Describe the scope of the research need:

Policy option or recommendation:

What research is being done/known?

What are the gaps in research?

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Natural Systems, Public Infrastructure

Research category/type:

☑ Modeling ☑ Products ☑ Education/Outreach ☐ Data Management ☑ Monitoring

Parties involved in implementation:

TWG: Economic Activities

5.1.5.3

Identify trends that may influence impacts of shipping on the environment, hunting, fishing and communities.

Unique Identifier: 108

☐ Overarching Need

Why is this an issue?

Climate change is reducing sea ice in the Arctic and allowing for increased shipping. This will potentially influence the environment, hunting, fishing and coastal communities. As such it is necessary to identify trends that may influence impacts of shipping on the environment, hunting, fishing and communities.

Describe the scope of the research need:

Policy option or recommendation:

What research is being done/known?

What are the gaps in research?

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Natural Systems, Public Infrastructure

Research category/type:

☑ Modeling ☑ Products ☑ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

TWG: Economic Activities

5.1.5.4

Increase ice-breaking capabilities in the Arctic.

Unique Identifier: 109

☐ Overarching Need

Why is this an issue?

Climate change is impacting the formation and breakup of sea ice in the Arctic. To increase the duration of shipping and provide for assistance in sea ice conditions, ice-breaking will be required. For these reasons it is imperative to Increase ice-breaking capabilities in the Arctic.

Describe the scope of the research need:

Policy option or recommendation:

What research is being done/known?

What are the gaps in research?

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Public Infrastructure

Research category/type:

☑ Modeling ☑ Products ☐ Education/Outreach ☐ Data Management ☑ Monitoring

Parties involved in implementation:

TWG: Economic Activities

5.1.5.5

Research innovative approaches and building techniques for supporting arctic shipping and developing sustainable ports.

Unique Identifier: 110

☐ Overarching Need

Why is this an issue?

Climate change is changing sea ice formation and breakup in the Arctic, which will change how ports are developed and shipping routes maintained. This will require research into innovative approaches and building techniques for supporting arctic shipping and developing sustainable ports.

Describe the scope of the research need:

Policy option or recommendation:

What research is being done/known?

What are the gaps in research?

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Public Infrastructure

Research category/type:

☑ Modeling ☑ Products ☑ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

TWG: Economic Activities

5.1.6.1

Assess the impact of climate change on existing rural transportation networks.

Unique Identifier: 111

☐ Overarching Need

Why is this an issue?

Much of Alaska's rural transportation network is non-road based, depending on frozen tundra and unfrozen river and lake routes for surface transportation. As a result, climate change can potentially significantly affect these networks. For these reasons, it is imperative to assess the impact of climate change on existing rural transportation networks.

Describe the scope of the research need:

Policy option or recommendation:

What research is being done/known?

What are the gaps in research?

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Public Infrastructure and Health and Culture

Research category/type:

☑ Modeling ☑ Products ☑ Education/Outreach ☐ Data Management ☑ Monitoring

Parties involved in implementation:

TWG: Economic Activities

5.1.6.2

Develop economic analysis of potential costs associated with expected impacts to rural transportation networks.

Unique Identifier: 112

☐ Overarching Need

Why is this an issue?

Much of Alaska's rural transportation network is non-road based. As a result, climate change can potentially significantly affect these networks. With increases to costs of transportation, it is important to develop economic analysis of potential costs associated with expected impacts to rural transportation networks.

Describe the scope of the research need:

Policy option or recommendation:

What research is being done/known?

What are the gaps in research?

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Public Infrastructure and Health and Culture

Research category/type:

☑ Modeling ☑ Products ☑ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

TWG: Economic Activities

5.1.7.1

Develop economic analysis of potential rise or decline of recreational, subsistence and commercial fishing.

Unique Identifier: 113

☐ Overarching Need

Why is this an issue?

Climate change will impact fish and their habitats to varying degrees. Some fisheries will benefit while others will be negatively impacted. Research into fisheries should support develop economic analysis of potential rise or decline of recreational, subsistence and commercial fishing.

Describe the scope of the research need:

Policy option or recommendation:

What research is being done/known?

What are the gaps in research?

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Natural Systems, Health and Culture

Research category/type:

☑ Modeling ☑ Products ☑ Education/Outreach ☑ Data Management ☑ Monitoring

Parties involved in implementation:

TWG: Economic Activities

5.1.7.2

Assess and model increased insurance costs.

Unique Identifier: 114

☐ Overarching Need

Why is this an issue?

Climate change is recognized as causing increased risks to private and government infrastructure. Insurance premiums are based on environmental conditions and projected risks. It will be important to assess and model insurance costs associated with risks perceived from climate change influences.

Describe the scope of the research need:

Policy option or recommendation:

What research is being done/known?

What are the gaps in research?

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Public Infrastructure and Health and Culture

Research category/type:

☑ Modeling ☑ Products ☑ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

TWG: Economic Activities

5.1.8.1

Develop economic analysis of potential rise or decline of tourism and impact on state revenues.

Unique Identifier: 115

☐ Overarching Need

Why is this an issue?

Tourism is an increasing contributor to the Alaskan economy. It is unknown how a changing climate may impact tourism. It is important to develop economic analysis of potential rise or decline of tourism and impact on state revenues related to climate change.

Describe the scope of the research need:

Policy option or recommendation:

What research is being done/known?

What are the gaps in research?

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Natural resources, Public Infrastructure, Health and Culture

Research category/type:

☑ Modeling ☑ Products ☑ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

TWG: Economic Activities

5.1.8.2

Develop economic (scenario) analysis of potential national and international changes in patterns of people and freight movements.

Unique Identifier: 169

☐ Overarching Need

Why is this an issue?

Climate change is impacting natural systems throughout the Arctic, both in the terrestrial and ocean areas. The impact to these natural systems will likely change the patterns of movement of people and freight. It is important to develop economic (scenario) analysis of potential national and international changes in patterns of people and freight movements.

Describe the scope of the research need:

Policy option or recommendation:

What research is being done/known?

What are the gaps in research?

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Public Infrastructure, Health and Culture

Research category/type:

☑ Modeling ☑ Products ☑ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

TWG: Economic Activities

5.1.8.3

Assess opportunities for development/enhancement of recreation due to climate change.

Unique Identifier: 170

☐ Overarching Need

Why is this an issue?

Climate change is impacting natural systems throughout the Arctic with changes to seasonal recreation. It is imperative to assess opportunities for development/enhancement of recreation due to climate change.

Describe the scope of the research need:

Policy option or recommendation:

What research is being done/known?

What are the gaps in research?

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Natural resources, Public Infrastructure, Health and Culture

Research category/type:

☑ Modeling ☑ Products ☑ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

TWG: Economic Activities

5.1.9.1

Improve mapping and surveying to accurately and efficiently establish boundaries, address boundary disputes as needed and aid charting for safe navigation.

Unique Identifier: 171

☐ Overarching Need

Why is this an issue?

As climate changes, boundaries that are dependent upon physical features may be impacted. It is necessary to improve surveying and mapping to accurately display the land and land/water interface. This will support establishing boundaries and provide data to address boundary disputes. Improved charting for safe navigation and mapping for overland travel will be an ancillary product.

Describe the scope of the research need:

Policy option or recommendation:

What research is being done/known?

What are the gaps in research?

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Natural resources, Public Infrastructure

Research category/type:

☑ Modeling ☑ Products ☑ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

TWG: Health and Culture

5.2.1.1

Regional economic models to quantify climate change impacts on communities and provide input to the NEPA process.

Unique Identifier: 83

☑ Overarching Need

Why is this an issue?

Communities can not adapt to the impacts of climate change without state and federal assistance, which requires compliance with the NEPA process and recommended alternatives. Climate change is raising significant economic questions with investment in communities and sustainability.

Describe the scope of the research need:

Economic models are needed that address the cost to adapt communities to a changing climate. This includes costs to maintain the community to preserve the culture, increase medical services with potential events and stresses, and determine the sustainability.

Policy option or recommendation:

What research is being done/known?

An economic model has been built for the risk to public infrastructure. Other economic models have components of subsistence as a factor in determining economic value of impacted communities.

What are the gaps in research?

Economic value of culture and costs to replace traditional knowledge and wisdom and traditional ecological knowledge are gaps that requires quantification.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Public Infrastructure and Economic Activities

Research category/type:

☑ Modeling ☑ Products ☐ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

US Army Corps of Engineers, EPA, BIA, NOAA and AK DCCED, DNR and DEC

TWG: Health and Culture

5.2.1.10

Refine global climate models for better understanding of regional variations within Alaska. Provide means to disseminate these data. Modeling. Better understanding of the effects of climate change

Unique Identifier: 29

☑ Overarching Need

Why is this an issue?

Improved monitoring and modeling data will allow for development and dissemination of environmental information and design criteria for use in adapting to climate change

Describe the scope of the research need:

1. Develop more detailed regional estimates of potential climate changes for Alaska using site specific estimates of temperature, precipitation, topography, etc. 2. Establish means to effectively distribute details on varying climate changes statewide

Policy option or recommendation:

Develop higher resolution climate monitoring and modeling

What research is being done/known?

SNAP

What are the gaps in research?

Variables not assessed as part of SNAP

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☐ Products ☐ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

Alaska state agencies, UA research centers, EPA, other federal agencies

TWG: Health and Culture

5.2.1.11

Assess the degree and rate of thawing submarine permafrost deposits in coastal areas due to warming sea temperatures. Evaluate the risk of subsidence and erosion and the consequent impact on human developments and ecosystems. Study of Climate Driven Instability of Coastal Permafrost.

Unique Identifier: 76

☑ Overarching Need

Why is this an issue?

Newtok relocated because of the thawing of subterranean and submarine permafrost. Other coastal communities in western, northwest and northern Alaska have comparable risk with retreat of sea ice.

Describe the scope of the research need:

Standard permafrost measurement techniques will provide the data to develop assessments.
Research needs to be completed in conjunction with coastal mapping and establishing vertical control.

Policy option or recommendation:

What research is being done/known?

US Army Corps of Engineers has researched conditions at Newtok

What are the gaps in research?

Limited understanding

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Public Infrastructure and Natural Systems

Research category/type:

☑ Modeling ☐ Products ☐ Education/Outreach ☐ Data Management ☑ Monitoring

Parties involved in implementation:

US Army Corps of Engineers, UA

TWG: Health and Culture

5.2.1.12

Unique Identifier: 78

☑ Overarching Need

Consider developing a television program similar to Alaska Weather that provides climate change projection information and data on issues of specific importance to Alaska's rural communities. Such a program would foster better understanding of how changes in future climate, both gradual and sudden, can impact communities and individual lives. This can become a catalyst for change in individual behavior. Research Ways to Improve Data Sharing Across Scales: Example: Increase Public Understanding and Recognition of Climate Change Impacts

Why is this an issue?

Public understanding of climate change and impacts to the health of the people and their culture is needed.

Describe the scope of the research need:

Research what is needed to present culturally accurate and appropriate materials and interviews for the program. Research sources of sponsorship and supporting materials.
Research network coverage and programs that my already be presenting information identified

Policy option or recommendation:

What research is being done/known?

Unknown, although non-profits and other entities outside the research community may be able to define what has been and is being done.

What are the gaps in research?

Research of the archive of Alaska climate change articles, programs and mini-series need to be completed.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☐ Products ☑ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

TWG: Health and Culture

5.2.1.13

Research and develop culturally appropriate curriculums and materials for traditional knowledge and local observations with accuracy of observations versus traditional knowledge and wisdom. Resolving the question of how accurate are low tech monitoring versus local observations may need to be resolved through social science methods. Determining whether lowering standards for local observations for a culture based on observations is effective or creating further communication barriers may require social and cultural research.

Unique Identifier: 163

☑ Overarching Need

Why is this an issue?

Community buy-in and cultural acceptance needs to have the education and tools to be implemented.

Describe the scope of the research need:

Policy option or recommendation:

Education component shared system for infrastructure observations use workforce to provide information into database:
Option1: Look at low-tech monitoring techniques, satellite imaging
-Local data observations with less than full weather service standards
-New sensors w communications systems. Use vehicles as probes

What research is being done/known?

Research is ongoing in finding local community members and programs.

What are the gaps in research?

Local climate change monitoring may not be recognized as cross-cutting to cultures and linked to acceptance of traditional knowledge and wisdom as a standard for observations and communications. Research plans that show how the two work together may prove beneficial.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☐ Products ☑ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

UA, ICC, NOAA, others

TWG: Health and Culture

5.2.1.14

Improve communications between federal scientists and state government agencies (such as the Alaska Departments of Fish and Game, Environmental Conservation, and Natural Resources) on climate science, the potential impacts, and data needs for those agencies concerning climate change.Research Ways to Improve Data Sharing Across Scales:Example: Bridge Gaps between State and Federal Science and Resource Agencies

Unique Identifier: 79

☑ Overarching Need

Why is this an issue?

Concern that the information is not accurate or all inclusive. Decision makers do not make decisions or communities have insufficient information to make an informed decision.
The other question is why is this an issue with the number of working groups that have collaborated for decades. Is it because the issue of climate change is so large and cross cutting that not all agencies are able to focus on the breadth of research needed. The Governor's sub-cabinet and working groups are an example of an effective method to address this issue.

Describe the scope of the research need:

Research is needed on the most effective way for data delivery and key word indexing, as disciplines speak in different languages.

Policy option or recommendation:

Establish and maintain a joint federal/state/public entity working group to develop guidance on interagency gaps.

What research is being done/known?

Unknown

What are the gaps in research?

No gaps in research. Gaps in priority use of research funding and networking opportunities, as well as leadership commitment of resources may be the critical gaps

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☐ Products ☑ Education/Outreach ☑ Data Management ☐ Monitoring

Parties involved in implementation:

Federal Executive Roundtable, Governor's Sub-cabinet, AGDC, ACCAP, International Forums, etc.

TWG: Health and Culture

5.2.1.2

Unique Identifier: 70

☑ Overarching Need

Revised Flood Risk Maps. Use projections for increased precipitation, loss of sea ice and the accompanied increase in storm activity over previously ice covered waters for the next 100 years to develop revised flood risk maps that will help guide communities and state agencies in making future planning and infrastructure development decisions. Allow for continual update of these maps to incorporate the expected ongoing refinement in climate projections over time.

Why is this an issue?

Communities can not obtain flood insurance. Securing funding for improving and maintaining community will be difficult as lack of information and accurate data will require conservative attitudes towards investment and economic development. This will hinder economic development for the community.

Describe the scope of the research need:

Updating the Precipitation Frequency Estimates (PFE) will require local collection of precipitation in each community. Developing education materials that encourage local monitoring and reporting of precipitation is needed. Analyzing storm frequency and intensity is an essential part of this effort. Ice retreat for coastal inundation and ice jamming for river flooding need to be documented for frequency and forecast based on hindcast of events.

Policy option or recommendation:

What research is being done/known?

National Weather Service is updating their cooperative observing network to compile precipitation data for updating Alaska PFE for more comprehensive data coverage.
DCCED is working to update Flood Plain Maps for NFIP.
DEM&HS is updating disaster risk maps based on past 27 years of history.

What are the gaps in research?

Data collection and analysis. Accurate contouring of rural Alaska communities on community maps.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Public Infrastructure, Economic Activities, and Natural Systems

Research category/type:

☐ Modeling ☑ Products ☐ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

TWG: Health and Culture

5.2.1.3

Develop sea level rise projection maps for coastal areas throughout Alaska, accounting for local isostatic rebound in conjunction with global sea level rise predictions. Work with coastal communities and the state of Alaska to incorporate this information into community and state planning efforts to better guide future development decisions. Allow for continual update of these maps to incorporate the expected ongoing refinement in climate projections over time. Sea Level Rise Projection Mapping.

Unique Identifier: 72

☑ Overarching Need

Why is this an issue?

Communities are unable to accurately plan for economic development and assess risks from erosion or inundation. Public is developing inaccurate perception of sea level rise and coastal inundation because of lack of accurate information and heavy press coverage.

Describe the scope of the research need:

Research needs to establish the vertical datum in coastal Alaska, particularly for western and northwestern Alaska and the north slope. Measurement must include accurate shoreline mapping to depict trends associated with erosion and accretion. Tidal measurements will be required to determine changes in the frequency of storm surges and provide the data to document sea level rise.

Policy option or recommendation:

What research is being done/known?

NOAA and USGS have ongoing programs. State is looking into digital mapping initiative (SDMI)

What are the gaps in research?

Costs of collecting data and establishing stations in western and northern Alaska.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Public Infrastructure, Natural Systems, and Economic Activities

Research category/type:

☑ Modeling ☐ Products ☐ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

NOAA, USGS, AK DNR, DCCED and UA

TWG: Health and Culture

5.2.1.4

Unique Identifier: 73

☑ Overarching Need

Alaska's communities will have significant challenges in adapting if climate modeling projections downscaled to the local or regional level is not available on which to base decisions. They will also have little incentive to adapt. Currently, ACCAP has identified global circulation models (GCM) best suited to northern latitudes, and can downscale the model results to every community in the state. Disseminating this information to communities is a first step toward helping them to plan and tailor adaptation to their own specific needs and impacts. However, data gaps remain. Information on projected changes to permafrost and sea level at the local and regional levels is still lacking. Development of a statewide research grant fund could be used to focus the scientific community on filling data gaps critical to community adaptation. Develop Downscaled Climate Modeling for Municipalities.

Why is this an issue?

Communities are coping with changes as seen over time while decision makers are looking for more accurate information to plan and predict actions that will be required. Research that will downscale models is identified as one solution.

Describe the scope of the research need:

Research needs include more data collection and analysis as models can only be scaled to data density and longevity available.

Policy option or recommendation:

Cost/benefit analyses should be conducted to determine the value of downscaled models in the decision process, so that the value of a funding strategy can be realized and/or defended.

What research is being done/known?

NOAA, NASA, NSF, ONR, other public science agencies and many universities are downscaling models for accuracy and reliability.

What are the gaps in research?

Downscaled models are not accurate assessment tools for each individual community as a means to discuss and decide the socio-economic and cultural costs against a determinable timeline. Conducting social science applied research will take these from physical models to socio-economic models that will serve community needs in adapting to climate change.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☑ Modeling ☑ Products ☑ Education/Outreach ☑ Data Management ☐ Monitoring

Parties involved in implementation:

NOAA, NASA, IARC, UA

TWG: Health and Culture

5.2.1.5

A strong need exists for a comprehensive inventory of the wide range of data collection, monitoring efforts, and research projects underway or planned in relation to the impacts of climate change on the environment. The benefit to federal, state and municipal entities of having this information accessible in some form of centralized information portal, gateway, or web-based clearinghouse would be significant, most notably in terms of improved ability to make adaptation decisions intelligently and effectively. In turn, duplication of monitoring efforts could be avoided and government entities could provide feedback on specific data gaps, serving to drive future research objectives. Conduct a Comprehensive Inventory of Current Research, Monitoring and Data Collection Efforts.

Unique Identifier: 69

☑ Overarching Need

Why is this an issue?

Overall perception that the communities and decision makers do not have adequate information on the research projects ongoing to make plans to adapt to changing climate. There is limited understanding of the timeline by which the research will conducted, analyzed and developed into applied research and information. With the days of internet and modern communication technology, impacted Alaska communities need access to up to date information and the ability to help guide research projects.

Describe the scope of the research need:

Policy option or recommendation:

What research is being done/known?

Federal Agencies are maintaining data archives, Universities have catalogs, and national climate change programs have research plans and programs.

What are the gaps in research?

No gaps in research, just gaps in communication and documentation followed by limited time to conduct the research of sources while completing there own research.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☐ Products ☐ Education/Outreach ☑ Data Management ☑ Monitoring

Parties involved in implementation:

TWG: Health and Culture

5.2.1.6

This research need is being addressed in the Public Infrastructure Working Group. Social research that will address the cultural impediments and history of government providing to communities may provide insight into how to sustain communities and maintain community infrastructure to different cultural standards, while recognizing the challenges of weather and seasons.

Unique Identifier: 165

☑ Overarching Need

Why is this an issue?

Community based reporting and protocols can insure longevity in public and private investment while fostering agreement to maintain systems to higher standards. Costs and sources of funding are major issues in this area.

Describe the scope of the research need:

Socio-economic research that addresses investment, operations and maintenance, and longevity based on climate impacts and limits in cash economies to maintain the investment.

Policy option or recommendation:

Education component shared system for infrastructure observations use workforce to provide information into database:
Option 3:
- move to probabilistic approach, make sure we can keep up with codes
- -No reward system for taking care of what you have.
- -Reward for destroying what you have through replacement
- -No systematic decision-making process
- -Fix from disaster—why build new when we can't maintain old?

What research is being done/known?

This area has been extensively discussed in the PI TWG. However the economic challenges of operations and maintenance versus construction requires additional research, economic modeling and cultural analysis.

What are the gaps in research?

Socio-economic and cultural research for the value of maintaining the communities infrastructure and visual appearance (social satisfaction) versus prioritizing use of funds versus other community needs. Research into the costs of deferred maintenance.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☑ Modeling ☑ Products ☐ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

TWG: Health and Culture

5.2.1.7

Social and Education research to develop culturally appropriate curriculums for maintaining public infrastructure and community property. Develop economic forecast models that show the cost savings by not deferring maintenance or in determining where deferred maintenance goes from cost savings to higher costs.

Unique Identifier: 164

☑ Overarching Need

Why is this an issue?

This is a continuation of the research needs associated with the public infrastructure TWG.

Describe the scope of the research need:

Work with Alaska communities to document the investment in maintenance, the levels of deferred maintenance and the costs to repair or replace. This needs to be linked to the increased damage from freeze and thaw cycles during any winter period. Take results and develop workforce curriculum to stimulate people to invest in their community for social satisfaction through well maintained personal/private infrastructure. This will allow for a quality workforce in maintaining public infrastructure and competing for local work.

Policy option or recommendation:

Education component shared system for infrastructure observations use workforce to provide information into database:
Option 2: Get good inventory of what we have, condition, vulnerability and reliability
-How do you collect and summarize data, maybe web based
-Use as education tool. Educate people about value of maintaining infrastructure

What research is being done/known?

Need to check with state and federal agencies as well as economic research groups and ISER.

What are the gaps in research?

Gaps exist in assessing the level of deferred maintenance

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☐ Products ☑ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

AK DCCED, BIA, DOTPF, other agencies

TWG: Health and Culture

5.2.1.8

Standardized Social Network research needs to be accomplished in select communities to understand potential impacts of relocation on social, sharing, economic and subsistence networks.

Unique Identifier: 82

☑ Overarching Need

Why is this an issue?

Standardized sampling methods for social networks, as being applied in different locations and for different cultures, can provide a tool by which the challenges facing Alaska communities can be better understood.

Describe the scope of the research need:

Research needs to identify the methodology used in different locations and cultures of indigenous people and small remote communities facing a change to culture and lifestyle with climate change. Compare questions and approaches for appropriateness to challenges being faced in Alaska. Tailor standardized research to culturally appropriate materials for Alaska's indigenous people.

Policy option or recommendation:

Apply methods as being used for indigenous people around the world that are facing impacts from climate change.

What research is being done/known?

The Inuit Circumpolar Council Indigenous Peoples workshop in Anchorage as a significant reference point.

What are the gaps in research?

Review existing social network research data for Alaska communities and people that are at risk from impacts of climate change. Assess adequacy of research questions and methodology to insure it is appropriate for the challenges faced across Alaska's people. Develop deterministic models to predict sustainability, outmigration and other risks with changes to the environment from climate change.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Economic Activities and Natural Systems

Research category/type:

☑ Modeling ☑ Products ☑ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

UA, ISER, ADF&G, DEC, Native Organizations

TWG: Health and Culture

5.2.1.9

Unique Identifier: 71

☑ Overarching Need

Using the SPOT satellite data system or others, to track changes in permafrost extent and work to develop projection maps for changes in extent over the next 100 years, based on climate change projections. Such data would serve to guide communities and state agencies in construction planning decisions, both for determining the location and means of construction of new projects as well as identifying those existing projects which may be at risk from thawing permafrost in the future. Allow for continual update of these maps to incorporate the expected ongoing refinement in climate projections over time.
Permafrost Extent Projection Mapping

Why is this an issue?

Communities need accurate data to understand changes to their community and surrounding environment. This will support subsistence

Describe the scope of the research need:

This is a data acquisition approach that is being discussed for the Statewide Digital Mapping Initiative

Policy option or recommendation:

What research is being done/known?

This is being done as part of private sector work in Alaska, as funded by federal, state, and private entities.

What are the gaps in research?

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Public Infrastructure, Forestry, Agriculture and Waste , and Economic Activities

Research category/type:

☐ Modeling ☐ Products ☐ Education/Outreach ☑ Data Management ☑ Monitoring

Parties involved in implementation:

UA, DNR, USGS and the SDMI team

TWG: Health and Culture

5.2.2.1

Unique Identifier: 80

☐ Overarching Need

Decline and migratory shifts of major subsistence species and vegetation can significantly affect a wide range of cultural, community, and economic conditions. The effects of events must be assessed after an assessment is made of existing climate related socio-economic studies. Assess socio-economic impacts of existing and emergent climate change events on culture, community wellness, subsistence, and overall economics. Assess socio-economic impacts of existing and emergent climate change events on culture, community wellness, subsistence, and overall economics.

Why is this an issue?

The enculturation process of young hunters and gatherers through experienced adults can be severely disrupted with loss or disappearance of important subsistence species. Migration of wildlife may require extended subsistence trips, increasing costs and risks as well as substitution of expensive store bought foods.

Describe the scope of the research need:

The need is statewide and should be focused on key subsistence species identified in cooperation with appropriate local, regional, and statewide Alaska Native entities.

Policy option or recommendation:

What research is being done/known?

see research need

What are the gaps in research?

There is a dearth of climate related socio-economic impact assessments

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☑ Products ☑ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

UA research centers, Alaska Native regional and statewide organizations, federal and state agencies

TWG: Health and Culture

5.2.2.2

Unique Identifier: 81

☐ Overarching Need

Standardized ADF&G Harvest Surveys (which include considerable social, demographic and economic information in addition to household harvest per species) need to be accomplished in each of the villages designated with emergency status. Standardized ADF&G Harvest Surveys

Why is this an issue?

Describe the scope of the research need:

Policy option or recommendation:

What research is being done/known?

What are the gaps in research?

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☐ Products ☐ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

TWG: Health and Culture

5.2.3.1

Regional Assessments of existing social service infrastructure, staffing, budgets and delivery need to be accomplished at regional level as baseline to plan for increased demand.

Unique Identifier: 84

☐ Overarching Need

Why is this an issue?

Services are changing with the stress on rural communities that are increasing because of many factors, including climate change. Stressors include health, behavioral health, and culture with sustainability. Having accurate assessments based on research results and predictive models will allow decision makers to make plans for meeting these future needs.

Describe the scope of the research need:

Research includes interagency and provider assessment of level of social services available, community assessment of the adequacy of services provided, and changes in nature of illnesses, behavioral health, and culture with changing climate. Research will require social economic models that can be used to substantiate agency programs and budget needs.

Policy option or recommendation:

What research is being done/known?

Review of state, federal and native entity operating budgets and programs will provide a base upon which further research will be needed. Assess the value of interagency coordination in assuring adequacy of services given all the stressors on rural communities.

What are the gaps in research?

A comprehensive review of existing services, costs, and potential needs with impacts from climate change.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☑ Modeling ☑ Products ☑ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

TWG: Health and Culture

5.2.3.2

Social Impact Assessments need to be conducted at regional and community level to provide information for Section III of the NEPA process, description of the affected environment.

Unique Identifier: 85

☐ Overarching Need

Why is this an issue?

Gathering social impact assessment information will be needed to complete impact assessments and provide preferred alternatives.

Describe the scope of the research need:

Research is needed to develop standardized questions for social impacts in communities at risk from climate change. This will allow input to models for assessing level of risk and timeframe.

Policy option or recommendation:

What research is being done/known?

What are the gaps in research?

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☑ Modeling ☑ Products ☐ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

NOAA, MMS, USGS, BLM and USACE depending on lead on federal NEPA process. Community and Regional Native Corporations and Councils should be included to provide insight on level of risk. AK DCCED and DNR should be part of the research team.

TWG: Health and Culture

5.2.3.3

Detailed interviews and oral histories need to be conducted to provide narrative information needed to assess the impacts of climate change and the potential impacts of different forms of relocation. These interviews and oral histories need to be placed in a comprehensive library and archive.

Unique Identifier: 86

☐ Overarching Need

Why is this an issue?

As stressors impact health and culture of rural communities and indigenous people, risks to cultures and oral histories exist. Insuring comprehensive collection and archiving will preserve heritage. This is critical as heritage is being lost with aging and passing of elders.

Describe the scope of the research need:

Through networking with community leaders and native organizations, oral histories are preserved in a paper and electronic library.

Policy option or recommendation:

What research is being done/known?

UA maintains an active program in preserving traditional stories and language. Various native organizations continue to invest in collecting detailed interviews and oral histories.

What are the gaps in research?

A comprehensive archive of stories, language, and cultural artifacts and anecdotes needs to be explored for the present level of collection and probability of future success.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☑ Products ☑ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

UA, Native Corporations and Associations, individual communities and families

TWG: Health and Culture

5.2.4.1

1. Assess ADEC watershed contamination protection laws and source water protection program. 2. Assess effectiveness of current monitoring and surveillance programs to identify and control new pathogens or increased contaminant infiltration/runoff from

Unique Identifier: 30

☐ Overarching Need

Why is this an issue?

Increased temperatures, changing precipitation patterns, flooding, melting permafrost, and other climate change-related risks could alter the geographic range and incidence of a wide range of infectious diseases and can result in contamination of food and water sources.

Describe the scope of the research need:

Policy option or recommendation:

Augment surveillance and control programs for vector-, water-, and foodborne diseases likely to become greater threats because of climate change. Improve understanding of the potential human health impacts of climate change

What research is being done/known?

What are the gaps in research?

See the research need

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☐ Products ☐ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

Alaska state agencies, UA research centers, EPA, other federal agencies

TWG: Health and Culture

5.2.4.2

1. Assess sanitation and solid waste disposal infrastructure and practices at risk from flooding, melting permafrost, and other risks, or that is otherwise subject to changed conditions that significantly reduce performance in environmental health protection

Unique Identifier: 31

☐ Overarching Need

Why is this an issue?

Increased temperatures, changing precipitation patterns, flooding, melting permafrost, and other climate change-related risks could compromise sanitation and solic waste disposal infrastructure and render current practices ineffective.

Describe the scope of the research need:

Policy option or recommendation:

Assess sanitation and solid waste disposal infrastructure and practices at risk from climate and other risks that significantly reduce performance in environmental health protection. Improve understanding of the potential human health and cultural impacts of climate change

What research is being done/known?

What are the gaps in research?

See the research need

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☐ Products ☐ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

Alaska state agencies, UA research centers, EPA, other federal agencies

TWG: Health and Culture

5.2.4.3

Work to quantify the climate warming impact from the potential release of methane hydrates in the Arctic due to warmer sea temperatures. Study Climate Warming and Methane Hydrate Deposits

Unique Identifier: 74

☐ Overarching Need

Why is this an issue?

Describe the scope of the research need:

Policy option or recommendation:

What research is being done/known?

What are the gaps in research?

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☐ Products ☐ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

TWG: Health and Culture

5.2.4.4

Study the potential increase in bioavailability of persistent organic and transboundary pollutants, including pesticides, mercury, perfluorochemicals and flame retardants, which may be released from melting ice and snow and thawing soil as a result of climate warming in the arctic. Evaluate the potential health impacts on humans, ecosystems from these chemicals as well as their behavior in the food web, and develop projections as to whether these impacts and release rates can be expected to increase and to what degree in the future. Study of Climate Warming and Persistent Organic and other Pollutants.

Unique Identifier: 75

☐ Overarching Need

Why is this an issue?

Transport of pollutants and toxins with changes in atmospheric flows and oceanographic currents are impacting Alaska. Determining the extent and risk to health are a research need.

Describe the scope of the research need:

Monitoring changes in levels of toxins and linking to circulation models can provide insight into risks to human health

Policy option or recommendation:

What research is being done/known?

What are the gaps in research?

Monitoring protocols need to include specific toxins and transboundary pollutants

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☐ Products ☐ Education/Outreach ☐ Data Management ☑ Monitoring

Parties involved in implementation:

EPA, AK DEC, UA and native health organizations

TWG: Health and Culture

5.2.4.5

Study the interaction of increased UV exposure in the arctic on humans, animals and vegetation in conjunction with projected climate changes. Study Climate Warming and Ultra-violet Radiation.

Unique Identifier: 77

☐ Overarching Need

Why is this an issue?

Climate change can change UV exposure that may affect human health and change plant and animal distribution. This will affect culture.

Describe the scope of the research need:

Include UV radiation as an integral part of weather monitor stations.
Document changes in skin cancer, sunburn, and other exposure illnesses in native populations

Policy option or recommendation:

What research is being done/known?

What are the gaps in research?

Medical records of exposure and changes in levels of UV radiation need to be monitored

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☐ Products ☐ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

TWG: Health and Culture

5.2.5.1

Unique Identifier: 33

☐ Overarching Need

Why is this an issue?

Increased temperatures, changing precipitation patterns, flooding, melting permafrost, and other climate change-related risks will affect the stability of archeological sites and gravesites, requiring plans for protection or recovery.

Describe the scope of the research need:

Policy option or recommendation:

1. In cooperation with appropriate entities, complete an assessment of archaeological sites most at risk, and develop a plan for their protection or recovery. 2. Complete a statewide assessment of and response to the gravesites most at risk. Improve understanding of the potential cultural impacts of climate change

What research is being done/known?

What are the gaps in research?

See the research need

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☐ Products ☐ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

Alaska state agencies, UA research centers, EPA, other federal agencies

TWG: Health and Culture

5.2.6.1

1. Identify effective cooperative mechanisms to support rural communities in dealing with multiple rules and requirements. 2. In partnership with local communities, conduct an assessment of the capacity of communities to design and implement programs a

Unique Identifier: 32

☐ Overarching Need

Why is this an issue?

Increased temperatures, changing precipitation patterns, flooding, melting permafrost, and other climate change-related risks will present a wide range of challenges to rural communities that will require them to deal with multiple state and federal agencies, with overlapping and sometimes conflicting rules and regulations.

Describe the scope of the research need:

Policy option or recommendation:

Identify approaches, as well as responsible individuals, to support rural communities in dealing with complex issues requiring coordination among multiple state and federal agencies, local governments, NGOs, and others. Improve understanding of the potential health and cultural impacts of climate change

What research is being done/known?

What are the gaps in research?

See the research need

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☐ Products ☐ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

Alaska state agencies, UA research centers, EPA, other federal agencies

TWG: Natural Systems 5.3.1.1

Develop better hydrology data and models statewide.

Unique Identifier: 53

☑ Overarching Need

Why is this an issue?

Trend data and global climate models indicate a warmer and sometimes wetter climate for Alaska in the future. Planning for river navigation, flood hazard estimation, and cost-efficient engineering of public roads, culverts, bridges, water, and wastewater systems require accurate estimation of water flow volume and seasonality. Historic data and existing statewide coverage are inadequate for present and future needs.

Describe the scope of the research need:

Improve the currently available hydrology (NHD) dataset so that accurate modeling can be accomplished to understand and develop forecasts to anticipate changing surface water bodies, surface and subsurface flow (volume, timing, and locations), composition (nutrients, sediment) in priority areas. Gather data on hydrologic parameters throughout the state to establish baselines, so the effects of climate change on these parameters (e.g., precipitation, snowpack, and streamflow) can be evaluated. Improve gauging and monitoring to determine water supply and seasonality.

Policy option or recommendation:

NS-3 Manage climate change impacts on watersheds and in-stream flows.

What research is being done/known?

USGS has a network of stream gages and has developed a list of locations for possible expansion in AK. The NSSI has been investigating remote sensing technologies for detecting flows.

What are the gaps in research?

Stream gage coverage is insufficient for accurate modeling in much of the state.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Overarching climate change information need.

Research category/type:

☑ Modeling ☐ Products ☐ Education/Outreach ☑ Data Management ☑ Monitoring

Parties involved in implementation:

USGS. IATCA

TWG: Natural Systems

5.3.1.10

Assess, model, and monitor coastal impacts of changes to sea level and ice.

Unique Identifier: 40

☑ Overarching Need

Why is this an issue?

Coastal erosion is increasing with reduced sea ice cover and thawing permafrost. Rapid erosion is exposing buried infrastructure, undercutting road and building foundations, and destroying natural and cultural resources.

Describe the scope of the research need:

Project, map and monitor coastal erosion impacts in the context of sea level rise, coastal uplift, reduced sea ice, subsidence from permafrost thaw, tides, storms, short-term (El Nino-type) components. Develop detailed sea level change models, projections, and impact maps; increase monitoring of coastal erosion in the context of sea level rise, coastal uplift, sea ice loss, subsidence, and permafrost thaw; and increase monitoring for real-time and forecasts of ocean conditions (winds, waves, sea ice, currents, temperature, salinity, pH, etc.). Assess coastal substrate/sediment susceptibility to erosion (rock, ice, soil). Develop detailed sea level change models, projections, and impact maps. Improve monitoring of key climate change indicators & effects. Monitor coastal erosion in context of changing sea level rise, coastal uplift, and sea ice loss. Improved monitoring and forecasting of sea level rise will inform modeling and forecasting of impacts. Increase monitoring of coastal erosion and storm impacts.

Policy option or recommendation:

Overarching climate change information need

What research is being done/known?

National Water Level Observation Network sites provide data for trends (http://co-ops.nos.noaa.gov/sltrends/sltrends.shtml). Numerous modeling efforts are underway relative to sea level, sea ice and permafrost. Coastal erosion has recently been quantified in several areas of the North Slope and NW Alaska.

What are the gaps in research?

Local isostatic rebound needs to be factored into models of sea level rise in formerly glaciated areas. DEMs are lacking for accurate coastline and inundation modeling. Need National Water Level Observation Network stations along west and north coasts; need technology developed to get these measurements in iced areas.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☑ Modeling ☑ Products ☐ Education/Outreach ☑ Data Management ☑ Monitoring

Parties involved in implementation:

AOOS, AGDC, NOAA, USGS, UAF, Land management agencies

TWG: Natural Systems

5.3.1.11

Down-scaled climate models

Unique Identifier: 39

☑ Overarching Need

Why is this an issue?

Global Climate Model data is too coarse to inform communities and local resource managers about probable changes at local levels.

Describe the scope of the research need:

Develop projections of future climate on a local scale for communities and land management units throughout Alaska, using scaled-down global climate model data and appropriate Alaska datasets (e.g., PRISM).

Policy option or recommendation:

Overarching climate change research need.

What research is being done/known?

SNAP and others are actively developing downscaled model data. Model outputs are available for most communities and land management units across Alaska.

What are the gaps in research?

Output needs to be generated for additional areas. Models need continual refinement to reflect new research findings and to correct assumptions. Expand these downscaling efforts to ocean environment (just starting in the Chukchi).

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☑ Modeling ☑ Products ☑ Education/Outreach ☑ Data Management ☐ Monitoring

Parties involved in implementation:

UAF SNAP, USGS, NOAA, FS

TWG: Natural Systems

5.3.1.12

Coordinated climate and ecosystem monitoring.

Unique Identifier: 38

☑ Overarching Need

Why is this an issue?

Long-term datasets with reliable indicators and across large geographic areas (regional and continental scale) are essential to determine climate and resource condition trends.

Describe the scope of the research need:

Develop a set of reliable physical and biological indicators of climate change (including species and phenology) and related community impacts, to identify the most effective ways to implement short-, mid-, and long-term status and trend monitoring across broad areas and multiple land management units. Consider low-tech monitoring techniques (and its adequacy), local data observations with less than full weather service standards, satellite imaging, new sensors with communications systems, vehicles as probes.

Policy option or recommendation:

What research is being done/known?

Many agencies already have long-term ecological research and monitoring programs that could contribute data, but comparability of observations of different variables collected by different methods is an issue. Many nongovernmental scientists (with universities, private companies, and corporations) also have environmental monitoring data that could contribute to overall understanding if it were to be made public.

What are the gaps in research?

Identification and adoption of a set of common physical and biological indicators across the state, nation, and worldwide is an early need for comparability of monitoring data. Intellectual property and other issues interfere with sharing of data.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☑ Products ☐ Education/Outreach ☑ Data Management ☑ Monitoring

Parties involved in implementation:

NPS, NOAA, USGS, EPA, AFS, ACCAP, AOOS, SAON, NEON

TWG: Natural Systems

5.3.1.13

Determine appropriate indicators of climate change and community impacts. Improve monitoring of key climate change indicators & effects, with emphasis on effects with large societal impacts. Monitor climate change indicators and their societal impacts

Unique Identifier: 1

☑ Overarching Need

Why is this an issue?

Improved monitoring of key climate change indicators relevant to Alaska will allow for tracking of climate change effects and will contribute data to modeling and assessments. Monitoring of indicators of community impacts related to climate change will inform assessments of societal impacts and support planning and adaptation.

Describe the scope of the research need:

1. Identification of appropriate indicators of climate change and of community impacts.
2. Development and implementation of routine, on-going monitoring of indicators.
3. Development and improvement of modeling capabilities for indicator prediction.4. Development of information and products for public use.

Policy option or recommendation:

Overarching climate change information need

What research is being done/known?

Relevant data has been collected by agency (ADF&G, Division of Forestry, USFWS), tribal managers (e.g., North Slope Department of Wildlife and Council of Athabaskan Tribal Governments) and University scientists (e.g., Long-term Ecological Research Sites) Examples of reports cards include:- Arctic Report Cards ((http://www.arctic.noaa.gov/reportcard/index.html) - Sea Ice Outlook (NOAA/PMEL)

What are the gaps in research?

Assessment of observed responses to determine the most sensitive indicators, that should be monitored and reported on.Gaps in monitoring of key climate change indicators may include: - ice type need to increase the density of climate change data sites - gaps in climate reference network (only 4 of 33 sites in AK installed)- monitoring trends in marine mammal species abundance and distribution

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☑ Modeling ☐ Products ☑ Education/Outreach ☑ Data Management ☑ Monitoring

Parties involved in implementation:

Alaska state agencies; University of Alaska; EPA, NOAA and other federal agencies

TWG: Natural Systems

5.3.1.14

Protect community water supplies and instream flows.

Unique Identifier: 26

☑ Overarching Need

Why is this an issue?

Freshwater runoff from snow and icemelt is a major source of drinking water for communities. Adequacy of future supplies cannot be assumed with climate change.

Describe the scope of the research need:

Identify water needs, supplies, and rights of Alaskan communities, domestic and commercial and ecological. Develop water supply scenarios to better understand the broad range of impacts of climate change on fresh water quantity, flow, seasonality and quality in Alaska. Assess community's current and future water needs. Assess water rights for community potable water supplies, "subsistence priority", and water fish and wildlife habitat. Assess sustainability of water flows used for hydropower and aquifer recharge, and in-stream flows. Identify areas where future water needs are likely to be insufficient, using assessment tools such as the Arctic Water Resources Vulnerability Index (AWRVI), and review appropriateness of long-term water management strategies for these regions.

Policy option or recommendation:

NS-3. Manage climate change impacts on watersheds and in-stream flows.
NS-6. Prepare for adaptive management of fish and wildlife.

What research is being done/known?

USGS and others operate river gages

What are the gaps in research?

Gather data on hydrologic parameters (e.g., precipitation, snowpack, streamflow) throughout the state to establish baselines, so effects of climate change on these parameters can be evaluated. Conduct legal analysis of water rights.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Health and Culture.
Public Infrastructure

Research category/type:

☑ Modeling ☑ Products ☐ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

ADF&G,ADNR,USGS,NOAA

TWG: Natural Systems 5.3.1.15

Expand research and monitoring of contaminants deposition and bioavailability under changing climate.

Unique Identifier: 178

☑ Overarching Need

Why is this an issue?

Contaminants can affect health and survival of fish, wildlife, and people.

Describe the scope of the research need:

Include consideration of Persistant Organic Pollutants (POPs) and mercury that are produced in other areas (by wildland fire, coal burning, etc.) and precipitate in arctic environments by global air circulation. Also consider potential for spread of contaminants result from permafrost thaw and erosion in historically contaminated areas (e.g., military dumps, legacy wells).

Policy option or recommendation:

What research is being done/known?

EPA and NPS have recently completed the Western Airborne Contaminants Assessment Program that had both expected and unexpected results about contaminants in remote areas of Alaska. The State has assessed contaminants in fisheries and subsistence foods. DOD has cleaned up several known contaminant sites.

What are the gaps in research?

Extent and locations of contaminated historic dumps are not fully delineated. Effects of climate change on bioavailability and biomagnifications, ecological, and human effects, are incompletely understood.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Overarching climate change information need

Research category/type:

☑ Modeling ☑ Products ☑ Education/Outreach ☐ Data Management ☑ Monitoring

Parties involved in implementation:

EPA, USGS, DOD, DNR, NPS

TWG: Natural Systems

5.3.1.16

Develop landcover base maps statewide

Unique Identifier: 183

☑ Overarching Need

Why is this an issue?

Understanding changes in landcover types are critical to assessments related to fire, forestry, wildlife, fisheries, etc. GIS and maps are basic tools needed for many analyses.

Describe the scope of the research need:

Need vegetation maps that are usually compiled from satellite imagery. Ortho rectified imagery would show human improvements and vegetation. A base map is needed for the state.

Policy option or recommendation:

Overarching climate change information need.

What research is being done/known?

Numerous mapping programs are underway, but purposes, coverage, scale, and details vary. GINA is compiling base maps for the North Slope

What are the gaps in research?

Currently only portions of the state have this information available.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☑ Products ☐ Education/Outreach ☑ Data Management ☐ Monitoring

Parties involved in implementation:

USGS, UAF GINA and all land management agencies

TWG: Natural Systems

5.3.1.17

Assess communications strategies for climate change information.

Unique Identifier: 186

☑ Overarching Need

Why is this an issue?

Poorly communicated information about climate change can cause more harm than good.

Describe the scope of the research need:

Determine the most effective information sources for communities to receive accurate and complete information about climate change.

Policy option or recommendation:

What research is being done/known?

The Alaska Immediate-Action Working Group has initiated a mini-grant program with six Alaskan communities in immediate risk of climate-induced erosion that demonstrates the feasibility of such a program.

What are the gaps in research?

Avoid or counter counterproductive "scary" and sensational information, as was sometimes the case information about avian influenza.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☐ Products ☑ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

UAF Cooperative Extension Service, ASG MAP, NPS, FS, and FWS resource interpretation programs, teacher education, curriculum-based materials, on the ground.

TWG: Natural Systems 5.3.1.2

Identify permafrost thaw hazards and incorporate into engineering guidelines.

Unique Identifier: 54

☑ Overarching Need

Why is this an issue?

The IPCC predicts widespread permafrost thaw across the Northern Hemisphere in this century. Cracking roads and subsiding building foundations are common in some areas where permafrost thaw is accelerating. Landslides and mudflows are also occurring on thawing wet hill slopes, sometimes blocking roads, rivers, and degrading fish habitats. Engineers, builders, and planners need accurate maps and forecasts for planning.

Describe the scope of the research need:

Permafrost thaw. Identify trends and trajectories in active layer (seasonal thaw zone) depth and permafrost zones (i.e., continuous, discontinuous), and thaw hazards, through modeling, soil surveys, and studies of permafrost degradation. Include analysis of geotechnical data collected for construction projects, drill logs, and collect data from monitoring systems that have already been installed under many Alaska highways. Include coastal erosion vulnerability mapping, as permafrost stability is a major factor. Incorporate data into an updated published environmental atlas for engineers.

Policy option or recommendation:

What research is being done/known?

UAF has several permafrost and active layer monitoring programs underway. CRREL has incorporated some newer information into the GIS-based Alaska Engineering Design Information System (AEDIS).

What are the gaps in research?

Permafrost and active layer mapping is incomplete across much of the state and several potentially useful data streams remain uncollected or unanalyzed (e.g., geotechnical soil test data, highway thermister networks) . Models are in development but require soils mapping for precision and monitoring data for verification. Data published in the Environmental Atlas of Alaska is long out of date (1978), and there appear to be liability concerns preventing engineers from widely adopting unpublished AEDIS data.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☑ Modeling ☑ Products ☐ Education/Outreach ☑ Data Management ☑ Monitoring

Parties involved in implementation:

UAF, ACCAP, NRCS, ADOT, NSF

TWG: Natural Systems

5.3.1.3

Identify and research regulatory and policy issues.

Unique Identifier: 57

☑ Overarching Need

Why is this an issue?

Many of the laws, policies, and regulations that direct management of public and private lands and waters are premised on stable climates, or at least on the ability to envision future conditions (e.g., ANILCA, ESA, CFR, CZMA). What will be the standard of successful resource management in a changing future? Can state and federal agencies preserve the unique and special values that are identified in legislation in the face of climate change? How will they develop adaptation strategies for fish, animals and plants when their natural climate zones move beyond management units, state and national borders?

Describe the scope of the research need:

Identify inconsistencies in laws, regulations and policies that limit the abilities of the State, federal, Native and local agencies, businesses and individuals to effectively address and manage climate change impacts on natural resources.

Policy option or recommendation:

What research is being done/known?

Several DOI agencies have begun identifying laws, regulations, and policies that may limit their ability to address climate change issues. UAA law professor Julie Lurman Joly has researched regulatory barriers to facilitated migration of at-risk species into more favorable habitats.

What are the gaps in research?

Laws, regulations, and policies need to be evaluated relative to potential future scenarios, and with legal advice to determine whether there is sufficient flexibility for dealing with climate changes or whether changes are appropriate.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Overarching climate change information need

Research category/type:

☐ Modeling ☑ Products ☐ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

ACCAP, Federal and State regulatory agencies, with legal advice from agency solicitors

TWG: Natural Systems 5.3.1.4

Implement local climate change scenario planning workshops in communities across Alaska (coastal, arctic, interior, etc.).

Unique Identifier: 58

☑ Overarching Need

Why is this an issue?

Alaskan's are receiving conflicting, sometimes sensational and frightening information about climate change from many sources. However, few communities really understand what changes to expect in their area, or how fast to expect them. As heard at the ACTEM climate change session, communities need updated mapping, photographs, and projections of environmental changes to be able to effectively plan for their adaptation to climate change.

Describe the scope of the research need:

Improve accuracy and currency of mapping and aerial photography near communities, to assist communities with planning for adaptation to climate change. Apply models and develop scenarios of changes in climate, environmental hazards (erosion, wildfire, flooding) to facilitate future community planning. Workshops would include discussion of potential effects under a probable range of future climate scenarios, with discussion of how physical, biological, cultural, and social changes associated with rapid climate change would affect communities and resources.

Policy option or recommendation:

What research is being done/known?

University of Alaska is developing remote sensing and photographic products (Geographic Information Network of Alaska - GINA) and scenarios of future environment and risks (Scenarios Network for Alaska Planning - SNAP)

What are the gaps in research?

Fill critical gaps in photography, maps and scenarios. Improve accessibility of information to agencies and communities.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☑ Modeling ☑ Products ☑ Education/Outreach ☑ Data Management ☐ Monitoring

Parties involved in implementation:

SNAP, AOOS, GINA, ACCAP. Coordinate information and activities with federal agencies (e.g., USGS, NOAA, NASA) and Native organizations.

TWG: Natural Systems

5.3.1.5

Hazards identification and assessments.

Unique Identifier: 56

☑ Overarching Need

Why is this an issue?

Describe the scope of the research need:

Identify and research specific hazards, mitigation measures, and response capacity needed for dealing with effects of rapid climate changes on: fire regimes and forest fuel hazards, physical hazards (glacial outbursts and river flooding, surging glaciers, avalanches, landslides, ground failures, solifluction, erosion, inundation, subsidence), invasive species (plants, animals, pests and diseases), species habitat loss and fragmentation, and vulnerabilities to spread of contaminants resulting from persistent organic pollutants (POPS) and permafrost thaw.

Policy option or recommendation:

What research is being done/known?

USGS, CCREL, and UAF researchers are researching and monitoring selected hazards (e.g., Hubbard and Tweedmuir glaciers), and other researchers and resource managers are dealing with recognized hazards, where possible.

What are the gaps in research?

A comprehensive and specific assessment, to identify specific risks and locations, is lacking. Southeast Alaska is a priority area due to rapid glacial retreat and unstable soils.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☑ Modeling ☑ Products ☐ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

USGS, NOAA, CG, EPA, multiple federal and state agencies

TWG: Natural Systems

5.3.1.6

Data integration

Unique Identifier: 50

☑ Overarching Need

Why is this an issue?

Decisions are being made without benefit of available data and redundant research activities are started for lack of access to existing data.

Describe the scope of the research need:

Expand data integration and collaboration to facilitate increased access to information and ensure inter-operability of multiple data management systems.

Policy option or recommendation:

What research is being done/known?

Leslie Holland-Bartels of USGS has assembled a group to integrate applications with several public databases

What are the gaps in research?

Unpublished data held by federal and state agencies, academic scientists, and businesses is still not widely shared.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☐ Products ☐ Education/Outreach ☑ Data Management ☐ Monitoring

Parties involved in implementation:

TWG: Natural Systems

5.3.1.7

Changes to vital ecosystem services

Unique Identifier: 45

☑ Overarching Need

Why is this an issue?

Describe the scope of the research need:

Research potential impacts/ramifications of the changes to all affected resource types, including: atmosphere, cryosphere, hydrosphere, biosphere, and lithosphere the ecosystem services that they provide, and the societal impacts of these changes.

Policy option or recommendation:

NS-2. Review and modify Alaska's wildland fire policy and programs.
NS-3. Manage climate change impacts on watersheds and in-stream flows.
NS-4. Reduce introduction and spread of invasive species in the context of climate change.
NS-6. Prepare for adaptive management of fish and wildlife.
NS-7. Develop capacity in new forestry and wood biomass opportunities.

What research is being done/known?

Research, monitoring, and modeling is underway to determine status and trends and to forecast changes in some topics. Fire modeling is underway to anticipate changes in fire behavior.

What are the gaps in research?

The cascading effects of large scale environmental change need to be considered. What are the consequences of ecosystem changes to vital natural services and economic resources, such as water supply, air quality, ocean fisheries, etc. How will large scale changes in the boreal forest affect other factors? What are the potential tipping points, where vital services are no longer being provided (e.g. fish population crash).

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☑ Modeling ☐ Products ☐ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

UAF, ACCAP, NSF ADF&G, USFWS, DOF

TWG: Natural Systems

5.3.1.8

Geospatial data needs, aerial photography, digital elevation models (DEM), and remote sensing data.

Unique Identifier: 42

☑ Overarching Need

Why is this an issue?

There are highly important specific early needs to facilitate other data gathering efforts. For example, accurately represented coastal land elevations are needed for modeling how sea level rise will affect low lying coastal areas.

Describe the scope of the research need:

Improve the currency and accuracy of aerial photography, DEMs, and remote sensing data available statewide for community and agency use in planning adaptation strategies for climate change. Ensure that new mapping meets needs of coastal and ocean community, as well as terrestrial needs.

Policy option or recommendation:

What research is being done/known?

Multiple agencies are acquiring imagery for particular purposes, but more coordination could result in better coverage and detail, potentially with less redundancy and lower overall cost.

What are the gaps in research?

Much of Alaska's area has not been mapped recently or to modern standards of accuracy. DEMs are required for appropriate orthorectification of imagery and to ensure an adequate base map is available for other resource mapping and analysis, including coastlines, fire, and wildlife.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☑ Products ☐ Education/Outreach ☑ Data Management ☐ Monitoring

Parties involved in implementation:

AGDC

TWG: Natural Systems 5.3.1.9

Coastal mapping and shoreline characterization.

Unique Identifier: 41

☑ Overarching Need

Why is this an issue?

Conduct an Alaska Shoreline Impact Assessment Project to establish a baseline of data on the existing biotic coastal resources and the projected impacts of sea level rise (including effects of tides, weather and short-term [El Nino-type] components). Characterize Alaska's coastal shoreline and coastal resources (e.g., NOAA ShoreZone), geomorphology, biology, cultural sites.

Describe the scope of the research need:

Complete baseline characterization of Alaska's coastlines (i.e., NOAA ShoreZone, geomorphology, biology, cultural sites) to enable coastal impact forecasting, scenario planning, monitoring, trend analysis, and spill response following shipping accidents, which are expected to increase as sea ice diminishes in the Northwest Passage.

Policy option or recommendation:

NS 6 Fish & Wildlife Management:(6.2) Coordinate state & federal management to adapt to mitigate climate change effects on species, when feasible.

What research is being done/known?

Much of Southeast and Southwest Alaska has been mapped through videography.

What are the gaps in research?

Northwest Alaska and some parts of Southeast (e.g., inner Glacier Bay) remain to be mapped. Mapping will require accurate DEM's for vertical control shoreline. Combine orthophoto mosaic data and oblique (ShoreZone) dataset to be able to use both. Access newly declassified defense imagery.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☑ Products ☐ Education/Outreach ☑ Data Management ☐ Monitoring

Parties involved in implementation:

AGDC, NOAA, USGS, NPS

TWG: Natural Systems

5.3.2.1

Synthesize current information about climate change impacts on fisheries impacts and assess its reliability and degree of uncertainty. Conduct fisheries ecological modeling.

Unique Identifier: 180

☐ Overarching Need

Why is this an issue?

Describe the scope of the research need:

Understand how productivity of coastal and estuarine systems may change and species composition shift in response to environmental changes and resource use. One connection may be to better understand the lack of recovery for herring, crab and shrimp fisheries along the Gulf of Alaska.

Policy option or recommendation:

NS-1. Incorporate climate change into commercial fisheries management and assist fishing communities and users in adaptation.

What research is being done/known?

Considerable research has been conducted on marine "regime change" due to "El Nino/La Nina" effects, that may be informative to modeling effects of long-term climate change.

What are the gaps in research?

Questions about some historic population shifts remain unanswered. Fisheries status and trend data is incomplete.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☑ Modeling ☑ Products ☑ Education/Outreach ☑ Data Management ☐ Monitoring

Parties involved in implementation:

UAF,NOAA/NMFS, NPRB, EVOSTC, USGS, NCCSP. Partnership between federal, state and university coastal labs and researchers. (John Piatt, Anne Hollowed)

TWG: Natural Systems

5.3.2.2

Arctic Ocean fisheries assessments.

Unique Identifier: 181

☐ Overarching Need

Why is this an issue?

Fisheries population shifts are occurring due to ecological change, and ship access is increasing with reduced sea ice. Commercial fishing in new areas would have uncertain effects to previously unaffected populations

Describe the scope of the research need:

Determine abundance and vulnerability of Arctic Ocean fish species, potential bycatch, and critical dependencies (e.g., marine mammals).

Policy option or recommendation:

NS-1. Incorporate climate change into commercial fisheries management and assist fishing communities and users in adaptation.

What research is being done/known?

Basic research has been completed on many Arctic species by academic researchers.

What are the gaps in research?

Status and trends of species with commercial potential is largely undetermined. Vulnerabilities of non-target species have not been determined.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☑ Modeling ☑ Products ☐ Education/Outreach ☐ Data Management ☑ Monitoring

Parties involved in implementation:

NOAA/NMFS, UAF, MMS

TWG: Natural Systems 5.3.2.3

Increase real-time monitoring and forecasts of physical ocean conditions (winds, waves, sea ice, currents, temperature, salinity, pH, etc.).

Unique Identifier: 13

☐ Overarching Need

Why is this an issue?

Improved monitoring and forecasting of changing ocean conditions will inform modeling and forecasting of related biotic changes, as well as inform marine-based human uses. Physical data is needed to predict and explain biological responses. Impacts of freshwater from glacial melt on marine ecosystem is needed to improve understanding of effects of climate change on marine ecosystems. Water temperature increases are correlated with oceanic regime changes and with locally reduced salmon returns and increased fish disease (e.g., Yukon River). Ocean acidification of the magnitude that has been occurring is expected to have significant impacts to food webs, and certain species (e.g. corals, shellfish).

Describe the scope of the research need:

Monitor and model potential change for ocean currents, temperature, salinity, and acidification. Temperature data has been collected for a long time at many tide stations (but we only have 2 tide stations in the Arctic), but the data is sparse across the Arctic, and oceanographic changes will need salinity data to understand what climate aspects are driving, changing oceanographic conditions. Add conductivity sensors to tide stations. Institute an ocean acidification monitoring program.

Policy option or recommendation:

NS-1. Incorporate climate change into commercial fisheries management and assist fishing communities and users in adaptation.

What research is being done/known?

AOOS is developing a cooperative network of observing stations.

What are the gaps in research?

Oceanic and coastal seawater monitoring remains limited.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☐ Products ☑ Education/Outreach ☑ Data Management ☑ Monitoring

Parties involved in implementation:

AOOS

TWG: Natural Systems

5.3.2.4

Fisheries policy considerations.

Unique Identifier: 179

☐ Overarching Need

Why is this an issue?

Describe the scope of the research need:

Research what other countries, U.S. federal agencies and other states are doing to incorporate climate change considerations into commercial fishing policies, management, and other adaptations. Assess what is appropriate to Alaska conditions.

Policy option or recommendation:

NS-1. Incorporate climate change into commercial fisheries management and assist fishing communities and users in adaptation.

What research is being done/known?

What are the gaps in research?

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☑ Products ☐ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

NMFS, NPRB, ADFG.

TWG: Natural Systems

5.3.2.5

Conduct physical, biological, and socioeconomic monitoring consistently over time to understand environmental change, distribution and abundance of freshwater, marine and andadromous species, and societal impacts.

Unique Identifier: 14

☐ Overarching Need

Why is this an issue?

Broad scale changes in fisheries species abundance and distribution are expected. Changing stream/lake biochemistry may drive freshwater ecosystem change and changes in abundance and distribution of species of commercial or subsistence importance (as well as other effects.) Monitoring is essential to inform policy, management, and users' decisions. Data will support modeling and forecasting. The Anadromous Waters Catalog is the key tool for documenting freshwaters important to anadromous fish and providing protection for this habitat.

Describe the scope of the research need:

Establish long-term monitoring to document changes and trends in fish species abundance and distribution. Update the Anadromous Waters Catalog to document and protect waters that support anadromous fish. Research stream/lake biochemistry in order to improve understanding of effects of climate change on freshwater ecosystems. Increase research on stream/lake biochemistry impacts due to land cover conversion, permafrost degradation, and changing precipitation regimes within watersheds. (Contact Bruce Peterson, Woods Hole Marine Biological Lab, http://ecosystems.mbl.edu/Tide/contact/peterson.htm) Improve information available to fishery managers, participants in commercial and subsistence fisheries, and fishing communities. Monitor trends in marine and freshwater fish species abundance and distribution.

Policy option or recommendation:

NS-1. Incorporate climate change into commercial fisheries management and assist fishing communities and users in adaptation. NS-6. Prepare for adaptive management of fish and wildlife.

What research is being done/known?

Salmon runs are monitored relative to escapement goals.

What are the gaps in research?

Marine fisheries monitoring is limited. Many streams are also not monitored regularly. Effects of permafrost thaw are largely undetermined

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☐ Products ☑ Education/Outreach ☐ Data Management ☑ Monitoring

Parties involved in implementation:

ADFG, NMFS, AOOS, ACCAP

TWG: Natural Systems

5.3.2.6

Consider need for protected fish conservation areas. Evaluate tools for fish species conservation

Unique Identifier: 15

☐ Overarching Need

Why is this an issue?

Expanding fisheries pressure can deplete target and bycatch populations and degrade habitats. Reduced sea ice increases the likelihood of increased fishing pressure in Arctic waters.

Describe the scope of the research need:

Research potential need for protected areas to ensure sustainabiliity of species important to commercial or subsistence fisheries.

Policy option or recommendation:

NS-1. Incorporate climate change into commercial fisheries management and assist fishing communities and users in adaptation.

What research is being done/known?

A growing body of research shows significant benefits from establishment of marine protected areas. However, such decisions are not always made on firm scientific basis relative to needs of commercially important species.

What are the gaps in research?

Species status and trend data, and assessments of habitat quality and fishing pressure would greatly help.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☑ Products ☐ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

ADFG, NOAA, NPS, USGS, UAF

TWG: Natural Systems

5.3.3.1

Fire and fuel modeling.

Unique Identifier: 44

☐ Overarching Need

Why is this an issue?

Fire hazards are expected to increase with rising air temperature.

Describe the scope of the research need:

Conduct detailed modeling (including hind- and fore-casting) of wildland fire frequency, intensity, and areas, including likely effects on principle landcover types (e.g., conifers, deciduous, grass, tundra). Modeling is needed to assess future fire dynamics under a suite of potential future climate scenarios. What would happen under an increased fire protection strategy scenario as well as the current management action. Fine-scaled projections of future fire regime would benefit communities in preparing their Community Wildfire Protection Plans.

Policy option or recommendation:

NS-2. Review and modify Alaska's wildland fire policy and programs.

What research is being done/known?

Modeling is underway by UAF SNAP with the AFS. Other published models are also available (e.g., Bachelet et al. 2005)

What are the gaps in research?

Modeling is more refined for coniferous forests than for tundra or grassland.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☑ Modeling ☐ Products ☐ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

UAF SNAP, ACCAP, JFSP

TWG: Natural Systems

5.3.3.2

Review and coordinate wildfire policies with Canadian counterparts. Determine efficacy and ecological effects of different fire management policies.

Unique Identifier: 10

☐ Overarching Need

Why is this an issue?

Current wildland policy is not Full Suppression. Research would inform policy makers about potential positive and negative effects to wildlife habitat of allowing wildland fires to burn.

Describe the scope of the research need:

Determine if mechanical fuel treatments are achieving the desired condition class change in the fuel type. Determine best landscape "mosaic" of burned and unburned areas for wildlife habitat, not just by landcover type, and incorporate information into policies. Monitor and research tundra fire effects, including the impacts of fire on winter caribou range and changes in vegetation patterns and succession caused by fire. This will require improved remote sensing of burn severity and depth of fire (e.g., deep fires on Yukon Flats).

Policy option or recommendation:

NS-2. Review and modify Alaska's wildland fire policy and programs.

What research is being done/known?

What are the gaps in research?

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☑ Modeling ☑ Products ☐ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

TWG: Natural Systems 5.3.3.3

Tundra fire mitigation measures.

Unique Identifier: 184

☐ Overarching Need

Why is this an issue?

Tundra fires are expected to increase as shrubs move into tundra and as soils dry from climate warming. Remote communities have limited fire fighting capacity.

Describe the scope of the research need:

Evaluate mitigation strategies for communities in tundra-dominated ecosystems to create fuel breaks at the wildland interface (e.g., gravel perimeter road around community) to reduce risk of wildland fire spreading among structures, as well as spread of fire from communities into wildlands (e.g., escaped trash fires at dumps).

Policy option or recommendation:

NS-2. Review and modify Alaska's wildland fire policy and programs.

What research is being done/known?

Considerable experience has been gained on managing wildland fire – urban interface in other environments. UAF SNAP is modeling future fire scenarios.

What are the gaps in research?

Tundra and permafrost respond differently to fire and other ground disturbing activities than other environments. Modeling of tundra fire is less developed than for coniferous forests.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Health and Culture

Research category/type:

☐ Modeling ☑ Products ☑ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

AFS, JFSP, affected communities, UAF SNAP

TWG: Natural Systems

5.3.4.1

Identify and develop methods to assess and control invasive and irruptive plant, animal, and diseases likely to become established, expand their range, or be intentionally introduced in Alaska due to climate change.

Unique Identifier: 52

☐ Overarching Need

Why is this an issue?

Established terrestrial, aquatic, and marine species are shifting north into Alaska, while other species are also arriving from other seas and continents. Some new arrivals will compete with current species or carry parasites and diseases previously not present in Alaska.

Describe the scope of the research need:

Identify, model, and monitor and research specific risks to native species and ecosystems due to climate-driven expansion of invasive plant, animal, disease and pest species (terrestrial, freshwater, and marine), including potential transmission routes, trigger points, and conditions affecting establishment. Irruptive native pests that, under conditions of climate change, may expand rapidy and have comparable effects to invasive non-native species (e.g., bark beetles, "rocksnot" diatom) should also be considered. Identify mechanisms of long-dispersal of plants and animals in order to create barriers for invasives, while not interfering with movement of native species. Expansion into warmer and dryer areas where native species are stressed by climate change needs to be modeled, so that control measures can be designed and implemented where appropriate. Identify new species with high risk of arrival and spread. Assess laws and policies affecting introduction, spread, and control of invasive species. Support development of "best methods" guidelines for preventing spread of invasive species. Assess existing ballast water treatment and hull cleaning technologies for application in Alaska. Assess effectiveness of practices for new-roads maintenance equipment, schedules and methods in reducing the spread of invasive plants. Develop capacity for commercial production of native plants materials from local sources for revegetation projects to reduce the probability of exotic species becoming established following ground disturbance (construction, fire, etc.). Research benefits, ecological niche, potential invasiveness of potential "new" introduced species, including agricultural, horticultural, and forest vegetation better adapted to a warming climate. Public outreach and education are needed to reduce introductions in fishing areas and along recreational and subsistence trails. Definitions: An "invasive species" is a species that is non-native (alien or exotic) to the ecosystem under consideration and whose introduction causes or is likely to cause economic or environmental harm or harm to human health. "Introduction" means the intentional or unintentional escape, release, dissemination, or placement of a species into an ecosystem as a result of human activity (Executive Order 13112).

Policy option or recommendation:

NS-4. Reduce introduction and spread of invasive species in the context of climate change.

What research is being done/known?

Alaska's invasive species plans address known risks for weeds, invasive species, and rodents, and are mostly focused on species with demonstrated high invasiveness through experience here or elsewhere: http://www.adfg.state.ak.us/special/invasive/invasive.php Criteria for ranking invasiveness have been developed for plants. Modeling has shown road, railroad, and trail corridors to be plant transmission zones, especially where they cross rivers and streams. Ballast water and recreational boating are among known aquatic hazards.

What are the gaps in research?

Disease organisms with high risks to agriculture and humans are largely recognized in the agricultural and human health fields, but are not fully considered in the context of climate change.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Forestry, Agriculture & Waste, Health & Culture

Research category/type:

☑ Modeling ☑ Products ☑ Education/Outreach ☐ Data Management ☑ Monitoring

Parties involved in implementation:

USGS, UAF, NMFS, CNIPM, ASG, ACCAP, FS, NRCS

TWG: Natural Systems

5.3.4.1

Provide effective monitoring, forecasting and response to marine invasive species

Unique Identifier: 12

☐ Overarching Need

Why is this an issue?

The number and distribution of invasive species is expanding in Alaska. Invasive species frequently outcompete valued native species and cause severe economic and ecological damage.

Describe the scope of the research need:

Monitor distribution and spread of marine species, Atlantic salmon, Spartina, green crabs, and invasive tunicates in Alaskan coastal waters. Develop and implement statewide monitoring program for disease irruptions and invasive species that affect fish and shellfish, including PSP, Vibrio and HAB

Policy option or recommendation:

NS 4 Invasive Species: implement statewide strategic plan of action to address invasives and erupted plants, insects, pathogens and marine invasivess.

What research is being done/known?

Information on the spread of marine invasive species in Alaska is largely localized or incidental.

What are the gaps in research?

Broad and consistent monitoring of marine invasive species, in time to take action, is largely lacking.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☐ Products ☑ Education/Outreach ☑ Data Management ☑ Monitoring

Parties involved in implementation:

DEC,State Public Health Dept.,EPA,NOAA,FDA

TWG: Natural Systems

5.3.5.1

Better wildlife and fisheries populations and harvest rate data.

Unique Identifier: 51

☐ Overarching Need

Why is this an issue?

Alaska's terrestrial, aquatic and marine ecosystems are changing, as are the natural habitats required by wildlife and fishery species. Scientists expect rapid change in some areas as trees and shrubs expand into tundra, fires reduce the size and extent of coniferous forests, and permafrost thawing and thermokarst change the distribution and size of wetlands. Alaska's rural population, tourism industry, and many businesses depend on healthy wildlife and fish populations for food and income. Accurate monitoring data and forecasts are needed to inform decision makers about resource management needs and options, including changes to laws, policies, and regulations.

Describe the scope of the research need:

Expand long-term monitoring, modeling, and use of traditional and local knowledge to understand how species abundance and distribution are changing. Develop criteria for triggering investigation of unexpected population changes. Develop projections of future changes to potential wildlife habitat that are likely to result from climate-driven changes to landcover (vegetation), wildfire frequency and intensity, and permafrost thaw, etc. Consider fire impacts from subsistence, historic, and TEK perspectives for holistically modeling fire effects. Prioritize subsistence and rare species based on current assessments (ADF&G wildlife conservation plan). Increase State/Federal cooperation in joint wildlife surveys, monitoring, and data management, especially for species with large home ranges (e.g., WACH WG, KBBPMG). Continue community/guild surveys (breeding bird, Christmas bird count) and available game surveys. Integrate High Latititude Ecological Survey (www.HLEO.org) with citizen reporting network (e.g., CARMA http://www.rangifer.net/carma/).

Policy option or recommendation:

NS 6 Fish & Wildlife Management:(6.2) Coordinate state & federal management to adapt to mitigate climate change effects on species, when feasible.

What research is being done/known?

ADFG and several federal agencies have ongoing population monitoring programs for many species. USGS, NPS, and FWS have implemented WildCast to model landcover and potential habitat change north of the Yukon River. Community harvest surveys that are conducted under ADFG protocols document historic and current consumption trends in many communities.

What are the gaps in research?

Frequency and precision of monitoring is insufficient to accurately estimate population status and trends for some species. Limited data sharing between State and federal agencies remains a constraint. Modeling of climate change impacts to wildlife is just beginning. Community harvest surveys are missing or out-of-date for many communities.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Health & Culture, Economic Activities

Research category/type:

☑ Modeling ☐ Products ☐ Education/Outreach ☑ Data Management ☑ Monitoring

Parties involved in implementation:

ADFG, FWS, NPS, NMFS, WACH WG, KBBPMG

TWG: Natural Systems

5.3.5.2

Develop projections of future changes to potential wildlife habitat that are likely to result from climate-driven changes to landscape, landcover (vegetation), wildfire frequency and intensity, permafrost thaw/thermokarst, and fragmented migratory corridors.

Unique Identifier: 16

☐ Overarching Need

Why is this an issue?

Climate change will have cascading effects on multiple physical, biological, social, and cultural resources. However, the scope and scale of those effects is largely undetermined.

Describe the scope of the research need:

Assess vulnerability of fish and wildlife ecosystems. Complete a vulnerability assessment to identify specific species, habitats, landscapes, ecosystem functions, and cultural resources that may be most sensitive to climate change, in order to prioritize allocation of scarce resources and improve management choice. Prioritize allocation of fish and wildlife management resources to ecosystems at highest risk from landscape changes.

Policy option or recommendation:

NS-6. Prepare for adaptive management of fish and wildlife.

What research is being done/known?

USGS has initiated WildCast research with NPS and FWS for areas north of the Yukon River. The State funded the ANHP to model species at risk 2 years ago, but we have not seen a product. USFWS has extensive experience in assessing risks to rare species.

What are the gaps in research?

Research relative to climate change risks is just beginning for most areas and species.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☑ Modeling ☑ Products ☐ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

Alaska state agencies, UA research centers, EPA, other federal agencies

TWG: Natural Systems

5.3.5.3

Evaluate and improve methods for caribou population enumeration.

Unique Identifier: 22

☐ Overarching Need

Why is this an issue?

Subsistence communities need accurate information to adjust harvest patters to changing wildlife abundance. Some herds are in decline and others may be. The accuracy and timeliness of caribou monitoring programs has been questioned by stakeholders and cooperators.

Describe the scope of the research need:

Evaluate reliability of conducting post-calving photocensus of caribou herds and alternate methods for assessing population abundance. Coordinate more between state and federal partners to incorporate "best methods" for accurate data, when caribou are not grouping for photo census. Evaluate improved census techniques. Use improved DEM data to determine caribou habitat use. Develop protocols for "citizen science" to document arrival, departure of species. Build habitat based models. Couple population data to climate trends, including tundra icing events. An international conference on census, herd composition, and trend methods is warranted to define scope problems and evaluate alternative methods (e.g., mark-recapture for population estimate, sampling effort and statistical power needed for detection of trend).

Policy option or recommendation:

NS 6 Fish & Wildlife Management:(6.1) Revise fish & wildlife management to adapt to effects of climate change.

What research is being done/known?

Periodic photocensus are conducted and caribou herd movement is tracked by GPS and radiocolars.

What are the gaps in research?

Photocensus may miss some groups leading to low estimates. Frequency and accuracy of census techniques may not be sufficient to detect the start of major population drops. Limited data sharing is a long-standing issue among cooperators.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☑ Modeling ☑ Products ☑ Education/Outreach ☑ Data Management ☑ Monitoring

Parties involved in implementation:

WACH working group, ADF&G, Canadian provincial agencies, universities, Scandinavians, Russians

TWG: Natural Systems

5.3.5.4

? Assess disjuncts between calendar dates for legal harvest, and actual biological behavior of species. Improve methods for moose population enumeration.

Unique Identifier: 24

☐ Overarching Need

Why is this an issue?

Hunters are concerned that legal harvest dates don't always correspond with available harvest opportunities. Managers are concerned that shifting a hunt into the rut period (when bulls are preoccupied with breeding) can increase hunting success, which could be a problem in low-density populations or those with a low bull:cow ratio.

Describe the scope of the research need:

Evaluate potential effect of allowing moose hunting during the rut on moose productivity. Evaluate tools or methods for wildlife species assessment. Conduct literature review about effects of temperature on rut timing and the potential effect of allowing moose hunting during the rut on productivity of moose. The most common request to date has been to shift moose hunting seasons later in autumn when weather is cooler (change to warmer weather in early September for parts of the Interior was documented by National Weather Service on request of Alaska Department of Fish and Game in 2008). Research on rutting behavior would require long-term observational studies, which would be challenging in boreal forest. Review data or model the potential effect of shifting moose hunting seasons into early October on the disruption of breeding success, particularly in low-density populations typical of many rural areas of Interior. Evaluate reliability of conducting population estimates or age-sex composition surveys for moose in autumn (before antler drop) compared with surveys in late winter.

Policy option or recommendation:

NS-5. Review State regulatory process for wildlife harvest to assure timely adaptation to changing conditions.
NS 6 Fish & Wildlife Management:(6.1) Revise fish & wildlife management to adapt to effects of climate change.

What research is being done/known?

What are the gaps in research?

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☑ Products ☐ Education/Outreach ☐ Data Management ☑ Monitoring

Parties involved in implementation:

ADF&G, USGS, UAF

TWG: Natural Systems

5.3.5.5

Identify how "sentinel" ecosystems are changing.

Unique Identifier: 182

☐ Overarching Need

Why is this an issue?

Continued monitoring in those areas where there are long-term records could provide valuable trend information.

Describe the scope of the research need:

Some operational surveys like ADFG small mesh survey in Kachemak Bay, have lost their operational need but provide an excellent indicator of ecosystem change.

Policy option or recommendation:

NS-6. Prepare for adaptive management of fish and wildlife.

What research is being done/known?

Long-term records of environmental and resource change exist for several areas, but some have been discontinued because their original purpose ended.

What are the gaps in research?

ADFG should review their data to see which data can be used to show ecosystem change and continue them for that purpose.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☐ Products ☐ Education/Outreach ☐ Data Management ☑ Monitoring

Parties involved in implementation:

ADFG

TWG: Natural Systems 5.3.6.1

Research and monitor forest response after disturbance. Research ecological tipping points.

Unique Identifier: 8

☐ Overarching Need

Why is this an issue?

Trees are moving into higher altitudes and higher latitudes as climate warms. Many common species are experiencing severe and recurring pest outbreaks (e.g., bark beetles, budworms, leaf miners) related to climate change (increased temperatures and transpiration, reduced soil moisture). Fire effects are increasing as flammable shrubs and trees expand into tundra, and as fire frequency increases in boreal forests. However, the full scope and trends has not been determined.

Describe the scope of the research need:

Document changes in treeline (fire risk/policy, wildlife habitat) and supply of commercial timber, and merge with fire history and insect outbreak data, especially in areas experiencing the most rapid change. Determine effects of changes in moisture and temperature on growth and survival of forest vegetation species important for commercial and subsistence uses, including response of vegetation after disturbance. Convene working group of scientists and managers to identify key forest vegetation species (fiber and food) and determine status of info needed to predict "tipping points" of rapid change/mortality (e.g., growth rings in spruce and birch approaching zero increment); Research and monitor response of vegetation after disturbance (e.g., fire, insect, disease, logging) For identified info needs, begin experimentation trials or monitoring protocols. Improve understanding of effects of climate change on forest ecosystems; prepare to capitalize on appropriate harvest opportunities.

Policy option or recommendation:

NS-2. Review and modify Alaska's wildland fire policy and programs.
NS-3. Manage climate change impacts on watersheds and in-stream flows.
NS-4. Reduce introduction and spread of invasive species in the context of climate change.
NS-5. Review State regulatory process for wildlife harvest to assure timely adaptation to changing conditions.
NS-6. Prepare for adaptive management of fish and wildlife.
NS-7. Develop capacity in new forestry and wood biomass opportunities.

What research is being done/known?

LANDFIRE classification of 2001 LANDSAT TM data is being completed now, update with finer resolution and ground-truthing of key communities is desirable (e.g., loss of alpine or low tundra). FS and UAF scientists have documented treeline change and pest outbreaks in many locations across the state.

What are the gaps in research?

Document changes in treeline (fire risk/policy, wildlife habitat) and supply of commercial timber (merge with fire history and insect outbreak mapping for age class); Provide focus on areas of most rapid change. Datasets should be merged, analyzed, and mapped in geographic information systems to show recent changes and indicate future trends.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☑ Modeling ☑ Products ☐ Education/Outreach ☑ Data Management ☑ Monitoring

Parties involved in implementation:

USFS, DNR Division of Forestry, USGS, National Park Service (Inventory and Monitoring Program)

TWG: Natural Systems

5.3.6.2

Assess efficacy, economics, and ecological effects of salvage logging to producing timber and wood biomass fuels from fire- and insect-killed trees.

Unique Identifier: 49

☐ Overarching Need

Why is this an issue?

Climate change related warming and drying is likely to result in more insect and fire-kiled timber and biomass.

Describe the scope of the research need:

Assess effectiveness, economics, and ecological effects of harvesting small diameter timber (insect- or fire-damaged). Research available types of harvesting equipment for small diameter timber and biomass to facilitate acceptance and use by local commercial contractors. Determine ecological effects of salvage logging (e.g., biomass, nutrient, and habitat removal, effects to soil, permafrost, invasive species). Identify practices that will help to ensure that salvage logging activities and replanting do not introduce invasive species.

Policy option or recommendation:

NS-7. Develop capacity in new forestry and wood biomass opportunities.

What research is being done/known?

A wide range of equipment and techniques have been developed for use in harvesting larger-diameter timber. Effects on soil fertility and erosion, wildlife and stream habitat from leaving or removing woody material following fires are generally well understood.

What are the gaps in research?

Technology transfer. Equipment and techniques need to be tested and adapted for use in Alaska and with smaller material. Effects of salvage harvests in subarctic environments may be less well understood.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☑ Products ☑ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

FS, DNR DOF, UAF

TWG: Natural Systems 5.3.6.3

Test various wood burning appliances and their air quality emissions in an arctic environment.

Unique Identifier: 185

☐ Overarching Need

Why is this an issue?

Increased use of wood and woody biomass as a "carbon neutral" heating fuel has potential to affect local air quality and resident health.

Describe the scope of the research need:

Test popular and experimental wood stove devices to rate their efficiency and determine effects on air quality under typical Alaska winter conditions.

Policy option or recommendation:

NS-7. Develop capacity in new forestry and wood biomass opportunities.

What research is being done/known?

Many wood and pellet stoves have been studied to determine air quality emissions, possibly under optimal fuel and burning conditions. The Cold Climate Housing Research Center (CCHRC) has tested high efficiency wood burning appliances in Fairbanks.

What are the gaps in research?

Testing needs to be completed with typical Alaska fuel wood sources and under Alaska air quality conditions.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Health and Culture

Research category/type:

☐ Modeling ☑ Products ☑ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

CCHRC

TWG: Natural Systems

5.3.6.4

Research net contributions of Alaska's natural areas to GHG release and sequestration.

Unique Identifier: 55

☐ Overarching Need

Why is this an issue?

Recent climate change is largely driven by greenhouse gas (GHG) levels. The effectiveness of cap and trade measures will also be affected by natural carbon sequestration and emissions. Understanding the relative contribution of sources of GHG compared to other human and natural sources is essential. Accurate modeling is critical for effective mitigation of atmospheric greenhouse gas emissions. Carbon emissions cap and trade systems are now being implemented to reduce global emissions of greenhouse gases. These systems are based on models of gas emissions and gas sinks. Current models cannot accurately determine whether Alaska's wild lands will sequester more carbon in vegetation than they release through wildland fires, oxidation of thawed organic permafrost, methane hydrates, etc.

Describe the scope of the research need:

Estimate and research net contribution to greenhouse gases (+ or -) to determine where Alaska lands and waters function as carbon sinks (e.g., forests) or sources (e.g., permafrost thaw, wildfire), as this is likely to become a national priority for mitigating and trading carbon emissions. Research the relative effects of forests, fire, and permafrost thaw on greenhouse gas emissions (e.g. CO2, methane) to inform policy decisions about sequestration options and wildland fire response in tundra and boreal forest environments. Develop protocols for certifying carbon storage and sequestration rates for boreal and coastal forests. The concept that wood fuels are carbon neutral should be thoroughly examined. This is a complex topic that involves carbon budgets and cycles in a dynamic environment.

Policy option or recommendation:

What research is being done/known?

Considerable research and modeling is underway at many levels. NSF funded researchers are also monitoring carbon flux on North Slope soils. Fire simulation modeling by D. Bachelet, et al. (2005) suggests that carbon emissions from forest fires will exceed carbon storage by the end of this century.

What are the gaps in research?

Models need to incorporate new and emerging information on emissions from permafrost, fires, methane hydrates, etc. Relative contributions of Alaska's natural areas are largely hypothetical, for lack of hard data on flux rates. Further research on burn intensity mapping and quantification of emissions from recent fires should be completed. Studies should look at both the long- and short-term emissions from fire and changes in the emission dynamics of permafrost response in boreal forest and tundra. Research on the relative contribution of GHG emissions from ecosystems that are independent of fire is also needed to put fire release of GHGs in context (e.g., release of methane CH4 from melting permafrost; it has >20 times the effect on climate warming than release of CO2).

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☑ Modeling ☑ Products ☐ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

UAF, NSF, USGS, NASA ACCAP, AFS, JFSP, FS,

TWG: Natural Systems

5.3.7.1

Agricultural products research. Research new agricultural product opportunities, technologies and best practices in order to prepare to capitalize on opportunities to expand sustainable agriculture in Alaska

Unique Identifier: 43

☐ Overarching Need

Why is this an issue?

Climate change may provide new opportunities in sustainable agriculture, that may be of increased importance to food security as access to other food sources change (e.g., due to loss of fish and wildlife harvest opportunities, or increased costs for shipped foods.)

Describe the scope of the research need:

Research and develop new agricultural products, technologies, and best practices to adapt effectively to changing climatic conditions, including agricultural opportunities for small and remote communities. Assess crops having potential for production locally. Assess soils for sustainability for agriculture. Test locally-produced natural products as soil supplements and agricultural fertilizer (e.g., fish waste, compost). Model frost and growing season. Research barriers to community gardening. Assess potential for inadvertent introduction and spread of invasive agricultural species, weeds, and pests.

Policy option or recommendation:

NS 1 Agriculture: Support and expand sustainable agriculture in Alaska at the local level
Implementation by: UAF, USDA, DNR DOA
NS-8. Support local sustainable agriculture in Alaska.

What research is being done/known?

undetermined

What are the gaps in research?

undetermined

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☑ Modeling ☑ Products ☑ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

DNR, USDA, UAF Cooperative Extension Service

TWG: Natural Systems 5.3.8.1

Assess effects of climate on access for hunting, fishing and other subsistence activities.

Unique Identifier: 17

☐ Overarching Need

Why is this an issue?

Forecasting is important to enhance safety of travel in road-less areas. Changes in freeze-up timing and conditions continue to affect subsistence harvest opportunities and uses through inaccessibility and/or increased access hazards. Low river water may preclude access. Changes in safe access may require consideration of alternative access means, changes in season timing, or other adaptation. Access by traditional means may also cause resource damage when conditions change (e.g. ORVs or snow machines on wet thawed ground).

Describe the scope of the research need:

Assess effects of temperature and rainfall patterns on river level for motor-boat access in autumn and the effect of temperature patterns on ice formation for winter travel on both freshwater ice and sea ice. Forecast sea-ice, river-ice and river flow levels relevant to hunter access. Improve forecasting of river level and sea- or river-ice conditions that affect hunter access. The travel relationships are complex, encompassing both natural sciences (climate, hydrology) and human behavior.

Policy option or recommendation:

NS-5. Review State regulatory process for wildlife harvest to assure timely adaptation to changing conditions.
NS 6 Fish & Wildlife Management:(6.1) Revise fish & wildlife management to adapt to effects of climate change.

What research is being done/known?

What are the gaps in research?

For ice travel & access - Request that NOAA in partnership with ADOT&PF develop the capability for improved, higher temporal and spatial resolution sea and river ice forecasts to enhance safety of winter travel in roadless areas (especially relevant to hunter safety.) For river travel & access - Review patterns of rainfall and trends in permafrost melt in river gauge levels in selected areas of the state to understand which indicators may be useful in predicting hunter access. Concurrent interviews with hunters in study sites to correlate firsthand observations in river travel difficulty would be instructive in understanding what proportion of a study areas has access restricted by low water levels for specific types of motor boats.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☑ Modeling ☑ Products ☑ Education/Outreach ☐ Data Management ☑ Monitoring

Parties involved in implementation:

State, FSP, UAF, ACCAP, land management agencies
NOAA,ADOT&PF,USFWS,ADF&G,USGS,University

TWG: Natural Systems

5.3.8.2

Update the Environmental Atlas of Alaska and Alaska Engineering Design Information System (AEDIS)

Unique Identifier: 188

☐ Overarching Need

Why is this an issue?

Engineers are sometimes using out of date environmental information in designing new facilities in Alaska.

Describe the scope of the research need:

Update and republish the Environmental Atlas with current data, trends and projections of climate change effects.

Policy option or recommendation:

What research is being done/known?

The Environmental Atlas of Alaska was published in 1978 and remains a standard desk reference for engineers.

What are the gaps in research?

Data has been updated in electronic format, but engineers are apparently reluctant to depend on unpublished data, out of liability concerns.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Transportation and Land Use
Public Infrastructure

Research category/type:

☐ Modeling ☑ Products ☐ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

CCREL, ADT

TWG: Public Infrastructure

5.4.1.1

Collect climate data and develop methodologies and capacity to enhance and increase the resolution of climate forecasting models.

Unique Identifier: 68

☑ Overarching Need

Why is this an issue?

Downscaled climate forecasts are needed so that Federal, state, and community planners & decision makers can establish:
1) time horizons within which they will need to address infrastructure fortification or relocation;
2) locations and designs of new infrastructure that accommodate these conditions; and
3) location-specific conditions that new infrastructure must be designed to accommodate.

Describe the scope of the research need:

State scientists, engineers, & decision-makers need to collaboratively update inputs to, revise climatic models as needed, and use models to produce a time sequence of forecasts of expected conditions due to climate change.

Policy option or recommendation:

- Develop an adaptive climate change model for public infrastructure that supports development of strategies and approaches to identify short and long-term sustainable solutions to a changing climate.
- Develop and implement sustainable solutions to adapt public infrastructure that is currently at significant risk, and future infrastructure, to the effects of climate change.

What research is being done/known?

The University of Alaska has created and invested in the Scenarios Network for Alaska Planning (SNAP) program.

What are the gaps in research?

Alaska's climate data collection, management, analysis, and monitoring, infrastructure is sparse and inadequate to effectively meet this research need.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☑ Modeling ☑ Products ☑ Education/Outreach ☑ Data Management ☑ Monitoring

Parties involved in implementation:

University of Alaska (SNAP), ADOT&PF, ADF&G, ADNR, ADCCED, ADEC, DOI, FWS, FS, BLM, NOAA, NWS, AOOS,

TWG: Public Infrastructure

5.4.1.2

The State needs to develop and deploy effective mechanism(s) to increase the availability and maximize the exchange of authoritative, defensible, and timely information to support analysis and decision-making on issues of climate change adaptation & mitigation, sustainability, and resiliency.

Unique Identifier: 146

☑ Overarching Need

Why is this an issue?

Climate analysis information delivery and availability is decentralized and uncoordinated, creating inefficiency, duplication of effort, wasted money, and difficulty in locating information of consistent and acceptable quality for a variety of purposes.

Describe the scope of the research need:

Mechanisms to increase information availability and collaboration must maximize the diversity of information suppliers and users - including public and private agencies, rural and urban citizens, scientists, engineers, planners, and decision-makers. Investment in an information clearinghouse requires increased commitment to continuous maintenance of a dynamic, integrated, information exchange mechanism that seamlessly supports information suppliers and users. Key services include:

- Knowledge management (archiving, updating, synthesizing)
- Interactivity (user-customized information delivery)
- Rapid data updates

Policy option or recommendation:

The state should collaboratively develop, establish, and effectively maintain an integrated, interactive information clearinghouse for policy, science, engineering standards, public discourse, and data pertaining to sustainable development and resiliency in Alaska.

What research is being done/known?

The University of Alaska has created the Alaska Center for Climate Assessment & Policy (ACAP), developed a "Resilience and Adaptation interdisciplinary Ph.D. program, and invested in the Scenarios Network for Alaska Planning (SNAP) program. The Alaska Department of Transportation & Public Facilities and the U.S. Army Corps of Engineers Cold Regions Research & Engineering Laboratory (CRREL) has invested in the Alaska Engineering Design Information System (AEDIS). The University of Alaska has Developed the Geographic Information Network of Alaska (GINA).
Web 2.0 social networking tools, "Wikis", and GIS data conversion tools offer promising models.

What are the gaps in research?

Legal defensibility, data analysis conversion algorithms, and development of tools for management of distributed database elements are areas that need additional investment in research and development in Alaska.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☐ Modeling ☑ Products ☑ Education/Outreach ☑ Data Management ☐ Monitoring

Parties involved in implementation:

University of Alaska, ADOT&PF, ADEC, ADNR, ADCCED, DOI, ADFG, Alaska Department of Law, Alaska Legislature, DOI, DOD, CRREL, and other government, private, and industry organizations.

TWG: Public Infrastructure 5.4.1.3

The state needs to develop a mechanism to systematically identify, collect, and analyze the data that it needs to economically plan, develop, and manage its public infrastructure in a sustainable manner.

Unique Identifier: 145

☑ Overarching Need

Why is this an issue?

The state's current project-based focus on infrastructure development discourages investment in the systematic collection and evaluation of long-term post-construction performance data after construction. Infrastructure performance monitoring and modeling is necessary to effectively evaluate if and how infrastructure might be developed more sustainably in Alaska.

Describe the scope of the research need:

Research is needed to:
- Identify barriers to scenario-based planning,
- Optimize investment in visualization tools for public involvement and planning,
- Determine which data and parameters are critical for increasing sustainability of infrastructure,
- Identify the best and most economical sources of data?
- Optimize investment in climate forecasting and modeling.
- Develop probabilistic models, planning, and design tools useful for planners, engineers, and decision-makers.
- Economically manage risk.

Policy option or recommendation:

The state should develop a strategic plan for data collection specifically to support planning, design, construction of sustainable public infrastructure. The strategic plan for data collection should directly support the State's comprehensive, integrated, and interagency asset management policy to guide public infrastructure planning and investment in Alaska.

What research is being done/known?

Implementable research on sustainable asset management is available from the Transportation Research Board of the National Academies. Other states have adopted best management practices that Alaska should emulate.

What are the gaps in research?

Those involved in the planning, financing, design, construction, and maintenance of public infrastructure in Alaska are not benefitting from knowledge that could be gained by systematic investment in collecting infrastructure performance data.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Research category/type:

☑ Modeling ☑ Products ☑ Education/Outreach ☑ Data Management ☑ Monitoring

Parties involved in implementation:

ADOT&PF, CRREL, University of Alaska, Governor's Office of Management & Budget, Alaska Legislature

TWG: Public Infrastructure

5.4.2.1

Analyze, develop, and update existing engineering and building codes and construction techniques for new infrastructure and structures in vulnerable areas.

Unique Identifier: 120

☐ Overarching Need

Why is this an issue?

Current designs likely do not incorporate the real risks and variability associated with climate change in Alaska. Consequently infrastructure may fail prematurely or require unnecessary expense to build and maintain, resulting in uneconomical and unacceptable risks to Alaskan communities.

Describe the scope of the research need:

It is likely that building, electrical, mechanical, materials, and sanitation design codes will need further research and testing to include new data collection, analysis, and modeling. All of this will require long-term investment and potentially the creation of new programs.

Policy option or recommendation:

The State of Alaska should adopt a statewide public infrastructure risk management policy.

What research is being done/known?

The University of Alaska has created the Alaska Center for Climate Assessment & Policy (ACAP) and invested in the Scenarios Network for Alaska Planning (SNAP) program. The Alaska Department of Transportation & Public Facilities and the U.S. Army Corps of Engineers Cold Regions Research & Engineering Laboratory (CRREL) has invested in the Alaska Engineering Design Information System (AEDIS). The University of Alaska has Developed the Geographic Information Network of Alaska (GINA).

What are the gaps in research?

Many existing infrastructure planning and engineering criteria, codes, and standards were developed with data that does not include the effects of climate change, especially in Alaska. Additionally, many of these techniques are based on deterministic methods that have limited ability to capture the effects of recent changes and variability of climate change.

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Energy Supply and Demand
Transportation & Land Use

Research category/type:

☑ Modeling ☑ Products ☑ Education/Outreach ☑ Data Management ☑ Monitoring

Parties involved in implementation:

Department of Transportation & Public Facilities, University of Alaska, Department of Commerce, Community & Economic Development, Local and Municipal Governments, Industry professional organizations. Alaska Legislature

TWG: Public Infrastructure

5.4.2.2

Establish an integrated baseline inventory on the location and condition of public infrastructure. Collect, assess and monitor data needed to develop sustainable solutions to adapt public infrastructure to the effects of a changing climate.

Unique Identifier: 67

☐ Overarching Need

Why is this an issue?

A complete inventory of public infrastructure (that is either now, or likely to be, at risk from the effects & hazards due to climate change) is needed in order to systematically identify public infrastructure vulnerability. Data that does exist is owned by several agencies and not effectively integrated and shared amongst. Inefficient duplication of effort is likely given the functionally separate organization and operations of State agencies.

Describe the scope of the research need:

The State needs to create an integrated inventory and document the condition of public infrastructure at risk due to the current and projected effects of climate change.

Policy option or recommendation:

The State should adopt a comprehensive, integrated, and interagency asset management policy to guide public infrastructure planning and investment in Alaska.

What research is being done/known?

1.ISER developed a preliminary and limited database of existing public infrastructure and projected the added cost (above normal wear and tear) from the effects of climate change on infrastructure at risk. See Larson, P.H., et al. (2008).
2. ADCCED's Division of Community and Regional Affairs (DCRA) maintains an online community databases that provide general information on community location, population, taxes, climate, history, culture, demographics, utilities, schools, health care, economy, transportation, contacts and capital projects and grants. Most of the public infrastructure is listed under the "Facilities, Utilities, and Services" data type. However, this information is limited and dated.

What are the gaps in research?

Existing State community and infrastructure databases are not comprehensive or contain insufficient information for asset management purposes. For example, the DCRA database does not provide information on the physical and environmental conditions (permafrost, river and coastal shorelines, etc.) that exist where the existing public infrastructure is located. Instead of maintaining a comprehensive database, ADOT&PF's archives data on individual transportation projects as they are built and does not regularly conduct condition monitoring. DCRA's Alaska Capital Projects Database was originally the "Rural Alaska Project Information Delivery System" (RAPIDS), which tracks capital funding for projects in rural Alaska. RAPIDS provided a place for agencies to list ongoing projects and collaborate with other agencies on project timing. In January of 2006, RAPIDS was changed to Alaska Capital Projects Database because the system is no longer exclusively for rural Alaska. The link to these databases: http://www.commerce.state.ak.us/dca/commdb/CF_COMDB.htm

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Energy Supply and Demand
Transportation & Land Use

Research category/type:

☐ Modeling ☐ Products ☐ Education/Outreach ☑ Data Management ☑ Monitoring

Parties involved in implementation:

ADCCED, ADEC, ADOT&PF, NOAA, University of Alaska, Alaska Legislature,

TWG: Public Infrastructure

5.4.2.3

Identify, analyze, and use national and international research results and products as a basis for developing solutions and expanding best management practices in AK.

Unique Identifier: 141

☐ Overarching Need

Why is this an issue?

Employees of Alaska State agencies are not consistently clear about the role their agencies play in developing and supporting sustainable and resilient infrastructure. Performance measures of state agencies do not consistently recognize a systems approach and the value of sustainability and resiliency for state investments. State leaders have a tendency to manage public infrastructure funding decisions as expenses rather than investments.

Describe the scope of the research need:

State agency leaders and managers must make sustainability and resiliency an effective priority and develop guiding coalitions to create a supportive culture in their organizations.

Policy option or recommendation:

- Require that state agencies involved in infrastructure planning, development, delivery, operation, and maintenance include explicit support for the development sustainable and resilient infrastructure in their vision & mission statements and strategic plans.
- Identify and remove institutional barriers to innovation and collaboration.

What research is being done/known?

The Transportation Research Board has created many research products and guides to assist Transportation Departments.

What are the gaps in research?

If this is a Cross-Cutting issue, what other topics (TWGs) does it apply to?

Energy Supply and Demand
Transportation & Land Use

Research category/type:

☐ Modeling ☑ Products ☑ Education/Outreach ☐ Data Management ☐ Monitoring

Parties involved in implementation:

ADOT&PF, ADEC, ADFG, ADCCED, Alaska Department of Law, Governor, Alaska Legislature

Appendix B

Letter to Governor's Sub-Cabinet on Climate Change

December 3, 2008

To: Governor's Sub-Cabinet on Climate Change
From: The Interagency Hydrology Committee for Alaska
Subject: Hydrology Needs for Alaska

The Interagency Hydrology Committee for Alaska (IHCA) is an organization of technical specialists working for Federal, State, borough, and local governments and Federally recognized tribes, who coordinate the collection and interpretation of data related to water resources and climate throughout the State of Alaska.

As you are well aware, climate change, particularly current warming trends in the high latitudes, is leading to changes in Alaska's freshwater, estuarine, and marine environments. One of the best measures of the rate and magnitude of change, and perhaps the most impacted natural resource in terms of both timing and quantity changes, is in fact water volume and associated characteristics. For example, rivers and lakes freeze over later in the year and become ice-free earlier in the year, permafrost is thawing, and precipitation patterns are changing. Agencies and communities in Alaska have become increasingly aware of the emerging and potential effects of climate change. However, the authorities charged with protecting the public safety and managing natural resources in the best public interest require appropriate information and tools to take specific actions in response to and preparation for changing environments.

IHCA has developed the following list of topics that are especially important to detecting, quantifying, and adapting to climate-driven change and recommend that research and monitoring in support of state and local needs be encouraged and supported with the highest priority:

- Extent of permafrost and the effects of changing permafrost on subsurface hydrology, aquifer yield, and lake draining or formation;
- Baseline flow and water volume conditions of rivers and lakes versus changing spatial and temporal hydrologic patterns, such as changes in seasonality, flood magnitude, and drought severity;
- The spatial and seasonal distribution, timing, intensity, and state of precipitation;
- Freeze-up, break-up, ice thickness, and ice jams on lakes and rivers;
- Extent of glacier mass changes, the contribution of glacier melt to streamflow, and frequency of outburst floods;
- Geologic and geotechnical trends related to active layer detachments, mass wasting, and sloughing;
- Avalanche timing, prevalence, and trends;
- Socio-economic cost to address changing conditions of water availability and quality;
- Erosion and sediment transport effects resulting from changes in runoff patterns;
- Short and long term planning for water supply, demand, and support infrastructure to mitigate emerging and anticipated environmental change.

IHCA will be happy to provide additional details, including specific agency projects and outstanding needs that will benefit from the hydroclimatic research listed here. We are also happy to provide technical support to your group upon request.

Sincerely,

Steven A. Frenzel
Chair, Interagency Hydrology Committee for Alaska

Press Releases

Melting ice could mean new riches

Jill Burke
Mar 1, 2010

"It's not a question of if but when."

That's what Mead Treadwell, chairman of the U.S. Arctic Research Commission, told a New York City crowd Monday about the prospect of a booming northwest passage.

Treadwell made the remarks during a moderated panel discussion, "Will the Bering Strait become the Panama Canal of the North?" hosted by the Council on Foreign Relations at Alaska House New York. (Alaska House is a nonprofit organization founded by Alaska Dispatch publisher Alice Rogoff to promote education about Alaska and its Native culture and foster economic development within the state.)

The day's discussion, which pulled together Alaska's congressional delegates, regional leaders and industry representatives, centered on the sense of urgency seemingly missing both in the state and nationwide for developing the infrastructure -- like deep water ports and international rules -- that will be needed to tap into a new hustling, bustling Bering Strait.

Two of the world's largest mining operations are above the Arctic Circle, including the Red Dog zinc mine in Alaska off the coast of Kivalina, according to Treadwell -- and the Arctic is poised to deliver even more resources. Minerals, fishing, oil and gas, exploration and science, and tourism all have northern footholds. Capturing opportunities related to those activities with the prospect of shorter shipping routes as ice recedes is something Americans need to be thinking about now, Treadwell said.

The challenge is building the infrastructure. Deep water ports are needed to accommodate large container ships and provide an anchor for the military presence that will need to increase to keep pace with a rise in offshore activity near the United States' northern coast.

Participants, including Rogoff, suggested that developing port infrastructure for Alaska's western coast, from Adak to Barrow, could be an economic boom as important to the state as the trans-Alaska oil pipeline, particularly when even a handful of new port jobs has the potential to pull villages teetering on the brink of economic failure into sustainability.

Alaska Sens. Lisa Murkowski, a Republican, and Mark Begich, a Democrat, attended the event and told participants they are aware of the critical role Alaska is poised to play in a changing Arctic environment. Murkowski is pushing for a Department of Defense and Homeland Security feasibility study for a deep water port off Alaska's shores.

"This study will determine whether it is in the strategic interest of the United States, as I believe it is, to build a port and where it might be located. A deep water port would not only serve our military and Coast Guard needs, but as we develop our offshore oil and gas reserves and see more shipping, tourism and vessel traffic in the Arctic, a deep water port could provide valuable support," Murkowski said.

A full transcript of the day's discussion will be posted online at the Council on Foreign Relations' Web site.

United States Senator Lisa Murkowski

Monday March 01 2010

Murkowski Speaks at Arctic Policy Roundtable at New York Council on Foreign Relations

NEW YORK - U.S. Sen. Lisa Murkowski, R-Alaska, helped lead a discussion on U.S. Arctic policy at a roundtable forum today at the Council on Foreign Relations in New York City. Also participating in the discussion was U.S. Sen. Mark Begich, D-Alaska, a number of Arctic policy experts and several Alaskans, including Mayor Edward Itta of the North Slope Borough. Following is a text of Sen. Murkowski's remarks as prepared for delivery:

"Good afternoon. It is my distinct pleasure to be back at the Council on Foreign Relations today to discuss one of my favorite subjects, the Arctic. As all of us in this room are aware, the United States is an Arctic nation because of Alaska. But, what does it mean to be an Arctic nation? I believe that the Federal Government is just waking up to this reality and we are frantically trying to define exactly what that distinction means. In my view, being an Arctic nation means that the United States has certain obligations and responsibilities in the region to the land, the water and the people. And we all need to help our nation understand what those are.

"The pace of change in the Arctic demands that greater attention be focused on the region. The implications of the dynamic changing Arctic for the residents and important U.S. security, economic, environmental, and political interests, depend on it.

"One of those responsibilities I spoke of is to have the necessary infrastructure in the region. I recently introduced legislation that directs the Department of Defense and the Department of Homeland Security to study the feasibility, location and resource needs for an Arctic deep water port. This study will determine whether it is in the strategic interest of the United States, as I believe it is, to build a port and where it might be located. A deep water port would not only serve our military and Coast Guard needs, but as we develop our offshore oil and gas reserves and see more shipping, tourism and vessel traffic in the Arctic, a deep water port could provide valuable support. I will insure that the Navy and Coast Guard actively consult with the communities and leaders of the region, as well as the State of Alaska.

"As we all are keenly aware, while the Arctic is becoming more and more ice free in the summer months, Arctic ice is not going to completely disappear. One of the major challenges that we face is our aging ice breaker fleet. I was able to get an appropriation to refurbish the Polar Star last year, and the Coast Guard has embarked on a study to determine whether we need to rebuild or replace our aging polar class vessels, but no matter the result of the study, we must have the commitment of the Administration and Congress that ice breakers are a national priority. And I will do all I can to advocate that position.

"Finally, I support a strong, bipartisan effort to ratify the United Nations Convention on the Law of the Sea. The United States is the only [illegible] treaty and we must act to [illegible] the U.S. to lead and to [illegible] strategic support [illegible]

Administration. As the only Arctic nation not a party to the treaty, failure to ratify continues to keep the United States at a disadvantage internationally and outside the process, without a seat at the table.

"Even though we are not a party to the Treaty, the United States is making progress on mapping our extended continental shelf. The results of Coast Guard ice breaker HEALY's hydrographic missions in the Arctic have been remarkable and I have supported this initiative with appropriations and legislation to authorize more funding. I was gratified to see the cooperation in the Beaufort between with the HEALY and the Canadian icebreaker the Louie St. Laurent. This is yet one example of international cooperation in the Arctic.

"While I was pleased that the United States released its long awaited Arctic Regional Policy in early 2009, implementation is still lagging. It may be necessary for Congress to step in and help move the process. While certain branches of the government, like the Navy and Coast Guard, are developing and implementing their portions of the policy, it is still not nearly to the degree I would like. Certainly other Arctic and non-Arctic nations are moving much more quickly to develop policies and support them, than we are.

"I believe we are at a very critical time in the Arctic. As many of us have identified, there are two paths we can go down in regards to international relations -- one is a path of competition and conflict, and the other is one of cooperation and diplomacy. This decision, and the direction it takes, will require vision and dynamic leadership, both at home and abroad. I believe the United States, as one of the most powerful Arctic nations, must step up and provide it.

"A changing Arctic brings risks and challenges to the environment and indigenous people of the region. But it also brings opportunity and awareness, and if we can work to identify and minimize the risks, and use the opportunities to better the lives of the people of the Arctic region, we can all prosper.

"Thank you and I look forward to a lively conversation this afternoon."

Opinion: Visit to New York, D.C. gets Arctic message across

By EDWARD ITTA

We Inupiaq like to say that the Arctic Ocean is our garden. It feeds us with its bounty of whales, seals, walrus, ugruk, fish and other subsistence foods. Our harvest is better in some years than in others. Weather, ice and ocean currents all affect the amount of "crops" we are able to feed to our families from year to year.

These are times of change for the ocean. Offshore oil and gas exploration is gearing up. We have seen plenty of evidence that climate change may cause dramatic shifts in the polar ice cap and in our weather. Receding ice could open up new shipping routes between Europe and Asia. We may see increased ocean traffic from commercial fishing boats and tourist ships.

What can we do about it? As mayor, I believe the borough should be engaged in the planning, monitoring, research and mitigation efforts that are being crafted right now as government agencies at all levels respond with a new sense of urgency to challenges and opportunities in the Arctic Ocean. That's why I spent the past week in New York and Washington, D.C. I joined Senators Begich and Murkowski in New York and the three of us made presentations on adapting to climate change in the Arctic to a group of policymakers, business people, scientists and journalists, who then participated in a roundtable discussion.

Policymakers are eager to hear our views, because they recognize that we have the most intimate knowledge of the Arctic and the most to lose if the ocean is not adequately protected. My message to them was that we don't want offshore development, but if it is going to happen, we insist on participating in decisions that will govern offshore activities and precautions. I showed them the Arctic policy principles adopted by ICC in 1984 as an example of longstanding Inuit leadership on protecting the polar region.

In Washington, I met with several of the highest officials in the Interior Department, including Interior Secretary Ken Salazar; his assistant secretary for Land and Minerals Management, Wilma Lewis; Liz Burnbaum, director of the Minerals Management Service (MMS); and Bob Abbey, director for BLM. I stressed that if the government is going to allow OCS activity, then it should set the bar very high when it comes to clean and cautious operations in the water.

I said that the shutdown requirement MMS wrote into Shell's Camden Bay permit is a good step in the right direction, since it gives that requirement the force of law for the first time. I argued for larger deferral areas around traditional Barter Island and Cross Island whaling areas, a moratorium on leasing new acreage, zero discharge of drilling wastes, a cumulative impacts analysis, and the need for better baseline science.

I invited Secretary Salazar to visit the North Slope this summer so he can get a first-hand look at some of the places that mean so much to our people. He agreed to pay us a visit in August.

At NOAA, I talked with two key officials about their efforts in preparing a new Environmental Impact Statement concerning the effects of oil and gas activities in the Arctic Ocean. Rather than the annual Incidental Harassment Authorizations (IHA) that are now issued, they are looking at doing five-year Incidental Take Authorizations. They believe it will build certainty and flexibility into their mitigation requirements, and I can see their point. I told them that we need more monitoring and study of the effects of noise on migrating whales. I discussed the Obama administration's new planning initiative for oceans and coastal areas with the head of the President's Council on Environmental Quality (CEQ). CEQ is spearheading the president's effort to deal with climate change. How this new ocean planning program will work is still something of a mystery, but it has a high priority in the administration. I focused on the need to be sensitive about traditional uses of the coastal and ocean areas and to make sure our voices are heard as these large-scale management programs are designed.

At the U.S. Fish and Wildlife Service, we discussed the ongoing management plan for Steller's eiders. I pointed out that our people are conservationists by nature and that education efforts about threatened species can be much more effective than hardball enforcement tactics. I thanked them for establishing a liaison position in Barrow (now held by Emma Huntsman) and said I look forward to better communication between the community and the agency.

Although I spent time with Senators Murkowski and Begich in New York, I was able to meet with each of them again in D.C. I also met with Congressman Young. In each case, I went over a range of issues that we can work on together, and I thanked them for legislation they sponsored in response to my eight-point OCS policy position.

All in all, it was a very productive week. If our voice is going to be heard in the halls of political power, it will be because we take our message to the decision makers and state our point clearly and forcefully. My staff and I will continue to engage with the agencies that shape the regulatory framework for North Slope activities of all kinds. In these challenging times,

these changing times, I want to make sure they can't forget our concerns as they plan the future in offices that are thousands of miles from the Arctic.

Edward Itta is mayor of the North Slope Borough.

Commander
Seventeenth Coast Guard District
Juneau, Alaska 99802-5517

24 September 2010

Dear Representative Joule,

Thank you for extending the invitation for me to participate in the Northern Waters Task Force. As you indicated, the Coast Guard can only serve in a limited capacity to the Task Force as a liaison and will not participate in the deliberative process, express an viewpoint, or provide an endorsement on the appropriateness of any course of action, recommendation, or position developed by the Task Force. Acknowledging this limited role in which I have been requested to serve, I am accepting your invitation to participate on behalf of the Coast Guard and the Seventeenth Coast Guard District.

I look forward to attending the initial Task Force meeting on Friday, October 1.

Sincerely,

CHRISTOPHER C. COLVIN
Rear Admiral, U. S. Coast Guard

Ms. Nancy H. Sutley
Mr. John P. Holdren
Co-Chairs, National Ocean Council
Washington, DC 20503

RE: Nominations to the National Ocean Council's Governance Coordinating Committee (GCC)

Dear Ms. Sutley and Mr. Holdren,

I serve as Chair of the Alaska Northern Waters Task Force (NWTF). The Task Force was created last spring with the support of the Alaska Bush Caucus which is comprised of all rural legislators within the Alaska State Legislature. The NWTF met for the first time on Oct. 1, 2010. (For more information about the task force, please see: http://housemajority.org/coms/index.php?c=104). All 11 members of the Task Force live on or near a coastline and are impacted by changes in the ocean and along the coast. The duties of the task force as outlined in the enabling legislation are as follows:

(1) assess and facilitate creation of a state and federal commission responsible for overseeing the development of state and federal northern ocean waters;
(2) facilitate regional coordination, cooperation, and outreach regarding the creation of the commission to keep local stakeholders informed and to incorporate their input into the process;
(3) identify and coordinate efforts of mutual concern for federal, state, and local agencies, as well as international interests in the creation of the commission; and
(4) conduct hearings in the Northern region of the state to fulfill its purpose;

The task force shall provide recommendations regarding the formation of the commission and shall deliver a preliminary report of its findings to the legislature by January 20, 2012, and deliver a final report to the legislature on January 30, 2012, together with legislative proposals for consideration. As you can see from the

information provided, we share similar goals.

The NWTF is itself an Alaskan ocean policy body and the task force would like to either have a member of the task force on the GCC or have input on who is nominated to the GCC from Alaska. We realize the nomination deadline for the Governor's nominations was Oct. 8, but are hoping the NOC would still consider nominations from the task force by November 15, 2010.

Thank you very much for your time and for your consideration of our requests regarding the GCC. We look forward to working with the NOC and the GCC to ensure vibrant, safe, and responsible development of Alaska's northern waters. If you have any questions or concerns please feel free to contact me at (907) 350-5057.

Sincerely,

Reggie Joule

Speaker Biographies

Dr. Larry Robinson (National Oceanic and Atmospheric Administration and the National Ocean Council) Dr. Larry Robinson is the Assistant Secretary of Commerce for Oceans & Atmosphere and the Deputy Administrator of the National Oceanic and Atmospheric Administration. Before joining NOAA he was the vice president for research and a professor in the Environmental Sciences Institute at Florida A&M University (FAMU). Since 2001, he has served as director of the NOAA Environmental Cooperative Science Center (ECSC) headquartered at FAMU, which consists of a broad, multi-institutional consortium of predominantly minority-serving institutions. Between 1984 and 1997, Dr. Robinson served as a research scientist and a group leader at Oak Ridge National Laboratory. His work there included detection and assessment of special nuclear materials and application of nuclear methods in nonproliferation, environmental science, forensic science and the assessment of high purity materials. From 1997 to 2003, Dr. Robinson directed FAMU's Environmental Sciences Institute where he led efforts to establish bachelor and doctoral degree programs. In 2007, he became the first African-American to serve as the science advisor to the United States Department of Agriculture's Cooperative State Research, Education and Extension Service.

Pat Pourchot (United States Department of the Interior)
Pat Pourchot is the Special Assistant to Secretary of the Interior for Alaska Affairs. His work focuses on working with Interior's senior management in Alaska and Washington, D.C. and the Department's major Alaska constituencies. Prior to his position with the Secretary of the Interior he was the senior policy representative, for the Audubon in Alaska, where he worked with federal, state, local governments and non-profit conservation organizations on Arctic Alaska land use and ocean issues. Pat has lived in Alaska for almost 40 years, and has had a career rich with work in the State government. He has been both a State Representative, and a State Senator, as well as worked for the Governor's office, and held the position of State Commissioner of the Department of Natural Resources. He holds a Master's degree from Harvard University, in public administration, with a focus on natural resource policy.

Renee Wallis (U.S. Navy, United States Department of Defense)
Ms Wallis is the Director of the Environmental Support Office of Navy Region Northwest, and serves as the deputy Navy Regional Environmental Coordinator (REC) for Region 10. She has been working in the environmental field for 18 years in a variety of compliance and policy positions. Since taking her current position in July 2008, she oversees the regional Oil Spill Response program, Fleet operations environmental support, and Environmental Policy and Outreach, including building effective relationships with Native American tribes. Renee works closely with the Region 10 Department of Defense REC to coordinate and communicate unified DoD positions on issues that can affect military sustainment, and to develop cooperative partnerships with federal, state and local agencies, tribes, and non-governmental organizations that support environmental stewardship. Prior to moving to the environmental field, Renee spent five years in the Navy's Ocean Engineering Field.

Captain Jason A. Fosdick (U. S. Coast Guard, United States Department of Homeland Security)
Capt Fosdick currently serves as Commanding Officer, Coast Guard Sector Anchorage as well as Captain of the Port for Western Alaska. Captain Fosdick was commissioned in 1988, and has completed tours of duty in Virginia, California, Washington, DC, Alabama and most recently in Texas. His career has focused on marine safety and environmental protection. Captain Fosdick holds a Bachelor of Science degree from the United States Coast Guard Academy, and a Master of Science degree in Information Technology Management from the Naval Postgraduate School in Monterey, California. His military awards include the Meritorious Service Medal (two awards), the Coast Guard Commendation Medal (three awards), and various unit and service decorations.

Directs coordinate across multiple juris-dictions for stewardship of oceans & waters.
National Ocean Policy: 9 Nat'l priority objectives

A Message from ICC-AK President
Jim Stotts

Two new initiatives are moving ahead with the potential to impact long-term development in the Arctic marine environment. First is the US National Ocean Council and second is the State of Alaska Northern Waters Task Force.

Other Arctic marine policy initiatives are moving ahead from the Arctic states themselves, the Arctic Council, and other international organizations that will impact our part of the world. What's amazing is the speed with which these initiatives are moving forward. It's important to be involved because there might not be a second chance to have our perspective heard. Decisions are being made right now, with or without us. It's time to participate and be involved.

The National Ocean Council (NOC) was established on July 19 to oversee the implementation of a comprehensive nation¬¬al policy for the stewardship of U.S. oceans, coasts and the Great Lakes. The new national policy identifies nine priority objectives for the NOC to pursue for effective coastal and marine spatial planning to address conservation, economic activity, user conflict and sustainable use. The NOC was created by recommendation of the U.S. Interagency Ocean Policy Task Force and is comprised of high-level U.S. government officials.

The NOC is directed to establish an eighteen member Governance Coordinating Committee (GCC). The GCC will consist of officials from State, tribal and local governments. Three of the eighteen members will be at-large tribal officials. Hopefully, one of the three chosen will be an Alaska Native. This initiative is brand new and holds promise for a better way to manage our nation's oceans and coastal areas.

The Northern Waters Task Force (NWTF) was established on March 26 by the Alaska State Legislature to facilitate regional coordination and State of Alaska leadership in the development of U.S. policy related to Arctic marine transportation, national security and resource development. The NWTF is comprised of legislators from northwest Alaska, Arctic community leaders and key federal agencies. Sadly there is no representation from tribal organizations.

The NWTF aims to assess and facilitate the creation of a joint state and federal entity to coordinate U.S. and Alaska interests that result from the opening of Arctic waters. This joint federal/state commission would guide interagency and inter-jurisdictional actions in the Arctic and provide an opportunity for Alaska's legislature and Arctic communities to be proactive in shaping this body and ensure Alaska's unique interests are represented.

So, here's a chance to once again raise our concerns. The NWTF would benefit from a tribal presence. The standards and conditions that need to be in place prior to opening Arctic waters for development need to be discussed and agreed to. The work already done by the Arctic Council needs to be considered in any review by either the NOC or NWTF. Finally, the local and indigenous citizen viewpoint must be a real part of the discussion. They are the ones most at risk if something should go wrong. The Coastal Zone Management program needs to be revisited and local government authority should be strengthened.

Executive Council Meets in Greenland

By ICC Alaska Staff

The Executive Council held its first meeting since last summer's General Assembly on September 28-29 in Nuuk, Greenland. The major topic of discussion was ICC's work plan for the next four years based on the Nuuk Declaration adopted last summer.

The first agenda items discussed were the Chair and Country Report Aqqaluk Lynge, ICC Chair, reported there are staffing and funding challenges for the near term for ICC Greenland that should be solved by next year. He will attend a summit of foundations in Copenhagen in November to discuss funding possibilities. He plans to concentrate on the indigenous human rights dimension during his term, including the rights of indigenous children. He will also be involved in issues concerning the European Union such as the seal skin ban. He has begun work on Inuit pan-arctic media cooperation.

Tatiana Achirgina, Chukotka President, spoke on progress in Chukotka. The Chukotka Inuit regional organization joined the Public Chamber of the Government of Chukotka in August, which is a milestone. She discussed recent developments on the Beringia National Park and the need to allow traditional reindeer herding and hunting activities in and around the park. She announced that for the first time in 20 years Russian Inuit will be allowed to hunt polar bears. Work to revitalize marine mammal hunting in Chukotka also looks promising. Finally she mentioned continuing work on the project "Ulyuvut" (our language). This project aims to preserve language and culture and generate interest among the younger generation.

Duane Smith, Canada President, reported on developments in Canada. The Canadian Inuit lawsuit against the European Union on the seal skin ban continues. The Canadian government recently apologized to Inuit for the forced relocation of Inuit from Nunavik to Grise Fiord and Resolute Bay. A new Minister of Indian Affairs and Northern Development, John Duncan, has been appointed. The Canadian government has unveiled a new international Arctic policy. Finally there were updates on Canada's continuing work on fundraising, Arctic languages, health issues, contaminants, biodiversity and the state of the Arctic Ocean.

Introducing the Newly Elected Members to the Executive Council

By ICC Alaska Staff

From Greenland, Hjalmar Dahl

Hjalmar Dahl is originally from the community of Qaqortoq in Southern Greenland. He has a long history with ICC. From 1981-2007, Hjalmar served as the Special Assistant to the first President of ICC and as head of the ICC Greenland office. He has been a member of the ICC Advisory Committee on United Nations issues, and has specialized on the rights of indigenous peoples for several years. He was directly involved in creation of the UN Permanent Forum on Indigenous Issues, and was on the ICC negotiating team that worked for the adoption of the UN Declaration on the Rights of Indigenous Peoples in 2007. For many years he was politically active at the grassroots level and was involved in creating the Inuit Ataqatigiit political party in Greenland. One of the main objectives of the party is to strengthen Inuit unity across the Arctic and to create closer cooperation and exchanges on educational and cultural issues. He received a degree from the Danish School of Pedagogy in 1974. In 2007, he received a degree from the Danish School of Journalism on communication.

From Canada, Kirt Kootoo Ejesiak

Born and raised in Iqaluit, Nunavut, Kirt Ejesiak has extensive experience in the public and private sector and is committed to solutions for improving the lives of Inuit. Kirt has an extensive background with the Nunavut Government and has represented Nunavut in many capacities at the regional, national and international level. He has been Chairman of the Board of the Iqaluit Museum; he served as deputy mayor of the city; and he was appointed Vice-Chair of Nunavut Trust. He has also worked for NTI, Kakivak, ITK, Pauktuutit, and he served as President of the Inuit Non-Profit Housing Board in Ottawa. In 2005, Kirt became Nunavut's first student at Harvard University when he was awarded a Fulbright scholarship to attend the Kennedy School of Government at Harvard. He completed his Masters of Public Administration there. Prior to his MPA, Kirt was Chief of Staff and Principal Secretary to the Premier of Nunavut. Kirt is currently working in Iqaluit and is Creative Director and CEO of Uqsiq Communications, a multi-media communications firm, and is managing partner of Gallery by the Red Boat.

From Chukotka, Elvira Tyunikova

Elvira Tyunikova comes from the Avatmit Eskimo clan, belongs to the Ankalin family, and was born in the village of Sireniki in the Chukotka region. Elvira first chose a career as an educator and studied at a pedagogical institute, but later found that she was more interested in administration and management. She changed career paths and completed her education at the Saint Petersburg Institute of Engineering and Economics, specializing in municipal and public administration. Elvira Tyunikova was a delegate to the 10th ICC General Assembly and became the Director for ICC Chukotka in the Provideniye Region. The region is recognized as the most diverse group of Russia's Inuit, and they have already entrusted Elvira to represent their interests at General Assemblies of the ICC for the second time.

From Alaska, Vera Metcalf

Vera Kingeekuk Metcalf was born and raised in Savoonga on St. Lawrence Island, Alaska. She now lives in Nome and has been the Director of the Eskimo Walrus commission (EWC) with Kawerak, Inc. since 2002. She continues to promote local community participation in research that involves a community's natural and cultural resources. As the EWC Director and with support of the nineteen commissioners representing coastal Alaska Native communities, she began several community-based projects documenting local traditional ecological knowledge and resource management practices, which she proposes as effective Pacific walrus management tools. As EWC Director, Vera is currently chair of the Pacific Walrus Conservation Fund and serves as the Special Advisor on Native Affairs on the Marine Mammal Commission. She also represents EWC on the Indigenous People's Council for Marine Mammals, which was formed to "identify and address marine mammal issues of common concerns." Vera is also currently on the steering committee of UAF's Alaska Center for Climate Assessment and Policy and recently served as a member on the US Arctic Research Commission (USARC). The USARC develops Arctic research plans and policy recommendations for the President of the United States. Finally, Vera served as a member of the Native American Graves Protection and Repatriation Act (NAGPRA) Review Committee, which recommends and advises the Secretary of the Interior on regulations and disputes. During these years, she documented and presented the results of community-based research used for repatriation purposes.

Northern Waters Task Force minutes – December 2, 2010

Members:
Representative Reggie Joule – Chair
Senator Bert Stedman – Vice Chair
Senator Donny Olson
Representative Bob Herron
Representative Bryce Edgmon
Chris Hladick
Chuck Greene
Dave Kubiak
Mayor Edward Itta
Captain Adam Shaw, USCG (on behalf of RADM Colvin)
Larry Hartig, Commissioner, DEC
(Rep. Seaton on phone as interested legislator)

Speakers:

Jimmy Stotts	Inuit Circumpolar Conference- Alaska
Johny Aiken	Alaska Eskimo Whaling Commission
Todd Sformo	North Slope Borough (NSB) Dept of Wildlife Management
Jason Herremia	NSB Dept of Wildlife Management
Barrett Ristroph	NSB Law Department
George Olemaun	Inupiat Community of the Arctic Slope (ICAS)
Debby Edwardson	Ilisagvik College
George Edwardson	ICAS
Gordon Brower	NSB Planning Department
Ethel Patkotak	Self

Representative Joule convened the meeting at 12:00 (check time) with introductory comment regarding the Task Force and the importance of hearing from the people that depend on the northern waters. Members in attendance introduced themselves.

Jimmy Stotts, President of the Alaska chapter of the Inuit Circumpolar Conference (ICC) addressed the Task Force from prepared remarks (attached) that defined the ICC and its purpose in strengthening unity among Inuit of the Arctic, promote Inuit rights and interest at the international level, develop and encourage long term policies that protect the Arctic environment, and seek full and active partnership in the political, economic, and social development of the Arctic. For 30 years, ICC has been pushing for Inuit influence over all activities affecting the people, homeland and environment.
After discussing concerns for a pro-development attitude of the State of Alaska and concerns for involving local people, he noted the importance of Arctic Council and the ICC's permanent participant status, encouraging the Task Force to stay informed of the work of the Arctic Council and particularly the human dimension. Jimmy offered 8 recommendations to the Task Force as follows:

1. Include a tribal presence on the task force
2. Put strong local influence back into Coastal Zone Management (CZM)
3. Realize Arctic offshore development is international in nature
4. Science and traditional knowledge should form the basis for decisions
5. Focus on offshore development must be holistic, not lopsided
6. Inupiat must benefit from development, beyond jobs

7. Seriously consider the NSB's offshore oil and gas policy (eight points)
8. Expand the task force mandate to review the environmental side of Arctic Ocean resource development

Jimmy concluded by noting that the ICC Inuit Leadership Summit on Resource Development on February 23-24 in Ottawa Canada to discuss offshore oil and gas development, uranium mining, and the social and environmental impact assessment process.
In addition to his written testimony, a copy of the Inuit Arctic Policy will be forthcoming to Rep. Joule.

Senator Stedman commented that CZM was a broader, statewide issue and also is complicated by the President Executive Order. He noted that the legislature will be working on this but may take more than one session.

Representative Herron questioned as to whether a multi-lateral treaty for the Arctic, similar to the Antarctic made sense thus keeping the governance close at hand.

Mr. Johny Aiken, Executive Director, Alaska Eskimo Whaling Commission (AEWC), provided a powerpoint presentation (to be posted) on the Alaska Whaling Commission, the distribution of bowhead whales and the challenges of whaling and working in heavy ice. The presentation was a repeat of the presentation made to BOEMRE in their July OCS Forum (transcript attached). His key points were:

- Migratory paths of the whales are known and well mapped
- Conflict avoidance agreements were effective for working together
- Heavy ice and pressure ridges make work very difficult
- Heavy ice requires the best technology and feeling is that the industry is not ready for those conditions in remote Alaska
- Deepwater Horizon showed even with infrastructure, how difficult controlling and containing an oil discharge is, making the point that Alaska and industry are not ready for work away from Prudhoe Bay
- Support Liberty directional and extended reach drilling as a way to avoid conflicts with whales and environmental risk

Johny concluded his comments noting that the AEWC strongly supported CZM and wanted to insure there was a community voice in development.

Todd Sformo and Jason Herremia, NSB Department of Wildlife Management provided an powerpoint presentation overview of the wildlife research and management. Todd provided a reference to "50 More Years Below Zero" section on "Science and Community: Inupiat Contributors to the Laboratory's Effectiveness" for "*Introduction to Alaska's Original Naturalist*" and "*Historical Perspectives on Inupiat Contributions to Arctic Science at NARL*" was made as to the importance of collaborative help. (I believe the quoted passage was from Kenneth Toovak, Sr. as he evaluated his career of collaboration with scientists: *I was scared of White people...I stayed to myself. Pretty soon, those folks started coming around to talk to me, asking questions. I started to get to know these people I had been scared of. We started to share the different things we know. This sharing became a very important part of my life. It wasn't easy...But, we kept on sharing knowledge...Scientist wanted my help...they felt good when I*

helped them on the ice. So I made myself available to them, and we went on sharing" (Toovak, 1992: 19)). The key point made by Todd was that the people of Barrow have been working to combine traditional knowledge and western science for over 50 years and are committed to many years more. Jason discussed the different research work of the Arctic Science Center, with a subsistence focus for the animals used by the community. The bowhead whale remains the primary research focus, with recognition of their extended age (180-200 yrs old). The Center has also expanded into collecting baseline disease assessments in ice seals and monitoring caribou populations. A recent focus has been on assessing the health of subsistence users as diets and climate conditions change. The center also tracks ESA listing as they pertain to local populations and subsistence (polar bears and ice seals). A plea was made for grant funding sources, as training is moving forward for the young people as they are the future of Barrow collaboration in science.

Senator Olson asked about narwhal research in the eastern Beaufort sea and Canada. It was noted that this was out of the area researched and little information existed at the NSB, although contacts with Canadian collaborators could help find information.

Barrett Ristoph, NSB Law Department spoke of her efforts to support policies of the NSB, including the Planning Department for the Alaska Coastal Management Program to improve the program and specific work on land use codes for the nearshore areas to streamline the permitting process. Barrett talked about wildlife co-management, climate issues, and her work with the AEWC, ICAs and others for Memorandums of Understanding and joint comments for federal and state actions.

Representative Herron raised the success of the Migratory Bird Treaty as an analogy to CZM. He noted that CZM worked for decades and with the issues facing Alaska could provide protection comparable to the Migratory Bird Treaty. Barrett commented that she did not see the aspects of international treaties in the CZM analogy. Representative Herron commented on CZM and states right and noted the importance of using the time available to resolve local governance and states' rights (This point may be mistaken in my shorthanded notes and memory).

George Olemaun talked on behalf of the Inupiat Community of the Arctic Slope (ICAS) prov9ided written comments (attached) that highlighted the relationship between the Inuit/Inupiaq people survivability and the natural resources. George talked on the ocean for survival and the importance of subsistence for the future. He noted that the marine mammals, fish and birds were circum Arctic Ocean and of dependence in Alaska from Kaktovik to Unalakleeet, with no compromise to be made for their safety. George stressed to keep the "Human Factor" upfront as the Inupiat are "who we are versus who we represent". By following guiding principles people can adapt for natural change and economic need. He concluded by recognizing the "persistent presence" of Inupiat people in the Arctic.

Debbie Edwardson, Director Workforce Development (?), Ilisagvik College, introduced the College mission as 2 fold, addressing human resource needs for the North Slope and perpetuate Inupiat language and culture for the students. She recognized the encroaching development needed attention from policy makers and professionals to insure community involvement and felt that Prudhoe Bay missed the mark in local hire of workforce. Debbie talked about the Marine Mammal Observer

Stewardship Program (background article, although not provided, at http://www.thearcticsounder.com/article/1045ilisagvik_colleges_marine_mammal_observer) and requested support from the NWTF as the program brought traditional Inupiat science together with NMFS in addressing the MMPA in the Arctic. She expressed concerns that these "observers" were a "token presence" and that in cases the observations were not respected and encouraged trust in the knowledge of people that have watched the marine mammals for decades. Debbie continued with sharing the accredited programs including USCG licensing that were AFN respected. On the subject of forthcoming regulations and the ability to comment, she highlighted the respect of the traditional knowledge of elders and their closeness to the sea.

Representative Joule commented on the proactive programs of Ilisagvik College and the investment of capital for "People Involvement" as the programs move forward.

George Edwardson, President, ICAS, stressed to keep the people and the authority at the table when looking at the animals and community dependence. With high unemployment rates people depended on subsistence to meet needs. George talked about jurisdiction of the tribe and how there was an analogy between UNCLOS and the Alaska constitution as the governance of the Inupiat people was linked to the animals and thus extended beyond state waters into federal waters and those waters agreed to by UNCLOS.

Gordon Brower, NSB Planning Department, provided remarks reflecting on Johny Aiken's presentation that pictures tell the story. He encouraged the task force to address ocean concerns as the ocean feeds the community. CZM was of significant interest as tools to reinforce local perspective, but cautioned that it was different across states. He encouraged reauthorization of the ACMP to strengthen local involvement and facilitate co-management in the EEZ. Concerns were noted for the migratory paths of bowheads and oil development and issues associated with nearshore re-zoning of the NSB. Respect was given for the importance of economic development and the success of Liberty and others and noted a balanced approach of jobs and risk mitigation. Examples included North Star being stuck in moving ice and the interest in an ordinance for ice capable barge system on the North Slope. Gordon asked for improved learning tools for better managing offshore development and looked for an offshore advisory panel and advanced technology in nearshore development. Gordon concluded with advice to the committee on finding balanced development.

Representative Herron noted a press conference on CZM as the Governor and colleagues move forward and asked whether "local control" or "local input" was preferred. Gordon commented that "local input" was a priority outside state waters and that the goal was to protect the bowhead whale.

Ethel Patkotak spoke on behalf of herself as a resident of Wainwright and a student of Mt. Edgcomb boarding school and having returned to Barrow after 20 years away from the North Slope. Ethel noted her 2 law degrees and work for indigenous people. In recognizing the value of the Task Force, she encouraged an understanding of the urban-rural to coastal-inland divide as community survival was no different between challenges with oil and gas fluctuations, salmon disasters and crash of the timber industry. In each case, endurance of the people is key and finding ways for sustainable local economies.

These included understanding a migratory versus mixed economy that cross-cuts subsistence versus economic activity. Ethel continued with guidance on keeping sigh on history, including the Exxon Valdez oil spill and the role of the RCAC's and OPA-90. The Gulf of Mexico needs to be looked at with fresh eyes to see who or what was overlooked and the voids or gaps in the scientific process. Ethel continued in expressing concerns for the use of statistics, whether shown in federal and industry expenditures, science in not understanding the Arctic, and how studies often need to be redone as site or subject specific to validate the statistical findings. In concluding, Ethel encouraged the Task Force to look back and see what is driving activities and look forward with defensible values.

After taking public testimony, Representative Joule looked to the Task Force members for closing comments.

Commissioner Hartig as the Administration's member noted the value of field hearings in risk decisions. He compared his use of market risk with the Permanent Fund Dividend versus DEC in environmental risk decisions. Clearly, the DEC environmental risk remains the ones of his greatest concern.

Senator Olson commented on his concerns for oil and ice and his fear of an incident. He noted the grave concerns logically presented at the hearing and noted looking to discussions of policies in the session between Legislators and Commissioners.

Captain Shaw, on behalf of RADM Colvin, appreciated the advocacy for balance between subsistence and development. The USCG maintains preparedness for oil spills and is working to insure input from local users. He introduced Joel Casto as the USCG Tribal Liaison for District 17 and encouraged working with him.

Representative Edgmon complimented those providing testimony for their passion and eloquence and how it mirrors the discussions he hears on Pebble. He recognized the importance of lifetime of resources behind these discussions. Representative Edgmon looks forward on making progress on CZM.

Representative Herron concurred with Representative Edgmon noting the Kuskokwim maintain salmon integral to the Yupik culture. He concluded with a compliment to Mayor Itta for his hospitality.

Mayor Itta complimented Senator McGuire for taking time to hear from the people in a cross-border Arctic Caucus meeting as it was relevant and timely. He reflected on Jimmy Stotts words for a national debate on energy and climate change as exploration in the Arctic is allowed. He concluded with a compliment of having the Task Force hearing in conjunction with PNWER.

Senator Stedman noted CZM discussions in January and the input focus. He noted that Ketchikan had lost its local subsistence rights and that Sitka was at risk and looks forward to resolutions of the issues in his communities.

Dave Kubiak complimented Senator Stevens for his appointment and appreciated the Barrow allies with equal concerns on the issues expressed before the Task Force.

Chris Hladick noted his community's role in oil and gas versus shipping and expressed the importance to insure the USCG is ready for the Arctic. He noted the risk for ships in the Bering Sea and cognizance of the correct skills, crews and sea lanes in managing shipping issues.

Chuck Greene encouraged the Task Force to understand what the final outcome will look like, as the issues are not part of a perfect process. He commented on the holistic process in balancing pro-development for input versus control and consideration of sustainability. This hearing reflected good cross section of the grass roots nature of public input and what it represents to the state.

Representative Joule concluded the comments encouraging attendees to continue with written comments. He respected the service of the Task Force members to the state and that sevice and reciprocity went hand in hand. Expanded services often include layer upon layer of government, but he hoped that the process offered to be participatory. The community ability to input often mitigates the needs for courts. This Task Force process offers to keep the input public and time is available given the CZM discussion in the Legislature and the National Ocean Council activities, although there is not a luxury of time. Representative Joule concluded by thanking the members and the attendees in the hearing.

The hearing adjourned at 2:15 (check time).

Northern Waters Task Force (December 2010)
By Jim Stotts, ICC Alaska

Thank you for this opportunity to address the Northern Waters Task Force (NWTF). Thank you for making the effort to visit Barrow which is on the front line for resource development in the US portion of the Arctic Ocean.

My name is Jim Stotts and I'm President of the Alaska chapter of the Inuit Circumpolar Council (ICC). Our membership includes Inuit from the North Slope, Northwest, Bering Straits and Southwest Delta regions of the state. Internationally, the ICC represents 160,000 Inuit from the United States, Canada, Greenland and Russia.

As a recognized non-governmental organization with consultative status to the United Nations, and a permanent participant to the Arctic Council, ICC is very much aware of activities going on in the Arctic at both the national and international level.

ICC's purpose is: to strengthen unity among Inuit of the Arctic; to promote Inuit rights and interests at the international level; to develop and encourage long term policies that protect the Arctic environment; and seek full and active partnership in the political, economic, and social development of the Arctic.

In other words, ICC pushes for Inuit influence over all activities affecting them and their homeland, on land, air and sea. This has been ICC's mission for 30 years. It's fitting to note that the ICC started right here in Barrow, through the vision of Eben Hopson Sr, the first Mayor of the North Slope Borough.

The NWTF is just starting its work and this is only its second hearing. So, timing is perfect to get things started out right, to ensure that the task force develops a balanced perspective moving forward. In ICC's opinion, the State of Alaska needs a more balanced perspective when it comes to development in northern waters and the Arctic Ocean.

We believe the State's approach is too favorable on the side of development. In other words, resource development trumps all other considerations, including cultural, social and environmental considerations. We hope the task force will be able to get beyond this lop-sided approach and come up with some ideas that the Inupiat can get behind. Without a balanced focus this could end up being a wasted effort.

Sadly there is no representation from tribal organizations on the task force. The task force would benefit greatly from a tribal presence. The Arctic Council, the inter-governmental organization of the eight Arctic nations, charged with developing Arctic policy, has indigenous people's organizations as permanent participants. The newly formed US National Ocean Council also calls for a tribal presence. The State of Alaska should consider doing the same. This would give the State greater credibility and acceptance with the Inupiat which is sorely needed at this time.

In HCR-22 which establishes the NWTF, the duties of the task force are spelled out as: 1) assess and facilitate the creation of a joint state and federal commission to oversee development of state and federal northern ocean waters; 2) facilitate regional coordination, cooperation, and outreach regarding creation of the commission to keep local stakeholders informed and incorporate their input into the process; 3) identify and coordinate mutual concerns of federal, state, and local agencies, and international interests in the creation of the commission. These are the three duties of the task force.

The task force shall carry out these duties by holding hearings in the northern region of the State, providing recommendations regarding the creation of the joint commission, and delivering reports to the legislature with legislative proposals for consideration in January 2012. In a nutshell this is the mandate of the NWTF.

I would be remiss if I didn't mention the fact that the State of Alaska missed an excellent opportunity to address one of the most important concerns raised by local authorities when the State failed to act, last legislative session, to

strengthen Coastal Zone Management. Local influence was, in effect, rubbed out. In our opinion, the State decided to follow industry's lead and made the wrong decision, again.

From ICCs perspective it appears the State doesn't trust local people and has decided that it will make the decisions that affect them on their behalf. It's no wonder the Inupiat are losing trust in the State to help them with their problems and concerns. This task force will have to wrestle with this local perception as it moves ahead trying to develop recommendations that Inupiat can support. Again, a balanced approach is necessary. Cultural, social and environmental issues must be considered at the same time as economic and resource development issues.

A few words about the Arctic Council, the Council has been and continues to be involved in developing Arctic policy in many areas, including areas that directly impact Arctic indigenous peoples. For example, on February 16th, there will be a meeting of the Health Ministers from the eight Arctic nations in Nuuk, Greenland. The Alaska State Commissioner of Health and Social Services will be invited to this meeting based on ICC Alaska's recommendation that he be invited. ICC Alaska knows the State will accept the invitation in the spirit in which it's made. We hope this will lead to mutual cooperation on the many health issues facing the Arctic. At least, it's a chance.

I mention this is to illustrate that Inupiat are and have been involved for many years in the process of helping create Arctic policy at the national and international level. Policies that protect the environment while allowing for sustainable development. Our understanding of sustainability includes the notion of cultural sustainability. We are fighting to keep our culture alive in this modern world. We will not back down. Some of you realize this already.

The United States and its Arctic Council partners are addressing important matters facing the Arctic. Offshore oil and gas and other Arctic Ocean developments, such as Arctic marine shipping, are just two of the topics being discussed. Other matters such as environmental protection, biological diversity, and climate change are also on the front burner.

The Arctic Council discusses many other topics that ICC chooses to call the "Human Dimension". The human dimension includes topics of great concern to the Arctic's indigenous peoples and residents at the community level, including: education, health, language and culture, community energy and infrastructure needs, pollution and toxic contamination, scientific research and traditional knowledge, just to name some of the issues being discussed.

I suggest the NWTF needs to be informed on the workings of the Arctic Council, including the perspectives of its permanent participants. The Council has already done much great work on the issues before this task force. It appears development of the Arctic Ocean will take a cooperative international approach rather than each Arctic nation going its own way. This means the State of Alaska will have to cooperate within this larger framework or get left behind or left out of the discussion. Please don't take this as a threat, it's simply my observation. This process is pretty far down the track already.

Early indications are that the US National Oceans Council will take a similar holistic approach to development as well. The task force probably should keep this in mind and keep itself informed on what's going on at the National Oceans Council. Again, we think this is good advice.

Okay, now for some specific recommendations:

1) **Include a tribal presence on the task force**
2) **Put strong local influence back into Coastal Zone Management**
3) **Realize Arctic offshore development is international in nature**
4) **Science and traditional knowledge should form the basis for decisions**
5) **Focus on offshore development must be holistic, not lopsided**
6) **Inupiat must benefit from development, beyond jobs**
7) **Seriously consider the NSB's offshore oil and gas policy (eight points)**
8) **Expand the task force mandate to review the environmental side of Arctic Ocean resource development**

In closing, I want to mention that the ICC is facilitating and hosting an Inuit Leader's Summit on Resource Development February 23-24 in Ottawa, Canada. The three topics of discussion are: offshore oil and gas development, uranium mining, and the social and environmental impact assessment process.

This Summit will bring together Inuit leaders from our four countries to discuss these important topics. The State of Alaska Commissioner of the Department of Natural Resources will be invited to the Summit to listen to what Inuit are thinking. This will be a great opportunity for networking. We hope the State will be able to attend.

Thank you for your time and good luck as you move forward. If ICC can be of help in the future please just let us know. I will be forwarding a copy of the Inuit Arctic Policy to Representative Joule for the task force's consideration. We call it the bible. If you have any questions, I'll be happy to try to answer them at this time.

Johny Aiken testimony from BOEMRE hearing in Anchorage, as he noted this is same presentation presented to the Northern Waters Task Force

http://www.boemre.gov/forums/documents/AnchorageTranscript26Aug10.pdf

Page 89

MR. AIKEN: Good morning, everyone. First of all, I would like to thank Director Bromwich and the Bureau of Ocean Energy Management, Regulation and Enforcement for holding this forum and to give us a chance to speak on how we feel about offshore activities in the Arctic.

My name is Johnny Aiken, and I am the executive director of the Alaska Eskimo Whaling Commission. I am from Barrow, Alaska and was born and raised there and have been whaling with my father for over 40 years. AWC has 11 whaling villages, and my presentation is focused on whaling and our environment. I do not want to take too much of your time, so I will make my presentation as brief as possible. I have a lot of pictures, and I think that looking at pictures tells a better story than words can say. So I just wanted to give you an idea of our environment and the culture we enjoy as a result of what our environment has to offer us as a people.

Page 90

This is a photograph of Harry Brower's whaling crew and a whale he harvested not very long ago. As most of you know, Harry Brower is the chairman of the Alaska Eskimo Whaling Commission and was not able to be here because of his busy schedule.

This is a slide that shows where the whales are in different times of the year. The yellow low is where the whales are in the wintertime. According to the tagged whales, we have learned that the yellow is the area where the whales winter every year. The green is showing you that during -- the green is during the spring when the whales start migrating north towards Canada, and that is when our spring whaling begins.

For Barrow, our whaling activities begin in mid to late April. I think the migration starts as early as January or February. The pink is where the whales summer in Canada. And the brown is where the whales start migrating south in the fall.

This slide shows the areas where seismic leasing and drilling are to occur in the Chukchi Sea and the Beaufort Sea should this program be opened. Here is where Shell's Beaufort Sea campaign is -- here is where Shell's Beaufort Sea campaign is to drill the Sivulliq project in the near future if allowed.

Page 91

I lost it, sorry. This slide shows where a lot of whale sighting occurred during 1979 and 2005 -- between 1975 and 2005. All the dates are whale sightings -- all the dots are whale sightings, I'm sorry. The yellow is the Kaktovik's bowhead use area, and people in Nuiqsut use area. The red lines indicate Nuiqsut's whaling GPS

tracking where they hunt, the red lines there inside all those dots.
This slide shows where Sivulliq is going to be located in the brown circles. And the gray indicate where deflection -- whale deflection distances from the center. The center being the Sivulliq project. Each circle represents a distance, and the distances are 6, 9, 15 and 19 miles. Those lines depict the use areas for Nuiqsut. As you can see, Sivulliq is right in the path of the migrating whales in the fall.
On this slide our lines, which -- depict the tagged whales and the lease areas. This is in the fall. As you can see, many whales migrate through the lease area.
Work in the Arctic will mean work in heavy ice, and we are concerned that there may not be technology to be working in the ice-infested waters. Ice is -- it can be a very strong -- it's something that you've got to be real careful with, and it's not going to be easy to work in the ice should a spill occur.

Page 92

This slide here shows typical ice structures in the winter. We have a lot of pressure ridges nearshore which tells us how powerful moving ice can be. As you can see, some of these pressure ridges can be pretty huge. For our whaling crews, a lot of work is involved in building trails to the open lead. Every year crews go out and build a trail to the open lead. Sometimes it can take weeks to get to the lead. We cannot use any heavy equipment. All the work is done by hand, labor, ice picks, and using heavy equipment may be too dangerous.
Our ocean, the Arctic Ocean, has many animals and fish, with the most important being the whale. The whales travel through any kind of ice conditions, whether it be closed or open. Many have calves either in the spring or the fall migration. We know whales can live under the ice when there is no water to be seen. We have seen air holes, such as this, even in three to four feet of thick ice. If oil is under the ice, the whales are sure to be there.
And this is a picture of a whale breathe through the ice. Should an oil spill occur, many animals will be impacted, probably much more than what happened in the Gulf. Since ice has receded in recent years because of global warming, hundreds of walrus have been found on beaches along the Arctic coast. I believe this photograph

Page 93

is located between Point Lay and Point Hope. Polar bears are a concern, too. I can't imagine a polar bear tarred with oil. I don't think it would ever survive if it had oil on its coat in the wintertime.
In the Arctic, we have our share of storms. Along with the storms comes erosion of our coastline. Here we see the same area before the storm. These are the same houses. In August of 2000 we had one of our biggest storms. The worst storms we had were in 1963 when we saw houses and fuel tanks floating along the coast. In October

2006, we had bad storms also. Some of these storms destroyed erosion control structures. This is in Wainwright. Almost straight offshore are the lease areas. This is a slide on the Liberty Project, and the reason I wanted to show this is because we need to find better technology if we're going to develop offshore oil and gas. Right now I believe that we are not ready to develop offshore oil and gas in the Arctic where it will be much harder to respond to an oil spill. The oil industry had a hard enough time in the -- in their response in the Gulf spill where there was no ice, where temperatures and weather were not an issue. It's extremely cold in the Arctic, and I can't imagine having to respond to a spill where there is ice and where it gets too cold for equipment. We need to wait until there is technology which is capable of responding to oil spills in the Arctic.

Thank you, Commissioner.

History and occupation of the Arctic Ocean

We, Tagiuqmuit/Ocean people, have occupied the Arctic Ocean which circumvents the Arctic Circle from Greenland to Canada to Alaska to Russia to the Scandinavians for millennium(s) using the natural resources for sustenance and clothing with our traditional knowledge gained through starvation, illnesses and natural disasters that enabled us to master the survival techniques that we have acquired to assure that we survived to the present.

The Inupiaq/Inuit are the original occupants from Greenland to Russia depending on our ocean for all our needs supplemented with plants and caribous from the land. The dependence on our ocean includes the Nunamuit/Inland people when their subsistence resources diminished to the point of starvation they moved to the coastal areas for sustenance knowing that the ocean would provide with the abundance of animals and the guidance of the Taguiqmuit for their survival.

With the knowledge that we have learned we teach our children as we were taught from our parents how to be caretakers of our ocean, land and air animals just taking what is needed and to assure that our sustenance will be fulfilled as much as the sustenance of our subsistence resources will be fulfilled now and into the future.

The whales, the marine mammals; polar bears, walrus, oogruks, fish and waterfowls that we depend on for subsistence from Kaktovik to Unalakleet, from the Beaufort Sea to the Chukchi Sea and to the Bering Sea use the Far North for rearing and brooding of their young which must not be compromised or the consequences that will be felt within our area will also be felt far beyond the realm with dire catastrophes to the wellbeing of all.

What I have stated with this letter is to let all of you understand that there is a Human factor and that you respect us for who we are as much as we respect who you represent as the Arctic Caucus Leadership Forum. The Far North must not be an item to discuss at a dinner table it must be in the forefront to establish the guiding principles to assure that it is managed with the utmost care with the changes that are being brought forth to address the Economic needs and the natural changes that are occurring.

Quyanaq / Thank you

George Olemaun

TFCC Strategic Outreach Plan – FY 2011

Updated on:
28 Nov at 1400

Arctic

October

- Attend: NSC Arctic and National Security Update, 10/4
- Attend: Arctic Policy Group, 10/7
- Attend: US Arctic Marine Transportation IAT, 10/6
- Speak: Norwegian visit to OSD, 10/21
- Organize: Arctic IPT Meeting, 10/22
- SA: Arctic Practitioner's Workshop, 10/26-27
- Attend: N86 Mtg Surface Combatants in the High Latitudes, 10/27
- Attend: Antarctic Astronomy Event, 10/28
- Attend: Atlantic Council Event, 10/28
- Attend: Raytheon Arctic Demo Day, 10/28

November

- *Speak: Finnish Arctic Conference, 11/8, Helsinki
- Attend: NORTHCOM Arctic Planning Mtg, 11/1-4
- Attend: Arctic FAST, 11/02
- Mtg: Institute for Foreign Policy Analysis, 11/16
- Brief: Norwegian Midshipman, 11/10
- Attend: CMTS IAT, 11/18
- SA: SEARCH Fall Mtg, 11/17-18
- Speak: DHS "IC Support to the Arctic" conference, 11/16-17
- SA: C3F/DHS Arctic Symposium, 11/23-24
- Attend: Arctic Policy Group, 11/18
- O/C: Danish Naval Atache, 11/23

December

- Attend: EUCOM Arctic Zephyr, 12/1-3
- Attend: NWC Arctic Shipping Wargame, 12/8-10
- Attend: Arctic Policy Group, 12/16
- *CNO Arctic Roadmap Update, 12/23

Climate Change

October

- *O/C: Brian Detter, DASN ExW, 10/06
- Attend: GreenGov Symposium, 10/5-7
- Attend: Irregular WF Wargame Debrief, 10/19
- Attend: NRC Review GAO Geoengineering Report, 10/6-7
- Speak: NSF Brown-bag, 10/19
- Attend: Woodrow Wilson Ctr Geoengineering Event, 10/6
- Speak: Draper Laboratory GCM Symposium, 10/21-22
- Mtg: Nat Climate Assessment, 10/07
- *Attend: OSTP CENRS Mtg, 10/21
- Attend: Inter-agency Forum on Climate Change, 10/27
- *O/C: ASN (EI&E) Pfannenstiel, 10/12
- Speak: University of Maine Climate conference, 10/25
- *O/C: Ford Hart, CNO Foreign Policy, 10/28
- Attend: Woodrow Wilson Ctr Human Security, 10/19
- Attend: UNFCCC Interagency Briefing, 10/28

November

- Mtg: Bipartisan Policy Center, 11/01
- *O/C: DASD Dory & GEN Engel, 11/16
- *Testify: House E&E Subcommittee, 11/17
- Attend: AEPI Briefing, 11/23
- *Speak: ONR, 11/2
- Attend: Raytheon Demo Day, 11/4
- Speak: NCEP Geoengineering TF, 11/18
- Mtg: USAID, 11/23
- Attend: UK Royal Society Geoengineering Conf, 11/8-9, London
- O/C: World Ocean Council, 11/18
- Attend: Defense Science Board, 11/8-9
- *Speak: TEDx, 11/19
- Attend: IAIA Symposium, 11/15-17
- Attend: UNFCCC Interagency Briefing, 11/22
- Speak: USNA Global Climate Change Course, 11/15

December

- *Speak: Blue Planet Forum, 12/2
- Mtg: OSD AT&L Desk Officer Brief, 12/08
- Mtg: GAO, 12/02
- *Speak: DoD Panel at COP16, Cancun12/09
- Mtg: SERDP SLR Study, 12/02
- Attend: Inter-agency Forum on Climate Change, 12/03
- Attend: AEPI Water Security Workshop, 12/14
- Attend: Nat Climate Assessment Scenarios Workshop, 12/6-8
- Attend: Defense Science Board, 12/17
- *Speak: SERDP/ESTCP Annual Symposium, 11/30-12/01
- *Speak: AGU Annual Symposium, 12/13-17
- Mtg: USGCRP Climate Comm. WG, 12/20

Energy

October

- Mtg: NECO WG, 10/05
- Mtg: NECO WG, 10/19
- Attend: SECNAV Energy Awards, 10/06
- SA: Navy Energy Forum, 10/13-14

November

- Mtg: NECO WG, 11/02
- Mtg: NECO WG, 11/30
- Mtg: NECO WG, 11/16

December

- Mtg: NECO WG, 12/14
- Mtg: NECO WG, 12/28

Northern Waters Task Force minutes – December 2, 2010 Barrow, Alaska

Members:
Representative Reggie Joule – Chair
Senator Bert Stedman – Vice Chair
Senator Donny Olson
Representative Bob Herron
Representative Bryce Edgmon
Chris Hladick
Chuck Greene
Dave Kubiak
Mayor Edward Itta
Captain Adam Shaw, USCG (on behalf of RADM Colvin)
Larry Hartig, Commissioner, DEC
(Rep. Seaton on phone as interested legislator)

Speakers:

Jimmy Stotts	Inuit Circumpolar Conference- Alaska
Johny Aiken	Alaska Eskimo Whaling Commission
Todd Sformo	North Slope Borough (NSB) Dept of Wildlife Management
Jason Herremia	NSB Dept of Wildlife Management
Barrett Ristroph	NSB Law Department
George Olemaun	Inupiat Community of the Arctic Slope (ICAS)
Debby Edwardson	Ilisagvik College
George Edwardson	ICAS
Gordon Brower	NSB Planning Department
Ethel Patkotak	Self

Representative Joule convened the meeting at noon with introductory commenst regarding the Task Force and the importance of hearing from the people that depend on the northern waters. Members in attendance introduced themselves.

Jimmy Stotts, President of the Alaska chapter of the Inuit Circumpolar Conference (ICC) addressed the Task Force from prepared remarks that defined the ICC and its purpose in strengthening unity among Arctic Inuit, promoting Inuit rights and interests at the international level, developing and encouraging long term policies that protect the Arctic environment, and seeking full and active partnership in the political, economic, and social development of the Arctic. For 30 years, ICC has been pushing for Inuit influence over all activities affecting their people, homeland, and environment.
Expressed concerns with the State's pro-development attitude feeling that the state's approach is not evenly balanced and lacks involvement of local people and tribes. He also noted the importance of the Arctic Council and the ICC's permanent participant status, and encouraged the Task Force to stay informed of the work of the Arctic Council and particularly the human dimension. Jimmy offered 8 recommendations to the Task Force as follows:

1. Recommends a tribal presence on the task force
2. Put strong local influence back into Coastal Zone Management (CZM) and criticized the state for failing to move forward on this legislation for years

3. Realize Arctic offshore development is international in nature and is a process already in motion the State's interest is late
4. Science and traditional knowledge should help form the basis for decisions
5. Focus on offshore development must be holistic, not lopsided state's present approach lacks balance
6. Inupiat must benefit from development and not just through jobs
7. Seriously consider the NSB's offshore oil and gas policy (eight points)
8. Expand the task force mandate to review the environmental side of Arctic Ocean resource development

Jimmy concluded by noting that ICC will be holding an Inuit Leadership Summit on Resource Development February 23-24 in Ottawa Canada to discuss offshore oil and gas development, uranium mining, and the social and environmental impact assessment process.
In addition to his written testimony, a copy of the Inuit Arctic Policy will be forthcoming to Rep. Joule.

Senator Stedman commented that CZM was a broader, statewide issue and also is complicated by the President's Executive Order. He noted that the legislature will be working on this but a resolution may take more than one session. Current system creates too much tension.

Representative Herron questioned as to whether a multi-lateral treaty for the Arctic, similar to the Antarctic made sense thus keeping the governance close at hand. Jimmy noted that an international treaty on search and rescue is in the works and that there are several bilateral treaties in existence.

Mr. Johny Aiken, Executive Director, Alaska Eskimo Whaling Commission (AEWC), provided a power point presentation on the Alaska Whaling Commission, the distribution of bowhead whales and the challenges of whaling and working in heavy ice. The presentation was a repeat of the presentation made to BOEMRE in their July OCS Forum. His key points were:

- Migratory paths of the whales are known and well mapped, have been researching them through a tagging process with the Department of Fish and Game
- Noted possible oil drilling sites that are in the whale's migratory paths
- Noted that past conflict avoidance agreements with the oil industry have been effective in working together balancing oil exploration with subsistence hunting needs
- Know that the whale's migration path can be impacted up to 20 feet away from oil development/sound
- Depend on food in the sea for survival most important being the whale
- Heavy ice and pressure ridges make work very difficult in the Arctic waters
- Heavy ice requires the best technology and feeling is that the industry is not ready to respond to a spill in these conditions in remote Alaska
- Deepwater Horizon showed even with infrastructure, how difficult controlling and containing an oil discharge is, making the point that Alaska and industry are not ready for work away from Prudhoe Bay
- Concern for animals if a spill occurred and feels it would be very difficult to help large animals impacted by a spill like whales and polar bears

- Support Liberty directional and extended reach drilling as a way to avoid conflicts with whales and environmental risk
- Does not support off shore development without better technology does not believe ready for the challenge in the Arctic

Johny concluded his comments noting that the AEWC strongly supports coastal zone management and wants to insure there is a community voice in the development process.

Todd Sformo and Jason Herremia, NSB Department of Wildlife Management provided a power point presentation overview of the wildlife research and management.

Todd provided a historical framework of research on the North Slope noting the long standing practice of working with local people as scientists from the earliest days. He referred to "50 More Years Below Zero" section on "Science and Community: Inupiat Contributors to the Laboratory's Effectiveness" for "*Introduction to Alaska's Original Naturalist*" and "*Historical Perspectives on Inupiat Contributions to Arctic Science at NARL*" to point out the importance of collaborative research work. He quoted a passage from Kenneth Toovak, Sr. as he evaluated his career of collaboration with scientists: " *I was scared of White people…I stayed to myself. Pretty soon, those folks started coming around to talk to me, asking questions. I started to get to know these people I had been scared of. We started to share the different things we know. This sharing became a very important part of my life. It wasn't easy…But, we kept on sharing knowledge…Scientist wanted my help…they felt good when I helped them on the ice. So I made myself available to them, and we went on sharing" (Toovak, 1992: 19)).* The key point made by Todd was that the people of Barrow have been working to combine traditional knowledge and western science for over 50 years and both sides are committed to continuing this process. He also noted that the NSB scientific research has had both regional and international significance.

Jason discussed the different research work at the Arctic Science Center, with a focus on subsistence animals used by the community. The bowhead whale remains one of the primary research focus areas, with recognition of their extended age (180-200 yrs old). They are also working on the entire genome of the whale with university researchers. The Center has also expanded into collecting baseline disease assessment, tracking, population data, and other related research for ice seals (ring, spotted), caribou herds, beluga whales, and a variety of water fowl. A recent focus has been on assessing the health of subsistence users as diets and climate conditions change. The center also tracks ESA listing as they pertain to local populations and subsistence foods (eiders, polar bears and ice seals). He noted that much of the funding for the research comes from a variety of grants and the North Slope Borough.

Senator Olson asked about narwhal research in the eastern Beaufort Sea and Canada. It was noted that this was out of the area researched and little information existed at the NSB, although contacts with Canadian collaborators could help find information. Additionally, in the future it is possible that research will happen on the narwhal.

Barrett Ristoph, NSB Law Department spoke of her efforts to support policies of the NSB, including the Planning Department for the Alaska Coastal Management Program to improve the program and specific work on land use codes for the nearshore areas to streamline the permitting process for development.

She is currently working on updating an outdated land use code, it is 20 years old. Barrett talked about wildlife co-management, climate issues, and her work with different groups like AEWC, ICAs and many others. The NSB tries to work collaboratively with other departments and agencies to achieve their common goals through Memorandums of Understanding and joint comments for federal and state processes.

Representative Herron raised the success of the Migratory Bird Treaty as an analogy to CZM. He noted that CZM worked for decades and with the present issues facing Alaska and the Arctic it could serve to provide protection comparable to the Migratory Bird Treaty. Herron noted that we didn't have decades to work out CZM. Barrett commented that the Migratory Bird treaty has been successful and gives the state's rights over an area that they wouldn't otherwise have much control over. She believes that the NSB can work cooperatively with the federal government to achieve common goals and that they have done so in the past. Representative Herron commented on CZM and states right and noted the importance of using the time available to resolve local governance and states' rights issues sooner rather than later.

George Olemaun talked on behalf of the Inupiat Community of the Arctic Slope (ICAS) and provided written comments that highlighted the relationship between the long term survivability of the Inuit, and the natural resources found in the area. George talked about the importance of the ocean for survival both as a food source but also as an integral part of the spiritual culture, and noted the importance of subsistence for the future and the next generation of Inuit. He spoke about the marine mammals, fish and birds that all come north to the Arctic Ocean and of the Inuit's dependence in Alaska from Kaktovik to Unalakleeet, believing that no compromise should be made for their safety. George stressed keeping the "Human Factor" upfront when making decisions about development and taking the time to get to know the people up north and respecting the Inupiat for "who we are versus who we represent". By following guiding principles he believes people can adapt for natural environmental change and economic need. He concluded by recognizing the "persistent presence" of Inupiat people in the Arctic.

Debbie Edwardson, Special Projects Coordinator, Ilisagvik College, and NSB School Board President. Debbie e introduced the College mission as 2 fold; (1) addressing human resource needs for the North Slope workforce, and (2) perpetuating Inupiat language and culture. She recognized that encroaching development needed attention from policy makers and professionals to insure community involvement and felt that Prudhoe Bay missed the mark in local hire of workforce. Debbie talked about the Marine Mammal Observer Stewardship Program (background article, although not provided, can be found at http://www.thearcticsounder.com/article/1045ilisagvik_colleges_marine_mammal_observer) and requested support from the NWTF as the program brought traditional Inupiat science together with National Marine Fisheries Services in addressing the MMPA in the Arctic. Through the program, local observers work on boats sharing traditional knowledge about the animals in an effort to keep them safe. NMFS is presently working on guidelines for observing mammals but she wants to insure that these guidelines give the observers a real presence on the boats and that they do not end up with a mere token presence noting the observers must have true authority to act. Noted that there have been some reports that these observers have been treated as a "token presence" and that in some cases the observations were not respected and encouraged trust in the knowledge of people that have watched

the marine mammals for decades. Debbie continued with sharing information about other accredited programs including USCG licensing program, this program has been accredited by AFN. On the subject of forthcoming regulations and the ability to comment, she highlighted the importance of respecting the traditional knowledge of elders and their closeness to the sea. She concluded by noting that "the sea is our garden."

Representative Joule commented on the proactive programs of Ilisagvik College and the investment of capital for "People Involvement" as the programs move forward.

George Edwardson, President, ICAS, stressed the importance of keeping the local people and the authority at the table when looking at the animals and community dependence. With high unemployment rates people depended on subsistence to meet needs. George talked about jurisdiction of the tribe and how there was an analogy between UNCLOS and the Alaska constitution as the governance of the Inupiat people was linked to the animals and thus extended beyond state waters into federal waters and those waters agreed to by UNCLOS. He noted that after the three mile limit the state had few rights but the tribes did so the state should work with the local people.

Gordon Brower, NSB Planning Department, provided remarks reflecting on Johny Aiken's presentation that pictures tell the story. He encouraged the task force to address ocean concerns as the ocean feeds the community. CZM was of significant interest as a tool to reinforce local perspective, but cautioned that it was different across the state. He encouraged reauthorization of the ACMP to strengthen local involvement and facilitate co-management in the EEZ. Concerns were noted for the migratory paths of bowheads and oil development and issues associated with nearshore re-zoning of the NSB. NSB has worked on new near shore zoning rules to mitigate risk. Respect was given for the importance of economic development and the success of Liberty and others and noted a balanced approach of jobs and risk mitigation. Examples included North Star being stuck in moving ice and the interest in an ordinance for ice capable barge system on the North Slope. Gordon asked for improved learning tools for better managing offshore development. He suggested an offshore advisory panel that could study existing near shore development and look into advanced technology for near shore development and make recommendations/regulations regarding the development. Gordon concluded with advice to the committee on finding balanced development by looking at what the NSB has done over the last several years.

Representative Herron noted a press conference on CZM as the Governor and colleagues move forward and asked whether "local control" or "local input" was preferred. Gordon commented that "local input" was a priority outside state waters and that the goal was to protect the bowhead whale. Noted the frustration of not being able to comment beyond the 3 mile limit.

Ethel Patkotak spoke on behalf of herself as a resident of Wainwright after a 20 year absence from the NSB. Ethel noted her 2 law degrees and her work for indigenous people. In recognizing the value of the Task Force, she encouraged an understanding of the urban-rural to coastal-inland divide as community survival is no different between challenges with oil and gas fluctuations, salmon disasters, or the crash of the timber industry. Different locations have had to survive different economic troubles. In each

case, endurance of the people is key and finding ways for sustainable local economies. Must recognize the migratory nature of many of our communities and the mixed economy that exists which combines subsistence and cash economic activity in communities. Ethel continued with guidance on keeping sight of history, including the Exxon Valdez oil spill and the role of the RCAC's and OPA-90. The Gulf of Mexico needs to be looked at with fresh eyes to see who or what was overlooked and the voids or gaps in the scientific process. Look at what has worked and what hasn't worked with the advisory councils. Ethel continued in expressing concerns for the use of statistics, whether shown in federal and industry expenditures, science in not understanding the Arctic, and how studies often need to be redone as site or subject specific to validate the statistical findings. In concluding, Ethel encouraged the Task Force to look back and see what is driving activities and look forward with defensible values, noting that committee members must stay true to their values. Sees the task force as looking for a means to keep communities involved in development processes but notes that the train is already moving full speed ahead.

Closing Comments:

After taking public testimony, Representative Joule looked to the Task Force members for closing comments.

Commissioner Hartig as the Administration's member noted the value of field hearings in making risk decisions. He compared his use of market risk with the Permanent Fund Dividend in making decisions versus DEC in environmental risk decisions. Clearly, the DEC environmental risk remains the ones of his greatest concern.

Senator Olson commented on his concerns for oil and ice and his fear of an incident. He recognized the grave concerns logically presented at the hearing and he looks forward to discussions of policies in the session between legislators and state commissioners.

Captain Shaw, on behalf of RADM Colvin, appreciated the advocacy for balance between subsistence and development. The USCG maintains preparedness for oil spills and is working to insure input from local users. He introduced Joel Casto as the USCG Tribal Liaison for District 17 and encouraged working with him.

Representative Edgmon complimented those providing testimony for their passion and eloquence and how it mirrors the discussions he hears on Pebble. He recognizes the importance of a lifetime of resources behind these discussions. Representative Edgmon looks forward to making progress on CZM.

Representative Herron concurred with Representative Edgmon noting the Kuskokwim area maintains salmon integral to the Yupik culture. He concluded with a compliment to Mayor Itta for his hospitality.

Mayor Itta complimented Senator McGuire for taking time to hear from the people in a cross-border Arctic Caucus meeting as it was relevant and timely. He reflected on Jimmy Stotts words for a national debate on energy and climate change as exploration in the Arctic is allowed. He expressed concern over

President Obama's recent decision to allow drilling in the Arctic reversing his prior order. Message is exploration will be allowed in Arctic, substantial offshore activity and this will affect all of us. He concluded with a compliment of having the Task Force hearing in conjunction with PNWER.

Senator Stedman noted upcoming CZM discussions that will occur in January. Has not talked with his communities yet but anticipates that there will not be uniform agreement among his communities but believes everyone will say that they want more input. Process may look messy from the outside but will smooth out and get resolution. Wants hearings in a variety of communities regarding CZM across the state. He noted that Ketchikan had lost its local subsistence rights and that Sitka was at risk and looks forward to resolutions of the issues in his communities.

Dave Kubiak complimented Senator Stevens for his appointment and appreciated Barrow's hospitality. He was very impressed with the speakers and sees Barrow as allies with equal concerns on the issues expressed before the Task Force.

Chris Hladick noted his community's role in oil and gas versus shipping and expressed the importance to insure the USCG is ready for the Arctic. He noted the risk for ships in the Bering Sea and cognizance of the correct skills, crews and sea lanes in managing shipping issues. Major concern of his area will be shipping as his area is a hub.

Chuck Greene noted that the Task Force members didn't yet have an idea of what the final outcome will look like, and noted that the issues are not part of a perfect process. He commented on the common words people used when testifying such as, "holistic process", "balanced development" "local input" "sustainability." This hearing reflected a good cross section of the grass roots nature of public input and what it represents to the state. Believes in the end the decision will be representative of what they have heard and believes that the task force has a good balance of people that represent the people of the state and the northern region.

Representative Joule concluded the comments encouraging attendees to continue with written comments if they didn't have an opportunity to testify. He acknowledged the service of the Task Force members to the state and that service and reciprocity often went hand in hand. Expanded services like the Task Force often include layer upon layer of government, but he hoped that the process offered to be participatory. Pleased to hear from the community that they wanted to participate in whatever process evolved. Believes that when the community and people have input often mitigates the needs for courts. This Task Force process offers to keep the input public and time is available given the on-going CZM discussion in the Legislature and the National Ocean Council activities, although there is not a luxury of time. Representative Joule concluded by thanking the members and the attendees in the hearing.

The hearing adjourned

12/22/2010

Johny Ailken testimony from BOEMRE hearing in Anchorage, as he noted this is same presentation presented to the Northern Waters Task Force

http://www.boemre.gov/forums/documents/AnchorageTranscript26Aug10.pdf

Page 89

MR. AIKEN: Good morning, everyone. First of all, I would like to thank Director Bromwich and the Bureau of Ocean Energy Management, Regulation and Enforcement for holding this forum and to give us a chance to speak on how we feel about offshore activities in the Arctic.

My name is Johnny Aiken, and I am the executive director of the Alaska Eskimo Whaling Commission. I am from Barrow, Alaska and was born and raised there and have been whaling with my father for over 40 years. AWC has 11 whaling villages, and my presentation is focused on whaling and our environment. I do not want to take too much of your time, so I will make my presentation as brief as possible. I have a lot of pictures, and I think that looking at pictures tells a better story than words can say. So I just wanted to give you an idea of our environment and the culture we enjoy as a result of what our environment has to offer us as a people.

Page 90

This is a photograph of Harry Brower's whaling crew and a whale he harvested not very long ago. As most of you know, Harry Brower is the chairman of the Alaska Eskimo Whaling Commission and was not able to be here because of his busy schedule.

This is a slide that shows where the whales are in different times of the year. The yellow low is where the whales are in the wintertime. According to the tagged whales, we have learned that the yellow is the area where the whales winter every year. The green is showing you that during -- the green is during the spring when the whales start migrating north towards Canada, and that is when our spring whaling begins.

For Barrow, our whaling activities begin in mid to late April. I think the migration starts as early as January or February. The pink is where the whales summer in Canada. And the brown is where the whales start migrating south in the fall.

This slide shows the areas where seismic leasing and drilling are to occur in the Chukchi Sea and the Beaufort Sea should this program be opened.

Here is where Shell's Beaufort Sea campaign is -- here is where Shell's Beaufort Sea campaign is to drill the Sivulliq project in the near future if allowed.

Page 91

I lost it, sorry. This slide shows where a lot of whale sighting occurred during 1979 and 2005 -- between 1975 and 2005. All the dates are whale sightings -- all the dots are whale sightings, I'm sorry. The yellow is the Kaktovik's bowhead use area, and people in Nuiqsut use area. The red lines indicate Nuiqsut's whaling GPS tracking where they hunt, the red lines there inside all those dots.

This slide shows where Sivulliq is going to

be located in the brown circles. And the gray indicate where deflection -- whale deflection distances from the center. The center being the Sivulliq project. Each circle represents a distance, and the distances are 6, 9, 15 and 19 miles. Those lines depict the use areas for Nuiqsut. As you can see, Sivulliq is right in the path of the migrating whales in the fall.
On this slide our lines, which -- depict the tagged whales and the lease areas. This is in the fall. As you can see, many whales migrate through the lease area. Work in the Arctic will mean work in heavy ice, and we are concerned that there may not be technology to be working in the ice-infested waters. Ice is -- it can be a very strong -- it's something that you've got to be real careful with, and it's not going to be easy to work in the ice should a spill occur.

Page 92

This slide here shows typical ice structures in the winter. We have a lot of pressure ridges nearshore which tells us how powerful moving ice can be. As you can see, some of these pressure ridges can be pretty huge. For our whaling crews, a lot of work is involved in building trails to the open lead. Every year crews go out and build a trail to the open lead. Sometimes it can take weeks to get to the lead. We cannot use any heavy equipment. All the work is done by hand, labor, ice picks, and using heavy equipment may be too dangerous.
Our ocean, the Arctic Ocean, has many animals and fish, with the most important being the whale. The whales travel through any kind of ice conditions, whether it be closed or open. Many have calves either in the spring or the fall migration. We know whales can live under the ice when there is no water to be seen. We have seen air holes, such as this, even in three to four feet of thick ice. If oil is under the ice, the whales are sure to be there.
And this is a picture of a whale breathe through the ice. Should an oil spill occur, many animals will be impacted, probably much more than what happened in the Gulf. Since ice has receded in recent years because of global warming, hundreds of walrus have been found on beaches along the Arctic coast. I believe this photograph

Page 93

is located between Point Lay and Point Hope. Polar bears are a concern, too. I can't imagine a polar bear tarred with oil. I don't think it would ever survive if it had oil on its coat in the wintertime.
In the Arctic, we have our share of storms. Along with the storms comes erosion of our coastline. Here we see the same area before the storm. These are the same houses. In August of 2000 we had one of our biggest storms. The worst storms we had were in 1963 when we saw houses and fuel tanks floating along the coast. In October 2006, we had bad storms also. Some of these storms destroyed erosion control structures. This is in Wainwright. Almost straight offshore are the lease areas.
This is a slide on the Liberty Project, and the reason I wanted to show this is because we need to find better technology if we're going to develop offshore oil

and gas. Right now I believe that we are not ready to develop offshore oil and gas in the Arctic where it will be much harder to respond to an oil spill. The oil industry had a hard enough time in the -- in their response in the Gulf spill where there was no ice, where temperatures and weather were not an issue. It's extremely cold in the Arctic, and I can't imagine having to respond to a spill where there is ice and where it gets too cold for equipment. We need to wait until there is technology which is capable of responding to oil spills in the Arctic.

Thank you, Commissioner.

Northern Waters Task Force minutes – December 2, 2010

Members:
Representative Reggie Joule – Chair
Senator Bert Stedman – Vice Chair
Senator Donny Olson
Representative Bob Herron
Representative Bryce Edgmon
Chris Hladick
Chuck Greene
Dave Kubiak
Mayor Edward Itta
Captain Adam Shaw, USCG (on behalf of RADM Colvin)
Larry Hartig, Commissioner, DEC
(Rep. Seaton on phone as interested legislator)

Speakers:

Jimmy Stotts	Inuit Circumpolar Conference- Alaska
Johny Aiken	Alaska Eskimo Whaling Commission
Todd Sformo	North Slope Borough (NSB) Dept of Wildlife Management
Jason Herremia	NSB Dept of Wildlife Management
Barrett Ristroph	NSB Law Department
George Olemaun	Inupiat Community of the Arctic Slope (ICAS)
Debby Edwardson	Ilisagvik College
George Edwardson	ICAS
Gordon Brower	NSB Planning Department
Ethel Patkotak	Self

Representative Joule convened the meeting at 12:00 (check time) with introductory comment regarding the Task Force and the importance of hearing from the people that depend on the northern waters. Members in attendance introduced themselves.

Jimmy Stotts, President of the Alaska chapter of the Inuit Circumpolar Conference (ICC) addressed the Task Force from prepared remarks (attached) that defined the ICC and its purpose in strengthening unity among Inuit of the Arctic, promote Inuit rights and interest at the international level, develop and encourage long term policies that protect the Arctic environment, and seek full and active partnership in the political, economic, and social development of the Arctic. For 30 years, ICC has been pushing for Inuit influence over all activities affecting the people, homeland and environment.
After discussing concerns for a pro-development attitude of the State of Alaska and concerns for involving local people, he noted the importance of Arctic Council and the ICC's permanent participant status, encouraging the Task Force to stay informed of the work of the Arctic Council and particularly the human dimension. Jimmy offered 8 recommendations to the Task Force as follows:

1. Include a tribal presence on the task force
2. Put strong local influence back into Coastal Zone Management (CZM)
3. Realize Arctic offshore development is international in nature
4. Science and traditional knowledge should form the basis for decisions
5. Focus on offshore development must be holistic, not lopsided
6. Inupiat must benefit from development, beyond jobs

7. Seriously consider the NSB's offshore oil and gas policy (eight points)
8. Expand the task force mandate to review the environmental side of Arctic Ocean resource development

Jimmy concluded by noting that the ICC Inuit Leadership Summit on Resource Development on February 23-24 in Ottawa Canada to discuss offshore oil and gas development, uranium mining, and the social and environmental impact assessment process.
In addition to his written testimony, a copy of the Inuit Arctic Policy will be forthcoming to Rep. Joule.

Senator Stedman commented that CZM was a broader, statewide issue and also is complicated by the President Executive Order. He noted that the legislature will be working on this but may take more than one session.

Representative Herron questioned as to whether a multi-lateral treaty for the Arctic, similar to the Antarctic made sense thus keeping the governance close at hand.

Mr. Johny Aiken, Executive Director, Alaska Eskimo Whaling Commission (AEWC), provided a powerpoint presentation (to be posted) on the Alaska Whaling Commission, the distribution of bowhead whales and the challenges of whaling and working in heavy ice. The presentation was a repeat of the presentation made to BOEMRE in their July OCS Forum (transcript attached). His key points were:

- Migratory paths of the whales are known and well mapped
- Conflict avoidance agreements were effective for working together
- Heavy ice and pressure ridges make work very difficult
- Heavy ice requires the best technology and feeling is that the industry is not ready for those conditions in remote Alaska
- Deepwater Horizon showed even with infrastructure, how difficult controlling and containing an oil discharge is, making the point that Alaska and industry are not ready for work away from Prudhoe Bay
- Support Liberty directional and extended reach drilling as a way to avoid conflicts with whales and environmental risk

Johny concluded his comments noting that the AEWC strongly supported CZM and wanted to insure there was a community voice in development.

Todd Sformo and Jason Herremia, NSB Department of Wildlife Management provided an powerpoint presentation overview of the wildlife research and management. Todd provided a reference to "50 More Years Below Zero" section on "Science and Community: Inupiat Contributors to the Laboratory's Effectiveness" for "*Introduction to Alaska's Original Naturalist*" and "*Historical Perspectives on Inupiat Contributions to Arctic Science at NARL*" was made as to the importance of collaborative help. (I believe the quoted passage was from Kenneth Toovak, Sr. as he evaluated his career of collaboration with scientists: *I was scared of White people...I stayed to myself. Pretty soon, those folks started coming around to talk to me, asking questions. I started to get to know these people I had been scared of. We started to share the different things we know. This sharing became a very important part of my life. It wasn't easy...But, we kept on sharing knowledge...Scientist wanted my help...they felt good when I*

helped them on the ice. So I made myself available to them, and we went on sharing" (Toovak, 1992: 19)). The key point made by Todd was that the people of Barrow have been working to combine traditional knowledge and western science for over 50 years and are committed to many years more. Jason discussed the different research work of the Arctic Science Center, with a subsistence focus for the animals used by the community. The bowhead whale remains the primary research focus, with recognition of their extended age (180-200 yrs old). The Center has also expanded into collecting baseline disease assessments in ice seals and monitoring caribou populations. A recent focus has been on assessing the health of subsistence users as diets and climate conditions change. The center also tracks ESA listing as they pertain to local populations and subsistence (polar bears and ice seals). A plea was made for grant funding sources, as training is moving forward for the young people as they are the future of Barrow collaboration in science.

Senator Olson asked about narwhal research in the eastern Beaufort sea and Canada. It was noted that this was out of the area researched and little information existed at the NSB, although contacts with Canadian collaborators could help find information.

Barrett Ristoph, NSB Law Department spoke of her efforts to support policies of the NSB, including the Planning Department for the Alaska Coastal Management Program to improve the program and specific work on land use codes for the nearshore areas to streamline the permitting process. Barrett talked about wildlife co-management, climate issues, and her work with the AEWC, ICAs and others for Memorandums of Understanding and joint comments for federal and state actions.

Representative Herron raised the success of the Migratory Bird Treaty as an analogy to CZM. He noted that CZM worked for decades and with the issues facing Alaska could provide protection comparable to the Migratory Bird Treaty. Barrett commented that she did not see the aspects of international treaties in the CZM analogy. Representative Herron commented on CZM and states right and noted the importance of using the time available to resolve local governance and states' rights (This point may be mistaken in my shorthanded notes and memory).

George Olemaun talked on behalf of the Inupiat Community of the Arctic Slope (ICAS) prov9ided written comments (attached) that highlighted the relationship between the Inuit/Inupiaq people survivability and the natural resources. George talked on the ocean for survival and the importance of subsistence for the future. He noted that the marine mammals, fish and birds were circum Arctic Ocean and of dependence in Alaska from Kaktovik to Unalakleeet, with no compromise to be made for their safety. George stressed to keep the "Human Factor" upfront as the Inupiat are "who we are versus who we represent". By following guiding principles people can adapt for natural change and economic need. He concluded by recognizing the "persistent presence" of Inupiat people in the Arctic.

Debbie Edwardson, Director Workforce Development (?), Ilisagvik College, introduced the College mission as 2 fold, addressing human resource needs for the North Slope and perpetuate Inupiat language and culture for the students. She recognized the encroaching development needed attention from policy makers and professionals to insure community involvement and felt that Prudhoe Bay missed the mark in local hire of workforce. Debbie talked about the Marine Mammal Observer

Stewardship Program (background article, although not provided, at http://www.thearcticsounder.com/article/1045ilisagvik_colleges_marine_mammal_observer) and requested support from the NWTF as the program brought traditional Inupiat science together with NMFS in addressing the MMPA in the Arctic. She expressed concerns that these "observers" were a "token presence" and that in cases the observations were not respected and encouraged trust in the knowledge of people that have watched the marine mammals for decades. Debbie continued with sharing the accredited programs including USCG licensing that were AFN respected. On the subject of forthcoming regulations and the ability to comment, she highlighted the respect of the traditional knowledge of elders and their closeness to the sea.

Representative Joule commented on the proactive programs of Ilisagvik College and the investment of capital for "People Involvement" as the programs move forward.

George Edwardson, President, ICAS, stressed to keep the people and the authority at the table when looking at the animals and community dependence. With high unemployment rates people depended on subsistence to meet needs. George talked about jurisdiction of the tribe and how there was an analogy between UNCLOS and the Alaska constitution as the governance of the Inupiat people was linked to the animals and thus extended beyond state waters into federal waters and those waters agreed to by UNCLOS.

Gordon Brower, NSB Planning Department, provided remarks reflecting on Johny Aiken's presentation that pictures tell the story. He encouraged the task force to address ocean concerns as the ocean feeds the community. CZM was of significant interest as tools to reinforce local perspective, but cautioned that it was different across states. He encouraged reauthorization of the ACMP to strengthen local involvement and facilitate co-management in the EEZ. Concerns were noted for the migratory paths of bowheads and oil development and issues associated with nearshore re-zoning of the NSB. Respect was given for the importance of economic development and the success of Liberty and others and noted a balanced approach of jobs and risk mitigation. Examples included North Star being stuck in moving ice and the interest in an ordinance for ice capable barge system on the North Slope. Gordon asked for improved learning tools for better managing offshore development and looked for an offshore advisory panel and advanced technology in nearshore development. Gordon concluded with advice to the committee on finding balanced development.

Representative Herron noted a press conference on CZM as the Governor and colleagues move forward and asked whether "local control" or "local input" was preferred. Gordon commented that "local input" was a priority outside state waters and that the goal was to protect the bowhead whale.

Ethel Patkotak spoke on behalf of herself as a resident of Wainwright and a student of Mt. Edgcomb boarding school and having returned to Barrow after 20 years away from the North Slope. Ethel noted her 2 law degrees and work for indigenous people. In recognizing the value of the Task Force, she encouraged an understanding of the urban-rural to coastal-inland divide as community survival was no different between challenges with oil and gas fluctuations, salmon disasters and crash of the timber industry. In each case, endurance of the people is key and finding ways for sustainable local economies.

These included understanding a migratory versus mixed economy that cross-cuts subsistence versus economic activity. Ethel continued with guidance on keeping sigh on history, including the Exxon Valdez oil spill and the role of the RCAC's and OPA-90. The Gulf of Mexico needs to be looked at with fresh eyes to see who or what was overlooked and the voids or gaps in the scientific process. Ethel continued in expressing concerns for the use of statistics, whether shown in federal and industry expenditures, science in not understanding the Arctic, and how studies often need to be redone as site or subject specific to validate the statistical findings. In concluding, Ethel encouraged the Task Force to look back and see what is driving activities and look forward with defensible values.

After taking public testimony, Representative Joule looked to the Task Force members for closing comments.

Commissioner Hartig as the Administration's member noted the value of field hearings in risk decisions. He compared his use of market risk with the Permanent Fund Dividend versus DEC in environmental risk decisions. Clearly, the DEC environmental risk remains the ones of his greatest concern.

Senator Olson commented on his concerns for oil and ice and his fear of an incident. He noted the grave concerns logically presented at the hearing and noted looking to discussions of policies in the session between Legislators and Commissioners.

Captain Shaw, on behalf of RADM Colvin, appreciated the advocacy for balance between subsistence and development. The USCG maintains preparedness for oil spills and is working to insure input from local users. He introduced Joel Casto as the USCG Tribal Liaison for District 17 and encouraged working with him.

Representative Edgmon complimented those providing testimony for their passion and eloquence and how it mirrors the discussions he hears on Pebble. He recognized the importance of lifetime of resources behind these discussions. Representative Edgmon looks forward on making progress on CZM.

Representative Herron concurred with Representative Edgmon noting the Kuskokwim maintain salmon integral to the Yupik culture. He concluded with a compliment to Mayor Itta for his hospitality.

Mayor Itta complimented Senator McGuire for taking time to hear from the people in a cross-border Arctic Caucus meeting as it was relevant and timely. He reflected on Jimmy Stotts words for a national debate on energy and climate change as exploration in the Arctic is allowed. He concluded with a compliment of having the Task Force hearing in conjunction with PNWER.

Senator Stedman noted CZM discussions in January and the input focus. He noted that Ketchikan had lost its local subsistence rights and that Sitka was at risk and looks forward to resolutions of the issues in his communities.

Dave Kubiak complimented Senator Stevens for his appointment and appreciated the Barrow allies with equal concerns on the issues expressed before the Task Force.

Chris Hladick noted his community's role in oil and gas versus shipping and expressed the importance to insure the USCG is ready for the Arctic. He noted the risk for ships in the Bering Sea and cognizance of the correct skills, crews and sea lanes in managing shipping issues.

Chuck Greene encouraged the Task Force to understand what the final outcome will look like, as the issues are not part of a perfect process. He commented on the holistic process in balancing pro-development for input versus control and consideration of sustainability. This hearing reflected good cross section of the grass roots nature of public input and what it represents to the state.

Representative Joule concluded the comments encouraging attendees to continue with written comments. He respected the service of the Task Force members to the state and that sevice and reciprocity went hand in hand. Expanded services often include layer upon layer of government, but he hoped that the process offered to be participatory. The community ability to input often mitigates the needs for courts. This Task Force process offers to keep the input public and time is available given the CZM discussion in the Legislature and the National Ocean Council activities, although there is not a luxury of time. Representative Joule concluded by thanking the members and the attendees in the hearing.

The hearing adjourned at 2:15 (check time).

Johny Ailken testimony from BOEMRE hearing in Anchorage, as he noted this is same presentation presented to the Northern Waters Task Force

http://www.boemre.gov/forums/documents/AnchorageTranscript26Aug10.pdf

Page 89
MR. AIKEN: Good morning, everyone. First
of all, I would like to thank Director Bromwich and the
Bureau of Ocean Energy Management, Regulation and
Enforcement for holding this forum and to give us a chance
to speak on how we feel about offshore activities in the
Arctic.
My name is Johnny Aiken, and I am the
executive director of the Alaska Eskimo Whaling Commission.
I am from Barrow, Alaska and was born and raised there and
have been whaling with my father for over 40 years.
AWC has 11 whaling villages, and my
presentation is focused on whaling and our environment. I
do not want to take too much of your time, so I will make
my presentation as brief as possible. I have a lot of
pictures, and I think that looking at pictures tells a
better story than words can say. So I just wanted to give
you an idea of our environment and the culture we enjoy as
a result of what our environment has to offer us as a people.
Page 90
This is a photograph of Harry Brower's
whaling crew and a whale he harvested not very long ago.
As most of you know, Harry Brower is the chairman of the
Alaska Eskimo Whaling Commission and was not able to be
here because of his busy schedule.
This is a slide that shows where the whales
are in different times of the year. The yellow low is
where the whales are in the wintertime. According to the
tagged whales, we have learned that the yellow is the area
where the whales winter every year. The green is showing
you that during -- the green is during the spring when the
whales start migrating north towards Canada, and that is
when our spring whaling begins.
For Barrow, our whaling activities begin in
mid to late April. I think the migration starts as early
as January or February. The pink is where the whales
summer in Canada. And the brown is where the whales start
migrating south in the fall.
This slide shows the areas where seismic
leasing and drilling are to occur in the Chukchi Sea and
the Beaufort Sea should this program be opened.
Here is where Shell's Beaufort Sea campaign
is -- here is where Shell's Beaufort Sea campaign is to
drill the Sivulliq project in the near future if allowed.
Page 91
I lost it, sorry. This slide shows where a lot of whale
sighting occurred during 1979 and 2005 -- between 1975 and
2005. All the dates are whale sightings -- all the dots
are whale sightings, I'm sorry. The yellow is the
Kaktovik's bowhead use area, and people in Nuiqsut use
area. The red lines indicate Nuiqsut's whaling GPS

tracking where they hunt, the red lines there inside all those dots.
This slide shows where Sivulliq is going to be located in the brown circles. And the gray indicate where deflection -- whale deflection distances from the center. The center being the Sivulliq project. Each circle represents a distance, and the distances are 6, 9, 15 and 19 miles. Those lines depict the use areas for Nuiqsut. As you can see, Sivulliq is right in the path of the migrating whales in the fall.
On this slide our lines, which -- depict the tagged whales and the lease areas. This is in the fall. As you can see, many whales migrate through the lease area. Work in the Arctic will mean work in heavy ice, and we are concerned that there may not be technology to be working in the ice-infested waters. Ice is -- it can be a very strong -- it's something that you've got to be real careful with, and it's not going to be easy to work in the ice should a spill occur.

Page 92

This slide here shows typical ice structures in the winter. We have a lot of pressure ridges nearshore which tells us how powerful moving ice can be. As you can see, some of these pressure ridges can be pretty huge. For our whaling crews, a lot of work is involved in building trails to the open lead. Every year crews go out and build a trail to the open lead. Sometimes it can take weeks to get to the lead. We cannot use any heavy equipment. All the work is done by hand, labor, ice picks, and using heavy equipment may be too dangerous.
Our ocean, the Arctic Ocean, has many animals and fish, with the most important being the whale. The whales travel through any kind of ice conditions, whether it be closed or open. Many have calves either in the spring or the fall migration. We know whales can live under the ice when there is no water to be seen. We have seen air holes, such as this, even in three to four feet of thick ice. If oil is under the ice, the whales are sure to be there.
And this is a picture of a whale breathe through the ice. Should an oil spill occur, many animals will be impacted, probably much more than what happened in the Gulf. Since ice has receded in recent years because of global warming, hundreds of walrus have been found on beaches along the Arctic coast. I believe this photograph

Page 93

is located between Point Lay and Point Hope. Polar bears are a concern, too. I can't imagine a polar bear tarred with oil. I don't think it would ever survive if it had oil on its coat in the wintertime.
In the Arctic, we have our share of storms. Along with the storms comes erosion of our coastline. Here we see the same area before the storm. These are the same houses. In August of 2000 we had one of our biggest storms. The worst storms we had were in 1963 when we saw houses and fuel tanks floating along the coast. In October

2006, we had bad storms also. Some of these storms destroyed erosion control structures. This is in Wainwright. Almost straight offshore are the lease areas. This is a slide on the Liberty Project, and the reason I wanted to show this is because we need to find better technology if we're going to develop offshore oil and gas. Right now I believe that we are not ready to develop offshore oil and gas in the Arctic where it will be much harder to respond to an oil spill. The oil industry had a hard enough time in the -- in their response in the Gulf spill where there was no ice, where temperatures and weather were not an issue. It's extremely cold in the Arctic, and I can't imagine having to respond to a spill where there is ice and where it gets too cold for equipment. We need to wait until there is technology which is capable of responding to oil spills in the Arctic.

Thank you, Commissioner.

Policy Brief Envisions Better Schools on Lower Budgets

Colorado's second straight year of inevitable cuts in state aid to education can become an opportunity to improve learning performance while shedding needless costs, according to a policy brief from the Centennial Institute, Colorado Christian University's think tank. The paper is online here.

"Much Better Schools on Much Lower Budgets: A Primer for Colorado Policymakers" draws on proven models for achieving more with less, from schools across the country and around the world. "Our state has massive cost inefficiencies and educational deficiencies within the structure of K-12 education, built up over decades and crying out for correction," says the author. Over $1 billion must be cut from projected spending in order to balance the 2011-2012 budget.

Students in neighboring Utah, the paper points out, significantly outperform Colorado students on the respected NAEP test, even though Utah's spending per pupil is only 61 cents on the dollar compared to Colorado's. Denver parochial schools succeed better with minority youngsters than nearby public schools, at just 55 cents on the dollar. Looking abroad, we see education systems from Canada to Korea to Germany far exceeding the United States in academic achievement at 30% lower cost.

The paper is organized in Q&A format around 20 concise topics, starting with "Admit: The US trails woefully in global rankings," running through "See why the teaching profession has faltered" and "Realize school funding is bloated, not starved," and concluding with recommendations to "Legislate boldly in 2011."

William J. Moloney, former Colorado Education Commissioner with a lifetime of school experience in a half-dozen other states and countries, authored the policy brief in consultation with a panel of educators, legislators, and budget experts. "It is in our power to fix what is broken; all that's needed is the political will," Moloney writes in the introduction. "There will never be a more opportune moment to break out of the old paradigm."

He calls on the General Assembly to reinterpret Amendment 23's factor formulas in line with budget realities; offer local school districts a timeout from costly mandates, accreditation, and testing; allow schools to outsource many functions; encourage charters, vouchers, and tax credits; and defuse PERA's "pension time bomb."

John Andrews, director of the Centennial Institute, says in an editor's note that when Moloney warned some weeks ago about Colorado public education becoming one of several "metastasizing entitlements that have reached a point of absolute unsustainability," defenders of the education status quo replied in print with emotion, not logic. They deemed the former commissioner's analysis "offensive to educators" -- without attempting to refute it factually. (Denver Post, Oct. 3 and Oct. 14, 2010.)

In releasing the policy brief today, Andrews commented: "Centennial Institute and Bill Moloney will be working actively with legislators of both parties to help translate this new paradigm into budgetary solutions. With or without cooperation from teacher unions and the education lobby, the state's dire fiscal condition is forcing policymakers to think way outside the box -- and that's good news for ill-served Colorado schoolchildren." Read the Policy Brief

North Slope Borough
Arctic Offshore Oil and Gas Development Policy Positions

Summary

Baseline Science

Provide funding for scientific research to gather adequate baseline data prior to new offshore activity. Support a collaborative approach to research and data sharing, such as the North Slope Science Initiative (NSSI). Tie specific research requirements to industrial activity.

Stricter Regulation

Require OCS production to use pipelines to shore-based facilities rather than tanker transportation. Require MMS to apply regulations and stipulations more vigorously. Improve standards in the leasing process. Require negotiation of CAAs with NSB for other marine mammals species.

Cumulative Impacts

Require detailed discussion of area-wide cumulative impacts in EIS/EA documents, including socio-cultural impacts. Stipulate limits on the number of projects allowed in an area at one time.

Revenue Sharing

Revenue sharing to offset impacts should be included in all phases of development, including pre-lease seismic and sampling work. Use the NPR-A model for early funding. Broaden acceptable uses for CIAP funds.

Discharge/Emissions

Require zero-volume discharge standards in arctic waters. Require reinjection of all cuttings, muds, produced waters and other byproducts of exploration and development. Write subsistence considerations into the Clean Water Act. Do not allow "disaggregation" as a strategy to avoid obtaining a Clean Air Act PSD permit.

Oil Spill Prevention and Response

Spill prevention and response are twin concerns in the OCS. Spill prevention efforts should be viewed as an investment that pays dividends in avoiding the costs of a spill. Best available technology related to undersea pipelines is an example of a worthy spill prevention investment. Spill response should be anchored in provable cleanup technologies, and real-world demonstrations of cleanup capabilities should be required before activity begins.

Coast Guard Presence

Offshore development and increasing vessel traffic point to the need for an effective U.S. Coast Guard presence. Congress should fund a year-round Coast Guard station with oceangoing and airborne response capabilities.

Compulsory Marine Pilotage

Add a provision in federal law that requires state-licensed Alaska marine pilots on qualified vessels in the Beaufort or Chukchi Seas.

North Slope Borough
Arctic Offshore Oil and Gas Development Policy Positions

Baseline Science

Provide funding for scientific research to gather adequate baseline data prior to new offshore activity. Support a collaborative approach to research and data sharing, such as the North Slope Science Initiative (NSSI). Tie specific research requirements to industrial activity.

Evaluation of impacts from oil and gas development has to start with an understanding of conditions prior to new activity. This understanding comes from a robust data set that should be gathered in anticipation of development. Baseline science is crucial to any assessment of change over time from natural and industrial causes. Mitigation measures are evaluated against this baseline data and best practices are established over time with its confirmation.

The federal government should enable baseline science before activity commences and should commit to collaborative research, data sharing and analysis through an organization such as NSSI, which brings together scientists from federal, state and local agencies, as well as industry and other organizations for just this type of collaboration.

Pre-leasing activities should mirror the approach that BLM has taken in NPR-A with its pre-activity study program. The needs are even greater offshore because the risks are greater. NEPA requires that MMS determine what effect any development scenario will have on the environment. Without adequate baseline science, such a determination is suspect and can be easily challenged.

Areas of incomplete baseline data include:

1. Air quality
2. Water quality
3. Marine mammal migration and habitat
4. Subsistence impacts
5. Health impacts.

The Borough is by no means alone in recognizing large data gaps in Arctic Ocean science. In its most recent multi-sale Draft EIS for the Beaufort and Chukchi Seas, MMS identified numerous areas in which data is insufficient. We look forward to working with the federal government in pursuit of increased research and better understanding of offshore areas.

North Slope Borough
Arctic Offshore Oil and Gas Development Policy Positions

Stricter Regulation of OCS Operations

Require MMS to apply regulations and stipulations more vigorously. Require OCS production to use pipelines to shore-based facilities rather than tanker transportation. Improve standards in the leasing process. Require negotiation of CAAs with NSB for other marine mammals species.

Alaskans and NSB residents have a lot to gain from new oil and gas development – especially the infrastructure associated with long-term jobs, maximized use of TAPS, and a healthy tax base. OCS development could add substantially to the North Slope's infrastructure, or it could bypass it entirely. It all depends on how the resources are transported to market. If they are piped to shore-based facilities and fed into existing or planned pipelines, then Alaskans can reap their fair share of economic stimulus from development in adjacent waters – even without federal revenue sharing.

However, there is no inherent barrier to producing oil from self-contained rigs and transporting the product by tanker to distant markets. Nor does any law or lease sale stipulation prevent oil companies from choosing that approach if it is in their economic interest. This must be resolved prior to development.

In the past decade, MMS has been increasingly lax in its interpretation of laws and enforcement of regulations as the nation's overseer of planning and operations for offshore development. Environmental concerns have been routinely ignored and impact assessments conducted with little vigor. In fact, the litigation that halted Shell's exploration plan was rooted in MMS' decision to substitute an EA for a full EIS, which requires little or no public input. Another example is the elimination of "Stipulation 5" from the pending draft EIS for arctic lease sales. This stipulation establishes a consultation process aimed at avoiding conflict between industry operations and subsistence activities.

The Conflict Avoidance Agreement (CAA) process has played a valuable role in bringing together developers and subsistence bowhead whaling communities to ensure that company operations do not compromise traditional subsistence whaling activities. This model should be extended to include other marine mammal species on which the Inupiat depend for nutritional and cultural survival. NSB should represent local concerns in CAA negotiations regarding these other species.

MMS planning, review and oversight of leasing processes need a thorough overhaul so as to honor the intent of existing laws and regulations. A guiding principle in this effort should be that MMS lease agreements must, at a minimum, meet or exceed standards set forth in the MMPA.

North Slope Borough
Arctic Offshore Oil and Gas Development Policy Positions

Cumulative Impacts

Require detailed discussion of area-wide cumulative impacts in EIS/EA documents, including socio-cultural impacts. Stipulate limits on the number of projects allowed in an area at one time.

Each discreet development activity has specific effects on air and water quality, marine life, habitat, and nearby communities. In combination with other projects or activities, an individual project can have unanticipated additional impacts. Cumulative effects can be significant, not only in areas of intensive development, but also where there is gradual expansion or infill.

Dramatically increasing impacts from climate change add a new dimension to any discussion of cumulative impacts and should be factored into the cumulative impacts review process. No single entity has the responsibility for comprehensive planning for oil and gas development in arctic waters and coastal areas.

The process for cumulative effects analysis and management is hampered by the absence of a coordinated review of planned industrial activities by all permitting agencies. A global, coordinated analysis should be required in the EIS/EA process. This analysis should consider limiting the number of projects in the region.

Cumulative impacts studies should include an overall analysis of the arctic region as a whole, including analysis of the Beaufort and Chukchi Seas.

Because of the sudden and significant level of impacts due to climate change in the Arctic, development should be phased gradually to allow for adequate study of the combined environmental effects.

Impacts to the health, social structure and culture of communities should also be subjected to substantial analysis.

North Slope Borough
Arctic Offshore Oil and Gas Development Policies

OCS Revenue Sharing

Revenue sharing to offset impacts should be included in all phases of development, including pre-lease seismic and sampling work. Use the NPR-A model for early funding. Broaden acceptable uses for CIAP funds.

Beyond three miles, the OCS is controlled by the federal government. State and local governments have very little input in decisions. Local communities bear all the direct risks of offshore development – environmental, social, cultural and economic – yet they receive very little in exchange. This is deeply disconcerting to us, because it suggests that the federal government either doesn't place much value on our ancestral connection to the ocean, or it doesn't recognize the risks to our most important subsistence food supply. The ocean is the cradle of our culture. It is where we most need to have a voice, yet we have almost none.

The Federal Government has a long established policy of sharing revenues from mineral leases with state and local governments. Any new revenue sharing program should be based on existing programs that acknowledge impacts and risks to local communities. A federal OCS program could provide direct payments to municipalities, as in the Gulf of Mexico Energy Security Act of 2006. If funds are not distributed directly to local governments, the NPR-A Impact Aid program offers another model, although it has been susceptible to state legislative interference in the disbursement of funds. The program could be improved if proof of impact by coastal communities were established in federal law and not required as a component of funding in the state appropriation process.

The authorized uses of revenue sharing funds should be as broad as those defined in the NPR-A Impact Aid program, but not restricted to particular issues like the Coastal Impact Aid Program (CIAP).

Any revenue sharing program should acknowledge that impacts begin before lease sales occur and extend beyond completion of the development project.

North Slope Borough
Arctic Offshore Oil and Gas Development Policy Positions

Discharge and Emissions

Require zero-volume discharge standards in arctic waters. Require reinjection of all cuttings, muds, produced waters and other byproducts of exploration and development. Write subsistence considerations into the Clean Water Act. Do not allow "disaggregation" as a strategy to avoid obtaining a Clean Air Act PSD (Prevention of Significant Deterioration) permit.

Discharge

The use of world-class technologies in arctic waters should be accompanied by world-class environmental standards. Zero-volume discharge is required in the northern region of the Barents Sea and in state waters of the Beaufort Sea, where it has proved to be both technically feasible and cost effective. Technological options that could satisfy the zero volume discharge requirement include use of a separate injection well, backside injection of an exploration well, or barging to shore, as is done in state waters.

The zero volume discharge requirement should also apply to sanitary waste, gray water and ballast water, as these will pollute the sea where our residents hunt for food. Traditional knowledge among subsistence whalers indicates that no amount of sanitary waste should be dumped in the ocean, as any type of human scent causes deflection of the whale migration. The Clean Water Act should be amended to protect subsistence activities by requiring zero volume discharge in all exploration and production activities.

The Borough is actively engaged in analysis of discharge options through a panel of its Scientific Advisory Committee, which is working with agencies and industry to identify preferred discharge policies.

Emissions

OCS operators are currently able to avoid the use of best available air pollution control technology in many cases. This is accomplished through a strategy of "disaggregation," in which companies artificially divide their operations into "separate" pollution sources so as to stay below the threshold that triggers a technical review aimed at determining the best pollution control technology. Disaggregation should not be allowed. All emissions associated with a company operation should be considered under a single Clean Air Act permit. This is the best way to assure that the best available technology is required under appropriate circumstances.

North Slope Borough
Arctic Offshore Oil and Gas Development Policy Positions

Oil Spill Prevention and Response

Spill prevention and response are twin concerns in the OCS. Spill prevention efforts should be viewed as an investment that pays dividends in avoiding the costs of a spill. Best available technology related to undersea pipelines is an example of a worthy spill prevention investment. Spill response should be anchored in provable cleanup technologies, and real-world demonstrations of cleanup capabilities should be required before activity begins.

Spill *prevention* must have the greatest emphasis in arctic waters. It can save industry from having to deal with spill response, which is likely to achieve only partial success in remote, icebound waters of the Arctic Ocean. Spill prevention includes three actions covered in the following pages: stricter regulation of OCS operations, compulsory marine pilotage with independent reporting duties, and a significant Coast Guard presence in the Arctic Ocean.

Spill prevention measures must also be built into undersea pipelines, including corrosion prevention systems, corrosion monitoring systems and leak detection systems. Recent experience in the Prudhoe Bay field demonstrates the need for these measures.

Adequate spill *response* should include a demonstration of industry's ability to retrieve spilled oil in broken or refreezing ice conditions during the transitional periods of spring and autumn. Purposely spilling a small amount of oil in representative conditions is worth the risk of minor contamination in order to prove the true extent of industry's spill response readiness. Allowing OCS development without such a demonstration means we are accepting substantial risk on the basis of a wish and a promise. As national policy, this is fundamentally irresponsible. A phased approach to a real-world demonstration could start with a laboratory prototype as a first step.

Spill response equipment should conform to "best available technology" standards.

The Borough's Scientific Advisory Committee is completing its final report on spill prevention and response.

North Slope Borough
Arctic Offshore Oil and Gas Development Policy Positions

Coast Guard Presence

Offshore development and increasing vessel traffic point to the need for an effective U.S. Coast Guard presence. Congress should fund a year-round Coast Guard station with oceangoing and airborne response capabilities.

Effective oil spill prevention and response in the Arctic Ocean are predicated on active monitoring of vessel traffic and swift emergency response capability in times of crisis. The U.S. Coast Guard plays a primary role in these activities in other coastal oil provinces, and extreme arctic conditions justify an important role for the Coast Guard in the Beaufort and Chukchi Seas.

Increased needs for navigation aid placement, vessel traffic management, ship compliance inspections, security considerations and emergency response capability clearly suggest that enhanced federal safety infrastructure and maritime resources need to be committed to this region. These needs include an expansion of the Marine Exchange with real-time data sharing that includes the NSB, the Barrow Arctic Science Consortium (BASC) and AEWC.

As sea ice continues to recede and make way for greater vessel access, international maritime shipping, tourism and commercial fishing may also add to marine traffic and increase the need for an expanded U.S. presence in arctic waters.

North Slope Borough
Arctic Offshore Oil and Gas Development Policy Positions

Compulsory Marine Pilotage

Add a provision in federal law that requires state-licensed Alaska marine pilots on qualified vessels in the Beaufort or Chukchi Seas.

Vessel traffic is increasing in the highly sensitive marine environment of the Chukchi and Beaufort Seas as oil companies show unprecedented interest in offshore prospects and shippers eye the rapidly receding ice pack with visions of an arctic shipping route. This intensifying interest in commercial uses of the Arctic Ocean causes North Slope residents grave concerns about the risk of oil spills and other industrial accidents. Among the most promising ways to minimize shipping accidents in the Beaufort or Chukchi Seas is to require the use of state-licensed marine pilots on all "qualified vessels" entering these waters. Federal regulations already allow the state to declare compulsory marine pilotage in federal waters. The Borough would like to see this state primacy codified in federal law.

Currently, the Arctic has state-licensed pilotage only in the nearshore state waters. Beyond the three-mile limit, there is only a voluntary system for ships that may be associated with oil and gas exploration, seismic testing, maritime shipping, tourism or any other commercial interest. This gives little comfort to North Slope residents, since almost all the industrial activity proposed for arctic waters would occur outside the current compulsory pilotage areas. Expanded compulsory pilotage is an important first step toward policies that will protect Alaska's arctic waters and preserve the traditional way of life for the whaling culture of the North Slope.

The State of Alaska recently issued a notice of a proposed regulatory change to extend compulsory state pilotage beyond three miles in the Chukchi and Beaufort Seas. This proposal faces strong resistance from industry. The NSB believes that licensed marine pilots with Alaskan experience will increase safety through their extensive knowledge of local conditions. They are clearly best suited to the task of navigating Beaufort and Chukchi waters. This precautionary approach will help to reduce the risk of accidents, and the use of marine pilots who independently report to the state will help to decrease residents' anxiety over increased offshore activity.

Compulsory marine pilotage is required in all other Alaskan waters. Surely the waters of the Arctic are just as precious.

Arctic Deep Water Sea Port Act of 2009 (Introduced in Senate)

S 2849 IS

111th CONGRESS

1st Session

S. 2849

To require a study and report on the feasibility and potential of establishing a deep water sea port in the Arctic to protect and advance strategic United States interests within the evolving and ever more important region.

IN THE SENATE OF THE UNITED STATES

December 8, 2009

Ms. MURKOWSKI introduced the following bill; which was read twice and referred to the Committee on Armed Services

A BILL

To require a study and report on the feasibility and potential of establishing a deep water sea port in the Arctic to protect and advance strategic United States interests within the evolving and ever more important region.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

SECTION 1. SHORT TITLE.

This Act may be cited as the `Arctic Deep Water Sea Port Act of 2009'.

SEC. 2. REPORT ON ESTABLISHMENT OF ARCTIC DEEP WATER PORT.

(a) Study-

(1) IN GENERAL- The Secretary of Defense, in consultation with the Secretary of Homeland Security, shall conduct a study on the feasibility and potential of establishing a deep water sea port in the Arctic to protect and advance strategic United States interests within the evolving and ever more important Arctic region.

(2) SCOPE- The study required under paragraph (1) shall address the following issues:

(A) The capability that such a port would provide.

(B) Potential and optimum locations for such a port.

(C) Resources needed to establish such a port.

(D) The time frame needed to establish such a port.

(E) The infrastructure required to support such a port, including Command, Control, Communications, Computers, Intelligence, Surveillance and Reconnaissance (C4ISR) facilities, health care facilities, barracks and housing, airfield and pier support, and operations facilities.

(F) Any other issues the Secretary determines necessary to complete the study.

(b) Report- Not later than two years after the date of the enactment of this Act, the Secretary of Defense shall submit to the Committees on Armed Services and Appropriations of the Senate and the House of Representatives a report on the findings of the study conducted under subsection (a).

News

Melting ice could mean new riches

Jill Burke
Mar 1, 2010

"It's not a question of if but when."

That's what Mead Treadwell, chairman of the U.S. Arctic Research Commission, told a New York City crowd Monday about the prospect of a booming northwest passage.

Treadwell made the remarks during a moderated panel discussion, "Will the Bering Strait become the Panama Canal of the North?" hosted by the Council on Foreign Relations at Alaska House New York. (Alaska House is a nonprofit organization founded by Alaska Dispatch publisher Alice Rogoff to promote education about Alaska and its Native culture and foster economic development within the state.)

The day's discussion, which pulled together Alaska's congressional delegates, regional leaders and industry representatives, centered on the sense of urgency seemingly missing both in the state and nationwide for developing the infrastructure -- like deep water ports and international rules -- that will be needed to tap into a new hustling, bustling Bering Strait.

Two of the world's largest mining operations are above the Arctic Circle, including the Red Dog zinc mine in Alaska off the coast of Kivalina, according to Treadwell -- and the Arctic is poised to deliver even more resources. Minerals, fishing, oil and gas, exploration and science, and tourism all have northern footholds. Capturing opportunities related to those activities with the prospect of shorter shipping routes as ice recedes is something Americans need to be thinking about now, Treadwell said.

The challenge is building the infrastructure. Deep water ports are needed to accommodate large container ships and provide an anchor for the military presence that will need to increase to keep pace with a rise in offshore activity near the United States' northern coast.

Participants, including Rogoff, suggested that developing port infrastructure for Alaska's western coast, from Adak to Barrow, could be an economic boom as important to the state as the trans-Alaska oil pipeline, particularly when even a handful of new port jobs has the potential to pull villages teetering on the brink of economic failure into sustainability.

Alaska Sens. Lisa Murkowski, a Republican, and Mark Begich, a Democrat, attended the event and told participants they are aware of the critical role Alaska is poised to play in a changing Arctic environment. Murkowski is pushing for a Department of Defense and Homeland Security feasibility study for a deep water port off Alaska's shores.

"This study will determine whether it is in the strategic interest of the United States, as I believe it is, to build a port and where it might be located. A deep water port would not only serve our military and Coast Guard needs, but as we develop our offshore oil and gas reserves and see more shipping, tourism and vessel traffic in the Arctic, a deep water port could provide valuable support," Murkowski said.

A full transcript of the day's discussion will be posted online at the Council on Foreign Relations' Web site.

Subject: Northern Waters Commission

Mike,

Here's an outline of what I suggested re Northern Waters.

The waters north and northwest of Alaska have strategic importance for at least these reasons:

1. Protection of routes of ocean transit.
2. Mineral and other resource rights, sub-surface and on-shore.
3. Territorial rights and claims by foreign governments.
4. Rights and welfare of local inhabitants.

I was very happy to hear that the Governor and you are already paying attention to the subject. I have also discussed this subject with Alan Austerman, Alice Rogoff, Mead Treadwell and Bob Walsh, whom I am copying.

The interests listed above are shared by the Federal government and the State of Alaska. As of now, there is no organized Federal-State mechanism for handling these matters. It is logical that there should be, and here is a suggestion on how to do it.

Suggestion.

1. Use the very successful Fishery Management Council model, on which Federal and State appointees sit.
2. Feds and State agree to form a Northern Waters Commission (working title).
3. Suggested Federal membership:
   a. State Department
   b. Homeland Security, specifically the US Coast Guard
   c. Defense Department, specifically the US Navy and Alaska Command
   d. Department of Energy
   e. US Arctic Research Commission
4. Suggested State membership:
   a. Two at-large members appointed by the Governor
   b. One local government appointee, rotating, appointed by the Governor
   c. DMVA
   d. DCCED
   e. DNR

As we concluded last night, more discussion on this concept is warranted. You suggested sometime the week of January 11 (??), when you would be in Anchorage. You name it. Let's coordinate a day/time and include others who have an interest in the subject and who could be helpful at this early stage.

Happy New Year to all,
Bill Noll

ALASKA STATE LEGISLATURE

SENATOR DONALD C. OLSON

ALASKA
STATE CAPITOL
ROOM 514
JUNEAU, ALASKA 99801-1182

(907) 465-3707
FAX (907) 465-4821

February 8, 2010

Dear Honorable Governor Parnell,

Given the great potential for finding and developing new energy resources in Alaska's offshore waters of the Arctic Ocean, we believe it would be prudent for this state to implement compulsory marine pilotage (CMP) within these areas. Please allow us to explain.

Having worked with the members of Alaska Marine Pilots over the years we have learned about the importance of state pilotage and the level of protection and independent oversight it brings to commercial shipping operations throughout the state. In our collective opinion, having marine pilots serving aboard commercial vessels that will operate in the Arctic will greatly reduce the risks associated with offshore oil and gas exploration and development. With this in mind we support the current proposed regulation by the Board of Marine Pilots that seeks to expand the State of Alaska's compulsory pilotage waters.

Compulsory marine pilotage is currently limited, by administrative rule, to waters within three-miles of the coast of Alaska. In general a state has considerable authority to regulate the waters off its coast, even beyond this traditional three-mile boundary. In fact, courts in other jurisdictions have allowed states to assert their pilotage regulations as far as 50 miles offshore, and beyond. The main consideration in these cases has been the courts' consideration of local needs and conditions. As Alaska addresses the development in the arctic that is on the horizon, we feel that it must keep in mind the intimate connection that many of the state's residents have with the Beaufort and Chukchi Seas. While the extension of CMP to cover the vast area that will see economic development is admittedly unprecedented, so is the development of this fragile and important marine environment.

Protection of life, property and the marine environment must go hand in hand with any future development in our offshore waters. To that end we respectfully ask that your administration give its full support to the expansion of CMP in the Arctic.

Thank you,

Senators;

Donald Olsen

Lyman Hoffman

Representatives;

Reggie Joule

Neal Foster

Bryce Edgmon

Subject: Fwd: Northern Waters Commission
Attachments: Northern Waters Commission

Below should be the original email I sent to Mike Nizich and others. There is just the concept and an initial outline of possible members.

I sent an email to Alice Rogoff, her staff and the folks at Center on Foreign Relations asking if teleconferencing is available for the March 1st event in New York. No response yet, but I'm sure we'll get an answer.

Thanks for your interest. I'd like to stay in contact with you on this subject. There is plenty of activity from the Federal side, including interest from Senator Murkowski and Congressman Young.

I mentioned this "commission" concept to Dave Benton (Marine Conservation Alliance) while in Juneau. He got the concept right away, especially the parallels with the establishment of the Fishery Management Councils to cope with policy and management issues of such magnitude. He wants to help/be involved as this idea moves ahead.

It was good to see you and Ginny in Juneau.

Best regards,
Bill
PS: Didn't know that Cliff Stone was a Vietnam vet. US Navy in Danang. We're going to compare notes next time I'm there. Bob Walsh was also US Navy in Vietnam.

Subject: Northern Waters Commission

Mike,

Here's an outline of what I suggested re Northern Waters.

The waters north and northwest of Alaska have strategic importance for at least these reasons:

1. Protection of routes of ocean transit.
2. Mineral and other resource rights, sub-surface and on-shore.
3. Territorial rights and claims by foreign governments.
4. Rights and welfare of local inhabitants.

I was very happy to hear that the Governor and you are already paying attention to the subject. I have also discussed this subject with Alan Austerman, Alice Rogoff, Mead Treadwell and Bob Walsh, whom I am copying.

Hello Alan,

This is to convey the email I sent to Chad Padgett for Congressman Young on the subject of the Northern Waters Commission. It is only a little expanded from the version I sent you before. Do you have interest in drafting anything for consideration for the Legislature? If so, would you like any assistance?

And lastly, would you have any interest in having me do a report for the Legislature on the current status of things at the Federal and local level? I am attending the March 1st sessions in NY, and I hear that you will be listening in. I hear that Rep. Gatto will attend. My report could summarize all actions up to date, provide current Federal reports, and report the presentations and comments from the two March 1st meetings.

My interest is high, and my rates are reasonable.

Best regards,
Bill Noll

Subject: Northern Waters commission

Chad,

Here's an outline of what I have recently sent to a few people regarding a commission that I have dubbed the "Northern Waters Commission." I realize that Congressman Young and Senator Murkowski have done work on this subject, submitting bills at the Federal level, but the State has not done much yet.

I view the situation in Northern Waters as follows.

The waters north and northwest of Alaska have strategic importance for at least these reasons:

1. Protection of routes of ocean transit.
2. Mineral and other resource rights, sub-surface and on-shore.
3. Territorial rights and claims by foreign governments.
4. Rights and welfare of local inhabitants.

The interests listed above are shared by the Federal government and the State of Alaska. Yet, as of now, there is no organized Federal-State mechanism for handling or even discussing these matters. I am apprehensive that a local ad hoc oversight group might spring up in Alaska, which is not what is needed right now, and, in fact, might be disruptive. (Is this perhaps the gist of what Sen. Begich is suggesting?)

There is another approach that is time-proven and very successful. Here is a suggestion on how to do it.

Suggestion.

1. Use the very successful Fishery Management Council model, on which Federal and State appointees sit.
2. Feds and State agree to form a Northern Waters Commission (working title).
3. Suggested Federal membership:
   a. State Department
   b. Homeland Security, specifically the US Coast Guard
   c. Defense Department, specifically the US Navy and Alaska Command
   d. Department of Energy
   e. US Arctic Research Commission
   f. USDOT.
4. Suggested State membership:
   a. Two at-large members appointed by the Governor
   b. One local government appointee, rotating, appointed by the Governor
   c. DMVA
   d. DCCED
   e. DNR

The Northern Waters Commission would be the forum in which to discuss policy issues, such as those listed above. Procedures for action would be established in its by-laws. Regular meetings would be held, just as with the Fishery Management Council, in a balanced atmosphere, with solid advice and input from a variety of sources.....again, like we have done so successfully on the North Pacific Fishery Management Council.

I have discussed this subject with Mike Nizich, Rep. Alan Austerman, Alice Rogoff, Mead Treadwell, Dave Benton and Bob Walsh. No actions have been undertaken as yet, but all have shown great interest. I am going to attend a March 1st meeting in New York where Senators Murkowski and Begich will address the Council on Foreign Relations. Karen Knudsen has committed an appointment for me at that time to brief Senator Murkowski on the Northern Waters Commission concept.

I also request the opportunity to talk with you about this concept, as well as Congressman Young, hopefully while he is here. I am available at your convenience.

Best regards,
Bill Noll

Arctic Marine Shipping Assessment Implementation Act of 2009 (Introduced in Senate)

S 1561 IS

111th CONGRESS

1st Session

S. 1561

To ensure safe, secure, and reliable marine shipping in the Arctic, including the availability of aids to navigation, vessel escorts, oil spill response capability, and maritime search and rescue in the Arctic, and for other purposes.

IN THE SENATE OF THE UNITED STATES

August 3, 2009

Mr. BEGICH introduced the following bill; which was read twice and referred to the Committee on Commerce, Science, and Transportation

A BILL

To ensure safe, secure, and reliable marine shipping in the Arctic, including the availability of aids to navigation, vessel escorts, oil spill response capability, and maritime search and rescue in the Arctic, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

SECTION 1. SHORT TITLE.

This Act may be cited as the `Arctic Marine Shipping Assessment Implementation Act of 2009'.

SEC. 2. FINDINGS.

Congress finds the following:

(1) The United States is an Arctic nation with--

(A) an approximately 700-mile border with the Arctic Ocean;

(B) more than 100,000,000 acres of land above the Arctic Circle; and

(C) an even broader area defined as Arctic by temperature, which includes the Bering Sea and Aleutian Islands.

(2) The Arctic region of the United States--

(A) is home to an indigenous population which has subsisted for millennia on the abundance in marine mammals, fish, and wildlife, many of which are unique to the region;

(B) is known to the indigenous population as Inuvikput or the `place where we live'; and

(C) has produced more than 16,000,000,000 barrels of oil and, according to the United States Geological Survey, may hold an additional 30,000,000,000 barrels of oil and 220,000,000,000,000 cubic feet of natural gas, making the region of fundamental importance to the national interest of the United States.

(3) Temperatures in the United States Arctic region have warmed by 3 to 4 degrees Celsius over the past half-century, a rate of increase that is twice the global average.

(4) The Arctic ice pack is rapidly diminishing and thinning, and the National Oceanic and Atmospheric Administration estimates the Arctic Ocean may be ice free during summer months in as few as 30 years.

(5) Such changes to the Arctic region are having a significant impact on the indigenous people of the Arctic, their communities and ecosystems, as well as the marine mammals, fish, and wildlife upon which they depend.

(6) Such changes are opening new portions of the United States Arctic continental shelf to possible development for offshore oil and gas, commercial fishing, marine shipping, and tourism.

(7) It is in the interests of the United States to work with the State of Alaska and the United States neighbors in the Arctic region to ensure that shipping in the Arctic Ocean and adjacent seas is safe for mariners, protective of the natural environment, including the air, land, water, and wildlife of the Arctic, and mindful of the needs of longstanding subsistence users of Arctic resources.

(8) It is in the interests of the United States to ensure that shipping in the Arctic Ocean and adjacent seas is secure, that United States sovereign and security interests, including the freedom of navigation rights of United States and foreign vessels to transit international straits, are respected and protected, consistent with international and customary law, that access is provided throughout the Arctic Ocean for legitimate research vessels of all nations, and that peaceful relations are maintained in the Arctic region.

(9) It is in the interests of the United States to cooperate to establish a system of international cooperation to support reliable shipping, with methods for joint investment in providing mariners aids to navigation, ports of refuge, vessel-to-shore communication, weather and ice forecasting, ship tracking and reporting, hydrographic mapping, and search and rescue capability.

(10) The United States has continuing research, security, environmental, and commercial interests in the Arctic region that rely on the availability of polar class icebreakers of the Coast Guard that were commissioned in the 1970s and are in need of replacement.

(11) Sovereign interests of the United States in the Arctic Ocean and Bering Sea regions may grow with submission of a United States claim for an extended continental shelf, pending the United States becoming a party to the United Nations Convention on the Law of the Sea, done at Montego Bay December 10, 1982.

(12) Building new icebreakers, forward operating bases, aids to navigation, and other facilities, and establishing coordinated shipping regulations and oil spill prevention and response capability through international cooperation requires long lead times.

(13) Beginning such efforts, with the completion of an Arctic Marine Shipping Assessment by the 8-nation Arctic Council, is essential to protect United States interests given the extensive current use of the Arctic Ocean and adjacent seas by vessels of many nations.

SEC. 3. PURPOSE.

The purpose of this Act is to ensure safe, secure, and reliable maritime shipping in the Arctic, including the availability of aids to navigation, vessel escorts, spill response capability, and maritime search and rescue in the Arctic.

SEC. 4. DEFINITIONS.

In this Act, the term `Arctic' has the meaning given that term in section 112 of the Arctic Research and Policy Act of 1984 (15 U.S.C. 4111).

SEC. 5. SENSE OF CONGRESS ON INTERNATIONAL AGREEMENTS.

It is the sense of Congress that, to carry out the purpose of this Act, the Secretary of State, in consultation with the Secretary of Homeland Security, acting through the Commandant of the Coast Guard, should work to establish agreements to promote coordinated action among the United States, Russia, Canada, Iceland, Norway, and Denmark and other seafaring and Arctic nations with respect to--

(1) placement and maintenance of aids to navigation in waters of the Arctic;

(2) improved navigational charts;

(3) the monitoring of ocean conditions including wind, waves, and currents and the timely reporting of information about ice and weather conditions;

(4) appropriate icebreaking escort, tug, and salvage capabilities;

(5) oil spill prevention and response capability;

(6) maritime domain awareness, including long-range vessel tracking and communications facilities;

(7) search and rescue; and

(8) facilities for ship generated waste.

SEC. 6. COAST GUARD ARCTIC MISSION ANALYSIS.

(a) Submission of Report Analysis to Congress-

(1) REQUIREMENT FOR SUBMISSION- Not later than 90 days following the completion of the High Latitude Polar Ice-Breaking Mission Analysis Report, the Commandant of the Coast Guard shall submit to the appropriate committees of Congress--

(A) such report; and

(B) consistent with section 93(a)(24) of title 14, United States Code, any recommendations of the Commandant related to such report.

(2) APPROPRIATE COMMITTEES OF CONGRESS DEFINED- In this subsection, the term `appropriate committees of Congress' means the Committee on Commerce, Science, and Transportation of the Senate and the Committee on Transportation and Infrastructure of the House of Representatives.

(b) Mission Requirements Analysis-

(1) MISSION REQUIREMENTS ANALYSIS- Not later than 90 days after the date of the enactment of this Act, the Commandant of the Coast Guard shall, subject to the availability of appropriations, execute a contract with an independent entity to--

(A) conduct an analysis of future mission requirements of the Coast Guard in the Arctic and Antarctic; and

(B) estimate the necessary resources to provide for such requirements.

(2) SUBMISSION OF ANALYSIS AND ESTIMATE- Not later than 120 days after the date that the contract described in paragraph (1) is executed, the analysis and estimate described in subparagraph (A) and (B) of that paragraph shall be submitted to--

(A) the appropriate committees of Congress;

(B) the Commandant of the Coast Guard; and

(C) the Comptroller General of the United States.

(3) ADDITIONAL RECOMMENDATIONS- Not later than 90 days after the submission of the analysis and estimate described in paragraph (2)--

(A) the Commandant of the Coast Guard shall submit to the appropriate committees of Congress, consistent with section 93(a)(24) of title 14, United States Code, any recommendations of the Commandant related to such analysis and estimate; and

(B) the Comptroller General shall submit to the appropriate committees of Congress any recommendations of the Comptroller General related to such analysis and estimate.

(4) APPROPRIATE COMMITTEES OF CONGRESS DEFINED- In this subsection, the term `appropriate committees of Congress' means--

(A) the Committee on Commerce, Science, and Transportation and the Committee on Homeland Security and Governmental Affairs of the Senate; and

(B) the Committee on Homeland Security and the Committee on Transportation and Infrastructure of the House of Representatives.

SEC. 7. ARCTIC VESSEL TRAFFIC RISK ASSESSMENTS.

(a) In General- Pursuant to sections 4 and 5 of the Ports and Waterways Safety Act of 1972 (33 U.S.C. 1223 and 1224), the Commandant of the Coast Guard, in consultation with the appropriate Area Committee established under section 311(j)(4) of the Federal Water Pollution Control Act (33 U.S.C. 1321(j)(4)), shall prepare--

(1) not later than 2 years after the date of the enactment of this Act, a vessel traffic risk assessment for the Bering Strait, Alaska; and

(2) not later than 3 years after the date of the enactment of this Act, a vessel traffic risk assessment for the Arctic Ocean waters adjacent to Alaska's North Slope.

(b) Contents- A vessel traffic risk assessment, prepared pursuant to subsection (a), shall describe for the Bering Strait or the Arctic Ocean, as appropriate--

(1) the amount and character of present and estimated future shipping traffic in the region; and

(2) the current and projected use and effectiveness in reducing risk of--

(A) traffic separation schemes and routing measures;

(B) long-range vessel tracking systems developed under section 70115 of title 46, United States Code;

(C) towing, response, or escort tugs;

(D) vessel traffic services;

(E) emergency towing packages on vessels;

(F) increased spill response equipment including equipment appropriate for severe weather and sea conditions;

(G) the automatic identification system developed under section 70114 of title 46, United States Code;

(H) particularly sensitive sea areas, important ecological areas, areas to be avoided, and other traffic exclusion zones;

(I) aids to navigation;

(J) vessel response plans, facility response plans, any other response plans that the Secretary deems necessary; and

(K) area contingency plans and the effectiveness of the several response plans to support an area contingency plans.

(c) Recommendations-

(1) IN GENERAL- An assessment, prepared pursuant to this section, may include any appropriate recommendations to enhance the safety and security, or lessen potential adverse environmental impacts, of marine shipping.

(2) CONSULTATION- Prior to making any recommendation described in paragraph (1), the Commandant of the Coast Guard, acting through the appropriate Area Committee established under section 311(j)(4) of the Federal Water Pollution Control Act (33 U.S.C. 1321(j)(4)), shall consult with affected Federal, State, and local government agencies, representatives of the fishing industry, Alaska Natives from the region, the conservation community, and the merchant shipping and oil transportation industries.

SEC. 8. CENTRAL BERING SEA HARBOR OF REFUGE.

(a) Consultation and Determination- Not later than 1 year after the date of the enactment of this Act, the Commandant of the Coast Guard shall consult with the Secretary of the Army to determine the viability of and the improvements necessary to make the harbor at St. George Island, Alaska, a fully functional harbor of refuge throughout the year to enhance safety of life at sea and protection from oil pollution in the Central Bering Sea.

