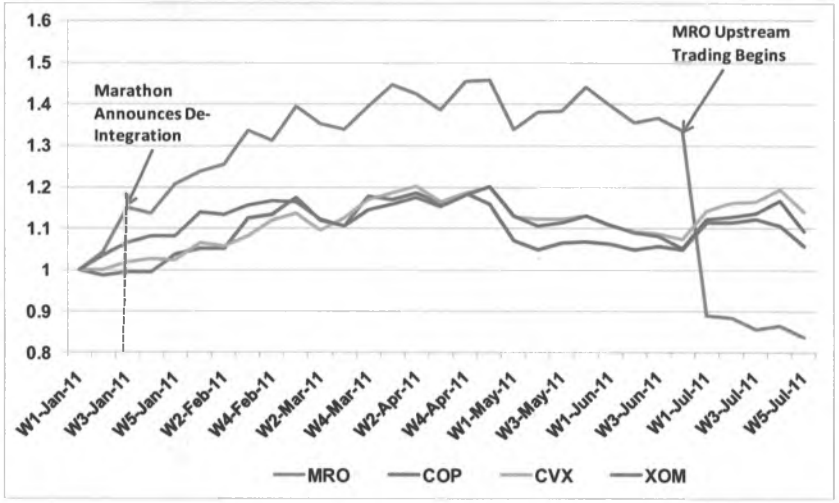


PFC Energy

Issue: Integration, Project Economics, and Decision Making

- *Share appreciation* appears the Number One driver for de-integration. Marathon and ConocoPhillips have both concluded that integration hides value that can otherwise be secured through greater management focus, transparency, and more appropriate strategy and execution within the de-integrated entities
- *Market development arguments* for a Downstream presence have largely ended
  - BP, TOTAL, Shell all divesting from Africa in favor of "pure play" refiners and marketers
  - No remaining examples where downstream presence is key to upstream success.

Weekly Share Price Performance, Selected IOCs (Week 1, January 2011 = 1.0)



- Improvements in internal decision processes and external regulation have eroded any value that could be secured through *cross-subsidization or barriers to competitor entry*
  - Rate of return regulation in midstream operations, open-access provisions, increased sophistication in both project and portfolio analysis => few opportunities remaining for active market manipulation
- There are *technical drivers* for integration, related to specific crude types and processing challenges (e.g., Canadian oil sands, Brazil waxy heavy crude, Venezuela ultra-heavy, Chad acidic crudes). However, these benefits can be secured through contracts and JV or partnering agreements with third party refiners

PFC Energy

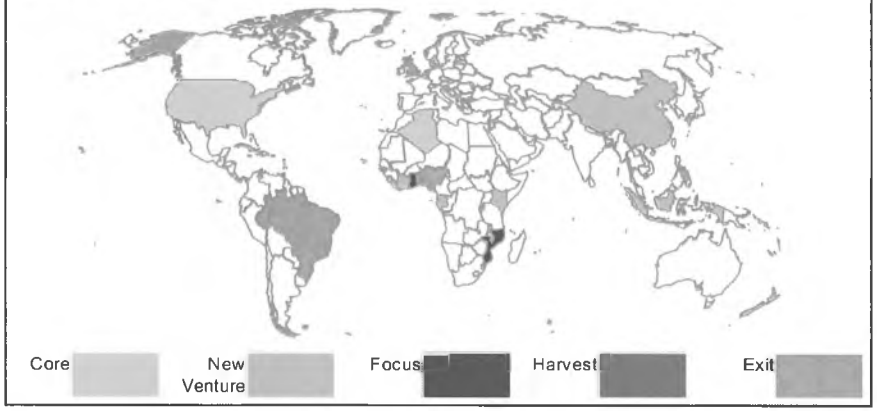
Issue: Basin Allocation and Free Cash Flow Distribution

- **"Core Area": Produces a stable stream of net cash flows, irrespective of commodity price variations and production replacement capabilities, and is material to the company. Can contribute to investment activity in other regions, but requires more than replacement level investment in order to maintain core area status. Tends to corresponds to a company's legacy assets.**
- **"Focus Area": Significant contributor to projected new source production and reserves growth in the medium- to long-term. Typically a net consumer of free cash flow until significant production levels are achieved.**
- **"New Venture": Areas new to the company—may be unexplored to fairly mature. Company has few, if any, assets and investment inflows can be modest (positions are usually characterized by exploration activity).**
- **"Harvest Area": Produces positive net cash flow, with investment activity typically at/below replacement level. Limits to growth from lack of geological potential, competitor landscape, limited "room to run", etc.**

Global Areas of Upstream Operations

		US	Algeria	China	Cote d'Ivoire	Gabon	Indonesia	Kenya	Liberia	New Zealand	Sierra Leone
Liquids	(mboe/d)	30	23	0	0	0	0	0	0	0	0
Gas	(mboe/d)	38	0	0	0	0	0	0	0	0	0

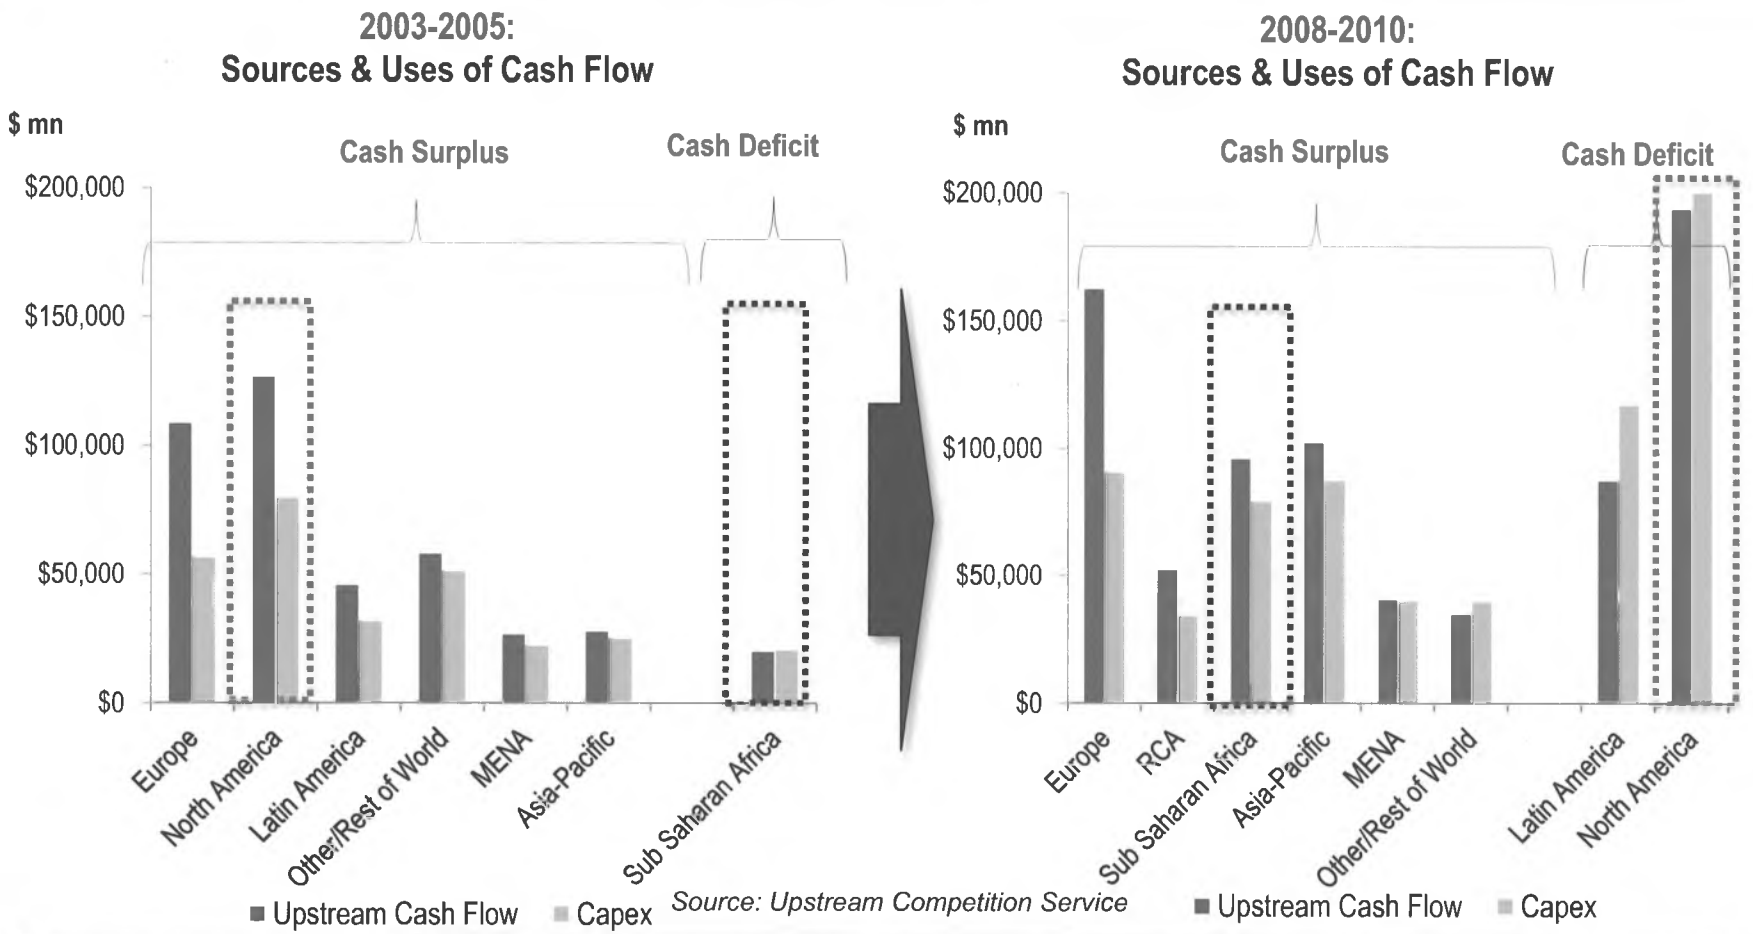
		Ghana	Mozambique	Benin	Brazil	Faroe Islands	Malta	Nigeria	Qatar	T&T	United Kingdom
Liquids	(mboe/d)	0	0	0	0	0	0	0	0	0	0
Gas	(mboe/d)	0	0	0	0	0	0	0	0	0	0



- **"Sit & Hold": Substantial resource base but investment delayed due to unattractive fiscal terms or significant above ground risks. Company may hold large projects in this area but is holding back the pace of investment.**
- **"Exit/Potential Exit": For reasons including lack of materiality, limits to future growth, change in strategy, the company has/is expected to make a decision to exit (asset sales, asset swaps, relinquishment of acreage).**

PFC Energy

Basin Success Delivers Transition in Free Cash Flow Allocation



Source: Upstream Competition Service

Along with Europe, Sub-Saharan Africa is now a key cash generating region for the IOCs—with surplus cash flow now supporting growth in North America

** Includes data from the following companies: Anadarko, Apache, BG, BHP, BP, CNRL, Chevron, ConocoPhillips, Devon, EnCana, Eni, ExxonMobil, Hess, Husky Oil, Marathon, Murphy, Nexen, Noble Energy, Oxy, Petrobras, Repsol YPF, Santos, Shell, Statoil, Suncor, Talisman, TOTAL, Woodside*

PFC Energy

Example: Nexen Inc.

- Free cash flow from Yemen/Masila block directed to North Sea assets; then from North Sea to Canadian oil sands and shale gas assets.
- Currently in Exit process in Yemen and shifting to Harvest in the UK

PFC Energy

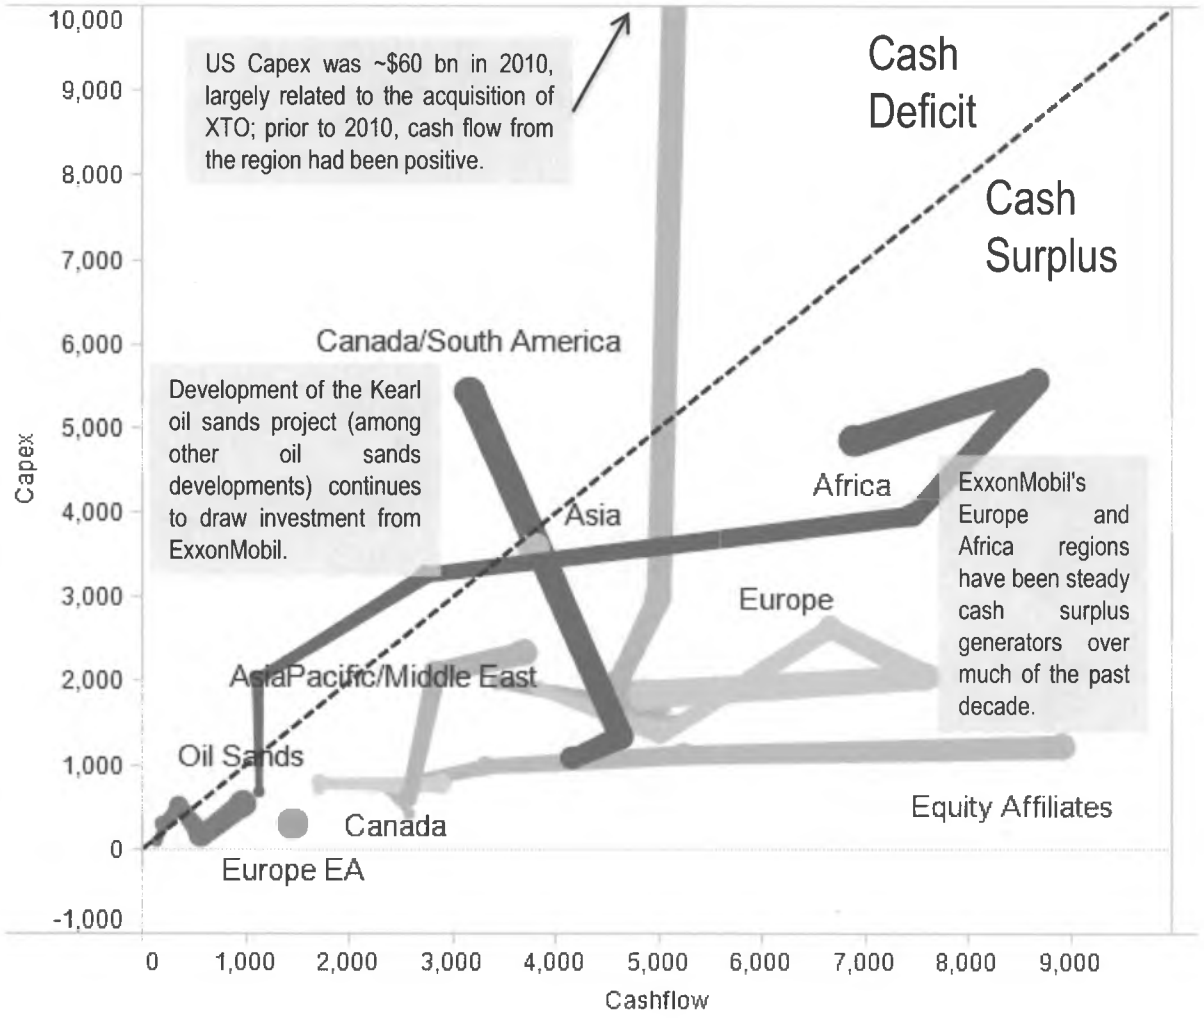
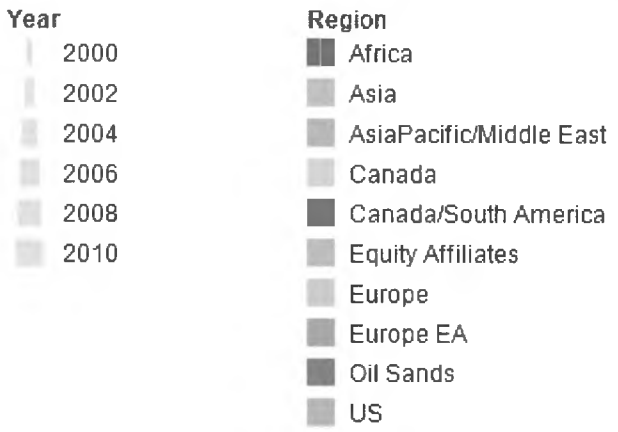
Example: ExxonMobil
How the Portfolio is Financed

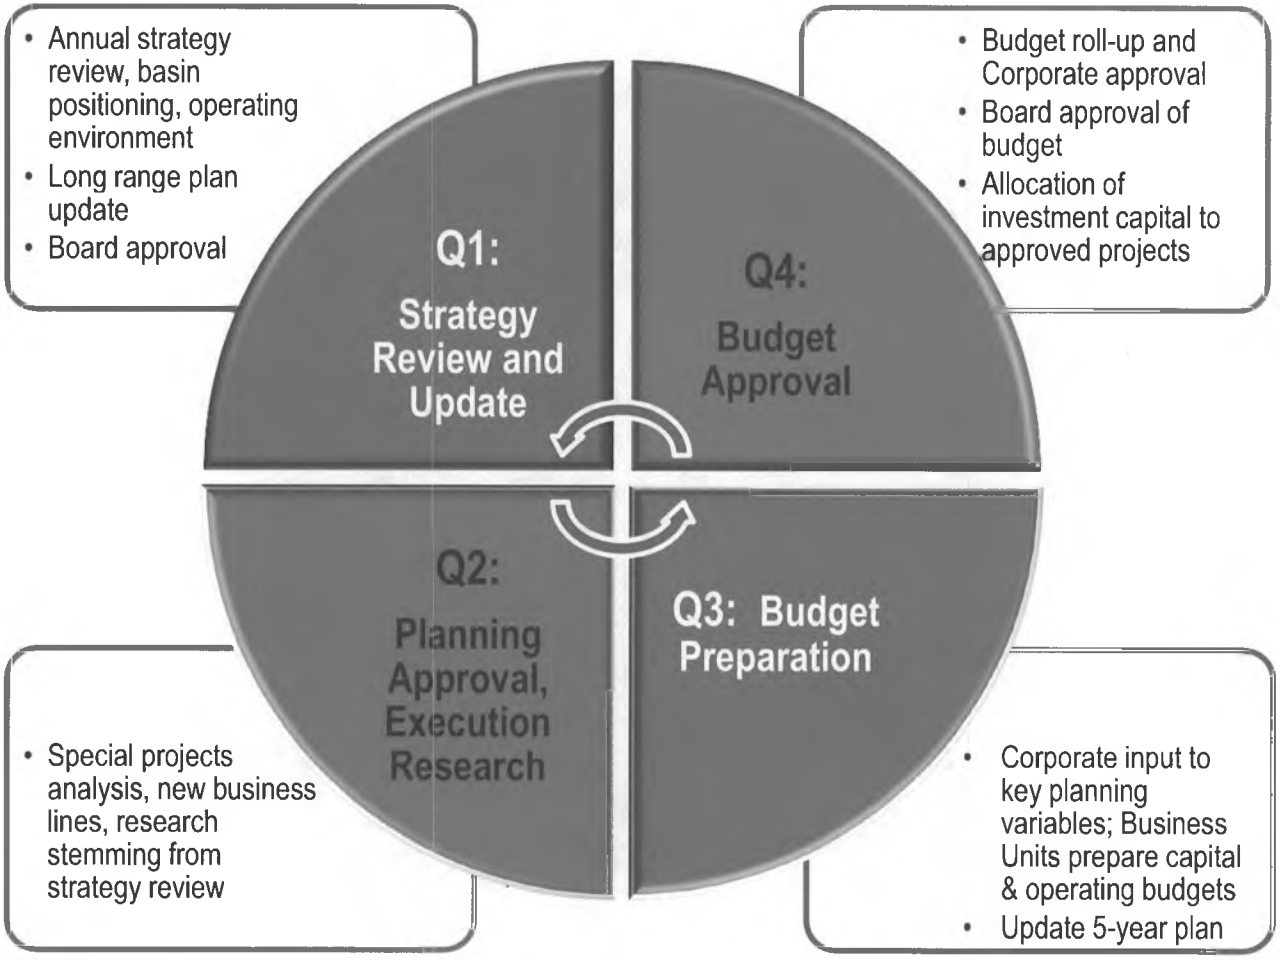




- US Onshore Europe were major sources of free cash flow for development of Middle East LNG and West Africa
- Now these latter regions are generating the free cash flow to support investment in US Onshore resource plays

PFC Energy

Questions and Discussion



PFC Energy

Principles of Fiscal Regime Design

Points to Address: Conceptual Overview of Progressivity

- Progressive vs. regressive fiscal regimes
- Rationale for a progressive fiscal regime
- How the concept of progressivity works in a range of other hydrocarbon jurisdictions
- Problems in the application of progressivity

The Art of Taxation

"The art of taxation consists in so plucking the goose as to get the most feathers with the least hissing."

Jean Baptiste Colbert - Economist and Minister of Finance under King Louis XIV of France, 1619

PFC Energy

...or, in more contemporary terms

- The art of taxation consists in maximizing revenues, subject to two important constraints
  - **Efficiency:** Not distorting investment choices, or preventing marginal investments that would otherwise have been made from occurring
  - **Competitiveness:** Ensuring that in the real world, which is characterized by limited capital with competing uses

Efficiency

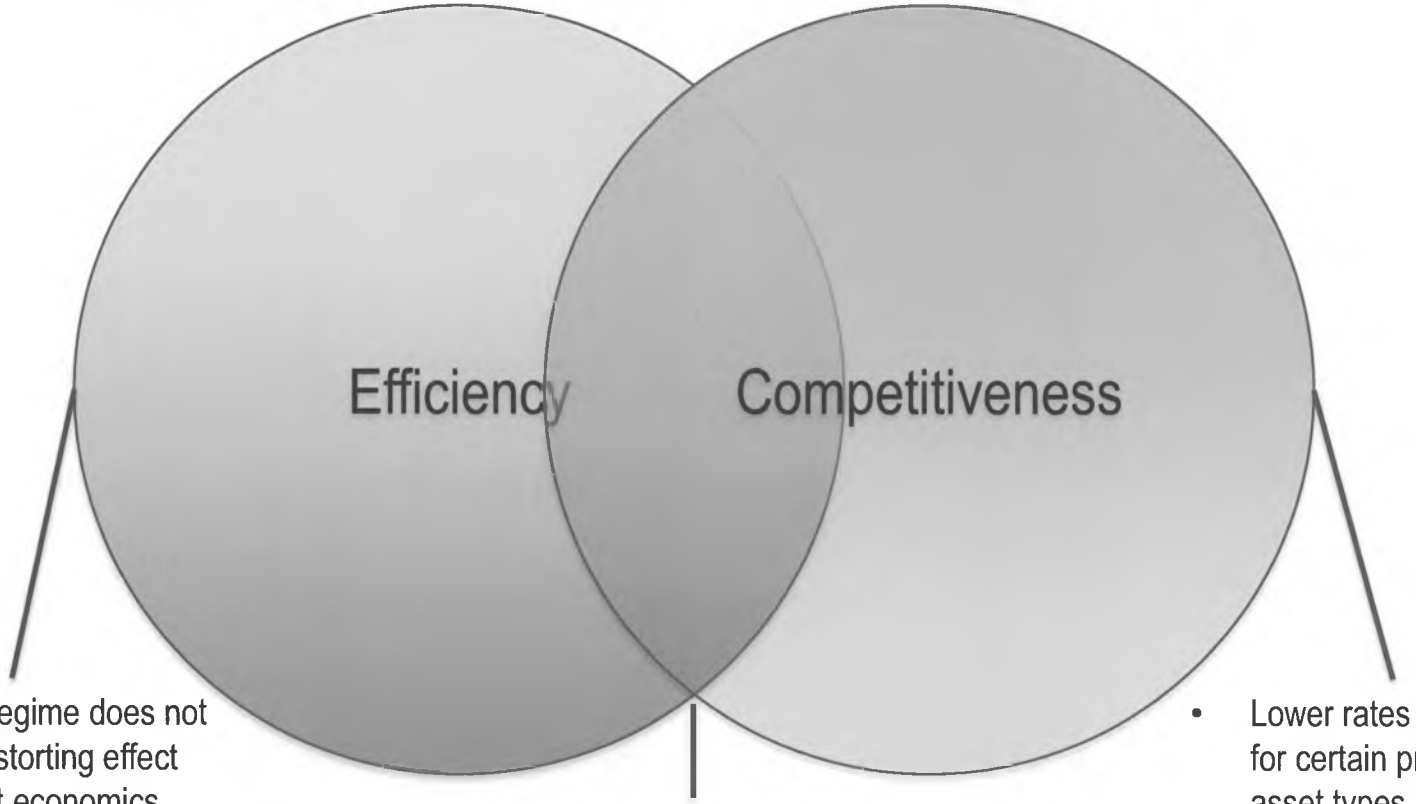
- Efficiency is an absolute concept – the degree of distortion in a taxation regime is something we can assess solely in relation to ourselves
  - Need to examine the incidence of the tax under different price and cost levels
  - Understand what components of the underlying economic activity are being taxed

Competitiveness

- Competitiveness is a relative concept – it requires us to examine our attractiveness in comparison to others
  - Need to understand what other jurisdictions we are competing with for capital
  - Need to understand whose capital we are competing for
  - Need to understand how rates of return for projects compare to what our target investors can achieve in other jurisdictions

PFC Energy

Finding the Intersection



- Efficient regime does not have a distorting effect on project economics
- But rates are too high, and other jurisdictions are more successful in attracting capital as a result

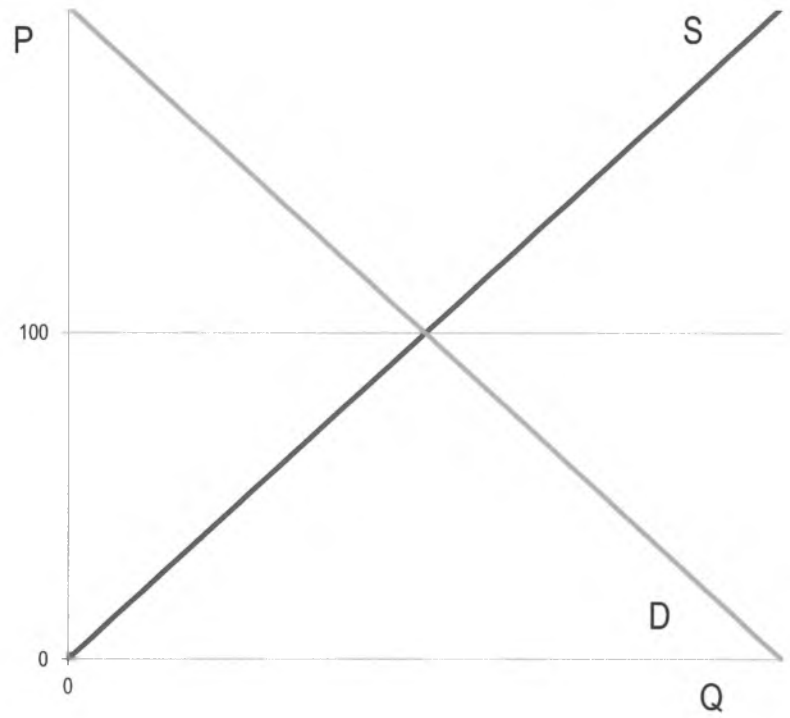
- Regime does not distort investment
- Rates are internationally competitive, given fundamental attractiveness of the opportunity

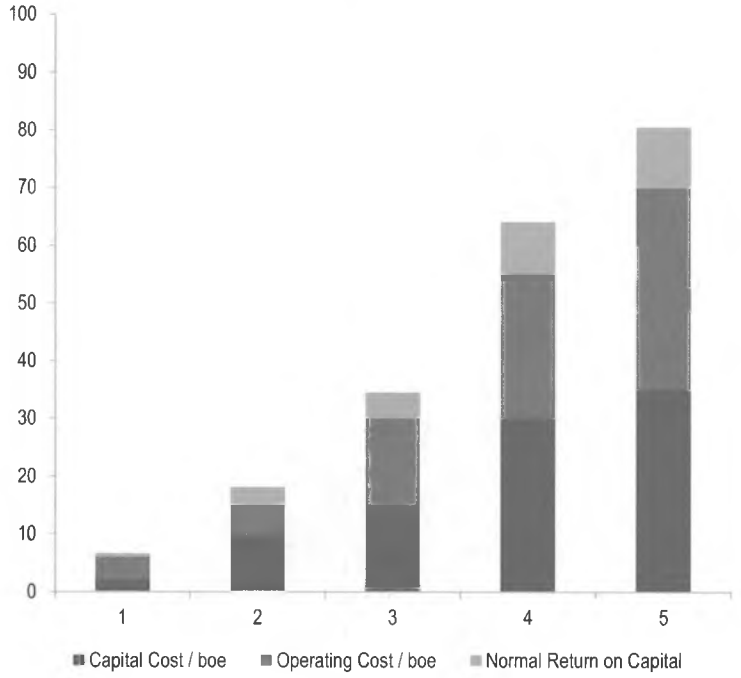
- Lower rates may mean for certain projects or asset types, the regime is highly internationally competitive
- But distorting structure means certain otherwise marginal projects are unviable

PFC Energy

Efficiency: Supply, Demand & Price

Upward Sloping Supply Curve

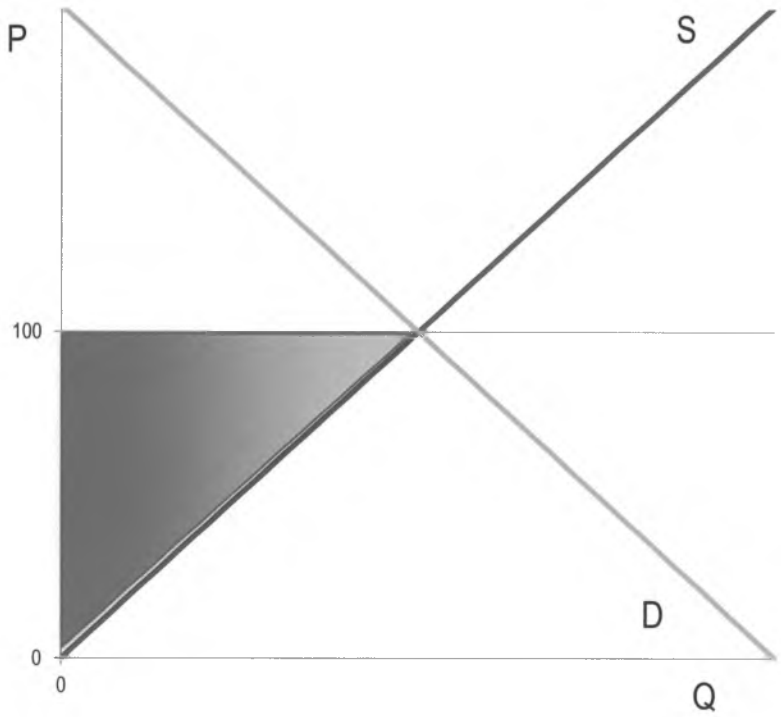


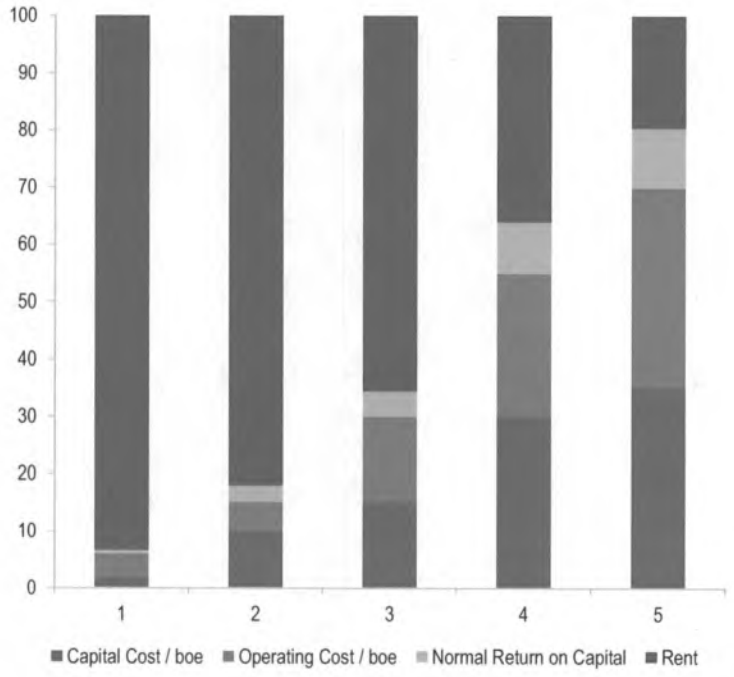


PFC Energy

Efficiency: Economic Rent

Upward Sloping Supply Curve

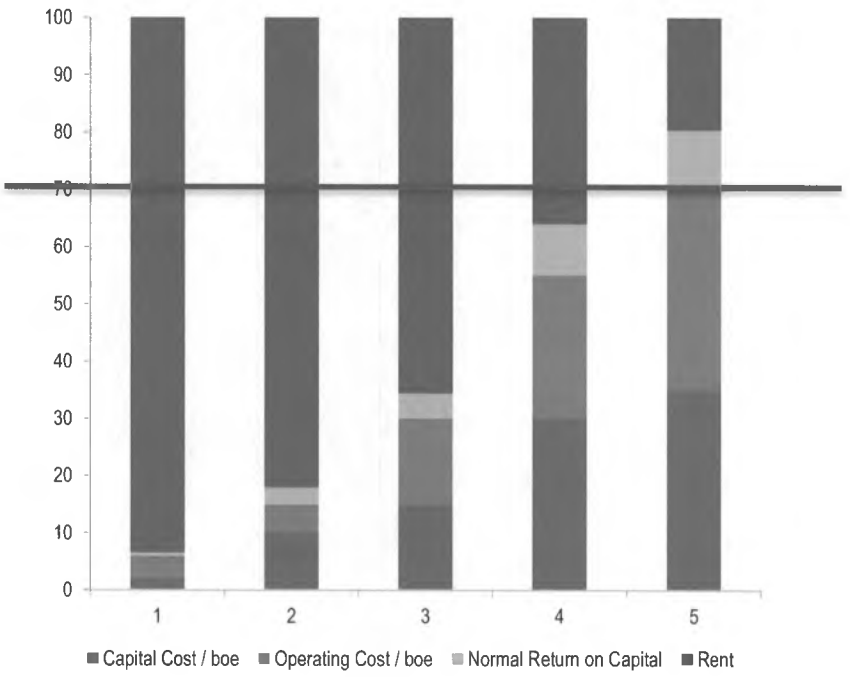




PFC Energy

Impact of a 30% Royalty

- The royalty successfully captures 30% of Gross Revenues from projects 1-4 for the Government
- The tax, however is highly distorting: Project 5 no longer earns a normal return on capital; if it were a prospective investment, it would now have negative NPV and would be cancelled
- If the oil price were to fall, the 30% royalty would make further projects non-economic



PFC Energy

Relative Government Take (Definition)

$$\textbf{Relative Government Take} = \frac{\text{Government Take}}{\text{Divisible Income}}$$

Divisible Income equals Gross Revenues less costs, including capex and transportation costs.

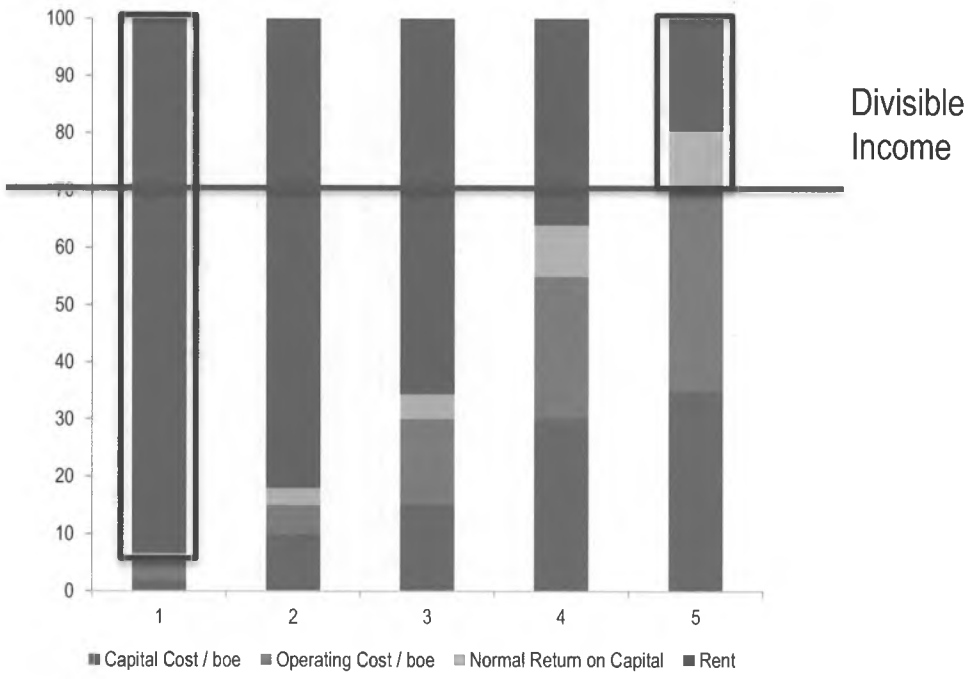
Government Take includes all payments the government mandates in its function as a sovereign:

- Royalties
- Land rental fees, property taxes
- Production taxes
- Income taxes

Government Take does not include amounts the government earns in an entrepreneurial function.

Relative Government Take Impact of a 30% Royalty

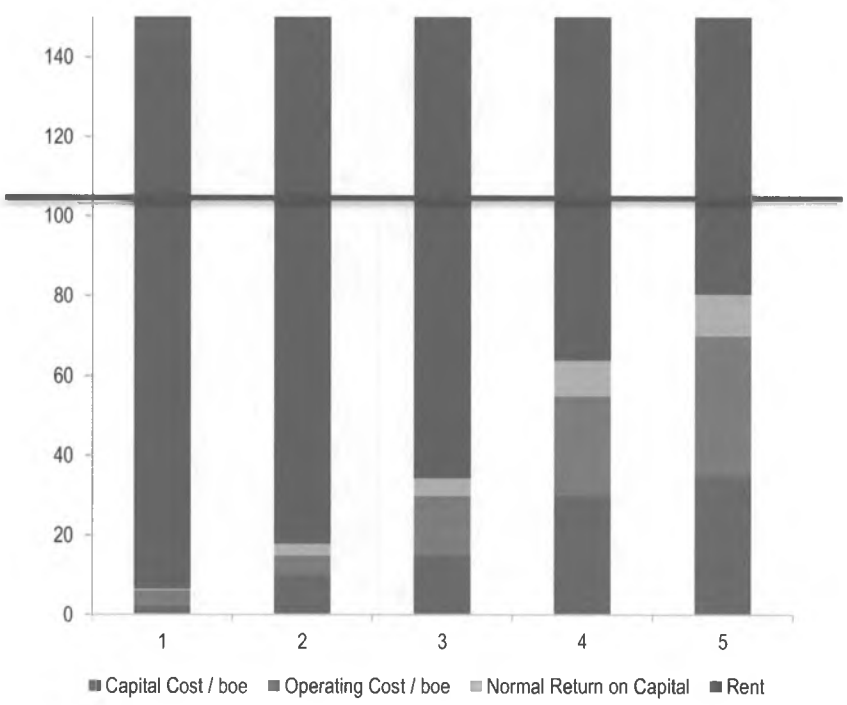
- The impact of the Royalty on Relative Government Take is also very different across different projects
  - For project 5, it is 100%
  - For project 1 it is less than 30%
- So a fixed percentage royalty is highly regressive with regard to costs – as costs increase, so does Relative Government Take



PFC Energy

Impact of an Oil Price Increase

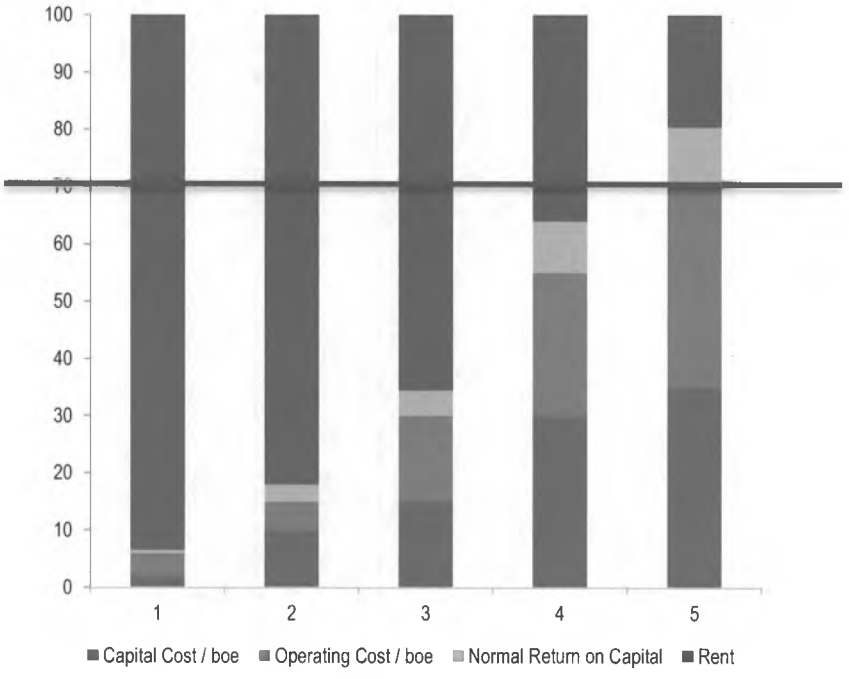
- If the oil price rises to $150/bbl, all projects are once again economic – but Relative Government Take has fallen dramatically, particularly for the more expensive projects
- For Project 5 it has fallen from 100% to 56%
- For Project 4 it has fallen from 66% to 47%



PFC Energy

Efficiency: Conclusions on a Fixed Percentage Royalty

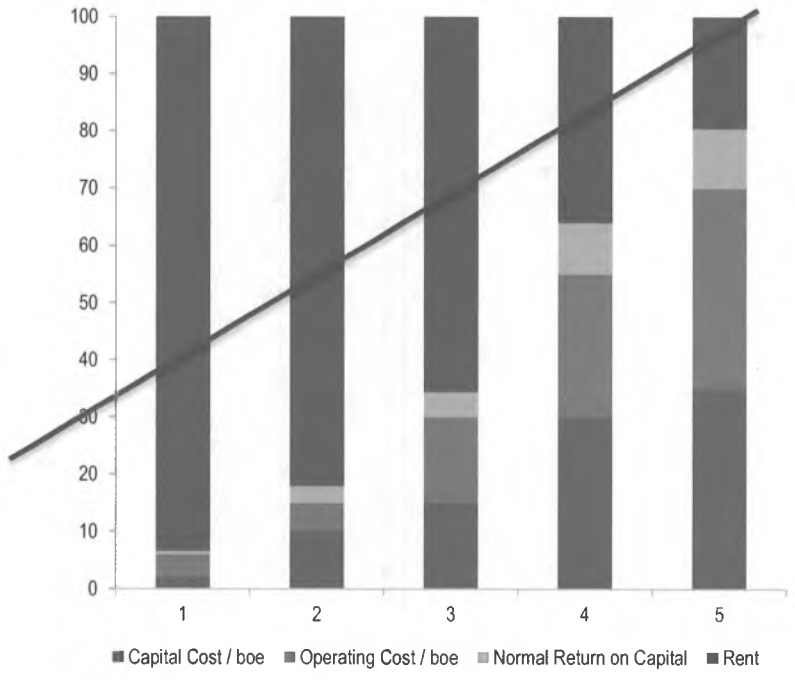
- The fixed royalty is **inefficient** because it distorts investment, making previously marginal projects uneconomic at a given price
- It is highly **regressive** with regard to both price and cost, because Relative Government Take falls as prices rise, and as costs fall
- This also increases **sovereign risk** – since when prices rise, governments will be tempted to set a new rate, even though investments have been made on the basis of the current one
- It has only one major strength – it is very **simple to administer**, requiring knowledge of only 2 variables - production and price



PFC Energy

Efficiency: Targeting Economic Rent

- What we would like to do instead is to tax the red bars – the Economic Rent – directly
- That way, we could *pluck more feathers*, with less *hissing*
- What are the different ways, over time, that governments have attempted to do this?



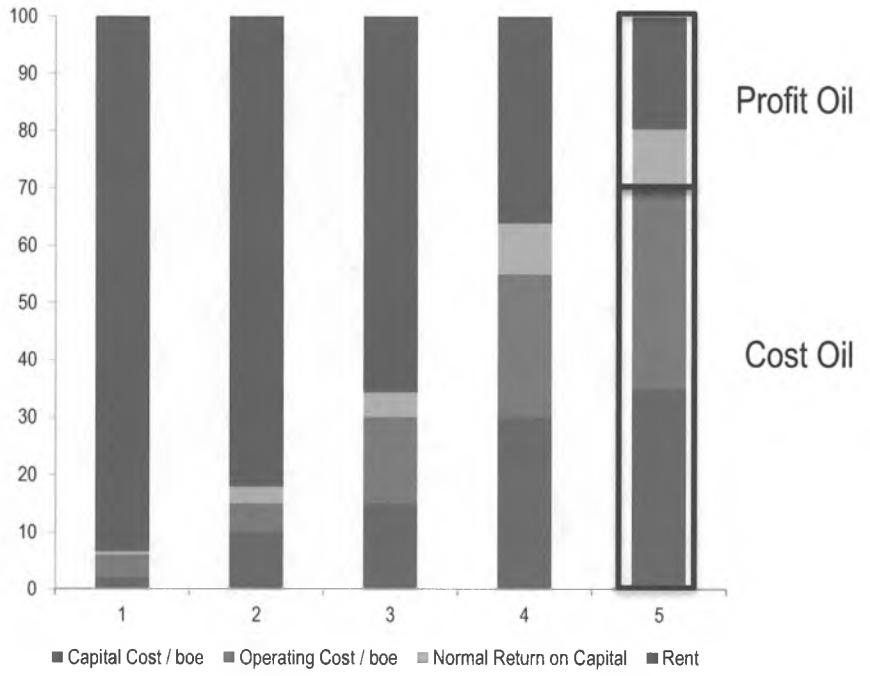
PFC Energy

A Brief History of Production Sharing Contracts

- ACES is in many ways a reflection of a recent trend we have seen in tax/royalty regimes around the world that have endeavored to capture a greater share of rent, by replicating many aspects of the economics of a Production Sharing Contract system (PSC). What is a PSC, and how did these evolve?
- Until the 1960s and 1970s, the global oil industry was dominated by tax/royalty type "concessions" for oil and gas production
- These were very simple to administer, and made sense so long as prices were reasonably low, and reasonably stable, and oil was easy to produce
- In many cases, relatively generous terms for oil companies reflected the colonial-era world in which the concessions had been set
- Rising nationalism in oil producing countries saw the first moves away from this system
  - OPEC formed in 1960
  - Indonesia introduced first "Contracts of Work" in mid 1960s, with terminology and mechanics very similar to later PSCs
- The 1973 Arab Oil Embargo sent oil prices from $3 to $12/bbl, dramatically eroding government take under tax/royalty systems, as International Oil Company profits surged
- Resulted in the widespread rescission of existing concessions in major oil producing nations, and introduction of Production Sharing Contracts

Structure of a Simple PSC

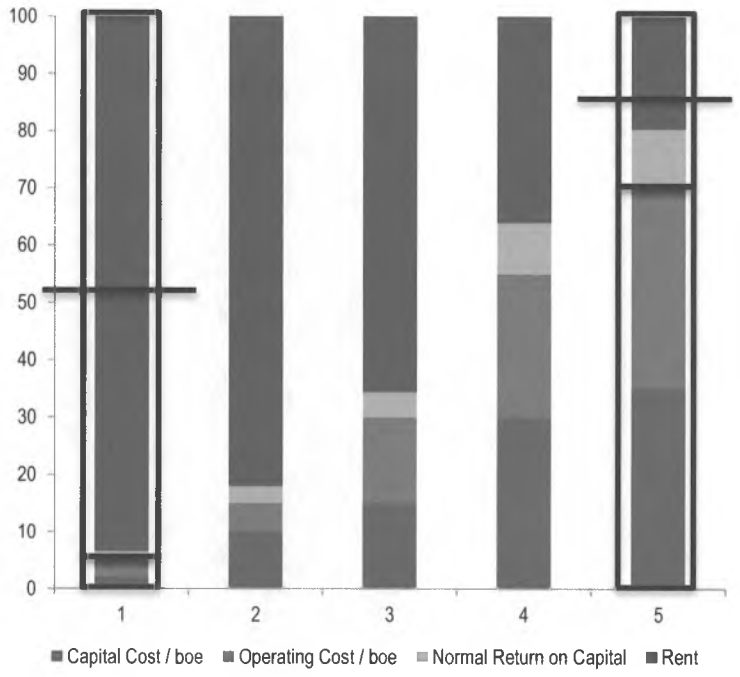
- Core to the PSC concept is the differentiation between "Cost Oil" and "Profit Oil"
- Cost Oil represents barrels of production required to recover (undiscounted) operating and capital costs
  - Under a PSC, an International Oil Company (IOC) is generally entitled to all available barrels required to recover costs
  - This would make Government Take backloaded, since governments could only receive barrels after IOC costs have been fully recovered
  - Governments that wish to front-load their payments often place a limit on the percentage of barrels in any given year than can be used for cost recovery
- The remainder of production (net of royalties, etc) is deemed Profit Oil
  - Profit Oil is split between the government and the IOC



PFC Energy

Malaysia-Thailand Joint-Development Area: A Very Simple PSC

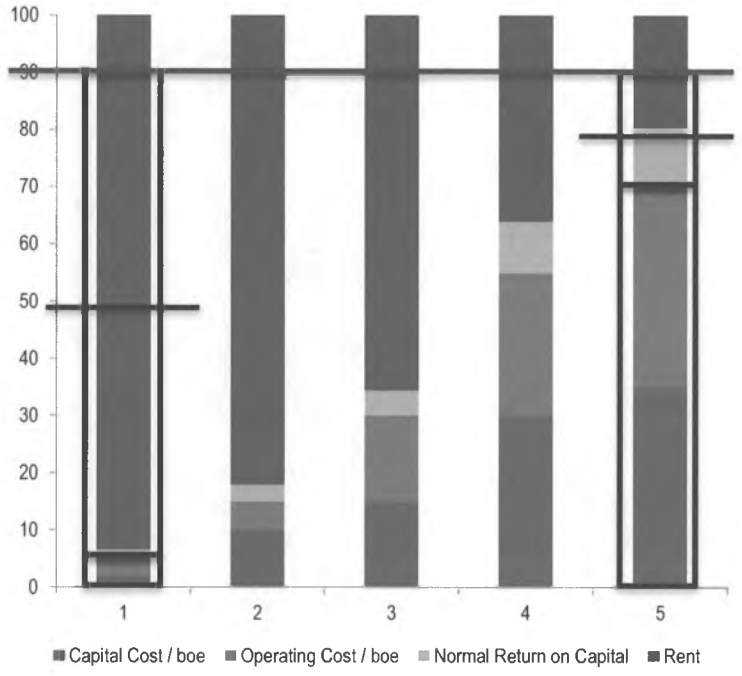
- The Malaysia Thailand Joint Development Area (MTJDA) has one of the simplest PSC structures anywhere
  - Cost Oil Limit: 50% of available gross revenues in any year
  - Profit Oil Split: 50% to IOC contractors, 50% to MTJDA Authority
  - 20% Corporate Income Tax (reduced in early years of production)
- Unlike the Royalty system we looked at, this is not regressive with regard to either price or cost – it is neutral with regard to both
  - If we simplify and ignore the impact of Corporate Income Tax, we can see that regardless of cost or price levels, Government Take will always be 50%
- Because it includes the normal return on capital in the "tax" base, it is regressive with regard to economic rent
  - Higher cost projects have a higher normal return on capital, and so the 50% split captures a higher share of the rent



PFC Energy

Many PSC-type regimes include progressive and regressive elements

- Many such systems (including PSC-replicating tax royalty systems) incorporate regressive elements like fixed-percentage royalties
  - Without progressive elements to counter these, these will no longer achieve the neutral Relative Government Take
  - In this example with a 10% royalty, Relative Government Take is higher in the high cost case, or in low price environments
- Some regimes, therefore add progressivity to their profit-focused components to compensate for regressive elements of the regime, to achieve a more neutral outcome
- Often, however, application of progressivity has been taken further, to focus on limiting the share of rent received by IOCs in high price environments, and maximizing Relative Government Take in these cases



PFC Energy

Progressivity may be focused on any of a range of metrics

- Tomorrow we will look at how progressivity works in a number of different regimes, both tax/royalties and PSCs around the world
- We will see that progressivity in different regimes is focused on a range of different metrics, including
  - Production levels
  - Price levels
  - Extent of cost recovery (ie, "R-Factor")
  - Rates of return (ie IRR)
- We will talk about what these may mean from an efficiency standpoint, but also what they may mean from a competitiveness standpoint – and why these may be quite different
- We will examine progressivity under ACES, including
  - How progressivity affects "upside" for oil companies, and what that means for project value, and thus ability to attract capital
  - What Government Take would look like (state and total, absolute and relative) under ACES in a range of different modification scenarios

Appendix: Additional Slides on Integrated v Non Integrated Oil Companies

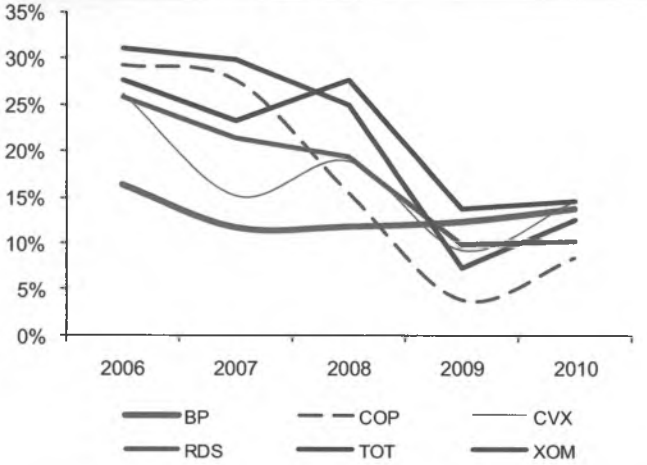
PFC Energy

Issue: Integration, Project Economics, and Decision Making

Arguments For Integration

- Superior market/financial management over commodity cycle
  - Counter: Collapse in Downstream profitability has seen a rise in successful "pure play" refining companies
- Integration is important for molecule management; ensures sophisticated refining capacity is in place for particular crudes
  - Counter: Independent IOCs are not hitting roadblocks in this regard; independent refiners are responsive to requirements.

Downstream ROCE – Selected Integrated IOCs (3-year roll)



- Integration is relevant for specific oil developments (e.g., Canadian oil sands, Venezuela heavy, high wax or acid content)
- Integration is a technical differentiator amongst IOCs => enhance ability to secure projects
  - Counter: The ability to build a refinery—which few IOCs have actually done recently—has little in common with the ability to execute efficiently on complicated upstream projects
- Integration allows participation in the Downstream Non-OECD growth story
  - Counter: The rapid petroleum product demand growth regions (China, Middle East, India) are dominated by NOCs or quasi-NOCs; choose partners based on what they bring to the table

PFC Energy

Issue: Integration, Project Economics, and Decision Making

Arguments Against Integration

- Capital markets value integrated IOCs below the sum of their parts
  - Counter: Expensive to split a company => if there is any identifiable value, should remain integrated (e.g., refining-petchems)
- Strategic focus: In many integrated companies, the Downstream sector is neglected strategically at the expense of Upstream positioning and growth—particularly in the current climate of narrow refining margins and sustained, high oil prices.
  - Counter: Unless the integrated IOC is certain that refining margins and economics will never recover, there is merit to retaining this mechanism for optimal capital allocation between sectors
- Materiality: There are few materially, physically integrated IOCs remaining
  - ExxonMobil and TOTAL have pursued integration between refining and petrochemicals, and there are strong arguments to continue this form of integration
  - Statoil, Eni, and Repsol are integrated on the basis of past roles as quasi-NOCs, and would likely face considerable government opposition to de-integration
- The world has evolved: more flexible and liquid trading markets and improved market & industry regulation have eroded whatever market management or cross subsidization benefits integrated IOCs derived from Downstream presence/dominance over the first 70+ years of their existence.

2/21/12 PRESENTATION: ANALYSIS OF ROYALTY MODIFICATION BY DNR

<TARGET><BILL></BILL><SUBJECT>2-21-12 PRESENTATION ANALYSIS OF ROYALTY MODIFICATION BY DNR</SUBJECT><COMM>SRES27</COMM></TARGET>

Senator G
Deputy Comm Tangeman

Senate Resources Committee
Joe Paskvan, Co-Chair
February 21, 2012

Let's call the meeting to order.

Let the record reflect that it is _____ p.m. on Tuesday, February 21.

Let the record reflect that there is a quorum. Present are

- Co-Chair Wagoner
- Senator Stedman
- Senator Stevens
- Senator Wielechowski
- Senator French
- Senator McGuire
- And myself, Senator Paskvan

Today, the Senate Resources Committee has several items on the agenda:

1. First, from 3:30pm to approximately 5pm, we will have a discussion about ROYALTY MODIFICATION, FOCUSING ON THE ECONOMIC ANALYSIS, with the Department of Natural Resource's Division of Oil and Gas.

Director Bill Barron

2. Beginning at approximately 4:55pm, Senator Wagoner will then chair a hearing on a few pieces of legislation. We need to start the bill hearing at this precise time so that Johanna Bales can offer testimony here before a 5pm Budget Subcommittee hearing in another room.

Welcome back, Mr. Barrron. I understand that Commissioner Sullivan is on the teleconference and will offer the Committee some opening remarks.

Please introduce yourselves for the public record and then begin your testimony.

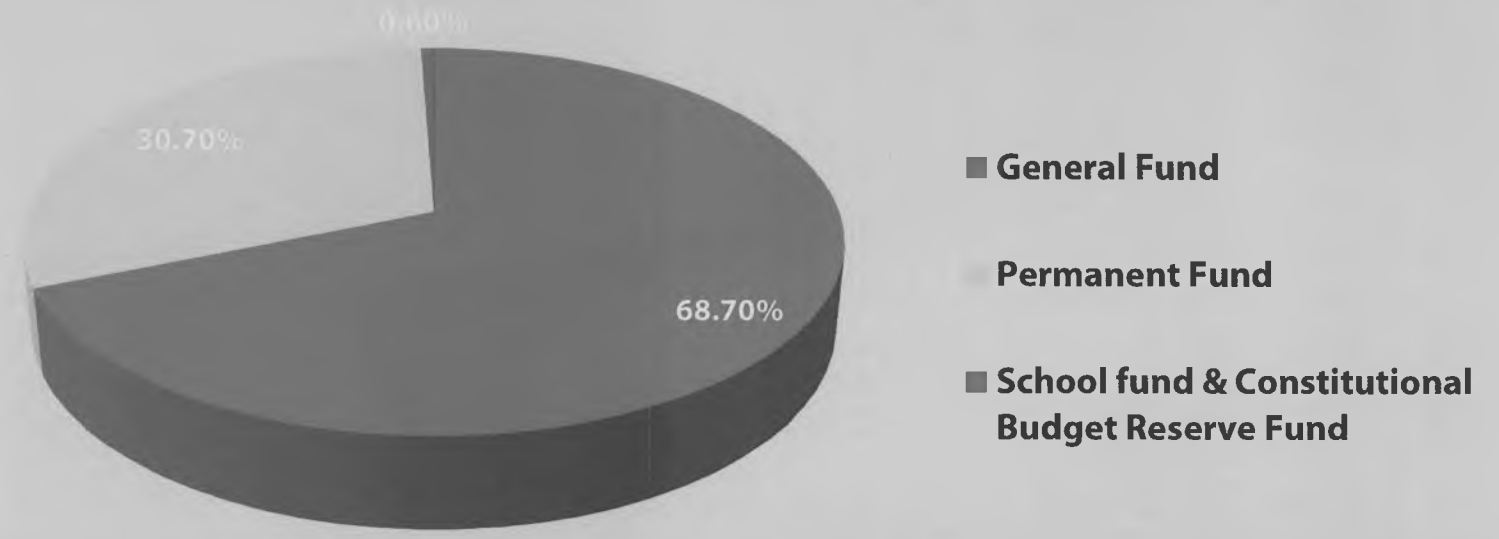
Senate Resources Committee
21 February 2012

William C. Barron
Director
Division of Oil and Gas

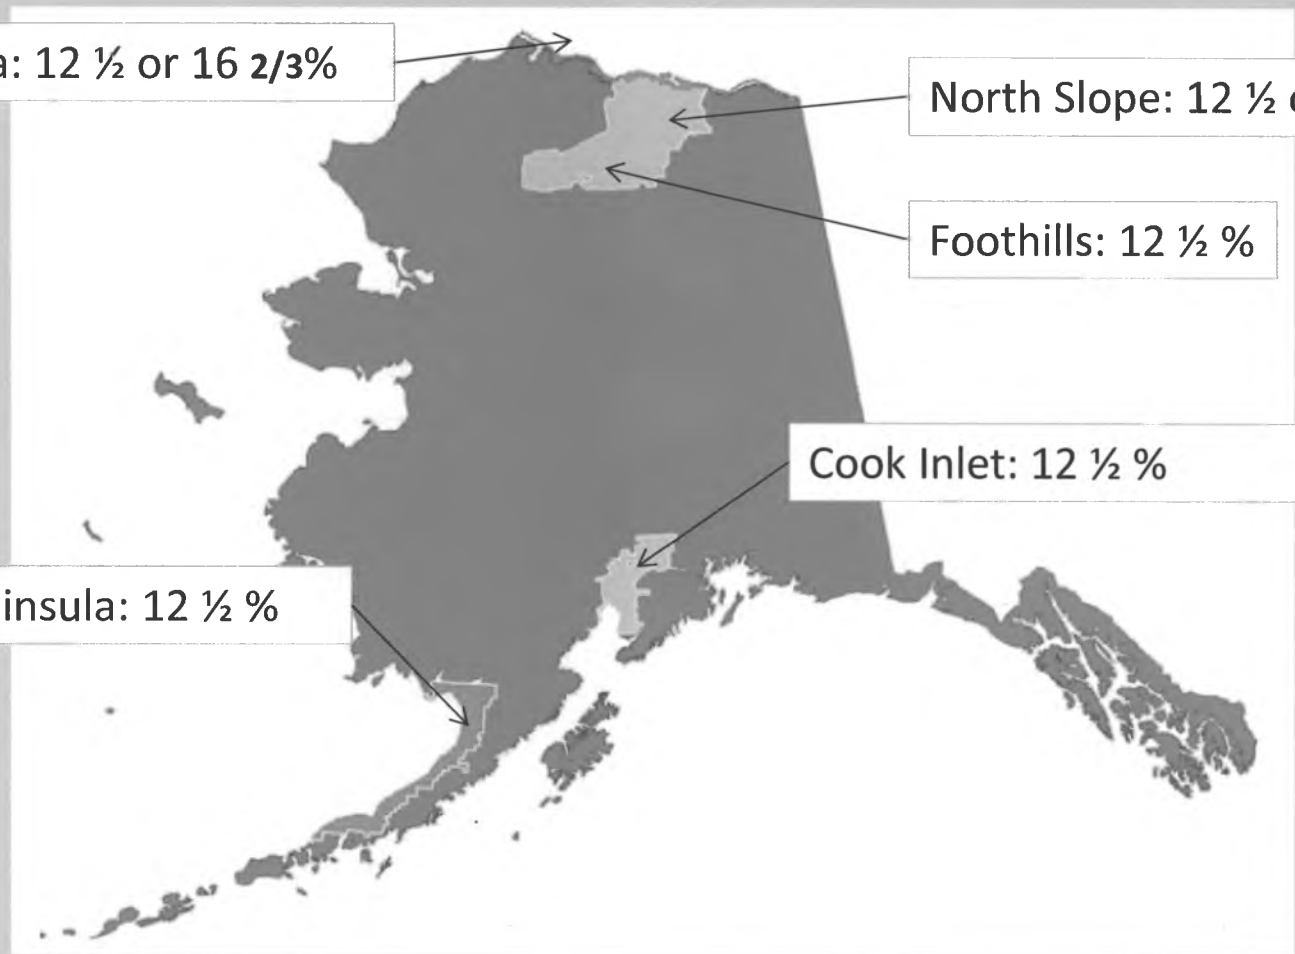
What is Royalty?
How is it distributed?

ROYALTY: THE STATE'S SHARE of the product or profit reserved by the owner of land for permitting another to develop his land for oil or gas

FY 2012 (through January) Royalty Revenue Distribution



Unmodified Royalty Rates by Region



History of Royalty Modification:
Legislative Action

- Royalty modification statute is a long-standing statute
  - An exchange for pool or field development
    - Legislatively-created mechanism to increase field and pool production
- Recent amendments in 1995 (HB 207) & 2003 (HB 28)
  - 1995 amendment (House Bill 207):
    - Lowered state oil royalties to encourage production and raise them when economic conditions warranted it
      - Allows DNR to analyze three prongs of any decision about the economics of an oil field: 1) costs of development, 2) the volume of oil in the field, and 3) the price of oil in making royalty reduction.
    - Added "new fields and pools"
      - As the industry starts to go out into new frontiers, we are looking at developing smaller and smaller fields. (Commissioner Shivley)
  - 2003 amendments (House Bill 28):
    - Intended to modify the 1995 law
      - Spur development of uneconomical fields by setting forth a more understandable and workable modification process
      - Protecting the public's interest and maintain public's input
    - Push to get Liberty and Badami online

History of Royalty Modification:
Circumstances Surrounding Amendments

- What was the product price at that time?
  - 1995 ~ $15-18/barrel
  - 2003 ~ $25-30/barrel
- What was going on in industry?
  - 1995:
    - Milne Point shut-in
    - Continued low oil prices
    - Only 1 new unit on North Slope since 1981 (North Star)
    - World-wide production declining due to industry consolidations and automobile efficiency and other Clean Air Act standards
  - 2003:
    - TAPS throughput dips below 1 million BOPD
    - Beginning of four year surge in North Slope unit approvals in 2001
    - Oil prices begin first climb since the 1980s moving above $30/barrel
    - Virtually no use of royalty modification by industry in last 7 years

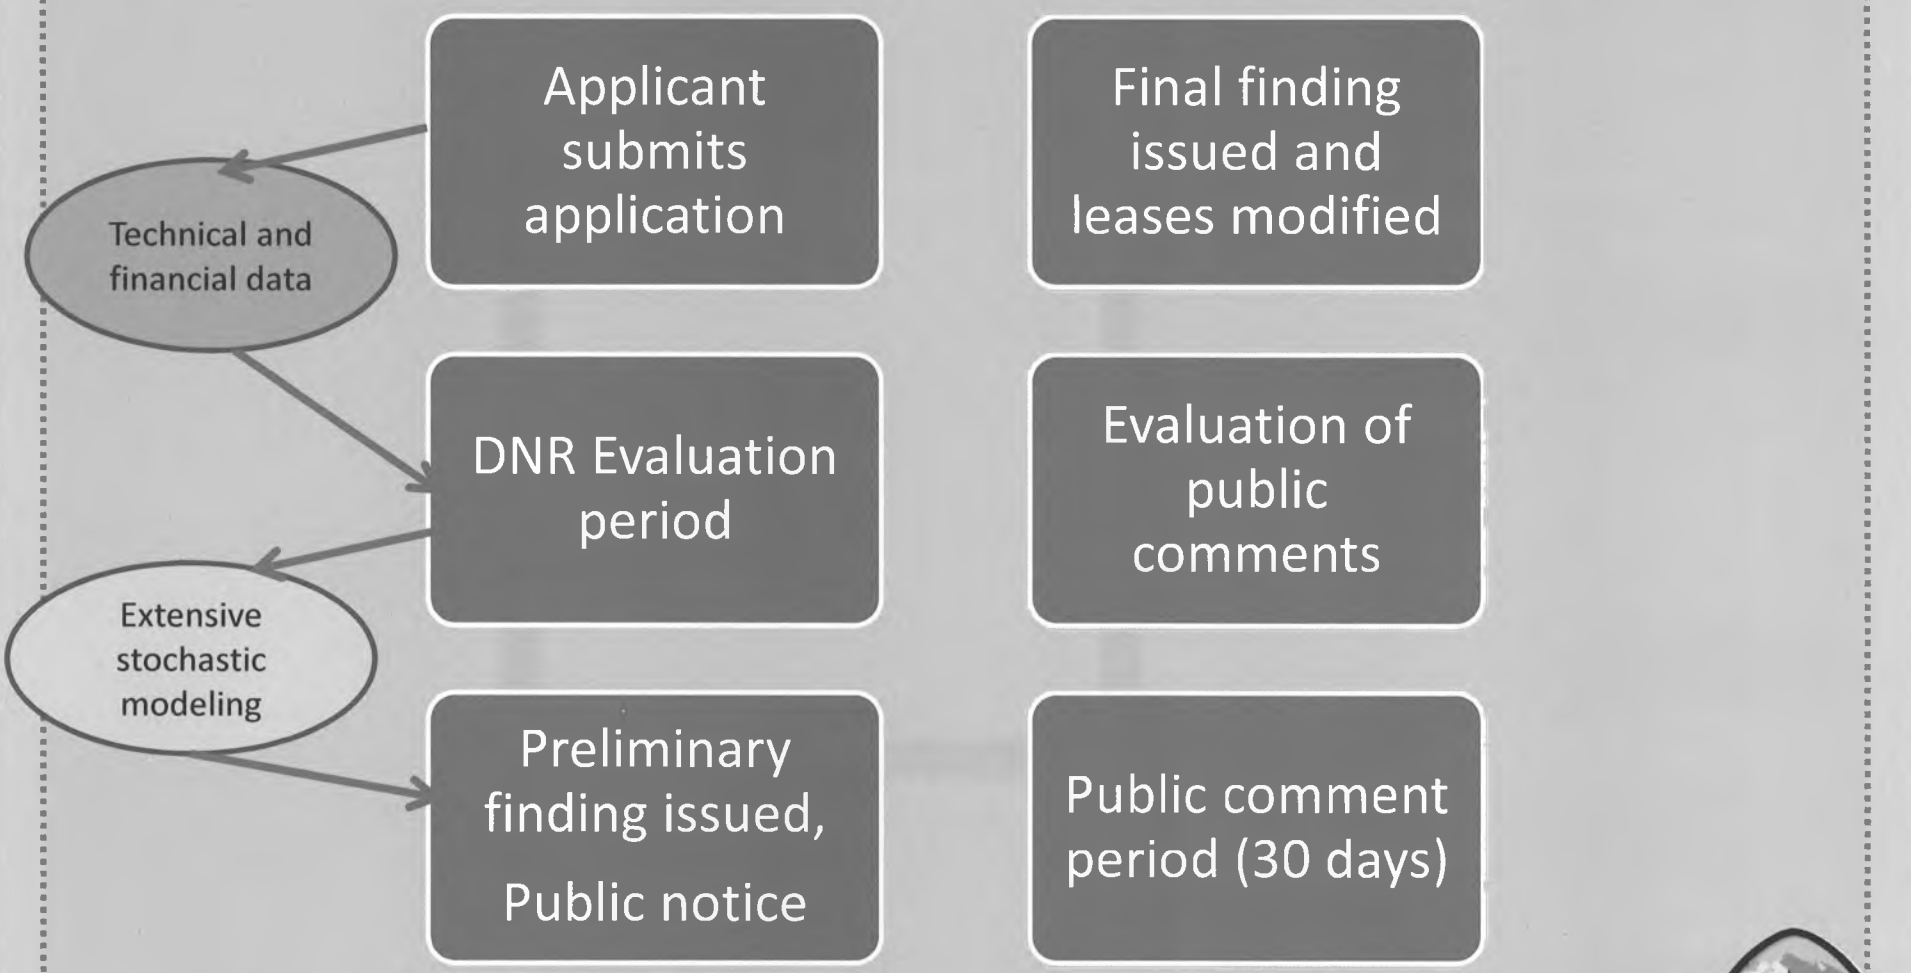
Royalty Modification
AS 38.05.180(j)

- Allows commissioner to modify royalty to allow for production from a field or pool under three conditions/scenarios:
  - Not in production
    - Field or pool must be sufficiently delineated
    - Field that would not otherwise be economically feasible
    - Royalty shall never be lower than 5%
  - Prolong economic life
    - As costs increase or price decreases… to make future production uneconomic
    - Royalty shall never be lower than 3%
  - Re-establish production
    - Royalty shall never be lower than 3%

Royalty Modification
AS 38.05.180(j)

- Commissioner may not approve unless he determines that lessee makes a clear and convincing showing that relief is in the best interest of the state
  - Without royalty modification, oil or gas production from the field or pool would probably not proceed i.e. shutin
  - Royalty modification is applied only to the point where investor is inclined to develop
- DNR may hire an independent contractor at the applicant's expense, for up to $150,000 per application
  - Selected by lessee from contractor list provided by DNR
- Relief mechanism must adjust percentage based on a change in the price of oil or gas and may also be based on other relevant factors such as a change in production rate, projected ultimate recovery, development costs, and operating costs. AS 38.05.180(j)(1)(A)(3)

Application Review Process Map



Decision Parameters

Royalty modification is provided if it can be demonstrated that the project is uneconomic without royalty relief.

Calculations:

Use Expected Monetary Value (EMV) to determine project economics

Monte carlo

Key Parameters :

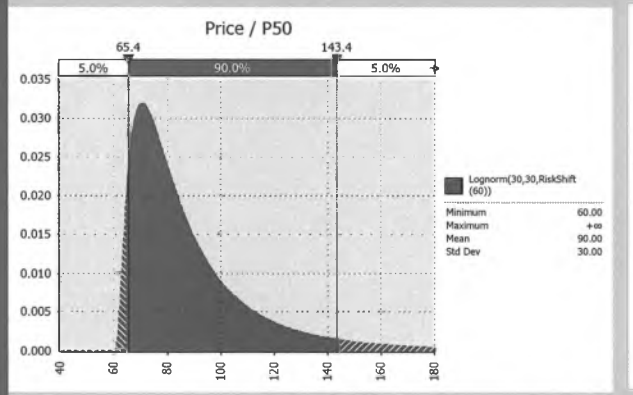
- Price of oil
- Potential reserves and production rates
- Capital Expenditures (CAPEX)
- Operating Expenditures (OPEX)

There is uncertainty associated with key parameters

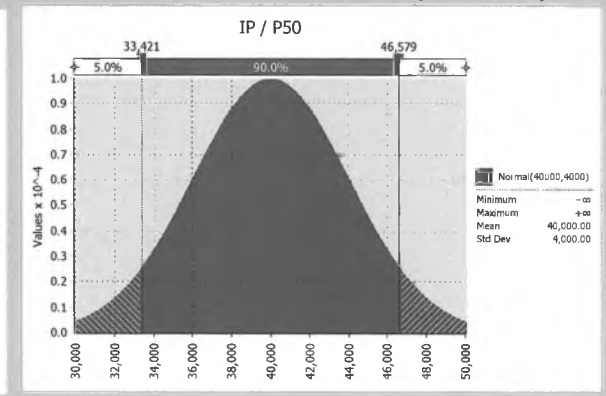
Modeling Uncertainty - Stylized Example

Input Distributions

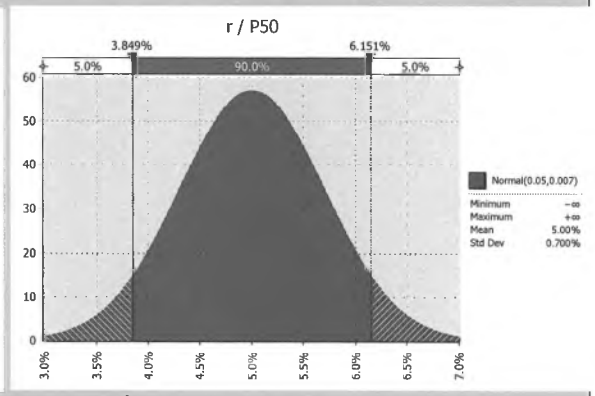
Price ($/bbl)



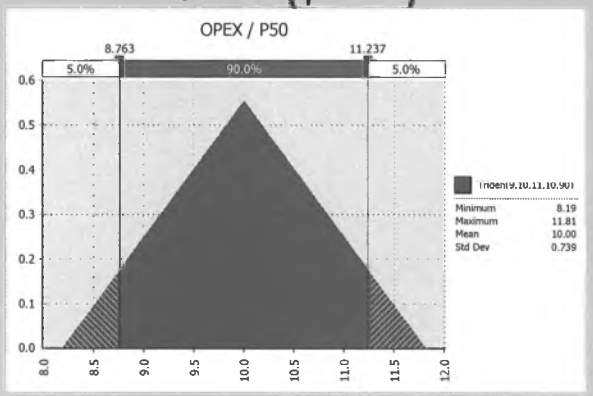
Initial Production (BOPD)



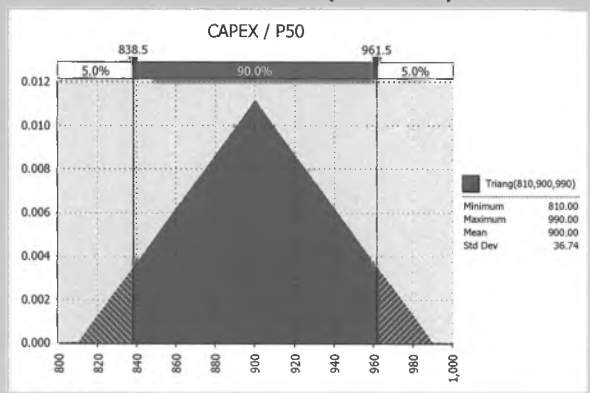
Production Decline (%)



OPEX ($MM)

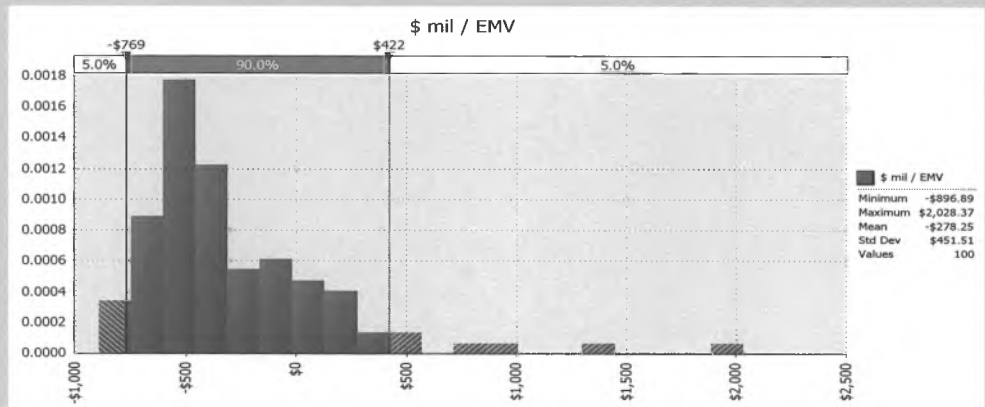


CAPEX ($MM)



Output Distribution

EMV ($MM)



Royalty Modification Applications

- February 1995 BP application for Milne Point
  - Application explicitly made only to comply with BP's contract with OXY
- 1997 Unocal application for 10 platforms in Cook Inlet
  - Unocal did not continue to pursue application
- 1999 Phillips application for Tyonek Deep in Cook Inlet
  - Phillips withdrew the application

2006 Nikaitchuq.

Royalty Modification Applications

- 2005 Pioneer Natural Resources application for leases in and near the Oooguruk Unit
  - Approval effective February 2, 2006
  - Royalty is reduced from 12.5% or 16.66667% to 5% on all production from the delineated reservoirs from the subject leases until NPSL payout.
  - Beginning on NPSL payout, royalty rates step-up to original royalty rates in four annual steps.
- 2006 Kerr-McGee application for leases in the Nikaitchuq and Tuvaaq units
  - Denied October 31, 2006
- 2007 Chevron application for leases in the Ivan River and Stump Lake units
  - Chevron withdrew the application

Kenai area

Royalty Modification Applications

- 2007 ENI application for leases in the Nikaitchuq Unit
  - Approval effective January 30, 2008
  - Royalty modification can be triggered by either of two mechanisms.
  - Low price trigger: for 25 years after first commercial production, if ANS WC inflation adjusted price falls below $42.64, royalty is modified to 5% on production from all subject leases from the reservoirs delineated in the application.
  - Low production trigger: between 18 months and 120 months after first commercial production, if production from all subject leases averages below 4,000 BOPD, royalty is modified to 5% no matter what oil prices are.

Summary

- Royalty modification is given in exchange for pool or field development
- Application must be for a pool/field – not projects
- Allows for production in new, shut-in, and existing fields/pools demonstrated to be economically unfeasible without royalty relief
- DNR uses Expected Monetary Value (EMV) to determine project economics
- Only 2 royalty modifications granted (Oooguruk and Nikaitchuq Units) 6 applications since 1996.
- Nikaitchuq royalty relief has never been realized – essentially serves as oil price insurance

Please answer the questions below, which were submitted to Commissioner Sullivan on 1/26:

Senator Paskvan is interested in learning more about DNR's economic analysis that is included in the Final Findings and Determination of the Commissioner of the Department of Natural Resources, regarding the Nikaitchuq Development Royalty Modification Application (see p. 19 – 20), which says, in part:

> *The DNR has determined that under the PPT and over the life of the project, KMG would pay, on a discounted basis, about $120 million less in taxes than under the previous fiscal regime. The high capital expenditures for the Nikaitchuq project serve to offset other statewide income streams and lower the overall tax obligation for the corporation. KMG and its parent, Anadarko Petroleum Corporation, will realize very large profits from Alaska production if oil prices stay at current high levels over the next several years.*
>
> *Simultaneously, high capital expenditures at Nikaitchuq will be taking place, resulting in lower net income statewide, offsetting statewide income dollar for dollar and generating "qualified capex" credits that reduce tax obligations. Additionally, at high prices the progressive element of the PPT will be in effect, further increasing taxes for KMG.*
>
> *Capital investments in Nikaitchuq development offset income and result in a lower net tax liability to KMG. Other impacts PPT will have on this project are shown in Table 1 [attached, p. 20]. From the working interest owner's perspective, the new tax regime improves the NPV, IRR, and the profit to investment ratio for the Nikaitchuq development project. At the same time PPT is improving the economics for the working interest owners, the State of Alaska is giving up a significant amount of tax revenue for this project.*

Some questions about this:

1. Why would Kerr-McGee (KMG) pay less under PPT than the previous fiscal regime (i.e., ELF), when PPT is generally understood to be a tax increase over ELF? If this is true, is it possible, then, that they would pay even less under ACES than PPT?

2. How is "over the life of the project … on a discounted basis" a different analysis than, simply, the nominal and/or effective tax rate?

3. DNR said in the Final Findings above: "The high capital expenditures for the Nikaitchuq project serve to offset other statewide income streams and lower the overall tax obligation for the corporation." Is this statement equally true for other current projects on the North Slope today? Why or why not?

4. In 2006 when oil prices were ~$60 per barrel, DNR found that: "KMG and its parent, Anadarko Petroleum Corporation, will realize very large profits from Alaska production if

oil prices stay at current high levels over the next several years." Is it the case, then, that KMG (or current operator) and its parent are currently realizing "very large profits" in 2012 since oil is, and has been, ~$100 per barrel? Or have other factors materialized over the past few years that reduced their profit (ACES, higher opex, higher capex, for example)?

5. In the Final Findings above, DNR stated: "Simultaneously, high capital expenditures at Nikaitchuq will be taking place, resulting in lower net income statewide, offsetting statewide income dollar for dollar and generating 'qualified capex' credits that reduce tax obligations." How has ACES changed or not changed the accuracy of this analysis since it replaced PPT?

6. DNR said in 2006 that, "From the working interest owner's perspective, the new tax regime improves the NPV, IRR, and the profit to investment ratio for the Nikaitchuq development project." Is the same true for the working interest owners under the current ACES tax regime? That is, does ACES improve the NPV, IRR, and the profit to investment ratio for new project development on the North Slope? Why or why not? How can we know?

7. In 2006, DNR found that: "At the same time PPT is improving the economics for the working interest owners, the State of Alaska is giving up a significant amount of tax revenue for this project." Is this statement still true today with the ACES tax system in effect? That is, if you substitute "ACES" for "PPT" in the sentence above, is it still accurate? Why or why not?

Final Findings and Determination Nikaitchuq Royalty Modification
Economic Analysis, pages 13 – 16
January 11, 2008

1. It is understood that, "The ADNR decision framework is confidential." Please tell the Committee what you can re: "It is designed to replicate the kind of framework used by industry for making prudent oil and gas investment decisions under uncertain conditional involving significant capital outlays and lengthy project lifes."

2. What do you mean by "prudent"? DNR mentions the "prudent-investor standard;" please elaborate on that concept. What does it mean? How is it applied? Ditto for "prudent-investor standards for economic feasibility."

3. How does DNR determine what "is in the best interests of the state" (page 18, #4)?

Sen Paskvan requests detailed, substantive information about the economic analysis.

Final Findings and Determination Nikaitchuq Development Royalty Modification
Economic Analysis, pages 17 – 20
October 30, 2006

1. Please explain Economic Analysis, which begins on page 17, paragraph 1. Why does DNR believe "granting royalty modification should influence the behavior of the applicant" (i.e., what's the rationale)? How do you know if royalty modification influences the behavior of the applicant or not? Please elaborate.

2. What does DNR mean by "forward-looking" companies, "sunk costs," and "project sanctioning decision"? Please describe each.

3. Please describe DNR's "own in-house economic model (DNR Model)." What is it? Who works on it? Is it accurate and effective? What, as specifically as you can describe, are the inputs and outputs? Please talk about the "assumptions and methods currently in use by the U.S. Minerals Management Service (MMS) for the Deep Water Royalty Relief Program (DWRR)."

4. Please discuss the concepts advanced on page 18, re: "a particular view of a projects economics," "40-year time horizon," "various financial metrics for the project including annual and cumulative discounted and undiscounted cash flow, years to payout, NPV, EMV, and IRR on investment, as well as state revenues." Why are these concepts important in evaluating royalty modification applications? What does this analysis tell you? Why is this analysis applied?

5. Please describe the Monte Carlo simulation employed by DNR. What is a Monte Carlo simulation? What are the inputs and outputs? What does it tell you?

6. DNR says, "Calculating risk weighted outcomes is critical to a full analysis of a project." Please describe "risk weighted outcomes" and how they are calculated by DNR. Why are they "critical to the full analysis of a project"?

7. Please describe annual netback price calculations, etc.

I. BACKGROUND

On January 11, 2006, Kerr-McGee Oil & Gas Corporation[1] (KMG) as operator of the Nikaitchuq Unit (NU) and on behalf of itself and ENI Petroleum Exploration Co. Inc. (ENI) submitted an application (Attachment 1) to the commissioner of the State of Alaska Department of Natural Resources (DNR) for royalty modification under AS 38.05.180(j)(1)(A) (Attachment 2). This Findings and Determination responds to the royalty modification application as required under AS 38.05.180(j)(11)(B).

KMG applied for royalty modification on 14 leases that overlie the Schrader Bluff and Sag River pools. They requested that the fixed royalty rate of 12.5 percent on the two Net Profit Share (NPS) leases, ADLs 355021 and 355024, and that the fixed royalty rate of 16.66667 percent on the 12 other leases, ADLs 388580, 388581, 388583, 388582, 390615, 390616, 388571, 388572, 388574, 388575, 388577, and 388578, be reduced to the minimum rate allowed, 5 percent, with the net profit rate to remain at 30 percent on the two NPS leases.

The commissioner published the Preliminary Findings and Determination and gave public notice of a 30-day public comment period that began on September 1, 2006, and closed at 5 p.m. October 2, 2006, with legal advertisements in the Anchorage Daily News, The Fairbanks News-Miner, and The Arctic Sounder (Attachment 7). The commissioner offered to appear before the Legislative Budget and Audit Committee to provide a review of the Findings and Determination, the Confidential Economic Analysis, and the administrative process, but no invitation for this briefing was received. The submitted data will be held confidential under AS 38.05.035(a)(9) at the request of the lessee and the Confidential Economic Analysis and Internal Decision Process will be held confidential under the Deliberative Process Privilege. This Final Findings and Determination is not appealable to the court.

II. SUMMARY OF KMG'S APPLICATION FOR ROYALTY MODIFICATION

A. Lease Summary

KMG applied for royalty modification on 14 leases. Twelve of the leases are committed to units. ADL 355024, an NPS lease, is committed in its entirety to the Kuparuk River Unit (KRU) and in part to the Kuparuk Participating Area (KPA). ADL 355021, also an NPS lease, is committed in its entirety to the Milne Point Unit (MPU) and in part to the MPU-KPA. Four leases are committed in their entirety to the Nikaitchuq Unit (NU), (ADLs 388580, 388581, 388582, 388583), and six are committed in their entirety to the Tuvaaq Unit (TU), (ADLs 388571, 388572, 388574, 388575, 388577, 388578). The remaining two leases, (ADLs 390615 and 390616), are not committed to a unit and remain in their primary term. (Attachment 3)

[1] Kerr-McGee Oil & Gas Corporation was acquired by Anadarko Petroleum Corp. on August 11, 2006, and is now a wholly-owned subsidiary.

DNR issued ADL 355024 effective June 1, 1983, on Competitive Oil and Gas Lease Form No. DMEM-4-83 (NET PROFIT SHARE)(REVISED May 5, 1983) DNR 10-1113, with a primary term of 10 years, 12.5 percent fixed royalty rate, and 30 percent NPS for the state. Effective June 1, 1985, ADL 355024 was committed in part to the KRU and in part to the KRU-KPA. Effective June 16, 1988, ADL 355024 was committed in its entirety to the KRU (Third Expansion of the Kuparuk River Unit).

DNR issued ADL 355021 effective August 1, 1983, on Competitive Oil and Gas Lease Form No. DMEM-4-83 (NET PROFIT SHARE)(REVISED May 5, 1983) DNR 10-1113, with a primary term of 10 years, 12.5 percent fixed royalty rate, and 30 percent NPS for the state. Effective April 27, 1992, ADL 355021 was committed in its entirety to the MPU in the Third Expansion of the MPU. The Northwest Milne #1 well was drilled on ADL 355021 and effective August 5, 1994, the well was certified capable of producing in paying quantities, thereby extending the lease's primary term indefinitely. Effective June 4, 1994, the lease was committed in part to the MPU-KPA.

DNR issued ADLs, 388571, 388572, 388574, 388575, 388577, 388578, 388580, 388581, 388582, and 388583 on state lease form DOG 9609(REV 6/97), effective January 1, 1998, with a seven-year primary term and a 16.66667 percent royalty rate. Effective April 30, 2004, ADLs 388580, 388581, 388582, and 388583 were committed in their entirety to the NU, and effective August 21, 2004, ADLs 388571, 388572, 388574, 388575, 388577, and 388578 were committed in their entirety to the Tuvaaq Unit extending the leases' terms beyond the primary term.

DNR issued ADLs 390615 and 390616 effective July 1, 2005, on state lease Form No. DOG 200204(REV10/03) with a seven-year primary term and a 16.66667 percent royalty rate.

As a result of assignments of working and royalty interest shares, KMG and ENI have established ownership positions in segments of the two NPS leases, ADLS 355024 and 355021. The royalty modification application is limited solely to the segments of these leases in which KMG and ENI retain working interest ownership (Attachments 1, 3 and 4).

ADL 355024 contains two horizontally differentiated segments, Segment 1 and Segment 2. Segment 1, the southern portion of ADL 355024, is not a part of the royalty modification application and KMG and ENI have no working interest in Segment 1. In Segment 2, commonly referred to as the Kigun portion of the lease, KMG retains a 54.74 percent working interest while ENI retains 44.8 percent. Armstrong Alaska and ExxonMobil each retain less than one percent working interest of Segment 2 only.

ADL 355021 contains three vertically differentiated segments, Segment 1, Segment A, and Segment B. KMG and ENI have no working interest ownership in Segment 1, which comprises the depth of the entire lease from the surface to 7,526 feet true vertical depth (TVD). Segment 1 is not part of the royalty modification application. Segment A,

referred to as Sag River, comprising the depth of the entire lease from 7,526 feet TVD to 9,507 feet TVD is owned by KMG (70 percent working interest owner), and ENI (30 percent working interest owner). Only Segment A of ADL 355021 is included in the royalty modification application. Segment B comprises the balance of the depth of the entire lease, from 9,507 feet to the center of the earth. KMG retains a 35 percent working interest ownership in this segment and ENI holds 15 percent. George Alan Joyce Jr. and Herbaly Exploration LLC hold 5 percent and 45 percent working owner interest respectively. Segment B is not part of the royalty modification application.

KMG and ENI retain 82.00 percent and 18.00 percent, respectively, of the six Tuvaaq leases, ADLs 388571, 388572, 388574, 388575, 388577, 388578. The four Nikaitchuq leases, 388580, 388581, 388582, and 388583, and the two non-unitized leases, ADLs 390615 and 390616, are owned 70 percent by KMG and 30 percent by ENI.

B. Project Development History

In the 2003-2004 and 2004-2005 exploration/appraisal drilling programs KMG/Armstrong encountered accumulations of hydrocarbons in the area of the then proposed NU that included heavy oil and relatively good reservoir rock in the Schrader Bluff Formation and higher-quality oils, but worse reservoir rock in the Sag River Formation. KMG drilled six wells in the Nikaitchuq area in the 2004 and 2005 winter drilling seasons. During the first quarter of 2004, KMG drilled two exploration wells in the NU, the Nikaitchuq #1 and #2 wells to the east of the proposed TU. The Tuvaaq #1 exploration well was also drilled to test the continuity of the Schrader Bluff reservoirs along with examining the potential of deeper horizons. Effective April 30, 2004, the NU was formed and effective August 21, 2004, TU was formed. Each Initial Plan of Exploration for these units was attached and made part of each unit agreement as Exhibit G.

The conclusions regarding the reservoirs and projected performance were derived from studies of the performance from similar reservoirs being developed by offsetting operators, evaluation of multiple exploration/appraisal wells on the Schrader Bluff and Sag River reservoirs drilled in 2004 and 2005, and extensive reservoir and commercial modeling. The confidential analyses of the proposed development were reviewed in meetings with the Division of Oil and Gas (DOG) in August 2005, and DOG held several working sessions with KMG throughout the fall. KMG submitted the Application for Royalty Modification for ADLs 355021, 355024, 388571, 388572, 388574, 388575, 388577, 388578, 388580, 388581, 388582, 388583, 390615, and 390616 on January 11, 2006.

The planned development incorporates the following:

- formation of a new unit possibly comprised of the area currently committed to the Nikaitchuq and Tuvaaq units, surrounding acreage such as ADLs 390615 and 390616, and segments of ADLs 355021 and 355024 in which KMG has a working interest ownership;

- construction of a gravel pad with drilling, gathering, and production facilities on Oliktok Point near the existing ConocoPhillips Alaska Inc. seawater treatment facility;
- construction of a gravel drilling island near Spy Island tied back via a 3.8-mile subsea flow line and utility bundle to Oliktok Point for fluid processing;
- construction of a +/-14 mile pipeline from Oliktok Point to a tie-in near KRU DS-1Y pad for connection to the Kuparuk Transportation common carrier pipeline; and
- consideration of future modifications required to adjust facility configuration to accommodate actual results of well performance.

