MEMORANDUM

Date: March 16, 2015

To: Senator Lesil McGuire
Senate Judiciary Committee, Chair

From: Representative Bob Herron 

RE: CSHJR 15 (JUD) – Honor Ted Stevens; Discipline Prosecutors

We respectfully request a hearing for CSHJR 15 (JUD), “Denouncing the decision to reverse the suspensions of the federal prosecutors who intentionally withheld evidence of innocence from the defense of Senator Ted Stevens; and honoring the service of Senator Ted Stevens” in the Senate Judiciary Committee.

HJR 15 Resolves that the Alaska State Legislature:

- Supports the full and fair exoneration of Senator Ted Stevens;
- Denounces the decision to reverse the suspensions of the federal prosecutors who intentionally withhold evidence from the defense of Senator Stevens;
- Requests the Alaska Bar Association determine whether federal prosecutors in the Stevens case violated the Alaska Rules of Professional Conduct;
- Honors the distinguished leadership of Senator Stevens to the State of Alaska on many issues that the state still faces today; and
- Further honors the importance of Senator Stevens’ service and legacy as a vital part of the history of the State of Alaska.

Witness List:

- Representative Bob Herron

No specialized IS equipment needed.

If you have any questions or need additional information, please call Rob Earl at 465-5141.

MEMORANDUM

To: The Honorable Lesil McGuire, Chair

Fr: Representative Tammie Wilson

Re: Hearing Request for CSHB 15 (FIN)

Date: April 13, 2015

Dear Chair McGuire,

I respectfully request a hearing for CSHB 15 (FIN) in the Senate Judiciary Committee. My staff on this piece of legislation is Barbara Barnes. She can be reached at (907) 465-4797.

Sincerely,

Tammie

SPONSOR STATEMENT

CSHB 15

**"An Act relating to credits toward a sentence
of imprisonment for certain persons under electronic monitoring."**

The state of Alaska faces rising incarceration costs, growing correctional populations, and declining financial resources. To face this challenge, Alaska must seek out alternatives which maximizes state financial resources while providing needed services. It is the purpose of HB 15 to grant credit against a sentence of imprisonment, if convicted, for time spent in a treatment program or under electronic monitoring.

Electronic monitoring (EM) is a tool utilized by the Department of Corrections (DOC) and private electronic monitoring companies that provides cost effective supervision of an alleged offender. The EM program allows qualified individuals to serve time at home while adhering to the program conditions. Qualified individuals can gain access to community-based treatment, maintain employment, access medical treatment and perform community service work. The ability to grant credit against a sentence of imprisonment for time spent under supervision of electronic monitoring or within a treatment program can potentially save the State millions of dollars a year while allowing citizens to continue to be productive while awaiting trial.

Thank you for your support of CSHB 15.

Sectional Analysis

CSHB 15 (FIN)

Section 1: Amends AS 12.55.027(a) to permit the Courts to grant defendants credit towards a sentence of imprisonment for time spent under electronic monitoring.

Section 2: Amends AS 12.55.027(d) allowing the Courts to grant defendants credit towards a sentence of imprisonment for time spent under electronic monitoring if the individual has not committed a criminal offense while under electronic monitoring, and the court imposes restrictions on the person's freedom of movement and behavior. Section 2 also provides restrictions of freedom exceptions for court appearances, meeting with counsel, and periods during which a person is at a location ordered by the court for purposes of employment, attending educational or vocational training, performing community volunteer work, or attending rehabilitative activities or medical appointments.

Section 3: Adds electronic monitoring to AS 12.55.027(e).

Section 4: Establishes the Applicability of the Act to an offense committed before, on, or after the effective date of the act.

STATE OF ALASKA
2015 LEGISLATIVE SESSION

Analysis

The bill, if enacted into law as drafted, would require the courts to grant credit, against a term of imprisonment, for time spent by the sentenced defendant in a private residence or under electronic monitoring. The bill would also require the Department of Corrections to administratively award "good time" deduction from a sentence of imprisonment for any period spent by the sentenced defendant in a treatment program, in a private residence or while under electronic monitoring.

The effect, if the bill became law, would be to increase the amount of time credited to a prisoner on his or her sentence for time spent by that prisoner "in a private residence," in a treatment program and/or under electronic monitoring. There could be a corresponding reduction in the costs to the state associated with housing incarcerated prisoners in jails and prisons and a corresponding increase in the costs associated with administering treatment programs and electronic monitoring programs, since the latter would likely become a preferred mode of supervision for many accused defendants, both pre- and post-trial, as a way of reducing the time spent in jail or prison.

The Departments of Law, Public Safety and Corrections and the Alaska Court System, along with accused and sentenced defendants, organizations and businesses concerned with victims' rights and bail/monitoring of defendants, all would likely be materially affected by the law.

What is meant by the term "in a private residence" is not defined.

The bill as such would not materially affect the operations or mission of the Office of Public Advocacy (OPA) but would definitely affect criminal defendants represented by OPA attorneys. The agency, therefore, submits a zero fiscal note.

FISCAL NOTE ANALYSIS

STATE OF ALASKA
2015 LEGISLATIVE SESSION

Analysis

This bill allows a court to grant credit against a sentence of imprisonment for time spent by a defendant in under house arrest or under electronic monitoring and allows good time credit to prisoners for time spent in treatment programs while under house arrest or electronic monitoring.

The Public Defender Agency does not anticipate a financial impact from this legislation. The agency, therefore, submits a zero fiscal note.

ASSOCIATED REGULATIONS

Does the bill direct, or will the bill result in, regulation changes adopted by your agency? No
 If yes, by what date are the regulations to be adopted, amended or repealed?

Why this fiscal note differs from previous version:

CSHB15 is revised removing "good time" credit for persons who spend time in treatment programs or on electronic monitoring.

Prepared By:	April Wilkerson	Phone:	(907)465-3460
Division:	Administrative Services - Department of Corrections	Date:	03/21/2015 12:00 PM
Approved By:	Remond Henderson, Deputy Commissioner	Date:	03/21/2015
Agency:	Department of Corrections		

FISCAL NOTE ANALYSIS

STATE OF ALASKA
2015 LEGISLATIVE SESSION

Analysis

This legislation will expand credit towards a sentence of imprisonment to those who are under electronic monitoring in pre-trial status.

Section 1: will require the court to grant credit toward a sentence of imprisonment for time spent on electronic monitoring while in pre-trial release status.

Section 2:

States that a person shall be awarded credit against a sentence of imprisonment for time spent under electronic monitoring. To receive this credit the person may not commit a criminal offense while under electronic monitoring and the court imposes substantial restrictions on the persons freedom of movement and behavior while under electronic monitoring.

The person on electronic monitoring will be confined to a residence with the exception of the following:

- Court appearances
- Meeting with counsel
- Employment (ordered by the Court)
- Educational or vocational training
- Performing community volunteer work (community work service)
- Attending rehabilitative activities
- Medical appointments

If a person in pre-trial status is allowed to leave the State of Alaska the requirements of the Inter-State Compact Agreement must be met prior to sentencing if probation will be a condition set by the Courts.

This bill will potentially reduce the length of time a person receiving credit is placed under the Department of Corrections custody. The department is currently unable to quantify any reduction to sentence lengths or impacts to the department with passage of this legislation, however, the department will monitor and track for any future fiscal impacts.

FISCAL NOTE ANALYSIS

STATE OF ALASKA
2015 LEGISLATIVE SESSION

Analysis

HB 15 requires a court to grant a credit against a sentence of incarceration to a person who is out of custody on bail if, as a condition of that bail, the person spends time in a private residence, on electronic monitoring or in a treatment program.

The Department of Law does not anticipate a fiscal impact.

**Explanation of Changes
CSHB 15 (FIN)**

“An Act relating to credits towards a sentence of imprisonment for certain persons under electronic monitoring”

1. CSHB 15 (FIN) removes the word substantial in reference to restrictions on the person’s freedom of movement and behavior.
2. CSHB 15 (FIN) adds electronic monitoring to AS 12.55.027(e).

Electronic Monitoring Requirements in Alaska

Minimum Requirements:

1. Release date is less than three years.
2. No current or prior sex offense related convictions.
3. No current domestic violence related convictions.
4. Reside in and work in the Anchorage, Fairbanks, Girdwood, Kenai, Ketchikan, Mat-Su or Sitka areas.
5. Land-line phone with basic service and long distance carrier
6. Must be able to provide a "clean" urine sample (no prescription narcotics or street drugs).
7. No weapons, alcohol, or controlled substances in the home.

The Electronic Monitoring (EM) program allows inmates who meet certain requirements to serve time at home. Inmates can maintain employment, access community-based treatment, perform community work service, address medical issues, and attend religious functions. There is a weekly cost associated with the program. A fee of either \$12.00 or \$14.00 a day will be assessed plus a \$10.00 urinalysis test fee is required.

Telephone Requirements:

1. No calling features such as call waiting, caller ID, voice mail.
2. Must have long-distance carrier. No long distance charges will be incurred by Electronic Monitoring equipment.
3. Must have one corded telephone.
4. The telephone line must be clear of all electronic equipment - no fax machines, computers, or answering machines, no dial-up internet connections.
5. Cable modem and DSL Internet connections must be removed.

Payment and Remand Information:

1. All payments are to be made in cash, money order, or cashier's check only.
2. All installation take place Monday-Friday at 7:45 a.m.
3. All enrolled individuals must be prepared to provide a urine sample and have \$108.00 for the first week's payment.
4. A fee of either \$12.00 or \$14.00 a day will be assessed plus a \$10.00 urinalysis test fee is required.

Alaska Department of Corrections Electronic Monitoring Terms and Conditions

Offender Name: _____

I understand that my placement on Electronic Monitoring (EM) is a privilege which may be revoked by the Department of Corrections (DOC); I understand that any violation of EM terms and conditions or conduct or activity that reflects a disregard for the rights of others shall be sufficient cause to terminate my EM participation.

I understand and agree to the following conditions during my participation in EM:

1. I will only reside in my approved residence at _____

2. I will obey all state, federal, and local laws, ordinances, orders, and court orders. **(Initial)** _____
3. I will report to the EM office located at _____
weekly or otherwise as directed by EM officers. **(Initial)** _____
4. I will maintain full time work and/or school during my house arrest confinement period unless otherwise authorized by EM officers. I will notify EM officers of unplanned changes in employment status immediately. **(Initial)** _____
5. I will obtain prior approval from EM officers before changing my employment, required treatment, and/or my residence. **(Initial)** _____
6. I will not be the sole guardian, babysitter, or custodian/primary caregiver for any person(s), children, or pets without approval from EM officers. **(Initial)** _____
7. I understand the house arrest confinement restrictions will be enforced by the use of electronic technology. To ensure compliance, I understand I will be required to wear an ankle bracelet 24 hours a day for the entire length of my participation in EM. **(Initial)** _____
8. I will install and maintain a telephone line, high quality telephone, and a 110-volt current at my expense and further agree to keep said service and equipment in proper working order. I understand that caller ID, call waiting, call forwarding, voice mail and answering machines are strictly forbidden while on EM. **(Initial)** _____
9. I will not tamper with, disconnect, move or remove any of the monitoring equipment (including phone and power cords). **(Initial)** _____
10. I will abide by all schedules and restrictions placed on me while participating in EM. I agree to remain in my approved residence at all times, except for those hours approved by the EM officers to fulfill employment, school/training, medical/treatment programs, and/or special authorized leave. I agree to go directly to the place(s) authorized and return directly to my approved residence. **(Initial)** _____

