As with any good story, the truth lies not only in the composite materials and feats of engineering but in the characters who bring the technology to life. Whittle takes the reader to 1973, the end of the Yom Kippur War between Israel and an Arab coalition led by Egypt and Syria. Abe Karem, an Israeli engineer who had risen to be chief designer with the government-owned Israel Aircraft Industries, was issued a challenge to rapidly create a decoy that could be released from a fighter jet to fool the Arabs' Soviet-built surface-to-air missile radar systems, which had served as a formidable counter to the powerful Israeli Air Force.

Though undistinguished in its military application, the decoy created was functional within two weeks and inspired Karem to recognize the future of unmanned flight. This occurrence pushed him to start Leading Systems, Inc. in his garage some years later, after relocating to California. The lightweight, broad-wing aircraft dubbed the "Amber" would later evolve to become the physical platform for General Atomics to create the present-day Predator.

Whittle observes that "Necessity is the mother of invention, and war [is] the mother of necessity" (page 293). Demand for development of the Predator increased during the conflict in the former Yugoslavia, where frustration reigned over lack of intelligence about movement of Serbian artillery targeting civilians in Bosnia. Early versions of the Predator flew over the region in 1995 with mixed success. One Predator was shot down by the Serbian military, while another crashed as a result of engine failure. The real-time information gathered amazed military commanders. But, due to lack of clearly defined leadership and disputes between the Navy, Army, Air Force, and CIA, targeted development of the Predator project was effectively handcuffed until the Air Force assumed full control of the program in October 1997.

Thereafter, advancements sped along, largely due to Big Safari, headquartered at Wright-Patterson Air Force Base in Dayton, Ohio. Development was guided by philosophies such as "modify, don't develop" and "provide the necessary, not the nice

Casey Civiello is an associate in the Boston, MA, law firm of Henshon Klein LLP. His practice covers a broad range of business and real estate transactions, with a particular focus on assisting early stage start-ups. He can be reached at cciviello@henshon.com.

to have." The Big Safari team and their supporting advocates inside the government are painted by Whittle as a group of gunslingers who efficiently carry the Predator project from successful experiment into modern-day prevalence, applying innovative ideas (streaming video, multiple-point flight control) to existing military hardware. The culmination of Big Safari innovation efforts resulted in a joint CIA-Air Force team tracking down and killing al-Qaeda military chief Muhammed Atef near Kabul, Afghanistan, in the weeks following 9/11.

Although it is possible to get lost at times in the alphabet soup of government programs, call-names, and plane designations, Whittle gives the reader confident insight into how the innovators were able to cut through red tape, draw resources, and complete a secret project under intense pressure and timelines. In truth, the sometimes confusing roster of players tied to the creation of the Predator may play as a parallel to the complexity of government contracting and development itself. Perhaps the hesitance displayed through bureaucracy is a necessary check on technological development that seems to be outpacing the balancing moral review.

Predator successfully lifts the veil of secrecy shrouding perhaps the most influential military innovation of a generation, but Whittle passes on the opportunity to analyze the ethical questions surrounding the Predator. References in the book to collateral damage are sterile, though likely an accurate representation of the feelings of those individuals affiliated with creating and operating the Predator. The book's excitement-inducing narrative tempts the reader to accept impolitic portrayals of casualties of war, such as referring to human bodies blown from a Hellfire blast as "flippers," or to those crawling from the scene as "squirters." Instead, the invitation (to the reader) could be for a more thorough reflection on the long-term impacts of remote-controlled warfare. What are the moral hazards of dehumanizing casualties? What role do anonymous strikes and collateral damage play in advancing the radicalization of Islam? What are the legal and foreign policy implications of this "video game" warfare?

Whittle perhaps recognizes the limitations of his book when near the end he posits, "When automobiles replaced horses, traffic laws and stoplights were needed" (page 305). The military development of unmanned aerial vehicles has quickly skipped to the consumer market and sparked huge popularity of drones for personal and commercial applications. This expansion further stretches the need for timely thought and action with respect to the role that innovators and lawmakers alike will have in shaping the future of drone usage. ◆

Make Connections That Matter at the ABA Annual Meeting: Sweet Home Chicago

By Ruth Hill Bro

In a 24/7 world humming on mobile technology, it's easy to forget that coming together face-to-face, in person, is the best way to make the connections that matter most. Although *distance* learning, *remote* connections, and *virtual* meetings are essential, they seem so far away and never quite as good as the real thing. In fact, one definition of "virtual" is that it is "*almost* or *nearly* as described, *but not completely*."

That's why most leading businesses recognize a key concept backed up by mounting data from biologists, computer scientists, and psychologists: no matter how well we communicate electronically, it's vital to come together in person. Two *Forbes* articles by Susan Adams, called "Being There" and "Why We Need to Meet in Person," discussed such data and noted, "Meeting face to face does three things better than virtual meetings. It captures trust, it inspires positive emotions, and it builds relationships."

If you doubt it, consider the many things you do more effectively in person: (1) going home for the holidays, relaxing with friends, and celebrating milestones; and (2) building relationships with clients and prospects, conducting job interviews, meeting potential employers and future colleagues, and expanding your network of peers and mentors. The list is endless. No matter what our personal life is like or our job setting is, *we're all in the people business.*

However much you get from your SciTech membership, you could be getting even more of that *SciTech Edge* if you visit your home Section at the ABA Annual Meeting. From July 30th through August 4, 2015, the American Bar Association will meet in Chicago, home to ABA headquarters, renowned architecture, high-profile professional sports teams, Lollapalooza and other top music venues, beautiful Lake Michigan, the Cloud Gate sculpture and Millennium Park, and the Art Institute (site of the 2015 ABA President's Reception) and other internationally acclaimed museums.

Join SciTech at the Annual Meeting to make the connections that matter most: at the SciTech Luncheon (with a top-notch speaker), the SciTech Reception (this year focused on diversity and inclusion and cohosted by the ABA Intellectual Property Law Section), SciTech and ABA CLE programs (meet the speakers), SciTech committee meetings on hot topics (explore ways to contribute and raise your profile), the ABA General Assembly (featuring a keynote address from a US Supreme Court Justice or other prominent legal figure), the ABA Expo (with a Grisham-esque authors panel on "The Law as a Platform for Writing"), etc. You'll also find:

- Meaningful ways to interact with other forward-thinking practitioners (find the answers you need now and colleagues and mentors for years to come).
- Indispensable resources and perspectives that make your work life easier.
- Opportunities to get involved, share insights, and shape law and policy on issues that are not only important, but also important to get right.
- So much more. Register and explore your options at ambar.org/scitech and ambar.org/annual. (Law students: for only $50, you can access 150+ CLE programs, dozens of committee/governance meetings, the General Assembly, and Expo.)

We hope you'll join us every year for the Annual Meeting, but especially this year in Chicago, whether you know it as Sweet Home Chicago (a la the Blues Brothers), my kind of town (a la Frank Sinatra), the Windy City (politics, and literally the wind), or the City of the Big Shoulders (a la poet Carl Sandburg). By standing on those shoulders, you'll see farther and make more of the connections that matter to you. ◆

Ruth Hill Bro, privacy attorney, speaker, and author (Chicago), chairs the Membership and Diversity (MAD) Committee of the ABA Section of Science & Technology Law and served as the 2008–09 Section Chair. She can be reached at ruth.hill.bro@gmail.com.
"It's a MAD World: Membership and Diversity, with a SciTech Edge," is a column designed to spotlight membership and diversity-related topics, resources, and opportunities for SciTech members.

Each year, thousands of members count on SciTech to put the tools they need at their fingertips to navigate rapidly changing science and technology law issues:

THREE INFORMATION-PACKED PERIODICALS:

- *The SciTech Lawyer*, our glossy quarterly magazine with cutting-edge coverage
- *SciTech e-Merging News*, our quarterly electronic newsletter with timely practice perspectives and Section activities/opportunities
- *Jurimetrics*, our quarterly electronic law review published by the Section and the Center for Law, Science & Innovation of the Sandra Day O'Connor College of Law at Arizona State University

---

- Unlimited access to over 20 free hot-topic committees and list serves
- Free access to Section articles via the SciTech e-Archive and ABA Web Store
- Members-only discounts on Section books (save 10% or more) and CLE programs (save $100 off the public rate, $50 off the ABA rate)
- Exclusive career and business development resources
- Free access to our podcast archive on emerging issues
- Four selected chapters from preeminent SciTech books (delivered electronically) and access to chapter archive
- Two free webinars/teleconferences: one practice-focused and one on a hot substantive topic (notices sent electronically)
- Limited-time special offers

Executive Summary

Purpose and Scope

In March 2013, the University of Alaska Fairbanks Center for Unmanned Aircraft Systems contracted with McDowell Group to analyze the economic conditions for unmanned aircraft systems (UASs) in Alaska and measure the projected economic impact of developing a Federal Aviation Administration (FAA) test site for UAS in Alaska. The economic impact assessment (EIA) in this report provides annual projections of the direct, indirect, and induced impacts to employment and wages as well as projections of output and value added related to the test site, called the Pan-Pacific UAS Test Range Complex (PPUTRC) – with test ranges located in Alaska, Hawaii, and Oregon. The EIA focuses on the additional economic activity that is expected in response to the PPUTRC test site selection. Additional information is provided in this report on the economic impact of the commercialization of UAS specifically in Alaska once UAS flights are allowed in the National Airspace System (NAS).

Summary

- UAS represent a new industry that is set to quickly grow once new government regulations increase access to designated test sites and then to the National Airspace System (NAS), the system of air traffic control that enables safe and efficient flight activity in the U.S.
- UAS applications are far reaching for civilian and military purposes; ranging from environmental monitoring to search and rescue to pipeline or powerline inspections.
- The FAA has limited the authorized use of UASs in the U.S. to efforts focused on the public interest. There are currently two ways to operate a UAS with the approval of the FAA (both of these options require that the flight takes place outside of densely-populated areas):
    - Certificate of Waiver or Authorization (COA) for public UAS
    - Special airworthiness certificate for private sector (civil) UAS
- However, the FAA is scheduled to designate six UAS test sites in the U.S., as required under the FAA Modernization and Reform Act of 2012. The sites will operate from January of 2014 to February 13, 2017 to provide opportunities for government agencies, industry, and researchers to access this airspace to aid in the integration of UASs in the NAS.
- According to the Association of Unmanned Vehicle Systems International (AUVSI), integration of UASs into the NAS will generate some $82 billion in activity in the U.S. between 2015 and 2025; employment impacts are estimated at just over 100,000 jobs by 2025.

- In an effort to bring additional UAS activity and related economic benefits to Alaska, UAF is leading the PPUTRC Test Site application process for 13 ranges in Alaska, Hawaii, and Oregon.
- Existing UAS activity in Alaska, Hawaii, and Oregon benefits from unique assets and opportunities, including government facilities (e.g. numerous military bases, universities, and maritime assets), wide-open airspace in largely unpopulated areas, and geographic diversity (e.g. tropical to arctic climates, oceanic or mountainous landscapes, and up/down weather fronts).
- In total, designation of PPUTRC as a UAS test site would be expected to generate 1,065 direct, indirect and induced jobs in 2014, increasing to over 1,400 jobs by 2017. Total labor income would climb from $57 million in 2014 to about $76 million in 2017.
- Output in the PPUTRC states attributable to test site designation would climb from $265 million in 2014 to $333 million in 2017.
- Value added would climb from $109 million to $134 million over the same period.
- Designation of the PPUTRC will provide a four-year total of $20 million of income tax revenue to Hawaii and Oregon.

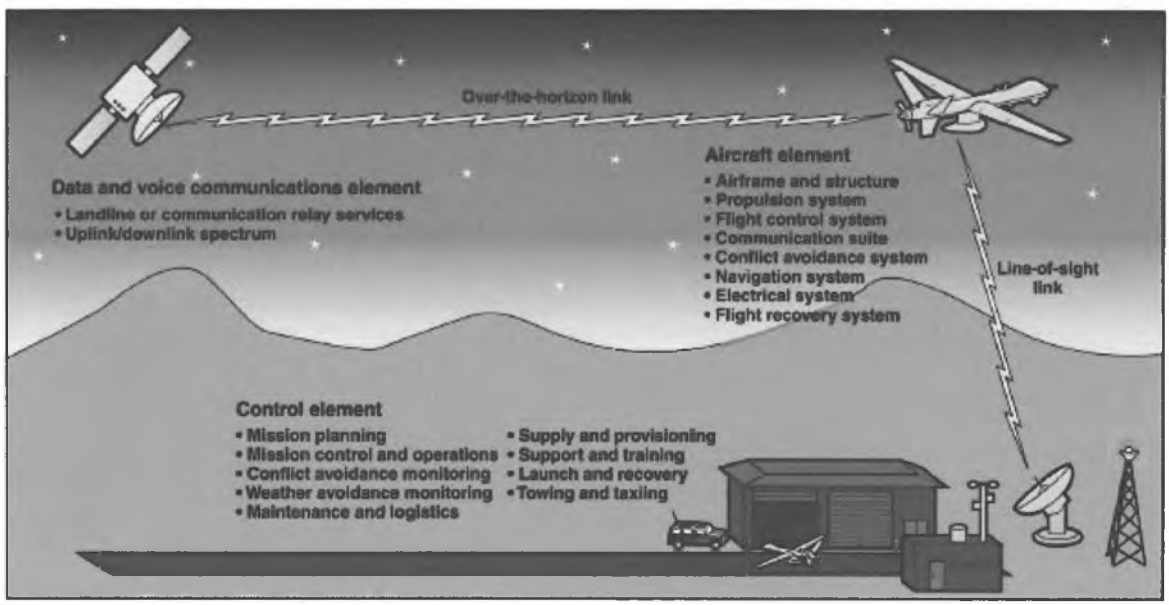
Chapter 1. Unmanned Aircraft Systems in the United States and the NAS

Background

Unmanned aerial vehicles (UAVs) were first described in the late-19th century. Early attempts to develop these UAVs, mostly for combat purposes, soon followed. These remotely piloted vehicles first entered U.S. combat in the mid-20th century to support missions focused on reconnaissance and surveillance, and sometimes they were also used as decoys. Throughout most of the 20th century UAVs lacked real-time data capability and instead focused on collecting images and video for surveillances purposes. Widespread adoption of the technology for U.S. military purposes did not begin until the 1990s and, to a much greater extent, the 2000s during the Afghanistan and Iraq conflicts. It was at this point that technological innovations related to onboard sensors, communication links, and data collection began drastically increasing the potential domestic uses of unmanned aircraft systems.

The increase in complexity for the UAVs required a systems approach to appropriately understand the interactions - and design each component from the start as an integratedsystem - among the on-the-ground control elements, the aircraft, and the communication links. This broader operational perspective is termed "unmanned aircraft system" (UAS). The image below provides a conceptual rendering of the interactions among key elements of a UAS flight.

Figure 1: Conceptual Rendering of an Unmanned Aircraft System



Source: GAO, 2013

UAS Applications

Unmanned aircraft often provide advantages in comparison to manned aircraft. For instance, flights that are dangerous or covert represent potential opportunities where an unmanned vehicle might be preferred over a manned vehicle. Similarly, dull tasks such as extended surveillance missions may be better suited for ground-based operators that can be relieved at the end of their shift. UAVs are often more fuel efficient, quieter, and less disruptive to their surroundings (in comparison to manned aircrafts) and, thus, can allow for fewer environmental disturbances as well as more accurate research results. Finally, initial costs, operating costs (e.g. maintenance costs, fuel costs, storage costs, etc.), and labor costs (e.g. wages, insurances, etc.) are all generally lower for UAVs (Source: Austin, 2010). UASs have already been shown to lead to arrests as well as saving lives during search and rescue missions (Source: The Verge, 2013).

The existing and potential applications for UASs are wide ranging for both civilian uses as well as for military purposes. The lists below provide an abbreviated look at how important this relatively new field may become to sectors throughout Alaska's economy (Source: Austin, 2010):

Civilian

- Aerial Photography - Film, video, stills, etc.
- Agriculture - Crop monitoring and spraying; herd monitoring and driving
- Coastguard – Search and rescue, coastline, and sea-lane monitoring
- Conservation – Pollution and land monitoring
- Customs and Excise – Surveillance for illegal imports
- Electricity Companies – Powerline inspection
- Fire Services and Forestry – Fire detection, incident control
- Fisheries – Fisheries protection
- Gas and Oil Supply Companies – Land survey and pipeline security
- Information Services – News information and pictures, feature pictures (e.g. wildlife)
- Lifeboat Institutions – Incident investigation, guidance, and control
- Local Authorities – Survey, disaster control
- Meteorological Services – Sampling and analysis of atmosphere for forecasting, etc.
- Oil Companies – Pipeline security
- Ordinance Survey – Aerial photography for mapping
- Police Authorities – Search for missing persons, security and incident surveillance
- Rivers Authorities –Water course and level monitoring, flood and pollution control
- Survey Organizations – Geographical, geological, and archaeological survey
- Traffic Agencies – Monitoring and control of road traffic
- Water Boards – Reservoir and pipeline monitoring

Military

- Navy
    - Shadowing enemy fleets

    - Decoying missiles by the emission of artificial signatures
    - Electron intelligence
    - Relaying radio signals
    - Protection of ports from offshore attack
    - Placement and monitoring of sonar buoys and possibly other forms of anti-submarine warfare
- Army
    - Reconnaissance
    - Surveillance of enemy activity
    - Monitoring of nuclear, biological, or chemical (NBC) contamination
    - Electronic intelligence
    - Target designation and monitoring
    - Location and destruction of land mines
- Air Force
    - Long-range, high-altitude surveillance
    - Radar system jamming and destruction
    - Electronic intelligence
    - Airfield base security
    - Airfield damage assessment
    - Elimination of unexploded bombs

UAS Categories

UASs are typically categorized based on the size or capability of the UAV. The five categories below provide a common categorization of UAS that helps simplify requirement assessments and costing estimates (Source: Teal Group, 2008):

- Micro or Mini – A small UAV that ranges in size from something that can be held in the palm of the hand to a UAV that can be carried on your back and launched by hand.
- Naval – A tactical UAV is generally operated with simpler systems over a radius between 100 and 300 km.
- Tactical – A reconnaissance UAV used by the Army for endurance missions ranging several hours over an operating radius up to 200 km.
- MALE – Medium Altitude Long Endurance reconnaissance UAVs fly between 5,000 and 15,000 meters in altitude for approximately 24 hours.
- HALE – High Altitude Long Endurance reconnaissance and surveillance UAVs are usually operated by Air Forces at altitudes over 15,000 meters for periods longer than 24 hours.

National Airspace System

The NAS was developed to allow for safe and efficient commercial aviation. However, commercial UAS flights are currently not allowed in the NAS due to concerns over (1) "the inability to detect, sense, and avoid other aircraft and airborne objects in a manner similar to 'see and avoid' by a pilot in a manned aircraft, (2) vulnerabilities in the command and control of UAS operations, (3) the lack of technological and operational standards needed to guide the safe and consistent performance of UAS, and (4) the lack of final regulations to accelerate the safe integration of UAS into the national airspace" (Source: U.S. GAO, 2012 and Waggoner, 2013).

The first authorized use of UASs in the NAS in the U.S. was permitted by FAA in 1990. Over the past 23 years, the FAA has limited the authorized use of UAS in the U.S. to efforts focused on the public interest. These missions have included border patrol, military training, disaster relief, firefighting, search and rescue, law enforcement, and testing and evaluation. According to the FAA, the Department of Homeland Security currently utilize UASs for border and port surveillance; NASA and NOAA utilize UAS to help with scientific research and environmental monitoring; law enforcement agencies utilize UASs to support public safety; and state universities use UASs to conduct research (Source: FAA Fact Sheet 2013). These efforts are limited to areas outside of major urban areas at elevations less than 50,000 feet. The aircraft range in size from a hummingbird to a wingspan as large as a Boeing 737; although many are the size of a remote-control plane or helicopter. Recreational use of airspace is allowed away from airports and air traffic and below 400 feet above ground level – informal flights for business purposes are specifically excluded (Source: FAA Advisory Circular 91-57).

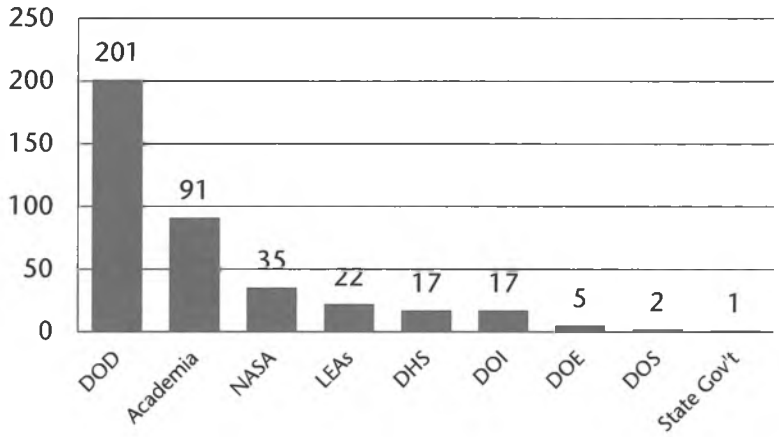
As of 2013, there are currently two ways to operate a UAS with the approval of the FAA: (1) Certificate of Waiver or Authorization (COA) for public UAS's and (2) special airworthiness certificate for private sector (civil) UAS's – both of these options require that the flight takes place outside of densely-populated areas.

Certificate of Waiver or Authorization (COA)

COAs allow public entities to fly UASs in a defined block of civil airspace. The FAA issued the first COAs in January 2007. With COAs, the UAV must remain in view, either of the ground crew or via a chase plane, since UAS technology cannot currently comply with 'See and Avoid' rules. COAs usually require between six and 24 months for approval and cost $40,000 to $60,000 (Source: Economic Development of Central Oregon, 2011). Most of the cost is for specialists in the testing protocols, documentation, and in managing the process through the FAA. Common applications by COA holders include firefighting, border patrol, disaster relief, search and rescue, military training, and other government operational missions (Source: FAA 2013b). The number of COAs issued has increased since 2009, with 146 in 2009, 298 in 2010, and 313 in 2011 (Source: FAA 2013b). In 2012, the FAA issued 391 COAs to 121 federal, state, and local government entities in the U.S. A total of 1,428 COAs have been issued since January of 2007 (Source: GAO 2013). As of February 15, 2013, there were 327 active COAs (Source: FAA 2013b).

The graph below aggregates the 391 COAs issued in 2012 to nine types of entities: U.S. Department of Defense, academia, NASA, local law enforcement agencies, U.S. Department of Homeland Security, U.S. Department of the Interior, U.S. Department of Energy, U.S. Department of State, and state government.

Figure 2: Number of Approved COAs, 2012



Source: GAO, 2013

Special Airworthiness Certificate

Special airworthiness certificates are the only way for civil operators to fly UASs in the NAS at present. However, these certificates cannot be utilized to carry people or property for compensation or hire – they can only be issued for research and development, crew training, or market surveys (Source: FAA 2011).

Allowing UAS in the NAS

In recent years the FAA has made a concerted effort to integrate UAS regulations into the NAS. In 2009, the FAA, NASA, DoD, and the Department of Homeland Security began addressing pathways to integrating UAS regulations into the NAS through their UAS Executive Committee. Additionally, the FAA chartered a UAS Aviation Rulemaking Committee in 2011 to create operational procedures, regulatory standards, and policies related to UAS flights in the NAS. In 2012, the FAA Modernization and Reform Act of 2012 (FMRA of 2012) was passed by Congress to approve six test sites where UAS integration could be tested prior to a 2015 integration of UAS regulations in the NAS (Source: FAA 2012). Delays within the FAA due to technical, logistical, and public outreach concerns may contribute to a UAS integration date later than 2015. However, six test sites are still scheduled to run from January 1, 2014 to February 13, 2017.

Six UAS Test Sites

There is considerable competition over where test sites will be designated, since designation will provide immediate employment in the selected region and support a strong foundation for UAS activity prior to integration of UAS regulation in the NAS. As of March 5, 2013, 50 applicants from 37 states were granted access to the FAA test site application web portal (Source: FAA 2013b). The FAA will consider

five key items when deciding the location of the six test sites: (1) geographic and climatic diversity, (2) location of ground infrastructure and research needs, (3) consultation with NASA and DOD, (4) population density and air traffic density of the surrounding area of any proposed location as well as the potential impact areas in the event of incidents, such as "Fly away" given potential safety mitigations; and (5) identification of specific goals and objectives to be accomplished. Additionally, the test sites are expected to provide an environment and opportunity to test conventional takeoff and landing capability, high speed flight (greater than 250 knots indicated air speed), maritime (launch/maneuver/recovery) capability, operations at extremely high altitudes (Class A airspace and above), and evaluation of dissimilar aircraft (including a mix of manned and unmanned aircraft) in multiple altitude structures (Source: FAA 2013a).

The six test sites that are selected will support the following operations and programs:

- Safe designation of airspace for integrated manned and unmanned flight operations in the national airspace system;
- Development of certification standards and air traffic requirements for unmanned flight operations;
- Coordinating with and leveraging the resources of NASA and the Department of Defense;
- Addressing both civil and public unmanned aircraft systems;
- Ensuring that the program is coordinated with the Next Generation Air Transportation System; and
- Ensuring the safety of unmanned aircraft systems and related navigation procedures before they are integrated into the national airspace system (Source: FAA, 2013b).

The test site operators will provide opportunities for government agencies, industry, and researchers to access this airspace to aid in the integration of UAS regulations in the NAS. Additionally, data collection will support development and operations research and professional development opportunities will be available for inspectors, airspace managers, air traffic controllers, and others. The specific goals described by the PPUTRC applicants include (Source: PPUTRC, 2013):

- Develop a set of standards for select unmanned aircraft categories, for aircraft state monitoring, and navigation. PPUTRC goals and objectives work will augment ongoing standards work with research on categories of UAS not yet addressed, and evaluations needed to refine emerging standards under consideration;
- Validate FAA acceptable risk thresholds or safety management system standards for UAS operations;

- Identify safety factors in UAS design; validate certification standards, including protocols for air traffic control interaction. Define and qualify underlying assumptions and a minimum set of air vehicle characteristics critical to safety, reliability, etc.;
- Develop effective, compliant 'sense and avoid' systems to satisfy regulatory guidance;
- Identify gaps in federal and state statutory and case law protections for privacy and recommend policies or legislation to remedy;
- Directly support the federal mandate for "Expanding Use of UAS in the Arctic" (in Sec 332(d) of Public Law 112-95);
- Design experiments and provide data to support American Society for Testing and Materials (ASTM) F38 and Radio Technical Commission for Aeronautics Special Committee (RTCA SC) 203 to evaluate minimum training and operator qualification standards for crew licensing.

Economic Impact of UAS in the U.S.

The economic implications of integrating UAS regulations into the NAS are substantial. According to a study conducted for the Association for Unmanned Vehicle Systems International (AUVSI), integration will generate $82 billion in activity between 2015 and 2025. Employment impacts are estimated at just over 100,000 jobs by 2025.

The direct economic impact of UAS development in the U.S. is expected to climb from $1.1 billion in 2015 to over $5 billion annually by 2025, measured in terms of output. Including indirect and induced effects, the annual economic impact is expected to rise from $2.3 billion in 2015 to $10 billion in 2025 (Source: AUVSI, 2013).

Areas selected as UAS test sites will have an advantage in capturing these economic benefits; thus the fierce competition among the 50 applicants.

Chapter 2. Pan-Pacific Test Range Complex

In 2012, the Alaska Center for UAS Integration (ACUASI) at the University of Alaska Fairbanks Geophysical Institute began collaborating with Oregon State University and the University of Hawaii to propose a Pan-Pacific Test Range Complex (PPUTRC) as one of the six FAA test sites. This proposed PPUTRC contains 13 test ranges located in Alaska, Hawaii, and Oregon. Of the 13 ranges, six ranges are in Alaska (Denali, Kodiak, North Slope, Oliktok, Poker Flat, and Wainwright), three ranges are in Hawaii (Humuula-R-3103, Makua-R-3109, and Maku-R-3110), and four ranges are in Oregon (Juniper MOA, Pendleton, Tillamook Coastal, and Warm Spring).

Existing UAS activity in Alaska, Hawaii, and Oregon benefits from unique assets and opportunities, including government facilities (e.g. numerous military bases, universities, and maritime assets), wide open airspace in largely unpopulated areas, and geographic diversity (e.g. tropical to arctic climates, oceanic or mountainous landscapes, and up/down weather fronts). The diverse testing environments for the PPUTRC are included in the Table 1 below:

Table 1: Diversity of Potential Testing Environments for the PPUTRC

360 degree oceanic airspace access	Arctic landscape	Extreme low temperatures
Oceanic and sea-ice access	High arctic winds	High sea-salt corrosion effect
Able to fully matrix UAS into NextGen and air traffic operating both VFR and IFR; high and low altitude	Operations in all classes and categories of military SUA	Operations in Classes A through F international airspace in the oceanic environment
Class C, D, & E airspace within 5-nautical miles of airports	High and low-land vegetation tundra	Numerous inland waterways and lakes
High density airports integration studies and testing	Class C, D, & E airspace airport approaches/departures	High-humidity high and low-altitude
Hot and cold high-desert testing	Littoral coastal region mountainous area	Class E (high) airspace
Jungle conditions	Class A airspace	Mountainous terrain
Volcanic	Glacier	Ship traffic including open ocean and ports

UAS Activity in Alaska, Hawaii, and Oregon

There are currently 15 active COAs in the PPUTRC area as well as eight in-process COAs and 20 expired COAs.

Alaska

ACUASI at the University of Alaska Fairbanks (UAF) is the lead organization for the proposed PPUTRC. The formal PPUTRC team includes over 80 businesses, universities, tribes, and economic development organizations in Alaska. UAF has actively managed UAS operations since 2004.

ACUASI was formed in 2012 to enhance UAS research in Alaska. ACUASI and the UAF Geophysical Institute have developed and flown a variety of in-situ and remote sensing instruments on various UASs in Alaska and throughout the world. Scientific and research campaigns undertaken in Alaska over the past decade include using UASs to support observation and monitoring of sea lions in the Aleutian Islands, weather forecasting, volcanic plume monitoring, atmospheric sampling during wildfires, monitoring of sea ice build ups, and oil spill mapping. Commercial applications trialed in Alaska include whale monitoring, cadastral mapping, maritime navigation support, industrial plant monitoring, and environmental clean-up. This experience, coupled with the FAA's UAS test site status, would leverage a variety of new economic activities in Alaska.