(b) Completion of Harbor- Not later than 3 years after the date of the enactment of this Act, the Secretary of the Army shall complete the harbor at St. George Island, Alaska, including the improvements determined under subsection (a) and any engineering design needed for safe navigation.

SEC. 9. REPORT ON ESTABLISHMENT OF ARCTIC DEEP WATER PORT.

(a) Study-

(1) IN GENERAL- The Commandant of the Coast Guard shall conduct a study on the feasibility and potential of establishing a deep water sea port in the Arctic to protect and advance strategic United States interests within the evolving and ever more important Arctic region.

(2) SCOPE- The study required under paragraph (1) shall address the following issues:

(A) The capability that such a port would provide.

(B) Potential and optimum locations for such a port.

(C) Resources needed to establish such a port.

(D) The time frame needed to establish such a port.

(E) The infrastructure required to support such a port.

(F) Any other issues the Secretary determines necessary to complete the study.

(b) Report- Not later than 1 year after the date of the enactment of this Act, the Secretary of Defense shall submit to the congressional defense committees a report on the findings of the study conducted under subsection (a).

SEC. 10. TRANSFER OF FUNDS FOR ICEBREAKING SERVICES.

Notwithstanding any other provision of law, the Director of the National Science Foundation shall transfer all amounts provided pursuant to any Act for the procurement of polar icebreaking services to the United States Coast Guard Appropriation Accounts, and such amounts shall remain available until expended for operating expenses, renovation, and improvement.

SEC. 11. AUTHORIZATION OF APPROPRIATIONS.

(a) In General- There are authorized to be appropriated to the Secretary of Homeland Security--

(1) $40,000,000 in fiscal year 2011 for the design of a new polar class icebreaker;

(2) $800,000,000 for each of fiscal years 2011 and 2012 for the construction of 2 polar capable icebreakers;

(3) $5,000,000 for each of fiscal years 2011 through 2015 for seasonal operations in the Arctic;

(4) $10,000,000 for each of fiscal years 2012 through 2015 to carry out any agreements referred to in section 5;

(5) $4,000,000, to remain available until expended, for a vessel traffic risk assessments to be conducted pursuant to section 7; and

(6) $100,000,000 in each of the fiscal years 2011 through 2013 for the construction of forward operating bases, including aircraft hangar, bunk and mess facilities in Barrow, Nome, and Saint Paul Island, Alaska.

(b) Hydrographic Services- Section 306 of the Hydrographic Services Improvement Act of 1998 (33 U.S.C. 892d) is amended by adding at the end the following new paragraphs:

`(7) To acquire hydrographic data, provide hydrographic services, and conduct coastal change analyses necessary to ensure safe navigation, and to improve the management of coastal change in the Arctic, $10,000,000 for each of fiscal years 2011 and 2012.

`(8) To acquire hydrographic data and provide hydrographic services in the Arctic necessary to delineate the United States extended continental shelf, $5,000,000 for each of fiscal years 2011 and 2012.'.

National Ocean Council

Overview

June is National Oceans Month. America's oceans, coastal, and Great Lakes regions support tens of millions of jobs and contribute trillions of dollars a year to our national economy. Our oceans, coasts, and Great Lakes are also a part of the American way of life; they are places of history and wonder and are places where our families go for fun, rest and restoration.

Last July, President Obama signed an Executive Order to ensure the continued health of these critical resources and established our Nation's first comprehensive *National Policy for the Stewardship of the Ocean, Our Coasts, and the Great Lakes* (National Ocean Policy). The National Ocean Policy sets priorities for Federal actions and strengthens our efforts to conserve, protect and sustainably manage our oceans by providing a structure that brings together State, local and tribal governments and the public and prioritizes efforts and resources to address the most critical issues facing our oceans. The Executive Order also established guiding principles for ocean management, and adopted a flexible framework for regionally based, collaborative spatial planning to address conservation, economic activity, competing uses, and sustainable use of the ocean, our coasts and the Great Lakes.

The Obama Administration remains committed to the conservation, protection and sustainable management of America's ocean and coastal resources so that they can continue to provide the many benefits to the nation. The Administration is working with stakeholders and the general public to find practical and effective solutions essential to ensuring the health of our oceans and addressing the needs and concerns of the American people. To this end, the National Ocean Council has released nine strategic action plan content outlines focused on key priorities to further the National Ocean Policy and address some of the most pressing challenges facing our ocean, coasts, and Great Lakes. The outlines are now available for a 30-day public comment period at www.whitehouse.gov/oceans.

Throughout June, the National Ocean Council will host 12 public listening sessions around the country. There are three main objectives for these listening sessions: 1) to hear about and discuss the actions and issues most important to Americans, 2) to use this knowledge to inform development of each of the nine strategic action plans, and 3) to offer a forum for the public to learn about the National Ocean Policy.

The National Ocean Policy

The National Ocean Policy provides a comprehensive approach, based on science and technology, to uphold our stewardship responsibilities and ensure accountability for management of our oceans and coasts to present and future generations. The National Ocean Policy significantly advances our capacity to maintain our ocean and coastal resources in the face of growing and often competing uses, including national security, shipping, energy production, and commercial fishing, as well as increasing pressure from pollution, resource extraction, and a changing climate. The National Ocean Policy will foster greater certainty and predictability for economic investments through sharing of environmental and ocean use data, improved management of cumulative impacts, and enhanced sustainability of the many uses in our oceans, coasts, and the Great Lakes.

Implementation of the National Ocean Policy is focused around nine priority objectives. The first four objectives, which together frame *How We Do Business*, are ways the Federal Government must operate to improve stewardship of the ocean, coasts, and Great Lakes. These four priority objectives are (1) ecosystem-based management, (2) coastal and marine spatial planning, (3) inform decisions and improve

understanding, and (4) coordinate and support. The remaining objectives identify five areas of special emphasis, each of which also represents a substantive area of importance to achieving the National Ocean Policy. These objectives are (1) resiliency and adaptation to climate change and ocean acidification, (2) regional ecosystem protection and restoration, (3) water quality and sustainable practices on land, (4) changing conditions in the Arctic, and (5) ocean, coastal, and Great Lakes observation, mapping, and infrastructure.

Strategic Action Plan Content Outlines

As part of President Obama's charge for Federal agencies to implement the National Ocean Policy, the National Ocean Council is responsible for developing strategic action plans for the nine priority objectives. Strategic action plans will identify specific and measurable near-term, mid-term, and long-term actions, with milestones, performance measures, and outcomes, to meet each of the nine priorities. Each plan will explicitly identify lead and participating agencies; gaps and needs in science and technology; potential resource requirements and efficiencies; and steps for integrating or coordinating current and out-year budgets. The plans will be adaptive to allow for modification and addition of new actions based on new information or changing conditions.

Under the direction of the National Ocean Council, experts from the Council's 27 Federal agencies and offices have drafted strategic action plans outlines with critical input from national, regional, and local stakeholders and the public. These outlines are an interim step toward developing the comprehensive strategic action plans called for by the President for each priority objective. They represent a starting point, leaving ample room for interested parties to help shape the targeted actions, outcomes, and milestones in the final plans.

Regional Public Listening Sessions

The National Ocean Council is hosting a series of 12 public Listening Sessions across the country to solicit input on the draft strategic action plan outlines. Representatives from some of the 27 Federal Agencies that comprise the National Ocean Council will be present at each listening session to describe the National Ocean Policy, take questions and hear the comments. The schedule of regional listening sessions is:

- **June 9,** 6:00-8:30 pm, Washington, DC, Women's Memorial at Arlington National Cemetery
- **June 9,** 4:00-9:00 pm, Barrow, AK, North Slope Borough Offices
- **June 10,** 4:00-9:00 pm, Anchorage, AK, Wilda Marston Theatre, Z. J. Loussac Library
- **June 13,** 1:00-5:00 pm, Chicago, IL, U.S. EPA Regional Headquarters
- **June 15,** 5:00-9:00 pm, Jacksonville, FL, University of North Florida
- **June 16,** 1:00-4:00 pm, Honolulu, HI, The Neal Blaisdell Center
- **June 27,** 11:30am-3:00 pm, Exeter, NH, Exeter High School
- **June 27,** 5:00-8:30 pm, Galveston, TX, Galveston Convention Center
- **June 27**, 8:30am-5:00 pm, Ocean Shores, WA, Quinault Beach Resort and Casino
- **June 30,** 1:00-5:00 pm, San Francisco Bay Area, CA, TBD
- **June 30,** 10:00am-5:00 pm, West Long Branch, NJ, Monmouth University
- **July 1,** Time TBD, Portland, OR, Portland State University

National Workshop on Coastal and Marine Spatial Planning

The National Ocean Council also will hold a National Coastal and Marine Spatial Planning (CMSP) Workshop in Washington, DC, on June 21-23. The Workshop will bring together Federal, state, tribal, and regional representatives to develop an understanding of the CMSP process, begin to build a community of future CMSP practitioners, and consider next steps for regional implementation. The first day of the Workshop will include a dedicated public and stakeholder session.

Collaborative, regionally based comprehensive planning is meant to improve communication between stakeholders, the public, and Federal, State, and tribal authorities and improve opportunities for community and citizen participation in the planning process. It is also meant to reduce significant upfront industry and agency costs. Comprehensive planning is not a new concept. The Federal Government has been working with the public, industry, and State and tribal partners for decades to collaboratively plan on many of our public lands. For National Forests and parklands, for example, comprehensive planning helps us achieve multiple goals, whether they are recreation, timber, energy, or protecting our ecological treasures. CMSP applies this concept to our oceans.

Obama Administration Marks Next Steps in Implementing Nation's First Ocean Stewardship Policy with Series of National Ocean Month Public Events

WASHINGTON – Today, the Obama Administration took another important step to implement the nation's first comprehensive ocean policy by launching a series of events aimed at gathering public input from the communities and economies that depend on and care for our ocean, coasts, and Great Lakes. Feedback and comments gathered through this public engagement will assist the National Ocean Council as it implements a new National Policy for the Stewardship of the Ocean, Our coasts, and the Great Lakes.

Under the Executive Order issued by President Obama last July that established the National Ocean Policy, the National Ocean Council is charged with implementing that policy. The National Ocean Council will host a series of public listening sessions across the country starting next week. Listening sessions will be held throughout the month of June in Washington, DC, Barrow, AK, Anchorage, AK, Chicago, IL, Jacksonville, FL, Honolulu, HI, Exeter, NH, Galveston, TX, Ocean Shores, WA, San Francisco Bay Area, CA, West Long Branch, NJ, and Portland, OR.

These listening sessions mark the latest milestone in implementing a robust ocean policy that will address the most critical issues facing our ocean, coasts, and Great Lakes and ensure that Federal resources in these domains are used wisely. The National Ocean Council's efforts will bring together State, local, and tribal governments and all of the ocean's users—including recreational and commercial fishermen, boaters, industry, environmental groups, scientists, and the public—to better plan for, manage, harmonize, and sustain the uses that healthy oceans, coasts, and the Great Lakes support.

In addition, the National Ocean Council has launched a month-long online public review period for nine draft strategic action plan outlines. These strategic action plans will propose attainable goals and specific, measureable actions the Federal government can take to address key challenges facing our ocean, coasts, and Great Lakes. Today, nine draft outlines were released for public comment, including: incorporating ecosystem-based management; implementing coastal and marine spatial planning; informing decisions and improving understanding to respond to changes and challenges facing our resources; improving coordination and support for Federal, state, tribal, local and regional management of our resources; addressing changing conditions in the Arctic; enhancing water quality; implementing a regional ecosystem restoration and protection strategy; strengthening and integrating ocean, coastal and great lakes observations, mapping and infrastructure, and strengthening the resiliency of coastal communities and their abilities to adapt to climate change impacts. These outlines were drafted with input from a wide range of stakeholders. To participate in providing feedback for the strategic action plans or to get more information on listening sessions please visit www.whitehouse.gov/oceans.

Later in June, the National Ocean Council will host State, regional, tribal, and local representatives, experts, and stakeholders from around the country at a national workshop focused on regional collaboration and soliciting public input in planning for the conservation and sustainable use of our ocean resources.

In a joint statement, National Ocean Council Co-Chairs Nancy Sutley and John P. Holdren said: "Our oceans, coasts and, Great Lakes support tens of millions of jobs and generate trillions of dollars each year for our economy through tourism, development, commercial and recreational fishing, energy, and waterborne commerce. The public's input will help us target limited Federal resources to where they are needed most to help our oceans and coastal economies and communities thrive."

To obtain a copy of these strategic action plan outlines and provide your comments on them, please visit www.whitehouse.gov/oceans

To find a National Ocean Council regional listening session near you, please visit http://www.whitehouse.gov/blog/2011/05/26/share-your-ideas-national-ocean-council-listening-session-near-you

###

THE WHITE HOUSE

WASHINGTON

March 30, 2011

PRESIDENTIAL POLICY DIRECTIVE/PPD-8

SUBJECT: National Preparedness

This directive is aimed at strengthening the security and resilience of the United States through systematic preparation for the threats that pose the greatest risk to the security of the Nation, including acts of terrorism, cyber attacks, pandemics, and catastrophic natural disasters. Our national preparedness is the shared responsibility of all levels of government, the private and nonprofit sectors, and individual citizens. Everyone can contribute to safeguarding the Nation from harm. As such, while this directive is intended to galvanize action by the Federal Government, it is also aimed at facilitating an integrated, all-of-Nation, capabilities-based approach to preparedness.

Therefore, I hereby direct the development of a national preparedness goal that identifies the core capabilities necessary for preparedness and a national preparedness system to guide activities that will enable the Nation to achieve the goal. The system will allow the Nation to track the progress of our ability to build and improve the capabilities necessary to prevent, protect against, mitigate the effects of, respond to, and recover from those threats that pose the greatest risk to the security of the Nation.

The Assistant to the President for Homeland Security and Counterterrorism shall coordinate the interagency development of an implementation plan for completing the national preparedness goal and national preparedness system. The implementation plan shall be submitted to me within 60 days from the date of this directive, and shall assign departmental responsibilities and delivery timelines for the development of the national planning frameworks and associated interagency operational plans described below.

National Preparedness Goal

Within 180 days from the date of this directive, the Secretary of Homeland Security shall develop and submit the national preparedness goal to me, through the Assistant to the President

for Homeland Security and Counterterrorism. The Secretary shall coordinate this effort with other executive departments and agencies, and consult with State, local, tribal, and territorial governments, the private and nonprofit sectors, and the public.

The national preparedness goal shall be informed by the risk of specific threats and vulnerabilities - taking into account regional variations - and include concrete, measurable, and prioritized objectives to mitigate that risk. The national preparedness goal shall define the core capabilities necessary to prepare for the specific types of incidents that pose the greatest risk to the security of the Nation, and shall emphasize actions aimed at achieving an integrated, layered, and all-of-Nation preparedness approach that optimizes the use of available resources.

The national preparedness goal shall reflect the policy direction outlined in the National Security Strategy (May 2010), applicable Presidential Policy Directives, Homeland Security Presidential Directives, National Security Presidential Directives, and national strategies, as well as guidance from the Interagency Policy Committee process. The goal shall be reviewed regularly to evaluate consistency with these policies, evolving conditions, and the National Incident Management System.

National Preparedness System

The national preparedness system shall be an integrated set of guidance, programs, and processes that will enable the Nation to meet the national preparedness goal. Within 240 days from the date of this directive, the Secretary of Homeland Security shall develop and submit a description of the national preparedness system to me, through the Assistant to the President for Homeland Security and Counterterrorism. The Secretary shall coordinate this effort with other executive departments and agencies, and consult with State, local, tribal, and territorial governments, the private and nonprofit sectors, and the public.

The national preparedness system shall be designed to help guide the domestic efforts of all levels of government, the private and nonprofit sectors, and the public to build and sustain the capabilities outlined in the national preparedness goal. The national preparedness system shall include guidance for planning, organization, equipment, training, and exercises to build and maintain domestic capabilities. It shall provide an all-of-Nation approach for building and sustaining a cycle of preparedness activities over time.

The national preparedness system shall include a series of integrated national planning frameworks, covering prevention, protection, mitigation, response, and recovery. The frameworks shall be built upon scalable, flexible, and adaptable coordinating structures to align key roles and responsibilities to deliver the necessary capabilities. The frameworks shall be coordinated under a unified system with a common terminology and approach, built around basic plans that support the all-hazards approach to preparedness and functional or incident annexes to describe any unique requirements for particular threats or scenarios, as needed. Each framework shall describe how actions taken in the framework are coordinated with relevant actions described in the other frameworks across the preparedness spectrum.

The national preparedness system shall include an interagency operational plan to support each national planning framework. Each interagency operational plan shall include a more detailed concept of operations; description of critical tasks and responsibilities; detailed resource, personnel, and sourcing requirements; and specific provisions for the rapid integration of resources and personnel.

All executive departments and agencies with roles in the national planning frameworks shall develop department-level operational plans to support the interagency operational plans, as needed. Each national planning framework shall include guidance to support corresponding planning for State, local, tribal, and territorial governments.

The national preparedness system shall include resource guidance, such as arrangements enabling the ability to share personnel. It shall provide equipment guidance aimed at nationwide interoperability; and shall provide guidance for national training and exercise programs, to facilitate our ability to build and sustain the capabilities defined in the national preparedness goal and evaluate progress toward meeting the goal.

The national preparedness system shall include recommendations and guidance to support preparedness planning for businesses, communities, families, and individuals.

The national preparedness system shall include a comprehensive approach to assess national preparedness that uses consistent methodology to measure the operational readiness of national

capabilities at the time of assessment, with clear, objective and quantifiable performance measures, against the target capability levels identified in the national preparedness goal.

Building and Sustaining Preparedness

The Secretary of Homeland Security shall coordinate a comprehensive campaign to build and sustain national preparedness, including public outreach and community-based and private-sector programs to enhance national resilience, the provision of Federal financial assistance, preparedness efforts by the Federal Government, and national research and development efforts.

National Preparedness Report

Within 1 year from the date of this directive, the Secretary of Homeland Security shall submit the first national preparedness report based on the national preparedness goal to me, through the Assistant to the President for Homeland Security and Counterterrorism. The Secretary shall coordinate this effort with other executive departments and agencies and consult with State, local, tribal, and territorial governments, the private and nonprofit sectors, and the public. The Secretary shall submit the report annually in sufficient time to allow it to inform the preparation of my Administration's budget.

Roles and Responsibilities

The Assistant to the President for Homeland Security and Counterterrorism shall periodically review progress toward achieving the national preparedness goal.

The Secretary of Homeland Security is responsible for coordinating the domestic all-hazards preparedness efforts of all executive departments and agencies, in consultation with State, local, tribal, and territorial governments, nongovernmental organizations, private-sector partners, and the general public; and for developing the national preparedness goal.

The heads of all executive departments and agencies with roles in prevention, protection, mitigation, response, and recovery are responsible for national preparedness efforts, including department-specific operational plans, as needed, consistent with their statutory roles and responsibilities.

Nothing in this directive is intended to alter or impede the ability to carry out the authorities of executive departments and agencies to perform their responsibilities under law and consistent with applicable legal authorities and other Presidential guidance. This directive shall be implemented consistent with relevant authorities, including the Post-Katrina Emergency Management Reform Act of 2006 and its assignment of responsibilities with respect to the Administrator of the Federal Emergency Management Agency.

Nothing in this directive is intended to interfere with the authority of the Attorney General or Director of the Federal Bureau of Investigation with regard to the direction, conduct, control, planning, organization, equipment, training, exercises, or other activities concerning domestic counterterrorism, intelligence, and law enforcement activities.

Nothing in this directive shall limit the authority of the Secretary of Defense with regard to the command and control, planning, organization, equipment, training, exercises, employment, or other activities of Department of Defense forces, or the allocation of Department of Defense resources.

If resolution on a particular matter called for in this directive cannot be reached between or among executive departments and agencies, the matter shall be referred to me through the Assistant to the President for Homeland Security and Counterterrorism.

This directive replaces Homeland Security Presidential Directive (HSPD)-8 (National Preparedness), issued December 17, 2003, and HSPD-8 Annex I (National Planning), issued December 4, 2007, which are hereby rescinded, except for paragraph 44 of HSPD-8 Annex I. Individual plans developed under HSPD-8 and Annex I remain in effect until rescinded or otherwise replaced.

Definitions

For the purposes of this directive:

(a) The term "national preparedness" refers to the actions taken to plan, organize, equip, train, and exercise to build and sustain the capabilities necessary to prevent, protect against, mitigate the effects of, respond to, and recover from those threats that pose the greatest risk to the security of the Nation.

(b) The term "security" refers to the protection of the Nation and its people, vital interests, and way of life.

(c) The term "resilience" refers to the ability to adapt to changing conditions and withstand and rapidly recover from disruption due to emergencies.

(d) The term "prevention" refers to those capabilities necessary to avoid, prevent, or stop a threatened or actual act of terrorism. Prevention capabilities include, but are not limited to, information sharing and warning; domestic counterterrorism; and preventing the acquisition or use of weapons of mass destruction (WMD). For purposes of the prevention framework called for in this directive, the term "prevention" refers to preventing imminent threats.

(e) The term "protection" refers to those capabilities necessary to secure the homeland against acts of terrorism and manmade or natural disasters. Protection capabilities include, but are not limited to, defense against WMD threats; defense of agriculture and food; critical infrastructure protection; protection of key leadership and events; border security; maritime security; transportation security; immigration security; and cybersecurity.

(f) The term "mitigation" refers to those capabilities necessary to reduce loss of life and property by lessening the impact of disasters. Mitigation capabilities include, but are not limited to, community-wide risk reduction projects; efforts to improve the resilience of critical infrastructure and key resource lifelines; risk reduction for specific vulnerabilities from natural hazards or acts of terrorism; and initiatives to reduce future risks after a disaster has occurred.

(g) The term "response" refers to those capabilities necessary to save lives, protect property and the environment, and meet basic human needs after an incident has occurred.

(h) The term "recovery" refers to those capabilities necessary to assist communities affected by an incident to recover effectively, including, but not limited to, rebuilding infrastructure systems; providing adequate interim and long-term housing for survivors; restoring health, social, and community services; promoting economic development; and restoring natural and cultural resources.

For Immediate Release
Office of the Press Secretary
December 17, 2003

December 17, 2003 Homeland Security Presidential Directive/Hspd-8

Subject: National Preparedness

Purpose

(1) This directive establishes policies to strengthen the preparedness of the United States to prevent and respond to threatened or actual domestic terrorist attacks, major disasters, and other emergencies by requiring a national domestic all-hazards preparedness goal, establishing mechanisms for improved delivery of Federal preparedness assistance to State and local governments, and outlining actions to strengthen preparedness capabilities of Federal, State, and local entities.

Definitions

(2) For the purposes of this directive:

(a) The term "all-hazards preparedness" refers to preparedness for domestic terrorist attacks, major disasters, and other emergencies.

(b) The term "Federal departments and agencies" means those executive depart-ments enumerated in 5 U.S.C. 101, and the Department of Homeland Security; independent establishments as defined by 5 U.S.C. 104(1); Government corporations as defined by 5 U.S.C. 103(1); and the United States Postal Service.

(c) The term "Federal preparedness assistance" means Federal department and agency grants, cooperative agreements, loans,

an guarantees, training, and/or technical assistance provided to State and local governments and the private sector to prevent, prepare for, respond to, and recover from terrorist attacks, major disasters, and other emergencies. Unless noted otherwise, the term "assistance" will refer to Federal assistance programs.

(d) The term "first responder" refers to those individuals who in the early stages of an incident are responsible for the protection and preservation of life, property, evidence, and the environment, including emergency response providers as defined in section 2 of the Homeland Security Act of 2002 (6 U.S.C. 101), as well as emergency management, public health, clinical care, public works, and other skilled support personnel (such as equipment operators) that provide immediate support services during prevention, response, and recovery operations.

(e) The terms "major disaster" and "emergency" have the meanings given in section 102 of the Robert T. Stafford Disaster Relief and Emergency Assistance Act (42 U.S.C. 5122).

(f) The term "major events" refers to domestic terrorist attacks, major disasters, and other emergencies.

(g) The term "national homeland security preparedness-related exercises" refers to homeland security-related exercises that train and test national decision makers and utilize resources of multiple Federal departments and agencies. Such exercises may involve State and local first responders when appropriate. Such exercises do not include those exercises conducted solely within a single Federal department or agency.

(h) The term "preparedness" refers to the existence of plans, procedures, policies, training, and equipment necessary at the Federal, State, and local level to maximize the ability to prevent, respond to, and recover from major events. The term "readiness" is used interchangeably with preparedness.

(i) The term "prevention" refers to activities undertaken by the first responder community during the early stages of an incident to reduce the likelihood or consequences of threatened or actual terrorist attacks. More general and broader efforts to deter, disrupt, or thwart terrorism are not addressed in this directive.

(j) The term "Secretary" means the Secretary of Homeland Security.

(k) The terms "State," and "local government," when used in a geographical sense, have the same meanings given to those terms

in section 2 of the Homeland Security Act of 2002 (6 U.S.C.

)1).

Relationship to HSPD-5

(3) This directive is a companion to HSPD-5, which identifies steps for improved coordination in response to incidents. This directive describes the way Federal departments and agencies will prepare for such a response, including prevention activities during the early stages of a terrorism incident.

Development of a National Preparedness Goal

(4) The Secretary is the principal Federal official for coordinating the implementation of all-hazards preparedness in the United States. In cooperation with other Federal departments and agencies, the Secretary coordinates the preparedness of Federal response assets, and the support for, and assessment of, the preparedness of State and local first responders.

(5) To help ensure the preparedness of the Nation to prevent, respond to, and recover from threatened and actual domestic terrorist attacks, major disasters, and other emergencies, the Secretary, in coordination with the heads of other appropriate Federal departments and agencies and in consultation with State and local governments, shall develop a national domestic all-hazards preparedness goal. Federal departments and agencies will work to achieve this goal by:

(a) providing for effective, efficient, and timely delivery of

Federal preparedness assistance to State and local governments;

and

(b) supporting efforts to ensure first responders are prepared to

respond to major events, especially prevention of and response

to threatened terrorist attacks.

(6) The national preparedness goal will establish measurable readiness priorities and targets that appropriately balance the potential threat and magnitude of terrorist attacks, major disasters, and other emergencies with the resources required to prevent, respond to, and recover from them. It will also include readiness metrics and elements that support the national preparedness goal including standards for preparedness assessments and strategies, and a system for assessing the Nation's overall preparedness to respond to major events, especially those involving acts of terrorism.

(7) The Secretary will submit the national preparedness goal to me through the Homeland Security

Council (HSC) for review and approval prior to, or concurrently with, the Department of Homeland Security's Fiscal Year 2006 budget submission to the Office of Management and Budget.

Federal Preparedness Assistance

(8) The Secretary, in coordination with the Attorney General, the Secretary of Health and Human Services (HHS), and the heads of other Federal departments and agencies that provide assistance for first responder preparedness, will establish a single point of access to Federal preparedness assistance program information within 60 days of the issuance of this directive. The Secretary will submit to me through the HSC recommendations of specific Federal department and agency programs to be part of the coordinated approach. All Federal departments and agencies will cooperate with this effort. Agencies will continue to issue financial assistance awards consistent with applicable laws and regulations and will ensure that program announcements, solicitations, application instructions, and other guidance documents are consistent with other Federal preparedness programs to the extent possible. Full implementation of a closely coordinated interagency grant process will be completed by September 30, 2005.

(9) To the extent permitted by law, the primary mechanism for delivery of Federal preparedness assistance will be awards to the States. Awards will be delivered in a form that allows the recipients to apply the assistance to the highest priority preparedness requirements at the appro-priate level of government. To the extent permitted by law, Federal preparedness assistance will be predicated on adoption of Statewide comprehensive all-hazards preparedness strategies. The strategies should be consistent with the national preparedness goal, should assess the most effective ways to enhance preparedness, should address areas facing higher risk, especially to terrorism, and should also address local government concerns and Citizen Corps efforts. The Secretary, in coordination with the heads of other appropriate Federal departments and agencies, will review and approve strategies submitted by the States. To the extent permitted by law, adoption of approved Statewide strategies will be a requirement for receiving Federal preparedness assistance at all levels of government by September 30, 2005.

(10) In making allocations of Federal preparedness assistance to the States, the Secretary, the Attorney General, the Secretary of HHS, the Secretary of Transportation, the Secretary of Energy, the Secretary of Veterans Affairs, the Administrator of the Environmental Protection Agency, and the heads of other Federal departments and agencies that provide assistance for first responder preparedness will base those allocations on assessments of population concentrations, critical infrastructures, and other significant risk factors, particularly terrorism threats, to the extent permitted by law.

(11) Federal preparedness assistance will support State and local entities' efforts including planning, training, exercises, interoperability, and equipment acquisition for major events as well as capacity building for prevention activities such as information gathering, detection, deterrence, and collaboration related to terrorist attacks. Such assistance is not primarily intended to support existing capacity to address normal local first responder operations, but to build capacity to address major events, especially terrorism.

(12) The Attorney General, the Secretary of HHS, the Secretary of Transportation, the Secretary of Energy, the Secretary of Veterans Affairs, the Administrator of the Environmental Protection Agency, and the heads of other Federal departments and agencies that provide assistance for first responder preparedness shall coordinate with the Secretary to ensure that such assistance supports and is consistent with the national preparedness goal.

(13) Federal departments and agencies will develop appropriate mechanisms to ensure rapid obligation and disbursement of funds from their programs to the States, from States to the local community level, and from local entities to the end users to derive maximum benefit from the assistance provided. Federal departments and agencies will report annually to the Secretary on the obligation, expenditure status, and the use of funds associated with Federal preparedness assistance programs.

Equipment

(14) The Secretary, in coordination with State and local officials, first responder organizations, the private sector and other Federal civilian departments and agencies, shall establish and implement streamlined procedures for the ongoing development and adoption of appropriate first responder equipment standards that support nationwide interoperability and other capabilities consistent with the national preparedness goal, including the safety and health of first responders.

(15) To the extent permitted by law, equipment purchased through Federal preparedness assistance for first responders shall conform to equipment standards in place at time of purchase. Other Federal departments and agencies that support the purchase of first responder equipment will coordinate their programs with the Department of Homeland Security and conform to the same standards.

(16) The Secretary, in coordination with other appropriate Federal departments and agencies and in consultation with State and local governments, will develop plans to identify and address national first responder equipment research and development needs based upon assessments of current and future threats. Other Federal departments and agencies that support preparedness research and development activities shall coordinate their efforts with the Department of Homeland Security and ensure they support the national preparedness goal.

Training and Exercises

(17) The Secretary, in coordination with the Secretary of HHS, the Attorney General, and other appropriate Federal departments and agencies and in consultation with State and local governments, shall establish and maintain a comprehensive training program to meet the national preparedness goal. The program will identify standards and maximize the effectiveness of existing Federal programs and financial assistance and include training for the Nation's first responders, officials, and others with major event preparedness, prevention, response, and recovery roles. Federal departments and agencies shall include private organizations in the accreditation and delivery of preparedness training as appropriate and to the extent permitted by law.

(18) The Secretary, in coordination with other appropriate Federal departments and agencies, shall

establish a national program and a multi-year planning system to conduct homeland security preparedness-related exercises that reinforces identified training standards, provides for evaluation of readiness, and supports the national preparedness goal. The establishment and maintenance of the program will be conducted in maximum collaboration with State and local governments and appropriate private sector entities. All Federal departments and agencies that conduct national homeland security preparedness-related exercises shall participate in a collaborative, interagency process to designate such exercises on a consensus basis and create a master exercise calendar. The Secretary will ensure that exercises included in the calendar support the national preparedness goal. At the time of designation, Federal departments and agencies will identify their level of participation in national homeland security preparedness- related exercises. The Secretary will develop a multi-year national homeland security preparedness-related exercise plan and submit the plan to me through the HSC for review and approval.

(19) The Secretary shall develop and maintain a system to collect, analyze, and disseminate lessons learned, best practices, and information from exercises, training events, research, and other sources, including actual incidents, and establish procedures to improve national preparedness to prevent, respond to, and recover from major events. The Secretary, in coordination with other Federal departments and agencies and State and local governments, will identify relevant classes of homeland-security related information and appropriate means of transmission for the information to be included in the system. Federal departments and agencies are directed, and State and local governments are requested, to provide this information to the Secretary to the extent permitted by law.

Federal Department and Agency Preparedness

(20) The head of each Federal department or agency shall undertake actions to support the national preparedness goal, including adoption of quantifiable performance measurements in the areas of training, planning, equipment, and exercises for Federal incident management and asset preparedness, to the extent permitted by law. Specialized Federal assets such as teams, stockpiles, and caches shall be maintained at levels consistent with the national preparedness goal and be available for response activities as set forth in the National Response Plan, other appropriate operational documents, and applicable authorities or guidance. Relevant Federal regulatory requirements should be consistent with the national preparedness goal. Nothing in this directive shall limit the authority of the Secretary of Defense with regard to the command and control, training, planning, equipment, exercises, or employment of Department of Defense forces, or the allocation of Department of Defense resources.

(21) The Secretary, in coordination with other appropriate Federal civilian departments and agencies, shall develop and maintain a Federal response capability inventory that includes the performance parameters of the capability, the timeframe within which the capability can be brought to bear on an incident, and the readiness of such capability to respond to domestic incidents. The Department of Defense will provide to the Secretary information describing the organizations and functions within the Department of Defense that may be utilized to provide support to civil authorities during a domestic crisis.

Citizen Participation

(22) The Secretary shall work with other appropriate Federal departments and agencies as well as State and local governments and the private sector to encourage active citizen participation and involvement in preparedness efforts. The Secretary shall periodically review and identify the best community practices for integrating private citizen capabilities into local preparedness efforts.

Public Communication

(23) The Secretary, in consultation with other Federal departments and agencies, State and local governments, and non-governmental organizations, shall develop a comprehensive plan to provide accurate and timely preparedness information to public citizens, first responders, units of government, the private sector, and other interested parties and mechanisms for coordination at all levels of government.

Assessment and Evaluation

(24) The Secretary shall provide to me through the Assistant to the President for Homeland Security an annual status report of the Nation's level of preparedness, including State capabilities, the readiness of Federal civil response assets, the utilization of mutual aid, and an assessment of how the Federal first responder preparedness assistance programs support the national preparedness goal. The first report will be provided within 1 year of establishment of the national preparedness goal.

(25) Nothing in this directive alters, or impedes the ability to carry out, the authorities of the Federal departments and agencies to perform their responsibilities under law and consistent with applicable legal authorities and presidential guidance.

(26) Actions pertaining to the funding and administration of financial assistance and all other activities, efforts, and policies in this directive shall be executed in accordance with law. To the extent permitted by law, these policies will be established and carried out in consultation with State and local governments.

(27) This directive is intended only to improve the internal management of the executive branch of the Federal Government, and it is not intended to, and does not, create any right or benefit, substantive or procedural, enforceable at law or in equity, against the United States, its departments, agencies, or other entities, its officers or employees, or any other person.

GEORGE W. BUSH

Ecosystem-Based Management
Strategic Action Plan
Full Content Outline

Objective: Adopt ecosystem-based management as a foundational principle for the comprehensive management of the ocean, our coasts, and the Great Lakes.

Definition: Ecosystem-Based Management (EBM) is an integrated approach to resource management that considers the entire ecosystem, including humans, and the elements that are integral to ecosystem functions. EBM is informed by science to conserve and protect our cultural and natural heritage by sustaining diverse, productive, resilient ecosystems and the services they provide, thereby promoting the long-term health, security, and well-being of our Nation.

I. Overview of Priority Objective: Ecosystem Based Management

- The National Ocean Policy recommended EBM as a foundational principle to promote more effective and sustainable stewardship of our Nation's oceans, coasts, and Great Lakes.
- The Strategic Action Plan (SAP) for EBM will enhance our Nation's efforts to understand, use, manage, and conserve our valuable coastal and marine ecosystems. This SAP will provide a conceptual framework for integrating the management of diverse human activities that are linked to or depend on coastal and marine resources (e.g., shipping, fishing, energy production, military operations, coastal development).
- EBM differs from current approaches that focus on single-sector management (i.e., a single species or type of activity) by considering the whole ecosystem, including humans. The foundation for sustaining the long-term capacity of these systems to deliver a range of ecosystem services depends on ensuring the health and function of ecosystems.
- EBM plans and strategies must incorporate the cumulative effects of multiple human activities and varying levels of those activities on entire ecosystems, and address explicitly approaches for assessing trade-offs among these activities with the goal of maintaining ecosystem health and services.

II. Context and Continuity

- The EBM SAP outlined below is founded on four themes:
  - EBM Leadership and Collaboration - Establishes a framework across Federal and non-Federal agencies and organizations at multiple levels to guide the implementation of EBM at multiple scales; defines the criteria for selecting the initial geographic areas where EBM will be implemented; and identifies a plan to phase EBM implementation into additional areas. This theme will complement the Coordinate and Support SAP.
  - Interagency EBM Science Framework - Develops and implements a hypothesis-driven, nation-wide framework of integrated observations, monitoring, and research to provide a sound scientific basis for understanding ecosystems and informing management decisions.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Inform Decision-making - Promotes the sharing of knowledge regarding EBM by communicating the principles, best practices, and decision-support tools among the partners involved in the decision-making process. This theme will be integrated with the Inform Decisions and Improve Understanding SAP.
- Policy and Governance - Identifies legislative and regulatory impediments to implementing EBM, and identifies actions to incorporate EBM cohesively into the environmental statutory and regulatory regime, project planning, and management strategies at the Federal, regional, state, territorial, tribal, and local levels. This theme will be integrated with the Inform Decisions and Improve Understanding SAP.

III. Body of the Plan

A. Action 1- EBM Leadership and Collaboration.

A Federal interagency working group will: (1) develop and propose an explicit framework for working with regional, state, territorial, tribal, and local management entities; (2) ensure that Federal agencies integrate EBM approaches into their decision-making processes; (3) identify strategies to increase understanding of EBM within the federal workforce; and (4) serve as a forum that monitors the integration of ecosystem-based activities within Federal agencies.

1. Why Do This
   - This action will lay the foundation for more efficient and effective management of the oceans, coasts, and Great Lakes by promoting a common understanding of and competence in leading implementation of the EBM approach to: (a) eliminate duplication of effort across agencies; (b) inform management decision-making with the best available science and data about the diverse interests of partners and stakeholders; and (c) build capacity and promote cooperation and leveraging of data, resources, and tools across all levels of government (Federal, regional, state, tribal, territorial, and local) and between governments and diverse stakeholders, including industry, NGOs, and the general public.
   - This action will ensure the assimilation of EBM and its principles as the improved way of doing business and promote stewardship of our Nation's coastal and ocean resources. It will incorporate lessons from and promote the exchange of information derived from Federal and non-Federal EBM models that successfully use collaborative, stakeholder-driven, place-based tools and approaches to address coastal and ocean management issues. Examples of those efforts include, but are not limited to, regional fisheries management (e.g., State of Alaska, NOAA), the National Estuary Program (EPA), Landscape Conservation Cooperatives (DOI, NOAA, and NGOs), and regional Governors' agreements. This action will build on those regional, state, tribal, territorial, and local models that apply EBM principles and build leadership and collaborative decision-making competence in additional places/regions.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

2. Timeframe –Mid-term

3. Outcomes

- Increased application of EBM by Federal and non-Federal agencies and organizations at multiple levels to support collaborative strategic planning and priority-setting in selected geographic areas. Federal and non-Federal parties will: a) develop and align place-based goals and plans; b) involve multiple stakeholder interests; c) improve the coordination of activities; and d) increase leveraging of each others' resources in support of outcome-oriented EBM. They will begin to better integrate and consider regional and local economic activity and human uses as well as the cumulative impacts on ecosystems. They will utilize scenario building, coastal and marine spatial planning (CMSP) tools, and other available decision-support tools.
- Enhanced integration of capabilities and resources among Federal and non-Federal parties. All partners will participate in the information sharing and promotion of holistic EBM and adaptive management approaches. Implementation of this action will promote the development and exchange of sound, accessible, and best-available scientific and socio-economic data regarding the condition and health of ecosystems and will highlight the results of efforts to apply EBM concepts at the regional, state, tribal, territorial, and local level.
- Criteria for identifying priority areas for EBM implementation will be selected. Representation on the working group will include consideration of unique marine environments, natural resources and cultural sensitivities as well as tribes' cultures, traditions, economic livelihoods, and public health.
- Place-based pilot projects will utilize best practices and promote understanding of and information about how to effectively implement EBM principles and concepts.
- A process is established to implement collaborative approaches to resource management, using EBM to set strategic goals and objectives and more effectively manage ecosystems. These processes will build upon the existing frameworks in those regions where Governors' agreements are in place.
- Educating and training a cadre of decision-makers and managers at all levels in EBM principles and practices will begin. The training and education will include transferring lessons learned from those entities already engaged in ecosystem-based management of coastal and ocean resources. These decision-makers and managers will be competent in leading the adoption of EBM approaches and of adaptive management principles and concepts.
- Regional, tribal, territorial, state and local stakeholders and decision-makers will begin collaborating to identify shared goals as well as common and divergent interests in each geographic region. They will develop and adopt strategies for addressing priority needs.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- As the EBM SAP is implemented, gaps in the coordination processes among state, tribal, territorial, and local authorities and regional governance structures will be identified and efforts undertaken to begin addressing those gaps.
- Efforts will be undertaken to align agency-specific and cross-agency EBM goals and objectives with existing regulatory and statutory management requirements.

4. Milestones
   - Establish a joint interagency-regional EBM Working Group.
   - Develop a course catalog of a recommended curriculum for developing competencies in leading the adoption of EBM and adaptive management approaches.
   - Identify geographic priority areas for EBM implementation based on a clearly defined set of criteria determined through an interagency process.
   - Establish criteria for identifying priority geographic areas to implement EBM in cooperation and consultation with Regional bodies and utilizing CMSP and other available tools.
   - Compile and disseminate information depicting examples of EBM capacity, as well as resources and tools to further EBM implementation at all levels. Utilize local community partnerships and build on existing EBM networks to facilitate implementation.
   - Complete agency-specific guidance that provides direction for using EBM to achieve management requirements with existing regulatory and legislative authorities.
   - Decision-makers and managers complete the recommended EBM curriculum and share a common knowledge base of EBM concepts, principles, and practices. Key decision-makers and managers include individuals working in Federal coastal, ocean, and Great Lakes programs and their counterparts at the state, regional, tribal, territorial, and local level.
   - Decision-makers and managers develop the skills to integrate technical and scientific knowledge into ecosystem-based approaches to management at a regional scale. This knowledge includes information and tools such as adequate scientific and socio-economic data and information, ecosystem modeling expertise, engagement of diverse stakeholders in collaborative processes designed to identify management priorities, and incorporating external, time-sensitive drivers of EBM (e.g., loss of critical Northeast groundfish, expansion of offshore energy development).
   - Develop and implement model agreements (e.g., Memoranda of Agreement) to coordinate intergovernmental EBM implementation processes.

5. Gaps and Needs in Science and Technology

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Report on the status of marine and coastal ecosystems at a relevant scale through ecosystem research, monitoring, and observations, including key indicators of stresses on those ecosystems.
- Leadership and governance capacity: lack of knowledge about EBM and adaptive management on the part of policymakers, decision-makers, and managers could be an obstacle to agencies' support for the development of leadership competencies in EBM and adaptive management.

B. Action 2 - EBM Science Framework.

Establish an interagency EBM Science Framework of integrated research, observation, and monitoring capacity to improve understanding of ecosystem functions and the degree to which interactions among and within human and natural systems effects ecosystem health and services. This action will incorporate many of the actions of the Inform Decisions and Improve Understanding SAP into the EBM science framework.

EBM needs a science framework that will:

- Identify and facilitate the fundamental research needed to inform, implement, support, and advance EBM across the country.
- Emphasize the need to understand the basic physical, biological, ecological, and socio-economic aspects of marine and coastal ecosystems, to assess the more complex interactions, cumulative effects, and trade-offs required to maintain ecosystem health and services.
- Identify ecosystem services, describe hidden costs associated with human use of those services, assess trade-offs in benefits versus costs, avoid or reduce user and management conflicts, improve management outcomes, and promote sustainable use of ecosystems.
- Identify spatial extent of ecosystems, or boundaries, in terms of both management needs and the natural environment. Identify potential connections at multiple scales for ecosystems that connect across multiple jurisdictional boundaries, including international.
- Provide the scientific basis for managing people and their actions in a manner that sustains healthy, resilient ecosystems and ecosystem services. Among other things, this will require more effective alignment of the spatial characteristics of human activities with the environmental characteristics of marine ecosystems through marine spatial planning.
- Include all forms of scientific investigation, including short- and long-term observations, hypothesis testing, adaptive experimentation, and predictive modeling.
- Provide a range of science information tools and their appropriate application to the decision-making process. These tools can be broadly classified as modeling tools, decision analysis tools, and indicators of ecosystem status.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Promote interdisciplinary research to understand the structure and function of marine ecosystems, including the complex interactions that shape them, rather than simply assessing their various components without regard to their role in ecosystems.
- Emphasize and enable applied research to address existing and anticipated management challenges, but also support basic research to promote scientific creativity and ingenuity.
- Utilize innovative technology (e.g., remote sensors) and field research programs, and build upon and complement existing Federal and non-Federal scientific programs.
- Leverage existing resources and capabilities from Federal and non-Federal agencies and organizations to provide stable and sustainable long-term financial support for EBM science framework.

1. Why Do This

An EBM approach depends on a strong scientific foundation that:

- Provides the physical, chemical, biological, ecological, and socio-economic data required to assess the linkages, interactions, interdependencies, and cumulative effects that are the metrics of ecosystem health, resilience, and productivity;
- Capitalizes on and complements the research capacity of Federal and non-Federal agencies and organizations at multiple levels;
- Elucidates benefits and costs associated with human activities within marine ecosystems;
- Centralizes research information to ensure that results are transparent, accessible, organized, and archived for future use;
- Promotes research targeted to specific regional ecosystems and sharing of information relevant to all regions and ecosystems;
- Utilizes targeted regional ecosystem projects to address specific knowledge gaps and inform place-based management needs;
- Develops new technology to enhance scientific and management efforts;
- Promotes a research-to-practice path for new technology; and
- Evaluates indicators of ecosystem health to provide the necessary assurance that our use of ecosystems is, in fact, sustainable.

2. Timeframe – Mid-term

3. Outcomes

- Establishment of a defined framework for guiding science, monitoring, and observations to inform and support EBM.
- Improved understanding of natural and human-related changes in ecosystems over time, as well as the implications of these changes for ecosystem and human health and for socio-economic well-being.
- Improved ability to forecast future conditions and outcomes.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Establishment of a comprehensive repository of governmental, non-governmental and private sector data and resources (e.g., Marine Protected areas, NOAA stock assessments, Navy monitoring efforts).

4. Milestones
   - Establish interagency EBM Science Work Group; develop charters setting forth goals and objectives.
   - Coordinate with Federal and non-Federal agencies and organizations at multiple levels to initiate development of the EBM science framework.
   - Catalog and inventory existing governmental, non-governmental and private sector research, programs, and assets aimed at or related to EBM (e.g., Ocean Observing Systems), and identify (1) areas of unnecessary redundancy or overlap and (2) gaps in science related to EBM.
   - Establish a comprehensive repository of governmental, non-governmental, and private sector data and resources management (e.g., Marine Protected areas, resource stock assessments, monitoring efforts).
   - Identify, develop, and implement tools for the effective execution of EBM (e.g., Integrated Ecosystem Assessment (IEA) approach). The results will provide a basis for balancing those uses through spatially and temporally explicit marine spatial planning.
   - Set up an adaptive management process for the next-generation of EBM, based on lessons learned in the first two years of implementation of data architectures and IEA processes.
   - Conduct regular reviews of the initial EBM scientific framework, examining its strengths, shortcomings, and key research topics needed to promote more effective EBM. These review and recommendation processes would be coordinated with the Observations, Mapping, and Infrastructure SAP.

5. Gaps and Needs in Science and Technology
   - Identification of key indicators of ecosystem health and spatial areas of high or unique value.
   - Identification of existing and emerging technology that enables scientists, decision-makers, and the public to more easily input, archive, access, share, analyze, visualize, and explain data and information, such as mapping and geospatial analysis tools. This will be done in coordination with CMSP and Inform Decisions and Improve Understanding SAPs.
   - Continued development of ocean observing systems (e.g., the Integrated Ocean Observing System, the Ocean Observatories Initiative) to collect physical, chemical, biological, and ocean use data in (near) real-time.
   - Facilitation of data access by developing formal metadata standards and specific guidance for data input, integration, and preservation.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Requirements for "open access" and "open science" for data and research methods.
- Development and adoption of protocols or standards for ecosystem service accounting and the valuation of EBM-relevant nonmarket goods and services that are not represented in the current economic literature.

C. Action 3 - Inform Decision-Making to Support EBM.

Develop and provide products and services to assist entities responsible for implementing EBM. Examples of products and services may include an interactive data portal, a synthesis and analysis of lessons learned from existing EBM initiatives, and an inventory of adaptive management approaches and tools. These products and services will enable Federal, state, territorial, tribal, regional, and local entities to share and discuss ecological, economic, social, physical, and other types of data and information that are needed to facilitate EBM and adaptive management approaches. This action will complement the actions of the Inform Decisions and Improve Understanding SAP.

1. Why Do This

Science-based products and services to support EBM are needed to:

- Ensure that decision-makers have access to the best available science, tools, and data;
- Ensure that the decision-making process reflects the interests of multiple stakeholders at Federal, state, territorial, tribal, regional, and local levels;
- Enable managers and stakeholders to consider all types of ecosystem services and the impacts to these services that may arise under alternative scenarios;
- Enable managers and stakeholders to assess the trade-offs associated with alternative policies and to minimize the conflicts that arise over multiple ecosystem uses;
- Promote collaboration and innovation among agencies responsible for managing our oceans, coasts, and Great Lakes; and
- Promote better informed and improved decision-making that will enhance our capacity to understand, respond, and adapt to a changing environment.

2. Timeframe – Mid-term

3. Outcomes

- Improved ability to balance the competing demands on ecosystems via improved understanding of ecosystem services, function, and resilience, and the interactions and feedbacks between human and natural systems.
- Enhanced management of resources due to the ability to evaluate trade-offs inherent in different management scenarios.
- An enhanced outreach and education program is available to inform stakeholders of EBM goals and underlying management and science principles.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Promote sharing of data among all EBM constituencies (i.e., at the Federal, state, regional, local, tribal, and territorial levels).
- Improved ability to minimize environmental risk with the use adoption of adaptive management approaches.
- Improved understanding of data and information required to fully adopt an ecosystem approach to management.
- Enhanced societal resiliency in response to environmental changes via understanding of environmental trends, and the causes and consequences of change.
- Improved public partnership and increased environmental awareness through an understanding of the role of humans in ecosystems, including feedbacks that affect livelihood, human health and well being, and quality of life.

4. Milestones
   - Complete inventory, analysis, and synthesis of "lessons learned," EBM pilot projects, and adaptive management approaches and tools pertaining to oceans, coasts, and Great Lakes.
   - Assess agency data and information holdings related to management of oceans, coasts, and Great Lakes, and the development of data listings.
   - Develop and initiate the implementation of an outreach and education program to inform stakeholders of EBM goals and underlying management and science principles.
   - Implement and complete two to three pilot studies using adaptive management decision-making tools in selected geographic areas.
   - Prepare case studies and document results of the pilot studies.

5. Gaps and Needs in Science and Technology
   - Reasonable approximations (including a range) of uncertainty and/or the scientific confidence associated with management actions that are not currently available must be developed.
   - Mechanisms to provide comprehensive information from science and research to better inform EBM decisions.

D. Action 4: Incorporate EBM Principles into Policy and Governance.

Incorporate EBM principles into Federal, regional, state, territorial, tribal, and local project planning and environmental review processes to support rapid and effective implementation of EBM throughout our Nation's marine and coastal ecosystems. This will be coordinated with the Coastal and Marine Spatial Planning (CMSP) SAP.

1. Why Do This
   - EBM needs to be incorporated cohesively into the environmental statutory and regulatory regime and project planning and review processes (e.g., National Environmental Policy Act, Endangered Species Act, Coastal Zone Management Act,

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

Magnuson-Stevens Fishery Conservation and Management Act) to ensure a more holistic ecosystem-based approach.

- Management that is based on and more fully integrates physical, biological, ecological, and socio-economic information is more likely to meet human-related objectives while promoting healthier, more resilient, and productive ocean, coastal, and Great Lakes environments.
- Maintaining the health, resilience, and productivity of marine ecosystems is essential if our Nation's use of those ecosystems is to be sustainable for future generations.
- Opportunity exists to incorporate EBM principles into the regulatory regime under the Executive priority to improve regulation and regulatory review, which directs agencies to conduct a retrospective analysis of existing significant regulations (see Executive Order 13563, January 18, 2011).

2. Timeframe – Mid-Term

3. Outcomes

- Federal, state, tribal, territorial, and local project planning and review processes will incorporate EBM principles.
- An EBM approach will promote better stewardship because it takes into account the interactions among all the components of an ecosystem, including human activities.
- An EBM approach will provide a framework for managing multiple types of human activities in ways that do not diminish substantially the essential characteristics of marine ecosystems or undermine their ability to provide vital ecosystem services.
- Impacts to ecosystem services and functions will be addressed explicitly through environmental risk analyses, permits, and authorizations under the National Environmental Policy Act and other relevant Federal environmental legislation.
- Federal agencies will work collaboratively with regional, state, territorial, tribal, and local agencies and organizations through the regional CMSP process and other means to promote efforts such as the national system of Marine Protected Areas, Migratory Bird Joint Ventures, Landscape Conservation Cooperatives, the Marine Intertidal Network, and other ecosystem-based activities to conserve habitats.
- Targeted statutory and regulatory changes may be made to address relevant deficiencies in law and policy when deemed necessary in order to advance EBM.

4. Milestones

- Fully incorporate EBM into Federal agency environmental planning and review processes.
- Incorporate EBM principles into efforts responsive to legislative and regulatory environmental mandates.
- Review environmental statutory and regulatory regimes to determine areas of conflict and opportunities for integrating multiple agency management objectives towards achieving EBM goals.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Prepare risk analyses and monitoring and mitigation plans that enable EBM to promote regulatory efficiency, consistency, and transparency across multiple management objectives.
- Issue model legislation and/or regulations.

5. Gaps and Needs in Science and Technology
   - Mechanisms for increasing awareness and understanding regarding EBM.
   - Getting near-term buy-in/agreement from Federal agencies that EBM is an integral approach towards integrating a science framework into current management.

INTERIM

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

Coastal and Marine Spatial Planning
Strategic Action Plan
Full Content Outline

Objective: Implement comprehensive, integrated, ecosystem-based coastal and marine spatial planning (CMSP) and management in the United States.

I. Overview of the Priority Objective

- This strategic action plan (SAP) addresses the National Ocean Policy priority objective to implement and expand the framework for effective CMSP as described in the Final Recommendations of the Interagency Ocean Policy Task Force (Final Recommendations), as adopted by Executive Order 13547, *Stewardship of the Ocean, Our Coasts, and the Great Lakes* (Executive Order).

- The Strategic Action Plan (SAP) for CMSP takes a different approach and has a significantly different structure than the other eight SAPs the other writing teams are developing.

    - This is appropriate, since much of the discussion in the Final Recommendations focuses on elements of the framework for implementing an effective CMSP process.

    - The National Ocean Policy calls upon the CMSP SAP Writing Team to reflect that approach and further develop those steps.

    - Moreover, the Executive Order and the framework for effective CMSP include specific expectations for additional guidance from the National Ocean Council (Council). The full content outline below provides a structure and some text in an effort to fulfill these expectations.

- As defined in the Executive Order, CMSP is a "comprehensive, adaptive, integrated, ecosystem-based, and transparent spatial planning process, based on sound science, for analyzing current and anticipated uses of ocean, coastal, and Great Lakes areas. It identifies areas most suitable for various types or classes of activities in order to reduce conflicts among uses, reduce environmental impacts, facilitate compatible uses, and preserve critical ecosystem services to meet economic, environmental, security, and social objectives. In practical terms, CMSP provides a public policy process for society to better determine how the ocean, coasts, and Great Lakes are sustainably used and protected -- now and for future generations."

- The Executive Order adopts a clear set of objectives that our Nation should pursue to further the National Ocean Policy. CMSP is one of the nine priority objectives under this implementation strategy. In his June 2009 memorandum establishing the Interagency Ocean Policy Task Force, President Obama specifically called upon the Task Force "to develop a recommended framework for effective coastal and marine spatial planning." As a result, the Task Force spent considerable time and effort to develop such a framework, largely based on valuable input from

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

a wide spectrum of stakeholders, scientists, academics, and policy experts, as well as the general public.

- The Task Force members concluded that CMSP was a crucial element in a comprehensive national policy for the stewardship of ocean and coastal resources. The Task Force then outlined a comprehensive vision for CMSP in the ocean, coastal, and Great Lakes waters of the United States that is included in its Final Recommendations.

- The CMSP process that the Task Force identified aspires to significantly improve how we manage and protect our priceless coastal, marine, and Great Lakes waters and resources. At its core, CMSP begins with assembling all relevant stakeholders in each of nine coastal regions and gathering together all of the critical data elements. This includes mapping and assessing the ecological, economic, cultural, and societal resources as well as transportation, recreation, other off-shore uses, and security information within the context of an ecosystem model. Each of the nine regional planning bodies (RPBs) which will be established pursuant to the Executive Order, working with all interested stakeholders and the general public, will consider this assessment and associated maps and data, together with the current and projected uses of the entire planning area, to comprehensively and proactively identify those areas best suited for certain uses based on all relevant factors.

- The entire process is designed to be transparent, with close coordination between all State (defined to include the Territories), Federal, and tribal bodies, as well as a wide variety of domestic and foreign stakeholders. CMSP is intended to create a common shared vision for what all parties see as the best uses for these regional planning areas.

- This SAP will further explain the process of implementing the framework for effective CMSP. To help guide these regional CMSP efforts leading to the eventual development of coastal and marine spatial plans (CMS plans), this SAP will provide national CMSP objectives and performance measures. While the objectives and corresponding performance measures are national in scope, the CMSP process and CMS plans will be developed regionally, with regional objectives and performance measures which are informed by the national objectives. CMSP and CMS plans will be developed cooperatively among the Federal, State, and tribal partners on the RPBs—in consultation with indigenous community representatives, Regional Fishery Management Councils, and scientific, technical, and other experts—with substantial stakeholder and public input. The goal will be to provide specific, actionable, measurable, and cost-effective guidance to best achieve the many economic, environmental, security, and social benefits of CMSP throughout the ocean, coastal, and Great Lakes waters of the United States.

II. Context and Continuity.

- As the concept is implemented, CMSP will yield substantial economic, ecological, and social benefits. To do so, it must incorporate the principles of sound science for ecosystem-based and adaptive management, be transparent, and be informed by all stakeholders and the general

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

public. Rather than adding layers of review and delays, CMSP will significantly improve and build upon existing Federal, State, tribal, local, and regional decision-making and planning processes. CMSP is intended to facilitate sustainable economic growth in coastal communities by increasing transparency and predictability for economic investments in coastal, marine, and Great Lakes industries, transportation, telecommunications, public infrastructure, and related businesses. CMSP should promote national objectives such as enhanced national energy security and trade and provide economic incentives, such as more predictable and faster project implementation, for a wide range of commercial users. CMSP is intended to improve ecosystem health and services by planning human uses in concert with the conservation of important ecological areas, such as areas of high productivity and biological diversity, areas critical to ecosystem function and resiliency, areas if spawning, breeding, and feeding; and migratory corridors. CMSP can promote enhanced ecosystem services and benefits because they are incorporated into the CMS plans as desired outcomes of the process and not just evaluated in the context of individual Federal or State agency action. CMSP allows for a comprehensive look at multiple sector demands which will provide a more complete evaluation of cumulative effects.

- Working in concert with the other eight SAPs, CMSP is intended to promote society goals, including greater opportunities for community and citizen participation in open planning processes that would determine the future of the ocean, our coasts, and the Great Lakes. For example, the CMSP process would recognize the social, economic, public health, and conservation benefits of sustainable recreational use of ocean, coastal, and Great Lakes resources, such as fishing, boating, swimming, and diving, by providing improved coordination with recreational users to ensure continued access and opportunities to experience and enjoy these activities consistent with economic, safety, and conservation goals. Integrated engagement and coordination will result in stronger and more diverse ocean, coastal, and Great Lakes stewardship, economies, and communities. Moreover, CMSP can assist Federal, State, tribal, and local managers in planning activities to sustain economic, cultural, and recreational uses, human health and safety, and the continued security of the United States. Through empowering the RPBs, CMSP can overcome the obstacles and take advantage of the many opportunities present in our ocean, coastal, and Great Lakes waters.

III. National Objectives and Performance Measures [This section begins the main body of the SAP. It will list the key national strategic objectives of CMSP and describe specific performance measures for each.]

- **Introduction to the Concept**
    - As directed by the Executive Order, this SAP enumerates national objectives and associated performance measures to promote national and regional consistency in the development and implementation of regional CMS Plans. The following four national objectives are based on the national goals and guiding principles for effective CMSP under the Executive Order. Explicitly designed to tier off these goals and guiding principles, these national objectives and their performance measures should be

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

interpreted as a complement to them and not a stand-alone list of objectives. An appendix to this SAP will define key terms relevant to the CMSP process.

- While providing specific and measurable guidance, these national objectives as listed below are designed to permit flexibility for each RPB to craft regional objectives that address specific regional and local needs while helping to achieve the national goals. Due to the comprehensive nature of CMSP and the degree of external variables that could influence outcomes relative to national objectives, the approach taken here includes both outcome-based and output-based performance measures. Each national CMSP objective is accompanied by either performance measures that assess outcomes and/or milestones used to track specific outputs such as the establishment of RPBs. Index measures are used to help determine relative performance before plans are in place and after they are implemented in an effort to monitor changes attributable to CMSP according to individual agency specific mandates, authorities, and other requirements.

- The CMSP National Objectives and Performance Milestones and Measures will be designed to be as specific, measurable, achievable, realistic, and timely as possible given the nature of the planning process. They will also be designed to complement each other and guide CMSP development and implementation as well as monitoring and evaluating progress toward achieving the objectives and benefits of CMS plans.

- Under the Government Performance and Results Modernization Act of 2010, the Federal government will establish Federal performance goals deemed critically important to the Nation. Having national objectives and performance measures to track their achievement will be a benchmark for tracking interagency contributions as a whole and individually. This SAP identifies CMSP characteristics that should be reflected in its national objectives and measures such as regional scope; transparency; developed cooperatively among Federal, State, tribal, and local authorities, with stakeholders and the public working toward a shared vision; and incorporating ecosystem-based management for a more effective and cost-efficient means to guide and balance allocation of multi-sector activities. CMSP should reduce adverse cumulative impacts from human uses on marine ecosystems and provide more certainty in planning new investments. Further, it should reduce conflicts between how best to use and preserve the environment for sustainability and environmental stewardship.

- **Four Key National Objectives and Related Performance Measures**

  - **Objective 1 – Establish nine RPBs to undertake CMSP and develop by 2020 initial CMS plans for sustainable use and long-term protection of the ocean, coasts, and Great Lakes.** Per the Executive Order, CMSP is to be developed and implemented using a regional approach to allow for the variability of economic, environmental, and social aspects among the different areas of the United States. Each region is unique in geographic scope, cultural expectations and sensitivities, economic development, and

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

existing structures and planning for marine spatial planning, environmental protection, and resource management. Organizing, establishing, and beginning the work of the nine fully functional RPBs are critically important steps in carrying out CMSP and the overall National Ocean Policy. The members of each RPB will prepare and execute a CMSP Development Agreement early in the process, and then begin the planning process.

- **Objective 2 – By 2015, applicable non-confidential and other non-classified Federal data identified for inclusion will be incorporated into the National Information Management System and Data Portal.** The underpinning of the National Ocean Policy and CMSP framework is science-based decision making. While it is true that much additional research is needed, a significant amount of data and information already exists. However, not all of it is accessible or in a useable format for CMSP purposes. This second national objective calls for an innovative approach to data integration across the Federal government, as well as extending this approach to State, local, and tribal governments, industry, academia, and non-governmental organizations (NGOs). The National Information Management System (NIMS) as called for in the National Ocean Policy will not only target integration of diverse data sets, but it will also make this data readily available to decision makers, ocean users, stakeholders, and the public and support the development of new and/or improved decision support tools critical to the CMSP process. This section will include concrete action items to identify how Federal agencies will make data available and how the NIMS will support regional and local efforts. It will also describe how to best integrate data products available at State, regional, and local levels.

- **Objective 3 – Preserve and enhance opportunities for sustainable and beneficial ocean use through the promotion of regulatory efficiency, consistency, and transparency as well as improved coordination across Federal agencies.** Efficient regulatory processes are essential to preserve and enhance the sustainable use of the oceans. Improving efficiency and coordination across Federal agencies, with States, tribes, local governments, indigenous community representatives, and international partners, where appropriate, will minimize the burdens of regulatory delays on all levels of government and the regulated community. Most laws include strict time frames within which review and analysis of permitted activities must be completed. However, currently it is difficult to meet these time frames, which often leads to increased scrutiny, legal filings, and even financial constraints for both those industries that are seeking the permits, as well as the responsible Federal agencies. Using a well-designed and data-supported CMSP process can reduce these delays and costs by pre-assessing areas where certain activities may be better suited; providing frameworks for compiling all the relevant environmental, economic, and social data and information; and identifying in advance those activities that might have synergistic relationships. Coordinated efforts for integration of data as outlined in Objective 2 will also provide efficiencies and consistencies and will aid in the reduction of effort and time (by both Federal and private entities) required to support comprehensive National Environmental Policy Act

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

(NEPA) analyses. This objective will help meet the Administration's goal of reducing redundancy in Federal processes where appropriate, lead to more efficient regulatory review, and better support coastal economies into the future.

- **Objective 4 – Reduce cumulative negative impacts on environmentally sensitive resources and habitats.** Conducting an environmental impact assessment with a cumulative impact assessment is a mandatory step for any federally-regulated activity, yet assessing cumulative impacts quantitatively is challenging. Cumulative negative impacts on sensitive resources and habitats are those which result from adverse incremental impacts of human uses from the past, present, and foreseeable future. As stewards of the marine environment, Federal agencies are tasked with ensuring that beneficial environmental goods and services are not compromised by permitted activities. Similarly, a regional CMSP process involves defining and analyzing existing conditions and future conditions spatially—*before* any particular permitted activity is considered. As comprehensive, integrated assessment tools and analytical methods are developed and strengthened, so too will be the outputs of these efforts. Thus, this objective strives to avoid those impacts considered unacceptable, will lead to desirable activities being planned for those areas where resulting impacts are minimized or avoided, and will maximize existing sustainable and beneficial of the marine environment.

IV. Regional Implementation, Actions and Milestones, and Work Products. [This section will discuss regional implementation of CMSP consistent with the Executive Order and the framework for effective CMSP. Each of its elements should be clear and succinct; actionable; based on measurable and realistic outcomes within the stipulated milestones, timeframes, and limited resources; and adaptive, to allow for modification and addition of new actions based on new information or changing conditions. This section will also help identify the national and regional obstacles that must be overcome, including lack of adequate funding and other resources, better management data, and improved communications between all levels of government. An appendix will provide the timeline for the first five years of implementing CMSP at the national and regional levels.]

- **Organization of Federal, State, and Tribal Representatives by Region.** [This section will concisely describe the process that Federal agencies are using to identify, train, and authorize their regional representatives to participate effectively in the work of the RPBs. It will make brief reference to the lessons learned from the Council's National CMSP Workshop and Simulation Exercise. And, it will provide Council-approved guidance as to how State and tribal government representatives on the RPBs might be identified and selected by the States and tribes to represent their jurisdictional authorities as regional CMSP gets underway.]

- **Preparation of Regional CMSP Development Agreements.** [This section will include guidance on the collaborative process whereby the RPBs would prepare CMSP development agreements. The process for CMSP provides that once the Federal composition of RPBs is determined, the Council would coordinate with the appropriate State authorities and all Federally-recognized tribal representatives in the regions to establish RPBs, and enter into a development agreement.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

The development agreement would constitute a commitment from the partners to participate in a cooperative, open, and transparent CMSP process leading to the eventual development of a CMS Plan, acknowledging that each partner may have different authorities and non-discretionary mission objectives that must be fully addressed. Each RPB will have the flexibility to tailor the agreements as necessary and appropriate to reflect regional considerations and priorities, including relevant State and tribal interests which are essential to the success of CMSP.

  - The agreement would not commit any Federal, State, or tribal partner to its approval of a regional CMS Plan. To this end, the Council, in consultation with the Governance Coordinating Committee, is preparing a model agreement to assist RPBs in developing their own such agreements, and to foster efficiency and consistency in forming the RPBs. The model will identify the minimum elements for inclusion in the regional development agreements to be executed by the RPBs to ensure consistency with the national framework for CMSP. The Council's Model CMSP Development Agreement will be included as an appendix.]

- **Regional Capacity Assessment.** [This subsection will include guidance in assessing regional capacity consistent with the Executive Order and the framework for effective CMSP. Among other things, it will note that some regions and regional bodies are well ahead of others in their governing structure, resources, experience, and progress toward implementing CMSP.]

- **Examples of Initial Regional Steps.** [Although the determination of the initial regional steps will be left to each RPB, this subsection will provide helpful examples and lessons learned in developing regional CMS plans. Among other things, it will provide examples in the process of identifying and organizing each RPB under the leadership of the Federal, State, and tribal RPB Co-Leads, the value in holding a regional CMSP workshop and simulation exercise early in the process, and the other initial necessary steps to get the RPBs organized, up-and-running, and ready to produce beneficial results. To the extent practicable and appropriate, it will detail relevant lessons learned from other nation's marine spatial planning experiences.]

- **Stakeholder and Public Engagement and Participation.** [This subsection will include how the CMSP process will engage and involve environmental and trade groups, commercial and recreational fishing interests, other stakeholders, and the general public, including traditionally underserved, low-income, indigenous, isolated, and minority populations. It will include a proposed timeline, with specific dates, during which the initial engagement with stakeholders in the process should be completed, and how it will continue as the CMS plans are reevaluated and updated over time.]

- **Consultation with Scientists and Technical and Other Experts.** [This subsection will describe how the RPB might best consult with scientists, technical experts, and those with traditional knowledge of or expertise in coastal and marine sciences and other relevant disciplines to ensure that the development of regional CMS plans is based on sound science and the best available information. To this end, the RPB should establish regional scientific, technical, and

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

other expert participation and consultation mechanisms to ensure that it obtains relevant information as required by the Executive Order and the framework for effective CMSP.]

- **Regional Advisory Committees (RACs).** [Consistent with the guidance in section 8 of the Executive Order, this subsection will describe how the Federal RPB Co-Lead, in consultation with the State and tribal Co-Leads and RPB members, could establish such advisory committees under the Federal Advisory Committee Act (FACA) as they may deem necessary to provide information and advice to the RPB on the development of regional CMS plans to better promote the purposes of the National Ocean Policy. In the end, each RPB would make the decision whether or not to establish any such FACA advisory body.]

- **Regional Work Plan Development.** [Although the development of a regional work plan will be left to the RPBs, this subsection will describe the process of how these bodies might choose to develop a regional work plan consistent with the Executive Order and the framework for effective CMSP. It will also outline how these bodies might plan to conduct their work in a wise and cost-effective manner, to enable them to produce a comprehensive, coherent, valuable, and consensus-based regional CMS plans as quickly and efficiently as possible.]

- **Council Certification of Regional CMS Plans.** [This subsection will describe the process of submitting the regional work plans and, eventually, the CMS plans to the Council to review, add value to, and then certify these plans in a timely and helpful manner. It will also explain what steps the RPB is to follow if the Council fails to certify all or part of a regional work plan or CMS plan. Finally, this subsection will provide details as to how the Council will review each regional CMS plan for national consistency after 30-days of public comment.]

- **Development of Regional CMS Plans.** [Although the development of the regional CMS plans will be left to the RPBs, this subsection will outline a recommended process for consideration. It will explain how the RPBs might choose to conduct their work in a wise and cost-effective manner, to enable them to produce a comprehensive, coherent, valuable, and consensus-based regional CMS plans as quickly and efficiently as possible. It will recognize that there will be different approaches, timetables, and expectations for developing these plans depending on regional conditions. It will also include possible target dates for the development of a preliminary draft, final draft, and final CMS plan. Finally, it will remind the regions of the need to include stakeholder engagement, scientific input, and public comment to ensure transparency and access the best possible ideas.]

- **Implementation of CMS Plans.** [Although the implementation of the CMS plans will be overseen by regional Federal, State, and tribal authorities with the necessary jurisdiction and authority, this subsection will provide appropriate guidance, along with the development of any monitoring and assessment mechanisms and any process for adaptive management. It will also recognize how CMS plans will be incorporated into the existing decision-making processes consistent with existing statutory authority, and describe opportunities for integration with existing and future State, tribal, regional, and local efforts.]

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

V. Council Guidance Regarding the Development of a National Information Management System and CMSP Portal. [This section will discuss CMSP-related data and informational requirements. It will be entirely informed, if not completely written, by the Council's interagency Data Management Working Group, which is now developing such information and data-related guidance under the auspices of the Council. The approved data standards and other information concerning the information system may be included as an appendix.]

VI. Legal Analysis and Guidance. [This section will set forth the Council's analysis of how various statutory authorities of particular agencies can be harmonized in order to support comprehensive, integrated regional CMSP. The analysis will include an effort to identify gaps and conflicts in existing Federal authorities and recommend potential steps to reconcile them. The Council will also consider how legal authorities of Federal, State, tribal, and local entities might collectively be used to support implementation of regional efforts. In this regard, the Council will coordinate with the Governance Coordinating Committee as appropriate to ensure full consideration of relevant State and tribal legal authorities. This section will also include guidance to assist RPBs in complying with various laws relevant to their operation, such as FACA and the Freedom of Information Act (FOIA).]

VII. Regional CMSP Dispute Resolution Mechanism. [This section will set forth the regional CMSP dispute resolution mechanism currently under development by the Council in cooperation with the Governance Coordinating Committee. As provided in the Executive Order, the Council will design the mechanism in a way to ensure that most disputes would be resolved at the regional level, while ensuring consistency between the RPBs. The mechanism will ensure that all State and tribal partners will exercise a vital role in resolution of disputes involving State or tribal interests in a particular region. The mechanism will account for decision-making by the RPB by consensus. The mechanism will require that the Council coordinate with the Governance Coordinating Committee on matters involving State or tribal interests in the event a dispute is elevated to the Council for resolution. The mechanism will also be included in Council's Model CMSP Development Agreement.]

VIII. On-the-Horizon Strategic Planning Guidance. [This section is designed to provide additional strategic, long-term guidance from the Council on implementing CMSP. It may describe the benefits and products that will flow from successful CMSP, including promoting the national and regional objectives and streamlining the process of sustainable economic development in the coastal regions. However, specific elements of this guidance will be included in this SAP only as the ORM-IPC (and OST-IPC) may deem necessary and appropriate. An appendix will provide technical and scientific information and resources likely to prove useful to regional CMS planners at the appropriate level of detail. The CMSP SAP Writing Team may consider the need for such guidance and draft appropriate language for coordination with other bodies and approval by higher authority, eventually including the Council.]

IX. Conclusion

- This SAP to implement the priority objective of CMSP is intended to help chart a new course for improved stewardship of the ocean, our coasts, and the Great Lakes. Specifically, this SAP is a way forward for implementing a comprehensive, science-based, integrated, transparent, and

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

ecosystem-based planning process to achieve the sustainable stewardship and optimum uses of these vitally important areas.

- The Council and the writing team preparing this SAP are aware that the Executive Order and National Ocean Policy—and this plan under development—may create a level of anxiety among those who rely on these resources and that it may generate questions about how this plan will align with existing processes, authorities, and budget challenges. Meaningful and frequent opportunities for stakeholder and public engagement throughout the implementation of CMSP will be an essential component of addressing these concerns.

- The Council and the writing team are confident that the investments and improvements described in this SAP will significantly advance the economic interests of the United States through sustainable and productive ocean uses; improve our capacity to address the long-term challenges and impacts of climate and environmental changes; and provide a lasting foundation for improving the stewardship of and further enhancing the many vital benefits our Nation can derive from these resources. With a clear, achievable, regionally-empowered approach to CMSP, we can achieve an America whose stewardship ensures that the ocean, our coasts, and the Great Lakes are healthy and resilient, safe and productive, and understood and treasured so as to promote the well-being, prosperity, and security of present and future generations.

INTERIM

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

Inform Decisions and Improve Understanding
Strategic Action Plan
Full Content Outline

Objective: Increase knowledge to continually inform and improve management and policy decisions and the capacity to respond to change and challenges. Better educate the public through formal and informal programs about the ocean, our coasts, and the Great Lakes.

I. Overview of the Priority Objective

This strategic action plan (SAP) addresses the National Ocean Policy priority objective to:

- Ensure the availability of cross-cutting scientific research and technological innovation for developing management and policy decisions for ocean, coastal, and Great Lakes ecosystems and processes;
- Engage in ocean exploration to expand knowledge that has the potential to lead to new discoveries for energy resources and improved human health and well-being;
- Develop a comprehensive awareness and understanding of current and emerging human activities, including traditional, cultural, and historical, that affect our coastal watersheds and the ocean; and
- Increase the understanding of the importance and benefits that the ocean, coasts, and Great Lakes provide to our Nation's people.

II. Context and Continuity

Meeting this priority objective requires:

- Supporting basic and applied disciplinary and interdisciplinary scientific research, mapping, monitoring, observation, and assessment, coupled with development of forecasts, models, interactive maps, and other decision-support tools to address priority issues in ocean, coastal, and Great Lakes environments, including climate change, risks, and vulnerabilities;
- Increasing understanding of existing, emerging, and future uses of coastal, marine, and Great Lakes resources, effects of such uses on the ecosystems, tradeoffs among uses, and ways to increase sustainability of uses;
- Increasing scientific knowledge and detailed understanding of current and emerging human activities taking place in and around our Nation's waters;
- Improving management of resources and uses through data integration, increased scientific knowledge supporting management, development and improvement of spatially-explicit decision-support tools, and transition of research results into information products and tools for management;
- Increasing human capacity, developing a knowledgeable workforce, and improving education in ocean-related fields, including a focus on disadvantaged and underrepresented communities;
- Increasing ocean literacy through formal and informal education and public outreach;
- Supporting fundamental research for ocean exploration and discovery; and

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Improving integration of social and natural sciences in developing policy and management actions for the ocean, coastal, and Great Lakes ecosystems.

III. Body of the Plan

A. Action 1 - Prioritize research activities based on "Science for an Ocean Nation: An Update of the Ocean Research Priorities Plan."

Federal agencies and partners will use the new "Science for an Ocean Nation: An Update of the Ocean Research Priorities Plan" ("Science for an Ocean Nation") as the primary basis for prioritizing research activities within their agencies. They will coordinate such activities across agencies to achieve maximum efficiencies in advancing the ocean sciences. Linkages between the research priorities in "Science for an Ocean Nation" and the National Ocean Policy priority objectives are explicitly identified in the new report, thereby allowing agencies to easily identify the connections between them. This action has connections to the data gaps and research needs identified in all eight of the other SAPs. (Note: While "Science for an Ocean Nation" has not yet been officially released, a preliminary draft was available to the SAP writing team and the full report will be available to the public within the next few months. Meanwhile, we urge readers to refer to the 2007 predecessor of "Science for an Ocean Nation" entitled "Charting the Course for Ocean Science in the United States for the next Decade." The new report differs from its predecessor by more strongly emphasizing the issues of ocean acidification and changing conditions in the Arctic, and by specifically linking the research priorities to the needs of the National Ocean Policy.)

1. Why Do This
   - The National Ocean Policy calls for use of "the best available science and knowledge to inform decisions affecting the ocean, our coasts, and the Great Lakes, and enhance humanity's capacity to understand, respond, and adapt to a changing global environment." It also calls on us to "improve our understanding and awareness of changing environmental conditions, trends, and their causes, and of human activities taking place in ocean, coastal, and Great Lakes waters."
   - The new "Science for an Ocean Nation" lays out research needs to inform policy decisions across six broad societal themes that directly connect with the objectives of the National Ocean Policy.
   - It therefore serves as a valuable framework to advance knowledge in a manner that will improve understanding and provide for informed decisions using the best available science.

2. Timeframe - Near-term

3. Outcomes
   - The recommendations in "Science for an Ocean Nation" significantly influence agency decisions about resource allocations and priorities within their science or education budgets.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Increased knowledge leads to enhanced sustainable uses of and benefits from ocean, coastal, and Great Lakes resources.
- Better stewardship of resources is enabled by increased understanding of ecosystem processes, impacts of human uses, and vulnerabilities.
- Knowledge allows the creation of comprehensive and generic multi-hazard risk assessments and warning system tools to support policy and management, as well as models, policies, and strategies for mitigation of and/or finding adaptive solutions to coastal and ocean hazards, ecosystem variability, and climate change.

4. Milestones
   - Agencies reference "Science for an Ocean Nation" in budget documents used to justify and defend budget decisions and include priorities from the report in annual budget requests.

5. Gaps and Needs in Science and Technology
   - "Science for an Ocean Nation" identifies a number of gaps and needs.

B. Action 2 – Provide science to support emerging sustainable uses of resources.
Federal agencies and partners will provide science and services to support the development and production of emerging sustainable uses of ocean, coastal, and Great Lakes resources.

1. Why Do This
   - Fundamental and applied scientific information and technology are needed to characterize resources, their uses, and potential environmental impacts.
   - Providing scientific information and services will ensure that emerging and future uses of ocean, coastal, and Great Lakes resources are economically and ecologically sustainable.
   - This will also better inform the process of coastal and marine spatial planning (CMSP) regarding potential economic and environmental impacts of compatible uses, and inform ecosystem-based management (EBM) (see the CMSP and EBM SAP outlines).

2. Timeframe - Long-Term

3. Outcomes
   - Private industry, government agencies, and partners make better informed decisions about the feasibility and operations of sustainable uses of ocean, coastal, and Great Lakes resources based on environmental, social, and economic data and predictive modeling.
   - Increased opportunities for sustainable and emerging uses of ocean, coastal, and Great Lakes resources, resulting in increased opportunities for economic growth, creation of new jobs, and increased sustainability of traditional ocean uses.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

4. Milestones
   - Develop joint agency aquaculture initiatives through the Joint Subcommittee on Aquaculture and other partnerships.
   - Design new renewable energy technologies using the integrated oceanic and atmospheric observation system and modeling programs.
   - Inventory the compiled nation-wide renewable energy potential and complete the national offshore wind energy resource map.
   - Develop test beds to provide enhanced wind energy forecasts via the High Resolution Rapid Refresh modeling system.

5. Gaps and Needs in Science and Technology
   - Research and technology development to support vibrant, profitable, and sustainable ocean, coastal, and Great Lakes resource and emerging technologies industries.
   - Information necessary for existing and emerging resource uses to make informed decisions through the CMSP framework.

C. Action 3 - Provide science support for managers and policy makers.

To enable and inform science-based decisions, Federal agencies and partners will regularly assess needs of resource managers and policy makers for research, data, and information, directly respond to those needs by providing data and information, developing and improving spatially-explicit decision-support tools (e.g., integrated ecosystem assessments), and expanding training and technical assistance. This action will connect with related training activities with the EBM SAP.

1. Why Do This
   - Robust decision-support tools and processes support rapid, effective, and publicly-supported management of growing uses of ocean, coastal, and Great Lakes resources.
   - Providing needed research, data, information, and traditional knowledge will help ensure sustainability of natural resources, biodiversity, and critical ecosystem services.
   - Assessing management and policy needs will also minimize the negative environmental and human health impacts (particularly due to climate change and sea-level rise) on vulnerable communities.

2. Timeframe - Mid-Term

3. Outcomes

   Ocean, coastal, and Great Lakes decision-makers use technically robust decision-support tools, processes, and services that:
   - Integrate scientific, environmental, and socio-economic information to support EBM and CMSP;

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Provide meaningful indicators of ecosystem health and societal goals; and
- Support prediction and scenario evaluation to make informed decisions, with particular focus on CMSP.

4. Milestones
   - Create an interagency (Federal, State, Tribal, regional, and local) team that will complete an assessment of existing and needed research, data, information, traditional knowledge, decision-support tools, and training to support ocean, coastal, and Great Lakes decision-makers.
   - Develop and provide appropriate training curricula, decision-support tools, and information services to meet the needs of ocean, coastal, and Great Lakes decision-makers and other stakeholders, as identified in the interagency assessment.

5. Gaps and Needs in Science and Technology
   - Social science research and application related to the effective design and application of tools, technologies and information services (See Action 7).
   - Quantification and valuation of ecosystem services related to coastal management decision making.

D. Action 4 - Develop human capacity and the workforce.

Develop human capacity and a knowledgeable workforce, and provide scholarships, internships, fellowships, and other opportunities for high school, undergraduate, and graduate students, particularly from underrepresented groups, pursuing degrees in ocean science, management, and related fields.

1. Why Do This
   - Current graduation rates in geosciences are low, particularly for underrepresented groups.
   - U.S. competitiveness depends on a well-educated workforce.

2. Timeframe - Mid-term

3. Outcomes
   - More students, particularly from underrepresented groups, graduate in academic fields related to ocean science and management at the undergraduate and graduate level.
   - The number of students entering the workforce through Federally-supported fellowship and internship programs related to ocean science and management is increased.
   - K-12 students are engaged in extracurricular ocean-related Science, Technology, Engineering, and Mathematics (STEM) activities.

4. Milestones

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Award scholarships, fellowships, and internships for high school, undergraduate, and graduate students that leverage Federal investment in research, laboratories, and natural areas to support education.
- Focus on underrepresented groups by working with professional societies, nonprofits, and minority-serving institutions when recruiting applicants for scholarship, fellowship, and internship programs.
- Develop a new post-doctoral program for ocean sciences.
- Host competitions and activities for high school students that demonstrate impact on students' choices of future academic and career paths.
- Support underwater and ocean technology programs for secondary and post-secondary education with Federal resources.
- Fund studies to track changes in the future ocean workforce.

5. Gaps and Needs in Science and Technology - None

E. Action 5 - Increase ocean literacy.

Increase ocean literacy and expand the accessibility and use of ocean content in formal and informal educational programming for students, teachers, and the public.

1. Why Do This
   - The Ocean Project study shows high public concern about but low understanding of ocean issues.
   - Studies by the National Research Council and others show effectiveness of formal and informal science education programs at raising levels of awareness and stewardship.

2. Timeframe - Mid-term

3. Outcomes
   - Greater access to Federally-funded ocean research for formal and informal education institutions.
   - Increased public awareness and understanding of ocean science issues.
   - Communities are better stewards of ocean, coastal, and Great Lakes resources.

4. Milestones
   - Support inclusion of ocean content in revised national science education standards.
   - Support regional ocean education plans.
   - Complete a study of environmental attitudes and knowledge in middle schools with environmental education programs.
   - Develop a comprehensive ocean science curriculum for middle school based on Ocean Literacy Essential Principles.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Use data from surveys of community understanding and attitudes of ocean issues to inform future educational programming, communications, and public engagement.
- Increase the numbers of scientists engaged in ocean education.
- Engage students and public audiences in ocean science and management through innovative programs and emerging technologies.
- Create new professional development opportunities for educators that use Federal ocean research and data; train educators to reach multicultural audiences.
- Increase use of Ocean Literacy Essential Principles and related principles by networks and partners that engage students, teachers, and the public.
- Increase outdoor and experiential learning opportunities in coastal watersheds.
- Develop infrastructure and demonstration projects that deliver ocean observing data for formal and informal education.
- Support citizen science programs that engage participants in ocean sciences.
- Use inventories of Federal STEM education programs to identify additional partnership opportunities.
- Support efforts to incorporate as appropriate native and traditional knowledge into ocean education materials.

5. Gaps and Needs in Science and Technology - None

F. Action 6 - Engage in ocean exploration.

Federal agencies will engage in exploration to expand our knowledge of little-known Great Lakes and oceanic biodiversity, biogeochemical processes, ecosystem services, and climate interactions to bring new understanding and benefits to research, management, policy, and the public.

1. Why Do This
   - Ninety-five percent of the ocean is poorly known or essentially unexplored, and the potential for discoveries to expand knowledge, lead to new energy sources, develop new products, and inspire the next generation of ocean scientists is enormous.
   - For the U.S. to be a global leader in ocean exploration and knowledge of the connections between human well-being and the natural environment, we need to explore currently unexplored or poorly-known Great Lakes and oceanic biodiversity, biogeochemical processes, ecosystem services, and climate interactions at the global-scale.

2. Timeframe - Mid-term

3. Outcomes
   - New ocean discoveries expand our knowledge and understanding of Great Lakes and oceanic biodiversity, biogeochemical processes, ecosystem services, and

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

climate interactions, and this new knowledge informs management, policy, the public, and future research.
- Scientific insights and innovative technologies enhance the Nation's competitiveness by increasing scientific and technological capability and discovering new opportunities for biomedical and business development.
- The pace, efficiency, and scope of exploration are increased, and resulting discoveries are disseminated to the global scientific and societal enterprise.

4. Milestones
- Execute five expeditions in poorly-known or unknown Great Lakes and national and international ocean regions.
- Communicate new discoveries from five expeditions regularly to the public as well as to the scientific community.
- Establish five new cost-sharing partnerships with domestic and international governmental and nongovernmental entities that support global-scale systematic exploration.

5. Gaps and Needs in Science and Technology
- Innovative tools, technologies, and international partnership activities to provide the most cost-effective strategies for ocean exploration and discovery.
- A suite of common products related to ocean exploration and research agreed to by Federal agencies and partners.
- An easily accessible electronic library of scientific information and products related to ocean exploration, research, and education efforts.

G. Action 7 - Integrate social and natural scientific information.
Federal agencies and partners will integrate information from a broad range of social sciences with the natural sciences.

1. Why Do This
- Information from social sciences and economics must be routinely integrated with the natural sciences to inform research, policy development, and management decision-making, especially for ecosystem-based management and restoration, to improve public understanding of management actions.
- Incorporating social and natural sciences will support and enhance sustainable economies and other uses.
- Using social science research to apply decision theory to ocean issues will inform ocean policy decisions and assist in developing best management practices.

2. Timeframe - Long-term

3. Outcomes

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Methods and metrics that integrate the social and natural sciences are developed.
- Knowledge of human behavior, attitudes and preferences, societal values, economics, and human use of and dependence on ecosystem services is routinely acquired and incorporated into ecosystem assessments, decision-making, and management of ocean, coastal, and Great Lakes resources.
- Public attitudes and preferences are routinely incorporated into ecosystem assessments, policy, and management decisions.

4. Milestones
   - Develop one or more pilot projects that use socioeconomics and natural sciences to identify, develop, and test valuation frameworks for ecosystem services.
   - Based on the results of the pilot projects, develop a framework for valuing the ecosystem services of the Nation's critical ocean, coastal, and Great Lakes resources.
   - Perform trends analyses to characterize human interactions with the ocean, coasts, and Great Lakes and identify 'cutting edge' issues, with intent to maintain relevant data collection and analyses for the long term.
   - Apply, adapt, or develop two new decision-support tools that integrate information from natural and social sciences and are targeted toward improving the ability of Federal, State, and Tribal authorities to meet their economic, environmental, public health and safety, social justice, and equity objectives related to ocean, coastal, and Great Lakes resources and uses.

5. Gaps and Needs in Science and Technology
   - More robust approaches to incorporate natural and social science perspectives and information in ongoing research, and policy development to support ecosystem-based management and restoration.
   - More quantitative data on ecosystem processes, functions, and services, such as for different landscape and habitat types and under different environmental conditions.
   - More broadly accepted methods for determining monetary and non-monetary values of ecosystem services that are relatively inexpensive and easy to implement and for the public to understand.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

Coordinate and Support
Strategic Action Plan
Full Content Outline

Objective: Better coordinate and support Federal, State, Tribal, local, and regional management of the ocean, our coasts, and the Great Lakes. Improve coordination and integration across the Federal Government and, as appropriate, engage with the international community.

I. Overview of the Priority Objective

- One of the significant obstacles to effective management of the ocean, our coasts, and the Great Lakes is the complex set of Federal, State, Tribal, and local laws, authorities, mandates, and governance structures intended to manage their use and conservation.
- Consistent approaches to the management of resources, including ecosystem-based and adaptive management, are difficult to achieve given this shared, piece-meal, and overlapping jurisdictional model.
- The United States is party to numerous international agreements and subject to customary international law regarding use and protection of the ocean, coasts and the Great Lakes. The United States should engage both domestically and internationally to achieve increased cooperation and coordination on ocean issues.
- Through increased communication, coordination, and integration across all levels of government, we can streamline processes, reduce duplicative efforts, leverage resources, resolve disparities, and enhance synergy.
- In terms of coordination, the strategic action plan (SAP) will address:
    - Identification of needs, inconsistencies, and duplications in statutory authorities, policies, and regulations, and necessary and appropriate actions to address them;
    - Procedures to identify and align mutual and consistent management objectives and actions across jurisdictions, including those actions identified in other SAPs;
    - Tangible tools and procedures to prevent and resolve conflicts across jurisdictions and disagreements concerning jointly managed ocean, coastal, and Great Lakes resources; and
    - Opportunities for engaging the international community to further the objectives of the policy, as appropriate.
- In terms of support, the SAP will address:
    - Actions to assist the States, Tribes, territories, and local governments in advancing the network of regional partnerships to protect ocean, coastal, and Great Lakes health;
    - Evaluation of existing or new non-Federal funding sources and options to protect, maintain, and restore ocean resources; and
    - Legislative or regulatory changes necessary to simplify the sharing and transfer of resources among Federal, State, Tribal, and local agencies.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

II. Context and Continuity

- This Plan will establish mechanisms to enhance communication and coordination among Federal, State, Tribal, territorial, regional, and local governments, external resource managers, and other interested parties. Taken collectively, the individual mechanisms for cooperation recommended in this SAP provide a framework for facilitating future cooperation.
- The analysis of legal, statutory, and regulatory gaps and overlaps will support efforts to reconcile existing authorities and provide recommendations to enact additional legislation or regulation where relevant. It will also help identify opportunities for future collaboration and coordination, as well as develop a shared set of principles and objectives, through identification of agency authorizing language.
- Development of a central repository for information accessible via the National Ocean Council's (NOC) National Information Management System (NIMS) between regions, territories, States, Tribes, and local governments will facilitate the development of networks between similarly aligned actors, and enhance coordination of efforts with regional entities.
- Coordination and revealing overlap will enable managers to effectively leverage funding, and provide a real benefit and incentive to increasing cooperative efforts. Dissemination of Best Management Practices will similarly enhance operations.

III. Body of the Plan

A. Action 1 – Develop a regional communication framework under the National Oceanographic Partnership Program (NOPP).

1. Why Do This
   - Constituents of Federal, State, Tribal, and local governments need consolidated, readily accessible and deliverable information regarding existing regional ocean partnerships, assets, and resources to advance regional ocean governance.
   - Over the years, various levels of government have come together to address issues related to ocean, coastal, and Great Lakes management on a regional basis. These groups address many similar overarching concerns, such as restoration, education, and science, and in many cases are in alignment with the National Ocean Policy.
   - As these groups have matured, it has become clear that enhancing communication among them, and with the Federal government, could further the priorities addressed in the National Ocean Policy. Specifically, the ability to simplify access to the breadth of Federal capacities (e.g., funding, expertise, programs) would greatly enhance regional ocean governance. The creation of a website would facilitate information exchange and improve communication.
   - A website that served as a repository for national and regional planning documents, available resources for collaboration support, and other relevant information would be a valuable communication tool among these various

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

identified regional entities, would facilitate information-sharing and mutual progress, and would help avoid duplication of efforts. To ensure that user group needs are met, input will be gathered from States, territories, Tribes, local governments, and Regional Ocean Governance (ROG) entities during website development. ROG entities include the Great Lakes Commission, the Governors' South Atlantic Alliance, the Gulf of Mexico Alliance, the Mid-Atlantic Regional Council on the Ocean, the Northeast Regional Ocean Council, and the West Coast Governors' Agreement on Ocean Health.

- This website will also be developed in coordination with the NIMS to facilitate the exchange of information and resources within and between Federal agencies and the various regional State, Tribal, and local government entities.
- Lastly, efforts will be coordinated with other SAP writing teams (e.g. Coastal Marine Spatial Planning, Ecosystem Based Management, Ocean, Coastal, and Great Lakes Observations, Mapping, and Infrastructure) to ensure the effective support and implementation of the National Ocean Policy.

2. Timeframe – Near-term

3. Outcomes

- Improved exchange of information between and among Federal, State, territorial, Tribal, and local government entities, as well as ROGs.
- Improved coordination and understanding among interested parties about which actions are underway at the national and regional level, and where partners could engage.
- Development of a website that includes:
    - Hotlinks connecting the various ROGs.
    - Lists of contact information for each ROG with e-mail info for all members.
    - Lists of key organizations that interface with the regional entities
    - Updated information about the activities of the NOC
    - Access by ROGs to funding, expertise, and program opportunities available to regional initiatives (e.g. National Environmental Policy Act projects).

4. Milestones

- Secure sufficient funding through NOPP for developing a website or web portal.
- Complete feasibility study of hosting the website or web portal via NOPP and integrating with the NIMS
- Complete a website or web portal that provides one-stop shopping for information about ocean governance.
- Enhance intra-Federal agency connection, and enhance interaction with States, through more regularly scheduled (quarterly as the ideal minimum) meetings.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

5. Gaps and Needs in Science and Technology – N/A

B. Action 2 –Identify, prioritize, and seek to resolve legal barriers to implementation of the National Ocean Policy.

Working through the NOC Legal Interagency Working Group, address legal barriers inhibiting effective implementation of the National Ocean Policy, such as uncertainty, inconsistency, or overlap of authorities. Conduct an analysis of overlaps or sufficiency in statutory authority on particular topics identified through this process. Develop forums whereby Federal, State, Tribal, local officials, and non-governmental organizations (NGO) can interact and exchange information to work through barriers to collaboration.

1. Why Do This
   - There may be insufficient or redundant authorities in Federal, State, and Tribal ocean management regimes. This effort will address these issues and align and coordinate competing interests in ocean management, and increase efficiency and effectiveness of ocean management actions.
   - This will further the National Ocean Policy's direction to "ensur[e] a comprehensive and collaborative framework for the stewardship of the ocean, our coasts, and the Great Lakes that facilitates cohesive actions across the Federal government...." It also furthers the principles stated in the National Ocean Policy; in particular it will help "ensure and advance coordination and collaboration across Federal, State, Tribal, and local jurisdictional lines" and "eliminate redundancy and encourage efficiencies and synergies."

2. Time Frame: Near-term to Mid-term

3. Outcomes
   - Identification of the most significant redundancies, conflicts, and inefficiencies in the current ocean management regime with respect to State, Tribal, and local equities.
   - Deliverables may include:
     - Review of reports of the various entities that have already assessed the authorities in U.S. ocean management.
     - Identification of any critical issues not currently being addressed by the NOC Legal Interagency Working Group, and prioritization for closer examination or action.
     - Legal analysis of these issues, which may include recommendations for legislative, regulatory, or administrative changes.

4. Milestones
   - Conduct review of existing reports and analyses
   - Identify any critical issues requiring further analysis
   - Conduct analysis and make recommendations

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

5. Gaps and Needs in Science and Technology – N/A

C. Action 3 –Identify barriers and obstacles to successful collaboration efforts.
Examine barriers between and among Federal, State, Tribal, regional, territorial, and local entities. Conduct this activity in consultation with and with the participation of ROGs, Tribal, and representative groups and industries to achieve stakeholder perspectives as well as governmental perspectives. Determine the origin of obstacles to collaboration, be it gaps or overlaps in legislation, institutional culture of agencies, competition between entities, political pressure from select constituencies, or other possible reasons. Assess where there is the need for remedial engagement tools, and implement those tools in coordination with the NOC Legal Interagency Working Group, to achieve an early resolution of competing authorities and interests.

1. Why Do This
   - Effective management of ocean resources is sometimes delayed or obstructed by confusion, misdirection, and conflicts between agencies and laws.
   - Identifying barriers and obstacles among existing entities and proposing solutions will provide opportunities for greater collaboration and alignment.

2. Timeframe –Mid-term

3. Outcomes
   - Federal, State, Tribal, territorial, regional, local governments, and ROGs function in a more integrated manner and with greater efficiency.

4. Milestones
   - Engage the ROGs in this discussion, noting ROG methods of dispute resolution. Input from other levels of interest, including industry and insular islands and territories, should be sought.
   - Identify the most common conflicts and their causes. These might include jurisdictional overlap or uncertainty in statutes, tendencies toward mission creep, cultural differences in agencies and governments, or lack of communication among executing entities.
   - Identify solutions for the most problematic or frequent causes.

5. Gaps and Needs in Science and Technology – N/A

D. Action 4 – Identify and disseminate Best Management Practices (BMPs) utilized in Federal or regional partnerships.
Help ensure that National Ocean Policy implementation will be successfully and consistently managed despite the diverse planning groups with varied traditions and activities throughout the regions.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

1. Why Do This
    - Federal agencies, States, Tribes, local governments, and ROGs and other regional ocean partnerships have varied governance structures and ways to encourage important collaborators to participate in regional ocean planning and implementation efforts.
    - This action will help to evaluate successful existing coordination practices among Federal, State, Tribal, local, university, private-public partnerships, NGOs, coastal communities, and Fishery Management Councils to share creative solutions and lessons learned.

2. Timeframe—Mid-term

3. Outcomes
    - Identification of successful practices and models of Federal partnerships between and among Federal agencies, ROGs and other regional ocean partnerships, Tribes, and local communities for successful practices within the partnerships. Assess the tools and techniques used by successful models of coordination, understand the timeline involved in establishing a framework for cooperation, and assess the costs and benefits of various alternatives.
    - Identification of existing coordination mechanisms, evaluated in terms of the National Ocean Policy priorities, and development of processes to use them to support the goals identified in the National Ocean Policy.
    - Promotion and adoption of the positive results of current successful coordination and support mechanisms.

4. Milestones
    - Publish guidance that identifies and outlines how to incorporate existing successful coordination practices for other interagency teams and partnerships.
    - Integrate BMPs into existing regional management plans at a Federal-level and encourage that they be stepped down into all plans.

5. Gaps and Needs in Science and Technology – N/A

E. Action 5 – Identify specific ways to prioritize and coordinate resources, reduce spending overlap, and leverage funding between and among Federal agencies, Tribes, and ROGs. Once those mechanisms are identified, encourage agencies to leverage resources through collaborative efforts using partnership organizations.

1. Why Do This

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Improved coordination within the Federal Government, between Federal, Tribal, State, regional, territorial, and local bodies, and through government-private partnerships will enable all parties to better leverage limited resources.
- This action will identify and inventory specific ways to leverage funding sources among and between Federal agencies, States, Tribes, local governments, ROGs, NGOs, and the private sector.
- We will explore existing capacity building collaborations, including but not limited to NOPP, Cooperative Ecosystem Studies Units (CESU) National Network, Landscape Conservation Cooperatives (LCC), the National Estuarine Research Reserve Program, the National Sea Grant Program, State coastal management programs, and NGOs to encourage stronger participation in using these programs to carry out the objectives of the National Ocean Policy.

2. Timeframe —Long-term

3. Outcomes
   - Determination of how to best leverage existing and future ocean-focused budgets, as well as work plans within and across the Federal government through coordination with the Office of Management and Budget (OMB).
   - Identification of overlapping or related resources that are being provided by State, Tribal, and local governments, as well as non-profits or private entities.
   - Identification of programs and projects with greater opportunities for leveraging funding resources through partnerships with Federal agencies and ROGs.
   - Reduction of obstacles and streamlining cross-Federal coordination processes (e.g., interagency agreements, General Services Administration smart buys, grants and cooperative assistance)
   - Agencies better utilize and support existing collaborative partnerships.
   - Leveraging of Federal, State, Tribal, local government, university, and nonprofit programs that work with coastal communities.

4. Milestones
   - Produce a budget in coordination with OMB that identifies existing funding sources within the Federal budget that support the nine priority objectives.
   - Identify and compile the common goals among the Federal agencies, States, Tribes, local governments, ROGs, and Federal partnerships. From the common goals, identify those funds which may be strategically leveraged to maximize the benefits relative costs.
   - Evaluate existing efforts to streamline cross-Federal coordination processes to ensure that real or perceived obstacles among the agencies related to implementing the National Ocean Policy are addressed.
   - Work with NOPP, CESU, the LCCs, and coastal management programs to identify opportunities for encouraging participation in these collaborative efforts.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

5. Gaps and Needs in Science and Technology – N/A

F. Action 6 –Identify appropriate opportunities for engaging the international community about the National Ocean Policy.

Elicit international support for and improve coordination on ocean, coastal, and Great Lakes issues, in particular with countries that share the United States maritime boundaries.

1. Why Do This
   - Implementation of our National Ocean Policy will be facilitated by enhanced communication and collaboration with the international community.
   - Doing so will increase awareness of the National Ocean Policy by other countries and international organizations, and will increase support for the objectives of the National Ocean Policy from key international partners.
   - Coordination with international partners is critical in responding to projected changes from climate change.

2. Timeframe – Mid-term

3. Outcomes
   - Increased awareness of the National Ocean Policy by other countries and international organizations.
   - Increased support for the National Ocean Policy objectives and strategies from key international partners.
   - Development and implementation of similar policies by other countries and in other regions.

4. Milestones
   - Create an inventory of bilateral and multilateral agreements/discussions (including inter-agency, inter-ministerial, and inter-governmental) by a sponsoring Federal agency so that common interests and efforts may be more closely coordinated between agencies.
   - Develop additional international partnerships, where relevant, to effectively promote our National Ocean Policy.
   - Identify international organizations that address ocean and maritime issues in the National Ocean Policy
   - Identify countries that may have an interest in exchanging information on matters related to the National Ocean Policy.

5. Gaps and Needs in Science and Technology – N/A

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

Resiliency and Adaptation to Climate Change and Ocean Acidification
Strategic Action Plan
Full Content Outline

Objective: Strengthen resiliency of coastal communities and marine and Great Lakes environments and their abilities to adapt to climate change impacts and ocean acidification.

I. Overview of the Priority Objective

- Research, observations, and modeling needed to forecast regional and local scale climate change impacts and related vulnerabilities for natural resources, health, infrastructure, and livelihoods, including social and economic impacts.
- Better integration of ocean and coastal science into the broader climate dialogue and measures to improve understanding of the connections among land, water, air, ice, and human activities.
- Evaluation of potential social and economic costs related to sea-level rise, such as accelerating erosion, increased saltwater intrusion, and more severe coastal and inland flooding.
- Adaptive actions to identify climate change impacts and related vulnerabilities, such as ocean acidification, and the development of ecological and economic resilience strategies and priorities for research and monitoring to address these strategies.
- Changes to local and regional ocean and lake management systems that incorporate changing climate risks and elements of resilient systems.
- A comprehensive approach to understanding human health implications of policies for the ocean, our coasts, and Great Lakes, and for identifying opportunities for the protection and enhancement of human health.

II. Context and Continuity

- The National Ocean Policy calls for better understanding of the ocean, coastal and Great Lakes environments and the changes happening there.
- Strategies to act on this recommendation should be developed and implemented to reduce vulnerability, increase resilience, and improve the adaptation of systems to climate change impacts.
- This Strategic Action Plan includes a set of interdependent actions that will yield better understanding of, preparation for, and response to the impacts of climate change and ocean acidification impacts on communities and ecosystems. The Plan includes a coordinated approach of gathering observations, conducting foundational and interdisciplinary research to enhance understanding of the impacts of climate change and ocean acidification, developing improved models and forecasts at appropriate geographic and temporal scales, and conducting vulnerability assessments of human and natural systems. These advances will serve as a platform for the provision of accessible, timely, useful, and relevant science to inform and support the implementation of adaptation actions.
- This Strategic Action Plan outline was prepared in coordination with other strategies, plans, and assessments addressing climate change adaptation that are available, currently under preparation or nearing completion, including the National Fish, Wildlife, and Plants Climate Adaptation Strategy;

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

National Climate Assessment; the Freshwater National Action Plan called for by the Interagency Climate Change Adaptation Task Force; and U.S. Global Change Research Program Strategic Plan.

III. Body of the Plan

A. Action 1 – Improve understanding of the impacts of climate change and ocean acidification.
Advance scientific understanding of the impacts of climate change and ocean acidification on ocean, coastal and Great Lakes ecosystems and communities to provide an information basis for forecasting, vulnerability assessments, and adaptation efforts.

1. Why Do This
   - Preparing for and responding to the impacts of climate change and ocean acidification requires improved understanding of the scale, scope and intensity of these impacts on the Nation's valuable ocean and coastal ecosystems and the communities that depend on them.
   - This action will provide the information needed for improved forecasts of changes in ecological, economic, and social systems due to climate change and ocean acidification.
   - An integrated research agenda, including physical, natural, and social sciences, will address critical gaps in understanding and build a foundation for the development of models, tools, and services that support the needs of decision makers at all levels.
   - This action will also advance understanding and decrease the uncertainties surrounding the physical, chemical and biological impacts of climate change and ocean acidification and how humans would prepare for and respond to those changes.
   - This action supports and extends Action 1 in the Inform Decisions and Improve Understanding SAP.

2. Timeframe – Long-term

3. Outcomes
   - Improved scientific knowledge of the scale and scope of impacts from climate change and ocean acidification on coastal and ocean ecosystems to support the implementation of actions that strengthen resiliency of ocean and coastal ecosystems and communities.

4. Milestones
   - Conduct strategic research on the response of key species to multiple stressors (e.g. pH, temperature, and nutrients) in ocean and coastal ecosystems.
   - Improve understanding of how changes at the organismal level for key species will alter ecosystem structure and function using techniques such as evolutionary genetics, and laboratory, field, and mesocosm experiments on single and multi-species assemblages.
   - Improve understanding and valuation of the impacts of climate change and ocean acidification on ecosystem services (e.g., fisheries, storm protection) and the communities/economies that depend on them.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Develop integrated (e.g., coupled natural and human system) research projects on regional ecosystem responses to climate change and ocean acidification impacts, including thermal and pH change, alterations in oceanic circulation patterns, variations in precipitation and freshwater input, and biogeographic range shifts.
- Integrate social, cultural, behavioral, and economic sciences into studies and models of climate change and ocean acidification impacts.
- Conduct research that assesses the roles and relative importance of coastal habitats in carbon storage and sequestration to increase the ability to incorporate these valuable ecological services into restoration, management, adaptation and mitigation efforts.

5. Gaps and Needs in Science and Technology
   - Understanding of potential for physiological acclimation and evolutionary adaptation, with emphasis on ecologically and economically important organisms.
   - Expanded implementation of alkalinity as a tracer and incorporation of particulate inorganic carbon (PIC) and remineralization formulations in the biogeochemistry ocean general circulation model (BOGCM).

B. Action 2 – Forecast the impacts of climate change and ocean acidification at decision-relevant scales.

Forecast the impacts of climate change and ocean acidification on ocean, coastal, and Great Lakes ecosystems and communities at temporal and spatial scales relevant for use in vulnerability assessments, adaptation planning, and decision-making.

1. Why Do This
   - The planning and management communities have identified a need for valid points of reference when preparing for future conditions and decisions are often made at state to local levels.
   - As current knowledge of climate change impacts is assimilated, and new knowledge is being produced, the ability to predict the future state of the ocean, our coasts, and the Great Lakes as they respond to the effects of climate change is becoming even more necessary to support planning and management
   - Projections are urgently needed to plan and conduct vulnerability assessments, to inform adaptation efforts, and to avoid maladaptive activities.
   - No single, reliable information broker is consistently meeting the demand, and the existing patchwork quilt of data, information, and services is inefficient and impedes a coordinated, ecosystem-based approach.
   - The federal government can fill an urgent need by assembling the best science from federal agencies and the greater research community into best projections of what changes to expect at different spatial scales in the coming decades.
   - These projections must be maintained through regular updates and recalibrated as new science and observations provide greater clarity; in addition, they must be disseminated to practitioners through an integrated framework of climate information and services.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

2. Timeframe – Long-term

3. Outcomes
   - For the upcoming 15, 30, 60 and 100 years, develop a "best" storyline for how the future will likely vary from historical/present conditions through projected impacts to:
     - Physical/chemical oceanography (e.g. temperature, salinity, and pH change, changes to currents and circulation patterns, wave climate, tidal range).
     - Geomorphology (e.g., shoreline erosion/progradation, tidal wetlands).
     - Hydroclimatology (e.g., variations in the timing of precipitation and freshwater input, storm frequency).
     - Biology and ecology (e.g. ocean and coastal biological resources, species composition, habitat shifts, potential for invasions).
     - Human and social systems (e.g. hazards, jobs, infrastructure, communities, cultural resources).
     - Coupled natural and human systems.
   - Projected regional changes in relative sea-level and Great Lakes water levels.

4. Milestones
   - Synthesize literature and compile existing data and models to provide the initial set of projections.
   - Coordinate modeling and projections with the National Climate Assessment.
   - Continue development of the Earth System Prediction Capability (NEON, IOOS, GEOSS, etc.) with respect to development of a fully coupled ocean observation, data assimilation, and modeling capability for the ocean, our coasts, and the Great Lakes.

5. Gaps and Needs in Science and Technology
   - Better, more integrated scientific data and information to support the development of forecasts and projections.
   - Federal capacity for maintaining, updating, disseminating and archiving model code and results to support management and decision making.

C. Action 3 – Strengthen and integrate observations from the Nation's existing array of protected areas, research sites and observing systems into a coordinated framework of "sentinel sites and systems" to provide information critical for improved forecasts, vulnerability assessments, and adaptation strategies.

Strengthening and integrating observational and monitoring networks from the Nation's existing array of protected areas (e.g., National Marine Sanctuaries, National Estuarine Research Reserves, National Estuary Program, coastal National Wildlife Refuges, coastal National Parks), research sites (e.g., coastal NEON, Long-Term Ecological Research sites, OceanSITES) and observing systems (e.g., IOOS, HAB and pathogen warning systems, NOAA fisheries and protected species stock assessments, NOAA Coral Reef Monitoring Network) into a coordinated set of "sentinel sites and systems" is a highly efficient and effective way to provide managers and communities with the information they need about how coastal and ocean conditions and resources are changing over time.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

1. Why Do This
   - To effectively prepare for and respond to increasing risks and impacts, managers and stakeholders need credible and consistent information on how ecosystems are being impacted now and are likely to be in the future in order to develop, implement, evaluate, and adjust management efforts over time.
   - Linking and enhancing existing observations at protected areas and other key locations are efficient and effective ways to meet these needs.
   - This action will advance a coordinated set of "sentinel sites and systems" that deliver information on past and current conditions, early warnings of changes to come, and improved forecasting and ability to track changes in coastal and ocean ecosystems in a changing climate.

2. Timeframe – Long-term

3. Outcomes
   - A coordinated set of observations and monitoring in existing protected areas, research sites, and observation systems that allows for more comprehensive understanding of climate change and ocean acidification processes, impacts, and trends.
   - A system of "sentinel sites" that provide the management community with the information needed to develop and implement adaptation actions.

4. Milestones
   - Complete inventory and assessment of existing observations and monitoring capabilities in networks/systems of coastal and ocean protected areas, research sites, and observing systems.
   - Based on the inventory (above), determine critical gaps in information/coverage and solutions for addressing these gaps.
   - In collaboration with the National Climate Assessment, integrate existing observational and monitoring efforts into a suite of indicators of community and ecosystem impacts (physical, biological, chemical, cultural, social, economic) to track changes in vulnerability and resiliency through time.
   - Create and implement an interagency plan for standardized monitoring of the impacts of climate change and ocean acidification through existing networks of protected areas using standardized and/or interoperable techniques, databases, and indicators (see above) when and wherever possible, to maximize integration of information across networks and agencies.
   - Integrate relevant socioeconomic monitoring information (e.g., U.S. Census and Bureau of Labor Statistics data) with ecosystem monitoring information within regions to understand changes in coupled human-natural systems through time.
   - Identify existing observations on changes in species phenology (i.e., the annual timing of major life cycle events such as migration, reproduction, flowering) in coastal and ocean

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

ecosystems, and develop a plan to provide for incorporating and accessing this information as part of the National Phenology Network.

- Deploy chemical sensors at existing coastal/ocean observing systems to monitor the variability and change at local to regional levels in biogeochemistry, particularly with regard to carbon system parameters (pH, DIC, TA, pCO2), temperature, oxygen dynamics, and nutrients.
- Deploy biological sensors at existing coastal/ocean observing systems to monitor the seasonal measurements of calcification rates and other CO2-sensitive processes not currently measured at time-series sites in order to assess the long-term response of ecosystems to ocean acidification.
- Disseminate and implement best practices, including guidance for relevant parameters that should be measured at each observing system, standardized chemical and biological monitoring protocols, and quality assurance and quality control procedures. This milestone should be coupled with appropriate training opportunities.

5. Gaps and Needs in Science and Technology

- Comprehensive monitoring in protected areas with appropriate instrumentation, methods, and quality control to provide an integrated, geographically-distributed database that can be used to estimate poorly understood spatial and temporal patterns of ocean acidification and sea level rise in estuaries and coastal zones.
- Advancements in the design of chemical and biological sensors that will allow for ready and accurate *in situ* measurements of multiple carbon system parameters (pH, DIC, TA, pCO2) and biological responses, and automatic collection of metadata, where feasible.
- Strategies to eliminate or minimize biofouling of sensors so that they can be used in marine environments for extended periods.
- Incorporation of instrumentation for monitoring the impacts of climate change and ocean acidification into existing coastal and ocean observational and monitoring networks.
- Integration and coordination between existing social, behavioral, and economic monitoring efforts and ecosystem monitoring efforts.
- Management and delivery (access) of data and information.

D. Action 4 – Provide accessible, timely, and relevant climate change and ocean acidification information, tools, guidance, and services to support decision making at all scales.

1. Why Do This

- Federal agencies must work together to provide decision makers at all levels with pertinent, comprehensive, accessible, and timely information for understanding, planning for, and responding to the impacts of climate change and ocean acidification.
- This action will support efforts to build resilience across ocean, coastal, and Great Lakes ecosystems and communities.

2. Timeframe – Mid-Term

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

3. Outcomes
   - Enhanced ability of individuals, communities, and governments at all scales to identify their needs, and ultimately, to implement forward-looking, adaptive actions that build ecosystem, societal, and economic resilience.

4. Milestones
   - Make geospatial data, especially information on relative locations of water and land surfaces, shallow bathymetry, and cardinal habitat and ecological characteristics, available to ocean, coastal, and Great Lakes communities as a basis for adaptation planning.
   - Develop an interagency plan for LiDAR mapping, to acquire and maintain more precise shallow bathymetry and terrestrial elevation data in order to ensure comprehensive and accurate topographic information for coastlines, enabling response to and planning for changing landforms, water levels, and other effects of coastal inundation.
   - Provide accessible, standardized guidance for incorporating climate change and ocean acidification information into ecosystem management and coastal and marine spatial planning activities.
   - Support economic and non-economic valuation of ecosystem services.
   - Integrate information, tools, and services on coasts and oceans into the emerging online interagency climate information clearinghouse/portal, which will include:
     - Best-available scientific data and information.
     - User-friendly projections.
     - Transferable decision-support tools.
     - Best practices.
     - Relevant contacts from adaptation activities across the Nation.
     - An active support mechanism to facilitate dialogue among users.
   - Foster a "community of practice" by bringing together coastal climate change adaptation practitioners to share strategies and lessons learned.
   - Coordinate Federal climate services (e.g. data, guidance, tools, etc.) to maximize utility of information for decision-makers at all scales.
   - Develop a strategic plan for continuously identifying information needs of decision makers and addressing them through a use-inspired, integrated research agenda.
   - Provide a standard suite of regional and decadal climate projections at the scale appropriate for decision-making.
   - Provide guidance on the effective use of best-available regional and decadal climate projections, including associated uncertainties.

5. Gaps and Needs in Science and Technology
   - Geopositioning (LiDAR, shallow bathymetry, etc.) products, data and derived elevation products to support a wide range of operational needs and to establish a consistent baseline for planning assumptions, regulatory decision making, and scientific research.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Expanded availability of geopositioning information and a unified portal for access to the data to support work to conduct robust national assessments of natural resource and landform response to sea-level change and of the vulnerability of infrastructure and human communities.

E. Action 5 – Assess vulnerability of the built and natural environments and their interactions in a changing climate.

1. Why Do This
   - Addressing the inherent links between the impacts of climate change on the natural environment and the consequences for human communities and infrastructure is fundamental to improving the resiliency of ecosystems, communities, and economies.
   - This action will support decision-makers with information they need to develop actions that reduce vulnerability and strengthen resiliency and adaptation of ocean and coastal ecosystems and communities in a changing climate.

2. Timeframe – Mid-Term

3. Outcomes
   - Strategically assessing the vulnerability of ocean and coastal ecosystems and coastal communities in a changing climate.

4. Milestones
   - Establish methods, best practices, and standards for vulnerability assessments, including the consequences of climate change and ocean acidification for economic, ecological, cultural, and social systems, infrastructure, and technology.
   - Conduct coupled vulnerability assessments that address the interactions of the built and natural environments in the face of a changing climate.
   - Complete comprehensive climate change vulnerability assessments for federally funded and/or managed coastal facilities, infrastructure, cultural resources, and ecosystems.
   - Identify the most vulnerable areas, as well as areas most likely to be resistant/resilient to climate change impacts, to help decision-makers design effective adaptation plans.
   - Develop partnerships, guidance, tools, and best practices to help support vulnerability assessments at local, state, tribal, and regional scales (See Action 4).

5. Gaps and Needs in Science and Technology
   - Pathways for incorporating improved knowledge about sensitivity, exposure, and adaptive capacity, as well as future environmental changes and impacts, into vulnerability assessments (See Actions 1, 2 and 3).

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

F. Action 6 – Design, implement and evaluate adaptation strategies in order to reduce vulnerabilities and promote risk-wise decisions.

1. Why Do This
   - The Nation's coastal and ocean resources are already being impacted by climate change and ocean acidification, and these impacts are expected to increase in the future.
   - Coordinated action is needed at all levels to reduce vulnerability and impacts to the built and natural environments.
   - There is an opportunity to make significant progress in this area through building on current efforts at local, state, tribal, and regional levels.
   - There is an urgent need for immediate and prolonged investment now in adaptation plans and actions for repair, replacement or expansion of existing critical infrastructure (e.g., water and waste water treatment plants, hospitals, coastal highways, etc.) to address current and future impacts as well as reduce future losses.
   - This action will help to reduce current and future vulnerabilities and impacts to climate change and ocean acidification by enhancing and increasing the design, implementation, and evaluation of adaptation plans for built and natural environments.
   - Accomplishing this action will directly advance the nation's ability to be "climate ready."

2. Timeframe – Long-term

3. Outcomes
   - Reduced vulnerability and improved resilience of communities, ecosystems, and infrastructure through actions that lead to "climate smart" siting and design, restoration and protection of ecosystem services, improved public health and safety, reductions in the loss of life and property, and decreased costs of responding to disasters.

4. Milestones
   - Promote, build on and incentivize design, implementation, and evaluation of adaptation strategies in local, state, regional, tribal, and federal decision making.
   - Develop tools, capacity, and best practices for adaptation planning at local, state, tribal, regional, and national scales.
   - Identify, protect, connect, and restore key areas needed to promote resilience, sustain biodiversity, ecosystem function and ecosystem services, and maintain plant, fish, and wildlife corridors along coasts and lakeshores.
   - Incorporate species migration patterns and ecosystem protection measures into all publicly funded infrastructure projects.
   - Promote regional frameworks (e.g., Interagency Climate Change Adaptation Task Force regional adaptation consortia, Landscape Conservation Cooperatives, CMSP Regional Planning Bodies) for coordinated adaptation planning, implementation, and evaluation across geographic scales and organizations.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Promote ecosystem-based approaches to adaptation to use the adaptive services of natural systems to help reduce vulnerabilities and risks to people and the built environment.
- Achieve a no-net increase in the amount of property and infrastructure in high-hazard areas.
- Mitigate vulnerability of coastal communities to the effects of climate change and ocean acidification. Develop plans for fortification, retreat, or other strategies that ensure continuity of critical services and reduced exposure to hazards. Consider ecosystem-based approaches (as opposed to gray infrastructure) when feasible.
- Implement pre-disaster mitigation planning and recovery to prepare for climate change. Revise Federal guidelines and programs to encourage more resilient and sustainable forms of rebuilding or retreat.
- Reduce the impacts of stressors over which we have more direct control (e.g., pollution, habitat destruction and resource extraction) to enhance the resiliency of coastal, ocean, and Great Lakes ecosystems to climate change and ocean acidification.
- Modify policies, practices, programs or projects that promote maladaption (increased vulnerability and risks to communities or natural environments).
- Expand the interpretation, and where necessary, issue proposals to strengthen the Coastal Zone Management Act and the Stafford Act to include and better support climate change adaptation efforts.
- Develop strategies to address the unique needs for adaptation of cultural resources on shores and under water, including consultation with tribes and State Historic Preservation Offices.
- Ensure that coastal and ocean ecosystems and coastal communities are included, where relevant, in Federal agency adaptation planning efforts under Executive Order 13514.
- Complete development of the National Fish Wildlife and Plant Climate Adaptation Strategy to safeguard the nation's valuable natural resources and the communities that depend on them in a changing climate.
- Include consideration of climate change and ocean acidification impacts and costs in all federal financing (grants, loans) programs that support the maintenance or construction of public infrastructure in coastal areas.

5. Gaps and Needs in Science and Technology

- Feasible alternative scenarios for the future operations, maintenance, and relocation of built infrastructure (e.g., coastal roads, port facilities, dam operation) to mitigate the effects of climate change on ecosystems.
- Evaluation and prediction of new coastal migration corridors and potential new habitat for ecosystems.
- Methods and standards for evaluation of resilience and adaptation that include economic, ecological, cultural, and technological consequences of climate change and ocean acidification.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

Regional Ecosystem Protection and Restoration
Strategic Action Plan
Full Content Outline

Objective: Establish and implement an integrated ecosystem protection and restoration strategy that is science-based and aligns conservation and restoration goals at the Federal, state, tribal, local, and regional levels.

I. Overview of the Priority Objective

- Ocean, coastal, and Great Lakes ecosystems continue to suffer significant adverse impacts resulting from urban and agricultural development and other human activities. These ecosystem threats are being exacerbated by other stressors like the impacts of climate change and invasive species. While progress has been made in addressing some of these challenges, fish and wildlife habitat continues to be degraded and destroyed. Because many of these threats cross jurisdictional boundaries, increasing Federal support for regional approaches to ecosystem protection and restoration is necessary.

II. Context and Continuity

Ocean, coastal, and Great Lakes ecosystem protection and restoration are being carried out at state and regional scales through implementation of Federal and state resource management and land-use planning initiatives. State plans include, but are not limited to, ocean plans, coastal zone management plans, wildlife action plans, and regional ocean governance plans.

- The Governors in five regions have established state-led regional ocean governance bodies to set coastal and ocean use, management, protection, and restoration priorities: Northeast Regional Ocean Council, Mid-Atlantic Regional Council on the Ocean, South Atlantic Alliance, Gulf of Mexico Alliance, and the West Coast Governors' Agreement on Ocean Health.
- Federal agencies are also engaged in various regions through interagency collaborations focused on ecosystem restoration and management, such as the Gulf Coast Ecosystem Restoration Task Force, Federal Leadership Committee for the Chesapeake Bay (Executive Order 13508), Great Lakes Inter-Agency Task Force (Executive Order 13340), Great Lakes Restoration Initiative, South Florida Ecosystem Restoration Task Force, Puget Sound, and the California Bay-Delta Conservation Plan. Additionally, through groups like the U.S. Coral Reef Task Force (USCRTF) and the Aquatic Nuisance Species Task Force (ANSTF), interagency efforts are coordinated across several regions to preserve and protect coral reef ecosystems and to prevent and control aquatic nuisance species, respectively. Regional initiatives and numerous local efforts are also supported by the 18 joint ventures, established under the *North American Waterfowl Management Act*, the National Fish Habitat Action Plan (NFHAP) network of Fish Habitat Partnerships, Landscape Conservation Cooperatives (LCCs), and the regional planning bodies being established to conduct coastal and marine spatial planning (CMSP). Through these diverse initiatives, Federal agencies are coordinating their activities and authorities, and ensuring that

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

their ecosystem protection and restoration projects use the best available science and promote resiliency and adaptation to the effects of climate change. These initiatives also provide a mechanism to facilitate coordination among the Federal, state, and local governments, and stakeholders, and to build shared capacity to address the threats to ocean, coastal, and Great Lakes ecosystems.

The National Ocean Policy (NOP) calls for development of a Regional Ecosystem Protection and Restoration Strategic Action Plan (SAP) to address project prioritization, collaboration and coordination, science-based planning, impacts of invasive species, and protection, maintenance, and restoration of populations and essential habitats. Future updates will provide an opportunity to include next steps to advance solutions to the issues in this SAP, identify different issues and priorities, and support actions in different geographic areas.

- This SAP is intended to provide a framework for Federal activities that support existing regional ecosystem protection and restoration efforts, strengthen and expand partnerships with non-Federal entities (i.e., state, tribal, local governments, regional ocean governance organizations, academic institutions, non-governmental organizations (NGOs), private and public entities) and jointly align regional priorities and goals.
- This SAP contains a discrete set of actions to address priority issues where increased coordination and prioritization among Federal agencies and their non-Federal partners, enhancement of program effectiveness, or development and improvement of methodologies and protocols will help achieve conservation success.
- Although this SAP is national in scope, several of the actions address issues specific to a region or a resource. The actions in this SAP will build upon, and be informed by, the processes, priorities, and ongoing programs at the regional, state, and local levels. It is meant to be a bottom-up process. Ongoing collaboration and coordination with the variety of regionally-focused ecosystem restoration efforts will also occur.
- This SAP will be coordinated with several other SAPs that include actions at a regional scale, including Ecosystem-Based Management (EBM) to adopt EBM principles in the regional planning and management of ocean and coastal resources, Coordinate and Support, Changing Conditions in the Arctic, Water Quality and Sustainable Practices on Land, and the Coastal and Marine Spatial Planning (CMSP) SAP work with relevant stakeholders in each of nine regions identified in the NOP.

III. Body of Plan

A. Action 1 – Support shared regional ecosystem protection and restoration priorities.

Federal agencies collaborate with state and regional ecosystem protection and restoration initiatives throughout the U.S., but do not always effectively coordinate with each other in these efforts. Agencies will align Federal resources to support the shared priorities among the Federal and regional ocean and Great Lakes plans.

Building on the existing geographic initiatives and regional activities and experience, the SAP will create mechanisms for the sharing of information, data, and ideas between

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

geographically based initiatives and provide opportunities for addressing areas of overlap, common concern, and mutual benefit. Activities under this action should be aligned with the Water Quality and Sustainable Practices on Land SAP.

This SAP will focus initially on regions where Federal agencies are working collaboratively with states, local governments, tribes, and other stakeholders to support regional ecosystem priorities, and be expanded to include other regions in future SAP updates. "Bottom-up" input from regions will be essential to updating the SAP. The Great Lakes, the Gulf of Mexico, and the Chesapeake Bay watershed are examples of geographic regions where efforts will be focused initially:

- Great Lakes: Building on existing partnerships, support the prioritization, development, and implementation of eight multi-agency aquatic nuisance species plans for early detection, rapid assessment and rapid response. If funds allow, a Federal interagency early detection, rapid assessment, and rapid response team will be established to conduct aquatic nuisance species response activities under Federal responsibility.
- Gulf of Mexico: Collaborate with the Gulf of Mexico Alliance and the Gulf Coast Ecosystem Restoration Task Force to support ongoing regional sediment management planning efforts. Beneficial use of sediment is a key tool for regional restoration projects (e.g., coastal wetlands, shellfish beds and living shorelines, sea grass beds, barrier islands). More detail on this action will be developed as the Gulf Coast Ecosystem Restoration Strategy is developed in the coming months.
- Chesapeake Bay: Support the land conservation goals under the Chesapeake Bay Executive Order 13508, by coordinating Federal programs supporting the conservation of public and private lands that provide important habitat and other ecosystem services, and sustain working landscapes and communities.
- Future SAPs will be coordinated with regional ocean and Great Lakes governance organizations to identify actions in (1) Mid-Atlantic region, (2) Puget Sound and San Francisco Bay and the West Coast region, (3) the Florida Everglades and the South Atlantic region, (4) the Gulf of Maine and the Northeast region, and (5) in regions where regional ocean governance organizations are not established (Alaska/Arctic, Caribbean, and Pacific Islands regions).

1. Why Do This

   Aligning resources will help to:

   - accomplish protection and restoration goals identified in both the Federal and regional ocean governance plans;
   - promote better coordination between Federal agencies and regional entities in identifying protection and restoration priorities, and implementing projects;
   - protect and restore ecosystem integrity and ecosystem services, support recovery of listed species, ensure sustainable populations of commercial

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

and recreational fish and other wildlife, build resilience to climate change, enhance recreational opportunities, and provide other societal benefits; and
- more effectively utilize sediments to restore wetlands and barrier islands in the Gulf of Mexico and develop information useful to improve sediment management in other areas of the country.

2. Timeframe – Mid-term

3. Outcomes
   - Lessons-learned analysis of successful protection and restoration projects.
   - Mechanism for sharing lessons learned and best practices in coastal and wetlands restoration between regionally and geographically based efforts.
   - Improved understanding of Federal opportunities and barriers to effective regional collaboration.
   - Identification of federal programs and efforts, competing mandates, and overlapping jurisdictions.
   - Support to efforts of the Great Lakes initiatives to reduce and control aquatic nuisance species.
   - Increased beneficial management and use of sediment for restoration projects in priority coastal areas, particularly in the Gulf of Mexico.
   - Strategic allocation of Federal land conservation funds in the Chesapeake Bay watershed.

4. Milestones
   - Complete and implement state and Federal interagency rapid assessment and response plans to prevent and control aquatic nuisance species in the Great Lakes.
   - Carry out a series of mock exercises to practice responses under the State and Federal plans and conduct actual responses throughout the Great Lakes Basin.
   - Assess, compile, and strategically integrate sediment management plans for priority coastal areas in the Gulf of Mexico and develop lessons learned documentation.
   - Conduct regular interagency meetings to align Federal assistance to support regional land conservation goals and identify opportunities for interagency collaboration.
   - Conduct a lessons-learned analysis of successful restoration and mitigation projects.
   - Compile assessment of regional and local initiatives, identifying Federal programs, grants and opportunities that can be brought to bear.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

5. Gaps and Needs in Science and Technology
    - Inventory of aquatic nuisance species that could potentially be introduced into the Great Lakes, their biology and life histories, and vectors by which they could be introduced.
    - Benthic data and maps for coastal areas in the Gulf of Mexico, including sediment type, contaminated sediment, and biological communities.

B. Action 2 – Strengthen conservation partnerships

Numerous innovative partnering efforts exist that contribute to progress in regional ecosystem protection and restoration. Enhanced mechanisms to increase partnerships are needed to bring together resources from Federal and non-Federal organizations to support restoration projects and facilitate the stewardship of ocean, coastal, and Great Lakes resources. As a first step towards building these the following actions will be taken:

- Encourage increased corporate support for ocean, coastal, and Great Lakes ecosystem protection and restoration by aligning the priorities of the Corporate Wetlands Restoration Partnership (CWRP) with other public-private organizations, including the regional joint ventures and Fish Habitat Partnerships. The Federal agencies will assist the CWRP Board to broaden its mission, expand its membership nationally, and increase its support of ocean, coastal, and Great Lakes ecosystem protection and restoration.
- Support an umbrella structure for a network of Coastal Conservation Corps to build local capacity to provide jobs and workforce training for a new generation of natural resource professionals, and engage citizens in protection, restoration, and stewardship of ocean, coastal, and Great Lakes ecosystems.
- Formalize Federal participation in the National Fish Habitat Action Plan (NFHAP), to protect, restore, and enhance our waterways and fisheries throughout the country.

1. Why Do This
    - Partnerships are critical to achieving the protection and restoration needed for coastal habitats that provide ecosystem services. Entities that make significant contributions towards protection and restoration include corporate, citizen-based, and local, tribal and state-led partnerships.
    - Corporations can provide an important source of investment in the conservation of ocean, coastal, and Great Lakes habitats. The CWRP provides a vehicle for corporations to invest in conservation either by providing direct project support or through the CWRP Foundation. CWRP has successfully engaged the private sector in working with Federal agencies to support coastal habitat protection and restoration. To date, the CWRP has contributed $4.5 million, which has leveraged $112 million of Federal, state, tribal, local, and non-governmental funds.
    - Several states have Conservation Corps programs that promote environmental stewardship, create jobs, and foster a commitment to community service that aligns with the goals of the America's Great Outdoors Initiative. Benefits to

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

local economies and ecosystem health can be expanded by supporting a coordinated network of local Conservation Corps. This action is linked to Action 4 in the Inform Decisions and Improve Understanding SAP, which addresses development of human capacity and the workforce.

- The NFHAP is an existing nationwide partnership–based investment strategy to increase the return on fish habitat conservation. There are 21 partnerships across all 50 States that benefit jobs, recreational and commercial fishing communities, and address the impacts of climate change.

2. Timeframe – Long-term

3. Outcomes
   - The CWRP provides project support for ocean ecosystem protection and restoration.
   - CWRP membership is expanded by 50 percent with a chapter in all 29 coastal States.
   - Increased corporate partnerships through CWRP to complete Federal ocean, coastal, and Great Lakes ecosystem protection and restoration projects.
   - Coastal Conservation Corps coordinating body is established and aligned with other national and regional initiatives, notably the America's Great Outdoors Initiative, to enlist citizens, including low-income and disadvantaged youth, to conduct coastal ecosystem protection and restoration projects and expand opportunities and funding for youth employment and training.
   - As appropriate and to the extent allowed by law, regional ecosystem conservation projects funded by Federal grant programs are coordinated with the objectives of the Fish Habitat Partnerships.
   - Increased capacity of a non-governmental Coastal Conservation Corps to engage citizens in ecosystem protection and restoration projects.

4. Milestones
   - Amend the CWRP Charter to include support of ocean ecosystem protection and restoration.
   - Coordinate between Coastal America Regional Implementation Teams and CWRP to increase ocean, coastal, and Great Lakes protection and restoration project identification.
   - Increase, by 50 percent, annual CWRP financial and in-kind contributions to Federal ocean, coastal, and Great Lakes protection and restoration projects.
   - Enable one coastal Conservation Corps to participate in the network in each region of the U.S.
   - Clarify and formalize the respective roles of the agencies in supporting the National Fish Habitat Action Plan (NFHAP). Create an expanded NFHAP Federal Caucus that includes active participation by all Federal agencies whose activities affect fish habitat.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

5. Gap and Needs in Science and Technology – None

C. Action 3 –Reduce coastal wetland loss and improve understanding of coastal wetland status and trends

To reduce, and work toward the goal of reversing, coastal wetland loss, the NOC (principally EPA, USACE, USFWS, and NOAA) will work together and in cooperation with states and tribes to identify the underlying factors responsible for the loss of wetlands in coastal watersheds. Pilot watersheds will be selected, in consultation with local, tribal, and state entities affected by their loss, based on where wetland loss is greatest due primarily to human activities and the availability of reliable and historic data. The NOC agencies will compile existing information for the pilot watersheds, including wetlands inventories, coastal change analyses, geospatial data, permits and other types of data on natural processes to assess the status of the coastal wetlands and the causes of observed losses. This assessment will result in recommendations on how all levels of government could collaborate to improve the management of coastal wetlands and reduce losses nationwide.

As an ongoing effort, NOAA and USFWS will produce an assessment of coastal wetland status and trends using data collected for the USFWS *Status and Trends of Wetlands* reports.

1. Why Do This

- Coastal wetlands are among the most productive ecosystems on Earth, providing critical services to communities and wildlife. According to the *Status and Trends of Wetlands in the Coastal Watersheds of the Eastern United States 1998-2004,* coastal wetlands were being lost at a faster rate than non-coastal wetlands. Development (urban, rural, and unclassified) was responsible for about 70 percent of the wetland loss in coastal watersheds. Remaining wetland losses occurred as a result of natural processes such as storms, erosion, subsidence, and sea-level rise.
- Of those wetlands lost as a result of development, some were authorized under Section 404 of the *Federal Water Pollution Control Act of 1972* (Clean Water Act) and offset by compensatory mitigation (programmatic no net loss). Others have resulted from unauthorized activities in violation of a variety of Federal and state environmental statutes. Still other losses may have occurred because the wetlands involved were not subject to any regulatory program. This assessment will more precisely identify causes of coastal wetland losses and potential program improvements to stem these losses.

2. Timeframe – Long-term

3. Outcomes

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- A better understanding of the underlying causes of wetland losses in rapidly developing areas and areas that are expected to be impacted by future development.
- A better understanding of the magnitude of unauthorized coastal wetland losses and how Federal, tribal, and state agencies might collaborate to reduce and ultimately reverse these losses.
- A better understanding of the extent of the losses that were beyond the scope of Federal regulatory programs and how such losses might be reduced in the future.
- Recommendations of actions Federal agencies could take to improve the management of coastal wetlands (e.g., education, restoration, protection, regulation) and communication of this understanding to regional programs.

4. Milestones

- Identify coastal watersheds for pilot assessments with updated wetland inventories and high-quality geospatial data, if available.
- Complete analyses of data and information from the 2011 Status and Trends of Wetlands in the Conterminous United States, NOAA's Coastal Change Analysis Program, the Section 404 program, and geospatial sources.
- A report recommending actions Federal agencies can take, in coordination with state, and tribal agencies, to improve the management of coastal wetlands and reduce losses nationwide.
- An assessment of the status and trends of coastal wetlands. The assessment will be included as a chapter in future *Status and Trends* reports, published by the USFWS every decade.

5. Gap and Needs in Science and Technology

- Reliable and consistent data on the location, size, type, and cause of coastal wetland losses.
- High resolution imagery that can detect changes in land use status from undeveloped to developed.

D. Action 4 – Create carbon-based incentives for coastal habitat conservation

Coastal wetlands, mangroves, and sea grasses sequester vast amounts of carbon in their plant material and sediments (up to five times the rate of tropical rainforests per unit area). These carbon sequestration and storage capabilities are important ecosystem services that can be evaluated and considered to increase the restoration and avoided loss of these habitats. Key first steps to take advantage of these benefits are developing carbon sequestration/storage protocols for coastal wetlands and exploring policy options for incorporating the carbon sequestration services of these habitats into Federal decision-making.

1. Why Do This

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- A more comprehensive understanding of the services provided by coastal wetlands promotes the conservation and restoration of these important habitats.
- Although carbon sequestration is a valuable ecosystem service, it is not explicitly quantified in Federal policies governing impacts to coastal habitats. Undertaking an analysis of policy options to potentially include carbon storage in the assessment of ecosystem services would be the first step in determining if policy changes could provide additional incentives for conservation (and disincentives for habitat destruction).
- Significant opportunities exist to channel private investment into coastal habitat protection and restoration, by bringing these projects into a voluntary carbon market or promoting the carbon services provided by these habitats; however, a protocol must first be developed that provides a reliable framework for evaluating and potentially quantifying carbon gains.
- This action supports the resilience of ecosystems to climate change, as presented in Action 6 of the Resiliency and Adaptation to Climate Change and Ocean Acidification SAP.

2. Timeframe – Near-term

3. Outcomes
   - Increased private investment is channeled into coastal habitat protection and restoration.
   - Increased protection and restoration of salt marsh, mangrove, and sea grass habitats and increased mitigation requirements for impacts to these systems.
   - Increased capacity for governments to implement voluntary restoration and protection programs.
   - Reliable framework developed for implementing coastal habitat conservation projects to create offset credits.
   - Greater understanding of Federal policy opportunities and barriers for including carbon sequestration in ecosystem service assessment calculations.

4. Milestones
   - Adoption of methodologies to assess carbon sequestration capacity for different coastal wetland types, mangroves, and sea grasses.
   - Identification of demonstration sites appropriate for carbon sequestration and emission research, with emphasis on sites already identified for the purposes of long-term ecological research (e.g., National Wildlife Refuges, National Estuarine Research Reserves, National Estuary Programs, and other sites that are part of the Long-term Ecological Research Network).
   - Development of a greenhouse gas offset protocol for coastal wetland conservation for use in voluntary carbon markets.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Completion of assessment of Federal policy opportunities and barriers for including carbon sequestration in ecosystem service assessment calculations.

5. Gaps in Science and Technology
   - Research to compare rates of carbon sequestration and carbon emission in different regions and under varying conditions (e.g., degraded vs. restored) is needed to understand the full nature of coastal ecosystem carbon services. This research gap is being addressed by the Resiliency and Adaptation to Climate Change and Ocean Acidification SAP.

E. Action 5 – Ensure full mitigation for injuries to coral reef ecosystems

To improve the protection and restoration of coral reef ecosystems, Federal agencies responsible for coral reef protection, restoration, and mitigation will develop standard protocols for coral reef ecosystem mitigation options and execute an agreement to use them as the basis for coral reef mitigation efforts. The USCRTF state and territory members will play key roles in contributing to the actions outlined here.

1. Why Do This
   - Responsibilities for mitigation assessment and policies regarding mitigation of impacts to coral reef ecosystems are distributed among four Federal agencies (EPA, USACE, DOI, and NOAA). Enhanced coordination will increase efficiency and effectiveness and improve scientifically sound mitigation, protection, and restoration of coral reef ecosystems.
   - Establishing a common set of protocols for mitigating impacts of human activities to coral reef ecosystems will result in scientifically sound and consistent coral reef mitigation projects.

2. Timeframe – Long-term

3. Outcomes
   - Identify and recommend assessment metrics specific to coral reef ecosystem functions and services.
   - Adoption of standard coral reef ecosystem mitigation protocols by the four Federal agencies with mitigation responsibilities.
   - Performance criteria, monitoring protocols, and mechanisms to track success or failure of mitigation.
   - Regionally specific guidance of measures necessary to reduce and mitigate coral reef ecosystem degradation and to restore damaged coral reefs.
   - A *Reef Managers Guide to Mitigation and Restoration* that provides guidance for managers on best management practices related to mitigation.

4. Milestones

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Establish a restoration and mitigation working group (including USACE and EPA) to act as a convening body for the USCRTF and other interested parties for coral reef ecosystem restoration and protection issues.
- Conduct a lessons-learned analysis of successful mitigation projects.
- Compile standard protocols for mitigation options to facilitate sound, consistent, and replicable restoration and mitigation of affected coral reef ecosystems.
- Prepare recommendations for improved policies and practices regarding compensatory mitigation related to coral reef ecosystems.
- Develop Draft and Final Functional Assessment for Coral Reef Ecosystem Mitigation.
- Develop a draft and final *Reef Managers Guide to Mitigation and Restoration*.

5. Gaps and Needs in Science and Technology
   - Document successful mitigation/restoration efforts for coral reefs.
   - Develop a standardized, regionally scalable methodology for assessing coral condition and valuing impacted resources. Because coral reef ecosystems are complex and their services vary considerably, even within a local area, assessment of their ecological value and mitigation costs must be conducted on a case-by-case basis.
   - Evaluate declining baseline conditions of coral reefs as a complicating factor in the assessment of restoration and mitigation success.

F. Action 6 – Reduce the threat of aquatic nuisance species

Aquatic nuisance species damage ecosystems by reducing biological diversity and adversely affect humans by hindering economic development, interfering with recreational and commercial activities, decreasing aesthetic values, and serving as vectors of disease. Through the Aquatic Nuisance Species Task Force (ANSTF), Federal agencies are working together to control aquatic nuisance species through regulation, management, and education.

- Agencies will work with the ANSTF to identify priority nuisance species needing immediate action.
- As an example, one known priority is the Indo-Pacific lionfish. Federal agencies will collaborate with non-Federal partners and stakeholders to develop an innovative inventory and control plan for the Indo-Pacific lionfish that can be adapted for transfer to other marine invasive species.

1. Why Do This
   - Support of ANSTF efforts emphasizes the need to prevent the introduction and dispersal of aquatic nuisance species, and provides the opportunity to address priority issues on a regional basis.
   - Because each region poses a set of unique challenges and available resources, mechanisms to increase partnerships are needed to bring together the

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

expertise, strengths, and resources from Federal, state, international agencies, Fishery Management Councils, academic institutions, and other organizations to effectively control invasive populations.

- As an example of the benefits of addressing priority aquatic nuisance species, an initial programmatic response can address Indo-Pacific lionfish. In less than a decade, the Indo-Pacific lionfish has become widely established along the Southeast U.S. and Caribbean, and poses a threat to many native reef fish populations through direct predation and competition for food and space resources. The lionfish is the first marine aquatic invasive finfish to become established within Western Atlantic waters; thereby the species is capable of providing new information on fundamental ecological processes including dispersal, competition, and community structure. This information would benefit ecosystem-based management of native reef fisheries through improved understanding of dispersal and connectivity, prevention of future invasions, control of established invaders, and opportunity to implement a control plan across international boundaries.

2. Timeframe – Near-term

3. Outcomes
   - A list of priority aquatic nuisance species to address in key geographic areas.
   - A lionfish control plan with goals and actions to reduce their threat to native ecosystems is implemented.

4. Milestones
   - Develop an initial set of priority aquatic nuisance species coordinated with affected regional entities.
   - Establish a Lionfish Control Committee in coordination with the ANSTF, and that Committee completes a draft lionfish control plan.

5. Gaps in Science and Technology
   - Better tools for lionfish control and management, including a better understanding of lionfish ecology in its native habitat and understanding of impacts across different reef systems.

G. Action 7 – Identify nationally significant marine and Great Lakes aquatic areas in need of protection.

Healthy and productive ocean and Great Lakes ecosystems support a variety of species, promote recreational opportunities, provide resilience to the effects of climate change, and support coastal communities through economic growth and increased employment opportunities. Three actions will be initiated as a first step to strengthening place-based conservation of marine and Great Lakes resources:

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Consult with the states and the CMSP Regional Planning Bodies about the existing and potential uses of areas and appropriate levels of protection.
- Develop a process for identifying ecologically important areas via a pilot map analysis.
- Characterize and prioritize marine areas of national significance, including consideration of ecosystem services, by reactivating the National Marine Sanctuary Site Evaluation List (SEL).

1. Why Do This
   These actions inform planning for future marine protected areas and ocean planning:
   - A marine gap analysis is needed to identify areas that are nationally significant, ecologically important, and provide important ecosystem services. This analysis will integrate resource characterization and human use data at regional scales and inform the CMSP process.
   - The SEL is a decision support tool designed to evaluate areas nominated for designation as marine sanctuaries, and is one of a number of tools that could be used to identify areas that are nationally significant due to their qualities (e.g., conservation, cultural, esthetic).

2. Timeframes – Mid-term

3. Outcomes
   - A protocol for evaluating nationally significant and ecologically important marine areas for protection that is science-based and balances human uses with conservation.
   - Updated and repopulated Sanctuary Evaluation List (SEL).
   - Recommendations of mechanisms to provide the appropriate level of protection to sustain ecosystem services for the listed sites.

4. Milestones
   - Establish an interagency working group to develop the gap analysis protocol.
   - Reactivate and repopulate the SEL with marine areas that have been identified as nationally significant due to their conservation, recreational, ecological, historical, scientific, cultural, archaeological, educational, or esthetic qualities.
   - Conduct an inventory of other information sources that could be integrated into the gap analysis.
   - Pilot the gap analysis protocol in two U.S. regions as part of the CMSP planning process.

5. Gaps in Science and Technology
   - Identification of potential protected areas requires using the best available scientific information and nominations from participating Federal and state

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

agencies and contributors. This will be coordinated with the Inform Decisions and Improve Understanding SAP.

H. Action 8 – Improving the effectiveness of coastal and estuarine habitat restoration projects

Several Federal agencies fund and implement coastal and estuarine habitat restoration projects. It is important that these efforts are coordinated, evaluated, and tracked to ensure that restoration implementation is effective and efficient. The Estuary Habitat Restoration Council, established under the *Estuary Restoration Act of 2000* (ERA), is an established vehicle to bring Federal agencies together to jointly solve habitat restoration issues. To further these efforts, Federal agencies, beginning with the Estuary Habitat Restoration Council members, will: (1) improve the effectiveness of coastal and estuarine habitat restoration projects by updating and adopting the ERA monitoring protocols; (2) work to identify socio-economic monitoring parameters; and (3) input estuary restoration project tracking information into the National Estuaries Restoration Inventory (NERI).

1. Why Do This
    - Monitoring allows practitioners to track project success, determine which restoration methodologies are the most successful and cost effective, document ecosystem services provided, and identify when adaptive management is required.
    - The ERA establishes a collaborative process among Federal agencies for addressing the threats to the health of our Nation's estuaries. The Act recognizes the importance of project monitoring and tracking to the success of any estuarine conservation program. The ERA established an interagency Estuary Habitat Restoration Council made up of DOI-FWS, NOAA, USACE, EPA, and USDA-NRCS.
    - The ERA required NOAA, in consultation with the Estuary Habitat Restoration Council (ERA Council), to establish minimum monitoring requirements for projects funded under the Act. These monitoring requirements have been established and are applicable to all coastal habitat restoration projects. Project effectiveness would benefit through consistent use of requirements for project monitoring.
    - The ERA also requires NOAA, in consultation with the ERA Council, to develop NERI, which maintains a publically accessible database of information concerning estuarine habitat restoration projects carried out under the Act, as well as for other projects that meet the minimum monitoring requirements. Using this database reduces duplicative and competing databases and helps to streamline restoration activities.

2. Timeframe – Mid-term

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

3. Outcomes
    - Adoption and implementation of the ERA coastal and estuarine habitat restoration monitoring protocols by Federal agencies involved in coastal habitat restoration.
    - Identification of socio-economic monitoring parameters for coastal and estuarine habitat restoration projects.
    - Incorporation of estuarine restoration data into NERI from all Estuary Habitat Council agencies' project tracking databases.

4. Milestones
    - With input from states and stakeholders, conduct review and subsequent update of ERA monitoring protocols; include suggestions for socio-economic parameters.
    - Evaluate interagency database needs and solutions, and update the existing NERI database accordingly to allow use by all restoration agencies.
    - Fifty percent of new estuarine restoration projects conducted by the Estuary Habitat Restoration Council agencies use ERA monitoring protocols.

5. Gaps in Science and Technology
    - Need to review and update restoration monitoring protocols at least once a decade.
    - Clarify Federal policy regarding geospatial data for projects on private lands.

INTERIM

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

Changing Conditions in the Arctic
Strategic Action Plan
Full Content Outline

Objective: Address environmental stewardship needs in the Arctic Ocean and adjacent coastal areas in the face of climate-induced and other environmental changes.

I. Overview of the Priority Objective

- Address environmental stewardship needs in the Arctic Ocean (including contiguous Bering, Chukchi, and Beaufort Seas) and adjoining coastal areas in light of climate and environmental change, as well as increasing accessibility to human activity.
- Improve efforts to conserve, protect, and sustainably manage Arctic marine resources, effectively respond to the risk of increased pollution and other environmental degradation on humans and marine life, and adequately safeguard living marine resources.
- Develop new collaborations to better monitor and assess environmental conditions and to devise procedures to respond to emergencies such as environmental accidents.
- Achieve consistency and coordination with the implementation of the United States Arctic Region Policy as promulgated in the National Security Presidential Directive 66/Homeland Security Presidential Directive 25 (2009).
- Improve the scientific understanding of the Arctic system and how it is evolving in response to climate change and other forcers.

II. Context and Continuity

- The Arctic is a frontier. While it is considerably less developed than other U.S. maritime areas, access to the region is increasing rapidly. To achieve National Ocean Policy goals, the U.S. will require fundamental research, improved coordination, and new infrastructure.
- Alaska Native communities rely on the Arctic environment for important cultural, subsistence, and ceremonial practices. Identification and implementation of the strategic actions in this plan will be undertaken with their active engagement.
- Seven themes were identified as focus areas for this action plan:
  - An integrated Arctic observing network.
  - Arctic climate and environmental change (understand, forecast, predict).
  - Arctic mapping and charting.
  - A safe, secure, and reliable Arctic Marine Transportation System.
  - Stewardship of the Arctic marine environment and sustainable development of resources.
  - Resilient and healthy Arctic communities and economies.
  - Domestic and international policy and partnerships in the Arctic.
- As one of nine national priority objectives "Changing Conditions in the Arctic" is unique. It is the only one that is place-based, or focused on a single region. As a result, many topics in the Arctic strategic action plan are also addressed in other plans, or are even their primary focus. To be

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

fully successful, the actions in the Arctic plan must be considered and implemented within the broader context of the other eight objectives.

- This Strategic Action Plan outline is consistent with other efforts, including the U.S. Global Change Research Program Strategic Action Plan.

III. Body of the Plan

A. Action 1: Improve Arctic environmental response management.
Develop management systems and procedures to protect communities and ecosystems from oil spills and other accidents associated with resource extraction (oil and gas) and Arctic marine transportation (e.g., commercial shipping and tourism). Specifically, inform the development and implementation of response coordination mechanisms such as the Environmental Response Management Application (ERMA®), a geospatial decision-support tool.

1. Why Do This
   - Exploration and development of natural resources in the Arctic, and a rise in marine traffic will increase the probability of accidents.
   - Taking action to prevent, prepare for, and respond to environmental emergencies will better protect communities and ecosystems.
   - To protect subsistence resources which provide the nutritional benefits and cultural practices of Alaska Native communities.
   - Procedures to respond to Arctic Ocean oil spills are specifically called for in the "Report of the National Commission on the BP Deepwater Horizon Oil Spill."
   - Responds to the National Ocean Policy goals to "respect and preserve our Nation's maritime heritage, including our social, cultural, recreational, and historical values," and, "support sustainable, safe, secure, and productive access to, and uses of the ocean, our coasts. . ."

2. Timeframe – Mid-term

3. Outcomes
   - Better protection of sensitive areas of the U.S. Arctic through more efficient resource management and emergency preparedness.
   - Increased coordination among Federal agencies in cooperation with state agencies, local, and Tribal governments, and international bodies.
   - Specific plans and understanding of responsibilities to prepare and respond to emergencies related to resource development and marine transportation.
   - Community participation in the development of oil spill prevention planning and response measures and coordination mechanisms.
   - Well-coordinated sharing of resources and information related to pollution response within the U.S. and across the Arctic.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Scientific support for prevention and management of a large pollution event in the Arctic is well coordinated among Federal and state agencies and local and Tribal governments.
- A comprehensive understanding of the impacts of a large pollution event in the Arctic on traditional livelihoods, sensitive ecosystems, economies, and security.

4. Milestones
   - Complete the development and implementation of ERMA® to prepare for Arctic oil spill response, assessment, and restoration.
   - Finalize and test contingency plans to ensure adequacy of response equipment, trained personnel, and nearshore protection strategies. Use existing response preparedness efforts, such as the Aleutian Island Risk Assessment.
   - Cross-train emergency responders (for example, response to oil in sea ice).
   - Assess and compile scientific research as well as traditional knowledge related to the impacts of resource development and pollution applicable to the Arctic.
   - Integrate Federal efforts to study oil spilled in ice-covered waters.
   - Support substantial U.S. participation in efforts to create an Arctic-wide agreement on oil spill preparedness and response that may ultimately lead to international standards for maritime activities including oil and gas operations in the Arctic.
   - Participate in joint training and workshops with other Arctic nations on oil spill prevention and response mechanisms and procedures, including deployment exercises in Arctic conditions.
   - Develop cooperative agreements with Tribal, local, State, Federal and other Arctic nations' governments for sharing response assets and resources across the Arctic in the event of a large pollution event, including: (1) worldwide inventory of equipment available for deployment in the Arctic; (2) command, control and communications strategies, and; (3) international guidelines for spill response in broken-ice and ice-covered environments.
   - Partner with industry to ensure the development of oil spill prevention, containment, and response infrastructure, plans, and technology that are proven effective in ice-covered seas.

5. Gaps and Needs in Science and Technology
   - Better spill containment technology that is suited for operation in the Arctic environment.
   - Increased coordination among scientists, resource managers, and constituents on the potential effects of a large pollution event in the Arctic; for example, marine mammal biologists and scientists studying ice flows working together on impacts of oil in an ice environment or scientists working more effectively with resource managers to better articulate information needs facilitating better emergency response.
   - Increased sharing across agencies of tools such as ERMA®.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Participation of U.S. Federal scientists in development of spill containment technology already taking place within industry.
- Local community training and education related to the impacts of resource development.
- International participation in Arctic-wide spill response efforts.

B. Action 2 – Observe and forecast Arctic sea ice.
Observe, predict, forecast, and ultimately project the extent, thickness, and age of summer and winter sea ice in the Arctic Ocean and contiguous seas. The timeframe and extent of the forecasts will be designed for a variety of stakeholders, and will support safe operations and ecosystem stewardship.

1. Why Do This
   - Sea ice forecasting is the most urgent and timely ocean issue to address in the Arctic region; continued rapid loss of sea ice will be a major driver of changes across the Arctic. The loss of sea ice affects marine access, regional weather, global climate, marine and terrestrial ecosystems, and coastal communities.
   - This action advances ocean stewardship, the economy, and national security by providing situational and domain awareness, and improves foundational science to understand and detect climate and ecosystem change.
   - Improving daily to weekly sea ice forecasts will benefit community activities (e.g., safer subsistence hunting, storm preparation/defense), support the management of protected marine resources, and improve the safety of general maritime activity.
   - Longer-term sea ice forecasts are needed for infrastructure planning, ecosystem stewardship under rapidly changing conditions, and projection of global climate impacts forced by changes first occurring in the Arctic.
   - All-season observations from platforms and ice camps on and under Arctic sea ice will improve our understanding of Arctic environmental variability.

2. Timeframe – Long-term

3. Outcomes
   - Accurate, quantitative, daily forecasts to decadal predictions of sea ice support safe operations and ecosystem stewardship.

4. Milestones
   - Conduct workshop on sea ice forecasting to prepare initial implementation plan.
   - Initiate interagency activity to improve application of remote sensing and buoy/mooring data to sea ice forecasting (DOD funding pending).
   - Initiate cataloging for U.S. Arctic Sea Ice Atlas.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Train and expand Volunteer Observing Ship and coastal community participation in sea ice observation program; catalogue user requirements for sea ice products, services and delivery.

5. Gaps and Needs in Science and Technology
   - Improved applications of remote sensing and buoy/mooring data for sea ice characteristics and sea ice vector analysis.
   - New real-time *in situ* observational technologies for atmosphere, ice, and ocean variables that control sea ice movement, melt, and growth.
   - Coordination with and access to charter and non-charter vessels capable of working in Arctic areas during spring, summer, and fall seasons.
   - Improved understanding of the links between sea ice an oceanography, such as through heat flux and circulation.
   - New sea ice models that: assimilate advanced observing data; output sea ice thickness, concentration, location with time at higher temporal and special resolution; and couple ice/ocean/atmospheric processes.

C. Action 3: Establish a distributed biological observatory.
Implement an international distributed biological observatory (DBO) in the Pacific Arctic sector focused on six locations along a latitudinal gradient from the northern Bering to the western Beaufort seas.

1. Why Do This
   - Scientific research will provide a better understanding of how climate change affects Arctic biology, and what steps will be necessary to improve stewardship of the Arctic marine ecosystem.
   - Changes in location and timing of the seasonal ice edge can have profound effects on benthic and pelagic marine ecology and human activity. These same changes also affect the ability of ice-dependent marine mammals to reproduce and rear young on ice.
   - Planktonic changes can affect distribution and abundance of baleen whales that are important to subsistence cultures. Likewise, stranding of ice-dependent species on land likely reduces their survival or reproductive rate and may make the animals less available to subsistence hunters.
   - Relationships between ice edge retreat, changes in plankton dynamics, loss of summer sea ice, and foraging success of whales and ice dependent species is poorly understood, as are the effects of these changes on Alaska Natives who depend upon these species.
   - Acidification of Arctic Ocean surface waters is projected to be greater than for any other marine waters on the planet, with largely unknown consequences.
   - The DBO will address the large uncertainties in the responses to climate and ecosystem changes in the biological domain including plankton, fish, birds, marine mammals and invasive species.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- The DBO will provide baseline information necessary to assess and mitigate potential impacts to subsistence activities of offshore resource development.

2. Timeframe – Long-term

3. Outcomes
   - Biological information gained from an Arctic biological observatory network will improve the ability of all participating agencies to determine the effects of their actions on marine resources, resulting in improved conservation, protection, and management of Arctic coastal and ocean resources.
   - Improved understanding of how Arctic ecosystem and climate changes will affect subsistence cultures in the region.
   - New collaborations and partnerships formed in implementing this network will increase our ability to monitor and assess environmental conditions under changing climate scenarios.

4. Milestones
   - DBO partners conduct DBO research cruises.
   - Pacific Arctic Group (PAG) meeting to review results from 2010 and 2011 pilot activities, plan for 2012 pilot activities.
   - DBO partners conduct DBO research cruises.
   - PAG meeting to review all pilot activities, plan for 2013.
   - International report on DBO activities and results to date.
   - DBO partners conduct DBO research cruises.
   - PAG meeting to review pilot activities; plan for 2014.
   - Updated DBO concept and implementation plan for longer-term implementation.
   - DBO partners perform DBO plans and prepare annual assessments on physical and ecological state of Pacific Arctic marine environment.

5. Gaps and Needs in Science and Technology
   - New technologies for continuous, year-round, real-time observations of key physical, chemical, and biological variables.
   - Coordination with and access to charter and non-charter vessels capable of working in Arctic areas during the spring, summer, and fall.
   - Improved use of community-based observations and instrumented animals.
   - Ecological implications of increasingly early ice edge retreat, absence of summer sea ice, increased severity of storms during the ice-free season.
   - Ecological implications of ice-dependent species forced to spend time on land, including impacts of human disturbance.
   - Ecological implications of ocean acidification on Arctic marine ecosystems, especially plankton and calcareous benthic organisms important as prey items to subsistence species.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

D. Action 4: Improve Arctic communication.
Participate in cross-cutting efforts to improve existing maritime communication networks/architecture with a focus on support for scientific research, environmental risk reduction and incident management, and sustainable, safe, secure, and productive access to and uses of the Arctic.

1. Why Do This
   - Significant gaps exist in Arctic communication systems that increase the risk of environmental damage and loss of life and property at sea.
   - Effective communication systems are a cornerstone for devising "early warning and emergency response systems" to "respond to emerging event in the Arctic Region such as environmental disasters."
   - Ability of users, vessels, and aircraft to communicate with each other and to receive information, such as real-time weather and sea ice forecasts, will significantly decrease the risk of environmental damage and loss of life and property at sea.
   - Leverages similar efforts being undertaken for other national interests in the region, including implementation of National Ocean Policy as promulgated in Executive Order 1357, and National Security Presidential Directive 66/ Homeland Security Presidential Directive 25 (§§ III(B), (E), (F) and (H)).

2. Timeframe – Long-term

3. Outcomes
   - A system that addresses the most urgent gaps in communications and meets relevant user needs in the Arctic region.
   - Prevention of/Response to allisions, collisions, and groundings.
   - Prevention of/Improved Response to environmental disasters and loss of life and property at sea.
   - Minimize injury to marine mammals from vessels strikes and entanglement in fishing gear.

4. Milestones
   - All to be developed in coordination with other interagency efforts:
     - Inventory of existing communication capabilities and gaps.
     - Baseline of the performance capabilities of MF/HF/VHF/UHF communications systems to air and surface vessels in the Arctic.
     - Baseline of the performance of air, surface, and available shore-based sensors.
     - Analysis of communication capabilities and gaps in the Arctic Region.
     - Analysis and recommendations for the most cost-effective means to reduce communication gaps and boost capabilities in the Arctic Region.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Implementation of recommendations to reduce communication gaps and boost capabilities in the Arctic Region commensurate with available resources and user needs.

5. Gaps and Needs in Science and Technology
   - Analysis of Arctic communications environment.
   - Analysis of alternatives.

E. Action 5: Advance Arctic marine mapping and charting.
This action will support accurate hydrographic surveys and biological/shoreline mapping that is essential for up-to-date nautical charts of U.S. Arctic waters and the Alaskan coastline, and for habitat characterizations for ecosystem stewardship and restoration.

1. Why Do This
   - Compared to the rest of the nation, the Arctic geospatial reference system (geodetic control, water level, hydrology, and shoreline) is poorly known.
   - This action contributes fundamental data essential for:
     - Nautical charting for safe navigation;
     - Sustainable, secure and productive access to the Arctic maritime environment;
     - Environmental management and emergency response planning;
     - Sea level change impact assessments;
     - Inundation modeling;
     - Biological assessments;
     - Awareness of environmental conditions in the Arctic domain;
     - Coastal community adaptation strategies for increased resilience to storm hazards and climate change impacts; and
     - Improve the resiliency of ocean economies and commerce.

2. Timeframe – Long-term

3. Outcomes
   - Improved maritime safety in the Arctic.
   - Resilient ocean economies and commerce.
   - Better tools for coastal communities to develop adaptation strategies and disaster planning.
   - Improvement to the underlying geospatial framework of data that supports scientific research and economic decision-making in the Arctic Ocean region.

4. Milestones
   - Complete airborne gravity data collection over the State of Alaska to help correct meters-level errors in positioning to centimeter level.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Explore potential partnerships to establish Continuously Operating Reference Stations and water level stations for accurate datums and positions.
- Conduct Waterway Analysis and Management System (WAMS) assessments and Port Access Route Studies (PARS) of the Arctic region, focusing on areas indicted by risk/return analysis, to support decisions on mapping and charting priorities and waterways management.
- Prioritized list of Arctic maritime regions and shorelines for surveying.
- Establish mapping guidelines and/or standards to facilitate integrated ocean and coastal mapping.
- Coordinate mapping operations for maximal efficiency and coverage.
- Acquire Arctic hydrographic and shoreline data for accurate nautical charts and storm surge models.
- Update nautical charts, environmental sensitivity indices, and other Arctic feature maps.
- Archive data at national data centers to facilitate additional uses and scientific study.
- Continue to work with the International Maritime Organization to develop safe and secure shipping and prevention of marine pollution by ships in the Arctic.

5. Gaps and Needs in Science and Technology
   - New *in situ*, underwater, airborne, and satellite observing technologies able to withstand the rigors of the Arctic environment to fill gaps in hydrographic, shoreline, and biological datasets.

F. Action 6: Improve coordination on Arctic Ocean issues.

Implementing this strategic action plan requires coordination of scientific research, natural resource management, and national and international marine stewardship policies concerning the Arctic Ocean. The roles and responsibilities of Arctic interagency policy groups must be clearly defined to efficiently share information.

1. Why Do This
   - To clarify the sometime overlapping efforts of the following Arctic interagency policy groups within the Federal government: the Interagency Arctic Research Policy Committee (IARPC), the Arctic Policy Group (APG), and the Arctic Region Interagency Policy Committee (ARIPC) associated with NSPD-66/HSPD-25.
   - To support, as appropriate, U.S. participation in the working groups of the Arctic Council and to clarify the links between domestic and international Arctic activities.
   - Helps leverage existing resources, capabilities, and knowledge among agencies; shares information to reduce duplication and increase interagency coordination; and increases government efficiency by using established groups.
   - This action will be coordinated with the Coordinate and Support SAP.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

2. Timeframe – Near-term

3. Outcomes
   - Increased sharing of data and information to improve understanding of the changing Arctic Ocean and natural resource management decision-making.
   - Clear communications among Federal agencies, the State of Alaska, Alaska Native communities, and international organizations through IARPC, APG, ARIPC, and bilateral activities with Arctic states.
   - Incorporation of traditional and local knowledge into scientific research and decision-making.
   - Integration of a wide-range of data types (satellite, *in situ* observations, charts).
   - Coordination and leveraging of agencies' Arctic Ocean resources.
   - Increase awareness of Arctic Ocean activities.

4. Milestones
   - IARPC report released by the National Science and Technology Council that clarifies interagency roles, responsibilities, and mechanisms for coordinated decision-making.
   - IARPC proposed structure for information sharing aligned with open.gov.
   - Routine coordination with regional groups including the Alaska Climate Change Executive Roundtable (ACCER), North Slope Science Initiative (NSSI), Landscape Conservation Cooperatives (LCCs), Arctic Ocean Observing System (AOOS).
   - Integrate national and international efforts by increasing coordination among IARPC, APG, and ARIPC.

5. Gaps and Needs in Science and Technology – None.

INTERIM

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

Ocean, Coastal, and Great Lakes Observations, Mapping, and Infrastructure
Strategic Action Plan
Full Content Outline

Objective: Strengthen and integrate Federal and non-Federal ocean observing systems, sensors, data collection platforms, data management, and mapping capabilities into a national system and integrate that system into international observation efforts.

I. Overview of the Priority Objective

- Our ability to understand weather, climate, ocean, geological/geophysical, and living marine resource processes and dynamics, to forecast key environmental conditions, and to strengthen ocean management decision-making at all levels is informed by a sound knowledge base and the integration of new tools and data.
- Efficient and effective coordination of tools, continued development of new tools and infrastructure, and their integration into a cohesive, unified, robust system is becoming increasingly difficult as more and more data collection and processing systems come on line.
- New observation technologies supported by robust infrastructure give us the ability to observe and study global processes at all scales, and advance our knowledge and understanding of the ocean, our coasts and the Great Lakes.
- The actions in this outline are intended to support acquisition and delivery of the knowledge and understanding needed to make progress on the other eight national priority objectives and further implement the National Ocean Policy.

II. Context and Continuity

- To be fully successful, the actions in this plan must be considered and implemented within the broader context of the other eight priority objectives in the National Ocean Policy. Observations, mapping, and infrastructure provide the means to gather information necessary to make progress in all areas of the policy's implementation.
- Meeting the objectives of the National Ocean Policy requires:
    - Geospatial information (data, charts and interpretive maps) obtained through coordination and leveraging of ocean and coastal mapping programs, resources and capabilities among federal and non-federal entities, including where appropriate, international collaborations.
    - Systems and associated infrastructure to improve data collection for national priority objectives, including the means to develop and test new technologies.
    - A framework for data integration across a diverse range of specialties and locations that will improve coordination for decision-making.
- Addressing our ability to observe the ocean, our coasts, and the Great Lakes and to deliver data needed to support informed decisions is an ongoing effort. This plan highlights the near-term

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

actions that will be undertaken now and lays the foundation for continuing efforts in the mid- and long-term.

- Ultimately this and successive plans are intended to result in progress in the following areas:
  - A nationally integrated system of ocean, coastal, and Great Lakes observing systems.
  - Delivery of data on key ocean, coastal, and Great Lakes variables.
  - Effectiveness of unmanned vehicles and satellite remote sensing platforms.
  - Improved capabilities and reduced gaps in the National Oceanographic Fleet of ships and related facilities.
  - Improved data management, communication, access, and modeling systems for the timely integration and dissemination of data and information products.
- These areas form the focus of the actions identified in this plan.

III. Body of the Plan

A. Action 1 – Examine the status of the National Oceanographic Fleet.

Provide a status report on the National Oceanographic Fleet, and identify ways to improve its utilization to achieve the priorities of the National Ocean Policy. The National Oceanographic Fleet is comprised of the federally-owned oceanographic ships operated by both Federal and academic organizations.

1. Why Do This
   - The National Oceanographic Fleet is essential to achieve the priorities of the National Ocean Policy.
   - This action seeks to identify fleet capabilities and gaps, and to improve coordination and management of existing fleet resources to close some of these gaps.

2. Timeframe – Near-term

3. Outcomes
   - Identification of National Ocean Policy at-sea survey (oceanographic and living-marine resource) and research missions, especially in the Arctic.
   - The current National Oceanographic fleet's status, capacities, and capabilities become the basis for planning survey and research work.

4. Milestones
   - Report on National Ocean Policy at-sea survey (oceanographic and living-marine resource) and research missions priorities.
   - Update the "Federal Oceanographic Fleet Status Report."
   - Complete analysis and selection of fleet effectiveness performance measurements.
   - Complete evaluation of a prototype platform allocation planning tool.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Assess the capabilities for oceanographic ships to support multi-mission agency activities in the Arctic.

5. Gaps and Needs in Science and Technology
   - New ship designs to improve operational efficiencies at sea.

B. Action 2 – Examine the status of unmanned and satellite remote sensing systems.
Provide a status report on the use and application of unmanned and satellite remote sensing systems, and identify ways to improve utilization of these systems, to achieve the priorities of the National Ocean Policy. The current inventory of federal and non-federal unmanned systems includes Unmanned Undersea Vehicles (both tethered and autonomous), Unmanned Air Systems, and Unmanned Surface Vehicles.

1. Why Do This
   - Air and sea unmanned systems already available from federal and non-federal partners can extend or multiply the reach of survey (oceanographic and living-marine resource) and research missions.
   - The potential for these systems to aid in science and emergency response activities.

2. Timeframe – Mid-term

3. Outcomes
   - Improved and more cost effective data collection to meet National Ocean Policy survey and research mission requirements.

4. Milestones
   - Report on National Ocean Policy Priority Objective observation requirements suitable for accomplishment with unmanned systems.
   - Complete an inventory of available federal and non-federal unmanned systems.
   - Complete analysis and selection of unmanned system utilization performance measurements.
   - Complete evaluation of a prototype unmanned system inventory and planning tool.
   - Assess the potential of developing unmanned sub-ice data collection vehicles.
   - Report on regulatory restrictions or obstacles that limit use of federal and non-federal unmanned systems, and identify ways to enable better use of these systems to achieve NOP priorities.

5. Gaps and Needs in Science and Technology
   - Access to regulated airspace for unmanned aerial vehicle operations.
   - Improved battery technology for unmanned or autonomous underwater vehicles.
   - Integration of unmanned systems into multi-purpose observing systems.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Coordination of autonomous operations of individual and swarms of unmanned systems.
- Sustained critical global and regional ocean time series observations.

C. Action 3 – Use advanced observation and sampling technologies to observe and study global processes.

Use advanced observation and sampling technologies currently funded to observe and study global processes at all scales and to further develop observational capabilities.

1. Why Do This
   - Short- to mid-term observing projects that utilize innovative observing tools and infrastructure provide significant advances in knowledge and understanding of the ocean, the coast, and the Great Lakes. These programs serve as a test-bed for addressing the science and technology gaps across the national priority objectives and the strategic action plans.
   - These activities are related to and will be coordinated with those listed under the Strategic Action Plan for Informing Decisions and Improving Understanding.

2. Timeframe – Mid-term

3. Outcomes
   - Scientific technique for integrating short-term data with sustained long-term ocean observing.
   - Scientific technique for integrating coastal and ocean, remote and in situ, physical and biological observations, and relating these observations to socio-economic data.
   - Real-time ocean data from the Ocean Observatories Initiative observing system for use in implementing the National Ocean Policy.
   - New scientific information for exploring the complexities of land, ocean, atmosphere, ice, biological, and social interactions.

4. Milestones
   - Implement data and/or modeling techniques which support a global mapping capability for seasonal changes in, for example, ocean surface topography, currents, waves, winds, phytoplankton content, nutrients, sea-ice extent, rainfall, sunlight reaching the sea, and sea surface temperature.
   - Release of report on Opportunities in Ocean Observations and Ecosystem Health.
   - Complete an inventory of unique national coastal and ocean facilities (and associated data) that fall outside normal assessments.

5. Gaps and Needs in Science and Technology
   - Improved battery technology for unmanned vehicles and moored buoy sensor systems.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Improved data communication technology from moored buoy sensor systems.
- Improved optical and biological sensors.
- Improved understanding of interrelations between the physical ocean phenomenon, the ocean observational data and the data identifying socioeconomic impacts.

D. Action 4 – Implement the Integrated Ocean Observing System (IOOS).
Implement IOOS to sufficient functional capability to provide standardized data discovery and access to a minimum set of ocean observing data from federal and non-federal sources.

1. Why Do This
   - IOOS initial capability will provide long-term, sustained, verified and validated ocean observations to meet the data needs of the National Ocean Policy
   - In particular, it will contribute to the extensive data needs for monitoring requirements of ecosystem-based management, water quality and sustainable practices on land, changing conditions in the Arctic, and ecosystem restoration and protection, as well as the Coastal and Marine Spatial Planning (CMSP) decision-making processes and the inform decisions and improve understanding strategic area.

2. Timeframe – Mid-term

3. Outcomes
   - A sustained IOOS that is responsive to and reflects priorities identified across federal agencies, regional planning entities, and state and local stakeholder communities.
   - Coordinated development that advances the individual and shared objectives of, and provides for integration across, targeted observing efforts including, for example, biological (e.g. Ocean Biographic Information System) and water quality (National Water Quality Monitoring Network) communities.
   - Improved access to standardized data to support the following societal goals: maritime commerce, safety at sea, weather and climate forecasts and effects, national and homeland security, sustainable living marine resources, and monitoring ecosystem health.

4. Milestones
   - Release IOOS certification standards.
   - Provide an independent cost estimate to implement the Integrated Ocean Observing System.
   - Implement the "National Water Quality Monitoring Network for U.S. Coastal Waters and Their Tributaries" design, which represents an integrated, multi-disciplinary approach, leveraging State and other diverse sources of data, information, and programs and linking observational capabilities from land-to-sea.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

5. Gaps and Needs in Science and Technology
   - Improved socio-economic information to quantify benefits of a long-term sustained global ocean, coastal, and Great Lakes capability and to refine products delivered to better meet needs.
   - Advancements in ability to synthesize outputs from models of different scales.
   - Common data management practices to effectively and efficiently utilize data from multiple, disparate collection systems and long-term data stewardship.

E. Action 5 – Coordinate and leverage ocean and coastal mapping efforts.
Coordinate and leverage ocean and coastal mapping programs, resources, capabilities, and capacities among federal and non-federal entities, for the provision of mapping data, value-added decision-support products, and state-of-the art mapping technologies.

1. Why Do This
   - Coordination and leveraging across mapping efforts will more efficiently and effectively meet National requirements for ocean and coastal mapping services, data, products, capabilities, tools, technologies, and research and development.
   - Addressing these requirements supports and advances priority objectives of the National Ocean Policy.

2. Timeframe – Long-term

3. Outcomes
   - Better informed decision-making as a result of improved user access to and identification of authoritative ocean and coastal mapping data.
   - Improved coordination in defining ocean and coastal mapping data gaps and efficiencies in allocating mapping acquisition resources.
   - Improved support for ocean and coastal decision-makers through improved mapping data integration and product development coordination.

4. Milestones
   - Complete development of a national ocean and coastal mapping inventory that will serve as a clearinghouse for mapping data and interpretive information and a registry of data acquisition activities.
   - Develop an annual national ocean and coastal mapping/data acquisition plan.
   - Make mechanisms available for leveraging the expertise, personnel, platforms, sensors, processing capabilities, etc. of federal and non-federal partners.

5. Gaps and Needs in Science and Technology
   - Autonomous air, surface and underwater technologies to support acquisition of mapping data.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Ability to efficiently acquire seafloor data in shallow, turbid water and efficiently and accurately measure topography and shallow bathymetry in wetland and marsh environments.
- Improvements in automated seafloor and land characterization techniques.
- Improvements in capabilities to merge multiple source seafloor and land data and create seamless environmental characterizations.

F. Action 6 – Develop an integrated observation data management system.
Develop an integrated physical, biological, chemical, geological/geophysical, ecological and observation data management system as part of the larger, overarching observing infrastructure to support the national priority objectives.

1. Why Do This
   - Meeting the data and information requirements of all the priority objectives in an integrated and collaborative manner will help enable the delivery of end-to-end data services including data collection, management, stewardship, integration, and product dissemination via Web based sources. This will maximize the utility of ocean and coastal observing capacity for the Nation.

2. Timeframe – Long-term

3. Outcomes
   - National, enterprise-wide data and information management, archive, access, and long-term stewardship systems and supporting policies that ensure the full value of the Nation's investment in ocean, coastal, and Great Lakes data and information.
   - A national data management and stewardship system that promotes the use of authoritative observations and mapping data.
   - Support for an operational integrated National Information Management System by identifying existing systems and integrative functions and based on authoritative data to support coastal and marine spatial planning (CMSP).

4. Milestones
   - Define Federal and non-Federal partners' data and information management, archive, access, and long-term stewardship systems modeled on the *U.S. IOOS®: A Blueprint for Full Capability*.
   - Ensure data collected from existing systems are submitted to the relevant national archive centers for long-term stewardship in a manner that supports the National Information Management System and other activities, and are easily retrievable in a format useable for decision-making.
   - Ensure mapping data are readily accessible through Federal geospatial systems, through support of the inventory work of the Interagency Committee on Ocean and Coastal Mapping.

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

- Agree to, among international stakeholders, formats for data transmission via the Global Telecommunications System (GTS), metadata and version control, as well as best practices for observing and quality.

5. Gaps and Needs in Science and Technology
   - Improved data interoperability between observing networks to facilitate sharing across agencies and partners.
   - Common data management practices to effectively and efficiently utilize data from multiple, disparate collection systems and long-term data stewardship.

INTERIM

This is a preliminary document that constitutes an important but interim step toward completion of the full strategic action plan.

Strategic Action Plan Outline Fact Sheet

Overview

As part of President Obama's charge for Federal agencies to implement the *National Policy for the Stewardship of the Ocean, Our Coasts, and the Great Lakes*, the National Ocean Council is responsible for developing strategic action plans to achieve nine priority objectives that address some of the most pressing challenges these resources face.

What is a Strategic Action Plan?

The nine priority objectives provide a bridge between the National Ocean Policy and action on the ground and in the water. Strategic action plans will identify specific and measurable near-term, mid-term, and long-term actions, with appropriate milestones, performance measures, and outcomes that Federal agencies will take to meet each priority objective. Each plan will explicitly identify key lead and participating agencies; gaps and needs in science and technology; potential resource requirements; ways to conduct activities more efficiently; and steps for integrating or coordinating current and out-year budgets. Collectively, the strategic action plans will constitute the implementation strategy for the National Ocean Policy. By having a unifying National Ocean Policy that clearly articulates our priorities and addresses them through the development of strategic action plans, the Federal government can more effectively ensure that the limited Federal resources we have are targeted and deliver demonstrable outcomes and results, such as predictability for users, more efficient and coordinated decision making, and improved sharing of data and technology.

Who is Developing the Strategic Action Plans?

Under the direction of the National Ocean Council, experts from the Council's 27 Federal agencies and offices are drafting the strategic action plans with a heavy emphasis on obtaining input from National, regional, and local stakeholders and the public. The Council's two Interagency Policy Committees (IPCs)-the Ocean Resource Management IPC and the Ocean Science and Technology IPC - are overseeing the development of the strategic action plans. The IPCs coordinate activities for all plan preparation and review draft and final products prior to submission to the Council. Through this process we are bringing together experience and authorities in science, natural resource management, economic development, infrastructure planning, public health, and social services as well as essential knowledge from the individuals who live and work along our Nation's coasts.

What are Strategic Action Plan Content Outlines?

As a first step in developing strategic action plans, the NOC writing teams have developed what we call 'content outlines' for each plan. The purpose of the outlines is to provide an initial view as to how Federal agencies might address the priority objectives as described in the National Ocean Policy. They are preliminary documents that constitute an important but interim step toward completion of the strategic action plans. The outlines, by design, do not and are not intended to

provide all of the details that will be provided in the plans. Nor is there necessarily the same level of specificity across all outlines. The outlines serve as an early and valuable point in the plan development process for focusing public and stakeholder input. The outlines were informed by the comments received during our initial scoping period that closed on April 29.

Each outline presents, in bulleted form, potential actions to address its priority objective. They briefly describe the reason for taking the action, expected outcomes and milestones, gaps and needs in science and technology, and the timeframe for completing the action. They also provide an overview of the priority objective the strategic action plan will address, and the greater context for the plan in implementing the National Ocean Policy.

In developing the outlines - and ultimately the full plans - the writing teams were operating under certain parameters that guided their discussions. Each plan is to have approximately six actions that are focused on Federal efforts. The actions are to be succinct, feasible activities based on measurable and achievable outcomes within the milestones and timeframe indicated. They are to be consistent with the President's management and budget goals, especially in consideration of the current budget climate in which little to no new resources likely will be available in the near- to mid-term. In that light, the actions are intended to focus on eliminating redundancy, encouraging efficiency, and evaluating and prioritizing ongoing and new activities. Options for long-term activities requiring additional resources will be considered as plans are developed in the out-years. Overall the strategic action plans should be adaptive to allow for modification and addition of new actions based on new information or changing conditions. The plans and their implementation would be assessed and reviewed annually by the National Ocean Council and modified as needed based on the success or failure of the agreed upon actions.

We Want to Hear From You

You have the opportunity to review these outlines and provide input during the June 2 to July 2 public comment period. To submit your comments please visit:
http://www.whitehouse.gov/administration/eop/oceans/sap

We welcome your general input, and also pose the following questions within the context of the nine national priorities:

- What changes on the water, to the coasts, or in the Great Lakes would make the biggest difference for you and how would you like to see these reflected in the strategic action plans?
- Do the actions address your community's needs or key concerns? If not, what areas should be considered for inclusion?
- How can the Federal government be a more effective partner to help make these changes?

Comments received will be provided to the IPCs and the writing teams for consideration as they develop the full draft strategic action plans. Draft plans are expected to be released for public review in the fall. Final plans are expected to be completed in early 2012.

Ecosystem-Based Management

Objective

Adopt ecosystem-based management as a foundational principle for the comprehensive management of the ocean, our coasts, and the Great Lakes.

Why Do This?

Traditional management of ocean, coastal, and Great Lakes resource uses focuses on single sector management (i.e., single species or activity type) and does not adequately consider the whole ecosystem. This may result in the loss of resources, economic hardship, and environmental risk. Ecosystem-based management (EBM) is an integrated approach to resource management that considers the entire ecosystem, including humans, and the natural elements that are integral to ecosystem functions. EBM is informed by science to conserve and protect our cultural and natural heritage by sustaining diverse, productive, resilient ecosystems and the services they provide, thereby promoting the long-term health, security, and well-being of our Nation. EBM will enable decision-makers to incorporate the cumulative effects of multiple activities on entire ecosystems, and identify approaches for assessing trade-offs among these activities with the goal of maintaining ecosystem health and services.

Potential Actions and Expected Outcomes

- **Establish Ecosystem-based Management Leadership and Collaboration** – Federal agencies will work with State, tribal, and local authorities and regional governance entities to apply successful EBM approaches in the areas of greatest need. This will lead to a more efficient and effective management of the oceans, coasts, and Great Lakes by promoting a common understanding and implementation of the EBM approach.

- **Establish an Interagency Ecosystem-based Management Science Framework** – A nation-wide interdisciplinary and integrated science-based framework will improve our understanding of ecosystem functions and how the interactions between and within human and natural systems affect ecosystem health and services. It will leverage, integrate, and coordinate existing scientific programs and observations, monitoring, and research capabilities, and identify future scientific needs to understand changes over time.

- **Inform Decision-making to Support Ecosystem-based Management** – Products, services, and communication tools will be developed and provided to support EBM. This will enable agencies to share and discuss ecological, economic, social, physical, and other types of data and information needed to facilitate EBM and adaptive management approaches.

- **Incorporate Ecosystem-based Management Principles into Existing Policy and Governance** – Legislative and regulatory roadblocks to implementing EBM will be identified. EBM principles will be incorporated into Federal, regional, State, territorial, tribal, and local project planning and environmental review processes to support rapid and effective implementation of EBM throughout our Nation's marine and coastal ecosystems. This will enhance ocean, coastal, and Great Lakes stewardship, rather than a fragmented process that only looks at individual components of or influences on an ecosystem.

Coastal and Marine Spatial Planning

Objective

Implement comprehensive, integrated, ecosystem-based coastal and marine spatial planning (CMSP) and management in the United States.

Why Do This?

Human uses of the ocean, our coasts, and the Great Lakes are expanding at a rate that challenges our ability to plan and manage them under the current sector-by-sector approach. Regionally-driven CMSP which fully incorporates the principles of adaptive, integrated, comprehensive, and ecosystem-based management (EBM) will provide a much more effective and cost-efficient means to objectively and transparently guide and balance allocation and stewardship decisions for the use and protection of our ocean, coastal, and Great Lakes waters and resources.

Potential Actions and Expected Outcomes

- **Establish 9 Regional Planning Bodies (RPBs) to undertake CMSP and develop initial CMS plans for sustainable use and long-term stewardship of the ocean, our coasts, and the Great Lakes -** A regionally-based framework to implement CMSP will allow for the variability of economic, environmental, and social aspects among the different areas of the United States.

- **By 2015, applicable non-confidential and other non-classified Federal data identified for inclusion into the National Information Management System and Data Portal -** Availability of data and information through a National Information Management System and Data Portal to the RPBs, other decision-makers, ocean users, stakeholders, and the public will directly support successful CMSP efforts.

- **Preserve and enhance opportunities for sustainable and beneficial ocean use through the promotion of regulatory efficiency, consistency, and transparency as well as improved coordination across Federal agencies -** Improving regulatory efficiency and coordination across Federal agencies will minimize the burdens of regulatory delays, increased scrutiny, costly litigation, and economic constraints.

- **Reduce cumulative negative impacts on environmentally sensitive resources and habitats -** Defining and analyzing existing conditions and forecasting future conditions of distinct areas as part the CMSP process *before* any particular activity is considered will help decision-makers minimize or avoid negative cumulative impacts to marine ecosystems, while promoting compatible sustainable uses of our ocean, coastal, and Great Lakes resources.

Inform Decisions and Improve Understanding

Objective

Increase knowledge to continually inform and improve management and policy decisions and the capacity to respond to change and challenges. Better educate the public through formal and informal programs about the ocean, our coasts, and the Great Lakes.

Why Do This?

Scientific research, monitoring, and assessment, coupled with forecasts, models, and other decision-support tools, will build knowledge of ocean, coastal, and Great Lakes ecosystems and processes and ensure that management, policies, and planning are based on sound science. Formal and informal education programs will create opportunities for enhanced appreciation of coastal and ocean issues, and better prepare the diverse, ocean-literate workforce of the future. Success in building our knowledge and applying it to improve management also relies on an engaged and informed public.

Potential Actions and Expected Outcomes

- **Prioritize research activities based on "Science for an Ocean Nation: An Update of the Ocean Research Priorities Plan"** – This new plan provides a valuable framework to advance knowledge, improve understanding, and inform decision based on the best available science.
- **Provide science to support emerging sustainable uses of resources** – Fundamental and applied scientific information and technology will ensure that emerging and future uses of ocean, coastal, and Great Lakes resources are economically and ecologically sustainable.
- **Provide science support for managers and policy-makers** – Robust decision-support tools and processes - based on sound research, data and information - will support effective and rapid management of growing uses of ocean, coastal, and Great Lakes resources.
- **Develop human capacity and the workforce** – U.S. competitiveness depends on a well-educated workforce. Scholarships and other opportunities for students pursuing degrees in ocean science, management, and related fields, particularly from underrepresented groups, will contribute to the development of this workforce.
- **Increase ocean literacy** – Expanding the accessibility to and use of ocean information for education programs will increase awareness and stewardship of ocean, coastal, and Great Lakes resources.
- **Engage in ocean exploration** –Exploration and discovery will expand knowledge of little-known Great Lakes and oceanic biodiversity, biogeochemical processes, ecosystem services, and climate interactions. These discoveries have the potential to lead to new energy sources, new products, and inspire the next generation of ocean scientists.
- **Integrate social and natural scientific information** – Integrating information from social and natural sciences, especially for ecosystem-based management and restoration, will inform research, policy development, and decision-making, and support and enhance sustainable economies.

Coordinate and Support

Objective

Better coordinate and support Federal, State, tribal, local, and regional management of the ocean, our coasts, and the Great Lakes. Improve coordination and integration across the Federal Government, and as appropriate, engage with the international community.

Why Do This?

One of the significant obstacles to effective management of the ocean, our coasts, and the Great Lakes is the complex set of Federal, State, tribal, and local laws, authorities, mandates, and governance structures intended to manage their use and conservation. Furthermore, the United States is party to numerous international agreements and subject to customary international law regarding use and protection of the ocean and the Great Lakes. This makes it difficult to achieve consistent approaches to resource management, including ecosystem-based and adaptive management. Through increased communication, coordination, and integration across all levels of government, we can streamline processes, reduce duplication, and leverage resources.

Potential Actions and Expected Outcomes

- **Develop a regional communication framework under the National Oceanographic Partnership Program** – Improved information exchange, communication, and coordination among interested parties will enhance our ability to work across jurisdictions to advance National Ocean Policy goals.
- **Identify, prioritize, and seek to resolve legal barriers to implementation of the National Ocean Policy** - Legal barriers inhibiting effective implementation of the National Ocean Policy, such as uncertainty and inconsistency or overlap of authorities, will be addressed. Identifying overlaps in statutory authority on particular topics will lead to greater efficiencies.
- **Identify barriers and obstacles to successful collaborative efforts** – Examining barriers and offering opportunities to work together among regional, State, and Federal entities will allow regional ocean governance (ROGs) entities to function with greater integration and efficiency.
- **Identify and disseminate Best Management Practices (BMPs) utilized in Federal or regional partnerships** – Successful practices among Federal agencies, ROGs, and other regional ocean partnerships will be evaluated. Their use will help ensure successful and consistent National Ocean Policy implementation throughout the regions.
- **Identify specific ways to prioritize and coordinate resources, reduce spending overlap, and leverage funding between and among Federal agencies and ROGs** - Collaboration among agencies will streamline processes, enhance coordination and leverage resources. This will improve processes and maximize benefits relative to costs.
- **Identify appropriate opportunities for engaging the international community about the National Ocean Policy** - Engage with international partners bilaterally and multilaterally to achieve increased cooperation and coordination on ocean issues. Improved international communication and coordination will facilitate implementation of the National Ocean Policy.

National Ocean Council: Strategic Action Plan Outline Overview

Resiliency and Adaptation to Climate Change and Ocean Acidification

Objective

Strengthen resiliency of coastal communities and marine and Great Lakes environments and their abilities to adapt to climate change impacts and ocean acidification.

Why Do This?

Global climate change and its associated impacts pose serious threats to ecosystems and coastal communities. Warming ocean temperatures have a profound impact on the distribution of rainfall over watersheds, the melting of ice sheets, and the distribution and productivity of species. Sea-level rise, increased severe storm events, rapid erosion, and salt water intrusion threaten low-lying coastal communities. At the same time, climate change is predicted to lower the water levels of the Great Lakes, thereby altering water cycles and supply, habitat, and economic uses of the Lakes. Ocean acidification is expected to have significant and largely negative impacts on marine food webs, ocean ecosystems, and biological diversity. We have an opportunity and a responsibility to develop strategies for reducing the vulnerability, increasing the resilience, and improving adaptation of human and natural systems to climate change impacts.

Potential Actions and Expected Outcomes

- **Provide critical information about the impacts of climate change and ocean acidification -** Access to this information will result in more accurate forecasts of the scale, scope, and impacts of climate change and ocean acidification.

- **Forecast the impacts of climate change and ocean acidification** - These forecasts will support improved vulnerability assessments, adaptation planning, and decision-making.

- **Strengthen and integrate observations from protected areas, research sites, and observing systems** - Coordinating observations from the Nation's sentinel sites will provide managers and communities with the ability to track changes in habitats and species over time.

- **Provide critical climate change and ocean acidification information, tools, guidance, and services** - This action will result in an enhanced ability of individuals, communities, and governments at all scales to identify their needs and ultimately to implement forward-looking, adaptive actions that build ecosystem, societal, and economic resilience.

- **Assess vulnerability of the built and natural environment in a changing climate –** Federal agencies will work with State, local, and tribal governments, non-governmental organizations, academia, and the private sector to conduct vulnerability assessments to inform more effective resilience and adaptation strategies.

- **Deploy and assess the effectiveness of resilience and adaptation strategies** - This will result in informed siting and design, protection of ecosystems, improved public health and safety, reductions in the loss of life and property, and decreased cost of responding to disasters.

Regional Ecosystem Protection and Restoration

Objective

Establish and implement an integrated ecosystem protection and restoration strategy that is science-based and aligns conservation and restoration goals at the Federal, State, tribal, local, and regional levels.

Why Do This?

Essential coastal and the Great Lakes habitats continue to suffer significant losses and degradation due to coastal development, sea-level rise, and associated human activities, as well as external stressors such as invasive species and climate change. Critical habitat loss and degradation of ecosystem services is apparent in many regions. Addressing challenges that cross jurisdictional boundaries and sectors on a regional and ecosystem scale will lead to more effective resource management.

Potential Actions and Expected Outcomes

- **Support Shared Regional Ecosystem Protection and Restoration Priorities –** Aligning Federal resources in three regions will improve our ability to protect and restore regional ecosystems.
- **Strengthen Conservation Partnerships –** This will bring together Federal and non-Federal expertise, strengths, and resources to increase support for the protection and restoration of ocean, coastal, and Great Lakes habitats that provide the ecosystem services.
- **Reduce Coastal Wetland Loss –** To address the alarming loss of coastal wetlands, Federal agencies will assess their causes. The findings will result in recommendations that will help Federal agencies take actions to reverse wetland losses.
- **Develop Carbon-based Incentives for Coastal Habitat Conservation –** A protocol will be developed and policy options explored for incorporating the carbon sequestration value of coastal habitats into Federal decision-making.
- **Ensure Full Mitigation for Injuries to Coral Reef Ecosystems –** Establishing standard protocols for coral reef ecosystem assessment and mitigation among the four Federal agencies responsible for coral reef protection, restoration, and regulation.
- **Reduce the Threat of Marine Invasive Species –** Federal agencies will coordinate planning to control marine invasive species and the resulting impacts to marine ecosystems, beginning with the Indo-Pacific lionfish.
- **Protect Nationally Significant Marine and Great Lakes Aquatic Areas –** Federal agencies will work with non-Federal partners to develop a process to identify marine areas that are ecologically important and nationally significant, and recommend the appropriate levels of protection.
- **Improve the Effectiveness of Project Monitoring and Tracking -** Federal agencies will adopt the monitoring protocols in the *Estuary Restoration Act of 2000* and add estuary restoration project information into the National Estuaries Restoration Inventory.

Water Quality and Sustainable Practices on Land

Objective

Enhance water quality in the ocean, along our coasts, and in the Great Lakes by promoting and implementing sustainable practices on land.

Why Do This?

Pollution from diffuse sources throughout the country caused by poor land management practices negatively impacts water quality in ocean, coastal, and Great Lakes ecosystems, resulting in harmful algal blooms, expansive dead zones, marine debris, and increased incidents of human illness. Addressing this problem requires a strong commitment to coordination and cooperation between multiple sectors and among Federal, State, tribal, local authorities, and regional governance structures.

Potential Actions and Expected Outcomes

- **Reduce rural and urban sources of excessive nutrients and sediments** – This action will enhance aquatic ecosystem health, reduce costs to wastewater treatment plants, retain storage capacity in flood control structures, and enhance recreational opportunities.

- **Assess hypoxia status, trends, and impacts nationwide -** Severe oxygen depletion or hypoxia is the most readily recognized symptom of impaired water quality. Studying hypoxia will help to mitigate or prevent mass fish kills, loss of reefs, economic impacts on commercial and sport fisheries, and degradation of ecosystem health.

- **Reduce trash and marine debris through pollution prevention and removal –** This action will use a comprehensive approach to mitigate the adverse effects of marine debris and trash in our watersheds, the ocean, our coasts, and the Great Lakes on human health, the environment, and the economy.

- **Assess health risks of coastal waters -** A better understanding of current and emerging health risks from impaired water quality, as well as the connections between upstream sources of pollution and downstream effects, will enhance disease surveillance, environmental/wildlife monitoring and watershed modeling, and inform remediation efforts.

- **Provide warning and reduce public health risks of coastal waters -** Connecting environmental monitoring with disease surveillance will help to quickly identify threats and notify communities of risks associated with contaminated recreational and drinking waters, seafood, and beaches; reduce health risks from pollutants; and help safeguard coastal resource-dependent economies.

- **Identify and protect high quality coastal waters** – This action will help to ensure the sustainability of ocean, coastal, and Great Lakes ecosystems and their associated public benefits.

Changing Conditions in the Arctic

Objective

Address environmental stewardship needs in the Arctic Ocean and adjacent coastal areas in the face of climate-induced and other environmental changes.

Why Do This?

Human-induced climate change is having the most immediate impact on polar regions. The Arctic, and indeed the world, faces serious consequences from accelerated permafrost thawing and carbon release, reductions in Arctic sea ice volume and extent, coastal erosion, and global sea-level rise from melting glaciers and ice caps. Increased human activity brings additional stressors that impact Arctic ecosystems and communities. At the same time, diminishing sea ice presents opportunities to further develop resources and to increase marine transportation. Working with all stakeholders, including the State of Alaska, and Alaska Native communities, we have an opportunity to develop scientifically informed plans to sustainably manage and encourage use of the Arctic while also continuing to protect it.

Potential Actions and Expected Outcomes

- **Improve Arctic environmental response management -** Developing new systems and procedures will help protect ecosystems, local communities, and subsistence resources from the effects of oil spills or other accidents associated with resource extraction and increasing Arctic marine transportation.

- **Observe and forecast Arctic sea ice -** Observing, predicting, and ultimately projecting the extent, thickness, and age of Arctic sea ice will improve daily forecasts and decadal predictions to help support safe, secure, and reliable marine operations and ecosystem stewardship.

- **Establish a distributed biological observatory -** Integrating biological and other oceanographic data from a network of observatories in the Pacific Arctic will improve understanding of climate and environmental change effects on marine ecosystems and communities that rely on them.

- **Improve Arctic communication -** Improving marine communication networks/architecture will support research, reduce environmental incidents, contribute to safe navigation, and facilitate emergency response, and search and rescue.

- **Advance Arctic marine mapping and charting** - Accurate hydrographic surveys and biological/shoreline mapping of U.S. Arctic waters and the Alaskan coastline are needed to improve the Arctic marine transportation system and to characterize habitats for ecosystem stewardship and restoration.

- **Improve coordination on Arctic issues -** Defining the roles and responsibilities of the Arctic interagency policy groups, as well as links to international efforts, such as through the Arctic Council, will result in greater government efficiency through decreased duplication of effort and increased sharing of resources, knowledge, and information.

Ocean, Coastal, and Great Lakes Observations, Mapping, and Infrastructure

Objective

Strengthen and integrate Federal and non-Federal ocean observing systems, sensors, data collection platforms, data management, and mapping capabilities into a national system, and integrate that system into international observation efforts.

Why Do This?

Our ability to understand weather, climate, and ocean conditions, to forecast key environmental processes, and to strengthen ocean management decision-making at all levels requires accurate data and information. Coordination and integration of the many available data collection, processing, management and access tools and infrastructure into a cohesive, unified, robust system will promote greater efficiency and effectiveness in shared efforts that significantly advance our knowledge and understanding of the ocean, our coasts, and the Great Lakes.

Potential Actions and Expected Outcomes

- **Examine the status of the National Oceanographic Fleet**–This action will identify ways to improve the coordination, management, and utilization of the National Oceanographic Fleet to achieve the Policy's priorities. The current Fleet's status, capacities, and capabilities will form the basis for planning survey and research work.

- **Examine the status of unmanned and satellite remote sensing systems–** Air and sea unmanned systems can extend or multiply the reach of survey and research missions, and are very effective in emergency situations. This action will identify ways to further take advantage of their effectiveness.

- **Observe and study global processes using advanced observation and sampling technologies –** Short- to mid-term observing projects that utilize innovative observing tools and infrastructure will provide significant advances in knowledge and understanding and address science and technology gaps in our long-term ocean observing systems.

- **Implement the Integrated Ocean Observing System (IOOS) –** A functional Integrated Ocean Observing System will provide long-term, sustained, verified and validated ocean observations to support federal, regional, state and local community stakeholder priorities.

- **Coordinate and leverage ocean and coastal mapping efforts –** Engaging providers and users in identification of information gaps and efficiencies in information development and delivery will lead to improved user access to information that supports policy and management decision-making.

- **Develop an integrated observation data management system –** A web-based data inventory, management, archive, and distribution system will capitalize on the Nation's investment in ocean, coastal, and Great Lakes data and information and allow their effective use by multiple groups addressing all National Ocean Policy objectives including Coastal and Marine Spatial Planning.

We want to hear from you!

Public comments on these Strategic Action Plan Outlines are being accepted at:

http://www.whitehouse.gov/administration/eop/oceans/sap

Eugene Brower; Charlie Edwardsen JR.; Caroline Cannon clear message communicate/inform Doreen Lampe Tribal govts.

E.B. O discharge, small boat harbors, people dictating, Mayors & points rest for oil/gas development

Robert Edwardson: Ocean livelihood/need GG assests

Nathaniel Olmann; Safe boat harbor designation, ice shove prevention -

George Olmann; - Erosion losing shoreline 20 ft last year needs to be addressed

Point Hope: oil & gas & subsistence issues in conflict

Gambell 1, 2-3.

Caroline Cannon: Ocean valuable want them in community communication problems / tribal control on CZM. Owners of ocean. Food security. Use local traditional knowledge. Arctic Policy will impact residents the most.

Pt. Lay-Leo Fer: Cruise ship traffic issue to harvest/timeline for ships. Decision making equal blw all villages. Share information.

Cully Corp. Dolly Norton: Policies new will it continue after this administration - what happens in 2018?

Doug Vincent Lang/Dept of F&G/Key to economic activity/fishing 60% of fish from Alaska. More coastline - Clearly defined outcomes & timelines, missing. Question legal authority of President. Invest in infrastructure. Need more resources NOT rules.

Price Leavitt/ED of ICAS/Subsistence important/wish to pass on/EBM like/moral obligation to future generations. Need EBM as soon as can. Rush to develope resources Better coordination blw agencies. One oil spill could ruin it all. OSR needs to be proven. Culmative Impacts need to be considered. INUA. tribes - - -

Rossman: WHISPERING/Afraid of changing ice conditions. Need to observe.

Nuiqsut: ∅ Rosemary

Bob Harachek: saying same things 30 yrs. little no action. Hope this body acts. Cultural/traditional knowledge needs emphasis. CZM Keep it Development inevitable - we can work together for best development. Residents integral part of Arctic

Glen Shannon: BASC Rules shouldn't be made at a distance. Need better telecommunication system - fiber optics. Long list of projects, ocean acidification. Sound through water impacts animals - needs to study.

Kain Okpik - stewards of lands. People grow tired of the meetings.

Gordon Brower. CZM Hard to be responsible steward.

Anne - People are part of ecosystem so need to be part of EBM. Traditional/local knowledge - had to be trusted to survive. Longer time depth for ecosystem.

Baseline data needed.

National Policy for Stewardship of the Ocean, Our Coasts, and the Great Lakes

Regional Listening Session
Strategic Action Plan Content Outlines

Barrow, Alaska
June 9, 2011

National Ocean Council

Today's Listening Session

4 PM to 9 PM

- Opening Comments – Jim Kendall DOI/BOEMRE
- Listening Session Background and Overview – Eileen Sobeck DOI NOC Representative, Amy Holman NOAA, and CDR Shane Montoya U.S. Coast Guard
- Public Comments, including Telephone comments from other North Slope Commenting

National Ocean Council

27 fed agencies working together = NOC

Executive Order 13547

- Establishes our Nation's first ever ***National Policy*** for Stewardship of the Ocean, our Coasts, and the Great Lakes
- Creates an interagency ***National Ocean Council*** to provide sustained, high-level, and coordinated attention to advance the National Policy
- Prioritizes ***9 categories for action*** that seek to address the most pressing challenges facing the ocean, our coasts, and the Great Lakes
- Establishes ***a flexible framework for effective coastal and marine spatial planning*** to address conservation, economic activity, user conflict, and sustainable use of ecosystem services

National Ocean Council

9 action items

Deadline = beg of next year

CMSP = regional effort regional planning body for Alaska

What is the National Ocean Policy about?

An America whose stewardship ensures that the ocean, our coasts, and the Great Lakes are

healthy and resilient, safe and productive, and understood and treasured

so as to promote the well-being, prosperity, and security of present and future generations.

National Ocean Council

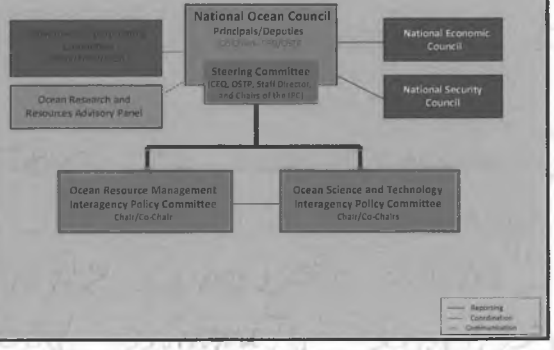
Why Do We Need a National Ocean Policy?

Provides a unifying framework to:

- Improve Federal management efforts to ensure healthy marine environments, sustainable economic growth, jobs, and recreational opportunities
- Foster coordination and communication among all levels of government to minimize duplication of effort, inefficiency, waste, and conflict
- Prioritize and focus efforts around key areas to maximize the investment of limited resources at the Federal level and ensure accountability for the effectiveness of such investments

National Ocean Council

National Ocean Council



Targeted Implementation Strategy

Strategic Action Plans

- The NOC is charged with developing *strategic action plans for* the nine priority objectives. Plans must--
  - Identify *specific and measurable* near-, mid-, and long-term actions to be taken to further the objective
  - Include smaller-scale efforts to build on existing activities, as well as more complex, larger-scale actions;
  - Identify leading and participating agencies in these efforts;
  - Identify gaps and needs in science and technology;
  - Determine resource requirements including steps for integrating and coordinating budgets

National Ocean Council

Strategic Action Plans

- Plans will be adaptive to allow for modification and addition of new actions based on new information or changing conditions
- Plans and their implementation would be assessed and reviewed annually by the NOC and modified as needed based on the success or failure of the agreed upon actions
- As the NOC develops and revises the plans, it will ensure substantial opportunity for public participation. Final plans, revisions, and reports of how well plan performance measures are being met would be made publicly available

National Ocean Council

Strategic Action Plan Content Outlines

- An interim step toward completion of the full draft strategic action plans
- Represent an early and important point in the SAP development process for seeking public and stakeholder input
- Provide an *initial* view as to how federal agencies might address the priority objectives
- By design, do not and are not intended to provide all of the details that will be provided in the full plans

National Ocean Council

Schedule and Additional Opportunities for Public Engagement

- Public Comment Website provided initial input into development of Strategic Action Plans – Closed April 29
- Release of Draft Full Content Outlines for Public Review – June 2011
- Public comment period and listening Sessions to provide input on the Content Outlines and development of full draft plans – June 2011
- Release of Draft Strategic Action Plans for Public Review- October 2011
- Public Comment period, stakeholder roundtables, and other means to provide input on the draft plans – October/November 2011
- Release of Final Strategic Action Plans – Early 2012
  - Comments on the Strategic action plan Outlines are now being accepted http://www.WhiteHouse.gov/administration/eop/oceans/comment

National Ocean Council

Why are we holding this Listening Session?

Why are we holding these listening sessions?
•We wish to inform local and regional stakeholders and the general public about our efforts to implement the National Ocean Policy
•We seek your input on the strategic action plan outlines

What's at stake?
•The plans being developed will shape Federal focus, actions, and resources with respect to the nine national priorities

Who should participate?
•Local residents, resource users, industry, and the general public- essentially anyone with interest in our ocean, coastal, and Great Lakes resources. This is a chance to help shape the Federal plans.

National Ocean Council

Questions to consider

- **We welcome your general input, and also pose the following questions within the context of the nine national priorities:**
  - What changes on the water, coasts, or Great Lakes would make the biggest difference for you and how would you like to see to see these reflected in the strategic action plans?
  - Do the potential actions address your community's needs or key concerns? If not, what areas should be considered for inclusion?
  - How can the Federal government be a more effective partner to help make these changes?

National Ocean Council

Examples of comments we have *received or anticipate*

- Subsistence hunting and gathering must be considered and protected. The ocean is our garden. The whales, other marine mammals, and fish must be managed and protected to ensure our way of life.
- With increased maritime traffic in the Arctic comes the need for better navigational aids, charts, weather data and forecasts, monitoring, spill prevention, incidence response, and enforcement capacity.
- Ensure that implementation of a National Ocean Policy is done in such a way that is helpful rather than harmful to the important national interests, including the interest of commercial and recreational users of the oceans and marine-related energy and natural resources.
- While the Arctic marine ecosystem is known to be rich and complex, it is poorly understood. There are broad data gaps, and unfortunately the Arctic marine ecosystem it difficult and expensive to study

National Ocean Council

We want to hear from you!

Public comments on these Strategic Action Plan Outlines are being accepted at:

National Ocean Council

Interior's Ocean and Coastal Role

Stewards of our Nation's Ocean, Coastal and Great Lakes Resources

As the principal resource steward of our Nation's Ocean, Coastal and Great Lakes Resources, the Interior Department uses science-based management to inform conservation, responsible use, and to increase our understanding of the environment. Interior is responsible for protecting and providing access to these significant resources and works with other federal agencies and partners to accomplish Interior mission goals.

Through diverse programs and responsibilities for scientific research, cultural preservation, energy and wildlife management, Interior manages and conserves ocean and coastal lands and waters to protect native species and their habitats, provide recreational opportunities for the public, and ensure safe and responsible natural resource energy development. Interior scientists conduct extensive ocean, coastal, and Great Lakes research and mapping to predict, assess, and manage impacts on coastal and marine environments. In collaboration with our partners, Interior integrates effective multiple-use management from upland ecosystems to deep oceanic waters.

Interior's Mission for Ocean, Coasts and Great Lakes

To uphold the Department's ocean, coastal and Great Lakes stewardship responsibilities through science-based management, conservation, responsible use, and increased understanding of the environment.

Interior contributes to implementing the National Ocean Policy

- Secretary Salazar and Chief of Staff Laura Davis serve on the National Ocean Council (NOC);
- Interior is a member of the NOC Steering Committee, co-chairs the Ocean Resources Management Interagency Policy Committee, and participates in the Ocean Science and Technology Interagency Policy Committee;
- Interior serves on all nine teams drafting the National Ocean Policy Strategic Action Plans, with the lead on the two Priority Objectives: "Coordinate and Support" and "Regional Ecosystem Protection and Restoration";
- Interior is hosting the National Coastal and Marine Spatial Planning Workshop, June 21-23, 2011

Interior manages vast coastal and ocean resources:

- 180 marine and coastal National Wildlife Refuges
- more than 35,000 miles of coastline
- 1.7 billion underwater acres of Outer Continental Shelf
- 3.6 million acres of coral reef ecosystems
- 180 island and coastal refuges
- 34 million acres in 84 coastal parks
- 4 Marine National Monuments --including Papahanaumokuakea Marine National Monument (with NOAA and the State of Hawaii)

Meeting Today's Ocean Challenges

Interior Bureaus work with other federal agencies and partners with diverse responsibilities to manage and conserve the Nation's ocean, coastal and Great Lakes natural resources and cultural heritage, to provide scientific and management information about those resources, and to honor trust responsibilities and special commitments to American Indians, Alaska Natives, and affiliated Island Communities.

The **National Park Service** established its Ocean Park Stewardship Action plan to protect ocean parks, engage visitors in stewardship, and increase exploration and ocean mapping. NPS manages 84 coastal Parks with over 86 million annual recreation visits.

The **U.S. Geological Survey** works closely with academic institutions, states, and other Federal agencies to better understand the processes that affect the health and sustainability of our natural resources. Sound Waves, a monthly newsletter, features coastal and marine research news from across the USGS. http://soundwaves.usgs.gov/

The **Fish and Wildlife Service** conserves and promotes the enjoyment and use of marine, coastal, and Great Lakes species and habitat. It manages the 550-unit National Wildlife Refuge System, 180 of which are found in marine, coastal, and Great Lakes environments.

The **Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE)** plays a key role in America's energy supply by managing renewable and mineral resources on the 1.7 billion acres of the Outer Continental Shelf (OCS), a significant source of our Nation's energy supply. The agency is responsible for overseeing the safe and environmentally responsible development of our Nation's traditional and renewable ocean energy and mineral resources. BOEMRE publishes Ocean Science, a science and technology journal. http://www.gomr.boemre.gov/homepg/regulate/environ/ocean_science/

The **Bureau of Land Management** manages the California Coastal National Monument which spans the entire 1,100 mile length of the California Coastline and extends 12 nautical miles from the shoreline.

The **Office of Insular Affairs** advances protection and sustainable management of coral reef resources in the insular areas through financial and technical assistance to support local initiatives.

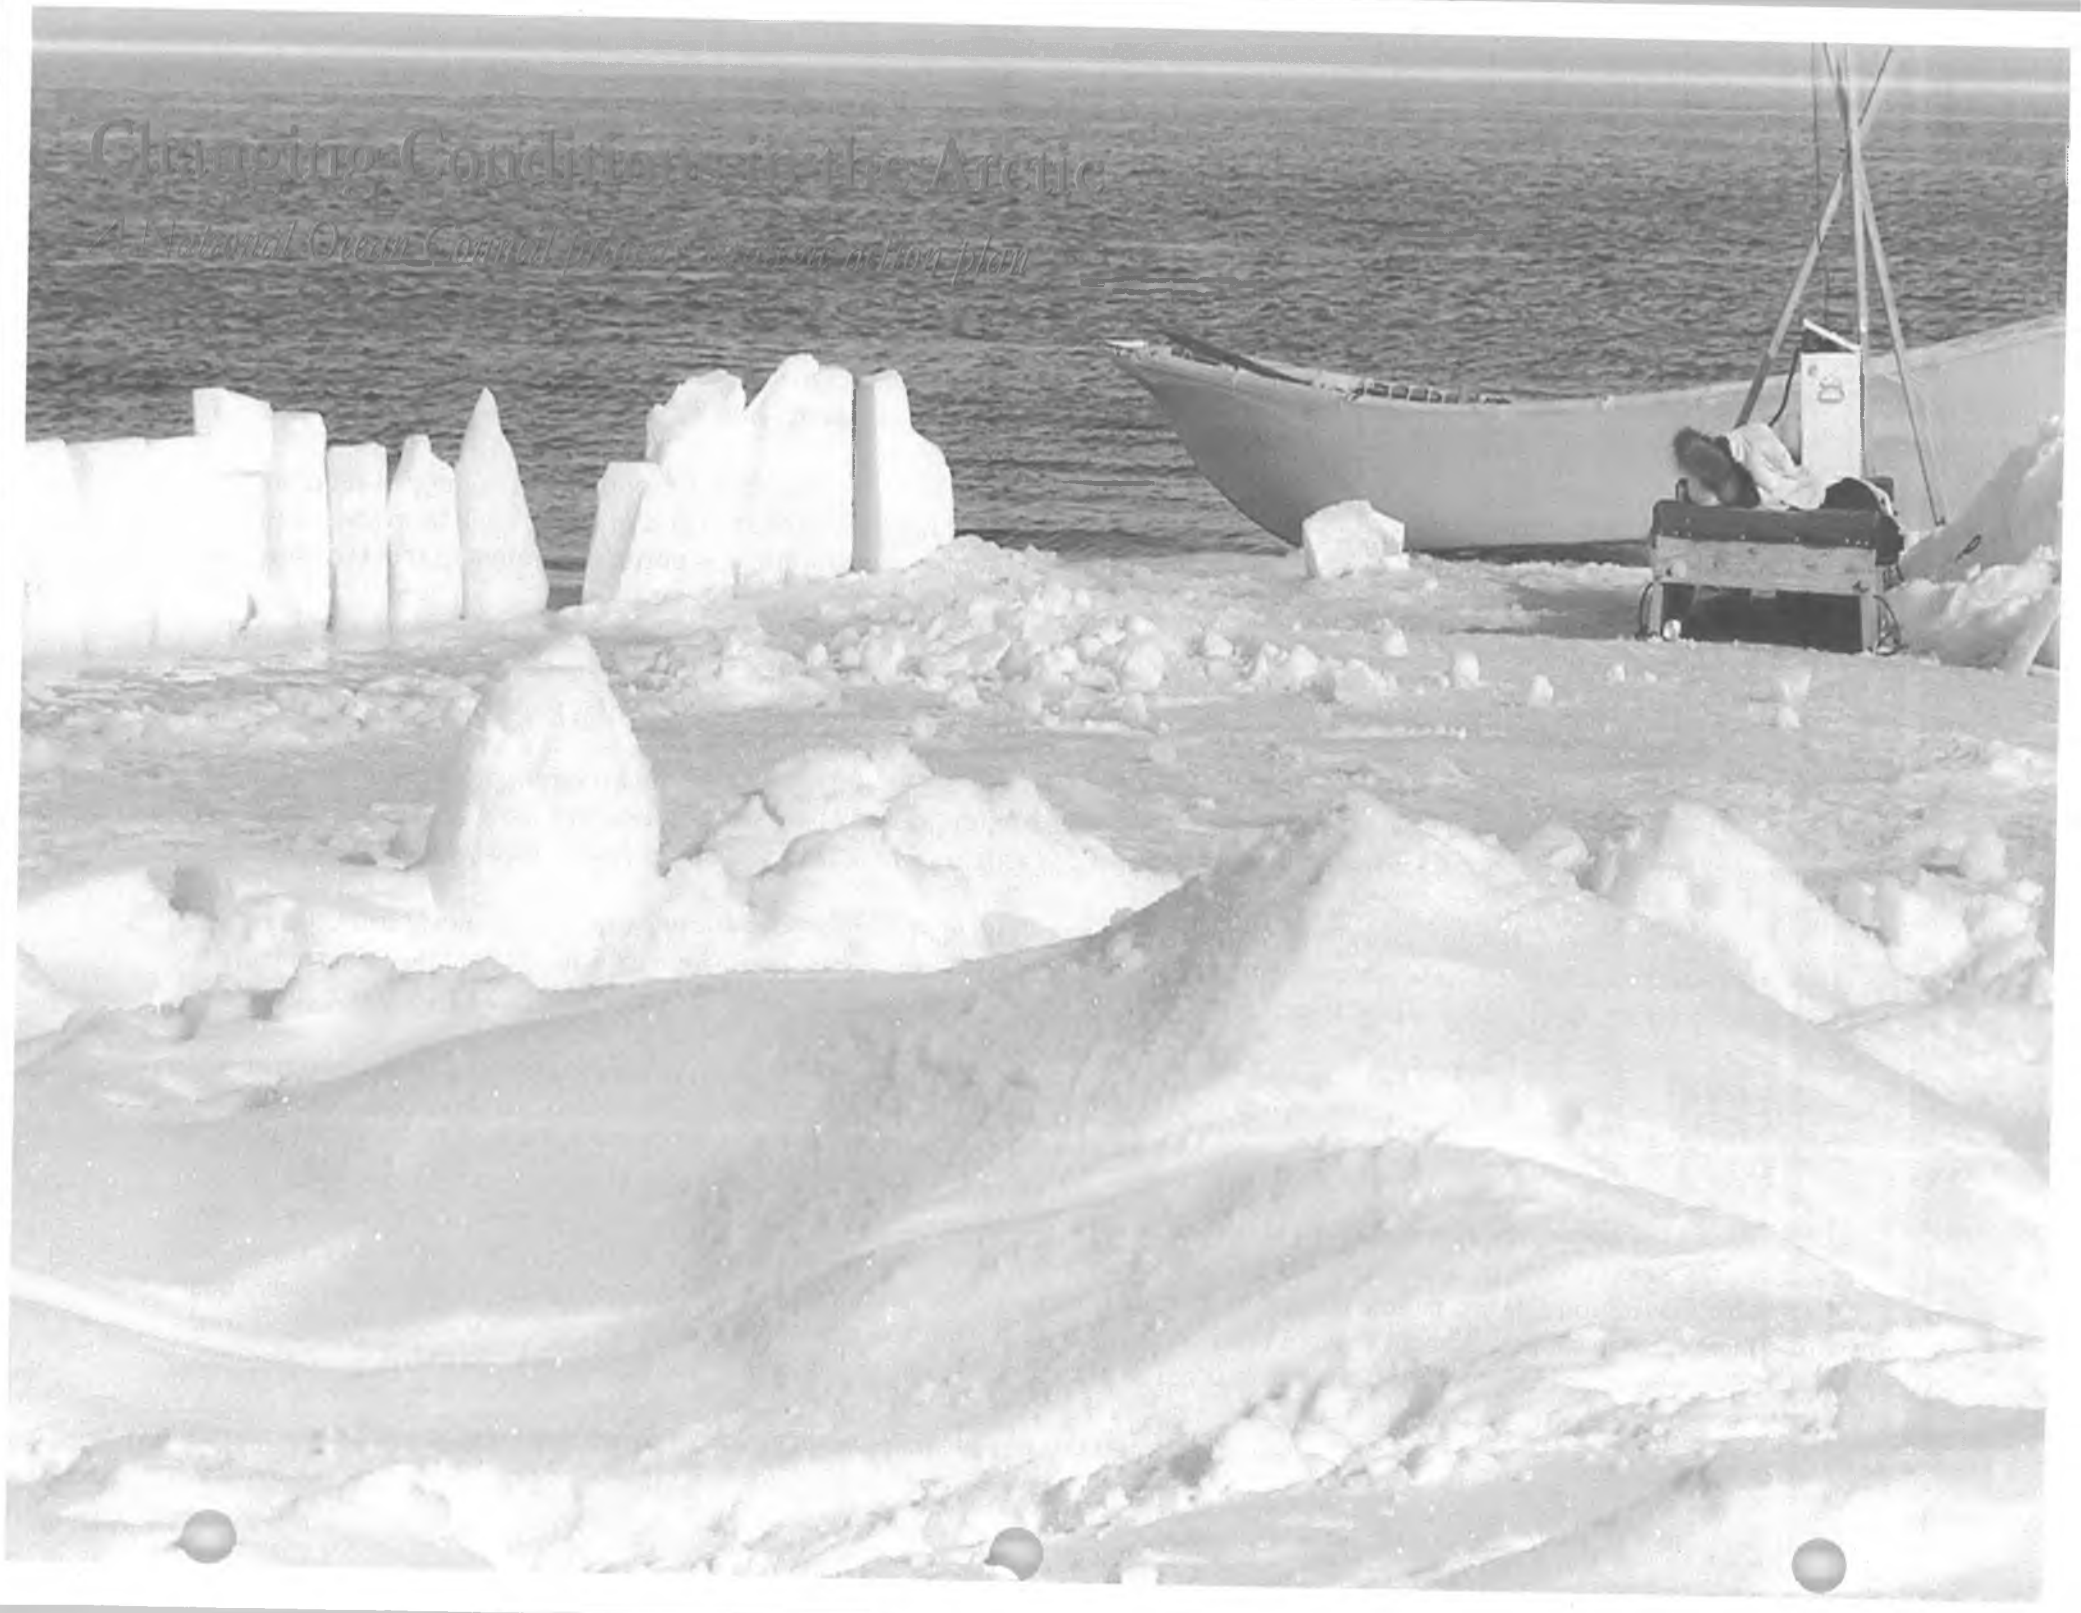
USGS science for a changing world



Changing Conditions in the Arctic
A National Ocean Council priority action plan

What does a strategic action plan mean to the local residents of the Arctic?

Your home is feeling the impacts of climate change far more than the rest of the world. The Arctic and local subsistence lifestyles face serious consequences from loss Arctic sea ice, coastal erosion, and sea-level rise from melting glaciers and ice caps. Longer periods of open water allow for additional resource development and increased ship traffic. . Increased human activity brings additional stress - and these things impact your communities and the places you hunt and travel through. Working with all stakeholders, including the State of Alaska, and Alaska Native communities, we have an opportunity to develop plans, based on sound science, to sustainably manage and encourage use of the Arctic while also continuing to protect it.

Actions and Anticipated Outcomes from the Plan

- **Improve Arctic environmental response management –** Oil spills and other accidents associated with resource extraction and increasing shipping are of high concern to Arctic residents. Developing new management systems and procedures will help protect subsistence resources – your whales, seals, walrus, fish, etc.-- and local communities, from impacts.

- **Observe and forecast Arctic sea ice –** Local hunters realize the value of knowing the ice. Observing, predicting, and ultimately projecting where the ice is, its thickness, and age, will improve daily forecasts and long term predictions which, in turn, supports safe and reliable activities on the water.

- **Establish a distributed biological observatory –** Collecting scientific data from stations (biological observatories) located in many different areas of the US Arctic will help us to understand the effects of climate change on the ocean, its inhabitants and communities that rely on them.

- **Improve Arctic communication –** Work together with involved parties to improve marine communications in the Arctic. Improved communications through improved infrastructure will support scientific research and help to reduce the risks of hunting/working in the marine environment.

- **Advance Arctic marine mapping and charting –** Good maps are essential to keep ships on route (and out of danger). They are also critical to understanding the impacts of climate change (for example: recording the land that is being lost along the coastline) and habitats that are important to the wildlife that live in the Arctic.

- **Improve coordination on Arctic Ocean issues –** Local people may have noticed that they are getting more and more requests to attend hearings, public comment sessions and open houses. This is because there is a lot going on in the Arctic. The better we can work together, the more efficient the government will be through the sharing of resources, knowledge, and information.

R41153

CRS Report for Congress
Prepared for Members and Committees of Congress

Summary

The diminishment of Arctic sea ice has led to increased human activities in the Arctic, and has heightened concerns about the region's future. The United States, by virtue of Alaska, is an Arctic country and has substantial interests in the region. On January 12, 2009, the George W. Bush Administration released a presidential directive, called National Security Presidential Directive 66/Homeland Security Presidential Directive 25 (NSPD 66/HSPD 25), establishing a new U.S. policy for the Arctic region.

Record low extent of Arctic sea ice in 2007 focused scientific and policy attention on its linkage to global climate change, and to the implications of projected ice-free seasons in the Arctic within decades. The Arctic has been projected by several scientists to be perennially ice-free in the late summer by the late 2030s.

The five Arctic coastal states—the United States, Canada, Russia, Norway, and Denmark (of which Greenland is a territory)—are in the process of preparing Arctic territorial claims for submission to the Commission on the Limits of the Continental Shelf. The Russian claim to the enormous underwater Lomonosov Ridge, if accepted, would reportedly grant Russia nearly one-half of the Arctic area. There are also four other unresolved Arctic territorial disputes.

The diminishment of Arctic ice could lead in the coming years to increased commercial shipping on two trans-Arctic sea routes. Current international guidelines for ships operating in Arctic waters are being updated, with a targeted completion date of 2010.

Changes to the Arctic brought about by warming temperatures will likely allow more exploration for oil, gas, and minerals. Warming that causes permafrost to melt could pose challenges to onshore exploration activities. Increased oil and gas exploration and tourism (cruise ships) in the Arctic increase the risk of pollution in the region. Cleaning up oil spills in ice-covered waters will be more difficult than in other areas, primarily because effective strategies have yet to be developed.

Large commercial fisheries exist in the Arctic. The United States is currently meeting with other countries regarding the management of Arctic fish stocks. Changes in the Arctic could affect threatened and endangered species. Under the Endangered Species Act, the polar bear was listed as threatened on May 15, 2008. Arctic climate change is also expected to affect the economies, subsistence, health, population, societies, and cultures of Arctic indigenous peoples.

Two of the Coast Guard's three polar icebreakers—*Polar Star* and *Polar Sea*—have exceeded their intended 30-year service lives. The Coast Guard since 2008 has been studying how many polar icebreakers, with what capabilities, should be procured as replacements for *Polar Star* and *Polar Sea*. The possibility of increased sea traffic through Arctic waters also raises an issue concerning Arctic search and rescue capabilities.

The Arctic has increasingly become a subject of discussion among political leaders of the nations in the region. Although there is significant international cooperation on Arctic issues, the Arctic is also increasingly being viewed by some observers as a potential emerging security issue. In varying degrees, the Arctic coastal states have indicated a willingness to establish and maintain a military presence in the high north. U.S. military forces, particularly the Navy and Coast Guard, have begun to pay more attention to the region.

Introduction

The diminishment of Arctic sea ice has led to increased human activities in the Arctic, and has heightened concerns about the region's future. Issues such as Arctic sovereignty claims; commercial shipping through the Arctic; Arctic oil, gas, and mineral exploration; endangered Arctic species; and increased military operations in the Arctic could cause the region in coming years to become an arena of international cooperation, competition, or conflict. The United States, by virtue of Alaska, is an Arctic country and has substantial political, economic, energy, environmental, and other interests in the region. Decisions that Congress, the executive branch, foreign governments, international organizations, and commercial firms make on Arctic-related issues could significantly affect these interests.

This report provides an overview of Arctic-related issues for Congress, and refers readers to more in-depth CRS reports on specific Arctic-related issues. Congressional readers with questions about an issue discussed in this report should contact the author or authors of the section discussing that issue. The authors are identified by footnote at the start of each section.

This report does not track legislation on specific Arctic-related issues. For tracking of legislative activity, see the CRS reports relating to specific Arctic-related issues.

Background[1]

Definitions of the Arctic

There are multiple definitions of the Arctic that result in differing descriptions of the land and sea areas encompassed by the term. Policy discussions of the Arctic can employ varying definitions of the region, and readers should bear in mind that the definition used in one discussion may differ from that used in another. This CRS report does not rely on any one definition.

Arctic Circle Definition and Resulting Arctic Countries

The most common and basic definition of the Arctic defines the region as the land and sea area north of the Arctic Circle (a circle of latitude at about 66.30° North). For surface locations within this zone, the sun is generally above the horizon for 24 continuous hours at least once per year (at the summer solstice) and below the horizon for 24 continuous hours at least once per year (at the winter solstice).

The Arctic Circle definition includes the northernmost third or so of Alaska, as well as the Chukchi Sea, which separates that part of Alaska from Russia, and U.S. territorial and Exclusive Economic Zone (EEZ) waters north of Alaska. It does not include the lower two-thirds or so of Alaska or the Bering Sea, which separates that lower part of the state from Russia.

[1] Except for the subsection on the Arctic and the U.N. Convention on the law of the Sea, this section was prepared by Ronald O'Rourke, Specialist in Naval Affairs, Foreign Affairs, Defense, and Trade Division.

Eight countries have territory north of the Arctic Circle: the United States (Alaska), Canada, Russia, Norway, Denmark (by virtue of Greenland, a member country of the Kingdom of Denmark), Finland, Sweden, and Iceland.[2] These eight countries are often referred to as the Arctic countries, and they are the member states of the Arctic Council, an intergovernmental forum established in 1996.[3] A subset of the eight Arctic countries are the five countries that are considered Arctic coastal states: the United States, Canada, Russia, Norway, and Denmark (by virtue of Greenland).

Definition in Arctic Research and Policy Act of 1984

Section 112 of the Arctic Research and Policy Act of 1984 (Title I of P.L. 98-373 of July 31, 1984[4]) defines the Arctic as follows:

> As used in this title, the term "Arctic" means all United States and foreign territory north of the Arctic Circle and all United States territory north and west of the boundary formed by the Porcupine, Yukon, and Kuskokwim Rivers [in Alaska]; all contiguous seas, including the Arctic Ocean and the Beaufort, Bering, and Chukchi Seas; and the Aleutian chain.

This definition, which is codified at 15 U.S.C. 4111,[5] includes certain parts of Alaska below the Arctic Circle, including the Aleutian islands and portions of central and western mainland Alaska, such as the Seward Peninsula and the Yukon Delta.

Other Definitions

Other definitions of the Arctic are based on factors such as average temperature, the northern tree line, the extent of permafrost on land, the extent of sea ice on the ocean, or jurisdictional or administrative boundaries.[6] A definition based on a climate-related factor could circumscribe differing areas over time as a result of climate change.