Development studies indicate that extended reach horizontal producing and injection wells required for pressure maintenance are needed to economically recover the hydrocarbons in place. The planned development would permit a relatively small footprint for centralized facilities and minimal well pads, thereby reducing environmental impacts to the region. Initial drilling will be from a 313,000-square-foot pad to be constructed at Oliktok Point. Existing roads will be used for access. The production facilities will be located on the same pad. A small gravel island is to be constructed shoreward of the barrier islands for future drilling. A subsea bundle containing a three-phase production line and multiple utility lines will be constructed to connect the gravel island to Oliktok Point to transport production to Oliktok Point and provide fuel, secondary recovery fluid, and power to the gravel island.

III. SUMMARY OF ROYALTY MODIFICATION AUTHORITY AS 38.05.180(j)(1)(A), (2), (3), (4)(A), (5)

A. Royalty Modification Requirements

AS 38.05.180(j)(1)(A) authorizes the DNR commissioner to provide for royalty modification on individual leases, leases unitized as described in (p) of this section (AS 38.05.180), leases subject to an agreement described in (s) or (t) of this section (AS 38.05.180), or interests unitized under AS 31.05 to allow for production from an oil or gas field or pool if:

1. the oil or gas field or pool has been sufficiently delineated to the satisfaction of the commissioner;
2. the field or pool has not previously produced oil or gas for sale; and
3. oil or gas production from the field or pool would not otherwise be economically feasible.

Under AS 38.05.180(j)(2), the commissioner may not grant a royalty modification unless the lessee or lessees requesting the royalty modification make a clear and convincing showing that a royalty modification meets the requirements of AS 38.05.180(j) and is in the best interests of the state.

B. Royalty Modification Terms

Under AS 38.05.180(j)(3) the royalty modification terms must provide for an increase or decrease or other modification of the state's royalty share by a sliding scale royalty or other mechanism that shall be based on a change in the price of oil or gas and may also be based on other relevant factors such as a change in production rate, projected ultimate recovery, development costs, and operating costs.

Under AS 38.05.180(j)(4)(A) a royalty modification may not be granted for the field or pool if the royalty modification would result in a royalty rate of less than 5 percent in amount or value of the production removed or sold from a lease or leases covering the field or pool.

Under AS 38.05.180(j)(5) a royalty reduction must include an explicit condition that the royalty reduction is not assignable without the prior written approval, which may not be unreasonably withheld, by the commissioner. The commissioner shall, in the preliminary and final findings and determinations, set out the conditions under which the royalty reduction may be assigned and may not grant a royalty reduction without an explicit condition that the royalty reduction is not transferable.

IV. DISCUSSION OF ROYALTY MODIFICATION REQUIREMENTS

A. Leases Are Eligible For Consideration

The leases meet the requirements for consideration. Six of the leases proposed for royalty modification are committed in entirety to the TU, four to the NU, one to the MPU, one to the KRU, and two are non-unitized leases. AS 38.05.180(j)(1) allows modification of royalty for individual leases and unitized leases.

B. Reservoir Description and Delineation

1. Introduction To Reservoir Description

The commissioner may grant royalty modification to allow for production from an oil or gas field or pool if the oil or gas field or pool has been sufficiently delineated to the satisfaction of the commissioner. For purposes of this decision, the KMG Nikaitchuq #1 is considered the type well for both the Schrader Bluff and Sag River pools. Nikaitchuq #1, completed April 1, 2004, was the first well drilled within the NU and proved potential in both the Sag River and Schrader Bluff formations. The Schrader Bluff pool encompasses both the N and OA Sands and is defined in Nikaitchuq #1 as the interval between 4,865 feet measured depth (MD) (3,999 feet subsea TVD) and 5,096 feet MD (4,174 feet subsea TVD). The Sag River pool is defined in Nikaitchuq #1 as the interval between 10,359 feet MD (8,631 feet subsea TVD) and 10,738 feet MD (9,039 feet subsea TVD).

The Nikaitchuq area for which royalty relief is sought lies offshore in the Beaufort Sea in the vicinity of Spy Island, approximately three miles north of Oliktok Point. The Nikaitchuq area is north of and contiguous with the northern edges of the KRU and MPU.

The MPU field lies to the south-southeast of the proposed unit and produces oil from the Schrader Bluff, Kuparuk, and Sag River formations.

2. Early Exploration History of the Area

Two early key exploration wells lie within several miles of the Nikaitchuq development area. The Unocal East Harrison Bay State #1 well lies near the northwest corner of the KRU, to the southwest of the NU. The well was drilled in February 1977 to a measured depth of 9,809 feet, bottoming in argillite basement. The East Harrison Bay State #1 well logs appear to contain about 15 feet of oil-bearing Kuparuk sandstone that appears cemented in the upper half. The Jurassic section looks silty on logs. The ARCO Kalubik 3 well, drilled in February 1998, lies to the south-southwest of the Nikaitchuq area. The well bottomed in the Jurassic at a measured depth of 7,000 feet. The well encountered a 40-foot-thick MD interval of Kuparuk C sandstone that appears on electric logs as oil-bearing, but siderite cemented in the upper 10 feet of the interval. On well logs the Jurassic interval appears silty with a 12-foot silty sand developed around 6,565 feet MD. The well was plugged and abandoned on March 6, 1998.

3. Drilling History

The first major exploration activity in the area in the early 1970s targeted the Ivishak Formation following the discovery of the prolific Ivishak Formation in Prudhoe Bay State #1 in 1967. The Hamilton Brothers Milne Point #18-1 was one of the early wells drilled on the Milne Point structure in 1970 in search of Ivishak and Lisburne objectives. This well encountered about 50 feet of tight oil-saturated sandstone that was not tested and a section of Kuparuk sandstone that tested at a rate of 875 BOPD. This discovery led to increased industry interest in the Milne Point area and led to exploration and delineation drilling for Kuparuk reserves. In the early 1980s the Sag River was cored in the Conoco Milne Point Unit #C-1 well and contained bleeding oil and gas. The Sag River Sandstone was also cored in the MPU #L-1 well and contained no visible porosity or staining and the Sag River appeared tight on wire line logs.

In the early 1990s about a dozen wells were drilled to the west-southwest of the Nikaitchuq area with Jurassic sandstones and Kuparuk C sandstones as targets. The ARCO Kalubik #1 well encountered approximately 160 feet of productive Nuiqsut and Nechelik sandstone that tested at an unstimulated rate of 336 BOPD. In addition the well penetrated an 85-foot section of Sag River Sandstone with calculated log porosities in the range of 15 to 22 percent. The Thetis Island #1 well also encountered an 80-foot section of porous Sag River sandstone with log-calculated porosities in the range of 16-24 percent. A pay section of Nuiqsut sandstone was also encountered in this well that tested at an average rate of 120 BOPD with a high rate of 650 BOPD. Both the Kalubik #1 well

and Thetis Island #1 well drilled through Brookian sandstones that contained mud log hydrocarbon shows.

In the late 1990s BP drilled several dedicated Sag River Sandstone test wells, including MPU #C-23, #K-33, #E-13A, 3F-33, #F-33A, and #F-73A. Alaska Oil and Gas Conservation Commission (AOGCC) production data indicate that several Milne Point wells have produced oil out of the Sag River Sandstone and two oil producing wells MPU F-33A and K-33, are currently shut-in. MPU #C-23 produced 378,012 barrels of oil between 1996 and 2001. MPU #F-33 produced 314,276 barrels of oil between September 1996 and May 1999 and was subsequently plugged and abandoned. MPU #K-33 has produced approximately 93,241 barrels of oil since 1997. MPU #E-13A produced 366,665 barrels of oil between 1995 and April 2001. MPU #F-33A produced approximately 533,351 barrels of oil since April of 2001. MPU #F-73A produced 13,430 and is now a water alternating gas injection (WAGIN) well. AOGCC reservoir data indicate that the oil commonly recovered from the Sag River sandstone has an API oil gravity of about 37 degrees. Total production from the MPU Sag River Sandstone has been 1,709,268 barrels of oil and 1,754,912 MSCF gas through February 2006.

The original GOR ranged from 784 – 974 SCF/STB. Production from the Sag River pool at MPU has been intermittent with shut-in periods from June 1999 through February 2002 and all of 2006.

4. Certified Wells in the Vicinity

Eight wells southwest of the Nikaitchuq area have been certified by the state as capable of production in paying quantities: the Exxon Thetis Island #1, the Kalubik #1, the Kuukpik #3; and five Colville Delta wells (Texaco Colville #1, #1A, #2, and #3 and the Amerada Hess Corporation Colville 25-13-6). The two closest certified wells to the Nikaitchuq development area are the Exxon Thetis Island #1 and ARCO Kalubik #1. The Pioneer Ivik #1 well, drilled about three miles south of Thetis Island #1 well in 2003, tested 1,300 BOPD in Jurassic sands.

The Exxon Thetis Island #1 well was spud on March 6, 1993, and completed on April 28, 1993. A combined co-mingled drill stem test was conducted in two intervals: 6,356 – 6,364 feet MD in a thin Kuparuk C sandstone and 6,404 – 6,460 feet MD in a Jurassic (probably Nuiqsut) sandstone. During the first 24 hours of the well test the well stabilized on an 18/64" choke at a flow rate of 64 BWPD and 43 BOPD (rate varied between 50-350 BOPD) of 24.8-degree API oil. The well was then treated with acid and flowed for 30 hours. The well flow rate stabilized on an 18/64" choke at an average rate of 154 BOPD in the last four hours of the test (188 BOPD rate the last hour of the test). Exxon also tested a sandstone within the Seabee Formation at 5,576 – 5,633 feet MD that produced mud filtrate with a trace of oil. Exxon applied for Thetis Island Unit Well 1 certification for lease ADL 379301 on May 18, 1994. The Thetis Island well was certified as capable of production in paying quantities on February 24, 1995.

The ARCO Kalubik #1 was spud on March 5, 1992, and completed on May 1, 1992. A drill stem test was conducted on the Kalubik #1 between April 16-19, 1992, on a perforated interval of Kuparuk C sandstone from 6,085 – 6,120 feet MD. The interval was tested for a 24-hour flow period and produced at a rate of 1,200 BOPD with a 450 GOR and 0 percent water cut. Two other intervals were tested in the well. An upper Cretaceous sandstone (5,050 – 5,250 feet MD) recovered 4.5 BO and 146 BW in a 12.5-hour test from which an average oil rate of 10 BOPD was calculated. The Jurassic Nuiqsut sandstone at 6,385-6,445 feet MD was also tested and recovered 280 BO (with a measured API gravity of 23 and a GOR of 232 scf/stb) and no formation water. During the 20-hour test a measured oil rate of 336 BOPD was recorded. ARCO applied for well certification for the Kalubik 1 well on 9/8/1997 and the well was certified by the state for the Kuparuk C sandstone effective January 21, 1998.

Southwest of the Kalubik #1 well the Texaco Colville Delta #1, #2, and #3, and the Amerada Hess Corporation (AHC) Colville #25-13-6 1 wells were certified by the state as capable of production in paying quantities from the Jurassic Nuiqsut sandstone on 10/14/1991. In the Texaco Colville Delta #3 well a test was done on a Torok sandstone (5,120 – 5,183 feet MD) that recovered 841 BO (24-degree API gravity) and diesel, 2 BW, and 508 MCF in 95.75 hours. A Torok test in the Texaco Colville Delta #2 well was wet. The state certified the ARCO Kuukpik #3 well as capable of production in paying quantities for the Kuparuk C and Jurassic Nuiqsut sandstones on April 14, 1993.

5. Brookian Sandstone Potential

Brookian sandstones were deposited during latest Cretaceous and Paleocene time in available accommodation spaces as the Colville Trough was filled with sediment in response to thrust loading from the Brooks Range, a large north vergent fold and thrust belt to the south. Brookian sandstone at 5,050 – 5,250 feet in the Kalubik #1 well tested oil (API gravity not measured) at the rate of 10 BOPD. Brookian sands were also tested in the Thetis Island #1 well at depths of 5,576 – 5,578 feet MD and 5,631 – 5,633 feet MD that produced mud filtrate with a trace of oil.

6. Jurassic Sandstone Potential

Several wells in the Colville Delta area tested Nuiqsut sands: the Texaco Colville Delta #1 well produced at a rate of 1,075 BOPD of 25 API oil; the Texaco Colville Delta #2 well produced at a rate of 409 BOPD with the measured oil gravity varying from 24- to 40-degree API; the Texaco Colville Delta #3 well produced at a rate of 2,170 BOPD of 27.7-degree API oil; and the ARCO Kalubik #1 well produced at a rate of 410 BOPD of 21-degree gravity oil.

7. Sag River Formation Tests

KMG Nikaitchuq #1 (completed April 1, 2004)
Nikaitchuq #1 encountered 41 feet gross and 23 feet net pay in the Schrader Bluff OA sand and 33 feet gross and 17 feet net Sag River B Sand. The Schrader Bluff was not tested.

On April 19, 2004 KMG announced that the Nikaitchuq #1 well "production tested more than 960 BOPD of 38-degree API crude" from the Sag River Sandstone between the depth of 10,408 – 10,472 feet MD (8,679 – 8,741 feet subsea TVD). The Sag River sand was tested for 210 hours, fluids were produced for 150 hours after oil reached surface. Daily rate peaked at 960 BOPD on Day 3 and declined to 760 BOPD at the end of the Day 6. Daily rates were calculated on a 24-hour basis rather than using instantaneous rates as plotted in the operator's report. GOR was 937 SCF/STB during the test. Wellhead pressure (WHP) fluctuated during the test mainly caused by water-loading and gas-slugging. The final WHP ranged between 300 psi to 400 psi and 14 percent water cut. A pressure transient test analysis showed permeability of about 3 – 4 millidarcies and no skin effect (undamaged). The 591-foot test radius of investigation represents about 25 acres, a relatively small portion of the reservoir.

KMG Nikaitchuq #2
The well encountered 30.5 feet gross Sag River sand and 7 feet net Schrader Bluff OA sand. There was no flow test conducted. The well was cored in the Sag River Sandstone and permeability measured 2 millidarcies indicating tight reservoir rock.

KMG Nikaitchuq #3
A 3,000-foot horizontal section was drilled with approximately 1,834 feet of net pay in the Sag River Sandstone. The Sag River was tested using a pump for 81 hours after oil surfaced. The initial rate declined from 1,327 BOPD at Day 1 to 760 BOPD (at 81 hours) of 32-degree API oil. Solution GOR averaged about 230 SCF/STB during the test. Wellhead pressure stabilized at 130 psi and pump intake pressure down hole finished at 1,230 psi prior to shut-in. Water cut ranged from 40-60 percent during the test but the water source was not determined conclusively. Pressure transient analysis indicated 5 millidarcies permeability, no skin damage, and the drainage area bounded by faults. Source of water production hampers the assessment of the formation's productivity.

8. Schrader Bluff Formation Tests

KMG Nikaitchuq #4
Approximately 3,000 feet of gross horizontal Schrader Bluff formation was drilled in this well, with approximately 2,270 feet of net pay, from a 30foot TVD net pay thickness. A two-week production test was performed on the well using an electric submersible pump (ESP) to aid in producing the 16 – 17 API crude. The well tested at rates up to 1,200 barrels of oil per day during periods of the initial test. Permeability estimated from the test were greater than 350 millidarcies and was confirmed from the analysis of the tests conducted on a whole core obtained from the well.

KMG Tuvaaq #1

The well was not tested. It penetrated 30 feet net pay Schrader Bluff OA Sand and 12 feet net Schrader Bluff N sand. There were no cores taken at Tuvaaq. Schrader Bluff N sand was interpreted to be oil filled here and at Kigun #1 appeared unconsolidated with permeability estimated from 100-1000 millidarcies and porosity 25-35 percent.

KMG Kigun #1

The well was not tested. It penetrated 29 feet net pay Schrader Bluff OA sand and 30 feet net N sand. An MDT tool run sampled the Schrader Bluff OA fluids which were 18° API, GOR 59 SCF/STB and viscosity of 82 cp at 87 degree reservoir temperature. (Contamination of the samples with oil-based mud caused concern about the reliability of the sample estimates.) Schrader Bluff OA sand core data indicated 25 percent to 38 percent porosity and up to 1,000 millidarcies permeability in the sandstone intervals.

9. Analog Schrader Bluff Formation Performance

The MPU Schrader Bluff Pool (Figure 1), KRU West Sak pool (Figure 2) and Prudhoe Bay Unit (PBU) Polaris and Orion pools – Figure 3, represent Schrader Bluff Formation analog performance. Each of the pools was developed initially with vertical or slanted completions. More recently a number of horizontal lateral and multi-lateral wells have been completed in each of these pools. MPU and KRU Schrader Bluff wells show a distinct, lower rate performance than the newer developed Polaris and Orion pool wells. The later Schrader Bluff Formation developments are building on earlier techniques by going from vertical to horizontal and multilaterals wells. The horizontal and multilaterals should consistently outperform the older wells because more formation is exposed and the completions are more efficient.

The wells in each Schrader Bluff Formation pool exhibit early flush production for six to 12 months. The PBU Schrader Bluff completions show slightly higher initial rate profiles followed by relatively steep decline. The average MPU Schrader Bluff completion (heavy bright green points and line) declined from 1,200 bopd to 500 bopd at 12 to 40 months. KRU West Sak lateral completions performed similar to MPU Schrader Bluff.

KMG has stated its plan is to develop Nikaitchuq Schrader Bluff Formation with horizontal wells. KMG's prognosis of performance can be compared to the analogs by evaluating average Schrader Bluff well performance from initial completion to date. There is nearly five years of history for the various Schrader Bluff Formation wells. Orion appears to be more productive so far but the long-term performance has not been adequately defined. KMG appears to assume its development will improve on the previous KRU and MPU Schrader Bluff completions by using the latest technology, namely horizontal and or multilateral completions. KMG's cases align reasonably with the MPU Schrader Bluff and KRU West Sak and PBU Polaris average performance. PBU Orion performance is notably better than KMG's high case average rates.

10. Analog Sag River Formation Performance

The Sag River Formation has been developed on a stand alone basis at MPU. Well performance is depicted in Figure 4 for the five MPU Sag River completions. They consistently show initial flush production followed by steep decline within the first year to less than 50 percent of the initial rate. KMG's Sag River tests showed similar initial production rates and comparable if not more pronounced decline. At this time no obvious upside is evident based on analog performance and KMG's test results. Stimulation and perhaps innovative EOR techniques could improve recovery prospects in the Sag River Formation at Nikaitchuq.

11. The Pools Are Sufficiently Delineated

KMG has adequately delineated the Schrader Bluff Formation in the Nikaitchuq area. The company's drilling, testing, and evaluation programs appear to have highlighted the obvious risks and identified the possible upside by extending drilling and completion technology. The Nikaitchuq facility may be standalone and therefore is likely economically challenged more so than the KRU, MPU, and PBU Schrader Bluff developments. These pools had established infrastructures to provide the basis for development.

Sag River Formation has lighter oil than the Schrader Bluff; however, it is plagued with poor quality reservoir rock. The development potential is marginal at best unless there are significant advances in stimulation or EOR technology. Delineation of the Sag River Formation at Nikaitchuq has revealed nothing better than the analog at MPU.

Figure 1. MPU Schrader Bluff Formation lateral performance and average performance (heavy green).

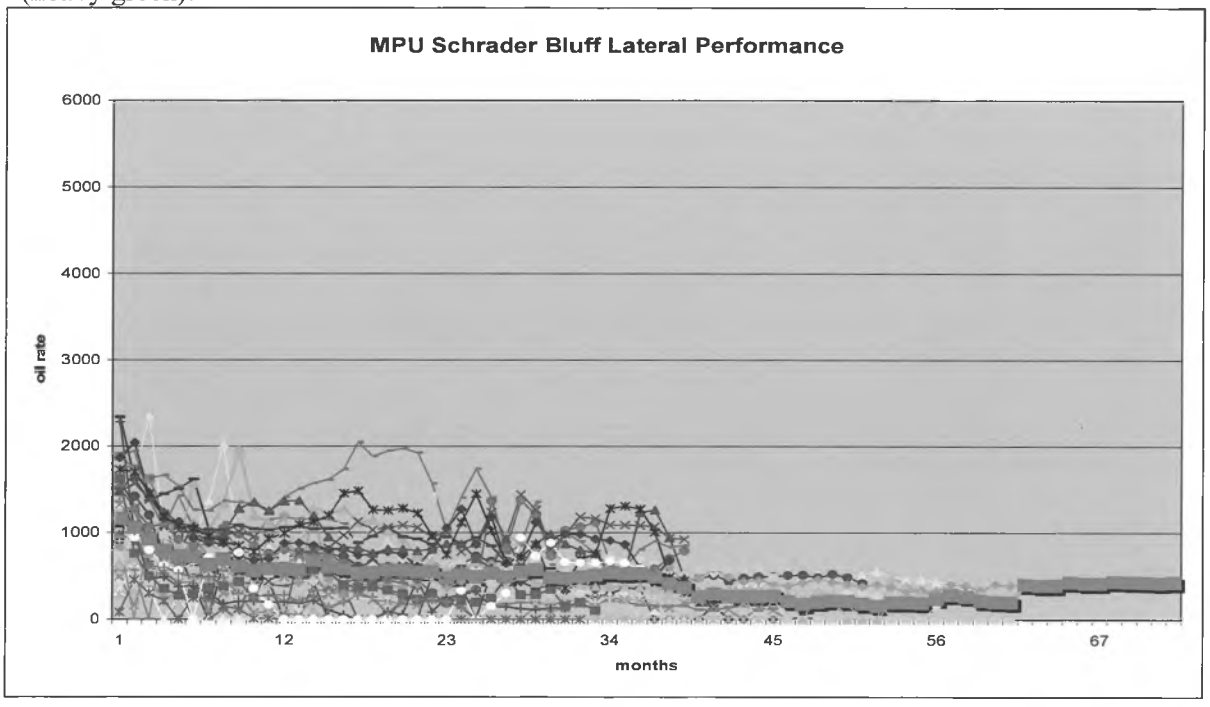

Figure 2. KRU West Sak sands lateral performance and average performance (heavy orange).

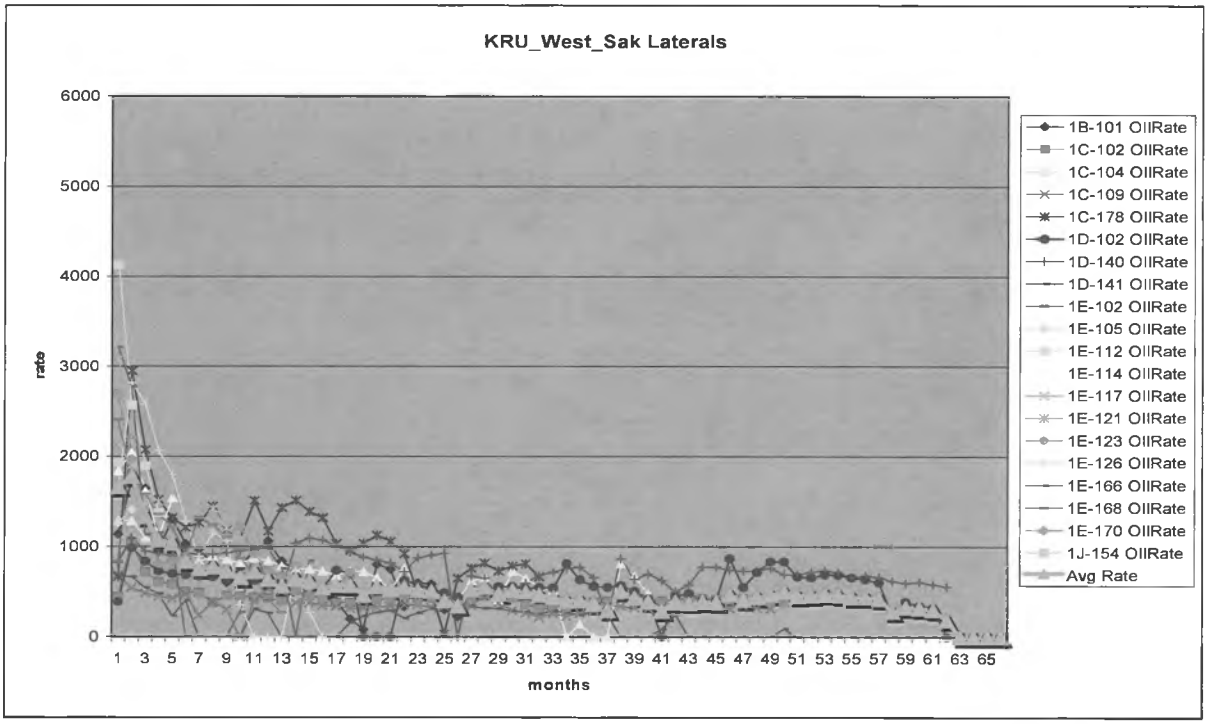

Figure 3. PBU Polaris and Orion Schrader Bluff Formation initial performance.

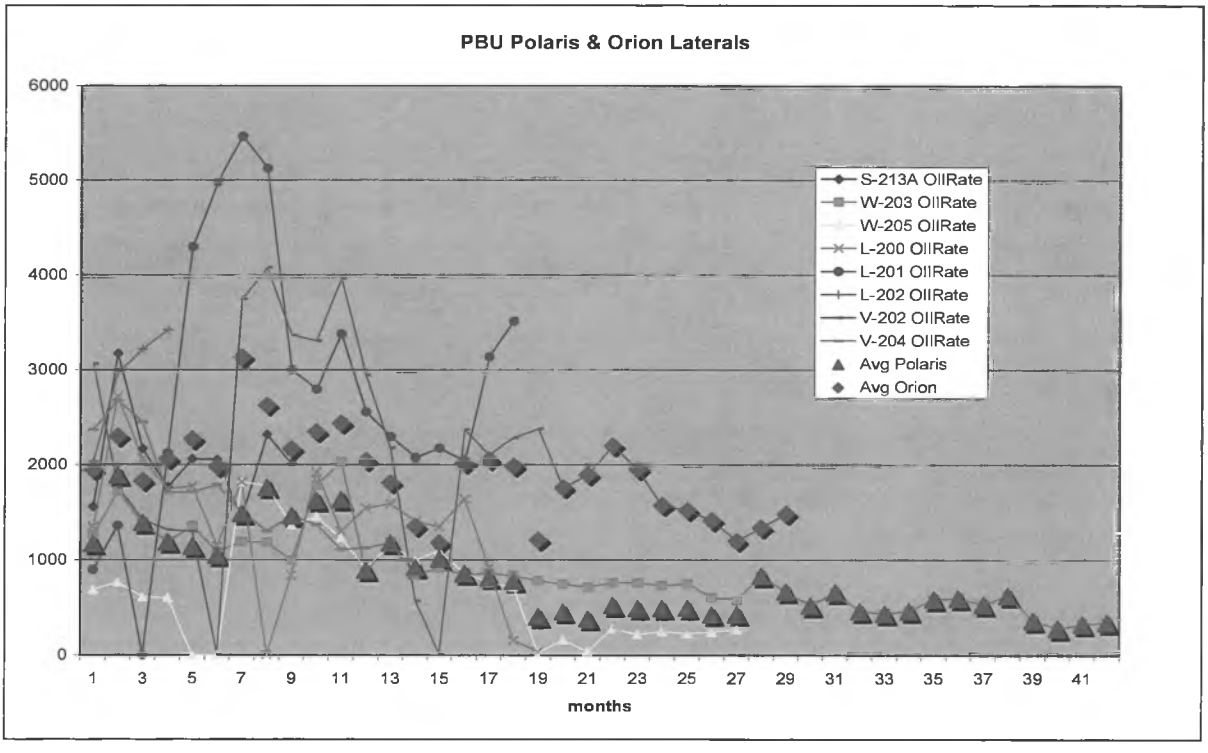

Figure 4. MPU Sag River Formation initial well performance.

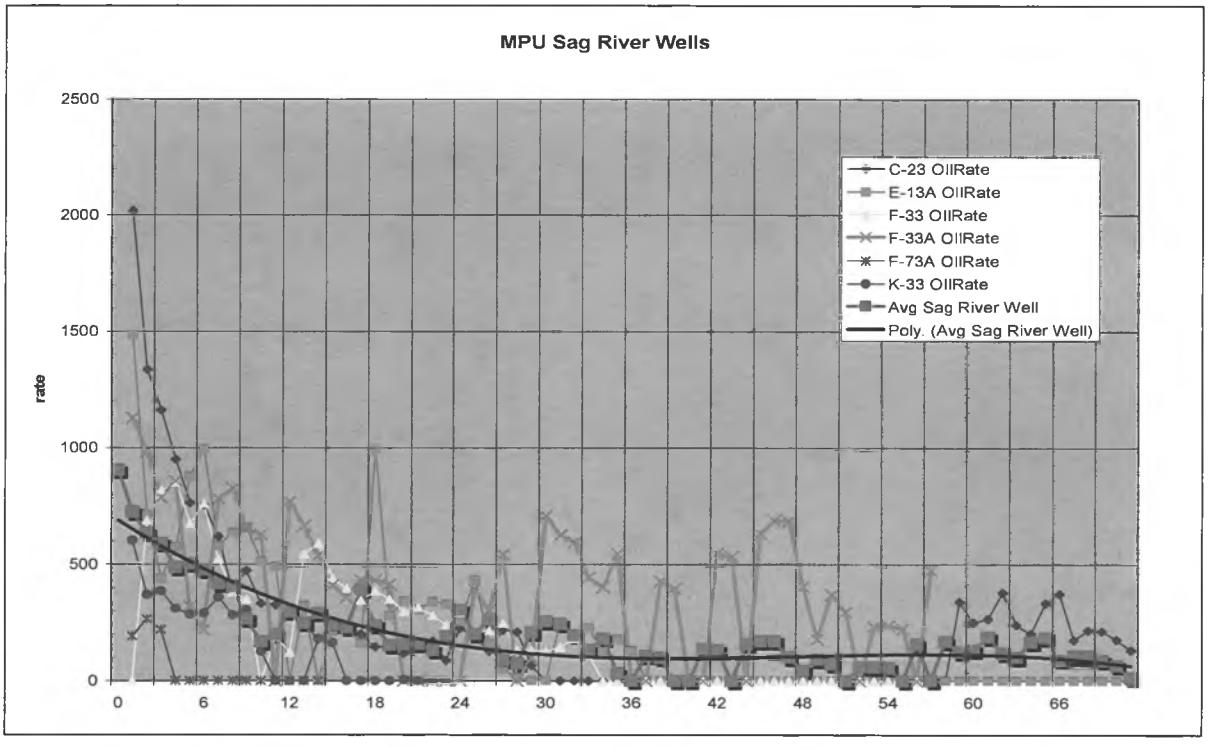

C. The Pools Underlying The Leases Have Not Previously Produced Oil or Gas for Sale

No production of oil or gas for sale has occurred from these pools.

D. Oil Production Is Economically Feasible

KMG has submitted financial and technical data and analyses and requested that they be held confidential in accordance with AS 38.05.035(a)(9). Thus, this section does not discuss any confidential information concerning KMG's geologic, engineering and cost data. These documents are included and discussed in detail in the Confidential Economic Analysis and Internal Decision Process in Attachment 5.

To obtain royalty relief the applicant must show by clear and convincing evidence that without royalty modification the project is not economically feasible. The history of this area indicates little interest in area prospects with high exploration and development costs and low production estimates. These assessments were all made under much less beneficial fiscal assumptions which have since improved as discussed below.

E. Economic Analysis

DNR believes that granting royalty modification should influence the behavior of the applicant – it should make a material difference to the applicant's decision-making. If, by modifying lease terms for the applicant, its behavior is not changed, i.e., working interest owners would have done the project anyway, the state has given up the value of the lost revenue for no reason. Because most companies are forward-looking in their decision-making process, DNR excludes sunk costs prior to the date of the application from the royalty modification analysis and the determination of whether a project is economically feasible. Sunk costs, or expenditures sanctioned prior to an application, do not factor into a project sanctioning decision for a forward-looking company and therefore should not be a factor in the determination of granting or denying royalty modification.

DNR analyzed the information submitted by KMG and used its own in-house economic model (DNR Model) for the Nikaitchuq development to independently assess the financial need and ultimate economic effects of a royalty modification for both KMG and the State of Alaska. KMG shared with the state portions of its proprietary economic model, but the state chose to use its own model that incorporated many input assumptions provided by KMG.

DNR examined the assumptions and methods currently in use by the U.S. Minerals Management Service (MMS) for the Deep Water Royalty Relief Program (DWRR). The MMS has developed an in-house proprietary probabilistic economic model for Royalty Suspension Viability Program (RSVP). Where possible, DNR adopted an approach

similar to that of the MMS by developing an independent model and implementing a decision path using economic metrics from the model.

An economic model reflects a particular view of a project's economics. The DNR Model describes the expected investment, production, price, revenue, and cost for the Nikaitchuq development over at least a 40-year time horizon. The DNR Model incorporates the state and federal tax and royalty fiscal system, as well as other important commercial relationships. This in-house model also was flexible, allowing DNR to quickly incorporate changes to the fiscal system and properly model the recently enacted production tax (PPT), signed into law on August 22, 2006. The model provides a platform for systematic evaluation of a change in the royalty rate in terms of various financial metrics for the project including annual and cumulative discounted and undiscounted cash flow, years to payout, net present value (NPV), expected monetary value (EMV), and internal rate of return (IRR) on investment, as well as state revenues. Also, DNR used its model to carry out sensitivity analysis of key driver assumptions and to characterize certain price, production, and cost variables in terms of probability distributions to evaluate how uncertainty among these drivers affects key project metrics and state revenues.

DNR incorporated the applicant's input data and probabilities into its model to derive independent results for the economic feasibility of the project. The DNR Model examines a range of possible inputs to derive a P50, or median, outcome from a Monte Carlo simulation. The P50 result is the value where 50 percent of the outcomes lay below this point and 50 percent of the outcomes lay above the P50 outcome. The DNR Model uses Palisades Software's "@Risk" Monte Carlo software application to run the simulations and generate charts, graphs and reports used in analysis.

For example, consider the determination of the amount of original oil in place (OOIP). The applicant submitted three scenarios (low, medium, and high) that characterize the range and likelihood of possible outcomes for the key determinants of OOIP: recovery rate, water saturation, permeability, porosity, net pay and areal extent. Each OOIP determinant is assigned a probabilistic value of perhaps P90, P50 and P10. The applicant's simulations indicate that 90 percent of the results are at least equal to X_{LOW}, n other words, the low case. A P50 indicates that 50 percent of the results are at least equal to X_{MEDIAN}, the median case. The P10 case is the high side case. Here the results fall at or above the X_{HIGH} range only 10 percent of the time. DNR's estimate of OOIP is calculated as a distribution of possible OOIP outcomes that takes into account the ranges and likelihoods for each of the OOIP determinants. The P50 OOIP calculated by the DNR Model directly incorporates uncertainty; it is risk weighted.

Calculating risk weighted outcomes is critical to a full analysis of a project. Once an OOIP distribution has been determined, an estimated ultimate recovery distribution and rate profile are determined based on the applicant's reservoir simulation results. The rate profile, when combined with netback price, determines the revenue stream. Annual netback prices were generated from an Ornstein-Uhlenbech type Mean-Reversion price

model[2] with parameters estimated as described by Schwartz (1997)[3] using annual price data for Alaska North Slope (ANS) West Coast crude as reported by Platt's. The price for 2006 was taken from U.S. Energy Information Agency's most recent price projection for West Texas Intermediate (WTI) crude, and adjusted for ANS-WTI basis by taking the previous 12-month average difference between these two prices. The riskweighted cost profiles are then matched to the revenue stream generated by the probabilistic price and production models. This yields an NPV distribution. The mean of the NPV distribution is the EMV for the entire project that incorporates uncertainty and can be compared "apples-to-apples" with other versions of the project.

Various what-if sensitivity analyses may be run by varying fiscal terms such as the tax system, interest rate, royalty rate and discount rate. For example, using the Excel goal seek function on discount rate, the DNR Model will calculate the discount rate at which the project reaches payout in 25 years. The DNR Model can assess outcomes for any level of probability, P1, P10, P99, for example, the state's share of divisible income under the P10 case, (high side).

The DNR and KMG models did not produce identical results. The numerous work sessions and presentations (Attachment 6) served to resolve some differences in modeling between DNR and KMG. And while the resulting DNR model reflects some disagreement between DNR and KMG on the model results, the differences can largely be explained by differences in the following formulas and assumptions:

1. severance tax formulas and input data assumptions;
2. oil price assumptions;
3. TAPS tariffs assumptions; and
4. oil quality adjustments assumptions.

DNR has received increasingly detailed input data from KMG at several points during the royalty modification application process. With each submission, KMG has revised the range of possible outcomes for resource, production, and cost. This reflects the increased level of knowledge that KMG has gained through study of the project and a more focused view of the project scope on the leases where the resources have been best delineated. DNR has used its model to analyze the series of submissions and has independently determined that the Nikaitchuq development, under the revised production tax, PPT, is economically feasible and does not require royalty modification.

The DNR has determined that under the PPT and over the life of the project, KMG would pay, on a discounted basis, about $120 million less in taxes than under the previous fiscal regime. The high capital expenditures for the Nikaitchuq project serve to offset other statewide income streams and lower the overall tax obligation for the corporation. KMG and its parent, Anadarko Petroleum Corporation, will realize very large profits from Alaska production if oil prices stay at current high levels over the next several years.

less under PPT

[2] Dixit & Pindyck, 1994, http://www.puc-rio.br/marco.ind/sim_stoc_proc.html#mc-mrd

[3] The Stochastic Behavior of Commodity Prices: Implications for Valuation and Hedging", Schwartz, E., Journal of Finance, 1997, Volume 52, issue 3, 923-973

Simultaneously, high capital expenditures at Nikaitchuq will be taking place, resulting in lower net income statewide, offsetting statewide income dollar for dollar and generating "qualified capex" credits that reduce tax obligations. Additionally, at high prices the progressive element of the PPT will be in effect, further increasing taxes for KMG. Capital investments in Nikaitchuq development offset income and result in a lower net tax liability to KMG.

Other impacts PPT will have on this project are shown in Table 1. From the working interest owner's perspective, the new tax regime improves the NPV, IRR, and the profit to investment ratio for the Nikaitchuq development project. At the same time PPT is improving the economics for the working interest owners, the State of Alaska is giving up a significant amount of tax revenue for this project.

Table 1. Effect of severance tax change, implementing PPT, on project economics.

	With PPT - Without PPT Difference
NPV(12% discount rate)	$86 MM
IRR	6.5%
Profit/Investment	17.7%
State of Alaska NPV(5)	-$87 MM

Under AS 38.05.180(j)(7)(A)&(B), DNR has the option of contracting with an independent consultant to provide additional analysis of a royalty modification application. The value of the contract is limited to $150,000.00, to be paid by the applicant. DNR did not contract with an outside consultant for the analysis of this application.

During DNR's discussions with the applicant and analysis of its royalty modification application KMG expressed concern that if the commissioner denied royalty modification it might be precluded from applying for royalty modification at a later date based on new information. The royalty modification statute does not preclude a company that has previously applied for royalty modification from applying again.

V. DISCUSSION OF THE FINAL FINDINGS AND DETERMINATIONS

A. Royalty Modification Requirements

1. KMG's application for royalty modification on ADLs 355021, 355024, 388571, 388572, 388574, 388575, 388577, 388578, 388580, 388581, 388582, 388583, 390615, 390616, meets the requirements for consideration under AS 38.05.180(j)(1). KMG paid the filing fee and submitted a complete application for the royalty modification, including financial and technical data that meet the requirements of 11 AAC 88.105, 11 AAC 83.185, 11 AAC 05.010(a)(10)(H), and AS 38.05.180(j)(6).

2. The Schrader Bluff and Sag River pools have been sufficiently delineated to the satisfaction of the commissioner for the purpose of considering royalty modification and these pools have not previously produced oil or gas for sale.
3. KMG has not shown that oil or gas production from the Schrader Bluff and Sag River pools would not otherwise be economically feasible.
4. KMG has failed to make a clear and convincing showing that a modification of royalty meets the requirements of 38.05.180(j) and is in the best interests of the state.

B. Royalty Modification Denied

AS 38.05.180(j)(1)(A), under which the application considered here was made, authorizes the DNR commissioner to provide for royalty modification when, in part, oil or gas production from the field or pool would not otherwise be economically feasible. DNR concludes that KMG has failed to show by clear and convincing evidence that the Nikaitchuq development project is economically infeasible without royalty modification and that the modification is in the best interests of the state.

C. Summary of Public Comments

The only public comment received was from the applicant. DNR believes that all of the applicants concerns have been addressed during the detailed analysis and numerous discussions that have occurred throughout the process of evaluating this application.

VI. FINAL FINDINGS AND DETERMINATION

After consideration and analysis of the materials presented by the applicant and comments received regarding the preliminary finding and determination, the DNR has determined that royalty modification for the Nikaitchuq development project is unwarranted. Newly implemented changes to the tax structure for the State of Alaska have materially improved the economics of this project. Therefore, the royalty modification application is hereby denied.

The Honorable , Commissioner Michael Menge
Department of Natural Resources, State of Alaska
550 W. 7th Avenue, Suite 1400
Anchorage, AK 99501

Re: Request for Royalty Modification
Various Leases
North Slope Alaska

Dear Commissioner Menge,

Kerr-McGee Oil & Gas Corporation ("Kerr-McGee") has drilled 3 exploratory wells and 3 appraisal wells in the area depicted on Exhibit A attached hereto (hereinafter "Area"). It has conducted extensive reservoir evaluation, engineering studies, and economic analysis to determine if it is feasible to develop and produce the hydrocarbons discovered in the Schrader Bluff and Sag River formations. Kerr-McGee has, on a confidential basis, shared with various personnel within the Division of Oil and Gas reservoir data, the results of reservoir and engineering analysis, and economic studies related to the Area.

Kerr-McGee hereby requests Royalty Modification for the Alaska State leases described on Exhibit "B" attached hereto ("Subject Leases") pursuant to AS 38.05.180(j). This application is limited to production from the stratigraphic equivalent of the interval from 3,470' to 8,600' TVDSS on the Kigun #1 PB01 log. As to ADL 355021 it is further limited to those depths below the stratigraphic equivalent of 100' below 7,426' TVDSS as drilled in the Conoco NW Milne No. 1 Well. As to ADL 355024 this application is limited to that portion of the lease described on Exhibit B.

This application is submitted by Kerr-McGee on behalf of itself and co-lessee Eni Petroleum Exploration Co. Inc. ("ENI").

Kerr-McGee on behalf of itself and ENI respectfully requests your approval and authorization of the reduction of royalty from the amount set out on Exhibit B to a flat five percent.

A check in the amount of two hundred fifty dollars ($250.00) is attached hereto in payment of the filing fee for this application.

Kerr-McGee has previously provided to personnel of the Division of Oil and Gas, on a confidential

basis, detailed geologic, engineering, and economic analysis sufficient to establish the following:

1 The oil field or pool underlying the Subject Leases has been sufficiently delineated.
2 The oil field or pool has not previously produced oil or gas for sale
3 Oil production from the field or pool would not otherwise be economically feasible.

A summary of the data previously submitted, together with related exhibits which we request you consider in making your determination is attached.

Kerr-McGee submits that it has made a clear and convincing showing through this application and the previously submitted confidential information that the proposed modification of royalty is in the best interest of the State of Alaska and meets the requirements of AS 38.05.180 (j).

Kerr-McGee requests that the information previously provided on a confidential basis remain confidential to the extent permitted by law and regulation and consistent with the requirements of this application and the related review process.

Yours truly,

David Henke

ATTACHMENT 2
Alaska Statute 38.05.180(j)

The commissioner

(1) may provide for modification of royalty on individual leases, leases unitized as described in (p) of this section, leases subject to an agreement described in (s) or (t) of this section, or interests unitized under AS 31.05

(A) to allow for production from an oil or gas field or pool if

(i) the oil or gas field or pool has been sufficiently delineated to the satisfaction of the commissioner;

(ii) the field or pool has not previously produced oil or gas for sale; and

(iii) oil or gas production from the field or pool would not otherwise be economically feasible;

(B) to prolong the economic life of an oil or gas field or pool as per barrel or barrel equivalent costs increase or as the price of oil or gas decreases, and the increase or decrease is sufficient to make future production no longer economically feasible; or

(C) to reestablish production of shut-in oil or gas that would not otherwise be economically feasible;

(2) may not grant a royalty modification unless the lessee or lessees requesting the change make a clear and convincing showing that a modification of royalty meets the requirements of this subsection and is in the best interests of the state;

(3) shall provide for an increase or decrease or other modification of the state's royalty share by a sliding scale royalty or other mechanism that shall be based on a change in the price of oil or gas and may also be based on other relevant factors such as a change in production rate, projected ultimate recovery, development costs, and operating costs;

(4) may not grant a royalty reduction for a field or pool

(A) under (1)(A) of this subsection if the royalty modification for the field or pool would establish a royalty rate of less than five percent in amount or value of the production removed or sold from a lease or leases covering the field or pool;

(B) under (1)(B) or (1)(C) of this subsection if the royalty modification for the field or pool would establish a royalty rate of less than three percent in amount or value of the production removed or sold from a lease or leases covering the field or pool;

(5) may not grant a royalty reduction under this subsection without including an explicit condition that the royalty reduction is not assignable without the prior written approval, which may not be unreasonably withheld, by the commissioner; the commissioner shall, in the preliminary and final findings and determinations, set out the conditions under which the royalty reduction may be assigned;

(6) shall require the lessee or lessees to submit, with the application for the royalty reduction, financial and technical data that demonstrate that the requirements of this subsection are met; the commissioner

(A) may require disclosure of only the financial and technical data related to development, production, and transportation of oil and gas or gas only from the field or pool that are reasonably available to the applicant; and

(B) shall keep the data confidential under AS 38.05.035 (a)(9) at the request of the lessee or lessees making application for the royalty reduction; the confidential data may be disclosed by the commissioner to legislators and to the legislative auditor and as directed by the chair or vice-chair of the Legislative Budget and Audit Committee to the director of the division of legislative finance, the permanent employees of their respective divisions who are responsible for evaluating a royalty reduction, and to agents or contractors of the legislative auditor or the legislative finance director who are engaged under contract to evaluate the royalty reduction, if they sign an appropriate confidentiality agreement;

(7) may

(A) require the lessee or lessees making application for the royalty reduction under (1)(A) of this subsection to pay for the services of an independent contractor, selected by the lessee or lessees from a list of qualified consultants compiled by the commissioner, to evaluate hydrocarbon development, production, transportation, and economics and to assist the commissioner in evaluating the application and financial and technical data; if, under this subparagraph, the commissioner requires payment for the services of an independent contractor, the total cost of the services to be paid for by the lessee or lessees may not exceed $150,000 for each application, and the commissioner shall determine the relevant scope of the work to be performed by the contractor; selection of an independent contractor under this subparagraph is not subject to AS 36.30;

(B) with the mutual consent of the lessee or lessees making application for the royalty reduction under (1)(B) or (1)(C) of this subsection, request payment for the services of an independent contractor, selected from a list of qualified consultants to evaluate hydrocarbon development, production, transportation, and economics by the commissioner to assist the commissioner in evaluating the application and financial and technical data; if, under this subparagraph, the commissioner requires payment for the services of an independent contractor, the total cost of the services that may be paid for by the lessee or lessees may not exceed $150,000 for each application, and the commissioner shall determine the relevant scope of the work to be performed by the

contractor; selection of an independent contractor under this subparagraph is not subject to AS 36.30;

(8) shall make and publish a preliminary findings and determination on the royalty reduction application, give reasonable public notice of the preliminary findings and determination, and invite public comment on the preliminary findings and determination during a 30-day period for receipt of public comment;

(9) shall offer to appear before the Legislative Budget and Audit Committee, on a day that is not earlier than 10 days and not later than 20 days after giving public notice under (8) of this subsection, to provide the committee a review of the commissioner's preliminary findings and determination on the royalty reduction application and administrative process; if the Legislative Budget and Audit Committee accepts the commissioner's offer, the committee shall give notice of the committee's meeting to all members of the legislature;

(10) shall make copies of the preliminary findings and determination available to

(A) the presiding officer of each house of the legislature;

(B) the chairs of the legislature's standing committees on resources; and

(C) the chairs of the legislature's special committees on oil and gas, if any;

(11) shall, within 30 days after the close of the public comment period under (8) of this subsection,

(A) prepare a summary of the public response to the commissioner's preliminary findings and determination;

(B) make a findings and determination; the commissioner's findings and determination prepared under this subparagraph regarding a royalty reduction is final and not appealable to the court;

(C) transmit a copy of the findings and determination to the lessee;

(D) with the applicant's consent, amend the applicant's lease or unitization agreement consistent with the commissioner's final decision; and

(E) make copies of the final findings and determination available to each person who submitted comment under (8) of this subsection and who has filed a request for the copies;

(12) is not limited by the provisions of AS 38.05.134 (3) or (f) of this section in the commissioner's determination under this subsection.

DEPARTMENT OF NATURAL RESOURCES
DIVISION OF OIL AND GAS

August 29, 2006

NOTICE
OF THE ISSUANCE OF THE
PRELIMINARY FINDINGS AND DETERMINATION
DENYING ROYALTY MODIFICATION ON
NIKAITCHUQ DEVELOPMENT LEASES:
ADLs 390615 and 390616 (NON-UNITIZED LEASES);
ADL 355021 (COMMITTED TO THE KUPARUK RIVER UNIT);
ADL 355024 (COMMITTED TO THE MILNE POINT UNIT);
ADLs 388571, 388572, 388574, 388575, 388577, and 388578
(COMMITTED TO THE TUVAAQ UNIT);
AND
ADLs 388580, 388581, 388582, 388583, 390615, and 390616
(COMMITTED TO THE NIKAITCHUQ UNIT)

The Alaska Department of Natural Resources (ADNR), Division of Oil and Gas (DO&G), gives notice under AS 38.05.180(j)(8) that it has issued the preliminary findings and determination under AS 38.05.180(j)(1)(A) that denies the royalty modification request on the 14 leases: ADL's 355021, 355024, 388580, 388581, 388583, 388582, 390615, 390616, 388571, 388572, 388574, 388575, 388577, and 388578. DNR received a correctly filed initial application on January 11, 2006, from Kerr-McGee Oil & Gas Corporation (KMG) as operator of the Nikaitchuq and Tuvaaq units on behalf of itself and ENI Petroleum Exploration Co. Inc. (ENI).

To determine whether this royalty modification should be granted, the commissioner of ADNR is required to issue a final written finding and determination that the royalty modification applies to individual leases, leases unitized as described in AS 38.05.180(p), (s) or (t), or interests unitized under AS 31.05 to allow for production from an oil or gas field or pool if

1) the oil or gas field or pool has been sufficiently delineated to the satisfaction of the Commissioner;
2) the field or pool has not previously produced oil or gas for sale; and
3) oil or gas production from the field or pool would not otherwise be economically feasible;

ADNR has received and analyzed the applicant information regarding the development of these 14 leases. The analysis was then used to prepare this written preliminary finding and determination, which addresses the amended January 11, 2006, application. In this preliminary findings and determination the Commissioner establishes the scope of the administrative review for the denial of royalty modification and considers and discusses certain important facts and issues determined to be material as required by AS 38.05.180(j)(1)(A) upon which the commissioner will base his final determination.

The commissioner shall publish this Preliminary Findings and Decision and give public notice of a 30-day public comment period as well as offer to appear before the Legislative Budget and Audit Committee and provide a review of the Findings and Determination and the administrative process. The commissioner shall keep the submitted data confidential under AS 38.05.035 (a)(9) at the request of the lessee or lessees making application for the royalty reduction. Within 30 days of the close of the public comment period the commissioner will prepare a summary of the public comments and make a Final Findings and Determination. The commissioner's final Findings and Determination regarding royalty modification is final and not appealable to the court.

PUBLIC COMMENT
DO&G invites the public to comment on any aspect of the royalty modification including the preliminary findings and determination and any proposed term or condition. Comments should be mailed, faxed or e-mailed to the Division of Oil and Gas, 550 W. 7th Ave., Suite 800, Anchorage, Alaska 99501-3560, Attention: Tim Ryherd, Commercial Analyst, Department of Natural Resources, Division of Oil and Gas; Phone 907-269-8771, Fax 907-269-8938; e-mail Tim_Ryherd@dnr.state.ak.us. Comments must be received no later than 5:00 p.m., October 2, 2006, to be considered in the final findings and determination.

Interested individuals may obtain copies of the preliminary finding and determination from DNR's website at www.dog.dnr.state.ak.us. The documents are also available for public review at the following locations: the Alaska State Library in Juneau, the Loussac Library in Anchorage, the DNR Public Information Center in Fairbanks, Anchorage, and the Barrow City Clerk's Office.

SUBJECT LEASE DESCRIPTION
The 14 subject leases are all located offshore in the Beaufort Sea north of Oliktok Point on Alaska's North Slope. Two of the subject leases are not committed to any oil and gas unit (ADLs 390615 and 390616); one lease is committed to the Kuparuk River Unit (ADL 355021); one lease is committed to the Milne Point Unit (ADL 355024); six leases are committed to the Tuvaaq Unit (ADLs 388571, 388572, 388574, 388575, 388577, and 388578); and six leases are committed to the Nikaitchuq Unit (ADLs 388580, 388581, 388582, 388583, 390615, and 390616). The amended application requests that the royalty rate for ADLs 355021 and 355024 be modified from a fixed royalty rate of 12.5 percent with a 30 percent NPS to the State to a 5 percent royalty rate with a 20 percent net profit share to the State, and that the royalty rate for ADLs 388581, 388580, 388583, 388582, 390615, 390616, 388571, 388572, 388574, 388575, 388577, and 388578 be modified from a fixed royalty rate of 16.6667 percent to a fixed royalty rate of 5 percent.

MAPS
A map of the subject lease area is available on the division's website at www.dog.dnr.state.ak.us and in the Preliminary Findings and Determination document.

FINAL BEST INTEREST FINDING
DNR anticipates making the final findings and determination available to the public on or about October 9, 2006.

ALTERNATIVE COMMUNICATION FORMATS
The ADNR, DO&G complies with Title II of the Americans with Disabilities Act of 1990. This publication can be made available on CD or in alternative communication formats upon request. Please contact Brock Stellar at (907)375-8231 to make any necessary arrangements.

LEGAL NOTICES

(COMMITTED TO THE NIKAITCHUQ UNIT)

The Alaska Department of Natural Resources (ADNR), Division of Oil and Gas (DO&G), gives notice under AS 38.05.180(j)(8) that it has issued the preliminary findings and determination under AS 38.05.180(j)(1)(A) that denies the royalty modification request on the 14 leases: ADL's 355021, 355024, 388580, 388581, 388583, 388582, 390615, 390616, 388571, 388572, 388574, 388575, 388577, and 388578. DNR received a correctly filed initial application on January 11,2006, from Kerr-McGee Oil & Gas Corporation (KMG) as operator of the Nikaitchuq and Tuvaaq units on behalf of itself and ENI Petroleum Exploration Co. Inc. (ENI).

To determine whether this royalty modification should be granted, the commissioner of ADNR is required to issue a final written finding and determination that the royalty modification applies to individual leases, leases unitized as described in AS 38.05.180(p), (s) or (t), or interests unitized under AS 31.05 to allow for production from an oil or gas field or pool if

1. the oil or gas field or pool has been sufficiently delineated to the satisfaction of the Commissioner;

2. the field or pool has not previously produced oil or gas for sale; and

3. oil or gas production from the field or pool would not otherwise be economically feasible;

ADNR has received and analyzed the applicant information regarding the development of these 14 leases. The analysis was then used to prepare this written preliminary finding and determination, which addresses the amended January 11, 2006, application. In this preliminary findings and determination the Commissioner establishes the scope of the administrative review for the denial of royalty modification and considers and discusses certain important facts and issues determined to be material as required by AS 38.05.180(j)(1)(A) upon which the commissioner will base his fina[illegible]nation.

The commissioner shall i[illegible]s Preliminary Findings and Decision and give public notice of a 30-day public comment period as well as offer to appear before the Legislative Budget and Audit Committee and provide a review of the Findings and Determination and the administrative process. The commissioner shall keep the submitted data c[illegible]l under AS 38.05.035 (a)(9) at the r[illegible] the lessee or lessees making application for the royalty reduction. Within 30 days of the close of the public comment period the commissioner will prepare a summary of the public comments and make a Final Findings and Determination. The commissioner's final Findings and Determination regarding royalty modification is final and not appealable to the court.

PUBLIC COMMENT

DO&G invites the public to comment on any aspect of the royalty modification including the preliminary findings and determination and any proposed term or condition. Comments should be mailed, faxed or e-mailed to the Division of Oil and Gas, 550 W. 7th Ave., Suite 800, Anchorage, Alaska 99501-3560, Attention: Tim Ryherd, Commercial Analyst, Department of Natural Resources, Division of Oil and Gas; Phone 907-269-8771, Fax 907-269-8938; e-mail Tim_Ryherd@dnr.state.ak.us. Comments must be received no later than 5:00 p.m., October 2, 2006, to be considered in the final findings and determination.

Interested individuals may obtain copies of the preliminary finding and determination from DNR's website at www.dog.dnr.state.ak.us. The documents are also available for public review at the following locations: the Alaska State Library in Juneau, the Loussac Library in Anchorage, the DNR Public Information Center in Fairbanks, Anchorage, and the Barrow City Clerk's Office.

SUBJECT LEASE DESCRIPTION

The 14 subject leases are all located offshore in the Beaufort Sea north of Oliktok Point on Alaska's North Slope. Two of the subject leases are not committed to any oil and gas unit (ADLs 390615 and 390616); one lease is committed to the Kuparuk River Unit (ADL 355021); one lease is committed to the Milne Point Unit (ADL 355024); six leases are committed to the Tuvaaq Unit (ADLs 388571, 388572, 388574, 388575, 388577, and 388578); and six leases are committed to the Nikaitchuq Unit (ADLs 388580, 388581, 388582, 388583, 390615, and 390616). The amended application requests that the royalty rate for ADLs 355021 and 355024 be modified from a fixed royalty rate of 12.5 percent with a 30 percent NPS to the State to a 5 percent royalty rate with a 30 percent net profit share to the State, and that the royalty rate for ADLs 388581, 388580, 388583, 388582, 390615, 390616, 388571, 388572, 388574, 388575, 388577, and 388578 be modified from a fixed royalty rate of 16.6667 percent to a fixed royalty rate of 5 percent.

MAPS

A map of the subject lease area is available on the division's website at www.dog.dnr.state.ak.us and in the Preliminary Findings and Determination document.

FINAL BEST INTEREST FINDING

DNR anticipates making the final findings and determination available to the public on or about October 9, 2006.

ALTERNATIVE COMMUNICATION FORMATS

The ADNR, DO&G complies with Title II of the Americans with Disabilities Act of 1990. This publication can be made available on CD or in alternative communication formats upon request. Please contact Brock Stellar at (907)375-8251 to make any necessary arrangements.

Subject: Comments re Preliminary Findings.... - Royalty Modification - Nikaitchuq area

Both Kerr-McGee Oil & Gas Corporation and Eni Petroleum US LLC have reviewed the Preliminary Findings and Determination for the requested royalty modification for the various leases in the Nikaitchuq area. We have each made individual determinations of the projected effect of the PPT legislation. We have also attempted to match the analysis completed by the DNR staff. Thus far we have not been successful in matching the results obtained by the DNR staff.

We believe it is premature to deny the application at this time for the following reasons:

1. We believe a full and open discussion between the staff and representatives of both Kerr-McGee and Eni identifying the parameters used for the calculation of the expected PPT results should be completed before a final decision is issued. Both Kerr-McGee and Eni will be ready to participate in such discussions during the first half of October. The analysis used in and following such discussions should be considered in the final determination process.

2. The Preliminary Findings and Determination were based upon the impact of recent changes in tax provisions but did not include an evaluation of ongoing changes in project economics or the currently estimated first production date. The costs for the Nikaitchuq project continue to increase and the costs in place after the completion of the 2-well program described below should be a more accurate estimate of the actual costs of the project at the point in time when a decision to proceed with sanction will be made. We believe a full analysis of the information available after the completion of the 2-well program will justify royalty modification.

3. We are conducting a 2-well program to gather additional information before making our final decision on sanctioning the project. The results, including costs, of this 2-well program should be utilized in making the final determination on royalty modification.

Please note my E-Mail Address has changed. Please update your contact list

I. INTRODUCTION AND BACKGROUND

A. Introduction

On October 16, 2007, Eni US Operating Co. Inc. (Eni), as operator of the Nikaitchuq Unit (NU), on behalf of its affiliate Eni Petroleum US LLC, 100 percent working interest owner of the subject leases, submitted an application to the commissioner of the State of Alaska Department of Natural Resources (ADNR) for modification of royalty under AS 38.05.180(j)(1)(A) (Attachment 1). On November 30, 2007, ADNR issued a Preliminary Findings and Determination to respond to Eni's royalty modification application. The public was invited to comment on the preliminary decision for 30 days ending January 7, 2008. ADNR hereby issues its Final Findings and Determination as required under AS 38.05.

Eni has applied for royalty modification on 12 leases which overlie the Schrader Bluff and the Sag River reservoirs. However, the Sag River reservoir was withdrawn from the application at the request of Eni. Eni requests that the fixed royalty rates of

- 12.5 percent on the Net Profit Share (NPS) lease, ADL 391283, and
- 16.66667 percent on the 11 leases (ADLs 388571, 388572, 388574, 388575, 388577, 388580, 388581, 388582, 388583, 390615, and 390616)

be reduced to the minimum rate allowed, 5.0 percent, with an annual sliding-scale royalty percentage adjustment based on the level of Alaska North Slope West Coast (ANSWC) crude oil price. The 30 percent net profit share rate on ADL 391283 is to remain unchanged. Attachment 2 depicts the Nikaitchuq Unit boundaries and leases subject to this royalty modification application.

This Final Findings and Determination responds to the royalty modification application as required under AS 38.05.180(j)(8). Part I summarizes the royalty modification application and process. Part II reviews the history of the Nikaitchuq Unit formation and development, and Eni's royalty modification application. Part III reviews the state's authority to carry out royalty modification. Part IV reviews the requirements and terms of royalty modification pursuant to this application. Part V contains ADNR's analysis of the application under the royalty modification criteria. Part VI is the Final Findings and Determination.

B. Royalty Modification Procedure

This Final Findings and Determination is the first step in a process contemplated in AS 38.05.180(j) that could result in an authorization to modify the royalty terms for certain leases. The commissioner published the Preliminary Findings and Determination, gave public notice of a 30-day public comment period (Attachments 3 and 4), and offered to appear before the Legislative Budget and Audit Committee to provide a review of the

Findings and Determination and the administrative process. The commissioner will keep the submitted data confidential under AS 38.05.035(a)(9) at the request of the lessee or lessees making application for the royalty reduction. This Final Findings and Determination by ADNR regarding royalty modification is final and not appealable. With the Applicant's concurrence, ADNR will amend the subject leases to conform to the terms of this royalty modification Final Findings and Determination.

II. SUMMARY OF ENI'S APPLICATION FOR ROYALTY MODIFICATION

A. Unit and Lease Summary

ADNR approved the formation of the Nikaitchuq Unit effective April 29, 2004. At that time, Kerr-McGee Oil & Gas Corp. (KMG) held 70 percent of the working interest and Armstrong Oil & Gas Inc. (Armstrong) held 30 percent. The unit originally consisted of eight leases covering 12,968 offshore acres in the shallow waters of Harrison Bay in the Beaufort Sea, approximately three miles north of Oliktok Point. The Kuparuk River Unit (KRU) lies to the south, and the Milne Point Unit (MPU) lies to the east of the Nikaitchuq Unit. The Tuvaaq Unit, formed in August 2004, was adjacent to the western boundary of the original Nikaitchuq Unit. Effective October 5, 2007, ADNR approved the first expansion of the Nikaitchuq Unit, termination of the Tuvaaq Unit and the contraction of the Kuparuk River Unit. The Nikaitchuq Unit expanded to include all of the Tuvaaq Unit leases, the Kigun lease, formerly committed to the KRU, and two additional leases acquired by ENI at the 2004 Beaufort Sea Sale.

All 12 leases in the Eni royalty modification application are committed to the expanded Nikaitchuq Unit. (See lease map in Attachment 2.)

The ownership of the Nikaitchuq Unit has changed significantly since formation. Eni acquired Armstrong's 30 percent WIO of Nikaitchuq Unit in August 2005. In August 2006, Anadarko Petroleum Co. (Anadarko) acquired KMG, including KMG's 70 percent WIO in Nikaitchuq Unit, and became Nikaitchuq Unit operator. Eni subsequently acquired the remaining 70 percent Nikaitchuq Unit ownership from the operator, Anadarko, in March 2007, and became the 100 percent WIO and operator of Nikaitchuq Unit.

On January 11, 2006, KMG submitted an application for royalty modification under AS 38.05.180(j)(1)(A) for 14 leases of which 12 are the subject of this application.[1] KMG's application requested that the royalty rate for the 14 leases be modified from their respective existing fixed royalty rates of 16.67 percent and 12.5 percent to a fixed royalty rate of 5 percent. Effective October 31, 2006, the ADNR issued the Final Findings and Determination of the Commissioner of the Department of Natural Resources for the Nikaitchuq Development Royalty Modification Application denying KMG's application for royalty modification.

[1] The KMG application included ADLs 355021, 355024, 388571, 388572, 388574, 388575, 388577, 388578, 388580, 388581, 388582, 388583, 390615, and 390616.

B. Project Development History

In the 2003-2004 and 2004-2005 exploration/appraisal drilling programs KMG/Armstrong encountered accumulations of hydrocarbons in the area of the then-proposed Nikaitchuq Unit. A total of six wells were drilled in the Nikaitchuq area in the 2004 and 2005 winter drilling seasons; two additional wells were drilled in 2006.

The planned development includes:

- Construction of a gravel pad with drilling, gathering and production facilities on Oliktok Point near the existing ConocoPhillips Alaska Inc. seawater treatment facility.
- Construction of a gravel drilling island near Spy Island tied back via a 3.8-mile subsea flow line and utility bundle to Oliktok Point for fluid processing.
- Construction of a +/-14-mile pipeline from Oliktok Point to a tie-in near KRU DS-1Y pad for connection to the Kuparuk Transportation common carrier pipeline.
- Consideration of future modifications required to adjust facility configuration to accommodate actual results of well performance.
- A total of 73 wells drilled between 2008 and 2011, of which 31 are expected to be producers.
- First oil expected in 2010.

Development studies indicate that extended reach horizontal producing and injection wells required for pressure maintenance are needed to economically recover the hydrocarbons in place. The planned development would permit a relatively small "footprint" for centralized facilities and minimal well pads, thereby reducing environmental impacts to the region. Initial drilling will be from a 313,000-square-foot pad to be constructed at Oliktok Point. Existing roads will be utilized for access. The production facilities will be located on the same pad. Later, a small gravel island is to be constructed within the barrier islands for future drilling. A subsea bundle containing a three-phase production line and multiple utility lines will be constructed to connect the gravel island to Oliktok Point to transport production and provide fuel, secondary recovery fluid, and power to the gravel island.

C. Eni Royalty Modification Request

On October 16, 2007, Eni submitted an application (Attachment 3) to the ADNR commissioner for modification of royalty on 12 leases, ADLs: 388571, 388572, 388574, 388575, 388577, 388580, 388581, 388582, 388583, 390615, and 390616 and ADL 391283 under AS 38.05.180(j)(1)(A). In accordance with 11 AAC 88.105, 11 AAC 83.185, and 11 AAC 05.010(a)(10)(H) Eni submitted a complete application with the required $250.00 filing fee.

The Eni application for royalty modification submitted on October 16, 2007, requests a 5.0 percent fixed royalty if the Alaska North Slope West Coast (ANSWC) crude oil price falls below an ANSWC price equivalent to the U.S. Department of Interior, Minerals Management Service (MMS) NYMEX West Texas Intermediate (WTI) oil price threshold for royalty modification for OCS August 2004-2006 deepwater oil leases in the Gulf of Mexico (GOM).[2] Eni proposes a sliding-scale royalty rate in any month after production start-up (expected in 2010) that would range between 5.0 and 16.6667 percent, depending on the average monthly price of ANSWC crude oil. An ANSWC monthly (nominal) price below the Alaska Department of Revenue (ADOR) *Spring 2007 Revenue Sources* forecast between 2010 (the year of first production) and 2017 shown in Figure II.1 (below) would trigger a reduced royalty rate from original fixed lease rates of 12.5 percent and 16.6667 percent, respectively. The amount of the reduction in royalty percentage would depend on (a) the original lease rate (either 12.5 percent or 16.6667 percent) and (b) the extent to which the actual future oil price falls below the ADOR forecast threshold.[3]

The original fixed royalty rate of 16.6667 percent for ADLs 388571, 388572, 388574, 388575, 388577, 388581, 388582, 388583, 390615, and 390616 and 12.5 percent with 30 percent net profit for ADL 391283 would be subject to the sliding scale modification in a low commodity price environment to a level at or above a floor of 5 percent. The 30 percent net profit share to the State attached to ADL 391283 would be unchanged under the Eni royalty modification proposal.

The Eni application also would provide full royalty relief at a reduced rate of 5 percent for all leases regardless of oil price if monthly production is below 4,000 barrels of oil per day for the first 10 years following the effective date of the royalty modification decision.

[2] ADNR estimates threshold to be $42.53 per barrel in 2010 based on a 2007 NYMEX WTI price of $42.64 assuming a 94 percent basis adjustment to ANSWC and 2 percent price escalation pursuant to the ENI proposal. See: MMS, *Price Thresholds and Annual Market Prices for MMS Deepwater and Deep Depth Oil and Gas Royalty Relief Programs*, Deep Water Oil, Economics Division at www.mms.gov/econ/DWRRAPrice1.htm.

[3] Under the Eni proposal, the royalty percentage rate adjustment would be approximately ¾ percentage point per $1 change in ANSWC price for leases with a 16.6667 percent base royalty rate and ½ percentage point per $1 change in ANSWC price for leases with a 12.5 percent base royalty rate. After 2017, the ADOR ANSWC price forecast is inflated by the monthly change in the Producer Price Index (PPI).

III. SUMMARY OF ROYALTY MODIFICATION AUTHORITY AS 38.05.180(j)(1)(A), (2), (3), (4)(A), (5)

A. General Royalty Modification Requirements

AS 38.05.180(j)(1)(A) authorizes the DNR commissioner to provide for royalty modification on individual leases, leases unitized as described in (p) of this section (AS 38.05.180), leases subject to an agreement described in (s) or (t) of this section (AS 38.05.180), or interests unitized under AS 31.05 to allow for production from an oil or gas field or pool if:

1. the oil or gas field or pool has been sufficiently delineated to the satisfaction of the commissioner;
2. the field or pool has not previously produced oil or gas for sale; and
3. oil or gas production from the field or pool would not otherwise be economically feasible.
4. Under AS 38.05.180(j)(2), the commissioner may not grant a royalty modification unless the lessee or lessees requesting the royalty modification make a clear and convincing showing that a royalty modification meets the three requirements set out above and is in the best interests of the state.

B. General Royalty Modification Terms

1. Under AS 38.05.180(j)(3) the royalty modification terms must provide for an increase or decrease or other modification of the state's royalty share by a sliding-scale royalty or other mechanism that shall be based on a change in the price of oil or gas and may also be based on other relevant factors such as a change in production rate, projected ultimate recovery, development costs, and operating costs.
2. Under AS 38.05.180(j)(4)(A) a modification to royalty may not be granted for the field or pool if the royalty modification would result in a royalty rate of less than 5 percent in amount or value of the production removed or sold from a lease or leases covering the field or pool.
3. Under AS 38.05.180(j)(5) a royalty reduction must include an explicit condition that the royalty reduction is not assignable without the prior written approval, which may not be unreasonably withheld, by the commissioner. The commissioner shall, in the preliminary and final findings and determinations, set out the conditions under which the royalty reduction may be assigned and may not grant a royalty reduction without an explicit condition that the royalty reduction is not transferable.

IV. DISCUSSION OF ROYALTY MODIFICATION CRITERIA

A. Leases Are Eligible For Consideration

The leases meet the requirements for consideration and all eleven subject leases proposed for royalty modification are committed in entirety to the Nikaitchuq Unit. AS 38.05.180(j)(1) allows modification of royalty for individual leases and unitized leases.

B. Reservoir Delineation: Discussion of Reservoir Geology and Engineering

1. Introduction to reservoir delineation.

The commissioner may grant royalty modification to allow for production from an oil or gas field or pool if the oil or gas field or pool has been sufficiently delineated to the satisfaction of the commissioner.

The area within the Nikaitchuq Unit for which royalty relief is sought lies offshore in the Beaufort Sea in the vicinity of Spy Island, approximately three miles north of Oliktok Point. The Nikaitchuq Unit is north of and contiguous with the northern edge of the KRU and the Milne Point Unit (MPU). The KRU is operated by ConocoPhillips and produces from the Cretaceous Kuparuk River Formation and shallower Schrader Bluff Formation. The BP-operated MPU field lies to the south-southeast of the Nikaitchuq Unit and produces oil from the Schrader Bluff, Kuparuk, and Triassic Sag River formations. The western edge of the proposed Nikaitchuq Unit is adjacent to the recently expanded Oooguruk Unit (OU) operated by Pioneer. Production from the OU is expected from the Kuparuk and Jurassic Nuiqsut sandstones.

Within the Nikaitchuq Unit, potential commercially recoverable reserves have been tested in both the Cretaceous Schrader Bluff and the Triassic Sag River formations.

Based upon the submitted application and the planned initial development, the request for royalty modification at Nikaitchuq is limited to the OA sand of the Schrader Bluff Formation. For the purpose of this application, the OA sand is defined in Kerr McGee Nikaitchuq #1 (API No. 50629231930000), completed in 2004, as the interval between 5034 feet measured depth (4127 feet subsea true vertical depth) and 5090 feet measured depth (4170 feet subsea true vertical depth).

ENI has adequately delineated the OA sand of the Schrader Bluff Formation in the Nikaitchuq area. Their drilling, testing, and evaluation programs appear to have highlighted the obvious risks inherent to developing viscous oil and identified the possible upside potential available through use of extended reach drilling and advanced completion technologies.

Although upside potential may also exist within the shallower Schrader Bluff N sand interval, the current lack of core, well test, or fluid data from this interval increases the risk and precludes it from being deemed delineated and included as part of this application. ENI plans to gather more data to thoroughly evaluate the N sand during the course of developing the deeper OA sand.

The Sag River Formation contains lighter oil than the Schrader; however, it is plagued with poor quality reservoir rock. The development potential is marginal at best unless there are significant advances in stimulation or enhanced oil recovery technology. Delineation of the Sag River Formation at Nikaitchuq to date has revealed limited reserves and similar test results to the analog at MPU where wells within the Sag River Formation consistently show initial flush production followed by steep decline within the first year. ENI is still evaluating the development potential of this interval and, as such, it has been excluded from this application.

2. Exploration History of the Area

Two key early exploration wells lie within several miles of the Nikaitchuq development area. The Unocal East Harrison Bay State #1 well lies near the northwest corner of the KRU, to the southwest of the Nikaitchuq Unit. The well was drilled in February 1977 to a measured depth of 9,809 feet, bottoming in argillite basement. The East Harrison Bay State #1 well logs appear to contain about 15 feet of oil-bearing Kuparuk Formation that appears cemented in the upper half. The Jurassic section looks silty on logs. The ARCO Kalubik #3 well, drilled in February 1998, lies to the south-southwest of the Nikaitchuq area. The well bottomed in the Jurassic at a measured depth of 7,000 feet. The well encountered a 40-foot-thick measured depth (MD) interval of Kuparuk C sandstone that appears on electric logs as oil-bearing, but siderite cemented in the upper 10 feet of the interval. On well logs the Jurassic interval contains silt with a 12-foot silty sand developed around 6,565 feet MD. The well was plugged and abandoned on March 6, 1998.

3. Drilling History

The first major exploration activity in the area in the early 1970s targeted the Ivishak Formation following the discovery of the prolific Ivishak Formation in Prudhoe Bay State #1 in 1967. The Hamilton Brothers Milne Point #18-1 was one of the early wells drilled on the Milne Point structure in 1970 in search of Ivishak and Lisburne objectives. This well encountered about 50 feet of tight oil-saturated sandstone that was not tested and a section of Kuparuk sandstone that tested at a rate of 875 BOPD. This discovery led to increased industry interest in the Milne Point area and led to exploration and delineation drilling for Kuparuk reserves. In the early 1980s the Sag River was cored in the Conoco Milne Point Unit #C-1 well and contained bleeding oil and gas. The Sag River Sandstone was also cored in the MPU #L-1 well and contained no visible porosity or staining and appeared tight on wire line logs.

In the early 1990s about a dozen wells were drilled to the west-southwest of the Nikaitchuq area with Jurassic sandstones and Kuparuk C sandstones as targets. The ARCO Kalubik #1 well encountered approximately 160 feet of productive Nuiqsut and Nechelik sandstone that tested approximately 336 BOPD (un-stimulated). In addition, the well penetrated an 85-foot section of Sag River Sandstone with calculated log porosities in the range of 15 to 22 percent. The Thetis Island #1 well also encountered an 80-foot section of porous Sag River sandstone with log-calculated porosities in the range of 16-24 percent. A pay section of Nuiqsut sandstone was also encountered that tested at an average rate of 120 BOPD with a high rate of 650 BOPD. Both the Kalubik #1 well and Thetis Island #1 well drilled through Brookian sandstones that contained mud log hydrocarbon shows.

In the late 1990s BP drilled several dedicated Sag River Sandstone test wells, including MPU #C-23, #K-33, #E-13A, 3F-33, #F-33A, and #F-73A. Alaska Oil and Gas Conservation Commission (AOGCC) production data indicate that several Milne Point wells have produced oil out of the Sag River Sandstone and two oil producing wells MPU F-33A and K-33, are currently shut-in. MPU #C-23 produced 378,012 barrels of oil between 1996 and 2001. MPU #F-33 produced 314,276 barrels of oil between September 1996 and May 1999 and was subsequently plugged and abandoned. MPU #K-33 has produced approximately 93,241 barrels of oil since 1997. MPU #E-13A produced 366,665 barrels of oil between 1995 and April 2001. MPU #F-33A produced approximately 661,099 barrels of oil since April of 2001. MPU #F-73A produced 13,430 and is now a water-alternating-gas injection (WAGIN) well. BP estimated the original oil-in-place (OOIP) at 62 MM STB oil and the reservoir area about 8500 acres based upon seismic and log data during an AOGCC Conservation Order hearing in May 1998. AOGCC reservoir data indicate that the oil commonly recovered from the Sag River sandstone has an API oil gravity of about 37 degrees. Total production from the MPU Sag River Sandstone has been 1,834,131 barrels of oil and 1,875,668 MSCF gas through October 2007. MPU Sag River recovery is less than 3 percent to date based on OOIP. The original GOR ranged from 784 – 974 SCF/STB. Production from the Sag River pool at MPU has been intermittent with extended shut-in periods since June 1999.

Between 2004 and 2005, Kerr McGee (KMG) drilled six wells in the Nikaitchuq and Tuvaaq Units. Initially, the primary exploration target was the Sag River Formation; the Kuparuk Formation was a secondary target. Although the wells did not encounter reservoir quality sand in the Kuparuk, the well logs indicated that sands in the shallower Schrader Bluff Formation were prospective. KMG then adjusted the exploration program to thoroughly evaluate the Schrader Bluff Formation. Three of the six wells tested oil from the viscous Schrader Bluff or Sag River formations. In 2006/2007 KMG drilled two additional pre-development wells from Oliktok Point to further delineate and test the Schrader Bluff sandstone. The two wells are currently suspended.

4. Schrader Bluff Formation Tests

KMG Nikaitchuq #4

Approximately 3,000 feet of gross horizontal Schrader Bluff OA sand was drilled in this well, with approximately 2,270 feet of horizontal or lateral net pay, from a 30-foot true-vertical-depth net pay thickness. A two-week production test was performed on the well using an electric submersible pump (ESP) to aid in producing the 16–17 API crude. The well tested at rates up to 1,200 barrels of oil per day during periods of the initial test. Permeability estimated from the test was greater than 350 millidarcies and was confirmed from the analysis of the flow tests conducted on a whole core obtained from the well.

KMG Tuvaaq #1

The well was not tested. It penetrated 30 feet net pay Schrader Bluff OA Sand and 12 feet net Schrader Bluff N sand. There were no cores taken at Tuvaaq. Schrader Bluff N sand was interpreted to be oil-filled here and at Kigun #1 appeared unconsolidated with permeability estimated from 100-1000 millidarcies and porosity 25-35 percent.

KMG Kigun #1

The well was not tested. It penetrated 29 feet net pay Schrader Bluff OA sand and 30 feet net N sand. An MDT tool run sampled the Schrader Bluff OA fluids which were 18 degree API, GOR 59 SCF/STB and viscosity of 82 cp at 87 degree reservoir temperature. (Contamination of the samples with oil-based mud caused concern about the reliability of the sample estimates and properties.) Schrader Bluff OA sand core data indicated 25 percent to 38 percent porosity and up to 1,000 millidarcies permeability in the sandstone intervals.

KMG Oliktok Point I-1 KMG Oliktok Point I-2

These two wells were drilled by KMG during the 2006/2007 drilling season as pre-development wells to further test and delineate the Schrader Bluff reservoir. These wells have been suspended. Results from these wells are currently held confidential under AS 38.05.035(a)(9).

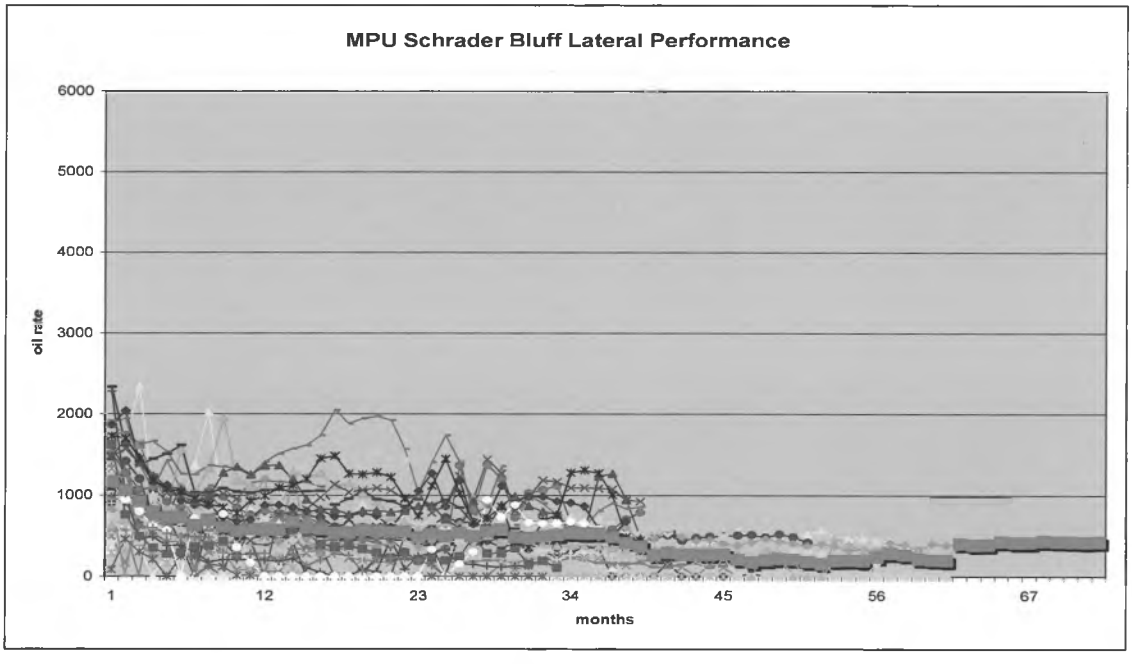
5. Analog Schrader Bluff Formation Performance

Milne Point Unit (MPU) Schrader Bluff Pool (Figure 1), Kuparuk River Unit (KRU) West Sak Pool (Figure 2) and Prudhoe Bay Unit (PBU) Polaris and Orion pools – Figure 3, represent analog Schrader Bluff Formation horizontal well performance. Each of the pools was developed initially with vertical or slanted completions. More recently a number of horizontal lateral and multi-lateral wells have been completed in each of these pools. MPU and KRU Schrader Bluff wells show a distinct, lower rate performance than the newer developed Polaris and Orion Pool wells. A significant portion of the performance difference is likely due to differences in fluid quality. Within the Schrader Bluff Formation / West Sak, developments oil gravities can vary between 15-24 degrees API and viscosity can vary between 5-130 centipoise. To date, development has been limited to those areas with higher API Gravity and lower viscosity. Later Schrader Bluff Formation developments are building on earlier techniques by going from vertical to

horizontal and multilaterals wells. The horizontal and multilaterals should consistently outperform the older wells because more formation is exposed and the completions are more efficient.

The wells in each Schrader Bluff Formation pool exhibit early flush production for six to 12 months. The PBU Schrader Bluff completions show slightly higher initial rate profiles followed by relatively steep decline. The average MPU Schrader Bluff completion (heavy bright green points and line) declined from 1200 bopd to 500 bopd at 12 to 40 months. KRU West Sak lateral completions have performed similar to MPU Schrader Bluff.

Figure 1. MPU Schrader Bluff Formation lateral performance and average performance (heavy green).



6. Reservoir delineation determination.

ENI has adequately delineated the OA sand of the Schrader Bluff Formation in the Nikaitchuq area. Their drilling, testing, and evaluation programs appear to have highlighted the obvious risks inherent to developing viscous oil and identified the possible upside potential available through use of extended reach drilling and advanced completion technologies.

Figure 2. KRU West Sak sands lateral performance and average performance (heavy orange).

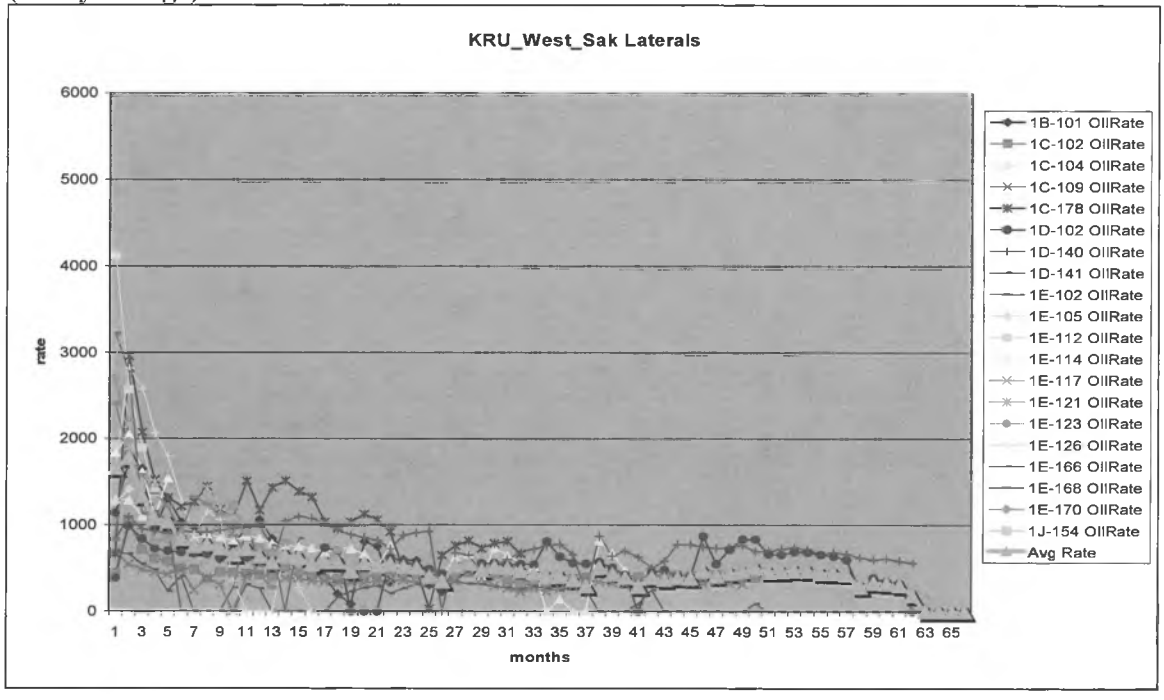


Figure 3. PBU Polaris and Orion Schrader Bluff Formation initial performance.

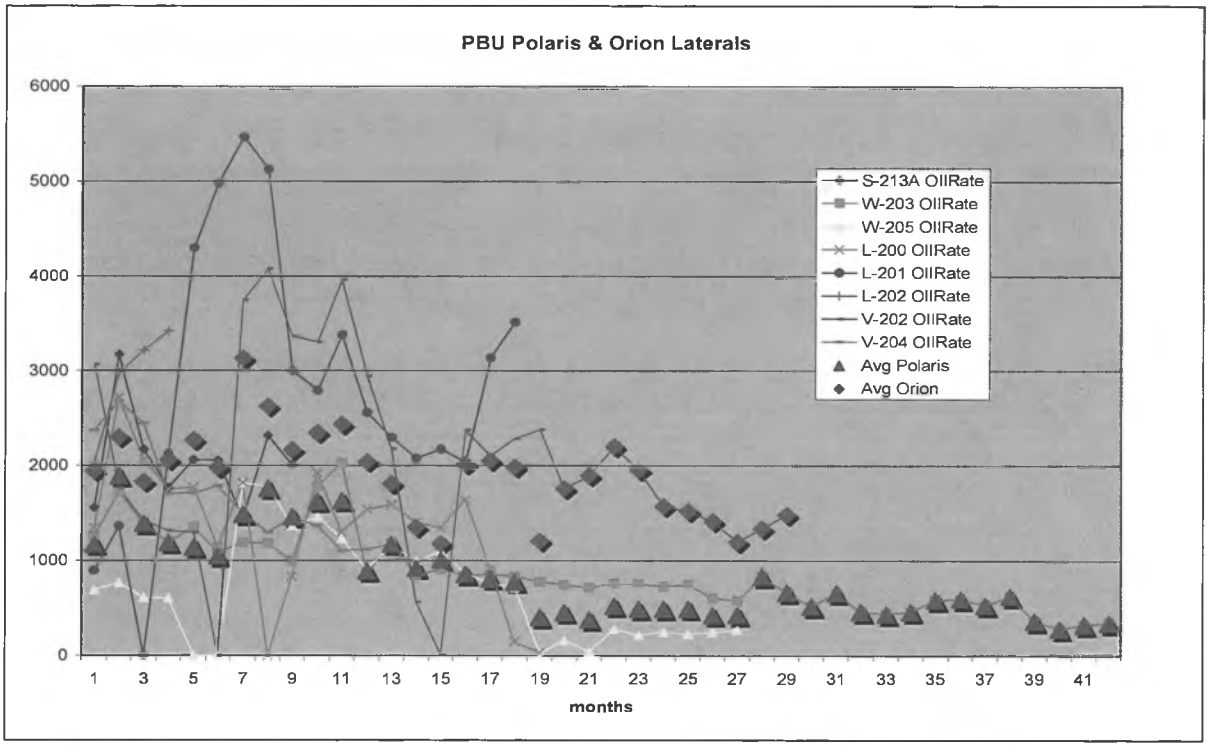

ENI stated that their plan is to develop Nikaitchuq Schrader Bluff Formation with horizontal wells. Their prognosis of performance can be compared to the analogs by evaluating average Schrader Bluff well performance from initial completion to date. There are up to seven years of production history for the various Schrader Bluff Formation horizontal and lateral wells. Orion appears to be more productive so far but the long term performance has yet to be defined. ENI appears to estimate their development will improve on the previous KRU and MPU Schrader Bluff completions by using the latest technology, namely very long horizontal and or multi-lateral completions. ENI's cases align reasonably with the MPU Schrader Bluff and KRU West Sak and PBU Polaris average performance. PBU Orion performance is notably better than ENI's high case average rates. Analyses of oil samples taken within the OA sand in the Nikaitchuq area demonstrate measured oil viscosities of 95–188 centipoise. This is heavier than the average viscosity of production from existing KRU, MPU and PBU Schrader Bluff developments. In addition, the Nikaitchuq development will include construction of a new standalone facility. The KRU, MPU, and PBU Schrader Bluff pools had existing infrastructure and production from other formations to support the additional development. Both of these factors increase the risk and make this project more economically challenged compared to existing heavy oil developments.

C. No Previous Sale of Produced Oil or Gas

The pools underlying the leases have not previously produced oil or gas for sale.

D. Economic Analysis

ADNR used its own in-house probabilistic economic model (ADNR Model) for the Nikaitchuq development to independently assess the financial performance and ultimate economic effects of a royalty modification for both Eni and for the State of Alaska. Eni shared with the state portions of its proprietary economic model, but the state chose to use its own model that incorporated many input assumptions provided by Eni.[4]

ADNR closely examined the assumptions and methods currently in use by the U.S. Minerals Management Service (MMS) for the Deep Water Royalty Relief Program. The MMS has developed an in-house proprietary probabilistic economic model for Royalty Suspension Viability Program. ADNR adopted an approach similar to that of the MMS by applying the quantitative results from the ADNR model to a prudent-investor decision framework. The ADNR decision framework is confidential. It is designed to replicate the kind of analytical framework used by industry for making prudent oil and gas investment decisions under uncertain conditions involving significant capital outlays and lengthy project life cycles.

[4] Eni has submitted financial and technical data and analyses and requested that they be held confidential in accordance with AS 38.05.035(a)(9). Thus this section does not discuss any confidential information concerning Eni's geologic, engineering and cost data. These documents are included and discussed in detail in the confidential *Economic Analysis and Internal Decision Process*, (Attachment 6).

The prudent investor standard is maintained throughout the project evaluation process. Under this standard, ADNR incorporates a collection of project performance benchmarks that are consistent with industry norms.

To obtain royalty relief the applicant must show by clear and convincing evidence that without royalty modification the project is not economically feasible. Nikaitchuq is an offshore, heavy oil prospect with relatively high expected exploration and development costs and low expected production possibilities. The final analysis of Nikaitchuq project development conducted by ADNR pursuant to the Eni royalty modification application suggests that, under reasonable assumptions about future oil prices and without some form of royalty relief, this project would not be sanctioned for funding and development.

In its simplest form, the ADNR Model describes project cash-flows for the Nikaitchuq development over a 50-year time horizon. The ADNR Model incorporates expected investment, production, price, revenue, and cost. It incorporates fiscal system attributes, including state and federal tax, state production tax (including the recent ACES legislation)[5], and royalty obligations, as well as other important commercial relationships, such as facility sharing and pipeline transportation charges.

The ADNR in-house model is flexible enough to allow ADNR to evaluate the effects of changes to the fiscal system. The model provides a platform for systematic evaluation of the effect of a change to the royalty rate. The model calculates the changes to the various financial metrics that result from a change in the royalty rate. These metrics include annual and cumulative discounted and undiscounted cash flow, years to payout, net present value (NPV), expected monetary value (EMV), and internal rate of return (IRR) on investment, as well as state revenues. Also, ADNR used its model to carry out sensitivity analysis of key driver assumptions and to characterize certain price, production, and cost variables in terms of probability distributions to evaluate how uncertainty among these drivers affects key project metrics and state revenues.

Eni furnished ADNR with 200 realizations of project production that depict the range of values and probabilities for the many reservoir factors that that determine ultimate reservoir recovery (e.g., aerial and vertical extent, rock characteristics, fluid composition and properties). These 200 Eni realizations represent the universe of possible resource recovery outcomes for ADNR's Monte Carlo analysis that fit the well-test data. The ADNR model samples repeatedly from this universe of production realizations, as well as from volatility inherent in price formation, as characterized in the mean reversion price model (see below), to generate a distribution of net present value (NPV) outcomes for the Nikaitchuq project. The central tendency (mean and median) and dispersion (variance) of the NPV outcomes depict project performance uncertainty and speak to the dimensions of ADNR's prudent-investor decision framework mentioned above.