The following table, which summarizes ACUASI activity in 2012, illustrates the variety of UAS activity supported by the organization. The table also provides revenue and staffing data for each UAS campaign.

Table 2: UAS Campaigns Supported by the University of Alaska Fairbanks in 2012

Client	Flight Locations	Type of UAS	Purpose of Flights	Revenue for Site Operator	Site Operator Staff	Flight Operator Staff
Aleutians	Aleutian Islands, AK	Aeryon Scout and Puma	Seal observation	$314,200	2 pilots	1 observer
Idaho	Lewiston, ID	Aeryon Scout	Salmon nest observation	$115,000	1 pilot	1 observer
Eglin Air Force Base	Fort Walton Beach, FL	ScanEagle and Aeryon Scout	Controlled burn experiment	$413,000	4 pilots	3 observers
Prudhoe Bay	Prudhoe Bay, AK	Aeryon Scout	British Petroleum flare stack monitoring	$190,000	1 pilot	1 observer
Nome	Nome, AK	Aeryon Scout	Harbor Ice monitoring for USCG	$30,000	1 pilot	1 observer
Ugak Island	Ugak Island, AK	Aeryon Scout	Seal population monitor	$6,500	1 Pilot	1 observer
Fort Greely	Fort Greely, AK	ScanEagle and Aeryon Scout	Flight test	$25,000	2 pilots	2 observers
Chile	Santiago, Chile	Aeryon Scout	Glacier Ice monitor	$9,000	1 pilot	1 observer
Belgium	Belgium	Gatewing	Flight training	$16,000	2 pilots	1 observer
Anchorage	Fort Richardson, AK	Aeryon Scout	Flight test and demonstration	$1,000	2 pilots	1 observer
Fairbanks	Poker Flat Research Range	ScanEagle	Payload test	$347,000	2 pilots	1 observer
Fairbanks	Poker Flat Research Range	Aeryon Scout	Payload test and demonstration	$30,000	2 pilots	1 observer
Fairbanks	Poker Flat Research Range	Raven	Flight test for avionics	$5,000	2 pilots	2 observers
Hawaii	Offshore Hawaiian Islands	Puma	Tsunami debris tracking	$95,000	1 pilot	1 observer

Hawaii

Hawaii offers many unique qualities that make UAS operations appealing. These include: (1) expansive over-water areas unencumbered by other aviation uses, (2) proximity to U.S. Pacific Command – a significant user of future UAS systems, (3) opportunities for joint operations with the Pacific Missile Range Facility – a major test range on Kauai, and (4) opportunities for long-range point-to-point tests with partner ranges in Alaska and Oregon. The Hawaii ranges have proven an important focus for the development of scientific applications of UAS, with significant milestones including test flights of the Aerovironment Pathfinder; Pathfinder Plus; and Helios solar-hybrid propulsion high altitude, long endurance UAS, between 1997 and 2001. Scientific applications led by U.S. federal agencies have recently seen Hawaii emerge as a focal point for NOAA's exploration of UAS as a tool for marine park surveillance. NOAA has utilized UAS to monitor Papahanaumokuakea Marine National Monument since 2007 and performed initial trials using small hand launched systems in mid-2012.

Oregon

The Oregon-based PPUTRC team members include 16 businesses, universities, tribes, and economic development organizations. Additionally, six committed team partners will convert to formal team members upon FAA test site designation award to PPUTRC. Engagements are also planned with a wide ranging network in Oregon – including the 111 AUVSI members and numerous startup companies, primarily in sensor, robotics, and other supporting technologies. In comparison to Alaska and Hawaii, Oregon has historically been more engaged in design, development, and manufacture of UAV systems and subsystems.

The two largest Oregon UAS firms are Insitu (design, development, and manufacture of UAS systems) and FLIR Systems (remote sensors). The main Oregon firm involved in UAS applications has been Near Space Corporation (NSC). NSC uses very high altitude unmanned balloons and gliders to perform scientific and commercial test activities, ranging from data gathering on behalf of government agencies to near-space testing of hardware and sensors for commercial firms. NSC is opening a new $6 million flight test and operations facility at the Tillamook Airport on the Oregon coast. Existing UAS activity also includes the Oregon Army National Guard operations in Pendleton. Oregon's UAS efforts are synergistic with a separately funded ground vehicle innovation initiative, Drive Oregon, which requires systems that can be spun out of UAS: quiet, efficient motors, lightweight composite designs, and navigation systems. The potential economic benefits of the test sites, as well as NAS integration, are particularly strong for Oregon's already significant aircraft manufacturing sector.

Recent UAS Funding in Alaska, Hawaii, and Oregon

Since 2004, nine Alaska contractors have received direct U.S. federal agency contracts for UAS goods and services. The largest federal contract in Alaska is a 5-year standing services award, worth $47 million, from the U.S. Navy to the University of Alaska in 2010 for UAS payload integration and flight test services. The second major award made since 2004 to an Alaska firm consists of a series of pacts totaling $17 million from the U.S. State Department to Anchorage-headquartered Kuk Construction (subsidiary of Olgoonik Development, an Alaskan Native Corporation) for the provision of UAS-based security surveillance services in Iraq in partnership with KBR, Inc. UAF has collaborated with commercial entities, such as Idaho Power Company, and manufacturers including AeroVironment to conduct surveys and observe environmental impacts. Additionally, UAF has collaborated with BP for oil spill response and flare stack monitoring, as well as projects focused on detecting and locating gas and oil pipeline leaks and developing new sensors and processes to identify leaks.

Hawaii's large military presence has resulted in defense spending as the primary source of federal funding to UAS vendors in the state. Direct defense contracts accounted for 94 percent of all awards in terms of obligated amounts from 2004-2012, rising to 97 percent when including awards placed by the General Services Administration on behalf of the U.S. Air Force. The remaining awards were placed with Honolulu-based Referentia Systems by NOAA as part of the Papahanaumokuakea Marine National Monument monitoring project. Hawaii supports a dedicated UAS development and manufacturing company, Williams Aerospace, a small firm currently developing new platforms in the fixed-wing, hand launched micro and medium altitude endurance classes. The state is also working to create two commercial UAS services arms, addressing the defense, homeland security, and precision agriculture markets.

In Oregon, a consortium of industry, academia, and public entities has created a 7-year strategic plan to double the size of the UAS industry in the state, with the help of a $2.5 million State of Oregon grant scheduled for the 2013-14 biennium and additional investments of at least $1.15 million from other sources for a total of $3.65 million. The plan specifically creates UAS solutions for commercial applications, and safely integrating those UAS solutions into the NAS. Projects include emergency response; weather; firefighting; search and rescue; wildlife and habitat management; law enforcement; physical and resource surveys (land and water); management of agriculture, livestock, and public lands; and management of public and private infrastructure. Oregon State University (OSU) has already begun UAS flights based on these research objectives.

Leveraging Current Research Institutes, Community Colleges, and Training Centers

ACUASI is collaborating with the UAF College of Engineering and Mines (CEM) and the Community and Technical College (CTC) to integrate UAS engineering, science, and technology into UAF's teaching, research, and service activities. Additionally, ACUASI is working with the CEM to fill a full-time tenure track engineering faculty position with a professor focused on UAS engineering, science, and technology. ACUASI and CTC also intend to include UAS technology courses in CTC's aviation curricula to train UAS developers, technicians, and pilots as well as to improve outreach to remote Alaskan villages that could benefit from UAS technologies. Cooperation with the CTC at UAA will add air traffic controller participation, offer training for UAS operators, and ultimately build a maintenance program similar to the Aircraft and Powerplant program currently offered.

The University of Hawaii is testing UASs in several of its research programs, evaluating the utility and impact of UAS through analysis of coastal resource management, terrestrial and aquatic environmental monitoring, natural source management and inventory, and human impact studies. University of Hawaii is also developing programs to train students and research professionals on UASs, and plans to integrate this capacity into accredited degree programs.

The new OSU industry-university UAS consortium will depend on test site facilities for collaborative research and development in all phases of operations and applications. Through the Colleges of Engineering, Science, Agriculture, Forestry and Earth, Ocean and Atmospheric Sciences, OSU has expertise and supports ongoing research on control theory and robotics, flexible airframes and flight, sensors, and signal processing, and numerous applications in natural and environmental sciences and environmental monitoring, measuring, and management. OSU-Cascades, located in Central Oregon near the Warm Springs and Juniper test ranges, offers programs in energy engineering, computer science, natural resources, and business, and plans to add programs designed in conjunction with the UAS industry. OSU-Cascades can also provide on-site facilities for OSU-Corvallis researchers leading projects in the region. Central Oregon Community College (COCC) has one of the largest aviation flight training programs on the West Coast – both fixed wing and rotary. COCC offers certifications for UAS flight training and plans to develop a program for data analysis of sensors, building on the school's strong geographic information systems program. Additionally, Blue Mountain Community College (BMCC) in Pendleton, Oregon is developing a UAS curriculum for instructional delivery and course certification. Oregon Institute of Technology (OIT) offers a variety of degrees in engineering and engineering technology, composite engineering, computer and software systems engineering, and electrical engineering, including a master's degree in manufacturing engineering. It offers degrees in professional land surveying and geographic information systems. OIT is collaborating with Rockwell Collins, the aviation electronics company, on real-world projects at a joint campus outside Portland and offers similar hands-on collaborations with other aerospace firms in the northwestern U.S.

Expansion of Existing Businesses and Attracting New Business Investment

The University of Alaska has spun off at least two companies who intend to test their products on the Pan-Pacific test range. These companies were created by University graduate students who were expanding their research in sensors for testing in UASs. UA recently received $5 million from the State of Alaska to support the development of a sustainable high-tech industry in Alaska. Already two companies have established satellite offices in Alaska to improve collaboration with the ACUASI.

Placement of a UAS test site in Hawaii will promote growth within Hawaii and reduce development cycles for manufacturers and researchers. Additionally, it would reduce or eliminate costs to ship sensors, and send knowledgeable staff, to mainland test sites to operate and demonstrate systems. Close proximity to a test site in Hawaii will greatly benefit firms such as BAE Systems, Williams Aerospace, and others – including many military and government contractors working with the Honolulu Fire Department, Honolulu Police Department, U.S. Civil Air Patrol, U.S. Coast Guard, U.S. Department of Defense, U.S. Department of Homeland Security, U.S. National Guard, and others.

In Oregon, more than a dozen companies have said that they will begin testing their sensor packages, propulsion systems, and airframes in Oregon if the Pan-Pacific UAS Test Area is designated as a national test site. Additionally, two companies have informally pledged to open satellite offices at a state test range. The PPUTRC will benefit UAS businesses in the Columbia River Gorge. Over the past seven years, the Gorge's UAS industry grew from a small core of 30 people to an employment base of more than 1,400 employees. Many of these new jobs were created by the UAS companies' suppliers. The two largest Oregon UAS manufacturers are Insitu, manufacturer of UAS platforms and subsystems, and FLIR Surveillance Systems, a manufacturer of electro-optic and infrared imaging systems. Insitu is a major global supplier of high endurance, runway-independent UAS. FLIR Surveillance provides more ER and IR imaging systems for unmanned aircraft, unmanned ground, and unmanned maritime platforms than any other company. Activity in the Gorge from firms such as Insitu, FLIR Surveillance Systems, Cloud Cap Technology, and UTC Aerospace has spun off more than 20 local companies. Central Oregon's general aviation aircraft manufacturing industry had a similar growth pattern over a 15-year period, expanding from a core company of about 30 employees (Lancair) to a cluster of 25 companies that now employs nearly 1,200 people. It is anticipated the PPUTRC will help expand these existing businesses in the Gorge and Central Oregon.

Infrastructure

Alaska expects to invest $1.5 million to construct a test site center at its Poker Flat Research Range, as well as develop and acquire mobile test infrastructure such as fixtures, data collection devices, and monitoring systems similar to its internet-Portable Aerial Surveillance System (iPASS), a web-based application that merges track information from radar, GPS, and a transponder interrogator/receiver. Additionally, large data collection requirements are expected to drive development of a data center for processing and storage.

Hawaii's test ranges link to military/restricted areas used for current UAS operations. These sites include the Pohakuloa training area on the Island of Hawaii, Bradshaw and Wheeler Army Airfields on Oahu, and the Pacific Missile Range Facility on Kauai. Other areas under consideration include Upolu and Dillingham Airfields (on the Big Island and Oahu, respectively). Test points within the ranges would be utilized to support both shore and ship-based development, testing and certification of new UASs, training and crew certification of operational UASs, and development of expanded and joint capabilities involving existing communications systems and operations tactics using UAS.

The budget for the $2.5 million Oregon innovation grant envisions spending at least $1.2 million at test ranges for new equipment and/or infrastructure, with the grant providing $300,000, private enterprise providing $750,000, and public entities providing $150,000. Possible infrastructure development proposed with this funding includes: portable ground radar units; an automatic dependent surveillance-broadcast ground station or a similar 'sense and avoid' technology system; one or more operations management buildings housing computers, calibration components, baseline sensors with a range of capabilities, data analysis equipment, supporting software, maintenance facilities and machine shops; and ground control stations, an observation tower, and ITAR facilities as needed. Additionally, as noted earlier, Near Space Corporation is preparing to open a new $6 million flight test and operations facility at the Tillamook airport.

Chapter 3. Potential Economic Impacts of the PPUTRC

Designation as one of the nation's six UAS test sites promises to have significant economic impacts in the areas where flight activity occurs and support services are provided. Private and public sector UAS activity that has been constrained by restricted access and a restrictive federal authorizing process will have much greater opportunity to conduct UAV flight operations. In this chapter the potential economic impacts in Alaska, Hawaii, and Oregon related to serving as a test site are quantified.

The following economic impact projections were developed by McDowell Group, Inc. utilizing flight activity, flight cost, and flight-related staffing data provided by PPUTRC team members. Direct economic activity was measured by approximating preflight administrative costs, site fees per day, operating costs per day, and total flight days from historical data provided by the applicant. Sector-level information was obtained from the applicant concerning the number of UAS-related firms and jobs per firm. Direct employment estimates were then coupled with multipliers obtained from the IMPLAN economic impact model to estimate total direct, indirect, and induced economic effects. Annual projections from 2014 to 2017 were calculated for each of the 13 ranges utilizing growth rates based on funding forecasts from the Teal Group UAS market profile and forecast report, historical flight activity, and projected growth in flight activity, research, and UAS-related manufacturing as provided by the applicant.

In total, designation of PPUTRC as a UAS test site would be expected to generate 1,065 direct, indirect, and induced jobs in 2014, increasing to over 1,400 jobs by 2017. Total labor income would climb from$57 million in 2014 to about $76 million in 2017.

Table 3: Summary Impacts of PPUTRC Test Site Designation, 2012-2017
Combined Impacts in Alaska, Hawaii and Oregon

Impact of Test Site Designation				
	2014	2015	2016	2017
Total Employment	**1,065**	**1,260**	**1,335**	**1,429**
Direct Employment	490	571	602	642
Indirect Employment	198	243	259	279
Induced Employment	377	447	474	508
Total Labor Income ($ million)	**$56.9**	**$66.9**	**$70.8**	**$75.6**
Direct Labor Income ($ million)	$26.4	$30.5	$32.2	$34.2
Indirect Labor Income ($ million)	$10.4	$12.5	$13.3	$14.4
Induced Labor Income ($ million)	$20.1	$23.8	$25.3	$27.1
Output ($ million)	**$265.0**	**$301.8**	**$315.9**	**$333.5**
Total Value Added ($ million)	**$109.3**	**$121.9**	**$127.1**	**$133.5**
State Income Taxes ($ million)	$4.3	$5.0	$5.3	$5.6

Employment Resulting from UAS and Test Site Operations

In 2014, with designation of PPURTC as a test site, UAS activity in Alaska, Hawaii, and Oregon is expected to account for 581 direct jobs and a total of 1,254 jobs - including direct, indirect, and induced jobs. Approximately 85 percent of that total employment (1,065 jobs) is attributable to test site designation. The remaining 15 percent (189 jobs) is expected to occur in the absence of PPUTRC test site designation. By 2017, employment will rise to an estimated 904 direct jobs and 1,991 total jobs - with 72 percent of that total employment (1,429) attributable to test site designation. A significant number of these direct jobs are expected in smaller communities that tend to have higher unemployment – thus test site designation for the PPUTRC will help improve opportunities where they will provide the most benefits.

Table 4: Direct Employment, 2012-2017

Direct Employment						
	2012	2013	2014	2015	2016	2017
Total Direct Employment						
PPUTRC	**74**	**82**	**581**	**712**	**801**	**904**
Alaska Ranges	43	47	129	142	157	173
Hawaii Ranges	-	-	-	72	95	126
Oregon Ranges	31	35	452	498	549	605
Impact of Test Site Designation						
PPUTRC	**-**	**-**	**490**	**571**	**602**	**642**
Alaska Ranges	-	-	77	82	86	91
Hawaii Ranges	-	-	-	72	95	126
Oregon Ranges	-	-	414	417	421	424

Oregon's relatively high direct employment numbers are due to the existing, well-developed aircraft manufacturing sector in Oregon. Oregon is well placed to supply the growing demand for UAS aircraft that will be triggered by UAS integration. Most of the new jobs created in Oregon due to PPUTRC designation include manufacturing jobs (many of which may be created due to designation of test sites anywhere in the U.S.). These numbers for Oregon are based on an analysis provided to McDowell Group by Economic Development for Central Oregon (EDCO).

In addition to direct jobs created from UAS firms, significant indirect and induced jobs will also be created. Indirect jobs represent jobs created throughout the supply chain to support the UAS industry and induced jobs represent jobs created due to changes in household consumption as a result of the UAS industry.

Table 5: Indirect Employment, 2012-2017

Indirect Employment						
	2012	2013	2014	2015	2016	2017
Total Indirect Employment

Note: Summation of columns may not match the total due to rounding

Labor Income Resulting from UAS and Test Site Operations

In 2014, UAS activity in Alaska, Hawaii, and Oregon is expected to account for $31 million in direct labor income and $67 million in total labor income - including direct, indirect, and induced - assuming the PPUTRC is awarded test site designation. Approximately 84 percent of that total labor income ($57 million) is attributable to test site designation, while the remaining 16 percent ($10 million) is expected to occur even if the proposed PPUTRC does not become a test site. By 2017, labor income is expected to include $106 million in total direct, indirect, and induced labor income - with 71 percent of that total labor income ($76 million) attributable to test site designation.

Table 7: Direct Income, 2012-2017 ($ million)

	Direct Income					
	2012	2013	2014	2015	2016	2017
Total Direct Income						
PPUTRC	**$4.0**	**$4.4**	**$31.3**	**$38.2**	**$42.9**	**$48.3**

Output, Value Added, & State Income Taxes Resulting from UAS and Test Site Operations

'Output' represents the value of industry production, and 'total value added' is the difference between an industry's total output and the cost of their intermediate inputs. Economic modeling conducted for the purposes of this study indicates output in the PPUTRC states attributable to test site designation would climb from $265 million in 2014 to $333 million in 2017. Value added would climb from $109 million to $134 million over the same period.

Table 10: Output, 2012-2017 ($ million)

	Output					
	2012	2013	2014	2015	2016	2017
Total Output						
PPUTRC	**$18.3**	**$20.2**	**$302.4**	**$366.8**	**$411.7**	**$463.6**
Alaska Ranges	$8.6	$9.5	$34.3	$37.8	$41.7	$46.0

Excerpts from FAA, Gao, and Other Federal Documents Governing UAS Use

<TARGET><BILL></BILL><SUBJECT>Excerpts from FAA, Gao, and Other Federal Documents Governing UAS Use</SUBJECT><COMM>JUNM28</COMM></TARGET>

DEFINITIONS

Certificate of Waiver or Authorization (COA)—The terms "certificate of waiver" and "certificate of authorization" mean a Federal Aviation Administration grant of approval for a specific flight operation. Applications for a COA are only accepted from public entities. An application may be referred to the FAA Office of the Chief Counsel (AGC), for determination of the status of an applicant, i.e., public or civil. COAs are typically issued for a period of up to one year, but may be issued for a lesser duration if requested or deemed appropriate.

Civil Applicants – Approvals for civil applications using the special airworthiness process receive their airworthiness certification as part of the review process with the FAA.

Civil UAS – Obtaining an experimental airworthiness certificate for a particular UAS is currently the only way civil operators of unmanned aircraft are accessing the NAS. Experimental certificate regulations preclude carrying people or property for compensation or hire, but do allow operations for research and development, flight and sales demonstrations and crew training. The FAA is working with civilian operators to collect technical and operational data that will help refine the UAS airworthiness certification process. The agency is currently developing a future path for safe integration of civil UAS into the NAS as part of NextGen implementation.

Model Aircraft – Recreational use of airspace by model aircraft is covered by FAA Advisory Circular 91-57, which generally limits operations to below 400 feet above ground level and away from airports and air traffic. In 2007, the FAA clarified that AC 91-57 only applies to modelers, and specifically excludes individuals or companies flying model aircraft for business purposes.

Pilot in Command (PIC): The person who has final authority and responsibility for the operation and safety of flight, has been designated as pilot in command before or during the flight, and holds the appropriate category, class, and type rating, if appropriate, for the conduct of the flight. The responsibility and authority of the pilot in command as described by 14 CFR 91.3, *Responsibility and Authority of the Pilot in Command*, apply to the unmanned aircraft PIC. The pilot in command position may rotate duties as necessary with equally qualified pilots. The individual designated as PIC may change during flight.

Public Aircraft – An aircraft operated by a public user which is intrinsically governmental in nature (i.e. federal, state, and local agencies). Examples of public entities are Department of Defense (DoD) and its military branches; other local, state, and federal government agencies; and state universities. Refer to 14 CFR 1.1, *General Definitions*, for a complete definition of a public aircraft.

Public UAS – COAs are available to public entities that want to fly a UAS in civil airspace. Common uses today include law enforcement, firefighting, border patrol, disaster relief, search and rescue, military training, and other government operational missions.

Unmanned Aircraft—The term "unmanned aircraft" means an aircraft that is operated without the possibility of direct human intervention from within or on the aircraft.

Unmanned Aircraft System—The term "unmanned aircraft system" means an unmanned aircraft and associated elements (including communication links and the components that control the unmanned aircraft) that are required for the pilot in command to operate safely and efficiently in the national airspace system.

UAS Test Sites
In the FAA Modernization and Reform Act of 2012, Congress directed the FAA to establish a program to integrate UAS into the national airspace system at six test ranges.

Department of Transportation Advisory Circular 91-57

- Simply stated, an unmanned aircraft is a device that is used, or is intended to be used, for flight in the air with no onboard pilot.
- These devices may be as simple as a remotely controlled model aircraft used for recreational purposes or as complex as surveillance aircraft flying over hostile areas in warfare.
- They may be controlled either manually or through an autopilot using a data link to connect the pilot to their aircraft.
- They may perform a variety of public services: surveillance, collection of air samples to determine levels of pollution, or rescue and recovery missions in crisis situations.
- They range in size from wingspans of four inches to 246 feet (like a Boeing 737); and can weigh from approximately four ounces to over 25,600 pounds.

The one thing they have in common is that their numbers and uses are growing dramatically. In the United States alone, approximately 50 companies, universities, and government organizations are developing and producing some 155 unmanned aircraft designs. Regulatory standards need to be developed to enable current technology for unmanned aircraft to comply with Title 14 Code of Federal Regulations (CFR).

FAA Fact Sheet: The FAA first authorized use of unmanned aircraft in the NAS in 1990. Since then, the agency has authorized limited use of UAS for important missions in the public interest, such as firefighting, disaster relief, search and rescue, law enforcement, border patrol, military training and testing and evaluation.

Unmanned aircraft are flying now in the national airspace system under very controlled conditions. Operations potentially range from ground level to above 50,000 feet, depending on the specific type of aircraft. However, UAS operations are currently not authorized in Class B airspace, which exists over major urban areas and contains the highest density of manned aircraft in the National Airspace System.

There are currently two ways to get FAA approval to operate a UAS. The first is to obtain an experimental airworthiness certificate for private sector (civil) aircraft to do research and development, training and flight demonstrations. The second is to obtain a Certificate of Waiver or Authorization (COA) for public aircraft. Routine operation of UAS over densely-populated areas is prohibited.

A New Office for New Technology

In 2012, the FAA established the Unmanned Aircraft Systems Integration Office to provide a one-stop portal for civil and public use UAS in U.S. airspace. This office is developing a comprehensive plan to integrate and establish operational and certification requirements for UAS. It will also oversee and coordinate UAS research and development.

Public Law 112-95 Feb 14, 2012
SEC. 332. Integration of Civil Unmanned Aircraft Systems into National Airspace System
(a) REQUIRED PLANNING FOR INTEGRATION.—
(1) COMPREHENSIVE PLAN.
(3) DEADLINE.—The plan required under paragraph (1) shall provide for the safe integration of civil unmanned aircraft systems into the national airspace system as soon as practicable, but not later than September 30, 2015.
(b) STANDARDS FOR OPERATION AND CERTIFICATION.—Not later than December 31, 2015, the Administrator shall develop and implement operational and certification requirements for the operation of public unmanned aircraft systems in the national airspace system.

FAA Interim Operational Approval Guidance 08-01; Unmanned Aircraft Systems Operations in the US National Airspace System

The proliferation of UAS into the NAS has resulted in an increased demand for the FAA to process a large number of applications to review for operational approvals. These approvals are required due to the fact that unmanned aircraft (UA) are not compliant with various sections of Title 14 of the Code of Federal Regulations (14 CFR) and therefore, require an alternate means of compliance. Most notably, the lack of an on-board pilot requires an alternate method of the "see-and-avoid" provisions of 14 CFR 91.113. **Restrictions/Requirements:**

8.2.5 Flight Over Populated Areas Routine UAS operations shall not be conducted over urban or populated areas. UAS operations may be approved in emergency or relief situations if the proposed mitigation strategies are found to be acceptable.

8.2.6 Flight Over Heavily Trafficked Roads or Open-air Assembly of People UAS operations shall avoid these areas.

8.2.7 Day/Nighttime Operations All UAS operations outside of Class A airspace must be conducted during daylight hours.

8.2.9 Autonomous Operations It is generally understood that most UAS have some level of autonomy associated with its operation. Although it is possible to have a completely manual UAS, which requires a pilot-in-the-loop, the majority of UAS are autonomous to a certain degree. Only those UAS that have the capability of pilot intervention, or pilot-on-the-loop, shall be allowed in the NAS outside of Restricted, Prohibited, or Warning areas. UAS that are designed to be completely autonomous, with no capability of pilot intervention, are not authorized in the national airspace system.

9.1 UAS Pilot Qualifications

The FAA is focused on insuring that UAS pilots have a common level of understanding of federal aviation regulations applicable to the airspace where the UA will operate. Pilots are responsible for a thorough preflight inspection of the UAS. They are accountable for controlling their aircraft to the same responsible standards as the pilot of a manned aircraft. Pilot qualifications for UAS operations conducted under IFR are addressed in this section. The following items apply to the pilots of all UAS:
• One pilot in command (PIC) must be designated at all times.
• The PIC of an aircraft is directly responsible, and is the final authority of, the operation of that aircraft.
• Pilots must not perform crew duties for more than one UAS at a time.
• Pilots are not allowed to perform concurrent duties both as pilot and observer.

GAO: Unmanned Aircraft Systems:

Why GAO Did This Study

UAS do not carry a pilot on board, but instead operate on pre-programmed routes and by following commands from pilot-operated ground stations. UAS can be small, generally 55 pounds or less, or large. Current domestic uses include law enforcement, forest fire monitoring, border security, weather research, and scientific data collection. However, current uses are limited. FAA authorizes UAS operations on a case-by-case basis after conducting a safety review.

Currently, FAA authorizes all domestic military; public (academic institutions, federal, state, and local governments including law enforcement organizations); and civil (private sector entities) UAS operations on a limited basis after conducting a case-by-case safety review. Federal, state, and local government agencies must apply for Certificates of Waiver or Authorization (COA), while civil operators must apply for special airworthiness certificates in the experimental category. Because special airworthiness certificates do not allow commercial operations, there is currently no means for FAA to authorize commercial UAS operations.

Since FAA started issuing COAs in January 2007, 1,428 COAs have been issued. At present, under COA or special airworthiness certification, UAS operations are permitted for specific time frames (generally 12 to 24 months); locations; and operations. So, one agency can be issued multiple COAs to operate one UAS for the same purpose. In 2012, FAA issued 391 COAs to 121 federal, state, and local government entities across the United States, including law enforcement entities as well as academic institutions

GAO earlier reported that unmanned aircraft systems (UAS) could not meet the aviation safety requirements developed for manned aircraft and posed several obstacles to operating safely and routinely in the national airspace system. These include 1) the inability for UAS to detect, sense, and avoid other aircraft and airborne objects in a manner similar to "see and avoid" by a pilot in a manned aircraft; 2) vulnerabilities in the command and control of UAS operations; 3) the lack of technological and operational standards needed to guide the safe and consistent performance of UAS; and 4) the lack of final regulations to accelerate the safe integration of UAS into the national airspace.

UAS aircraft do not carry a human operator on board, but instead operate on pre-programmed routes or by following commands from pilot-operated ground stations. These aircraft are also referred to as "unmanned aerial vehicles," "remotely piloted aircraft," "unmanned aircraft," or "drones." The term "unmanned aircraft system" is used to recognize that a UAS includes not only the airframe, but also associated elements such as a ground station and the communications links.

GAO July 2012: Current domestic uses of UAS are limited and include law enforcement, monitoring or fighting forest fires, border security, weather research, and scientific data collection. UAS have a wide-range of potential uses, including commercial uses such as pipeline, utility, and farm fence inspections; vehicular traffic monitoring; real estate and construction site photography; relaying telecommunication signals; and crop dusting. FAA's long-range goal is to permit, to the greatest extent possible, routine UAS operations in the national airspace system while ensuring safety. Using UAS for commercial purposes is not currently allowed in the national airspace. As the list of potential uses for UAS grows, so do the concerns about how they will affect existing military and non-military aviation as well as concerns about how they might be used.