The 10° C isotherm definition of the Arctic defines the region as the land and sea area in the northern hemisphere where the average temperature for the warmest month (July) is below 10° Celsius, or 50° Fahrenheit. This definition results in an irregularly shaped Arctic region that excludes some land and sea areas north of the Arctic Circle but includes some land and sea areas south of the Arctic Circle. This definition currently excludes all of Finland and Sweden, as well as

[2] On November 25, 2008, voters in Greenland approved a referendum for greater autonomy that some observers view as a step toward eventual independence from Denmark. (Alan Cowell, "Greenland Vote Favors Independence," *New York Times*, November 26, 2008.)

[3] For more on the Arctic Council on the Internet, see http://www.arctic-council.org/.

[4] Title II of P.L. 98-373 is the National Critical Materials Act of 1984.

[5] As codified, the definition reads, "As used in this chapter...."

[6] For discussions and (in some cases) maps, see Susan Joy Hassol, *Impacts of a Warming Arctic* [Executive Summary]. Cambridge, Cambridge University Press, 2004, p. 4. Available online at http://amap.no/acia/; Oran R. Yong and Niels Einarsson, *Arctic Human Development Report*, Stefansson Arctic Institute, Akureyri, Iceland, 2004, pp. 17-18, available online at http://www.svs.is/AHDR/AHDR%20chapters/English%20version/Chapters%20PDF.htm; and Hugo Ahlenius, editor in chief, et al. *Vital Arctic Graphics, People and Global Heritage on Our Last Wild Shores*, UNEP/GRID-Arendal, Arendal, Norway, p. 6, available online at http://www.grida.no/publications/vg/arctic/.

some of Alaska above the Arctic Circle, while including virtually all of the Bering Sea and Alaska's Aleutian Islands.[7]

The definition of the Arctic adopted by the Arctic Monitoring and Assessment Programme (AMAP)—a working group of the Arctic Council—"essentially includes the terrestrial and marine areas north of the Arctic Circle (66°32' N), and north of 62° N in Asia and 60° N in North America, modified to include the marine areas north of the Aleutian chain, Hudson Bay, and parts of the North Atlantic, including the Labrador Sea."[8] The AMAP website includes a map showing the Arctic Circle, 10° C isotherm, tree line, and AMAP definitions of the Arctic.[9]

Some observers use the term "high north" as a way of referring to the Arctic. Some observers make a distinction between the "high Arctic"—meaning, in general, the colder portions of the Arctic that are closer to the North Pole—and other areas of the Arctic that are generally less cold and further away from the North Pole, which are sometimes described as the low Arctic or the subarctic.

U.S. Arctic Research

Arctic Research and Policy Act of 1984, As Amended

The Arctic Research and Policy Act of 1984 (Title I of P.L. 98-373 of July 31, 1984[10]) "provide[s] for a comprehensive national policy dealing with national research needs and objectives in the Arctic."[11] The act, among other things

- made a series of findings concerning the importance of the Arctic and Arctic research;
- established the U.S. Arctic Research Commission (USARC) to promote Arctic research and recommend Arctic research policy;
- designated the National Science Foundation (NSF) as the lead federal agency for implementing Arctic research policy;
- established the Interagency Arctic Research Policy Committee (IARPC) to develop a national Arctic research policy and a five-year plan to implement that policy, and designated the NSF representative on the IARPC as its chairperson;[12] and

[7] A map showing the line that results from 10° isotherm definition is available online at https://www.cia.gov/library/publications/the-world-factbook/reference_maps/pdf/arctic.pdf.

[9] Discussion entitled "Geographical Coverage," available online at http://www.amap.no/ (click on "About AMAP" and then the tab "Geographical coverage.")

[10] Title II of P.L. 98-373 is the National Critical Materials Act of 1984.

[11] These words are taken from the official title of P.L. 98-373. (Arctic Research and Policy Act of 1984 is the short title of Title I of P.L. 98-373.) The remainder of P.L. 98-373's official title relates to Title II of the act, the short title of which is the National Critical Materials Act of 1984.)

[12] The IARPC currently includes more than a dozen federal agencies, departments, and offices. Additional information on the IARPC is available on the Internet at http://www.nsf.gov/od/opp/arctic/iarpc/start.jsp.

- defined the term "Arctic" for purposes of the act.

The Arctic Research and Policy Act of 1984 was amended by P.L. 101-609 of November 16, 1990. For the texts of the Arctic Research and Policy Act of 1984 and P.L. 101-609, see **Appendix A** and **Appendix B**, respectively.

NSF FY2011 Budget Request For Arctic Research

NSF—the lead federal agency for implementing Arctic research policy (see "Arctic Research and Policy Act of 1984, As Amended")—carries out Arctic research activities through its Division of Arctic Sciences (ARC), which forms part of NSF's Office of Polar Programs (OPP). NSF is requesting a total of $527.99 million for OPP for FY2011, including $111.36 million for ARC and $54.0 million for U.S. Coast Guard polar icebreaker operations and maintenance in support of Arctic and Antarctic research activities.[13] NSF states in its budget request that

> OPP provides primary U.S. support for fundamental research in polar regions through several mechanisms. In addition, NSF provides interagency leadership for U.S. activities in polar regions. In the Arctic, NSF leads research planning as directed by the Arctic Research Policy Act of 1984. The NSF Director chairs the Interagency Arctic Research Policy Committee created for this purpose....
>
> Research in polar regions addresses critical aspects of the global earth system – glacial and sea ice, permafrost, terrestrial and marine ecosystems, the ocean, and the atmosphere – that help shape the global environment and climate. This work addresses the Administration's focus on making the U.S. a world leader on climate change and builds on a foundation established during the International Polar Year (IPY) 2007-2009.... Research in polar regions also offers opportunities for fundamental advances in each of the disciplinary sciences, ranging from the behavior of the Earth's inner core, the formation of galaxies, the biology of life in the cold and dark, and how Arctic residents and institutions are affected by environmental change.
>
> The Administration is assessing the overarching issues facing the Arctic, including those associated with impacts of climate change, increased human activity, new or additional information needs, and conservation of Arctic resources. This approach will necessarily include identifying implementation issues associated with the U.S. Arctic Policy released in January 2009.[14]

Regarding the $111.36 million requested for ARC for FY2011, NSF states

---

[13] National Science Foundation, *FY 2011 Budget Request to Congress*, February 1, 2010, p. OPP-1 (pdf page 167 of 458). Regarding the $54.0 million requested for U.S. Coast Guard polar icebreaker operations and maintenance, NSF states:

> This budget line item funds the operation and maintenance of the [Coast Guard polar icebreaker] Polar Sea and the [Coast Guard polar icebreaker] Healy in support of NSF science and, on a reimbursable basis, the needs of other federal agencies. The U.S. Coast Guard estimates that $54.0 million will be needed to fund operation and maintenance of the two vessels in FY 2011, which includes significant funding for a triennial dry dock for each vessel.
>
> (National Science Foundation, *FY 2011 Budget Request to Congress*, February 1, 2010, p. OPP-16 (pdf page 182 of 458).)

[14] National Science Foundation, *FY 2011 Budget Request to Congress*, February 1, 2010, p. OPP-2 (pdf page 168 of 458).

> ARC is organized into several programs that support research in social science, earth system science, and a broad range of natural science. Educational projects are also supported. The Research Support & Logistics program assists researchers with access to the Arctic, improves safety and environmental stewardship, and increases the ability of researchers to share plans and results with local Arctic communities.... Arctic Sciences funds a broad range of activities to provide an integrated understanding of environmental change in the Arctic, including study of significant, system-scale environmental change and its human dimension.[15]

NSF's FY2011 budget also requests $1.6 million to fund the operations of USARC.[16]

January 2009 Presidential Arctic Policy Directive

On January 12, 2009, the George W. Bush Administration released a presidential directive establishing a new U.S. policy for the Arctic region. The directive, dated January 9, 2009, was issued as National Security Presidential Directive 66/Homeland Security Presidential Directive 25 (NSPD 66/HSPD 25). The directive was the result of an interagency review, and it superseded for the Arctic (but not the Antarctic) a 1994 presidential directive on Arctic and Antarctic policy. The directive, among other things,

- states that the United States is an Arctic nation, with varied and compelling interests in the region;
- sets forth a six-element overall U.S. policy for the region;
- describes U.S. national security and homeland security interests in the Arctic; and
- discusses a number of issues as they relate to the Arctic, including international governance; the extended continental shelf and boundary issues; promotion of international scientific cooperation; maritime transportation; economic issues, including energy; and environmental protection and conservation of natural resources.

---

[15] National Science Foundation, *FY 2011 Budget Request to Congress*, February 1, 2010, p. OPP-9 (pdf page 175 of 458).

[16] Regarding this request, NSF states:

> USARC was created by the Arctic Research and Policy Act of 1984, (as amended, P.L. 101-609), to establish the national policy, priorities, and goals necessary to construct a federal program plan for basic and applied scientific research with respect to the Arctic, including natural resources and materials, physical, biological and health sciences, and social and behavioral sciences. This request provides funds to promote Arctic research, to recommend Arctic research policy, and to communicate research and policy recommendations to the rest of the Administration and the Congress, as well as supporting close collaboration with the National Science Foundation (NSF) as the lead agency responsible for implementing Arctic research policy and supporting cooperation and collaboration throughout the Federal Government. In addition, USARC gives guidance to the Interagency Arctic Research Policy Committee (IARPC) to develop national Arctic research projects and a five-year plan to implement those projects. USARC also supports interaction with Arctic residents, international Arctic research programs and organizations, and local institutions, including regional governments, in order to obtain the broadest possible view of Arctic research needs. USARC is an independent federal agency, funded through NSF's appropriations, specifically as an activity in the Research and Related Activities account.
>
> (National Science Foundation, *FY 2011 Budget Request to Congress*, February 1, 2010, p. USARC-1 [pdf page 189 of 458]. Additional information about USARC is available on the Internet at http://www.arctic.gov.)

The Obama Administration has not issued a new directive superseding NSPD 66/HSPD 25; it is currently operating under the Bush Administration's policy directive.[17] For the text of NSPD 66/HSPD 25, see **Appendix C**.

May 2010 National Security Strategy

In May 2010, the Obama Administration released a national security strategy document, which states:

> The United States is an Arctic Nation with broad and fundamental interests in the Arctic region, where we seek to meet our national security needs, protect the environment, responsibly manage resources, account for indigenous communities, support scientific research, and strengthen international cooperation on a wide range of issues.[18]

The Arctic and the U.N. Convention on Law of the Sea (UNCLOS)[19]

Background to UNCLOS

In November 1994, the United Nations Convention on the Law of the Sea (UNCLOS) entered into force. This convention establishes a treaty regime to govern activities on, over, and under the world's oceans. It builds on the four 1958 law of the sea conventions and sets forth a framework for future activities in parts of the oceans that are beyond national jurisdiction.[20] The 1982 Convention and its 1994 Agreement relating to Implementation of Part XI of the Convention were transmitted to the Senate on October 6, 1994.[21] In the absence of Senate advice and consent to adherence, the United States is not a party to the convention and agreement.

Part VI of UNCLOS and Commission on Limits of Continental Shelf

Part VI of the convention, dealing with the Continental Shelf, and Annex II, which established a Commission on the Limits of the Continental Shelf, are most pertinent to the Arctic as it becomes more accessible ocean space, bordered by five coastal states.[22] The convention gives the coastal state sovereign jurisdiction over the resources, including oil and gas, of its continental shelf.[23]

---

[17] CRS communication with State Department official, October 8, 2010.

[18] *National Security Strategy*, Washington, May 2010, p. 50. The quoted sentence constitutes the entirety of the document's comments specifically on the Arctic. It is the final sentence of a section on "sustain[ing] broad cooperation on key global challenges" that includes longer discussions on climate change, peacekeeping and armed conflict, pandemics and infectious disease, transnational criminal threats and threats to governance, and safeguarding the global commons.

[19] This section prepared by Marjorie Ann Browne, Specialist in International Relations, Foreign Affairs, Defense, and Trade Division.

[20] The United States is party to the four conventions adopted in 1958: Convention on the Territorial Sea and the Contiguous Zone, Convention on the High Seas, Convention on the Continental Shelf, and Convention on Fishing and Conservation of the Living Resources of the High Seas.

[21] Treaty Document 103-39.

[22] Other relevant provisions of the Convention, applicable depending on the extent of Arctic melting, relate to navigation, high seas freedoms, fisheries, and exclusive economic zones.

[23] The continental shelf is the under-sea extension of a coastal state's land territory. Article 76 of the Convention defines the continental shelf, *inter alia*, as "the seabed and subsoil of the submarine areas that extend beyond its (continued...)

Under Article 76 of the convention, a coastal state with a broad continental margin may establish a shelf limit beyond 200 nautical miles. This jurisdiction is subject to the submission of the particulars of the intended limit and supporting scientific and technical data by the coastal state to the commission for review and recommendation.[24] The commission reviews the documentation and, by a two-thirds majority, approves its recommendations to the submitting state. Coastal states agree to establish the outer limits of their continental shelf, in accordance with this process and with their national laws. In instances of disagreement with the commission's recommendations, the coastal state may make a revised or new submission. The actions of the commission "shall not prejudice matters relating to delimitation of boundaries between States with opposite or adjacent coasts."[25] The "limits established by a coastal State on the basis of these recommendations shall be final and binding."[26]

U.S. Activities As a Non-Party to UNCLOS

As a non-party to the convention, the United States cannot participate as a member of the commission; it cannot submit a claim under Article 76. Over the years, however, it has submitted observations on submissions made by other states, requesting that those observations be made available online and to the commission. In addition, since 2001, the United States has gathered and analyzed data to determine the outer limits of its extended continental shelf. Starting in 2007, this effort became the Extended Continental Shelf Project, directed by an interagency task force under the lead of the Department of State.[27]

Some observers have suggested that a separate regime be negotiated to address the changing circumstances in the Arctic. They maintain that this phenomenon was not envisioned at the time the Law of the Sea Convention was negotiated. Still others suggest that the Arctic region above a certain parallel be designated a wilderness area, and they cite as precedent Article 4 of The Antarctic Treaty, under which any current claims to sovereign territory are frozen and

> No acts or activities taking place while the present Treaty is in force shall constitute a basis for asserting, supporting or denying a claim to territorial sovereignty in Antarctica or create any rights of sovereignty in Antarctica. No new claim, or enlargement of an existing claim, to territorial sovereignty in Antarctica shall be asserted while the present Treaty is in force.

Supporters of the Law of the Sea Convention maintain that changing circumstances in the Arctic strengthen their argument that the United States should become a party to the convention. In this way, they argue, the United States can be best situated to protect and serve its national interests, under both Article 76 and other parts of the convention.

(...continued)

[coastal state's] territorial sea throughout the natural prolongation of its land territory to the outer edge of the continental margin."

[24] A coastal State party has 10 years from the entry into force of the Convention for submission of information on its proposed limits. In May 2001, the Meeting of States Parties to the Convention decided that for any State for which the Convention entered into force before May 13, 1999, the date of commencement of the 10-year time period for making submissions to the Commission is May 13, 1999.

[25] Annex II, Article 9. Article 83 of the Convention provides that questions relating to these boundary delimitation disputes shall be resolved by agreement between the States or by the Dispute Settlement options set forth in Part XV of the Convention.

[26] Article 76, para. 8.

[27] For more information, see http://www.state.gov/g/oes/continentalshelf/index.htm.

Issues for Congress

Climate Change and Loss of Arctic Sea Ice[28]

Record low extent of Arctic sea ice in 2007 focused scientific and policy attention on its linkage to global climate change, and to the implications of projected ice-free[29] seasons in the Arctic within decades. The Arctic has been projected by several scientists to be ice-free in the late summer in most years as soon as the late 2030s.[30] This opens opportunities for transport through the Northwest Passage and the Northern Sea Route, extraction of potential oil and gas resources, and expanded fishing and tourism (**Figure 1**). Loss of Arctic sea ice could also impact traditional livelihoods and cultures in the region and survival of polar bear and other animal populations, and raise risks of pollution, food supply, safety, and national security.

Like the rest of the globe, temperatures in the Arctic have varied over the past century, but show a significant warming trend, especially since the 1970s.[31] The annual average temperature for the Arctic region (from 60° to 90° N) is now about 1.8° F warmer than the average for the "climate normal" (the average from 1961 to 1990). Temperatures in October-November are now about 9° F above the seasonal normal. Scientists have concluded that most of the global warming of the last three decades is very likely caused by human-related emissions of greenhouse gases (GHG, mostly carbon dioxide); they expect the GHG-induced warming to continue for decades, even if, and after, GHG concentrations in the atmosphere have been stabilized.

Modeling of GHG-induced climate change is particularly challenging for the Arctic, but it consistently projects warming through the 21st century, with annual average Arctic temperature increases ranging from +1° to +9.0° C (+2° to +19.0° F), depending on the GHG scenario and model used. While such warming is projected by most models throughout the Arctic, some models project slight cooling localized in the North Atlantic Ocean just south of Greenland and

[28] This section prepared by Jane Leggett, Specialist in Energy and Environmental Policy, Resources, Science, and Industry Division.

[29] In scientific analyses, "ice-free" does not necessarily mean "no ice." The definition of "ice-free" or sea ice "extent" or "area" varies across studies. Sea ice "extent" is one common measure, equal to the sum of the area of grid cells that have less than a set percentage—frequently 15%—ice concentration. For more information, see the National Snow and Ice Data Center, http://nsidc.org/seaice/data/terminology.html.

[31] There was a regionally warm period in the Arctic from the mid-1920s to around 1940, which scientists have assessed to have been driven by natural climate variability. They have found that period to be distinctly different from the recent multi-decadal warming, in part because the current warmth is global.

Iceland. Most warming would occur in autumn and winter, "with very little temperature change projected over the Arctic Ocean" in summer months.[32]

The observed warmer temperatures in the Arctic have reduced sea ice extent and thickness, and the amount of ice that persists year-round ("perennial ice"); natural climate variability has likely contributed as well, such as in the record low ice extent of 2007. The 2007 record minimum sea ice extent was influenced by warm Arctic temperatures and warm, moist winds blowing from the North Pacific into the central Arctic, contributing to melting and pushing ice toward and into the Atlantic past Greenland. Warm winds did not account for the near-record sea ice minimum in 2008.[33]

Due to observed and projected climate change, scientists have concluded that the Arctic will have changed from an ice-covered environment to a recurrent ice-free[34] ocean (in summers) as soon as the late 2030s. The character of ice cover is expected to change as well, with the ice being thinner and more fragile. The variability from year to year of both ice quantity and location could be expected to continue.

Territorial Claims and Sovereignty Issues[35]

Motivated in part by a desire to exercise sovereign control over the Arctic region's increasingly accessible oil and gas reserves (see "Oil, Gas, and Mineral Exploration"), the four Arctic coastal states other than the United States—Canada, Russia, Norway, and Denmark (of which Greenland is a territory)—are in the process of preparing territorial claims in the Arctic, including claims for expanded Exclusive Economic Zones (EEZs), for submission to the Commission on the Limits of the Continental Shelf. (As mentioned earlier—see "U.S. Activities As a Non-Party to UNCLOS"—the United States, as a non-party to UNCLOS, cannot participate as a member of the commission; it cannot submit a claim under Article 76. Over the years, however, it has submitted observations on submissions made by other states, requesting that those observations be made available online and to the commission. In addition, since 2001, the United States has gathered and analyzed data to determine the outer limits of its extended continental shelf.)

Russia has been attempting to chart the Arctic Ocean's enormous underwater Lomonosov Ridge in an attempt to show that it is an extension of Russia's continental margin. The Russian claim to this ridge, if accepted, would reportedly grant Russia nearly one-half of the Arctic area; a 2001 claim submitted by Russia was rejected as insufficiently documented. Canada also claims a portion of the Lomonosov Ridge as part of its own underwater continental shelf.[36] In August 2007, a Russian submersible on a research expedition deposited an encased Russian Federation flag on the seabed of the presumed site of the North Pole. The action captured worldwide attention, but analysts note that it did not constitute an official claim to the territory and was therefore a purely symbolic act.

At a May 2008 meeting in Ilulissat, Greenland, the five Arctic coastal states reaffirmed their commitment to the UNCLOS legal framework for the establishment of extended continental shelf limits in the Arctic.[37] (For further discussion, see "Extent of the Continental Margin" in "Oil, Gas, and Mineral Exploration.")

In addition to this process, there are four unresolved Arctic territorial disputes:

- Scientists have forecast that in coming decades, global warming will reduce the ice pack in Canada's northern archipelago sufficiently to permit ships to use the trans-Arctic shipping route known as the Northwest Passage during the summer months (see "Commercial Sea Transportation"). The prospect of such traffic raises a major jurisdictional question. Ottawa maintains that such a passage would be an inland waterway, and would therefore be sovereign Canadian territory subject to Ottawa's surveillance, regulation, and control. The United States, the European Union, and others assert that the passage would constitute an international strait between two high seas.
- The United States and Canada are negotiating over a binational boundary in the Beaufort Sea.

[35] This section prepared by Carl Ek, Specialist in International Relations, Foreign Affairs, Defense, and Trade Division.

[36] "Russia, Canada Make Competing Claims To Arctic Resources," *The Canadian Press*, September 16, 2010.

[37] "5 Countries Agree To Talk, Not Compete, Over the Arctic," *New York Times*, May 29, 2008.

- The United States and Russia in 1990 signed an agreement regarding a disputed area of the Bering Sea; the U.S. Senate ratified the pact the following year, but the Russian *Duma* has yet to approve the accord.
- Denmark and Canada disagree over which country has the territorial right to Hans Island, a tiny, barren piece of rock between Greenland and Canada's Ellesmere Island. Some analysts believe the two countries are vying for control over a future sea lane that might be created if the Arctic ice were to melt sufficiently to create a Northwest Passage. Others claim that the governments are staking out territorial claims in the event that future natural resource discoveries make the region economically valuable.[38]

In addition to these disputes, Norway and Russia had been at odds for decades over the boundary between the two in the so-called "Grey Zone" in the Barents Sea, an area believed to hold rich undersea deposits of petroleum. On September 15, 2010, Norwegian Prime Minister Jens Stoltenberg and Russian President Dmitry Medvedev signed an agreement in Murmansk, a Russian city near the Norwegian border. The accord awards roughly half of the 175,000 square kilometer area to each country; it spells out fishing rights, and provides for the joint development of future oil and gas finds that straddle the boundary line. Some observers believe it is noteworthy that Russia would concede sovereignty over such a large, resource-rich territory to a small, neighboring country. But others have noted that Moscow may be hoping for Norwegian cooperation in developing offshore resources, and eventually in winning approval when Russia submits its Article 76 UNCLOS claim.[39]

In August 2010, Canadian Foreign Minister Lawrence Cannon announced a new "Statement of Canada's Arctic Policy," which reaffirmed the government's commitment to Canada's sovereignty in the region, to economic and social development, to environmental protection, and to empowerment of the peoples in the north. The statement also emphasized the government's intention to negotiate settlements to its disputes with the United States over the Beaufort Sea boundary, and with Denmark over Hans Island. Minister Cannon declared that "making progress on outstanding boundary issues will be a top priority."[40]

Commercial Sea Transportation[41]

Background

The search for a shorter route from the Atlantic to Asia has been the quest of maritime powers since the Middle Ages. The melting of Arctic ice raises the possibility of saving several thousands of miles and several days of sailing between major trading blocs.[42] If the Arctic were to become a viable shipping route, the ramifications could extend far beyond the Arctic. For example, lower shipping costs could be advantageous for China (at least its northeast region), Japan, and South Korea because their manufactured products exported to Europe or North America could become less expensive relative to other emerging manufacturing centers in Southeast Asia, such as India.[43] Melting ice could potentially open up two trans-Arctic routes (see **Figure 1**):[44]

- **The Northern Sea Route** (NSR, a.k.a. the "Northeast Passage"), along Russia's northern border from Murmansk to Provideniya, is about 2,600 nautical miles in length. It was opened by the Soviet Union to shipping in 1931 but was not opened to the rest of the world until 1991. Even so, these waters are little used by non-Russian ships.[45] This route would be applicable for trade between northeast Asia (north of Singapore) and northern Europe.
- **The Northwest Passage** (NWP) runs through the Canadian Arctic Islands. The NWP actually consists of several potential routes. The southern route is through Peel Sound in Nunavut, which has been open the past three summers and contains mostly one-year ice. However, this route is circuitous, contains some narrow channels, and is shallow enough to impose draft restrictions on ships. The more northern route, through McClure Strait from Baffin Bay to the Beaufort Sea north of Alaska, is much more direct, and therefore more appealing to ocean carriers, but more prone to ice blockage.[46] The NWP is potentially applicable for trade between northeast Asia (north of Shanghai) and the northeast of North America, but is considered by many to be less commercially viable than the NSR.[47]

[41] This section prepared by John Frittelli, Specialist in Transportation Policy, Resources, Science, and Industry Division. Vanessa Cieslak, Information Research Specialist, Knowledge Services Group, assisted in compiling information for the background part of this section.

[42] Extended daylight hours in the Arctic during the summer may also be an advantage.

[43] Presentation by Stephen Carmel, Senior Vice President, Maersk Line Ltd., Halifax International Security Forum, *Arctic Security: The New Great Game?* November 21, 2009, available at http://fora.tv/.

[44] A third but more remote possibility is a route directly over the North Pole.

[45] In the summer of 2009, two German-owned ships are believed to be the first non-Russian ships to transit the NSR, sailing from Korea to deliver oil-service equipment to the Russian Arctic and then sailing on to Rotterdam.

[46] This was the route pioneered by the *SS Manhattan*, an oil tanker modified for ice breaking in 1969 to carry Alaskan North Slope oil to the Atlantic. This was the first commercial passage through the NWP, but the building of the Alaskan pipeline was found to be the more economical means of transporting oil from the North Slope to the lower 48 states.

[47] Although the NWP is often compared to the alternative route through the Panama Canal in terms of distance and sailing days from Asia to the U.S. east coast, another alternative to consider is the shorter and faster transcontinental rail route across Canada or the United States.

Destination Traffic, Not Trans-Arctic Traffic

Almost all cargo ship activity currently taking place in the Arctic is to transport natural resources from the Arctic or to deliver general cargo and supplies to communities and natural resource extraction facilities. Thus, cargo ship traffic in the Arctic presently is mostly regional, not trans-Arctic. While there has been a recent uptick in Arctic shipping activity, this activity has more to do with a spike in commodity prices than it does with the melting of Arctic ice. Even so, recent activity is less than it has been in the past. The NSR continues to account for the bulk of Arctic shipping activity. The western end of the NSR, in the Barents Sea, is open year round. Further east, sections of the NSR are open for as little as two and a half months during the summer. From Murmansk, oil is transported to Europe, as well as ore and timber, while general cargo and fuel are delivered to the port by ship. Nickel and copper are also shipped from the northern coast of Russia. Coal has been shipped from Svalbard to Europe for almost a century. The Murmansk Shipping Company keeps the NSR route open with nuclear powered icebreakers. It is partially owned by LukOil, which has a fleet of ice-strengthened oil tankers. Norilsk Nickel, a large producer of nickel, is also a large shipper in NSR and is currently building five reinforced cargo vessels. In NWP waters, general cargo is shipped along Alaska's north coast between Point Barrow and Prudhoe Bay and zinc is shipped from the Red Dog Mine in Alaska. Crude oil tankers load at Bent Horn and Cameron Island in the Canadian Arctic.

Cruise Ship Activity

Considerable cruise ship activity takes place in Arctic waters. In the summer of 2007, three cruise ships reportedly sailed through the NWP from the Atlantic to Alaska's North Slope.[48] In the Barents Sea, there are regular cruise ships sailing to Svalbard. The inherent dangers for passenger ships in the Arctic have prompted calls for international regulations promoting the safety of cruise ships in the area. Some have suggested that cruise ships sail in pairs to provide assistance to one another, given the Arctic's remoteness and the difficulty land based rescuers would have in reaching a vessel in distress.[49] Requiring that Arctic cruise vessels have ice-strengthened hulls and be equipped with enclosed lifeboats could be other safety requirements. In 2003, some Arctic cruise and tourist operators formed the Association of Arctic Expedition Cruise Operators (AECO) to establish agreed-upon safety and environmental protection guidelines, but this organization only covers the portion of the Arctic around Greenland, Svalbard, and Jan Mayen.[50]

Unpredictable Ice Conditions Hinder Trans-Arctic Shipping

Arctic waters do not necessarily have to be ice free to be open to shipping. Multiyear ice can be over 10 feet thick and problematic even for icebreakers, but one-year ice is typically three feet thick or less. This thinner ice can be more readily broken up by icebreakers or ice class ships. However, more open water in the Arctic has resulted in another potential obstacle to shipping, namely unpredictable ice flows. In the NWP, melting ice and the opening of waters that were once covered with one-year ice has allowed blocks of multiyear ice from farther north, or icebergs from Greenland, to flow into potential sea lanes. The source of this multiyear ice is not predicted to dissipate in spite of climate change. Moreover, the flow patterns of these ice blocks

[48] "U.S. Needs to Prepare for Arctic Traffic Surge," *Anchorage Daily News*, February 12, 2008, p. A4.

[49] "Northern Waters," *The Globe and Mail* (Canada), August 14, 2008, p. A8.

[50] See http://www.aeco.no/index.htm for more information.

are very difficult to predict, and they have blocked potential routes for shipping.[51] Thus, the lack of ice in potential sea lanes during the summer months can add even greater unpredictability to Arctic shipping. This is in addition to the extent of ice versus open water, which is also highly variable from one year to the next and seasonally. As mentioned above, "ice free" does not mean "no ice" and the presence of even small blocks of ice or icebergs from a melting Greenland ice sheet requires slow sailing.

The unpredictability of ice conditions is a major hindrance for trans-Arctic shipping in general, but can be more of a concern for some types of ships than it is for others. For instance, it would be less of a concern for cruise ships, which may have the objective of merely visiting the Arctic rather than passing through the Arctic and could change their route and itinerary depending on ice conditions. On the other hand, unpredictability is of the utmost concern for container ships that carry thousands of containers from hundreds of different customers, all of whom expect to unload or load their cargo upon the ship's arrival at various ports as indicated on the ship's advertised schedule. Other ships carrying entirely one commodity in bulk from one port to another for just one customer could have more flexibility in terms of a delivery window, but would not likely risk an Arctic passage under prevailing conditions.

Ice is not the sole impediment to Arctic shipping. Adverse weather is also an impediment. This includes not only severe storms, but also intense cold, which can impair deck machinery. During the summer months when shipping is most likely to occur, heavy fog is most common in the Arctic. Operating costs are higher in the Arctic. Ship size is an important factor in reducing freight costs, and many ships sailing in other waters would require two icebreakers to break a path wide enough for them to sail through.[52] Also, icebreakers or ice-class cargo vessels burn more fuel than is required to sail through open water and ships would have to sail at slower speeds. The shipping season in the Arctic only lasts for a few weeks. Icebreakers and other special required equipment would sit idle the remainder of the year. None of these impediments by themselves may be enough to discourage Arctic passage but they do raise costs, perhaps enough to negate the savings of a shorter route. Thus, from a shipper's perspective, shorter via the Arctic does not necessarily mean cheaper and faster.[53]

Basic Navigation Infrastructure Is Lacking

Considerable investment in navigation-related infrastructure would be required if trans-Arctic shipping were to become a reality. Channel marking buoys and other floating visual aids are not possible in Arctic waters because moving ice sheets will continuously shift their positions. Therefore, marine surveys and ice charts would need to be relied on exclusively. For some areas in the Arctic, however, these surveys and charts are out of date and not sufficiently accurate.[54] To remedy this problem, aviation reconnaissance of ice conditions and satellite images would need to

[51] S.E.L. Howell and J.J. Yackel, "A Vessel Transit Assessment of Sea Ice Variability in the Western Arctic, 1969-2002: Implications for Ship Navigation," *Canadian Journal of Remote Sensing*, vol. 30, no. 2, 2004.

[52] "Arctic Unlikely to See Major Shipping Growth," *New Zealand Transport and Logistics Business Week*, April 24, 2008.

[53] Presentation by Stephen Carmel, Senior Vice President, Maersk Line Ltd., Halifax International Security Forum, *Arctic Security: The New Great Game?* November 21, 2009, available at http://fora.tv/.

[54] In July and August 2010, NOAA is surveying the Bering Straits area in order to update its charts but states that it will take more than 25 years to map the prioritized areas of navigational significance in U.S. Arctic waters. See http://www.noaanews.noaa.gov/stories2010/20100720_fairweather.html.

become readily available for ship operators.[55] Ship-to-shore communication infrastructure would need to be installed where possible. Refueling stations may be needed, as well as, perhaps, transshipment ports where cargo can be transferred to and from ice capable vessels at both ends of Arctic routes. Shipping lines would need to develop a larger pool of mariners with ice navigation experience. Marine insurers would need to calculate the proper level of risk premium for polar routes, which would require more detailed information about Arctic accidents and incidents in the past.

Regulation of Arctic Shipping

Due to the international nature of the shipping industry, maritime trading nations have adopted international treaties that establish standards for ocean carriers in terms of safety, pollution prevention, and security. These standards are agreed upon by shipping nations through the International Maritime Organization (IMO), a United Nations agency that first met in 1959.[56] Key conventions that the 168 IMO member nations have adopted include the Safety of Life at Sea Convention (SOLAS), which was originally adopted in response to the Titanic disaster in 1912 but has since been revised several times; the Prevention of Pollution from Ships (MARPOL), which was adopted in 1973 and modified in 1978; and the Standards for Training, Certification, and Watchkeeping for Seafarers (SCTW), which was adopted in 1978 and amended in 1995. It is up to ratifying nations to enforce these standards. The United States is a party to these conventions and the U.S. Coast Guard enforces these regulations when it boards and inspects ships and crews arriving at U.S. ports and the very few ships engaged in international trade that sail under the U.S. flag. Like the United States, most of the other major maritime trading nations lack the ability to enforce these regulations as a "flag state" because much of the world's merchant fleet is registered under so-called "flags of convenience." While most ship owners and operators are headquartered in developed countries, they often register their ships in Panama, Liberia, the Bahamas, the Marshall Islands, Malta, and Cyprus, among other "open registries," because these nations offer more attractive tax and employment regulatory regimes. Because of this development, most maritime trading nations enforce shipping regulations under a "port state control" regime—that is, they require compliance with these regulations as a condition of calling at their ports. The fragmented nature of ship ownership and operation can be a further hurdle to regulatory enforcement. It is common for cargo ships to be owned by one company, operated by a second company (which markets the ship's space), and managed by a third (which may supply the crew and other services a ship requires to sail), each of which could be headquartered in different countries.

Arctic Guidelines

While SOLAS and other IMO conventions include provisions regarding the operation of ships in ice-infested waters, they are not specific to the polar regions. To supplement existing requirements, in December 2002, the IMO approved guidelines for ships operating in Arctic ice-covered waters.[57] These are only recommendations for ships operating in the Arctic, not requirements. They apply to passenger and cargo ships of 500 gross tons or more engaged in international voyages. They do not apply to fishing vessels, military vessels, pleasure yachts, and

[55] Ice reporting that currently exists is intended for scientists not mariners.

[56] See http://www.imo.org/ for more information.

[57] See MSC/Circ. 1056/MEPC/Circ.399 at http://www.imo.org/.

smaller cargo ships. The guidelines are intended to improve safety and prevent pollution in the Arctic, and they include provisions on ship construction, ship equipment related to navigation, and crew training and ship operation. The guidelines recommend that ships carry fully enclosed lifeboats or carry tarpaulins to cover their lifeboats. They recommend that the crew include at least one ice navigator with documented evidence of having completed an ice navigation training program.

Nations can enforce additional requirements on ships arriving at their ports or sailing through their coastal waters. For instance, U.S. Coast Guard regulations largely follow IMO conventions but mandate additional requirements in some areas. U.S. coastal states can require ships calling at their ports to take additional safety and pollution prevention safeguards. Canada and Russia have additional pollution regulations for Arctic waters exceeding MARPOL. The U.S. Coast Guard is seeking agreement with Russia to establish a vessel traffic separation scheme for the strait between Alaska and Russia. The United States and Canada have set up a unique cooperative arrangement in governing the St. Lawrence Seaway System that some suggest could serve as a model for multinational regulation of Arctic shipping.

Regardless of whether it is trans-Arctic or destination shipping that increases in the region, protection of life and the environment is a concern. Among the issues for U.S. policymakers to consider are whether IMO guidelines for Arctic shipping should become mandatory, the appropriate roles of the U.S. federal government and the state of Alaska in regulating Arctic shipping, and how best to arrange a multinational framework for governing Arctic navigation.

Oil, Gas, and Mineral Exploration[58]

Changes to the Arctic brought about by warming temperatures resulting from climate change will likely allow more exploration for oil and gas offshore where the extent of summer sea ice is shrinking. Similarly, shrinking glaciers onshore could expose land containing economic deposits of gold, iron ore, or other minerals that were previously covered by glacial ice. Warming that causes permafrost to melt could also pose challenges to onshore exploration activities because ground structures, such as pipelines and other infrastructure that depend on footings sunk into the permafrost for support, could become unstable. Despite the warming temperatures, however, exploration and development in the Arctic would still be subject to harsh conditions, especially in winter, which makes it costly and challenging to develop infrastructure necessary to produce, store, and transport oil, gas, and minerals from newly discovered deposits.

Shrinking sea ice cover in the Arctic has also intensified interest in mapping the continental margins of countries with lands in the Arctic. Delineating the extent of the continental margins beyond the 200 nautical mile Exclusive Economic Zone (EEZ) under the terms of Article 76 of the U.N. Convention on the Law of the Sea (UNCLOS) could open up substantial amounts of submerged lands for development. Mapping projects are underway, by individual countries and in cooperative studies, that would be used to support national claims to submerged lands which may contain large amounts of oil, natural gas, methane hydrates, or minerals.

[58] This section prepared by Curry Hagerty, Specialist in Energy and Natural Resources Policy, Resources, Science, and Industry Division; Peter Folger, Specialist in Energy and Natural Resources Policy, Resources, Science, and Industry Division; and Marc Humphries, Analyst in Energy Policy, Resources, Science, and Industry Division.

Expiration of the annual congressional moratoria on September 30, 2008, coupled with other developments in offshore leasing activity, impacts federal policies on Arctic offshore development in a number of ways.[59] The expiration of leasing restrictions allows Outer Continental Shelf (OCS) areas where leasing has not been considered for many years to be considered for potential federal leasing activity. Other developments in offshore leasing activity include a presidential order to lift the executive restrictions on certain OCS areas to allow offshore drilling,[60] the emergence of new offshore operations (OCS renewable energy leasing in Arctic areas[61]), and the general emergence of new technologies related to OCS research and development. Diminished leasing restrictions impact OCS activity in a domestic and an international context and generally contribute to the larger debate over OCS drilling in the Arctic.

Oil and Gas

A primary driver for the increased interest in exploring for oil and gas offshore in the Arctic is the shrinking Arctic ice cap, or conversely, the growing amount of ice-free ocean in the summertime. Reduced sea ice in the summer means that ships towing seismic arrays[62] can explore previously inaccessible regions of the Arctic Ocean, Chukchi Sea, Beaufort Sea and other offshore regions for longer periods of time without risk of colliding with floating sea ice. Less sea ice over longer periods compared to previous decades also means that the seasonal window for offshore drilling in the Arctic remains open longer in the summer and increases the chances for making a discovery.

In addition to the improved access to larger portions of the Arctic afforded by shrinking sea ice, recent interest in Arctic oil and gas was fueled by a 2008 U.S. Geological Survey (USGS) appraisal of undiscovered oil and gas north of the Arctic Circle.[63] The USGS asserts that "The extensive Arctic continental shelves may constitute the geographically largest unexplored prospective area for petroleum remaining on Earth."[64] In the report, the USGS estimates that 90 billion barrels of oil, nearly 1,700 trillion cubic feet of natural gas, and 44 billion barrels of natural gas liquids may remain to be discovered in the Arctic. Nearly all (84%) of the oil and gas is expected to occur offshore. The USGS estimate for total undiscovered oil and gas in the Arctic exceeds the total discovered amount of Arctic oil and oil-equivalent natural gas (240 billion

[59] The Continuing Appropriations Resolution 2009 (P.L. 110-329) did not extend the annual congressional moratorium on oil and gas leasing activities. On March 11, 2009, the Omnibus Appropriations Act, 2009 (P.L. 111-8) was enacted without moratoria provisions, confirming that the oil and gas development moratoria in the OCS along the Atlantic and Pacific Coasts, parts of Alaska, and the Gulf of Mexico that had been in place since 1982 had not been restored in 2009 appropriations measures. The combined effect of Presidential Directives from 1990 to 2008 also impacted moratoria constraints.

[60] On July 14, 2008, a Modification of the Presidential Withdrawal of areas of the United States Outer Continental Shelf from leasing disposition was announced by President Bush in the following statement, "Under the authority vested in me as President of the United States, including section 12(a) of the Outer Continental Shelf Lands Act, 43 U.S.C. 1341(a), I hereby modify the prior memoranda of withdrawals from disposition by leasing of the United States Outer Continental Shelf issued on August 4, 1992."

[61] Effective on June 29, 2009, the rule established two types of leases: (1) commercial leases for full development and power generation, and (2) limited leases for resource assessment and technology testing. See 73 Fed Reg 39376.

[62] A seismic array is typically a long string or streamer of geophones—acoustic devices used for recording seismic signals—towed behind a ship while the ship traverses a prospective oil and gas-bearing portion of the seafloor. The seismic signals are processed and interpreted to give a cross-section or three-dimensional image of the subsurface.

[63] See USGS Circum-Arctic Resource Appraisal website at http://energy.usgs.gov/arctic/.

[64] USGS Fact Sheet 2008-3049: Circum-Arctic Resource Appraisal: Estimates of Undiscovered Oil and Gas North of the Arctic Circle; at http://pubs.usgs.gov/fs/2008/3049/.

$ 5774.00

barrels), which constitutes almost 10% of the world's known conventional petroleum resources.[65] An important caveat to the USGS assessment, however, is that it excludes economic considerations. The report only includes resources that would be technically recoverable with current technology; they may not necessarily be economically recoverable under prevailing oil and gas prices.

Despite the warming trend in the Arctic, a discovery of new oil and gas deposits far from existing storage, pipelines, and shipping facilities can not be developed until infrastructure is built to extract and transport the petroleum. For example, a Devon Energy spokesman noted in April 2008 that a 240 million barrel discovery in the Beaufort Sea won't be developed for at least 10 years because the company does not have the infrastructure to transport the oil.[66] Other areas with oil and gas potential, such as offshore east Greenland, may take even longer to develop because they are still covered by substantial summer sea ice that would hinder exploration and development unless more ice melts.[67]

Extent of the Continental Margin

Increased interest in developing offshore resources in the Arctic has sparked efforts by nations bordering the Arctic Ocean to map the extent of their continental margins beyond the 200-mile EEZ limit. Under UNCLOS, nations can submit a claim to submerged lands if they demonstrate that their continental margin extends beyond the 200-mile limit according to the definition in Article 76. Under Article 76, the extent of the continental margin beyond the 200-mile limit depends on the position of the foot of the continental slope, the thickness of sediments, and the depth of water. Also, the continental margin could include geologic features that extend from the continent out to sea, which may include undersea ridges continuing for hundreds of miles offshore.

As mentioned earlier—see "U.S. Activities As a Non-Party to UNCLOS"—the United States, as a non-party to UNCLOS, cannot participate as a member of the Commission on the Limits of the Continental Shelf; it cannot submit a claim under Article 76. Over the years, however, it has submitted observations on submissions made by other states, requesting that those observations be made available online and to the commission. In addition, since 2001, the United States has gathered and analyzed data to determine the outer limits of its extended continental shelf.

Arctic border countries have begun the complex investigations needed to support claims for an extended continental shelf in the Arctic. Claims have already been submitted by several countries, including the Russian Federation, which submitted its UNCLOS claim to a portion of the Arctic continental shelf in 2001.[68] Russia made claims to the Lomonosov Ridge, an undersea feature spanning the Arctic from Russia to Canada, as an extension of its continental margin. The submission demonstrated Russia's bid to extend activities in Arctic regions. The United States has

started to gather and analyze data through an initiative called the Extended Continental Shelf Project.[69] In this effort, the United States is working closely with Canada to prepare and present Canada's submission to the Commission on the Limits of the Continental Shelf.

Canada and the United States share overlapping regions of the seabed as part of the extended continental margin of both nations. Both countries have conducted research singly and jointly to map the extended continental shelf.[70] In August 2008, Canada's prime minister announced that Canada would spend $100 million (Canadian) over five years to map its total Arctic mineral and energy resources and bolster Canada's sovereignty over its northern resources.[71] On January 12, 2009, the Bush Administration issued a presidential directive addressing the extended continental shelf and boundary issues in the Arctic, among other issues, including national security and maritime transportation.[72] The directive acknowledges an unresolved boundary between the United States and Canada in the Beaufort Sea, and notes that Russia and the United States abide by a 1990 maritime boundary treaty pending its entry into force once it is ratified by the Russian Federation. According to the USGS, however, most of the potential oil and gas resources estimated for the Arctic are likely to occur within already agreed-upon territorial boundaries.[73] (For further discussion, see "Territorial Claims and Sovereignty Issues.")

Minerals

A warming Arctic means new opportunities and challenges for mineral exploration and development. Receding glaciers expose previously ice-covered land that could host economic mineral deposits that were previously undetectable and un-mineable below the ice. Longer summers would also extend exploration seasons even for areas not currently ice-covered but which are only accessible for ground surveys during the warmer months. In some parts of the Arctic, such as Baffin Island, Canada, less sea ice allows ships to transport heavy equipment to remote locations, and to convey ore from mines to the market further south. Some railway and mining operators are considering developing railroads and other infrastructure to transport ore year-round.[74] As with onshore oil and gas development, however, mining infrastructure that depends on footings sunk into permafrost could become unstable if the permafrost melts in response to warmer temperatures. Also, as with oil and gas development, mineral deposits that may be technically recoverable with current technology may not be economically profitable.

One important part of the current infrastructure in the Arctic that supports oil, gas, and mineral development is the construction and use of ice roads—built and used during the winter—but which are not passable during the warmer months. Warmer temperatures are shortening the ice

[69] The purpose of the U.S. Extended Continental Shelf Project is to establish the full extent of the continental shelf of the United States, consistent with international law. Involved in this mission are the U.S. Coast Guard (USCG), Department of State (DOS), and the University of New Hampshire (UNH). NOAA has the lead in collecting bathymetric data. The U.S. Geological Survey has the lead in collecting seismic data.

road transport seasons and creating transportation challenges. For example, the opening date for tundra roads in northern Alaska has shifted from early November prior to 1991 to January in recent years.[75]

Environment and Economics

The warming Arctic has focused attention on threats to its wildlife and ecosystems, and it is expected that increased oil, gas, and mineral exploration and development activities may also invite increased scrutiny of possible harm to the fragile Arctic ecosystems. Federal offshore programs are often the subject of this type of scrutiny, as demonstrated by litigation largely focusing on environmental impacts. For example, plaintiffs in cases challenging government approval of OCS development activity in the Chukchi Sea generally are local communities and national environmental groups. The defendant in litigation over federal leasing in the Alaska program areas is the Secretary of the Interior. Typically litigation over federal offshore programs in Alaska takes place in two venues—the U.S. Court of Appeals for the Ninth Circuit, and/or the U.S. District Court of the District of Alaska. The schedule for litigation can be an issue because the schedule in one venue has some bearing on rulings related to litigation in the other venue. A new schedule for litigation regarding OCS development in the Chukchi Sea is currently under consideration. The outcome of court cases will likely impact future development activities.

The outcome of judicial action on environmental regulations is not yet known, but it is widely accepted that complying with current environmental laws and regulations in the Arctic adds to the comparatively high cost of doing business in the far north. In addition, the price and price stability of petroleum and mineral commodities will underlie industry decisions about whether to make large investments in multi-year exploration and development projects in the Arctic. Low or volatile prices could curtail any sustained development efforts north of the Arctic Circle, even if continued warming opens new territory to petroleum and mineral exploration. In addition to uncertainty regarding the price of oil, gas, and minerals, and the environmental considerations that accompany exploration and development, there is the uncertainty for the United States regarding its claims to submerged lands beyond the 200-mile EEZ.

Even if the commodity prices and environmental costs were favorable toward exploration and development, uncertainty over U.S. claims to the extended continental shelf—because the United States is a non-party to UNCLOS—may influence private sector decisions to invest in Arctic oil, gas, and mineral resource development.

Oil Pollution and Pollution Response[76]

Oil Pollution Implications of Arctic Change

Climate change impacts in the Arctic, particularly the decline of sea ice and retreating glaciers, have stimulated human activities in the region, many of which have the potential to create oil pollution. A primary concern is the threat of a large oil spill in the area. Although a major oil spill

[75] See National Oceanic and Atmospheric Administration, Arctic Change, at http://www.arctic.noaa.gov/detect/land-road.shtml?page=land.

[76] This section prepared by Jonathan L. Ramseur, Analyst in Environmental Policy, Resources, Science, and Industry Division.

has not occurred in the Arctic region,[77] recent economic activity, such as oil and gas exploration and tourism (cruise ships), increases the risk of oil pollution (and other kinds of pollution) in the Arctic. Significant spills in high northern latitudes (e.g., the 1989 *Exxon Valdez* spill in Alaska and spills in the North Sea) suggest that the "potential impacts of an Arctic spill are likely to be severe for Arctic species and ecosystems."[78]

Risk of Oil Pollution in the Arctic

A primary factor determining the risk of oil pollution in the Arctic is the level and type of human activity being conducted in the region. Although climate changes in the Arctic are expected to increase access to natural resources and shipping lanes, the region will continue to present logistical challenges that may hinder human activity in the region. For example (as discussed in another section of this report),[79] the unpredictable ice conditions may discourage trans-Arctic shipping. If trans-Arctic shipping were to occur on a frequent basis, it would represent a considerable portion of the overall risk of oil pollution in the region. In recent decades, many of the world's largest oil spills have been from oil tankers, which can carry millions of gallons of oil.[80]

Although the level of trans-Arctic shipping is uncertain, many expect oil exploration and extraction activities to intensify.[81] Historically, oil well blowouts from offshore oil extraction operations have been a source of major oil spills. The largest accidental oil spill in world history—the IXTOC I, estimated at 140 million gallons—was due to an oil well blowout in Mexican Gulf Coast waters in 1979.[82] A 1969 well blowout off the coast of Santa Barbara released approximately 4 million gallons into the environment and has been credited with catalyzing some of the landmark environmental legislation of the 1970s. However, in recent decades the spill record for offshore platforms in U.S. federal waters has improved.[83] Indeed, a 2003 National Research Council (NRC) study of oil and gas activities on Alaska's North Slope identified five loss-of-well-control events between 1977 and 2001, but none of these incidents led to oil spills. During this time period, approximately 5,000 wells were drilled or re-drilled, yielding an event frequency of 1 per 1,000. According to studies cited in the NRC report, this is comparable to frequencies in other regions, such as the Gulf of Mexico or the Pacific Coast. The NRC report stated "the conclusion of these analyses is that blowouts that result in large spills are unlikely."[84]

[84] National Research Council of the National Academies of Science, *Cumulative Environmental Effects of Oil and Gas Activities on Alaska's North Slope* (2003).

Although the 2003 NRC report stated (citing Minerals Management Service data) that there have been no spills over 39,000 gallons on the North Slope,[85] approximately 200,000 gallons of crude oil were released from a North Slope pipeline in 2006.[86] This spill drew intense attention from the public and Members of Congress.[87] Even under the most stringent control systems, some tanker spills, pipeline leaks, and other accidents are likely to occur from equipment leaks or human error.

Potential Impacts

No oil spill is entirely benign. Even a relatively minor spill, depending on the timing and location, can cause significant harm to individual organisms and entire populations. Regarding aquatic spills, marine mammals, birds, bottom-dwelling and intertidal species, and organisms in early developmental stages—eggs or larvae—are especially vulnerable. However, the effects of oil spills can vary greatly. Oil spills can cause impacts over a range of time scales, from only a few days to several years, or even decades in some cases.

Conditions in the Arctic may have implications for toxicological effects that are not yet understood. For example, oil spills on permafrost may persist in an ecosystem for relatively long periods of time, potentially harming plant life through their root systems. Moreover, little is known about the effects of oil spills on species that are unique to the Arctic, particularly, species' abilities to thrive in a cold environment and the effect temperature has on toxicity.[88]

The effects of oil spills in high latitude, cold ocean environments may last longer and cause greater damage than expected. Some recent studies have found that oil spills in lower latitudes have persisted for longer than initially expected, thus raising the concern that the persistence of oil in the Arctic may be understated. In terms of wildlife, population recovery may take longer in the Arctic because many of the species have longer life spans and reproduce at a slower rate.[89]

Response and Cleanup Challenges in the Arctic Region

Climate changes in the Arctic are expected to increase human activities in the region, many of which impose a risk of oil pollution, particularly from oil spills. Conditions in the Arctic region impose unique challenges for personnel charged with oil spill response—the process of getting people and equipment to the incident—and cleanup duties—either recovering the spilled oil or mitigating the contamination so that it poses less harm to the ecosystem. These challenges may play a role in the policy development for economic activities in the Arctic.

[85] Between 1977 and 2000, the 10 largest crude oil spills on the Alaskan North Slope ranged between 5,000 and 39,000 gallons. National Research Council of the National Academies of Science, *Cumulative Environmental Effects of Oil and Gas Activities on Alaska's North Slope* (2003).

[88] AMAP, Arctic *Oil and Gas 2007* (2008).

[89] AMAP, *Arctic Oil and Gas 2007* (2008).

Spill Response Challenges

Response time is a critical factor for oil spill recovery. With each hour, spilled oil becomes more difficult to track, contain, and recover, particularly in icy conditions, where oil can migrate under or mix with surrounding ice.[90] Most response techniques call for quick action, which may pose logistical challenges in areas without prior staging equipment or trained response professionals. Many stakeholders are concerned about a "response gap" for oil spills in the Arctic region. A response gap is a period of time in which oil spill response activities would be unsafe or infeasible. Although the response gap in the Arctic has not been quantified, a recent estimate of Prince William Sound (PWS) may be instructive. A 2007 study found a response gap for PWS of 38% for the time of the study period (65% during the winter season).[91] The response gap for the northern Arctic latitudes is likely to be higher due to its more extreme weather conditions. In addition, PWS has existing infrastructure for response, while the more remote Arctic areas do not. A recent NOAA report concluded that "there is a clear need for emergency response equipment for SAR [search and rescue] and pollution response throughout the Arctic."[92]

The history of oil spills and response in the Aleutian Islands raises concerns for potential spills in the Arctic region:

> The past 20 years of data on response to spills in the Aleutians has also shown that almost no oil has been recovered during events where attempts have been made by the responsible parties or government agencies, and that in many cases, weather and other conditions have prevented any response at all.[93]

Moreover, the commander of the Coast Guard's 17th District, which covers Alaska, noted in an online journal that "we are not prepared for a major oil spill [over 100,000 gallons] in the Arctic environment. The Coast Guard has no offshore response capability in Northern or Western Alaska and we only dimly understand the science of recovering oil in broken ice."[94]

Oil Spill Cleanup Challenges

The behavior of oil spills in cold and icy waters is not well understood.[95] Cleaning up oil spills in ice-covered waters will be more difficult than in other areas, primarily because effective strategies have yet to be developed. Natural oil seeps, which are a major source of oil in the arctic environment, may offer opportunities for studying the behavior of oil.[96]

[96] Arctic Monitoring and Assessment Programme (AMAP), *Arctic Oil and Gas 2007* (2008).

The Arctic conditions present several hurdles to oil cleanup efforts. In colder water temperatures, there are fewer organisms to break down the oil through microbial degradation. Oil evaporates at a slower rate in colder water temperatures. Although slower evaporation may allow for more oil to be recovered, evaporation removes the lighter, more toxic hydrocarbons that are present in crude oil.[97] The longer the oil remains in an ecosystem, the more opportunity there is for exposure. Oil spills may get trapped in ice, evaporating only when the ice thaws. In some cases, oil could remain in the ice for years.

Icy conditions enhance emulsification—the process of forming different states of water in oil, often described as "mousse." Emulsification creates oil cleanup challenges by increasing (1) the volume of the oil/water mixture and (2) the mixture's viscosity (resistance to flow). The latter change creates particular problems for conventional removal and pumping cleanup methods.[98] Moreover, two of the major non-mechanical recovery methods—in-situ burning and dispersant application—may be limited (or "precluded") by the Arctic conditions and lack of logistical support: aircraft, vessels, and other infrastructure.[99]

Existing Policy Framework

Considering both the recent increase in human activity in the region (and expectation of further interest) and the response and recovery challenges that an oil spill would impose in Arctic waters, many would assert that the region warrants particular attention in terms of governance. However, the existing framework for international governance of maritime operations in the Arctic region lacks legally binding requirements. While the Safety of Life at Sea Convention (SOLAS) and other International Maritime Organization (IMO) conventions include provisions regarding ships in icy waters, the provisions are not specific to the polar regions. The IMO has "Guidelines for Ships Operating in Arctic," but these were considered inadequate by many participants in a recent workshop.[100] As stated in a recent NOAA report, the non-binding IMO provisions seem "inconsistent with the hazards of Arctic navigation and the potential for environmental damage from such an incident."[101]

Fisheries[102]

Large commercial fisheries exist in the Arctic, including in the Barents and Norwegian Seas north of Europe, the Central North Atlantic off of Greenland and Iceland, and the Newfoundland and Labrador Seas off of northeastern Canada.[103]

[102] This section prepared by Eugene Buck, Specialist in Natural Resources Policy, Resources, Science, and Industry Division.

In the 110th Congress, P.L. 110-243 stated that "the United States should initiate international discussions and take necessary steps with other Arctic nations to negotiate an agreement or agreements for managing migratory, transboundary, and straddling fish stocks in the Arctic Ocean and establishing a new international fisheries management organization or organizations for the region." In response to this, the United States participated in meetings with other Arctic nations at the March 2009 UN Food and Agriculture Organization Committee on Fisheries meetings in Rome. These international discussions are continuing.

On February 5, 2009, the North Pacific Fishery Management Council, acting under the authority of the Magnuson-Stevens Fishery Conservation and Management Act, unanimously approved the Council's draft Arctic Fisheries Management Plan and approved the preferred alternative, which would (1) close the Arctic to commercial fishing until information improves so that fishing can be conducted sustainably and with due concern to other ecosystem components; (2) determine the fishery management authorities in the Arctic and provide the Council with a vehicle for addressing future management issues; and (3) implement an ecosystem-based management policy that recognizes the resources of the U.S. Arctic and the potential for fishery development that might affect those resources, particularly in the face of a changing climate.

On November 3, 2009, the National Marine Fisheries Service (Department of Commerce) issued a final rule that implemented the North Pacific Council's Fishery Management Plan for Fish Resources of the Arctic Management Area, as well as Amendment 29 to the Fishery Management Plan for Bering Sea/Aleutian Islands King and Tanner Crabs. This action followed the North Pacific Council's recommendations establishing a basis for sustainable management of commercial fishing in the Arctic Management Area and moving the northern boundary of the crab fishery south of the Arctic Management Area to Bering Strait.[104]

Protected Species[105]

Concern over development of the Arctic relates to how such development might affect threatened and endangered species. Under the Endangered Species Act (16 U.S.C. §§ 1531-1543), the polar bear was listed as threatened on May 15, 2008. In addition, a positive 90-day finding was made on a petition to list the ribbon seal on March 28, 2008. The failure by the U.S. Fish and Wildlife Service to make a 90-day finding on a 2008 petition to list Pacific walrus has led to submission of 60-days notice of a future citizen suit, and a petition to list ringed, bearded, and spotted seals was filed May 28, 2008.

In either terrestrial or marine environments, the extreme pace of change makes a biological response many times more difficult. For species with adaptations for a specific optimum temperature for egg development, or production of young timed to match the availability of a favored prey species, or seed dispersal in predictable fire regimes, etc., evolutionary responses may well not keep pace with the rate of change.[106] While species of plants and animals farther

[106] Among biologists, it is traditionally said that a species faced with extreme change can respond in three basic ways: (continued...)

south might migrate, drift, or be transplanted from warming habitats to more northerly sites that may continue to be suitable,[107] once a terrestrial species reaches the Arctic Ocean, it is very literally at the end of the line. No more northern or colder habitat is available.

The Marine Mammal Protection Act (MMPA; 16 U.S.C. §§ 1361 et seq.) protects whales, seals, walruses, and polar bears. The MMPA established a moratorium on the "taking" of marine mammals in U.S. waters and by U.S. nationals on the high seas, including the Arctic. The MMPA protects marine mammals from "clubbing, mutilation, poisoning, capture in nets, and other human actions that lead to extinction." Under the MMPA, the Secretary of Commerce, acting through National Marine Fisheries Service (NMFS), is responsible for the conservation and management of whales and seals. The Secretary of the Interior, acting through the Fish and Wildlife Service (FWS), is responsible for walruses and polar bears.[108] Despite the MMPA's general moratorium on taking, the MMPA allows U.S. citizens to apply for and obtain authorization for taking small numbers of mammals incidental to activities other than commercial fishing (e.g., offshore oil and gas exploration and development) if the taking would have only a negligible impact on any marine mammal species or stock, provided that monitoring requirements and other conditions are met.

Indigenous People Living in the Arctic[109]

Background

Seven of the eight Arctic nations have indigenous peoples,[110] whose predecessors were present in parts of the Arctic over 10,000 years ago, well before the arrival of peoples with European backgrounds.[111] Current Arctic indigenous peoples comprise dozens of diverse cultures and speak dozens of languages from eight or more non-Indo-European language families.[112]

(...continued)

"migrate, mutate, or die." When change is rapid enough, mutation (accompanied by natural selection of individuals within the population more suited to the changed environment) may not be able to occur fast enough, leaving migration and death as the only options. The problem of response rate is more severe for species that reproduce slowly (e.g., polar bears) and less severe for species that reproduce rapidly (e.g. algae).

[107] The efficacy and the effect of this tactic is often questioned, since natural migration is unlikely to involve the entire suite of species in an ecosystem (e.g., host plants might not move north (or up) as fast as their moth herbivores, nor as fast as the birds that depend on the moths). Moreover, the southerners will not find a land of sterile bare dirt—the species that are already there may be threatened themselves by the competition from the new arrivals, perhaps tipping the balance and pushing still more species toward extinction.

[108] Under the MMPA, both NMFS and FWS have responsibility for additional marine mammal species (e.g., manatees, sea otters, dolphins) which are not currently found in the Arctic.

[112] *AHDR*, pp. 47, 53; David Crystal, *Cambridge Encyclopedia of Language*, 2nd ed. (Cambridge: Cambridge University Press, 1997), chap. 50; *Ethnologue: Languages of the World*, 16th ed., ed. M. Paul Lewis (Dallas: SIL International, 2009) available online at http://www.ethnologue.com/. The number of languages and language families varies not only with definitions of the Arctic but with definitions of languages and language families.

Before the arrival of Europeans, Arctic indigenous peoples lived in economies that were chiefly dependent, in varying proportions, on hunting land and marine mammals, catching salt- and fresh-water fish, herding reindeer (in Eurasia), and gathering, for their food, clothing, and other products.[113] Indigenous peoples' interaction with and knowledge of Arctic wildlife and environments has developed over millennia and is the foundation of their cultures.[114]

The length of time that Arctic indigenous peoples were in contact with Europeans varied across the Arctic. As recorded by Europeans, contact began as early as the 9th century CE, if not before, in Fennoscandia[115] and northwestern Russia, chiefly for reasons of commerce (especially furs); it progressed mostly west-to-east across northern Asia, reaching northeastern Arctic Asia by the 17th century.[116] North American Arctic indigenous peoples' contact with Europeans started in Labrador in the 16th century and in Alaska in the 18th century, and was not completed until the early 20th century.[117] Greenland's indigenous peoples first saw European-origin peoples in the late 10th century, but those Europeans died out during the 15th or 16th century and Europeans did not return permanently until the 18th century.[118]

Contact led to significant changes in Arctic indigenous economies, political structures, foods, cultures, and populations, starting especially in the 20th century. At present, for instance, most Arctic indigenous peoples are minorities in their countries' Arctic areas, except in Greenland and Canada (one source estimates that, around 2003, about 10% of an estimated 3.7 million people in the Arctic were indigenous).[119] While many Arctic indigenous communities remain heavily dependent on hunting, fishing, and herding and are more likely to depend on traditional foods than non-indigenous Arctic inhabitants,[120] there is much variation. Most Arctic indigenous people

[119] *AHDR*, pp. 19, 29. Estimates of Arctic indigenous populations are complicated by varying definitions not only of the Arctic but also of indigenous peoples; for instance, Russia does not count some non-European Arctic ethnic groups, such as the Yakut, as "indigenous minorities" (see "Peoples of the Arctic: Characteristics of Human Populations Relevant to Pollution Issues," in *AMAP Assessment Report: Arctic Pollution Issues*, ed. Simon J. Wilson et al. (Oslo: Arctic Monitoring and Assessment Programme, 1998), pp. 167-169; this report is subsequently cited in this section as *AMAP 1998*.

[120] *AMAP 1998*, chapter 5; see also Birger Poppel et al., *SLiCA Results*, Survey of Living Conditions in the Arctic (Anchorage: Institute of Social and Economic Research, University of Alaska Anchorage, 2007), pp. 4-7, http://www.arcticlivingconditions.org.

may no longer consume traditional foods as their chief sources of energy and nutrition.[121] Major economic change is also relatively recent but ongoing.[122] Many Arctic indigenous communities have developed a mixture of traditional economic activities and wage employment.[123] Subsistence and economics will be key factors in the effects of climate change on Arctic indigenous peoples, and on their reaction to Arctic climate change.

Arctic indigenous peoples' current political structures vary, as do their relationships with their national governments. Some indigenous groups govern their own unique land areas within the national structure, as in the United States and Canada; others have special representative bodies, such as the Saami parliaments in Norway, Finland, and Sweden;[124] a few areas have general governments with indigenous majorities, such as Greenland (a member country of Denmark), Nunavut territory in Canada, and the North Slope and Northwest Arctic boroughs in Alaska.[125] Control of land, through claims and ownership, also varies among Arctic indigenous peoples, as do rights to fishing, hunting, and resources.[126] Arctic indigenous peoples' political relationships to their national and local governments, and their ownership or claims regarding land, are also significant factors in the responses to Arctic climate change by the indigenous peoples and by Arctic nations' governments.

Effects of Climate Change

Arctic climate change is expected to affect the economies, subsistence, health, population, societies, and cultures of Arctic indigenous peoples. Changes in sea ice and sea level, permafrost, tundra, and tree and vegetation distribution, and increased commercial shipping, will affect the distribution of land and sea mammals, of freshwater and marine fish, and of forage for reindeer, and this will in turn affect traditional subsistence activities and related indigenous lifestyles.[127] Arctic indigenous peoples' harvesting of animals is likely to become riskier and less predictable, which may increase food insecurity, change diets, and increase dependency on outside, non-traditional foods.[128] Sea and permafrost changes have damaged infrastructure and increased coastal erosion, especially in Alaska, where the Government Accountability Office (GAO) found that "coastal villages are becoming more susceptible to flooding and erosion caused in part by rising temperatures."[129]

Oil, gas, and mineral exploration and development are expected to increase, as are other economic activities, such as forestry and tourism, and these are expected to increase economic

opportunities for all Arctic residents, including indigenous peoples.[130] Pressures to increase participation in the wage economy, however, may speed up changes in indigenous cultures. Increased economic opportunities may also lead to a rise in the non-indigenous population, which may further change the circumstances of indigenous cultures.

Health problems may increase with Arctic climate change. Economic development may exacerbate Arctic pollution problems, including food contamination, and warmer temperatures may increase insect- and wildlife-borne diseases.[131] Climate change may lead to damage to water and sanitation systems, reducing protection against waterborne diseases.[132] Changes in Arctic indigenous cultures may increase mental stress and behavioral problems.[133]

The response to climate change by Arctic indigenous peoples has included international activities by Arctic indigenous organizations and advocacy before their national governments. As one report noted, "the rise of solidarity among indigenous peoples organizations in the region is surely a development to be reckoned with by all those interested in policy issues in the Arctic."[134] Six national or international indigenous organizations are permanent participants of the Arctic Council, the regional intergovernmental forum.[135] In April 2009, the Inuit Circumpolar Council (an organization of Inuit in the Arctic regions of Alaska, Canada, Greenland, and Russia) hosted in Alaska the worldwide "Indigenous Peoples Global Summit on Climate Change."[136] The conference report, forwarded to the Copenhagen Conference of the Parties of the U.N. Framework Convention on Climate Change (December 2009), noted "accelerating" climate change caused by "unsustainable development" and, among several recommendations, called for a greater indigenous role in national and international decisions on climate change, including a greater role for indigenous knowledge in climate change research, monitoring, and mitigation.[137] In Alaska, the Alaska Federation of Natives has asked Congress to mitigate flooding and erosion in Alaska Native villages and to fund relocation of villages where necessary.[138]

Polar Icebreaking[139]

The Coast Guard's three polar icebreakers perform a variety of missions supporting U.S. interests in the Arctic, including the following:

- conducting and supporting U.S. scientific research in the Arctic;[140]
- defending U.S. sovereignty in the Arctic by helping to maintain a presence in the region;
- defending other U.S. interests in polar regions, including economic interests relating to the U.S. exclusive economic zone (EEZ) north of Alaska;
- monitoring sea traffic in the Arctic, including ships bound for the United States; and
- conducting other typical Coast Guard missions (such as search and rescue, law enforcement, and protection of marine resources) in Arctic waters, including U.S. territorial waters north of Alaska.

The Coast Guard's two heavy polar icebreakers—*Polar Star* and *Polar Sea*—have exceeded their intended 30-year service lives. The *Polar Star* is not operational and has been in caretaker status since July 1, 2006.[141] Congress in FY2009 and FY2010 provided funding to repair *Polar Star* and return it to service for 7 to 10 years; the Coast Guard expects the reactivation project to be completed in 2013.[142] On June 25, 2010, the Coast Guard announced that *Polar Sea* had suffered an unexpected engine casualty and consequently will likely be unavailable for operation until at least January 2011.[143] The United States currently has no operational heavy polar icebreakers.

The Coast Guard's third polar icebreaker—*Healy*—entered service in 2000. Compared to *Polar Star* and *Polar Sea*, *Healy* has less icebreaking capability (it is considered a medium polar icebreaker), but more capability for supporting scientific research. The ship is used primarily for supporting scientific research in the Arctic.

A 2007 report from the National Research Council (NRC) on the U.S. polar icebreaking fleet states that "U.S. [polar] icebreaking capability is now at risk of being unable to support national interests in the north and the south." On July 16, 2008, Admiral Thad Allen, the Commandant of the Coast Guard, testified that: "Today, our nation is at a crossroads with Coast Guard domestic and international icebreaking capabilities. We have important decisions to make. And I believe we must address our icebreaking needs now."

---

[139] This section prepared by Ronald O'Rourke, Specialist in Naval Affairs, Foreign Affairs, Defense, and Trade Division. It is adapted from CRS Report RL34391, *Coast Guard Polar Icebreaker Modernization: Background, Issues, and Options for Congress*, by Ronald O'Rourke.

[140] The Coast Guard's polar icebreakers also support U.S. scientific research in the Antarctic.

[141] Source for July 1, 2006, date: U.S. Coast Guard email to CRS on February 22, 2008.

[142] "Icebreaker POLAR SEA Sidelined By Engine Troubles," *Coast Guard Compass (Official Blog of the U.S. Coast Guard)*, June 25, 2010. An FY2011 budget justification document—Department of Homeland Security, *Congressional Budget Justification FY 2011*, p. USCG-9 (pdf page 2176 of 3985)—states that the repairs to *Polar Star* are to be completed in FY2012.

[143] "Icebreaker POLAR SEA Sidelined By Engine Troubles," *Coast Guard Compass (Official Blog of the U.S. Coast Guard)*, June 25, 2010.

The Coast Guard since 2008 has been studying how many polar icebreakers, with what capabilities, should be procured as replacements for *Polar Star* and *Polar Sea*.[144] Following a decision to design and build one or more new polar icebreakers, the first replacement polar icebreaker might enter service in 8 to 10 years, by which time *Polar Star* and *Polar Sea* could be more than 40 years old. The Coast Guard estimated in February 2008 that new replacement polar icebreakers might cost $800 million to $925 million each in 2008 dollars, and that the alternative of extending the service lives of *Polar Sea* and *Polar Star* for 25 years might cost about $400 million per ship.

Potential policy issues for Congress regarding Coast Guard polar icebreaker modernization include the potential impact on U.S. polar missions of the United States having no operational heavy polar icebreakers; numbers and capabilities of polar icebreakers the Coast Guard will need in the future; whether to provide these icebreakers through construction of new ships or service life extensions of *Polar Star* and/or *Polar Sea*; whether to accelerate the Coast Guard's current schedule for acquiring replacement ships; whether new ships should be nuclear powered; and whether new ships should be funded entirely in the Coast Guard budget, or partly or entirely in some other part of the federal budget, such as the Department of Defense (DOD) budget, the National Science Foundation (NSF) budget, or both.

Search and Rescue[145]

The possibility of increased sea traffic through Arctic waters has increased concerns regarding Arctic-area search and rescue capabilities. Given the location of current U.S. Coast Guard operating bases, it could take Coast Guard aircraft several hours, and Coast Guard cutters a few or several days, to reach a ship in distress in Arctic waters. In addition, the harsh climate complicates search and rescue operations in the region.

Particular concern has been expressed about cruise ships that may experience problems and need assistance; there have already been two incidents of this kind in recent years in waters off Antarctica. One option for mitigating the risks associated with cruise ship operations in the Arctic would be to require the vessels to sail in pairs, so that if one ship experiences a problem, the other one could quickly come to its aid.

Increasing U.S. Coast Guard search and rescue capabilities for the Arctic could require one or more of the following: enhancing or creating new Coast Guard operating bases in the region, procuring additional Arctic-capable aircraft, cutters, and rescue boats for the Coast Guard, and

[144] The eight Arctic countries have differing requirements for polar icebreakers, depending on the nature and extent of their activities in Arctic (and Antarctic) waters. According to one source, as of January 2009, Russia had a fleet of 25 polar icebreakers (including six active heavy icebreakers, two heavy icebreakers in caretaker status, 15 other icebreakers, and two additional icebreakers leased from the Netherlands); Finland and Sweden each had seven; Canada had six; and the United States had three (including one active heavy icebreaker (Polar Sea), one heavy icebreaker in caretaker status (Polar Star), and one additional icebreaker (Healy)). (Source: Slide entitled "Icebreaker Force Laydown," in "The Accessible Arctic, A Quick Overview," a presentation given at a seminar entitled "The Changing Strategic Landscape for Sea-Based Missile Defense," Center for Technology and National Security, National Defense University, Fort Lesley J. McNair, Washington, DC, December 2-3, 2009. The slide defined a heavy icebreaker as one with a propulsion plant rated at more than 45,000 break horsepower (BHP).) Russia's heavy icebreakers are nuclear-powered.

[145] This section prepared by Ronald O'Rourke, Specialist in Naval Affairs, Foreign Affairs, Defense, and Trade Division.

adding systems to improve Arctic maritime communications, navigation, and domain awareness.[146] It may also entail enhanced forms of cooperation with navies and coast guards of other Arctic countries.

U.S. Relations with Other Arctic Countries[147]

Of the other Arctic coastal nations, the United States enjoys strong political and commercial ties with Canada, Norway, and Denmark; all four countries are members of NATO. Although the United States views Russia as an important partner in developing policies to cope with changing conditions in the Arctic, relations with Moscow have been somewhat problematic in recent years, particularly in the wake of Russia's August 2008 incursion into South Ossetia and Georgia, and its cutoff of natural gas to Ukraine and Europe.[148] The two nations have also been at odds over Washington's plans to install in Europe missile defense facilities intended to guard against missiles launched from Iran. In February 2009, Vice President Joseph Biden stated the Obama Administration's intention "to press the reset button and to revisit the many areas where we can and should work together."[149] Washington has sought to engage Russian cooperation in negotiations with North Korea. Also, in support of UN sanctions, Moscow has cancelled the proposed sale of its S-300 anti-aircraft missiles to Iran. In addition, Russia is permitting non-lethal supplies to be transported across its territory to NATO forces in Afghanistan. Finally, in April 2010 the two countries signed the New Start Treaty, currently pending Senate ratification.

As noted elsewhere in this report (see "Territorial Claims and Sovereignty Issues"), in late May 2008, ministerial representatives of the Arctic littoral states (the United States, Denmark, Norway, Russia, and Canada) attended a meeting convened by Denmark in Ilulissat, Greenland. Danish Foreign Minister Stig Møller implied that the meeting was intended to develop interim measures for Arctic governance: "We must continue to fulfill our obligations in the Arctic area until the U.N. decides who will have the right to the sea and the resources in the region. We must agree on the rules and what to do if climate changes make more shipping possible."[150] Attendees discussed a variety of issues, including the environment, transportation, resources, and security. The Danish Foreign Ministry stated that the resulting Ilulissat Declaration

> sent a clear political signal to the local inhabitants and the rest of the world that we will act responsibly when addressing the development in the Arctic Ocean. We have committed ourselves politically to solve any disagreements through negotiation. Thus, hopefully, we have eradicated all the myths about a 'race for the North Pole.' The legal framework is in place and the five States have now declared that they will abide by it.[151]

[151] Conference In Ilulissat, Greenland: Landmark Political Declaration on the Future of the Arctic, Edited December 11, 2008, website of the Danish Foreign Ministry, http://www.um.dk/en.

The Arctic has increasingly become a subject of discussions in bilateral meetings among leaders of the nations in the region. The main international forum for cooperation in the high north, however, is the eight-nation Arctic Council, of which the United States is an active member. The chief topics addressed by the six working groups of the Council, which was formed in 1996, are sustainable development, environmental protection, and the social well-being of the indigenous communities. The United States reportedly vetoed security as an issue of consideration for the Council. The Council holds ministerial-level meetings biennially, while the working groups meet more frequently; the most recent ministerial was held in Tromsø, Norway, in April 2009. Denmark currently holds the revolving chairmanship. Russia has taken the lead within the Council for developing a plan for international cooperation in search-and-rescue activities in the region.[152]

Although the establishment of sovereignty through the demarcation of boundaries in the region is being conducted peacefully under the auspices of the U.N. Convention on the Law of the Sea (UNCLOS), the Arctic is also increasingly being viewed by some as a potential emerging security issue. Canadian academic Rob Huebert pointed out that in August 2010 the United States, Canada, and Denmark conducted in the Canadian Arctic their annual joint naval exercises involving several advanced and powerful warships. Huebert observed that "while defence officials are quick to point out they see no military threat to the region, it's still interesting to see these three Arctic friends coming together to improve their naval combat capability in the Far North...."[153] The Russian government has stated that, although it deplores the notion of an arms race in the region and does not foresee a conflict there, it intends to protect its Arctic interests.[154] In varying degrees, the Arctic coastal states have indicated a willingness to establish and maintain a military presence in the high north.[155] Although some have argued that terrorism and hijacking may constitute security concerns in the region, others maintain that such threats are chimerical, given the challenges of distance and geography, and the difficulty of navigating in a polar environment.

China has also evinced a growing interest in the Arctic region, based mainly upon its interest in the possibility of shorter sea routes and in the eventual development of energy-related natural resources. China's economy is strongly dependent upon exports; one analyst has reported an estimate that one-half of China's GDP is reliant upon shipping. The opening of Arctic Ocean corridors north of Russia and/or Canada would drastically reduce both sailing times and transportation costs. China has also been active in conducting research on the Arctic; it acquired a large icebreaker in 1993 and is planning to construct domestically a state-of-the-art polar capable research vessel.

---

[152] The Council members are the "Arctic 5" coastal States plus Sweden, Finland, and Iceland. Six indigenous Arctic peoples organizations are permanent participants. Several other countries, including Spain, China, and the UK, have observer status. "Document On Cooperation In Arctic Search and Rescue Efforts Could Be Ready In April 2011," *Interfax: Russia & CIS Military Newswire*, February 26, 2010. [154] "Russia Will Protect Interests In Arctic: Official," *Agence France Presse,* June 10, 2009. "Russia Opposes Arms Race In Arctic Region—Diplomat," *ITAR-TASS World Service,* July 21, 2009.

[155] See, for example, "Canada Vows 'Firm' Defence of Arctic Border," *Canwest News Service,* November 24, 2009. "Danes With Dogs To Join Military Sovereignty Patrol Of Canadian Arctic," *The Canadian Press,* March 3, 2010. "Norway Plans One New Arctic Base, Perhaps More," *Defense News,* March 8, 2010.

Some Chinese leaders have voiced concern over perceived emerging security issues in the Arctic. In early March 2010, a Chinese Admiral stated that "the current scramble for the sovereignty of the Arctic among some nations has encroached on many other countries' interests," and he added that China had to "make short and long term ocean strategic development plans to exploit the Arctic because it will become a future mission for the navy." Some analysts, however, believe that China's general approach toward the Arctic will remain decidedly low-key: "To date China has adopted a wait-and-see approach to Arctic developments, wary that active overtures would cause alarm in other countries due to China's size and status as a rising global power." China is believed to be keen on resolving through diplomacy the national interests of both littoral and non-Arctic states in the high north. Toward that end, it has sought permanent observer status on the Arctic Council.[156]

The Arctic has also become a region of interest for NATO. Speaking in Reykjavík in January 2009, former NATO Secretary General Jaap de Hoop Scheffer urged that member states not allow the Arctic to become a divisive issue. He also recommended that the alliance and Russia cooperate through building upon their shared experience in search-and-rescue operations. Former Danish Prime Minister Anders Fogh Rasmussen, who became secretary general of the alliance in August 2009, has also addressed security in the high north. Citing the "potentially huge security implications" of Arctic climate change, Rasmussen in October 2009 stated that "I think it is within the natural scope of work for NATO to be the forum for consultation and discussion on [selected Arctic] issues." In March 2009, however, Russia's NATO ambassador stated that Moscow would not cooperate with the alliance on Arctic matters. And in September 2010, President Medvedev reportedly observed that "the Arctic can do fine without NATO," and that his government "views [possible NATO] activity with quite serious tension, because it is after all a zone of peaceful cooperation, economic cooperation, and of course the military factor always—at a minimum—creates additional questions."[157]

As noted earlier (see "January 2009 Presidential Arctic Policy Directive" in "Background"), the Bush Administration in early January 2009 issued a presidential directive outlining its policy on the Arctic region; the last such directive had been issued in 1994. The Obama Administration is currently operating under the Bush Administration's policy directive.[158]

U.S. Military Forces and Operations[159]

During the cold war, the Arctic was an arena of military competition between the United States and the Soviet Union, with both countries, for example, operating nuclear-powered submarines, long-range bombers, and tactical aircraft in the region. The end of the cold war and the collapse

[159] This section prepared by Ronald O'Rourke, Specialist in Naval Affairs, Foreign Affairs, Defense, and Trade Division.

of most elements of the Russian military establishment following the dissolution of the Soviet Union in December 1991 greatly reduced this competition and led to a reduced emphasis on the Arctic in U.S. military planning.

The diminishment of Arctic sea ice is now leading U.S. military forces to pay increased attention to the Arctic. This is particularly true in the case of the Navy and Coast Guard, because the diminishment of Arctic sea ice is opening up potential new operating areas for their surface ships. Defense officials in the United States and other countries view issues such as sovereignty, freedom of navigation, and energy exploration as creating a potential in the Arctic for military cooperation, competition, or conflict, depending on how these issues are handled.[160]

2010 Quadrennial Defense Review

The Department of Defense's (DOD's) report on the 2010 Quadrennial Defense Review (QDR), submitted to Congress in February 2010, states:

> The effect of changing climate on the Department's operating environment is evident in the maritime commons of the Arctic. The opening of the Arctic waters in the decades ahead[,] which will permit seasonal commerce and transit[,] presents a unique opportunity to work collaboratively in multilateral forums to promote a balanced approach to improving human and environmental security in the region. In that effort, DoD must work with the Coast Guard and the Department of Homeland Security to address gaps in Arctic communications, domain awareness, search and rescue, and environmental observation and forecasting capabilities to support both current and future planning and operations. To support cooperative engagement in the Arctic, DoD strongly supports accession to the United Nations Convention on the Law of the Sea.[161]

The report also states:

> The Department of Defense and its interagency partners must be able to more comprehensively monitor the air, land, maritime, space, and cyber domains for potential direct threats to the United States. Such monitoring provides the U.S. homeland with an extended, layered in depth defense. This effort includes enhanced coordination with Canada for the defense of North America as well as assisting Mexico and Caribbean partners in developing air and maritime domain awareness capacities. Special attention is required to develop domain awareness tools for the Arctic approaches as well. In coordination with domestic and international partners, DoD will explore technologies that have the potential to detect, track, and identify threats in these spheres to ensure that capabilities can be deployed to counter them in a timely fashion.[162]

The report further states:

---

[160] See, for example, John Vandiver, "NATO Commander Sees Arctic Seabed As Cooperative Zone," *Mideast Stars and Stripes*, October 10, 2009; Tom Coghlan, "Nato Commander Warns Of Conflict With Russia In Arctic Circle," *London Times*, October 3, 2009; Gerard O'Dwyer, "Danish Report: Conflicts Coming Over Arctic," *Defense News*, September 28, 2009: 18; Gerard O'Dwyer, "Russia Warns Denmark Over Arctic Arms Race," *Defense News*, August 3, 2009: 13; Gerrard Cowen, "Russia and NATO Look to Co-operation In Arctic," *Jane's Defence Weekly*, April 8, 2009: 12; David Scutro, "Thawing Arctic Seas May Bring Security Risk," *NavyTimes.com*, January 29, 2009.

[161] Department of Defense, *Quadrennial Defense Review Report*, February 2010, p. 86.

[162] Department of Defense, *Quadrennial Defense Review Report*, February 2010, p. 19.

> Central to the security of the United States is a strong transatlantic partnership, which is underpinned by the bilateral relationships between the United States and the governments of Europe. We will continue to work with this community of like-minded nations, whether by engaging with allies still shaping their democracies after decades of living in the shadow of the Soviet Union, building on the benefits of French reintegration into NATO's military structure, or addressing new security issues such as those arising in the Arctic region.[163]

The report states: "We will seek out opportunities to work with Moscow on emerging issues, such as the future of the Arctic" and that DOD "will also enhance defense relationships and continue to work with Canada in the context of regional security, increased interaction in the Arctic, and combat operations in Afghanistan."[164]

Navy and Coast Guard

The Navy and Coast Guard are exploring the potential implications that increased surface ship and aircraft operations in the Arctic may have for required numbers of ships and aircraft, ship and aircraft characteristics, new or enlarged Arctic bases, and supporting systems, such as navigation and communication systems. The Navy and Coast Guard have sponsored or participated in studies and conferences to explore these implications, the Coast Guard has deployed boats and aircraft into the region to better understand the implications of operating such units there,[165] and Navy sailors in 2009 rode on Canadian Navy ships deploying to Arctic waters for similar reasons.[166] The Coast Guard is coordinating with the North Atlantic and North Pacific Coast Guard forums to plan exercises in the Arctic in the summer of 2010.[167]

These U.S. Navy and Coast Guard activities are taking place as other countries, such as Canada and Russia, are examining the potential implications for their military forces of diminished Arctic sea ice, and taking or contemplating steps to increase their own navy and coast guard presence and operations in the region.[168]

Points or themes that have emerged in studies and conferences regarding the potential implications for the U.S. Navy and Coast Guard of diminished Arctic sea ice include but are not limited to the following:

- The diminishment of Arctic ice is creating potential new operating areas in the Arctic for Navy surface ships and Coast Guard cutters.
- U.S. national security interests in the Arctic include "such matters as missile defense and early warning; deployment of sea and air systems for strategic sealift, strategic deterrence, maritime presence, and maritime security operations; and ensuring freedom of navigation and overflight."[169]
- A mission of potential particular interest for expanded surface ship operations in the Arctic would be defending the U.S. (and European Union) claim that the Northern Sea Route running along Russia's north coast and the Northwest Passage running through Canada's northern archipelago constitute international straits which allow right of innocent passage.
- Search and rescue in the Arctic is a mission of increasing importance, particularly for the Coast Guard, and one that poses potentially significant operational challenges (see "Search and Rescue" above).
- More complete and detailed information on the Arctic is needed to more properly support expanded Navy and Coast Guard ship and aircraft operations in the Arctic.
- The Navy and the Coast Guard currently have limited infrastructure in place in the Arctic to support expanded ship and aircraft operations in the Arctic.[170]

Pugliese, "Wakeup Call?" *Seapower*, October 2007: 19-20, 22; Iam Austen, "Canada Announces Plans For 2 New Bases In Its Far North," *New York Times*, August 11, 2007; "Canada To Strengthen Arctic Claim," BBC News, August 10, 2007.

[169] NSPD 66/HSPD 25, Section III B.

[170] Regarding infrastructure in the Arctic, an October 2009 press report stated:

> A big challenge will be logistics support since the only [U.S.] supply base currently available is the town of Barrow, Alaska. [Rear Admiral Dave] Titley [the Oceanographer of the Navy] explained that the Arctic region is roughly the size of the United States. By way of illustration Titley said: "Think of trying to conduct operations through the entire U.S., and your one logistics base is the size of San Clemente Island [an island off the coast of Southern California]. That is roughly the size of Barrow."

(Bob Freeman, "Conference Addresses Navy's Role in a Changing Arctic," Navy New Service, October 4, 2009. See also Zachary M. Peterson, "As A Result of Melting Ice, Navy Study Need For Base in Far North," *Inside the Navy*, December 29, 2009; Patricia Kime, "CG Boss Calls For Forward Bases In The Arctic," *NavyTimes.com*, September 28, 2007.)

- Expanded ship and aircraft operations in the Arctic may require altering ship and aircraft designs and operating methods.[171]
- Cooperation with other Arctic countries will be valuable in achieving defense and homeland security goals.

The National Ice Center (a multi-agency operational center operated by the U.S. Navy, the National Oceanic and Atmospheric Administration (NOAA), and the U.S. Coast Guard) and USARC sponsored a 2007 symposium on the impact of an ice-diminished Arctic on naval and maritime operations. The summary report on the symposium stated, among other things, that: "While an ice-diminished Arctic will increase the scope of naval and maritime operations, the U.S. has little capacity to expand and little ability to operate in the Arctic environment."[172] During discussions at the symposium, the following points, among others, were made:

- Mechanisms for joint (i.e., integrated multi-service) operations in the Arctic do not currently exist.
- A lack of infrastructure will be an issue for the Navy.
- It is important to develop interoperability between the U.S. and Canadian navies, and among circumpolar nations.[173]

In October 2007, the Navy, Marine Corps, and Coast Guard released a joint document on maritime strategy, which states in part:

> Climate change is gradually opening up the waters of the Arctic, not only to new resource development, but also to new shipping routes that may reshape the global transport system. While these developments offer opportunities for growth, they are potential sources of competition and conflict for access and natural resources.[174]

In a February 2009 journal article, the Oceanographer of the Navy stated:

> Competing claims dealing with the Arctic are often political in nature and have important implications. For example, in the summer of 2008 Canada announced that it would increase its military presence in the region, begin construction of a deep-water port on Baffin Island, establish a cold weather training base at Resolute Bay, and build six new ice-hardened ships to patrol the Northwest Passage. During the same period, Russia conducted strategic bomber flights over the area for the first time since the end of the Cold War....
>
> Preserving freedom of navigation in the region is an important tenet of U.S. policy. The NSR [Northern Sea Route], however, is a contested waterway, with Russian claims of sovereignty

[173] Impact of an Ice-Diminishing Arctic on Naval and Maritime Operations, Summary Report, July 10-12, 2007, pp. 15 and 50-51, http://www.star.nesdis.noaa.gov/star/documents/2007IceSymp/Summary_Report_2007.pdf.

[174] *A Cooperative Strategy for 21st Century Seapower*, Washington, 2007, p. 3 (Section entitled "Challenges of a New Era"), http://www.navy.mil/maritime/MaritimeStrategy.pdf.

competing against U.S. and European Union insistence that it is an international strait available to all nations, subject to mutually recognized terms. Another potential [Arctic] transoceanic shipping route may be the Northwest Passage, which extends from the Atlantic through Baffin Bay and the Canadian Archipelago and into the Pacific by way of the Bering Strait. Canada claims sovereignty over the waters of the Canadian Archipelago, although the United States and the European Union claim that the Northwest Passage also constitutes an international strait which allows right of innocent passage....

Aside from access and right of passage, the Navy and Coast Guard, in particular, must also be concerned with strategic choke points such as the Bering Strait, Canada's Queen Elizabeth Islands in the Northwest Passage, and Russia's Severnaya Zemlya and New Siberian Islands in the Northern Sea Route. These narrow passages offer some protection from persistent ice blockage, but they are also vulnerable to control or blockade by adversaries that would significantly disrupt potential commercial shipping and oil transport....

U.S. naval interests will face new challenges in an increasingly ice-free Arctic with a strategic objective to understand potential threats to the United States from the maritime domain. As throughout the global commons, the U.S. Navy must be aware of activities that could be harmful to national security interests in a region that will, no doubt, see fewer barriers to access by potential adversaries in the future. National and homeland security interests pertinent to the U.S. Navy in the region would include early warning/missile defense; maritime presence and security; and freedom of navigation and over-flight....

The region is primarily a maritime domain and the U.S. Navy of the future must be prepared to protect sea lines of communication supporting maritime commerce and other national interests—including national security—there. In addition to thinking through how we adjust our shipbuilding emphasis to support such operations, the Navy should also be thinking strategically about building the necessary infrastructure to provide logistic support for Arctic patrols, search and rescue capabilities, and shore-based support activities.

To ensure complete maritime domain awareness in the region, and to provide our forces a competitive advantage, it will be necessary to have comprehensive knowledge of the physical environment. Data must be obtained by a suite of remote sensors (satellites, radars), autonomous sensors (data buoys, unmanned vehicles), and manned sensors (shipboard, coastal observing stations). Computer-based ocean and atmospheric models must be adjusted to the geophysical peculiarities of high latitudes. Communication lines for data exchange and reach-back processing at high-performance computing production centers must be robust and reliable. To ensure safety of navigation, we will also need to conduct more high-resolution bottom surveys and increase the scrutiny we place on sea ice conditions.

The Navy relies on its international and interagency partners for assistance to ensure success of maritime domain awareness and maritime security missions. To meet the demands of national security in the changing northern environment, strengthening mechanisms for cooperation among the regional nations and U.S. agencies must remain a high priority. Like everywhere else in the world, sound national security in the Arctic will require strategic access, military mobility, safe navigation, unimpeded maritime transportation, improved homeland security, and responsible, sustainable use of ocean and coastal resources. International and interagency agreements and partnerships are vital to incorporating these essential elements into a viable national security policy and will be critical for resolving future naval challenges of a changing Arctic.[175]

[175] David Grove, "Arctic Melt: Reopening a Naval Frontier?" *U.S. Naval Institute Proceedings*, February 2009: 16-21.

In a spring 2010 journal article, the Oceanographer of the Navy (the successor to the officer who authored the above journal article) and a coauthor stated that "Navy surface vessels are able to operate up to the marginal ice zone but will require ice-strengthening to operate in higher ice conditions; Navy aircraft are capable of operating in the Arctic, but the lack of divert fields limits their duration and range."[176] The article also stated:

> While the Navy has a rich history in the Arctic, several challenges must be met to ensure successful operations in the future. These include the lack of support infrastructure and logistics support, environmental hazards such as drifting sea ice and icing on exposed surfaces, and communications difficulties. Antiquated nautical charts, drifting ice, low visibility, and the paucity of electronic and visual navigation aids hinder safety of navigation. A lack of coastal installations also contributes to the difficulty of search and rescue (SAR) operations. The only American-owned deepwater port near the Arctic basin is Dutch Harbor, in the Aleutian Islands.[177]

A March 2010 press report stated that

> a sustained [Navy] presence [in the Arctic] requires a lot of answers and training in the near future. Specifically, the harsh environment will require significant modifications in ship and satellite architecture.
>
> "Where do we keep our fuel?" [Admiral Gary Roughead] the CNO [Chief of Naval Operations] said. "The way that we design our heating and ventilation systems are just not designed to keep up with ambient temperatures that are as cold as it gets up there. You have difficulties sometimes in how the more traditional outside equipment is maintained, and when you have freezing rain and things like that, how do you keep it clear? There are a lot of ship designs and ship alterations aspects. ... What sort of communication architectures do we have to have? I really believe now is the time to start thinking about that because it means changes to ship design, which means we have to start laying in. It means perhaps some new overhead satellite architectures, and those are extraordinarily costly."[178]

The Navy examined issues and concerns relating to climate change at a May 15, 2009, meeting of the Chief of Naval Operations (CNO) Executive Board. Following this meeting, the Navy decided to establish a Navy group led by the Oceanographer of the Navy called Task Force Climate Change (TFCC), and to develop Navy roadmaps first for the Arctic, and later for more general responses to global climate change.

The Navy issued its Arctic roadmap on November 10, 2009.[179] The document, which is dated October 2009 and co-sponsored by TFCC and the Oceanographer of the Navy,[180] is intended to guide the service's activities regarding the Arctic for the period FY2010-FY2014. The November 10 cover memo states that the document is to remain in effect until the completion of the report

[179] Memorandum for Distribution dated November 10, 2009, from Admiral J. W. Greenert, Vice Chief of Naval Operations, on the subject of the Navy Arctic Roadmap. The document was posted on *InsideDefense.com* (subscription required).

[180] U.S. Navy, U.S. Navy Arctic Roadmap, Washington, 2009, 29 pp. (October 2009, sponsored by Task Force Climate Change [and] Oceanographer of the Navy.) The document was posted on *InsideDefense.com* (subscription required).

on the FY2014 Quadrennial Defense Review (QDR), at which time it will be reviewed and revised to incorporate guidance from that QDR.

The roadmap states that "significant action items" for FY2010 for the Navy include the following:

- Conduct assessments of fleet readiness and mission requirements in the Arctic region.
- Develop Navy strategic objectives in the Arctic region.
- Continue partnership-building activities with stakeholders in the region and conduct a limited objective experiment (or LOE—a kind of exercise) for the Arctic.
- Continue monitoring the Air Force's Polar Military Satellite Communications (MILSTACOM) program.
- Advocate for U.S. accession to the U.N. Convention on the Law of the Sea.
- Develop a Navy position regarding combatant commander authorities and responsibilities for the Arctic.
- Conduct research and development on a next-generation environmental prediction capability that is applicable to the Arctic.

The roadmap states that "significant action items" for FY2011-FY2012 for the Navy include the following:

- Initiate assessments of required Navy Arctic capabilities.
- Develop recommendations to address Arctic requirements for program proposals in the Navy's Program Objective Memorandum (or POM—a document that guides the development of a Navy budget) for FY2014 (POM-14).
- Continue biennial Navy participation in Arctic exercises, including ICEX-11, ICEX-13, Arctic Edge, and Arctic Care.
- Formalize new cooperative relationships that increase Navy experience and competency in search and rescue (SAR), maritime domain awareness (MDA), and humanitarian assistance and disaster response (HADR) in the Arctic, and defense support of civil authorities (DSCA) in Alaska.

The roadmap states that "significant action items" for FY2013-FY2014 for the Navy include the following:

- Execute Navy POM-14 budget initiatives that address Arctic requirements.
- Initiate combined (i.e., multi-lateral) and bilateral activities which support safety, security, and stability in the region.[181]

A March 2010 report stated the following regarding the roadmap:

[181] For additional discussion of the roadmap, see David W. Titley and Courtney C. St. John, "Arctic Security Considerations and the U.S. Navy's Roadmap for the Arctic," *Naval War College Review*, Spring 2010: 35-48.

> Capabilities-based assessments and preparation for major funding requests will follow in fiscal 2011-12. A priority will be an increase in hydrographic and bottom-mapping surveys, as less than 5 percent of the region is mapped to current standards. Simultaneously, training to increase experience and competency in search and rescue, maritime domain awareness, humanitarian assistance and disaster response will expand. The first major investments for major training and ship preparation will be sought in fiscal 2014.[182]

The report also stated that

> one option the Coast Guard is considering is a modified version of its Offshore Patrol Cutter [OPC], the third large ship it plans as part of its modernization program. The Coast Guard could build a "Flight II" OPC, he said, built specifically to withstand the punishing seas and drifting ice. All the ships in that special class would likely be stationed in Kodiak, Alaska.[183]

In December 2009, it was reported that "U.S. and Canadian defense officials are studying emerging gaps in their awareness of Arctic activities, seeking to boost North American Aerospace Defense [NORAD] Command's maritime-warning mission and crafting a new threat assessment for the region." The effort would reportedly involve both NORAD and a Canadian-American advisory board called the Permanent Joint Board on Defense.[184]

In May 2010, it was reported that "American and Canadian defense officials are bolstering collaboration on military exercises, investment plans and technology development related to the Arctic." The report stated that "U.S. and Canadian intelligence officials have created a classified joint "utilization" assessment for the Arctic looking out to 2020, which will be continuously updated." It also stated that "American and Canadian defense officials have just started implementing a new five-year work plan that contains specific initiatives and requires concrete deliverables, Stockton said, noting the Arctic received special attention in the plan. The plan also covers defense critical infrastructure protection, defense support to civil agencies and defense cooperation in the Americas."[185]

A September 2010 GAO report on the Coast Guard's efforts to identify Arctic requirements in general stated:

> The Coast Guard has taken specific action to identify Arctic requirements and gaps while also collecting relevant information from routine operations. The High Latitude Study is the centerpiece of the agency's efforts to determine its Arctic requirements. The Coast Guard has also established temporary operating locations in the Arctic and conducted biweekly Arctic overflights to obtain more information on the Arctic operating environment. In addition, information gathered during the Coast Guard's routine missions—ice breaking, search and rescue, and others—also informs requirements. The agency's preliminary efforts to identify its Arctic requirements generally align with key practices for agencies defining missions and desired outcomes.

---

[182] Lance M. Bacon, "Ice Breaker," *Armed Forces Journal*, March 2010: 16-19, 34-35.

[183] Lance M. Bacon, "Ice Breaker," *Armed Forces Journal*, March 2010: 16-19, 34-35. For more on the OPC, see CRS Report RL33753, *Coast Guard Deepwater Acquisition Programs: Background, Oversight Issues, and Options for Congress*, by Ronald O'Rourke.

[184] Christopher J. Castelli, "DOD, Canada Aim TO Develop Arctic Policy Options By Early 2010," *Inside the Navy*, December 7, 2009.

[185] Christopher J. Castelli, "American, Canadian Defense Officials Tighten Ties On Arctic Issues," *Inside the Navy*, May 3, 2010.

> The Coast Guard faces Arctic challenges including limited information, minimal assets and infrastructure, personnel issues, and difficult planning and funding decisions, but is taking initial steps to address these challenges. Specifically, the Coast Guard does not currently have Arctic maritime domain awareness—a full understanding of variables that could affect the security, safety, economy, or environment in the Arctic—but is acquiring additional Arctic vessel tracking data, among other things, to address this issue. In addition, the Coast Guard's Arctic assets and infrastructure are limited and not suitable for the harsh environment, but the agency is testing equipment and using alternative options to mitigate gaps. Finally, the Coast Guard faces uncertainty over the timing of predicted environmental changes in the Arctic, as well as over future funding streams. To address these challenges the Coast Guard obtains scientific data on Arctic climate change and is studying its Arctic resource requirements to support potential future funding needs.[186]

January 2009 Arctic Policy Directive

As noted earlier (see "January 2009 Presidential Arctic Policy Directive" in "Background" and also "U.S. Relations with Other Arctic Countries"), the Obama Administration is currently operating under the January 2009 Arctic region policy directive (NSPD 66/HSPD 25) issued by the George W. Bush Administration.[187] Potential oversight questions include but not are limited to the following:

- Is NSPD 66/HSPD 25 a suitable statement of U.S. policy for the Arctic region?[188]
- Although the Obama Administration is currently operating under NSPD 66/HSPD 25, does the Obama Administration fully agree with all parts of it? If not, with which parts does it not fully agree?
- Is the Obama Administration planning to conduct a review of NSDP 66/HSPD 25? If so, what is the Administration's schedule for conducting and releasing the results of that review?

Appendix A. Arctic Research and Policy Act of 1984 (Title I of P.L. 98-373)

The text of the Arctic Research and Policy Act of 1984 (Title I of P.L. 98-373 of July 31, 1984[189]) is as follows:

TITLE I – ARCTIC RESEARCH AND POLICY

SHORT TITLE

SEC. 101. This title may be cited as the "Arctic Research and Policy Act of 1984".

FINDINGS AND PURPOSES

SEC. 102. (a) The Congress finds and declares that-

(1) the Arctic, onshore and offshore, contains vital energy resources that can reduce the Nation's dependence on foreign oil and improve the national balance of payments;

(2) as the Nation's only common border with the Soviet Union, the Arctic is critical to national defense;

(3) the renewable resources of the Arctic, specifically fish and other seafood, represent one of the Nation's greatest commercial assets;

(4) Arctic conditions directly affect global weather patterns and must be understood in order to promote better agricultural management throughout the United States;

(5) industrial pollution not originating in the Arctic region collects in the polar air mass, has the potential to disrupt global weather patterns, and must be controlled through international cooperation and consultation;

(6) the Arctic is a natural laboratory for research into human health and adaptation, physical and psychological, to climates of extreme cold and isolation and may provide information crucial for future defense needs;

(7) atmospheric conditions peculiar to the Arctic make the Arctic a unique testing ground for research into high latitude communications, which is likely to be crucial for future defense needs;

(8) Arctic marine technology is critical to cost-effective recovery and transportation of energy resources and to the national defense;

(9) the United States has important security, economic, and environmental interests in developing and maintaining a fleet of icebreaking vessels capable of operating effectively in the heavy ice regions of the Arctic;

[189] Title II of P.L. 98-373 is the National Critical Materials Act of 1984.

(10) most Arctic-rim countries, particularly the Soviet Union, possess Arctic technologies far more advanced than those currently available in the United States;

(11) Federal Arctic research is fragmented and uncoordinated at the present time, leading to the neglect of certain areas of research and to unnecessary duplication of effort in other areas of research;

(12) improved logistical coordination and support for Arctic research and better dissemination of research data and information is necessary to increase the efficiency and utility of national Arctic research efforts;

(13) a comprehensive national policy and program plan to organize and fund currently neglected scientific research with respect to the Arctic is necessary to fulfill national objectives in Arctic research;

(14) the Federal Government, in cooperation with State and local governments, should focus its efforts on the collection and characterization of basic data related to biological, materials, geophysical, social, and behavioral phenomena in the Arctic;

(15) research into the long-range health, environmental, and social effects of development in the Arctic is necessary to mitigate the adverse consequences of that development to the land and its residents;

(16) Arctic research expands knowledge of the Arctic, which can enhance the lives of Arctic residents, increase opportunities for international cooperation among Arctic-rim countries, and facilitate the formulation of national policy for the Arctic; and

(17) the Alaskan Arctic provides an essential habitat for marine mammals, migratory waterfowl, and other forms of wildlife which are important to the Nation and which are essential to Arctic residents.

(b) The purposes of this title are-

(1) to establish national policy, priorities, and goals and to provide a Federal program plan for basic and applied scientific research with respect to the Arctic, including natural resources and materials, physical, biological and health sciences, and social and behavioral sciences;

(2) to establish an Arctic Research Commission to promote Arctic research and to recommend Arctic research policy;

(3) to designate the National Science Foundation as the lead agency responsible for implementing Arctic research policy; and

(4) to establish an Interagency Arctic Research Policy Committee to develop a national Arctic research policy and a five year plan to implement that policy.

ARCTIC RESEARCH COMMISSION

SEC. 103. (a) The President shall establish an Arctic Research Commission (hereafter referred to as the "Commission").

(b)(1) The Commission shall be composed of five members appointed by the President, with the Director of the National Science Foundation serving as a nonvoting, ex officio member. The members appointed by the President shall include-

(A) three members appointed from among individuals from academic or other research institutions with expertise in areas of research relating to the Arctic, including the physical, biological, health, environmental, social, and behavioral sciences;

(B) one member appointed from among indigenous residents of the Arctic who are representative of the needs and interests of Arctic residents and who live in areas directly affected by Arctic resource development; and

(C) one member appointed from among individuals familiar with the Arctic and representative of the needs and interests of private industry undertaking resource development in the Arctic.

(2) The President shall designate one of the appointed members of the Commission to be chairperson of the Commission.

(c)(1) Except as provided in paragraph (2) of this subsection, the term of office of each member of the Commission appointed under subsection (b)(1) shall be four years.

(2) Of the members of the Commission originally appointed under subsection (b)(1)-

(A) one shall be appointed for a term of two years;

(B) two shall be appointed for a term of three years; and

(C) two shall be appointed for a term of four years.

(3) Any vacancy occurring in the membership of the Commission shall be filled, after notice of the vacancy is published in the Federal Register, in the manner provided by the preceding provisions of this section, for the remainder of the unexpired term.

(4) A member may serve after the expiration of the member's term of office until the President appoints a successor.

(5) A member may serve consecutive terms beyond the member's original appointment.

(d)(1) Members of the Commission may be allowed travel expenses, including per diem in lieu of subsistence, as authorized by section 5703 of title 5, United States Code. A member of the Commission not presently employed for compensation shall be compensated at a rate equal to the daily equivalent of the rate for GS-16 of the General Schedule under section 5332 of title 5, United States Code, for each day the member is engaged in the actual performance of his duties as a member of the Commission, not to exceed 90 days of service each year. Except for the purposes of chapter 81 of title 5 (relating to compensation for work injuries) and chapter 171 of title 28 (relating to tort claims), a member of the Commission shall not be considered an employee of the United States for any purpose.

(2) The Commission shall meet at the call of its Chairman or a majority of its members.

(3) Each Federal agency referred to in section 107(b) may designate a representative to participate as an observer with the Commission.

These representatives shall report to and advise the Commission on the activities relating to Arctic research of their agencies.

(4) The Commission shall conduct at least one public meeting in the State of Alaska annually.

DUTIES OF COMMISSION

SEC. 104. (a) The Commission shall-

(1) develop and recommend an integrated national Arctic research policy;

(2) in cooperation with the Interagency Arctic Research Policy Committee established under section 107, assist in establishing a national Arctic research program plan to implement the Arctic research policy;

(3) facilitate cooperation between the Federal Government and State and local governments with respect to Arctic research;

(4) review Federal research programs in the Arctic and suggest improvements in coordination among programs;

(5) recommend methods to improve logistical planning and support for Arctic research as may be appropriate and in accordance with the findings and purposes of this title;

(6) suggest methods for improving efficient sharing and dissemination of data and information on the Arctic among interested public and private institutions;

(7) offer other recommendations and advice to the Interagency Committee established under section 107 as it may find appropriate; and

(8) cooperate with the Governor of the State of Alaska and with agencies and organizations of that State which the Governor may designate with respect to the formulation of Arctic research policy.

(b) Not later than January 31 of each year, the Commission shall-

(1) publish a statement of goals and objectives with respect to Arctic research to guide the Interagency Committee established under section 107 in the performance of its duties; and

(2) submit to the President and to the Congress a report describing the activities and accomplishments of the Commission during the immediately preceding fiscal year.

COOPERATION WITH THE COMMISSION

SEC. 105. (a)(1) The Commission may acquire from the head of any Federal agency unclassified data, reports, and other nonproprietary information with respect to Arctic research in the possession of the agency which the Commission considers useful in the discharge of its duties.

(2) Each agency shall cooperate with the Commission and furnish all data, reports, and other information requested by the Commission to the extent permitted by law; except that no agency need furnish any information which it is permitted to withhold under section 552 of title 5, United States Code.

(b) With the consent of the appropriate agency head, the Commission may utilize the facilities and services of any Federal agency to the extent that the facilities and services are needed for the establishment and development of an Arctic research policy, upon reimbursement to be agreed upon by the Commission and the agency head and taking every feasible step to avoid duplication of effort.

(c) All Federal agencies shall consult with the Commission before undertaking major Federal actions relating to Arctic research.

ADMINISTRATION OF THE COMMISSION

SEC. 106. The Commission may-

(1) in accordance with the civil service laws and subchapter III of chapter 53 of title 5, United States Code, appoint and fix the compensation of an Executive Director and necessary additional staff personnel, but not to exceed a total of seven compensated personnel;

(2) procure temporary and intermittent services as authorized by section 3109 of title 5, United States Code;

(3) enter into contracts and procure supplies, services, and personal property; and

(4) enter into agreements with the General Services Administration for the procurement of necessary financial and administrative services, for which payment shall be made by reimbursement from funds of the Commission in amounts to be agreed upon by the Commission and the Administrator of the General Services Administration.

LEAD AGENCY AND INTERAGENCY ARCTIC RESEARCH POLICY COMMITTEE

SEC. 107. (a) The National Science Foundation is designated as the lead agency responsible for implementing Arctic research policy, and the Director of the National Science Foundation shall insure that the requirements of section 108 are fulfilled.

(b)(1) The President shall establish an Interagency Arctic Research Policy Committee (hereinafter referred to as the "Interagency Committee").

(2) The Interagency Committee shall be composed of representatives of the following Federal agencies or offices:

(A) the National Science Foundation;

(B) the Department of Commerce;

(C) the Department of Defense;

(D) the Department of Energy;

(E) the Department of the Interior;

(F) the Department of State;

(G) the Department of Transportation;

(H) the Department of Health and Human Services;

(I) the National Aeronautics and Space Administration;

(J) the Environmental Protection Agency; and

(K) any other agency or office deemed appropriate.

(3) The representative of the National Science Foundation shall serve as the Chairperson of the Interagency Committee.

DUTIES OF THE INTERAGENCY COMMITTEE

SEC. 108. (a) The Interagency Committee shall-

(1) survey Arctic research conducted by Federal, State, and local agencies, universities, and other public and private institutions to help determine priorities for future Arctic research, including natural resources and materials, physical and biological sciences, and social and behavioral sciences;

(2) work with the Commission to develop and establish an integrated national Arctic research policy that will guide Federal agencies in developing and implementing their research programs in the Arctic;

(3) consult with the Commission on-

(A) the development of the national Arctic research policy and the 5-year plan implementing the policy;

(B) Arctic research programs of Federal agencies;

(C) recommendations of the Commission on future Arctic research; and

(D) guidelines for Federal agencies for awarding and administering Arctic research grants;

(4) develop a 5-year plan to implement the national policy, as provided for in section 109;

(5) provide the necessary coordination, data, and assistance for the preparation of a single integrated, coherent, and multiagency budget request for Arctic research as provided for in section 110;

(6) facilitate cooperation between the Federal Government and State and local governments in Arctic research, and recommend the undertaking of neglected areas of research in accordance with the findings and purposes of this title;

(7) coordinate and promote cooperative Arctic scientific research programs with other nations, subject to the foreign policy guidance of the Secretary of State;

(8) cooperate with the Governor of the State of Alaska in fulfilling its responsibilities under this title;

(9) promote Federal interagency coordination of all Arctic research activities, including-

(A) logistical planning and coordination; and

(B) the sharing of data and information associated with Arctic research, subject to section 552 of title 5, United States Code; and

(10) provide public notice of its meetings and an opportunity for the public to participate in the development and implementation of national Arctic research policy.

(b) Not later than January 31, 1986, and biennially thereafter, the Interagency Committee shall submit to the Congress through the President, a brief, concise report containing-

(1) a statement of the activities and accomplishments of the Interagency Committee since its last report; and

(2) a description of the activities of the Commission, detailing with particularity the recommendations of the Commission with respect to Federal activities in Arctic research.

5-YEAR ARCTIC RESEARCH PLAN

SEC. 109. (a) The Interagency Committee, in consultation with the Commission, the Governor of the State of Alaska, the residents of the Arctic, the private sector, and public interest groups, shall prepare a comprehensive 5-year program plan (hereinafter referred to as the "Plan") for the overall Federal effort in Arctic research. The Plan shall be prepared and submitted to the President for transmittal to the Congress within one year after the enactment of this Act and shall be revised biennially thereafter.

(b) The Plan shall contain but need not be limited to the following elements:

(1) an assessment of national needs and problems regarding the Arctic and the research necessary to address those needs or problems;

(2) a statement of the goals and objectives of the Interagency Committee for national Arctic research;

(3) a detailed listing of all existing Federal programs relating to Arctic research, including the existing goals, funding levels for each of the 5 following fiscal years, and the funds currently being expended to conduct the programs;

(4) recommendations for necessary program changes and other proposals to meet the requirements of the policy and goals as set forth by the Commission and in the Plan as currently in effect; and

(5) a description of the actions taken by the Interagency Committee to coordinate the budget review process in order to ensure interagency coordination and cooperation in (A) carrying out Federal Arctic research programs, and (B) eliminating unnecessary duplication of effort among these programs.

COORDINATION AND REVIEW OF BUDGET REQUESTS

SEC. 110. (a) The Office of Science and Technology Policy shall-

(1) review all agency and department budget requests related to the Arctic transmitted pursuant to section 108(a)(5), in accordance with the national Arctic research policy and the 5-year program under section 108(a)(2) and section 109, respectively; and

(2) consult closely with the Interagency Committee and the Commission to guide the Office of Science and Technology Policy's efforts.

(b)(1) The Office of Management and Budget shall consider all Federal agency requests for research related to the Arctic as one integrated, coherent, and multiagency request which shall be reviewed by the Office of Management and Budget prior to submission of the President's annual budget request for its adherence to the Plan. The Commission shall, after submission of the President's annual budget request, review the request and report to Congress on adherence to the Plan.

(2) The Office of Management and Budget shall seek to facilitate planning for the design, procurement, maintenance, deployment, and operations of icebreakers needed to provide a platform for Arctic research by allocating all funds necessary to support icebreaking operations, except for recurring incremental costs associated with specific projects, to the Coast Guard.

AUTHORIZATION OF APPROPRIATIONS; NEW SPENDING AUTHORITY

SEC. 111. (a) There are authorized to be appropriated such sums as may be necessary for carrying out this title.

(b) Any new spending authority (within the meaning of section 401 of the Congressional Budget Act of 1974) which is provided under this title shall be effective for any fiscal year only to such extent or in such amounts as may be provided in appropriation Acts.

DEFINITION

SEC. 112. As used in this title, the term "Arctic" means all United States and foreign territory north of the Arctic Circle and all United States territory north and west of the boundary formed by the Porcupine, Yukon, and Kuskokwim Rivers; all contiguous seas, including the Arctic Ocean and the Beaufort, Bering, and Chukchi Seas; and the Aleutian chain.

Appendix B. P.L. 101-609 of 1990, Amending Arctic Research and Policy Act of 1984

The Arctic Research and Policy Act of 1984 (see **Appendix A**) was amended by P.L. 101-609 of November 16, 1990. The text of P.L. 101-609 is as follows:

> SECTION 1. Except as specifically provided in this Act, whenever in this Act an amendment or repeal is expressed as an amendment to, or repeal of a provision, the reference shall be deemed to be made to the Arctic Research and Policy Act of 1984.
>
> SEC. 2. Section 103(b)(1) (15 U.S.C. 4102(b)(1)) is amended—
>
> (1) in the text above clause (A), by striking out `five' and inserting in lieu thereof `seven';
>
> (2) in clause (A), by striking out `three' and inserting in lieu thereof `four'; and
>
> (3) in clause (C), by striking out `one member' and inserting in lieu thereof `two members'.
>
> SEC. 3. Section 103(d)(1) (15 U.S.C. 4102(d)(1)) is amended by striking out `GS-16' and inserting in lieu thereof `GS-18'.
>
> SEC. 4. (a) Section 104(a) (15 U.S.C. 4102(a)) is amended—
>
> (1) in paragraph (4), by striking out `suggest' and inserting in lieu thereof `recommend';
>
> (2) in paragraph (6), by striking out `suggest' and inserting in lieu thereof `recommend';
>
> (3) in paragraph (7), by striking out `and' at the end thereof;
>
> (4) in paragraph (8), by striking out the period and inserting in lieu thereof a semicolon; and
>
> (5) by adding at the end thereof the following new paragraphs:
>
> `(9) recommend to the Interagency Committee the means for developing international scientific cooperation in the Arctic; and
>
> `(10) not later than January 31, 1991, and every 2 years thereafter, publish a statement of goals and objectives with respect to Arctic research to guide the Interagency Committee established under section 107 in the performance of its duties.'.
>
> (b) Section 104(b) is amended to read as follows:
>
> `(b) Not later than January 31 of each year, the Commission shall submit to the President and to the Congress a report describing the activities and accomplishments of the Commission during the immediately preceding fiscal year.'.
>
> SEC. 5. Section 106 (15 U.S.C. 4105) is amended—
>
> (1) in paragraph (3), by striking out `and' at the end thereof;

(2) in paragraph (4), by striking out the period at the end thereof and inserting in lieu thereof `; and'; and

(3) by adding at the end thereof the following new paragraph:

`(5) appoint, and accept without compensation the services of, scientists and engineering specialists to be advisors to the Commission. Each advisor may be allowed travel expenses, including per diem in lieu of subsistence, as authorized by section 5703 of title 5, United States Code. Except for the purposes of chapter 81 of title 5 (relating to compensation for work injuries) and chapter 171 of title 28 (relating to tort claims) of the United States Code, an advisor appointed under this paragraph shall not be considered an employee of the United States for any purpose.'.

SEC. 6. Subsection (b)(2) of section 108 (15 U.S.C. 4107(b)(2)) is amended to read as follows:

`(2) a statement detailing with particularity the recommendations of the Commission with respect to Federal interagency activities in Arctic research and the disposition and responses to those recommendations.'.

Appendix C. January 2009 Presidential Arctic Policy Directive

On January 12, 2009, the George W. Bush Administration released a presidential directive establishing a new U.S. policy for the Arctic region. The directive, dated January 9, 2009, was issued as National Security Presidential Directive 66/Homeland Security Presidential Directive 25 (NSPD 66/HSPD 25). The text of NSPD 66/HSPD 25 is as follows:

SUBJECT: Arctic Region Policy

I. PURPOSE

A. This directive establishes the policy of the United States with respect to the Arctic region and directs related implementation actions. This directive supersedes Presidential Decision Directive/NSC-26 (PDD-26; issued 1994) with respect to Arctic policy but not Antarctic policy; PDD-26 remains in effect for Antarctic policy only.

B. This directive shall be implemented in a manner consistent with the Constitution and laws of the United States, with the obligations of the United States under the treaties and other international agreements to which the United States is a party, and with customary international law as recognized by the United States, including with respect to the law of the sea.

II. BACKGROUND

A. The United States is an Arctic nation, with varied and compelling interests in that region. This directive takes into account several developments, including, among others:

1. Altered national policies on homeland security and defense;

2. The effects of climate change and increasing human activity in the Arctic region;

3. The establishment and ongoing work of the Arctic Council; and

4. A growing awareness that the Arctic region is both fragile and rich in resources.

III. POLICY

A. It is the policy of the United States to:

1. Meet national security and homeland security needs relevant to the Arctic region;

2. Protect the Arctic environment and conserve its biological resources;

3. Ensure that natural resource management and economic development in the region are environmentally sustainable;

4. Strengthen institutions for cooperation among the eight Arctic nations (the United States, Canada, Denmark, Finland, Iceland, Norway, the Russian Federation, and Sweden);

5. Involve the Arctic's indigenous communities in decisions that affect them; and

6. Enhance scientific monitoring and research into local, regional, and global environmental issues.

B. National Security and Homeland Security Interests in the Arctic

1. The United States has broad and fundamental national security interests in the Arctic region and is prepared to operate either independently or in conjunction with other states to safeguard these interests. These interests include such matters as missile defense and early warning; deployment of sea and air systems for strategic sealift, strategic deterrence, maritime presence, and maritime security operations; and ensuring freedom of navigation and overflight.

2. The United States also has fundamental homeland security interests in preventing terrorist attacks and mitigating those criminal or hostile acts that could increase the United States vulnerability to terrorism in the Arctic region.

3. The Arctic region is primarily a maritime domain; as such, existing policies and authorities relating to maritime areas continue to apply, including those relating to law enforcement.[1] Human activity in the Arctic region is increasing and is projected to increase further in coming years. This requires the United States to assert a more active and influential national presence to protect its Arctic interests and to project sea power throughout the region.

4. The United States exercises authority in accordance with lawful claims of United States sovereignty, sovereign rights, and jurisdiction in the Arctic region, including sovereignty within the territorial sea, sovereign rights and jurisdiction within the United States exclusive economic zone and on the continental shelf, and appropriate control in the United States contiguous zone.

5. Freedom of the seas is a top national priority. The Northwest Passage is a strait used for international navigation, and the Northern Sea Route includes straits used for international navigation; the regime of transit passage applies to passage through those straits. Preserving the rights and duties relating to navigation and overflight in the Arctic region supports our ability to exercise these rights throughout the world, including through strategic straits.

6. Implementation: In carrying out this policy as it relates to national security and homeland security interests in the Arctic, the Secretaries of State, Defense, and Homeland Security, in coordination with heads of other relevant executive departments and agencies, shall:

a. Develop greater capabilities and capacity, as necessary, to protect United States air, land, and sea borders in the Arctic region;

b. Increase Arctic maritime domain awareness in order to protect maritime commerce, critical infrastructure, and key resources;

c. Preserve the global mobility of United States military and civilian vessels and aircraft throughout the Arctic region;

d. Project a sovereign United States maritime presence in the Arctic in support of essential United States interests; and

e. Encourage the peaceful resolution of disputes in the Arctic region.

C. International Governance

1. The United States participates in a variety of fora, international organizations, and bilateral contacts that promote United States interests in the Arctic. These include the Arctic Council, the International Maritime Organization (IMO), wildlife conservation and management agreements, and many other mechanisms. As the Arctic changes and human activity in the region increases, the United States and other governments should consider, as appropriate, new international arrangements or enhancements to existing arrangements.

2. The Arctic Council has produced positive results for the United States by working within its limited mandate of environmental protection and sustainable development. Its subsidiary bodies, with help from many United States agencies, have developed and undertaken projects on a wide range of topics. The Council also provides a beneficial venue for interaction with indigenous groups. It is the position of the United States that the Arctic Council should remain a high-level forum devoted to issues within its current mandate and not be transformed into a formal international organization, particularly one with assessed contributions. The United States is nevertheless open to updating the structure of the Council, including consolidation of, or making operational changes to, its subsidiary bodies, to the extent such changes can clearly improve the Council's work and are consistent with the general mandate of the Council.

3. The geopolitical circumstances of the Arctic region differ sufficiently from those of the Antarctic region such that an "Arctic Treaty" of broad scope—along the lines of the Antarctic Treaty—is not appropriate or necessary.

4. The Senate should act favorably on U.S. accession to the U.N. Convention on the Law of the Sea promptly, to protect and advance U.S. interests, including with respect to the Arctic. Joining will serve the national security interests of the United States, including the maritime mobility of our Armed Forces worldwide. It will secure U.S. sovereign rights over extensive marine areas, including the valuable natural resources they contain. Accession will promote U.S. interests in the environmental health of the oceans. And it will give the United States a seat at the table when the rights that are vital to our interests are debated and interpreted.

5. Implementation: In carrying out this policy as it relates to international governance, the Secretary of State, in coordination with heads of other relevant executive departments and agencies, shall:

a. Continue to cooperate with other countries on Arctic issues through the United Nations (U.N.) and its specialized agencies, as well as through treaties such as the U.N. Framework Convention on Climate Change, the Convention on International Trade in Endangered Species of Wild Fauna and Flora, the Convention on Long Range Transboundary Air Pollution and its protocols, and the Montreal Protocol on Substances that Deplete the Ozone Layer;

b. Consider, as appropriate, new or enhanced international arrangements for the Arctic to address issues likely to arise from expected increases in human activity in that region, including shipping, local development and subsistence, exploitation of living marine resources, development of energy and other resources, and tourism;

c. Review Arctic Council policy recommendations developed within the ambit of the Council's scientific reviews and ensure the policy recommendations are subject to review by Arctic governments; and

d. Continue to seek advice and consent of the United States Senate to accede to the 1982 Law of the Sea Convention.

D. Extended Continental Shelf and Boundary Issues

1. Defining with certainty the area of the Arctic seabed and subsoil in which the United States may exercise its sovereign rights over natural resources such as oil, natural gas, methane hydrates, minerals, and living marine species is critical to our national interests in energy security, resource management, and environmental protection. The most effective way to achieve international recognition and legal certainty for our extended continental shelf is through the procedure available to States Parties to the U.N. Convention on the Law of the Sea.

2. The United States and Canada have an unresolved boundary in the Beaufort Sea. United States policy recognizes a boundary in this area based on equidistance. The United States recognizes that the boundary area may contain oil, natural gas, and other resources.

3. The United States and Russia are abiding by the terms of a maritime boundary treaty concluded in 1990, pending its entry into force. The United States is prepared to enter the agreement into force once ratified by the Russian Federation.

4. Implementation: In carrying out this policy as it relates to extended continental shelf and boundary issues, the Secretary of State, in coordination with heads of other relevant executive departments and agencies, shall:

a. Take all actions necessary to establish the outer limit of the continental shelf appertaining to the United States, in the Arctic and in other regions, to the fullest extent permitted under international law;

b. Consider the conservation and management of natural resources during the process of delimiting the extended continental shelf; and

c. Continue to urge the Russian Federation to ratify the 1990 United States-Russia maritime boundary agreement.

E. Promoting International Scientific Cooperation

1. Scientific research is vital for the promotion of United States interests in the Arctic region. Successful conduct of U.S. research in the Arctic region requires access throughout the Arctic Ocean and to terrestrial sites, as well as viable international mechanisms for sharing access to research platforms and timely exchange of samples, data, and analyses. Better coordination with the Russian Federation, facilitating access to its domain, is particularly important.

2. The United States promotes the sharing of Arctic research platforms with other countries in support of collaborative research that advances fundamental understanding of the Arctic region in general and potential Arctic change in particular. This could include collaboration with bodies such as the Nordic Council and the European Polar Consortium, as well as with individual nations.

3. Accurate prediction of future environmental and climate change on a regional basis, and the delivery of near real-time information to end-users, requires obtaining, analyzing, and disseminating accurate data from the entire Arctic region, including both paleoclimatic data and observational data. The United States has made significant investments in the infrastructure needed to collect environmental data in the Arctic region, including the establishment of portions of an Arctic circumpolar observing network through a partnership among United States agencies, academic collaborators, and Arctic residents. The United States promotes active involvement of all Arctic nations in these efforts in order to advance

scientific understanding that could provide the basis for assessing future impacts and proposed response strategies.

4. United States platforms capable of supporting forefront research in the Arctic Ocean, including portions expected to be ice-covered for the foreseeable future, as well as seasonally ice-free regions, should work with those of other nations through the establishment of an Arctic circumpolar observing network. All Arctic nations are members of the Group on Earth Observations partnership, which provides a framework for organizing an international approach to environmental observations in the region. In addition, the United States recognizes that academic and research institutions are vital partners in promoting and conducting Arctic research.

5. Implementation: In carrying out this policy as it relates to promoting scientific international cooperation, the Secretaries of State, the Interior, and Commerce and the Director of the National Science Foundation, in coordination with heads of other relevant executive departments and agencies, shall:

a. Continue to play a leadership role in research throughout the Arctic region;

b. Actively promote full and appropriate access by scientists to Arctic research sites through bilateral and multilateral measures and by other means;

c. Lead the effort to establish an effective Arctic circumpolar observing network with broad partnership from other relevant nations;

d. Promote regular meetings of Arctic science ministers or research council heads to share information concerning scientific research opportunities and to improve coordination of international Arctic research programs;

e. Work with the Interagency Arctic Research Policy Committee (IARPC) to promote research that is strategically linked to U.S. policies articulated in this directive, with input from the Arctic Research Commission; and

f. Strengthen partnerships with academic and research institutions and build upon the relationships these institutions have with their counterparts in other nations.

F. Maritime Transportation in the Arctic Region

1. The United States priorities for maritime transportation in the Arctic region are:

a. To facilitate safe, secure, and reliable navigation;

b. To protect maritime commerce; and

c. To protect the environment.

2. Safe, secure, and environmentally sound maritime commerce in the Arctic region depends on infrastructure to support shipping activity, search and rescue capabilities, short- and long-range aids to navigation, high-risk area vessel-traffic management, iceberg warnings and other sea ice information, effective shipping standards, and measures to protect the marine environment. In addition, effective search and rescue in the Arctic will require local, State, Federal, tribal, commercial, volunteer, scientific, and multinational cooperation.

3. Working through the International Maritime Organization (IMO), the United States promotes strengthening existing measures and, as necessary, developing new measures to improve the safety and security of maritime transportation, as well as to protect the marine environment in the Arctic region. These measures may include ship routing and reporting systems, such as traffic separation and vessel traffic management schemes in Arctic chokepoints; updating and strengthening of the Guidelines for Ships Operating in Arctic Ice-Covered Waters; underwater noise standards for commercial shipping; a review of shipping insurance issues; oil and other hazardous material pollution response agreements; and environmental standards.

4. Implementation: In carrying out this policy as it relates to maritime transportation in the Arctic region, the Secretaries of State, Defense, Transportation, Commerce, and Homeland Security, in coordination with heads of other relevant executive departments and agencies, shall:

a. Develop additional measures, in cooperation with other nations, to address issues that are likely to arise from expected increases in shipping into, out of, and through the Arctic region;

b. Commensurate with the level of human activity in the region, establish a risk-based capability to address hazards in the Arctic environment. Such efforts shall advance work on pollution prevention and response standards; determine basing and logistics support requirements, including necessary airlift and icebreaking capabilities; and improve plans and cooperative agreements for search and rescue;

c. Develop Arctic waterways management regimes in accordance with accepted international standards, including vessel traffic-monitoring and routing; safe navigation standards; accurate and standardized charts; and accurate and timely environmental and navigational information; and

d. Evaluate the feasibility of using access through the Arctic for strategic sealift and humanitarian aid and disaster relief.

G. Economic Issues, Including Energy

1. Sustainable development in the Arctic region poses particular challenges. Stakeholder input will inform key decisions as the United States seeks to promote economic and energy security. Climate change and other factors are significantly affecting the lives of Arctic inhabitants, particularly indigenous communities. The United States affirms the importance to Arctic communities of adapting to climate change, given their particular vulnerabilities.

2. Energy development in the Arctic region will play an important role in meeting growing global energy demand as the area is thought to contain a substantial portion of the world's undiscovered energy resources. The United States seeks to ensure that energy development throughout the Arctic occurs in an environmentally sound manner, taking into account the interests of indigenous and local communities, as well as open and transparent market principles. The United States seeks to balance access to, and development of, energy and other natural resources with the protection of the Arctic environment by ensuring that continental shelf resources are managed in a responsible manner and by continuing to work closely with other Arctic nations.

3. The United States recognizes the value and effectiveness of existing fora, such as the Arctic Council, the International Regulators Forum, and the International Standards Organization.

4. Implementation: In carrying out this policy as it relates to economic issues, including energy, the Secretaries of State, the Interior, Commerce, and Energy, in coordination with heads of other relevant executive departments and agencies, shall:

a. Seek to increase efforts, including those in the Arctic Council, to study changing climate conditions, with a view to preserving and enhancing economic opportunity in the Arctic region. Such efforts shall include inventories and assessments of villages, indigenous communities, subsistence opportunities, public facilities, infrastructure, oil and gas development projects, alternative energy development opportunities, forestry, cultural and other sites, living marine resources, and other elements of the Arctic's socioeconomic composition;

b. Work with other Arctic nations to ensure that hydrocarbon and other development in the Arctic region is carried out in accordance with accepted best practices and internationally recognized standards and the 2006 Group of Eight (G-8) Global Energy Security Principles;

c. Consult with other Arctic nations to discuss issues related to exploration, production, environmental and socioeconomic impacts, including drilling conduct, facility sharing, the sharing of environmental data, impact assessments, compatible monitoring programs, and reservoir management in areas with potentially shared resources;

d. Protect United States interests with respect to hydrocarbon reservoirs that may overlap boundaries to mitigate adverse environmental and economic consequences related to their development;

e. Identify opportunities for international cooperation on methane hydrate issues, North Slope hydrology, and other matters;

f. Explore whether there is a need for additional fora for informing decisions on hydrocarbon leasing, exploration, development, production, and transportation, as well as shared support activities, including infrastructure projects; and

g. Continue to emphasize cooperative mechanisms with nations operating in the region to address shared concerns, recognizing that most known Arctic oil and gas resources are located outside of United States jurisdiction.

H. Environmental Protection and Conservation of Natural Resources

1. The Arctic environment is unique and changing. Increased human activity is expected to bring additional stressors to the Arctic environment, with potentially serious consequences for Arctic communities and ecosystems.

2. Despite a growing body of research, the Arctic environment remains poorly understood. Sea ice and glaciers are in retreat. Permafrost is thawing and coasts are eroding. Pollutants from within and outside the Arctic are contaminating the region. Basic data are lacking in many fields. High levels of uncertainty remain concerning the effects of climate change and increased human activity in the Arctic. Given the need for decisions to be based on sound scientific and socioeconomic information, Arctic environmental research, monitoring, and vulnerability assessments are top priorities. For example, an understanding of the probable consequences of global climate variability and change on Arctic ecosystems is essential to guide the effective long-term management of Arctic natural resources and to address socioeconomic impacts of changing patterns in the use of natural resources.

3. Taking into account the limitations in existing data, United States efforts to protect the Arctic environment and to conserve its natural resources must be risk-based and proceed on the basis of the best available information.

4. The United States supports the application in the Arctic region of the general principles of international fisheries management outlined in the 1995 Agreement for the Implementation of the Provisions of the United Nations Convention on the Law of the Sea of December 10, 1982, relating to the Conservation and Management of Straddling Fish Stocks and Highly Migratory Fish Stocks and similar instruments. The United States endorses the protection of vulnerable marine ecosystems in the Arctic from destructive fishing practices and seeks to ensure an adequate enforcement presence to safeguard Arctic living marine resources.

5. With temperature increases in the Arctic region, contaminants currently locked in the ice and soils will be released into the air, water, and land. This trend, along with increased human activity within and below the Arctic, will result in increased introduction of contaminants into the Arctic, including both persistent pollutants (e.g., persistent organic pollutants and mercury) and airborne pollutants (e.g., soot).

6. Implementation: In carrying out this policy as it relates to environmental protection and conservation of natural resources, the Secretaries of State, the Interior, Commerce, and Homeland Security and the Administrator of the Environmental Protection Agency, in coordination with heads of other relevant executive departments and agencies, shall:

a. In cooperation with other nations, respond effectively to increased pollutants and other environmental challenges;

b. Continue to identify ways to conserve, protect, and sustainably manage Arctic species and ensure adequate enforcement presence to safeguard living marine resources, taking account of the changing ranges or distribution of some species in the Arctic. For species whose range includes areas both within and beyond United States jurisdiction, the United States shall continue to collaborate with other governments to ensure effective conservation and management;

c. Seek to develop ways to address changing and expanding commercial fisheries in the Arctic, including through consideration of international agreements or organizations to govern future Arctic fisheries;

d. Pursue marine ecosystem-based management in the Arctic; and

e. Intensify efforts to develop scientific information on the adverse effects of pollutants on human health and the environment and work with other nations to reduce the introduction of key pollutants into the Arctic.

IV. Resources and Assets

A. Implementing a number of the policy elements directed above will require appropriate resources and assets. These elements shall be implemented consistent with applicable law and authorities of agencies, or heads of agencies, vested by law, and subject to the availability of appropriations. The heads of executive departments and agencies with responsibilities relating to the Arctic region shall work to identify future budget, administrative, personnel, or legislative proposal requirements to implement the elements of this directive.

[1] These policies and authorities include Freedom of Navigation (PDD/NSC-32), the U.S. Policy on Protecting the Ocean Environment (PDD/NSC-36), Maritime Security Policy (NSPD-41/HSPD-13), and the National Strategy for Maritime Security (NSMS).[190]

July 2011

Shell outlines oil spill response plan for the Arctic OCS

In a briefing open to the press with Senator Lisa Murkowski, Shell emphasized its experience in harsh, remote Arctic environments and the lengths and expense it is willing to go to safely explore, develop and produce oil and gas resources in the Chukchi and Beaufort seas.

"We do work in a lot of areas worldwide where there are weather conditions that are more challenging than what we see in the Beaufort and the Chukchi," said Shell Alaska Vice President Pete Slaiby. "For instance, we've been operating in the North Sea since the mid-1960s where we have higher winds and seas. The Gulf of Mexico can have dramatically higher wind. What we get in the Beaufort and Chukchi is multi-year ice. The currents you see right out the window here in Cook Inlet are probably two to three times the current you see in the Chukchi, and Shell put the first two platforms in Cook Inlet in the early 1960s."

Shell oil spill response equipment on deck at Dutch Harbor.

The Chukchi Sea is an important future source of U.S. energy supply with up to 29 billion barrels of oil and 209 trillion cubic feet of natural gas potentially in place. The Chukchi is considered the most prospective unexplored offshore basin in the country.

Shell has been slammed with repeated permitting and litigation delays and has spent in excess of $3.5 billion over the past several years to acquire leases and prepare for drilling. The company is seeking approval for a 2012 exploration plan that would allow it to drill several wells in both the Chukchi and Beaufort, reinforced by a flotilla of support ships, barges, tugs, recovery vessels, back-up drill rigs, and a double-hulled icebreaking tanker with a capacity of 513,000 barrels.

Shell was planning to mobilize its fleet in 2010, but the Deepwater Horizon spill in the Gulf of Mexico led to a de facto moratorium on Arctic drilling. The company's 2011 program was scuttled after its final air permit was revoked by the Environmental Protection Agency's (EPA) appeals board.

Shell is now looking for a positive record of decision on a supplemental environmental impact statement by October 3. If that decision isn't positive, the 2012 program would also be derailed.

In an encouraging sign, the EPA has issued draft air quality permits for Shell and ConocoPhillips exploratory drilling operations in the Chukchi and Beaufort seas beginning in 2012. The draft permits are subject to a 30-day public review, and it is likely that environmental groups will also appeal the most recent drafts. Shell has spent over $60 million over the past four years to secure its air permits.

"We believe the work we have done to further modify and reduce our air emissions to meet new standards meets the goal of having no measurable impact on the environment or coastal villages," said Shell's spokesperson Curtis Smith.

At a July briefing in Anchorage, Shell highlighted its comprehensive spill prevention and response plans to Murkowski and the press. The company assured Murkowski it has the capability to respond quickly and effectively to a spill without the support of onshore infrastructure, which is currently quite limited in the Arctic.

Shell noted that drilling in the Arctic offers distinct differences and advantages over deepwater exploration and development in

The Resource Review is the official periodic publication of the Resource Development Council (RDC), Alaska's largest privately funded nonprofit economic development organization working to develop Alaska's natural resources in a responsible manner and to create a broad-based, diversified economy.

Past issues of the Resource Review (1978-2011) are available at akrdc.org.

Jason Brune accepts new position at Anglo American

RDC Executive Director Jason Brune has been appointed Public Affairs and Government Relations Manager for Anglo American US. Brune's resignation from RDC became effective June 1.

Anglo American is one of two partners pursuing development of the Pebble copper and gold prospect in Southwest Alaska. Brune will be based at the company's Anchorage office.

"Through the RDC, I have had the privilege of working with Jason for the last three years and besides his energy, integrity, and commitment to the responsible development of Alaska's resources, I have been very impressed with his efforts to build consensus and engage constructively on even the most challenging issues," said Paul Henry, Chief Operating Officer of Anglo American US. "I am therefore delighted to welcome Jason into the Anglo American family and I know he will make a great addition to our team."

Brune first came to RDC in August 2000 and served six years as Projects Coordinator and led the Alaska Mineral and Energy Resource Education Fund, now Alaska Resource Education, as its Executive Director. He was appointed RDC Executive Director in November 2006.

At the Annual Meeting Luncheon June 28, RDC President Tom Maloney presented Jason Brune with one of RDC's limited edition First Barrel of Oil plaques in appreciation for his 11 years of service to the statewide business organization. Brune served as Executive Director for over four years.

During his tenure at RDC, Brune built on RDC's successes, working closely with state and federal governments and the Alaska Legislature on key resource development initiatives and issues. He also worked to expand RDC's membership base and grow the organization's special events. He was a key player in building public opposition to several ballot initiatives which would have been detrimental to the responsible development of Alaska's oil and gas and mineral resources.

The RDC Board of Directors has initiated a search for a new Executive Director.

Alaskans turn out in force to support OCS drilling

Pro-drilling OCS energy advocates heavily dominated a public hearing in Anchorage June 29 on Lease Sale 193.

Approximately 100 Alaskans attended the hearing and of those who testified, 32 spoke in favor of Lease Sale 193 while 11 urged the federal government to dismiss it. Pro-drilling advocates included private citizens and representatives from virtually every Alaska industry and sector of the economy, including mining, timber, tourism and organized labor.

Speaking against exploration were representatives of a number of international and national environmental activist groups, including the Pew Environmental Group, Sierra Club, Wilderness Society, and Ocean Conservancy, along with several private citizens.

The federal Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) recently released a new Draft Supplemental Environmental Impact Statement (SEIS) for the 2008 Chukchi Sea lease sale in which Shell, ConocoPhillips, Statoil, and others had purchased leases for oil and gas exploration. In July 2010, the U.S. District Court in Alaska, in response to an appeal against the lease sale, ordered BOEM to rework some technical aspects of the original Environmental Impact Statement for the sale, and the court banned lease related activities in the Chukchi Sea until BOEMRE prepared a new SEIS to the court's satisfaction.

The federal agency initially released a draft SEIS in October, but after reviewing public comments on the draft, BOEMRE chose to add an analysis of a very large oil spill in the Chukchi. The scenario of 2.2 million barrels spilled from a blowout lasting 74 days is considered a theoretical "worst case" for drilling across the large lease sale area. That analysis has now been completed and is included in the new draft SEIS.

A Final SEIS will provide the Secretary of the Interior with sufficient information and analyses to make an informed decision on whether to affirm, modify, or cancel Lease Sale 193. No drilling can take place until the final EIS is issued and Sale 193 is affirmed.

In its comments, RDC urged BOEMRE to affirm the lease sale as held.

OCS oil and gas development is absolutely critical to Alaska's future economy. With the Trans-Alaska Pipeline System now running at one-third capacity, exploration blocked

(Continued to page 4)

Shell confident it can respond to Arctic spill

(Continued from page 1)

the Gulf of Mexico. The pressure encountered in deepwater drilling is multiple times greater than in Alaska where wells would be in much shallower water. The much lower reservoir pressure in the Alaska OCS means a significantly lower blowout risk compared to deepwater drilling in the Gulf. There are also major differences in well designs, as well as fundamental differences in the geology of the regions.

As it does with hurricanes in the Gulf of Mexico, Shell also has the ability to quickly move rigs out of harms way if ice moves in during its summer open-water drilling season.

Shell pointed out that the cold water of the Arctic and the depth of drilling offer some advantages that work in the company's favor. For example, the Deepwater Horizon spill in the Gulf of Mexico last summer occurred in 5,000 feet of water. In the Chukchi, Shell proposes to drill in water up to 150 feet deep. In deepwater drilling in the Gulf of Mexico, down-hole pressure is three to five times greater than what would be encountered in the Arctic, making a well much more difficult to cap in the Gulf. With the much shallower waters of the Alaska Arctic, an initial oil slick – should an accident occur – would be between 150-250 feet wide.

Oil would reach the surface in less than 10 seconds if a blowout occurred in Alaska, while oil from last summer's Gulf spill took more than an hour to surface and by then the slick was a mile wide.

Because oil would not emulsify as quickly in cold water, Shell would have a longer window of opportunity to use dispersants in the Arctic without losing their effectiveness.

At the core of Shell's contingency plan is to have oil spill response equipment on site at drilling locations and staged at strategic points, ready for deployment in the unlikely event of a spill. The self-contained response capability would also include trained personnel and supplies.

The company already has extensive experience operating in remote Arctic regions with little or no infrastructure. Shell will use equipment specifically designed for deployment in icy conditions, even though the company would be drilling during a 105-day open-water season.

Shell emphasized its top priority and focus is the prevention of spills through effective well planning and the use of remote oversight and monitoring of drilling operations.

Given the difficulty encountered in stemming the flow of oil from the deep water spill in the Gulf of Mexico, Shell is developing two new well capping and containment devices for use in the Arctic. If there were a blowout in the Arctic and if the well's blowout preventer recessed into the sea floor were to fail, Shell's first response would be to cap the well to stop the escape of oil into the ocean. That could be done by lowering a capping system onto the well bore and then it would be clamped into place. This system would include conduit to send oil to storage vessels at the surface. This system would give drillers the capability to kill the well by re-entering the well or by injecting fluids.

A second device that could be deployed is a containment dome designed to be lowered over the top of the well to gather oil escaping from the well and direct it through piping to surface vessels.

Shell's plan for the recovery of oil includes three tiers: recovery near the well site, recovery near to shore, and recovery onshore and along the shoreline.

Shell's drilling operations will have a purpose built, ice-capable spill response vessel on site to support any well site oil recovery operation. The Nanuq is already in operation while a second vessel is under construction. The Arctic Endeavor, an ice-strengthened barge, would support nearshore response.

The vessels would be fully equipped with boom, skimmers, and other spill response equipment. An ice-class, double-hulled tanker would be used to store recovered oil.

For the shoreline and onshore areas, Shell has pre-staged equipment at strategic sites and has a contract with the spill response cooperative Alaska Clean Seas for onshore operations. Plans include the protection of high priority, environmentally-sensitive onshore sites.

Shell says it has enough equipment to respond independently to the largest foreseeable spill at any of its drilling operations in the Arctic. Should it prove necessary, the company also has access to caches of spill response equipment worldwide. Much of the equipment could be flown in through Barrow or the village of Wainwright. Much of the equipment is packaged so it can be transported quickly.

RDC touts benefits of tapping Alaska OCS

(Continued from page 3)

in ANWR, and non-development activists working toward Wilderness designations in the National Petroleum Reserve, nothing less than Alaska's future economy is at stake.

Development of potentially immense oil and gas deposits in the Chukchi Sea would significantly boost the economy for a generation and extend the life of the oil pipeline. Without new oil production, TAPS could be uneconomic to operate at some point in the next decade.

"If there is no oil and gas development in ANWR and the OCS, and the best prospects in NPR-A are taken off the table, the federal government must then accept the consequences, including heavier reliance on foreign oil, soaring trade deficits, a weaker national economy, and compromised national security," said RDC Deputy Director Carl Portman. "For Alaskans, our future will be bleak with the state losing much of its economic base."

OCS production could provide an annual average of 54,700 jobs nationwide with an estimated cumulative payroll of $145 billion over the next 50 years. Moreover, revenues generated from OCS development in the Arctic could amount to hundreds of billions of dollars in revenues to federal, state and local governments over a 50-year period.

The potential recoverable reserves offshore Alaska is more than all the current total proven U.S. oil reserves of approximately 21 billion barrels.

Please see RDC's comments at akrdc.org.

Alaska ranks low in two recent surveys measuring business climate

Despite a pro-business governor, a treasure-trove of natural resources and a budget surplus, Alaska ranks near the bottom in two recent surveys of places to do business. We know how great it is to work, live and play here, so we find such rankings frustrating. However, objective observers are telling us that our economic house is not in order, and they are telling us what needs improvement.

The annual CNBC survey of "America's Top States for Business" puts Alaska in 49th place. Last year we were 50th, and this year our huge oil tax surplus helped move us ahead of Rhode Island.

The study looked at the basic indicators of economic health and growth, including fiscal health, which was calculated by examining projected budget gaps (or surpluses) for the coming fiscal year. Even this bright spot was somewhat dimmed by learning that North Dakota and Wyoming beat us in this category – both with oil taxes orders of magnitude lower than Alaska's.

We flunked most of the other categories: 49th in cost of doing business, 48th in workforce, 43rd in technology and innovation, 41st in education, 49th in cost of living. We got slightly better grades in access to capital, 35th, and business friendliness, 34th. The one category where we usually think we don't stack up – what I call the "cold and dark" measure - we proved ourselves competitive in the middle of the pack at 21st.

But wait, there's more!

A recent report issued by the Fraser Institute, a well-respected Canadian research organization, ranked locations in terms of their favorability to oil and gas development. Alaska's scores went from bad last year to dismal this year, falling behind 21 oil regions.

While Alaska only ranked in the third quintile, other U.S. states dominated the top quintile, with eight of the top 10 spots going to U.S. states: Mississippi, Ohio and Kansas taking the top three spots.

> **"A recent report issued by the Fraser Institute, a well-respected Canadian research organization, ranked locations in terms of their favorability to oil and gas development. Alaska's scores went from bad last year to dismal this year, falling behind 21 oil regions."**
>
> **– Rachael Petro**

Meantime, Alaska offshore plunged from 57th to 78th and Alaska onshore fell from 68th to 83rd. Ouch!

So why is a state with a world-class resource ranked with Uzbekistan and Uganda? In the case of offshore, the report says: "investors continue to be turned off by environmental regulations and related uncertainties in these areas."

Onshore, the report says, Alaska dropped 15 places "due to poorer scores on a number of issues, including fiscal terms, environmental regulation, the cost of regulatory compliance, uncertainties about protected areas and Native land claims."

Maybe that explains why a single exploratory well was drilled on the North Slope last year – and a single well this year, despite record high oil prices. No more waiting to reform our oil tax!

But wait, there's more! The operator of the trans-Alaska pipeline – the economic engine that pays for 90 percent of state government – just issued a report warning that we need to act now to increase flow through the pipeline.

"The study findings make it clear that the technical challenges compound and increase as throughput declines," said Alyeska Service Company President Tom Barrett. "The simplest, most direct and cost-effective path to dealing with these challenges is to stop the decline by adding more oil."

Our own Senator Lisa Murkowski quickly called for action on the federal level. And Senator Begich is aggressively pushing the federal government as well, calling the pipeline a national asset that delivers about 12 percent of U.S. oil production.

Here at home, Governor Sean Parnell outlined the "Secure Our Future" strategy, a five-point program to increase pipeline throughput to one million barrels a day:

- Boosting Alaska's competitiveness and investment climate.
- Structuring the permitting processes to improve resource development decision-making.
- Facilitating and incentivizing the next phases of North Slope development.
- Forging national partnerships to increase investment, while protecting the state's interest.
- Promoting domestic oil production and Alaska's role.

We know how to improve our business rankings, but our policy makers must agree and take action – as soon as possible.

Calling all champions for Alaska's future. Let's work together to improve Alaska's business climate!

Plan to participate in the Alaska State Chamber of Commerce's 52nd Annual Conference, where fellow champions will gather to discuss and plan Alaska's future success. The conference will be in Talkeetna, Alaska from September 19-21. Register today at www.alaskachamber.com.

Rachael Petro is the President and CEO of the Alaska State Chamber of Commerce.

America is funding its own demise

In a keynote address before 950 Alaskans attending RDC's 36th Annual Meeting Luncheon in Anchorage June 28, Wyoming attorney Karen Budd-Falen reported that environmental groups are collecting tens of millions of dollars in attorney fees from the federal government in lawsuits aimed at systematically stopping development in oil, mining, timber, and other industries.

At issue is the Judgment Fund and the Equal Access to Justice Act (EAJA) which requires the federal government to pay attorney fees when it loses cases under statutes that do not specifically call for such fees to be paid by the government.

Budd-Falen and a growing block of Republicans in Congress argue that environmental groups have taken advantage of a lack of oversight on such payments and file lawsuits they know they can win on procedural grounds. Frequent litigants include the Sierra Club Legal Defense Fund, the Center for Biological Diversity, and Earthjustice.

Budd-Falen noted the Judgment Fund is reauthorized every year by Congress, but with no specified amount. The fund pays for litigation under the Clean Water Act, the Clean Air Act, and the Endangered Species Act (ESA). The Equal Access to Judgment Act applies in cases involving the National Environmental Policy Act (NEPA).

The Wyoming attorney and rancher reported that the Sierra Club alone has collected at least $56 million from the federal government for attorney fees. She said in one case, the government agreed to pay Earthjustice an hourly rate of $750 in attorney fees.

In that case, the environmental law firm collected $500,000. She said that in many cases the federal government would not disclose fees paid to environmental groups. In at least 10 percent of the cases nationwide, there is no information available as to how much in U.S. tax dollars were paid in attorney fees to environmental groups.

Budd-Falen pointed out that although federal law requires the awarding of fees be limited to the winning party in a lawsuit, in 21 percent of the cases, the government paid fees before the outcome of the case was determined.

Budd-Falen emphasized that in most cases, the groups sue on process, not substance. She said that despite best intentions, the federal agencies cannot fulfill all NEPA and ESA requirements in an entirely perfect manner, given compliance is too complex. This opens the door for environmentalists to sue on process issues, not on the impacts of a project itself.

For instance, under the ESA, the government has 90 days to respond to a petition to list a species for special protection. If the government does not respond to the petition within that time period, it is vulnerable to a process-driven lawsuit where the environmental group gets its fees paid, even for writing the petition in the first place, Budd-Falen warned.

The Center for Biological Diversity last year alone filed 1,000 petitions with the federal government to list species under the ESA.

The litigation climate in Alaska and elsewhere is driving investment away from America, Budd-Falen warned. "We're funding our own demise."

In research she conducted, Budd-Falen discovered that between 2000 and 2009, in 19 states 14 environmental groups filed 3,000 lawsuits in federal district courts, collecting $37 million in attorney fees. In addition, they collected an additional $4 million from private companies. No fees were disclosed in at least 10 percent of the cases.

Karen Budd-Falen spoke at RDC's 36th Annual Meeting Luncheon June 28, addressing the topic of environmental litigation and a strategy to restore fairness to industry and consumers. Budd-Falen warned that environmental groups are collecting tens of millions of dollars in attorney fees from the federal government in lawsuits that are brought largely on procedural grounds. These lawsuits have delayed or derailed projects in the oil and gas, mining, and timber industries that are important to national and local economies.

Moreover, court documents revealed that the federal government and private companies were forced to make $555,000 in donations to environmental groups, Budd-Falen said.

She noted that twice as many cases have been filed during the Obama administration, suggesting green groups may be emboldened by favorable decisions from a Democratic U.S. Justice Department. The most heavily litigated industry is the oil and gas sector.

According to a separate academic study outside of Budd-Falen's research, the Forest Service itself paid $6.1 million in legal fees to groups that sued it over a six-year period. The payments cover the period spanning 1999-2005.

Budd-Falen said there are efforts underway in Congress to accomplish litigation reform to curb what she called abuses of the system. A Republican-backed bill, H.R. 1996, would reform the law to restrict reimbursements for each entity to no more than three in a calendar year and would prevent payments to any group that has a net worth of more than $7 million. Attorney fees would be capped at $175 an hour and maximum payment for each case would be $200,000. Accountability of every dollar paid out in attorney fees would be required.

With regard to NEPA cases, Budd-Falen said the impacts of delays stemming from litigation should be calculated into the cost of a project. She said that in all NEPA compliant projects, the federal government should be required to equally consider the economic benefits of a project to local communities. She said the NEPA process needs to consider local economic stability in the permitting process. These recommendations are being worked into federal legislation. A video of Budd-Falen's presentation is available at akrdc.org.

Emerging ocean policy draws concern from Alaskans

By Marleanna Hall

Recent listening sessions, public workshops, and review of the nine Strategic Action Plan outlines issued by the National Ocean Council (NOC) have offered little more to further explain the future of national ocean policy.

There is growing concern that the new ocean policy, especially coastal and marine spatial planning (also widely called ocean zoning), could cause unnecessary harm to economies across the United States. In Alaska, industries such as fishing, transportation, mining, tourism, forestry, oil and gas, and support sectors could all be impacted. These impacts will likely cause a larger burden on Alaskans than the rest of the nation.

Given Alaska has more coastline than the continental U.S. combined, a national ocean policy will have a greater impact on the state, further hampering the already slow processes with little or no added benefit to the environment. Alaskan stakeholders are discouraging a one-size-fits-all ocean policy.

Given Alaska has more coastline than the continental U.S. combined, the state's economy could be disproportionately impacted by the emerging federal ocean policy. Industries potentially impacted include fishing, oil and gas, mining, timber, tourism, and transportation. At right is the Red Dog Mine's port facilities on the Chukchi Sea.

RDC and member concerns

Although their own documents state that effective implementation will require regulations where appropriate, the NOC continues to state that the nine strategic action plans are not regulatory, and they will not replace other regulatory mechanisms. Even so, RDC continues to remind the NOC of the existing array of measures in place to protect the nation's waters. These plans may lead to increased litigation on responsible resource development projects, with no added benefit to the environment. These projects create jobs in communities where few other jobs are available.

In Anchorage on June 10, members of the NOC received public comments from Alaskan stakeholders on the SAP outlines. Stakeholders also questioned the authority of the program, and where funding might come from. While the NOC came under fire for these important issues, RDC continued to support improving existing coordination of protection measures, instead of the addition of another layer of bureaucracy.

Doug Vincent-Lang, Acting Deputy Commissioner of the Department of Fish and Game for the State of Alaska, spoke to the importance of natural resources to Alaska's economy. Vincent-Lang noted Alaska's large Outer Continental Shelf boasts up to 29 billion barrels of oil and 209 trillion cubic feet of natural gas.

"Alaska's interest in our managing coastal and marine resources cannot be overstated," Vincent-Lang asserted.

Coastal and Marine Spatial Planning

Alaska accounts for one of the nine regional planning areas to be assigned a regional planning body (RPB), though the members of the RPB have not yet been announced. RDC has urged the NOC to involve stakeholders early, and to coordinate with existing measures and groups to define members of the RPBs.

June 21st marked a national gathering in Washington, D.C., with hundreds of online participants across the country. The focus of the three-day workshop was on National Coastal and Marine Spatial Planning (CMSP), with the first day dedicated to presentations and public testimony. The NOC has committed to future regional workshops, but has yet to propose the dates.

Presenters at the workshop, including Dr. Jane Lubchenco, Undersecretary of Commerce for Oceans and Atmosphere and Administrator of NOAA, spoke about CMSP being a "common vision." But participants asked, whose vision?

Brent Greenfield of the National Ocean Policy Coalition testified to the NOC, urging that CMSP first be tested in a pilot project and "must rely on neutral government funding to ensure that Coastal and Marine Spatial Plans are not seen as being paid for by advocates."

Additionally, there must be focus placed on using the best available science, and the amount of science used must be sufficient. RDC has advocated for further studies and research, and supports ocean access and safety through increased infrastructure and Coast Guard presence.

RDC's ongoing efforts

RDC submitted comments addressing concerns on the nine SAP outlines. These and earlier comments can be found online at akrdc.org. RDC members are encouraged to get involved and to watch for action alerts regarding the next steps.

While RDC staff continues to monitor the advancement of ocean policy, RDC has joined the National Ocean Policy Coalition. The NOPC is a national group with 10 principles that support the development and implementation of a sound, balanced ocean policy. For more information on these guiding principles, and to view NOPC members and comment letters, please visit oceanpolicy.com.

State challenges Roadless Rule, delegation seeks repeal

Governor Sean Parnell and Attorney General John Burns have directed the Department of Law to file a legal challenge to the Roadless Rule adopted in 2001 by the United States Forest Service (USFS). The Roadless Rule prohibited local and regional control over decisions about road construction, reconstruction and timber harvest on roughly 58.5 million acres of national forest lands.

As the latest step in a complex history of litigation, a March 2011 Federal District Court ruling set aside a Tongass National Forest exemption and reinstated the application of the Roadless Rule in the Alaska Forest. A 2003 administrative ruling had previously blocked the rule's implementation in the Tongass.

"Applying the Roadless Rule to national forest lands in Alaska diminishes jobs and hurts families, and removes local and regional management of the forests from the state, communities, residents, and foresters," Governor Parnell said. "This is the wrong time for the Forest Service to further restrict timber supply, new mining jobs and development, and impose higher energy costs on communities. Our forests are best managed for multiple uses including mining or logging, which require construction of roads. A one-size-fits-all forest mandate from Washington, D.C. is the wrong approach."

If allowed to stand, the Roadless Rule will increase costs for developing hydroelectric projects by prohibiting roads along transmission line routes for construction and maintenance. Those increased costs would be passed along to consumers.

"As Federal District Court Judge Brimmer already found in the roadless case in Wyoming, procedure counts," Attorney General Burns said. "The Roadless Rule and the rushed manner in which it was adopted violates several federal statutes, including the Administrative Procedure Act (APA), the National Environmental Policy Act, and other federal statutes. It creates de facto wilderness without the approval of Congress."

The State of Alaska also filed a notice of appeal of the Federal District Court decision that the Tongass exemption was invalid. Judge Sedwick ruled that the Forest Service violated the APA by changing the status of the Tongass from not exempt to exempt without providing adequate reasons.

The state maintains that the Forest Service provided a substantial examination during the Tongass exemption decision. The record shows extensive discussion about the settlement with the state, the direction provided to the USFS by Congress in the Alaska National Interest Lands Conservation Act (ANILCA) and the Tongass Timber Reform Act.

ANILCA provides that administration agencies may not withdraw more Alaska land for wilderness without the approval of Congress. The Tongass Timber Reform Act mandates that the Forest Service must seek to meet timber demand from the Tongass, while the Roadless Rule makes that impossible.

Meanwhile, Senator Mark Begich and Congressman Don Young recently introduced legislation to repeal the Roadless Rule in Alaska's national forests. Senator Lisa Murkowski co-sponsored the Senate measure.

"This cookie-cutter rule is a bad fit for Alaska," Begich said. "With high unemployment and high energy costs in Southeast Alaska, the Forest Service needs greater flexibility to address these issues. Repealing the rule will help keep the few existing mills alive and allow for the development of hydro projects throughout the region as well as two promising mining projects on Prince of Wales Island. Instead of adding options, the roadless rule takes them away."

> **"The roadless rule never made sense for Alaska since 96 percent of the Tongass and 99 percent of the Chugach are already protected by ANILCA and forest management plans. Exempting the Tongass from the roadless rule will help make certain that what little remains of the timber industry in Southeast can survive long enough for the Forest Service to implement its second-growth harvest."**
>
> **– Senator Lisa Murkowski**

"As we have seen time and time again, the one-size-fits-all approach rarely ever applies to Alaska," said Congressman Don Young. "The economic well-being and way of life for many Alaskans relies on responsible resource development and this legislation will ensure that this rule doesn't harm Alaska more than it already has. Over the last few decades I have watched the timber industry go from thousands of jobs to nothing; we cannot allow the government to decimate this area more than they already have. This legislation is an economic necessity so that Alaskans may start to responsibly develop our resources in these areas again."

"The roadless rule never made sense for Alaska since 96 percent of the Tongass and 99 percent of the Chugach are already protected by ANILCA and forest management plans," Murkowski said. "Exempting the Tongass from the roadless rule will help make certain that what little remains of the timber industry in Southeast can survive long enough for the Forest Service to implement its second-growth harvest policy. The exemption will also ensure that hydropower and other affordable energy projects in Southeast can move forward."

As implemented, the rule prohibits new roads in inventoried roadless areas and prohibits most timber harvest in these areas. The March court decision reinstating the rule effectively places 300,000 acres of inventoried roadless area in which logging would have been allowed under the Tongass Land Management Plan off limits to development.

The legislation introduced last month would prevent use of the rule in planning and decision making for Alaska's Chugach and Tongass National Forests.

Alaska's two national forests are the nation's largest. The Tongass is 17 million acres, covering an area the size of West Virginia. The Chugach National Forest is 5.4 million acres.

RDC staff attends Emerging Leaders Dialogue in Kotzebue

By Natasha Shively, RDC Intern

Kotzebue hosted the 2011 Emerging Leaders Dialogue, led by the Institute of the North, in early June. Attending from RDC were staff members Deantha Crockett, Marleanna Hall, and summer intern Natasha Shively.

The first Emerging Leaders Dialogue was first held in 2007 in Girdwood and is now held each spring in communities around the state. The theme of this Dialogue was "Livable Communities and the Human Condition." Most of the focus was on small group discussions. Topics ranged from getting youth involved in making community decisions and focusing on economic opportunities to preventing domestic abuse and addressing racism. The Dialogue featured a full slate of speakers, including Representative Reggie Joule, and Kotzebue Mayor Martha Siikauraq Whiting.

The Dialogue also included a tour of Red Dog Mine and a trip to Noatak. Featured in the Red Dog tour was a safety orientation, as well as a walk-through of the mill, mine, and fish weir. Visitors learned of the economic impact of Red Dog and the $145.9 million in royalties paid to NANA Regional Corporation in 2010. Studies have shown that most of rural Alaska's population is diminishing because people are moving into urban areas, which offer better economic opportunities. However, this isn't the case for the NANA Region, mainly because of the Red Dog Mine.

Noatak rolled out the welcome mat for the group by serving traditional native foods like caribou, sheefish, and dryfish. Many attendees participated in the Walk for Life; a walk through the village to recognize how devastating the suicide rate is for Alaska Natives in small villages. The group was also given a tour of the new high school and had a chance to visit with the locals.

RDC very much appreciated the opportunity to participate in this Dialogue, as well as the hospitality in Kotzebue, Noatak, and Red Dog.

Pictured in Kotzebue from left to right are Marleanna Hall, Natasha Shively, and Deantha Crockett.

Parnell details new Alaska energy policy

Governor Sean Parnell and Natural Resources Commissioner Dan Sullivan met with national reporters to share the state's plan to offer additional lands and offshore waters for oil and gas exploration.

The briefing with national media is part of the Parnell administration's wide-ranging efforts to generate national awareness and support for the state's goal to boost the flow of oil through the Trans Alaska Pipeline to one million barrels of oil within a decade.

"By reaching this goal we will strengthen Alaska's contribution to U.S. energy security and we will create tens of thousands of new jobs and billions of dollars in payroll," Parnell said after the briefing.

Calling President Obama's decision to release 30 million barrels of oil from the nation's Strategic Petroleum Reserve "bad policy," Parnell said "the real Strategic Petroleum Reserve is Alaska, which has the potential to provide more than 30 *billion* barrels of oil over three decades." He said developing Alaska's vast hydrocarbon resources will supply the nation with billions of barrels of domestic crude, provide tens of thousands of high paying jobs and generate hundreds of billions of dollars in revenue for the federal government.

Parnell also described his efforts in recent months to reach out to Obama, members of Congress, and other governors to encourage broad cooperation on boosting domestic energy production.

Commissioner Sullivan laid out the state's plan to boost development on its land and in state waters. He also discussed the stringent environmental protection measures in place that protect the sensitive tundra and the North Slope's wildlife populations.

The Central North Slope undeveloped acreage still holds three to six billion barrels of oil and 24 to 45 trillion cubic feet of natural gas, according to federal estimates of the region's undiscovered, technically-recoverable resources. The undiscovered resources on state land include dozens of pools of conventional oil that range in size from 50 to 150 million barrels, tens of billions of barrels of heavy and viscous oil, and potentially enormous shale oil deposits.

These estimates do not include the more than five billion barrels of conventional oil reserves that lie under producing fields or fields that are close to being placed into production.

Importantly, some of the known oil and gas plays on state land straddle highly prospective federal lands, including the National Petroleum Reserve-Alaska (NPR-A) and the 1002 Area of the Arctic National Wildlife Refuge (ANWR). By drilling on state land and waters adjacent to NPR-A and ANWR, developers may end up drawing untapped oil that lies beneath these federal lands.

"I applaud Governor Parnell and Commissioner Sullivan for stepping up to the plate to help deliver American energy that we so clearly need," said Karen Harbert, president and CEO of the U.S. Chamber's Institute for 21st Century Energy. "Alaska is acting to address our supply problems because the federal government has not. I hope that policymakers in Washington will take notice of the example set by Alaska's leaders by allowing more access to our oil and gas resources which will create jobs and improve our energy security."

RDC elects new statewide board, Maloney continues as president

Pictured above are members of the 2011-2012 RDC statewide Board of Directors who attended the 36th Annual Meeting at the Dena'ina Convention Center in Anchorage June 28. Pictured in the front row are Treasurer Eric Fjelstad, Vice President Len Horst, President Tom Maloney and Immediate Past President Wendy Lindskoog. At top right, Governor Sean Parnell was one of two speakers addressing a luncheon crowd of 950. At bottom right, Governor Parnell presents the Interstate Mining Compact Commission's 2011 National Minerals Education Award to Alaska Resource Education (ARE). Receiving the award are Nick Enos, Vice President of ARE and Michelle Brunner, Executive Director. (Photos by Judy Patrick)

Tom Maloney was re-elected to a second term as the President of the Resource Development Council Board of Directors. RDC's statewide board met for its 36th Annual Meeting in Anchorage June 28.

A 22-year Alaska resident, Maloney is Alaska Area Manager for CH2M HILL. He has worked as a senior project controller, corporate business manager, and president of two operating companies. He has also headed up business development, external affairs, and government relations. At RDC, Maloney has been a long-time member of the Executive Committee and had served as Treasurer before being elected to his first term as president in July 2010.

Phil Cochrane, Vice President of External Affairs at BP Exploration (Alaska), Inc., was re-elected Senior Vice President while Len Horst, Senior Vice President and Commercial Loan Manager at Northrim Bank, was re-elected Vice President. Ralph Samuels, Vice President of Government and Community Relations at Holland America Line, was elected Secretary while Eric Fjelstad, an attorney at Perkins Coie, was re-elected Treasurer.

Newly-elected to the RDC Executive Committee were Lisa Parker, Parker Horn Company, Scott Jepsen, ConocoPhillips Alaska, Inc., and Ralph Samuels.

New incoming board members were Dave Cruz, Cruz Companies, Palmer; Tim Gallagher, HDR Engineering, Anchorage; Ricky Gease, Kenai River Sportfishing Association, Soldotna; Larry Houle, RIM Architects, Anchorage; Jim Laiti, Pipefitters Local 375, Fairbanks; Thomas Mack, Aleut Corporation, Anchorage; Sam Mazzeo, Wells Fargo, Anchorage; Mike Satre, Council of Alaska Producers and Hecla Mining, Juneau, and Lorali Simon, Usibelli Coal Mine, Palmer.

Karen Budd-Falen, an attorney from Cheyenne, Wyoming, was the keynote speaker at the RDC Annual Meeting Luncheon. Budd-Falen addressed the topic of environmental litigation and a strategy to restore fairness to industry and consumers. See a recap of her presentation on page 6. A video is also available at akrdc.org.

Portman Achieves 30 Years at RDC

On April 1, 2011, Carl Portman celebrated his 30th Anniversary at RDC. Carl celebrated by not discussing the occasion with anyone he knew and crossing his fingers that nothing was planned to recognize him. His hopes were dashed upon arriving at the Petroleum Club of Anchorage for what he thought was a business meeting, only to be greeted by a huge group of colleagues, friends, and family.

Carl began his amazing career at RDC as a Community Relations Coordinator and worked in various capacities over the years, including Interim Executive Director several times. His current title is Deputy Director, but expanded titles include Mentor, Resident Genius and Oracle of all things Resource Development.

Former Executive Directors Applaud Portman

Paula Easley, Executive Director 1979-1987
You don't become a change-agent to get rich. You do it because you care about people and believe your work can improve peoples' lives. That's really what RDC has always been about - changing policies and systems so we all can live and work in this great state. Carl is that change-agent; he thrives on the daily challenges and if he gets discouraged, you'd never know it. His tenacity, passion and integrity are unmatched, as is the quality of his work. He's grown a lot and given a lot in the last three decades. Alaskans owe him a huge "thank you" for his contributions.

Becky Gay, Executive Director 1987-1998
Since we met in 1984, I think of Carl synonymous with the Resource Review. It epitomizes Carl's decades of dedicated work. In the early years, it absorbed him as photojournalist and researcher. Over the decades, as editor, writer and publisher, his words helped shape public views of Alaska resource development for policy, education, and debates nationwide. Carl clearly has staying power, creating his own destiny at RDC. Funny, he so resists change, but Carl has been at the forefront of change in Alaska. Now with his RDC career span of 30 years, Carl is a force to be reckoned with, a determined constant. I could always count on Carl as my "compass" on all things RDC.

Debbie Reinwand, Executive Director 1998
Everyone who works with Carl knows what an incredible resource he is for historic and current information about Alaska. From resource development, to oversight laws and regulations, to weather patterns for the past 30 years, Carl is our "go-to" guy. As a reporter in the 80s, I would call him for information and he always had it. Now at Bradley Reid, when discussing resource projects, we often say "Carl will know that - let's call him!" He is a unique Alaska treasure. I'm honored to have worked with him and that he allows me to continue to rely on him as a credible source of information.

Ken Freeman, Executive Director 1998-2001
Carl is one of the finest, most genuine and sincere persons I have ever known. Carl taught me a lot about RDC during my early days as an intern, projects coordinator, and most of all when I had the opportunity to serve as Executive Director. RDC is one of the most dynamic and important organizations in support of Alaska's economy, and the continuity Carl has provided over the many years of tireless service have helped make it one of the most prominent organizations in the state.

Tadd Owens, Executive Director 2001-2006
It is a great privilege to have the opportunity to contribute something in honor of Carl and his 30 years of service to RDC. Readers of this newsletter know Carl through his outstanding writing, public policy analysis, and advocacy for the responsible development of Alaska's natural resources. Others have gotten to know Carl over the years at RDC events and public hearings, and they have invariably come away impressed with Carl's intelligence, passion and tireless work ethic.
By employing these qualities and characteristics over the course of a 30-year career at RDC, Carl has left an indelible mark on the organization. RDC would not be what it is today without Carl. In many respects the organization IS Carl Portman.

Carl, back row, third from right, poses for a photo with several former and current board members in attendance at a reception honoring him April 1.

Jason Brune, Executive Director 2006-2011
"Nobody knows more about resource development in Alaska than Carl Portman." That is a phrase I've repeated over and over again in my time at RDC, often to Carl's blushing, waving of hands, and denial. As humble and embarrassed as Carl may be, it's true. Across all resource sectors, Carl is a wealth of knowledge. Each Executive Director RDC has ever had has had the privilege of working with Carl. He has made the organization what it is today. I learned so much from Carl and I will always value his mentorship and sincere caring nature. Alaskans owe a sincere debt of gratitude to Carl Portman.

Supporting Alaska's Resource Development

At Dowland-Bach, we know critical equipment requires sophisticated safety controls. We have the right stuff, employing mechanical and electrical engineers, PLC/HMI software programmers and developers, licensed electricians and certified welders. Our world headquarters in Anchorage, Alaska houses our command center and fabrication facility where our team of skilled professionals work together for you, ensuring every mission is a success. Dowland-Bach manufacturers control systems and products including:

Chemical Injection Modules/Skids – Well Head Safety Control Panels – Industrial Control Panels for Termination Boxes for Ordinary and Hazardous Locations
Flexible Cordsets for Hazardous Locations

Underwriters Laboratories (UL) and Intertek/ETL authorize Dowland-Bach to mark its products according to the following safety standards:
UL 508A, UL 698A, UL 1203, UL 1773, UL 62, UL 2225, ANSI/ISA-12.12.01-2007

Training Mariners for Ice Navigation with Ship Simulator Exercises

White Paper - Alaska Maritime Training Center - AVTEC, Seward, Alaska

18 May 2011

Orson P. Smith, PE, Ph.D.[1], Capt. Robert Thomas[2], and Capt. Scott Hamilton[3]

Introduction

The Alaska Maritime Training Center at AVTEC, Seward, Alaska, is currently engaged in development of ice navigation curricula (Smith et al 2010) that comply with requirements of the International Maritime Organization (IMO 2009) and with related standards of Det Norske Veritas (DNV 2008) for training ship officers for service in ice-covered waters. These training guidelines follow long-negotiated international standards for safe operation of ships in polar waters, the so-called "Polar Code" (IMO 2010 and Jensen 2007). The Polar Code calls for ice navigators, generally defined as watch-keeping officers and crew aboard ships in polar seas, to have documentary evidence of completing an approved training program providing knowledge necessary for prudent operation of a ship in ice-covered waters. The AVTEC ice navigation curriculum is designed to provide this training and an associated certificate of competency on completion of a comprehensive course with intensive ship simulator exercises. The opportunity to safely and affordably apply sophisticated information in realistic simulations assures a high level of understanding and skill in applying ice navigation knowledge in a broad range of challenging circumstances (Smith et al 2010 and Jensen 2006).

Realistic exercises in the AVTEC ship simulator are a safe alternative to extensive real-world exposure to the remote and inhospitable Arctic marine environment that is otherwise required for deep appreciation of ambient hazards and of technology and skills applied in their detection with modern instruments and telemetry. AVTEC's three full-sized ship simulator bridges can realistically enact impacts of natural hazards to the progress and safety of a variety of vessel types including ice breakers, tankers, cruise ships, tug boats, oil spill response ships, and military vessels. Many years at sea would be required to encounter the variety of dangerous situations that can be enacted in a ship simulator in a few days. Real-world experience is usually superior, but even time at sea may not involve an individual in the decisions at the level of intensity possible in a modern well-equipped ship simulator such as operated at AVTEC. Furthermore, the AVTEC ice navigation curriculum emphasizes timely constructive review by expert mentors of actions in simulations for the purpose of education and skill enhancement.

---

[1] Civil Engineering Professor at the University of Alaska Anchorage

[2] Senior Instructor, Ice Curriculum Coordinator, Alaska Maritime Training Center, AVTEC; LCDR US Coast Guard (Ret)

[3] Department Head, Alaska Maritime Training Center, AVTEC; Master, Any Gross Tonnage; Oceans; First Class Federal Pilot with over 20 years' experience sailing Alaskan waters

AVTEC Ship Simulator

AVTEC's ship simulator was developed by Kongsberg Norcontrol IT of Horten, Norway and consists of 3 full-mission ship bridges, a fourth bridge currently under development, a Navigation Lab with six 3-monitor desktop computer stations, and a comprehensive instructor station. The instructor station provides for creation and control of multiple simultaneous simulator scenarios, graphical displays for monitoring progress of exercises, and closed-circuit television to observe human interactions in the simulated bridge environment.

One of the 3 full-scale ship's bridges at AVTEC projects a 240° horizon meeting the Det Norske Veritas (DNV) visual standard for a Class A bridge simulator. The other two operational bridges each have five 1.25-meter synchronized monitors for visuals to meet DNV Class B bridge simulator standards. All 3 operational bridges include a helm station, two radar/ARPA units, and a navigational table, along with a complete set of navigational instrumentation, including DGPS, steering and auto pilot control, VHF, sound signals, alarms, thruster control, tachometer, rudder angle and command indicators, log, echo sounder, Doppler log, gyro, anemometer, and magnetic compass. A fourth bridge under construction at AVTEC will have a 270° horizontal view that will enhance scenarios involving multiple ships and geographical constraints. All four bridges are suitable for training ice navigators, though each has advantages for simulating the bridges of certain types of ships. The Navigation Lab allows for running the Kongsberg Norcontrol simulation software on six individual computer stations that are fully interactive with each other and can replicate scenarios configured for the four full-scale ship bridges. The system is presently configured with 16 geographical databases covering large areas of Alaska's navigable waters and 30 ship models from which to choose for a simulator exercise. Software upgrades on order will expand these capabilities, particularly in the realm of sea ice and polar ocean conditions.

AVTEC Ice Navigation Comprehensive Course

The AVTEC Ice Navigation curriculum includes a comprehensive master course from which selected topics may be offered in shorter formats. The comprehensive course involves 9 intensive days of classroom presentations and discussion, reading assignments and written exercises, table-top exercises, and realistic ship simulator exercises. Classroom presentation and discussion topics are listed in Table 1. Table-top exercises are conducted on ice report interpretation, on voyage planning, and on ship and crew preparations. Ship simulator topics are listed in Table 2. Each table-top and ship simulator exercise is followed with critical review by participants and mentors. These activities are supplemented by reading assignments and study questions that are reviewed at the start of each new day in the course.

All of these course activities convey knowledge and skills that satisfy the full list of competencies called for my IMO (2009) and DNV (2008).The AVTEC Ice Navigation curriculum targets a range of learning levels, as defined by Bloom's Taxonomy of educational goals (Bloom et al 1956 and Anderson et al 2001), by application of course resources, including use of the ship simulator. DNV (2008) specifies learning levels on this scale. Table 3 describes the AVTEC strategy for achieving these varying levels of learning by students in the ice navigation course.

Table 1. AVTEC Ice Navigation Comprehensive Course – Classroom Presentations and Discussions	
L1.	Regulations and Guidelines of IMO/STCW, USCG, State of Alaska, Canada, and others
L2.	Ice Physics – Part 1 (water, ice, salinity, sea ice formation, growth, and decay)
L3.	Ice Physics – Part 2 (Ice response to wind and currents, ice forces)
L4.	Ice Classification and Reporting (sea ice, glacier ice, lake ice, river ice, VOS reports…)
L5.	Obtaining and Interpreting Ice Reports
L6.	Polar Weather
L7.	Sea Spray Icing
L8.	Ice regimes of the world
L9.	Navigating in High Latitudes
L10.	Ice route planning
L11.	Ice-class Ships
L12.	Navigating in Ice – Ship handling and ice management

S7.	Navigating in Ice (ship handling and ice management)
S8.	Navigating in Ice (entering the ice)
S9.	Navigating in Ice (getting beset)
S10.	Navigating in Ice (overtaking and passing other vessels)
S11.	Navigating in Ice (anchoring and mooring to ice edge)
S12.	Navigating in Ice (pilot transfer)
S13.	Navigating in Ice (docking, undocking, and port security)
S14.	Navigating in Ice (working with icebreakers)
S15.	Navigating in Ice (working with convoys)
S16.	Navigating in Ice (oil spills and emergency operations)

Academic Oversight

The Alaska Maritime Training Center is guided by an Advisory Board of senior Alaska mariners, maritime industry leaders, and academicians, who meet regularly to review all of AVTEC maritime education programs, including the ice navigation curriculum. The Advisory Board helps the Center design curriculum and assures that real needs of the State of Alaska and maritime industry are met by AVTEC investments in educational resources of the Alaska Maritime Training Center. Board member are particularly attuned to emerging issues and growing concerns surrounding the opening of the Arctic Ocean to increased waterborne commerce, tourism, oil and gas exploration, commercial fishing, and subsistence and recreational boating. These issues and concerns are addressed by the AVTEC Ice Navigation Curriculum with approval of the Advisory Board.

Table 3. AVTEC Ice Navigation Learning Level Achievement Strategy	
Learning Level	**AVTEC Course Resources Applied**
Level 1 (Knowledge)	classroom presentation, discussion, and written exercises
Level 2 (Understanding)	classroom presentation, discussion, and written exercises involving more complex questions than Level 1 topics
Level 3 (Application)	classroom presentation, discussion, written exercises, and table-top or simulator exercises with critiques
Level 4 (Integration)	classroom presentation, discussion, written exercises, and table-top or simulator exercises with critiques involving open-ended situational challenges more complex than Level 3

Ongoing Refinements

The Alaska Maritime Training Center, in collaboration with the School of Engineering of the University of Alaska Anchorage, is investigating recent marine accidents and near-misses in Arctic settings to develop related scenarios for ship simulator exercises. These exercises will be designed for incorporation in the ice navigation curriculum. They may also be applied in a proposed new "Alaska Arctic Marine Domain Awareness" course for maritime industry and government managers intended to impress participants with the extent of natural hazards to ships in the Arctic, with the variety of instrumentation available on well-equipped modern ship bridges for detection of hazards, with reports available via radio and satellite transmissions, and with the impact of combined hazards on progress of a voyage and safety of passengers, crew, and cargo. AVTEC is continually expanding its geographical databases and ship model capabilities as resources become available, with a view toward keeping its place as Alaska's premier maritime training institute.

USGS
science for a changing world

An Evaluation of the Science Needs to Inform Decisions on Outer Continental Shelf Energy Development in the Chukchi and Beaufort Seas, Alaska

Background

On March 31, 2010, Secretary of the Interior Ken Salazar announced a national strategy for Outer Continental Shelf (OCS) oil and gas development. In that announcement, the Administration outlined a three-pronged approach (U.S. Department of the Interior, 2010a):

Development: "...expand development and production throughout the Gulf of Mexico, including resource-rich areas of the Eastern Gulf of Mexico..."

Exploration: "...expand oil and gas exploration in frontier areas, such as the Arctic Ocean and areas in the Atlantic Ocean, to gather the information necessary to develop resources in the right places and the right ways."

Conservation: "...calls for the protection of special areas like Bristol Bay in Alaska...national treasure[s] that we must protect for future generations."

In a companion announcement (U.S. Department of the Interior, 2010b), within the Administration's "Exploration" component, the Secretary asked the U.S. Geological Survey (USGS) to conduct an initial, independent evaluation of the science needs that would inform the Administration's consideration of the right places and the right ways in which to develop oil and gas resources in the Arctic OCS, particularly focused on the Beaufort and Chukchi Seas (fig. 1).

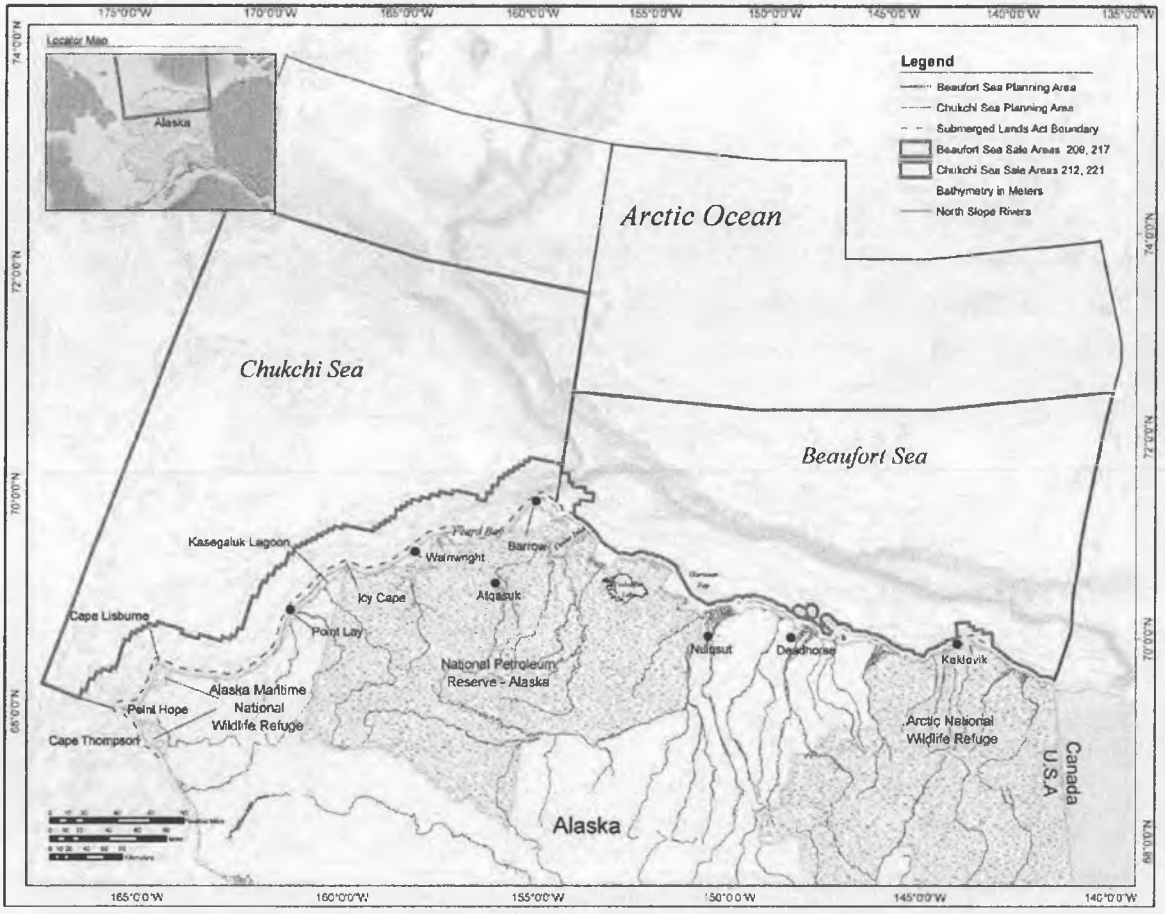

Figure 1. North Slope of Alaska from Point Hope to the United States–Canada border showing principal coastal communities, Outer Continental Shelf oil and gas leasing areas, and major Federal land holdings. From the Bureau of Ocean Energy Management, Regulation and Enforcement, formerly the Minerals Management Service (2008).

Printed on recycled paper

Fact Sheet 2011–3048
June 2011

Oil and gas potential is significant in Arctic Alaska (fig. 2). On Alaska's North Slope, the Nation's largest oil field, Prudhoe Bay, has been in production for several decades. Oil has been produced from the Beaufort Sea OCS since the early 2000s, and the Arctic OCS potential for production of additional oil and gas resources is significant. Beyond petroleum potential, this region supports unique fish and wildlife resources and ecosystems, and indigenous people who rely on these resources for subsistence. While the potential for, and interest in, energy resources is clear, there is significant public discourse over the ability to develop oil and gas resources safely, to understand environmental and social consequences of any development, and to implement effective impact prevention and mitigation strategies. Such discourse often revolves around different views on the sufficiency of the scientific information available to evaluate energy development options and to understand environmental sensitivity in this frontier area.

The USGS was asked to summarize key existing scientific information, develop a rapid process to identify where knowledge gaps exist, and provide initial guidance of what new and (or) continued research could improve decision making. Determining what is a "science gap" or what is "sufficient science" is difficult. These concepts vary with the values and beliefs of every concerned individual when faced with complex issues and uncertainty. Decisions to develop resources in the Arctic are inherently difficult because they must consider factors such as the economic stakes, Native traditions, environmental risks, and multiple objectives.

Figure 2. Assessment units of the Circum-Arctic Oil and Gas Assessment, color-coded according to the mean estimated undiscovered, technically recoverable oil resources. The open rectangle denotes the approximate location of the Alaska North Slope and Beaufort and Chukchi Seas OCS areas. Modified from Gautier and others (2009).

High levels of project uncertainty are inherent in working in a frontier environment. Decisions are complicated because multiple choices need to be made and multiple organizations must make those choices.

Thus, the USGS OCS Team took an inclusive approach to its "science gap and sufficiency" evaluation by not only examining available literature, but also gathering input from many entities that influence decisions about what science is "needed" for oil and gas development in the Arctic OCS.

The USGS OCS Team examined more than 400 scientific publications, workshop findings, science policy documents, and web sites. The team met with more than 40 individuals and organizations that have research or science assessments on these issues. Our group conducted a series of structured discussion sessions with key vested parties, including Alaska North Slope and Native interests, the oil industry, State of Alaska, Federal regulatory agencies, and non-regulatory organizations. Finally, we held a special session at the Alaska Marine Science Symposium (in Anchorage, January 2011) to gain focused input from the science community on key topics.

Results

The USGS developed more than 50 findings and an equal number of recommendations in the course of our examination of these topics. Specific and detailed scientific information, key knowledge gaps, and recommendations are presented in Holland-Bartels and Pierce (2011). Those recommendations are important for understanding what the USGS discovered in the course of this study and to help inform and improve decision making. In this Fact Sheet, we provide a high-level summary and synthesis of our findings to help inform the Secretary of the Interior's considerations to develop oil and gas resources in the Arctic OCS.

Climate change is impacting physical, biological, and social conditions in the Arctic and affecting all resource-management strategies. Climate conditions in the Arctic have been undergoing remarkable changes, particularly during the last 20 years. Climate model projections show pronounced warming that will continue to change the physical environment and ecological conditions (for example, ocean acidification, sea-ice ecosystems, species response). While international development of global climate models is progressing rapidly, forecasting techniques currently lack sufficient regional grain, particularly in the Arctic. Thus, a more refined regional understanding of climate change is required to help clarify development scenarios. Uncertainties exist on topics for which more science focus is required, including: (1) physical parameters, such as storm frequency and intensity, and circulation patterns, and (2) species' response to environmental changes, for which periodic population and distributional surveys could provide key data.

A key aspect critical to any development planning scenario is sufficient information for effective ***oil-spill risk assessment, preparedness, and response***. There have been significant advances in spill-risk evaluation and response knowledge, but concern remains that key inputs to spill models (oceanographic, weather, ecological) are insufficient and that the manner in which ecological data are included is not always clear, nor quantitative. Further, the applicability of laboratory and mesoscale studies to full field conditions remains largely untested, although international efforts are improving this foundation. Both the *Exxon Valdez* and the *Deepwater Horizon* oil spills demonstrate that spill contingency planning and a suite of spill response tools must be available

and effective. Significant questions exist about the scientific and technical information needed for contingency planning and prompt emergency response (response gap) in the Arctic, which are potentially complicated by a changing climate.

Inherent in understanding the full suite of impacts—both beneficial and detrimental—is the need to understand the cumulative effects of all changes (human and natural) in the Arctic. The development of a comprehensive, quantitative, cumulative effects analysis for the Arctic OCS remains a challenge. Numerous efforts have been unsuccessful at developing a transparent, quantitative, and comprehensive method to assess cumulative impacts. This methodology challenge, combined with the lack of available foundational geospatial data for the Arctic OCS, makes the process and findings of cumulative impact analyses inadequate to a broad suite of stakeholders. Climate change exacerbates this challenge by influencing the baseline such that it becomes a "moving" target. Thus, development of new, more analytical approaches to cumulative analyses would likely benefit the overall decision making on oil and gas development options.

Resonating throughout every topic we studied were several overarching themes, which include the need for: (1) ***large-scale synthesis of data and information,*** (2) ***enhanced dialog and collaborative science planning,*** and (3) ***a more transparent and inclusive planning and decision-making process.***

Information and data in the Arctic are emerging rapidly, but most studies focus on subjects with small spatial and temporal extent and are independently conducted with limited synthesis. Access to information, especially in Arctic frontier areas, is critical to move forward strategically. Thus, large-scale synoptic efforts are needed to synthesize the many studies, on a full range of topics and on individual topics, by many researchers and organizations examining the Arctic. One example, from onshore Alaska (fig. 3), shows the type of data synthesis that is needed to inform decision making.

Enhanced dialog and collaborative science planning are essential, both domestically and internationally. There are many entities in the "decision arena" of *Federal* oil and gas development, all of which bring critical information to the decision process and have responsibility along the spectrum of potential

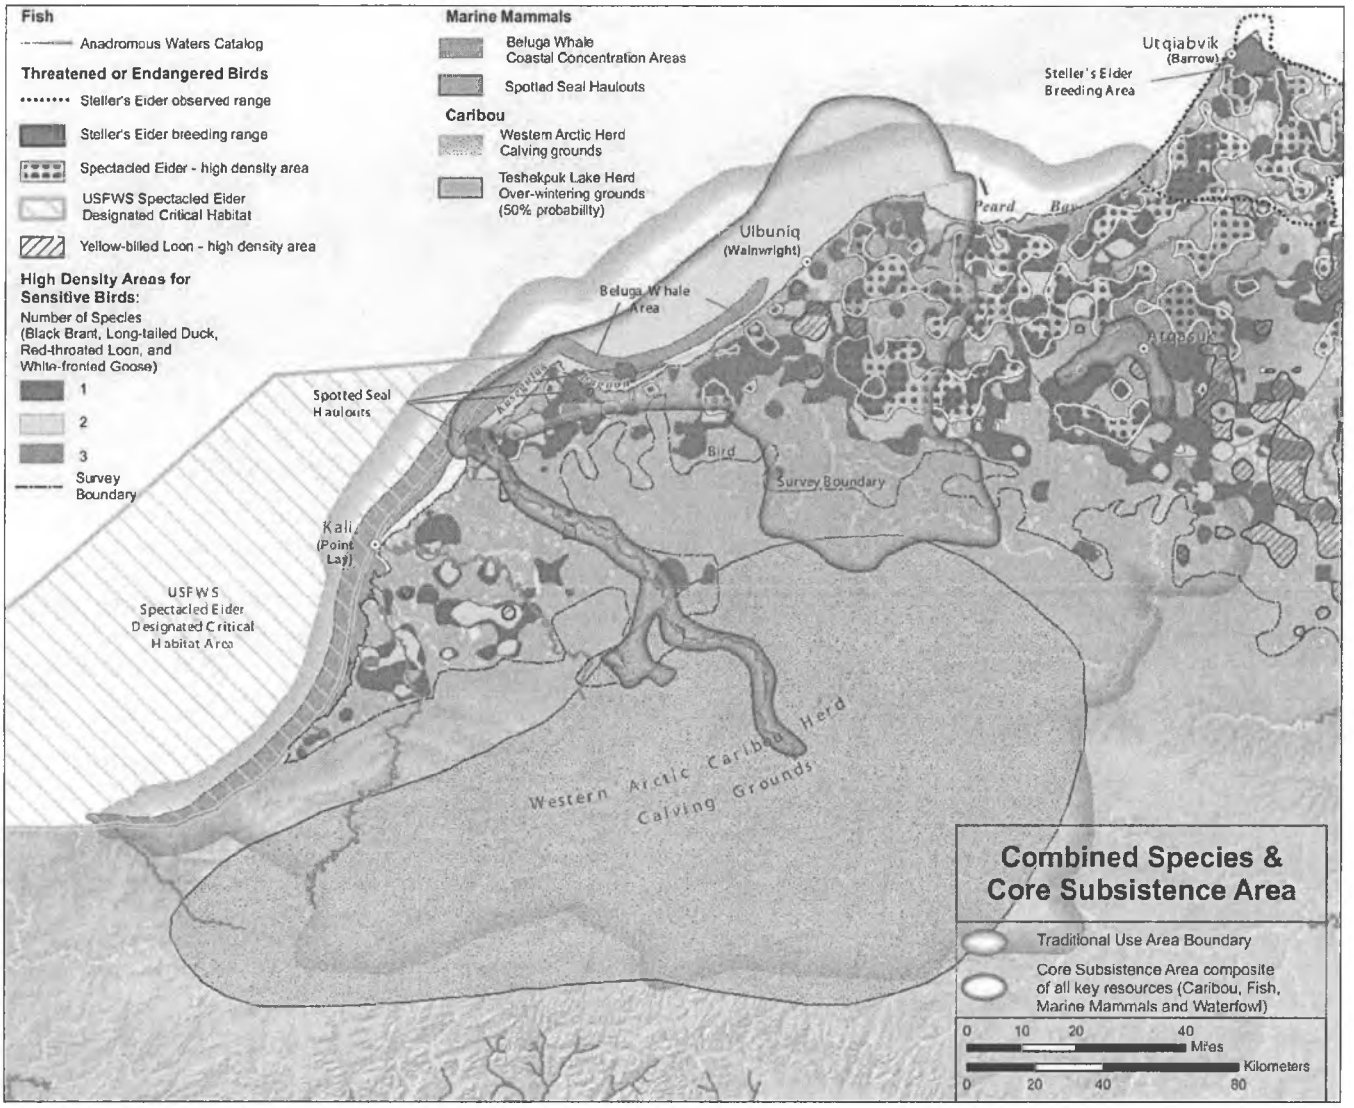

Figure 3. Combined sensitive species habitat areas and core subsistence areas for onshore Arctic Alaska. Modified from The Nature Conservancy and Wainwright Traditional Council (2008).

development. The many planning processes and consultations do not necessarily develop a consensus view on science gaps. There is a need for additional science dialogue with *Native communities* to more comprehensively incorporate local traditional knowledge into decisions. Significant research also is being conducted *internationally*, and emerging opportunities exist with other Arctic Nations. Enhanced science dialog and joint efforts would benefit all countries.

All these efforts will lead to a more transparent and inclusive science planning and decision-making process. Tools like Structured Decision Making (SDM) help the decision maker develop the fullest possible understanding of the complexities of the decision, including decision objectives, tradeoffs, uncertainties, and risks (fig. 4). In our discussions with individuals and groups, it became clear that evaluating science needs and filling identified science gaps will not be sufficient to address the many issues surrounding energy development in the Arctic. People have strong feelings about oil and gas development, which span the spectrum—some think there is already enough science and some think there will never be enough science. There are clearly areas of significant scientific research that form a sound basis upon which to make decisions; there are clearly areas where additional science is needed; but there also is an area in which more than science is needed. For that reason, we suggest the use of tools like Structured Decision Making to promote broad, transparent, and structured participation to inform decisions about energy development in the Arctic.

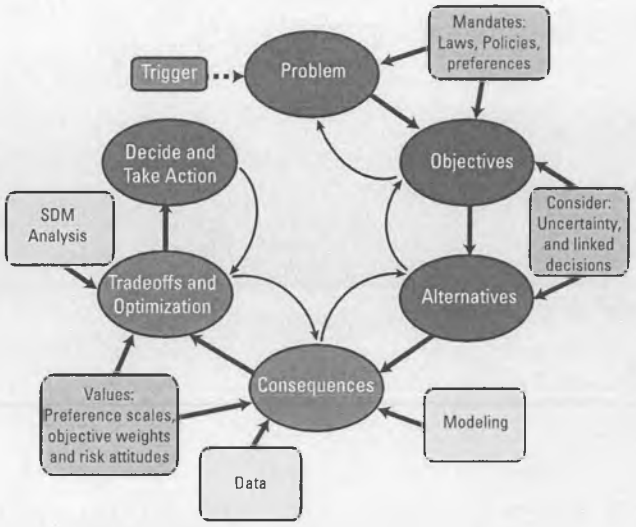

Figure 4. Schematic representing various steps included in a Structured Decision Making process. Modified from U.S. Fish and Wildlife Service (2008).

Thus, while there is a growing base of scientific and technical information for the Arctic, which is synopsized in Holland-Bartels and Pierce (2011), as are science gaps that should be addressed, many of the challenges emerging in Arctic oil and gas development decision making are beyond the ability of science alone to resolve. A collaborative and comprehensive Arctic science planning process would bring great value to the decisions required to proceed with development of oil and gas and other strategic assets in the Arctic in a changing climate environment. Such a science plan and its implementation must be informed by an SDM-like process and the syntheses of information we discussed above. This process needs to include appropriate measures of accountability for all responsible parties or entities. In our many discussions, we heard that managers, responders, scientists, and community members are willing to engage in discussing information needs, but they have a growing expectation that those needs will be considered and, if appropriate, addressed in a visible, documented manner.

Fact Sheet 2011–3048

An Evaluation of the Science Needs to Inform Decisions on Outer Continental Shelf Energy Development in the Chukchi and Beaufort Seas, Alaska

By Leslie Holland-Bartels and Brenda Pierce

Background

On March 31, 2010, Secretary of the Interior Ken Salazar announced a national strategy for Outer Continental Shelf (OCS) oil and gas development. In that announcement, the Administration outlined a three-pronged approach (U.S. Department of the Interior, 2010a):

> ***Development:*** "...expand development and production throughout the Gulf of Mexico, including resource-rich areas of the Eastern Gulf of Mexico..."
>
> ***Exploration:*** "...expand oil and gas exploration in frontier areas, such as the Arctic Ocean and areas in the Atlantic Ocean, to gather the information necessary to develop resources in the right places and the right ways."
>
> ***Conservation:*** "...calls for the protection of special areas like Bristol Bay in Alaska...national treasure[s] that we must protect for future generations."

In a companion announcement (U.S. Department of the Interior, 2010b), within the Administration's "Exploration" component, the Secretary asked the U.S. Geological Survey (USGS) to conduct an initial, independent evaluation of the science needs that would inform the Administration's consideration of the right places and the right ways in which to develop oil and gas resources in the Arctic OCS, particularly focused on the Beaufort and Chukchi Seas (fig. 1).

Oil and gas potential is significant in Arctic Alaska (fig. 2). On Alaska's North Slope, the Nation's largest oil field, Prudhoe Bay, has been in production for several decades. Oil has been produced from the Beaufort Sea OCS since the early 2000s, and the Arctic OCS potential for production of additional oil and gas resources is significant. Beyond petroleum potential, this region supports unique fish and wildlife resources and ecosystems, and indigenous people who rely on these resources for subsistence. While the potential for, and interest in, energy resources is clear, there is significant public discourse over the ability to develop oil and gas resources safely, to understand environmental and social consequences of any development, and to implement effective impact prevention and mitigation strategies. Such discourse often revolves around different views on the sufficiency of the scientific information available to evaluate energy development options and to understand environmental sensitivity in this frontier area.

The USGS was asked to summarize key existing scientific information, develop a rapid process to identify where knowledge gaps exist, and provide initial guidance of what new and (or) continued research could improve decision making. Determining what is a "science gap" or what is "sufficient science" is difficult. These concepts vary with the values and beliefs of every concerned individual when faced with complex issues and uncertainty. Decisions to develop resources in the Arctic are inherently difficult because they must consider factors such as the economic stakes, Native traditions, environmental risks, and multiple objectives. High levels of project uncertainty are inherent in working in a frontier environment. Decisions are complicated because multiple choices need to be made and multiple organizations must make those choices.

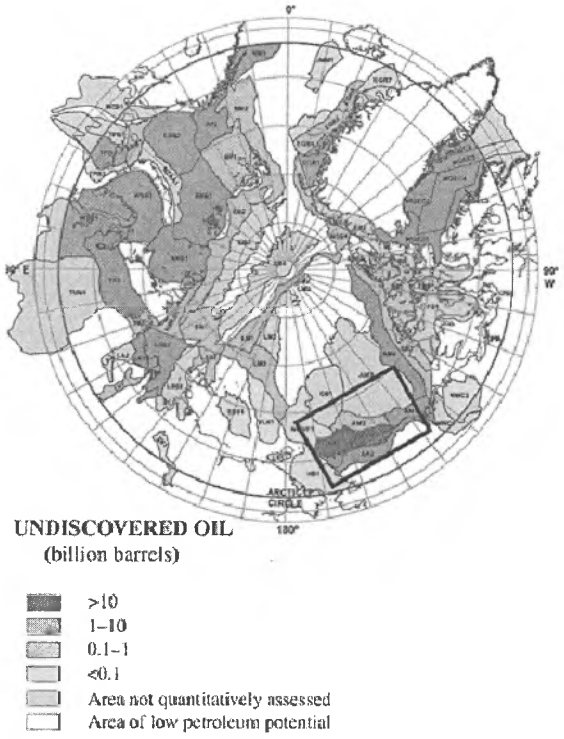

Figure 2. Assessment units of the Circum-Arctic Oil and Gas Assessment, color-coded according to the mean estimated undiscovered, technically recoverable oil resources. The open rectangle denotes the approximate location of the Alaska North Slope and Beaufort and Chukchi Seas OCS areas. Modified from Gautier and others (2009).

Thus, the USGS OCS Team took an inclusive approach to its "science gap and sufficiency" evaluation by not only examining available literature, but also gathering input from many entities that influence decisions about what science is "needed" for oil and gas development in the Arctic OCS.

The USGS OCS Team examined more than 400 scientific publications, workshop findings, science policy documents, and web sites. The team met with more than 40 individuals and organizations that have research or science assessments on these issues. Our group conducted a series of structured discussion sessions with key vested parties, including Alaska North Slope and Native interests, the oil industry, State of Alaska, Federal regulatory agencies, and non-regulatory organizations. Finally, we held a special session at the Alaska Marine Science Symposium (in Anchorage, January 2011) to gain focused input from the science community on key topics.

Results

The USGS developed more than 50 findings and an equal number of recommendations in the course of our examination of these topics. Specific and detailed scientific information, key knowledge gaps, and recommendations are presented in Holland-Bartels and Pierce (2011). Those recommendations are important for understanding what the USGS discovered in the course of this study and to help inform and improve decision making. In this Fact Sheet, we provide a high-level summary and synthesis of our findings to help inform the Secretary of the Interior's considerations to develop oil and gas resources in the Arctic OCS.

Climate change is impacting physical, biological, and social conditions in the Arctic and affecting all resource-management strategies. Climate conditions in the Arctic have been undergoing remarkable changes, particularly during the last 20 years. Climate model projections show pronounced warming that will continue to change the physical environment and ecological conditions (for example, ocean acidification, sea-ice ecosystems, species response). While international development of global climate models is progressing rapidly, forecasting techniques currently lack sufficient regional grain, particularly in the Arctic. Thus, a more refined regional understanding of climate change is required to help clarify development scenarios. Uncertainties exist on topics for which more science focus is required, including: (1) physical parameters, such as storm frequency and intensity, and circulation patterns, and (2) species' response to environmental changes, for which periodic population and distributional surveys could provide key data.

A key aspect critical to any development planning scenario is sufficient information for ***effective oil-spill risk assessment, preparedness, and response***. There have been significant advances in spill-risk evaluation and response knowledge, but concern remains that key inputs to spill models (oceanographic, weather, ecological) are insufficient and that the manner in which ecological data are included is not always clear, nor quantitative. Further, the applicability of laboratory and mesoscale studies to full field conditions remains largely untested, although international efforts are improving this foundation. Both the *Exxon Valdez* and the *Deepwater Horizon* oil spills demonstrate that spill contingency planning and a suite of spill response tools must be available and effective.

Significant questions exist about the scientific and technical information needed for contingency planning and prompt emergency response (response gap) in the Arctic, which are potentially complicated by a changing climate.

Inherent in understanding the full suite of impacts—both beneficial and detrimental—is the need to understand the cumulative effects of all changes (human and natural) in the Arctic. The development of a comprehensive, quantitative, cumulative effects analysis for the Arctic OCS remains a challenge. Numerous efforts have been unsuccessful at developing a transparent, quantitative, and comprehensive method to assess cumulative impacts. This methodology challenge, combined with the lack of available foundational geospatial data for the Arctic OCS, makes the process and findings of cumulative impact analyses inadequate to a broad suite of stakeholders. Climate change exacerbates this challenge by influencing the baseline such that it becomes a "moving" target. Thus, development of new, more analytical approaches to cumulative analyses would likely benefit the overall decision making on oil and gas development options.

Resonating throughout every topic we studied were several overarching themes, which include the need for: (1) ***large-scale synthesis of data and information,*** (2) ***enhanced dialog and collaborative science planning***, and (3) ***a more transparent and inclusive planning and decision-making process.***

Information and data in the Arctic are emerging rapidly, but most studies focus on subjects with small spatial and temporal extent and are independently conducted with limited synthesis. Access to information, especially in Arctic frontier areas, is critical to move forward strategically. Thus, large-scale synoptic efforts are needed to synthesize the many studies, on a full range of topics and on individual topics, by many researchers and organizations examining the Arctic. One example, from onshore Alaska (fig. 3), shows the type of data synthesis that is needed to inform decision making.

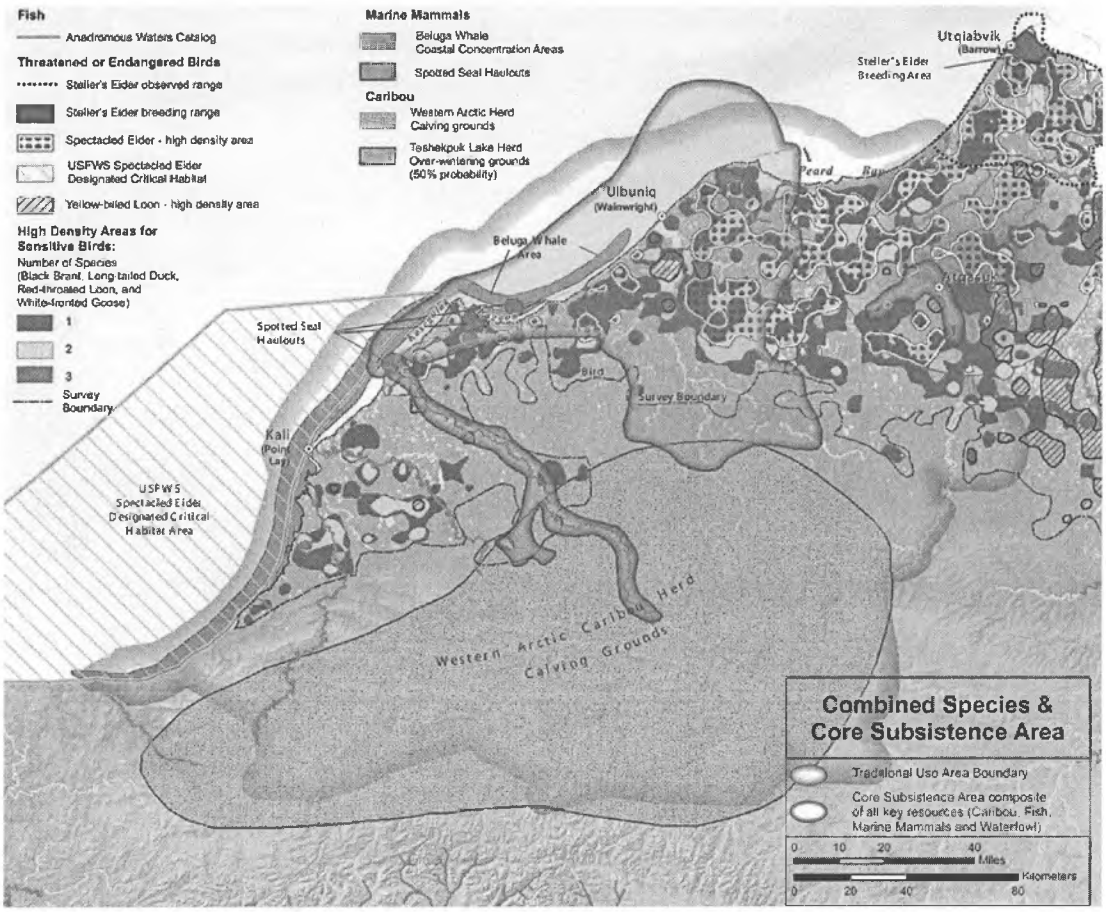

Figure 3. Combined sensitive species habitat areas and core subsistence areas for onshore Arctic Alaska. Modified from The Nature Conservancy and Wainwright Traditional Council (2008).

Enhanced dialog and collaborative science planning are essential, both domestically and internationally. There are many entities in the "decision arena" of *Federal* oil and gas development, all of which bring critical information to the decision process and have responsibility along the spectrum of potential development. The many planning processes and consultations do not necessarily develop a consensus view on science gaps. There is a need for additional science dialogue with *Native communities* to more comprehensively incorporate local traditional knowledge into decisions. Significant research also is being conducted *internationally*, and emerging opportunities exist with other Arctic Nations. Enhanced science dialog and joint efforts would benefit all countries.

All these efforts will lead to a more transparent and inclusive science planning and decision-making process. Tools like Structured Decision Making (SDM) help the decision maker develop the fullest possible understanding

of the complexities of the decision, including decision objectives, tradeoffs, uncertainties, and risks (fig. 4). In our discussions with individuals and groups, it became clear that evaluating science needs and filling identified science gaps will not be sufficient to address the many issues surrounding energy development in the Arctic. People have strong feelings about oil and gas development, which span the spectrum—some think there is already enough science and some think there will never be enough science. There are clearly areas of significant scientific research that form a sound basis upon which to make decisions; there are clearly areas where additional science is needed; but there also is an area in which more than science is needed. For that reason, we suggest the use of tools like Structured Decision Making to promote broad, transparent, and structured participation to inform decisions about energy development in the Arctic.

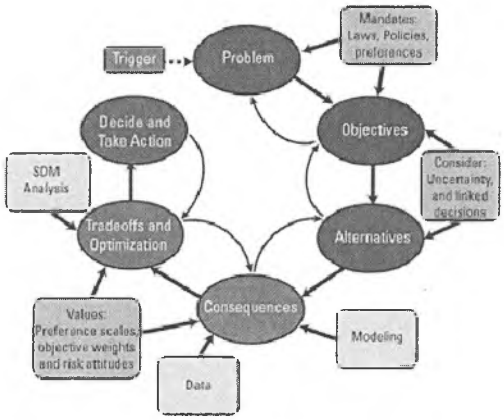

Figure 4. Schematic representing various steps included in a Structured Decision Making process. Modified from U.S. Fish and Wildlife Service (2008).

Thus, while there is a growing base of scientific and technical information for the Arctic, which is synopsized in Holland-Bartels and Pierce (2011), as are science gaps that should be addressed, many of the challenges emerging in Arctic oil and gas development decision making are beyond the ability of science alone to resolve. A collaborative and comprehensive Arctic science planning process would bring great value to the decisions required to proceed with development of oil and gas and other strategic assets in the Arctic in a changing climate environment. Such a science plan and its implementation must be informed by an SDM-like process and the syntheses of information we discussed above. This process needs to include appropriate measures of accountability for all responsible parties or entities. In our many discussions, we heard that managers, responders, scientists, and community members are willing to engage in discussing information needs, but they have a growing expectation that those needs will be considered and, if appropriate, addressed in a visible, documented manner.

Northern Waters Task Force fills gap

Rep. Reggie Joule, chair of task force, says Alaska needs to be involved in Arctic policy decisions for both benefits and protection

Steve Quinn

For Petroleum News

The state's Northern Waters Task Force is off to a slow start, but don't blame its leader Rep. Reggie Joule.

The 11-person group has been entrusted with a joint state/federal commission designed to oversee development of northern oceans.

And Joule is ready to get down to business.

But thanks to a special session Joule has had to postpone meetings and even a trip to Norway, an Arctic nation with similar resource development issues as Alaska.

The group was established with unanimous backing of the Legislature toward the end of last year's session.

The task force will spend the rest of the year addressing areas including Arctic governance; oil, gas and mineral development; Arctic fisheries; marine transportation; Arctic research and Arctic infrastructure.

It features some familiar names like Vice-Chair Sen. Bert Stedman, a Sitka Republican, Sen. Lyman Hoffman, a Bethel Democrat, and Rep. Bob Herron.

Others include leaders from coastal communities and Department of

Environmental Conservation Commissioner Larry Hartig.

Joule will provide a final report to the Legislature by Jan. 30, 2012.

Joule is in his 10th term with the Legislature and a member of the House Finance Committee which reviews all resource development issues with price tags attached to them.

Joule sat down with Petroleum News to discuss his goals for the task force and what may be ahead for the state's oil tax rewrite debate.

Petroleum News: How did this group come together?

Joule: The Senate President (Gary Stevens) and House Speaker (Mike Chenault) made the decisions. It's largely for those communities to be impacted, from the North Slope to Dutch Harbor, which is kind of the springboard for marine transportation.

Petroleum News: Did you want to be chairman?

Joule: I guess so, yeah. I just wanted to get on the task force because it's timely. I try to take somewhat of a balanced approach to how the agenda gets set, so that when we sunset in 2012, we try to come up with a sound set of recommendations for the Legislature that would hopefully set up a permanent commission or task force that would continue to monitor efforts in Alaska regarding our oceans. I think we are going to see huge activity.

Petroleum News: What are some of the priorities?

Joule: I guess mostly that we are aware and are responsible, and definitely engaged. I have my own opinion about oil and gas development offshore, but if this is something that is going to happen, how can we benefit from it and how can we safeguard ourselves at the same time? Those are conversations that are happening at the federal level. But as a state what should we be getting excited about and what should we be moving with caution. The same with fisheries and marine transportation. There already is a huge research effort going on, but is it the right kind for the activity that's being proposed? Are we taking advantage of the science and the research that should be done to ensure the safety of the ecosystems not only in the oceans, but as they come to shore and the people who depend on those things onshore?

Petroleum News: What are your thoughts on offshore drilling?

Joule: I'll just keep that to myself.

Petroleum News: Is this anything like coastal management?

Joule: There is a huge difference. Actually, they are almost not even related. They

may intersect in places. Coastal zone management is about permitting and getting local input into those things that are needed to obtain permits whether large-scale coastal areas or even local efforts such as accessing gravel for communities. All that stuff needs to get permitted. The Northern Waters Task Force, one of the reasons that we put this together, with the advent of climate change there are a lot of things that we became aware of that presented themselves as opportunities and challenges all rolled into one. The legislature and global community were having discussions about these potential events in Arctic waters. The Alaska Legislature was not even in the mix of knowing what those things were. You've got the Arctic Council, which the United States has a seat at because of Alaska's place on the Arctic.

There are others active there. Oil companies, shipping firms, fishing industries and even the coast guard are formulating plans figuring out how do deal with all of these kinds of activities.

We weren't part of that conversation. Part of all of this effort is to bring us up to speed. There is going to be a need for infrastructure; there is going to be a need for science; there is going to be a need for communications with communities and Alaskans. There is probably going to be at some point some policy calls that we need to be involved in. There could be opportunities for jobs.

But there may be times where we are going to have to deal with mitigation. All of those things taken together is why the Northern Waters Task Force was formed, recognizing of course that as one of the few coastal states in this country, we didn't have any kind of a way to be plugged into what's going on with the oceans. Here we had a president and an administration putting together a national oceans council in search of members to sit on a task force. We were nowhere.

Petroleum News: You mentioned various events, what kind of events did you have in mind?

Joule: I'm not sure. Let's see. Could it be things like melting ice? Could it be things like fish moving to colder water? Ocean acidification? Diminishing sea levels? Diminishing sea ice?

Petroleum News: So you have those changes, but there are also events like prospective drilling, right?

Joule: There are things to consider like OCS, whether we like it or not, the north pacific management council, marine shipping, national defense and the need for infrastructure, whether it's the coast guard or military. All of those may mean potential jobs. Some of the challenges like over-the-top transportation corridors — there are some choke points in the Bering Straits. There is some concern about invasive species that are cling-ons to hulls of ships. With offshore drilling there are concerns about are we prepared to deal with the unfortunate events of potential spills and the destructions of what goes on there? How is that going to impact search and rescue efforts, cleanup efforts? Are we prepared for that? Are

we prepared for the potential economic opportunities in terms of workforce and companies? Are we up to speed on what's going on? There are both sides, and we are trying to bring focus to all of that. Then there is the issue of governance, which I'm not sure I've completely wrapped my own arms around: When Russia threw a flag under the water somewhere and started staking a claim. America through Alaska's position has offered to set boundaries that we may be able to lay claim to, maybe even more so if we pass the Laws of the Sea treaty. That may impact us in a largely more positive way, so there is a lot of stuff out there to consider.

Petroleum News: Shifting gears, but still on resource development, what, if anything would you like to see done with oil taxes? House Bill 110 is stuck in the Senate, what do see happening next year.

Joule: I voted against the oil tax (HB 110) and I think with some modest changes I could vote for it. Back when we did the legislation back in 2007, the House was under a cloud of corruption.

I recognize what we ended up settling on was probably a little bit overboard; we may have taken it a bit too far in my opinion. We probably needed to find a sweet spot that still allows the state to benefit from our resources.

I don't know that the state or the people in the government are happy with that level but on the other I don't think the oil companies would have been completely happy with everything.

When the bill comes back up, there is going to be probably a different level of conversation.

Recently BP successfully pulled about 350 barrels of heavy oil, and converted that and shipped it down the pipeline. How does that factor into that discussion?

The president of ConocoPhillips (Jim Mulva) has made some commitments in terms of the type of things what can be expected of them in terms of investment in Alaska. We didn't have any of that on the House side. Then there is the exploration piece. How do we encourage those who are interested in wildcatting and exploring, finding new sources of oil utilizing the new technology so we can continue to get new barrels of product into the TAPS? So I actually think when the conversation comes up, it's going to begin at a whole different level with information that we didn't have prior to this.

Petroleum News: What has been the most important thing for your region as far as resource development?

Joule: Whether it's the North Slope, which has been primarily onshore development, or at Red Dog Mine, it's important that the industries have been — I don't know if willing is the correct word — but the end result is that the caribou populations are still healthy through an oil field and all the infrastructure. People

still have access to their land-based food source. We've set up systems that by working with local people that can ensure for that. That has probably been the biggest milestone of development in those resource rich parts of the state. All of that did not come easy.

Petroleum News: You were supposed to have completed a trip to Norway, but the special session pushed that back. What did you hope to learn from that trip?

Joule: I was interested in how they conducted their offshore development. I wanted to see what the differences were. I wanted to see how they accomplish some things. I want to see what restrictions they place on industry and still yet see how that development would occur and how does that compare to what is being asked in Alaska. Are we being unreasonable or can this still occur? Being an Arctic nation, they too are going to be impacted by less ice. I want to see what they are doing. How are they planning and preparing for those kinds of times? How do they monitor their fisheries? We don't have very much by way of commercial fisheries in the north. Is that even an issue there? Then there is the whole piece on infrastructure. So, there is a lot to learn from folks who have been engaged in those things.

Learning from the Deepwater Horizon Oil Spill of National Significance

The member agencies of the Pacific States/British Columbia Oil Spill Task Force continue to monitor the response, Natural Resource Damage Assessments, Lessons Learned and policy developments associated with the Deepwater Horizon Spill of National Significance. The Office of Spill Prevention and Response (OSPR) at the California Department of Fish and Game continues to send personel to the Gulf of Mexico to assist with shoreline cleanup and assessment as well as Natural Resource Damage Assessments.

We were honored to host officials and experts who were involved in the Deepwater Horizon response as speakers at our 2010 Annual Meeting in October. You can view their presentations - which addressed the complexities of responding to a Spill of National Significance, the technologies used and pending policy developments - at this link: http://oilspilltaskforce.org/2010conference/index.htm.

A Coast Guard HH-65C Dolphin helicopter passes over the site of the Deepwater Horizon oil spill, July 4, 2010. U.S. Coast Guard photo by Petty Officer 1st Class John Masson; photo courtesy of the Associated Press.

We have also tracked various reports on the response and are awaiting the final report from the U.S. Coast Guard's Incident Specific Preparedness Review (ISPR) Team. Larry Dietrick, Director of the Division of Spill Prevention and Response for the Alaska Department of Environmental Conservation and Dale Jensen, Program Manager for the Washington Department of Ecology Spill Prevention, Preparedness & Response Program participated as member and alternate to the ISPR Team to represent the Task Force. Most recently, the Task Force Coordinating Committee met by conference call to review the recommendations in the recent report from the National Commission on the BP Deepwater Horizon Oil Spill and Offshore Drilling, which is available at http://www.oilspillcommission.gov/final-report.

Key policy themes for the Pacific States/British Columbia Oil Spill Task Force going forward include:

- Continued state access to planning through the Area Contingency Planning process;
- Continued state access to decision-making during a response through Unified Command and the Incident Command System;
- Coordinating industry contingency planning with Area Plans in order to ensure that sufficient response equipment is available for both offshore and nearshore response to a Worst Case Discharge; and
- Ensuring that each coastal region - including our Pacific Coast area - has adequate response capacity for mutual aid at the regional level.

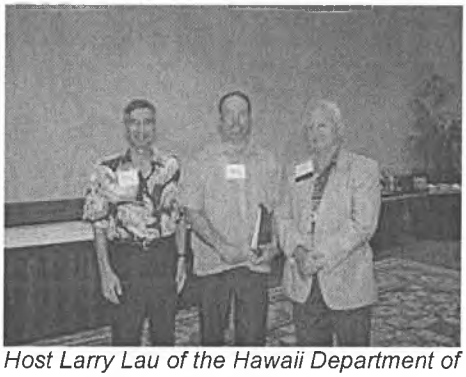
Our 2010 Annual Report

Our 2010 Annual Report provides updates on the activities of the Oil Spill Task Force and its member agenices. Our 2009 regional spill data is also included.
Download the report. (pdf, 3.8MB)

Our 2010 & 2011 Annual Meetings

Our 2010 Annual Meeting, hosted by the Hawaii Department of Health, was a great success!

Seventy-five persons participated, eagar to hear from various speakers who addressed the theme "What the Deepwater Horizon Spill of National Significance Can Teach Us."



Host Larry Lau of the Hawaii Department of Health (left) visits with Mike Zollitsch from the Oregon Department of Environmental Quality (center) and Roland Guidry, the Louisiana Oil Spill Coordinator, one of our speakers (right).

Other speakers included (photos below in the following order) USCG CAPT John Caplis, John Tarpley from NOAA, Al Allen from Spiltec, Ann Hayward-Walker of SEA, Brian Parscal of CIC, Ed Owens of Polaris, and Skip Volkle of the Marine Resources Group.

You can view videos of their presentations, as well as updates from each of our member jurisdictions and an update on the Pacific States/British Columbia Oil Spill Task Force activities at this link:
http://oilspilltaskforce.org/2010conference/index.htm

The Alaska Department of Environmental Conservation will host our 2011 Annual Meeting on August 24th in Anchorage. Stay tuned for hotel information and a program agenda.

The Stakeholder Workgroup Review of Planning and Response Capabilities for a Marine Oil Spill on the U.S./Canadian Transboundary Areas of the Pacific Coast - Final Project Report.

The Pacific States/British Columbia Oil Spill Task Force has sponsored a stakeholder workgroup to review the status of oil spill planning and preparedness on the U.S./Canadian borders between Alaska and British Columbia, and between Washington and British Columbia. The final Workgroup report - with recommendations - is available at
http://oilspilltaskforce.org/docs/notes_reports/Final_US_Canada_Transboundary_Project_Report.pdf (pdf, 9.4MB).

Known as "the U.S./Canadian Transboundary Spill Planning and Response Project Stakeholder Workgroup," they first convened in June of 2008 and adopted a Work Plan that fall. Their stated goal was to review and document existing U.S./Canadian Transboundary oil spill response plans and capabilities for the British Columbia/Alaska and British Columbia/Washington borders, acknowledging existing authorities and response management systems; and to recommend improvements as needed for joint response and planning efforts, as well as for planning and capacity building within each jurisdiction.

The Project Workgroup chartered five Subcommittees (Command, Planning, Operations, Logistics and Finance) which then developed reports on a variety of topics ranging from management of multiple command posts to remote location logistics. Those draft reports have undergone an iterative review and comment process over the past two years to produce this final Project Report with recommendations to improve spill response on the two Pacific Coast borders of the U.S. and Canada.

Many persons - representing many organizations and interests - have made a significant investment in this review of oil spill planning and preparedness. Many of these same persons will now be involved in implementing the recommendations in this Project Report. The Pacific States/British Columbia Oil Spill Task Force is deeply grateful for their ongoing commitment.

Events Calendar (pdf, 40k)

A handy reference guide to conferences and other events of interest to oil spill professionals.
If you would like to add your event to this calendar, please send information to JeanRCameron@oregoncoast.com.

Clean Pacific Conferences

Our 2009 Clean Pacific Conference was held September 14 - 16th at the lovely - and Green - Oregon Convention Center, 852 persons participated, and everyone seemed pleased with the program and the exhibitors, as well as with the setting.

We were pleased to have the U.S. Coast Guard co-host the conference, and RADM Gary Blore, Commander of the 13th Coast Guard District, delivered the keynote address. Jessica Keys, Natural Resource Advisor to Oregon Governor Kulongoski, welcomed the conference delegates to Oregon.

The conference also featured the Pacific States/British Columbia Oil Spill Task Force's 2009 Legacy Awards and a reading of the 1999-2008 Legacy Award Honor Roll, activity updates from state, provincial, and federal agencies (U.S. & Canada), two pre-conference workshops, three "Super Sessions", six poster sessions, and fifteen regular sessions. An Opening Night Reception honored our 20th Anniversary, and the U.S. Coast Guard held an Open House for their FOSCs. We are most

RADM Gary Blore, Commander U.S.

Jessica Hays of the Oregon Governor's

grateful to the Conference Sponsors, to the fine exhibitors, and to everyone who attended for making this such a success!

Please click on the Clean Pacific logo below for more information on the conference and for access to the presentation archives (if you were an attendee TradeFair Group will email you an access password for this).

Based on feedback to the TradeFair group (who organizes the Clean Pacific Conferences) from potential exhibitors who cannot participate in both the International Oil Spill Conference in May 2011 and a Clean Pacific Conference in September 2011 - both on the West Coast - we have agreed to reschedule the next Clean Pacific Conference to May 15-17, 2012 at the Long Beach Convention Center.

We look forward to seeing you in California in 2012!

Coast Guard District 13 was the Keynote Speaker

Office and Dick Pedersen, Oregon's Task Force Member

Shocking discovery for joint relief

How does the FBI quickly learn new languages?

Pondering impact of drilling off remote northwest Alaska

By Steven Mufson, Published: August 16

WAINWRIGHT, ALASKA — To archaeologist Richard E. "Rick" Reanier, the 10-foot-high mound on a sandy spit on the coast of northwest Alaska was no mere pile of sand.

Circling in front, he found the top of an old kerosene tin. Around the side, he turned over a rusty door from a nearly century-old cast iron stove. Brushing away some sand, he uncovered the ruins of an entrance corridor to an Inupiat house made of sod and driftwood.

Beyond this stretch of beach lies the vast Chukchi Sea, stretching from eastern Siberia to the Alaskan coast on the edge of the Arctic. For centuries, Native Alaskan Inupiat have roamed these shores hunting bowhead whales, bearded seals, walruses and caribou.

Now Shell Oil is also hunting in the Chukchi Sea. This pristine area inside the Arctic Circle is the next frontier for offshore oil drilling in the United States. The Interior Department estimates the Chukchi Sea could hold as much as 12 billion recoverable barrels of oil, about half of current U.S. proved reserves.

Shell agrees, and some in Washington are inclined to support the company at a time of soaring energy costs. Even though it has not drilled a single hole yet, Shell has spent $2.1 billion to acquire Chukchi leases, plus almost $2 billion to collect seismic data, study the coast, and refurbish ice-breaking ships for drilling 70 miles offshore here and in the Beaufort Sea during the summer of 2012.

Reanier, working under a contract with Shell, is identifying cultural sites to be avoided if and when a pipeline comes ashore. "If you don't know where they are, you can't protect them," he said, marking the location of the sandy mound.

Two decades ago, a handful of wells were drilled in the Chukchi Sea, but oil companies didn't think it was worth developing. Now, prices have soared, and Shell thinks there is more recoverable oil there than previously thought.

"There is a prize over there," says Pete Slaiby, vice president of Shell Alaska.

But oil development could threaten the sea mammals the Inupiat people hunt for food. Several lawsuits have been filed to get government agencies to block

Chukchi drilling. Alaska Natives worry that the mere noise of drilling would disrupt the feeding and migration patterns of bowhead whales, beluga, walruses and seals. The draft of a study done for Shell suggests that seismic surveys have already silenced walruses, or frightened them off to other feeding grounds.

A sea-centered culture

"Our culture revolves around the ocean," Mae Hank, an outspoken resident of Point Hope, to the south of the village of Wainwright, says tearfully. "The ocean is very sensitive."

The drilling moratorium after the Gulf of Mexico spill last year put Shell's plans on ice for a time and heightened anxiety about how Shell could deal with an Arctic spill. And in the past week, a 1,300-barrel oil spill at a Shell platform in the North Sea aroused drilling foes.

Coast Guard Rear Adm. Paul Zukunft said recently that dispersants wouldn't work in icy water, that the Arctic doesn't have the same oil-chomping microbes the gulf has and that the nearest Coast Guard response vessel is 1,200 miles away. Whereas thousands of workers flocked to the gulf coast to fight the spill there, there are only a handful of rooms at the tiny Olgoonik Hotel here.

The window for drilling here is short, from July through October. The rest of the year, temperatures drop as low as 56 degrees below zero and the Chukchi Sea is largely frozen. So Shell is pressing to line up regulatory approvals for the Chukchi as well as the Beaufort Sea to the northeast.

"Even in areas that are [in theory] open to production, we still face debilitating regulatory red tape," Marvin Odum, president of Shell in the Americas, said in a speech to the U.S. Chamber of Commerce in Washington on July 28. Odum, who has made several trips to Alaska to reassure Alaska Natives, said the lease sale was, "in effect, an invitation from the government" but lamented that Shell had "been strung along by regulatory and legal barriers."

Shell's efforts have become a cause celebre in Washington. In June, the House passed a measure that would force the Environmental Protection Agency to speed up permit decisions and prohibit the EPA's Environmental Appeals Board from hearing challenges to air permits needed by drill ships. But Rep.