ADNR incorporated the applicant's input data into its model along with its own assumptions about the path of uncertain future prices to derive independent results for the

[5] See HB2001 (11/15/2007).

economic feasibility of the Nikaitchuq project. The ADNR Model examines a range of possible inputs to derive a P50, or median, outcome from a Monte Carlo simulation. The P50 result is the value where 50 percent of the outcomes lay below this point and 50 percent of the outcomes lay above the P50 outcome. The ADNR Model uses Palisades Software's "@Risk" Monte Carlo software application to run the simulations and determine risk-weighted outcomes reported in the confidential supplement to this *Final Findings and Determination* (Attachment 7).

Calculating risk weighted outcomes is critical to a full analysis of a project. The probabilistic rate profile, determined based on the applicant's reservoir simulation results, is combined with pricing to determine the project revenue stream. Annual Alaska North Slope West Coast (ANSWC) crude oil prices were generated from an Ornstein-Uhlenbech type Mean-Reversion price model[6] with parameters estimated as described by Schwartz, (1997)[7] using annual price data for ANSWC crude as reported by Platt's. The starting ANSWC delivered price used in the model is $67 per barrel, the average price for 2007. The risk weighted cost profiles are then matched to the revenue stream generated by the probabilistic price and production models. This yields an NPV distribution. The mean of the NPV distribution is the EMV for the entire project that incorporates uncertainty and can be compared "apples-to-apples" with other versions of the project.

ADNR analyzed various senarios to explore Nikaitchuq project performance with and without royalty modification. DNR approves royalty modification only when it believes a project will not go forward without it. This means that the impact to royalty revenues to the state is the difference between the royalty revenues with royalty modification as was prescribed in the DNR decision and zero. Even under low price scenarios, ADNR determined that the state can expect to receive an additional $100 million over the life of the project.

If it is assumed that the project could have gone forward without royalty modification (again, not what ADNR assumes) the impact would be as indicated in Table 1. This table presents several possible price scenarios and the indicated change to the state royalty cash flow stream.

In Table 1 the scenarios labeled "$43 and Above (Sustained)" and "$40 Sustained" simply use a flat price deck for "Alaska North Slope West Coast" (ANSWC) crude oil (before inflation) for the life of the project, the price does not vary from year-to-year. An oil price of $40 is always just below the $42.64 royalty modification threshold and thus results in 5 percent royalty rates for every barrel of oil produced from the reservoir for the life of the project and the greatest negative impact to overall state royalty revenues.

---

[6] Dixit & Pindyck, 1994, http://www.puc-rio.br/marco.ind/sim_stoc_proc.html#mc-mrd.

[7] The Stochastic Behavior of Commodity Prices: Implications for Valuation and Hedging", Schwartz, E., Journal of Finance, 1997, Volume 52, issue 3, 923-973

Table 1. Change in Alaska royalty revenues if royalty modification were not necessary and project produced oil without royalty modification.

Price Scenario	Impact on State of Alaska Royalty Revenue ("With Royalty Modification Per Decision" Minus "Without Royalty Modification", 5% discount rate)
$43 and Above (Sustained)	$0 million
DNR Price Model	($39 million)
$40 Sustained	($160 million)

The "DNR Price Model" scenario does not use a constant or "sustained" price for the life of the project (i.e. flat price deck) as is the case with the other two scenarios in Table 1. We use a forward-looking, Monte Carlo-based "mean-reversion" model, as discussed above. This price model creates a price forecast where oil price fluctuates over time, simulating real-life price variability similar to what history has shown. The price for 2007, $67 per barrel ANSWC, was taken from U.S. Energy Information Agency's most recent price projection for West Texas Intermediate (WTI) crude, and adjusted for ANS-WTI basis by taking the previous 12-month average difference between these two prices. The model reverts to DNR's expected mean value of $53 per barrel, over time.

The ADNR has determined that under ADNR's price and discounting assumptions, the project attributes furnished by Eni, and the existing lease royalty rates in effect prior to this *Final Finding and Determination* (16.6667 percent fixed royalty rate and the 12.5 percent fixed royalty with 30 percent NPS for ADL 391283), the Nikaitchuq project does not meet prudent-investor standards for economic feasibility. ADNR concludes further that the royalty modification terms and conditions stipulated in Section IV.B would improve project economics. Eni represents that royalty modification would make project sanction more likely.

V. PUBLIC COMMENTS

On November 30, 2007, ADNR issued a Preliminary Findings and Determination to respond to Eni's royalty modification application. The public was invited to comment on the preliminary decision for thirty days, ending January 7, 2008 (Attachments 3 and 4).

No comments were received from the public.

VI. STATE'S PROPOSED ROYALTY MODIFICATION

A. Royalty Modification Requirements for the Nikaitchuq Project

1. Eni's application for royalty modification on ADLs 388571, 388572, 388574, 388575, 388577, 388580, 388581, 388582, 388583, 390615, and 390616, and ADL 391283 meets the requirements for consideration under AS 38.05.180(j)(1). Eni has paid the filing fee and submitted a complete application for the royalty modification including financial and technical data that meet the requirements of 11 AAC 88.105, 11 AAC 83.185, 11 AAC 05.010(a)(10)(H), and AS 38.05.180(j)(6).

2. The Schrader Bluff pool has been sufficiently delineated to the satisfaction of the commissioner for the purpose of considering royalty modification; this pool has not previously produced oil or gas for sale.

3. Eni has shown that oil or gas production from the Schrader Bluff pool would not otherwise be economically feasible.

4. Eni has made a clear and convincing showing that a modification of royalty meets the requirements of 38.05.180(j)(1)(A), and is in the best interests of the state.

B. Royalty Modification Terms for the Nikaitchuq Project

1. Royalty modification pursuant to the terms herein is granted to Eni US Operating Co. Inc. (Eni), as operator and 100 percent working interest owner of the Nikaitchuq project (Project), on ADLs 388571, 388572, 388575, 388574, 388577, 388581, 388582, 388583, 390615, 390616, and 391283. Royalty modification is denied for ADL 388580 because there was no apparent resource allocated to this lease.

2. Only production from Nikaitchuq Unit's Schrader Bluff OA reservoir, as delineated under this Findings and Determination, shall be eligible for royalty modification. To receive royalty modification on production, the lease must be committed to an approved participating area within six years of the date of Project sanction. After six years, any subject lease or portion of a subject lease not committed to an approved participating area for the Nikaitchuq Schrader Bluff OA reservoir shall revert to the respective individual lease royalty rates that were in effect immediately prior to this Findings and Determination.

3. If the Project, not materially changed from that set out in the October 16, 2007, royalty modification application, is not sanctioned by all working interest owners by February 28, 2008, this royalty modification decision is rescinded.

4. Within 30 days following the date of Project sanction, the working interest owners shall provide ADNR with the Project sanction documents, approvals for expenditure, and other documents supporting the technical and financial data submitted with Project sanction documents excluding any proprietary data. ADNR agrees to keep all such data confidential.

5. If six years following the date of Project sanction total actual Project spending starting December 1, 2007, does not meet $822 million in nominal dollars, then this royalty modification is rescinded. If 11 years following the date of Project sanction total actual Project spending does not meet $1.398 billion in nominal dollars, then this royalty modification is rescinded. The ADNR may audit the working interest owners' spending on this Project to determine compliance any time between the sixth and the 13th year following Project sanction. If at either cost threshold juncture this royalty modification is rescinded, then Eni will refund to the State of Alaska the difference between the royalty which would have been due at the royalty rates that were in effect immediately prior to the effective date of this Findings and Determination and the royalty due at the modified royalty rate, with interest as set forth in AS 38.05.135(d).

6. The NPS lease regulations set out in 11 AAC 83.201 – 11 AAC 83.295 remain in full force and effect for ADL 391283, except that the cost to the applicant for the application for royalty modification will not be included in any NPS lease Development Account balance.

7. (a) Nikaitchuq royalty modification mechanism implemented as follows:

   i. Original lease rates are 12.5 percent for ADL 391283 and 16.67 percent for ADLs 388571, 388572, 388575, 388574, 388577, 388581, 388582, 388583, 390615, and 390616.

   ii. For the first 25 years following the date of first sustained production, when Alaska North Slope West Coast ("ANS WC") delivered crude prices are below the threshold price per barrel as adjusted by inflation, then production from the Nikaitchuq Schrader Bluff OA reservoir on the subject lease will pay a 5 percent royalty. The ANS WC crude price for the month of production is the average assessment by Platt's Oilgram Price Report and Reuters online data providing service, of the spot price for ANS delivered on the West Coast. The average assessment of the spot price for ANS by each reporting service is the average of the midpoints of the high and low closing assessments for the spot price for ANS for all days during the month of production for which closing assessments are

reported. The threshold price shall start at $42.64 per barrel. This threshold price will be adjusted annually for inflation starting on May 1, 2008, and shall be adjusted on each May 1 thereafter. The inflation adjustment shall be (1 + inflation rate) multiplied by the previous year's inflation-adjusted threshold price. The inflation rate shall be determined by taking the previous year's annual implicit price deflator for GDP (initially, for the year 2007) as reported by the end of April of each year, dividing that deflator by the two-years-previous annual implicit price deflator (initially, for the year 2006), and then subtracting 1. The source of the inflation data shall be the Department of Commerce Bureau of Analysis (BEA) U.S. Economic Accounts-GDP. National Income and Productions Account (NIPA) Table 1.1.9. When the monthly ANS WC oil price is above the threshold, royalty rates for production attributable to such month(s) shall return to the original lease royalty rates.

iii. This royalty modification shall be terminated 25 years following the date of first sustained production and at that time royalty rates shall revert to the respective individual lease royalty rates that were in effect immediately prior to this Findings and Determination.

(b) For the 18th through the 120th months after first commercial production from the Nikaitchuq Schrader Bluff OA reservoir, if production from all of the subject leases averages below 4,000 barrels of oil per day for any previous twelve month period, full royalty modification rates of 5 percent shall be in effect for all production from the Nikaitchuq Schrader Bluff OA reservoir, regardless of oil price. Provided, however, nothing in this provision shall prevent Eni from applying for royalty modification under AS 38.05.180 (j)(1)(B)or (C).

8. In the determination of royalty value of oil or gas from any of its properties, Eni shall waive any rights to a transportation deduction for the pipeline constructed pursuant to the Easement granted on ADL 417493. This waiver shall remain in effect even if such pipeline is converted to a common carrier.

9. If any working interest owner should contract to use any processing facilities at any time for production from the reservoirs delineated and leases covered in this Findings and Determination, that working interest owner shall furnish ADNR the facilities contract, including information regarding the fee structure and volumes processed unless such contract prevents disclosure of such information. This information will be kept confidential by ADNR. The working interest owner shall also furnish produced oil, water, and gas volumes on a monthly basis broken down by individual working interest owner.

10. Should any third party petition the Nikaitchuq Unit facility owners to contract for use of any unit facilities, the cost of use shall be based on market rates. Any

resulting contract covering facilities access or use shall be shared with the ADNR. ADNR agrees to keep all such information confidential.

11. This royalty modification is not assignable without prior written approval of the ADNR commissioner, which shall not be unreasonably withheld. The assignee must be fit, willing, and able to satisfy all of the duties and obligations attached to this royalty modification and all other lease terms.

12. If at any time royalty modification is rescinded, the terms and conditions of this Findings and Determination shall terminate, with two exceptions. First, the provisions of Term 8 shall survive the termination of royalty modification. Second, all obligations to keep information confidential that was submitted pursuant to this Findings and Determination shall survive the termination of royalty modification.

VI. PROPOSED FINDINGS AND DETERMINATION

After detailed consideration where all the materials presented by the applicant were reviewed and incorporated into our analysis, the ADNR has determined that Eni meets the necessary requirements and that royalty modification for the Nikaitchuq development project is warranted under the terms established in Section IV of this finding and determination.

2/22/12 MINING INDUSTRY BRIEFING

<TARGET><BILL></BILL><SUBJECT>2-22-12 MINING INDUSTRY BRIEFING</SUBJECT><COMM>SRES27</COMM></TARGET>

ALASKA MINERS ASSOCIATION, INC.

Issues of Concern
for the Alaska Mining Industry for 2012

Actions needed by the Administration and/or the Legislature: January 2012

CRITICAL ITEMS: PERMITTING INTEGRITY – LITIGATION REFORM – ENERGY – INFRASTRUCTURE

Integrity of Permitting System - Ensure the integrity of the current rigorous, science-based state permitting process and fund it at a level that will ensure its integrity.

- Provide sufficient staff and funding for permitting functions of the Departments of Natural Resources, Fish & Game and Environmental Conservation.
- Ensure and enhance public confidence in the permitting system.

Increase Oil Flow in TAPS – Without oil flow the entire State economy will implode, with serious consequences for every business, including mining.

Litigation Reform – Support efforts to bring more accountability to the appeals and litigation processes for community and resource development projects.

Infrastructure - Advocate for and fund infrastructure that will provide access to remote areas of Alaska so natural resource projects can be developed.

- Settle on a route from the Parks/Dalton Hwys to Western Alaska and begin the development.
- Establish an effective design standard for pioneer roads.
- Fund roads between communities.

Energy - Advocate and adopt a state energy plan and fund interties, pipelines, hydroelectric, etc. to provide energy for resource development and communities.

- Ensure that Healy Plant #2 comes on line at the earliest possible date.
- Rationalize the management and control of the railbelt electrical intertie system.
- Fund and construct a regional electrical interties.
- Develop and implement a strategy to provide stable sources of energy to the railbelt.

PERMITTING PROCESS

Wetlands Mitigation & Banking – Establish a State mitigation program and evaluate State primacy over Section 404 wetlands mitigation, permitting and management.

Water Quality Standards - Continue to review water quality standards to ensure standards are scientifically supportable and developed using Alaska-specific criteria. Also, ensure continued availability of mixing zones and adoption of anti-degradation regulations.

EPA Permit Review Process - Oppose use of 404(c) and Aquatic Resources of National Importance (ARNI) to stop projects.

Public Interest Litigation – Enact legislation to require public disclosure of funding sources for public interest litigation.

Non-Profit Foundation Money - Enact legislation to require public disclosure whenever funds from 501(c)(3) non-profit foundations are used to affect public policy; disclosure to include name of the source, amounts and purpose for which the moneys are given.

Financial Assurance - Ensure that financial assurance (bonding) requirements for environmental compliance are managed exclusively by the State. Aggressively oppose federal takeover.

Endangered Species Act – Continue to aggressively oppose ESA listings in the courts to ensure decisions are based on sound science.

FISCAL ISSUES

Taxation - Maintain an equitable and stable tax structure at state and local government levels.

State Fiscal Policy - Adopt a long range fiscal plan.
Annual Airborne Geophysical Mapping Program - Increase funding for the extremely effective airborne geophysical mapping program.

Mineral Education & Training - Continue to support mining engineering and geological engineering, geology, the Mining and Petroleum Training Service (MAPTS), and the Delta Mine Training Center (DMTC) at levels that will ensure a trained workforce; continue funding the State's share of Alaska Resources Education (ARE).

LAND MANAGEMENT ISSUES

State Authorities - Ensure development of state-owned natural resources is not compromised by municipal or borough regulations or taxation or local government moratorium.

Land Management Philosophy - Ensure that uses of land are not mutually exclusive - resource development and recreation; mining and fish; oil and caribou; resource development and subsistence.

RS-2477 Rights-of-Way & Navigability - Continue to systematically and aggressively pursue State rights, both administratively and in the courts, to RS-2477 rights-of-way and State ownership and authority over navigable waters as granted at Statehood.

State Lands - Ensure no net loss of multiple use lands. *Oppose* additions to any state parks, refuges, critical habitat areas, marine restricted areas, or any other restricted-use areas, *unless* an equal acreage of other lands already having a similar designation is released and the new area being designated is first evaluated for mineral potential.

Land Transfers - Prior to any state land transfers to boroughs, land disposals/sales, or leases not required for resource development, require a detailed mineral evaluation, to include airborne geophysical surveys, be completed to help ensure that mineralized lands or key access routes are not transferred.

Outdated Federal Withdrawals - Pursue removal of old federal land withdrawals (where purpose for withdrawal has expired) which are blocking land transfers to the State, such as PLO 5150, the outer pipeline corridor. Encourage BLM to remove such PLOs and open the lands through its land planning process.

New Federal Withdrawals - Oppose all new federal land withdrawals, marine restricted areas, Antiquities Act designations, BLM wilderness studies, etc. and fight vigorously against additional buffers or other restrictions to multiple use of federal lands in Alaska. Oppose 2001 Roadless Rule and support the restoration of the 2003 Tongass Exemption. The Alaska National Interest Lands Conservation Act (ANILCA) provides that "no more" federal land will be withdrawn for parks, preserves, monuments, wilderness designations, wild & scenic river designations, etc.

International Heritage & Biosphere Designations - Oppose establishment of international parks, biosphere reserves, and world heritage sites, such as the so-called Beringia (over the Seward Peninsula & Bering Sea), NPRA, or ANWR. International designations would - 1) surrender partial sovereignty to the United Nations, and 2) eliminate access across the affected lands and waters.

Federal Mining Law - Continue to oppose changes to federal law and regulations that would be adverse to Alaska miners.

NPR-A – Petition Congress to open NPR-A to mineral entry and coal leasing.

OTHER ISSUES

Business Climate – Promote Alaska resource opportunities to counter the negative perceptions identified in polls by CNBC, Forbes, etc.

NEPA - Provide funding for State agencies to participate in NEPA processes.

Coal Development - Encourage utilization of coal liquefaction and gasification technologies for Alaska's vast coal resources.

Climate Change - Oppose all federal actions unless they are based on sound data and peer-reviewed science.

Jones Act - Because Jones Act vessels for bulk mineral shipments are not available, petition Congress to amend the Jones Act to allow use of non-Jones Act vessels for shipment of "non-petroleum bulk natural resources within or from Alaska or intra-Alaska shipments of petroleum".

The Economic Benefits of Alaska's Mining Industry

January 2012

Mining is a growing force in Alaska's economy

providing jobs for thousands of Alaskans and millions of dollars of personal income throughout Alaska. Alaska's mining industry includes exploration, mine development, and mineral production. Alaska's mines produce zinc, lead, gold, silver, coal, as well as construction materials, such as sand, gravel, and rock.

In 2011, Alaska's mining industry provided:

- **4,500 direct** mining **jobs** in Alaska.
- **9,000 total** direct and indirect **jobs** attributed to Alaska mining industry.
- **$620 million** in total direct and indirect **payroll**.
- Some of Alaska's highest paying jobs with an estimated **average annual wage of $100,000**, over twice the state average for all sectors of the economy.
- **$17 million** in **local government revenue** through property taxes and payments in lieu of taxes.
- **$148 million** in **state government revenue** through rents, royalties, fees, and taxes, up 170% from 2010.
- **$172 million** in payments to **Alaska Native corporations**.
- **Mostly year-round jobs for residents** of more than **120 communities** throughout Alaska, half of which are found in rural Alaska where few other jobs are available.

Largest Producing Mines and Selected Advanced Exploration Projects

Pebble Project	State	X	X	X

2011 Economic Benefits

estimated

Exploration

- **$300 million** spent on exploration, up 13% from 2010.
- **60 exploration projects** spending more than $100,000, of which **30 projects spent more than $1 million**.
- **$2.8 billion** spent on exploration since 1981.

Development

- **$175 million** spent on **mine construction,** down 40% from 2010.

Production

- **$3.8 billion** in **gross mineral production value** from Red Dog, Greens Creek, Fort Knox, Pogo, Kensington, and Usibelli Coal mines, placer mines, and rock, sand, and gravel operations, up 16% from 2010.
- More than **200 placer mines** produced **70,000 ounces** of gold, as well as platinum.
- **$80 million in production value** from more than 120 active rock quarries, and sand and gravel operations.
- Export value of **$1.3 billion**, or **31%** of Alaska's **total exports** (2010).

Usibelli Coal Mine
Coal

- Alaska's only operating coal mine, exporting half of its production in 2011
- Fuels 40% of Interior Alaska's electricity
- Founded in 1943
- 138 employees in 2011

Greens Creek Mine
Silver, zinc, gold, and lead

- Among the world's top 10 silver producers
- Largest Southeast Alaska for-profit employer, in terms of payroll
- Largest payer of property tax in the City & Borough of Juneau
- Discovered in 1975, producing from 1989 to 1993, and continuously since 1996
- 355 employees in 2011

Red Dog Operations
Zinc, lead, and silver

- One of the world's largest zinc concentrate producers
- Only taxpayer in the Northwest Arctic Borough
- Discovered in 1968, producing since 1989
- 620 employees (including 130 contractors) in 2011

Fort Knox Mine
Gold

- Alaska's largest surface gold mine
- Largest single property taxpayer in the Fairbanks North Star Borough
- Discovered in 1984, producing since 1996
- 500 employees in 2011

Pogo Mine
Gold

- Discovered in 1994, producing since 2006
- 312 full-time employees and 150 full-time contractors in 2011
- Paid more than $51 million in wages in 2011
- Capital spending exceeded $11 million in 2011

Kensington
Gold

- 2011 marked the first full year of production
- Expect nearly 90,000 ounces of gold in 2011
- Adding infrastructure to provide long-term, sustainable production
- 230 employees in 2011

Nixon Fork
Gold and copper

- Discovered in 1917, intermittent production since 1920s
- Production suspended in 2007, re-opened in 2011
- 100 jobs in 2011

Chuitna
Coal

- Currently in the permitting process
- 300-350 expected production jobs

Wishbone Hill
Coal

- First mined in 1916
- Project feasibility study completed in November 2011
- 75-125 potential production jobs

Donlin Gold
Gold

- Discovered in 1988, continued exploration since 1995
- Permitting process expected to start in 2012
- 87% Calista shareholder hire at its camp operation
- Up to 1,400 potential production jobs, depending on the production timeline

Livengood
Gold

- Placer mining began in 1914, lode deposit discovered in 2007
- Pre-feasibility Study expected by June 2012
- Approximately 500 potential production jobs

Niblack
Gold, silver, copper, and zinc

- Ongoing exploration for more than 10 years
- $26 million invested since 2009
- 200-300 potential production jobs

Pebble Project
Copper, gold, and molybdenum

- Discovered in 1987, ongoing exploration and environmental studies since 2002
- Over $400 million invested through 2010
- 800-1,000 potential production jobs

Strengthening Local Economies and Communities

Mining companies strengthen Alaska's local economies by employing Alaska residents from more than 120 Alaska communities located in 26 out of 29 Alaska boroughs or census areas. The industry also purchases supplies and services from hundreds of Alaska businesses.

These mining companies are also a significant source of stable revenue for local governments, as well as significant state government revenue. In 2011, Alaska's mining industry paid:

An estimated total of **$17.2 million to local governments,** including:

- $8.9 million in payment in lieu of taxes (PILT) by Red Dog to the Northwest Arctic Borough.
- $5.6 million in property taxes paid by Fort Knox to the Fairbanks North Star Borough.
- $1.4 million in property taxes paid by Greens Creek to the City and Borough of Juneau.
- $1.2 million in property taxes paid by Kensington to the City and Borough of Juneau.
- Tax payments to other local governments, including Denali Borough, City of Nome and others.
- Mining industry employees also pay local property and sales taxes.

Mining companies paid an estimated **$148 million to state government** in royalties, rents, fees, and taxes, up 170% from 2010.

The mining industry also paid **$70.1 million in other state government-related revenues,** including:

- $28 million to the Alaska Railroad Corporation – $21 million for moving coal and $7 million for moving sand and gravel.
- $41.1 million to Alaska Industrial Development & Export Authority for the use of state-owned facilities (DeLong Mountain Regional Transportation System and Skagway Ore Terminal).

- $1.0 million to the Alaska Mental Health Trust for rents and royalty payments, and construction material sales.

Partnering with Alaska Native Corporations

All Alaska Native corporations benefited from mining industry activity – in 7(i) and (j) royalty sharing payments, in jobs for shareholders, or through business partnerships.

- $169.9 million in net proceeds from Red Dog Operations to NANA and distributed $82.0 million to other Alaska Native regional and village corporations.
- 56% of the 550 year-round jobs at Red Dog are filled by NANA shareholders, including Teck Cominco, NANA Lynden and NANA Management Services jobs.
- Calista Corporation anticipates $2 million in royalties and other revenue for mineral agreements, including lode exploration, placer gold production, and construction material sales.
- Calista shareholders, descendants and spouses predominantly fill the exploration camp jobs at Donlin Gold.

Many Alaska Native corporations have taken the opportunity to develop businesses that serve the mining sector, including: NANA Regional Corporation, Calista Corporation, The Kuskokwim Corporation, Central Council Tlinglit & Haida Indian Tribes of Alaska, Goldbelt, Inc., Kake Tribal Corporation, Klukwan, Inc., Prince of Wales Tribal Enterprise Consortium, Iliamna Development Corporation, Pedro Bay Corporation, Alaska Peninsula Corporation, Kijik Corporation, Igiugig Native Corporation, Tenalian Incorporated, and Tyonek Native Corporation.

Every Alaska Native region has some form of mining potential, ranging from gravel operations to gold, silver, copper, nickel, lead, zinc, platinum, tungsten, manganese, rare earth minerals, jade, limestone, and coal deposits. Several Alaska Native corporations, such as NANA Regional Corporation, Calista Corporation, The Aleut Corporation, Sealaska Corporation, CIRI, Doyon Ltd., Ahtna Inc. and Arctic Slope Regional Corporation, are actively evaluating the mining potential in their regions.

Special thanks to Dave Szumigala, Alaska Department of Natural Resources, and Lisa Harbo, Alaska Department of Commerce, Community and Economic Development for their assistance. Other sources used in this report include: State of Alaska Departments of Commerce, Community and Economic Development, Labor and Workforce Development, Natural Resources, and Revenue, Alaska Railroad Corporation, Alaska Industrial Development & Export Authority, various local and borough governments, and mining companies. Prepared in consultation with McDowell Group, Inc.

AMA Issues of Concern

- Integrity of the Permitting System
- Increased Oil Flow in TAPS
- Litigation Reform
- Infrastructure
- Energy

ALASKA MINERS ASSOCIATION

AMA Permitting Issue – Wetlands

- U.S. Army Corps of Engineers – Section 404
- All activities on all lands
- >50% of Alaska is classified as wetlands
- 'No Net Loss' is the policy
- Impacts must be offset
- Compensatory Mitigation Credits are required

ALASKA MINERS ASSOCIATION

AMA Advocates

- Establishing a State mitigation program
- Evaluating State primacy over Section 404 wetlands mitigation, permitting, and management
- Many states with similar issues have established state run programs
- Provide mitigation credits where there are limited options
- Developed to address DOT needs, expanded to other permittees

ALASKA MINERS ASSOCIATION

Perspectives

- Alaska's scale is unique
  - Access to mineral lands is vital
  - Industry is a century old but in its infancy
  - Infrastructure is key limitation
    - Roads to Resources
    - Lines to Mines
  - Uncertainty is the enemy of economic investment
  - Need to continue to strengthen the process

ALASKA MINERS ASSOCIATION

The Economic Impacts of Alaska's Mining Industry

Prepared for:

Joint Senate and House Resources Committee

Prepared by:
McDowell Group, Inc.

Presentation Contents

- Overview of Alaska Mining Activity
- Employment and Payroll
- Alaska Resident Employment
- Alaska Spending
- Payments to Local and State Governments
- Benefits to Alaska Native community

Alaska Mining Activity in 2011

- Exploration
  - $300 million , up 13% from 2010
  - 60 exploration projects spending more than $100,000
- Development
  - $175 million, down 40% from 2010

Alaska Mining Activity in 2011

- Production
  - $3.8 billion in gross mineral production value
  - >200 placer mines
  - >120 active RSG operations
- Exports of $1.3 billion (2010) or 31% of AK's exports

Employment and Payroll (2011)

- 4,500 direct jobs
- 9,000 total direct and indirect jobs
- $620 million in total direct and indirect payroll
- Average annual wage of $100,000 (double the statewide average)

Purchases of Goods and Services in Alaska

- Large operating mines spent $620 million on goods and services
  - $500 million (or 70% of total) was spent with Alaska businesses
- More than 600 Alaska businesses provided goods and services to Alaska's large mines
- 500 Alaska businesses supported advanced exploration projects

Payments to Local Governments (2011)

$17.2 million to local governments, including:

- $8.9 million in PILT to NWAB
- $5.6 million to FNSB
- $2.6 million to CBJ
- Other payments to Denali Borough City of Nome, etc.
- Employees also pay local property and sales tax

Payments to State Government (2011)

- $148 million in royalties, rents, fees, and taxes -- up 170% from 2010
- Also paid $70 million in other revenues, including:
  - $28 million to Alaska Railroad (coal, sand & gravel)
  - $41 million to AIDEA for DeLong Mountain Regional Transportation System &Skagway Ore Terminal use
  - $1 million to the Alaska Mental Health Trust

Benefits to Alaska Native Corporations

- Nearly all Alaska Native corporations benefit from mining
  - 7(i) and (j) royalty sharing payments
  - jobs for shareholders and descendants
  - business partnerships

Benefits to Alaska Native Corporations

- ANC benefits include:
  - $170 million in net proceeds from Red Dog Operations to NANA, of which $82 million was distributed to other ANCSA regional and village corporations
  - 56% of the 550 year-round jobs at Red Dog are filled by NANA shareholders
- Every ANCSA region has some form of mining potential

Summary

- Significant source of jobs (9,000 jobs in Alaska)
- Provides high-paying, year-round jobs
- Key source of tax revenue, especially to local governments
- Critical ANC benefits
- Economic benefits spread throughout Alaska

Thank You!

Alaska Producers

2/23/12 PRESENTATION BY DEPARTMENT OF REVENUE: ACCESS TO INFORMATION AND FISCAL NOTE ANALYSIS

<TARGET><BILL></BILL><SUBJECT>2-23-12 PRESENTATION BY DEPARTMENT OF REVENUE ACCESS TO INFORMATION AND FISCAL NOTE ANALYSIS</SUBJECT><COMM>SRES27</COMM></TARGET>

Senate Resources Committee
Joe Paskvan, Co-Chair
February 23, 2012

Let's call the meeting to order.

Let the record reflect that it is _____ p.m. on ~~Tuesday~~ Thursday, February 23.

Let the record reflect that there is a quorum. Present are

- Co-Chair Wagoner
- Senator Stedman
- Senator Stevens
- Senator Wielechowski
- Senator French
- Senator McGuire
- And myself, Senator Paskvan

During this hearing, the Senate Resources Committee will learn more about the Department of Revenue's perspective on "Access to Information" and "Taxpayer Confidentiality."

This issue first presented itself to me when I read the December 30, 2011, Decision Following Trial De Novo regarding the Assessed Valuations of TAPS.

In that decision, the judge wrote that the Alaska statutes "grant the Division certain investigative powers" but that "there was no persuasive evidence presented at the trial de novo that the Division has ever exercised these powers with respect to the valuation of TAPS."

Additionally, the judge wrote, "The Division broadly interprets what it considers 'taxpayer confidential' information under applicable statutes and will not disclose such information to the Municipalities specifically or public generally. The Division considers all information that it receives from a taxpayer as 'taxpayer confidential,' even if it does not contain the particularities of a taxpayer's business affairs and is obtainable from the public domain."

There is more in the decision about this issue, and we have discussed it in detail during a prior hearing; however, today is the Department of Revenue's day. I look forward to their testimony.

Welcome back, Commissioner Butcher.

Please introduce yourself for the public record and then begin your testimony.

RECEIVED JAN - 3 2012

IN THE SUPERIOR COURT FOR THE STATE OF ALASKA

THIRD JUDICIAL DISTRICT AT ANCHORAGE

BP PIPELINES (ALASKA) INC., EXXONMOBIL PIPELINE COMPANY, UNOCAL PIPELINE COMPANY, CONOCOPHILLIPS TRANSPORTATION ALASKA, INC. and KOCH ALASKA PIPELINE COMPANY, Owners, and ALYESKA PIPELINE SERVICE COMPANY, as Agent for the Owners, FAIRBANKS NORTH STAR BOROUGH and CITY OF VALDEZ, Appellants/Cross-Appellants, v. STATE OF ALASKA DEPARTMENT OF REVENUE, STATE ASSESSMENT REVIEW BOARD, and NORTH SLOPE BOROUGH, Appellees.	Case No. 3AN-06-8446 CI (Consolidated) Tax years 2007/08/09

ORDER ON RECONSIDERATION RE EXHIBITS SOA7-11 and SOA7-110

The Department and the Municipalities dispute the extent to which SOA7-11 and SOA7-110 should be confidential. The Municipalities submitted copies of the exhibits with proposed redactions on October 28, 2011. This Court issued an oral ruling with respect to confidentiality of those documents on October 31, 2011.[1] Thereafter, both parties filed motions to reconsider that order. At the request of the Court, each party filed responses to those motions to reconsider.

[1] Tr. 12429 – 12432

This Court ordered that for all fields with three or more producers or explorers, the categories of production in that field, including under development (UD) and under evaluation (UE), would be public. For fields with less than three or more producers or explorers, only the total production would be public.

The State seeks reconsideration and argues that the individual categories should remain confidential for all fields, regardless of the number of producers within the field. The State asserts that because the UD and UE categories of production "were informed by information from the operator, ... then taxpayer confidential communications and information received from the operator could be determined."[2]

The Municipalities assert that the Court should not have made any of the production forecasts confidential, regardless of the number of producers in a given field. They assert that the portions of SOA7-11 and SOA7-110 that they designated to be public do not contain taxpayer information protected by any applicable statute,[3] that the Department changed its policy to make this information confidential in 2006 without following proper rule-making procedures,[4] and that they are only seeking to have the Department's own work product made public – not information from the operators.[5]

---

[2] SOA's Motion for Reconsideration at 3.

[3] Munis' Motion for Reconsideration at 3.

[4] *Id.* at 4.

[5] *Id.* at 5.

Based upon this Court's review of the parties' submissions, and applying the same legal analysis that was set forth by this Court in the Order re Confidentiality of Certain Exhibits dated October 17, 2011,[6] the Municipalities' Motion to Reconsider is GRANTED. SOA7-11 and SOA7-110 shall be public except as to the redactions proposed by the Municipalities in their filing dated October 28, 2011.

This Order shall become effective twenty days from the date of its distribution, unless otherwise ordered by the Court. Upon receipt of this Order, the State shall immediately provide a copy of this Order to all entities that may have provided confidential information to the State that is included within the two exhibits, and shall accord to each such entity the opportunity to review the public and confidential versions of each exhibit.

DATED this 29th day of December, 2011.

Sharon Gleason
Judge of the Superior Court

I certify that on 12.30.11
a copy was mailed to each of the following
at their address of record:
Diane Mercer
Judicial Assistant / Deputy Clerk

Scedorf, Palumbo, Mahoney, Garatoni, Gabel
Diemer, Johnson, Richards, Brena, Long
& Baker

[6] Pages one through five of that Order is incorporated by reference as if fully set forth herein.

Access to Information / Confidentiality
February 23, 2012

Notes

1. DOR reading of statutes is the broadest possible, even broader than a plain reading would support, in my opinion.

2. Why is any information provided to DOR treated as the business particulars of a taxpayer? For instance why are hypothetical cost studies that contain no business particulars treated as confidential? Why is the data received when doing the production forecast for the revenue sources book confidential - although the companies are taxpayers (as is every entity and person at some level) but they are not providing the information as part of the taxation process? It's just an excuse to do business behind closed doors, it seems to me.

3. Even if DOR interpretation of statutes were reasonable, the process could be opened up via legislation. As a matter of public policy, this seems so obviously in the best interests of the public and in preventing corruption. Would they support that?

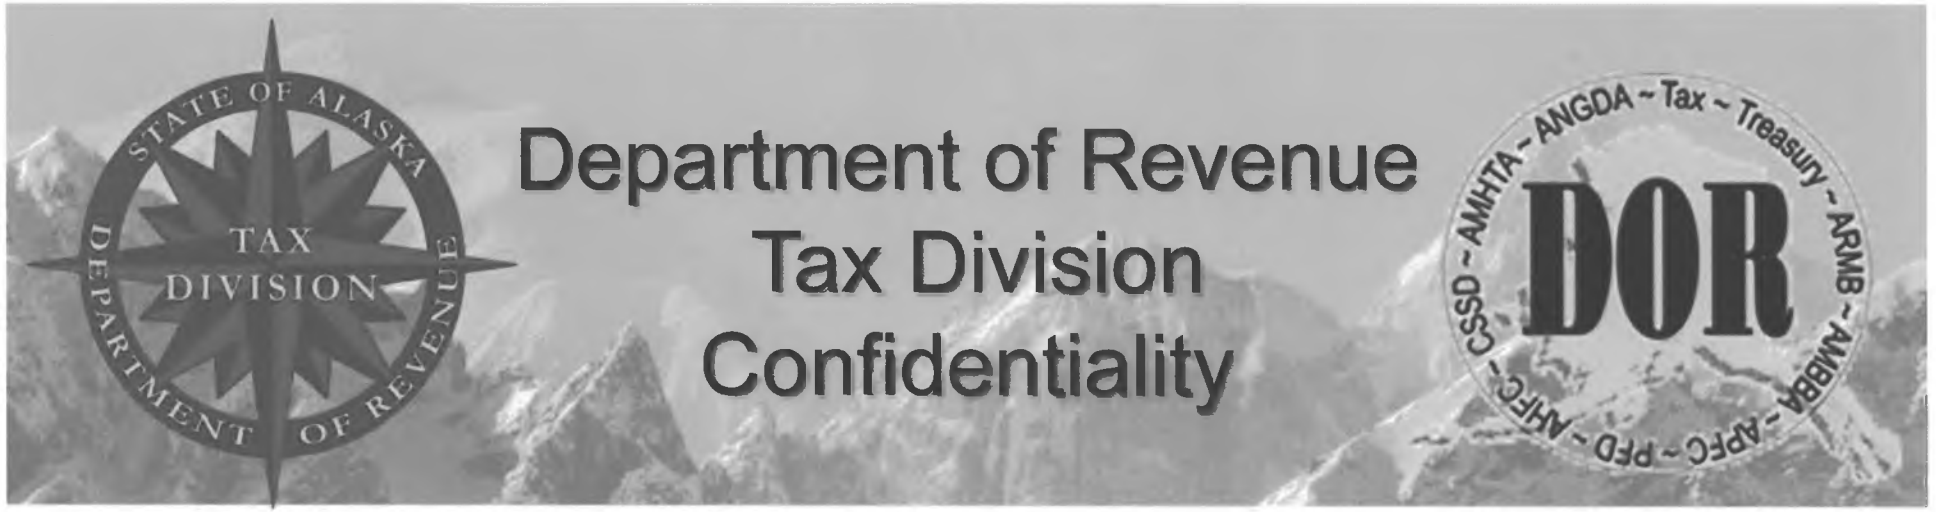
4. It's suggested DOR has good information provided by industry via subpoenas and cooperation. Gleason reviewed what DOR had and was unimpressed by what was voluntarily provided (that was in her latest decision).

5. I doubt DOR uses subpoenas with any regularity or with vigor in the context of production taxes because info they do have tends to show up in the property tax context and production forecasting (although I am not familiar with DORs use of subpoenas in this area).

Question re: Forecast Information

The Revenue Sources Book only publishes production forecasts for the next 10 years. How do we (and the public) know the forecast beyond that?

Could you please provide the Committee with that information on a pool basis (Orion, West Sak is a pool, etc.)?



Presentation to the Senate Resources Committee February 23, 2012 Alaska Department of Revenue

Access to Information

- Assessment Process
- Relevant Confidentiality Statutes
- Legislators' Concerns Regarding Confidentiality
- DOR Information Gathering Procedures
- State Assessment Review Board (SARB) Proceedings
- Subpoena Power
- Joint Administrative Agreements
- Municipal Codes
- Benefits of Confidentiality

Assessment Process

- Preliminary Assessment by State Assessor
- Appeal to Department & Informal Conference Decision
- Appeal to SARB & SARB Determination
- Certified Assessment
- Appeal to Superior Court & Superior Court Decision
- Appeal to State Supreme Court & Supreme Court Decision

Relevant Statutes

- AS 43.05.230 states in part
  - "It is unlawful for a current or former officer, employee, or agent of the state to divulge the amount of income or the particulars set out or disclosed in a ***report or return*** made under this title . . ."
- AS 40.25.100(a) which also applies to DOR states in part
  - "Information in the possession of the Department of Revenue that discloses the particulars of the business or affairs of ***a taxpayer or other person*** is not a matter of public record . . ." It further states that this information will be "kept confidential".
- The statutes referenced above are very broad and apply to all information that discloses the business affairs of all persons, not just taxpayers
- AS 43.05.230(f) provides that for each violation of confidentiality there is a penalty of up to $5,000 or prison sentence of up to 2 years or both

Legislators' Concerns Regarding Confidentiality

- During special legislative session (ACES) in 2007, the topic of confidentiality came up on several occasions
- Industry concerned with DOR's ability to maintain taxpayer confidentiality
- Legislators voiced those same concerns
- Legislators discussed increasing penalties for breaches of confidentiality
- As a result DOR adopted a "Confidentiality Policy" and requires annual confidentiality training of all DOR employees, contractors and others that have legal access to taxpayer information

DOR Information Gathering Procedures

- DOR compels taxpayers to provide information in a variety of ways
- Tax returns and property tax statements must be signed by the taxpayer as truthful renditions under penalties of perjury
- DOR and DNR receive confidential producer data related to reserves, such as confidential plans of development (for which there are also public versions available) and proprietary production forecasts internal to producer companies
- TAPS assessments by DOR (not SARB) were $4.5 billion in 2007, $7.2 billion in 2008 and $7.7 billion in 2009.
- Using information under the de novo provisions at trial in 2011 that was not actually in existence in 2007, the Superior Court ruled TAPS value at $8.9 billion in 2007, $9.6 billion in 2008, and $9.2 billion in 2009. The Municipalities in contrast argued TAPS value is at least $13 billion, while the TAPS Owners argued TAPS value is around $1 billion.
- Based upon the information in existence at the time the Department conducted its property tax assessments for the 2007-2009 tax years, the Department's valuations were reasonable.

SARB Proceedings

- 1983 AG Opinion
  - Determinations of the SARB are public
    - "There is nothing in AS 09.25.100 [renumbered to the current AS 40.25.100] nor AS 43.05.230 that implies that the legislature intended these assessment procedures and records to be confidential. Both of these statutes are aimed a preventing disclosure of information on the amount of income of a taxpayer or the particulars of a business of a taxpayer. These restrictions are not violated by assessing property of the taxpayer and making the valuation of that property open to the public."
  - Information on the amount of income or the particulars of a business of a taxpayer should be held confidential
    - "15 AAC 56.005(b) makes the property statement filed by a person owning property taxable under AS 43.56 a 'report or return for purposes of AS 43.05 and 15 AAC 05.' To the extent that the statement reveals information on the amount of income or the particulars of a business of a taxpayer, the statement should be held confidential in accordance with the dictates of AS 09.25.100 and AS 43.05.230."

SARB Proceedings (cont.)

- In compliance with the 1983 AG opinion, SARB conducts public hearings
- SARB does not, however, hold taxpayer information confidential as required under the statutes and as advised by the AG opinion
- All information would be available to SARB and the municipalities during SARB proceedings if taxpayer information was treated as confidential in accordance with applicable statutes and the AG opinion

Subpoena Power

- AS 43.05.040(a) grants subpoena power to DOR
- Subpoenas are expensive and time consuming
- Subpoenas can be appealed, or DOR may seek a court order to compel a taxpayer to comply with a subpoena
- As such, subpoenas are litigated and can be litigated all the way to the Alaska Supreme Court
- Subpoenas have been utilized by DOR but only when deemed necessary
- Subpoenas have not been used on property tax issues due to statutory deadlines and the reality that any confidential information received under a subpoena would not be reviewed by SARB upon appeal of the Department's assessments

Joint Administrative Agreements

- AS 43.56.060(g) allows the Department to "enter into agreements with a municipality for the cooperative or joint administration of the assessing authority . . ."
- DOR had an agreement for several years with North Slope Borough (NSB)
- DOR ended the agreement with the NSB when NSB's only two employees working under the agreement retired and the NSB did not hire new employees to continue the cooperative joint administration of the property tax function
- DOR previously engaged in discussions with other municipalities up through 2007 for Memorandums of Understanding ("MOUs"), but agreement on MOU terms could not be reached primarily due to the requirement that the municipalities must provide resources to assist in the assessment function. Since that time, Municipalities have not requested MOUs.

who said — is this recorded somewhere?

NOTE:
"blatantly false" → ask for more information.

Municipal Codes

- NSB Ordinance - Chapter 3.27.050 states in part
  - "(A) Every person having ownership or control of or an interest in AS 43.56 property must file with the Borough Assessor a copy of the return filed with the Department of Revenue..."
  - "(B) The Assessor is not bound to accept the return rendered by the Department of Revenue as correct but may make an independent investigation whether or not a return has been filed on the AS 43.56 property. In either case, the Assessor may make his own valuation of the AS 43.56 property, which is prima facie evidence of value."
- Valdez Ordinance – Chapter 3.28.020 states in part
  - "(A) Every person having ownership or control of or an interest in property taxable under Alaska Statutes chapter 43.56..., shall file with the city assessor a copy of the Alaska Statutes Chapter 43.56 property tax return filed with the State of Alaska Department of Revenue..."
  - "(B) The Assessor is not bound to accept the return rendered to the Department of Revenue as correct. He may make an independent investigation of Alaska Statutes Chapter 43.56 property... In either case, the assessor may make his own valuation of the Alaska Statutes Chapter 43.56 property, which is prima facie evidence of value."
- The Department does not know if the Fairbanks North Star Borough has a similar provision, but if not, it certainly has the ability to enact one
- Existing municipal ordinances give municipalities the ability to conduct their own investigations regarding property tax assessments. To DOR's knowledge, municipalities have never done this.

Benefits of Confidentiality

- Leads to cooperation between DOR and its taxpayers
- Fosters trust in us by our taxpayers
- Lends credibility to the Division
- Aids us in obtaining information without costly litigation

Summary of Confidentiality

- Confidentiality statutes are very broad; all information regarding business affairs of any person is confidential
- SARB does not put measures in place, such as issuing protective orders, to protect taxpayer confidential information in administering its AS 43.56 property assessment appeal hearings
- Municipalities have access to all taxpayer information at Superior Court under protective order. In addition, some municipalities have ordinances which allow them to conduct their own investigations regarding property taxes.
- DOR is willing to enter into agreements with municipalities under 43.56.060(g), but in so doing municipalities must assist cooperatively in the assessment process
- The intent of AS 43.56.060(g) is not, nor are MOU agreements executed, to simply to give municipalities information.

Questions?

Access to Information

- Relevant Statutes
- Department Will Not Use Subpoena Power
- The Department Overuses Taxpayer Confidential Designations
- Department Will Not Agree to a Joint Administrative Agreement

Access to Information

491. SARB observed the following in its Certificate of Determination for the 2007 assessment year:

> The Board also found that the Owners failed to take advantage of the opportunity to provide the Division with persuasive data to challenge the reserves estimates or throughput projections used by the Division if the Owners have such data. The Board found that the Owners chose not to the [sic] share information that the Owners and their parent companies possess regarding throughput and proven reserves with the Division or the Board and instead chose to present evidence and testimony from outside experts who did not have access to the information the Owners possess that was not already in the public record, and who lacked adequate direct experience with, or expertise about, the TAPS or the Alaska North Slope reserves.

Gleason Decision ¶ 491

Access to Information

5. AS 43.56.080 grants the Division certain investigative powers when assessing AS 43.56 properties, including the power to "enter any premise necessary for the investigation during reasonable hours," to "examine property and appropriate records," and to compel owner representatives "to appear for examination under oath by the department." There was no persuasive evidence presented at the trial de novo that the Division has ever exercised these powers with respect to the valuation of TAPS.

Gleason Decision ¶ 5

Access to Information

6. The Division broadly interprets what it considers "taxpayer confidential" information under applicable statutes and will not disclose such information to the Municipalities specifically or to the public generally. The Division considers all information that it receives from a taxpayer as "taxpayer confidential," even if it does not contain the particularities of a taxpayer's business affairs and is obtainable from the public domain. As a result, the Division did not provide the Owners' new replacement cost study by Stantec Consulting, Inc. ("Stantec") to the Municipalities.

Gleason Decision ¶ 6

Access to Information

7. AS 43.56.060(g) provides that "[t]he department may enter into agreements with a municipality for the cooperative or joint administration of the assessing authority conferred on the department by this section." The North Slope Borough previously had such an agreement with the Department. The City of Valdez and Fairbanks North Star Borough have never been parties to joint assessment agreements with the Department.

Gleason Decision ¶ 7

Access to Information

8. In its 2010 decision, SARB expressed its concerns regarding the Division's assessment practices:

> The Board believes that it is time for the Division to address the problems created by the way it handles taxpayer confidential information in the assessment process. The Division's failure to provide interested parties with the information on which the assessment was made in time to allow those parties meaningful input in the determination of the property's assessed value, before that determination is subject to limited review of an appeal before the Board, has the potential to throw the fundamental fairness of the AS 43.56 assessment process into question. The Board believes that, due to the Division's current practices with regard to the use of taxpayer confidential information in its AS 43.56 assessments, that process is close to broken and is headed in the wrong direction.

This Court concurs with the Board's observations in this regard.

Gleason Decision ¶ 8

Access to Information
Information at DOR Level

- History of TAPS Valuation
- DOR Process
- Access to Taxpayer Information
- Treatment of Taxpayer Information
- Consequence of Lack of Access to Information

Access to Information

History of TAPS Valuation

- DOR relying on TSM based rates lead the assessments falling from over $8 billion in the mid-1980s to $2.75 billion in 2001 [Gleason Decision ¶ 30]
- For decades the valuation of TAPS was a negotiated process that largely excluded the Municipalities
- The Municipalities fully engaged the process for the 2005 assessment

Access to Information

Observation About DOR's Process

- Key DOR staff are fair, dedicated, and highly competent
- The SARB has also been balanced and diligent
- However the DOR process–as related to information relied on in the taxation process–is close to broken. [Gleason Decision ¶ 8]

Access to Information

Access to Confidential Information

- Taxing authorities typically compel information
  - DOR can subpoena information, depose taxpayer representatives, and investigate property and records [AS 43.56.080; AS 29.45.130; AS 43.55.040(a)]
- DOR policy is to work cooperatively with industry, so it does not exercise these powers [Gleason Decision ¶ 8]
- Thus, DOR relies on information that a taxpayer volunteers or that is publicly available

Access to Information
Taxpayer Information

- The Alaska Public Records Act, AS 40.25.110, requires State documents to be subject to public examination

- Exception exists under AS 40.25.100(a) for tax information "that discloses the particulars of the business or affairs of a taxpayer" in which case the "information shall be kept confidential except when . . . required in an official investigation [or proceeding]"

- AS 43.05.230(a) also makes it unlawful to "divulge the amount of income or the particulars set out or disclosed in a report or return" except in conjunction with "investigations or proceedings"

Access to Information

Taxpayer Information

DOR narrowly reads taxpayer confidentiality statutes, denying public access to:

- All information provided by taxpayers
  - Non-sensitive correspondence, hypothetical studies, publicly available information, etc.
- Information provided for its production forecasting, which is a budgeting function [2007-2009 Trial Tr. 8813-14, Tr. 10874-877]
- The Municipalities
  - AS 43.56.060(g) allows for joint administration of taxes
  - North Slope Borough had such an agreement until recently

Access to Information

Consequence of Information Access

- Industry acts to prevent the best information from harming its position on taxes
  - Low flow documents
  - Royalty trust statements removed
  - BP Pipelines no longer participating in reserves function [2007-2009 Trial Tr. 11480]
  - As a matter of policy DOR does not compel the production of useful information
- DOR does not make publicly available taxpayer information in its possession
- Result–DOR and Legislature do not have access to information necessary to be informed about oil and gas tax issues in Alaska

Access to Information
Source Materials

- Alaska Statutes

Conclusion

- Open Access to Facilities
- Reasonable Transportation Rates
- Minimize Barriers to Entry
- Sound Tax Policy
  - Recognizes Market Structure
  - Recognizes Specific Behavior and Participants Most Likely to Be Impacted by Tax Incentives
  - Recognizes Stage of Development of Basin

THANK YOU

3/01/12 DEPARTMENT OF REVENUE: RESPONSES TO COMMITTEE QUESTIONS ON OIL AND GAS PRODUCTION TAX

Oil and Gas Production Tax

Department of Revenue:

Responses to Committee Questions

March 1, 2012

State of Alaska
Department of Revenue

Commissioner Bryan Butcher

SEAN PARNELL, GOVERNOR
333 Willoughby Avenue, 11th Floor
P.O. Box 110400
Juneau, Alaska 99811-0400
Phone: (907) 465-2300
Fax: (907) 465-2389

The Honorable Joe Paskvan
Alaska State Senator
State Capitol, Room115
Juneau, Alaska 99801

December 21, 2011

Dear Senator Paskvan,

Thank you for your detailed and thoughtful lists of questions submitted to the Department of Revenue in May and September of this year. As previously discussed, we have been working on the answers to your questions during the interim and are providing them now, as a single package, in advance of the 2012 legislative session. It was very important for me to use the most up-to-date information available and the Fall 2011 Revenue Sources Book (RSB) is what we are using to answer your questions. At the same time as we were preparing the RSB over the past several months, we were also undertaking several other projects that will provide even more information. This will also no doubt lead to good discussions this session.

The analysis contained herein involved the work of numerous individuals on the Department of Revenue team and required large time commitments and custom model runs with significant manual analysis required. Staff were directed to make your request a top priority after completing the Fall 2011 revenue forecast and they should be commended for the time and effort put into this request.

Please don't hesitate to contact me with any additional information requests. We look forward to a constructive and meaningful discussion with you about how to best achieve our mutual goal of increasing oil and gas production in Alaska and incentivizing company investment in exciting and challenging new resources that hold the potential to mitigate the production decline.

Sincerely,

Bryan Butcher
Commissioner

Questions from emails dated May 2, 2011 and May 3, 2011:

1. **Regarding the income statement charts sent on Sunday, May 1:**
   a. **Are the credits from Cook Inlet included within the "Estimated Tax after refunded credits" category?**

      The income statement tables provided on May 1, 2011 included estimates for all production tax credits, including Cook Inlet. Note that our estimates have recently been revised from those provided on May 1, to reflect new information included in the Fall 2011 forecast.

   b. **Are there other credits or deductions which are not reflected in the charts?**

      The income statement tables provided on May 1 are illustrative of all credits and deductions taken. Note that the income statement format is an oversimplification of the tax calculation which in reality is a company-specific calculation. Therefore actual deductions and credits on the company-specific calculations will vary somewhat with those shown on the income statement. Please pay particular attention to the footnotes to the income statement tables to better understand the limitations of the income statement format.

2. **Explain the difference between the $2.572 B in FY11 capital expenditures in the charts and the $2.761B in capital expenditures presented to the Senate Finance Committee on 2/10/11.**

   The $2.572 billion estimate was published in the Fall 2010 RSB and represented a *Fiscal Year* 2011 estimate. The presentation made on February 10, 2011 to the Senate Finance Committee of $2.761 billion represented a *Calendar* Year 2011 estimate.

3. **Provide 5 years of forward-looking capital expenditure estimates as reported by operators in both the fall and the spring of each year, starting with 2005 estimates.**

   See answer to question 4, below.

4. **Provide 5 years of forward-looking capital expenditure estimate as reported by companies with little or no production, starting with 2005 estimates.**

Due to confidentiality requirements, we cannot provide the actual forward-looking capital expenditure estimates that we received from companies. However we can provide the aggregate capital expenditure forecasts prepared by DOR. Our forecast is based primarily on company-provided information that we receive from operators, supplemented as needed by publicly available information, and conversations with non-operators about their spending plans. For the Fall 2011 revenue forecast, we expanded our consultations with non-operators to gain additional confidential information about their capital spending plans, and this information was incorporated into our Fall 2011 revenue forecast.

The table below shows the capital cost forecasts used by DOR in each forecast release for 5 years, beginning with Fall 2006. Prior to Fall 2006, the DOR forecast did not incorporate capital expenditure forecasts because the production tax in place at the time was based on gross value adjusted by an Economic Limit Factor.

Capital Expenditure Estimates - all North Slope Capital Expenditures
All Amounts in $ Millions

Forecast	FY 2007	FY 2008	FY 2009	FY 2010	FY 2011	FY 2012	FY 2013	FY 2014	FY 2015	FY 2016
Fall 2006	$ 1,467	$ 1,507	$ 1,548	$ 1,591	$ 1,635					
Spring 2007	$ 1,346	$ 1,896	$ 1,975	$ 1,954	$ 2,031					
Fall 2007		$ 1,502	$ 1,896	$ 1,976	$ 1,962	$ 2,031				
Spring 2008		$ 2,182	$ 2,491	$ 2,829	$ 2,970	$ 3,460				
Fall 2008			$ 2,342	$ 3,009	$ 3,044	$ 2,869	$ 3,122			
Spring 2009			$ 2,123	$ 2,933	$ 2,910	$ 2,505	$ 2,912			
Fall 2009				$ 2,505	$ 2,882	$ 2,924	$ 2,723	$ 2,623		
Spring 2010				$ 2,430	$ 2,945	$ 2,955	$ 2,762	$ 2,674		
Fall 2010					$ 2,572	$ 2,937	$ 3,175	$ 3,019	$ 2,899	
Spring 2011					$ 2,451	$ 2,793	$ 3,135	$ 3,054	$ 2,909	
Fall 2011						$ 2,702	$ 3,018	$ 3,688	$ 3,889	$ 3,323

5. **Regarding the drafting of regulations to receive additional information about credits and categories of expenditures:**

   a. **Provide detail on the types of information DOR/DNR will be requesting.**

   The Department does not have statutory authority to retroactively require a producer or explorer to provide information related to prior years' capital expenditures. The Department is in the process of developing a list of categories for future reporting that would identify various types of capital expenditure categories and reports that would be incorporated into the TRMS project referenced in the question.

Workshops were held October 10, 2011, November 10, 2011, and December 12, 2011 to discuss the appropriate categories to be included and reported.

b. **Provide information about the statutory authority for requesting the information.**

AS 43.55.040(5) and AS 43.55.110 provide the Department with statutory authority for filing of reports under Chapter 55 of Title 43, Revenue and Taxation. This information may be disclosed under AS 43.55.890 if the information is aggregated among three or more producers or explorers and presented in such a manner as to preclude the determination of the affected parties.

6. **Regarding the "effective tax rate":**

a. **Should the "effective tax rate" be based upon the "Estimated Tax after refunded credits" as shown on the income statement charts sent on Sunday, May 1?**

The goal of the "effective tax rate" metrics we have presented on several occasions is to illustrate the overall tax rate that is paid by a typical company currently producing oil on the North Slope at a given oil price. Credits that are refunded are not included in the calculation of the production tax for two reasons: (1) they are not treated as deductions from the production tax in either our state accounting system or state tax system and require special appropriation by the legislature; and (2) they represent payments made to companies that have no production tax liability in the state.

b. **Is not the split of profit oil, defined as the split of PTV, the best way to analyze Alaska's production tax system?**

Several different metrics can be of value in analyzing Alaska's production tax system, and no one piece of information should be taken in isolation.

7. **Provide income statement charts showing all credits for FY12 using the Spring 2011 forecast for oil prices from $40 to $200 per barrel in $5 increments. Hold all other assumptions constant, including assumptions regarding credits.**

Addendum A of this document contains income statement tables as requested with the following changes: (1) In order to use the most recent information

available to DOR, the tables are presented using the Fall 2011 forecast model and assumptions. (2) The tables presented are for FY 2013, so as to use a year with no actual data so as to better illustrate the impacts of changing prices. (3) The tables begin with a $50 oil price.

PLEASE NOTE THAT THESE STATEMENTS ARE SIMPLIFICATIONS, INTENDED TO ILLUSTRATE A VERY COMPLEX SET OF COMPANY-SPECIFIC TAX CALCULATIONS AT VARIOUS PRICES AND SHOULD BE INTERPRETED AS SUCH.

8. **Provide income statement charts for FY10-FY12 using Fall 2010 and Spring 2011 forecasts assuming HB110/SB49 were applicable in those years. Hold all other assumptions constant, including assumptions regarding credits.**

We previously provided income statement illustrations for HB110/SB49 for FY10-12 using Fall 2010 forecast assumptions, in our response to Senate Resources questions dated March 19, 2011. As requested, those tables are provided again (with clarification of the "base tax" and "progressive tax" per our response to Question 11 of your September 22, 2011 letter to DOR), and we also provide the income statement illustrations using the Spring 2011 forecast assumptions. Additionally, in order to provide you with the most current information and forecast assumptions, we have provided information beyond your initial request and added income statement charts for FY11-FY13 using the Fall 2011 forecast assumptions. See Addendum B for all of these charts.

Note that for the well lease expenditure credits extended to the North Slope under HB110/SB49, the tables prepared under the Fall 2010 and Spring 2011 assumptions assumed that the entire amount of the credit would be applied against tax liability. In actuality, only a portion of the well credits would accrue to companies that could apply them against tax liability; this fact is reflected in tables prepared using the Fall 2011 assumptions.

Additionally, we have provided a detailed breakdown of all credits applied against tax liability as well as detail on credits available for refund. We hope you will find this additional information helpful.

PLEASE NOTE THAT THESE STATEMENTS ARE SIMPLIFICATIONS, INTENDED TO ILLUSTRATE A VERY COMPLEX SET OF COMPANY-SPECIFIC TAX CALCULATIONS AT VARIOUS PRICES AND SHOULD BE INTERPRETED AS SUCH.

9. **Provide income statement charts or other similar analysis to reflect production tax impact on various types of producers, including incumbent producer and new producer.**

The tables below illustrate one hypothetical example of the production tax impact on new and incumbent producers. In this example, 10,000 barrels per day of production is added through a capital investment of $250 million and operating expenditures of $30 million by both a hypothetical new producer and a hypothetical incumbent producer. The new producer is assumed to have no other production in the state, and the incumbent producer already has production of 100,000 b/d prior to the investment. The tables show the difference in tax paid and in value to the producers in one year of production.

As you will see in the tables, the new producer pays no production tax due to the small producer credit, and receives refundable credits for capital expenditure credits and for net operating loss credits. The incumbent producer benefits from credits for capital expenditures and from the tax rate being lower due to the additional barrels produced. This is just one possible illustration using one possible set of assumptions.

New Producer - Investment in 10,000 b/d Project	
Oil price	$100
Transport costs	$8
Wellhead price	$92
Total production in barrels/day	10,000
Total annual production in barrels	3,650,000
Value of total production	$335,800,000
Royalty	$41,975,000
Value of taxable barrels	$293,825,000
Operating expenditures	$30,000,000
Capital expenditures	$250,000,000
Production tax value	13,825,000
Higher of base tax or minimum tax	11,753,000
Progressive tax	$0
Total tax before credits	11,753,000
Small producer credit	11,753,000
Credit to be refunded	$116,543,750
Total tax after credits	**$0**

Incumbent Producer - Existing Production	
Oil price	$100
Transport costs	$8
Wellhead price	$92
Total production in barrels/day	100,000
Total annual production in barrels	36,500,000
Value of total production	$3,358,000,000
Royalty	$419,750,000
Value of taxable barrels	$2,938,250,000
Operating expenditures	$300,000,000
Capital expenditures	$200,000,000
Production tax value	$2,438,250,000
Base tax (25% * PTV)	$609,562,500
Progressive tax	$451,997,155
Total tax before credits	$1,061,559,655
Credits	$40,000,000
Other credits	$0
Total tax after credits	**$1,021,559,655**

Incumbent Producer - WITH INVESTMENT	
Oil price	$100
Transport costs	$8
Wellhead price	$92
Total production in barrels/day	110,000
Total annual production in barrels	40,150,000
Value of total production	$3,693,800,000
Royalty	$461,725,000
Value of taxable barrels	$3,232,075,000
Operating expenditures	$330,000,000
Capital expenditures	$450,000,000
Production tax value	$2,452,075,000
Base tax (25% * PTV)	$613,018,750
Progressive tax	$390,346,260
Total tax before credits	$1,003,365,010
Credits	$90,000,000
Other credits	$0
Total tax after credits	**$913,365,010**

10. Provide income statement chart for FY12 assuming production of only 250,000 b/d of unconventional oil with capex of $22.33 per barrel, using oil prices from $50 to $150 per barrel in $5 increments. Hold all other assumptions constant.

Addendum C-1 presents an illustration using the income statement format of the production tax calculation for a hypothetical producer with 250,000 barrels per day of production. As requested, these statements are produced from $50 to $150 per barrel in $5 increments. We use the $22.33 per barrel capital expenditure assumption you provided and also use the following assumptions to illustrate an "unconventional" oil concept: $20 / barrel operating expenditure, 15% quality bank discount, 12.5% royalty, and no change in transportation costs from our Fall 2011 forecast for FY 12.

Note that the income statements in this illustration are for a hypothetical producer and project in full production and do not include the massive expenditures that would be required during the development phase for unconventional oil development on this scale. Currently, heavy oil development is in the pilot project stage and years away from potential commercial production.

PLEASE NOTE THAT THESE STATEMENTS ARE SIMPLIFICATIONS, INTENDED TO ILLUSTRATE A VERY COMPLEX SET OF COMPANY-SPECIFIC TAX CALCULATIONS AT VARIOUS PRICES UNDER THIS HYPOTHETICAL SCENARIO AND SHOULD BE INTERPRETED AS SUCH.

11. Provide income statement chart for FY12 assuming FY12 production plus 250,000 b/d of heavy oil (capex of $22.33 per barrel? Not specified). Apply a quality price differential if appropriate. Hold all other assumptions constant.

The illustration in Addendum C-2 provides a hypothetical income statement for FY 12, at the fall 2011 forecast price, with 250,000 barrels per day of heavy oil added. For consistency with our response to question 10, we used the same assumptions and simply added the production to our existing FY 12 income statement as provided in the Fall 2011 Revenue Sources Book.

In addition to our forecasted production and costs for FY12, an additional 250,000 barrels per day of production is assumed. For the additional production we use the $22.33 per barrel capital expenditure assumption you provided for question 10 and also use the following assumptions to illustrate a "heavy" oil concept: $20 / barrel operating expenditure, 15% quality bank discount, 12.5% royalty, and no change in transportation costs from our Fall 2011 forecast for FY 12.

Note that the heavy oil production represents an illustration of a project in full production and does not include the massive expenditures that would be required during the development phase for unconventional oil development on this scale. Currently, heavy oil development is in the pilot project stage and years away from potential commercial production.

PLEASE NOTE THAT THESE STATEMENTS ARE SIMPLIFICATIONS, INTENDED TO ILLUSTRATE A VERY COMPLEX SET OF COMPANY-SPECIFIC TAX CALCULATIONS AT VARIOUS PRICES UNDER THIS HYPOTHETICAL SCENARIO AND SHOULD BE INTERPRETED AS SUCH.

Questions from September 22, 2011 letter to Commissioner Butcher:

1. **What has the recent 100 plus days delivered as to the filling of the high level DOR positions? For example, what is the status of the Director of the Tax Division, Commercial analysts, Audit Master and others? If any difficulty has been encountered in filling these positions, is there any particular identified reason? What are the key positions that currently remain unfilled? How many positions within your department are currently unfilled?**

   Matt Fonder accepted our offer for the Tax Director position and started on October 24th. We have filled both Commercial Analyst positions, one of whom has graciously accepted the responsibilities relating to the Chief Economist. We also have an Acting Assistant Chief Economist in Juneau. We purposely wanted to address these positions prior to recruiting for the final high level position of Audit Master which is still vacant. However, now that we have a better feel for our team and what everyone brings to the table, we are in a better position to begin the recruitment process for the 4th of 4 Audit Masters. We are currently working on this recruitment.

2. **What number of personnel would need to be hired to have DOR fully staffed?**

   "Fully staffed" is certainly a noble goal but for any organization this size, public or private, 0% vacancy is generally unattainable. As of September 27, 2011 we were running just over 6% for the department.

3. **I would like to know how the regulation drafting process is proceeding. What areas have been covered and what areas still need to be rewritten?**

   This response pertains to regulations being drafted for the ACES production tax only and does not address any other regulation projects by the Department.

   Since the passage of ACES the Department has implemented or amended over 70 regulations related to oil and gas production taxes. These include regulations for

lease expenditures and overhead under AS 43.55.165, exploration credits, facility sharing/access, valuation and transportation of gas related to a major gas sale under AGIA, and other miscellaneous and conforming changes. Note that the regulations for the exploration credits under AS 43.55.025 were written prior to the passage of SB 309 and HB 280, respectively, that included the "Jack-up Rig credit" under AS 43.55.025(l) and the "well lease expenditure credit" under AS 43.55.023(l). However, the Department has drafted an Advisory Bulletin (under AS 43.55.110(g)) addressing issues related to the credit under AS 43.55.025(l).

The Department has recently completed the public process for regulation changes required under AS 43.55.011(m) related to what were formerly treated as "excess tax credits" under ceilings required by AS 43.55.011(j), (k), and (o). The Department is currently in discussions with the Department of Law to assess the need for regulations for geological and geophysical exploration, the heating value of gas, information required for forecast reporting requirements, and the well lease expenditure credit.

4. **I understand the implementation of the tax management system may take 3- 5 years. What is currently DOR's knowledge as to the gaps in Alaska's capacity to understand capital expenditures?**

   The Department does not have statutory authority to retroactively require a producer or explorer to provide information related to prior years' capital expenditures. The Department is in the process of developing a list of categories for future reporting that would identify various types of capital expenditure categories and reports that would be incorporated into the TRMS project referenced in the question.

   Workshops were held October 10, 2011, November 10, 2011, and December 12, 2011 to discuss the appropriate categories to be included and reported.

5. **As you know I am most interested in the production tax bill which you are carrying. I have had a number of inquires as to aspects of Alaska's system, including its credits. As DOR is carrying the tax bill, I assume that inquires should be directed to DOR. Please let me know if I am in error or misunderstand as to where I can or should forward my inquiries.**

   You are correct. Please route inquiries through the Commissioner's office. Also to the extent possible we hope that you will share in our goal of keeping future inquiries focused and constructive so that we can best use our staff resources and produce analysis that will be of value in decision making.

6. **Based upon the return of Mr. Dees from vacation in June, possibly the credit issue can be better understood. Please let me know if I may directly contact Mr. Dees, Audit Master, as to credit issues?**

Please route inquiries through the Commissioner's office so that staff time can be allocated and appropriate staff can respond.

7. **I have been trying to obtain the actual bottom line amount of production tax money which Alaska keeps after all credits, whether under ACES, PPT or previous system, what is the actual net dollar amount of production tax money for each year from 2000 until now. I would like to know this both as to calendar and fiscal years if possible. By "all credits" I mean, especially as to ACES, the following credits:**

   - **qualified cap exped, 023(a)(l)**
   - **CFAL, 023(b)**
   - **TIE, 023(i)**
   - **40% Cook Inlet, 023(1)**
   - **new area dev, 024(a)**
   - **small producer, 024(c)**
   - **exploration 30 40, 025**
   - **Cook Inlet jack-up, 025)1)**
   - **CAPEX exploration well, 023(a)(2)**
   - **other credits.**

   The following table presents total production tax for FY 2000 to FY 2011 including an accounting of total credits applied against tax liability. This information is being provided in fiscal year format as our accounting system, Revenue Sources Books, and Annual Reports from which the information is drawn all operated on a fiscal year basis.

Total Production Tax and Tax after all credits, FY 2000 to FY 2011 ($ millions)

Fiscal Year	2000	2001	2002	2003	2004	2005	2006[1]
Production Tax before Credits	$ 703	$ 704	$ 496	$ 599	$ 652	$ 863	$ 1,200
Credits Applied Against Tax Liability	$ -	$ -	$ -	$ -	$ -	$ -	$ -
Total Tax after credits	$ 703	$ 704	$ 496	$ 599	$ 652	$ 863	$ 1,200
Credits Refunded	NA	NA	NA	NA	NA	NA	NA
Production Tax after refunded credits	$ 703	$ 704	$ 496	$ 599	$ 652	$ 863	$ 1,200

Fiscal Year	2007[1]	2008	2009	2010	2011	Total FY 00-11
Production Tax before Credits	$ 2,764	$ 7,198	$ 3,445	$ 3,288	$ 4,958	$ 26,869
Credits Applied Against Tax Liability	$ 556	$ 375	$ 333	$ 417	$ 405	$ 2,086
Total Tax after credits	$ 2,208	$ 6,823	$ 3,112	$ 2,871	$ 4,553	$ 24,783
Credits Refunded	$ 55	$ 54	$ 193	$ 250	$ 450	$ 1,002
Production Tax after refunded credits	$ 2,153	$ 6,769	$ 2,919	$ 2,621	$ 4,103	$ 23,781

(1) The combined total of tax credits applied against tax liabilities in FY07 include tax credits earned during the months of April and May 2006.

8. **I am interested in first receiving the gross production tax [I guess in the nominal amount] for each fiscal year from 2000 to present. I would then like to have for each year the delineation of the amount of each credit for each year. This would then be followed with the amount kept by Alaska after all credits are accounted for. How could I find in past Revenue books [possibly] a starting point for your nominal production tax? Is there an explanation or method or way to understand the impact of credits on the nominal tax rate, as I am interested in an actual bottom line dollar amount, the credits deducted include both offsets against the tax and payments by the state . If a credit is spread over more than 1 tax reporting year, please identify the gross and the amounts for each year.[I understand that CAPEX is spread over 2 years and that this is shown as credit against tax or for purchase.] To some extent I believe that this is shown in the Revenue Sources book, as to CAP EX anyway.**

The table in Question 7 above shows the amount of production tax revenue collected after all credits have been accounted for. Because production tax credits are often not applied or refunded in the period in which they were earned, we are unable to match credits with the spending that earned them. We can, however, give an estimate of the nominal tax rate for each year by dividing the production tax after all credits by the gross value at the point of production for each year. This analysis would effectively illustrate what an equivalent nominal tax rate on the gross production value would be, much like the tax rates that are applied to the gross value in many states. This information is shown below.

Production Tax as a Percentage of Gross Value at Point of Production (in $millions unless otherwise noted)

Fiscal Year	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011
Value at Point of Production	$6 556	$7 145	$5 498	$7 396	$8 544	$11 650	$15 188	$14 608	$20 746	$13 681	$14 157	$16 813
Production tax before credits	$703	$704	$496	$599	$652	$863	$1 200	$2 764	$7 198	$3 445	$3 288	$4 956
Credits applied against tax liability								$656	$375	$333	$417	$405
Production tax after credits against tax liability	$703	$704	$496	$599	$652	$863	$1 200	$2 208	$6 823	$3 112	$2 871	$4 553
Credits refunded								$55	$54	$193	$250	$450
Production Tax after Credits against tax liability and refunded credits	$703	$704	$496	$599	$652	$863	$1 200	$2 153	$6 769	$2 919	$2 621	$4 103
Tax Received/Value at Point of Production												
Before Credits	11%	10%	9%	8%	8%	7%	8%	19%	35%	25%	23%	29%
After Credits applied against tax liability	11%	10%	9%	8%	8%	7%	8%	15%	33%	23%	20%	27%
After credits applied to tax liability and credits refunded	11%	10%	9%	8%	8%	7%	8%	15%	33%	21%	19%	24%

9. **I am interested in receiving this information in a format followed by Fall2010 RSB appendix D. Again, my overriding intent is to receive the actual bottom line amount of production tax money that Alaska actually keeps.**

   The income statement format is an illustration of the production tax calculation only intended to help people understand how the production tax calculation works. Since it is a simplified presentation of a very complex tax system, it does not exactly reflect the "actual bottom line" tax revenue to the state. Refer to our table presented above for the actual production tax revenue before and after credits for each year from FY 2000 to FY 2011, as well as an accounting of production tax after credits refunded.

10. **I am also interested in receiving the responses as to my inquires of May 3, 2011. I am interested in maintaining the parameters as set forth in the email. I need the charts-FY 2010, 2011 and 2012 Fall10 and Spring 11 forecasts depicting SB49/HB 110.**

    Responses to your May 3, 2011 inquiries are included in this response document. Also, to the extent possible, we provided analysis using the Fall 2011 forecast assumptions which reflect the best available and most current information at this time, so as to be most helpful in understanding the tax and making decisions about the tax.

11. **There were 3 charts provided as part of the 3/19/11 DOR letter. Who prepared those charts? What information was relied upon as to rate of progressivity? Why is the rate not shown next to "Progressive Tax" line? [The rate is shown at 7.4%, current tax system, in chart of FY 2011 using Fall 2010 forecast.] [Also, the amount of the progressive tax under the current system is $686.7M] How is Progressive Tax for FY 2011, page 8 of 3/19/11, of $1,029.9 calculated under SB49 analysis? Something does not appear to add up, do you agree? I need an**

explanation of this as the production tax value per barrel is $48.54 under both charts. Is there a reason for the stark increase in progressivity tax under SB49 analysis?

The tables were prepared by staff in our Economics Research Group. The income statement tables were produced using our Fall 2010 revenue forecast assumptions and model, under current law and as modified to reflect the provisions of HB 110 / SB49.

Three income statement format tables were provided showing an illustration of the tax calculation under ACES, in the Fall 2010 Revenue Source Book, Appendix D. At your request, three income statement format tables were provided showing an illustration of the tax calculation under SB 49, in the response dated March 19, 2011 addressing numerous questions and information requests made by members of the Senate Resources committee.

Under ACES, a base tax and progressivity calculation are clearly and separately provided for in statute, with the base tax rate calculated under AS 43.55.011(e), and the progressive surcharge calculated under AS 43.55.011(g).

Under SB 49, there is no longer a distinct "base tax" and "progressivity surcharge" but rather a bracketed tax rate system, with the entire tax calculation provided for under AS 43.55.011(g).

For purposes of preparing the income statement tables, the "progressive tax" shown under ACES represented revenue for the progressive surcharge, over and above the base tax rate. The "progressive tax" line in the SB 49 income statements represented the entire tax for all tax brackets except the first tax bracket. While the total tax was presented correctly in the SB 49 tables, we agree that the breakout between "base tax" and "progressive tax" was confusing. As a result, in the HB 110 / SB 49 income statements provided in this response, the "base tax" represents 25% of production tax value (or 15% for examples of hypothetical production qualifying for the 15% new fields base rate), and "progressivity" represents all tax above and beyond the base rate. This presentation should be easier to understand and more readily comparable to the current tax system.

12. **Could a CAPEX credit under low pricing of oil exceed actual production tax to be received? In other words, could credits, at low oil pricing, overwhelm the tax itself? Does HB 110 / SB49 increase the risk of credits overwhelming the tax? What occurs if credits overwhelm the tax?**

If credits exceed production tax, the state could potentially collect zero production tax in a year at very low oil prices. HB110/ SB49 does not create this scenario, and since the first tax bracket in HB110/SB49 retains the ACES base

rate of 25%, the tax liability before credits under either tax system would be similar when production tax value per barrel is $30 or less. The expansion of the credit system under HB110/SB49 could increase the amount of credits available, however.

The production tax is a company-specific calculation and even at current prices, some companies have expenditures that exceed the value of oil produced (companies with very little production in the state and explorers for example). Such companies, as long as they meet certain criteria, can apply to the state for a transferrable tax credit certificate which can be transferred to another company or refunded by the state. The monies for purchasing tax credit certificates are appropriated annually by the legislature into a sub-fund of the General Fund established for that purpose. Under a low oil price scenario, we would expect that more companies would have low or no production tax liability and those eligible would request refunds for credits. Under such a scenario, many companies would curtail expenditures unless or until oil prices recover.

13. What increase or decrease in OPEX and CAPEX does DOR see between now and 2020? What increase or decrease in downstream costs does DOR see between now and 2020?

The following table presents the Fall 2011 forecast assumptions for total operating expenditures, total capital expenditures, and total downstream costs (ANS Marine Transportation, TAPS tariff, and other downstream costs) for FY 2011 as well as the forecast for FY 2012 through FY 2020. Note that the level of expenditures is based primarily on information provided by operators and non-operators and assumes that oil prices maintain or exceed forecasted levels.

Fiscal Year	2011	2012	2013	2014	2015
Total Operating Expenditures ($ million)	$ 2,614	$ 2,579	$ 2,375	$ 2,375	$ 2,359
Total Capital Expenditures ($ million)	$ 2,317	$ 2,743	$ 3,057	$ 3,726	$ 3,926
Average Downstream Costs ($ / barrel)	$ 7.17	$ 8.72	$ 8.56	$ 8.83	$ 9.15

Fiscal Year	2016	2017	2018	2019	2020
Total Operating Expenditures ($ million)	$ 2,384	$ 2,428	$ 2,664	$ 2,683	$ 2,711
Total Capital Expenditures ($ million)	$ 3,360	$ 2,882	$ 2,499	$ 2,348	$ 2,304
Average Downstream Costs ($ / barrel)	$ 9.55	$ 9.78	$ 10.00	$ 10.35	$ 10.76

14. What spread between WTI and ANS does DOR see between now and 2020? What is the current in-house belief of oil prices for the remainder of this fiscal year?

The differential between WTI and ANS has been volatile over the past year. ANS began the year trading at a modest premium to WTI, and by September 2011 ANS traded as high as $28.60 / barrel over WTI. As of December 9, 2011, ANS traded at a premium of about $8 / barrel over WTI.

To prepare the Fall 2011 revenue forecast, DOR applied a market-based differential estimate to derive ANS prices from our forecast for WTI prices. This produced an estimated differential of $18.41 (ANS premium) for FY 2012. Since preparing this estimate, the differential has narrowed to about $8 / barrel as of December 9, 2011. However, the narrowing has been a result of WTI prices increasing relative to other global crude oils (for example, Brent and Dubai), while ANS prices have remained near forecasted levels and in line with global crude oil prices.

More discussion of the ANS / WTI differential and the outlook and methodology used for the Fall 2011 forecast may be found on page 34 of the Fall 2011 Revenue Sources Book.

15. I would like a HB110/SB49 application prepared upon the May 1, 2011 charts. The income statement approach seems to be most understandable. The charts arise out of the April17, 2011 email from me to Mr. Tangeman.

We previously provided income statement illustrations for HB110/SB49 for FY10-12 using Fall 2010 forecast assumptions, in our response to Senate Resources questions dated March 19, 2011. As requested, those tables are provided again (with a new presentation of the "base tax" and "progressive tax" per our response to Question 11 of your September 22, 2011 letter to DOR with the base tax representing 25% of production tax value), and we also provide the income statement illustrations using the Spring 2011 forecast assumptions. Additionally, in order to provide you with the most current information and forecast assumptions, we have provided information beyond your initial request and added income statement charts for FY11-FY13 using the Fall 2011 forecast assumptions. See Addendum B for all of these charts.

Note that for the well lease expenditure credits extended to the North Slope under HB110/SB49, the tables prepared under the Fall 2010 and Spring 2011 assumptions assumed that the entire amount of the credit would be applied against tax liability. In actuality, only a portion of the well credits would accrue to companies that could apply them against tax liability; this fact is reflected in tables prepared using the Fall 2011 assumptions.

Additionally, we have provided a detailed breakdown of all credits applied against tax liability as well as detail on credits available for refund. We hope you will find this additional information helpful.

PLEASE NOTE THAT THESE STATEMENTS ARE SIMPLIFICATIONS, INTENDED TO ILLUSTRATE A VERY COMPLEX SET OF COMPANY-SPECIFIC TAX CALCULATIONS AT VARIOUS PRICES AND SHOULD BE INTERPRETED AS SUCH.

16. **I would request charts following a Fall2010 RSB appendix D format under proposed HB 110/SB 49, as to the estimated monies, if any, to be received by Alaska assuming 500,000bbl's/day and 700,000 bbl's/day from Shells proposed Chukchi and Beaufort Sea operations.**

We are unable to fulfill your request with the information provided. It is not clear what oil price you would like us to use or what fields/companies are producing the 500,000 barrels per day. If you would like to provide us with more specific information, we will be happy to accommodate your request.

With regard to the Beaufort Sea operations, most of the production would likely be in federal waters and not subject to the production tax. An addition of 700,000 barrels of oil through TAPS should, however, lower the tariff in the range of $2.00 per barrel, providing the state with additional royalty and production tax revenue from barrels produced on state lands.

17. **I would request charts following a Fall2010 RSB appendix D format under proposed HB 110/SB 49, as to the estimated monies, if any, to be received by Alaska assuming 100,000 bbls/day from a hypothetical NPRA development.**

The income statement tables in Addendum D show an illustration of revenue from a hypothetical 100,000 barrel per day development, under HB 110 / SB 49. *As requested, these tables are provided in the income statement format and therefore are for a single year only and only include production tax revenue and do not include property tax, corporate income tax, or shared royalties.*

Addendum D presents an illustration using the income statement format of the production tax calculation under HB 110 / SB 49 for a hypothetical producer with 100,000 barrels per day of production. We prepared these statements at several oil prices: our Fall 2011 forecast for FY 12 ($108.89), and also $75, $100 and $125. We use ongoing capital costs of $10 per barrel and $15 per barrel operating expenditure. We assume a 12.5% royalty. For transportation costs for

this illustration we use the Fall 2011 forecast for FY 12, plus an additional $2 per barrel.

Note that the income statements in this illustration are for a hypothetical producer and project in full production and do not include the significant expenditures that would be required during the development phase for a new NPRA oil development on this scale.

PLEASE NOTE THAT THESE STATEMENTS ARE SIMPLIFICATIONS, INTENDED TO ILLUSTRATE A VERY COMPLEX SET OF COMPANY-SPECIFIC TAX CALCULATIONS AT VARIOUS PRICES UNDER THIS HYPOTHETICAL SCENARIO AND SHOULD BE INTERPRETED AS SUCH.

18. **Over the years, from 2000 to present, what record of underpayment as to the royalty revenue has occurred? In part, please set forth the amounts collected from each year, 2000-present.**

The Department of Revenue does not assess royalty payments or track the underpayment of royalty revenue. Royalty payments fall under the jurisdiction of the Department of Natural Resources. Questions regarding royalty payments should be directed to that department.

19. **Same as question 18, but pertaining to the production tax revenue.**

We do not have an analysis of underpayments for each tax year readily available, however we do have information about total collections from production tax assessments and settlements, which are deposited into the Constitutional Budget Reserve Fund. The following data come from the Tax Division Annual Reports.

Oil and Gas Production Tax to CBRF ($ millions)

Fiscal Year	Amount
2011	62.9
2010	459.8
2009	81.1
2008	47.2
2007	17.5
2006	2.6
2005	21.3
2004	4.2
2003	3.7
2002	24.2
2001	34.8
2000	17.5

20. How does Alaska compare as to other jurisdictions as to the discovering underpayments of a.) royalty monies and b.) production tax monies.

The Department of Revenue has not prepared any analysis regarding underpayments of oil and gas revenues as compared to other jurisdictions.

21. Importantly, I would welcome you alerting me to other areas which are or which will be impacting DOR. As always, you may call me at any time and I certainly welcome the opportunity to meet with you also at any time.

Thank you, I look forward to working with you this session and making progress towards improving Alaska's attractiveness to new oil development.

ADDENDUM A:

FY 2013 Production Tax Estimates – Income Statement Format showing ALL Credits using Fall 2011 forecast assumptions and oil prices from $50 to $200 in $5 increments

These tables are meant to provide an illustration of the production tax calculation under current law, at a range of different ANS prices. Since this is a simplification of the tax calculation, total tax amounts shown here may not exactly match those reported in other analysis. The following notes apply to all the tables in this addendum:

(1) Royalty, Federal and other barrels represents our best estimate of barrels that are not taxed. This estimate includes both state and federal royalty barrels, barrels produced from federal offshore property, and barrels used in production. For purposes of this calculation, also includes barrels produced by companies with zero PTV. The effectively taxable volume amount shown here is calculated AT OUR FORECAST PRICE and we do not adjust it between tables.

(2) For purposes of this illustration, to more closely reflect actual tax received by the state, "taxable barrels" shown here exclude barrels produced by companies expected to have zero tax liability.

(3) Deductible Lease Expenditures represents our best estimate of lease expenditures that are applicable to currently producing fields that are likely to produce a tax liability for the company or companies producing them. The per-barrel expenditures reflect expenditures per taxable barrel and do not reflect expenditures per all barrels produced.

(4) Estimated Total Tax after credits is a calculated total based on constant daily production, constant oil prices, constant expenditures for the entire year, and no company specific information. Variations in these assumptions captured in larger revenue models will produce different results that differ from the estimates in the simple model above.

(5) Lease expenditures not included in Tax Revenue Calculation represents lease expenditures made by companies with little to no tax liability.

(6) Estimated Tax after refunded credits represents the total estimated tax revenue minus the amount of credits refunded, which is paid by appropriation through the Production Tax Credit Fund at AS 43.55.028.

FY 2013 Production Tax Estimates - Income Statement Format showing ALL Credits using Fall 2011 forecast assumptions with $50 ANS price

ADDENDUM B-1:
FY 2010-FY 2012 Production Tax Estimates - Income Statement Format showing ALL credits Assuming Fall 2010 Forecast assumptions and HB 110/SB 49 tax system

These tables are meant to provide an illustration of the production tax calculation under HB110/SB49 in various years and using various forecast assumptions. Since this is a simplification of the tax calculation, total tax amounts shown here may not exactly match those estimated in other analysis. The following notes apply to all the tables in this addendum:

DOR historical and current revenue models are based on fiscal year data, which is also used for this analysis. To the extent that HB110/SB49 would use calendar year averages for production, price, and costs, the results may differ from that shown in this illustration.

(1) Royalty, Federal and other barrels represents our best estimate of barrels that are not taxed. This estimate includes both state and federal royalty barrels, barrels produced from federal offshore property, and barrels used in production.

(2) Deductible Lease Expenditures represents our best estimate of lease expenditures that are applicable to currently producing fields that are likely to produce a tax liability for the company or companies producing them. The per-barrel expenditures reflect expenditures per taxable barrel and do not reflect expenditures per all barrels produced.

(3) New well lease expenditure credits under HB110/SB49 are shown fully deducted against tax liability for consistency with previously presented information using the Fall 2010 and Spring 2011 forecast assumptions. Beginning with estimates using Fall 2011 forecast assumptions, we include a portion of these credits as taken against tax liability, and a portion as available for refund.

(4) Estimated Total Tax after credits is a calculated total based on constant daily production, constant oil prices, constant expenditures for the entire year, and no company specific information. Variations in these assumptions captured in larger revenue models will produce different results that differ from the estimates in the simple model above.

(5) Lease expenditures not included in Tax Revenue Calculation represents lease expenditures made by companies with little to no tax liability.

(6) Estimated Tax after refunded credits represents the total estimated tax revenue minus the amount of credits refunded, which is paid by appropriation through the Production Tax Credit Fund at AS 43.55.028.

The following notes apply to all the tables in this addendum:

DOR historical and current revenue models are based on fiscal year data, which is also used for this analysis. To the extent that HB110/SB49 would use calendar year averages for production, price, and costs, the results may differ from that shown in this illustration.

(1) Royalty, Federal and other barrels represents our best estimate of barrels that are not taxed. This estimate includes both state and federal royalty barrels, barrels produced from federal offshore property, and barrels used in production.

(2) Deductible Lease Expenditures represents our best estimate of lease expenditures that are applicable to currently producing fields that are likely to produce a tax liability for the company or companies producing them. The per-barrel expenditures reflect expenditures per taxable barrel and do not reflect expenditures per all barrels produced.

(3) New well lease expenditure credits under HB110/SB49 are shown fully deducted against tax liability for consistency with previously presented information using the Fall 2010 and Spring 2011 forecast assumptions. Beginning with estimates using Fall 2011 forecast assumptions, we include a portion of these credits as taken against tax liability, and a portion as available for refund.

(4) Estimated Total Tax after credits is a calculated total based on constant daily production, constant oil prices, constant expenditures for the entire year, and no company specific information. Variations in these assumptions captured in larger revenue models will produce different results that differ from the estimates in the simple model above.

(5) Lease expenditures not included in Tax Revenue Calculation represents lease expenditures made by companies with little to no tax liability.

(6) Estimated Tax after refunded credits represents the total estimated tax revenue minus the amount of credits refunded, which is paid by appropriation through the Production Tax Credit Fund at AS 43.55.028.

FY 2010 Production Tax Estimates - Income Statement Format Showing ALL Credits using Spring 2011 Forecast Assumptions, HB110/SB49 tax system

ADDENDUM B-3:
FY 2011-FY 2013 Production Tax Estimates – Income Statement Format Assuming Fall 2011 Forecast assumptions and HB 110/SB 49 tax system

These tables are meant to provide an illustration of the production tax calculation under HB110/SB49 in various years and using various forecast assumptions. Since this is a simplification of the tax calculation, total tax amounts shown here may not exactly match those estimated in other analysis. The following notes apply to all the tables in this addendum:

DOR historical and current revenue models are based on fiscal year data, which is also used for this analysis. To the extent that HB110/SB49 would use calendar year averages for production, price, and costs, the results may differ from that shown in this illustration.

(1) Royalty, Federal and other barrels represents our best estimate of barrels that are not taxed. This estimate includes both state and federal royalty barrels, barrels produced from federal offshore property, and barrels used in production. For purposes of this calculation, also includes barrels produced by companies with zero PTV.

(2) For purposes of this illustration, to more closely reflect actual tax received by the state, "taxable barrels" shown here exclude barrels produced by companies expected to have zero tax liability.

(3) Deductible Lease Expenditures represents our best estimate of lease expenditures that are applicable to currently producing fields that are likely to produce a tax liability for the company or companies producing them. The per-barrel expenditures reflect expenditures per taxable barrel and do not reflect expenditures per all barrels produced.

(4) For new well lease expenditure credits under HB 110/SB49 we include a portion of these credits as taken against tax liability, and a portion as available for refund.

(5) Estimated Total Tax after credits is a calculated total based on constant daily production, constant oil prices, constant expenditures for the entire year, and no company specific information. Variations in these assumptions captured in larger revenue models will produce different results that differ from the estimates in the simple model above.

(6) Lease expenditures not included in Tax Revenue Calculation represents lease expenditures made by companies with little to no tax liability.

(7) Estimated Tax after refunded credits represents the total estimated tax revenue minus the amount of credits refunded, which is paid by appropriation through the Production Tax Credit Fund at AS 43.55.028.

ADDENDUM C-1:

FY 2012 Production Tax Estimates – Income Statement Format for illustration of 250,000 barrels per day of "Unconventional Oil" using provided assumptions

These tables are meant to provide an illustration of the production tax calculation under current law in FY 12, for a hypothetical producer with 250,000 barrels per day of unconventional oil production, using a specific set of assumptions. This is a hypothetical only prepared by request. The following notes apply to all the tables in this addendum:

(1) This analysis illustrates the tax calculation for a hypothetical producer for a single year with the following characteristics: 250,000 barrels per day production from state land, 15% quality discount, $22.33 / barrel capex, $20 / barrel opex. No company-specific modeling is included. Importantly, this illustration assumes an operation in full production with the stated costs and does not consider the development phase when large expenditures are made without corresponding production.

(2) For purposes of this illustration, this number reflects a 12.5% royalty only.

(3) For purposes of this illustration, deductible lease expenditures are assumed to be $22.33 / barrel (for all barrels) for capital expenditures and $20 / barrel (for all barrels) for operating expenditures. The per-barrel expenditures shown here reflect expenditures per taxable barrel, for consistency with other income statement presentation, and do not reflect expenditures per all barrels produced.