Table 1: Key Federal UAS Stakeholders and Their Roles Integrating UAS into the National Airspace Key stakeholders	UAS integration role
Federal Aviation Administration (FAA)	FAA's UAS Integration Office is responsible for ensuring that UAS operate safely in the national airspace.
Department of Defense (DOD)	DOD provides FAA with UAS operational and safety data, as well as research and development support.
National Aeronautics and Space Administration (NASA)	NASA provides research and development and testing on UAS integration efforts.
Department of Homeland Security (DHS)	DHS's Customs and Border Patrol has provided flight demonstrations to FAA's Next Generation Air Transportation System (NextGen) Office.
General Services Administration (GSA)	The General Services Administration (GSA) is responsible for tracking the federal government's UAS inventory. Federal agencies that own or lease UAS report their UAS inventory, cost and utilization data to GSA.
Department of Justice (DOJ)	DOJ's National Institute of Justice is responsible, in part, for assisting the technology needs—including UAS—of local, state, and tribal law enforcement agencies.

Meeting the 2012 Act's Requirements Will Continue to Challenge FAA

January 31, 2013 Deadline	FAA Modernization and Reform Act of 2012 requirement	Status of action
05/14/2012	Enter into agreements with appropriate government agencies to simplify the process for issuing COAs or waivers for public UAS.	In process
05/14/2012	Expedite the issuance of a COA for public safety entities.	Completed
08/12/2012	Establish a program to integrate UAS into the national airspace at 6 test ranges. This program is to terminate 5 years after date of enactment.	In process
08/12/2012	Develop an Arctic UAS operation plan and initiate a process to work with relevant federal agencies and national and international communities to designate permanent areas in the Arctic where small unmanned aircraft may operate 24 hours per day for research and commercial purposes.	Completed
08/12/2012	Determine whether certain UAS can fly safely in the national airspace before the completion of the Act's requirements for a comprehensive plan and rulemaking to safely accelerate the integration of civil UAS into the national airspace or the Act's requirement for issuance of guidance regarding the operation of public UAS including operating a UAS with a COA or waiver.	In process
11/10/2012	Develop a comprehensive plan to safely accelerate integration of civil UAS into national airspace.	In process
11/10/2012	Issue guidance regarding operation of civil UAS to expedite COA process; provide a collaborative process with public agencies to allow an incremental expansion of access into the national airspace as technology matures and the necessary safety analysis and data become available and until standards are completed and technology issues are resolved; facilitate capability of public entities to develop and use test ranges; provide guidance on public entities' responsibility for operation.	In process

GAO July 2012: Obstacles to Safe and Routine Integration of UAS:

Sense and avoid technologies. To date, no suitable technology has been identified that would provide UAS with the capability to meet the detect, sense, and avoid requirements of the national airspace system.

Command and control communications. Similar to what we previously reported, ensuring uninterrupted command and control for UAS remains a key obstacle for safe and routine integration into the national airspace.

Standards. A rigorous certification process with established performance thresholds is needed to ensure that UAS and pilots meet safety, reliability, and performance standards. Minimum aviation system standards are needed in three areas: performance; command and control communications; and sense and avoid.

Regulations. FAA regulations govern the routine operation of most aircraft in the national airspace system. However, these regulations do not contain provisions to address issues relating to unmanned aircraft.

Security requirements have yet to be developed for UAS ground control stations—the UAS equivalent of the cockpit

Privacy concerns over collection and use of surveillance data. Following the enactment of the UAS provisions of the 2012 FAA reauthorization act, members of Congress, a civil liberties organization, and others have expressed concern that the increased use of UAS for surveillance and other purposes in the national airspace has potential privacy implications.

Proposed legislation in the 112th session of Congress, seeks to limit or serve as a check on uses of UAS by, for example, limiting the ability of the federal government to use UAS to gather information pertaining to criminal conduct without a warrant.

Currently, no federal agency has specific statutory responsibility to regulate privacy matters relating to UAS.

Representatives from one civil liberties organization told us that since FAA has responsibility to regulate the national airspace, it could be positioned to handle responsibility for incorporating rules that govern UAS use and data collection. Some stakeholders have suggested that the FAA has the opportunity and responsibility to incorporate such privacy issues into the small UAS rule that is currently underway and in future rulemaking procedures. However, FAA officials have said that regulating these sensors is outside the FAA's mission, which is primarily focused on aviation safety,

Model Aircraft flyers:

Owners of model aircraft do not require a COA to operate their aircraft

Furthermore, as part of its 2012 reauthorization act, FAA is prohibited from developing any rule or regulation for model aircraft under a specified set of conditions. The Academy of Model Aeronautics, which promotes the development of model aviation as a recognized sport and represents a membership of over 150,000, published several documents to guide model aircraft users on safety, model aircraft size and speed, and use.

Public Law 112-95 Feb 14, 2012

SEC. 336. Special Rule for Model Aircraft.

(a) IN GENERAL.—Notwithstanding any other provision of law relating to the incorporation of unmanned aircraft systems into Federal Aviation Administration plans and policies, including this subtitle, the Administrator of the Federal Aviation Administration may not promulgate any rule or regulation regarding a model aircraft, or an aircraft being developed as a model aircraft, if—

This document and the processes prescribed do not apply to hobbyists and amateur model aircraft users when operating systems for sport and recreation. Those individuals should seek guidance under Advisory Circular (AC) 91-57, Model Aircraft Operating Standards, which is currently under revision.

Federal Aviation Administration

Fact Sheet – Unmanned Aircraft Systems (UAS)

For Immediate Release

February 19, 2013
Contact: Les Dorr or Alison Duquette
Phone: (202) 267-3883

Unmanned Aircraft Systems (UAS) come in a variety of shapes and sizes and serve diverse purposes. They may have a wingspan as large as a Boeing 737 or smaller than a radio-controlled model airplane. Regardless of size, the responsibility to fly safely applies equally to manned and unmanned aircraft operations.

Because they are inherently different from manned aircraft, introducing UAS into the nation's airspace is challenging for both the FAA and aviation community. UAS must be integrated into a National Airspace System (NAS) that is evolving from ground-based navigation aids to a GPS-based system in NextGen. Safe integration of UAS involves gaining a better understanding of operational issues, such as training requirements, operational specifications and technology considerations.

The FAA's Role: Safety

Safety is the FAA's top mission, and the agency maintains the world's safest aviation system. As a provider of air traffic control services, the FAA also must ensure the safety and efficiency of the nation's entire airspace.

The FAA first authorized use of unmanned aircraft in the NAS in 1990. Since then, the agency has authorized limited use of UAS for important missions in the public interest, such as firefighting, disaster relief, search and rescue, law enforcement, border patrol, military training and testing and evaluation. Today, UAS perform border and port surveillance by the Department of Homeland Security, help with scientific research and environmental monitoring by NASA and NOAA, support public safety by law enforcement agencies, help state universities conduct research, and support various other missions for public (government) entities.

Unmanned aircraft are flying now in the national airspace system under very controlled conditions. Operations potentially range from ground level to above 50,000 feet, depending on the specific type of aircraft. However, UAS operations are currently not authorized in Class B airspace, which exists over major urban areas and contains the highest density of manned aircraft in the National Airspace System.

There are currently two ways to get FAA approval to operate a UAS. The first is to obtain an experimental airworthiness certificate for private sector (civil) aircraft to do research and development, training and flight demonstrations. The second is to obtain a Certificate of Waiver or Authorization (COA) for public aircraft. Routine operation of UAS over densely-populated areas is prohibited.

Civil UAS

Obtaining an experimental airworthiness certificate for a particular UAS is currently the only way civil operators of unmanned aircraft are accessing the NAS. Experimental certificate regulations preclude carrying people or property for compensation or hire, but do allow operations for research and development, flight and sales demonstrations and crew training. The FAA is working with civilian operators to collect technical and operational data that will help refine the UAS airworthiness certification process. The agency is currently developing a future path for safe integration of civil UAS into the NAS as part of NextGen implementation.

Public UAS

COAs are available to public entities that want to fly a UAS in civil airspace. Common uses today include law enforcement, firefighting, border patrol, disaster relief, search and rescue, military training, and other government operational missions.

Applicants make their request through an online process and the FAA evaluates the proposed operation to see if it can be conducted safely.

The COA allows an operator to use a defined block of airspace and includes special provisions unique to the proposed operation. For instance, a COA may require flying only under Visual Flight Rules (VFR) and/or only during daylight hours. COAs usually are issued for a specific period—up to two years in many cases.

Most COAs require coordination with an appropriate air traffic control facility and may require a transponder on the UAS to operate in certain types of airspace.

Because UAS technology cannot currently comply with "see and avoid" rules that apply to all aircraft, a visual observer or an accompanying "chase plane" must maintain visual contact with the UAS and serve as its "eyes" when operating outside airspace restricted from other users.

COAs Issued:

2009	146
2010	298
2011	313
2012	257

There were 327 COAs active as of February 15, 2013.

Streamlining the Process

The FAA has been working with its government partners to streamline COA procedures. In 2009, the FAA, NASA and the Departments of Defense and Homeland Security formed a UAS Executive Committee, or "ExCom" to address UAS integration issues. The ExCom established a working group that developed suggestions to expedite the COA process and increase transparency.

For new applications from public users, the FAA has an on-line process that ensures paperwork is complete and ready to be assessed. Today, the average time to issue an authorization for non-emergency operations is less than 60 days, and the renewal period is two years. The agency has expedited procedures in place to grant one-time COAs for time-sensitive emergency missions, such as disaster relief and humanitarian efforts.

Model Aircraft

Recreational use of airspace by model aircraft is covered by FAA Advisory Circular 91-57, which generally limits operations to below 400 feet above ground level and away from airports and air traffic. In

2007, the FAA clarified that AC 91-57 only applies to modelers, and specifically excludes individuals or companies flying model aircraft for business purposes.

The FAA guidance is available at: http://www.faa.gov/documentLibrary/media/Advisory_Circular/91-57.pdf

Operation and Certification Standards

Integrating UAS into the nation's airspace presents both opportunities and challenges. However, everything the FAA does is focused on ensuring the safety of the nation's aviation system. New policies, procedures and approval processes will address the increasing desire by civilian operators to fly UAS in the NAS. Developing and implementing new UAS standards and guidance is a long-term effort.

The FAA chartered a UAS Aviation Rulemaking Committee in 2011 to develop inputs and recommendations on appropriate operational procedures, regulatory standards and policies before allowing routine UAS access to the nation's airspace.
The FAA has asked RTCA – organized in 1935 as the Radio Technical Commission for Aeronautics, a group that facilitates expert advice to the agency on technical issues – to work with industry to assist in the development of UAS standards. RTCA's technical group will address how UAS will handle communication, command and control and how they will "sense and avoid" other aircraft.
The FAA continues to work closely with its international aviation counterparts to harmonize standards, policies, procedures and regulatory requirements.

UAS Test Sites

In the FAA Modernization and Reform Act of 2012, Congress directed the FAA to establish a program to integrate UAS into the national airspace system at six test ranges. The designation and operation of test sites will be a tool for testing all aspects of UAS integration. Some facets of test site selection and operation include:

Safe designation of airspace for integrated manned and unmanned flight operations in the national airspace system
Development of certification standards and air traffic requirements for unmanned flight operations
Coordinating with and leveraging the resources of NASA and the Department of Defense
Addressing both civil and public unmanned aircraft systems
Ensuring that the program is coordinated with the Next Generation Air Transportation System
Ensuring the safety of unmanned aircraft systems and related navigation procedures before they are integrated into the national airspace system

The FAA issued a Screening Information Request on February 14, 2013 for proposals to manage these sites. You can read the press release here: (http://www.faa.gov/news/press_releases/news_story.cfm?newsId=14313)
http://www.faa.gov/news/press_releases/news_story.cfm?newsId=14313
(http://www.faa.gov/news/press_releases/news_story.cfm?newsId=14313)

Small Unmanned Aircraft

Small unmanned aircraft (sUAS) are likely to grow most quickly in civil and commercial operations because of their versatility and relatively low initial cost and operating expenses. The FAA is working on a proposed rule governing the use of a wide range of small civil unmanned aircraft systems.

The 2012 reauthorization bill also directed the FAA to "allow a government public safety agency to operate unmanned aircraft weighing 4.4 pounds or less" under certain restrictions. The bill specified these UAS must be flown within the line of sight of the operator, less than 400 feet above the ground, during daylight conditions, inside Class G (uncontrolled) airspace and more than five miles from any airport or other location with aviation activities.

Prior to the congressional action, the FAA and the Justice Department had been working on an agreement to streamline the COA process for law enforcement – an agreement that also meets the mandate. Initially, law enforcement organizations will receive a COA for training and performance evaluation. When the organization has shown proficiency in flying its UAS, it will receive an operational COA. The agreement expands the allowable UAS weight up to 25 pounds.

A New Office for New Technology

In 2012, the FAA established the Unmanned Aircraft Systems Integration Office to provide a one-stop portal for civil and public use UAS in U.S. airspace. This office is developing a comprehensive plan to integrate and establish operational and certification requirements for UAS. It will also oversee and coordinate UAS research and development.

Over more than 50 years, the FAA has a proven track record of introducing new technology and aircraft safely into the NAS. The agency will successfully meet the challenges posed by UAS technology in a thoughtful, careful manner that ensures safety and addresses privacy issues while promoting economic growth.

(e) USE OF DESIGNEES.—The Administrator may use designees to carry out subsection (a) to the extent practicable in order to minimize the burdens on pilots.

(f) REPORT TO CONGRESS.—

(1) IN GENERAL.—Not later than 1 year after the date of enactment of this Act, and annually thereafter, the Administrator shall submit to the Committee on Transportation and Infrastructure of the House of Representatives and the Committee on Commerce, Science, and Transportation of the Senate a report on the issuance of improved pilot licenses under this section.

(2) EXPIRATION.—The Administrator shall not be required to submit annual reports under this subsection after the date on which the Administrator has issued improved pilot licenses under this section to all pilots.

Subtitle B—Unmanned Aircraft Systems

49 USC 40101 note. Applicability.

SEC. 331. DEFINITIONS.

In this subtitle, the following definitions apply:

(1) ARCTIC.—The term "Arctic" means the United States zone of the Chukchi Sea, Beaufort Sea, and Bering Sea north of the Aleutian chain.

(2) CERTIFICATE OF WAIVER; CERTIFICATE OF AUTHORIZATION.—The terms "certificate of waiver" and "certificate of authorization" mean a Federal Aviation Administration grant of approval for a specific flight operation.

(3) PERMANENT AREAS.—The term "permanent areas" means areas on land or water that provide for launch, recovery, and operation of small unmanned aircraft.

(4) PUBLIC UNMANNED AIRCRAFT SYSTEM.—The term "public unmanned aircraft system" means an unmanned aircraft system that meets the qualifications and conditions required for operation of a public aircraft (as defined in section 40102 of title 49, United States Code).

(5) SENSE AND AVOID CAPABILITY.—The term "sense and avoid capability" means the capability of an unmanned aircraft to remain a safe distance from and to avoid collisions with other airborne aircraft.

(6) SMALL UNMANNED AIRCRAFT.—The term "small unmanned aircraft" means an unmanned aircraft weighing less than 55 pounds.

(7) TEST RANGE.—The term "test range" means a defined geographic area where research and development are conducted.

(8) UNMANNED AIRCRAFT.—The term "unmanned aircraft" means an aircraft that is operated without the possibility of direct human intervention from within or on the aircraft.

(9) UNMANNED AIRCRAFT SYSTEM.—The term "unmanned aircraft system" means an unmanned aircraft and associated elements (including communication links and the components that control the unmanned aircraft) that are required for the pilot in command to operate safely and efficiently in the national airspace system.

SEC. 332. INTEGRATION OF CIVIL UNMANNED AIRCRAFT SYSTEMS INTO NATIONAL AIRSPACE SYSTEM.

49 USC 40101 note.

(a) REQUIRED PLANNING FOR INTEGRATION.—

(1) COMPREHENSIVE PLAN.—Not later than 270 days after the date of enactment of this Act, the Secretary of Transportation, in consultation with representatives of the aviation industry, Federal agencies that employ unmanned aircraft systems technology in the national airspace system, and the unmanned aircraft systems industry, shall develop a comprehensive plan to safely accelerate the integration of civil unmanned aircraft systems into the national airspace system.

Deadline.

(2) CONTENTS OF PLAN.—The plan required under paragraph (1) shall contain, at a minimum, recommendations or projections on—

(A) the rulemaking to be conducted under subsection (b), with specific recommendations on how the rulemaking will—

(i) define the acceptable standards for operation and certification of civil unmanned aircraft systems;

(ii) ensure that any civil unmanned aircraft system includes a sense and avoid capability; and

(iii) establish standards and requirements for the operator and pilot of a civil unmanned aircraft system, including standards and requirements for registration and licensing;

(B) the best methods to enhance the technologies and subsystems necessary to achieve the safe and routine operation of civil unmanned aircraft systems in the national airspace system;

(C) a phased-in approach to the integration of civil unmanned aircraft systems into the national airspace system;

(D) a timeline for the phased-in approach described under subparagraph (C);

(E) creation of a safe

(F) airspace designation for cooperative manned and unmanned flight operations in the national airspace system;

(G) establishment of a process to develop certification, flight standards, and air traffic requirements for civil unmanned aircraft systems at test ranges where such systems are subject to testing;

(H) the best methods to ensure the safe operation of civil unmanned aircraft systems and public unmanned aircraft systems simultaneously in the national airspace system; and

(I) incorporation of the plan into the annual NextGen Implementation Plan document (or any successor document) of the Federal Aviation Administration.

(3) DEADLINE.—The plan required under paragraph (1) shall provide for the safe integration of civil unmanned aircraft systems into the national airspace system as soon as practicable, but not later than September 30, 2015.

(4) REPORT TO CONGRESS.—Not later than 1 year after the date of enactment of this Act, the Secretary shall submit to Congress a copy of the plan required under paragraph (1).

Deadlines.
Publication.
Web posting.

(5) ROADMAP.—Not later than 1 year after the date of enactment of this Act, the Secretary shall approve and make available in print and on the Administration's Internet Web site a 5-year roadmap for the introduction of civil unmanned aircraft systems into the national airspace system, as coordinated by the Unmanned Aircraft Program Office of the Administration. The Secretary shall update the roadmap annually.

Deadline.
Federal Register, publication.

(b) RULEMAKING.—Not later than 18 months after the date on which the plan required under subsection (a)(1) is submitted to Congress under subsection (a)(4), the Secretary shall publish in the Federal Register—

(1) a final rule on small unmanned aircraft systems that will allow for civil operation of such systems in the national airspace system, to the extent the systems do not meet the requirements for expedited operational authorization under section 333 of this Act;

(2) a notice of proposed rulemaking to implement the recommendations of the plan required under subsection (a)(1), with the final rule to be published not later than 16 months after the date of publication of the notice; and

(3) an update to the Administration's most recent policy statement on unmanned aircraft systems, contained in Docket No. FAA–2006–25714.

(c) PILOT PROJECTS.—

Deadline.

(1) ESTABLISHMENT.—Not later than 180 days after the date of enactment of this Act, the Administrator shall establish a program to integrate unmanned aircraft systems into the national airspace system at 6 test ranges. The program shall terminate 5 years after the date of enactment of this Act.

Termination date.

(2) PROGRAM REQUIREMENTS.—In establishing the program under paragraph (1), the Administrator shall—

(A) safely designate airspace for integrated manned and unmanned flight operations in the national airspace system;

Standards.

(B) develop certification standards and air traffic requirements for unmanned flight operations at test ranges;

(C) coordinate with and leverage the resources of the National Aeronautics and Space Administration and the Department of Defense;

(D) address both civil and public unmanned aircraft systems;

(E) ensure that the program is coordinated with the Next Generation Air Transportation System; and

(F) provide for verification of the safety of unmanned aircraft systems and related navigation procedures before integration into the national airspace system.

(3) TEST RANGE LOCATIONS.—In determining the location of the 6 test ranges of the program under paragraph (1), the Administrator shall—

(A) take into consideration geographic and climatic diversity;

(B) take into consideration the location of ground infrastructure and research needs; and

Consultation.

(C) consult with the National Aeronautics and Space Administration and the Department of Defense.

(4) TEST RANGE OPERATION.—A project at a test range shall be operational not later than 180 days after the date on which the project is established. Deadline.

(5) REPORT TO CONGRESS.—

(A) IN GENERAL.—Not later than 90 days after the date of the termination of the program under paragraph (1), the Administrator shall submit to the Committee on Commerce, Science, and Transportation of the Senate and the Committee on Transportation and Infrastructure and the Committee on Science, Space, and Technology of the House of Representatives a report setting forth the Administrator's findings and conclusions concerning the projects.

(B) ADDITIONAL CONTENTS.—The report under subparagraph (A) shall include a description and assessment of the progress being made in establishing special use airspace to fill the immediate need of the Department of Defense—

(i) to develop detection techniques for small unmanned aircraft systems; and

(ii) to validate the sense and avoid capability and operation of unmanned aircraft systems.

(d) EXPANDING USE OF UNMANNED AIRCRAFT SYSTEMS IN ARCTIC.—

(1) IN GENERAL.—Not later than 180 days after the date of enactment of this Act, the Secretary shall develop a plan and initiate a process to work with relevant Federal agencies and national and international communities to designate permanent areas in the Arctic where small unmanned aircraft may operate 24 hours per day for research and commercial purposes. The plan for operations in these permanent areas shall include the development of processes to facilitate the safe operation of unmanned aircraft beyond line of sight. Such areas shall enable over-water flights from the surface to at least 2,000 feet in altitude, with ingress and egress routes from selected coastal launch sites. Deadline. Plans.

(2) AGREEMENTS.—To implement the plan under paragraph (1), the Secretary may enter into an agreement with relevant national and international communities.

(3) AIRCRAFT APPROVAL.—Not later than 1 year after the entry into force of an agreement necessary to effectuate the purposes of this subsection, the Secretary shall work with relevant national and international communities to establish and implement a process, or may apply an applicable process already established, for approving the use of unmanned aircraft in the designated permanent areas in the Arctic without regard to whether an unmanned aircraft is used as a public aircraft, a civil aircraft, or a model aircraft. Deadline.

SEC. 333. SPECIAL RULES FOR CERTAIN UNMANNED AIRCRAFT SYSTEMS. 49 USC 40101 note.

(a) IN GENERAL.—Notwithstanding any other requirement of this subtitle, and not later than 180 days after the date of enactment of this Act, the Secretary of Transportation shall determine if certain unmanned aircraft systems may operate safely in the national airspace system before completion of the plan and rulemaking required by section 332 of this Act or the guidance required by section 334 of this Act. Deadline. Determination.

Determination.

(b) ASSESSMENT OF UNMANNED AIRCRAFT SYSTEMS.—In making the determination under subsection (a), the Secretary shall determine, at a minimum—

(1) which types of unmanned aircraft systems, if any, as a result of their size, weight, speed, operational capability, proximity to airports and populated areas, and operation within visual line of sight do not create a hazard to users of the national airspace system or the public or pose a threat to national security; and

(2) whether a certificate of waiver, certificate of authorization, or airworthiness certification under section 44704 of title 49, United States Code, is required for the operation of unmanned aircraft systems identified under paragraph (1).

(c) REQUIREMENTS FOR SAFE OPERATION.—If the Secretary determines under this section that certain unmanned aircraft systems may operate safely in the national airspace system, the Secretary shall establish requirements for the safe operation of such aircraft systems in the national airspace system.

49 USC 40101 note.

SEC. 334. PUBLIC UNMANNED AIRCRAFT SYSTEMS.

Deadline.

(a) GUIDANCE.—Not later than 270 days after the date of enactment of this Act, the Secretary of Transportation shall issue guidance regarding the operation of public unmanned aircraft systems to—

(1) expedite the issuance of a certificate of authorization process;

(2) provide for a collaborative process with public agencies to allow for an incremental expansion of access to the national airspace system as technology matures and the necessary safety analysis and data become available, and until standards are completed and technology issues are resolved;

(3) facilitate the capability of public agencies to develop and use test ranges, subject to operating restrictions required by the Federal Aviation Administration, to test and operate unmanned aircraft systems; and

(4) provide guidance on a public entity's responsibility when operating an unmanned aircraft without a civil airworthiness certificate issued by the Administration.

Deadline.

(b) STANDARDS FOR OPERATION AND CERTIFICATION.—Not later than December 31, 2015, the Administrator shall develop and implement operational and certification requirements for the operation of public unmanned aircraft systems in the national airspace system.

(c) AGREEMENTS WITH GOVERNMENT AGENCIES.—

Deadline.

(1) IN GENERAL.—Not later than 90 days after the date of enactment of this Act, the Secretary shall enter into agreements with appropriate government agencies to simplify the process for issuing certificates of waiver or authorization with respect to applications seeking authorization to operate public unmanned aircraft systems in the national airspace system.

(2) CONTENTS.—The agreements shall—

(A) with respect to an application described in paragraph (1)—

(i) provide for an expedited review of the application;

(ii) require a decision by the Administrator on approval or disapproval within 60 business days of the date of submission of the application; and Deadline.

(iii) allow for an expedited appeal if the application is disapproved;

(B) allow for a one-time approval of similar operations carried out during a fixed period of time; and

(C) allow a government public safety agency to operate unmanned aircraft weighing 4.4 pounds or less, if operated—

(i) within the line of sight of the operator;

(ii) less than 400 feet above the ground;

(iii) during daylight conditions;

(iv) within Class G airspace; and

(v) outside of 5 statute miles from any airport, heliport, seaplane base, spaceport, or other location with aviation activities.

SEC. 335. SAFETY STUDIES. 49 USC 40101 note.

The Administrator of the Federal Aviation Administration shall carry out all safety studies necessary to support the integration of unmanned aircraft systems into the national airspace system.

SEC. 336. SPECIAL RULE FOR MODEL AIRCRAFT. 49 USC 40101 note.

(a) IN GENERAL.—Notwithstanding any other provision of law relating to the incorporation of unmanned aircraft systems into Federal Aviation Administration plans and policies, including this subtitle, the Administrator of the Federal Aviation Administration may not promulgate any rule or regulation regarding a model aircraft, or an aircraft being developed as a model aircraft, if—

(1) the aircraft is flown strictly for hobby or recreational use;

(2) the aircraft is operated in accordance with a community-based set of safety guidelines and within the programming of a nationwide community-based organization;

(3) the aircraft is limited to not more than 55 pounds unless otherwise certified through a design, construction, inspection, flight test, and operational safety program administered by a community-based organization;

(4) the aircraft is operated in a manner that does not interfere with and gives way to any manned aircraft; and

(5) when flown within 5 miles of an airport, the operator of the aircraft provides the airport operator and the airport air traffic control tower (when an air traffic facility is located at the airport) with prior notice of the operation (model aircraft operators flying from a permanent location within 5 miles of an airport should establish a mutually-agreed upon operating procedure with the airport operator and the airport air traffic control tower (when an air traffic facility is located at the airport)).

(b) STATUTORY CONSTRUCTION.—Nothing in this section shall be construed to limit the authority of the Administrator to pursue enforcement action against persons operating model aircraft who endanger the safety of the national airspace system.

(c) MODEL AIRCRAFT DEFINED.—In this section, the term "model aircraft" means an unmanned aircraft that is—

(1) capable of sustained flight in the atmosphere;

(2) flown within visual line of sight of the person operating the aircraft; and

(3) flown for hobby or recreational purposes.

Subtitle C—Safety and Protections

SEC. 341. AVIATION SAFETY WHISTLEBLOWER INVESTIGATION OFFICE.

Section 106 (as amended by this Act) is further amended by adding at the end the following:

"(t) AVIATION SAFETY WHISTLEBLOWER INVESTIGATION OFFICE.—

"(1) ESTABLISHMENT.—There is established in the Federal Aviation Administration (in this subsection referred to as the 'Agency') an Aviation Safety Whistleblower Investigation Office (in this subsection referred to as the 'Office').

"(2) DIRECTOR.—

"(A) APPOINTMENT.—The head of the Office shall be the Director, who shall be appointed by the Secretary of Transportation.

"(B) QUALIFICATIONS.—The Director shall have a demonstrated ability in investigations and knowledge of or experience in aviation.

"(C) TERM.—The Director shall be appointed for a term of 5 years.

"(D) VACANCIES.—Any individual appointed to fill a vacancy in the position of the Director occurring before the expiration of the term for which the individual's predecessor was appointed shall be appointed for the remainder of that term.

"(3) COMPLAINTS AND INVESTIGATIONS.—

"(A) AUTHORITY OF DIRECTOR.—The Director shall—

"(i) receive complaints and information submitted by employees of persons holding certificates issued under title 14, Code of Federal Regulations (if the certificate holder does not have a similar in-house whistleblower or safety and regulatory noncompliance reporting process) and employees of the Agency concerning the possible existence of an activity relating to a violation of an order, a regulation, or any other provision of Federal law relating to aviation safety;

"(ii) assess complaints and information submitted under clause (i) and determine whether a substantial likelihood exists that a violation of an order, a regulation, or any other provision of Federal law relating to aviation safety has occurred; and

Recommendations.

"(iii) based on findings of the assessment conducted under clause (ii), make recommendations to the Administrator of the Agency, in writing, regarding further investigation or corrective actions.

"(B) DISCLOSURE OF IDENTITIES.—The Director shall not disclose the identity of an individual who submits a complaint or information under subparagraph (A)(i) unless—

"(i) the individual consents to the disclosure in writing; or

Interim Operational Approval Guidance 08-01

Unmanned Aircraft Systems Operations in the U. S. National Airspace System

March 13, 2008

Purpose

Aviation Safety Unmanned Aircraft Program Office (UAPO) Interim Operational Approval Guidance, *Unmanned Aircraft Systems Operations in the U. S. National Airspace System,* provides guidance to be used to determine if unmanned aircraft systems (UAS) may be allowed to conduct flight operations in the U. S. national airspace system (NAS). UAPO and Air Traffic Organization (ATO) personnel will use this policy guidance when evaluating each application for a Certificate of Waiver or Authorization (COA) and special airworthiness certificates (normally issued in an experimental category). UAPO Interim Operational Approval Guidance provides additional information on a number of items in the COA processor application developed by the Air Traffic Organization. Used in conjunction with the COA online application system, this guidance will simplify the COA evaluation process.

1.0 Introduction

The proliferation of UAS into the NAS has resulted in an increased demand for the FAA to process a large number of applications to review for operational approvals. These approvals are required due to the fact that unmanned aircraft (UA) are not compliant with various sections of Title 14 of the Code of Federal Regulations (14 CFR) and therefore, require an alternate means of compliance. Most notably, the lack of an on-board pilot requires an alternate method of the "see-and-avoid" provisions of 14 CFR 91.113, *Right-of-Way Rules: Except Water Operations*.