11. I understand that unauthorized deviation from my approved schedule could result in termination from the program. In the event of an emergency (i.e. medical emergency, fire) I will contact EM officers as soon as possible, following the emergency situation. I understand I will be required to provide full documentation of the emergency situation. **(Initial)** _____
12. I agree to pay the cost of electronic monitoring. The total cost to be paid per day shall be \$12 if alcohol is not a factor in your crime and \$14 if it is, plus \$10 per week for drug testing. The total cost then will be either \$94 or \$108 per week. I understand payments will be made to the Department of Corrections in installments one week in advance and prior to installation. If removed from the program for a violation, I agree to forfeit all funds paid in advance. Money order, certified check and/or cash must be used to make payments. Personal checks will not be accepted. **(Initial)** _____
13. I understand that I will be held responsible for damages (other than normal wear and tear) to the equipment. I further understand that if the equipment is not returned in good condition, I will be charged for replacement on release and hereby agree to pay for it. **(Initial)** _____
14. I will report any problems with the electronic monitoring or alcohol testing equipment immediately to DOC staff. **(Initial)** _____
15. I agree that the Department of Corrections and the vendor providing the electronic monitoring equipment are not liable for any damages and/or injuries as a result of wearing or tampering with the monitoring device. **(Initial)** _____
16. I agree that the Department of Corrections, or its officers, have no responsibility to provide food, shelter, clothing, medical care, or dental care during my house arrest confinement period. **(Initial)** _____
17. I will not drive a motor vehicle of any kind (includes cars, trucks, 4-wheelers, snow machines, motorcycles and boats) without prior written approval from EM staff. **(Initial)** _____
18. I agree to have no non-employment-related contact with a convicted felon without the permission of EM officers. **(Initial)** _____
19. I will allow DOC staff and/or police to enter my residence to install, maintain, repair or inspect the monitoring equipment and/or verify compliance with the terms and conditions of EM. **(Initial)** _____
20. I will not consume or possess alcoholic beverages of any kind, nor enter any establishment where alcoholic beverages are sold, stored, or dispensed as the primary business of the establishment. Further, I agree not to use any personal hygiene products such as mouthwash, cologne, etc. that contain alcohol. Also, I will not use cleaning products such as Lysol™ that contain alcohol while enrolled in EM. **(Initial)** _____
21. I will not consume or possess any controlled substances, prescribed or not, nor possess any drug paraphernalia, nor be in the presence of persons consuming or possessing the same. **(Initial)** _____
22. I will submit to breath and urine tests for analysis for alcohol, drugs, or metabolites of drugs upon request of the EM officers. I understand that I am responsible for the cost of the drug screening. I understand refusal to submit to a breath or urine test upon request is a violation of the program. Any positive test for alcohol or drugs will result in termination from EM. A negative UA sample must be provided prior to placement on EM. **(Initial)** _____
23. I will, upon requests by DOC staff, submit to a search of my person, personal property, residence, or any vehicle which I own or under which I have control for the presence of contraband. **(Initial)** _____
24. I will not possess any firearms, ammunition, explosives, or deadly weapons on my person, within my approved residence, or within my vehicle. I certify that all these items have been removed from those areas before beginning EM, including home inspection. **(Initial)** _____

25. I will immediately report all law enforcement contacts to EM officers. **(Initial)** _____
26. I will not enter into any agreement or other arrangement with any law enforcement agency, which will place me in the position of violating any law or condition of EM. I understand that Department of Corrections' policy prohibits me from working as an informant. **(Initial)** _____
27. I understand any false information given to EM officers or law enforcement officers will result in immediate termination from the program. **(Initial)** _____
28. I understand that giving or offering any program staff a bribe or anything of value for a service or favor will result in immediate termination from the program. **(Initial)** _____
29. I understand that my failure to successfully complete EM will result in my return to a correctional center for the remainder of my sentence. **(Initial)** _____
30. I hereby waive any right to an extradition hearing if I leave the State of Alaska while on EM. **(Initial)** _____
31. I agree that there will be no smoking while EM officers are in my residence. **(Initial)** _____
32. In accordance with local policy, a home inspection will be completed prior to installation to insure there are no weapons, alcohol, drugs, and drug paraphernalia. In addition, the home must be neat, clean, and not pose any officer safety concerns. **(Initial)** _____

I, _____, hereby acknowledge that I have read or had read to me the terms and conditions of EM. I further certify that I understand the contents and agree to the terms and conditions of EM.

Offender Signature

Date

BI TAD[®] offers both alcohol monitoring and curfew monitoring in one piece of equipment.

Alcohol Monitoring + Reliable Curfew Monitoring

Until now, corrections agencies, courts and treatment providers have had limited options for alcohol monitoring. Backed by the electronic monitoring industry leader, BI TAD is a pioneering device that offers objective, reliable alcohol monitoring and radio-frequency (RF) curfew monitoring in one unit.

Product Overview

BI TAD provides alcohol monitoring and relies on radio-frequency (RF) technology to report alcohol events to officers. Using transdermal technology, TAD is an ankle-worn device that senses alcohol through the skin. It detects and reports alcohol events over a 0.020 transdermal alcohol concentration (TAC) threshold. Installed in the client's home, the BI HomeBase receiver collects alcohol events and reports them to the central monitoring computer. To accommodate the growing needs of clients without a landline connection, HomeBase is offered with cellular capability.

To detect a potential drinking event, the alcohol detection module on the back of the device monitors moisture and vapor excreted from the client's skin for alcohol. If a client exceeds the 0.020 TAC threshold, an alcohol event will be recorded and transmitted to the central monitoring computer when he or she comes within 50 feet of the HomeBase.

Simultaneous Curfew Monitoring

For agencies that perform alcohol and curfew monitoring, TAD provides a comprehensive solution in one product. Agencies are able to eliminate inventory management issues by using TAD for clients on alcohol and RF monitoring. Using the proven 314.2 Mhz frequency and the same RF monitoring technology trusted in other BI products, TAD is capable of monitoring the presence or absence of a client in the home. If a violation is detected, an alert is generated, and the supervising agency or officer is notified.

BI HomeBase is available with
landline or cellular service.

Key Features

BI TAD

- Size: 2.7 x 2 x 3.4 inches
- Weight: 8 ounces
- RF operates on 314.2 Mhz frequency
- Calibration every 6-months
- Multiple modes of tamper detection
- Water resistant
- No client testing or initial training needed

BI HomeBase

- Variable range for curfew monitoring – 35, 75, or 150 feet
- 48-hour backup battery
- 90,000 message buffer
- Landline or cellular compatibility
- Multiple alert notification methods (fax, page, e-mail, text message)
- Hello calls logged with every download (4 hour default)

Compatibility

- BI ExacuTrack®
- BI ExacuTrack® One
- BI Drive-BI®

BI TAD®, BI ExacuTrack®, BI ExacuTrack®AT, BI HomeBase™, and BI Drive-BI® are registered trademarks of BI Incorporated in the United States and/or others countries.

Easy-to-Use & Secure

Because TAD is ankle-worn and easy to install, it removes the complexity associated with many hand-held breath alcohol testing devices. Client enrollment in the software is simple and doesn't require any initial client testing, training or participation. In addition, TAD incorporates several tamper detection technologies including:

- Proximity detection gauges the unit's proximity to the client's leg.
- A motion sensor to record the amount of time the unit is stationary, which may indicate it has been removed from the ankle.
- A skin contact sensor to ensure the client is not blocking the alcohol reading.
- A fiber optic strap to detect attempts to compromise or cut the strap.

Combined, these technologies provide comprehensive protection against client tamper attempts and help to ensure system integrity.

The Technology Behind TAD

TAC levels can be correlated to blood alcohol content (BAC) levels, but not at a precise time because it takes much longer for alcohol to reach an individual's perspiration than to enter his or her bloodstream. Thus, alcohol events are reported after the fact since there is an inherent delay in transdermal alcohol testing. TAD uses a proprietary algorithm that provides a baseline for each individual wearing the device and enhances testing accuracy.

Court Validated, Single-source Admissibility

Results generated by TAD stand on their own – no secondary or backup testing is needed. TAD has single source admissibility for court and revocation hearings and has met the Daubert standard of scientific evidence admissibility.

Compatibility with the BI ExacuTrack GPS Series

In addition to providing RF and alcohol monitoring, TAD can be used in conjunction with active or passive GPS tracking. This capability for RF, alcohol, and GPS monitoring in one system simply requires an ankle-worn transmitter each for both alcohol and GPS monitoring.

THE USE OF ELECTRONIC MONITORING IN THE ALASKA CRIMINAL JUSTICE SYSTEM: A PRACTICAL YET INCOMPLETE ALTERNATIVE TO INCARCERATION

NATASHA ALLADINA*

ABSTRACT

Alaska's prisons are full, but crime has not come to a standstill. The costs of incarceration continue to rise and so do the number of inmates. The State has found itself in the midst of an urgent dilemma – it must control the mounting costs of criminal justice yet ensure public safety. It must also ensure that criminals receive just punishment. And since packing prisons has proved an inadequate solution, it is time to search for effective alternatives. This Note proposes increasing the use of electronic monitoring as an alternative to incarceration. The current electronic monitoring program in Alaska has addressed budget concerns but has not met crime reduction goals. Thus, the Note proposes a “hybrid” electronic monitoring program – one that combines the current electronic monitoring program with other alternatives to incarceration, including therapeutic justice and halfway housing. This “hybrid” should maximize resources and minimize costs, helping to correct the prison-packing predicament of the Alaskan criminal justice system.

INTRODUCTION

With one of the fastest-growing prison populations in the United States, Alaska faces an urgent criminal justice dilemma of how to control costs while maintaining public safety.¹ Alaska spends \$44,000 per

* The author is a member of the Class of 2011 at Duke University School of Law and received a B.A. in English from Emory University in December 2007.

inmate per year, and prisons are at full capacity.² In addition to curbing the rising costs of incarceration and the number of inmates, the state must simultaneously ensure public safety and effective use of tax dollars.³ And, of course, offenders must receive punishments that appear just and serve retributive, deterrent, and rehabilitative or reintegrative goals.⁴ Because increasing the prison population has failed to thwart the mounting crisis,⁵ the use of alternatives to incarceration has become imperative. One such alternative is electronic monitoring.

The Electronic Monitoring (EM) program in Alaska, governed by sections 33.30.061(c) and 33.30.065 of the Alaska Statutes,⁶ "allows inmates who meet certain requirements to serve time at home."⁷ Eligible offenders apply to one of five Electronic Monitoring Offices, located in Anchorage, Fairbanks, Kenai, Ketchikan, and Sitka.⁸ If approved, an offender pays a twelve or fourteen dollar fee per day plus ten dollars for a urinalysis test.⁹ She may then serve her sentence from home, in accordance with specific terms and conditions.¹⁰ Outwardly, Alaska's EM program, like several others across the country, appears to provide a cost-effective and viable alternative to incarceration.¹¹ However, successful use of EM has not yet been fully realized in the state.¹² This is

COST OF CRIME], available at http://www.iser.uaa.alaska.edu/Publications/researchsumm/RS_71.pdf.

2. *Id.* at 2. The \$44,000 per inmate per year figure is actually less than its 1980s counterpart. *Id.* Martin and Colt contend that even so, the figure is still high. *Id.* But cf. U.S. DEP'T OF JUSTICE, SOURCEBOOK OF CRIMINAL JUSTICE STATISTICS 11 (2003), available at <http://www.albany.edu/sourcebook/pdf/t18.pdf> (documenting state and local justice system per capita expenditures and specifically documenting Alaska's high per capita expenditures on corrections as \$279.09—second only to those for the District of Columbia).

12. See *id.* (noting that, although significantly less expensive than other alternatives to jail and prison, EM has not been shown to reduce future crime in Alaska).

due to several factors, including the newness of the technology,¹³ but courts' confusion with how to apply credit from time served while on EM to sentencing has been particularly problematic. The Alaska Court of Appeals' holding in *Matthew v. State*¹⁴ is a telling example.

In *Matthew*, the court applied its rule from an earlier case, *Nygren v. State*,¹⁵ holding that petitioner's court-ordered condition of release—EM—did not amount to “restrictions approximating those experienced by one who is incarcerated.”¹⁶ The court further held that a petitioner subjected to pretrial conditions of release that are the same as those experienced by a sentenced individual should not automatically receive credit for time served.¹⁷ Although the court affirmed the “restrictions approximating those experienced by one who is incarcerated”¹⁸ standard set out in *Nygren*, the case as a whole demonstrates a continuing lack of clarity about the effective and efficient use of EM in the criminal context—especially with respect to its dissimilar use in the pretrial and sentencing contexts. Embedded in this uncertainty is the need to manage prisons and balance punitive goals with budget concerns. The current EM program in Alaska has addressed budget concerns, but has not met crime reduction goals.¹⁹ At the same time, prisons are still overcrowded.²⁰ This Note attempts to put these various issues into perspective and proposes a possible solution that could

successfully incorporate EM into the Alaskan criminal justice system both efficiently and effectively.