(4) Estimated Total Tax after credits is a calculated total based on constant daily production, constant oil prices, constant expenditures for the entire year, and no company specific information. Variations in these assumptions captured in larger revenue models will produce different results that differ from the estimates in the simple model above.

(5) At lower prices, credits not applied against tax liability could be carried forward or sold but would not be eligible for refund for a producer with 250,000 barrels per day of production.

ADDENDUM C-2:

FY 2012 Production Tax Estimates – Income Statement Format for illustration of 250,000 barrels per day of "Heavy Oil" using provided assumptions, PLUS existing FY 2012 forecast

This table is meant to provide an illustration of the production tax calculation under current law in FY 12, assuming our Fall 2011 forecast assumptions for FY 12, PLUS 250,000 barrels per day of unconventional oil production, using a specific set of assumptions. This is a hypothetical only prepared by request. The following notes apply to this addendum:

(1) This analysis takes the FY12 income statement from the Fall 2011 RSB and adds and illustration for additional production with the following characteristics: 250,000 barrels per day production from state land, 15% quality discount, $22.33 / barrel capex, $20 / barrel opex. No company-specific modeling is included. Importantly, this illustration assumes an operation in full production with the stated costs and does not consider the development phase when large expenditures are made without corresponding production.

(2) Royalty, Federal and other barrels represents our best estimate of barrels that are not taxed. This estimate includes both state and federal royalty barrels, barrels produced from federal offshore property, and barrels used in production. For purposes of this calculation, also includes barrels produced by companies with negative PTV. For the additional production illustration, assumes a 12.5% royalty rate only.

(3) Deductible Lease Expenditures represents our best estimate of lease expenditures that are applicable to currently producing fields that are likely to produce a tax liability for the company or companies producing them. For the additional production, deductible lease expenditures are assumed to be $22.33 / barrel (for all barrels) for capital expenditures and $20 / barrel (for all barrels) for operating expenditures. The per-barrel expenditures shown here reflect expenditures per taxable barrel, for consistency with other income statement presentation, and do not reflect expenditures per all barrels produced.

(4) Estimated Total Tax after credits is a calculated total based on constant daily production, constant oil prices, constant expenditures for the entire year, and no company specific information. Variations in these assumptions captured in larger revenue models will produce different results that differ from the estimates in the simple model above.

FY 2012 Production Tax Estimates - Income Statement Format using Fall 2011 forecast assumptions, PLUS 250,000 barrels per day of "Heavy Oil" using provided assumptions[1]

	Price	Barrels	Value ($M)
Avg ANS Oil Price ($/bbl) & Daily Production (bbls)	$108.98	824,373	$85.7
Annual Production (bbl)			
Total		300,896,327	$31,294.0
Royalty, Federal and other barrels[2]		-45,108,639	($4,728.8)
Taxable barrels[3]		255,787,688	$26,565.2
Downstream (Transportation) Costs ($/bbl)			
ANS Marine Transportation	-$2.71		
TAPS Tariff	-$5.16		
Other	-$0.85		
Total Transportation Costs	-$8.72	255,787,688	($2,231.0)
Deductible Lease Expenditures[3]			
Deductible Operating Expenditures	-$16.78		($4,293.1)
Deductible Capital Expenditures	-$15.02		($3,841.6)
Total Lease Expenditures	-$31.80	255,787,688	($8,134.7)
Production Tax			
Production Tax Value (PTV)			$16,199.5
Base Tax (25%*PTV)			$4,049.9
Production Tax Value per barrel	$63.33		
Progressive Tax = (13.3% * PTV)			$2,159.8
Total Tax before credits			$6,209.7
Total Credits			($807.5)
Estimated Total Tax after credits[4]			**$5,402.2**

ADDENDUM D:

FY 2012 Production Tax Estimates – Income Statement Format for illustration of 100,000 barrels per day of "NPRA Development" under HB110/SB49

These tables are meant to provide an illustration of the production tax calculation under HB110/SB49 in FY 12, for a hypothetical producer with 100,000 barrels per day of NPRA oil production, assuming HB110 / SB49 were in full effect and the development received the 15 percent new fields base rate. The tables are produced at several prices: our FY 12 forecast price, $75, $100, and $125. This is a hypothetical only prepared by request. The following notes apply to all the tables in this addendum:

(1) This analysis illustrates the tax calculation for a hypothetical producer for a single year with the following characteristics: 100,000 barrels per day production from NPRA, $10 / barrel capex, $15 / barrel opex. No company-specific modeling is included. **Importantly, this illustration assumes an operation in full production with the stated costs and does not consider the development phase when large expenditures are made without corresponding production.**

(2) For purposes of this illustration, this number reflects a 12.5% royalty only.

(3) For purposes of this illustration, adds $2 / barrel to Fall 2011 forecast amounts to account for potential feeder pipeline costs.

(4) Deductible lease expenditures are assumed to be $10 / barrel (for all barrels) for capital expenditures and $15 / barrel (for all barrels) for operating expenditures. The per-barrel expenditures shown here reflect expenditures per taxable barrel, for consistency with other income statement presentation, and do not reflect expenditures per all barrels produced.

(5) For illustration purposes, assumes that all provisions of HB 110 / SB 49 are in place and that the development would qualify for the 15 percent new field base rate.

(6) Estimated Total Tax after credits is a calculated total based on constant daily production, constant oil prices, constant expenditures for the entire year, and no company specific information. Variations in these assumptions captured in larger revenue models will produce different results that differ from the estimates in the simple model above.

FY 2012 Production Tax Estimates - Income Statement Format for illustration of 100,000 barrels per day of "NPRA oil" under HB 110/SB49[1]

	Price	Barrels	Value ($M)
Avg ANS Oil Price ($/bbl) & Daily Production (bbls)	$108.89	100,000	$10.9
Annual Production (bbl)			
Total		36,500,000	$3,974.5
Royalty barrels[2]		-4,562,500	($496.8)
Taxable barrels		31,937,500	$3,477.7
Downstream (Transportation) Costs ($/bbl)			
ANS Marine Transportation	-$2.71		
TAPS Tariff	-$5.16		
Other[3]	-$2.85		
Total Transportation Costs	-$10.72	31,937,500	($342.4)

The Honorable Joe Paskvan
Alaska State Senator
State Capitol, Room115
Juneau, Alaska 99801

December 21, 2011

Dear Senator Paskvan,

Thank you for your detailed and thoughtful lists of questions submitted to the Department of Revenue in May and September of this year. As previously discussed, we have been working on the answers to your questions during the interim and are providing them now, as a single package, in advance of the 2012 legislative session. It was very important for me to use the most up-to-date information available and the Fall 2011 Revenue Sources Book (RSB) is what we are using to answer your questions. At the same time as we were preparing the RSB over the past several months, we were also undertaking several other projects that will provide even more information. This will also no doubt lead to good discussions this session.

The analysis contained herein involved the work of numerous individuals on the Department of Revenue team and required large time commitments and custom model runs with significant manual analysis required. Staff were directed to make your request a top priority after completing the Fall 2011 revenue forecast and they should be commended for the time and effort put into this request.

Please don't hesitate to contact me with any additional information requests. We look forward to a constructive and meaningful discussion with you about how to best achieve our mutual goal of increasing oil and gas production in Alaska and incentivizing company investment in exciting and challenging new resources that hold the potential to mitigate the production decline.

Sincerely,

Bryan Butcher
Commissioner

State of Alaska

Department of Revenue

Commissioner's Office

SEAN PARNELL, GOVERNOR
333 Willoughby Avenue, 11th Floor
P.O. Box 110400
Juneau, Alaska 99811-0405
Phone: (907) 465-2300
Fax: (907) 465-2394

November 13, 2009

The Honorable Edward S. Itta
Mayor, North Slope Borough
P.O. Box 69
Barrow, AK 99723

Dear Mayor Itta,

The Department of Revenue has over the years benefited from the assessment assistance provided by the North Slope Borough (NSB) under a Memorandum of Understanding (MOU) authorized under AS 43.56.060(g). Since the MOU's most recent revision in 2006, the Department has undergone a series of internal initiatives to strengthen the protection of taxpayer confidential information. We do not believe the current MOU is consistent with these internal standards. Therefore, please consider this notification that the Department is withdrawing from the agreement effective 30 days from the date of this letter as required in section seven of the MOU.

In light of the recent staff retirements within the NSB, which has left the NSB Audit Group without staff, the Department will now resume performing the appraisal functions that had been previously performed by the NSB under the MOU. As a result, we do not anticipate any negative impacts to the NSB or the state from the termination of the current MOU. Should the opportunity arise in the future to again work together under AS 43.56.060(g), we remain open to developing a new MOU with the NSB consistent with the Department's confidentiality requirements.

In accordance with paragraph 4 of the MOU, please have all AS 43.56 hard copy files stored at the NSB returned to the Department. Likewise, all electronic AS 43.56 files should be copied onto a disk and returned to the Department and subsequently deleted from all NSB computers and servers.

To avoid any confusion regarding the exchange of confidential taxpayer information, the Department will notify AS 43.56 taxpayers that the Department and NSB are no longer exchanging information pursuant to an MOU relating to AS 43.56 assessment matters.

We thank you for the excellent working relationship we have enjoyed with the NSB property assessment staff over the years.

Sincerely,

Marcia Davis

Marcia Davis, Deputy Commissioner

Good Afternoon Senator,

I have received the below request as well as the request dated 5/2/11 3:57pm (CORRECTED version). I have been and will continue to pass along your appreciation to the folks in my department who have worked so hard on your requests. I am fortunate to be working with such a terrific group of people.

As you may or may not be aware, we are a fairly lean shop when it comes to this type of detailed economic analysis and back in January I requested of them to "drop everything else & all hands on deck" during the regular 90 day session in order to turn requests around as fast as possible. We've got some folks on vacation and those that are here are catching up on their other day-to-day duties that were "neglected" during the 90 day session.

That being said, we will absolutely get to work on your very detailed requests from 5/2 and 5/3 however I cannot guarantee a turnaround time on these. It may take several weeks but we will keep you posted as to their progress.

Thanks and we'll talk soon.

Bruce Tangeman
Deputy Commissioner
Department of Revenue
(907) 269-0721

Subject: Questions / May 3, 2011

Hello Bruce,

I very much appreciate the assistance that you and the Department have been providing. Please extend my gratitude to all of your team members.

I have been thinking about the numbers that you sent me on Sunday and, respectfully, would like to submit more questions for you to analyze.

Using the FY12 Production Tax Estimates showing all credits (from the charts transmitted May 1) and also using the Spring 2011 forecast, I request a number of charts be prepared as to prices of $40, $50, $75, $80, $100, $110 to $175 in $5.00 increasing incremental pricing, and $200 per barrel. The chart that I have already been provided shows the calculations based upon a $94.70 price per barrel. The current depicted transportation costs, total lease expenditures, credits against tax liability and credits to be refunded should be held constant in this new analysis. This, I believe, will

change the amount of royalty and production tax value which will then result in a change of the total tax before credits, the estimated tax after credits and the estimated tax after refund amounts. The range of prices will depict the application of the base rate and various levels of progressivity, including the transition beyond $92.50 PTV. (Generally, I am interested in receiving the numbers that apply pursuant to the spectrum of pricing under AS 43.55.011(g), (g)(1) and (g)(2)). Please let me know if this request has been framed in an acceptable manner in order to receive charts at the various pricing levels. Please let me know if you have any questions.

I also request that the 6 charts – FY2010, FY2011 and FY2012 under both the Fall 10 and Spring 11 forecasts provided to me on May 1st – be recalculated assuming HB110/SB49 were applicable for the years 2010, 2011 and 2012. Based upon that assumption, what effect would the tax change have upon the 1) total tax before credits, 2) estimated tax after credits and 3) estimated tax after refund for each of those years. In other words, all values within the charts should remain constant except for the tax rate.

I am also interested in the types of financial information that you can share which might better show the production tax impact upon existing operators with production as compared to operators without production. In particular, I am interested in any internal method for analyzing the production tax impact upon various types of central North Slope operators. Can the 6 charts be adjusted to reflect various types of operators and if so can this adjustment extend to the impact at a spectrum of crude prices?

I also request that, as to the unconventional oil such as heavy oil, a FY2012 Production Tax forecast be prepared solely as to the unconventional oil and assuming 250,000 barrels per day and also assuming a $10/barrel increase in capital expenditure over the current $12.33 rate. The other downstream costs and deductible lease expenditure rates should remain the same. Royalty would, of course, be appropriately adjusted based upon the volume. I request that the individual charts span the range in prices based upon this assumption from $50/ barrel to $150/barrel, in $5/barrel increments.

Lastly, I request that charts at various prices be prepared based upon the assumption above as to heavy oil, as an unconventional oil, and its injection or its blending with 2012 conventional oil throughput. This separate set of charts would combine the 610,460 barrels per day conventional oil, under the FY2012 Production Tax Estimates showing All Credits and using the Spring 2011 forecast assumptions, and the 250,000 barrels per day of heavy oil for tax purposes. If the difference between the quality price differential of the heavy oil can be estimated as compared to the conventional oil pricing, please reflect that price difference in the chart.

Again, I very much appreciate your efforts. Please let me know if you have any questions or comments.

Sincerely,

Joe

Sen. Joe Paskvan

Subject: Response times for your questions

Follow Up Flag: Follow up
Flag Status: Flagged

Good Morning Senator,

I wanted to respond to your many questions we have received over the past few weeks. As I stated in my May 3rd response, the Petroleum Economic Analysis group within the Tax Division is a fairly lean shop. This group did a tremendous amount of work during session responding to hundreds of questions we received from both House and Senate committees. At my direction, I requested that they make these responses their #1 priority in order to educate the legislature on one of the Governor's highest priorities - HB110/SB49.

However now that session has come to an end these folks need to catch up with their other priorities that face the Department of Revenue and the State of Alaska such as continuing the audit process and the continued revamping of regulations. We are also in the process of filling several high level positions, including the Director of the Tax Division, Commercial Analysts, and Audit Master that could eventually help address questions such as yours. However at this time I do not have someone I can dedicate solely to addressing these questions and therefore I cannot promise when we will be able to get back to you with responses. Once we are fully staffed I should have a better feel for how we can fully engage our staff to address both the day-to-day business of the State and special requests such as your questions.

Until then, I believe you have some very knowledgeable resources at your disposal such as Legislative Research, Legislative Finance, and the various consultants LB&A has under contract that should be able to address most of your questions.

That being said, HB110/SB49 will continue to be a high priority for the State and I fully expect to continue working closely, as we did all session, with you and your staff during the interim.

Thanks for your time and I look forward to chatting with you soon.

Bruce Tangeman
Deputy Commissioner
Department of Revenue
(907) 269-0721

Subject: Questions Update

Good Afternoon Senator Paskvan,

I wanted to give you a brief update on your questions you have forwarded to DOR. I can appreciate the fact that you may not have received responses as quickly as you would have hoped, but we have put the RSB to bed and are finishing up your responses and should have them for you by late next week and well in advance of session kick-off.

It was very important for me to use the most up-to-date information available and the Fall 2011 Revenue Sources Book (RSB) is what we are using to answer your questions. At the same time as we were neck deep in the RSB compilation we were also undertaking several other projects that will provide even more information. This will also no doubt lead to good discussions this session.

As was done last year, I will be instructing my Tax Division staff to be ready to go DAY ONE of session and that all other issues are to fall in line behind answering questions and providing information. This system certainly lead to a backlog for my staff in their day-to-day duties that required catch-up duty once session was over but I think it was well worth it. As a side note, I'd like to pass along that they certainly appreciated the kind public words you used in describing the service we provided you and your staff with quick responses and always being available last session. You will see the same service this coming session.

Thanks again for your patience Joe and I look forward to working with you this session.

Bruce Tangeman
Deputy Commissioner
Department of Revenue

STATE OF ALASKA

DEPARTMENT OF NATURAL RESOURCES

OFFICE OF THE COMMISSIONER

SEAN PARNELL, GOVERNOR

550 WEST 7TH AVENUE, SUITE 1400
ANCHORAGE, ALASKA 99501-3650
PHONE: (907) 269-8431
FAX: (907) 269-8918

RECEIVED
JAN 23 2012

January 17, 2012

The Honorable Joseph Paskvan
Alaska State Legislature
State Capitol Room 115
Juneau, AK 99801

Dear Senator Paskvan

Thank you for providing the Department of Natural Resources (DNR) the opportunity to respond to your questions concerning permitting, facility access, new resource developments, and pipeline capacity considerations among other issues important to oil and gas development in Alaska, as outlined in your September 22, 2011, and October 6, 2011, letters. I regret that our response was not more prompt. The breadth of the subject matter and volume of your questions required us to collect information from different divisions within the department and from outside resources. While this response was a top priority for my staff, the demands of processing unit and permit applications, lease sale preparation, task forces, and other daily demands delayed our response.

DNR is making significant strides toward accelerating the rate of bringing new resources online, maintaining production from our legacy fields, and providing new independent operators the means for successful exploration and production. We hope this response will assist you and the legislature in making policy decisions critical to boosting oil production in our state.

I look forward to meeting with you in the coming months.

Sincerely,

Daniel S. Sullivan
Commissioner

Cc: Bill Barron, Director, Division of Oil and Gas

Please find below DNR's responses to the 30 questions from September 22, 2011.

1(a) Q. I would like to have DNR's current knowledge as to the fluid handling capacities of the central North Slope treatment facilities.

A. The following table provides a list of capacities for the central North Slope facilities along with handling limitations to the best of our knowledge.

Unit	Oil and NGLs, standard barrels per day (stb/d)	Gas, million standard cubic feet per day (mmscfd)	Water (bwpd)	Water Injection (bwpd)	Handling Limitations and comments
Badami	35,000	25	12,000	30,000	No Limits
Colville River	140,000	180	100,000	140,000	We know of no limits at this time
Endicott	115,000	455	225,000	245,000	Limited gas and water
Kuparuk					Limited Gas, water, and total fluid handling
CPF-1	170,000	200	250,000	250,000	
CPF-2	160,000	260	250,000	300,000	
CPF-3	85,000	150	100,000	220,000	
Milne Point	75,000	42	99,000		None known for current development
Northstar	77,000	555	30,000		Limited by gas handling, water production is not at limit. Uncertain whether rated capacity is current.
PBU					Limited gas, water handling - Note: cannot add up each facility to obtain total facilities restrictions
FS-1	360,000	2,800	140,000		
FS-2	360,000	1,200	650,000		
FS-3	360,000	1,300	300,000		
GC-1	330,000	2,600	180,000		
GC-2	250,000	1,070	300,000		
GC-3		1,100	275,000		
CGF		8,700			
CCP		7,700			
LPC - Greater Pt. McIntyre	205,000	450	120,000		Limited gas, water, and total fluid. Some wells from Pt. McIntyre flow into GC1
Oooguruk					Production to Kuparuk CPF-3. No known handling limits at Oooguruk.
Nikaitchuq	40,000	unknown	120,000		No limits at this time

1(b) Q: I would like to know the individual ownership interests in all central North Slope treatment facilities.

A: Companies are not required to submit information on ownership interest for treatment facilities to the State; therefore, we have no information to provide for this question. However, facility ownership typically follows working interest ownership percentages. This statement is supported by the fact that operating and capital expenditures on facilities are split amongst partners based on their interest ownership percentages in the field.

1(c) Q: What internal analysis has DNR prepared as to likely continuing near future [next five years or so] constraints as to treatment capacity at particular facilities?

A: To our knowledge, there are no sanctioned projects to increase treatment capacities. The Prudhoe Bay Unit (PBU) Working Interest Owners (WIO) are considering the installation of a gas partial processing plant in the GC2 area, Pad Z, which would partially separate 350 million cubic feet of gas from well production, and compress the gas for gas lift. This will decrease the volume of gas to the central facilities, effectively increasing gas handling, which would be especially beneficial as the Gas-to-Oil Ratios are lower at GC2 as compared to other facilities, and there is potential for increased rates and reserves through drilling of western satellite wells. The increased gas handling will allow for less back-out of oil from existing wells when new wells are brought on line. As noted, however, this project has not been sanctioned and therefore is several years away if in fact it is ever undertaken.

1(d) Q. I would like to know the specifics as to the individual facility constraints as to both water and gas and which facilities are currently constrained as to either the water or the gas or both water and gas, also, as to oil flow downstream of the facility, what line capacity constraints, if any exist?

A. See table above in question 1(a) for the individual facility's status. As noted above, because the facilities are integrated with one another, a significant constraint on oil production to consider is the gas constraints at the central facilities, such as the CCP and the CGF in the Prudhoe Bay Unit.

1(e) Q. What knowledge, if any, as to the construction of new treatment facilities has been conveyed by the oil industry?

A. See answer to question 1(c) above.

1(f) Q. What information does DNR have as to the likely duration of the current constraints in processing capacity of water and gas?

A. With the exception of the potential PBU partial processing plant (not sanctioned), we have no information that the facilities' handling capacities will be increased in the near future.

1(g) Q. The DNR knows of no major gas handling expansion for the Prudhoe Bay area occurring after 1995.

A. That is accurate.

2(a) Q. What information does DNR have as to well shut in as a result of back out facility sharing? [By this I mean conduct both as to inter-company and intra-company conduct.]

A. The operator of each unit is required to submit to the AOGCC a list of all wells that are shut in (SI) for more than one year, and the reasons for SI. We recommend contacting AOGCC for further details on this matter. That said, the annual surveillance reports submitted to the AOGCC are shared with DNR and the operators usually list those wells SI for greater than one year and note those that are shut-in because they are non-competitive either due to water or gas production. However, we have not seen information concerning wells SI due to facility sharing.

2(b) Q. Who is the person at DNR that is most knowledgeable as to back-out agreements and facility sharing agreements?

A. Kevin Banks with the Division of Oil and Gas is the most knowledgeable on these subjects.

3 Q. Other than fluid handling capacities at the treatment facility, what other types of facilities sharing arrangements is the oil industry entering into on the central North Slope? Who within is most knowledgeable as to this area? Can facilities sharing be used as a barrier to development of Alaska's resources?

A. There are other facility sharing agreements, other than fluid handling, on the North Slope. DNR would not necessarily know about other sharing agreements (with the exception of fluid handling agreements as parties need DNR approval to commingle fluids). All facility sharing agreements are confidential. To our knowledge, other services and facilities being shared include gravel roads, drilling pads, grind and inject facilities, gravel mining pits, and power supplies. General, common facility sharing is a routine practice within the industry as a means of decreasing overall operating and capital costs. As noted in testimony by Director Bill Barron in November 2011 House Resource committee hearing on oil development impediments, the Division of Oil and Gas will be encouraging industry to cooperate on developing common needs to reduce costs of operation. The Division of Oil and Gas is likely the most knowledgeable on this subject.

4(a) Q. Ultimate TAPS throughput is associated with the capacities of the treatment facilities on the central North Slope. What internal analysis of the range of throughput reduction is anticipated within the next 5 to 10 years if no additional treatment facilities for conventional oil processing are constructed?

A. DNR does not publish our own predictions. However, DNR reservoir engineers review results of the Department of Revenue's (DOR) published predictions, and they are similar to our own. The following was published by the DOR in their Fall 2011 forecast.

Figure 4-11. Alaska North Slope Production, FY 2011 and Forecasted FY 2012-2021[m] (million barrels per day)

Fiscal Year	Currently Producing	Percent Change from Prior Yr.	Under Development	Under Evaluation	Total ANS	Percent Change from Prior Yr.
2011	0.603	(6.3%)	0.000	0.000	0.603	(6.3%)
2012	0.548	(9.1%)	0.026	0.001	0.574	(4.7%)
2013	0.485	(11.6%)	0.069	0.001	0.555	(3.3%)
2014	0.451	(6.9%)	0.099	0.010	0.561	1.0%
2015	0.406	(10.0%)	0.115	0.017	0.538	(4.1%)
2016	0.369	(9.1%)	0.151	0.029	0.550	2.1%
2017	0.336	(9.1%)	0.179	0.034	0.549	(0.1%)
2018	0.307	(8.5%)	0.171	0.066	0.544	(0.9%)
2019	0.282	(8.1%)	0.166	0.066	0.515	(5.4%)
2020	0.262	(7.4%)	0.164	0.061	0.486	(5.6%)
2021	0.241	(7.7%)	0.161	0.056	0.458	(5.8%)

4(b) Q. Has DNR assessed the engineering or science of a mature oil field as to likely increasing volumes of water and or gas in the next 5 to 10 years?

A. With only a handful of engineers on staff, engineering assessments and studies are rarely undertaken by Department staff. DNR has not undertaken its own assessment of the engineering or science at Prudhoe Bay or Kuparuk. However, some aspects of mature oil fields are well-known. In water-flooded fields, the water-oil ratio will increase over time. Furthermore, the ability to lift the high water cut wells with the existing systems (mostly gas lift) becomes problematic. Similarly, fields such as Prudhoe with gas cap expansion will experience increasing gas-oil ratios. The operators have put a lot of effort into sidetracking wells to areas where oil has been unswept by water or gas, and hence should have lower gas-oil and water-oil ratios at initial production. At some point, as these unswept areas are produced, lower oil rates will result from the well work. The water and gas production rates are constrained by the facilities handling, and hence, with the increasing gas-oil and water-oil ratios, the oil rate decreases.

4(c) Q. Who within DNR is the most knowledgeable in this area?

A. The Division of Oil and Gas has engineers knowledgeable on these subjects; however, we ask that legislative inquiries be directed to the Director's Office or DNR Legislative Liaison Esther Tempel.

5(a) Q. We have had discussions as to the need for revisions to the state's regulations. What is the status of these revisions to the regulations, particularly those related to shale oil development? Is Alaska's DNR fully prepared for a transition to the likely future of unconventional oil development? What DNR additional staffing might need to be addressed and what new areas of staffing should be considered?

A. DNR has established a permitting task force led by Deputy Commissioner Ed Fogels to help streamline the State's permitting process and relieve the current permit backlog. DNR has also established a multi-agency shale oil task force to facilitate and efficiently permit environmentally responsible North Slope shale resource development on State lands. The shale task force is led by the Division of Oil and Gas and includes representatives from DEC, Fish and Game, AOGCC, DMLW, and OPMP. The shale task force is currently identifying regulatory issues and staffing needs to address the increased pace and magnitude of permitting and development inherent in shale oil development. The state is well-positioned from a regulatory and statutory standpoint to manage shale development because the permitting required for conventional wells is applicable to shale development.

DNR is leading the effort to prepare the state for the potential of widespread shale oil development on state lands. The shale task force has been in operation for a mere three months. Although progress has been steady, the scope of their work is large. The shale task force will have more details on staffing needs as it completes its work in March 2012.

5(b) Q. What other areas of interest is DNR considering may participate in the upcoming lease sale?

A. It has been just over a year since the news of shale oil development struck Alaska. News of BP's successful production of heavy oil at Milne Point occurred less than a year ago. DNR representatives have actively marketed the fall lease sale to companies throughout the world. We have two major new players (Shell and Royale Energy) investing in the North Slope with Conoco leasing a number of tracts near Badami and Nordaq moving north to explore Smith Bay. While we were excited by the magnitude of the sale, we have not learned the intentions of the new bidders.

5(c) Q. As to heavy oil development, are regulatory modifications needed or appropriate to this area?

A. Heavy oil permitting has been following the lines of conventional oil development. Current heavy oil development takes place in current operations and participating areas with existing infrastructure. We do not see a need to make regulatory or staffing changes to address the heavy oil development at this time.

6(a) Q. What are DNR's thoughts on quality bank adjustments as to heavy oil?

DNR believes that the litigation process, which involves significant tension between commercially-sophisticated parties, has generally produced a reasonable quality bank compensation formula.

TAPS crudes of different quality are comingled. The TAPS quality bank is a means by which different shippers compensate each other for the fact that the value of the crude that a given shipper's delivery to the line differs from the value that the shipper receives when it receives comingled crude at destination.

From the narrow view of royalty and tax value, the state should be largely indifferent as to the particulars of the quality bank formula. A formula that Shipper A might view as an under-compensation for degradation in its crude quality causes a symmetric over-compensation for Shipper B's crude. Overall, state value should be largely unaffected.

Of course, the state has a broader dynamic interest in ensuring that the quality bank treats all parties fairly, as this promotes maximum efficient development of state resources. The TAPS quality bank litigation has been hard-fought over for many years. The litigation has involved commercial tension between extremely sophisticated parties with detailed knowledge and understanding of how refineries run and value crude oil of different qualities. The state has also participated in this process. In general, the state believes that the process has produced reasonable results and will continue to do so for heavy and viscous oil production.

6(b) Q. What sources of information does DNR look to as to pricing of heavy oil in other jurisdictions?

A. The DNR subscribes to several periodicals that report prices of a number of different crudes. These include Platt's Oilgram News, Oil Daily, and Petroleum Argus.

6(c) Q. What are DNR's thoughts on the magnitude of the operating and capital expenditures needed for heavy oil?

A. Heavy oil development on the North Slope may benefit from the existence of considerable "sunk" infrastructure costs that may be used towards processing and transporting heavy

oil. That said, incremental capital costs are likely to be considerable and DNR is of the general belief that these will be materially greater on a dollar-per-barrel basis than for legacy production on the North Slope. DNR lacks data to offer good estimates on the relative magnitude difference, however. We do not have projections for CapEx and OpEx necessary for heavy oil development.

7. Q. **I would also like similar information, to that requested in the above paragraph, but in the area of shale oil.**

A. DNR's understanding is that an "average" horizontal producing shale oil well in the Bakken has CapEx costs of over $6 million, with annual OpEx around $85,000. Costs in Alaska are expected to considerably exceed these figures. To date, no well has yet been drilled for shale oil in Alaska. Until many such wells have been drilled and produced, the question of costs cannot be answered with a great degree of confidence.

8. Q: **Who within DNR is most knowledgeable in the individual areas of heavy and shale oil production?**

A: The Division of Oil and Gas has several individuals in the Resource Evaluation and Commercial sections knowledgeable in the areas of heavy and shale oil development. To determine the person most suitable to answer questions, please contact the Division of Oil and Gas Director's Office.

9. Q. **What is the drilling activity expected to be between now and summer 2012? Are all drilling rigs currently under contract even if not currently drilling? Are there any rigs which are now idle? What is the type of activity which they are performing? How many exploration wells are anticipated in the drilling season? How many development wells are anticipated in the upcoming drilling season? How many well work-over projects are anticipated?**

See the table in Exhibit A for anticipated exploration activities during the winter 2011-2012 drilling season. This is a list of plan of operations applications submitted to DNR this year. Exploration drilling activities generally cease during the summer months on the North Slope but may continue during the summer in Cook Inlet at locations located near existing infrastructure. The Alaska Oil and Gas Conservation Commission is better equipped to answer questions about the availability of drill rigs and number of exploration and development wells under permit for the upcoming year.

10. Q. **An area of critical importance is in the process of permitting. What percentage of increase or decrease in permit applications has occurred from that which was submitted in 2007, for example, to the 2010 and 2011 time periods, what do you expect for next year? What generally can be said as to the types and numbers of permits which are**

currently being filed? What historical data exists as to the numbers and types of permit applications from, for example, 2000 to present? What historical data exists about the companies submitting those applications? What is the permit application distribution between majors and independents over the past 10 years?

A. Below is a list of Lease and Unit plan of operations applications for independent and major operators in 2007, 2010, and 2011. The change between 2007 and 2010 are not significant; however, the lease plan of operations applications dropped nearly 40% for major operators in 2011 from 2007 and 2010.

Year	*Type of Permit Application*	Operator	Count
2007	*Lease Plan of Operations*	Independent operator	10
2007	*Lease Plan of Operations*	Major operator	86
2007	*Unit Plan of Operations*	Independent operator	6
2007	*Unit Plan of Operations*	Major operator	25
2010	*Lease Plan of Operations*	Independent operator	4
2010	*Lease Plan of Operations*	Major operator	85
2010	*Unit Plan of Operations*	Independent operator	5
2010	*Unit Plan of Operations*	Major operator	23
2011	*Lease Plan of Operations*	Independent operator	6
2011	*Lease Plan of Operations*	Major operator	51
2011	*Unit Plan of Operations*	Independent operator	4
2011	*Unit Plan of Operations*	Major operator	24

A list of submitted applications for plan of operations permits can be found in Exhibit A which details proposed activities for this winter. We are receiving a steady amount of permits applications for exploration work this winter. However, plan of operation approval does not necessarily translate to drilling this winter. At this juncture, we have not received the volume of exploration applications that was projected by companies. Below is a table providing permit counts from 2000-2011 between majors and independents.

Division of Oil & Gas Permitting Activity : 2000 through 2011

Permit type	Operator type	Count
Easements	Independent operators	7
Geothermal Plan of Operations	Independent operators	11
Lease Plan of Operations	Independent operators	81
Multiple Land Use Permit	Independent operators	41
Unit Plan of Operations	Independent operators	41
Lease Plan of Operations	Major operators	644
Multiple Land Use Permit	Major operators	25
Unit Plan of Operations	Major operators	186

11(a) Q. I generally understand that consideration is occurring as to the adding of NGL's downstream of pump station 1 as compared to adding this stream upstream of pump station 1.

A: Currently, NGLs are injected upstream of Skid 50 and flow into Pump Station 1 through the Sadlerochit (Prudhoe) 501 transit oil pipeline. DNR has received no information on plans for studies on injecting NGLs directly into TAPS, downstream of Pump Station 1. Alyeska Pipeline Service Company and the North Slope producers are studying a number of changes to processing facilities and TAPS. A number of screening studies, estimates, conceptual designs, and other efforts are currently being conducted to enhance low-throughput and cold-temperature operations.

Introduction of NGLs into TAPS is not a straight-forward replacement for the same volume of oil. NGLs have a higher vapor pressure and there is probably a limit to the volume able to enter TAPS. Introduction of NGLs into TAPS from the newly-completed Central Gas Facility in Prudhoe during the early 1990s resulted in vapor control problems and required modifications to facilities. Thus, there is still much to learn about this process.

11(b) Q. What potential volumes are considered from NGLs?

A. For the main Prudhoe area, NGLs sold into the pipeline in 2010 averaged 45.6 thousand barrels per day (MSTB/D).

11(c) Q. Does DNR have an estimate to the volumes in barrels of NGLs from the gas volumes from GHX1 and GHX2?

A. As a result of GHX1, peak NGL sales increased by approximately 18,000 barrels per Day (STBD) from additional gas handling of +/- 1.8 billion cubic feet per day (BSCFD)

As a result of GHX2, peak NGL sales increased by approximately 20,000 barrels per Day (STBD) from additional gas handling of +/- 2.0 billion cubic feet per day (BSCFD)

11(d) Q. What percentage, if any, of NGLs which are used for miscible injection are, in the future, not recoverable?

A. We do not have estimates of these volumes. The recovery of remaining NGLs depend upon future depletions plans such as injection of water, lean gas, or CO2 to sweep NGLs remaining.

11(e) Q. What volume of NGLs is necessary for miscible injection?

A. Miscible injection averaged 169 million cubic feet per day (MMSCF/D) in 2010. Of these volumes, 24.7% consisted of propane and about 2.2% were heavier end hydrocarbons. Not all of the propane volumes can be stabilized as liquids. Only volumes of NGLs that cannot be sold into TAPS, due to vapor pressure restrictions, are used for miscible injection. It is likely that if more miscible gas volumes were available, they would be used to increase recovery in Prudhoe, including the satellite pools.

11(f) Q. What additional oil volume is currently extracted because of NGL miscible injection?

A. As noted above, propanes and heavier components comprise about 27% of the gas volume of MI, or 46.6 MMscfd. We do not have this volume in barrels, and as also stated above, these volumes cannot be stabilized into oil for TAPS.

12. Q. Has DNR analyzed the potential volume of liquids which can be transported by TAPS if a GTL processing plant was located on the central North Slope?

A. DNR has no definitive information on this issue. The ability for TAPS to transport hydrocarbon liquids depends upon the type of hydrocarbons that a GTL plant will produce. Light hydrocarbons (such as NGLs) can create vapor-pressure problems. Heavy oils can create excessive pressure loss and require additional pumps or pump stations. Theoretically, TAPS can ship the same volume of artificially produced hydrocarbon liquid as naturally produced oil, if the liquid is tailored to have physical characteristics similar to current North Slope production. The current limit of TAPS facilities is 1.4MM BOPD, with injection of large amounts of Drag Reducing Agent.

13. Q. Has DNR analyzed the potential range of volumes of heavy oil which would flow through TAPS?

A. No. Heavy oil throughput is really a question of how aggressively BP and Conoco Philips pursue new viscous development. We could see these levels stay flat at current rates, decline, or increase. Ultimately, heavy oil development will depend on price, success of ongoing pilot projects, availability of diluents such as NGLs, perhaps TAPS heating situation, and other factors relevant to a company's investment strategy.

Current total production for existing developed "viscous" oil is 36,000 BOPD, with a peak of 44,000 BOPD in 2008. Online wells have stayed relatively steady since 2008. Note these are "viscous" Schrader Bluff/West Sak pools, not the "heavy" Ugnu formation which is in current pilot testing at Milne Point and Kuparuk.

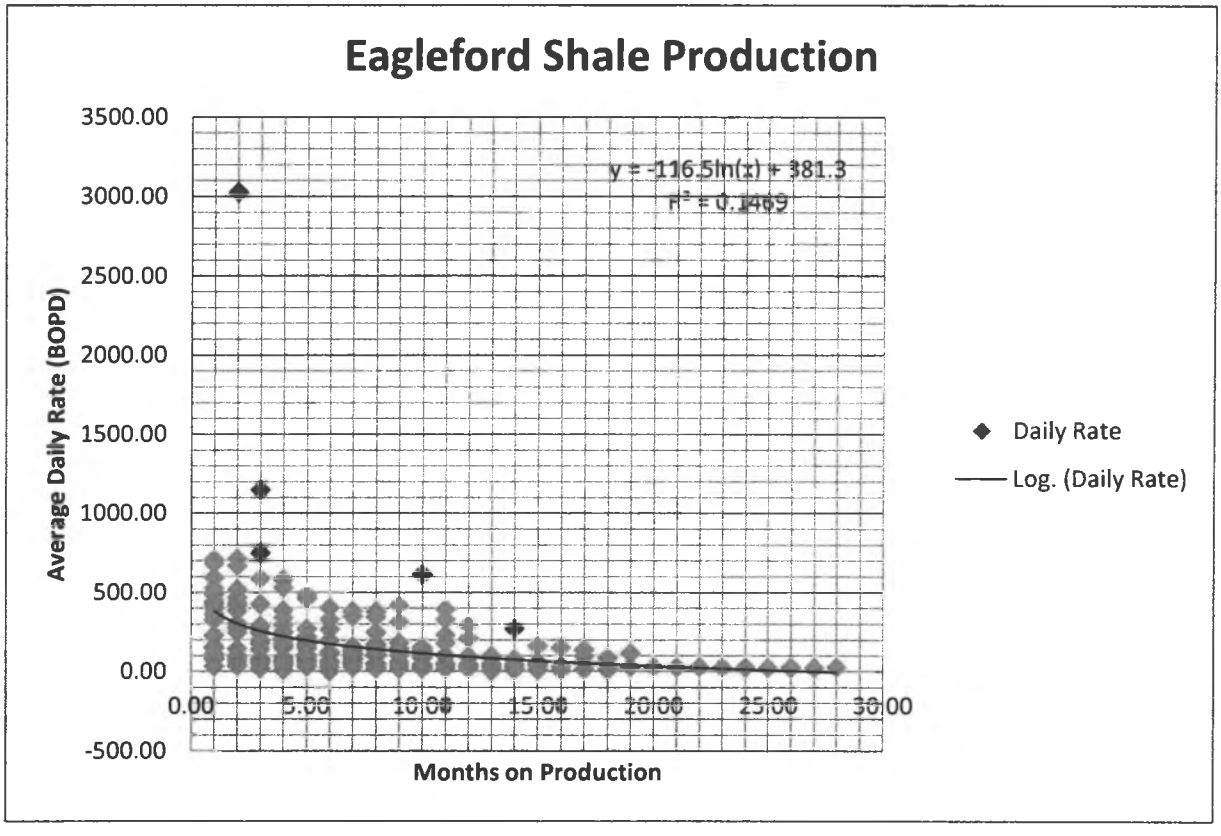
14. Q Has DNR analyzed the potential ranges of volumes of the oil obtained from the Chukchi/Beaufort from Shell's current plans that would travel through TAPS?

A. No. We do not have resource volumes or production forecasts for all of Shell's OCS oil prospects. Some have known, discovered resources (Sivulliq/Hammerhead) and others (Torpedo, etc.) are still undrilled, undiscovered, hypothetical barrels. Burger in the Chukchi has known gas and is prospective for oil or condensate liquids, but whether it will ship via TAPS is uncertain.

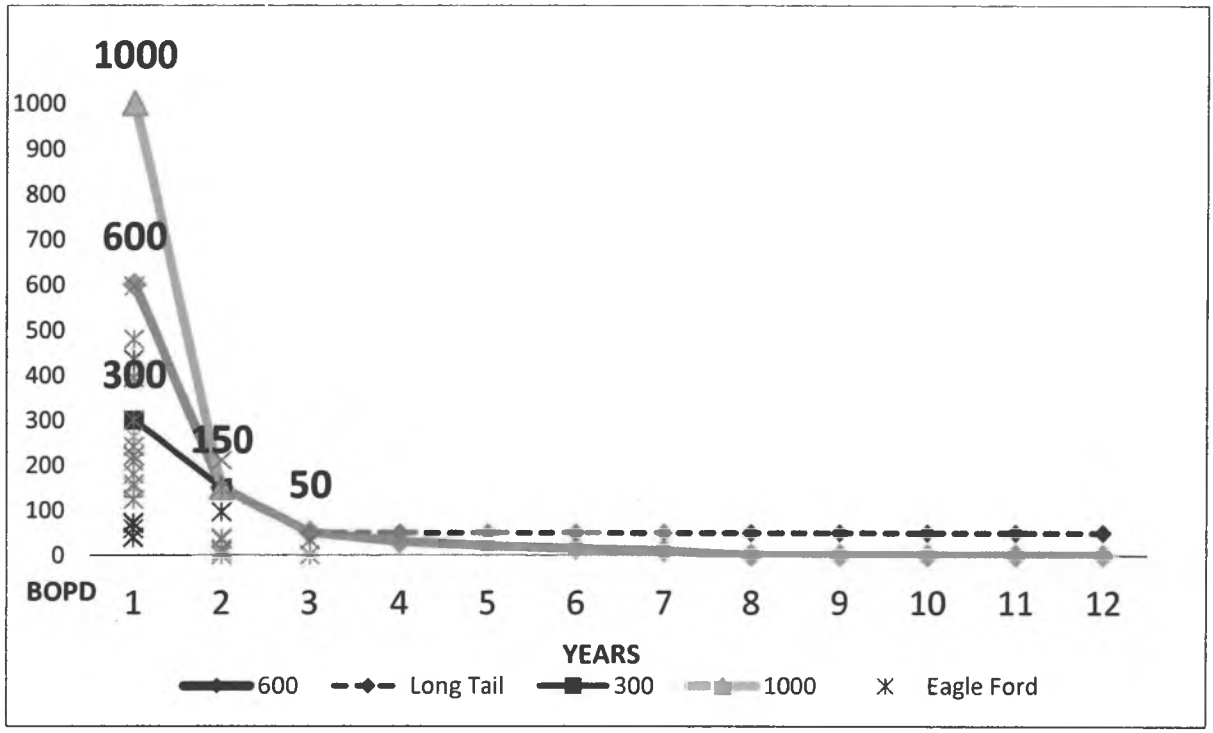
15. Q. Has DNR analyzed the potential volumes of Shale oil from Alaska's source rocks that may travel through TAPS assuming the successful implementation of shale oil extraction in Alaska?

A. DNR's analysis regarding the potential of the Alaskan shale resource play has centered on production of oil wells in the Eagle Ford Shale in Texas. The Eagle Ford was selected because the primary target of the current Alaskan operator, Great Bear, is the Shublik shale which has been compared to the Eagle Ford formation as an analogue.

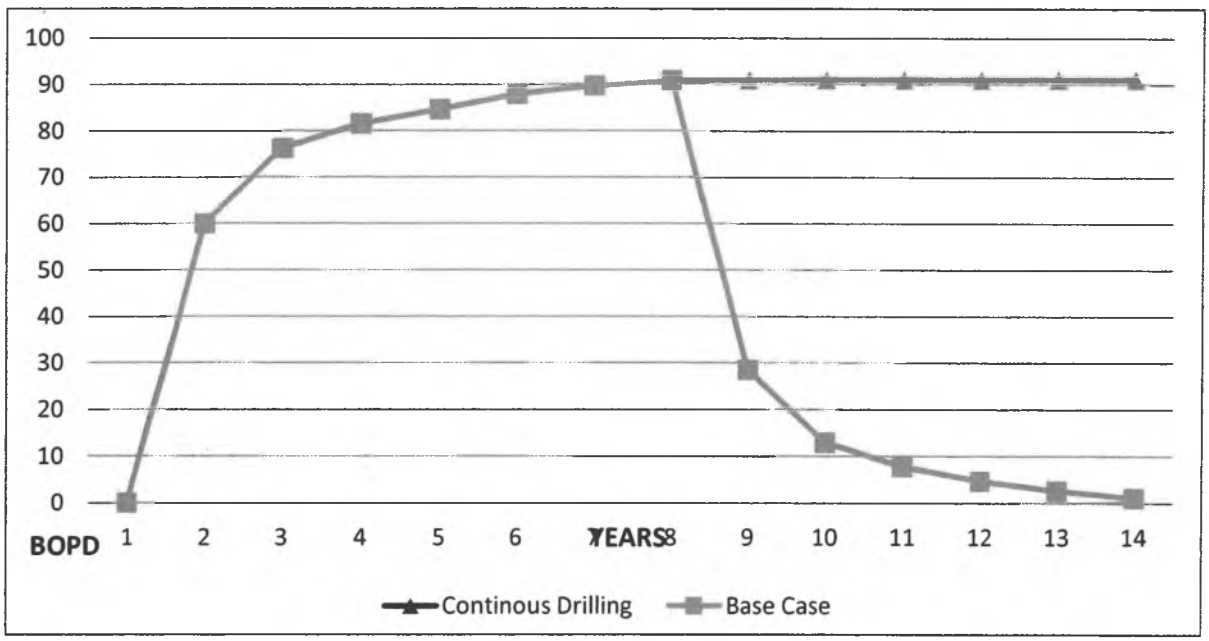
The central question around any shale development is whether or not the characteristics of the shale itself will allow hydraulic fracturing and production of hydrocarbons in commercially successful volumes. Until testing of the Alaskan source rocks occurs, the true potential will not be known. If the Eagle Ford is a true indicator of potential oil production of the Shublik, production could mirror data from the Texas Railroad Commission website. Research conducted by DNR and University of Alaska graduate students indicated that for Eagle Ford certified oil wells, production was as follows: First month production was between 80 and 700 BOPD for a first month average. The oldest well of the data set was at 24.5 BOPD after 28 months.



With this data, the Division of Oil and Gas commercial team developed the following single well dual lateral production profiles:



The commercial team then built up the following production profile based on a six-rig drilling program with year-on-year development within the lease term of 10 years and drilling for 7 years or continuing beyond the lease term with all leases held by at least one well:



This case shows a rate of 90,000 BOPD rate potential assuming all wells produce with the same rate initially which will most likely not be true. The rate will increase with more rigs

drilling the wells. Twelve rigs would result in a potential 180,000 BOPD added to the pipeline.

It is important to understand that these numbers are based on year-on-year "assembly line" type of development with all wells being equal in the production arena. While the assembly line type of development can be within the control of the state and the operators, the production is not, especially when data is studied for any other shale resource currently in production. The case also studies a single interval, not three as proposed in the highest Great Bear estimates. Prior to any tests being completed on the Shublik interval, all production data discussed above are only educated guesses as tests may find actual production to be lower or higher.

16 **Q. Has DNR analyzed the range of volumes of conventional oil from Conoco Phillips Colville River development assuming the bridge crossing is approved?**

A. Although there are no public numbers available, DNR believes that a wide range of possible oil reserves can be estimated for the proposed CD-5 pad based on the performance of the Alpine field consisting of the CD-1 and CD-2 pads and the two satellite areas: the Fiord CD-3 pad and the Nanuq CD-4 pad. DNR sees the possibility of 25-200 MM BOPD being recovered from CD-5 with peak production of 10-100 thousand barrels per day based on what we have seen at the first four pads.

17. **Q. What strategic planning would be needed to increase TAPS throughput capacity above 1.1 million bbl's/day should oil volumes, both conventional and unconventional, need to be transported by TAPS?**

A. TAPS capacity can be increased above 1.1 million BOPD. However, increases beyond 1.4 million BOPD or significant increases in unconventional oil (heavy oil or NGLs) may require modifications. The capacities of the facilities and the mainline are addressed independently:

Mainline: The mainline appears sufficient for rates of 1.1 million BOPD. It has flowed at rates up to 2.1 million BOPD. However, this was not a TAPS physical limit, but a maximum created by North Slope production decisions and regulatory approvals. Since that time, Alyeska has de-rated the maximum allowable pressure in certain locations. Alyeska would likely have to repair or replace specific pipe defects to increase pressure in these sections again. Typical mainline modifications can be made within a year of funding.

Facilities: The new Strategic Reconfiguration (SR) facilities can pump 1.14 million BOPD with no modifications. Simulations performed by Alyeska indicate that with large volumes of Drag Reducing Agent, the SR facilities can transport up to 1.4 million BOPD.

Alyeska designed each SR pump station for future expansion by allowing room to add one additional pump, motor, turbine, and variable frequency device (VFD).

Legacy Pump Stations with higher capacities are still online at Pump Station (PS) 01 and PS07. Part or all of abandoned legacy pump stations still exist at PS02, PS03, PS04, PS06, PS08 and PS09. PS05 contains piping to add more pumps.

Extensive production of non-conventional oil or NGLs may require additional pumps at existing pump stations or new pump stations. Adding redundant equipment to increase reliability would require more equipment. Typical major facility modifications can be made in two to five years at existing sites and three to five years at new sites or sites requiring air permits.

18. Q. **What are DNR's thoughts as to the additional fluid handling treatment facilities needed within the next 5-10 years? I am interested in this information both as to conventional and unconventional oil and state and federal land developments.**

A. It is likely that, as new discoveries are made or opportunities are found within existing fields, operators will continue to build or expand facilities as needed. The need for incremental oil processing facilities on the North Slope will be driven by the exploration and development activities being undertaken today. At present, we do not know the projected results of those efforts. Without an assessment of incremental production, we cannot estimate the amount of incremental facilities needed.

19. Q. **Do you agree that Alaska's current production tax credits provide for both the CAPEX deduction of costs and credit of 20% as they relate to fluid handling, both treatment facility upgrades and construction?**

A. We would agree with this assessment for all of the geographic areas listed, with the exception of Chukchi and Beaufort Sea oil. Production from the Outer Continental Shelf (OCS) is not on land within the geographic boundaries of the state, and therefore not subject to the state production tax. Accordingly, costs associated with developing OCS acreage do not receive deductions or credits under Alaska's current production tax system.

20. Q. **Does DNR acknowledge that if additional treatment facilities had been constructed on the central North Slope, for example in 2005, that 1) TAPS throughput would exceed the current throughput and 2) assuming excess capacity at the newer constructed facility that would provide motivation for exploration, especially by independent oil companies?**

A. With regard to (1): There are areas on the North Slope where processing facility constraints require operators to make optimization decisions about which wells to shut in (e.g. those with the highest ratios of gas to oil production) and which to keep in production. If there were more gas and water handling facilities available then the economics of keeping marginal wells online would improve. All else equal, that would lead to increased production.

That said, this says nothing about the economics of constructing additional facilities or debottlenecking existing facilities to increase their capacity. The economics of those decisions are not known by the DNR, as we do not know the cost of incremental facilities or the benefits of augmenting or accelerating production by bringing additional wells online.

With regard to (2): If there was excess capacity at newer constructed facilities, and such capacity was made available at commercially reasonable terms, then additional exploration could be facilitated. The key issues here are the relative costs of fluid processing at a large facility versus a possibly much smaller modular facility, and the commercial terms by which excess capacity might be made available. DNR does not currently have adequate estimates of these relative costs, in part because the model of using smaller modular processing facilities has not yet been developed on the North Slope.

21. **Q. What analysis has DNR done as to why it took approximately 30 years for the first independent to produce any oil from the central North Slope? Who at DNR is most knowledgeable as to potential impediments to independent production of Alaska's resources?**

A. DNR has conducted no formal analysis or finding concerning this question. Any, or a large, number of potential factors invite speculation, including: high costs of unaffiliated transportation (TAPS and OPA-90 compliant tankers); the pace of technology diffusion associated with Arctic operation acumen; comparatively lower historical oil prices; the high costs of exploration and development in an Arctic environment; smaller apparent remaining oil fields to develop; or costs of complying with environmental sensitivities.

Additional questions as to potential impediments to independent production of Alaska's resources should be directed to Bill Barron, Director of the Division of Oil and Gas.

22. **Q. Please set forth: a) the types of non-public information and b) the types of public information which DNR has which would qualify the oil production benefits of future gas and water handling capacity investments as stated June 8th 2011.**

A. Projections to quantify benefits of gas and water handling capacity investment are based on AOGCC's production data, which is publicly available, and aspects of a company's plan of development that are non-confidential. DNR receives confidential data in the plans of development submitted to the Division of Oil and Gas that can be helpful in determining benefits of investment; however, we are unable to make projections based on this information for fear that our interpolation will reveal confidential data. DNR does not receive company information critical for developing projections such as optimization records, reservoir models, or cost and price information. Thus, we are limited in what benefits of adding handling capacity we can project.

23(a) Q. How many BCF of gas does the central North Slope consume in a years' time and set forth the benefit to Alaska in either royalty or tax revenues which Alaska receives for that gas?

A. The State's share of gas produced and sold off unit (royalty-bearing gas) in 2010 was 3.52 BCF. The State received $11,676,308 for that gas. Non-royalty bearing gas for in unit consumption was 450 BCF in 2010.

23(b) Q. Has there been a royalty inventory as to any gas volumes used on the central North Slope?

A. DNR has not initiated a royalty inventory at this time.

24(a) Q. What water oil ratio does DNR anticipate at Prudhoe Bay from 2010 (at, I believe approximately 4: 1 water oil ratio) to 2020?

A. At the current rate of drilling, sidetrack, and work-overs, we estimate an average field-wide water-to-oil ratio of approximately 6 to 7:1 on average for Prudhoe Bay (Ivishak Initial Participating Area plus western satellite development).

24(b) Q. Will those increasing water oil ratios over the next decade reduce throughput from Prudhoe Bay?

A. Yes, increasing water-to-oil ratios will reduce oil throughput from the water-flood areas. Work-over or sidetracks of wells to reduce water will have diminishing rate impacts over time. In addition, artificial lift using gas lift will become increasingly inefficient.

25. Q. How is NGL processing for sales into TAPS accounted for in royalty?

A. NGLs are valued as oil, except that DL-1 leases subject to the 1995 Gas Settlement Agreement pay a higher field cost deduction.

26. Q. Does DNR agree that throughput in 2006-2007 occurred due to corrosion and shut down issues?

A. We are unable to comment on these issues because they are the subject of litigation scheduled for trial.

27. Q: Well work-over activity in the central North Slope has been high in recent years. Is it generally accurate that the activity will likely increase production volumes from the wells for years to come, but subject to the treatment facility constraints?

A: Rig or non-rig work-overs have proven to be the most cost effective method of maintaining the highest production rates of current reserves. To state that the activity increases production volumes and will for years to come is not exactly correct. The activity returns most wells to their highest possible production rates by fixing an issue that is typically mechanical in a well. In a few cases, the work-over activity will access new reserves. For the most part, this work maintains or accelerates the production of current reserves. It is important to caution that production volumes from a well will not be perpetually increased through work-over activities as the reserves are diminished over time. The comment on production increase being constrained by treatment facility limitations is generally correct. If the production of the newly-fixed well is not impacted, there is typically another less competitive well or wells that are backed out of the system to make room for the increased production.

28. Q. Does DNR agree that oil throughput at Prudhoe Bay is constrained by the ability of field operators to process and re-inject associated natural gas?

A. Yes, gas processing is a significant facility constraint in Prudhoe Bay. While new wells could be drilled with lower GORs, other high GOR wells have to be shut-in because of the gas processing limitation.

29. Q. As of the early 1990's, does DNR agree that Prudhoe Bay was past the point where well drilling could stave off a falling oil rate?

A. Yes. The Prudhoe Bay Unit WIOs had a very aggressive drilling program in 1986-1992. In addition, a major gas handling expansion (GHX-1) occurred in the late 1980s which helped stem decline. Significant delay in the production plateau would have been difficult.

Please find below DNR's responses to the 11 questions from October 6, 2011.

1(a) Q. The Charter of Development dated December 1999 contains facility requirements. Who is the person most knowledgeable at DNR as to paragraphs F and G?

A. A number of DNR staff is familiar with certain aspects of the Charter. We ask that inquiries be directed to DOG Director Bill Barron to identify the staff member with the most knowledge on a specific aspect of the Charter.

1(b) Q. Specifically, what are the past and current understandings of terms as to:

a. Non-discriminatory, just and reasonable?
See response below

b. Allowing access to existing unit facilities?
See response below

c. Reasonable commercial terms?

A. For question (a) – (c), we have asked the Department of Law to provide interpretations on contract terms for you.

d. Further, who are the qualified producers under G?

A. At this time, it appears that qualified producers counted under paragraph G would be the following: ASRC, Doyon, Murphy Exploration, Petro-Hunt, Pioneer, Savant, and NANA Corporation. However, we are not privy to the assets of each of these corporations.

e. What leasehold production has been purchased by Charter signers?

A. Production has been purchased from the Northstar, Nikaitchuq, Colville River, Oooguruk, and Badami units.

f. What accounting as to the 30,000 bbls/day exists?

A. There has not been an official accounting of the volume; however, the Division of Oil and Gas has current information on production sold by qualified producers.

g. Has the 30,000 bbls/day been reached?

A. From our information, it appears that less than half that amount is currently being sold by qualified producers.

h. What policy background exists as to the inclusion of these paragraphs in the Charter?

A. The merger of BP and ARCO would have led to the entire North Slope being operated by a single entity. There were concerns from the Federal Trade Commission on the potential effect of the merger on the downstream crude oil market and the petroleum products market on the US West Coast. The State provided its position in paragraph F (1) of the Charter agreement. To our knowledge, the State has never intervened to ensure that BP and ConocoPhillips have complied with the Charter in a facility access dispute or in purchases of crude from smaller producers. Furthermore, DNR has not been asked by interested parties to invoke the Charter for access to facilities operated by BP and ConocoPhillips.

i. What if anything has been accomplished by paragraphs F and G?

A. Most notably, the provisions of the Charter were effective in helping Pioneer negotiate a facility sharing agreement with Conoco for the Oooguruk unit production. UltraStar has also come to terms with BP on a framework for access to drill sites and for future use of Lisburne facilities for the Dewline unit. We presume the Charter was instrumental in negotiating the UltraStar agreement, but we cannot confirm this fact.

2(a) Q. Since 1995 has any treatment facility, other than ENI's, been built?

A. Alpine facility installation in 1999-2000. Expansion of processing facilities has occurred since 1995 which is detailed in the answer to question 5 below.

2(b) Q. What are the ENI treatment facility capacities?

A. ENI's treatment facility capacity is around 40,000 barrels of oil per day of heavy crude with sand and 120,000 barrels of water per day.

2(c) Q. What current end throughput comes from ENI's facility?

A. The current end throughput, to the best of our knowledge, is 6-7000 BOPD and 100 BWPD.

2(d) Q. Is there spare capacity at the ENI facility?

A. There appears to be spare capacity at the ENI facility based on the numbers above.

2(e) Q. Is any spare capacity expected to be used by ENI alone?

A. Treatment facilities could reduce oil production reaching TAPS if facilities reaching fluid limits are not augmented and well workovers and new drilling are not employed in a field to access new lower GOR and WOR reserves. Otherwise, operators have been employing smaller-scale facilities additions/debottlenecking to address fluid handling, for example:

- Milne Point processing expansions in 1996
- Alpine expanded water handling
- Prudhoe Bay Unit
  - GC2 water handling debottlenecking and miscible gas lines to the West End of PBU
  - Prudhoe GPMA LPC – installed miscible injection (MI) pump. Increased water handling.
  - MI is also being sent to Pt. McIntyre from PBU via conversion of a water line to an MI line
  - Seawater injection started back up and water being injected into Prudhoe gas cap. This is proving to increase reservoir energy, decrease decline, and reduce GORs
  - Water injection into Lisburne gas cap to reduce GORs
- Oooguruk Unit processes production through sharing at KRU CPF3. New drill sites, lines for injection of water and gas lift were installed.

6. **Q. Do you agree that without more fluid treatment capacity, oil throughput is constrained?**

A. Oil throughput constraint is not solely a fluid treatment issue as gas separation is also a factor. In some fields fluid treatment may constrain throughput; however, with proper resource management, most fields are able to adapt to decreasing GORs and overcome constraints without additional fluid treatment capacity.

7. **Q. For how many years have treatment facility constraints affected oil throughput volumes?**

A. We are unable to provide a timeline on purported constraints. Continuous debottlenecking and drilling or work overs are used to stem throughput decline which inhibit our ability to track these issues. Debottlenecking and work overs are actions of a prudent operator decreasing constraint occurrences. It appears that some of the fields such as Badami and Nikaitchuq may not be limited for some time. Proper resource management helps to limit gas and water processing constraints.

8. **Q. Can treatment facility access be used in a manner harmful to Alaska's interests? If so, how?**

A. It is unclear how increased access by third parties to treatment facilities, under commercially reasonable terms, could bring harm to Alaska's interests. The Division is not aware of any development that has not proceeded simply because reasonable third party access terms could not be negotiated.

9. **Q. Can a company's internal conduct as to back outs of volumes be used in a manner harmful to Alaska? If so, how?**

A. This question is difficult to answer without clarification on what is meant by "a company's internal conduct as to backout volumes." We request more specifics or information in order to answer this question properly.

10. **Q. Do Alaska's credits allow for expansion of and construction of treatment handling facilities? By this I mean: Does both deduction from gross and credit [20%] to bottom line currently exist? It is my belief that the current tax system allows for both deduction and credit as to treatment handling facilities.**

A. Generally, capital expenditures for expanding or constructing new treatment facilities would generally count as permissible lease expenditures under ACES, and so would allow a working interest owner to both deduct the expenses and qualify for a qualified capital expenditure credit. For more information on this topic, we suggest contacting the Department of Revenue which is responsible for administering the production tax system.

11(a) Q. As to fluid volume handling, what are the percentages of access by company at each facility? The total at each facility should equal 100%.

11(b) Q. Of all operators at central North Slope, who have entered into back out agreements?

11(c) Q. Of all operators at central North Slope, who have entered into sharing agreements?

11(d) Q. As to those agreements, please identify the payer and payee and the volumes and facility percentages.

11(e) Q. What are the highest percentages of a facility's capacity which has been subject to an agreement?

11(f) Q. What companies have internally engaged in back out type conduct?

A. [*This response addresses all the questions posed in 11 above*]
We noted in an earlier question that back out and facility sharing agreements between two separate units are confidential. There are numerous in-unit agreements that DNR receives on a voluntary basis; however, industry is very hesitant to provide these documents. For the state to continue to receive these documents, there must be a degree of trust that the agreements will not become public unless absolutely necessary. Therefore, answering the questions above will lead DNR breaching our duty of

confidentiality or the possibility industry will discontinue their practice of providing in-unit agreements to DNR.

Company	Project Name	Project Type	Project Description	Received Date
Buccaneer	**Cook Inlet Exploratory Drilling**	**Exploration**	Buccaneer plans to conduct a four well, offshore exploratory drilling program in upper Cook Inlet at its proposed locations on the following State of Alaska oil and gas leases: Alaska Division of Land (ADL) 17595-2 (Southern Cross Unit #1), ADL 391108 (Southern Cross Unit #2), ADL 391270 (Northwest Cook Inlet Unit #1), and ADL 391611 (Northwest Cook Inlet Unit #2). **Purpose:** (To explore for oil & gas). **Proposed start-up date:** 07/01/2011 **Expected Completion Date**: 08/31/2013	**7/11/2011**
Cook Inlet Energy, LLC	**Otter Prospect Gas Exploration Well**	**Exploration**	An exploratory drilling program. **Purpose:** to test the Lower Miocene Sterling and Beluga formations and Upper Oligocene - Lower Miocene Tyonek formation that CIE has named the "Otter Prospect" . **Proposed start-up date:** 10/01/2011; **Expected Completion Date:** 9/30/2012	**8/10/2011**
Nuna Exploration	**2011-2012 North Slope Exploration Wells**	**Exploration**	PNRA proposes to drill and test two exploration wells with associated activities as described in the POO. **Proposed start-up date:** 11/1/2011; **Expected Completion Date:** 5/31/2012	**8/10/2011**
UltraStar Exploration, LLC	**North Dewline #1 Well**	**Exploration**	Directionally drill one onshore well from an ice pad off lease. Dependent on rig availability. **Purpose:** To assess oil and gas reserves within oil and gas leases held by UltraStar. **Proposed start-up date:** 12/01/2011 **Expected Completion Date:** 04/30/2012	**8/18/2011**
Great Bear	**Great Bear 2011-2012 E&E Program**	**Exploration**	Exploration & Evaluation Program (E&E Program) which includes up to 4 vertical wells for coring samples and potential laterals with hydraulic fracture stimulation, with the possibility for two additional wells, if required. **Purpose:** To prove the unconventional resource play. **Proposed start-up date:** 11/01/2011 **Expected Completion Date:** Summer/Fall 2012	**9/14/2011**
Repsol	**Repsol**	**Exploration**	Single vertical well and, time permitting, up to two sidetracks from an ice pad. **Purpose**: is to primarily assess oil reserves within leases operated by Repsol. **Proposed start-up date:** 11/01/2011 **Expected Completion Date:** 05/31/2012	**9/16/2011**

Repsol	**Repsol**	**Exploration**	Single vertical well and, time permitting, up to two sidetracks from an ice pad. Purpose: is to primarily assess oil reserves within leases operated by Repsol. **Proposed start-up date:** 11/01/2011 **Expected Completion Date:** 05/31/2012 **Well Names to Drill:** Qugruk No. 3, Kachemach No. 1	**9/16/2011**
Brooks Range Petroleum Corporation	**2011-2012 Mustang Exploration Program**	**Exploration**	BRPC requests the following modifications - to re-enter & complete North Tarn 1A well at the North Tarn Pad, and if successful, drlill up to 3 additional wells from the same pad; and possibly perform a short term production flow test(s); use Nabors rig 7ES during the 2011-2012 drilling season; update exploration activity timeframes - ice road & pad construction (pre-packing) may commence as soon as November 2011, with drilling activities scheduled for completion by the end of the winter tundra travel season (April-May2012). **Purpose:** to find significant hydrocarbons during drilling and then test and confirm flow rates and reservoir characteristics. **Proposed start-up date:** 11/1/2011 **Expected Completion Date:** 08/31/2011	**9/21/2011**
ConocoPhillips Alaska, Inc.	**Shark Tooth No. 1**	**Exploration**	CPAI proposes to build approximately 4 miles of ice road, an ice pad and to drill a single appraisal well, approximately 2 miles east of Drill Site 2L in the south-west area of the Kuparuk River Unit (KRU). **Purpose:** To provide additional reservoir information in this area and narrow uncertainty around reservoir description parameters including oil-water contact, sand quality and thickness, and oil viscosity **Proposed start-up date:** 01/01/2012 **Expected Completion Date:** 04/30/2012	**10/13/2011**
NordAq Energy Inc.	**Tiger Eye North No. 1 Exploration Project**	**Exploration**	NordAq proposes an exploratory drilling program for one well, Tiger Eye North #1, which will be drilled in summer 2012. **Purpose:** (To explore for oil & gas). **Proposed start-up date:** 11/01/2011 **Expected Completion Date:** 09/15/2012	**10/26/2011**
CGGVeritas	**Tabasco 3D Seismic**	**Geophysical**	**Project Description:** CGGVeritas plans to acquire a multi-client 3D seismic program on the North Slope this winter 2012 on behalf of the CGGVeritas Multi-Client & New Ventures Division. **Purpose:** To shoot approximately 200-300 square miles of 3D Seismic . **Proposed start-up date:** December 15, 2011; **Expected Completion Date:** May 31, 2012; **PROGRAM NAME:** Tabasco North 3D and Tabasco South 3D.	**10/24/2011**

STATE OF ALASKA

DEPARTMENT OF NATURAL RESOURCES

DIVISION OF OIL & GAS

State Capitol Room 115
Juneau AK, 99801

Senator Thomas Wagoner
Senate Resources Committee Co-Chair
State Capitol Room 427
Juneau AK, 9980

Dear Senators:

I wanted to take this opportunity to thank you both for inviting me to testify before the Senate Resources Committee on February 3, 2012. The committee is trying to understand a very complex subject matter, and I am pleased that the Division has been called upon to provide the factual basis for crafting solutions to perceived facility issues. This correspondence allows me to reiterate a few of the more salient aspects of my testimony and present to the committee an updated table on Capacities of North Slope Facilities from page 11 of my February 3rd slide package (enclosed). It is crucial that we all operate under a similar framework and understanding of reservoir dynamics and facility capabilities; therefore, I offer the bulleted information below to clarify the main points of my testimony. Please keep in mind the underlying pretext of my comments involved the issue of third party access to existing process facilities.

- The Prudhoe and Kuparuk units are experiencing typical reservoir depletion which requires handling and processing of increasing amounts of water and gas, decisions on facility management, effective well utilization, and complex reservoir management.
- Facilities are designed to meet a wide range of production profiles with varying water-oil and gas-oil ratios (WOR and GOR, respectively). As the reservoir matures, reservoir management and facility debottlenecking for water and gas handling, water and/or gas injection to maintain reservoir pressure, well workovers, and new infield development drilling is required.
- Pipeline capacity is available throughout most of the North Slope, thus companies with new oil discoveries will need to negotiate to share the existing transport facilities.
- Corporate culture and size of a discovery typically dictate decisions whether to build new process facilities or enter into commercial agreements to access existing facilities.
- Statutory changes for facility access will be difficult and likely ineffective due to the complexity and idiosyncrasies of each field's physical assets, reservoir management approach, and commercial conditions.

Again, thank you for the opportunity and I look forward to future discussions.

Sincerely,

W.C. Barron
Director

Capacity of North Slope Facilities						
Unit	**Oil and NGLs, standard barrels per day (stb/d)**	**Gas, million standard cubic feet per day (mmscfd)**	**Water (bwpd)**	**Water Injection (bwpd)**	**Handling Limitations, and comments**	**Field/Facility Startup**
Badami	35,000	25	12,000	30,000	No Limits	Aug 1998
Colville River	140,000	180	100,000	140,000	We know of no limits at this time	Nov 2000, expansions in 2004 and 2005
Endicott	115,000	455	225,000	245,000	Limited gas and water	Jul 1986
Kuparuk					Limited Gas, water, & total fluid handling	
CPF-1	170,000	200	250,000	250,000	Rates currently below referenced limits	Dec 1981
CPF-2	160,000	260	250,000	300,000	Rates currently below referenced limits; may be nearing water limits	Jun 1983
CPF-3	85,000	150	100,000	220,000	Rates currently below referenced limits	Jun 1985
Milne Point	75,000	42	99,000		None known for current development	Jul 1983
Northstar	77,000	555	30,000		Limited by gas handling, water production is not at limit. Uncertain whether rated capacity is current.	Oct 2001
PBU					Limited gas, water handling - Note: cannot add up each facility to obtain total field restrictions. SI wells to maintain field limits.	
FS-1	360,000	2,800	140,000		Limited gas and water handling	Jun 1977
FS-2	360,000	1,200	650,000		Possible water handling limit	Jun 1977

FS-3	360,000	1,300	300,000		Note: FS-3 and GC-3 production can be diverted to either/both gathering center. Combined FS-3 and GC-3 at gas handling limits	Mar 1979
GC-1	330,000	2,600	180,000		High GORs - some wells not competitive at field level.	May 1977
GC-2	250,000	1,070	300,000		Limited gas and water handling	Jun 1977
GC-3		1,100	275,000		Note: FS-3 and GC-3 production can be diverted to either/both gathering center. Combined FS-3 and GC-3 at gas handling limits	Apr 1978
CGF		8,700			Limited by gas handling. Note, while "Design" capacity is 8.7 BCF/D peak, actual operating capacity around 7.5 BCFD average yearly at the plant inlet, with peaks of around 8.2 BCFD.	Jun 1977 Full Start, (NGL initial prod 1980, expansions in 1986, 1990, and 1994)
CCP		8,700			Actual Injection Peaks at 7.2-7.8 BCFD. Limited by CGF gas handling capacity	Jun 1977 Expansions in 1986, 1990, and 1994, Peak NGL Rate 97,000/day in 1996
LPC - Greater Pt. McIntyre	205,000	450	120,000		Limited gas, water, and total fluid. Some wells from Pt. McIntyre flow into GC1	Dec 1986
Oooguruk					Production to Kuparuk CPF-3. No known handling limits at Oooguruk.	Jun 2008
Nikaitchuq	40,000	unknown	120,000		No limits at this time	Jan 2011

The Honorable Hollis French
Alaska State Senator
State Capitol, Room 417
Juneau, AK 99801

February 13, 2012

Dear Senator French:

Thank you for your email on January 30, following up with questions you have from the Senate Resources committee.

1. *Today in committee your slide #3 told us that Texas is BOOMING (your caps). Imagine how I felt to read in your department's recent publication "Alaska's Oil and Gas Fiscal Regime" on page 4 that "Oil production in Texas is up slightly". Which is it?*

   After decades of a production decline remarkably similar to Alaska's, Texas has flattened out their decline curve and begun to increase production. This activity has resulted in thousands of new jobs and has played a large role in pulling Texas out of the nationwide recession. Defining what is considered a boom is subjective. In my opinion, if we can achieve in Alaska what has been achieved in Texas over the last few years, I would consider that a boom.

2. *Last week I asked you about whether the new production in Texas was conventional or shale oil. You replied that is was conventional. You have been asked to document that assertation. Please share your documentation with me as well.*

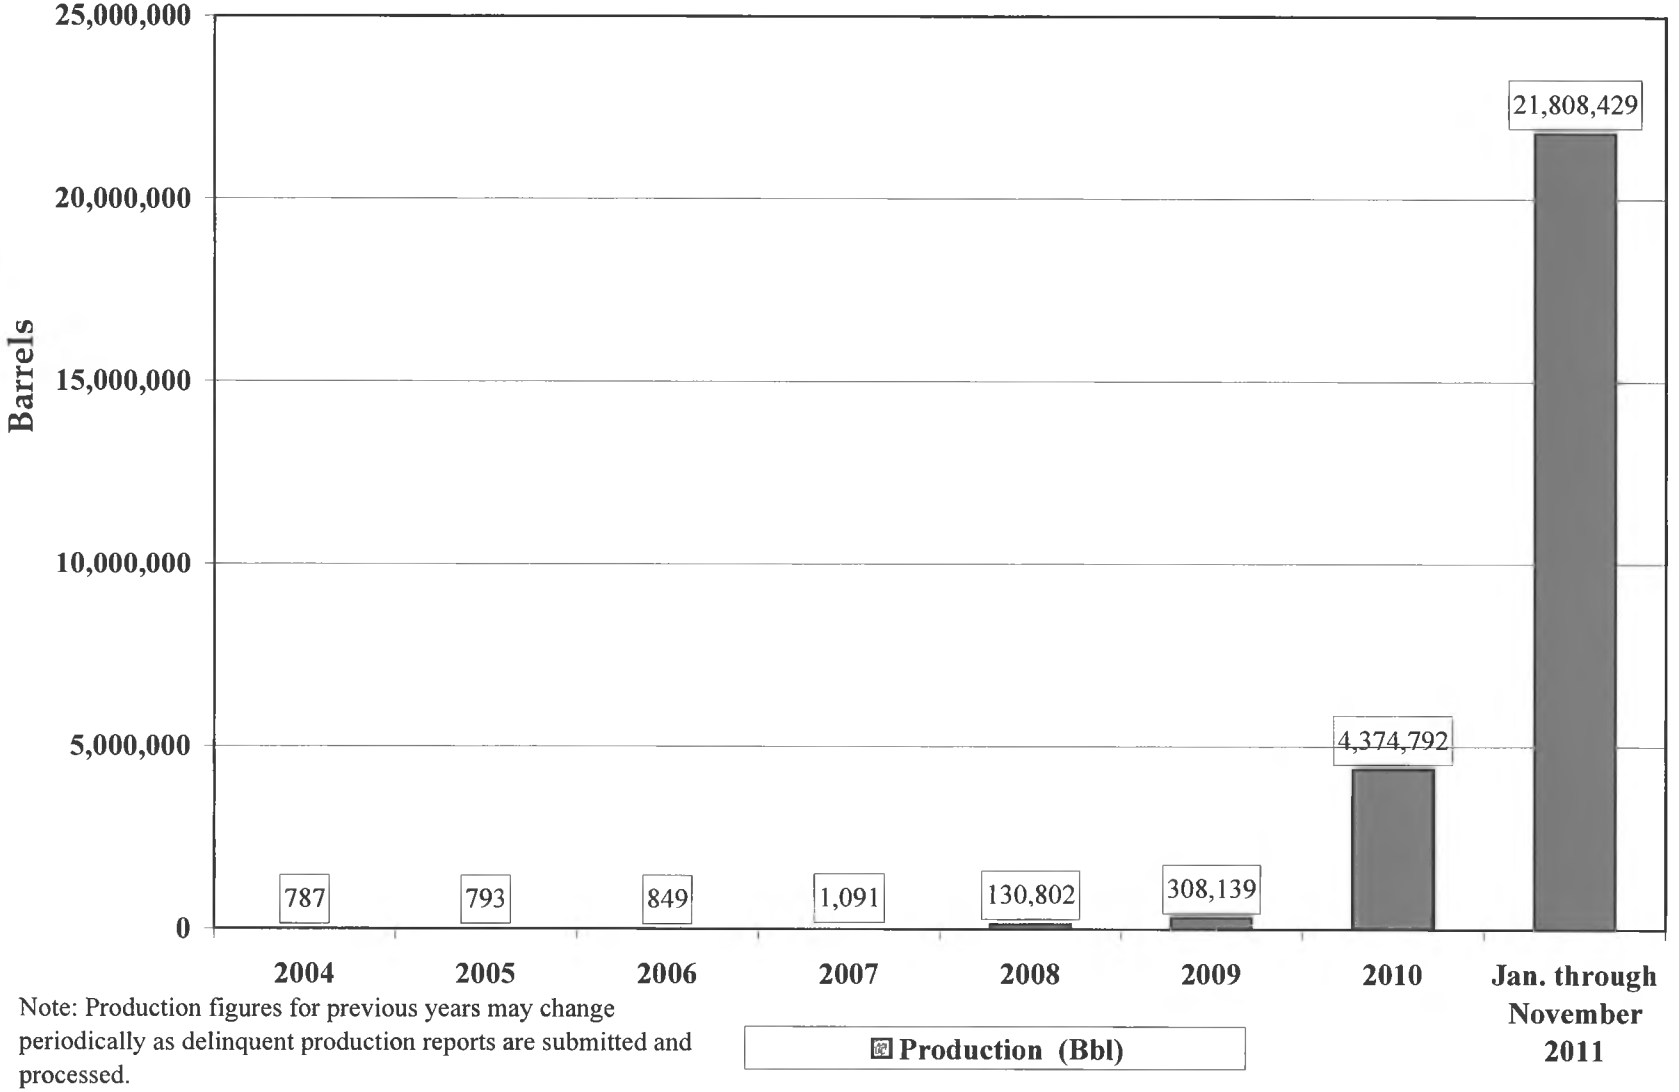
   Comments made recently about the flattening of the decline curve having resulted from conventional oil are a result of our face to face discussions with the Railroad Commission of Texas, the Texas equivalent of AOGCC. The majority of shale oil being produced in Texas is from the Eagle Ford shale play. Attached you will find a year to year summary of shale oil production from Eagle Ford from 2004 through November, 2011. This information may be found on-line at http://www.rrc.state.tx.us/eagleford/EagleFordOilProduction.pdf . As you can see, the biggest jump in production occurred in 2011, which was not included in DOR's slide presented to you in Senate Resources on January 27, 2012.

Please let me know if you have any further questions or comments.

Sincerely,

Bryan Butcher
Commissioner

Texas Eagle Ford Shale
Oil Production
2004 through November 2011



Note: Production figures for previous years may change periodically as delinquent production reports are submitted and processed.

Historical Oil Production:

How Did Our Competition Fare When Prices Spiked?

State of Alaska
Department of Revenue

Commissioner Bryan Butcher

SEAN PARNELL, GOVERNOR
333 Willoughby Avenue, 11th Floor
P.O. Box 110400
Juneau, Alaska 99811-0400
Phone: (907) 465-2300
Fax: (907) 465-2389

The Honorable Joe Paskvan
The Honorable Tom Wagoner
Co-Chairs, Senate Resources Committee
Alaska State Senate
State Capitol, Room 119
Juneau, AK 99801

February 14, 2012

Re: Response to Questions from Senate Resources Hearing on January 27, 2012

Dear Senators Paskvan and Wagoner:

The purpose of this document is to respond to the follow-up questions raised by the Senate Resources Committee meeting during our presentation to the committee on January 27, 2012. The requests/questions and responses follow.

1) **Provide details on how the Department studies "Project Economics" per slide 4.**

The Department does not perform project economics on individual projects included in our production forecast. In the Department's view, the economic viability of the projects and development included in the production forecast is implied by the individual company's inclusion in their production forecast submission.

2) **Identify what projects are in the "under development" and "under evaluation" categories, to the extent possible.**

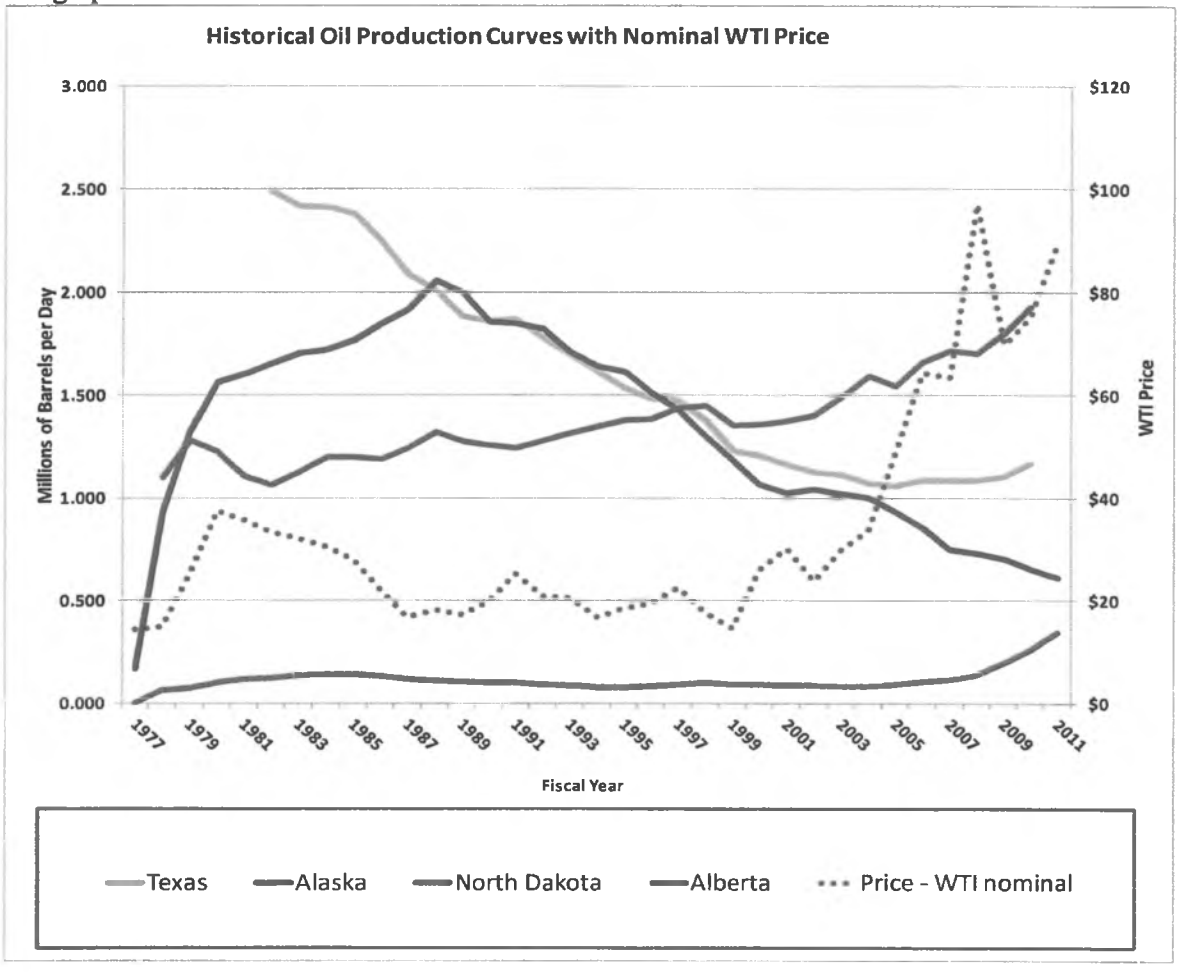
From the Department's Fall 2011 Revenue Sources Book, pg 41, located online here: *http://www.tax.alaska.gov//programs/documentviewer/viewer.aspx?2443f*

"Examples of production currently under development include the Nanuq and Alpine West satellites at Alpine, the Borealis and Orion satellites at Prudhoe Bay, development drilling at Liberty, Oooguruk and Nikaitchuq, and ongoing development drilling at Prudhoe Bay and Kuparuk."

"Under Evaluation: Examples include longer term Orion drilling, long-term production from Pt. Thomson and associated satellites, and pools within NPR-A."

3) Provide data to support information provided to the Senate Resources Committee on the production increases / decreases in Texas and other jurisdictions compared to Alaska

See graph with notes and sources below.



Notes and Sources

- Alaska production is from the same sources used in publication of the RSB and includes NGLs and non-state volumes at Northstar.
- North Dakota Production was provided by the North Dakota Pipeline Authority.
- Texas, Oklahoma and California production is all from the EIA. Texas oil production includes volumes from the Eagle Ford and Barnett shale plays.
- Alberta and Saskatchewan production is from the Canadian Association of Petroleum Producers and includes both oil sands and heavy oil production. Also, please note the

Alberta data was adjusted from two separate sources at CAPP per conversations with individuals at CAPP in Alberta and may not match the data online exactly.
- Alaskan production and ND production are in Fiscal Years (FY). All other production is in Calendar Year (CY).

4) Provide estimates for Prudhoe and Kuparuk recovery rates compared to Texas, Oklahoma, and North Dakota

Recovery rates are estimates that vary with the resource, reservoir, and recovery types. Further, recovery rates vary both over time, and from one field to another. The recovery rate for Prudhoe Bay as outlined in the attachment, "Prudhoe Lisburne Fact sheet" was originally expected to be 40% but has increased to over 60% due to new technologies. Kuparuk recovery is expected to exceed 40%. Publicly available estimates for recovery factors in the Bakken in North Dakota range from 3% to 50%. The Department was unable to obtain recovery rates, or estimated recovery rates for Texas or Oklahoma. Estimated recovery rates for individual fields in Texas and Oklahoma will vary with the resource, reservoir and recovery types.

5) Provide an estimate of revenue under the 300,000 barrels per day scenario like Slide 7 of the Senate Resources presentation of January 27, 2012, using HB 110.

As currently written, most of the provisions of HB 110 would take effect on January 1, 2013, meaning that HB 110 would be in place for only half of FY 2013. However, in order to be responsive to your question, we have calculated the revenue as if HB 110 were in effect for the entirety of FY 2013. With that assumption, and an assumption of $300 million for well lease expenditure credits, plus all the assumptions included in slide 7, we estimate total GF unrestricted revenue to be $3.2 billion.

Using the same assumptions in slide 7 of the presentation, a total of GF unrestricted revenue in FY 2013 of $3.2 billion would translate out to a revenue to budget shortfall of $3.23 billion. Based on high level assumptions regarding income and sales in the state, this amount could hypothetically be filled by one of the following: (1) every Alaska resident paying the state $4,500; (2) a statewide sales tax of up to 48%; or (3) a statewide flat income tax of up to 18%.

6) Provide monetary value of 100% deduction for capital expenditures for all years shown on slides 13 and 14

The following table illustrates the approximate benefit of 100% deduction of capital expenditures in FY 2007-FY 2011 and forecasted FY 2012. To estimate these values, we calculate the statewide tax liability using the "income statement" approach, under status quo (with 100% deduction for capital expenditures in the year the expenditure was made), and under ACES with an alternative deduction for capital expenditures. Two alternatives are shown:

1. The first assumes a 10-year depreciation schedule for capital expenditures beginning in FY 2007. For this presentation we assume that in FY 2007, the only deduction would be for 1/10th of that year's spending. In FY 2008, the deduction would be 1/10th of that year's spending plus 1/10th of the prior year's spending, and so on. This attempts to illustrate the impact of a depreciation schedule for capital expenditures had such a schedule been put in place for the net profits tax when it was first enacted.
2. The second alternative assumes that no deduction at all is allowed for capital expenditures in calculating production tax and so all capital expenditures were removed from the tax calculation.

Note that our calculations use yearly and statewide averages instead of company-specific monthly calculations, and therefore are approximate. The capital expenditure numbers used are company-reported capital expenditures before exclusions. Also, note that this analysis considers only companies with tax liability, and the value of being able to deduct capital expenditures in calculating tax due – it does not consider the value of the Net Operating Loss Carry forward credit to companies without a tax liability.

See table on the following page and also attached "Prudhoe Lisburne Fact sheet."

I hope these answers fully address your questions.

Sincerely,

Bruce Tangeman
Deputy Commissioner

Estimated monetary value of 100% deduction for capital expenditures, FY 2007 - FY 2011 and forecast FY 2012 ($M)

Current Production Tax Calculation - using 100% deduction for capital expenditures in the year earned						
Fiscal Year	2007	2008	2009	2010	2011	2012

Amounts in $ millions except for tax rate

Amounts shown here are illustrations using "income statement" approach, not precise company-specific calculations

FY 2007-2008 taken from DOR forecast models, FY 2009+ taken from "Income Statement" sheets

Depreciation example assumes 10-year depreciation with 2007 being the first year. In 2007, only 10% of 2007 capex is deducted. In 2008, the deduction is 10% of 2007 plus 10% of 2008, and so on.

FY 2007 tax is PPT and represents 14 months of production, FY 2008-on are ACES

GREATER PRUDHOE BAY

After more than 30 years of production, Prudhoe Bay remains the largest oil field in North America and ranks among the 20 largest fields ever discovered. When production started at the Prudhoe Bay field the recovery rate of the 25 billion barrels of oil in place was expected to reach 40 percent. Today, using new technologies that estimate has increased to more than 60 percent.

The initial producing area of Prudhoe Bay field has produced more than 12 billion barrels, of which BP's net cumulative production is approximately 4.6 billion barrels of oil equivalent (BOE). Production from the Prudhoe Bay initial producing area averaged approximately 314,000 BOE per day in 2008. The Energy Information Administration estimates the field also contains an estimated recoverable 26 trillion cubic feet of natural gas in an overlying gas cap and in solution with the oil.

Prudhoe Bay produces from the Sadlerochit sandstone formation, nearly 9,000 feet below sea level. The oil bearing column is 500 feet thick in some areas. The Greater Prudhoe Bay Area, which includes the fields of Prudhoe Bay, its satellite fields and the Greater Point McIntyre Area fields, in total produce about 392,000 BOE per day. Cumulative production has exceeded 13 billion barrels; BP's net share is 4.8 billion barrels.

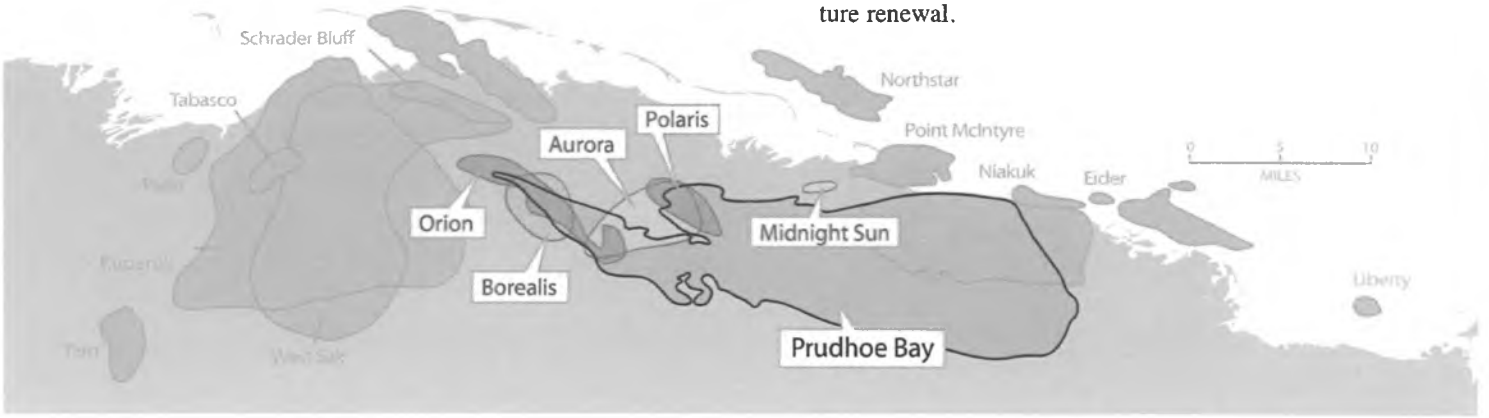
BP's net production from Greater Prudhoe Bay Area averages approximately 98,000 barrels of oil equivalent per day (BOED). Prudhoe Bay was discovered in 1968 and came on-stream June 20, 1977. Production averaged more than 1.5 million barrels of oil and gas liquids per day for more than a decade.

Prudhoe Bay satellites

Satellite fields are smaller accumulations of oil that can often be developed using existing infrastructure. The average daily production from Prudhoe Bay satellites is about 45,700 barrels of oil equivalent per day. BP's net share of that production is about 8,600 barrels. There are five satellite fields currently producing and the liquids are processed through the field's main facilities. Aurora and Borealis satellite fields produce from similar formations. Midnight Sun produces from a sandstone formation at 8,000 feet below sea level. Orion and Polaris fields both produce the difficult heavy oil from the Schrader Bluff formation, at depths of 4,000 to 5,000 feet below sea level. By using advanced drilling technologies we are growing this important resource. The Prudhoe Bay satellite fields have produced more than 118 million barrels of oil equivalent. BP's net cumulative production is approximately 23.4 million barrels of oil equivalent.

Prudhoe Bay renewal

BP completed replacing 16-miles of oil transit lines and put these lines into service in late 2008. The project included rebuilding the main Prudhoe Bay oil delivery system, pigging modules, corrosion inhibitor injection facilities, state-of-the-art leak detection, metering facilities and all the affiliated electrical and emergency systems. This $500 million project incorporates the best technology and materials to ensure safe operations. BP will continue to invest in safe, reliable and efficient operations through infrastructure renewal.