This document is intended to provide guidance and information to Aviation Safety (AVS) and ATO personnel who are charged with the processing, reviewing, and approving of UAS operations. The interim guidance presented in this document represents the culmination of best practices and procedures used in prior UAS approvals, as well as input from other government agencies, industry and user stakeholders. It should be noted that the material presented in this document is a recommended approach to approving typical UAS operations, however, each application needs to be assessed on its own technical merits and may require unique authorizations which are based on the specific needs or capabilities of the UAS in question.

It should be further noted that due to the rapid evolution of UAS technology, this guidance material will be subject to continuous review and may be updated when appropriate.

Note: In general, and as a minimum, applicants must observe all applicable regulations of 14 CFR parts 61 and 91. This document is intended to identify alternate methods of compliance with the regulations when evaluating proposed UAS operations.

For a complete listing of regulations, refer to the following website:
http://www.faa.gov/regulations_policies/faa_regulations/

2.0 Background

UAS operations have increased dramatically during the past several years in both the public and private sectors. In response to this increasing activity, it has become necessary to develop guidance for Federal Aviation Administration to use when evaluating applications for certificate(s) of waiver or authorization and special airworthiness certificates. This guidance is

not meant as a substitute for any regulatory process. This guidance was jointly developed by, and reflects the consensus opinion of:

- The Unmanned Aircraft Program Office (UAPO), FAA Aircraft Certification Service (AIR-160)
- The Production and Airworthiness Division, FAA Aircraft Certification Service (AIR-200)
- The Flight Technologies and Procedures Division, FAA Flight Standards Service (AFS-400)
- The FAA Air Traffic Organization's Office of System Operations and Safety, (AJR-3).

3.0 Definitions

The following definitions apply to terms used in this document.

- **Airworthiness:** For the UAS to be considered airworthy, both the aircraft and all of the other associated support equipment of the UAS must be in a condition for safe operation. If any element of the systems is not in condition for safe operation, then the UA would not be considered airworthy.
- **Chase aircraft:** A manned aircraft flying in close proximity to an unmanned aircraft that carries, in addition to the pilot in command (PIC) of the aircraft, a qualified visual observer.
- **Cooperative aircraft:** Aircraft that have an electronic means of identification (i.e., a transponder) aboard and operating.
- **Inspection:** The routine performance of inspection tasks at prescribed intervals. The inspection must ensure the airworthiness of an aircraft up to and including its overhaul or life limits.
- **Non-Cooperative aircraft:** Aircraft that do not have an electronic means of identification (i.e., a transponder) aboard or not operating such equipment due to malfunction or deliberate action.
- **Off-Airport:** Any location used to launch or recover an unmanned aircraft that is not considered an airport (i.e., an open field).
- **Pilot in Command (PIC):** The person who has final authority and responsibility for the operation and safety of flight, has been designated as pilot in command before or during the flight, and holds the appropriate category, class, and type rating, if appropriate, for the conduct of the flight. The responsibility and authority of the pilot in command as described by 14 CFR 91.3, *Responsibility and Authority of the Pilot in Command*, apply to the unmanned aircraft PIC. The pilot in command position may rotate duties as necessary with equally qualified pilots. The individual designated as PIC may change during flight.
- **Public aircraft:** An aircraft operated by a public user which is intrinsically governmental in nature (i.e. federal, state, and local agencies). Examples of public entities are Department of Defense (DoD) and its military branches; other local, state, and federal government agencies; and state universities. Refer to 14 CFR 1.1, *General Definitions*, for a complete definition of a public aircraft.

- **Scheduled Maintenance (Routine):** The performance of maintenance tasks at prescribed intervals.
- **Supplemental Pilot:** Supplemental pilots are those pilots assigned unmanned aircraft flight duties to augment the pilot in command. It is common for applicants to have both an "internal" and an "external" unmanned aircraft pilot. The supplemental pilot can assume either of these positions. The supplemental pilot may also assume duties of the pilot in command if they meet the qualifications.
- **Unmanned Aircraft:** A device used or intended to be used for flight in the air that has no onboard pilot. This includes all classes of airplanes, helicopters, airships, and translational lift aircraft that have no onboard pilot. Unmanned aircraft are understood to include only those aircraft controllable in three axes and therefore, exclude traditional balloons
- **Unscheduled Maintenance (Non-Routine):** The performance of maintenance tasks when mechanical irregularities occur. These irregularities are categorized as to whether or not they occur during flight time.
- **Visual Line-of-Sight:** A method of control and collision avoidance that refers to the pilot or observer directly viewing the unmanned aircraft with human eyesight. Corrective lenses (spectacles or contact lenses) may be used by the pilot or visual observer. Aids to vision, such as binoculars, field glasses, or telephoto television may be employed as long as their field of view does not adversely affect the surveillance task.
- **Visual Observer:** A trained person who assists the unmanned aircraft pilot in the duties associated with collision avoidance. This includes, but is not limited to, avoidance of other traffic, clouds, obstructions and terrain.

4.0 Methods of Authorization and Applicability

Guidance in this document of an operational nature always applies to both civil and public operators. In the areas of pilot certification, crew certification, pilot currency, medical certificates, and airworthiness, it is assumed that all public aircraft comply with processes and policies established by the public entity, in a manner similar to publicly operated manned aircraft. If no established policies exist regarding pilot certification, crew certification, pilot currency, medical certificates, and airworthiness, it is highly recommended that the public agency/department apply the guidance outlined in this document.

The procedures contained in this document are applicable for operations in the contiguous United States, Alaska, Hawaii, and the Flight Information Regions delegated to the United States and areas where the FAA is the Air Traffic Service Provider.

In general, specific authorization to conduct unmanned aircraft operations in the NAS outside of active Restricted, Prohibited, or Warning Area airspace must be requested by the applicant. Airspace inside buildings or structures is not considered to be part of the NAS and is not regulated. The two methods of approval are either a certificate of waiver or authorization (COA) or the issuance of a special airworthiness certificate.

The guidance information presented in this document applies to approvals for both COA and special airworthiness certificates. Unless otherwise stated, recommended procedures and guidance that appear in this document apply to both.

The applicability and process to be used in a UAS operational approval is dependent on whether the applicant is a civil user or a public user. A public user is one that is intrinsically governmental in nature (i.e., federal, state, and local agencies). Public applicants should utilize the COA application process. Civil applicants must apply for an airworthiness certificate.

Regardless of authorization method, all UAS applications are ultimately processed through ATO, UAPO, Flight Standards, and Aircraft Certification staff at the headquarters level for final approval and disposition.

Notes:

- ***This document and the processes prescribed do not apply to hobbyists and amateur model aircraft users when operating systems for sport and recreation. Those individuals should seek guidance under Advisory Circular (AC) 91-57, Model Aircraft Operating Standards, which is currently under revision.***
- ***Civil UAS operations require a special airworthiness certificate and should follow the process as specified in this document.***
- ***AC 91-57 shall not be used as a basis of approval for UAS operations and is applicable to recreational and hobbyists use only.***

4.1 Certificate of Waiver or Authorization (COA)

Applications for a COA are only accepted from public entities. An application may be referred to the FAA Office of the Chief Counsel (AGC), for determination of the status of an applicant, i.e., public or civil. COAs are typically issued for a period of up to one year, but may be issued for a lesser duration if requested or deemed appropriate. COAs are not required for operations conducted wholly within an active Restricted, Prohibited or Warning Area airspace when operating with permission from the appropriate authority or using agency of that airspace.

4.1.1 General Process Air Traffic Operations (ATO) is responsible for the COA process. Applications can be made on the internet or can be made on FAA Form 7711-2, *Application for Certificate of Waiver or Authorization.* If the application is made on FAA Form 7711-2 it will be sent to Headquarters ATO, through the local Air Traffic Service Area. ATO has developed a guidance checklist covering the application and approval process. This form and guidance material can be found on the internet at www.faa.gov/uas via the Air Traffic Airspace (ATA), Unmanned Aircraft Systems (UAS) Group link.

Prior to issuance of a COA, ATO normally requests a review of the COA application by the UAPO. Specifically, the AFS-400 members of the UAPO evaluates each application to determine if risks associated with the operation have been acceptably mitigated. Formal recommendations are forwarded to ATO from the UAPO at the conclusion of the review process.

4.1.2 National Security Considerations When the Department of Defense or the Department of Homeland Security declares a UAS operation is a matter of "national security," the FAA may approve an application for a COA which, under normal circumstances, might not otherwise conform to the guidelines set forth in this guidance document. In this case, national security itself may override risk mitigation requirements and the applicant must declare in the COA application acceptance of all risks associated with the UAS operations. In general, such requests should be directed to the Administrator, Federal Aviation Administration, from an equivalent level individual of the applicant's organization.

4.2 Special Airworthiness Certificate

Civil applicants are required to apply for a special airworthiness certificate, typically, an experimental certificate. The applicant is required to submit the requisite data to support a determination that the aircraft and its systems, including the control station(s) is designed, built, and maintained in a safe and airworthy condition. Experimental certificates are typically issued for a period of up to one year. Experimental certificates are typically issued to industry and manufacturers wishing to accomplish UAS research and development, testing, crew training, and market survey in accordance with 14 CFR Part 21.191. In cases where an applicant has been issued a special airworthiness certificate, and concurrently operates a corresponding UAS on a COA in support of a public activity, the applicant must elect, prior to each flight, what authority is to be used to conduct the flight. The use of both a special airworthiness certificate and a COA authorization on a single flight is not permitted.

4.2.1 General Process For civil UAS operations, the Aircraft Certification Service, Production and Airworthiness Division, AIR-200, at FAA headquarters is responsible for the issuance of special airworthiness certificates. The issuance of an experimental certificate is coordinated with the UAPO as well as AVS and ATO personnel at the headquarters and regional levels. A thorough review is conducted by this team to evaluate the system's airworthiness and operational specifics and to determine mitigations required to meet acceptable standards of safety.

5.0 Alternate Methods of Compliance

All limitations and procedures presented in this guidance document are to be considered as general guidelines only. Each application is evaluated on its own technical merit based on its own set of operational parameters and proposed operational profiles, mitigations, and systems. As such, deviations and alternate methods of compliance may be approved and may differ from the information presented in this document. Therefore, if the applicant makes a safety case and presents sufficient data for an alternate means of compliance, then this data should be taken into consideration and evaluated for possible approval.

6.0 UAS Airworthiness

All UAS must be shown to be airworthy to conduct flight operations in the NAS. UAS should be maintained and conform to the same airworthiness standards as defined for the 14 CFR parts

under which UAS are intended to be operated. The FAA recognizes that some of the requirements can differ from those for manned aircraft and appropriate changes can be defined. In the future, UAS Maintenance Technician certification will parallel existing standards for manned aviation. As with airworthiness standards, Maintenance Technicians Requirements will be reviewed as part of the data collection process.

6.1 Public Applicants

The applicant must provide an airworthiness statement specifying compliance with the proponent's applicable airworthiness policy or criteria. Examples of acceptable policy/criteria include, but are not limited to:

- DoD: MIL-HDBK 516B, *Airworthiness Certification*
- Air Force: AFPD 62-6, *USAF Aircraft Airworthiness Certification*
- Army: AR 70-62, *Airworthiness Qualification Of US Army Aircraft Systems (Level 1)*
- Navy and Marine Corps: NAVAIRINST 13034.1C, *Flight Clearance Policy for Air Vehicles and Aircraft Systems.*

Note: As an example, an airworthiness statement could include words to this effect: This COA application for (name of UAS) has been reviewed on behalf of the (name of applicant or agency) in accordance with (MIL-HDBK-516 or specified alternative method) and has been determined to be airworthy to operate as specified in this application subject to the following restrictions (specify the conditions). The statement should be on letterhead paper and both dated and signed by the responsible reviewing authority.

6.2 Civil Applicants

Approvals for civil applications using the special airworthiness process receive their airworthiness certification as part of the review process with the FAA.

7.0 Continued Airworthiness

Applicants for UAS operational approvals must address continued airworthiness procedures as part of their application. It is highly recommended that all applicants provide the following information: a Continuing Airworthiness Program, a Maintenance Training Program, any unique skill sets or maintenance practices relating to their aircraft and/or aircraft operations that may be outside the current scope and practices of manned aviation and a process to report any applicable data relating to the operation and maintenance of the UAS. All information that is received from UAS operators will aid the FAA in tracking the various existing UAS types and operations. This data will help expedite the regulatory process for UAS and allow the FAA to have a historical data base from which to base current and future UAS regulatory guidance. Accurate recordkeeping is essential in assuring positive operational and quality airworthiness control.

8.0 Flight Operations

8.1 General

The guidance presented in this document applies only to those UAS operations affecting areas of the NAS other than active Restricted, Prohibited, or Warning Areas. The FAA is particularly concerned that UAS operate safely among all users of the NAS, including non-cooperative aircraft and other airborne operations not reliably identifiable by radar (i.e., balloons, gliders, parachutists, etc).

Unless specifically authorized, UAS operations in other than active Restricted, Prohibited, or Warning Areas, or Class A airspace shall require visual observers, either airborne or ground-based.

While considerable work is ongoing to develop a certifiable "detect, sense, and avoid" system, no current solution exists. Compliance with the "see and avoid" aspect of 14 CFR 91.113, *Right-of-Way Rules: Except Water Operations*, becomes one of the primary issues in UAS operational approvals. As a result, alternate methods of compliance are required to accomplish the "see and avoid" function. See and avoid risk mitigation strategies are normally based on the use of visual observers or other methods of segregation. Risk mitigations may also include other methods or systems that an applicant may propose for consideration. An applicant may propose any reasonable type of mitigation or system, however, the FAA approves UAS flight activities that can demonstrate that the proposed operations can be conducted at an acceptable level of safety.

Applicants proposing "see and avoid" strategies in lieu of visual observers, need to support proposed mitigations with system safety studies which indicate the operations can be conducted safely. Acceptable system safety studies must include a hazard analysis, risk assessment, and other appropriate documentation that support an "extremely improbable" determination.

It is the applicant's responsibility to demonstrate that injury to persons or property along the flight path is extremely improbable. UA with performance characteristics that impede normal air traffic operations may be restricted in their operations.

8.1.1 System Considerations

- **Onboard Cameras/Sensors:** Although onboard cameras and sensors that are positioned to observe targets on the ground have demonstrated some capability, their use in detecting airborne operations for the purpose of deconfliction is still quite limited. Therefore, these types of systems may not be considered as a sole mitigation in the see and avoid risk assessment. In general, current designs are not mature and have shown to be insufficient to provide the sole mitigation in the see and avoid risk assessment. Although these systems are currently immature, applicants may be allowed to propose any system solution that provides a mitigation strategy and should be evaluated as a potential solution.
- **Radar and Other Sensors:** If special types of radar or other sensors are utilized to mitigate risk, the applicant must provide supporting data which demonstrates that:

- both cooperative and non-cooperative aircraft, including targets with low radar reflectivity, such as gliders and balloons, can be consistently identified at all operational altitudes and ranges, and,
- the proposed system can effectively deconflict a potential collision.

- **Lost Link Procedures:** In all cases, the UAS must be provided with a means of automatic recovery in the event of a lost link. There are many acceptable approaches to satisfy the requirement. The intent is to ensure airborne operations are predictable in the event of lost link.
- **Flight Termination System (FTS)**: It is highly desirable that all UAS have system redundancies and independent functionality to ensure the overall safety and predictability of the system. If a UAS is found to be lacking in system redundancies, an independent flight termination system that can be activated manually by the UAS PIC, may be required to safeguard the public.

8.2 Operational Requirements

Unless operating in an active Restricted, Prohibited, or Warning Area, UAS operations must adhere to the following requirements.

8.2.1 Observer Requirement VFR UAS operations may be authorized utilizing either ground-based or airborne visual observers onboard a dedicated chase aircraft. A visual observer is required to perform the see and avoid function as alternative compliance to 14 CFR 91.113, *Right-of-Way Rules: Except Water Operations.*

The task of the observer is to provide the pilot of the UAS with instructions to steer the UA clear of any potential collision with other traffic. Visual observer duties require the ability to maintain visual contact with the UA at all times while scanning the immediate environment for potential conflicting traffic. At no time will the visual observer permit the UA to operate outside their line-of-sight. This ensures that any required maneuvering information can be reliably provided to the PIC.

The visual limitation will specify both a lateral and vertical distance and shall be regarded as a maximum distance from the observer where a determination of a conflict with another aircraft can be made. When an application is approved by the FAA, the visual limitation distance becomes a directive upon the observer.

Generally, observers are to be positioned no greater than one nautical mile laterally and 3000 feet vertically from the UA. The use of nautical miles is based on the fact that the UA is being positioned by the pilot via control stations that typically use moving map displays that are referenced in nautical miles.

This distance is predicated on the observer's normal unaided vision. Corrective lenses, spectacles, and contact lenses may be used.

When using other aids to vision, such as binoculars, field glasses, or telephoto television, visual observers must use caution to ensure that the UA remains within the approved visual limitation distance of the observer. Due to field of view and distortion issues, the

use of such aids can be used to augment the observer's visual capability but cannot be used as the primary means of visual contact.

Although this guidance specifies an observer distance, the small size of some UA may not allow for adequate observation at the one mile limit. It should be understood that this limit is the maximum range allowed and that a practical distance may be something less, with the determination of such at the discretion of the applicant. Therefore, until an on site validation of observer distance is conducted by the FAA, it will remain the responsibility of the applicant to ensure the safety of flight and adequate visual range coverage to mitigate any potential collisions. Conversely, larger UA may accommodate an observer distance greater than the one mile limit. The applicant may establish a distance greater than one mile based on a variety of factors. Increased observer distances may be proposed by the applicant and will be subject to review by the FAA either by on site demonstration or other means.

If UAS applications are approved for nighttime operations with flight operations that will depart or arrive between sunset and sunrise, the ground observer(s) must be in place one hour prior to that operation to ensure acclimation to the twilight/nighttime environment.

8.2.2 ATC Communications Requirements The UAS pilot must have immediate radio communication with appropriate ATC facilities anytime:

- the UA is being operated in Class A, D or sometimes E airspace (See 9.2.14 for operations in Class B or C Airspace)
- the UA is being operated under instrument flight rules (IFR)
- it is stipulated under the provisions of any issued COA or a special airworthiness certificate.

It is preferred that communications between the UAS pilot and ATC be established through onboard radio equipment to provide a voice relay; this is required for IFR flight.

8.2.3 Inter-Communications Requirements Any visual observer, sensor operator, or other person charged with providing collision avoidance for the UA must have immediate communication with the UAS pilot. If a chase aircraft is being utilized, immediate communication between the chase aircraft and the UAS pilot shall be required at all times. If the UAS pilot is talking to air traffic control, monitoring of the air traffic control frequency by all UAS crew members (UAS pilots, observers, and chase pilots) is recommended for shared situational awareness. However, unless it is necessary, the UAS PIC or the supplemental pilots are the only crewmembers that will talk to Air Traffic Control.

8.2.4 Dropping Objects/Hazardous Materials If the UA's intended operation includes the dropping or spraying of aircraft stores outside of active Restricted, Prohibited, or Warning Areas, the application must specifically address the hazard and make a clear case that injury to persons on the ground is extremely remote and operational risks have been sufficiently mitigated. A similar case must be made for hazardous materials carried aboard the UA.

8.2.5 Flight Over Populated Areas Routine UAS operations shall not be conducted over urban or populated areas. UAS operations may be approved in emergency or relief situations if the proposed mitigation strategies are found to be acceptable.

8.2.6 Flight Over Heavily Trafficked Roads or Open-air Assembly of People UAS operations shall avoid these areas. If flight in these areas is required, the applicant will be required to support proposed mitigations with system safety studies that indicate the operations can be conducted safely. Acceptable system safety studies must include a hazard analysis, risk assessment, and other appropriate documentation that support an "extremely improbable" determination. Additionally, it is the applicant's responsibility to demonstrate that injury to persons or property along the flight path is extremely improbable. UAS with performance characteristics that impede normal air traffic operations may be restricted in their operations.

8.2.7 Day/Nighttime Operations All UAS operations outside of Class A airspace must be conducted during daylight hours. Nighttime operations may be considered in other airspace if the applicant provides a safety case and sufficient mitigation to avoid collision hazards at night. Examples of such may be transit operations in Class D airspace over a non-joint use military airfield adjacent to restricted airspace.

8.2.8 Flights Below Class A Airspace All UAS operations (IFR or VFR) outside of active Restricted, Prohibited or Warning Areas and below flight level (FL) 180 shall be conducted in visual meteorological conditions (VMC) and in accordance with 14 CFR 91.155, *Basic VFR Weather Minimums*, however, a minimum flight visibility of not less than three statue miles (SM) shall be maintained at all times. Cloud clearance requirements shall remain as specified in 14 CFR 91.155, *Basic VFR Weather Minimums*. Special VFR requirements per 14 CFR 91.157, *Special VFR Weather Minimums*, do not apply to UAS operations and cannot be exercised.

8.2.9 Autonomous Operations It is generally understood that most UAS have some level of autonomy associated with its operation. Although it is possible to have a completely manual UAS, which requires a pilot-in-the-loop, the majority of UAS are autonomous to a certain degree. Only those UAS that have the capability of pilot intervention, or pilot-on-the-loop, shall be allowed in the NAS outside of Restricted, Prohibited, or Warning areas. UAS that are designed to be completely autonomous, with no capability of pilot intervention, are not authorized in the national airspace system. Although the pilot may be technically considered out-of-the-loop in a lost link scenario, this restriction does not apply to UAS operating under lost link.

8.2.10 Operations from Off-Airport Locations In most cases, an off-airport location should be situated no closer than five nautical miles (NM) from any airport or heliport. The operational areas, including the launch and recovery zones, should be free from obstructions and reasonable efforts should be made to keep operations away from structures and heavily trafficked roads. Due to the unique attributes of off-airport locations, approval requests need to be evaluated on a case-by-case basis.

8.2.11 Other Mitigations in lieu of Observers See Alternate Methods of Compliance section.

8.2.12 Operating Under Instrument Flight Rules (IFR) While operating on an instrument flight plan, the following must exist, be completed, or be complied with:

- The pilot in command must hold a current instrument rating in a manned aircraft.
- The aircraft's airworthiness statement includes IFR flight and all equipment is certified and working (including pitot static and transponder checks).
- Aviation database and charts are current and available to the UAS pilot.
- An IFR flight plan is filed.
- An ATC clearance has been obtained and all clearances followed.
- Direct two-way radio communication between the UAS pilot and ATC is available. Communication relay through the UA is required.
- Pre-coordination with ATC has been accomplished.
- The UA is equipped with a certified operating mode C (mode S preferred) transponder.
- Visual observers are utilized in accordance with this guidance document.
- ATC radar monitoring is available throughout the portion of the flight in Class A airspace.
- All operations outside of Class A airspace and active Restricted, Prohibited, or Warning Areas shall be conducted in VMC conditions only.

8.2.13 Chase Aircraft Operations The chase aircraft must remain at a safe distance from the UA to ensure collision avoidance should a UAS malfunction occur, but remain close enough to provide visual detection of conflicting aircraft in the path of the UA in a timely manner to advise the UAS PIC of the situation. Should the UAS pilot operate the UA from the chase aircraft, the chase aircraft must remain within radio control range of the UA to maintain appropriate signal coverage for flight control or activation of the flight termination system. Chase aircraft may be required to have communication with appropriate ATC facilities based on the applicant's application or mission profile.

- Chase aircraft are not required in Class A, active Restricted, Prohibited, or Warning Area airspace.
- Chase operations shall be conducted during daylight hours only.
- Flight visibility for all UAS chase operations shall be three statute miles or greater.
- Chase aircraft pilots must not concurrently perform either observer or UA pilot duties along with chase pilot duties.
- Chase aircraft operating as a formation flight will immediately notify ATC if they are using a non-standard formation.

Note: A standard formation is one in which a proximity of no more than 1 mile laterally or longitudinally and within 100 feet vertically from the flight leader is maintained by each wingman.

Note: Nonstandard formations are those operating under any of the following conditions:

- ***When the flight leader has requested and ATC has approved other than standard formation dimensions.***
- ***When operating within an authorized altitude reservation (ALTRV) or under the provisions of a letter of agreement.***
- ***When the operations are conducted in airspace specifically designed for a special activity.***

8.2.14 Airspace Considerations by Airspace Designation:

Note: UA operating in airspace designated as reduced vertical separation minimum (RVSM) airspace must comply with 14 CFR 91.180, Operations within Airspace Designated as Reduced Vertical Separation Minimum Airspace.

- **Class A:** Observers are not required in Class A. All UAS must be operating on an instrument flight plan. UAS operations approved for Class A must comply with 14 CFR 91.135, *Operations in Class A Airspace.*
- **Class B:** UAS operations are currently not authorized. Class B airspace contains terminal areas highest density of manned aircraft in the National Airspace System. As with all applications, the FAA will consider exceptional circumstances.
- **Class C and airspace within 30 nautical miles of an airport listed in 14 CFR 91.215:** Requests for approval will be handled on a case-by-case basis and may be approved if sufficiently mitigated and a safety case has been established. UAS operations approved for Class C must comply with 14 CFR 91.130, *Operations in Class C Airspace*, and 14 CFR 91.215, *ATC Transponder and Altitude Reporting Equipment and Use*. The transponder requirement will not be waived.
- **Class D:** Requests for approval will be handled on a case-by-case basis and may be approved if sufficiently mitigated and a safety case has been established. UAS operations approved for Class D must comply with 14 CFR 91.129, *Operations in Class D Airspace.*
- **Class E:** If there is an operating Air Traffic Control Tower Class D rules may apply. UAS operations approved for Class E must comply with 14 CFR 91.127, *Operating on or in the Vicinity of an Airport in Class E Airspace.*
- **Class G:** UA operations approved for Class G must comply with 14 CFR 91.126, *Operating on or in the Vicinity of an Airport in Class G Airspace.*

8.3 Oceanic Operations

8.3.1 UAS operations wholly contained within Warning areas are handled in the same manner as those operations conducted in active Restricted and Prohibited areas, that is, no specific approval is required and observers or chase aircraft are not required.

8.3.2 Flight Information Region Operations. FAA rules and policies apply in the flight information regions (FIRs) where the FAA is the air traffic service provider. As such, the guidelines specified in this document apply to UAS operations conducted in these FIRs.

9.0 Personnel Qualifications

This section addresses the qualifications of UAS pilots, observers, maintainers, and other personnel as appropriate. All references to a pilot certificate refer to an FAA issued private pilot certificate or higher.

9.1 UAS Pilot Qualifications

The FAA is focused on insuring that UAS pilots have a common level of understanding of federal aviation regulations applicable to the airspace where the UA will operate. Pilots are responsible for a thorough preflight inspection of the UAS. They are accountable for controlling their aircraft to the same responsible standards as the pilot of a manned aircraft. Pilot qualifications for UAS operations conducted under IFR are addressed in this section.

The following items apply to the pilots of all UAS:

- One pilot in command (PIC) must be designated at all times.
- The PIC of an aircraft is directly responsible, and is the final authority of, the operation of that aircraft.
- Pilots must not perform crew duties for more than one UAS at a time.
- Pilots are not allowed to perform concurrent duties both as pilot and observer.

9.1.1 Pilot in Command (PIC) The designated PIC is the pilot responsible for the UAS flight operation. The PIC may be augmented by supplemental pilots; however, the PIC retains complete and overall responsibility of the flight, regardless of who may be piloting the UA. It is common for applicants to have both an "internal" and an "external" UAS pilot. The PIC can assume any of these positions. The PIC duty may be rotated as necessary to fulfill operational requirements.

9.1.1.1 Ratings Rating requirements for the UAS PIC depend on the type of operation conducted and fall into two categories:

- Operations that require a pilot certificate
- Operations that do not require a pilot certificate.

The requirement for the PIC to hold a pilot certificate is based on various factors including the location of the planned operations, mission profile, size of the UA, and whether or not the operation is conducted within or beyond visual line of sight. Operations without a pilot certificate may be allowed, permitting smaller UA to operate below certain altitudes while controlled strictly by visual line of sight. The cutoff point at which the smaller UA criteria will be utilized is yet to be defined; therefore, each application will be carefully reviewed to assess the feasibility of allowing that type of operation.

Operations requiring a pilot certificate: The PIC shall hold, at a minimum, an FAA pilot certificate under the following circumstances:

- All operations approved for conduct in Class A, C, D, and E airspace.
- All operations conducted under IFR (FAA instrument rating required).
- All operations approved for nighttime operations.
- All operations conducted at joint use or public airfields.
- All operations conducted beyond line of sight.
- At any time the FAA has determined the need based on the UAS' characteristics, mission profile, or other operational parameters.

***Note:** The FAA may require specific aircraft category and class ratings in manned aircraft depending on the UAS seeking approval and the characteristics of its flight controls interface.*

Operations not requiring a pilot certificate: The PIC *may not* be required to hold a pilot certificate for operations approved and conducted solely within visual line of sight in Class G airspace. For the PIC to be exempt from the pilot certificate requirement the following conditions must exist and the alternate compliance method described below must be followed:

Pilot certificate

- The operation is conducted in a sparsely populated location, and,
- The operation is conducted from a privately owned airfield, military installation, or off-airport location.
- Visual line of sight operations conducted no further than 1 NM laterally from the UAS pilot and at an altitude of no more than 400 feet above ground level (AGL) at all times.
- Operations shall be conducted during daylight hours only.
- Operations shall be conducted no closer than 5 NM from any airport or heliport.
- **Alternate Compliance Method**: In lieu of a pilot certificate, the PIC must have successfully completed, at a minimum, FAA private pilot ground instruction, and have passed the written examination.

***Note:** The FAA may require an instrument rating in a specific aircraft category in manned aircraft depending on the UAS seeking approval and the characteristics of its flight controls interface.*

9.1.1.2 **Currency** The applicant shall provide a process that ensures that the pilots receive an appropriate level of currency in the UAS being operated. At a minimum, the PIC must demonstrate three takeoffs (launch) and landings (recovery) in the specific UAS in the previous 90 days.

For those operations approved for night operations, the PIC must demonstrate three takeoffs (launch) and landings (recovery) in the specific UAS at night to a full stop in the previous 90 days.