Part I discusses the nature of EM in the criminal justice system and focuses on the present use of it in the Alaskan correctional system. Part II analyzes the state of the law concerning EM in Alaska. Part III probes both the potential of and the controversy surrounding the use of EM as an alternative to incarceration through the lenses of efficiency and effectiveness. Part IV then proposes a practical approach to EM that merges its use with other alternatives to incarceration.

I. THE NATURE OF ELECTRONIC MONITORING IN THE CRIMINAL JUSTICE SYSTEM

A. What Is Electronic Monitoring?

1. *Electronic Monitoring in General*

EM is a tool that is often used in conjunction with house confinement or house arrest to monitor an offender's whereabouts and restrict his movements.²¹ By using electronic devices that emit electronic signals, EM systems can track an offender's location and ensure compliance with the requirements of sentencing or supervised release.²²

EM systems vary widely and include a range of options such as "home monitoring devices, wrist bracelets, ankle bracelets, field monitoring devices, alcohol testing devices, and voice verification systems."²³ In a typical EM program, offenders wear uniquely coded electronic transmitter devices.²⁴ This uniquely coded device sends a signal to a home monitoring device located in offenders' homes and communicates with a central computer (and monitoring specialists) located in a monitoring center via telephone line.²⁵ Because offenders must follow a regimented schedule and because their uniquely coded

24. NLECTC, *supra* note 23, at 2.

25. *Id.*

devices signal any deviations from that schedule, monitoring specialists are able to keep track of offenders' activities at all times.²⁶

Electronic offender monitoring occurs either passively or actively.²⁷ Passive EM systems usually require an offender to speak to a case officer via telephone (e.g. voice verification system) or verify his presence by inserting an electronic transmitter, unique to him, into a home monitoring device.²⁸ These systems may also require an offender to breathe into a home breathalyzer device to determine his sobriety.²⁹ Active EM systems, on the other hand, have the advantage of constantly monitoring an offender's whereabouts and do not depend on the offender's cooperation.³⁰

2. *Economic, Practicability, and Eligibility Issues Surrounding the Use of Electronic Monitoring*

With either the passive or active EM model, certain economic, practicability, and eligibility issues arise. First, EM programs require participating offenders to have access to homes with telephone land lines.³¹ Since these are not available to all who may wish to participate, the requirement unfairly limits the pool of eligible offenders at the outset—discriminating against the poor and those who do not have homes or phones.³² Consequently, “[a] challenge that the rich get tagged and the poor get prison might well have some substance.”³³ But at the same time, EM is viewed as more economical than incarceration precisely because most offenders subjected to EM programming must cover the costs of that sanction.³⁴

Second, the criminal justice process as a whole is not without an underlying profit motive.³⁵ EM programs resulted from privatization

34. See Brian K. Payne & Randy R. Gainey, *The Electronic Monitoring of Offenders Released from Jail or Prison: Safety, Control, and Comparisons to the Incarceration Experience*, 84 PRISON J. 413, 415 (2004).

35. See WHITFIELD, *THE MAGIC BRACELET*, *supra* note 32, at 109.

and eventually, public-private partnerships,³⁶ and the commercial pressures of the private sector may have led to overselling and unrealistically high expectations.³⁷ The powerful interest groups that form this sector may have framed EM as more advantageous than it actually was,³⁸ thereby contributing to “the unexpectedly slow development of electronic monitoring.”³⁹

Third, EM programs typically target low-risk offenders.⁴⁰ The term “low-risk” reflects both the actual offenses committed and the characteristics of the offenders, including first-time offenders, those who committed non-violent or property offenses, and those with structured living arrangements.⁴¹ Moderate- to high-risk offenders may also be subjected to EM programming, but the EM used for these types of offenders consistently differs from that used for those who are considered to be lesser risks.⁴² Specifically, “[in] low-risk populations, EM may be used by itself or in conjunction with other forms of low-contact monitoring. In moderate to high-risk populations, EM is more likely to be one part of a program that involves human contact and supervision, drug treatment, or other services.”⁴³ Accordingly, for higher risk offenders, EM may prove to be a more rehabilitative and complete alternative to prison. Yet, because further research is necessary, this conclusion is, at best, a speculative one. For now, those most often selected for EM programming, whether passive or active, continue to be those who are low-risk offenders, or as some have argued, those that “probably don’t need to be monitored anyway.”⁴⁴

37. *See id.* at 112-13.

38. *See* WHITFIELD, TACKLING THE TAG, *supra* note 13, at 47 (“‘Success’ rates on electronic monitoring—as in so much of criminal justice—are infinitely elastic, easily manipulated and often conceal more than they reveal. They should be treated with considerable caution.”).

39. WHITFIELD, THE MAGIC BRACELET, *supra* note 32, at 113.

40. *See* MACKENZIE, *supra* note 21, at 319; *see also* WHITFIELD, TACKLING THE TAG, *supra* note 13, at 46; DeMichele & Payne, *supra* note 23, at 36 (recognizing that “community corrections focus on technologies designed for low-risk offenders because these offenders do not need face-to-face interaction . . . [and] are people who have committed crimes that deserve to be addressed but who do not present any unique risk to society”).

41. WHITFIELD, TACKLING THE TAG, *supra* note 13, at 46-47.

42. *See* Marc Renzema & Evan Mayo-Wilson, *Can Electronic Monitoring Reduce Crime for Moderate to High-risk Offenders?*, 1 J. OF EXPERIMENTAL CRIMINOLOGY 215, 215-16 (2005) (describing how the use of EM differs according to the type of risk an offender presents); *see also* DeMichele & Payne, *supra* note 23, at 35 (“[M]any different practices are used to monitor offenders in the community, including classifying offenders by risks, needs and change levels.”).

43. Renzema & Mayo-Wilson, *supra* note 42, at 215-16.

44. WHITFIELD, TACKLING THE TAG, *supra* note 13, at 47 (citation omitted).

3. *Electronic Monitoring in Alaska*

Alaska has adopted a passive EM system. The Anchorage Correctional Complex, for example, requires an offender to connect a large black box, a Field Monitoring Device, to the power and phone lines in her home.⁴⁵ The offender must keep the phone lines clear at the designated call time and must answer after the fourth ring.⁴⁶ In some instances, the offender must also provide a breath sample using a "sobriotor" device.⁴⁷ More remotely, in Mat-Su Valley, the Kids Are People, Inc. EM program requires a juvenile probationer to connect a base unit to the phone line in her home.⁴⁸ The offender must also wear an ankle bracelet that transmits signals to a receiving computer.⁴⁹ Then, at preplanned intervals throughout the day, indicator lights trigger reporting from the offender so that information on her location is periodically updated into a file that is monitored and then reviewed by case managers at the Mat-Su Youth Corrections Office.⁵⁰

B. The History of Electronic Monitoring Use in Law Enforcement

1. *Early Electronic Monitoring Programming and Design*

Whether testing sobriety or ensuring that an offender remains within a certain radius, EM systems provide a means of enforcing compliance with conditions of supervised release, or "community control."⁵¹ But this punitive aspect of "compliance" was not what the systems' designers originally had in mind for the systems' prototype.⁵² Instead, the designers sought "to help offenders gain self-esteem and

PROBATION 21, 21 (2005) (noting EM documents violations of community supervision better than more traditional procedures); see also MACKENZIE, *supra* note 21, at 319 (describing how technological advances of EM made it possible to ensure compliance with EM correctional programs).

52. See Gable & Gable, *supra* note 51, at 21.

socially valued skills.”⁵³ Others, including Jack Love, a former federal public defender and judge, specifically sought to create a scheme that would keep individuals out of prison.⁵⁴ Love focused on probationers who had breached their probation orders and, in 1983, first used an electronic device to monitor five offenders.⁵⁵ He wanted to know whether EM would allow probation to continue on a restricted basis, reducing various white collar offenders’ exposure to risks of violence in prison.⁵⁶ That curiosity helped stimulate the commercial use of EM for correctional purposes.⁵⁷ Another system was developed by Thomas Moody in Florida, and “[b]y 1987, 21 states had reportedly begun EM programs, with more than 900 offenders being monitored.”⁵⁸ “[B]y 1993, EM was employed in all fifty states . . . [and] approximately seventy thousand offenders were being monitored electronically.”⁵⁹ By 2005, about twenty percent of community-based supervision programs in the United States had incorporated the use of EM and about twenty private companies provided the necessary equipment.⁶⁰

2. *Prison Overcrowding as a Driving Force Behind the Growth of Electronic Monitoring Use*

Although a number of factors contributed to the rapid growth of EM programs in the 1980s and onward, prison overcrowding is consistently cited as a driving force.⁶¹ In the 1980s, prison populations

57. *Id.* at 33–34; *see also* Gable & Gable, *supra* note 51, at 21. Inspired by “a ‘Spiderman’ story in which the villain attached an electronic bracelet to Spiderman to monitor his movements,” Judge Jack Love persuaded Michael Goss to develop a similar apparatus. *Id.* His curiosity helped develop and commercialize EM equipment. *Id.* But Judge Love was not the first to experiment with EM. *Id.* Dr. Ralph Schwitzgebel of Harvard University is credited with patenting the first correctional EM system in 1969. *Id.*

58. *See* Gable & Gable, *supra* note 51, at 21 (citation omitted).

59. MACKENZIE, *supra* note 21, at 319 (citation omitted).

60. *See* Gable & Gable, *supra* note 51, at 21.

61. *See, e.g.,* Michael G. Maxfield & Terry L. Baumer, *Home Detention with Electronic Monitoring: Comparing Pretrial and Postconviction Programs*, 36 CRIME & DELINQ. 521, 521–22 (1990). In addition to prison and jail overcrowding, factors contributing to the rapid growth of EM included private entrepreneurs’ aggressive marketing of EM equipment as a solution to prison and jail overcrowding and the extension of home detention to broader categories of offenders, such as those directly released from prison or jail and those who had not been convicted but were held in lieu of bail. *Id.* at 522. Yet another was the belief in the infallibility of EM technology, also known as a “technofallac[y].” *See* Terry L. Baumer & Robert I. Mendelsohn, *Electronically Monitored Home*

“had reached a crisis point in both legal and financial terms” and led to judicial mandates to limit prison intake.⁶² Unfortunately, the situation is no better today and, for Alaska, the problem is particularly acute. In the 1980s, the state expanded its justice system and enforced stiffer, more uniform sentences for the most serious felonies.⁶³ A sharp increase in the number of incarcerated individuals resulted.⁶⁴ By 2007, Alaska had five times the inmates it had in 1981, and spending for the state’s justice system almost doubled in those years.⁶⁵ An immediate solution was needed both in the state and across the country, and the technologically advanced (and less expensive) alternative of EM offered a seemingly “quick fix.”⁶⁶ The shortcomings of probation programs only added to the “nothing works” debate and incentivized the rapid rise of EM programs in correctional systems.⁶⁷

3. *The Interests Served and Overarching Goals of Correctional Electronic Monitoring Programs*

Effective marketing of EM equipment by retailers also contributed to the rapid rise of correctional EM.⁶⁸ As any profit-seeking businessmen would do, these retailers saw an opportunity in the prison overcrowding crisis and seized it.⁶⁹ And, by strategically offering an inexpensive, utilitarian, and immediate solution to overcrowded prisons, EM vendors found a receptive audience in correctional departments across the country.⁷⁰ These departments faced a pressing need to protect their communities from potentially dangerous offenders

Confinement: Does it Work?, in SMART SENTENCING: THE EMERGENCE OF INTERMEDIATE SANCTIONS (J.M. Byrne, A.J. Lurigio, & J. Petersilia eds., 1992) 54, 54; see also WHITFIELD, THE MAGIC BRACELET, *supra* note 32, at 9 (citing “technical advances, a huge and costly rise in prison populations and the growing use of house arrest or curfew schemes” as the three reasons why, in the 1980s, the increased development of EM became possible).