GREATER POINT MCINTYRE

The Greater Point McIntyre Area encompasses Point McIntyre field and the nearby satellite fields of West Beach, North Prudhoe Bay, Niakuk and Western Niakuk. The Lisburne Production Center processes fluids from Point McIntyre Area fields and the Lisburne field. Production averaged about 40,900 barrels per day in 2008. Cumulative production from the Greater Point McIntyre area is 717 million barrels of oil equivalent. BP's cumulative net production is approximately 165 million barrels of oil equivalent.

Point McIntyre

Located seven miles north of Prudhoe Bay, the Point McIntyre field was discovered in 1988 and came on-line in 1993. Point McIntyre contained an estimated 900 million barrels of oil in place, of which about 500 million barrels is recoverable with existing technology. The field's production peaked in 1996 at 170,000 barrels per day. Production averaged about 27,000 barrels per day in 2008. BP produces the field from two gravel drill site pads. Production rates are maintained through drilling new wells, enhanced oil recovery methods and upgrades to facilities.

Drill rig at Point McIntyre.

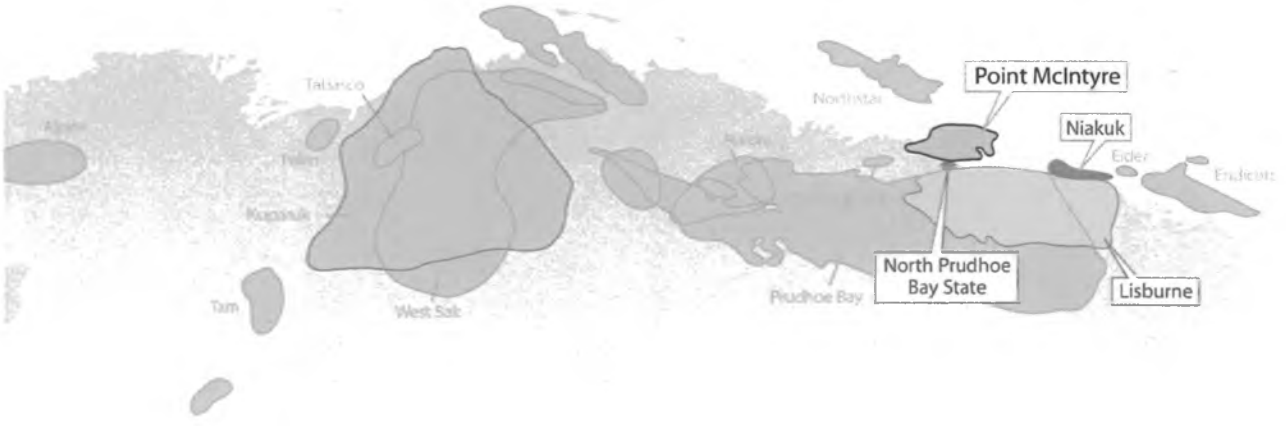
Niakuk and Western Niakuk

The Niakuk fields lie offshore and contain about 300 million barrels of original oil in place. Production in 2008 averaged about 5,500 barrels per day from the lower Cretaceous Kuparuk River formation, a structurally and stratigraphically complex formation.

Lisburne Processing Center

Lisburne

The Lisburne field is a complex, fractured carbonate reservoir that lies underneath and adjacent to the main Ivishak reservoir at Prudhoe Bay. The field was discovered in 1968 along with the Prudhoe Bay field and came on-stream in late 1986. The field contained an estimated 1.8 billion barrels of oil in place. Production averaged about 8,400 barrels per day in 2008. Cumulative production from the Lisburne field is is nearly 189 million barrels of oil equivalent. BP's cumulative net production from the field is approximately 44 million barrels of oil equivalent. Horizontal drilling technology using coiled tubing drilling, along with geosciences techniques to identify fracture and fault locations, have increased production rates in recent years.



The Niakuk and Western Niakuk fields lie offshore of the Prudhoe Bay.

February 16, 2012

The Honorable Joe Paskvan
The Honorable Tom Wagoner
Co-Chairs, Senate Resources Committee
Alaska State Senate
State Capitol, Room 119
Juneau, AK 99801

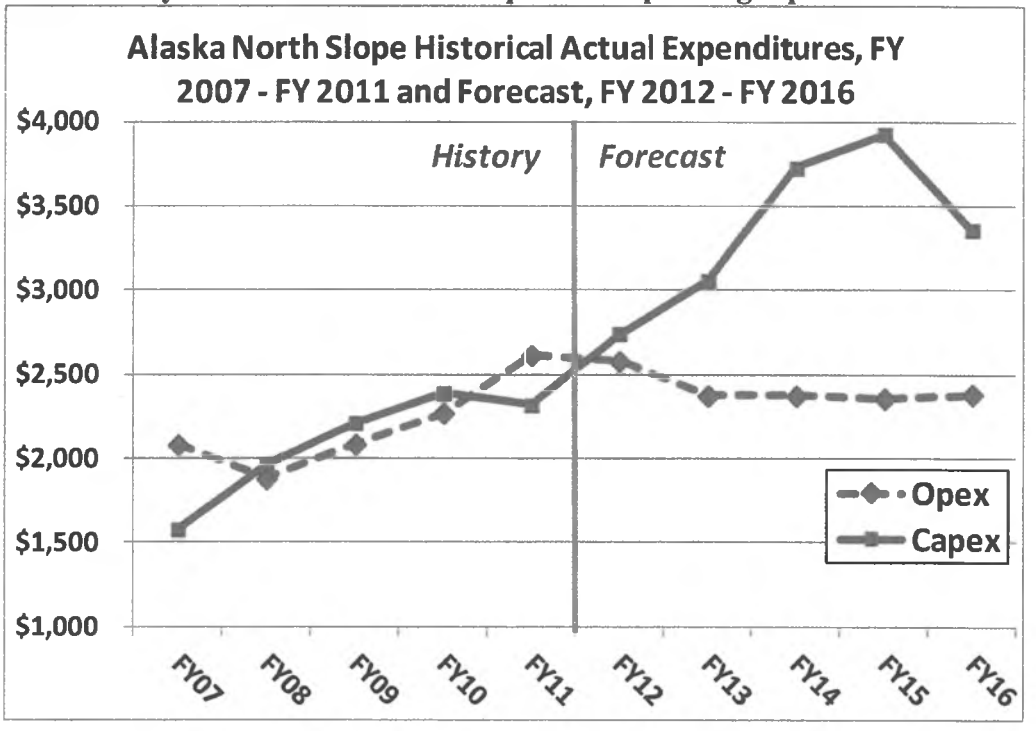
Re: Response to questions from Senate Resources Hearing on February 10, 2012

The purpose of this document is to respond to the follow-up questions raised by the Senate Resources Committee meeting on February 10, 2012.
The requests/questions and responses follow.

1) **Provide details on Texas reserves tax.**

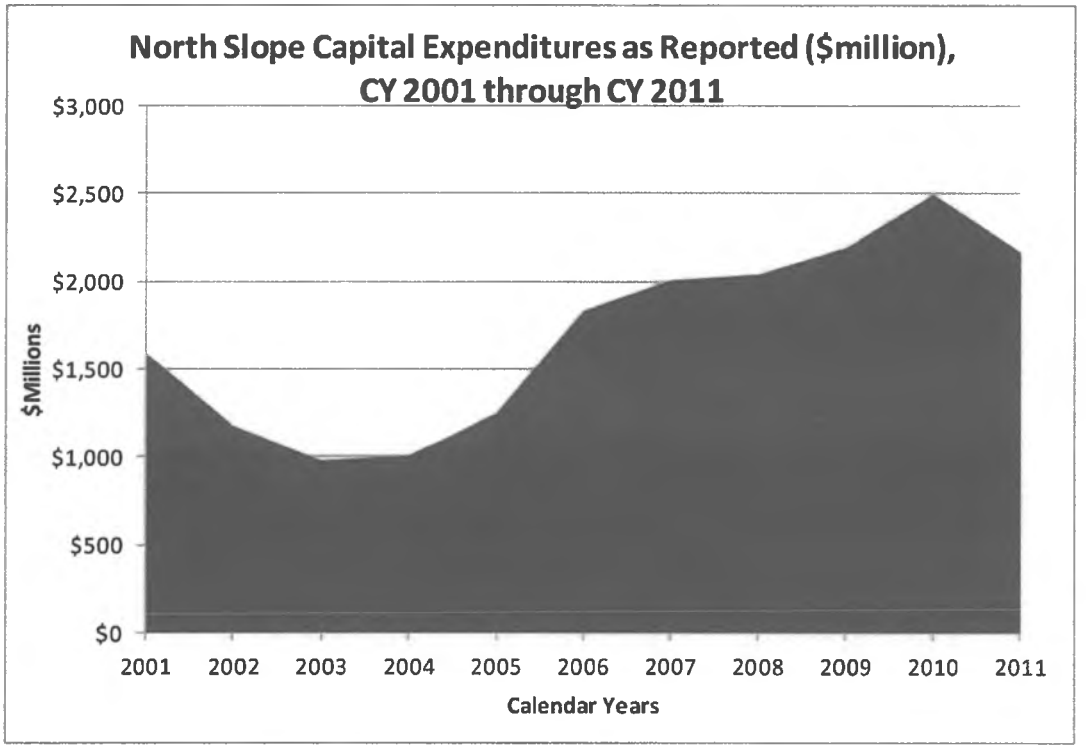
The Texas fiscal system is discussed on page 37 of our publication "Alaska's Oil and Gas Fiscal Regime – A Closer Look from a Global Perspective." Texas includes oil and gas reserves in their property tax calculation; property taxes are assessed at 2.5 percent, levied on the fair market value of reserves as determined by discounted present value. This rate reflects a statewide percent average for counties and school districts.

2) **Add several years of forecasts to our capital and operating expenditure slide.**



3) Provide expenditure history beginning in 2000 or as far back as we have it

Slide 6 of our presentation includes the 5 fiscal years of actual operating and capital expenditure information, subsequent to the enactment of a net profits tax, based on company submitted annual returns and monthly information forms. This slide, which is included above with extended forecast information per the committee's request, represents the extent of our complete data for total lease expenditures. We do not have complete operating expenditure information prior to FY 2007.
For capital expenditures, we do have data on a calendar year basis beginning with 2001. That information was provided to the committee in Chart 3 of the "Oil & Gas Tax Status Report 2011" dated January 18, 2011 and has been updated here for your convenience.



4) Provide calculations for how we arrive at $29 tax per barrel at $100 and provide the tax per barrel chart on Slide 10 with PPT included.

The illustration presented to the Senate Resources Committee was primarily intended to show how the production tax under the ELF system compares to the production tax under the ACES system at today's oil prices. The tax calculation was simplified for a wider audience by removing reference to royalties. The calculation as indicated in the slide presented for the Senate Resources Committee assumes that the barrel is a "taxable" barrel. If we had included royalties in the calculation, the numbers would have been slightly lower, but the effect would have been the same—that is, at $100 per barrel, the ACES tax was triple the amount it would have been under the ELF tax system.

The following calculations show how the $29 in tax per taxable barrel (without the impact of royalties) is calculated under ACES at $100 per barrel. We also include the calculations under ELF and PPT per the request of the committee. As noted, this example assumes transportation costs of $7 per barrel, and capital and operating expenditures each of $10 per taxable barrel. The calculation for the PPT assumes that TIE credits add credits equal to 10% of the capital expenditures. These assumptions are in line with the level of expenditures in place when ACES was implemented in FY 2008.

Again, the high-level simplistic analysis is intended to show how the tax burden changed from ELF to PPT to ACES. As shown, PPT more than doubled the tax burden compared to the ELF system, while ACES more than tripled it.

Tax Calculations - One TAXABLE barrel				
	ELF	**PPT**	**ACES**	
Destination Value	$100.00	$100.00	$100.00

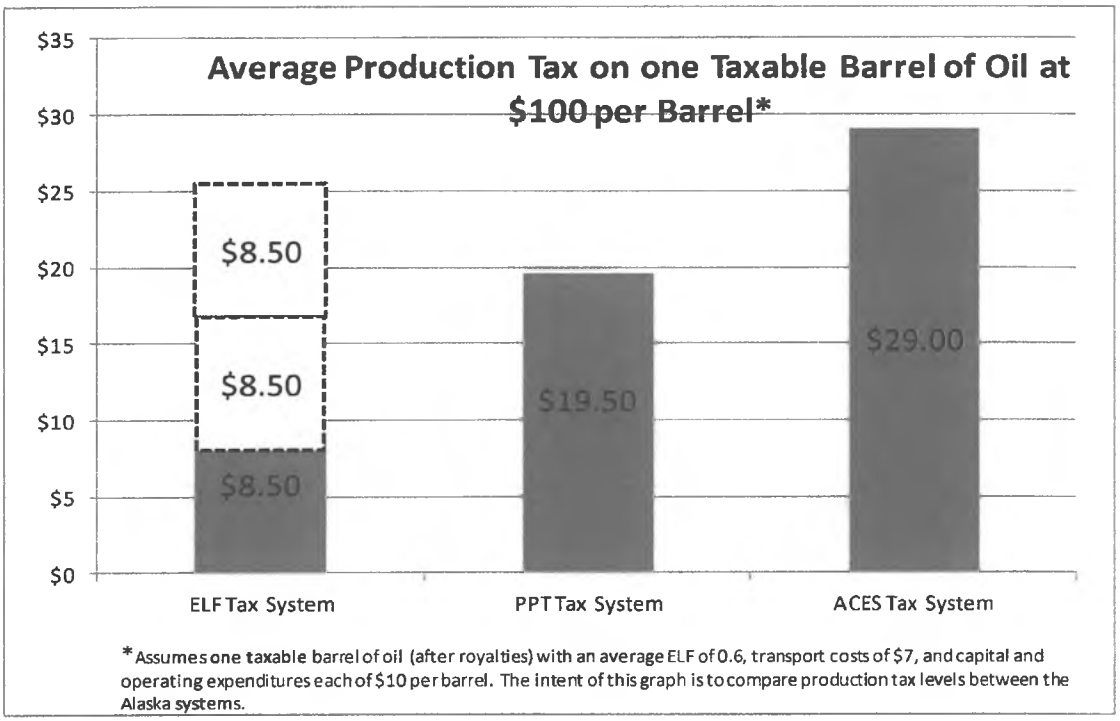
**PPT tax calculation assumes TIE credits of $1 per barrel				



5) Provide information on Cook Inlet and how SB 309 impacted activity at different prices, credits, and tax rates. Provide examples of what SB 309 has done to incentivize activity.

SB 309 (2010), which was later incorporated into HB 280 (2010), "The Cook Inlet Recovery Act," expanded the alternative tax credit for oil and gas exploration under AS 43.55.025 and changed the existing Gas Exploration and Development credit under AS 43.20.043. SB 309 created what is commonly referred to as the "Cook Inlet Jack-up Rig Credit," which offers a credit to the first three unaffiliated persons that drill an offshore exploration well for the purposes of discovering oil or gas in Cook Inlet that penetrates and evaluates a prospect in the pre-Tertiary zone using a jack-up rig. Following the bill's passage, Furie Operating Alaska (formerly Escopeta) used a jack-up rig to begin drilling the KLU No. 1 well in Cook Inlet in September 2011. Escopeta cited the Jack-up Rig Credit as incentive to drilling the KLU No. 1 well. A second company, Buccaneer Alaska, expects to have a jack-up rig in Cook Inlet in April 2012 and begin drilling May.

SB 309 also increased the existing Gas Exploration and Development credit under AS 43.20.043. It increased the credit from 10% to 25% of qualified expenditures beginning January 1, 2010 and increased the amount of corporate income tax liability the credit can offset from 50% to 75%. While these changes are an incentive for natural gas exploration and development in Cook Inlet, the amount of Gas Exploration and Development credits applied against corporate income tax liability cannot be reported due to taxpayer confidentiality constraints.

Senate Bill 309 and the natural gas storage credit provisions in HB 280 have expanded the incentives for developing both oil and gas in Cook Inlet. There has been a resurgence of interest and activity in Cook Inlet that may be at least partially attributable to the incentives provided. However, the department cannot determine with any certainty the exact impact that oil or gas prices, credits, and tax rates would have had on Cook Inlet activity.

6) **How many wells have come back into production due to high prices in Texas that were previously shut in?**

We contacted the Oil and Gas Division of the Railroad Commission of Texas to assist with this request. They compared two snapshots of their wellbore database, one as of 1/31/2012 and one as of 1/31/2007.

Of the 90,174 wellbores wells that were inactive as of 1/31/2007, 19,028 are now plugged, 15,271 have been returned to active operation or worked over, and 55,875 remain in inactive status.

Note: this is a comparison of two snapshots in time. If a well had returned to active operation and then became inactive again, or if a well had returned to active operation and then been plugged, those would not show up in the data. One cannot point to high oil prices as the sole factor in play here. For example, in 2009 Texas adopted additional requirements associated with an operator's inactive well inventory; the resulting cleanup of records as well as restoration of wells to activity to avoid those requirements may have also contributed (in an indeterminable degree) to the shift.

7) **Provide backup for Alaska's 26.8% effective tax rate in slide 11**

The 26.8% effective tax rate was calculated by the Montana Department of Revenue as follows:

Oil and Gas Revenue Collected divided by the Value of Oil and Natural Gas Produced = $6,900,000,000/$25,741,800,390 = 26.8%

Based on the total revenue the Montana Department of Revenue included, it appears that they incorporated only the production tax and the petroleum property tax into their totals and did not include state petroleum royalties or corporate income tax.

I hope these answers fully address your questions.

Sincerely,

Bruce Tangeman
Deputy Commissioner

State of Alaska
Department of Revenue

Commissioner Bryan Butcher

SEAN PARNELL, GOVERNOR

The Honorable Bert Stedman
The Honorable Lyman Hoffman
Co-Chairs, Senate Finance Committee
Alaska State Senate
Juneau, AK 99801

February 16, 2012

Re: Response to questions from Senate Finance Hearing on February 2, 2012

Dear Senators Stedman and Hoffman:

The purpose of this document is to respond to the follow-up questions raised by the Senate Finance Committee meeting on February 2, 2012.
The requests/questions and responses follow.

1) **Provide what information the Department of Revenue (DOR) has about facilities constraining oil production (i.e. lack of gas or water handling capacity).**

Most of the facilities on the slope are constrained by either available gas handling or water handling capacity or both. Gas handling constraints are the reason we see the large swings when comparing summer to winter production. This is because of ambient temperature fluctuations. Gas compressors are powered by gas turbines whose efficiency and power output vary significantly with the ambient temperatures. Colder ambient temperatures yield high horsepower outputs and increased gas compression capacities. Well oil production on the slope is optimized to an incremental GOR (gas oil ratio) and WOR (water oil ratio) based on facility handling constraints.

The department accounts for facility handling constraints in its production forecast on an individual well basis. The well history will include when the well was producing versus when the well was shut in based on facility handling constraints. In fitting a decline curve, the shut in periods of time are factored in and reflected in the forecast.

2) **Provide further breakdown of FY 13 / 14 / 15 expenditure forecasts as much as possible.**

The Department of Revenue is seeking clarification from the Department of Law on the extent to which it can disclose information about expenditure forecasts provided by companies.

3) **What amount of expenditures is made by oil companies that are not deductible for purposes of the ACES tax?**

The amount of expenditures that are not deductible for the ACES tax is not reported to the Department of Revenue. There are several expenditures that are specifically excluded from qualifying as lease expenditures under ACES at AS 43.55.165(e), such as costs for dismantlement, removal, surrender or abandonment of a facility, pipeline, or other property used for producing oil and/or gas. Costs for deferred maintenance are also disallowed as well as a limitation on capital expenditures (the "$.30 haircut" under AS 43.55.165(e)(18)).

Regulations detailing qualified lease expenditures are written to conform to allowable costs as provided for under most joint operating agreements (JOAs). Most JOAs (as well as our lease expenditures) allow direct costs of production as well as an allowance for overhead expenses. The state allows a fixed percentage of 4.5% of direct costs as an overhead allowance that may be deducted as lease expenditures. The statutes provide that only those costs that are related to exploring for, developing, or producing oil or gas may be deducted as lease expenditures. Therefore, expenditures that are related to research and development type costs are not allowed as lease expenditures since they are not expenditures related to exploring for, developing, or producing oil or gas.

4) **How much production do the credits the state has issued translate out to?**

Based on our understanding of the question, the intent is to translate production tax credits in each year to a certain amount of production for each year. To illustrate this concept, we present total credits in each year relative to lease expenditures per barrel in each year. The resulting calculation illustrates the number of barrels for which the costs would be covered by the total credits in each fiscal year. When viewing this data, note that many credits are issued to companies that are not producing oil, and also that many if not most credits represent investments in future production as opposed to current year production.

Illustration of Amount of Production that would be paid for by tax credits, FY 2007-FY 2012

	FY 2007 / Pre-2008 [1]	FY 2008	FY 2009	FY 2010	FY 2011	FY 2012
Total Credits [2] ($ million)	$673	$509	$641	$773	$863	$533
Total Lease Expenditures ($ million)	$3,659	$3,848	$4,297	$4,659	$4,931	$5,322
ANS Production, bpd	734,000	716,000	693,000	644,000	603,000	574,000
Lease Expenditures per Barrel of Total Production	$13.70	$14.70	$17.00	$19.80	$22.40	$25.30
Total Credits / Lease Expenditures per Barrel	49,124,000	34,626,000	37,706,000	39,040,000	38,527,000	21,067,000

(1) To simplify this analysis all "pre-2008" credits are shown relative to FY 2007 production.
(2) Includes both tax credit certificates and credits applied against production tax liability. FY 2011 and FY 2012 are estimated pending final true-ups.

5) Provide history of year-forward forecasts (ie 2011 forecast for FY 12, 2010 forecast for FY 11, etc).

The following table presents the Fall forecasts for lease expenditures for the following year (ie Fall 2007 forecast for FY 2008, etc), for Fall 2007 through Fall 2011 forecasts. We also include the actual lease expenditures for the first four years.

Year-forward lease expenditure forecasts and actuals

Forecast	Year Forecasted	Forecast Opex ($ millions)	Actual Opex ($ millions)	Forecast Capex ($ millions)	Actual Capex ($ millions)	Forecast Total ($ millions)	Actual Total ($ millions)
Fall 2007	FY 2008	$ 2,149	$ 1,881	$ 2,188	$ 1,967	$ 4,337	$ 3,848
Fall 2008	FY 2009	$ 2,153	$ 2,085	$ 2,373	$ 2,212	$ 4,526	$ 4,297
Fall 2009	FY 2010	$ 1,996	$ 2,270	$ 2,505	$ 2,389	$ 4,501	$ 4,659
Fall 2010	FY 2011	$ 2,553	$ 2,614	$ 2,572	$ 2,317	$ 5,125	$ 4,931
Fall 2011	FY 2012	$ 2,579		$ 2,743		$ 5,322	

Source: Fall 2007-Fall 2011 Revenue Sources Book "Basic Data" tables

6) Break out credit for Cook Inlet.

See attached S FIN 2.2.12 credits.pdf

7) Update credit slides with FY 2013 projections.

See attached S FIN 2.2.12 credits.pdf

8) Provide information about the basis of our 10-year property tax forecast.

Property taxes are difficult to forecast for a variety of reasons. As such, in forecasting petroleum property taxes, the Department has adopted a simple model which takes the previous year assessed tax value, and projects it forward with assumptions that depreciation slightly offsets appreciation. This is a conservative estimate. The state's petroleum property tax forecast is outlined at the top of page 27 of the Department's Fall 2011 Revenue Sources Book.

9) Show municipal and state shares each year.

The property tax forecast is limited to the state's share. The Department does not forecast municipal property taxes. However, the Department does acquire current fiscal year property tax by municipality. The breakdown can be found on page 43 of the Department's Fall 2011 Revenue Sources Book. It is the Department's understanding that certain municipalities may conduct their own property tax forecasts, but the Department does not receive or review those forecasts.

10) Compare our forecast to expectations based on the Gleason decision.

The Department has not performed further property tax forecasting based on Judge Gleason's recent decision. Judge Gleason's decision is not yet "final" at the Superior Court level, and will likely get appealed to the Alaska Supreme Court for a final determination

11) Provide a history for CBRF (slide 4) of starting balance and fund flows.

See attached document named S FIN 2.2.12 CBRF Analysis Chart.pdf, which has been prepared in response to a question regarding the Constitutional Budget Reserve Fund cash flows. We started in 1991 with the appropriation into the CBRF. Each of the blue bars represents either a contribution or withdrawal into the CBRF. The investment income (represented by the green line) plus the cumulative amount contributed (represented by the light blue fill) equals the net asset value (represented by the black dotted line). We have also placed the various tax structures and price of oil on the graph so that a historical construct can be made around the CBRF inflow and outflows.

12) Provide a history of monthly cash flows for PCE… appropriations, earnings, payments out, and rates of return.

See attached document named S FIN 2.2.12 PCE Analysis – FY11 & FY12.pdf, which shows the monthly contributions, withdrawals and income or loss to the Power Cost Equalization fund along with rates of return. This information is updated monthly on the Department of Revenue's website http://www.dor.alaska.gov/treasury/programs/programs/other/ifr/index.aspx?2012

13) Make a recommendation for changes to PCE payout rates and rates of return.

The Power Cost Equalization Endowment (PCE) provides ongoing funding to assist in stabilizing electricity rates throughout the state as well as to make grants to improve state utility performance. The key operating assumptions set in statute are for the commissioner of revenue to invest the endowment to achieve at least a seven percent nominal return over time and for the endowment to provide for annual disbursements of seven percent based on the past 36 month endowment balance.

Since the PCE's expected long term return of 7% is equal to the 7% disbursement level, the fund and the purchasing power of disbursements can be expected to diminish with inflation over time absent additional state support. Many endowments are structured to payout current benefits while protecting future purchasing power to provide a similar level of future benefits. Funds are generally designed to accomplish this by targeting a rate of return that exceeds the payout level by the expected inflation rate.

The addition of $400 million to the PCE in July of 2011 provides the state with an opportunity to protect the endowment against inflation without requiring an increase in risk or a reduction from recent appropriations.

The endowment targets a nominal rate of return of at least 7% which necessitates a relatively high level of risk. This level of risk and return is reasonable since it is consistent with the long term ability of the endowment to bear risk.

To protect the endowment from inflation, I recommend decreasing the appropriation level. The long term expectation for inflation is 3%. Since the target return is 7%, this leaves 4% for appropriation. Over the long term, a 4% real rate of return for appropriation should be achievable.

As a result of the recent $400 million infusion, a 4% appropriation should result in disbursements increasing by 30% from $22.9 million in FY2011 to an estimated $29.8 million in FY2014. The additional capital is averaging into the appropriation calculation over a three year period between FY2012 and FY2014. To avoid a reduction in the level of recent appropriations, I would recommend transitioning to the 4% rate by fixing the appropriations for FY2012 and FY2013 at $25 million and $27.3 million. The following table provides the recent appropriations, the 4% estimates, and the recommendation:

Fiscal Year	(a) 36 Month Average Value	(b) Appropriation	(c) 4% Calculation	(d) Recommendation
FY2008	301,024,639	21,071,725		
FY2009	340,491,397	23,834,398		
FY2010	338,189,252	23,673,248		
FY2011	327,150,521	22,900,536		
FY2012 est.	*468,541,379*		*18,700,000*	*25,000,000 fixed $*
FY2013 est.	*606,523,926*		*24,300,000*	*27,300,000 fixed $*
FY2014 est.	*744,575,228*		*29,800,000*	*29,800,000 4%*

Protecting the Power Cost Equalization Endowment from the impact of long term inflation will help preserve the purchasing power of the endowment and allow for future benefits to increase with inflation. The current disbursement model is likely to result in either decreasing future disbursements or the need for additional state support. The state has a unique opportunity this fiscal year to move toward inflation-proofing this endowment without increasing risk or decreasing the level of recent appropriations.

14) Provide a report about the PF earnings reserve account over the past 5 years, balances, and how it was invested.

See attached document named S FIN 2.2.12 APFC earnings reserve.pdf

I hope the answers fully address your questions.

Sincerely,

Bruce Tangeman
Deputy Commissioner

State of Alaska
Department of Revenue

Commissioner Bryan Butcher

SEAN PARNELL, GOVERNOR
333 Willoughby Avenue, 11th Floor
P.O. Box 110400
Juneau, Alaska 99811-0400
Phone: (907) 465-2300
Fax: (907) 465-2389

The Honorable Joe Paskvan
Alaska State Senator
State Capitol, Room 115
Juneau, Alaska 99801

February 20, 2012

Dear Senator Paskvan:

I am writing in response to your recent questions regarding the "Gas Partial Processing Plant," and specifically, your requests for information on:

1) Whether BP has applied for a tax credit for this project; and
2) If so, provide the details including the amount of credits rewarded.

The provisions of Alaska statutes 40.25.100 and 43.05.230(a) require the Department to hold information provided in returns or reports confidential. These statutes are taken seriously by all Department staff. Generally speaking, the Department is required to keep all taxpayer information that it receives confidential. Alaska statute 43.05.230(f) makes it a crime for an individual to release such information, punishable by up to a $5,000 fine, or two years in jail, or both.

I hope our response fully answers your question.

Sincerely,

Bruce Tangeman
Deputy Commissioner

State of Alaska
Department of Revenue

Commissioner Bryan Butcher

SEAN PARNELL, GOVERNOR
333 Willoughby Avenue, 11th Floor

Fax: (907) 465-2389

The Honorable Joe Paskvan
Alaska State Senator
State Capitol, Room115
Juneau, Alaska 99801

February 21, 2012

Re: Memo dated January 28, 2012.

Dear Senator Paskvan:

This letter is in response to the memo you sent to me on January 28, 2012, with questions regarding Alaska's hypothetical income statement using Department of Revenue price, production, and tax and credit forecasts. Below, I have itemized your requests and questions and my responses based on enumerated paragraphs from your memo.

Paragraph 3: "I request charts/slides for FY 11, FY12 and FY13 in the income statement format [i.e. in a similar format to Fall 2011 RSB D-1a, D-1b, and D-1c] showing in a new column to the right side of the current Value column the 25% private royalty load and the 10% gross production tax load. I would like the royalty amount to appear in the same horizontal line as Alaska's royalty and I would also like to have the gross production tax to appear on the same horizontal line as Total Tax before credits. For each year, the same revenue earned in Alaska is to be used such that the 25% and 10% load is applied for FY11 on revenue [$million] of $20,786.7, for FY12 on revenue of $22,848.2 and for FY13 on revenue of $22,185.1."

Response: Figures 1 through 3, attached to the end of this letter, are modifications on figures D-1a, D-1b, and D-1c, from the *Fall 2011 Revenue Sources Book* (RSB), as requested. I added a column on each figure where calculations of hypothetical royalty and gross tax are shown.

I am concerned with the assertion in your January 28 memo that the royalty rates in North Dakota and Texas are 25 and 35 percent, respectively. These values are the extreme high values of a range you may have seen in the comparison table in DOR's publication titled *Alaska's Oil and Gas Fiscal Regime* (January 2012).[1]

[1] Alaska Department of Revenue, 2012, Alaska's Oil and Gas Fiscal Regime – A Closer Look from a Global Perspective. Table 6-2 provides minimum and maximum ranges of values for fiscal term elements for twelve jurisdictions that comprise Alaska's fiscal regime peer group.

I believe that if, for simplicity, you want to model a single royalty rate and a single severance tax rate, it is prudent to use values similar to those recommended by PFC Energy and others in their *World Rating of Oil and Gas Fiscal Terms (2011)*, which quotes a royalty rate of 18.75 percent and severance tax rate of 11.5 percent used for modeling North Dakota and a royalty rate of 25 percent and severance tax rate of 4.6 percent for modeling Texas. I use assumptions for your request that are more representative of fiscal terms for North Dakota[2].

Paragraph 4: "My very rough calculations using, for example, FY11 revenue show royalty at $5,196.6 [I have not factored in federal royalty monies] and gross resource tax at $2,078.6 for a total of $7,275.2. Is this accurate?"

Response: It appears that the value you calculated, $5,196.6 million, is the value of royalty production assuming price and gross annual production equals the values seen in the Fall 2011 RSB D-1a, but using a 25 percent royalty rate.

Your gross tax calculation is incorrect. In most states, the royalty interest in oil produced from a state, federal or municipal oil and gas lease is exempt from severance tax. Almost all of Alaska's oil and gas are produced from leases that would qualify in most states for royalty oil exemption from severance tax. I would recommend assuming all royalty production is exempt from severance tax in your hypothetical example, since that is the case in Alaska, and that is the way that I have done the calculation in the tables provided with this letter.

Paragraph 5: "In FY11, FY12, FY13 charts/slides, I would like to also show for each year the credits for potential purchase as shown on page 31 of Fall 2011 RSB. This results, for example, in a reduction from $4,501.28 to $4,051.28 in FY11 at the bottom line."

Response: Figures 1 through 3, attached to the end of this letter, include the requested modifications.

Paragraph 6: "The no OPEX or CAPEX deduction or credits are not to be factored into the far right hand column as North Dakota does not have deductions or credits. Is this correct?"

Response: North Dakota does not offer direct OPEX or CAPEX deductions or credits.

---

[2] PFC Energy, Van Meurs Corp., and Rodgers Oil & Gas Consulting, 2011, World Rating of Oil and Gas Terms: Volume 1, North America, Annex C. A detailed breakdown and description of North Dakota's fiscal terms is provided on pages 100 – 105 of Annex C. A detailed breakdown and description of Texas' fiscal terms is provided on pages 114 – 116 of Annex C.

Paragraph 7: "On a different topic, how many barrels are excluded under the footnote 2 to the income statement? Also, what models, as discussed in footnote 4, can be shared with Senate Resources?"

Response: Regarding Footnote 2, disclosing production attributed to companies expected to have zero tax liability would violate DOR confidentiality constraints. Regarding Footnote 4, we shared an ACES and HB110 revenue model with you on March 17, 2011. This model is still a good tool to apply to these issues. The "larger models" referred to in Footnote 4 include confidential taxpayer information and cannot be made public.

Paragraph 8: "I also request that DOR prepare a chart/slide using the FY13 income statement depiction but changing only one variable which is to increase the ANS Oil Price to $110.46. This is a $1/bbl increase as to FY13, D-1c in Fall 2011 RSB."

Response: Figure 4 provides the change as requested.

I hope this letter fully addresses your needs on these issues. Please remember that the original estimates in figures D-1a, D-1b, and D-1c of the RSB are simplifications of complicated tax and credit calculations and do not accurately reflect Department of Revenue expectations. Calculations based on modifying these figures are subject to the same accuracy issues. The modifications are provided here at your request and do not reflect Department of Revenue expectations.

Sincerely,

Bryan Butcher
Commissioner

Figure 1. FY 2011 production tax estimate, reproduced from Fall 2011 RSB Figure D-1a Income Statement. Modified by adding column with hypothetical calculations (highlighted) added at the request of Senator Paskvan.

			As reported in Fall 2011 RSB	Per Paskvan Request
	Price	**Barrels**	**Value ($MM)**	**Value ($MM)**
Avg ANS Oil Price ($/bbl) & Daily Production (bbls)	$94.49	602,723	$56.9	$56.9
Annual Production (bbl)				
Total		219,993,895	$20,786.7	$20,786.7
Royalty, Federal and other barrels[1]		-29,505,505	($2,787.9)

Notes: (1) Royalty, Federal and other barrels represents our best estimate of barrels that are not taxed. This estimate includes both state and federal royalty barrels, barrels produced from federal offshore property, and barrels used in production. For purposes of this calculation, also includes barrels produced by companies with negative PTV.

(2) For purposes of this illustration, to more closely reflect actual tax received by the state, "taxable value" shown here excludes the value of barrels produced by companies expected to have zero tax liability.

(3) Deductible Lease Expenditures represents our best estimate of lease expenditures that are applicable to currently producing fields that are likely to produce a tax liability for the company or companies producing them. The per-barrel expenditures reflect expenditures per taxable barrel and do not reflect expenditures per all barrels produced.

(4) Estimated Total Tax after credits is a calculated total based on constant daily production, constant oil prices, constant expenditures for the entire year, and no company specific information. Variations in these assumptions captured in larger revenue models will produce different results that differ from the estimates in the simple model above.

The Honorable Tom Wagoner
Co-Chairs, Senate Resources Committee
Alaska State Legislature
Juneau AK, 99801

SUBJECT: Response to Questions from Senate Resources Meeting on February 27, 2012

Dear Senators Paskvan and Wagoner:

Thank you for the opportunity to provide our follow-up responses from the Senate Resources Committee meeting on February 27, 2012. The questions and responses follow.

1.) **Is the 30 cents per barrel capital expenditures exclusion included in the snapshot model charts presented?**

For purposes of the charts presented we did not separately break out the 30 cents / barrel exclusion. Please remember that charts and analysis presented in committee represent volume-weighted data that has been aggregated to a high level to identify trends in how various tax schemes impact North Slope operations. This is a high-level comparison that makes simplifying assumptions allowing the user to compare different fiscal regimes and the conclusions and outcomes of the model are the same whether or not this specific provision is broken out.

2.) **What would the FY 12 revenue impact be if amendment B.5 was in effect for the full year?**

For FY 2012, based on our Fall 2011 forecast assumptions, the provisions of amendment B.5 (bracketed progressivity with 50% maximum tax rate) would impact revenue by approximately $1.7 billion if in effect for the full year.

3.) **What would the difference be between amendment B.5 and CSSB 192, for FY 12, at $150 per barrel?**

If the provisions of CSSB 192 were in effect for the full year in FY 2012, and assuming our Fall 2011 forecast assumptions except for a constant ANS price of $150 per barrel, we would expect approximately $9.90 billion in production tax revenue. Under the provisions of amendment B-5 and the same assumptions, we would expect approximately $7.15 billion in production tax revenue, for a difference of approximately $2.75 billion.

4.) What is the revenue impact of amendment B.18?

Using the Fall 2011 oil price, production, and cost levels, production tax values for the next several years do not exceed roughly $72 per barrel. Therefore, the progressivity rates in this amendment do not have a dramatic impact on production tax revenues. Our modeling results regarding the impact of amendment B.18 over the term of the fiscal note are as follows:

Revenue Impact of Amendment B.18 FY13 - FY18 ($millions)	
FY 2013	$27.00
FY 2014	$7.00
FY 2015	$0.00
FY 2016	$0.00
FY 2017	$0.00
FY 2018	$1.50

5.) Provide charts for amendment B.8 and amendment B.18 similar to charts we provided for bracketed progressivity amendments.

See attached slides.

6.) Provide marginal tax rates for each of the proposals shown in the presentation.

See attached slides.

We hope our responses fully answer your questions.

Sincerely,

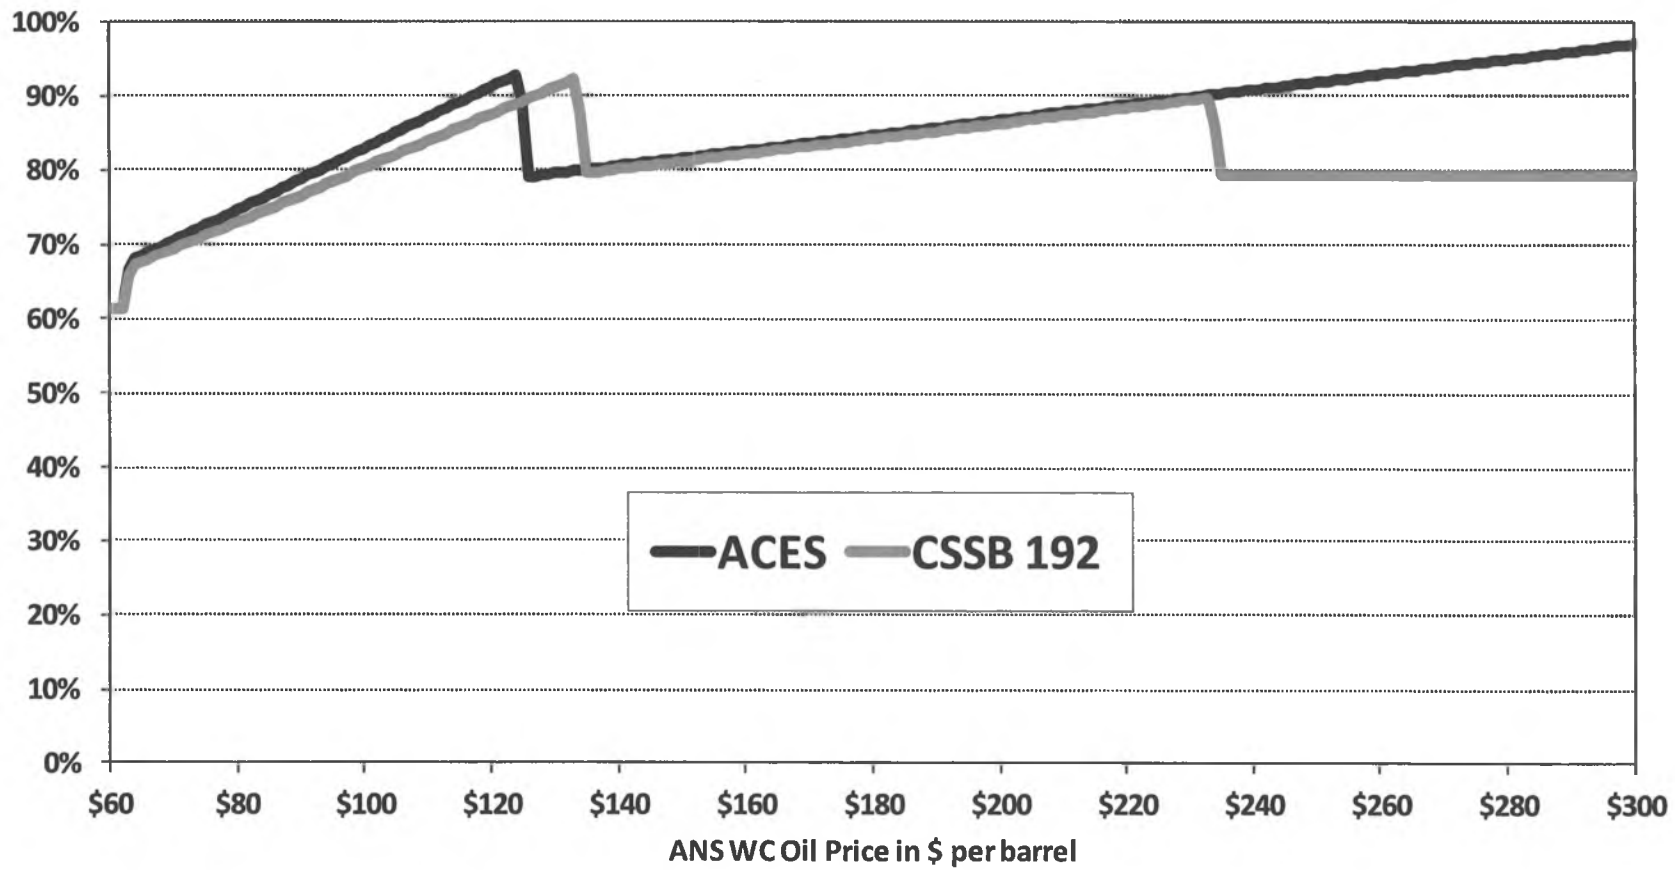
Bruce Tangeman
Deputy Commissioner

Enclosures

Marginal Government Take

(includes all federal and state taxes)

ACES and CSSB 192 \B

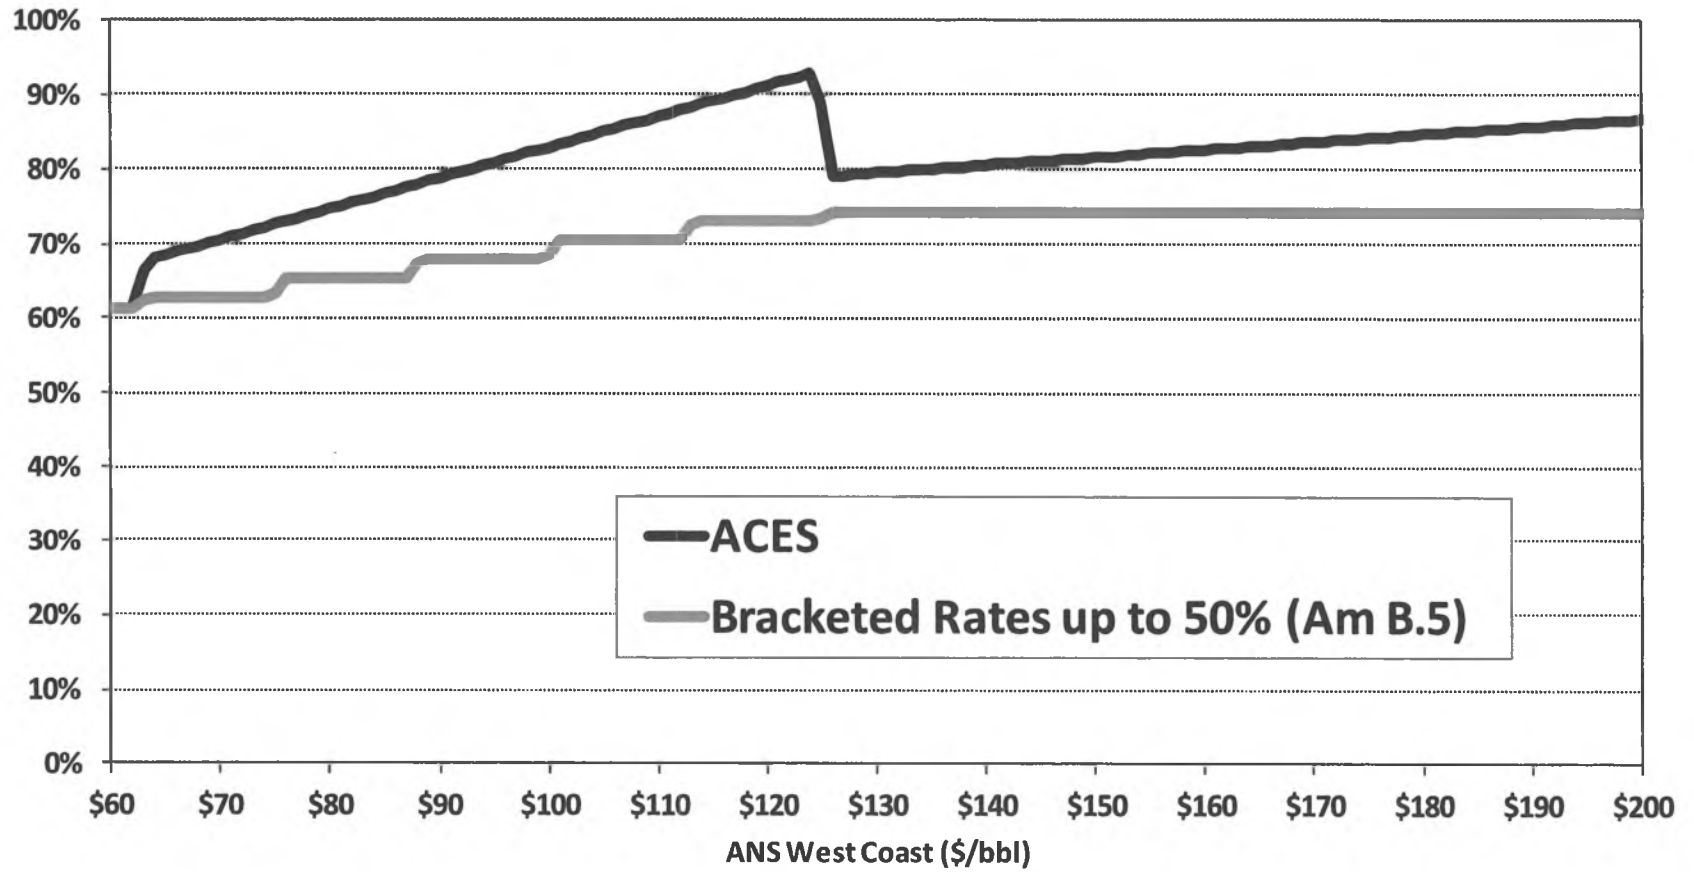


Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl.

Marginal Government Take

(includes all federal and state taxes)

ACES and Bracketed Rates up to 50% (Am B.5)

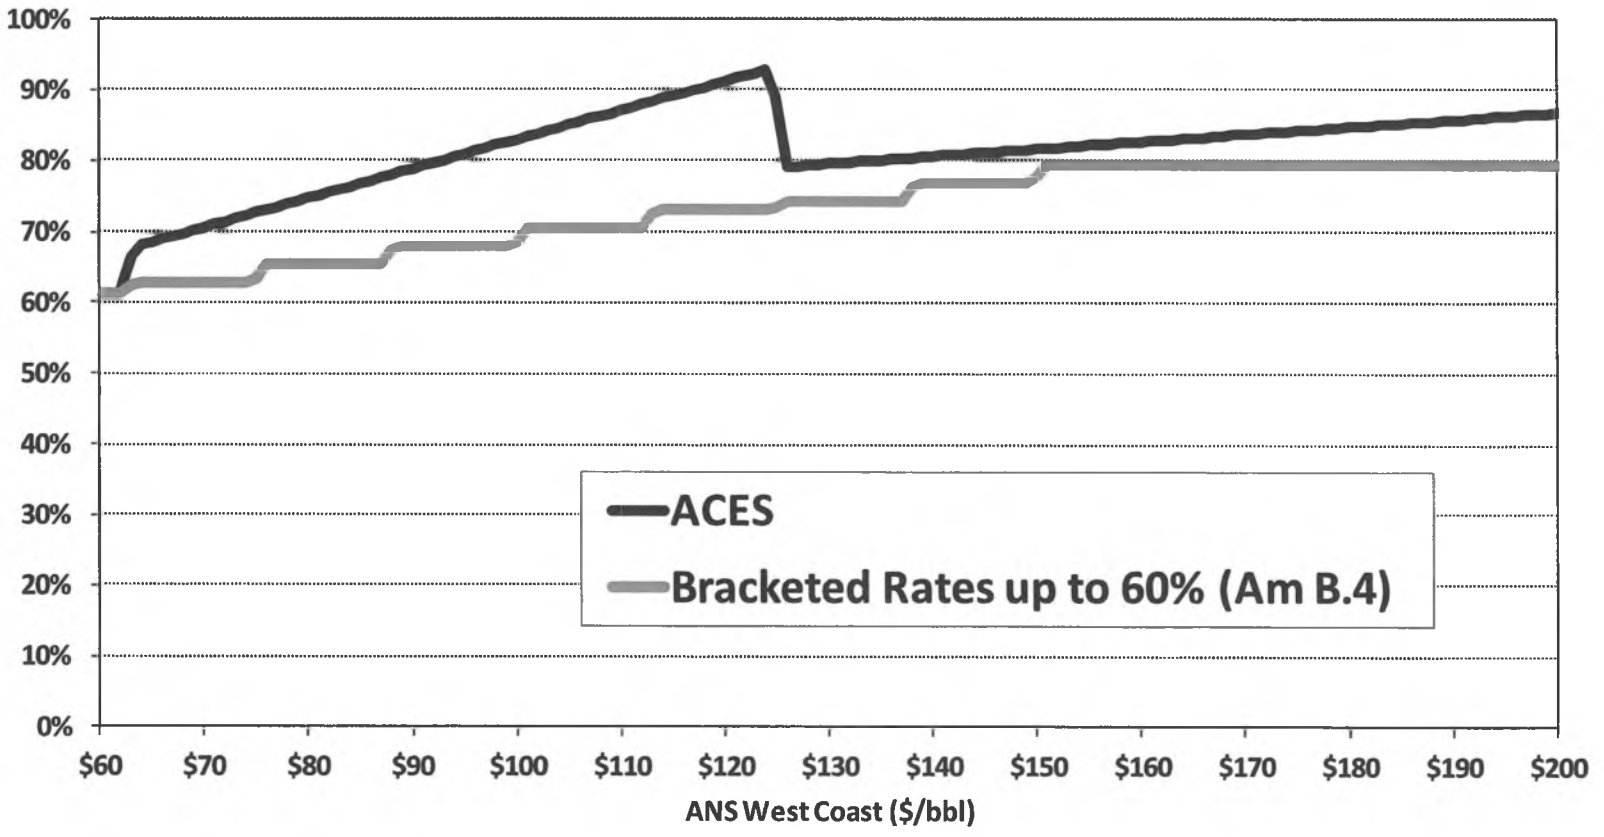


Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl.

Marginal Government Take

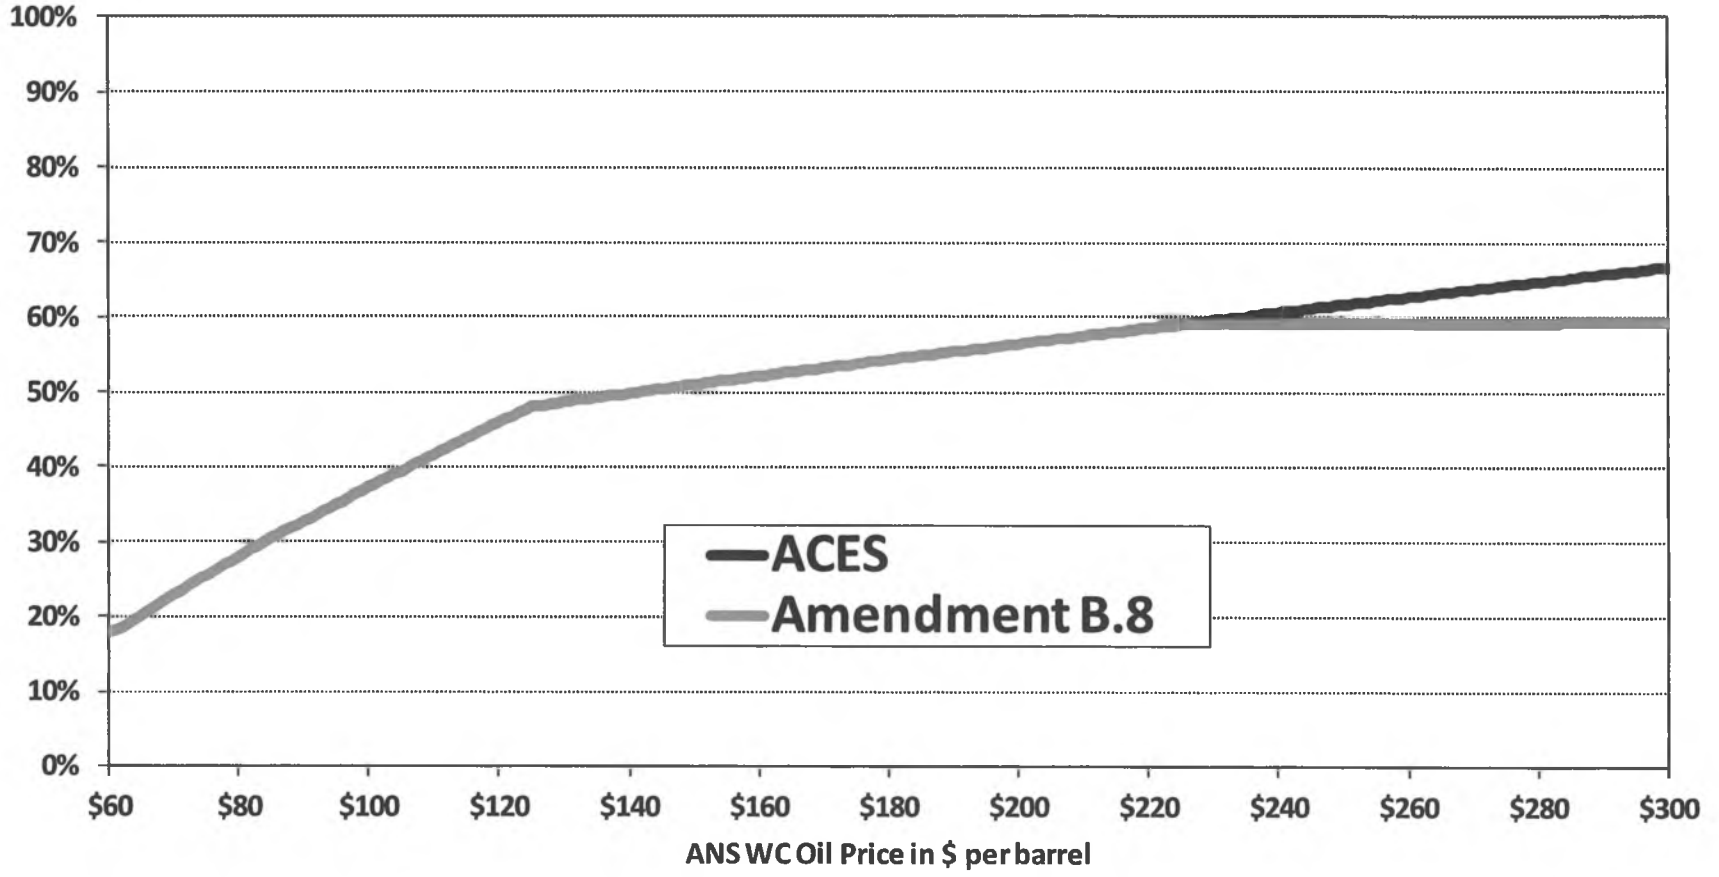
(includes all federal and state taxes)

ACES and Bracketed Rates up to 60% (Am B.4)



Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl.

Effective Production Tax Rates:
ACES and Am B.8 (ACES capped at 60%)

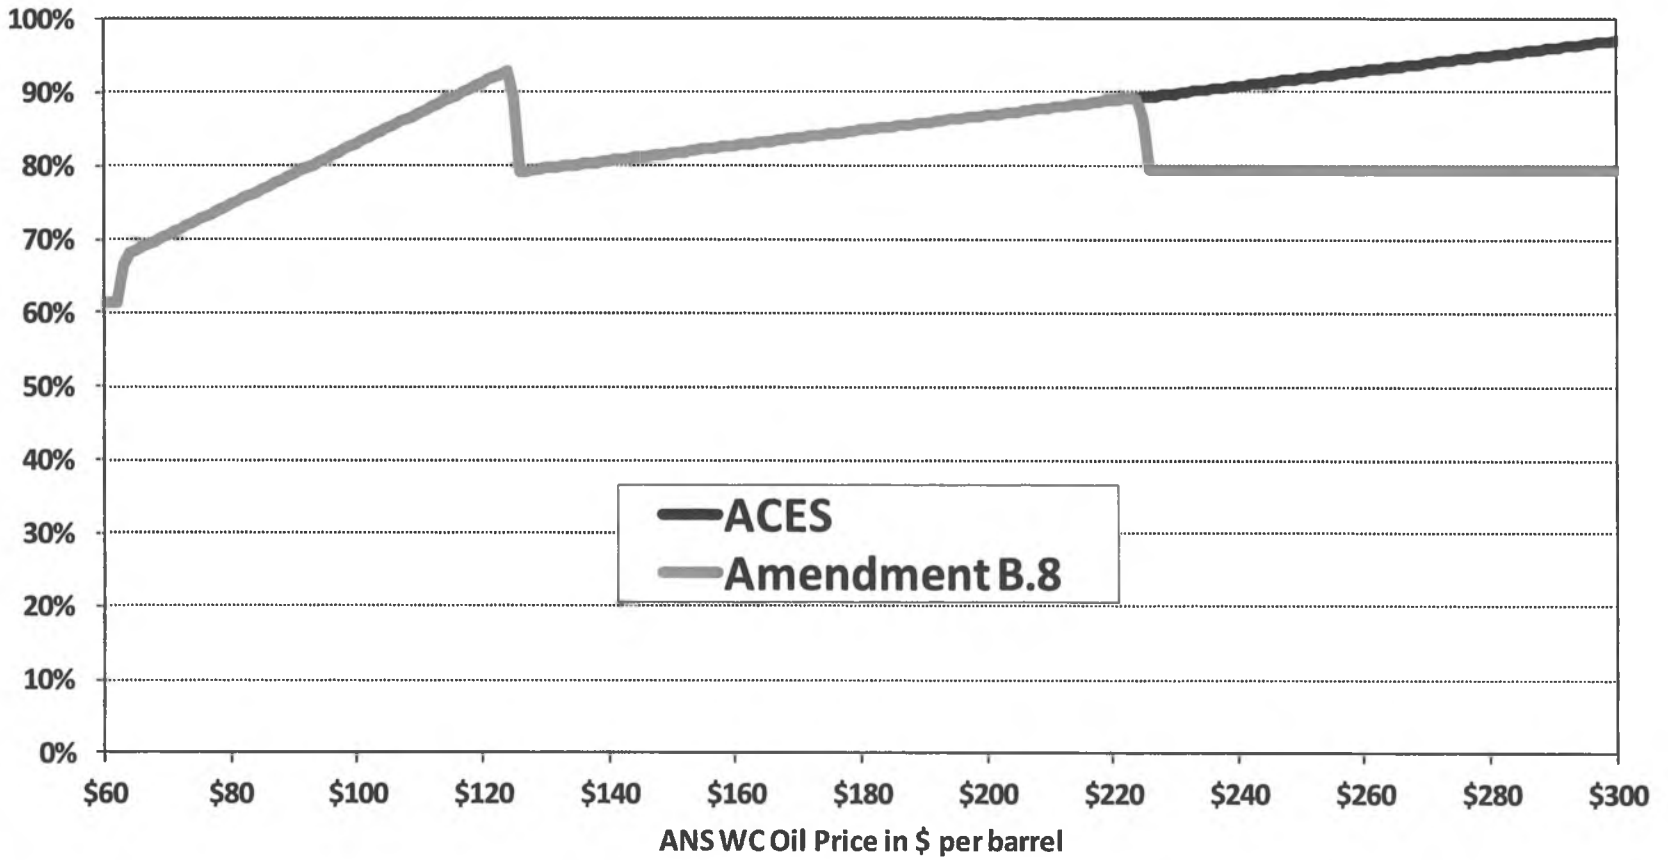


Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl.

Marginal Government Take

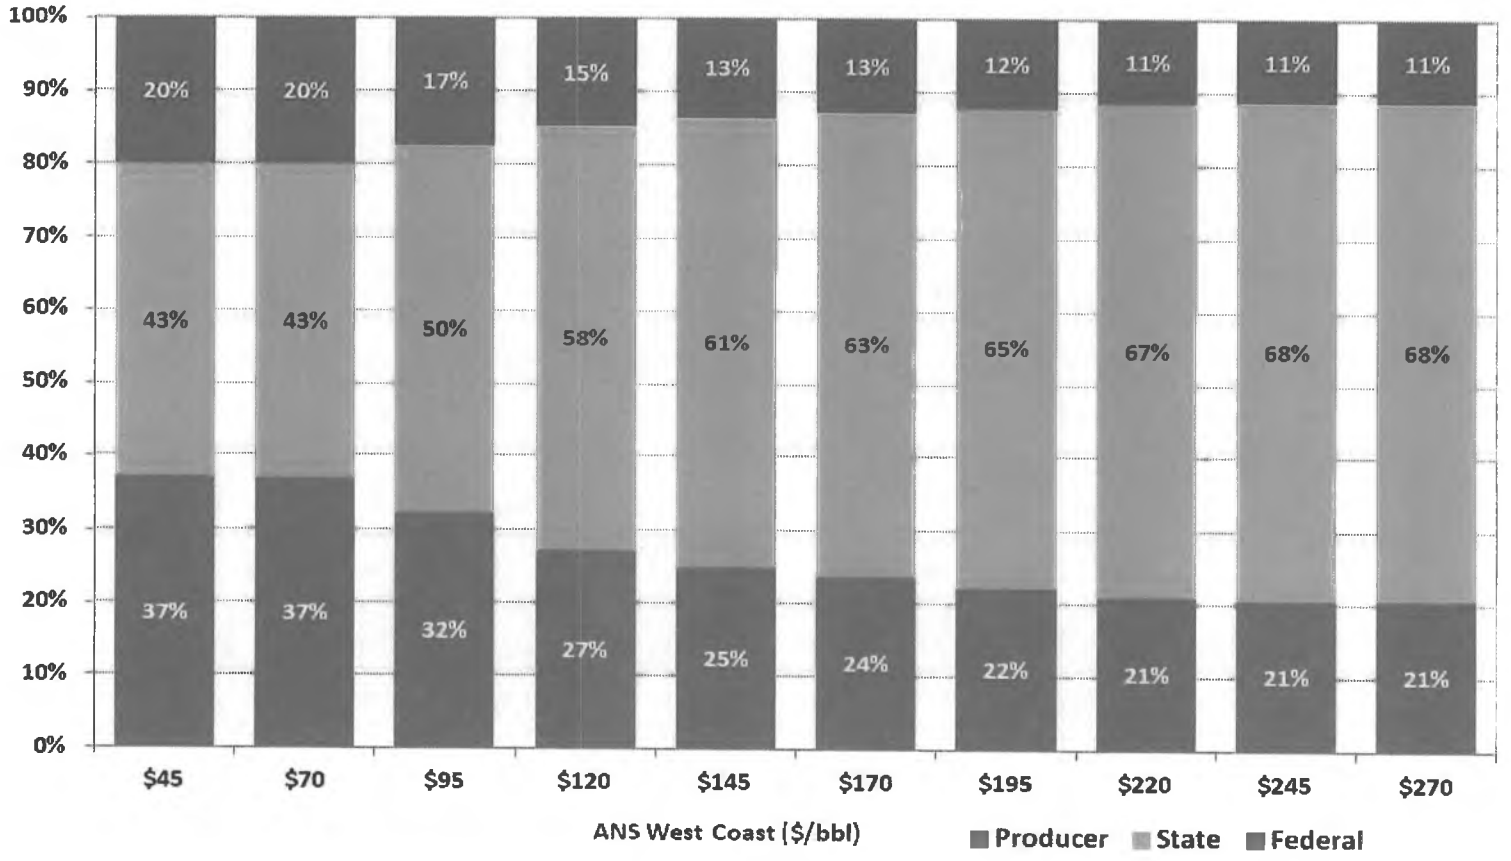
(includes all federal and state taxes)

ACES and Am B.8 (ACES capped at 60%)



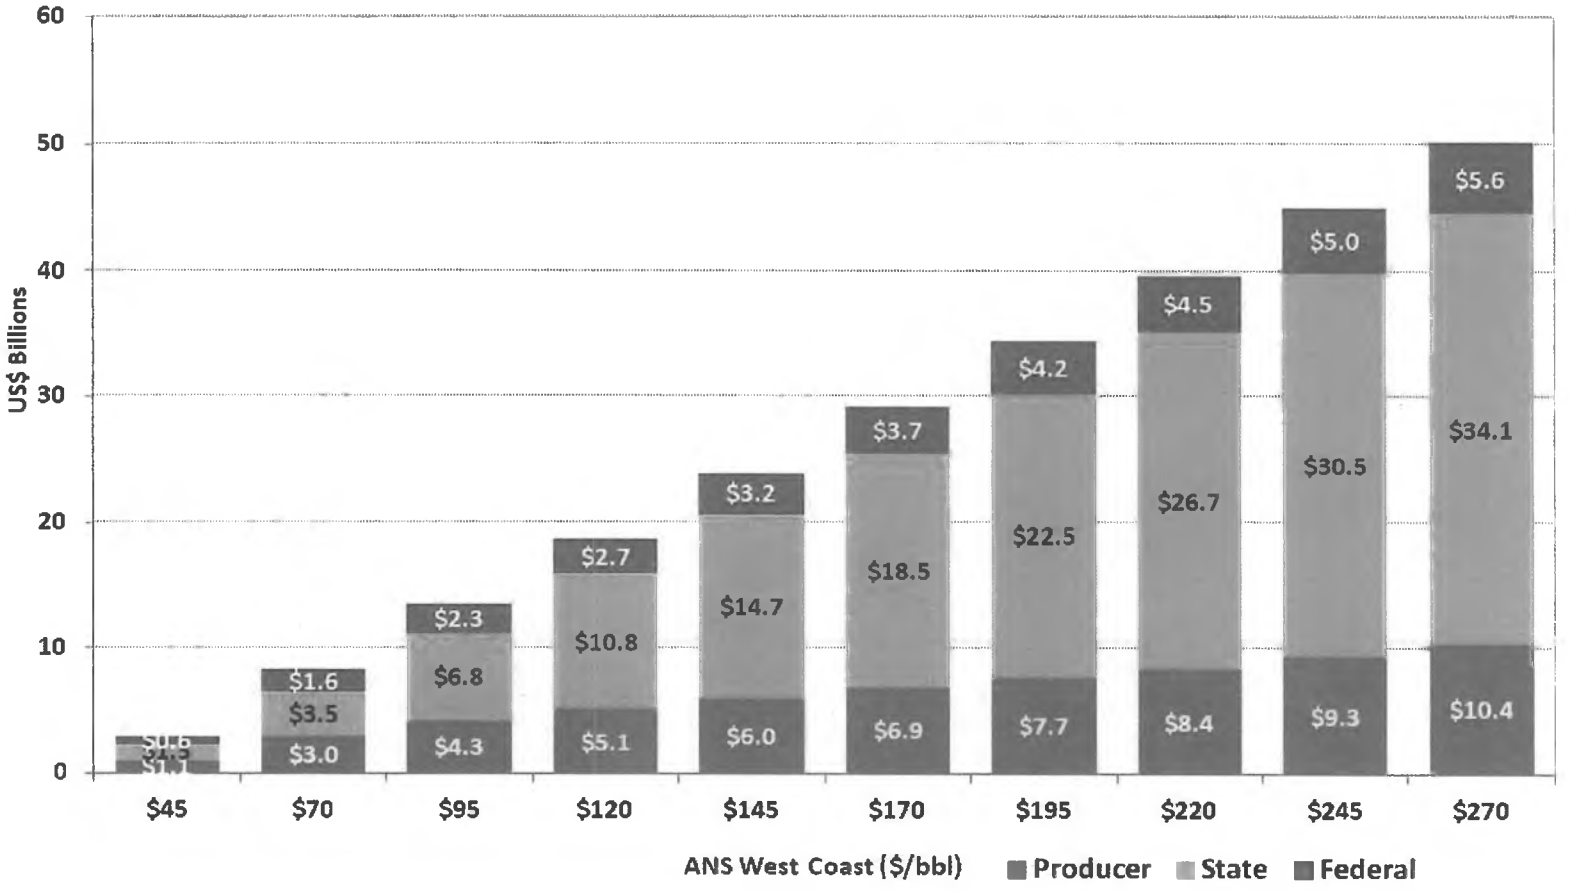
Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl.

Share of Profit under Amendment B.8 (ACES capped at 60%)



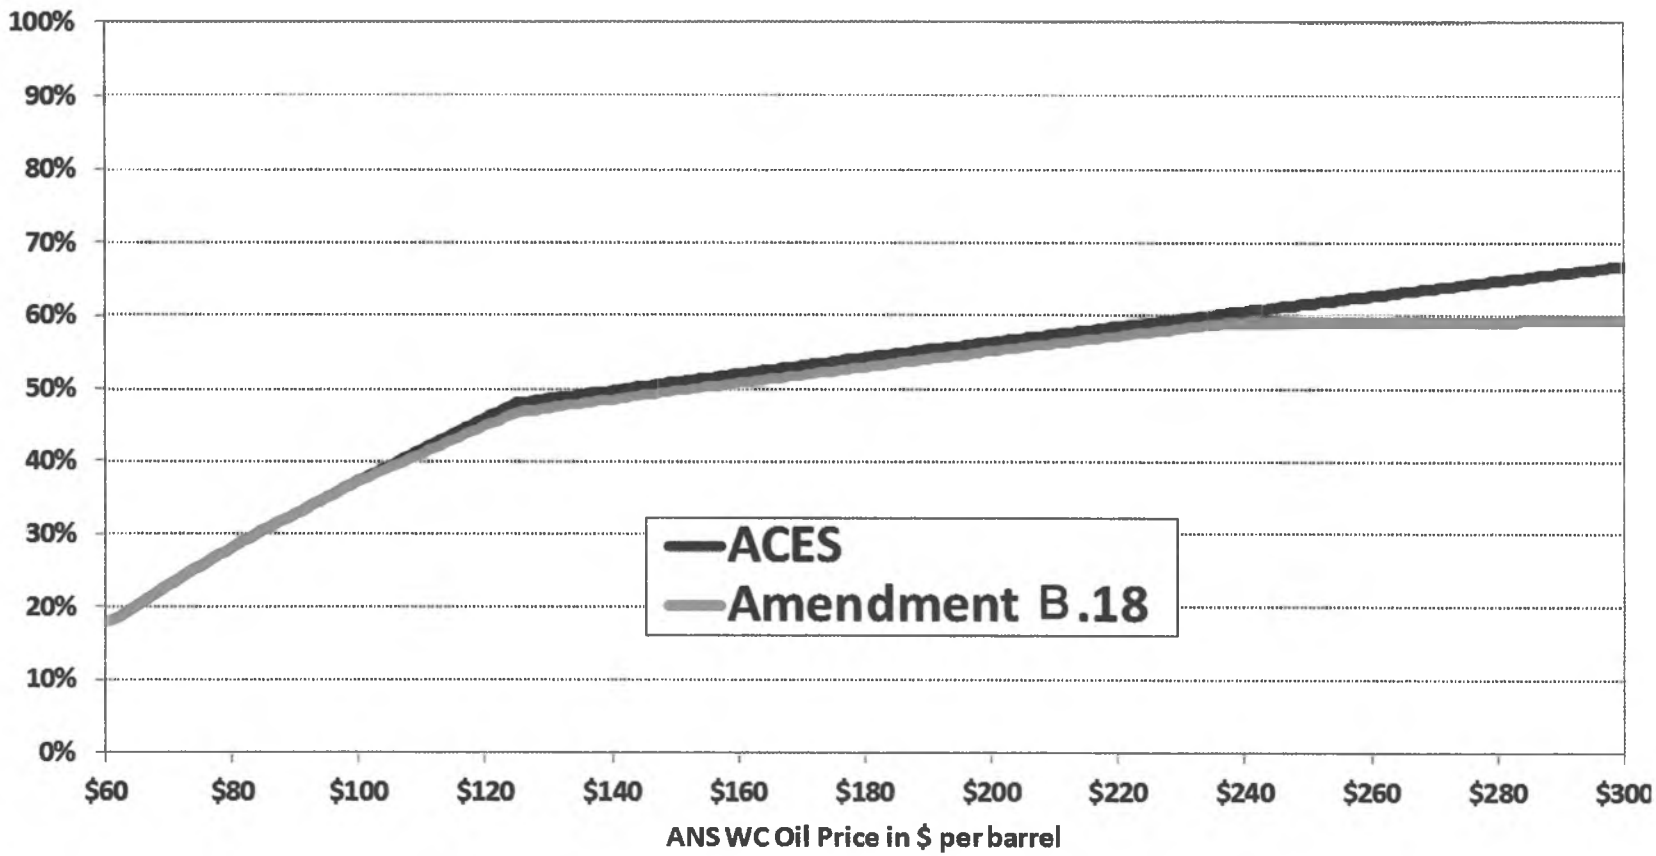
Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl.

Absolute Profit under Amendment B.8 (ACES capped at 60%)



Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl.

Effective Production Tax Rates:
ACES and Am B.18 (ACES capped at 60%, 0.35% progressivity from $67.50 to $92.50 PTV)



Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl.

Marginal Government Take

ConocoPhillips
Alaska, Inc.

RECEIVED
FEB 29 2012

February 29, 2012

The Honorable Joe Paskvan
Co-Chairman, Senate Resources Committee
Alaska State Legislature
Alaska State Capitol, Room 115
Juneau, AK 99801-1182

Dear Senator Paskvan:

Thank you for your letter dated February 22, 2012. We are happy to clarify the statements that we made regarding the net income and payments to governmental authorities for ConocoPhillips Company and its wholly owned subsidiaries (including ConocoPhillips Alaska, Inc.) operating in Alaska ("CPA"), as well as our analysis of the data in the Alaska Department of Revenue Fall 2011 Revenue Source Book (RSB).

Let me first address CPA's tax and royalty payments in comparison to our reported net income. For the years 2007 through 2011, CPA earned total net income of $9.83 billion. During that same time period, we paid a total of approximately $21 billion in royalties and taxes (taxes include payments to local governments, the State of Alaska, and the federal government). For the year 2011, CPA earned $1.98 billion and paid a total of approximately $5 billion in taxes and royalties. Of this $5 billion, approximately $4 billion (taxes and royalties) was paid to the State of Alaska alone. All of the tax numbers come directly from the 10-K forms that CPA has filed with the Securities and Exchange Commission. The value of the royalty payments has been estimated using our actual royalty rate of 13.6%. These figures form the basis for our statement that in Alaska, we pay approximately twice as much in taxes and royalties as we earn.

Your letter also attempts to understand our comments in the context of the industry as a whole as portrayed by the RSB for FY2011. I believe that the following discussion will help in understanding why industry earnings as a whole track CPA's government payments to earnings ratio.

When we consider the tax burden in Alaska, we take into account all of the taxes we pay. The additional burdens that were excluded in your analysis do make a significant difference with respect to the industry's tax burden as well as the tax revenue for state and local

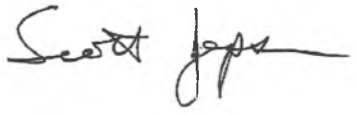
governments. Using the RSB, the industry paid $542 million in state income taxes and $476 million in property taxes (state share $110 million, local share $366 million). The total of these additional burdens is over $1 billion more in taxes to the industry than in your analysis.

There are two other areas that differ between our analysis and yours. First, we have used a federal tax rate of 35% which corresponds to our federal tax rate. Second, it appears that $850 million of tax credits were deducted from the calculated production tax to determine the production tax paid after credits. From the large producer perspective, $400MM applies to the producers' tax liability. The other $450 million is identified as "Credits for Potential Purchase" earned by those parties who do not generate sufficient production tax liability to utilize the credits. The production tax paying producers do not receive the benefit of the "Credits for Potential Purchase" unless the credits are purchased at some nominal discount, in which case the value realized by the purchaser is a small fraction of the tax credit itself. Including these adjustments, the production tax paying producers paid approximately $11 billion dollars in taxes and royalties with after tax cash flow of approximately $4.7 billion dollars. This results in a ratio of tax and royalty payments to earnings of about 2.3. Excluding federal tax payments, the ratio of state taxes and royalty to earnings is about 1.8.

As a sensitivity, we have looked at the case where ANS crude is priced at $120/bbl (versus $94.49/bbl in the RSB) with all other assumptions in the RSB remaining the same. The $120/bbl case demonstrates one of the key problems with ACES – as prices increase, industry sees very little of the uplift. At $120/bbl, our model estimates total government share and royalties is about 3 times industry's share, and state severance tax alone is about 1.5 times the industry total share. In absolute terms, with a price increase from $94.49/bbl to $120/bbl, we estimate industry's share increases about $700MM while the state's share (taxes and royalties) increases by approximately $4.5 billion.

I appreciate your desire to understand the basis for our statements as well as to understand our perspective regarding the reasons that we believe substantial changes are needed to ACES to attract more investment by the industry. I hope this response to your letter has helped in this regard as well as in understanding the basis for our comments regarding the ratio of taxes and royalties to profits. Please feel free to contact me if you have additional questions.

Respectfully,



J. Scott Jepsen

RE: DOR "Access to Information" Power Point Presentation

Dear Senators Paskvan and Wagoner:

Thank you for the opportunity to provide our follow-up responses from the Senate Resources Committee meeting on February 23, 2012. The questions/comments and responses follow.

1.) **Clarification about Slide 6 demonstrating that the difference between the DOR assessed TAPS values and Superior Court values was due to information that did not exist before the trial.**

To clarify Slide 6 from the Department's Power Point presentation to your committee on February 23, 2012, on the subject matter of, "Access to Information."

The fourth bullet point of Slide 6 stated in part:

> "TAPS assessments by DOR (not SARB) were $4.5 billion in 2007…"

The fifth bullet point of Slide 6 stated in part:

"Using information under the de novo provisions at trial in 2011 that was not actually in existence in 2007, the Superior Court ruled TAPS value at $8.9 billion in 2007…"

Questions from the committee, as well as the Department's responses to those questions, were framed in the context of Alaska North Slope (ANS) reserve estimates. The information this slide is referring to, however, is TAPS replacement cost data and not ANS reserves data. The Department's statements in relation to Slide 6 therefore should be taken only in the context of TAPS replacement cost data and not in the context of a position on ANS reserves.

Slide 6 is simply meant to demonstrate that TAPS assessed value as determined by the Superior Court continues to most closely agree with the Department's assessments relative to the values

argued by the Municipalities and the TAPS Owners. In the recent 2011 TAPS property tax trial covering tax years 2007 – 2009, the biggest discrepancy between the Department's and court's assessed value occurred in tax year 2007. The main reason for the discrepancy was the court's reliance on TAPS replacement cost data that was in existence in 2011, but did not actually exist in 2007 when the Department did the original assessment.

It is also important to clarify that this TAPS replacement cost data did not exist in 2007, as opposed to being in the possession of the TAPS owners and not provided to the Department. Rather, this TAPS replacement cost data was information the Municipalities commissioned after the 2007 TAPS assessment. It was provided to the Department to consider for the 2008 TAPS assessment. The Department did in 2008 rely on this data, and did so before the tax year was under litigation. The Department continues to consider and rely on this data in its TAPS assessments, irrespective of the ongoing TAPS litigation.

2.) **Why was the FY 2016 production forecast reduced by 79,000 barrels per day from Spring 2011 to Fall 2011, and can we release the supporting documents from producers based on court order that any production with 3 or more companies be made public?**

- In response to your question regarding the 79,000 BPD difference between DOR's Spring 2011 forecast and Fall 2011 forecast for FY 2016:
    - In our spring forecast, we included the Umiat, Orion, Nikaitchuq, and Liberty fields;
    - Between the release of our spring forecast and the compilation of info for our fall forecast, there were changes in all of the fields listed above which caused DOR to reduce its estimates (changes re: deferred plans, reduced scope, and reduced reserves).

3.) **Provide backup for bullet 3 on slide 10, explaining why the cooperative agreement with the North Slope Borough was ended. Provide the letter from Marsha Davis regarding ending the North Slope Borough cooperative agreement for property tax.**

Please see attached letter from Deputy Commissioner Marcia Davis re: the ending of the North Slope Borough cooperative agreement for property tax.

Sincerely,

Bruce Tangeman
Deputy Commissioner

November 13, 2009

The Honorable Edward S. Itta
Mayor, North Slope Borough
P.O. Box 69
Barrow, AK 99723

Dear Mayor Itta,

The Department of Revenue has over the years benefited from the assessment assistance provided by the North Slope Borough (NSB) under a Memorandum of Understanding (MOU) authorized under AS 43.56.060(g). Since the MOU's most recent revision in 2006, the Department has undergone a series of internal initiatives to strengthen the protection of taxpayer confidential information. We do not believe the current MOU is consistent with these internal standards. Therefore, please consider this notification that the Department is withdrawing from the agreement effective 30 days from the date of this letter as required in section seven of the MOU.

In light of the recent staff retirements within the NSB, which has left the NSB Audit Group without staff, the Department will now resume performing the appraisal functions that had been previously performed by the NSB under the MOU. As a result, we do not anticipate any negative impacts to the NSB or the state from the termination of the current MOU. Should the opportunity arise in the future to again work together under AS 43.56.060(g), we remain open to developing a new MOU with the NSB consistent with the Department's confidentiality requirements.

In accordance with paragraph 4 of the MOU, please have all AS 43.56 hard copy files stored at the NSB returned to the Department. Likewise, all electronic AS 43.56 files should be copied onto a disk and returned to the Department and subsequently deleted from all NSB computers and servers.

To avoid any confusion regarding the exchange of confidential taxpayer information, the Department will notify AS 43.56 taxpayers that the Department and NSB are no longer exchanging information pursuant to an MOU relating to AS 43.56 assessment matters.

We thank you for the excellent working relationship we have enjoyed with the NSB property assessment staff over the years.

Sincerely,

Marcia Davis

Marcia Davis, Deputy Commissioner

The Honorable Bert Stedman
State Capitol Room 516
Juneau AK, 99801

March 20, 2012

The Honorable Lyman Hoffman
State Capitol Room 518
Juneau AK, 99801

SUBJECT: Response to Questions from Senate Finance Meeting on March 14, 2012

Dear Senators Stedman and Hoffman:

Thank you for your questions and the opportunity to provide our follow-up responses from the Senate Finance Committee meeting on March 14, 2012. The questions and responses follow.

1. **Reproduce slide 5 using total lease expenditures for all companies.**

   Please see slide 1 attached.

2. **Can you run another slide #5 that shows the production tax revenue in dollars on the Y axis and the ANS WC Oil price in $ per barrel on the X axis but only from $60 to $140 instead of going all the way out to $300.**

   Please see slide 2 attached, with the X axis out to $200 per barrel.

3. **Reproduce slides 21-23 using 25% and 20% federal CIT rates.**

   Please see slides 3-8 attached.

4. **Reproduce slides 21-23 using total lease expenditures for all companies.**

   Please see slides 9-11 attached.

5. **Reproduce slides 21-23 showing total dollars to state, federal, and producer.**

   Please see slides 12-14 attached.

6. **For slide 27, what gross tax rate would generate an equal amount of production tax at $120 / barrel for each tax system?**

   Using FY 2012 assumptions of $8.72 in transport costs, opex of $14.03 per taxable barrel, and capex of $10.25 per taxable barrel, we calculated the following "equivalent" gross tax for ANS WC oil price of $120 per barrel.

   ACES Tax System: 35%
   HB 110 Brackets only: 24%

7. **For slide 29, provide share of profit charts, both as percent and dollar value.**

   Please see slides 15-20 attached.

8. **Reproduce slide 24 using total lease expenditures for all companies.**

   Please see slide 21 attached.

9. **Provide administration's position regarding continuing separate tax treatment for gas produced in Cook Inlet and gas used in state.**

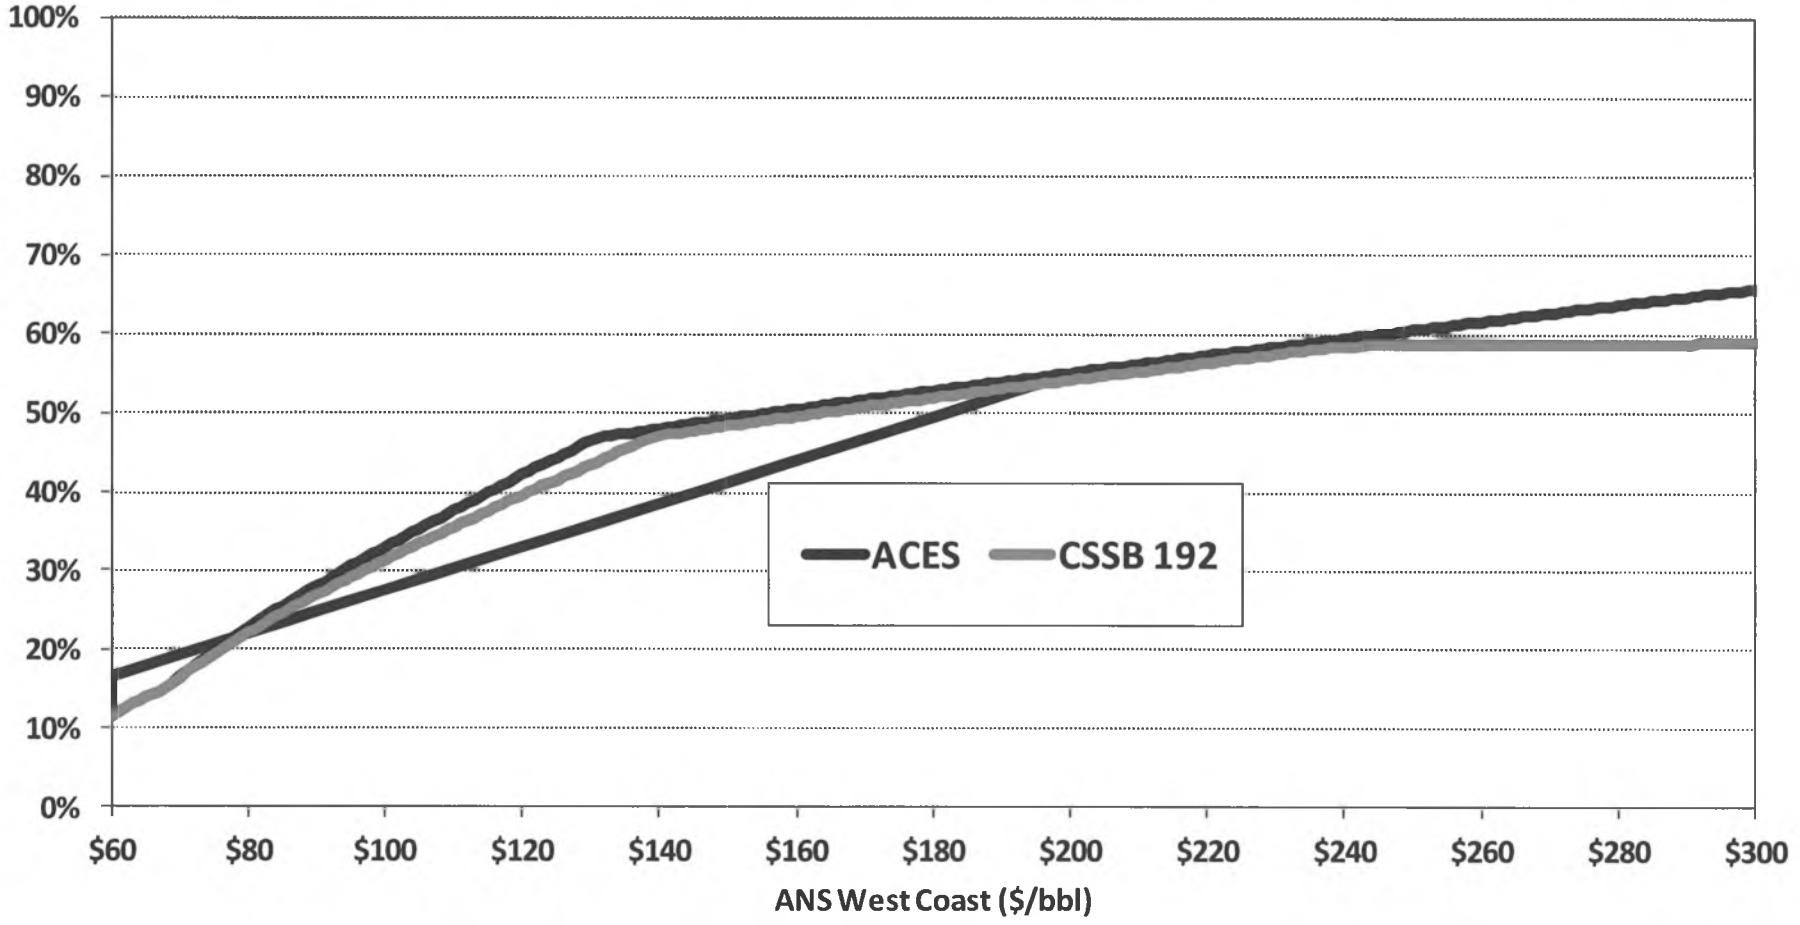
   The administration has not proposed making any changes to the current gas tax structure during this legislative session. The Governor has stated that he wants to address oil taxes this session to make Alaska more competitive for company investment that would lead to additional oil production. The Governor has also stated that he wants to address gas taxes in a future legislative session, in the context of a more concrete proposal for major gas sales.

We hope our responses fully answer your questions.