Henry Waxman (D-Calif.), ranking Democrat on the House Energy and Commerce Committee, says that delays have been caused by multiple revisions in Shell's permit applications.

Piles of permits

Shell needs about 10 permits for each of the three wells it hopes to drill next summer in the Chukchi Sea (as well as others in the Beaufort Sea). It has obtained one from the Army Corps of Engineers for a drilling structure and one from the EPA to discharge drilling fluids; it awaits others from the EPA, the U.S. Fish and Wildlife Service, the Coast Guard, the National Oceanic and Atmospheric Administration and the Bureau of Ocean Energy Management, Regulation and Enforcement. Slaiby says "we have to bat 1.000 to be ready to go."

President Obama appears inclined to go ahead with Chukchi exploration, provided there are safeguards to prevent or limit any spill. The president has established an inter-agency group to streamline permitting in Alaska. And he has endorsed oil development in the National Petroleum Reserve, which lies along the probable 280-mile-long route that would link a Shell pipeline to the Trans-Alaska Pipeline System, which carries oil south from Prudhoe Bay.

But the mere thought of a spill is daunting, despite Shell's extensive preparations and assurances. Much of the Chukchi is shallow, so Shell's wells are in water only 150 feet deep. The company also says that the pressure in the reservoirs is lower and easier to manage than in the Gulf of Mexico. Its blowout preventers will have two blind shear rams, instead of the customary one; the rams are designed to cut through and seal steel drill pipe.

Yet in its revised exploration plan submitted in May, Shell said that the worst case spill — while a "very low likelihood" — could reach 23,100 barrels a day, nearly half the rate of BP's gulf spill. A Canadian government study said that bad weather would prevent any spill response one out of five days in June, the mildest month, and two out of three days in October, the end of the open-water season.

The company, however, has refurbished a ship called the Kulluk whose conical hull is designed for Arctic conditions. Positioned between the Chuckchi and Beaufort seas, the Kulluk could reach the drill site and complete

a relief well in 34 days. A tanker capable of holding half a million barrels could be on hand within 24 hours, Shell says; that would store the first 20 days of a leak until another tanker could arrive. A nearby barge would also be able to store oil. And a capping stack like the one used to stop the BP spill last year would be warehoused on land between the Chukchi and Beaufort seas.

In an old gravel pit along the lagoon behind Wainwright, Shell has already stored 18 yellow and blue containers with boom for oil spills and a handful of small boats to spread them.

Studying shore and currents

Shell is also collecting scientific data, an answer to environmental groups who argue that more research needs to be done. In addition to hiring Reanier, Shell has deployed small teams of hydrologists, soil experts and naturalists to scout the shoreline. Two tiny antennae on a bluff generate information about currents by bouncing high-frequency radar off the water surface. The company has dropped buoys the size of medicine balls offshore to collect more information about the currents, which often go one way on the surface and the opposite way below.

Standing beside Reanier on the beach, the calm sea in one direction and soggy brownish-green tundra in the other appear endless. Aside from a few caribou tracks and sea birds, there are few signs of life — except for swarms of mosquitoes. A pair of hydrologists working for Shell walks nearby, measuring the shape of the shoreline as currents deposit sand and rich black muck inside a lagoon.

After a while, a helicopter chartered by Shell drops Reanier farther down the coast, where he pokes around some more sod houses. He finds the bottom of a beer bottle and jots down a pattern and some numbers from it. He later goes online and finds that the bottle was probably produced by an Owens Illinois plant in Charleston, W.Va., in 1933.

The nearest settlement is the ramshackle Inupiat village of Wainwright, population 540, named for a lieutenant who came here on an 1826 expedition. A skinned walrus head sits drying on a porch there. A caribou carcass is perched awkwardly on another. Strips of seal dry in the summer sun. Boats, pickup trucks and four-by-four vehicles are parked helter skelter amid the

homes of wood and corrugated metal. People chat on an open radio line, trading the mundane details of life 72 miles from Barrow, the nearest town.

In the distance sits an abandoned early warning station built when the Air Force worried about a Soviet attack. Now, all that guards the town are rows of snow fences that prevent drifts from burying homes during the long, sunless winters.

Many people work for the North Slope borough government. Seventeen work at the school. Others do maintenance work. But almost everyone hunts, from boats and from cabins on the tundra or along the coast. Food is stored in large chests, or in holes dug in the ground where temperatures stay in the 20s during the summer.

Some people keep souvenirs; one home displayed 24 fist-sized eardrums taken from killed whales.

At the fire station one recent evening, members of a local dance group, the Kuugmiut Dancers of Wainwright, gracefully move their arms and stomp their feet as others chant and beat drums. They are preparing for a competition in Fairbanks. "We listen for the animals, and after we hunt the animals, we sing and dance," one song goes, says the group's founder, McRidge Nayakik.

There is support for development here.

"You have to think of your country, like that president said," says the village mayor, Enoch Oktollik, struggling to recall the name of John F. Kennedy. Oktollik, who maintains boilers and does other handy work, says that more than half the people in Wainwright are unemployed. They might be able to find work supporting the oil companies.

For it and against it

Though people here talk about protecting their subsistence way of life, they still rely on planes and ships for some supplies. Those shipments are expensive. A new port would reduce those expenses, the mayor adds. Bob Shears, a local contractor, estimates that building a road costs $1 million a mile and buying gasoline, even with subsidies, costs about $7 a gallon.

The Olgoonik Corp., the village company that runs the hotel and store, has

printed a slick brochure with a vision for a port and encampments for oil workers.

"They smell money," says resident Frank Bester Jr.

But there is uncertainty among the Alaska Natives along the coast, especially further south in Point Hope but even in Wainwright.

Oktollik asks, "Are we willing to risk our subsistence way of life?" He says, "We don't have gardens to grow vegetables, or potatoes or tomatoes."

Bester says that he's "both for and against" oil development.

The Chukchi and the tundra are Wainwright's lifelines. Recently, after a Shell helicopter shuttling scientists to points along the coast landed, Oktollik rushed up to the pilots to make sure they weren't frightening caribou spotted to the north.

Time after time, people mention the spill in the Gulf of Mexico.

"I'm afraid being so rural here, they may not have the proper equipment to take care of it," says Ralph Aveoganna, who works at a local gasoline station. He also fears oil development might change the migration patterns of the bowhead whale.

Yet change is probably coming to Wainwright in any case. Climate change is altering the ice melt and could change migration patterns. It could also turn the Arctic into a shipping channel; last year the first commercial cargo trip was made, carrying iron ore from Norway to China.

One night recently, with the summer sun still shining across the water and bouncing off the pale pastel colors of the homes here, Muriel Panik, a 34-year-old single mother who has attended the tribal college in Barrow, sat on her four-by-four vehicle. She said that oil development would be good for jobs and that she wants her own daughter to do something different. She doesn't want big changes in Wainwright, but she recognizes they could come about anyway as video games transfix the village's young people and climate change threatens its fast-eroding shoreline.

"The older generation says this is the last frontier," she says. "I say this is the

next frontier."

Trying To Unravel The Mysteries Of Arctic Warming

by RICHARD HARRIS

Enlarge John McConnico/AP

An iceberg is seen melting off the coast of Ammasalik, Greenland, in July 2007. This year, scientists say sea-ice extent in the Arctic has reached its lowest level since monitoring by satellite began in 1979, the result of rising temperatures.

The Arctic may be the world's next geopolitical battleground. The melting ice will have profound consequences for the roof of the world, opening strategic waterways to shipping, reducing the ice cap on Greenland, and spurring a rush to claim rights to the wealth of natural resources that lie beneath. NPR examines what's at stake, who stands to win and lose, and how this could alter the global dynamic.

The final installment in a six-part series

August 20, 2011

text size A A A

The Arctic is heating up faster than anyplace on Earth. And as it heats, the ice is growing thinner and melting faster. Scientists say that sometime this century, the Arctic Ocean could be free of ice during the summers. And that transition is likely to be chaotic.

Arctic sea ice has always seen dramatic swings. Every winter, the ocean is completely covered with ice. It starts to melt in the late spring, and by September about half that ice has melted away.

The Arctic's Diminishing Sea Ice

Now, add to that annual gyration a more recent trend. The seasonal melt has been claiming more and more ice since at least 1979, when researchers started monitoring that trend from space.

"Within the satellite record, this [year] is the lowest ice extent for July that we've ever seen," says Mark Serreze, who heads the National Snow and Ice Data Center at the University of Colorado.

In fact, current conditions aren't far from the 2007 record low for seasonal ice loss.

"The Arctic keeps surprising us," Serreze says. "The point is we're losing the sea ice faster than we think we ought to be. And this is causing us to revise some of our estimates."

Challenges To Predicting An Ice-Free Arctic

Just a few years ago, scientists forecast that global warming would clear summer ice from the Arctic Ocean by the year 2100. Now, many forecasts say that could happen in the middle of this century. And Serreze says a few peg that ice-free spell as early as 2030.

"We very likely will live to see ice-free summers in the Arctic," says Marika Holland, of the National Center for Atmospheric Research in Boulder, Colo. "Or if we don't live to see it, our children will."

Holland says nobody can pinpoint a date because Arctic sea ice is hard to predict year to year. That unpredictability has implications for people who are thinking about exploiting Arctic resources and expanding Arctic sea routes.

Enlarge Jackie Northam/NPR

A polar bear makes its way across the ice in Canada's Northwest Passage. Melting ice in the Arctic will make survival increasingly difficult for wildlife in the region.

"Some of these shipping routes will become open much more reliably," she says. "But we're not close to that yet and we can't really predict exactly when that's going to happen."

The sea ice is at the mercy of currents, cloud patterns and a host of other variables that change naturally from year to year.

"We could have instances of very rapid sea-ice loss. Those might be followed for years, or even a decade, by quite stable sea-ice conditions. But it's difficult to predict exactly when these instances of rapid sea-ice loss could occur," Holland says.

Repercussions Ripple Outside Arctic

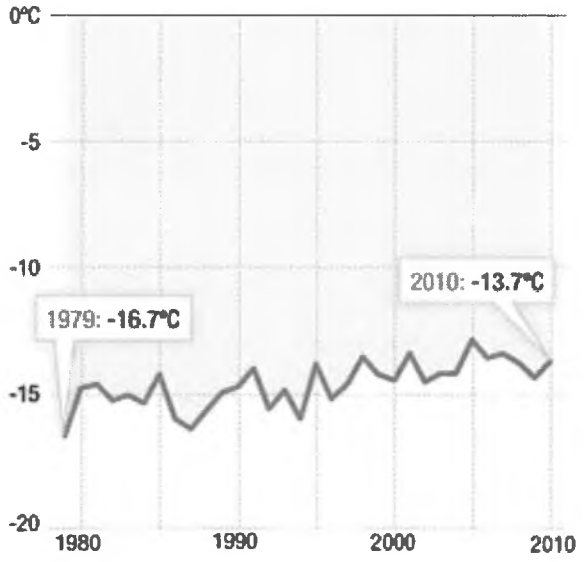
The consequences of melting ice are going to be felt first in the Arctic region. For example, polar bears and walruses rely on sea ice as hunting platforms and places to rest. As those ice edges move out into deeper water, farther from the shore, it will become harder for those animals to survive.

Leonid Polyak, from the Byrd Polar Research Center at Ohio State University in Columbus, says wildlife had to face a temporary warm spell in the Arctic about 8,000 years ago. Then, it was actually hotter than it is today, the result of a temporary change in the Earth's orientation relative to the sun. But this time is different.

"Significant changes in the ice cover will affect the ecological system very profoundly," Polyak says. "And it's not given that many of those species will survive if Arctic ice disappears completely in summer."

Warming In The Arctic

Annual Air Temperatures From 1979-2010



Credit: Stephanie d'Otreppe/NPR

And the changes aren't just going to affect wildlife. The ice serves as a giant reflector for energy. Some 80 percent of the sun's energy bounces back into space when it hits the ice. But when the ice melts and exposes the ocean, that darker surface absorbs 90 percent of the incoming energy. As a result, the loss of ice leads to more warming.

That will drive up the temperature on nearby land masses. In the coming decades, the frozen ground that makes it relatively easy to get around in the Arctic will start turning to mush. And the effects of Arctic warming will gradually reach farther south.

"What happens in the Arctic affects heat waves in Chicago — or elsewhere," Holland says.

And then there's global sea-level rise — an effect that isn't as obvious as it might seem. Because when sea ice melts, it does not raise sea level. After all, lemonade doesn't overflow when the ice that's floating in it melts.

But what happens to the ice that's sitting out of the water, on the Greenland bedrock, is another story altogether.

"If we see this enhanced warming, due to sea-ice loss, we'll very likely start to melt more of the Greenland ice sheet," Holland says. "That water does lead to sea-level rise."

And those global impacts are going to be much more noticeable than the changes in the remote north, which will gradually reshape the Arctic.

In The Land Of White Nights And Erik The Red

by PHILIP REEVES

1 of 6

Some of the world's largest energy and mineral companies are interested in drilling and mining around Disko Bay, off the west coast of Greenland. To date, there have been relatively few such projects on the island because of the harsh conditions. (Photos by Philip Reeves/NPR)

August 17, 2011

text size A A A

For most of history, Greenland has been one of the most remote and inhospitable places on the planet. You would be hard-pressed to find someone who could say exactly where it is, who runs the place and who lives there. But with the Arctic ice retreating, some of the world's largest energy and mining companies are now eager to explore for oil, gas and rare earth minerals. As part of our series on the Arctic this week, NPR's Phil Reeves visited Greenland and talked to the people about the prospects of change. You can hear his reports on Morning Edition. Here are some of his observations during his recent stay in Greenland's capital, Nuuk.

Enlarge Philip Reeves/NPR

Nuuk, Greenland's capital, has 16,000 residents — or about one-quarter of the island's population. It's a town of stark contrasts, home to supermarkets stocked with Italian wines and French cheese as well as shops selling whale skin, blubber and racks of seal ribs.

A drizzling fog has sauntered in from the sea and swallowed up the town. The hour is late. Finally, I have my fingers around the neck of Erik the Red.

Erik was the man who, about 1,000 years ago, gave this giant island the wrong name. He was keen to persuade his fellow Norsemen to leave neighboring Iceland and settle on these shores.

So he talked of a place called Greenland, thinking this alluring billing would surely attract boatloads of Vikings. At least, so say the Icelandic Sagas.

The name was a lie: Greenland was then, and is now, a vast wilderness of ice, snow and rock, most of which is above the Arctic Circle.

Even in its exposed parts, along the coastal fringe, Greenland is more brown than green: I haven't seen a tree.

Greenlanders of the modern age have rewarded Erik's outrageous hype by immortalizing him in liquid form.

Heard On NPR

August 18, 2011
Mineral Companies Eye Greenland's Untapped Wealth
[7 min 46 sec]

August 17, 2011
Greenlanders Divided On Arctic Oil, Gas Exploration
[7 min 46 sec]

In the bars of Nuuk, you can buy bottles of locally brewed "Erik the Red" beer. I have my hand wrapped around one now. A swig of Erik is an antidote to a day spent pounding the streets of this unusual town.

Nuuk lies in a rocky cradle of land, surrounded by jagged mountains beside a cold, clean sea that is ornamented, in the summer, by the occasional shard of passing ice.

A few days ago, two whales were spouting in the steely waters below the wheels of the Fokker 50 propeller plane as we prepared to land in Nuuk from Iceland.

Beyond the town lies a vast, wild network of fjords and glaciers, the plumbing system for the runoff from the gigantic ice cap that covers most of Greenland, the world's largest island and a self-governing dependency of Denmark.

Nuuk is the capital of Greenland, and the town therefore holds itself in high esteem. Yet only 16,000 people live here.

In Greenland, 16,000 is a big number, more than a quarter of the island's entire population — most of whom are indigenous Inuits. The tourist blurb in my hotel calls Nuuk "tiny," but also boasts of a "sprawling metropolis."

One Greenlander I interviewed compared Nuuk with Las Vegas. At least, she says, that is how dazzling the town seems to an Inuit hunter or fisherman when he arrives for the first time from one of Greenland's tiny, faraway coastal villages.

Enlarge Philip Reeves/NPR

Some Soviet-style apartment blocks in the middle of Nuuk are crumbling, reeking and covered in graffiti. Apartments such as these were built in the 1960s and '70s to house Inuit hunters and fishermen forced out of their remote settlements to supply labor for fish factories.

That hunter-fisherman will find that Nuuk has several big, well-stocked stores, including a large supermarket selling Italian wines, French cheese, olives and pineapples.

He will find a shop that sells cuts of whale skin, big lumps of blubber and racks of seal ribs.

If he tours around town by taxi — and he should expect breathtakingly high fares — he will also find a few boutiques, cafes, bars and restaurants, including one that serves surprisingly good Thai food.

During the summer's "white nights," when the sun barely sets, the hoots and howls of drinkers echo into the early hours. Sometimes these chime with the pounding rhythms of a Nuuk rock band. The town has a remarkably active music scene.

Yet Nuuk is not Sin City, not by a long shot. There are just two traffic lights, and much of the time the city is hushed.

A few days in, I find myself wondering why the town is not dying of boredom. Yet the people tell me there is much to do, especially if you have a family. "We celebrate everything that happens in the family," one Nuuk resident told me.

"If it's your birthday, we have a party. If you're setting off to college, there's a party. If you're coming home from college — another party," I was told. There is evidence of this in the local paper. It carries big advertisements announcing the birthdays of children.

Enlarge Philip Reeves/NPR

The tiny fishing village of Maniitsoq is located on Greenland's west coast. The global aluminum giant Alcoa is proposing to build a large smelter there.

Proof of another great passion lies down in the harbor. There is a large fleet of tiny boats in which people sail out in the summertime to explore the fjords. They build cabins, fish and shoot seals. Residents say they fill their freezers with the meat and fish they've killed.

Evidence of Greenland's hunting culture is everywhere. Even the chairs in Nuuk's cheerful little airport are lined with seal fur.

This picture has one big — and, to the outsider, surprising — blemish. Dotted around Nuuk, looking utterly out of place, there are some giant down-at-heel Soviet-style apartment blocks.

They are the product of a program a few decades back, when Inuit hunters and fishermen were forced to move out of their coastal settlements and into Nuuk to provide labor for the fishing industry.

The issue remains a sore point. Greenlanders tend to blame the Danes, their former colonial masters. The apartments are gradually being knocked down, but they remain a nasty scar on an otherwise idyllic landscape.

Erik the Red — the Viking equivalent of a Realtor — would surely have been appalled at these eyesores.

Russia Pushes To Claim Arctic As Its Own

by DAVID GREENE

Enlarge David Greene/NPR

Murmansk, Russia, is the largest city above the Arctic Circle. If Russia follows through with plans to explore for oil and natural gas offshore in the Arctic Ocean, the city and its port could see significant economic benefits.

The Arctic may be the world's next geopolitical battleground. Temperatures there are rising faster than anywhere else in the world, and the melting ice will have profound consequences for the roof of the world, opening strategic waterways to shipping, reducing the ice cap on Greenland, and spurring a rush to claim rights to the wealth of natural resources that lie beneath. NPR examines what's at stake, who stands to win and lose, and how this could alter the global dynamic.

Second in a six-part series

August 16, 2011

text size A A A

Four years ago, Russian researchers made a bold, if unseen, move. From a submarine, deep beneath the icy waters of the North Pole, they planted a Russian flag on the ocean floor.

Russia has the world's longest Arctic border, which stretches more than 10,000 miles. And for Russia, that 2007 research mission was only the beginning of a major drive to claim ownership of vast portions of the Arctic, as well as the oil and gas deposits that are beneath.

Credit: Stephanie d'Otreppe/NPR

At present, Russia has some islands in the Arctic Ocean. But aside from that, the country's northern border effectively ends where the Arctic Ocean begins.

Yet the Russian government is now making the argument that its border should be extended northward. The government says that hidden under the Arctic's icy waters is a mountain range, the Lomonosov Ridge, which goes all the way to the North Pole. They say this shows that Russia continues north below sea level, and the country has scientists in the Arctic Ocean now, collecting evidence for the claim.

On a recent visit, a speedboat raced up the Pechora River in one small part of the vast region. The river cuts through hundreds of miles of empty green and sandy tundra and empties into the Arctic Ocean.

In a small fishing village with a smattering of wooden houses in the Nenets Autonomous Region, Yuri Tyulyubayev, a travel company owner, says many local residents agree with the government.

"People are happy that we have oil because ... we have more work, we have more profit, we have everything," says Tyulyubayev.

Enlarge David Greene/NPR

Nadezhda Lyashenko is a spiritual leader in the Saami tribe, indigenous people who live in Russia's northwest Arctic region. As Russia and other world powers search for oil in the

In many ways, Tyulyubayev is a poster child in Russia's campaign for

Arctic Ocean, she worries about the environmental consequences.

Arctic energy. He arranges travel for the oil industry. So his small company stands to profit if foreign energy companies flock here. His native land of north-central Russia is largely unspoiled.

"It's a very, very reindeer region," he says. "We have more than 150,000 reindeer for 40,000 people."

'They Could Break Everything'

And now, a lot of oil and gas companies. There are Russian firms, but also companies from the U.S. and Vietnam, all exploring for oil and gas onshore. And if Russian leaders have their way, exploration will begin in the Arctic Ocean itself as early as this winter. Tyulyubayev says the more money and business that come to this region, the better.

But what about the risks to the environment?

"Of course we worry. But I would not say that this is the first worry in our life," he says. "Economic life is much more important for people."

Arctic Warming Unlocking A Fabled Waterway

For centuries, the ice-choked Northwest Passage has been prized as a potential trade route.

In The Land Of White Nights And Erik The Red

Change is coming to Greenland, the world's largest island, and its 56,000 residents.

The Russian Arctic has the scars of history. The northwest, around the port city of Murmansk, was pummeled by Adolf Hitler's forces during World War II. The Arctic was also one of Soviet dictator Josef Stalin's favorite places to send his perceived enemies, with gulags that dotted the snowy landscape.

The indigenous people of this region bore much of the brunt. The Saami

In The Arctic Race, The U.S. Lags Behind

U.S. readiness for increased activity in the Arctic is limited, and it's not part of a key treaty.

The Arctic's Diminishing Sea Ice

The Earth is warming, with profound consequences for the Arctic, the roof of the world.

tribe, for one, has lived centuries in Russia's northwest, near the Norwegian border. Saami people were forcibly collectivized on farms under Stalin. Nadezhda Lyashenko, the Saami woman singing traditional tribal music here, can recount the horror stories. Her grandfather, a reindeer shepherd, was shot in 1937, accused of being a spy after he crossed into Finland chasing a reindeer herd.

After decades of relative peace, Lyashenko says, trouble seems to be returning to her native Arctic lands. She sees Russia and other world powers in a race for oil and gas, ignoring the potential impact to a part of the Earth that's been rarely touched.

"The Arctic is just so fragile," she says. "This time, it's a research boat going out there. It's like the prick of a needle, and the land will heal. But if they go with knives, with spears, they could break everything. And then what?"

Putin's Political Gift

Russia has signaled that it means business. The government seems determined to militarize the Arctic, announcing recently that two army brigades — several thousand troops — will soon be patrolling there.

Prime Minister Vladimir Putin, in a speech to the country's ruling United Russia party this summer, vowed to open the Arctic Ocean for offshore development. He announced plans to build a new, year-round port on the Yamal Peninsula in the center of Russia's north coast. Putin said that Russia would consult with other Arctic countries. But, he added, Russia will be "firm and persistent" in protecting its interests.

Enlarge David Greene/NPR

The village of Teriberka, in the Murmansk region of Arctic Russia, is an impoverished and desolate community. Many of the 700 residents are out of work.

Konstantin Simonov, who heads the National Energy Security Fund, a Russian think tank that consults with

oil and gas companies, says the Arctic is a political gift for Putin. As Soviet power fades into memory, Putin can say this is one part of the world where Russia still calls the shots.

"With the help of Arctic, Putin can show to people that Russia is still a serious power," Simonov says.

The risk, Simonov says, is exaggerated expectations. Many of the offshore oil and gas projects are at least a decade away from bringing economic benefit — assuming they succeed.

Yet Russians who live above the Arctic Circle are growing excited. They look to neighboring Norway, or to Alaska, where citizens share in oil profits. And they believe their time has come. Simonov thinks about one desolate village, Teriberka. It's on the coast near the Norwegian border. People there were told that as soon as a new offshore gas deposit, known as the Shtokman field, is explored, the community will get a natural gas processing plant and plenty of jobs.

Enlarge David Greene/NPR

Andrei Udin, 33, works odd jobs around Teriberka — including at this repair shop — but he can't find steady work. He has grown impatient, fearing a natural gas processing plant promised to this community will never materialize.

"I can understand these people because they have no other alternative but to dream that our plans to develop Arctic will be realistic," Simonov said.

Holding On To Hope

To reach the village of Teriberka requires driving 100 miles across empty tundra. It's a place that's struggling. It has dirt roads and

maybe 700 residents who live in old Soviet housing that's crumbling.

According to 33-year-old Andrei Udin, life in Teriberka is depressing. He has tried for years to find real work. Udin likes the tough talk from Putin, the promise to fight for Arctic territory. "What's ours should be ours," Udin says. But after years of delay, he's beginning to wonder if that natural gas processing plant is really coming to Teriberka.

"If I don't have a job, natural gas does nothing for me," Udin says. "I can't exactly use the gas for food." Frustration is growing around this village. People are beginning to say that unless the oil and gas riches will be shared, maybe it's best to leave nature alone.

In The Arctic Race, The U.S. Lags Behind

by MARTIN KASTE

Enlarge Prentice Danner/AP

The U.S. Coast Guard Cutter Healy breaks ice to support scientific research in the Arctic Ocean near Barrow, Alaska, in this file photo from July 2006 provided by the Coast Guard. In addition to the medium-class Healy, the U.S. just has two polar-class icebreakers — one of which will be decommissioned soon.

The Arctic may be the world's next geopolitical battleground. Temperatures there are rising faster than anywhere else in the world, and the melting ice will have profound consequences for the roof of the world, opening strategic waterways to shipping, reducing the ice cap on Greenland, and spurring a rush to claim rights to the wealth of natural resources that lie beneath. NPR examines what's at stake, who stands to win and lose, and how this could alter the global dynamic.

Fifth in a six-part series

August 19, 2011

text size A A A

Seattle is the home of the U.S. Coast Guard's entire fleet of polar-class icebreakers.

Both of them.

Capt. George Pellissier commands both the Polar Sea and the Polar Star. He has spent much of his career on these ships, which were built in Seattle in the 1970s.

"The two ships are almost identical. They were built a year apart. Our design is to break 6 feet of ice continuously, and we can break up to 21 feet of ice," Pellissier says, referring to the thick "pressure ridges" that can form between sheets of ice in the waters north of Alaska, and which can trap and even crush less sturdy vessels.

He takes pride in the fact that these "polars," as they're called, are still among the most capable icebreakers out there — not counting the Russians' big nuclear-powered icebreakers.

But Pellissier admits that if an ice-breaking emergency broke out, America wouldn't have much to offer because, right now, neither polar icebreaker is functional.

Four decades of ramming sea ice will do that. The Polar Star will recover — it's currently being refurbished — but the Polar Sea will be scrapped.

Enlarge Martin Kaste/NPR

U.S. Coast Guard Capt. George Pellissier stands aboard the Polar Sea, one of two of the Coast Guard's polar-class icebreakers. But the ships — built in the 1970s — have seen better days, and the Polar Sea will soon be scrapped.

"I would dearly love to keep them both. I understand the fiscal realities that we're in. It's always sad to actually decommission a ship," Pellissier says.

The U.S. also has a medium-class icebreaker, the Healy, but it's a research vessel and isn't designed to break through ice more than 8 feet thick.

Building 'A Persistent Presence'

The Coast Guard has told Congress it needs at least three medium and three heavy icebreakers. Global warming means more activity in the Arctic, and more civilian vessels are venturing north into harm's way.

In early August, the Obama administration gave a tentative green light to Shell Oil to start drilling for oil in the waters north of Alaska. The U.S. is also in the process of mapping the seafloor north of Alaska, with an eye to claiming more of the continental shelf, and the resources it may contain.

The increased activity means the U.S. could face more challenges to its interests in the polar latitudes. Yet the U.S. isn't party to a major treaty that will shape territorial claims in the region.

Lisa Murkowski, the Republican senator from Alaska, is a big believer in establishing a more persistent U.S. presence in the Beaufort and Chukchi seas, north of her state.

"We are an Arctic nation. And as such, we have responsibilities and obligations in the Arctic," she says.

It's not just about icebreakers; she says it's time for a deep-water port on Alaska's north shore. That is an expensive proposition, she admits, but the U.S. has to protect its interests.

Arctic Warming Unlocking A Fabled Waterway

For centuries, the ice-choked Northwest Passage has been prized as a potential trade route.

Russia Pushes To Claim Arctic As Its Own

Russia has launched a drive to own vast parts of the Arctic, including its oil and gas deposits.

"There are a lot of folks that are looking with great interest at the level of activity by the Chinese up in the Beaufort and Chukchi. And they're wondering, 'What's going on up there?' Because we don't think that they're doing any sightseeing," she says.

Arctic Skepticism

In The Land Of White Nights And Erik The Red

Change is coming to Greenland, the world's largest island, and its 56,000 residents.

The Arctic's Diminishing Sea Ice

The Earth is warming, with profound consequences for the Arctic, the roof of the world.

The big argument for establishing a more "persistent presence" in the Arctic is the expectation that, in the next couple of decades, melting ice will turn the Arctic Ocean into a major commercial shipping route between the Atlantic and Pacific. But Lawson Brigham says that expectation is overblown.

"Most of us that work on this don't believe that's going to happen," says Brigham, a former U.S. Coast Guard icebreaker captain who has a doctorate in polar oceanography. He studies sea ice, and he says people have to remember that even though the ice is rapidly thinning, it's not going away altogether.

"Perhaps during the summertime, today and in the future, there will be a window, a short period of time of opportunity to sail ships across the top of the world," he says. "But as a regular, year-round and just-in-time cargo-carrying system, it's going to be very difficult to do with the ice cover present."

Brigham imagines the time savings would be offset by the ships' slower speed as they watch for rogue ice, and he doubts their insurance companies would consider the Arctic route a good bet.

He is even more dismissive about the much-heralded Northwest Passage through Canada's northern archipelago. He says the ice in those narrow straits and inlets may prove more stubborn than the polar ice cap itself.

"It just gets fused in those islands, and breaks up at various times, and the ice cover is extraordinarily variable from year to year, so it's a hugely variable and complicated place," he explains.

Brigham is also skeptical of the ominous warnings about the Russians and Chinese, and possible conflict over resources in the Arctic — a skepticism shared by Navy Rear Adm. David Titley in testimony to the Senate in July.

"I'm sure many of you have heard in the media, especially a year or two ago, people talk about the Arctic as the 'Wild West,' and it's the 'race for resources.' That really isn't true," he said.

It isn't true, he says, because of the United Nations Convention on the Law of the Sea. Among other things, the global treaty lays out how countries go about claiming natural resources on the ocean floor.

Law Of The Sea, But Not The U.S.

Yet the U.S. Senate has never ratified the treaty, because of anti-U.N. sentiment among some conservative Republicans. Titley says that puts the U.S. in an awkward spot as the Arctic opens up.

"Other countries are frankly looking for the U.S. to show leadership, and it's hard to show leadership in this treaty when we're not a party to it," he said.

It's a common complaint among those who favor more development in the Arctic. Alaska's Murkowski, for instance, wants the Senate to ratify the treaty so the U.S. can extend its claim on the continental shelf north of Alaska, and also so it can participate in the treaty organization's future decisions relating to Arctic resources.

But Steven Groves, an international law analyst at the conservative Heritage Foundation, says that's no reason to embrace the U.N.'s Law of the Sea.

"As a conservative, I believe the United States and the American people have a right to all of [its continental shelf]. They don't have to lay claim to it by being a party to a treaty. They own it already," he says.

Plus, Groves says, the treaty requires offshore oil companies to pay royalties to the international treaty organization, shortchanging the U.S. Treasury. Treaty supporters — the Obama administration among them — acknowledge this, but they're still pressing for ratification, perhaps this fall.

They say as long as the U.S. isn't a party to the treaty, when it comes to shaping the future of the melting Arctic, the U.S. will be stuck on the outside, looking in.

Arctic Warming Unlocking A Fabled Waterway

by JACKIE NORTHAM

1 of 9

The Louis S. St.-Laurent crashes through ice along the Northwest Passage, a series of waterways winding through Canada's Arctic archipelago. Affectionately known as the Louis, the country's largest icebreaker spends most of its time in the Arctic these days dedicated to scientific research. (Photos by Jackie Northam/NPR)

The Arctic may be the world's next geopolitical battleground. Temperatures there are rising faster than anywhere else in the world, and the melting ice will have profound consequences for the roof of the world, opening strategic waterways to shipping, reducing the ice cap on Greenland, and spurring a rush to claim rights to the wealth of natural resources that lie beneath. NPR examines what's at stake, who stands to win and lose, and how this could alter the global dynamic.

First in a six-part series

August 15, 2011

text size A A A

It appears as just a speck on the horizon, a slightly darker shape against a vista of Arctic ice. Soon enough, the ship's bridge makes the announcement: "Polar bear, starboard."

Crew and passengers onboard the CCGS Louis S. St.-Laurent, Canada's largest icebreaker, head to the open deck, binoculars and cameras ready, and watch as the bear lumbers from one ice floe to another, quickly dipping into the inky blue water and effortlessly pulling himself back up again.

Often, a bear will head toward the ship and gaze up at the people gazing down at it, head tilted to one side. The massive creatures don't demonstrate any fear, just curiosity.

That's likely because they rarely see anything like a ship passing through the Northwest Passage, a series of waterways winding through Canada's Arctic archipelago of 36,000 islands. It's midsummer and the first time the coast guard icebreaker, affectionately known as the Louis, is making its way through the ice-choked waters this season.

Enlarge Jackie Northam/NPR

A polar bear approaches the Louis S. St.-Laurent, Canada's largest icebreaker, as it makes its way through the Northwest Passage in mid-July. The ship was on a journey that began in Newfoundland and would ultimately take it to the Beaufort Sea.

But temperatures in the Arctic are rising faster than anywhere else in the world, making the Northwest Passage easier to navigate. As the ice melts faster, the vitally strategic waterway is expected to open up for longer periods of time — an attractive notion for shipping companies hoping to shorten trade routes and gain easier access to economic powerhouses such as China and India, as well as for nations within the Arctic Circle jockeying for vast, untapped natural resources.

'Everything Is Going To Change'

For hundreds of years, the Northwest Passage has been prized as a potential transit route across the polar region, linking the Atlantic and Pacific oceans and greatly reducing transit times for ships that would have relied on the long, southern route through the Panama Canal. In the past, it proved to be a dangerous and difficult waterway, and the chilly Arctic waters hold the wrecks of earlier attempts to navigate the passage.

Andrew McNeill, captain of the Louis, says it's not nearly as difficult as it was when he first started sailing in Arctic waters some 30 years ago.

"My first season here was, it was 36 hours of constant ramming of ice to get through this area. ... There's been times when the ship has had to reschedule events because of delays getting through the passage," he recalls.

In The Land Of White Nights And Erik The Red

Change is coming to Greenland, the world's largest island, and its 56,000 residents.

In The Arctic Race, The U.S. Lags Behind

U.S. readiness for increased activity in the Arctic is limited, and it's not part of a key treaty.

The Arctic's Diminishing Sea Ice

The Earth is warming, with profound consequences for the Arctic, the roof of the world.

As the Louis makes its way through the waterway, it slices easily through the polar ice sheet. It's mesmerizing: Enormous blocks of shimmering ice shoot up, twist onto their sides and bob along in the clear water, regrouping in the ship's wake.

Eddy Carmack, a leading oceanographer with Fisheries and Oceans Canada, has carefully charted the changes in the Arctic since he first visited in 1969. He is part of a diverse group of business, science and government leaders who are traveling aboard the Louis, brainstorming about the Arctic and its future. The ship is wending its way from Newfoundland in Canada's northeast, with stops in Resolute and Cambridge Bay, all the way, ultimately, to the Beaufort Sea off the country's northwest coast.

Carmack says the ice on this voyage looks the same as earlier trips he's made on the Northwest Passage, but it has a different feel.

"I would say what we're experiencing now is softer ice, it's not as formidable, it's yielding to the pressure of the ship, it's breaking easily. And that's because the ice itself is warmer," he says.

Rising air and water temperatures in the Arctic mean there is less ice each year, and for longer periods of time. Steve MacLean, president of the Canadian Space Agency, says that trend is expected to continue throughout the Northwest Passage.

"It's always opened up for the last 15 years for about six weeks in the summer. Now it is expected that period will extend. And because it's going to extend, everything is going to change," MacLean says.

Historically, that season has generally spanned late July into early September — and sometimes as late as October.

Enlarge Jackie Northam/NPR

As Arctic temperatures rise, the Northwest Passage will be open up for longer periods of time. Here, the Louis slices through sea ice.

These longer periods of ice-free waters will likely mean more vessels trying to navigate the narrow straits and channels of the Northwest Passage, including commercial shippers looking for a shortened trade route. Yet only about 10 percent of the Northwest Passage is charted.

Competing Claims In The Region

As the waterway opens up, so, too, does the issue of who controls it. The U.S. and other nations see it as an international waterway that just happens to pass through Canada's Arctic region. Under that premise, Canada would not have the right to deny passage to foreign ships.

But Canada calls the Northwest Passage an internal waterway, and maintains it has the right to regulate and protect the passage. Leona Aglukkaq, Canada's minister of health, is from Gjoa Haven, a tiny town along the Northwest Passage. She says Canada's sovereignty over its land and its waters in the Arctic is longstanding and well-established.

"Our position is that these waters are Canadian, subject to full Canadian regulation and control. And [foreign vessels] only enter Canadian internal waters with the consent of Canada. That's our position; that remains our position," Aglukkaq says.

Last year, Canada released a new northern strategy that emphasized how it would bolster its sovereignty claims. That includes increasing scientific and environmental research of the region, and promoting exploration, along with economic development and governance of the indigenous communities.

Canada is beefing up military operations in the Arctic as well, and is conducting a five-year, $100 million study of the region's natural resources — oil, gas and minerals. It's believed that more than 20 percent of the world's oil and gas reserves are hidden in the Arctic.

Enlarge Jackie Northam/NPR

Much of the Northwest Passage experiences 24 hours of light during the summer months. But as the Louis heads further south toward Cambridge Bay, a sunset appears on the horizon.

David Boerner, a director general of the Canadian Geological Survey, says he believes those figures are generally "in the right ballpark." But he says they're often underestimated because geologists aren't able to conduct enough detailed work to establish the full extent of the resources.

Canada has also been mapping the Arctic seabed to determine how far its land mass, or continental shelf, extends past its visible coastline. This is critical to proving its right to

resources under the water. Canada has until 2013 to present its case to the United Nations. The U.S., Russia and others are doing the same.

Warwick Vincent, director of the Center for Northern Studies at Laval University in Quebec City, says there's a need to quickly put international border and sovereignty agreements into place because development of the region is already taking place. And, he says, it's accelerating.

"Right at this moment, the Arctic is experiencing unprecedented transformation as a result of not only climate but as a result of economic development. So we need those regulations in place, rapidly," Vincent says.

Challenges Remain In Inhospitable Terrain

Even if all of these claims are settled, the Arctic is still an extremely difficult place to operate, says Martin Bergmann, director of Natural Resources Canada's Polar Continental Shelf Program, a key logistical facility for research in the Arctic.

"The Arctic in Canada is basically the size of Europe, has maybe 30 kilometers of roads, no trains, very few airports," Bergmann says, adding that about 30 communities have the capability to land small aircraft on gravel.

Bergmann says sealift — the main form of bringing heavy cargo and larger equipment to the region — only happens "once a year when a ship visits the Arctic, just like Christmas comes once a year."

But the land and the weather are inhospitable, and the waters will stay frozen for much of the year for decades to come. And that, geophysicist Boerner says, makes it extremely expensive to do any kind of work in the area. Given all that, he says, it's

It's an untouched area; very few people come through here still. You feel very humbled and fortunate to experience that.

unlikely there will be a mad rush to the Arctic by oil and gas companies anytime soon.

- Andrew McNeill, captain of the icebreaker Louis S. St.-Laurent

"You don't really know what's there until you've tried to extract it or drill it. ... It's also not sort of who gets there first. There are well-established regulatory regimes for giving out land, and giving the rights to explore and ... a whole bunch of environmental checks and controls and balances," he says.

Given the warming trend, development is inevitable in the Arctic. Yet despite the changes, McNeill, captain of the Louis, says he still feels the magic, and mystique, as he journeys through this pristine, mostly unexplored area.

"It's an untouched area; very few people come through here still," McNeill says. "You feel very humbled and fortunate to experience that, and you can relate to the hardships that those early explorers and traders had to deal with back then."

BOEMRE Awards $5.6 Million for Arctic Environmental Study

Research to Focus on Hanna Shoal Ecosystem in Alaska's Chukchi Sea

WASHINGTON — The Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) today announced it has signed a cooperative agreement with the University of Texas at Austin and a team of highly qualified and experienced Arctic researchers for a comprehensive study of the Hanna Shoal ecosystem in the Chukchi Sea off Alaska's northwest coast. The study will be conducted from 2011-2016 and is expected to cost $5,645,168.

Ongoing studies have highlighted Hanna Shoal as an important biological ecosystem between the Chukchi Sea and Arctic Ocean waters. BOEMRE analysts and decision makers will use the information developed by this study in future *National Environmental Policy Act* analyses and decision-making regarding potential energy development in the Chukchi Sea.

"Over the course of many years, we have devoted substantial resources to promote better understanding of the Arctic environment," said BOEMRE Director Michael R. Bromwich. "This five-year study will greatly contribute to the body of knowledge regarding the biological diversity of the Hanna Shoal area and will provide additional valuable information about the ecosystem that supports marine life."

The main objectives of the study are to identify and measure important physical and biological processes that contribute to the high concentration of marine life in the Hanna Shoal area. The study will document physical and oceanographic features, ice conditions, and information concerning local species. BOEMRE will integrate data gained from this study with other relevant Chukchi Sea studies to provide a more complete understanding of environmental considerations such as food web and contaminant bioaccumulations.

Dr. Kenneth H. Dunton, University of Texas at Austin, will serve as Principal Investigator. His team will include researchers from the Florida Institute of Technology, Old Dominion University, the University of Alaska Fairbanks, the University of Maryland, the University of Rhode Island, and the Woods Hole Oceanographic Institution. BOEMRE will be involved in all phases of the study, including substantial input to the field research design and coordinating with other research efforts in the Chukchi Sea to ensure BOEMRE information needs are met. BOEMRE staff may also participate in field cruises, field data interpretations and analyses, and in writing articles that flow from research that will be conducted under this cooperative agreement.

Although BOEMRE developed the Hanna Shoal study parameters in 2010, the study will also address several issues raised by the U.S. Geological Survey June 2011 report, *An Evaluation of the Science Needs to Inform Decisions on Outer Continental Shelf Energy Development in the Chukchi and Beaufort Seas, Alaska.*

Since the early 1970s, BOEMRE and its predecessor organizations have funded more than $340 million in studies in Alaska. The Hannah Shoal study is one of approximately 40 ongoing studies the bureau's Alaska Region is currently coordinating and managing. The bureau's Environmental Studies Program conducts and oversees world-class, scientific research to inform policy decisions regarding leasing and development of OCS energy and mineral resources.

For additional information about BOEMRE's studies program, see: http://www.boemre.gov/eppd/sciences/esp/index.htm.

Aleutian wave

HAGINAA KIDUL • HELPING TO GROW

Shipping Pollution in the Alaska Arctic

by Steve Sumida and Bruce Wright

With climate change reducing Arctic ice, Aleut and Pribilof people will find themselves living at the crossroads of two shipping lanes - the Great Circle route to Asia and the fabled Northwest Passage. It also means that those of us living in the Bering Sea region will be increasingly exposed to unprecedented levels of virtually unregulated emissions.
Ships in this region are allowed to use high sulfur fuels with 45,000 ppm sulfur - a much higher level than those set in most US waters of 10,000 ppm sulfur content for the majority of bulk fuel blends.

So Alaskan waters are once again the battleground for resolving hydrocarbon pollution. In 1989 the Exxon Valdez spilled crude oil that spread for hundreds of miles in the pristine waters along Alaska's coast. Our understanding at the time discounted oil as little more than a semi-noxious pollutant and a killer of birds. But oil toxicity research funded by the multi-million dollar settlement from the Exxon Valdez Oil Spill Trustee Council changed that almost benevolent view of oil pollution. We now know it is thousands of times more toxic than realized. Marine species have continued to be effected long after that catastrophic spill, evidenced mostly by salmon not returning to spawning streams. Many other birds and mammals were also harmed or killed.

The pollution caused by burning high sulfur fuels can have the same toxic effects.

Large container ships, tankers, bulk carriers, cruise ships and Lakers are significant contributors to air pollution in many of our nation's cities and ports. There are two types of engines used on large ships: main propulsion and auxiliary engines. The main propulsion engines on most large ships are "Category 3" marine engines with displacement greater than 30 liters per cylinder, which can stand over three stories tall and run the length of two school buses. Auxiliary engines on large ships typically range in size from small portable generators to locomotive-size engines.

Studies by the Environmental Protection Agency determined that emissions from large marine vessels burning bunker fuel within 200 miles of the U.S. west coast shore can result in serious impacts to human and environmental health as well as permanent environmental degradation as far inland as the Grand Canyon. As a result, the United States negotiated an international law preventing emissions from this fuel anywhere within 200 miles of the U.S. coast - except for the regions from the Alaska Peninsula, through the Aleutians and Pribilof Islands, western Alaska and along the Arctic coast. These regions remain exposed and unprotected to bunker fuel burning up to 45,000 parts per million sulfur content and unprecedented levels of virtually unregulated emissions. This at a time when the EPA requires all fuel for small marine vessels, highway, and non-road diesel engines including locomotives to be limited to 15 ppm sulfur content.

Plant Reports

Atka Pride Seafoods

2010 was the first year of operations following the major plant renovation that took place between 2008 and 2010. Celebrating the preseason and the reopening of APS, a BBQ was held in May of last year attended by community members and staff. APS's operating season went smoothly, although longer than usual due to fishing difficulties caused by weather. While major repairs were being made to the APS dock last season, offloading and transport from the Atka city dock to the plant proved to be highly successful; our thanks and appreciation to the city. APS managers Larisa and Jimmy Prokopueff attended the Boston Seafood Show along with Shore Side Operations Manager Ken Smith and Shore Side Operation Specialist Kevin Gramson in mid-March. The Boston show assists the Shoreside Division of APS and BPS in the continual creation of a cutting edge production team. APS will begin hiring processors in April and the 2011 production season begins on May 1st.

APS 2010 Production Highlights:
310,967 lbs. halibut H&G.
38,239 lbs. skin on/off of halibut fillets.
121,947 lbs. sablefish.

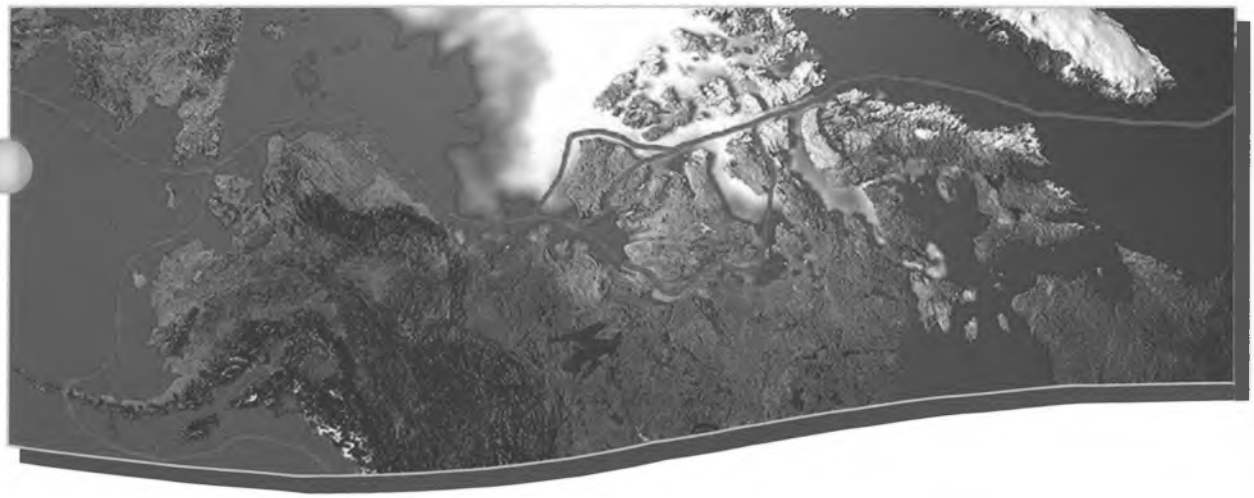
Bering Pacific Seafoods

2010 marked the third year of operations for BPS. Improvements to power generation and refrigeration systems during the previous offseason proved to be a success and BPS operations are showing continual improvement on a yearly basis. A test program of value added production showed a reasonable amount of success last season and the program is being taken into consideration for the 2011 production season. BPS, along with APS, will be looking to purchase higher quantities of halibut and sablefish during the 2011 season. Bering Pacific Seafoods will open this year on June 7th.

BPS 2010 Production Highlights:
485,811 lbs. of salmon processed.
242,962 lbs. processed in July.
15,000 lbs. of value added Sockeye fillets.

Work at APS and BPS this summer!

Hiring for Atka Pride Seafoods will begin in April and in May for Bering Pacific Seafoods. Local residents of Atka and False Pass as well as other regional community members are encouraged to apply. If you are interested in working as a processor in one of these great locations this summer, please contact APICDA Human Resources at (888) 927-5273.
See page 11.



Shipping Pollution in the Alaska Arctic

continued...

The EPA does not have any emissions monitoring stations in the Aleutian region. But the number of vessels moving through Unimak Pass is large and increasing, so we can't begin to know the exposure level to people living and working in the Bering Sea region.

We do know increased shipping activity and lack of emission controls over sulfur will contribute to the serious problem of ocean acidification and nutrient enrichment in the North Pacific Ocean through significant increases of nitrogen and sulfur deposits.

By 2020, international shipping is expected to account for 10 to more than 25 per cent of total annual sulfur deposition along the entire Atlantic, Gulf of Mexico, and Pacific coastal areas of the U.S. The impact of these deposits will extend inland for hundreds of kilometers. This means International shipping will contribute to total annual sulfur deposition not only along all U.S. coastal areas, but throughout the entire U.S. land mass, impacting sensitive terrestrial and aquatic ecosystems in the vast interior and heartland regions.

Researchers with a U.S. Forest Service study conducted in Southeast Alaska found evidence of sulfur emissions impacting lichen communities.

The authors concluded that the main source of sulfur and nitrogen found in the lichens in likely the burning of fossil fuels by cruise ships. Lichen are an important food source for caribou and there is a probability that large vessel emissions are damaging lichens and impacting the southern Alaska peninsula caribou hear which is an important food source to local subsistence-based cultures. This heard has been decreasing in size, has poor calf survival and low pregnancy rates which has resulted in the current ban on caribou hunting in this region. One can only imagine the effects these emissions are having on the dwindling Bering Sea fishing stocks.

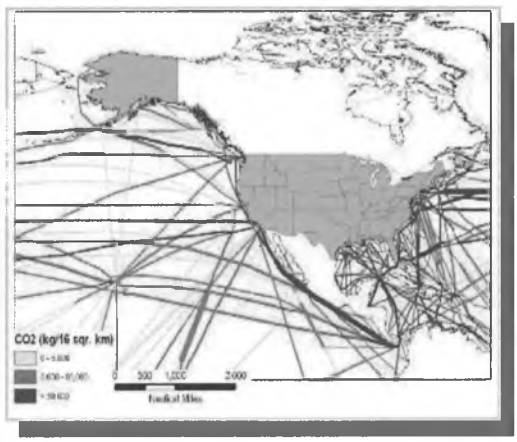
Nature Conservancy

Everette Anderson presenting the CDQ overview for APICDA

On November 16 - 17, 2010, Everette Anderson represented APICDA at an event entitled, "Fisheries Management in an Ecosystem Context: An exchange between the Humboldt Current and the Eastern Bering Sea" held by the Nature Conservancy in Seattle, WA.

The purpose of the event was to discuss the opportunities and challenges of adopting ecosystem based management principles into large scale fisheries. While on opposite hemispheres and possessing unique ecosystems, the Humboldt Current (anchovy/sardine fisheries) and Eastern Bering Sea share the distinction of hosting the world's largest scale fisheries. These fisheries are facing similar issues including the use of quota systems, monitoring, certification, and optimizing profits while providing biomass for top predators and other species. Investigation and understanding the challenges and opportunities for adopting ecosystem based management principles in large scale Pacific pelagic fisheries were explored. The meeting focused on exchanging information regarding:



- Management approaches taken in the anchoveta and Eastern Bering Sea Pollock fisheries that attempt to optimize profits in the fishery and biomass in the sea for top predators and other species.
- How the needs of local communities and artisanal fishermen can be integrated into the management framework of large industrial fisheries.
- The key components and collaborative approaches needed to design and implement effective monitoring systems in large industrial fisheries.

Chilean delegates discussing anchovy fishery issues

CDQ & IFQ : Sablefish

CDQ and IFQ Sablefish Harvest totals for CY2010

BS/AI CDQ Sablefish
BS CDQ:125,332 round pounds

Harvested: (99%) 120,873 net pounds

Area 4D IFQ Halibut:
53,576 net pounds
Harvested: 22,371 net pounds

Tourism

Ugludax Lodge, LLC

When APICDA first started marketing reindeer hunts in the Aleutians, it was admittedly a small and limited operation. Initially, we offered a few guided hunts on Umnak Island out of the Ugludax Lodge in Nikolski. After enjoying a moderate level of success, APICDA management knew that Nikolski could provide world class reindeer hunts to a much larger group of hunters - If marketed properly.

Our marketing opportunity came in 2009, when Tourism Division management formed a partnership with world renowned big game hunter Jim Shockey. Since partnering with Jim Shockey's hunting adventures in 2009, the Tourism Division has been able to turn both Atka and Umnak into world class reindeer hunting destinations. Currently, both locations are booked through 2013!

On a yearly basis, we now offer 7 day hunts, 16 in Umnak and another 10 in Atka. We have enjoyed a high level of success in both locations due in part to excellent marketing by Shockey's team but also due to the hard work of the local community residents, team members, and tourism management. To further sales and promote tourism in our region by increasing name recognition through networking, APICDA attended hunting and fishing trade shows in Dallas, Reno, Miami, and Long Beach in early 2011.

In the future, we hope to expand our hunting and halibut fishing operations in Atka to the level that we operate on Umnak. One of the goals in the expansion of the Atka operation is to build a cabin that would house hunting and fishing clients during their stay. Presently, APICDA has secured local housing for clients.

For questions, pricing, and scheduling please contact us at (888)430-8329 or visit our website at www.aleutianadventures.com.

Umnak Island Tourism Highlights for 2010:

-The Ugludax Lodge in Nikolski welcomed seven fishermen and fourteen reindeer hunting clients in 2010.

-Ugludax is a fully equipped hunting lodge with cedar finished bedrooms, private decks, panoramic views of the island, and home cooked meals.

-A new tent camp was constructed on Umnak which serves as a field site for hunters. The tent camp will eventually be upgraded to a modest cabin.

-Film was shot for episodes of *Jim Shockey Adventures* on Umnak and Atka during hunts with Barbara Crown, Eva Shockey, and Shockey Adventures VP of sales and marketing Dan Goodenow. The shows will air on the Outdoor Channel this year.

-Editor Barbara Crown wrote about her Umnak reindeer hunting experience in the November 2010 edition of the Hunting Report. To read about the hunts in a condensed online version please see:
http://www.huntingreport.com/temp_Adventure_In_The_Aleutian_Islands_Alaska_10_28_2010.cfm

To read more about the lodge and hunts please see:
http://www.nikolskiadventures.com/

Aleutian Adventures Highlights for 2010:

Nelson Lagoon:

The Sapsuk River tent camp was completed last season. The Steelhead Camp received major upgrades, including a cook tent, bathhouse, outhouse, and interconnecting decks between tents. The camps welcomed twenty-nine fishermen and five duck hunters.

The 2011 fishing and hunting seasons in Nelson Lagoon are well on their way to being successful as well. Presently, there are ten fisherman and eight duck hunters booked.

Atka

There were four reindeer hunters to visit Atka in 2010, among them Barbara Crown from *The Hunt Report*. An episode of *Jim Shockey Adventures* was also filmed on Atka and will be aired on the Outdoor Channel this year. For more information about Aleutian Adventures, Nelson Lagoon, and Atka please visit our website http://www.aleutianadventures.com/index.html

A SHORT HISTORY OF ST. GEORGE

The St. George Community's relationship with the federal government began with the purchase of Alaska from Russia. The Aleut residents of St. George were slaves/wards of the U.S. government as their labor was required for the commercial fur seal industry. As such, residents were not allowed to leave the Island by the US Government for medical, educational or other needs the residents deemed necessary without government permission. Aleut residents employed in the fur seal industry did not earn a daily wage for their work but instead were given staples that were allotted to them on a weekly basis depending on family size. Residents that defied the US Government and left the Island were not allowed back to the community and lost their jobs and homes.

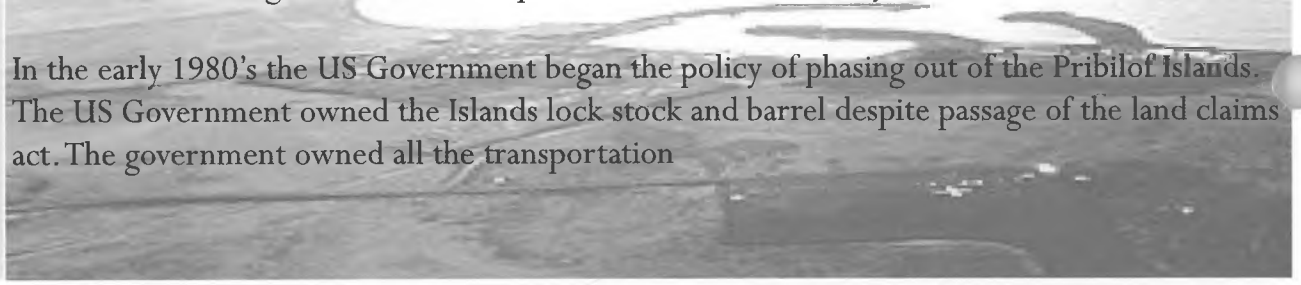
In the early 1960's the US Government initiated a policy to terminate the community of St. George, wanting instead to consolidate both St. George and St. Paul into one community. Residents of St. George were offered jobs and housing in St. Paul if they agreed to move from St. George. Many families did move, although many more protested and refused to move. The homes of the families that did move were bulldozed and burned to the ground to reinforce the US Government policy at the time.

Then State of Alaska Representative Carl Moses flew to St. Paul to campaign and visit his constituents. The US Government representative at the time met the plane and refused to allow Carl Moses to leave the plane stating these residents were not State of Alaska voters. Carl Moses was forced to leave and he started a protest that was heard in the halls of Washington DC and elsewhere. Howard Rock, the Publisher of the Tundra Times, published an article in his newspaper describing the plight of the Aleuts in the Pribilof Islands. Immediately, Congressional hearings were held by then US Senate "Bob" Bartlett that led to the Fur Seal Act of 1966. Thereafter, residents were allowed to vote, earned a civil service wage with benefits and more importantly not forced off St. George Island.

The ensuing years to 1983 were not much better. Commercial Fur Sealing was ended in St. George in 1972 and the tree huggers started in earnest with their attempts to stop the commercial harvest altogether. The only mode of transportation off St. George was by ship four times a year and the US mail was dropped out of Coast Guard planes

In 1968 St. George residents built a small airstrip on their own time without compensation or federal funding. But, the first plane did not arrive until January, 1971 when a US Navy plane (an albatross) was in St. Paul during Russian Orthodox Christmas with US Senator Ted Stevens. When the navy co-pilot refused to fly to St. George from St. Paul, co-pilot Ted Stevens flew by himself to St. George with Christmas presents for the community.

In the early 1980's the US Government began the policy of phasing out of the Pribilof Islands. The US Government owned the Islands lock stock and barrel despite passage of the land claims act. The government owned all the transportation



infrastructure, the homes, and public utilities. All of this was slated for transfer to the Islanders. St. George prepared for the phase out by incorporating a City Government on September 13, 1983 and on October 28, 1983 the US Government ceased to operate in the Pribilof Islands.

As part of the termination of government control on the islands, a Memorandum of Understanding between the federal government, the state of Alaska and the communities of St. George and St. Paul was signed that recognized the special needs for infrastructure on the islands. This recognition acknowledged that transition to a non-fur seal economy required access to fishery resources, which could only occur if safe harbors were constructed in both communities.

Planning for the St. George harbor project started in 1982. Site investigation, geotechnical and bathometric data were collected and analyzed and presented to the City in 1983-1984. In 1984 the City of St. George authorized bidding on the project and subsequently awarded a contract for construction in September of 1984. The contractor was unable to accomplish the terms of the contract in 1986. The City of St. George, thru force account, purchased the contractor's construction equipment and mined armor rock in 1986 and 1987, constructing the three North, South and Inner breakwaters.

In 1988 two docks were constructed along with a mooring dolphin by force account.

In 1989 the City issued General Obligation Bonds of $3 million (after the State refused to fund the project despite signing a MOU with the Feds and local entities recognizing the special needs under the federal phase out in 1983) to match the Corps $4 million under the Section 104 dredging program. The Corp awarded a contract in 1989 for dredging of the St. George harbor. The dredging project was substantially completed in late summer of 1990. The contractor failed to dredge to design depths in the entrance channel leaving high spots of -18.8 feet. That failure allowed the Corp to maintain that the Corp had no legal responsibility for maintenance dredging. The contractor subsequently sued the Corp for cost overruns on the project. In Federal Court the Contractor prevailed with an award of $1.2 million by the judge -- the irony is the City owes the Corp for the claim award.

Since completion of dredging in 1990, opilio and bairdi crab processing occurred in the St. George Harbor from 1990-2001. In 2004 a major storm event damaged the South Breakwater Arm and deposited sand in the entrance channel. The harbor had limited function and vessels could not utilize the harbor for crab processing under the newly implemented crab rationalization program. The City of St. George declared a disaster and the harbor was included in the federal disaster DR-1571. FEMA funding was applied for and FEMA made available to the City $8 million to repair the damage. The South Breakwater was repaired with approximately 15K cyds of armor rock placed in 2006 and the entrance channel was dredged this spring with 12K cyds of sand removed from the channel. And they lived happily ever after.....

2011 APICDA Scholarships

Congratulations, 2011 Spring Higher Education Scholarship Recipients!
A total of $54,594 was awarded in scholarships to the following students for the spring semester. APICDA is very proud to give these awards and to assist you in earning your education.

Recipient	School	Community
Sarah Bereskin	University of Alaska Anchorage	Akutan
Theresa Bindley	Wenatchee Community College	Unalaska
Kelsey Clark	Brigham Young University	Unalaska
Chase Guitard	Lake Washington Technical College	Unalaska
Jake Herring	University of Oregon	Unalaska
John Honan	George Fox University	Unalaska
Susan Honan	George Fox University	Unalaska
Michelle Kashevarof	Mat-Su College	St. George
Evangelina Kenezuroff	University of Alaska Anchorage	False Pass
Chantae Kochuten	University of Alaska Anchorage	False Pass
Nadine Kochuten	University of Alaska Anchorage	False Pass
Renee Kochuten	University of Alaska Anchorage	False Pass
Alicia LaPlant	Central Washington University	Unalaska
Brittany Larson	Rocky Mountain College, Montana	Unalaska
Delores Gregory	University of Alaska Fairbanks	Unalaska
Okalena Lekanoff-Gregory	University of Alaska Fairbanks	Unalaska
Tracy Lekanof	University of Alaska Anchorage	St. George
Derrick Magnusen	Seattle University	Unalaska
Jblynn Magpantay	Gonzaga University	Unalaska
Samantha Mierzejek	University of Alaska Anchorage	St. George
Carlene Moller	Northwest University	Unalaska
Anna Myrgorod	American University, Washington DC	Unalaska
Perfina Pletnikoff	University of Jyvaskyla, Finland	St. George
Jack Pound	Seattle University	Unalaska
Christopher Price	Alaska Pacific University	Unalaska
Nikita Robinson	University of Alaska Anchorage	Unalaska
Aidee Rodriguez	University of Alaska Anchorage	Unalaska
Julie Rowland	University of Alaska Fairbanks	Unalaska

2011 Spring GPA Scholarship Recipients

Students earning a GPA of 3.5 or greater
who received an additional $500 scholarship.

John Honan
Evangelina Kenezuroff
Chantae Kochuten
Aidee Rodriguez
Julie Rowland
Anfesia Tutiakoff

Construction

Various APICDA facilities will undergo energy efficiency audits this year beginning with Bering Pacific Seafoods. The energy audits will establish an energy consumption baseline which will allow APICDA to pursue grants for renewable energy projects. A generator waste heat recovery system to reduce fuel consumption will also be installed at BPS.

The first construction crew of the season headed out to False Pass in March to begin preseason improvements. Improvements will include expanding the size of the blast freezers to allow for an increase in production capacity; enhancements to the cold storage area; a reinforced ice bin and installing an ice chute. In addition to improvements in the main plant, the BPS multi-purpose building will have new work and storage areas added. The 80'x 50'structure is currently undivided and separate rooms for a machine shop, welding area, carpentry shop, and tourism storage will be partitioned out.

Preseason improvements to Atka Pride Seafoods have also begun including improvements to the blast freezers and upgrades to the processing line.

Human Resources

-Steven Kashevarof, Assistant to the General Manager of Shoreside Operations
Steven was hired in October of 2010 and will be working with the GM of Shoreside Ops, Ken Smith, in the Anchorage office and in-region.

-Kevin Gramson, Shore Side Operations Specialist
Kevin became a permanent employee in October of 2010 after having worked as an invaluable productions consultant for APICDA for three years; he will work in production and sales.

-Alvin Merculief, Port Engineer
Alvin joined the APICDA team in January of 2011 as the new Port Engineer for APICDA Vessels and will be working in Anchorage, Homer, and in-region.

To read more please see: http://www.apicda.com/staff_members.html

Bon Voyage Joe!

Joe Kyle resigned as APICDA's Chief Operating Officer and Chief Financial Officer in early January. Joe has been with APICDA since its formation in 1992. He played an invaluable role in making APICDA what it is today. We will miss Joe, and wish he and his wife Lisa the very best in the future.

Rob Smith has been named as the new Chief Financial Officer. Rob has been APICDA's controller for the past fifteen years. We are confident Rob will do an excellent job in his new position.

Welcome aboard Don!

We are pleased to announce that Don Beeson has been hired as the Chief Operating Officer for APICDA Joint Ventures, Inc. Don worked for Icicle Seafoods for 21 years in a variety of positions including plant manager for Icicle's Homer facility and manager of Icicle's Arctic, Yukon and Kuskokwim operations. For the past ten years Don has been the project manager for a company constructing multiple housing developments. We had a number of very good applicants. Don had the right mix of skills and experience for this particular job. As COO, Don will oversee and manage seafood harvesting/processing and construction/ maintenance operations. Don started at APICDA's Anchorage office April 11th.

Congratulations Desiree!

Desiree Merculief of St. George, daughter of Chris and Sally Merculief, was named the 2011 Fur Rondy Queen. See: http://www.adn.com/2011/02/16/1707124/fur-rondy-2011.html#id=1707122&view=large_view

Welcome Katie Johnson!

Katie joined the APICDA team this March as Nelson Lagoon's newest Community Liaison Officer.
She may be reached at nelsonlagoonclo@apicda.com. For more information about APICDA CLO's please visit our website at http://www.apicda.com/clos.html

Human Resources

APS and BPS Processors Job Announcement!

Atka Pride Seafoods, Inc. is currently accepting applications for seafood processors for their halibut and sablefish processing plant in Atka, AK.

Rate of Pay: $ 9.00 per hour
Start Date: May 1, 2011
A 90 day employment agreement is required for the season. Transportation to and from the job site is provided with a completed agreement. Room and board is also provided. For more information or to submit an application, please contact:
Human Resources Laura or Becky 1-888-927-4232

Bering Pacific Seafoods is accepting applications for seafood processors for their salmon fish plant in False Pass, AK

Rate of Pay: $ 9.00 per hour
Start Date: June 1, 2011
A 90 day employment agreement is required for the season. Transportation to and from the job site is provided with a completed agreement. Room and board is also provided. For more information or to submit an application, please contact:

CAMP COOK

This position is located in Nelson Lagoon, Alaska and will cook for 4-6 salmon sport fish clients and crew at the remote river camp site. Trips are approximately 3 days long at the camp site and 1-2 days in town preparing for the next trip. Applicants must have 2 years previous cooking experience, valid Alaska Food Worker Card, excellent time management skills, willing to work in remote locations, excellent customer service skill, motivated, organized and a self-starter.

Duties include:

- ☐ Preparing a hot breakfast, bag lunch and hot dinner each night at the camp.
- ☐ A menu guide will be provided for this position.
- ☐ Prepping food for camp while in town
- ☐ Assisting guides in preparing gear and food for trips to camp
- ☐ Being part of the team that ensures clients enjoy their stay with Aleutian Adventures!

Position Begins mid-June until mid -September.
Rate of Pay is: $2,500 per month DOE plus tips
Transportation to and from work site and lodging is provided.

LODGE COOK

This position is located at The Ugludax Lodge on Umnak Island in the village of Nikolski. This position is responsible for cooking for 6-8 hunting clients and crew. Applicants must have 2 years previous cooking experience with menu planning, valid Alaska Food Worker Card, excellent time management skills, willing to work in remote locations, excellent customer service skill, motivated, organized and a self-starter.

Duties include:

- ☐ Menu planning and ordering food
- ☐ Cooking three family style meals a day for 6-8 people
- ☐ Baking and preparing appetizers for clients
- ☐ Housekeeping duties for the lodge
- ☐ Being part of the team that ensures clients enjoy their stay with AleutianAdventures!

Position Begins mid –September through November 1st.
Rate of Pay is: $3,000 per month plus tips
Transportation to and from work site and lodging is provided.

collaboration, cooperation, & communication
Industry must work with b/w industry agencies,
locals, feds. Feds must fund

www.arcticoilspill.org

About the Alaska Forum on the Environment - A 501(c)(3) Non-Profit

Our Organization:

The Alaska Forum, Inc. was initially formed to support an annual education event, the Alaska Forum on the Environment, which celebrates its 13th year in 2011. This widely recognized event began in 1990 as the Alaska Federal Facility Environmental Roundtable; an annual conference focused on contaminants, hazardous waste cleanup, hazardous materials management, pollution prevention, etc., at federal facilities. It was expanded by an agreement called the Statement of Cooperation between the leadership of environmental regulators, military departments, and federal agencies. The Alaska Forum on the Environment– the Alaska Forum, Inc. operates as a 501(c)(3) non-profit organization to support this annual educational event and to extended our mission to promote effective cooperation, communication, and education in Alaska.

Our Process:

The Alaska Forum on the Environment results from the efforts of a diverse group of organizations that serve as our Planning Committee and seeks to provide an open exchange of ideas and information in a respectful and courteous atmosphere. The structure of the event allows the opportunity to reach a greater understanding of the issues and of each other among the full range of participants: rural and urban; industry and private; agency and public; students and scholars; ...and those who are just plain interested in the environment!

Our event is successful with the dedicated support of volunteers using a team approach that is respectful of the diversity of opinions and perspectives of all Alaskans.

We actively seek agenda input throughout the planning process. While most topics are informational, others present more complex issues and challenges facing environmental, corporate, and regulatory agencies in Alaska. We actively work to best address all issues including those that are complex by structuring sessions to encourage problem solving and present diverse perspectives and alternative viewpoints. We encourage the opportunity for an informed and respectful dialogue with all of our presenters.

The Alaska Forum on the Environment, and other Alaska Forum programs and projects do not take political or advocacy positions. The result is a hugely diverse agenda, with over 80 Breakout Sessions and four Keynote Events. Topics and the presenters range from Alaska's communities, to federal, state and tribal government agencies; international organizations and governments; to those specialized in technical science and the environment.

If you are interested in helping to shape the agenda of the Alaska Forum on the Environment, please contact us: your support is welcome!

Our Funding:

The Alaska Forum on the Environment is a 501(c)(3) non-profit organization. Approximately 40 percent of our funding is provided in voluntary contributions and sponsorships by our leadership partners. Our leadership partners are organizations that invest both staff resources and funding in the Alaska Forum on the Environment. Eight percent of our funding is invested by leading Alaskan industries and businesses. The remaining 52 percent of event funding is derived directly from participants through event registration fees. We regulate organizational and sponsor contributions to ensure that our funding sources represent the diversity we strive to achieve within the Alaska Forum on the Environment.

Our Commitment:

The Alaska Forum on the Environment actively solicits partners that can provide constructive input in our team approach. We value the individuals and the organizations that work with us in a statewide spirit of cooperation to achieve this premier event. We believe that we can find positive ways to maximize environmental benefits through cooperative approaches, partnerships, and the sharing of information and ideas in a respectful forum. We believe that effective communication can provide the foundation for Alaska's environmental community. Our mission is to promote a healthy environment through communication and education; and we welcome support from those who share in this goal.

The Alaska Forum on the Environment Mission

"Alaskans working together to promote a clean, healthy environment through communication and education."

The Alaska Forum and our programs or projects will not take political or advocacy positions. The Alaska Forum works to promote a more productive and efficient relationship between government agencies, businesses, organizations, tribes, and the public by:

- developing a more common understanding and educational foundation;
- providing opportunity for the exchange of information and experiences; and
- understanding the diversity of opinions and concerns of others.

Leadership Partners & Exhibitors 2011

Leadership Partners

Leadership Partners (Providing In-Kind and Financial Support)

Alaska Native Tribal Health Consortium
BP Exploration, Alaska
Canadian Consulate
ConocoPhillips Alaska
Knik Tribal Council
Oil Spill Recovery Institute
Prince William Sound Regional Citizens' Advisory Council
US Air Force, 11th Air Force
US Bureau of Ocean Energy Management, Regulation and Enforcement
US Coast Guard, District 17
US Department of Interior
US Environmental Protection Agency, Office of Policy
US Fish & Wildlife Service
US Forest Service, Alaska Region
US National Park Service
US Natural Gas Transportation Office
US Navy Region Northwest

Leadership Partners (Providing In-Kind Support)

Alaska Department of Environmental Conservation
Alaska Industrial Development and Export Authority
Alaska Native Science Commission
Alaska Pacific University
Cascadia Green Building Council
CH2MHill
Ecology and Environment
HDRinc
Mat-Su Borough
National Wildlife Federation
Resource Development Council
University of Alaska, Fairbanks - Cooperative Extension Service
University of Alaska
US Air Force, Alaska Command
US Army Corps of Engineers
US Environmental Protection Agency, Region 10

Exhibitors

USDA Natural Resources Conservation Service
Alaska Forum on the Environment
Total Reclaim
Alaska Community Action on Toxics
Bethel Services
National Snow and Ice Data Center
611 Civil Engineer Squadron
Division of Coastal and Ocean Management
Alaska Native Tribal Health Consortium
Alaska Marine Science & Fisheries Career Coalition
Institute for Tribal Environmental Professionals
Fairbanks Soil and Water Conservation District/AACD
Jacobs Engineering
UAF Bristol Bay Campus
Alaska Pacific University
Prince William Sound RCAC
Office of the Federal Coordinator
Rural Alaska Fuel Services
US EPA/Office of Environmental Information/Analysis
Alaska Center for Climate Assessment & Policy
Scenarios Network for Alaska & Arctic Planning
Summit Consulting Services, Inc.
TTT Environmental
Tok Welding
SGS North America
TestAmerica
BGES, Inc.
AK Dept. of Environmental Conservation
Alaska Native Tribal Health Consortium
Alaska Dept. of Fish & Game and US Fish & Wildlife
Rural CAP
US Navy
Dept. of Defense - Native American Lands Environmental Mitigation Program (NALEMP)
UB International
Renewable Resources Foundation
R-Valued Homes Ltd.
Environmental Management
Alaska Conservation Alliance
Youth Booth
Defenders of Wildlife
US Army Corps of Engineers
Cook Inlet RCAC
US Environmental Protection Agency, Region 10
Center for Alaskan Coastal Studies
Ridolfi, Inc.
Green Star
Bureau of Land Managment
Pew Environment Group's US Arctic
US Forest Service
University of Alaska, Fairbanks - Cooperative Extension Service

Skip Bourgeois, Coffman Engineers ..... "AVEC Wind Turbine Foundation Designs"

Skip Bourgeois, Coffman Engineers ..... "Biomass Boiler System for the Delta-Greely School District"

Sunny Castillo, Soil Conservationist, Natural Resources Conservation Service..... "Biochar and its Benefits in Rural Alaska"

Chet Chambers, Sustainable Energy Technician, UAF Bristol Bay Campus ..... "The Passive Office"

Heather Lawrence, Savannah College of Art and Design..... "Reconnecting with Nature"
Winner, International Composting Awareness Week Poster Contest

Rachael Wadsworth, M.S. Candidate, UAF..... "Ecosystem-Based Management of Living Marine Resources in the Aleutian Islands Region"

Marilyn Sigman, The Alaska Center for Ocean Science..... "Traditional Knowledge and Climate Change"

YOUTH POSTERS

Alaska Youth for Environmental Action (AYEA), Dillingham, Emmonak, Fairbanks, Togiak, Yakutat ..... "Teens Fighting for Wild Salmon"

Cordova High School and the Copper River Watershed Project, Cordova..... "Odiak Pond Field Study"

Cordova High School Science Club, Cordova..... "Biogas Digesters Using AK Lake Mud"

Cordova High School Science Club, Cordova..... "Building a Wind Turbine"

Cordova High School Science Club, Cordova ..... "Converting Plastic to Oil"

EcoLogical Team, Homer ..... "Reduce, Reuse, Recycle Runway"

EcoLogical Team, Homer..... "Presidential Environmental Youth Award (PEYA) Winning Recycle and Waste Reduction Project"

Homer Flex High School, Homer ..... "The Garden of Eatin'"

Matanuska-Susitna Career & Tech High School, Wasilla ..... "Alaska Climate Research Using Tree Phenology"

Metlakatla High School, Metlakatla..... "Metlakatla High School School-to-Work"

Martin L. Olson Schools, Golovin..... "3 Girls Campaign-Changing Habits for a Healthier Tomorrow"

National Park Service Rivers, Trails, and Conservation Assistance Program, Anchorage ... "State and National Youth Environmental Award Programs"

National Park Service Rivers, Trails, and Conservation Assistance Program, Anchorage .. "Youth Environmental Engagement Opportunities in Alaska"

Polaris K-12 School, Anchorage ..... "Measuring Fish Food: Relative Abundance and Sizes of Macroinvertebrates in Anchorage Creeks"

Polaris K-12 School, Anchorage..... "Getting Un-Energized"

Rebels to the Pebble, Dillingham..... "Rebels to the Pebble"

The Center for Alaskan Coastal Studies, Homer..... "Youth Environmental Stewardship (YES) Camp"

2011

Board of Directors & Staff

Board of Directors

Officers and Directors:
Vivian Melde, Ecology and Environment
Greg Goodale, Mat-Su Borough
Thomas Manson, ConocoPhillips
Pat Lavin, National Wildlife Federation
Patricia Cochran, Alaska Native Science Commission
Kurt A. Eilo, Alaska Forum

Ex-Officio Officers: (non-voting)
Doug Mutter, Department of the Interior
Carl Gysler, Federal Aviation Administration

Staff

Executive Director: Kurt Eilo
Deputy Director: Paula Conru
Karen Kroon, Program Manager
Peter Melde, Program Manager

Planning Committee

Susan Alexander, US Forest Service
Tommie Baker, 611th Civil Engineer Squadron
Jessica Beecher, US Fish & Wildlife Service
Jason Brune, Resource Development Council for Alaska, Inc.
Meg Burgett, UAF- Cooperative Extension Service
Izetta Chambers, Alaska Sea Grant Marine Advisory Program
Laurel Devaney, US Fish & Wildlife Service
Susan Erben, Alaska Department of Environmental Conservation
Santina Gay, US Environmental Protection Agency
Lisa Geist, US Army Corps of Engineers
David Guest, US Environmental Protection Agency
Katharine Heumann, Alaska Department of Environmental Conservation
Cory Hinds, CH2MHill
Timothy Hoffman, Alaska Department of Environmental Conservation
Doug Huntman, Alaska Department of Environmental Conservation
Rosalie Kalistook, Orutsararmiut Native Council
Klaudia Jo Klaudi, Knik Tribe
Anna Kohl, HDR Alaska, Inc.
David Lockard, Alaska Energy Authority
Danielle McClain, US Fish & Wildlife Service
Thomas W. Manson, ConocoPhillips Alaska, Inc.
Mark Masteller, Cascadia Green Building Council
Vivian Melde, Ecology and Environment
Jerome Montague, US Air Force Alaska Command
Shane Montoya, US Coast Guard
Doug Mutter, US Department Of Interior
Richard Newman, Bureau of Ocean Energy Management, Regulation and Enforcement
Richard Porter, Knik Tribe
Todd Radenbaugh, University of Alaska
Ann Rappoport, US Fish & Wildlife Service
Betsy Rickards, US Forest Service
Heather Rice, National Park Service
Linda Robinson, Prince William Sound Regional Citizens' Advisory Council
Joel Scheraga, US Environmental Protection Agency
Cherie Shelley, US Forest Service
Robert Shirley, US Air Force
Aurora Sidney-Ando, Alaska Pacific University
Lauri Strauss, kpb architects
Stephanie Tepperberg, US National Park Service
Win Westervelt, CH2M Hill
Carolyn Winters, US Navy

Monday, February 7

MORNING

7:30 a.m. - 9 a.m.

❒ Registration *Upper Lobby 3rd Floor*

8 a.m. - 8:30 a.m.

❒ Moderator Training (by Invitation Only)
K'enakatnu Executive Board Room

8:30 a.m. - 9 a.m.

❒ MORNING MUSIC EVENT *Tikahtnu Ballroom*
Michael Gorder on Acoustic

9 a.m. - 9:30 a.m.

❒ Introduction and Opening Comments *Tikahtnu Ballroom*

9:30 a.m. - 10:15 a.m.

❒ KEYNOTE EVENT *Tikahtnu Ballroom*
Mead Treadwell, Alaska Lieutenant Governor

10:30 a.m. - 11:45 a.m.

❒ Case Studies: Pore Water Issues at Two Contaminated Sites *Kahtnu 1*
❒ Youth Environmental Program Showcase *Kahtnu 2*
❒ Dealing with Invasive Plants: Strategies, Outreach and Success in Alaska *Tubughneng' 3*
❒ Tribal Mining Review in Lower 48 *Tubughneng' 4*
❒ Oil Drilling Basics for Onshore and Offshore Exploration *Tubughneng' 5*
❒ Effective and Meaningful Tribal Consultation: Perspectives and Experiences *Tikahtnu C*
❒ 7 Generations Training: A Tool for Tribes *Tikahtnu D*
❒ Human Overpopulation: Root Cause of Environmental Degradation *Tikahtnu E*

AFTERNOON

12 p.m. - 1:45 p.m.

❒ KEYNOTE EVENT *Tikahtnu Ballroom*
Scott Friedman, Inspirational Humorist

2 p.m. - 3:15 p.m.

❒ Alaskan Youth Environmental Engagement: A Poster Session *Upper Lobby 3rd Floor*
❒ Cutting PCB Cleanup Costs at Remote Sites: A Case Study of Grain Size Separation *Kahtnu 1*
❒ Marine Invasive Species in Alaska *Tubughneng' 3*
❒ Is Small Scale Nuclear Energy An Option for Alaska? *Tubughneng' 4*
❒ Recent Advances in Climate Science in Alaska *Tubughneng' 5*
❒ Cultural Sustainability in Environmental Program Development *Tikahtnu C*
❒ Tools for Tribal Governments on Environmental Planning *Tikahtnu D*
❒ Alaska Natives and Climate Change: Reactivating Indigenous Perceptions *Tikahtnu E*

3:30 p.m. - 4:45 p.m.

❒ Environmental and Public Health Agencies: Their Roles and How They Partner to Address Public Health Concerns at Contaminated Sites *Kahtnu 1*
❒ Recipe for Creating a Successful Youth-Led Program *Kahtnu 2*
❒ An Overview of Invasive Species in Alaska *Tubughneng' 3*
❒ Human Health Implications of Coal Combustion in Alaska *Tubughneng' 4*
❒ Toward a Coordinated Response to Climate Adaptation in Alaska *Tubughneng' 5*
❒ Alaska GAP Peer Assistance Provider Network Activities *Tikahtnu C*
❒ Tribal Perspectives on Planning For Climate Change *Tikahtnu D*
❒ Freshwater and Coastal Surveys by the Alaska Department of Environmental Conservation *Tikahtnu E*

Alaska Forum on the Environment
Registration Services and all Keynote Events
will be located at the Dena'ina Convention Center,
TIKAHTNU (COOK INLET) BALLROOM, 3rd Floor

AGENDA At a Glance

Tuesday, February 8

MORNING

8 a.m. - 8:45 a.m.

❒ MORNING KEYNOTE EVENT - Larry Persily, Federal Coordinator Alaska Natural Gas Transportation Projects *Tikahtnu Ballroom*

9 a.m. - 10:15 a.m.

❒ The Living Building Challenge and Net Zero Energy *Kahtnu 1*
❒ Youth Environmental Summit (Part 1 of 2) *Kahtnu 2*
❒ Endangered Species Research in Glacier Bay National Park and Preserve *Tubughneq' 3*
❒ Susitna Hydro Project *Tubughneq' 4*
❒ Renovate Right: Important Lead Hazard Information for Families, Child Care Providers, and Schools *Tubughneq' 5*
❒ Alaska Brownfields Topics: Tribal, State, and US Environmental Protection Agency Response Programs (Part 1 of 2) *Tikahtnu C*
❒ Success Stories in Alaska Small Demonstration Projects *Tikahtnu D*
❒ Environmental Analysis and Decision Making Processes *Tikahtnu E*

10:30 a.m. - 11:45 a.m.

❒ Breaking the Barriers to Green Building *Kahtnu 1*
❒ Youth Environmental Summit (Part 2 of 2) *Kahtnu 2*
❒ Candidates for Listing as Threatened/Endangered Species in Alaska *Tubughneq' 3*
❒ Teaching Alaska's Miners About Alaska's Fisheries *Tubughneq' 4*
❒ Climate Adaptation and Environmental Justice *Tubughneq' 5*
❒ Alaska Brownfields Topics: Tribal, State, and US Environmental Protection Agency Response Programs (Part 2 of 2) *Tikahtnu C*
❒ Environmental Restoration Efforts at Federal Sites in Alaska *Tikahtnu E*
❒ Using Natural Resources for Solving Energy Problems *K'enakatnu Executive Board Room*

AFTERNOON

12 p.m. - 1:45 p.m.

❒ LUNCH ON YOUR OWN

2 p.m. - 3:15 p.m.

❒ Introduction to Conservation Subdivisions *Kahtnu 1*
❒ Youth and Adult Partnerships Showcase *Kahtnu 2*
❒ Workshop on the Conservation/Recovery Plan for Polar Bears in Alaska (Part 1 of 2) *Tubughneq' 3*
❒ Energy Efficiency Opportunities in Alaska *Tubughneq' 4*
❒ Fugitive Dust - What is it? Why should I care? *Tubughneq' 5*
❒ Solid Waste and Contaminants in Alaska: A Talking Circle (Part 1 of 2) *Tikahtnu C*
❒ Environmental Protection Agency Civil/Criminal Enforcement Procedures for Environmental Violations *Tikahtnu D*
❒ Amchitka Underground Nuclear Test Site Monitoring Program *Tikahtnu E*

3:30 p.m. - 4:45 p.m.

❒ Case Studies: Conservation Subdivisions in Alaska *Kahtnu 1*
❒ Tribal Climate Change Training and Technical Assistance Efforts *Kahtnu 2*
❒ North Slope Methane Hydrates and Carbon Dioxide Exchange *Tubughneq' 4*
❒ Department of Environmental Conservation Water Quality, Permits and Communications *Tubughneq' 5*
❒ Solid Waste and Contaminants in Alaska: A Talking Circle (Part 2 of 2) *Tikahtnu C*
❒ Federal Site Remediation Roundtable *Tikahtnu E*
❒ Energy and Climate Action in Alaskan Communities: Resources, Examples, and Discussion *K'enakatnu Executive Board Room*

3:30 p.m. - 6 p.m.

❒ Workshop on the Conservation/Recovery Plan for Polar Bears in Alaska (Part 2 of 2) *Tubughneq' 3*

Alaska Forum on the Environment Registration Services and all Keynote Events will be located at the Dena'ina Convention Center, TIKAHTNU (COOK INLET) BALLROOM, 3rd Floor

Wednesday, February 9

MORNING

8 a.m. - 8:45 a.m.

❒ MORNING KEYNOTE EVENT - Dennis McLerran, US Environmental Protection Agency Regional Administrator *Tikahtnu Ballroom*

9 a.m. - 10:15 a.m.

❒ Experiences Needed for Students to Become Environmental Leaders *Kahtnu 1*
❒ Native Voices: Traditional Knowledge & Climate Change (Part 1 of 2) *Kahtnu 2*
❒ Shipping in Arctic Waters: Implications of Climate Change *Tubughneng' 3*
❒ The Arctic Environmental Response Management Application (ERMA) *Tubughneng' 4*
❒ Federal Interagency Coordination on Environmental Justice Issues (Part 1 of 2) *Tikahtnu C*
❒ US Forest Service Listening Session on Sacred Sites Policy (Part 1 of 2) *Tikahtnu E*
❒ Hydrocarbon Risk Calculator (Part 1 of 2)—Concepts, Regulatory Status, Data Needs, Closure Decisions *K'enakatnu Executive Board Room*

9 a.m. - 4 p.m.

❒ Brownfields Tribal Response Program Training *Marriott Hotel*

10:30 a.m. - 11:45 a.m.

❒ Drumbeats: Place-Based Environmental Education Certificate for Rural Alaska *Kahtnu 1*
❒ Native Voices: Traditional Knowledge & Climate Change (Part 2 of 2) *Kahtnu 2*
❒ What is Coastal and Marine Spatial Planning? *Tubughneng' 3*
❒ Oil Development in the Arctic *Tubughneng' 4*
❒ Federal Interagency Coordination on Environmental Justice Issues (Part 2 of 2) *Tikahtnu C*
❒ Contaminants in Subsistence Foods *Tikahtnu D*
❒ US Forest Service Listening Session on Sacred Sites Policy (Part 2 of 2) *Tikahtnu E*
❒ Hydrocarbon Risk Calculator (Part 2 of 2) - Case Studies *K'enakatnu Executive Board Room*

AFTERNOON

12 p.m. - 1:45 p.m.

❒ LUNCH ON YOUR OWN

2 p.m. - 3:15 p.m.

❒ Sustainable Energy in Environmental Education *Kahtnu 1*
❒ Marine Debris Workshop (Part 1 of 2) *Tubughneng' 3*
❒ Lessons Learned: Information Flow Comparison between the Selendang Ayu and the Deepwater Horizon Incidents *Tubughneng' 4*
❒ Tribal and Community Perspectives on Environmental Justice Issues in Alaska (Part 1 of 2) *Tikahtnu C*
❒ Geographic Information System Rural Alaska *Tikahtnu D*
❒ Community Gardening Benefits in Rural Alaska *Tikahtnu E*
❒ Vapor Intrusion Evaluation Case Studies (Part 1 of 2) *K'enakatnu Executive Board Room*
❒ Tracking Backhaul Success *Kahtnu 2*

3:30 p.m. - 4:45 p.m.

❒ Promoting Rural Workforce Development through Environmental Internships *Kahtnu 1*
❒ Annual Alaska Mining Report *Kahtnu 2*
❒ Marine Debris Workshop (Part 2 of 2) *Tubughneng' 3*
❒ Area Contingency Planning for Oil Spill Response in Alaska *Tubughneng' 4*
❒ Working Together to Address Environmental Justice Issues Identified by Tribal and Community Panelists (Part 2 of 2) *Tikahtnu C*
❒ General Assistance Program (GAP) Online *Tikahtnu D*
❒ Baseline Water Quality Monitoring - Lessons Learned *Tikahtnu E*
❒ Vapor Intrusion Evaluation Case Studies (Part 2 of 2) *K'enakatnu Executive Board Room*

EVENING

5 p.m. - 7:00 p.m.

❒ EVENING EVENT: Regional Tribal Operations Committee Social *Tikahtnu Ballroom*

Alaska Forum on the Environment Registration Services and all Keynote Events will be located at the Dena'ina Convention Center, TIKAHTNU (COOK INLET) BALLROOM, 3rd Floor

At a Glance AGENDA

AGENDA At a Glance

Thursday, February 10

MORNING

8 a.m. - 8:45 a.m.

❒ MORNING KEYNOTE EVENT:
Lynn Paulson, "As Within, So Without"
Tikahtnu Ballroom

9 a.m. - 10:15 a.m.

❒ Federal Actions and Next Steps on Leaded Aviation Gasoline (Part 1 of 2) *Kahtnu 1*
❒ Climate Science in the Arctic and What It Means to Alaskans *Kahtnu 2*
❒ The National Environmental Policy Act De-Mystified *Tubughnenq' 3*
❒ How to Organize a Household Hazardous Waste Collection Program *Tubughnenq' 4*
❒ How to Perform a Village-Based Dump Site Assessment: A Scammon Bay Case Study *Tikahtnu C*
❒ Native American Lands Environmental Mitigation Program *Tikahtnu D*
❒ Hazard Communication Standard *Tikahtnu E*

9 a.m. - 4 p.m.

❒ Brownfields Tribal Response Program Training
Marriott Hotel

10:30 a.m. - 11:45 a.m.

❒ Federal Actions and Next Steps on Leaded Aviation Gasoline (Part 2 of 2) *Kahtnu 1*
❒ Climate Change in Northern Communities: Canadian Federal and Municipal Perspectives *Kahtnu 2*
❒ New Landscape Conservation Cooperatives in Alaska to Address Climate Change *Tubughnenq' 3*
❒ Impacts of Poor Solid Waste Management on Village Health *Tubughnenq' 4*
❒ The National Environmental Policy Act: Tools and Tips *Tubughnenq' 5*
❒ Environmental Protection Agency's Update and Listening Session on Alaska and National Mining Issues (Part 1 of 2) *Tikahtnu C*
❒ Environmental Issues Associated with Meth Lab Cleanup *Tikahtnu D*

AFTERNOON

12 p.m. - 1:45 p.m.

❒ AFTERNOON KEYNOTE EVENT - Fran Ulmer, Chancellor University of Alaska Anchorage
Tikahtnu Ballroom

2 p.m. - 3:15 p.m.

❒ General Assistance Program Solid Waste Solutions *Kahtnu 1*
❒ National Environmental Policy Act in the Courtroom: Case Law *Tubughnenq' 3*
❒ Rural Development Water and Environmental Program Overview and Application Process (Part 1 of 2) *Tubughnenq' 5*
❒ Environmental Protection Agency's Update and Listening Session on Alaska and National Mining Issues (Part 2 of 2) *Tikahtnu C*
❒ Burn Unit Pilot Project *Tikahtnu E*

2 p.m. - 4:45 p.m.

❒ Coastal America Alaska Regional Implementation Team Meeting *K'enakatnu Executive Board Room*

3:30 p.m. - 4:45 p.m.

❒ Landfill Alternatives/Resource Recovery *Kahtnu 1*
❒ Alaska Youth and Climate Change: Building a Program that Works *Kahtnu 2*
❒ National Environmental Policy Act, Marine Fisheries, and Public Participation *Tubughnenq' 3*
❒ FILM FESTIVAL: People of the Seal film *Tubughnenq' 4*
❒ Rural Development Water and Environmental Program Overview and Application Process (Part 2 of 2) *Tubughnenq' 5*
❒ General Assistance Program (GAP) Peer Assistance Providers Open Working Session for Grants Management Assistance and GAP Proposal Development *Tikahtnu C*
❒ Resources for Tribal Environmental Advocacy *Tikahtnu D*

Alaska Forum on the Environment
Registration Services and all Keynote Events
will be located at the Dena'ina Convention Center,
TIKAHTNU (COOK INLET) BALLROOM, 3rd Floor

Friday, February 11

8 a.m. - 5 p.m.
❒ HAZWOPER 8-Hour Refresher Course *Kahtnu 1 & 2*

8:15 a.m. - 1:30 p.m.
❒ Oil Spill Recovery Institute Advisory Board Meeting
K'enakatnu Executive Board Room

8:30 a.m. - 10:15 a.m.
❒ GAP: Topics in Environmental Education and Outreach
Tikahtnu C

8:30 a.m. - 12 p.m.
❒ FILM FESTIVAL: Film event *Tubughneng' 4*

8:30 a.m. - 4 p.m.
❒ Climate Change and the National Environmental Policy Act Class
Tubughneng' 3

9 a.m. - 10:15 a.m.
❒ Introduction to Class III Landfills and Top 10 Problems
Tubughneng' 5

10:30 a.m. - 11:45 a.m.
❒ Best Practices for Solid Waste Management in Rural Alaska
Tubughneng' 5
❒ General Assistance Program Tribal Environmental Professionals Community Building Session and Conference Wrap Up *Tikahtnu C*

12 p.m. - 1 p.m.
❒ LUNCH ON YOUR OWN

2 p.m. - 4 p.m.
❒ Solid Waste Administration of North America Alaska Chapter Quarterly Business Meeting *Tubughneng' 5*

Detailed Agenda

NOTES:

Alaska Forum on the Environment
Registration Services and all Keynote Events
will be located at the Dena'ina Convention Center,
TIKAHTNU (COOK INLET) BALLROOM, 3rd Floor

2011

Morning

February 7

MONDAY

7:30 a.m. - 9:00 a.m.

Registration
Upper Lobby 3rd Floor

Details: The Dena'ina Center opens for Registration at 7:30 AM.
Save time...Don't wait in line...Register Online!
http://www.akforum.com/register.html

Pick up conference information and name tags here.

8:00 a.m. - 8:30 a.m.

Moderator Training (by Invitation Only)
K'enakatnu Executive Board Room

Details: By Invitation Only. Moderators for the conference are asked to attend this training to help ensure all sessions progress in a timely and professional manner.

8:00 a.m. - 9:00 a.m.

MORNING MUSIC EVENT
Michael Gorder on Acoustic
Tikahtnu Ballroom

Details: Grab your morning coffee and listen to the acoustic music of Anchorage talent Michael Gorder.

9:00 a.m. - 9:30 a.m.

Introduction and Opening Comments
Tikahtnu Ballroom

9:30 a.m. - 10:15 a.m.

KEYNOTE EVENT

MEAD TREADWELL
Lieutenant Governor
Tikahtnu Ballroom

Details: Mead Treadwell was elected as Alaska's Lieutenant Governor in November, 2010. Lt. Governor Treadwell places a priority in fulfilling his constitutional duties, supporting Alaska's governor, and being accessible to Alaskans. He is committed to strengthening Alaska's economy by filling the Trans Alaska Pipeline, helping get a gas pipeline built, bringing affordable energy to Alaskans, and standing up to the federal government to ensure access to our natural resources. Mead Treadwell brings a record of private and public sector success to the job of Lieutenant Governor. He is recognized as one of the world's Arctic policy experts.

Treadwell was appointed to the United States Arctic Research Commission by President George W. Bush in 2001 and designated by the President as the Commission's chair in 2006. Under his leadership, a new United States Arctic Policy was developed and adopted by President Bush and is now being implemented by the current administration.

After graduating from Yale, Treadwell moved to Alaska in 1978 and worked as lead political reporter for the ANCHORAGE TIMES. In 1980, he was part of a team of writers which won the Blethen Award, a top prize for investigative reporting in the Pacific Northwest. In 1982, after completing his MBA at the Harvard Business School, Treadwell joined former Governor Hickel and former Governor Bill Egan as founders of the Yukon Pacific Corporation which started the all Alaska gas pipeline project.

During the Exxon Valdez oil spill crisis, Mead Treadwell went to Cordova and served as the city's director of spill response. He worked with Cordova citizens and Alaska's congressional delegation to launch the Prince William Sound Science Center, home of the Prince William Sound Oil Spill Recovery Institute. He also worked with Southcental coastal communities, Congress, and the oil industry to create the Prince William Sound Regional Citizens Advisory Committee.

When Wally Hickel was elected to his second term as Alaska's Governor, he appointed Mead Treadwell to serve as Deputy Commissioner of the Department of Environmental Conservation. Treadwell helped write Alaska's new environmental protection regulations and established the environmental crime unit for the state. He represented Alaska on U.S. delegations which established the eight nation Arctic Council, and supported Governor Hickel's establishment of the Northern Forum.

Over the years, Mead Treadwell has held leadership positions in a wide range of policy, professional, public service, governmental and international organizations.

Case Studies: Pore Water Issues at Two Contaminated Sites

Kahtnu 1

Details: Pore water is generally defined as water between grains of sediment, but can have its origin as either surface water or groundwater. For contaminated sites management, pore water is often more specifically defined as saturated zone water in the subsurface that is hydrologically connected to surface water. Thus it can serve as a transport mechanism between contaminated groundwater and surface water bodies, and be both an ecological and human health exposure pathway to contaminants. This presentation will focus on two case studies involving the use of pore water to understand exposure pathways as part of risk evaluation and regulatory compliance for contaminated site management.

Presenter: James Fish, Alaska Department of Environmental Conservation
Moderator: Susan Erben, Alaska Department of Environmental Conservation

Human Overpopulation: Root Cause of Environmental Degradation

Tikahtnu E

Details: Most environmental degradation from climate change to habitat loss can trace its roots to human overpopulation. Presentations will review the "state of the debate" on population and broach topics as the recent United States census, the demographic roles of immigration vs. birthrates, United States and global population projections, climate change, peak oil, and the key concepts of carrying capacity, "overshoot", and the ecological footprint. The Empty Space Delusion (why the earth, America, and even Alaska are overpopulated in spite of empty space to spare) will be discussed.

Presenters: Leon Kolankiewicz, Mangi Environmental Group; Paul Erlich, Stanford University
Moderator: Jerome Montague, Alaskan Command

Dealing with Invasive Plants: Strategies, Outreach, and Success in Alaska

Tubughnenq' 3

Details: Come learn about identifying and managing invasive plants. In this session, invasive plant species in Alaska will be identified, and speakers will describe outreach efforts and specific examples of managing invasive plants.

Presenters: Ashley Grant, Alaska Cooperative Extension Service; John Morton, US Fish & Wildlife Service; Dave Cannon, Aniak
Moderator: Barbara Schrader, US Forest Service

Youth Environmental Program Showcase

Kahtnu 2

Details: This session will feature representatives from 4 youth-led community projects: Teens Fighting for Wild Salmon (statewide), 3 Girls Campaign-Changing Habits for a Healthier Tomorrow (Golovin), Getting Un-Energized (Anchorage) and The Garden of Eatin' (Homer).

Presenters: Danielle McClain, US Fish & Wildlife Service; Joseph Ransdell-Green; Maka Monture; Sandi Echuck; Gunner Gregory; Aurora Hoefferle; Renatta Olson; Molly Moses; Chelsea Fagerstrom; Debbie Anungazuk; Delana Eby; Ryan McLaughlin; Barae Hirsch; Kilian Roberts; Kathryn Smith; Benson Eldon; Homer Olson; Jeff Szarzi; Shannon Kuhn, Alaska Youth for Environmental Action.
Moderator: Jessica Beecher, US Fish & Wildlife Service

Effective and Meaningful Tribal Consultation: Perspectives and Experiences

Tikahtnu C

Details: This session will focus on US Environmental Protection Agency Region 10 Tribal Consultation Procedures. There will be a panel discussion on perspectives and experiences.

Presenters: Harriette Kaufman, Native Village of Tyonak; Violet Yeaton, Port Graham Tribal Council; Sally Thomas, US Environmental Protection Agency; Tami Fordham, US Environmental Protection Agency
Moderator: Santina Gay, US Environmental Protection Agency

7 Generations Training: A Tool for Tribes

Tikahtnu D

Details: The 7 Generations approach to planning has been used as a tool to address environmental issues using a common sense approach that promotes and encourages community-driven environmental management.

Presentor: Larry Merculieff and Bill Stokes, 7 Generations Consulting
Moderator: Desirae Roehl, Alaska Native Tribal Health Consortium

Tribal Mining Review in Lower 48

Tubughnenq' 4

Details: This session will provide the opportunity for Tribes that participated in a coordinated tour of L ower 48 mines to reflect upon what they learned and observed.

Presenters: Chief Gary Harrison, Native Village of Chickaloon; Frank Standifer, Native Village of Tyonek
Moderator: Brian Hirsch, National Renewable Energy Laboratory

MONDAY Afternoon

February 7

10:30 a.m. - 11:45 a.m. (cont.)

Oil Drilling Basics for On-Shore and Off-Shore Exploration

Tubughnenq' 5

Details: This presentation traces the history of drilling from methods employed over 2,000 years ago using human power to modern drilling rigs. Also discussed is a history of offshore drilling and safety systems, including well design, used to avoid dangerous and environmentally damaging well blowouts.

Presenter: Les Skinner, Shell Exploration and Production Company
Moderator: Westley Foster, US Environmental Protection Agency

12:00 p.m. - 1:45 p.m.

KEYNOTE EVENT

SCOTT FRIEDMAN
Inspirational Humorist

Tikahtnu Ballroom

Details: Back for his second appearance at the Alaska Forum on the Environment, Scott Friedman is a humorous speaker who gets audience members laughing and feeling good ... while opening their minds to new ideas.

As Scott tickles their funny bones with his quick wit and playful style, he always slips in "how to" techniques and practical ideas.

In his programs, Scott skillfully challenges people to take control of their lives ... and offers concrete ways to do so. Specifically, he assists participants in mastering change, relieving stress and burnout, developing their own sense of humor, and creating more value in their careers. His improvisational skills and delightful nature add a refreshing quality to each program.

2:00 p.m. - 3:15 p.m.

Cutting PCB Cleanup Costs at Remote Sites: A Case Study of Grain Size Separation

Kahtnu 1

Details: Cleanup of PCBs (polychlorinated biphenyls) in Alaska is very costly, especially at remote sites. Reducing the soil volume by removing oversize material (rocks) can potentially save a significant amount of money on cleanup costs at some sites. A pilot study was performed at Anvil Mountain White Alice Radio Relay Station to evaluate the correlation between particle size and PCB concentration. This led to applying the strategy to a full-scale project. This Anvil Mountain case study can provide a model for how to implement a similar strategy for other PCB cleanups.

Presenter: Tamar Stephens, Alaska Department of Environmental Conservation
Moderator: Katharine Heumann, Alaska Department of Environmental Conservation

Recent Advances in Climate Science in Alaska

Tubughnenq' 5

Details: This session will provide an overview of recent scientific findings on changes in climate occurring in Alaska and their potential impacts such as new information about community specific climate change impacts being observed in the Northwest Arctic region of Alaska. The session will also discuss the implications for public health. Findings from recent assessments in Kivalina, Noatak, Kiana, and other Arctic communities will be presented.

Presenters: Sarah Trainor, University of Alaska, Fairbanks; Raj Chavan, Alaska Native Tribal Health Consortium, Center for Climate and Health; Larry Hinzman, International Arctic Research Center
Moderator: David Guest, US Environmental Protection Agency

Marine Invasive Species in Alaska

Tubughnenq' 3

Details: Invasive species in Alaska's marine environments are an emerging problem. This session will identify and describe issues associated with invasive marine species. Speakers will also outline methods to monitor and identify marine invasives.

Presenters: Linda Shaw, National Oceanic and Atmospheric Administration; Gino Graziano, Alaska Department of Natural Resources; Rachel Lord, Cook Inlet Keeper
Moderator: Barbara Schrader, US Forest Service

Alaskan Youth Environmental Engagement: A Poster Session

Upper Lobby 3rd Floor

Details: Please join us for an exciting poster session highlighting the innovative ways youth from all over the state are working to improve the environment throughout Alaska. Youth from the communities of Golovin, Wasilla, Cordova, Homer, Metlakatla, and Anchorage will be available during this session to discuss their projects with you.

Presenters: 3 Girls Campaign-Changing Habits for a Healthier Tomorrow; Alaska Climate Research Using Tree Phenology; Biogas Digesters Using AK Lake Mud; Center for Alaska Coastal Studies; Teens Fighting for Wild Salmon; Getting Un-Energized; Measuring Fish Food: Relative Abundance and Sizes of Macroinvertebrates in Anchorage Creeks; Metlakatla High School School-to-Work; Odiak Pond Field Study; The Garden of Eatin'; Building a Wind Turbine; Converting Plastic to Oil; Rebels to the Pebble; Reduce, Reuse, Recycle Runway; ECOlogical Group; Youth Environmental Stewardship Camp (YES Camp); Youth Environmental Engagement Opportunities; Youth Environmental Award Programs
Moderator: Stephanie Tepperberg, National Park Service – Rivers, Trails, and Conservation Assistance Program

Tools for Tribal Governments on Environmental Planning

Tikahtnu D

Details: Tools for Tribal governments on environmental planning is a Talking Circle session. Peer Assistance Providers will be present to share resources.

Co-Moderators: Adrienne Fleek, US Environmental Protection Agency; Klaudia Klaudi, Knik Tribal Council

Alaska Natives and Climate Change: Reactivating Indigenous Perceptions

Tikahtnu E

Details: This discussion will follow a traditional structure and will provide an opportunity for participants to exchange information with Tribal representatives from other regions. It will be a place for participants to share their concerns, tribal observations and information about climate change.

Moderators: Victoria Hykes-Steere, Alaska Pacific University; Michelle Davis, US Environmental Protection Agency

Is Small Scale Nuclear Energy an Option for Alaska?

Tubughneng' 4

Details: Many people have heard of the Toshiba 4S nuclear reactor that has been proposed for Galena. How do these small modular reactors, sometimes called 'nuclear batteries', actually work? What is the status of the technology, and what is the potential for Alaska?

Presenter: Gwen Holdmann, Alaska Center for Energy and Power
Moderator: Katherine Brown, US Environmental Protection Agency

Cultural Sustainability in Environmental Program Development

Tikahtnu C

Details: This session will follow a Talking Circle format, where session participants will discuss their experiences in education, and offer Tribal perspectives on building environmental programs with Native Language and Culture as the foundation.

Moderators: Tami Fordham and Santina Gay, US Environmental Protection Agency

NOTES:

3:30 p.m. - 4:45 p.m.

Environmental and Public Health Agencies: Their Roles and How They Partner to Address Public Health Concerns at Contaminated Sites

Kahtnu 1

Details: Representatives from two state agencies and a federal agency will discuss their roles and responsibilities, and how their agencies partner at specific contaminated sites in Alaska to address public health concerns. The presenters are from the Alaska Department of Environmental Conservation's Spill Prevention and Response Division, Contaminated Sites Program; the Alaska Department of Health and Social Services' Division of Public Health, Epidemiology Section; and the US Department of Health and Human Services' Agency for Toxic Substances and Disease Registry.

Presenters: Marty Brewer, Alaska Department of Environmental Conservation; Nim Ha, Alaska Department of Health and Social Services; Joe Sarcone, Agency for Toxic Substances and Disease Registry
Moderator: Susan Erben, Alaska Department of Environmental Conservation

Freshwater and Coastal Surveys by the Alaska Department of Environmental Conservation

Tikahtnu E

Details: The Alaska Monitoring & Assessment Program (AKMAP) will give an overview of recent freshwater and coastal surveys conducted by the State of Alaska. Topics will include the 2010-2011 Chukchi Sea Survey, 2009 Yukon River Survey, 2008 Cook Inlet Lakes and the upcoming 2011 Arctic Wetlands.

Presenters: Doug Dasher and Terri Lomax, Alaska Department of Environmental Conservation
Moderator: Tim Hoffman, Alaska Department of Environmental Conservation

Toward a Coordinated Response to Climate Adaptation in Alaska

Tubughnenq' 5

Details: On October 5, 2010, the federal Climate Change Adaptation Task Force, co-chaired by the White House Council on Environmental Quality (CEQ), the Office of Science and Technology Policy (OSTP), and the National Oceanic and Atmospheric Administration (NOAA) released its interagency report outlining recommendations to President Obama for how Federal Agency policies and programs can better prepare the United States to respond to the impacts of climate change. The report recommends that the Federal Government implement actions to expand and strengthen the Nation's capacity to better understand, prepare for, and respond to climate change. This session will focus on: (1) the use of science to enable more effective adaptation to climate change; (2) how federal agencies could cooperate and work together, in partnership with stakeholders in Alaska, to focus on climate impacts of greatest concern to Alaska and to implement effective climate adaptation strategies; and (3) lessons the rest of the nation can learn from Alaska's experiences adapting to climate change.

Presenters: Thomas Armstrong, Department of Interior; Larry Hartig, Alaska Department of Environmental Conservation; Daniel White, Alaska RISA-ACCAP; Mark Shasby, Alaska Climate Science Center and US Geologic Survey.
Moderator: Joel Neimeyer, Denali Commission

An Overview of Invasive Species in Alaska

Tubughnenq' 3

Details: Speakers in this session will discuss current strategies around the state to manage invasive species in various environments. We'll look into the future by examining climate change and its possible impacts on invasive species in Alaska and the Arctic.

Presenters: Tammy Davis, Alaska Department of Fish and Game; Ann Ferguson, US Animal and Plant Health Inspection Service; Denny Lassuy, US Fish & Wildlife Service
Moderator: Barbara Schrader, US Forest Service

Recipe for Creating a Successful Youth-Led Program

Kahtnu 2

Details: This interactive session will provide the essential ingredients to help you cook up a successful youth-led environmental project.

Presenter: Megan McBride, Alaska Youth for Environmental Action; Ann Mayo-Kiely, Alaska Geographic
Moderator: Annette Heckart, US Forest Service

Tribal Perspectives on Planning for Climate Change

Tikahtnu D

Details: Tribal representatives discuss the Indian General Assistance Program and other program approaches to addressing climate change impacts being observed in Alaska today. This session will focus on demonstrations of tools and information that tribes can use into their environmental programs to plan for climate change impacts on their traditional lands and resources. It will feature the Region 10 EPA's Tribal Climate Change Action Plan from the 2010 Tribal Leader's Summit in Juneau Alaska.

Presenters: Moses Tcheripanoff, Alaska Native Tribal Health Consortia; Sarah Trainor, University of Alaska Fairbanks; Jen Marlow and Jeni Krencicki Barcelos, University of Washington
Moderator: Michelle Davis, US Environmental Protection Agency

Human Health Implications of Coal Combustion in Alaska

Tubughneq' 4

In this third session on Coal in Alaska, the panel will address specific health concerns associated with coal ash, dust, mining, and emissions.

Presenters: Sarah Petras, Alaska Community Action on Toxics; Northern Alaska Environmental Center; Russ Maddox, Sierra Club; Dr. Michele Prevost
Moderator: Brian Hirsch, National Renewable Energy Laboratory

Alaska GAP Peer Assistance Provider Network Activities

Tikahtnu C

Details:This is a closed meeting of the GAP Peer Assistance Network representatives

Moderator: Mahri Lowinger, US Environmental Protection Agency

NOTES:

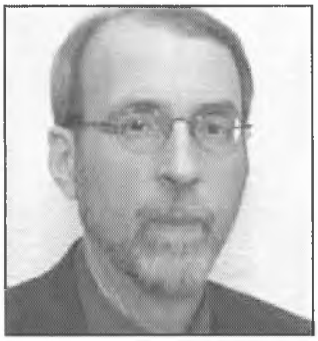
TUESDAY Morning

February 8

8:00 a.m. - 8:45 a.m.

MORNING KEYNOTE EVENT

LARRY PERSILY
Federal Coordinator - Alaska Natural Gas Transportation Projects
Tikahtnu Ballroom



Details: Please join us for an exceptional Morning Keynote at the Alaska Forum on the Environment, 2011.

Larry Persily is the federal coordinator for Alaska Natural Gas Transportation Projects, where he manages a staff in Washington, D.C., and Anchorage, working to ensure that federal agencies are ready to handle permit applications for construction and operation of a North Slope natural gas pipeline to the Lower 48 states.

Before starting the job in March as a presidential appointee, Persily worked as an oil and gas aide in the Alaska Legislature and, previously, as an aide in the governor's office in Washington on oil and gas issues.

He also has served as deputy commissioner at the Alaska Department of Revenue and was a journalist in Alaska for more than 20 years.

9:00 a.m. - 10:15 a.m.

The Living Building Challenge and Net Zero Energy
Kahtnu 1

Details: The Living Building Challenge (LBC) defines the most advanced measure of sustainability in the built environment possible today, and acts to diminish the gap between current limits and ideal solutions. Living Buildings are net-zero energy and water, and they contain no toxic materials. Worldwide there are over 70 Living Building projects underway, several of which are certified. Is it possible to build a Living Building that works in Alaska? This session will provide an overview of the LBC, net-zero energy construction, and what it all means for Alaskans.

Presenters: Clark Brockman, SERA Architecture; Eric Soladay, Integral Group
Moderator: Mark Masteller, Cascadia Green Building Council

Environmental Analysis and Decision Making Processes
Tikahtnu E

Details: This session will provide information and specific examples of environmental analysis in Alaska required under the Comprehensive Environmental Response Compensation and Liability Act (CERCLA), the National Historic Preservation Act (NHPA) and Section 106, and the National Environmental Policy Act (NEPA).

Presenters: Diane Hanson, University of Alaska; Kendra Colyar and Amy Burt, US Navy
Moderator: Cindy O'Hare, US Navy

Renovate Right: Important Lead Hazard Information for Families, Child Care Providers and Schools
Tubughneq' 5

Details: A panel of EPA-approved Alaskan Training Providers will explain the use of lead-safe work practices for Renovation, Repair and Painting (RRP) of pre-1978 homes and child care facilities. This presentation will demonstrate how activities like sanding, cutting and demolition can create hazardous lead dust and chips by disturbing lead-based paint, which can be harmful to children and adults. The panel will respond to questions and will provide information about new funding opportunities.

Presenters: Dorothy Saunders, US Environmental Protection Agency; Dan Dougherty, Environmental Management, Inc.; Steven Wisdom, Wisdom and Associates.
Moderator: Katharine Heumann, Alaska Department of Environmental Conservation

Endangered Species Research in Glacier Bay National Park and Preserve

Tubughneng' 3

Details: In response to proposals to increase cruise ship traffic in Glacier Bay National Park and Preserve, the National Park Service formed a Science Advisory Board and implemented several Board-recommended research projects to assess the impact of cruise ships on Park resources. Much of this research is groundbreaking work. This session will outline research on birds and marine mammals in the Park that are either listed under the Endangered Species Act or are candidate species.

Presenters: Brendan J. Moynahan and Jamie N. Womble, National Park Service; Karin R. Harris, University of Washington
Moderator: Susan J. Alexander, US Forest Service, member Glacier Bay Science Board

Youth Environmental Summit (Part 1 of 2)

Kahtnu 2

Details: Teams of participants will identify an environmental problem common to their communities, develop a plan to address it, and present their solutions to the larger group for feedback.

Presenter: Laurel Devaney, US Fish & Wildlife Service; Lilly Goodman-Allwright, UAA Adjunct Faculty
Moderator: Meg Burgett, UAF-Cooperative Extension Service

Success Stories in Alaska Small Demonstration Projects

Tikahtnu D

Details: Tribal representatives take a look back at 2010 successful US Environmental Protection Agency Alaska Tribal Multi-Media demonstration project accomplishments. These are exemplary projects that have components which can be duplicated by other Tribes in Alaska.

Presenters: Traditional Council of Togiak; Algaaciq Tribal Government; Kenaitze Indian Tribe; Native Village Paimiut; Central Council Tlingit and Haida Indian Tribes of Alaska; Traditional Council of Togiak; Algaaciq Tribal Government; Kenaitze Indian Tribe; Native Village Paimiut; Central Council Tlingit and Haida Indian Tribes of Alaska; Native Village of Eyak; Native Village of Elim; Chilkoot Indian Association; Nunakauyak Traditional Council (Toksook Bay); and Pedro Bay Village Council
Moderators: Desirae Roehl, Alaska Native Tribal Health Consortium; AJ Salkoski, RurALCAP

Susitna Hydro Project

Tubughneng' 4

Details: Hydropower provides approximately 24 percent of the electric energy used in Alaska. The 2010 Alaska legislature declared a state energy policy in which 50 percent of state energy needs would come from renewable and alternative energy sources by 2025. The Alaska Energy Authority will present project information and impacts of the new Susitna Dam project.

Presenter: Bryan Carey, Alaska Energy Authority
Moderator: Katherine Brown, US Environmental Protection Agency

Alaska Brownfields Topics: Tribal, State and US Environmental Protection Agency Response Programs (Part 1 of 2)

Tikahtnu C

Details: This session will include case studies from US Environmental Protection Agency (EPA) Brownfields Tribal Response Program Coordinators. US EPA and Alaska Department of Environmental Conservation staff will also share updates of their Brownsfield Programs. EPA Technical Assistance to Brownfields (TAB) Grantee - Creative Center for Land Recycling (CCLR) will discuss competitive EPA Bronwfields grants and the assistance their organization can provide to potential grantees in the application process.

Presenters: Susan Morales, US Environmental Protection Agency; John Carnahan and Sonja Benson, Alaska Department of Environmental Conservation; Neli Nelson, Organized Village of Kasaan; Ignacio Dayrit of Creative Center for Land Recycling (CCLR)
Moderator: Mary Goolie, US Environmental Protection Agency

NOTES:

10:30 a.m. - 11:45 a.m.

Breaking the Barriers to Green Building
Kahtnu 1

Details: What is the future of green buildings in Alaska? How can we reduce our environmental impact? Will a living building and net zero energy ever be possible in the arctic? What are the technical and regulatory barriers and how can we mitigate those? This panel discussion will address actual and perceived obstacles to the future of sustainable building design in Alaska.

Presenters: Clark Brockman, SERA Architecture; Eric Soladay, Integral Group; Steven Apfelbaum, Applied Ecological Services; Louis Zizza, Coffman Engineers; Thorsten Chlupp, REINA Alaska LLC
Moderator: Lauri Strauss, KPB Architects

Environmental Restoration Efforts at Federal Sites in Alaska
Tikahtnu E

Details: This session will provide an opportunity for the Air Force, Army, and Federal Aviation Administration to present information on cleanup projects at federal sites in Alaska. The discussion will address progress that has been made in the past year to accomplish remediation goals.

Presenters: Steve Mattson and Mark Prieksat, US Air Force; Ken Andraschko, US Army Corps of Engineers; Scott Berglund, Federal Aviation Administration
Moderator: Scott Hansen, US Air Force

Climate Adaptation and Environmental Justice
Tubughnenq' 5

Details: A discussion examining tribal adaptation to climate change. Tribal governments and tribal community-based grassroots groups are pursuing options for their tribes to adapt to the changes in the environment due to climate change. This session will discuss the approaches being taken or considered, as well as opportunities for tribal governments and tribal community-based groups to collaborate on such approaches. The session will also initiate a discussion on the possible role of the US Environmental Protection Agency and other federal agencies in helping tribes and tribal organizations in their efforts.

Presenters: Jon Waterhouse, Yukon River Intertribal Watershed Council; Debra Lekanof, Swinomish Indian Tribal Community; Arlene Gundersen, Aleut International Association, Aleut Mammal Commission.

Candidates for Listing as Threatened/Endangered Species in Alaska
Tubughnenq' 3

Details: Presentations will focus on the species in Alaska which are currently under consideration and study for possible Federal listing as threatened or endangered. Information will be given on what they are, why they are being considered, and the process being followed.

Presenters: Marilyn Myers, US Fish & Wildlife Service; Brad Smith, National Marine Fisheries Service
Moderator: Pamela Bergmann, US Department of the Interior

Youth Environmental Summit (Part 2 of 2)
Kahtnu 2

Details: Teams of participants will identify an environmental problem common to their communities, develop a plan to address it, and present their solutions to the larger group for feedback.

Presenter: Laurel Devaney, US Fish & Wildlife Service; Lilly Goodman-Allwright, UAA Adjunct Faculty
Moderator: Meg Burgett, UAF-Cooperative Extension Service

Teaching Alaska's Miners About Alaska's Fisheries
Tubughnenq' 4

Details: This presentation is an overview of the 2-day short course on Mining & Fisheries, presented at the Alaska Miners' Association's annual convention in November 2010.

Moderator: Tom Manson, ConocoPhillips Alaska, Inc.

Using Natural Resources for Solving Energy Problems
K'enakatnu Executive Board Room

Details: This presentation will focus on the use of thermochemical conversion as a way to reduce organic waste streams such as fisheries waste, and use of low value natural resources and fire-killed biomass for the production of hydrocarbons and heat.

Presenter: J. Andres Soria, University of Alaska, Anchorage
Moderator: Westley Foster, US Environmental Protection Agency

10:30 a.m. - 11:45 a.m. (cont.)

Alaska Brownfields Topics: Tribal, State, and US Environmental Protection Agency Response Programs (Part 2 of 2)

Tikahtnu C

Details: This session will include Brownfields Jeopardy with updates from the AK Department of Environmental Conservation staff. US Environmental Protection Agency Brownfields Program will provide updates as well on AK Brownfields and Targeted Brownfields Assessments.

Presenters: John Carnahan, Sonja Benson, and Deborah Williams, Alaska Department of Environmental Conservation; Susan Morales and Joanne LaBaw, US Environmental Protection Agency
Moderator: Mary Goolie, US Environmental Protection Agency

12:00 p.m. - 1:45 p.m.

LUNCH ON YOUR OWN

2:00 p.m. - 3:15 p.m.

Introduction to Conservation Subdivisions

Kahtnu 1

Details: Conservation subdivisions preserve and restore healthy natural resources within developments and offer a multitude of benefits ranging from increased property values and reduced infrastructure (i.e., storm sewer systems, etc.), to greater human values and higher quality of life. This session will be your opportunity to learn more about what conservation subdivisions are, how they're created, successful conservation subdivision projects in the Lower 48 (with an emphasis on those built in cold climate and rural areas), and why conservation subdivisions make sense for Alaska.

Presenter: Steve Apfelbaum, Applied Ecological Services
Moderator: Ann Rappoport, US Fish & Wildlife Service Anchorage Field Office

Fugitive Dust - What is it? Why should I care?

Tubughneng' 5

Details: This session will discuss what fugitive dust is and potential sources of fugitive dust in Alaska, including an overview of other States' regulations to control fugitive dust and methods of control available. Alaska Department of Environmental Conservation staff will be available to discuss what are possible regulation options.

Presenters: Tom Turner and Nattinee Nipataruedi, Alaska Department of Environmental Conservation
Moderator: Katharine Heumann, Alaska Department of Environmental Conservation

2:00 p.m. - 3:15 p.m. (cont.)

Amchitka Underground Nuclear Test Site Monitoring Program

Tikahtnu E

Details: This session will provide an overview on the underground nuclear tests conducted on Amchitka Island between 1965 and 1971, subsequent monitoring efforts, and plans for future monitoring. The specific focus will be on plans for biota, sediment, and surface water sampling during the summer of 2011. Representatives from the US Department of Energy and it's contractors, Alaska Department of Environmental Conservation, Aleutian Pribilof Islands Association, US Fish & Wildlife Service and the University of Alaska Fairbanks will present information on the project and answer questions.

Presenters: John Halverson and Doug Dasher, Alaska Department of Environmental Conservation; Steven Jewett, University of Alaska; Mark Kautsky, US Department of Energy; Karen Pletnikoff, Aleutian Pribilof Islands Association
Moderator: Lisa Geist, US Army Corps of Engineers

Workshop on the Conservation/Recovery Plan for Polar Bears in Alaska (Part 1 of 2)

Tubughneng' 3

Details: The objective of the workshop will be to help the US Fish & Wildlife Service develop the Conservation/Recovery Plan for polar bears. The main topic will be human-caused removals: how to develop mitigation strategies for future impacts to Alaska's polar bears as a result of human-caused removals. The workshop is designed for entire-session participation. Participants are asked to stay for the entire workshop in order to effectively exchange information and ideas.

Moderators: James Wilder, US Fish & Wildlife Service; Colleen Matt, CAMatt

Youth and Adult Partnerships Showcase

Kahtnu 2

Details: Representatives from projects that feature youth and adult partnerships to accomplish scientific research and community projects will share their experiences. Projects presented will be: Biogas Digesters Using AK Lake Mud, Metlakatla High School School-to-Work, Odiak Pond Field Study, Alaska Climate Research Using Tree Phenology.

Presenters: Jessica Beecher, US Fish & Wildlife Service; Craig Bailer; Sophia Meyers; Shannon Lindow; Ben Americus; James Allen; Adam Low; Katherine McGillton; Demitrius Milne; Martin Vera; Brielle Pringle; Avery Winter; Taw Lindsey; Gabrielle Brown; Casey Smyke; Kate Alexander; Rachael Quiriarte; Alyssa Peters; Timothy Lundt
Moderator: Danielle McClain, US Fish & Wildlife Service

2:00 p.m. - 3:15 p.m. (cont.)

Environmental Protection Agency Civil/Criminal Enforcement Procedures for Environmental Violations

Tikahtnu D

Details: This session will outline the Environmental Protection Agency Region 10 enforcement procedures. Discussion will focus on various agency databases that can be accessed to review environmental monitoring information related to permitting and other regulatory requirements. Additionally, the discussion will include a survey of environmental crimes in Alaska to include past criminal cases in Alaska.

Presenters: John Pavitt, Keith Cohon, Frank Powers, Matt Goers, and Steve Witkin, US Environmental Protection Agency
Moderators: Tami Fordham and Katherine Brown, US Environmental Protection Agency

Solid Waste and Contaminants in Alaska: A Talking Circle (Part 1 of 2)

Tikahtnu C

Details: This session will be held in a Talking Circle format to cover the Environmental Protection Agency's capacity building grants, and how they address environmental impacts associated with solid waste and contaminants issues. Case studies from the General Assistance Program (GAP) grants and Brownfields State-Tribal Response Program grant programs will be among those issues highlighted during this session.

Moderators: Santina Gay, US Environmental Protection Agency; Larry Merculieff, 7 Generations Consulting

Energy Efficiency Opportunities in Alaska

Tubughnenq' 4

Details: This is a time of unprecedented opportunities for energy efficiency improvements in Alaska. In this presentation the Alaska Energy Authority will present an overview of recent energy efficiency programs and activities in Alaska, focusing on new programs for public and commercial buildings. Application forms will be available for the new state-wide Alaska Commercial Energy Audit Program. Renewable Energy Alaska Project will present more detailed information on the new state loan program for public buildings.

Presenters: Sean Skaling, Alaska Energy Authority; Michelle Wilber, Renewable Energy Alaska Project
Moderator: Mary Mae Aschoff, ConocoPhillips Alaska, Inc.

3:30 p.m. - 4:45 p.m.

Case Studies: Conservation Subdivisions in Alaska

Kahtnu 1

Details: Do conservation subdivisions work in Alaska? Two Alaska developers have proven that conservation subdivisions not only work in Alaska but they also make environmental and economic sense. Kevin Sorensen, residential land developer, owner and founder of Glacier Ridge Properties, LLC, in Palmer, Alaska has developed and sold over 35 residential lots in his conservation subdivision, River Bend, since 2006. Kevin will discuss the conservation principles he used at River Bend and why they are good, overall development practices. Devony Lehner and Tom Taffe, owners of Stream Hill Park in Homer, Alaska, will describe how they became interested in developing a conservation subdivision, obstacles they overcame during the development process, and recommendations on of how to go about pursuing development of a conservation subdivision.

Presenters: Kevin Sorensen, River Bend; Devony Lehner and Tom Taffe, Stream Hill Park
Moderator: Stephanie Tepperberg, National Park Service

Federal Site Remediation Roundtable

Tikahtnu E

Details: This session brings together the Federal government, Alaska state government, federally recognized tribes, environmental groups and the public to discuss cleanup of contaminated sites. The Roundtable welcomes the community to engage with the Federal government to promote understanding of community priorities for remediation. The focus of this facilitated discussion is the impact to tribes and communities, and collaborative strategies to address challenges. The purpose of this session is to create a productive dialog aimed to improve remediation at contaminated sites.

Moderator: Catherine Villa, US Environmental Protection Agency

Department of Environmental Conservation Water Quality, Permits and Communications

Tubughnenq' 5

Details: The Alaska Department of Environmental Conservation will present information regarding the collaboration between the State, US Environmental Protection Agency, and the Yukon Koyukuk Tribes on communications within the Alaska Pollutant Discharge Elimination System permitting process, the Permit Issuance Plan for 2011-13 that identifies waste water discharge proposals, and recent and upcoming regulatory changes to Alaska's Water Quality Standards Triennial Review.

Presenters: Katharine Heumann, Sharon Morgan and Jim Powell, Alaska Department of Environmental Conservation
Moderator: Susan Erben, Alaska Department of Environmental Conservation

3:30 p.m. - 4:45 p.m. (cont.)

Energy and Climate Action in Alaskan Communities: Resources, Examples and Discussion

K'enakatnu Executive Board Room

Details: Alaskan villages are affected by climate change and rely on costly fossil fuels. Actions in the areas of energy generation can reduce greenhouse gas emissions while allowing communities to adapt to climate change. The synergy between climate mitigation and adaptation will be discussed followed by presentations from communities who have planned for or implemented renewable energy, energy efficiency, and food security projects. Communities will discuss their experience including the challenges that they encountered, lessons learned and design methodologies. The session will end with a question and answer session.

Presenters: Peter Crimp, Alternative Energy and Energy Efficiency Programs, Alaska Energy Authority; Brian Hirsch, Department of Energy, National Renewable Energy Lab; Ross Coen, Tanana Chiefs Conference and University of Alaska
Moderator: Jackie Kramer, US Environmental Protection Agency

Tribal Climate Change Training and Technical Assistance Efforts

Kahtnu 2

Details: This session will provide an overview of the Institute for Tribal Environmental Professional's (ITEP) climate change training and technical assistance services. ITEP provides training and technical assistance to tribes nationally interested in issues related to climate change adaptation planning. Time will be given during the session to hear back from tribal representatives from Alaska about issues and resources that could assist them with adaptation planning and training.

Presenters: Mehrdad Khatibi, ITEP, Northern Arizona University; Rose Kalistook, Orutsararmuit Native Village
Moderators: Westley Foster and Michelle Davis, US Environmental Protection Agency

Solid Waste and Contaminants in Alaska: A Talking Circle (Part 2 of 2)

Tikahtnu C

Details: This session will be held in a Talking Circle format to address environmental impacts associated with solid waste and contaminants issues, where participants can voice their concerns and share in the development of solutions.

Moderators: Santina Gay, US Environmental Protection Agency; Larry Merculieff, 7 Generations Consulting

North Slope Methane Hydrates and Carbon Dioxide Exchange

Tubughnenq' 4

Details: What are methane hydrates, how they are they formed and where are they found in nature? This presentation will answer these questions and discuss a test of the carbon dioxide/methane hydrate exchange mechanism in naturally occurring hydrates present just below the North Slope permafrost.

Presenter: David Schoderbek, ConocoPhillips Alaska, Inc.
Moderator: Mary Mae Ashoff, ConocoPhillips Alaska, Inc.

3:30 p.m. - 6:00 p.m.

Workshop on the Conservation/Recovery Plan for Polar Bears in Alaska (Part 2 of 2)

Tubughnenq' 3

Details: A continuation of the workshop. The objective of the workshop will be to help the US Fish & Wildlife Service develop the Conservation/Recovery Plan for polar bears. The main topic will be human-caused removals: how to develop mitigation strategies for future impacts to Alaska's polar bears as a result of human-caused removals.

Moderators: James Wilder, US Fish & Wildlife Service; Colleen Matt, CAMatt

NOTES:

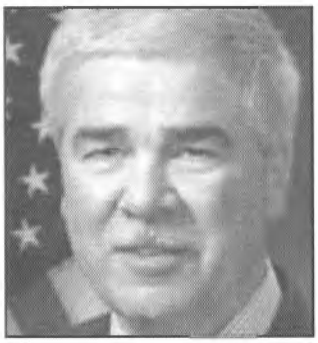
WEDNESDAY Morning

February 9

8:00 a.m. - 8:45 a.m.

MORNING KEYNOTE EVENT

DENNIS MCLERRAN
US Environmental Protection Agency
Regional Administrator
Tikahtnu Ballroom



Details: Please join us for an exceptional Keynote Event with Dennis McLerran at the Alaska Forum on the Environment, 2011.

Dennis McLerran, US Environmental Protection Agency (EPA) Regional Administrator, was appointed by President Barack Obama to serve as the Regional Administrator (RA) for Region 10, leading a staff of 650 employees, with responsibility for an annual budget of $500 million. He was sworn in on February 22, 2010.

As RA, Dennis oversees the implementation and enforcement of the federal environmental rules and regulations in the states of Washington, Oregon, Idaho, and Alaska, including 271 tribal governments in the Pacific Northwest and Alaska.

Before moving to EPA, Dennis served as Executive Director of the Puget Sound Clean Air Agency, a state chartered regional agency that adopts and enforces air quality standards that protect the health of 3.5 million Washington residents. As executive director, he led the development of an innovative strategy to reduce emissions at the ports of Seattle, Tacoma and Metro Vancouver. Prior to that, he served as City Attorney for the City of Port Townsend and Director of the Seattle Department of Construction and Land Use. Dennis has over 20 years experience as an advocate, attorney and administrator.

Dennis received his bachelor's degree from the University of Washington and a J.D. from the Seattle University School of Law.

9:00 a.m. - 10:15 a.m.

Native Voices: Traditional Knowledge & Climate Change (Part 1 of 2)
Kahtnu 2

Details: This session seeks to gather and obtain information from Alaska Native Villagers about their traditional Tribal Ecological Knowledge (TEK), how they are currently coping, and what barriers they face to effectively adapt to these changes. The session will comprise presentations that illustrate the richness and value of TEK, and traditional lifeways and explore tools/systems for gathering and disseminating this information.

Presenters: Carl Wassillie, Alaska's Big Village Network; Rose Kalistook, Orutsararmiut Native Village
Moderator: Don Bantz, Alaska Pacific University

The Arctic Environmental Response Management Application (ERMA)
Tubughnenq' 4

Details: The National Oceanic and Atmospheric Administration is initiating development of the ERMA geospatial decision-support tool to prepare for Arctic oil spill response, assessment, and restoration. The first steps in developing the tool are to identify priority decisions, applications, and users; and then to work with decision makers and stakeholders to identify key data and information needs. This web-based visual tool will combine product output from NOAA sources, as well as data sets agreed upon by stakeholders.

Presenters: Kari Sheets, National Oceanic and Atmospheric Administration; Allison Bailey, NOAA/SoundGIS
Moderator: Tracy Minick-Ross, NOAA/Genwest Systems

US Forest Service Listening Session on Sacred Sites Policy (Part 1 of 2)
Tikahtnu E

Details: In Part 1, US Department of Agriculture and Forest Service officials will provide an overview of their 2011 review of sacred sites policies and procedures. Officials will highlight the existing laws, regulations, policies and practices and the Department's intent to ensure a consistent level of protection for American Indian and Alaska Native sacred sites located on National Forest System lands. The introductory information provided in Port 1 will not be repeated in Part 2.

Presenters: Beth Pendleton and Ruth Monahan, US Forest Service
Moderator: Steve Kessler, US Forest Service

9:00 a.m. - 10:15 a.m. (cont.)

Shipping in Arctic Waters: Implications of Climate Change

Tubughneq' 3

Details: A presentation on how the reduction of Arctic summer sea ice may impact future shipping and coastal communities; learn about the numerous factors that have to be taken into account such as Arctic governance, infrastructure, impacts to communities and the Arctic environment, and how to become involved.

Presenters: Shawna Larson and Colleen Keane, Pacific Environment
Moderator: Shane Montoya, US Coast Guard 17th District

Hydrocarbon Risk Calculator (Part 1 of 2) Concepts, Regulatory Status, Data Needs, Closure Decisions

K'enakatnu Executive Board Room

Details: The Hydrocarbon Risk Calculator (HRC) is an Alaska Department of Environmental Conservation (AEDC) approved tool for calculating human health risks and alternative cleanup levels at hydrocarbon spill sites. The HRC may be used as an alternative Method 3 Calculator and to assist in Method 4 risk assessments for petroleum contaminated sites under 18 AAC 75, allowing Responsible Parties to demonstrate whether sites meet acceptable human health risk levels. An overview of the calculator will be provided, the primary differences between the ADEC online method 3 calculator and the HRC will be highlighted, and the site characterization data used in the HRC will be briefly discussed. The presentation will also include a review of ADEC regulations on developing soil cleanup levels under Methods 1-4, groundwater cleanup levels, and cleanup complete decisions. Examples of the types of sites that may benefit from using the HRC will be discussed.

Presenters: Larry Acomb, Geosphere; Fred Vreeman and John Halverson, Alaska Department of Environmental Conservation
Moderator: Scott Berglund, Federal Aviation Administration

Federal Interagency Coordination on Environmental Justice Issues (Part 1 of 2)

Tikahtnu C

Details: This 2-part session will outline Federal Interagency Coordination on Environmental Justice from the perspective of the Federal Interagency Working Group on Environmental Justice (IWG EJ). Discussions will cover: the current activities of the IWG EJ, the December 2010 White House Forum on Environmental Justice, plans for agencies to create EJ strategies, and plans for regional IWG EJ public sessions. Part 2 will focus on specific work, partnerships and programs of the participating agencies, which tribes and community representatives may find helpful in their efforts to address their environmental, public health and other environmental justice concerns.

Presenters: Lisa Garcia, US Environmental Protection Agency; Willie Taylor, Department of Interior
Moderator: Sherri White, US Environmental Protection Agency

Experiences Needed for Students to Become Environmental Leaders

Kahtnu 1

Details: This session discusses the resources necessary to help make environmental education in Alaska more relevant and visible in our education system by identifying important leaders, organizations, and resources. Experiences from successful programs and tools helpful for students to become environmental leaders in their community will be shared. Participants are asked to share tools and resources that may help programs create positive leadership experiences.

Presenters: Kevin Char, National Oceanic and Atmospheric Administration; Brenda Duffy, Alaska Department of Fish & Game, Project Wild; Daniel Chythlook, Aleknagik Traditional Council Environmental Program
Moderator: Todd Radenbaugh, University Alaska Fairbanks

9:00 a.m. - 4:00 p.m.

Brownfields Tribal Response Program Training

Marriott Hotel

Details: This session is about establishing a Tribal Response Program authorized under 128(a) of CERCLA and funded by EPA under 128(a) Cooperative Agreements. The TRP is intended to address the releases of hazardous substances, pollutants and contaminants from Brownfields, mine scarred lands, petroleum, and other sites and sources. This session will be primarily intended for those Tribes that would like to establish a TRP, are in the early stages of establishing a TRP or are part of a TRP consortium.

Presenter: Mickey Hartnett, Midwest Assistance Center
Moderator: Mary Goolie, US Environmental Protection Agency

10:30 a.m. - 11:45 a.m.

US Forest Service Listening Session on Sacred Sites Policy (Part 2 of 2)

Tikahtnu E

Details: In part 2, we will listen to participants and record your comments on how to improve sacred sites policies and procedures. After consultation on a draft report this summer, a final report with recommendations will be submitted to the Secretary of Agriculture by November 2011.

Presenters: Beth Pendleton and Ruth Monahan, US Forest Service
Moderator: Steve Kessler, US Forest Service

Contaminants in Subsistence Foods

Tikahtnu D

Details: The presence of heavy metals, persistent, man-made chemicals and natural toxins in the arctic subsistence foods generate concerns about the potential threat to the ecosystem and risks to human health. This presentation will focus primarily upon two toxins of the greatest concern to Alaskans: mercury and paralytic shellfish poisoning (PSP), and how these toxins occur in subsistence diet.

Presenters: Bruce Wright, Knik Tribal Council; David Harrison, Alaska Inter Tribal Council; Joe Sarcone, Agency for Toxic Substances and Disease Registry; Alex James, Yakutat Tlingit Tribe
Moderator: Klaudia Jo Klaudi, Knik Tribal Council

Native Voices: Traditional Knowledge & Climate Change (Part 2 of 2)

Kahtnu 2

Details: This session seeks to gather and obtain information from Alaska Native Villagers about their traditional Tribal Ecological Knowledge(TEK), how they are currently coping, and what barriers they face to effectively adapt to changes. The session will comprise presentations that illustrate the richness and value of TEK and traditional lifeways and explore some tools/systems for gathering and disseminating this information.

Presenters: Colleen Swan, Kivalina; Orville Huntington, Husila
Moderator: Don Bantz, Alaska Pacific University

What is Coastal and Marine Spatial Planning?

Tubughnenq' 3

Details: This session will explore the topic of Coastal and Marine Spatial Planning (CMSP). Under the new National Ocean Policy, CMSP has been emphasized as "an important planning tool for regional ocean governance. CMSP is a comprehensive, adaptive, integrated, ecosystem-based, and transparent spatial planning process, based on sound science, for analyzing current and anticipated uses of ocean, coastal, and Great Lakes areas."

Presenter: Ian Dutton, Alaska SeaLife Center
Moderator: Deborah Rudis, US Fish & Wildlife Service

Hydrocarbon Risk Calculator (Part 2 of 2) Case Studies

K'enakatnu Executive Board Room

Details: The Hydrocarbon Risk Calculator is currently being applied at three Federal Aviation Administration fuel spill sites in Alaska. Examples of preliminary results from the HRC will be compared with results from the Alaska Department of Environmental Conservation on-line method 3 calculator for the same sites. Differences in results will be highlighted and discussed to develop an understanding of the differences between the calculation methods and the calculated differences in risk to human health from each method. Comparisons of sampling methods and their applicability, results and "lessons learned" will be provided.

Presenters: Larry Acomb, Geosphere; Jamie Oakley, AHTNA, Inc
Moderator: Scott Berglund, Federal Aviation Administration

Federal Interagency Coordination on Environmental Justice Issues (Part 2 of 2)

Tikahtnu C

Details: Part 2 of this session will focus on specific work, partnerships, resources, and programs of the participating agencies, which tribes and community representatives may find helpful in their efforts to address their environmental, public health and other environmental justice concerns.

Presenters: Mathy Stanislaus, US Environmental Protection Agency; Melinda Downing, US Department of Energy; David Rivers, Medical University of South Carolina; Bob Furlong, US Department of Defense; Ethan Shenkman, Department of Justice; Merlaine Kruse, US Department of Agriculture
Moderator: Amber Blaha, Department of Interior

must have capacity to respond to worst case scenario / Intl. standards for Arctic Countries

Afternoon

February 9

WEDNESDAY

10:30 a.m. - 11:45 a.m. (cont.)

Drumbeats: Place-Based Environmental Education Certificate for Rural Alaska

Kahtnu 1

Details: Come discover successful ways place based science education is being delivered in rural Alaska. This session presents the best practices employed by four University Alaska Fairbanks certificate programs (Environmental Studies, Ethnobotany, High Latitude Range Management, and Veterinary Science) and will discuss the challenges and rewards of using online tools coupled with a "subsistence science" perspective.

Presenters: Todd Radenbaugh, Suze Nolan, Rose Meier, and Trisha Walters, University of Alaska Fairbanks
Moderator: Elisa Bruns, University of Alaska Fairbanks, US Department of Agriculture

Oil Development in the Arctic

Tubughneq' 4

Details: This session will include presentations and discussions about what research has been done and what is still needed for safe oil production in the Arctic and what response methods will be on hand and available in case of an incident.

Presenters: Marilyn Heiman, US Arctic Program/Oceans North; Ron Morris, Alaska Clean Seas; Dr. Robert Suydam, North Slope Borough
Moderator: Scott Pegau, Oil Spill Recovery Institute

12:00 p.m. - 1:45 p.m.

LUNCH ON YOUR OWN

Alaska Clean Seas — has equipment/wraps most oil co use them
Response cap needed in-vestment
Pew Environment & Climate Change 2x rest of world extreme temps-access issues
Better oversight for spill response/prevention
Better tech/research
Seasonal drilling restrictions
Increase oversight + funding for fed agencies (USCG, NEXT, EPA). Greater community involvement. Science gaps need to be filled in.

2:00 p.m. - 3:15 p.m.

Geographic Information System Rural Alaska

Tikahtnu D

Details: This will be a brief introduction to the concepts and benefits of using a geographic information system (GIS) to manage data within Alaska communities. Topics to be covered include: What is GIS? Visualizing and analyzing your data and GIS applications in Tribal Governments.

Presenters: Adrian Guthrie, Knik Tribal Council; Chester Murphy, Department of Natural Resources
Moderator: Richard Porter, Knik Tribal Council

Community Gardening Benefits in Rural Alaska

Tikahtnu E

Details: This session focuses on community and greenhouse gardening in rural Alaska and the incorporation of Native food use, collection and storage techniques. Besides increased nutrition and economic benefits, gardening has other beneficial side effects such as neighborhood beautification, recreation, exercise and therapy along with opportunities for social interaction and intergenerational and cross-cultural connections.

Presenters: Bruce Wright, Knik Tribal Council; Danny Consenstein and Jim Loiland, US Department of Agriculture; Connie Fredenberg, Marsh Creek; Bob Mikol, University of Alaska Fairbanks
Moderator: Theo Garcia, Knik Tribal Council

Marine Debris Workshop (Part 1 of 2)

Tubughneq' 3

Details: This all-afternoon workshop will review the actions taken on marine debris in the past year, trends seen in ongoing studies, and tools for outreach to communities on marine debris cleanup. Topics for this session will include advancements in sonar work, mapping, large scale projects, and community outreach.

Presenters: Patrick Chandler, Center for Alaskan Coastal Studies; Fritz Klasner, Kenai Fjords National Park; David Gaudet, Marine Conservation Alliance Foundation; Peter Murphy, National Oceanic and Atmospheric Administration Marine Debris Division; Chris Pallister, Gulf of Alaska Keeper
Moderator: Erika Ammann, National Marine Fisheries Service

Lack of infrastructure
Few response vessels only 1 cutter
CG = Kodiak increase capabilities
Boat ramps/airports
equipment on site
maybe off limit areas
smaller lease sales

level of performance needed that is not currently in play

2:00 p.m. - 3:15 p.m. (cont.)

Vapor Intrusion Evaluation Case Studies (Part 1 of 2)

K'enakatnu Executive Board Room

Details: This presentation will describe vapor intrusion investigations conducted at sites in Fairbanks, AK. The effects of temperature and volatile organic compound concentrations will be discussed, along with standard and innovative methods for developing subslab to indoor air attenuation factors.

Presenters: Dr. David Barnes, University of Alaska Fairbanks; Joseph King, US Army; Dennis Shelton and Jeremy Blei, CH2M HILL
Moderator: Janice Wiegers, Alaska Department of Environmental Conservation

Tribal and Community Perspectives on Environmental Justice Issues in Alaska (Part 1 of 2)

Tikahtnu C

Details: In the first portion of this two-part session, tribal and community panelists will present on key environmental justice issues in Alaska. Senior level representatives from various Federal Agencies, including the Environmental Protection Agency (EPA), Department of Energy, Department of Defense, Department of Interior, and Department of Justice will be present to listen and learn. Opening remarks will be provided by EPA's Regional Administrator, Dennis McLerran.

Presenters: Dennis McLerran, US Environmental Protection Agency; Nelson Island Consortium Elder Theresa Abraham; Shawna Larson, Pacific Environment; Millie Hawley, Native Village of Kivalina; George Edwardson, Inupiat Community of the Arctic Slope; Viola Waghiyi, Alaska Community Action on Toxics; Hazel Blackmore, Anchorage Neighborhood Housing Services.
Co-Moderators: Larry Merculieff, 7 Generations Consulting; Wenona Wilson, US Environmental Protection Agency
Translation Coordinators: Tami Fordham and Cathy Villa, US Environmental Protection Agency
Translator: Marie Meade, University of Alaska Anchorage

Daily Meetings / Radio
Unified command
Lightering by helicopter
work group process
Daily situation report

Sustainable Energy in Environmental Education

Kahtnu 1

Details: This session discusses environmental education resources needed to reduce our use of fossil fuel consumption, and how sustainable energy education plays a significant role in solving many energy related problems such as high costs and short supply of fuel. If you want to be a part of the solution, come to this session and learn about sustainable energy educational activities in Alaska. This session will include presentations and discussions on existing efforts, emerging programs, current needs, possibilities for collaboration, and more.

Presenters: Kat Keith, Alaska Center for Energy and Power; Kaarle Strailey, Alaska Center for the Environment; Tom Marsik, University of Alaska Fairbanks
Moderator: Tom Marsik, University of Alaska Fairbanks Bristol Bay Campus Sustainable Energy Program

Lessons Learned: Information Flow – The Selendang Ayu and the Deepwater Horizon Incidents

455, oil
oil spill

Tubughnenq' 4

Details: The Selendang Ayu and the Deepwater Horizon in the Gulf of Mexico had different methods of providing information to the public. Presenters will discuss methods of information dissemination and anticipated changes.

Presenters: Gary Folley, Alaska Department of Environmental Conservation; Kristina Peterson, Communities on the Horizon; Ron Morris, Alaska Clean Seas
Moderator: Joe Banta, Prince William Sound Regional Citizens' Advisory Council

Tracking Backhaul Success

Kahtnu 2

Details: Total Reclaim along with Everts and Kawarek will present on backhauling recyclables, specifically regarding how Kawarek took on the responsibility of accepting materials from outlying villages and subsequently staging, repackaging, and shipping those materials via Everts to Total Reclaim and other recyclers (all within the last year).

The Nome program is good example of utilizing a hub to facilitate the backhaul of potentially harmful materials. Additionally, Total Reclaim will explain the Rural Tracking Program, its benefits, and report on recycling stats for 2010. Further, future projects and goals for 2011 will be discussed.

Presenters: Reilly Kosinski, Total Reclaim; Lacey Whitehead and Sabrina Volstad, Everts Air; Anahma Saito, Kawerak Inc.
Moderator: Larry Zirkle, Total Reclaim

3:30 p.m. - 4:45 p.m.

Area Contingency Planning for Oil Spill Response in Alaska
Tubughneng' 4

Details: This session provides attendees with an overview of the joint Federal/State planning process to update the Subarea Contingency Plans (SCPs) for the North Slope, Northwest Arctic, Bristol Bay, and Western Alaska subareas. Planning team members will describe the types of local/traditional information needed from subarea residents, local governments, and federally-recognized tribes to further improve the plans which address protocols for responding to oil discharges and hazardous substance releases. They will also run through a spill response scenario.

Presenters: Rob Hollinger and Jay Calkins, US Coast Guard; Dale Gardner and Larry Iwamoto, Alaska Department of Environmental Conservation
Moderator: Linda Swiss, Prince William Sound Regional Citizens' Advisory Council

Annual Alaska Mining Report
Kahtnu 2

Details: Alaska mine operators will provide an update on their existing operations, with the focus this year on tailings and waste rock issues.

Presenters: Mike Satre, Council of Alaska Producers; Todd Roth, Sumitomo Metal Mining Pogo Mine; TBA Kinross Fort Knox Mine
Moderators: Jason Brune, Resource Development Council; Thomas Crawford, Department of Natural Resources

Marine Debris Workshop (Part 2 of 2)
Tubughneng' 3

Details: The continuation of this all-afternoon workshop will review the actions taken on marine debris in the past year, trends seen in ongoing studies, and tools for outreach to communities on marine debris cleanup. Topics for this session will include advancements in sonar work, mapping, large scale projects, and community outreach.

Presenters: Patrick Chandler, Center for Alaskan Coastal Studies; Fritz Klasner, Kenai Fjords National Park; David Gaudet, Marine Conservation Alliance Foundation; Peter Murphy, National Oceanic and Atmospheric Administration Marine Debris Division; and Chris Pallister, Gulf of Alaska Keeper
Moderator: Erika Ammann, National Marine Fisheries Service

Vapor Intrusion Evaluation Case Studies (Part 2 of 2)
K'enakatnu Executive Board Room

Details: Pressure-based Dynamics of Vapor Intrusion: Recently collected data will be presented that outlines how dynamic changes in barometric and building interior pressures affect vapor intrusion processes and indoor air quality. Lessons learned and recommended sampling and analysis strategies will be discussed.

Presenter: Patrick Haas, P.E. Haas & Associates
Moderator: Janice Wiegers, Alaska Department of Environmental Conservation

General Assistance Program (GAP) Online
Tikahtnu D

Details: This session will familiarize GAP grantees on how to use GAP Online for Workplan entry and quarterly reporting.

Moderators: Sherry Kimmons and Westley Foster, US Environmental Protection Agency

Baseline Water Quality Monitoring - Lessons Learned
Tikahtnu E

Details: What is a baseline for water quality and how is it established? What's the difference between assessment and monitoring? What is a Quality Assurance Project Plan (QAPP) and why is it needed? What kinds of equipment and supplies are needed to get started? These questions and more will be answered by several speakers who will share their experiences in conducting baseline water quality assessments.

Presenters: Dan Bogan, UAA Environment and Natural Resources Institute; Daniel Chythlook, Aleknagik Tribal Council; Edda Mutter, UAF Water and Environmental Research Center; Leah Mackey, Yukon River Inter-Tribal Watershed Council
Moderator: Mahri Lowinger, US Environmental Protection Agency

WEDNESDAY Afternoon

February 9

3:30 p.m. - 4:45 p.m. (cont.)

Working Together to Address Environmental Justice Issues Identified by Tribal and Community Panelists (Part 2 of 2)

Tikahtnu C

Details: In the second part of this two-part session, all session participants, including panelists and federal agency representatives, will break into working groups to address key environmental justice issues in Alaska. Workgroups will discuss and provide recommendations to the Environmental Justice Interagency Working Group and EPA Region 10. Workgroups will focus on subsistence, resource extraction, transportation impacts, children's health, and other issues identified by the panelists.

Co-Moderators: Larry Merculief, Seven Generations Consulting; Wenona Wilson, US Environmental Protection Agency
Translation Coordinators: Tami Fordham and Cathy Villa, US Environmental Protection Agency

Promoting Rural Workforce Development through Environmental Internships

Kahtnu 1

Details: This session highlights successful internship programs offered across rural Alaska by federal, state and private agencies, and links the importance of place based rural internships with workforce development. Discussions will be led by both mentors and student interns.

Presenters: Chris Czarnecki, Alaska Conservation Foundation; Candice Bressler, Alaska Department of Fish & Game; Kim Seybert Bristol Bay Native Association; Paul Liedberg, US Fish & Wildlife Service Togiak Wildlife Refuge
Moderators: Paul Liedberg, US Fish & Wildlife Service Togiak Wildlife Refuge; Dr. Todd Radenbaugh, University of Alaska Fairbanks

5:00 p.m. - 7:00 p.m.

EVENING EVENT

Regional Tribal Operations Committee Social

Tikahtnu Ballroom

Details: Come and enjoy appetizers at an evening social event hosted by the Regional Tribal Operations Committee, and gain the opportunity to interact with the RTOC Advisory members. Keynote presentations are to be announced. The annual Ellanak Environmental Excellence Award will also be presented.

Moderated by RTOC Co-Chairs: Violet Yeaton, Port Graham Tribal Council; Rose Kalistook, Orutsaramiut

NOTES:

8:00 a.m. - 8:45 a.m.

MORNING KEYNOTE EVENT

LYNN PAULSON
"As Within, So Without"
Tikahtnu Ballroom

Details: Please join us for an exceptional Morning Keynote at the Alaska Forum on the Environment, 2011.

Dr. Lynn Paulson is a teacher, personal development coach, motivational speaker and writer. She has lived in Anchorage, Alaska since 1993.

Lynn's work is focused on human emotional and spiritual well-being as the foundation for all efforts aimed at sustainability. A healthy world requires healthy inhabitants who practice an ethic of care that includes the self, fundamentally.

Lynn's message is that we have a responsibility to heal ourselves so that we can make our greatest possible contribution to larger causes that concern us all. Her goal is to motivate clients, listeners and readers to make positive changes to their lives now.

Her keynote address for the Alaska Forum, "As Within, So Without," stresses the importance of developing habits and practices that sustain us as human beings and move us to create lives that support our well-being and effectiveness. Making loving self-care a priority creates more balanced lives and balanced people, who are more positive, healthy and effective in their lives and in their communities.

Before creating Flying Heart Industries and developing her career in life coaching and motivational speaking, Dr. Lynn Paulson, Ph.D, spent over 25 years teaching and writing about various topics in communication, social interaction and culture, first at the University of Nebraska, at Lincoln, and then at Alaska Pacific University in Anchorage, Alaska.

8:00 a.m. - 11:45 a.m.

Statement of Cooperation Executive Steering Committee Meeting - By Invitation Only
K'enakatnu Executive Board Room

Details: This session is a closed session of the steering committee.

9:00 a.m. - 10:15 a.m.

How to Organize a Household Hazardous Waste Collection Program
Tubughneq' 4

Details: Come and learn how to set up a household hazardous waste collection program in your community, and options for shipping these wastes out of your community.

Presenter: Terry Berger, Mat-Su Borough
Moderator: Cory Hinds, CH2M HILL

Hazard Communication Standard
Tikahtnu E

Details: The Hazard Communication Standard is also known as "the worker right to know."

Presenter: Chuck Mitchell, University of Washington
Moderator: Klaudia Jo Klaudi, Knik Tribal Council

Native American Lands Environmental Mitigation Program
Tikahtnu D

Details: This session is an overview of the Department of Defense's environmental program including eligibility criteria, Cooperative Agreements and the selection process.

Presenters: Theo Garcia, Knik Tribal Council; Alex James, Yakutat Tlingit Tribe; Valerie Palmer, Department of Defense, US Army Corps of Engineers; Terri Kelley, Keres Consulting
Moderator: Richard Porter, Knik Tribal Council

Climate Science in the Arctic and What it Means to Alaskans
Kahtnu 2

Details: A discussion on the implications of Arctic science and what it means to the daily lives of Alaskans. This session will include a discussion of the work of the Arctic Council and the Sustaining the Arctic Observing Network, and climate change activities of Indigenous People in the local, national and international arenas.

Presenters: John Calder, National Oceanic and Atmospheric Administration/Sustaining the Arctic Observing Networks; Victoria Gofman, Arctic Council Representative; Patricia Cochran, Alaska Native Science Commission
Moderator: David Guest, US Environmental Protection Agency

9:00 a.m. - 10:15 a.m. (cont.)

The National Environmental Policy Act De-Mystified
Tubughneng' 3

Details: Taking the "Scary" out of the National Environmental Policy Act (NEPA): A fun, interactive session including "NEPA Jeopardy" with PRIZES! The very basics of NEPA including the purpose and intent of the law and overview of the Council on Environmental Quality's implementing regulations will be covered. NEPA is not just for mining activities; other resource extraction including woody biomass can trigger the NEPA process. This session is designed for individuals wishing to learn more about NEPA and when it applies and for agency representatives that implement NEPA. Participants will learn the foundations of a NEPA analysis, basics of public involvement, factors used to determine significant effects and the types of documents used by Federal agencies during the NEPA process. Agency participants will gain insight on the general level of knowledge of the NEPA process and where their assistance is needed most.

Presenters: Betsy Rickards, US Forest Service; Izetta Chambers, University of Alaska Bristol Bay
Moderator: Bud Rice, National Park Service

How to Perform a Village-Based Dump Site Assessment: A Scammon Bay Case Study
Tikabtnu C

Details: In the spring of 2010 the Native Village of Scammon Bay partnered with the Agency for Toxic Substances and Disease Registry to explore concerns regarding the possible impact of the village dumpsite on a nearby subsistence stream. Over the course of three days a village based dumpsite assessment process developed which resulted in a detailed assessment report that could be shared with others. The process included a number of steps: establish the purpose for an assessment, provide/receive exposure pathways training, visit the site to get the overall picture, brainstorm to identify the needed exposure pathway details (where, what, how much, how far from ,etc.), develop a site investigation form unique to the site, perform fact finding/research including conduct a detailed inspection of the site and surroundings, develop a report outline and write the assessment report. The Scammon Bay case study was a learning experience for all involved and hopefully will be useful to others in their villages.

Presenters: Josh Akerelrea, Native Village of Scammon Bay; Joe Sarcone, Agency for Toxic Substances and Disease Registry
Moderator: Santina Gay, US Environmental Protection Agency

Federal Actions and Next Steps on Leaded Aviation Gasoline (Part 1 of 2)
Kahtnu 1

Details: This is a two-part session. Discussion of the respective regulatory roles of the US Environmental Protection Agency and the Federal Aviation Administration regarding leaded aviation gasoline, activities by the Federal government to date and their next steps.

Presenters: Marion Hoyer and Kathryn Sargeant, US Environmental Protection Agency; Mark Orr, Federal Aviation Administration
Moderator: John Pavitt, US Environmental Protection Agency

9:00 a.m. - 4:00 p.m.

Brownfields Tribal Response Program Training
Marriott Hotel

Details: Part 2 of this session is about enhancing an existing CRECLA 128(a) Tribal Response Program (TRP) funded by the US Environmental Protection Agency under a 128(a) Cooperative Agreement. The TRP is intended to address the releases of hazardous substances, pollutants and contaminants from brownfields, mine scarred lands, petroleum, and other sites and sources. This session will be primarily intended for those tribes or villages that have some experience in establishing a TRP, either directly or as part of a TRP consortium, and now are seeking ways to enhance and further develop their TRP.

Presenter: Mickey Hartnett, Midwest Assistance Center
Moderator: Mary Goolie, US Environmental Protection Agency

NOTES:

10:30 a.m. - 11:45 a.m.

Impacts of Poor Solid Waste Management on Village Health
Tubughnenq' 4

Details: Come participate in this roundtable discussion on the impacts of poor solid waste management practices. There will be a brief introduction presentation about hazardous substances in your community and exposure pathways.

Presenters: Jennifer Williams, Institute for Tribal Environmental Professionals; Joe Sarcone Agency for Toxic Substances and Disease Registry
Moderator: Greg Goodale, Mat-Su Borough

Environmental Issues Associated with Meth Lab Cleanup
Tikahtnu D

Details: The hazards associated with the making, selling and use of Methamphetamine and other health issues including environmental concerns. This course is designed ONLY as an awareness program.

Presenter: Chuck Mitchell, University of Washington
Moderator: Theo Garcia, Knik Tribal Council

Climate Change in Northern Communities: Canadian Federal and Municipal Perspectives
Kahtnu 2

Details: This panel will feature strategies for addressing climate change on both a federal and municipal level in Canada; featuring Yellowknife Mayor and Federation of Canadian Municipalitites Board Member Gordon VanTighem and Consul Jennifer Loten of the Consulalte of Canada, Anchorage exploring ideas from your neighbor to the West.

Presenters: Jennifer Loten, Consulate of Canada-Anchorage; Gordon VanTighem, Federation of Canadian Municipalities
Moderator: Shane Montoya, US Coast Guard 17th District

Federal Actions and Next Steps on Leaded Aviation Gasoline (Part 2 of 2)
Kahtnu 2

Details: Discussion continues of the respective regulatory roles of the US Environmental Protection Agency and Federal Aviation Agency regarding leaded aviation gasoline, activities by the Federal government to date, and their next steps.

Presenters: Barbara Trost, Alaska Department of Environmental Conservation; Troy Ritter, Alaska Native Tribal Health Consortium; Tom George, Aircraft Owners and Pilots Association; Susan Flensburg, Bristol Bay Native Association
Moderator: John Pavitt, US Environmental Protection Agency

New Landscape Conservation Cooperatives in Alaska to Address Climate Change
Tubughnenq' 3

Details: America's natural systems and landscapes are impacted by increasing land use pressures and widespread resource threats amplified by a rapidly changing climate. These changes are occurring at an unprecedented pace and scale. Landscape Conservation Cooperatives (LCCs) are a network of applied conservation science partnerships between the US Fish & Wildlife Service and other federal agencies, states, tribes, NGOs, universities and stakeholders within a geographically defined area working in unison to ensure the sustainability of America's land, water, wildlife and cultural resources. There are 5 LCCs covering Alaska.

Presenter: Greg Balogh, US Fish & Wildlife Service
Moderator: John Duffy, JD Associates

The National Environmental Policy Act: Tools and Tips
Tubughnenq' 5

Details: The National Environmental Policy Act (NEPA) was implemented to ensure that local communities have a voice in the decision-making process for the utilization and conservation of our natural and cultural resources. NEPA can be a factor in any resource extraction, including woody biomass and any other resource from federal lands or waters. Getting involved, however, can be intimidating and confusing. It can also be challenging for agency representatives implementing NEPA to provide relevant resources for those wishing to become involved. This session offers Alaska based and national resources that can assist individuals and communities become effectively involved in the NEPA process and aid agency representatives in guiding these individuals to relevant and appropriate sources of information.

Presenters: Izetta Chambers, University of Alaska Bristol Bay; Meg Burgett, University of Alaska Fairbanks; Pat Reed, US Forest Service
Moderator: Bud Rice, National Park Service

Environmental Protection Agency's Update and Listening Session on Alaska and National Mining Issues (Part 1 of 2)
Tikahtnu C

Details: In Part 1 of this two part session presenters will summarize current National and Alaska mining issues, including potential regulations being developed by the US Environmental Protection Agency. Participants will have the chance to discuss these issues and other topics about mining in Alaska. Most of the discussion time will occur in Part 2.

Presenters: Patty McGrath and Mathy Stanislaus, US Environmental Protection Agency
Moderator: Tami Fordham, US Environmental Protection Agency

THURSDAY Afternoon

February 10

12:00 p.m. - 1:45 p.m.

KEYNOTE EVENT

FRAN ULMER
Chancellor University of Alaska Anchorage
Tikahtnu Ballroom

Details: Fran Ulmer is chancellor of Alaska's largest public university, the University of Alaska Anchorage (UAA).

In addition to serving as UAA's Chancellor, Ms. Ulmer was appointed by President Barack Obama in June 2010 to the National Commission on the BP Deepwater Horizon Oil Spill and Offshore Drilling. The commission is charged with investigating the causes of the explosion and oil spill, and recommending changes to prevent future disasters from occurring.

Prior to her appointment to the oil spill commission, Ms. Ulmer was a member of the Aspen Institute's Commission on Arctic Climate Change and held Board positions with the Alaska Nature Conservancy, the National Parks Conservation Association and the Union of Concerned Scientists. Appointed Chancellor in 2007, Ms. Ulmer previously was a Distinguished Visiting Professor of Public Policy and Director of the Institute of Social and Economic Research at UAA.

During her more than 30 years of work in public service on the local, state and national level, Ms. Ulmer has helped to shape both public and environmental policy.

2:00 p.m. - 3:15 p.m.

Rural Development Water and Environmental Program Overview and Application Process (Part 1 of 2)

Tubughneng' 5

Details: This session will provide an overview of the US Department of Agriculture Rural Development Water and Environmental Programs, which provides loans, grants, and loan guarantees for drinking water, sanitary sewer, and solid waste in rural communities throughout Alaska. Find out which applications may apply to your community's needs. During this session participants will have time to walk-through the application process with USDA staff and may ask specific questions about potential projects.

Presenter: Misty D. Hull, US Department of Agriculture Rural Development
Moderator: Cory Hinds, CH2M HILL

Burn Unit Pilot Project

Tikahtnu E

Details: Mr. Lance Jackson, the Principle of Tuluksak High School, will give an account of an innovative approach to construction of a burn unit for the community by recycling existing materials, as in using an old 3,000 gallon fuel tank. This was a hands on student project with a curriculum involving welding, geography, science, math and writing.

Presenter: Lance Jackson, Tuluksak High School.
Moderator: Richard Porter, Knik Tribal Council

NEPA in the Courtroom: Case Law

Tubughneng' 3

Details: The National Environmental Policy Act (NEPA) court decisions in Alaska have shaped how NEPA is applied today. Of particular interest is recent court decisions about when it is a federal action and when NEPA applies.

Presenter: Jeff Parker, Environmental Law Attorney
Moderator: Dick Anderson, National Park Service

2:00 p.m. - 3:15 p.m. (cont.)

Environmental Protection Agency's Update and Listening Session on Alaska and National Mining Issues (Part 2 of 2)

Tikahtnu C

Details: Participants will have the chance to discuss National and Alaska mining issues presented in Part 1 as well as other mining related topics.

Presenters: Patty McGrath and Mathy Stanislaus, US Environmental Protection Agency
Moderator: Tami Fordham, US Environmental Protection Agency

GAP Solid Waste Solutions

Kahtnu 1

Details: This session will be an open format session provided to General Assistant Program recipients on potential solutions for addressing solid waste issues in rural Alaska, such as banning plastic bags/styrofoam, illegal dumps, landfill permitting, backhaul and recycling.

Moderators: Ted Jacobson, RurAL CAP; Doug Huntman, Alaska Department of Environmental Conservation; Santina Gay, US Environmental Protection Agency

2:00 p.m. - 4:45 p.m.

Coastal America Alaska Regional Implementation Team Meeting

K'enakatnu Executive Board Room

Details: Annual meeting of the Coastal America Alaska Regional Implementation Team and Regional Principals.

Co-chairs: Jon Kurland, National Marine Fisheries Service; Doug Mutter, US Department of the Interior

NOTES:

3:30 p.m. - 4:45 p.m.

Alaska Youth and Climate Change: Building a Program that Works
Kahtnu 2

Details: This session will focus on how to develop a strong youth environmental program.

Presenters: MaryAnn Porter, Yakutat Tlingit Tribe; Brenda Trefon, Kenaitze Indian Tribe; Charlie Ess, RurALCAP
Moderator: Michelle Davis, US Environmental Protection Agency

Landfill Alternatives/Resource Recovery
Kahtnu 1

Details: Come find out about the Reduce part of Reduce-Reuse-Recycle. Participants will learn about alternatives to landfilling solid waste and how to set up a resource recovery and reuse program in their community.

Presenters: Ted Jacobsen, US Environmental Protection Agency; Doug Huntman, Alaska Department of Environmental Conservation
Moderator: Cory Hinds, CH2M HILL

Rural Development Water and Environmental Program Overview and Application Process (Part 2 of 2)
Tubughnenq' 5

Details: Overview continues of the US Department of Agriculture Rural Development Water and Environmental Programs, which provides loans, grants, and loan guarantees for drinking water, sanitary sewer, and solid waste in rural communities throughout Alaska. Find out which applications may apply to your community's needs. During this session participants will have time to walk-through the application process and may ask specific questions about potential projects.

Presenter: Misty D. Hull, US Department of Agriculture Rural Development

National Environmental Policy Act, Marine Fisheries, and Public Participation
Tubughnenq' 3

Details: A presentation and panel discussion on how the National Environmental Policy Act process fits into North Pacific Marine Fisheries decisions, and how the public can participate in the process. Tribal consultation and federal fisheries management will also be discussed.

Presenters: Izetta Chambers, Alaska Sea Grant; John Sky Starkey, Alaska Native subsistence and tribal rights; Michael Sloan, Nome Eskimo Community
Moderator: Heather Brandon, World Wildlife Fund

General Assistance Program (GAP) Peer Assistance Providers Open Working Session for Grants Management Assistance and GAP Proposal Development
Tikahtnu C

Details: If you work for a Tribe and are interested in improving the financial and administrative systems in your office, or are a new General Assistance Program recipient who may have questions about policies and procedures, this opportunity will allow you to meet with a Peer Assistance Provider. Participants are also welcome to bring their draft FY 2012 GAP proposals for assistance with revisions.

Presenters: Don Wedll, AVCP; Klaudia Klaudi, Knik Tribal Council; Mike Grunberg, Yukon River Inter-Tribal Watershed Council; Leilani Knight, CCTHITA; Roxanna Kashetok, APIA; Violet Yeaton, Port Graham Village Council;
Moderators: Mahri Lowinger, Sherry Kimmons and Westley Foster, US Environmental Protection Agency

FILM FESTIVAL: People of the Seal
Tubughnenq' 4

Details: Award winning film, with introduction by Aquilina Lestenkoff, Aleut Community of St. Paul Island Tribal Government, Tanax^ ~ Unaag^im Maqax^singin Office- Cultural Affairs.

8:00 a.m. - 5:00 p.m.

HAZWOPER 8-Hour Refresher Course

Kahtnu 1 & 2

Details: This training applies to those who engage in hazardous waste/substance operations, hazardous materials emergency response, and who have previously completed either 24-hour or 40-hour hazardous waste site training. This course satisfies the Occupational Safety and Health Administration (OSHA) 8-hour annual refresher training requirements for employees conducting hazardous waste operations as specified under 29 Code of Federal Regulations (CFR) 1910.120. Participants wanting to take this session must pre-register or sign up in advance at the main conference registration desk.

Additional Information: You need to be a paid Alaska Forum on the Environment (AFE) Conference registrant to take this annual 8-hour HAZWOPER refresher class.

Topics covered, as recommended under 29 CFR 1910.120(e)(8) will include: safety plan development and site entry procedures, chemical hazards, biohazards, nature of radiation/radiation protection methods, selecting appropriate personal protective equipment (PPE), air monitoring, decontamination, and hazard communications. Please ensure that you add your name to the sign-up list for this session event by selecting the online or paper registration form.

Instructors: Chuck Mitchell, University of Washington

8:15 a.m. - 1:30 p.m.

Oil Spill Recovery Institute Advisory Board Meeting

K'enakatnu Executive Board Room

Details: Semi-annual meeting of the Prince William Sound Oil Spill Recovery Institute Advisory Board. The Oil Spill Recovery Institute was established by the Oil Pollution Act of 1990 to fund and carry out research and development and education on Arctic and sub-Arctic oil spills; spill response technologies; and the assessment of impacts to the environment, economy and lifestyles of Alaskans.

Presenter: Nancy Bird, Oil Spill Recovery Institute

8:30 a.m. - 10:15 a.m.

GAP: Topics in Environmental Education & Outreach

Tikahtnu C

Details: An exciting sampling of projects that are geared toward environmental education in Alaska, including a look at on line resources.

Presenters: Ray Paddock, Jr, CCTHITA; Lance Simons, Ketchican Indian Community; Lynn Zender, Zender Environmental; Brenda Duty, Project WILD, Alaska Department of Fish and Game; Charlene Dubay from Telida Tribal Council
Moderator: Mahri Lowinger, US Environmental Protection Agency

8:30 a.m. - 2:30 p.m.

FILM FESTIVAL

Tubughneng' 4

"Unraveling the Story of Trash in Rural Alaska" video contest winners

Details: Rural Community Assistance Corporation (RCAC) with support from U.S. Department of Agriculture Rural Development, and in cooperation with the Alaska Department of Environmental Conservation and Solid Waste Association of North America – Alaska Chapter, presents the winner of the first annual "Unraveling the story of trash in rural Alaska" video contest. Contestants were asked to share the realities of dealing with trash in their rural community by putting together a three minute video and submit it via You-Tube. Prizes will be awarded to all videos that meet the criteria of this contest. This session highlights the contest and shows the winning video.

Moderators: Jim Wilson, Rural Community Assistance Corporation; Doug Huntman, Alaska Department of Environmental Conservation

"Understanding the Healing Hands of the Maniilaq Tribal Doctors: A Training Video"

Details: All images in this video are from the 1983 recordings of the Maniilaq Health Services. The original videos are referred to generally as "the Della Keats" collection. These recordings were edited under a 2009 National Library of Medicine award into this introductory program to help explain the types of traditional Inupiaq practices employed in northwestern Alaska to enhance or restore well-being. Commentary is included from an Osteopathic Physician providing initial attempts at forging a common vocabulary of the techniques utilized. [32:40 min]

"Play Again"

Details: At a time when children play more behind screens than outside, PLAY AGAIN explores the changing balance between the virtual and natural worlds. Is our connection to nature disappearing down the digital rabbit hole? This emotionally moving and humorous documentary follows six teenagers who, like the "average American child," spend five to fifteen hours a day behind screens. PLAY AGAIN unplugs these teens and takes them on their first wilderness adventure - no electricity, no cell phone coverage, no virtual reality.

"The Bering Sea: An Ecosystem in Crisis"

Details: The MY Esperanza made a two month long voyage into the Bering Sea to visit some 20 Tribal Communities to collect information about their concerns relating to the Bering Sea. George Pletnikoff, Alaska Oceans Campaigner for Greenpeace speaks to and interviews Tribal Leaders and Members to see where Greenpeace might be able to help solve some of these very serious problems. [12 min]

"Eye to Eye with Ivan"

Details: The Cold War was not fought on any conventional battlefield, and the members of the Alaska National Guard were far from a conventional unit. Native Alaskans stood guard and engaged with the Soviet Union along our nation's western frontier for 50 years. Paul Gray's film provides a thoughtful approach to the complicated issues of cultural contact involving the US and USSR, and Alaskan

8:30 a.m. - 2:30 p.m. (cont.)

villagers within the dramatically changing times in America during the second half of the 20th century. Through stories, photographs, and archival film clips, the men of the Alaska National Guard recall a time when, while the rest of the country was learning how to duck and cover, they were standing on the shores of the Bering Sea, where the Cold War was the coldest.

"Wild Salmon Universe: People and Tradition on the Nushagak River in Alaska's Bristol Bay"

Details: Alaska's Bristol Bay is home to 51 percent of the planet's wild sockeye salmon. The Nushagak River, the subject of this short film, along with the Kvichak River, are alone responsible for 25 percent of the Earth's wild salmon. With such a remarkable resource borne of its lakes and rivers, it's no surprise that nature runs on salmon in Bristol Bay. And all across this corner of Alaska, families and livelihoods depend on salmon, too. This short film is produced in the form of a "photographer's notebook" that is narrated by Alaska photographer Clark James Mishler. In telling about his travels along the Nushagak River, Mishler shares photos and stories of the people he meets in several villages, including Koliganek, New Stuyahok, Ekwok, and Dillingham. Everywhere he goes, whether traveling by skiff or floatplane, or walking the beaches of Bristol Bay, Mishler's camera captures people who hold a deep respect for wild salmon. This film is produced by Dustin Solberg of The Nature Conservancy in Alaska with the iMovie video editing program and relies exclusively on still images. [4:16 min]

"Increase your Bottom Line – Be Energy Smart"

Details: The film summarizes the journey of four diverse Anchorage businesses which have undergone energy efficiency improvements and have reaped the benefits. Businesses that have completed energy efficiency retrofits have lowered operating costs, lowered energy bills, lowered maintenance costs, increased return on investments and increased economic competitiveness. The film tells the unique story of each business and addresses questions business owners should know about energy efficiency. Now is the time for Alaska State Legislation to incentivize private commercial businesses, non-profit organizations and churches to improve their energy efficiency. The commercial sector must be involved to reach Alaska's goal of increasing energy efficiency by fifteen percent by year 2020. Length: 30min.

Moderator: Doug Huntman, ADEC Solid Waste Program

8:30 a.m. - 4:00 p.m.

Climate Change and the National Environmental Policy Act Class

Tubughneng' 3

Details: This class will focus on incorporating climate change considerations into National Environmenntal Policy Act documents and will discuss recent Council on Environmental Quality and Department of the Interior guidance on this topic.

Instructors: Ted A. Boling, US Department of the Interior; Michael Smith, ICF International

9:00 a.m. - 10:15 a.m.

Introduction to Class III Landfills and Top 10 Problems

Tubughneng' 5

Details: Come listen to a review of the Top 10 problems at rural landfills, then stick around to find better ways to manage solid waste in your community.

Presenters: Ted Jacobsen, US Environmental Protection Agency; Doug Huntman, Alaska Department of Environmental Conservation
Moderator: Jeff Raun, Colorado State University - Joint Base Elmendorf-Richardson

10:30 a.m. - 11:45 a.m.

Best Practices for Solid Waste Management in Rural Alaska

Tubughneng' 5

Details: Come learn about best management practices for solid waste management from our local experts.

Presenters: Kit Persson, Alaska Department of Environmental Conservation; Sandra Woods, Alaska Department of Environmental Conservation
Moderator: Jeff Raun, Colorado State University - Joint Base Elmendorf-Richardson

General Assistance Program Tribal Environmental Professionals Community Building Session and Conference Wrap Up

Tikahtnu C

Details: Closing session for all General Assistance Program conference participants. Talking Circle to share how tribal representatives are answering environmental issues at home, and what take home messages came out of the conference this week. Drawing of donated items!

Moderators: Cathy Villa and Tami Fordham, US Environmental Protection Agency

3:30 p.m. - 4:45 p.m.

Resources for Tribal Environmental Advocacy

Tikahtnu D

Details: Panelists share information on their approaches to advocacy and resources for Tribes in environmental program building.

Presenters: Violet Yeaton, Tribal Government of Port Graham; Shawna Larsen, Pacific Environment; David Harrison, Alaska Inter-Tribal Council; Ole Lake, Hooper Bay
Moderator: Richard Porter, Knik Tribal Council

Monday, February 7

3:30 p.m. - 4:45 p.m.
Alaska GAP Peer Assistance Provider Network Activities
Tikahtnu C

Details:This is a closed meeting of the GAP Peer Assistance Network representatives

Moderator: Mahri Lowinger, US Environmental Protection Agency

Wednesday, February 9

9 a.m. - 4 p.m.
Brownfields Tribal Response Program Training
Marriott Hotel

Details: This is a required training for Brownfields grant recipients. This training will be held at the Marriott. Tribal representatives will receive training on Brownfields topics.

Presenter: Mickey Hartnett, Midwest Assistance Center
Moderator: Mary Goolie, US Environmental Protection Agency

Thursday, February 10

8 a.m. - 11:45 a.m.
Statement of Cooperation Executive Steering Committee Meeting
K'enakatnu Executive Board Room

Details: By invitation only. This is a closed session of the steering committee.

9 a.m. - 4 p.m.
Brownfields Tribal Response Program Training
Marriott Hotel

Details: This is a required training for Brownfields recipients. During Day 2 of this two-day training, tribal representatives will receive training on Brownfields topics.

Presenter: Mickey Hartnett, Midwest Assistance Center
Moderator: Mary Goolie, US Environmental Protection Agency

2 p.m. - 4:45 p.m.
Coastal America Alaska Regional Implementation Team Meeting
K'enakatnu Executive Board Room

Details: Annual meeting of the Coastal America Alaska Regional Implementation Team and Regional Principals.

Co-chairs: Jon Kurland, National Marine Fisheries Service; Doug Mutter, US Department of the Interior

Thursday, February 10 (cont.)

3:30 p.m.-4:45 pm
Red Devil Tribal Meeting
Tikahtnu E

Details: This is a closed meeting.

Presenter: Mathy Stanislaus, US Environmental Protection Agency

Friday, February 11

8:15 a.m. - 1:30 p.m.
Oil Spill Recovery Institute Advisory Board Meeting
K'enakatnu Executive Board Room

Details: Semi-annual meeting of the Prince William Sound Oil Spill Recovery Institute Advisory Board. The Oil Spill Recovery Institute was established by the Oil Pollution Act of 1990 to fund and carry out research and development and education on Arctic and sub-Arctic oil spills; spill response technologies; and the assessment of impacts to the environment, economy and lifestyles of Alaskans.

Presenter: Nancy Bird, Oil Spill Recovery Institute

2 p.m. - 4 p.m.
SWANA Alaska Chapter Quarterly Business Meeting
Tubughnenq' 5

Details: The Alaska Chapter of Solid Waste Association of North America (SWANA) will hold their quarterly business meeting. This is a session reserved for Chapter members.

NOTES:

CLEAN UP & REMEDIATION

Monday, February 7
10:30 a.m. - 11:45 a.m.
- ❒ Case Studies: Pore Water Issues at Two Contaminated Sites *Kahtnu 1*

2 p.m. - 3:15 p.m.
- ❒ Cutting PCB Cleanup Costs at Remote Sites: A Case Study of Grain Size Separation *Kahtnu 1*

3:30 p.m. - 4:45 p.m.
- ❒ Environmental and Public Health Agencies: Their Roles and How They Partner to Address Public Health Concerns at Contaminated Sites *Kahtnu 1*

Tuesday, February 8
9 a.m. - 10:15 a.m.
- ❒ Environmental Analysis and Decision Making Processes *Tikahtnu E*
- ❒ Alaska Brownfields Topics: Tribal, State, and US Environmental Protection Agency Response Programs (Part 1 of 2) *Tikahtnu C*

10:30 a.m. - 11:45 a.m.
- ❒ Environmental Restoration Efforts at Federal Sites in Alaska *Tikahtnu E*
- ❒ Alaska Brownfields Topics: Tribal, State, and US Environmental Protection Agency Response Programs (Part 2 of 2) *Tikahtnu C*

2 p.m. - 3:15 p.m.
- ❒ Amchitka Underground Nuclear Test Site Monitoring Program *Tikahtnu E*
- ❒ Solid Waste and Contaminants in Alaska: A Talking Circle (Part 1 of 2) *Tikahtnu C*

3:30 p.m. - 4:45 p.m.
- ❒ Solid Waste and Contaminants in Alaska: A Talking Circle (Part 2 of 2) *Tikahtnu C*
- ❒ Federal Site Remediation Roundtable *Tikahtnu E*

Wednesday, February 9
9 a.m. - 10:15 a.m.
- ❒ Hydrocarbon Risk Calculator (Part 1 of 2) – Concepts, Regulatory Status, Data Needs, Closure Decisions *K'enakatnu Executive Board Room*

10:30 a.m. - 11:45 a.m.
- ❒ Hydrocarbon Risk Calculator (Part 2 of 2) - Case Studies *K'enakatnu Executive Board Room*

2 p.m. - 3:15 p.m.
- ❒ Vapor Intrusion Evaluation Case Studies (Part 1 of 2) *K'enakatnu Executive Board Room*

Thursday, February 10
9 a.m. - 10:15 a.m.
- ❒ Native American Lands Environmental Mitigation Program *Tikahtnu D*

CLIMATE CHANGE

Monday, February 7
2 p.m. - 3:15 p.m.
- ❒ Recent Advances in Climate Science in Alaska *Tubughneq' 5*

3:30 p.m. - 4:45 p.m.
- ❒ Toward a Coordinated Response to Climate Adaptation in Alaska *Tubughneq' 5*

Tuesday, February 8
10:30 a.m. - 11:45 a.m.
- ❒ Climate Adaptation and Environmental Justice *Tubughneq' 5*

3:30 p.m. - 4:45 p.m.
- ❒ Energy and Climate Action in Alaskan Communities: Resources, Examples and Discussion *K'enakatnu Executive Board Room*
- ❒ Tribal Climate Change Training and Technical Assistance Efforts *Kahtnu 2*

Wednesday, February 9
9 a.m. - 10:15 a.m.
- ❒ Native Voices: Traditional Knowledge & Climate Change (Part 1 of 2) *Kahtnu 2*
- ❒ Shipping in Arctic Waters: Implications of Climate Change *Tubughneq' 5*

10:30 a.m. - 11:45 a.m.
- ❒ Native Voices: Traditional Knowledge & Climate Change (Part 2 of 2) *Kahtnu 2*

Thursday, February 10
9 a.m. - 10:15 a.m.
- ❒ Climate Science in the Arctic and What it Means to Alaskans *Kahtnu 2*

10:30 a.m. - 11:45 a.m.
- ❒ Climate Change in Northern Communities: Canadian Federal and Municipal Perspectives *Kahtnu 2*
- ❒ New Landscape Conservation Cooperatives in Alaska to Address Climate Change *Tubughneq' 3*

Friday, February 11
8:30 a.m. - 4 p.m.
- ❒ Climate Change and the National Environmental Policy Act Class *Tubughneq' 3*

ENERGY

Monday, February 7
10:30 a.m. - 11:45 a.m.
- ❒ Tribal Mining Review in Lower 48 *Tubughneq' 4*
- ❒ Oil Drilling Basics for On-Shore and Off-Shore Exploration *Tubughneq' 5*

2 p.m. - 3:15 p.m.
- ❒ Is Small Scale Nuclear Energy An Option for Alaska? *Tubughneq' 4*

3:30 p.m. - 4:45 p.m.
- ❒ Human Health Implications of Coal Combustion in Alaska *Tubughneq' 4*

Agenda by Subject

ENERGY (CONT.)

Tuesday, February 8
9 a.m. - 10:15 a.m.
❒ Susitna Hydro Project *Tubughneng' 4*
❒ The Living Building Challenge and Net Zero Energy *Kahtnu 1*

10:30 a.m. - 11:45 a.m.
❒ Teaching Alaska's Miners About Alaska's Fisheries *Tubughneng' 4*
❒ Using Natural Resources for Solving Energy Problems *K'enakatnu Executive Board Room*

2 p.m. - 3:15 p.m.
❒ Energy Efficiency Opportunities in Alaska *Tubughneng' 4*

3:30 p.m. - 4:45 p.m.
❒ North Slope Methane Hydrates and Carbon Dioxide Exchange *Tubughneng' 4*

ENVIRONMENTAL EDUCATION & TRAINING

Wednesday, February 9
9 a.m. - 10:15 a.m.
❒ Experiences Needed for Students to Become Environmental Leaders *Kahtnu 1*

10:30 a.m. - 11:45 a.m.
❒ Drumbeats: Place-Based Environmental Education Certificate for Rural Alaska *Kahtnu 1*

2 p.m. - 3:15 p.m.
❒ Sustainable Energy in Environmental Education *Kahtnu 1*

3:30 p.m. - 4:45 p.m.
❒ Promoting Rural Workforce Development through Environmental Internships *Kahtnu 1*

ENVIRONMENTAL JUSTICE

Tuesday, February 8
10:30 a.m. - 11:45 a.m.
❒ Climate Adaptation and Environmental Justice *Tubughneng' 5*

Wednesday, February 9
9 a.m. - 10:15 a.m.
❒ Federal Interagency Coordination on Environmental Justice Issues (Part 1 of 2) *Tikahtnu C*

10:30 a.m. - 11:45 a.m.
❒ Contaminants in Subsistence Foods *Tikahtnu D*
❒ Federal Interagency Coordination on Environmental Justice Issues (Part 2 of 2) *Tikahtnu C*

2 p.m. - 3:15 p.m.
❒ Tribal and Community Perspectives on Environmental Justice Issues in Alaska (Part 1 of 2) *Tikahtnu C*

ENVIRONMENTAL JUSTICE (CONT.)

Wednesday, February 9
3:30 p.m. - 4:45 p.m.
❒ Working Together to Address Environmental Justice Issues Identified by Tribal and Community Panelists (Part 2 of 2) *Tikahtnu C*

ENVIRONMENTAL REGULATIONS

Monday, February 7
3:30 p.m. - 4:45 p.m.
❒ Freshwater and Coastal Surveys by the Alaska Department of Environmental Conservation *Tikahtnu E*

Tuesday, February 8
9 a.m. - 10:15 a.m.
❒ Renovate Right: Important Lead Hazard Information for Families, Child Care Providers and Schools *Tubughneng' 5*

2 p.m. - 3:15 p.m.
❒ Fugitive Dust - What is it? Why should I care? *Tubughneng' 5*

3:30 p.m. - 4:45 p.m.
❒ Department of Environmental Conservation Water Quality, Permits and Communications *Tubughneng' 5*

Thursday, February 10
9 a.m. - 10:15 a.m.
❒ Federal Actions and Next Steps on Leaded Aviation Gasoline (Part 1 of 2) *Kahtnu 1*

10:30 a.m. - 11:45 a.m.
❒ Environmental Protection Agency's Update and Listening Session on Alaska and National Mining Issues (Part 1 of 2) *Tikahtnu C*
❒ Federal Actions and Next Steps on Leaded Aviation Gasoline (Part 2 of 2) *Kahtnu 1*

2 p.m. - 3:15 p.m.

Attention Rural Landfill Operators and Administrators!

Solid Waste Administration (SWA) & Rural Alaska Landfill Operator (RALO)

2011 TRAINING SCHEDULE

RALO	March 15-17	Anchorage
	May 10-12	Anchorage
RALO	April 12-14	Bethel
SWA	May 24-26	Anchorage

Alaska Forum, ITEP, and SWANA are pleased to offer two solid waste training courses designed for landfill operators in Rural Alaska communities. Courses are offered at no cost to the communities, thanks to supporting grants from the USDA and EPA OSWER.

Course Description: RALO

The Rural Alaska Landfill Operator (RALO) course is for the designated village landfill operator and administrator managing a Class III landfill or open dump and focuses on the duties of the landfill operator, personal safety, and the safety of the village. Participants will learn about landfill regulations and requirements, household hazardous waste, waste separation and screening, waste reduction and segregation, recycling, personal protection equipment, and much more. These courses are hosted by AK Forum, Inc. with trainers and expertise provided in cooperation with Solid Waste Administration of North America (SWANA), Alaska Chapter. Total Reclaim will demonstrate packaging, staging, and shipping hazardous waste for recycling. Also, Manny Masony of Evert's Air Cargo will address backhauling hazardous waste by aircraft and Peter Melde of AK Forum will discuss a funding opportunity that can support community efforts to purchase personal safety equipment and hazardous waste storage and shipping materials through a USDA Technical Assistance and Training (TAT) grant administered by AK Forum.

For RALO applications and information:
Website: www.akforum.org Email: info@akforum.org Phone/Fax (toll free): (888) 301-0185

Course Description: SWA Identifying Hazards and Developing Solutions in Rural Alaska

This course is specifically designed for community leaders, solid waste managers, and other decision makers in Alaska native villages who are working with on-going solid waste management programs.

Course Highlights: Solid Waste Administration

- Identifying Hazardous Materials That Should NOT Go Into Your Landfill and Burn Boxes
- How to Collect, Stage, Recycle/Dispose of Household Hazardous Waste
- Outreach Techniques on Environmental and Health Issues
- Regional, Municipal, and Tribal Collaboration
- Developing Fee Systems and Collection Programs
- C&D Waste Disposal Options
- Preparing Action Plans, Grants, and Proposals

For SWA applications and information:
Call Jennifer Williams 907-250-3826 email: jennifer.williams@nau.edu website: www.nau.edu/itep

The Alaska Forum will provide a limited number of (up to) $500 reimbursement scholarships for qualified attendees' travel expenses (lodging and airfare) per training, through grant support from the USDA. Participants must be pre-approved. See course information for requirements.

Participants must make their own travel arrangements and should plan to arrive before 8:00 am on the first morning of class and plan to leave after 5:00pm on the final day of class.

EDITORIAL & CONTENTS

"Globalization of Enlightenment"

"What we are witnessing at present in Egypt, but not only there, is a turning point, a historic watershed. We don't know how the situation in Egypt, in the Arab world countries or in North Africa will develop. However, it's already clear that nothing will be as it was before." These were the words Federal Foreign Minister Guido Westerwelle used in early February to begin his speech to the German Bundestag about the situation in Egypt. Fascinated and spellbound, people in Germany followed developments in Tunis, Cairo and other cities. And, naturally, during those days the images of the year 1989 came back into people's minds – memories of the peaceful revolution of the people in Dresden, Leipzig and East Berlin that ended with German unification. Freedom and democracy. People in the Arab world also want to be accepted as free individuals, want human rights, want opportunities and to take part in what the Federal Foreign Minister calls "a globalization of enlightenment, a globalization of values and a globalization of civil liberties". The community of states is thinking about how it can support and accompany the transformation process that will bring the Near and Middle East both stability and peace (see page 6).

For very different grounds another region of the world is also in the limelight: the Arctic. Its geopolitical importance is growing for various reasons. Here, too, many questions have to be solved jointly and intergovernmentally. Experts on the Arctic will be gathering in Berlin in mid-March for a major conference. Discover more in our special feature on the subject (from page 40).

I wish you all a pleasurable read,
Peter Hintereder, Editor-in-Chief

Cover: Polarstern, the research ship of the Alfred Wegener Institute, is on course

Polar adventure: a ship under way in the Arctic Ocean. The geopolitical importance of the region has been increasing because of its resources, trade routes and climate change

Agenda

Alaska Northern Waters Task Force (ANWTF)
Agenda for Kotzebue and Nome Meetings: July 6-9, 2011

KOTZEBUE:

July 7th[th], Thursday, Northwest Arctic Borough Assembly Chambers

Presenters on the following resource development topics:

- **8:30 to 9 a.m. UAF Workshop Findings: Arctic Marine Shipping Assessment Presentation: Mike Sfraga, University of Alaska Fairbanks, Vice-Chancellor**
- **9 to 9:30 a.m. Presentation by Shell on Arctic off shore development plans: Colleen McCarthy, Communications Manager, Shell Oil and Wayne Leighty, Commercial Regulatory Analyst, Shell Oil**
  9:30 to 10 a.m. Presentation by Tom Okleasik, Planning Director, Northwest Arctic Borough, Subsistence mapping

-15 minute break-

- **10:15 to 11:15 a.m. Presentation on oil spill response capabilities and cooperative agreements with other Arctic nations:**
  - **Department of Environmental Conservation, Larry Dietrick, Director of Division of Spill Prevention and Response**
  - **U.S. Coast Guard, Captain Adam Shaw**

Lunch break from 11:30 to 1 p.m.

- **1:15 to 2 p.m. PEW Environment Group/Marilyn Heiman, Director Pew Environment Group, U.S. Arctic Program**
- **2 to 3 p.m. Lessons Learned Deep Water Horizon: Fran Ulmer, Chair, U.S. Arctic Research Commission**
- **3:30-5:30 Presentation by Rep. Joule on Northern Waters Task Force followed by public testimony on Northern Waters Issues**

Flight from Kotzebue to Nome: Flt. 153 departing at 7:29 pm landing at 8:11 pm

Presenters

NORTHERN WATERS TASK FORCE
PRESENTERS JULY 7th, 2011
KOTZEBUE, ALASKA

Mike Sfraga, University of Alaska Fairbanks, Vice-Chancellor:

Mike Sfraga assumed responsibilities as vice chancellor for students in January 2010. As vice chancellor, he oversees a broad range of departments that serve UAF's students, including admissions, the registrar's office, financial aid, student activities and residence life.

Sfraga's career at the university has spanned nearly 25 years. During that time, he has served in a variety of student services and academic positions, from his first job at UAF as a residence hall director to associate vice president for student and enrollment services at UA statewide. Most recently he served as director of the UA Geography Program and associate dean of the School of Natural Resources and Agricultural Sciences.

Sfraga earned his bachelor's degree and a doctoral degree in geography and northern studies from UAF. He also holds a master's degree from Bowling Green State University. Sfraga's areas of academic concentration are in polar geography, exploration, geography of the circumpolar North, geography of Alaska and the history of field science. He is the author of *Bradford Washburn: A Life of Exploration* (2004), the first comprehensive biography of celebrated American explorer and photographer Bradford Washburn.

He is currently the co-director of the University of the Arctic's Institute for Applied Circumpolar Policy and associate editor of *Polar Geography*. Sfraga also serves on numerous nonprofit boards including the Denali Education Center, the Alaska Geographic Association and the Institute of the North.

Colleen McCarthy, Communications Manager, Shell Oil:

Colleen McCarthy is a Communications Manager for Shell Oil. She previously served as the Community Relations Director for ConocoPhillips, the Industrial Business Development Lead for CH2MHILL and has twenty years experience with the federal government in Alaska working for the Mineral Management Services and the Bureau of Land Management. Colleen is a graduate of Montana College of Mineral Science and Technology and holds a bachelor's degree in geological engineering.

Wayne Leighty, Commercial Regulatory Analyst, Shell Oil:

Wayne Leighty was born and raised in Juneau and has worked in Alaska as a wilderness guide, scientific researcher, General Manager in the tourism industry, and Chief of Staff in the Legislature. Wayne has studied Alaska's natural systems and energy industry extensively, publishing papers on carbon sequestration in the Tongass National Forest, electricity conservation in Juneau, and the impacts of tax policy on economically optimal oil production from the North Slope. He has also earned bachelors degrees in environmental science and economics, masters degrees in resource economics, transportation technology, and business administration, and a doctorate from the sustainable transportation energy program at UC Davis. Wayne previously worked for Shell in the downstream business (chemicals) and is now a commercial regulatory analyst with Shell's Alaska Venture.

Larry Dietrick, Director, Spill Prevention and Response Prevention, Department of Environmental Conservation:

Larry Dietrick is the Director of the Division of Spill Prevention and Response for the Alaska Department of Environmental Conservation. The Division was created in response to the 1989 Exxon Valdez oil spill and is responsible for coordinating and implementing oil and hazardous substance spill prevention, preparedness and response in Alaska. The Division has been instrumental in implementing the recommendations made by the Alaska Oil Spill Commission in follow up to the catastrophic spill in Prince William Sound and major legislative initiatives passed by the Alaska State Legislature in cooperation with other state and federal response agencies, response action contractors, citizen's oversight committees, industry and the public. The Division has developed and pioneered many of the response tools that enable Alaska to have one of the most advanced oil spill safety nets in the nation. Mr. Dietrick has worked for the Department since 1976 and has served in numerous capacities related to oil spill planning, preparedness and response. In addition he served with the Ohio Environmental Protection Agency prior to his work in Alaska. Mr. Dietrick has extensive experience in environmental programs and a strong foundation in the technical requirements, procedural aspects and legal framework of oil spill response. He has a good working knowledge of oil and gas exploration in Alaska including the Trans-Alaska Pipeline System and North Slope oil and gas development. His prior experience also includes participation in the application and design review of the Alaska Natural Gas Transportation System from 1978 – 1982, which produced a complete design package and right of way alignment for a large diameter chilled gas pipeline from the North Slope to the Canadian border. He has also participated in development of the initial requirements for offshore oil and gas exploration in Alaska's Arctic and was a member of the Incident Specific Preparedness Review for the BP Deepwater Horizon Oil Spill. Mr. Dietrick has completed graduate studies at the University of Cincinnati, Ohio State University and received a Master of Science degree in Environmental Quality Science from the University of Alaska in 1975.

Captain Adam J. Shaw, United States Coast Guard:

Captain Shaw of San Jose, California, graduated from the United States Coast Guard Academy, earning a Bachelor's of Science degree in Management and Economics. He also earned a Master's of Public Administration degree from the University of Alaska. He holds a Merchant Mariner's License and is certified in the National Incident Management System. His Coast Guard career covers a broad range of assignments, including: coordinating Search and Rescue and Law Enforcement missions in the Gulf of Alaska; supervising a multi-million dollar acquisition project for the replacement of inland buoy tenders; managing inland waterways and aids to navigation for the entire California coast; and conducting International Port Security assessments in Africa, Europe and the Middle East. Captain Shaw also served on several Coast Guard Cutters (four as the Commanding Officer), conducting Law Enforcement, Oil Spill Response, Drug Interdiction, Search and Rescue, and Aids to Navigation missions. Captain Shaw is currently assigned to Juneau, Alaska where he is responsible for Maritime safety and security of Alaskan waters. Captain Shaw has three children with his Christine Shaw from Fremont, California.

Fran Ulmer, Chair, U.S. Arctic Commission:

Fran Ulmer is the Chair of the U.S. Arctic Research Commission. She recently retired as Chancellor of the University of Alaska Anchorage. In June 2010 she was appointed by President Barack Obama to the National Commission on the BP Deepwater Horizon Oil Spill and Offshore Drilling. The commission was charged with investigating the causes of the explosion and oil spill, and recommending changes to prevent future disasters from occurring. Prior to her appointment to the commission, Ms. Ulmer was a member of the Aspen Institute's Commission on Arctic Climate Change and held Board positions with the Alaska Nature Conservancy, the National Parks Conservation Association and the Union of Concerned Scientists. Prior to being appointed Chancellor in 2007, Ms. Ulmer was a Distinguished Visiting Professor of Public Policy and Director of the Institute of Social and Economic Research at UAA. Ms. Ulmer served as an elected official for 18 years as the mayor of Juneau, a state representative and as Lieutenant Governor of Alaska. As Director of Policy Development for the State of Alaska, Ms. Ulmer managed multiple Programs and served as the first Co-Chair of the Alaska Coastal Policy Council. At the national level, Ms. Ulmer served (for more than 10 years) on the North Pacific Anadromous Fish Commission; as a member of the Federal Communications Commission's State and Local Advisory Committee and the Federal Elections Commission's State Advisory Committee; and co-chaired the National Academy of Science's Committee on State Voter Registration Databases. Ms. Ulmer earned a J.D. cum laude from the University of Wisconsin Law School, and has been a Fellow at the Institute of Politics at the Kennedy School of Government.

Marilyn Heiman, Director Pew Environment Group, U.S. Arctic Program:

Marilyn Heiman joined the Pew Environment Group in January 2009 as director of the U.S. Arctic Program, which works to protect the U.S. Arctic Ocean and its marine life from rapid industrialization made possible by the warming climate and the melting ice cap.

Before joining Pew, Heiman was campaign manager for the International Boreal Conservation Campaign, which works to protect one of the largest forest ecosystems on Earth. She served as the Secretary of Interior's Alaska policy advisor during the Clinton administration. In that capacity, she coordinated activities of the Bureau of Land Management, the Minerals Management Service, the National Park Service, the Bureau of Indian Affairs, the U.S. Fish and Wildlife Service and the U.S. Geological Survey in Alaska. As Alaska representative to the Secretary of Interior, she served on the six-person Exxon Valdez Oil Spill Trustee Council.

Previously, she was special assistant on natural resources and oceans for Alaska Gov. Tony Knowles and was director of his statewide transition team after his election in 1994. Prior to that she worked as an aide to the House Resources Committee in the Alaska legislature during the Exxon Valdez oil spill and was staff to the Exxon Valdez Oil Spill Commission. Heiman holds a bachelor's degree from the University of California, Berkeley.

Tom Okleasik, Planning Director, Northwest Arctic Borough:

Ukallaysaaq / Duk'aan / Tom Okleasik is the planning director of the Northwest Arctic Borough. He is a proud *Inupiaq Qawairaqmiut* who was born and raised in Sitnasuaq (Nome, Alaska). He was also given a Tlingit name of *Duk'aan* from the honorable *Lw'ooghu* Amy Nelson – the past clan mother of the Kiks'adi Clan of the Raven moiety. Ukallaysaaq graduated with honors from California Lutheran University with a Bachelor of Science degree in Business Administration. His wife is *Igluguq* Dianne Okleasik, originally from Kotzebue, and his stepsons are Ivik and Qaulluq Henry.

Career experience includes planning director for the Northwest Arctic Borough, principal consultant of Northwest Planning and Grants Development, senior trainer for Native American Management Services – Alaska Training Center, vice-president of Kawerak Inc. Community Service Division, project director of Central Council of Tlingit and Haida's Vocational Training and Resource Center, and business manager of the Northwest Campus, UAF.

As the planning director, Ukallaysaaq has worked jointly with the North Slope Borough to re-organize joint planning commission meetings, update village comprehensive plans, continue collaborative relationships with industry for permitting and community outreach, and started a community engagement e-mail list serve to help keep residents informed.

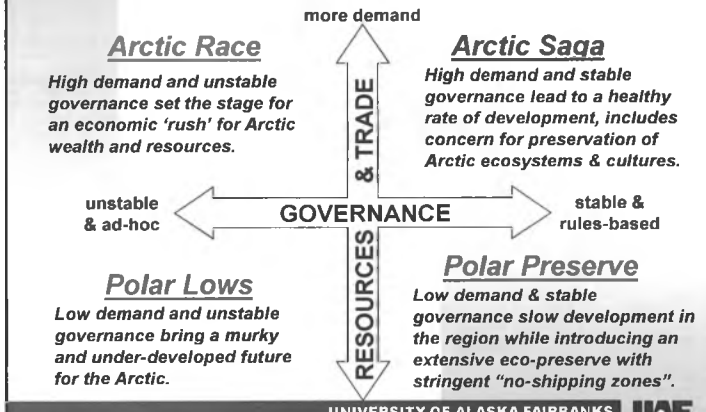
Scenarios on the Future of Arctic Marine Navigation in 2050



UNIVERSITY OF ALASKA FAIRBANKS

CONSIDERING A ROADMAP FORWARD: THE ARCTIC MARINE SHIPPING ASSESSMENT

University of Alaska Fairbanks

Dartmouth College

University of the Arctic
Institute for Applied Circumpolar Policy

Fairbanks Workshop
October 22-24, 2009

UNIVERSITY OF ALASKA FAIRBANKS

Introduction and Background

- Second workshop of the University of the Arctic Institute for Applied Circumpolar Policy
- Topic: Policy review of the recommendations from the Arctic Council's 2009 Arctic Marine Shipping Assessment
- 60 experts from broad array of stakeholders and actors
- Sponsors: UAF Chancellor's Office, Holland America Lines, U.S. Arctic Research Commission, University of the Arc
- AMSA can be viewed as:
  - Baseline assessment of marine activity in the Arctic
  - Strategic guide for Arctic nations and peoples
  - Negotiated policy document of the Arctic Council

UNIVERSITY OF ALASKA FAIRBANKS

Guidance to Working Groups

Working Groups:

- Enhancing Arctic Marine Safety
- Protecting Arctic People and the Environment
- Building the Arctic Marine Infrastructure

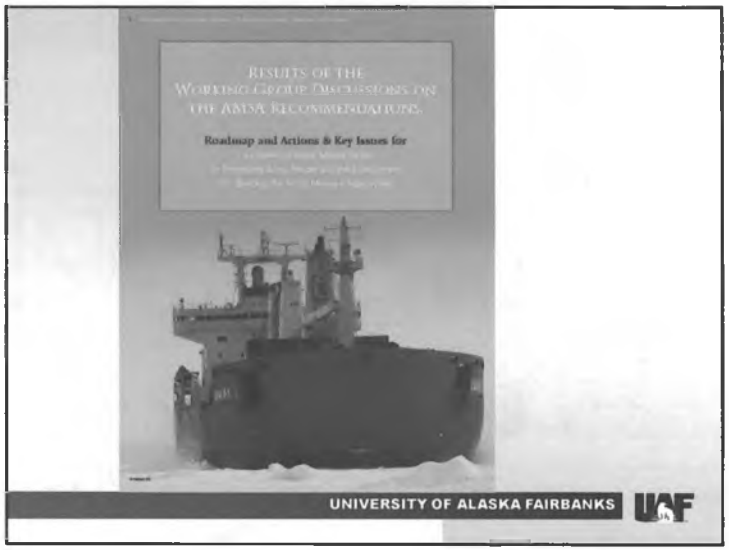
Tasks:

- Identify Stakeholders
- Develop Roadmap and Key Issues
- Funding Issues & Timelines

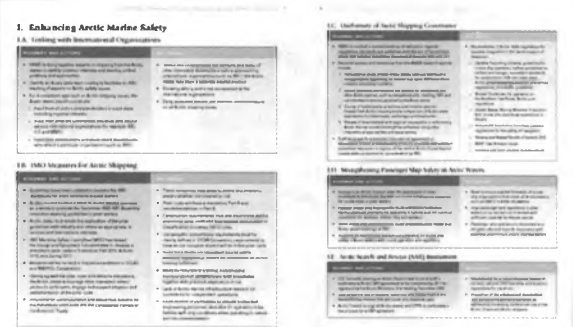
UNIVERSITY OF ALASKA FAIRBANKS

Identifying Stakeholders and Actors

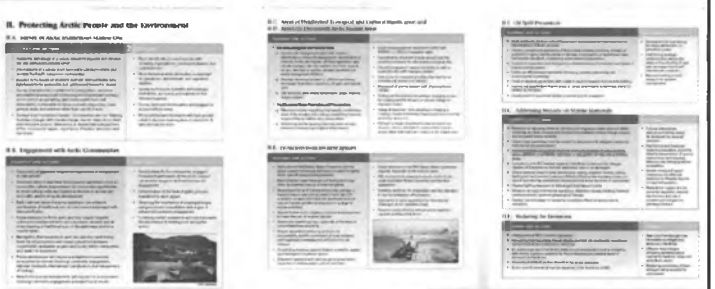
- Sovereign States
- Indigenous Groups
- International Governmental Organizations
- Maritime Industry
- Marine Insurers
- Private/Independent



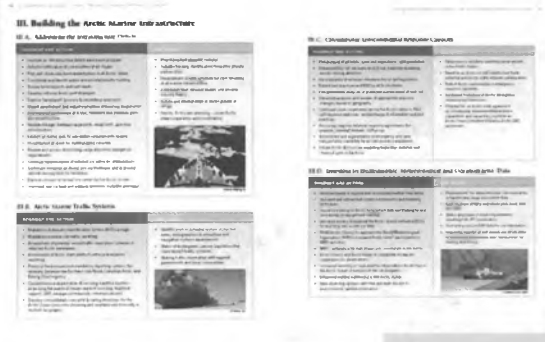
Enhancing Arctic Marine Safety



Protecting Arctic People and the Environment



Building the Arctic Marine Infrastructure



UNIVERSITY OF ALASKA FAIRBANKS

Funding Issues

- Indigenous Marine Use Surveys
- Marine Infrastructure Elements
- Liability and Compensation Challenges

UNIVERSITY OF ALASKA FAIRBANKS

Summary ~ Key Policy Issues Ahead

Highest Priority

- Mandatory Polar Code
- Full Tracking and Monitoring of Commercial Ships (Mandatory AIS)
- Arctic Search and Rescue (SAR) Agreement
- Indigenous Marine Use Surveys
- Circumpolar Response Capacity Agreement
- Arctic Observing Network Implementation

UNIVERSITY OF ALASKA FAIRBANKS

Chukchi Sea Program Update Shell Oil

#2

Northern Waters Task Force

Shell Camden Bay and Chukchi Sea Program Update

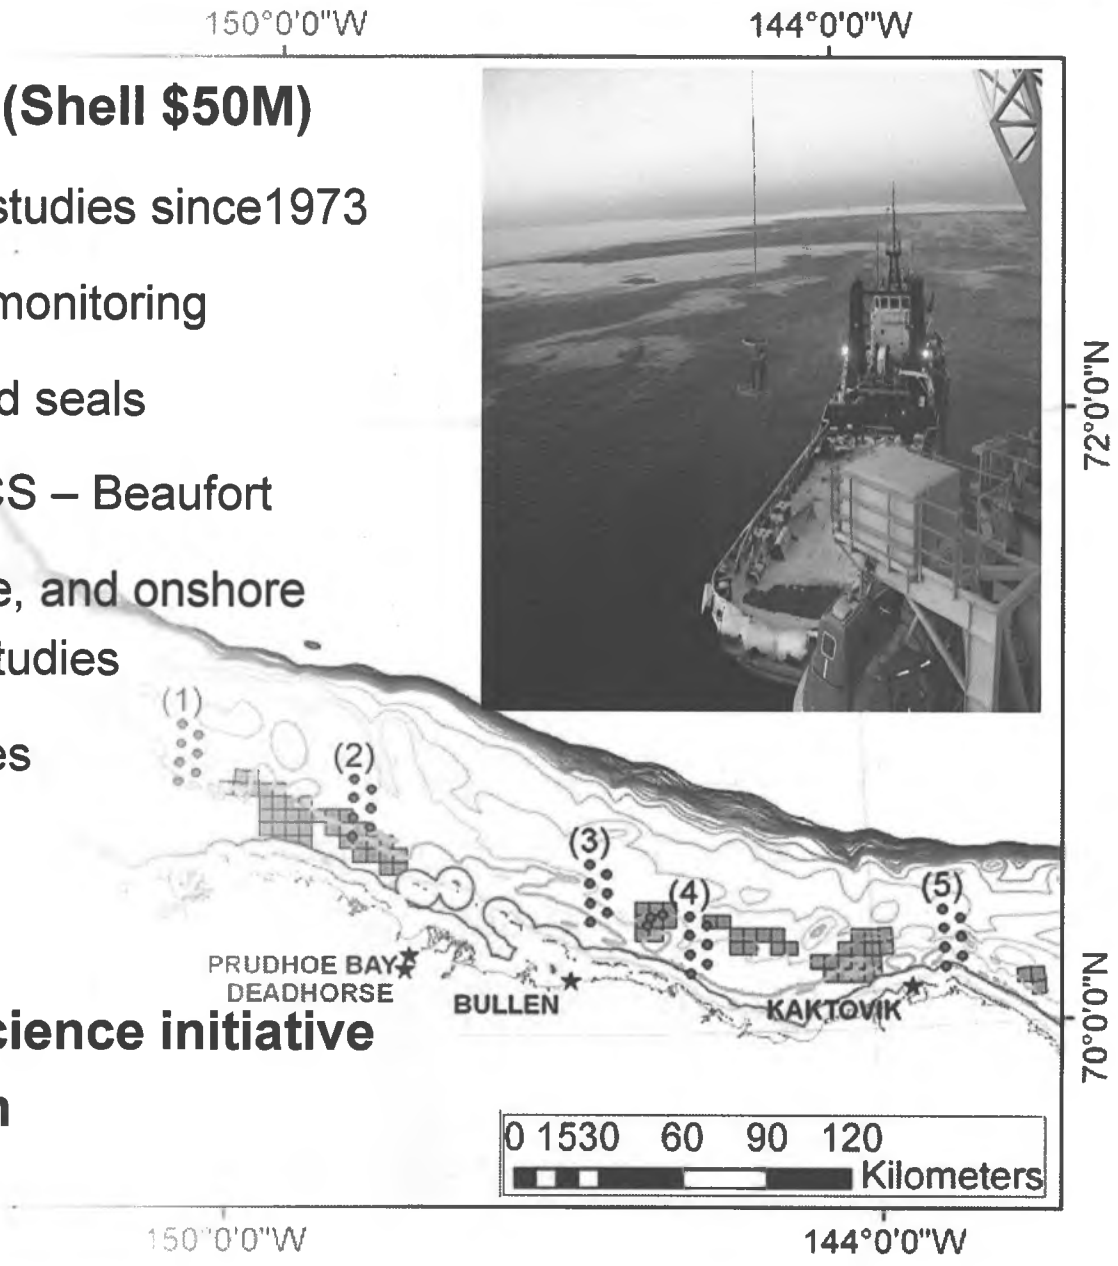
July 2011

2011 Shell Proposed Operations

- **Shell 2011 program:**
  - Marine mammal and bird observations
  - Traditional Knowledge and Archeology
  - Zooplankton and Fisheries
  - Physical Oceanography
  - Benthic and Sediment Chemistry Studies
  - Acoustic Recorders and Ice and Metocean buoys
  - UAV Montoring and Upward Looking Sonar
  - Coastal Stability, Hydrology and Habitat Assessment

Baseline Science Supports Exploration In Alaska

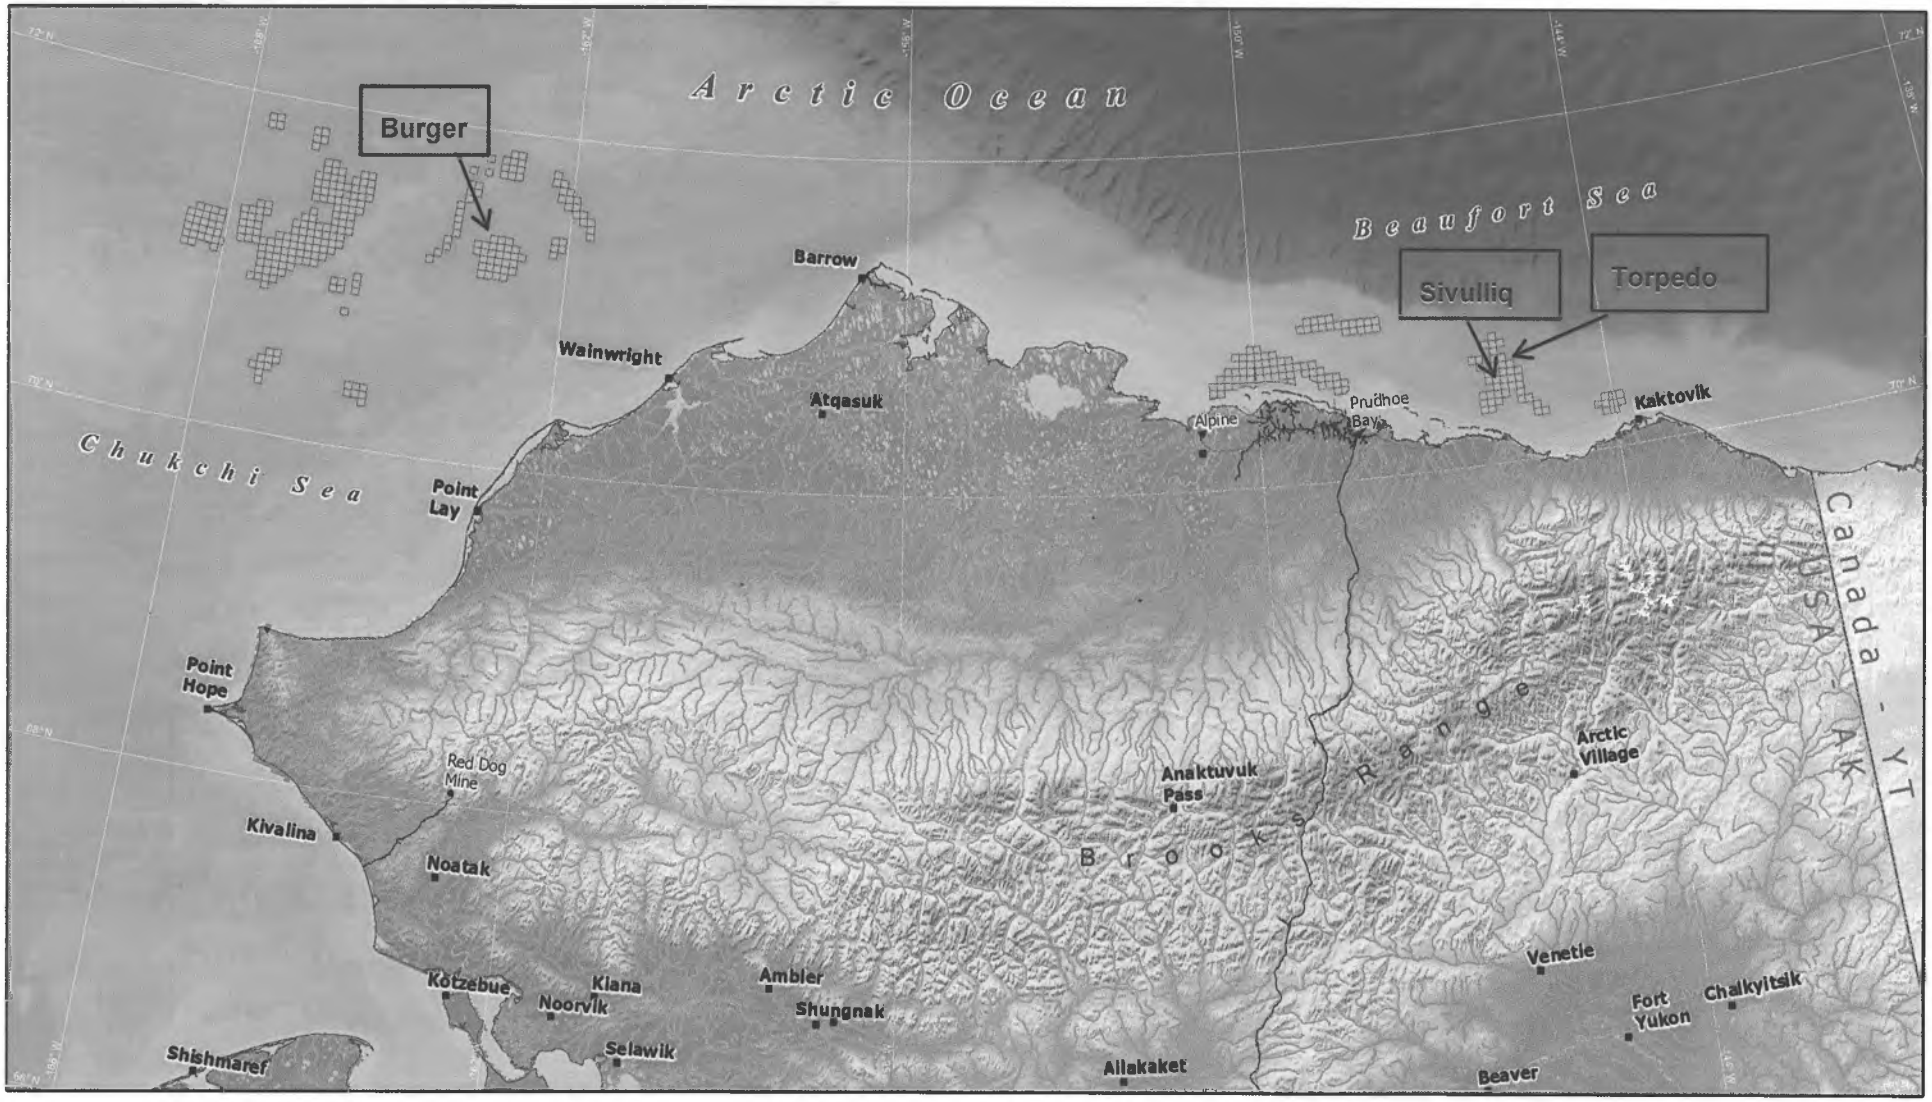
- **$500 Million and growing (Shell $50M)**
  - 5000 independent scientific studies since1973
  - 6 years of marine mammal monitoring
  - Tagging studies – walrus and seals
  - First air quality station in OCS – Beaufort
  - Ongoing offshore, nearshore, and onshore ecological characterization studies
  - Traditional knowledge studies
  - Health impact assessments
- **Up to $5 million annual science initiative with North Slope Borough**



NSB Collaborative Science Agreement

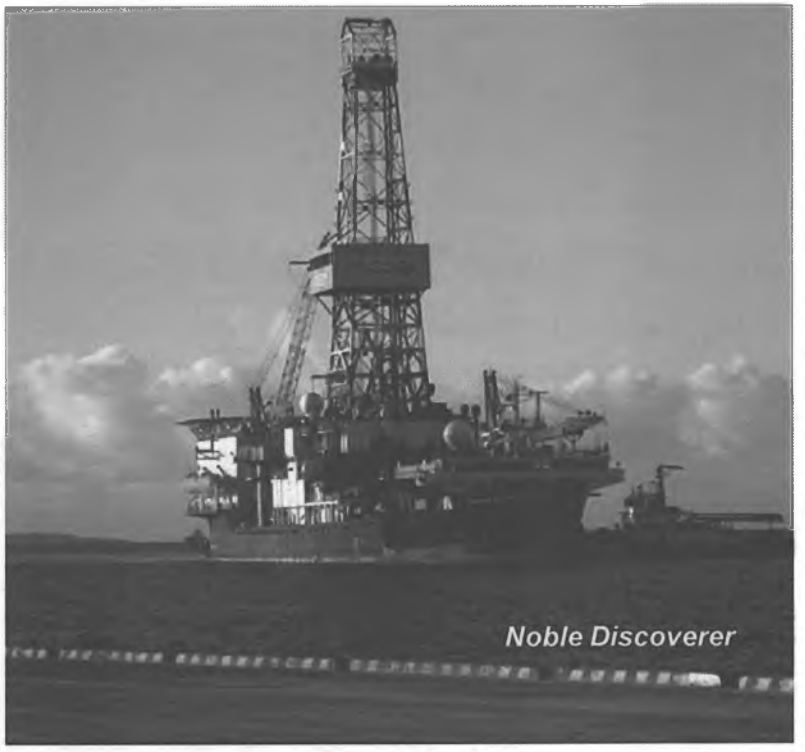
- Objective: To enable community members in coastal villages of the Chukchi and Beaufort Seas to participate and prioritize science being conducted related to the potential effects and impacts of oil and gas exploration and development in the outer continental shelf (OCS).
- Signed Sept. 24, 2010
- Funded annually by Shell for an initial term of five years, and administered by the NSB Mayor's Office
- 14-Member Steering Committee
  - Coastal Villages
  - NSB Wildlife Department and Mayor's Office
  - Independent Scientists
  - Shell

Chukchi and Beaufort Seas



2012-13 Proposed Operations

- Drill up to three wells per year in Chukchi Seas during open water drilling season (July-October)
- Drill up to two wells per year in Beaufort Sea during open water drilling season (July-October)



- Continuation of Shell's long-term ecological characterization offshore and onshore

Mitigation Shell has committed to

- Communication Plan for avoiding conflicts with subsistence users
- Collaboration and Communication with Whaling Associations, Walrus, Nanuq and Seal Commissions beluga
- Commitment to hire Subsistence Advisors
- Marine Mammal Observers on all vessels
- Robust Marine Mammal Monitoring Protocol
- Real time Ice and Weather Forecasting
- Crew change by helicopter and collaboration on routes to and from operations
- Deadhorse, Wainwright and Barrow shore bases
- No transiting, including within polynya zone, without communicating

Commitments

- **Prevention Is the First Priority and Can Be Accomplished**
- **Blow Out Preventers – testing and enhancements**
  - **Testing every 7 days instead of every 14 days**
  - **Use of second set of shear rams**
  - **Sub-sea remote operating panel relocation**
  - **Remotely Operated Vehicle/Diver options on and near site**
- **Arctic Cap and Containment System**
- **Full OSR capabilities for each sea**
- **Second rig relief well capability**

Alaska Arctic Cap and Containment System

Arctic Response Options

Offshore:

Mechanical

In-situ Burning

Dispersants
(under select conditions)

Nearshore:

Mechanical

In-situ Burning

Onshore:

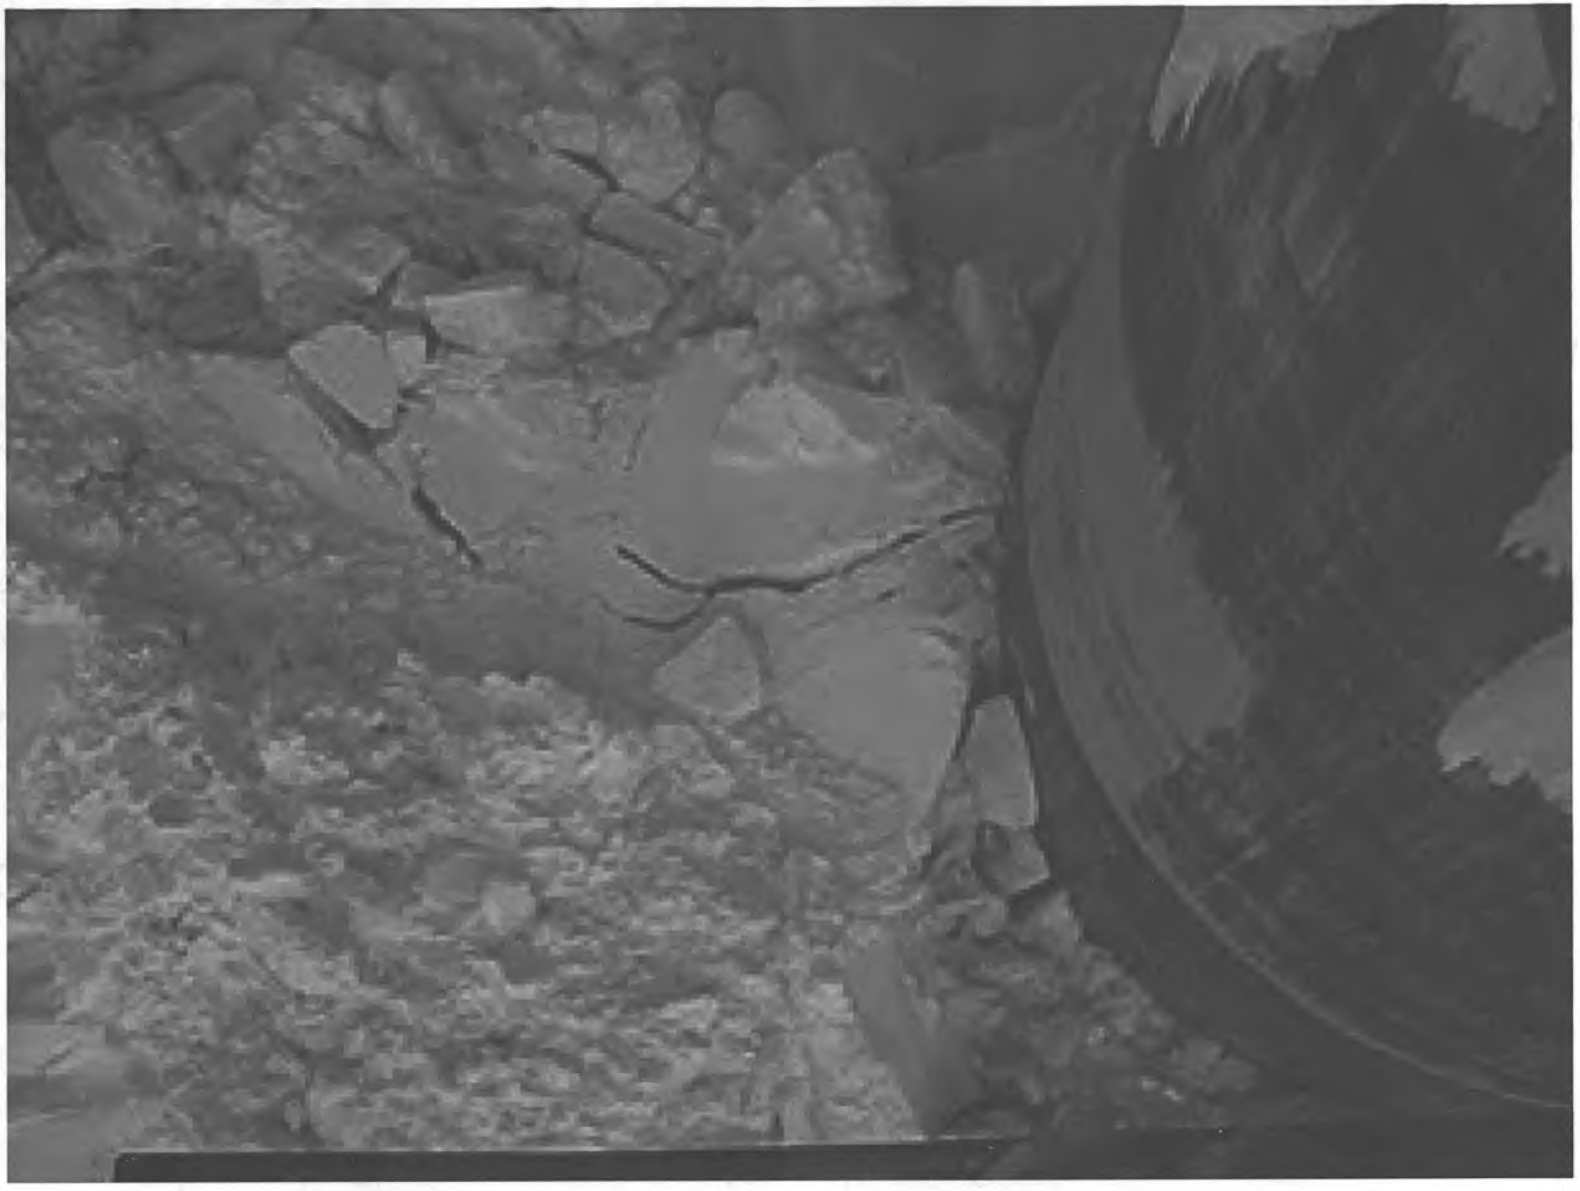
Mechanical

In-situ Burning

Brent 'B' production platform photographed in stormy weather.

The photograph shows the ferocity of the wind and waves during a storm in the North Sea. Winds of more than 100 mph produced waves reaching up to the underside of the deck which is 75 ft above sea level. Platform on calm day shown at bottom.