62. WHITFIELD, TACKLING THE TAG, *supra* note 13, at 35.

63. THE COST OF CRIME, *supra* note 1, at 2.

64. *Id.*

65. *Id.* at 1.

66. See WHITFIELD, TACKLING THE TAG, *supra* note 13, at 36 (describing how the allure of new EM technology and the belief that it would provide an immediate solution to the problem of rising crime led to the rapid growth of EM programming).

67. See *id.* at 37 (explaining the failures of traditional probation that led to a sudden rush for experimental alternatives such as EM).

68. See Maxfield & Baumer, *supra* note 61, at 522.

69. See *id.*

70. See *id.*

and could not do so with prisons at maximum capacity.⁷¹ They therefore had a strong interest in a solution that would specifically deter offenders—one that would keep potentially dangerous offenders off the streets and under appropriate custody.⁷² EM programming appeared to offer just that.⁷³

In reality, the conditions imposed under EM programs are less restrictive than those imposed under traditional incarceration.⁷⁴ This means the use of EM may actually *benefit* the same individuals it is supposed to punish.⁷⁵ EM programs provide certain offenders a more rehabilitative option of reintegrating back into their communities while still serving time for their wrongdoings.⁷⁶ As a result, the programs may promise more return as specific and utilitarian deterrents (in terms of providing efficient, economic, and secure public safety) and even more as rehabilitating and reintegrative alternatives to incarceration. And it is quite possibly this promise—rather than one rooted in a retributive goal—that has maintained the growth of EM programming in corrections.⁷⁷

But while the growing number of EM programs might point to success in terms of quantity, a few questions still remain: Have the programs succeeded in terms of quality? How do the programs compare to incarceration or other punitive options? Is EM enough of a sanction? Is it efficient? What is the best use of EM programming for Alaska?

71. See *id.* at 521–22 (describing how chronic overcrowding in jails and prisons led “to desperation on the part of criminal justice officials . . . [and] a frantic search for punitive, safe, and secure alternatives to incarceration”).

72. See *The Legality of Innovative Sanctions for Nonviolent Crimes*, 111 Harv. L. Rev. 1944, 1960–61 (1998) (discussing criminal sentencing’s goal of protecting the public from dangerous offenders through incarceration).

73. See Maxfield & Baumer, *supra* note 61, at 522.

74. See Payne & Gainey, *supra* note 34, at 432 (recognizing that although EM is less restrictive than other sanctions, it “is still punitive and potentially rehabilitative” even if it “is often misinterpreted as a slap on the wrist”).

75. Offenders commented that they preferred EM to incarceration and viewed EM as controlling, but not nearly as controlling or invasive as prison; the EM option afforded them certain everyday luxuries and freedoms that they were denied in prison. *Id.* at 428. For example, they enjoyed control over the television and being able to eat whatever they wanted and whenever they wanted. *Id.*

76. See *id.* at 416.

77. Retributive rationales for punishment often conflict with utilitarian and rehabilitative rationales. See generally Frase, *supra* note 4, at 75–77 (discussing the limitations of and conflicts between various contemporary sentencing rationales). The attractive promise advertised by EM retailers appeared to resolve this conflict and therefore appealed to correctional departments both in the United States and abroad. However, EM programs probably hold more “promise” as deterrents and even more so as mechanisms of rehabilitation/reintegration for reasons discussed below. See *infra* Part III.B.

The remainder of this Note will address these questions and others and will ultimately propose a solution that maximizes the potential of EM in Alaska by incorporating it into other correctional programs.

II. THE LAW ON ELECTRONIC MONITORING

Any attempt to maximize the potential of EM must comport with the current law on the subject, and therefore, it is critical to understand the parameters of that statutory framework. This Part endeavors to explain the relevant statutes and case law effecting EM in Alaska. Because EM is still relatively new and EM programming is still gaining momentum as an “effective” alternative to incarceration, the law governing its use is sparse and still developing. This is especially true in Alaska. A few statutes and cases provide some guidance, but the law on the correctional use of EM is far from settled.

A. The Statutes Governing Correctional Electronic Monitoring in Alaska

At present, two statutes control the use of EM in Alaska—Section 33.30.061, and more significantly, Section 33.30.065 of the Alaska Statutes. Section 33.30.061(c) allows for the use of EM at the discretion of the Department of Corrections commissioner but expressly excludes certain classes of offenders:

The commissioner may, under [section 33.30.365], designate a prisoner to serve the prisoner’s term of imprisonment or period of temporary commitment, or a part of the term or period, by electronic monitoring. A prisoner serving a term of imprisonment, or a period of temporary commitment, for a crime involving domestic violence is not eligible for electronic monitoring.⁷⁸

Section 33.30.065 provides specific, practical guidelines for administering EM.⁷⁹ Subsection (a) mandates that EM be administered by the Department of Corrections and that EM equipment be designed “so that any attempt to remove, tamper with, or disable the monitoring equipment or to leave the place selected for the service of the term or period will result in a report or notice to the department.”⁸⁰ Subsection (b) lists criteria for

78. ALASKA STAT. § 33.30.061(c) (2010).

79. § 33.30.065.

80. § 33.30.065(a).

determining whether to designate a prisoner to serve a term of imprisonment or period of temporary commitment by electronic monitoring, [including]

- (1) safeguards to the public
- (2) the prospects for the prisoner's rehabilitation
- (3) the availability of program and facility space
- (4) the nature and circumstances of the offense for which the prisoner was sentenced or for which the prisoner is serving a period of temporary commitment;
- (5) the needs of the prisoner as determined by a classification committee and any recommendations made by the sentencing court;
- (6) the record of convictions of the prisoner, with particular emphasis on crimes specified in AS 11.41 or crimes involving domestic violence;
- (7) the use of drugs or alcohol by the prisoner; and
- (8) other criteria considered appropriate by the commissioner.⁸¹

Subsection (c) emphasizes that EM does not provide an offender with a liberty interest and that a "prisoner may be returned to a correctional facility at the discretion of the commissioner."⁸² Subsection (d) permits the commissioner to require an offender to pay all or some of the costs of EM, but acknowledges that only offenders with sufficient financial resources should be subjected to such a requirement.⁸³

Both sections 33.30.061(c) and 33.30.065 of the Alaska Statutes *only* pertain to sentencing.⁸⁴ In Alaska, there is no statutory law on the use of EM for pretrial, pre-sentencing, or pre-appeal purposes. The closest such statute, section 12.25.025(c) of the Alaska Statutes, has been interpreted to extend credit for time spent in pretrial, pre-conviction, or pre-appeal custody,⁸⁵ but this has not included time spent on EM—yet.⁸⁶ And while several cases have explained the applications of section 12.25.025(c) of the Alaska Statutes in non-EM situations, the statute has proven quite controversial with respect to EM.

B. The Case Law on Alternatives to Incarceration

The case law governing EM use in Alaska has developed in response to the enactment of statutes governing alternatives to incarceration (mainly sections 12.25.025(c), 33.30.061(c), and 33.30.065 of the Alaska Statutes) and case law directing the use of those alternatives. This precedent has set limits on alternatives to incarceration, and the limits, in turn, have implications for EM. Understanding the precedent governing alternatives to incarceration is therefore useful for understanding the current status of correctional EM in the state.

1. *The Early Cases Defining Appropriate Alternatives to Incarceration*

In its 1980 decision *Lock v. State*, the Alaska Supreme Court ruled that “upon revocation of probation, one is entitled to credit against his sentence on the original offense for time spent as a condition of probation, in a rehabilitation program which imposes *substantial restrictions on one’s freedom of movement and behavior*.”⁸⁷ In *Nygren v. State*, the Alaska Court of Appeals sought to determine what types of restrictions meet the “*substantial restrictions on one’s freedom of movement and behavior*” test.⁸⁸ It concluded that credit for time served while released on bail or probation is determined by the “extent to which a person released on bail or probation is subjected to restrictions approximating those experienced by one who is incarcerated.”⁸⁹ The court also listed several characteristics common to incarcerative facilities, noting that those characteristics, though not exhaustive, were “at least sufficient to serve as sound points of reference for determining, in any given case, whether ‘substantial restrictions on one’s freedom of movement and behavior’ have been imposed, so as to require credit for time served under *Lock*.”⁹⁰ The list included the following restrictive characteristics:

[R]esidents are invariably sent there by court order; the facilities require residency, and residency requirements are sufficiently stringent to involve a definite element of confinement; residents of the facilities are subject to twenty-four hour physical custody or supervision; any periods during which residents may be permitted to leave the facility are expressly limited, both as to time and purpose; while in the

90. *Id.*

facility, residents are under a continuing duty to conform their conduct to institutional rules and to obey orders of persons who have immediate custody over them; and residents are subject to sanctions if they violate institutional rules or orders and to arrest if they leave the facility without permission.⁹¹

2. *Cases Applying the Nygren Example to Non-Electronic Monitoring Alternatives*

The *Nygren* test has already been applied to award credit for time served in residential alcoholism treatment programs⁹² and Community Residential Centers (CRCs).⁹³ In the 2002 case *State v. Fortuny*, the Alaska Court of Appeals gave the defendant credit against his sentence for the time he voluntarily spent in a residential alcoholism treatment facility before sentencing.⁹⁴ The court began its analysis by first comparing the *Nygren* list of restrictions (deemed equivalent to incarceration) to the restrictions imposed by the residential program in which Fortuny participated. It reasoned that the defendant's work release privileges at the facility were "not conspicuously different from the work release privileges that are granted to selected prisoners in the custody of the Department of Corrections."⁹⁵ The court also noted that the facility provided twenty-four hour supervision, required conformity to a set of house rules, and subjected residents to bed checks, random checks, and random urine and breath tests.⁹⁶ Because these restrictions generally complied with the remainder of the *Nygren* factors, the court granted Fortuny credit for the time he served there and ruled that work release constituted "a supplemental method of correction" rather than "a vacation from correctional supervision."⁹⁷

That same year, in *Potter v. State*, the court was presented with the question of whether *Nygren* credit could be applied to time spent under the court-ordered custody of a CRC prior to sentencing.⁹⁸ Again, the court began its analysis by going through the *Nygren* test.⁹⁹ It then reasoned that the restrictions imposed by the CRC in custody of Potter amounted to incarceration as defined by *Nygren*. It emphasized how the

CRC required Potter to remain there under strict supervision, only permitted him to leave unescorted under limited circumstances, and would subject him to sanctions if he violated program rules and regulations.¹⁰⁰ Much as it did in *Fortuny*, the court relied on the *Nygren* test and held that Potter should not be barred from receiving credit toward the time he served at the CRC merely because he was regularly allowed to leave the facility to work.¹⁰¹

By testing the *Nygren* list of restrictions approximating incarceration against the specific restrictions imposed by various incarcerative facilities, the Alaska Court of Appeals effectively extended credit for time served in residential alcohol treatment programs and CRCs prior to sentencing. Its decisions in *Fortuny* and *Potter* also cemented the fact that work release privileges would not hinder a defendant from receiving credit for time served at a residential alcohol treatment program or CRC prior to sentencing. Unfortunately, the same has not been true of EM programming since the Alaska Court of Appeals has firmly refused to extend credit to time served on EM prior to sentencing.¹⁰²

3. *Why Electronic Monitoring Does Not Fit the Nygren Test – the Matthew v. State Perspective*

In *Matthew v. State*, the Alaska Court of Appeals denied defendant Matthew credit toward his sentence of imprisonment for the time he voluntarily spent subjected to EM.¹⁰³ After his sentencing, Matthew asked the trial court to delay the date on which he was to report for incarceration.¹⁰⁴ He specifically asked for a sixty-day extension that would allow him to work in Barrow while being monitored by a private EM system known as “secure continuous remote alcohol monitoring,” or SCRAM.¹⁰⁵ The SCRAM system is an ankle bracelet that detects alcohol consumption through skin pores and tracks a subject’s whereabouts through an attached global positioning system, or GPS.¹⁰⁶ In Alaska it is operated by a private company, Alaska Monitoring Services.¹⁰⁷

107. *Matthew*, 152 P.3d at 470.