For those operations that require a certificated pilot per section 9.1.1.1 above, the PIC, in order to exercise the privileges of his certificate, shall have flight reviews and maintain currency in manned aircraft per 14 CFR 61.56, *Flight Review* and 61.57, *Recent Flight Experience: Pilot in Command.*

For operations approved for night or IFR, the PIC shall maintain currency per 14 CFR 61.57, *Recent Flight Experience: Pilot in Command*, as applicable.

9.1.1.3 **Medical** The PIC shall maintain, at a minimum, a valid FAA Class 2 medical certificate issued under 14 CFR part 67, and have it in their possession.

9.1.1.4 **Training** In addition to the aforementioned training required for a pilot certificate, UAS pilots will have additional training in all specific details of the UAS being operated including normal, abnormal, and emergency procedures. This must include manufacturer specific training (or military equivalent), demonstrated proficiency, and testing in the UAS being operated.

9.1.2 **Supplemental Pilots** Supplemental pilots are those pilots assigned UA flight duty to augment the PIC. It is common for applicants to have both an "internal" and an "external" UA pilot. The supplemental pilot can assume any of these positions.

9.1.2.1 **Ratings** No specific rating is required for supplemental pilots unless they are assuming the role of pilot in command. However, at a minimum, they must have successfully completed private pilot ground school and have passed the written test.

9.1.2.2 **Currency** The applicant shall provide a process that ensures that the pilots maintain an appropriate level of currency in the UAS being operated.

9.1.2.3 **Medical** Supplemental pilots shall maintain, at a minimum, a valid FAA Class 2 medical certificate issued under 14 CFR part 67, and have it in their possession. Any supplemental pilot acting as a dedicated visual observer or flying the UA on a visual basis shall also maintain a valid FAA Class 2 medical certificate.

9.1.2.4 **Training** In addition to all training required for receiving and maintaining a pilot certificate, the UAS pilot shall be additionally trained in all specific details of the UAS being operated including normal, abnormal, and emergency procedures.

9.2 Observer Qualifications

All observers must have an understanding of federal aviation regulations applicable to the airspace where the UA will operate. Observers are considered a crewmember of the UAS. Observers must not perform crew duties for more than one UAS at a time. Observers are not allowed to perform concurrent duties both as pilot and observer.

9.2.1 **Medical** All observers shall maintain, at a minimum, a valid FAA Class 2 medical certificate issued under 14 CFR 67, and have it in their possession. 14 CFR 91.17, *Alcohol or Drugs*, applies to all UAS crewmembers, including observers.

9.2.2 Training Observers must have completed sufficient training to communicate to the pilot any instructions required to remain clear of conflicting traffic. This training, at a minimum, shall include knowledge of the rules and responsibilities described in 14 CFR 91.111, *Operating Near Other Aircraft;* 14 CFR 91.113, *Right-of-Way Rules: Except Water Operations;* and 14 CFR 91.155, *Basic VFR Weather Minimums;* knowledge of air traffic and radio communications, including the use of approved ATC/pilot phraseology; and knowledge of appropriate sections of the *Aeronautical Information Manual.*

9.3 Other Personnel Qualifications

Ancillary personnel such as systems operators or mission specialists must be thoroughly familiar with and possess operational experience of the equipment being utilized. If the subject systems being utilized are for observation and detection of other aircraft for collision avoidance purposes, they must be thoroughly trained on collision avoidance procedures and techniques and have direct communication with the UAS pilot, observer, and other applicable personnel on an inter-communication system.

9.4 Maintenance Personnel Qualifications

9.4.1 Ratings Will be established as more data is collected and a regulatory guideline is developed.

9.4.2 Currency It is suggested that applicants follow applicable guidelines of 14 CFR 65.83 as appropriate until final UAS regulatory guidelines are available.

9.4.3 Medical No medical requirements have been defined at this time.

9.4.4 Training It is highly recommended that a Maintainer/Operator of a UAS submit a training program. This requirement will be further defined as more data is collected and the regulatory process better defines these guidelines.

UNMANNED AIRCRAFT SYSTEMS

Use in the National Airspace and the Role of the Department of Homeland Security

GAO
Accountability * Integrity * Reliability
Highlights

Highlights of GAO-12-889T, a testimony before the Subcommittee on Oversight, Investigations, and Management, Committee on Homeland Security, House of Representatives.

Why GAO Did This Study

UAS aircraft do not carry a human operator on board, but instead operate on pre-programmed routes or by following commands from pilot-operated ground stations. An aircraft is considered to be a small UAS if it is 55 pounds or less, while a large UAS is anything greater. Current domestic uses of UAS are limited and include law enforcement, monitoring or fighting forest fires, border security, weather research, and scientific data collection by the federal government. FAA authorizes military and non-military UAS operations on a limited basis after conducting a case-by-case safety review. Several other federal agencies also have a role or interest in UAS, including DHS. In 2008, GAO reported that safe and routine access to the national airspace system poses several obstacles.

This testimony discusses 1) obstacles identified in GAO's previous report on the safe and routine integration of UAS into the national airspace, 2) DHS's role in the domestic use of these systems, and 3) preliminary observations on emerging issues from GAO's ongoing work.

This testimony is based on a 2008 GAO report and ongoing work, and is focused on issues related to non-military UAS. In ongoing work, GAO analyzed FAA's efforts to integrate UAS into the national airspace, the role of other federal agencies in achieving safe and routine integration, and other emerging issues; reviewed FAA and other federal agency efforts and documents; and conducted selected interviews with officials from FAA and other federal, industry, and academic stakeholders.

What GAO Found

GAO earlier reported that unmanned aircraft systems (UAS) could not meet the aviation safety requirements developed for manned aircraft and posed several obstacles to operating safely and routinely in the national airspace system. These include 1) the inability for UAS to detect, sense, and avoid other aircraft and airborne objects in a manner similar to "see and avoid" by a pilot in a manned aircraft; 2) vulnerabilities in the command and control of UAS operations; 3) the lack of technological and operational standards needed to guide the safe and consistent performance of UAS; and 4) the lack of final regulations to accelerate the safe integration of UAS into the national airspace. GAO stated in 2008 that Congress should consider creating an overarching body within the Federal Aviation Administration (FAA) to address obstacles for routine access. FAA's Joint Planning and Development Office (JPDO) has taken on a similar role. FAA has implemented GAO's two recommendations related to its planning and data analysis efforts to facilitate integration.

The Department of Homeland Security (DHS) is one of several partner agencies of JPDO working to safely integrate UAS into the national airspace. Since 2005, FAA has granted DHS authority to operate UAS to support its national security mission in areas such as the U.S. northern and southern land borders. DHS's Transportation Security Administration (TSA) has the authority to regulate security of all modes of transportation, including non-military UAS, and according to TSA officials, its aviation security efforts include monitoring reports on potential security threats regarding the use of UAS. Security considerations could be exacerbated with routine UAS access. TSA has not taken any actions to implement GAO's 2008 recommendation that it examine the security implications of future, non-military UAS.

GAO's ongoing work has identified several UAS issues that, although not new, are emerging as areas of further consideration in light of greater access to the national airspace. These include concerns about privacy relating to the collection and use of surveillance data. Currently, no federal agency has specific statutory responsibility to regulate privacy matters relating to UAS. Another emerging issue is the use of model aircraft (aircraft flown for hobby or recreation) in the national airspace. FAA is generally prohibited from developing any rule or regulation for model aircraft. The Federal Bureau of Investigation report of a plot to use a model aircraft filled with plastic explosives to attack the Pentagon and U.S. Capitol in September 2011has highlighted the potential for model aircraft to be used for unintended purposes. An additional emerging issue is interruption of the command and control of UAS operations through the jamming and spoofing of the Global Positioning System between the UAS and ground control station. GAO plans to report more fully this fall on these issues, including the status of efforts to address obstacles to the safe and routine integration of UAS into the national airspace.

Figure 1: Example of a Small UAS (SkySeer) and a Large UAS (Predator)

Sources: Octatron, Inc. and DHS.

Chairman McCaul, Ranking Member Keating, and Members of the Subcommittee:

I appreciate the opportunity to testify before you today on obstacles to unmanned aircraft systems (UAS) safe and routine operations in the national airspace, the role that the Department of Homeland Security (DHS) has in UAS operations, and emerging UAS issues. Many stakeholders have exhibited increased interest in UAS for border security and disaster assistance, among other uses. Additionally, as combat operations in Afghanistan decrease, all of the United States military services expect to conduct more UAS training flights across the contiguous United States.[1]

UAS aircraft do not carry a human operator on board, but instead operate on pre-programmed routes or by following commands from pilot-operated ground stations. These aircraft are also referred to as "unmanned aerial vehicles," "remotely piloted aircraft," "unmanned aircraft," or "drones." The term "unmanned aircraft system" is used to recognize that a UAS includes not only the airframe, but also associated elements such as a ground station and the communications links. UAS are typically described in terms of weight, endurance, purpose of use, and altitude of operation. Most UAS are considered small, weighing less than 55 pounds; some of which fly less than 400 feet above the ground. According to an industry association, small UAS are expected to comprise the majority of UAS that will operate in the national airspace.

The Federal Aviation Administration (FAA) authorizes military and non-military (academic institutions; federal, state, and local governments including law enforcement entities; and private sector entities) UAS operations on a limited basis after conducting a case-by-case safety review. Only federal, state, and local government agencies can apply for a Certificate of Waiver or Authorization (COA); private sector entities must apply for special airworthiness certificates in the experimental category. [2]

[1]House Permanent Select Committee on Intelligence, *Performance Audit of the Department of Defense Intelligence, Surveillance, and Reconnaissance* (Washington, DC: Apr. 2012).

[2]COAs and special airworthiness certifications in the experimental category represent exceptions to the usual certification process. FAA examines the facts and circumstances of a proposed UAS to ensure that the prospective operator has acceptably mitigated safety risks.

Between January 1, 2012 and July 17, 2012, FAA had issued 201 COAs to 106 federal, state, and local government entities across the United States, including law enforcement entities as well as academic institutions. Additionally, FAA had issued 8 special airworthiness certifications for experimental use to four UAS manufacturers. Presently, under COA or special airworthiness certification, UAS operations are permitted for specific times, locations, and operations. Thus it is not uncommon for an entity to receive multiple COAs for various missions. Over the years, concerns have been expressed by the Congress and other stakeholders that sufficient progress has not been made to integrate UAS into the national airspace system. In 2008, GAO reported that safe and routine access to the national airspace system poses several obstacles. We also stated that Congress should consider creating an overarching body within FAA to coordinate federal, academic, and private-sector efforts in meeting the safety challenges of allowing routine access to the national airspace system. Additionally, we made two recommendations to FAA related to its planning and data analysis efforts to facilitate the process of allowing UAS routine access to the national airspace. We also recommended that DHS assess the security implications of routine access. FAA is working toward implementing the requirements set forth by its February 2012 reauthorization to accelerate UAS integration.[3]

Several other federal agencies also have a role or interest in UAS, including the Department of Homeland Security (DHS), the Department of Defense (DOD), and the National Aeronautics and Space Administration (NASA).[4] DHS's Transportation Security Administration (TSA) has authority to regulate the security of all transportation modes, including non-military UAS, to ensure that appropriate safeguards are in place. According to TSA, its aviation security efforts include addressing risks, threats, and vulnerabilities related to non-military UAS. In addition, According to DHS officials, Customs and Border Protection (CBP) owns ten UAS that it operates for its own missions as well as for missions in conjunction with other agencies. DOD has successfully used UAS for

[3]FAA Modernization and Reform Act of 2012, Pub. L. No. 112-95, §§ 332 – 334, 126 Stat. 11 (2012).

[4]Senior executives from these four federal agencies represent the UAS ExCom, whose mission is to enable increased and ultimately routine access of federal UAS engaged in non-military aircraft operations into the national airspace to support these agencies' operational, training, development, and research requirements.

intelligence, surveillance, reconnaissance, and combat missions.[5] While many of DOD's UAS operations currently take place outside of the United States, the military services require access to the national airspace to conduct UAS training. DOD has also assisted DHS in border security missions, including two missions since 2006 where the National Guard provided support in four southwestern border states. NASA uses UAS primarily for research purposes, such as the Predator B for wildfire mapping and investigations as well as an expected arctic mission next year on surface sea ice.

My statement today discusses 1) obstacles we identified in our previous report to the safe and routine integration of UAS into the national airspace, 2) DHS's role in the domestic use of these systems, and 3) preliminary observations on emerging issues from our ongoing work examining UAS. This statement is based on our 2008 UAS report[6] and ongoing work for this subcommittee, the House Committee on Transportation and Infrastructure and its subcommittee on Aviation, and the Senate Committee on Science, Commerce and Transportation. Our ongoing work is focused on issues related to non-military UAS and is based on our analysis of FAA's efforts to integrate UAS into the national airspace, the role of other federal agencies in achieving safe and routine integration, and other emerging issues. Our preliminary observations are based on our review of various FAA and other federal agency efforts and documents; and selected interviews with officials from FAA and other federal, industry, and academic stakeholders. Our 2008 report contains detailed explanations of the methods used to conduct that work. We have discussed the information in this testimony with officials from FAA and DHS, and incorporated their comments as appropriate. The work on which this statement is based was performed in accordance with generally accepted government auditing standards. Those standards require that we plan and perform the audit to obtain sufficient, appropriate evidence to provide a reasonable basis for our findings and conclusions based on our audit objectives. We believe that the evidence obtained

[5]GAO, *Unmanned Aircraft Systems: Comprehensive Planning and a Results-Oriented Training Strategy Are Needed to Support Growing Inventories*, GAO-10-331 (Washington, DC: Mar. 26, 2010).

[6]GAO, *Unmanned Aircraft Systems: Federal Actions Needed to Ensure Safety and Expand Their Potential Uses within the National Airspace System,* GAO-08-511 (Washington, D.C.: May 15, 2008).

provides a reasonable basis for our findings and conclusions based on our audit objectives.

Background

Current domestic uses of UAS are limited and include law enforcement, monitoring or fighting forest fires, border security, weather research, and scientific data collection. UAS have a wide-range of potential uses, including commercial uses such as pipeline, utility, and farm fence inspections; vehicular traffic monitoring; real estate and construction site photography; relaying telecommunication signals; and crop dusting. FAA's long-range goal is to permit, to the greatest extent possible, routine UAS operations in the national airspace system while ensuring safety. Using UAS for commercial purposes is not currently allowed in the national airspace. As the list of potential uses for UAS grows, so do the concerns about how they will affect existing military and non-military aviation as well as concerns about how they might be used.

Domestically, state and local law enforcement entities represent the greatest potential use of small UAS in the near term because small UAS can offer a simple and cost effective solution for airborne law enforcement activities for agencies that cannot afford a helicopter or other larger aircraft.[7] For example, federal officials and one airborne law enforcement official said that a small UAS costing between $30,000 and $50,000 is more likely to be purchased by state and local law enforcement entities because the cost is nearly equivalent to that of a patrol car. According to recent FAA data, 12 state and local law enforcement entities have a Certificate of Waiver or Authorization (COA) while an official at the Department of Justice said that approximately 100 law enforcement entities have expressed interest in using a UAS for some of their missions. According to law enforcement officials with whom we spoke, small UAS are ideal for certain types of law enforcement activities. Officials anticipate that small UAS could provide support for tactical teams, post-event crime scene analysis and critical infrastructure photography. Officials said that they do not anticipate using small UAS for

[7]FAA generally considers UAS in the two broad categories of "small" and "large," and has used these categories to split its efforts to develop rules that would allow government and commercial UAS access to the national airspace. FAA has been developing rules for small UAS for several years. Although there is no widely accepted common classification system for UAS, an aircraft is considered to be a small UAS if it is 55 pounds or less, while a large UAS is anything greater.

routine patrols or missions that would require flights over extended distances or time periods.

FAA has been working with the Department of Justice's National Institute of Justice to develop a COA process through a memorandum of understanding to better meet the operational requirements of law enforcement entities. While the memorandum of understanding establishing this COA process has not been finalized, there are two law enforcement entities that are using small UAS on a consistent basis for their missions and operations. The proposed process would allow law enforcement entities to receive a COA for training and performance evaluation. When the entity has shown proficiency in operating its UAS, it would then receive an operational COA allowing it to operate small UAS for a range of missions. In May 2012, FAA stated that it met its first requirement to expedite the COA process for public safety entities. FAA's reauthorization also required the agency to enter into agreements with appropriate government agencies to simplify the COA process and allow a government public safety agency to operate unmanned aircraft weighing 4.4 pounds or less if flown within the line of sight of the operator, less than 400 feet above the ground, and during daylight conditions, among others stipulations.

Obstacles to Safe and Routine Integration of UAS

In 2008, we reported that UAS could not meet the aviation safety requirements developed for manned aircraft and posed several obstacles to operating safely and routinely in the national airspace system.

- *Sense and avoid technologies*. To date, no suitable technology has been identified that would provide UAS with the capability to meet the detect, sense, and avoid requirements of the national airspace system. Our ongoing work indicates that research has been carried out to mitigate this, but the inability for UAS to sense and avoid other aircraft or objects remains an obstacle. With no pilot to scan the sky, UAS do not have an on-board capability to directly "see" other aircraft. Consequently, the UAS must possess the capability to sense and avoid an object using on-board equipment, or with the assistance of a human on the ground or in a chase aircraft,[8] or by other means, such

[8]Chase pilots are in constant radio contact with research pilots and serve as an "extra set of eyes" to help maintain total flight safety during specific tests and maneuvers. Chase pilots monitor certain events for the research pilot and are an important safety feature on all research missions.

as radar. Many UAS, particularly smaller models, will likely operate at altitudes below 18,000 feet, sharing airspace with other vehicles or objects. Sensing and avoiding other vehicles or objects represents a particular challenge for UAS, because other vehicles or objects at this altitude often do not transmit an electronic signal to identify themselves and, even if they did, many small UAS, do not have equipment to detect such signals if they are used and may be too small to carry such equipment.

- *Command and control communications.* Similar to what we previously reported, ensuring uninterrupted command and control for UAS remains a key obstacle for safe and routine integration into the national airspace. Without such control, the UAS could collide with another aircraft or crash, causing injury or property damage. The lack of dedicated radiofrequency spectrum for UAS operations heightens the possibility that an operator could lose command and control of the UAS. Unlike manned aircraft that use dedicated radio frequencies, non-military UAS currently use undedicated frequencies and remain vulnerable to unintentional or intentional interference. To address the potential interruption of command and control, UAS generally have pre-programmed maneuvers to follow if the command and control link becomes interrupted (called a "lost-link scenario"). However, these procedures are not standardized across all types of UAS and, therefore, remain unpredictable to air traffic controllers who have responsibility for ensuring safe separation of aircraft in their airspace.

- *Standards.* A rigorous certification process with established performance thresholds is needed to ensure that UAS and pilots meet safety, reliability, and performance standards. Minimum aviation system standards are needed in three areas: performance; command and control communications; and sense and avoid. In 2004, RTCA, a standards-making body sponsored by FAA, established a federal advisory committee called the Special Committee 203 (or SC 203), to establish minimum performance standards for FAA to use in developing UAS regulations.[9] Individuals from academia and the private sector serve on the committee, along with FAA, NASA, and

[9]RTCA, formerly the Radio Technical Commission for Aeronautics, is a private, not-for-profit corporation that develops consensus-based performance standards regarding communications, navigation, surveillance, and air traffic management system issues. RTCA serves as a federal advisory committee, and its recommendations are the basis for a number of FAA's policy, program, and regulatory decisions.

DOD officials. ASTM International Committee F38 on UAS, an international voluntary consensus standards-making body, is working with FAA to develop standards to support the integration of small UAS into the national airspace.[10]

- *Regulations*. FAA regulations govern the routine operation of most aircraft in the national airspace system.[11] However, these regulations do not contain provisions to address issues relating to unmanned aircraft. As we highlighted in our previous report, existing regulations may need to be modified to address the unique characteristics of UAS. Today, UAS continue to operate as exceptions to the regulatory framework rather than being governed by it. This has limited the number of UAS operations in the national airspace, and that limitation has, in turn, contributed to the lack of operational data on UAS in domestic operations previously discussed. One industry forecast noted that growth in the non-military UAS market is unlikely until regulations allow for the routine operation of UAS. Without specific and permanent regulations for safe operation of UAS, federal stakeholders, including DOD, continue to face challenges. The lack of final regulations could hinder the acceleration of safe and routine integration of UAS into the national airspace.

Given the remaining obstacles to UAS integration, we stated in 2008 that Congress should consider creating an overarching body within FAA to coordinate federal, academic, and private-sector efforts in meeting the safety challenges of allowing routine access to the national airspace system. While it has not created this overarching body, FAA's Joint Planning and Development Office has taken on a similar role. In addition, Congress set forth requirements for FAA in its February 2012 reauthorization to facilitate UAS integration. Additionally, we made two recommendations to FAA related to its planning and data analysis efforts to facilitate the process of allowing UAS routine access to the national airspace, which FAA has implemented.

[10]ASTM International, formerly known as the American Society for Testing and Materials (ASTM), is a globally recognized leader in the development and delivery of international voluntary consensus standards. ASTM members deliver the test methods, specifications, guides and practices that support industries and governments worldwide.

[11]Title 14, Code of Federal Regulations (14 CFR).

Role of the Department of Homeland Security in Domestic UAS Use

DHS is one of several partner agencies of FAA's Joint Planning and Development Office (JPDO) working to safely integrate UAS into the national airspace. TSA has the authority to regulate the security of all transportation modes, including non-military UAS, and according to TSA officials, its aviation security efforts include monitoring reports on potential security threats regarding the use of UAS. While UAS operations in the national airspace are limited and take place under closely controlled conditions, this could change if UAS have routine access to the national airspace system. Further, DHS owns and uses UAS.

Security is a significant issue that could be exacerbated with an increase in the number of UAS, and could impede UAS use even after all other obstacles have been addressed. In 2004, TSA issued an advisory in which it stated that there was no credible evidence to suggest that terrorist organizations plan to use remote controlled aircraft or UAS in the United States. However, the TSA advisory also provided that the federal government remains concerned that UAS could be modified and used to attack key assets and infrastructure in the United States. TSA advised individuals to report any suspicious activities to local law enforcement and the TSA General Aviation Hotline.[12] Security requirements have yet to be developed for UAS ground control stations—the UAS equivalent of the cockpit.[13] Legislation introduced in the 112th Congress would prohibit the use of UAS as weapons while operating in the national airspace.[14]

In our 2008 report, we recommended that the Secretary of Homeland Security direct the Administrator of TSA to examine the security implications of future, non-military UAS operations in the national airspace and take any actions deemed appropriate. TSA agreed that consideration and examination of new aviation technologies and operations is critical to ensuring the continued security of the national airspace. According to TSA officials, TSA continues to work with the FAA and other federal agencies concerning airspace security by implementing security procedures in an attempt to protect the National Airspace

[12]Department of Homeland Security, *TSA Advisory: Security Information Regarding Remote Controlled Aircraft and Unmanned Aerial Vehicles* (Washington, DC: Nov. 22, 2004).

[13]Additionally, in response to the events of September 11, 2001, entry doors to passenger airplane cockpits were hardened to prevent unauthorized entry.

[14]No Armed Drones Act of 2012, H. R. 5950, 112th Cong. (2012).

System. Examples of this collaboration include the coordinated efforts to allow access to temporary flight restricted airspace such as those put in place for Presidential travel and DHS Security Events. However, to date, neither DHS nor TSA has taken any actions to implement our 2008 recommendation. According to TSA officials, TSA believes its current practices are sufficient and no additional actions have been needed since we issued our recommendation.

DHS is also an owner and user of UAS. Since 2005, CBP has flown UAS for border security missions. FAA granted DHS authority to operate UAS to support its national security mission along the United States northern and southern land borders, among other areas. Recently, DHS officials told us that DHS has also flown UAS over the Caribbean to search for narcotics-carrying submarines and speedboats. According to DHS officials, CBP owns ten UAS that it operates in conjunction with other agencies for various missions. As of May 2012, CBP has flown missions to support six federal and state agencies along with several DHS agencies. These missions have included providing the National Oceanic and Atmospheric Administration with videos of damaged dams and bridges where flooding occurred or was threatened, and providing surveillance for DHS's Immigration and Customs Enforcement over a suspected smuggler's tunnel. DHS, DOD, and NASA, are working with FAA to identify and evaluate options to increase UAS access in the national airspace. DHS officials reported that if funding was available, they plan to expand their fleet to 24 total UAS that would be operational by fiscal year 2016, including 11 on the southwest border.

The DHS Inspector General reviewed CBP's actions to establish its UAS program, the purpose of which is to provide reconnaissance, surveillance, targeting, and acquisition capabilities across all CBP areas of responsibility. The Inspector General assessed whether CBP has established an adequate operation plan to define, prioritize, and execute its unmanned aircraft mission. The Inspector General's May 2012 report found that CBP had not achieved its scheduled or desired level of flight hours for its UAS. It estimated that CBP used its UAS less than 40 percent of the time it would have expected.[15]

[15]The report made four recommendations intended to improve CBP's planning of its UAS program to address its level of operation, program funding, and resource requirements, along with stakeholder needs.

Preliminary Observations on Emerging UAS Issues

Our ongoing work has identified several UAS issues that, although not new, are emerging as areas of further consideration in light of the efforts towards safe and routine access to the national airspace. These include concerns about 1) privacy as it relates to the collection and use of surveillance data, 2) the use of model aircraft, which are aircraft flown for hobby or recreation, and 3) the jamming and spoofing of the Global Positioning System (GPS).

- *Privacy concerns over collection and use of surveillance data.* Following the enactment of the UAS provisions of the 2012 FAA reauthorization act, members of Congress, a civil liberties organization, and others have expressed concern that the increased use of UAS for surveillance and other purposes in the national airspace has potential privacy implications. Concerns include the potential for increased amounts of government surveillance using technologies placed on UAS as well as the collection and use of such data. Surveillance by federal agencies using UAS must take into account associated constitutional Fourth Amendment protections against unreasonable searches and seizures. In addition, at the individual agency level, there are multiple federal laws designed to provide protections for personal information used by federal agencies. While the 2012 FAA reauthorization act contains provisions designed to accelerate the safe integration of UAS into the national airspace, proposed legislation in the 112th session of Congress, seeks to limit or serve as a check on uses of UAS by, for example, limiting the ability of the federal government to use UAS to gather information pertaining to criminal conduct without a warrant.[16]

  Currently, no federal agency has specific statutory responsibility to regulate privacy matters relating to UAS. UAS stakeholders disagreed as to whether the regulation of UAS privacy related issues should be centralized within one federal agency, or if centralized, which agency would be best positioned to handle such a responsibility. Some stakeholders have suggested that FAA or another federal agency should develop regulations for the types of allowable uses of UAS to specifically protect the privacy of individuals as well as rules for the conditions and types of data that small UAS can collect. Furthermore,

[16]Preserving Freedom from Unwarranted Surveillance Act of 2012, S. 3287, 112th Cong. (2012) and Farmer's Privacy Act of 2012, H.R. 5961, 112th Cong. (2012).

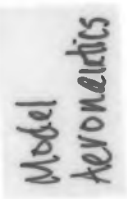
stakeholders with whom we spoke said that developing guidelines for technology use on UAS ahead of widespread adoption by law enforcement entities may preclude abuses of the technology and a negative public perception of UAS. Representatives from one civil liberties organization told us that since FAA has responsibility to regulate the national airspace, it could be positioned to handle responsibility for incorporating rules that govern UAS use and data collection. Some stakeholders have suggested that the FAA has the opportunity and responsibility to incorporate such privacy issues into the small UAS rule that is currently underway and in future rulemaking procedures. However, FAA officials have said that regulating these sensors is outside the FAA's mission, which is primarily focused on aviation safety, and has proposed language in its small UAS Notice of Proposed Rulemaking to clarify this.

- *Model aircraft*. According to an FAA official with whom we spoke and other stakeholders, another concern related to UAS is the oversight of the operation of model aircraft—aircraft flown for hobby or recreation—capable of sustained flight in the atmosphere and a number of other characteristics.[17] Owners of model aircraft do not require a COA to operate their aircraft.[18] Furthermore, as part of its 2012 reauthorization act, FAA is prohibited from developing any rule or regulation for model aircraft under a specified set of conditions.[19] However, the 2012 reauthorization act also specifies that nothing in the act's model aircraft provisions shall be construed to limit FAA's authority to take enforcement action against the operator of a model

[17]The 2012 reauthorization act defines the term "model aircraft" to mean an unmanned aircraft that is: (1) capable of sustained flight in the atmosphere, (2) flown within visual line of sight of the person operating the aircraft, and (3) flown for hobby or recreational purposes.

[18]FAA's Advisory Circular 91-57 sets out model aircraft operating standards that encourage voluntary compliance with specified safety standards for model aircraft operators.

[19]This prohibition on FAA model aircraft rules or regulations only applies where the aircraft is: (1) flown strictly for hobby or recreational use, (2) operated in accordance with a community-based set of safety guidelines and within the programming of a nationwide community-based organization, (3) limited to not more than 55 pounds (unless otherwise certified through a design, construction, inspection, flight test, and operational safety program administered by a community-based organization), (4) operated in a manner that does not interfere with and gives way to any manned aircraft, and (5) when flown within 5 miles of an airport, prior notice of the operation is given to the airport operator and the air traffic control tower.



aircraft who endangers the safety of the national airspace system.[20] The Federal Bureau of Investigation report of the arrest and criminal prosecution of a man plotting to use a large remote-controlled model aircraft filled with plastic explosives to attack the Pentagon and U.S. Capitol in September 2011 has highlighted the potential for model aircraft to be used for non-approved or unintended purposes.

The Academy of Model Aeronautics, which promotes the development of model aviation as a recognized sport and represents a membership of over 150,000, published several documents to guide model aircraft users on safety, model aircraft size and speed, and use. For example, the Academy's National Model Aircraft Safety Code specifies that model aircraft will not be flown in a careless or reckless manner and will not carry pyrotechnic devices that explode or burn, or any device that propels a projectile or drops any object that creates a hazard to persons or property (with some exceptions).[21] The Academy of Model Aeronautics also provides guidance on "sense and avoid" to its members, such as a ceiling of 400 feet above ground of aircraft weighing 55 pounds or less. However, apart from FAA's voluntary safety standards for model aircraft operators, FAA has no regulations relating to model aircraft. Currently, FAA does not require a license for any model aircraft operators, but according to FAA, the small UAS Notice of Proposed Rule Making, under development and expected to be published late 2012, may contain a provision that requires certain model aircraft to be registered.