Sincerely,

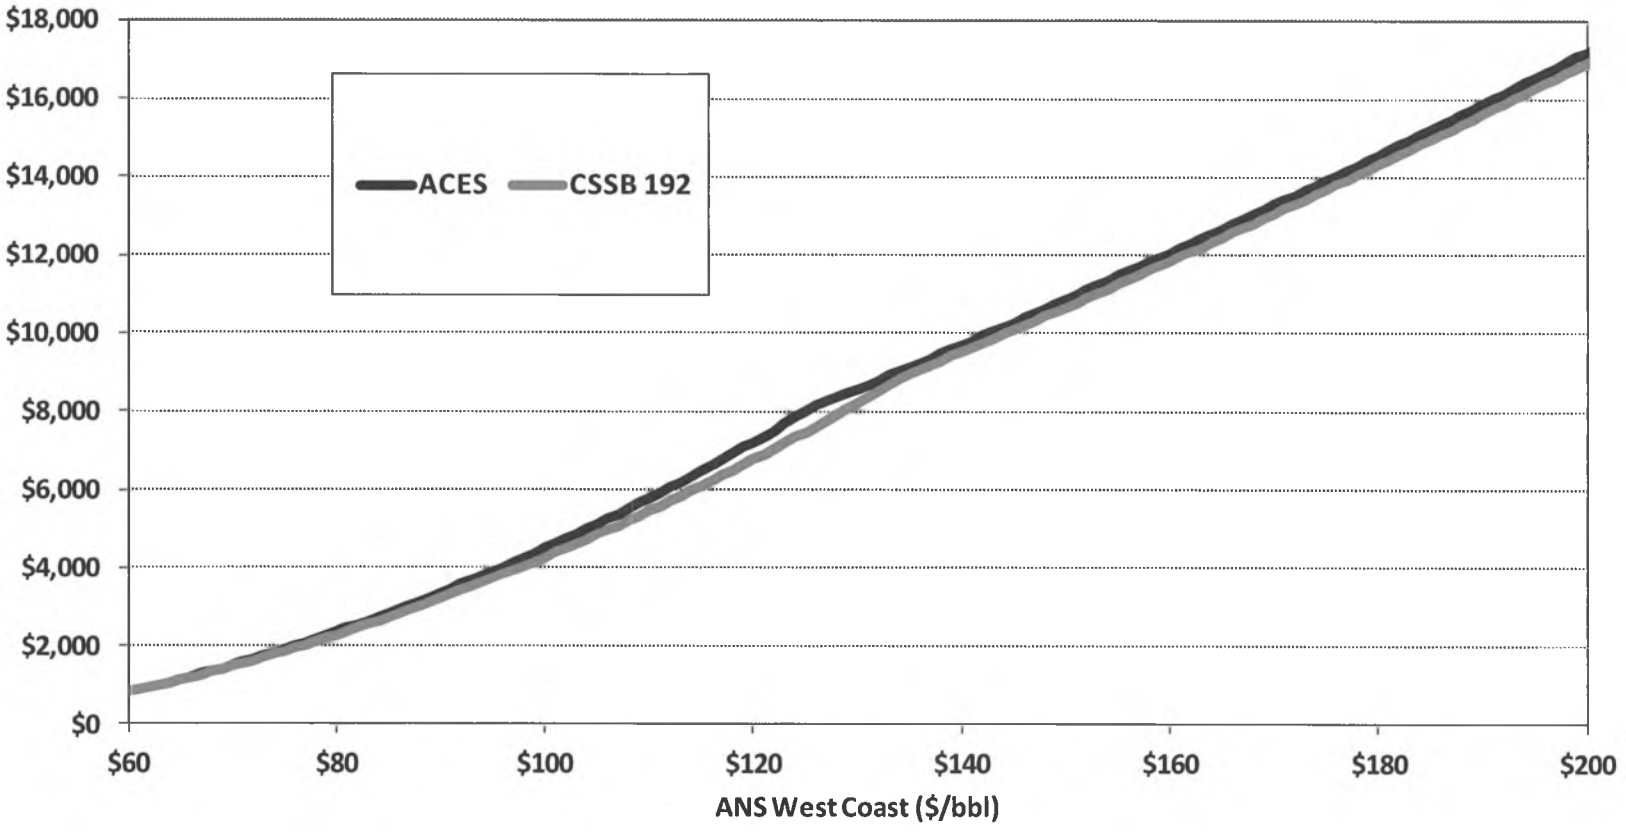
Bruce Tangeman
Deputy Commissioner

Effective Production Tax Rates: ACES and CSSB 192 (progressivity only) using Total Lease Expenditures for all Companies



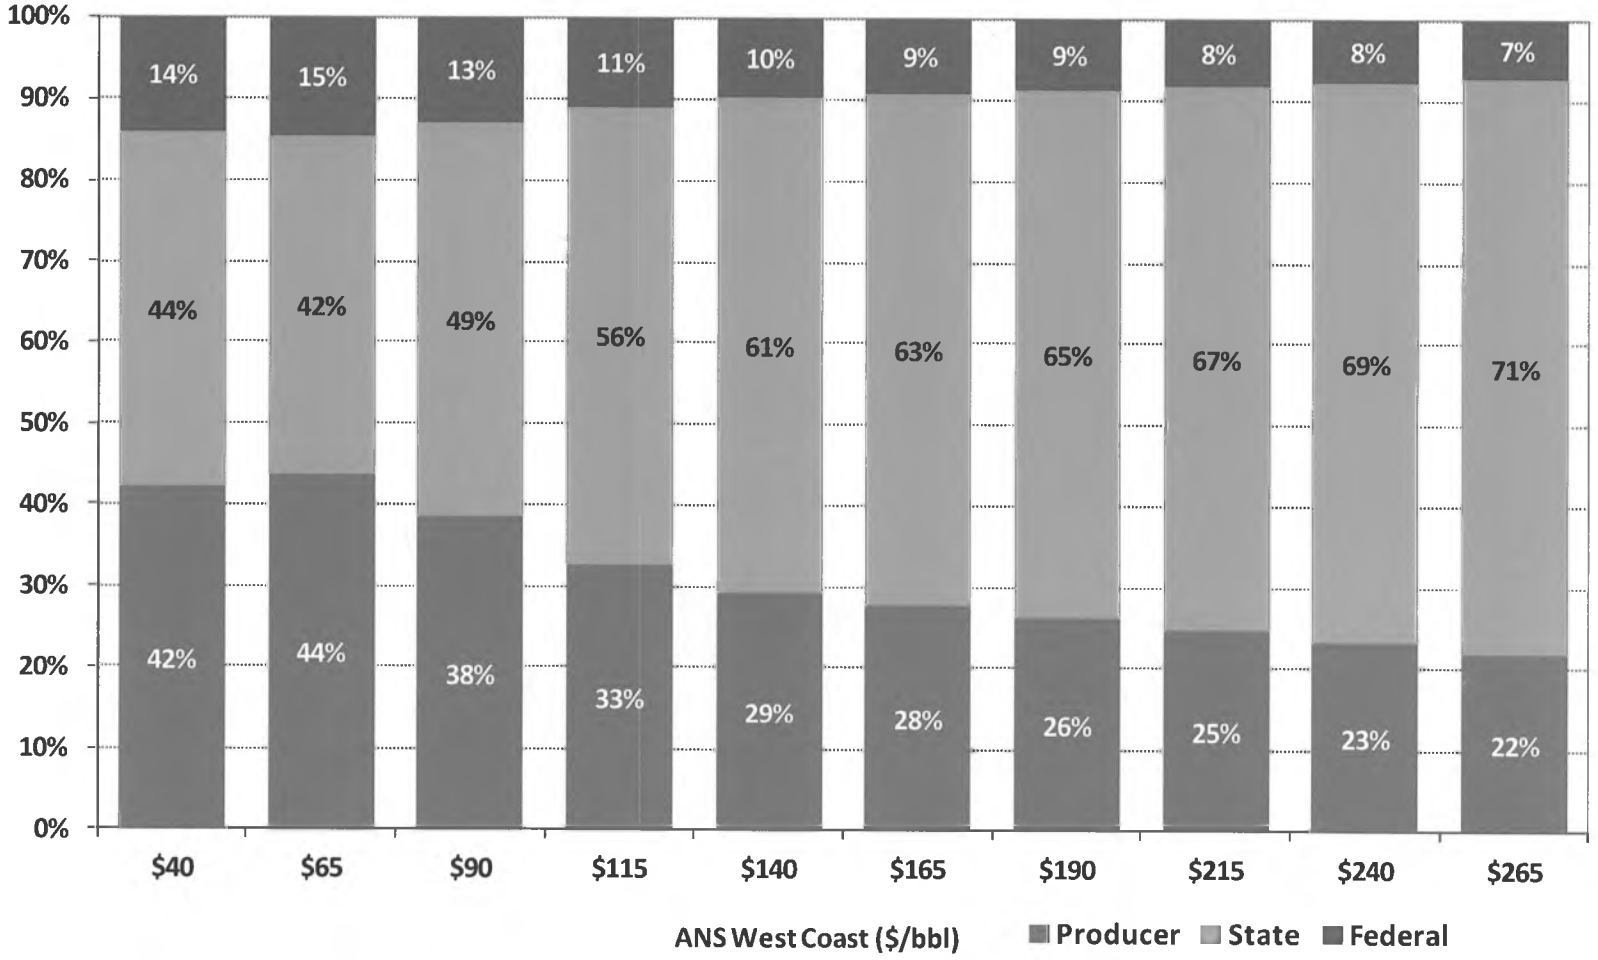
Assumes FY 2012 expenditures for all companies regardless of whether they have a tax liability: Transport costs of $8.72/ bbl, Opex of $14.06 per taxable barrel, and Capex of $14.95 per taxable barrel.

Production Tax Revenue after credits: ACES and CSSB 192 (progressivity only)



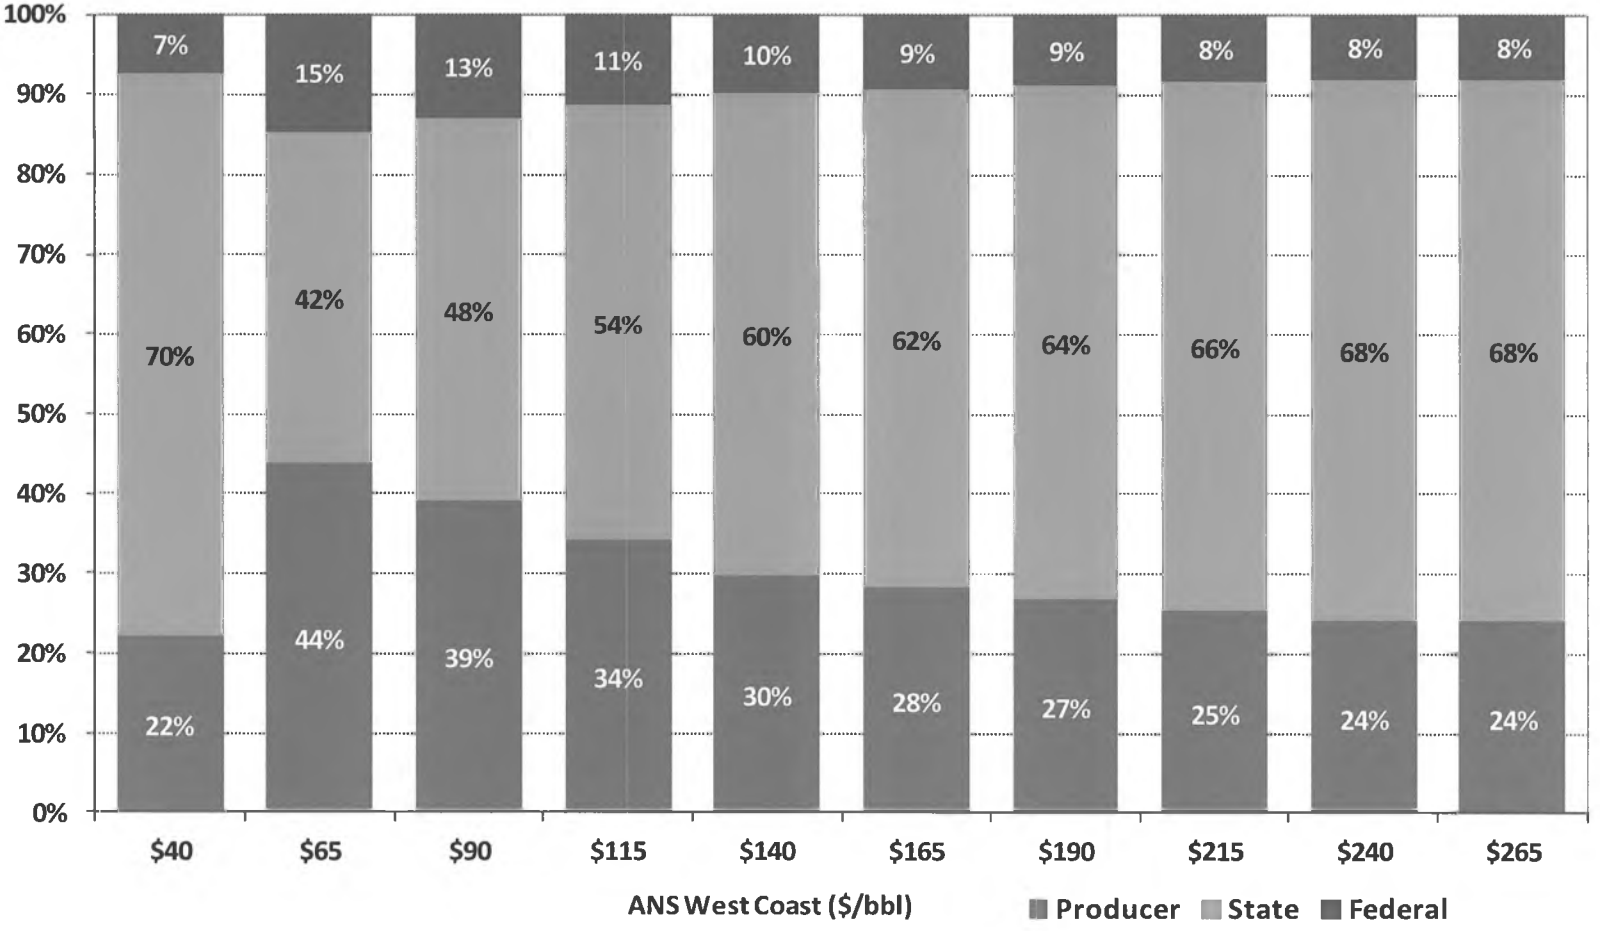
Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl.

Share of Profit under ACES with 25% federal CIT



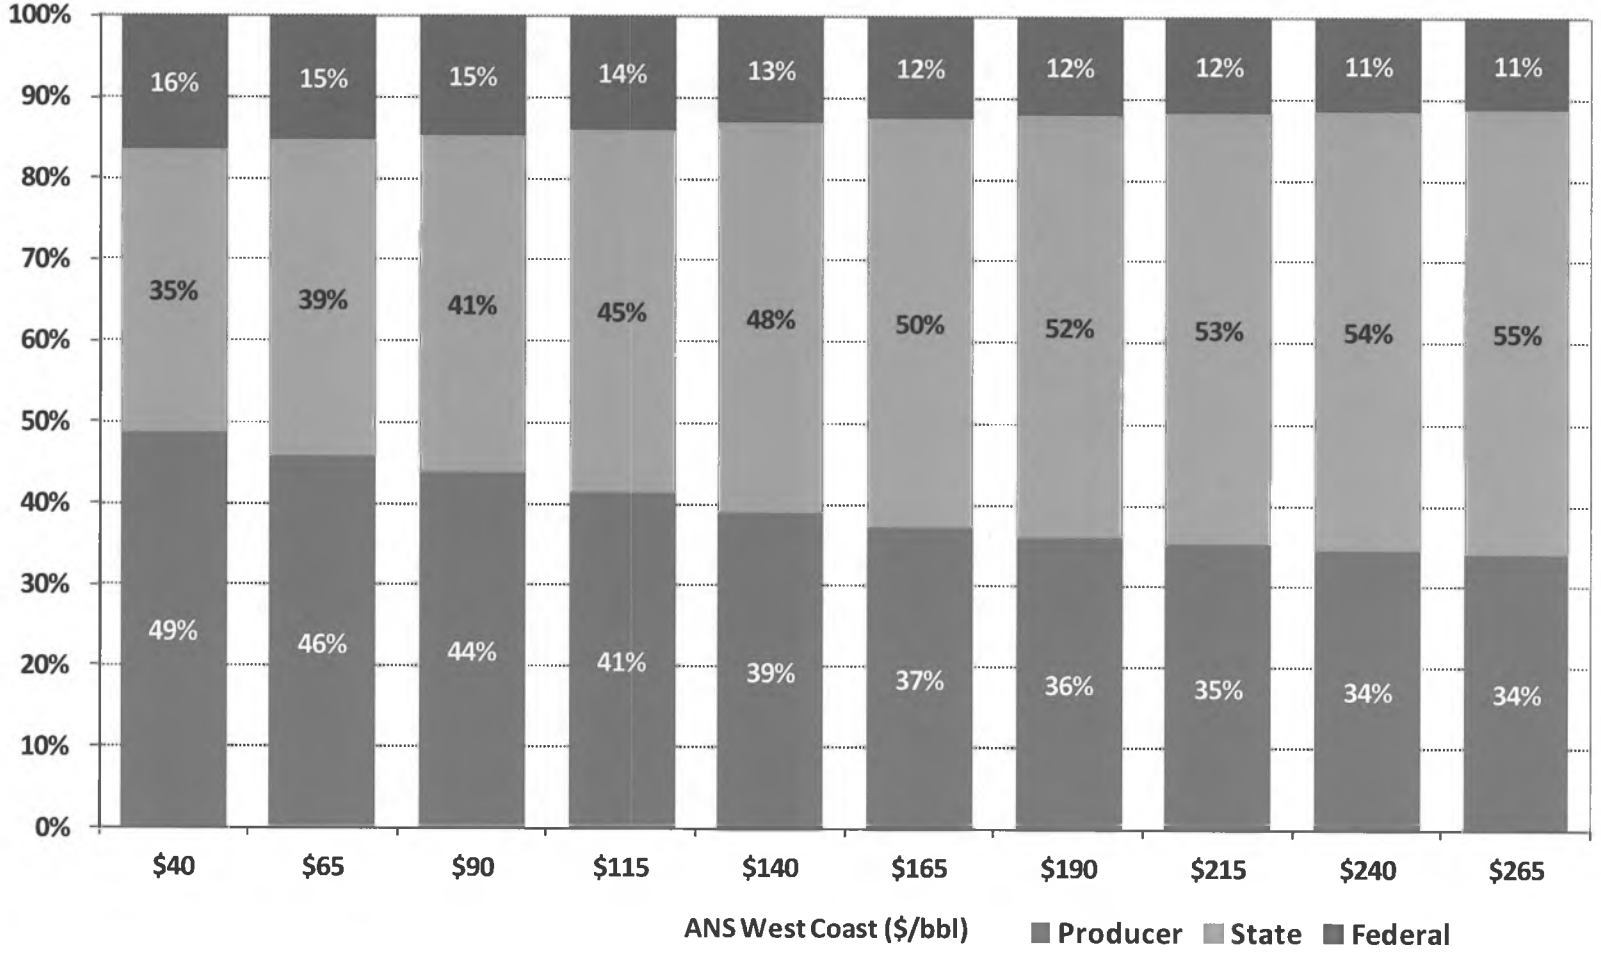
Profit defined as total gross value of all oil produced, less transportation costs and lease expenditures.
Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl.

Share of Profit under CSSB 192 with 25% federal CIT



Profit defined as total gross value of all oil produced, less transportation costs and lease expenditures.
Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl.
Assumes that 80% of production is impacted by 10% gross minimum tax with no credits allowed against gross tax.

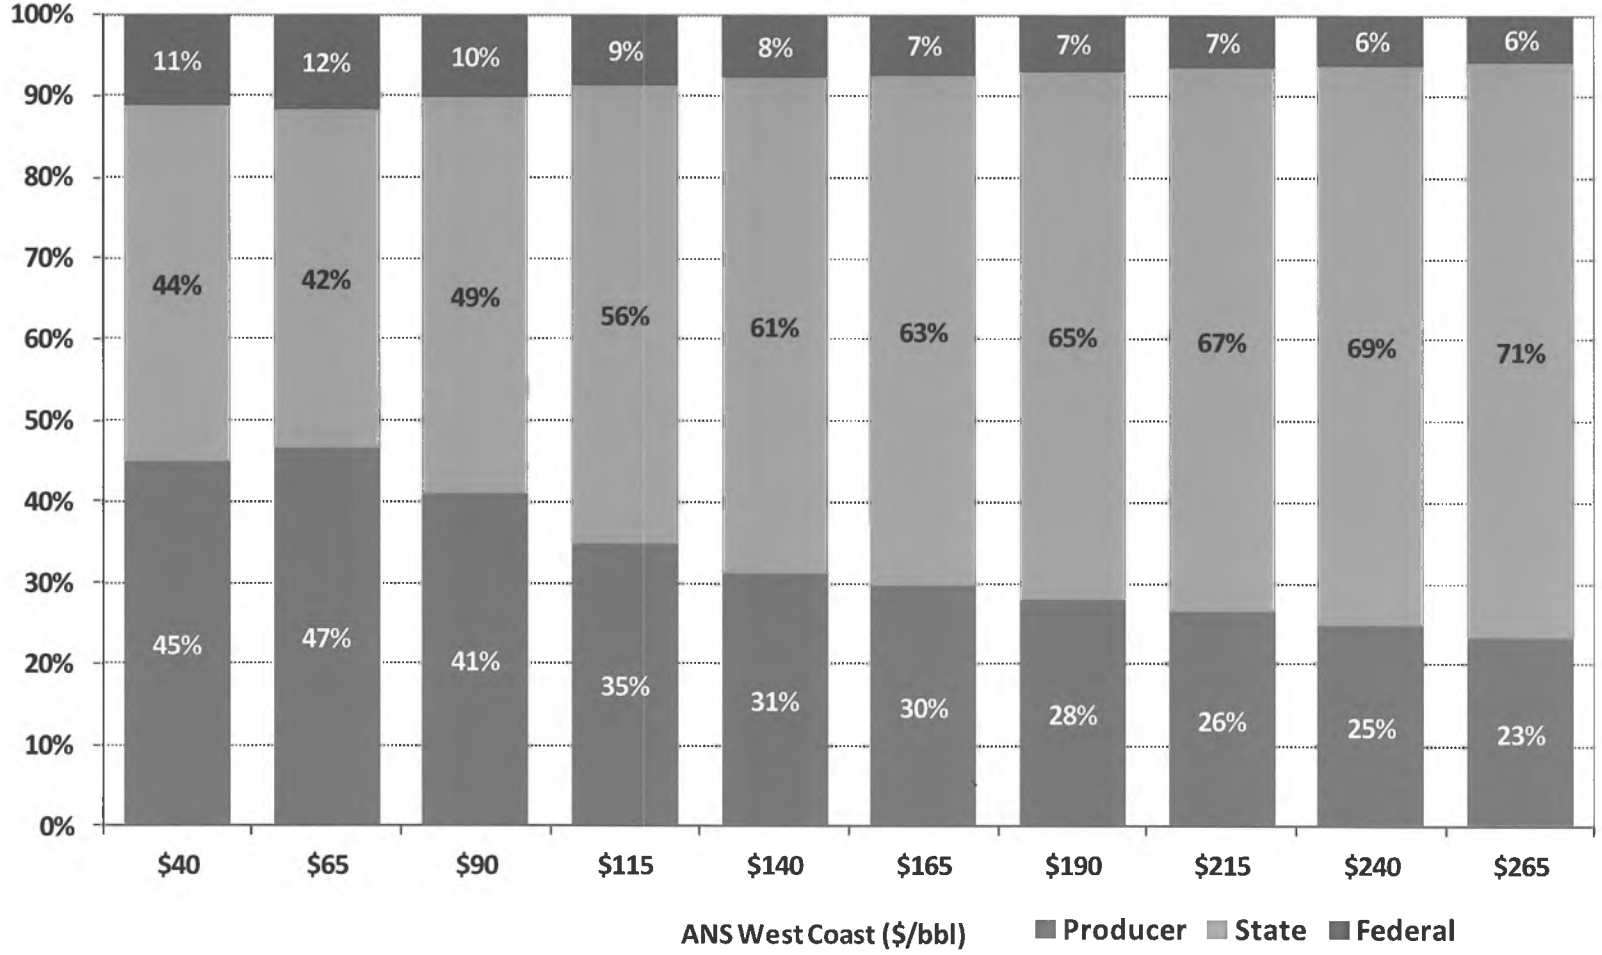
Share of Profit under CS HB 110 (FIN) with 25% federal CIT



Profit defined as total gross value of all oil produced, less transportation costs and lease expenditures.

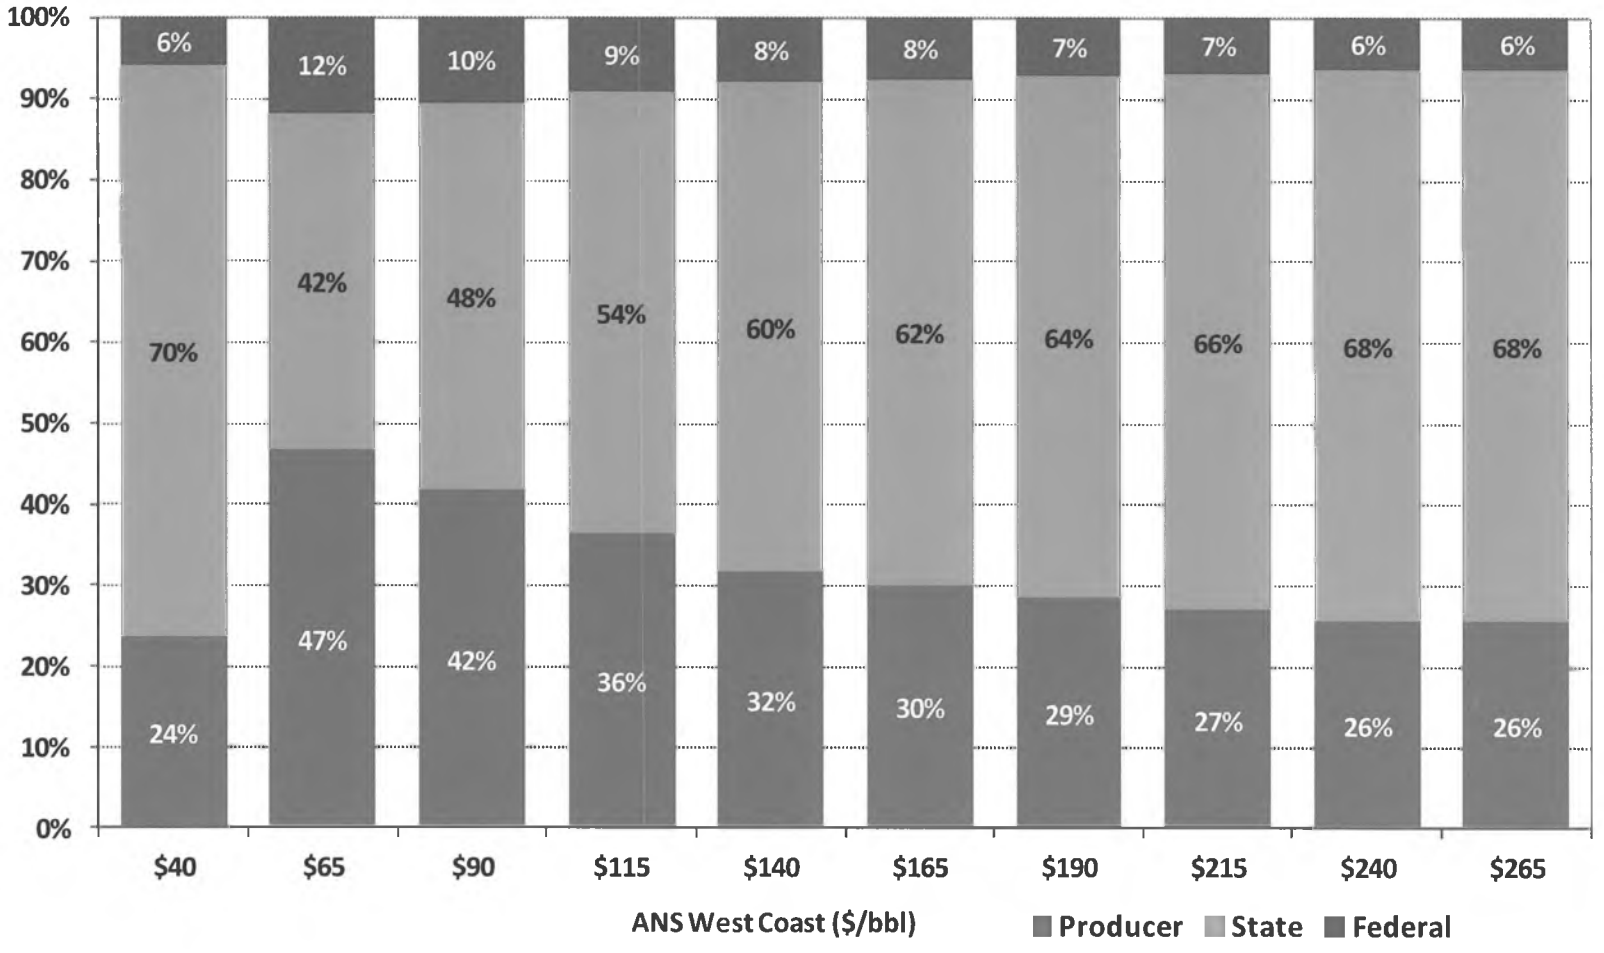
Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl.

Share of Profit under ACES with 20% federal CIT



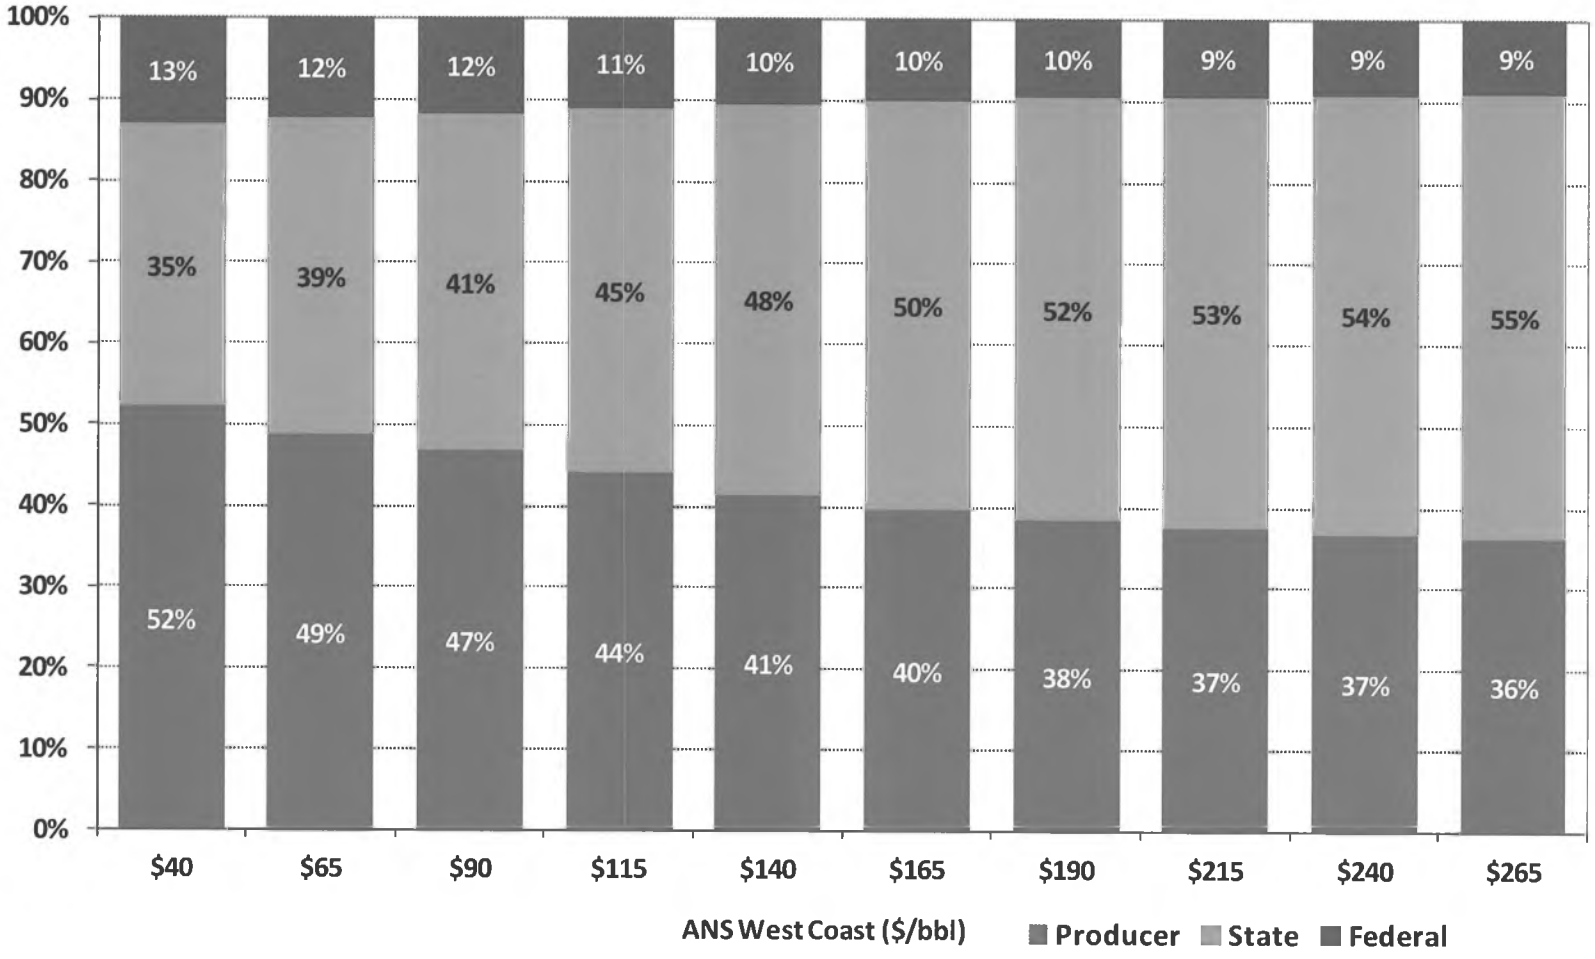
Profit defined as total gross value of all oil produced, less transportation costs and lease expenditures.
Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl.

Share of Profit under CSSB 192 with 20% federal CIT



Profit defined as total gross value of all oil produced, less transportation costs and lease expenditures.
Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl.
Assumes that 80% of production is impacted by 10% gross minimum tax with no credits allowed against gross tax.

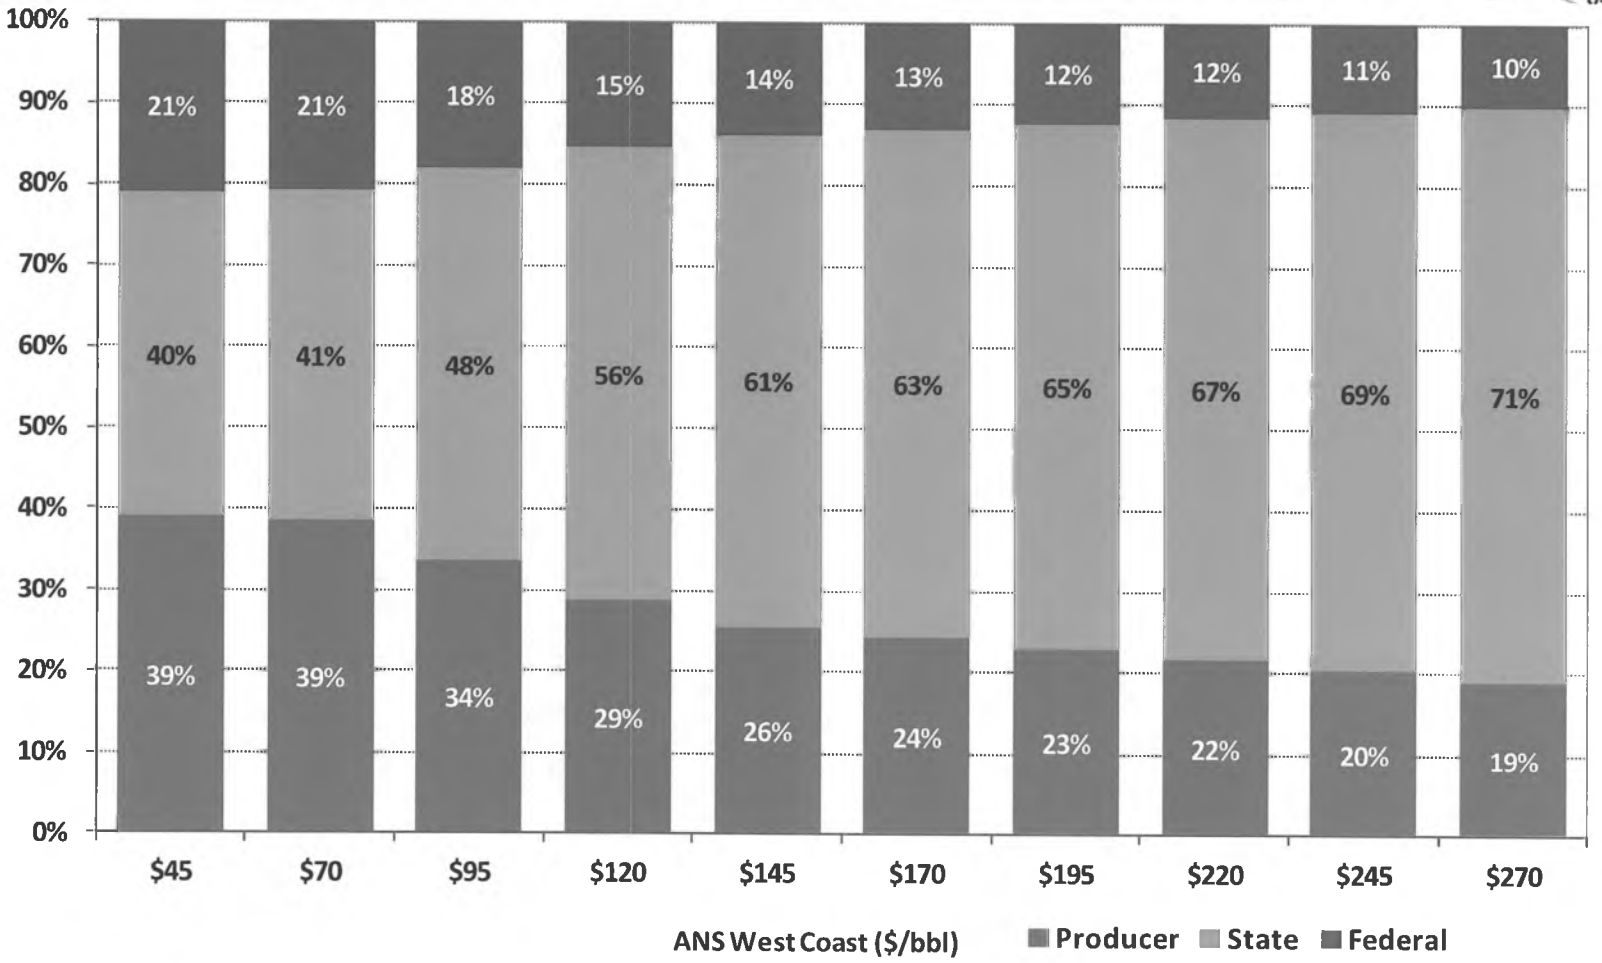
Share of Profit under CS HB 110 (FIN) with 20% federal CIT



Profit defined as total gross value of all oil produced, less transportation costs and lease expenditures.
Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl.

Share of Profit under ACES

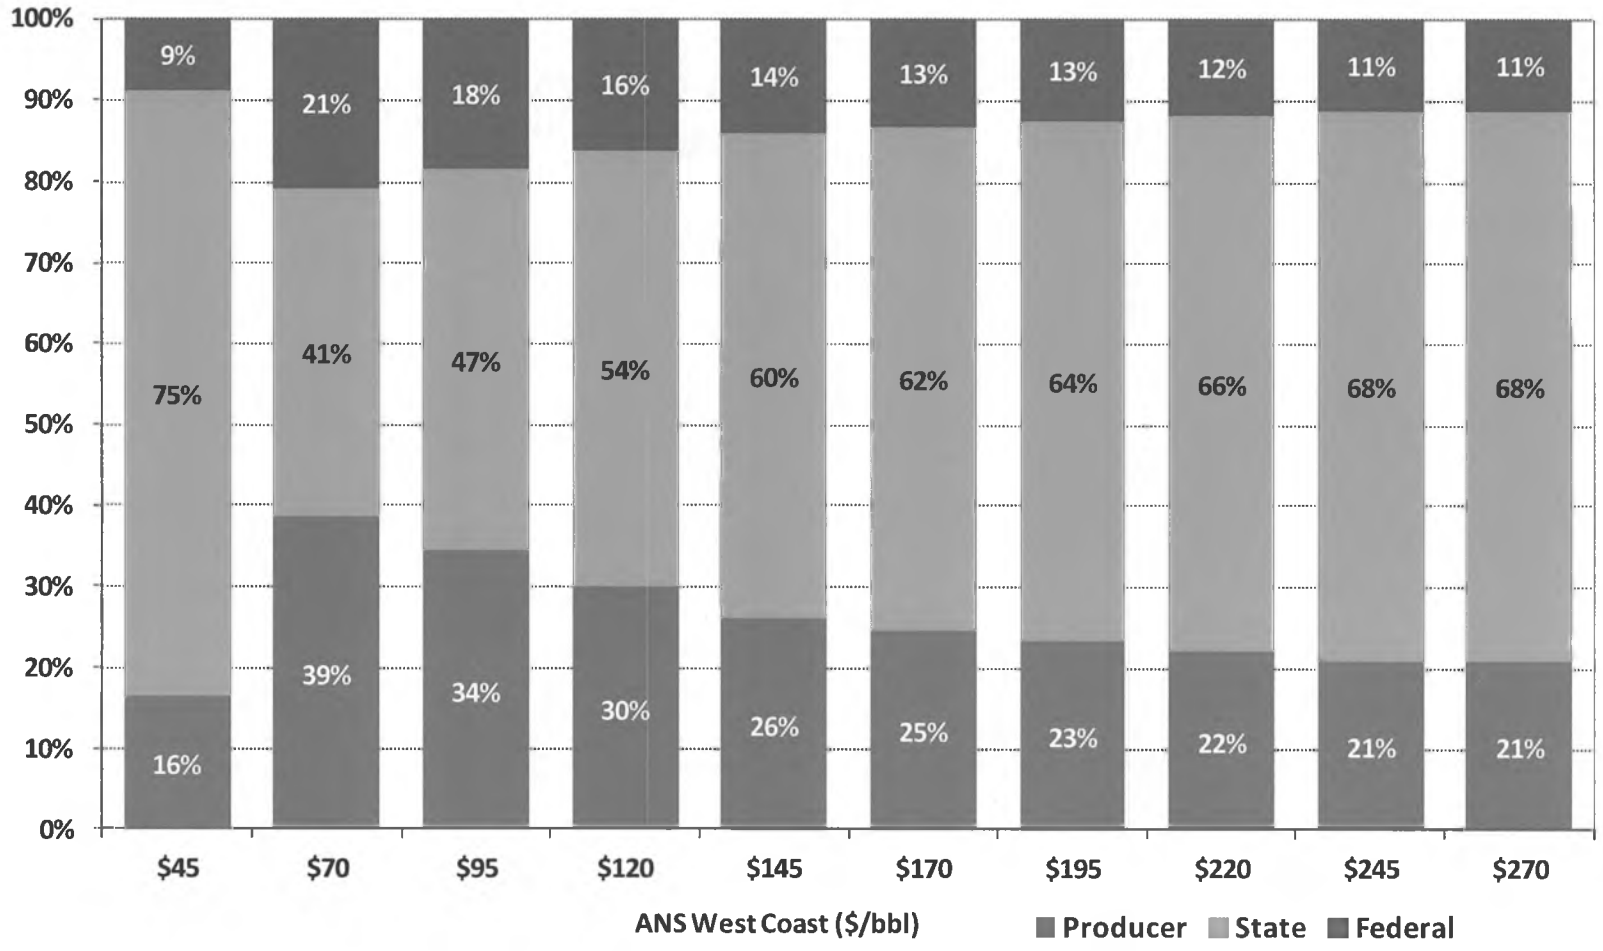
Using total lease expenditures for all companies



Profit defined as total gross value of all oil produced, less transportation costs and lease expenditures.
Assumes FY 2012 expenditures for all companies regardless of whether they have a tax liability: Transport costs of $8.72/ bbl, Opex of $14.06 per taxable barrel, and Capex of $14.95 per taxable barrel).

Share of Profit under CSSB 192

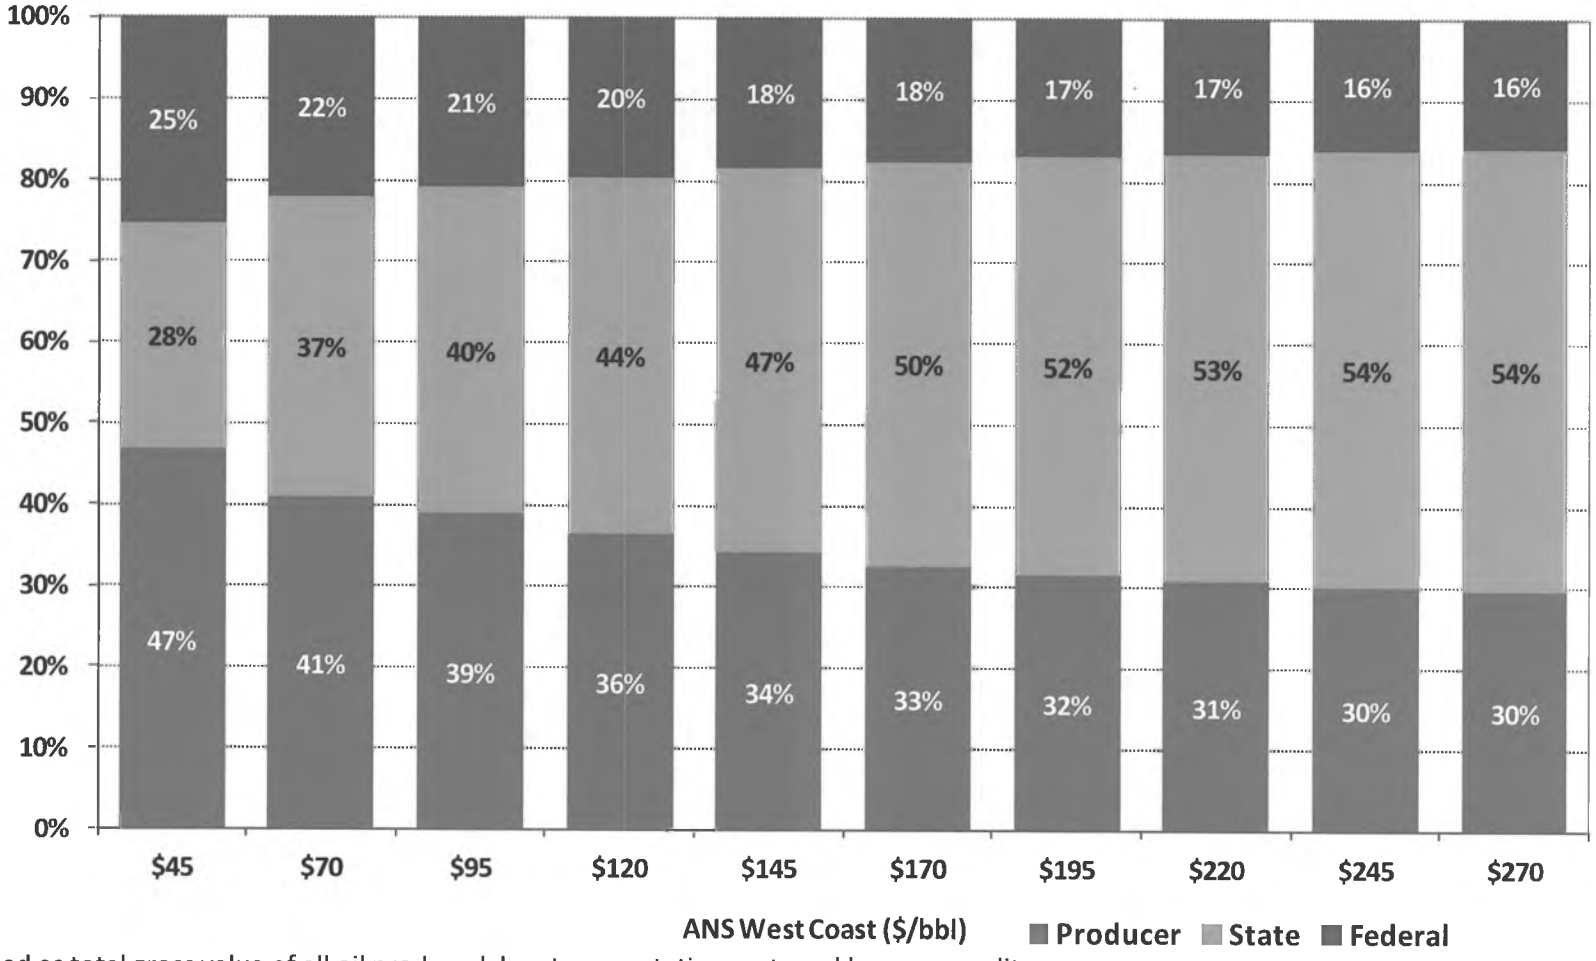
Using total lease expenditures for all companies



Profit defined as total gross value of all oil produced, less transportation costs and lease expenditures.
Assumes FY 2012 expenditures for all companies regardless of whether they have a tax liability: Transport costs of $8.72/ bbl, Opex of $14.06 per taxable barrel, and Capex of $14.95 per taxable barrel). Assumes that 80% of production is impacted by 10% gross minimum tax with no credits allowed against gross tax.

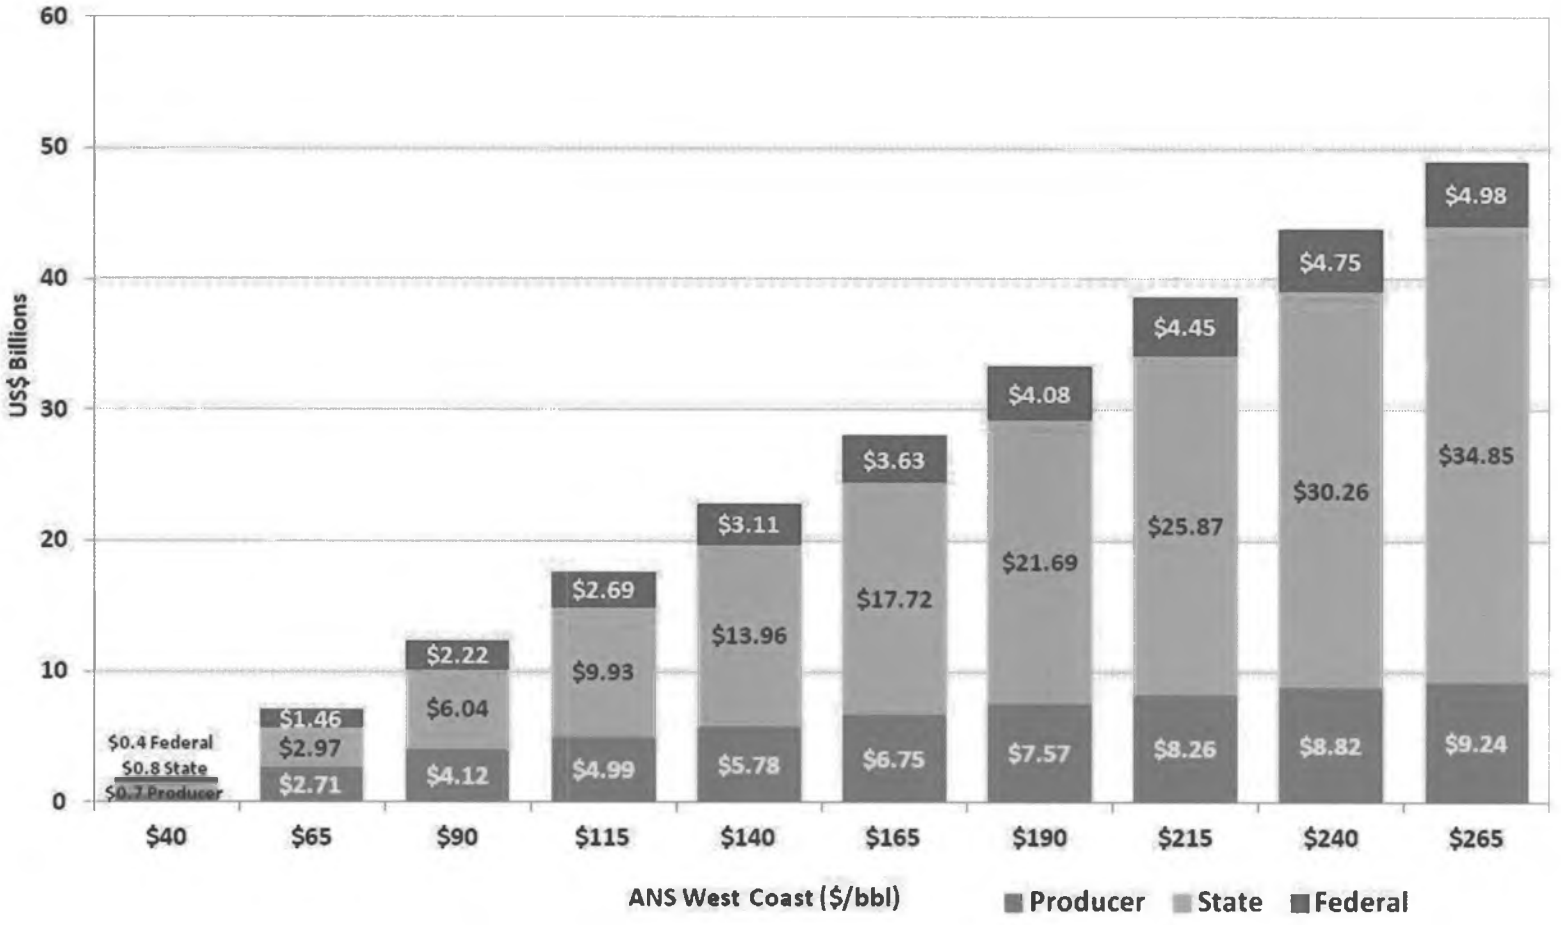
Share of Profit under CS HB 110 (FIN)

Using total lease expenditures for all companies



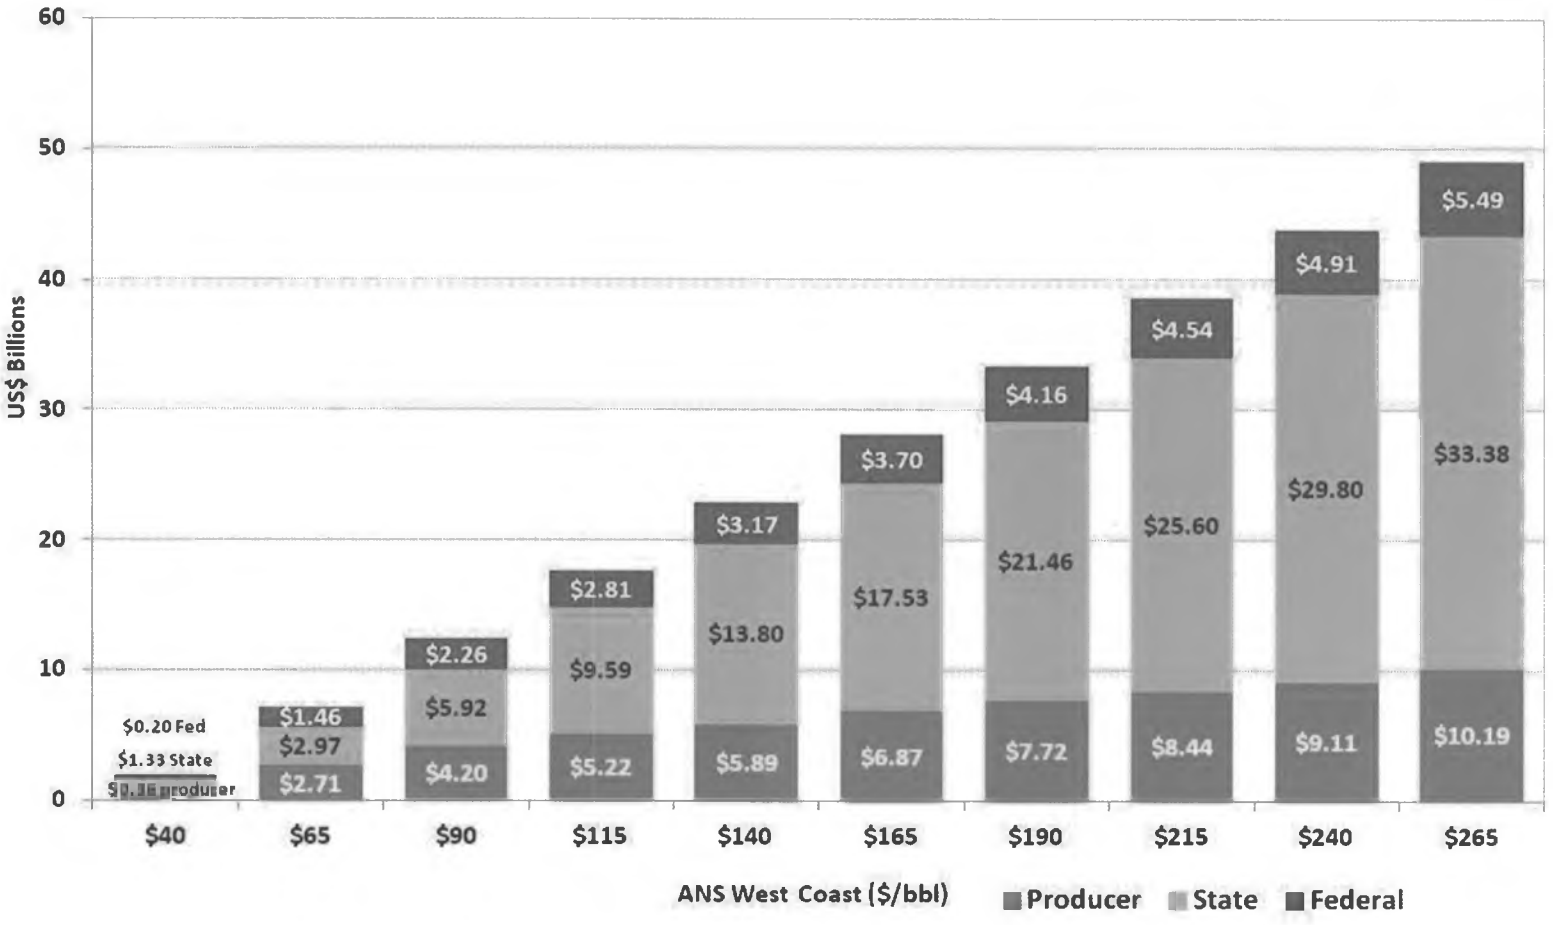
Profit defined as total gross value of all oil produced, less transportation costs and lease expenditures.
Assumes FY 2012 expenditures for all companies regardless of whether they have a tax liability: Transport costs of $8.72/ bbl, Opex of $2579 million ($12.30 per total barrel), and Capex $2743 million ($13.08 per total barrel).

Absolute Profit Split under ACES



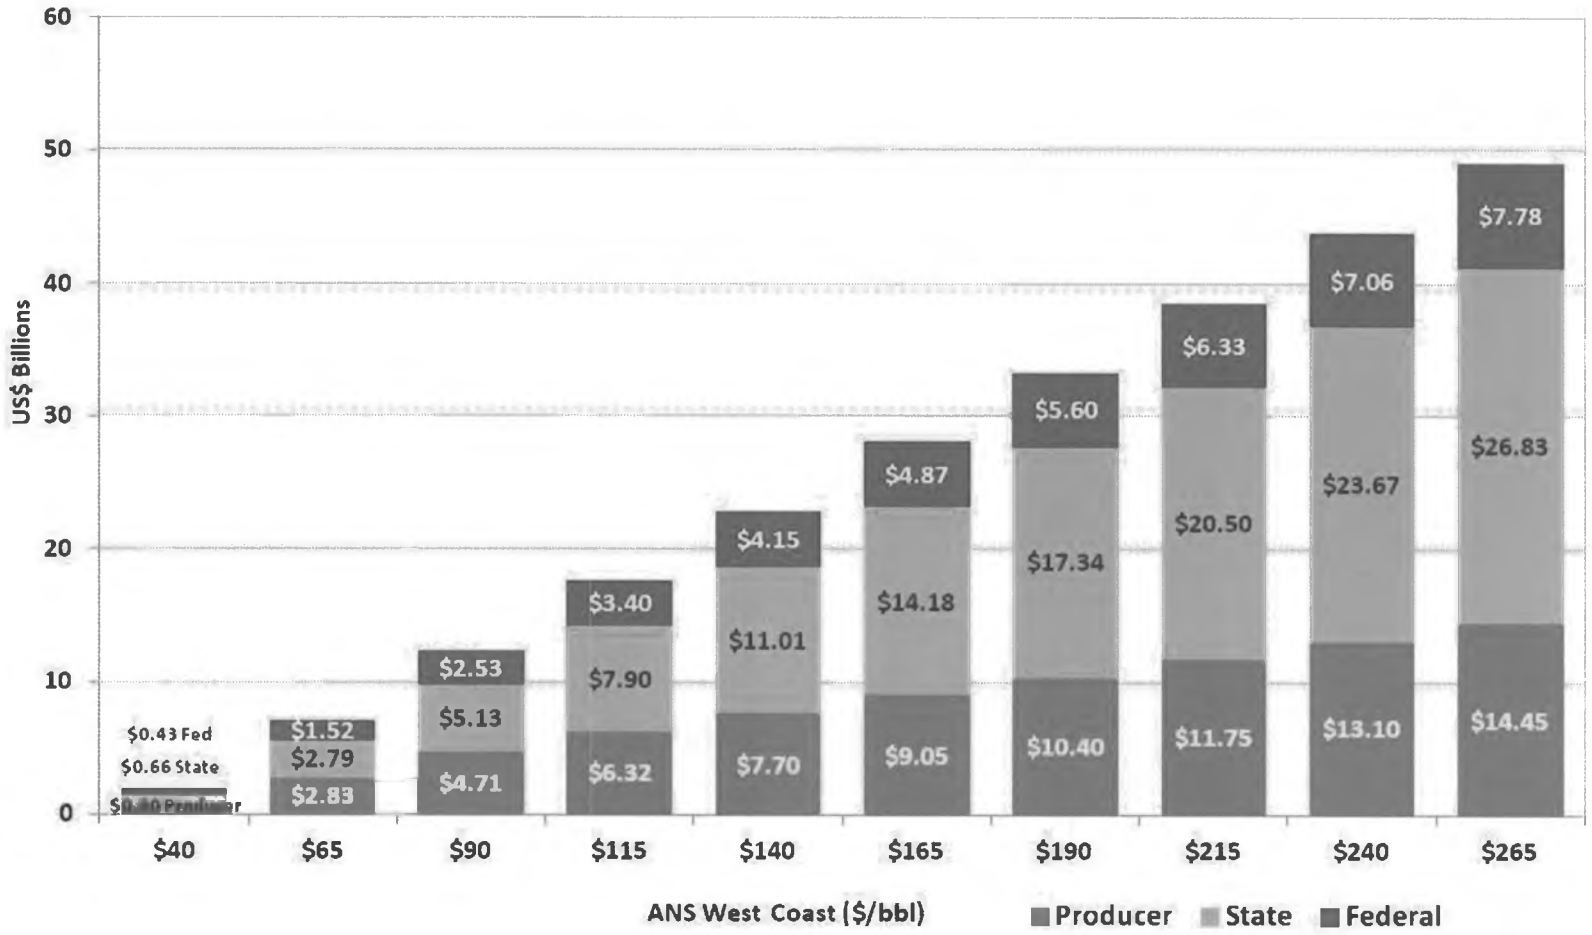
Profit defined as total gross value of all oil produced, less transportation costs and lease expenditures.
Assumes FY 2012 production of .574 mmb/d, transport costs of $8.72/bbl, opex of $14.03 per taxable barrel, and capex of $10.25 per taxable bbl.

Absolute Profit Split under CSSB 192



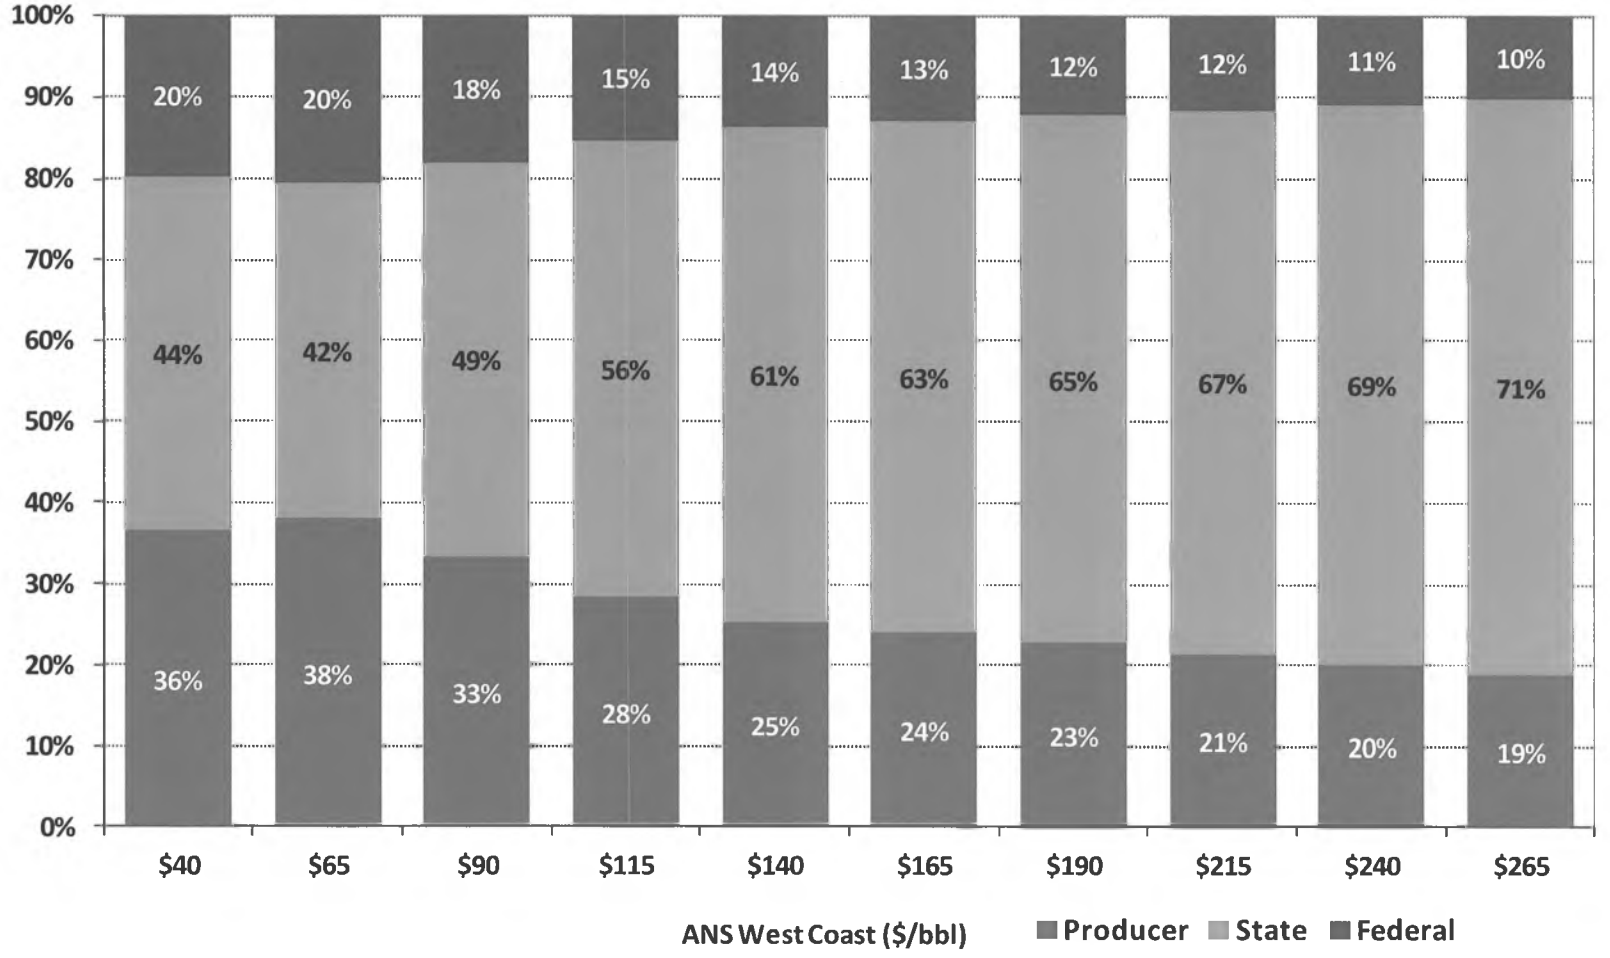
Profit defined as total gross value of all oil produced, less transportation costs and lease expenditures.
Assumes FY 2012 production of .574 mmb/d, transport costs of $8.72/bbl, opex of $14.03 per taxable barrel, and capex of $10.25 per taxable bbl.

Absolute Profit Split under CSHB 110(FIN)



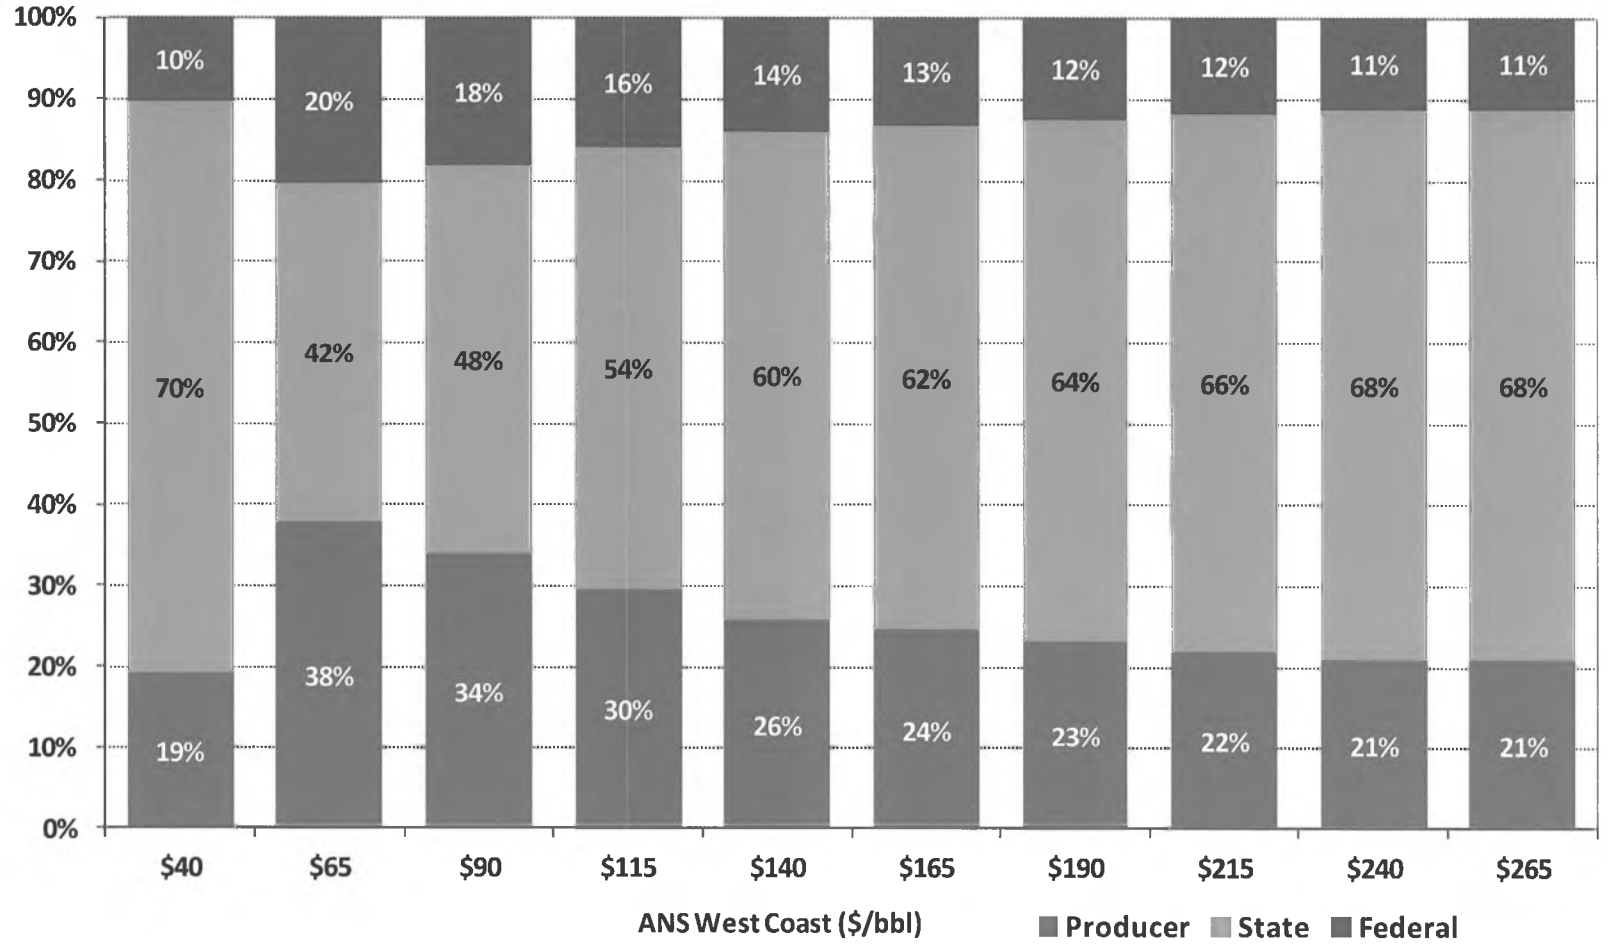
Profit defined as total gross value of all oil produced, less transportation costs and lease expenditures.
Assumes FY 2012 production of .574 mmb/d, transport costs of $8.72/bbl, opex of $14.03 per taxable barrel, and capex of $10.25 per taxable bbl.

Share of Profit under ACES



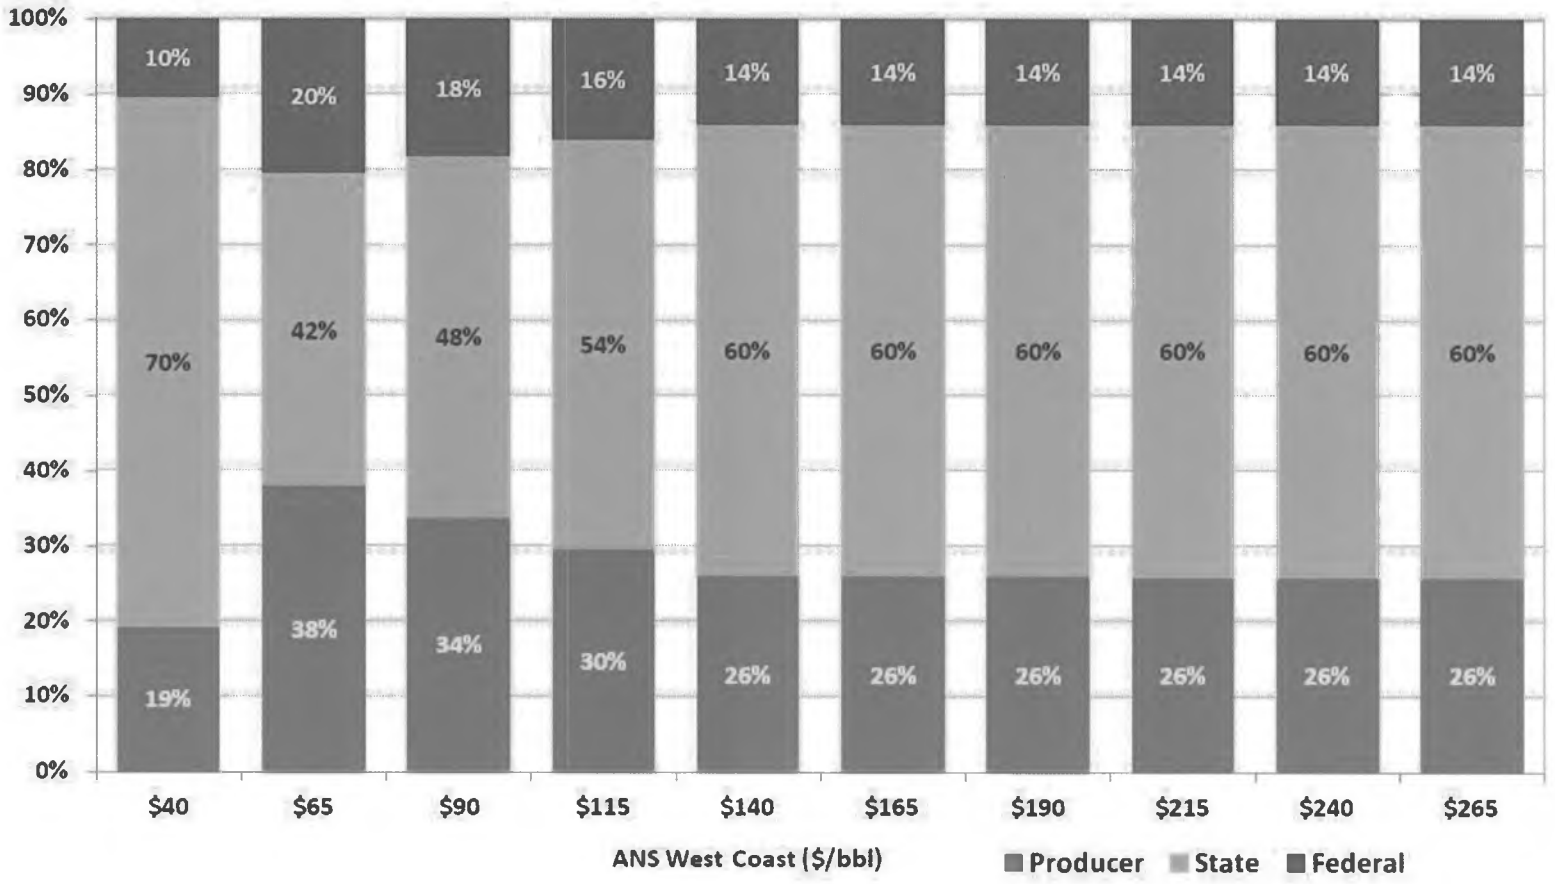
Profit defined as total gross value of all oil produced, less transportation costs and lease expenditures.
Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl.

Share of Profit under CSSB 192



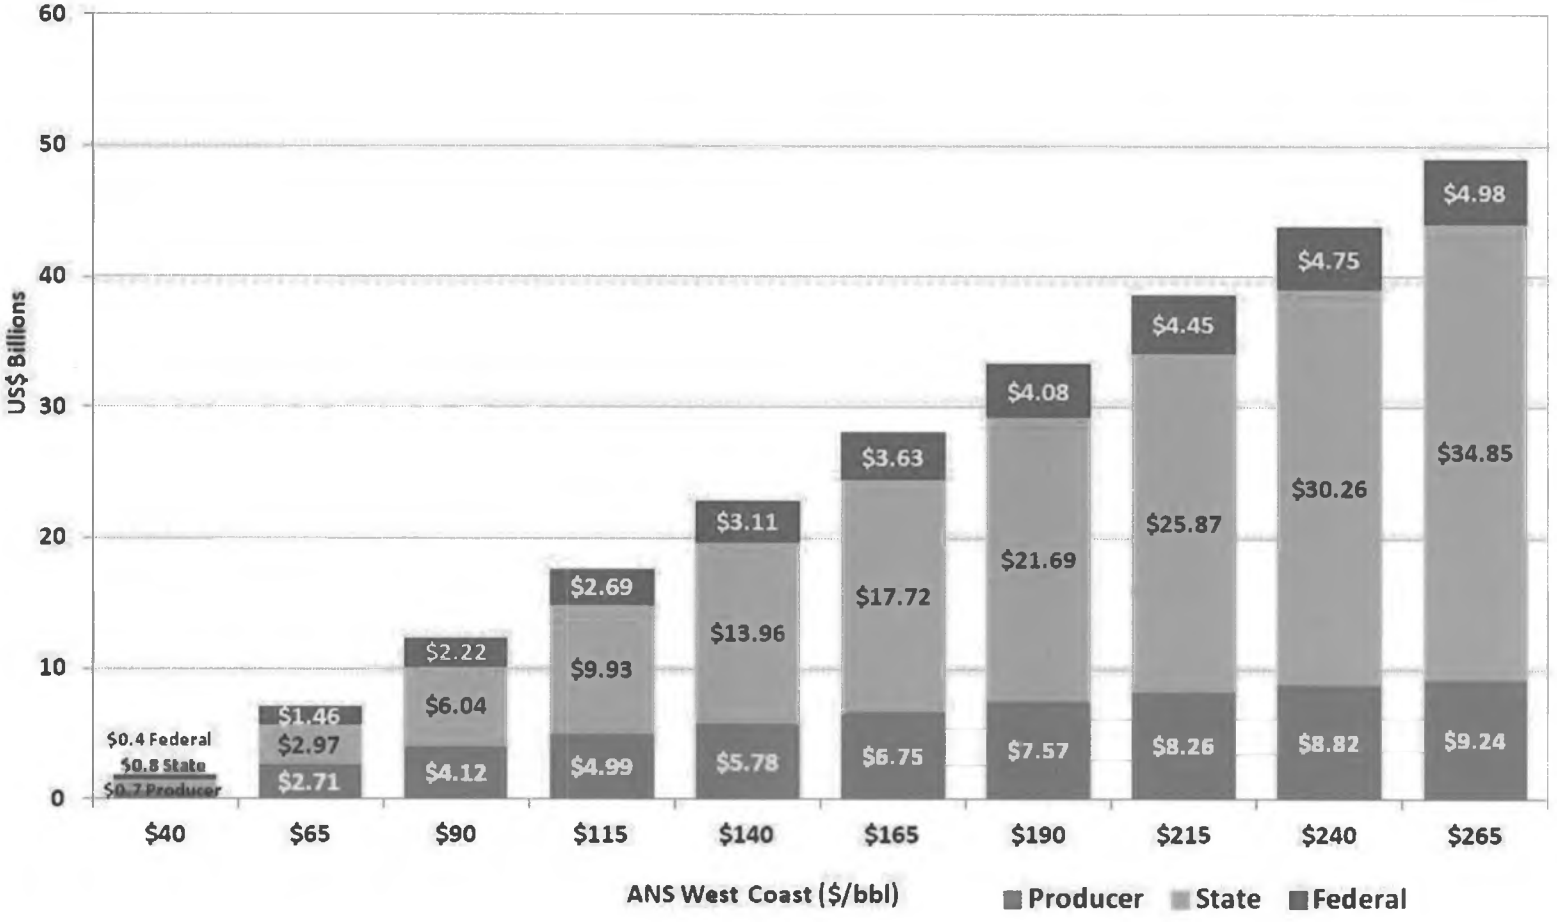
Profit defined as total gross value of all oil produced, less transportation costs and lease expenditures. Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl. Assumes that 80% of production is impacted by 10% gross minimum tax with no credits allowed against gross tax.

Share of Profit under CSSB 192 with 50% Maximum Tax Rate



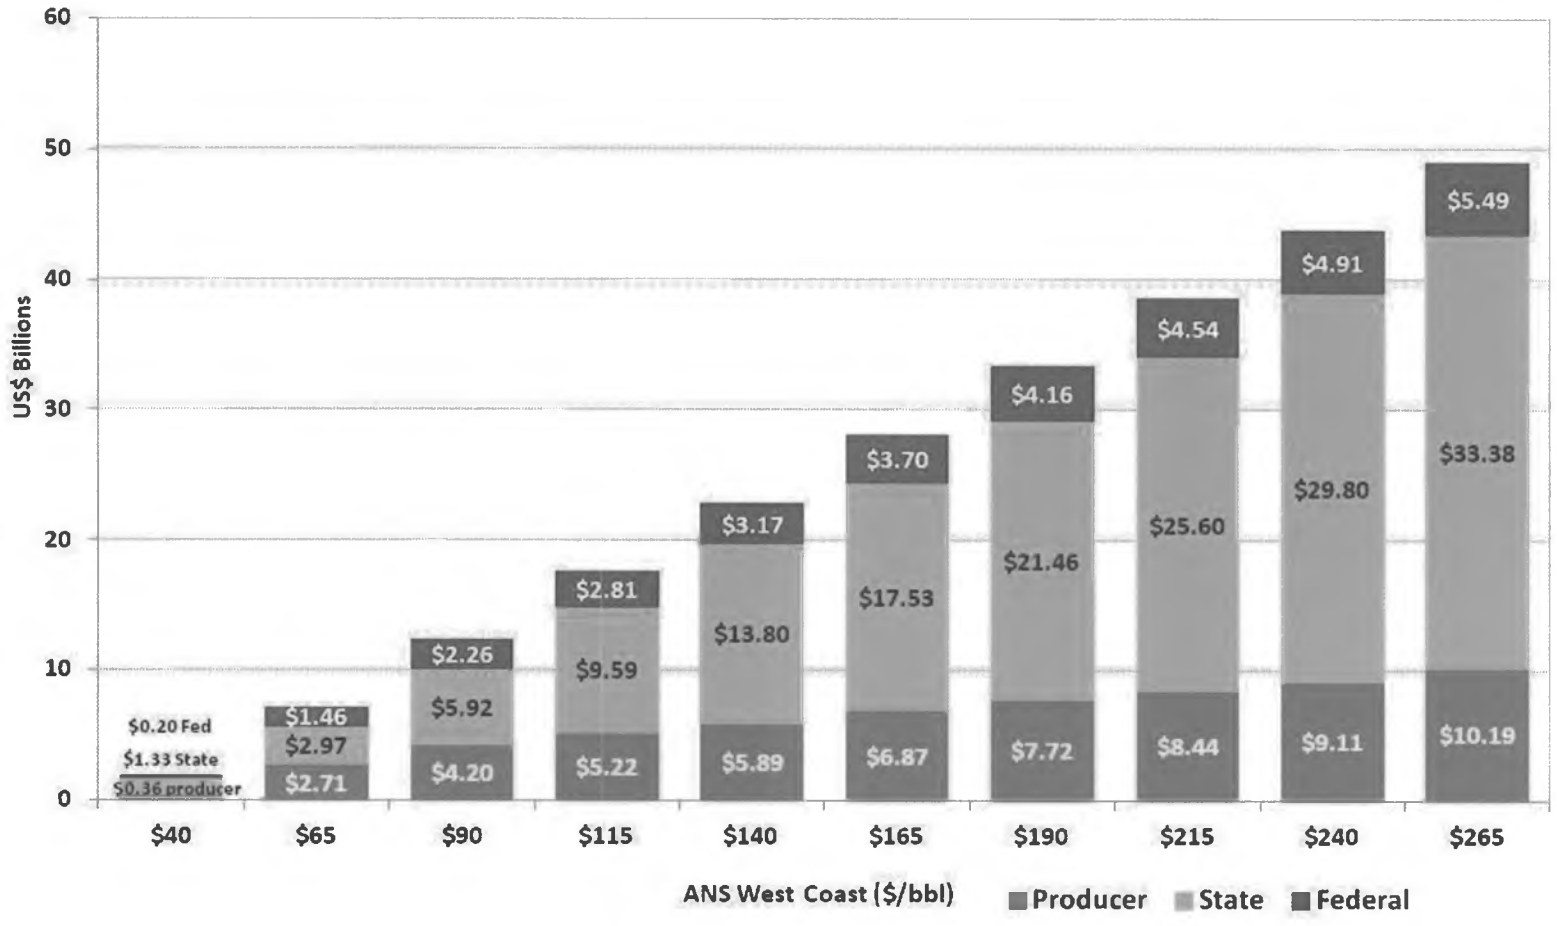
Profit defined as total gross value of all oil produced, less transportation costs and lease expenditures. Assumes FY 2012 Transport costs of $8.72/ bbl, Opex of $14.03 per taxable barrel, and Capex of $10.25 per taxable bbl. Assumes that 80% of production is impacted by 10% gross minimum tax with no credits allowed against gross tax.

Absolute Profit Split under ACES



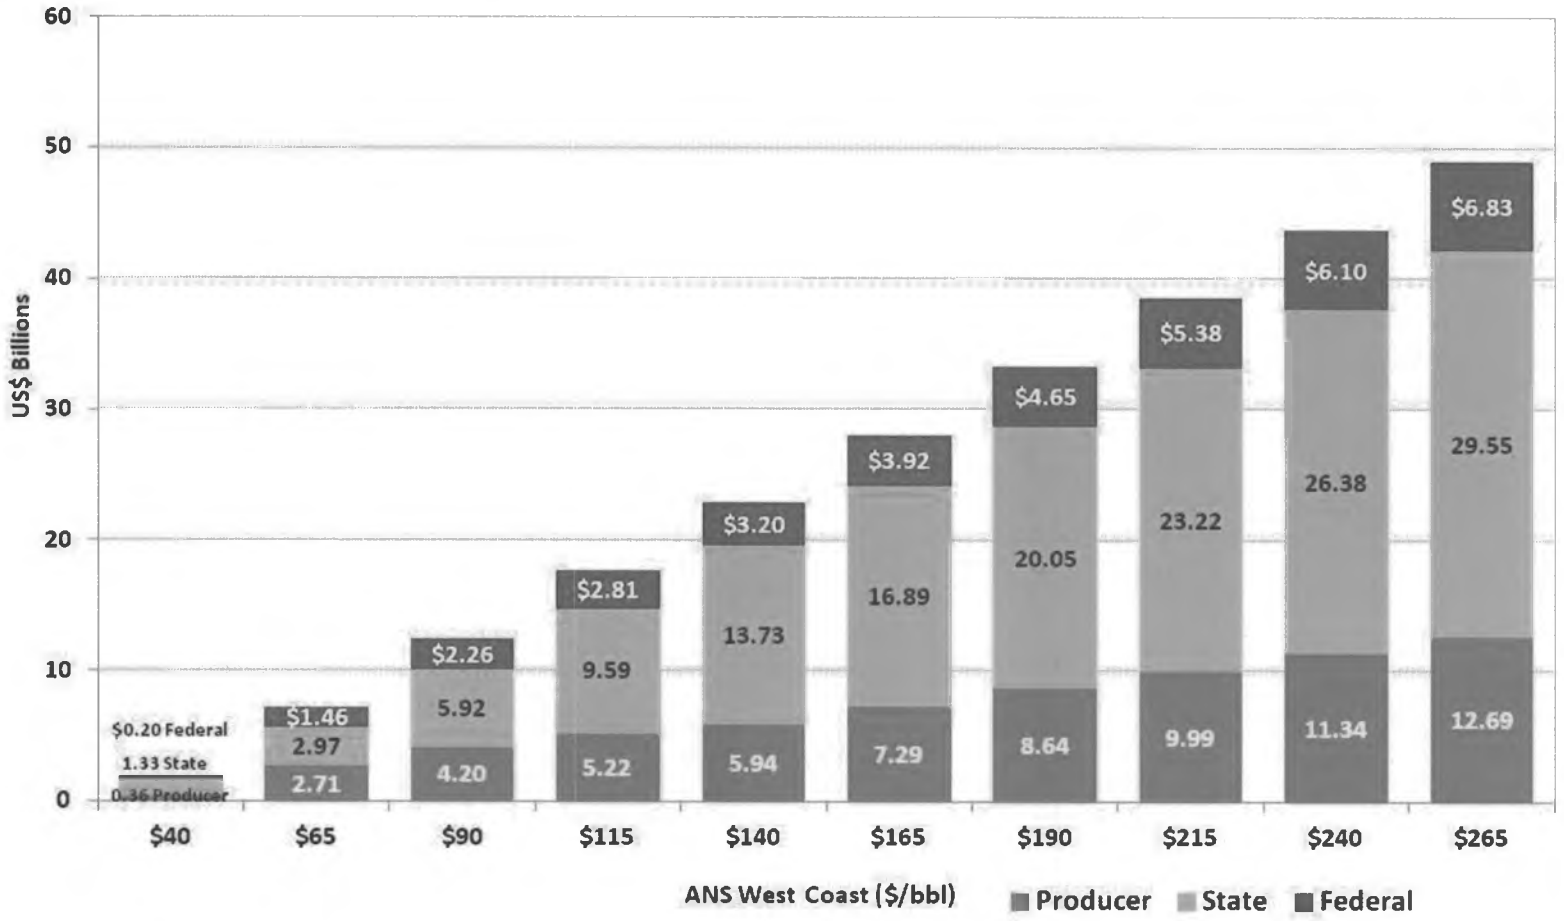
Profit defined as total gross value of all oil produced, less transportation costs and lease expenditures. Assumes FY 2012 production of .574 mmb/d, transport costs of $8.72/bbl, opex of $14.03 per taxable barrel, and capex of $10.25 per taxable bbl.

Absolute Profit Split under CSSB 192



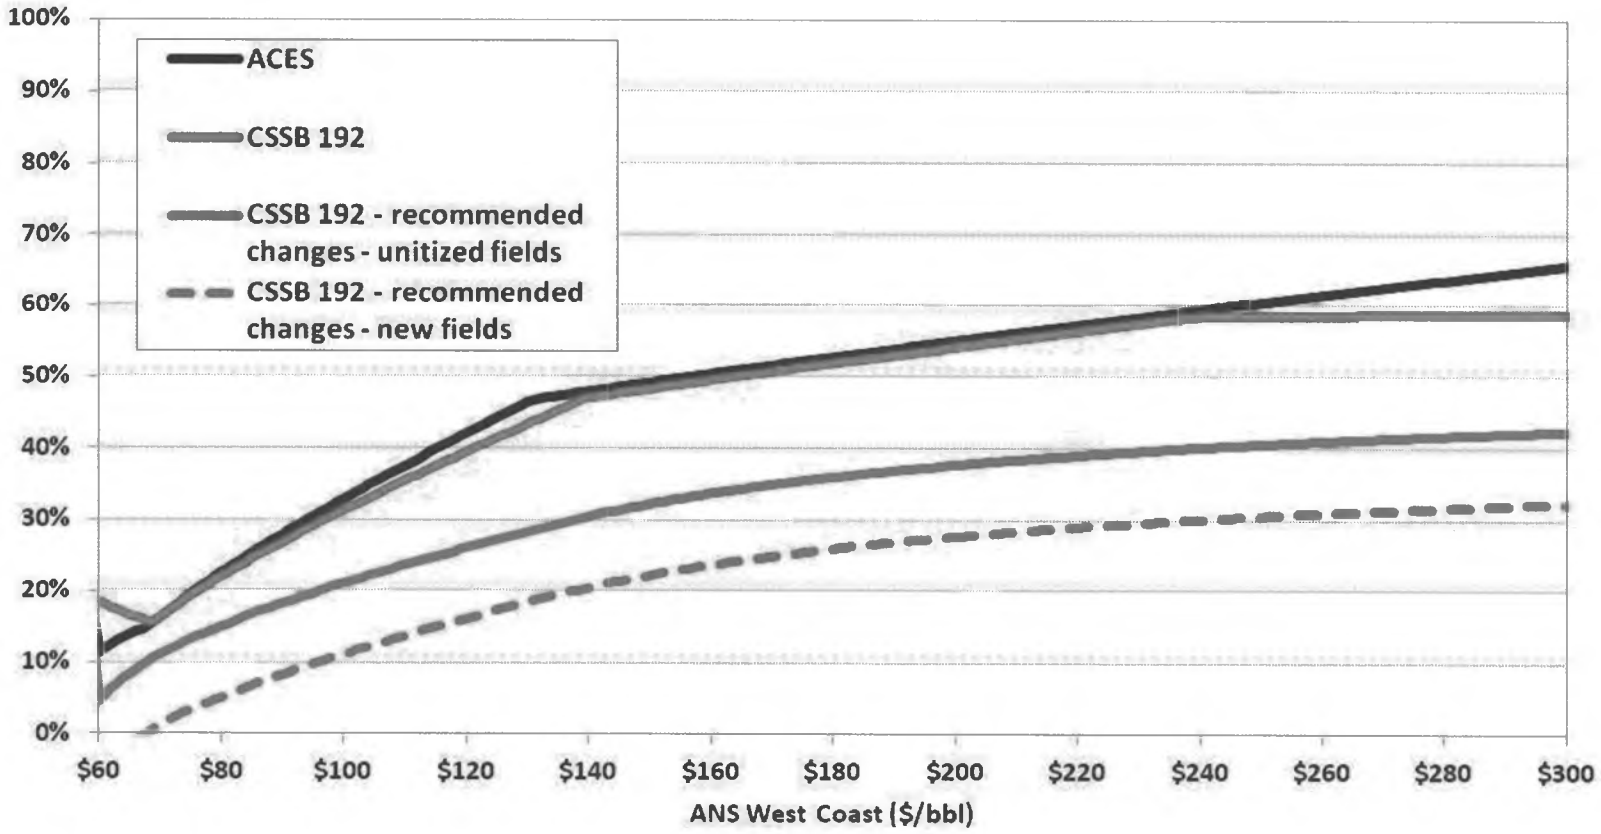
Profit defined as total gross value of all oil produced, less transportation costs and lease expenditures.
Assumes FY 2012 production of .574 mmb/d, transport costs of $8.72/bbl, opex of $14.03 per taxable barrel, and capex of $10.25 per taxable bbl.

Absolute Profit Split under CSSB 192 with 50% Maximum Tax Rate



Profit defined as total gross value of all oil produced, less transportation costs and lease expenditures. Assumes FY 2012 production of .574 mmb/d, transport costs of $8.72/bbl, opex of $14.03 per taxable barrel, and capex of $10.25 per taxable bbl. Assumes that 80% of production is impacted by 10% gross minimum tax with no credits allowed against gross tax.