Per Matthew's request, the trial judge granted the stay of imprisonment and ordered him confined to work, home, and travel back and forth.¹⁰⁸ The judge also told him that no credit would be awarded toward his sentence for any time served while released on EM.¹⁰⁹ The same occurred at Matthew's bail hearing, where he was granted another delay of his imprisonment.¹¹⁰ Nevertheless, Matthew attempted to obtain credit toward his sentence of imprisonment for the time he spent subjected to EM.¹¹¹ His motion was denied, and Matthew subsequently appealed.¹¹²

In its ultimate ruling, the appellate court incorporated the same analytical method it did in both *Fortuny* and *Potter*, starting with a review of the *Nygren* test.¹¹³ It also noted that it must review *de novo* whether the conditions of release imposed on Matthew sufficiently approximated incarceration.¹¹⁴ The court then analyzed the conditions of release Matthew faced under EM.¹¹⁵ It found that those restrictions included requirements that Matthew be at home, work, or commuting in between and that his movements and alcohol consumption be constantly monitored by EM.¹¹⁶ It further found that the restrictions did not amount to "restrictions approximating those experienced by one who is incarcerated."¹¹⁷

The court reasoned that "Matthew's day-to-day activities were unencumbered by the kind of institutional rules and routines that are the hallmark of correctional or residential rehabilitative facilities."¹¹⁸ It also observed that "[t]he conditions of release did not subject him to the kind of structured, regimented lifestyle that is the central feature of both incarceration and residential treatment programs."¹¹⁹ The court then explained its interpretation of EM's shortcomings, specifying that Matthew "could do whatever he wanted to do (except for consume alcohol) and was free to associate with whomever he wanted."¹²⁰ Moreover, he "did not suffer the same lack of privacy experienced by an

offender in an incarcerative facility or residential program.”¹²¹ The court again referred to its analysis as an application of the *Nygren* test before concluding that the restrictions imposed on Matthew did not “approximate those experienced by one who is incarcerated.”¹²²

In its reasoning, the court broadly claimed to have applied the *Nygren* test, but a closer examination suggests that it instead focused on one particular *Nygren* factor,¹²³ that “while in the facility, residents are under a continuing duty to conform their conduct to institutional rules and to obey orders of persons who have immediate custody over them.”¹²⁴ Such a focus fits with the fact that EM differs from residential alcohol treatment programs and CRCs in one critical respect—an offender lives within the confines of his or her own home (or other private residence) rather than in a communal or more institutional facility. In recognizing a structured, regimented lifestyle as “the central feature of both incarceration and residential treatment programs” and institutional rules and routines as “the hallmark of correctional or residential rehabilitative facilities,”¹²⁵ the court elevated the significance of this one *Nygren* factor to become more of a requirement rather than a mere “point of reference.”¹²⁶ Its decision to deny Matthew credit for the time he served on EM turned on a perceived lack of institutional rules, regulations, and structure in EM correctional programming.¹²⁷

4. *Rethinking the Outcome in Matthew v. State*¹²⁸

In its interpretation of *Nygren*, the court in *Matthew* failed to clarify what is meant by “institutional rules and routines.” For example, are institutional rules and routines only administered in an *institution*? Because the Department of Corrections administers EM sanctions, are the regulations imposed under EM still institutional? Do such institutional rules and routines completely inhibit an incarcerated individual from exercising any free will, enjoying free association, or

maintaining privacy? None of these questions are answered by the Court of Appeals in *Matthew*. As a result, if EM is to obtain independent standing as an alternative to incarceration—one that could give credit toward an offender's sentence—a reworking of the *Matthew* decision is necessary.

Nygren aside, the decision in *Matthew* may affect how other courts interpret credit for time served on EM when it is used before trial or prior to sentencing. This, in turn, could influence whether these courts will ever interpret EM as a sufficient *sanction*, at least with respect to retribution rationales. In other words, the parameters placed on the use of EM in the pretrial context could affect those placed on EM sanctions. Moreover, the purposes of pretrial detention (especially pretrial release under EM) could also have an effect on EM sanctions. Instead of retribution, punishment, or general deterrence, the rationale behind pretrial detention is based on protecting communities from potentially dangerous offenders (*specific deterrence*) and ensuring that offenders appear at court proceedings.¹²⁹ EM's strength is just that (in addition to serving rehabilitative or reintegrative purposes). Thus, the strengths of EM are most apparent in the pretrial context. It is very likely that EM also has unrealized potential as a sanction, but policymakers and lawmakers must first examine its use in the pretrial context to determine what works and what challenges may arise in the sentencing context.

The *Matthew* court's treatment of EM credits suggests that there might be some reluctance to viewing EM as a sufficient sanction. In its analysis, the court emphasized EM's inability to satisfy the "institutional rules" prong of *Nygren*.¹³⁰ It also expressed a concern that *Matthew* "did not suffer the same lack of privacy experienced by an offender in an incarcerative facility or residential program."¹³¹ That concern might be even more acute in the sentencing context. But, while the court was correct in acknowledging that EM is advantageous to offenders, its reasoning was somewhat misguided.

An offender may watch television at his will or choose what he will have for lunch while subjected to home confinement under EM, but his privacy is hardly undisturbed. He must respond to routine phone calls or video check-ins, may have his every move tracked by an electronic device, and may be subjected to random checks or visits from EM

officers or administrators. These constraints clearly do not amount to those experienced under traditional incarceration, but they are nevertheless adequate. In fact, the use of EM may very well be advantageous for the correctional system as a whole because it frees space in jails and prisons, it costs less than incarceration, and it benefits yet penalizes offenders. So even though EM may fall short under a strict application of *Nygren*, it would likely prove viable under a broader assessment. In particular, when a court-ordered sanction is at issue, EM could prove particularly viable because a court-ordered sanction presumably imposes the most stringent possible requirements. Accordingly, and in spite of the suggestion in *Matthew*, a court-ordered EM sanction could prove even more successful than its pretrial counterpart, which is designed as an alternative to detention and which presumes release.

The court's "something is missing with EM" opinion in *Matthew* hinders defendants from obtaining credit for pretrial, pre-appeal, and pre-sentencing release under EM, and therefore it has limited EM's potential as an alternative to incarceration. A solution that resolves EM's supposed lack of institutional structure would likely remedy the problem. One particularly promising option is to incorporate EM into other court-approved alternatives to pretrial, pre-appeal, and pre-sentencing incarceration, such as residential alcohol treatment programs or CRCs. A proposal for such a "hybrid" use of EM and other alternatives to incarceration is presented in Part IV.

III. THE POTENTIAL AND THE CONTROVERSY SURROUNDING THE USE OF ELECTRONIC MONITORING

This Part will address the broader potential and possible pitfalls of EM—an analysis that must necessarily precede any Alaska-specific proposal for new, or modified, EM programming. The Alaska Court of Appeals' recent decision in *Matthew* reflects a narrow view of EM's potential and thus provides an interesting point of comparison. That view might lead to a conclusion that EM is less valuable than incarceration. But, as noted by the National Law Enforcement and Corrections Technology Center, "EM offers two distinct advantages over incarceration."¹³² The first is cost-effectiveness.¹³³ The second is a reduction in prison overcrowding.¹³⁴ For the purposes of this Note, these

132. NLECTC, *supra* note 23, at 1.

133. *See id.*

134. *Id.*

“advantages” will be respectively analyzed in terms of efficiency and effectiveness.

A. The Efficiency Rationale

1. A Cost-Benefit Analysis of Electronic Monitoring

On average, EM programs cost between five and twenty-five dollars per day.¹³⁵ Incarceration costs, on the other hand, average fifty dollars a day—at least twice the cost of EM.¹³⁶ Yet, the comparatively inexpensive EM equipment is not the only cost-effective benefit that EM programs promise. Other tangible benefits include pretrial release of offenders who would have otherwise been detained, early release from incarceration and the resulting reduction in overall confinement costs, reduced costs for repeated treatment enrollments, and finally, a diminished need for the construction of new prisons.¹³⁷ The realization of such cost savings will vary according to the actual costs of incarceration and EM equipment and programming in a specific jurisdiction.¹³⁸ In Alaska, the high number of inmates and lack of prison space is a particularly pressing issue.¹³⁹ For example, the new Mat-Su prison, scheduled to open in 2012, is already expected to be full soon after it opens.¹⁴⁰ Strategically expanding EM programming would offer a workable solution that could potentially curb the need for another Mat-Su (or several) in the future.

Already, Alaska has seen savings in social costs because EM programs allow offenders to work and later pay off the costs of EM participation.¹⁴¹ But such intangible savings are not all. Currently, the

135. *See id.* This claim was based on 1999 estimates of EM program costs. *Id.*

136. *See id.* In 1999, the cost of incarceration per inmate per day in Alaska was \$97.92. In Louisiana, it was \$30.36. ANN H. CROWE ET AL., AMERICAN PROBATION AND PAROLE ASS'N, OFFENDER SUPERVISION WITH ELECTRONIC TECHNOLOGY: A USER'S GUIDE 44 fig.5b (2002), available at <http://www.ncjrs.gov/pdffiles1/nij/grants/197102.pdf>. *But cf.* Admin. Affairs, *Costs of Incarceration and Supervision, THE THIRD BRANCH* (May 2004), http://www.uscourts.gov/News/TheThirdBranch/05-05-01/Costs_of_Incarceration_and_Supervision.aspx (citing Bureau of Prisons statistics indicating that the cost of imprisonment in a Bureau of Prisons facility at the time was \$63.51 per inmate per day).

137. *See* CROWE ET AL., *supra* note 136, at 27, 44–45.

138. *Id.*

139. *See generally* THE COST OF CRIME, *supra* note 1.

140. *Id.* at 4 fig.8.

141. *See* CROWE ET AL., *supra* note 136, at 45; *see also* NLECTC, *supra* note 23, at 1 (contending that communities benefit from EM “because offenders are paying taxes, taking care of their families, and sometimes even going to school to increase their future employment options”).

use of EM saves the state about twenty-two times more than it would spend on incarceration.¹⁴² This figure trumps all other alternatives to incarceration but falls short in one regard—reduced recidivism rates.¹⁴³ Other alternatives to prison have saved the state money *and* successfully reduced recidivism rates.¹⁴⁴ Thus, with respect to recidivism, the failures of Alaska's current correctional EM programming suggest that EM is not the cheap "quick fix" it may appear to be.

And while EM is cost-effective relative to incarceration, there are still cost concerns. Intangible costs, or "hidden fees," of EM use include initial investments in staff time for education and marketing purposes and investments in the planning process for incorporating EM use into existing correctional options.¹⁴⁵ An increased net-widening effect (whereby offenders who would have otherwise been successfully supervised without EM would now be placed in an EM program), opportunity costs (in terms of other correctional programs that could be implemented), and increased technical violations (which could lead to additional court hearings or reincarceration and therefore result in extra costs to the justice system) also add to the cost of EM.¹⁴⁶ These potential costs, along with concerns about the effectiveness of EM programming as opposed to incarceration or other alternatives, stress the need for careful and calculated spending on correctional EM.