- *GPS jamming and spoofing.*[22] The jamming and spoofing of the communication signal between the UAS and ground control station could also interrupt the command and control of UAS operations. In a GPS jamming scenario, the UAS could potentially lose its ability to determine where it is located and in what direction it is traveling. Low

[20]Pub. L. No. 112-95, § 336, 126 Stat. 11 . 77 (2012).

[21]The Academy of Model Aeronautics National Model Aircraft Safety Code allows members to fly devices that burn producing smoke and are securely attached to the model aircraft and use rocket motors if they remain attached to the model during flight. Model rockets may be flown but not launched from a model aircraft.

[22]GPS spoofing is when counterfeit GPS signals are generated for the purpose of manipulating a target receiver's reported position and time. Todd E. Humphreys, *Detection Strategy for Cryptographic GNSS Anti-Spoofing*, IEEE Transactions on Aerospace and Electronics Systems (August 2011).

cost devices that jam GPS signals are prevalent. According to one industry expert, GPS jamming would become a larger problem if GPS is the only method for navigating a UAS. This problem can be mitigated by having a second or redundant navigation system onboard the UAS that is not reliant on GPS. In addition, a number of federal UAS stakeholders we interviewed stated that GPS jamming is not an issue for the larger, military-type UAS, as they have an encrypted communications link on the aircraft. A stakeholder noted that GPS jamming can be mitigated for small UAS by encrypting its communications, but the costs associated with encryption may make it infeasible. Recently, researchers at the University of Texas demonstrated that the GPS signal controlling a small UAS could be spoofed using a portable software radio. The research team found that it was straightforward to mount an intermediate-level spoofing attack but difficult and expensive to mount a more sophisticated attack.[23]

The emerging issues we identified not only may exist as part of efforts to safely and routinely integrate UAS into the national airspace, but may also persist once integration has occurred. Thus, these issues may warrant further examination both presently and in the future.

Chairman McCaul, Ranking Member Keating, and Members of the Subcommittee, this concludes my prepared statement. We plan to report more fully this fall on these same issues, including the status of efforts to address obstacles to the safe and routine integration of UAS into the national airspace. I would be pleased to answer any questions at this time.

[23]The presentation "Assessing the Civil GPS Spoofing Threat" by Todd Humphreys, Jahshan Bhatti, Brent Ledvina, Mark Psiaki, Brady O'Hanlon, Paul Kintner, and Paul Montgomery sought to assess the spoofing threat of a small civil UAS. The team built a civilian GPS spoofer and tested some countermeasures. They concluded that GPS spoofing is a threat to communications security and civil spoofing has not been the focus of research in open literature.

GAO Contact and Staff Acknowledgements

GAO's Mission

The Government Accountability Office, the audit, evaluation, and investigative arm of Congress, exists to support Congress in meeting its constitutional responsibilities and to help improve the performance and accountability of the federal government for the American people. GAO examines the use of public funds; evaluates federal programs and policies; and provides analyses, recommendations, and other assistance to help Congress make informed oversight, policy, and funding decisions. GAO's commitment to good government is reflected in its core values of accountability, integrity, and reliability.

Obtaining Copies of GAO Reports and Testimony

The fastest and easiest way to obtain copies of GAO documents at no cost is through GAO's website (www.gao.gov). Each weekday afternoon, GAO posts on its website newly released reports, testimony, and correspondence. To have GAO e-mail you a list of newly posted products, go to www.gao.gov and select "E-mail Updates."

Order by Phone

The price of each GAO publication reflects GAO's actual cost of production and distribution and depends on the number of pages in the publication and whether the publication is printed in color or black and white. Pricing and ordering information is posted on GAO's website, http://www.gao.gov/ordering.htm.

Place orders by calling (202) 512-6000, toll free (866) 801-7077, or TDD (202) 512-2537.

Orders may be paid for using American Express, Discover Card, MasterCard, Visa, check, or money order. Call for additional information.

Academy of Model Aeronautics National Model Aircraft Safety Code

Effective January 1, 2011

A. **GENERAL**: A model aircraft is a non-human-carrying aircraft capable of sustained flight in the atmosphere. It may not exceed limitations of this code and is intended exclusively for sport, recreation and/or competition. All model flights must be conducted in accordance with this safety code and any additional rules specific to the flying site.

1. Model aircraft will not be flown:
   (a) In a careless or reckless manner.
   (b) At a location where model aircraft activities are prohibited.
2. Model aircraft pilots will:
   (a) Yield the right of way to all man carrying aircraft.
   (b) See and avoid all aircraft and a spotter must be used when appropriate. (AMA Document #540-D-See and Avoid Guidance.)
   (c) Not fly higher than approximately 400 feet above ground level within three (3) miles of an airport, without notifying the airport operator.
   (d) Not interfere with operations and traffic patterns at any airport, heliport or seaplane base except where there is a mixed use agreement.
   (e) Not exceed a takeoff weight, including fuel, of 55 pounds unless in compliance with the AMA Large Model Aircraft program. (AMA Document 520-A)
   (f) Ensure the aircraft is identified with the name and address or AMA number of the owner on the inside or affixed to the outside of the model aircraft. (This does not apply to model aircraft flown indoors).
   (g) Not operate aircraft with metal-blade propellers or with gaseous boosts except for helicopters operated under the provisions of AMA Document #555.
   (h) Not operate model aircraft while under the influence of alcohol or while using any drug which could adversely affect the pilot's ability to safely control the model.
   (i) Not operate model aircraft carrying pyrotechnic devices which explode or burn, or any device which propels a projectile or drops any object that creates a hazard to persons or property.
   Exceptions:
   - Free Flight fuses or devices that burn producing smoke and are securely attached to the model aircraft during flight.
   - Rocket motors (using solid propellant) up to a G-series size may be used provided they remain attached to the model during flight. Model rockets may be flown in accordance with the National Model Rocketry Safety Code but may not be launched from model aircraft.
   - Officially designated AMA Air Show Teams (AST) are authorized to use devices and practices as defined within the Team AMA Program Document (AMA Document #718).

   (j) Not operate a turbine-powered aircraft, unless in compliance with the AMA turbine regulations. (AMA Document #510-A).
3. Model aircraft will not be flown in AMA sanctioned events, air shows or model demonstrations unless:
   (a) The aircraft, control system and pilot skills have successfully demonstrated all maneuvers intended or anticipated prior to the specific event.
   (b) An inexperienced pilot is assisted by an experienced pilot.
4. When and where required by rule, helmets must be properly worn and fastened. They must be OSHA, DOT, ANSI, SNELL or NOCSAE approved or comply with comparable standards.

B. ***RADIO CONTROL (RC)***

1. All pilots shall avoid flying directly over unprotected people, vessels, vehicles or structures and shall avoid endangerment of life and property of others.
2. A successful radio equipment ground-range check in accordance with manufacturer's recommendations will be completed before the first flight of a new or repaired model aircraft.
3. At all flying sites a safety line(s) must be established in front of which all flying takes place (AMA Document #706-Recommended Field Layout):
   (a) Only personnel associated with flying the model aircraft are allowed at or in front of the safety line.
   (b) At air shows or demonstrations, a straight safety line must be established.
   (c) An area away from the safety line must be maintained for spectators.
   (d) Intentional flying behind the safety line is prohibited.
4. RC model aircraft must use the radio-control frequencies currently allowed by the Federal Communications Commission (FCC). Only individuals properly licensed by the FCC are authorized to operate equipment on Amateur Band frequencies.
5. RC model aircraft will not operate within three (3) miles of any pre-existing flying site without a frequency-management agreement (AMA Documents #922-Testing for RF Interference; #923- Frequency Management Agreement)
6. With the exception of events flown under official AMA Competition Regulations, excluding takeoff and landing, no powered model may be flown outdoors closer than 25 feet to any individual, except for the pilot and the pilot's helper(s) located at the flight line.
7. Under no circumstances may a pilot or other person touch a model aircraft in flight while it is still under power, except to divert it from striking an individual. This does not apply to model aircraft flown indoors.
8. RC night flying requires a lighting system providing the pilot with a clear view of the model's attitude and orientation at all times.
9. The pilot of a RC model aircraft shall:
   (a) Maintain control during the entire flight, maintaining visual contact without enhancement other than by corrective lenses prescribed for the pilot.
   (b) Fly using the assistance of a camera or First-Person View (FPV) only in accordance with the procedures outlined in AMA Document #550.

C. **FREE FLIGHT**

1. Must be at least 100 feet downwind of spectators and automobile parking when the model aircraft is launched.
2. Launch area must be clear of all individuals except mechanics, officials, and other fliers.
3. An effective device will be used to extinguish any fuse on the model aircraft after the fuse has completed its function.

D. **CONTROL LINE**

1. The complete control system (including the safety thong where applicable) must have an inspection and pull test prior to flying.
2. The pull test will be in accordance with the current Competition Regulations for the applicable model aircraft category.
3. Model aircraft not fitting a specific category shall use those pull-test requirements as indicated for Control Line Precision Aerobatics.
4. The flying area must be clear of all utility wires or poles and a model aircraft will not be flown closer than 50 feet to any above-ground electric utility lines.
5. The flying area must be clear of all nonessential participants and spectators before the engine is started.

AC 91-57

DATE June 9, 1981

ADVISORY CIRCULAR

DEPARTMENT OF TRANSPORTATION
Federal Aviation Administration
Washington, D.C.

Subject: MODEL AIRCRAFT OPERATING STANDARDS

1. PURPOSE. This advisory circular outlines, and encourages voluntary compliance with, safety standards for model aircraft operators.

2. BACKGROUND. Modelers, generally, are concerned about safety and do exercise good judgement when flying model aircraft. However, model aircraft can at times pose a hazard to full-scale aircraft in flight and to persons and property on the surface. Compliance with the following standards will help reduce the potential for that hazard and create a good neighbor environment with affected communities and airspace users.

3. OPERATING STANDARDS.

a. Select an operating site that is of sufficient distance from populated areas. The selected site should be away from noise sensitive areas such as parks, schools, hospitals, churches, etc.

b. Do not operate model aircraft in the presence of spectators until the aircraft is successfully flight tested and proven airworthy.

c. Do not fly model aircraft higher than 400 feet above the surface. When flying aircraft within 3 miles of an airport, notify the airport operator, or when an air traffic facility is located at the airport, notify the control tower, or flight service station.

d. Give right of way to, and avoid flying in the proximity of, full-scale aircraft. Use observers to help if possible.

e. Do not hesitate to ask for assistance from any airport traffic control tower or flight service station concerning compliance with these standards.

R. J. VAN VUREN
Director, Air Traffic Service

DEPARTMENT OF TRANSPORTATION

Federal Aviation Administration

14 CFR Part 91

Docket No. FAA-2006-25714

Unmanned Aircraft Operations in the National Airspace System

AGENCY: Federal Aviation Administration (FAA), DOT.

ACTION: Notice of policy; opportunity for feedback.

SUMMARY: This notice clarifies the FAA's current policy concerning operations of unmanned aircraft in the National Airspace System.

FOR FURTHER INFORMATION CONTACT: Kenneth D. Davis, Manager, Unmanned Aircraft Program Office, Aircraft Certification Service, Federal Aviation Administration, 800 Independence Avenue, SW., Washington, DC 20591, (202) 385-4636, email: *kenneth.d.davis@faa.gov.*

Background

Simply stated, an unmanned aircraft is a device that is used, or is intended to be used, for flight in the air with no onboard pilot. These devices may be as simple as a remotely controlled model aircraft used for recreational purposes or as complex as surveillance aircraft flying over hostile areas in warfare. They may be controlled either manually or through an autopilot using a data link to connect the pilot to their aircraft. They may perform a variety of public services: surveillance, collection of air samples to determine levels of pollution, or rescue and recovery missions in crisis situations. They range in size from wingspans of six inches to 246 feet; and can weigh from approximately four ounces to

over 25,600 pounds. The one thing they have in common is that their numbers and uses are growing dramatically. In the United States alone, approximately 50 companies, universities, and government organizations are developing and producing some 155 unmanned aircraft designs. Regulatory standards need to be developed to enable current technology for unmanned aircraft to comply with Title 14 Code of Federal Regulations (CFR).

The Federal Aviation Administration's current policy is based on whether the unmanned aircraft is used as a public aircraft, civil aircraft or as a model aircraft.

Unmanned Aircraft Systems Operating as Public Aircraft

The most common public use of unmanned aircraft today in the United States is by the Department of Defense. U.S. operations in Iraq, Afghanistan and elsewhere have fueled a huge increase in unmanned aircraft demand. In Iraq alone, more than 700 unmanned aircraft are in use for surveillance and weapons delivery.

Other agencies have also found public uses for unmanned aircraft. For example, the Customs and Border Protection uses them to patrol along the US/Mexican border. In the future, unmanned aircraft could be used to provide first responder reports of damage due to weather or other catastrophic causes.

In response to this growing demand for public use unmanned aircraft operations, the FAA developed guidance in a Memorandum titled "Unmanned Aircraft Systems Operations in the U.S. National Airspace System – Interim Operational Approval Guidance" (UAS Policy 05-01). In this document, the FAA set out guidance for public use of unmanned aircraft by defining a process for evaluating applications for Certificate(s) of Waiver or Authorization (COA's) for unmanned aircraft to operate in the National Airspace System. The concern was not only that unmanned aircraft operations might interfere with

commercial and general aviation aircraft operations, but that they could also pose a safety problem for other airborne vehicles, and persons or property on the ground. The FAA guidance supports unmanned aircraft flight activity that can be conducted at an acceptable level of safety. In order to ensure this level of safety, the operator is required to establish the Unmanned Aircraft System's (UAS) airworthiness either from FAA certification, a DOD airworthiness statement, or by other approved means. Applicants also have to demonstrate that a collision with another aircraft or other airspace user is extremely improbable as well as complying with appropriate cloud and terrain clearances as required. Key to the concept are the roles of pilot-in-command (PIC) and observer. The PIC concept is essential to the safe operation of manned aircraft. The FAA's UAS guidance applies this PIC concept to unmanned aircraft and includes minimum qualifications and currency requirements. The PIC is simply the person in control of, and responsible for, the UAS. The role of the observer is to observe the activity of the unmanned aircraft and surrounding airspace, either through line-of-sight on the ground or in the air by means of a chase aircraft. In general, this means the pilot or observer must be, in most cases, within 1 mile laterally and 3,000 feet vertically of the unmanned aircraft. Direct communication between the PIC and the observer must be maintained at all times. Unmanned aircraft flight above 18,000 feet must be conducted under Instrument Flight Rules, on an IFR flight plan, must obtain ATC clearance, be equipped with at least a Mode C transponder (preferably Mode S), operating navigation lights and / or collision avoidance lights and maintain communication between the PIC and Air Traffic Control (ATC). Unmanned aircraft flights below 18,000 feet have similar requirements, except that if operators choose to operate on other than an IFR flight plan, they may be required to pre-coordinate with ATC.

The FAA has issued more than 50 COA's over the past 2 years and anticipates issuing a record number of COA's this year.

For more information, Memorandum on UAS Policy (05-01) and other policy guidance is available at the FAA Website: *http://www.faa.gov/uas.*

Unmanned Aircraft Systems Operating as Civil Aircraft

Just as unmanned aircraft have a variety of uses in the public sector, their application in commercial or civil use is equally diverse. This is a quickly growing and important industry. Under FAA policy, operators who wish to fly an unmanned aircraft for civil use must obtain an FAA airworthiness certificate the same as any other type aircraft. The FAA is currently only issuing special airworthiness certificates in the experimental category. Experimental certificates are issued with accompanying operational limitations (14 CFR § 91.319) that are appropriate to the applicant's operation. The FAA has issued five experimental certificates for unmanned aircraft systems for the purposes of research and development, marketing surveys, or crew training. UAS issued experimental certificates may not be used for compensation or hire.

The applicable regulations for an experimental certificate are found in 14 CFR §§21.191, 21.193, and 21.195. In general, the applicant must state the intended use for the UAS and provide sufficient information to satisfy the FAA that the aircraft can be operated safely. The time or number of flights must be specified along with a description of the areas over which the aircraft would operate. The application must also include drawings or detailed photographs of the aircraft. An on-site review of the system and demonstration of the area of operation may be required. Additional information on how to apply for an

experimental airworthiness certificate is available from Richard Posey, AIR-200, (202) 267-9538; email: *richard.posey@faa.gov.*

Recreational/Sport Use of Model Airplanes

In 1981, in recognition of the safety issues raised by the operation of model aircraft, the FAA published Advisory Circular (AC) 91-57, Model Aircraft Operating Standards for the purpose of providing guidance to persons interested in flying model aircraft as a hobby or for recreational use. This guidance encourages good judgment on the part of operators so that persons on the ground or other aircraft in flight will not be endangered. The AC contains among other things, guidance for site selection. Users are advised to avoid noise sensitive areas such as parks, schools, hospitals, and churches. Hobbyists are advised not to fly in the vicinity of spectators until they are confident that the model aircraft has been flight tested and proven airworthy. Model aircraft should be flown below 400 feet above the surface to avoid other aircraft in flight. The FAA expects that hobbyists will operate these recreational model aircraft within visual line-of-sight. While the AC 91-57 was developed for model aircraft, some operators have used the AC as the basis for commercial flight operations.

Policy Statement

The current FAA policy for UAS operations is that no person may operate a UAS in the National Airspace System without specific authority. For UAS operating as public aircraft the authority is the COA, for UAS operating as civil aircraft the authority is special airworthiness certificates, and for model aircraft the authority is AC 91-57.

The FAA recognizes that people and companies other than modelers might be flying UAS with the mistaken understanding that they are legally operating under the authority of

AC 91-57. AC 91-57 only applies to modelers, and thus specifically excludes its use by persons or companies for business purposes.

The FAA has undertaken a safety review that will examine the feasibility of creating a different category of unmanned "vehicles" that may be defined by the operator's visual line of sight and are also small and slow enough to adequately mitigate hazards to other aircraft and persons on the ground. The end product of this analysis may be a new flight authorization instrument similar to AC 91-57, but focused on operations which do not qualify as sport and recreation, but also may not require a certificate of airworthiness. They will, however, require compliance with applicable FAA regulations and guidance developed for this category.

Feedback regarding current FAA policy for Unmanned Aircraft Systems can be submitted at www.faa.gov/uas. (Scroll down to the bottom of the page and find Contact UAPO. Click into this link.)

Issued in Washington, DC on February 6, 2007

/s/ Nick Sabatini

Nicholas Sabatini
Associate Administrator for Aviation Safety

NOTICE

U.S. DEPARTMENT OF TRANSPORTATION
FEDERAL AVIATION ADMINISTRATION

N 8900.207

National Policy

Effective Date:
1/22/13

Cancellation Date:
1/22/14

SUBJ: Unmanned Aircraft Systems (UAS) Operational Approval

1. Purpose of this Notice. This notice provides policies necessary for reviewing and evaluating the safety and interoperability of proposed Unmanned Aircraft Systems (UAS) flight operations conducted within the United States (U.S.) National Airspace System (NAS) for the Aviation Safety (AVS) Flight Standards Service (AFS), UAS Integration Office (AFS-80), when assessing applications for a Certificate of Waiver or Authorization (COA) or special airworthiness certificate.

2. Audience. This notice applies to AFS divisions at the Federal Aviation Administration (FAA) Washington headquarters (HQ) and regional field offices.

3. Where You Can Find This Notice. You can find this notice on the MyFAA Web site at https://employees.faa.gov/tools_resources/orders_notices/. Inspectors can access this notice through the Flight Standards Information Management System (FSIMS) at http://fsims.avs.faa.gov. Air carriers and operators can find this notice on the FAA's Web site at: http://fsims.faa.gov. This notice is available to proponents and the public at http://www.faa.gov/regulations_policies/orders_notices.

4. Background.

a. UAS Operations. UAS operations have increased dramatically in both the public and private sectors. This proliferation has introduced greater exposure and elevated risk to the safety of operations within the NAS. This growth in UAS operations has increased the number of applications for operational approvals and increased demand on the FAA to process them. For these activities, the development of a notice is required for the FAA to use when evaluating applications for COAs and special airworthiness certificates.

b. Policy. Policy identifies Unmanned Aircraft (UA) as "aircraft" flown by a "pilot" regardless of where the pilot is located. Aircraft and pilots must demonstrate compliance with applicable sections of Title 14 of the Code of Federal Regulations (14 CFR) to operate in the NAS. However, UA are not compliant with certain sections of 14 CFR. For instance, the absence of an onboard pilot means that the "see-and-avoid" provisions of 14 CFR part 91, § 91.113, cannot be satisfied. Without an onboard pilot, there is a significant reliance on the command and control link, and a greater emphasis on the loss of functionality associated with lost link. Furthermore, for air traffic control (ATC) operations requiring visual means of maintaining

in-flight separation, the lack of an onboard pilot does not permit ATC to issue all of the standard clearances or instructions available under the current edition of FAA Order 7110.65, Air Traffic Control. Consequently, to ensure an equivalent level of safety, UAS flight operations require an alternative method of compliance (AMOC) or risk control to address their "see-and-avoid" impediments to safety of flight, and any problems they may generate for ATC. In the future, permanent and consistent methods of compliance will be needed for UAS operations in the NAS without the need for waivers or exemptions.

5. Consensus Opinion. This notice is subject to continuous review, will be updated when appropriate, is not meant as a substitute for any regulatory process, and was jointly developed by and reflects the consensus opinion of:

- Flight Technologies and Procedures Division (AFS-400);
- UAS Integration Office (AFS-80) and the ATO component of AFS-80; and
- Aircraft Certification Service, Production & Airworthiness Branch (AIR-240).

Note: In general, and as a minimum, proponents must observe all applicable regulations of 14 CFR parts 61 and 91. This notice identifies acceptable AMOC with the regulations when evaluating requests for approval of proposed UAS operations. Refer to the following Web site for a listing of regulations: http://www.faa.gov/regulations_policies/faa_regulations/.

6. Discussion. This notice represents the culmination of input from government agencies, industry, and user stakeholders along with best practices and procedures that have been used by FAA in prior approvals for UAS applications for COAs or special airworthiness certificates. The material presented in this notice represents the process and procedures necessary for approving applications for UAS flight operations. However, because of the uniqueness of various UAS flight operations, each application must be evaluated on its own technical merits, including operational risk management (RM) planning. Each application may require unique authorizations or limitations directly related to the specific needs or capabilities of the UAS and/or the proposed specific mission and operating location.

7. Applicability and Approval Process Criteria. The applicability and process to be used in UAS operational approval are dependent on whether the proposed UAS operation within the territorial airspace of the United States (the airspace above the contiguous United States, Alaska, Hawaii, U.S. territories, and U.S. territorial waters) is defined as public or civil (see 14 CFR part 1, § 1.1 and Public Law 110-181, "The National Defense Authorization Act of 2008"). UAS operations outside the territorial airspace of the U.S. will be classified as either state or civil operations in accordance with international law. A public operation is one that is intrinsically governmental in nature (i.e., Federal, State, and local agencies). Proponents requesting approval of public aircraft operations by UAS will use the COA application process. In contrast, proponents for civil operations approval will use the special airworthiness certificate process. Part 91, § 91.319(a)(2) specifically prohibits operation of an aircraft that has an experimental certificate from "carrying persons or property for compensation or hire."

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

a. Coordination and Approval. Regardless of the process for the authorization approval, COA applications for UAS flight operation approvals will be coordinated through the ATO component of AFS-80 and AVS. Special airworthiness certificates will be coordinated through the Aircraft Certification (AIR-240) staff as well as the ATO and AFS component of AFS-80 for final approval and disposition.

b. Applicability and Methods of Authorization. Operational policy in this notice applies to both public and civil operations and certain state aircraft operations.

(1) Applicability. These procedures are applicable for all operations in the contiguous United States, Alaska, Hawaii, U.S. territories, and international airspace in the Flight Information Regions (FIR) delegated to the United States where the FAA is the Air Traffic Service (ATS) provider. These procedures do not apply to the territorial airspace of another sovereign country that lies within FIRs delegated to the United States where the FAA is the ATS provider, except by agreement with that country, or airspace in FIRs delegated to other countries. All UAS proponents, operators, and pilots must observe all applicable regulations of 14 CFR.

(a) In general, specific authorization to conduct UAS operations in the NAS outside of active Restricted and Warning Areas designated for aviation use, or approved Prohibited Areas, must be requested by the proponent. Airspace inside buildings or structures is not considered to be part of the NAS and is not regulated. (Refer to the current edition of Order JO 7400.8, Air Traffic Organization Policy.)

(b) This notice and the processes prescribed do not apply to hobbyists and amateur model aircraft users when operating unmanned systems for sport and recreation. Those individuals should seek policy under the current edition of Advisory Circular (AC) 91-57, Model Aircraft Operating Standards. AC 91-57 is not to be used as a basis of approval for operation of any other aircraft, including by Federal, State, and local governments, commercial entities, or law enforcement.

(c) This notice and the processes prescribed also do not apply to UAS operations in FAA-controlled international airspace by an agency of, or a contractor to, the Federal government when those operations are appropriately designated as State aircraft operations and are operated under "due regard" rules and procedures established by the Federal agency responsible for the operation. The designation of flight operations as State aircraft operations normally are made in coordination with the U.S. Department of State. This notice and the processes prescribed do, however, apply where the responsible Federal agency either has not established a formal set of rules and procedures for "due regard" operations, or is not operating the UAS under "due regard" rules and procedures in FAA-controlled international airspace. This notice and the processes prescribed also apply to all UAS operations by an agency of, or a contractor to, the Federal government that transit through U.S. territorial airspace en route to or from international airspace. See Appendix F, UAS COA Requirement. The "due regard" option is not available for state aircraft operations transiting through U.S. territorial airspace en route to or from international airspace.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

(d) Oceanic Operations Within Warning Areas. UAS operations contained within Warning Areas are handled in the same manner as those operations conducted in active Restricted and approved Prohibited areas; that is, neither specific FAA approval nor observers or chase aircraft are required by the FAA.

(e) The only public aircraft that can fly under "due regard" are U.S. government aircraft designated as State aircraft.

(2) Methods. The two methods of approval are the issuance of either a COA for public aircraft operations or a special airworthiness certificate for civil operations. In the case of public aircraft operations, the operating entity applying to conduct the UAS operation must comply with its own processes, policies, and standards in the following areas, in addition to complying with all applicable safety provisions in all other parts of 14 CFR:

- Pilot certification,
- Crew certification,
- Recent pilot experience (or, currency),
- Medical certificates, and
- Airworthiness of public UAS.

Note: If no established public entity processes, policies, or standards exist, it is highly recommended that the public agency/department apply the specifics outlined in this notice and comply with the provisions of 14 CFR applicable to civil UAS operations.

8. COA for Public Operations.

a. Applications. Applications for a COA are only accepted from entities that intend to conduct public aircraft operations. An application may be referred to the FAA Office of the Chief Counsel (AGC-200) for determination of the status of a proponent as a government entity under the public aircraft statute. The duration of COAs complies with the time limitations specified under the current edition of FAA Order 7210.3, Facility Operation and Administration. COAs may be issued for a lesser duration if requested or deemed appropriate. COAs are not required for operations conducted within active Restricted or Warning Area airspace designated for aviation use, or approved Prohibited Areas with permission from the appropriate authority or using agency of that airspace. (Refer to the current edition of Order JO 7400.8, Special Use Airspace.)

b. Approving and Reviewing Authority. AFS-80 is responsible for determining whether the proponents' proposed UAS operations can be conducted safely and responsibly in the NAS, and that they comply with all COA limitations and provisions.

(1) In accordance with FAA Order 7210.3, "As a general rule, a waiver or authorization should be canceled when it is no longer required or there is an abuse of its provisions or unforeseen safety factors develop. Failure to comply with the waiver or authorization is cause for cancellation."

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

(2) The FAA has the authority to suspend or cancel the COA, or to delay any activities if there is a violation of the terms in the COA, or if the safety of persons or property on the ground or in the air is determined to be in jeopardy. That may include, but is not limited to:

- Incidents or accidents occurring during UAS operations in the NAS;
- Habitual noncompliance with administrative requirements, such as failure to provide the FAA with monthly reports on the number of flights, pilot duty time, or unusual equipment malfunctions (e.g., a malfunction or failure of ground control station (GCS) flight control hardware or software (other than loss of control link); a power plant failure or malfunction; a deviation from any provision contained in the COA);
- Deviations from ATC instructions, operational, or coordination issues; and
- Events of intermittent or persistent lost-link as described in the COA or events determined to pose as a risk to the safety of the NAS.

(3) COA suspensions and cancellations are not automatic. Whenever possible, a documented conversation, between the FAA and the proponent, will happen before the suspension/cancellation is issued. Timely and transparent responses to accidents, deviations, and similar safety-related events are expected.

c. Accident and Incident Notification and Investigation. The current edition of FAA Order 8020.11C, Aircraft Accident and Incident Notification, Investigation, and Reporting, and Title 49 of the Code of Federal Regulations (49 CFR) part 830, outlines reporting procedures for accidents and incidents involving civil aircraft and certain public aircraft. All accidents and incidents involving fatalities, injuries, property damage, and fly-away by civil aircraft and those public aircraft subject to part 830 require FAA notification within 24 hours. No additional flights by those aircraft under this COA are allowed before notification. An immediate investigation is required, and when requested to do so, UAS proponents are expected to provide copies of written aircraft accident/incident reports to AFS-80 for review. In accordance with 49 CFR part 1520, § 1520.5, reports will not be released outside of government channels without originator permission.

d. General COA Process. The ATO component of AFS-80 is responsible for the COA process. Applications can be made two ways:

(1) On the Internet using the UAS COA Online System at https://ioeaaa.faa.gov. The UAS COA Online System requires a user name and password; a support desk phone number and e-mail address is provided to assist with obtaining an account.