Ice Against Platform Legs - video



Shell's History in Alaska

- Shell operated in Alaska for 50 years until 1998
- 1st Royalty Payer to State of Alaska
- Extensive experience and operations in Cook Inlet
- Previous drilling in Beaufort and Chukchi Seas

Historical Drilling Activities

Cook Inlet									Gulf of Alaska										Bering and Beaufort Sea					Chukchi Sea		
1964	▸	▸	▸	▸	▸	▸	▸	▸	1977	1978	1979	1980	1981	1982	1983	1984	1985	1986	1987	1988	1989	1990	1991			

Shell in Alaska Today

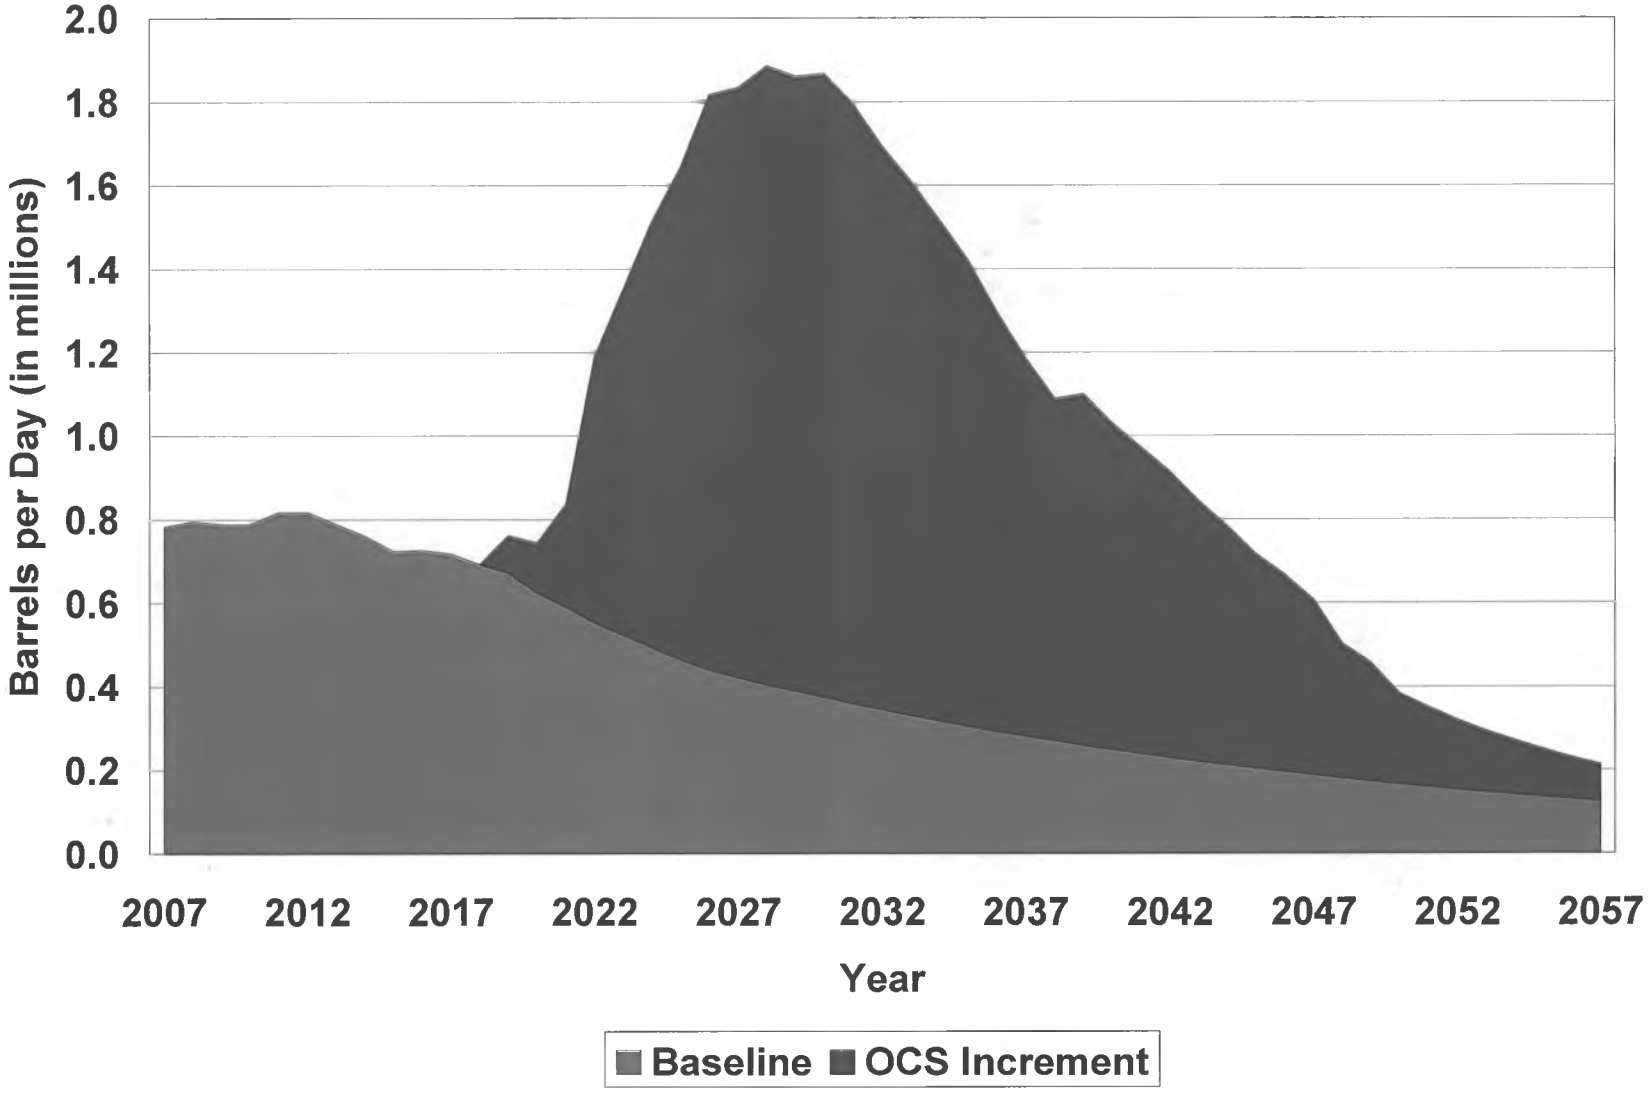
- Arctic potential: roughly ¼ of undiscovered hydrocarbons, with ¼ of that in Alaska OCS – mostly oil
- Has attracted multiple operators
- 137 Beaufort leases - $84M
- 275 Chukchi leases - $2.1 Billion
- Total investment to date: $3.75 billion
- Conservative estimates: 25 billion barrels of oil and 120 TCF of gas in Alaska Arctic (mean estimate)
- Most material OCS hydrocarbon outside of Deepwater GOM OCS
- Exceeds east/west coast OCS resources combined
- Domestic energy security

Alaska Offshore: Vital To Alaska & Our National Economy

- Over 54,000 new jobs nationwide each year for 50 years of project life*
- Amounts to $145 billion in payroll*
- New Federal, State & local government revenue would total over $193 billion at $65/bbl or over $300 billion at current prices.
- Extends the life of Trans Alaska Pipeline
- Opens up "stranded" resources in National Petroleum Reserve – Alaska (NPRA)
- Clear link from OCS projects to new energy prospects, new job development and longevity of the Trans Alaska Pipeline
- Reinforces development of a gas pipeline

*2011 Northern Economics/ ISER Economics Study

The Future of Trans-Alaska Pipeline



Thank-you

Subsistence Mapping in the Northwest Arctic Borough

#3

Subsistence Mapping in the Northwest Arctic Borough

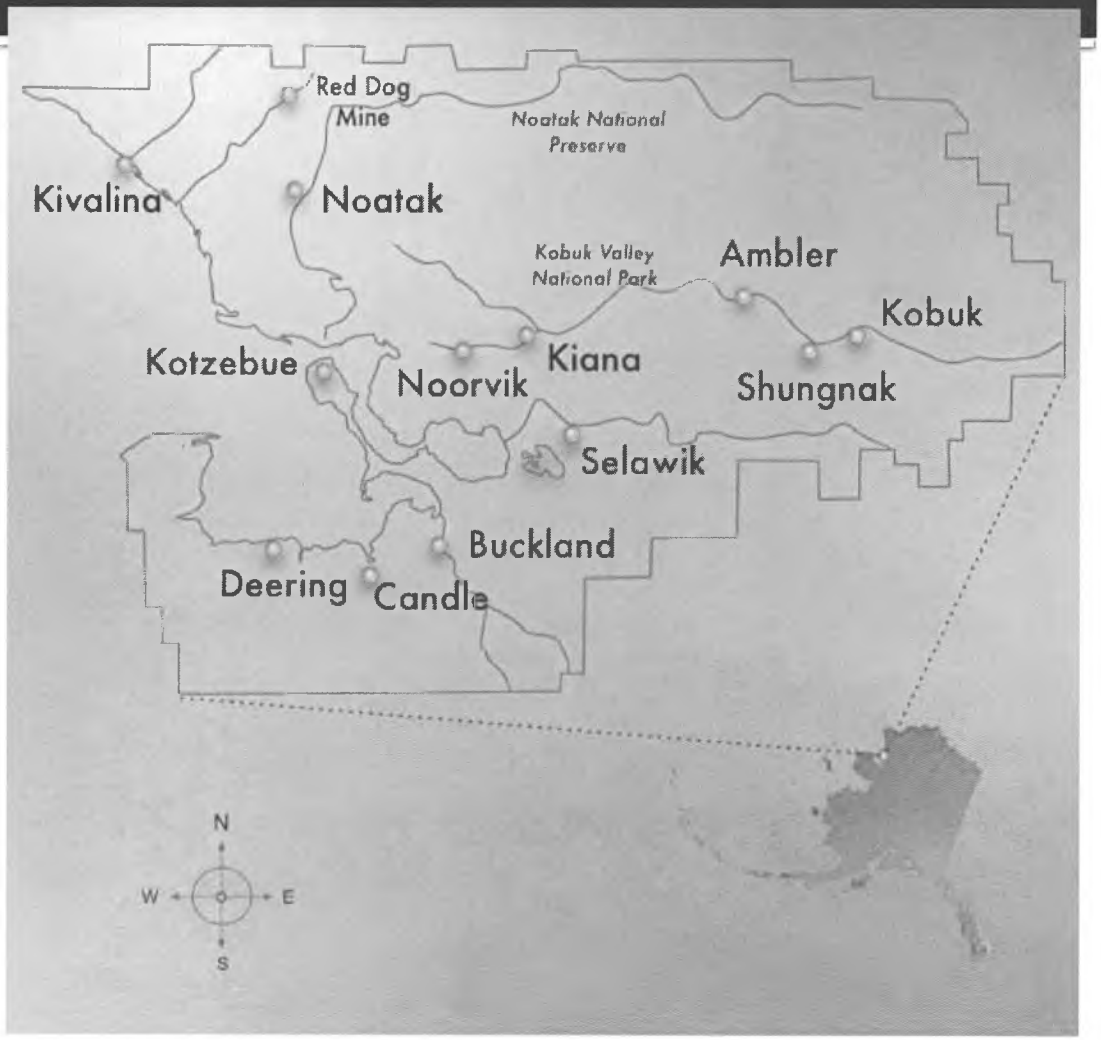
Planning Department
T: 907-442-2500
Fax: 907-442-3740

Northwest Arctic Borough
PO Box 1110
Kotzebue, AK 99752

Northwest Arctic Borough Overview

- Municipal home-rule government located in Northwest Alaska above the Arctic Circle.
  - Over 35,000 square miles of land and over 4,700 square miles of water along the Chukchi Sea, Kotzebue Sound & Noatak, Selawik & Kobuk Rivers.
- Residents 90% Iñupiaq

Northwest Arctic Borough Overview



Northwest Arctic Borough Overview

- Subsistence is key to Economy & Culture
  - Way of Life: hunting & gathering natural resources from land & water
- Human Connection to the Environment
  - Wildlife: caribou, birds, wolves, foxes, musk ox, moose
  - Fish: salmon, shee fish, trout, herring, pike, cod, smelt
  - Marine life: crab, seals, beluga whales , bowhead whales, walrus
  - Plants: blue berries, salmon berries, greens, roots, tea, leaves

Borough Comprehensive Plan Goals

- Maintain the Iñupiaq culture
- Promote & Maintain subsistence and the traditional way of life
- Protect the NWAB environment
- Support the viability of existing communities
- Support & Help develop local self-determination
- Foster appropriate economic development
- Raise the standard of living for Borough residents
- Facilitate implementation & activities & programs by villages, and regional institutions within the NWAB
  - ***Northwest Arctic Borough, Comprehensive Plan, March 1993***

Project Need

- Climate Change
- Endangered Species Listings
- Balancing Resource Development & Subsistence
  - Offshore Oil and Gas Development
  - Expanded Mining Interest
  - Arctic Marine Transportation
  - Commercial Fisheries Expansion
  - Growing Sport Hunting

- Cooperation of State & Federal Government, but lack scientific data (in their eyes) for backing their decisions

Project Need

- A foundation of
  - Science,
  - Local and traditional knowledge,
  - & Planning
- Ensure **economic activities** in the region will be conducted sustainably with healthy ecosystems.
- Developers need additional/updated information to guide decisions with communities on how development can be conducted responsibly, including when, where and how conducted.

Overall Project Goal

- Protect subsistence and promote compatible development by integrating traditional knowledge and western science to document and map important subsistence uses and habitats.
  - Key philosophy: traditional knowledge at the same level as western science.
  - Areas not fully understood by western science, & traditional knowledge often oral and not documented / both working together in project.

Objectives

- To create a secure place for collecting existing data, maps, traditional knowledge and studies that are incorporated into a geographic information system (GIS) database and ensure the database will be updated with most recent scientific information.

Objectives

- To engage borough communities in the documentation of traditional knowledge through community-based focus groups and incorporate it into the GIS database.

Objectives

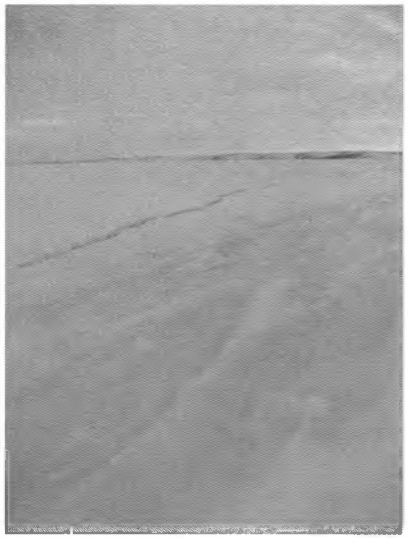
- To complete an expert review of the GIS database layers by Elders and experienced subsistence users.

Objectives

- To identify both Important Ecological Areas (IEAs) and Potential Resource Development Areas of the region.

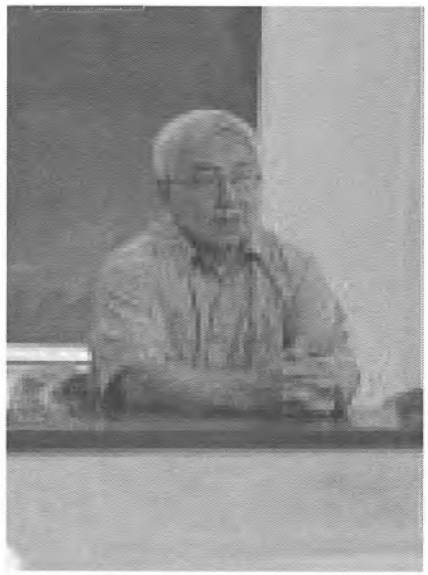
Objectives

- To publish an atlas of identified IEAs and supporting ecological information, and give appropriate staff training to use the atlas and GIS database to address needs of the Borough.



Project Staffing & Partners

- Elders
- Youth
- Residents
- Corporations
- State and federal agencies
- Interested organizations
- NWAB Planning Department
- Glenn Gray and Associates: 3rd party evaluation consultant to assess the effectiveness of the project.



Project Staffing & Partners

- Project Coordinator
- Traditional Knowledge Specialist
- Social Anthropologist
- Project Interns (3) based in Villages
- Managed/Organized within the Planning Department

Project Benefits

- Information used by the Borough in planning and zoning including land use permitting.
- State and federal agencies for implementation of coastal management, agency permitting & land use responsibilities.
- Overall, protect subsistence and promote compatible development.

Contacts

- Ukallaysaaq Tom Okleasik, Planning Director, tokleasik@nwabor.org
- Pamiuqtaq Zach Stevenson, Subsistence Mapping Project Coordinator, zstevenson@nwabor.org
- John Goodwin, Traditional Knowledge Specialist, jgoodwin@nwabor.org
- Brandan Chapman, Social Anthropologist, bchapman@nwabor.org

Closing / Taikuu

State/Federal Oil Spill Planning & Response AKDEC

Alaska Northern Waters Task Force
State/Federal Oil Spill Planning and Response in Northwest Alaska
July 7, 2011

#4

Alaska Northern Waters Task Force

State/Federal Oil Spill Planning and Response in Northwest Alaska

July 7, 2011

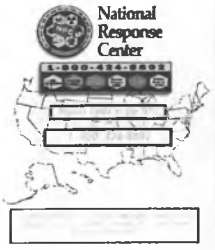
State of Alaska
Department of Environmental Conservation
Spill Prevention and Response Division

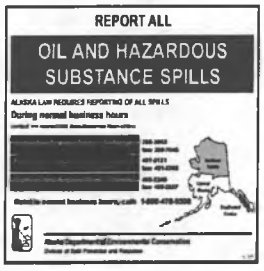
Overview

- Spill Reporting
- Responsible Party
- Spill Response in Alaska
- Spill Planning and Preparedness in Alaska
- Northwest Arctic Subarea Contingency Plan
- Local Response
- Recommendations

2

Spill Reporting - Federal/State Reporting Requirements





Responsible Party

- Spiller is responsible and liable for response, removal and restoration
- The spiller's response is a regulated activity under state and federal law
- USGC, EPA or State of Alaska can augment or take over a spill response if the RP is unwilling or unable

Spill Response in Alaska

- Roughly 2,000 spills per year on the average
- Approximately 750-800 spills require a response
- Approximately 25-30 "significant" spills occur annually

5

The Overall Challenge

570,374 square miles - Alaska
35,600 miles – Alaska coastline
12,383 miles – US coastline
16,780 miles – BC coastline

6

Response Challenges

- Respond to spills in any location within the state at any time in challenging conditions with challenging logistics in remote locations requiring remote operations
- Tsunamis, floods, earthquakes, lahars, ice conditions, sea states, narrow passages and other environmental limitations present unique challenges across the State of Alaska
- Marine vessels are transient, carry a known quantity of oil and have been the source of the largest offshore spills in Alaska
- Offshore drilling occurs in specific geographic areas including 65 wells in the Arctic Ocean, 20 wells in the Bering Sea and 653 wells in Cook Inlet

7

Response Priorities

- Safety
- Protect state resources
- Contain, control and remove
- Mitigate impacts

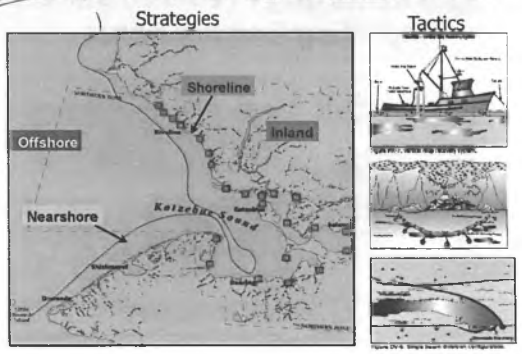
8

Response Strategies and Tactics

- Offshore operations: >three miles
- Near shore operations: Shoreline to three miles
- Shoreline protection
- Inland waters and land

9

Response Strategies and Tactics



10

Spill Planning and Preparedness in Alaska – Jurisdictional Authority

- Oil Pollution Act of 1990 requires USCG and EPA to create a National Contingency Plan, plus Regional and Area Plans throughout the country
- Alaska Statute requires ADEC to develop a State Master Plan and Regional Master oil spill response contingency plans
- The planning process includes local government participation
- Government Plans are approved by the state and federal On Scene Coordinators responsible for implementing the response
- Federal and state law also require oil spill contingency plans for certain "regulated" facilities

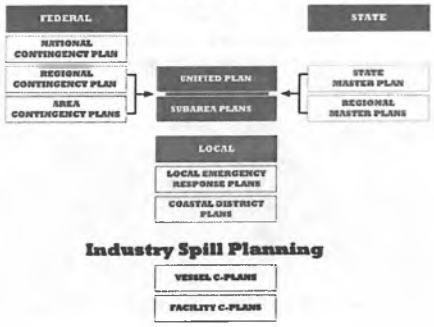
Alaskan Adaptation

- Under OPA 90, the entire State of Alaska is one federal "Region" which requires its own plan. Three "Area" plans are required for the USCG and one "Area" plan for the EPA
- Under Alaska Statute, ADEC is required to develop one State Master Plan and ten "Regional" Plans
- Working cooperatively, USCG, EPA, and ADEC have created a joint Unified Plan and ten "Subarea" plans that satisfy all federal and State planning requirements
- The USCG and the EPA participate with ADEC in the State-required public review process

Unified Plan for Alaska

13

Government Spill Planning



Industry Spill Planning

- VESSEL C-PLANS
- FACILITY C-PLANS

14

DEC's Role in Planning

- Prepare Joint Federal/State Plans for spill response using the Incident Command System (ICS)
- Review and approve Industry Contingency Plans with public review
- Develop and maintain ten Subarea Plans for the State of Alaska
- Update Subarea Plans every five years
- Include local and regional input in subarea spill response planning
- Formalize community response agreements with local government for planning, preparedness and response

15

Government versus Industry Plans

Government Plans

- Required based on a geographic area
- Worst Case Discharge Scenario for the geographic area
- No response planning standards
- Sensitive Areas Information
- Geographic Response Strategies
- Potential Places of Refuge
- Near shore response plans
- No dedicated equipment, trained personnel or response resources to execute tactics and strategies

Industry Plans

- Required based on facility or vessel type including offshore exploration and production, vessels, tank farms, railroad and other regulated facilities
- Worst Case Discharge Scenario for the facility
- Include response planning standards
- Equipment, trained personnel and response resources must be available to meet state/federal response planning standards

16

Alaska's Arctic Subareas

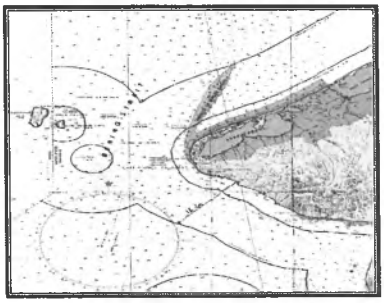
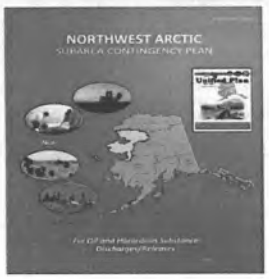
Federal jurisdiction to 12 miles



20

Northwest Arctic Subarea Contingency Plan



21

Northwest Arctic Subarea Plan

Major Components

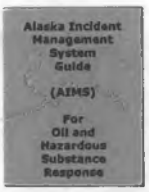
- Response Section
- Resources Section
- Hazmat Section
- Sensitive Areas Section
- Background Section
- Scenarios Section
- Geographic Response Strategies Section
- Potential Places of Refuge Section
- Nearshore response plan

Support Documents

- Local Response Agreements
- Alaska Incident Management System
- Spill Tactics for Alaska Responders Manual
- Tundra Treatment Manual

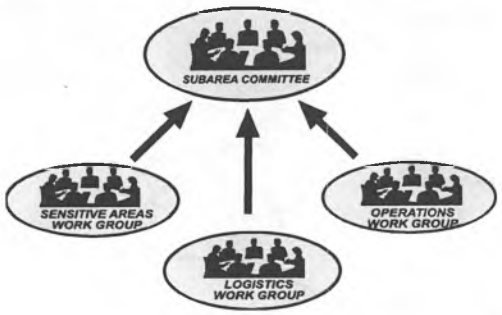
22

Subarea Plan Supporting Documents



23

NW Subarea Committee

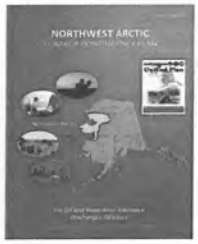


24

Alaska Northern Waters Task Force
State/Federal Oil Spill Planning and Response in Northwest Alaska
July 7, 2011

NW Arctic Subarea Plan Schedule

- September 2010 - Public Outreach Meetings – (Kotzebue and Nome)
- October – December 2010: Outreach/Consultation
- April-June 2011: Alaska Regional Response Team, Tribal Government Review
- July-October 2011: Public Review
- November 2011: Plan Finalized
- June 2012: Nearshore Operations Response Strategy Incorporated



25

Subarea Planning Priorities

- Protect state waters and coastal areas from spill impacts
- Augment subarea planning preparedness from increased risks from Arctic marine vessel traffic and offshore oil and gas development
- Integrate local knowledge, personnel, equipment and resources in planning and response
- Augment local response through Community Response Agreements, drills, training and equipment

26

Subarea Response Planning

- Environmentally sensitive areas and resources at risk
- Geographic Response Strategies
- Near shore Response Plans
- Potential Places of Refuge
- Emergency Towing Systems
- Local Response
- Drills

27

Environmentally Sensitive Areas Resources at Risk

28

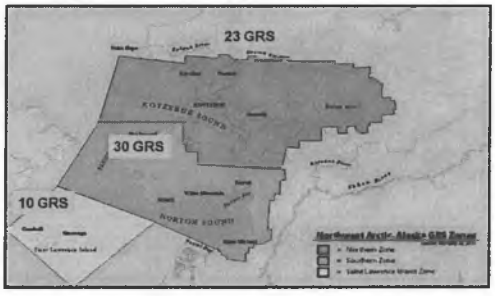
Geographic Response Strategies

63 site specific geographic strategies in the Northwest Arctic Subarea

- Site specific response and protection strategies to protect environmentally sensitive areas and resources at risk
- Pre-identified operational tactics, personnel and equipment

29

Northwest Subarea Geographic Response Strategies



30

State Nearshore Response Planning Initiative

- Protect state waters (0 – 3 miles) and coastal resources from impacts of oil spills
- Develop specific nearshore operations response strategies and tactics

31

State Nearshore Response Planning

- Develop strategies and tactics for detection, containment, control and removal of oil in state waters which extend out to 3 miles from the shoreline

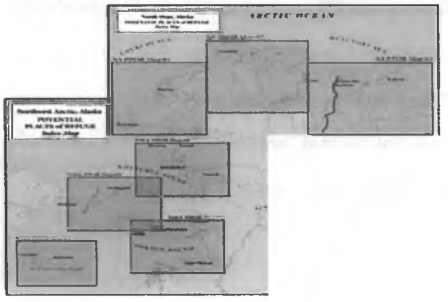
32

State Nearshore Response Plan

- Identify nearshore response zones for the northwest subarea
- Develop nearshore response tactics for each zone for open water and broken ice conditions
- Identify equipment, trained personnel, response resources, staging areas and logistical support
- Develop the Unified Command and control structure for implementation using the incident command system

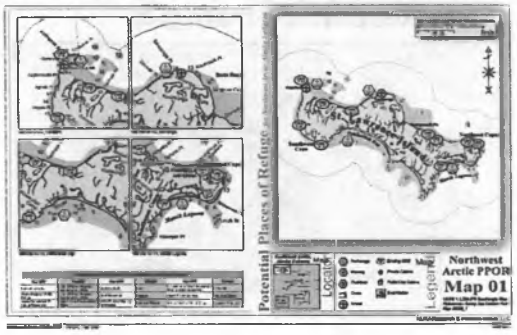
33

Arctic Potential Places of Refuge



34

Potential Places of Refuge Document



35

Emergency Towing System

M/V Golden Seas under tow by Tor Viking with ETS
Atka to Dutch Harbor

36

Local Response

- All responses are local
- Local knowledge
- Local response
- Local resources
- Local On-Scene Coordinator
- Drills, training and exercises
- Participation in the Incident Command System

North Slope Borough Village Response Team – GC-2 Spill (March 2006)

Local-Hire Worker – Selendang Ayu Spill (April 2005)

37

Community Response Agreements

- Formal agreement between DEC and local community
- Activated by DEC's State On-Scene Coordinator for spills in local area
- Local community reimbursed by DEC for response expenses when activated by the State On Scene Coordinator
- DEC requests CIP funding for local equipment, training and drills

38

State of Alaska Local Response Assets

39

Drills

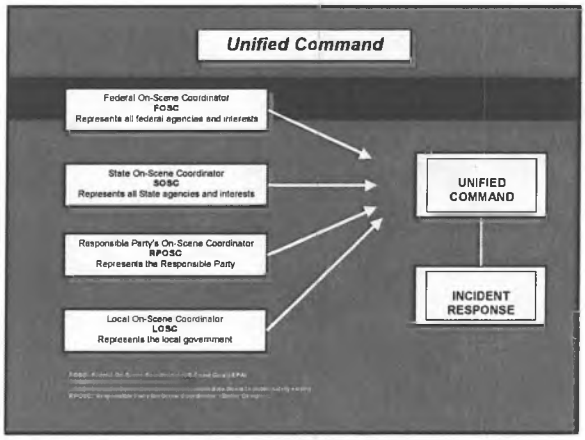
- "If you want to play in the game you have to come to practice....." Thad Allen
- Drills are regularly conducted with government and industry oil spill plans
- DEC provides training to local responders

40

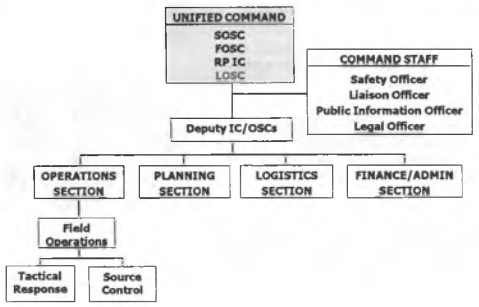
Drills

Local Responders Use Pre-developed GRS and Staged Spill Response Equipment to Protect Critical Coastal Sensitive Areas

41



Unified Command Response Organization



Recommendations

- The State should support national, international and trans-boundary efforts to enhance northern waters spill response planning and preparedness, response capability, infrastructure development and methods to reduce the risk of oil spills from vessels and offshore oil and gas development.
- The State should support improvements to subarea contingency plans to protect northern waters and coastal resources.
- The State should oppose efforts that would duplicate or supplant established state and federal jurisdictional processes for northern waters oil spill response planning and preparedness and insist that any new efforts and initiatives acknowledge and build upon these existing processes.
- The State should support existing Alaska institutions and development of new institutions here in Alaska with a focus on oil spill prevention and response methods and technologies with application to northern waters.

44

Recommendations

- The established state/federal jurisdictional process for oil spill planning and preparedness in Alaska should be adequately resourced by state and federal agencies to accommodate Arctic marine vessel traffic and northern waters offshore drilling.
- The adequacy of the states conservation surcharge to support the states spill prevention and response programs should be evaluated to augment northern waters spill prevention, planning and preparedness and incentivize local participation in subarea oil spill planning.
- The State should continue to support local involvement in spill prevention and response and solicit local knowledge and resources for these purposes.
- The State should support efforts to promote research into oil spill prevention, fate and effects, and response strategies and technologies.

45

Questions?

46

7
Arctic Pollution Response US Coast Guard

Arctic Pollution Response
NWTF - 07 July 2011

Captain Adam Shaw
Chief of Prevention
CCGD17

Oil Pollution Act of 1990 (OPA-90)

Result of the Exxon Valdez oil spill

- Established the Oil Spill Liability Trust Fund
- Requires "spiller pays"
- Created Oil Spill Response Organizations (OSRO)
- Required creation of Area Contingency Plans

Oil Spill Liability Trust Fund

- Created in 1986, but not authorized for use
- OPA-90 Authorized use of the fund
- Consolidation of several different pollution funds
- Funded by a tax on the petroleum industry
- Use delineated by OPA-90

Responsible Parties

A Responsible Party is defined in OPA-90 for the following:

- Tank Vessels
- Onshore Facilities
- Offshore Facilities
- Deepwater Ports
- Pipelines

Responsible Parties are held accountable for spilled oil and hazardous substances.

Oil Spill Response Organizations

- OPA-90 Required submission of response plans by Responsible Parties
- Response plan must identify, among other things, proof that a worst case discharge can be cleaned up by private personnel and equipment
- OSROs were created to make the identification of those resources easier and to assist in meeting oil clean up requirements.

Alaska Unified Plan

The Unified Plan is a comprehensive pollution response doctrine that defines the organizational and procedural framework of the Alaska oil spill response network. USCG, State, & EPA work together to develop the Unified Plan with input from the Alaska Regional Response Team (ARRT).

Ten Sub-Area Plans supplement the Unified Plan and describe geographic specific strategies for a coordinated federal, state and local response.

Sub-Area Plans Address/Identify:
- PPORs
- Response Procedures
- Environmentally Sensitive Areas
- Available Resources
- Notification Procedures
- Geographic Response Strategies

Alaska Regional Response Team (ARRT)

Purpose: To support development of the Unified Plan prior to incidents and provide technical expertise to the UC, if stood up, during a spill.

Composition: The Co-Chairs are USCG and EPA.

Members: ADEC, DOD, GSA, DOI, NOAA, FEMA, DHHS, DOJ, USFS, DOL, DOE & DOT, Tribal Representatives

Alaska Sub-Area's

UNIFIED COMMAND

Scenario: Cruise Ship Runs Around in Vicinity of Barrow with 500,000 gallons of heavy fuel oil (aka 'Bunkers')

Sector Anchorage FOSC, ADEC & RP will stand up a Unified Command in Barrow, AK.

Why? The FOSC makes the determination based on the incident (e.g. multiple agency interest, high visibility, unit overwhelmed or duration).

Where? Depends on the incident and surrounding infrastructure. Typical UC requires adequate communications gear, meeting rooms, & possible lodging.

Who: Unified Command will also work with Federally recognized tribes and stakeholders within the impacted area.

International Partnerships

Canada: MOUs:
- Joint Marine Pollution Contingency Plan
- Arctic Region Marine Spill Response Plan
- SE Alaska: 8 Exercises Since 2000 (CANUSDIX)
- Arctic: Seminar & TTX in 2010 (CANUSNORTH)

Russia: MOUs:
- Joint Contingency Plan on Combating Pollution in the Bering and Chukchi Seas (2001)
- Annual Work Plan to Improve Spill Response in Arctic
- State Marine Pollution Control, Salvage, and Rescue Administration (SMPCSRA)
- BILAT Update at Russian Ministry of Foreign Affairs
- Arctic Council Response Agreement Initial Effort
- Sakahalin Base TTX held in Aug 2003
- International Oil Spill Conference, Portland, OR 2011

Conceptual Response Tool Box

- Mechanical Containment and Recovery
  - USCG Owned
  - ADEC Owned
  - Industry Owned
  - Oil Spill Removal Organizations (OSRO)
- In-Situ Burning
- Chemical Dispersants (not preauthorized within State of Alaska – requires ARRT consultation)

Government Equipment Overview

- United States Coast Guard (USCG)
- Alaska Department of Environmental Conservation (ADEC)
- Navy Supervisor of Salvage (NAVSUPSALV)

Response gear from every agency can be transported via any available military aircraft or vessel or via commercial chartered aircraft, train, truck or vessel

USCG Owned Equipment Caches

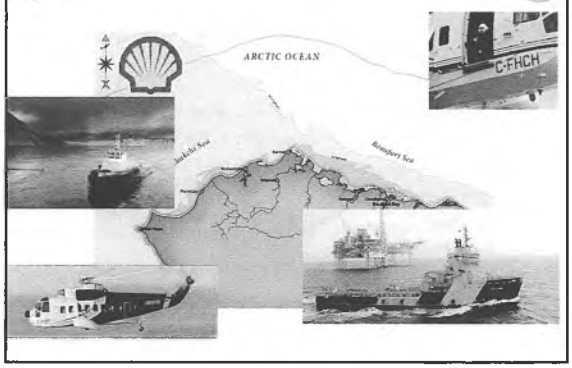
ADEC Owned Equipment Caches

Navy SUPSALV Equipment

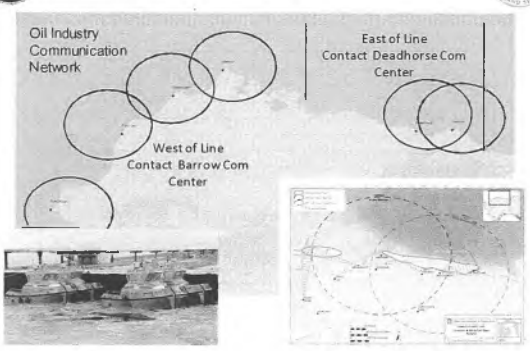
Located at FT. Richardson in Anchorage, AK

- Strong Open Ocean Recovery Capabilities
- Skimmers, Hard Boom, Support Vessels, Vacuum Systems, Storage Bladders, Command Trailer (with Communications Suite), Submersible Pumps, Arctic Oil Recovery System, etc.
- Salvage Equipment, Transfer Systems, Oily Water Separators, Viscous Oil Pumps

Private and Industry Resources



Private and Industry Resources



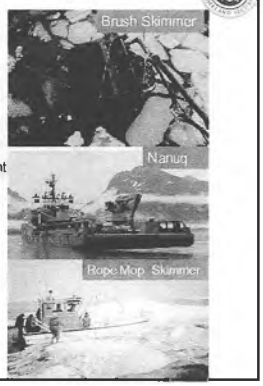
Oil in Ice Response Capabilities in the Arctic

Mechanical Recovery Challenges:

- Containment boom isn't effective
- Brush skimmers often become clogged
- Not effective if ice cover is too great
- Increased oil viscosity in lower temps
- Icing/Freezing of machinery parts
- Limited/difficult access to the oil
- Oil difficult to locate under ice
- CG doesn't own oil in ice recovery equipment

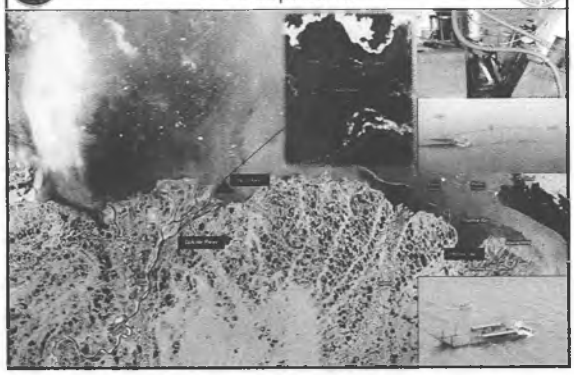
Accomplishments?

- Over 40 years of research conducted
- More response equip. than anywhere in US.
- Brush skimmers, high potential for recovery
- Winterization of equipment reduces freezing
- Vessels equipped with latest technology
- On-scene within 1hr of spill



Oil in Ice Response Capabilities Cont.

Barge Grounding – Stryker 14 Sept 2010



Oil Spill Response Challenges

- Weather/Season/Temperature/Darkness
- Remote location/Logistics
- Lack of infrastructure/improvising
- Distance of response capabilities/Logistics
- Limits of spill response equipment/Availability
- Safety of Responders (Weather, Bears)
- Joint Training/Coalition Exercises
- Funding
- Agreements/MOU
- International Media Interest/Visibility

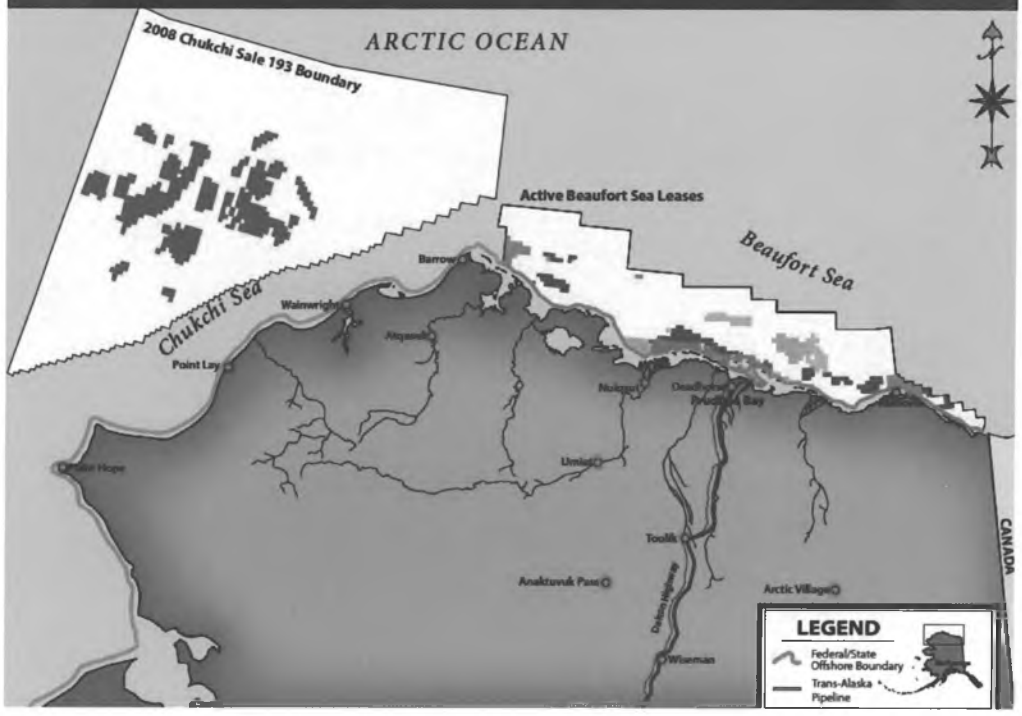
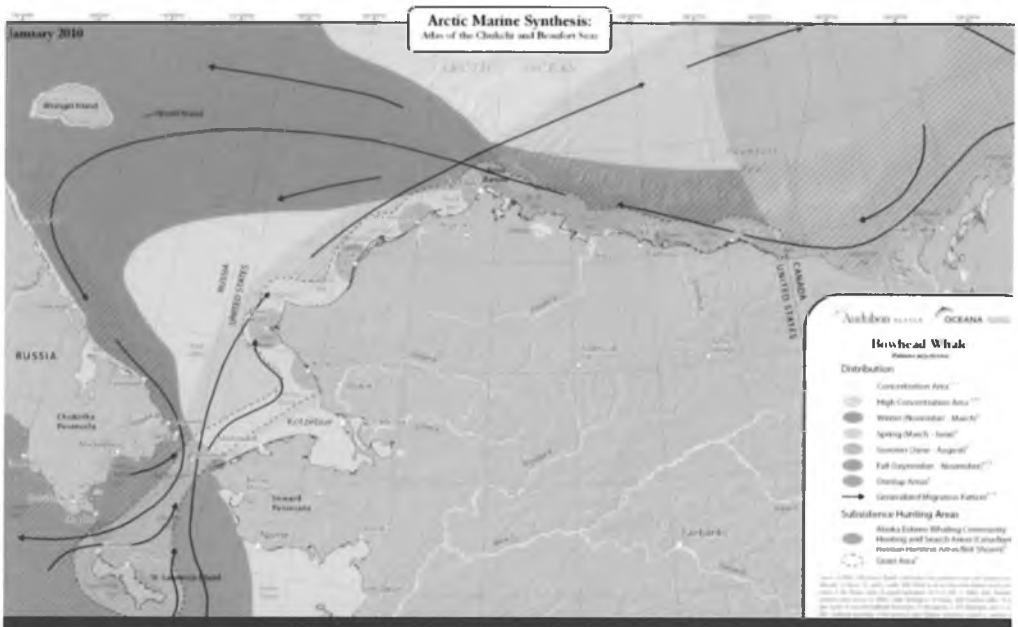
Map of Active Lease Areas in the Arctic OCS





1. Resource management agencies must develop and conduct a long-term comprehensive research and monitoring plan.

2. Spill risk assessment and spill prevention technologies must reflect arctic conditions

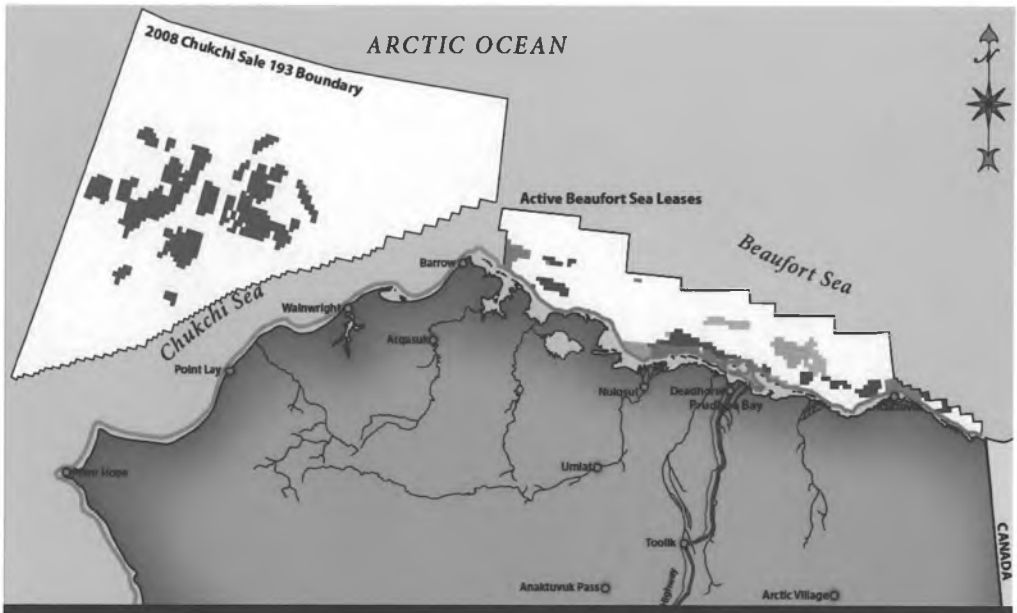
3. Spill response standards must be strengthened and tailored to arctic conditions (BOP, containment system, ice-class vessels)

Table 6-2. Environmental Factors Affecting Operational Limitations in the U.S. Arctic Ocean
(adapted from data at Western Regional Climate Center 2009a & 2009b)

Environmental Factors and Response Gaps (Estimated Percentage of Time When Operating Limits Are Impaired or Exceeded in U.S. Arctic)			
Winter (Jan-March)	**Spring (April-June)**	**Summer (July-Sept)**	**Fall (Oct-Dec)**
Ice Condition: Solid (100%)	Ice Condition: Solid (80%), Broken Ice (20%)	Ice Condition: Broken Ice (60%) Open Water (40%)	Ice Condition: Open Water (20%), Broken Ice (60%), Solid (20%)
Approx. Daylight Hrs 4.5	Approx. Daylight Hrs 19	Approx. Daylight Hrs 21	Approx. Daylight Hrs- 5.5
Avg. # Days Peak Gust >30: 20 (22%)	Avg. # Days Peak Gust >30: 12 (1%)	Avg. # Days Peak Gust >30: 19 (21%)	Avg. # Days Peak Gust >30: 30 (34%)
Avg. # Days of Fog: 51 (57%)	Avg. # Days of Fog: 53 (58%)	Avg. # Days of Fog: 44 (49%)	Avg. # Days of Fog: 51 (57%)
Avg. Ext Min Temp: -49F	Avg. Ext Min Temp: -9F	Avg. Ext Min Temp: 20F	Avg. Ext Min Temp: -32F

Spill prevention should reflect arctic conditions to reduce the risk of a sustained blowout or oil spill

- Containment system, built, tested and proven to work in the Arctic Ocean
- Blowout Preventer redundancy
- Second drilling vessel, designed for operating in arctic conditions, near the drill site for relief well capability
- Realistic worst-case scenario analysis and trajectory model
- Reduce drilling season to open water only, pre-fall whaling



4. Review and oversight of oil and gas drilling must be enhanced

Implement Aleutian Islands Risk Assessment Recommendations in the Arctic Ocean

- Bolster Sub-Area Contingency Planning
- Enhance U.S. Coast Guard Capability
- Establish Restricted Areas and Protective Measures
- Increase Oil Spill Response Capability
- Increase Vessel Monitoring and Reporting

Recommendations to Improve the State's Spill Response Planning and Preparedness

- Identifying and Protecting environmentally sensitive and subsistence use areas
- Pre-staged equipment
- Coastal Protection and Response Strategies – developed and tested with field exercises and drills

CONCLUSION

- Federal Standards specific to arctic offshore energy exploration and development
- Enhanced prevention and response equipment built for the Arctic
- Reduce risk with a summer-only drilling timeline
- Connecting the AIRA recommendations to Arctic preparedness

Lessons Learned from the Deep Water Horizon US Arctic Research Commission

#7

US ARCTIC RESEARCH COMMISSION

ABOUT

The US Arctic Research Commission (USARC) is an independent federal government agency created by the Arctic Research and Policy Act of 1984. The Commissioners are appointed by the President of the United States.

USARC is responsible to both the President and the Congress. Every two years, the Commission develops goals and objectives for the nation's Arctic research program, which has a budget of approximately $400 million per year, and is conducted by approximately 15 US federal agencies and state agencies, local governments, university partners, and private-sector collaborators. The Commission's goals are adopted by an Interagency Arctic Research Policy Committee (IARPC) that develops the national five-year Arctic Research Plan. The Commission is also explicitly tasked with making recommendations on the means for developing international scientific cooperation in the Arctic.

DUTIES

- Develop and recommend a national Arctic research policy
- Assist IARPC in establishing a national Arctic research program plan to implement the policy
- Facilitate cooperation in Arctic research among federal, state, and local governments, and international partners
- Review federal Arctic research programs and recommend coordination improvements
- Recommend improvements in Arctic research logistics
- Recommend improved methods for data sharing among research entities

THE US ARCTIC RESEARCH COMMISSION ENCOURAGES RESEARCH IN FIVE GENERAL AREAS

Environmental Change of the Arctic Ocean and Bering Sea

The Arctic is a clear priority for marine scientific research because the combination of climate change, technological advances, and economic forces make this region increasingly accessible for resource development, transportation, tourism, sovereignty, and security. USARC calls for coordinated research in the Chukchi and Beaufort Seas akin to what was accomplished by the Bering Sea Ecosystem Study. The Study of Environmental Arctic Change (SEARCH), an enduring, interagency effort to understand the nature, extent, and evolution of Arctic environmental change, has grown by the addition of the Arctic Observing Network (AON). The emerging Distributed Biological Observatory (DBO) initiative shows great promise for the Pacific Arctic sector. USARC recommends:

- Increased support for, and broader participation in, AON, DBO, and SEARCH
- Greater integration of Arctic marine research, and support for the strategic action plans being developed by the National Ocean Council

Arctic Human Health

A distinctive approach is required to address health issues of indigenous peoples and to effectively overcome the region's health disparities. US Arctic residents are susceptible to a broad range of physical and behavioral health issues that result in lower life expectancies and higher infant mortality rates than found elsewhere. While the transition from a traditional subsistence lifestyle has brought positive change, it has also increased the prevalence of chronic diseases such as diabetes, hypertension, obesity, and cardiovascular and mental illnesses. Study has just begun on the impact of environmental pollutants and climate change on food safety and health consequences. USARC recommends:

- Developing and implementing an interagency Arctic human health research plan
- A focus on mental and behavioral health issues
- Greater focus on research that would improve access to clean water and improved sanitation systems in rural Alaska

Civil Infrastructure Research

Climate change is impacting civil infrastructure (e.g., roads, buildings, pipelines, ports). Thawing permafrost, increasing coastal erosion, and generally warmer conditions are all contributors. The implications for the Arctic's transportation, communication, energy, and community infrastructure networks are considerable, largely because long-held engineering standards assumed a perpetually stable thermal/permafrost regime. Research is needed to develop new and climate-change-adaptive standards for design, construction, and maintenance. Research and innovative engineering solutions are needed to create new infrastructure to address the demands of an increasingly accessible Arctic, whether by land, sea, or air.

Natural Resource Assessment and Earth Science

As has been clear since the building of the Trans-Alaska Pipeline System, the US Arctic is rich with natural resources from oil and gas, minerals (including rare earth elements), fisheries, lumber, and wildlife ecosystems. Further assessments of living and nonliving resources are needed in the Arctic. Specifically, the US Geological Survey should implement its "Resource Assessment Program" (AMRAP) required by law. Earth science initiatives should continue to incorporate fundamental geophysical and geological research (especially in the Arctic Ocean) so that as a nation, we understand our land, its value, and the extent of our offshore sovereignty beyond the current Exclusive Economic Zone. Emphasis should also be placed on oil-spill prevention and response in the Arctic and sub-Arctic, better Arctic mapping, gas hydrate research, studies of contaminant fluxes and impacts, and long-term funding for the North Slope Science Initiative.

Indigenous Language, Identity, and Culture

Language defines the cultural diversity of our planet, and allows us to separate one population from another. Although critical, language is one of the most vulnerable elements of our cultural heritage. Of the thousands of known languages, fewer than 10 are used by nearly 60 percent of the global population and more than 500 are extinct. In the Arctic, language vulnerability is especially acute, where loss stems from separation of indigenous people from their cultural past. Without a research plan to address Arctic language preservation, the path to language extinction is likely to shorten. This plan should incorporate:

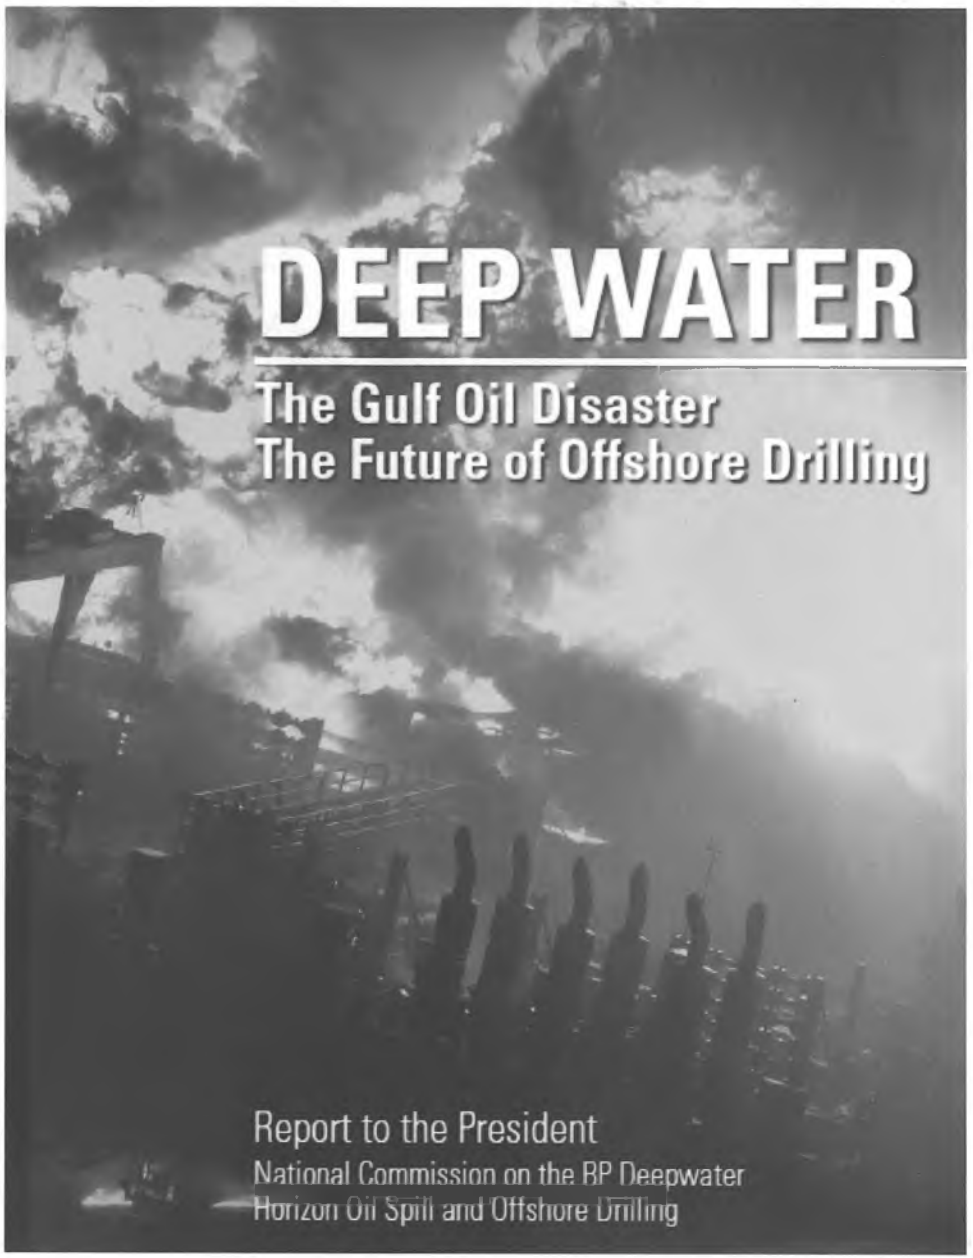
- Regular, permanent census processes to understand the diversity of languages spoken by Arctic people, and the viability of those languages
- Documented procedures to ensure that languages and place names spoken and given by Arctic people are recorded and preserved
- Defined policy options and processes for language preservation that have succeeded in the Arctic, and elsewhere, and are made available to Arctic policymakers and residents

National Commission on the BP Deepwater Horizon Oil Spill and Offshore Drilling

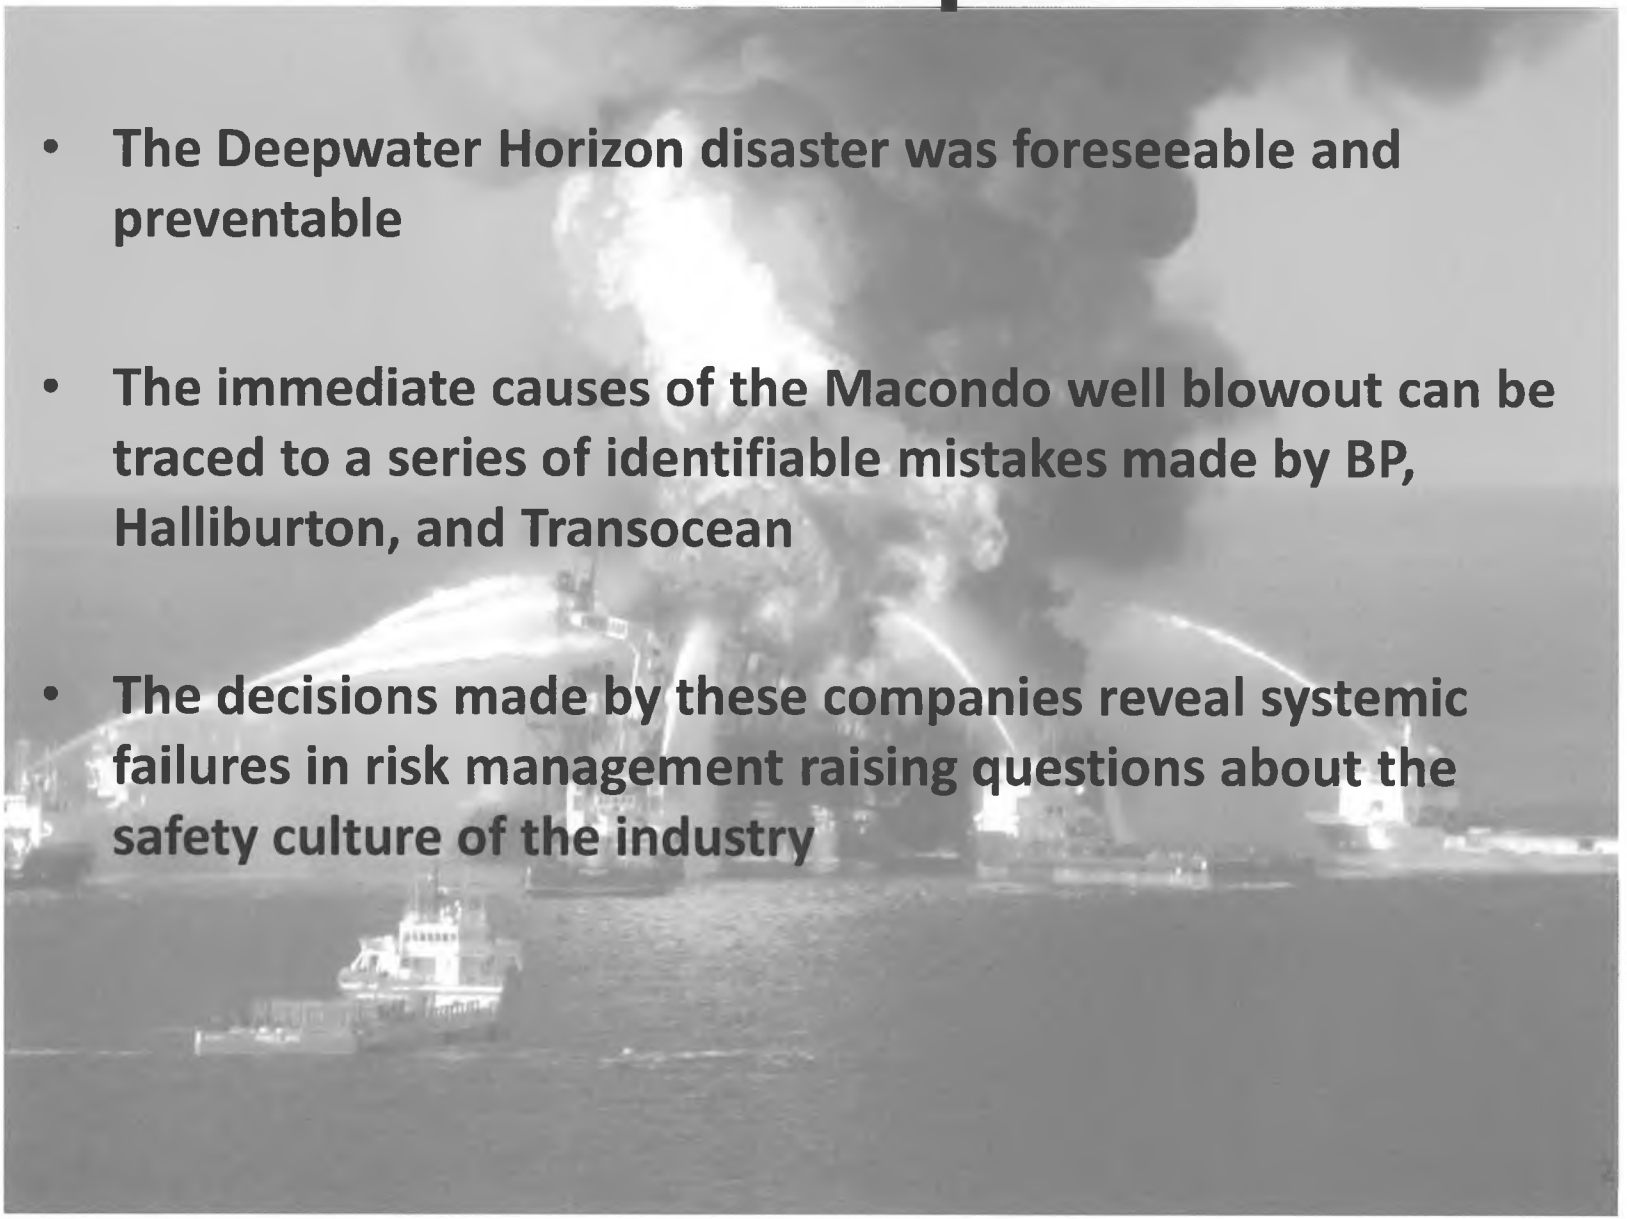
Report to the President

www.oilspillcommission.gov

National Commission on the
BP DEEPWATER HORIZON OIL SPILL
AND OFFSHORE DRILLING



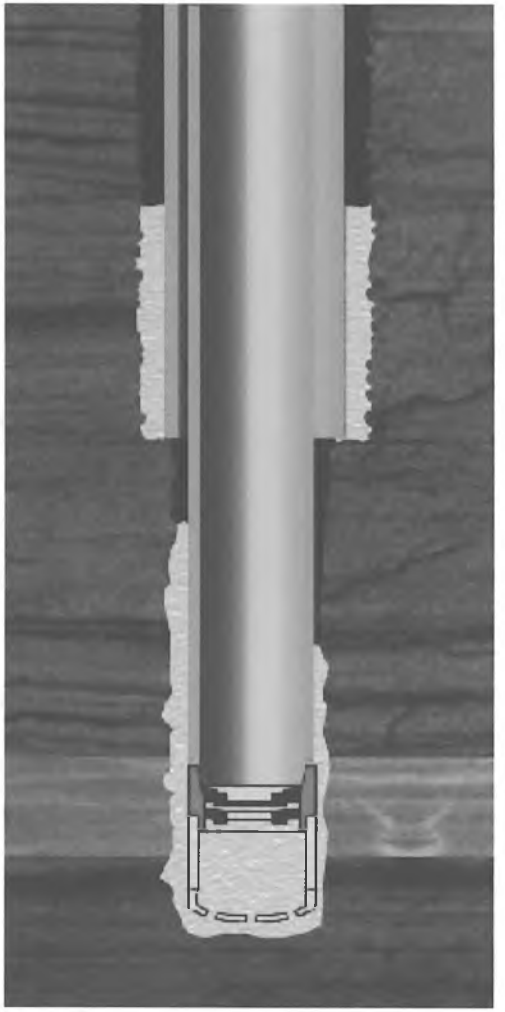
Causes of Explosion



- The Deepwater Horizon disaster was foreseeable and preventable
- The immediate causes of the Macondo well blowout can be traced to a series of identifiable mistakes made by BP, Halliburton, and Transocean
- The decisions made by these companies reveal systemic failures in risk management raising questions about the safety culture of the industry

Major Factors Leading to Blowout

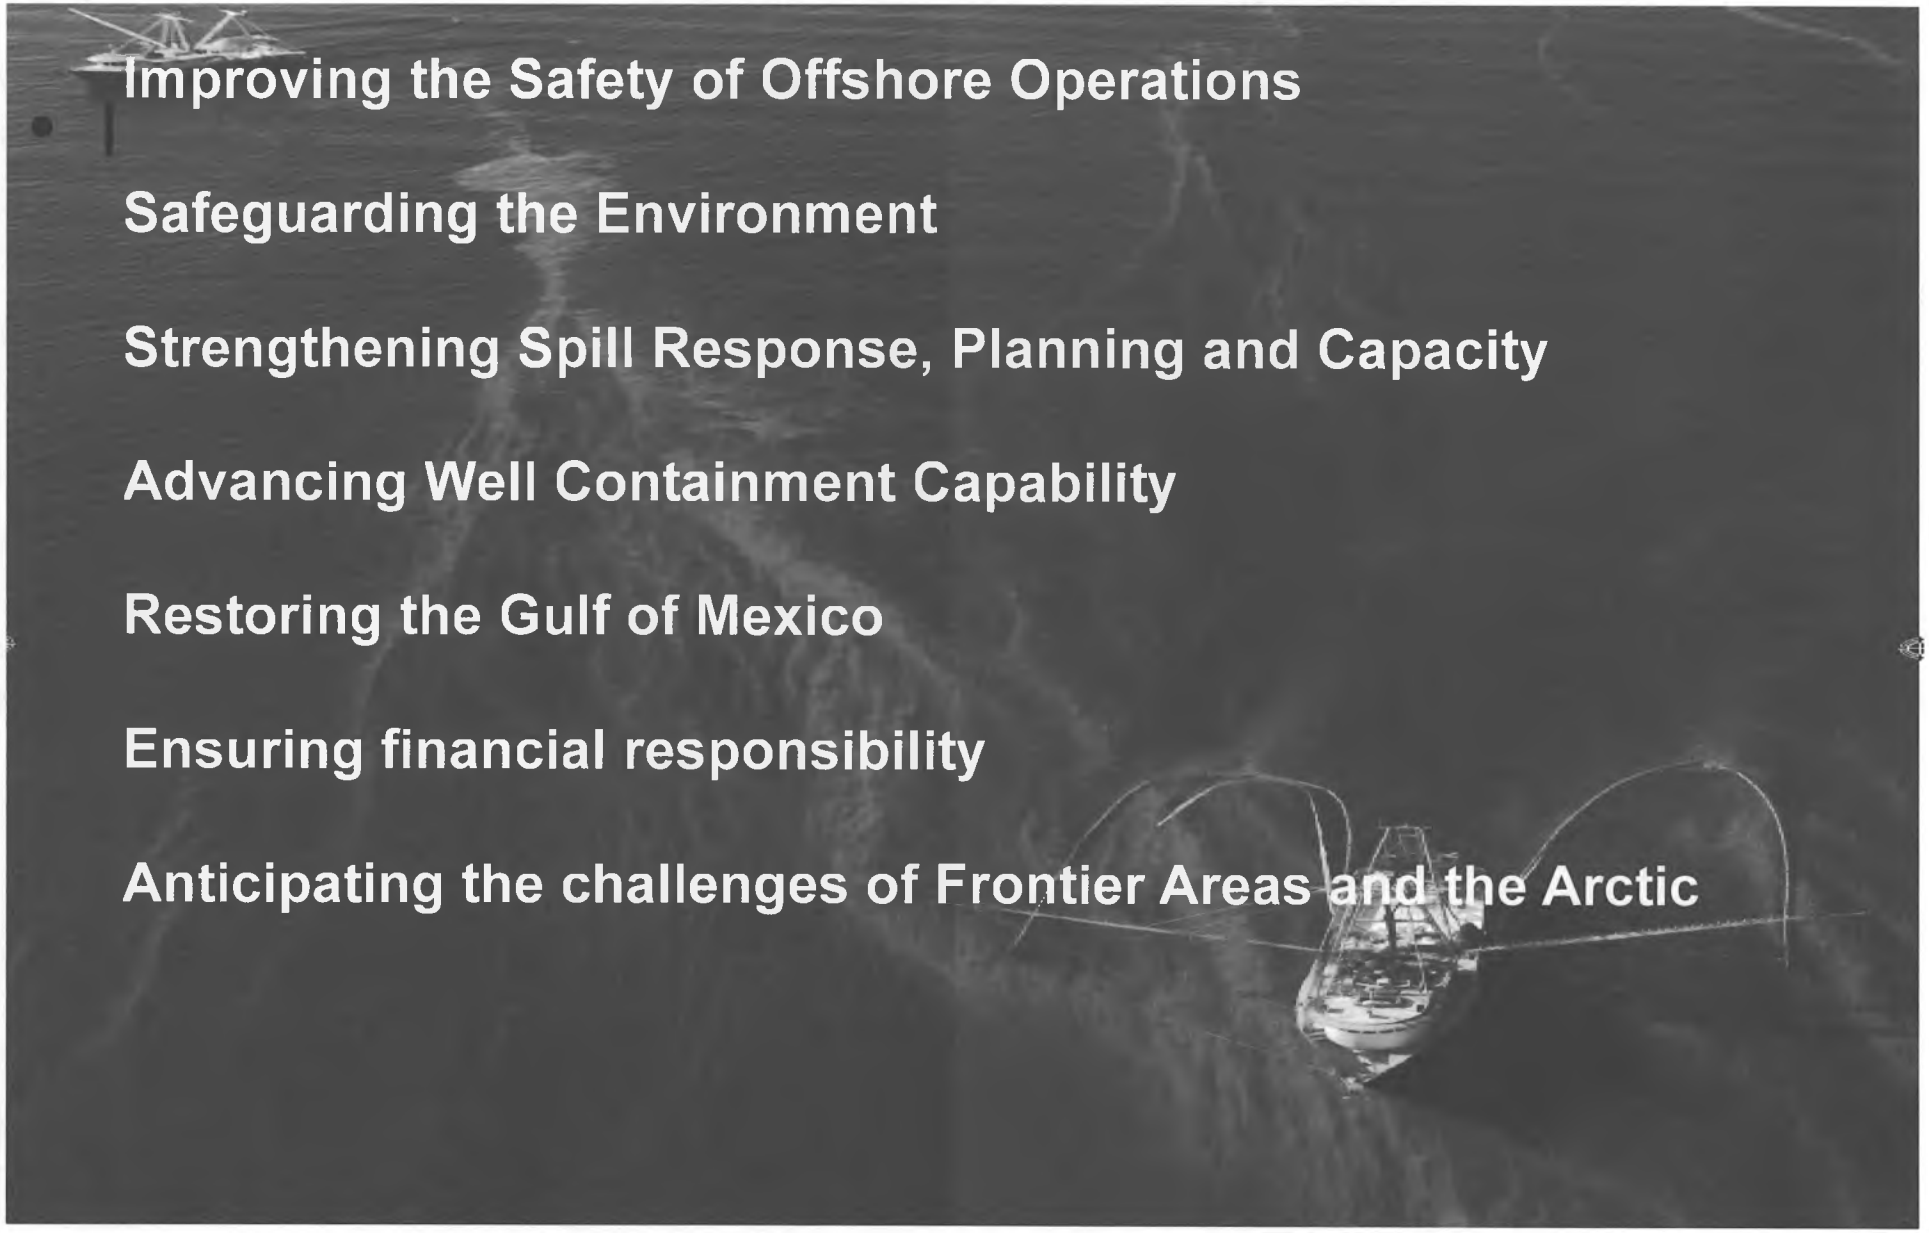
- Flawed design for cement slurry
- High risk cementing procedures
- Misinterpretation of negative pressure tests
- Risky Temporary Abandonment Procedures
- Inattention to signs of "kicks"
- Failure to respond appropriately once the blowout began
- Poor communication
- Haste, pressure and confusion



Government Also Failed

- Government regulations did not address several key causes of the blowout
- Regulators lacked the resources or technical expertise to address many issues
- The regulator, MMS, faced conflicts of interest in its diverse responsibilities:
  - Promote offshore leasing
  - Collect revenues from offshore leasing
  - Conduct environmental reviews
  - Review plans and issued permits
  - Conduct audits and inspections
  - Enforce safety and environmental regulations

Key Recommendations



Improving the Safety of Offshore Operations

Safeguarding the Environment

Strengthening Spill Response, Planning and Capacity

Advancing Well Containment Capability

Restoring the Gulf of Mexico

Ensuring financial responsibility

Anticipating the challenges of Frontier Areas and the Arctic

Recommendations for Federal Agencies

- Assign offshore energy management responsibilities to 3 entities
  - An independent safety authority
  - A Leasing and Environmental Science Office
  - An Office of Natural Resources Revenue
- Promulgate improved regulations and interagency coordination
- Develop management system incorporating "safety case" approach
- Promote adoption of consistent international best practice standards
- Improve NEPA environmental reviews
  - Stronger interagency consultation (particularly with NOAA)
  - Implemented by Office of Environmental Science

Recommendations for Congress

- Establish independent Bureau of Safety and Environmental Enforcement
  Would oversee all forms of offshore energy exploration, development, and production
- Establish fees as dedicated source of funding for regulators
- Provide full dedicated funding for R&D to improve
- Response and containment techniques
- Significantly increase liability cap and financial responsibility requirements
- Increase allowable payouts from oil spill liability trust fund
- Establish a state-federal gulf coast ecosystem restoration council with long-term funding
- Dedicate 80% of Clean Water Act penalties to Gulf restoration

Recommendations for Industry

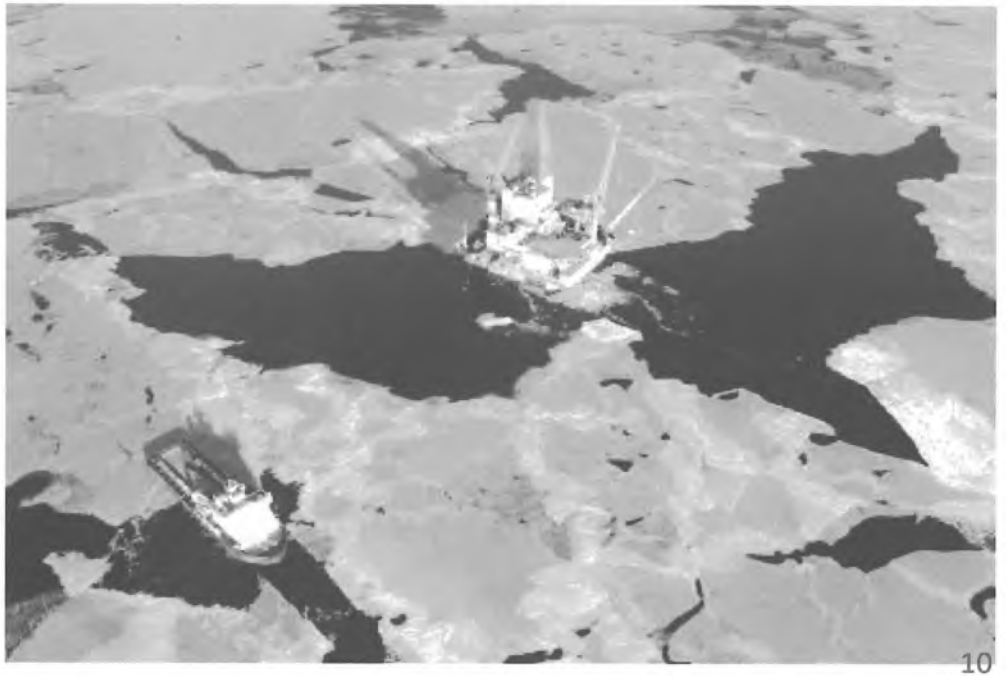
- The oil and gas industry should establish its own "Safety Institute"
  - The nuclear power industry did this after Three Mile Island accident
  - Develops and enforces industry standards of excellence
  - Operate independently of the American Petroleum Institute
- The oil and gas industry must adopt a "culture of safety" as a collective responsibility
  - A focused commitment to constant improvement and zero failure rate
  - Other high risk industries have agreed to hold themselves and peers accountable for safety
  - Set up mechanisms to make this real
- Should benchmark safety and environmental practice rules against recognized global best practices
- Should have containment technologies immediately available

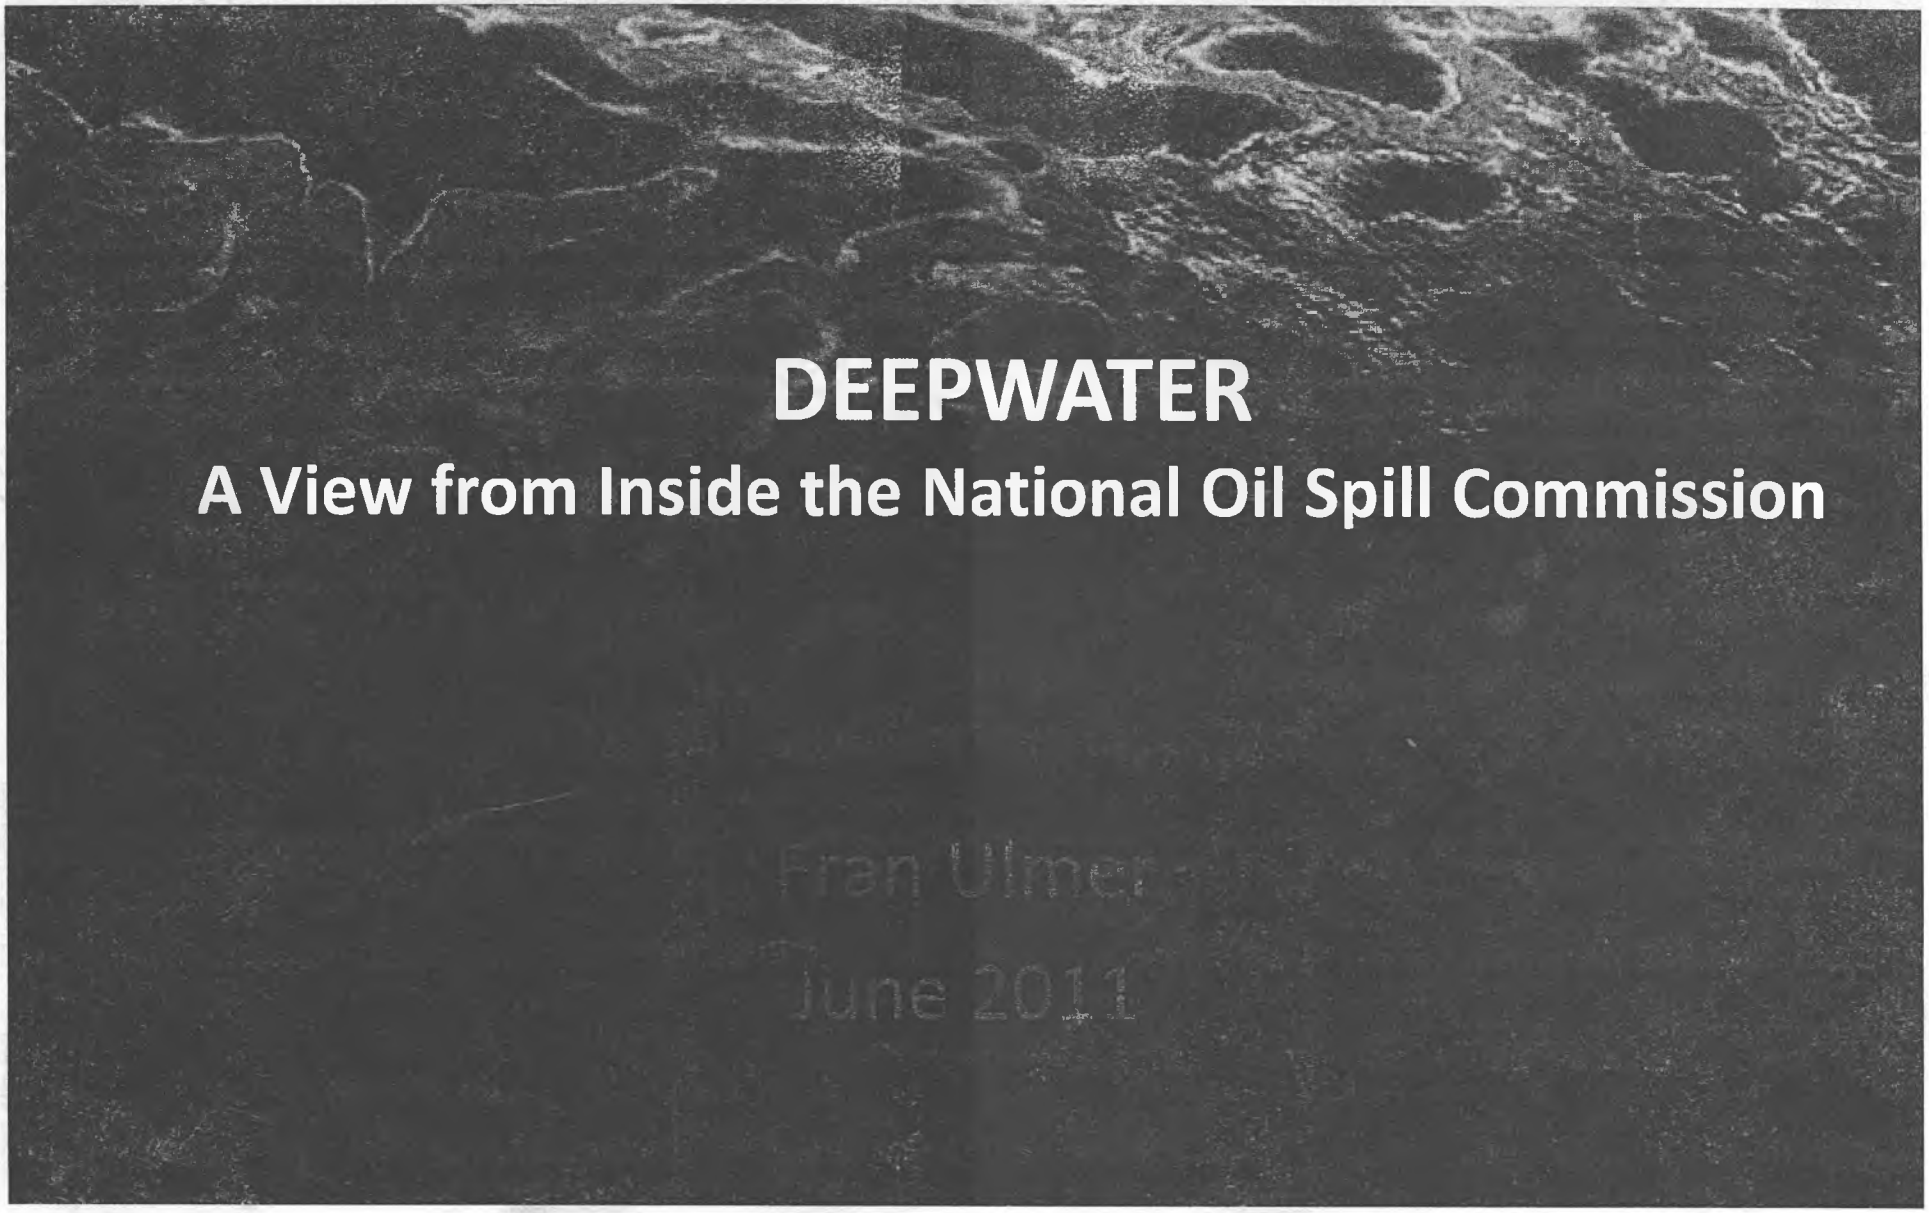
Response and Containment Recommendations

- Improve oil spill response capabilities
  - Better planning: broader reviews, incorporate "worst-case" scenarios
  - Establish special processes for spills of national significance
  - Strengthen state and local involvement
  - Increased research and development
  - Improved regulations governing dispersants
  - More careful evaluation of extraordinary measures, e.g. sand berms
- Improve well containment capabilities
  - Government should acquire technical expertise
  - Industry should have adequate well containment capability readily available
  - Improve ability to estimate well flow rates accurately
  - Safer well design
  - Better and more sensors

Recommendations for the Arctic

- Drilling must be done with the utmost care because of the sensitive Arctic environment
- An immediate, comprehensive research program to provide a foundation of scientific information is needed
- Industry and the Coast Guard should address gaps with respect to:
  - Oil-spill response
  - Containment
  - Search and rescue
- The U.S. should promote the development of international drilling standards for the Arctic





DEEPWATER

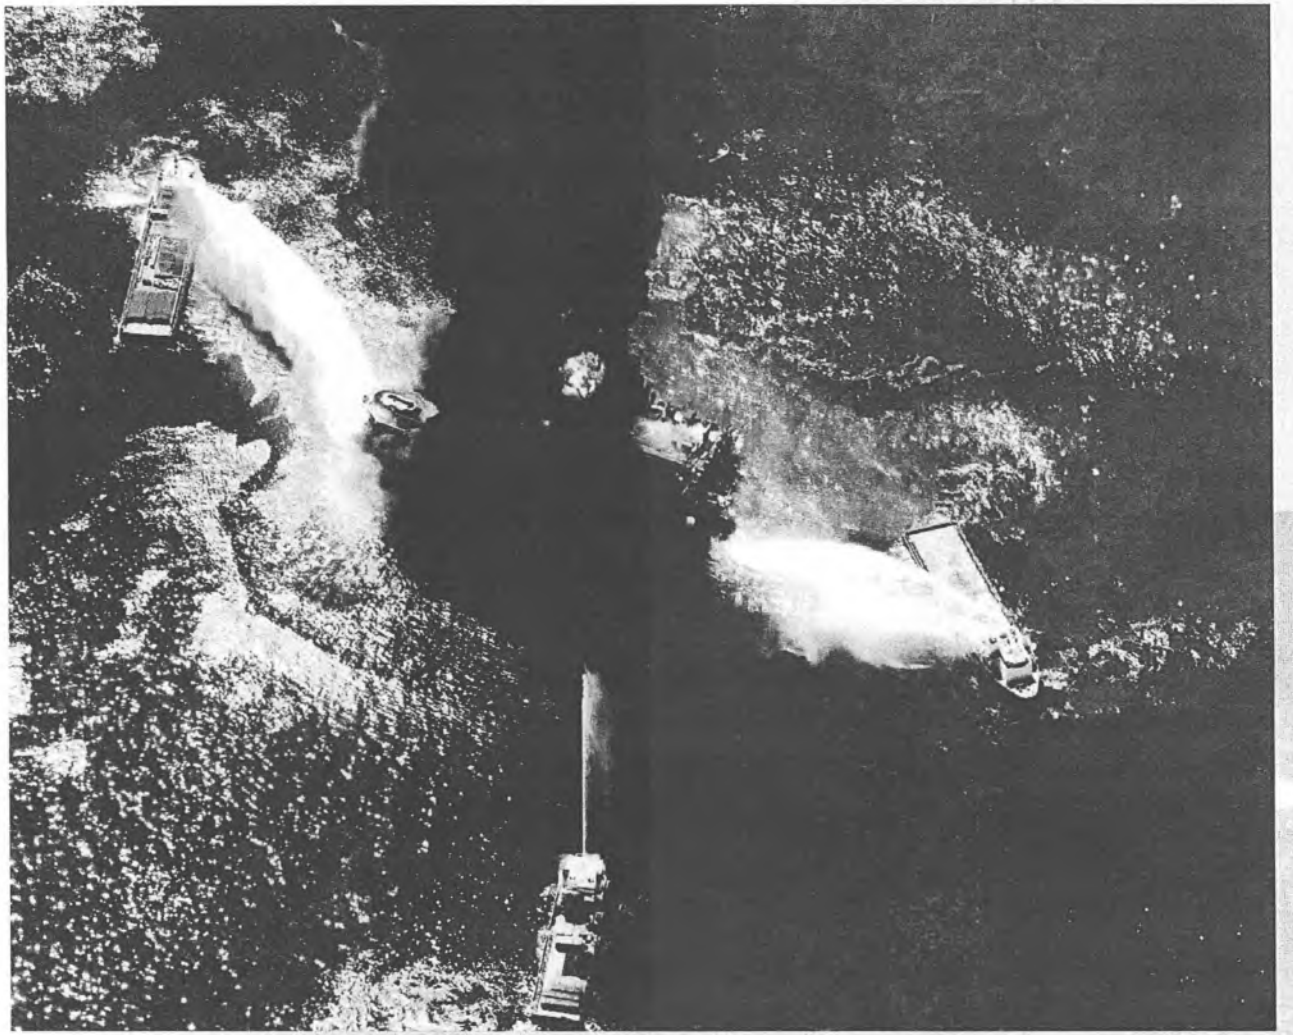
A View from Inside the National Oil Spill Commission

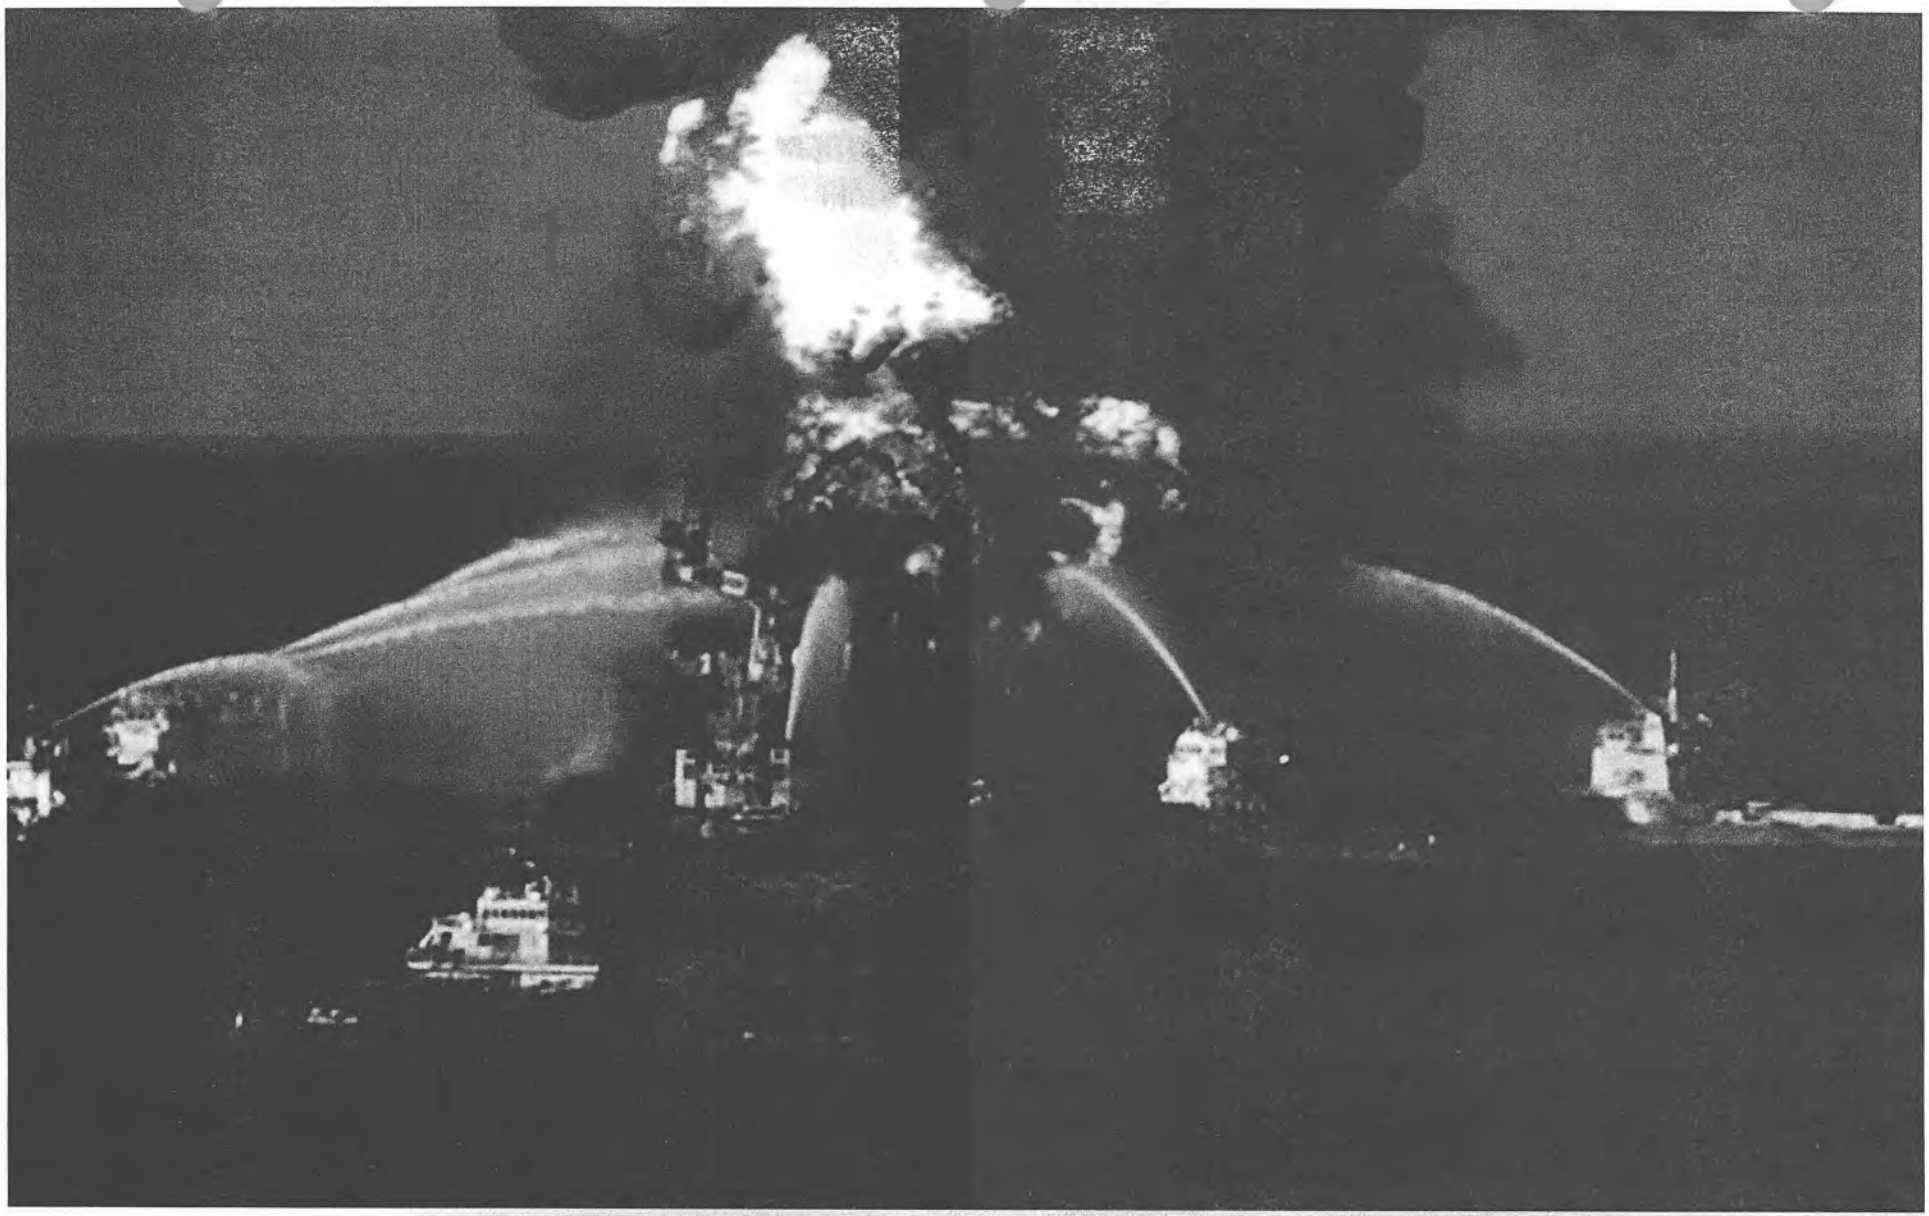
Fran Ulmer

June 2011

National Commission on the
BP DEEPWATER HORIZON OIL SPILL
AND OFFSHORE DRILLING

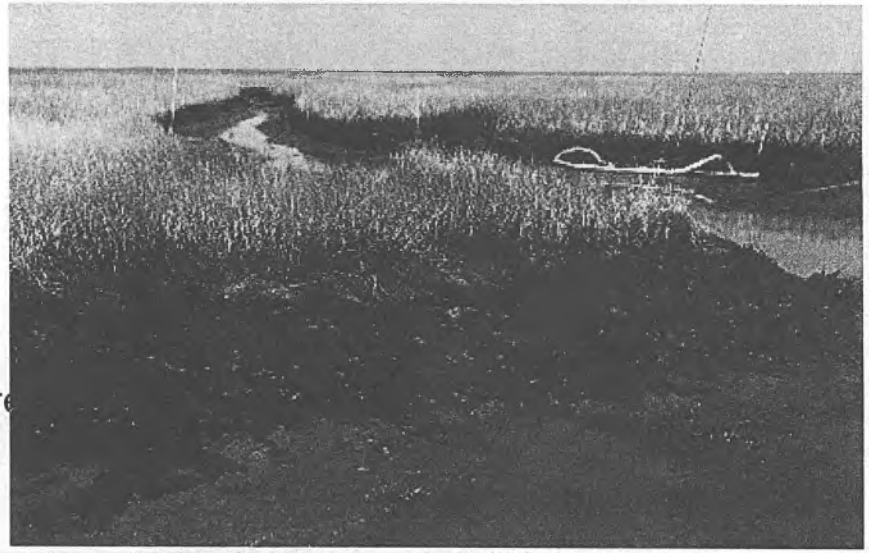
April 20, 2010

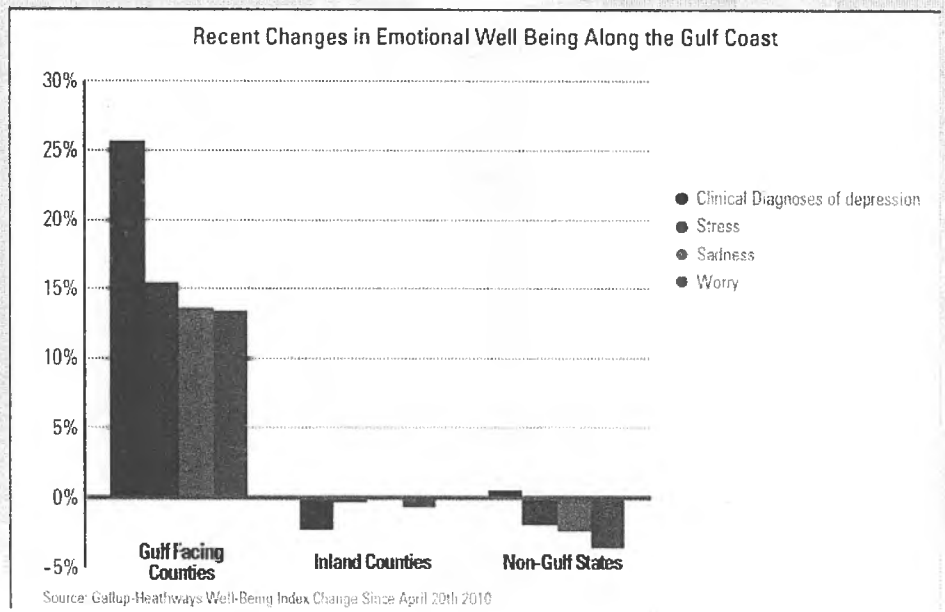




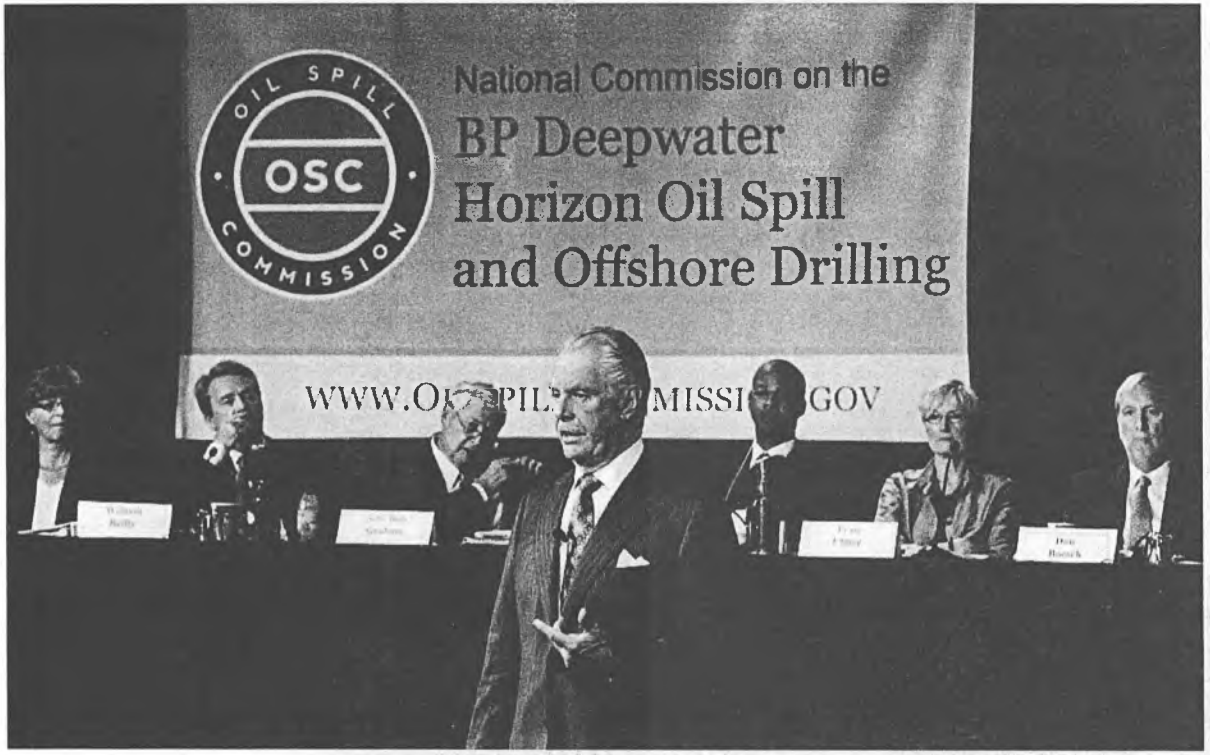
Costs of Blowout Significant

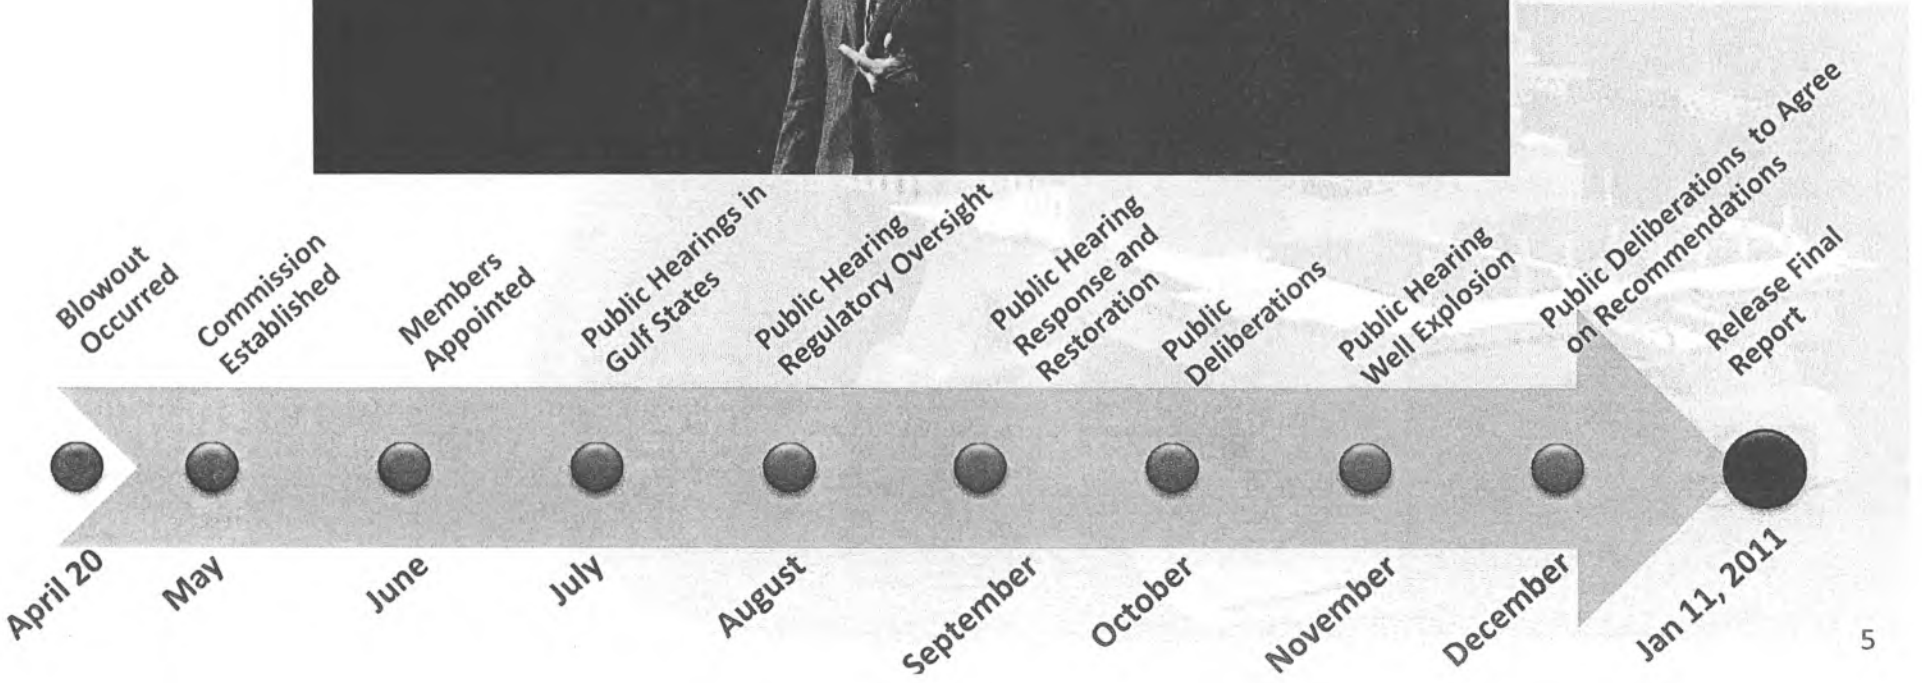
- Eleven men died, dozens injured
- Millions of gallons of oil released into Gulf
- Response Costs
- Environmental Damage
  - Marine and coastal ecosystems already severe stressed
  - Long-term impacts not yet known
- Economy
  - Seafood Industry
  - Tourism Industry
  - Oil and gas industry
- Residents of Gulf
  - Impacts on health
  - Increased depression





The Commission

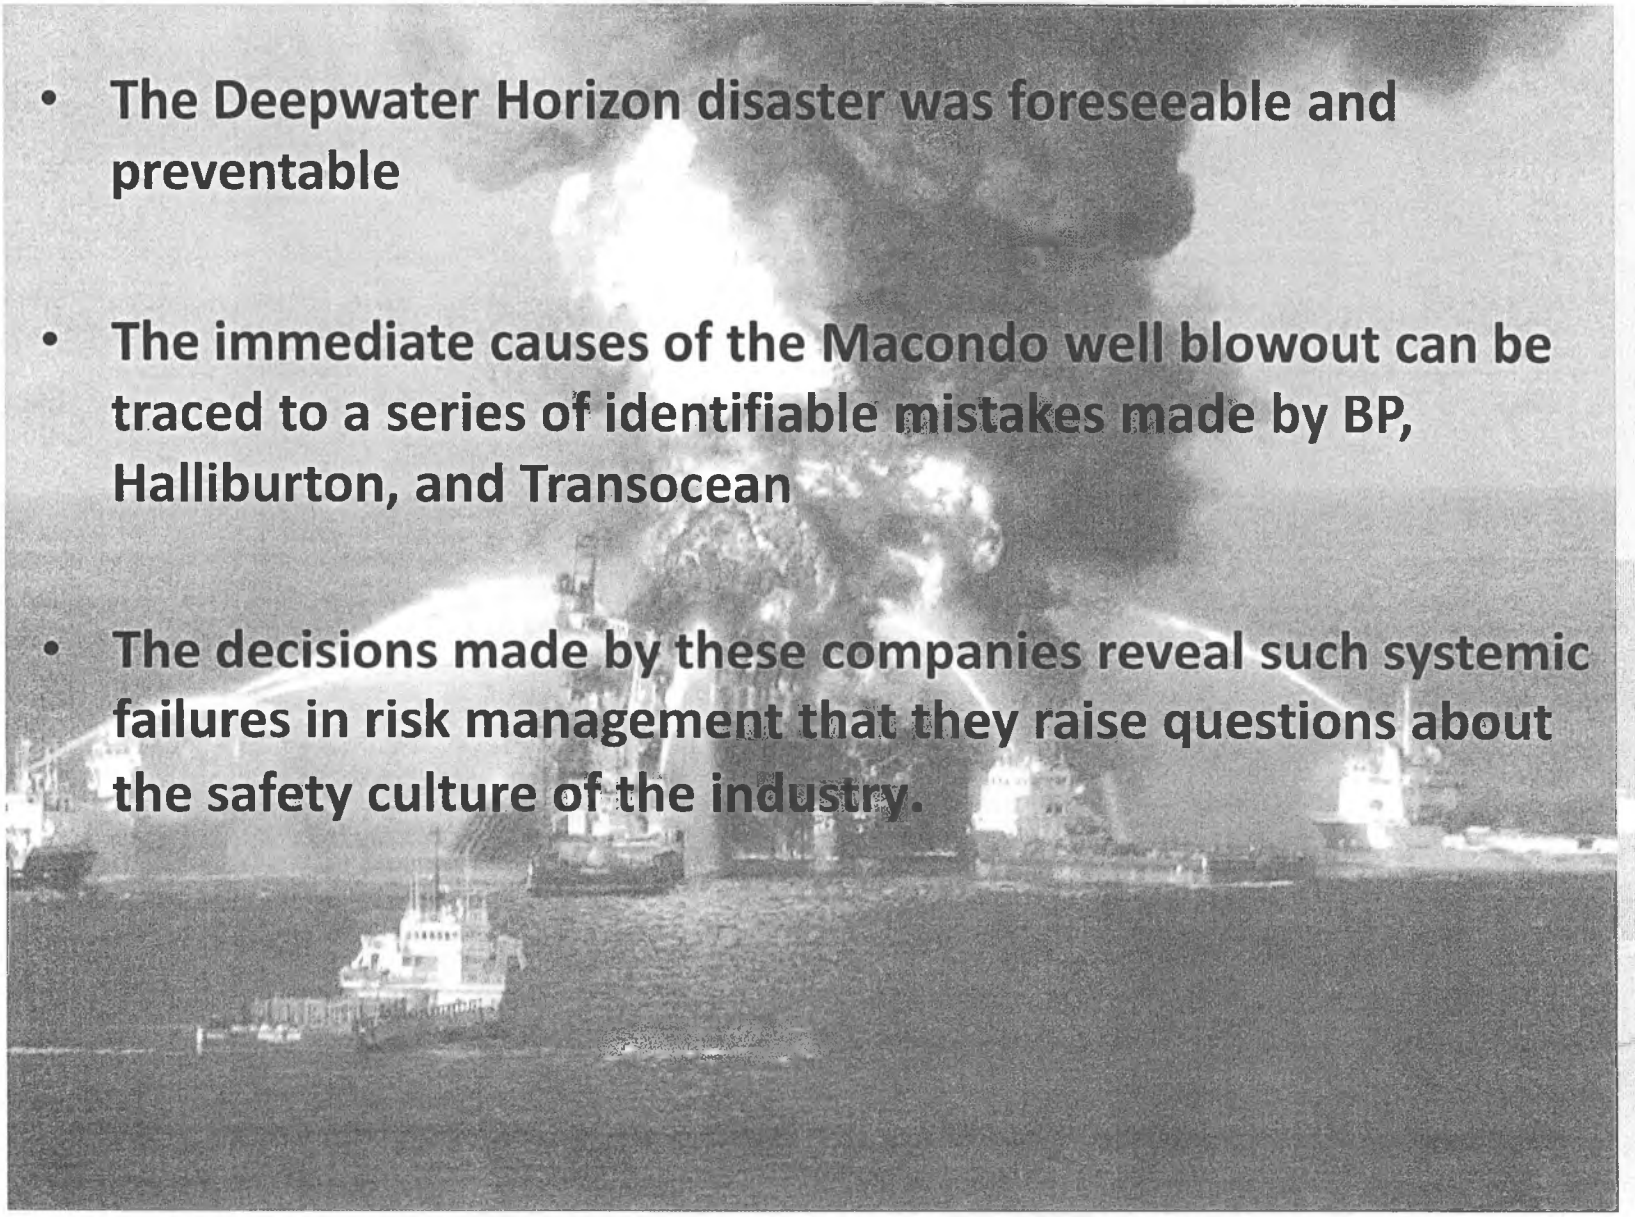




Our Mission

- **Created by Executive Order 13543, dated May 21, 2010**
- **The President asked the Commission to**
  - Examine the relevant facts and circumstances concerning the root causes of the Deepwater Horizon oil disaster;
  - Develop options for guarding against, and mitigating the impact of, oil spills associated with offshore drilling, taking into consideration the environmental, public health, and economic effects of such options
- **The Commission did not attempt to:**
  - Fix legal culpability
  - Reformulate US energy policy

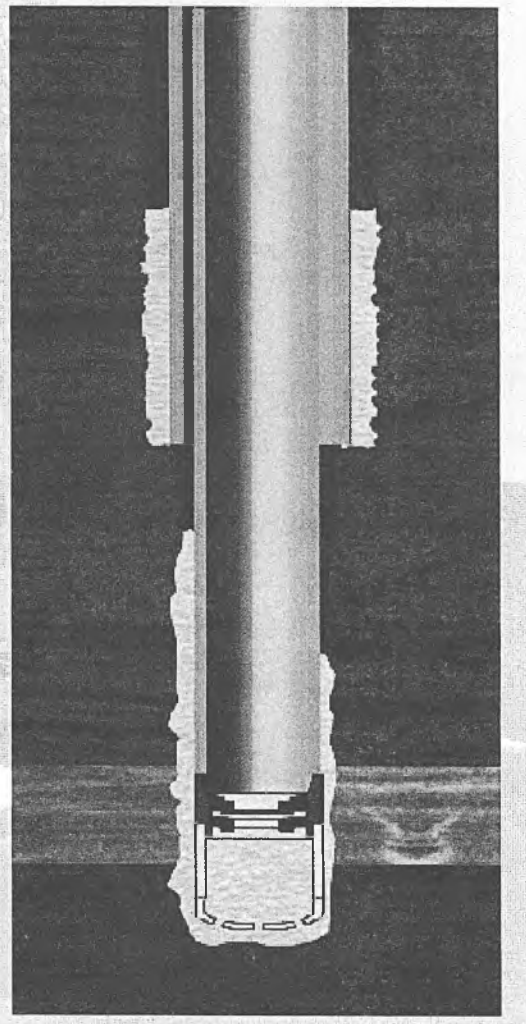
Key Findings on Causes of Explosion



- The Deepwater Horizon disaster was foreseeable and preventable
- The immediate causes of the Macondo well blowout can be traced to a series of identifiable mistakes made by BP, Halliburton, and Transocean
- The decisions made by these companies reveal such systemic failures in risk management that they raise questions about the safety culture of the industry.

Major Factors Leading to Blowout

- Flawed design for cement slurry
- High risk cementing procedures
- Misinterpretation of negative pressure tests
- Risky Temporary Abandonment Procedures
- Inattention to signs of "kicks"
- Failure to respond appropriately once the blowout began
- Poor communication
- Haste, pressure and confusion

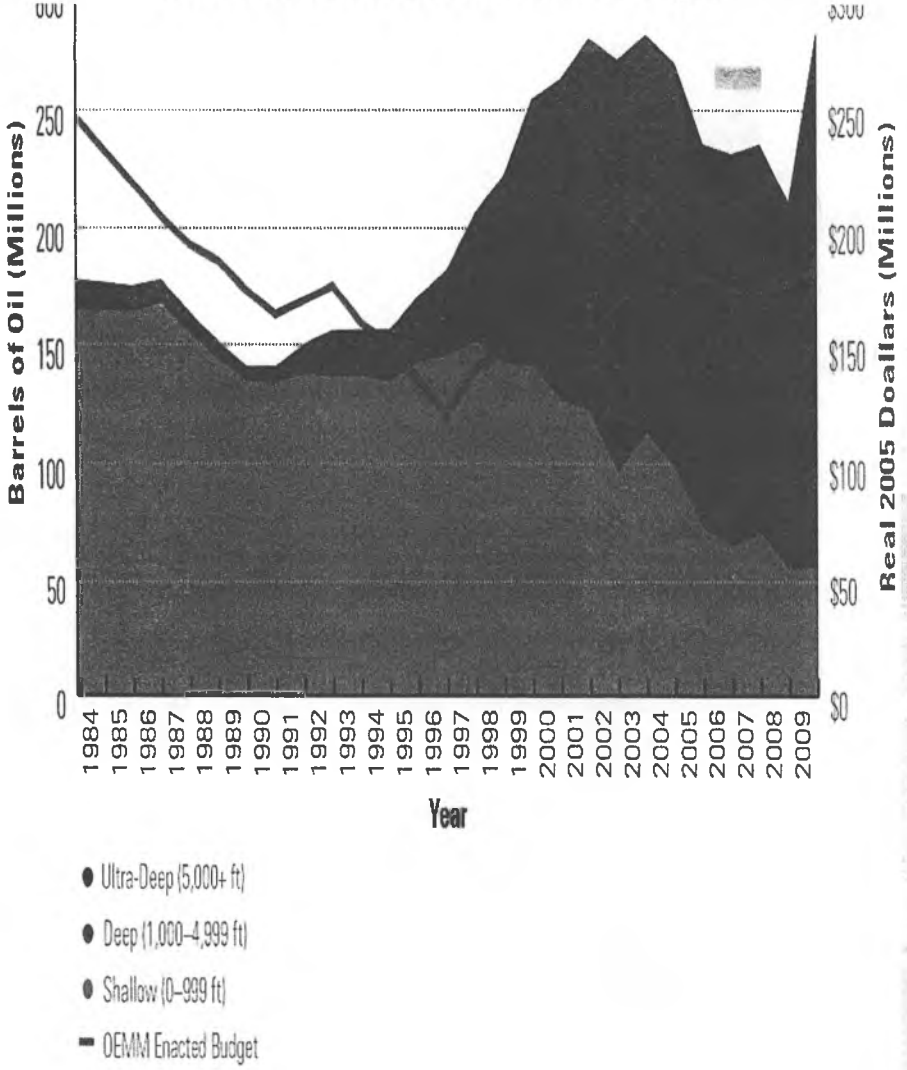


Government Failures

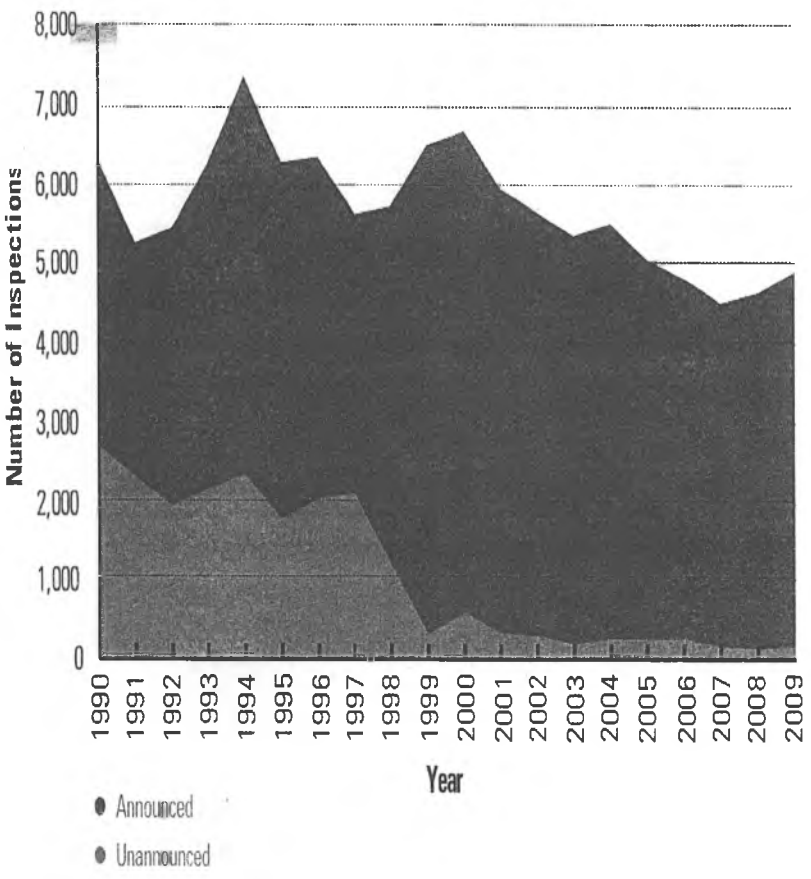
- Government regulations did not address several key causes of the blowout
- Regulators lacked the resources or technical expertise to address many issues.
- The regulator, MMS, faced conflicts of interest in its diverse responsibilities:
  - Promote offshore leasing
  - Collect revenues from offshore leasing
  - Conduct environmental reviews
  - Review plans and issued permits
  - Conduct audits and inspections
  - Enforce safety and environmental regulations

MMS Resource Constraints

OCS Oil Production and MMS Budget

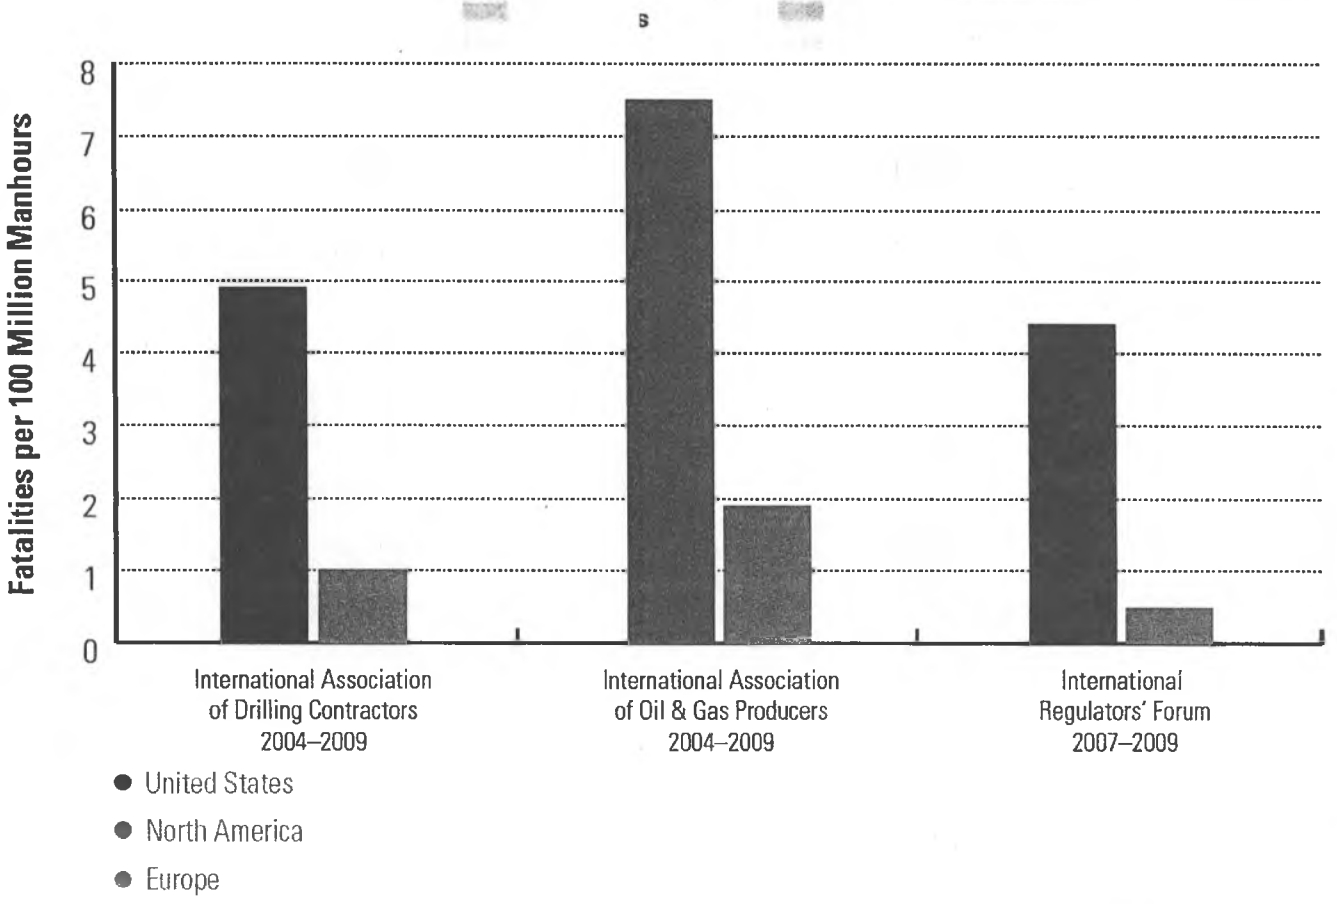


MMS Inspections



Lower Fatality Rate in European than US Operations

Fatalities from Offshore Oil and Gas Operations:
Europe and the United States



http://www.irfoffshoresafety.com/country/performance/.

Recommendations for Federal Agencies

- Assign offshore energy management responsibilities to 3 entities
  - An independent safety authority
  - A Leasing and Environmental Science Office
  - An Office of Natural Resources Revenue
- Promulgate improved regulations and interagency coordination
- Develop management system incorporating "safety case" approach
- Promote adoption of consistent international best practice standards
- Improve NEPA environmental reviews
  - Stronger interagency consultation (particularly with NOAA)
  - Implemented by Office of Environmental Science

Recommendations for Congress

- Establish independent Bureau of Safety and Environmental Enforcement
  Would oversee all forms of offshore energy exploration, development, and production
- Establish fees as dedicated source of funding for regulators
- Provide full dedicated funding for R&D to improve
- Response and containment techniques
- Significantly increase liability cap and financial responsibility requirements
- Increase allowable payouts from oil spill liability trust fund
- Establish a state-federal gulf coast ecosystem restoration council with long-term funding
- Dedicate 80% of Clean Water Act penalties to Gulf restoration

Recommendations for Industry

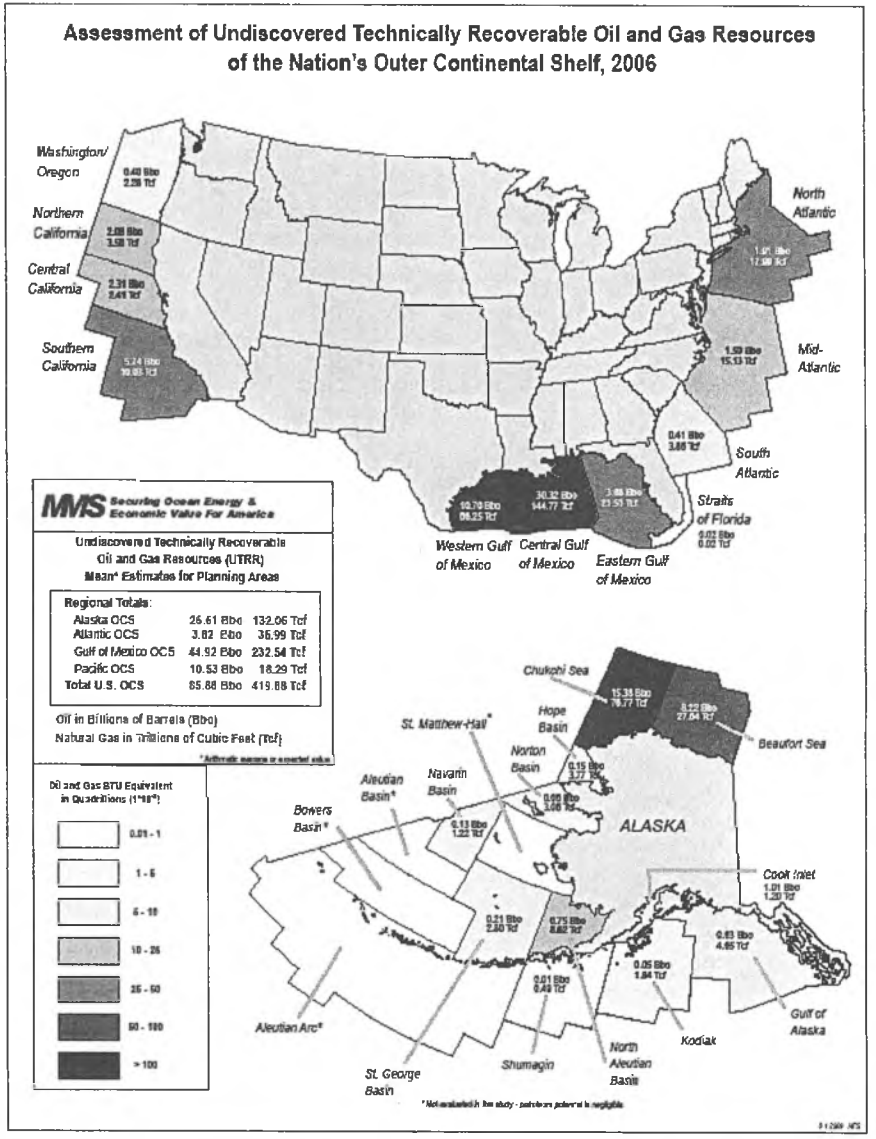
- The oil and gas industry should establish its own "Safety Institute"
  - The nuclear power industry did this after Three Mile Island accident
  - Develops and enforces industry standards of excellence
  - Operate independently of the American Petroleum Institute
- The oil and gas industry must adopt a "culture of safety" as a collective responsibility
  - A focused commitment to constant improvement and zero failure rate
  - Other high risk industries have agreed to hold themselves and peers accountable for safety
  - Set up mechanisms to make this real
- Should benchmark safety and environmental practice rules against recognized global best practices
- Should have containment technologies immediately available

Response and Containment Recommendations

- Improve oil spill response capabilities
  - Better planning: broader reviews, incorporate "worst-case" scenarios
  - Establish special processes for spills of national significance
  - Strengthen state and local involvement
  - Increased research and development
  - Improved regulations governing dispersants
  - More careful evaluation of extraordinary measures, e.g. sand berms
- Improve well containment capabilities
  - Government should acquire technical expertise
  - Industry should have adequate well containment capability readily available
  - Improve ability to estimate well flow rates accurately
  - Safer well design
  - Better and more sensors

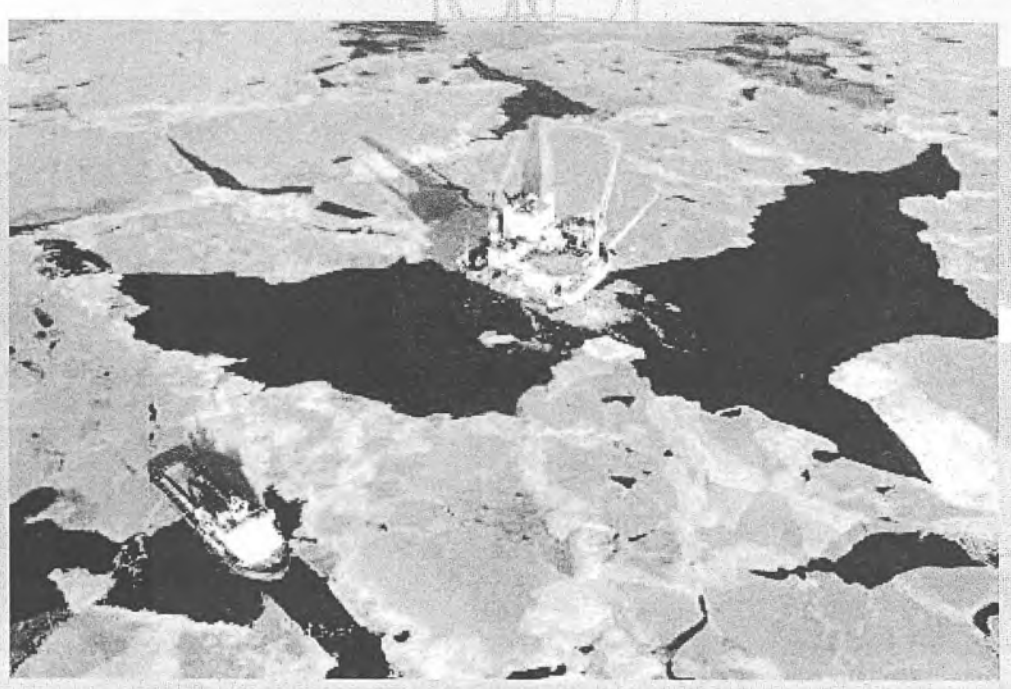
The Future

- Offshore drilling will become more complex and riskier
  - Deeper, higher pressure
  - New regions
  - More remote (Alaska)
- Offshore drilling in nations adjacent to the U.S. is likely to accelerate
  - Mexico and Cuba in the Gulf
  - Russia and Canada in Arctic
- Offshore deepwater drilling can be done safely



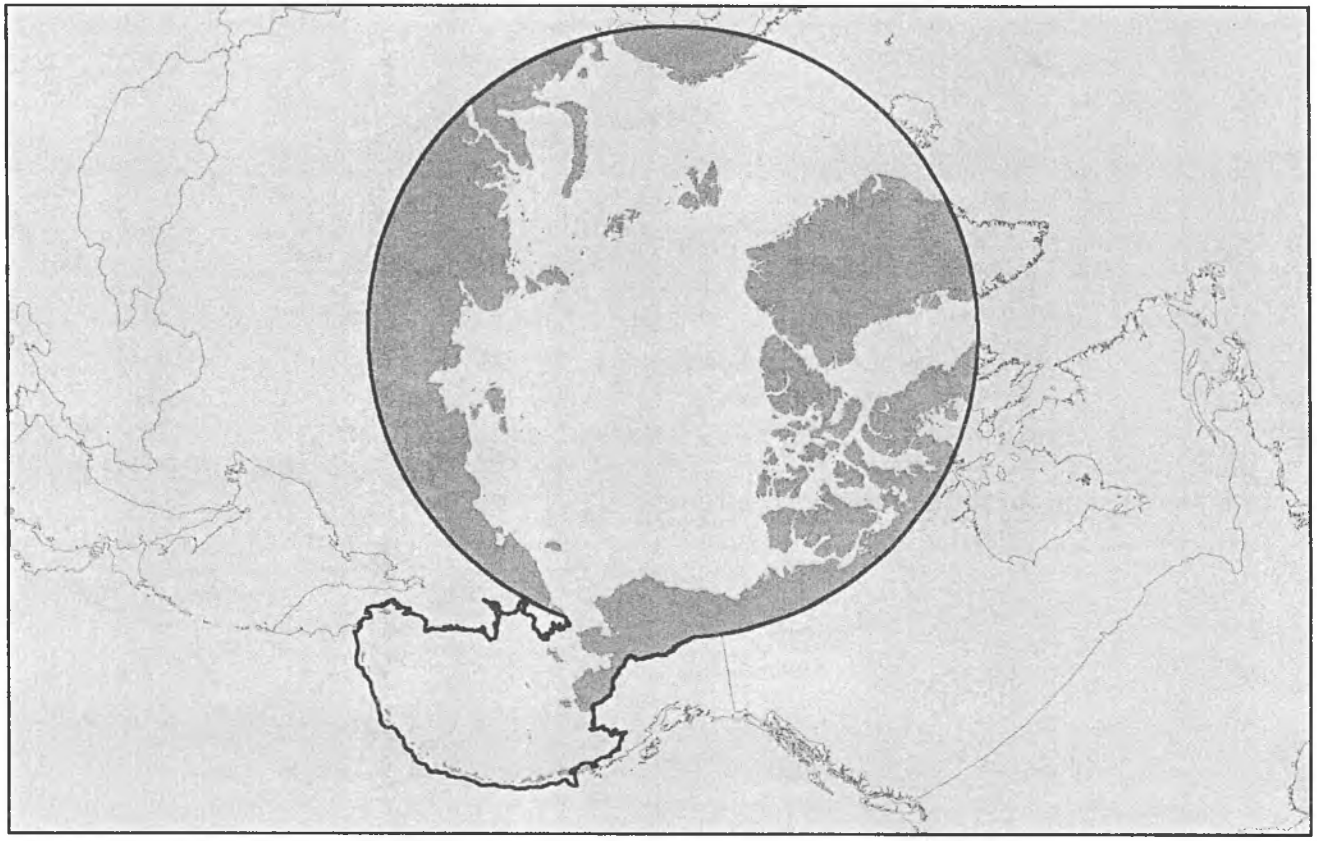
Recommendations for the Arctic

- Drilling must be done with the utmost care because of the sensitive Arctic environment
- An immediate, comprehensive research program to provide a foundation of scientific information is needed
- Industry and the Coast Guard should address gaps with respect to:
  - Oil-spill response
  - Containment
  - Search and rescue
- The U.S. should promote the development of international drilling standards for the Arctic



Arctic Boundary as defined by the Arctic Research and Policy Act (ARPA)

All United States and foreign territory north of the Arctic Circle and all United States territory north and west of the boundary formed by the Porcupine, Yukon, and Kuskokwim Rivers; all contiguous seas, including the Arctic Ocean and the Beaufort, Bering and Chukchi Seas; and the Aleutian chain.[1]



Acknowledgement: Funding for this map was provided by the National Science Foundation through the Arctic Research Mapping Application (armap.org) and Contract #0520837 to CH2M HILL for the Interagency Arctic Research Policy Committee (IARPC).

Map author: Allison Gaylord, Nuna Technologies. May 27, 2009.

1. The Aleutian chain boundary is demarcated by the 'Contiguous zone' limit of 24-nautical miles.

Northern Waters Task Force Overview

NWTF Chair Rep. Joule

Northern Waters Task Force

An Introduction

NWTF: Introduction

The Northern Waters Task Force (NWTF) was created by HCR 22 during the 2010 legislative session.

NWTF: Membership

- The NWTF is comprised of legislators, leaders of Arctic communities, and members of key state and federal agencies.
- Membership includes:

Rep. Reggie Joule
Kotzebue, Chair

Sen. Bert Stedman
Sitka, Vice-Chair

Sen. Lyman Hoffman
Bethel

Rep. Bob Herron
Bethel

NWTF: Membership

DEC Commissioner
Larry Hartig

Mayor Edward Itta
North Slope Borough

Chris Hladick
Unalaska City Manager

Mayor Denise Michels
Nome

Chuck Greene
Vice-President, NANA Corp.

Dave Kubiak
Alaska Marine
Conservation Council

Alternates: Sen. Donald Olson; Rep. Bryce Edgmon; Richard Glenn, *Arctic Slope Regional Corp*oration; Commissioner Cora Campbell, *Alaska Dept. of Fish & Game; Rear Admiral Ostebo, Federal Liaison*

NWTF: Duties

- According to the resolution the task force will:
  - Create a state and federal commission responsible for overseeing development
  - Facilitate regional coordination, cooperation, and outreach in creating a commission to keep local stakeholders informed and able to engage
  - Identify and coordinate efforts of mutual concern for federal, state, local and international agencies
  - Conduct hearings in the northern region of the state to fulfill the above purposes

NWTF: Meetings

- Past Meetings
  - Anchorage- October 1st, 2010
    - *Introduction of issues and organizational meeting*
  - Barrow- December 2nd-3rd, 2010
    - *Local, regional and international perspective on the Arctic*
  - Juneau - March 14th, 2011
    - *Organizational meeting*

- Upcoming Meetings
  - Girdwood – June 19th-21st
    - *Arctic Imperative*
  - Kotzebue and Nome – July 5th-6th
  - Unalaska – August 24th-27th
  - Bethel – October

On the web at *www.housemajority.org/joule*

NWTF: Why monitor the Arctic?

- Loss of sea ice has led to increased human activity in the Arctic and has raised a variety of concerns about future development
- Forecasts predict the possibility of an ice-free Arctic within 20-30 years
- An ice-free Arctic would create new challenges and opportunities for
    - Arctic inhabitants
    - Communities
    - State of Alaska
    - United States
    - other countries

NWTF: Areas the task force is addressing

- Arctic Governance
- Oil, Gas and Mineral Development
- Arctic Fisheries
- Marine Transportation
- Arctic Research
- Arctic Infrastructure

NWTF: Arctic Governance

- The United States is an Arctic country by virtue of Alaska's geography
- Eight countries have territory north of the Arctic Circle
  - Finland
  - Sweden
  - Iceland
  - United States
  - Canada
  - Russia
  - Norway
  - Denmark (Greenland)
- The last five countries are on the Arctic coast

NWTF: Indigenous Engagement

- Seven of the eight countries in the Arctic are home to indigenous peoples.

- The indigenous populations have a unique and vast knowledge of the Arctic region and environments developed over a long period of time.

NWTF: Questions to Consider

- How does the US govern the Arctic internally while cooperating with the state and local Arctic communities and peoples?

- How do we govern the Arctic region cooperatively with other Arctic nations?

NWTF: Oil, Gas and Mineral Exploration

- A 2008 US geological survey estimates 13% of the earth's undiscovered oil reserves and 30% of the undiscovered gas reserves are in the Arctic.
- The majority of the oil is likely be offshore.
- <u>In perspective, this equates to:</u>
  - 90 billion barrels of oil
  - 1,700 trillion cubic feet of natural gas
  - 44 billion barrels of natural gas liquids

NWTF: Question to consider

- How do we develop our resources responsibly while maintaining sustainable environments and thriving Arctic communities?

- How do we develop Arctic resources cooperatively with other nations

  while maintaining sustainable environments and thriving Arctic communities?

NWTF: Arctic fisheries

- Alaska and the Arctic contain some of the worlds largest and most valuable fisheries.

- Scientists are discovering that a number of sub-arctic species, such as cod, herring and pollock,

  are expanding their habitation further north and creating commercial fishing opportunities.

- The North Pacific Fisheries Management Council currently bans commercial fishing in the Arctic.

NWTF: Question to consider

- Should commercial fishing be banned in the Arctic?
- Who will manage and monitor Arctic fisheries for sustainability?
- How would you manage an Arctic Ocean fisheries management area with other countries?

NWTF: Marine Transportation

- Diminished sea-ice has led to increases in commercial shipping on two trans-Arctic sea routes.
- An estimated 6,000 individual vessels operate in the Arctic (2009, AMSA).
- Tourism and passenger vessels visits are increasing.
- In 2007, an estimated 2.4 million cruise ship passengers traveled to Arctic destinations.

NWTF: Question to consider

- Who will govern shipping, security and safety in the Arctic Ocean?
- How do you govern shipping cooperatively with other nations?

NWTF: Infrastructure

Arctic Infrastructure Investment and Long-term Planning

The increase in human activity will require new infrastructure to support increased activities in

- fishing
- oil and gas development
- marine transportation

NWTF: Question to consider

- What infrastructure is needed to support increased activity in resource development, transportation, fisheries and national security?
- How can the infrastructure development be accomplished cooperatively with local communities to meet everyone's needs?
- Who is responsible for long-term planning and monitoring?

NWTF: Research

- What research needs to be done to ensure sustainable development while protecting the region?
- How do we work collaboratively with other Arctic countries on research to obtain the best available data?
- How do we decide what research is important?
- What research is still missing?

The Red Dog Difference

- Roads between villages will only be viable with resource development projects.
- Energy infrastructure will be enhanced by resource development project funding.
- Money will be needed to protect access to subsistence and traditional activities.
- Access to gravel sources will save money for other village projects.

The Red Dog Difference

- Economic engine for Alaska and the region
- $1.5 billion in wages, royalties, taxes (1989 – 2010)
- $596 million in proceeds to NANA (1989 – 2010)
- $94 million in PILT to NAB (1989 – 2010)
- 58% shareholder hire (340 shareholder jobs)

Shareholder Benefits

- $20.5 million in dividends to 12,700 shareholders
- Additional $2,000 dividend to each NANA Elder
- $4 million to the Aqqaluk Trust
  - $803,920 in scholarships to 275 shareholders
- More than $200,000 in in-region sponsorships

Support for Future Development

Shareholder Survey

Support for Roads

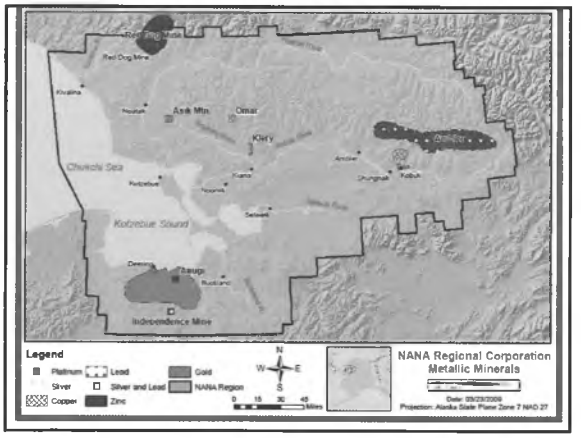
Shareholder Survey

NANA

Based upon NRC board and shareholder priorities the goal for the resource team is to develop new sources of jobs/revenues before Red Dog closes

- Shareholder priorities include lands/subsistence and mining development (jobs)
- Project development takes 15-20 years of active work
- Goal is to replace the jobs and revenue from Red Dog by 2031

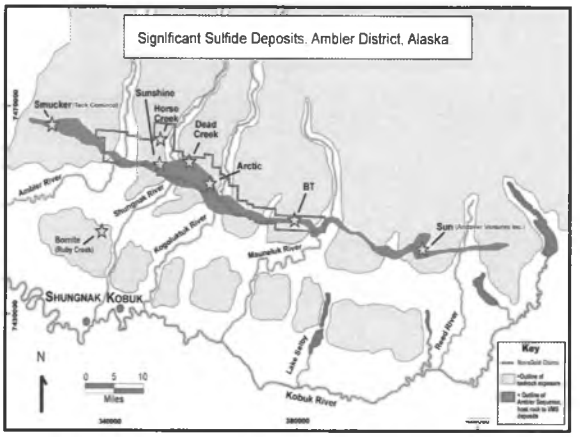
Overarching commitment is that subsistence is the primary and highest priority use of NANA's lands



NANA

Upper Kobuk Mineral Project

- Copper, Zinc, Lead and Silver
- Opportunity to expand reserve at the Arctic Deposit and Bornite
- 15 years of activity associated with trying to move project forward to this point in time
- NRC Board approved partnership with NovaGold for exploration
- Work in 2011



NANA

Oil and Gas projects

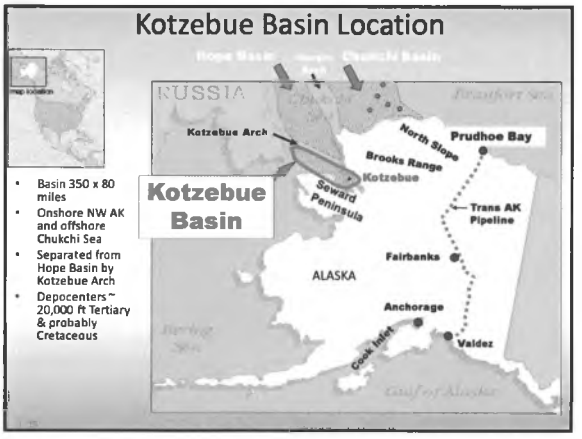
- No known resource; truly Wildcat exploration
- Good potential
- Partnered with Northwest Alaska, LLC
- 3 on-shore potential locations with 4 well sites
  - Kobuk Delta, Baldwin Peninsula and Cape Espenburg
- Working on funding – approximately $20-25M needed for 1-2 wells
- Approaching numerous companies

NANA

Key Points

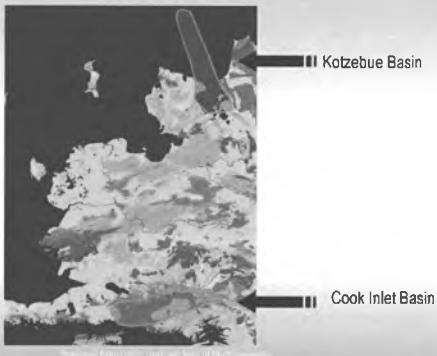
- Major unexplored deep (20,000') sedimentary basin
  - Similar in size to Cook Inlet & San Joaquin-Sacramento Basins
- Potential significant petroleum producing province
- Favorable hydrocarbon system
- Many large targets – structural and stratigraphic

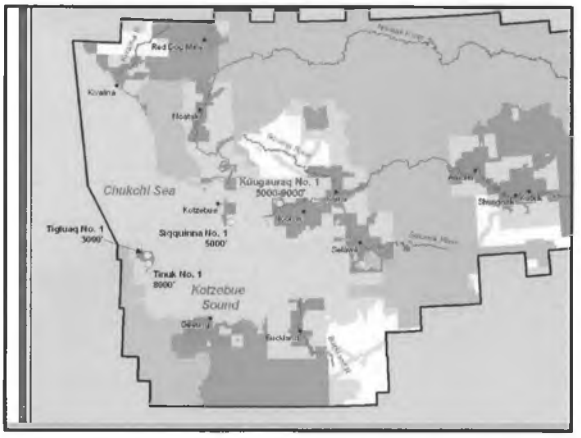
Kotzebue Basin Location



- Basin 350 x 80 miles
- Onshore NW AK and offshore Chukchi Sea
- Separated from Hope Basin by Kotzebue Arch
- Depocenters ~ 20,000 ft Tertiary & probably Cretaceous

Basin Comparison





Renewable Solutions

NANA

- Energy Efficiency & Conservation - Energy Wise
- Wind
- Hydro
- Biomass

Agenda

NOME:

<u>July 8th[th], Friday, Old St. Joes</u>

Presenters on the following Arctic infrastructure and research topics:

- **9 to 9:30 a.m. Nome update, impacts of recent changes on local community: Mayor Denise Michels**
- **9:30 to 10:30 a.m. Discussion of possible future deep water port sites in the Northern region, state and federal perspectives:**
    - **Department of Transportation, Michael Lukshin, Engineer**
    - **US Army Corps of Engineers, Stephen Boardman, District Chief, Civil Project Management Branch**

--15 min. break--

- **10:45 to 11:15 a.m. Bering Straits Port Access and Route Study presentation: Captain Adam Shaw, U.S. Coast Guard**
- **11:15 to 11:45 a.m. Land Conservation Cooperation Project: Polly Wheeler, Coordinator, Northwestern Interior Forest Landscape Conservation Cooperative, U.S. fish and Wildlife**

Lunch break from 11:45 to 1:00 p.m.

- **1 to 1:30 p.m. Discussion of vessel tracking in the Arctic: Marine Exchange of Alaska, Ed Page, U.S. Coast Guard (Ret), Executive Director, Marine Exchange of Alaska**
- **1:30 to 2 p.m. Navigational and search and rescue aides needed for the Arctic: U.S. Coast Guard, Captain Adam Shaw**
- **2. to 2:45 p.m. Arctic research presentation: Dr. Kathleen Crane, PhD, Arctic Research Program, NOAA Co Chair of the Arctic Council's Circumpolar Biodiversity Marine Monitoring Program, CAFF**
- **2:45 to 3:15 p.m. Inuit Circumpolar Council, Jimmy Stotts, President**

--15 min. break--

- **3:30-5:30 Presentation by Rep. Joule on Northern Waters Task Force followed by public Testimony on Northern Waters Issues**

Presenters

NORTHERN WATERS TASK FORCE
PRESENTERS JULY 8th, 2011
NOME, ALASKA

Nome Mayor, Denise Michels:

Mrs. Michels was elected to serve as Mayor of the City of Nome, pop. 3545, in the October 2003 municipal election. Born and raised in Nome, she is the first Alaskan Native to serve in this capacity, and the first woman elected to the post. As chief executive officer, she works closely with an appointed city manager, the Nome City Council and other elected and appointed boards and commissions. The Mayor is the chief spokesperson for the City, representing community legislative priorities to the Alaska Legislature and the U.S. Congressional delegation. She continues to focus on public safety, community, economic and infrastructure development, and promotes bringing diverse groups and residents together.

The position of the Nome Mayor can be characterized as a "full-time job with part-time pay". Mrs. Michels is employed as Director of Transportation by Kawerak, Inc., a Native not-for-profit service organization. In this position, she is responsible for overseeing the development and implementation of strategies for transportation and public infrastructure.

Stephen Boardman, District Chief, Civil Project Management Branch, U.S. Army Corps of Engineers:

Stephen C. Boardman serves as the District's Chief, Civil Project Management Branch since its inception in December 1990. His responsibilities include the planning, design, and construction of navigation improvement, flood control, and erosion control projects throughout the state. Mr. Boardman also serves as one of the District's Congressional Liaison Officers.

Earlier Alaska District assignments include Chief, Operations and Readiness Branch of the Construction-Operations Division (1982-1989); Chief, Project Operations Section of the Operations and Readiness Branch (1981-1982); and Chief, Compliance Section of the Regulatory Branch (1979-1981). Mr. Boardman worked in the Corps' Louisville District, Regulatory Branch, Operations Division from 1972-1979. Mr. Boardman received a B.S. degree in civil engineering from Rose-Hulman Institute of Technology, Terre Haute, Indiana, in 1972.

Captain Adam J. Shaw, United States Coast Guard:

Captain Shaw of San Jose, California, graduated from the United States Coast Guard Academy, earning a Bachelor's of Science degree in Management and Economics. He also earned a Master's of Public Administration degree from the University of Alaska. He holds a Merchant Mariner's License and is certified in the National Incident Management System. His Coast Guard career covers a broad range of assignments, including: coordinating Search and Rescue and Law Enforcement missions in the Gulf of Alaska; supervising a multi-million dollar acquisition project for the replacement of inland buoy tenders; managing inland waterways and aids to navigation for the entire California coast; and conducting International Port Security assessments in Africa, Europe and the Middle East. Captain Shaw also served on several Coast Guard Cutters (four as the Commanding Officer), conducting Law Enforcement, Oil Spill Response, Drug Interdiction, Search and Rescue, and Aids to Navigation missions. Captain Shaw is currently assigned to Juneau, Alaska where he is responsible for Maritime safety and security of Alaskan waters. Captain Shaw has three children with his wife, Christine Shaw from Fremont, California.

Polly Wheeler, Coordinator, Northwestern Interior Forest Landscape Conservation Cooperative

Polly Wheeler has lived in Alaska since 1983, 20 of those years in Fairbanks. She has worked throughout the state in various capacities dealing with natural and cultural resource management and policy. Polly earned her Master's degree in anthropology at the University of Alaska Fairbanks, and her Ph.D. in Anthropology from the University of Alberta. Prior to joining the U.S. Fish and Wildlife Service in 2002, Polly worked for private, tribal, and statewide organizations, and also owned her own contracting business. She came to the U.S. Fish and Wildlife Service from the Alaska Department of Fish and Game, where she headed up a subsistence research program for the northern parts of the state. Before joining the Northwestern Interior Forest LCC as Coordinator, Polly served as the Deputy Assistant Regional Director at the Office of Subsistence Management.

Captain Ed Page, Executive Director, Marine Exchange of Alaska:

Captain Page assumed the position as the first Executive Director of the non-profit Marine Exchange of Alaska in April 2001 after serving 29 years as a commissioned officer in the U.S. Coast Guard.

The Marine Exchange of Alaska is a maritime organization with the mission of providing information, communications and services to aid safe, secure, efficient and environmentally sound maritime operations. The Exchange has established an extensive satellite and AIS (Automatic Identification System) vessel tracking system to locate and monitor vessels in Alaska and North America. The system is presently used to track cargo ships, fishing vessels, tankers,

cruise ships, offshore supply vessels, ferries, tugs and barges, and Coast Guard vessels operating in Alaska and has aided responses to a variety of maritime emergencies including oil spills. The data from the system is presently being used to assess current and historical vessel traffic information in the Arctic for the conduct of risk assessment studies. Captain Page has led the Marine Exchange's development and operation of one of the largest and most comprehensive vessel tracking and maritime safety nets in the world with over 80 AIS stations extending from the Arctic west to Adak and south to Ketchikan earning the Coast Guard's Public Service Award.

Upon graduating from the Coast Guard Academy in 1972 Captain Page served as a deck officer on the Coast Guard cutter BOUTWELL, sailing out of Boston, and later Seattle conducting patrols of the Atlantic, Pacific and Alaska waters. He later served in marine safety, environmental protection and search and rescue assignments at Port Safety Station Concord, California, Loran Station Iwo Jima, Japan, Marine Safety Office San Francisco, Marine Safety Office Anchorage and Group Ketchikan. He also served as Chief of Environmental Protection for the 17th District in Juneau during which time he was involved in the response to the Exxon Valdez oil spill as well implementation of OPA-90.

Dr. Kathleen Crane, Program Manager, Arctic Research Program:

Dr. Crane is a Program Manager in the Arctic Research Program of the Climate Office of NOAA. She is currently the U.S. mission coordinator for the Russian American Long-term Census of the Arctic and the co-chair of the Arctic Council's Circumpolar Marine Biodiveristy Monitoring Program. She was formerly a Professor of Oceanography at Hunter College, the City University of New York and an Adjunct Senior Research Scientist at the Lamont-Doherty Earth Observatory of Columbia University. She received her PhD in 1977 at Scripps Institution of Oceanography, University of California, San Diego, and was a Post Doctoral Fellow at the Woods Hole Oceanographic Institution from 1977-1979. Dr. Crane has also been a visiting scientist at the University of California, Santa Barbara; the University of Hawaii; the University of Oslo, Norway; the University of Paris, France; the Environmental Defense Fund, where she developed the *Arctic At Risk* Program; and at the Naval Research Laboratory, where she managed the Arctic At Risk initiative. Dr. Crane has been the chief scientist of 20 multi-national expeditions including work with Russia, Japan, France, Italy, Norway, Sweden, Denmark, Germany, China and Canada. She has participated in 43 expeditions at sea, including many dives to the seafloor on the deep-diving submersibles Alvin and Mir.

James Stotts, President, Inuit Circumpolar Council-Alaska:

James Stotts (Jimmy) was born in 1947 at Barrow, Alaska and raised in Barrow and other communities throughout rural Alaska. Like many of his generation he attended Mt. Edgecumbe High School, a Bureau of Indian Affairs boarding school located in Sitka, Alaska. After high school he attended the University of Alaska Anchorage where he earned a degree in Business Management.

Jimmy has extensive managerial experience in the private sector. He worked for his village corporation (Ukpeagvik Inupiat Corporation) and regional corporation (Arctic Slope Regional Corporation). Over a thirty year career he worked in various executive capacities at both organizations and served on the Board of Directors of both organizations. Jimmy also had a brief career in local politics as an Assembly Member of the North Slope Borough from 1978 through 1983. He was elected President of the Assembly the last two years he served.

Jimmy has a long history of involvement with the Inuit Circumpolar Council (ICC). He represented Alaska on the first ICC Executive Council in 1980, eventually serving three consecutive terms from 1980 to 1989. In the early 1990s he worked for ICC Greenland as Environmental Projects Coordinator in Nuuk, Greenland. Since January 2008 he worked for ICC Alaska as Executive Director in Anchorage, Alaska. In June 2009 he was appointed by the ICC Executive Council to serve as ICC Acting Chair through June 2010. Jimmy currently serves as the President of ICC-Alaska.

From Mayor Michels
re: July meeting

Arctic Access Port-Nome – the northern most commercial port in the US
Presentation By Denise Michels, Mayor for the City of Nome 2011

Today I will provide an overview of our observations in regards to arctic marine shipping in Nome and activities in the region in general.

History: Nome we were "discovered" in 1899 during the gold rush and incorporated on April 9th, 1901. The City of Nome is located on the Seward Peninsula facing the Norton Sound. We are 539 air miles northwest of Anchorage and 520 air miles from Fairbanks. The Nome Census Area is commonly referred to as the Bering Strait region. Currently 17 communities occupy the Nome Census Area, of which Nome has the largest population at 3500 and is the regional hub for medical and transportation facilities including a port and harbor, and other essential services for the region. The Bering Strait region is about the size of West Virginia and a population of over 9000.

Unlike most areas in America, a road system does not exist throughout the Bering Strait Region. Air transportation is the most common and reliable mode of transportation throughout the year. During the summer months Nome is a hub for ocean shipping-- our port handles community re-supply and destinational traffic.

A 1900 DOI USGS Preliminary Report on the Cape Nome Gold Region identified a need for harbor facilities for ocean vessels. "Though it seems highly probable that with continued development of the Seward Peninsula regions these harbors will eventually have railroad connections with the Nome Region, nevertheless the lack of harbor facilities at present at Nome is embarrassing (Page 39). Improvements were suggested for necessary public improvements including constructing a deep water pier. It also recommended that a life saving station be established.

Hence today this is what we are talking about, over 100 years later--still the same issues. The USACE in 1919 started constructing the jetty to dredge the federal inner harbor for commerce activities.

In 1981 a Port Mast Plan was completed study identified a need to construct a 3,600 foot long causeway to support medium-draft ocean going vessels to -35 MML with dockside depth of 30 feet. For some reason or another they fell short and in 1985 they constructed the causeway to 2,712 feet with a -22 depth. (800 feet short)

In 1997 the City starting working with the USCOE along with other funding partners and in 2006 completed the Nome Harbor Improvements Project by adding an additional 3,025 foot breakwater east of the existing Causeway and a 270 foot spur at the end of the Causeway. These necessary improvements allow the Port of Nome to serve additional vessels in a more protected marine environment.

The Nome Small Boat Harbor offers protected mooring for recreational and fishing vessels up to a -10 foot draft (MLLW). We've also increased the floating dock space. Smaller cargo vessels and landing crafts load village freight and fuel at the east and south inner harbor sheet pile docks for delivery in the region. Another new addition to the Nome facility is a 60 foot wide concrete barge ramp located inside the inner harbor just west of the Snake River entrance providing the bulk cargo carriers with a suitable location closer to the Causeway to trans-load freight to landing crafts and roll equipment on and off their barges. These improvements have given benefited the private sector and increase their efficiencies in delivering services to Western Alaska.

There are plans for construction of two boat ramps to accommodate recreational water craft and suction dredges. With the high price of gold, suction dredges have increased in front of Nome in State waters. We do appreciate their business in Nome but we also need to solve user conflict and there is a need for enforcement.

As you can see in these slides tonnage and volume has increased since 1988 and continues to rise steadily. In the photo's you can see that we are at full capacity and we have vessels waiting to dock and utilize the cells. We need to extend the causeway add additional cells to meet the needs of the industry to allow aid in lowering their operational costs.

Arctic shipping has increased with more ocean vessel traffic in the Bering Sea and Norton Sound. Our data since 1990 for the Port of Nome vessel traffic was 34 dockings, we peaked in 2009 with 304 dockings and last year 295. This includes fuel, bulk cargo, gravel and equipment barges, cruise ships, government ships, research and exploration vessels. In 2008 we saw in increase due to the Chukchi lease sales. Miscellaneous pleasure craft vessels, including foreign registered vessels also stop in Nome. In 2008 three vessels completed the Northwest Passage; in 2009 four completed the trip and in 2010 three stopped in Nome.

Normally, four cruise ships use Nome as a port of call. The "World" stopped in Nome, this is a large class cruise ship.

The shipping seasons on the Bering Sea and Norton Sound waters are growing longer. For the last three years we have seen operations last until November. Captain Raiha brought in the USCG Alex Haley to Nome in November. 10 years ago this was almost unheard of.

Nome is in a strategic location for national defense, the Port of Nome is a logical location to serve the vast area from Unalaska to Barrow and beyond and can support the all ocean going vessels efforts to patrol and monitor the Bering and Chukchi Sea and Arctic Ocean. Nome is a prime location to be a FOL for quicker emergency responses and to monitor environmental concerns. The Port of Nome can presently serve as a port of refuge/place of refuge for medium size vessels.

In coinciding with this activity, the City of Nome is working with the US Corps of Engineers (USCOE) to expand the causeway to -35, this enhancement will allow the

Nome Port to accommodate vessels with drafts greater than 22 feet. The expansion is estimated at $1b to construct to meet the needs and demands of ocean vessel traffic. We will need investment partnerships from the State and Federal governments and the private sectors to help invest in this infrastructure.

This improvement will support and enable our country to protect our expanding economic fisheries interests. An immediate and important benefit of this investment in the City's infrastructure will be the increased efficiency in rural Western Alaska logistical support. With improvements of the port, resource development may become more economical and provide continued stimulus to the region and State economy. OCS vessels would save two days one way to the Chukchi leases and fuel can be brought in bigger barges which require less handling and safer for the environment. There are concerns by community member about vessels using Port Clarence, those residents heavily rely on marine mammals and fish for subsistence have concerns of continamines being released from vessels using it as a staging area.

The City is requesting Congressional support to provide additional resources to assist the USCG as they consider Nome as a Seasonal Forward Operating Location along with other Arctic locations. An increased port infrastructure would improve our capability to provide our Nation with critical nodes of Homeland Defense/Security presence in the Arctic and the need for environmental enforcement.

The City of Nome believes in responsible resource and economic development. As part of the planning process we must look at future economic opportunities in port development. There are two projects that we must consider and incorporate into our planning process.

Were working with DOTPF on the Nome Airport Master plan extending the runway safety area and recommend that they also incorporate needs of all intermodal making for a comprehensive system, air, water, rail/road. We are also supporting the Western Arctic Access Corridor to Nome. This would open up resource development and potentially increase shipping (barging ore out to markets, etc.,) So if you tie all these commerce activities together we trust all parties involved will recognize and concur with the needs the City has identified and advocate for improvements to our port and harbor and other intermodal infrastructure for national security and life safety along with economic development opportunities.

Within the Norton Sound and Bering Sea residents rely on marine mammals for subsistence. The choke point between Diomede and the Cape Prince of Wales has small ocean vessel traffic traveling between the two for hunting marine mammals. Residents use small skiffs to cross between the two because there is no public transportation. In the summer folks also cross to King Island. We have a healthy fishery in the waters with Norton Sound Economic Development Corporation the local CDQ, small vessels are fishing for herring, salmon, king crab and out at the St. Lawrence Island halibut. Traditional whaling activities also happen in the waters.

The reason why I bring this up is that user conflict will happen with large vessels and small skiffs using the same area. The Bering Sea is also known for its tremendously dangerous fall storms that create havoc and but life and property in danger. Response time from Kodiak to the Norton Sound is over 2 hours with a C130. The need for S&R near our fisherman, hunters and pleasure craft are essential. We rely on NOAA Weather information and support the need for more resources for reading equipment in gaps where there are no equipment. This gives us valuable time to protect our property and for vessels to find shelter during a storm.

Because of Alaska, the US is an Arctic Nation. Nome is the northern most Arctic Access port in the US. Any given time of the year we are working with multiple local, state, federal and international agencies, IMO's and businesses with climate change, resource development, logistics, etc. There is no stop shop within the State of Alaska and we have been participating in the State of Alaska's Northern Water's Task Force recommending that the State of Alaska create department to coordinate, communicate and consult with local communities.

The City of Nome supports the Arctic Marine Shipping Assessment's recommendations and encourages full public participation in the process. The City feels very strongly about Section II that we need to be at the table and consulted with at the local level regarding any proposed laws, regulations, and policies that the national and international bodies are considering because those decisions will affect us directly.

We support the Alaska Legislature's last two resolutions to Congress urging them to ratify UNCLOS. There are so many international vessels conducting studies beyond the EEZ based on information provided to us but because the US has not ratified UNCLOS we are "missing the boat". If ratified USA could start the process to claim that area.

We do appreciate the Institute of the North, Commonwealth of the North, the Aspen Institute and the Alaska Dispatch fostering discussion and we look forward to holding these policy discussions at the hub level in rural Alaska so that many of our residents who are sea faring folks to have the opportunity to participate. They have the local knowledge to aid in decision making.

Lastly we appreciate the efforts our congressional delegation has taken to bring Arctic issues to the forefront on national level. Based on this information, you can see that Arctic shipping has increased, **it is happening** and we need to be proactive to meet the needs of marine transportation instead of being reactive. Thank you for the invitation to speak to you today. I'm available if you have any questions.

Alaska Deep Draft Arctic Ports Study

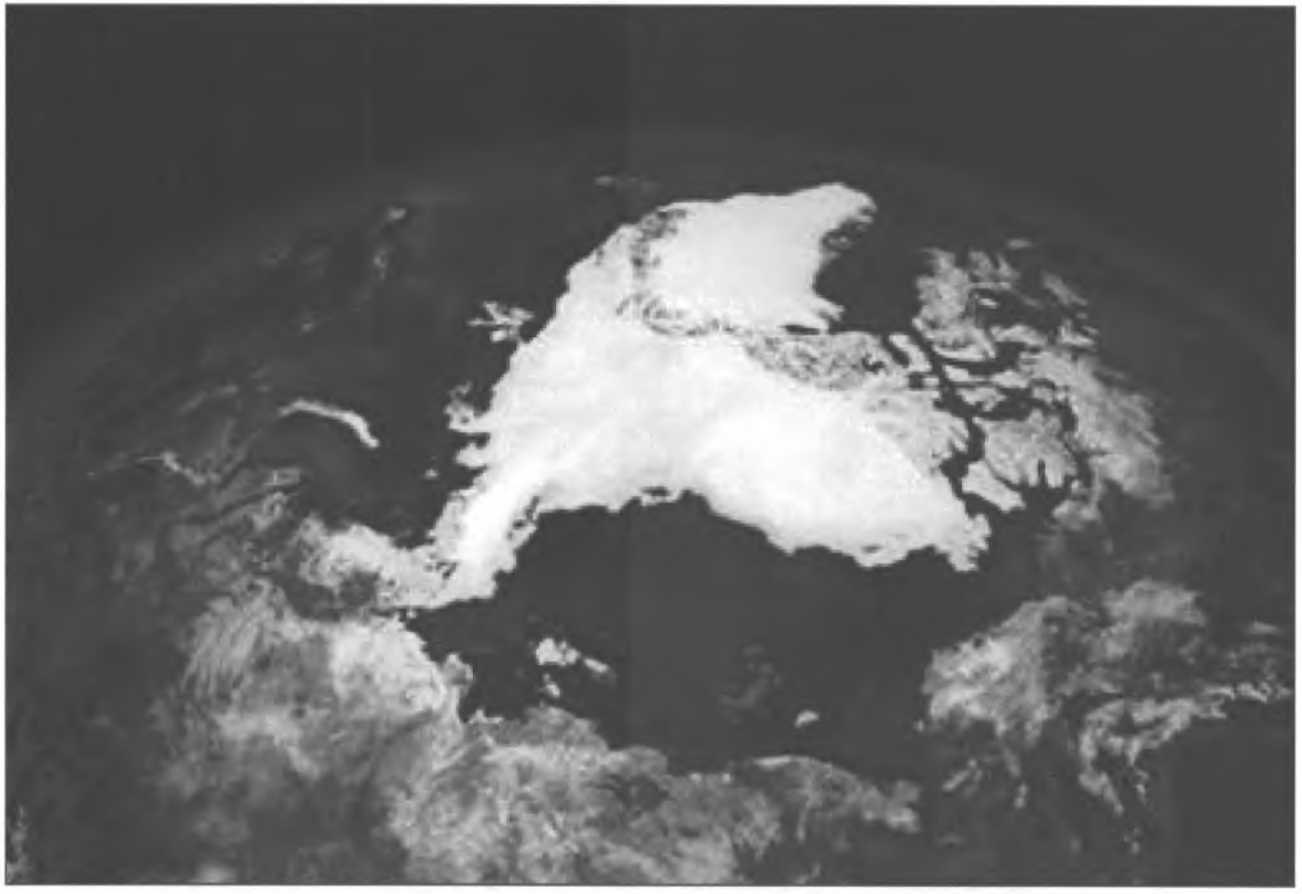
Alaska Department of Transportation & Public Facilities

Alaska Deep Draft Arctic Ports Study

Michael Lukshin, P.E.

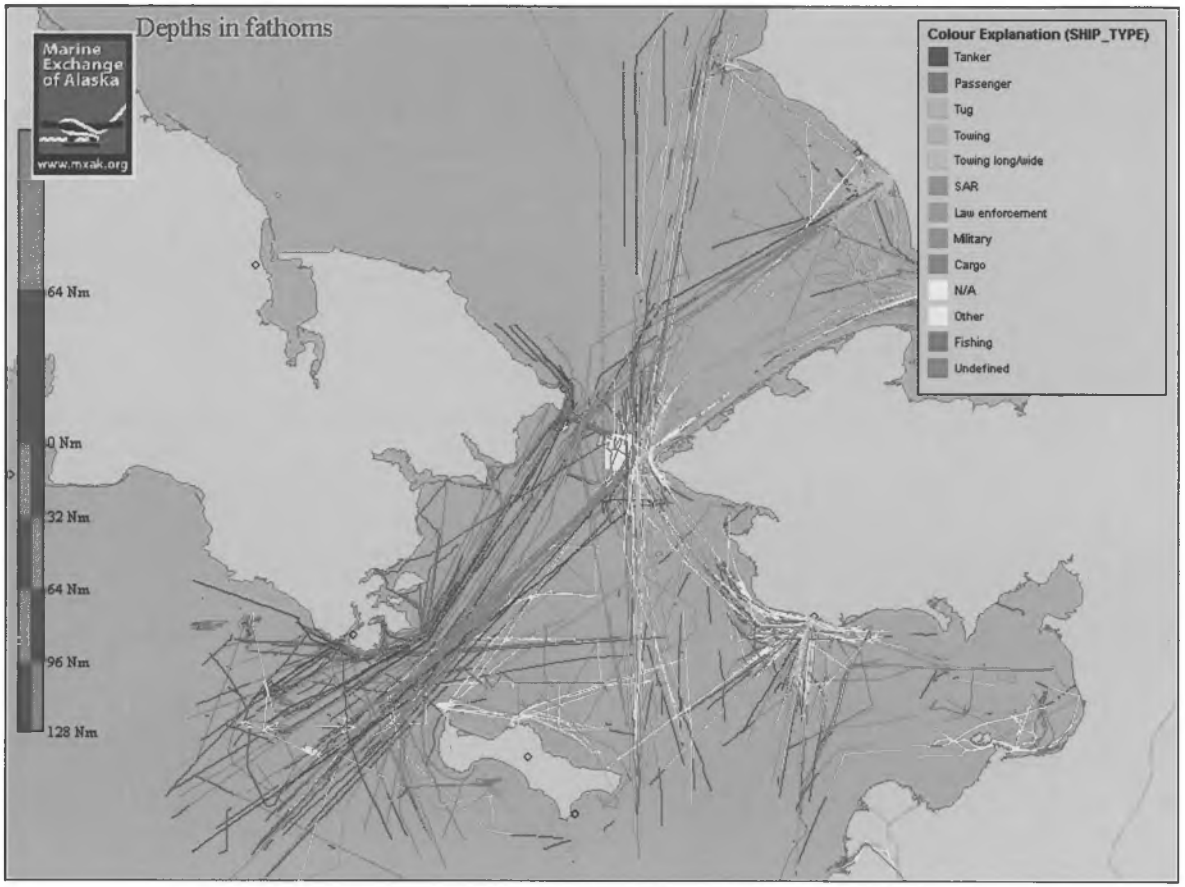
July 8, 2011

Sea ice is shrinking and thinning



Captain William Deal (Commanding Officer of Coast Guard station Kodiak) flying the HC-130 Hercules over the coast near Barrow on the last Arctic Domain Awareness flight of the year. Photo by Dennis Zaki

Arctic marine traffic is increasing



Why hold a planning charrette?

- Governor Parnell requested funding for an Arctic Ports Study to support economic development in Alaska.
- The state legislature appropriated funding for a 3-year study starting in FY2012.
- The Alaska Congressional delegation sponsored legislation highlighting the need for U.S. Arctic ports to support national sovereignty, environmental stewardship and life safety.

Panel #1 – Federal Interests

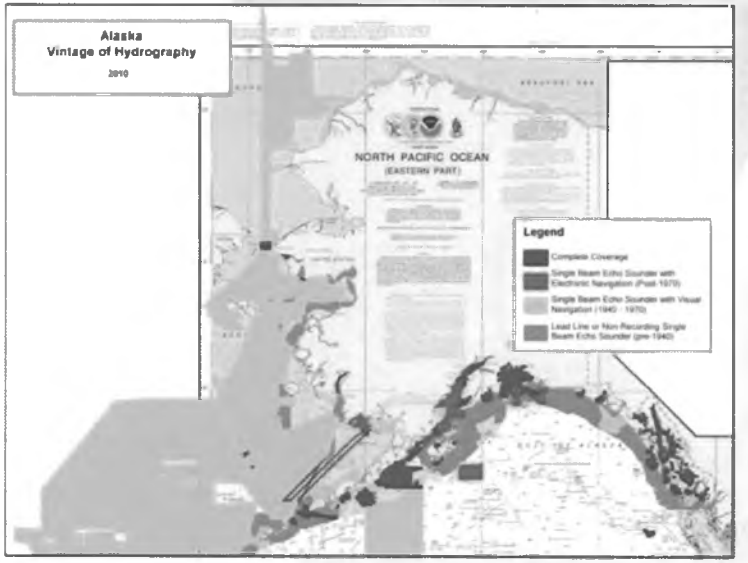
Long Distance Search And Rescue

Kodiak to Point Barrow is 940 miles across three mountain ranges

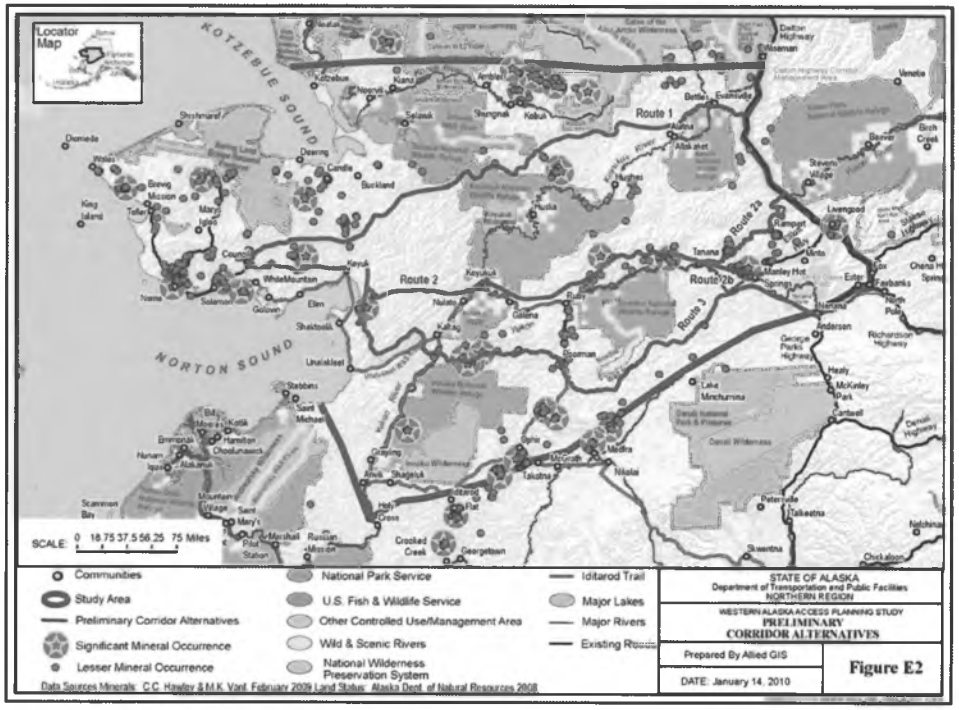
About the same distance as LA to Seattle!

26

Current State of Hydrography in Alaska



Panel #2 – State Interests

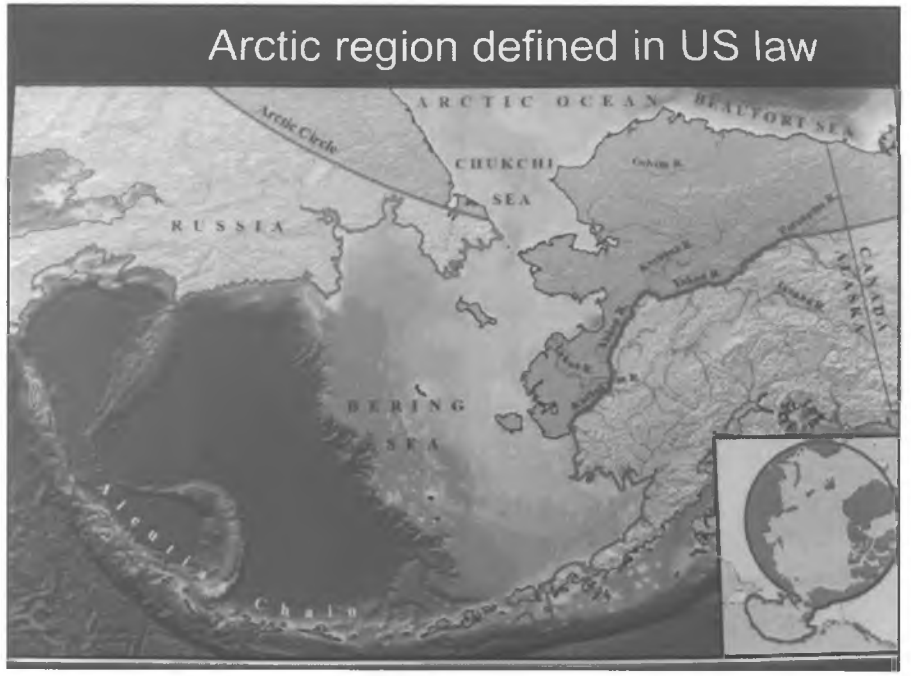


Panel #3 - Funding Options

Who Pays? / When?	Our Money	Other's Money
Now	Direct appropriation from GF (Example state or local capital budget)	Appropriation from Federal Government (Example: Federal Earmarks)
Future (Borrowing)	Our Child… (Example: G…	…r's Children …e: Stimulus)

P3's– Private capital funds; user's pay over time.

Breakout #1 - Define Arctic Geography

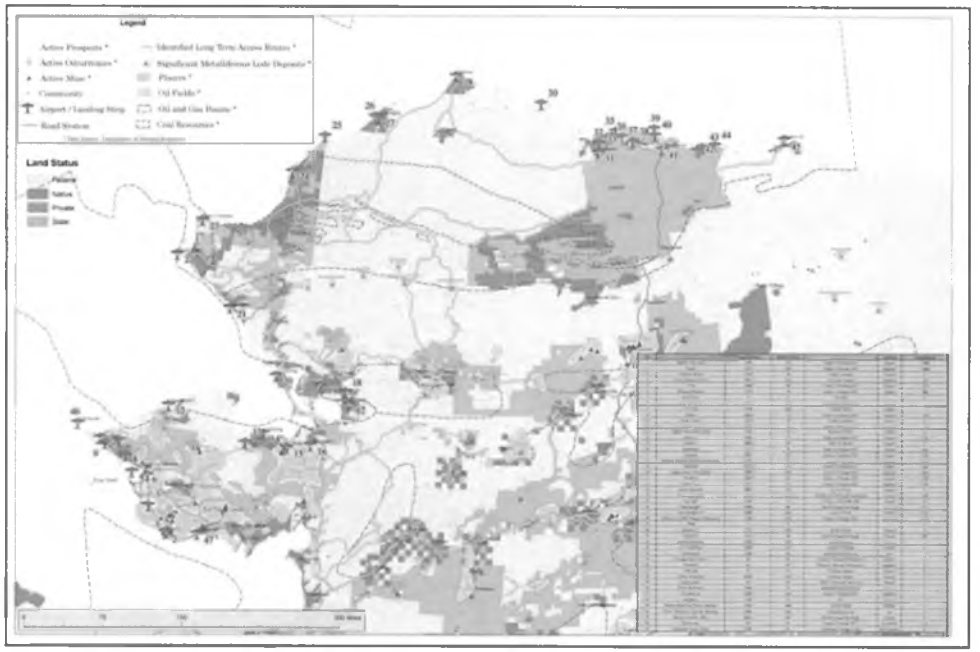


Breakout #2 - Define Vessel Parameters

- Diverse vessels types
- Desired depth 20-50’
- Need Tugs
- Increased traffic
  - SAR
  - Spill response
  - Life safety
- Port Infrastructure lacking

Breakout #3 - Port Siting

- No one port solution
- Need upland facilities
- Resource development and industry
- Partnerships necessary



Breakout #4 - Draft Study Outline

1. Executive Summary
2. Introduction
3. Driving Factors
4. Potential Port Sites
5. Land Access
6. Environmental Constraints
7. Vessel Parameters
8. Design Criteria
7. Port Site Evaluation
8. Port Structures
9. Port Layout Concepts
10. Shore-based Infrastructure Requirements
11. Cost Estimates
12. Schedule
13. Conclusion

What's Next?

- What's Clear?
- What's Unclear?
- Possible Interim Solutions
- Keys to a Successful Planning Study

BUILDING STRONG®

Agenda

- Navigational Improvements History
- Marine transportation successes
- Initiation of the Alaska Regional Ports Study
- Ongoing work
    - Economic evaluation of subsistence
    - Rock quarry findings
    - Climate change effects on transportation
    - Arctic Deep Draft Harbors Study
- The Path Forward

HISTORY

The Corps of Engineers has been developing and constructing navigational improvements in Alaska since 1912. The first project was improving the Apoon Mouth of the Yukon. The first permanent project was Nome Harbor which was started in 1916.

Since then the Corps has constructed 46 harbors and 15 channels. The Corps maintains the General Navigation Features (breakwaters, entrance channels, and maneuver channels) for each of the projects.

Two harbors are under construction while we are improving another.

Marine transportation successes

- Constructed Harbor Projects or Phases

	Project Cost ($000)	Basin Size (acres)	Approx # of Vessels Accommodated
Unalaska Hbr – Phase 1	8,900	16.8	75
Douglas Hbr – Phase 1	4,300	5.5	72
False Pass Harbor	23,000	5.2	88
Saint Paul Harbor	21,000	3.3	60

Marine transportation success stories

- Data Collection and Analyses
  - Western Alaska Hindcast Study
  - Western Alaska Storm-Induced Water Level Prediction
- Alaska Ocean Observing System (AOOS)
  - Multi-agency Initiative: DEC, F&G, DNR, Universities, USGS, USCG, Corps, USFWS, USFS, BOEMRE, and others
  - Building network of observation platforms and forecast models
- Coordinating planning and engineering efforts
  - State coastal engineers, University of Alaska, U.S. Navy

Transition From Individual to Systems Based Planning

- For years, every project had to be justified on its own merits. Neighbors often competed against each other to justify any improvements.
- Desire by many was to have a harbor at each community. Insufficient benefits to support adjacent harbors.
- Initial funding provided in FFY 2003 to begin a Reconnaissance level study to determine if there was a Federal interest in participating in cost shared feasibility studies addressing regional ports and harbors throughout the State of Alaska.
- However, we realized that harbors were a system, not individual community needs, and as such they need to be analyzed and justified as a system.

Transition From Individual to Systems Based Planning

- The focus of the study was to be a systematic analysis of existing and future needs for harbors and navigational systems.
- Coastal Alaska was divided into five regions: Southeast, Southcentral, Yukon-Kuskokwim, and Northwestern Regions.
- Early on it was determined that the State of Alaska would be a major stakeholder, if not the most logical cost sharing partner, for such an analysis.
- In order to gain knowledge prior to the conclusion of the Reconnaissance (905(b)) Report, the State of Alaska and the Corps of Engineers hosted the first Alaska Regional Ports Conference in January 2008. Over 125 attendees.
    - Overwhelming Mandate – The need for ongoing collaboration, comprehensive planning and leadership.
    - Develop a comprehensive ports and harbor plan for Alaska.

Transition From Individual to Systems Based Planning

- Corps published the 905(b) Report in May 2008.
- State of Alaska and Corps of Engineers entered into a cost shared Feasibility Study to establish baseline information needed for a statewide plan. The following items were commissioned:
    - Strategic Trends Analysis
    - Hub Analysis
    - Projects Needs List
    - Policy Recommendations
    - Identify locations of potential construction materials (ex., rock)
- Second Statewide Alaska Regional Ports and Harbors Conference conducted November 2010. 150+ attendees.
    - Reviewed the projects lists by region, identified selection criteria for investment, and ranked projects by priority.

Initiated a Subset Study to the Alaska Regional Ports Study – Arctic Deep Draft Harbors Study

- Interest by Congressional Delegation and Governor.
- Goal – Identify and locate potential sites for an arctic deep water (draft) port(s).
- To do that, we needed to identify criteria for an arctic deep draft harbor :
    - What is required? - Depth, moorage capacity, upland infrastructure, intermodal transportation requirements, etc.
    - Who are the potential users?
    - Where is the arctic?
- Conducted a "Planning Charrette" in May 2011.
- Next step – Extend the request for information to the public.

Next Steps

- Funding constraints:
  - Federal funding is limited. Not included in PRESBUD for FFY11 or FFY12. Reprogramming funds from other existing projects.
  - State funding is limited. SFY12 appropriation.

Where One Can Find Information on the Alaska Regional Ports Study

1. 2008 Statewide Conference
2. 2010 Statewide Conference
3. 2011 Arctic Deep Draft Study Charrette

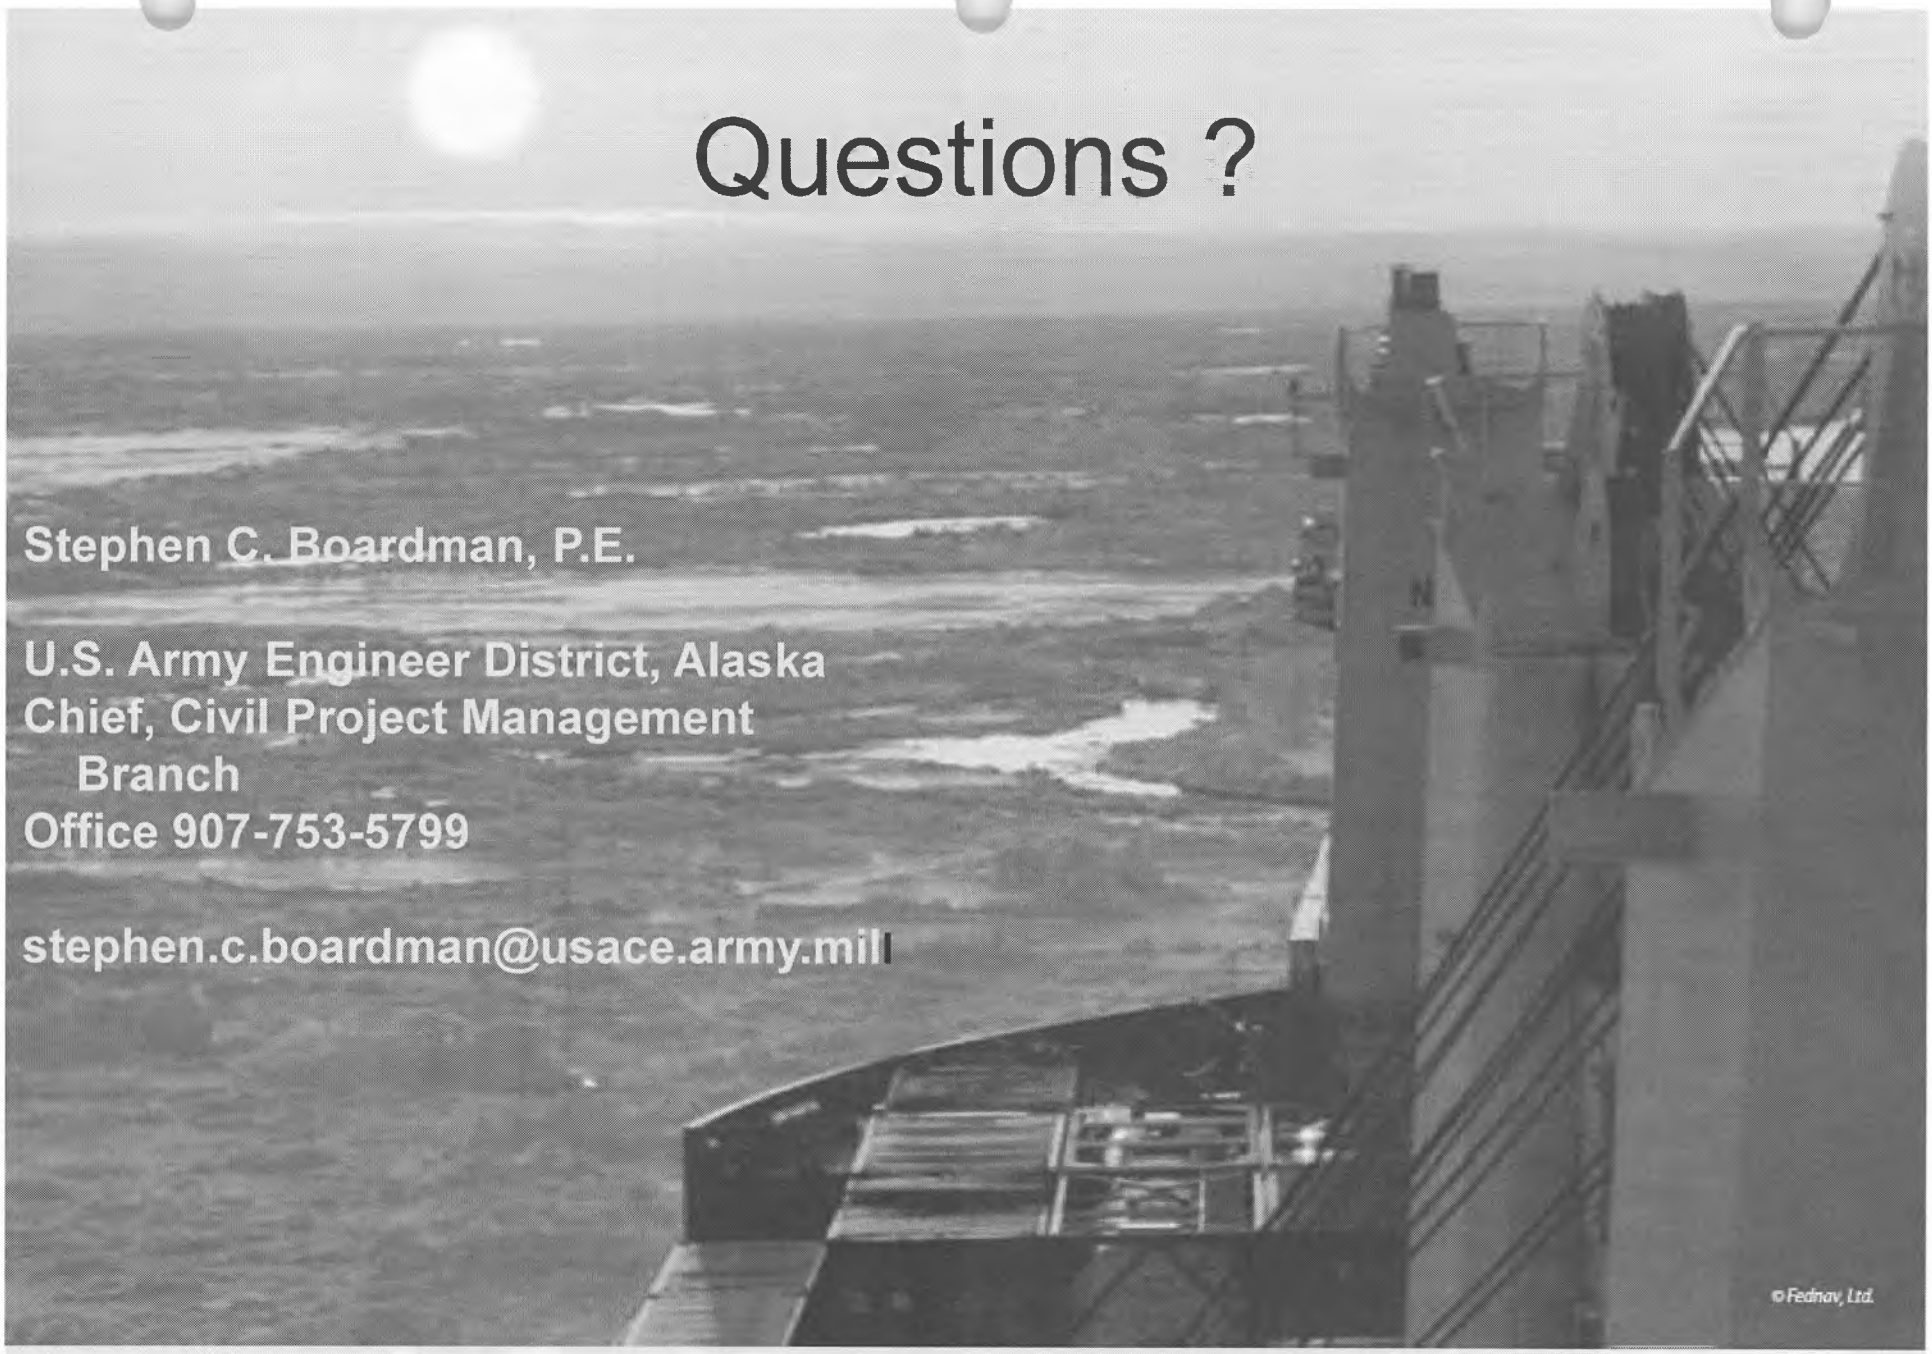
Questions ?



Stephen C. Boardman, P.E.

U.S. Army Engineer District, Alaska
Chief, Civil Project Management Branch
Office 907-753-5799

stephen.c.boardman@usace.army.mil

Employ an Integrated, Comprehensive Systems-Based Approach

Lessons Learned From Hurricane Katrina

- Tyranny of Decisions (50 Year Chronology)
- Recommendations:
  - "Actions for Change"
    1. Comprehensive systems approach
    2. Risk-informed decision making
    3. Communication of risk to the public
    4. Professional and technical expertise

Capitalizing on Federal Policy Interpretations

- Subsistence Benefit Evaluation
  - Historically undervalued economic benefit
  - Partnered with Kawerak to study quantifiable value of subsistence activities
  - Will culminate in economic model which captures nuances of subsistence
- Watershed/Systems Approach
  - Harbors function as a system
- Streamline Planning Process

Employ an Integrated, Comprehensive Systems-Based Approach

Why?

- *Focus on balancing multiple objectives with a view towards future needs*
- *Develop partnerships through strategic alliances*
- *Develop system wide opportunities*
- Consider future comprehensive needs by developing a long term framework for decision making

Employ an Integrated, Comprehensive Systems-Based Approach How Do We Get There?

- ✓ Different Levels of Government and Community Coming Together
- ✓ New Partnerships and Collaboration
- ✓ Expanded Sponsor involvement
- ✓ Identify solutions to local and regional problems with broader ramifications

Improve Project Development Process

- Rock Quarry Investigation
  - Partnered with State explore new quarry development
  - Joint quarry development
  - Evaluate improvements to Corps permitting process
- Contracting Options
  - Notice to Proceed – specify multi-year time frame
  - Separable construction components (contracts)
- Shared Projects
  - Local, State, USCG, Corps, Navy, etc
  - Shared use and costs

Corps Marine Development Authorities

- General Investigations
  - Specifically Authorized
- Continuing Authorities Program
  - Section 107 for small navigation projects (ON HOLD)
- Planning Assistance to States
- Tribal Partnership
- Interagency and International Support

Committee for Marine Transportation Systems

- Develop and implement national MTS policies
- Interagency partnership of four lead MTS agencies
  - US Army Corps of Engineers (MG William Grisoli, Chair)
  - National Oceanic and Atmospheric Administration
  - Maritime Administration
  - U.S. Coast Guard
  - Over twenty agencies or departments represented
- 2010 Work Plan Tasks – Integrated Action Teams (IATs)
  - MTS National Strategy
  - Assessment of the MTS
  - Maritime Data Coordination and Information Management
  - Navigation Technology Integration & Coordination

6
Bering Strait Port Access Route Study

Bering Strait
Port Access Route Study

Captain Adam Shaw
17th Coast Guard District

Ports and Waterways Safety Act (PWSA)
P.L. 95-474; 33 U.S.C. 1223

Coast Guard is responsible for:

Designation of fairways and traffic separation schemes to provide safe access routes for vessels proceeding to and from ports

International Strait = International Rules

International Maritime Organization study requires evaluation of:

- Navigational Hazards
- Traffic Patterns
- Environmental Concerns
- Aids to Navigation
- Hydrographic Surveys

PARS Process

Federal Register Notice
Public Comment (ends May 9th)

Port Access Route Study
Vessel Traffic, Marine Environmental, Mandatory or Voluntary, AtoN Considerations

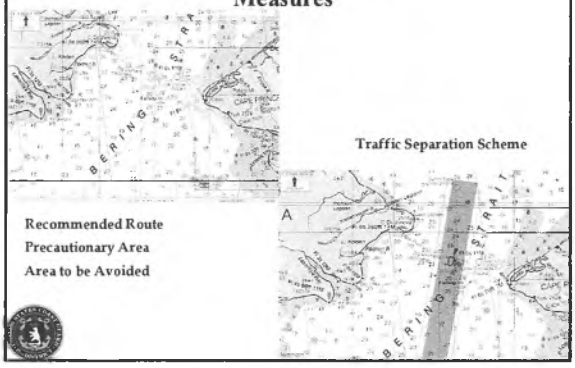
Federal Register Notice
Public Comment (on PARS recommendations)

US Interagency Group
Departments of State, Defense, and Commerce

Joint US-Russia Proposal Negotiations

International Maritime Organization

Potential Ship Routing Measures



Ship Reporting Systems

- Simple Call In Reporting
- Vessel Traffic Services

We are specifically looking for answers to the following questions:

1. What navigational hazards do vessels operating in the study area face?
2. Are there strains on safe navigation in the Bering Strait, such as increasing traffic density?
3. What are the benefits and drawbacks to establishing new routing measures?
4. What impacts, both positive and negative, would new routing measures have on the study area?
5. What costs and benefits are associated with the potential study recommendations listed above? What measures do you think are most cost effective?

Questions?

Alaska Landscape Conservation Project

Alaska's Landscape Conservation Cooperatives

Climate Impacts

Wetlands and estuaries critical to shorebirds, waterfowl, and salmon may be affected by sea-level rise and coastal erosion.

The reduction in sea-ice is bringing new opportunities for shipping routes that would cross through the Alaska LCCs, but also threatens many ice-dependent species.

Changing ocean temperatures, circulation patterns and acidity may alter the entire marine ecosystem, affecting, among other things, the availability of prey for seabirds, marine mammals, and important commercial and subsistence fisheries.

Coastal erosion, accelerated by increased storm activity, is already forcing some villages in Alaska to relocate.

Warming and melting permafrost will change the landscape, altering the distribution and abundance of wetlands and some vegetation communities. The stability of village infrastructure and services such as water treatment facilities and roads are uncertain.

Increased wildfire, with potential increases in pests and diseases, are expected throughout the boreal regions of the state.

USFWS

Landscape Conservation Cooperatives in Alaska:
Alaska overlaps five LCCs: Aleutians and Bering Sea Islands, Arctic, North Pacific, Northwest Interior Forest, and Western Alaska. Each LCC is in a different stage of development. The Arctic LCC was the first LCC to be established in Alaska. In 2010, steps were taken to pilot both Western Alaska and North Pacific. Both the Aleutians and Bering Sea Islands and Northwestern Interior Forest are still in the early stages of initiation.

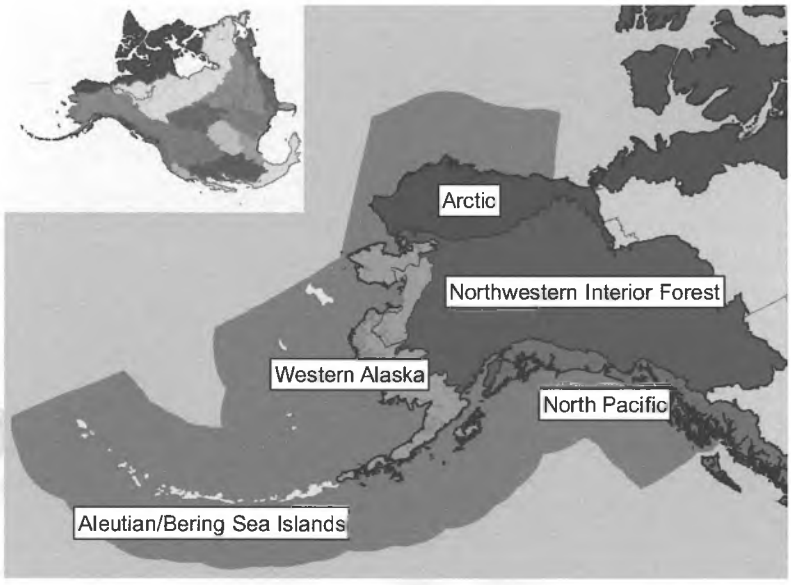
The Conservation Challenge

Climate change is one of the greatest environmental and conservation challenges of the 21st century. The impacts of climate change are already being felt in Alaska. Coastal erosion is accelerating, threatening homes and infrastructure, and as a result, entire communities may need to be relocated. Changing migration patterns of waterfowl, terrestrial and marine mammals, and fluctuations in the movement of fish stocks have influenced subsistence harvest. Warm, dry summers are producing drought conditions over much of the state, altering the landscape by drying wetlands, slowing the growth of trees, and producing more frequent wildland fires.

Understanding and responding to the many facets of environmental change will require unprecedented collaboration and communication among researchers, public agencies, and private organizations.

Landscape Conservation Cooperatives

Landscape Conservation Cooperatives (LCCs) are self-directed partnerships that link science with conservation actions to address climate change and other stressors within and across landscapes. They compliment and build upon existing science and conservation efforts – such as fish habitat partnerships and migratory bird joint ventures – as well as water resources, land, and cultural partnerships. While LCCs will not assume other partner responsibilities or supersede agency decision-making, they will provide the scientific information needed to help inform the development of strategic conservation actions.



Terrestrial boundaries of the five LCCs within Alaska; marine boundary of Alaska LCCs shown in teal blue. Inset shows distribution of LCCs across the North American continent.

USFWS

Susanne Miller/USFWS

Arctic LCC

Contact:
Greg Balogh
Arctic LCC Coordinator
greg_balogh@fws.gov
(907) 786-3605

The geographic scope of the Arctic LCC spans the northern portion of Alaska and Canada. Within Alaska, the landscape is characterized by rugged mountains, large expanses of tundra, and abundant wetlands and ponds. Arctic Alaska provides breeding grounds for millions of birds from more than 100 species, including species that breed nowhere else in the U.S. The area also provides habitat for threatened Steller's eiders, spectacled eiders, and polar bear as well as other species of conservation concern, including yellow-billed loon, Kittlitz's murrelet, Pacific black brant, and Pacific walrus.

The cultural identity of Alaska Natives and arctic rural residents is closely tied to their environment, and subsistence harvest continues to provide a large portion of the food consumed in arctic communities. Important subsistence resources include marine mammals, caribou, fish, and waterfowl. Climate change is already affecting access to some of these species.

The Arctic LCC was established in 2009. The Arctic Steering Committee has developed a charter and identified a set of common conservation goals. Projects funded in 2010, focus on modeling ecosystem transitions, understanding the arctic hydrologic systems, and improving access to geospatial data. The geographic scope of this LCC creates additional collaboration opportunities with Canada and potentially other arctic nations.

Bill Hinkey/USFWS

Western Alaska LCC

Contact:
Karen A. Murphy
Western Alaska LCC Coordinator
karen_a_murphy@fws.gov
(907) 786-3501

The Western Alaska LCC covers a wide diversity of ecological conditions including permafrost dominated landscapes, complex river deltas, abundant volcanoes, and forests. Western Alaska streams are home to the world's largest natural runs of Pacific salmon and the adjacent marine waters support the largest commercial fisheries in the U.S. They support local communities both as a source of income and as a key component of a subsistence lifestyle.

The Western Alaska LCC is home to Pacific walrus, threatened sea otters, and spectacled and Steller's eiders. Steller sea lions, short-tailed albatrosses, and eight species of whales in this region are endangered. Millions of seabirds breeding along the shore form a strong link between land and sea. Astounding numbers of waterfowl and shorebirds use these areas for breeding, migration, and wintering habitat. Caribou roam the land, as do populations of moose, bears and wolves.

In 2010, the first steps were taken to pilot the Western Alaska LCC. Representatives from State and Federal agencies have recently begun discussing how to convene the partnerships. We are meeting throughout the region to speak with potential partners from the local borough governments, Alaska Native organizations and tribes, other government and nongovernment organizations and academia. A climate change state-of-the-science workshop to help this new LCC identify initial science needs and collaboration opportunities is being scheduled for 2011.

Steve Hillebrand/USFWS

Steve Hillebrand/USFWS

North Pacific LCC

Contact:
Mary Mahaffy
Interim NPLCC Coordinator
mary_mahaffy@fws.gov
(360) 753-7763

Art Souls/USFWS

U.S. Forest Service

The North Pacific LCC stretches from the eastern half of the Kenai Peninsula south to northern California. The marine, estuarine, freshwater, and terrestrial habitats of this LCC support a rich diversity of species. They have cultural significance to Native Americans throughout the region. Marine and coastal island habitats are essential to sea birds, shorebirds and other Pacific Flyway migratory species. Highly productive nearshore marine ecosystems are key to sustaining healthy populations of marine mammals, Pacific salmon, forage fish, and shellfish. Forested habitats in the Pacific Coast mountain ranges support many resident and migratory birds including species of conservation concern such as marbled murrelets, and Queen Charlotte goshawks. Prairie habitats in the southern regions of this LCC are host to numerous species of imperiled plants, birds, mammals, and butterflies.

In 2010, the first steps were taken to pilot the North Pacific LCC. This LCC area already has a number of partnerships focused on large-scale biological planning and conservation design. We will work closely with these existing partnerships and provide a forum that encourages continuous exchange of information and feedback and enhances understanding among resource managers, scientists, and stakeholders. The geographic scope of this LCC creates additional collaboration opportunities with Canada and the other states within the LCC.

Aleutian/Bering Sea Islands LCC

Contact:
Steve Delehanty
steve_delehanty@fws.gov
(907) 235-6546

USFWS

The Aleutians and Bering Sea Islands area supports an extraordinarily productive marine ecosystem. Pollock, cod, flatfish, halibut, crab, and salmon are abundant, and these fisheries provide more than half of the seafood consumed in the U.S. In addition to providing jobs and income through the commercial fishing industry, the region supports the subsistence lifestyle of many communities within the LCC. About 100 million seabirds from more than 30 different species breed and summer here. Nearly half of Alaska's seabirds breed in 10 large colonies in the Bering Sea. Tens of thousands of marine mammals including Steller sea lions, sea otters, seals, Pacific walrus, and whales depend on this important region.

There are already a number of strong conservation and management partnerships operating within the boundary of the Aleutian/Bering Islands LCC. The challenge will be to bring these existing partnerships together to identify shared goals and consider how climate change may add new dimensions to existing resource challenges and to seek ways to appropriately integrate this science with on-going marine partnerships.

In 2010, the Aleutian/Bering Islands LCC established an initial partnership of interested agencies and organizations.

Steve Hillebrand/USFWS

Northwestern Interior Forest LCC

Contact:
Mike Spindler
(907) 456-0331
mike_spindler@fws.gov

The geographic scope of the Northwestern Interior Forest LCC includes south central and interior Alaska, most of the Yukon Territory, and the northern portion of British Columbia. The LCC is dominated by a patchwork of spruce and hardwood forests, regions of extensive wetlands and numerous lakes, and rugged alpine tundra. In more mountainous areas, ice fields and glaciers are interspersed among the tundra and forested lowlands. Frequent wildland fires continually reshape the mosaic of vegetation communities.

The boundary of the LCC encompasses large portions of the Yukon, Kuskokwim, Susitna, and Copper River watersheds. The landscape remains largely undeveloped and supports health populations of large and small mammals, resident fish, Pacific salmon, and upland birds. During summer, the region provides valuable breeding habitat for millions of migratory waterfowl. All of these resources are critical to the cultural heritage of Alaska Natives and support a subsistence lifestyle.

USFWS

USFWS

In 2011, early initiation steps for the Northwestern Interior Forest LCC will begin and a partnership of interested agencies and organizations will be established. There are already a number of conservation and management partnerships operating in the area and the Northwestern Interior Forest LCC will identify ways to contribute to those efforts by addressing their science needs. By virtue of its geographic scope, this LCC creates additional opportunities for collaboration with Canada.

Facilitating Collaborative Action on Climate Change within Alaska

The Alaska Climate Change Executive Roundtable (ACCER), established in 2007, is comprised of both federal and non-federal senior level agency executives from throughout Alaska. The ACCER will provide the oversight necessary to ensure coordination and integration of activities within the five Alaska LCCs, as well as coordination among the LCCs, the USGS Climate Science Center, and NOAA's Climate Service for Alaska.

LCC Contributions to Conservation

- Articulate priority science needs of the partnerships and find ways to address those needs.
- Help partners design and implement science-based monitoring programs.
- Work with partners to improve access to natural resources spatial data.
- Form a link between research communities and resource managers.

Inuit Circumpolar Council Written Testimony

INUIT

Northern Waters Task Force (July 2011)
By Jim Stotts, ICC Alaska President

I'm Jim Stotts, President of the Alaska branch of the Inuit Circumpolar Council (ICC). Our membership includes Inupiat, St. Lawrence Island Yupik and Central Yupik from the Bering Straits, North Slope, Northwest and Southwest delta regions. Internationally ICC represents approximately 160,000 Inuit from Alaska, Canada, Greenland, and Chukotka.

Thank you for this opportunity to address the task force. It's fitting that the task force is meeting here in Nome since there are northern waters issues facing the Bering Straits region and communities. We hope concerns raised at this meeting will lead to State policy that will help the region and improve community life.

I testified at the second task force meeting last December in Barrow. I'm providing copies of my earlier testimony to illustrate what's been going on during the past seven months. These two testimonies when viewed together will show some trends and serves as a sort of report card on progress from the ICC perspective.

We're glad to see the task force discussions now have a somewhat broader and more balanced focus. This is evident from the task force agenda for the recent meeting in Kotzebue and this meeting here in Nome.

In addition to marine shipping, oil and gas, mining, ports and infrastructure; there is discussion on oil spill prevention and response, environmental concerns, biodiversity, and Inuit concerns and perspectives. We applaud the task force for recognizing the need to look at development more holistically. Cultural, social and environmental issues must be considered at the same time as economic and resource development issues.

At the Barrow meeting: we mentioned ICC had arranged for an invitation to the Commissioner of Health and Social Services to an Arctic nations health ministers meeting in Nuuk, Greenland; and ICC invited the Commissioner of Natural Resources to an Inuit Leaders Summit on resource development in Ottawa, Canada. Both of these meetings occurred last February.

Unfortunately the State declined to attend either meeting. These meetings would have provided an excellent opportunity for the State to network and expand its horizons. We're providing copies of *"A Circumpolar Inuit Declaration on Resource Development Principles in Inuit Nunaat"* for your review and information. This declaration was formulated at the Inuit Leaders Summit in Ottawa.

On a positive note, Lieutenant Governor Mead Treadwell attended the Arctic Council Ministers meeting last May in Nuuk, Greenland as part of the U.S. delegation. We can't think of anyone better suited to represent the State at these forums than Mead Treadwell. Hopefully this outreach will continue. Make no mistake about it; this is where much of the action is. This is where Arctic policy is being made. The recent *"Arctic Imperatives Summit"* held in Girdwood clearly emphasized this fact.

At the Barrow meeting, we presented eight specific recommendations to the task force. I want to focus now on our fourth recommendation which simply states that: science and traditional knowledge should form the basis for decisions.

The current prevailing opinion is: not enough is known about the Arctic Ocean to start the development being contemplated. In other words: more science is necessary to better understand the ecosystem and the consequences of our actions. This has been stated many times by Inuit, local authorities, the scientific community, the Arctic Council, and our own federal government.

Despite this strong prevailing opinion, the State continues to take the position that enough scientific research has been conducted and let's start development, right now. This is political decision making, and has nothing to do with using science and traditional knowledge to make decisions. We believe this is the wrong approach. The risk is too high for Arctic peoples and the Arctic Ocean environment. So, our advice is simple: let's quit dragging our feet and start conducting the scientific research that's needed. The State of Alaska needs to step up and be part of the solution.

What about traditional knowledge? How will traditional knowledge be captured? How will local input be obtained? We don't mean to rub salt on old wounds, but what happened regarding Alaska's Coastal Zone Management Program recently was a big step backwards in our opinion. This was a huge lost opportunity for cooperation between the State and local authorities. This was a huge lost opportunity to incorporate traditional knowledge into the planning process. What does aggregate evidence mean, exactly? At the Barrow meeting, our second recommendation was: put strong local influence back into Coastal Zone Management.

I'd like to switch topics now and talk about another issue that ICC believes is important to bring before the task force.

The number one priority of ICC Alaska is food security. Food security is a global concern and a critical issue for Inuit as well. We are concerned about the fish, birds and animals that we depend on for nutritional and cultural survival. We are concerned about the need for a clean and safe habitat for those food resources. For ICC Alaska this is job #1.

This leads me to an issue that hasn't been discussed by the task force, but needs to be mentioned since it involves northern water resources. That issue is commercial fishing and its effects on Inuit food security. I realize that commercial fishing is outside the mandate of the task force, but commercial fishing is impacting Inuit food security and some of our people have trouble putting food on the table because of restrictions on subsistence fishing. It's not an exaggeration to say we are getting starved out.

Last month, the North Pacific Fishery Management Council met here in Nome to discuss, among other issues, salmon by-catch problems in the pollock fishery. ICC Alaska provided testimony at that meeting. Much of the testimony given at this meeting mentioned salmon by-catch problems under State managed fisheries as a major culprit when it comes to getting salmon up the rivers to spawn.

Despite the best efforts of the State to manage salmon, our people find themselves losing access to this important food resource. It's high time to find a solution to this problem. It's time to address the Bristol Bay and Area M fisheries. Not enough salmon are making their way back up the rivers of western Alaska. This is another strong message that needs to find its way back to Juneau.

We traveled to Juneau last March and met with a number of Commissioners about the possibility of the State becoming involved in the Arctic Council and other international forums where Arctic policy is being created. We suggested the State create a small group to work with ICC cooperatively on issues concerning us all. We still wait.

We're sorry if we're coming on a little strong; but it's becoming increasingly clear to us that the current State administration has little, if any, interest in cooperating with Inuit. When it comes to development our positions are miles apart and we can't seem to sit down together and talk about it. So, we will continue talking with our federal government and others that will listen. We will contribute our views and traditional knowledge and are confident we will be listened to. We're sorry to say the current State administration has left us with no other option.

We know many of you with the task force believe much as we do. We thank those of you that fought the good fight trying to keep the Coastal Zone Management Program alive. We know you did the best you could. Unfortunately, our best just wasn't good enough at the end of the day. It's not the end of the world. The discussion on the future of the Arctic is just getting started and we will continue.

So, this is our evaluation on progress made over the past seven months; we think the trend is negative; and the report card had a poor grade. As before, we wish the task force good luck, and we still are willing to help if we can. Thank you and I'll be happy to answer any questions you may have.

Northern Waters Task Force (December 2010)
By Jim Stotts, ICC Alaska President

Thank you for this opportunity to address the Northern Waters Task Force (NWTF). Thank you for making the effort to visit Barrow which is on the front line for resource development in the US portion of the Arctic Ocean.

My name is Jim Stotts and I'm President of the Alaska chapter of the Inuit Circumpolar Council (ICC). Our membership includes Inuit from the North Slope, Northwest, Bering Straits and Southwest Delta regions of the state. Internationally, the ICC represents 160,000 Inuit from the United States, Canada, Greenland and Russia.

As a recognized non-governmental organization with consultative status to the United Nations, and a permanent participant to the Arctic Council, ICC is very much aware of activities going on in the Arctic at both the national and international level.

ICC's purpose is: to strengthen unity among Inuit of the Arctic; to promote Inuit rights and interests at the international level; to develop and encourage long term policies that protect the Arctic environment; and seek full and active partnership in the political, economic, and social development of the Arctic.

In other words, ICC pushes for Inuit influence over all activities affecting them and their homeland, on land, air and sea. This has been ICC's mission for 30 years. It's fitting to note that the ICC started right here in Barrow, through the vision of Eben Hopson Sr, the first Mayor of the North Slope Borough.

The NWTF is just starting its work and this is only its second hearing. So, timing is perfect to get things started out right, to ensure that the task force develops a balanced perspective moving forward. In ICC's opinion, the State of Alaska needs a more balanced perspective when it comes to development in northern waters and the Arctic Ocean.

We believe the State's approach is too favorable on the side of development. In other words, resource development trumps all other considerations, including cultural, social and environmental considerations. We hope the task force will be able to get beyond this lop-sided approach and come up with some ideas that the Inupiat can get behind. Without a balanced focus this could end up being a wasted effort.

Sadly there is no representation from tribal organizations on the task force. The task force would benefit greatly from a tribal presence. The Arctic Council, the inter-governmental organization of the eight Arctic nations, charged with developing Arctic policy, has indigenous people's organizations as permanent participants. The newly formed US National Ocean Council also calls for a tribal presence. The State of Alaska should consider doing the same. This would give the State greater credibility and acceptance with the Inupiat which is sorely needed at this time.

In HCR-22 which establishes the NWTF, the duties of the task force are spelled out as: 1) assess and facilitate the creation of a joint state and federal commission to oversee development of state and federal northern ocean waters; 2) facilitate regional coordination, cooperation, and outreach regarding creation of the commission to keep local stakeholders informed and incorporate their input into the process; 3) identify and coordinate mutual concerns of federal, state, and local agencies, and international interests in the creation of the commission. These are the three duties of the task force.

The task force shall carry out these duties by holding hearings in the northern region of the State, providing recommendations regarding the creation of the joint commission, and delivering reports to the legislature with legislative proposals for consideration in January 2012. In a nutshell this is the mandate of the NWTF.

I would be remiss if I didn't mention the fact that the State of Alaska missed an excellent opportunity to address one of the most important concerns raised by local authorities when the State failed to act, last legislative session, to strengthen Coastal Zone Management. Local influence was, in effect, rubbed out. In our opinion, the State decided to follow industry's lead and made the wrong decision, again.

From ICCs perspective it appears the State doesn't trust local people and has decided that it will make the decisions that affect them on their behalf. It's no wonder the Inupiat are losing trust in the State to help them with their problems and concerns. This task force will have to wrestle with this local perception as it moves ahead trying to develop recommendations that Inupiat can support. Again, a balanced approach is necessary.

Cultural, social and environmental issues must be considered at the same time as economic and resource development issues.

A few words about the Arctic Council, the Council has been and continues to be involved in developing Arctic policy in many areas, including areas that directly impact Arctic indigenous peoples. For example, on February 16th, there will be a meeting of the Health Ministers from the eight Arctic nations in Nuuk, Greenland. The Alaska State Commissioner of Health and Social Services will be invited to this meeting based on ICC Alaska's recommendation that he be invited. ICC Alaska knows the State will accept the invitation in the spirit in which it's made. We hope this will lead to mutual cooperation on the many health issues facing the Arctic. At least, it's a chance.

I mention this is to illustrate that Inupiat are and have been involved for many years in the process of helping create Arctic policy at the national and international level. Policies that protect the environment while allowing for sustainable development. Our understanding of sustainability includes the notion of cultural sustainability. We are fighting to keep our culture alive in this modern world. We will not back down. Some of you realize this already.

The United States and its Arctic Council partners are addressing important matters facing the Arctic. Offshore oil and gas and other Arctic Ocean developments, such as Arctic marine shipping, are just two of the topics being discussed. Other matters such as environmental protection, biological diversity, and climate change are also on the front burner.

The Arctic Council discusses many other topics that ICC chooses to call the "Human Dimension". The human dimension includes topics of great concern to the Arctic's indigenous peoples and residents at the community level, including: education, health, language and culture, community energy and infrastructure needs, pollution and toxic contamination, scientific research and traditional knowledge, just to name some of the issues being discussed.

I suggest the NWTF needs to be informed on the workings of the Arctic Council, including the perspectives of its permanent participants. The Council has already done much great work on the issues before this task force. It appears development of the Arctic Ocean will take a cooperative international approach rather than each Arctic nation going its own way. This means the State of Alaska will have to cooperate within this larger framework or get left behind or left out of the discussion. Please don't take this as a threat, it's simply my observation. This process is pretty far down the track already.

Early indications are that the US National Oceans Council will take a similar holistic approach to development as well. The task force probably should keep this in mind and keep itself informed on what's going on at the National Oceans Council. Again, we think this is good advice.

Okay, now for some specific recommendations:

1) **Include a tribal presence on the task force**
2) **Put strong local influence back into Coastal Zone Management**
3) **Realize Arctic offshore development is international in nature**
4) **Science and traditional knowledge should form the basis for decisions**
5) **Focus on offshore development must be holistic, not lopsided**
6) **Inupiat must benefit from development, beyond jobs**
7) **Seriously consider the NSB's offshore oil and gas policy (eight points)**
8) **Expand the task force mandate to review the environmental side of Arctic Ocean resource development**

In closing, I want to mention that the ICC is facilitating and hosting an Inuit Leader's Summit on Resource Development February 23-24 in Ottawa, Canada. The three topics of discussion are: offshore oil and gas development, uranium mining, and the social and environmental impact assessment process.

This Summit will bring together Inuit leaders from our four countries to discuss these important topics. The State of Alaska Commissioner of the Department of Natural Resources will be invited to the Summit to listen to what Inuit are thinking. This will be a great opportunity for networking. We hope the State will be able to attend.

Thank you for your time and good luck as you move forward. If ICC can be of help in the future please just let us know. I will be forwarding a copy of the Inuit Arctic Policy to Representative Joule for the task force's consideration. We call it the bible. If you have any questions, I'll be happy to try to answer them at this time.

INUIT

A Circumpolar Inuit Declaration on Resource Development Principles in Inuit Nunaat

Preamble

Recognizing the Arctic's great resource wealth, the increasing global demand for the Arctic's minerals and hydrocarbons, the scope and depth of climate change and other environmental pressures and challenges facing the Arctic;

Mindful of the core rights of Inuit as recognized in the *United Nations Declaration on the Rights of Indigenous Peoples*, as provided for in a variety of other legal and political instruments and mechanisms, including land rights settlement legislation, land claims agreements (treaties), and self-government, intergovernmental and constitutional arrangements, and as asserted in *A Circumpolar Inuit Declaration on Sovereignty in the Arctic*; and

Respectful of the ingenuity, resilience and wisdom of previous generations of Inuit, confident of the ability of every generation of Inuit to adapt to change, and determined to provide for the material and cultural well-being of Inuit into the future;

We, the Inuit of *Inuit Nunaat*, declare:

- Healthy communities and households require both a healthy environment and a healthy economy.
- Economic development and social and cultural development must go hand in hand.
- Greater Inuit economic, social and cultural self-sufficiency is an essential part of greater Inuit political self-determination.
- Renewable resources have sustained Inuit from the time preceding recorded history to the present. Future generations of Inuit will continue to rely on Arctic foods for nutritional, social, cultural and economic purposes.
- Responsible non-renewable resource development can also make an important and durable contribution to the well-being of current and future generations of Inuit. Managed under *Inuit Nunaat* governance structures, non-renewable resource development can contribute to Inuit economic and social development through both private sector channels (employment, incomes, businesses) and public sector channels (revenues from publicly owned lands, tax revenues, infrastructure).
- The pace of resource development has profound implications for Inuit. A proper balance must be struck. Inuit desire resource development at a rate sufficient to provide durable and diversified economic growth, but constrained enough to forestall environmental degradation and an overwhelming influx of outside labour.
- Resource development results in environmental and social impacts as well as opportunities for economic benefits. In the weighing of impacts and benefits, those who face the greatest and longest-lasting impacts must have the greatest opportunities, and a primary place in the decision-making. This principle applies between *Inuit Nunaat* and the rest of the world, and within *Inuit Nunaat*.
- All resource development must contribute actively and significantly to improving Inuit living standards and social conditions, and non-renewable resource development, in particular, must promote economic diversification through contributions to education and other forms of social development, physical infrastructure, and non-extractive industries.
- Inuit welcome the opportunity to work in full partnership with resource developers, governments and local communities in the sustainable development of resources of *Inuit Nunaat*, including related policy-making, to the long-lasting benefit of Inuit and with respect for baseline environmental and social responsibilities.

In further detail, we declare:

1. Candour, Clarity and Transparency

1.1 The world's peoples and their social, cultural and economic systems are becoming more interconnected, the pace of change is accelerating, the challenges faced by the world are escalating in complexity, and the risks associated with human activities are of increasing significance.

1.2 To prosper under these circumstances, the peoples and states of the world must conduct their relations cooperatively with candour, clarity and transparency – an approach in keeping with Inuit culture and custom.

1.3 It is our desire to declare our key understandings, positions and intentions in relation to resource development, recognizing that doing so will benefit Inuit and the global community.

1.4 While the focus of this Declaration is on the development of non-renewable resources, it must be understood that (a) issues surrounding the appropriate use of non-renewable and renewable resources are inextricably linked, and (b) the principles set out in this Declaration are, in many ways, applicable to the use of renewable resources.

2. United Nations Declaration on the Rights of Indigenous Peoples

2.1 Resource development in *Inuit Nunaat* must be grounded in the *United Nations Declaration on the Rights of Indigenous Peoples.*

2.2 The *UN Declaration* recognizes the right of indigenous peoples to self-determination. Under that right, Inuit have the right to freely determine collectively our political, social, economic, and cultural development. Resource development in *Inuit Nunaat* directly engages our right to self-determination, and many other provisions of the *UN Declaration.*

2.3 Our rights as an indigenous people, including our right to self-determination, may be exercised in a practical way through governance structures that combine both Inuit and non-Inuit constituents. No matter what level or form of self-determination the Inuit of any particular region have achieved, resource development in *Inuit Nunaat* must proceed only with the free, prior, and informed consent of the Inuit of that region.

2.4 Private sector resource developers, and governments and public bodies charged with the public management of resource development, must all conduct themselves in concert with the *UN Declaration.* Respect for the *UN Declaration* should be open and transparent, and be subject to independent and impartial review.

3. A Circumpolar Inuit Declaration on Sovereignty in the Arctic

3.1 Resource development in *Inuit Nunaat* must be grounded in *A Circumpolar Inuit Declaration on Sovereignty in the Arctic*, adopted by the Inuit Circumpolar Council in April 2009.

3.2 *A Circumpolar Inuit Declaration on Sovereignty in the Arctic* identified many principles that are relevant to the governance and carrying out of resource development in *Inuit Nunaat*, including the importance of the rule of law and recognition of the rights of Inuit as an Arctic indigenous people under both international and domestic law.

4. Inuit as Partners in Policy Making and Decision Making

4.1 Central to *A Circumpolar Inuit Declaration on Sovereignty in the Arctic* is the requirement that Inuit must be active and equal partners in policy-making and decision-making affecting *Inuit Nunaat.*

4.2 Partnerships with Inuit in relation to resource development will have different characteristics depending on the circumstances, but the spirit and substance of partnership must extend to both public sector governance and private sector enterprise.

4.3 Partnerships must include the meaningful engagement and active participation of Inuit in local communities who are most directly affected by resource development in *Inuit Nunaat.*

4.4 Partnerships must draw upon the growing capacity and aspirations of Inuit businesses and enterprises through use of vehicles such as joint ventures, commercial mechanisms for facilitating equity participation, and the issuance of land and resource rights through licences, leases and similar instruments.

4.5 Inuit recognize the need within *Inuit Nunaat* to create and implement inter-Inuit consultation mechanisms to ensure that approval of major resource development projects in one Inuit region, with major environmental and other implications for one or more adjacent Inuit regions, is accompanied by sufficient opportunity for an

informed exchange of information and opinion between or among the Inuit regions.

5. Global Environmental Security

5.1 Inuit and others – through their institutions and international instruments – have a shared responsibility to evaluate the risks and benefits of their actions through the prism of global environmental security.

5.2 Resource development in *Inuit Nunaat* must contribute to, and not detract from, global, national and regional efforts to curb greenhouse emissions and should always be seen through the reality of climate change.

5.3 In their implementation of mechanisms for adaptation to climate change, states and the international community as a whole must commit to paying the cost of climate change adaptation measures and the upgrading of fuel-related infrastructure in *Inuit Nunaat* regions and communities.

5.4 Resource development projects must not exacerbate the climate change-related stresses on the survival of Arctic wildlife.

5.5 To minimize risk to global environmental security, the pace of resource development in the Arctic must be carefully considered.

6. Healthy Communities in a Healthy Environment

6.1 The physical and mental health of human communities and individuals cannot be separated from the health of the natural environment.

6.2 Resource development proposals for *Inuit Nunaat* must be assessed holistically, placing human needs at the centre.

6.3 Resource development in *Inuit Nunaat* must promote the physical and mental health of communities and individuals within *Inuit Nunaat.*

6.4 Resource development must enhance, not detract from, Inuit food security.

6.5 In a contemporary context, healthy communities in the Arctic require the establishment, maintenance and improvement of core infrastructure needs, including housing, education, health care and social service delivery infrastructure, and core transportation and communications networks that facilitate both public sector activities and private sector entrepreneurship.

7. Economic Self-Sufficiency and the Sustainable Development of Resources in *Inuit Nunaat*

7.1 Inuit seek to make use of the economic opportunities available through long-term development of the resources of *Inuit Nunaat.*

7.2 Resource development in *Inuit Nunaat* must be sustainable. It must serve the needs of Inuit today without compromising the ability of Inuit meet their needs of tomorrow.

7.3 The proponent of a resource development project bears the burden of demonstrating that the proposed development is sustainable.

7.4 In determining the sustainability of a resource development initiative, the best available scientific and Inuit knowledge and standards must be determined and employed.

7.5 International standard-setting bodies must seek and secure direct and meaningful input from Inuit. National, regional and local bodies, such as offshore and land management regimes, must be designed and operated to be effective, transparent and accountable, thereby gaining and sustaining the confidence of the Inuit public at all times.

7.6 Sustainability standards must emphasize the need for the demonstrated support of those communities directly affected by a resource development proposal.

8. Impact Assessment, Prevention and Mitigation

8.1 Notwithstanding property rights or government rights-granting regimes, there is no free-standing or unqualified "right" to proceed with non-renewable resource development in *Inuit Nunaat.* Projects must be scrutinized by Inuit and proved to be in the best interests of Inuit and the wider public.

8.2 Land and offshore management regimes must include (a) long-term land use plans that set out ground rules for development applicable to specific projects, and (b) robust impact assessment processes to gauge the likely impacts of specific projects.

8.3 Management, land use planning and impact assessment regimes must address the cumulative impacts of existing and potential projects and, where prudent, limit the number and scope of projects permitted.

8.4 Impact assessments covering broad geographic areas are important and necessary management tools, and their completion in advance of specific project proposals should be encouraged.

8.5 Impact assessments should examine all potential environmental, socio-economic and cultural impacts anticipated both during the project and after the project is completed or abandoned.

8.6 In accordance with relevant provisions of the *Rio Declaration on Environment and Development*, the precautionary principle and the polluter pays principle must be applied in all stages of project planning, assessment, implementation and reclamation.

8.7 Reclamation and recovery of habitat and affected lands and waters must be thoroughly planned and fully funded in advance of and throughout project implementation.

8.8 All development in *Inuit Nunaat* must adhere to the most developed and demanding environmental standards taking Arctic conditions fully into account. (For example, mining operations and offshore hydro-carbon development should entail zero-volume discharge onto land and into Arctic waters.)

8.9 Preventing spills offshore and eliminating release of toxic substances to land and waters are paramount. Prevention efforts should be viewed as investments that pay dividends in cost avoidance.

8.10 Response to spills, contamination of lands or waters, and mining emergencies must meet the highest technological standards and be anchored in proven cleanup technologies with full Inuit participation.

8.11 Proposals for spill response in Arctic waters must include a proven demonstration of the industry's ability to retrieve spilled oil in frozen, broken and refreezing ice conditions. Allowing resource development without such a demonstration would be fundamentally irresponsible.

8.12 Effective oil spill prevention and response in Arctic waters requires active monitoring of vessel traffic and swift and effective emergency response in the event of mishap. Public authorities and developers with relevant responsibilities must commit to increased investment in navigation aids, vessel traffic management, ship compliance inspections, security considerations, emergency response capability, and overall port and harbour infrastructure.

8.13 Standards and requirements for Arctic marine pilots must be carefully conceived and strictly applied.

8.14 An international liability and compensation regime for contamination of lands, waters and marine areas resulting from offshore oil exploration and exploitation must be established.

8.15 Respecting the Arctic Council's "Arctic Offshore Oil and Gas Guidelines" as minimum standa

9. Improving Inuit Living Standards and Expanding Inuit Governance

9.1 Inuit expect that new resource development projects will contribute to an improvement in our material well-being. This expectation is well-rooted in the fundamental features of relevant international indigenous and human rights laws and standards, in the underlying constitutional constructs and political values of the four Arctic States in which Inuit live, and in the application of fairness and reason.

9.2 Through a variety of mechanisms – land rights settlement legislation, land claims agreements (treaties), self-government arrangements, and intergovernmental and Constitutional provisions – Inuit have acquired critical means and levels of control over the governance of *Inuit Nunaat.* Many of these mechanisms provide for direct Inuit participation in specialized resource management bodies, including planning, project review, and regulatory bodies.

9.3 While this trend is primarily a result of Inuit effort and determination, it has often been assisted and welcomed as healthy and normative by and within the four Arctic States.

9.4 Accordingly, resource development projects must take into account the trend toward greater Inuit self-governance and, to the extent possible, advance it.

9.5 Public sector revenues derived from all phases of resource development should be distributed in a fair and visible way according to the following hierarchy of priorities: (1) providing security against unplanned or unintended environmental consequences, (2) compensating for negative community and regional impacts, (3) contributing to the improvement of community and regional living standards and overall well-being, and (4) contributing to the fiscal health and stability of institutions and mechanisms of Inuit governan Only after the legitimate needs of the Inuit of *Inuit Nunaat* are met, should public sector revenues contribute to the coffers of central State treasuries.

9.6 Inuit employment at all levels must be maximized in

resource development activities in *Inuit Nunaat.*

9.7 Independent of the rate of resource development, Inuit must derive direct and substantial employment income benefit from resource development projects. Accordingly, an Inuit education fund should be established in each of Canada, Greenland, Russia and the U.S.A. with public sector investments.