2. *Electronic Monitoring on the Alaska Budget*

Alaska's spending on correctional EM depends on several factors, with federal spending in Alaska the primary factor. After the 1980s oil boom faded, Alaska increasingly relied on federal spending to fuel the state's economy.¹⁴⁷ Between 1993 and 2003, federal spending in the state more than doubled (not counting inflation), but nationwide, federal spending increased only about fifty percent.¹⁴⁸ Between 1996 and 2002, federal spending for grants jumped from \$1.3 billion to \$3.1 billion, and fifty-six percent of grants were undesignated.¹⁴⁹ Because such undesignated grants could provide funding for electronic supervision

149. *See id.*

programs, the fifty-six percent is critical. While it is true that grants are only one of several sources of EM program funding,¹⁵⁰ in Alaska, federal spending and federal grants make up a vast portion of the state's economy.¹⁵¹ As such, the ways in which federal grants are allocated could indirectly yet significantly impact the state's correctional EM programs. Because Alaska is a young, developing state and because only a few private industries bring in new revenue, federal spending is important to the state's economy and, ultimately, to EM programming.¹⁵²

Despite the ample (and increasing) federal spending in Alaska, total state spending on corrections has not experienced as substantial a jump—yet. The state's operating budget has grown, but the percentage spent on corrections has been rather steady.¹⁵³ This percentage has also lagged in comparison to other states. In Fiscal Year 2007, Alaska spent 5.3% of its total state government expenditures on corrections while the nation on average spent 6.8%.¹⁵⁴ Moreover, “[e]xpenditures for the major justice system agencies—Department of Corrections, Public Safety, and Law, the Alaska Court System, Public Defender Agency, and Office of Public Advocacy—have comprised about 9 percent of Alaska's total state agency spending for the past ten years (FY 2000-2010).”¹⁵⁵ The figures are especially dreary for correctional EM. For Fiscal Year 2009, the Department of Corrections received \$245,962,000 in resources “to achieve results,”¹⁵⁶ but just 914.1 Results Delivery Units (RDU) were

allotted to EM.¹⁵⁷ In contrast, 13,099.1 RDU were allotted to statewide probation and parole and 16,827.6 RDU were allotted to Community Residential Centers in an effort to manage prison populations.¹⁵⁸ Clearly, if efficient EM use is to occur, Alaska will have to invest more in EM by adjusting spending priorities and allocating more resources to the Department of Corrections, which in turn should allocate more to EM programming. This will have to happen alongside a broader effort to attain more substantial federal grants for the state's justice system.

B. The Effectiveness Rationale

1. *What Does the Current Research Tell Us? General Purposes and Successes of Electronic Monitoring*

Other than cost savings, EM promises a reduction in prison overcrowding.¹⁵⁹ But the promise actually extends much further. A few original purposes of EM included reintegrating offenders into the community, treating them, and to a lesser degree, punishing and deterring them from future criminal conduct.¹⁶⁰ Others included public safety, compliance with mandates to reduce prison and jail overcrowding, and the provision of the most cost-effective correctional services.¹⁶¹ At present, however, these purposes have focused almost exclusively on inexpensive and safe ways to provide surveillance or incapacitation while relieving overcrowded jails and prisons.¹⁶² In a sense, then, these "new" purposes of EM actually tend to emulate the

See Jody Klein-Saffran, *Electronic Monitoring vs. Halfway Houses: A Study of Federal Offenders*, ALTERNATIVES TO INCARCERATION, Fall 1995, at 1 (excerpts from unpublished Ph.D dissertation, University of Maryland) (stating that the primary purpose of current community corrections programs is to provide surveillance or incapacitation for as little cost as possible), http://www.bop.gov/news/research_projects/published_reports/gen_program_eval/orepralternatives.pdf (last visited Feb. 21, 2011); see also DeMichele & Payne, *supra* note 23, at 34 (discussing Rios and Greene's notion of the justice reinvestment movement, a concept suggesting that current use of community corrections is meant to offset state budgets by serving as an alternative to incarceration) (citing N. RIOS & J. GREENE, REDUCING RECIDIVISM: A REVIEW OF EFFECTIVE STATE INITIATIVES (2009)).

retributive and deterrent purposes of incarceration, which primarily seek “to punish offenders, to protect society by removing dangerous offenders from society, and to deter future criminal behavior.”¹⁶³ Alaska’s current EM program is an apt example. As such, when evaluating the effectiveness of the program, the state’s policymakers must keep in mind the many *different* purposes EM was intended to serve (as opposed to incarceration) and the diverse goals it aspired to achieve. Doing so will help these policymakers understand how to combine EM with other sanctions to maximize its potential.¹⁶⁴

At this point, regrettably little is known about the effectiveness of EM as an alternative to incarceration, and it is still unclear whether EM has successfully met its purported purposes and goals.¹⁶⁵ The uncertainty results from sparse research into the operation and impact of EM¹⁶⁶ and a lack of empirical proof.¹⁶⁷ More rigorous empirical research is necessary to render reliable and widely applicable conclusions,¹⁶⁸ but until this occurs, the current research proves helpful in assessing the uses and general successes of EM. For example, EM has been cited as having at least three distinct uses.¹⁶⁹ These include use in the pretrial context, use as a sanction in and of itself immediately after conviction, and use in conjunction with other sanctions (i.e., offenders who receive a jail or prison sentence and are subsequently placed on EM when released back into the community).¹⁷⁰ Within the context of each use, EM has already had several successes.¹⁷¹

163. See Gainey, Payne & O’Toole, *supra* note 160, at 746 (describing the main purposes of incarceration).

164. See *id.* at 747 (suggesting that because the purposes of incarceration and EM are so different, it makes theoretical and practical sense to combine sentences for certain offenders).

165. Kathy G. Padgett, William D. Bales, & Thomas G. Blomberg, *Under Surveillance: An Empirical Test of the Effectiveness and Consequences of Electronic Monitoring*, 5 CRIMINOLOGY & PUB. POL’Y, 61, 65 (2006). “Although some form of home confinement with EM had been implemented in all 50 states by 1990 there is still little known about its effectiveness as an alternative to incarceration or in protecting public safety by reducing rates of reoffending.” *Id.*; see also Annesley K. Schmidt, *Electronic Monitoring: What Does the Literature Tell Us?*, 62 FED. PROBATION 10, 10 (1998) (explaining why little is definitively known about EM devices’ effectiveness).

170. *Id.*

171. See *infra* text accompanying notes 172–76.

Pretrial home detention under EM has allowed suspects “to avoid the criminogenic environment found in many jails,”¹⁷² provided more access to attorneys,¹⁷³ given another option to “those unable to post bond or to meet eligibility criteria for release on recognizance,” helped offenders maintain employment and family ties, and depending on the particular program, may even provide rehabilitative effects.¹⁷⁴ Immediately after conviction, EM serves punitive and rehabilitative purposes, protects public safety by subjecting offenders to a controlled environment, and in some cases, deters offenders from committing new offenses.¹⁷⁵ Finally, an EM sanction that follows time served in an incarcerative facility “affords offenders respect by trusting them with early release into the community.”¹⁷⁶

2. *How Is the Success of Electronic Monitoring Measured? Common Methods of Evaluation*

The success of EM in the pretrial context, immediately after conviction, and following incarceration can be measured by several factors.¹⁷⁷ After all, EM would hardly be effective (or desirable) if it only relieved prison and jail overcrowding.¹⁷⁸ Accordingly, its success is often determined by answering a number of instructive questions: How many violations of EM conditions occurred? Did offenders fail to finish the full length of their EM sanctions? Was EM able to deter future misconduct? Is there public support of EM for less serious and less dangerous offenders? Did offenders still experience the pains of incarceration while serving time under EM supervision? Did they perceive the EM experience to be a punitive one?¹⁷⁹

Running through these questions are three purposes of criminal justice: retribution, deterrence, and rehabilitation or reintegration.¹⁸⁰ The

177. *Id.* at 416-17 (listing EM's successes pretrial, immediately after conviction, and postincarceration).

178. See Stephen J. Fay, *Electronically Monitored Justice: A Consideration of Recent Evidence as to Its Effectiveness*, 24 *ANGLO-AM L. REV.* 397, 424 (1995) (“Of course, to do something in response to prison and jail overcrowding is not necessarily to do something effective.”).

179. Payne & Gainey, *supra* note 34, at 416-17.

180. See DAVID LEVINSON, *ENCYCLOPEDIA OF CRIME AND PUNISHMENT* 333-34 (2002). According to Levinson, the two main justifications for punishment are retribution and prevention (deterrence) with rehabilitation and reintegration as secondary justifications often grouped under deterrence. *Id.* Having established the added and significant rehabilitative purpose of alternative sanctions such as

remainder of this section will attempt to probe the effectiveness of EM through these three lenses.

*a. The Retributive Model*¹⁸¹

EM is often considered less restrictive than other sanctions, especially incarceration.¹⁸² But while less restrictive, EM is still *punitive*.¹⁸³ At least one study points to the lack of freedom experienced under EM.¹⁸⁴ Others refer to the structure and control imposed by EM.¹⁸⁵ Taken together, the studies suggest commentators' views on EM's effectiveness that are in direct opposition to the one suggested by the Alaska Court of Appeals in *Matthew v. State*.¹⁸⁶ There the court decided that EM did not approximate the restrictions experienced in prison or jail because Matthew "could do whatever he wanted to do (except for consume alcohol) and was free to associate with whomever he wanted."¹⁸⁷ He also "did not suffer the same lack of privacy experienced by an offender in an incarcerative facility or residential program."¹⁸⁸ Although these observations were correct, the court appears to have taken a rather cursory view of EM's retributive purpose. A comprehensive study of offenders' perspectives on the Alaska EM program could shed light on this matter, providing the court with a more reliable and more informative basis for evaluating the freedom (or lack thereof) experienced under the Department of Correction's EM program.

Another broader concern about retribution entails the use of punishment in the pretrial context.¹⁸⁹ The question often asked is whether it is ethical or logical to punish a "presumed innocent"

EM, this Note elevates rehabilitation and reintegration to primary rather than secondary justifications for punishment. While all three justifications are evaluated in this Note, particular attention will be paid to the potential rehabilitative effect of EM.

181. According to Levinson, "[r]etribution is based on a theory that it is right to punish those who have committed a wrong." *Id.* at 333. Black's Law Dictionary defines it as "punishment imposed as repayment or revenge for the offense committed; requital" and "something justly deserved; repayment; reward." BLACK'S LAW DICTIONARY 1431 (9th ed. 2009).

defendant before he or she is convicted.¹⁹⁰ Viewed in this regard, EM is all the more appropriate alternative to incarceration precisely because it is less restrictive than others.¹⁹¹

b. *The Deterrence Model*

Black's Law Dictionary defines deterrence "as a goal of criminal law, the prevention of criminal behavior by fear of punishment."¹⁹² As such, recidivism¹⁹³ rates provide a "logical tool for measuring the performance of the criminal justice system in Alaska."¹⁹⁴ Alaska's criminal justice system applies presumptive sentencing and significantly increases an offender's sentence if she commits a new offense after an earlier conviction.¹⁹⁵ "Thus, arrests and convictions of recent offenders are logical measures for the effectiveness of the system."¹⁹⁶ Already, recidivism reports have helped measure the success of various criminal justice programs and policies, including the effectiveness of the state's therapeutic courts.¹⁹⁷ The same is possible with respect to evaluating the effectiveness of Alaska's EM program.¹⁹⁸

In 2007, the Alaska Judicial Council conducted the state's first general study on recidivism.¹⁹⁹ Unfortunately, the results were undeniably disappointing. Just three years after they were released from their sentences, "66% of all offenders in the sample had been re-

190. *See id.* at 524 (proposing that "the propriety of trying to rehabilitate an unconvicted and presumed innocent pretrial population can be questioned").

191. *See id.* at 523 ("Defendants wearing wristlets and confined to home or work face more restrictions than do those on bond, but awaiting trial at home is less restrictive than confinement in jail.").

192. BLACK'S LAW DICTIONARY 514 (9th ed. 2009). Deterrence is classified as either specific ("actions taken to prevent that defendant from committing future offenses") or general ("actions designed to prevent others from committing crimes") and falls under the broader category of prevention. LEVINSON, *supra* note 180, at 333.