(2) Using FAA Form 7711-2, Application for Certificate of Waiver or Authorization, available online at http://www.faa.gov/documentLibrary/media/form/faa7711-2.pdf. The completed form can be mailed to: FAA Headquarters, Unmanned Aircraft Systems Integration Office, 490 L'Enfant Plaza SW, Suite 3200, Washington, DC 20024. Mail submittal may encounter significant delay due to current U.S. Postal Service security screening procedures in place.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

e. Operational Review. Prior to issuance of a COA, air traffic specialist components of AFS-80 conduct an operational validation that addresses ATC processes. Next, an aviation safety inspector (ASI) evaluates each application to determine if risks to the NAS associated with the operation have been acceptably mitigated. Both the ASI and ATC requirements are merged into the final COA.

f. Safety Risk Management (SRM) Process. ASIs and other FAA personnel use SRM principles outlined in the current edition of AC 120-92, Safety Management Systems for Aviation Service Providers, to maintain or improve the safety of the NAS by identifying safety risks, hazards, and mitigations associated with proposed UAS operations. When deemed appropriate, Safety Risk Management Documents (SRMD) are created through SRM reviews of specific operations or of risks associated with UAS operations in various classes of airspace. SRM reviews may result in the incorporation of additional mitigations or controls into all or some COAs.

g. National Security Considerations. When appropriate levels of Department of Defense (DOD) or Department of Homeland Security (DHS) declare a UAS operation to be a matter of national security, the FAA may approve an application for a COA which, under normal circumstances, might not otherwise conform to the guidelines set forth in this notice. In this case, national security may override risk mitigation requirements. Such requests to the FAA Administrator will originate from an equivalent level of authority from the proponent's parent organization.

h. Special COA.

(1) National Disaster COA. Due to the unpredictability of national disasters, a National Disaster COA is issued in two parts. In part 1 of the COA, AFS-80 completes an evaluation, excluding the location of the disaster. All known information is inserted into a template and signed by appropriate FAA authority. Once the specific location is identified, this information, along with the specific operation, is inserted into part 2 of the COA in the form of an attachment. Part 2 of the COA must then be signed by appropriate FAA authority, which completes and establishes a valid COA.

(2) Emergency COA. An emergency UAS COA may be considered when all of the following conditions apply:

(a) A situation exists that is defined as a condition of distress or urgency, where there is, or that has, the extreme possibility of loss of life, and

(b) The proponent has determined that manned flight operations cannot be conducted efficiently, and

(c) The proposed UAS is operating under a current approved COA for a different purpose or location.

Note: Requests for UAS COAs that fall outside of these parameters will be processed through the normal online COA application process. Emergency UAS COAs will not be considered for:

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

- Demonstration flights,
- Flights to test capabilities,
- Training,
- Flights in Class B Airspace, or
- Flights over populated areas, unless a suitable mitigation strategy is proposed and found to be acceptable.

9. Special Airworthiness Certificate for Civil UAS Applicants.

a. Airworthiness Determination. Civil applicants may apply for a special airworthiness certificate from the FAA. The proponent is required to submit the requisite data to support a determination that the aircraft and its systems, including the control station (CS), are designed, built, and maintained in a safe and airworthy condition.

b. Special Airworthiness Certificate Issuance. Special airworthiness certificates are typically issued to proponents wishing to conduct UAS research and development (R&D), crew training, and market surveys under 14 CFR part 21, § 21.191. Special airworthiness certificates are issued in accordance with FAA Order 8130.34, Airworthiness Certification of Unmanned Aircraft Systems and Optionally Piloted Aircraft, current edition. Refer to Order 8130.34 for in-depth information on special airworthiness certificates.

c. Proponents with both a COA and Special Airworthiness Certification. In cases where a proponent has been issued a special airworthiness certificate, and is concurrently eligible to operate a corresponding UAS on a COA as a public aircraft operation, the proponent must elect, prior to each flight, which authority is to be used to conduct the flight. The use of both a special airworthiness certificate and a COA on a single flight is not permitted.

d. General Process for Civil UAS Operations. For civil UAS operations, the Aircraft Certification Service, Production and Airworthiness Division (AIR-200) at FAA HQ, is responsible for the issuance of special airworthiness certificates according to FAA Order 8130.34. The issuance of a special airworthiness certificate is coordinated with AIR-200, AFS-80 and the ATO component of AFS-80, and AVS at the HQ and regional levels. A thorough review is conducted by the FAA to evaluate the system's airworthiness and operational specifications. In addition, the FAA reviews and accepts mitigations developed by the proponent to meet acceptable standards of safety.

10. UAS Airworthiness. All UAS must be in an airworthy condition to conduct flight operations in the NAS. An "airworthy condition for UAS subject to a COA" means that the UAS meets the applicable standards and requirements of its operating agency and is capable of operating in compliance with the applicable requirements in 14 CFR part 91. The FAA recognizes that some of the requirements can differ from those for manned aircraft and appropriate changes can be defined. As with airworthiness standards, maintenance technician requirements will be addressed as part of the review process.

a. Public Aircraft Proponents. The proponent must provide an airworthiness statement specifying compliance with the proponent's applicable airworthiness criteria. Airworthiness statements must be provided on agency letterhead and include:

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

- The date the statement is effective,
- A signature of the responsible certifying authority within the agency,
- A point of contact (POC), and
- Any warnings/limitations.

(1) Airworthiness statements are generally written for one UAS. If more than one UAS model is included on a single airworthiness statement, each UAS will be listed and specific information for each UAS will be included in the statement. Airworthiness statements with an expiration date must remain current for the duration of the COA including extensions. If a new airworthiness statement is issued during the period the COA is active, a copy of the airworthiness certificate must be provided to AFS-80.

(2) Examples of acceptable policy/criteria include, but are not limited to:

- Department of Defense (DOD) Handbook, MIL-HDBK 516B, Airworthiness Certification Criteria;
- Air Force Policy Directive (AFPD) 62-6, USAF Aircraft Airworthiness Certification;
- Army Regulations (AR) 70-62, Airworthiness Qualification of Aircraft Systems; or
- Naval Air Systems Command Instruction, NAVAIRINST 13034.1 series, Flight Clearance Policy for Air Vehicles and Aircraft Systems.

b. Civil Aircraft Proponents. Approvals for civil applications using the special airworthiness certificate process receive their airworthiness certification from the FAA.

c. Continued Airworthiness.

(1) Public Aircraft. Proponents for UAS used in public aircraft operations should follow their own agency's procedures and guidelines to maintain continued airworthiness at a level which ensures they continue to operate the aircraft safely.

(2) Civil Aircraft. Proponents for civil UAS operational approvals must address continued airworthiness procedures as part of their application. Civil UAS should be maintained and must conform to the same airworthiness standards defined in 14 CFR parts under which UAS are intended to be operated. It is highly recommended that all proponents provide the following information:

- A Continuing Airworthiness Program,
- A maintenance training program,
- Any unique skill sets or maintenance practices relating to their aircraft and/or aircraft operations that may be outside the current scope and practices of manned aviation, and
- A process to report any applicable data relating to the operation and maintenance of the UAS.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

d. Database and Recordkeeping. All information received from UAS proponents aids the FAA in establishing a database for the existing UAS types and operations. This data is critical to our development of future certification criteria for both systems and pilots. It expedites the regulatory process for UAS and allows the FAA to have historical data from which to base current and future UAS policy. Accurate recordkeeping is essential in assuring positive operational and quality airworthiness control. In accordance with 49 CFR § 1520.5, reports will not be released outside of government channels without originator permission.

11. Flight Operations of a UAS.

a. Applicability and Requirements. This notice applies to UAS operations conducted in the NAS other than in active Restricted and Warning Areas designated for aviation use or approved Prohibited Areas. The FAA requires aircraft to operate safely among all users of the NAS, including non-cooperative aircraft (e.g., aircraft operated without a transponder), and other airborne operations not reliably identifiable by ATC radar (e.g., balloons, gliders, parachutists). Unless otherwise specifically authorized, UAS operators must use observers, either airborne or ground-based, to comply with 14 CFR part 91 requirements.

b. Risk Mitigation. While considerable work is ongoing to develop a certifiable detect, sense, and avoid system as an AMOC with the see-and-avoid aspect of §§ 91.113 and 91.115, no current solution exists. As a result, compliance with the see-and-avoid requirement and navigational awareness are primary concerns in UAS operational approvals leading to imposition of AMOC. Risk mitigation for these two issues is normally based on the use of observers or other methods of maintaining flight separation and collision avoidance or 'segregation'; however, they may also include other concepts or systems that a proponent may propose for FAA review. The FAA only approves UAS flight operations that can be conducted at an acceptable level of safety. Refer to the current editions of AC 120-92 and FAA Order 8000.369, Safety Management System Guidance.

> **Note:** Risk mitigations that depend on the establishment of new types and categories of airspace are extremely difficult and time-consuming. The NAS is established and configured through a rigorous regulatory process. Risk mitigations that result in the prohibition of the public's right to transit airspace will require a very long lead time with no guarantee that they will be approved.

(1) Proponents proposing see-and-avoid strategies in lieu of visual observers (VOs) are required to support proposed mitigations with system safety cases which indicate the operations can be conducted safely. Acceptable system safety cases must include a hazard analysis, risk assessment, and other appropriate documentation that identifies the level of risk.

(2) It is the proponent's responsibility to demonstrate that the risk of injury to persons or property along the flightpath is appropriately mitigated. Aircraft with performance characteristics that impede, delay, or divert other normal air traffic operations may be restricted in their operations.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

12. System Considerations for UAS.

a. Traffic Alert and Collision Avoidance Systems (TCAS). The use of TCAS by UAS has not been validated as an acceptable alternative for see-and-avoid requirements, and is not an approved means of mitigation for UAS see-and-avoid requirements or strategies.

b. Onboard Cameras/Sensors. Although onboard cameras and sensors positioned to observe targets on the ground have demonstrated some capability, their use in detecting airborne operations for the purpose of segregation is still quite limited. To date, these types of systems have not been approved as a sole mitigation in the see-and-avoid risk assessment.

c. Use of Equipment in Lieu of VOs.

(1) Any equipment proposed for use on UAS to accomplish the function of see-and-avoid in lieu of VOs must:

- Be certified as an aircraft system and equipment using standards, requirements, and processes commensurate with installation of equipment in aircraft by a recognized airworthiness authority, and
- Meet the requirements of 14 CFR part 25, § 25.1309, or equivalent process, for any UAS installation, regardless of its size, performance, or maximum takeoff weight.

Note: For other equipment that is not proposed for use in meeting see-and-avoid requirements, § 23.1309, or equivalent process, should be used.

(2) It is the responsibility of the proponent to show that the contemplated standards, requirements, and processes meet an equivalent level of safety.

d. Radar and Other Sensors. If special types of radar systems or other sensors are utilized to mitigate risk, the proponent must provide supporting data which demonstrates the following can be accomplished safely:

- Both cooperative and non-cooperative traffic can be detected and tracked to ensure appropriate separation and collision avoidance,
- The proposed system can effectively mitigate a potential collision,
- Operators are suitably trained and equipped to use them effectively, and
- Procedures are in place for the pilot in command (PIC) to effectively use the data.

e. Lost Link Procedures. There are many acceptable approaches to satisfy lost link requirements. The intent of any lost link procedure is to ensure airborne operations remain predictable. Proponents will comply with the UAS lost link procedures as specified in the COA.

Note: Lost link is not considered fly-away. Refer to definitions in Appendix A.

(1) Unless otherwise authorized, lost link solutions must comply with the last ATC clearance (if ATC clearance is required), for a period of time sufficient for ATC to ensure conflict resolution without loss of required separation.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

(2) Lost link procedures are pre-coordinated by AFS-80 with the appropriate ATC facility and included in the COA. They include, at a minimum, lost link route of flight, transponder use, lost link orbit points, communications procedures, and pre-planned flight termination points (FTP) or other contingency planning measures in the event recovery of the UAS is not feasible.

(3) If lost link occurs within a Restricted Area, Warning Area, or Class A airspace, or lost link procedure takes aircraft into one of these areas, the aircraft will not exit that airspace, unless otherwise authorized, until link is re-established. All exceptions will be submitted as part of the COA application to AFS-80 for review.

(4) Unless otherwise authorized, lost link procedures will conform to the Contingency Planning Limitations in Appendix E and in general, include the following:

- Limiting of UAS operations to operations over water or sparsely populated areas over the ground to transit to another Restricted Area, Warning Area, or to a pre-planned lost link orbit point within visual line-of-sight to re-establish link. (The UAS lost link procedure will not transit over fixed structures on the water.)
- Lost link programmed procedures will avoid unexpected turn-around and/or altitude changes and will provide sufficient time to communicate and coordinate with ATC.
- Lost link orbit points will not be contained within any published holding area, airway, Jet route, T route, or other area navigation (RNAV) published route.

(5) If the link is not re-established within a pre-determined time as defined by the FAA-approved COA, the aircraft may:

- Autoland; however, the aircraft will not exit the Restricted Area or Warning Area in accordance with subparagraph 12.e.(3) above,
- Proceed to another lost link point (LLP) in an attempt to regain communication link, or
- Proceed to an FTP or the location specified in other contingency planning measures for flight termination.

Note: LLPs may be used as FTPs. In this case, the aircraft may loiter at the LLP/FTP until link is re-established or fuel exhaustion occurs.

- UAS without auto-land capability will proceed to a pre-planned FTP or other acceptable contingency planning option prior to fuel exhaustion.

(6) Refer to Appendix E for more Contingency Planning Limitations.

f. Flight Termination System (FTS). It is highly desirable that all UAS have system redundancies and independent functionality to ensure the overall safety and predictability of the system. UAS that lack system redundancies may be required to have an independent FTS that can be activated manually by the UAS PIC to safeguard the public.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

g. Spectrum Authorization.

(1) Every UAS proponent must have the appropriate National Telecommunications and Information Administration (NTIA) or Federal Communications Commission (FCC) authorization/approval to transmit on the radio frequencies (RF) used for UAS uplink and downlink of control, telemetry, and payload information.

(2) Non-Federal public agencies, such as universities and State/local law enforcement, and all civil UAS proponents generally require a license from the FCC as authorization to transmit on frequencies other than those in the unlicensed bands (900 megahertz (MHz), 2.4 gigahertz (GHz), and 5.8 GHz). This generally will be in the form of an Experimental Radio License or a Special Temporary Authority (STA) issued by the FCC. Non-Federal public agencies and civil UAS proponents that operate systems using frequencies assigned to the Federal government (e.g., the DOD) must demonstrate they have the proper authorization through FCC-issued documentation.

(3) DOD agencies will typically demonstrate UAS spectrum authorization through an STA issued by NTIA or a frequency assignment in the NTIA-administered Government Master File (GMF). Authorizations issued under Title 47 of the Code of Federal Regulations (47 CFR) part 300, in the NTIA Manual, Chapter 7, paragraph 7.11, Use of Frequencies by Certain Experimental Stations, are not appropriate for UAS operations.

(4) Federal public agencies other than DOD, such as National Aeronautics and Space Administration (NASA), U.S. Coast Guard (USCG), and U.S. Customs and Border Protection (USCBP), also need an STA issued by NTIA or a frequency assignment in the NTIA-administered GMF. This is especially important for systems designed to operate on frequencies assigned to DOD.

13. Operational Requirements for UAS. Unless operating in an active Restricted or Warning Area designated for aviation use, or approved Prohibited Areas, UAS operations must adhere to the following requirements.

a. Observer Requirement. Visual flight rules (VFR) UAS operations may be authorized utilizing either ground-based or airborne VOs onboard a dedicated chase aircraft. A VO must be positioned to assist the PIC, to exercise the see-and-avoid responsibilities required by §§ 91.111, 91.113, and 91.115 by scanning the area around the aircraft for potentially conflicting traffic and assisting the PIC with navigational awareness.

(1) VOs:

(a) Must assist the PIC in not allowing the aircraft to operate beyond the visual line-of-sight limit, and

(b) Must be able to see the aircraft and the surrounding airspace sufficiently to assist the PIC with:

- Determining the UA's proximity to all aviation activities and other hazards (e.g., terrain, weather, structures), and

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

- Exercising effective control of the UA, and
- Complying with §§ 91.111, 91.113, and 91.115, and
- Preventing the UA from creating a collision hazard, and

(c) Must inform the PIC before losing sufficient visual contact with the UA or previously sighted collision hazard. This distance is predicated on the observer's normal vision. Corrective lenses, spectacles, and contact lenses are permitted.

(2) Because of field of view and distortion issues with aids to vision such as binoculars, field glasses, night vision devices, or telephoto lenses, these are allowed only for augmentation of the observer's visual capability; they cannot be used as the primary means of visual contact. When using other aids to vision, VOs must use caution to ensure the aircraft remains within normal visual line-of-sight of the observer. These aids to vision are not to be confused with corrective lenses or contact lenses, which do not alter the field of view or distort vision.

(3) The responsibility of ensuring the safety of flight and adequate visual range coverage to avoid any potential collisions remains with the PIC. The PIC for each UAS operation must identify a location from which the observer will perform his/her duties. This location will be selected to afford the best available view of the entire area within which the operation is to be conducted.

(4) Daisy-chaining of observers to increase operational distance is not normally approved; however, a proponent may provide a safety case for daisy-chaining in accordance with paragraph 16 by demonstrating an acceptable level of risk to the NAS.

(5) Observer(s) must be in place 30 minutes prior to night operations to ensure dark adaptation. Refer to subparagraph 13.i.(2)(b) for night operations information.

b. ATC Communications Requirements.

(1) The UAS pilot must establish and maintain direct two-way radio communication with appropriate ATC facilities anytime:

- The aircraft is being operated in Class A or D airspace (under §§ 91.135 or 91.129) or, when required, in Class E and G airspace (under §§ 91.127 or 91.126). See subparagraph 13.q.(2) and (3) for operations in Class B or C airspace; or
- The aircraft is being operated under instrument flight rules (IFR); or
- It is stipulated under the provisions of any issued COA or Special Airworthiness Certificate.

(2) It is preferred that communications between the UAS pilot and ATC be established through onboard radio equipment to provide a voice relay, however, for IFR flight this method of transmission is required.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

c. Inter-Communications Requirements. Any VO, sensor operator, or other person charged with providing see-and-avoid assistance must have immediate communication with the UAS pilot. If a chase aircraft is being utilized, immediate communication between the chase aircraft and the UAS pilot is required at all times. If the UAS pilot is in communication with ATC, monitoring of the ATC frequency by all UAS crew members (pilots, observers, and chase pilots) is recommended for shared situational and navigational awareness. However, unless it is approved for others to do so, the UAS PIC or the supplemental pilots are the only crewmembers that will communicate with ATC.

d. Electronic Devices. The use of electronic devices (including cell phones) other than for UAS flight- and mission-required usage is governed by § 91.21, which ensures these devices do not interfere with the UAS systems. The use of electronic devices (including cell phones) is not authorized for primary communication with ATC unless authorized under the Special Provisions of the COA.

e. Dropping Objects/Expendable Stores or Hazardous Materials. If the intended UAS operation includes the carriage, dropping, or spraying of aircraft stores outside of active Restricted or Warning Area airspace designated for aviation use, or approved Prohibited Areas, the proponent must ensure that specific approval is listed in the special provisions, the operational risks have been sufficiently mitigated as required by 14 CFR § 91.15, and that the hazardous material requirements in 49 CFR have been met. Acceptable procedures for hung stores and loss of control link while carrying stores must be provided to the FAA. A similar case must be made for hazardous materials carried aboard the aircraft and, if approved, will be listed in the special provision section of the COA.

f. Flight Over Populated Areas. Routine UAS operations are prohibited over urban or populated areas, except where the level of airworthiness allows. UAS operations may be approved in emergency or national disaster relief situations if the proposed mitigation strategies are found to be acceptable. See Appendix A for definition of populated or urban area.

g. Air Shows. A proponent is required to provide a safety case in accordance with paragraph 16 that demonstrates an acceptable level of risk and must receive a separate Air Show Waiver in accordance with FAA Order 8900.1, Flight Standards Information Management System (FSIMS).

h. Flight Over Heavily Trafficked Roads or Open-Air Assembly of People. UAS operations must avoid these areas, except where level of airworthiness allows. If flight in these areas is required, the proponent is required to support proposed mitigations with system safety cases that indicate the operations can be conducted safely. Acceptable system safety cases must include information located in paragraph 16. Additionally, it is the proponent's responsibility to demonstrate that risk of injury to persons or property along the flightpath has been mitigated. UAS with performance characteristics that impede, delay, or divert other air traffic operations may be restricted in their operations. Refer to AC 120-92 and FAA Order 8000.369, current editions.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

i. Day/Night Operations.

(1) Day Operations. UAS operations outside of Class A airspace, active Restricted or Warning Areas designated for aviation use, or approved Prohibited Areas will be conducted during daylight hours unless otherwise authorized.

(2) Night Operations.

(a) Night operations may be considered if the proponent provides a safety case and sufficient mitigation to avoid collision hazards at night.

(b) UAS night operations are those operations that occur between the end of evening civil twilight and the beginning of morning civil twilight, as published in the American Air Almanac, converted to local time. (Note: this is equal to approximately 30 minutes after sunset until 30 minutes before sunrise, except in Alaska.) External pilots and observers must be in place 30 minutes prior to night operations to ensure dark adaptation.

j. Flights Below Class A Airspace. All UAS operations outside of active Restricted/ Warning/Sensitive Security Information (SSI) airspace designated for aviation use, or approved Prohibited Areas must be conducted in visual meteorological conditions (VMC) if using ground or airborne VOs. In addition, the following weather requirements apply:

- If on IFR flight, remain clear of clouds. This requirement does not relieve the PIC from following the ATC clearance. According to § 91.3, the PIC retains responsibility for, and is the final authority as to the operation of that aircraft.
- If on VFR flight, maintain § 91.155 VFR cloud clearances, except in Class G airspace, where Class E airspace visibility requirements must be applied, but not less than 3 statute miles (SM) in-flight visibility.
- Special VFR is not permitted.
- For chase aircraft, 5 SM in-flight visibility.

k. Autonomous Operations. Although it is possible to have a completely manual (direct pilot intervention) UAS, the majority of UAS are autonomous to a certain degree. Only those UAS which have the capability of direct pilot intervention will be allowed in the NAS outside of active Restricted or Warning Areas designated for aviation use, or approved Prohibited Areas. Because the pilot may be technically considered out-of-the-loop in a lost link scenario, this restriction does not apply to UAS operating under lost link.

l. Operations from Off-Airport Locations. In most cases, an off-airport location should be situated no closer than 5 nautical miles (NM) from any airport or heliport. The operational areas, including the launch and recovery zones, should be free from obstructions; reasonable efforts should be made to keep operations away from structures.

m. Crew Resource Management (CRM). Proponents must train all UAS crewmembers in CRM. The current edition of FAA AC 120-51, Crew Resource Management Training, or an FAA-recognized equivalent applies to UAS operations. Proponents must implement the recommended training and procedures included in AC 120-51, or in an FAA-recognized

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

equivalent. The PIC of a UAS must ensure no activities other than those duties required for safe flight operation are performed. No UAS crewmember may engage in any activities unrelated to those required for safe operation of the UAS during critical phases of flight such as launch/takeoff and landing/recovery.

n. Sterile Cockpit. Proponents must comply with the current edition of AC 120-71, Standard Operating Procedures for Flight Deck Crewmembers, or the FAA-recognized equivalent, for ensuring the PIC implements sterile cockpit procedures. During critical phases of flight, including all ground operations involving taxi (movement of an airplane under its own power on the surface of an airport), takeoff and landing, and all other flight operations in which safety or mission accomplishment might be compromised by distractions, no crewmember may perform any duties not required for the safe operation of the aircraft. No crewmember may engage in, nor may any PIC permit, any activity during a critical phase of flight which could distract any crewmember from the performance of his/her duties or interfere in any way with the proper conduct of those duties.

o. Operating Under IFR. While operating on an instrument flight plan, the following must exist, be completed, or be complied with:

(1) The PIC must hold a current instrument rating or an FAA-recognized equivalent.

(2) The aircraft's airworthiness signature statement for flight release (not airworthiness document) must include IFR flight and indicate that all equipment required for IFR operations is certified and working (including pitot-static and transponder checks).

(3) Applicable navigation database and charts are current and available to the UAS pilot.

(4) An IFR flight plan is filed.

(5) An ATC clearance has been obtained and all clearances must be followed.

(6) Direct two-way radio communication between the UAS pilot and ATC is established and maintained. (A communication relay through the aircraft may be required.)

(7) Alternate communication capabilities with ATC for the purpose of lost link and/or lost communication are designated and operational during all phases of flight.

(8) The UAS is equipped with a certified operating mode C (mode S preferred) transponder.

(9) ATC radar services are obtained throughout the portion of the flight in Class A airspace whenever possible (overwater non-radar operations may be allowed in the special provisions section).

(10) All operations outside of Class A airspace and active Restricted, Prohibited, Warning Areas, or SSI airspace designated for aviation use, must remain clear of clouds. If operating under IFR, to comply with this provision, the PIC must have an ATC clearance to deviate.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

According to § 91.3, the PIC retains responsibility for, and is the final authority as to, the operation of that aircraft.

(11) VOs are not required in Class A airspace unless stipulated in the COA.

p. Chase Aircraft Operations. The chase aircraft:

(1) Must remain at a safe distance from UA to ensure collision avoidance if a malfunction occurs, and

(2) Must remain close enough to the UA to provide visual detection of any conflicting aircraft and advise the PIC of the situation.

(3) Must remain within radio control range of the UA, in the case of pilot operation from the chase aircraft, to maintain appropriate signal coverage for flight control or activation of the FTS.

(4) May be required to have communication with appropriate ATC facilities based on the proponent's application or mission profile.

(5) Is not required by FAA in active Restricted or Warning Area airspace designated for aviation use, or approved Prohibited airspace.

(6) Is not required for Optionally Piloted Aircraft (OPA) if a qualified VO is on board.

(7) Is not required in Class A airspace unless stipulated in the COA.

(8) Operations must be conducted in accordance with the Special Provisions listed in the approved COA.

(9) Must maintain 5 SM in-flight visibility restrictions.

(10) Pilot/observer:

- Will not concurrently perform either observer or UAS pilot duties along with chase pilot duties unless otherwise authorized.
- Must maintain direct voice communication with the UAS pilot.

(11) Pilots operating as a formation flight will immediately notify ATC if they are using a non-standard formation. Non-standard formations must be pre-approved by ATC. Proponents adhere to the current edition of Order JO 7610.4, Special Operations, as applicable. Refer to Appendix A for definitions of standard and non-standard formations.

(12) Operations will not be conducted in IMC.

(13) Operations will be thoroughly planned and briefed.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

(14) Pilot, during a lost link situation, must be notified immediately along with ATC. The chase pilot will report to ATC that the UA is performing lost link procedures as planned or if deviations are occurring.

(15) Pilot will ensure safe separation with the UA, and immediately notify ATC and the UA PIC during loss of visual contact with the UA by both the chase pilot and observer, when such contact cannot be promptly re-established. The UA PIC will either execute lost link procedures to facilitate a rejoin, recover the UA, or terminate the flight as appropriate.

q. Airspace Considerations by Airspace Designation.

Note: UAS operating in airspace designated as reduced vertical separation minimum (RVSM) airspace must comply with § 91.180.

(1) Class A. Observers are not normally required in Class A. All UAS must be operating under IFR and on an instrument flight plan. UAS operations approved for Class A must comply with § 91.135.

(2) Class B. UAS operations are currently not authorized. Class B airspace contains terminal areas with the highest density of manned aircraft in the NAS. On a case-by-case basis, the FAA may consider exceptional circumstances. For public aircraft, a Letter of Agreement (LOA) between the affected ATC facility and the proponent describing UAS segregation procedures is required. For civil aircraft, segregation procedures should be incorporated into the operating limitations. UAS operations must not impede, delay, or divert other Class B operations.

(3) Class C (and airspace within 30 NM of an airport listed in Appendix D, section 1, § 91.215). UAS operations approved for Class C must comply with §§ 91.130 and 91.215. Requests for operations without this equipment will be handled on a case-by-case basis and may be approved if sufficiently mitigated and a safety case has been established. For public aircraft, an LOA between the affected ATC facility and the proponent describing UAS segregation procedures may be required. For civil aircraft, segregation procedures should be incorporated into the operating limitations. UAS operations must not impede, delay, or divert other Class C operations.

(4) Class D. Requests for approval will be handled on a case-by-case basis and may be approved if sufficiently mitigated and a safety case has been established. UAS operations approved for Class D must comply with § 91.129. For public aircraft, an LOA between the affected ATC facility and the proponent describing UAS segregation procedures may be required. For civil aircraft, segregation procedures should be incorporated into the operating limitations. UAS operations must not impede, delay, or divert other Class D operations.

(5) Class E. If there is an operating ATC tower, Class D rules may apply. UAS operations approved for Class E must comply with § 91.127. For public aircraft, an LOA between the affected ATC facility and the proponent describing UAS segregation procedures may be required. For civil aircraft, segregation procedures should be incorporated into the operating limitations. UAS operations must not impede, delay, or divert other Class E operations.

(6) Class G. UAS operations approved for Class G must comply with § 91.126.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

r. ATC Visual Approach Clearances. The UAS PIC must not accept a visual approach clearance, an instruction to follow another aircraft by visual means, or a clearance to maintain visual separation from another aircraft.

s. In-Flight Emergencies.

- The PIC will notify ATC of any in-flight emergency or aircraft accident as soon as practical.
- The PIC will notify ATC of any loss of control link as soon as practical. Loss of control link scenarios may be handled by ATC as an emergency.

14. Contingency Planning Limitations. See Appendix E.

15. Personnel Qualifications. This paragraph addresses the qualifications of all UAS flightcrew members, observers, maintainers, and other personnel as appropriate. All references to a pilot certificate or FAA written examination refer to an FAA-issued private pilot certificate, higher certification, or an FAA-recognized equivalent.

a. UAS Pilot Qualifications. The FAA is focused on ensuring that UAS pilots have an appropriate level of understanding of 14 CFR applicable to the airspace where UAS operate. UAS pilots are responsible for controlling their aircraft to the same standards as the pilot of a manned aircraft. Civil UAS pilots may be required to have instruction by an FAA-certificated flight instructor.

b. UAS General Operational Requirements. The following operational restrictions apply to all UAS pilots:

- One PIC must be designated at all times.
- The PIC of an aircraft is directly responsible for, and is the final authority of the operation of that aircraft.
- Pilots must not perform crew duties for more than one UAS at a time.
- Pilots are not allowed to perform concurrent duties both as the pilot and the VO. In the case of OPA, the airborne pilot may assume the role of PIC at all times, but will only be the observer when the OPA is operated by the CS pilot.
- Unless undergoing initial qualification training, pilots must be qualified on the aircraft being flown.
- Only one PIC per aircraft is authorized, and the PIC must be in a position to assume control of the aircraft.

c. PIC.