10. Promoting and Accommodating a Dynamic Inuit Culture

10.1 Many international law principles and standards in relation to indigenous peoples are rooted in the strong conviction that the development and preservation of human cultural diversity is both a responsibility and a benefit for all humanity. The *UN Declaration on the Rights of Indigenous Peoples* acknowledges that indigenous peoples have the right to maintain, control, protect and develop their language, traditional knowledge and cultural heritage and expressions.

10.2 Inuit culture is both well-rooted and dynamic. Inuit are committed to ensuring that resource development projects must be planned and implemented in such a way as to support and enhance Inuit culture, rather than subvert or overwhelm it.

10.3 Inuit are committed to safe-guarding Inuit culture against excess adverse pressures and impacts that could be brought on by an overly ambitious, ill timed, or poorly planned and implemented staging of major resource development projects, particularly insofar as such a scenario precipitated a major influx of non-Inuit while failing to impart the technologies, skills and training, and business opportunities needed by Inuit.

10.4 Governments, public bodies and private sector actors in *Inuit Nunaat* must share in these commitments.

We, the *Inuit* of *Inuit Nunaat*, are committed to the principles on resource development in *Inuit Nunaat* set out in this Declaration. Inuit invite – and are entitled to expect – all those who have or seek a role in the governance, management, development, or use of the resources of *Inuit Nunaat* to conduct themselves within the letter and spirit of this Declaration.

Rec'd. Dec. 27, 1901

LETTERS OF TRANSMITTAL.

DEPARTMENT OF THE INTERIOR,
Washington, February 1, 1900.

SIR: I have the honor to acknowledge receipt of the resolution of the Senate, dated the 3d ultimo, as follows:

Resolved, That the Secretary of the Interior be, and he is hereby, directed to submit to the Senate of the United States a report on any investigations that may have been made by the Geological Survey in the Cape Nome district of Alaska.

In response thereto I transmit herewith a copy of a letter from the Director of the Geological Survey, dated February 1, 1900, to whom the resolution was referred, inclosing a report covering the information desired.

Very respectfully, E. A. HITCHCOCK,
Secretary.

The PRESIDENT PRO TEMPORE OF THE UNITED STATES SENATE.

DEPARTMENT OF THE INTERIOR,
UNITED STATES GEOLOGICAL SURVEY,
Washington, February 1, 1900.

SIR: I have the honor to acknowledge the receipt, by reference of the Hon. Thomas Ryan, Acting Secretary, of a copy of a resolution of the United States Senate, dated January 3, 1900, and reading, "That the Secretary of the Interior be, and he is hereby, directed to submit to the Senate of the United States a report on any investigations that may have been made by the Geological Survey in the Cape Nome district of Alaska," with instructions to consider and make an early report.

The report is sent herewith. The delay in transmitting it has been due to the serious illness of Mr. A. H. Brooks, one of the geologists who worked in the Cape Nome district.

I am, with respect, your obedient servant,

CHAS. D. WALCOTT, *Director.*

The SECRETARY OF THE INTERIOR.

WASHINGTON, D. C., *February 1, 1900.*

SIR: In accordance with your instructions, we have hastily prepared the following brief report of the Cape Nome gold region of Alaska. It is based upon observations made during a short visit to the region last October. We fully realize its incompleteness, but believe it contains information of immediate use to those who may visit the region in the near future. With the view of making it of practical rather than of scientific interest, we have omitted theoretical discussion and avoided technical terms as far as possible.

Very respectfully,

FRANK C. SCHRADER,
ALFRED H. BROOKS,
Assistant Geologists.

Hon. CHAS. D. WALCOTT,
Director United States Geological Survey.

PRELIMINARY REPORT ON THE CAPE NOME GOLD REGION, ALASKA.

By F. C. SCHRADER and A. H. BROOKS.

INTRODUCTION.

The following report is based on a few weeks' examination of the recently discovered Nome gold-mining region, made by us in October, 1899. We collected such topographic and geologic data of this important region as the climatic conditions would permit and our limited time would allow, the trip to Nome being a hurried utilization of a delay while waiting for a steamer for Seattle after the completion of the regular field work in the Yukon Basin.

As boats, tents, and camping outfits had been left in the Yukon country, the party was dependent upon such accommodations as could be procured at Nome, or from the miners on the creeks and in the gulches. The topography was done, under direction of Mr. T. G. Gerdine, by Mr. D. C. Witherspoon, using Nome as the base of supplies, because of the severity of the climate and absence of timber for camping purposes; while the geology and photography were done by us. With our packs of sleeping bags, instruments, and provisions, we made a several days' trip into the mountains and gulches to examine the formations and diggings. On account of the cold weather and freezing up of the creeks, most of the gulch diggings had already closed down early in October and the operators had departed. Wherever we found the miners, however, their hospitality was generously extended. We would express our indebtedness to Dr. F. P. King and members of the Pioneer Mining Company on Anvil Creek for many accommodations, and to Messrs. Davidson and Ashford, United States deputy surveyors, for the magnetic variation which they had recently determined at Nome; also to many prospectors and other citizens of Nome who furnished us with valuable information about those portions of the region which we were not able to examine in person.

NOME BEACH DIGGINGS, WITH WEST POINT IN BACKGROUND, 12 MILES DISTANT; FROM BEACH 2 MILES WEST OF NOME, LOOKING N. 70° W., OCTOBER 17, 1899.

The gravels of the terraces on the mountain slopes, which have been already described, have a similar origin to those of the coastal plain and are probably of a similar character. We can judge of this only by inference, as we unfortunately found no section of these gravels exposed. These terraces are probably in part the remnants of coastal plains that had a far wider extent than they have at present. The elevation and erosion of such plains produced the present topographic forms.

The gravels of the gulches and smaller valleys represent the stream deposits during the period of the deposition of the coastal plain. They lie on the bed rock and are usually of no great thickness. The material is usually coarser than the tundra gravel, and its source is easily traceable to the bed rocks of the vicinity.

Perhaps we have given a more detailed description of the origin and deposition of the unconsolidated formations than the limits of this report would seem to warrant. If so, it has been done because of the close relation of the gold deposits to the gravel, and because of the frequent popular misconception in regard to the origin of these beds. We wish to emphasize the fact that during the deposition of these gravels and sands the conditions were not materially different from those of to-day, except that the land stood at a lower elevation relative to the sea. There is no evidence whatever of glacial action in the region, and the popular idea that the gravels were brought to their present position by ice action is entirely erroneous.

MINERAL RESOURCES AND METHODS OF MINING AND EXTRACTION.

GOLD.

NOME REGION.

The gold of this region has so far all been obtained from placer deposits, which can be conveniently grouped as gulch placers, bar placers, beach placers, tundra placers, and bench placers. During last season only those of the gulches and beach have been important gold producers. No facilities were available for exploiting the tundra deposits, and the benches have not as yet been investigated.

The amount of gold produced during the last season can not be estimated definitely. While there are, as a rule, fairly reliable data as to the production of the gulches and creeks, the amount taken from the beach can only be roughly approximated. From the best information we could gather we believe that the production of gold of the entire belt during the season of 1899 will approach $3,000,000.[1]

[1] Dr. Cabell Whitehead, of the Mint Bureau, informs us that the official records of that Bureau show a receipt of more than $2,600,000 in Nome gold prior to January 1, 1900.

ground in large tracts, is essential, so that ground sluicing, stripping by horsepower, and other "dead" work may be performed on a large scale, and extensive areas of the frozen ground be bared to the thawing influence of the atmosphere and the sun. This method, in connection with ground sluicing and box sluicing, seems to be the most promising and the least expensive. In most cases it will be found advantageous to lead the water from near the edge of the mountains to insure sufficient fall, or to raise it from neighboring streams. Also steam drills and high-pressure streams and jets of hot water may prove to be advantageous, but, presumably, not so profitable when the cost of fuel and machinery and the limited area such plants may be able to cover in a given time are considered.

HISTORY AND DEVELOPMENT OF THE NOME GOLD REGION.

DISCOVERY OF GOLD.

CREEK GOLD.

Up to the time of the "Klondike rush" of 1897 and 1898 but little attention was paid to prospecting in Seward Peninsula, in spite of the fact that both gold and silver had been found in the Golofnin Bay region. According to Father F. Barnum, for many years missionary on the Lower Yukon, and one of the best-informed men of the country, the presence of gold in the Nome region was reported by natives to Yukon prospectors some six or eight years ago. These seem to have placed but little confidence in the report, and did not consider it worthy of further investigation. In the fall of 1898 a considerable influx of disappointed "Klondikers" into the Golofnin Bay district took place, and the prospecting of Seward Peninsula may be said to have been then inaugurated.

In July, 1898, a rumor is said to have reached the Swedish Mission at Golofnin Bay that gold had been found by a reindeer herder on the coast at Sinrock, about 30 miles northwest of Cape Nome. Soon after a party, consisting of the missionary, N. C. Hultberg, J. J. Brinterson, and others, set out for Sinrock in a small boat along the coast. Becoming storm bound on the way, they landed near the mouth of Snake River, at the present site of Nome. Here they are reported to have prospected some, and found fine gold on the bars in the lower reaches of the river, which led them next day to cross over the tundra to the now famous Anvil Creek, a tributary of the Snake. Here, on July 26 or 27, they found some colors of coarse gold, but the majority of the party insisted on proceeding to Sinrock, their original destination. At Sinrock, however, they were not successful, and returned to Golofnin Bay. The colors of coarse gold which had been found on

Anvil Creek during their storm-bound period were not forgotten, for they were considered a favorable prospect by Hultberg. Accordingly, a small party of Swedes or Norwegians, consisting of Eric O. Lindblom, John Brinterson, and Jafet Linderberg, one of whom was in the employ of the Government reindeer service as herder, and another a whaler from the bark *Alaska*, returned to Anvil Creek[1] about the middle of September (1898). Here they spent a couple of weeks, and on the 20th are reported to have discovered coarse gold of unquestionable economic value. They made extensive locations on Anvil Creek, and also crossed over the low divide and staked claims on Glacier Creek and one of its tributaries, Snow Gulch, which during last season proved the richest gulch in the Nome region. Ground was also located on Rock and Dry creeks. After collecting some samples, the party returned to Golofnin Bay, with ground enough staked to make all of them millionaires, as the development of the property last season demonstrated.

Upon their return to Golofnin Bay another and larger party was soon formed, which hurried back to the Nome region, and as the news spread, notwithstanding the lateness of the season, a general stampede for the new El Dorado, to secure locations, set in from Golofnin Bay, the Fish River country, and St. Michael. A meeting was held on October 18 (1898), when the Cape Nome mining district was organized, which was to comprise an area 25 miles square, with Cape Nome at its southeastern corner. Dr. Kittleson is reported to have been elected recorder. The meeting also determined that the size of all locations should be 320 by 560 feet. Nearly every individual located not only for himself, but also for his many friends, by power of attorney. These locations comprised not only mining claims on the different gulches, but also town lots near the present site of Nome. The lowest number of locations said to have been made by any one person was four and the highest thirty. To such an extent was the power of attorney here abused that more than 7,000 acres of ground were located by fewer than forty persons, for themselves and their friends, so that the several thousand Americans who arrived later, finding no unstaked ground anywhere in the vicinity, justly raised a somewhat bitter complaint.

At present the majority of the Nome miners are said to be in favor of abolishing the right to stake ground by power of attorney, of reducing each mining district to 5 miles square and making a reduction in the size of claims, and of restricting ownership to one claim per individual in each district. Such a reform would seem to be a commendable step toward the prevention of fraud and the practice of parasitism on the

[1] This creek and its adjacent mountain are reported to have been named Anvil by Linderberg from the huge anvil-like shape of the boss or knob of rock at the top of the mountain, as shown in the left of Plate VII.

miners' vocation by the great number of so-called "pencil and hatchet men," whose design is not to mine, but merely to make extensive locations for purely speculative purposes. Ground thus held has not only retarded the development of many of the mining districts of Alaska, but has been the source of unlimited trouble in many placer camps.

As it was already late in the fall of 1898 when gold was discovered, but little attempt could be made at development that season. About $2,000, however, were taken out of Anvil Creek and Snow Gulch before the creeks became tied up by frost.

BEACH GOLD.

Up to the middle of the summer of 1899 the attention of the prospectors was entirely confined to the creeks and gulches, but late in July the first discoveries of gold beach were reported almost simultaneously by a soldier from the United States army barracks, who is said to have found gold while digging a well, and by some prospectors of Nome.

One of the first reported to engage in beach diggings was an old prospector from Idaho, by the name of John Hummel, who, it is said, was afflicted with scurvy and, therefore, could not reach the gulches. Hummel prospected the beach, and, finding that it yielded a fair return, went to work with a rocker and took out $1,200 in twenty days of work.

As soon as the news of these rich finds became disseminated, a perfect frenzy for digging in the beach seized the people of Nome. The commandant of the United States army post enforced a regulation[1] that no claims could be staked within a strip of ground running along the beach, 60 feet in width, measured from high-tide limit. Within this reserved area all had an equal right to dig and wash the gravels. The good feeling and good fellowship which generally prevailed in this isolated community is attested by the fact that, in spite of the crowded condition of this public strip, few, if any, serious disputes occurred between the miners. This is rather remarkable, considering the fact that men are often working within a few feet of one another on the same pay streak. This may have been in part because of the popular fallacy that the beach furnished an inexhaustible supply of gold, and that the deposits were being constantly renewed by the action of the surf.

During the height of the excitement upward of 1,000 men were at work on the beach; by some the estimate is even put as high as 2,000. Every man at Nome, be he physician or carpenter, lawyer or barkeeper, dropped his usual vocation and went to work with a shovel and rocker. Men who had been employed in the gulches at good

[1] See circular from the General Land Office, issued June 8, 1898, page 18, section 41, on "A roadway 60 feet in width parallel to shore line."

wages flocked to the beach and went to work for themselves. This undoubtedly retarded the development of the gulch diggings very much, for it was difficult to get miners, even when the wages went up to $11 a day. The beach placers proved a veritable "poor man's proposition." No capital for development was required, any one owning a shovel and a rocker having an equal chance with the rest.

The larger part of this crowd of men were at work near the town, but the beach diggings extend for 12 or 15 miles to the west of Nome. In the fall, when this army of miners had stopped work because of the frost, an almost continuous rampart extended along the beach near Nome, which had been formed by the newly dug gravel, and gave the shore the appearance of having been fortified to repel an invasion. (Plate XII.)

The output of gold from the beach can only be roughly estimated, for no records were kept. It is fair to assume that the beach miners averaged at least good wages. Such being the case, the product of the beach must have been upward of half a million dollars, and may have been much more. There are some intelligent men, who were at Nome during the excitement, who estimate the beach output of gold at from $900,000 to $1,000,000.

ROUTES AND TRANSPORTATION.

SUMMER ROUTES.

All-ocean route.—The shortest and quickest route from the States to the Nome region is by ocean steamer, from Seattle across the North Pacific Ocean and Bering Sea direct to Nome. The distance is about 2,700 miles, and under favorable circumstances about ten days are required to make the trip. Some of the largest and most commodious steamers of the Pacific coast ply on this route. A stop for coal and water is usually made at Unalaska, between the Pacific Ocean and Bering Sea. Freight rates from Seattle to Nome are usually quoted at $40 per ton, first cabin passenger rates $100, and second cabin $60; but as circumstances often govern rates, and some companies readily deviate from the established schedule at chance of gain, the above may be no criterion for the season of 1900, when a large traffic is expected. It would seem, however, that the release of American transports from the Philippine service and the competition of Atlantic coast and other vessels which are to be placed on the line may operate toward the prevention of exorbitant rates. Certain vessels are reported to have engaged all their space last November for their first trip to Nome next June, at prices amounting to several times the usual rates, but we do not know this to be authentic. The leading companies operating on the line and at Nome last season were the Alaska Commercial Company, the North American Transportation and Trading Company,

and the Alaska Exploration Company. Other companies intending to place boats on the line are the Pacific Steam Whaling Company, the Empire Line, and the Pacific Clipper Line. Most of the companies expect to have their first boats direct for Nome leave Seattle early in June. Those leaving much earlier will, presumably, discharge their cargoes at Unalaska, or engage in other traffic this side of Bering Sea. On account of the ice in Bering Sea the season of ocean transportation to Nome is, as a rule. restricted to a period of five months, from about early June to early November. During the remainder of the year the northwest coast of Alaska is usually icebound, and not accessible by vessel.

Distances by ocean route from Seattle to Cape Nome and St. Michael.[1]

Nautical miles.		Station.	Statute miles.	
Local.	Through.		Through.	Local.
	0	Seattle	0	
130				150
	130	Off Strait of Fuca	150	
1,552				1,785
	1,682	Unalga Pass	1,935	
20				23
	1,702	Dutch Harbor, Unalaska	1,958	
645				742
	2,347	Cape Nome	2,700	
105				121
	2,425	St. Michael[2]	2,821	

[1] For these distances we are indebted to the United States Coast and Geodetic Survey.
[2] St. Michael from Dutch Harbor direct is 760 statute miles, and from Seattle direct 2,718 miles.

Yukon route.—Another route, also a summer route, and nearly all by water, is the inland or Yukon route. This is by ocean steamer from Seattle to Skagway, thence by the White Pass and Yukon Railway over the Coast Range to Lake Bennett, the head waters of the Yukon, and from here by river steamer down the Yukon to St. Michael, and from St. Michael by ocean steamer to Nome. This route is not nearly so direct or expeditious as the all-ocean route, as frequent changes and delays are usually involved. There is a change of river steamers on the upper waters of the Yukon, covering Miles Canyon and White Horse Rapids, around which the portage of about 3 miles is by horse tramway. Skagway is open to ocean vessels the year round, but as the ice does not leave the lakes and the Upper Yukon waters until early June, the route offers little or no gain to the Nome-bound passenger, so far as reaching his destination early in the season is concerned. As a return route the Yukon is not practicable for boats leaving St. Michael later than early in September, on account of the ice which forms on its upper waters later in the month. Prob-

ably the chief advantage of the Yukon route consists in its enabling the passenger to escape an open sea voyage. The principal companies operating from Seattle to Skagway are the Pacific Coast Steamship Company, the Pacific Steam Whaling Company, and the Alaska Steamship Company. Others also frequently visit Skagway. The principal company of the Upper Yukon is the Canadian Development Company, operating as far down as Dawson, where connections for St. Michael are made with the commodious Lower Yukon steamers of the A. C. Co., N. A. T. and T. Co., and other companies.

It should be mentioned that when navigation closed on the Upper Yukon waters last October hundreds of tons of freight are reported to have been accumulated at Lake Bennett, where it is said it will have to lie until the opening of navigation next spring, a point worthy of consideration by any who may contemplate the shipment of much freight over this route during the season of 1900.

Owing to the lack of harbor facilities and the precarious method of landing freight at Nome, persons making shipments to that point may do well to contract with the company of the vessel to deliver their goods ashore above high-tide mark.

OVERLAND OR WINTER ROUTES.

These routes are overland or winter routes only so far as pertains to Alaska and a portion of the Northwest Territory.

Yukon route.—One of them, the Yukon route, leaves the coast at Skagway, or the head of Lynn Canal, crosses Chilkoot Pass or White Pass, and follows the Yukon the same as the Yukon steamer route, with the exception that the transportation is by dog sled or reindeer down the river on the ice instead of on the water by boat. But at the mouth of Autokatat River it would leave the Yukon and proceed westward over the portage to Unalaklik River and the head of Norton Sound; thence across or around the head of Norton Bay to Nome. It is by this route that both the Canadian and the American mails are sent to the Yukon region at the present time, largely through the agency of the Canadian Development Company. Much of the danger formerly attending this route has been eliminated by the establishment of Northwest mounted police posts at regular intervals on the Upper Yukon, and of American posts, stations, and natives' villages on the lower part of the river. It is the only overland route in practical use at the present time. Dawson and the Klondike have largely made it what it is. The route, however, is a long one, the trail rugged, on account of the roughness of the ice on the river, and the journey arduous.

Valdes route.—For several years past some effort has been made to explore and open up a so-called "All-American route" from the coast to the Yukon country, by way of Valdes and Copper and Tanana

rivers, but as yet it has not come into practical use. As a route to Nome it is rather indirect. By it the Nome-bound passenger would proceed by ocean steamer to the head of Prince William Sound, leave the coast at Valdes, travel northward through Copper River Basin, over the divide, by way of Mentasta Pass, to the Tanana, and westward down the Tanana to the Yukon; thence down the Yukon to Nome by way of the route described above. But as relay or supply stations have not yet been established along this route, and native villages are remote between the coast and the Yukon, and the country is subject to fierce blizzards, this route should not be undertaken during the present winter except in large and well-organized parties, and then with caution.

Cook Inlet–Kuskokwim route.—This is, as yet, only a proposed route, but, according to Captain Jarvis, J. E. Spurr, F. Barnum, and other pioneers, who are most familiar with the country, it seems without doubt destined to become immediately the favorite overland route for the Nome, St. Michael, and Lower Yukon regions. This route leaves the western shore of Cook Inlet just north of Kamishak Bay and a little northwest of Augustine Island, in approximately 59° 30′ north latitude. It leads westward from Iliamna Lake, past Kakwok, and northwestward across Tikchik Lake to Kalmakof on the Kuskokwim and northwestward to Holy Cross Mission and Anvik on the Yukon, up Anvik River, and over Anvik portage to the head of Norton Sound; thence to Nome as before. By this route the distance from the coast at Cook Inlet to St. Michael and the head of Norton Sound is approximately 400 miles, with the country for the most part of easy, gentle slope and no barriers. Katmai, about 100 miles south of where the route would leave the coast, is open to vessels all winter. The same, so far as known, is true of the Kamishak Bay region. If this is correct, for smoothness of country, shortness, directness, and dispatch, as an overland route the Cook Inlet and Kuskokwim route can not be equaled. At present writing we are informed that Captain Jarvis, of the revenue service, is planning to send a party to examine the route. It seems highly commendable that the Government should without delay give the route a most thorough investigation, that the northwest Alaskan public may reap its benefits. By some it is thought that the route may be practicable in summer as well as in winter. Its early development is expected.

Bering Sea coast route.—Another route is the more or less well-known winter route along the coast, or in use to some extent by the Russians. Starting from Katmai or vicinity and crossing the base of Alaska Peninsula, it follows the coast more or less continuously around to the head of Norton Sound. At the mouth of the Kuskokwim, however, is offered an alternative of proceeding about 100 miles up this river, thence about 20 miles across to the Yukon, then up the

Yukon, and, by way of Holy Cross Mission and Anvik River and portage, to Norton Sound and Nome, as before. This route is rather circuitous and long, but has the advantage of safety, as the posts and native villages upon it, from which food and dog feed may usually be obtained, are nearly always within reach.

TRAVEL AND TRANSPORTATION IN NOME REGION.

In the Nome region, along the coast, waterways, and streams of sufficient size, travel and transportation are principally by small boats and canoes. Across the country there are as yet but few definite or well-marked trails. The country is not, however, of so rugged a character but that one can without much difficulty proceed in almost any direction. During last summer several pack trains of horses were employed in conveying freight and supplies from Nome to the gulch diggings. Some teaming by wagon was also done to these points. About Nome, during the summer season, freighting is accomplished on wheeled vehicles drawn principally by dogs and horses, notwithstanding the fact that the tundra is usually soft for horse footing. Since the larger part of Seward Peninsula seems not ill adapted for teaming and pack trains, it appears certain that horses will be very extensively employed throughout the region during the coming season. So far as experience goes, travel in winter is best accomplished by dog teams or, preferably, reindeer. The use of dogs for sledding in this region has long been too well known to require further mention. The dog, however, is reported to be much surpassed by the reindeer, recently introduced into Alaska, especially in districts where the reindeer moss abounds, as on Seward Peninsula. The chief advantage of the reindeer consists in the fact that it is not necessary to carry forage, since the deer subsists upon the moss wherever camp may be made. There are at present some 1,000 or 1,200 Government reindeer on Seward Peninsula, scattered principally in stations along the southern part and on the coast, with centers at Golofnin Bay and Port Clarence. Dogs are usually scarce in most Alaskan mining regions during the winter season. At Nome last fall an average dog was worth from $50 to $100. A fair team generally consists of about 9 dogs. In reindeer freighting the poulka, or Lapland freight sled, shaped like a boat, is employed. A collection of these was seen on Anvil Creek. They are usually drawn by one or two reindeer. Where real sleds are used the sleds are very low and the runners wide. A trained or draft reindeer at Nome is said to be worth about $150.

HARBOR FACILITIES.

Unfortunately there are no harbor facilities for ocean vessels in the Nome region. The only representative or semblance in this line is the lagoon-like inlet known as Port Safety, about 25 miles east of

Nome. It, however, is suitable only for small boats and craft not drawing over 8 feet of water. It was investigated last season by the United States Coast and Geodetic Survey, whose statement concerning it, as published in the "Notice to Mariners, No. 250" (p. 9, sec. 23), is here quoted for the information of those interested:

ALASKA.

Norton Sound—Cape Nome—Port Safety—Range beacons established.—The commanding officer of the United States Coast and Geodetic Survey steamer *Patterson* reports that on September 10, 1899, he erected two whitewashed beacons, which form a range for crossing the outer bar at Port Safety.

The outer beacon, pyramidal in shape, is located on the end of the low spit marking the western side of the entrance.

The inner beacon, also pyramidal in shape, is located on the inshore side of Port Safety Bay, and is about 2¼ miles WNW. from the outer beacon.

To cross the bar.—With the two beacons in range, bearing WNW., stand in until the breakers on both sides of the channelway are abeam; then change course for the middle of the entrance.

Port Safety is situated about 12 miles eastward of Cape Nome, Norton Sound, and affords excellent shelter for vessels drawing not over 8 feet.

As it is the only harbor in the vicinity, a preliminary examination of it has been made, and a sketch will be published as soon as practicable.

(October 27, 1899. Chart affected: T.)

Port Safety, however, as stated, can in nowise accommodate seagoing vessels such as touch at Nome with freight and passengers. The nearest harbor for such vessels is Port Clarence, about 70 miles northwest of Nome, or Golofnin Bay, more than 80 miles east of Nome. Though it seems highly probable that with continued development of the Seward Peninsula regions these harbors will eventually have railroad connections with the Nome region, nevertheless the lack of harbor facilities at present at Nome is embarrassing. Last season more than 5,000 passengers and many thousand tons of freight were landed at Nome from ocean vessels through the surf by the rudimentary means of river steamboats, barges, scows, rowboats, and canoes. (See Plates XVIII and XIX.) The inconvenience and risk of such methods will be realized when it is learned that the beach at Nome is so shallow that seagoing vessels can not approach much within a mile of shore, and that the beach during much of the time is swept by a heavy surf, with high combers, breakers, and squalls, which are frequently fatal to the various kinds of craft used in landing freight and passengers, and often result in the loss of both craft and cargo, amounting to many thousand dollars in value. Two such instances occurred while we were there in October. Last season, so far as known, no life was lost, though in a number of cases passengers received injuries or suffered broken limbs. The expense of landing freight in this way is usually $15 or $20 per ton. Moreover, the delay occasioned to large seagoing vessels in discharging their cargoes in

this manner is not only embarrassing but very expensive. It frequently happens that, on account of storm and the surf, vessels are isolated from the beach or have to put out to deeper sea for safety, and can not unload for a period of several days. Realizing the great need of harbor facilities here, it is reported that a number of enterprising men have organized a company and are negotiating to construct at Nome an extensive deep-water pier or wharf, to extend nearly a mile from shore, to a point where ocean vessels can discharge their cargoes onto it, whence they will be brought ashore by tramways to warehouses along the beach.

Until harbor facilities are provided, persons shipping freight to Nome should contract with the company of the vessel for the deliverance of freight on shore above high-water line, as the present precarious method of landing may result in loss of freight or entail risk or damage which few can afford to bear.

CLIMATE.

The climate on Seward Peninsula, though it is arctic, is milder and much more even than that in the same latitudes in the interior of Alaska, or the Yukon country. The precipitation, also, is considerably greater. The summer is not so warm, nor the winter so cold. The sea, here traversed by a branch of the Japanese Current, is the great moderator. About the only weather records we have of the region, which are of a primitive character, are those kept by the missionary and reindeer people at Port Clarence, Golofnin Bay, Prince of Wales, and those of Captain Jarvis, of the United States Revenue Service.[1] Some incomplete records were also made at Port Clarence in 1850–1852, and meteorologic observations were maintained at St. Michael (100 miles to the southeast) for many years.

According to the records of the Weather Bureau, the mean annual temperature at St. Michael is 26.1° F., and the annual precipitation (rain and snow) 14.44 inches. The extremes of temperature noted on the island are 75° F. in July and —55° F. in February. The records show freezing temperatures every month except July. The most reliable data indicate that the temperature at Nome is usually somewhat lower than at St. Michael, and that the precipitation is about the same. The winters, as noted, are not so cold at Nome as in the Yukon Basin, but are more trying, because of the dampness and of the cold winds, from which there is no shelter.[2]

The summer, which is short and generally cool, resembles spring in the northern United States. During the warmer months many

[1] The former are found in the reports on the Introduction of Domestic Reindeer in Alaska, by Dr. Sheldon Jackson, and those of Captain Jarvis in the Report of the Cruise of the U. S. Revenue Cutter *Bear* and Overland Relief Expedition in 1897 and 1898.

[2] See Reports of the U. S. Weather Bureau, Department of Agriculture, summarized in Maps and Descriptions of Routes of Exploration in Alaska in 1898, United States Geological Survey, 1899, pp. 133–135.

POPULATION.

Native inhabitants: Eskimo.—The natives of Seward Peninsula, numbering about 800, are Mahlemuts, or Eskimo. They are, in general, scattered along the coast, with several more or less centralized settlements about the missions and reindeer stations, at Port Clarence, Cape Prince of Wales, Golofnin Bay, and in the Cape Nome region. They usually live in small villages of 8 or 10 families, crowded in crude underground huts, or dugouts. Their principal support is by hunting and fishing. They are a good-natured people, and generally industrious. The youth are reported to be apt in the mission schools.

Whites.—Prior to the recent discoveries of gold, about the only whites on Seward Peninsula were the few Americans in charge of the several missions and reindeer stations, and a score or so of Swedes and Laps employed as herders. Accordingly the population of Nome, as a mining camp, is essentially unique, and as yet, for the most part, scarcely six months old. A year ago a few Eskimo huts and one or two sod houses of white men were the only human habitations along 60 miles of the present Nome coast. Last June a dozen or score of tents contained the whole population. By October a town of 5,000 inhabitants fronting the ocean was crowded for a mile or more along the beach. Hundreds of galvanized-iron and wooden buildings were irregularly scattered along two or three thoroughfares, running parallel with the coast line. There is every description of building, from the dens of the poor prospectors, built of driftwood, canvas, and sod, to the large companies' warehouses, stores, and the army barracks—a city, as it were, sprung up in the night, built under the most adverse circumstances on the barren seacoast, a coast without harbor, all the supplies being landed through the surf, as already described and shown on Plates XVIII and XIX. The country contributes nothing toward the support of the population except a few fish and a limited supply of driftwood.

The city is of the most cosmopolitan type and contains representatives of almost every nationality on the globe: Germans, Canadians, Frenchmen, Englishmen, Russians, Swedes, Norwegians, Poles, Chinese, negroes, Italians, Spaniards, Greeks, Jews, and Americans. The dominant type is the American, through whose efforts, with that inherent talent of the Anglo-Saxon race for self-government, this isolated community at once organized a city government. Before the close of the summer Nome had a mayor, councilmen, a police force, a deputy United States marshal, a United States post-office, a fire department with town well, a board of health, a hospital corps, and charitable organizations. A majority of the people consists of the shifting population of the Yukon country, which, upon hearing the news of the discovery of gold, poured itself into Nome. Hundreds also came from the Koyukuk,

Kotzebue Sound, and Kowak River regions, whence, unsuccessful in their search for gold, they reached Nome in a financially stranded condition, but soon became prosperous by mining on the beach. Many also, designing to engage in sundry lines of business and trade, came from the southeastern coast of Alaska and the United States. The influx continued until late in the fall.

By calling, the majority of the people were miners and prospectors, or hoped to become such. The professions of law, medicine, and divinity are well represented, also the vocations of surveying, real estate, insurance, and sundry mercantile branches of business. The saloon, hotel, and restaurant business is prominent and profitable. Along with the shifting population of the Yukon from Dawson and other camps came also many would-be explorers, adventurers, and especially gamblers, but good order prevails throughout. Drunkenness, disorderly conduct, and theft are promptly tried before the police justice and punished by fine and imprisonment. Copies of the official rules and regulations are kept posted before the city hall and in other conspicuous places, as a warning to all: "Ignorance of the law is no excuse." Some of the well-known "toughs" and most undesirable characters are reported to have been rounded up by the authorities late in the fall and exported to the States. There is also quartered here, in comfortable barracks, a detachment of United States soldiers, under Lieutenant Craigie, who in the early part of the season are reported to have done much toward the maintenance of order and the protection of individual rights and property.

A thoroughly energetic and enterprising American spirit pervades the business world. There are several printing presses and three newspapers—the Nome News, Nome Herald, and Nome Gold Digger. The Nugget, with printing press and equipments from Dawson, bound for Nome, went down in a gale on Norton Sound in September, and a similar Nome-bound outfit was wrecked on the *Laurado*, at St. Lawrence Island in Bering Sea, a few weeks later. The leading large companies operating at Nome are the Alaska Commercial Company, the North American Transportation and Trading Company, and the Alaska Exploration Company. There are also innumerable smaller companies and firms engaged in various mercantile lines and sundry vocations. Early in the winter, on recommendation of Mr. G. N. Wright, postmaster at Nome, effort was made by the United States Post-Office Department at Washington, D. C., to secure for the Nome people semimonthly mails during this winter, and a contract was let for the transportation of such mails by way of the Yukon country. With what success this has met has not yet been learned.

There are at least 2,500 people now wintering at Nome, and, by estimate, at least several thousand are on their way there by winter routes. Last season, as soon as the richness of the discoveries

became realized, the larger trading companies built large warehouses and shipped all the supplies possible from St. Michael to Nome, in addition to those brought from the States. Also, a considerable supply of fresh reindeer meat was imported from the Siberian coast by enterprising owners of schooners and other seagoing vessels. It is estimated that, with no accident, there will be sufficient to carry the population through the winter, but none to spare. During the fall, and especially at the close of the season, commodities and living were high. Coal was $125 per ton; wood, gathered from the driftwood on the beach, was $50 and upward per cord; lumber, $125 to $300 per M., when it could be bought at all; board and lodging, from $6 to $10 per day. The price of an ordinary meal was from $1.50 to $3; fresh meat was $1 to $1.50 per pound, and other things almost proportional. Unskilled labor received $12 per day.

IMPROVEMENTS SUGGESTED.

Government.—Since, according to the conservative estimate of those who are best situated to judge, it is believed that the Nome region will have a population of at least 30,000 or 40,000 people this year (1900), some public improvements there seem not only commendable but urgently necessary. Among these the most important are: Some municipal form of government, water supply, land-office service, and harbor facilities. As the General Government had never made provision for any form of municipal government in Alaska, the people of Nome, in response to the urgency of the hour, called a mass meeting, and organized the present government of Nome, with a complete corps of city officers, as aforesaid, though they were conscious at the time that it was without authority from the United States Government. The town was divided into three wards, with two councilmen from each. The expenses of the government were defrayed by taxing business houses and general property owners. There was also a poll tax of $5. The government, for the most part, worked admirably and was fruitful of beneficent results. However, with the large influx of people expected during the coming season, it is most earnestly hoped that, acting on the recommendation of the governor of Alaska and representatives of Nome, the present Congress will make provision for some form of municipal government, so much needed at Nome.

Drainage and water supply.—The climate, though somewhat harsh in cold weather, is generally healthful. Nevertheless, last fall Nome was visited, to a rather alarming extent, with typhoid fever. The hospitals, which were soon crowded to their utmost capacity, rendered most efficient service. However, many cases complicated with pneumonia proved fatal. The fever is ascribed by the health officers and physicians to the poor drainage and unwholesome water supply. This can be remedied at small cost, for, though the tundra about Nome is

nearly level, its elevation and relations to the beach, to Dry Creek on the north, and to Snake River toward the west, as shown on Map 2, are such that the drainage can be rendered comparatively perfect without great expenditure of money and labor. With reference to the water supply, the topography is also most favorable, as shown on Map 2. An abundance of most wholesome water could at moderate cost be drawn from the upper reaches of Snake River, or its tributaries, issuing from the mountains at some distance back from the coast, and distributed through the town. From early spring until winter these streams discharge a considerable volume of water derived from rain and the melting snow and ice in the mountains and hills. The water accordingly is of the most desirable quality. It could probably be best conducted to Nome by means of surface conduits, or flumes, especially as the streams could not be depended upon for winter use. For permanent or perennial supply a large well, to be sunk in the tundra at a safe distance back from Nome, is suggested.

Harbor facilities.—One of the most urgent needs is that of harbor facilities. Improvements in this direction will justify the expenditure of a considerable amount, and will, presumably, yield good returns. As has already been stated, it is reported that capital has been enlisted by a company of enterprising men, who are now petitioning and negotiating with the Government for right of way and certain longshore privileges, to construct at Nome a deep-water pier, and it is hoped that their efforts may meet with success. The pier is to be built in sections at Unalaska, and when erected at Nome is to extend with its tramway nearly a mile to sea, where deep-sea-going vessels can discharge their cargoes. Only with more extended discoveries of gold can Nome hope for railroad connections with the harbor at Port Clarence, which is about 70 miles distant, or Golofnin Bay, still farther away.

Life-saving station.—Unless harbor improvements are provided in the near future, the establishment of a life-saving station at Nome during the summer months seems to be of importance. It should be brought before the authorities and not overlooked.

Land office.—There has been no branch of the General Land Office at Nome during the past season. It seems beyond question that a branch of this service would be of more benefit to the public at this point during the coming season than at any other place in Alaska. It is presumed that the authorities will not overlook this important matter.

Railway and telegraphic connections.—Governor Brady, in his recent report of 1899, p. 22, has emphasized the necessity of railway connections between the Cape Nome region and Port Clarence and Golofnin Bay, in case the region produces half what is expected of it during the coming season. The importance of cable and telegraphic connections

has also been set forth by the governor, and with further development it is to be hoped that such service will be realized in the not distant future.

SUMMARY.

In the foregoing preliminary report we have attempted to sum up the existing knowledge of the Nome region and the adjacent portions of Seward Peninsula. Our notes on the Nome district proper are chiefly the result of our own observations, while those on the other mining districts are based on the most reliable information available.

We have shown that the bed rock of the Nome district consists of more or less altered limestones, mica-schists, and gneisses. The rocks are closely folded and have an east-west strike. Mineralized quartz and calcite are common. The gravels we have classified as gulch, terrace, and tundra gravels, those of the beach being closely related to the latter. The presence of these terraces indicates that the entire region has been slowly elevated.

We have noted that the important gold deposits thus far exploited are the gulch and beach placers. Gold is also known to occur in the bars of the larger rivers and in the tundra. Our theories would lead us to believe that the higher benches and terraces are worthy of investigation by the prospectors. The gulch and beach placers are extraordinarily rich. As would be expected in a new region, no bed-rock mining has been done; but as the gravels and gold are largely of local origin, there is at least a possibility that workable mineral veins will eventually be found. The methods of mining and separating in use last season are crude and imperfect, so that much of the fine gold was lost.

Of other parts of Seward Peninsula we know nothing from personal observation. The Solomon River and Bonanza River region is said to afford good prospects for gold. The Golofnin Bay region, still farther east, has produced gold in commercial quantities. Gold is said to occur on the rivers of Norton Bay and on Unaklik and Anvik rivers. To the northwest of Nome gold has been reported from near Cape York.

The geographic positions of some of these different localities suggest that they may belong to the same gold belt. The facts known to us are not sufficient to prove this, and it must simply be regarded as a working hypothesis. Should subsequent development and investigation show that the gold of all of these districts of Seward Peninsula is derived from the same series of rocks, this gold-mining region will embrace an area of at least 5,000 or 6,000 square miles. If this proves to be the case, it does not by any means follow that the entire belt will contain workable gold deposits. We should rather expect to find the gold confined to certain zones within the belt.

In the coming spring (1900) it is expected that there will be a very large influx of population into the Nome and adjacent regions. A conservative estimate places the number at at least 20,000 men. Several thousand miners and prospectors wintered at the various camps along the coast, and during the winter many will probably go down the Yukon on the ice. It is evident, therefore, that this region, compared with other parts of Alaska, will be densely populated, and it is not likely that the high rate of wages paid last year will be maintained.

The newcomers in the spring will find that nearly all of the known gold-bearing region has been staked. If the beach strip continues to be withheld from private ownership it will undoubtedly offer good opportunities for many men. It must be remembered, however, that the beach placers, like all others, are not inexhaustible, and that they do not, by any means, extend along the whole coast.

While the staking of new claims in the Nome region is probably nearly a thing of the past, yet those having capital to invest will undoubtedly find plenty of claims for sale. Those who lack knowledge of mining matters should invest their money very cautiously, for there is a vast army of speculators at Nome ready to "unload" when the first steamerful of "tenderfeet" arrives. It would be very wise for all inexperiened newcomers to save money for the return passage.

There will be good opportunities at Nome for experienced miners in working on shares or for wages. Good mechanics will also be in demand. We would warn the public of the danger of typhoid fever and other epidemics in the crowded mining camps, a danger which was amply proved by the conditions at Nome last season.

We believe that the Nome region has a great future, but would strongly advise men inexperienced in mining and prospecting to consider the matter carefully before joining in the mad rush which will undoubtedly take place in 1900.

SEATTLE

Methods of Travel

THE two most important industrial features of Northwestern Alaska relate to water and transportation. Water is as essential to mining as it is to agriculture, and without proper transportation facilities a large area of this country never would be developed. When miners have to pay from $200 to $300 the ton for transporting their supplies from Nome to the mines which they desire to operate, it is apparent that these mines must contain extraordinary values in order to be profitably worked. The extensive mineral deposits which contain values designated as low grade will remain undeveloped until such time as railroads have provided a cheap method of transportation.

The necessity of railroads in this country is apparent to everyone familiar with the situation. The character of the surface of the earth, the swampy coastal plains or tundri, the hillsides covered with reindeer moss, growing in a comparatively dry crust of earth over a treacherous bog, and the miry spots to be found in the mountains as well as on the plains, are evidences of the difficulties to be encountered in constructing wagon roads. Freighting is done all over the peninsula by means of teams and wagons, but in all of Northwestern Alaska there is not a highway or anything that can be designated by the title of road. The nearest approach to a road is a river bed. When a teamster can follow the course of the stream, sometimes wading through deep fords, at other times jostling over big rough boulders, he is fortunate and happy. Where the trails cut across the hills there are frequent places where the horses flounder belly deep in muck and mire and the wagon wheels drop to the axle in the soft ground. No wonder that freighting is expensive. Horses as well as men must be adapted to this work. A nervous horse will quickly wear himself out, and a nervous man will quit the job.

But notwithstanding this physical condition, railroads are easily constructed. A narrow-guage line, where not much attention is paid to the road-bed, the object being simply to construct a road over which freight can be hauled, can be built at a cost of $5,000 the mile. For short hauls there is no question of the superiority of a narrow-gauge railroad over any other methods of transportation in this country. By ditching and draining the tundra and marshy ground of the upland, a firm and permanent road-bed for a railroad can be made. This fact has been demonstrated by the Council City and Solomon River Railroad Company, which is building a standard-gauge road from the mouth of Solomon River to Council City. Sixteen miles of this company's road which has been constructed and is in operation, is evidence of the assertion that a firm, permanent road-bed can be constructed without difficulty in this country.

The development of Seward Peninsula will necessitate the building of railroads from a seaboard terminal to every important mining camp. The men who are now building railroads in this part of Alaska are doing a great public service. They are assisting to develop the country. They are factors in the industrial work of this region second only

to the men who are digging ditches and providing the adequate water supply to wash the auriferous gravels.

Transportation in the winter time is not so serious a problem. After the snows have fallen and the trails have been broken, it is not a difficult matter to haul on sleds a load of five or six tons across the country with a team that could not haul more than a ton in the summer season. The only detriment to the work of freighting in the winter time is the cold weather and frequent blizzards. The snow storms obliterate trails and often necessitate a great deal of work to get them open for traffic. Blizzards are dangerous things to encounter. In the early days the mortality list resulting from blizzards was unnecessarily long. In later winters a better understanding of the blizzards' habits has made fewer casualties from freezing.

Stage lines run from Nome to important parts of the peninsula during the winter season. The stages are on runners and are covered completely with heavy canvas. A stove inside the vehicle has given the conveyance the name of hot-air stage. A stage line with vehicles of this description is in operation between Nome and Council City. It runs on schedule time except in few instances where severe storms interfere. There are convenient road-houses on the trails where the stage driver and his passengers may be housed when the short winter day is done.

A REINDEER IN HARNESS.

In the history of Alaska dogs are inseparably connected with the pioneers. Dog teams were the primitive method of transportation in the winter season, and they are used today where quick service is desired and light freight is to be transported. Dogs are used almost entirely for transporting the mails in Alaska. Every winter the mail to Nome is carried by relays of dog teams down the Yukon and across from Unalakleet to Nome; and from Nome it is sent to every postoffice in Northwestern Alaska by dog teams. The distance between Nome and Unalakleet is 240 miles, and it has been covered with a dog team, by mail carrier M. L. V. Smith, in sixty-nine hours total time. Mail Carrier Eli Smith has the distinction of having made the record trip with a dog team in this country. He brought the Kotzebue mail to Nome, a distance of 350 miles, in five days. If the mail service on the Yukon was as efficient as the service furnished by Calkins & Company on Seward Peninsula, the residents of Nome would get their mail in the winter time in forty days or forty-five days instead of waiting for two months or more for it.

The phase of the transportation question between Nome and the states is simply that of an ordinary ocean voyage until the steamer drops anchor in the roadstead at Nome.

It is a long voyage, the distance from Seattle to Nome being 2,350 miles. The vessels of the Nome fleet are from eight days to ten days making the trip. On this journey the passenger approaches very near to the line in the Pacific Ocean where in traveling westward, a day is gained; and where the eastbound traveler loses a day. In order to get to Nome the vessel must sail a long distance to the westward, and the traveler will cross a meridian that passes to the westward of the Sandwich Islands.

If the weather be favorable the trip will be delightful. When the vessel arrives at Nome the passenger will receive his first introduction to the difficulties of transportation in the Northland. Instead of the vessel tying up to a pier and permitting the passengers to walk ashore on a gang plank, the captain of the ship will anchor in the roadstead, two miles from shore. A little tug drawing a big black barge will steam from the shore out to the vessel. The passengers will be landed upon this barge, and the tug will haul them ashore. If the weather be favorable and the sea calm, the barge will be hauled in so that the passengers may land by a gang plank. But if the water be rough, as it frequently is, the new arrivals will be hoisted from the barge by means of a derrick and boom and slung through the air onto a wharf built at the water's edge.

Every pound of freight shipped to this camp must be lightered ashore from the vessel carrying it. In order to transact the business of discharging freight at Nome there are several lighterage companies and a small army of longshoremen. The cost of lighterage is about four dollars the ton, half as much as the cost of transporting freight from Seattle to the spot in the roadstead where the ship drops anchor.

The necessity of a pier or a dock at Nome is obvious. The question is, can one be constructed that will withstand the storms, and not be destroyed by the ice when it goes out.

I have neglected in this story, which is but a brief reference to some of the phases of transportation of the north country, to refer to the prospector with a pack on his back. In 1900 dozens might be met daily on every trial, each man with a pack on his back and a shovel on his shoulder. Carrying his pack across the swampy tundra, over the hills, through wet willow thickets, fording streams waist deep, sleeping at night in wet blankets and eating hastily prepared fare—pan-cakes, bacon and coffee,—is the experience of nearly every pioneer of this country.

Wherever practical or possible, the rivers of Seward Peninsula have been used for transportation purposes. But none of the streams are navigable except for small, light draft vessels, and wherever a miner could reach his destination by following a water course, a means of transportation was open to him. A small boat could be poled up the river or towed up stream, men and dogs, sometimes horses being utilized at the end of the tow line. The work of poling and towing a boat up most of the streams of Seward Peninsula, is an exceedingly laborious task, but it has been the only method by which prospectors in the early days were enabled to get supplies any great distance into the interior.

Seward Peninsula Railroads

Seward Peninsula has thirty-five miles of railroads in operation. The Nome-Arctic Railroad Company has a narrow-guage line between Nome and Anvil and Dexter Creeks. This line was constructed by the Wild Goose Mining and Trading Company from Nome to Anvil Creek in 1900. It has since been extended up the left limit of Anvil Creek across the divide between Anvil and Dexter Creeks to the southeastern base of King Mountain overlooking Nome River. The terminal is ten miles from Nome. This road is pointing toward Kougarok District and may be extended to this part of the interior of Seward Peninsula as soon as the traffic justifies the construction of the road-bed.

The Council City and Solomon River Railroad is a standard-guage line planned to connect Solomon with Council City. The line has been constructed and equipped to East Fork, sixteen miles from Solomon. This road has its shops and offices, which are of a subtantial character, at Dickson, the seaboard terminal of the road just across the river from Solomon. This railroad has been constructed in a substantial manner with a view to permanency and future operations. The road-bed is level and ballasted, and all the work both in construction of the road and in the construction of the company's buildings shows painstaking care and the intention to secure lasting results. There is material on the ground to complete the road from its present terminal to Council City.

The Wild Goose Mining and Trading Company has a railroad in operation between Council City and No. 15 Ophir Creek. This road was constructed to accommodate the traffic of the company, but it has proved to be a great convenience to other operators on Ophir Creek. The line is seven miles long. It is a narrow-gauge road, the kind best adapted for short hauls in Alaska.

Nome's Commerce

SIX years ago the only vessels that touched at points of Seward Peninsula were whalers and an occasional schooner engaged in trade with the natives. This year the commerce of Nome requires fourteen steamers having an aggregate tonnage of 25,000 tons and several schooners that are capable of carrying 5,000 tons every trip. Most of the steamers make from four trips to six trips in a season. In 1901 more than 150,000 tons of freight were landed on the beach at Nome, and 15,000 people accompanied these miscellaneous and heterogeneous cargoes. No such a volume of freight nor such a number of people has been transported in any of the succeeding seasons. In 1902 the cargoes landed at Nome and Solomon aggregated near 70,000 tons; but this included material for the Council City and Solomon River Railroad, which was near 20,000 tons. In 1904 the shipments to the Nome country were more than 80,000 tons. In all probability the shipments for the season of 1905 will exceed this quantity, as a great deal of mining machinery is going into the country.

Seattle, San Francisco and Portland are the principal supply stations of the Nome country. A part of the mining machinery and the material for the construction and equipment of the railroads is purchased in the East, but, with a few exceptions, the food, clothing and fuel for Northwestern Alaska is bought on the Pacific Coast. The foregoing facts furnish the basis for an estimate of the present value of Seward Peninsula to the cities where the larger amount of supplies are purchased. This value will steadily increase with the development of the country. The industries of Northwestern Alaska are in their infancy. There is every indication that there will be an annual increase of the mineral product of this country for many years. Much of the work which has been done during the past two years and much that will be done for the next three or four years is of a preliminary character. The railroads that are building and the ditches that are being constructed are preparations for more extensive mining. The mining of the future, provided with adequate facilities, will be conducted more profitably than it has been in the past. The exploitation of the tin region will add to the mineral wealth and product of this country. With an increase of the mineral product there will be a commensurate increase of commerce.

Seattle being the nearest shipping point in the United States should naturally command the largest part of trade with Nome. The distance from Seattle to Nome is 2,350 miles. The fastest steamers of the Nome fleet make the trip in eight days. Most of the commerce of Nome from the eastern states passes through Seattle. The development of this northern empire of stupendous mineral resources will be a conspicuous factor in the growth and prosperity of Seattle. The far-seeing business men of Seattle recognize this fact have organized a club composed of 700 representative citizens, and having for its object the promotion and encouragement of all legitimate enterprises for the development of Alaska. The Alaska Building, recently constructed in Seattle, is the finest struc-

Alaska Building, Seattle.

ture in the city, and it is a prophesy of what the development of Alaska will be to the Queen City of Puget Sound.

The Alaska Club is doing a splendid work for Alaska. It is a representative body to voice Alaska's needs in Washington and it is doing commendable work to give publicity to Alaska's resources, and the great commercial possibilities of this new country which are now lying fallow.

HARBOR FOR NOME.

Better facilities for landing and loading freight at Nome will be of material benefit to the commerce of this country. Captain E. W. Johnston, who has been prominently identified with the lighterage business of Nome since 1900, has consummated plans to provide these facilities. Last winter a charter was secured from Congress to permit, under the supervision of the war department, the building of a pier at the mouth of Snake River. The Nome Improvement Company was organized in Oldtown, Me., and $300,000 was subscribed to make a harbor at Nome. The contract for constructing this harbor has been given to Captain Johnston.

THE JOHNSTON LIGHTERAGE PLANT AT NOME.

The New Harbor Will Change This Method of Landing Freight and Passengers.

The pier will consist of cribs thirty by fourteen feet tapering to twelve feet wide on top. These cribs will be filled with rock from Sledge Island and Cape Prince of Wales. They will be covered two feet above water with edge-bolted timbers, and will extend into the sea a distance of 750 feet from the mouth of Snake River. There will be two parallel lines of these cribs. The distance between them at the mouth of Snake River will be 110 feet. This width converges to eighty feet at the end of the pier, where there will be fourteen feet of water. A breakwater 400 feet long will be built in the sea beyond the pier. Piles will be driven along the easterly side of Snake River, and all the sheds and warehouses necessary for the shipping business of Nome will be constructed on this side of the river.

It is proposed by this enterprise to furnish a safe harbor for all the small vessels at Nome, and a means of reaching the larger steamers during the stress of the worst weather. The cost of lighterage will be reduced, and the danger to life and property on this storm-beaten shore will be lessened.

The Nome Improvement Company is a strong organization, with money subscribed to complete the work undertaken, and ample funds at command to consummate any business plans essential for the success of the enterprise that has been inaugurated. The following gentlemen are the trustees of the company: Herbert Gray, of Oldtown, Me., president and treasurer; C. P. Dam, of Nome, secretary; Mark Reed, of Seattle; George Van Dyke, of Boston; J. G. Gould, of Oldtown.

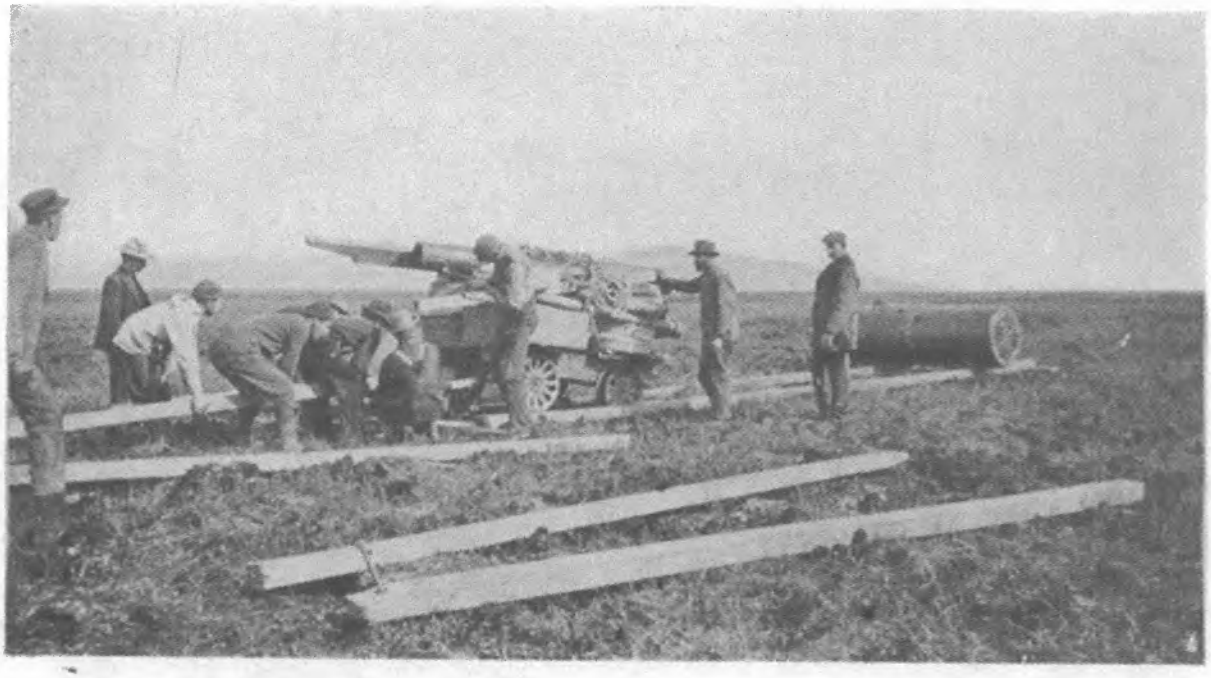
Booklet of information about

NORTHWESTERN ALASKA



GETTING A SMALL PUMPING PLANT OVER THE TUNDRA TO A FRESH WATER LAKE.

RAILROAD EXTENSION AND NEW LINE PROJECTED BY MAJOR L. H. FRENCH.

There is a conspicuous need of transportation facilities in Northwestern Alaska. In 1900 was the beginning of railroad construction and operation, and since then several railroad enterprises have been undertaken and consummated or partially consummated. This kind of work is proceeding as rapidly as the means and opportunities of those engaged in it will permit. All kinds of development and progress in this country are slow, but there is no question that the development of the country would be accelerated if better transportation facilities were provided. There is no question, on the other hand, of the requirements of miners, who are beginning to develop the interior country, accelerating the building of railroads.

The United States Government has a fund from the license money for the building of wagon roads, and this will add very much to the transportation facilities of the Northern country. But time is required, and the wheels of progress in this frozen land move very slowly. In the years to come, when we will ride in cars from Nome to Candle Creek,

and probably to the region of the Kobuk River, possibly to the Colville River, and from Nome to the well-known mining centers of Seward Peninsula, and see the traffic that these trains will carry, we will wonder why men familiar with the transportation business were so long in understanding and realizing the great wealth of this country, and wonder why they did not construct these railroads at an earlier date.

But substantial progress was made during the past season in the way of extending lines. The Nome-Arctic Railroad extended its line several miles up Nome River beyond the terminal of last year, and has planned to enter the Kougarok next season. The Council City and Solomon River Railroad added five miles to its line last season, making its present terminal twenty-one miles from Solomon, and within three miles of the divide between the Solomon River region and the Council City country. It is probable that this line will be completed to Council City next season. The operations of the past summer have been the most successful in the history of the road. This line has been under the management this year of Mr. Hugh F. Magee. He says that by August 15, 1906, the road will be ready to deiver freight on the Casadepoga River.

J. Warren Dickson, the promoter of the Council City and Solomon River railroad, has organized another company, and by letter and wire has informed the Chamber of Commerce of Nome that he will be in the country next season prepared to build a line from Nome to Kougarok.

One of the most important railroad enterprises of Seward Peninsula is a line to be built from the north side of Port Clarence Bay to the Kougarok region, touching the tin mines. Surveys and maps have been made of this road and the work will be undertaken next season. Charles D. Lane is the president of this company and Major L. H. French, the president and general manager of the Cedric Ditch Company, is the manager of the enterprise. During the past summer Major French has been the leader in industrial enterprises of Northwestern Alaska, and this railroad is among the most important of all the great work that he has undertaken to do. He has acquired large holdings of mining ground on the Kougarok River. These holdings comprise fifteen consecutive miles of the stream, and he has planned large dredging operations in this region. The economical consummation of these plans requires the construction of a railroad from the most available seaboard terminal to his base of operations. Primarily, it may be said that the railroad is only a factor in the extensive work he has mapped out in this part of the peninsula. But aside from its value to him and his associates in the work they are going to do, the road will be of great benefit to the country, and will assist the development of a practically undeveloped region. Eliminating, however, all of these features, there is every reason to believe that the road will be a profitable commercial venture. The prospects of the tin mines and the back haul of tin ore and concentrates from these mines, the freight to be transported to the Kougarok and intermediate points, which must now be hauled in over the snow or taken in small craft up the river, will provide a revenue that will pay interest on the investment from the beginning of operations.

The development of this vast interior region has been retarded by lack of transportation facilities. A country must be immensely rich if it can be developed when freight charges from the nearest base of supplies are $300 the ton. But the Kougarok region has been slowly and steadily advancing and growing in importance and value, notwithstanding this serious handicap. A railroad from tidewater will hasten this development, and if a road can see enough business in sight now to pay an interest on the

investment, it will be a splendid dividend property when it has opened up and made accessible the country it crosses.

The Kougarok Mining and Transportation Company is the name of the corporation that will accomplish the work just mentioned. The company will build a town on Port Clarence Bay, which is the best harbor on Seward Peninsula. Ultimately the road will be extended to Candle Creek and Inmachuck River.

BEACH AT NOME AFTER A STORM.

NOME DAILY NUGGET

MINING EDITION

NOME, ALASKA, 1908.

ERNST, ENG.

WILD GOOSE MINING & TRADING COMPANY

In considering the history of the Nome Mining District, and, in fact, that of the whole of Seward Peninsula, no single factor has been of greater importance in the development of its natural resources than the Wild Goose Mining & Trading Co.

This company was organized by that energetic and intrepid old veteran Chas. D. Lane and financed by some of the wealthiest men in California, Washington and the eastern states, and was the first organization having large capital at its command to get a foothold in Seward Peninsula.

The vast treasures of gold that lay hidden in the gravels of Anvil and Dexter and Glacier creeks were early appreciated by the experienced eye of Mr. Lane, and he rapidly acquired large interests for his company. Instituting a policy of vigorous development of the company's holdings, he soon realized the necessity of cheaper and quicker transportation of supplies from the seaboard to the diggings across the rough and boggy tundra, and in the winter of '99 he laid before the directors of his company a proposition to build a railroad from Nome to Anvil creek and backed his proposition with such substantial arguments as to its feasibility and financial success that the necessary capital was provided, and in the early spring of 1900 the rails, ties, rolling stock and other equipment was landed upon the beach at Nome, and by mid-summer the Wild Goose Railroad was in full operation.

This road has the distinction of being the first railroad built in Alaska, and has the further distinction of being the only railroad ever built which paid for itself the first year of its operation. It also has the distinction of having reduced the cost of transportation of freight from twenty cents per pound, or $400 per ton, to $40 per ton, over a given distance immediately upon its completion, and was thus the means of materially aiding every claim owner in its vicinity in the development of his property.

Mr. Lane also foresaw the necessity of obtaining a larger and more constant water supply for washing the rich gold-bearing gravels of Anvil and Dexter, and believing at that time that ditches would not be a success over the glaciated surfaces of the hillsides, he again drew upon the exchequer of the company for the necessary capital to build one of the largest and best equipped pumping plants ever built in any mining community. This plant is said to have cost over a half million dollars and is capable of pumping 3,000 gallons of water per minute through five miles of pipe line to an elevation of 750 feet.

The Wild Goose railroad was later merged into the Nome-Arctic railroad and then into the Seward Peninsula railroad, the Wild Goose company

T. M. GIBSON.

parting with all its holdings, but the great pumping plant, the twin conception of the railroad, still stands upon the bank of Snake river at the edge of town and is still the property of the Wild Goose company. Since the time that this was built it has been demonstrated not only that ditches along the hillsides are possible, but that the cost of their construction and maintenance is such as to make the water delivered by them more economical than that delivered by the pumping plant, so that the plant is now only used for delivering water to mines at low elevations on the tundra.

The Wild Goose company also secured through Mr. Lane extensive and very valuable holdings on Ophir creek in the Council district. In fact, the company owns practically all of Ophir creek from Discovery to the mouth of Crooked creek, a distance of nine miles. This valuable property is under a splendid system of ditches aggregating some fifty miles in extent and taking water from upper Ophir creek and the Pargon river. These ditches deliver 5,000 miners' inches of water, which is used under high pressure in hydraulic elevators and giants, and vast quantities of the rich auriferous gravels of Ophir creek are annually washed and their treasures of gold turned into the coffers of the Wild Goose Company.

This vast Ophir creek enterprise is probably the most valuable holding of the Wild Goose company in Alaska, and will require many years of constant effort to exhaust the stores of wealth.

Here, too, Mr. Lane showed his ability to grasp big things and comprehend their possibilities. Here, also, is another Wild Goose railroad, which takes supplies from Council to Ophir creek, and also steam boats, barges and other river equipment on the Fish and Niukluk rivers, which transport supplies from Golovin Bay to Council.

The Wild Goose company has expended a vast amount of money in exploiting this district, and is sure to reap a rich reward for its expenditure. Mr. Lane, owing to ill health and the infirmity of declining years, severed his connection with the company in the spring of 1906, and was succeeded in the management by Mr. Frank Shaw, who had been an able lieutenant under Mr. Lane in the Ophir creek district.

Mr. Shaw, however, seeing the great possibilities for individual effort in the Nome district, in the spring of 1907 gave up the management of the company to operate on his own account, and was succeeded by Mr. T. M. Gibson, whose management of the company during the past year has been eminently successful.

Mr. Gibson has acquired many additional valuable holdings for the company since he became its manager and the cleanups this spring from the winter work are the largest in the history of the company. The company owns or controls nearly a mile of the rich third beach pay streak, and besides having several very large and rich dumps from the winter's work, is daily hoisting pay gravel from several different shafts, and will undoubtedly make 1908 a banner year for the company.

The work in which the company is at present engaged and has been carrying on the past winter along the third beach line is such as only large capital can handle, as the ground is wet and requires an immense initial outlay to carry it on. Large and ex-

pensive pumps must be installed and kept steadily running to keep the mines unwatered, and a forest of timber is used in supporting the tunnels and stopes.

It is said over one million feet of lumber will be required for this summer's work of the Wild Goose Co.

Manager Gibson, with his usual foresight in handling the company's business took advantage of the good sleigh roads just before the breakup and delivered to the various mines the necessary amount of lumber to carry them through the summer season, thus saving the heavy cost of summer freighting over the tundra. He has also distributed a large amount of fuel oil to the mines which is stored in tanks set upon the hillsides above the workings and distributed by gravity to the various boiler houses through a system of pipes which not only facilitates the work, but greatly reduces the cost of handling the fuel.

In the winter season the pay gravel is mined and hoisted to the surface and placed in dumps, from which it is shoveled into sluice boxes as soon as water is available for sluicing in the spring. In the spring and summer it is hoisted and dumped into large gravel bins and drawn through chutes directly into sluice lines, and the gold is cleaned up daily.

This system of handling the pay gravel is made possible by the large ditches which tap the headwaters of the rivers and bring down to the diggings a plentiful and constant supply of water for sluicing purposes.

The Wild Goose company, although at first somewhat backward about engaging in ditch building enterprises, subsequently became heavily interested in this class of investments, and is now the owner of the fine system of ditches known as the Seward Ditch, which takes three thousand miners' inches of water from Nome river near the mouth of Dorothy creek and delivers it through thirty odd miles of ditches, flumes and pipe lines to the various creeks, benches and bench lines along the front of Anvil mountain and adjacent hills. This ditch system has made it possible to work large areas of gold bearing gravel lying in the creeks and on the slopes under it, which would otherwise have lain idle, and has very materially increased, and will continue to increase, the gold output of this district.

Another enterprise which the Wild Goose company is putting through is known as the Grand Central High Pipe Line, which, when completed, will deliver 4,000 miners' inches of water under high pressure on the top of the highest divides separating the well-known gold-bearing creeks in the vicinity of Anvil mountain. This pipe line takes the waters of the Grand Central river, in the heart of the Sawtooth range, and diverts them through a wood stave pipe 52 inches in diameter at the intake and 42 inches in diameter on the grade line, and built upon a carefully prepared grade having a fall of fifteen feet per mile. Several miles of this line have already been completed at its upper end, and the work is to go steadily forward until it is finished. The entire line will be over fifty miles long, and it is estimated that it will cost one and one-half million dollars. It is the most gigantic water enterprise so far undertaken on Seward Peninsula and will have far-reaching effects and give tremendous impetus to mining on the high benches, where at present no water is available for sluicing. The well-known ability of the Wild Goose company to finance such an undertaking and the certainty of its being a paying proposition when completed are a sufficient guarantee of the early completion of the work. These water enterprises, together with the ditches of Ophir creek and the Pargon river, make the Wild Goose company by far the largest ditch owners in Alaska.

Another new and to a large extent untried field of endeavor in this part of Alaska is now being exploited by Manager Gibson on behalf of the company, and if successful will have far-reaching effects upon the mining industry in Seward Peninsula. This new venture is the development of what promises to be an extensive coal field in the vicinity of Norton Bay. Considerable work has been done during the past winter and is still being carried forward upon the Dusty Diamond coal mines at the head of Norton Bay, about one hundred and fifty miles east of Nome, and the results are sufficiently encouraging to justify the prediction that before the close of navigation this year the Wild Goose company will be shipping coal to this port for general consumption, and it is firmly believed that the local coal will largely supplant the outside coal for household and mining purposes. The coal has been tried in stoves and boilers and found to burn freely and give satisfactory results. It is believed it can be handled here and sold in the market for about half the price of outside coal used at present for the same purposes.

This is a matter of the utmost importance to the miners of this district, as the fuel consumed in thawing the frozen ground and pumping water from the thawed areas forms a very heavy item of the expense of mining, and cheap fuel will make possible the working of large areas of low grade gravel which cannot be worked under the conditions that have heretofore prevailed.

The Seward Peninsula Railway

It is safe to say that the most important factor in the development of Seward Peninsula at the present time is and in the future will be the Seward Peninsula Railroad. It has opened to the prospector districts which were formerly practically terrae incognitae and it has enabled owners of properties on the beach lines to operate with much less expense.

The road has a mileage of 100. In its equipment are included 109 freight cars, 16 passenger cars, 5 locomotives aided considerably in the development and 1 motor car.

In the year 1907 it expended for improvements and construction the sum of $100,000 and the warehouse they constructed at Lane's Landing have

TRESTLE AT LANE'S LANDING.

of the Kougarok.

The company intends to extend the line toward the Kougarok for a distance of 25 miles from the present terminal. It is also the intention to install two passenger motor cars, each able to accommodate 20 to 30 passengers, which will be able to make the round trip each day between Nome and Lane's Landing.

At Nome will be established first class machine shops and as the country grows the road will advance apace. On its line today are quartz ledges for which transportation facilities are required, and the effect of the construction of the railroad on them is already becoming apparent. For the placer miners of the Kougarok and sections less remote the road has performed Trojan service, and its period of usefulness has only begun.

Nome as Base For Arctic Exploration Supplies

THAT Nome is destined to be a most important base of supply for Arctic exploration is a fact which may be deduced from the circumstances relating to the expedition of Steffansson and other expeditions which outfitted here this summer. George Phillips, the fiscal agent of the Canadian government, who accompanied the expedition as far as this city, and Mr. V. Stefansson himself have declared that in no other city on earth could they have secured the supplies which they obtained here and their words are borne out by the fact that supplies to the value of $30,000 or $40,000 were purchased here by that one party alone. The Lane expedition which had scientists and hunters aboard also outfitted in Nome for a winter in the Arctic and various smaller fishing, hunting and scientific expeditions recognized the advantage of purchasing here the supplies which Nome's merchants alone kept in stock.

The Stefansson expedition left here this summer for the Arctic in three vessels which are the Karluk, the Alaska and the Mary Sachs. It is the intention to spend at least three years in Arctic waters during which time Mr. Stefansson will make a closer study of the people who have come to be known as the Blonde Eskimos whom he is accredited with discovering during the former trip which made him famous. With the expedition were several scientists, geologists and others who hoped to secure some valuable information along various lines and who during their three years in the Arctic will probably add considerably to the world's knowledge of that strange and practically unexplored region. The Karluk is commanded by Captain Bartlett who commanded the ship of Peary when he reached the North pole.

During their stay in Nome while they were outfitting the members of the expedition were guests at several functions and at various times they asserted that their decision to outfit here was one of the wisest.

After his historic voyage through the Northwest passage Amundsen, later the discoverer of the South pole, landed at Nome and it was here that he first saw real civilization since he departed on his famous journey and it was here that he enjoyed his first taste of the pleasures of the world he had left.

Nome is only a little more than 100 miles from Bering straits, the entrance to the Arctic ocean, and the supplies kept in stock here contain all the articles necessary for Arctic travel because the travelers on the trails on Seward peninsula in the coldest part of the winter wear and eat what Arctic travelers wear and eat. Amundsen is now about to secure here the dogs to be used in his search for the North pole to which he intends to drift with the ice and from Nome he will set sail into the Arctic desolation.

Nome is really the gateway to the boundless seas and lands beyond the Arctic circle. It is the last port of call and the natural base of supply.

ROADS AND TRAILS

In Northwestern Alaska

THE MATERIAL development of all sections of the world depends no less upon the richness and extent of their resources than upon transportation facilities. The first systematic work done in road construction in the Seward Peninsula was in 1900 by private interests and public subscription. In June, 1900, work was begun by the Wild Goose Mining, Trading, and Transportation Company to build its railway from the western end of Nome where the company supplies were stored, to the scene of its main operations near the upper end of Anvil Creek, a distance of approximately three and one-half miles.

Simultaneously with the Wild Goose railroad construction, a party of mine operators, assisted by public subscription, began to build a road from Nome to upper Dry Creek and to Dexter Creek, a distance of seven miles. The work was difficult and expensive because of the soft ground to be traversed. This road today constitutes the main arterial from which branch roads lead to the Osborn Creek region, the Anvil Creek region, Glacier Creek, and the upper Snake River basin. The next road to be constructed was from Nome to Fort Davis. It was built by public subscription and by the local military authorities.

In 1905, the Federal Board of Road Commissioners began to function. It cooperated with the various mine owners and was assisted by public subscription. New roads were constructed and the older roads were extended, to many mining localities, as the limited means at the disposal of the Board would possibly permit. This agency had exclusive charge of our roads and trails until 1915, when the Alaska Legislature created the Territorial Board of Road Commissioners. By this act four road boards were established, one for each of the Judicial Divisions into which the Territory of Alaska is divided. The Road Board for the Second Division had its headquarters at Nome, where the Federal Road Board was also maintaining its offices. These two road boards functioned independently, the one procuring its funds from the Federal Government, and the other from the Territory. In 1919, however, the Legislature enacted a law whereby the Territorial Road Board was to form a working agreement with the Federal Road and was to be under the supervision and direction of the latter Board. This was to secure cooperation and efficiency at less cost.

Since 1919 all road construction, extension and repairs, as well as all trail staking and building of shelter cabins at needed places on the trails, have been done by the Alaska Road Commission, which is a Federal agency using Federal and Territorial funds.

In this connection, too much emphasis cannot be placed upon the outstanding fact that Nome has had and still possesses the largest and best equipped transfer outfit ever assembled in Alaska. During the past thirty years no operator can truthfully say that he was delayed for a single day on account of unavailable transfer equipment.

The Northwestern Alaska Chamber of Commerce has outlined an extensive program for road extension and construction, whereby all centers in each of the four Divisions of the Territory of Alaska which are known to possess extensive and valuable resources would be connected by arterial highways. Branch roads from these arterials could be built from time to time as local developments would warrant them.

Reference is now made to the two-page map on page 20 and 21, as it shows the Chamber's Arterial Road Project, and, also, the proposal of the International Highway Commissioners for the construction of a road connecting the Pacific States, British Columbia, Yukon Territory, and passing through the Interior of Alaska to Cape Prince of Wales, and from there crossing Bering Straits into Asia!

FROM EVERY PORT in Northwestern Alaska, roads are being extended and maintained, as rapidly as available funds will permit. It is the policy of the Alaska Road Commission to cooperate with financiers of worthy enterprises to facilitate the moving of freight to the scene of operation. This map shows the project of road extension as adopted and vigorously advocated by the Northwestern Alaska Chamber of Commerce.

AVIATION. Left column: *A load of vegetables is checked out on a PAA flight to Nome.* • *Ship of the Alaska Airlines fleet.* • *Wien plane on the beach at Wales.* Right column: *Baggage being loaded into a Pan American Clipper.* • *Stinson Tri-Motor operated by Munz Airlines.* • *A Munz plane being used on a big game hunt, with one of the victims in the foreground.*

AVIATION

ON THE afternoon of August 17, 1920, The Black Wolf Squadron of the United States Army, composed of four DeHaviland planes under the command of Captain St. Clair Street, flying from Mineola, New York, landed on the sand spit at the mouth of Nome River, where a landing field had been hurriedly prepared for them in response to an order from Washington.

These were the first planes to come to Seward Peninsula, and were objects of great curiosity to the Eskimos and whites alike, very few of whom had ever beheld an airplane before, and had assembled en-masse to see and greet the aviators. The landing was made amid scenes of the wildest enthusiasm, and an ovation was tendered the pilots.

THE "LINDYS" VISIT NOME

Today the arrival or departure of planes from the aviation field near Nome is commonplace, and excites little or no comment. Within the last five years transportation by air in Alaska has passed the experimental stage, and from being almost prohibitive in cost, has now become so reasonable that plane travel, especially during the winter, is cheaper than any other mode of transportation. Where formerly only those to whom haste was vital made use of the planes, they are now used by all classes, even the Eskimo traveling by air in preference to going by dog team.

The lower rates were brought about by the construction of landing fields throughout

An N.A.T. Plane Based at Nome

Seward Peninsula by the the Federal and Territorial governments, enabling the operators of commercial planes to land passengers and express loads in the outlying districts without risk.

At the present time the traveler disembarking at Nome, can take a plane and fly to the borders of Alaska, or if need be into Canada. Point Barrow, the most northerly point on the North American continent, is only six hours from Nome by air, and planes have been there as late as the end of October,

and as early as the middle of February, and these were not stunts, for a record, but flights made in the regular course of business, for the purpose of bringing out passengers, thirty-nine of whom were taken out from the immediate neighborhood of Barrow by one company.

The planes used are almost all modern, closed, cabin monoplanes, heated for the comfort of the passengers and driven by the latest types of powerful air cooled, radial mot-

An Alaskan Airways Plane Based at Nome

ors, which experience has demonstrated to be the most suitable for this climate. All planes are under Federal inspection by the United States Department of Commerce.

In case of sickness of distress, all communities in Northwestern Alaska are just across the street from Nome and a plane is on the spot in a short time to convey the patient to the nearest hospital, or to rush a doctor to the scene. In this respect the planes have saved many lives and much suffering has

Laiblin & Graham Plane based at Nome

been alleviated. They also enable the crews in outlying sections to work up to the day before the last steamer sailing, thereby lengthening the mining season from ten days to two weeks, with an increased gold production resulting. They carry all sorts of cargoes, fur to the markets for the traders, freshly caught fish to the cities, first class mail as a matter of course on all flights, with large quantities of freight and express matter, from wedding rings to mining machinery.

A cargo of furs valued at a quarter of a million dollars was transported from a trading vessel frozen in at North Cape, Siberia to Nome and advantage taken of a rising market.

Before the advent of commercial planes such a thing as securing a head of lettuce in the winter would have been impossible. Today planes arriving from points on the Alaska Railroad bring fresh fruit and vegetables, celery from California, tomatoes from Mexico, bananas, strawberries, in fact anything the market offers.

Another phase of plane activity which is developing, is that of placing prospectors and the necessary tools and supplies for their use, in the interior at points which under the old conditions, were almost inaccessable. This can now be accomplished in a few hours by flying, and contact maintained at predetermined inter-

Pontoon Planes Land on the Beach at Nome

vals with the men in the field. In this way more can be accomplished in one season than formerly could be done in three years, at a fraction of the cost. New country, hitherto practically impossible to reach is by this means being opened up, and affords an attractive opportunity for the speculative investor.

A unique use to which the airplane has been put is that of assisting in the locating of reindeer lost, from the herd, or in locating an entire herd prior to a round-up. The plane covers a given unit in a matter of a few hours' flying time, returns to headquarters and gives the information enabling the herders to go direct to the animals, eliminating from ten days to two weeks' search on the ground.

(Continued on Page Thirty-Three)

AVIATION

(Continued From Page Seven)

Where natural landing fields are located in the vicinity of the herd, the plane has taken the herders direct to the deer. Planes have been used in contacting the herd of 3,000 reindeer which are being driven into Canada for the Canadian government; this drive is traversing a country almost inaccessible at certain periods of the year to those using any other means of transportation than airplanes.

The companies engaged in commercial aviation are prepared to move all kinds of freight, within certain piece weight limits, to any points where landings can be effected on either land or water. During the summer the planes operate on wheels or pontoons depending on the landing conditions, and during the winter the wheels or pontoons are replaced with skils, as the country after snow begins to fall, is a nearly continuous landing field for a plane so equipped.

Nome is geographically situated very close to the western edge of Alaska and being directly on the Great Circle from New York to the Orient, is the logical point of arrival and departure for trans-continental flights. In the year 1931 a number of flights of this kind occurred; that of Post and Gatty on their record-breaking flight around the world; Colonel Lindbergh's flight to the Orient; Moyle and Allen on their flight from Japan to Tacoma, as well as the non-stop flight from Seattle to Tokyo, attempted by Robbins and Jones, which ended here. A number of others are projected and some of these will be made in the near future.

CHAMBER OF COMMERCE

NOME • ALASKA

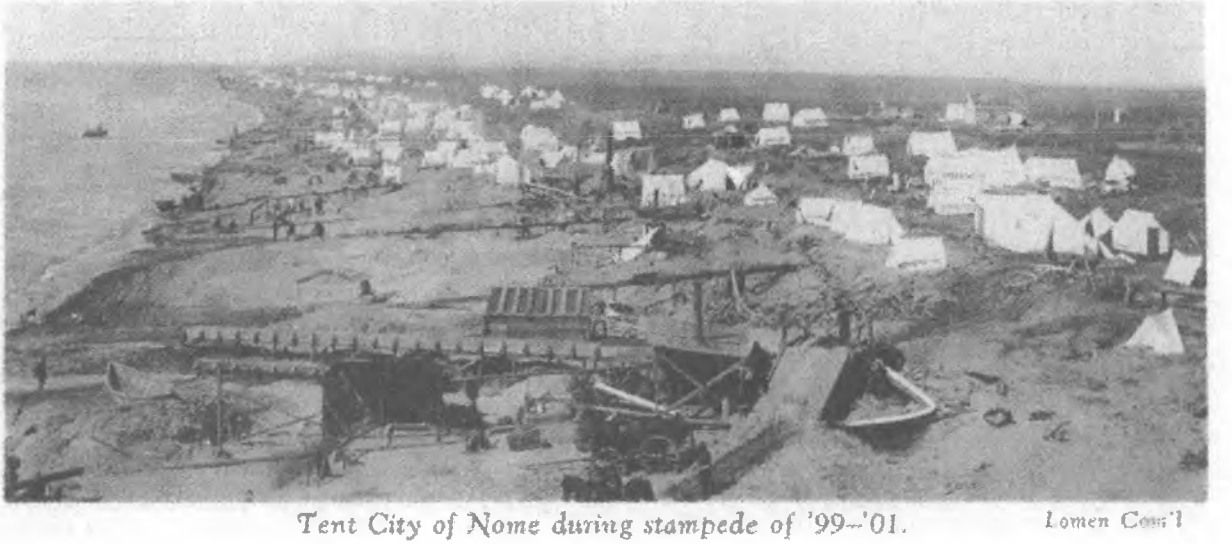
averages around 160.

Nome has year-'round radio telegraphic communication with other parts of Alaska and the States, the U. S. Signal Corps maintaining a station which handles commercial business. The telephone system extends from Nome to various towns and mining districts. Passengers, freight and mail reach Nome by boat from Seattle during the open season. Ocean-going vessels lie at anchor a mile from shore and passengers and supplies are brought to town on lighters with tugs. Small coastwise boats ply from Nome to points up and down the coast from St. Michael to Kotzebue. A harbor at the mouth of the Snake river at Nome shelters small boats and lighterage equipment.

Aviation is an important factor in the lives and economy of the residents of Nome and Northwestern Alaska, giving surprisingly good air transport service to this section. Both in winter and summer the planes of Pan-American World Airways, Alaska Airlines and Wien Airlines include Nome on their regular schedules. Munz Air Service and local pilots cover the Seward Peninsula. Planes come and go from Nome almost daily. Pan-American has recently added to their service by delivering fresh farm produce to Nome merchants. Dog teams are still used to some extent in winter but this mode of transportation is rapidly being replaced by planes equipped with skis and pontoons.

Aside from mining, Nome's foremost industry, there are very promising indications that fishing will in the near future add materially to the city's prosperity. A survey of the fish resources in the Bering Sea will undoubtedly be made at an early date, and development of this industry will result in marketing of king crab, shrimp, cod, halibut, herring, and salmon. Cargoes of fish to the States will reduce freight rates northward, as ships now return without freight, thus increasing costs of the long haul to Nome.

The thriving city of Nome, which serves as a gateway to the highly important Seward Peninsula, is well represented by progressive merchants whose stores would be a credit to a larger community. Socially and spiritually the city has various clubs and churches. There are many things yet to be desired but with the indomitable spirit of its citizens, backed by the wide-awake Northwestern Alaska Chamber of Commerce, prospects for the community's future growth and prosperity are exceedingly bright.



Tent City of Nome during stampede of '99–'01. Lomen Com'l

The headquarters of the Reindeer Service is located at Nome.

TOURIST ATTRACTIONS

A trip to Nome and Seward Peninsula is one never to be forgotten. Tourists and sportsmen will find this section of Alaska little changed since the gold rush days. Nome and other well-known mining towns and villages have retained much of the flavor and color that intrigued past generations. Gone are most of the famous characters of yesteryear; the Dan McGrews and the dance-hall girls are but memories; in their place are a pioneer people, kindly, progressive. They offer a hearty welcome to the stranger, go out of their way to make his sojourn most enjoyable.

Sportsmen with gun and rod will find game in abundance in this section. One of the greatest sports—and a most useful one—is hunting of wolves by plane. Local planes can be chartered for this purpose or for an exciting fishing trip to one of the many spots where the limit of Arctic trout, and other members of the finny tribe can be caught.

The scenery of Northwestern Alaska is for the most part entirely different from that found in other parts of the Territory. Much of the terrain is comparatively level with countless little lakes and mountain streams. Here and there lofty mountains rise above the billowing tundra, their snow-capped peaks piercing the sky. The Bering Sea, Norton Sound, Kotzebue Sound, and the Arctic Ocean which borders the extreme northwestern coast, provide many a beautiful picture. Sometimes placid, sometimes turbulent and troubled, other times in the grip of winter's glistening ice, these famous waters are awe-inspiring to behold. Here the Eskimo, in all his glory, with his tiny skin boat, wrests fish, seal, and walrus from the challenging sea. To witness his primitive yet ingenious method of seeking a livelihood is an unforgettable experience awaiting the tourist to Nome and Northwestern Alaska.

TOWNS AND VILLAGES

There are 50 or more towns and villages in the Second Division of Alaska which comprises all territory from Nunivak Island on the south to Point Barrow on the north, from Cape Prince of Wales on the west to the Koyukuk Divide and the Endicott Mountains on the east. More than three-fourths of the population of this vast area, whites and Eskimos, live outside of Nome. A brief description of the principal communities follows:

Jacobs

HOMES. *Nome homes are well built, comfortable. They are heated largely by oil, coal being rather expensive because of the transportation difficulties. The picture in the lower right corner is indicative of the taste with which many of the homes are furnished and decorated. Utilization of native artcrafts is common for homekeepers who strive for character in their rooms.*

Introducing SPONSORS OF NOME and NORTHWESTERN ALASKA BOOKLET

A. POLET

Department store; pioneer merchant, starting in Nome in 1900; member of new Territorial Development Board and Grand President of Alaska Pioneers; features and encourages native artcrafts.

BON MARCHE STORES

Groceries, meats, fresh vegetables and fruits, clothing, beverages; established 42 years; one of leading firms of Northwestern Alaska; owned and operated by L. Seidenverg & Sons, Inc.; Edward M. Seidenverg, manager.

MINERS & MERCHANTS BANK OF ALASKA

Established Nome 1904; general banking business, serving the financial needs of the Second Division; gold dust bought; G. R. Jackson, president and manager; Ira D. Orton, vice-president; H. G. Gabrielson, secretary and cashier.

NORTHERN COMMERCIAL CO.

Closely linked with the history and development of the Territory; 34 mercantile branches in Alaska and Yukon, including Fairbanks, Anchorage, Nome, Circle, Nenana, Tanana, Ruby, Fort Yukon, Eagle, and Hot Springs; everything for the household; serves the mining, logging, fur, and farming industries.

LOMEN COMMERCIAL CO.

Nome, Fairbanks, Anchorage, Juneau; for 36 years serving business interests of Alaska; distributors of nationally-known dependable equipment, supplies for miners, contractors, industrial uses; lighterage service covering Seward Peninsula area; staff of expert mechanics and technicians ready to help with individual problems.

PAN AMERICAN WORLD AIRWAYS

Provides Nome with direct service to Fairbanks, Whitehorse, Juneau and Seattle, with 21-passenger Clippers; stewardess service; Rita Travis, traffic representative, Nome.

ALASKA AIRLINES

U. S. mail and passenger service to Anchorage, Homer, Kodiak, Juneau, Nome, other points; fleet of modern planes insures comfort, safety, provides connections throughout Alaska and the States; headquarters in Anchorage.

GLENN CARRINGTON CO.

Fairbanks, Nome, Seattle; Alaska distributors and jobbers of nationally-known industrial and mining machinery; complete outfitters for placer, hard-rock miners; International trucks, tractors, power units; farm machinery and building material of all kinds; serving Alaska since 1915.

WIEN ALASKA AIRLINES

"The Pioneer Line"; passenger, mail, express service to practically all points in Interior Alaska, including Nome, Galena, Seward Peninsula, the Yukon, Point Barrow, Circle, Forty-Mile country, Wiseman, Big Delta, Tanacross, etc.; charter trips available; Boeing and other first-class planes, flown by experienced pilots.

NORTHERN LIGHT & POWER CO.

Nome, Alaska; serving Nome and vicinity with electric light and power; established since early days of city; electrical supplies; furnishes winter power for operations of U.S.S.R. & M. Co.; O. S. Weaver, president and general manager.

LARRY GALVIN

Diesel Oil Sales; delivery of oil six days a week regardless of weather; G.-E. heating plants; Dodge and Plymouth car dealer; established five years and owned-operated by Larry Galvin.

NOME MOTOR CO.

Modern garage and office building constructed after Nome's two fires; auto repairs and service of all kinds; Chevrolet and Buick dealers; agency G.-E.-Delco heating systems; established 1934; H. F. Harper, proprietor.

POLAR CURIO SHOP

Featuring a large stock of the finest in Eskimo ivory and needle arts; beautiful display of souvenirs and curios of various kinds; owned and operated by George Madsen and Keith Hedreen.

NORTH POLE BAKERY AND RESTAURANT

Pioneer of Nome since the gold rush days; known far and wide as a good place to eat, best of foods; everything the market affords; when in Nome the North Pole is a "must"; owned and managed by Mr. and Mrs. Garnet Martin.

WALLACE HOTEL

Modern, comfortable hotel of Nome, where courtesy and Alaskan hospitality prevail; on the shores of the Bering Sea; owned and operated by Mr. and Mrs. Joe Wallace.

NOME GRILL

Serving Nome and vicinity with good restaurant service; meals and lunches at all hours; fine service; quality foods, well prepared; established six years; owned and managed by Monte Ferguson and A. E. Lord.

LINCOLN HOTEL

"Where the Sourdoughs Meet"; operated continuously since the early days and now a landmark of Nome; owned and operated by Joe Mullins and Emile Laurin, pioneer freighting and mining men.

NOME HARDWARE CO.

Established in 1900; now housed in fine, modern building; general hardware and building materials; managed and owned by Guy Mish and Andrew Sather.

NOME NUGGET

Founded in 1900 by former Gov. J. F. A. Strong; one of oldest newspapers in the Territory; a tri-weekly, it is owned and edited by W. A. Boucher.

THE NEVADA

Oldest tavern in Nome, operating since early gold rush days; associated with the color and romance of the Nome stampede; owned by H. G. Gabrielson, cashier of Miners & Merchants Bank.

MAY'S TAVERN

A unique place where the accent is placed on refreshments and entertainment; owned and managed by May Bale, 20-year resident, winner of dog team races and ski prizes; "Try a glogg at May's."

MODERN CLEANERS

All that the name implies; first class cleaning and pressing; prompt, courteous service; Mr. and Mrs. Carl Mickleson, props.

DREAM THEATER

Nome's amusement theater, where latest available motion pictures are shown; be sure to visit the Dream when you visit Nome; Charles Code, owner.

THE GLUE POT

Recreation headquarters; all kinds soft drinks, cigarettes, cigars, tobaccos; a place to spend an idle hour; a real Alaska greeting awaits you here; owned by Nick Simeon and Charles Goetzenberger.

R. J. SOMMERS CONSTRUCTION CO.

Built Army air fields at Galena, Lake Menchumina, Moses Point, Unalakleet, two fields at Nome; important construction jobs at Ladd Field, Annette, Juneau, Ketchikan, Seward, etc.; Gordon Wildes, superintendent; Ivor Kriken, superintendent Nome projects.

MUNZ AIR SERVICE

Serving Seward Peninsula; Stinson 10-passenger plane and three Stinson Juniors; regular trips to Pilgrim Hot Springs, Taylor, Deering, Kotzebue, Candle; William Munz, well-known pilot, established line in 1938; chartered planes for fishing and hunting trips.

POLAR BAR

"Meet the Boys at the Polar"; finest of refreshments and courteous treatment; owned and managed by George Madsen and Keith Hedreen, old-time residents of Territory; other interests mining and aviation.

TELLER MERCANTILE CO.

General store and post office; pioneer firm of Teller, established since 1903; serving entire Teller area; owned and operated by Mrs. Peterson and Mrs. Marx.

NORTH STAR MERCANTILE CO.

General merchandise, quality goods; furs, ivory, mukluks; large mining interests of Teller district; operated by N. B. Tweet & Sons, pioneer Alaskans.

GEORGE R. GOSHAW

Fox fur farm, Shishmaref, Alaska; pioneer in the fox industry of Northwestern Alaska; started first white fox farm of record and originated platina fox furs; also raises blue fox; 150 to 200 pelts shipped annually.

MOLLIE DEXTER

Trading Post, Golovin; successor to her father, John Dexter, pioneer; general store and roadhouse, serving the Golovin district for many years.

This booklet is a reprint of a special section of Alaska Life Magazine for May, 1945.

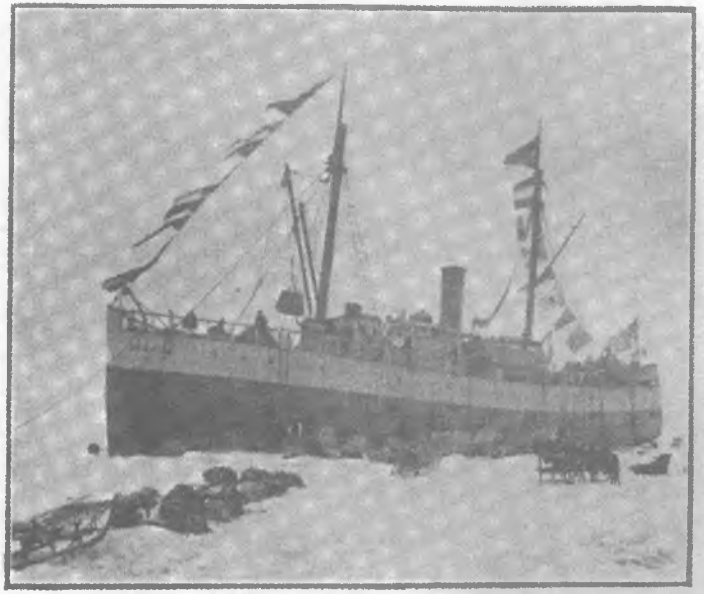
The Corwin

ALTHOUGH the Corwin has opened navigation for us in Nome every year since the spring of 1903, nothing has ever been mentioned of it in our annual.

The Corwin, a wooden steamer of .... tons, is much less than half the size of the other ships that come up to Nome. Under the able command of Captain West, who has had wide experience in these waters, this little steamer has plowed through ice fields that have punched holes in large steel ships and even taken them up North toward Bering Straits.

We "sourdoughs," who have been isolated in this little town of Nome without any communication to the states except through the mails brought by dog teams which travel over a month to reach here, and by wireless telegraphy which serves as communication for the papers, appreciate the arrival of the "first boat." On it come the "cheechacos" and the fresh fruit and vegetables, all of which get a hearty welcome. The town becomes alive with people for everybody, after not seeing a ship for seven months, gets out to view the Corwin.

The Corwin leaves Seattle every year on or about the tenth of May. The first five or six days of travel by the inside passage bring the steamer to "points" in Alaska, from which the people are as anxious to hear of its progress in the papers, each day, as they are the progress of the dog teams on the "dog dope" boards during the annual sweepstake race. For five or six days and even two weeks before the Corwin arrives, people begin to "see things," that is, they think they see the Corwin coming in



S. S. CORWIN ARRIVING AT NOME JUNE 1, 1907.

when it is really nothing but black cakes of ice, that look like spots, floating on the horizon.

One thing noticeable during the breakup of the ice are the beautiful and rapidly changing mirages. It was by these that the Corwin was discovered out in the ice floes in the spring of 1907 when it was miles away from Nome. First the black spot representing the hull showed and then the smokestack with the smoke pouring downward. The mirage then disappeared but showed up again and the whole boat was in plain view. It disappeared again and soon the real smoke of the real steamer was seen coming in slowly among the ice fields, and the Corwin dropped anchor on June third at the edge of the ice about three miles off of Nome.

Since the spring of 1903 the Corwin has steadily opened navigation for us, some years coming in when the ice was still fast in the roadstead, and in other years when the ice was floating about in cakes or had left altogether.

The steamer makes only one trip from Seattle every year. After it arrives at Nome it sails at almost regular intervals to different points along the coast of Bering Sea. It is the largest of the coasting fleet.

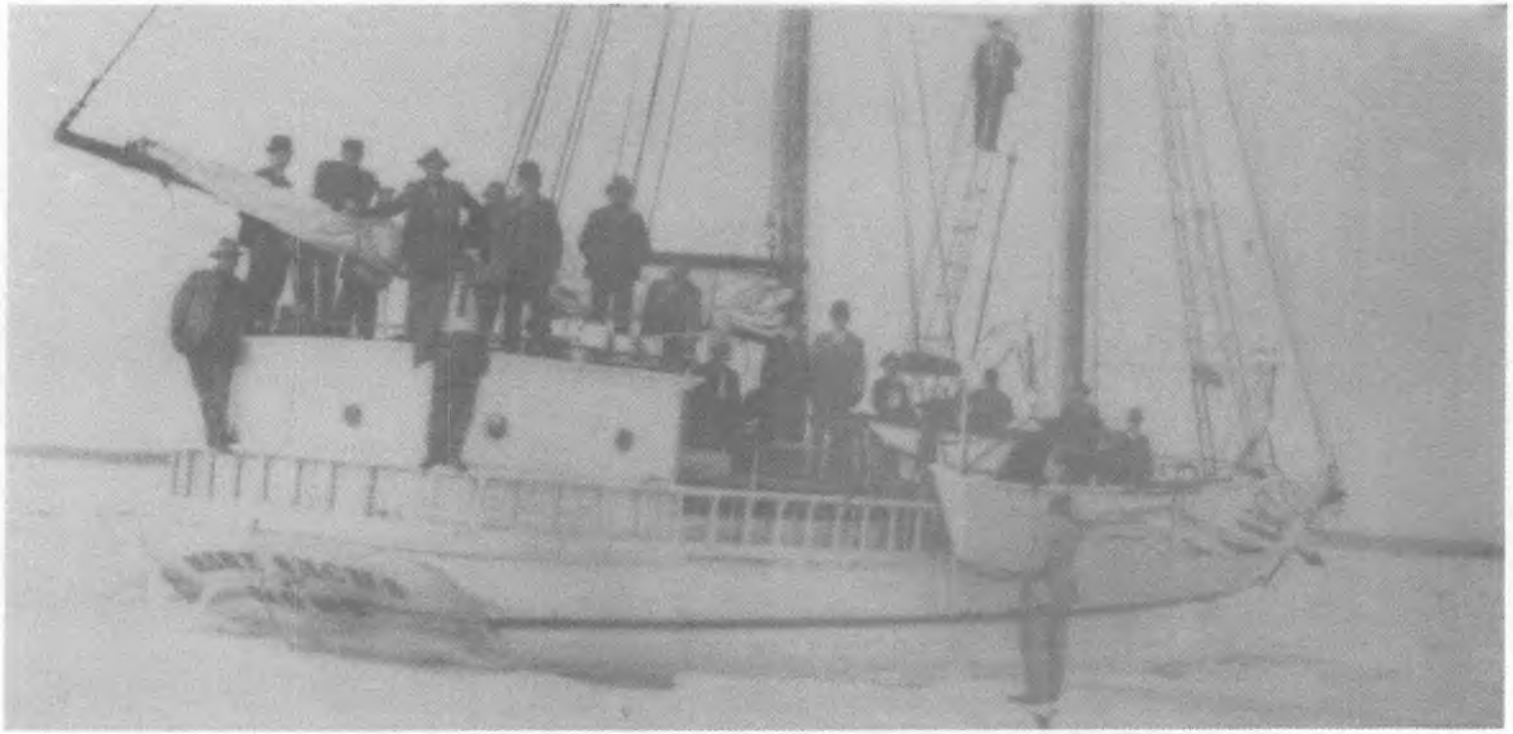
PETER BERNARD



Moving Gold Beach Dredge from Dry Creek to Osborne Creek, weight 50 tons; March 12th, 1911

C. L. Morris Co., J. H. Montgomery, Manager

Heavy Freighting.

In March 1911, hundreds of spectators gathered to see the transporting of one of the largest pieces of machinery ever moved on Seward Penin ula. This was accomplished by means of horses. It was the Dry Creek dredge, which was taken to Osborne Creek, a distance of fourteen miles. The barge was ninety feet long and thirty-two feet wide, and was divided into two sections, each weighing fifty tons. Each section was raised at the front end by means of jacks; two pairs of skids were then placed under the section, with two large cabin sleds under the skids, while the other end of the section dragged over the snow.

Owing to the heavy fall of snow and continuous storms, thousands of dollars were expended in breaking trail for the barge. As many as seventy horses were engaged at one time for this purpose.

At the sound of a whistle, blown by Mr. Montgomery, the manager of this undertaking, every one of the sixty-eight horses threw his weight into the collar, and the massive barge moved slowly forward without a stop until it reached Nome River, a distance of nine miles, in three hours.

No heavier freighting, in all probability, is done anywhere than in Nome.

The Caisson, weighing eighty-three tons, was successfully moved by thirty-two head of horses. Several large dredges have been transported, to say nothing of the numerous tons of freight hauled to the creeks, during both summer and w nter.

One outfit employed in this heavy freighting cost over $100,000. Hydraulic jacks, reputed to raise over 2,000 tons at one time, are a part of the W. J. Rowe equipment, as well as several heavy moving sleds, trucks of thirty tons capacity, and a set of huge wheels, twelve feet in diameter, guaranteed to carry one hundred tons.

FAIRBANKS BRIDGE DURING CONSTRUCTION.

Digitized by Google

NOME DISTRICT.

(Mr. DANIEL A. JONES, Superintendent.)

Route 8—Nome-Council Road (approximately 82 miles; 57 constructed).—Maintenance work on the Nome-Fort Davis section included blasting the ice under bridges in the spring and resurfacing 3,300 feet of road with gravel. The Rocker Creek Bridge was repaired by constructing two new crib supports and replacing old stringers.

No expenditure was made on the Fort Davis-Cape Nome section, which, as noted in previous reports, was very badly damaged by the storm of 1913. The Territorial road commission is now engaged upon the reconstruction of this section.

Work on the Cape Nome section, which was reconstructed in 1915 by the Territorial road commission, consisted of removing slides, cleaning ditches, and constructing 1,575 feet of approaches to the new road, at a cost of $2,826.99.

General maintenance and the construction of 6,945 feet of gravel-surfaced corduroy constituted the year's work on the Solomon-East Fork section. The total expenditure was $5,041.23.

Maintenance of the Fox River-Council section, which is entirely corduroy, cost $445.10 per mile.

The maintenance and operation of the Safety Ferry cost $885.80, of which $385.80 was expended for new cable and minor repairs to the scow.

The cost of maintaining and operating the Bonanza Ferry was $537.70; of this amount, $162.70 was for new cable and repairs to the ferry scow.

Route 13A—Nome-Bessie Road (3.3 miles).—General maintenance on this route, including resurfacing 7,335 linear feet with gravel, cleaning ditches, and opening channels through the ice under bridges during the spring, cost $696.97 per mile. In addition, 400 cubic yards of material in the fill over Dry Creek, washed out by high water, was replaced at a cost of 51 cents per cubic yard. The maintenance cost for the year was greater than usual, largely because of the heavy rains during the summer of 1916.

During June of this year 1,200 tons of freight were transported over this road, and the daily average freight movement throughout the year was approximately 30 tons.

Route 13B—Bessie-Banner Road (3.5 miles).—The work of the year on this route was confined to surfacing 2.3 miles with gravel, at a cost of $3,797.07.

Route 13C—Bessie-Little Creek Road (1.25 miles).

Route 13D—Bessie-Dry Creek Road (1.25 miles).

No work was done on these routes during the year.

Route 13E—Dry Creek-Newton Road (0.33 mile).—Repairs to culverts on this road cost $27.

Route 13F—Nome-Osborne Road (4 miles).—General maintenance work on this route cost $45.18 per mile.

Route 13G—Grass Gulch Road (1.75 miles).—No work was undertaken on this route during the year.

Digitized by Google

Route 13H—Center Creek Road (1.37 miles).—The cost of resurfacing 625 feet of this road with gravel was $386.84.

Route 13I—Nome River Road (5 miles).—The protection of this road during the spring break-up cost $13.05 per mile. No other work was done during the year.

Route 13J—Wonder-Flat Creek Road (2 miles).—General repairs and maintenance on this route cost $178.05 per mile.

Route 13K—Bessie-Buster Road (5 miles).—The work of the year on this route consisted of general maintenance and surfacing 1 mile with gravel 12 inches thick, at a cost of $0.36 per foot.

Route 18—Kaltag-Solomon Trail (248 miles).—On the Topkok-Unalaklik section of this trail 2,818 permanent stakes, each 3 inches in diameter at the butt and 9 feet long, were cut and set. In addition the permanent stakes on 79 miles were repaired and reset where necessary and 4½ miles of new trail cleared through timber. The total cost was $961.85.

Route 21—Unalaklik-St. Michael Trail (approximately 65 miles).—The temporary staking of 18 miles on the ice between St. Michael and Klikitarick cost $16. The remainder of the work embraced restaking 27 miles with permanent stakes and the construction of a light tram over the Golsovia River, at a total cost of $381.40.

Route 25A—Cripple River Road (13.5 miles, total A and B).

Route 25B—Penny River Road.

Route 25C—Nome-Wireless Road (0.25 mile).

No work was done on these routes during the year.

Route 25D—Mouth of Center Creek Road (2 miles).—General maintenance and repairs on this road cost $87.66 per mile.

Route 25E—Submarine Paystreak Road (2.5 miles).—As originally built this road extended from near the mouth of Snake River for a distance of approximately 1 mile along the submarine paystreak. A total of only $620.84 has been expended on it since its location in 1907, and no work has been done on it for several years. At the present time a new road, following a better location, is being constructed from the Snake River bridge to the submarine paystreak. This road will be designated by the same name and route number as the old road, which has been abandoned.

The work of the year consisted chiefly in the construction of fills leading to the Snake River bridge approaches, containing 1,460 cubic yards of material. A branch road 1,200 feet in length was also constructed from the west approach to a point near the mouth of Snake River. The total cost of all work was $1,765.07.

Route 25F—Anvil-Glacier Road (3 miles).—General repairs to this route included cleaning ditches and hauling 480 cubic yards of gravel surfacing. The average cost was $395.85 per mile.

Route 25G—Snake River Extension Road (3 miles).—The work of the year on this route embraced general repairs and the surfacing of 2,380 linear feet of road with gravel. A suspension foot bridge over Snake River at the mouth of Boulder Creek, having a span of 130 feet, and two 18-foot bridges over Sledge Creek were constructed at a cost of $294.73. The material used was largely obtained from the old Snake River bridge.

Route 25H—Otter Creek Road (1.25 miles).—No work was done on this route during the year.

Digitized by Google

Route 25—Sinrock Ferry.—The total cost of maintaining and operating this ferry was $321.90, of which $71.90 was expended for minor repairs to the scow.

Route 26—Candle-Candle Creek Road (5 miles).—The year's work on this route consisted of cutting and tying 3,382 fifty-pound bundles of willows, which were hauled and distributed along the road during the winter for use in constructing corduroy this year.

Route 27—Deering-Inmachuck Road (25 miles).—General maintenance covering the whole route, together with some new construction on the left bank of the Inmachuck River, eliminating seven crossings of the river, constituted the work of the past year. The center pier of the bridge over the lagoon near Deering had been undermined and was removed and replaced by piles. Eight new culverts were constructed, 0.5 mile of road graded and ditched, and 2,700 feet of corduroy laid and graveled.

Route 28—Dahl Creek-Candle Trail (140 miles).—The repair and replacement, where necessary, of permanent stakes throughout the entire length of the route cost $1 per mile.

Route 37—Topkok-Candle Trail (141 miles).—Twenty-six miles of this route were restaked with permanent stakes and 3 miles cleared through timber, at a total cost of $460.

Route 42—St. Michael-Kotlik Trail (approximately 70 miles).—Those portions of this route not on the ice were marked with permanent stakes, 40 to the mile. The work was done by contract and cost $350.

Route 49—Davidsons Landing-Taylor Creek Road (40 miles; 24 constructed).—This road extends from the head of navigation on Marys River to Taylor Creek, in the Kougarok mining district. Only light construction work was undertaken, covering the first 24 miles of the route, and consisting of clearing out the road, eliminating creek crossings by grading, and laying gravel-surfaced willow corduroy over soft spots. Since the work was done teams have been able to haul loose loads 1,500 pounds greater than the average before the improvement was made.

Marshall Road.—This road when completed will extend from a tributary slough of the Yukon to the placer mines of the Marshall district and will be about 3 miles in length. The work done during the past year consisted of cutting and hauling poles for approximately 2 miles of corduroy. Only a part of the accounts covering this work have been received, and the total cost can not be reported.

This project has been taken over and will be completed this year by the Territorial road commission.

Flagging trails.—Approximately 550 miles of trails, in addition to those permanently marked, were temporarily staked or flagged for the guidance and safety of winter travel. The total cost, including cost of inspection trips by the superintendent of the district, was $4,225.30.

Snake River Bridge.—The construction of this bridge (see annual report 1916, p. 18) was begun June 17 and completed August 19, 1916. Nearly all of the material used, including piles, lumber, and steel, had to be obtained and shipped from Seattle, largely increasing the cost. The two 100-foot spans are of the combination Pratt truss type. All truss timbers, stringers, and planks are Douglas fir.

Digitized by Google

The total cost, including the expenditure reported last year, was $16,949.93, distributed as follows:

Material	$5,646.72
Equipment	400.21
Freight on material and equipment	8,441.05
Engineering	600.00
Labor	6,188.39
Hire of animals	453.31
Miscellaneous (fuel, telegraph, etc.)	220.25
Total	16,949.93

Of the above amount $526.50 was expended during the winter in protecting the piers by cutting away the ice and placing riprap around them.

ACCOUNTING.

The expenditures of the Alaska Road Commission during the fiscal year July 1, 1916, to June 30, 1917, amounted to $576,747.90, of which $76,716.15 was received from the Alaska fund, $500,000 from a special appropriation made by Congress, and $31.75 from collections reverting to that fund.

As the Territory of Alaska covers approximately 590,000 square miles, and road work is done in all parts thereof, it is, of course, impossible for the disbursing officer to make all disbursements personally, although all accounts eventually pass through his office and are verified there before being forwarded to the War Department.

In order to pay promptly all accounts in outlying districts, each superintendent, one at Nome, Fairbanks, Seward, and a disbursing clerk at Ruby, acts as disbursing agent for his district.

Checks on local banks or commercial companies are given by the local disbursing agent for bills as they are incurred, and at the end of each month the total amount of checks cashed in payment of bills is telegraphed and the disbursing officer issues a Treasury check to cover the overdraft.

Proper vouchers to offset the overdrafts are forwarded by the superintendents, who are held responsible for a proper accounting for the indebtedness incurred by them.

The above system has been in operation for several years and has proven satisfactory and has enabled prompt settlement of accounts.

On June 11, 1917, the main office of the commission was moved from Valdez, where it had been for several years, to Juneau, the capital of the Territory. This transfer became necessary on account of certain additional duties being assigned to Lieut. Col. Davison, secretary and disbursing officer, in connection with the militia affairs of the Territory, which required his presence at the capital.

The office at Valdez was left in charge of a disbursing clerk, who handles all accounts of the Valdez-Chitina-Fairbanks Road.

On June 29, 1917, at a meeting of the entire board, funds to the amount of $420,000 were allotted for various projects in the Territory for the period July 1, 1917, to June 30, 1918. Several small allotments have been made since that date.

The following statement shows in detail the receipts and disbursements from July 1, 1916, to June 30, 1917, inclusive:

STATEMENT OF RECEIPTS AND DISBURSEMENTS.

This report covers vouchers received and placed in the account, including June 30, 1917:

Balance on hand July 1, 1916	$54,137.28
Received from the Treasurer of the United States:	
Appropriation "Military and post roads, bridges, and trails" (act Aug. 29, 1916)	500,000.00
Alaska fund	50,000.00
Correction of vouchers:	
Alaska fund	1.00
Special appropriation	31.75
Sales of property, Alaska fund	2,375.40
Total	606,545.43
Disbursed as per tabulated statement below	576,747.90
Balance on hand	29,797.53

NEW ALASKAN RAILROADS.

Road from Nome to Port Safety Nearing Completion—Other Lines Planned.

Special to The New York Times.

TACOMA, Wash., June 16.—Railroad building in the Far North is one of the features of the rush to that country which began with the discovery of gold in the Klondike in the Fall of 1896, followed by the discoveries at Nome, Koyukuk, and other places in Alaska. What will be, perhaps, the most northerly railroads in the world will be the Nome and Port Safety Road, and the line to the Wild Goose mining district from Nome, both of which are expected to be completed and in operation during the present Summer.

Next to these lines is the proposed road from Nome, or rather from the end of the Nome and Port Safety line, at Port Safety, to Katmai, around by the mainland and across the mouth of the Yukon River and through the Kuskoquim country, reaching the coast at a point opposite Kodiak Island, which is open to navigation generally at all times of the year, thus putting the Nome country in direct communication with the outside world.

The White Pass Railroad is rapidly pushing on to Dawson, the division between Caribou and Le Barge being completed and in operation, sixty cars and four locomotives having been put on the line ten days ago.

Another possible line is the Copper River Road, for which a survey has been made, but on account of the progress of the White Pass Road, the Copper River project has been allowed to rest owing to the recent report of rich discoveries on the Christiechina, a branch of the Copper River, by Melvin Dempsey, a Colorado miner, the railroad project is again being revived. This line is planned to run from Valdes, on Prince William's Sound, up Copper River and down Forty-Mile Creek to the Yukon, near Dawson.

Half a million dollars' worth of goods were lost last season at Nome in attempting to land them on the beach from the vessels out in the sea. At high tide steamers of light draught can lay alongside Nome in the river and on the seaside, but oceangoing vessels have to anchor off from shore, and goods are carried ashore in lighters. By the construction of the Nome & Port Safety Road, a distance of 100 miles along the beach, a harbor is reached with six to ten fathoms of water where oceangoing craft have ample room to load and discharge cargoes, and where docks are to be built for that purpose in connection with the railroad. The road will do an immense local business, the promoters say, in addition to the through traffic to Nome. Material for the road is on board the barge Skookum, built at Tacoma, and the largest barge on the Pacific. The extension to Wild Goose Mines will be built this season, and an extension to Cape York, or in that direction, is promised.

The Nome and Southern Road, a preliminary survey or reconnoissance for which was made this Spring, is considered a certainty, if the Nome goldfields turn out anywhere near as rich as they promise. This line would put Nome in communication with the outside world at all times of the year, and when it is remembered that Bering Sea is full of ice from October to June, and sometimes is only open three months in the year, the importance of this project is apparent.

NWTF Meeting

Unalaska

August 24th, 2011

1 Agenda

2 NWTF Presenters

3 Comments of CPT Whalen
AK Marine Pilots – CPT Carter Whalen

4 Arctic Salvage Operations
Magone Salvage – Dan Magone

5 Law of the Sea Convention
US Coast Guard – Rear Admiral Kenny

6 Bering Sea Fisheries Overview
Citv of Unalaska – Frank Ketlev

7 Arctic Fishery Management
N.Pac. Fishery Mng Cncl – Steve MacLaean

8 Arctic Fisheries Research
UAF Fish & Ocean Sciences – Dr. Kruse

9 U.S. Customs & Border Protection Alaska
US Customs– Jefferv Lisius

10 Seafood Industry in Alaska's Economy
Marine Conservation Alliance -

1
Agenda

Alaska Northern Waters Task Force (ANWTF)
Agenda for Unalaska: August 24, 2011
Grand Aleutians Hotel

August 24thth, Wednesday, Grand Aleutians Hotel

Presenters on the following Arctic fishing and shipping topics:

- **8:30 to 9 a.m. Presentation by U.S. Coast Guard on Arctic Summer Operations: Rear Admiral Ostebo, United States Coast Guard 17th District**
- **9 to 9:30 a.m. Presentation by City of Unalaska on Aleutian Islands Risk Assessment, emergency towing systems, and the mooring buoy project: Shirley Marquardt, Mayor of Unalaska**
- **9:30 to 10 a.m. Presentation by Alaska Marine Pilots on pilotage in Arctic waters: Captain Carter Whalen, Alaska Marine Pilots**

-15 minute break-

- **10:15 to 10:45 a.m. Presentation on Arctic salvage operations: Dan Magone, Owner Magone Salvage**
- **10:45 to 11:30 a.m. Presentation by U.S. Coast Guard on United Nations Convention on Law of the Seas: Rear Admiral Kenny, Judge Advocate General and Chief Counsel, U.S. Coast Guard**

Lunch break from 11:30 to 1 p.m.

- **1:00 to 1:30 p.m. Presentation on the Arctic's Future: Senator Lisa Murkowski**
- **1:30 to 2 p.m. Presentation on Bering Sea Fisheries: Frank Kelty, Natural Resource Analyst, City of Unalaska**
- **2 to 3:00 p.m. Presentation on Development and Implementation of an Arctic Fishery Management Plan: Steve MacLean, North Pacific Fisheries Management Council, Protected Species Coordinator and Fisheries Analyst**
- **3 to 3:30 p.m. Presentation on Arctic fisheries research: University of Alaska, Gordon Kruse, President's Professor of Fisheries, School of Fisheries Division**

- 3:30 to 4 p.m. Presentation on invasive species and border control: Jeffrey J. Lisius, Assistant Port Director Trade
- 4:00-5:30 p.m. Presentation by Rep. Edgmon on Northern Waters Task Force followed by public testimony on Northern Waters Issues

Legislative Fly-In August 25-27th

2
Presenters

NORTHERN WATERS TASK FORCE PRESENTERS
AUGUST 24, 2011
DUTCH HARBOR, ALASKA

REAR ADMIRAL OSTEBO, UNITED STATES COAST GUARD 17TH DISTRICT

Rear Admiral Thomas P. Ostebo assumed the duties as the Commander, Seventeenth Coast Guard District in May 2011. He is responsible for all Coast Guard Operations throughout Alaska which includes protecting life and property, enforcing federal laws and treaties, preserving the living marine resources, and promoting national security. Headquartered in Juneau, AK, the Seventeenth District includes portions of the North Pacific Ocean, Arctic Ocean, and Bering Sea. As the Commander, U.S. Naval Forces Alaska, he provides operationally ready maritime forces to both Coast Guard and Department of Defense Commanders for Coast Guard, joint, and interagency operations both domestically and internationally.

In his previous assignment, Rear Admiral Ostebo was the Coast Guard's Assistant Commandant for Engineering and Logistics (CG-4). He was responsible for all naval, civil, aeronautical, and industrial engineering and logistics for the Coast Guard's $25 billion capital plant which includes 23,000 facilities, 230 ships, 1,800 boats, and 200 aircraft. RADM Ostebo is responsible for executing an annual budget of $1 billion and leading 2,200 personnel at Coast Guard Headquarters and three major Headquarters commands.

Rear Admiral Ostebo's other assignments include Executive Assistant to the Commandant of the Coast Guard, Executive Assistant to the Chief of Coast Guard Operations, Commanding Officer of Air Stations Cape Cod and Traverse City, and Chief Aeronautical Engineering Officer at Air Station Clearwater, Florida and Air Station Sitka, Alaska. He has also served as Chief of Inventory, Logistics, and Finance at the Coast Guard's largest industrial depot, the Aircraft Repair and Supply Center, in Elizabeth City, North Carolina and as First Lieutenant aboard USCGC ACTIVE in New Castle, New Hampshire.

Rear Admiral Ostebo completed Naval Flight Training in 1984 in Pensacola, Florida and completed tours of duty at CGAS Cape Cod, CGAS Sitka, CGAS Clearwater, CGAS Traverse City, and the CG Aircraft Repair and Supply Center. During this time, he flew 4,000 flight hours, attained qualifications on the HH-3F, HH-60J, HC-130H, HH-65A/B and the HU-25, and qualified as an Aircraft Commander and Instructor Pilot. Admiral Ostebo also completed his Civilian Airline Transport Rating and Airframe and Power Plant Authorization.

A native of Kings Park, New York, Admiral Ostebo graduated from the U.S. Coast Guard Academy in 1981 with a Bachelors of Science in Mathematics and Computer Science. In 1993, Admiral Ostebo earned a Master of Science in Industrial Administration from Purdue University's Krannert School of Business. He has completed a Senior Fellowship in National Security at Harvard University in 2002 and a Senior Fellowship at the Naval War College in 2005. Additionally, he has earned a Program Manager Level III Certification in Acquisitions and a Program Manager Level I Certification in Logistics. Admiral Ostebo was promoted to flag rank in July 2008.

His military decorations include two Legions of Merit, the Distinguished Flying Cross, three Meritorious Service Medals, two CG Commendation Medals, and the CG Achievement Medal

SHIRLEY MARQUARDT, MAYOR OF UNALASKA

I came to Unalaska in 1980 for the summer, fell in love with the people and the lifestyle, and never left. I worked in seafood shore plants and on offshore factory vessels for the first 10 years and then moved to the surface transportation and fishing logistics field for the last 20. I have been employed by Samson Tug and Barge for the last 17 while raising daughter Emma and son Rex with my patient husband Bob. I was first elected to the City Council in 1994 and served in that capacity until being elected Mayor in 2004. I currently serve as a member of MTAB, as a

member of the Aleutian Islands Risk Assessment Advisory Panel, as a member of the American Seafoods Community Advisory Board, as the President of the Unalaska Senior Citizen's, as President of the SWAMC Board of Directors, and as the incoming 2012 President of the Alaska Municipal League. In my spare time I take long hikes with my dog Shadow, and experiment in the kitchen. I choose to stay busy, because if I don't', I will just be tired and chubby.

CAPTAIN CARTER WHALEN, ALASKA MARINE PILOTS

Captain Carter Whalen is the President of Alaska Marine Pilots and works as a licensed state pilot in the waters of Western Alaska. Carter has been affiliated with the Alaska Marine Pilots for 9 years. Prior to joining the Alaska Marine Pilots, Carter worked in the service of the state as a licensed Federal pilot with the Alaska Marine Highway for 7years.

Born in Ketchikan Alaska, Carter attended the Massachusetts Maritime Academy graduating with a degree in marine transportation. Earning his Master mariners license by the age of 27, Carter has worked all but one year of his 16 years going to sea in Alaskan waters.

DAN MAGONE, MAGONE SALVAGE

Mr. Magone has been a small business entrepreneur since his early childhood. As an avid teenage sport diver his first career inspiration was to become a commercial deep sea diver. To this end he completed a six month course in Wilmington, California and went directly to work in the Gulf of Mexico on oil rigs and pipelines.

He started his own company in California in 1974 and gradually built up a clientele of fishing vessels doing welding, machine work and underwater repairs. In 1978 he was called to Dutch Harbor to repair a rudder on a king crabber and seeing an opportunity moved to Dutch in February of 1979 with the dream of building a shipyard. Magone Marine evolved from there.

In 1980 Magone Marine Service was incorporated in the State of Alaska with Mr. Magone as President, operations manager and principle stockholder along with his wife Sue. Today the shipyard acts as a base for Magone salvage vessels, barges and cranes that are also utilized in construction and logistical support of contractors operating in remote areas within a 1,000 mile radius of Dutch Harbor. Since 1991 Magone Marine has been an independent oil spill response contractor in Dutch and has been a Basic Ordering Agreement contractor for the USCG since 1993. Because of the versatility of the company, annual revenues are over $5,000,000 and the company employs over 40 trades people and operators.

Accreditations: Commercial diving certificate from Commercial Diving Center (now the College of Oceaneering) 1971. Explosives handlers' license for the State of Alaska since 1990. Underwater welding certification to AWS standards, HAZWOPER, incident command and controlled use pesticide certificates (to control rats from shipwrecks).

Education/Training: After graduating from high school in 1970 Mr. Magone attended the Commercial Diving Center in Wilmington, California and graduated in 1971. Other than a welding course at the same time, that was the end of formal education. In recent years Mr. Magone has brought trainers in from the mainland for himself and crew to maintain certificates required by OSHA for normal shipyard safety and spill responder regulations. Mr.

Magone's expertise in marine operations and salvage is due to the experience gained working on the front lines for his entire career, with experienced people, studying on his own, and learning by figuring out what works.

Accomplishments: In 1998 and 1999 Mr. Magone received Public Service Commendations from the USCG Commander of the 17th District for his company's response to the Kuroshima and Hekifu incidents. Marine salvage is somewhat glamorous to the world at large and Mr. Magone is mostly know for over 60 significant marine salvage operations in western Alaskan waters that he personally directed plus a number of others where his company was the subcontractor. His most significant accomplishment is surviving in business and by the grace of God having the faith to get up every morning and keep trying.

General: Mr. Magone's normal job duties include job planning, estimating, job managing, report writing, permitting, mechanical drawing, supervising the dive team, directing the vessel crews and marine operations. He has the support of his wife, his shipyard operations manager that takes care of the day to day shipyard work and an in-house Controller and staff to keep the office functioning during his frequent offsite operations.

REAR ADMIRAL KENNEY

Rear Admiral Kenney serves as Judge Advocate General and Chief Counsel of the Coast Guard, responsible for the delivery of all legal services in support of the Coast Guard's missions, its units and its people. He leads a dedicated, agile corps of legal professionals, including 184 military attorneys, 92 civilian attorneys and 87 legal support personnel. He was commissioned in 1981 after graduating from Officer Candidate School. He is a graduate of Michigan State University and the University of San Francisco School of Law, where he served as Editor-in-Chief of the *Maritime Law Journal*.

Rear Admiral Kenney's other legal assignments include duty as Chief of the Office of Maritime and International Law, Washington, DC, where he was the head of the United States delegation to the International Maritime Organization's Legal Committee and an appellate judge on the Coast Guard Court of Criminal Appeals; Executive Assistant and Chief of the Coast Guard's Office of Legal Policy and Program Development, Staff Judge Advocate, First Coast Guard District, Boston, MA; Coast Guard Liaison Officer to the Office of Oceans Affairs, U.S. Department of State, Chief of the Marine Safety and Environmental Protection Law Branch in the Office of Maritime and International Law; and Assistant Legal Officer, First Coast Guard District.

Operational assignments include service as Commanding Officer of Coast Guard Pacific Area Tactical Law Enforcement Team, San Diego, CA; Officer in Charge, Coast Guard Law Enforcement Detachment, Alameda, CA; and First Lieutenant and Operations Officer aboard Coast Guard Cutter WESTWIND, a polar icebreaker. Extended temporary operations assignments include duty as Senior Coast Guard Officer, Allied Forces Southern Europe, and in the Office of Law Enforcement, Seventh Coast Guard District, Miami, FL.

Rear Admiral Kenney's decorations include the Legion of Merit (three awards), the Defense Meritorious Service Medal, the Coast Guard Meritorious Service Medal with Operational Distinguishing Device (three awards), the Coast Guard Commendation Medal with Operational Distinguishing Device (two awards), the Coast Guard Achievement Medal and the NATO Medal. Non-military awards include the U.S. Environmental Protection Agency's Gold Medal, the Department of State Superior Honor Award, and the Department of Justice Certificate of Commendation.

Rear Admiral Kenney is a member of the bars of the State of California, the Court of Appeals for the Armed Forces, and the U.S. Supreme Court. He and his wife, Cassi, reside in Washington, DC. They have two college-age daughters, Elizabeth and Charlotte.

FRANK KELTY, NATURAL RESOURCE ANALYST, CITY OF UNALASKA

Professional Achievements:

Frank Kelty has lived and worked in Alaska for 41 years, almost all of that time has been spent in the Aleutian Islands in Unalaska, Alaska. During his working career Frank spent 30 years working in the Alaska seafood industry with two shore-based companies where he rose to the rank of plant manager at both operations and over-saw the production millions of pounds of crab, cod and other species. In December of 2000 Frank left the seafood industry to work full time for the City of Unalaska as their Fisheries Resource Analyst.

Community Achievements:

Frank became involved with city government in the early 1980's and served three terms as a city councilman; in 1991 he was elected Mayor of Unalaska and was reelected four times served ten years before resigning in December 2000 to begin his new full time fisheries position with the City of Unalaska. During Franks ten years as Mayor, he was a strong proponent of quality of life upgrades in the community, the city completed projects well in excess of 100 million dollars, they include new city hall, community center, museum, library, public works facility, road paving and harbor expansions.

In addition under Frank's leadership the City took strong positions in fishery issues, supporting rationalization programs for both the Bering Sea Pollock and Crab Rationalization Plan.

Throughout the years Frank, has also been involved with many other boards and commissions in Southwest Alaska, he was appointed by two Governors and served six years on the State of Alaska Coastal Policy Council. Frank served two terms as President of the Southwest Alaska Municipal Conference and has been a board member for ten years, this organization promotes responsible economic development an opportunities for the people of Southwest Alaska. Currently Frank is Chairman of the Board of Directors of the Aleutian West Coastal Resource Service Area, which is a part of the State of Alaska Coastal Zone Management Program. Frank is a former President and a current board member of the Marine Conservation Alliance and alliance of harvesters, processors, fishery associations and fishery dependant communities, that promote the conservation and sustainable use of the marine resources in the North Pacific by supporting a sound science based policy. He has also Chairman the local Fish & Game Advisory Committee, and has served on the local AC committee for over 25 years. Frank, also just completed serving six years on the North Pacific Research Board, Advisory Panel. Frank is married to Nancy Kelty and they one daughter and three granddaughters who all live in Unalaska.

U.S. SENATOR LISA MURKOWSKI (R – ALASKA)

Senator Lisa Murkowski is the first Alaskan born Senator and only the sixth United States Senator to serve the state. The state's senior senator, Lisa Murkowski is a third generation Alaskan, born in Ketchikan and raised in towns across the state: Wrangell, Juneau, Fairbanks and Anchorage. Since joining the Senate in 2002, Senator Murkowski has been a strong advocate for Alaska on the important issues facing the state, including energy, health care, education, military/veterans' affairs and infrastructure development.

Only the 33rd female to serve in the United States Senate since its founding in 1789, Senator Murkowski has assumed leadership roles quickly. She is the senior Republican member of the Senate Energy and Natural Resources Committee and also serves on the Senate Appropriations Committee, where she is the ranking Republican of the Interior and Environment Subcommittee. Senator Murkowski is a member of the Senate Health,

Education, Labor and Pensions Committee -- the first Alaskan to serve on that panel – and also is a senior member of the Senate Indian Affairs Committee.

She earned a B.A. in economics from Georgetown University in 1980 and a law degree from Willamette University in 1985. Prior to her appointment to the United States Senate, Senator Murkowski practiced commercial law in Anchorage and served three terms in the Alaska State House of Representatives. She was elected to a full six-year U.S. Senate term in 2004, and was re-elected in 2010 in a historic write-in campaign, the first successful write-in effort to the Senate since 1954.

Senator Murkowski is married to Verne Martell and they have two sons. She enjoys spending time with her family in the Alaska outdoors.

Brief Biography:
Senator Lisa Murkowski
Born: Ketchikan, AK
Husband: Verne Martell
Children: Two sons, Nicolas and Matt

Education:
High School: Monroe High School, Fairbanks, AK
Economics Degree, Georgetown University
Juris Doctor, Willamette College of Law

Senate Committee Assignments:
- Ranking Member of the Senate Energy and Natural Resources Committee
- Member of the Senate Appropriations Committee
  - Ranking Member of Interior-Environment Subcommittee
- Member of the Senate Health, Education, Labor & Pensions Committee
- Member of the Senate Indian Affairs Committee

STEVEN MACLEAN, NORTH PACIFIC FISHERIES MANAGEMENT COUNCIL, PROTECTED SPECIES COODINATOR AND FISHERIES ANALYST

Stephen Ahgeak MacLean is the Protected Species Coordinator and Fishery Analyst for the North Pacific Fishery Management Council. Steve joined the Council staff in May, 2011. Before joining the Council staff, Steve spent six years as the Bering Sea and Polar Marine Program Director for The Nature Conservancy where he worked closely with Bering Sea commercial fishing interests to reduce potential impacts to protected species and habitat. Steve has also worked for a private ecological consulting firm and State and University wildlife management departments. Steve has extensive experience living and working in rural Alaska. Steve received a Bachelor of Arts degree in Biology from Whitman College in Walla Walla, Washington and a Master of Science degree in Wildlife

and Fisheries Sciences from Texas A&M University. Steve's MS thesis concerned the occurrence, behavior, and genetic diversity of bowhead whales in the Sea of Okhotsk in the Russian far east.

GORDON KRUSE, UNIVERSITY OF ALASKA, PRESIDENT'S PROFESSOR OF FISHERIES

Dr. Gordon Kruse is the President's Professor of Fisheries at the School of Fisheries and Ocean Sciences (Juneau Center), University of Alaska Fairbanks. He earned his B.S. in Biomathematics from Rutgers University and M.S. and Ph.D. in Fisheries from Oregon State University. Prior to joining UAF in 2001, he worked for 16 years with the Alaska Department of Fish and Game, where he headed their marine fisheries research program. For the past 26 years, Gordon has conducted a wide variety of applied fishery research in Alaska involving a variety of species such as king and Tanner crabs, scallops, shrimp, sea cucumbers, pollock, herring, and spiny dogfish. His research focuses on stock assessments, population dynamics, fishery oceanography, and fishery management. He has mentored 16 current and former masters and doctoral students and teaches courses in fisheries management, marine ecosystems, and other topics. Among his many external activities, he is a long-term member of the Scientific and Statistical Committee that provides scientific advice on federal fishery management to the North Pacific Fishery Management Council and he is vice-chairman of the Fishery Science Committee for the North Pacific Marine Science Organization (PICES), an international marine science organization involving Pacific Rim countries.

JEFFREY J. LISIUS, ASSISTANT PORT DIRECTOR TRADE, US CUSTOMS

Jeffrey Lisius started his federal career in 1986 with the U. S. Navy. After his discharge in 1994 he accepted a position with the United States Customs Service in 1995.

Jeff worked as a U.S. Customs Inspector at the Port of Entry in Blaine, WA until September 1999. From there he moved to the Progreso, TX Port Of Entry as a Journeyman Inspector. In 2000, he became the Chief Steward of the Nation Treasury Employees Union (NTEU) and served in that position until May of 2002.

In 2002, he accepted an appointment to the Customs Academy and was detailed to the Federal Law Enforcement Training Center (FLETC) as a Physical Techniques Department Instructor/Course Developer (PTD CD/I). In this position he assisted with the merger of U.S. Customs, Immigration and Naturalization Service, Border Patrol, and U.S. Agriculture and the creation of U.S. Customs and Border Protection. Jeff assisted with the development of the new national Office of Field Operation Academy for CBP. He was also instrumental in the development of the CBP Baton and Oleo Resin Caspian Spray (OC Spray) training and policy. After four years as a PTD CD/I he moved to the academic side of the academy as a CBP CD/I. There he taught new and advanced officers, Title 8 and Title 19 law, use of force, and IT systems such as TECS, IDENT, NSEERS, and USVISITS.

While assigned to the OFO Academy, Jeff was selected to open the Container Security Initiative office in Liverpool U.K. He stood up the office and served as the team leader for five months in a TDY capacity. He was also selected to serve as a special advisor to the Narcotics Affairs Sector of the United States Embassy in Peru. While there, he instructed the Peruvian Customs agents in seaport enforcement operations and the use of Non-Intrusive Inspection (NII) devices, both small and large scale.

Jeff volunteered and was selected for the collateral duty of coordinator for the CBP Agriculture Academy located in Frederick, Maryland. He oversaw all CBP course material and maintained all administrative functions from 2006 until 2008.

In August of 2008, Jeff was selected to his current position as the Assistant Area Port Director Trade for the Area Port of Anchorage, Alaska. He is responsible for all trade activities within the state. He has direct over sight of the fifth largest commercial airport in the world, two express consignment hubs (FedEx and UPS), trade operations at ten seaports, three airports, three land border ports, two seasonal ports, and one pre-clearance port. He also has direct oversight of the Agricultural Specialist, the Fines Penalties and Forfeiture, Entry, and Import Specialist branches.

Jeff is married to his wife of two years, Kim, and has two children, Rachael, twenty and, Steven, nineteen. Jeff and Kim also share the joys and responsibility of raising their granddaughter, Rhylie.

REPRESENTATIVE BRYCE EDGMON

Representative Bryce Edgmon was born and raised in Dillingham, where he fished commercially for salmon and herring for more than twenty years. He has also worked as the Community Development Quota Manager for the Department of Commerce, Community & Economic Development and is a former Chief Operating Officer for the Bristol Bay Economic Development Corporation.

Presently, the representative is Chairman of the Board of Choggiung Ltd., the Alaska Native village corporation for Dillingham, Ekuk, and Portage Creek.

A legislator since January 2007, Rep. Edgmon is presently seated on the House Finance Committee, with chairmanships of the Department of Transportation and Department of Corrections Budget Subcommittees. In the 26th Legislature, he was Chairman of the House Special Committee on Fisheries and Co-Chair of the House Energy Committee. Additionally, he has served on the Resources and Education standing committees and the ADF&G, Revenue, CCED, and Transportation budget subcommittees.

Rep. Edgmon's experience also includes service at the Legislature prior to holding elected office, in staff positions for a number of lawmakers representing coastal communities across Western Alaska.

Throughout his career, the representative has worked to foster the responsible development of economic opportunities in his district and beyond while also promoting conscientious stewardship of our natural resources. He has also been effective in bringing infrastructure projects to Southwest Alaska that meet crucial immediate needs at the same time they become valuable investments in the region's future.

He lives with his wife Melody and their son Evan and daughter Emma in Dillingham.

To be good Stewards over the waters which we are licensed to protect

Comments of Captain Carter Whalen, President, Alaska Marine Pilots to the members of the NWTF at the Grand Aleutian Hotel Dutch Harbor Alaska, Made on 8/24/2011

Good morning, my name is Carter Whalen and I am the president of Alaska Marine Pilots (AMP). First off, I'd like to thank you for inviting me to speak here today. My purpose in speaking here this morning is to introduce my organization (AMP) and to briefly

- Describe the profession of piloting
- Talk about AMP and the specific regional service we provide
- Discuss how we can help with respect to the increased ship traffic in our Northern Waters

AMP is the regional pilotage organization responsible for providing pilotage services in Western Alaska. Our pilotage district spans West of Kodiak Island out to the end of the Aleutian Islands and North to the Canadian Arctic border. Our mandate by law is "To protect life, property, and the marine environment."

Compulsory pilots are advisors whose sole responsibility is to ensure the safe conduct of all vessels operating within the confines of a state's designated pilotage waters. Pilots are able to do this because we possess intimate local knowledge for the region in which we're licensed. This knowledge of local waters and geography, combined with extensive training and experience specific to the safe and responsible conduct of ships are put to use on a variety of ship types in a variety of conditions in our effort to mitigate the posed risks to Alaska's coastal waters and coastlines.

ALASKA MARINE PILOTS LLC
P.O. Box 920226 - Dutch Harbor, AK 99692
Office (907)581-1240 - Fax (907)581-1372
www.alaskamarinepilots.com

To be good Stewards over the waters which we are licensed to protect

Within the various pilotage systems spread around the world there are two types of marine pilots. They are: compulsory marine pilots and non-compulsory or volunteer marine pilots. In the context of what is about to take place in the Arctic, it's important that you understand the primary difference between the two, which is: the compulsory marine pilot has accountability to the state he works in whereas the volunteer marine pilot has accountability only to the company that employs him or her. In Alaska we have compulsory marine pilotage. Under state law an Alaskan pilot is not allowed to be an employee of a steamship company and the reason for that is he or she remains outside the steamship company's economic control. This arrangement insures independent third regulatory oversight and stands in stark contrast to the volunteer pilot who is simply another employee of the shipping owner and as such is subject to his company's bottom line. Because of this relationship the volunteer pilot's ability to focus and act purely on safety is compromised from the beginning.

In summary, compulsory pilotage is not about response, it's about prevention. To sound cliché' "An ounce of prevention is worth a pound of cure.

At present AMP have ten members with varied backgrounds that hail from all sectors of the maritime industry. My personal background began when I was born in Ketchikan Alaska, raised on an Island in Washington State, and graduated from Massachusetts Maritime Academy with a degree in Marine Transportation. I've been going to sea for close to twenty years with fifteen of those years spent sailing in Alaskan waters as a pilot, aboard the Alaskan Marine Highway, and aboard tow boats.

What makes piloting in Western Alaska both unique and challenging is the sheer size and unconventional nature of the geography combined with a lack of infrastructure.

ALASKA MARINE PILOTS LLC

To be good Stewards over the waters which we are licensed to protect

For the past twenty years the primary economic engine of our pilotage district **has been** the fishing industry. I say **has been** because with the rapidly receding ice pack in the arctic coupled with the oil industries plans for drilling operations in the US Arctic OCS we believe that engine is about to change.

With this change there will not only be new opportunities but new risks as well. Since Risk mitigation is our business, it is our responsibility to be involved in any new shipping activities which take place in our region that pose risk to that which we are mandated to protect. AMP's involvement with the anticipated offshore shipping activities in the Arctic began almost five years ago in the summer of 2007 with the arrival of a drill ship and other support vessels in Dutch Harbor. Considering the size and scope of the intended operation, we asked ourselves, "If it's not safe to do this sort of operation inside of three miles without a pilot then why is it safe to conduct these sort of operations outside of three miles absent an independent state licensed marine pilot?"

Our answer was, and remains, "It's not"

How we can help in the Arctic

At present the Arctic has only a three-mile protective covering of state mandated pilotage. Outside this thin, three-mile boundary are volunteer pilotage waters. To date we have asked the state to consider the expansion of compulsory pilotage into the unregulated / offshore waters of the Arctic to cover the areas of recent federal oil and gas leases. Predictably, the extension of compulsory marine pilotage has met stiff resistance from industry.

This campaign continues to encounter significant opposition from both industry and the state of Alaska, yet as unpopular as our position may be we continue to maintain the position that independent marine pilots in the

To be good Stewards over the waters which we are licensed to protect

Arctic would significantly contribute to preventing marine casualties in the OCS of the Arctic Ocean.

Now, having said this I believe it's important for me to share with all of you today that while our advocacy of arctic pilotage remains,

AMP no longer sits top dead center on this issue. In other words, over the course of the last five years we have come to recognize the fact that independent marine pilotage in the Arctic will not work without the cooperative effort of the oil industry. In other words, it's not a system that can be just "regulated" into being.

Some of the primary reasons for this are *logistics, a lack of infrastructure, and the sheer size and remoteness of the area.* I can not overstate that these hurdles are significant in nature and if pilotage is to become a component in the overall safety net that will be deployed in the Arctic, overcoming them will require a collaborative effort by all parties who have a vested interest in protecting the Arctic.

We believe such an undertaking should incorporate all available assets to set the standard of risk mitigation above and beyond in the interest of prevention and not just response. A cooperative effort, built around a strong sense of both respect and humility when considering the challenges and consequences.

AMP has grown into our existing region over twenty plus years.

Some examples of that growth would be our participation in developing and implementing an emergency towing system for rendering assistance to disabled vessels in and around Dutch Harbor and the Eastern Aleutians. This towing system serves as a protective shield designed to protect the community of Dutch Harbor from the numerous stricken and disabled vessels that transit through Unimak Pass each year.

Office (907)581-1240 - Fax (907)581-1372
www.alaskamarinepilots.com

To be good Stewards over the waters which we are licensed to protect

Our port parameters and severe weather guidelines serve to give definition to what we can and cannot do safely. The severe weather guidelines were developed cooperatively with the USCG. All of these serve as excellent examples of our commitment to safety.

This summer we've had several pilots working in the Arctic aboard eco cruise ships, ore ships, and a Crowley ATB delivering fuel to remote regions near Barrow.

With these examples in mind AMP put together an initial pilotage plan for the proposed 2011 drill season. With this plan, it was our hope that the oil industry would also be amicable to the adoption of these best industry practices and that this document would allow AMP to participate in what we had thought would be the first of many open water drilling seasons to come.

I have that document with me here today and will make it available to those of you who may be interested in reviewing its contents.

Over the years AMP has been successful in our efforts to protect Western Alaska's sensitive marine environment. This is due to the fact that we exercise conservative risk management. It is also due, in no small part, to the fact that we have taken the time to involve and work with the various community leaders in Western Alaska.

Considering all I've said here today I think on a number of levels it would be beneficial for all stakeholders in the Arctic if pilots were invited to provide an active presence not just inside this states current three mile limit but outside three miles as well. I encourage all of you to learn more about my profession so that you can make an informed and independent decision about the value of marine pilots in the arctic and how we might best help prevent tomorrows maritime casualty from becoming today's headlines.

To be good Stewards over the waters which we are licensed to protect

In closing I would offer this.

AMP's mission statement is:

"To be good stewards over the waters which we are licensed to protect."

And since those waters include the Arctic, we stand ready to help when and where we can. Having said that, the choice to use our particular expertise in the Arctic is left entirely up to you, industry, the state of Alaska, and last but not least, the publics good will.

Alaska Marine Pilots Arctic Pilotage Plan

A first year pilotage model designed specifically for the 2011 open water drilling season in the U.S. Arctic Ocean

FORMALLY SUBMITTED FOR CONSIDERATION BY ALASKA MARINE PILOTS LLC

ALASKA MARINE PILOTS LLC
P.O. Box 920226 - Dutch Harbor, AK 99692

Alaska Marine Pilots (AMP) Pilotage Plan for Shell Oil's 2011 Open Water Exploration Season for the Beaufort and Chukchi Sea.

Introduction

This plan is based on Shell Oil's 2010 Outer Continental Shelf Lease Exploration plan(s) and as such may be amended as necessary for the 2011 drill season. Vessels identified as "high risk" carriers are the tanker *Affinity* (or vessel with similar liquid storage capacity) that will be staged near the prospect area of drilling operations. The second vessel taken into account is the proposed drill ship *Frontier Discovery*. When selecting vessels of "high risk", considerations taken into account were: vessel size, maneuverability, oil and fuel capacity, draft, ice classification / capabilities', and mission of craft. Normal and customary duties of the pilot have been listed. It should be noted however that this "list" is by no means fully descriptive and is only meant to provide a general overview of a pilot's responsibilities for those unfamiliar with a pilot's role.

2011 Pilotage Plan for Shell Oil's Arctic Exploration Fleet.

For the initial entry into the Arctic Ocean, AMP will board the tanker "*Affinity*" (or any other tanker being utilized for the purposes of lightering operations and / or spill response) and the drill ship *Frontier Discovery* (or any other drill ship being utilized for the purposes of oil exploration) at one of the designated pilot stations located in either Nome, Adak, or Dutch Harbor. Upon boarding, AMP will ride / pilot the vessel(s) through the Bering Straits to their designated anchoring positions in either the Chukchi or Bering Sea. After anchoring the vessel(s), AMP will disembark the tanker / drillship.

Upon completion of the drilling season and prior to vessel(s) southbound voyage from Arctic waters AMP will embark the tanker / drillship at their designated anchorage area and ride / pilot the vessel(s) until clear of the Bering Straits. After clearing the Straits, AMP will disembark at one of the above-mentioned pilotage stations. Due to Logistics and transportation availability it is understood AMP may not always be able to leave immediately after a maneuver or transit. Every effort will be made to secure the earliest possible transportation mode.

During Arctic operations the need to raise the anchor and maneuver is likely to occur. Good faith effort will be made to embark AMP for these maneuvers. Due to logistics and operational area it is understood that this may not always be possible but every effort will be made to board a pilot. During the course of the drilling season if the drill ship *Frontier Discovery* should be required to be maneuvered alongside the tanker (or vice versa) AMP will be embarked for such maneuvers.

ALASKA MARINE PILOTS LLC

Office (907)581-1240 - Fax (907)581-1372
www.alaskamarinepilots.com

To accomplish the above AMP will utilize transportation services provided by Shell Oil which will include aircraft AW 139 or EC 255 along with personal / crew boats of suitable size and configuration. Furthermore, to be on station for such services AMP will position pilot(s) at one of Shell Oil's shore side operations center located at either at Wainwright or Barrow, Alaska.

Normal and customary duties of the pilot

Master / Pilot exchange to include: Master's written assurance that all appropriate pollution prevention measures have been complied with and that the vessel is not leaking any oil. Recommend also for Arctic operations the inclusion of certification / proof demonstrating that vessel has been vetted for Arctic operations by a responsible 3rd party. (e.g. the vessel agent, or the USCG, DEC or other regulatory entity)

Route planning

Ensure that all bridge, engine room, and deck equipment are in proper working order

Exchange of all pertinent information relating to the safe navigation of vessel over intended route.

Review of vessels operating / handling characteristics.

Conning the vessel(s) for all maneuvering, mooring, anchoring and transiting evolutions.

Provision of additional advice as needed / requested

Pilot Training

Prior to the 2011 drilling season all AMP pilots who are to be engaged on either the tanker or drill ship will take an ice management class similar in scope to *The Fundamentals of Ice Navigation* course conducted at Centre for Marine Simulation (CMS) Marine Institute St. John's NL. For the 2011 drill season Shell agrees to sponsor two AMP Pilots to attend such a class.

Conclusion

The above outlined procedures / services may be provided under either a memorandum of understanding between Shell Oil and AMP or through a federal permitting process

and which shall be in place prior to the commencement of the 2011 drilling season. Upon completion of the 2011 drilling season AMP and Shell Oil will continue to refine and develop the above pilotage operations. The goal of this work will be to develop an independent and comprehensive system of marine pilotage that is both acceptable and accountable to the State of Alaska.

Respectfully Submitted,

Captain Peter S Garay
President
Alaska Marine Pilots, LLC

ARCTIC SALVAGE OPERATIONS

This discussion is intended to provide an overview of marine salvage methodology in the arctic and subarctic to promote the safe and effective means to conduct these operations based on the experience Magone Marine has had over the last three decades.

TRANSPORTATION

The arctic and subarctic coastal areas and seas are some of the most remote, least populated areas on the planet. Assisting a casualty or conducting extensive wreck removal operations require mobilizing and supporting personnel and equipment over great distances where challenging weather and environmental conditions are the norm.

Typically, emergency response to a vessel adrift, minor groundings and small vessel casualties would be handled directly by the nearest tug/salvage operator. When these casualties are too remote or complex and with vessels getting larger and regulatory requirements being what they are, it is more common for a national or international salvage contractor that has a salvage/lightering/firefighting contract in place with the Responsible Party to respond by mobilizing a small team by air directly to the casualty or to the nearest port with available support vessels.

VESSELS

I will not address the issue of tug classes required for arctic salvage work as that is a subject big enough for its own paper but I will address the various types of vessels that would be available and their applicability.

Salvage Vessels

Dedicated salvage vessels are specialized in that besides towing capacity, they have stowage for all the typical tools of the trade including beach gear, purchase tackle, grapple hook, chasing ring, Orvil hook, messenger, transfer and floating tow lines, tow bridles, line gun, davit mounted small boat, helicopter pad, immersion work suits, dive station, portable dewatering and lightering pumps and hoses, oil absorbent materials and PPE etc. as well as bunk space for a salvage crew and the vessel operating crew.

At present, there are not many dedicated salvage vessels in the world as a whole, let alone being available for immediate response in the arctic and even when a salvage vessel is available it will often need the support of other vessels so it is common to use vessels of opportunity for primary or support roles in a salvage operation.

Tugs And Barges

Barges of various types are typically available in most ports; they provide a very stable work platform and can quickly be loaded with large quantities of equipment and supplies. Mobil cranes, multiple point mooring winches and associated equipment can sometimes be found already set up on construction barges.

Tug and barge units are relatively slow when compared to unencumbered salvage vessels traveling at 5 to 7 knots typically in fair weather and much slower in rough weather. Barges under tow are vulnerable to heavy weather especially in strong currents and restricted waters. Barges onsite even on four point moorings are vulnerable to gales and sea ice so operational plans utilizing barges must be limited to appropriate weather windows and with consideration given as to the nearest safe port or mooring site.

One specialized barge utilizes "spuds", large heavy wall steel columns that pass through the hull and stake into the seafloor to locate the barge in position. This system will only work in the most protected waters since only a slight sea state will damage the spuds and or barge. A jack up barge or boat is similar but the columns are powered such that the entire hull is jacked up off the water. The great advantage with this is that the wave or surf action does not affect the hull of the vessel as it passes underneath. Although these units are common in the Gulf of Mexico, they are indeed rare to the northern waters and are slow and vulnerable in transit.

General Support Vessels

A useful workboat could be anything from coast guard buoy tender to a fishing boat with the more open deck space and cargo handling gear the better. An offshore supply vessel or OSV

with a deck crane is probably the best example of a workboat well suited to support a salvage operation with the large vessels providing the best platforms in potentially rough water.

Landing Crafts

A landing craft is a common workboat in the arctic with their shallow draft and tunnel hulls they can navigate the shallow rivers and approaches to coastal villages carrying supplies, equipment and fuel to land on beaches where there are no docks. On a salvage job they can be very useful attending a casualty aground in shallow water or landing equipment such as dozers or excavators on the beach. However when the summer is over they are hauled out or head south since they are not suited to fighting either gale weather or ice.

Accommodation Vessels

Although some salvage operations could take place in shallow coastal areas or even rivers, the long distances involved traveling to and from the north as well as weather considerations require a blue water type accommodation vessel. Examples would include converted deep sea fishing vessels, scientific research vessels and some icebreakers.

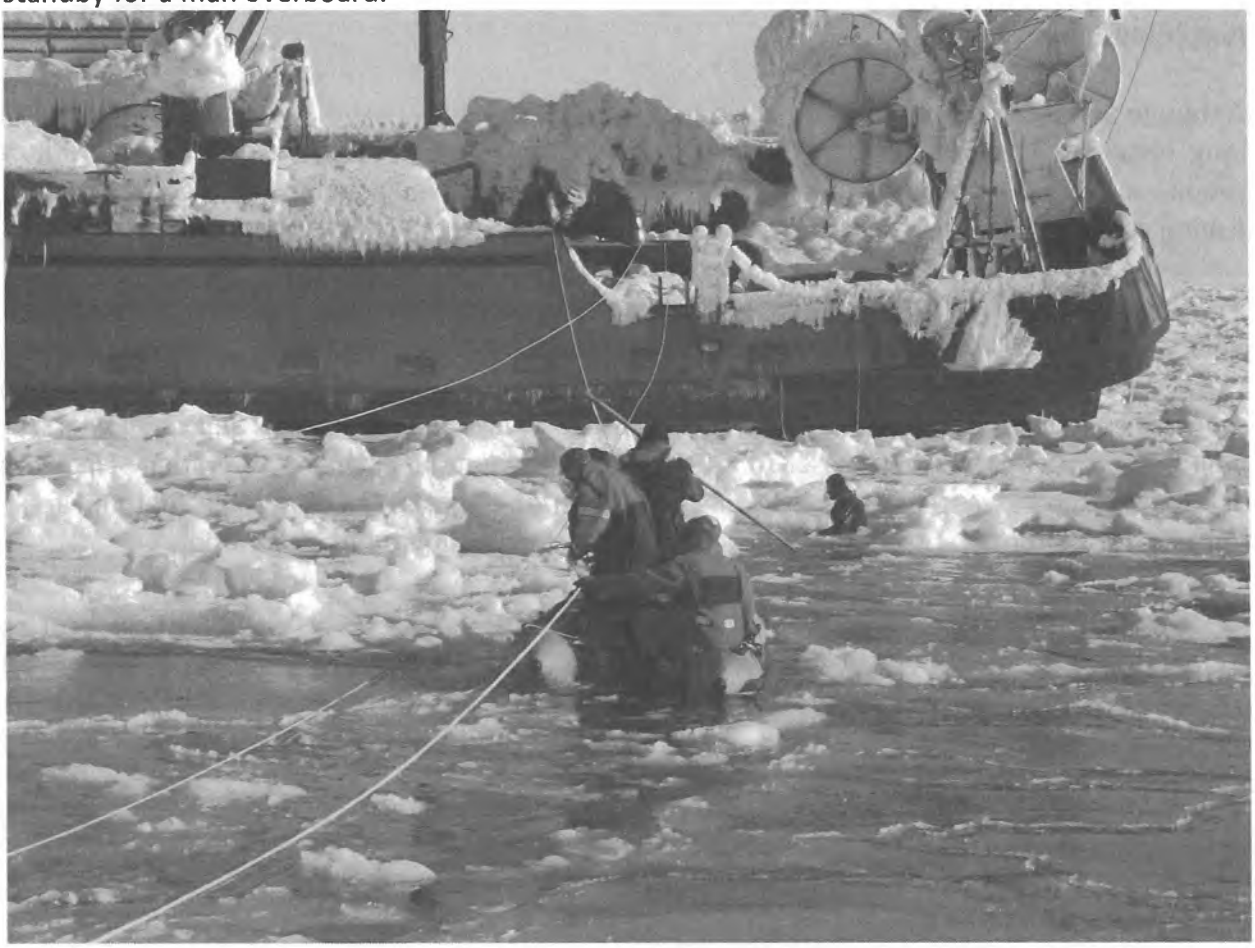
An example of a multiple vessel response in the far north would include one or more tugs for pulling, towing or handling the casualty. A tug and barge unit to provide crane and various support services. A workboat such as an oil field supply boat with a large open deck on which modular connex type units can be stowed for diving, salvage, pollution gear, and small boats, as well as an accommodation vessel to support the manning level of the operation. Finally, a suitable re-supply vessel for transporting materials, equipment and especially fuel and fresh water for the support vessels so they can stay on station throughout the operation.

Of course, if a group of vessels supporting a casualty are expected to operate in light to moderate sea ice conditions (heavy sea ice is not an option) then each vessel will need to meet ice class hull requirements, and possibly an icebreaker from the Coast Guard to support the operation.

Cargo stowage for arctic operations is very important since deck loads can be subjected to rolling in heavy weather, spray and freezing spray. Equipment and materials stowed on deck are best kept in "connex" shipping containers or sturdy watertight totes. Tarps can blow off and typical steel basket type equipment totes can turn into solid blocks of ice.

Small Boats

Small boat operations are an important component to most salvage and pollution response operations; these would include transporting personnel from the response vessels to the casualty, from one support vessel to another. To perform depth sounding and reconnoitering ops in shallow water, connecting messenger or floating tow lines to the casualty or as a safety standby for a man overboard.



The types of small boats are as varied as the tasks they perform. On one hand the largest small boat that the support vessel can safely and efficiently handle makes the most stable and efficient platform to handle personnel. On the other hand, if the boat needs to be pulled out on a beach or around, through, or up on over the sea ice, it needs to be light enough for personnel to handle.

Safety considerations for small boat ops in the arctic would include:

Dependability, if a boat motor shuts down you are immediately at risk. Clean moisture free fuel is essential. Water in fuel drums is the nemesis of small boats ops in the north. Water in the new 4-cycle fuel injected outboard motors will ruin injectors and effectively take the engine offline for the operation. In cold conditions, ice in the fuel can shut down an engine by blocking the fuel system anywhere between the fuel tank, the injectors or carburetors. It is essential that everything be done to protect the integrity of the small boat fuel supply.

A secondary small boat and operator is generally a requirement as a back up to recover the primary boat and personnel if it loses power, is swamped or mechanically damaged and as backup to the primary boat to prevent the stranding of a deployed salvage team.

Besides the applicability of the small boat design to the task, the types of operations that can be safely conducted depend solely on the skill and experience of the operator.

AVIATION

While the heavy lifting in Marine Salvage operations is carried out with various types of vessels, aviation is usually a component on various levels.

1. Mobilizing personnel from around the country by the big name scheduled airlines to the nearest port or air charter hub to the casualty.

2. The Charter of cargo aircraft to carry specialized equipment to the port where support vessels can be loaded.

3. Small fixed wing aircraft to transport personnel to small local airstrips or beaches on wheels or skies and floats for protected water landing.

4. Helicopters have a multitude of uses in salvage operations and are usually onsite to provide close air support.

Everyone who lives or operates in the north understands that flying is completely dependent on the weather. Fog, wind, blinding snow, darkness, and cloud cover frequently make flying conditions untenable. Salvage ops planning and operational expectations need to take this into consideration, the fact that flying can come to a sudden stop and stay that way for days. Back up plans that utilize surface craft or vehicles must be in place if any progress is to be made during unflyable conditions. When salvage teams are deployed by air the safety plan must include a plan to recover the team by surface vessel or other means to prevent them being stranded in a deteriorating circumstance. If a wreck is ashore and safe from breaking up it may simply mean having sleeping and survival gear on the casualty so they can wait out the weather and avoid undue risks in the surf or dangerous flying conditions.

One common problem at remote sites is adequate protection for aircraft that are kept near the operation. Without a hanger aircraft are subject to high winds so adequate tie downs are essential but damage can still be caused by flying debris, sand or gravel. Another problem with uncovered aircraft is icing, deicing in cold conditions is problematic to say the least therefore just having a helipad on a vessel is not adequate to support helicopter ops in cold weather, typically the USCG are the only ones set up for remote arctic helicopter ops with their hanger equipped cutters.

It is important when planning remote salvage operations to stow aircraft fuel on a salvage vessel for emergency use if not for planned operations. Of course the integrity of this fuel is even more important than was mentioned concerning small boat fuel.

As problematic as helicopter operations in north may be they are still a very important asset in many if not all complex salvage operations therefore the salvage contractor will often have a helicopter lined up and onsite. What can be the case is where pollution SCAT teams or other interested parties are in need of helicopter ops as well and while the salvage contractor may wish to cooperate there is a limit what they can do without compromising their main responsibility. We have seen where there is a serious shortage of helicopter time available for the tasks at hand so it is important for all parties to plan ahead and avoid being left in limbo.

Ground Transportation

This is the land of 4-wheel drive trucks, all terrain vehicles (ATV's) and snow machines. A Nodwell is one of several manufacturers of special tracked vehicles used like a truck to carry equipment over tundra, ice and snow.

EQUIPMENT OPERATION AND MAINTENANCE

The difference with operating equipment in the north is all about temperature, the colder it gets the more trouble you will have. Of course the large vessels will need to protect their cooling systems from freezing and deal with ice forming onboard but the real problems come with operating portable equipment at a wreck site.

As was previously mentioned small boat engines are susceptible to fuel problems in cold weather, which increases the exposure danger to personnel. These same fuel problems will plague any portable equipment if steps are not taken to insure the fuel is kept clean and moisture free.

Generators, hydraulic power pac's and the like can be difficult to start without oil pan heaters and without protection from freezing spray and heavy snow portable equipment can be rendered completely inoperable. Air control systems commonly found in crane and winch controls must be diligently protected from moisture in the air systems with the clutch and brake mechanisms on this type of equipment being prone to freezing solid from melting ice and snow between operations. Sometimes the only way to keep this kind of equipment available for use is to cover it with tarps with one or more diesel fired torpedo heaters blowing underneath.

By far the most troublesome equipment to operate in the cold is water pumps. The small diesel engines are hard to start and ice will quickly form in suction and discharge hoses soon after they are shut off. Thawing out the frozen hoses in freezing weather can be an exercise in futility so back up hoses need to be on hand. If the pump housing freezes it will crack the housing so it is good to have spare pumps, parts and replacement housings on hand.

PERSONAL PROTECTIVE EQUIPMENT

Of course PPE is an important and expensive aspect to all operational planning in the north when personnel are expected to work outside.

For small boat operations or any time personnel are working around open water a watertight immersion suit is required. Float coats, water resistant insulated overalls (Mustang suits) and PFD's in general are not designed to provide any thermal protection for someone in the water or wet out of the water.

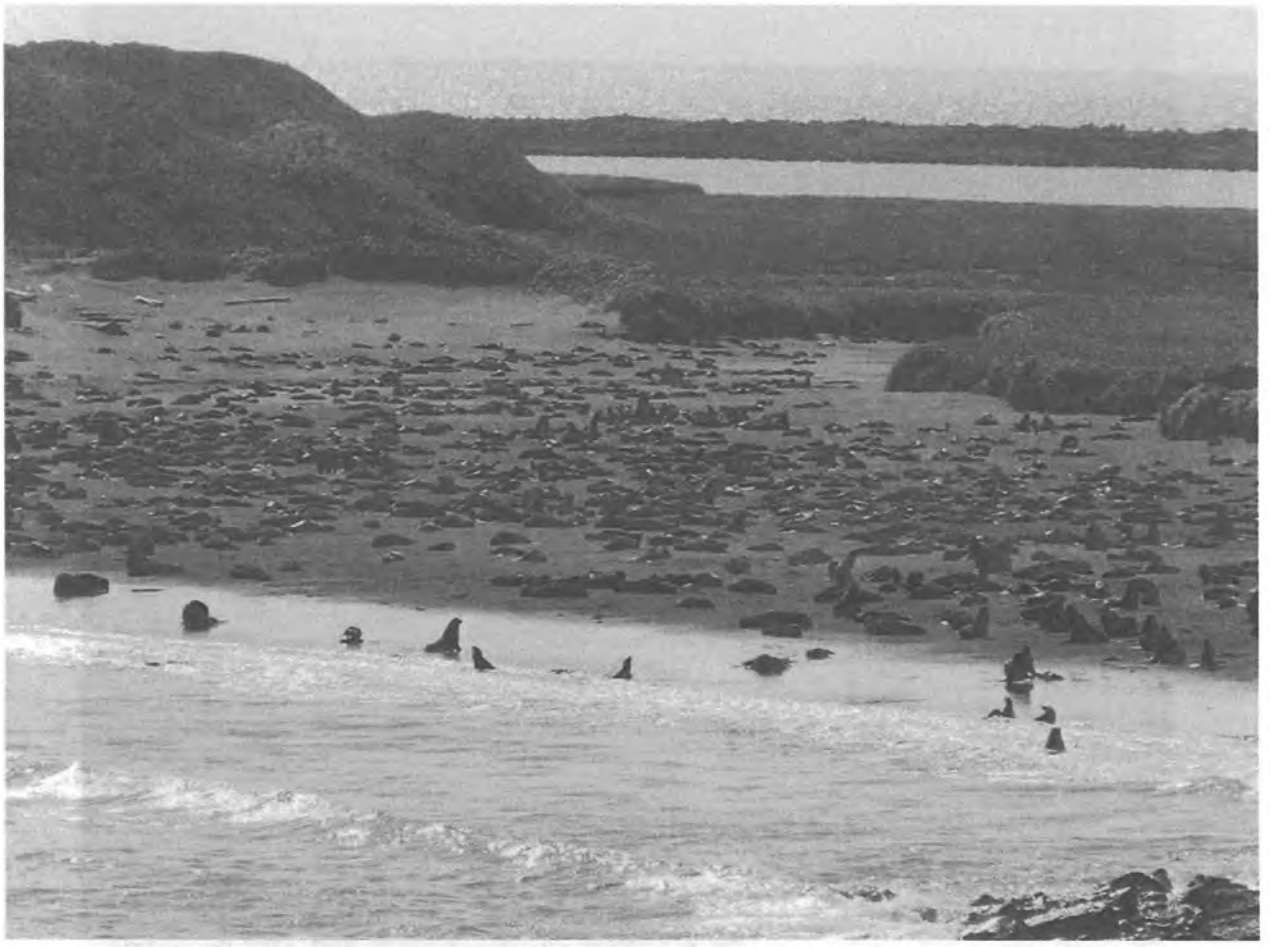
Lace up ankle fitting over boots with heels and drain holes are best for use with immersion suits since they protect the feet and help prevent ankle injuries. Thermal lined "Pac Boots" are best when it is cold and dry. Boot dryers and spare liners are a necessity.

Gloves are another important consideration, the type and design will depend on the temperature, wet or dry environment and the work that needs to be performed. Normally all salvage personnel will require a variety of gloves and spares on any job. Cases of chemical hand warmer packs are something we never leave home without.

Divers will of course need dry suits as a minimum for thermal protection but hot water suit systems will enable better production when there is extensive diving work. The down side of the hot water systems are their bulk and the challenge to keep hoses and heater units from freezing when shut down and the difficulty to thaw them out when they do. For this reason it is sometimes better to keep the equipment simple and make the dives shorter.

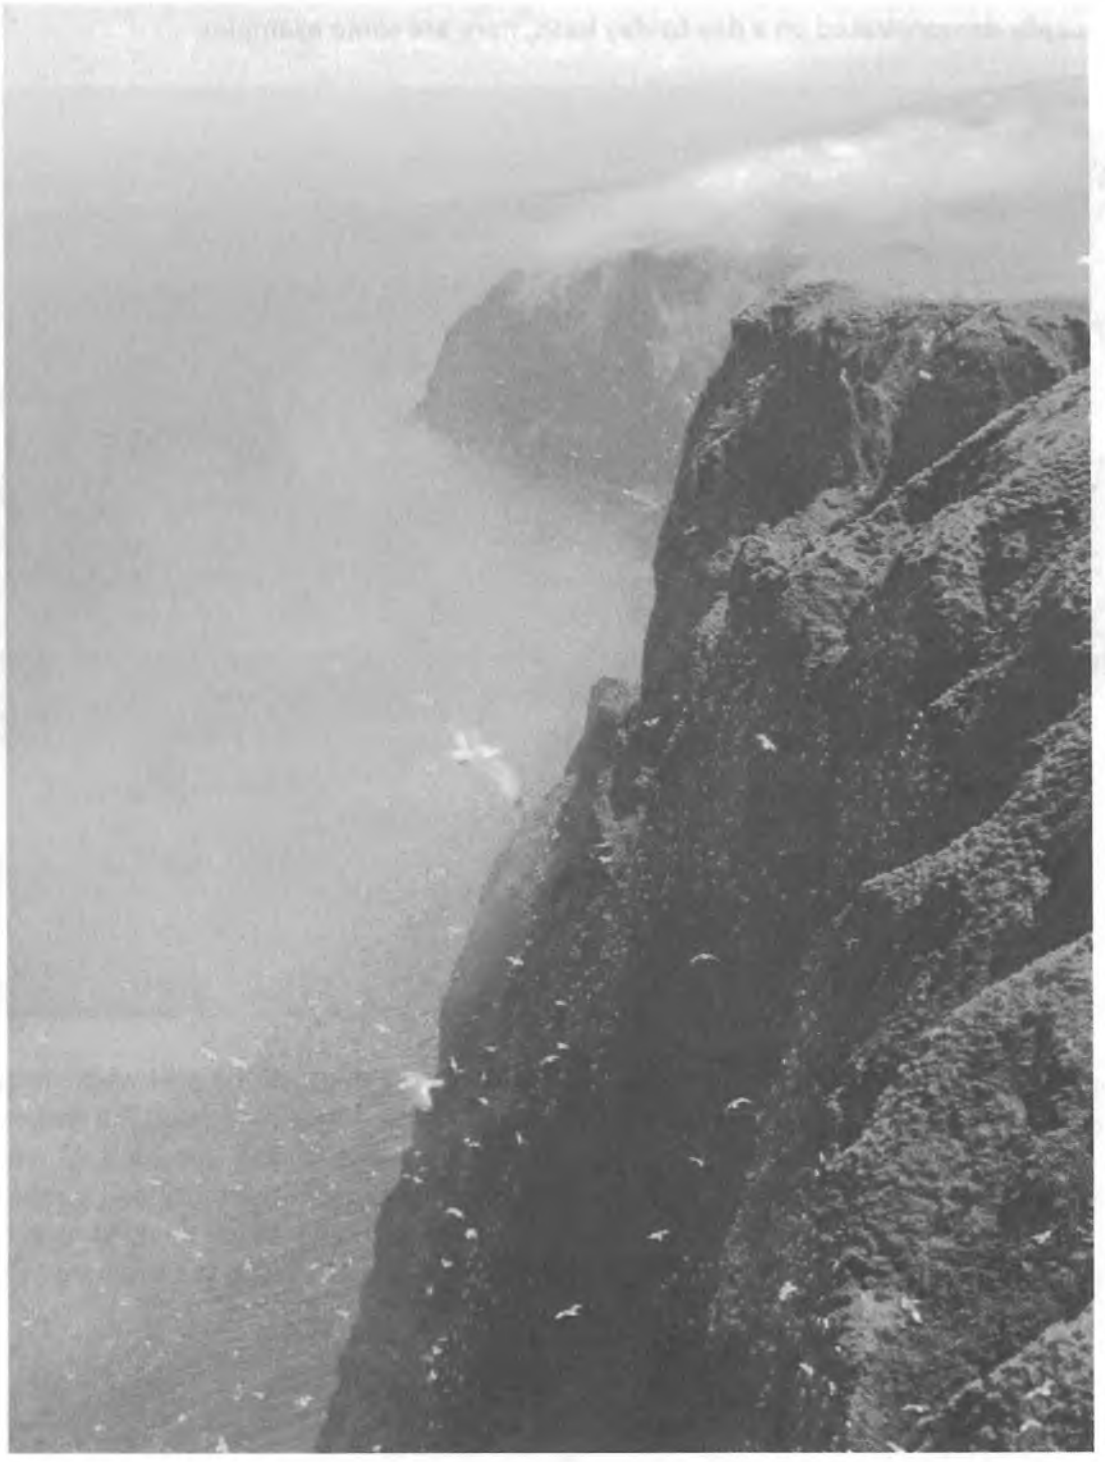
WILDLIFE

One of the rewards to working in the north and Alaska in particular is in observing the beauty of landscapes unaltered by man and the abundant wildlife found therein. As salvers our work is in defense of the environment and the wildlife that depends on the clean water and space they need to survive. There are few places on earth where the reasons for our effort are so dramatically demonstrated on a day-to-day basis, here are some examples.



We once found ourselves working a grounded trawler in the midst of the gray whale migration, with dozens of whales around us while scores of seals and sea lions consumed the thousands of fresh codfish we threw over to lighten the vessel. If the media had got wind of what was happening around us the hue and cry from the environmental community and public would have been a huge distraction considering we were already doing all we could to prevent the 130' vessel from breaking up in the next gale. Since we were successful the drama was kept to ourselves.

We performed an explosive demolition of a sunken factory trawler 15 miles south of Round Island one of the largest walrus haul outs in the world. Another time our task was to remove a 160' oil field supply boat with its bottom torn out and back broke in the middle of a 2 million strong seabird colony while they were nesting. By working with refuge managers and biologists operations like these are sometimes possible without causing undue stress to the wildlife.



Often though and especially in recent years it is getting harder and harder to find a consensus among the concerned parties that allows an operationally practical (at least cost effective) approach. So whether it is reasonable or not we are forced to do our work during the winter or early spring before breakup or moderating weather.

On the one hand we have the wildlife that is such a blessing to observe and our responsibility to protect and on the other the challenges of face-to-face encounters. From near misses with whales to the biggest bears in the world tearing up our gear and running us off the beach, a bull sea lion grabbing a diver on the ladder and throwing him through the air to tame arctic foxes that love to steal or just chew up your gear but in the summer the worst can be the mosquitoes.

So for all these kind of reasons wildlife issues are going to be an important part of any arctic salvage operational planning as well as crew training. For example vessel operators should be aware that their lights attract birds at night and to avoid mass bird strikes they may need to shut down all but essential navigational lighting. Beach crew personnel need a plan to keep food supplies bear proof and resist the temptation to feed the animals.

EMERGENCY MANAGEMENT

With the advent of OPA 90 and the Incident Command System that followed an efficient protocol has been established to manage emergency maritime incidents. The strength of this system is the organization it brings to the complex issues that arise when responding to a large vessel incident. This system does not in itself create sound, timely decision-making on scene and can if it is overly burdensome, even obstruct on scene operations.

There is no substitute for having an experienced salvage master on scene who has the authority to implement an appropriate response to the given situation and circumstances. A classic example of the failure to listen to the salvage master was the capsizing of the French liner Normandie at pier 88 in New York harbor.

Although there are many examples of things going well we tend to learn some of our most important lessons when things get out of control. Here are three examples of situations in my own experience that show the result of a lack in on scene leadership and control.

The M/V Swallow a 307' refrigerated cargo ship had run aground on Ulakta Head, a tug was dispatched to pull it free as an onshore gale was developing, a marine surveyor had come aboard and instructed the vessels master not to take the tow line since he was afraid of damage to the ships propeller if it struck a rock during the pulling operation. The result of the delay in making up the tow was the constructive total loss of the ship and a destructive heavy oil spill for the area.

The 378' "Reefer Ship" M/V Kuroshima was swept by huge wave while hauling in their anchors that killed two of their officers and injured a third. The ship was subsequently driven aground by the storm force winds. At dusk one of my men and I reached the ship by inflatable boat to

help the captain and assess the situation. One of the USCG 378' cutters was in port at the time with a helicopter and a large crew but with darkness falling, 20' seas, hurricane force winds, with driving snow and drops of heavy oil driving through the air, there was not much the coast guard equipment could do. So the cutter crew along with the local USCG Marine Safety Detachment and response teams from the police and port department converged on the scene using the local road system.

With hundreds of response personnel on the beach it was decided that the ship's crew could evacuate in the port lifeboat with a line to the beach and a line to the ship to keep it in the lee of the ship. The two deceased and one injured officer were placed in the lifeboat with 17 other crewmembers and the boat was lowered to just above the wave tops. I unsuccessfully argued that the line attached from the lifeboats bow be drawn in by the men on the beach and instead it was connected to a loader on the road that we could not see. The loader operator was supposedly given a radio to communicate with us on the ship but instead they just started pulling and never responded to our calls to stop. The result was that the lifeboat was pulled away from the ships side until the line broke just as the boat touched a wave top and the crew cut loose the falls. With the line gone on the bow the lifeboat was immediately sucked out with the wave behind the ship and into the huge breaking surf. The lifeboat was eventually recovered and pulled up onshore but what should have been a safe and simple operation became for a time a terrifying and life-threatening situation for the lack of a strong designated leader.

Another four-hold tramper the M/V Hekifu was driven upon an extensive shoal by hurricane force winds while being moved by a marine pilot. Bottom plating was being set in by the ship working on boulders, especially under the engine room where breached shell plate and flooding was imminent. In heavy horizontal snow causing periods of zero visibility and sustained winds at times above 100 knots our salvage vessel was able to drop anchors, back in and connect a towline. Using our bow anchors we pulled back into deep water and a tractor tug made up alongside to add pulling power. There was a small harbor tug on scene that was acting as the pilot boat and our captain wanted it secured to our starboard bow to help hold our heading once the anchors were brought up. The pilot on the tramper wanted his pilot boat to stand by the ship and the tractor tug captain said he would be able to hold our heading, but our captain insisted it was needed. So to make peace I compromised by saying we would keep the small tug at our starboard bow but not put a line on it and once the ship was free the pilot could have it back. With a dropping off of the wind we were able to start moving the ship as soon as we began to pull. As the pilot began to feel some motion with his ship he called for his pilot boat that immediately left station at our bow. The moment he was gone the ship came aground again along with more 100-knot winds. Our vessel and the tractor tug began swinging to starboard and there was nothing we could do about it. Locked in irons we swung like a pendulum as the tug alongside threw their lines and we dropped our anchors. By the time we fetched up on our anchors we had rocks on both sides but did not hit one. By the time we pulled out to safety we had lost the tide, so the ship had to spend the night aground however, since it was off the rock pile and the winds came down it suffered no further damage. That was another lesson to show the salvage master must take charge of the assets at hand or there can be more in peril than just the casualty.

ARCTIC SALVAGE OPERATIONAL DIFFERENCES

Probably the most obvious difference dealing with the arctic compared to anywhere else in the world is ice. Sea ice can limit or curtail vessel operations; it can carry off buoys and disrupt or break ground tackle or towing cables.

Ice can affect the casualty in a number of ways for example:

Surface ice can block access to open water and large individual ice floes driven by wind or current can ground alongside a casualty thwarting towing or ground tackle operations.

Structural damage can result when sea ice presses against a grounded vessel and heavy ice with big seas can reduce any vessel to scrap metal.

Freezing spray can build up on a drifting vessel to the point of its capsize and over time freezing spray can build up on a vessel aground encasing machinery, covering access hatches, fuel manifolds, vents and etc. Freezing spray will also add considerably to the ground effect due to its weight.

Because of these ramifications decisions must be made at the outset how to avoid the ice or work with it, since working against it is never much of an option, for example:

Compromises may have to be worked out with agencies, refuge managers and biologists who would prefer we worked in the winter when most wildlife is gone. When they realize that the alternative may be a much less desirable outcome for everyone if the hull breaks up in the meantime. Sometimes prep work can be done in the winter to minimize the window needed at

that crucial time when the ice breaks up and just before most of the birds and mammals show up.

One example of using ice to our advantage was in Nome when the 225' triple screw AHTS "Aquamarine" was handling the 558' "Bima", the world's largest bucket dredge. During a fall gale at the end of the season the Bima drug the Aquamarine over the tailings pile under full power damaging all three 8' props and bending two propeller shafts and the starboard rudder. With the Aquamarine out of commission and no tugs for thousands of miles capable of towing the Bima south the decision was made to move both vessels alongside the rock jetty that protects Nome's harbor and then to build an ice dam to protect the two vessels from the sea ice that was beginning to form. This was done by spraying seawater though monitors placed around the dredge in a semicircle that froze and built up, first floating and then sinking as the weight of the spray ice increased. When the ice reached the bottom the dam was built up until it was 20' or more above sea level and 50' wide. During the winter our company was contracted to repair the Aquamarine behind the ice berm in the water under the ice. In the spring the ice berm successfully protected the vessels from the gale tossed sea ice and both vessels went right to work after breakup.

Early one spring we were tasked with the lightering of fuel and removal of a crabber wrecked on a reef that was soon to be occupied by thousands of fur seals. The wreck was so covered with frozen spray that it resembled an iceberg and there was no way to access the fuel tanks let alone conduct wreck removal operations. We finally settled on a system of boring holes into the ice in which an explosive charge was detonated to fracture the ice sufficiently to allow efficient manual removal. These explosive charges created very little air blast and caused no damage to the casualty. Frozen spray with its entrapped tiny air bubbles is one of the toughest forms of ice, unless you have wacked this stuff with a sledge hammer it would be hard to believe how tough it really is.

If a casualty cannot be towed south before freeze up some areas are much safer than others for spending the winter, both in terms of safety for the vessel as well as environmental risk. A Port of Refuge policy for the arctic is something that will need to be fully developed as it has been successfully implemented and utilized in Southwest Alaska and elsewhere.

Urethane Foam

Next to ice, remoteness from conventional resources shapes operational planning and methodology more than anything else. An example of this is our use of Urethane Foam. Expandable urethane foam came on to the salvage scene over 30 years ago but never gained widespread use due to its expense, technical challenges and the mess of dealing with expanded foam in ship spaces in the ship repair or breaking yard.

Despite these disadvantages urethane foam has been a reasonable alternative to us where heavy lift equipment is not available and operational windows are short by rapidly creating non-shifting internal buoyancy.

Explosives

Another tool that can improve operational effectiveness in remote locations is the judicial use of explosives.

The principle uses of explosives in salvage are as follows:

1) Blasting of rocks penetrating or blocking a vessel aground

2) Blasting of bedrock under a vessel to allow access for divers

3) Blasting ice blocking a vessel or frozen spray covering a vessel.

4) Cutting steel above and below the water during demolition operations especially making the last strategic cuts to eliminate risks to topside burners or divers.

5) Scuttling charges for sinking wrecks rapidly in positions agreed to in EPA Ocean Dumping permits

6) Utilizing the heat generated by explosives to ignite the bunkers in a vessel and burn it before it breaks up to prevent a spill.

If there is a stigma associated with the use of explosives in salvage operations it is because almost everyone has heard some story of the misuse or ineffectual use of explosives. For this reason it is important that these types of marine operations be conducted by experienced personnel familiar with the principles appropriate to the applications mentioned above since as difficult as it is to obtain approval for the use of explosives it will only get more difficult if the

public and involved agencies do not see safe, clean, effective use with minimal impact on wildlife.

In the six applications for the use of explosives listed above the first five require the blaster to have expertise in rock blasting and demolition in the marine environment, although specialized, these people are generally available.

The last application, as a component to in-situ burning of bunkers in the vessel involves more than just the knowledge of the use of explosives and it could be difficult or impossible to locate explosive handlers with firsthand experience therefore it's very important for the salvage response contractor to have a thorough understanding of the principles of in-situ burning in order to work up a competent plan of action with his blasting crew.

The fundamentals of in-situ burning of bunkers in the vessel are as follows:

This action is usually only considered when time constraints due to weather and location make it impossible to lighter bunkers before the vessel is expected to break up and the environmental damage from the oil spill is expected to far exceed the air pollution associated with the burning of bunkers.

Explosives are used because it provides a safe way to ignite the oil remotely and the intense heat generated by the explosives can create a conflagration of such heat and magnitude that it will rapidly and efficiently burn the bunkers with a minimum of heavy smoke and air pollution.

The explosives employed are designed to ignite the fuel and not damage the hull since the vessel must contain the fuel while it is being burned. Since flash and heat are essential Class A type high explosives would typically be used with charges connected with high core load detonating cord such as 200 grain.

All explosive materials are a balanced combination of fuel and oxidizer when detonated with fuel oil there is of course a huge imbalance so to be efficient an additional source of oxygen should be provided.

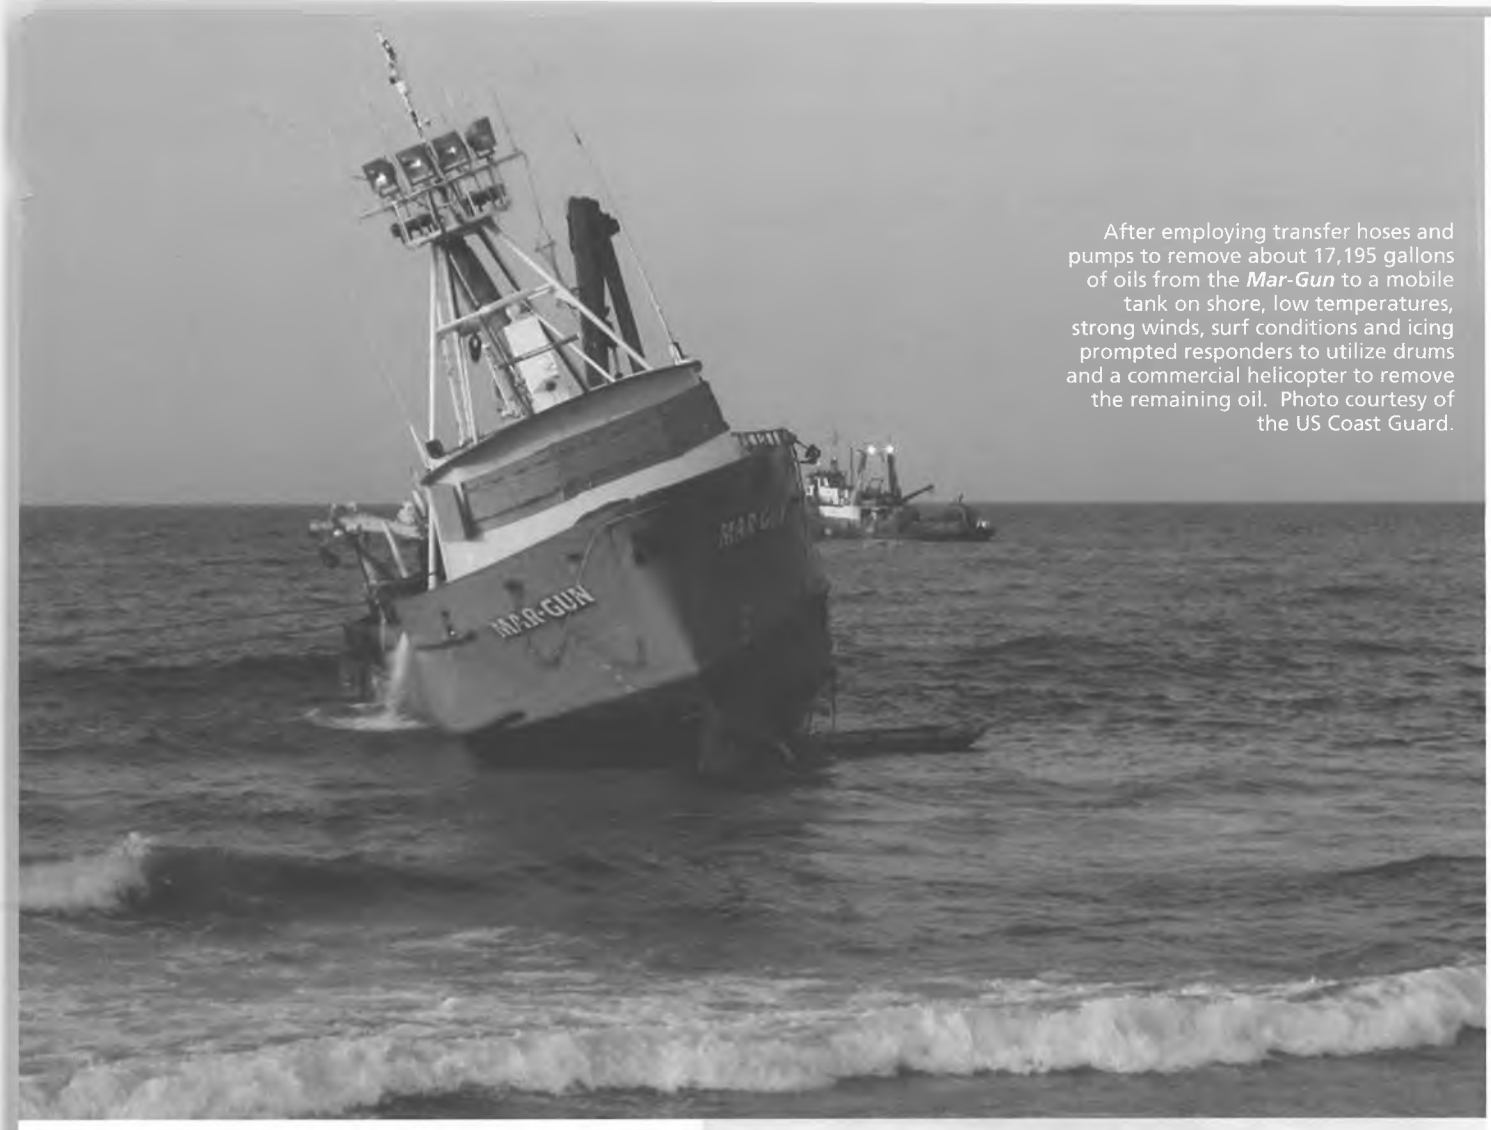
The use of explosives in the arctic and the marine environment in general is mainly limited by its effect on marine life. By working with agency biologists we can make responsible determinations as to the potential risks to marine life and how they may be avoided or minimized by operational timing or technique.

To summarize, men have been working at the edge of the ice for all of history but today's technologies are allowing us to accomplish a great deal in relative comfort and safety as long as we maintain the same respect for these cold waters as the seafarers before us.

Magone Marine Service:
30 Years in Dutch

By Dan Magone

Top: Magone Marine responded in 2006 when the car carrier ***Cougar Ace*** lost stability and developed a 60-degree list to port south of the Aleutian Islands. Magone photo. Above: Some of the company's equipment at the facility in Dutch Harbor, Alaksa. Magone photo. Right: The 112-foot fishing vessel ***Mar-Gun*** was fishing for Pollock earlier this year when she went aground on the rocky shoal off St. George Island. Here she is being atended to by Magone and Coasst Guard personnel. Photo courtesy of the US Coast Guard.



After employing transfer hoses and pumps to remove about 17,195 gallons of oils from the ***Mar-Gun*** to a mobile tank on shore, low temperatures, strong winds, surf conditions and icing prompted responders to utilize drums and a commercial helicopter to remove the remaining oil. Photo courtesy of the US Coast Guard.

Magone Marine Service was founded by Dan Magone in Dutch Harbor, Alaska in 1979. Thirty years later, the company employs 45 men and women. Today, the success of the company depends on the varied talents, experience and teamwork of the whole crew.

I was an entrepreneur since early childhood; everything from selling light bulbs door to door to a firewood and tree trimming business. On leaving high school I opted to start in the trades before going to college to get some sense of direction. I never found time to go back to school. As an avid teenage sport diver, my first career inspiration was to become a commercial deep-sea diver. To this end I completed a six-month course in Wilmington, California and went directly to work in the Gulf of Mexico on oilrigs and pipelines.

After a year and a half in the Gulf and somewhat disillusioned with the lack of glamour and prospects of an oilfield diver, I moved back to California and went to work in a heavy truck shop as a welder, fabricator and mechanic. I simultaneously formed my own company, Welding Specialties, and in 1974 the company was successful enough to allow me to go out on my own.

In spring of 2007 Magone Marine added a 1,000-ton floating drydock, thereby enabling the local fishing fleed to haul their boats out without having to travel thousands of miles for basic hull maintenance and emergency repairs. Magone photo.

As I gradually built up a clientele of fishing vessels on the coast, I began to see a niche for the kind of work I loved to do, including diving, and I renamed the company Magone Marine Service in 1975. I quickly discovered that the worst nightmare a large vessel owner had when operating in northern California or southern Oregon was propulsion machinery damage, since there were no drydocks between San Francisco Bay and Coos Bay. With this in mind, I studied the theory and technique of propeller and shaft removal and repair, babbit bearing repair and engine/shaft alignment. My one-ton service truck was set up with all the tools and equipment to remove, repair, balance and reinstall damaged propellers, while the boat sat in the water tied to the dock, usually within a 24 hour period. It wasn't long before Magone Marine Service gained the title of the "wet drydock" and I serviced a fleet of trawlers and albacore boats that operated from Half Moon Bay, California to Brookings, Oregon.

In 1978 one of my clients was running a king-crabber out of Dutch Harbor and called to say "grab your gear and get up here… my rudder has come adrift".

On arriving in Dutch Harbor I looked out in the bay to see the 'cover girls' of the fishing magazines, the finest boats in the US fleet that I had only read about, and nobody there to fix 'em! After repairing the ***Sea Witch,*** I returned to Bodega Bay, sold everything but my tools to pay my bills and by February of 1979, at the age of 27, I had moved to Dutch Harbor.

In the late '70s, fishing was good, the fishermen were wild and there were no dry-docks for thousands of miles. I set up shop first in a WW II hanger at the airport and later in a warehouse on Standard Oil Hill, and started planning for the shipyard that would take decades to complete.

Soon I was joined by brothers David and Craig, who helped in the business when they were not commercial fishing.

In 1980 Magone Marine Service was incorporated in the state of Alaska with me as president, operations manager and principle stockholder. Two years later I married Susan Carney, and as my family will agree, I sure needed a good woman in my life!

Dan Magone straightens a propeller at the company's facility in Dutch Harbor. Magone photo.

1982 was also the year the company entered into a joint venture with the regional native corporation to rebuild the area's old military marine railways and run a shipyard operation. Although this was a busy time, the business relationship did not work, out so after the first year Magone Marine moved out on its own again and continued performing below waterline repairs with divers.

Magone's departure from the marine

The bulk freighter ***Selendang Ayu*** broke in half after running aground off the coast of Unalaska, spilling oil and its cargo of soybeans. Photos courtesy of the US Coast Guard and Magone Marine.

railways facility coincided with the dramatic decline in the crab fisheries, and since the US trawl fisheries had not yet been developed the ship repair business looked bleak. What saved the company was the price of oil. With oil up to $33 a gallon the geophysical ships were headed to the Bering Sea, and they needed support for their vessels in Dutch Harbor.

Within a few years the exploratory drilling rigs moved in with all their support vessels and provided us with the work we needed to not only survive, but provide valuable experience for my crew of young divers and shipwrights.

By the mid '80s the price of oil dropped, and with it went the oil field supply boats, but by then the Pollack and Cod trawl fisheries where in full swing and the company's services were once again important to the fishermen.

Having the only diving crew around, the company was of course called to the aid of vessels in distress following accidents and groundings, to perform emergency hull repairs and assist in refloating. We even completed salvage jobs on vessels that wrecked in Unalaska Bay. In the meantime I came to know eminent west coast salvage master Mick Leitz, who would call

on Magone Marine to assist in fishing vessel salvage operations in the vicinity and for support for his operations further north with the salvage vessel ***Salvage Chief***.

He was a mentor to me. These were in the days before the current wreck removal laws so you only took on a salvage job if you could save them money on the value of the hull and machinery.

Leitz showed me the need to assess the cost of the entire salvage, tow and repair. If your client hires you to salvage a vessel and later finds out it cannot be cost effectively repaired, then somebody has a big problem on his hands. You'll wish you had never gotten involved.

In 1989, while the country's attention was focused on the ***Exxon Valdez***, Magone Marine Services had developed into a serious marine salvage company and was busy with other projects including raising the seiner ***Northern Dawn*** and the trawler ***Rosella*** and refloating the crabber ***American Beauty***. The company also performed the wreck removal of the Japanese refrigerated cargo ship ***Swallow*** from Ulakta Head.

By 1990 the company had grown to 50 employees with gross earnings for the year of $6.2 million, the majority of which was general ship repair, but marine salvage was becoming a significant part of our overall operations. At the time Magone was operating from a warehouse in Captains Bay, but our landlord wanted it for other purposes, so with no more WWII warehouses left to move to, we bought a WWII vintage troop transport barge from Western Pioneer, had it converted to a machine shop/office/bunkhouse/crane barge at Marine Industries Northwest in Tacoma, and had Crowley tow it to Dutch Harbor.

We moved in to our new facility, such as it was, in November of 1990. By then the company had added another 260-foot by 48-foot "APL" that we had salvaged, and with the two barges moored to shore with drive on ramps, the Magone Marine facility in Dutch Harbor was born.

In 1991 an overcapitalized fishing fleet was restricted from fishing year round and there began an abrupt and steady decline in the vessels using Dutch Harbor that is only now stabilizing. To cover the company's now increased overhead amid plummeting revenues, the company diversified into dock repair and maintenance. I also set the company up as the local oil spill response contractor, and in 1993 became a "BOA" oil spill response contractor with the USCG. In 1991 we began rebuilding an old Yard Freighter hull and converting it to a salvage tug, hoping to glean more work from a larger area.

Times were hard for the next 10 years but with our tug ***Redeemer*** which came online in late 1992, besides salvage work we were able to haul anything for anybody to anyplace nobody else would. We hauled cattle, horses, drilling rigs,

Magone was called to salvage the stern of the *Selendang Ayu*. Magone photo.

construction equipment and materials… you name it. Combined with the new wreck removal laws we once again found enough work to get by.

With a few exceptions Magone Marine has handled all the significant salvage or wreck removal work from Kodiak westward and the Bering Sea since that time. We are typically subcontractors to the big international salvage companies when responding to the largest ship casualties, but these appear to take place only every 5 or 10 years in our neighborhood.

Since the company's remote shipyard had focused on emergency repairs and unplanned vessel maintenance problems, work was always cyclical with the fishing seasons, and over the course of the year ship repair was only marginally profitable. However the shipyard acted as a base for our salvage vessels, and kept a core crew at hand for the big emergencies when they happened. Examples include such high-profile cases as the ***Kuroshima***, ***Selendang Ayu*** and ***Cougar Ace***. These projects generated considerable revenue through vessel day rates, equipment and labor, and the profit was put back into the business to strengthen and upgrade the services the company has always offered, and to upgrade the facility to provide more of a year round operation.

In 1989 Magone Marine Services developed into a "serious marine salvage company."

In 2005 we expanded our dock facility with the addition of a 300-foot by 90-foot floating dock on which was installed a smooth concrete deck to facilitate equipment operating and cargo handling. Heavy ramps at each end accommodate trucks, large load-

Magone Marine for 30 years of service to the Maritime Industry from your proud partners in risk management
Wells Fargo Insurance Services Northwest

WELLS FARGO

ers and cranes. With the new dock, the Magone facility now covers 1,200 feet of the waterfront in Dutch Harbor between the Coast Guard dock and the new Dutch Harbor Ports facility.

In the spring of 2007, my longtime dream of having my own drydock came true with the acquisition of a 1,000-ton-capacity floating dry-dock from Foss Shipyard in Seattle. Foss had purchased the dry-docks from the former Marco shipyard when that yard closed, and sold this one to make room at their facility. The new drydock has proved to be a blessing for Magone Marine as well as the local fleet, as they are no longer forced to travel thousands of miles for basic hull maintenance and emergency repairs. It has acted to stabilize the Magone Marine Services workflow and allowed the company to hire and retain more skilled shipyard personnel. The drydock is also allowing us to catch up on maintenance and upgrades to our own fleet, that now includes three salvage vessels, one landing craft and three mobile barges. The Magone dock facility is made up of 4 permanently moored barges.

> "It is gratifying to see the company coming together and interesting to look at the future of our area in these changing times." DAN MAGONE

In 2006 Magone Marine became a member of the American Salvage Association, and in July of that year the company participated in a joint effort with ASA members Titan, Crowley and Foss in the salvage of the capsized car carrier ***CougarAce***. The ***CougarAce*** job was a good example of ASA members working together. Through the Incident Command system, the Port of Refuge issue was handled efficiently with all the regulatory agencies and concerned parties, which enabled the salvors to bring the ship into protected waters where it could be safely righted.

Although we certainly have a ways to go in terms of upgrading our facility and organization the vision I have had for Magone Marine in Unalaska/Dutch Harbor is finally coming together. In the last few years I have received some big help to the organizational end of things.

Mark Stahl joined the company in February of 2006 as Controller/office manager. Mark had previously spent two years in Afghanistan with his wife and family, working as Finance Manager for PACTEC. After two years in Kabul, his wife decided Unalaska Island in the Aleutians didn't sound too bad.

Mark has done a great job raising the level of professionalism and ef-

Dan Magone is seen here directing winch operators for the purchase tackle on the ***Mar-Gun*** salvage. Magone photo.

ficiency in our office that was needed to support our current operational workload and the financial issues that are involved.

John Adams joined the company in October of 2007 as Shipyard Superintendent, coming from a navy background as a nuclear engineering officer on the ***USS Carl Vinson***, ***USS Nimitz*** and ***USS California***. Later in his Navy career he worked as Project Manager, Production Manager, Project and Planning Engineer and Assistant Superintendent on various nuclear submarine and surface combatant overhaul and repair projects.

After retiring from the Navy, John was working as an owner's representative and consultant on yacht construction projects out of Tuzla, a small suburb of Istanbul, Turkey, when he responded to an ad for a Shipyard Superintendent position in the Aleutians. His organizational skills have been put to the test, but it looks like he's winning.

We've seen some good men come and go over the years, and a great many colorful characters, but many of the old guard remain, including Jeff Whited, who is in charge of the machine shop and outside machinist duties including the company's engine and shaft alignment work.

Dave Magone, Butch Aus and Ted Sherebernikoff, as salvage vessel operators, have over the years done much to build the company's reputation in trying circumstances with limited resources and with not one significant casualty to vessels or crew on any salvage job to date.

Finding good talent for our small company in the remote location has always been challenging, but I am encouraged by the quality of our new hire captains, divers and engineers this last year. It seems the slowdown in the offshore oil industry has been to our advantage.

There is still a lot of work to do to get the company ship shape, But it takes time when you put your customers' jobs first, which is how it needs to be.

It is gratifying to see the company coming together and interesting to look at the future of our area in these changing times. As I look out from the company's Dutch Harbor base over the vast ocean to the North, South, East and West, I ask myself, will the fisheries remain healthy? Is Arctic oil development just around the corner? How rapidly will we be seeing an increase in Arctic marine transportation? I don't know the answers, but I expect our talented crew will continue to be around to offer service and support as long as there's a need. PMM

Thank you to our customers, marine surveyors, insurers, suppliers, bankers and lawyers – as well as the maritime community of the Pacific Northwest.

We are blessed to have so many friends.

Salvage capabilities in Alaska's North,

As we see interest increasing for oil and gas development, transportation and tourism in the Alaskan Arctic the question arises, what about emergency response and salvage? The short answer is there is not much here yet but that's about to change. For a better understanding of what to expect let's take a look at what's been going on in Alaska and how that will effect coming operations in the arctic.

A brief history of modern marine salvage in the Alaskan arctic and subarctic would start with development at the North Slope of Alaska when in 1975 Crowley Maritime operated their "Sea Train" of tugs and barges to haul the modules, equipment and supplies north each summer for the oil companies. As there was no salvage support anywhere north of Puget Sound their underwriters required that a salvage vessel sail with them. Fred Devine's "Salvage Chief" was chosen and sailed with the fleet in 1975 and '76. The next year Crowley brought the "Arctic Salvor" online, an offshore supply type vessel set up with an extensive salvage spread including multiple heavy winches for ground tackle and towing operations similar to the Salvage Chief. The Arctic Salvor took over the Sea Train duties in 1977.

I started operations in Dutch Harbor on Unalaska Island in the eastern Aleutians as Magone Marine Service in 1978 and used vessels of opportunity for Salvage operations until 1993 when we completed conversion of a Navy "Yard Freighter" to our salvage tug "Redeemer". Since that time we have handled almost all the marine salvage work in Western Alaska, largely composed of fishing or coastal transportation. The exceptions are the few very large salvage operations in which we have typically been subcontractors to the big salvage operators from the "Lower 48".

Following the grounding of the Exxon Valdez in 1989 and the OPA 90 Act that resulted we saw the formation of oil pollution contractors, co-ops and regional response organizations such as CISPERI (Cook Inlet Spill Prevention & Response Inc.) covering the Cook Inlet oil and gas operations, and Alyeska Pipeline Service Company with their SERVS (Ship Escort/Response Vessel System) which covers the entire trans-Alaska pipeline, the oil terminal in Valdez and Prince William Sound out to where the tankers enter the Gulf of Alaska. Both CISPERI and SERVS have emergency response/towing vessels especially SERVS with 5 Crowley owned assist tugs of over 10,000 HP but these vessels are committed to serving in relatively small geographical areas in support of ongoing operations.

So to date Alaska does not have much to brag about in terms of marine salvage resources but we do have a good record for pulling together when the need arises, here are a few good examples:

During a gale in October of 2002 a zinc ore lightering barge broke tow and grounded in 20' seas and 60 knot winds off the village of Kivalina located at 67° 44 N and 164° 33 W, approximately 82 miles north of the Arctic Circle on the Chukchi Sea and not too far from where Shell would like to do some exploratory drilling this summer. As Divine Salvage had the response contract with the gale subsiding Mick Lietz arrived on scene with a plane load of equipment and divers he rounded up in Anchorage. What he found was a 300' barge with a massive aft superstructure supporting an ore offloading boom and conveyors system that had drifted in over the outlying shoals and was now sunk on the bottom save for the buoyancy in the bow rake tanks. It would make a great story how Mick and company got the wreck to float and out of there before the next gale, towing it to shelter behind one island and then another before making it to the Magone Marine facility in Dutch Harbor. The barge was floating on a "bubble" and there was bottom plate missing from a large area of the stern with plate hanging 30' below the bottom. The starboard chine was crushed up 6' to 8' and all below deck spaces were holed or common with each other except the bow rake tanks. Any other time a barge damaged to this extent would be scuttled in deep water but the ore handling equipment mounted on the deck could not be removed and it represented 50% of the production capacity of the largest zinc mine in the world therefore it had to be saved. The project to make this wreck "seaworthy" for a winter tow from Dutch to Seattle would be another good story to tell, and they did make it there in time for Christmas.

When the car carrier Cougar Ace rolled over to a 60° list to starboard, 230 miles south of the Aleutians in the summer of 2006 we had a classic example of how Alaskans and the salvage community at large were able to pull together. Magone provided two salvage vessels to transport a Titan response team to the ship while Foss released a tug from its barge in Adak to assist the casualty and Crowley dispatched two big tugs from Puget Sound over 2,000 miles away. So you have four ASA members working together to save the ship and prevent the pollution its demise would cause, but that wasn't enough. Without the help of the USCG Morgenthau and its H65 helicopter the salvage team could not have boarded to inspect, stabilize and rig the ship for tow. When initial efforts to right the ship at sea looked doubtful we began working through the Unified Command with the State of Alaska, on a "Port of Refuge" and through the cooperation and input of the various agencies and concerned parties a plan was put into place in a timely manner that led to a successful outcome of the incident without loss of ship or pollution. A formal Port of Refuge plan for the Alaskan Arctic is still in its infancy and will take some time to implement but the State of Alaska and the USCG are familiar enough with the principles to manage an incident responsibly in the meantime.

When the Selendang Ayu grounded and broke in half in December of 2004 Magone supported Smit's operation in removing the remaining heavy oil in the stern section while Magone later performed a partial wreck removal of the stern section. This incident caused the worst oil spill in Alaska since the Exxon Valdez with the expected outcry from the public as to what can be done to prevent another such incident. With funds from the Selendang settlement the Aleutian Islands Risk Assessment (AIRA) was formed to push for shipping safety in the Aleutians and in particular the stationing of a large rescue tug in the area: You can see what they are doing by going to their web site at http://aleutianriskassessment.com/.

Of course the heavy hitters in the marine response community are looking for a financially viable way to provide this response vessel but it hasn't happened yet.

I am seeing a lot more interest in my neighborhood in the last year or so with Shell Oil and their contractors stirring around in Dutch, while Global Diving and Salvage has set up shop in Anchorage and Bisso has staged response equipment with CISPRI. But for now in the Bering Sea and north it's still more up to Alaskan ingenuity than impressive equipment when it comes to dealing with a marine emergency response.

The American Salvage Association has added "Arctic Salvage Operations" to their list of training modules which provide the information that state and federal agencies and other interested parties need to better understand and work with the salvage community when called upon. For information on the ASA training modules and conferences go to their web site at http://americansalvage.org/.

At your service,

Dan Magone, President
Magone Marine Service, Inc.

Law of the Sea Convention

1982 Law of the Sea Convention (LOS Convention)

Why becoming a party benefits the United States

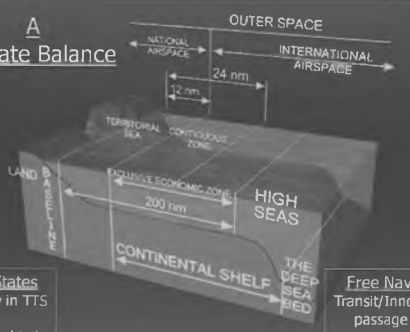
Rear Admiral Fred Kenney
U.S. Coast Guard
The Judge Advocate General

CGJAG

U.S. COAST GUARD

Law of the Sea

A Delicate Balance



Coastal States
Sovereignty in TTS

Resource Rights in EEZ

Free Navigation
Transit/Innocent/ASL passage in TTS

FON in EEZ

U.S. COAST GUARD

Background on Law of the Sea

Customary International Law

- "General practice accepted as law" (ICJ Statute Art. 38(1))
- Primary source for the creation of universal international law
- Subject to change

Territorial Sea (TTS) Limit:

Cannon ball-shot
3 nm
12 nm

1958 Law of the Sea (lacked balance)

- TTS – CZ – CS – HS/Fishing (The 4 not linked)
- Nations could pick and choose
- No agreement on TTS limit
- Didn't adequately account for advances in tech

U.S. COAST GUARD

Background on Law of the Sea

1982 Law of the Sea

- Strikes balance between coastal states and freedom of navigation interests
- Tech advances in such things as refrigeration and seabed drilling drive inclusion of EEZ provisions and extended continental shelf provisions

1982 Law of the Sea Crystallizes:

- TTS at 12nm
- Right of innocent passage through foreign TTS
- Traditional high seas freedoms of navigation (FON) and overflight seaward of TTS
- Transit passage through international straits and archipelagic sea lanes

U.S. COAST GUARD

Background on Law of the Sea

1982 Law of the Sea

New Convention concluded in 1982 but U.S. and other developed nations did not join because of following objections to the Part IX deep seabed provisions:

- Governance of the International Seabed Authority
- Forced technology sharing
- Production limits and fees

CGJAG

U.S. COAST GUARD

Background on Law of the Sea

President Reagan declared that the United States will abide by all provisions of the 1982 Convention except Part XI

Part XI fixed by 1994 Implementing Agreement

1982 Convention, as modified by the Part XI agreement, submitted to the Senate in 1994 by President Clinton

Every Administration, both Democratic and Republican, since 1994 has supported the LOS Convention

Twice favorably voted out of the Senate Foreign Relations Committee but not brought to the floor for a vote

CGJAG

U.S. COAST GUARD

Background on Law of the Sea

Law of the Sea Convention entered into force in 1994

161 nations, and the European Union, have joined the Law of the Sea Convention

The United States is the only major maritime power that is not a party to the Convention

All Arctic nations, except the United States, are party to the Convention

Accession to the Convention is supported by the U.S. military, and national security, business, & environmental interests

CGJAG

U.S. COAST GUARD

Myths About the LOS Convention

The LOS Convention:

- Does not create a United Nations navy
- Does not create a United Nations body that governs the world's oceans
- Does not require mandatory technology transfer
- Does not subject military activities to dispute resolution
- Does not restrict U.S. intelligence activities
- Does not require the U.S. to litigate disputes before an international court of justice
- Does not erode U.S. sovereignty

CGJAG

U.S. COAST GUARD

U.S. Accession Promotes National Security

Becoming a party to the Convention advances our security interests by allowing us to:

- Leverage the Convention's provisions to push back extended territorial claims, such as in the South China Sea
- Improve international maritime cooperation
- Exercise the right of approach and visit
- Secure our territorial sea and assert authority in the contiguous zone
- Be on the "inside" in interpreting and further developing the Convention

Joining the Convention promotes our long-term strategic interests

CGJAG

U.S. COAST GUARD

U.S. Accession Benefits Our Economic Interests

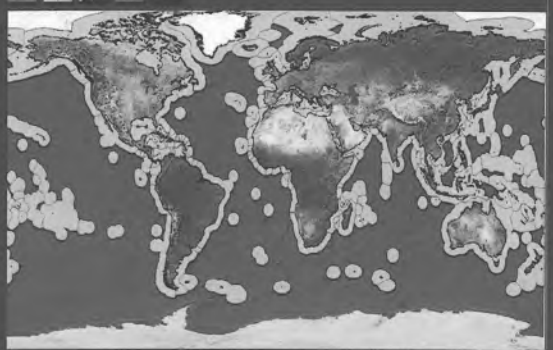
The Law of the Sea Convention will help American business by securing rights to ocean and seabed resources; ensuring open sea lanes for maritime commerce; and promoting access to lay submarine cables and pipelines:

- U.S. Exclusive Economic Zone is third largest in the world
- Permits U.S. to perfect rights to resources over one of the world's largest continental shelf
- Provides mechanisms to secure rights to mine the deep seabed
- Ensures an efficient global marine transportation system
- Accession supported by business, shipping, offshore industry, and fisheries interests

CGJAG

U.S. COAST GUARD

Exclusive Economic Zone (EEZ)



U.S. COAST GUARD

Extended Continental Shelf (ECS)

U.S. COAST GUARD

Benefits to the U.S. Coast Guard

Successive Commandants of the Coast Guard have strongly supported joining the Convention because:

- The freedom of navigation provisions assure our ability to project global Coast Guard presence
- The legal certainty and clarity of a treaty improves mobility to get on-scene for mission execution
- Improves our standing and credibility to achieve desired national outcomes in maritime agreements, especially at IMO and for counterdrug cooperation
- Gains leverage to hold other nations accountable for ensuring safety, security, and environmental protection
- Enhances our ability to advance U.S. interests in the new frontier of the Arctic

CG JAG

U.S. COAST GUARD

Why the U.S. Needs to Become a Party Now

The U.S. should join the Convention now because we need to:

- "Lock in" the favorable rights under the Convention as a matter of treaty law before they get eroded
- Take advantage of the economic benefits afforded by the Convention
- Get a "seat at the table" to shape the law of the sea and related policy in other international forums
- Improve our strategic position, especially regarding deep seabed mining and Arctic rights

CG JAG

U.S. COAST GUARD

Total biomass		754,746	246,493	1,001,239

Arctic Foreseeable Future Actions

Table 3-1 Past, Present, and Reasonably Foreseeable Future Actions

Oil, gas, and mineral development	• Lease sales, seismic exploration, and exploratory drilling • Chukchi Sea routine exploration • Beaufort Sea routine exploration • Other mineral development • Introduction of invasive species
Transportation and shipping	• Seasonal tug, barge, freight transport supporting local development • New polar shipping routes • Introduction of invasive species
Changing infrastructure demands	• Infrastructure changes in response to melting permafrost, increases in flooding, and coastal erosion
Subsistence and Commercial Harvests	• Subsistence – bowheads, beluga, seals, fish, birds • Past commercial whaling
Scientific research	• Icebreakers • Seasonal surveys • Marine mammal research
Actions by other federal, state, and international agencies	• US Coast Guard activities • Expansion and construction of boat harbors • Tourism

Issues of Concern facing Bering Sea/ Aleutian Island Fisheries

- Endangered Species Act
- Marine Spatial Planning
- Bycatch Management
- Catch Share Legislation
- Marine Protected Areas
- MSA Reauthorization

Video of drone aircraft with a video camera to improve SSL counts

- This program is being worked on by Cascade Fishing Company, North Pacific Fisheries Foundation and University of Alaska Fairbanks. Cascade Fishing is heavily involved in the Aleutian Island Mackerel and Pacific Cod fisheries, that have been impacted by the latest SSL Bi-Op restrictions.

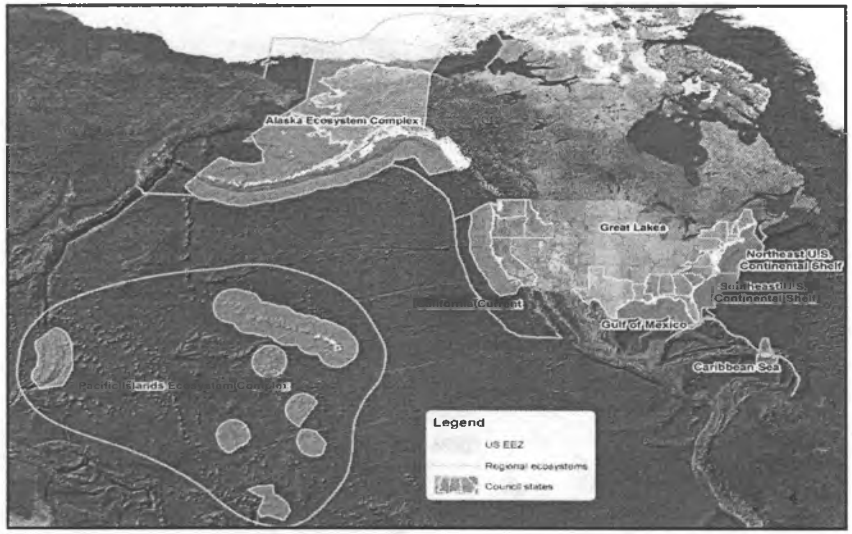
Who is the North Pacific Fishery Management Council?

What is an Arctic Fishery Management Plan?

What do we do with an Arctic Fishery Management Plan?

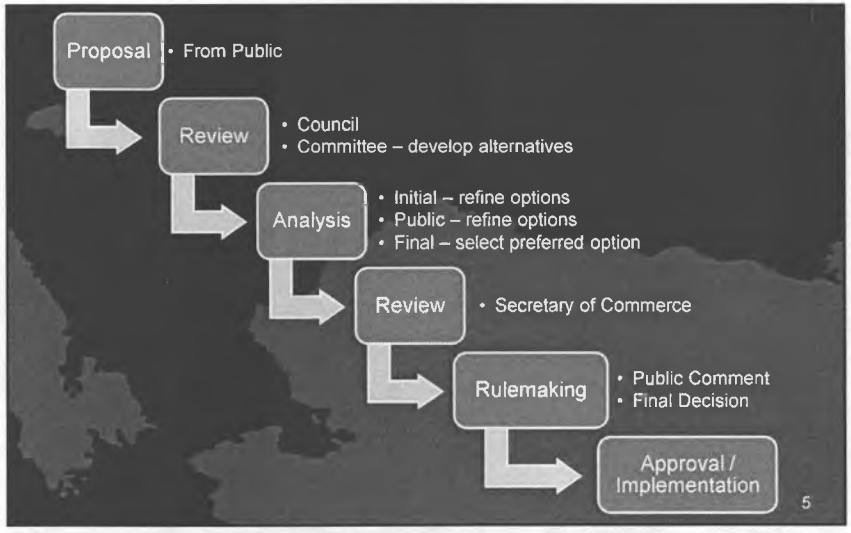
2

Membership of the North Pacific Fishery Management Council



4

5



Who is the North Pacific Fishery Management Council?

What is an Arctic Fishery Management Plan?

What do we do with an Arctic Fishery Management Plan?

6

Fishery Management Plans (FMPs)

- Policy guidance for fishery management
- Informs the public
- Establishes expectations
- Content:
  - Conservation and management measures necessary to prevent overfishing and to promote long-term health and stability of the fishery

7

National Standards

1. Prevent Overfishing
2. Use Best Scientific Information
3. Manage Stocks as Discrete Units
4. No Discrimination Between Residents of Different States
5. Promote Efficiency in Fishery Resource Utilization
6. Variations in Fisheries, Fish Stocks and Catches
7. Minimize Costs and Avoid Duplication
8. Include Fishing Communities
9. Minimize Bycatch and Bycatch Mortality
10. Promote Safety

8

Fishery Regulations

- Catch Quotas
- Gear Types
- Seasons
- Bycatch Limits
- PSC Limits
- Protected Resources
- Habitat
- Entry Control
- Community Considerations

9

Existing Fishery Management Plans

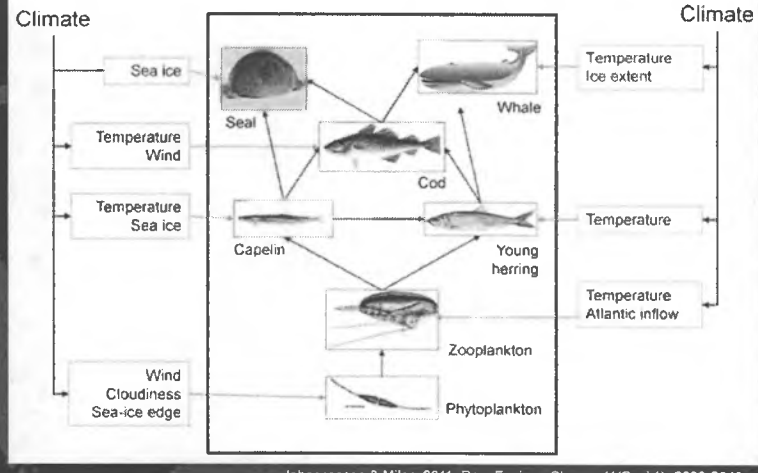
- GOA Groundfish
- BSAI Groundfish
  - Aleutian Islands Fishery Ecosystem Plan
- BSAI King and Tanner Crab
- Alaska Scallop
- Salmon
- Arctic

10

Heightened Interest in Arctic

- Alaska ecosystem management initiatives
- Ecosystem-based fishery management
- Public comment
- Proactively address future issues in the Arctic
- Orderly Arctic fishery development

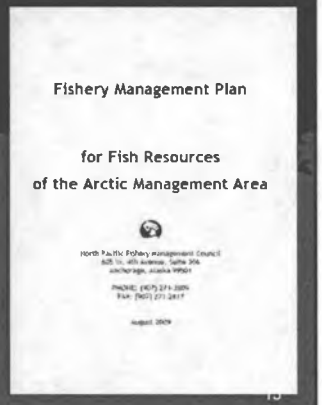
11



Johannessen & Miles. 2011. Reg. Environ. Change 11(Supl 1): S239-S248

Arctic Fishery Management Plan

- Available at NPFMC website
  - www.fakr.noaa.gov/npfmc/
- 7 Chapters
  - Introduction
  - Management Policy & Objectives
  - Conservation & Management Measures
  - Habitat, Fisheries, Ecosystem
  - Applicable Law and Other Fisheries
  - Fishery Impact Statement
  - References



Fishery Management Plan

for Fish Resources
of the Arctic Management Area

13

14

Chapter 2: Management Policy & Objectives

Ecosystem-based management policy that proactively applies judicious and responsible fisheries management practices, based on sound scientific research and analysis, to ensure the sustainability of fishery resources, to prevent unregulated or poorly regulated commercial fishing, and to protect associated ecosystems for the benefit of current users and future generations.

1. Biological Conservation
2. Economic and Social
3. Gear Conflict
4. Habitat
5. Vessel Safety
6. Due Process
7. Research and Management
8. Alaska Native Consultation
9. Enforceability
10. Marine Mammal and Seabird

15

Chapter 3: Conservation and Management Measures

- Assessment of biological resources of Management Area
- Best available scientific information
- Establish Fisheries Management criteria
  - Maximum Sustainable Yield
  - Optimum Yield
  - Methods
  - Overfishing Limits
  - Finfish Tiers
  - Acceptable Biological Catch
  - Total Allowable Catch
- Restrictions
  - Gear, Time & Area, Catch, Bycatch,
- Monitoring
- Management & Enforcement

16

Summarize Existing Data

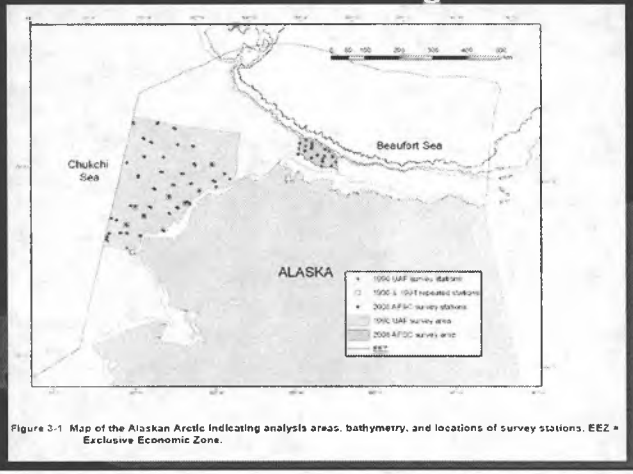


Figure 3-1 Map of the Alaskan Arctic indicating analysis areas, bathymetry, and locations of survey stations. EEZ = Exclusive Economic Zone.

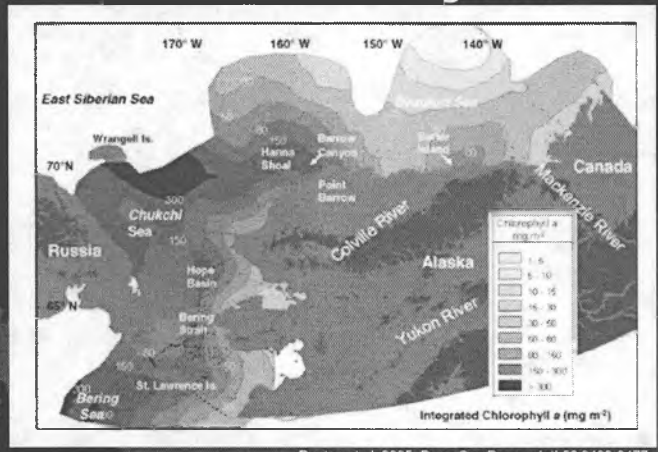
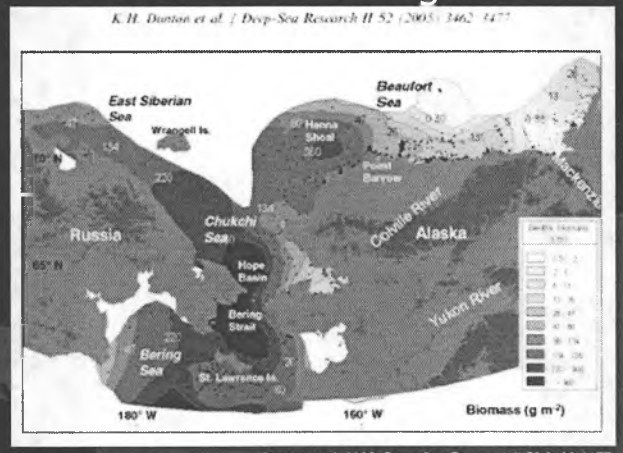
Summarize Existing Data



Dunton et al. 2005. Deep-Sea Research II 52:3462-3477

18

Summarize Existing Data

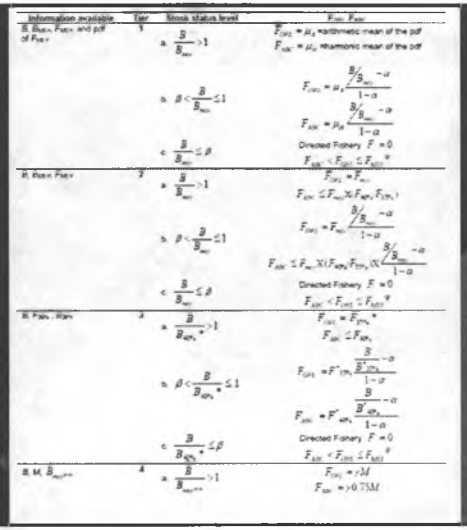


Dunton et al. 2005. Deep-Sea Research II 52:3462-3477

19

		Survey Region	
		Chukchi	Beaufort
Species		Biomass estimate (mt)	
Arctic Cod	*Boreogadis saida*	27,122	15,127
Saffron Cod	*Eleginus gracilis*	4,605	0
Bering Flounder	*Hippoglossoides robustus*	1,761	436
Pacific herring	*Clupea pallasi*	1,298	0
Warty sculpin	*Myoxocephalus verrucosus*	966	14
Snow crab	*Chionoecetes opilio*	66,491	29,731

20



21

Fishery Criteria

- Maximum Sustainable Yield
  - Arctic Cod – 5,758 mt
  - Saffron Cod – 589 mt
  - Snow Crab – 453 mt
- Optimum Yield
  - Reductions from Socio-economic, ecological factors
  - Arctic Cod – 100%
  - Saffron Cod – 100%
  - Snow Crab – 100%

No commercial fishing for any FMP managed fishery is currently authorized in the Arctic management area

22

application of products of science

Research

- Council research priorities
- Activities most important for conservation and management of fisheries
- Recommended by Council
- Conducted by
  - NOAA
  - ADFG
  - Universities
  - NGOs
- Funded by NSF, NPRB, etc.

I. Fisheries
II. Fisheries Interactions
III. Habitat
IV. Other Needs

23

Chapter 4: Fishery Impact Statement

Because the Arctic FMP does not [currently] *authorize any commercial fishing and no commercial fishing occurred… no fishery impact is expected.*

SFOS Fisheries Division for AY10-11

SFOS Combined:

- $18.2 million in research grants/contracts
- Breakdown: 67% federal, 28% corporate/private, and 5% state/local

Fisheries Division:

- 13.5 fisheries faculty (5.5 in Fairbanks and 8 in Juneau)
- 71 fisheries undergraduates (59 B.S. and 12 B.A.)
- 80 graduate students (51 M.S. and 29 Ph.D.)

Recent SFOS Fishery Research Topics

- **Freshwater fisheries**
  - Ecology, population dynamics and fisheries for whitefishes, inconnu, lampreys, northern pike, rainbow trout, Arctic char, burbot, etc.
- **Anadromous fisheries**
  - Salmon genetics, ecology, diseases, survival, population dynamics, and fishery management
- **Marine Fisheries**
  - Genetics, ecology, population dynamics, fishery oceanography, economics, seafood science, and management of Pacific halibut, rockfishes, sablefish, pollock, cod, herring, crabs, shrimps, octopus, etc.

Retrospective Analysis of Trends in Fish, Seabird, and Mammal Populations in the Eastern Bering Sea

UAF PIs: Franz Mueter, Gordon Kruse

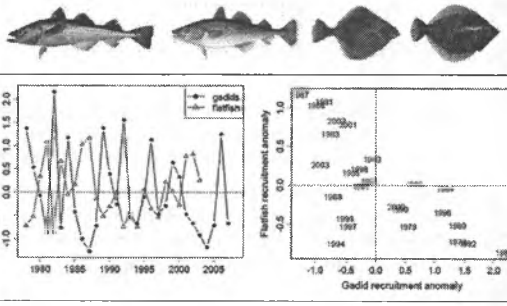
Collaborators: USFWS

Project Status: Ongoing

Project Goals: (1) Examine similarities/differences in trends in abundance, productivity, and diets among fish, seabirds, and marine mammals; (2) estimate relationships with environmental variability.

Motivation: Understanding trends and possible drivers will allow better predictions of the future effects of climate variability.

Results: Environmental variability appears to have some common and opposite effects on different species. Hence, there will be some 'winners' and 'losers' under climate change.



Biomass Dynamic Model for the Eastern Bering Sea

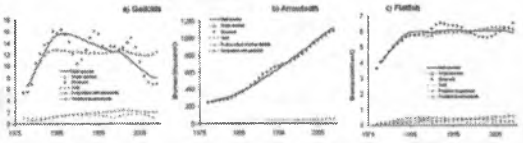
UAF PIs: Gordon Kruse, Franz Mueter

Project Status: Ongoing

Project Goals: (1) Develop a relatively simple simulation model describing the ecological interactions of pollock, cod, arrowtooth flounder, and other flatfishes; (2) determine whether this simple model can perform as well or better than complex ecosystem models for forecasting.

Motivation: Large ecosystem models are very expensive, complex, and tend not to be useful for fishery management purposes.

Results:



- Loss of cod biomass owing to competition/predation by arrowtooth flounder exceeded commercial catches of cod since 1986
- Negative effects of arrowtooth flounder will intensify with continued increases in their abundance

Shifts in Spatial Distribution of Fish and Shellfish on the Eastern Bering Sea Shelf

UAF PI: Franz Mueter

Co-PI: Blue World Research

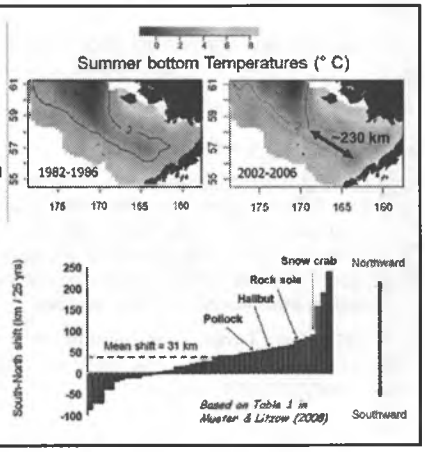
Project Status: Ongoing

Project Goal: Understand shifts in the spatial distribution of fish and invertebrates in the eastern Bering Sea

Motivation: Shifts in the distribution of commercial species in the eastern Bering Sea may affect their availability to the fishery, as well as their predator-prey interactions with other species

Results:

Northward shifts in distribution of many species and changes in species composition and diversity are associated with warming trends



Forecasting Changes in Eastern Bering Sea Walleye Pollock under Climate Change

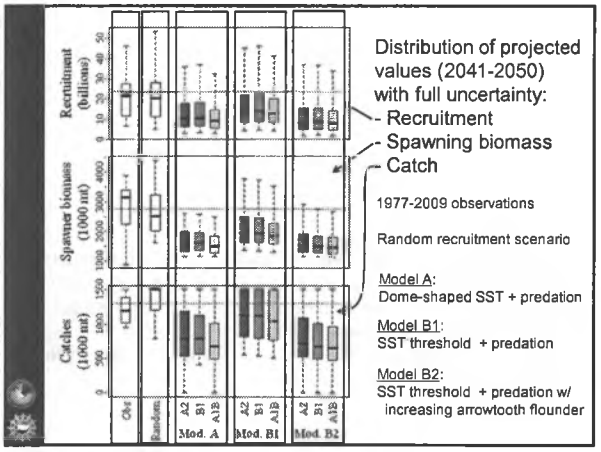
UAF PI: Franz Mueter

Collaborators: NOAA, University of Washington

Project Status: Completed

Project Goals: Forecast likely catch levels, recruitment, and biomass of EBS walleye pollock under different climate scenarios and harvest strategies through 2050.

Motivation: Walleye pollock in the eastern Bering Sea support the largest commercial fishery in Alaska. Long-term forecasts can help managers and industry prepare for possible effects of climate change.



Distribution of projected values (2041-2050) with full uncertainty:
- Recruitment
- Spawning biomass
- Catch

1977-2009 observations

Random recruitment scenario

Model A:
Dome-shaped SST + predation

Model B1:
SST threshold + predation

Model B2:
SST threshold + predation w/ increasing arrowtooth flounder

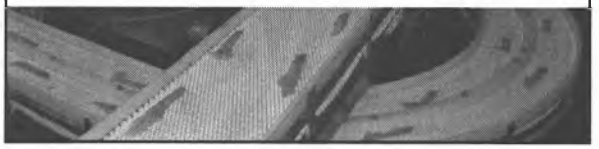
A Historical and Economic Analysis of the Bering Sea Pollock Fishery

UAF PIs: Keith Criddle

Project Status: completed

Funding Source: NMFS

Project Goal: Document the development and evolution of the eastern Bering Sea pollock fishery and to develop statistical model of domestic and international markets for pollock fillets, surimi, and roe.



Results:

- The Western Alaska CDQ program entities receive about $60 million/yr in royalties from pollock leases and about $120 million/yr from investments from royalties.
- Because fuel costs are likely to continue to rise and pollock are increasingly likely to be found at long distances from processing plants in Unalaska and Akutan, losses to the State, CDQs, and the pollock fishery are likely.
- In fall 2007, the inshore sector left 37,991 mt worth $8 million of the B-season (July-October) pollock allocation unharvested due to high fuel prices and long distances to productive pollock fishing grounds northwest of the Pribilofs.

Cooperative and Non-cooperative Strategies for Management of Bering Sea Pollock

UAF PIs: Keith Criddle, Terrance Quinn II

Project Status: in progress

Funding Source: NPRB

Project Goal: Derive management strategies for eastern Bering Sea pollock that better account for Russian catches in the Navarin Basin

Motivation: Under warm conditions, a portion of the EBS pollock stock shifts into Russian waters. Russian catches are not considered in current management. As warming continues, failure to account for Russian catches could jeopardize sustainability of EBS pollock.

Characterization of the Salmon Bycatch in the Bering Sea and Aleutian Islands (BSAI) Pollock Fisheries and its Effects

UAF PIs: Milo Adkison, Keith Criddle

Project Status: in progress

Funding Source: NPRB

Project Goal: Determine the impact of bycatch in Bering Sea groundfish trawl fisheries on Western Alaska salmon returns

Motivation: Although salmon bycatch is a small (<0.1%) percentage of the target catch, the magnitude of groundfish harvests from the BSAI trawl fisheries is so great that total bycatch of Chinook and other salmon can be substantial.