193. *Black's Law Dictionary* defines recidivism as "[a] tendency to relapse into a habit of criminal activity or behavior." *Id.* at 1384.

incarcerated at least once, for a new offense or a probation or parole violation [and] 59% were arrested at least once for a new offense."²⁰⁰ Offenders were also "most likely to recidivate during the first year of release and even more so during the first six months."²⁰¹ Other recidivism studies have produced mixed results with respect to EM.²⁰² Some show that EM has successfully helped reduce recidivism rates.²⁰³ Some show there is no difference in recidivism rates after EM and after incarceration.²⁰⁴ Nonetheless, even if EM does not reduce recidivism, unchanged conviction rates with EM still allow for a more cost-effective sanction overall.²⁰⁵ EM expert Dick Whitfield specifically suggests using EM as a part of a wider approach of deterrence.²⁰⁶ In his opinion, seeing how EM fits into a broader scheme of deterrence "is a much more realistic way of measuring the impact [it] has had, and the policy contribution it can make."²⁰⁷ Of course, in assessing EM's value as "part of a whole," researchers and policymakers will have to keep in mind that EM is a strictly voluntary sanction, and therefore, the primary target for home confinement under EM will continue to be the "low-risk" offender who is not considered a threat to public safety.²⁰⁸ Unless there is such a combined, or "hybrid," approach to EM and "unless there is a shift in emphasis away from surveillance and control towards (more expensive) treatment as the basis of intermediate sanctions, electronic

203. See *id.* at 737-38 (listing studies that suggest high rates of program completion for EM programs in which offenders were sentenced to house arrest with EM but not incarcerated).

204. See *id.* at 738. The authors specifically discuss a 1997 study comparing recidivism rates of offenders sentenced to jail with those of offenders sentenced to house arrest with EM. *Id.* The study found that the recidivism rates for both groups were relatively low and the differences between the groups were more or less negligible. *Id.*

205. See WHITFIELD, THE MAGIC BRACELET, *supra* note 32, at 92. Whitfield explains that EM's cost-effectiveness has been used as a justification for expanding its use. *Id.* He then cautions that EM must nevertheless demonstrate an "added value" component if it is to become a more prominent part of sentencing schemes. *Id.*

206. See *id.* at 94.

207. *Id.*

208. Baumer & Mendelsohn, *supra* note 61, at 65. EM is a strictly voluntary sanction because the incapacitation it provides is only supported by "the threat of detection and sanctions for violations." *Id.* This suggests that low-risk offenders, who are a lesser threat to public safety, will remain the target population for participation in EM programming. *Id.*

monitoring is never likely to 'deliver the goods' in terms of reduced rates of recidivism."²⁰⁹

c. *The Rehabilitation or Reintegration Model*

Rehabilitation is the last of the three traditional theories of criminal justice.²¹⁰ Reintegration is closely associated with rehabilitation and seeks "to change deviant behavior, while emphasizing that the change can most effectively be accomplished in concert with the community, and not in a prison or jail."²¹¹ The Alaska Constitution espouses these same views and even includes "the principle of reformation" as a policy underlying the state's criminal justice system.²¹² And while "an offender's constitutional right to rehabilitation does not extend beyond release from custody, Alaska law recognizes a *public* interest in rehabilitation."²¹³ One such interest involves public safety.²¹⁴ Because studies have shown "a statistical relationship between a lack of employment and increased risk of recidivism," released offenders should be given adequate opportunities for employment in order to prevent the potentially costly and dangerous consequences that would otherwise become the burden of the Alaska taxpayer.²¹⁵ In fact, the Alaska Department of Corrections has explicitly referred to goals of "reformation" or "reintegration" in both its mission and vision statements.²¹⁶

This evident institutional support and promotion of the rehabilitative or reintegrating aspects of criminal justice implies that Alaska policymakers will likely endorse a reasonable and effective rehabilitative alternative to incarceration. Although some criticize EM as a lesser form of rehabilitation (because offenders released on home confinement do not get exposed to the social networks and rebuilding

216. ALASKA DEP'T OF CORR., (last visited Jan. 30, 2011), <http://www.correct.state.ak.us/corrections/index.jsf;jsessionid=C565744BDA54E72C6EE44270D1718602>.

skills that incarcerated offenders are exposed to),²¹⁷ EM gives eligible offenders the ability to maintain family ties,²¹⁸ teaches them to control themselves and structure their daily activities,²¹⁹ and ultimately eases them back into society by providing them with the tools necessary to reintegrate and comport with the expectations of their local communities.²²⁰ The dire statistics on recidivism in Alaska provide yet another compelling (and cost-effective) reason to reallocate current resources to "re-entry" programs that can reduce recidivism by helping offenders adjust to the expectations of mainstream society and their local communities.²²¹ EM is a fitting program in this regard.

In order to consistently reach its full rehabilitative potential, EM should be combined with other correctional programs that focus on treatment.²²² This will require a much more substantial financial investment in combined EM efforts and a major shift away from surveillance and control to a more integrative, and hence, more rehabilitative and reintegrating option.²²³

IV. ELECTRONIC MONITORING AS A VIABLE BUT INCOMPLETE ALTERNATIVE TO INCARCERATION

As an alternative to incarceration, home confinement under EM has proven significantly more cost-effective.²²⁴ Nonetheless, its ability to

217. See Fay, *supra* note 178, at 409 (arguing that EM, "in its obsession with potential cost-savings . . . ignores the value of assessment, counseling and support offered by experienced probation personnel"); see *id.* at 416 (suggesting that "rehabilitation is seldom a specific objective of electronic monitoring [programs]").

218. See Payne & Gainey, *supra* note 34, at 428 (summarizing statements from offenders sentenced to EM that note EM gives offenders the ability to maintain ties with their families).

219. See Maxfield & Baumer, *supra* note 61, at 524 (stating that EM forces participating offenders to plan their activities and may thus impose order on heretofore disorderly lives).

220. See Payne & Gainey, *supra* note 34, at 416 (proposing that the use of EM as a sanction has rehabilitative effects and helps offenders reintegrate into the community).

221. See ALASKA JUDICIAL COUNCIL, CRIMINAL RECIDIVISM IN ALASKA, *supra* note 199, at 14; see also Carns, *supra* note 194, at 27.

222. See Fay, *supra* note 178, at 417 (discussing how researchers have already recognized that EM programs should include a treatment component and focusing on the insistence that EM be accompanied by treatment plans that cater to each individual offender and are designed to have effects that last beyond the offender's release date).

223. See *id.* at 423.

224. See THE COST OF CRIME, *supra* note 1, at 3 fig.6 (demonstrating that the use of EM saves the state about twenty-two times what it would have spent on other alternatives to incarceration).

carry out the three theories, or goals, of criminal justice has not provided the same assurance. Perhaps this is the reason why the Alaska Court of Appeals restricted the use of correctional EM in *Matthew v. State*²²⁵ and why others courts have ruled similarly.²²⁶ In order to persuade these courts—and particularly the Alaska Court of Appeals—that EM is capable of carrying out the three goals of criminal justice in an efficient and effective manner, it is imperative to highlight the potential EM would reach as part of a “hybrid” correctional scheme.²²⁷

In *Matthew*, the court expressed dissatisfaction with what it perceived to be the lack of “institutional rules and routines” in correctional systems based on home confinement with EM.²²⁸ Other critics argue that home confinement under EM cannot punish enough,²²⁹ cannot deter criminals from recidivating anymore than other alternatives,²³⁰ and cannot rehabilitate because it strips offenders of the social networking and rebuilding skills offered in prison.²³¹ Any proposal for a hybrid scheme obviously will have to correct for these perceived shortcomings if it is to be implemented and widely accepted for use at various stages of the correctional process, and particularly the sentencing stage.

Matthew (and its stringent adherence to *Nygren*) will pose some obstacles to hybrid endeavors because it emphasizes the perceived shortcomings of EM. But the opinion is not definitive precedent for how to approach EM as a judicial sanction. A court will still give credit for a sentence served as long as that sentence was the one an offender

225. See 152 P.3d 469 (Alaska Ct. App. 2007).

226. See also *CROWE ET AL.*, *supra* note 136, at 24–25 (citing *Fralely v. U.S. Bureau of Prisons*, 1 F.3d 924 (9th Cir. 1993); *United States v. Herrera*, 913 F.2d 761 (11th Cir. 1991); *Pennsylvania v. Shartle*, 652 A.2d 874 (Pa. Super. Ct. 1995)) (discussing selective cases in which courts denied credit for time served on EM).

227. See *Payne & Gainey*, *supra* note 34, at 431 (“[C]ommunity-based sanctions can be effectively used in conjunction with other traditional sanctions.”). Here the authors specifically suggest that applying EM directly after incarceration would be most effective. *Id.*

228. See 152 P.3d at 472.

229. See *Payne & Gainey*, *supra* note 34, at 432 (explaining that EM “is often misinterpreted as a slap on the wrist”).

230. See *Fay*, *supra* note 178, at 415 (noting that various research studies have found that EM offers no significant advantages in terms of reducing recidivism rates); *cf.* *Gainey, Payne & O’Toole*, *supra* note 160, at 737 (“Research findings . . . suggest that the effects of participation in house arrest with electronic monitoring are not clear-cut.”).

231. See *Fay*, *supra* note 178, at 409 (arguing that the strategy of substituting inexpensive EM for incarceration, “in its obsession with potential cost-savings . . . ignores the value of assessment, counseling and support offered by experienced probation personnel”); see *id.* at 416 (“[R]ehabilitation is seldom a specific objective of electronic monitoring [programs].”).

received. Thus, the success of EM as a sanction will likely depend on other factors: whether courts will be willing to impose EM as a sentence in and of itself, whether the appropriate vehicles exist to carry out such a sanction, and whether the public will recognize it as just if it is used more widely.²³²

Strategically pairing EM with another correctional system can win over critics and EM-opposed courts by combining the clear benefits of EM with a scheme that embodies the “institutional” elements that EM may lack. It is therefore crucial to choose an appropriate alternative to incarceration to complete the “hybrid.” The options are abundant, but this Note will attempt to narrow the available choices to those most advantageous to Alaska.

A. Proposal One: Combine Electronic Monitoring with Existing Therapeutic Jurisprudence and Programs

Several commentators have already recommended adding a more substantial treatment element to home confinement under EM.²³³ Combining EM sanctions with existing therapeutic alternatives to incarceration would supply this “treatment” aspect. Even more convincing is the fact that Alaska has already successfully implemented therapeutic, or problem-solving, courts in several cities. The courts work to address a myriad of therapeutic concerns and are akin to traditional courts because they weigh the seriousness of a crime and then look for an appropriate sanction.²³⁴ They are innovative in their additional focus on treatment options and the likelihood that offenders will participate in available options and rehabilitate from that participation in ways that benefit both offenders and society.²³⁵ By striving “to balance the letter of

232. The author gives special thanks to Professor Lisa Kern Griffin, Duke University School of Law, for assistance with this paragraph.

233. See Fay, *supra* note 178, at 417 (pointing to two research studies which have already recognized that many of the offenders subjected to home confinement under EM should receive other treatment in conjunction with EM).

234. See *Therapeutic Jurisprudence*, ALASKA JUST. F., Spring 2009, at 10, 10, available at <http://justice.uaa.alaska.edu/forum/26/1spring2009/261.spring2009.pdf>.

235. See *id.* Other common purposes of such courts include (1) providing positive outcomes for not only offenders but also victims and society as a whole; (2) promoting reform by responding to problems such as substance abuse or mental illness; (3) encouraging judicial involvement to address offenders’ problems; (4) encouraging collaboration with groups operating outside the justice system in order to improve treatment options; (5) taking on “unconventional” and less adversarial roles; (6) screening and assessing which

the law and the spirit in addressing issues of fairness to offenders and to victims and communities," these problem-solving courts have demonstrated an ability to reduce both recidivism and incarceration rates.²³⁶

Problem-solving courts' success with respect to deterrence and rehabilitation²³⁷ provides compelling reason for combining therapeutic jurisprudence with EM. But since most of Alaska's problem-solving courts concentrate on addictions or mental health issues,²³⁸ it will be necessary to expand the scope of the courts' current reach (in terms of what issues they address). Then, especially with lower risk offenders, the courts could possibly prescribe sentences that involve elements of institution or community-driven therapy followed by home confinement on EM.

A sanction involving elements of therapeutic jurisprudence followed by the use of EM would provide a more graduated and guided release to home confinement on EM and could therefore broaden the scope of eligible offenders. For example, higher risk offenders that may have been excluded from EM participation due to inappropriate behavior in jail or prison or severe substance abuse or mental illness²³⁹ might find a "second chance" in this proposal.