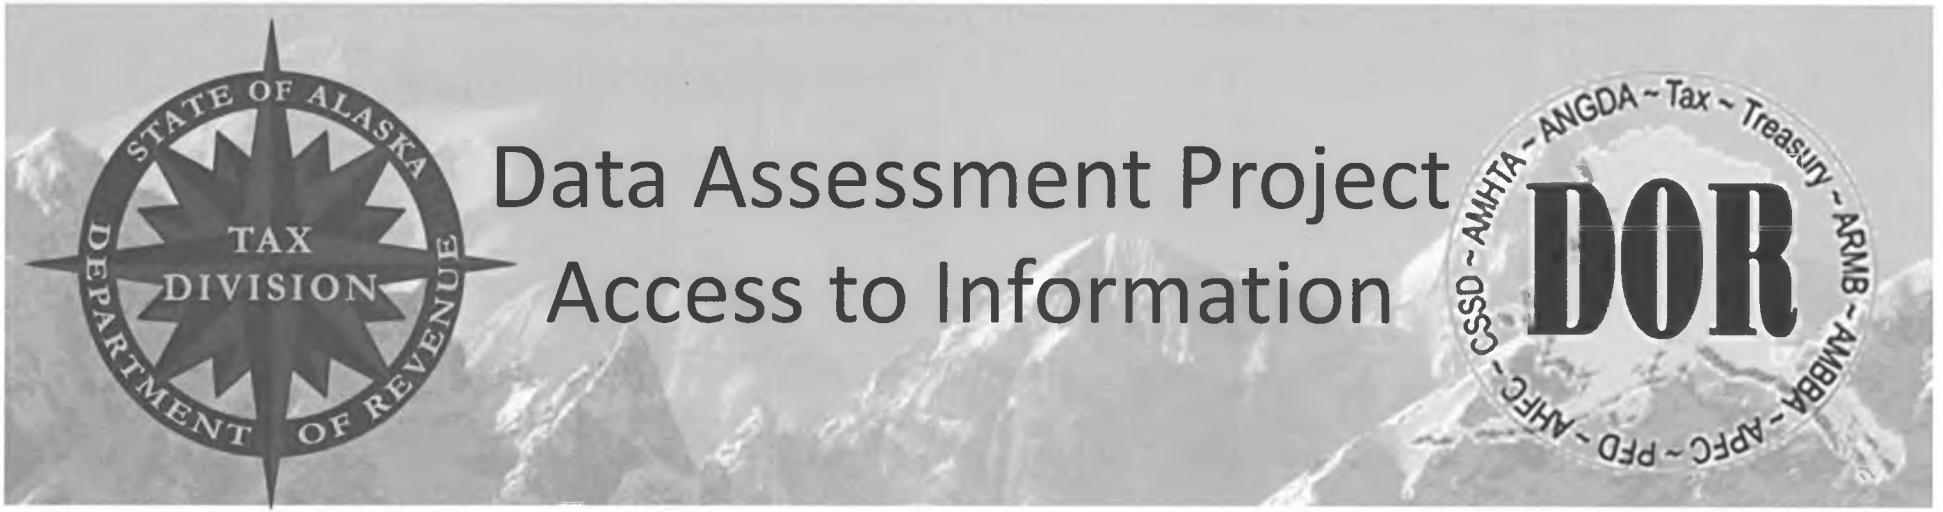
Effective Production Tax Rate (Post-Credits) using Total Lease Expenditures for all companies



Assumes FY2012 expenditures for all companies, regardless of whether they have a tax liability: transport costs of $8.72/bbl, Opex of $14.06 per taxable barrel, and Capex of $14.95 per taxable bbl.

3/26/12 PRESENTATION BY DEPARTMENT OF REVENUE: DATA ASSESSMENT PROJECT

<TARGET><BILL></BILL><SUBJECT>3-26-12 PRESENTATION BY DEPARTMENT OF REVENUE DATA ASSESSMENT PROJECT</SUBJECT><COMM>SRES27</COMM></TARGET>



Presentation to Senate Finance
March 26, 2012
Alaska Department of Revenue

Slide Index

- Project purpose and goals
- Accomplishments to Date
- Project Approach
- Five Focus Areas
- Cost Information Gathering Process
- Data Assessment – Over the Past Year
- Capital Expenditure Categories
- 5 Year Look Back Overview
- Data Assessment – Next 15 Months
- Data Assessment – Future 2014 Forward
- Benefits of the Project
- Next Steps
- Handout List
- Industry Information Catalogue
- SB 192, Amendment 26 Comparison to Currently Collected Data by Agency

Data Assessment Project
Purpose and Objective

Purpose: to establish the foundation of data types required by the department for establishing a centralized, reliable, secure, and automated database of oil and gas production and tax information for DOR to evaluate tax obligations, have efficient reporting, have full compliance from producers/explorers, and for data integration into more advanced information and revenue management systems.

Objective: to assist in the design, development, and implementation of standardized reporting forms from industry leading to the development and implementation of a standardized and automated collection of oil and gas production volume, value, expense, credits, cost forecasts and revenue information to address tax related oil and gas economic, financial, and policy issues and questions for the legislature, the Governor and department.

Accomplishments
Spring 2011 to Spring 2012

- Gathered data, identified information needs and sources.
- Completed Industry Information Catalogue – *Handout 1.*
- Focused on 5 Areas of oil and gas tax information needs.
- Hosted 4 industry workshops to communicate goals.
- Requested and compiled 5-year look back (2006—2010) of capital expenditures (CAPEX) by high level category.
- Integrated, streamlined, and automated forms.
- Proposed work plan to obtain/report detail data for FY12.
- Proposed work plan to integrate (sub ledger) oil and gas accounting data into other information systems .

Project Approach

DOR used an "integrated collaborative" approach among DOR , DNR, AOGCC, industry, and other agencies to gather current information.

- Identified current information received by DOR, DNR, AOGCC and other oil and gas industry associated agencies – "Industry Information Catalogue" – *Handout 1*.
- Identified and cross referenced statute and regulation requirements of data received and NOT received.
- Reviewed past and current DOR information requests.
- Reviewed compliance level of responses
- Identified type and format of information submitted by companies (PDF,'s Excel Spreadsheets, etc) for documents, graphs, charts, displays, narratives, spreadsheet data files.

Focus on Current Areas

- Production Forecast Reporting
- Cost Forecast Reporting
- Monthly Information Reporting
- Credit Application Filing
- Annual Production Tax Return

These areas are the key sources of oil and gas tax related information and reporting activities.

Cost Information Gathering Process

- Conducted in house discussion and review.
- Developed CAPEX & OPEX Expense Category Lists.
- Conducted 4 workshops with industry.
- Industry responsive in both active participation and written comments.
- Developed CAPEX 5 year look-back of high level cost categories.
- Proposed forward-looking more detailed CAPEX and OPEX cost categories – *Handout 2*.

Data Assessment to Date

- Data Assessment Project accomplishments, forms & processes.
- 5 Year Look Back effort – compiled baseline data.
- Annual Cost Supplemental Information Report, rev 1.
  - Effective for CY 2011 tax reporting due March 31, 2012
  - Uses high level look back CAPEX categories
  - Filed by producers and explorers
- Near completion of Annual Production Tax Return

Capital Expenditure Categories

- Look Back Categories for 2006-2010:
  - Geological & Geophysical Work (G&G)
  - Exploration Drilling
  - Development Drilling
  - Facilities
  - Other Capital
- High level categories were used as a result of workshop discussions with industry to balance the department's information needs and the industry's ability to respond in a short time frame for 5 years of historical data.
- Categorized capital expenditure data provided represents 90% of company reported capital expenditures relating to credits.

5 Year Look Back (2006-2010) Qualified Capital Expenditures

- Another aspect of the Data Assessment Project included the 5 year look back of qualified capital expenditures into pre-defined industry compatible categories.
- The pre-defined categories for the look back were high level common categories used across the industry to serve as a historical baseline for analysis.
- For CY 2012 and forward tax reporting the department has proposed expanded pre-defined more detailed CAPEX and OPEX cost categories to the industry.

Data Assessment Next 15 Months

- Host prospective Cost Information Workshops on CAPEX\OPEX.
- Update Annual Cost Supplemental Information Report , rev 2.
  - Effective for CY 2012 reporting due March 31, 2013
  - Uses more detailed categories following additional workshops – April 2012
  - Filed by producers and explorers
- Finalization of Annual Production Tax Return for 2012 reporting.
- Consolidating standardized forms to eliminate duplicate reporting.
  - Finalize oil and gas reporting processes, definitions
  - Compile 5 YLB historical cost data with 2012 cost data for analysis
- Complete the foundation and basis for data integration with a Tax Revenue Management System ("TRMS").
- Refine proposed work plan to initiate development and integration of standardized oil and gas accounting information into a secured database once the Tax Revenue Management System ("TRMS ") project plans decisions advance.

Data Assessment
Future July 2014 Forward

- The project has defined what we need to do to organize the oil and gas accounting information.
- TRMS project needs to establish the project implementation plan in order for our project to integrate into that system.
- After TRMS project implementation plan is defined, the next step is to define how the oil and gas accounting information will be incorporated into TRMS and when it can begin.

Benefits of Data Assessment Project

- Proposed reporting definitions and automation standards.
- Established reporting categories for qualified capital expenditures categories.
- Obtained historical capital expenditure information.
- Developed requirements to report cost categories going forward in 2012.
- Identified potential for electronic data sharing among associated agencies.

Next Steps

- Continued interaction with stakeholders to complete indentifying and defining more detailed cost categories for both CAPEX and OPEX for 2012 tax reporting
- Complete standardization of forms, format and content
- Automation of the standardized forms

Handouts

1 – Industry Information Catalogue

2 – Proposed Master Expenditure Cost Categories detailed CAPEX and OPEX and definitions

3 – SB 192, Amendment 26 information requirements comparison to currently collected data by Agency

Industry Information Catalogue

- The department's review catalogued information reported to the following State of Alaska agencies:
  - Department of Revenue, Tax Division
  - Department of Natural Resources, Division of Oil & Gas
  - Alaska Oil & Gas Conservation Commission

SB 192, Amd 26 Petroleum Information Management System (PIMS)

- 90% of PIMS data requirements already collected by DOR, DNR and AOGCC.
- 4 out of 35 data items not currently collected and require further coordination with Department of Labor.
- More data collected by DOR, DNR and AOGCC than identified in SB 192, Amendment 26.

March 30, 2011

Wednesday April 6, 2011 – Senator Paskvan to Chair

Big Game Commercial Services Board; (R) Karen Polley

Big Game Comercial Services Board; (R) Kelly Vrem

Board of Game; (R) Stanley "Stosh" Hoffman

Board of Game; (R) Ted Spraker

Board of Game; (R) Nathan Turner

Board of Game; (N) Nick Yurko

(R) = reappointment

(N) = new appointment

Karen Polley
Big Game Commercial Services Board

Karen (Ryals) Polley

Summary of Qualifications

Over 25 years of experience in education including teaching, administration, leadership, planning, and development of adult education, vocational education, and employment training programs. My employment has given me experience in policy development and regulations at the state and national levels. I have had the opportunity to develop extensive service on boards and commissions including the Professional Teaching Practices Commission, The Glacier Highway Electric Association Board, National Association of State Directors of Vocational Education, the Juneau Community Garden Association, The University of Alaska Vocational Education Advisory Board, Alaska Nutrition Education Training Program Advisory Committee, and the Alaska Home Economics Association Board. My professional positions enabled me to be instrumental in the initiation and establishment of multiple agency collaborative efforts including the Departments of Education, Health and Social Service, Labor, Community and Regional Affairs, municipal governments and the private sector. In my leisure time I enjoy hunting, fishing and outdoor recreation.

Employment

2005- Present	Self employment: Stone Soup Alaska Designs
1999-2005	University of Alaska Southeast Ketchikan Campus Director, Ketchikan
1997-1998	Owner/ Operator, Polley's Waterbug Service
1995-1996	Interim Director, School of Career Education, University of Alaska Southeast
1994-1996	Consultant with Ernest Polley and Associates
1992-1993	Program Coordinator, Southeast Regional Resource Center, Juneau
1987-1991	Director of Adult and Vocational Education, Alaska Department of Education, Juneau
1978-1987	Education Administrator Career and Vocational Education, Alaska Department of Education, Juneau
1974-1978	Instructor, Juneau Douglas Community College
1968-1974	Home Economics Teacher, City and Borough of Juneau School District, Juneau

Education

United State Merchant Marine License 50 ton qualification 1998-2008
Certificate Basic Facilitator, Association for Quality and Participation 1992
Principals Credential, University of Alaska Southeast, Juneau 1998
M. Ed Secondary Education, University of Alaska Juneau, 1978
BA Home Economics and BA in Home Economics Education, Eastern Washington State University, Cheney, 1968

Awards

Excellence in Education for Work, 1987 the Alaska Committee
Alaska Home Economist Outstanding Contributions Award 1983, Alaska Home Economics Association
Leadership in Vocational Education Award 1980, Alaska State Vocational Association
Home Economist of the Year, 1991, Alaska Home Economic Association
Meritorious Service Award for Outstanding Service, 1991 from the Alaska State Vocational Association

Kelly Vrem

Kelly Vrem
Big Game Commercial Services Board

Objective: Registered Guide Member of the Big Game Commercial Services Board

Biography

I was born in Anchorage 1953. Eagle River resident 1954-1979, Bethel 1979-82, Chugiak 1982-2009, Sutton 2009-present. Married to Linda 35 years, 3 children.

Linda and I reside on 20 acres in Sutton where we keep our 13 horses, and we own a hanger at the Birchwood Airport with my brother Tracy and his wife.

Experience

Big Game Guiding

- Licensed as an Assistant Guide 1973
- Employed by Gene Needels of Chugiak in GMU's 11, 12,13 and 9. I was a pilot as well as an assistant guide and I continued to work for Gene until 1982 while my business was getting established.
- My Registered Guide License was obtained in December 1977 Currently Master Guide #102
- 1979 to present self-employed in my guiding business.
  I am licensed to guide in GMU's 6,9,11,13, 14, 16-22, 25 and 27

At this time we guide in the Wrangell Mountains, Alaska Peninsula, and Game Management Unit 16. I also work for Bruce Werba of Holy Cross as a guide and pilot in support of his guiding operation in GMU 18 & 21.

Over the years we have operated a guide business on State, Forest Service, USFWS, BLM and National Park Service lands.

While my Guide business was getting established I was a heavy equipment operator in IUOE Local 302, and as a commercial pilot and mechanic.

Commercial Pilot

As you can see I have worked for several air operators. My air taxi was also a licensed Transporter in GMU 19. I understand the needs and concerns of that segment of Big Game Commercial Service Providers.

- Commercial Pilot 1979
- Chugiak Aviation Bethel 1980-81 on demand charter
- SEAIR North Slope and Bethel 1981-84 Scheduled mail and passenger service in Bethel, Air support for geophysical exploration companies on the North Slope, operating out of Umiat and Deadhorse

- 1985 USFWS Yukon Delta National Wildlife Refuge Bethel Wildlife surveys and research support.
- Woods Air Service Palmer 1990-93. State wide on demand charter and fuel hauling.
- Owner and Director of Operations, Chief Pilot and Director of Maintenance Nordic Flying Service 1994-2005 Birchwood Airport.

Ratings and Education

Commercial Pilot Instrument Rating; SEL; MEL; SES; Helicopter; Airline Transport Pilot MEL; A&P Mechanic, IA.

During my 15,000 hours of Alaska flying time, I've had the good fortune to see Alaska from Yakutat Bay to Cold Bay to Prudhoe Bay. My flying career has allowed me to fly J3's to DC-6's. I still take a flying job at a fishing Lodge operated by my Brother Tracy as time permits.

Big Game Commercial Services Board

As an Assistant Guide and then a young Registered Guide I began attending the Guide Board meetings in 1974 and have attended the majority of the meetings conducted by both governing bodies of guides and transporters to date. It was my privilege to help on several special and sub committees for the BGCSB. I have also proctored for the oral tests on occasion. I regularly attend Board of Game meetings as an APHA member and served on the Western Alaska Moose Management Planning Committee. I have maintained an active interest and participated in guiding boards since the 70's. I have seen the Board process from its inception to the present. I feel I have more to contribute and would consider it an honor to serve on the commercial Services Board.

I have been an active member of the Alaska Professional Hunters Association Since 1979. Serving over 14 years as a board member of the APHA and Vice President for the past several years

Education

Chugiak, and Eagle River Elementary Schools Chugiak High School class of 1971

Western State College, Gunnison CO 1971-1972 I did not return for the sophomore year so I could pursue my guiding career.

Other Activities

Board Member of Anchorage Ski Club 1991 to 1996. Volunteer director and a coach of the Anchorage Ski Club Racing Team. We had skiers from 8 to 18 years old in the program

Hobbies

Ski Racing, current member of the Alyeska Ski Club, Masters Ski Racing program

Adult league hockey. Alaska Aviation .

Alaska Organizations

Alaska Professional Hunters Association Alaska Airmen's Association

Alaska Outdoor Council Birchwood Airport Association

Hoffman, Stanley "Stosh"
Board of Game

Stanley (Stosh) Hoffman, Jr.

Objective: *Interested in serving on the State of Alaska Board of Game*

Summary of Qualifications

- Lifelong Alaskan
- Very Familiar with Hunting, Guiding, Subsistence Activities
- Experienced Assistant Guide, License #3951 (Big Game) Issued 8/12/97
- Commercial Fisherman, 21 Years, Captain 10 Years
- Familiar with City, State and Federal Agencies and Regulations
- Familiar with Alaska Native Cultures and Languages
- Self-Motivated

Owner & Business Manager:
S & A Rentals, Nunapik Dish Network,
Tundra Fencing

Work History

Employment Duties	*Position*	*Employer/Address*	*Reason for Leaving*
1/07 – Present	Director of Corporate Facilities	Yukon-Kuskokwim Health Corporation PO Box 528 Bethel, AK 99559	N/A
7/98 – 1/07	Projects/Safety Manager; Assist Director of Public Works; Project Supervisor; Port Supervisor; Construction Project Foreman Supervisor:	City of Bethel PO Box 388 Bethel, AK 99559	Accepted Position with YKHC

HOFFMAN Pg. 2/2

10/92-7/98	Driver: Operate fuel truck, deliver bulk fuel.	Hoffman Fuel Service PO Box 406 Bethel, AK 99559	Left while employed w/ summer jobs
1992 – 1998	various seasonal construction jobs in the Bethel area.		

Education History

High School:	McGrath High School	McGrath, Alaska 1985 – 1989
Degree/Diploma:	High School Diploma – Salutatorian	
College:	University of Alaska Anchorage	1989-1991 General Courses

Spraker, Ted H.
Board of Game

Ted H. Spraker

I was raised in Wyoming and completed my college education at the University of Wyoming. I hold a bachelor's degree in Wildlife Management and Master's in Range Management. I finished graduate school in May of 1973 and moved to Alaska in July. I have never been out of the state except for vacations. I'm 53 years old and married to Elaina Spraker. I have one son from a previous marriage, Clint, 23 and two stepchildren with Elaina, Ashley 14 and Kyle 12. My wife and all of our children are successful big game hunters and enjoy fishing. Kyle is my trapping partner.

Work.

I worked for U.S. Fish and Wildlife Service for five months, three in Southeast and two at the Kenai Moose Research Center in 1973.

I was hired by Department of Fish and Game on February 1, 1974, following one month of volunteer work. I worked in the Anchorage office for eight months before being promoted to Assistant Wildlife Biologist and transferred to Glennallen.

In July 1978, I was promoted to Area Wildlife Biologist and transferred to Soldotna as the biologist for the Kenai Peninsula. I remained in that position until I retired June 1, 2002, 28 years 4 months service.

Accomplishments with the Department:

I have made many changes during my near three decades career with the Department concerning wildlife, and hunting and trapping opportunities. Some of the most important projects were: In 1981, I presented survey data to the Board of Game to change the goat hunting on the Kenai. This hunting program is still in place

I served as the project leader when caribou were relocated from Glennallen to the Kenai in 1985 and 1986 to establish the Twin Lakes, Killey River and Fox River herds. Eighty animals were released that grew to over 800 by fall 2002. One of the reasons we moved caribou was to establish new herds for hunting.

In 1987, I worked with the five local Fish and Game Advisory Committees and Board of Game to change the bag limit for moose from an "any bull" program to a Selective Harvest System. This effort was successful in restoring the bull to cow ratio, resulting in an improvement in our local moose population's health and longer hunting seasons. The success on the Kenai inspired the Board of Game to approve this system for other Game Management Units from southeast to the interior.

I have received several conservation awards including the Life Time Conservation award from Safari Club International and a conservation award from the local trappers association.

I'm a member of the Alaska Trappers Association, Safari Club International and a lifetime member of NRA. I'm an avid hunter, trapper and fisherman. I have commercial halibut fished every year since 1979 and currently hold a small IFQ.

I'm interested in being on the Board of Game due to my long-term involvement in this regulatory process and wildlife management. I also believe that under this new administration the Board will be allowed to make needed changes to benefit wildlife populations and their habitats, and a variety of users across the state.

Thank you for your support,

Ted

Turner, Nathan
Board of Game

Nathan Turner

I was born and raised on a dairy farm in upstate New York. From an early age I learned the values and benefits of living a life close to the land, and especially the hard work and rewards that result from being dependent on the natural resources for your livelihood. I am grateful for those early years on the farm, and the important lessons that this type of life has to offer.

In 1989, at age 17, my father and I headed for Alaska with two pick-ups loaded with the essentials, the result of his lifelong dream of trapping in the Far North, and also a timely advertisement in Fur - Fish - and Game magazine; *Trapline For Sale in Alaska.* It took us 6 days to reach Alaska, and 10 additional days were spent on the road system in the Interior, preparing for our first winter on the Kantishna River. The trapline we purchased had been unused for the previous 12 years, but had been started in 1926, and few but the old timers in the country even knew where it was. We were dropped off by a local bush pilot from Nenana in mid September, and for the next ten months we learned a lot about Alaska… The winter of 1989 and 1990 was record breaking for the deep cold spells and snowfall – every winter has been an easy one since!

The next year one of my brothers joined us, we began in earnest to build our traplines into something that could support our family for the years to come. We started with the idea to treat trapping as though it were a business, working 6 days a week, with our cut-off period for trapping being 40 below. Three years later we started an additional trapline 85 miles to the west in the Nowitna country and during the next 19 years we cleared over two hundred miles of trapline trails for our dog teams and sno-gos, operated subsistence and test fishwheels (for both Fish and Game and the National Park Service), annually grew large gardens for our winter needs, built log homes and cabins for hire in the bush, and seasonally guided big game hunters. When we first arrived in the country, we were often told that the days of life on the trapline were gone; that this way of life wasn't possible anymore in Alaska. We found that they were wrong. The country hadn't changed and the economics of the life hadn't changed so much as the spirit of the people seemed to have. With first the dream, hard work, and room to grow we found that it is still possible to live a rich and rewarding life directly from the resources the country provides. Alaska has been generous to us.

In 1996 I started working as an assistant hunting guide in the Nowitna drainages for the neighboring trapper who had a small guiding operation. We worked together for 6 years, guiding hunters in our adjoining trapping areas, before I started contracting clients on my own in 2002. Since then, I have been fortunate to share this guiding opportunity with other neighbors in my part of the Interior – all of us currently live and trap close to the areas we hunt in. We have been able to meet our annual subsistence needs, while being paid to do so, much like the trapline. The harvested meat is shared among our families, and with less successful neighbors in the region. These packing and guiding jobs are the only local means of employment for most of us, other than trapping.

For the past 14 years I have also worked as an assistant guide for sheep in the Northern Brooks Range, and for Brown Bear out of Cold Bay on the Alaska Peninsula. In spite of having my own guiding business, I continue to work as an assistant guide on these hunts since it allows for me to annually visit these remote parts of the State, which have become a very important to me, and

also to simply be 'a guide' and share in the daily adventure with the hunters as the experience unfolds.

Participation in the Public Process:

In recent years, I have felt the need and responsibility to actively take part in the public processes that have to do with my family's way of life. I have actively participated with the Board of Game process during the last 4 years, submitting proposals for consideration and volunteering to participate in side boards that I feel have the ability to affect my way of life. I have also been actively involved in the restructuring efforts of the guiding industry. In 2007 I was nominated and elected to the Board of Directors of the Alaska Professional Hunters Association, the only professional association for the industry in the State. Our work in recent years has focused on aiding the Big Game Commercial Services Board in bringing oversight and accountability to guiding activities in the State and working with the Dept. of Natural Resources in creating the Guide Concession Area program. The goal of this program is to minimize the overcrowding of service providers throughout the State, while at the same time establishing a framework by which service providers can be held accountable for resource stewardship and their conduct in the field. Every user group will benefit from these efforts at self reform.

Purpose for Applying to the Board:

As noted above, I have come to feel a strong sense of responsibility to participate in the public processes that have bearing on my family's ability to make a living from the land. I recognize that there are many others in the State who are in similar situations, and yet I believe that I may have a somewhat unique perspective to bring to the table. I also feel that we need to continue the focus on restoring our wildlife populations in challenged parts of the State through sound management practices, and that these efforts will in time ease the conflicts among our various user groups.

Formal education:

I completed my final two years of high school through the Yukon Koyukuk School District, Northwind correspondence program based out of Nenana. A teacher visited by bush plane several times during the winter to check my work. I was twice selected for "Who's Who Among American High School Students", and also competed in the Academic Decathlon.

Work History:

Through 1989: raised on our family dairy farm

1989 through present:

- actively trapping 5 to 6 months of each season since 1989
- seasonally guiding big game guiding hunters (3 to 4 months each year) since 1996
- I and my family have built 19 structures (mostly log) along several rivers of the Interior, a number of these for hire during the summer months. For several summers I also worked

intermittently as a carpenter's helper for a local contractor in Fairbanks. We have built our own fishwheels, dogsleds, snowshoes, and boats over the years.
- subsistence fishing for our annual needs

Licensing Held :

Private Pilot license - land and seaplane
Captain - Inland Freshwater Six pack license
Alaskan Registered Guide – No. 1036

Past Participation with Government Processes:

- I have a held a number trapping cabin permits with both the Bureau of Land Management, and the US Fish and Wildlife Service for many years now, all in good standing.
- I have several permitted hunting camps on BLM, USFWS, and State of Alaska lands, all in good standing.
- For many years we operated test recovery wheels for counting salmon entering Denali National Park via the Kantishna River drainage, funded by both the State and the National Park Service.
- In the early to mid 90's we supplied the USFWS in Galena with Lynx and Marten carcasses for their wildfire / marten studies, and continue to provide marten carcasses to the State Area Biologist in Galena to maintain the data continuity.
- We volunteered salmon blood samples to an ADF&G biologist in Fairbanks to aid in his studies related to stress levels in tagged salmon we had recovered, part of his Master's thesis.

Board of Fisheries; (R) Michael Smith

DAN SEAMOUNT Jr.

Seamount, Daniel
Alaska Oil & Gas Conservation Commission

Is Chair of the Alaska Oil & Gas Conservation Commission in which he has been a commissioner since 2000. The mission of the Commission is to protect the public interest in exploration and development of oil and gas resources throughout Alaska. The main emphasis is regulation of underground drilling and reservoir development operations to ensure conservation of resources, protection of drinking water, and protection of correlative rights. The Commission staff consists of geologists, petroleum engineers, reservoir engineers, IT personnel, and support staff.

He has worked on many important Alaskan issues over the past 10+ years including the North Slope Natural Gas Pipeline, the evolving Cook Inlet Energy supply challenges, the development of Colville River and Northstar Oil fields, the continuing development of the world class Prudhoe Bay and Kaparuk River oil Fields, investigations of several major incidents, the advances of energy sources such as geothermal and underground coal gasification, and much more.

While commissioner he has been an associate and official representative of four consecutive Alaska Governors to the Interstate Oil and Gas Compact Commission (IOGCC), Vice-Chair in 2008, and was chairman of the North American Coastal Alliance and Public Lands Committees of the IOGCC. He also was Vice-Chair of DOE' s Ultra-deep Water Advisory Committee in 2007 and presently continues as an active member.

For 27 years prior to that he worked in exploration and development geology at different times for Chevron, Marathon, and Unocal in California, the Rocky Mountains, the Mid-continent, and Alaska.

He has an M.S. in Geology from the University of CA, Riverside with an emphasis on geothermal development and exploration and is a licensed professional geologist in Alaska.

RESUME'

DANIEL TAYLOR SEAMOUNT Jr.
State of Alaska Professional Geologist License #507
AIPG Certified Professional Geologist #10425
State of Texas Professional Geologist- #3182 (expired)

WORK EXPERIENCE:

Alaska Oil & Gas Conservation Commission, 2/14/00 to Present
Title: ***Commissioner (Geologist Seat)***

Duties: Help manage State Oil & Gas Conservation Commission (AOGCC) whose mission is to protect the public interest in exploration and development of oil and gas resources throughout Alaska. Main emphasis is regulation of underground drilling and reservoir development operations to ensure conservation of resources, protection of drinking water, and protection of correlative rights. Associated with full range of petroleum geology, reservoir engineering, and drilling engineering of the State's exploration areas and oil and gas fields. Exploration activity mainly includes Cook Inlet and North Slope. Participate in numerous hearings and incident investigations. Write conservation, disposal, area, and storage injection orders. Help in managing the Class II Underground Injection Control (UIC) program as authorized by the U.S. Environmental Protection Agency. Worked on multi-agency task force to develop regulations and policies to ensure protection of underground sources of drinking water in areas of coal bed methane development. Periodically advise and make presentations to State & Federal Legislatures and the Governor's office concerning energy legislation and policy. Chaired the IOGCC North American Coastal Alliance and Public Lands Committee. IOGCC representative of Governors Knowles, Murkowski, Palin, and Parnell. IOGCC Vice-chair in 2006. 2007 Vice-chair and presently member of DOE's Ultra-deep Water Advisory Committee.

Seamount International Eploration, 2004 to 2006
Title: ***Geological Consultant (part time)***
Duties: Advised investors on oil and gas prospects in Kazakhstan

Union Oil Co. of Ca., 2/8/93 to 2/14/00
Title: ***Senior Advising Geologist***

Duties: Most of the time was the geologist on a team with geophysicists, reservoir engineers and drilling engineers to redevelop the tightly folded Middle Ground Shoal (MGS) and Trading Bay Fields. Planned highly deviated and sidetracked wells and directed drillers to the targets. Assisted research department in reservoir simulations of MGS. Also, for 3½ years explored for hydrocarbons in Cook Inlet Basin on both regional and specific prospect levels. Worked on prospects in the offshore, Matanuska Valley, South Cook Inlet, Susitna Basin and west side and east side areas. Estimated volumetric and economic potential of the prospects. For 3 ½ years was project manager and Team leader of a group, which exploited development, exploration, and business opportunities in Cook Inlet and Alaska North Slope. Was project manager of the Matanuska Valley Coal Bed Methane project (Pioneer Unit). Heavily involved in planning and budgeting wells and forming partnerships. Made numerous written and oral presentations to management and partners to update them on project progress and presented to state agencies (DNR & AOGCC) to form units, drilling PA's, spacing exceptions, and plans of operations. Involved in some evaluation of OBO North Slope Oil Fields and prospects. Proficient in Landmark's Stratworks, Petroworks, and Seisworks packages.

SEAMOUNT 46.3/3

Union Oil Co. of Ca.(UNOCAL), 5/16/88 to 2/8/93
Titles: ***District Development Geologist: 8/89 to 2/93***
Geologist: 5/88 to 8/89
Duties: Supervised and worked development and exploration geology of UNOCAL operated properties in the San Juan, Paradox, and Piceance Basins. Exploited tight sandstone reservoirs (27 wells), coal seam gas (57 wells), and conventional sandstone and carbonate oil and gas reservoirs. Horizontal, deviated, and vertical well bores were utilized. Additional work included managing geological contractors; progress reporting of drilling programs and field mapping. Presented San Juan Dakota reservoir characterization results to NM State O&G Comm. in approval process of tight gas sands designation. Worked with Utah O&G Comm. in forming Lisbon Field Unit. Presented to numerous potential partners and was on a team which sold Unocal's alternative fuel tax credit to outside investors.

Marathon Oil Co., 7/13/81 to 5/16/88
Titles: ***Staff Geologist: 1986 to 1988***
Project Supervisor: 1984 to 1986
Geologist: 1981 to 1984
Duties: Oil and gas prospecting in the D-J Basin (one Paleozoic discovery), the Green River Basin (assisted in two Moxa Arch Frontier and Dakota gas discoveries and one sub-economic oil well), the Las Animas Arch (Morrow ss), and the central Kansas uplift (Pennsylvanian basal ss and Lansing- Kansas City Fm.). Work included regional & local mapping of structures, thickness', and facies of Rocky Mountain petroleum reservoirs and presentation of prospects to management. Was expert witness in Nebraska lawsuit between Marathon and KN Energy concerning underground gas storage.

Chevron U.S.A. Inc., 8/18/73 to 1/3/79
Titles: ***Geologic Assistant: 1975-1979***
Computer Analyst: 1973-1975
Duties: Utilized geologic and geophysical computer programs. Performed well site work and prospect generation in California onshore and offshore. Correlated logs and generated structure and isopach maps. Witnessed logging runs, DST's, production tests, coring, and fracture stimulations.

EDUCATION:

M.S. - Geology, 6/81, University of CA, Riverside, CA.
Emphasis on geothermal development and exploration. Thesis titled, " Well Log Study of the Hydrothermally Altered Sediments of Cerro Prieto Geothermal Field, Baja California, Mexico".

B.S. - Geology, 5/73, University of CA, Riverside

Senator Tom Wagoner, Co-Chair
Senator Joe Paskvan, Co-Chair
Senate Resources Committee
Alaska State Legislature
120 4th Street, State Capitol, Room 3
Juneau AK 99801-1182

RE: Support for Confirmation of Ben Brown for Commercial Fishery Entry Commissioner

Dear Senators Paskvan, Senator Wagoner, and Committee members,

United Fishermen of Alaska (UFA) represents 38 Alaska commercial fishing organizations from fisheries throughout Alaska and the federal waters off our shores. UFA supports the confirmation of Ben Brown for Commercial Fishery Entry Commissioner.

The Commercial Fishery Entry Commission (CFEC) administers permitting for commercial fisheries, involving complex issues based on statute, regulation, and interpretation of historical court cases. This permitting is a cornerstone of stability that is a primary key to the sustainability of Alaska's fisheries, and essential to ensuring that our fisheries provide maximum benefits to Alaskans.

We feel Mr. Brown's background as a legislative aide and experience in the legal profession provide the qualifications for this position. We support the approval of Ben Brown's appointment by the Senate Resources Committee and by the Alaska State Legislature.

Thank you for your consideration.

Sincerely,

Mark D. Vinsel

"Deindustrialization and Industrial Structure." Journal of Economic Issues. June 1988.

Relevant experience:
My academic background will make me a valuable asset to the Board of Fisheries. One of my teaching fields, Resource and Environmental Economics, is directly applicable to the work of the Board. Just as importantly, my training as an economist forces me to see the costs and benefits of any action and to see the tradeoffs involved in any decision.
I have also been an avid fisherman my entire life. My father first took me fishing when I was 4 years old -- I still remember my first fish! -- and have become only more passionate about fishing in my later years. I have been traveling to Mexico almost every year since 1980 to fish for marlin. For my 50th birthday, I took a trip to Mongolia to fish for taimen, the largest salmonid in the world. And to celebrate my victory over prostate cancer, I went to Egypt to fish for Nile perch in 2007.

My passion for fish and fishing is why I want to serve on the Alaska Board of Fisheries. I will have one interest while serving on the Board: To protect the fisheries resource. Managed correctly, our children and grandchildren will enjoy the same fishing opportunities I have, and Alaska will do its job to provide excellent quality fish for the tables of the world. But if we are not careful, we'll see the Alaskan fisheries go the way of Atlantic salmon and Atlantic halibut. My first term on the Board has been hard work, but also a learning and rewarding experience. I am most proud that I was able to bring careful data analysis to the work of the board; my economics background has helped considerably in this area. I hope to continue on the Board and am confident that I can be more effective in the years ahead.

Jeffrey, Susan
Board of Fisheries

SUSAN JEFFREY

Objective

To serve the state as a member of the State of Alaska Board of Fisheries and use my fisheries knowledge, background and experience as a public official to conserve and develop the fishery resources of the State of Alaska.

Highlights of Qualifications

- Elected Official, Kodiak Island Borough Assembly, 2005-present
- Borough representative, Kodiak Fishery Advisory Committee, 2007-present
- Commercial salmon fisherman at Kodiak family setnet site, 1987-present
- Subsistence halibut and salmon fisherman, 1972-present
- Co-founder/board member, Kodiak Maritime Museum, 1995-present
- Fisheries reporter/editor, *Kodiak Daily Mirror*, 1994-2002
- Freelance fisheries writer, 1991-2002
- Editor, *Homeport Kodiak* fisheries journal, 1991-1993
- Co-owner, commercial crab vessel, 1978-1987

Education

2006 Bachelor/Liberal Arts Degree, University of Alaska Southeast
1993 Associate of Arts Degree, University of Alaska Anchorage

Experience

2008-present Library Assistant, University of Alaska Anchorage, Kodiak College
2005-present Member, Kodiak Island Borough Assembly
1987-Present Owner/Operator commercial salmon fishing business
2006 Author, *The Russian-American* Magazin: *A Legacy Built to Last*
2004-2006 Full-time student
2002-2004 High School Registrar, Kodiak Island Borough School District
Staff Writer/Fisheries Editor, *Kodiak Daily Mirror*
1991-Present Freelance Writer/Photographer
Editor/News writer, *Homeport Kodiak* fisheries journal

Personal Statement

Alaska's fishery resources are vital to the State of Alaska and must be managed wisely so they remain sustainable. To that end, the Board of Fisheries is charged with conserving and developing Alaska's fishery resources for subsistence, sport, commercial sport, commercial and personal use fisheries. Making allocative decisions within these fisheries requires careful, thoughtful analysis of the science and socio-economic studies presented to the Board of Fisheries. Based on nearly 40 years of personal involvement in Alaska's fisheries, I understand that serving on the Board of Fisheries often involves a contentious deliberative public process. It is not for the faint of heart but I am willing to serve because I believe that only through a fair, well-informed public process can the state wisely conserve and develop its world-class fishery resources for future generations.

Jensen, John E.
Board of Fisheries

December 2, 2002

John E. Jensen

RESUME
COMMERCIAL FISHING HISTORY

FISHERIES

1965: This was the first year I was a paid commercial fisherman, I crewed during the halibut fishery in the summer.

1966-1967: SE AK—crew for salmon seine.
Gulf of AK—halibut crew.

1968: SE AK—salmon seine as crew.

1969-1971: Gulf of Alaska—halibut and seined salmon in
SE AK—crew for salmon seine.
Bering Sea/Aleutians—red crab crew.

1972: SE AK—salmon gillnet, I purchased my first commercial fishing boat, the F/V High Voltage; salmon seining.
Gulf of AK—crew halibut.

1973-1976: SE AK—salmon gillnet.
Gulf of AK—crew for halibut.

1977: SE AK—salmon gillnet.
Gulf of AK—crew for halibut.
Bering Sea/Aleutians—crew for red king crab.

1978-79: SE AK—salmon gillnet.
Gulf of AK—crew for halibut, tanner crab.

1980: SE AK—salmon gillnet.
Gulf of AK—crewed for halibut.
For two months I participated in the building of my boat, F/V Summer Breeze in Puyallup, WA.

1981: SE AK—salmon gillnet, halibut, experimental fishery for octopus pot fishing, Dungeness crab, tanner crab and herring gillnet.

1982: SE AK—halibut, tanner /red crab, salmon gillnet, herring gillnet, herring seining as crew.
Bristol Bay—salmon gillnet, herring gillnet.

1983: SE AK—halibut, tanner/red crab, salmon gillnet, herring gillnet, octopus pot fishing.
Bristol Bay—herring gillnet, salmon gillnet

1984: SE AK—halibut, tanner/red crab, Dungeness, salmon gillnet, herring gillnet.
Bristol Bay—salmon gillnet, herring gillnet.
Togiak/Security Cove/Goodnews Bay—herring gillnet, roe on kelp.

1985: SE AK—halibut, tanner, salmon gillnet, herring gillnet.
Bristol Bay—herring seine, salmon gillnet.
Norton Sound—herring gillnet as crew.

1986: SE AK—halibut, tanner crab, Dungeness crab.
Bristol Bay—herring seining/salmon gillnet.
SE AK—skipper for salmon tendering

1987-1989: SE AK—tanner crab, halibut.
1987: Prince William Sound—tendered for herring with a 58' vessel as skipper.
Alaska Peninsula—salmon drift gillnet.

1990-1993 SE AK—tanner crab, halibut, salmon gillnet. I skippered a 96' king crab/tender for salmon tendering.
1991: Dungeness crab.
1992: Blackcod.

1993-1995: SE AK—tanner/red/Dungeness crab, halibut and some salmon gillnetting.

1996-1998: SE Alaska—tanners/red crab, Dungeness crab.

1997-2002: SE Alaska: tanners/ red crab(when there was a season)/brown crab, Dungeness crab.
Gulf of AK/SE: F/V Westerly—crew for halibut/blackcod

2002 SE Alaska: F/V Westerly—Skipper for salmon tendering

RESUME

Background: I was born in Petersburg, AK, February 16, 1951. I am a lifetime resident of Petersburg. I graduated from Petersburg High School in 1969. I attended Yakima Valley College for 1 year before purchasing my first fishing vessel and beginning my fishing career. I am a third generation Alaska fisherman. I have fished commercially since 1965. I have owned and operated four fishing vessels from 1972-1993. I have participated in fisheries in SE Alaska, Bristol Bay, Gulf of Alaska, Bering Sea/Aleutians, Alaska Peninsula, Cook Inlet, Prince William Sound, and Western Alaska. I have attended Merchant Marine Training Services in Seattle, WA and acquired my Master 100 GT and Assistance Towing license.

Other Interests: Hunting and sport fishing, camping, woodworking, reading, Alaskan history.

Family: I have been married to Pamela R. (Meeks) of Petersburg, AK. Since 1972. We have two sons, Jeremy and Samuel.

WORK EXPERIENCE: Listed separately.

Biography of Daniel S. Sullivan

From June 2009 until December 2010, Sullivan served as Alaska's Attorney General. In that capacity, Sullivan focused on issues of natural resource management and development. Under his leadership, the Department of Law undertook an aggressive strategy of initiating and intervening in environmental and related federal litigation to protect the state's economic and resource development interests in areas from timber to mining to Outer Continental Shelf oil and gas development. Sullivan has led the state's negotiations with ExxonMobil over the disputed Point Thomson field, a role he will continue to hold at DNR. He also served on the Governor's Resource Development Subcabinet and was a trustee of the Exxon Valdez Oil Spill Trustee Council.

Prior to becoming Attorney General, Sullivan served as the U.S. Assistant Secretary of State for Economic, Energy, and Business Affairs. His nomination by President George W. Bush for this position was unanimously confirmed by the United States Senate in May 2006, and he served until January 2009. In this role, he was a senior advisor to Secretary of State Condoleezza Rice and other top U.S. government officials on the formulation and execution of international energy, economic, trade, finance, transportation, telecommunications, and Arctic policies. Sullivan also led and managed the 200-employee State Department Bureau of Economic, Energy, and Business Affairs.

As the Assistant Secretary of State, much of Sullivan's work focused on international energy issues. He served as the U.S. Governing Board member of the Paris-based International Energy Agency – the world's premier energy security organization. He and the State Department bureau he led worked closely with the Office of the Federal Coordinator for Alaska Natural Gas Transportation Projects on Alaska gas pipeline issues. He also worked on the development and implementation of major gas and oil pipeline projects in Central Asia and the Caspian Sea region. Sullivan also was responsible for overseeing and leading several complex international negotiations of strategic importance to the United States, including sovereign debt restructuring accords, aviation liberalization agreements, and serving as the primary negotiator for the President at the Group of Eight (G8) Summits. Prior to serving as the Assistant Secretary of State, Sullivan was a Director in the International Economics Directorate of the National Security Council and National Economic Council staffs at the White House.

Legal and Academic Background

Sullivan is one of a select number of Alaska attorneys who has held judicial clerkships on both the highest state and highest federal courts in Alaska. He was a judicial law clerk for Judge Andrew Kleinfeld of the United States Court of Appeals for the Ninth Circuit in Fairbanks from 1997-98 and for Chief Justice Warren Matthews of the Alaska Supreme Court in Anchorage from 1998-99. Following his clerkships, Sullivan joined the Anchorage office of Perkins, Coie, LLP. His practice focused on corporate transactions and commercial litigation, and he represented a variety of clients, including Alaska small businesses and Native corporations.

Sullivan graduated *magna cum laude* from Harvard University, earning a bachelors degree in Economics, where he was a Harvard College scholar during each of his four years. Sullivan graduated *cum laude* from Georgetown University Law Center, earning a Juris Doctor and Masters of Science in Foreign Service joint degree. He was an articles editor on the *Georgetown Law Journal*. During his final year at Georgetown, Sullivan worked as a law clerk for Judge James L. Buckley on the U.S. Court of Appeals for the District of Columbia Circuit.

U.S. Military Service

Sullivan has served in the United States Marine Corps since 1993 on active duty and in the reserves as an infantry and reconnaissance officer, including with Second Battalion, Fifth Marines at Camp Pendleton, California, and for several years with Anchorage-based Echo Company, Fourth Reconnaissance Battalion – the Marine Corps Reserve's premier cold weather reconnaissance unit. In recent years, Sullivan has been recalled to active duty twice: in January 2009 to help draft a regional strategy report for the Commander of U.S. Central Command (CENTCOM), General David Petraeus, and from December 2004 until April 2006 to serve as a strategic advisor to CENTCOM Commander General John Abizaid. He now serves in the U.S. Marine Corps' active reserves with the 4th Marine Division's Anti-Terrorist Battalion.

Awards, Honors, and Personal Information

Sullivan is the recipient of numerous professional, academic, and military awards, including the White House Fellowship, the National Security Council Outstanding Service Award, and the Defense Meritorious Service Medal. He is a member of the Council on Foreign Relations.

Sullivan was born in Fairview Park, Ohio. He has been married for 16 years to Julie Fate Sullivan of Fairbanks. They moved to Alaska in 1997, after Sullivan completed active duty service with the Marine Corps. They have three daughters.

CORA J. CAMPBELL
1840 Wickersham Avenue
Juneau, AK 99801

OBJECTIVE

Consideration by the Joint Boards of Fish and Game as a candidate for Commissioner of the Alaska Department of Fish and Game.

SUMMARY OF QUALIFICATIONS

- Comprehensive understanding of Alaska's fish and wildlife and natural resource management issues.
- Established working relationships with administration, legislature, fish and game employees, and user groups as well as expertise in state and federal regulatory forums.
- Experienced developing and implementing policies and programs for the State of Alaska related to management of fisheries and wildlife.
- Proven expertise in interdepartmental coordination, grants administration, budget development, communication with the legislative branch, and representing the State of Alaska in policy forums.

PROFESSIONAL EXPERIENCE

Fisheries Policy Advisor and Special Assistant 2007-2010

Office of the Governor, Juneau, AK

Served as fisheries policy advisor and special assistant in the Office of the Governor with responsibilities for fish and game, environmental conservation, climate change, natural resources, commercial fisheries entry commission, revolving loan funds, seafood marketing and Arctic issues.

With governor and commissioners, developed and implemented State of Alaska policies and programs for fisheries, wildlife, environmental conservation, and resource management.

Coordinated with state and federal agencies, legislative and congressional offices, and stakeholders to develop and negotiate adoption of state and federal legislation and funding requests.

Responsible for review and recommendations on policy matters, budget requests, legislation, and regulations for multiple State of Alaska departments.

Chaired Fisheries and Oceans sub-cabinet responsible for designing and administering grant programs, development of fisheries and oceans policy, and coordination of various departments involved in regulation and development of Alaska's fisheries.

Served as the Governor's representative to various boards and committees, including the North Pacific Fishery Management Council and the Alaska Seafood Marketing Institute Board of Directors.

Primary responsibility for constituent contacts, correspondence, and meetings on behalf of the Governor.

Subsistence Outreach Coordinator 2005-2007

United Fishermen of Alaska, Juneau, AK

Coordinated education and outreach program to increase the number and diversity of users and interest groups involved in the federal subsistence management process. Produced newsletters, reports, and briefings focusing on interaction between federal and state managers and impacts of federal management on user groups. Maintained extensive website dedicated to subsistence in Alaska and responded to inquiries.

Executive Director 2001-2007

Petersburg Vessel Owners Association, Petersburg, AK

Fisheries policy analyst and advisor for regional fishing association. Advocated for a diverse group of fishermen in state, federal, and international regulatory and legislative forums. Analyzed fisheries issues, prepared briefings, and provided policy guidance to board of directors. Negotiated passage of regulations, coordinated collaborative research projects with management agencies, and managed office and budget for association. Increased supporting membership in association by twenty percent.

Advisory Panel Member 2003-2006

North Pacific Fishery Management Council, Anchorage, AK

Provided policy guidance to North Pacific Fishery Management Council on conservation, management, and allocation decisions for federal fisheries off Alaska. Prepared amendments, motions, and testimony on fishery management proposals and served on various committees.

Subsistence Chair/Executive Committee Member 2001-2006

United Fishermen of Alaska, Juneau, AK

Leadership role in statewide fisheries organization. Provided analysis, briefings, and policy guidance for state and federal subsistence management issues. Assisted in development and implementation of policies and representation of organization in various forums. Supervised subsistence program staff, budget, and operations.

Fisheries Committee Member 2002-2006

Southeast Conference, Juneau, AK

Served as a member of an advisory group tasked with providing conference members with policies and actions relevant to fisheries issues and economic development in Southeast Alaska.

Advisory Panel Member 2003-2004

North Pacific Research Board, Anchorage, AK

Served as a panel member responsible for recommending research and funding priorities to address fishery management needs in the North Pacific.

Commercial Fishing/Shore Operations 1992-2006

Various Fishing Vessels,, Petersburg, AK

Employed as crew for various commercial fisheries including salmon trolling, seining, and Dungeness crabbing. Managed shore operations for diversified fishing business including financing, accounting, tax preparation, state and federal permitting and reporting, and contracts.

March 16, 2010

Dear Senator:

As you approach confirmation of the Governor's appointments, the Board of Directors of the Alaska Chapter of Sportsmen For Fish and Wildlife unanimously encourages a "yes" vote for Ms. Cora Campbell as Commissioner of the Alaska Department of Fish and Game.

As you know, SFW-Alaska membership includes more than 2,000 Alaskans whose goal is supporting management for abundance of Alaska's fish and game resources.

Sincerely,

SPORTSMEN FOR FISH AND WILDLIFE – ALASKA

Subject: DF&G Commissioner confirmation

Dear Senators and Representatives,

The PWSCBA supports the conformation of Cora Campbell and believe she will make a good DF&G Commissioner. However this positions will require her to step out of her commercial fishing background and look closely at how the sport fishing industry impacts our state economically and our resources. I've just completed the attached graph showing the commercial and sport halibut fishing catch since 1995 when the IFQ program began. The graph should explain what has happened very clearly.

I'm also attaching some of the reference material and information that any commissioner holding this position should analyze and understand when representing the state as a voting member of the NPMFC. The economic health and well being of our state and the lively hood of many Alaskans is dependent on decisions made by the commissioner. We are seeing some severe economic impacts in the recreational fisheries based on the attached NMFS annual reports.

Things of note between 2006 and 2008 for all recreational fishing in Alaska:

For Hire non-resident angler expenditures down from 148M to 83.6M
Private resident up 50.2M from 28.8M

Total Trip Expenditures down from 209.5M to 121.6M for Non Residents Up 69.9M from 48M for Residents

Total state Trip and durable Equipment expenditures down from 499M to 388.9M

Loss of 1206 For Hire Jobs
Loss of 96.4M in total For Hire Sales
Loss of 54.4M in Value Added Revenue
Loss of 133M in total sales all together and combined with 78M loss in value added is a total loss of economic expenditures totaling $211,000,000.00

This is equal to or more then the revenue generated by commercially caught halibut on an industry utilizing less the 15% of the resource.

The question we must ask of Cora is how does she in her role as commissioner intend to stop the hemorrhaging we're currently seeing in economic losses in our recreational fisheries? The lively hood of many Alaskans is counting on Cora Campbell and we believe she will use her best judgement to set aside any prejudice for the commercial fishing industry for what's best for the state of Alaska.

RE: Support for Confirmation of Cora Campbell as Fish and Game Commissioner

Dear Senators Paskvan, Senator Wagoner, and Committee members,

United Fishermen of Alaska (UFA) represents 38 Alaska commercial fishing organizations from fisheries throughout Alaska and the federal waters off our shores. UFA supports the confirmation of Cora Campbell as Commissioner of the Alaska Department of Fish and Game.

Campbell's experience in the state and federal fisheries management processes, and her experience as Fisheries Policy Analyst for Governor Palin and Natural Resources Policy Analyst for Governor Parnell provide her with broad knowledge of fish and game management throughout Alaska.

We support the approval of Ms. Campbell's appointment by the Senate Resources Committee and by the Alaska State Legislature.

Thank you for your consideration.

Sincerely,

Mark D. Vinsel

WESTERN ALASKA COMMUNITY DEVELOPMENT ASSOCIATION

March 21, 2011

State of Alaska
Senate Resources Committee of the 27th Legislature
Senator Thomas Wagoner, Co-Chair
State Capitol, Room 427
Juneau, AK 99801-1182

Dear Senator Wagoner:

On behalf of the six CDQ entities, the 65 eligible CDQ communities and the more than 29,000 residents of western Alaska, the Western Alaska Community Development Association extends its support for the confirmation of the appointment of Cora Campbell as Commissioner of the Alaska Department of Fish and Game.

As a lifelong Alaskan, Ms. Campbell has been exposed to multiple facets of the fishing industry. From her experience with state and federal fishery and regulatory forums to her service to the North Pacific Fisheries Management Council, the Exxon Valdez Oil Spill Trustee Council, and the North Pacific Research Board, Campbell has developed a fine-honed sense of the challenges and opportunities encompassed in Alaska's fisheries. She understands how inextricably the communities and residents of western Alaska are tied to the fishery resources of the Bering Sea. Campbell has dedicated countless hours to representing the best interests of all Alaskans, advocating for Alaska's fishing, hunting, and wildlife viewing opportunities. Through her attention to detail, grace under pressure, and even temperament, she is distinguishing herself as a leader.

For these reasons and more, the Western Alaska Community Development Association urges your full support of the appointment of Cora Campbell as the Commissioner of the Department of Fish and Game. Please call on us if we can provide additional information or support for Ms. Campbell's appointment.

Sincerely,

WESTERN ALASKA COMMUNITY DEVELOPMENT ASSOCIATION

March 18, 2011

Dear Alaska Representatives,

I received this email message from Sara Jackinsky and I agree with her and also urge you to consider the qualifications that Cora Campbell holds for the significance of this position. As a graduate student in the field of fisheries as well as a personal family history and current involvement in the industry, it is distressing what has been considered as thorough and credible for a position such as ADFG "Commissioner." Her background, though interesting, is not enough to make the top-level decisions necessary for Alaska state fishery resources.

Sincerely,
Emilie Springer

I urge a vote against confirmation of Cora Campbell as Commissioner of Fish and Game.

Fish and Game resources are important and vital to Alaska. The people of Alaska are entitled to the best leadership available in this area.

Ms. Campbell is not qualified to hold this position. Ms. Campbell holds ONLY a BA in Education from Pacific Lutheran University. She has no scientific background. She has no research background. She has no conservation background. She has no education in fisheries issues. She has no statistical background. She has no economic background. Her experience includes attending meetings, her resume states she has been fishing since early 1990's. She is age 31 now so this would put her at about age 10. Are you seriously considering this as professional experience or is this just padding her resume. It appears that her entire resume is heavily padded.

If this appointment is confirmed it is a slap in the face to those involved in commercial fishing, sport fishing, subsistence fishing in Alaska, as well as a detriment to the fish and game resources of Alaska. It is a slap to those who have pursued their education in fisheries and related fields, and to all others who have worked hard at their education.

Please, let's honor this State and it's resources. The people of the State of Alaska deserve a Commissioner who is knowledgeable, who has a background and EDUCATION in an appropriate area (in this case fisheries, biology, natural resources, etc), who has experience.

If this appointment goes through, it is merely a case of "who you know," with no regard to the importance of the position. An appointment with these qualifications is not a healthy nor an appropriate way to conduct the business of such an important resource.

Again, I urge denial of confirmation this appointment.

Regards,

Sara Jackinsky

Please enter into the record my testimony to the Senate Resources
committee name

Committee on Campbell, ADF&G Confirmation, dated 3-23-11
bill # / subject — public hearing date

Dear Senate Resources Standing Committee,

I strongly oppose the confirmation of Cora Campbell! I have several friends in various positions in game and fish, I have asked them what they think about this nomination and they just shrug their shoulders and say it was a shock. They have varying opinions as to how it came about but they all seem to agree in the fact that she isn't qualified or experienced enough to run the department. She is probably a great kid. A shooting star, she will probably grow up someday to be something quite great, but right now we need a leader in game and fish. We are facing huge issues in almost every area of Fish and Game. This would be a monumental challenge to an experienced manager but we are going to through this kid to the wolves? We are being challenged for the right to manage our resources by our national government, we are experiencing a decline in every game animal or fish run we use! The only thing that is doing well are bears and wolves. We won't make it very far eating those. The commercial fish division keeps saying if we would just harvest more fish it would solve all of our problems. Maximum sustained yield. Yet we are running out of fish and they want to blame pike. The pike have been there longer than the nets but we need to kill more fish. This is the school Cora came up in and thinks is the answer. It is true that in years of small returns God helps the rebound of our stocks by providing a higher survival rate for the threatened young. However it doesn't work if you pound it to near extinction year, after year, after year! This is the mindset of the young Cora Campbell. She has been surrounded by it her entire life, yes, she is the daughter of a commercial fisherman and has only worked in the commercial fishing side of Game and Fish. So not only has she not run anything like the entire fish and game department, She has never put on the hat of any other of the branches of Game and Fish. Not to mention the STRONG commercial fishing ties. I voted for our Governor last election and this selection has made me regret that decision. I don't have any faith in his ability to choose a "QUALIFIED" applicant for our various appointed positions. So he won't get my vote again, I can't vote for all of you but I can pass the word about how you do as our representatives.
Thanks,

To: Jeff Stepp; Mary Jackson
Subject: FW: Commissioner ADF&G

A Homer constituent asked that his comments on Commissioner Campbell be entered into the record.

Thanks,
Doug

Dear Senator,

Departments of Education, and of Fish and Game ,and the Regulatory Commission have been constructed to limit the power of a governor to control them. With other state agencies that is not true. They are designed to be more at a governor's command.

The immediate concern is a new commissioner for ADF&G. The proper process is for the Joint Board of Fisheries and Game to advertise the position, to review candidates qualifications, to solicit comment from the local advisory committees and from the general public, and to choose one or more names for a governor to consider. A governor may reject nominees and ask for additional choices. A governor should not tell the the boards whom to nominate.
After appointment, subject to legislative confirmation, the commissioner serves at the pleasure of the governor. As with education, the management of wildlife and fish was identified as so central to the general welfare that the founders tried to insulate them from politics as usual and the politics of the moment.

The harvesting and use of wild resources of our lands and waters is basic to community and family needs and responsibilities. Less so in some times, and in some places, as extraction industries come and go, but perhaps even more vital as booms turn to busts; and mining and oil towns return to dust.

The process for selection of a commissioner for ADF&G has been honored often in the breech by governors wishing to exercize more authority. This is also true, of course, for choices for the governing boards whose members are often appointed for just those reasons prohibited in statute: geographical location of residence and factional interest. It could be that the time has come to think again about establishing professional boards (or at least one for fisheries), but while the present system is in place it should be utilized according to governing law.

There were no public meeting act hearings or advisory commmittee processes leading to the nomination of the commissioner candidate now being considered for confirmation. For this reason the matter should be remanded to the joint boards for orderly consideration by the properly established process. I recognize this means that the present acting commissioner will continue to serve in the interim and may well emerge as the choice of the process due.

My personal criteria for an ADF&G commissioner includes significant scientific education, preferably in wildlife biology, and meaningful years of effective service in the field, and in the labs, and in the offices of fish and wildlife management agencies, preferably in Alaska. I can think of two past commissioners without such qualifications; one an economist by training, one a landsman, but both had prior experience in resource agencies including ADF&G.

Since statehood, as a general matter, the Alaska Department of Fisheries and Game, and its commissioners, have benefited by universal respect for high caliber management. Very well respected around the nation and the world.

Neglect of our instruments, established by the founders to provide for the utilization of replenishable resources, has resulted in a department diminished in spirit, in quality, in ability to sustain yields, and in the respect for Alaska's resource management program.

Respectfully, Larry Smith

Ketchikan, Alaska 99901
(907) 225-3697

January 2, 2011

Dear Legislator,

This letter is to inform you that we join with the Alaska Native Brotherhood *in opposing* the appointment of Cora Crome Campbell by Governor Parnell to head the Alaska Department of Fish and Game.

Cora Campbell was formerly appointed to be Governor Palin's fisheries advisor following the recommendations of the Petersburg Vessel Owners Association, which she was former Executive Director of.

During her tenure as fisheries advisor to the governor, it was difficult if not impossible to reach the governor on issues that related to subsistence, sport fishing, and conservation. Her own interests and lack of experience are well known throughout Southeast Alaska.

As commissioner of the Alaska Department of Fish and Game, we are concerned that her focus will be more on "maximum yield" rather than on "maximum sustainable yield" when it comes to fisheries interests involving her former colleagues, supporters, and personal family members operating in the herring industry. This can be detrimental to many fisheries stocks in Alaska, create further division among user groups, and foster a degree of mistrust with the Department of Fish and Game at a time when all interests need to work together.

We have seen no evidence that her former agenda will not carry over in her position as commissioner of the Alaska Department of Fish and Game.

Considering her conflict of interest and lack of experience in biological and critical habitat issues, please vote NO to the appointment of Cora Campbell as commissioner of the Alaska Department of Fish and Game.

Very Sincerely,

Andy Rauwolf, Chair
Ketchikan Herring Action Group

BOARD OF FISHERIES

Orville Huntington
Huslia, AK 99746

Orville Huntington was born in Huslia, Alaska and received a B.S. in Wildlife Biology from University of Alaska, Fairbanks. Mr. Huntington is dedicated to working closely with young people to promote the values of traditional Native elders combined with contemporary western knowledge. He is committed to protecting the aboriginal rights of Native people to continue to live a subsistence way of life and preserve the cultural beliefs associated with that way of life as it is consistent with State and Federal law. His primary responsibilities continue to be the preservation of Native subsistence hunting, fishing, gathering and trapping opportunities and the cultural events that surround those beliefs, and as a public servant for the village of Huslia and the 43 villages of the Tanana Chiefs Conference region.

Mr. Huntington currently works as the Wildlife and Parks Director for the Tanana Chiefs Conference. Prior to that, he served for 14 years as a Refuge Information Technician at the Koyukuk/Nowitna NWR Complex and U.S. Fish and Wildlife Service. As a scientist he worked closely with local village people in the villages of Kaltag, Nulato, Koyukuk, Galena, Ruby, Huslia and Hughes on subsistence surveys.

Previous employment:

- Seasonal labor, Bureau of Land Management (Emergency Fire Fighter)
- Fisherman
- Laborer's and Carpenter's Union
- Huslia Tribal Council (Tribal Operations Specialist)
- Tribal and City Council member

Affiliations:

- Alaska Federation of Natives board of directors (interior village representative)
- K'oyitl'ots'ina Ltd. Board of Directors (Treasurer) for the villages of Huslia, Hughes, Allakaket and Alatna
- Brooks Range Contracting Board of Directors
- Koyukuk Moose Hunter's Working Group
- Interior Regional Housing Authority Board of Commissioners
- Interior Athabascan Tribal College Board of Trustees
- Alaska Native Science Commission Board of Commissioners

Board of Fisheries

1. Please comment on your qualifications for the position and tell the Committee the reasons that you'd like to be appointed to the Board of Fisheries.

2. Please comment on the two or three most important issues facing the Board of Fisheries. If confirmed, how do you intend to deal with these issues?

Alaska Department of Fish and Game

Welcome to the Board of Fisheries!

Board of Fisheries Members 2011-2012

Board of Fisheries News

- Board of Fisheries Call for Proposals 2012-2013 (*PDF 68 kB*)
- Board of Fisheries 2012–2013 Meeting Schedule (*PDF 56 kB*)

About the Board

The Alaska Board of Fisheries consists of seven members serving three-year terms. Members are appointed by the governor and confirmed by the legislature. Members are appointed on the basis of interest in public affairs, good judgment, knowledge, and ability in the field of action of the board, with a view to providing diversity of interest and points of view in the membership (see Alaska Statute 16.05.221).

The Board of Fisheries' m@ain role is to conserve and develop the fishery resources of the state. This involves setting seasons, bag limits, methods and means for the state's subsistence, commercial, sport, guided sport, and personal use fisheries, and it also involves setting policy and direction for the management of the state's fishery resources. The board is charged with making allocative decisions, and the department is responsible for management based on those decisions.

The board meeting cycle is three years long. The Meetings generally occur from October through March. The Board of Fisheries meets four to six times per year in communities around the state to consider proposed changes to fisheries regulations around the state. The board uses the biological and socioeconomic information provided by the Alaska Department of Fish and Game, public comment received from people inside and outside of the state, and guidance from the Alaska Department of Public Safety and Alaska Department of Law when creating regulations that are sound and enforceable.

Board of Fisheries Authority

The Board of Fisheries is established under Alaska Statute 16.05.221 for the purposes of the conservation and development of the fisheries resources of the state. The Board of Fisheries has the authority to adopt

regulations described in AS 16.05.251 including: establishing open and closed seasons and areas for taking fish; setting quotas, bag limits, harvest levels and limitations for taking fish; and establishing the methods and means for the taking of fish. The regulations the Board of Fisheries has authority over are 5 AAC Chapters 1- 77.

Resume

Name:	Karl S. Johnstone
Address:	Anchorage, Alaska 99516
Time in Alaska:	1967 to present
Date of Birth:	
Health:	Perfect
Education:	Bachelor's degree in Business, 1964 U. of Arizona Juris Doctor in Law, 1967 U. of Arizona

Veterans'/National Guard Preference
Are you a veteran or a member of the Alaska National Guard? If no, you may proceed to the Optional State of Alaska Equal Employment Opportunity Questionnaire below.

Are you a veteran who served on active duty (not active duty for training) in the United States Armed Forces and did you receive an honorable or general discharge? Yes No

If Yes:

Did you serve during a war* OR during the period beginning April 28, 1952, and ending July 1, 1955? OR

Did you serve for more than 180 consecutive days, any part of which occurred during the following periods:

- After November 11, 1918, and before December 2, 1919;
- After September 15, 1940, and before December 7, a941;
- After December 31, 1946, and before January 1, 1948;
- After June 26, 1950, and before April 18, 1952;
- After January 31, 1955, and before October 15, 1976; or
- In the Alaska Territorial Guard?

Did you serve during the Gulf War period beginning August 2, 1990, and ending January 2, 1992? AND If you originally enlisted after September 7, 1980, or entered on active duty on or after October 14, 1982, without having previously completed 24 months of continuos active duty, did you serve continuously for 24 months or the full period called or ordered to active duty? OR

Were you awarded a campaign or expedition medal or an award or decoration for heroism or gallantry in action? AND if you originally enlisted after September 7, 1980, or entered on active duty on or after October 14, 1982, without having previously completed 24 months of continuous active duty, did you serve continuously for more than 180 days or the full period called or ordered to active duty?

Yes No

OR

Are you currently a member of the Alaska National Guard and have you served for eight (8) years or longer? Yes No

*Under Title 5 Section 2108 of the United States Code the following time periods are considered periods of war.

- World War I Between April 6, 1917, and November 11, 1918, inclusive Unless service was with the United States military forces in Russia, then the ending date is April 1, 1920. Service after November 11, 1918, and before July 2, 1921, is considered World War I service if time was served in the active military, naval, or air service after April 5, 1917, and before November 12, 1918.
- World War II: Between December 7, 1941, and December 31, 1946. If in service on December 31, 1946, continuous service before July 26, 1947, is also considered World War II service.

Are you entitled to disability compensation, disability retirement benefits, or disability pension under laws administered by the United States Department of Veterans Affairs or a military department? OR

Were you honorably discharged and awarded the Purple Heart? Yes No

The State of Alaska complies with Title I of the Americans with Disabilities Act (ADA). Individuals with disabilities who require special accommodation, auxiliary aides or services, or alternative communication formats call 465-3897 in Juneau or (907) 465-3514 TTY.

Subject: confirmation of Karl Johnstone to the Alaska Board of Fish

Categories: Printed

4/8/12 Dear Senator Paskvan: I'm writing to urge your support in the confirmation of Karl Johnstone's re-appointment to the Alaska Board of Fish. Mr. Johnstone has always been a valuable member of the Board because of his willingness to listen to both sides of an issue and make thoughtful, well informed decisions, just as he did as a Superior Court Judge. His concern is for Alaska's fisheries first and foremost, and as such he represents the resource rather than one specific constituency or the other. I urge you to support his confirmation.

Sincerely,
Pudge Kleinkauf

Mr. Paskvan,
On Monday, your Resources Committee will be vetting Karl Jonstone for re-appointment to the Board of Fisheries. As I'm sure you know by now, there are serious questions about his residency as well as his fitness to serve on that board. I know you are in possession of some documents that have been making the rounds pointing out some of the more serious allegations against him.

I will be signed up to testify at my local LIO, but that testimony does not offer the opportunity to ask questions of Mr. Johnstone. You, however, will have that opportunity.

As I mentioned in an email to Mr. Kawasaki, which I believe has been forwarded to you by his staff member, Mindy O'Neall, I am very concerned not only about Mr. Johnstone's residency, but also about the inclusion of Bob Penny in internal BOF emails. In the off-chance you did not get a copy of that email, I'm pasting in the content of my portion of that exchange below.

Bob Penny is a well-known, powerful, and influential Kenai businessman with a vested interest in eliminating as much of commercial salmon fishing in upper Cook Inlet as possible,

My hope is that as co-chair of the Senate Resources Committee, in addition to the residency questions, etc, you will ask pertinent questions of Mr. Johnstone regarding why on earth Mr. Penny has been included in internal BOF emails, and when he will be able to provide copies of all the emails that were blind-copied to Mr. Penny. I also would like to know who else has been included on that email chain, specifically which members of the Kenai River Sportfishing Association, such as Ricky Gease, Rueben Hanke, etc.

With regards to the question about him having flown to Georgia to have Billy Morris, of Morris Communications which owns the Alaska Journal of Commerce, kill a follow-up story about his residency, the person to whom he was overheard bragging that he did that was Rueben Hanke.

As I said in my email to Mr. Kawasaki, this all points to a level of corruption in the Board of Fisheries that is nothing short of astounding. The fact that it goes at least as far up the ladder as Kelly Hepler is unforgivable, and something that the legislature should be very, very concerned about. Is this the way we want the people's business to be conducted? Please, please look into these allegations before you move his confirmation out of committee.

My many thanks for your attention to this matter,
Cristy Fry
299-6745

email to Scott Kawasaki:
Mr Kawasaki,
Thank you for asking the questions you did of Karl Johnstone at yesterday's hearing. I suspect he did indeed have those documents you were working from, he just hadn't figured out how to counter some of the allegations

yet. It would have been nice to have asked him if he had access to his email where he was so that he could have read them before you continued. That being said, I'm wondering when he will again be available in a public setting to answer the rest of your questions on the record?

One thing that did not make it into the documents you had, the State apparently tried to pay John Jensen a per diem at a meeting in Petersburg, his home town, (although he did not ask for it and did not cash it,) presumably to be able to say, "See, OTHER people get per diems in their home towns, too!" This would come out in an audit of Boards Support books.

One thing that bothers me almost as much as him not being a resident is the inclusion of Bob Penny in internal BOF emails. We have always known that Bob ran the Cook Inlet meetings; at the last round he would walk through the back of the room when the board took a break, nod his head, and the four board members who consistently voted with the sport fishermen would follow him out of the room (the votes were consistently 4-3). To find out that Bob is included in internal board business is just too much. And Kelly Hepler KNEW he was being copied, he REPLIED to him! I need to know, and so does everyone else in Cook Inlet, the extent of Bob's influence on this board and the broader ADF&G in Cook Inlet decisions, and the extent of his inclusion in internal board emails.

Please don't let this fall between the cracks. All of this is true and will be made public, Morris Communications is not the only game in town. The Board of Fisheries is corrupt in its current form, and any decisions made 4-3 when it turns out Johnstone was not a resident at the time of the 2011 Cook Inlet meetings should be thrown out. Please make the necessary investigations.

Thank you again.
Cristy Fry

RECEIVED

APR 0 6 2012

Dear Legislator,

On April 10 you will be asked to confirm a non-resident, KARL JOHNSTONE, to the Board of Fish (BOF). We ask you to say no to this appointment and ask the Governor to nominate a resident of Alaska who will fairly and objectively represent the resource for those who utilize our fisheries resources for work and recreation.

Karl Johnstone, the Governor's nominee, no longer lives in Alaska year round and is not qualified to serve on the BOF. News reports and documents received through the Freedom of Information Act from the Alaska Department of Fish and Game indicate that Mr. Johnstone lives in Arizona for at least eight months out of the year. His home in Anchorage, which he claims as his "primary residence," is occupied for only a couple of months during the summer. When Karl returns to Alaska for BOF Meetings in his "home town," he stays in a hotel on the State's dime, claiming per diem rather than opening the home he shutters for the winter.

Karl is the only Board or Commission member statewide receiving these special payments, contrary to Statute and the Alaska Administrative Manual. Why? Prior to his appointment to the BOF in 2008, Mr. Johnstone did not receive a Permanent Fund Dividend (PFD) check. Once appointed, he began claiming a PFD check. Public Records Requests were submitted and have brought residency problems to light which the Legislature should look into immediately. The financial records we have seen entered from the department indicate illegal payments were made. It is time for a Legislative audit of the Boards Support budget to discover if there are serious irregularities concerning a non-resident BOF Member. The Department and the Board process should be above reproach and fair and legal for all.

From the public records request, it is obvious that some staff in the Department knows Mr. Johnstone resides for a majority of the year in Arizona. Department staff should have informed the Governor to prevent him from making this nomination. In looking at Mr. Johnstone's history, it is revealed that there is a long history of ethical issues. Alaska residents should be able to rely on a vetting process within the Governor's office. A full review of Mr. Johnstone's records should occur to determine if Mr. Johnstone's appointment is legal, or has resulted in illegal payments as he travels from Arizona to Alaska for BOF meetings.

On March 4, the Alaska Journal of Commerce published a story on Mr. Johnstone that raised the issue of residency and illegal payments. Mr. Johnstone authored a full page opinion piece which spoke of how the BOF works, but never answered the original questions of residency and illegal payments. Mr. Johnstone was overheard boasting to "his constituents" that he was going to Georgia to get future stories concerning himself pulled. William Morris, the owner of the Alaska Journal of Commerce, lives in Georgia. What happened to the follow-up article? Did Mr. Johnstone pressure the Alaska Journal of Commerce to back off, one can only guess. In time, the answers will come out; we hope you will not embarrass Alaska residents by re-confirming this individual in the BOF.

Judge's integrity comes under question as election issue

By SHEILA TOOMEY
Daily News reporter

Low ratings for integrity, by lawyers in general and by his fellow judges in particular, are why the Alaska Judicial Council recommended that Karl Johnstone be removed from the Anchorage Superior Court bench, according to council Executive Director Hal Brown.

Johnstone

But Johnstone said the ratings are basically a popularity contest and pointed out that he has never been sanctioned or disciplined by any of the panels that oversee judicial conduct.

"My integrity is unblemished," he said.

Of 17 judges on the ballot for retention Nov. 8, only Johnstone has been deemed "not qualified" by the judicial council. Partly because voters rarely have independent information about how judges do their jobs, the council's judgment could spell real trouble for him.

The rating is done by lawyers, judges, police and probation officers in a written, anonymous survey.

Johnstone was rated by 631 people. He received acceptable or better ratings from lawyers and judges in categories dealing with legal ability and administrative skills; law enforcement officers in general rated him acceptable or better in all categories except "freedom from arrogance."

He ran into trouble in categories listed under judicial temperament and integrity, including an unacceptable integrity rating from judges in the Third Judicial District and from judges statewide.

An acceptable rating is 3. Johnstone was given an average rating of 2.8 by other judges.

He categorized it as the equivalent of a C-minus and said he thought it should be better.

Judges who said they had substantial direct professional experience with Johnstone rated him slightly lower, at 2.6, according to council figures.

"We're talking about people who are not only lawyers," Brown said, "they're judges, presumably the people who are working most closely day to day with Judge Johnstone."

Said Brown: "No Superior Court judge has ever received an unacceptable survey rating in integrity, from the time that the judicial council started doing surveys, which was in 1976."

Judge Mark Rowland, Johnstone's colleague and longtime friend on the Superior Court bench, said he knows of no reason why anyone should question Johnstone's integrity.

"I've known Judge Johnstone for a long time. I know him to be an excellent judge and a valuable addition to the bench in Anchorage," Rowland said.

On the survey, integrity is defined as conducting oneself in a manner free from impropriety or the appearance of impropriety. Respondents do not have to back up their ratings with specific allegations.

Johnstone said he was disturbed and puzzled by his low marks. "It's impossible for me to respond to an anonymous rating on integrity."

Said Johnstone: "There's not a public employee in the state who gets rated on the basis of anonymous ratings."

He attributed the low grades to old grudges from lawyers and judges he pushed too hard during his early years on the bench in an effort to make the court system more efficient.

He was appointed by Jay Hammond in 1979.

"I pushed real hard initially, too hard initially; and I've been outspoken; and I've never adopted the company line or joined the fraternity that says leave well enough alone; and it's made me unpopular. ... Grudges just sometimes don't die. ... What better way to get back at a judge you don't like for one reason or another ... than to be able to anonymously attack his integrity without having to identify yourself and without having to be specific?"

Johnstone originally attributed the judicial council's recommendation that he not be retained to a 2.2 rating on "freedom from arrogance" — the lowest rating he received in any category. Brown said that was not so.

"His very poor ratings as far as arrogance were not the leading reasons. ... The focus would have to be on the integrity."

Brown also disputed Johnstone's suggestion that people who didn't like him simply voted across the board against him. "They marked him low on eight out of 20 categories. They didn't just go through and vote the entire ticket, so-called."

And although law enforcement officers in general gave Johnstone an acceptable 3.2 rating for integrity, those who said they had substantial direct professional experience with him rated him an unacceptable 2.9, Brown said.

Johnstone handles mostly criminal cases. One reason the low ratings puzzled him, he said, is that he is rarely bumped off cases by lawyers these days and rarely is overturned by appeals courts.

This is the first year Johnstone has faced a peer review. He was on the ballot in 1982 and was retained by the voters. However, a dispute over whether he belonged on the ballot, which went all the way to the Alaska Supreme Court, delayed the decision until it was too late for him to be included in the judicial council survey.

The judicial council is a constitutionally mandated watchdog agency that evaluates judicial applicants and judges standing for retention. Brown emphasized that the survey results are only one factor considered by the six members of the council in reaching a decision to recommend for or against. Candidates fill out a detailed questionnaire and special questionnaires are sent to attorneys who have appeared before the judge under review. Council staff does a background check on the candidate and meets with the candidate in person.

Johnstone said he is relying on the public to recognize that he is doing a good job. He pointed to support from Victims for Justice, a group that sends court watchers to observe judges. Of the Superior Court judges standing for retention, Johnstone got the highest overall rating from up to 15 group participants.

The Judicial Council's record for convincing voters to get rid of judges is mixed. In 1976 and 1980, the council recommended against retention of Juneau District Court Judge Gerald Williams. The voters sided with him both times.

The council twice recommended against retention of Anchorage District Court judges Joseph Brewer and Virgil Vochoska. Voters turned them out in 1982.

THIRD JUDICIAL DISTRICT RETENTION ELECTION

Judge's integrity comes under question as election issue

By SHEILA TOOMEY
Daily News reporter

Low ratings for integrity, by lawyers in general and by his fellow judges in particular, are why the Alaska Judicial Council recommended that Karl Johnstone be removed from the Anchorage Superior Court bench, according to council Executive Director Hal Brown.

Johnstone

But Johnstone said the ratings are basically a popularity contest and pointed out that he has never been sanctioned or disciplined by any of the panels that oversee judicial conduct.

"My integrity is unblemished," he said.

Of 17 judges on the ballot for retention Nov. 6, only Johnstone has been deemed "not qualified" by the judicial council. Partly because voters rarely have independent information about how judges do their jobs, the council's judgment could spell real trouble for him.

The rating is done by lawyers, judges, police and probation officers in a written, anonymous survey.

Johnstone was rated by 631 people. He received acceptable or better ratings from lawyers and judges in categories dealing with legal ability and administrative skills; law enforcement officers in general rated him acceptable or better in all categories except "freedom from arrogance."

He ran into trouble in categories listed under judicial temperament and integrity, including an unacceptable integrity rating from judges in the Third Judicial District and from judges statewide.

An acceptable rating is 3. Johnstone was given an average rating of 2.8 by other judges.

He categorized as the equivalent of a C-minus and said he thought it should be better.

Judges who said they had substantial direct professional experience with Johnstone rated him slightly lower, at 2.6, according to council figures.

"We're talking about people who are not only lawyers," Brown said, "they're judges, presumably the people who are working most closely day to day with Judge Johnstone."

Said Brown: "No Superior Court judge has ever received an unacceptable survey rating in integrity, from the time that the judicial council started doing surveys, which was in 1976."

Judge Mark Rowland, Johnstone's colleague and longtime friend on the Superior Court bench, said he knows of no reason why anyone should question Johnstone's integrity.

"I've known Judge Johnstone for a long time. I know him to be an excellent judge and a valuable addition to the bench in Anchorage," Rowland said.

On the survey, integrity is defined as conducting oneself in a manner free from impropriety or the appearance of impropriety. Respondents do not have to back up their ratings with specific allegations.

Johnstone said he was disturbed and puzzled by his low marks. "It's impossible for me to respond to an anonymous rating on integrity."

Said Johnstone: "There's not a public employee in the state who gets rated on the basis of anonymous ratings."

He attributed the low grades to old grudges from lawyers and judges he pushed too hard during his early years on the bench in an effort to make the court system more efficient.

He was appointed by Jay Hammond in 1979.

"I pushed real hard initially, too hard initially; and I've been outspoken; and I've never adopted the company line or joined the fraternity that says leave well enough alone; and it's made me unpopular. ... Grudges just sometimes don't die. ... What better way to get back at a judge you don't like for one reason or another ... than to be able to anonymously attack his integrity without having to identify yourself and without having to be specific?"

Johnstone originally attributed the judicial council's recommendation that he not be retained to a 2.2 rating on "freedom from arrogance" — the lowest rating he received in any category. Brown said that was not so.

"His very poor ratings as far as arrogance were not the leading reasons. ... The focus would have to be on the integrity."

Brown also disputed Johnstone's suggestion that people who didn't like him simply voted across the board against him. "They marked him low on eight out of 20 categories. They didn't just go through and vote the entire ticket, so-called."

And although law enforcement officers in general gave Johnstone an acceptable 3.2 rating for integrity, those who said they had substantial direct professional experience with him rated him an unacceptable 2.9, Brown said.

Johnstone handles mostly criminal cases. One reason the low ratings puzzled him, he said, is that he is rarely bumped off cases by lawyers these days and rarely is overturned by appeals courts.

This is the first year Johnstone has faced a peer review. He was on the ballot in 1982 and was retained by the voters. However, a dispute over whether he belonged on the ballot, which went all the way to the Alaska Supreme Court, delayed the decision until it was too late for him to be included in the judicial council survey.

The judicial council is a constitutionally mandated watchdog agency that evaluates judicial applicants and judges standing for retention. Brown emphasized that the survey results are only one factor considered by the six members of the council in reaching a decision to recommend for or against. Candidates fill out a detailed questionnaire and special questionnaires are sent to attorneys who have appeared before the judge under review. Council staff does a background check on the candidate and meets with the candidate in person.

Johnstone said he is relying on the public to recognize that he is doing a good job. He pointed to support from Victims for Justice, a group that sends court watchers to observe judges. Of the Superior Court judges standing for retention, Johnstone got the highest overall rating from up to 15 group participants.

The Judicial Council's record for convincing voters to get rid of judges is mixed. In 1976 and 1980, the council recommended against retention of Juneau District Court Judge Gerald Williams. The voters sided with him both times.

The council twice recommended against retention of Anchorage District Court judges Joseph Brewer and Virgil Vo[illegible]ka. Voters turned them out in 1982.

Come on Governor Parnell, in a State with over 700,000 People, Do We Really Need to Import a Board of Fisheries Member from Arizona?

Karl's wife's business web page states "in Arizona from October to May" - 8 Months - (www.valvanbrocklin.com)
Karl's Anchorage phone says "Don't Leave a Message – Call him at a (928) Area Code", which is in Arizona

In the last two years, the Board of Fisheries has met in Anchorage for a total of 43 Days –

- ✓ **Karl's hotel - $5,000**
- ✓ **Karl's per diem - $3,000**
- ✓ **This picture of Karl's house with an unplowed driveway and NO footprints to the house since Nov. 1, 2011 (the first snow) – $Priceless**

Under the Alaska Administrative Manual - AAM 60.180:
In a Meeting in the "vicinity of the Member's residence, the Member is not in travel status and not entitled to reimbursement for per diem or lodging." This rule is enforced for all other Board and Commission Members except Karl Johnstone. Mel Morris did not get paid for meetings in Kodiak, Bonnie Williams did not get paid for meetings in Fairbanks, Janet Woods did not get paid for meetings in Fairbanks, John Jensen did not get paid for meetings in Petersburg. The distance from the meeting location to Karl's house is shorter than the distance to the hotel where Karl stayed. Karl never stays in the hotel where the meeting is held, so why would Commissioner Campbell waive this rule and reimburse Karl as she seeks an increase to the Board budget to cover increased costs of over $300,000? Contact your Legislator to request an audit of ADF&G Boards Support and make Bob Penny "Buy Alaskan" – The Board of Fish process should NOT be for sale!
More to Follow!

6 Days after a Board of Fisheries meeting in Anchorage

Top Ten
Reasons Karl Johnstone should **NOT** be reappointed to the BOF:

1. In an October 30, 1988 Anchorage Daily News article, Karl Johnstone was given "low ratings for integrity, by lawyers in general and his fellow judges in particular" by the Judicial Council. In fact, in each of the three times he came up for review, his judicial scores were pathetic – hardly inspiring.

   http://news.google.com/newspapers?nid=1828&dat=19881030&id=eEAdAAAAIBAJ&sjid=7aYEAAAAIBAJ&pg=1325,7122185

2. Mr. Johnstone has failed to comply with an ADF&G public records request for copies of e-mails he sent to other BOF members along with upper level staff from ADF&G. He also apparently "BLIND" copied Bob Penny. Had Bob Penny not hit the "Reply to All" button, we would have never known Karl Johnstone was sending emails to non-BOF and Department individuals. We still don't know is who else was "BLIND" copied on the emails. As a former Judge, he should comply with the public records request, just as other BOF members have and disclose this chain of e-mails before he is confirmed.

3. In 2000, Mr. Johnstone was publicly reprimanded by the Alaska State Supreme Court for creating the appearance of impropriety in the hiring of Richard McVeigh. http://www.touchngo.com/sp/html/sp-5273.htm

4. In December 2011, Mr. Johnstone accepted a car ride from a lobbyist for Kenai River Sport Fishing to and from a BOF meeting in Valdez. This financial gratuity from a lobbyist has never been disclosed.

5. When Mr. Johnstone was originally appointed to the BOF in 2008, he did not receive a PFD. But, he now "qualifies" for a 2009, 2010 and 2011 PFD because he returns for BOF meetings in the winter.

6. In 2007, 2008 or 2009, Mr. Johnstone did not qualify for the City of Anchorage residential property tax exemption. Now, in 2010 and 2011, he has received the exemption. Under the exemption rules, he must occupy his Anchorage residence for at least 185 days per year.

7. In 2010, as a "resident" of Arizona, he did not get the senior property tax exemption in the City of Anchorage. But now, beginning in 2011, he receives the exemption.

8. Mr. Johnstone is the only Board or Commission member in Alaska to receive a "waiver" for hotel and per diem payments while attending BOF meetings in his "hometown." These payments have been in excess of $8,000. Karl also receives a State of Alaska retirement of nearly $10,000 per month. Does the State really need to pay for his hotel bill in Anchorage, which is "his hometown?" ADF&G

said these waivers were granted because it is in the State's interest to allow Mr. Johnstone to meet with constituents and allow time to prepare for the BOF meetings. These reasons would not seem nearly as contrived if other Board members were afforded the same accommodations. Mr. Johnstone's house was not available in the winter, and he did not stay in the same hotel the BOF meeting was held. In fact, the last two BOF meetings were held at a hotel which was nearer to Mr. Johnstone's house than the hotel where he stayed. Once again, this creates the appearance of impropriety.

9. In an e-mail exchange prior to the 2011Valdez BOF meeting, Mr. Johnstone wrote that "If the flight from Anchorage to Valdez is cancelled or can't get into Valdez, I plan on checking into the Capt. Cook and I will wait for further information." First, he is flying in from Phoenix and going to a hotel in Anchorage, not his house, which certainly seems inappropriate. Secondly, this is five days prior to the meeting; there are no constituents to meet with. It would appear that some ADF&G staff are helping a non-resident cover up residency problems. Is Mr. Johnstone simply a "snowbird?" Is he really now a resident of Arizona? The Alaska State Legislature should start an investigation immediately to determine these residency issues.

10. And the number 10 reason that Karl Johnstone should not serve a second term on the BOF is quite simple: He is an arrogant, bombastic bully who abuses the public and ADF&G staff. A Kenai River Sportfish group and various guide and charter groups seem to control his vote. He is not objective or fair to other user groups. Perhaps that is how "business" is conducted in Arizona, but in Alaska we deserve better. This is not an allocation fight over sport and commercial fish; it is a fight over what is fair and legal. Confirming Karl Johnstone to the BOF for a second term needs to be prevented.

Subject: Karl Johnstone

Dear Senator Paskvan;

I am writing to express my complaint against the reappointment of Karl Johnstone to the Board of Fisheries.

My personal experience is that he is fully aligned with and essentially "working for" the KRSA organization and that he shows disregard for other voices of reason and science with a predetermined intention of following a one-sided agenda.

I add my voice to many others in urging the legislature to require Governor Parnell to select another appointee who will adhere to the intended ethics and spirit of the Alaska Board of Fisheries.

Thank you.

Ted Crookston

April 5, 2012

Dear Senator Paskvan,
On Friday you'll be asked confirm Karl Johnstone to the board of fish. I hope you'll consider saying no and asking Governor Parnell to reconsider Frank Kelty or another candidate who is a resident of Alaska.
Some serious questions have been raised regarding Mr. Johnstone's residency, questions he has not answered. By his own admission, Mr. Johnstone spends eight months a year in Arizona. Prior to being appointed to the Board of Fish by Governor Palin, he did not receive a PFD. How can he possibly be considered a resident of Alaska?
A recent story in the Alaska Journal of Commerce shows that Mr. Johnstone does not occupy his home in Anchorage during the winter. When BOF meetings are held in Anchorage, Mr. Johnstone does not stay in the home he claims is his primary residence, instead staying in hotels at the expense of the State of Alaska.
In addition to Mr. Johnstone's questionable residency he has been a divisive force on the BOF.
If you're wondering why Mr. Johnstone concerns me so much it is because he seems to have no regard for commercial fishing interests in Cook Inlet. My family and I fish in the inlet and I am concerned about our future with Mr. Johnstone leading the Board of Fish. Rather than consider the inlet as resource that can be shared by sport, personal use and commercial fishermen, he seems intent on shutting down or seriously curtailing commercial salmon fishing. He appears to base his decisions on politics rather than biology and I'm afraid he is undermining public trust in the BOF process.
I started commercial fishing for salmon in Cook Inlet in 1981 and things have changed the dramatically over the years since. Sport fishing interests have taken a greater role in allocation decisions and rightly so, the population has increased in and so to the demands on the resource. But Cook Inlet is big enough and the runs are strong enough to support all users in good years and bad. Please consider finding another candidate who will treat all users in a manner that is fair and equitable.

Sincerely

Andy Hall

Subject: weather

Hello All: I have been tracking the weather for the Gulf of Alaska and it looks like a very large storm will be hitting the Gulf and South Central Alaska Tuesday and Wednesday with significant snow and/or rain forecast for PWS. I am not sure what contingency plans can be made at this late date in the event that we are unable to get to Valdez. The forecast for Valdez calls for 80% chance of snow all week starting Tuesday. If the flight from Anchorage to Valdez is cancelled or can't get into Valdez, I plan on checking into the Capt. Cook and will wait for further information. Karl

Dear Legislator,

On Friday you will be asked to confirm a non-resident to the Board of Fish, we ask you to say no to this appointment and ask the Governor to nominate a resident of Alaska who will fairly represent those who utilize our fisheries resources for work and recreation.

Karl Johnstone, the governor's nominee, no longer lives in Alaska full time. He is not qualified to serve on the board of fish. News reports and documents received from the Alaska Department of Fish and Game through a Freedom of Informaton Act request indicate that Mr. Johnstone lives in Arizona for at least eight months a year. A home in Anchorage, which he claims as his "primary residence," is only occupied a couple of months during the summer. When he returns to Alaska for Board of Fish Meetings in his "home town" he stays in a hotel on the state's dime, claiming per diem rather than open up the home he shutters for the winter.

Prior to his appointment to the board of fish in 2008, Mr. Johnstone did not receive a Permanent Fund Check. Once appointed, he began claiming a check.

He is the only Board or Commission member evidently statewide receiving this special dispensation, contrary to Statute and the Alaska Administrative Manual. Why? The answers we have seen from the department are ridiculous and ring of cover-up. It is time for a legislative Audit of the Boards Support budget to discover if there are serious irregularities and illegal acts that have aided a non-resident Board Member. Is ADF&G staff providing this support simply because Mr. Johnstone is powerful or is he delivering results that some upper level staff within the department are seeking. The Department and the Board process should be above reproach and be fair and legal for all, we can then argue for our share of the pie and feel like at least the playing field was level and fair.

From the partial FOI request it is obvious that upper level staff in the department knows Mr. Johnstone resides a significant portion of the year in Arizona and should have informed the Governor to prevent him from making this embarrassing spectacle necessary. Are these facts just Mr. Johnstone once again creating the appearance of impropriety or are they as we suspect a much deeper problem? We have just begun to look into Mr. Johnstone's appointment and have found a long history of ethical problems which have apparently continued to today without much notice. We should be able to rely on a vetting process within the Governor's office however it would appear this has been deficient. We intend to continue to press for full disclosure of the records to see if Mr. Johnstone's appointment is illegal or has resulted in additional expenses to the state so that he can return to Alaska for BoF meetings.

On March 4 the Alaska Journal of Commerce published a story on Mr. Johnstone that had many of these facts and which also alluded to a subsequent story; instead, Mr. Johnstone authored what appeared to be a full page op-ed piece which spoke of how hard the Board works, but never answered the original questions posed by the article. Mr. Johnstone was overheard boasting to "his constiuents" at the most recent Board meeting that he went to Georgia and got the story killed, now we learn that William Morris the owner of the Journal lives in Georgia. What happened to the follow-up article, did Mr. Johnstone pressure the Journal to back off, one can

only guess? In time the answers will come out, we hope you haven't embarrassed the state by reconfirming this individual in the interim.

Top Ten

Reasons Karl Johnstone should **NOT** be on the Board of Fish

1. In an October 30, 1988 Anchorage Daily News article Karl Johnstone was given "Low ratings for integrity, by lawyers in general and his fellow judges in particular" from a rating by the Judicial Council. In fact in each of the three times he came up for review his scores were pathetic. Hardly inspiring.
   http://news.google.com/newspapers?nid=1828&dat=19881030&id=eEAdAAAAIBAJ&sjid=7aYEAAAAIBAJ&pg=1325,7122185

2. Mr. Johnstone has failed to comply with a Public Records Request sent to ADF&G on February 24 requesting copies of an e-mail he sent to other BoF members along with upper level staff from ADF&G where he apparently "BLIND" copied Bob Penny. Had Bob Penny not been dumb enough to hit the reply to all button we would have never known. What we still don't know is who else was "BLIND" copied and what other "ethical challenges" Mr. Johnstone has perpetrated. As a former Judge he should follow the public records request just as other Board members have and disclose this chain of e-mails long before he is confirmed so the legislature knows just what they are getting.

3. In 2000 Mr. Johnstone was publicly reprimanded for creating the appearance of impropriety in the hiring of Richard McVeigh in 1994 while he was a judge in Anchorage, he retired shortly afterwards.