Dispersal and Behavior of Pacific Halibut in the Bering Sea and Aleutian Islands

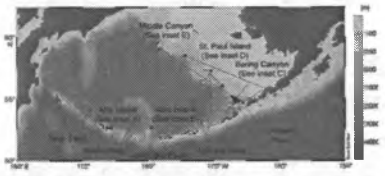
UAF PIs: Andy Seitz and Brenda Norcross

Collaborating organization(s): IPHS USGS

Funding source: IPHC, USGS, NPRB

Project Status: Ongoing

Project Goal: To investigate the degree to which halibut, found in the BSAI during summer, remain there to spawn in winter. A better understanding of spawning stock structure may yield insight into why halibut abundance is increasing in the Bering Sea and western GOA and decreasing in the eastern GOA and Southeast AK.



Results:

- The BSAI region contains a separate spawning group of adult halibut
- There is evidence for geographically localized groups of halibut along the Aleutian Islands; their movements may be impeded by tidal currents in island passes.
- Mid-winter aggregation areas of halibut are assumed to be spawning grounds, extending the species' presumed spawning range

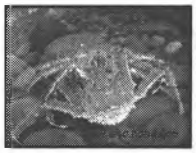
- Evolution of reproductive biology in sculpins (Cottidae) – Andres Lopez

Effects of Climate and Gadid Predation on Red King Crab



UAF PI: Gordon Kruse

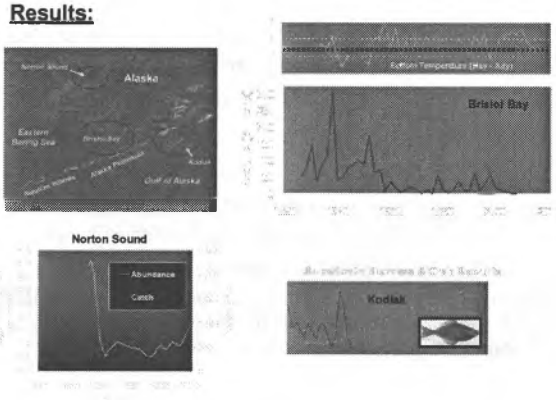
Co-Pis: ADF&G, Bechtol Research

Project Status: Ongoing

Project Goal: Develop an understanding of king crab stock successes and failures by comparative analysis

Motivation: Most red king crab fisheries collapsed in the early 1980s. Few recovered and many remain severely depressed.

Results:



Recruitment Mechanisms for Tanner crabs in the Eastern Bering Sea

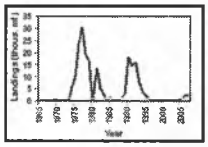
UAF PIs: Gordon Kruse

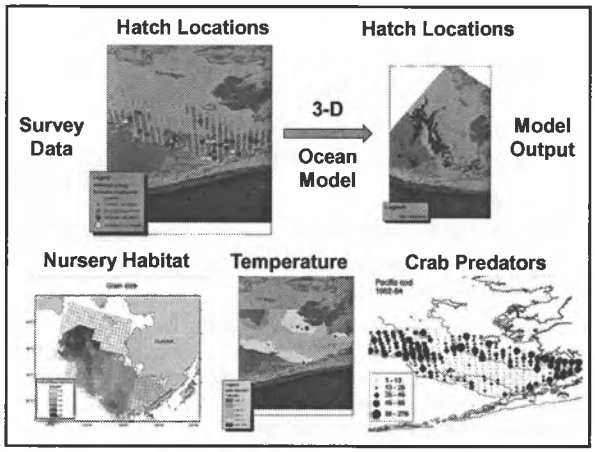
Co-PIs: NOAA, Rutgers

Project Status: Ongoing

Project Goal: Investigate processes that regulate the productivity of Tanner crab fisheries in the eastern Bering Sea

Motivation:





Development of Biological References Points for Bering Sea Snow Crab

UAF PIs: Ginny Eckert, Gordon Kruse

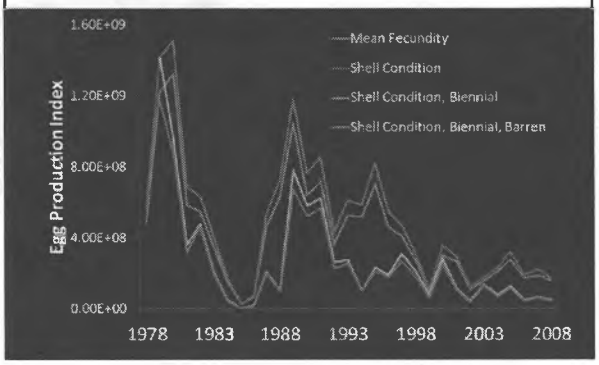
Funding: NPRB

Project Status: Ongoing

Project Goal: To improve understanding of factors influencing variability in female reproductive potential

Motivation: Snow crabs support the largest crab fishery in Alaska. The fishery has suffered wide booms and busts, including declared "overfished". Current management reference points are problematic.

Alternative Egg Production Indices



Analysis of the Minimum Size Limit for Eastern Bering Sea Tanner Crab Fisheries

UAF PIs: Gordon Kruse, Josh Greenberg

Co-PI: Bechtol Research (consulting)

Funding: BSFRF

Project Status: Completed

Project Goal: Analyze merits of reduced minimum size limits for Tanner crab fisheries

Motivation: Mean size of crab maturity has been declining since the mid 1970s. Many crabs no longer grow to legal size leading to high sorting & handling mortality rates, failure to achieve TACs, and poor economic viability of the fishery.

Results: Reductions in size limit: (1) increases legal male abundance, (2) increases legal male CPUE, (3) reduces fishing effort needed to achieve the TAC, (4) reduces discard mortality rates, and (5) likely increased market share and prices.

Outcome: In March 2011, the Alaska Board of Fisheries reduced the size limit from 5.5" carapace width to 4.4" for the Pribilof area and 4.8" for the Bristol Bay area. Reduced costs and increased landings should accrue to $ millions annually.

Other Related Projects

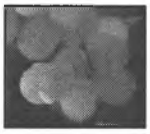
- Reproductive biology of snow crabs – Sherry Tamone (UAS), Ginny Eckert (UAF), Tom Shirley (Texas A&M)
- Molting biology of male snow crabs – Sherry Tamone (UAS)



Arctic Integrated Ecosystem Survey

UAF PI: Franz Mueter

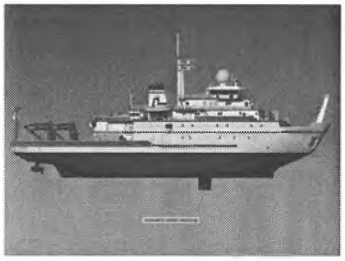
Co-PIs: Trent Sutton, Brenda Norcross, Megan McPhee (UAF). Ed Farley (NOAA).

Project Status: Getting underway

Project Goals: Provide baseline oceanographic and fisheries data for the northern Bering Sea and Chukchi Sea to help resource managers better predict effects of climate and human impacts on ocean productivity and on the ecology of marine and anadromous fishes.

Motivation: The Arctic FMP has closed Arctic waters off Alaska to commercial fishing because of rapid changes occurring in the Arctic. Adequate baseline information is currently missing and is needed to assess if or when sustainable fishing may be possible.

R/V Sikuliaq



- 261 foot vessel accommodates 26 scientists and students to conduct multi-disciplinary research
- Launch in mid 2012; ready for full operation 2014

U.S. Customs and Border Protection Alaska

U.S. CUSTOMS AND BORDER PROTECTION ALASKA

OVER VIEW

120 CBPO and 7 CBPAS

10 seaports

3 land border ports

6 Airports

2 seasonal ports

1 pre clearance port

MISSION

We are the guardians of our Nation's borders.
We are America's frontline.

We safeguard the American homeland
at and beyond our borders.

We protect the American public against terrorists
and the instruments of terror.

We steadfastly enforce the laws of the United States
while fostering our Nation's economic security
through lawful international trade and travel.

We serve the American public with
vigilance, integrity and professionalism.

We Facilitate Trillions of Dollars Per Year In Global Trade With The U.S.

In Just One Typical Day Last Year…

Travelers processed	989,689
Containers and vehicles processed	329,039
Undeclared/illegal currency seized, in dollars	300,582
Pounds of drugs seized	14,645
People apprehended for illegal entry	2,139
People refused entrance to the U.S. at ports of entry	616
Agricultural pests caught	454
Criminals arrested at ports of entry	107
False documents intercepted	72
Individuals matched with names in terrorism database	14

CBP SEA PORT EFFORTS

- 100% of cargo and passengers are screened pre arrival
- High risk vessels are met by enforcement boarding teams
- Partnership with federal, as well as state and local authorities
- Outreach and education
- Technologies
- Partnership to address northern passage

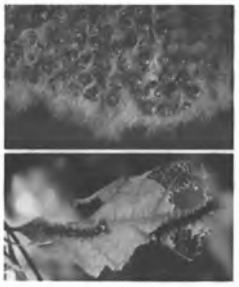
TARGETS

- Terrorist and implements of terror
- Narcotics
- Immigrants (Undocumented)
- IPR and Consumer Safety
- Tech
- Child Porn
- Invasive Species
- Weapons

U.S. Customs and Border Protection August 2011 Field Operations

Invasive Species

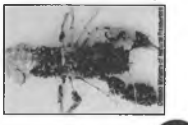
- Can be described as any foreign plant pests, weeds, and/or diseases.
- Introduction will harm the economy, the environment, and/or human health



U.S. Customs and Border Protection August 2011 Field Operations

Why Important?

- Scientists estimate the economic impact to exceed $1 Billion annually.
- Push out native species
- Close foreign markets (trade in certain affected commodities)
- Reduce biological diversity
- Place other species to/nearer extinction Kill Forest trees
- Kill Forest trees
- Alter wildfire intensity and frequency
- Damage crop yields



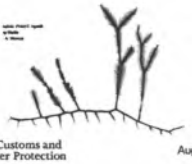
U.S. Customs and Border Protection August 2011 Field Operations

Arrival Mechanisms

- Almost always result from human activity
- Some intentionally brought into new region and released
- Unintentionally introduced as a byproduct of cultivation, commerce, tourism, and/or travel.

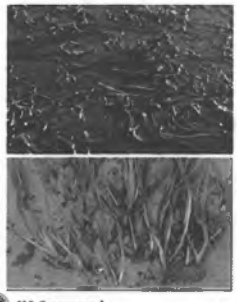
Seaweed

- Can be spread by Tanker ballast water, seaweed mariculture, shellfish farming, live seafood packing, or even the aquarium trade.



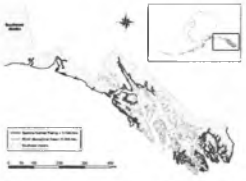
- "Killer Seaweed" (***Caulerpa taxifolia)*** - Invaded Mediterranean at a rate of 50km/year and displaced 30,000 acres of seagrass meadows.
- California eradication successful at a cost of $7 million over a 6 year period.

Dwarf Eelgrass (*Zostera japonica)*



- Seagrass4-14" long and 1.5mm wide, annual or short-lived perennial, SP-P, mid intertidal, sandy and muddy shores, salt or brackish waters; 6-7 month life cycle.
- Native to Asia, Russia, Sakhalin Is.
- Decreases water flow/increases sedimentation rates. Long term possibility of raising elevation of mudflats causing eventual disruption of ocean currents.
- First Collected in American in 1957. Is known to be in Washington, Oregon, and British Columbia.
- Warming waters could further speed spread northward.

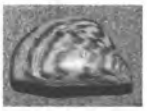
Chord Grass
(*Spartina* spp.)



- perennial grass, 1-1.5m tall, SP-P, on mud flats, estuaries, salt marshes, sand or cobble beaches.
- Native to the Atlantic Ocean
- Currently found In Pacific Northewest.
- Aggressive, forming dense, monospecific stands, converting mudflats into marsh, and altering patterns of circulation and drainage.
- 4 Species considered noxious from CA to WA.
- On Map red indicates areas with a rating of 3 (most positive based on 0-3 scale) where chord grass would find optimal growing conditions.

U.S. Customs and Border Protection August 2011 Field Operations

Zebra Mussel
(Dreissena polymorpha)



- Believed to have come from ballast tanks of a transoceanic ship
- Native to Caspian and Black Seas
- First found in the great lakes in 1988
- Freshwater mussel now found throughout the great lakes,19 states, and all large navigable rivers in the eastern US
- 1 adult female can produce 30,000 young each season and has up to two seasons per calendar year.
- Attach to virtually anything in mass numbers from pipes to sea creatures. Major impact on factories and water treatment facilities as well as biological hosts whom are ultimately unable to perform life functions with the attached mussels.
- In Lake St. Claire in 2 years after known introduction ALL hard-shelled native species were encrusted by Zebra mussels.
- Sheer numbers reduce biomass to a level that also significantly reduces/removes native species

U.S. Customs and Border Protection August 2011 Field Operations

Asian Gypsy Moth
(*Lymantria dispar*) "AGM

- 1869 French naturalist imported gypsy moths to try to breed with silkworms.
- The lineage of these moths now infest at least 15 states and defoliate hardwood forests…prefer oak but will also target willow, birch and aspen.
- 1993 Vessel at Wilmington NC opened cargo hold to release dozens of Asian Gypsy Moths (AGM)…more threatening relatives of the European gypsy moths already here.
- AGM eat the foliage of both conifers and hardwoods (600 different species vs 250 species in the European gypsy moth)
- Unlike European gypsy moths AGM females can fly and rapidly expand infestation area.

U.S. Customs and Border Protection August 2011 Field Operations

AGM Reference Map

U.S. Customs and Border Protection August 2011 Field Operations

Egg Masses

Egg masses are usually velvety in texture. They are generally 1.5 inches long and .75 inches wide, but can be as small as a dime. Their color ranges from light tan to dark brown. 500-1500 eggs typical per egg mass

U.S. Customs and Border Protection August 2011 Field Operations

AGM Larvae

- Larvae sizes range from 2mm long at hatching to 3 inches long in the mature stage.
- Dispersing larvae may be seen blowing on silk strands.
- Once hatched move to vertical structures and rapidly climb

U.S. Customs and Border Protection August 2011 Field Operations

Adult AGM

- Adult gypsy moths are typically active July-September.
- Female moths (left) can have wingspans of over 3.5 inches wide. Male moths (right) tend to be smaller with wingspans near 1.5 inches wide.

U.S. Customs and Border Protection August 2011 Field Operations

AGM Infestation

- AGM ports in Russia and Japan are becoming infested.
- Trapping records indicate very large populations of AGM in Far East Russian

U.S. Customs and Border Protection August 2011 Field Operations

AGM Vessel Inspection

The entire superstructure of the vessel must be inspected.

Egg masses are normally deposited in sheltered locations such as in crevices or cavities, under tarps and behind walls and doors.

Female moths tend to oviposit near light sources

U.S. Customs and Border Protection August 2011 Field Operations

SUCCESS

- IPR Linked to terrorist organizations
- Multiple heroin seizures.
- Breeder documents
- AGM and Zebra Muscles
- 300% increase in Ag intercepts
- WHTI, CTPAT, ACAS, NII and TECH
- 13 Million addition revenue collected

U.S. Customs and Border Protection

August 2011

Seafood Industry in Alaska's Economy

MARINE CONSERVATION ALLIANCE

SEA FACTS

THE SEAFOOD INDUSTRY IN ALASKA'S ECONOMY

As a major player in global markets, Alaska's seafood industry is an economic engine for both the state and the nation. This publication updates "The Seafood Industry in Alaska's Economy," first published in 2009. It shows that the seafood industry continues to be the largest private sector employer in the state.

Photo courtesy of ASMI

2011 Executive Summary Update

- Alaska led all states in terms of both volume and ex-vessel value of commercial fisheries landings in 2009, with a total of 1.84 million metric tons (MT) worth 1.3 billion dollars (NMFS 2010a).

- National harvest volume in 2009 was 3,568,599 MT (NMFS 2010a).

- In the list of top 50 U.S. ports based on volume for 2009, Alaska had 11 including Dutch Harbor-Unalaska (1st); Kodiak (4th); Naknek-King Salmon (11th); Sitka (14th); Ketchikan (15th); Petersburg (18th); Cordova (21st); Seward (26th); Homer (36); Juneau (41st); Kenai (50th) (NMFS 2010a).

- In the list of top 50 U.S. ports based on ex-vessel value for 2009, Alaska had 10; 8 of them were in the top 20. These ports include Dutch Harbor-Unalaska (2nd); Kodiak (3rd); Naknek-King Salmon (4th); Sitka (9th); Homer (12th); Seward (17th); Ketchikan (18th); Cordova (19th) (NMFS 2010a). Three other Alaska ports, Akutan, King Cove and Sand Point, would also make the top 20 were it not for confidentiality requirements that prevent release of data for ports with fewer than three processors.

- In 2009, Dutch Harbor-Unalaska was the leading U.S. port in quantity of commercial fishery landings, and the second U.S. port in value of commercial fishery landings (NMFS 2010a)

- Dutch Harbor-Unalaska ranked second (after New Bedford, MA) with a harvest value of $159.7 million dollars; Kodiak was ranked third at $103.8 million, and Naknek-King Salmon ranked fourth at $76.1 million dollars (NMFS 2010a).

- The seafood industry, through direct, indirect and induced effects, contributed a total of $4.6 billion to Alaska's economic output in 2009.

Prepared by Northern Economics

Importance of Alaska to the Global Seafood Market

- If Alaska were a nation it would have placed 14th among seafood producing countries in 2008 (NMFS 2010b and FAO 2010).

- Alaska landings of global groundfish species groups (including cod and pollock) and flatfish accounted for 18 percent of the world harvest of these species groups in 2008 (Hiatt, et al. 2010 and FAO 2010).

- In 2008 about 35 percent of the world capture production of salmon occurred in Alaskan waters (Hiatt, et al. 2010 and FAO 2010).

- Alaska accounted for 95 percent of total U.S. pacific salmon landings in 2009 (NMFS 2010a).

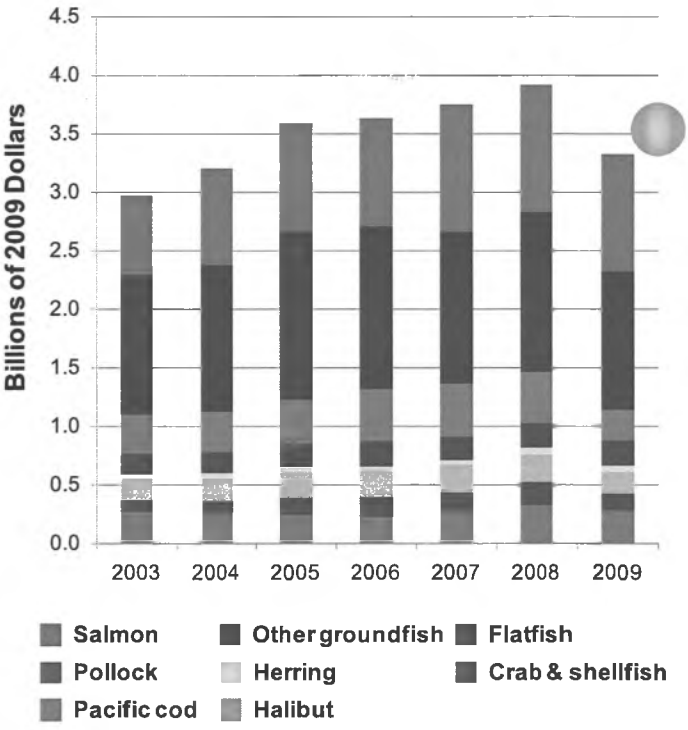
- The 2010 salmon season was one of the best on record with almost 170 million fish harvested in Alaska, the 11th highest number since statehood. Preliminary 2010 estimates show that the salmon harvest generated $533.9 million, the highest ex-vessel value in eighteen years (since 1992) (ADF&G 2010).

- In 2009, $1.6 billion dollars worth of seafood was exported directly from Alaska to destinations such as Japan, China, South Korea, Canada, and Europe (Office of the Governor of the State of Alaska 2009, NOAA 2010a).

- In 2009 Japan was the leading direct importer of Alaska fish and fisheries products (by value) followed by China, South Korea, Germany, the Netherlands and Canada (NOAA 2010a).

Photo Courtesy of PSPA

Real Wholesale Value by Species, 2003-2009



Source: Hiatt, 2007 and Hiatt, 2010b

Importance of Alaska Seafood to the U.S.

- In 2009, Alaska accounted for over 52 percent of the volume of the commercial seafood harvested in the United States (NMFS 2010a).

- Alaska as a single state led all other multi-state regions in the U.S. in terms of ex-vessel value with over 34 percent of the U.S. total (NMFS 2010a).

- The five New England States combined for a distant second with 20 percent, followed by the five states on the Gulf of Mexico with 16 percent (NMFS 2010a).

- Alaska's pollock fishery is the largest in the U.S., accounting for 24 percent of total U.S. fisheries landings (NMFS 2010a).

- In 2009, 26 percent of total U.S. crab catches were king and snow (tanner) crab, and they accounted for 35 percent of total U.S. crab value (NMFS 2010a). King and snow crab come entirely from Alaska.

- Dutch Harbor-Unalaska holds the record for catch volume with 911.3 million pounds landed in 2006 (NMFS 2010a).

- Alaska landings of Pacific Sea Herring accounted for 98 percent of the Pacific coast with 87 million pounds valued at over $29.3 million (NMFS 2010a).

Importance of Alaska Seafood to Alaska

- In 2009 total estimated ex-vessel value of Alaska's commercial harvest was $1.3 billion (NMFS 2010a).

- The additional value added by Alaska's seafood processing sector brought the first wholesale value of Alaska's commercial seafood industry to over $3.3 billion in 2009 (Hiatt et al. 2010).

- It is estimated that the seafood industry's $3.3 billion in wholesale value generated an additional $1.3 billion in indirect and induced economic output for a total contribution of $4.6 billion to Alaska's economic output (NEI using Hiatt 2010b, NOAA 2010b, Mothership Fleet Cooperative 2010 and IMPLAN 2009 data).

- The seafood industry also generated more than 80,800 direct, indirect, and induced jobs and $1.45 billion in direct, indirect and induced payments to labor and income (NEI using Hiatt 2010b, NOAA 2010b, Mothership Fleet Cooperative 2010 and IMPLAN 2009 data).

- In 2009 the wholesale value generated by the seafood industry represented over 10 percent of the $34 billion basic sector activity in Alaska's economy (Hiatt 2010b, Office of the Governor of the State of Alaska 2009, U.S. Census Bureau 2010 & 2011, ADOR 2011, McDowell 2010, and Szumigala 2010). The basic sector, because it brings money into the state from outside, is the driving force behind all economic activity in the state.

- The seafood industry ranks third in importance behind the North Slope oil and gas industry and federal government in terms of generating basic economic activity in Alaska (NEI using ADOLWD 2010 and ADOLWD 2011a).

- Alaska's seafood industry generated about $79 million in state taxes and fees, in addition to local fish taxes in fiscal year 2009 (ADOR 2009; ADCCED 2011).

- Seafood was Alaska's leading export in 2009 and accounted for 50 percent of total direct exports—nearly double the value of the second highest export sector (minerals at 26 percent), (U.S. Census Bureau 2010). Total Alaskan seafood exports were even greater; a large portion of Alaskan seafood is exported internationally from packaging and storage facilities in Washington.

- In 2009, seafood processing accounted for about 95 percent of all food manufacturing jobs in Alaska, and 71 percent of total manufacturing jobs (ADOLWD 2010 and ADOLWD 2011b).

Photo courtesy of Ron Clarke

- With 70,548 estimated direct jobs in seafood harvesting and processing, the seafood industry employs more workers than any other non-government industry sector in Alaska, including oil and gas and mining combined. (ADOLWD 2010, ADOLWD 2011a and Warren 2010).

- With the concentration of major fishing ports in the Aleutian and Pribilof Islands region, seafood processing accounted for 58 percent of all private sector payments to labor in the Aleutian West Census Area in 2009 (ADOLWD 2011b).

- The seafood processing industry is estimated to have accounted for 35 percent of private-sector payments to labor in Kodiak in 2009 (ADOLWD 2011b).

- The Western Alaska Community Development Quota (CDQ) program, which allocates a portion of the Bering Sea catch for coastal communities to invest in economic development, generates millions of dollars each year. In 2008, the CDQ entities collectively generated more than $180 million in revenue (WACDA 2008).

- The CDQ Program augments the important role of the seafood industry in Western Alaska. Sixty-five Bering Sea communities participate in the CDQ program (WACDA 2008).

- From 1992 through 2008 the CDQ Program generated over $240 million in wages, payments to fishers, and scholarships and training benefits (WACDA 2008).

- In 2008 CDQ entities provided wage and salary jobs to more than 1,600 individuals, and the combined payroll for the year exceeded $22.3 million (WACDA 2008).

- The value of the six CDQ groups' assets increased from about $13.3 million in 1992 to over $559 million in 2009 (WACDA 2008).

Table 1. Seafood Industry Employment by Region, 2009

Summary of Workers	Harvesting	Processing	Total
Aleutian and Pribilof Islands	5,309	6,276	11,585
Bristol Bay	9,385	4,522	13,907
Kodiak	3,664	2,934	6,598
Northern	627	68	695
Southcentral	8,071	3,491	11,562
Southeast	10,150	4,886	15,036
Yukon Delta	2,986	831	3,817
At-Sea	1,732	5,616	7,348
Regional Total (Total Seafood Jobs)	**41,924**	**28,624**	**70,548**

Source: Northern Economics, Inc. and ADOLWD, 2010.
Note: On-shore regional worker counts do not sum to the statewide workforce total as a single worker may be active in more than one region. NEI uses the sum of the regions as an estimate of total seafood jobs.

Table 2. Estimated Seafood Ex-vessel Volume and Value by Region, 2009

Region	Harvest Weight (1,000 MT)	Ex-Vessel Value ($ Millions)
Aleutian and Pribilof Islands	497.2	393.7
Bristol Bay	86.6	119.0
Kodiak	157.2	129.8
Northwest/Arctic/Yukon-Kuskokwim	3.9	6.7
Southcentral	77.8	177.0
Southeast	134.4	209.8
At-Sea	883.0	307.9
Total	**1,840.0**	1,343.8

Source: Estimated by Northern Economics using NMFS (2010a), Hiatt (2010a) and Hiatt (2010b).

Table 3. Estimated Seafood Wholesale Volume and Value by Region, 2009

Region	Product Weight (1,000 MT)	Wholesale Value ($ Millions)
Aleutian and Pribilof Islands	180.9	735.8
Bristol Bay	48.6	250.2
Kodiak	72.9	261.1
Northwest/Arctic/Yukon-Kuskokwim	2.3	15.9
Southcentral	45.4	289.3
Southeast	81.1	374.2
At-Sea	457.0	1,396.3
Total	**888.1**	**3,322.9**

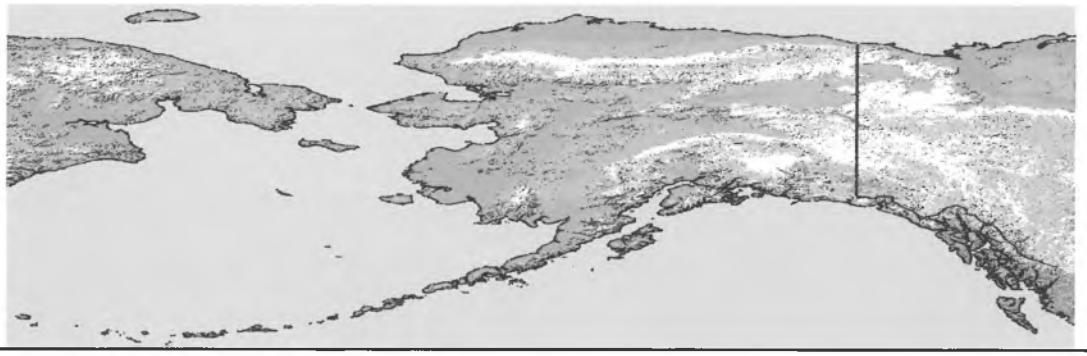
Agenda



Alaska Northern Waters Task Force

October 10, 2011 (Monday)
Bethel, AK – Yup'iit Piciryarait Cultural Center

- Arctic Research
- Climate Change & Erosion

Monday, October 10	**Alaska Northern Waters Task Force**
8:12am	**FYI: AKAIR #41 Arrives from Anchorage**
8:45 – 9:45am	**Breakfast – ANWTF Members (Breakfast at YKHC Board Room – 10 AM reconvenes at Cultural CTR)**
10:00 – 10:05am	**Introduction from ANWTF Chair Reggie Joule**
10:05 – 10:20am	**Mary Pete, USARC**
10:20 – 11:00am	**Mike Coffey, DOT, Maintenance and Operations Chief** Climate Change and Alaska's Public Infrastructure
11:00 – 11:10am	**BREAK**
11:10 – 11:50am	**Mike Brubaker, ANTHC, Director, Community Environmental Health** Climate Change: Challenges to existing community infrastructure and design for future sustainability
11:50 – 12:00pm	**BREAK**
12:00 – 1:15pm	**Local Knowledge Elders Panel:** William Alstrom, St. Mary's; Robert Nick, Nunapitchuk; Elias Venes, Bethel; Kenneth Laraux, Bethel; Stanley Tom, Newtok; Howard Amos, Mekoryuk
1:15 – 1:45pm	**Pizza Lunch Provided**
1:45 – 2:30pm	**Tim Andrew, AVCP, Natural Resource Manager**
2:30 – 3:15pm	**Steve Street, AVCP, Director of Cultural & Environmental Sciences** Shoreline Erosion: A Crisis for Historic Preservation
3:15 – 3:30pm	**BREAK**

3:30 – 5:00pm	**Public Testimony (Any topic related to the ANWTF)**
5:00pm	**Meeting Adjourned**
5:30pm-7:00pm	**VFW Reception** VFW Post Bethel
8:39pm	**FYI: AKAIR #46 Leaves for Anchorage**

U.S. Arctic Research

US ARCTIC RESEARCH COMMISSION

ABOUT

The US Arctic Research Commission (USARC) is an independent federal government agency created by the Arctic Research and Policy Act of 1984. The Commissioners are appointed by the President of the United States.

USARC is responsible to both the President and the Congress. Every two years, the Commission develops goals and objectives for the nation's Arctic research program, which has a budget of approximately $400 million per year, and is conducted by approximately 15 US federal agencies and state agencies, local governments, university partners, and private-sector collaborators. The Commission's goals are adopted by an Interagency Arctic Research Policy Committee (IARPC) that develops the national five-year Arctic Research Plan. The Commission is also explicitly tasked with making recommendations on the means for developing international scientific cooperation in the Arctic.

DUTIES

- Develop and recommend a national Arctic research policy
- Assist IARPC in establishing a national Arctic research program plan to implement the policy
- Facilitate cooperation in Arctic research among federal, state, and local governments, and international partners
- Review federal Arctic research programs and recommend coordination improvements
- Recommend improvements in Arctic research logistics
- Recommend improved methods for data sharing among research entities

Ex-Officio Member
Director, National Science Foundation
Arlington, Virginia

THE US ARCTIC RESEARCH COMMISSION ENCOURAGES RESEARCH IN FIVE GENERAL AREAS

Environmental Change of the Arctic Ocean and Bering Sea

The Arctic is a clear priority for marine scientific research because the combination of climate change, technological advances, and economic forces make this region increasingly accessible for resource development, transportation, tourism, sovereignty, and security. USARC calls for coordinated research in the Chukchi and Beaufort Seas akin to what was accomplished by the Bering Sea Ecosystem Study. The Study of Environmental Arctic Change (SEARCH), an enduring, interagency effort to understand the nature, extent, and evolution of Arctic environmental change, has grown by the addition of the Arctic Observing Network (AON). The emerging Distributed Biological Observatory (DBO) initiative shows great promise for the Pacific Arctic sector. USARC recommends:

- Increased support for, and broader participation in, AON, DBO, and SEARCH
- Greater integration of Arctic marine research, and support for the strategic action plans being developed by the National Ocean Council

Arctic Human Health

A distinctive approach is required to address health issues of indigenous peoples and to effectively overcome the region's health disparities. US Arctic residents are susceptible to a broad range of physical and behavioral health issues that result in lower life expectancies and higher infant mortality rates than found elsewhere. While the transition from a traditional subsistence lifestyle has brought positive change, it has also increased the prevalence of chronic diseases such as diabetes, hypertension, obesity, and cardiovascular and mental illnesses. Study has just begun on the impact of environmental pollutants and climate change on food safety and health consequences. USARC recommends:

- Developing and implementing an interagency Arctic human health research plan
- A focus on mental and behavioral health issues
- Greater focus on research that would improve access to clean water and improved sanitation systems in rural Alaska

Civil Infrastructure Research

Climate change is impacting civil infrastructure (e.g., roads, buildings, pipelines, ports). Thawing permafrost, increasing coastal erosion, and generally warmer conditions are all contributors. The implications for the Arctic's transportation, communication, energy, and community infrastructure networks are considerable, largely because long-held engineering standards assumed a perpetually stable thermal/permafrost regime. Research is needed to develop new and climate-change-adaptive standards for design, construction, and maintenance. Research and innovative engineering solutions are needed to create new infrastructure to address the demands of an increasingly accessible Arctic, whether by land, sea, or air.

Natural Resource Assessment and Earth Science

As has been clear since the building of the Trans-Alaska Pipeline System, the US Arctic is rich with natural resources from oil and gas, minerals (including rare earth elements), fisheries, lumber, and wildlife ecosystems. Further assessments of living and nonliving resources are needed in the Arctic. Specifically, the US Geological Survey should implement its "Resource Assessment Program" (AMRAP) required by law. Earth science initiatives should continue to incorporate fundamental geophysical and geological research (especially in the Arctic Ocean) so that as a nation, we understand our land, its value, and the extent of our offshore sovereignty beyond the current Exclusive Economic Zone. Emphasis should also be placed on oil-spill prevention and response in the Arctic and sub-Arctic, better Arctic mapping, gas hydrate research, studies of contaminant fluxes and impacts, and long-term funding for the North Slope Science Initiative.

Indigenous Language, Identity, and Culture

Language defines the cultural diversity of our planet, and allows us to separate one population from another. Although critical, language is one of the most vulnerable elements of our cultural heritage. Of the thousands of known languages, fewer than 10 are used by nearly 60 percent of the global population and more than 500 are extinct. In the Arctic, language vulnerability is especially acute, where loss stems from separation of indigenous people from their cultural past. Without a research plan to address Arctic language preservation, the path to language extinction is likely to shorten. This plan should incorporate:

- Regular, permanent census processes to understand the diversity of languages spoken by Arctic people, and the viability of those languages
- Documented procedures to ensure that languages and place names spoken and given by Arctic people are recorded and preserved
- Defined policy options and processes for language preservation that have succeeded in the Arctic, and elsewhere, and are made available to Arctic policymakers and residents

U.S. ARCTIC RESEARCH COMMISSION

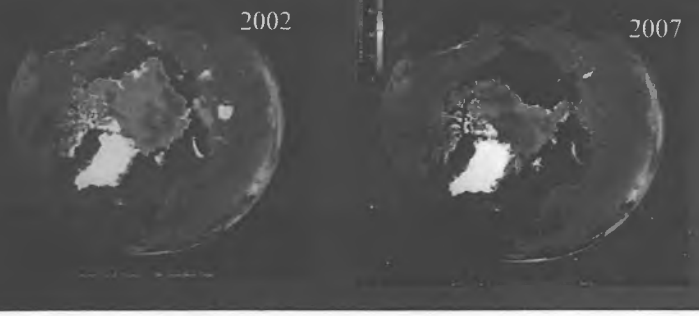
Mary C. Pete
Commissioner
Bethel, Alaska

Kuskokwim Campus – University of Alaska Fairbanks

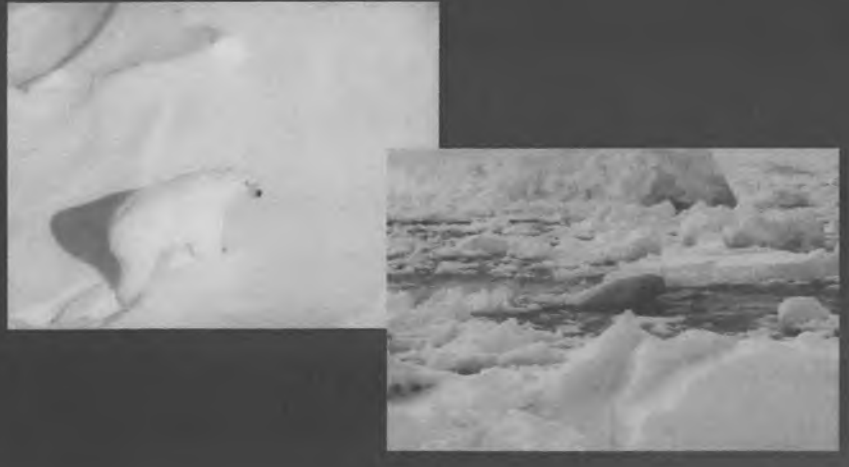
- One of 5 two-year UAF rural campuses
- 13 member advisor council representing 6 school districts in service area and major partners – AVCP, YKHC, AVCP Housing Authority, ONC, alumni, and students
- Sackett Hall: 38-bed dormitory
- Committed to addressing educational needs of a changing environment

Arctic Overview

- Many Arctic related issues in the news today
- Climate change
- Resource development



- Species listings
- Subsistence concerns



- Increased shipping activity
- Territorial disputes
- Contaminant deposition

US Arctic Research

~$400M/yr across >15 federal agencies

...cooperating with over a dozen nations

...using research infrastructure worth billions

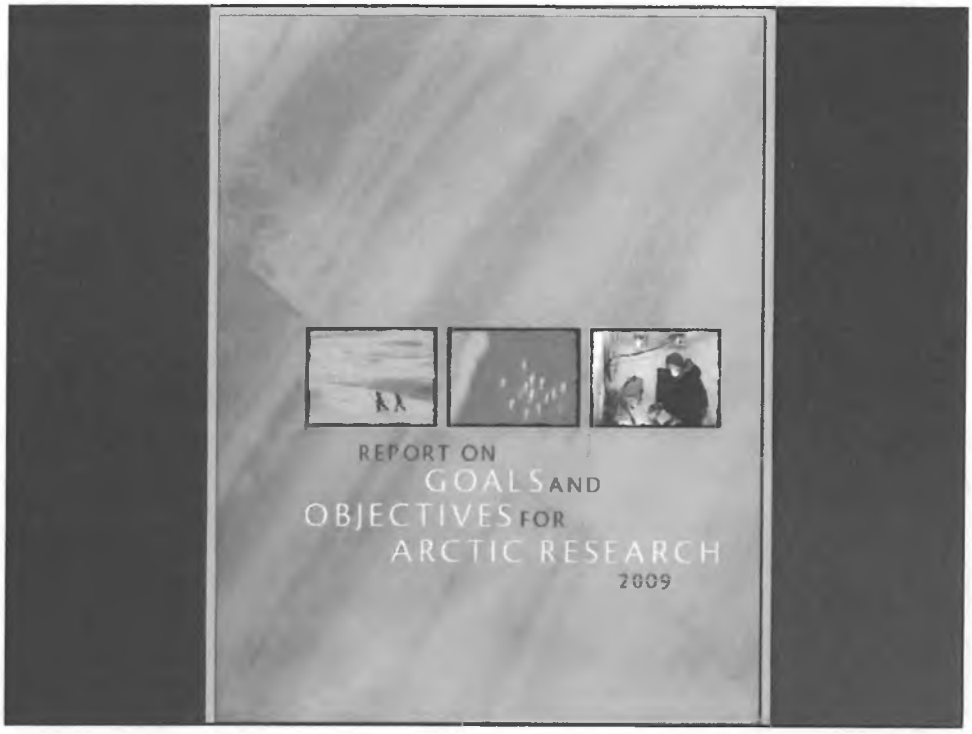
[USARC's budget is ~$1.5M]

What is the USARC?

- Independent US federal government agency that advises Congress a of the President
- Established by the Arctic Research and Policy Act of 1984
- 7 presidentially appointed commissioners, and 4 staff in DC & Anch
- By law, works directly with both Congressional and Executive branc
- Develops and recommends an integrated national Arctic research p
- Helps establish a national Arctic research program plan to impleme
- Facilitates cooperation among many groups

Duties of the Commission:

- Develop, recommend and assist in implementation of an integrated national Arctic research policy
- Facilitate cooperation in Arctic research between Federal, State and local governments
- Review federal Arctic research programs and recommend improvements
- Recommend improved methods for **data sharing** among all Arctic research entities
- Cooperate with the Governor of Alaska in the formulation of Arctic research policy
- Recommend methods for improving international scientific cooperation in the Arctic



Goals Report research themes

- Environmental Change
- Arctic Human Health
- Civil Infrastructure
- Natural Resource Assessment & Earth Science
- Indigenous Languages, Identities, Cultures

What does this mean to Arctic residents?

•USARC listens and responds to the voices of all Americans, including rural Alaskans.

•USARC priorities and initiatives that support Arctic human health research and recommendations that address Arctic languages, cultures, and identities, are examples of this.

•USARC is committed to including Arctic residents in the process to develop Arctic scientific research recommendations and Arctic research policy, and we recognize the value of traditional knowledge with respect to the scientific method.

What does this mean to Arctic researchers?

USARC:
•obtains the broadest possible view of Arctic research needs
•promotes Arctic research
•recommends policy

Our recommendations to the President and Congress that reflect the advice of the scientific community, and the needs of the country.

We recommend research priorities and work with other entities to turn these into an integrated and coordinated national Arctic research plan of funded programs.

Recent USARC activities…

- Ongoing promotion of 5 Research Priorities (climate/environmental change, civil infrastructure, indigenous languages, cultures and identities, Arctic health, resource assessment)
- Helped initiate & participated in drafting of newly released Arctic Policy
- Provided various support for the production of new US icebreakers
- Co-sponsor of many Arctic research meetings
- "Arctic Marine Shipping Assessment"
- Promoting ARRV, IOOS, BARC, etc., and work with Alaskan delegation & Governor's Office, as well as many other interagency initiatives

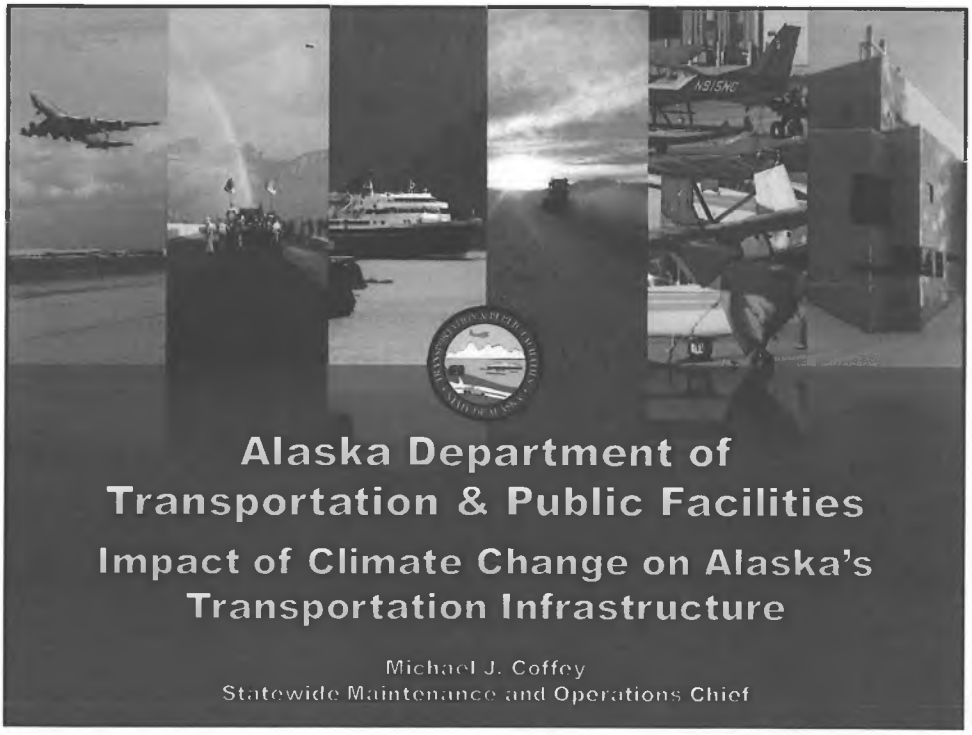
Impact of Climate Change on Alaska's Transportation Infrastructure



Alaska Department of Transportation & Public Facilities

Impact of Climate Change on Alaska's Transportation Infrastructure

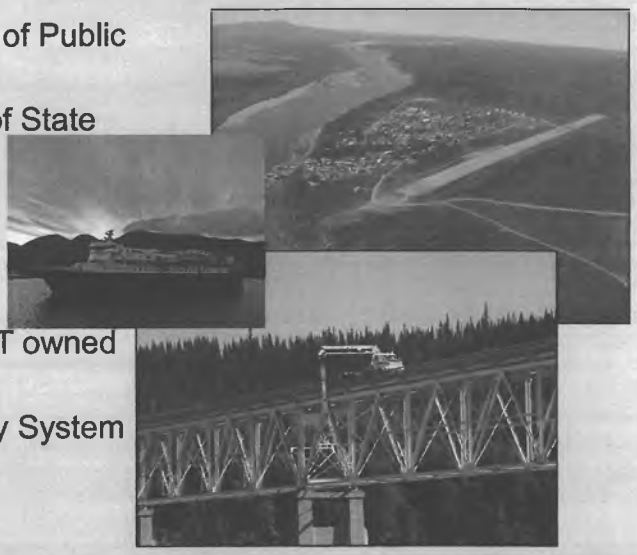
Michael J. Coffey
Statewide Maintenance and Operations Chief

Public Infrastructure and Climate Change – ADOT/PF

- The Alaska Department of Transportation and Public Facilities (ADOT&PF) manages the State's transportation infrastructure in a very challenging environment
- Many facilities in the Alaska's interior, northern, and southwest regions are underlain by ice-rich permafrost

Alaska Department of Transportation and Public Facilities

- Over 14,000 Miles of Public Roadway
- Over 5,600 Miles of State owned road
- 845 Bridges
- 255 Rural Airports
- 28 Harbors
- 720 Buildings (DOT owned or managed)
- Alaska Marine Hwy System
  - 33 ports of call
  - 11 vessels
  - 3,500 miles



Climate Change Impacts

- **Melting/Warming permafrost**
- **Increased storm frequencies and intensity**
- **Increased Coastal erosion due to lack of sea-ice**
- **Increased river and shore erosion**
- **Sea-level rise**
- **Increasing temperatures**

Melting/Warming Permafrost

Tok Cutoff Highway

- Current estimate is the Northern Region M&O spends approximately $10+ million annually due to melting permafrost
- This represents a fraction of the need
- Costs will increase if warming trend continues

Melting/Warming Permafrost

- Increased highway and airport surface distress
- Increased Active Layer Detachments (slope sloughing and failures)
- Embankments built over permafrost will need to be thicker to prevent the underlying ground from thawing
- Public buildings may require relocation/ reconstruction if their foundations thaw

Permafrost Problems

Glenn Highway Distress

Dalton Highway Frost Heaves

Mile 15-18 Elliot Highway Pavement Rutting

Alaska Highway Damage and rutting

Longitudinal Shoulder Cracking

Thaw Settlement

Ice-Rich Permafrost Thawing

Ice-Rich Permafrost Thawing

Increased Storm Frequencies and Intensities

- Changes in timing, frequency, form and/or intensity of precipitation may cause related and increasing natural processes, including:
  - Debris flows
  - Avalanches
  - Floods
- Significantly increases M&O costs

Increased Storm Frequencies and Intensities

- Coastal communities and their infrastructure are vulnerable to accelerated coastal erosion due to storm activity and wave action eroding shorelines once protected by shore-fast sea ice

Loss of Shore-fast Sea Ice

Open Water Jan 2007

Open Water Feb 2006

Loss of Shore-fast Sea Ice

- Erosion rate: These two photos were taken 2 hours apart, note the ATV tracks in the road (note the 55 gallon barrel). This road no longer exists.
- In 1997, Shishmaref lost 125 feet of beach in a single storm

Flooding

Flooding

Eagle/Yukon River Ice Jam

The Eagle Flood/Ice Dam

- A long cold winter combined with higher than usual snow pack (up to 150% of normal), higher than usual ice formation on the river (up to 140% of normal) and several days of unseasonably warm weather, which caused rapid melting and ice movement downstream on the Yukon

The Eagle Flood/Ice Dam

The Eagle Flood/Ice Dam

The Eagle Flood/Ice Dam

Taylor Highway Flooding 2010

- Three significant rainfall and flooding events occurred in just over three weeks in the Fortymile River and adjacent American Creek basins during July 2010. To have three weather systems of this magnitude impact this otherwise climatologically dry region in such a short period of time is highly unusual and unprecedented. Several weather stations along the Taylor Highway reported close to their annual average precipitation during this period.
- Annual precipitation in the region is between 10-12 inches, so roughly one quarter of the annual precipitation fell in just over a day.

Taylor Highway Flooding 2010

General Warming Trend

A longer seasonal transition period from fall to winter and winter to spring may require a different and potentially more costly approach to snow and ice control

General Warming Trend

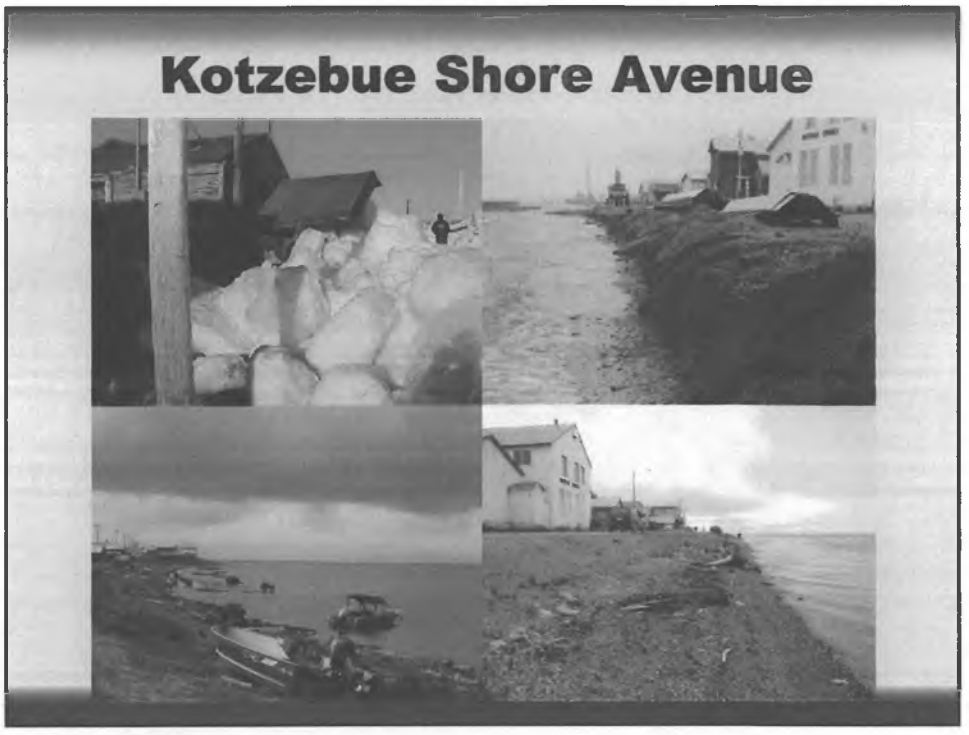
- The continued warming trend will likely result in the increase in erosion of shorelines and riverbanks which will impact any facility constructed adjacent to the waterbody
- Aufeis problems will likely increase as melt water flows out of warming zones of permafrost, requiring additional maintenance

General Warming Trend

- Warming temperatures are altering the blend of vegetative growth on the North Slope of Alaska
- Increasing temperatures will allow a variety of invasive plants and insects to prosper in Alaska

ADOTPF Adaptation Strategies

- **Shoreline Protection**
- **Relocation**
- **Evacuation Routes/Shelters**
- **Flood Mitigation**
- **Drainage Improvements**
- **Permafrost Protection**
- **implementation of new technologies**



Kotzebue Shore Avenue

Kotzebue Shore Avenue

Unalakleet Dynamaically Stable Beach

Unalakleet Airport Road as constructed Sept. 2008

Average 8" stone randomly placed at about a 1.5 to 1 slope prior to re-shaping.

Some reshaping toward its' final design profile has taken place after two years and several major storms. Structure remains intact.

Note logs thrown over top of structure from high wave action.

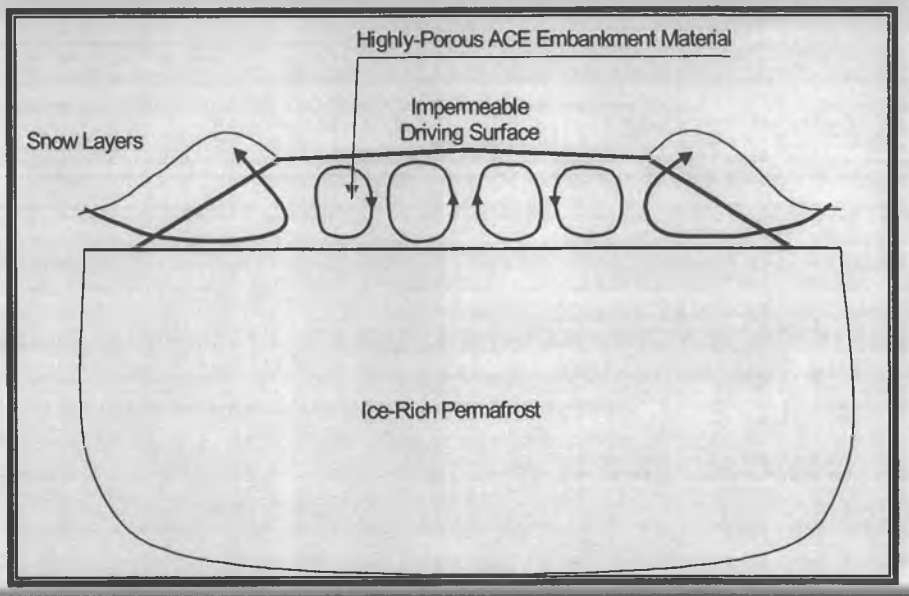
Koyukuk Airport Improvements

- Airport project completed in 2006
- Lengthened and widened runway.
- Raised grade above the 100 year flood levels
- Total Cost: $9.2 M

Koyukuk Airport

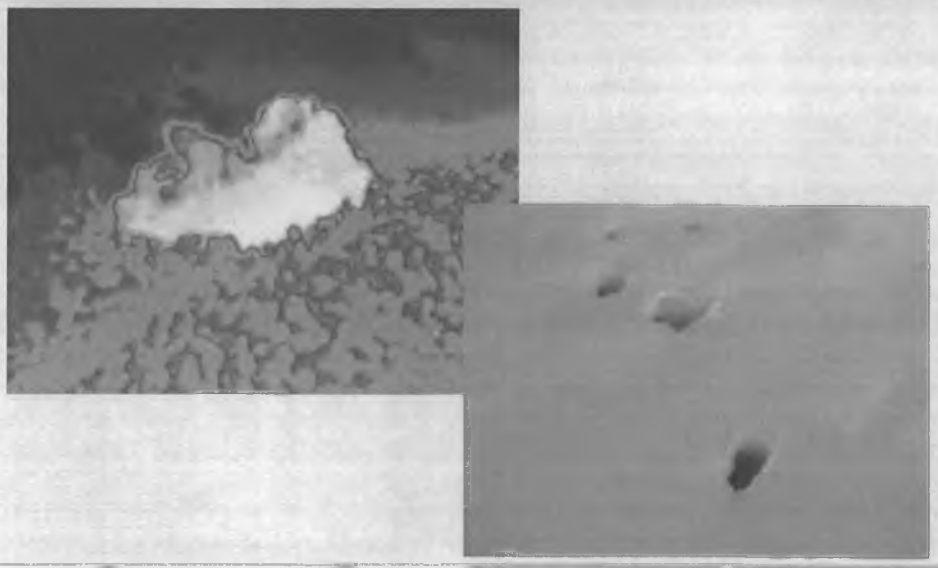
Completed runway above flood levels in 2006

Air Convection Embankment Concept



ACE – Thompson Drive Fairbanks

ACE in Action



Additional Permafrost Construction Techniques

Newtok Relocation Example

ADOT/PF's Involvement

- Designed and constructed new barge landing facility (2009), partially funded by EDA grant
- Worked cooperatively with the USACE on road design and permitting (State funded)
- ADOT/PF purchased 4900CY of road construction materials (Newtok Traditional Council also contributed funding)
- US Military (IRT) personnel constructed a 14 foot wide, 1500 foot road last summer with ADOT/PF oversight
- Oversaw the design and first phase of construction for the evacuation shelter funded by State grant to Newtok
- Developed mining plan for quarry development which produced approx. 100,000 CY of material this year

IRT Involvement

2011 Construction Season

What Needs to be Done

- Increase the collection and density of data ranging from
  - stream flow records
  - precipitation and other weather related data records
  - geotechnical and foundation information
  - other hydrologic data
- Investigate alternative design, construction, and maintenance techniques to address the changing environment

What Needs to be Done

- Continue partnering with the University of Alaska and other State and Federal agencies to address the most immediate needs of communities already being impacted
- Identify the critical information we need to gather to be able to address future impacts of climate change

Ongoing AUTC and DOT/PF-Sponsored Research

- Characterizing and adapting to changing permafrost dynamics:
  - Engineering Techniques to Control Permafrost Degradation under Roads Preservation of the Alaska Highway
  - Use of Shallow Anchors and Anchored Mesh System for Cut Slope Protection in Ice-Rich Soils
  - Documenting Best Management Practices for Ice-Rich Soils and Permafrost Sites (recently completed)
  - Design Manual for Air Convection Embankment (ACE)
- Meteorology & Hydraulics research and climate monitoring.
  - Impacts of Climate Variability and Change on Flood Frequency Analysis for Transportation Design
  - Updated Precipitation Frequency Analysis for the State of Alaska

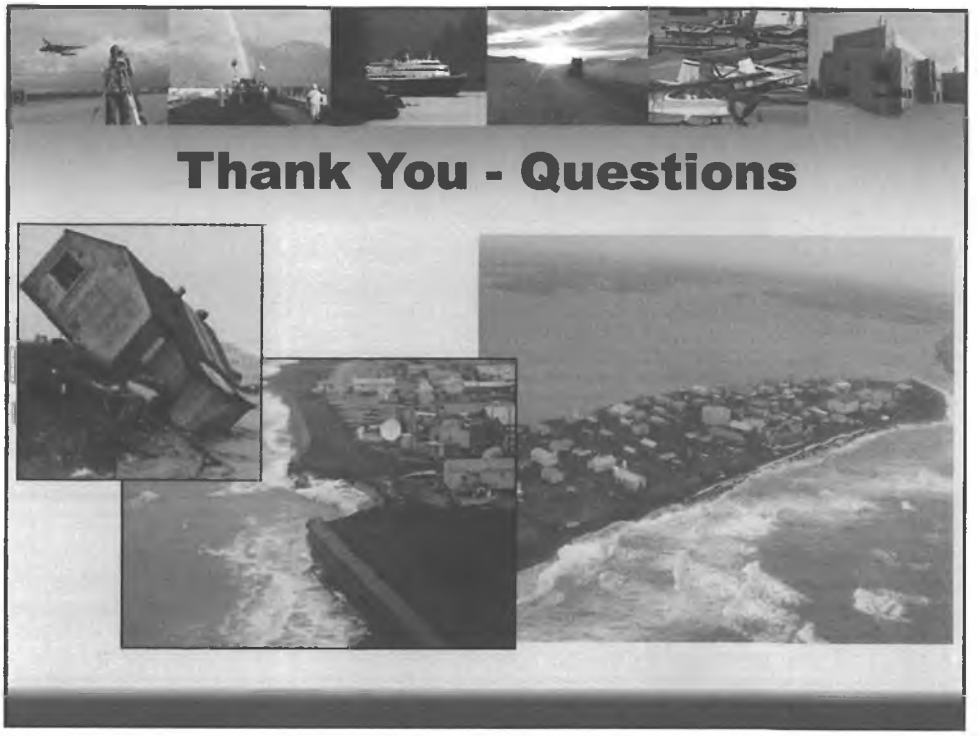
Final Thoughts – Why is this Important

- The USACE has identified over 180 communities that are threatened by erosion

Six Communities in Jeopardy

- Kivalina*
- Shishmaref*
- Newtok*
- Unalakleet
- Koyukuk
- Shaktoolik

* Have already begun relocation plans



Thank You - Questions

Important Subsistence Issues in the AVCP Region

Important Subsistence Issues in the AVCP Region

For the Northern Waters Task Force

Bethel, Alaska

October 10, 2011

Yupiit Piciryarait Cultural Center

Prepared by

Timothy Andrew, Director of Natural Resources for the Association of Village Council Presidents

Myron P. Naneng Sr., President

Raymond J. Watson, Chairman

AVCP Regional Subsistence Facts

- Highest per capita consumption of wild foods in the State of Alaska: 664 pounds
- Fish are the highest contributor to the subsistence diet: 60%
  - Salmon are very likely a high contributor, up to 80%
- Land mammals are the second highest: 20%
  - Moose, caribou, bear and musk ox contribute largely to the subsistence harvest.
- Marine mammals are third: 14%
  - Seals, walrus, and whales are the highest contributors.
- The remaining six percent consists of birds, shellfish, and plants.
  - The AVCP Region has the highest documented subsistence harvest of migratory birds in the state of Alaska (195,082 birds in 2009 compared to the Bering Straits-Norton Sound at 123,257 in 2007.

Subsistence Fisheries

- Salmon
- Halibut
- Herring
- Capelin
- Cisco
- Resident Species
  - Burbot
  - Sheefish
  - Whitefish
  - Blackfish
  - Rainbow Trout
  - Dolly Varden
  - Arctic Char
  - Needle Fish
  - Pike

Subsistence Birds

- Migratory Birds
  - Tundra Swans
  - Pacific White-fronted Geese
  - Cackling Canadian Geese
  - Emperor Geese
  - Black Brant
  - Ducks
  - Cranes
  - Spectacled Eiders
  - Stellar's Eiders
  - King Eiders
- Resident Species
  - Ptarmigan
  - Grouse

Subsistence Big Game Animals

- Moose
- Black Bear
- Grizzly Bear
- Caribou
- Musk Ox

Subsistence Small Game Animals

- Beaver
- Lynx
- Snowshoe Hare
- Tundra Hare
- River Otter
- Muskrat

Subsistence Marine Mammals

- Beluga Whale
- Pacific Walrus
- Ringed Seal
- Spotted Seal
- Harbor Seal
- Bearded Seal
- Ribbon Seal
- Sea Otter

Subsistence Plants and Berries

- Fireweed
- Wild Rhubarb
- Wild Celery
- Fiddlehead Ferns
- Sourdock
- Mouse Food
- Buttercups
- Willow greens
- Cloudberries
- Blue Berries
- Cranberries
- Raspberries
- Moss Berries
- Rose Hips

Subsistence Issues with Fisheries

The MOST IMPORTANT of subsistence fisheries issues is the state of our Chinook Salmon.

•The Yukon and the Kuskokwim River derive 80% of the State of Alaska's subsistence harvest of Chinook salmon.

•The returns of all salmon species crashed in the summer of 1998 due to unknown reasons. During that time, the Alaska Department of Fish & Game, A-Y-K Management staff came to AVCP and asked that we co-endorse a windows schedule in order to minimize the harvest of Yukon Kings and summer chums.

- •Since 1998, the Yukon River King Salmon have never fully recovered despite conservation measures imposed by both the Alaska Department of Fish & Game and the Office of Subsistence Management.
- •Conservation measures included 10-day closures which placed hardships on many of our Yukon River subsistence dependent communities.

Subsistence Issues with Fisheries

Continued:

•In 2007, the Bering Sea Pollock Fishermen harvested an estimated 122,000 Chinook salmon as bycatch.

•In 2009, during the North Pacific Fisheries Management Council meeting held in Anchorage, the former Commissioner of the Alaska Department of Fish & Game, Denby Lloyd, put forward a motion to allow the Bering Sea Pollock fishermen to harvest as bycatch upto 60,000 Chinook salmon with a performance cap of 47,500. This measure was beyond the AYK supported amount of 30,000.

•For several years, the Pilot Station Sonar has not been fully operational due to high water conditions, debris flow, and silt. During this time period, the Alaska Department of Fish & Game instituted conservative counting measures which placed undue restrictions on the subsistence and commercial fishermen of the Lower Yukon.

•There has not been a Chinook directed commercial fishery on the Lower Yukon River since 2007. In the subsequent years, a prohibition on the sales of Yukon Chinook salmon during chum directed fisheries was imposed.

Subsistence Issues with Fisheries

•On the Kuskokwim River, for three years in a row, the Lower Kuskokwim River tributaries of the Kwethluk, Kiseralik, and the Tuluksak have not achieved their escapement goals.

•In the summer of 2011, the Alaska Department of Fish & Game instituted windows and the U.S. Fish & Wildlife Service instituted a closure from the mouth of the Kuskokwim River to the Aniak River. Many people were dismayed and frustrated with the dual management system and the lack of communication.

Subsistence Issues with Fisheries

AVCP Recommends the following:

1. Institute a multiple user process to help determine the best rebuilding plan for the Yukon River Chinook salmon to include Tribal interests based on the best available science and traditional ecological knowledge.
2. Develop a run reconstruction model to assist the Alaska Department of Fish & Game in accurately reporting Chinook salmon passage at the Pilot Station Sonar during years of high debris flow, high water conditions, and silt.
3. Develop and utilize a total human-caused mortality enumeration model to include at-sea (Pelagic fisheries by-catch and environmental conditions), in-river (subsistence, commercial, sport and customary trade), and spawning ground mortalities (mining, sport fisheries, spawning stream.
4. Improve all means and methods of salmon enumerations projects to allow for any environmental condition that may affect counts in spawning streams and in-river

Subsistence Issues with birds

The current most important birds to the subsistence diet in the AVCP Region are: Black Brant, Lesser Pacific White-fronted Geese, Cackling Canadians, Lesser Snows and the Emperor Geese. (92,837 harvested in 2009 followed by ducks at 66,303)

- The Cackling Canadians and the White-fronted Geese have surpassed their population objectives
- The Emperor Geese and Black Brant populations have remained relatively stable but experience variations in population.
- The EMPEROR GEESE are one of the species of most concern.
  - Despite conservation efforts, the population remain relatively low with an occasional increase.
  - Issues that may affect population include continued hunting pressure, development in the wintering areas and environmental factors in their wintering and rearing colonies.
  - HABITAT important to the Emperors include Izembek National Wildlife Refuge and the mid-coastal areas.
- Spectacled Eiders are also one of the species of most concern.
  - Like the Emperor's, despite conservation measures , the population remains relatively lower than historical levels.
  - Issues that may affect populations include hunting, predation, and environmental factors
  - Habitat important to spectacled Eiders include the Bering Sea and Chukchi coastal areas and a portion of the Bering Sea south of St. Lawrence Island.

Subsistence Issues with big game animals

Moose and Caribou contributes the most to subsistence from big game animals.

The lower Yukon and Unit 18 remainder moose populations are the most dense while the Lower Kuskokwim Moose population remains relatively low.

The Lower Kuskokwim, within the last three years, have just emerged out of a moratorium and the population continues to build. Hunting seasons remain relatively short (10 days) with a registration requirement.

The Mulchatna Caribou Herd and the Western Arctic Caribou Herd are the most frequent visitors of the AVCP Region.

Caribou from the Mulchatna Herd contributes the most to the subsistence diet of the region.

The Mulchatna Caribou Herd experienced a historical high of 220,000 animals in 1996 and decreased to possibly less than 30,000 animals today. Hunting season are getting more restrictive and bag limits are decreasing.

Subsistence Issues with marine mammals

The ringed, bearded and spotted seals were recently listed as possible candidates under the Endangered Species Act due to global warming and the receding seasonal ice in the Bering Sea. Additional factors that may threaten the Bering Sea populations of marine mammals may include increased shipping traffic as the Bering Sea remains Ice free for longer durations and the northward expansion of the Bering Sea trawl fisheries into the currently closed Northern Bering Sea Research Area.

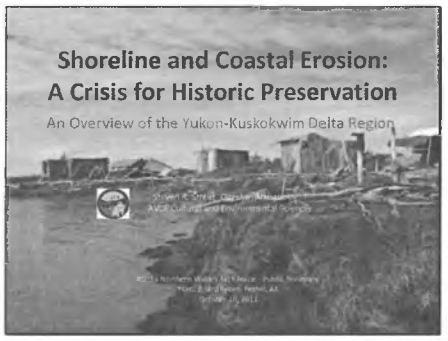
Very little scientific information is known about the marine mammal populations in the AVCP Coastal Areas, but traditional and ecological knowledge indicates the erratic movement of ice may affect their availability. As winds blow ice seaward, marine mammal availability decreases and as the winds blow the ice towards land, marine mammals availability increases.

Toi, quyana!
Questions?

5

Shoreline and Coastal Erosion: a Crisis for Historic Preservation

Slide 1



A contemporary fish camp on the middle channel of the Yukon River – A historic site "in the making"

The site exhibits all of the characteristics of shoreline erosion typical to a riverside environment in the Yukon-Kuskokwim Delta.
Note that the site is located on the active bend of the river because of ease of access along the bank; unfortunately, also the bank most prone to destruction.

Note also, with increased thawing, even the vegetated shoreline in the foreground is receding very rapidly.
The location and aspect of the site are very typical.

Slide 2

56 tribal service areas – based on federally-recognized tribes in the region, each with ANCSA village corporations, municipalities and at least one Tribal government.

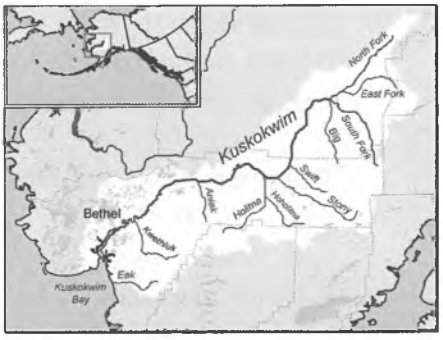
10 AVCP Units – reflect some real cultural relationships; representatives on the AVCP E-Board

Note that ANCSA selections and village corporations do not match Tribal service areas!

Note that Native allotments are not under Tribal jurisdiction (or at least within Tribal property boundaries!)

The Calista/AVCP region generally coincides with Central Yup'ik speakers or Cup'ik/Cupiq in certain sub-regions today.

Slide 3



Kuskokwim River Watershed – the Kuskokwim River Watershed Council (KRWC) is charged with protecting the "subsistence way of life" on the Kuskokwim.
*Note that Yukon watershed is partially visible to the NW – in ancient times, the Kuskokwim was a Yukon river channel.
Earliest people in Alaska likely came through this way!

Most significant historic sites in the region are along the shorelines of the main rivers or tributaries. These locations were focused on marine and riverine resources Almost nothing is known about much earlier sites located in the interior. Some predict climate change might lead to a rise in sea level between 2-4 meters.

Slide 4

Permafrost and ground-ice conditions throughout the arctic and subarctic regions of the world.
[International Permafrost Association, Data and Information Working Group (1998), available from the National Snow and Ice Data Center, Boulder CO]

Note in the Y-K Delta region, the area of continuous permafrost basically coincides with the Yukon National Wildlife Refuge.

More recent research indicates that rapid retreat of arctic sea ice increases the thawing of the permafrost.

Arctic soils hold 30% or more of all stored carbon in soils worldwide; melting likely will increase greenhouse gas emissions significantly

Slide 5

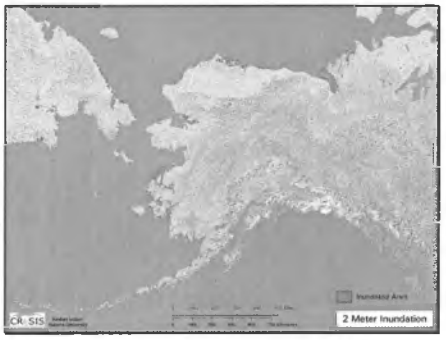
Thermokarst geomorphology -- This is "an irregular land surface containing ... bogs, caverns, pits, and other small depressions, formed in a permafrost region by the melting of ground ice."

YK Delta is predominately "gelisols." Gelisols are soils with permafrost and many are cryoturbated (churning of soils from frost action, including heaving, solifluction and mass movements)

*Though many of our tundra lakes have been relatively stable over time, the topography could change dramatically with increased thawing of the permafrost.

More severe storm surges are also exposing frozen ground and degrading the permafrost.

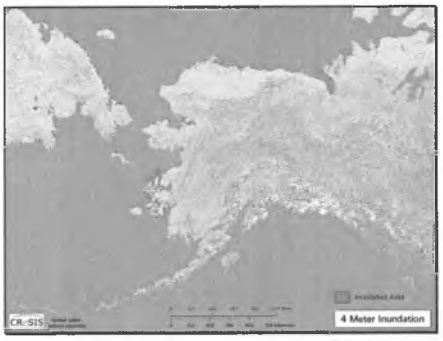
Slide 6



Predicted coastal inundation resulting from sea level rise of approximately 2 m (CReSIS, Center for Remote Sensing of Ice Sheets, The University of Kansas, Lawrence, Kansas, 2011, supported by NSF)

The 2m contour seems to coincide well with areas that are currently under threat from shoreline or coastal erosion and are subject to storm surges. I would contend that this is the best working model for examining the state of these sites today and is a starting point for understanding the threat.

Slide 7



Predicted coastal inundation resulting from sea level rise of approximately 4 m (CReSIS, Center for Remote Sensing of Ice Sheets, The University of Kansas, Lawrence, Kansas, 2011, supported by NSF)

At the 4m contour, most of the contemporary river deltas, most riverine environments in the Y-K Delta, and most contemporary villages would be under water.

Note that in areas of relatively higher elevation (such as on Nunivak Island or along Nelson Island), red spots basically coincide with historic site locations!

This is because access to water along shorelines was a major criterion for site placement in the past and communities were located is relatively low areas near the shore or along the rivers, not areas removed from the water.

Slide 8

This is an example of a historic site in a currently stable environment

Note the boundaries of this very large qasgiq (a communal men's house) – this site is not on the water now, but likely was along an old course of the Yukon River.
(Bureau of Indian Affairs archaeologist Matthew O'Leary is recovering material for radiocarbon dating from the center of the feature)

*Many sites in our region are only accessible in the summer by helicopter (because they are not now on the river system or are not accessible by modern

watercraft); in the winter, you would go past them on snowmachines but you would not be able to see them because of snow cover.

Slide 9

This is an actively eroding historic site on the coast, near the mouth of the Kuskokwim River. Currently, the shoreline may be receding at a rate of several meters a year.

Significant historic sites are being lost much faster than archaeologists can identify them.

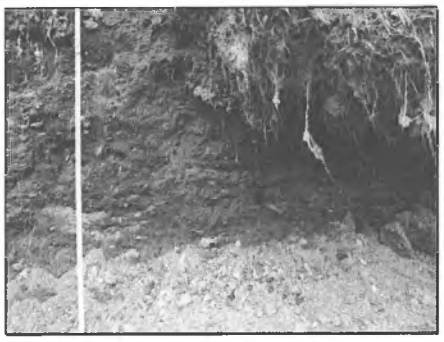
Monitoring or systematic field inventory is nearly non-existent throughout the Y-K Delta region.

Slide 10

This is an actively eroding profile at a coastal site on Nelson Island.

The dark bands that are clearly visible are floor surfaces of semisubterranean houses that have been damaged and lost from erosion from shore-fast ice and tidal action.

Slide 11



Detail of the profile above; note cultural wood, calcine bone, floor surfaces and relatively good preservation.

Preservation in frozen and/or waterlogged contexts is exceptionally good but, with thawing and freezing cycles and exposure on the surface, destruction increases rapidly.

Slide 12

This is a view of the same profile (me in the foreground identifying the cultural lenses and Nick Riordan, sedimentologist and son of anthropologist Ann Fienup-Riordan, to the left).

Notice the rubble where I am kneeling – This is predominately the result of people actively digging into this part of the site.

*Many of the most significant historic sites in the region are easily accessible from existing communities, are on ANCSA village corporation land (which is not protected by many federal and Alaska state historic preservation laws), and because of erosion are more visible to casual observers.

Shoreline erosion has two major effects:

- Direct loss of archaeological context, artifacts and, because of the destruction of context, loss of cultural knowledge
- Increased collecting and looting – with more visibility, more people are involved in actively damaging the sites.

Slide 13

The "built environment," with many significant historic structures in existing communities, is also at risk from shoreline erosion.

Note the historic structure to the left of this photograph which is falling into the river.

Human activity also increases erosion and becomes a significant contributing factor – most of the erosion in this case, for example, is from frequent boat traffic in the community, with large engines and resulting wakes damaging the shoreline.

Slide 14

Burials and human remains that are often present at significant historic places are also at risk.

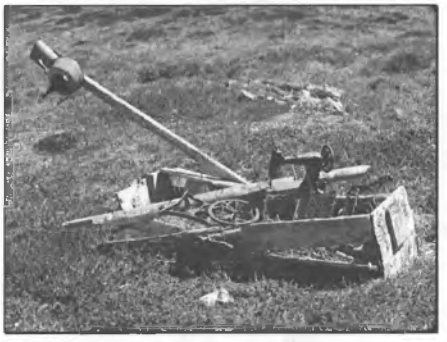
Here I am orienting a human radius that an elder noticed on the surface at an old village site. This particular site is atypical, with an abundance of prehistoric human skeletal remains present on the surface. Many skeletal elements are discovered comingled with artifacts along the beach and are also being lost at an unknown rate on an annual basis.

*Most local people who are concerned about the loss of these cultural resources do not know who to contact and feel these issues should be handled within the community; however, most landowners and Tribal governments are not organized to respond to these concerns.

NAGPRA (the Native American Graves Protection and Repatriation Act), in most cases, does not protect human remains and associated grave goods on private property. NAGPRA does apply on federal lands or federally-restricted property (i.e., Native allotments.)

Alaska state law requires the involvement of law enforcement, the Alaska State Medical Examiner and the State Historic Preservation Officer in the case of inadvertent discoveries.

Slide 15



This is a fine example of a historic surface grave – notice the "gender specific" grave accoutrements, such as the fine treadle sewing machine (photographed during the summer of 1984). These graves are located in a stable landscape of moist tundra vegetation, well away from the shoreline.

The site was a seasonal camp used by a small family. Graves of this young woman, her husband and infant were still visible in good condition during 2007.

Slide 16

This is a cemetery in a contemporary village along the Kuskokwim River that is actively eroding onto the beach and into the water.

Note human skeletal remains visible in the center of the photograph. These are not ***in situ*** (or in their original location) but have been gathered up and placed together by passersby. Most people in the villages have learned from their elders that it is appropriate to replace human remains as best they can as close to their original locations.

*This cemetery is now located on village corporation land and, according to the USACOE, would cost millions of dollars to stabilize. Of course, this is symptomatic of problems in all communities and no one has the money or clear responsibility to do it.

Slide 17

A view along the beach during the summer of 2010; note the small (presumably infant) coffin which has fallen down onto the beach.

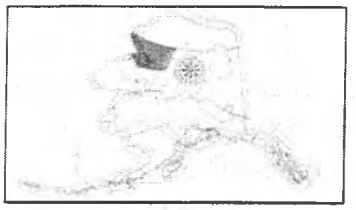
It is likely this had appeared on the surface relatively recently, since it is undamaged and still intact. One suspects that between the time this picture was taken and now, the coffin has disappeared and its contents have washed down the river.

DRAFT

Climate Change Impacts in Northwest Alaska

CCH Bulletin No. 7, October 15, 2011

This bulletin summarizes major climate change impacts, based on the findings from health impact assessments performed in the Northwest Arctic region; including the communities of Point Hope, Kivalina, Noatak, Kiana and Selawik. The purpose is to identify potential climate change-related impacts and provide information for local and regional planning.



Rural Alaska communities are vulnerable to climate change and residents seek adaptive strategies that will protect health, health infrastructure and the traditional way of life. The ANTHC, Center for Climate and Health is performing health impact assessments in Northwest Alaska to describe climate change impacts and provide information for adaptation planning. The work is in partnership with local governments, the North Slope Borough, the Northwest Arctic Borough, and Maniilaq Association, the regional tribal health consortium. In Northwest Alaska climate change is impacting the weather, the coastline, land, lakes and rivers, wildlife, plants, and the lives of the people who live here. Specific health concerns include food insecurity, water insecurity, injury, and damage to water and sanitation infrastructure. A summary of regional impacts is provided.

The Northwest is warmer. Gradual warming has occurred over the past sixty years. Average annual temperature has increased by 3.2 °F (1949 to 2006). Winter temperatures have increased the most, by 6.8°F.

The Northwest is wetter. Weather Service data from Kotzebue shows that average annual precipitation is increasing. Despite higher annual precipitation, very hot and dry summers have occurred, especially in upriver communities.

The land is increasingly fragile. Warming is increasing the thaw zone for permafrost, resulting in rapid erosion and subsidence. In areas where the permafrost has been disturbed or exposed, thawing is accelerated.

The land is disappearing. Over 1000 thermokarst slumps have been mapped in the Northwest Arctic Borough and a lot of soil is washing into the rivers. For communities that rely on rivers for water, the high turbidity decreases water quality and can disrupt treatment systems.

The rivers are wider, shallower, and dirtier. Surveys of the Kukpuk, Wulik, Noatak, Kobuk and Selawik rivers have documented miles of severe erosion. Permafrost thaw is a major factor, resulting in meters of lost river bank.

Thermal river break-up is more common. In recent years the Noatak and Kobuk rivers have increasingly had slow thermal break-up rather then the forceful, dynamic break-up that was typical. This may benefit some communities by reducing spring erosion and ice jam related flooding. Earlier break-up may increase the season for boating and for making community water.

The coastlines are increasingly vulnerable. Delayed freeze-up is increasing the season when storms can cause serious erosion. Warming is contributing by thawing permafrost.

Communities are flooding. Changing ice conditions, erosion and subsidence are contributing to an increased risk of flooding in coastal communities. Establishing evacuation shelters above the flood zone will help reduce anxiety, fear, and risk of injury.

The ice is thinning. The season for travel on ice is shorter. Hunters in Point Hope, Kivalina and Noatak describe falls-through-ice, interruptions and delays to seal and whale.

The tundra is receding. Residents in Noatak are concerned about increasing shrub lands, dry tundra, and impacts on berry harvests, caribou migration routes and wildfire.

The forest is expanding. Warming is resulting in northward expansion of forest and associated wildlife. Increasing moose populations is providing new subsistence opportunities.

The animals are moving. Migrating fish and land mammals provide new economic and subsistence opportunities while displacing some traditional subsistence species.

Lakes are disappearing. Thawing permafrost is causing lakes to warm and shrink. Algae blooms disrupted water treatment in Point Hope causing hundreds or hours of maintenance.

Existing transportation systems are threatened. Low rivers increase damage to boats and increase travel-related risk and cost. Low water is impacting boat and barge travel.

New transportation systems are opening. Sea ice loss has Increased marine vessel traffic, creating opportunity for new industrial and economic activities.

Traditional systems for food storage are failing. Warming is interrupting practices for drying fish, seal, and caribou. Traditional ice cellars are failing because of permafrost thaw.

Houses are breaking. Foundations are sinking causing building system damage. Many structures need to be leveled annually to prevent serious damage. Also homes are not designed for the high summer temperatures. Designs that accommodate cooling are needed.

Traditional sources of water are changing. Traditional sources include water brought to the village or camp for personal use. New species in Arctic rivers may be vectors for disease, such as giardia. Practices for safe use of traditional water sources are changing.

Community water systems are breaking. Permafrost thaw is a causing millions of dollars of damage and disruption to community water systems; impacting source water, and damaging treatment systems, distribution lines, and sewer mains and lagoons.

For more information about these and other health impacts and appropriate adaptation strategies, contact the Center for Climate and Health at ANTHC 907-729-2464.

6
Bering Sea Datapoint Project

The Bering Sea Datapoint Project:

Rescue of environmental data from the records of fishing, naval and other vessels operating in the Bering Sea, 1900 to present

MARK EDWARD SPRINGER
P.O. Box 3311
Bethel, Alaska 99559
543-7704

Abstract

The Bering Sea datapoint Project will echo the **CLIWOC Climatological database for the World's oceans: 1750 – 1850** (http://www.ucm.es/info/cliwoc/) carried out by Universidad Comlutense de Madrid, University of Sunderland, University of East Anglica, Royal Netherlands Meteorological Institute, Instituto de Nivologia, Glaciologia y Ciencias Ambientales (Argentina) with: National maritime Museum (London), the Netherlands Institute for Scientific Information Services and the US National Oceanic and Atmospheric Administration.

CLIWOC concluded in a freely available database of climatological data compiled from sailing ship logbooks of British, Dutch and Spanish and French fleets traversing the trade and naval routes of the globe from 1750 to 1850.

The Bering Sea Datapoint Project proposes to undertake the same effort, utilizing logbook and fisheries data from the commercial fishing fleets (US, Japan, USSR/Warsaw Pact, PRC, etc.) that have operated in the Eastern Bering Sea since the early part of the 20th Century. In addition logbook information from government and merchant vessels will be mined to develop a database that can be inputted to the Arctic Regions Supercomputer resulting in a visualization product that will allow researcher to pick a date and see a multi-dimensional representation of water temperature (at S.L. and depth), air temperature, wind speed and direction, barometric pressure at sea level overlain bathymetric information, historical weather observations, satellite weather photos, shore-side observations, catch-per-unit of effort (CPUE) data (if trawl monitor i.e. "suitcase" data is available). Other overlays may include SOSUS data analyzed for marine mammal sounds.

Western Alaskan residents can carry out a great deal of this data rescue in their home communities following a training period in Bethel. Compiled data will be transferred to UAF by digital means.

If successful, this project should in a few short years begin to yield sufficient data to allow visualization of environmental trends in the Eastern Bering Sea and allow researchers a powerful took in looking at and analyzing signals of short and long-term environmental changes effecting the Bering Sea and Western Alaska bioregion.

Potential partners in this project include the University of Alaska Geographic Information Network of Alaska; Community Development Quota companies; The North Pacific Fishery Management Council; North Pacific Research Board; Office of Naval Research and U.S. Department of State.

The existence of abundant meteorological data from logbooks of different European countries constitutes a common and invaluable heritage of the most outstanding scientific interest. The analysis of the logbooks content will contribute to characterise climate during XVIII th and XIX th centuries and to asses climate change.

These logbooks are an unique source of information which can not be obtained from any other way and will help to understand climate variability for a period and area (the oceans) with scarce data until now. The availability of such data to the scientific community will contribute to a better detection of climate change. The main aim of the project is to produce and make freely available for the scientific community the world's firsts daily oceanic climatological database for the period 1750 to 1850. The database will provide a better knowledge of oceanic climate variability over the study period. Data will be obtained from documentary sources, mostly logbooks records, which are kept in a number of European archives in Spain, Britain, Holland and France.

The original records will be transcribed and introduced into a computer based database.
Better knowledge of climate variability during the study period from sources that have not been exploited until now will be obtained. They will contribute to a better assessment of climate change especially of the behaviour of the major teleconnections. The results will be available for the whole scientific community, which will use them in different types of studies: Climate Variability analysis, modeling testing and calibration or climate change modeling and detection.

NAVAL LOGBOOKS – SOME BACKGROUND

1

From the earliest days of ocean sailing, mariners have kept accounts of their voyages. Christopher Columbus and the great Portuguese navigators began this tradition that persists to the present day. One of the principal functions of these logbooks was to assist in the navigation of the vessel. This was especially important when ships were out of sight of land and had no points of reference with which to determine their positions. By 1750 the keeping of logbooks was universal amongst the officers of European ships.

LOGBOOKS IN CLIMATIC RESEARCH

One of the factors that a ship's officer needed to take into account for reliable navigation was the weather. Navigation became a precise science only in the nineteenth century. Before that time more approximate methods were used to determine the true direction of the vessel's course and the distance covered each day These all required that wind force and wind direction be carefully recorded, the information being then used to determine the 'leeway', made by the ship. Mariners also kept a careful note of other weather phenomena such as rain, thunder, fog and snow. Because observations were made several times each day during the voyage, logbooks contain huge amounts of such detailed information.

THE ARCHIVES

2

Many logbooks failed to survive the rigours of life at sea but several thousand have come down to the present day. Some date from as long ago as the seventeenth century. Most frequent amongst the survivors are the logbooks of vessels in state service. Many thousands have been gathered together in a number of important archives. The United Kingdom, France, Spain and the Netherlands all possess notable collections. The CLIWOC project is the first attempt at a comprehensive study of this rich source of climatic data. It is curiously ironic that this legacy of the many past wars and conflicts between these nations should offer such an opportunity for co-operative scientific endeavour in this later age.

3

PROJECT OBJECTIVES

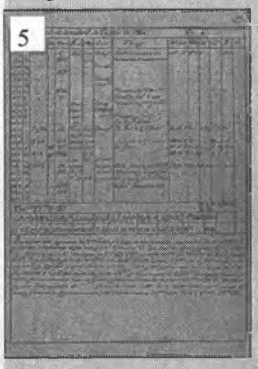
4

The principal objective of the CLIWOC project is to realise the scientific potential of logbook climatic data and to produce a database of daily weather observations for the world's oceans between 1750 and 1850. On completion of the project in 2004, this database will be made freely available to the scientific community. Other objectives are:

1. to provide a comprehensive understanding of the nature of climatic change over the oceans for the century after 1750 when logbooks become abundant
2. to provide secondary databases that summarise the character of climatic change at the annual and decadal scales
3. to link with existing data bases that cover the period from 1850 onwards
4. through the particular abundance of information from the North Atlantic region, to refine our knowledge of the behaviour of the NAO at this critical time before climate falls under any marked anthropogenic influence.
5. to stimulate a wider interest in the value of historical documents for climatic research.

MAKING SENSE OF LOGBOOK INFORMATION

Logbooks were written by seasoned mariners in the vocabulary unique to their profession and their times. Instruments were only rarely used and interest in the weather was limited to those aspects that influenced the navigation and progress of their ships. Seen through the eyes of the modern-day reader the descriptions of the weather are a mixture of the familiar and curious. Because the records were made to serve the needs of the day, and not those of the twenty-first century scientific enquirer, one of the principal challenges to the CLIWOC team is to interpret the weather vocabulary of former times, and thereby determine the true nature of the weather so assiduously recorded in often difficult circumstances.



5

A WORLD-WIDE DATABASE FOR 1750 TO 1850

The CLIWOC database will include daily observations from all the World's major oceanic areas. The North and South Atlantic and the Indian Oceans are well served in this respect but the vast expanses of the Pacific Ocean are expected to yield less information. The published data will be presented in a processed form using terms conforming to present-day usage and understanding. Information will be based on the most frequently recorded elements of wind strength and direction but data will also be provided on a wider range of commonly recorded phenomena that include rain and snow, thunder, fog and even the incidence of sea ice cover. To render the database more manageable annual and decadal summaries will be included. A meta-database will also allow enquirers to trace and consult the original sources. A CD-ROM will be produced not only of the database but also with digital images of the pages of the logbooks that were used in the project.

6

TURNING WORDS INTO NUMBERS

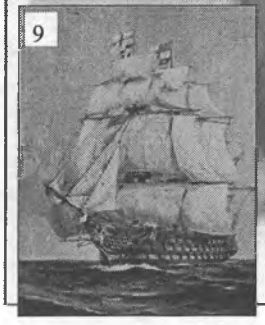
7

Until the closing years of the project's study period, shipboard instruments were an unreliable rarity. The vast majority of the logbook data are therefore in qualitative, descriptive form. This is not however to diminish their scientific value or to deny the possibility of their objective examination by statistical or content analysis. Most logbook entries lend themselves to various forms of frequency analysis. This approach gains added importance as a result of the century-long time span of the project. Within that period it will be possible to see how wind patterns varied, how rainfall frequencies fluctuated even how sea ice advanced and retreated across the frequently-navigated far northern oceans. By these means narrative accounts can be drawn into the arena of scientific debate thereby helping to meet the various CLIWOC objectives.

8

APPLICATIONS AND DEVELOPMENTS

In addition to the project's primary objectives, other valuable outcomes will also be achieved. Important amongst these is the insight that the logbooks will give to the question of climatic change over oceanic areas. These cover three-quarters of the Earth's surface, yet no other source provides a means to examine daily weather variations in these areas in the pre-instrumental period. This unique opportunity will be exploited to its fullest potential whilst not overlooking the importance of longer term trends. The results will provide important information for those engaged in assessing climatic change and its possible consequences.



9

LINKS WITH OTHER DATABASES

The CLIWOC database cannot claim to be the first attempt to provide a summary of marine-based climatic data. The COADS database (developed in the United States) covers the mid-nineteenth century to the present day and has an international reputation, as do the Japanese Kobe collection and the data assembled at the UK's Hadley Centre. These databases are concerned with instrumental information only. CLIWOC's contribution will be to extend the record of oceanic climate back by a century into the period before instruments were widely used.

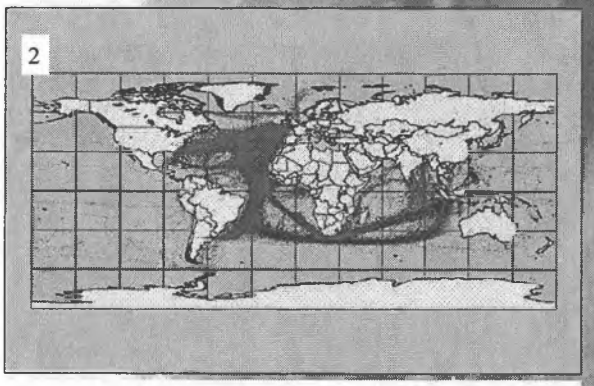
INTRODUCTION

At completion of the CLIWOC project, the team can look back upon a successful undertaking. The principal objective of the preparation of a database drawing on British, Dutch, French and Spanish ships' logbook records for the immediate pre-instrumental period (1750 to 1850) has been achieved. The database is freely available and we anticipate its widespread use. CLIWOC has established early ships' logbooks as another source available to those rising to the challenge of understanding climatic change, and can be set alongside proxy and instrumental data. The restrictions on the time span embraced by the available historical marine data are compensated by the fine scale of temporal resolution of the data (daily noon observations), and by the extensive geographical range of the observational record (only the Pacific Ocean lacks detailed coverage for this period). The maritime character of the data adds further to their value as oceanic areas are not well-served by data for this period.

LOGBOOKS IN REVIEW

Eighteenth and early nineteenth century logbooks had previously been used only in case studies of individual events of historic or climatic interest. Hitherto no comprehensive review of their scientific potential had been undertaken. CLIWOC's endeavours in this field have confirmed that they cast a new and more detailed light on the climate over the oceans in the immediate pre-instrumental period. It has also shown, however, that the data need to be treated with caution, and subjected to careful scrutiny. The range of information is consistent between the different national sources, and consists of wind force terms, wind directions and general weather descriptions. It is largely non-instrumental and based on the observations made by experienced officers.



CLIWOC data coverage: red—English sources, blue—Dutch sources and purple—Spanish sources

THE DICTIONARY – A SCIENTIFIC KEY

The weather terms employed by mariners before 1850 could not be taken at face value; the words they used were familiar, but their exact meanings initially uncertain. Wind force descriptors presented a great challenge, but had to be 'homogenised' through conversion to their present-day Beaufort Force equivalents. Only then could their scientific value be realised. The vocabulary differed between the national sources. English mariners used a relatively narrow range of terms, whereas their Dutch, French and Spanish counterparts employed a much more varied set of descriptors. In all cases, however, the majority of wind force entries were accounted for by just twelve or so terms. Content analysis and other methods were used to prepare a dictionary in which the majority of all wind force terms were defined on the Beaufort Scale. This multi-lingual dictionary has now been published.

ACHIEVING CLIWOC'S OBJECTIVES

The project has achieved success in drawing a new data source into the scientific realm, and has provided an enduring legacy of methods, data and understanding. In doing so it has:

1. established a freely-available database of calibrated climatic data that will be of continued and growing value in climatic studies
2. confirmed by objective means the reliability of logbook data
3. provided a dictionary of terms that allows other scientists to decipher more readily the descriptions contained in logbooks
4. developed a statistical algorithm by which fields of collated logbook data can be used to reconstruct atmospheric pressure fields over the oceans
5. the CLIWOC database is also being used to extend the record from instrumental logbooks contained in the well-established I-COADS dataset. The CLIWOC data and investigations have also provided a valuable complement to the US Maury dataset being developed by the I-COADS team.

DATA VERIFICATION

The intrinsic reliability and consistency of the logbook weather record was determined by sampling from the large number of logbooks where ships were in convoy or travelling in close company. These voyages often lasted several weeks giving large replicate samples. The degree of correlation in recorded wind forces was consistently high, as was the degree of similarity in recorded wind directions. On a number of occasions, however, small but persistent differences were found between absolute wind force records prepared on vessels of different sizes. Whilst not materially influencing the scientific outcome of the project, it remains a matter for further investigation. Further tests have been carried out to compare the aggregated logbook wind field records with the I-COADS maritime database and the NCEP/NCAR reanalysis.

THE DATABASE

Version 1.0 of the database was released in late 2003. The database is available as a CD-ROM, but can also be interrogated through a dedicated CLIWOC website (see below). An important development is its simultaneous availability through the I-COADS site. Release version 1.0 is based on the International Maritime Meteorological Archive (IMMA) format, which is being developed under the joint WMO/IOC Technical Commission for Oceanography and Marine Meteorology (documentation at I-COADS website; see contacts). Version 1.0 has over one quarter of a million records, but this will increase quickly in the planned later versions as more data are processed for inclusion. The database includes information on date and time of each observation, the latitude and longitude of the recording vessel and its country of origin. This is followed by the key climatic information for wind direction and wind force. Where such data are available, and this is generally only found in the more recent records, instrumental observations are also included.

3

Front cover of CLIWOC's multilingual dictionary

DATA CORRECTION

Logbook data often need correction as well as verification. Not only did archaic wind force terms require conversion to Beaufort scale equivalents, but wind directions had to be adjusted if they had been made by reference to magnetic, as opposed to true, north. This correction varied over space and time, but could be as much as 30 degrees. Latitude and, more especially as precise navigational methods were commonplace only towards the close of the study period, longitude sometimes required correction using specifically designed software to detect and rectify logbook errors.

CLIWOC DATA APPLICATIONS

The CLIWOC team are calibrating statistical models with which the database information for wind force and direction can be processed to provide monthly pressure field reconstructions for the Indian and the South and North Atlantic Oceans. These will provide a means for studying climatic change over the oceans in the 100 years beginning in 1750, and will permit important measures such as the North Atlantic Oscillation and Southern Oscillation indices to be estimated for this pre-instrumental period.

CLIWOC IN THE FUTURE

The CLIWOC project closed in 2003, and has as its most durable legacy the database and the knowledge that a new climatic data source has been confirmed. The British, Dutch and Spanish sources have contributed equally to the database, each providing approximately 100,000 days of noon observations. French logbooks have also been used, but no other significant European sources exist for ocean voyages prior to 1850. The database will, however, continue to develop. Whilst the Spanish logbooks have been extensively studied, over 50 per cent of Dutch and over 90 per cent of British and French logbooks remain wholly unexamined. There are several thousand such items. They cover most of the oceanic areas and embrace the CLIWOC period and earlier times as far back as the mid-seventeenth century. All national sources, however, include many non local-noon observations that also require consideration. In many respects the close of the formal CLIWOC programme serves only to open a longer phase of fruitful investigation.

To obtain a copy of the data (CD-ROM or via ftp) please go to www.ucm.es/info/cliwoc for details.

1 Introduction

1 Introduction

This is the final report of EU funded CLIWOC project (EVK2-CT-2000-00090). The project started on 1 December 2000 and continued until 30 November 2003. Project partners are: Universidad Complutense de Madrid, Spain (partner 1 and coordinator), University of Sunderland, UK (partner 2), Royal Netherlands Meteorological Institute (KNMI), the Netherlands (partner 3), IANIGLA, CONICET, Argentina (partner 4) and University of East Anglia, UK (partner 5). A warm and highly cooperative working environment has developed among the partners. This has led to a very active and fruitful interchange of experiences that has resulted in the efficient and successful completion of the project.

The aim of this report is to provide a global view of the main project activities and achievements. Chapter 2 reviews the four principal activities as described in the working packages: data abstraction (wp 1-4), control of the data quality (wp 5), database construction (wp 6) and the first scientific results (wp 7). In chapter 3 the project objectives are evaluated, while the milestones and deliverables are reviewed in chapter 4. Fortunately, the results have been so encouraging and successful that CLIWOC related undertakings have not ended with the formal conclusion of the project. The partners are committed to continuing the activities of the CLIWOC project and building on its successes; these activities are described in chapter 5. The management report is included as chapter 6, while chapters 7 and 8 include the complete list of participants and the acknowledgements.

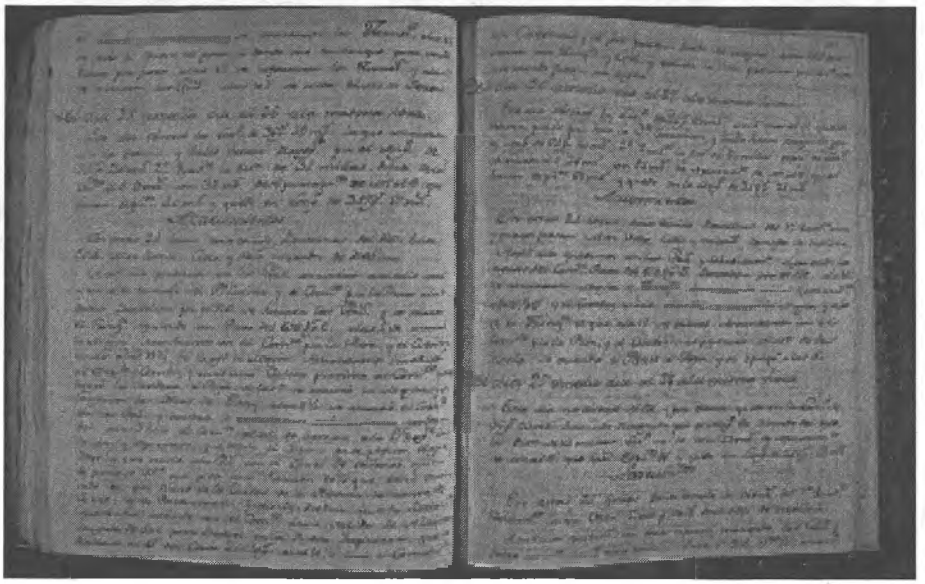
2 Activities

2 Activities

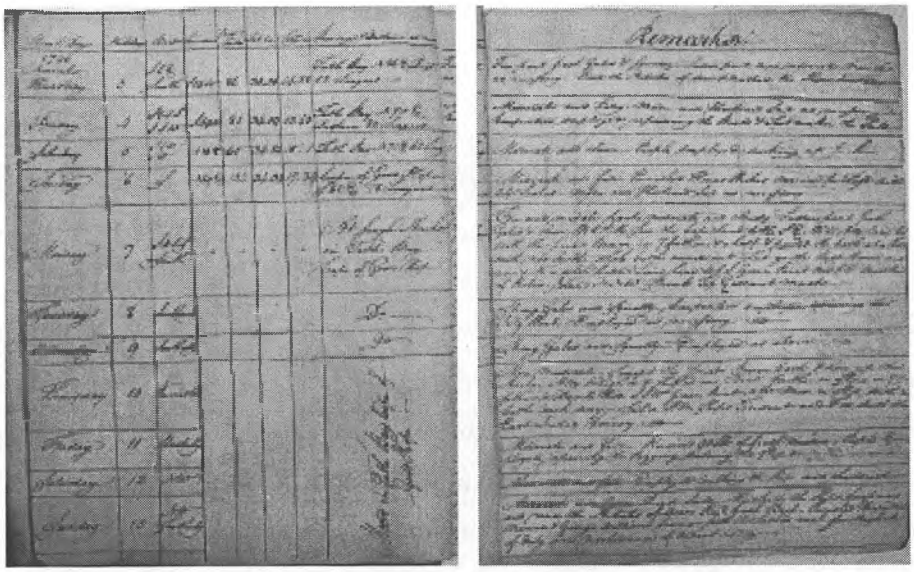
2.1 Data abstraction

The partners in the abstraction process employed different strategies. These were designed to adapt abstraction methods as efficiently as possible to the particular requirements of the Archives in each country. Thus, the abstraction from Spanish and Dutch logbooks has been made after producing digital images of the original logbooks preserved in the respective archives (Archivo del Museo Naval and Archivo General de Indias in Spain and the Nationaal Archief in The Netherlands). This procedure fosters better preservation of the original documents and minimises the working time at the archives. Additionally it contributes to a better access to the document contents, which includes a large volume of non-climatic information. This activity is one of the many multidisciplinary features of the project. After solving some of the copyright issues, which vary among the countries, the projects web page (www.ucm.es/info/cliwoc) will host all the images of the logbooks that are made freely available by the host archives. Figure 1 shows some examples of logbook pages from the different countries.

a)



b)



c)

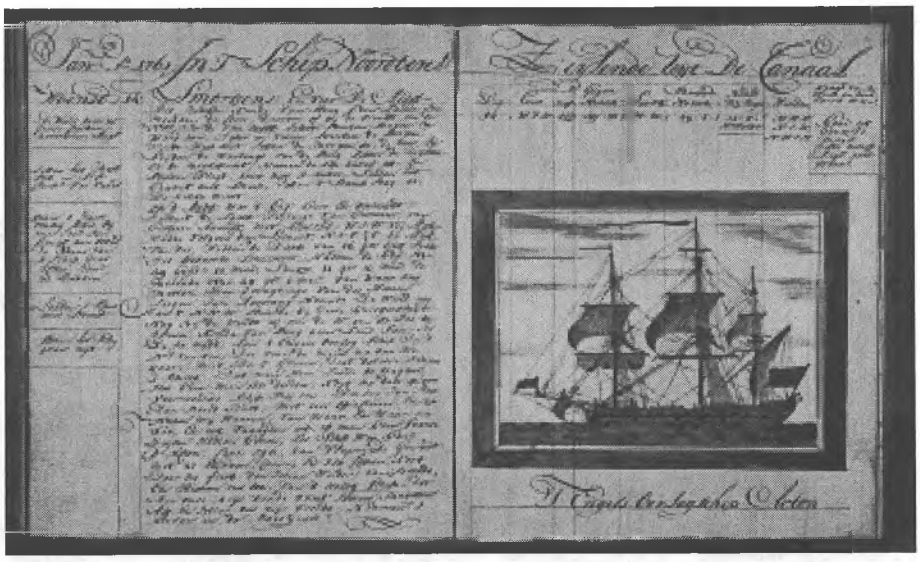


Figure 1. *Sample logbook pages from different countries showing typical layout. a) from Spain, b) England and c) the Netherlands*

Because of the much greater volume of logbooks to be consulted and the different logistic requirements, the English data have been abstracted directly from the original documents into the database. In addition, Partner 2's team were based in the Archives of the National Maritime Museum (Greenwich, London) thereby minimising the need to prepare 'transportable' digital images.

Finally, many French logbooks have been abstracted from microfilm images that have been bought from CARAN (Centre d'Accueil et de Recherche des Archives Nationales).

To ensure homogeneity in the abstracted data, the partners agreed:

1) To use a common protocol for the raw database. All meteorologically relevant data of the midday (noon) observation were extracted, i.e. the date, geographical position, wind direction, wind force, present weather, sea state and, when available, sea ice reports, air temperature and air pressure data. Spanish and French logbooks contain usually one observation per day, generally at noon, but UK and Dutch logbooks include sub daily observations as well, although with less detail than the noon observations. For reasons of efficiency, the sub-daily observations were generally ignored in the extraction, but metadata such as the archive where the logbook is kept and its catalogue code, the ship's name and type, the names of the logbook keepers, reports of encounters at sea and, for users outside the climatological fields, recordings of notable events on board were all abstracted. The latter includes references to deaths on board, punishments, sightings of birds, whales, etc., as well as other information. This subset of information may be particularly relevant to historians interested in non-climatic applications of the database, such as military studies, trade and economic history etc.

2) To abstract the logbook observations into the working database without any preliminary conversion or elaboration of the content. This allows for greater flexibility in the post-processing and in the preparation of the different versions of the database, thereby optimising its potential and permitting easy reference back to the source material.

3) To make preliminary and intermediate integration exercises. From the outset this has been a highly successful exercise, allowing data inhomogeneities and

curiosities to be detected, speeding the production of the final database and permitting the easy integration of information from the different sources.

In total, 1,624 logbooks were digitized, comprising of 273,269 observations. Table 1 shows the distribution over the countries.

	Logbooks	*Observations*
Spain	408	50,935
UK	591	88,475
Netherlands	613	126,541
France	12	7,318
TOTAL	***1,624***	***273,269***

Table 1. *Number of CLIWOC logbooks and observation by country.*

2.2 Data quality

One of the main objectives of CLIWOC was to obtain a high quality dataset. Consequently much effort has been invested in checking and assuring the quality of the abstracted data. Package 5 was principally devoted to the many quality issues. Three main levels of quality control may be distinguished:

1) quality of the data transcription,
2) quality of the data interpretation,
3) quality checks of the derived observations.

1) Quality of the data transcription

In order to evaluate and minimize the errors when keying the data from the original documents into the raw database, a common procedure was implemented. A sample of 5% of the total keyed pages was routinely sampled every month to check for typing or

other errors. Where significant errors were found that month's work, it was re-abstracted.

2) Quality of data interpretation

The correct typing of the original logbooks was only the first step of the process. These raw data were, however, written in archaic versions of four languages (Spanish, English, Dutch and French), all of which had to be translated into their modern English equivalent if the database was to be useful and accessible.

With this aim in mind, a multilingual dictionary was produced. It is currently available from the project web page, and is one of the first attempts in the literature to express the wealth of archaic logbook wind force terms in a form that is comprehensible to the modern-day reader. Oliver and Kington (1970) and Lamb (1982) have drawn attention to the importance of logbooks in climatic studies, and Lamb (1991) offered a conversion scale for early eighteenth century English wind force terms, but no studies have thus far pursued the matter to any greater depth. At an early stage in the project it was apparent that many of the logbook weather terms, whilst conforming to a conventional vocabulary, possessed meanings that were unclear to twenty-first century readers or had changed over time. This was particularly the case for the important element of wind force; but no special plea is entered for the evolution in nautical vocabulary, which often reflected more wide-ranging changes in the respective native languages.

The key objective was to translate the archaic vocabulary of the late eighteenth and early nineteenth century mariner into items in the current international standard of the Beaufort Scale. Only then could the project's scientific programme be embarked upon. The dictionary is the result of the largest undertaking into logbook studies that has yet been carried out. Several hundred logbooks from British, Dutch, French and Spanish archives were examined, and the exercise offered a unique opportunity to explore the vocabulary of the one hundred year period beginning in 1750. The logbooks from which the raw data have been abstracted range widely across the North and South Atlantic and the Indian Oceans. Only the Pacific, largely in consequence of the paucity of regular naval activity in that area, is not well represented. The range of climates encountered in

this otherwise wide geographic domain gives ample opportunity for the full range of the mariner's nautical weather vocabulary to be assessed, from the calms of the Equatorial regions, through the gales of the mid-latitude systems to the fearsome storms of the tropical latitudes. The Trade Winds belts, the Doldrums, the unsettled mid-latitudes, even the icy wastes of the high latitudes, are all embraced in this study. The text seeks to provide a means of understanding archaic wind force terms and, other than to indicate those items that were not commonly used, no information is given on the frequency with which different terms appeared in the logbooks. The work is offered to the wider academic community in the hope that it will prove to be of as much value as it has been to the CLIWOC team. The complete text of the dictionary can be obtained in PDF-format from the project web page: www.ucm.es/info/cliwoc

3) Quality checks of the derived observations

After the extraction and an initial quality control, which included a calendar check of data from English logbooks prepared between 1750 and 1752 (a period when the Julian calendar was still in use), the data were sent to the Dutch partner. For every ship, the route was plotted, checked and adjusted according to the present-day prime meridian convention (i.e. Greenwich). In total, 636 different zero meridians were identified as being used over the study period. The reason for this vast number is the habit in those days of changing the zero meridian at each major landfall or sighting. Despite such longitude corrections, some coordinates continued to suggest overland and otherwise obviously erroneous positions. This is because most of the longitude determinations were based on dead reckoning, and the accumulation of small errors could result in an increasing miscalculation of the ship's longitude as the voyage progressed. After determining the part of the voyage that needed correction, the final step was to apply incremental adjustments to the ship's longitudes throughout that leg of the voyage and thereby to estimate the most likely track. This was done according to the method originally developed by Jackson et al. (2000). Figure 2 shows an example of the effect of longitude adjustments on the track of a ship's voyage. Note that in this example the outward journey contained many more land sightings and hence more changes in longitude zero points than the return trip, which went over the open ocean with far fewer land sightings.

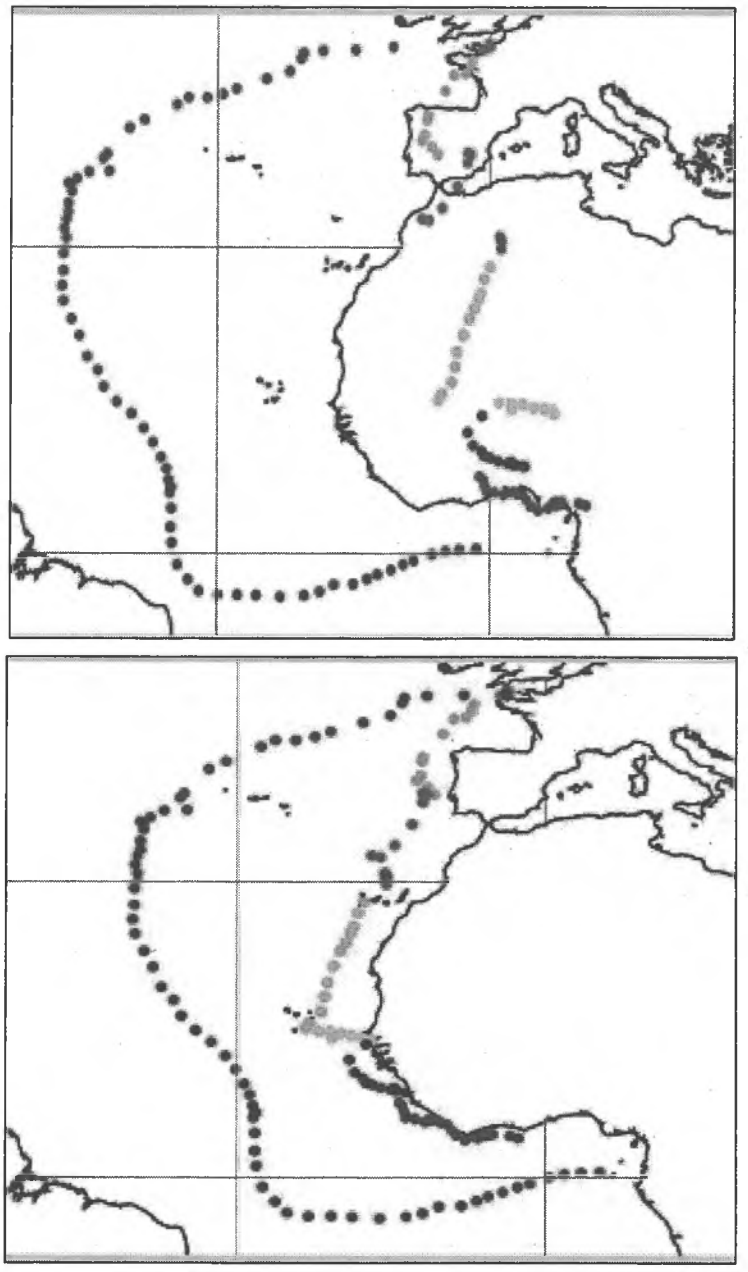

Figure 2. *The top figure shows the positions of HMS* Surprise *(1750-1751) without correcting the longitude to the current standard, i.e. Greenwich. Each different colour corresponds to a different zero meridian, which are, in order: Start Point, Ushant, Cape Roxent, Madeira, Point Negro, Isle of May Bay, Cape St. Maries, Bananas and (at the return trip) St. Thomas's. The bottom figure shows the corrected positions.*

The figure is typical for CLIWOC in the sense that more than 50% of ship tracks needed major revision. Only when the reliability of the original data had been confirmed and corrected if necessary, could attention could turn to the question of observational bias and intrinsic errors in the key meteorological observations.

The first task was to search for bias in the scale used for recording of wind direction. In theory, winds were recorded on 32-point compass, but a sample of over 4000 observations showed that there was a bias towards using only the 16- (NNE, SSE etc.), 8- (NW, SW etc.) and 4-point (N, W, etc.) elements of the compass. Table 2 shows the observed – expected values and chi-square statistics over the first eight decades of the study period. In all decades except the 1810s this tendency is statistically significant at the 0.01 level.

Decade	4-point	8-point	16-point	32-point	Test Stat
1750s	171.25	764.25	423.5	-1359	**1278**
1760s	116.25	252.25	201.5	-570	**482**
1770s	97.75	215.75	77.5	-391	**403**
1780s	72.75	223.75	208.5	-505	**433**
1790s	35.63	192.63	65.25	-293.5	**266**
1800s	75.75	114.75	123.5	-314	**240**
1810s	14.75	1.75	-7.5	-9	4.5
1820s	20.63	17.63	39.25	-77.5	**50.7**

Table 2. *Observed minus expected frequencies based on the null hypothesis of no bias in the use of the 32-point compass. Chi-square statistics in bold are statistically significant at the 0.01 level.*

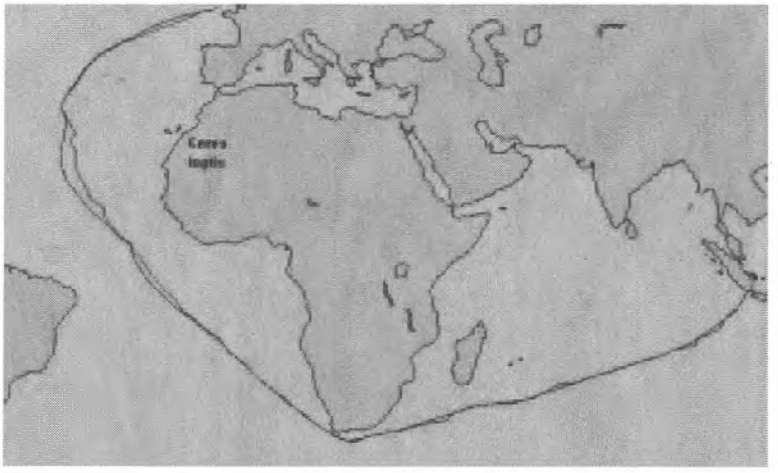

Figure 3. *One of the 'dual' voyages (East India Company ships* Ceres *and* Inglis*) used in the study of data consistency.*

Secondly, an examination was made of the consistency with which wind force and wind direction (the two principal weather elements) were recorded. This was performed by taking records from ships in company over long voyages. The differences between such independently derived data sets provided a measure of data reliability. The results for wind direction are shown in Figure 4, in which the mean difference is 2.47 compass points, with a modal class of 1 compass point. It shows also that 45 per cent of differences were 1 point (22 degrees) or less.

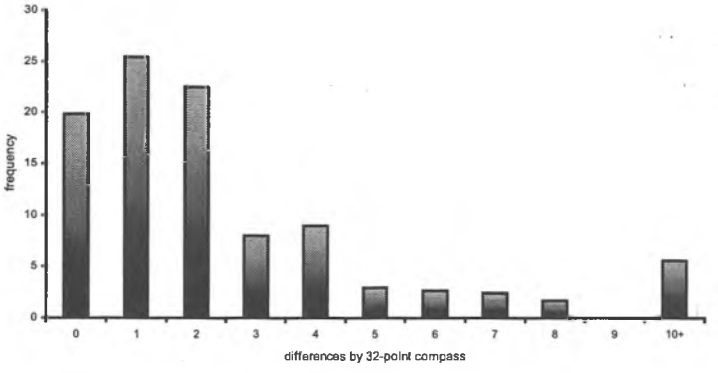

Figure 4. *Histogram of wind direction differences from independent observations of the same conditions. Sample size = 413 pairs of observations.*

Finally, wind force records were compared after their conversion to present-day Beaufort Scale equivalents. The sample size was 461 pairs of records. Figure 5 summarises the differences and shows a mean of 0.9 of a wind force and a modal class of zero. Table 3 provides a more detailed statistical summary of the wind force analysis. All correlations between the series were significant at the 0.05 level (all except one at the 0.01 level). The mean differences in all pairs of voyages were less than one force on the Beaufort Scale (but were significant in a number of cases).

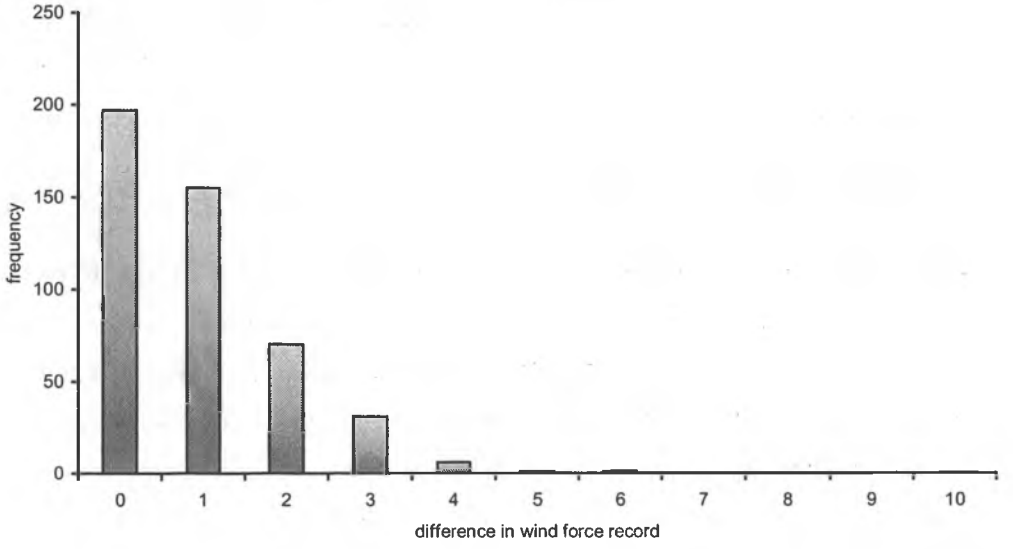

Figure 5. *Histogram of wind force differences from independent observations of the same conditions. Sample size = 461 pairs of observations.*

Larger Vessel	Smaller Vessel	Dates	Year	Region	Wind Speed Corr.	n	Sig.	T-test of means Diff.	Dig.

Table 3. *Summary table showing the comparisons between wind force records from nine dual voyages.*

A final issue surrounded the question of wind direction. These records were usually based on readings from a magnetic compass, the use of which was widespread in the CLIWOC period. Navigators were aware of the differences between the direction of true and magnetic north, termed the 'magnetic variation'. The absolute magnetic variation could be as much as 10 degrees, sometimes even over 30 degrees. The question arose as to whether the reported wind directions were related to true north or magnetic north There were no international conventions at the time and studies of contemporary texts did not answer this question adequately or consistently for all of the participating countries, although it did provide some useful information the case of English logbooks. Consequently additional analysis of the CLIWOC database was carried out. A comparison of the average wind directions of the four nations in an area of relatively constant winds (the Trade winds belt in the North Atlantic) with the present-day climatic values indicate that the British used magnetic wind directions throughout the CLIWOC period. The pre-1800 Spanish data shows a preference for wind directions relative to true north, while the Dutch made a switch from magnetic to

true directions somewhere in the period 1790-1810. For the French data and the post-1800 Spanish data the analysis was inconclusive. Table 4 shows which north is assumed in the CLIWOC wind direction procedure.

Spain	≤1800	True
	>1800	True*
UK	≤1800	Magnetic*
	>1800	Magnetic*
Netherlands	≤1800	Magnetic
	>1800	True
France	≤1800	Magnetic*

Table 4. *Recording of wind direction with respect to magnetic or true north by country and period. In the CLIWOC database, this table is used to convert to true wind direction. Values marked with an asterisk are not based on empirical evidence.*

The conclusions of this chapter can be summarized as follows:

a) The results of the verification/quality control analysis strongly suggest that the CLIWOC data are based on reliable and consistent records of the conditions at the time, in particular: 1. magnetic and true wind directions can be identified and 2. the majority (67%) of recorded wind directions are reliable to within 22 degrees.
b) Wind force records are reliable to within one force on contemporary 12-point scales.
c) *N*-sample independent wind force series are significantly correlated.
d) Wind force terms in all participant languages can be confidently and reliably expressed in modern-day Beaufort scale equivalent forces and speeds.

2.3 Database construction

The construction of the database was the main objective of working package 6. This section summarizes the main results obtained using release 1.5. The previous versions were more limited in scope.

After being properly corrected for position and date, the observations were put in the

database in IMMA standard format (Woodruff, 2003). This format allows the use of the present day unit conventions in a core record along with the original data in attachments to the core. For all records, the original data were kept. These were stored in the original languages; their equivalents being derived from the dictionary. The meteorological content was treated similarly: the original units and descriptive wind force terms were kept and linked to the values in modern units by a lookup table. The wind force dictionary, which is presented in four principal sections, one for each partner-language, provides a means of converting wind descriptors into Beaufort force numbers and is included as a dynamical module within in the database, which allows for efficient updating. Temperature recordings were converted to Celsius, while barometer readings were converted to hPa from a variety of units. Again the original recordings are kept in the IMMA-attachments and the converted recordings are in the IMMA core.

The CLIWOC philosophy recognized the need for easy accessibility to the data. Since a long-term aim of the project team was incorporating the data into the ICOADS database, early contacts were made with its management group. It was agreed subsequently that the format for the final CLIWOC database would accord with the IMMA standards. The core of the records in this format contain the basic coordinates and meteorological elements in present SI units, together with pointers to attachments, where the original recorded material is stored. For wind speed, the transformation from the original terminology to the SI units involves two steps: first from the old terms to those of the Beaufort scale, using the dictionary and, second, by assigning average m/s values to the Beaufort forces according to the WMO code 1100 scale. See Table 5 for this conversion series, and for the assignment of non-integer Beaufort force numbers where greater descriptive detail allowed for such more detailed identifications.

Beaufort	Class boundary [m/s]	Lower-half value [m/s]	Midpoint value [m/s]	Higher-half value [m/s]	Class boundary [m/s]
0	0	0.0	0.0	0.1	0.2
1	0.3	0.6	1.0	1.2	1.5
2	1.6	2.0	2.6	2.9	3.3
3	3.4	4.0	4.6	4.9	5.4
4	5.5	6.1	6.7	7.3	7.9
5	8.0	8.7	9.3	10.0	10.7
6	10.8	11.6	12.3	13.1	13.8
7	13.9	14.7	15.4	16.3	17.1
8	17.2	18.1	19.0	19.8	20.7
9	20.8	21.7	22.6	23.5	24.4
10	24.5	25.5	26.8	27.4	28.4
11	28.5	29.5	30.9	31.6	32.6
12	32.7	33.9	35.0		

Table 5. *Assignment of m/s values to the Beaufort forces.*

Temperature, and other instrumental data were standardized to SI units using conventional arithmetic conversion factors. Barometer readings were converted to hPa using basic procedures. First the readings were converted to millimeters (using 25.4 and 27.0699534 millimeters for English and French inches, respectively) and then to hPa after which the pressure was reduced to standard gravity. No correction for the temperature or the height above the sea surface was applied to the pressure data The adjustments for magnetic wind directions were calculated with software that was kindly made available by Andrew Jackson of the University of Leeds Geophysical Research Group. Pointers are also included in the database to non-meteorological data such as casualties and conditions on board, and to pathways to digital images of the pages (where available) of the logbook from which the data were abstracted.

All data are available individually i.e. daily, but they are also presented in monthly summaries of u and v vectors in 8°×8° grid boxes for wind. For the period 1824-1854 there were sufficient data for monthly summaries of pressure and temperature also. In

due course, the data will be incorporated in the monthly summaries of ICOADS and integrated with the Maury data collection. To facilitate an even larger group of users, the data are stored in Microsoft Access format as well. Both Access97 and Access2000 are downloadable from the CLIWOC website.

Partner 1 will maintain the CLIWOC database. The data will also be accessible through KNMI and ICOADS as a separate data set. Future investigations will determine if the methodologies developed during the production of the CLIWOC database are applicable to other data sets from similar sources.

The database is currently available as CD-ROM, and from the website. Table 6 shows the number of CLIWOC data days by ocean, country of origin and 50-yr period. Here, the border between the Atlantic and Indian Oceans is put at 20°E (near Cape Town); the border between the Indian and Pacific Oceans at 120°E (a meridian that runs close to Manila), and the border between the Pacific and Atlantic Oceans at 70°W (Drake Strait). Figure 6 show the geographical coverage of CLIWOC by country over its entire 1750-1854 period.

		N-Atlantic	S-Atlantic	Indian Ocean	Pacific	All Oceans
Spain	≤1800	28,236	11,622	319	1,614	41,791
	>1800	399	190	301	89	979

Table 6: *Number of CLIWOC data per ocean, country and period.*

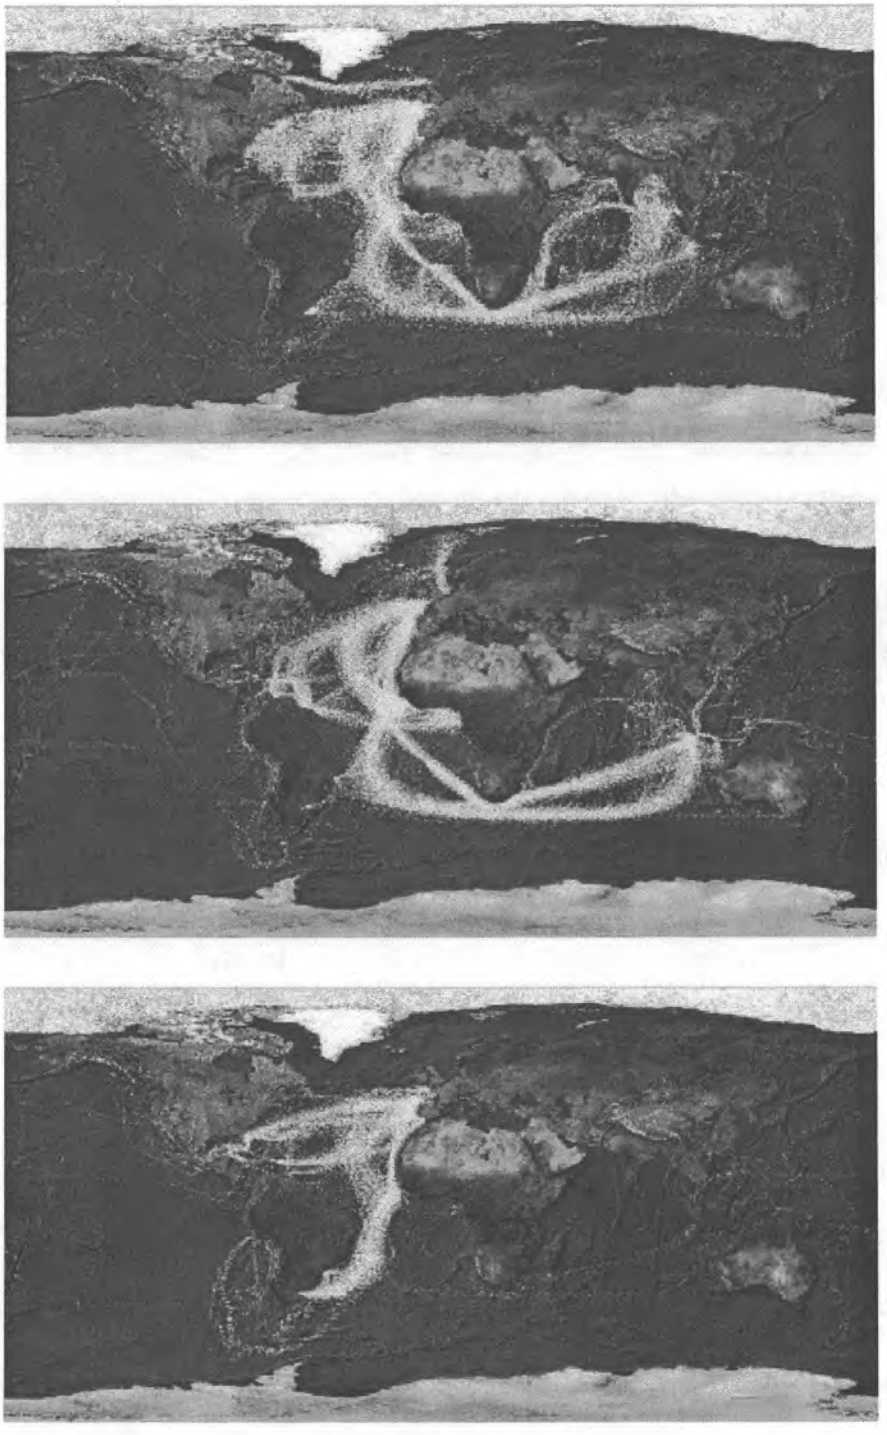

Figure 6. *Geographical distribution of the observations per collecting country; from top to bottom: United Kingdom, The Netherlands and Spain.*

Table 6 and Figures 6 and 7 show the following three features. First, the Atlantic and Indian oceans are well covered with data; but the Pacific coverage is poor. Second, the UK and Dutch cover the Atlantic and the Indian Oceans, in both the 18th and the 19th century. Third, the Spanish and French ships' tracks are predominantly from the 18th century, and principally enhance the data density over the Atlantic Ocean.

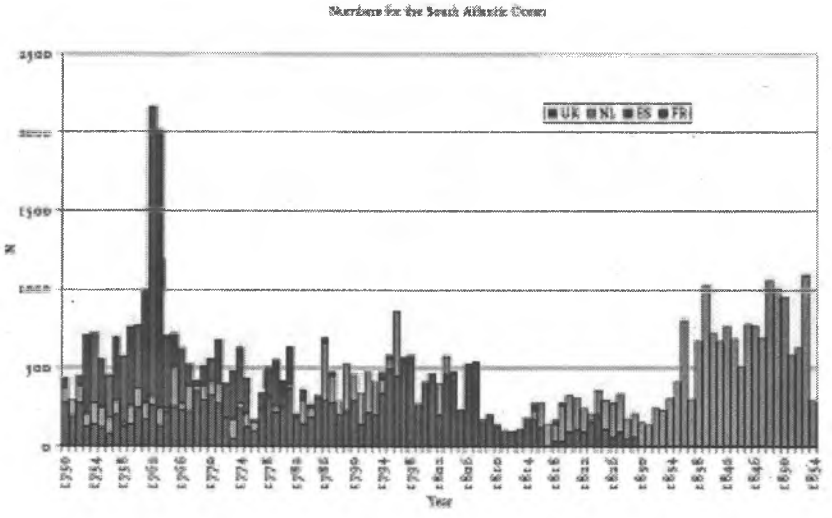
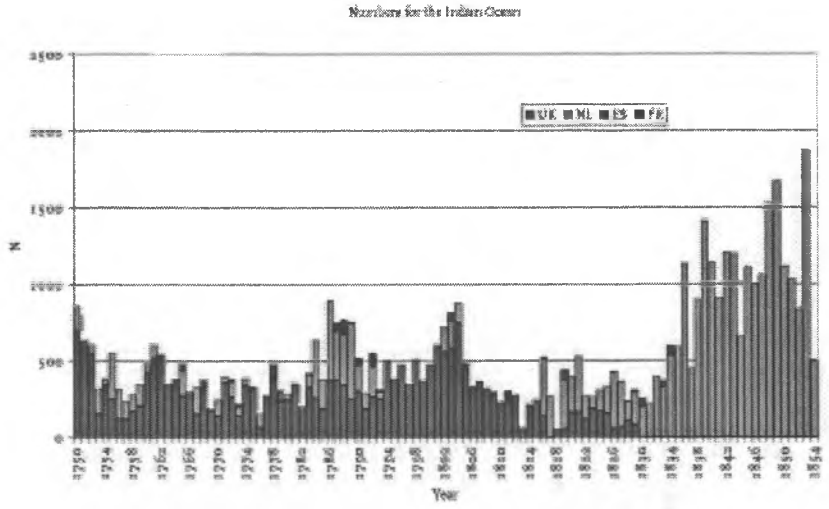
b)



c)



d)

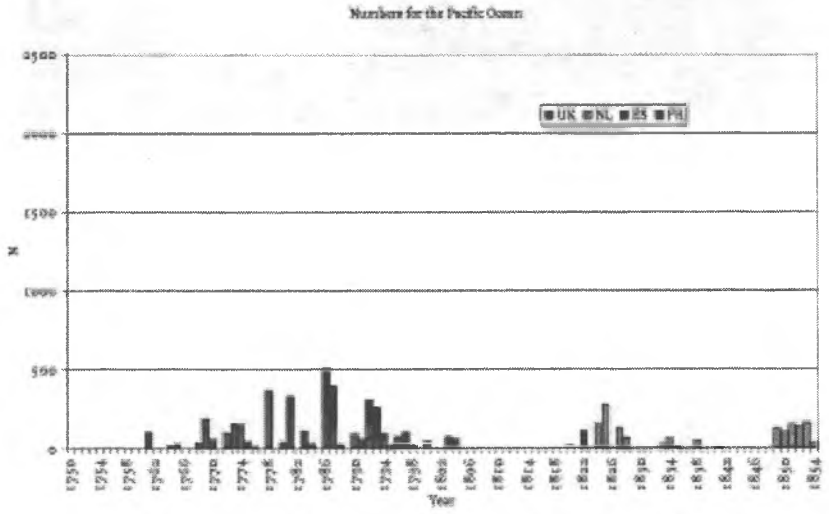


Figure 7. *Number of observations per year per ocean area for each country. Graph 7a and 7b show the North and South Atlantic Ocean, respectively. Graph 7c shows the Indian Ocean, while 7d depicts the number of observations in the Pacific Ocean.*

Figures 7a and 7b show that the Dutch/UK contributions are such that they produce a consistent temporal coverage for the North and South Atlantic Oceans, while the Spanish and French data are concentrated in the 18th century coverage. Over the Indian Ocean, the data come primarily from the Dutch and UK sources. The number of observations gathered for the Indian Ocean (Figure 7c) is roughly one third of that for the N-Atlantic (Figure 7a). This suggests that evidence of the North Atlantic Oscillation (NAO) may be more confidently derived from the CLIWOC database than of the El Niño Southern Oscillation (ENSO).

Table 7 shows the number of observation that report both wind force and wind direction, as well as the number of reported air pressure and air temperature recordings per ocean for the period 1800-1854. Pre-1800 numbers are not included in the table, as there were few instrumental observations being made at the time. The numbers of pressure and temperature recordings in Table 7 are strikingly similar. This is a consequence of the fact that ships that were instrumented usually carried both a thermometer and a barometer.

	N-Atlantic	**S-Atlantic**	**Indian Ocean**	**Pacific**	**All Oceans**
Wind	38,353	21,533	30,289	1,696	91,871
Air temperature	18,203	11,348	15,833	1,046	46,430
Air pressure	18,294	11,322	16,105	908	46,629

Table 7. *Number of CLIWOC data 1800-1854 per ocean and element; the numbers of pre-1800 pressure and temperature observations are negligible.*

2.4 Preliminary results

This section summarizes some of the most relevant scientific results obtained so far. The partners recognize that the full potential of CLIWOC can only be reached in the long term, and the careful scientific exploitation of CLIWOC data will be matter of years in coming to fruition Consequently, as foreseen in the project contract, these

results are only a minor part of the expected outcomes, and are mostly intended to show the great potential of CLIWOC. Additionally, and again as noted in the contract, they are focused on obtaining a reconstruction of the North Atlantic Oscillation index (NAO).

The first derivative is the provision of surface wind climatologies for the period 1750-1850. Figure 8a shows monthly maps of surface winds, in which the seasonal and spatial patterns of average conditions can be clearly seen. Using this wind climatology (with average values of *u* and *v* components for 1961-90) we reduced all the ICOADS and CLIWOC data to anomalies for each month in each year, 1750-1997. In addition to the *u* and *v* wind anomalies, we also retained the number of observations each month in each 2°x 2° square. Figure 8b shows the difference in vector winds for the 12 months of the year between the CLIWOC average (for 1750-1850) and ICOADS (for 1961-90). There is little difference between the two fields, and the consequent anomaly-difference vectors are small compared to those for the absolute winds in Figure 8a. Differences are larger in regions of sparser coverage and where day-to-day variability is high (e.g. the westerlies at high latitudes in the Southern hemisphere and in the northern North Atlantic). This high level of agreement between CLIWOC and ICOADS climatology serves as an additional check and confirmation of the high quality of the data abstracted in CLIWOC.

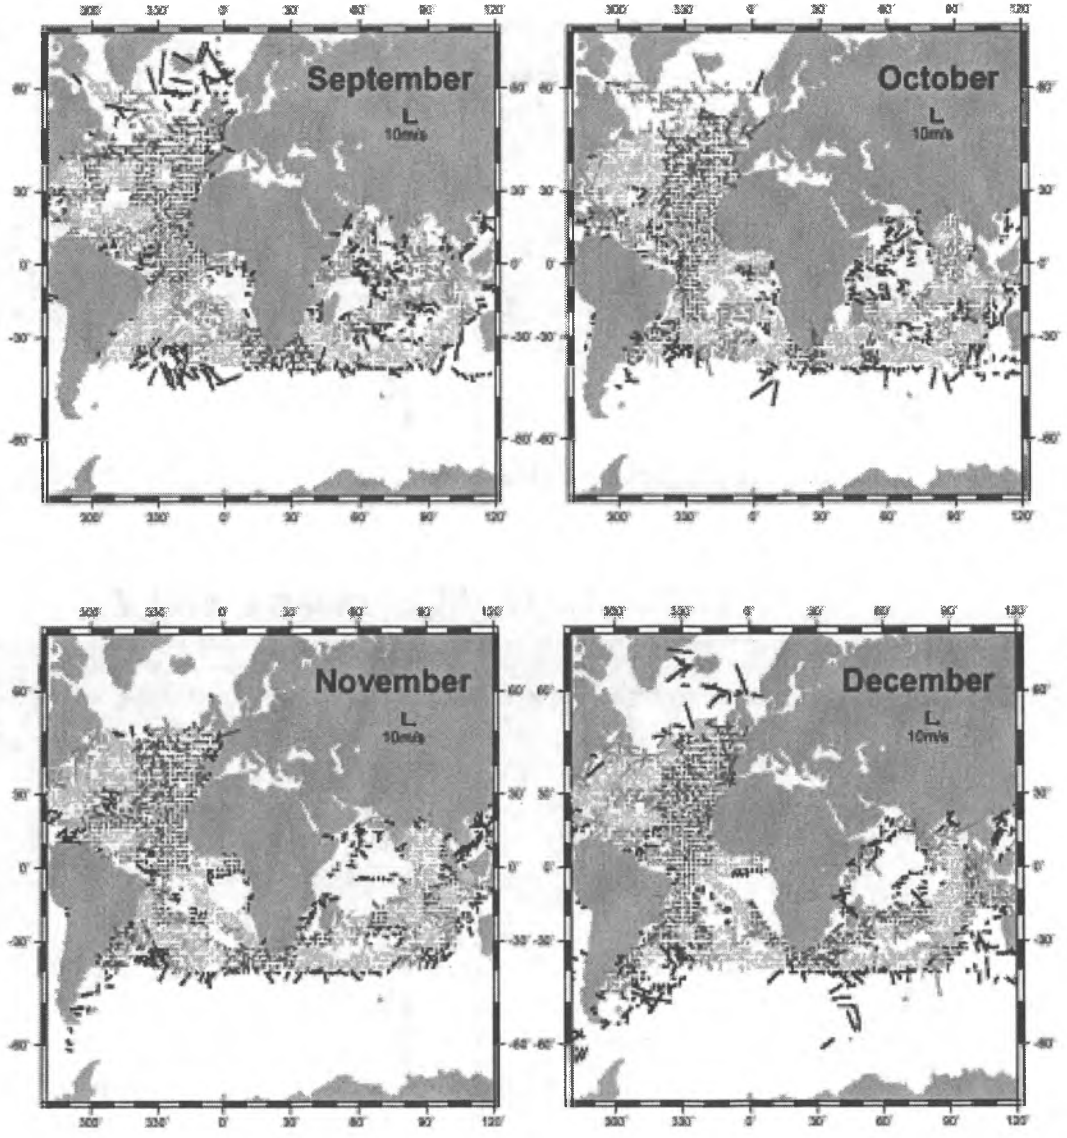

Figure 8. ***a)*** *average CLIWOC and ICOADS wind vectors for each of the 12 months for the 1961-1990 period on a 2° grid.* ***b)*** *differences in wind vectors for each of the 12 months, CLIWOC for 1750-1850 minus ICOADS for the 1961-1990 period on a 2° grid. The colours on this plot represent the following: dark red, <20; red, <50; light green, <100, and dark green >100 observations during the 101 years on the 2° grid.*

Orthogonal spatial regression (OSR) techniques were used to relate the predictor variables (u and v components of the wind) to the predictand data (circulation index). In OSR, the amplitude time series of the Principal Components (PCs) of the u and v wind component series for each ocean basin are offered for regression against the circulation data (single time series of the NAO). PCs are retained only when their eigenvalue exceeds one.

OSR is a form of multiple linear regression, simplified by the orthogonality constraint on the variables on both sides of the equation. This means that the whole procedure is relatively simple compared to stepwise regression. It is a recommended technique when, in response to their spatial character, there are strong interdependencies between the u and v wind components. The technique remains principally regression-based, however, and it is essential to develop the equations over one period (calibration) and to test them over an independent (verification) period. Here we use 1881-1940 for calibration and 1941-1997 for verification.

Despite the unavoidable limitations of the CLIWOC/ICOADS cover for the study period, sufficient data were available to provide useful reconstructions of circulation patterns. The results also indicated that with additional data of this type yet more comprehensive and detailed reconstructions are possible using the same methods and procedures.

OSR was employed to reconstruct 'seasonal' NAO series based on the u and v wind component data for the N. Atlantic (24°-56°N). Again, the calibration period was 1881-1940 with verification over the 1941-1977 period. Table 8 summarizes the pertinent statistics. The principal conclusion is that the 'winter' season performs much better than the 'summer' season. This has been found for all attempts to reconstruct either circulation indices or pressure data and relates to the less well-organized state of the atmospheric circulation in the NH summer season.

Circulation Index (Season)	Calibration (1881-1940)	Verification (1941-1997)	# PCs [1]	%Variance [2]
NAO (DJF)	0.937	0.907	15	82.5
NAO (MAM)	0.764	0.631	15	82.0
NAO (JJA)	0.555	0 225	15	81.5
NAO (SON)	0.835	0.788	16	83.7

Table 8. *Calibration (1881-1940) and verification (1941-1997) period statistics (correlation coefficients) for 'seasonal' NAO reconstructions. [1] Number of u and v wind component PCs retained (where Eigenvalue > 1). Maximum number of variables for the NAO data was 60 u/v series). [2] Percentage of variance of the accounted for by the PCs.*

Figure 9 presents time series plots for four reconstructions; those for NAO winter (DJF), spring (MAM) and autumn (SON) and the SOI (Southern Oscillation Index). There is obviously good agreement between the reconstructions and the station-pressure-based circulation indices, but apart from the 1820-50 period, which is the 'overlap' period when the index is based on homogenized instrumental data, the CLIWOC data cannot be fully tested, i.e. back to 1750 in respect of the formal NAO series. To assess the reconstructions over their entire period, we compared them with terrestrial-based proxy reconstructions. We made use (Figure 10) of the seasonal values of NAO indices from Luterbacher et al. (2002), in which European documentary and instrumental sources from as early as 1500 are employed. We also compared (Figure 11) our reconstructions of the winter (DJF) NAO estimates from tree-ring measurements from Europe, North Africa and North America (Cook, 2003) and from ice-core isotope measurements from Greenland (Vinther et al., 2003). All such terrestrial based series extend back much earlier than 1750, Luterbacher et al. (2002) to 1500, Cook (2003) to 1400, Vinther et al. (2003) to 1245.

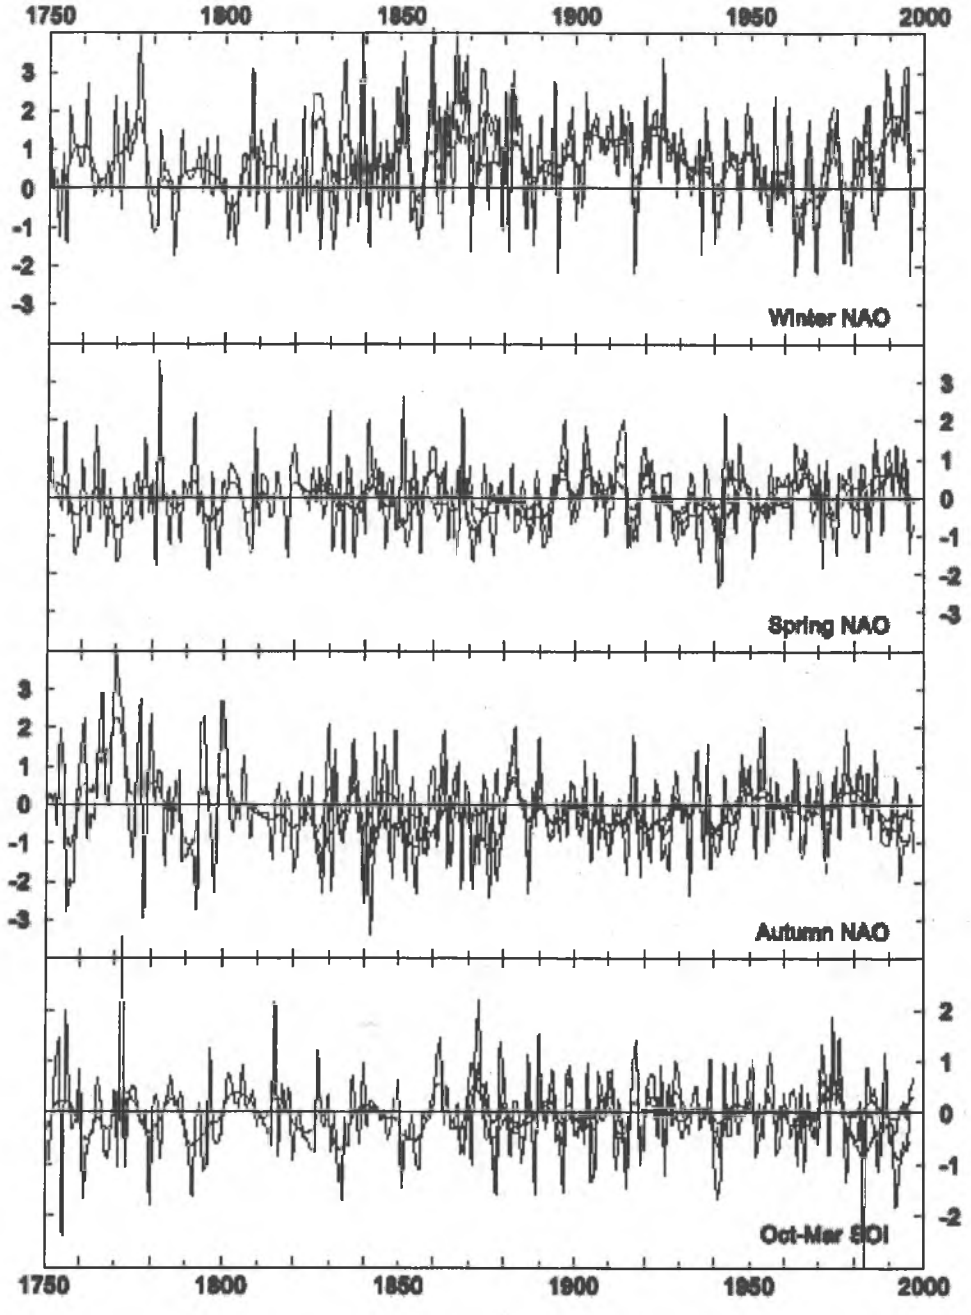

Figure 9. *Reconstructions of the NAO and SOI, 1750-1997 compared with instrumental data.*

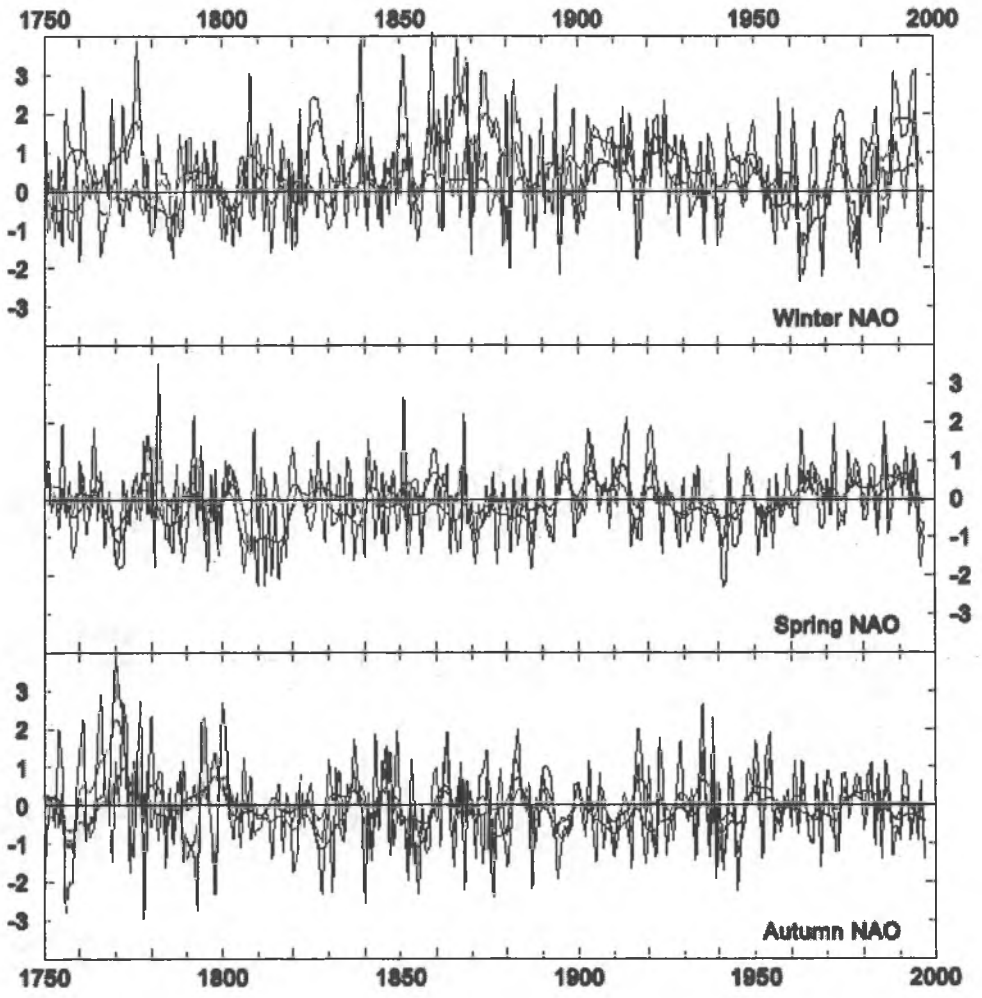

Figure 10. *Comparisons of the wind-based reconstructions (CLIWOC) for the NAO with those from Luterbacher et al (2002) for the winter (December-February), spring (March to May) and autumn (September to November) seasons.*

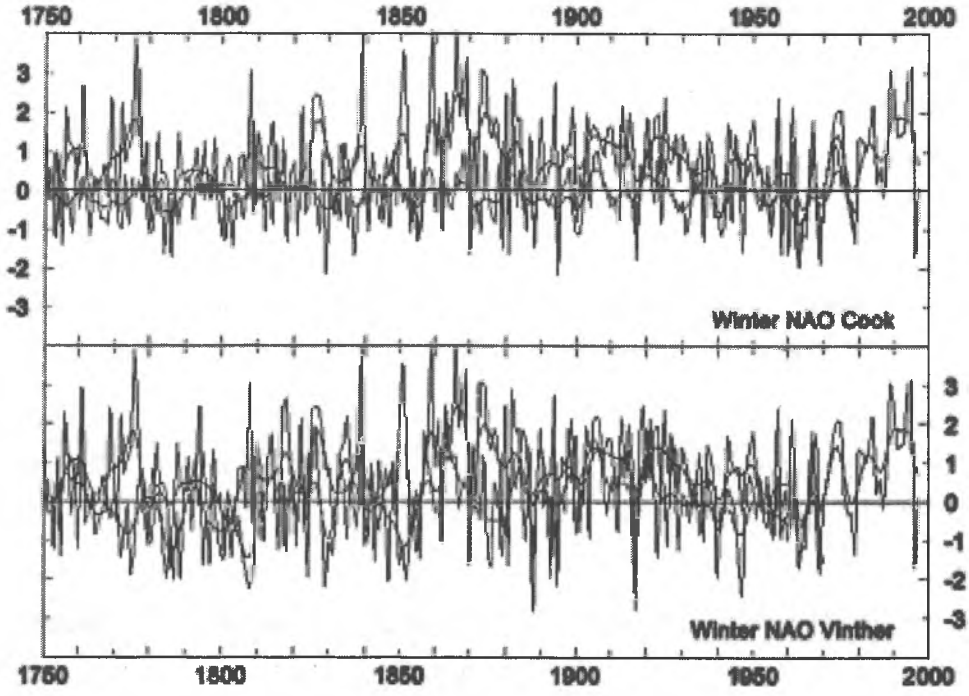

Figure 11. *Comparisons of wind-based (CLIWOC) reconstructions for the NAO with reconstructions from tree-rings and ice-cores by Cook (2003) and Vinther et al (2003).*

Table 9 gives means and standard deviations over two periods (1881-1997 and 1750-1850) for both indices and for 1825-1880 for the NAO from these various sources. Table 10 gives correlations between the series over the same selected periods.

1750-1850 (This paper)	--	0.23

Table 10. *Correlation Matrices for the NAO for Winter (DJF), Spring (MAM) and Autumn (SON) for selected periods.*

The initial results for the CLIWOC period (1750-1850, using version 1.1 of the database) are relatively poor compared to the land-based proxies of Luterbacher et al. (2002), Cook (2003) and Vinther et al. (2003). From Figures 9, 10 and 11, this can be seen to be due to a few outliers over the 101-year period. Work is still continuing to determine the reason for this, but it is hoped that they will improve with the final version of the CLIWOC database. At the moment it appears that the outliers are due to too few observations in specific seasons in the regions found to be important from the OSR program. The calibration and verification statistics (Table 8) found using the ICOADS data over the 1881-1997 period clearly indicate that wind vector data can produce a reliable NAO reconstructions for all seasons except summer. In Figure 10, comparisons with the Luterbacher et al. (2002) reconstructions (which is considered to

be the best of the 'other' reconstructions used) indicate that low-frequency aspects (on decadal timescales) of the reconstruction are reasonably well produced. As noted in the introduction to this report, the results are preliminary and are likely to be improved as more data for the period are entered into the CLIWOC database.

3 Evaluation of Objectives

3. Evaluation of objectives

While chapter 2 is principally concerned with how the project's activities had been developed and with the most relevant results, this chapter reviews how the projects objectives have been achieved.

Objective 1. *To produce and make freely available for the scientific community the World's first daily oceanic climatological database for the period 1750 to 1850.*

This objective has been achieved by producing the database, making it available as CD-ROM, and through the project's web page.

Objective 2. *To realize the potential of the database to provide a better knowledge of oceanic climate variability over the study period.*

The quality checks and the first results show that the data are consistent and reliable. The results obtained in the preliminary analysis of the data show that they can contribute significantly to a better understanding of past climate variability over the ocean and at a global scale.

Objective 3. *To use the information to extend and enhance existing oceanic-climate databases.*

The participation, as adviser, of Scott Woodruff from NOAA has facilitated the integration of CLIWOC data into the ICOADS (International Comprehensive Oceanic and Atmospheric Dataset); the most widely used database of this type among the scientific community. The adoption of the IMMA format provides an integrative connection into ICOADS. Additionally, CLIWOC can be directly downloaded from ICOADS and remains a clearly identifiable European contribution to this system.

Objective 4. *To disseminate the proposal's findings and to stimulate interest and awareness in this source with a view to fostering its further development and realising its scientific potential.*

Throughout the execution of the project, the team members were aware of the importance not only of establishing useful data but also of drawing wide attention to its existence and to the benefits of its application. Dissemination has been a highly successful component of the project, and the following section summarizes the achievements in this area.

4 Deliverables and milestones

4 Deliverables and milestones

This section reviews the achievement of deliverables and milestones included in the project contract. They can be divided into four different classes: reports, meetings, products and dissemination activities.

4.1 Reports

It was agreed to produce 5 progress biannual reports and seven meeting reports. They were all produced on time, and sent to the scientific officer. Additionally, 30 quality control and assessment reports were produced, as planned, during the abstraction process.

4.2 Meetings

Finally seven meetings were held:
Kick-off meeting in Seville (Spain), February 2001
Meeting 2 in Greenwich (UK), September 2001
Meeting 3 in Córdoba (Spain), February 2002
Meeting 4 in De Bilt (The Netherlands), September 2002
Meeting 5 in La Gomera (Spain), February 2003
Meeting 6 in Prague (Czech Republic), September 2003
Closing meeting in Brussels (Belgium), November 2003.

4.3 Products

The main products of CLIWOC are the dictionary and the database. The dictionary was initially scheduled for month 12 and was conceived as a task of the highest priority. However, it was soon realised that the dictionary could only be properly developed after a careful examination of a representative sample of the terms used in the logbooks. Thus it was decided to postpone it until month 33. This has allowed us to prepare a dictionary, which not only includes all the terms of the database, but also provides

accurate modern equivalents and valuable additional material gathered during the progress of the project.

The database is currently available as version 1.5. A previous version was freely available as release 1.0. Release 2.0 will be available in the CD-ROM format during the spring of 2004.

4.4 Dissemination

The web page has been operational since month 6; the University Complutense of Madrid will continuously update it. It has received a total of 5379 visits during the period 15-March-2001 to 15 February 2004. Their distribution is shown in table 11.

	Country		
1.	USA	1811	33.7 %
2.	Spain	985	18.3 %
3.	UK	694	12.9 %
4.	The Netherlands	685	12.7 %
5.	Canada	212	3.9 %
6.	Australia	120	2.2 %
7.	Germany	107	2.0 %
8.	France	60	1.1 %
9.	Belgium	55	1.0 %
10.	Denmark	46	0.9 %
	Unknown	158	2.9 %
	Others	446	8.3 %
	Total	5379	100.0 %

Table 11 *Distribution of the visits received by the CLIWOC project web paged in the period 15-March-2001 to 15-february-2004.*

The opening and concluding brochures were ready in months 6 and 35, as expected. They are included in Appendix 2 of this report. The papers and presentations derived from CLIWOC have been summarised in section 3 of this report. They are much greater in number, and wider in terms of the media used for their dissemination, than had originally been envisaged. This development reflects not only the scientific but also the high level of general interest engendered by CLIWOC. A workshop was initially planned, however, in the course of the project, the partners agreed to its substitution by a themed session to be held at the European Geophysical Union's first Assembly. The session is titled 'Proxy, documentary and early instrumental marine climate data', it is scheduled by EGU for session CL23 at their *1st General Assembly*, to be held in Nice, France 25-30 April, 2004. R. García-Herrera, S.D. Woodruff and P.D. Jones will act as conveners. It is believed that this session will contribute more effectively to CLIWOC's dissemination than the planned workshop.

5 Future developments

5. Future developments

The social and scientific interest generated during CLIWOC led the partners to believe that it will be a lasting initiative. It has proven that logbooks data contain significant climatic information, and it has provided a useful methodology to make the old logbooks understandable and accessible to the scientific community. Thus, there is no doubt that the project will continue after the formal ending in December 2003. Additionally the cooperative environment and collaborative team spirit reached among the partners, supports the continuation of the project. There are a number of means by which the impetus of the CLIWOC project can be sustained. Initially, the partners will try to maximize the dissemination initiatives and offer more detailed accounts of the project's achievements. This will be done through the *Climatic Change* monographic issue, described in section 3 and which is currently in preparation, and through a synthesis paper in a major journal with a more multidisciplinary character. The next stage will involve the detailed exploitation of the database. This will be done directly by the project's partners and by encouraging other teams not directly involved with CLIWOC. In addition, it must not be thought that the abstraction of the logbook collections currently available in the European archives has been completed. Much remains to be done, and Table 11 shows the best estimate of the volume of data in the remaining logbooks.

	Main Period	Keyed Data	Data/yr	Available	Exhaustion	Data/yr if Exhausted
CLIWOC	**1750-1854**	**0.3 M**	**3 k**	**2.2 M**	**14 %**	**22 k**
CLIWOC/Spanish	1750-1800	0.1 M	2 k	0.1 M	100%	2 k
CLIWOC/Dutch	1750-1854	0.1 M	1 k	0.2 M	50%	2 k
CLIWOC/UK	1750-1850	0.1 M	1 k	1.4 M	7 %	14 k
CLIWOC/French	1750-1800	7 k	0.14 k	0.5 M	1 %	5 k
US Maury	1830-1859	1.0 M	30 k	1.5 M	100%	30 k
ICOADS*	1854-1870	0.2 M	12 k	0.2 M	100%	12 k

* Excluding the US Maury collection

Table 12. *Volume of data in the CLIWOC database and in the US Maury collection, and in the 1854-1870 period of ICOADS. All values are reduced to the number of ship-day observations.*

The results obtained at present confirm the high scientific interest and value of any additional abstraction exercises aimed at extending the time and space coverage and increasing the data density achieved in CLIWOC. This will require a combined effort from different institutions, and is an enterprise that the partners will actively promote.

Finally, the partners consider that CLIWOC experience can be used as guideline into a more general context of documentary sources. Thus, they will apply within FP6 call INFRASTR-4 with a proposal titled ENABLE. Its main objective being to perform a design study to create a European database of paleoclimatic data from a much wider range of documentary sources.

6 Management report

6. Management report

This section reviews the management of the project, and is focused on the main items included in the project contract. According to the latter, the key areas with respect to management at the team level are:

i. *Appointment of suitably qualified staff for data abstraction*

Every team recruited the required personnel depending on their administrative procedures and the team's responsibilities. A small delay in the initial contracts occurred, but it was corrected during the project's lifetime and did not materially influence the outcomes or management of the project.

ii. *Quality control of primary data abstraction*

As described in section 2.2, the abstraction quality control procedure was common for all the partners and based on a 5% sample of the total abstracted data. The *a posteriori* checks provided additional verification of the abstraction quality.

iii. *Working database management*

The intermediate inter-group comparison exercises, which started in month six, have allowed a flexible design of the working database, which has grown in quality (including more accurate fields and information) and quantity. It has been managed on a real time basis and has always been accessible to all the project participants

iv. *Preparation of twice-yearly team reports (for inclusion in full report)*

The annual reports have been produced on schedule and approved by the scientific and administrative officials. Funding has arrived from the EU Commission and been distributed subsequently to all the participants without significant delays.

v. *Coordination with secondary level team groups*
The coordination within the groups has been made by the respective team leaders and did not present any significant problems.

vi. *General aspects of team management and communication with the coordinator and other team leaders*
The warm and friendly environment reached among the participants has allowed for easy communication and cooperation. The meetings have been very useful for discussion and consensus agreements, and have allowed for a fruitful exchange of ideas. As a result, the integration of all the working packages proceeded efficiently.

In addition to these responsibilities the project coordinator had to ensure:

i. *that deliverables are achieved,*
ii. *milestones are reached on the specified dates,*
iii. *the preparation of the full reports,*
iv. *overall project management including effective communication between the teams and communication with the EU.*

As described in the previous sections, all the deliverables have been achieved, with the exception of the workshop, which was substituted by the EGU session with the agreement of all the partners. After obtaining the proper permission, the money initially budgeted for the workshop was invested in increasing the personnel for data abstraction. The only milestone suffering a significant delay was the dictionary, which was postponed from month 12 to month 33. This decision was not the result of any problems in the project process, but brought about by a carefully considered change of strategy. The final result, that of a complete multilingual dictionary capable of providing the modern equivalent of all the archaic terms, whatever their original language, has fully justified this decision.
No problems arose in the project reporting or in the overall communication processes.

Summing up, the management of the project did not present any significant problems. Personnel were contracted by the different partners, in some cases with a small delay due to administrative requirements, and the money arrived on time. During the rest of the period, standard management procedures have been followed.

The final cost justification is included as Appendix 3 of this report.

7 List of participants and assistants

7. List of participants and assistants

- From partner 1 Profs. Emiliano Hernández, Luis Gimeno and Pedro Ribera and in the abstracting team: Natalia Calvo, Guadalupe Fernández, David Gallego, Esther González, Eneko Mazo, Daniel Paredes, M. José Portela, Francisco Rubio. Pilar del Campo and Dolores Higueras at the Archivo del Museo Naval and Antonio López at the Archivo general de Indias.

- From partner 2 Dr. Clive Wilkinson (office manager) and the abstraction team of Ellie Gatrill-Smith, Catharine Ward and Simon Bailey worked diligently towards the successful conclusion of the abstraction of data from the English logbooks at the National Maritime Museum, Greenwich, Excellent coordination with the Museum was maintained through Dr. Nigel Rigby (NMM Director of Research).

- From partner 3: the abstraction team: Esther Balkestein, Florie Barnhoorn, Pauline Beckers, Denise Berck, Frank Boekhorst, Chantal Dekker, Inge Hickmann, Niels Hupkes, Roel Huttenga, Maarten Koek, Renate Meijer, Bruni Oehlers, Simone Pathuis, Rob de Rooij, Jolanthe Schretlen, Ronald Schurink, Marja Segers, René Snoey Kiewit, Toni Spek, Tineke Tegelaers, Theo Tieken, Pim Vente, Eric Verlinde, Rolf de Weijert; Netherlands Institute for Scientific Information Services (NIWI): Richard Bos, Sirius Bosch, Dr. Peter Doorn, Drs. Berry Feith, Iolando da Mata Brito; Nationaal Archief: Suzanne Barbier, Liesbeth Keijser, Joop Korswagen, Ton van Velzen; Others: I. van den Bout, Prof. Dr. Femme Gaastra, H.A. Hachmer, Irene Jacobs, Drs. W. Kerkmeijer, Juliette Uitdenbogaard and W. Visser.

- From partner 4 The abstraction team: Tech. Carlos Baez, who worked carefully on the abstraction of data from the French and Spanish logbooks and Tech. Fabian Diaz, who contributed to the abstraction of data from French logbooks. Particular mention must also be made of the Executive Secretary of the Centro Regional de Investigaciones Científicas y Técnicas

of Mendoza – Argentina (Ing. Carlos Wuilloud), who lent the microfilm readers and made special provision for the completion of the work. .

- From partner 5 Mike Salmon has performed all the calculations for the reconstruction of the circulation indices and the pressure data.

- David Parker from the UK Hadley Centre and Scott Woodruff, from the NOAA CDC acted as advisers. Their contribution has been valuable and contributed significantly to the project's development and success.

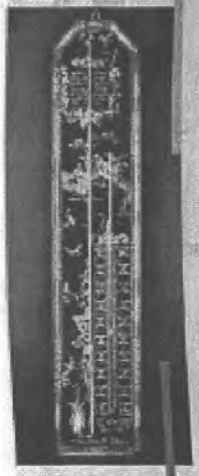
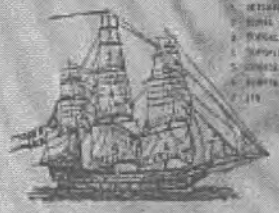
CLIWOC MULTILINGUAL METEOROLOGICAL DICTIONARY

An English-Spanish-Dutch-French dictionary of wind force terms used by mariners from 1750 to 1850





Koninklijk Nederlands Meteorologisch Instituut

Prepared under the EU-funded project EVK1-CT-2000-00090

Roberto Gustavo Herrera

During the course of the preparation of this dictionary, one of the contributors, Roberto Gustavo Herrera, passed away. This completed work is dedicated to his memory.

A la memoria del Roberto Gustavo Herrera, que contribuyó con su entusiasmo y buenhacer a este diccionario. ¡Que tengas buena travesía, marinero!

Many people have contributed towards the preparation of this volume.

from the Spanish project partners: Ricardo García-Herrera, Luis Prieto, David Gallego, Emiliano Hernández and Luis Gimeno

from the Dutch partners: Gunther Können and Frits Koek

from the English partners: Dennis Wheeler and Clive Wilkinson

from the Argentinean partners: Maria Del Rosario Prieto and Carlos Báez

further additional valuable contributions were made by Scott Woodruff of the US National Oceanographic and Atmospheric Administration (NOAA), Boulder, Colorado.

INTRODUCTION

This dictionary is the first attempt to express the wealth of archaic logbook wind force terms in a form that is comprehensible to the modern-day reader. Oliver and Kington (1970) and Lamb (1982) have drawn attention to the importance of logbooks in climatic studies, and Lamb (1991) offered a conversion scale for early eighteenth century English wind force terms, but no studies have thus far pursued the matter to any greater depth. This text attempts to make good this deficiency, and is derived from the research undertaken by the CLIWOC project[1] in which British, Dutch, French and Spanish naval and merchant logbooks from the period 1750 to 1850 were used to derive a global database of climatic information. At an early stage in the project it was apparent that many of the logbook weather terms, whilst conforming to a conventional vocabulary, possessed meanings that were unclear to twenty-first century readers or had changed over time. This was particularly the case for the important element of wind force; but no special plea is entered for the evolution in nautical vocabulary, which often reflected more wide-ranging changes in the respective native languages.

The key objective was to translate the archaic vocabulary of the late eighteenth and early nineteenth century mariner into expressions directly comparable with the Beaufort Scale (see Appendix I). Only then could the project's scientific programme be embarked upon. This dictionary is the result of the largest undertaking into logbook studies that has yet been carried out. Several thousand logbooks from British, Dutch, French and Spanish archives were examined, and the exercise offered a unique opportunity to explore the vocabulary of the one hundred year period beginning in 1750. The logbooks from which the raw data have been abstracted range widely across the North and South Atlantic and the Indian Oceans. Only the Pacific, largely in consequence of the paucity of regular naval activity in that area, is not well represented. The range of climates encountered in this otherwise wide geographic domain gives ample opportunity for the full range of the mariner's

nautical weather vocabulary to be assessed, from the calms of the Equatorial regions, through the gales of the mid-latitude systems to the fearsome storms of the tropical latitudes. The Trade Winds belts, the Doldrums, the unsettled mid-latitudes, even the icy wastes of the high latitudes, are all embraced in this study. It is not here intended to pass any judgements on the climatological record of the logbooks, and this text seeks only to provide a means of understanding archaic wind force terms and, other than to indicate those items that were not commonly used, no information is given on the frequency with which different terms appeared in the logbooks. Attention is, furthermore, confined to Dutch, English, French and Spanish because these once great imperial powers were the only nations able to support wide-ranging ocean-going fleets with their attendant collections of logbooks and documents over this long period of time. The work is offered to the wider academic community in the hope that they will prove to be of as much value as it has been to the CLIWOC team.

ACKNOWLEDGEMENTS

The authors gratefully acknowledge the kind assistance of the library staff at the National Maritime Museum, Greenwich, UK, the Archivo General de Indias, Seville, the Museo del Archivo Naval, Madrid, Spain, the Nationaal Archief of the Netherlands (The Hague), and the Netherlands Institute for Scientific Information Services (Amsterdam). THE BEAUFORT WIND FORCE AND WEATHER SCALES

The period in question (1750 to 1850) was a vital one in the evolution not only of English but, arguably, of nautical vocabularies generally. It was in 1806 that Francis Beaufort first formulated his wind and weather scale (Courtney, 2002). It is to this wind force scale, or to be more precise, its more recent derivatives, that the many and various logbook descriptors are equated

[1] For more information on this project consult the website at http://www.ucm.es/info/cliwoc/

in this dictionary. Although used only in his personal logbooks in the first instance, Beaufort's later influence as hydographer to the Royal Navy led to its formal adoption by the Service in 1838. His first two schemes can be found in Appendix I, but these original proposals have undergone several minor changes over the past century and half, particularly in respect of the names allocated to some of the wind forces. These changes are not discussed here in detail, and the dictionary's attention focuses on the more immutable thirteen numbers used to distinguish the scale. Beaufort's scale was proposed in the age of sail, and the forces from 5 onwards were defined in terms of the type and quantity of sail that could be safely carried in a "well-conditioned man of war". Only in 1906 did George Simpson redefine the scale in terms of the state of the sea that accompanies the different wind forces (Appendix I). The International Meteorological Organisation adopted the Beaufort wind and weather scales in 1939, over 100 years after its first proposal. At the same time, wind speed ranges were included in the scale to define the upper and lower limits of each force. Discussions of the Beaufort Scale, its origin, character and development can be found in Fry (1967), Kinsman (1969) and Crutcher (1975).

AN INTRODUCTION TO NAVAL LOGBOOKS

The dictionary focuses on those terms found in naval logbooks. It is only in such documents that weather terms were used in a regular and broadly consistent fashion. In that important sense they differ from many contemporary landsmen's diaries and letters, in which descriptions of the weather followed few conventions in respect of vocabulary. Only the five-point scheme proposed by the *Societas Meteorologica Palatina* (Kington, 1988) in the late eighteenth century sustains comparison with the wind force scales used by mariners.

The majority of logbooks that have survived from the study period are derived from either the state naval services of Britain, France, Spain and the Netherlands, or from the quasi-colonial joint stock undertakings of the English

East India Company (EEIC) or the Dutch East India Company (VOC – Verenigde Oostindische Compagnie), the West India Company (WIC: Westindische Compagnie) and the Middelburg's Commercial Company (MCC: Middelburgsche Commercie Compagnie).. Each of these sources had a strong and often distinctive tradition of training officers who were responsible for keeping the logbooks. The EEIC enjoyed the services of its own hydrographer, one of whom - Alexander Dalrymple - exercised a profound influence on Francis Beaufort. But long before Beaufort devised his wind force scale in 1806 most officers, and those of the British services in particular, used nationally-based unofficial, but widely-adopted scales when describing wind force. There were of course no anemometers at this time, and estimates were based on experience and judgement.

Logbooks were not, however, weather diaries. They served two, more important, functions. On the one hand they were the officer's official account of the management of his vessel, and could be called upon as legal documents in the event of a court martial or enquiry; a function that they continue to carry out today. On the other hand they were also navigational documents in which the ship's progress was carefully noted and her location estimated. For much of the study period, the most important navigational challenge was the determination of longitude. Although the Harrison chronometer and the method of 'lunar distances' had been fully developed by the close of the eighteenth century, many ships' officers continued to employ the system of 'dead (or deduced) reckoning' when estimating longitude (Hewson, 1983). This reluctance to adopt the new and more reliable methods was a consequence of the cost of a chronometer, and the numerical demands of the method of lunar distances. Dead reckoning, however, was not without its arithmetic challenges, and is described in texts such as Robertson (1786) and, Norie (1889). It is this latter respect that weather observations were so assiduously collected. Wind force and wind direction were needed to provide a measure of the degree to which the vessel's course was offset from its compass bearing; a feature known as 'leeway'. Without these estimates, projected and plotted course could be wildly inaccurate.

Whilst the layout of the logbooks inevitably differed from country to country, the weather information that was collected was confined to the same three categories of wind force, wind direction and weather. Wind force and wind direction were the most important from the point of view of navigation, but notes were also made on the general state of the weather. Thus, entries would appear making reference to rain, snow, fog, thunder, hail or lightning. The sighting of icebergs often excited attention and were usually recorded. For the most part, the terms that were used when describing such events are those that are in common use today. They need no translation, and even the occasional archaic term is usually without ambiguity. For this reason, much of what follows concentrates on the more vexed issue of wind force terms.

Logbooks also contained references to the state of the sea. In the case of Dutch, English and French logbooks such entries were relatively infrequent, and did not conform to any recognisable scale. Spanish officers, on the other hand, paid closer attention to the state of the sea using what appears to have been a standardised set of descriptors. For this reason, a section on sea state terms has also been included.

For the purposes of ease of use, the dictionary is presented in four major sections, each of which represents one of the four languages of the original documents, and each of which is introduced by a general account of the background to the original work as each nationally-based data set provided its own suite of problems and challenges. A concluding summary section provides a multi-lingual overview.

THE DERIVATION OF THE EQUIVALENCE SCALES

The following sections were derived using a variety of methods. Most importantly, a number of contemporary documents and nautical texts exist that shed light on the meanings to be attached to some of the terms. More specific reference is made to these in the introductions to the language-based sections.

Other logbook entries were also of use in respect of defining archaic terms. One of the most valuable of these was the inclusion of the distances covered each day by the vessels (this measure was used with particular, almost daily, frequency in English logbooks). Because there is a well-known relationship between ship speed under sail and wind velocity, which is quasi-linear up to Beaufort force 7 (Harland and Myers, 1984), this allowed the relative strengths of winds described by different terms to be assessed. References to the amount of sail that could safely be carried also clarified the issue, and Beaufort was later to use this criterion to define a number of his wind force terms (Kinsman, 1969). Wheeler's (1995) analysis of an illustrated series of logbooks kept by the eighteenth century mariner Nicholas Pocock was also useful in confirming the definitions of some terms.

Although assistance in interpretation came from several sources, there remained a residual group of terms that defied unambiguous definition. Fortunately such terms were infrequently used, representing less than 2 per cent of the sample of logbook entries that were used in the preparation of this dictionary. These words or descriptions were idiosyncrasies of expression employed occasionally by a few officers, but never consistently. They have, for the purposes of completion, been included within the dictionary but without the benefit of any Beaufort Force equivalent, and in the hope that future editions or later work may provide a resolution to this issue. Also included are those descriptions of wind which, though popular, have no meaning in Beaufort Scale terms ('variable', 'squally' etc.). In order to maintain a measure of consistency with the character of the Beaufort Scale, and not to lengthen the text unnecessarily, the terms listed in the following sections include only the principal adjectival qualifiers ('moderate', 'fresh', 'strong' etc.). Secondary adjectival qualifiers such as 'very', 'slightly' or 'less' (and their equivalents in the French, Dutch and Spanish) have been excluded. Neither is any attempt is made to interpret the vast range of terms peculiar to the management of ships in the age of sail, and the interested reader is referred to the dictionaries listed at the conclusion of this document. Attention is otherwise confined to those terms that relate directly to the description of wind.

The complexities of interpretation that prevailed in respect of wind force terms were not, however, repeated in descriptions of the weather. These, for the most part, consist of expressions, the meanings of which have not changed over the centuries (rain, snow, hail, fog etc.) in any of the languages and, for this reason, they are not included in this dictionary.

KEY TO DICTIONARY ABBREVIATIONS

BF: Beaufort Force

EEIC: English East India Company

IU: infrequently used

NDA: no definition available. This may be because the term refers to wind direction, .e.g. 'fair wind', rather than force, or because of uncertainty or imprecision regarding its point on the Beaufort wind force scale, e.g. 'baffling winds'. Descriptions such as 'variable winds' etc. fall into this same category.

OBT: original Beaufort term, i.e. used in his modified scale proposed in 1807 (English dictionary only)

OED: Oxford English Dictionary

RN: English Royal Navy

VOC: Dutch East India Company (Verenigde Oostindische Compagnie)

In the four language sections that follow, each logbook term is followed by the equivalent Beaufort Force number or NDA. For example, **brisk gale:** BF 6

INTRODUCTION TO ENGLISH TERMS

One of the characteristics of English nautical weather terms is the perceptible evolution of the vocabulary over the study period. In many cases therefore an attempt has been made to indicate not only the Beaufort equivalent force of the term but also to note its origin. The emergence of the Beaufort Scale at this time has been noted above, and the evolving vocabulary that characterises the period can be seen most readily in the gradual adoption before 1790 of the term 'breeze' in its various forms of 'light', 'moderate' etc. The term had been part of the English language since the early seventeenth century, but had been used in only a limited fashion to describe those coastal circulations that are today known as land and sea

breezes. Before 1750 most winds other than 'calms' and 'light airs' had been described as some form of 'gale' varying between the 'strong' and 'hard' down to the 'small', 'soft' and 'feint'. The latter terms are included in this dictionary, but had passed out of use by 1750 for all but the most conservative and long serving of officers. It was these lesser 'gales' that were replaced in the vocabulary by the various forms of 'breeze', light, fresh etc. as appropriate. A full account of late seventeenth wind force terms can be found in Suárez Dominguez (2002).

Specific guidance in understanding archaic English terms was found in contemporary publications. Most important of these is William Falconer's *Universal Dictionary of the Marine,* which ran to several editions in the late eighteenth and early nineteenth century (Falconer, 1780). The *Oxford English Dictionary* (1933) provided historical information on many of the terms. Further guidance was offered by *Horsborough's Sailing Directions* (Horsborough, 1817), the introduction of which is of particular interest.

Whilst the vocabulary changed, becoming generally wider after 1750, there is no evidence to suggest that the meanings of the various terms underwent any significant change, and the dictionary is reliable for the one hundred years beginning 1750 (see Appendix I). It must, however, be noted that a distinction existed between the vocabularies of the officers of the Royal Navy and those of the EEIC. Close examination of many hundred logbooks from both sources confirms that the former used a relatively narrow range of terms that in the years immediately before 1800 closely resembled the Beaufort terms. Beaufort had himself been a naval officer with experience in both services (Courtney, 2002). On the other hand, the EEIC logbooks indicate a much more complex system in which winds were classified not only by strength but also by origin. Thus, for example, distinction is made between 'breezes', 'trades', 'monsoons' and 'gales'. This attention to detail reflects the influence of the Company's first hydrographer – Alexander Dalrymple – and has given rise to a particularly rich vocabulary sub-type.

The following section is based on over 15,000 logbook entries for wind force. Those that are described as IU (infrequently used) represent, in total, less than 0.5 per cent of those entries. There will, nevertheless, be a number

of residual, non-standard descriptions in logbooks not included in this survey. Fortunately it is probable that they represent little more than the idiosyncratic or fanciful employment of terms by individuals, and they enjoyed no wide currency in the officer classes. Plural terms are taken to be synonymous with their singular forms. For example, 'light air' is defined together with 'light airs', 'strong gale' with 'strong gales' etc.

DICTIONARY OF ENGLISH TERMS

baffling airs/light winds/winds: IU, NDA, refers to winds of changeable direction

blows fresh (incl. blowing and blew fresh): IU, but popular before 1700. BF 6

blows hard (incl. blowing and blew hard): IU, but popular before 1700. BF 10

blows strong (incl. blowing and blew strong): IU, but popular before 1700. BF 9

breeze: IU, generic term rarely used without an adjectival qualifier. Derived from Castilian *briza* or north-east wind, introduced into English in C16 (OED). Widespread as a wind force term only after 1750.

brisk gale: BF 6

brisk trade: BF 5

calm (incl. dead calm and flat calm): BF 0

constant breeze/gale/trade/wind: IU, NDA without further qualification such as 'strong', 'fresh'

easy breeze: IU, BF 2

easy gale: IU, but popular before 1700. BF 3

faint breeze, gale: see feint

fair winds: IU, NDA. Refers to direction in relation to the vessel's motion, and is a following wind. It makes no presumption of force.

feint breeze: BF 2

feint gale: BF 3

fine breeze: BF 5

fine gale: BF 5

fine trade: BF 5

fresh breeze: BF 5, OBT

fresh gale: BF 8

fresh monsoons: IU, NDA

fresh trade: BF 6

fresh wind: BF 6

gale: IU, an ancient generic term, rarely used without an adjectival qualifier. Of probable Scandinavian origin (OED). Used before 1770 to describe winds of a very wide range of strengths, including those covered today by various 'breezes' of the Beaufort Scale (see Appendix I).

gentle breeze: BF 3, OBT

gentle gale: BF 3

gentle trade: BF 3

great gales: IU, OBT

hard gale: BF 10

heavy gales: IU, BF 9

hurricane: BF 12, OBT. Introduced into English in the C16 by contact with Spanish navigators who, in turn, adopted the term from the indigenous Carib (West Indian) expression *furacan*.

inclinable to calms: BF 1, almost always used with 'light airs, i.e. 'light airs, inclinable to calm'.

increasing breezes/gales/trade/wind: IU, NDA. The term suggests wind rising from a lower to a higher force.

light airs: BF 1, OBT.

light breeze: BF 2, OBT.

light gale: IU, BF 3. Commonplace before 1700, but rare after 1750.

light monsoons: IU, BF 4

light trade: BF 4

light winds: BF 2

little winds: BF 2

moderate: BF 4. Used abundantly until 1838. Francis Beaufort railed against its seeming ambiguity, but employed it frequently until 1806.

moderate breeze: BF 4, OBT

moderate gale: BF 7, OBT

moderate monsoons: IU, BF 5

moderate trade: BF 5

monsoon: IU, generic term rarely used without an adjectival qualifier. Employed widely by EEIC officers, but rarely by those of the RN. To be found only on those occasions when the vessel was in the Indian Ocean or South China Sea. Derived, through Dutch contacts, from the Arabic *mausim*. Not used in English before C17.

pleasant breeze: BF 4

pleasant gale: BF 5

pleasant monsoon: IU, NDA

pleasant trade: BF 5

pleasant wind: BF 4

small airs: BF 1

small gale: IU but popular before 1750, BF 4

squalls (incl. squally and all derivatives): NDA, squalls appear in association with winds of all forces from 1 upwards, and have no correspondence on the Beaufort Scale. Dalrymple (1789) offers this same interpretation.

steady breeze: BF 5

steady gale: BF 6

steady trade: BF 6

stiff breeze: BF 6, OBT, but changed to strong breeze in the 1838 Beaufort scale

storm (incl. stormy): BF 11, OBT. Also used widely in non-scientific writing. Derived from Old High Gothic *sturm*.

strong breeze: see also stiff breeze, BF 6

strong gale: BF 9, OBT

strong gusts: IU, OBT

strong monsoon: IU, BF 7

strong trade: BF 7

strong wind: BF 8

top-gallant gale: IU, BF 5

tempest: BF 11. Also used widely in non-scientific writings. From the Latin *tempestas*.

trades: IU, generic term rarely used without an adjectival qualifier. Employed widely by EEIC officers, but rarely by those of the RN. To be found only on those occasions when the vessel was in the Trade Winds belts immediately north and south of the Equator. Derived from the expression 'blows trade', which is a wind that blows steadily (it has nothing to do with the business of trade). In the C16 and C17 it was used to describe any such persistent wind, but by 1750 it had assumed (as the logbook evidence confirms) its present-day meaning.

tremendous gales: IU, BF 11

typhoon: IU, BF 12, this term is of uncertain origin. It is often suggested to derive from the Chinese term 'tai fung' (great wind), but may also derived from the Arabic 'tufan', or even the Greek 'tuphon' (whirlwind).

unsettled wind: NDA. The nature of such winds forbids conversion to the Beaufort Scale, see also **variable**.

variable: IU, NDA. Its very nature, and that of its compound uses, denies definition in Beaufort force terms.

violent gales: IU, BF 9

violent storm: IU, BF 11

whole gale: BF 10, OBT

INTRODUCTION TO SPANISH TERMS

One of the greatest difficulties in working with wind and weather terms from Spanish sources is the lack of codes or conventions to govern the use of the many descriptors. The first significant contribution in this field came as late as 1831 from O'Scanlan, whose Maritime Dictionary lamented the absence of any generally agreed scheme until that date. Yet Spanish navigators had been amongst the first to set forth on the high seas in search of trade and empire. A Royal Order issued in 1575 required ships' officers employed in the service of the *Carrera de Indias* (the route from Spain to her American

colonies) to keep a record of each trans-Atlantic journey, paying particular attention to winds, currents and hurricanes. Consequently wind force terms are recorded as far back as this formative period. Prieto and Herrerra (1999) have examined the climatological evidence in some of these records. Whilst every effort was made to gather and record information in the Spanish documents, little attention was given to the question of standardisation of expression or vocabulary. From the mid-eighteenth century a change does begin to take place, and Spanish officers begin to adopt terms not unlike those being used by English mariners at the time. At the close of the century the famous scientist Antonio de Ulloa (1795) published an item in which wind forces were defined with a hitherto unknown degree of rigour, using a system that carries a striking similarity to that being used in England at the same timer. The scheme seems not, however, to have enjoyed the wide popularity of its British counterpart. Such conservatism notwithstanding, by the mid nineteenth century the direct equivalent of the Beaufort Scale had official recognition and appeared in texts such the Spanish translation of Bechet (1863), prepared by M. Lobo, which includes a Spanish version of the wind scale.

Logbooks of Spanish vessels in the service of the government postal system can be found in the Archivo General de Indias (Seville). They cover only the latter half of the eighteenth century, but are homogenous with respect to their routes (one to La Havana, the other to Montevideo), to their officer crews (all of whom were similarly trained) and to the type of vessel that was used. It seems probable that their vocabulary was common to Spanish mariners of the age.

Over 800 wind descriptors were identified at the first stage of the analysis. However, the judicious grouping of terms, for example by standardising spellings and avoidance of multiple adjectival qualifiers, reduced the final count to just 104; a figure only marginally greater than that from the English sources. Of these, the five most frequent account for over 75 per cent of all entries. In common with English logbooks, this suggests that the vocabulary was common to, and understood by, the majority of Spanish

officers despite their tendency often to describe the wind and weather in terms that were frequently lyrical rather than objectively scientific.

The analysis of the equivalence of Spanish terms to the Beaufort scale revealed that a number of items, whilst clearly referring to strong and intense winds, could not confidently be ascribed to a specific point on Beaufort's scale. Such ambiguous items are denoted in the dictionary by BF>8.

INTRODUCTION TO DUTCH TERMS

The most notable feature of the Dutch wind force vocabulary is the remarkable degree to which the terms were based on the maximum amount of sail that a vessel could carry under the prevailing conditions. Indeed, nearly 50 per cent of the expressions make direct reference to specific sails (in English there is only one such expression – topsail gale). Because of the increased stresses on the ship's sails, masts and rigging occasioned by stronger winds, the number and area of sails had to be reduced as wind speeds became greater. If the sails were so removed, the process started with the uppermost and smallest, then progressing to lower and larger sails. Around 1750 sail technology had already improved so far that sails did not need to be taken in completely, but could, by the process of 'reefing'[2], be progressively reduced in area. This technique was refined in the subsequent years, and at the close of the study period in 1850 mainsails could carry as many as four rows of reefs. At the time, sails were described as single, double, triple or close reefed depending upon how many of the rows of reefs

[2] a reef is a line of long canvas tags stitched to the sail that allowed part of it to be hauled in, but leaving all that below the reef exposed to receive the wind.

were taken up. Close reefing would reduce the sail area by most. Further information on reefing and sail management can be found in Harland and Myers (1984).

Until the end of the eighteenth century most of the ocean-going vessels were square-rigged sailing ships, which means that they were equipped with three sails standing above each other. The highest sail was called the "bramzeil" (topgallant sail in English), the middle was the "marszeil" (topsail) and the lower one the "onderzeil" (course or mainsail). Around the turn of the century a sail above the "bramzeil" was added that was called the "bovenbramzeil" (royal sail), leaving the other "bramzeil" as the "onderbramzeil" (topgallant). Later also the "marszeil" was split in the same fashion to give the "bovenmarszeil" and the "ondermarszeil" (upper and lower topsails). The terminology of the wind forces progressed parallel to these developments. Appendix IV provides a complete list of all sail names for ships of this period.

Since the Dutch wind force terminology is so closely linked to the sailing practice, it provides an explicit means of determining the order of the many Dutch wind force terms. This allows for refinements in the Dutch translations to the Beaufort Scale that are not possible in the other languages.

In the Dutch dictionary that follows some individual adverbs and adjectives are also included. This is because they appear very often in the descriptive terminology of the wind forces. As no wind force definition can be applied to them and they were not intended to be used for this purpose, they are distinguished by use of italic script. The frequently used descriptions of the degrees of reefing are similarly identified.

DICTIONARY OF DUTCH TERMS

***afwisselend*:** IU, varying

al de zeilen bij: IU, BF 1, all sails in use

blackstill, bladstil: see **stil**

bovenbramzeilskoelte: BF 2, royal sail breeze (see also later qualified uses of this term)

bovenmarszeilskoelte: BF 5, upper topsail breeze (see also later qualified uses of this term)
bramzeilskoelte: BF 3, topgallant sail breeze (see also later qualified uses of this term)
briesie, briesje: BF 1
buiig, buijig: IU, squally
coeltie, coeltje: see **koelte**
***dicht* (incl. *digt, driedubbel* or *3 gereefde*):** NDA, not a wind force term, but indicates that three reefs on a sail have been taken in, see following items
dicht gereefde marszeilskoelte: BF 9, close reefed topsails
dicht gereefde onderzeilskoelte: IU, BF 10, close reefed mainsails
dood stil, doodstil, doodstilletjes, doodstilte: see **stil**
***doorgaand, doorstaand*:** NDA, constant
***doorkomend*:** NDA, starting, increasing
***dubbel* (incl. *dubbel, dubbeld* or *2 gereefde*):** NDA, not itself a wind force term, but indicates that two reefs on a sail have been taken in (double reefing), see following items
dubbelgereefde bramzeilskoelte: IU, BF 5, double reefed topgallants
dubbelgereefde marszeilskoelte: BF 6, double reefed topsails
***enkelgereefde, gereefde*:** NDA, not itself a wind force term,
but indicates that one reef on a sail has been taken in (single reefing)
enkelgereefde (marszeils)koelte: see **gereefde marszeilskoelte**
***frische* (incl. *frissche, frisse, frissen*):** NDA, fresh
frisse koelte: BF 1
flaauw (incl. flauw, flauwtjes, flouw): BF 1, light, weak
flauwe bovenbramzeilskoelte: IU, BF 2
flauwe bramzeilskoelte: BF 3
flaauwe koelte, flauwe koelte: BF 1
frisse marszeilskoelte: BF 4
***gemeene, gemene*:** NDA, normal or commonplace, see following items
gemene bramzeilskoelte: BF 3
gemene frisse bramzeilskoelte: IU, BF 2
gemene koelte: BF 2

gemene marszeilskoelte: IU, BF 4

gereefde marszeilskoelte: BF 5, single reefed topsails

gereefde onderzeilskoelte: BF 9, single reefed coarses

gestadig: steady

gestadige bovenbramzeilskoelte: IU, BF 2

gestadige bramzeilskoelte: IU, BF 3

gestadige koelte: IU, BF 5

harde wind: IU, BF 7

kleine koelte: IU, BF 1

koelte (incl. koelten, koeltie, koeltje, koeltjes): BF 2, but also used as a general qualifier for other terms where it carries the meaning 'breeze'.

labber (incl. labbere koelte, labberkoelte): BF 2

labber bramzeilskoelte: BF 2

leizeilskoelte, lijzeilskoelte: IU, BF 2, studding sail breeze

lichte bovenbramzeilskoelte: BF 2

lichte bramzeilskoelte: IU, BF 3

lichte koelte: BF 1

luchtje (incl. lugie, lugje, lugtje): see **koelte**

marszeilskoelte: BF 4, topsail breeze

onderzeilskoelte: BF 8

onegale, ongestadig: NDA, unsteady. Usually used as an adjectival qualifier

ongelijke bramzeilskoelte: IU, BF 3

ongestadige bramzeilskoelte: BF 3

ongestadige flauwe koelte: IU, BF 1

ongestadige gereefde marszeilskoelte: BF 5

ongestadige koelte: BF 2

ongestadige marszeilskoelte: BF 4

orcaan, orcaen, orkaan: IU, BF 12. Literally, a hurricane and again derived from the same Carib linguistic source as the English term.

passaat, passaatkoelte, passaatwind: IU, BF 4, Trade Wind. Unlike the English equivalent term this was rarely used, and confined to lighter winds.

rondlopende (or rondgaande) koelte: IU, BF 1, variable breeze

slappe bramzeilskoelte: BF 2

slappe koelte: BF 1

stijve bramzeilskoelte: BF 4

stijve gereefde marszeilskoelte: BF 6

stijve koelte: BF 6

stijve marszeilskoelte: BF 5

stil (incl. still, stille, stilleties, stilletjes, stilte, stiltetjes, stilties): BF 0

storm: IU, BF 10

swaere storm, zware storm: IU, BF 10

topzeilskoelte: IU, BF 4, topsail breeze

variable, variabele: BF 1

variabele koelte: IU, BF 1

zeer zware storm: IU, BF 11

zuchje (incl. zuchtje, zuggie, zugje): see **koelte**

INTRODUCTION TO FRENCH TERMS

A sample of 99 logbooks from the Archives Nationales, Marine, Service Hydrographique, included in the "Marine Subserie 4 JJ 7-26: Journaux de bord" were used in this part of the study. The results suggest that although a wide range of terms was in use during the study period, the vast majority of logbook entries fell into a relatively small number of descriptors. The five most commonly used wind force terms accounted for 62 per cent of all French logbook entries. Much of the proliferation of terms resulted from the frequent use of multiple adjectival qualifiers to the principal descriptor, once these had been removed, leaving only the 'base terms', the underlying vocabulary was more clearly distinguishable.

Contemporary texts provided much helpful guidance in the interpretation of the terms. The *Diccionario Marítimo Español* (O'Scanlan, 1831), although a Spanish item, contains a useful appendix with French – Spanish translations (see previous Spanish section). Also useful was the *Nuevo Diccionario Francés- Español y Español- Francés* (Salva, 1897) and the *Laroussse de la Langue Française*. Alexander Dalrymple's late eighteenth century publication *Practical Navigation* also contains a summary table

showing how English and French terms correspond, and is one of the earliest such attempts at direct translation. The latter is of interest as the table is based not only on contemporary logbooks but also on Dalrymple's correspondence with French mariners. Some of the terms cited by Dalrymple, including *vent peu* and *vent moyenne frais* (see Appendix II) did not, however, appear in the sample of logbooks used in this study. Fortunately, a large number of contemporary French and French-English maritime dictionaries have survived, and provided useful evidence for the meaning of different terms. Those by Bourde (1773), Lescallier (1783), Romme (1804, 1813) and Lecomte (1835) were of particular value. That by Pirrie (1895) although post-dating the study period was also useful. Falconer's *Universal Dictionary of the Marine* (1780) provides French translations of many of its terms, but contains also a valuable appendix of French terms and provides another opportunity for comparing contemporary terms in different languages.

In common with the Spanish terms, the analysis of French expressions has revealed a number of ambiguous expressions at the upper end of the wind force scale. Descriptions were encountered that clearly denote winds of notable strength, but it proved impossible to allocate them with confidence to any single point on the Beaufort scale. Such terms are denoted by BF>8 in the dictionary.

There is evidence, particularly from the many contemporary dictionaries, that the French marine vocabulary was undergoing an evolution in parallel with that taking place in English at that time. In particular, the term brisa (*Eng.* breeze), was not in widespread use in 1750, and was very narrowly defined (restricted to coastal land and sea breezes). Within twenty years, however, the term was being employed widely to cover a range of wind strengths at the lower end of the scale, and was applied irrespective of its suspected cause.

DICTIONARY OF FRENCH TERMS

a peu: IU, BF 5

affraîcheur: IU.

affraichi: BF 6

beacoup moins violent: IU, BF > 8

beacoup molli: IU, BF 1

beau: IU, BF 5

beau frais: BF 5

beau petit frais: BF 4

beaucoup de calme: BF 0

beaucoup de forces: BF > 8

beaucoup de vent: BF 7

belle brise: BF 4

bien petit frais: BF 4

bon frais: BF 5

bon frais an peu violent: BF 5

bon frais fraisant: BF 5

bon gros frais: IU, BF 7

bon petit frais: BF 4

bon vent: IU

bonne brise: BF 5

brise carabinée : BF 6

brise fiable : BF 2

brise folle: NDA, literally, baffling wind, and having no specific foce

brise forte: BF 7

brise fraîche : BF 5

brise ronde : NDA, translates as a 'steady breeze'

calme: BF 0

calme plat: BF 0

calme tout plat: BF 0

considerablement: IU, BF 8

coup de vent: BF 10

en tourmente: BF > 8

extrêmement fort: BF 10

extrêmement violent: BF 11

faible: BF 1

faible brise: BF 1

forcé: BF 8

fort: BF 7

forte: BF 7

fraîcheur: BF 1

fraîchir: BF 6

frais: BF 6

fraisant: IU, NDA

grand frais: BF 7

grand vent: BF 7

grande violence: BF 11

gros: BF 7

gros frais: BF 7

gros vent: BF 9

grosse brise: IU, BF 7

il a calmé: IU, BF 0

impetueux: BF > 8

joli frais: BF 4

joli petit frais: BF 4

jolie brise: BF 4

légère brise: BF 2

maniable : BF 4

mediocre: NDA

molli: IU, BF 2

mou: IU, BF 2

mousson : NDA, translates as the generic term 'monsoon'. It makes no specific reference to force, and its use is confined to vessels in the asiatic tropics.

ouragan: BF 12

petit: NDA

petit vent: IU, BF 5

petit air: BF 3

petit fraîcheur: BF 4

petit frais: IU, BF 4

petit temps: IU, BF 3

petit vent: BF 3

petite brise: BF 3

peu: IU, BF 5

porter les perroquets : BF 5. Contemporary duictionaries define this as a 'top sail gale'. See English section.

presque calme: BF 1

rafale (incl. raffalle): NDA, translates as 'squalls' (see also English section).

rafraîchi: IU, NDA

rafraîchissant: IU, NDA

soufflant impétueux: IU, BF 8

tempête: BF 10

tiphon (incl. tifon) : BF 12, derived from the Chinese term for 'great wind', and restricted to vessels in the asiatic tropics. See also English section.

tombé: IU, BF 0

vent alizé : NDA, translates as 'Trade Wind'. See also English section.

vent forcé : BF 8

vent frais: BF 6

vent moins impéteux : BF 6, contemporary dictionaries define this as a 'stiff gale'. See also English section.

vent mou : BF 2

ventand considerablement: BF > 8

violence: BF 11

violent: BF 11

violent ouragans: BF 12

SEA STATE DESCRIPTORS IN LOGBOOKS

Wind force terms followed a general 'code of practice' in all four national groups of logbooks examined here, and since 1906 the Beaufort Wind force scale has been specifically linked to the state of the sea (see Appendix I). Today marine observers are issued with official 'state of the sea cards' with which to compare and determine the nature of the observed conditions (Meteorological Office, 1983). The pictorial association between the two has, however, a much longer history. With notable prescience, Alexander Dalrymple (1789) used what he described as "...pictures of sea-pieces in my possession, to shew the different terms on the Scale, and teach the navigators, of all countries, the same language in describing winds." (p.36). It is perhaps, therefore, all the more remarkable that, with one exception, the description of sea state followed no Beaufort-like convention, indeed it was infrequently recorded in comparison with wind force. The one exception was that of the Spanish logbooks of the *Carrera de Indias*. Here is found a vocabulary unique in its concision and application. Once again, the over-qualification of 'base terms' and the occasional use of peculiar, non-standard descriptions needed to be addressed but, having done so, the following nine-point scheme emerged with notable clarity (see table below). This tradition continued, and as late as the second half of the nineteenth century when another, not altogether dissimilar, scale for Spanish navigators was proposed in 1881: *muy liana, llana, marejadilla, marejada, mar picada, muy picada, mar gruesa, mar gruesa y gruesísima*. It was just twenty five years later that George Simpson suggested the formal link between the Beaufort wind force and sea state that is still used today. The degree to which the eighteenth century Spanish system anticipated that of the twentieth century is remarkable, and for purposes of comparison the Douglas Sea Scale (the system currently in use, and also of nine points) is included in the following table.

Scale point†	Original Spanish term	English translation	Douglas sea scale
0	calma	calm	calm
1	liana	flat	smooth
2	bella	pleasant	slight
3	marejada	swell	-
4	picada	choppy	moderate
5	muy picada	very choppy	rough
6	gruesa	heavy sea	very rough
7	muy gruesa	very heavy sea	high
8	muy alta	high waves	very high
9	furiosa	stormy	precipitous
-	indeterminante	uncertain	confused

† this number system is used only to illustrate the order of the scale. No numbers were used in the original documents.

English officers, so assiduous in their observations of wind force, are notably reticent on the issue of sea state. Such observations as were made were usually confined to the incidence of swell and the direction from which it was driven. Only rarely was the sea state *sensu stricto* noted, and in many cases weeks or months might pass without any such reference. Dutch and French mariners seem likewise to have paid scant formal regard to the sea state.

SUMMARY OF WIND FORCE TERMS IN BEAUFORT SCALE ORDER

BEAUFORT FORCE 0: calm

ENGLISH	SPANISH	FRENCH	DUTCH
calm, flat calm, dead calm,	calma, calma muerte, calmo, debil, no ha habido, pacifico, sereno, sosegado,	beaucoup de calme, calme, calme plat, calme tout plat, il a calme, tombé	blackstill, bladstil, dood stil, doodstil, doodstilletjes, doodstilte, stil, still, stille, stilleties, stilletjes, stillies, stilte, stiltetjes, stilties

BEAUFORT FORCE 1: light airs

ENGLISH	SPANISH	FRENCH	DUTCH
inclinable to calm, light airs, small airs	aventolinado, blandura, ventolinas	beaucoup molli, faible, faible brise, presque calme, fraîcheur	al de zeilen bij, briesie, briesje, frisse koelte, flaauw, flauw, flauwtjes, flouw, flaauwe koelte, flauwe koelte, kleine koelte, lichte koelte, ongestadige flauwe koelte, rondlopende koelte, variable, variabele koelte

BEAUFORT FORCE 2: light breeze

ENGLISH	SPANISH	FRENCH	DUTCH
easy breezes, feint breeze, light breeze, light winds, little winds	abrisado, brisa, brisado, calmoso, de 6 y 7 millas, escaso, flojito, pardo, poco, suave, vacilante,	brise fiable, légère brise, molli, mou vent mou	bovenbramzeilskoelte, coeltie, coeltje, flauwe bovenbramzeilskoelte, gemene frisse bramzeilskoelte, gemene koelte, gestadige bovenbramzeilskoelte, koelte, koelten, koeltie, koeltje, koeltjes, labber, labbere koelte, labberkoelte, labber bramzeilskoelte, leizeilskoelte, lijzeilskoelte, lichte bovenbramzeilskoelte, luchtje, lugie, lugje, lugtje, ongestadige koelte, slappe koelte, zuchje, zuchtje, zuggie, zugje

BEAUFORT FORCE 3: gentle breeze

ENGLISH	SPANISH	FRENCH	DUTCH
easy gale, feint gale, gentle breeze, gentle gale, gentle trade, light gale	de 8 y 9 millas, endeble, flojo	petit air, petit temps, petit vent, petite brise	bramzeilskoelte, flauwe bramzeilskoelte, gemene bramzeilskoelte, gestadige bramzeilskoelte, lichte bramzeilskoelte, ongelijke bramzeilskoelte, ongestadige bramzeilskoelte

BEAUFORT FORCE 4: moderate breeze

ENGLISH	SPANISH	FRENCH	DUTCH
light monsoon, light trade, moderate, moderate breeze, pleasant breeze, pleasant wind, small gale	abonanzado, abonanzando, abonanzo, apacible, apaciguado, benigno, bonancible, bonanza, moderado	beau petit frais, belle brise, bien petit frais, bon petit frais, joli frais, joli petit frais, jolie brise, petit fraîcheur, petit frais maniable	frisse marszeilskoelte, gemene marszeilskoelte, marszeilskoelte, ongestadige marszeilskoelte, stijve bramzeilskoelte, topzeilskoelte

BEAUFORT FORCE 5: fresh breeze

ENGLISH	SPANISH	FRENCH	DUTCH
brisk trade, fine breeze, fine gale, fine trade, fresh breeze, moderate monsoon, moderate trade, pleasant gale, pleasant trade, steady breeze, top-gallant gale	fresquecito, fresquito,	a peu, beau, beau frais, bon frais, bon frais an peu violent, bon frais fraisant, bonne brise, brise fraîche, petit vent, peu, porter les perroquets	bovenmarszeilskoelte, dubbelgereefde bramzeilskoelte, enkelgereefde (marszeils)koelte, gereefde marszeilskoelte, gestadige koelte, ongestadige gereefde marszeilskoelte, passaat, passaatkoelte, passaatwind, stijve marszeilskoelte

BEAUFORT FORCE 6: strong breeze

ENGLISH	SPANISH	FRENCH	DUTCH
blows fresh, brisk gale, fresh trade, fresh wind, steady gale, steady trade, stiff breeze, strong breeze	de alta vela, de toda vela, de toda vela larga, durito, fresco, frescote, fuertecito, vivito	affraichi, brise carabinée, fraîchir, frais, vent frais, vent moins impéteux	dubbelgereefde marszeilskoelte, stijve gereefde marszeilskoelte, stijve koelte

BEAUFORT FORCE 7: near gale

ENGLISH	SPANISH	FRENCH	DUTCH
moderate gale, strong monsoon, strong trade	altivo, duro, frescachon, frescachonazo, fuerte, intenso, mucho, recio, vivo	beaucoup de vent, bon gros frais, brise fort, fort, forte, grand frais, grand vent, gros, gros frais, grosse brise	harde wind

BEAUFORT FORCE 8: gale

ENGLISH	SPANISH	FRENCH	DUTCH
fresh gale, strong wind	muchisimo, temporal	considerablement, force, soufflant impétueux, vent forcé	onderzeilskoelte

BEAUFORT FORCE 9: strong gale

*refers to those expression that can only be classified as force 9 or greater

ENGLISH	SPANISH	FRENCH	DUTCH
blows strong, heavy gale, strong gale, violent gale	alterados*, amenazante*, atrubonado*, borrascoso*, demasiado*, fuerza*, furia*, furioso*, impetuoso*, inaguantable*, insoportable*, insufrible*, intolerable*, rieguroso*, tempestad*, tempestuoso*, tormenta, tormentoso, turbonada*	beacoup moins violent*, beaucoup de forces*, en tourmente*, gros vent, impétueux*, ventand considerablement*	dicht gereefde marszeilskoelte, gereefde onderzeilskoelte

BEAUFORT FORCE 10: storm

ENGLISH	SPANISH	FRENCH	DUTCH
blows hard, hard gale, whole gale		coup de vent, extrêmement fort, tempête	dicht gereefde onderzeilskoelte, storm, swaere storm, zware storm

BEAUFORT FORCE 11: violent storm

ENGLISH	SPANISH	FRENCH	DUTCH
storm, tremendous gale, violent storm	fortisimo	extremêment violent, grande violence, violent, violence	zeer zware storm

BEAUFORT FORCE 12: hurricane

ENGLISH	SPANISH	FRENCH	DUTCH
hurricane, typhoon	ahuracanado, ferocidad extraordinario, fugadas huracanadas, huracan, huracanado, tormentoso como especie de huracan	ouragan, tifon, violent ouragan	orcaan, orcaen, orkaan

APPENDIX I

THE BEAUFORT WIND FORCE AND WEATHER SCALES

There have been several versions of the Beaufort Scale. Francis Beaufort first proposed his scheme in 1806 when, on 13th January, he entered the following comments and notes in the logbook of the vessel of which he was then Captain, HMS *Woolwich*.[3] This scale employed no new terms and, indeed, was itself not wholly original and is a close copy of the scale proposed by Alexander Dalrymple (hydrographer to the English East India Company) in the late eighteenth century (see Appendix II).

"Hereafter I shall estimate the force of the wind according to the following scale as nothing can convey a more uncertain idea of wind and weather than the old expression of moderate and cloudy &c &c"

0	Calm	7	Gentle steady gale
1	Faint air just not calm	8	Moderate gale
2	Light airs	9	Brisk gale
3	Light breeze	10	Fresh gale
4	Gentle breeze	11	Hard gale
5	Moderate breeze	12	Hard gale with heavy gusts
6	Fresh breezes	13	Storm

Within eighteen months, Beaufort modified his scale and included, for the first time, a set of criteria. In his logbook for 14th September 1807, the following appears:

Scale of Winds

Or key to the wind column in this log

1	Light airs	That which just enables a ship to steer
2	Light breeze	That which will impel a man of war with all sail set by the wind 3 or 4 knots
3	Gentle breeze	That which will impel a man of war with all sail set by the wind 4 or 5 knots
4	Moderate breeze	That which will impel a man of war with all sail set by the wind 5 or 6 knots
5	Fresh breeze	That with which whole topsails, royals, staysails &c may be just carried full and by
6	Stiff breeze	That with which single reefed topsails, gallants, courses, jib and driver would be just carried by the wind, by a wholesome frigate when fairly pressed in chase
7	Moderate gale	That which the same vessel would just set 2nd reefed topsail and jib
8	Fresh gale	That which the same vessel could barely carry 3rd reefed topsails and courses
9	Strong gale	That which she would beat off a lee shore with reefed courses
10	A whole gale	That when she could show no other courses than storm staysails
11	Storm	That which would blow away any sails made in the usual way
12	Hurricane	Hurricane!

Beaufort continued to use this scheme and various development of it in all his logbooks, ruling additional columns into which the wind force number could be entered. The scale was finally adopted in December 1838 by the Admiralty for use in all Royal Navy logbooks, but even that had to be modified as ship design and the introduction of steam power imposed new demands on the scheme. The most recent form, together with the equivalent sea states, is given below, and is that to which the definitions in this volume are related.

[3] This logbook is in the care of the UK Meteorological Office Archives.

Force	term	Description of the state of the sea	Wind speed (knots)	range	Sea state	Wave height (m)
0	Calm	Sea like a mirror	0	<1	Calm	0
1	Light air	Ripples with the appearance of scales are formed, but without foam crests.	2	1-3	Smooth	0.1
2	Light breeze	Small wavelets, still short but more pronounced. Crests have a glassy appearance and do not break.	5	4-6	Smooth	0.2
3	Gentle breeze	Large wavelets. Crests begin to break. Foam of glassy appearance. Scattered white horses.	9	7-10	Slight	0.6
4	Moderate breeze	Small waves, becoming longer, fairly frequent white horses.	13	11-16	Moderate	1
5	Fresh breeze	Moderate waves, taking a more pronounced long form; many white horses are formed. Chance of some spray.	19	17-21	Rough	2
6	Strong breeze	Large waves begin to form; white foam crests are more extensive everywhere. Probably some spray.	24	22-27	Very rough	3
7	Near gale	Sea heaps up and white foam from breaking waves begins to be blown in streaks along the direction of the wind.	30	28-33	High	4
8	Gale	Moderately high waves of greater length; edges of crests begin to break into spindrift. The foam is blown in well-marked streaks along the direction of the wind.	37	34-40	Very high	5.5
9	Strong gale	High waves. Dense streaks of foam along the direction of the wind. Crests of waves begin to topple, tumble and roll over. Spray may affect visibility.	44	41-47	Very high	7
10	Storm	Very high waves with long over-hanging crests. The resulting foam, in great patches, is blown in dense white streaks along the direction of wind. On the whole the surface of the sea takes a white appearance. The 'tumbling' of the sea becomes heavy and shock-like. Visibility is affected	52	48-55	Phenomenal	9
11	Violent storm	Exceptionally high waves (small & medium sized ships might be lost to view for a time behind the waves). The sea is completely covered with long white patches of foam lying along the direction of the wind. Every-where the edges of the wave crests are blown into froth. Visibility is affected.	60	56-63	Phenomenal	11.5
12	Hurricane	The air is filled with foam and spray. Sea completely white with driving spray; visibility very seriously affected	64+			14

APPENDIX II

ALEXANDER DALRYMPLE'S WIND FORCE SCALE

The following table is a direct and unabridged copy from Alexander Dalrymple's *Practical Navigation* of 1789. It includes his own 'wind scale', which is of particular importance as it predates Francis Beaufort's scheme of 1806, and upon which the latter in heavily drawn. Indeed, the two were very much acquainted. Dalrymple acknowledges, in turn, the engineer John Smeaton's scale based on the study of the behaviour of a wind mill in Lincolnshire, eastern England (Smeaton, 1759). Of particular interest is Dalrymple's inclusion of a scale of comparative French terms in use at the time. For a fuller discussion of the origin of Beaufort's Scale and its development from earlier schemes see Wheeler and Wilkinson (in press).

TABLE OF COMPARISON OF WINDS, from Ship's Journals, with Mr. SMEATON'S Scale from Authorpe Mill, the Length of the Sails being 34 feet from the Center; or 68 feet diameter.

My Scale	Mr. Smeaton's Scale	and his description	French Terms
0 Calm	0 Calm	The Motion of the Air, not felt	0 Calme
1 Faint-Air, i.e. not quite calm	Scarce a Breeze	Do.....scarcely felt	1 Petit fraicheur, ou feible
2 Light-Air	Light Breeze not working	The direction of the wind sensible, but insufficient to move the Mill, or under 6 turns a minute	2 Fraicheur
3 Light -Breeze	1 Light working Breeze	Just sufficient to move the Mill 6 turns	3 Petit frais, ou petit brise
4 Gentle-Breeze	2 Breeze	Sufficient, to move the branches of trees, and Mill from 6 to 9 turns	4 Jolie brise?
5 Fresh-Breeze	3 Fresh Breeze	Move the boughs with some noise, Mill 9 to 13 turns	5 Jolie frais?
6 Gentle-Gale			6 Vent peu de frais
7 Moderate-Gale			7 Vent moyenne frais
8 Brisk-Gale	4 Fresh	Wind heard against solid objects and agitation of trees, Mill from 13 to 18	8 Vent frais
9 Fresh-Gale	5 Very fresh	Wind growing noisy, and considerable agitation of trees, Mill 18 to ¾ cloth	9 Bon frais
10 Strong-Gale	6 Hard	Wind troublesome, larger trees bend, ¾ to ¼ cloth	10 Grand frais
11 Hard-Gale	7 Very hard	Wind very loud and troublesome, large trees much agitated, Mill ¼ cloth to close struck	11 Vent fort
12 Storm	8 Storm	Wind exceeding loud, trees very much agitated and some broke, mill 25 to 30 turns without cloth	12 Tempeste

APPENDIX III

TRANSLATIONS OF PRESENT DAY BEAUFORT WIND FORCE TERMS

BF	ENGLISH	ESPAÑOL	FRANÇAIS	DUTCH
0	Calm	Calma	Calme	Stil
1	Light airs	Ventolina	Trés légère brise	Zwakke wind
2	Light breeze	Flojito	Légère brise	Zwakke wind
3	Gentle breeze	Flojo	Petite brise	Matige wind
4	Moderate breeze	Bonancible	Jolie brise	Matige wind
5	Fresh breeze	Fresquito	Bonne brise	Vrij krachtige wind
6	Strong breeze	Fresco	Vent frais	Krachtige wind
7	Near gale	Frescachón	Grand frais	Harde wind
8	Gale	Temporal	Coup de vent	Stormachtig
9	Strong gale	Temporal fuerte	Fort coup de vent	Storm
10	Storm	Temporal duro	Tempête	Zware storm
11	Violent storm	Temporal muy duro	Violent tempête	Zeer zware storm
12	Hurricane	Temporal huracanado	Ouragan	Orkaan

APPENDIX IV

SAIL PLAN AND SAIL NAMES OF A TYPICAL OCEAN-GOING VESSEL OF THE LATE EIGHTEENTH AND EARLY NINETEENTH CENTURIES

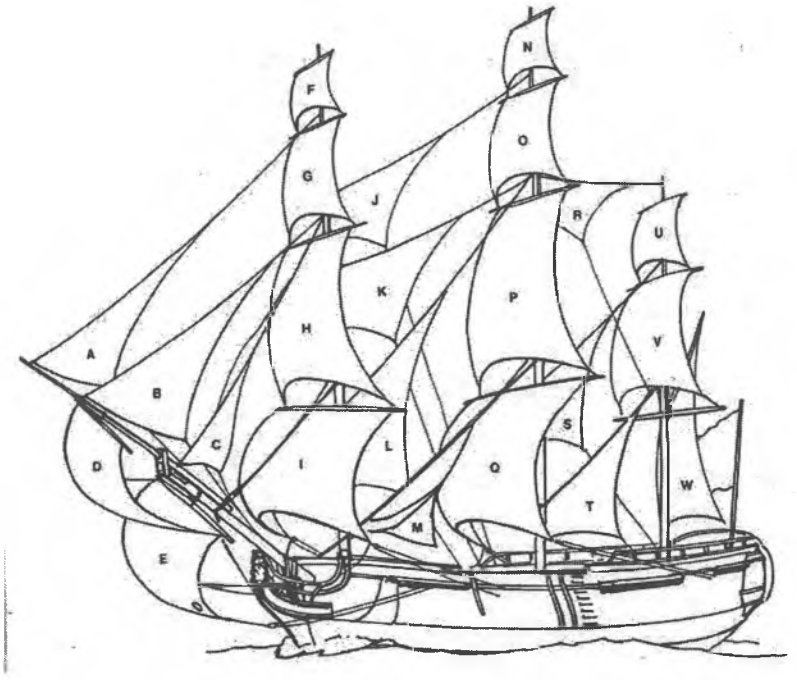

Figure 1. Sail plan of a typical late eighteenth century ship-of-the-line. Most of the logbooks used in the CLIWOC project would have been built to this, or a very similar, design. The key to the sail plan is provided in the following table in which the names of the various sails are given in each of the four languages used in the project.

drawing by Mark Myers RSMA, F/ASMA from Harland and Myers, *Seamanship in the Age of Sail,* (1984). Reproduced by kind permission of the authors.

Subject: Northern Waters Task Force Presentation

In the 1892 landmark case called "Illinois Central", the U.S. Supreme Court said that the government holds wildlife and navigable waterways in trust for the people so that they may fish, have a food supply, and meet other basic needs. This public trust doctrine is the oldest environmental principle of this great nation. Additionally, the U.S. E.P.A. is the arm of the federal government with the trust duty of protection towards Indian interests as its obligation since it began .This trust duty is embedded in federal law and predates statutory law by some 125 years. And this Indian trust doctrine is EPA's foremost obligation. And the governments public trust duty is to preserve the natural resources for all people today and future generations.

My paternal grandfather was a young man in 1892, when the U.S. Supreme Court ruled on this public trust doctrine. And the rule for him passed down throughout generations, was to preserve and protect the natural resources then and for future generations. His duty was to protect and teach the young men of keeping our environment pristine, thereby protecting natures trust asset for generations to come. To protect our land from pollutants, and not to discharge pollutants to the aquatic ecosystems. His knowledge was from traditional litanies of survival in this pristine wilderness rich in wild food supply. And throughout time we have learned that a government that fails to protect its natural resources sentences its people to hard times.

The EPA has charge of our natural trust. As governments are the only enduring institutions with control over human actions that affect natural resources, courts characterize it as the trustee of these resources. We have now learned that with every trust concept, the most important duty is protection, as natural trust lasts in perpetuity. And the amount of natural wealth passed to future generations depends entirely on how well the government trustees defend the trust.

The 3rd obligation of the EPA are the environmental statutes passed in the 1970's, to be used as tools to restore the natural trust. The two statutes are the Clean Air Act, and the Clean Water Act. Even with these governmental statutes, polluted water and degraded aquatic ecosystems threaten the viability of all living things. And million tons of air toxics have been emitted to outdoor air. We all now face an increased likelihood of cancer just by toxins in outdoor air. And the pollution that EPA and the state agencies have control over is ending up

in the traditional food supply of tribal people everywhere. We are in a moment of time where entire food groups are contaminated, where water everywhere is polluted and carries poisons, and global warming is threatening to destroy nearly all of Nature's trust

One hundred years ago, our grandparents, and parents probably never imagined that the destruction of our environments would come in the next generation...my generation. But here we are..experiencing the impoverishment of nature because of the consequences to society from actions taken by this generation of people. And the sad part is that we will not be here 100 years from now, when it will be too late to save what we still have.

Let me share a few thoughts of global warming...but let us hear what an Elder from Napaskiak told us years ago...long before I heard about El Nino, and global warming...."The fish in our rivers and lakes survive in median water temperature between warm and cold".So if the water temperature rises above the median, the fish will die.

Scientific data tells us that the recommended temperature for salmon spawning is 55 degrees Fahrenheit, and warmer temperatures cause diseases for fish and reduce availability of nutrients and oxygen. And based on historical weather data, Alaska's annual temperature has risen some 5 degrees, with winter temperature rising up to 10 degrees. And it is speculated that Arctic region could go up to 18 degrees Fahrenheit warmer by the year 2100. And we may have only 64% of our current snowpack by then.

Since the tributaries of the Kuskokwim and Yukon Rivers are the spawning habitats of all five species of salmon, let us briefly track their migration from spawning, out to the Bering Sea at six months, and their return to their natal streams seven years later to spawn and die. The chinook survives the six plus years in the rich plankton pastures of the Bering Sea. The Colder deep Bering Sea waters create a surfacing effect where the waters rich in nutrients rise to the surface where sunlight produces plankton growth. Every Spring, the melting ice pack leaves in its place this plankton that nourishes salmon, pollock, halibut, king crab, marine mammals, and 80 % of the seabird population.

Finally, those of us living in the wetlands of Western Alaska are seeing the forming of little ponds on the tundra in our villages. This I attribute to the melting of ice crystals below the surface of the tundra. Almost at every joint meeting of our local organizations, we are talking of the need to move to higher ground. In fact, our good Senator Hoffman did get a $50 thousand re-location feasibility study grant, but was vetoed by our short-lived Governor Sarah Palin. And our lakes and rivers are getting shallower in the dryer summer months.

In closing, there has been many scientific notations on causes of climate change, and the one that stands out is the greenhouse gases in the atmosphere caused by the industrial revolution of the twentieth century. Therefore man needs to decrease the amount of heat trapping gases in our atmosphere, as the accumulation of these gases are increasing the protective blanket around the earth. And this is causing the warming of earth's temperature. The leading greenhouse gas is carbon dioxide, and as an industrialized nation, the U.S. accounts for more than 20% of the world's greenhouse gas emissions. We do this by heating our homes, generating electricity, powering our cars, sno-machines, and outboards. And this carbon pollution and other gases we emit today, 2011, will stay in the atmosphere until our grandchildren become adults.

So, we need to change how we produce and consume energy today, as scientists predict even more devastating consequences for the earth.

Only, "WE" hold the solutions to protect our environment, our natural food sources, our health, our economy, our community, our planet, and our very existence on it.

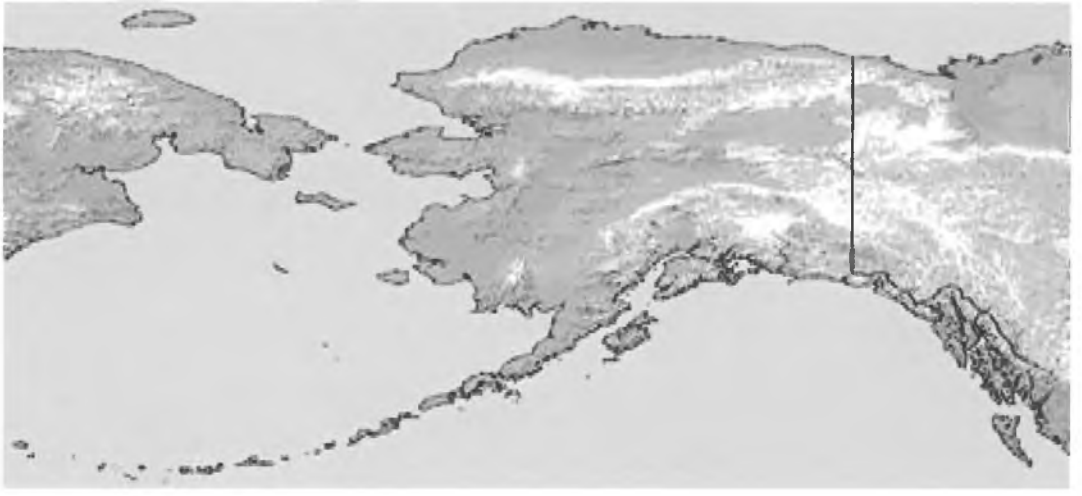
8

Draft Recommendation of the Northern Waters Task Force

Alaska State Legislature
Alaska Northern Waters Task Force
January, 2012 Report

The Northern Waters Task Force would like to thank the many communities and people throughout the state that welcomed us and took the time to help us better understand their communities and the Arctic issues facing them. Additionally, we would like to thank the many presenters who addressed the task force on their areas of expertise. Without hesitation, and often paying their own way, presenters flew thousands of miles to share their information with us. Their guidance was invaluable when making our final recommendations.

Statement from a Wales resident: From here we can see into tomorrow
(Looking from Wales toward Russia)



Introduction:

Does the resource-rich Arctic contain the next Prudhoe Bay?

Diminishing sea ice and worldwide need for natural resources has brought increased interest in the Arctic region. The Arctic's future will be dynamic, bringing both opportunities and challenges through mineral extraction, oil & gas development, fisheries, tourism, marine shipping, cultural protection, and other activities. Besides the eight Arctic nations, other countries are eyeing the resource rich area as a future economic bonanza including the European Union, China, Japan and South Korea. [1] For Alaska, the economic opportunities over the long term could be huge. The wealth of the pipeline could someday be replaced by the wealth of our ocean.

The Arctic is experiencing rapid change on many different fronts: environmental, social, economic, cultural and climatic. The Arctic is warming at twice the rate of the rest of the planet resulting in the loss of perennial sea ice. Recent predictions see an ice-free Arctic summer within 30 to 40 years resulting in new transportation routes.[2] Since record keeping began around 1880, the years spanning 2005-2010 were the warmest yet measured in the Arctic [3]

The Arctic itself covers more than a sixth of the Earth's total land mass not including the vast Arctic Ocean. Eight countries have territory north of the Arctic Circle; Canada, Russia, Norway, Denmark (Greenland), Finland, Sweden, Iceland, and the United States. By virtue of Alaska, the United States is an Arctic country. Five of the Arctic countries are on the Arctic coast. Seven of the eight Arctic countries have indigenous populations with more than 30 different groups inhabiting the region. The indigenous inhabitants have a unique and vast knowledge of the areas they have lived in for thousands of years and are dependent on a healthy Arctic ecosystem to meet their subsistence needs and to sustain their cultural heritage. Moreover, the Beaufort and Chukchi Seas are among the most diverse ecosystems in the world. One-tenth of the world's polar bears, one hundred known fish species, millions of shorebirds, seabirds, and waterfowl, and numerous unique marine mammals call these oceans home. Many of these species are found nowhere else in the world.

Many decisions about the Arctic's future are rapidly moving ahead seemingly without much input from Alaskans. The recent and rapid changes in the Arctic are presenting local, state, federal, and international communities with serious new challenges and require a review of fundamental policies in the areas of habitat management, resource development, marine navigation, economic development and national security. Numerous international, federal and state Arctic initiatives are planned for the near future, and a joint federal-state commission on Northern Waters issues is being considered. Immediate attention from state and federal leaders is crucial to maintain America's and Alaska's interests in the region. Decisions on these Arctic related issues could significantly impact Alaskans and indigenous populations. For these reasons, the Alaska State Legislature passed House Concurrent Resolution 22

[1] China and South Korea have increased their research in the area, are constructing several ice breakers and established a permanent research station at Svalbard.

[2] Snow, Water Ice and Permafrost in the Arctic, Executive Summary 2011. This report focuses on the impacts of a changing climate on snow, ice, and frost conditions in the Arctic over the last ten years. The work is directed by the Arctic Council and carried out by 200 of the world's leading Arctic researchers.

[3] Id.

which created the Northern Waters Task Force (NWTF). The task force set out to examine the changes in the Arctic and to speak with people in the local communities about the changes they were seeing and how they would like to participate in the many decisions being made. To carry out its mission, the task force has held hearings and taken public testimony in impacted communities, listened to many experts from a broad swath of organizations, and toured first-hand impacted areas and potential future infrastructure sites.

As Alaskans and Americans we need to refocus our attention on what needs to be done in the Arctic and better prepare for the changes and challenges ahead. This report reflects our deliberations and recommendations on Arctic issues affecting Alaska. The recommendations are in the following six areas:

- ***Arctic Governance***
- ***Arctic Planning & Infrastructure Investment***
- ***Oil & Gas Development***
- ***Arctic Fisheries***
- ***Marine Transportation***
- ***Arctic Research***

DRAFT

MEMBERSHIP AND DUITES OF THE TASK FORCE:

The Alaska State Legislature created the Alaska Northern Waters Task Force (ANWTF) in 2010 to assess development of state and federal northern waters. The Alaska Northern Waters Task Force is comprised of legislators, leaders from Arctic communities, and representatives of key federal and state agencies. Members of the task force are as follows: Representative Reggie Joule, Chair; Senator Bert Stedman, Vice-Chair; Representative Bob Herron; Senator Lyman Hoffman; Dept. of Environmental Conservation Commissioner Larry Hartig; North Slope Borough Mayor Edward Itta; Unalaska City Manager Chris Hladick; Nome Mayor Denise Michels; NANA Corp. Vice-President Chuck Green; and Alaska Marine Conservation Council Chair Dave Kubiak. Alternate members of the task force include Senator Donald Olson; Representative Bryce Edgmon; Richard Glenn from Arctic Slope Regional Corporation and Cora Campbell, Commissioner of the Department of Fish & Game. The United States Coast Guard served as the federal liaison and was represented by Rear Admiral Christopher Colvin until May 19, 2011. Upon Rear Admiral Colvin's departure, Rear Admiral Thomas Ostebo served as the federal liaison for the reminder of the term.

The duties of the task force are as follows:

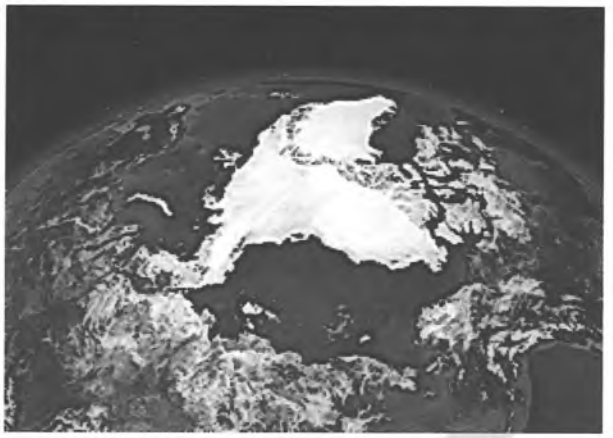
(1) Assess and facilitate creation of a state and federal commission responsible for overseeing the development of state and federal northern ocean waters;

(2) Facilitate regional coordination, cooperation, and outreach regarding the creation of the commission to keep local stakeholders informed and to incorporate their input into the process;

(3) Identify and coordinate efforts of mutual concern for federal, state, and local agencies, as well as international interests in the creation of the commission; and

(4) Conduct hearings in the Arctic & Sub-Arctic regions of Alaska to fulfill its purpose.

The task force must provide final recommendations to the Legislature by January 30, 2012. The full text of House Concurrent Resolution 22 which formed the Northern Waters Task Force can be found at attachment B.