Then again, the extent that an offender would be eligible should still be weighed against the probability that the hybrid might successfully punish, deter, and rehabilitate him. This would vary according to the unique capabilities and capacities of each individual hybrid program. Reasonable expectations for community safety would also factor in, so offenders deemed highly dangerous probably would not meet the criteria for eligibility unless the conditions imposed by the hybrid advanced to accommodate such offenders. And since assessing these matters would require additional time and monetary investment on top of what would likely be an already expensive hybrid, selectively screening potential participants might be even more necessary with the hybrid than without.

At the very least, the therapeutic justice-EM approach would help relieve the state's overcrowded prisons and bolster EM's ability to deter and rehabilitate offenders. But in case policymakers or other critics

offenders should be referred to therapeutic courts; and (7) using screening and assessing tools as early as possible to identify potential candidates. *Id.*

236. *Id.*

237. *See id.*

238. *See id.*

239. *See* CROWE ET AL., *supra* note 136, at 36 (recommending exclusion criteria for EM participation, with one criterion being "severe substance abuse or mental illness that limits offender's ability to control his or her behavior").

argue that this hybrid lacks an appropriate degree of “retribution,” another option would be to impose a shorter sentence of traditional incarceration followed by the therapeutic justice-EM approach. Although this alternative might not immediately relieve jail and prison overcrowding, it could speed up the turnover in these facilities while successfully deterring and rehabilitating participants. Ultimately, no matter how the hybrid is implemented, it will surely require significant research, planning, resource redistribution, financial investment, and patience.

B. Proposal Two: Combine Electronic Monitoring with Halfway Housing

A halfway house, or residential community treatment center, “is a transitional housing facility designed to rehabilitate people who have recently left a prison or medical-care facility, or who otherwise need help in adjusting to a normal life.”²⁴⁰ The restrictive community-based environment comprises the punitive component of this sanction while the reintegration and transitional services offered to participants comprise the rehabilitative, or reintegration, component.²⁴¹ Adding an EM element to halfway housing could reinforce the sanction’s restrictive and retributive aspects. This option would also appease those concerned with public safety. And for several of the same reasons the therapeutic jurisprudence-EM option allows a larger class of offenders to reap the benefits of EM, the community-driven reintegration offered in the halfway house-EM option likewise would allow many more offenders to benefit.

Although halfway houses have not been shown to reduce recidivism any more than other alternatives to incarceration,²⁴² policymakers could potentially borrow from the successful recommendations of therapeutic courts and apply those to the halfway house-EM combination. In the alternative, policymakers could implement further restrictions on halfway houses that would more closely reflect the “institutional rules and routines” found in traditional jails or prisons. By then adding the EM element of restraint, correctional systems would better achieve a balance between community-driven and institutional-enforced retribution, deterrence, and rehabilitation.

241. See Klein-Saffran, *supra* note 162, at 24–25.

242. See generally Charles L. Walsh and Scott H. Beck, *Predictors of Recidivism Among Halfway House Residents*, 15 AM. J. CRIM. JUST. 1066 (1990).

CONCLUSION

In order to move toward the realization of EM “hybrid” efforts, whether based on therapeutic jurisprudence or halfway housing, Alaska policymakers need to encourage public understanding and generate wider support for EM at different stages of the criminal justice process. Policymakers should also recognize the feasibility of combining diverse sanctions, consider how different offenders respond to different sanctions, and remember not to overrate or underrate EM’s potential as an efficient and effective alternative to incarceration when part of a combined correctional scheme.²⁴³ These steps will allow policymakers to maximize the potential benefits of EM while addressing the concerns discussed by the Alaska Court of Appeals in *Matthew v. State* and cited by various critics. Because these concerns pinpoint a perceived lack of institutional structure, policymakers should first conduct an in-depth statistical analysis of the advantages and deficiencies of home confinement under EM in Alaska.²⁴⁴ Knowing these advantages and deficiencies will allow them to target the alternatives to incarceration that will produce the most efficient and effective “hybrid” when combined with EM.

The success EM already has had as the state’s most cost-effective alternative to incarceration and as a viable method of reintegration suggests that it certainly can improve Alaska’s correctional system if executed strategically. While the means to this end may be costly in the short term, the results would allow for a more cost-effective and comprehensive administration of criminal justice in the long term. Consequently, Alaska policymakers will have to redistribute resources and seek out new ones in addition to planning and executing the substantive EM hybrid. Then, through trial and error, the state’s correctional department will be in a much more informed and experienced position to determine whether to expand the use of EM or continue the search for a more suitable alternative to incarceration. Perhaps this determination will confirm the perceived shortcomings of EM discussed in *Matthew v. State* or perhaps it will have the opposite effect—proving that the potential of home confinement under EM *can* be realized in Alaska. This, in turn, could affect the status of the statutes governing EM use in the state and could even affect the current interpretation and importance of *Nygren v. State*. For now, the state ought to at least engage in a close examination of what could potentially

Electronic Monitoring Reduces Recidivism

A large NIJ-funded study of Florida offenders placed on electronic monitoring found that monitoring significantly reduces the likelihood of failure under community supervision. The decline in the risk of failure is about 31 percent compared with offenders placed on other forms of community supervision.

Researchers from Florida State University's Center for Criminology and Public Policy Research compared the experiences of more than 5,000 medium- and high-risk offenders who were monitored electronically to more than 266,000 offenders not placed on monitoring over a six-year period. The researchers worked with the Florida Department of Corrections to secure approval, obtain administrative data, and gain help in contacting local probation offices for interviews. The researchers interviewed offenders, probation officers, supervisors and administrators to uncover insights into the electronic monitoring process.

INCREASING USE OF ELECTRONIC MONITORING

States now use electronic monitoring in a wide variety of settings, such as a pretrial supervision alternative to jail, an alternative to imprisonment for some offenders, and a mandated supervision requirement for some felons released from prison. Some states now mandate electronic monitoring for released sex offenders. More than 5 million offenders in the United States are under some form of community supervision, according to the Bureau of Justice Statistics. Electronic monitoring may increase over time as states seek less expensive

alternatives to imprisonment. The cost of imprisonment is about six times higher than the cost of electronic monitoring.¹

Florida has used electronic monitoring of released felons for decades, mostly on higher risk offenders. The first home confinement program that used electronic monitoring started in Florida's Palm Beach County in 1984. At the end of June 2009, the state had 143,191 offenders on supervision, including 2,392 under electronic monitoring.

To assess the impact of electronic monitoring, researchers gathered information on people under supervision between June 1, 2001, and June 30, 2007. Using Florida's risk classifications, the research focused on medium- and high-risk offenders. The sample included 5,034 medium- and high-risk offenders on electronic monitoring and 266,991 offenders who were not placed on electronic monitoring. In addition, the researchers interviewed 105 offenders. Offenders were selected for interviews using convenience sampling. Visits were made to geographically strategic probation offices throughout Florida during reporting week for offenders. Probation officers referred offenders to the researchers in a private room to receive an explanation of the study, consent process and interview. The interviewed sample included mostly medium- and high-risk offenders. Of this group, 97 percent were under electronic monitoring; the rest had been on monitoring devices before the interview. The researchers also interviewed 36 probation officers who oversee such offenders and 20 administrators who oversee the program.

OVERALL FINDINGS

The quantitative analysis showed significant decreases in the failure rate for all groups of offenders, and the decreases were similar for all age groups. More specifically, the analysis showed that:

- Electronic monitoring reduces offenders' risk of failure by 31 percent.
- Electronic monitoring based on Global Positioning Systems (GPS) typically has more of an effect on reducing failure to comply than radio frequency (RF) systems.
- Electronic monitoring had less of an impact on violent offenders than on sex, property, drug and other types of offenders. However, the effect remains statistically significant.

The qualitative analysis revealed various perceptions about electronic monitoring. For administrators, the primary goals of the electronic monitoring program are to ensure that offenders comply with the terms of their supervision, track offenders, reduce recidivism and protect the public. Overall, administrators say that although electronic monitoring has achieved these goals, they also see ways to improve the system. In addition, they see monitoring as a tool that helps probation officers do their jobs, not as a replacement for personal contact with offenders. Sometimes the offenders and officers voiced different opinions. For example, 85 percent of offenders said electronic monitoring does not affect the likelihood that they would abscond. In contrast, 58 percent of officers thought electronic monitoring made it less likely that an offender would abscond.

PERCEPTIONS OF THE EFFECTS ON PERSONAL RELATIONSHIPS

Many probation officers and offenders believe that monitoring has a negative impact on offenders' relationships with their spouses, children and friends. Some 43 percent of the offenders believed monitoring had a negative impact on their partners because it created an inconvenience. Of the officers interviewed, 89 percent felt that offenders' relationships with their significant others changed because of being monitored.

In addition, most offenders said they felt a sense of shame about being under electronic monitoring and felt they were unfairly stigmatized. Some said media reports about monitoring focus mostly on sex crimes, which may lead the public to believe that everyone who is monitored is a sex offender. One offender said the electronic monitoring system "serves as a scarlet letter." Another reported, "Every time it goes off, we think the police are coming to arrest me." Perhaps the most poignant comments concerned the effects on children. One offender said, "I've got a child who straps a watch on his

ankle to be like daddy." Another said, "When it beeps, the kids worry about whether the probation officer is coming to take me to jail. The kids run for it when it beeps."

PERCEPTIONS OF THE EFFECTS ON EMPLOYMENT AND HOUSING

Offenders and officers alike were almost unanimous in their belief that the visibility of the monitoring systems makes it much more difficult for offenders to obtain and keep a job. Offenders told stories of job interviews taking on a different tenor as soon as an interviewer noticed the devices. In addition, sometimes the systems would issue an alarm because the signal had been lost when offenders were inside a building. They would then have to take a break from work and walk outside, often for 15 minutes, before the signal was reestablished. This did not please employers. Of the offenders interviewed, 22 percent said they had been fired or asked to leave a job because of electronic monitoring. Of that group, 32 percent assigned the cause to signal loss. Others cited various reasons, such as limits on their flexibility (related to work hours or distance from work). Five percent said they were fired because their bosses did not want customers to see the monitoring devices.

Electronic monitoring did not deter offenders from finding housing. However, the various residency controls on sex offenders did have an impact.

Some courts mandate that offenders repay the state for the cost of electronic monitoring. Offenders often had trouble paying. The monthly costs determined by the court were waived for 39 percent of the offenders. Among the remaining 61 percent of offenders who were ordered to pay, 53 percent were not paying each month. The average monthly cost paid by offenders was \$64.

HOW ELECTRONIC MONITORING WORKS

Electronic monitoring was approved by the Florida legislature in 1987, and the Florida Department of Corrections started using RF systems in 1988 for house arrest cases where offenders were required to be home during certain hours of the day. RF systems use a device that alerts supervising officers when offenders violate home curfews. An RF ankle bracelet worn by the offender communicates with a base unit connected to the landline at the offender's home. The unit alerts a monitoring center when the offender moves beyond a predetermined distance from the base unit during specific times.

Florida started using GPS technology in 1997. This technology uses global positioning satellites to track offenders' movements in real time. Offenders wear an ankle bracelet that communicates with a

larger device that they must carry. The device is about 5 inches wide, 2 inches thick and 5 inches tall and must be visible. It is a distinctive piece of equipment that is noticed by others. The monitoring device communicates with a satellite and sends a signal to a monitoring center using a cell phone system. The device also has a screen that displays messages from supervising officers, who are able to track the exact location of offenders on a computer screen and see when they enter restricted zones. Officers can set up exclusion zones for various purposes. For example, they may set up an exclusion zone around a victim's house or place of work. Sex offenders may be required to avoid locations such as daycare centers or schools. The system sends an alert to a supervising officer if the offender enters an exclusion zone.

A third type of monitoring is passive GPS. These systems store GPS data throughout the day and then send a day's worth of information to a supervising officer. Florida started using this technology in 2001 but ended it in 2006 because of the cost.

OUTLOOK

Many probation officers thought the courts should concentrate monitoring efforts on high-risk offenders who pose the most risk to the public.

About a third of the offenders would have served time in prison if the electronic surveillance alternative had not been available. Thus, the monitoring

gives offenders much more freedom despite any drawbacks involved in wearing a visible device. Given the cost savings involved, policymakers may want to consider expanding monitoring programs.