4. In December 2011 Mr. Johnstone rode in a car to and from a Board meeting in Valdez with a lobbyist for Kenai River Sport Fishing, at least 12 hours of lobbying time, no telling what was discussed. Once again creating the appearance of impropriety!

5. Mr. Johnstone did not receive the PFD in 2008 when he was originally appointed to the Board or in 2009, but he now "qualifies" for the PFD in 2010 and 2011 because he now returns for Board meetings which occur in the winter.

6. He did not get the City of Anchorage residential property tax exemption, approximately $300, in 2007, 2008 or in 2009 but now beginning in 2010 and 2011 he receives the exemption. Under the rules he must occupy the house 185 days per year. He has used his airline tickets and PFD qualifications in 2010 and 2011 to qualify for the exemption; only problem he stays in a state paid for hotel and not his house during these Board meetings.

7. He did not get the City of Anchorage senior property tax exemption in 2007, 2008 or in 2009 but now beginning in 2010 and 2011 he receives the exemption which requires the same criteria as above. This one is worth $2,300 per year and has been recently challenged.

8. Mr. Johnstone is the only Board or Commission member in Alaska receiving a "waiver" to stay in a hotel and receive per diem while in meetings in his "hometown" totaling roughly $8,000. ADF&G has said these waivers were granted because it is in the State's interest to allow him to meet with constituents and because of the extensive reading he must do. These reasons would not seem nearly as contrived if other Board members were afforded the same accommodations or if Mr. Johnstone's house was livable in the winter, which it is not, or if he stayed in the same hotel as the meeting which he does not. In fact two of the meetings in the last two years were at the Coast Inn by the airport, much closer to Mr. Johnstone's house than the hotel Captain Cook where he stayed. Once again creating the appearance of impropriety!

9. In an e-mail exchange prior to the Valdez Board meeting in December 2011Mr. Johnstone writes that "If the flight from Anchorage to Valdez is cancelled or can't get into Valdez, I plan on checking into the Capt. Cook and I will wait for further information." First he is flying in from Phoenix and going to a hotel in Anchorage not his house which certainly seems inappropriate and secondly this is 5 days before the meeting, hardly in the state's interest for him to need to stay at a hotel when the meeting is not even started and there are no constituents to meet with. It would appear that some in AFF&G are helping a non-resident to cover up his residency problems or at least waiving hotel

and per diem costs in appropriately. Is Mr. Johnstone simply a "snowbird" or is he really now a resident of Arizona? Only the state can determine these facts and that investigation should be started immediately! The state (ADF&G) has not yet complied with all of the FOI or public records request which was submitted in February and again in March. When they do many of these facts will be made abundantly clear, hopefully the legislature will not look foolish for confirming someone with what appears to be a number of "improprieties" at best.

10. And the number 10 reason that Karl Johnstone should not serve a second term on the Board is quite simple. He is an arrogant, bombastic bully who abuses the public and ADF&G staff and only sees one side of an argument; Kenai River Sport Fish and the guide/ charter industry own the man. He is not objective or fair to other users. Perhaps that is how "business" is conducted in Arizona, but in Alaska we deserve better. This is not an allocation fight over sport and commercial fish; it is a fight for what is fair and legal. Confirming Karl Johnstone to the Board of Fish for a second term is going to expose the state to numerous legal challenges beginning with his e-mails that he has failed to produce.

Come on Governor Parnell, Alaska has over 700,000 people, do we really need to import a Board of Fisheries member from Arizona?

Karl's wife has a business Web Page, it states in Arizona from October to May-8 Months-(www.valvanbrocklin.com)

Karl's Anchorage phone says "don't leave a message call him at a (928) Area Code"-Arizona

In the last two years the Board has met in Anchorage 43 days-

Karl's hotel cost $5,000
Karl's per diem cost $3,000
The picture of Karl's house with an unplowed driveway and NO footprints to the house since the first snow on Nov. 1st-Priceless!
This picture was taken March 30, 2012-6 days after an Anchorage BoF meeting.

Under the Alaska Administrative Manual- AAM 60.180 in a meeting in the "vicinity of the member's residence the member is not in "Travel Status" and not entitled to reimbursement for per diem or lodging. This rule stands for all other Board and Commission members in Alaska, except Karl Johnstone. Mel Morris didn't get paid for meetings in Kodiak! Bonnie Williams didn't get paid for meetings in Fairbanks! Janet Woods didn't get paid for meetings in Fairbanks! John Jensen didn't get paid for meetings in Petersburg! No Board of Game member gets this payment. Karl stays in the Hotel Captain Cook which has never been the location of a Board meeting and since he never stays in the meeting location hotel, why would Commissioner Campbell waive this rule and pay Karl. She is seeking an increase to Boards budget because of increased costs of over $300,000? Ask Your Legislator to request an audit of ADF&G Boards Support and Make Bob Penny Buy Alaskan-More to Follow!

Governor Sean Parnell
P.O. Box 110001
Juneau, AK 99811-0001

March 25, 2012

Dear Governor Parnell,

My name is Andy Hall, and I am a Cook Inlet set net fisherman and lifelong resident of Alaska. I am writing to express my concerns over the actions and residency status of the current Board of Fisheries chairman Karl Johnstone.

Over the last few years Mr. Johnstone's actions on the BOF, at least in regard to upper Cook Inlet, appear to be focused on ending commercial fishing in the Inlet or at best rendering it economically unfeasible as a means to make a living.

Mr. Johnstone, along with fellow BOF members Mike Smith, Bill Brown and Tom Kluberton, hold a majority position on the board and have routinely voted to cut fishing opportunities for Inlet fishermen, limiting fishing time, closing waters to drift fishermen, etc.

I can list the actions that I see as negative but I'd be presenting them through my own biased perspective. I ask that you seek input from people you trust and ask them if Cook Inlet commercial fishermen have been treated responsibly and fairly by the BOF.

Justification for many of these actions has been provided by lobbyists for the guide industry while ignoring recommendations from the Alaska Department of Fish and Game. Certainly in-river guides should have a say in the decision-making process, but of late their action requests have been enacted without regard for their affect on other users and to the fishery itself. Action requests from commercial fishermen have been ignored. A quick look at the actions taken by the BOF in 2011 when it last took up Upper Cook Inlet management will support my last statement.

Cook Inlet has enough fish for all user groups to share, in good years and bad, under the wise management of state biologists. ADF&G's management of Alaska's salmon is renowned the world over but questioned and subverted by political interests in one body of water, Cook Inlet. Don't let this to spread to other Alaska fisheries.

Governor Parnell, you are about to decide whether or not to reappoint Mr. Johnstone to the BOF. I ask you to thank him for his work and allow his term to expire.

I'm sure you're aware of the recent story that ran in the Alaska Journal of Commerce indicating Mr. Johnstone may not even be a legal resident of the state. Yes, he has had a long and storied career in Alaska, but he lives elsewhere for eight months a year. How can he be eligible to serve on the BOF?

For the sake of maintaining public trust in the BOF process and sustaining a diversified and healthy Cook Inlet fishery that provides for sport anglers, personal use and commercial fishermen, please consider naming someone other than Karl Johnstone to the BOF.

Respectfully

George Andrew (Andy) Hall

All,

I have a 4-Runner and would be O.K. with driving, but prefer to meet riders in Wasilla/Palmer as I'd be coming from Talkeetna.

The car can manage driver + 3 comfortably or driver + 4 in a crush situation.

I'll leave it to the Dept. to advise on the disposition of plane tickets if we move to a Plan-B before the Airline actually cancels the flight (I suppose we could depart en-mass from Anchorage International as soon as they cancel), how the issue of the public and staff facing the same hurdle might affect the validity of the meeting, etc. . .

Will stand-by, and, my default is to show up at the airport to see what happens.

Got my fingers crossed. . .

Tom

Hi Kelly and Monica: Just an update on the Valdez weather and some information that might help you decide on alternatives. As you know I am a pilot with a fair number of hours in alaska. As of this hour, the aviation terminal forecast goes to around 4AM tomorrow. It calls for cloud bases of around 1500' and visibilities varying around 2 miles, sometimes more or less. Long range forecasts, which may not be very reliable call for 80 to 100% snow all day on Thursday. Cloud cover and visibility are unknown. There is no precision approach to the Valdez airport that I am aware of. Because of the terrain, very high minimums apply. Actually VFR minimums are much lower but an air carrier will very likely not attempt VFR flight into Valdez except in very good conditions and then only during daylight hours. The minimum IFR altitude for an instrument approach is 4500'. That means that if the field is not in sight at 4500' during final approach the pilot is required to execute a missed approach. Similar standards apply to departures. and additional restrictions apply at night. The minimums for departure require the pilot to be able to see visually up to around 2000' all the way to Bligh and then he or she can proceed on instruments. However that does not apply at night. Higher conditions must prevail then. In my experience, air carriers will not attempt a flight when the forecast is below minimums and given that our flight to Valdez is scheduled at around 5PM it will be technically at night. I could be incorrect about the minimums I am referring to, but they are what I got online for the Valdez airport. There may be a GPS approach that I am unaware of that allows a lower approach, but I could not find it. If I am correct, I am thinking that it is unlikely that anyone will be able to fly from Anch to Valdez on Thursday and probably the next day as well. I am thinking that perhaps a car caravan could be considered from Anch to Valdez as an alternative in the event we cannot fly. It is around a 6 hour drive in normal winter conditions. A check with the DOT on road conditions would be advisable to make sure it can be accomplished. I do not mean to put a damper on the trip, but merely am providing what limited information I can. Karl

Hey Bob. I am getting a little different read on the weather than Karl down on the golf course. Karl and I talked earlier today. Monica Wellard is flying ERA into Valdez as we speak so we need to see if she actually lands or not. Take care.

Subject: Fwd: BOF Committee Process

Hello All:

I plan on using the committee of a whole process in Valdez instead of separate smaller committees as done in the past. Listed below are several reasons for this decision:

1) I have been advised by the Department of Law that using the committee of a whole process would help avoid any appearance of potential conflict with the Open Meetings Act.

2) I believe that we will have greater public awareness of our actions.

3) Members of the public that might wish to participate in more than one committee but could not sit in more than one at a time will be able to participate in any proposals that are of interest to them.

4) Since no report will be necessary, it will save significant staff resources.

It is my hope that having all members present for public discussion on all proposals that we will be better informed and prepared

in making our decisions. I realize that using a committee as a whole process may take more time than running concurrent committees. However, by eliminating the need for a committee report and then the need to refine that report, we might make up for some of the additional time needed doing the committee as a whole.

Committee of the whole Process

In order to facilitate this process, I intend on having proposals logically grouped together similar as we did when using the committee process. These groups will be given a number or letter designation. Three members of the Board will be assigned to each group, one of whom will be designated to lead the public discussion pertaining to the proposals in that group. Prior to the public discussion for each group the discussion leader, with the assistance of the other members assigned to the group, if needed, shall circulate a sign-up sheet for those public members who wish to speak during the discussion of the proposals in that group. Public members shall be selected for the purpose of maximizing public participation and with a goal of obtaining a fair and reasonable representation of those who may be affected by the proposals. After a reasonable sign-up opportunity, comment and questions from the public on that group of proposals will be limited to those who signed-up and were approved by the board members who obtained the signatures. The member who leads the discussion shall make sure that only those who have signed up are permitted to speak. However, I encourage flexibility in granting additional sign-ups any time prior to the public discussion when it may be necessary to get good representation. Those not listed to speak may ask questions or make comments by enlisting those who are approved to speak for them.

Deliberation Process

During deliberations the three board members assigned to any group, shall in addition to other deliberative discussions, initiate discussions of relevant policies and standards that are to be applied to all proposals in their group. Any other members may and are encouraged to participate in such standards and policy considerations together with engaging in all other relevant discussions. Should any board member believe that substitute language or an amendment to any proposal is in order they may, with the assistance of staff, develop and propose such changes at the proper time.

I have discussed these procedures with representatives of the Department of Fish and Game, the Board Support Executive Director, and the Department of Law lawyer representing the Board. They all believe that this process will be consistent with and not in violation of the Open Meeting Act or the APA, will help us develop a good record, and maximize public participation. Please let me have your comments and suggestions. I can't promise that I will incorporate them, but I will give them thoughtful consideration. This process will be used on a trial basis and may be modified appropriately as needed.

Subject: ADF&G Public Records Request: BOF Travel Costs
Attachments: Itemized BOF Travel 2009-2012.pdf

Good Afternoon,

The Alaska Department of Fish and Game has prepared records responsive to the first part of your Alaska Public Records Request. Specifically, you requested:

> "Meeting expenses paid for Board of Fisheries members from 2009-2012. The information should include every board meeting during the requested period, be itemized by board member and by expense category (i.e. per diem, hotel, surface transportation, misc, etc.) and amount paid in each category with totals for each member and each meeting."

The attached document includes the requested information in the desired format. Please note that there is a piece of financial information not included for one meeting. This record is being pulled from State Archives and updated information will be provided as soon as it is retrieved.

The second part of your request for communications about the Valdez Board of Fish meeting in December 2011 is still in process and we plan to have those records to you as soon as possible. Thank you for your recent clarification of this part of the request.

If you have any questions or concerns, feel free to contact me.

Have a great day.

Sincerely,

Abby Smith

Mr. Jensen,

Commissioner Campbell forwarded your inquiry regarding payments made to BOF Chairman Karl Johnstone to me for response. I have provided answers to each of your questions below in blue.

My responses are limited to questions raised in your February 29th email. Other staff in the department are compiling responses to your initial request from last Friday, February 24th.

If you have any questions regarding information I have provided below, please feel free to contact me.

Sincerely,

Kevin Brooks

Subject: Request for comment and FOIA status update

Hello, I am writing to inquire about a FOIA request sent to the Board Support office of ADF&G and the commissioner's office last Friday, Feb. 24. I have not heard back from anyone on this request and would like a confirmation it was received and a status update of when the information I've requested will be available.

In the interim, I need comments from the Commissioner and the Governor's office regarding information currently in my possession that shows that Board of Fisheries Chairman Karl Johnstone had $1,440 in travel expenses for the October meeting in Anchorage. Given that Mr. Johnstone lives in Anchorage, the payment of per diem and other travel expenses such as hotel and mileage or rental car are against state law. I refer to
AS 39.20.185. Per Diem Prohibited in Community of Residence, which states:

"A state official or employee who is a member of the judicial council or a state official or employee appointed by the governor to a state board, commission, or committee established under the authority of law is not entitled to per diem when the meeting or other business takes place in the community of which the member is a resident."

AS 39.20.190 defines the terms "employee" or "state employee" as someone working for a state agency. It further defines "official" or "state official" as the head of a state agency, i.e. the commissioner of a state department. Mr. Johnstone is neither a state employee or a state official as defined in AS 39.20.190 and therefore is not covered by AS 39.20.185.

This section of Alaska Statutes specifically addresses state employees and/or officials who are appointed to a board or commission. For example, the current director of Enterprise Technology Services in the Department of Administration is also a member of the State Board of Education, and the commissioners of Revenue and Administration are both members of the Alaska Retirement Management Board.

My questions that need responses as soon as possible are as follows:

Why was Mr. Johnstone allowed to claim per diem and stay in a hotel during a meeting in Anchorage when he lives in Anchorage?

Travel costs for board members are addressed in AS 39.20.180, and further clarified in the State Administrative Manual (AAM 60.180, copy attached) promulgated by the Department of Administration under AS 39.20.160. The entire manual is available online at http://doa.alaska.gov/dof/manuals/aam/

The AAM delegates authority to the commissioner or designee to authorize reimbursement when a meeting takes place within the vicinity (within 50 miles) of the member's residence, when in the best interest of the state. Approval was granted to Mr. Johnstone because meeting days require long hours and work sessions in the evenings, and informal meetings with the public and other board members before and after formal, on-the-record sessions. Preparation for meetings also requires review of hundreds of pages of reading material.

Who within the Department of Fish and Game approved these travel expenses?

Authority to approve waivers to the "50-mile" rule has been delegated to me as Director of Administrative Services; and Cristine O'Sullivan, Finance Officer for ADFG. Ms. O'Sullivan approved the waiver for Mr. Johnstone (copy attached).

Is Commissioner Campbell aware that Mr. Johnstone was allowed to receive travel expenses in his community of residence in violation of state law? If she was aware, why has she allowed these reimbursements to be paid?

As discussed above, payment for expenses in the vicinity of the member's home is not a violation of state law, and is allowable under the State Administrative Manual. Commissioner Campbell was not aware of the request or the subsequent approval of the request at the time it was granted.

Has Mr. Johnstone received per diem and hotel expenses for other meetings in Anchorage?

Yes, a quick review revealed a similar approval for the February-March 2011 meeting, and also for the upcoming BOF meeting later this month (copies attached). As we compile information in response to your public records request for board member expenditures back to 2009, we will let you know if there are any other similar approvals.

Knowing that state law regarding per diem payments was violated during the October meeting in Anchorage, what if anything is being done to correct this situation?

Again, no violation has occurred. Any such request requires prior approval by an appropriate departmental authority based on legitimate business reasons.

The information in my possession was generated by ADF&G in a table format, and should be easily generated for the previous meetings for which I requested information. Similarly, the request regarding emails concerning the Valdez meeting in my FOIA is limited to a fairly specific time period and should not be difficult to collect. Please advise when I can expect to receive these records, and when I will be receiving responses soon to the above questions.
Thank you for your help.

Good Morning,

The Alaska Department of Fish and Game has prepared records responsive to the second part of your Alaska Public Records Request. Specifically, you requested the following in your clarification of March 9, 2012:

> "Regarding the second paragraph, the information I'm looking for is related to preparations for the Valdez meeting. If there is confusion, I would clarify that the request is not for every email among staff and board members during the requested period, but for only emails related to preparations for the Valdez meeting. My request still includes any emails received from Penney, or sent to Penney, by staff and board members, either directly, cc or bcc.
>
> To help the process, the specific topics covered would be:
>
> Weather issues
> Transportation issues
> Any discussion about changing the meeting location or the schedule of the meeting"

The attached document includes the requested information. Please note that your most recent request for information on 3/16/2012 is being handled as a separate Alaska Public Records Request and we expect to have the response available very soon.

Feel free to contact me with any questions or concerns.

Thanks,

Abby Smith

Dear Honorable Thomas Wagoner, Chair
Honorable Joe Paskvan, Chair
Honorable Eric Representative Feige; Chair
Honorable Representative Paul Seaton, Chair

I'm writing this letter in support for the nomination of Mr. Orville Huntington to the Board of Fisheries (BOF). As the State Senator for Senate District T, I represent approximately 47 communities, the majority of whom depend on salmon and other fish as a staple in their diet. Furthermore, the salmon are also crucial to the economic and cultural way of life for the communities in my district.

To add to his qualifications and this recommendation, Mr. Huntington is from the Arctic-Yukon-Kuskokwim region. He has proven to be ardent in his work on fisheries and his representation will be valuable for this region. The past several years, the Chinook stocks have seen a severe decline. As a result, the fishermen and families that depend on the salmon for their sustenance have endured several economic and cultural hardships. In these grave times, it is imperative that Mr. Huntington be appointed to be BOF. His experience, knowledge and understanding of the salmon stocks and the rural needs make him the appropriate appointment.

Thank you for your time and consideration to this urgent matter. If you have any questions, please do not hesitate to contact my office at 907) 465-3707.

Sincerely,

Senator Donald Olson
Alaska Senate District T

Huntington, Orville
Board of Fisheries

Orville Huntington
Huslia, AK 99746

Orville Huntington was born in Huslia, Alaska and received a B.S. in Wildlife Biology from University of Alaska, Fairbanks. Mr. Huntington is dedicated to working closely with young people to promote the values of traditional Native elders combined with contemporary western knowledge. He is committed to protecting the aboriginal rights of Native people to continue to live a subsistence way of life and preserve the cultural beliefs associated with that way of life as it is consistent with State and Federal law. His primary responsibilities continue to be the preservation of Native subsistence hunting, fishing, gathering and trapping opportunities and the cultural events that surround those beliefs, and as a public servant for the village of Huslia and the 43 villages of the Tanana Chiefs Conference region.

Mr. Huntington currently works as the Wildlife and Parks Director for the Tanana Chiefs Conference. Prior to that, he served for 14 years as a Refuge Information Technician at the Koyukuk/Nowitna NWR Complex and U.S. Fish and Wildlife Service. As a scientist he worked closely with local village people in the villages of Kaltag, Nulato, Koyukuk, Galena, Ruby, Huslia and Hughes on subsistence surveys.

Previous employment:

- Seasonal labor, Bureau of Land Management (Emergency Fire Fighter)
- Fisherman
- Laborer's and Carpenter's Union
- Huslia Tribal Council (Tribal Operations Specialist)
- Tribal and City Council member

Affiliations:

- Alaska Federation of Natives board of directors (interior village representative)
- K'oyitl'ots'ina Ltd. Board of Directors (Treasurer) for the villages of Huslia, Hughes, Allakaket and Alatna
- Brooks Range Contracting Board of Directors
- Koyukuk Moose Hunter's Working Group
- Interior Regional Housing Authority Board of Commissioners
- Interior Athabascan Tribal College Board of Trustees
- Alaska Native Science Commission Board of Commissioners

Re: Letter Supporting the Confirmation of Orville Huntington to Board of Fish

Dear Co-chair Paskvan and Co-chair Wagner:

On behalf of the Alaska Federation of Natives (AFN), I am writing to urge your support of Governor Sean Parnell's nomination of Orville Huntington to the Alaska Board of Fisheries.

AFN is the largest Alaska Native organization in Alaska. Our membership includes 178 villages (both federally recognized tribes and village corporations), 13 regional for-profit Native corporations (established pursuant to the Alaska Native Claims Settlement Act), and 11 regional non-profit and tribal consortia that contract and run federal and state programs providing a broad range of human services to their member villages. AFN's over-arching mission is to enhance and promote the cultural, economic and political voice of Alaska Natives. We are committed to ensuring that Alaska Natives continue to have a strong voice in our State government.

Each of the Board of Fisheries' seven members are appointed based on interest in public affairs, good judgment, knowledge, and ability in the field of action of the board, with a view to providing diversity of interest and points of view in the membership[1]. Governor Parnell, by his appointment, demonstrates his confidence that Orville Huntington will exemplify each of the characteristics desired in a Board of Fisheries member, and AFN absolutely agrees.

I will be on travel status on Monday, April 9, 2012 when you hold a committee hearing on the confirmation of the nominees for the Board of Fish. I hope my letter supporting the confirmation of Mr. Huntington to the Alaska Board of Fisheries will be considered timely submitted although I am submitting it today.

Thank you for your time and consideration. Please let me know if you have questions or need additional information.

Sincerely,

Nelson Angapak, Sr.
Senior Vice President

Juneau, AK 99811-0001

RE: Confirmation of Orville Huntington to the Alaska Board of Fisheries

Dear Alaska State Senators and Representatives:

On behalf of the Alaska Federation of Natives (AFN), I am writing to urge your support of Governor Parnell's nomination of Orville Huntington to the Alaska Board of Fisheries. AFN is the largest Alaska Native organization in Alaska. Our membership includes 178 villages (both federally recognized tribes and village corporations), 13 regional for-profit Native corporations (established pursuant to the Alaska Native Claims Settlement Act), and 11 regional non-profit and tribal consortia that contract and run federal and state programs providing a broad range of human services to their member villages. AFN's over-arching mission is to enhance and promote the cultural, economic and political voice of Alaska Natives. We are committed to ensuring that Alaska Natives continue to have a strong voice in our State government.

Each of the Board of Fisheries' seven members are appointed based on interest in public affairs, good judgment, knowledge, and ability in the field of action of the board, with a view to providing diversity of interest and points of view in the membership[1]. Governor Parnell, by his appointment, demonstrates his confidence that Orville Huntington will exemplify each of the characteristics desired in a Board of Fisheries member, and AFN absolutely agrees.

Thank you for your time and consideration. Please let me know if you have questions or need additional information.

Sincerely,

Nelson Angapak, Sr.
Senior Vice President, Alaska Federation of Natives

Alaska State Legislature
Alaska State Senate
Alaska House of Representatives
Juneau, Alaska 99811-0001

Dear Alaska State Senators & Representatives,

I am writing as President of the Association of Village Council Presidents (AVCP) to support the appointment and confirmation of Orville Huntington to the Alaska Board of Fisheries. AVCP represents 56 federally recognized Native Villages located along the Yukon and Kuskokwim River drainages. Our villages depend on salmon and other fish as a central part of their diet. Salmon are also vital to the economic and cultural way of life of the people residing in the region.

It is absolutely essential that the BOF include a person from the Arctic-Yukon-Kuskokwim region and Orville Huntington will be a dedicated and effective representative for the region. This is a critical time for the salmon fishery resources in the region and the people who depend upon these stocks. The Chinook stocks on the Yukon and Kuskokwim River are in a serious cycle of decline. As a result of these declines, commercial fisheries are closed and subsistence fisheries are severely restricted. In these times, it is particularly necessary that Mr. Huntington be appointed to the Board. He has a broad and intimate knowledge and understanding of the salmon stocks and the users on the Yukon and Kuskokwim. His role in helping to arrive at regulatory solutions is essential.

Users are very concerned about the way the salmon fisheries have been managed in the region. Failing to appoint Orville Huntington will increase peoples' concerns and broaden the divide between the state managers and the Board and users. I urge you on behalf of the Yukon and Kuskokwim users to appoint Orville Huntington. Please feel free to call me if I can provide more information.

Sincerely,

Myron P. Naneng, Sr.
President, AVCP

SB 91
HOUSE HEARING TODAY ON GUIDE LICENSE SUNSET

The first House hearing of the session on extension of the sport fishing guide license and logbook extension is scheduled for 1 p.m. today in the **House Resources Committee.**

The Senate unanimously passed **SB 91,** without debate, on April 4. Sponsored by **Sen. Lesil McGuire** (R-Anch.) the bill moves the program sunset date to Jan. 1, 2017 from next Jan. 1. No House version was introduced.

HB 347
HOUSE DEBATING MUNY MUZZLE BILL

Stiffening opposition from local governments against **HB 347** didn't slow its progress through two committees to the House floor vote less than six weeks after it was introduced.

The bill got a second floor reading Friday, and a substantial amendment, but was held for its final House vote Monday.

The original bill said any spending by a municipality to influence a state or local initiative petition must first be approved in a local election. The amendment from Anchorage Democrat **Lindsey Holmes** deleted that provision relating to local initiatives and passed on a 20-16 vote, with 15 majority members in support.

Introduced Feb. 22 by Soldotna **Rep. Kurt Olson,** the bill has 12 fellow Republican cosponsors, all but Haines **Rep. Bill Thomas** and Ketchikan Rep. **Kyle Johansen** from Anchorage or Interior districts. The bill moved through the House State Affairs and Judiciary Committees with only one hearing in each.

"I believe this is a direct response to the coastal management initiative," said **Kathy Wasserman,** executive director of the **Alaska Municipal League,** at the bill's April 2 hearing in the House Judiciary Committee.

Unalaska Mayor Shirley Marquardt, current AML, president, also questioned the proposal. "I'm not seeing a reason why this has become a problem for the state and municipalities that it needs to be fixed," she said by teleconference

Olson is adamant that his bill is not a reaction to municipal funding that helped pay for signature gathering for the **Sea Party** initiative petition that put revival of the **Alaska Coastal Management Program** on the next state general election ballot. He has complained, at hearings, about what he suggested were tens of thousands of local government dollars spent on petition signature gathering.

Reports filed through January with the **Alaska Public Offices Commission** show the North Slope and Bristol Bay Boroughs, respectively contributed $25,000 and $4,000 to the Sea Party. The Aleutian Pribilof Islands Community Development Association and **Western Alaska Community Development Association** gave $10,000 and $5,000 respectively and the **Bristol Bay Native Corporation** gave $5,000.

The local officials also bridled at Olson's assertion, backed by somewhat conflicting memos from Dept. of Law and legislative attorneys, that municipal governments have no free speech rights. "This is just trying to stifle our word. I don't know what some members are afraid of," Wasserman added with Olson sitting directly behind her.

Legislative attorney **Alpheus Bullard** wrote a Jan. 19 memo to Olson "to alert you to constitutional issues raised by the bill." He noted a 1988 **US Supreme Court** ruling that Colorado could not prohibit the payment of signature collectors because circulation of initiative petitions is "core political speech." **(Continued on Page 2.)**

Quotes from the Week

"This is one of the rare occasions when the Murkowski Administration might have made a mistake. That wasn't a gag line. (Laughs from the room) I guess it was."
--Rep. Bill Stoltze (R-Chugiak), on HB 125, moving the Alcohol Beverage Control Board to the Dept. of Commerce from the Dept. of Public Safety, where it was placed during the Murkowski Administration, during House floor debate, April 4.

"Let me put it this way, in my district we don't have those problems."
--Sen. Bert Stedman (R-Sitka) commenting on cost overruns and dodgy financial planning of major South Central projects including the Goose Creek Prison, Port MacKenzie, Port of Anchorage and Knik Arm toll bridge, April 7.

"Anyone who relies on fish and wildlife for part of what they eat and what they have for their own culture, sport fishing or sport hunting or subsistence is all the same really."
--Board of Fisheries appointee Orville Huntington, when asked to define "subsubsistence" harvesting, during his confirmation hearing in the House Fish Committee, April 5.

"If you look out for the resource first, everybody hates you."
--Howard Delo, former Fish Board member, during House Fish Committee confirmation hearings on new Fish Board members, April 5.

MUZZLE BILL CONSTITUTIONALITY UNCERTAIN (From Page 1.)

Assistant Attorney General **John Ptacin** wrote in a March 27 memo that the bill has no constitutional problems because government entities, "including municipalities have no independent **First Amendment** rights."

In an April 2 memo responding to Olson's specific constitutionality question, Bullard said the question is "broad (and) involving the complex government speech doctrine," then dodged it. He said HB 347 is only "state constraint on certain municipal expenditures."

Rep. Max Gruenberg (D-Anch.) questioned the bill's constitutionality in its State Affairs Committee hearing. He noted that Alaska's constitution has stronger personal rights protections than those of most other states and that Bullard's second memo cited no Alaska court cases to support his views. "Municipalities, as the representative of the people, may have very significant First Amendment rights of free speech," Gruenberg said.

He wrote 13 amendments for the bill's Judiciary Committee hearing but offer only five of which two were adopted. One, which Olson endorsed, added an Aug. 29 effective date to prevent the complications that could arise if the coastal zone initiative petition is on the Aug. 28 primary ballot and the bill took effect in the middle of the election campaign. The second amendment removed repetitive language.

Gruenberg offered and then withdrew another amendment to protected municipal officials from criminal prosecution for failure to comply with the bill after eliciting the statement from the legislature's attorney that local officials could be charged with crimes "It is on the record that a person can be criminally and civilly liable," Gruenberg said.

SESSION ADJOURNMENT DATE CONTROLS COASTAL ZONE INITIATIVE BALLOT SCHEDULE

It's all but official that the legislature won't pass a bill to reestablish a coastal zone management, but the timing of end of the session remains an important factor in the fate of the **Sea Party's** initiative petition that does so.

Article 11, Sec. Four of the **Alaska Constitution** says a properly qualified initiative petition, which the Sea Party's is, appears on the next statewide election ballot "more than 120 days after adjournment of the legislative session following the filing."

That's the current session and if it ends by its statutory, 90-day deadline of April 15, the 120th day falls on Aug. 3 and the petition appears on the Aug. 28 primary.

If lawmakers ignore the 90-day limit and the session continues under the constitution's 120-day limit, then April 28 becomes the deadline for adjournment to keep the petition on the primary election ballot.

These events would also impact HJR 4, Rep. Peggy Wilson's resolution putting a constitutional amendment to re-establish a dedicated transportation projects fund on the next general election ballot. The resolution is in the Senate Finance Committee.

HJR 26
SECOND SENATE SEA OTTER HEARING TODAY

Rep. Peggy Wilson's resolution calling on federal authorities to do something to address the impact on subsistence and commercial fishing from the expanding sea otter population in the Southeast Panhandle should move out of the **Senate Resources Committee** after its second hearing this afternoon.

HJR 26 was reviewed there without action last Wednesday.

The resolution asks for an amendment to the **Marine Mammal Protection Act** to replace references to "authentic" and "traditional" products with the phrase "Alaska Native articles of handicraft." The change would allow Native artisans to create modern items, for example with zippers, and could enhance the economic prospects for Native-run tanneries in Sitka and possibly other communities in the region.

The resolution also asks federal managers to "expand and enhance" small business and broader economic opportunities for residents of the region.

Sen. Tom Wagoner (R-Nikiski), cochairman of the Senate Resources Committee expressed support for the resolution and said **Kachemak Bay** and other locales outside the Southeast region area also being decimated by sea otter population growth. Other lawmakers showed some skepticism.

"It's always a little bit dangerous when mankind tries to plays around with the ecological balance," said **Sen. Bill Wielechowski** (D-Anch.).

'DUDE' FISHING LICENSES MAY COST STATE $390K

Two members of the **Fishermen's Fund Advisory & Appeals Council** are calling for an increase in the fee for 7-day nonresident commercial fishing crew licenses to close a loophole that may be costing the state more than $390,000 a year.

The current fee schedule could threaten the long-term viability of the self-supporting $11 million fund that pays for medical treatment of on-the-job injuries to harvesters without health insurance, warned **James Herbert** and **Clay Bezenek,** at their **Senate Resources Committee** hearing, April 6.

"By our calculations may be as much as $393,000 that the state is not realizing from the sale of nonresident crew member licenses 'cause of the way this is structure," Herbert said. **Gov. Sean Parnell** named Herbert to a fourth term, and Bezenek to a second on the council.

In an April 4 letter responding to questions from **Rep Paul Seaton** (R-Homer), Herbert said sales of the 7-day commercial fishing crew license, first offered in 2004 to help promote "dude fishing" excursions for tourists, have steadily increased, resulting in a drop in overall state income and revenues to the Fishermen's Fund.

"We are unaware of any business in the state that regularly advertises 'Dude Fishing,' though we imagine it happens occasionally," Herbert wrote with reference to the advisory counsel.

The one-week license cost $30 regardless of residence. Full year licenses cost $60 for residents and $200 for nonresidents. "CFEC cannot readily tell us where these licenses were issued and how many were sold to the same individual. Regardless, something is wrong here," Herbert wrote.

"More than likely this is a large and attractive loop hole in the licensing process for some of our

crewmen," he continued.

"We feel for the most part this is coming out of the **Bristol Bay** region where the fishery is about one month long," added Bezenek at the hearing.

Using **Commercial Fishing Entry Commission** data for 2011, Herbert wrote that the state would have earned $459,200 if all 2,296 nonresident crewmembers working in Alaska that year had bought $200 crew licenses. If those nonresidents all bought only one 7-day license their total bill would have been $68,880.

Herbert said nonresidents could save money even if they bought as many as six one-week licenses at the current rate to see them through the Bristol Bay sockeye season.

Under state law the Fishermen's Fund receives 39% of the value of each crew license sold up to $50. Herbert acknowledged that the fund would receive more revenue if one person bought six 7-day licenses instead of a seasonal license but suggested that's not happening.

"Personally I doubt that there are that many people buying six 7-day nonresident licenses. I think the numbers point in the direction that this is an unfortunate loophole in the fee schedule that benefits nonresidents and hurts the state," he wrote.

"Enforcement only samples a small portion of the fleet, so it could be that some individuals only buy one license and hope for the best," he added.

Herbert's letter said the "simplest solution" is an increase in the 7-day fee for nonresidents to $100. That would make it, like the equivalent resident license, half of the full-season rate and probably avoid any legal difficulties from overcharging nonresidents.

Bezenek suggested the law could also be changed to allow the same person to buy only one 7-day license per year. "I don't think it'll hurt the dude fishing industry that hasn't really picked up yet," he added.

AOC CITES SELECTIVELY IN HUNTINGTON FISH BOARD OPPOSITION

With a broad blast at the knowledgeability of recent **Board of Fishery** members, the **Alaska Outdoor Council** declared its opposition to the confirmation of new appointee **Orville Huntington** at his **House Fish Committee** hearing, April 5.

Spokesmen for other sport fishing organizations either endorsed or declared their neutrality on Huntington's appointment. No representatives of any commercial fishing organizations testified.

"Lately we have observed a disturbing trend. The trend is the governor nominating and the legislature confirming people to the Board of Fisheries who do not know the laws that are working with it," said **Rod Arno,** executive director of the AOC in testimony during the confirmation hearings.

Arno did not comment specifically during the subsequent hearing on the qualifications of **Karl Johnstone,** a former judge and current board chairman who was appointed to his second full term by **Gov. Sean Parnell.** Huntington was named to his first 3-year term.

Selectively quoting a passage from a two-paragraph biography of Huntington provided by the governor's office, Arno suggested Huntington did not demonstrate sufficient knowledge, or perhaps support, of Alaskans' equal rights to subsistence harvest opportunities.

Earlier in the hearing Chairman **Steve Thompson** (R-Fairbanks) said the same passage in which Huntington referred to defending "aboriginal rights" of Native people "jumped out at me." Thompson noted that aboriginal rights in Alaska were extinguished by the **Alaska Native Claims Settlement Act.**

"That was when I worked for Fish & Wildlife," Huntington said with reference to the US Fish & Wildlife Service. "There's no aboriginal rights in the State of Alaska, except for **Metlakatla,** maybe," Huntington added, with reference to the only "Indian reservation" in the state, on the southern Southeast island.

During the hearing's public comment period Arno quoted part of a line from the biography, which declared that Huntington "is committed to protecting the aboriginal rights of Native people to continue to live a subsistence way of life and preserve the cultural beliefs associated with that way of life."

"This statement that he wants to protect aboriginal rights is a cause for concern," Arno continued.

The origin of the short biography is also unclear, as Arno heard if he was listening to the committee's questions before he testified, but Arno ignored the uncertainty and suggested it didn't matter when the statement was written, or who wrote it. "It is troubling that he wrote it in the first place," he declared.

Rep. Alan Austerman (R-Kodiak) then noted that Arno had not read the full sentence, but left off the final phrase, which indicated that Huntington supported the Native aboriginal right "as it is consistent with State and Federal law."

"Does that make any difference to you as the AOC or did you only want to read the first part of his sentence?" Austerman asked.

Arno claimed that he left the nine words out "for time's sake," adding, "It doesn't make a bit of difference."

Where the entire biography came from was never clarified. **Rep. Scott Kawasaki** (D-Fairbanks) noted that it is written in the third person and asked for its origin.

Huntington said it came from the governor's office and may have been written by **Jason Hooley,** director of the Office of Boards & Commissions, or **John Moller,** the governor's senior rural affairs advisor.

Contacted after the hearing **Sharon Leighow,** the governor's press secretary, said in a phone message, "We did not write it. We did supply it, though, to the committee." She added that Huntington apparently used the biography in previous job applications.

In his opening statement by teleconference, Huntington, who works for the **Tanana Chiefs Conference,** said he volunteered for the Fish Board "because I thought I could be fair to all the fisheries users of Alaska. I thought Interior would be well represented by me on the board."

Asked to define "subsistence user," Huntington said, "A subsistence user is anyone who relies on fish or wildlife for part of what they eat and what they have for their own culture whether it's sport fishing or sport hunting or subsistence hunting. It's all the same really."

A lifetime resident of **Huslia,** Huntington said his father, Jimmy, was a member of the Alaska Legislature and his uncle, Sidney, a former Game Board member. He said he no longer owns any commercial fishing permit because of the continuing closure of Interior river fisheries.

"I just found it was better to actually work than to try to fish. There was no money in it," he said.

Rep. Thompson noted that nine "Huntingtons" were listed as permit holders in Commercial Fishery Entry Commission records from 2010 and asked Orville for his views on conflicts of interest.

"I don't think it's right that we vote any time there is something to be gained," Huntington declared, noting that two cousins are permit holders.

Huntington said he would base his board votes on scientific information, primarily from the **Dept. of Fish & Game.** "Their staff seems to have the best science."

"As long as you can defend it scientifically I'll support it. It doesn't matter if it's from my own back yard. I won't support it," Huntington added.

Thompson also noted a 2004 court case in which Huntington was convicted of misdemeanor harassment and asked for an explanation "so that we know that it's not a temper problem."

Huntington said the incident occurred shortly before his wife died. "It was a hard time in my life. I pleaded no contest but it was set aside by the court. It's not an anger problem," he said.

The **Kenai River Sportfishing Association** neither endorsed nor opposed Huntington's confirmation but Exec. Dir. **Ricky Gease said,** "Although we're neutral, I'm looking forward to sitting down with Mr. Huntington in the future and talking about our local issues." He said Huntington answered the committee's questions "in a fair and honest manner. He cleared up some ... what could be troubling issues for us."

Melvin Grove, noting that he is president of the **Prince William Sound Charterboat Association,** but speaking only for himself, said of Huntington, "If he does believe all Alaskans are subsistence users I would support his nomination."

Speaking for **Kawerak,** the Nome-based regional nonprofit group, **Rose Fosdick** strongly endorsed Huntington. "He understands the **Yukon River** and knows the salmon population history and health," she said.

Committees no longer vote to endorse or oppose the confirmation of gubernatorial appointees.

SUPREME COURT CENSURED FISH BOARD CHAIRMAN FOR APPEARANCE OF IMPROPRIETY WHILE JUDGE

The chairman of the **Board of Fisheries** was publicly reprimanded by the **Alaska Supreme Court** in 2000 for leaving "the appearance of impropriety" in his appointment of the state coroner for Third Judicial District where he was presiding judge when he retired from the state bench in 1996.

Although **Karl Johnstone** was vaguely questioned by one lawmaker about "allegations of improprieties" relating to his homes in Anchorage and Prescott, Arizona, at his April 5 confirmation hearing in the **House Fish Committee,** the high court censure was not mentioned last week, nor during his first legislative review after he was appointed to the board in 2008 by **Gov. Sarah Palin.**

"Our independent review of the record convinces us that, in their totality, the events of this case give rise to an overwhelming appearance of impropriety; they would leave an objectively reasonable person with the indelible impression that (Coroner) McVeigh's hiring involved favoritism," the Supreme Court declared in the May 19, 2000 opinion.

The opinion also implicates former **Chief Justice Daniel Moore,** who was presiding when the events of the matter occurred and a personal friend of McVeigh.

The **Senate Resources Committee** has Johnstone slated for a confirmation hearing this afternoon at 3:30. A House/Senate session is scheduled for Tuesday morning to vote on all of **Gov. Sean Parnell's** new board and commission appointees.

Parnell announced the appointments of Johnstone and Huslia resident **Orville Huntington** to the Fish Board on March 31. For the first time in at least two decades the **House Resources Committee** will not hold a confirmation hearing on new Fish Board appointees.

The Supreme Court opinion came in response to Johnstone's challenge to a ruling by the **Alaska Commission on Judicial Conduct** that his appointment of coroner **Richard McVeigh** created the appearance of impropriety. The high court issued the public reprimand, apparently Johnstone's only punishment, at the recommendation of the commission.

"Judge Johnstone's conduct was negligent at best ... And at worst, given that the judge was repeatedly advised of the undesirable appearance that his actions would create, his mental state could be classified as recklessness or actual knowledge" of wrongdoing, the opinion declared.

McVeigh was appointed coroner in January 1995. The commission received a complaint shortly afterwards and began a preliminary investigation of the matter that February, according to the opinion.

Johnstone retired from the bench after 17 years in July 1996 but the investigation continued. A special counsel was hired in February 1997 and the commission issued a complaint about three months later. A three-day, formal disciplinary hearing was held in October 1997.

On a 3-5 vote the commission "declined to find clear and convincing evidence of actual impropriety" but unanimously **found the evidence sufficient to support the charge that it created the appearance of impropriety.**

Beside challenging the substance of the commission's finding, Johnstone also claimed it had no jurisdiction because he was retired.

Johnstone rejects hiring process after Chief Justice suggests applicant

The Supreme Court rejected that argument and its review of the case indicates that Johnstone largely caused his own problems after the previous coroner resigned.

As presiding judge of the district, Johnstone had the authority to directly appoint a replacement to the partially exempt post. Instead he directing area court administrator **Albert Szal** to commence a standard merit recruitment process, which includes various public notice, application and deadline requirements.

After the recruitment bulletin was issued the court personnel office found 39 qualified applicants and narrowed the eight finalists. A committee appointed by Szal ranked the finalists and agreed that one person clearly topped the list, but two others followed not far behind.

"At some point during the recruitment process," the opinion continues, Johnstone informed Szal that he wanted the new coroner to have legal training and experience, criteria that had not been included in the recruitment bulletin.

When Szal provided Johnstone with the results of the recruitment process in December 1994 Johnstone, apparently inaccurately, "expressed dissatisfaction that none of the top-ranked candidates had any legal training," the opinion notes.

Johnstone discussed the situation with then-Chief Justice **Daniel Moore,** who "suggested that Richard McVeigh either had applied or might apply for the coroner position," the opinion continues.

It notes that McVeigh has legal training, previous public employment and "he was also a personal friend of the chief justice."

Johnstone contacted McVeigh about the job shortly afterwards and McVeigh applied the next day with a cover letter and resume rather than completion of the form required of all other applicants.

While Szal was on a short vacation Johnstone contacted his secretary and ordered that the personnel committee interview McVeigh. It did so but largely retained its previous ranking and placed McVeigh sixth among the now nine finalists.

Johnstone said he would appoint McVeigh anyway. He met again with the chief justice and Szal and, during the meeting was advised against hiring McVeigh by **Stephanie Cole,** then deputy court administrative director.

Johnstone ignored warning of risk to court credibility

"Cole warned that accepting the late application could jeopardize the credibility of the court system's hiring process," the opinion continued. She said McVeigh was ineligible for hiring because he had applied after the deadline and that the only proper way he could be considered was to throw out the previous process and begin again.

Johnstone gave that order, but Szal noted that the first applicant pool had included other attorneys and that the administrator "could not justifiably declare all 39 candidates unsuitable for the job."

In a December 21, 1994 letter Szal informed the previous candidates that Johnstone had not selected any of them and that a "subsequent selection process" would occur.

That never happened. Instead, Szal contacted McVeigh to discuss his appointment as

coroner only to find that he first was reluctant to take the job for fear that he would jeopardize his state retirement payments.

Johnstone then ordered the appointment of McVeigh on a temporary basis, allowing him to collect his retirement and a new salary.

Cole, the deputy administrator, first counseled against this approach. She later concluded a temporary appointment for an indefinite term would be illegal, and counseled Johnstone against signing appointment order, the opinion said.

Johnstone, "through Szal, then submitted a second order by fax, proposing to appoint McVeigh as temporary coroner for a term of eleven months," the opinion continued without further explanation.

In a Jan. 6 memo to Johnstone, Cole wrote, "I asked Al Szal today if, in fact, Mr. McVeigh's appointment had an expected duration of eleven months or less. Al indicated that he did not know."

Cole also provided Johnstone with another way to sidestep the law by applying through administrative channels for an exemption authorizing him to hire a temporary coroner. A Jan. 11 memo from Szal to Cole declared, according to the opinion, "Presiding Judge Karl Johnstone has informed me that he does not expect Richard McVeigh to occupy the position of coroner for more than 11 months. Therefore, . . . Mr. McVeigh can be placed on the payroll as a temporary employee."

McVeigh was then appointed.

More recently, Johnstone was in the news for collecting preapproved per diem payments for hotel rooms in downtown Anchorage for board meetings last October and last month, despite having a permanent residence on Potter Valley Road about 12 miles away.

Photos of Johnstone's home, published March 1 by the **Alaska Journal of Commerce,** showed several feet of snow completely surrounding a house that had no appearance of recent occupation. The magazine reported that the **Dept. of Fish & Game** approved $108 for surface transportation, $792 for a hotel room and $540 in meal expenses for the board's Oct. 4-10 meetings and preapproval for expenses for this week's sessions.

Johnstone labeled Fish Board 'commuter'

Rep. Bob Herron (D-Bethel) said during last week's hearing that he had receive "lots of emails ... most of the time, to be perfectly honest, it's about having a Board of Fisheries member who, quote unquote, commutes from the Lower 48."

It wasn't clear where Johnstone was during his confirmation hearing, but he said by teleconference that he had heard the same complaints after his original appointment.

"Because I own a home in Prescott does not in my opinion, I believe legally anyway, mean I'm not a resident," Johnstone said. "While I'm not there fulltime it's certainly enough to constitute a residence," he added.

Declaring that it was his choice to avoid Alaska's cold winters he said, "many people do it, including some legislators."

Also at last week's hearing **Rep. Scott Kawasaki** (D-Fairbanks) asked Johnstone if he had received copies of "some things that were written opposing your confirmation to a second term."

Johnstone indicated he had received the information but Kawasaki said the apparently anonymous information had been distributed to the other committee members and that he wanted to review "several pages of documents with allegations of improprieties on your homes in Arizona and Anchorage."

"When things are not signed and people throw out random stuff I don't usually trust it, but I want to make sure you got it before House Resources," Kawasaki said.

Johnstone then explained that after his early board meetings in 2009 he "realized my job, like yours as lawmakers, is not 8 to 5."

Before the past winter's Anchorage meetings Johnston said he asked the Fish Board's executive director about per diem policy and let him know Johnstone's home was 15 miles from the downtown Anchorage meeting location.

Johnstone added that if his preference would be to work an 8 to 5 meeting day if he had to drive home and "didn't want to be wined and dined and stay up late and find himself fatigued and drive home at 10 p.m."

"I never asked for anything. I never demanded anything, but apparently I was issued a waiver by board executive director," Johnstone said.

Despite his history, Johnstone was strongly endorsed for reappointment by fellow board members **Bill Brown,** of Juneau, former board member **Howard Delo,** of Big Lake, and several sport fishing and professional guide's organizations.

The **United Fishermen of Alaska** endorsed Johnstone's appointment in 2009 but did not comment at his hearing last week.

HCR 18
SENATE PASSES 'GRAY OF FLEET' RESOLUTION

The Senate unanimously agreed to the plan to appoint two lawmakers to keep an eye on **University of Alaska** efforts to expand its seafood industry-related curriculum and help more Alaskan youth make it their career at some level.

HCR 18, sponsored by the **House Fish Committee,** originally intended to prompt legislative action to reverse the aging or "graying" of Alaska's commercial fishing fleet. As passed the resolution directs the House speaker and Senate president to appoint one member each who will serve as liaisons to the university. The liaisons are directed to report, quarterly, on the university efforts and to offer any recommendations for changes by Jan 20, 2013.

"This helps these young people get started in an industry that's going to be here in Alaska for a long, long time," said **Sen. Tom Wagoner** (R-Nikiski), a commercial fisherman, before the Senate vote.

HB 59 *First reported in LFTS #15, April 4.*
'BUY ALASKAN' LOAN RATE CUT PASSED BY HOUSE

Rep. Paul Seaton's bill allowing the state to cut two percent off commercial fishing loans used mainly to buy machinery or equipment manufactured in Alaska passed the House, April 4, on a 40-0 vote. **HB 59** has no Senate twin and was referred to the **Senate Resources** and **Finance Committees.**

The bill allows the **Div. of Economic Development** to offer a two percent cut in interest rates on engine upgrade and energy efficiency loans from the **Commercial Fishing Revolving Loan Fund** if at least 50% of the borrowed amount is spent on gear manufactured in the state.

The loan portfolio operates with a three percent floor on interest rates and the current low prime interest rate effectively means even if the bill becomes law it won't provide any rate relief until commercial interest rates rise. The bill was amended in the House Finance Committee to apply only to new energy efficiency loans and its permissive language means loan managers are free to reject rate reduction requests in any case.

"The purpose of this bill is to support and create jobs in Alaska," said Seaton (R-Homer). He noted that the Alaska Diesel Electric Co., in Anchorage, and **Coastal Refrigeration,** in Homer, manufacture equipment that could be purchased with loans that would qualify for the bill's interest rate cut.

SB 203/HB 336
ENERGY ASSISTANCE VOUCHERS NEAR PASSAGE

The chance that Alaskans will receive a little help with their energy bills this fall increased slightly with the advancement of **HB 336** out of the House Energy Committee, April 3.

With a week remaining in the session HB 336, sponsored by Rep. Steve Thompson (R-Fairbanks), still faces House Labor & Commerce and Finance Committee hearings. The bill had been there since it was introduced on Feb. 22.

The substantially identical Senate version, **SB 203,** moved out of the Senate Finance Committee, April 6 and faces a Senate floor vote today.

The **Dept. of Revenue** fiscal note on HB 336 estimates costs from $115 million to $430 million. The broad range is a result of projections using what it said are the current state average cost of kilowatt-hours of 15.5 cents and the $3.50 average for 2010 heating fuel prices, with a note that the latter has probably risen. The Permanent Fund Div. said the bill will cost another $291,000 to cover its hold harmless provision for welfare recipients.

As amended in the Energy Committee the bill gives all adults eligible for Permanent Fund dividend checks a voucher worth 250 gallons of heating oil, 35,000 cubic feet of natural gas or 1,500 kilowatt-hours as applicable to their permanent residences. Voucher values would be based on local prices on a date chosen by the Alaska Housing Finance Corp., which would administer the program.

A provision added at the request of Energy Committee Chairman **Neil Foster** (D-Nome) to cover wood-heating homeowners is not present in the Senate bill. It allows residents without "reasonable access" to heating oil, natural gas or electricity to receive a $500 check, the rough equivalent of a two-month supply of cordwood. Renters who certify that they pay no direct heating or energy costs may receive a $250 check or have their voucher transferred their landlords. Landlords would be required to deduct the "full value" of the voucher from their tenants' rent.

Senate Finance Committee Report on SB 203
Recommending "do pass": Hoffman, Thomas, Egan, Olson, Ellis.
No recommendation: Stedman.

SB 159
SENATE SENDS SUSITNA FOREST BILL TO HOUSE

With a 20-0 vote the Senate, April 4, passed **SB 159, Sen. Linda Menard's** bill to create Alaska's fourth state forest. No House version was introduced.

The Susitna State Forest would include 763,200 acres among 14 parcels. Designation as a state forest prioritizes the included lands for logging and clears the way for the Div. of Forestry to invest in logging roads and other subsidies to allow long term timber harvests.

"This is set aside, like I said, for hunters, fishers, for mining," Menard said in her comments before the Senate vote. The bill has an April 10 hearing in the House Community & Regional Affairs Committee

Senate, House, Governor agree on $3.2B total
CAPITAL BUDGET ON SENATE FLOOR MONDAY

A fiscal 2013 capital budget said to have House and executive branch agreement on a final total in the $3.2 billion range is scheduled for a Senate floor vote on Monday after being adopted, but not reported out of the Senate Finance Committee shortly after 9 p.m. Saturday.

The committee draft of **SB 160** contains $2.63 billion in spending, including $720 million in Senate project and no changes from $1.8 billion in projects included in **Gov. Sean Parnell's** original bill, according to **Sen. Bert Stedman** (R-Sitka), cochairman of the Senate Finance Committee. The House will add another $720 million worth of projects as part of the three-way agreement that should result in minimal vetoes, he added.

"That's what I'd expect, that there wouldn't be a lot of that.
We had a set target and we stayed within it. Unless there's an issue with one of the projects, technical issue, then I would expect him to step in with his veto pen for checks and balances. That's what it's for," Stedman said.

OMB Dir. **Karen Rehfeld** was present for the seven-minute hearing, which included only adoption of the new draft and a brief description by Stedman's aid **Wes Eiler.**

The bill includes $56.1 million and $43.5 million, respectively, from the Parnell Administration FY 12 capital and operating expenses.

A spending breakdown by House Districts released with the Senate bill shows top recipients as $380 million for Anchorage area wide, $155.3 million for Fairbanks area wide, $104.4 million Bering Straits, Kodiak $87 million, Kenai $82.7 million, Ketchikan $76.7 million and Mat-Su area wide $76.5 million.

The Capital City was in the middle of the pack with $45 million. At the bottom were Richardson/Glenn Highways (Dist. 12) with $20.5 million and the Northwest Arctic Region (Dists. 39, 40) with $15.9 million.

HJR 4
DEDICATED TRANSPORTATION FUND MOVES TO SENATE FINANCE COMMITTEE

Rep. **Peggy Wilson** thinks the Senate will pass her resolution for a constitutional amendment to reestablish a dedicated transportation projects fund if it gets the chance to take a vote. **HJR 4** moved out of the Senate Transportation Committee, April 3, into the growing line of bills awaiting Senate Finance Committee review.

If ratified by the voters the resolution deposits all revenues from motor fuel, studded tire and vehicle rental taxes, plus their license and registration fees into the **Alaska Transportation Infrastructure Fund.** Wilson (R-Wrangell) wants "ATIF" endowed with a $1 billion appropriation, which she

hopes will provide $100 million annually for projects that would be prioritized by a stakeholder panel but finally chosen by the legislature.

Sen. Charlie Huggins (R-Wasilla) said at the hearing that he'd support a $2 billion endowment.

SENATE SHRINKING SOUTH CENTRAL PORT FUNDING

Funding for a railroad extension to **Port MacKenzie** will be cut from $110 million to "probably $30 million" in the statewide general obligation bill, Senate Finance Committee Cochairman **Bert Stedman** (R-Sitka) said Saturday. The new draft of **SB 163,** the general obligation bond bill, should get a hearing today.

Stedman said total funding in the bill will remain at $450 million as introduced but other changes are forthcoming.

The **Senate Transportation Committee,** last month, added $50 million each for a deep-water port at Cape Blossom near Kotzebue and improvements to the Port of Nome.

The Anchorage port project should end up with $100 million, half of the governor's request. The GO bond bill will contain $50 million, another $25 million is in **SB 160,** the FY 13 capital projects bill and Stedman said he was "optimistic" the House would add another $25 million.

Stedman said the Port MacKenzie project is surviving only on its political connections.

"If that dysfunctional project was anywhere with a smaller population it would be stopped by the state and they'd be forced to either go through **AIDEA** (Alaska Industrial Development & Export Authority) with a business model that works or come up with some package," said. "I'm not in a position to put the kibosh on it, or I'd stop it in its tracks," he added.

Stedman agreed with reporters that the Anchorage port project suffered up to $30 million in "waste."

Asked to assess the cost overruns in the Goose Creek prison, KABATA **(Knik Arm Bridge And Toll Authority)** and port projects Stedman said, "Let me put it this way, in my district we don't have those problems."

CORRECTION

Laws for the SEA reported, incorrectly, in last Monday's edition ('**FY 13 BUDGET READY SENATE VOTE**') that the new state operating budget approved by the Senate Finance Committee was $22.1 million higher than that proposed by **Gov. Sean Parnell.**

The $9.5 billion budget in **HB 284**, which passed the Senate Wednesday on a 14-6 vote, is $22.1 million lower than the governor's spending plan

Laws for the SEA regrets the error.

OTHER BILLS & NEWS

HB 219
HOUSE OK'S EMERGENCY SERVICE SUBSCRIPTIONS

Legislation exempting volunteer fire, ambulance and other emergency departments operated by local government and nonprofit agencies from state insurance law passed the House on a 40-0 vote, April 4.

HB 219, sponsored by **Rep. Eric Feige** (R-Chikaloon), is a response the **Div. of Insurance's** interpretation that annual optional "subscription" fees paid by local residents to support the emergency services amount to insurance policies subject to state regulation. Feige is a founder and chief of the **Chikaloon Fire Dept.**

No Senate version was introduced and HB 219 was referred to the Senate Community & Regional Affairs and State Affairs Committees.

HB 125
HOUSE BACKS ABC BOARD MOVE TO DCCED

HB 125, the hotly debated bill to move the **Alcohol Beverage Control Board** from the **Dept. of Public Safety** to the more business-friendly **Dept. of Commerce** easily passed the House, April 4, after adoption of an amendment delaying the administrative relocation one year to July 1, 2012.

Sponsored by the **Legislative Budget & Audit Committee,** the bill is a top priority of the **Cabaret, Hotel, Retailers & Restaurant Association,** which has argued that the state should do more to promote the liquor industry.

Rep. Bill Stoltze (R-Chugiak) called the bill, "probably not the best politics (but) ... important public policy."

Opposition to the move came mainly from Democrats including majority caucus members Neal Foster, Bob Herron and Reggie Joule. Anchorage Rep. **Anna Fairclough** was the only Republican to vote against the bill. No Senate version was introduced.

HB 125 was referred to the Senate Labor & Commerce and Finance Committees.

HB 64
HOUSE PASSES PERMANENT VEHICLE, TRAILER REG ADDS SOFT CAP ON LOCAL REG TAXES

Legislation offering permanent registration to owners of motor vehicles at least eight years old and any noncommercial trailers passed the House on a 39-0 vote, April 5, after the bill's effective date was moved from 2015 to the end of this year.

HB 64 sets the permanent fee at a one-time combination of the current biennial registration fees plus $25. Those are $100 and $30 for motor vehicles and trailers, respectively. The bill also allows collection of a $2 fee on permanently registered vehicles if they are under an emission control inspection program.

Permanent registration expires if the item is sold.

The size of the bill's impact on local governments is unknown but negative on the 16 that now impose vehicle registration taxes. The Alaska Municipal League spoke against it when it was introduced last year but has grown silent in large part because House Finance Cochair **Bill Stoltze** (R-Chugiak) is it's prime sponsor.

The bill allows the **Div. of Motor Vehicles** to continue to collect the local taxes for municipalities, but only if they are no more than $100.

HB 312
ENERGY CONVERSION LOAN UP FOR HOUSE VOTE

Rep. Tammie Wilson's expanded bill offering effectively free loans for home heating improvements was amended in the House Finance Committee and is scheduled for a House floor vote today.

In what would be another program managed by the **Alaska Housing Finance Corp., HB 312** offers ten-year loans, at one percent interest, for the lesser of $7,500 or the actual cost of a new heating device powered by natural gas, propane, electricity, biomass (meaning pellets) or district heating. The device must be the primary heating source for the residence.

To qualify for a loan, the home must first be inspected by a certified energy-rater or mechanical contractor to confirm that the device will improve energy efficiency. The cost of the inspection, labor and materials for the installation would be paid by the homeowner.

SB 23
FILM TAX EXTENSION STILL IN SUBCOMMITTEE

The subcommittee on the proposed ten-year extension of Alaska's film tax credit may be ready to take the issue, and even a new version of **SB 23** back to the full **House Finance Committee** on Monday.

Rep. Mia Costello (R-Anch.), chair of the subcommittee, said after its sixth

session, Friday, that she wants to find a way to link the level of credits allowed for salaries of film stars, screen writers, producers and directors, known as "above the line" expenditures, to an increase in "below the line" spending, which includes jobs and vendor contracts for Alaskans.

Costello also suggested the creation of a small "film board" of perhaps three members, that would oversee program administration generally and specifically review the movie scripts and production proposals for their treatment of oil and other resource development issues.

"Above the line" costs may account for over 50% of a feature film budget but the bill limits credits to no more than 15% of total qualified expenditures for a single project.

Joe Mathis, vice president of **NANA Development Corp.** said the regional Native corporation subsidiary supplies many "below the line" services. He said the bill must be passed this year to allow the growing flow of Alaskan film projects to continue. Mathis called for a "competitive cap" on above the line spending and provisions for the state to buy credits back from producers to assure they would receive full value.

Film credits generally trade in the 85 to 90 percent range among the several states offering them.

In a 20-minute address the head of the **University of Alaska** film program called for creation of a comprehensive workforce training program, state subsidies for sound stages and other infrastructure and direct grants to Alaskan film projects.

Jerry LaVine, owner of **Connection Films**, in Anchorage, opposed the bill without major changes and said increases in "below the line" credits hurts his business by making it more attractive for Hollywood producers to use their regular Lower 48 contractors. LaVine also charged that the bill contains a "loophole" that allows Alaskan businesses to serve effectively as fronts for Outside vendors.

"The industry was growing before the incentive program began distorting the economics," LaVine said.

Mark Brinser, a 30-year industry veteran in Homer who produces TV commercials and documentaries, spoke against the bill and spent more than ten uninterrupted minutes lashing the Hollywood film industry as "a traveling circus of carpetbaggers wandering around the country" taking advantage of film credits.

"These people are the master chefs at cooking the books," Brinser said.

Committee Hearings & Other Events April 9-13

The legislature is operating under the so-called "24-Hour Rule," which requires that committee meetings be publicly announced before midnight on the night before they occur. For immediate information on committee schedules check the legislature's BASIS webpage at: <http://www.legis.state.ak.us/basis/start.asp?session=27>.

MONDAY, April 9

8 A.M. House Finance Subcommittee: SB 23/Film production tax credit sunset.

9:00 House Finance Committee: HB 286/General Obligation bonds for port projects.

1:00 House Resources Committee: SB 91/Sport fishing guide license & logbook sunset extension.

1:00 Senate Finance Committee: SB 163/General Obligation bonds for port projects.

3:30 Senate Resources Committee: Board of Fisheries confirmation hearings for **Orville Huntington, Karl Johnstone; HJR 26/**Sea otter management; **SB 207/**Sport fishing license exemption for disabled persons.

TUESDAY, April 10

9 A.M. House Community & Regional Affairs Committee: SB 159/

Susitna State Forest.

11:00 Joint House/Senate Session: Vote on confirmation of new board & commission appointees.

1:30 Senate Labor & Commerce Committee: HB 252/Small business income tax exemption; **HB 301/**Permanent boating safety regulations.

3:30 Senate Resources Committee: HCR 24/Establish state food resources development group.

5:00 House Energy Committee: Review of short & long term stability of gas from Cook Inlet fields.

WEDNESDAY, April 11

1:30 P.M. Senate Judiciary Committee: HB 168/Wage & contractor security bonds.

FISHERMAN'S FUND ADVISORY AND APPEALS

General: Please comment on the most important issue facing the Fisherman's Fund Advisory and Appeals Board and how you intend to approach that issue.

Clay Bezenek: You are being re-appointed, Mr. Bezenek. What is the most difficult issue that you've had to deal with? What was the outcome?

Boards & Commissions Factsheets

FISHERMEN'S FUND ADVISORY & APPEALS

Board: Fishermen's Fund Advisory and Appeals Council
Board identification number: 038

Department: DEPARTMENT OF LABOR AND WORKFORCE DEVELOPMENT

Authority: AS 23.35.010

Status: Active

Sunset date:

Requirements: Legislative Confirmation and Financial Disclosure

Prohibitions: None

Term: 5 years

Description: The board consists of 6 members: 5 appointed by Governor from five specific districts listed in statute and the Commissioner of the Deptartment of Labor, or the commissioner's designee, who serves as chair.

Function: The council consults with the Commissioner (or designee) regarding negative decisions on appeals filed in relation to care of sick and disabled fisherman; Advises the department on administration of the fund.

Chair: Labor Commissioner.

Special facts: Each district is set out in Alaska Statute as follows: District 1: Wrangell and areas south; District 2: Areas north of Wrangell to include Yakutat; District 3: Areas west of Yakutat to East Coast of Alaska Peninsula, including Prince William Sound, Cook Inlet, and Kodiak; District 4: Areas west of Alaska Peninsula to Cape Newenham, including Bristol Bay. District 5: Areas north of Cape Newenham, including Kuskokwim, Yukon, Kotzebue, and the Arctic.

Compensation: Standard Travel and Per Diem. No additional compensation.

Meetings: 2 times per year; 10 days maximum.

BOARDS AND COMMISSIONS APPLICATION FORM

INSTRUCTIONS

A separate application is required for each position for which you apply. Complete and specific answers will aid in rapid and accurate processing of your resume. Please type or print legibly in ink. Forward to the above address. Be sure your answers are true. A willfully false answer may result in your disqualification or removal from office if you are appointed.

Board or Commission and seat for which I am applying: Fishermans Fund Board
(For example, Board of Agriculture, public seat)

Please list any other State Boards or Commissions on which you currently or previously have served:
Fish Fund Bord 08-12

Name: Clay Bezenek

Mailing Address: _____

Residence Address: _____

City, State and Zip Code: Ketchikan Ak 99901

Home or Message Telephone: _____ Business Telephone: _____

Fax Number: _____ Cell Phone: _____

Email address: _____

AS 39-05-100 requires that a person appointed to a state board or commission be a registered voter prior to the last general election:

Are you a registered voter: YES X NO _____ Voter Registration Number (Optional): _____

Social Security Number (Optional, required if appointed for travel, reimbursement etc.): _____

Have you ever been convicted of a misdemeanor within the past five years or a felony within the past ten years?

YES _____ NO X if "YES", explain the circumstances on a separate sheet of paper and attach it to this application. A conviction is not necessarily grounds for disqualification. The number of convictions, nature, recentness, and relationship to the board position applied for, will be evaluated and a determination will be made after a review of all relevant facts.

CONFLICTS OF INTEREST: Certain boards and commissions require full disclosure of personal financial data under AS 39.50.010. If required for the board or commission for which you are applying, are you willing to do so?
YES X NO _____

Could you or any member of your family be affected financially by decisions to be made by the board or commission for which you have applied? YES _____ NO X

If "YES", explain:

DEC-21-2011 15:33 From: To:19072697461 Page:1/4

TRAINING AND EXPERIENCE: (If resume attached, it is not necessary to complete items A-D)

A. List any professional licenses, certifications, or registrations and dates obtained that may be used as qualifying criteria:

100 Ton masters License
AB license
Numerous endorsements

B. List both formal and informal education and training experiences: (Use additional paper if necessary).

K-12 Bagley Lake Public Schools. Bottle Lake, MN 1968-1980
Concordia College. Moorhead, MN 1980-82

C. List any community service, municipal government, and state positions held, and any awards received. Include both compensated and uncompensated positions (such as president of a service organization or a mayor). Include length of time serviced.

SARDFA Board of Directors 2yrs
Ketchikan Advisory Board (Fish & Game) 4yrs
First Lutheran Church Council 1yr

D. Employment work history – paid, unpaid or voluntary: (Use additional paper of necessary).

Commercial Fisherman 1983 - present

The Office of the Governor and the State of Alaska have an Affirmative Action Equal Employment Opportunity Program. Grant approved to improve shellfish testing program

Posted: Thursday, January 04, 2001

KETCHIKAN (AP) -- The Ketchikan Gateway Borough has approved a grant to improve a paralytic shellfish poisoning testing program.

The assembly on Tuesday unanimously approved appropriating $15,000 for the Southeast Alaska Regional Dive Fisheries Association. The money will pay for consultant Cheryl Sutton to work with the Department of Environmental Conservation on the program to allow for pre-opening testing.

Geoduck clams are in demand in the Orient but processors can't guarantee timely delivery because the clams must be tested after fishery openings, fisherman Clay Bezenek told the assembly.

The Alaska Department of Environmental Conservation does not perform pre-fishery testing in Southeast Alaska because the geoduck fishery near Ketchikan is too far from the state testing laboratory in Palmer, Bezenek said.

Dive fisheries in Canada and Washington are more competitive because authorities conduct tests in the weeks before fisheries open and continue testing during fishing periods, he said.

Clam beds are either approved as being free of toxins or are closed to fishing. Dive fishermen, therefore, can ship the clams directly from the grounds to customers in China and other nations.

The 104 licensed divers in Southeast took about 400,000 pounds of clams in the last year. The dive association is projecting that the fishery will soon produce more than a million pounds a year.

The price for live geoducks has increased from 50 cents a pound a few years ago, to $6 or more a pound, Bezenek said.

The rest of the geoduck farming story

My turn

Posted: Thursday, February 22, 2001

By A column

CLAY BEZENEK

I am a geoduck diver in Southeast Alaska and would like to respond to Mr. Pihlman's letter (Empire, Feb. 21) regarding the Southeast Regional Dive Fisheries Associations {SARDFA} letter (Empire, Feb. 13) regarding the geoduck aquaculture permit applications.

Mr. Pihlman's letter has some "Clintonesque" statements in it that I'd like to respond to. "Clintonesque" in my opinion, means putting make-up on a half or mistruth, and hoping people don't call you on it. Well, people became well-aware of Clinton's tactics and it's time for you to be aware of the real truths regarding the whole geoduck aquaculture fiasco.

The reason that people have become so venomous regarding the geoduck resource in Southeast is because the clams have become one of the most highly sought after seafood products in the world! The prices in Washington normally range from $7-10 per pound for these mollusks, and the outlook remains good. So people are trying to gain access to these animals at any cost.

I would like to start out by saying that I haven't heard a single harvest diver say that they're against aquaculture for geoducks. What they do have a great problem with is aquaculture permittees gaining access to large amounts of wild geoducks on their sites.

A couple examples of what some permittees said on their applications to the state are: "No naturally occurring geoducks here..." The state, with their own survey, found this applicant to have roughly 325,000 pounds of clams on his proposed site.

Another applicant claimed, after 20 survey dives, to have seen marginal geoduck distribution of wild clam on his sites... The Fish and Game survey results: 615,000 pounds of clams! Does everybody see our point now? I'll do the math for you. At $4.50 live price, which I received for my live clams this year, the first site equals $1.46 million, the second $2.77 million.

This isn't the idea that any of us commercial fisherman had to what "farming" was all about! We believe that you plant a seed, keep the predators out, then harvest your product. What is happening is the Aquatic Farm Act is being loopholed to death so some people can capitalize off our state's resources.

And by the way, SARDFA has been the best thing to happen to the dive fisheries in Southeast since the drysuit! We have developed a working relationship with the Legislature, Fish and Game, and our local municipalities that is second to none. Our executive director, Julie Decker, has gone beyond what any fisheries executive director I have been associated with. As far as ethics and integrity goes, she's won the respect of a lot of people in Southeast Alaska.

Mr. Pihlmans' letter is in poor taste and really doesn't deserve any reply. I'm just letting you people of Juneau hear my version of the truth. All my statements can be verified by the state of Alaska.

Clay Bezenek is a commercial salmon fisherman and harvest diver who lives in Ketchikan.

Time to take a different look at fisheries resource management

My turn

Posted: Monday, February 26, 2001

By A column
BRIAN ZWICK

As a member of the Southeast Alaska Regional Dive Fisheries Association, SARDFA, and geoduck diver I would like to comment on the recent debate over aquaculture. I have seen the geoduck fishery in Alaska go from almost nothing 15 years ago to now almost less than nothing in terms of dollars we make. I wonder if it's time to take a different look at how we manage some of our fishery resources

Aquatic farmers for geoducks want to go into areas that are not being used by our dive fishery and develop aquatic farms using the existing stock to increase the productivity of the of the bed. If we are not using the resource and it doesn't conflict with the fishery, I don't see why another commercial user group shouldn't have the opportunity for another use.

If someone can come up with a better way to bring more value to the fishery or resource then I feel we should listen. Part of the problem in Alaska is that we have heard so much hype about what others in Washington and Canada are making from the geoducks resource that we can't seem to properly assess our own resource.

I have seen the letters from SARDFA Executive Director Julie Decker and SARDFA members Clay Bezenek and Lance Pihlman. I have no vested interest in any of the proposed aquatic farms and as a geoduck diver eligible for a limited entry permit I support the geoduck farmers.

What I don't support is Mrs. Decker saying that SARDFA believes that these farmers will "rob" and "destroy" the resource. Those are ridiculous statements and unfounded.

I find it frustrating that Mrs. Decker and members like Clay Bezenek say they are not opposed to aquatic farms, yet we are just now finding out that SARDFA has taken thousands of dollars from our self assessment fund to hire lawyers to file briefs against "all" of the geoduck farmers in the lawsuit against the state. Who is robbing who here? This is my money and they are taking it to fight against something that many of us support. What these members of SARDFA are really saying is that they are not against geoduck farms, just anybody who is currently trying to do it.

Mr. Bezenek talks about the 800,000 pounds of resource on the proposed farm sites, but fails to point out that there are about 18 million pounds of geoduck bio-mass dedicated to the current fishery. He also fails to point out that fishery is still open today because nobody wants the product.

By next year limited entry will be in place that will give sole commercial access to 104 divers with only 52 of these permits being transferable, and the majority of those permits going to out of state divers. Using Mr. Bezenek's numbers and logic, by next year, 52 mostly out-of-state diver will have the sole rights to buy and sell $81 million worth of geoduck resource and he believes any future commercial expansion of the resource should go entirely to this one group.

Mr. Bezenek talks about the geoduck aquaculture fiasco. In my opinion the real fiasco here is SARDFA and the Alaska Department of Fish & Game (ADF&G). In my view all of the misinformation and nonfacts have been coming from SARDFA and ADF&G.

If you look at how we are taxing ourselves it really doesn't make a lot of sense. For example, we are currently taxed on our sea cucumber fishery, yet the fishery is fully developed and completely funded through ADF&G' s budget. The tax this year increased ADF&G's budget for this fishery by 250 percent. This money goes into the general fund and then goes directly back to ADF&G.

In my view SARDFA will likely end up being a good example of how not to manage or develop fisheries. What we have done here, is to completely politicize an industry that really just needed a little funding and some good science and management.

Brian Zwick is a SARDFA member and a geoduck diver who lives in Ketchikan.

Tim has been there

Letter to the Editor

Posted: Monday, November 04, 2002

I urge my fellow commercial fishing families to vote for Tim Grussendorf for state House. Tim has been a commercial fisherman for 23 years and has lived through the tough fishing seasons. Tim knows what needs to be done to save our lifestyle.

I've fished around Tim on the grounds. He has the dedication, commitment, hard-work ethic, and intuition to change how he did business to adapt to changing market demands to enable him to continue being a commercial fisherman. These are the same qualities that we need in our elected officials.

Only a commercial fisherman who has lived the lifestyle and gone through the tough fishing seasons understands what it takes to be in this line of work.

Let's join the United Fisherman of Alaska in supporting Tim.

We need a representative in the Legislature to look out for our interests. We need Tim Grussendorf to be our state representative.

Clay Bezenek

Boards and Commissions
Office of the Governor
P.O. Box 110001
Juneau, AK 99811-0001

Dear Madam or Sir:

Please accept my application for reappointment to the Fisherman's Fund Advisory and Appeals Council. My current term expires at the end of this month. I understand that if no new person is appointed I will continue serving until such time as the Governor makes a decision.

I have submitted the standard application and attached a resume. As a serving member of the Fisherman's Council, I feel I can offer corporate knowledge and general experience in coping with individual appeals. The financial health of the Fund has always been of great importance to me and I feel I can provide solid advice and perspective on fiduciary matters.

Please contact me if you need more information or if I should submit other forms or letters.

Sincerely yours,

Jim Herbert

RESUME

JAMES W. HERBERT
Seward, Alaska 99664

EDUCATION:

Mount Vernon High School, Mount Vernon, New York
September 1961 – June 1965
Regents Diploma
University of Wisconsin, Madison, WI
September 1965 -June 1969
Bachelor of Arts. Major in Zoology
University of Oregon, Eugene, OR
January 1975 - December 1976
Master of Arts, Marine Biology
Oregon State University, Marine Science Center,
Newport, OR, Spring 1975

LICENSES AND CERTIFICATES:

U.S. Coast Guard Merchant Marine License (#774244)
Master - 1600 GT Oceans
Unlimited Radar Observer Endorsement
Marine Fire Fighting School - Delgado Community College
STCW Certificate – BST, PSC, ARPA, BRM, RFPNW
Merchant Mariner Document - Able Seaman - Unlimited
Instructor - Trainer Alaska Marine Safety Education Association.
Emergency Medical Technician I
National Cargo Bureau Fishing Vessel Stability Certificate.
Commercial Driver's License - Class B and Passengers

EXPERIENCE:

September 2001 – present: Owner/operator F/V CAPTAIN COOK, 48 foot fiberglass fishing and research vessel. Commercial fishing and charter operations in South Central Alaska.

June 1995 - present: Skipper or Mate of MARITIME MAID, 86 foot research vessel operating in the Gulf of Alaska and Southeast Alaska. Oversight of a crew of four and up to 15 researchers conducting biological research.

December 1987 – May 2004: Maritime Department Head/Instructor at Alaska Vocational Technical Center, Seward, AK. Teaching marine related classes including Net Repair, Electronic Fish Finding, Radar, Loran, GPS, Trawling Technology, Commercial Fishing Methods, Safety and Survival, First Aid, CPR, and Vessel Operator Training. Development of a large number of USCG approved courses. Community Development Quota training outreach.

April 1988 - June 1996: Owner/operator of NORTHERN LIGHT, a 43-foot steel fishing vessel. Primary focus is long line fishing and salmon seining in Kodiak Island waters. Providing a learning and job opportunity for four individuals.

January 1979 - June 1987: Owner/operator of the 48 foot steel combination vessel CAPE CHACON. Responsibilities included the safe, efficient, and profitable operation of vessel targeting on salmon, scallops, shrimp, halibut, ground fish, Dungeness, tanner, and king crab. Also salmon research charters for the Alaska Department of Fish and Game. Waters of Southeast Alaska to Kodiak Island.

January - May 1981: Instructor Marine Program, Prince William Sound Community College, Valdez, AK. Teaching a wide variety of courses relevant to commercial fishing including Seamanship, Hydraulics, Diesel Mechanics, Trawling, Long Lining, Pot Fishing, Net Construction and Repair.

ORGANIZATIONS:

US Coast Guard Commercial Fishing Industry Vessel Advisory Committee
1989 - 1992, 1995- 2005.
Chairman 1998 - 2005

Alaska Marine Safety Education Association
Board of Directors 1990 – present
Chairman 1999 – present

Alaska Fisherman's Fund Advisory and Appeals Council
1997 – present

United Fishermen of Alaska
1985 - present

North Pacific Fisherman's Association
Member 1980 - present
Board of Directors 1986 - 1993

Homer Fish and Game Advisory Committee
Member - 1979 - 1991
Chairman - 1985 – 1989

Senate Resources Committee
Joe Paskvan, Co-Chair / April 6, 2012

Thank you, Senator Wagoner.

I will chair the hearings for the four people nominated to serve on the Big Game Commercial Services Board and the three people nominated to serve on the Board of Game.

I will first ask each of the Big Game Commercial Services Board nominees to make a brief 3 minute statement about his or her qualifications and his or her reasons for wanting to serve on the respective Board. Then Committee members will ask questions of that nominee.

Once each nominee has completed his or her statement and committee members have asked questions, we will go to public testimony – on each of the Big Game Commercial Services Board nominees – and allow two minutes for those statements.

We will then repeat the same process for the Board of Game nominees.

The order will be:

Big Game Commercial Services Board

Michael Meekin – Palmer
Michele Metz – Douglas
Donald Quarberg – Delta Junction
Brenda Rebne – Anchorage

Board of Game

Lynn Keogh, Jr. – Anchorage
Teresa Sager-Albaugh – Tok
Robert Mumford – Anchorage

Senate Resources Committee
Confirmation of Governor's Appointments

FRIDAY, APRIL 6

Fishermen's Fund Advisory and Appeals Council

Clay Bezenek – Ketchikan
Appointed: 12/26/2007
Reappointed: 3/1/2012 Term Expires: 3/1/2017

James Herbert – Seward
Appointed: 9/19/1997
Reappointed: 1/31/2001
Reappointed: 3/8/2006
Reappointed: 5/17/2011 Term Expires: 3/1/2016

Big Game Commercial Services Board

Michael Meekin – Palmer
Appointed: 2/1/2012 Term Expires: 3/1/2015

Michele Metz – Douglas
Appointed: 2/1/2012 Term Expires: 3/1/2014

Donald Quarberg – Delta Junction
Appointed: 6/20/2011 Term Expires: 3/1/2014

Brenda Rebne – Anchorage
Appointed: 1/28/2008
Reappointed: 3/1/2012 Term Expires: 3/1/2016

Board of Game

Lynn Keogh, Jr. – Anchorage
Appointed: 7/28/2011 Term Expires: 6/30/2013

Teresa Sager-Albaugh – Tok
Appointed: 7/1/2009
Reappointed: 7/1/2012 Term Expires: 6/30/2015

Robert Mumford – Anchorage
Appointed: 7/1/2012 Term Expires: 6/30/2015

MONDAY, APRIL 9

Board of Fisheries

Orville Huntington – Huslia
Appointed: 7/1/2012 Term Expires: 6/30/2015

Karl Johnstone – Anchorage
Appointed: 12/05/2008
Reappointed: 7/1/2009
Reappointed: 7/1/2012 Term Expires: 6/30/2015

Senate Resources Committee
Confirmation Hearings
April 6, 2012

MOTION TO FORWARD THE NOMINEES

In accordance with AS 39.05.080, the Senate Resources Committee is forwarding the following names to a joint session of the Legislature for a hearing.

Big Game Commercial Services Board

Michael Meekin
Michele Metz
Donald Quarberg
Brenda Rebne

It should be noted that this does not reflect an intent by any of the members to vote for or against the confirmation of the individuals during any further sessions.

Are there any objections? If not, the names will be forwarded.

~~Let the record reflect that it is _____ p.m. We are adjourned.~~

Senate Resources Committee
Confirmation Hearings
April 6, 2012

MOTION TO FORWARD THE NOMINEES

In accordance with AS 39.05.080, the Senate Resources Committee is forwarding the following names to a joint session of the Legislature for a hearing.

Board of Game

Lynn Keogh, Jr.
Teresa Sager-Albaugh
Robert Mumford

It should be noted that this does not reflect an intent by any of the members to vote for or against the confirmation of the individuals during any further sessions.

Are there any objections? If not, the names will be forwarded.

In the interest of the state's wildlife resources, the Big Game Commercial Services Board adopts regulations governing the big game commercial service industry in Alaska.

The Board makes final licensing decision and takes disciplinary actions against persons who violate licensing laws.

The Big Game Commercial Services Board is staffed by the Division of Corporations, Business and Professional Licensing.

The Big Game Commercial Services Board consists of two licensed Registered Guide-Outfitters, two licensed Transporters, two private landholders, two public members, and one member from the Board of Game.

Board members are appointed by the Governor and confirmed by the Legislature.

Frequently Asked Questions

1. Do I need a guide?

Nonresidents who hunt Brown Bear, Dall Sheep, or Mountain Goat must be accompanied in the field by licensed Alaska Big Game Registered Guide-Outfitter or be accompanied in the filed by an Alaska resident 19 years or older who is within the second degree of kindred.

Nonresident aliens (non-U.S. citizens) hunting any big game must be accompanied in the field by an Alaska Big Game Registered Guide-Outfitter.

2. How can I receive a list of big game guides?

Download List of Licensees from Internet.

To receive a list in the mail of all currently licensed Big Game Master/Registered Guides-Outfitters and Transporters, submit a check or money order in the amount of $5 (U.S. currency), made payable to the State of Alaska. Upon receipt of your written request and $5 fee, a list will be forwarded to you. The $5 fee and written request can be mailed to:

Division of Corporations, Business and Professional Licensing
Big Game Commercial Services Board
P.O. Box 110806
Juneau, AK 99811-0806

If a guide-outfitter intends to provide big game services during the calendar year, the roster will provide the guide use area(s) that the master or registered guide-outfitter is authorized to provide big game services and the addresses of the master/registered guide-outfitters and transporters.

3. How do I get a list of big game guide-outfitters that provide services for a particular species?

Obtain the most current hunting regulations from the Department of Fish and Game, Wildlife Conservation (907 465-2376), to determine which Game Management Unit(s) list the type of species you are interested in hunting. Once you have determined the Game Management Unit(s) you want to hunt in, you can request a list of currently licensed big game master/registered guide-outfitters who provide services in the unit(s) (see number 4 below).

4. Can I obtain a list of guide-outfitters who are providing big game services in a specific Game Management Unit (GMU)?

There are two ways you can obtain this information:

1. Click here for the website that provides a list of guides-outfitters who are providing big game services in a specific game management unit.

2. Submit a written request and state which GMU(s) you

would like. Enclose a check or money order in the amount of $5 (U.S. currency), made payable to the State of Alaska, and mail to the address above. Upon receipt of your written request and $5 fee, the list will be forwarded to you.

NOTE: Each guide-outfitter can only operate within three GUAs for which he registers annually. GUAs are subdivisions of GMUs.

5. How do I obtain a hunting license, tags, drawing permit, or hunting regulations?

To obtain any of the above items, click on the following web address:

http://www.wildlife.alaska.gov/

6. How do I get an application to become a Fishing Guide or obtain a list of Fishing Guides?

To obtain any information regarding fishing guides, click on the following web address: http://www.sf.adfg.state.ak.us/statewide/SF_home.cfm

Fishing guides also need a Business License. **Please visit:** www.commerce.state.ak.us/occ

7. Can I pay application, examination, license, or the big game guide-outfitter and transporter list fees by credit card?

Yes, this office does accept credit cards for the application, examination, licensing fees, or for the list of big game guide-outfitters and transporters. Please visit: www.commerce.state.ak.us/occ and click on "Credit Card Authorization Form."

8. I am a registered guide-outfitter in need of an assistant who is looking for work. Does the board maintain a list of guides seeking employment?

The board does not maintain a list of licensed guides seeking employment. However, you can purchase a list of all currently licensed guides or you can download the information from the Internet. **See FAQ #2.**

9. How do I notify the office of a change of address?

We must have the request for address change in writing. We will accept a fax, E-mail, or written notice that comes directly from you. We cannot accept a telephone call for a change of address.

10. I lost my license and I need a new one, how do I get a copy? Can you fax it?

To obtain a copy of your license, submit a written request and a duplicate license fee of $5 (U.S. Currency). The duplicate license fee can be paid in the form of a check or money order made payable to the State of Alaska, and mailed to the address above. Upon receipt of your written request and $5 duplicate license fee, we will mail the duplicate license to you. We do not fax licenses.

11. When will I receive my license renewal form?

Master/Registered Guide-Outfitter, Class-A Assistant Guide, Assistant Guide, and Transporter licenses expire on December 31 on odd-numbered years. Renewal forms are mailed to all current licensees

approximately 30 days prior to the expiration date.

12. I am a guide/outfitter in another state. Does the Alaska Big Game Commercial Services Board have reciprocity with any other states?

The board does not offer reciprocity. To become a contracting guide in Alaska, you must have performed the services of either a licensed class-A assistant or assistant guide in the state for a part of each three years (Alaska Statute (AS) 08.54.610(6)) and meet the requirements of AS 08-54.605 and .610.

Application forms describe the qualification requirements for licensure.

13. Can a nonresident or nonresident alien obtain a guide or transporter license?

A nonresident can obtain a guide or transporter license by meeting the qualifications under Alaska Statute 08.54 and 12 AAC 75.

A nonresident alien may also obtain a guide or transporter license by meeting the qualifications under Alaska Statute 08.54 and 12 AAC 75.

Although the board may issue a nonresident alien a professional license, that does not mean the board is giving the individual authority to work in the United States. Licensees must meet all the requirements of the State and Federal government. The board advises each nonresident alien who obtains a professional license to contact immigration officials regarding the process for receiving authority to actually work in the United States.

14. Can I take the Registered Guide-Outfitter or Game Management Unit Certification examination in another location or time other than what is specified on the examination schedule?

The Registered Guide-Outfitter and Game Management Unit (GMU) certification examination locations and dates are predetermined and set by current statute (Alaska Statute 08.54.600(8) and regulations 12 AAC 75.100-.110)

We do not administer Registered Guide-Outfitter and GMU examinations at any different location or dates.

15. What first aid courses are recognized by the board?

The following are first aid courses recognized by the board:

- The American Red Cross
- American Heart Association
- Medic First Aid
- National Safety Council

(*We do not have telephone numbers for the above first aid administrators.*)

Sealaska Lands Manager Appointed to Big Game Commercial Services Board

Alaska Governor Sean Parnell announced in early February 2012 that Michele Metz would serve on the Big Game Commercial Services Board. The board oversees licensing and regulating activities of providers of commercial services to big game hunters for Alaska. The board is under the Alaska Department of Commerce, Community, and Economic Development.

According to the press release from the Office of the Governor, "Service on a board or commission provides an opportunity for Alaskans to take ownership of their government," Gov. Parnell said. "I am proud of these individuals, representing all regions of the state, who have stepped forward to serve the public. I am pleased to present these names to the Legislature for approval."

The board includes two registered guide/outfitters, two licensed transporters, one member chosen by the Board of Game, two private landholders and two public members. Metz fills one of two seats representing private landholders.

Metz is the Sealaska lands manager and has worked with Sealaska since 2002.

BIG GAME COMMERCIAL SERVICES BOARD APPLICATION
FOR DON QUARBERG, PAGE 2

A: N/A

B: University of Wisconsin, Bachelors Degree in Natural Resources and Water Resources Management.

Texas A&M University, Master of Science Degree in Fisheries Science.

35 years as a resident of Interior Alaska.

Member of the Alaska Professional Hunters Association.

Member of the Alaska Outdoor Council

Member of the National Rifle Association

Member of Safari Club International

Attended Big Game Commercial Services Board meeting to testify as chair of the Delta Fish and Game Advisory Committee on the AK DNR Guide Concession Areas prospectus. My testimony followed an intensive review (over 20 hours) with local registered guides and assistant guides in an effort to educate myself about the guiding industry in Alaska, as I am not professionally involved in that activity.

C: Current chair and member of the Delta Fish and Game Advisory Committee (20+ years).

Current member of the Delta Bison Management Working Group (30 years +/).

Past President/member of the Deltana Fair Board (12 years).

Past member/officer of the Delta Lions Club (20 years).

Past member of the Salcha - Delta Soil and Water Conservation District (20 years).

D: US Navy, Aviation Electrician, 1961-1965.

Texas A&M University, Research Associate, 1972-1974.

USDA- Soil Conservation Service, Soil/District Conservationist (1976-1979).

University of Alaska Fairbanks, Cooperative Extension Service, Agricultural Agent, (1979-1997).

Retired, Professor Emeritus, University of Alaska Fairbanks, (1997 - present).

BIG GAME COMMERCIAL SERVICES BOARD APPLICATION FOR DON QUARBERG, PAGE 4

Donald M Quarberg, age 67 of Delta Junction is a retired Professor Emeritus of Extension from the University of Alaska - Fairbanks. Mr. Quarberg holds a bachelor's degree in natural resources and water management from the University of Wisconsin and a Master of Science degree in Fisheries Science from Texas A&M University. In addition, he has a long history of serving on the Delta Junction Fish and Game Advisory Committee and the Delta Bison Management Working Group with the Department of Fish and Game.

Alaska opens Delta Junction bison hunt early

Posted: Monday, July 26, 2010

FAIRBANKS - The state is opening the Delta Junction bison hunt two months early to help cut down on damage to local crops.

The early hunt that begins Monday will be for bulls only and will take place in limited areas.

Hunters with permits can take bison on private and public land north of the Alaska Highway. One parcel of private agricultural land south of the highway also will be open.

The early season does not apply to the 90,000-acre Delta Junction Bison Range or military lands south of the Alaska Highway. This is where bison typically roam before moving into farm fields.

A crop damage assessment conducted last fall estimated that bison caused more than $142,000 worth of damage to crop lands.

"We're hoping an early hunt can be a helpful management tool," biologist Steve DuBois with the Alaska Department of Fish and Game said in a statement.

The Delta bison hunt, which normally opens Oct. 1, is the most popular drawing permit hunt in the state. It attracts more than 10,000 applications each year for about 100 permits. The state issued 70 bull permits and 50 cow permits this year.

Crop damage caused by bison has been a long-standing problem for farmers in the area. The 400-head herd spends about half its time on private agricultural land, where the animals eat, tromp and destroy crops like barley, hay and potatoes.

Some farmers have called for fencing the herd in or fencing their crops in, as well as reducing the size of the herd. Hunters have strongly opposed those options, resulting in a stalemate over the issue.

The early hunt was a suggestion from the Delta Bison Working Group, an advisory committee created by Fish and Game. The group, which has representatives from farming and hunting interests, has not come to any kind of consensus over decreasing herd size or fencing.

Delta farmer Mike Schultz, who represents the farming community in the group, said opening the season earlier is "worth a try."

Don Quarberg, one of two hunting representatives, agreed.

"I don't think (an earlier hunting season) is going to be the salvation but it can't be any worse," he said. "At least they're doing something."