(NASA image from 2007shows Arctic summer sea ice. Reuters)

Hearings Schedule:

The task force held meetings around the state as follows:

- Anchorage October 1, 2010
- Barrow December 2 and 3rd in conjunction with PNWER and the Arctic Caucus
- Juneau March 14th, 2011
- Kotzebue July 6-7th
- Nome and Wales July 8-9th
- Unalaska August 24th
- Bethel October 10th
- Anchorage October 11th
- Anchorage December
- Anchorage hearing in conjunction with Alaska Federation of Natives, public testimony only October 19th

Many members of the task force also participated in the Arctic Imperative in Girdwood on June 19-21st; Yellowknife Arctic Caucus August 17-19th in the Northwest Territories, Canada; and the Norway Policy Tour, August 27th-Septemebr 4th in Oslo.

(The agendas for each of the meetings can be found at Attachment C)

DRAFT

ARCTIC GOVERNANCE:

Introduction:

A new generation of economic development is upon us. Development of the resource rich Arctic, while maintaining sustainable communities and preserving the unique Arctic environment, will require unprecedented cooperation between Arctic nations. This level of cooperation will require a paradigm shift in how Arctic nations think about their territories, land and water boundaries. Migrating fish stocks, oil spills, and ship wrecks will not respect territorial boundaries. Each Arctic nation needs to recognize that how they develop their resources can impact not only themselves but their neighbors in a very substantial way. Proactively working together the Arctic Nations have an unheard of opportunity to create an Arctic with self-sustaining growth and development while respecting the Arctic's fragile environment and unique cultures of its inhabitants.

International and Federal Involvement:

The NWTF Recommends that the Alaska State Legislature and the State of Alaska Should Urge the United States to ratify the United Nations Convention on the Law of the Sea:

The NWTF strongly encourages the United States to ratify the Laws of the Sea Convention. International cooperation in the Arctic must be strengthened with the force of international law. Public testimony and comments from international representatives indicated that there is a general consensus that the legal framework is already in place to resolve Arctic disputes. One of the mechanisms to resolve disputes is the Law of the Sea Convention. For the process to work all members need to ratify the Convention yet the United States has so far failed to do so. The United States is the only major maritime power that is not a party to the Convention. 161 nations, and the European Union, have joined the Law of the Sea Convention. Ratification of the Law of the Sea Treaty by the United States is vital for our country to legitimize its Extended Continental Shelf claims. The Law of the Sea Convention provides a mechanism for the United States to perfect rights to resources (oil and mining) over one of the world's largest continental shelves. Under the convention, nations can submit a claim to submerged lands if they demonstrate that their continental margin extends beyond the 200-mile limit. In this way nations can claim additional submerged lands and gain access to additional oil and gas reserves. This benefits our country's economic and national security interests. Ratifying the Laws of the Sea will secure rights to ocean and seabed resources; ensure open sea lanes for maritime commerce; and promote access to lay submarine cables and pipelines. The U.S military, national security and business interests support ratifying the convention. By failing to act the United States misses an opportunity to help shape future ocean policies, loses the opportunity to improve their strategic position in the Arctic, and fails to take advantage of the economic opportunities afforded under the convention. The United States should ratify the Law of the Sea as quickly as possible.

The NWTF Supports the Development of a comprehensive United States Arctic strategy:

Develop a comprehensive Untied States Arctic strategy, as many other Arctic countries have

done, including an investment plan to fund the initiatives identified as priorities.

The federal government recently tasked the U.S. Arctic Research Commission and the Navy to co-lead an interagency effort to prepare a strategic action plan for the "Changing Conditions in the Arctic." The State of Alaska and local communities should take an active role in the planning process, and the Commission should conduct thorough outreach to share information and gain insight from Alaskans.

The NWTF Recommends that the State Support and Encourage Greater International Cooperation, Collaboration and Leadership through the Arctic Council and Inuit Circumpolar Council-Alaska:

There is a need for an on-going international Arctic community that proactively works on Arctic issues. This group should consist of a broad sector of individuals and provide for all voices to be heard. The ongoing cooperation between the United States, Canada and other Arctic nations in research, seafloor mapping, vessel tracking and other issues is encouraging but more is needed. The Arctic international community needs to cooperatively work toward formal agreements in the areas of shipping, fishing, environmental protection, and resource development.

The Arctic Council is an intergovernmental and multinational group formed in 1996 that has begun to address this need. Its members include the governments of Canada, Denmark (including the Faroe Islands and Greenland), Finland, Iceland, the Russian Federation, Norway, Sweden, and the United States of America. The permanent participants of the Arctic Council are as follows: Aleut International Association (AIA), Arctic Athabaskan Council (AAC), Gwich'in Council International (GCI), Inuit Circumpolar Council (ICC), Russian Association of Indigenous Peoples of the North (RAIPON), and the Saami Council. The Council's work is supported by six active working groups that monitor the Arctic, conduct research, and prepare scientific reports with recommendations for the council and other international bodies. Sweden currently chairs the Arctic Council until 2013 when Canada will assume the chairmanship.

Recently the Arctic Council[4] helped formalize a Search and Rescue agreement that details emergency responses in Arctic regions. In May 2011, the Arctic Council set up a task force to begin developing an agreement for preventing and managing potential oil spills in the Arctic. These agreements will hopefully serve as blueprints for future agreements. The Arctic Council could possibly serve as the starting point of a broader international group that works on Arctic issues and other international cooperative agreements.

The Arctic Council has been on the forefront of the changing Arctic encouraging Arctic nations to recognize issues and collaboratively working with others to solve them, most notably with

[4] The Arctic Council is an intergovernmental and multinational group formed in 1996. Its members include the governments of Canada, Denmark (including the Faroe Islands and Greenland), Finland, Iceland, the Russian Federation, Norway, Sweden, and the United States of America. The permanent participants of the Arctic Council are as follows: Aleut International Association (AIA), Arctic Athabaskan Council (AAC), Gwich'in Council International (GCI), Inuit Circumpolar Council (ICC), Russian Association of Indigenous Peoples of the North (RAIPON), and the Saami Council. The Council's work is supported by six active working groups. Sweden currently chairs the Arctic Council until 2013 then Canada will assume the chairmanship.

Arctic indigenous people's organizations. Their work has been beneficial to all Arctic nations and is the only high-level forum where the Arctic indigenous peoples are actively involved as participants. Currently, the Arctic Council's work is limited to environmental protection and sustainable development. The United States, other Arctic nations, and the Arctic Council should review whether the mandate of the Arctic Council should be broadened and whether it should be transformed into a more formal international organization. The Arctic Council should consider adding additional participants or increasing the number of observer participants to the existing council.

The Task Force recommends the state support the efforts of the Inuit Circumpolar Council-Alaska.[5] As part of any Arctic governance structure, indigenous populations and the preservation and enhancement of their unique culture, history, and languages must be a priority. There is much to be gained from indigenous knowledge and understanding of the Arctic region. Every Arctic country that has adopted an Arctic strategy has made preservation of the indigenous populations a priority. ICC-Alaska provides a forum for Alaskan's indigenous populations needs to be represented. ICC should be recognized by any international group that works on Arctic issues and the State of Alaska should support ICC- Alaska in their efforts.

The NWTF recommends that the State of Alaska and Alaska's Congressional Delegation Consider Restructuring the Denali Commission

Restructure the Denali Commission as a joint federal/state body that focuses on Arctic issues and actively seeks funding for Arctic matters or expand the mission of the Denali Commission to include an Arctic component.

State & Local Involvement:

The NWTF Recommends that the State of Alaska Develop a comprehensive Alaskan Arctic Strategy:

Develop a comprehensive Alaska Arctic strategy, as many other Arctic countries have done, including an investment plan to fund the initiatives identified.

The NWTF recommends that the Alaska State Legislature Establish a Special Committee, an Oceans Commission, or continue the Northern Waters Task Force:

The Alaska State Legislature should either establish a second Northern Waters Task Force to monitor the Arctic or establish within the legislature a special committee on the Northern Waters or create an Oceans Commission through legislation. By continuing to monitor and participate in forums about the Arctic the Alaska State Legislature will be better able to make decisions that are in the state's best interest.

---

[5] Founded in 1977 by the late Eben Hopson of Barrow, Alaska, the Inuit Circumpolar Council (ICC) has flourished and grown into a major international non-government organization representing approximately 150,000 Inuit of Alaska, Canada, Greenland, and Chukotka (Russia). The organization holds Consultative Status II at the United Nations.

The NWTF recommends that the Alaska State Legislature remain engaged with the Pacific North West Economic Region (PNWER's) Arctic Caucus:

Recently, PNWER formed an Arctic Caucus. PNWER is a public-private partnership and is a forum for collaborative bi-national planning. PNWER's membership includes the states of Alaska, Idaho, Montana, Oregon, Washington, and the Canadian provinces of Alberta, British Columbia, Saskatchewan, and the Yukon and Northwest Territories. PNWER encourages global competiveness while striving to maintain the environment. The Arctic Caucus is focusing on how the PNWER partners can work together on Arctic issues to further everyone's best interests and have already held several meetings. The Alaska State Legislature should continue to participate in the Arctic caucus and provide the needed funding to advance the joint objectives of the caucus and send Alaska representatives to the meetings.

The NWTF Recommends that the State of Alaska Establish a Regional Advisory Council or that the three Arctic Areas Form an Arctic Working Group:

The North Slope Borough, the Northwest Arctic Borough, the Bering Straits Region, and local tribes may want to consider forming an Arctic working group or an Arctic Citizens Council to formulate a joint agreement regarding their vision of the Arctic's future to strengthen the voice of the Arctic communities. (or maybe just a regional advisory council with a broader mix of people like the Prince William Sound or Cook Inlet?) From 2013 to 2017, the Arctic Council will be chaired by Canada and then the United States providing any organized group a unique opportunity to advance their objectives. The working group could additionally influence Arctic policy by having their members participate on state and federal boards and commissions that would further advance joint policies. A coalition of this magnitude could carry great weight in influencing policy and decision making at the state, federal, and international level and provide a clear voice for local residents.

The NWTF Recommends that the State of Alaska Re-Establish a Coastal Zone Management Program:

OIL & GAS DEVELOPMENT and RESEACRH:

Introduction:

A warming Arctic means new opportunities and challenges for oil and gas development and research. A 2008 US geological survey estimates that 13% of the earth's undiscovered oil reserves and 30% of the undiscovered gas reserves are in the Arctic.[6] To put that into perspective it is the equivalent of adding two Saudi Arabia's to the world's global reserves. The majority of the oil is predicted to be offshore. This equates to the following:

- 90 billion barrels of oil
- 1,700 trillion cubic feet of natural gas
- 44 billion barrels of natural gas liquids.

On top of that is an additional 240 billion barrels, or about 10% of the world's known petroleum reserves, that is already discovered. [7] The Chukchi and Beaufort Sea Areas off of Alaska's north coast rank behind the Gulf of Mexico for domestic resources. [8] However, there are substantial challenges and risks associated with developing in the Arctic. The Chukchi and Beaufort Seas are covered with ice for eight to nine months a year. Remote locations, high winds, reduced visibility from fog and darkness, freezing temperatures, sudden storms, and changing sea ice cover all limit exploration, drilling operations, oil spill response capability, and scientific research.

Just as we are looking at developing our resources so are other Arctic nations. With increased interest in developing offshore resources in the Arctic almost all Arctic nations have begun mapping the Arctic ocean floor beyond the 200 mile EEZ limit. Under UNCLOS, nations can submit a claim to submerged lands if they demonstrate that their continental margin extends beyond the 200-mile limit. In this way nations can claim additional submerged lands and gain access to additional oil and gas reserves. As previously stated, the NWTF cannot stress enough the importance of the United States government becoming a signatory to UNCLOS. By not being a signatory to UNCLOS the United States is losing out on the opportunity to access additional oil and gas reserves.

Although we have good data on some specific species that inhabit the Arctic we have little data on how the ecosystem functions as whole. Existing research has not been synthesized in a way that can guide informed decision making about drilling. In many areas, basic ecosystem data is lacking. Moreover, there is uncertainty about the combined impacts on the Arctic ecosystem of a changing climate and increased human activity. We do know that the Beaufort and Chukchi Seas are among the most diverse in the world. Many of the species found in the Arctic region

---

[6] See USGS Cricum-Arctic Resource Appraisal website at http://energy.usgs.gov/arctic/.

[7] USGS Fact Sheet 2008-3049:Circum-Arctic Resource Appraisal: Estimates of Undiscovered Oil and Gas North of the Arctic Circle; at http://pubs.usgs.gov/fs/2008/3049/.

[8] Department of the Interior, "Estimated Undiscovered, Economically Recoverable Resources," http://www.doi.gov/whatwedo/energy/ocs/upload/UERR-map-2012-2017-80-NoYear-Note.pdf.

are found nowhere else. The Inupiat Eskimo who inhabit the area are dependent on a healthy Arctic ecosystem to meet their subsistence needs and to sustain their cultural heritage. These facts provide a back drop for the type of science that is needed in order to drill responsibly in the Arctic.

The NWTF Recommends that the State of Alaska and the United States Need to Establish A Comprehensive Research and Monitoring Plan:

To protect the Arctic ecosystem, a comprehensive research and monitoring plan needs to be in place before expanding drilling in U.S. Arctic waters. To this end the NWTF makes the following recommendations:

- Initiate an Arctic research collaboration effort and implementation plan that builds on the recommendations of the USGS Gap Analysis.

- Governments at the international, federal, state, and local level, as well as, industry, public agencies, and universities, need to work together to synthesize the research work that has already been completed. The parties then need to partner to complete a comprehensive science plan, that includes through and complete research and data collection on the Arctic marine environment. Using the information from the completed science gaps analysis by the USGS, the partners should work to complete the research that is needed to have a complete picture of the Arctic marine ecosystem. A process for identifying important ecological and subsistence areas to protect them from drilling should be part of the comprehensive science plan. Traditional knowledge should be used as part of the process to better understand the Arctic environment.

- After a comprehensive science plan has been conducted and the information synthesized, a long-term comprehensive monitoring program needs to be established to understand the impacts of drilling and oil spills on walrus, ice seals, bowhead whales, fish, birds, and other marine mammals that inhabit the Beaufort and Chukchi Seas.

- Encourage increased funding and support for international and other Arctic scientific research collaboration and greater transparency in funding of U.S. Arctic Research. The Arctic Research & Policy Act, as well as the legislation establishing the North Pacific Research Board and North Slope Science Initiative, establishes a process for much greater federal-state cooperation and budgeting than is now in place.

The research outlined above should assist in the decision making progress regarding oil and gas leasing, exploration and development, measuring and monitoring impacts from oil and gas development on the ecosystem, and damage assessment if an oil spill occurs.

The NWTF Recommends that the State of Alaska and the United States Need to Invest in Arctic Specific Oil Spill Response Capabilities and create a University Research Center:

In the event of an oil spill, the Arctic presents unique challenges faced nowhere else. Oil spill risk assessment and spill prevention and response technologies must account for Arctic conditions. Industry in cooperation with federal and state government must work together to reestablish leadership in Arctic and sub-Arctic oil spill research and development technology. A comprehensive research program to address oil spill containment and response issues in the Arctic should be established. As part of the research program, risk assessments need to be done which account for the types of spills that might occur and the resulting impacts. Better research and methods for tracking spilled oil and how it would react to Arctic conditions, particularly in ice needs to be conducted. Currently, the University of Alaska Fairbanks is proposing to establish a research center focused on oil spill prevention and preparedness in the Arctic. Experts across the University are currently engaged in numerous research projects related to Arctic oil spills and the center would help consolidate the effort. This center will allow UAF to partner with state and federal agencies, industry, and other academic institutions on their work.

The NWTF Recommends that the State of Alaska and the United States Need to Encourage the Adoption of an International Agreement for Oil and Gas:

Whether or not the United States advances offshore Arctic oil and gas exploration, other nations are proceeding with hydrocarbon development and oil spills are no respecters of international boundaries. The NWTF recommends that international standards related to Arctic oil and gas activities be established among all Arctic nations. Guidelines should include requirements for the design, construction, transportation, installation, operations, and removal of offshore structures. Both the Arctic Council and the International Standards Organizations have begun work in this direction and the NWTF supports these efforts and encourages the completion of the agreements before more development occurs. Additionally, an international agreement on oil spill response may be beneficial to all Arctic nations as well. Considering the level of risk these standards should demonstrate a level of performance never achieved before by the oil and gas industry.

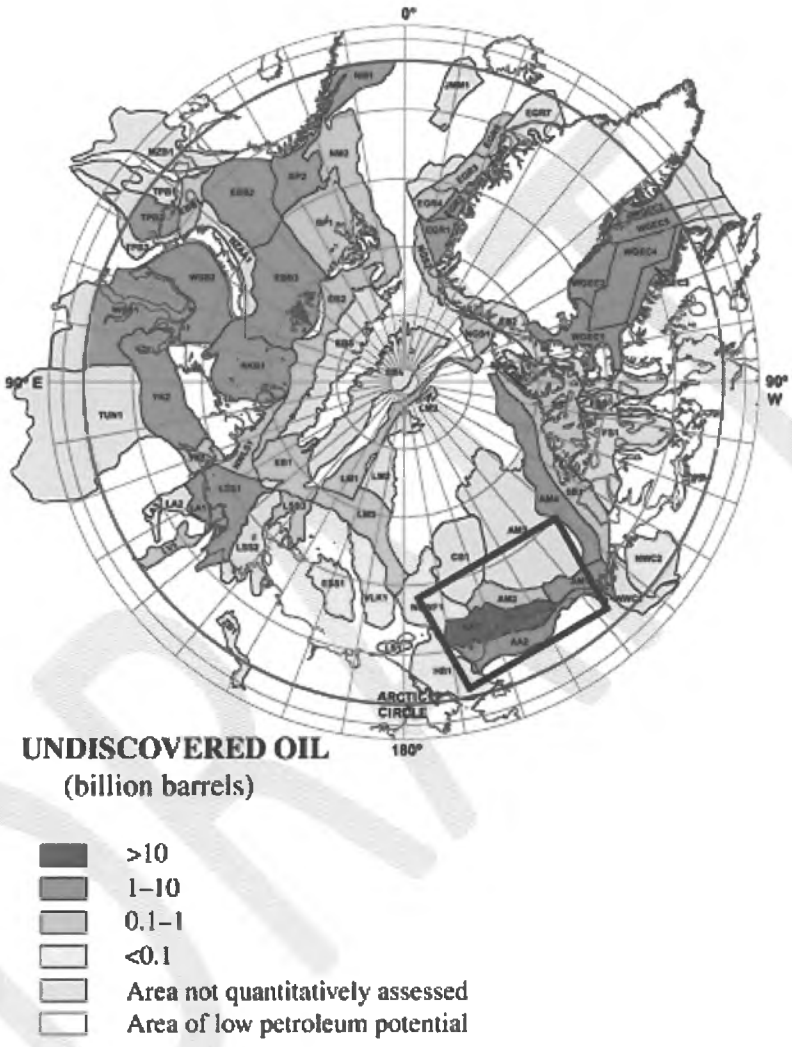
The NWTF Recommends that the State of Alaska Needs to Encourage Congress to Raise Liability Limits and to Fund Oil Spill in Ice Research:

The state and the legislature should encourage Congress to raise the liability limit for oil spills and increase the per incident pay out from the Oil Spill Liability Trust Fund. The state and the legislature should also encourage Congress to fund oil spill in ice research by appropriating the OPA 90 resources as originally intended.

The NWTF Recommends Increased Communication and Input from Alaskans:

Alaskans must have a seat at the table when Arctic policy and OCS development decisions are being made. The Task Force believes that successful communication, information sharing, and local input can only enhance the economic development opportunities of the Northern region.

Both the state and federal governments need to increase the lines of communications with Alaskans and the indigenous people. It was clear during the public hearing process that across the board Alaskans did not feel that they were being fairly represented and heard in the decision making process.



Assessment units of the Circum-Arctic Oil and Gas Assessment, color-coded according to the mean estimated undiscovered, technically recoverable oil resources. The black rectangle outlines the approximate location of the Alaska North Slope and Beaufort and Chukchi Seas OCS areas. Modified from Gautier and others (2009) by the U.S. Geological Services.

Marine Transportation:

Introduction:

Over the next ten to twenty years, the loss of perennial sea ice is expected to open Arctic waters, for at least part of the year, to new shipping routes. Maritime powers have been searching for a shorter route from the Atlantic to Asia for centuries. The melting Arctic raises the possibility of two shorter sea routes described below:

- The Northern Sea Route which runs along Russia's northern border from Murmansk to Providenya and could be used for trade between northeast Asia and northern Europe.

- The Northwest Passage which runs through the Canadian Arctic Islands and would could be used for trade between northeast Asia and North America.

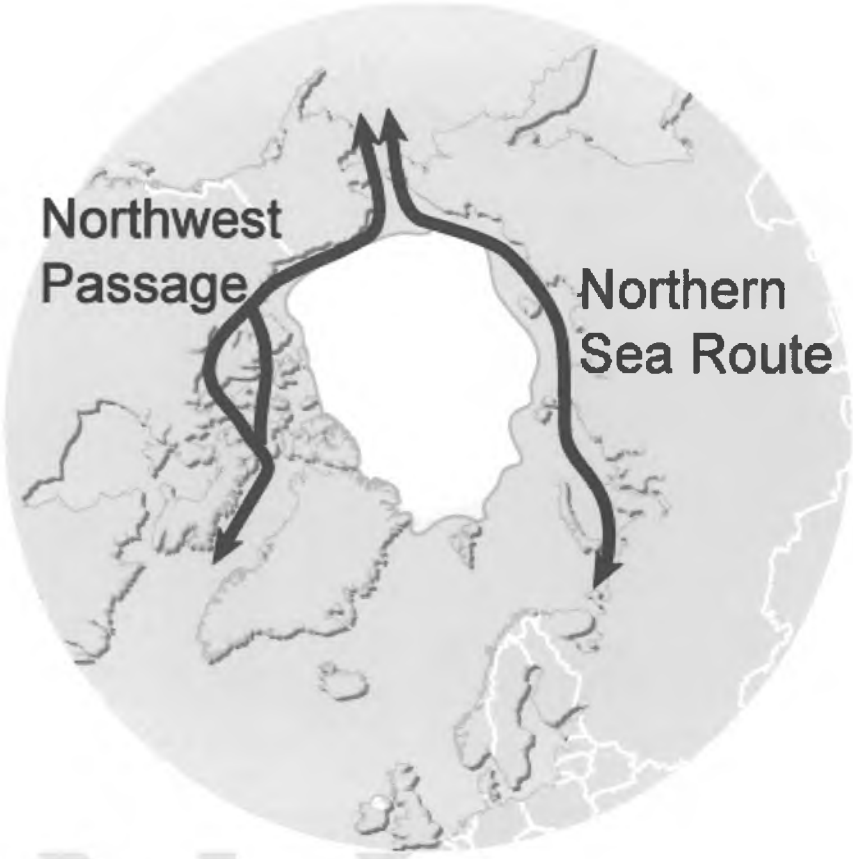
The economic benefits of these new routes could be significant. It has been estimated that ships sailing between East Asia and Western Europe could save more than 40% in transportation time and fuel costs by navigating the northern sea lanes north of Siberia rather than through the Suez Canal. Currently, most of the Arctic marine traffic is destinational delivering goods and supplies to the area or transporting minerals out. In 2006, it was estimated that some 6,000 vessels operated in the Arctic. Tourism as an economic engine is expanding rapidly in the region. In 2004, an estimated 1.2 million passengers visited the region but by 2007 the number of visitors had doubled.[9] With increased shipping come increased risks in vessel groundings, spills, collisions, pollutants, noise disturbances, and invasive species. With this information in mind the NWTF makes the following recommendations:

The NWTF Recommends that the State of Alaska Conduct A Shipping Risk Assessment for the Bering Straits:

The NWTF recommends that the State of Alaska conduct a shipping risk assessment of the Bering Straits by providing funding to the Department of Environmental Conservation to carry it out. The state should support efforts of the USCG Port Access Routing Study with a bilateral risk assessment of the increased shipping through the Bering Straits and options for international assets to respond to the risk (US assets staged or stored at Nome or Russian asset

[9] Arctic Council, 2009. **Arctic Marine Shipping Assessment 2009 Report**

staged or stored at Provdinya). This risk assessment could build on the findings of the Aleutian Island Risk Assessment and future findings of the Cook Inlet Risk Assessment.



Source: Hugo Ahlenius, UNEP/GRID-Arendol

The NWTF Recommends that the United States Works with the International Community to Finalize the Polar Code:

Maritime shipping is regulated through international treaties that establish standards for the safety and security of maritime operations. These standards are agreed upon through the International Maritime Organization (IMO), an agency of the United Nations.

Currently, Arctic ships are governed by the same requirements as any other open water ships. The IMO needs to finalize the Polar Code to supplement the international maritime and environmental conventions which already apply in the Arctic to support safe shipping and pollution prevention in the region. The Polar Code can provide for additional requirements on rescue equipment, firefighting, ice navigation, navigation in uninhabited areas, and consider requirements for Arctic ship construction, design, equipment, crew training and operations. The Polar Code is currently being drafted and the rules are expected to be in force by 2013-2014. The United States and Alaska should be actively involved in these discussions with the IMO to ensure that Alaska's unique geography and needs are met.

The IMO should consider measures or regulatory frameworks that will provide safety

mechanisms for the regions of the central Arctic ocean that are beyond coastal state jurisdiction.

The IMO should consider measures that strengthen passenger safety in Arctic taking into consideration the challenges of rescuing people in the region, including measures such as requiring voyages to be timed in such a way that at least one other vessel is in the area at all times.

Charts and other aids to navigation:

For safe shipping existing nautical charts will need to be updated. Additional navigation aids may be needed as well eg; buoys markers, ice atlases and charts. An assessment of navigational needs should be undertaken to identify priority actions and target locations most likely to present hazards in an effort to reduce the likelihood of accidents. Increased vessel monitoring and reporting may be needed as well for better enforcement in identified areas to be avoided and other traffic risk mitigation measures.

Charge (and support) the University of Alaska Fairbanks Scenarios Network for Alaska and Arctic Planning (SNAAP - http://www.snap.uaf.edu/) to develop specific and applicable data-driven models and scenarios that influence and inform future policy development, state investment, asset allocation, resource development, and community planning. SNAAP should be charged with developing both terrestrial and marine-focused scenarios. Marine scenarios should include ice dynamics and predictions, port development and access, marine mammal migration patterns, and the like. Terrestrial models should include predictions of landscape changes and the implications of such changes (melting permafrost, shifting and intensity of fire regimes, etc.) on the state's roads, airports, coastal ports, pipelines, and rural communities. Such models would inform future infrastructure development and management.

The NWTF Recommends that the Alaska State Legislature and the State of Alaska Continue to Support the Marine Exchange of Alaska:

Continue to support the Marine Exchange of Alaska, with expansion across the North Slope waters to Tuktoyaktuk, NWT, CA under a state-federal-international (US/Canada)-industry partnership. The idea of expansion into Canada was acknowledged as a worthwhile effort and endorsed as a project for the Arctic Caucus of PNWER.

The NWTF Recommends that the Alaska State legislature and the State of Alaska Continue to Support the AVTEC Maritime Training Center

Provide support to the AVTEC Maritime Training Center for improvements to the multi-pilot house marine simulator that will include training for ice navigation (both visual presentation and ice pressures on ship operations) . Support the development and approval of an "Ice Navigator" curriculum with the USCG that implements the recommendations of the Arctic Marine Shipping Assessment and is consistent with the future requirements of the IMO "Polar Code". AVTEC's Maritime Training Center is upgrading the multiple pilot house marine simulator to include ice operations. Through combined expertise of ocean engineers, ice-vessel operators, marine pilots and the programs instructors an ice navigator curriculum is being

developed. Continued support for this expanding program will enable Alaska to have an approved curriculum to train ice navigator with knowledge of working in the ice covered waters of Alaska and beyond as required by the U.S. and Canadian Coast Guards and under the guidance of the IMO Polar Code.

Adopt/Support the recommendations of the Aleutian Islands Risk Assessment

The Aleutian Island Risk Assessment completed Phase A under the guidance of Alaska DEC and the USCG, with findings posted at http://aleutiansriskassessment.com/. The study focused on the traffic predominately following the great circle route through the Aleutian Islands and Bering Sea. A stakeholder Advisory Panel developed recommendations that characterized risk reduction options into three categories: Risk Reduction Options recommended for immediate implementation; Options recommended for study in Phase B study; and those options considered but set aside.

The guiding principles applied to the analysis of these options were that prevention measures take priority over response measures and all measures should be realistic and practical.

The Options found to be practicable for immediate implementation include:

- Develop an enhanced vessel monitoring and reporting program;
- Enhance towing capabilities on Coast Guard cutters, and increase cutter presence in the Aleutians;
- Stage additional emergency towing systems in the Aleutians.

The Advisory Panel recommended four Options that require additional work or study in Phase B, prior to full implementation. These are:

- Increase rescue tug capability in the Aleutians
- Increase salvage and spill response capability in the Aleutians
- Determine the boundaries of IMO Particularly Sensitive Sea Areas, and develop recommendations for associated protective measures
- Strengthen the Aleutians Subarea Contingency Plan

This risk assessment highlighted the value of a multi-year stakeholder Advisory Panel reviewing the options and making recommendations. The NWTF recommends that the options for immediate implementation should be adopted and the Alaska State Legislature should provide funding for those objectives to be implemented. Efforts for Phase B should be continued to be addressed.

DRAFT

ARCTIC PLANNING & INFRASTRUCTURE INVESTMENT:

Immediate investment in Arctic infrastructure is a foremost priority for Alaska and the entire United States. Investment is needed to secure the well-being of Alaskans and other Arctic residents, responsibly develop resources, and facilitate and profit from new global transportation routes. Two significant events, The Arctic Council's Search & Rescue (SAR) agreement and the U.S. Coast Guard's Maritime Traffic Routing Study, will only further highlight the need for increased infrastructure investment. This investment in Arctic infrastructure will improve the safety, security, and reliability of transportation in the region – a goal established by the U.S. Arctic Policy signed in 2009.

The SAR agreement was signed by Secretary of State Hillary Clinton in Nuuk, Greenland on May 12, 2011 at the Arctic Council Ministerial Meeting. The SAR agreement commits the United States to search and rescue response in regions of the Arctic. Additionally, in coastal waters, the National Contingency Plan requires the U.S. Coast Guard to oversee oil spill planning and preparedness and to supervise any oil-spill response. All of these commitments require infrastructure. At present, the Coast Guard has very limited Arctic emergency response capabilities, no infrastructure on Alaska's North Slope to support its operations including an absence of housing for deployed personnel and support facilities, and only one operational Arctic icebreaker. Clearly, the Coast Guard has not been given the necessary tools to adequately carry out their directive.

The NWTF Recommends that the Alaska State Legislature Should Urge the United States to Forward base the U.S. Coast Guard:

The nearest Coast Guard base to the Arctic is in Kodiak 1,000 miles away from the drilling sites and Arctic shipping. A U.S. Coast Guard base decidedly nearer to the Arctic Ocean will be necessary in the near term. The Coast Guard needs a greater presence in the Arctic and should have bases in Kotzebue and Barrow and be given the requisite equipment needed to carry out their duties.

The NWTF Recommends that the Alaska State Legislature Should Encourage the United States to Fund Ice Breakers and Other Ice-capable Vessels:

The Coast Guard only has one operational icebreaker which presents a major challenge when it comes to operations in Arctic waters. Having ice-capable surface assets is vital for scientific research and the maintenance of sovereignty, as well as for the provision of emergency response assistance.

The NWTF supports funding the construction of at least one or preferably two new ice breakers for the U.S. Coast Guard, and supports planning for other necessary assets for search and rescue responsibilities, spill clean-up equipment and response vessels, and research. Search and rescue and oil spill response capacity need to be aligned with current disaster plans and coordinated

with emergency response organizations, including local community level organizations.

Navigation Aids:

Safe, secure and environmentally sound marine transportation will require infrastructure investment to support it. Short and long range navigation aids, high-risk area vessel-traffic management systems, iceberg and other sea condition warning systems, and improved communication technology are needed for safe navigation and shipping.

Of particular interest is having the Alaska Marine Exchange Automated Identification System (AIS) expanded across the northern waters beyond the Canadian border to Tuktoyuktuk. This will allow a clear record of transport across the US Arctic waters particularly for vessels either servicing the Canadian western Arctic communities or bound for transit through the Northwest Passage. As AIS provides a traffic monitoring service, it also provides a mechanism where a navigation watch with safety zones can aid navigation across the Arctic waters where permanent aids to navigation are difficult to power and maintain. To date, the Alaska Marine Exchange has developed through a joint state-federal-industry funding stream. The opportunity to extend into the Canadian Arctic has been discussed at the Pacific Northwest Economic Region at their Barrow Arctic Caucus meeting and deemed a priority. Insuring an adequate funding stream as a state-federal-international-industry partnership that meets both industry and government needs remains a priority. Completion of the AIS network across the western Arctic will allow for compliance under the International Maritime Organization (IMO) Polar Code (Guidance for Operating in Ice Covered (Polar) Waters (find correct title)).

Mapping:

Fund and expedite the mapping of the Chukchi and Beaufort Seas. Support NOAA in their efforts to fund the mapping of the Chukchi and Beaufort Seas with particular support for the coastal navigation routes (5-15 fathoms) and entrance routes to coastal villages. Encourage the expedited completion of priority areas in accordance with the 2011 National Hydrographic Survey Priorities.

Support the Statewide Digital Mapping Initiative to establish accurate horizontal and vertical control for the communities and significant land and water features adjoining the northern waters. From these surveys, accurately map existing infrastructure of the communities.

Support NOAA in their efforts to fund additional tidal observations to close the tidal datum gap in accordance with the 2008 NOAA Network Gap Analysis for NWLON. These increased observations will allow the joining of the digital mapping initiative vertical data with the Mean High Water and Mean Lower Low Water datum that determine ownership and jurisdiction of state, federal, native and private lands.

Ports and safe harbors:

The NWTF Recommends Funding the Institute of the North's Comparative Analysis of Port and Airport Infrastructure in Arctic Nations:

The Arctic Maritime and Aviation Transportation Infrastructure Initiative (Initiative) is a result of the work of the Arctic Council's Arctic Marine Shipping Assessment (AMSA) and the on-going work of a multi-agency (including DOT, FAA and Transport Canada) effort that sponsors the Arctic Aviation Initiative (AAI). It builds on and responds to past efforts and projects of two working groups within the Arctic Council – PAME's AMSA (2009) and the SDWG's Circumpolar Infrastructure Task Force (CITF), which acted as a platform for the Arctic Aviation Experts Workshop in 2005 and 2006. More directly, it follows on the strategic plan set forth at the 2010 Arctic Aviation Experts Conference (AAEC).

The Initiative seeks to address the infrastructure deficit – a lack of ports and airports that have adequate infrastructure and response capabilities (and in some nations a lack of ports in general) - by inventorying maritime and aviation assets in the Arctic that impact the region's ability to respond. This will be accomplished by developing guidance for a robust, effective transportation system in the North. By setting benchmarks for what capacity and capability should look like and establishing a current baseline of Arctic maritime and aviation transportation infrastructure, the Initiative will be able to produce a gap analysis that more efficiently facilitates the application of resources by federal, regional and local governments, as well as international bodies. In this, the intermodal approach helps to avoid duplication, leverages a multiplicity of efforts and provides efficiencies to infrastructure development in a region that often struggles with economies of scale.

As part of the scope of this Initiative, it is envisioned that a multi-year campaign take place. In the first year, a budget of $440,000 (see Annex 1) establishes a foundation to work from and begins the benchmarking process as well as gathering baseline data. Much of this has been done on the marine side by the AMSA, which will be updated and correlated with current and best aviation information. Baseline data will be fed into both a final guidance document and a revised version of the Institute of the North's Arctic Aviation Database, an updated form of which will be a deliverable from this effort; it will include port infrastructure and be renamed to reflect this expanded scope. The **Arctic Maritime and Aviation Infrastructure Database** will include a web-based, searchable map that illustrates the overlapping spheres of responsibility and capacity as well as perceived gaps in the system as a whole. Arctic nations' ability to respond will be coordinated, intentional and built upon a well-established understanding of both need and capability.

A second deliverable will be the **2012 Arctic Aviation Experts Conference**, which will review and assess the aviation portion of the guidance document. This is the only venue to date in the world dedicated to Arctic aviation and provides an invaluable service in connecting stakeholders from across the Arctic to one another and critical issues. A corresponding **2012 Arctic Port Response Infrastructure Conference** will take place to evaluate the maritime transportation portion of the final document. A draft version of the Guidance Document will then be delivered to the Arctic Council's SDWG for review and input.

In the second year of the project, the Guidance Document will be refined and finalized, with results of the Initiative disseminated and work groups identified to address individual projects identified in the final document. At the same time, the Arctic Maritime and Aviation Infrastructure Database will be launched and outreach conducted. Similar funding needs are anticipated for this phase (see budget, in Annex 1).

The NWTF Recommends continuing the analysis of ports and safe harbors in the Arctic Region:

Continue the analysis of options for port and safe harbor construction in the Arctic and assess the pros and cons of alternative locations, alternative types of ports, and seek out funding alternatives. Building on the findings of the 2008 & 2011 state-federal Alaska Regional Ports Workshops and the 2011 Arctic Ports Charette, convene an industry focused Alaska Arctic Ports Workshop that addresses the environmental conditions and engineering approaches to develop an Arctic deepwater port strategy for the following locations:

a. Nome-Teller port complex with expansion of the Nome causeway and breakwater, upgrade of the Nome-Teller road, and a seasonal landing/mooring facility off Teller in the Port Clarence bay.
b. Kotzebue Sound port complex for approaches to improve the materials handling at DeLong Mountain Terminal Port or construct the Kotzebue-Cape Blossom road and offshore causeway.
c. Other locations as identified in the previous workshops for supporting and lightering to river-bound traffic into the Yukon, Kuskokwim and other navigable waters, with particular reference to mooring buoys and localized community barge landing improvements.

Detailed description of each project follows.

Nome/Teller:

The Nome-Teller port complex provides an option for linking the established transportation infrastructure of Nome (air and medium draft port) with the large protected embayment of Port Clarence via the road to Teller. Expansion of the port of Nome for deep draft will require studies of the environmental impact of expanding the causeway >1200 feet to 35 feet of water and providing adequate protection from winds and waves during the ice free season. Operation of the port during the ice covered period will remain limited.
Support for deeper draft vessels <40 feet can be accommodated in Port Clarence with staging from Teller. The support could include an improved landing for lightering materials to and from the ship that were previously landed at Nome and transported to Teller. A second function of this protected embayment is as a "harbor of refuge" where vessels could be located under U.S. flag state control and in accordance with Alaska state laws for in voyage repairs, marine casualties, or for failure to comply with Arctic shipping requirements, including the IMO Polar Code.

A US Coast Guard deactivated runway and moth-balled facilities remain at the closed LORAN station on the Port Clarence spit. While these assets remain viable for re-activation, the transportation capacity between the 3000 foot runway at Teller, the 72 mile Teller Highway from Nome, the 6000 foot runways

at Nome and the 3000 foot causeway and breakwater at Nome appear to limit the value of investment in additional port capacity off the existing road system.

A study on the engineering approaches, the cost for improvements to the Nome-Teller port complex and the potential economic benefit merits consideration as a contender for a viable US Arctic Port with 35 feet of draft. Improvements to the community infrastructure as an Arctic operation hub should be factored in to this study.

The Kotzebue Sound port complex is an example where existing shallow draft ports could provide the foundation for improving the viability of mining activities and sustainability of the Northwest Arctic Borough communities. Presently the Delong Mountain Terminal Port provides a shallow draft lightering capability for the seasonal export of the Red Dog Mine ore concentrate. Studies have been conducted to developing a dredged channel and landing at the terminal, but found to not be cost effective and difficult to maintain. However, if additional mineral deposits are developed, either with Arctic coal or minerals from the Ambler district and west, the further development of this port merits review.

Across Kotzebue Sound is Cape Blossom, a potential deepwater port site for the hub community of Kotzebue. Presently, Kotzebue and its surrounding Northwest Arctic Borough communities depend on long distance lightering from offshore barges for re-supply with significant economic impact. Studies by the State of Alaska have shown that a road from Kotzebue to Cape Blossom and development of an extended length causeway of 7000 feet (?) (Harvey Smith for details) is feasible from an engineering perspective. Further studies will be needed to determine the actual cost effectiveness of this seasonally available deepwater port.

Support for a review of the port capabilities and lightering and storage options for fuel and supplies, as well as energy distribution and electricity generation should be considered.

The northern waters of Alaska also include the major river drainages of the Yukon, Kuskokwim, Noatak and Kobuk Rivers and Bristol Bay. Recognizing the communities on these river drainages receive a significant amount of re-supply by seasonal barge, the Denali Commission and U.S. Army Corps of Engineers completed a Statewide Barge Landing System Design study that defined different types of mooring and landing facilities for the northern waters area. The Phase 1 assessment was completed in 2009 and covered 111 communities on the Alaska Peninsula, the Yukon, Kuskokwim, and Kobuk Rivers, and the Bering, Chukchi and Beaufort Sea coasts and resulted in 36 priority projects. These approaches ranged from simple mooring points located above the river edge to barge ramps and jetties based on discussions with the local communities and the river operators. The study showed how efficiencies could be gained and environmental risks minimized with mooring of the tugs and barges during offloading. While initial projects showed the value and success of the approaches, the sources of federal funding have decreased significantly. Based on these findings, support for the construction of the priority community barge landings as designed is recommended.

Roads:

Convene a "Transportation Corridors to Resources" conference addressing access by road, rail or water to major natural resources, including mineral deposits that can be developed for the domestic and international market. Explore the options for public-private partnerships in capitalizing development of the resource deposits and providing a return on investment to the state and private sector. Provide a prioritized strategy for approaches to specific resource deposits and options for developing and moving to market.

Co-host (NWTF and the University of Alaska Fairbanks) a workshop:

Co-host a workshop the purpose of which would be to cross walk the 17 AMSA recommendations (developed to address issues throughout the Circumpolar North) with the specific needs of Alaskans discovered during the NWTF initiative. AMSA provides invaluable recommendations for the broad Arctic community and these recommendations would be helpful in guiding specific Alaska-focused recommendations toward actionable and helpful next steps. With AMSA as a framework, and covering broad-based issues from infrastructure and oil and gas development to inclusion and protection of indigenous communities, the NWTF-UAF workshop would produce specific, Alaska-based initiatives that may help to prepare communities for a dynamic, changing, and challenging future.

Implementation of AMSA for training of Ice Navigators:

Support the Alaska Vocational Technical Center Maritime Training Center and the U.S. Coast Guard in establishing a program for training of mariners as "Ice Navigators" to operate in ice covered waters. This is a recommendation from the Arctic Marine Shipping Assessment and is being incorporated into the International Maritime Organization Polar Code. AVTEC's Maritime Training Center is upgrading the multiple pilot house marine simulator to include ice operations. Through combined expertise of ocean engineers, ice-vessel operators, marine pilots and the programs instructors an ice navigator curriculum is being developed. Continued support for this expanding program will enable Alaska to have an approved curriculum to train ice navigator with knowledge of working in the ice covered waters of Alaska and beyond as required by the U.S. and Canadian Coast Guards and the International Maritime Organization.

The NWTF Recommends that the Alaska State legislature fund a Search and Rescue Coordination Center along the coast or provide funding to the Local Search and Rescue Efforts on the North Slope Borough and the Northwest Arctic Borough and Bering Straits:

Review and Consider Efforts to Expand Fiber Optic Cable Routes Across Northern Waters:

The retreat of sea ice and stability of the sea floor in the Arctic is creating interest in a potential

fiber optic cable route from London to Tokyo via the Canadian Northwest Passage and Alaska Arctic. Just as shipping routes are significantly shorter across the northern waters, so will be fiber optic cable routes. In 2010, Kodiak Kenai Cable Company developed an international consortium for the Arctic Link with landing at Prudhoe Bay. Similarly, within the United States, the company proposed the Northern Fiber Link, with branches at linking Kodiak with remote communities of Dutch Harbor, Nome, Kotzebue, and Barrow before linking back in to the Prudhoe Bay landing. While this proposal was unsuccessful in obtaining funding, valuable research was conducted into a viable Arctic cable route and the Arctic Cable Company was formed. On land, GCI's Terra SW is connecting coastal villages and communities to a fiber optic-microwave network. This network will explore expansion to include the communities of northwest Alaska. On the North Slope of Alaska, the Arctic National Broadband Network initiative proposed to develop broadband capability between Barrow and Nuiqsut. These efforts are exploring how both terrestrial and seabed fiber optic cable communications can be deployed across the Arctic and between sub-Arctic countries. Others will continue to explore the options of increasing broadband capacity via offshore cable routes that are shorter and more seasonally protected than those existing in the boreal, temperate and tropic oceans. Support for these studies should continue and opportunities considered in joining fiber optic cable venture that will land fiber optic links to the coastal hub communities and industry bases adjoining the northern waters.

The NWTF Recommends that the Alaska State Legislature Explore Models for an Arctic Infrastructure Development Authority or Recommend that the Legislature Work with the Arctic Caucus in PNWER to Explore Options by Providing Funding and Staff Support:

What can Alaska do to attract investors? Consider restructuring AIDEA and use PFD monies? How could Alaska cooperate with other Arctic countries to develop infrastructure?

(NOAA boat headed out to conduct research in the Arctic)

ARCTIC FISHERIES:

Introduction:

Alaska and the Arctic contain some of the world's largest and valuable fisheries. There are some 100 known species of fish in the Arctic Ocean. Scientists are discovering that a number of sub-Arctic species, such as Cod, Herring, and Pollock, are expanding their habitation further north as sea ice melts and the oceans warm.[10] At the same time, fish stocks are likely to be impacted by increased economic activity, ocean acidification, salinity and temperature changes in the ocean and loss of sea ice, these changes will require data collection and monitoring of fish stocks over a significant period of time. This shift in fish habitat creates potentially new commercial fishing opportunities for Arctic nations. For rural Alaskans this could present an economic opportunity for people living in remote areas of the state. The task force makes the following recommendations regarding Arctic fisheries.

Need for Comprehensive Research and Monitoring Plan:

On February 5, 2009, the North Pacific Fishery Management Council imposed a moratorium on fishing in Alaska's northern waters until more information is available so that any future commercial fishing operations can be sustainable. The current moratorium on Arctic fisheries in the U.S. Exclusive Economic Zone (EEZ) should not postpone Arctic fisheries research. For the last two years, there has been a lack of any significant research or data collection to justify the moratorium. There is a critical need to establish baseline data on fish stocks and to conduct other relevant research to inform future decision-making. Research in the following areas is recommended:

- Baseline assessment surveys to estimate biomass of potentially harvestable species
- Ecosystem studies to evaluate potential effects of fisheries on other species of marine mammals and seabirds which feed on the seafloor
- Species specific productivity parameters, rates of growth, recruitment and natural mortality, to estimate potential sustainable fishery yields
- Social and economic studies to evaluate benefits and costs to communities along the Arctic coast
- Dedicated funding to support fisheries research

[10] K. Arkema, S. Abramson and B. Dewsbury, 2006. "Marine ecosystem-based management: from characterization to implementation," Frontiers in Ecology and the Environment. 4: 525-532.

The NWTF Recommends that the State of Alaska and the United States Need to Expand the North Pacific Management Council for Local Input:

The North Pacific Management Council should be expanded to include a seat each for the North Slope Borough, Northwest Arctic Borough, Bering Straits, and the local tribes to ensure local input on decisions being made about the Arctic. The Governor currently appoints members to the Council which, in some people's views, hasn't led to the best representation of all Alaskan's views. However, there has been a recent push from Oregon and Washington to expand their presence on the council. With this in mind it may be better to work with the Governor to see if two or more of the seats can be site specific to the Arctic. Adding these specific seats would ensure local input about the Arctic and would guarantee a venue for local people to voice their concerns and be heard.

Expand the CDQ Program:

Alaska should explore the possibility of an additional CDQ harvest area in the Chukchi and Beaufort Seas as a way to harvest and protect the fisheries in the area. An expansion of the CDQ program requires a change in federal law. If fisheries are open in the Beaufort and Chukchi Seas as part of allocating the new quota there should be two new CDQ organizations formed to represent the communities in those areas. The State of Alaska and the Alaska State Legislature should work with Alaska's Congressional delegation in moving this priority forward.

The NWTF Recommends that the State of Alaska and the United States Need to Encourage the Adoption of an International Agreement for Fisheries:

The United States has meet with other countries regarding the management of Arctic fish stocks. The federal government should continue international discussions and take the necessary steps to negotiate an agreement with other Arctic nations to cooperatively research fish stocks, and sustainably manage migratory, transboundary, and straddling fish stocks. Northern fisheries are covered by international agreements in waters within the 200-mile limits of coastal nations. However, high Arctic waters beyond those limits, such as those of the Canada Basin west of the Arctic islands, are unregulated. The time to enter into an international cooperative agreement with other Arctic nations is before commercial fishing begins so it is appropriate to move forward with this initiative in the near future.

As part of any international agreement, the Arctic nations should consider establishing an international fisheries management organization for the Arctic. The state of Alaska, the North Slope Borough, Northwest Arctic Borough, Bering Straits, and/or the local tribes should be participants on any organization that is formed.

ARCTIC RESEARCH:

Rather than view research as the animal that is going to kill development it is time for Alaska to shift the paradigm and recognize that research will actually expedite and assist Alaska in developing its vast resources and gain an international reputation as a world leader. It is also an opportunity for Alaska to diversify its economy and grow a world class research university. Just recently BOEMRE awarded a $5.6 million dollar contract for Arctic research to a Texas University one of many research opportunities lost by Alaska.

Conduct a Survey of Alaska Native marine/subsistence use:

The Alaska Marine Shipping Assessment found that information on marine use by Arctic indigenous peoples is missing. Establish the *Alaska Indigenous Marine Use Survey Project*, directing state, and requesting federal resources to capture the varied and unique ways indigenous peoples use and rely upon marine-based resources. Some efforts have been made or are in progress, but more needs to be done to bring subsistence use information up to date. Much of the existing information lacks detail such as specifying the season, length, or range of the subsistence use making it difficult to identify potential conflicts with industry activities. Subsistence patterns, use patterns, and economic and social implications of potential conflict with other marine use stakeholders are examples of some of the issues to be surveyed and explored. Accurate and complete data will best help inform Arctic users on how to minimize impacts on subsistence and other community activities. Since the Beaufort and Chukchi Seas are the first areas that will see oil drilling in order to get baseline data, the NWTF recommends that the Alaska State Legislature fund grants to the North Slope Borough, the Northwest Arctic Boroughs, the Bering Straits, to conduct the research over the next two years.

Conduct a Survey of Impacts on Arctic communities and their inhabitants:

The NWTF recommends that the State of Alaska fund research on the social, economic, cultural and subsistence impacts that the changes in the Arctic are having on Arctic inhabitants. The research could be conducted by the University of Alaska, the Department of Health and Social Services, Alaska Native Tribal Health Consortium, or the Arctic Council within the next two years.

Support Alaska Based Arctic Research and Use of Traditional Knowledge:

Across a variety of areas additional research regarding the Arctic needs to be undertaken. The NWTF supports this research being conducted in Alaska in conjunction with the University of Alaska and should include the use of traditional knowledge. Arctic research provides a unique opportunity for the University of Alaska to expand and become a world leader in Arctic

research. It also provides an opportunity for the State of Alaska to benefit from the economic impact of the research and a potentially growing University system.

Every Arctic country that has formulated an Arctic strategy recognizes the importance of the Arctic indigenous peoples and their knowledge of the region they have inhabited for thousands of years. Likewise, in Alaska the use of traditional knowledge should be part of the scientific process to better understand the Arctic environment.

Improved sea ice nowcasts and forecasts and trajectories:

This requires coupling weather forecasts (atmospheric models) with currents and waves (ocean circulation models) with sea ice (sea ice models), and it currently is not being done. Improving these would give better warnings of onshore ice shoves (similar to what happened in Kotzebue last spring), and better real time forecasts not only of what sea ice conditions are today, but also what they will be tomorrow to better inform decision making by boat captains and subsistence hunters operating in mixed ice/open water conditions. This was the #1 recommendation coming out of a sea ice workshop last week attended by experts from the National Weather Service, National Ice Center, and National Snow and Ice Data Center. The big challenge with sea ice forecasting continues to be the need sea ice thickness, which isn't captured by satellites as well as extent is.

***Establishing routine surveys of key chemical, physical and biological parameters of the Bering and Chukchi Seas so that you can see change over time, especially in the next decade if oil and gas exploration continues and as the Arctic warms*:**

This will be one of the top priorities in the federal Strategic Action Plan for the Arctic – it's referred to as a Distributed Biological Observatory, and it consists of transects that run from shore across the continental shelf at various key areas of the Bering Sea, Bering Strait and Chukchi Sea to Pt Barrow. The surveys could be taken by scientific expeditions from the many nations that are sending ice breakers to the Arctic (a group of them have already agreed to do this) and by industry and government partners. We know conditions are changing, and we need to start the monitoring to measure that change. The Arctic is one of the regions that is potentially most susceptible to ocean acidification.

***Research and monitoring of marine mammal response to noise*:**

The Arctic is becoming a noisier place, and as shipping traffic increases and with the potential of oil and gas drilling, it will become even noisier. Many entities are studying this, but an overall coordinated plan needs to be developed and put in place.

Ocean circulation nowcast/forecast:

We need an operational model that assimilates real-time data to be used for search and rescue, to include in #1 above, and in the event of an oil spill. The pieces are there, but it is not in "operational" mode yet, still on a research basis.

***Biological hotspots in the Arctic*:**

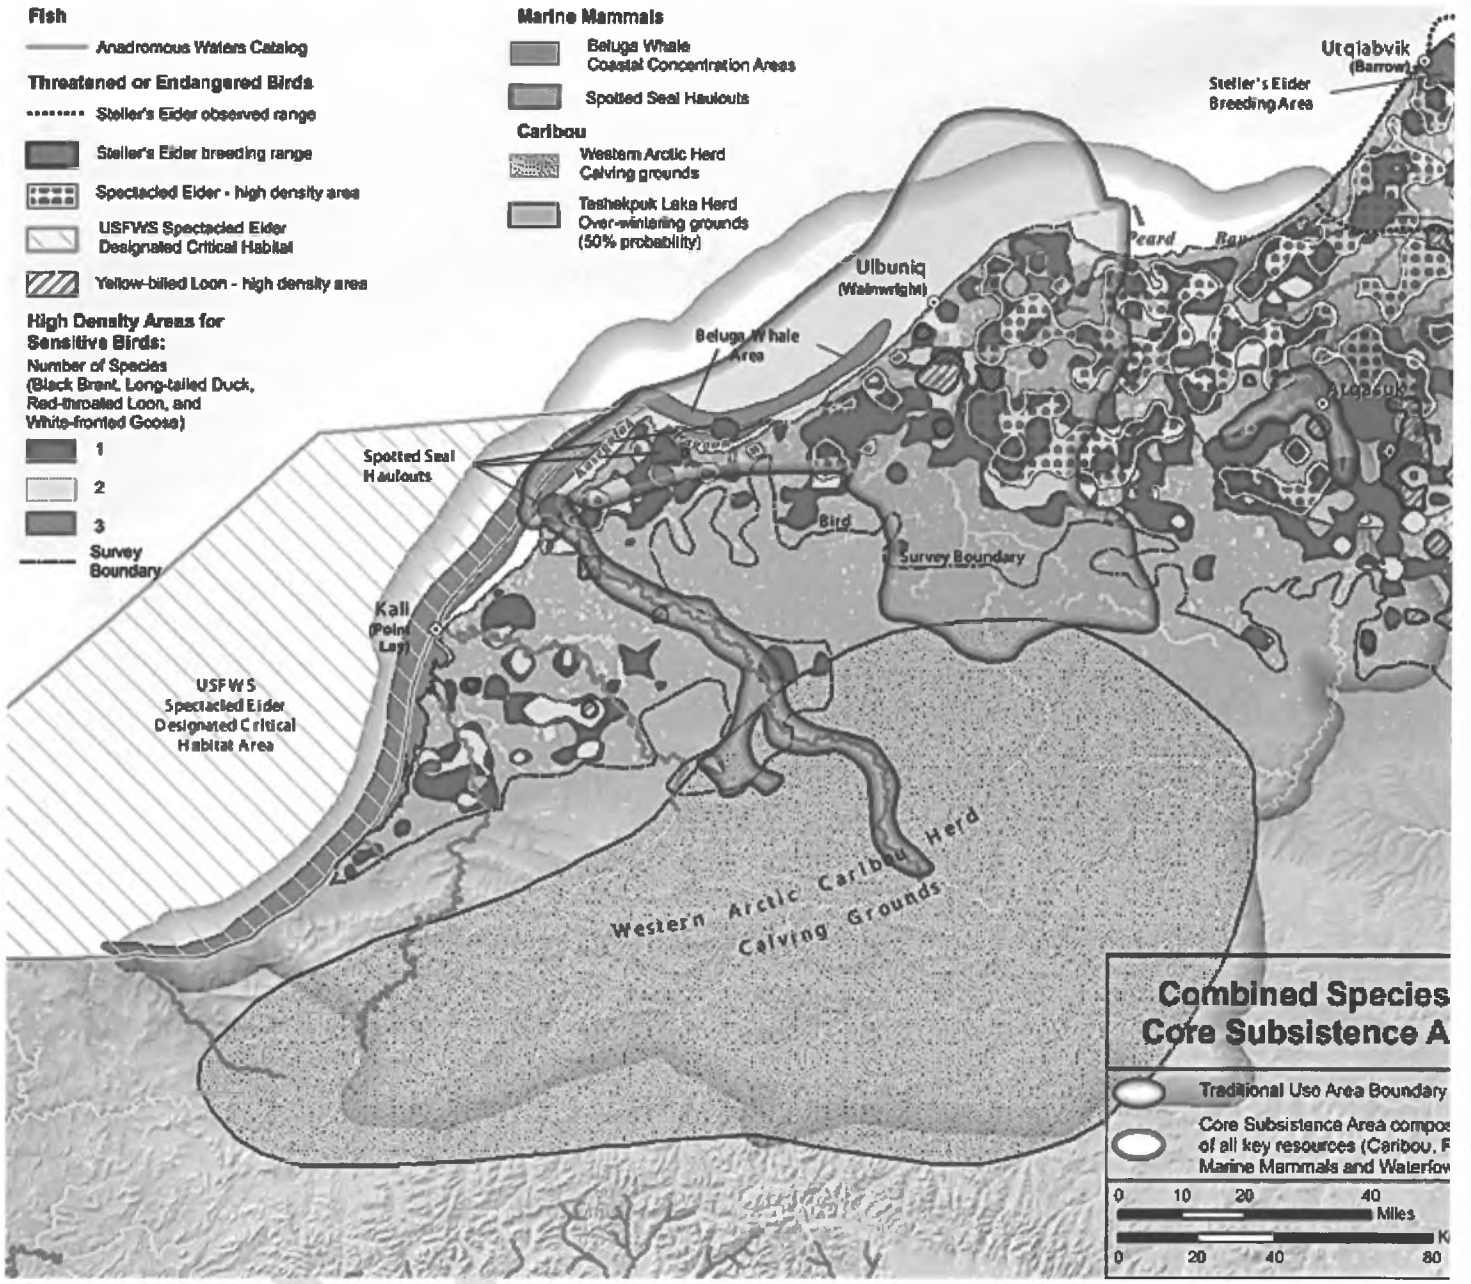
Where are they? How important are they to the ecosystem? We know where a few area, but don't know enough about them to determine the role they play in ecosystem function.

***Integrated data management*:**

You can have all the data you need, but if it is not accessible or usable, then it has very little value. Integrating the data collected by state and federal agencies, academics, and industry is essential. Several entities are taking steps to make this happen. The Alaska Ocean Observing System is one; the North Slope Science Initiative is attempting this for the North Slope; and there are several efforts at the international level. These need to be encouraged, because they are the basis for multiple stakeholder data applications such as emergency response tools, nowcasts/forecasts of ocean and sea ice conditions, etc.

***A grand plan*:** There have been a lot of research plans done for the Bering Sea and the Arctic for various programs, but most end up being a laundry list of potential projects. We still don't have an overarching research plan for the Arctic that captures the current state of knowledge and is designed to meet multiple stakeholder needs, not just those of the research community.

DRAFT



Combined sensitive species habitat areas and core subsistence areas for onshore Arctic Alaska. Modified from The Nature Conservancy and Wainwright Traditional Council (2008) by the U.S. Geological Survey.

CONCLUSIONS

A directed course of action that includes the recommendations of this report is needed for Alaska to be the valuable partner with the federal government on Arctic issues. The United States and Alaska (together and independently) should seek increased cooperation with other Arctic governments. Arctic residents should have full participation in deciding Arctic issues.

ATTACHMENT B HOUSE CONCURRENT RESOLUTION 22:

HCR022c -1- CSHCR 22(FIN)
New Text Underlined [DELETED TEXT BRACKETED]
26-LS1622\W

CS FOR HOUSE CONCURRENT RESOLUTION NO. 22(FIN)
IN THE LEGISLATURE OF THE STATE OF ALASKA
TWENTY-SIXTH LEGISLATURE - SECOND SESSION
BY THE HOUSE FINANCE COMMITTEE
Offered: 4/9/10
Referred: Rules
Sponsor(s): HOUSE COMMUNITY AND REGIONAL AFFAIRS COMMITTEE

A RESOLUTION

Establishing and relating to the Alaska Northern Waters Task Force.

BE IT RESOLVED BY THE LEGISLATURE OF THE STATE OF ALASKA:

WHEREAS Alaska is the only Arctic state in the nation; and

WHEREAS recent warming trends have resulted in the depletion of Arctic perennial sea ice by nine percent a decade; and

WHEREAS, according to the National Aeronautics and Space Administration, the rate of depletion is accelerating because of the interaction among the ice, oceans, and atmosphere; and

WHEREAS rapidly retreating sea ice is altering fish and wildlife habitats and affecting the accessibility and viability of certain species, on which many local communities rely for nutritional and cultural purposes; and

WHEREAS reduced sea ice is affecting polar route navigation by opening oceans previously frozen year-round; and

WHEREAS the new accessibility of the Northern waters is resulting in increased marine transportation, access to resources, tourism, fisheries, and the presence of United States government agencies in the North; and

26-LS1622\W

WHEREAS the waters of Northern Alaska are of national security and strategic importance to the United States and the State of Alaska; and

WHEREAS, because of national security concerns, the United States Coast Guard is increasing its presence in the North and has plans to build new infrastructure to support its heightened activity, including housing and office facilities and possibly a deep water port; and

WHEREAS Northern Alaska contains important mineral and other resources both in state waters and on the outer continental shelf; and

WHEREAS commercial activities, including resource development, and the revenue they generate for the state may be significantly affected by the changing Arctic waters; and

WHEREAS those changes will affect local communities, businesses, the state, and the natural resources on which they rely; and

WHEREAS there is no comprehensive state plan for Alaska's Northern waters; and

WHEREAS various federal agencies and international bodies are working together to form a commission to address the changing ocean patterns and the opportunities and problems that may arise as a result of those changing patterns; and

WHEREAS the State of Alaska should be involved in the process of forming the commission; and

WHEREAS a comprehensive plan to address the warming ocean, including the economic, ecological, and security effects, will benefit the state and its residents;

BE IT RESOLVED by the Alaska State Legislature that the Alaska Northern Waters Task Force is created in the legislative branch and shall consist of 11 members as follows:

(1) two senators appointed by the President of the Senate;

(2) two representatives appointed by the Speaker of the House of Representatives; and

(3) seven members appointed jointly by the President of the Senate and the Speaker of the House of Representatives, as follows:

(A) five public members, three of whom reside in coastal areas of the state;

(B) one member representing the executive branch of state government;

(C) one member representing the federal government; and be it

FURTHER RESOLVED that a vacancy on the task force shall be filled in the manner of the original appointment; and be it

FURTHER RESOLVED that the legislators on the task force shall select a chair from among themselves and the chair may assign staff to provide support to the task force; and be it

FURTHER RESOLVED that the public members, and, if the member does not receive reimbursement for expenses from the federal government, the federal government member of the task force may receive per diem and travel expenses authorized for boards and commissions under AS 39.20.180; and be it

FURTHER RESOLVED that the task force may meet during and between legislative sessions and the duties of the task force include the following:

(1) assess and facilitate creation of a state and federal commission responsible for overseeing the development of state and federal northern ocean waters;

(2) facilitate regional coordination, cooperation, and outreach regarding the creation of the commission to keep local stakeholders informed and to incorporate their input into the process;

(3) identify and coordinate efforts of mutual concern for federal, state, and local agencies, as well as international interests in the creation of the commission; and

(4) conduct hearings in the Northern region of the state to fulfill its purpose; and be it

FURTHER RESOLVED that the task force shall provide recommendations regarding the formation of the commission and shall deliver a preliminary report of its findings to the legislature by January 20, 2012, and deliver a final report to the legislature on January 30, 2012, together with legislative proposals for consideration; and be it

FURTHER RESOLVED that the task force shall be available for legislative hearings regarding its final report and recommendations; and be it

FURTHER RESOLVED that the continuation or termination of the task force shall be reevaluated during the Second Regular Session of the Twenty-Seventh Alaska State Legislature.

DRAFT

ATTACHMENT C HEARING SCHEDULES:

NORTHERN WATERS TASK FORCE AGENDA

October 1, 2010 8 am to 5 pm
Anchorage Legislative Office
Anchorage, Alaska

1. Welcome and organization 8-8:45 a.m.

   Introduce members
   Overview of task force and task force mission
   Travel and accounting procedures
   Discussion of possible schedules for future hearings and sites:

   - Alaska Federation of Natives (Oct. 20-23rd)
   - Nov. 14-17th Kotzebue and Nome
   - Dec. 1-2 Barrow with PNWER
   - End of January Bethel
   - Possible Unalaska date?
   - Topics for hearing

   15 min. break

2. Introduction and overview 9-9:15 a.m.

   Presenter: Molly McCammon, Director
   Alaska Ocean Observing Systems

3. Science of the warming waters and federal policy update 9:15-10 a.m.

   Presenter: Dr. Kate Moran, Senior Policy Analyst
   Whitehouse Office of Science and Technology Policy
   By video conference

   15 min. break

4. Overview from the National Oceanic and Atmospheric Administration 10:15 to 11 a.m.

   Presenters: Laura K. Furgione, National Oceanic and Atmospheric Administration (NOAA) Deputy Assistant Administrator for Weather Services and Deputy Director of the National Weather Service (NWS).

   Dr. Douglas DeMaster, NOAA's Science and Research Director, Alaska Fisheries Science Center

DRAFT

Amy Holman, NOAA's Alaska Regional Coordinator

5. Overview of the State of Alaska's and the state/federal executive roundtable activities regarding the Arctic 11-11:45 a.m.

   Presenter: Mr. Larry Hartig, Commissioner, Department of Environmental Conservation

   15 min break to get lunch which will be served there
   International Lunchtime Panel 12 to 1 p.m.:
   Presenters:
   Cheryl Rosa, Deputy Director, United States Arctic Research Commission
   Jennifer Loten, Canadian Consul, Canadian Consulate
   Mayor Edward Itta, Former President, Inuit Circumpolar Consul

6. Overview from the United States Coast Guard on marine shipping and Coast Guard activities in the Arctic 1:15 to 2 p.m.

   Presenters: Rear Admiral Christopher Colvin, USCG and Capt. Carl Uchytil

7. Overview from the United States Arctic Research Commission 2-2:45 pm

   Presenter: Cheryl Rosa, Deputy Director of USARC and Anchorage Director

   15 min. break

8. Oil and gas presentation regarding exploration in the Arctic 3-3:45 p.m.

   Presenters:

   Marilyn Crockett
   Executive Director
   Alaska Oil & Gas Association

   Cam Toohey, Government Affairs Manager
   Shell Exploration & Production Company, Alaska

   Jason Brune
   Executive Director
   Resource Development Council

DRAFT

Northern Waters Task Force Agenda
March 14th
Noon to 2 p.m.
State Capitol Building Room 106
Teleconference 1-855-463-5009

1. Topics for Consideration at Hearings

Arctic Governance

- What is the federal government doing?
  - -Office of Science and Technology Policy
  - -National Ocean Council/Regional Planning Bodies
  - -Coastal and Marine Spatial Planning
  - -NOAA
  - -USARC
- Laws of the Sea
- Boundaries and extended continental shelf issues
- What is the State of Alaska doing?
- What are local communities doing?
  - -Important Ecological Areas
- What is happening internationally? International agreements for research, shipping, search and rescue, oil and gas activities and spill response
- Arctic Council and ICC Updates
- What does multi-jurisdictional cooperation in the Arctic look like? How does the state participate? How do local people participate?

(Possible speakers: Bering Sea Partnership, Barry Briscoe, Environmental Law Institute, NOAA, Alaska Ocean Observing Systems, Arctic Council, ICC, US Coast Guard, Institute of the North, US State Department, Office of Science and Technology, Council on Environmental Quality, Ocean and Coastal Policy, Mark Robbins, Oceana, Aspen Institute, Charles Ehler)

---Participation in the Arctic Imperative event at Alyeska in June may cover some of the above topics

Oil and Gas Development and Research

- Proposed 5 year development schedule
- Current oil spill response capabilities and technology and research needed in this area
- What are Coast Guard, industries, states, and local capabilities to respond to an oil spill?
- Research needed to provide understanding of Arctic environment, ecosystems and environmental conditions, baseline data, and oil spill impacts on environment
- Possible oversight needed at the local, state, federal and international level

DRAFT

(Possible speakers: Shell, Conoco, Fran Ulmer, Pew Research, Oil Spill Recovery institute, US Arctic Program, Oceans' North, Alaska Clean Seas, Aleutian Island Risk Assessment, Prince William Sound Advisory Council, Alaska Eskimo Whaling Commission, North Slope Borough, Northwest Arctic Borough, Barrents Sea Plan, Norway)

Arctic Infrastructure Investment and Long Term Planning

- What investments need to be made
- Who should make the investments
- What research/planning needs to still take place

(Possible speakers: US Coast Guard, Navy, Department of Transportation)

Arctic Fisheries

- NPFMC Fishing moratorium
- International agreement to manage migratory, transboundary, and straddling fish stocks in the Arctic Ocean and possible future international fisheries management organization
- Need for eco-system research and baseline data collection to inform future decision making

(Possible speakers: National Marine Fisheries Service on recent fish stock study, North Pacific Fisheries Management Council)

Marine Transportation

- Commercial shipping
- Vessel monitoring and tracking
- International search and rescue capabilities and agreements with other countries for search and rescue
- What are the Coast Guards, State of Alaska, and local capabilities for search and rescue?
- Regulation of shipping, international shipping rules and agreements
- Navigation aids, maritime communication, ports, and other infrastructure needed
- National Security
- Invasive Species

(Possible speakers: US Coast Guard, Pacific environment, Marine Exchange of Alaska, Crowley, Aleutians Island Risk Assessment, Protection of Arctic Marine Environment (PAME), Alaska Marine Shipping Assessment, Saint Lawrence Seaway, Department of Transportation)

Research

- What science is needed? How does research inform management decisions?
- Gap analysis of what science is missing and coordination of research
- Climate Change impacts on communities

DRAFT

- Endangered Species Act

(Possible speakers: USGS, USARC, NOAA, Walrus commission, Alaska Eskimo Whaling Commission, North Slope Borough Wildlife Department, Beluga commission. Alaska Native Tribal Health Consortium, Aspen Institute, ESA speaker, Office of Polar Programs, National Science Foundation)

2. Subcommittees

Discuss possibility of subcommittees to work on coordinating the meetings

3. Hearing Schedule

- Bethel
- International Forum Girdwood NWTF invited June 20-21st
- Kotzebue and Nome: July 5-7th in conjunction with Trade Fair
- Unalaska: August 24-26th with the legislative fly-in
- Final Recommendations Meeting: September/October in Anchorage

4. Preliminary Recommendations

Discuss preliminary recommendations

11:30 a.m. -11:50 a.m. DIALOGUE

DRAFT

THEME: National Security
LUNCH: Columbia Ball Room
12:10 p.m.-12:30 p.m. General Joseph Ralston (Ret.), Former Supreme Allied Commander of NATO
12:30 p.m. -12:45 p.m. Brigadier General Robert Chekan,
Deputy Director of the Strategy, Policy, and Plans Directorate,
United States Northern Command
12:45 p.m. -1:00 p.m. Rear Admiral Christopher C. Colvin, Deputy Commander, Pacific Area
United States Coast Guard
1:00 p.m.-1:20 p.m. DIALOGUE
1:20 p.m. -1:50 p.m. BREAK
THEME: Resources
KAHIHTNA COURT
1:50 p.m. -1:55 p.m. MODERATOR: Drue Pearce, Senior Policy Advisor, Crowell Morning
1:55 p.m.-2:10 p.m. Robert Blaauw, Senior Advisor, Shell Global Arctic Theme
2:10 p.m.-2:25 p.m. Jimmy Stotts, Chair, ICC Alaska
2:25 p.m. -2:40 p.m. Marie Greene, President and CEO, NANA Regional Corporation
2:40 p.m. -2:55 p.m. Dan Sullivan, Commissioner, Department of Natural Resources, State of Alaska
2:55 p.m. -3:05 p.m. BREAK
3:05 p.m. -3:20 p.m. Admiral Thomas Barrett, USCG (Ret.), President, Alyeska Pipeline Services Co.
3:20 p.m. -3:35 p.m. Geoffrey Haddad, Vice President, Exploration and Land, Conoco Phillips
3:35 p.m. -4:50 p.m. Pete Slaiby, Vice President, Shell Alaska
4:50 p.m. -5:30 p.m. DIALOGUE
5:30 p.m. -6:30 p.m. BREAK
6:30 p.m. BANQUET- Columbia Ball Room
6:45 p.m. -7:15 p.m. Artur Chilingarov, Deputy Chairman, State Duma of the Russian Federation
President of Non-commercial Partnership of the Coordination of
Northern Sea Route Usages
7:15 p.m.-7:30 p.m. George Noongwook, Vice Chair, Alaska Eskimo Whaling Commission
7:30 p.m.-7:45 p.m. ***

TUESDAY June 21st, 2011

KAHILTNA COURT
8:00 a.m. -8:05 a.m. Susan Bell, Commissioner, Department of Community, Commerce, and Economic Development
8:05 a.m. -8:10 a.m. Harvey Brooks, Deputy Minister, Yukon Economic Development
THEME: Shipping, Port Development, Ice Breakers
8:10 a.m. -8:15 a.m. Moderator: Scott Borgerson, Managing Director, CargoMetrics Inc.
8:15 a.m. -8:30 a.m. Lawson W. Brigham, Distinguished Professor of Geography & Arctic Policy
University of Alaska Fairbanks;
Chair, Arctic Marine Shipping Assessment of the Arctic Council (2005-09)
8:30 a.m. -8:40 a.m. Stephen Carmel, Senior Vice President, Marine Services, Maersk Line, Ltd.
8:40 a.m. -8:50 a.m. Ross MacDonald, Transport Canada
8:50 a.m. -9:00 a.m. Simon P. Lisiecki, Former Vice President, Government & Industry, BP Shipping

DRAFT

9:00 a.m. -9:10 a.m. Michael Terminal, Edison Chouest Offshore
9:10 a.m. -9:30 a.m. BREAK
9:30 a.m. -9:40 a.m. Thomas Mack, President, Aleut Corporation
9:40 a.m. -9:50 a.m. Matt Ganley, Vice President, Lands, Bering Straits Native Corporation
9:50 a.m. -10:00 a.m. Robert Keith, Chairman of the Board, Kawerak Inc.
10:00 a.m. -10:10 a.m. The Honorable Dora Akingka, Mayor, City of Diomede
10:10 a.m. -10:20 a.m. The Honorable Ellen Richards, President of the Native Village of Wales
10:20 a.m. - 11:00 a.m. DIALOGUE
LUNCH: Tent
12:10 p.m. -12:30 p.m. Kenneth Rogoff, Professor of Economics, Harvard University
12:30 p.m. -12:45 p.m. The Honorable Lesil McGuire, Alaska State Senator;
President, Pacific Northwest Economic Region
THEME: Arctic Science and Traditional Knowledge
KAHILTNA COURT
1:00 p.m-1:15 p.m. MODERATOR: Fran Ulmer, Chair, United States Arctic Research Commission
1:15 p.m.- 1:30 p.m. Danielle Labonte, Director General, Indian and Northern Affairs Canada
1:30 p.m. -1:45 p.m. Crocker Snow, Director, Murrow Center for Public Diplomacy
1:45 p.m. -2:00 p.m. Vera Metcalf, Director, Eskimo Walrus Commission
2:00 p.m. -2:30 p.m. DIALOGUE
2:30 p.m. -2:45 p.m. BREAK
THEME: Arctic Policy/Governance
2:45 p.m. -2:50 p.m. MODERATOR: David Monsma, Executive Director,
Energy and Environment Program, Aspen Institute
2:50 p.m. -3:05 p.m. The Honorable Bill Sheffield, Former Governor of Alaska
Director, Port of Anchorage
3:05 p.m. -3:20 p.m. The Honorable Reggie Joule, Alaska House of Representatives;
Chair, Alaska State Legislature NWTF
3:20 p.m.-3:35 p.m. The Honorable Frank Murkowski, Former Governor and Senator of Alaska
3:35 p.m. -3:50 p.m. John Miller, Author
3:50 p.m. -4:05 p.m. Harold Heinze, CEO, Alaska Natural Gas Development Authority
4:05 p.m. -4:20 p.m. Carter Roberts, President and CEO, World Wildlife Fund United States
4:20 p.m. -4:35 p.m. The Honorable Edward Itta, Mayor, North Slope Borough
4:35 p.m. -5:05 p.m. DIALOGUE
5:30 p.m. -6:30 p.m. RECEPTION -Tent-Closing Remarks

WEDNESDAY June 23rd, 2011
ARCTIC TOUR (OPTIONAL)
*order subject to change depending on protocol of confirmed speakers
*Details on investor roundtables and entertainment will be published in the Summit program

DRAFT

Alaska Northern Waters Task Force (ANWTF)
Agenda for Kotzebue and Nome Meetings: July 6-9, 2011

KOTZEBUE:

July 6th, Wednesday – Kotzebue Field Tour

- **8:00 am Bering Air Terminal to depart for tour**
- **Tour of Red Dog Mine and Port Site**
- **Group lunch at Red Dog**
- **Return to Kotzebue between 2 to 3 p.m.**
- **Wind mill and city tour (3 to 4 do radio show)**
- **6:00 p.m. Group dinner at NANA Board Room, presentations by:**
  - **NANA Regional Corporation on possible resource development opportunities and**
  - **City of Kotzebue/Cape Blossom group on deep water port sites**

July 7th[th], Thursday, Northwest Arctic Borough Assembly Chambers

Presenters on the following resource development topics:

- **8:30 to 9 a.m. UAF Workshop Findings: Arctic Marine Shipping Assessment Presentation: Mike Sfraga, University of Alaska Fairbanks, Vice-Chancellor**
- **9 to 9:30 a.m. Presentation by Shell on Arctic off shore development plans: Colleen McCarthy, Communications Manager, Shell Oil and Wayne Leighty, Commercial Regulatory Analyst, Shell Oil**

  9:30 to 10 a.m. Presentation by Tom Okleasik, Planning Director, Northwest Arctic Borough, Subsistence mapping

  -15 minute break-
- **10:15 to 11:15 a.m. Presentation on oil spill response capabilities and cooperative agreements with other Arctic nations:**
  - **Department of Environmental Conservation, Larry Dietrick, Director of Division of Spill Prevention and Response**
  - **U.S. Coast Guard, Captain Adam Shaw**

Lunch break from 11:30 to 1 p.m.

- **1:15 to 2 p.m. PEW Environment Group/Marilyn Heiman, Director Pew Environment Group, U.S. Arctic Program**
- **2 to 3 p.m. Lessons Learned Deep Water Horizon: Fran Ulmer, Chair, U.S. Arctic Research Commission**

DRAFT

- **3:30-5:30 Presentation by Rep. Joule on Northern Waters Task Force followed by public testimony on Northern Waters Issues**

NOME:

July 8th, Friday, Old St. Joes

Presenters on the following Arctic infrastructure and research topics:

- **9 to 9:30 a.m. Nome update, impacts of recent changes on local community: Mayor Denise Michels**
- **9:30 to 10:30 a.m. Discussion of possible future deep water port sites in the Northern region, state and federal perspectives:**
  - **Department of Transportation, Michael Lukshin, Engineer**
  - **US Army Corps of Engineers, Stephen Boardman, District Chief, Civil Project Management Branch**

--15 min. break--

- **10:45 to 11:15 a.m. Bering Straits Port Access and Route Study presentation: Captain Adam Shaw, U.S. Coast Guard**
- **11:15 to 11:45 a.m. Land Conservation Cooperation Project: Polly Wheeler, Coordinator, Northwestern Interior Forest Landscape Conservation Cooperative, U.S. fish and Wildlife**

Lunch break from 11:45 to 1:00 p.m.

- **1 to 1:30 p.m. Discussion of vessel tracking in the Arctic: Marine Exchange of Alaska, Ed Page, U.S. Coast Guard (Ret), Executive Director, Marine Exchange of Alaska**
- **1:30 to 2 p.m. Navigational and search and rescue aides needed for the Arctic: U.S. Coast Guard, Captain Adam Shaw**
- **2. to 2:45 p.m. Arctic research presentation: Dr. Kathleen Crane, PhD, Arctic Research Program, NOAA Co Chair of the Arctic Council's Circumpolar Biodiversity Marine Monitoring Program, CAFF**
- **2:45 to 3:15 p.m. Inuit Circumpolar Council, Jimmy Stotts, President**

--15 min. break--

- **3:30-5:30 Presentation by Rep. Joule on Northern Waters Task Force followed by public Testimony on Northern Waters Issues**

July 9th, Saturday, Nome field tours

- **9 am Bering Air Terminal to depart for tour**
- **Morning flight to Wales for community visit**
- **Fly over of Little Diomede, Bering Strait choke point, shoal area off the Wales coast, and possible future deep water port site at Port Clarence**

LUNCH ON OWN

- **Tour of Nome port facilities and gold suction dredging**
- **Tour of rock quarry**

Alaska Northern Waters Task Force (ANWTF)
Agenda for Unalaska: August 24, 2011
Grand Aleutians Hotel

August 24th, Wednesday, Grand Aleutians Hotel

Presenters on the following Arctic fishing and shipping topics:

- **8:30 to 9 a.m. Presentation by U.S. Coast Guard on Arctic Summer Operations: Rear Admiral Ostebo, United States Coast Guard 17th District**
- **9 to 9:30 a.m. Presentation by City of Unalaska on Aleutian Islands Risk Assessment, emergency towing systems, and the mooring buoy project: Shirley Marquardt, Mayor of Unalaska**
- **9:30 to 10 a.m. Presentation by Alaska Marine Pilots on pilotage in Arctic waters: Captain Carter Whalen, Alaska Marine Pilots**

-15 minute break-

- **10:15 to 10:45 a.m. Presentation on Arctic salvage operations: Dan Magone, Owner Magone Salvage**
- **10:45 to 11:30 a.m. Presentation by U.S. Coast Guard on United Nations Convention on Law of the Seas: Rear Admiral Kenny, Judge Advocate General and Chief Counsel, U.S. Coast Guard**

Lunch break from 11:30 to 1 p.m.

- **1:00 to 1:30 p.m. Presentation on the Arctic's Future: Senator Lisa Murkowski**
- **1:30 to 2 p.m. Presentation on Bering Sea Fisheries: Frank Kelty, Natural Resource Analyst, City of Unalaska**
- **2 to 3:00 p.m. Presentation on Development and Implementation of an Arctic Fishery Management Plan: Steve MacLean, North Pacific Fisheries Management Council, Protected Species Coordinator and Fisheries Analyst**
- **3 to 3:30 p.m. Presentation on Arctic fisheries research: University of Alaska, Gordon Kruse, President's Professor of Fisheries, School of Fisheries Division**
- **3:30 to 4 p.m. Presentation on invasive species and border control: Jeffrey J. Lisius, Assistant Port Director Trade**
- **4:00-5:30 p.m. Presentation by Rep. Edgmon on Northern Waters Task Force followed by public testimony on Northern Waters Issues**

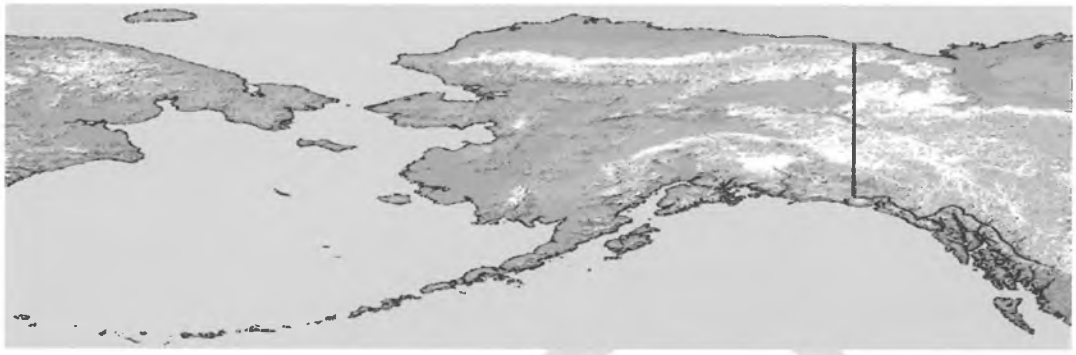
Legislative Fly-In August 25-27th

Alaska Northern Waters Task Force

October 10, 2011 (Monday)
Bethel, AK – YKHC Board Room

- Arctic Research
- Climate Change & Erosion

Monday, October 10	**Alaska Northern Waters Task Force**
10:00 – 10:05am	**Introduction from ANWTF Chair Reggie Joule**
10:05 – 10:45am	**Mike Coffey, DOT, Maintenance and Operations Chief** Climate Change and Alaska's Public Infrastructure
10:45 – 11:00am	**BREAK**
11:00 – 11:45am	**Mike Brubaker, ANTHC, Director, Community Environmental Health** Climate Change: Challenges to existing community infrastructure and design for future sustainability
11:45 – 12:00pm	**BREAK**
12:00 – 1:15pm	**Local Knowledge Elders Panel**
1:15 – 1:45pm	**Pizza Lunch Provided**
1:45 – 2:30pm	**Tim Andrew, AVCP, Natural Resource Manager**
2:30 – 3:15pm	**Steve Street, AVCP, Director of Cultural & Environmental Sciences** Shoreline Erosion: A Crisis for Historic Preservation
3:15 – 3:30pm	**BREAK**
3:30 – 5:00pm	**Public Testimony (Any topic related to the ANWTF)**
5:00pm	**Meeting Adjourned**



Alaska Northern Waters Task Force

October 11, 2011
Anchorage, AK – Anchorage LIO Conference Room
Topic: Current Arctic Research and Research Gaps

Tuesday, October 11	**Alaska Northern Waters Task Force**
8:30am	**Call to Order & Introductions**
8:45 – 9:30am	**Molly McCammom, AOOS** *Summary of Major Arctic Research*
9:30am – 10:30am	**Panel Presentation & Discussion** **Melanie Smith, Audubon Alaska** *Arctic Marine Data Synthesis and Research Gaps* **Leslie Holland-Bartels, USGS** *Research Gaps*
10:30am – 11:15am	**Billy Connor, UA Transportation Center** *Permafrost Issues in Alaska Relating to Transportation and Construction*
11:15am – 11:25am	**Break**
11:30am – 12:00pm	**Kristen Shake, UAF School of Fisheries & Ocean Sciences** *Ocean Acidification*
12:00pm – 12:45pm	**Lunch: Provided (ANC LIO Conference Room)** **Bill Schnabel, UAF Water and Environmental Research Center** *"Coastal Communities and Climate Change" video provided by Marine Advisory Program*
12:45pm -1:00pm	**Cpt. Pater Garay,** *AK Marine Pilots*

1:00pm – 1:30pm	**Nils Andreassen** *Institute of the North*
1:30pm – 4:00pm	**Discussion and Decisions on Final Recommendations**
4:00	**Meeting Adjourned**

DRAFT

ATTACHMENT D: DEFINITION OF THE ARCTIC:

Arctic Boundary as Defined by the Arctic Research and Policy Act (ARPA)

All United States and foreign territory north of the Arctic Circle and all United States territory north and west of the boundary formed by the Porcupine, Yukon, and Kuskokwim rivers; all contiguous seas, including the Arctic Ocean and the Beaufort, Bering, and Chukchi seas; and the Aleutian chain.

Overview of Research and Monitoring in the Arctic

Overview of research and monitoring in the Arctic

Northern Waters Task Force

October 11, 2011

Molly McCammon, Executive Director

Alaska Ocean Observing System

www.aoos.org

AOOS

Alaska Ocean Observing System

1 year ago: gave talk to NWTF on "Why Care about the Arctic"

- U.S. is an Arctic nation
- Alaska IS the U.S. Arctic
- Arctic Ocean is least studied in world
- Arctic affects global climate
- Home to indigenous populations
- Rich in oil & gas, fisheries
- Biodiverse

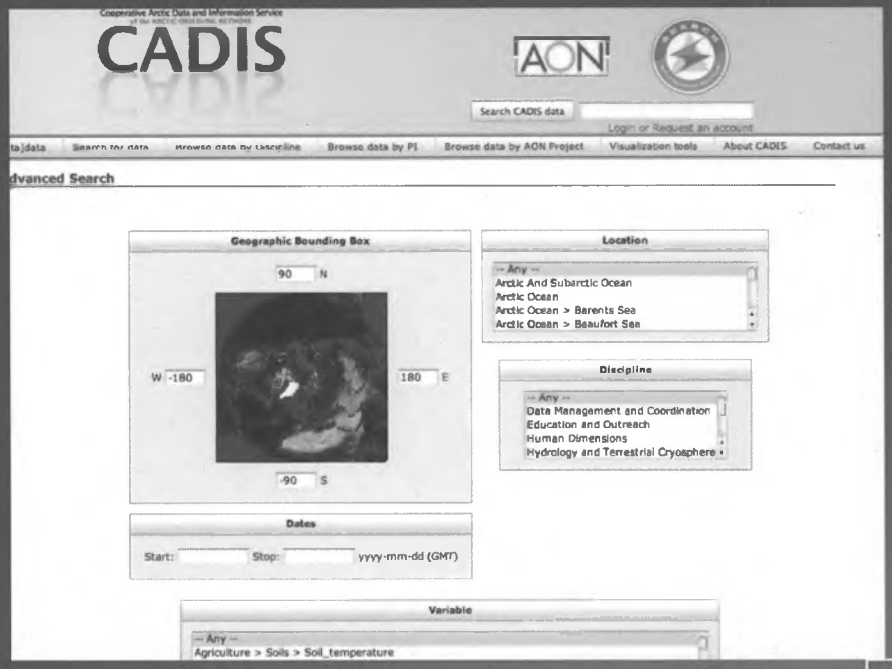
cont.

- Ground zero for climate change
- National security issues
- Opportunities for increased tourism, resource use, shipping
- Concerns for coastal communities, subsistence users, endangered species, ocean acidification

In past year, NWTF has

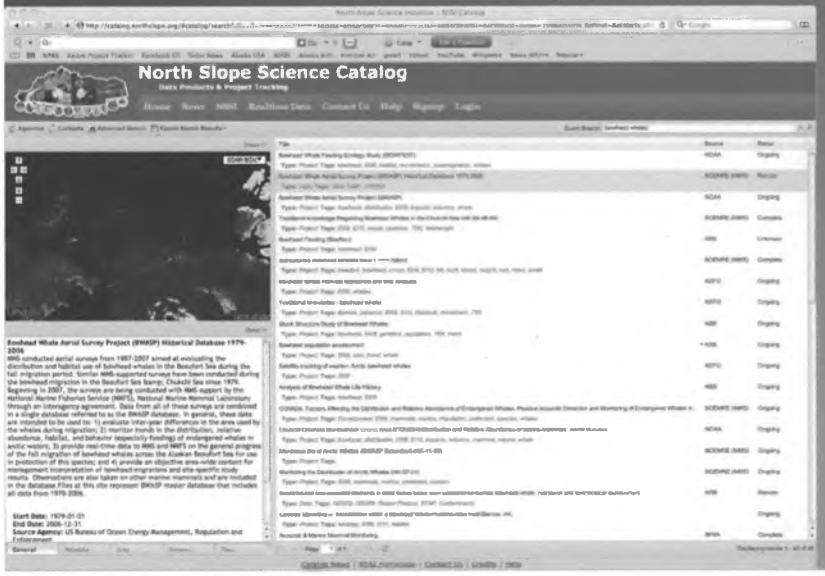
- Held meetings in Nome, Kotzebue, Unalaska, Bethel, Anchorage
- Visited other rural coastal communities
- Heard from dozens of Alaskans, scientists, agency experts

Arctic Research & Monitoring: a mix of players



Where do you go for information?

3 major data portals:
NSSI, AOOS & ACADIS



AOOS Arctic Assets Map

ARCTIC SCIENCE SUMMARY

2. APOA and AOGA Nearly 400 studies in Prudhoe Bay and Beaufort Sea, all related to potential impacts from oil and gas developments. Both biological and physical aspects. Start of assessment of acoustic impact on marine life and effectiveness of mitigation.

15. UW Sound Measurements. Sound and propagation characteristics of various industrial activities have been documented over the years. The measurment protocol and equipment has evolved over the years. No standardized methodology for these type of measurements exists.

23. SBI cruise is an example of change from single cruises to large multi-year, multi-disciplinary environmental programs in the Arctic.

31. Environmental Studies Program from CPAI, Shell and Statoil is unique in the sense that oceanographic and biological data are collected in a structural integrated manner, allowing

1. WEBSEC Characterization of oceanographic and biological data summer/fall season. Chukchi Sea (1970) and Beaufort Sea (1971-1972). Resulted in comprehensive list of species sampled.

3-13, 15-17, 19. OCSEAP Result from various disciplines are reported in a Synthesis Report in 1978: 'Beaufort/Chukchi Interim Synthesis Report'. No integrated analyses across disciplines were conducted. Access to Report through BOEMRE's website.

9. Bird Colony Surveys. Radio transmitters placed on birds from these colonies starting in 1994 (by USGS)document ed areas of the OCS were utilized by these colonies

8. Beaufort Sea ice studies confirmed that critical life processes of most Arctic invertebrates and vertebrates take place during the relatively calm

24. RUSALCA is a multi-year, multi-disciplinary program utilizing scientists from the US and Russia to collect benchmark information about Arctic processes.

Research Programs*

1930 1931 1932 1933 1934 1935 1936 1937 1938 1939 1940 1941 1942 1943 1944 1945 1946 1947 1948 1949 1950 1951 1952 1953 1954 1955 1956 1957 1958 1959 2000 2001 2002 2003 2004 2005 2006 2007 2008 2009 2010

1. Western Beaufort Sea Ecological Cruises (WEBSEC)
Beaufort Sea

2. Oil and Gas Industry Research Programs (coordinated through APOA and AOGA)
Beaufort Sea. Start of assessment of acoustic impact on marine life and effectiveness of mitigation

3. Long term study of Black Guillemot Colony, Cooper Island, Beaufort Sea (OCSEAP, UAF)
OCSEAP — Beaufort Sea. After OCSEAP continuing annual monitoring of Black Guillemot nesting colonies by Dr. Divoky (UAF) in relation to climate change

4. Arctic Fish Habitat Use Beaufort Sea (OCSEAP, ADFG, NOAA, BOEMRE, Industry)
Beaufort Sea. Fish studies conducted by ADFG (1974), BOEMRE (1980) and ARCO, CPAI & BP (1976-present)

5. Bearded Seal History and Ecology (OCSEAP)
Beaufort Sea & N-Pacific

6. Ice Edge Ecosystem Productivity, plankton focus (OCSEAP)

7a. Ice-seal and other Marine Mammal Surveys, Chukchi Sea (OCSEAP, ADFG, USFWS, USGS)
Chukchi and Bering Sea. Ice-seal feeding and ecology studies. Aerial surveys ringed seals, and ongoing studies (e.g. see 7b, 7c)

7b. Ice Seal Satellite tracking studies (ADFG, Kotzebue hunters)
Chukchi Sea. Fieldwork with native hunte

7c. Walrus satellite and radio tracking, population surveys (ADFG, USGS, Russians, Chukchi hunters)
Chukchi Sea

8. Beaufort Sea Icebreaker Studies (OCSEAP), continuation of WEBSEC
Beaufort Sea

9. Bird Colony surveys Cape Lisburne & Cape Thompson (OCSEAP, USFWS, USGS)
Chukchi Sea (OCSEAP) — USFWS — USGS

10. Beaufort Sea Barrier Island - Lagoon Ecosystem Process Study (OCSEAP)
Beaufort Sea

11. Bowhead Whale Migration, Distribution and Abundance. Aerial surveys (OCSEAP, BOEMRE, NMML)
Bering, Chukchi, Beaufort Seas Aerial Survey (OCSEAP) — Beaufort Sea. Bowhead Whale Aerial Survey Program (BWASP), conducted by BOEMRE and NMML.

12. Foodweb and Nutrient Dynamics Nearshore Alaskan Beaufort Sea Waters (OCSEAP)
Beaufort Sea

13. Toxicity of Oil-Well Drilling Muds to Alaskan Larval Shrimp and Crabs (OCSEAP)

14. Polar Bear Research, Southern Beaufort population (USFWS, USGS)
Beaufort Sea. Mark-Recapture surveys. Aerial surveys. Effect of climate change on population

15a. UW Sound Measurement and Localisation from Prudhoe Bay Region (OCSEAP)
Beaufort Sea. Started as OCSEAP. UW sound measurements of man-made sounds is ongoing and mainly conducted by Industry (e.g. 15b, 15c, 15d)

15b. UW Sound and Marine mammal Monitoring Expl. Drilling and Icebreaker Operations (Industry)
Beaufort Sea. A total of 30 wells were drilled during this period

15c. UW Sound and Marine Mammal Monitoring Seismic/Shallow Hazard Surveys, Beaufort Sea (Industry)
Beaufort Sea — Beaufort Sea

15d. UW Sound and Marine Mammal Monitoring Northstar Island (Industry)
Beaufort Sea. Information on bowhead deflection related to offshore production.

16. Chukchi Sea Coastal Studies, Habitat mapping related to oil spill response (OCSEAP)
Chukchi Sea

17. Winter Ecology of Under Ice Benthos (OCSEAP)
Beaufort Sea

18. Migratory Bird Management Surveys (USFWS)
Chukchi and Beaufort Sea. Aerial population surveys of various sea ducks and waterfowl.

19. Oil-Ice-Sediment Interactions during Freeze-up and Break-up (OCSEAP)

20. UW Sound and Marine mammal Monitoring Expl. Drilling and Icebreaker Operations (Industry)
Chukchi Sea. Five wells were drilled

21. ANIMIDA and c-ANIMIDA Program (BOEMRE)
Beaufort Sea

22. Beluga Movements and Satellite tagging Studies (NSB, ABWC, NMFS)
Chukchi and Beaufort Seas

23. Western Shelf Basins Interactions Project (SBI) - funded by NSF, ONR, USCG
Chukchi Sea

24. Russian-American Long-Term Census of the Arctic (RUSALCA)
Chukchi Sea

25. Bowhead Whale Tagging Study (ADFG, AEWC, BOEMRE)
Chukchi & Beaufort Seas

26. Bowhead Whale Feeding Ecology Study (BOWFEST)
Beaufort Sea, Barrow

27. Acoustic Monitoring of Bowhead Calls, Beaufort Sea (Shell)
Beaufort Sea

28. UW Sound and Marine Mammal Monitoring Seismic and Shallow Hazard Surveys (Industry)
Chukchi Sea

29. Polar Bear surveys Chukchi Sea population (USFWS, USGS)
Chukchi Sea

30. COMIDA Bowhead Whale Abundance and Distribution, Chukchi Sea (BOEMRE, NMML)
Chukchi Sea

31. Environmental Studies Program Chukchi Sea (CPAI, Shell, Statoil)
Chukchi Sea

32. COMIDA studies, Chukchi Sea (BOEMRE)

33. CHAOZ Acoustic, Oceanography, and Zooplankton Study (NMML, NOAA)

34. Bearded Seal Movement, Habitat use and Foraging behavior Study (NSB, NOAA)

Color Legend:

- Beaufort Sea Studies
- Chukchi Sea Studies
- Studies applying both to the Beaufort and Chukchi Sea
- Area of survey unknown

Sources: Websites of BOEMRE, NMFS, ADFG, USFWS, AOFG, NSB, and Shell 2010; Science of the U.S. Arctic Outer Continental Shelf, Vol.1

Note: This summary includes main research programs and is not intended as a comprehensive list of all studies that were or are being conducted.

ARCTIC SCIENCE SUMMARY

	Research Programs:	Research Disciplines	Location	Season
1	Western Beaufort Sea Ecological Cruises (WITSEC)	Physical Oceanography, Chemical, Plankton, Benthos, Fish	Beaufort Sea (Chukchi, 1975)	Summer / Fall
2	Oil and Gas Industry Research Programs (coordinated through APOA and AOGA)	Physical Oceanography, Ice Dynamics, Oil in water, Underwater Sound, Marine Mammals, Birds	Beaufort Sea	Winter / Summer
3	Long-term study of Black Guillemot Colony (OCSEAP, UAF)	Seabird	Beaufort Sea, Cooper Island	Summer
4	Arctic Fish Habitat Use Beaufort Sea (OCSEAP, ADFG, NOAA, BOEMRE Industry)	Marine Fish	Beaufort Sea, nearshore areas	Summer
5	Bearded Seal History and Ecology (OCSEAP)	Marine Mammals	Beaufort Sea and North Pacific	??
6	Ice Edge Ecosystem Productivity, plankton focus (OCSEAP)	Plankton, focusing on ice edge system	Beaufort Sea?, Chukchi Sea?	Spring?
7a	Ice seal and other Marine Mammal Surveys, Chukchi Sea (OCSEAP, ADFG, USFWS, USGS)	Marine Mammals	Chukchi and Bering Sea	Spring / Summer
7b	Ice Seal Satellite tracking studies (ADFG, Kotzebue hunters)	Marine Mammals	Chukchi Sea	Spring / Summer
7c	Walrus radio tracking (USGS, hunters Chukchi villages)	Marine Mammals	Chukchi Sea	Spring / Summer
8	Beaufort Sea Icebreaker Studies (OCSEAP), Phyto/Zooplankton, continuation of WITSEC	Phytoplankton, Zooplankton	Beaufort Sea	Summer / Fall
9	Bird Colony surveys Cape Lisburne & Thompson (OCSEAP, USFWS, USGS)	Seabirds	Chukchi Sea	Spring
10	Beaufort Sea Barrier Island - Lagoon Ecosystem Process Study (OCSEAP)	Zooplankton, Benthos, Fish, Seabirds, Marine mammals	Beaufort Sea	Summer / Fall
11	Bowhead Whale Migration, Distribution and Abundance (OCSEAP, BOEMRE, NMML)	Marine mammals, specifically bowhead whale	Beaufort Sea	Summer / Fall
12	Foodweb and Nutrient Dynamics Nearshore Alaskan Beaufort Sea Waters (OCSEAP)	Ice-algae, phytoplankton production	Beaufort Sea	??
13	Toxicity of Oil/Well Drilling Muds to Alaskan Larval Shrimp and Crabs (OCSEAP)	Shrimp and Crab larva	NA	NA
14	Polar Bear Research, Southern Beaufort population (USFWS, USGS)	Marine Mammals	Beaufort Sea	Spring / Summer
15a	UW Sound Measurement and Localization from Prudhoe Bay Region (OCSEAP)	Acoustic	Beaufort Sea	Winter / Spring / Summer
15b	UW Sound and Marine mammal Monitoring Exp. Drilling and Icebreaker Operations (Industry)	Marine Mammals, Acoustic	Beaufort Sea	Summer / Fall
15c	UW Sound and Marine Mammal Monitoring Seismic Surveys, Beaufort Sea (Industry)	Marine Mammals, Acoustic	Beaufort Sea	Summer / Fall
15d	UW Sound and Marine Mammal Monitoring Northstar Island (Industry)	Marine Mammals, Acoustic	Beaufort Sea	Winter/ Spring / Summer
16	Chukchi Sea Coastal Studies, Habitat mapping related to oil spill response (OCSEAP)	Physical and Biological description of northern Chukchi Sea coastline	Chukchi Sea	
17	Winter Ecology of Under Ice Beluga (OCSEAP)	Invertebrates, vertebrates under ice	Beaufort Sea	Winter?
18	Migratory Bird Management Surveys (USFWS)	Sea ducks	Chukchi and Beaufort Sea	Spring?
19	Oil-Ice-Sediment Interactions during Freeze-up and Breakup (OCSEAP)	Interactions of oil, ice and suspended particulate matter	NA	NA
20	UW Sound and Marine mammal Monitoring Exp. Drilling and Icebreaker Operations (Industry)	Marine Mammals, Acoustic	Chukchi Sea	Spring / Summer
21	ANIMIDA and c-ANIMIDA Program (BOEMRE)	Soil and Biota Chemistry, Contaminants, Biological effects Pollutants, Marine Mammals, Whaling	Beaufort Sea	Spring / Summer
22	Beluga Movements and Satellite tagging Studies (NSB, AEWC, NMFS)	Marine Mammals	Chukchi and Beaufort Sea	Spring
23	Western Shelf Basins Interactions Project (SBI) - funded by NSF, ONR, USCG	Physical Oceanography, Marine mammal acoustics (passive), Zooplankton acoustics (active)	Chukchi Sea	Spring / Summer
24	Russian-American long-term Census of the Arctic (RUSALCA)	Physical Oceanography, Plankton, Marine mammals (opportunistic)	Chukchi and Bering Seas	Summer
25	Bowhead Whale tagging Study (ADFG, AEWC, BOEMRE)	Marine Mammals, bowhead whales	Chukchi and Beaufort Sea	Spring
26	Bowhead Whale feeding Ecology Study (BOWFEST)	Oceanography, Zooplankton, Seabeds, Marine Mammals, Acoustic	Beaufort Sea, Barrow area	Summer / Fall
27	Acoustic Monitoring of Bowhead Calls, Beaufort Sea (Shell)	Marine Mammals, Acoustic	Beaufort Sea	Summer / Fall
28	UW Sound and Marine Mammal Monitoring Seismic and Shallow Hazard Surveys (Industry)	Marine Mammals, Acoustic	Chukchi Sea	Summer / Fall
29	Polar Bear surveys Chukchi Sea population (USFWS, USGS)	Marine Mammals	Chukchi Sea	Summer / Fall
30	COMIDA Bowhead Whale Abundance and Distribution, Chukchi Sea (BOEMRE, NMML)	Marine mammals, specifically bowhead whale	Chukchi Sea	Summer / Fall
31	Environmental Studies Program Chukchi Sea (CPAI, Shell, Statoil)	Oceanography, Chemistry, Ocean acidification, Plankton, Benthos, Seabirds, Marine Mammals, Acoustic	Chukchi Sea	Summer / Fall
32	COMIDA studies, Chukchi Sea (BOEMRE)	Benthic, Soil and Biota Chemistry, Opportunistic Seabird and Marine Mammal	Chukchi Sea	Summer / Fall
33	CHAOZ Acoustic, Oceanography, and Zooplankton Study (NMML, NOAA)	Oceanography, Zooplankton, Acoustic	Chukchi Sea	Summer
34	Bearded Seal Movement, Habitat use and Foraging behavior Study (NSB, NOAA)	Marine Mammals	Chukchi Sea	Summer

Color Legend:

- Beaufort Sea Studies
- Chukchi Sea Studies
- Studies applying both to the Beaufort and Chukchi Sea
- Area of survey unknown

Sources: Websites of BOEMRE, NMFS, ADFG, USFWS, AOGA, AOA and Shell 2010, Initiation of the U.S. Arctic Outer Continental Shelf, Vol I

Note: This summary includes main research programs and is not intended as a comprehensive list of all studies that were or are being conducted.

Primary funding sources

- National Science Foundation*
- BOEM(RE), former MMS*
- Industry: Shell, CP, Statoil, BP*
- Other federal agencies: USGS, NOAA, EPA, USFWS
- State agencies: ADF&G, ADEC
- North Pacific Research Board
- Other (e.g., North Slope Borough, AOOS, NGOs)

Federal research commitment to Arctic: estimated at $400m/year (includes satellites)

Primary coordination/collaboration entities…many w/stakeholder advice

- North Slope Science Initiative
- Alaska Ocean Observing System
- North Pacific Research Board
- US Arctic Research Commission/Interagency Arctic Research and Policy Committee (IARPC)
- DOI LCCs, DOI Climate Center, NOAA Climate Service
- AK Climate Change Executive Roundtable
- ACCAP
- Co-management groups: whaling, walrus, beluga
- North Pacific Fishery Management Council
- AK Marine Ecosystem Forum
- ARCUS

International Groups

- Arctic Council
- Sustained Arctic Observing Network (SAON)
- Arctic Marine Assessment Program (AMAP)
- Internatl Arctic Science Committee (IASC)
- North Pacific Marine Science Organization (PICES)
- Pacific Arctic Group (PAG)

National Science Foundation

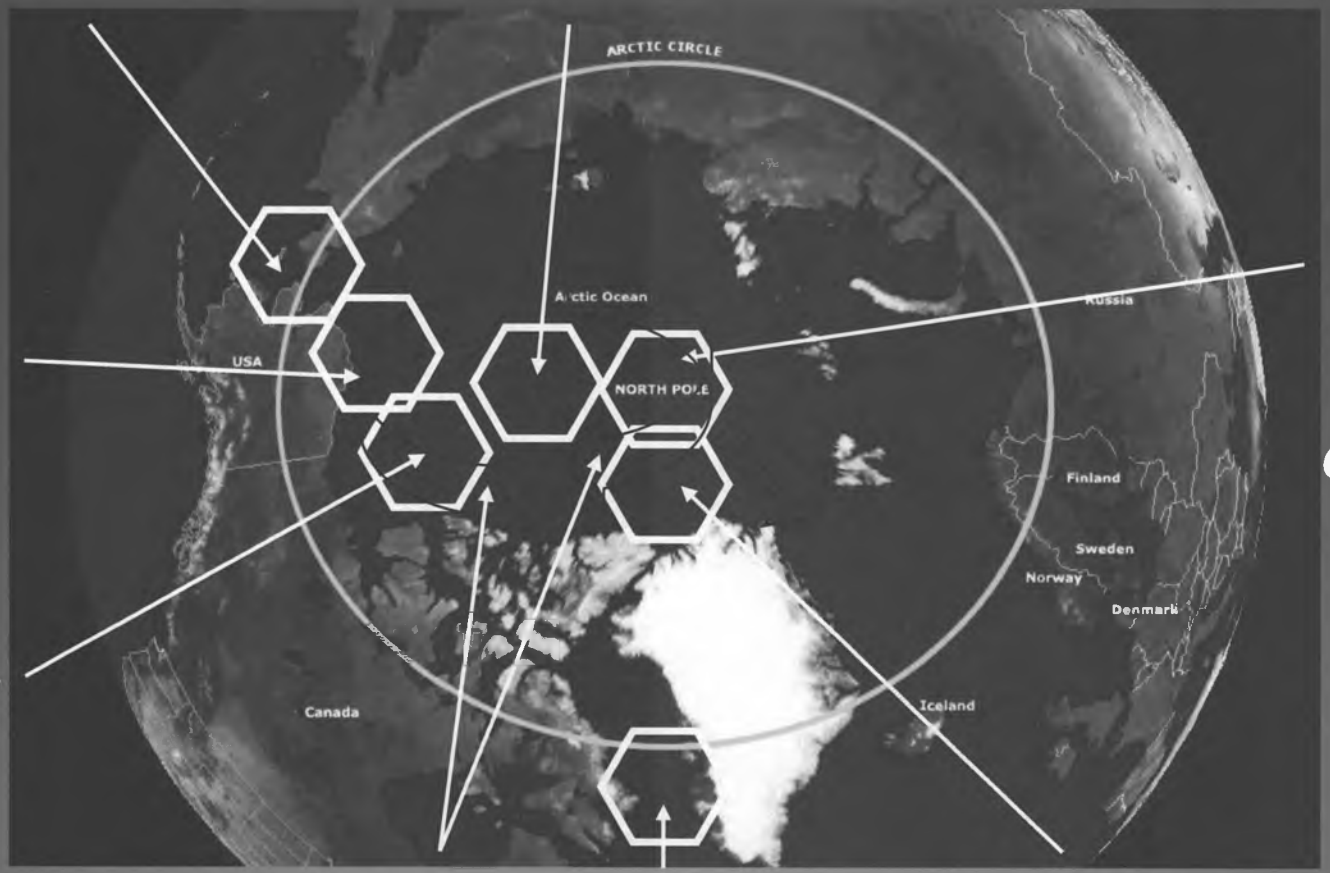
- Largest federal funder
- Focus: central Arctic basin for climate & sea ice
- Main interagency umbrella program: SEARCH:

  observe, understand, respond to change
- Added Arctic Observing Network (AON – 40 projects) during IPY: ice-tethered profilers, ice mass balance buoys, ocean flux buoys, No Pole observatory, Beaufort Gyre
- BEST, Arctic System Science Program & Synthesis (of Arctic processes), Shelf-Basin Investigations (Healy cruises to study warming of Arctic), & Study of Northern AK Coastal Systems (coastal zone)
- Arctic Report Card, Sea Ice Outlook
- Supported by ARCUS

Physical & Chemical Oceanography; Sea Ice

Bering Strait

Aerial Hydrographic Surveys



Seasonal Ice Zone

North Pole Environ-mental Observatory

Beaufort Gyre Observatory & Deepest Waters

Ice-Tethered Profilers & Ice Dynamics and Weather Buoys

Davis Strait

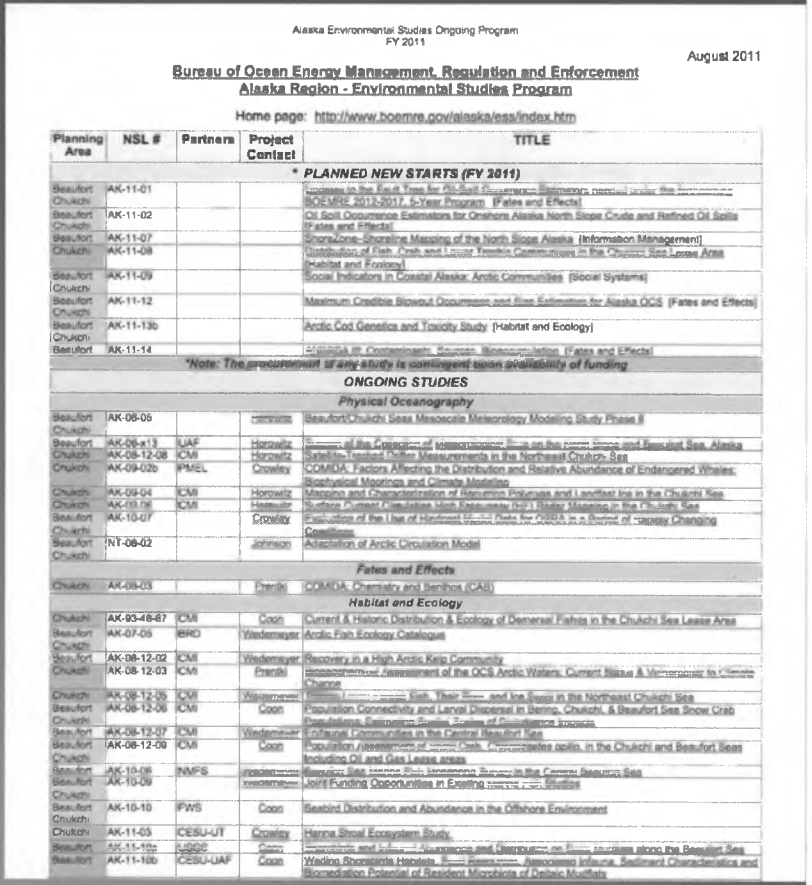
Switchyard & Seasonal Ice Zone

More recently….

- Beaufort/Chukchi nearshore oceans
- Bering Sea Sub-Network
- Western Arctic mooring: with OA sensors
- More IABP buoys in nearshore waters….
- SIZONET : nearshore radars, webcams, local observers

BOEM(RE)

- 2007-2009, leveraged $30m studies in Chukchi: about $10-15m a year
- Studies focus on info needed to assess potential environmental problems w/O&G activities
- Ocean circulation, baseline chemistry, physics & biology, habitat, fate & effects of oil, protected species, subsistence
- Identified need for more synthesis: physics & marine mammal synthesis underway



Alaska Environmental Studies Ongoing Program
FY 2011

Industry

- Offshore work: primarily Shell, ConocoPhillips, & Statoil, some BP
- $20-40m a year, including ship time
- Joint environmental studies in Chukchi
- Individual companies: weather buoys & sea ice SAR images: to aid research & exploration vessels
- Shell: $4-5m/yr to NSB for science studies
- Joint Industry Program (JIP): industry cooperative to fund studies important to entire international industry (cleanup of oil in ice)

Joint Industry Studies

- Jt Environmental studies focusing on lease areas, permit requirements, & baseline data
- Work covers: birds, mammals & fish, zooplankton, ocean chemistry & physics
- Significant work on bottom sediments, also effects of noise on marine mammals

Other federal agencies

- NOAA: RUSALCA w/NSF & Russia: since 2004, Bering Strait moorings & cruises; DBO; climate; weather & sea ice forecasting; Sea Ice Outlook for Walrus Hunters; Arctic website; satellites; unmanned aircraft
- USGS: coastal erosion, freshwater fish, polar bears, Regional Climate Center
- USFWS: LCCs about $2 m each (5 in AK), also sea otters, walrus & sea birds w/USGS
- Navy: sea ice in Chukchi, Natl Ice Center (w/Coast Guard & NOAA)
- NASA: satellites; National Snow & Ice Data Center (w/NSF & NOAA)
- Army Corps: CRREL (Cold Regions Research Lab) & coastal erosion
- DOE: atmosphere
- EPA: water quality

North Pacific Research Board

- 2007-2012: $52m joint study in Bering Sea w/NSF
- FY 11: $400k in data rescue, Arctic cod, algal toxins in marine mammals
- FY 12 RFP: $400k for specific work in Arctic cod, fish, fish habitat, lower trophic levels & primary production, walrus, belugas & ice seals; additional $400k to non-specific Arctic
- FY 12 RFP w/NSF: $1.5m for synthesis & gap analysis (industry funded)

Product will help inform joint NPRB/NSF/plus others major integrated research program beginning 2014

NPRB Arctic funding commitment planned: $3m min

(plus staff time)

Announcing a special Bering Sea session at the 2012 Ocean Sciences Meeting
The Bering Sea Project's Science Advisory Board and program managers are pleased to announce acceptance of a Bering Sea-focused special session for the 2012 Ocean Sciences Meeting, 19-24 February 2012 in Salt Lake City, Utah. This will be a great opportunity to showcase Bering Sea Project results in a major venue, and to build on the Bering Sea special session held previously at the 2010 OS meeting in Portland. Follow these links for more information on:
the Ocean Sciences Meeting in general
the special session details (#165 within the 'high latitude' category)
abstract submission and registration - note the firm 7 October 2011 abstract submission deadline!!
Contact the session co-chairs, Mike Sigler and Mike Lomas, or Tom Van Pelt with any questions.
2nd 'Bering Sea Project Special Issue' announced
To best communicate the tremendous amount of new information emerging from the Bering Sea Project, our vision has been to develop special journal issues on a roughly annual schedule. The first Bering Sea Project special issue is progressing well, with 24 manuscripts in the late stages of peer review-- we anticipate publication in Deep-Sea Research II around January 2012.
UPCOMING EVENTS
29 September PI teleconference, 0900 AK time
3 October deadline for AMSS abstract submission
7 October deadline for Ocean Sciences Meeting abstract submission - note special Bering Sea session #165
14-23 October PICES-2011, 20th annual meeting of PICES. Khabarovsk, Russia.
24 October SAB teleconference, 1000 AK time
26-27 October MSE Workshop, Seattle. Contact Andre Punt or Liz Moffitt for details.
27 October PI teleconference, 0900 AK time
30 November deadline for manuscript submission for 2nd Bering Sea Project special issue
1 December PI teleconference, 0900 AK time
For more information about upcoming events, or if you'd like to add a relevant event, please contact Tom Van Pelt.

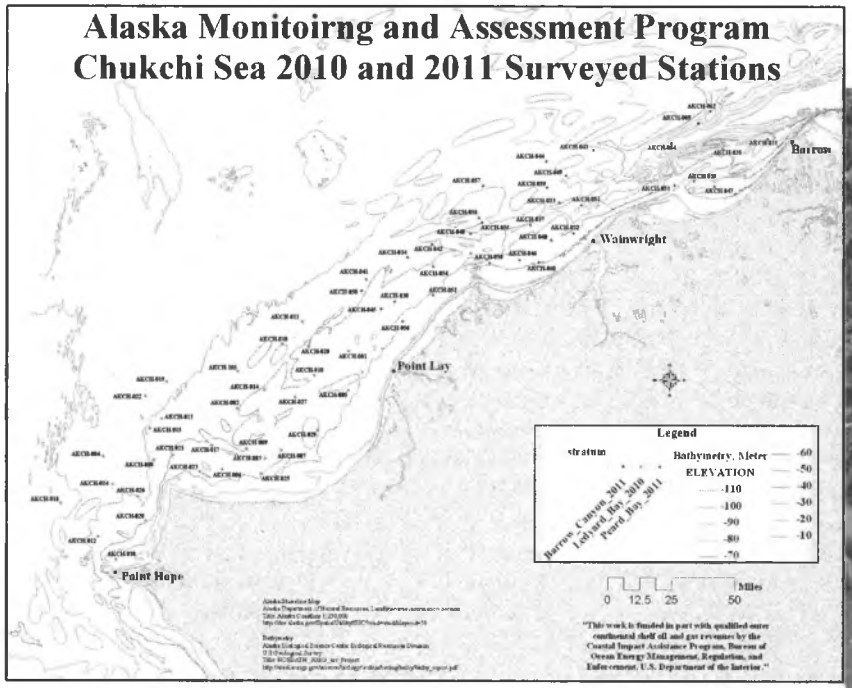
Implications of a colder Bering Sea explained in KDLG-Dillingham radio interview (December 2010)
Bering Sea Project featured in Nature (November 2010)
Find all news items here.

State of Alaska

- ADF&G bowhead & gray whale tagging
- ADEC: $2.1m 2010-2011 Chukchi & Beaufort water quality monitoring project, AKMAP funded by CIAP



Others

- North Slope Borough – mostly spring work on bowheads, agreement w/Shell for $4-5m a year science work identified as important by communities
- AOOS: contribute to equipment purchases; data integration & visualization; Arctic assets map, ship coordination; sea ice atlas; coordination & facilitation, 10 year buildout for long term obs

Recommendations

- Improved sea ice nowcasts/forecasts & trajectories
- Baseline surveys of key physical, chemical & biological parameters – monitor change over time
- Marine mammal response to noise – research
- Develop ocean circulation nowcast/forecasts
- ID & monitor biological hotspots: Hannah Shoal, Ledyard Bay, Barrow Canyon, Boulder Patch in Prudhoe Bay
- Integrate & visualize data
- Develop a grand plan

USARC: establishes research goals & sets research policy

IARPC: adopts goals, creates research plan

White House: OMB/OSTP

Congress: authorizers & appropriators

USARC comments on budget to Congress

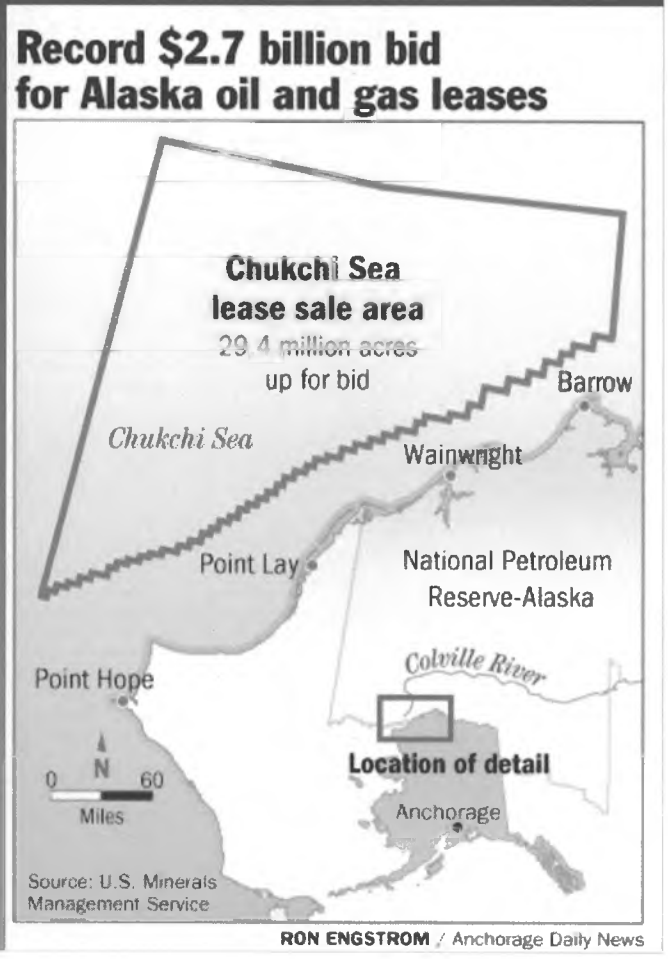
Industry/NOAA Data Sharing MOA

- Signed in August by NOAA & 3 companies: Shell, Statoil & ConocoPhillips
- Umbrella agreement committing industry to sharing data with government and public
- 1st priority: met ocean data in real-time to assist weather forecasting & sea ice images for forecasting
- 2nd priority: non-real time data: hydrographic & bathymetry surveys for charting, habitat mapping; modeling & environmental studies
- Potential use of AOOS Data Portal for public access

CMSP Proposal

- State concerns w/CMSP
- Focus on identifying needs for additional data layers for decision support: human uses,

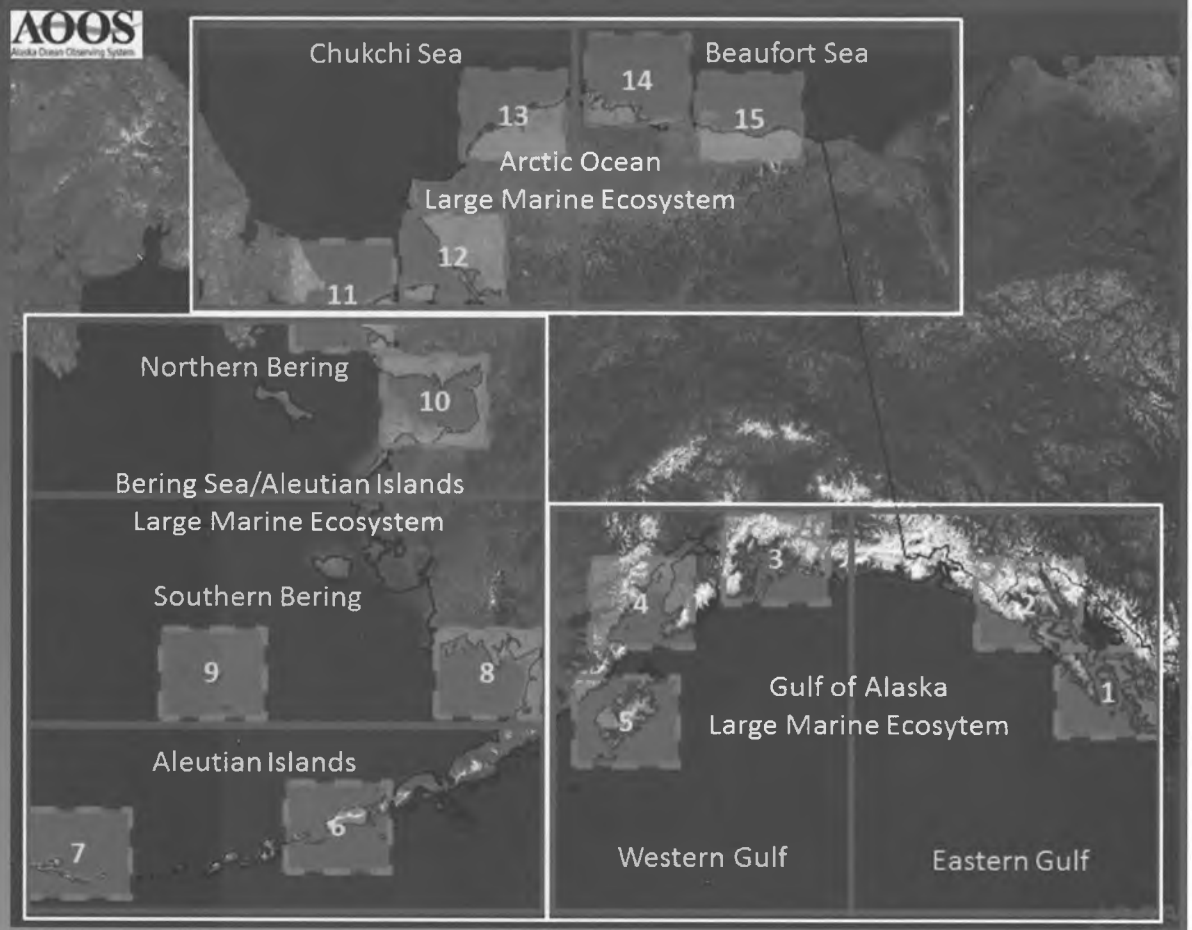
  20 year climate scenarios
- What info do stakeholders need?
- 1 year, $760k
- Partners: AOOS, UA, TNC



10 year AOOS build out

4 themes:
- Marine operations
- Coastal Hazards
- Climate trends
- Ecosystems/fisheries & water quality

3 Large Marine Ecosystems
7 Sub-regions
15 (or more) Areas



Other Activities

- US Arctic Observing Coordination Mtg, March 2012
- Sea Ice Forecasting Workshops
- NPRB/NSF synthesis & proposed ecosystem studies
- Sikuliaq launch 20123-14
- Coast Guard study of Bering Strait
- NOAA Arctic Vision & Strategy
- AK Sea Grant workshop in Bering Strait
- Natl Ocean Policy: Arctic Strategic Action Plan

Conclusions

- A lot of research and monitoring going on in the Arctic
- Nobody knows it all, nor is there 1 place to find it all
- There's probably some duplication, but everyone is trying to avoid that with $$ so tight
- A lot of new data has been collected, but not all of it has been synthesized in a way that furthers our big picture understanding of the Arctic
- We can do better

Evaluation of Science Needs on OCS Energy Development

An Evaluation of the Science Needs to Inform Decisions on Outer Continental Shelf Energy Development in the Chukchi and Beaufort Seas, Alaska

Leslie Holland-Bartels
USGS Arctic OCS Team
October 11, 2011

Northern WaterTask Force
Anchorage AK

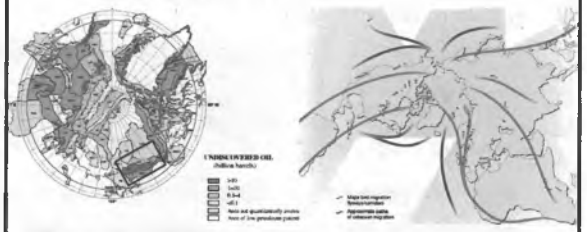
Context: March 31 Energy Policy Announcement

Development: "…expand development and production throughout the Gulf of Mexico, including resource-rich areas of the Eastern Gulf of Mexico…"

Exploration: "…expand oil and gas exploration in frontier areas, such as the Arctic Ocean and areas in the Atlantic Ocean, to gather the information necessary to develop resources in the right places and the right ways."

Conservation: "…calls for the protection of special areas like Bristol Bay in Alaska…national treasure[s] that we must protect for future generations."

USGS



High Energy Potential | High Ecological Value

USGS

What this was not

- Prioritize research for permitting decisions
- Review and report on all research that exists

We were asked to

- Gain a better understanding of the breadth of perspective across major vested parties: Give the Secretary more context to the divergent perspectives brought to him
- Examine the literature and ongoing work and give the Secretary an independent flavor of the available science and potential useful future effort in specific focal areas that he had received significant public comment on

USGS

USGS Arctic OCS Study – Assignment

An initial, independent evaluation of science needs to understand the resilience of Arctic coastal and marine ecosystems to Outer Continental Shelf resource extraction activities – Chukchi and Beaufort Seas.

Key Topics of Focus:

Marine Mammals and Seismic Activities: Effect of seismic exploration activities (sound) on marine mammals;

Oil Spill Response: Research needs to allow for an effective and reliable oil spill response in ice-covered regions; and

Cumulative Impacts: Cumulative impacts of development, infrastructure, and maintenance activities;

Climate Change Considerations: How the likely effects of climate change will either mitigate or compound the impacts from energy development in the Arctic environment.

USGS

USGS Arctic OCS Study – Process

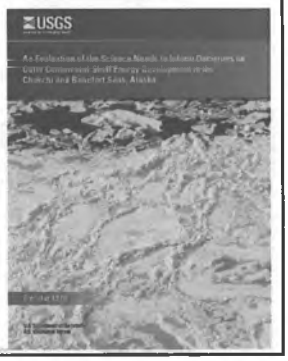
- Reviewed >400 scientific publications, workshop findings, science policy documents, and web sites.
- Met with >40 individuals and organizations that have research or science assessments on the issue topics.
- Conducted a series of structured information sessions with key vested parties: Prototype "Disparate Stakeholder Analysis" with Northslope community, oil industry, State, Federal, and nonregulatory interests to clarify points of disention and what, if any, science could improve consensus building.
- Held a special session at the Alaska Marine Science Symposium to gather final thoughts on specific science gaps.

USGS

USGS Arctic OCS Study – Products

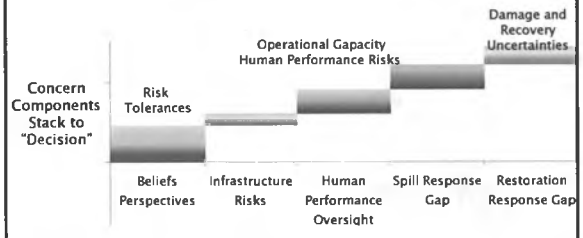
Resulting findings:

•USGS Circular 1370:
•http://pubs.usgs.gov/circ/1370



USGS

Full Cycle View: Stakeholder reach their "decisions" and see GAPs differently



USGS

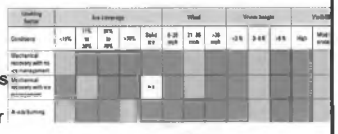
Oil Spill Risk, Response, and Impact: examples

- Develop centralized information to house rapidly emerging science and technical information: Big Challenge
- Better understand physical oceanography, meteorology to refine oil spill trajectory and other models
- Support and enhance decision support and ocean observing systems improve preparedness by highlighting data and operational needs (ERMA, AOOS)
- Better understand oil-in-ice weathering -- response and ecosystem exposure
- Evaluate standardized testing procedures and results cross-comparability for mechanical containment (eg wave tanks); develop collaborative protocols
- Further develop mechanical recovery systems that work under ice
- Develop system able to make short-term ice dynamics forecasts
- Improve understanding of effectiveness of *in situ* burning and enhance information -- emissions and residue characterization and improved plume modeling

USGS

Information for Effective Oil Spill Risk Assessment, Preparedness, and Response advancing, but significant challenges remain

- *Exxon Valdez* and Deepwater Horizon Oil Spills demonstrate that a suite of spill response tools must be available and effective, and change over time of spill
  - Significant question exists about the Response Gap for the Arctic; this is exacerbated by expected climate change factors. No authoritative analysis of the recent or forecasted Response Gap exists. (Expert Consultation response)

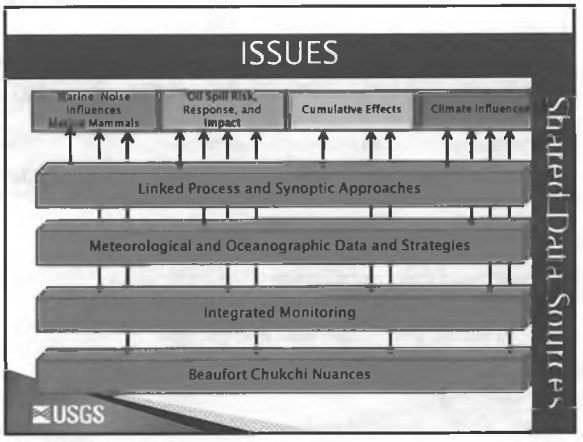


From Nuka Research and Planning Group, LCC and Pearson Consulting, LCC (2010, tables 6-1, 6-2); USGS Table 5-4

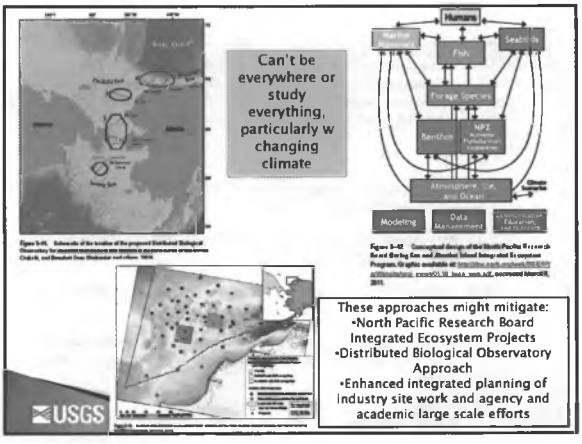
Commission authoritative assessment of "Response Gap" now/future climate

USGS

ISSUES

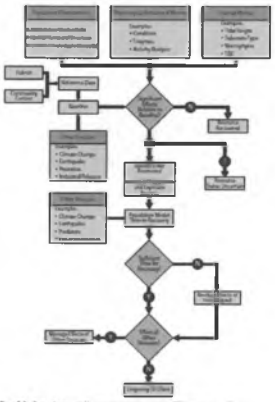


USGS



USGS

What do you really need "ahead" to assess impact if a spill were to happen?



USGS

Big Picture View

- The Arctic science and resource community is a model of collaboration. Found an open and energized desire to understand different views on development and to find means to move forward. Thus, the development of integrated monitoring efforts and collaborative science efforts across governmental, industry, and nongovernmental entities can be accomplished. However, we believe focused attention is required to envision and implement such a fully collaborative environment.
- Found many excellent examples of thoughtful analyses of science and technology needs to inform oil and gas development decisions in the Arctic. Our recommendations and findings add to those already in the literature. To move forward, we strongly recommend that a collaborative implementation process be put in place, but it needs to include appropriate measures of accountability for all responsible parties/entities. In our many discussions, we heard that managers, responders, scientists, and community members are willing to engage in discussing information needs, but they have a growing expectation that those needs are considered and, if appropriate, addressed in a visible and traceable manner.

USGS

14

Big Picture View

- Structured Decision Making (SDM) approaches bring vested and interested stakeholders into the decision process in a transparent and documented way. The process allows for learning and adaptation, which are critical concepts in a frontier and changing environment like the Arctic and we encourage its use.
- Oil and gas development decision making occurs within the broader context of Arctic issues. A collaborative and comprehensive Arctic science planning process would bring great value to the decisions required to proceed with development of oil and gas and other strategic assets in the Arctic in a changing climate environment. Such a science plan and its implementation must be informed by an SDM-like process and the syntheses of information we discussed earlier.

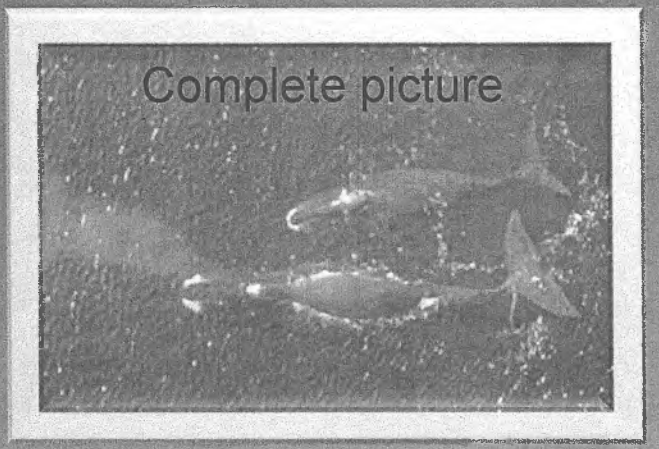
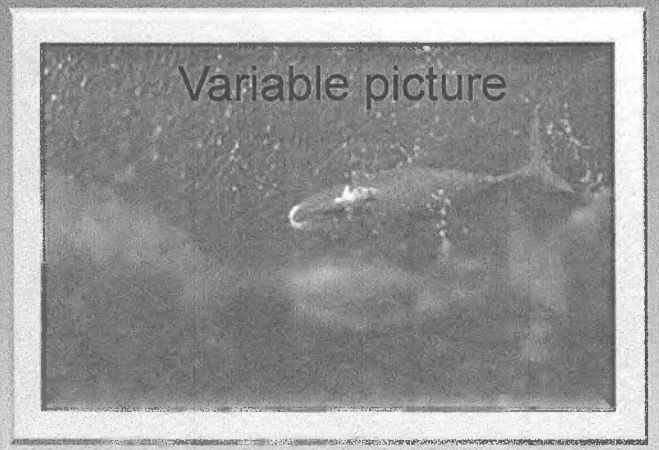
Data Quality

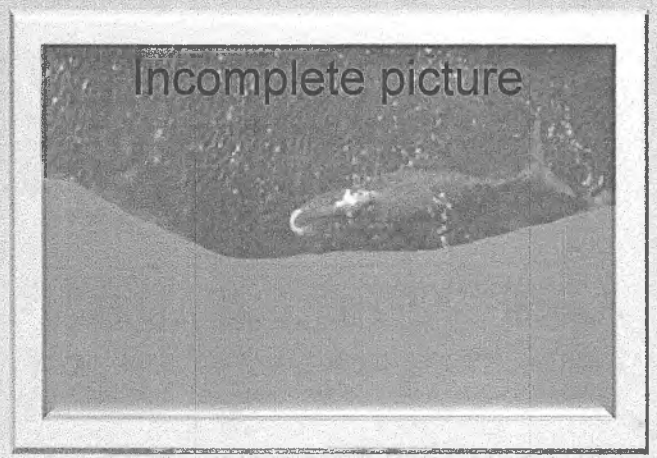
Good: provides a complete geographic picture of the resource or species

Fair: provides a variable geographic picture; some areas are represented by high-quality data and other portions are outdated or missing.

Poor: provides an incomplete geographic picture; information is missing, outdated, or deficient.

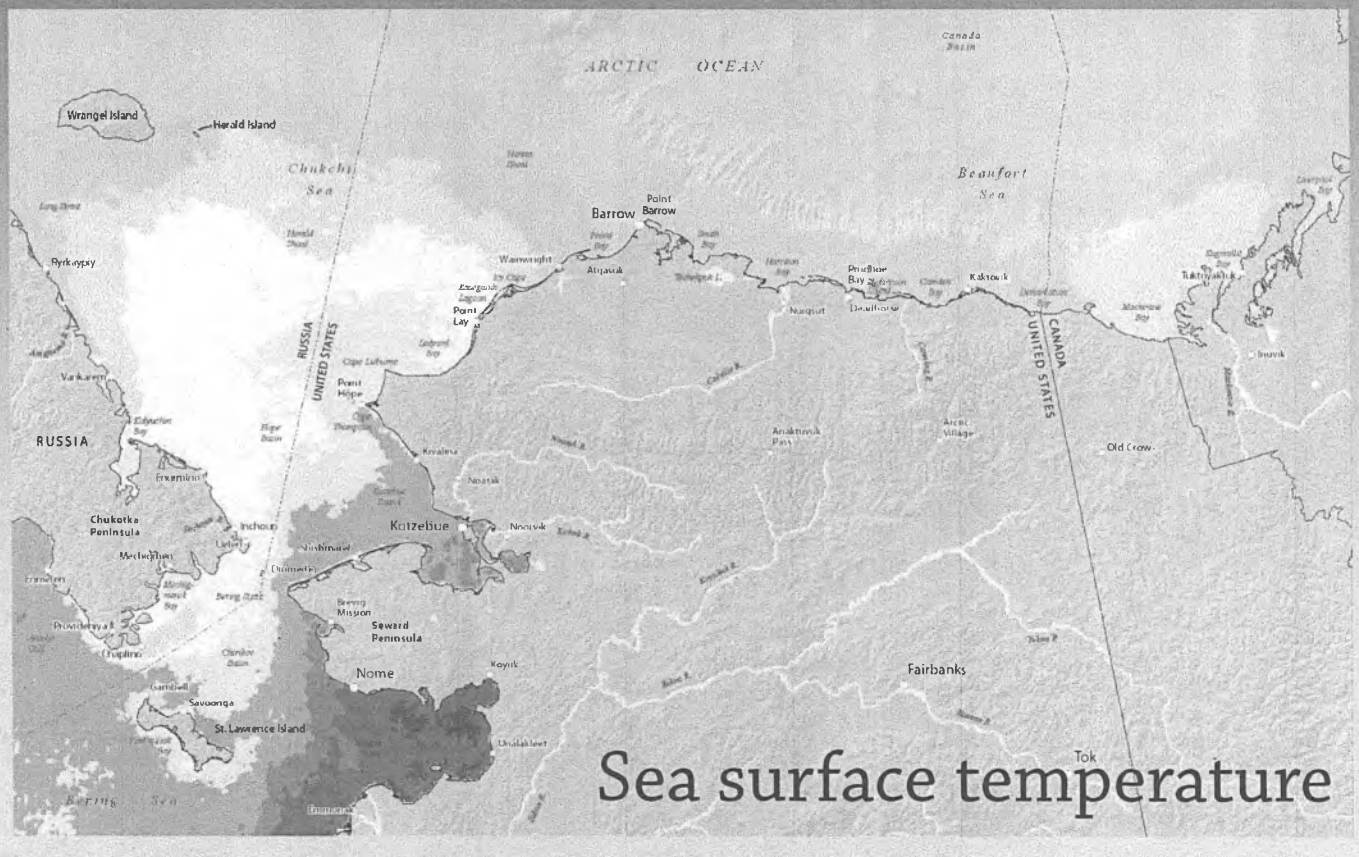






Data Quality

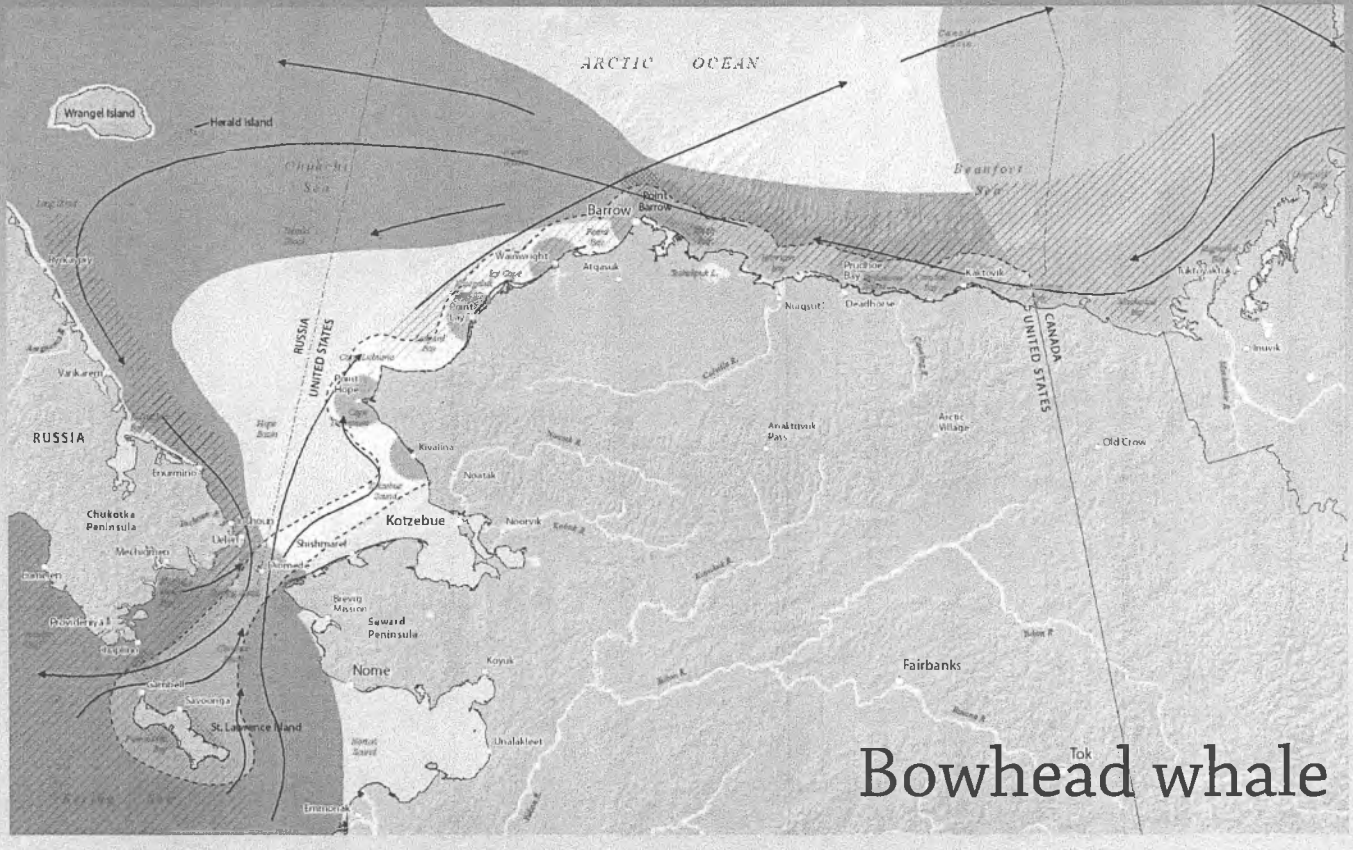
Good: provides a complete geographic picture of the resource or species



Sea surface temperature

Data Quality

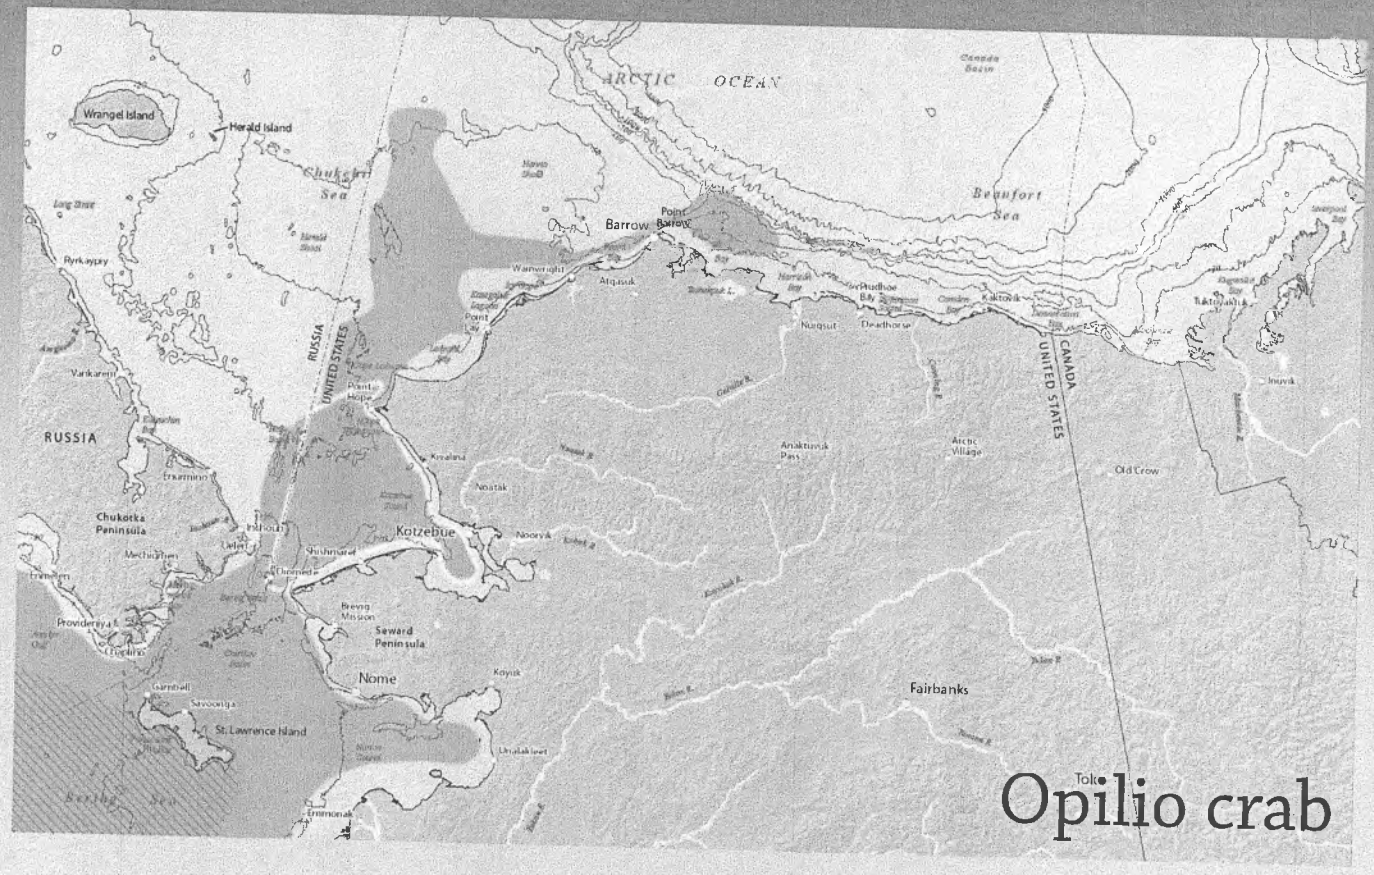
Fair: provides a variable geographic picture; some areas are represented by high-quality data and other portions are outdated or missing.



Bowhead whale

Data Quality

- **Poor**: provides an incomplete geographic picture; information is missing, outdated, or deficient.



Opilio crab

Data Gaps

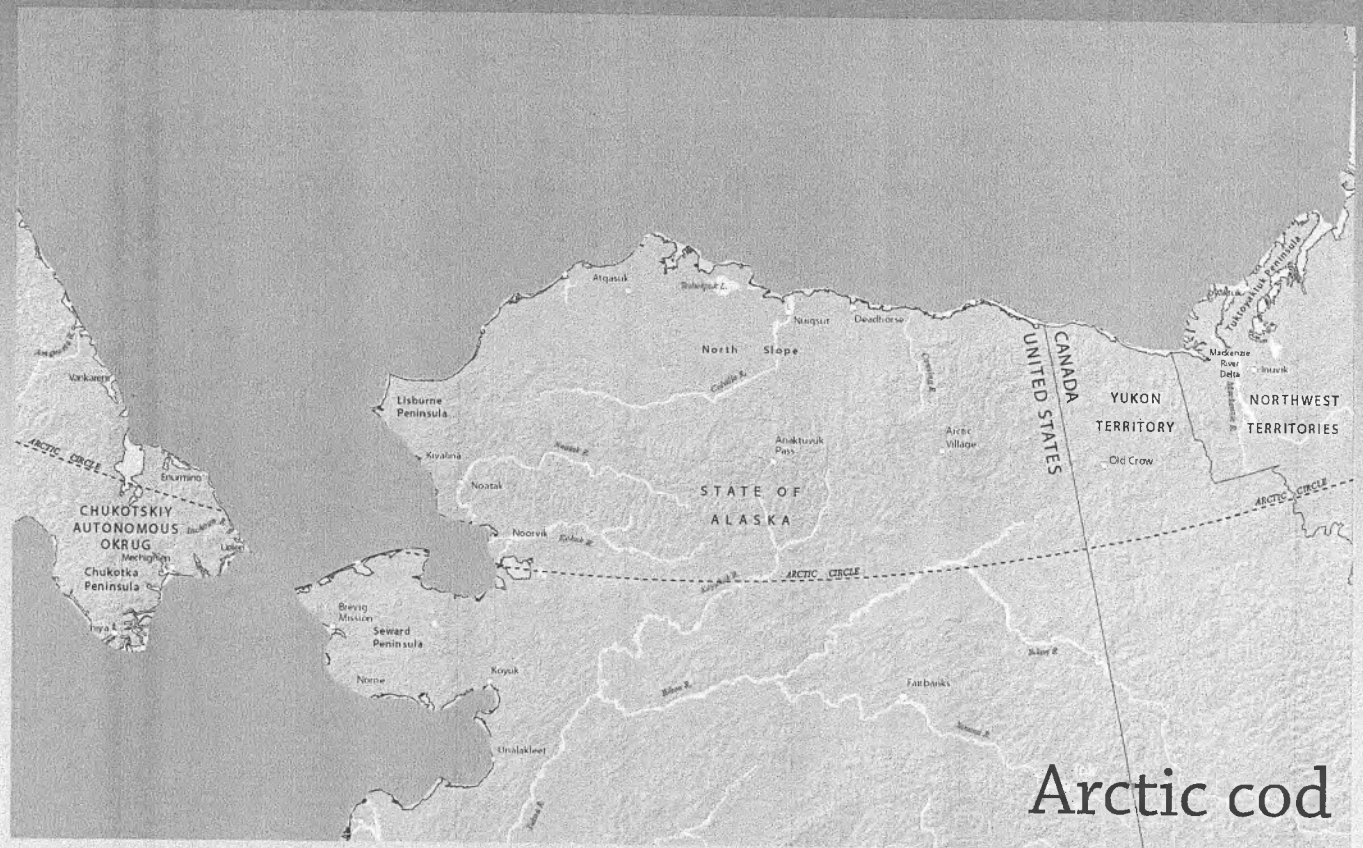
Types of Data Gaps

- **Topic:** little or no information, understanding is rudimentary.
- **Abundance:** Little or no information on population size or relative abundance among sites. Trends not detectable.
- **Spatial coverage:** Uneven sampling across the area of interest.
- **Temporal coverage:** no data to detect changes in patterns through time.
- **Spatial scale:** Fine-scale studies are not set up for broad-scale effects analysis; broad-scale data not meant for project planning.

Data Gaps

Types of Data Gaps

- **Topic:** little or no information, understanding is rudimentary.

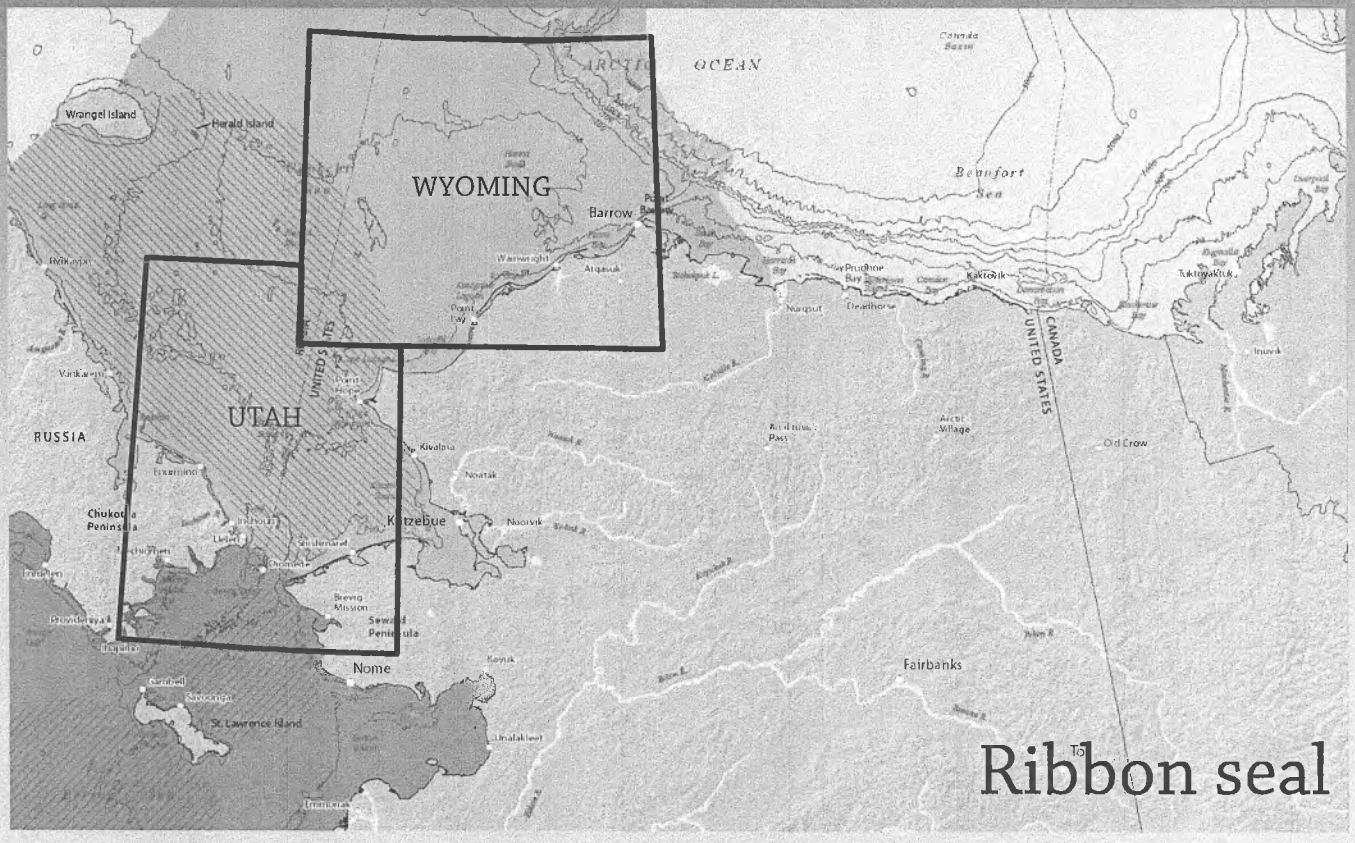


Arctic cod

Data Gaps

Types of Data Gaps

- **Abundance:** Little or no information on population size or relative abundance among sites. Trends not detectable.

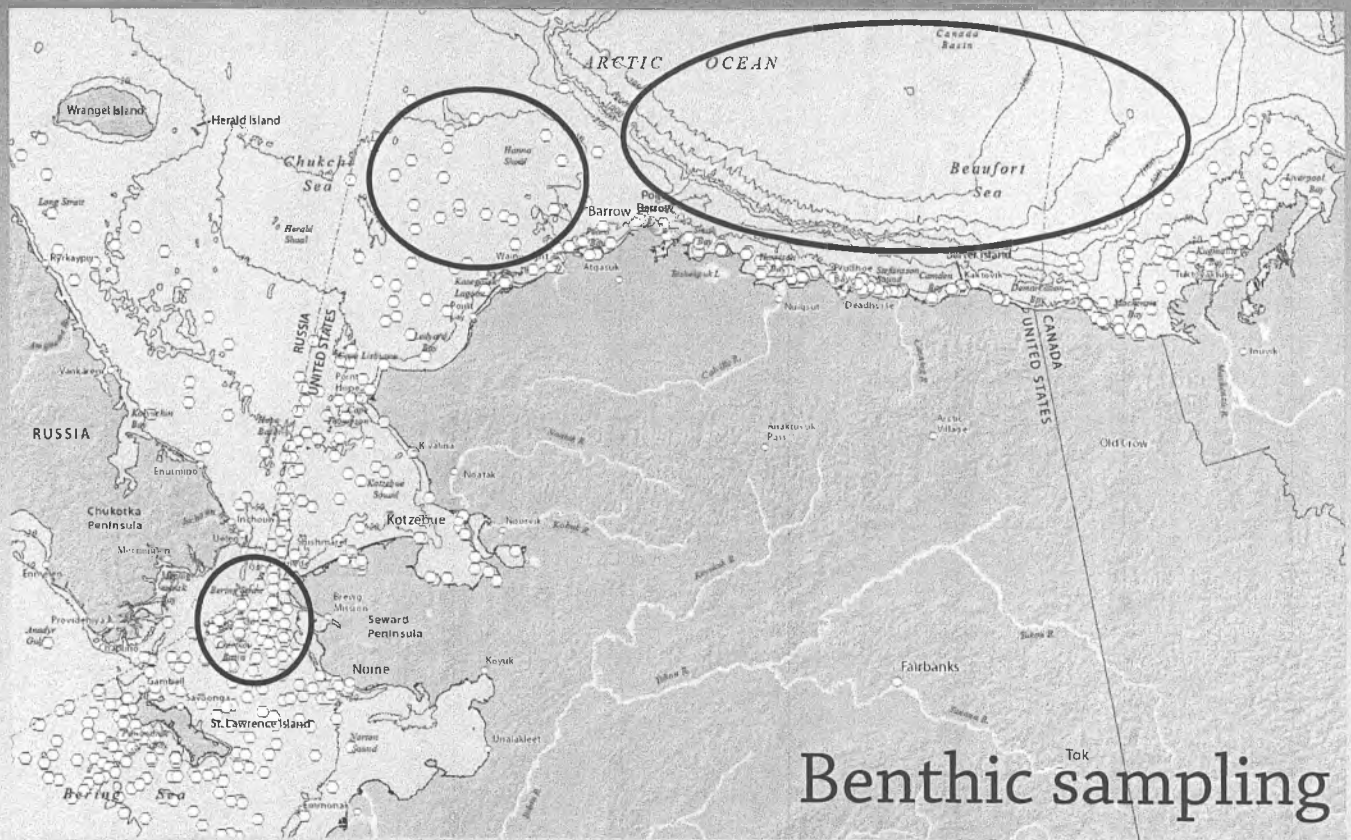


Ribbon seal

Data Gaps

Types of Data Gaps

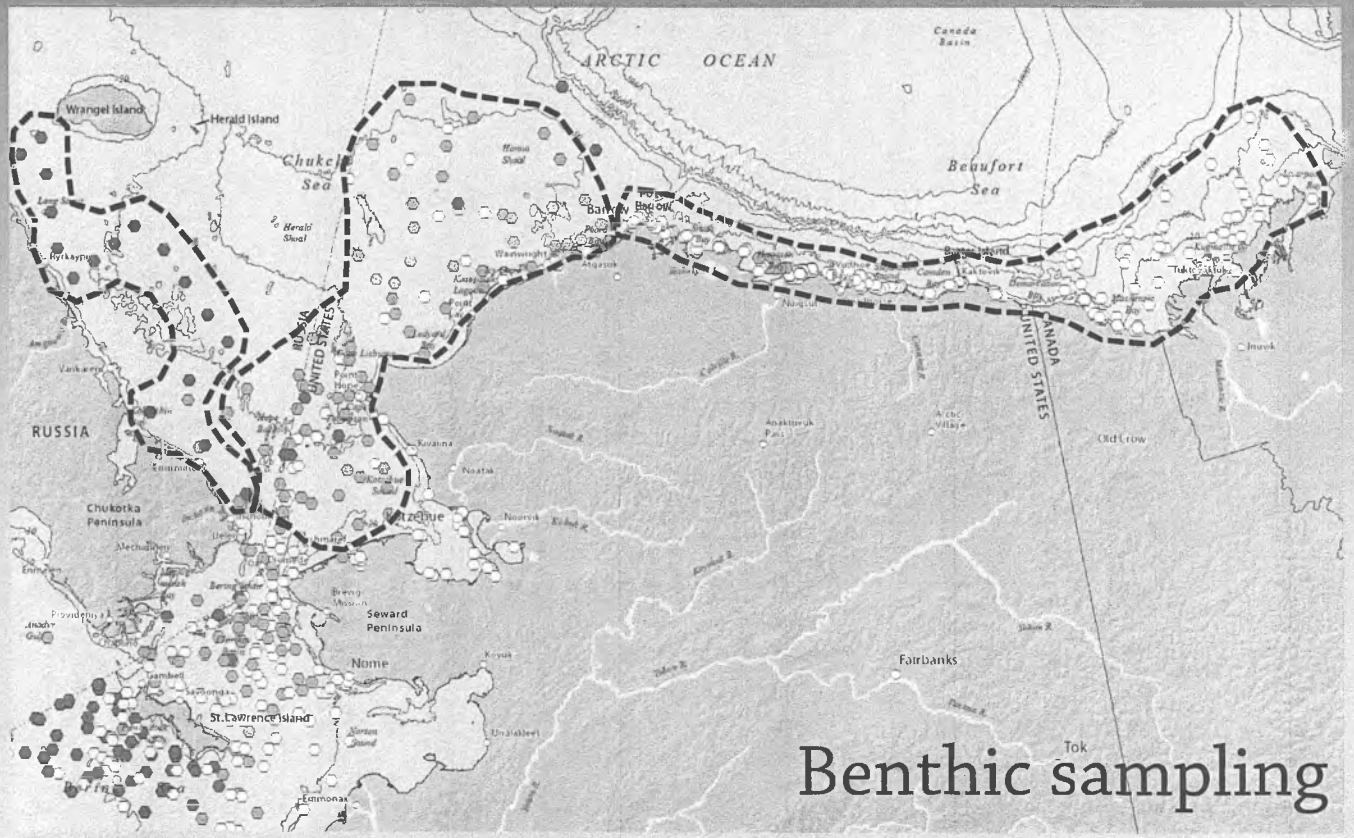
- **Spatial coverage:** Uneven sampling across the area of interest.



Data Gaps

Types of Data Gaps

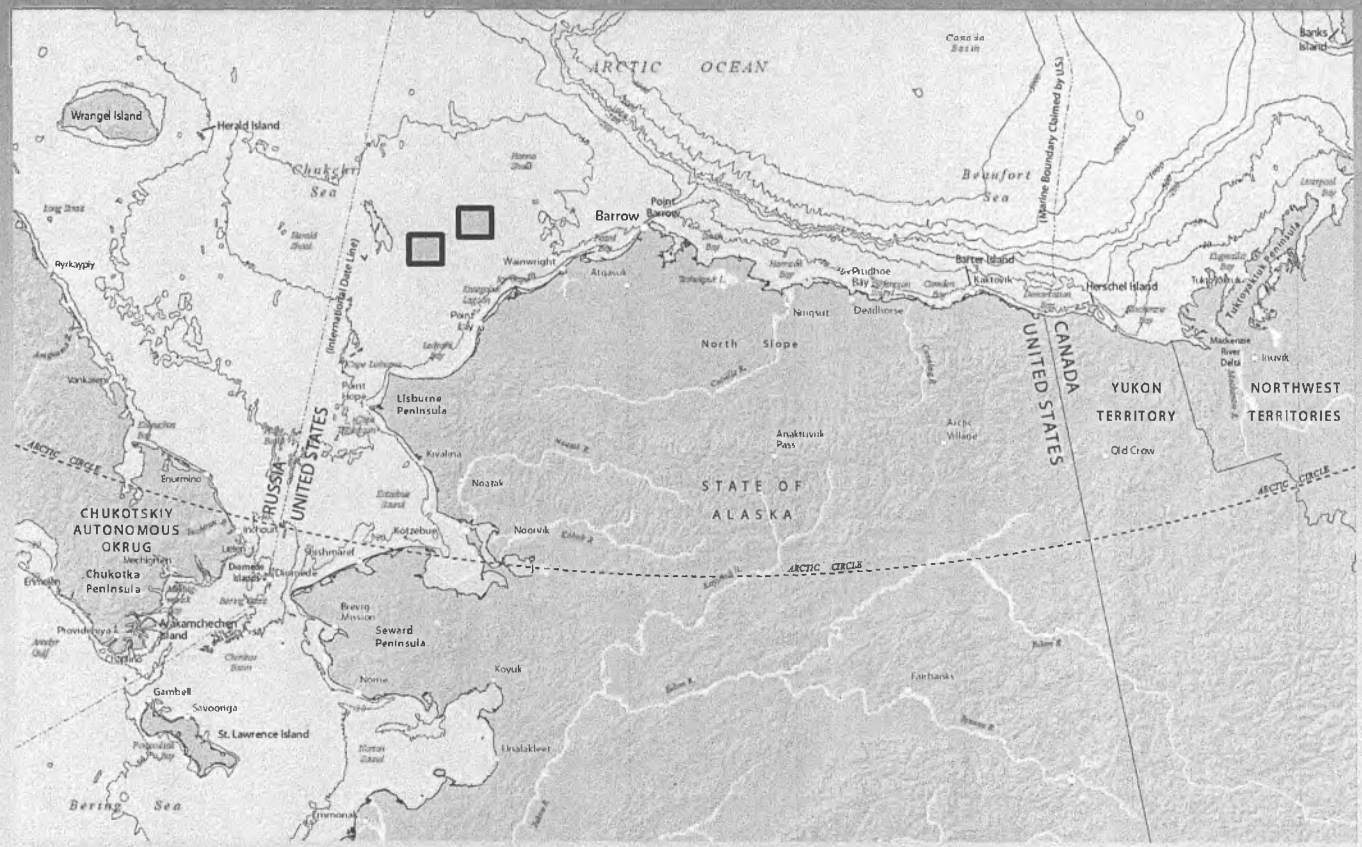
- **Temporal coverage:** no data to detect changes in patterns through time.



Data Gaps

Types of Data Gaps

- **Spatial scale:** Fine-scale studies are not set up for broad-scale effects analysis; broad-scale data not meant for project planning.



What Needs to Be Done

Make an Arctic science plan:

1. Integrate the latest research with older studies
2. Incorporate local and traditional knowledge
3. Assess data gaps spatially and temporally
4. Prioritize what we need to know
5. Create an action plan based on the USGS study

"Practical decisions about regulatory and mitigation issues are being made based on best available, but incomplete, knowledge which raises questions about how defensible these decisions are."

USGS report on data gaps

What Needs to Be Done

Data collection:

1. Revisit the Outer Continental Shelf Environmental Assessment Program (OCSEAP 1975-1982)
2. Design a sampling scheme which addresses data gaps
   - Topic: Collect data on understudied topics such as fish and invertebrates
   - Abundance: Set up sampling design to assess relative abundance between sites and total abundance within the Arctic EEZ
   - Spatial coverage: Sample the entire EEZ
   - Temporal coverage: Conduct repeated surveys for key resources, then continue long-term monitoring of key sites
   - Spatial scale: Optimize the spatial frequency of transects ; more intensive than OCSEAP
3. Collect local and traditional knowledge

What Needs to Be Done

Other recommendations:

1. Fund sustained scientific research and monitoring that matches the spatial scale of planning and development
2. Defer further leasing in the Arctic Ocean (Chukchi and Beaufort seas) during the next OCS 5-year plan (2012-2017)
3. Ensure effective oil spill response capability (dedicated nearby personnel and equipment)
4. Identify important coastal and offshore habitats that should be protected

To be good Stewards over the waters which we are licensed to protect

Good Afternoon,

I am Captain Pete Garay and am a member of Alaska Marine Pilots (AMP).

Since AMP's president Captain Carter Whalen has already testified before this committee my intention here today is only to address the closing comment that Captain Whalen left with you in his testimony before this task force in Dutch Harbor this summer and that comment was this: ***"AMP stands ready to help in the Arctic when and where it can."*** Unfortunately, before you or anybody else for that matter can determine how independent state licensed marine pilots may ultimately help in the Arctic there remains one outstanding questions that must first be answered which is this:

"What is the extent of a states authority to impose compulsory marine pilotage requirements in its coastal waters outside of three miles? "

This question has now been discussed / debated in front of Alaska's State Board of Marine Pilots for close to five years now and sadly has yet to be answered.

ALASKA MARINE PILOTS LLC
P.O. Box 920226 - Dutch Harbor, AK 99692
Office (907)581-1240 - Fax (907)581-1372
www.alaskamarinepilots.com

To be good Stewards over the waters which we are licensed to protect

After having heard numerous public testimony on the legality of compulsory marine pilotage (CMP) outside of a states traditional three mile limit the current Chairman of Alaska's State Board of Marine Pilots, (BOMP) Mr, Curtis Thayer drafted a letter on behalf his board to this states AG's office addressing this issue. I have that letter here today with me for your review. In this letter Chairman Thayer (to his credit) laid out the history of this issue, timelines of all ensuing public testimony and board discussion and concluded his letter with, and I quote:

"But how far outside of State waters may the board extend state marine pilotage requirements? Are special navigational factors (such as shallow waters, or extreme ice conditions) necessary to justify this extension? May the board impose pilotage requirements on vessels subject to AS 08.62 intending to moor along stationary structures such as a drilling platform? What about drilling platforms that are located outside of state waters? Are amendments in state law needed to authorize the board to adopt the measures it has discussed? What limits do federal laws place on the Boards authority in this area?" End quote.

I believe most would agree that these are, in fact, good questions.

Chairman Thayer's letter was sent to the AG's office over a year and a half ago. To date we have not seen a response from that office or Mrs. Gayle Horetski who normally handles all BOMP legal correspondence to the state. While the question is now almost two years old, given what is about to unfold in the Arctic AMP believes it is only appropriate that this state share its legal analyses / opinion on this matter with all vested stake holders.

ALASKA MARINE PILOTS LLC
P.O. Box 920226 - Dutch Harbor, AK 99692
Office (907)581-1240 - Fax (907)581-1372
www.alaskamarinepilots.com

To be good Stewards over the waters which we are licensed to protect

With these thoughts in mind it is our specific request of this task force to focus on the legal questions surrounding pilotage. It seems that between the AG's office and Legislative Legal Services there are plenty of good legal minds to evaluate the question. AMP, however, is happy to assist in the evaluation if asked.

In addition, AMP would also ask the Task Force to consider recommending a special committee of the Legislature to assess how pilots would fit into Arctic OCS activity prospectively. That committee should be empowered to consider regulations to establish pilotage rules from the Bering Straits to the Canadian border. In the alternative, if as suggested at the Dutch Harbor meeting, there is an Arctic Shipping Risk Assessment recommended it is appropriate to recommend that a component of the analysis would be to determine the pilotage requirements for activity proposed in the Arctic.

I will close with another quote from a letter which I also have with me here today for your review that was written by Mr. Paul Kirchner. Mr. Kirchner serves as Executive Director and general counsel for the American Pilots Association. Mr. Kirchner's letter addresses not only the legality of the Chairman's question from the pilot's perspective but also from a good public policy position.

ALASKA MARINE PILOTS LLC
P.O. Box 920226 - Dutch Harbor, AK 99692
Office (907)581-1240 - Fax (907)581-1372

To be good stewards over the waters which we are licensed to protect

*"In our view, it is both responsible stewardship and forward – thinking for the government of Alaska to explore **now** how to utilize its pollution prevention and navigation safety authority in order to best protect its waters and marine environment. Because it would take some time to put in place the necessary pilotage infrastructure to meet the needs associated with such an extension of state pilotage waters, waiting until energy exploration and exploitation efforts are fully underway (and with it the resultant increase in commercial traffic) to consider enhanced compulsory pilotage regulation would not be prudent."* End quote.

Next year this state will more likely than not have an open water drilling season in the Arctic. The time is ***now*** to explore how to utilize the preventative tools at our disposal to protect the Arctic. Marine pilotage is one of those tools and should be given your full consideration.

RE: State Compulsory Pilotage Authority

Dear Captain Garay:

You asked the American Pilots' Association for analysis and responses to a series of questions regarding the extent of a State's authority to impose compulsory pilotage requirements in its coastal waters. We understand that these questions were posed in the context of the State of Alaska's ongoing consideration of extending its compulsory pilotage waters to cover newly ice-free areas of the Chukchi and Beaufort Seas and to extend pilotage requirements to vessels engaged in other than innocent passage in those waters.

In our view, it is both responsible stewardship and forward-thinking for the government of Alaska to explore **now** how to utilize its pollution prevention and navigation safety authority in order to best protect its waters and marine environment. Because it would take some time to put in place the necessary pilotage infrastructure to meet the needs associated with such an extension of state pilotage waters, waiting until energy exploration and exploitation efforts are fully underway (and with it the resultant increase in commercial vessel traffic) to consider enhanced compulsory pilotage regulation would not be prudent.

Responses to each of your questions are provided below.

a. *By how far outside of State waters may a State extend marine compulsory pilotage requirements?*

Neither the courts nor the Congress have established a geographic limit to a State's authority to assert its pilot regulations and pilotage waters. Rather, it is a well-established U.S. maritime law principle that a State can assert its pilotage authority and extend its compulsory pilotage waters as far from its coastline as the State reasonably believes is necessary to achieve the objectives of its compulsory pilotage system. *See, e.g.*, Gillis v. Louisiana, 294 F. 3rd 755 (5th Cir. 2002). The Court in that case held that the geographic reach of a state's pilotage jurisdiction is neither limited to three miles nor preempted by federal law.

Courts have consistently emphasized that a State's territorial limits (e.g., three nautical miles) is a wholly separate matter from the State's right to control navigation. Warner v. Dunlap. 532 F.2d 767, 772 (1st Cir. 1976). In cases dating back well over a century, a State's broad authority to establish and enforce its own compulsory pilotage regulations and requirements "at distances considerably greater than three miles from their shores" has been consistently upheld. *Id.* at 772. *See, e.g.*, Wilson v. McNamee, 102 U.S. 572, 573-574 (1881) (recognizing a State's authority to establish pilotage requirements out to at least "fifty miles from port"), and The Whistler, 13 F. 295, 296 (D.Or. 1882) (affirming state pilotage requirements out to at least "30 miles from the [river] mouth"). In summary, "wide latitude is given to the states in determining the waters in which a vessel must procure a state-licensed pilot" and there is no fixed distance from its shores beyond which a State is *per se* prohibited from establishing compulsory pilotage requirements. Admiralty and Maritime Law, at 150-151 (Robert Force ed., 2004).

b. *Are special navigational factors (such as shallow waters or extreme ice conditions) necessary to justify an extension of marine compulsory pilotage requirements beyond State Waters?*

Again, it is important not to merge the issue of a State's territorial waters with its right to establish and enforce compulsory pilotage requirements. States can establish their pilotage waters as far from their coast as is necessary to "promote navigational safety and to protect the environmental integrity of their coastlines (from, e.g., oil spills caused by tankers running aground) by regulating pilotage...." Warner, 532 F.2d at 772. While factors such as shallow waters, shoaling, reefs, bars, narrow channels, peculiar currents, environmental sensitivities, vessel traffic, and other localized navigational factors (which could include extreme ice conditions) may factor into a State's decision regarding the extent and nature of its compulsory pilotage system, State pilotage programs can and should be designed by each State government to meet its distinctive needs, address its unique challenges, and carry out its particular public policy objectives.

c. *Are amendments to Alaska state law required in order for the Alaska Board of Marine Pilots to extend the State's compulsory pilotage waters?*

We are not aware of any State or federal statutory provision or judicial holding that would require the authorization of the Alaska State Legislature before the Board of Marine Pilots could exercise its authority under AS 08.62.160 to define waters subject to the State's compulsory pilotage requirements.

d. *May a State impose compulsory marine pilotage requirements on vessels not intending to enter a State port, river, sound or other internal state waters?*

The present federal statutory provisions regarding the State regulation of pilotage, 46 U.S.C. § 8501 *et seq.*, do not expressly limit a State's authority to impose compulsory pilotage requirements to vessels intending to enter or depart from a port or place in that State. The grant of State authority over pilotage extends to pilotage in the "bays, rivers, harbors and ports of the United States." 46 USC §8501(a).[1] Obviously, this language looks to the location of the piloting activity, not to the origin or destination of the vessel, subject to the specific exemption from State regulation for U.S-flag vessels engaged in domestic, coastwise operations.[2]

Nevertheless, the U.S. Supreme Court has suggested that a State's authority to require a vessel to take a compulsory pilot is related to whether or not the vessel is bound to or from a port or place within that State. Wilson, 102 U.S. at 573. Moreover, as a matter of customary international law as reflected in the United Nations Convention on the Law of the Sea, it is our understanding that the U.S. government subscribes to the view that, as a general matter, compulsory pilotage requirements for foreign-flag vessel should be limited to vessels intending to enter or depart a port or place in the U.S.

e. *May a State impose compulsory marine pilotage requirements on vessels intending to moor along stationary structures, such as drilling platforms that are within State waters? What about drilling platforms that are beyond State waters? What limitations do federal laws place on a State's authority in this area?*

Based on federal statutes and a U.S. Customs Service (USCS) ruling, the regulation of activities associated with a drilling platform, whether within or beyond State waters,

---

[1] Each U.S.-flag coastwise vessel (e.g., a vessel transiting from one U.S. port to another) is required by federal law to use a pilot holding a federal license issued by the Coast Guard. *See* 46 U.S.C. § 8501(d).

[2] It should also be recognized that § 8501(a) is in no way a geographic limitation on State authority to regulate pilotage. In analyzing § 8501(a) and its reference to "bays, inlets, rivers, harbors, and ports," courts have made clear that "[r]ather than a limited grant of authority to the states over the specified bodies of water, the statute has been interpreted as an expression of Congress' general intent *not* to limit the power already held by the states...." Gillis, 294 F. 3rd at 761. (original emphasis).

falls under federal jurisdiction and the federal coastwise laws apply.[3] Specifically, pursuant to section 4(a) of the Outer Continental Shelf Lands Act of 1953 (OCSLA), as amended (67 Stat. 462; 43 U.S.C. § 1333(a)), the laws and jurisdiction of the United States are extended to:

> "...the subsoil and seabed of the outer Continental Shelf and to all artificial islands, and all installations and other devices permanently or temporarily attached to the seabed, which may be erected thereon for the purpose of exploring for, developing, or producing resources therefrom...to the same extent as if the outer Continental Shelf were an area of **exclusive Federal jurisdiction located within a State.**" (emphasis added).

Based upon this statutory provision, the USCS ruled that U.S. "coastwise laws are extended to...drilling platforms...and similar structures [on the outer Continental Shelf]...." Customs Letter 115293, dated March 7, 2001. If the oil platforms are located not on the outer Continental Shelf, but within state waters (3 nautical miles), they would clearly fall within in coastwise waters and, pursuant to 46 U.S.C. § 8501(d), a state's pilotage regulatory authority is limited.

Based upon the foregoing federal statutes and the ruling of the USCS, it appears that oil drilling platforms fall within the class of structures subject to U.S. coastwise laws and a State would, therefore, be limited in its authority to require compulsory pilotage for vessels intending to moor alongside such a structure.

Please feel free to call on the American Pilots' Association if we can provide any further assistance. Alaska's consideration of extending its compulsory pilotage requirements in order to meet the navigational safety challenges of newly opening Arctic waters is an important development in pilotage, and we will continue to support your efforts.

Sincerely,

Paul G. Kirchner
Clayton L. Diamond

[3] This response was focused exclusively on drilling platforms. Pursuant to the Deepwater Port Act of 1974 (33 USC 1501 *et seq*), and specifically §1518(a)(2), a deepwater port located within state territorial waters, may be subject to State laws, including pilotage requirements.

Re: Arctic Marine Pilotage

Dear Mr. Sullivan:

As you know, there is tremendous national and international interest in the Arctic region. Continued reduction of the Arctic ice cover is expected to allow increased access to the region. The Arctic region is rich in natural resources, including fish, marine mammals, seabirds, oil, gas, and other minerals.

Over the last couple of years the Alaska Board of Marine Pilots (Board) has been discussing the extension of mandatory marine pilotage waters from those set out in 12 AAC 56.090 and 12 AAC 56.100 to encompass large areas of the Chukchi and Beaufort Seas. The boundaries of the proposed new mandatory marine pilotage waters include the outer continental shelf oil and gas lease areas where exploratory drilling is expected to occur this summer.

The Board is seeking advice from your office regarding the extent of the Board's authority under existing state and federal laws to adopt regulations that extend the state's mandatory marine pilotage waters to include large areas of the Chukchi and Beaufort Seas. Some background follows.

Like other U.S. maritime states,[1] Alaska requires foreign vessels and U.S. "registered vessels" heading for its ports, or transiting inland waters, to employ a state-

[1] *See generally*, A. Parks, The Law of Tug, Tow, and Pilotage 991-1003 (3rd ed. 1994).

Email: questions@commerce.state.ak.us Website: http://www.commerce.state.ak.us/

licensed marine pilot.[2] The marine pilot boards the foreign vessel and guides it into and out of port, or through navigational hazards in inland waters.

The seven-person Board of Marine Pilots regulates marine pilotage in Alaska.[3] Under AS 08.62.040(a)(1) - (3), the Board must "provide for the maintenance of efficient and competent pilotage service", regulate the training, examination, and licensure of marine pilots, and "keep a register of licensed pilots, licensed deputy pilots, and agents". AS 08.62.040(a)(1) requires the Board to adopt regulations to "assure the protection of shipping, the safety of human life and property, and the protection of the marine environment" on the "inland and coastal water of and adjacent to the state".
AS 08.62.160 requires the Board to "define the mandatory pilotage water of the state", and requires a vessel subject to AS 08.62 to employ a state-licensed marine pilot while "navigating the inland or coastal water of or adjacent to the state".[4] Violation of this requirement is a misdemeanor crime.[5]

---

[2] AS 08.62.160. The federal government has authority over commerce and shipping, but federal statutes grant authority for marine pilotage laws to the states.
46 U.S.C.A. sec. 8501(a) states: "[e]xcept as otherwise provided in this subtitle, pilots in the bays, rivers, harbors, and ports of the United States shall be regulated only in conformity with the laws of the States." Under 46 U.S.C.A. sec. 8502(a) vessels licensed under U.S. laws engaged in domestic or coastwise trade fall under the jurisdiction of the U.S. Coast Guard, and are not subject to state pilotage laws. These are commonly referred to as "enrolled vessels". *Hochstetler v. Board of Pilot Commissioners*, 8 Cal. Rptr. 2d 403, 407 (Cal. App. 1 Dist. 1992). Foreign vessels and U.S. licensed vessels "sailing on registry" must comply with state pilotage laws. *Ray v. Atlantic Richfield Co.*, 435 U.S. 151, 159-160 (1978), T. Schoenbaum, 2 Admiralty and Maritime Law, sec. 13-1 (4th ed. 2004). These are commonly referred to as "registered vessels". *Hochstetler v. Board of Pilot Commissioners*, 8 Cal. Rptr. 2d 403, 407 (Cal. App. 1 Dist. 1992).

[3] AS 08.62.040. The Board consists of two licensed marine pilots, two registered vessel agents, two members of the public, and the commissioner of DCCED or the commissioner's designee; AS 08.62.010.

[4] State waters are not defined in AS 08.62, but under AS 44.03.010 the state asserts jurisdiction over "water offshore from the coast of the state", including (1) the "marginal sea", (2) the high seas claimed by the United States, and (3) the submerged lands under that water.

[5] AS 08.62.190.

The boundaries of those areas where use of a state-licensed marine pilot is mandatory are set out in 12 AAC 56.090 and 12 AAC 56.100. 12 AAC 56.090 is a general provision. In 2008[6] 12 AAC 56.090 provided, in part: "[p]ilotage is compulsory at all entrances from seaward to Alaska bays, sounds, rivers, straits where the passage is within three nautical miles of this state, or other estuaries for which specific boundaries are not otherwise described in this chapter."

The boundaries of mandatory pilotage waters in specific locations are set out in 12 AAC 56.100. 12 AAC 56.100(14) describes the mandatory pilotage waters along the coast of the Chukchi Sea and in Kotzebue Sound.

During a public comment period at a Board meeting held on January 22-23, 2008, a licensed marine pilot asked the Board to consider the adoption of a Board regulation to extend the compulsory (mandatory) pilotage waters from those set out in 12 AAC 56.090 and 12 AAC 56.100. The marine pilot suggested that the compulsory pilotage waters be extended out into the Chukchi and Beaufort Seas to an area roughly concurrent to outer continental shelf oil and gas lease areas.[7]

As originally proposed, pilotage would be compulsory for all vessels subject to AS 08.62 "engaged in commercial activities" within the designated waters of the Chukchi and Beaufort Seas. As proposed, the pilotage requirements would not have been restricted to vessels entering state ports, rivers, sounds, etc., but would have applied to all commercial vessels moving through the specified waters (including oil exploration and drilling vessels).

By a vote of four to three, the Board members voted to accept the marine pilot's suggestion for a proposed regulation to extend compulsory pilotage waters into the Chukchi and Beaufort Seas. A public notice of the proposed amendment to 12 AAC 56.100(14), requesting public comment on the proposed language, was issued on March 13, 2008.[8]

---

[6] As explained later in this memorandum, 12 AAC 56.090 has been amended slightly, effective November 4, 2009, Register 192.

[7] These leases are under the authority of the U.S. Department of the Interior, Minerals Management Service.

[8] This is a necessary first step in the adoption of an administrative regulation under AS 44.62.020--300 (Administrative Procedure Act); AS 44.62.190, 44.62.200.

Significant public comment on the proposed amendment was received, both in support of and in opposition to the proposal. The Board held a public hearing on the proposal at a meeting on April 18, 2008. Many of those who commented supported the proposed expansion of compulsory pilotage waters, citing the need to protect the fragile Arctic ecosystem, fish and wildlife, and indigenous peoples. Other commentators expressed concern that such a significant expansion of compulsory pilotage waters might be interpreted to apply to vessels not bound for Alaska ports, but merely passing through the lease areas, and would exceed the Board's authority. Oil companies interested in resource development in the Arctic, including ConocoPhilips, Shell Oil, and BP, were generally opposed to the proposed expansion of compulsory pilotage waters.

The Board voted to revise the proposed language in response to some of the comments received, including clarification of the right to "innocent passage".[9] The Board requested public comment on the revised version in a supplemental notice issued on June 23, 2008. The revised version also contained some technical clarifications to other existing regulations. The revised version included a new cross-reference in 12 AAC 56.090, the revised boundaries in 12 AAC 56.100(14), some technical amendments in 12 AAC 56.990(a)(5) and (8), and added a definition of the state's coastline in 12 AAC 56.990(a)(39).

A second public hearing was held at a Board meeting on October 1, 2008. The Board again considered testimony and several written comments received. The proposed amendments were further revised, and a second supplemental public notice requesting comments was issued on February 18, 2009.

A third public hearing was held at a Board meeting on April 15, 2009. At that hearing the Board decided to adopt the remaining proposed language changes dealing with the general boundaries of compulsory marine pilotage waters and definitions, but not to adopt the proposed new compulsory marine pilotage areas in the Chukchi and Beaufort Seas. These adopted regulations contain changes only to 12 AAC 56.090 and 12 AAC 56.990(a)(5) and (8), and the new definition in 12 AAC 56.990(a)(39). By the addition of the words "inlets, harbors, ports" and "adjacent to Alaska" the revised regulations are intended to make the scope of the regulations identical to the legislature's

[9] The right of innocent passage refers to the right to navigation through the territorial sea by ships of all nations, to traverse the area without entering internal waters or proceeding to or from internal waters or a port. *See* U.N. Convention on the Law of the Sea, Arts. 17 & 18 (1982).

grant of jurisdictional authority to the Board in AS 08.62.040(a)(1). These regulation changes took effect on November 4, 2009.

The Board concluded that further consideration was needed on some aspects of the Arctic pilotage proposal. A Board subcommittee was appointed to study the issue in more detail. At a Board meeting on January 28, 2010, the chair of the Board subcommittee reported his conclusion that the subcommittee likely would be unable to resolve the concerns expressed about the proposed expansion of compulsory marine pilotage into Arctic waters. Some subcommittee members questioned whether the Board possessed the legal authority to adopt the proposed regulation changes.

At a meeting held on April 28, 2010, the Board decided to ask your office for assistance in determining the scope of the Board's authority in this area.
AS 08.62.040(a)(1) requires the Board to regulate marine pilotage "on the inland and coastal water of *and adjacent to* the state" (emphasis added). By its own terms, this legislative grant of authority to the Board appears to contemplate marine pilotage requirements extending beyond state waters.[10]

But how far outside of state waters may the Board extend state marine pilotage requirements? Are special navigational factors (such as shallow waters, or extreme ice conditions) necessary to justify this extension? May the Board impose pilotage requirements on vessels subject to AS 08.62 that do not intend to enter state ports, rivers, or sounds, or even to enter state waters at all? May the Board impose pilotage requirements upon vessels subject to AS 08.62 intending to moor along stationary structures such as a drilling platform? What about drilling platforms that are located outside of state waters? Are amendments in state law needed to authorize the Board to adopt the measures it has discussed? What limits do federal laws place on the Board's authority in this area?

The Board requests advice from your office addressing the above questions, and the extent of the Board's legal authority to adopt the proposed mandatory pilotage

---

[10] Maritime zones recognized under international law include: internal waters (3 nautical miles), territorial sea (12 nautical miles), contiguous zone (24 nautical miles), exclusive economic zone (200 nautical miles), and the high seas. Courts have approved mandatory marine pilotage requirements imposed by state law on vessels located many miles outside of state waters. *See, e.g., Gillis v. Louisiana*; 294 F.3d 755 (5th Cir. 2002).

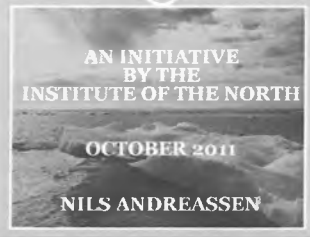
Arctic Infrastructure & Advocacy

Arctic Infrastructure and Advocacy



About the Institute

Growing Success

- Strategic partnership with UAF
- 10 new board members
- 200 participants in quarterly Arctic Policy Forums
- 550 participants in our first Week of the Arctic
- 200 attendees at the Emerging Leaders and Alaska Dialogue
- 300 young Alaskans at Institute events
- 100 Alaskans educated about ANILCA
- An Arctic Council-approved project
- Launch of the Arctic Energy Network

Sustainable Projects

- Arctic Council projects respond to real need.
- AMATII builds on the work of others...
  - The Circumpolar Infrastructure Task Force (CITF) and the Arctic Aviation Experts Conference
  - The Arctic Marine Shipping Assessment (AMSA) – recommendations 3(a) infrastructure development and 3(c) accessing response capacity

Building a Foundation for...

- Community
- Cultural
- Economic
- Environmental

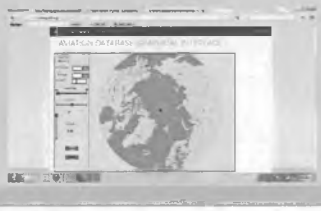
.....Resiliency!

Sustainable Development

- Connectivity
  - Connecting people to one another
  - Leveraging resources effectively
- Intermodal response capacity
  - Response should be rapid, dynamic and efficient
  - Ability is dependent on available resources

Deliverables

- Arctic Ports Dialogue and the Arctic Aviation Experts Conference
- Arctic Transportation Infrastructure Database and Map



Next Steps

- US has committed to this project – Iceland as co-lead country
- US DOT Maritime Administration, State Department, University of Alaska Fairbanks have all committed financial resources – more needed to meet full budget
- Identification of a steering committee to provide additional scope for this project, along with Subject Matter Expert Groups
- Hosts for the Arctic Ports Dialogue and Aviation Conference

Arctic Energy Network

- *Vision* - The exchange of knowledge results in the responsible development of Arctic energy resources and improves the economic, social and environmental conditions of Arctic communities, states and nations.
- *Mission* - The AEN connects stakeholders in Arctic energy issues, building bridges and creating opportunities to learn, teach and collaborate on shaping the emerging and best practices in Arctic energy policies, technology, infrastructure and security.

AEN

- Hosting networking and learning opportunities
- Educating policy makers and administrators
- Seeking out and sharing best practices

AEN

- Supporting collaborative research opportunities
- Convening around emerging energy issues
- Conducting research projects on critical challenges
- Hosting the Arctic Energy Summit

Arctic Energy Principles

- Energy should be affordable, reliable and accessible.
- Energy wealth should be invested to support community and economic development.
- A balance of non-renewable and renewable energy sources is necessary.
- Wise energy development is the cornerstone to economic sustainability in the Arctic.

Moving Forward

- Keep it simple
- Invest in success
- Educate and broaden outreach
- Build capacity, competitiveness, and competency

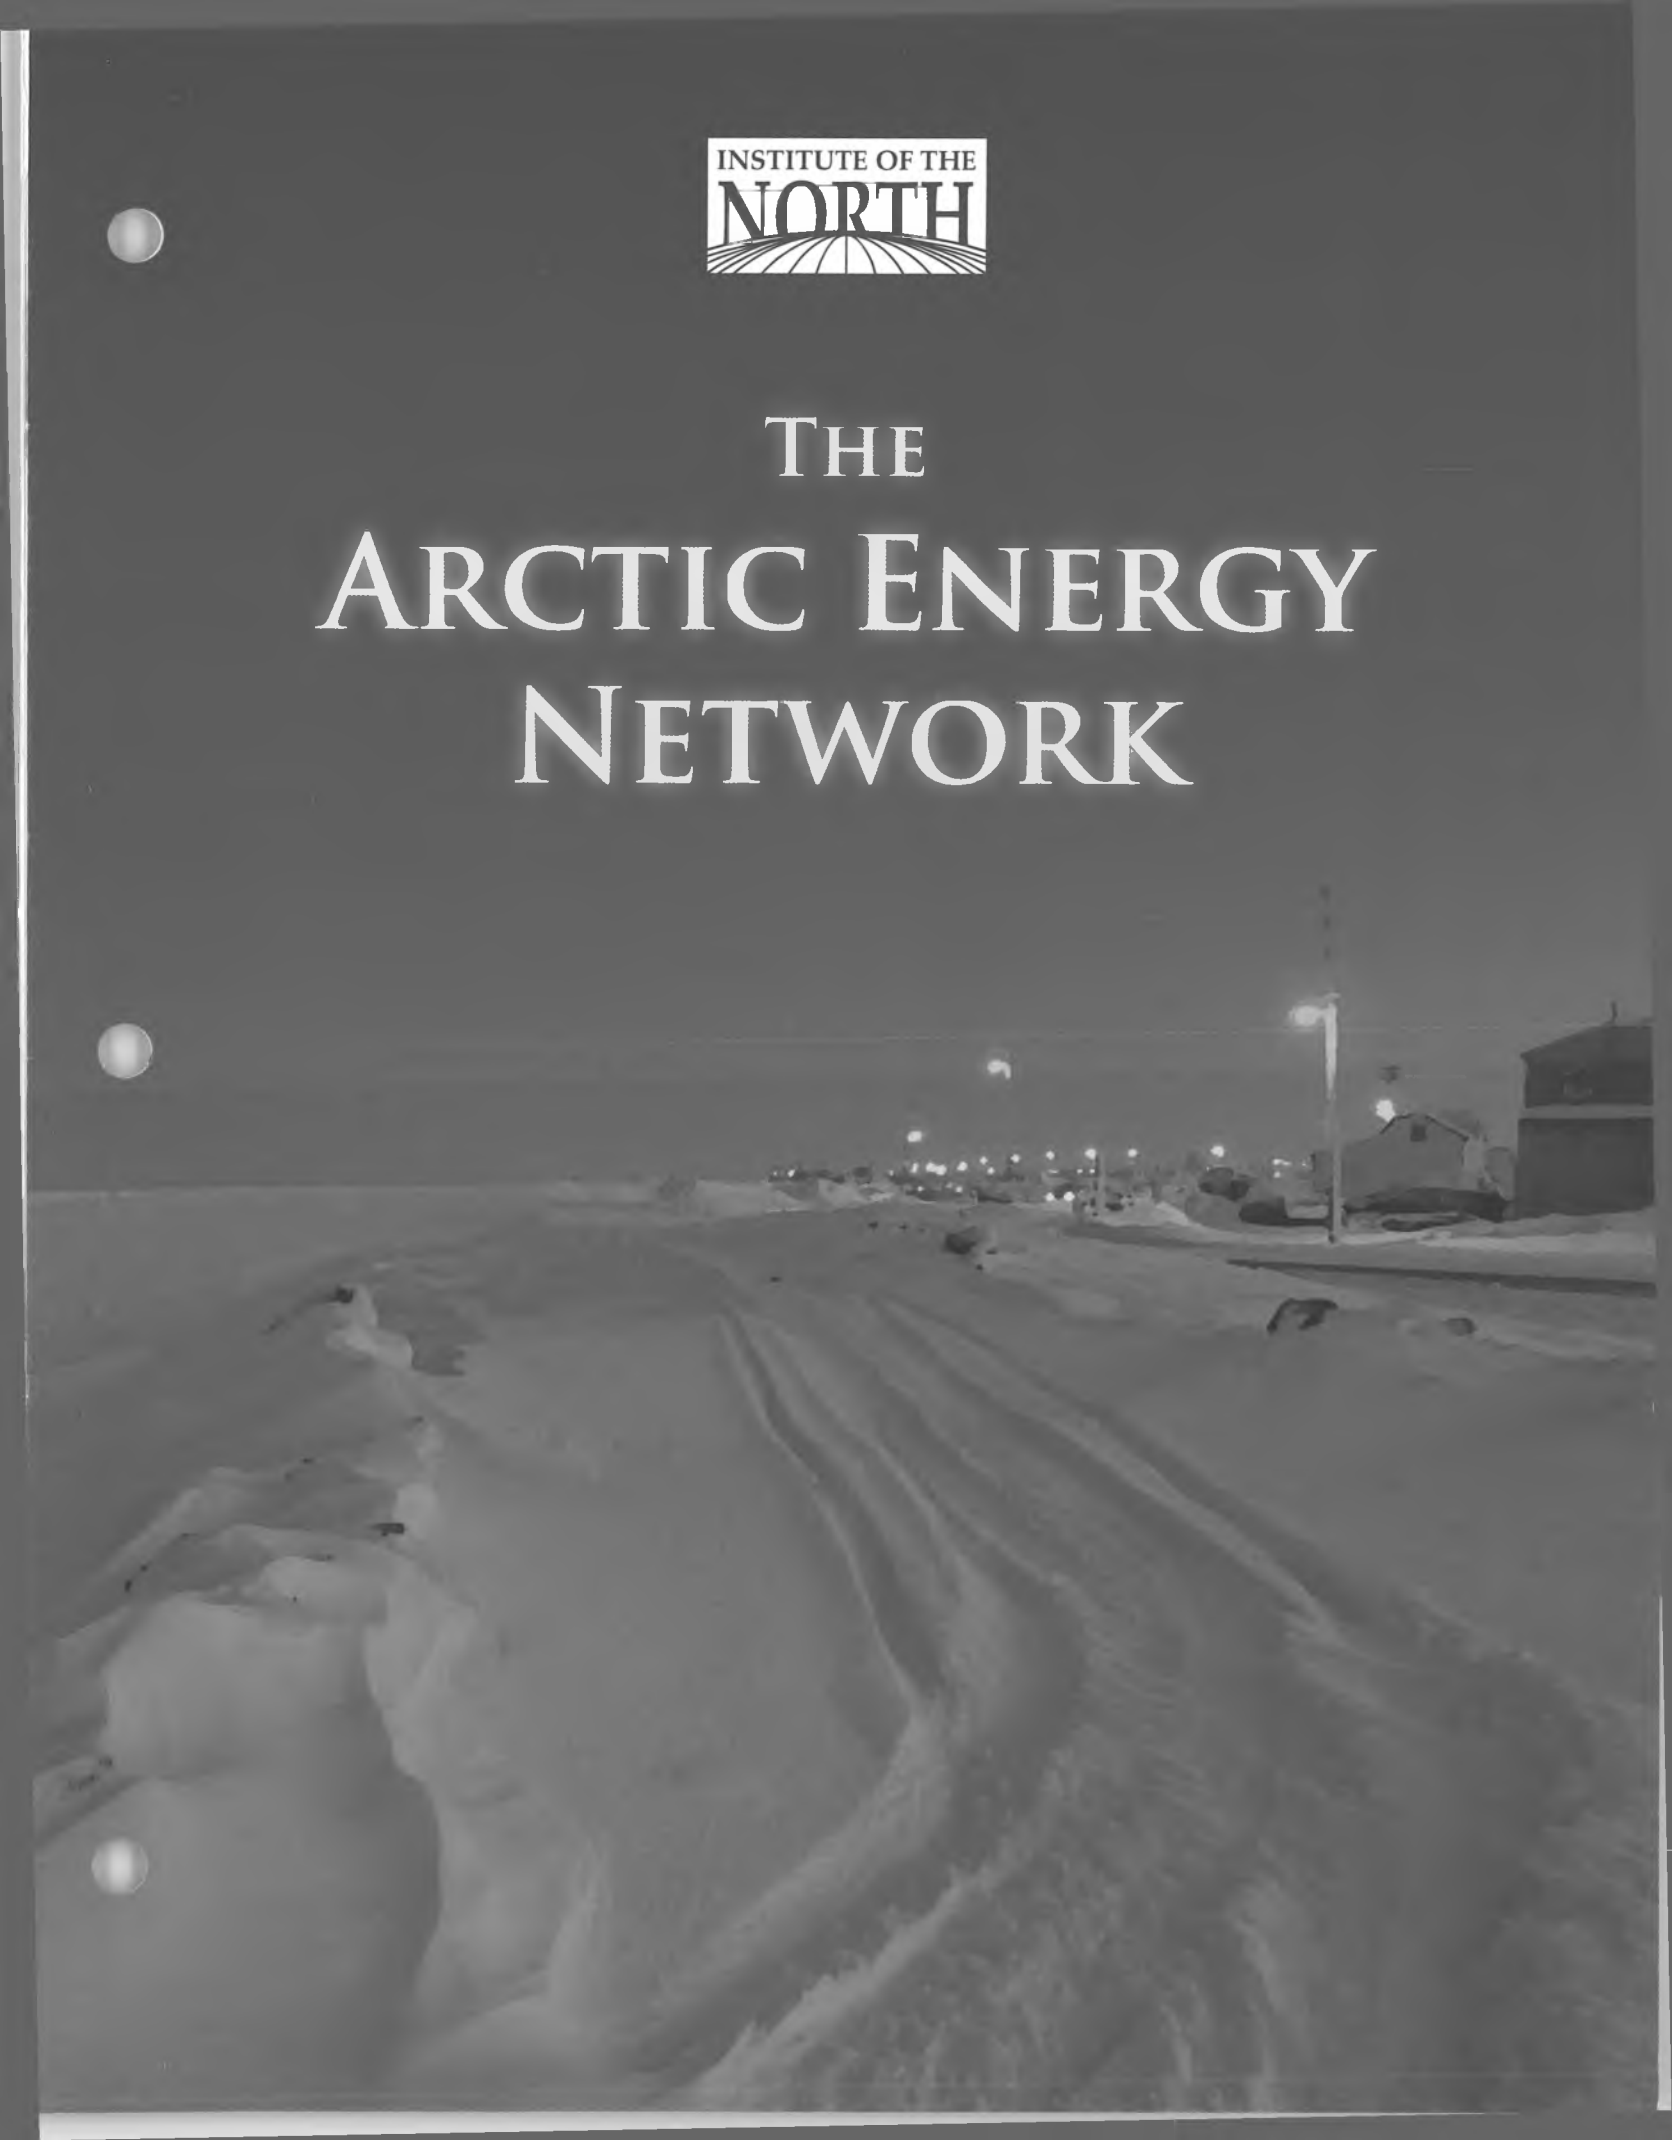
An Alaska Arctic Agenda

- Arctic policy development
  - Comprehensive approach
- Infrastructure investment
  - Linking transportation with energy
- Response capacity
  - Coordination command centers
- Intermodal connectivity
  - Ground, air and water transportation of resources and people
- Cross-border collaboration and sharing
  - International best practices for remote or rural economies
- Local, private, public, academic input
  - Clear lines of consultation

Thank you

INSTITUTE OF THE NORTH

THE ARCTIC ENERGY NETWORK



Appendix A

Members of the AEN have indicated recommended the following areas of work for the Arctic Energy Network to focus their energy and attention on. The AEN Advisory Council will assist in prioritizing the most cutting edge issues, developing projects and promoting opportunities for members to engage each other, exchanging knowledge and pioneering new thoughts on these and many other critical arctic energy issues.

COMMUNITY ENERGY ISSUES

Arctic communities are consumers of energy that is not often affordable, reliable or accessible to them, greatly impacting their sustainability. In finding community energy solutions, topics of interest include improving the transportation, storage and transmission of energy, developing stranded renewable resources, improving energy efficiency, improving and developing new technology for community energy projects, financing research for development, testing and implementation of new technology, creating viable energy markets in remote and rural locations, reducing diesel consumption, and enhancing leadership development and training opportunities for local people to administer, develop and improve on community energy solutions.

RESOURCE DEVELOPMENT

Responsible development of extractive and renewable energy resources is a challenge and an opportunity in the Arctic. It is estimated that 25% of the undiscovered global oil and gas resources are in the Arctic as well as bountiful supply of renewable resources including bio-mass, wind and geothermal energy. Creating infrastructure to develop and transport these resources, addressing indigenous and other community concerns with resource development, the security of the projects being developed, evaluating new technologies that are being deployed, sharing best practices for development in sensitive Arctic environments, promoting technology exchange between the renewable and extractive energy sectors, and strengthening trust and facilitating better relationships are among the hot topics that the members of the AEN are interested in.

PUBLIC POLICY

Public policy for the Arctic has not necessarily kept pace with the changes in the Arctic. While Arctic environment has been the subject of much hotly contested policy work, the Arctic as a global commons, indigenous rights, stewardship, local, national and international standards for development, improvements in regulatory structures, disaster mitigation, public-private partnerships, projected increases in Arctic development particularly by non-Arctic nations, sovereign wealth funds, sustainability of communities, the effects of climate change, reducing black carbon, and other unique Arctic issues have received less attention.

DATA COLLECTION

Significant gaps still exist in the Arctic knowledge base that can be filled by the AEN from creating a comprehensive database of expertise, knowledge, best practices and current projects in the Arctic, to mapping energy use in the Arctic and proving assessments of resource wealth and renewable energy resources.

Arctic Maritime and Aviation Transportation Infrastructure Initiative

Providing a Comparative Analysis of Port and Airport Infrastructure in Arctic Nations

Proposal Developed by the Institute of the North
Anchorage, Alaska, United States

June 2011

DRAFT

Arctic Maritime and Aviation Transportation Infrastructure Initiative

Coordinating Institution
Institute of the North
509 West Third Ave., Suite 107
Anchorage, AK 99501
United States

Lead Country
United States

Co-Lead Country (proposed)
Iceland, Canada and/or Norway

- Participation as co-lead country could mean a financial contribution, an in-kind contribution of staff/technical resources or agreement to host either the Arctic Port Response Infrastructure Conference or Arctic Aviation Experts Conference

Principal Investigator
Nils Andreassen, Institute of the North

Steering Committee and Work Group members (potential)
Composed of government, academic and private sector entities
See attached for draft list

Deliverables

- Guidance document to include benchmarking and baseline assessment of port and airport infrastructure
- Web-based, interactive map of current maritime and aviation infrastructure
- Arctic Aviation Experts Conference and Arctic Port Response Infrastructure Conference

Accountability
Outcomes will be communicated regularly to the Sustainable Development Working Group of the Arctic Council.

Deliverables will better illustrate gaps in knowledge and capacity; and may propose guidelines for addressing both. Any formal recommendations produced from this process will be reviewed by SDWG members for approval.

Deliverables will be included for submission as a product of SDWG under the 2011-2013 Swedish Chairmanship.

Overview

The Arctic Maritime and Aviation Transportation Infrastructure Initiative (Initiative) is a result of the work of the Arctic Council's Arctic Marine Shipping Assessment (AMSA) and the on-going work of a multi-agency (including DOT, FAA and Transport Canada) effort that sponsors the Arctic Aviation Initiative (AAI). It builds on and responds to past efforts and projects of two working groups within the Arctic Council – PAME's AMSA (2009) and the SDWG's Circumpolar Infrastructure Task Force (CITF), which acted as a platform for the Arctic Aviation Experts Workshop in 2005 and 2006. More directly, it follows on the strategic plan set forth at the 2010 Arctic Aviation Experts Conference (AAEC).

It is important to recognize the intermodal nature of transportation challenges in the Arctic – and an increasingly busy circumpolar North – and the AAEC and AMSA highlighted the unique needs and opportunities for Arctic transportation. Increased resource extraction to support economic and community development; increased shipping traffic through the Northern Sea Route and activity in the Northwest Passage due to a lessening of sea ice extent; and increased passenger traffic for the same reason, have resulted in the corresponding need for an increased capacity to respond by sea and by air. Response, which would include Search and Rescue (a response to human safety needs in the Arctic maritime environment) and Oil Spill Response (or more broadly any environmental disaster), is most effective when addressed through a strategic, intermodal approach that includes marine and air ability. Arctic ports and airports act as an important base for response capability; with each serving as a gateway anchor that supports SAR; resource extraction and development activities; pollution prevention and environmental safety; and community health and security. These can be considered critical components of sustainable development and the resiliency of Arctic peoples and communities.

The Initiative seeks to address the infrastructure deficit – a lack of ports and airports that have adequate infrastructure and response capabilities (and in some nations a lack of ports in general) - by inventorying maritime and aviation assets in the Arctic that impact the region's ability to respond. This will be accomplished by developing guidance for a robust, effective transportation system in the North. By setting benchmarks for what capacity and capability should look like and establishing a current baseline of Arctic maritime and aviation transportation infrastructure, the Initiative will be able to produce a gap analysis that more efficiently facilitates the application of resources by federal, regional and local governments, as well as international bodies. In this, the intermodal approach helps to avoid duplication, leverages a multiplicity of efforts and provides efficiencies to infrastructure development in a region that often struggles with economies of scale.

As part of the scope of this Initiative, it is envisioned that a multi-year campaign take place. In the first year, a budget of $440,000 (see Annex 1) establishes a foundation to work from and begins the benchmarking process as well as gathering baseline data. Much of this has been done on the marine side by the AMSA, which will be updated and correlated with current and best aviation information. Baseline data will be fed into both a final guidance document and a revised version of the Institute of the North's Arctic Aviation Database, an updated form of which will be a deliverable from this effort; it will include port infrastructure and be renamed to reflect this expanded scope. The **Arctic Maritime and Aviation Infrastructure Database** will include a

web-based, searchable map that illustrates the overlapping spheres of responsibility and capacity as well as perceived gaps in the system as a whole. Arctic nations' ability to respond will be coordinated, intentional and built upon a well-established understanding of both need and capability.

A second deliverable will be the **2012 Arctic Aviation Experts Conference**, which will review and assess the aviation portion of the guidance document. This is the only venue to date in the world dedicated to Arctic aviation and provides an invaluable service in connecting stakeholders from across the Arctic to one another and critical issues. A corresponding **2012 Arctic Port Response Infrastructure Conference** will take place to evaluate the maritime transportation portion of the final document. A draft version of the Guidance Document will then be delivered to the Arctic Council's SDWG for review and input.

In the second year of the project, the Guidance Document will be refined and finalized, with results of the Initiative disseminated and work groups identified to address individual projects identified in the final document. At the same time, the Arctic Maritime and Aviation Infrastructure Database will be launched and outreach conducted. Similar funding needs are anticipated for this phase (see budget, in Annex 1).

Background

AMSA as a Foundational Document
Released in 2009 by the Arctic Council, the focus of the AMSA is marine safety and marine environmental protection, which is consistent with the Arctic Council's mandates of environmental protection and sustainable development. The Arctic Council's PAME Working Group was an instrumental driver in the delivery and production of the AMSA, which provides a useful framework for the Sustainable Development Working Group (SDWG) in its approach to addressing the human dimension of AMSA.

Two recommendations from AMSA that directly relate to, or have impacts upon, Arctic peoples and communities are found within one of AMSA's three major themes, that of **Building the Arctic Marine Infrastructure.** Specifically, the following two recommendations can be addressed through a sustainable development approach:

> **III A. Addressing the Infrastructure Deficit:** That the Arctic states should recognize that improvements in Arctic marine infrastructure are needed to enhance safety and environmental protection in support of sustainable development.
>
> **III C. Circumpolar Environmental Response Capacity:** That the Arctic states decide to continue to develop circumpolar environmental pollution response capabilities that are critical to protecting the unique Arctic ecosystem.

A well-developed Arctic infrastructure ensures that Arctic nations have the capacity to address community needs and environmental response. An Arctic Maritime and Aviation Initiative that has as its goals to benchmark and conduct a baseline assessment of aviation and maritime infrastructure and capacity lends itself to sustainable development in the Arctic.

Furthermore, specific findings within AMSA point to the need for an intermodal approach to maritime infrastructure in the Arctic. It is worth highlighting that

> Emergency response capacity for saving lives and pollution mitigation is highly dependent upon a nation's ability to project human and physical resources over vast geographic distances in various seasonal and climatic circumstances. The current lack of infrastructure in all but a limited number of areas, coupled with the vastness and harsh environment, makes carrying out a response significantly more difficult in the Arctic. Without further investment and development in infrastructure, only a targeted fraction of the potential risk scenarios can be addressed. (AMSA, 2009)

An intermodal approach to a nation's and region's ability to respond to this challenge is necessary and the Arctic Council has an opportunity to address this through this Initiative.

CITF and the Arctic Aviation Experts Conference

In 2005, as Chair of the Circumpolar Infrastructure Task Force – a project of the SDWG – the Institute of the North hosted the Arctic Aviation Experts Workshop held in Khanty-Mansiysk Autonomous Okrug, Russia. As a follow up to that workshop, with support from LPS Aviation and the Government of Manitoba, the Institute was able to host the first Arctic Aviation Experts Conference in 2006.

The outcomes from that event continue to resonate today, and the importance of the issues addressed is highlighted in the growing demand for Arctic-specific conversations. That demand resulted in the 2010 Arctic Aviation Experts Conference (AAEC), where many previous recommendations were re-explored and evaluated. The most recent AAEC:

- addressed growing social, political, and economic needs for air transportation and the challenges to sustaining and improving transportation in the north;
- acknowledged the unique economic pressures on arctic aviation, as well as the application of technological advances in the unique northern environment;
- discussed ways to improve the reliability and safety of arctic aviation and airport operations;
- facilitated conversations that further the deployment of advanced aviation technology to enhance safety, capacity and connectivity in the Arctic;
- compared the response of circumpolar communities to the emerging sustainability, climate and environmental challenges of arctic transportation; and
- worked to develop an overarching process for change that addresses the interdependency of the social, economic, environmental, technological, and safety aspects of Arctic aviation.

From the 2010 Arctic Aviation Experts Conference (AAEC) that was hosted in Fairbanks, Alaska a better understanding of the unknown has been realized. Key to this has been the development of an increased awareness of parallel activities, programs and resources being delivered/expended throughout the Arctic that impact Arctic aviation policy, technology, and infrastructure. The Institute of the North and AAEC participants identified an urgent need for

coordination, collaboration, and networking of aviation related systems if Arctic nations are to improve aviation access and transit within the Circumpolar North to its fullest potential.

At the AAEC, participants identified numerous current and future infrastructure and service projects intended to improve aviation, which are essentially isolated projects, confined to local areas of implementation and local use. Many of the activities and infrastructures are paralleled with other ongoing activities that could be linked together in some manner to provide a more seamless service to a broader audience and across borders. Collaboration and coordination of parallel activities such as Automatic Dependent Surveillance Broadcast (ADS–B), weather data networks, camera networks, Search and Rescue (SAR) services and methods, and other systems, could provide broader, more effective services and achieve greater success if they were 'connected'. This connectivity could provide great socio-economic benefits and savings; and could improve the quality of services to governments, communities, and airports, as well as improving the delivery of passengers and cargo throughout the Circumpolar North.

Numerous technologies, engineering and construction methods and best practices are in place in Arctic nations, as well as efforts on research and development projects. Many of these are isolated knowledge bases, which have great potential to benefit a much broader aviation related audience than they do today. Put simply, it is evident that those working to address these issues could do so more effectively with a coordinated, intermodal approach.

Increased activity in the Arctic brings with it human impacts. The aviation industry must be positioned to respond to the need for an expansion in the delivery of services, whether they are related to Search and Rescue, community resupply, development efforts or an environmental disaster. This expansion brings with it an increasing need for the facilitation of shared knowledge, collaboration of services, and coordination of activities amongst the eight Arctic nations.

An Arctic Maritime and Aviation Transportation Infrastructure Initiative – the Project
There is – clearly – a need for the Arctic Maritime and Aviation Transportation Infrastructure Initiative to facilitate the development of aviation and port policy, infrastructure, and technology throughout the Circumpolar North for the benefit of all of the Arctic nations. Recognizing an increasingly busy Arctic – driven in part by climate change and economics – the Institute of the North's Arctic Maritime and Aviation Transportation Infrastructure Initiative provides a platform for addressing Arctic marine and air transportation infrastructure challenges and opportunities. In order to ensure the continuity in the discussion and to be able to actively work toward recommendations from past efforts, this Initiative is best approached through the Arctic Council's Sustainable Development Working Group.

The Initiative will approach Arctic air and maritime transportation policy, education, and research from many different vantage points and will facilitate ongoing and increased communication and collaboration throughout the Arctic. It will act as a coordination point for conducting research to identify gaps in port and airport infrastructure; and will facilitate technology transfer within and between Arctic nations in order to ensure best practices in infrastructure development. It is important to keep in mind the impact that climate change will have on infrastructure; and to work toward future infrastructure that prevents pollution and is

climate resilient. At the same time, the Initiative will provide an education and outreach role in developing a robust maritime and air transportation industry in the Arctic, able to meet community, environmental and economic needs. This effort will be focused on highlighting the ongoing efforts to address the infrastructure deficit by educating policy makers and administrators, community leaders, and the general public.

The Institute of the North will develop and manage the Arctic Maritime and Aviation Transportation Infrastructure Initiative with the following in mind, to be referenced throughout the life of the Initiative and reflected upon/updated by all stakeholder/partners as it evolves.

> ***Mission Statement***: To initiate a strategic approach to the development of a sustainable, resilient maritime and aviation transportation infrastructure in the North.
>
> ***Founding Principle***: To promote Arctic maritime and aviation transportation policies and technologies that support critical infrastructure while enhancing safety and environmental protection in support of sustainable development .
>
> ***Vision***: To create a safe, environmentally sensitive and effective maritime and air transportation system in the Arctic.

The Initiative's mission will be accomplished through the guidance of an international steering committee, as well as two expert groups comprised of subject matter experts. These groups will convene regularly to re-engage in the recommendations and action items from previous efforts. The task of each expert group will be to accomplish the intended outcomes – as described here-in – that work together to develop and support the mission, objectives, and goals of the Arctic Maritime and Aviation Transportation Infrastructure Initiative.

These two expert groups will address separately the Arctic Maritime and Port Infrastructure; and Arctic Aviation and Airport Infrastructure. Groups will work to

- Identify, define and promote Arctic maritime and aviation transportation policies that affect infrastructure development, through reciprocal education and communication with stakeholders and partners.

- Accelerate implementation of available/emerging technologies and operational practices into the maritime and aviation infrastructure, for improved services that support community safety and access as well as the protection of the Arctic environment.

- Provide guidance to Arctic nations to build, improve and maintain infrastructure that supports increased and changing maritime and aviation activity in the Arctic, balancing the social, economic, and environmental needs of local communities by incorporating lessons learned from across and beyond the Arctic.

These three missions will be accomplished in the initial phase of the Initiative through research and analysis that accurately depicts current conditions and informs future conditions of Arctic maritime and aviation infrastructure.

With regard to current and future Arctic maritime and aviation policy, technology, and infrastructure, each expert group will provide a Gap Analysis Report and deliver a Summary of Findings to improve maritime and aviation transportation capacity within the Circumpolar North to its fullest potential. Upon completion of these deliverables, an Arctic Maritime and Aviation Transportation Guidance Document will be produced.

This Phase One activity will develop a comparison of actual conditions with its potential future conditions. At its core are three questions: "Where are we?", "Where do we want to be?", and "How do we get there?" These questions will be addressed with the completion of three Phase One Deliverables:

- Expert Group Gap Analysis Reports
- Expert Group Summary of Findings
- Arctic Maritime and Aviation Transportation Guidance Document

Each Expert Group will deliver a Gap Analysis Report and a Summary of Findings. Upon completion of these deliverables, the project Steering Committee in conjunction with the Expert Groups will develop the final Arctic Maritime and Aviation Transportation Guidance Document.

Gap Analysis

This Gap Analysis will be a formal study and assessment of maritime and aviation transportation and infrastructure capacity (including critical support functions such as meteorological forecasting, marine/ice conditions, and communications) in the Arctic. This technical analysis will be divided into three milestone events: develop a benchmark; research current conditions; and produce a gap assessment. The outcomes of this Analysis will be used to develop the Expert Group Summary of Findings as a deliverable of this phase of work.

The Benchmark is intended to describe the desired and potential future conditions of aviation and maritime transportation in the Arctic. The Current Conditions milestone will define the current conditions of Arctic marine and air transportation – specifically, this will assess, describe and map port and airport infrastructure. The Gap Assessment will identify and articulate the gaps, deficiencies, and differences between current conditions and the potential future conditions.

This study and assessment should include analysis of findings from AMSA, as well as the recommendations of the 2005 and 2006 CITF Arctic Aviation Experts Conferences and those of the 2010 AAEC.

Summary of Findings

Upon completion of the Gap Analysis each Expert Group will develop a Summary of Findings that will describe actionable items found within the Gap Analysis. This document will provide an overall 'picture' of the current conditions of the Work Groups' specific focus. The Summary of Findings document will include conditions, activities, and projects that are planned or in progress in various locations, or areas, of the Arctic, as well as to identify future possibilities.

These documents will remain as "living documents" to be updated as new information becomes available from ongoing research and other activities and can be analyzed for potential use in future projects and Initiative course changes or corrections.

Arctic Maritime and Aviation Transportation Guidance Document

The Arctic Maritime and Aviation Transportation Guidance Document will be developed from the outcomes of the Gap Analysis and Summary of Findings documents that will be delivered by each of the Expert Groups of this phase of work.

The Guidance Document will be a stand-alone document that can be used as a roadmap to the future of Arctic air and maritime transportation infrastructure in the North and can be used to set the international benchmark for the development of well-crafted policy, best and latest technology, and effective infrastructure; as well as a communications and sharing format for Arctic maritime transportation and aviation system providers, users, stakeholders, sponsors, and other interested parties.

This document will:

- Identify the ongoing parallel projects, plans, policies, and technologies that could be combined or shared for the use and benefit of a broader Arctic maritime transportation and aviation audience.
- Point to potential methods, actions, and collaborations.
- Develop an overall picture of the gap between the future of Arctic air and maritime transportation and the current conditions of Arctic air and maritime transportation infrastructure.
- Provide the recommendations and information necessary to achieve the goal to improve capacity, access and services in the Arctic while enhancing human safety and the environment in support of sustainable development.

The Arctic Maritime and Aviation Transportation Database

With inputs from Civil Aviation authorities, the Arctic Council's CITF and the Institute of the North compiled a database of over 600 airports north of 55 degrees in all circumpolar countries: United States, Russia, Canada, Greenland/Denmark, Iceland, Norway, Sweden, and Finland.

The web-based data describes the location and infrastructure for the airports along with statistics and contact information. The information is meant for investigation and planning purposes and not for air navigation. This data needs to be updated to more accurately reflect increased activity – and corresponding needs – in the Arctic.

In addition to updating the airport information, it is envisioned that adding port infrastructure to what becomes an Arctic Maritime and Aviation Transportation Database will better demonstrate the capacity Arctic nations have to respond to environmental safety concerns, community needs, and development activity. This will be a significant contribution to the Arctic community's understanding of aviation and maritime infrastructure. These data sets could be added to the Arctic Portal for a comprehensive examination of Arctic challenges and opportunities.

Significance and Justification

The Arctic Maritime and Aviation Transportation Infrastructure Initiative has the potential to be an incredibly successful platform for addressing critical needs in the Arctic's aviation and maritime environment. At the same time, it demonstrates international cooperation and collaboration by translating prior Arctic Council efforts into a comprehensive approach to infrastructure development. It also works to incorporate and leverage new efforts such as the multi-agency Regional Response Team (RRT) in the U.S.; the U.S. National Ocean Policy and Arctic Strategic Action Plan; EPPR's proposed Arctic Region Oil Spill Response Resource and Logistics Guide; the State of Alaska's Arctic Ports Study; the Arctic ERMA; SAON (Sustaining Arctic Observing Networks) and other initiatives taking place in other Arctic nations.

AMSA's impact on Arctic policy will be felt well into the future. Its relevance to a connected, intermodal approach to Arctic air and maritime transportation is clear. The Arctic Maritime and Aviation Transportation Infrastructure Initiative is a next step in that approach and by leveraging international resources, global interest and local input the Arctic Council's SDWG will be fulfilling its mission and responding to the human condition.

Aviation and marine shipping infrastructure in the Arctic are inextricably linked in their ability to deliver goods and services, respond to needs, produce community and economic development, and protect the environment and human health. Not only that, but they link Arctic nations and peoples and build a resilient North. Partners and stakeholders from the eight Arctic nations – Sweden, Norway, Denmark, Finland, Iceland, Canada, Russia and the United States – can jointly work to address an infrastructure deficit in the Arctic. At the same time, this Initiative responds to more recent efforts such as the Search and Rescue Agreement signed by Arctic nations at the Arctic Council Ministerial in Nuuk, Greenland.

Timeline (draft)

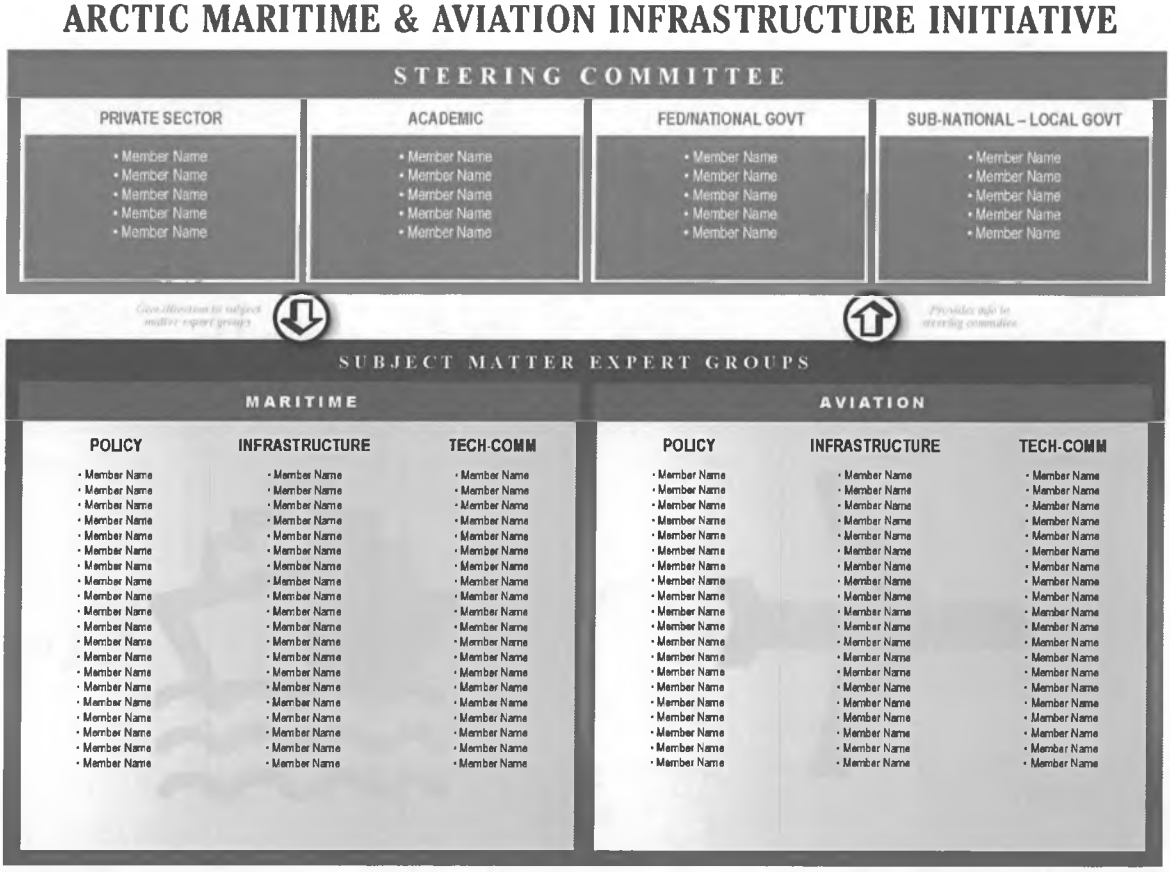
Year 1:

1) Obtain SDWG Project Approval
2) Enlist participating countries and form Steering Committee/SMEGs
3) Develop Project Management Plan and Scope of Work
4) Develop database and identify web-based platform
5) Host Arctic Port Response Infrastructure Conference and Arctic Aviation Experts Conference
6) Brief SDWG twice a year on progress/milestones

Year 2:

1) Compile and organize data from participating countries
2) Test and launch pilot Arctic Maritime and Aviation Infrastructure Database
3) Brief SDWG twice a year on progress/milestones and conduct demonstration of system
4) Produce hard copies of Guidance Document and Database
1) Obtain SDWG/SAO review/approval of final deliverables
2) Publicize & disseminate Guidance Documents and Database

The Steering Committee and Project Timeline/Process



AMATII's Steering Committee will reflect the overall commitment to balanced, informed discussion that incorporates economic, social and environmental perspectives from four sectors – private industry, academia, local/sub-national government, and national government agencies. Twenty high-level committee members will be selected based on established relationships developed during AMSA and the AAEC, with input from the co-lead countries.

The purpose of the steering committee is to:

- Establish and maintain a transparent, inclusive consultation process
- Establish and maintain consistent goals for Subject Matter Expert Groups
- Establish timeline for meeting goals and project deliverables
- Reconcile differing views; taking into consideration cross-sectoral issues and working toward their resolution
- Review and approve assessment, benchmarking and gap outputs
- Provide regular updates and reports to SDWG

Time for a New Approach

Rather than decision based on approach base decision on

- Cost
- Risk
- Consequences

Risk

Understanding the type of failure and the chances that failure will occur

Consequences

What happens should a failure occur?

Until Now That was Based on About 100 Years of Climate Data.

So Do We

Accept Performance

Remove and Replace

Keep Frozen

Or Thaw

Or Do We Evaluate

Cost

Risk

Consequences

In an Uncertain Future

The Canadians are Choosing the Latter and Performing Vulnerability Studies.

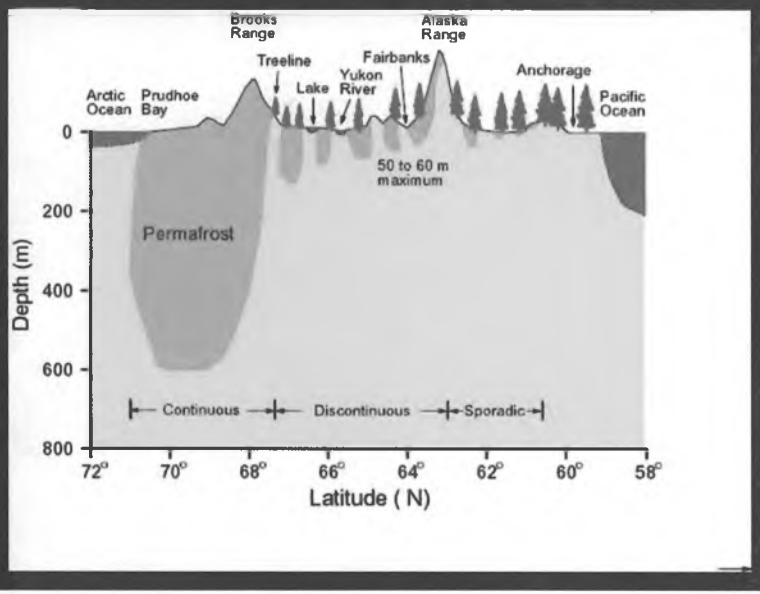
Vulnerability Studies Allow us to Select Designs Which Will Be Best Suited to Our Future

Take-Aways

Engineers and Scientists Must Begin to Work Together

All Alternatives are Expensive, but we Must Move Away from the First Cost Paradigm

We Must Adapt to an Uncertain Climate

We Must Consider Cost, Risk and Consequences in Our Decision Process


We Must Understand the Vulnerabilities of our Infrastructure to Thawing Permafrost