(1) The designated PIC:

- Has been designated as PIC before or during the flight.
- Is responsible for the UAS flight operation as described under § 91.3, or FAA-recognized equivalent.
- Is responsible for determining whether the UAS is in condition for safe flight.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

- Must land as soon as safely practical when any condition occurs that causes operations to be unsafe.
- May be augmented by supplemental pilots; however, the PIC retains complete and overall responsibility of the flight, regardless of who may be piloting the aircraft.
- Has the ability to assume the duties of an internal or an external UAS pilot at any point during the flight.
- May rotate duties as necessary to fulfill operational requirements.
- Operating under a public agency, must have a thorough knowledge of the COA issued to the organization and must retain a copy to reference during flight.
- Must be trained and qualified on the specific UAS for the conduct of the flight.
- May assume the duties of VO or PIC, if piloting an OPA when the OPA is being utilized as a UAS and being flown by the CS pilot.

(2) PIC Rating Requirements. Rating requirements for the UAS PIC depend on the type of operation conducted; they fall into two categories:

- Operations that require at least a private pilot certificate or FAA-recognized equivalent, or
- Operations that do not require at least a private pilot certificate or FAA-recognized equivalent.

(a) The requirement for the PIC to hold a pilot certificate or FAA-recognized equivalent is based on various factors including:

- The location of the planned operations,
- The mission profile,
- The size of the aircraft, and
- Whether or not the operation is conducted within or beyond visual line-of-sight.

(b) The PIC must hold, at a minimum, an FAA private pilot certificate or FAA-recognized equivalent for all operations listed below:

- Flight in Class A, B, C, D, E, and G (400 feet above ground level (AGL)) airspace.
- IFR (must have instrument rating) operations.
- Night operations.
- At joint use or public airfields.
- Requiring a chase aircraft.
- At any time the FAA has determined the need, based on the UAS characteristics, mission profile, or other operational parameters.

(c) Operations without a pilot certificate may be allowed when all of the following conditions are met:

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

- The PIC has successfully completed, at a minimum, FAA private pilot ground instruction and passed the FAA Private Pilot written examination or FAA-recognized equivalents. (Airman Test Reports are valid for the 24 calendar-month period preceding the month the exam was completed, at which time the instruction and written examination must be repeated.)
- Operations are during daylight hours.
- The operation is conducted in a sparsely populated location.
- Operations are approved and conducted solely within visual line-of-sight in Class G airspace.
- Visual line-of-sight operations are conducted no further than ½ NM laterally from the UAS pilot and at an altitude of no more than 400 feet AGL at all times. Refer to Appendix A for the visual line-of-sight definition.
- Operations are conducted no closer than 5 NM from any FAA-designated airport or heliport other than the airport from which the aircraft is operating.
- The operation is conducted from a privately owned airfield, military installation, or off-airport location.

(3) PIC Recent Flight Experience (Currency). The proponent must provide documentation showing the pilots maintain an appropriate level of recent pilot experience in the UAS being operated, or in an FAA-certified simulator. At a minimum, the PIC must conduct three takeoffs (launch) and three landings (recovery) in the specific UAS within the previous 90 days (excluding pilots who do not conduct launch/recovery during normal/emergency operations); or as prescribed by the proponent's accepted recurrent training and currency program.

(a) For those operations that require a certificated pilot, the PIC, to exercise the privileges of his certificate, must have flight reviews and maintain recent pilot experience in manned aircraft per 14 CFR part 61, as appropriate; or FAA-accepted equivalent.

(b) For flights approved for night operations, the PIC must conduct three takeoffs (launch) and three landings (recovery) each, in the specific UAS at night, to a full stop in the previous 90 days (excluding pilots who do not conduct launch/recovery during normal/emergency operations).

(c) For operations approved for night or IFR, the PIC must maintain recent pilot experience per § 61.57 or FAA-accepted equivalent as applicable.

(4) PIC Medical. The PIC must maintain, at a minimum, a valid FAA second-class medical certificate issued under 14 CFR part 67 or the FAA-recognized equivalent. The second-class medical certificate expires at the end of the last day of the 12th month after the month of the date of the examination shown on the medical certificate listed in § 61.23.

(5) Section 91.17 or FAA-recognized equivalent applies to all UAS crewmembers.

(6) PIC Training.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

(a) In addition to the training required for a pilot certificate, UAS PICs must have the following additional training (or FAA-recognized equivalent):

- Including normal, abnormal, and emergency procedures in all specific details of the UAS being operated,
- Manufacturer-specific training,
- Demonstrated proficiency, and
- Testing in the UAS being operated.

(b) Proponents must maintain individual training records of all UAS personnel. All training and testing will be documented in the individual's training record by the instructor and initialed by the trainee.

d. Supplemental Pilots. Supplemental pilots are those pilots assigned UAS flight duty to augment the PIC. It is common for proponents to have both an internal and an external UAS pilot. The supplemental pilot can assume either of these positions.

(1) Ratings. Supplemental pilots must have, at a minimum, successfully completed private pilot ground school and passed the written test or FAA-recognized equivalents. The ground school written test results are valid for two years from the date of completion, at which time the instruction and written examination must be repeated. If a supplemental pilot assumes the role of PIC, he/she must comply with the PIC rating, currency, medical, and training requirements listed above in subparagraph 15c.

(2) Recent Pilot Experience. The proponent must provide a process that ensures that pilots maintain an appropriate level of recent pilot experience for the position they are assigned in the UAS being operated.

(3) Medical. Supplemental pilots must maintain, at a minimum, a valid FAA second-class medical certificate issued under part 67 or the FAA-recognized equivalent. The second-class medical certificate expires at the end of the last day of the 12th month after the month of the date of the examination shown on the medical certificate, according to § 61.23. Section 91.17 or FAA-recognized equivalent applies to all UAS crewmembers.

(4) Training.

(a) UAS supplemental pilots must have:

- Training in all specific details of the UAS being operated, including normal, abnormal, and emergency procedures;
- Manufacturer-specific training (or FAA-recognized equivalent);
- Demonstrated proficiency and successful testing in the UAS being operated.

(b) Proponents must maintain individual training records for all UAS personnel. All training must be documented by the instructor and initialed by the trainee.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

e. UAS Observer Qualifications. All observers must have an understanding of Federal aviation regulations applicable to the airspace where the UAS will operate. Observers are considered crewmembers. Observers must not perform crew duties for more than one UAS at a time. Observers are not allowed to perform concurrent duties both as UAS pilot and observer.

(1) Medical. All observers must have a valid FAA second-class medical certificate issued under part 67; an FAA-recognized equivalent is an acceptable means of demonstrating compliance with this requirement. The second-class medical certificate expires at the end of the last day of the 12th month after the month of the date of the examination shown on the medical certificate. Section 91.17 or FAA-recognized equivalent applies to all UAS crewmembers.

(2) Training. Observers must complete sufficient training to communicate to the pilot any information required to remain clear of conflicting traffic, terrain, and obstructions, maintain proper cloud clearances, and provide navigational awareness. This training, at a minimum, must include knowledge of:

(a) Their responsibility to assist pilots in complying with the requirements of 14 CFR:

- § 91.111, Operating Near Other Aircraft;
- § 91.113, Right-of-Way Rules: Except Water Operations;
- § 91.115, Right-of-Way Rules: Water Operations; and
- § 91.155, Basic VFR Weather Minimums;

(b) Air traffic and radio communications, including the use of approved ATC/pilot phraseology; and

(c) Appropriate sections of the Aeronautical Information Manual (AIM).

f. UAS Maintenance Personnel Qualifications.

(1) Maintenance Ratings. Will be established as more data is collected and a regulatory guideline is developed.

(2) Recent Maintenance Experience. It is suggested that proponents follow applicable guidelines of 14 CFR part 65, § 65.83, as appropriate, until final UAS regulatory guidelines are available.

(3) Maintenance Medical Requirements. At a minimum, the requirements of § 91.17 or FAA-recognized equivalent must be met. No additional medical requirements have been defined at this time.

(4) Maintenance Training. It is highly recommended that a proponent of a UAS submit a training program. This requirement will be further defined as more data is collected and the regulatory process affects these guidelines.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

g. Other UAS Personnel Qualifications. Ancillary personnel such as systems operators or mission specialists must be thoroughly familiar with and possess operational experience of the equipment being utilized. If the systems being utilized are for observation and detection of other aircraft for collision avoidance purposes, personnel must be thoroughly trained on collision avoidance procedures and techniques and have direct communication with the UAS pilot, observer, and other applicable personnel.

16. AMOC. This notice defines certain limitations and procedures to conduct UAS operations, but each application is evaluated on its own technical merit based on its own set of operational parameters and proposed operational profiles, mitigations, and systems. When a proponent desires to deviate from these limitations and procedures, an AMOC that includes a safety case (recommended format provided in Appendix D), must be submitted for approval. For a proponent to make an acceptable safety case, information must be provided that outlines all hazards and risks associated with the requested AMOC. In addition, the proponent must provide a description of the methods and procedures or equipment for mitigating each hazard and risk. As such, deviations and AMOC may differ from the information presented in this notice. Therefore, if the proponent provides an acceptable safety case with sufficient data that supports the proposal, the AMOC will be considered and evaluated for approval.

a. Safety Case Information. The proponent should include at a minimum:

(1) A thorough description of the environment in which the aircraft will operate;

(2) Criteria for categorizing hazards (e.g., severity and likelihood);

(3) A detailed airworthiness description of the affected items associated with the proposed AMOC, which includes, as a minimum:

- Certification status of components and systems, or statement of airworthiness for public aircraft,
- Reliability data,
- Redundant systems,
- Failure modes and effects, including system response to loss of control link, and
- An airworthiness determination (for COA proponents only);

(4) Capabilities of the aircraft;

(5) Flight data;

(6) Accident data;

(7) Emergency procedures; and

(8) Pilot/crew roles and responsibilities.

b. Sample Safety Case. Appendix D represents the FAA's approach to documenting the process used for hazard identification and risk mitigation. It is provided as an example for proponents to use when developing and documenting a safety case. In addition to these

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

guidelines, other government and industry methods similar to the FAA's approach to developing a safety case also provide acceptable hazard analysis tools. These include Preliminary Hazard Analysis, Operational Safety Assessment, Comparative Safety Assessment, and Fault Hazard Analysis. See Appendix D for a complete list.

17. Disposition. We will incorporate the information in this notice into FAA Order 8900.1 before this notice expires. Direct questions concerning the information in this notice to the Unmanned Aircraft Systems Integration Office, AFS-80, at 202-385-4835.

APPENDIX A. DEFINITIONS

1. Aircraft. A device used or intended to be used for flight in the air, including unmanned aircraft (UA).

2. Airworthiness [UAS]. A condition in which the unmanned aircraft system (UAS) (including the aircraft, airframe, engine, propeller, accessories, appliances, and control station (CS)) conforms to its type certificate, if applicable, and is in condition for safe operation.

3. Airworthiness Certification. Process and aircraft qualification for civil UAS proponents to obtain a special airworthiness certificate.

4. Airworthiness Statement. Document required from public UAS proponents during a Certificate of Waiver or Authorization (COA) application process which confirms aircraft airworthiness.

5. Certificate of Waiver or Authorization (COA). An FAA grant of approval for a specific operation. The authorization to operate a UAS in the National Airspace System (NAS) as a public aircraft outside of Restricted, Warning, or Prohibited areas approved for aviation activities.

6. Chase Aircraft. A manned aircraft that carries its own pilot-in-command (PIC) and a separate qualified VO flying in proximity to a UA.

7. Civil Aircraft. Aircraft other than public aircraft.

8. Cooperative Aircraft. Aircraft that have an electronic means of identification (i.e., a transponder or ADS-B transceiver) aboard in operation.

9. Crewmember [UAS]. In addition to the crewmembers identified in 14 CFR part 1, a UAS flightcrew member includes pilots, sensor/payload operators, and VOs, but may include other persons as appropriate or required to ensure safe operation of the aircraft.

10. Crew Resource Management (CRM). The effective use of all available resources including human, hardware, and information resources.

11. Daisy-Chaining. Aviation jargon for the use of multiple, successive observers to extend the flight of a UA beyond the direct visual line-of-sight of any other PIC or VO.

12. Experimental Certificate. A type of special airworthiness certificate issued for the purposes of research and development (R&D), crew training, exhibition, and market survey as defined in 14 CFR part 21, § 21.191(a), (c), and (f). Note: According to § 91.319(a)(2), experimental aircraft may not be used for carrying persons or property for compensation or hire.

a. R&D Aircraft. Aircraft testing new design concepts, equipment, installations, operating techniques, or uses for aircraft. Any unmanned aircraft system (UAS), including an Optionally Piloted Aircraft (OPA) is eligible for an experimental certificate under this purpose. Operations

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

may be conducted by the proponent only as a matter of research or to determine whether an idea warrants further development.

b. Crew Training. Crew training is limited to the number of flight crews required by the proponent to conduct experimental aircraft operations.

c. Market Survey. Aircraft may be used for the purposes of conducting market surveys, sales demonstrations, and customer crew training of the manufacturer's customers as provided in part 21, § 21.195.

13. External Pilot. A UAS pilot who flies from outside a CS shelter with direct visual contact with the aircraft.

14. FAA-Recognized Equivalent. An FAA recognition that a public agency may exercise its own internal processes regarding airworthiness and pilot, aircrew, and maintenance personnel certification and training; furthermore, the agency has determined that its UAS is capable of safe operation in the National Airspace System (NAS) when conducting public aircraft operations under Title 49 of the United States Code (49 U.S.C.) §§ 40102(a)(41) and 40125.

15. Fly-Away. An interruption or loss of the control link, or when the pilot is unable to effect control of the aircraft and, as a result, the UA is not operating in a predicable or planned manner.

16. Formation.

a. Non-standard formation. A formation operating under any of the following conditions:

- When the flight leader has requested and ATC has approved other than standard formation dimensions;
- When operating within an authorized block altitude or under the provisions of a letter of agreement (LOA);
- When the operations are conducted in airspace specifically designed for a special activity.

b. Standard formation. A formation in which proximity of no more than 1 NM laterally or longitudinally and within 100 feet vertically from the flight leader is maintained by each wingman or UA.

17. Inspection. The routine performance of inspection tasks at prescribed intervals. The inspection must ensure the airworthiness of an aircraft up to and including its overhaul or life limits.

18. Internal Pilot. A UAS pilot who flies from inside a CS shelter without direct visual contact with the aircraft.

19. Lost Link. An interruption or loss of the control link, or when the pilot is unable to effect control of the aircraft and, as a result, the UA will perform a predictable or planned maneuver. Loss of command and control link between CS and aircraft. There are two types of links:

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

- An uplink which transmits command instructions to the aircraft, and
- A downlink which transmits the status of the aircraft and provides situational awareness to the pilot.

20. Missile. A non-recoverable, powered, guided munition that travels through the air or space.

- Ballistic missiles follow a ballistic trajectory.
- Cruise missiles generate lift.
- Guided missiles are launched from a ship or aircraft and serve as a self-contained precision bomb.

21. Non-Cooperative Aircraft. Aircraft that do not have an electronic means of identification (e.g., a transponder) aboard or that have inoperative equipment because of malfunction or deliberate action.

22. Non-Standard Formation. See Formation.

23. Observer. A trained person who assists a UAS pilot in the duties associated with collision avoidance and navigational awareness through electronic or visual means. (Collision avoidance includes, but is not limited to, avoidance of other traffic, clouds, obstructions, terrain and navigational awareness.) A visual observer (VO) is a trained person who assists the UAS pilot by visual means in the duties associated with collision avoidance. A VO includes the OPA pilot when the OPA is being operated as a UAS.

24. Off-Airport. Any location used to launch or recover aircraft that is not considered an airport (e.g., an open field).

25. Optionally Piloted Aircraft (OPA). An aircraft that can conduct operations as a traditional aircraft with a pilot aboard the aircraft, and can also operate as a UAS when the aircraft is operated and controlled by the CS pilot, allowing the pilot aboard the aircraft to become a qualified observer and remain a PIC. OPA operating as a UAS must meet UAS guidance requirements.

26. Pilot Duty Period. The period beginning when a flightcrew member is required to report for duty, with the intention of conducting a flight, and ending when the aircraft is parked after the last flight. It includes the period of time before a flight or between flights that a pilot is working without an intervening rest period.

27. Pilot-in-Command (PIC)-[UAS]. The person who has final authority and responsibility for the operation and safety of flight, has been designated as PIC before or during the flight, and holds the appropriate category, class, and type rating, if appropriate, for the conduct of the flight. The responsibility and authority of the PIC as described by 14 CFR part 91, § 91.3 apply to the UA PIC. The PIC position may rotate duties as necessary with equally qualified pilots. The individual designated as PIC may change during flight. Note: The PIC can only be the PIC for one aircraft at a time. For OPA, PIC must meet UAS guidance requirements for training, pilot licensing, and medical requirements when operating OPA as a UAS.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

28. Populated or Urban Areas. Areas depicted in yellow on a Visual Flight Rules (VFR) sectional chart or as determined from other sources.

29. Proponent. A person or agency making an application for a Certificate of Waiver or Authorization (COA).

30. Public Aircraft. An aircraft operated by a governmental entity (including Federal, State, or local governments, and the U.S. Department of Defense (DOD) and its military branches) for certain purposes as described in 49 U.S.C. §§ 40102(a)(41) and 40125. Public aircraft status is determined on an operation by operation basis. See 14 CFR part 1, § 1.1 for a complete definition of a public aircraft.

31. Public Operator. An operator that is classified as government and/or otherwise qualifies for public aircraft operation under 49 U.S.C. §§ 40102(a)(41) and 40125. Not all flights by a public aircraft operator qualify as a public aircraft operation under the statute. Public aircraft operation status is not automatic for flights conducted by a government entity or a contractor to a government entity.

32. Rocket. A powered, unguided munitions (DOD); or an aircraft propelled by ejected expanding gases generated in the engine from self-contained propellants and not dependent on the intake of outside substances. It includes any part which becomes separated during the operation (14 CFR).

33. Safety Risk Management (SRM). A formalized, proactive approach to system safety. SRM is a methodology that ensures hazards are identified, risks are analyzed, assessed, and prioritized; and results are documented for FAA decision-makers to transfer, eliminate, accept, or mitigate risk.

34. Scheduled Maintenance (Routine). The performance of maintenance tasks at prescribed intervals.

35. Segregation. Setting apart from other air traffic operations in the NAS. Segregation is not synonymous with required air traffic separation standards. Therefore, segregation does not prescribe or mandate criteria such as vertical, lateral, or longitudinal distances.

36. Shells. Munitions that are fired from a gun whether guided or not.

37. Smart Bomb. Precision-guided munitions.

38. Standard formation. See formation.

39. Supplemental Pilot. Pilots assigned UAS flight duties to augment the PIC. It is common for proponents to have both an internal and an external UAS pilot. The supplemental pilot can assume either of these positions. The supplemental pilot may also assume duties of the PIC if the specified qualifications are met.

40. Torpedoes. Powered munitions that travel through water.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

41. Unmanned Aircraft (UA). A device used or intended to be used for flight in the air that has no onboard pilot. This devise excludes missiles, weapons, or exploding warheads, but includes all classes of airplanes, helicopters, airships, and powered-lift aircraft without an onboard pilot. UA do not include traditional balloons (see 14 CFR part 101), rockets, tethered aircraft and un-powered gliders.

42. Unmanned Aircraft System (UAS). A UA and its associated elements related to safe operations, which may include CSs (ground, ship, or air-based), control links, support equipment, payloads, flight termination systems (FTS), and launch/recovery equipment.

43. Unscheduled Maintenance (Non-Routine). The performance of maintenance tasks when mechanical irregularities occur.

44. Visual Line-of-Sight. Unaided (corrective lenses and/or sunglasses exempted) visual contact between a PIC or a VO and a UAS sufficient to maintain safe operational control of the aircraft, know its location, and be able to scan the airspace in which it is operating to see and avoid other air traffic or objects aloft or on the ground.

APPENDIX C. RELATED REGULATIONS AND PUBLICATIONS

1. Title 14 of the Code of Federal Regulations (CFR).

a. Part 1, Definitions and Abbreviations.

b. Part 21, Certification Procedures for Products and Parts.

- Section 21.191, Experimental certificates.
- Section 21.193, Experimental certificates: general.
- Section 21.195, Experimental certificates: Aircraft to be used for market surveys, sales demonstrations, and customer crew training.
- Section 21.197, Special flight permits.
- Section 21.199, Issue of special flight permits.

c. Part 23, § 23.1309, Equipment, Systems, and Installations.

d. Part 25, § 25.1309, Equipment, Systems, and Installations.

e. Part 61, Certification: Pilots, Flight Instructors, and Ground Instructors.

- Section 61.23, Medical Certificates: Requirement and Duration.
- Section 61.56, Flight Review.
- Section 61.57, Recent Flight Experience: Pilot in Command.
- Section 61.58, Pilot-in-Command Proficiency Check: Operation of an Aircraft that Requires more than one Pilot Flight Crewmember or is Turbojet-Powered.

f. Part 65, § 65.83, Recent Experience Requirements.

g. Part 67, Medical Standards and Certification.

h. Part 91, General Operating and Flight Rules.

- Section 91.3, Responsibility and Authority of the Pilot in Command.
- Section 91.13, Careless or Reckless Operation.
- Section 91.15, Dropping Objects.
- Section 91.17, Alcohol or Drugs.
- Section 91.21, Portable Electronic Devices.
- Section 91.111, Operating Near Other Aircraft.
- Section 91.113, Right-of-Way Rules: Except Water Operations.
- Section 91.115, Right-of-Way Rules: Water Operations.
- Section 91.126, Operating on or in the Vicinity of an Airport in Class G Airspace.
- Section 91.127, Operating on or in the Vicinity of an Airport in Class E Airspace.
- Section 91.129, Operations in Class D Airspace.
- Section 91.130, Operations in Class C Airspace.
- Section 91.135, Operations in Class A Airspace.
- Section 91.155, Basic VFR Weather Minimums.

APPENDIX D. SAFETY CASE FORMAT

1. **Signature Page.** Include the following information on the signature page:

   - Title: A clear and concise description of the proposed method for AMOC;
   - Originator Information: Originator's name, organization, contact information, etc.;
   - Safety Risk Management Document (SRMD) Information: Safety Case submission date, revision number, etc.

2. **Executive Summary.** The summary should give a general description of the proposed AMOC, including a list of the hazards with associated risk level (high, medium, low) and their corresponding initial and predicted residual risk. Include a high level system description, a summary of how the Safety Case was developed, and what process/method was used to move through the risk assessment process.

3. **Introduction.** Provide a brief reasoning/rationale for the initiative. The scope of the proposed AMOC, whether it is more complex or far-reaching, will determine the need for increased scope and detail of the analysis to be performed.

4. **Section 1.** Current System/System Baseline. Provide a description of the current system or existing procedures as well as the corresponding (operational) system states. If the proposal entails a procedural change, describe the current procedure and its operational environment. If the current system or procedure is unique and has challenges associated with its unique situation, be sure to delineate.

5. **Section 2.** Proposed Change. Provide a description of the proposed change/procedure, identifying which safety parameters are involved.

6. **Section 3.** Safety Risk Management (SRM) Planning and Impacted Organizations. Prior to initiation of the safety analysis, SRM planning is necessary. It is essential to select the appropriate SRM participants, identify the SRM Panel, schedule milestones, and assign tasks and responsibilities. With regard to the organizations that are impacted by the change, describe the method used for collaboration between those organizations during the identification, mitigation, tracking, and monitoring of hazards associated with the change.

7. **Section 4.** Assumptions. If in the process of developing a procedure to validate an AMOC, any assumptions are made to make the evaluation of the change more manageable, clearly define and document them in this section.

8. **Section 5.** Phase 1: System Description. The description of the system/procedure, its operational environment, the people involved/affected by the change/procedure, and the equipment required to accommodate the proposal must be provided.

9. **Section 6.** Phase 2: Identified Hazards. The SRM Panel identifies hazards as a collaborative effort. The tool(s) and technique(s) used to identify hazards should be specified and discussed. The identified hazards are documented as well as their corresponding causes, the corresponding system states considered and the consequent potential outcome. It is important to realize that while identification of the worst credible outcome and the system state in which the worst

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

credible outcome occurs is required, system states with less severe outcomes should not be ignored.

10. Section 7. Phase 3 & 4: Risk Analysis & Risks Assessed. Describe the process used to analyze the risks associated with the identified hazards. Specify what type of data was used to determine the likelihood of risk occurrence (e.g., quantitative or qualitative) as well as the sources of the data. A risk matrix should provide an illustration of the predicted initial/current risk(s) associated with the identified hazards.

11. Section 8. Phase 5: Treatment of Risks/Mitigation of Hazards. If the existing controls and mitigations do not acceptably mitigate the hazards, then additional recommended safety requirements should be identified. An explanation of how the recommended safety requirements are expected to reduce the initial/current risk to an acceptable predicted residual risk level should be included. Low-risk hazards may still warrant recommended safety requirements.

12. Section 9. Tracking and Monitoring of Hazards. Once the proposal has been approved and implemented, tracking of hazards and verification of the effectiveness of mitigation controls throughout the lifecycle of the system or change are required. Also, the methodology for this tracking and monitoring should be outlined.

13. Appendices.

a. Documents Related to the SRMD. Include a list of documents (orders, directives, regulations, handbooks, and manuals) that pertain to the proposed change, which have been consulted in the development of the proposed change and the corresponding safety analysis.

b. Hazard Identification Tools. Provide information on the different tool(s), method(s), and technique(s) used during the safety analysis. (See Figure D-1, for a chart listing acceptable hazard analysis tools and techniques.)

c. Hazard Analysis and Risk Matrix. Depending on the analyses necessary, there might be one or more appendices with analyses. A risk matrix reflecting the initial and predicted residual risks should also be included.

d. Glossary. Include any acronyms and definitions for any terms you listed in the Safety Case.

Figure D-1. Acceptable Hazard Analysis Tools and Techniques

This chart from the ATO Safety Management System Manual, available on the Internet, displays acceptable hazard analysis tools for developing safety cases.

Air Traffic Organization Safety Management System Manual - Version 2.1

Table 3.1: Selection of Hazard Identification and Analysis Tools and Techniques

Tool or Technique	Summary Description	Page in Appendix G
Preliminary Hazard Analysis (PHA)	The PHA provides an initial overview of the hazards present in the overall flow of the operation. It provides a hazard assessment that is broad, but usually not deep.	G-1
Operational Safety Assessment (OSA)	The OSA is a development tool based on the assessment of hazard severity. It establishes how safety requirements are to be allocated between air and ground components and how performance and interoperability requirements might be influenced.	G-3
Comparative Safety Assessment (CSA)	The CSA provides management with a listing of all of the hazards associated with a change, along with a risk assessment for each alternative hazard combination that is considered. It is used to rank the options for decision-making purposes. The CSA's broad scope is an excellent way to identify issues that may require more detailed hazard identification tools.	G-5
Fault Hazard Analysis (FHA)	The FHA is a deductive method of analysis that personnel can use exclusively as a qualitative analysis or, if desired, can expand to a quantitative one. The FHA requires a detailed investigation of the subsystems to determine component hazard modes, causes of these hazards, and resultant effects on the subsystem and its operation.	G-8
Failure Mode and Effect Analysis (FMEA)	The FMEA determines the results or effects of sub-element failures on a system operation and classifies each potential failure according to its severity.	G-9
Failure Modes, Effects, and Criticality Analysis (FMECA)	The FMECA is an essential function in design from concept through development. To be effective, the FMECA is iterative to correspond with the nature of the design process itself. The FMECA identifies component and sub-system failure modes, including the impact of human error; evaluates the results of the failure modes; determines rates and probability; and demonstrates compliance with safety requirements.	G-9
What-If Analysis	The What-If Analysis methodology identifies hazards, hazardous situations, or specific accident events that could produce an undesirable consequence. One can use the What-If Analysis as a brainstorming method.	G-10
Scenario Analysis	The Scenario Analysis identifies and corrects potentially hazardous situations by postulating accident scenarios in cases where it is credible and physically logical.	G-12
Change Analysis	The Change Analysis analyzes the hazard implications of either planned or incremental changes (e.g., operation, equipment, or procedure).	G-13
Cause-Consequence Analysis	The Cause-Consequence Analysis combines the bottom-up and top-down analysis techniques of Event Trees and Fault Trees. The result is the development of potential complex accident scenarios.	G-15

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

Figure D-1. Acceptable Hazard Analysis Tools and Techniques, continued

Air Traffic Organization Safety Management System Manual - Version 2.1

Tool or Technique	Summary Description	Page in Appendix G
Hazard and Operability Tool (HAZOP)	A group uses the HAZOP to analyze hazards of completely new operations and to review the significance of all of the ways that a process element can malfunction or be incorrectly operated. The technique is essentially a structured brainstorming using specific guide words.	G-17
Interface Analysis	One uses the Interface Analysis to discover the hazardous linkages between interfacing systems.	G-18
Accident/Incident Analysis	The Accident/Incident Analysis uses data on recorded hazardous events. One groups these events in various ways according to a pre-established criterion, usually a common cause or outcome. One then identifies the groupings as hazards.	G-19
Job Safety Analysis (JSA)	One uses this technique to assess in detail the safety considerations in a single job or task..	G-20
Energy Trace and Barrier Analysis (ETBA)	The ETBA is highly structured. It documents all energy sources in system. One identifies the energy sources as hazards. One identifies the barrier between the energy sources and the operators, maintainers, and other systems as mitigations.	G-21
Fault Tree Analysis (FTA)	An FTA is a graphical design technique that can provide an alternative to block diagrams. It is a top-down, deductive approach structured in terms of events. One models faults in terms of failures, anomalies, malfunctions, and human errors.	G-22
Management Oversight and Risk Tree (MORT)	One uses the MORT technique to systematically analyze hazards to examine and determine detailed information about the process and accident contributors.	G-24
Human Error Analysis (HEA)	HEA, in a system context, involves assessing each human-machine interface point, decision, or action for the potential for human error to adversely impact system performance or safety of the system and its users. There are a variety of methodologies for conducting these analyses.	G-26
Job Task Analyses (JTA)	The foundation of the performance of HEA is a task analysis, which describes each human task/sub-task within a system in terms of the perceptual (information intake), cognitive (information processing and decision making), and manual (motor) behaviors required of an operator, maintainer, or support person. It should also identify the skills and information required to complete the tasks; equipment requirements; the task setting; time and accuracy requirements; and the probable human errors and consequences of these errors. There are several tools and techniques for performing task analyses, depending on the level of analysis needed.	G-28

Check with FSIMS to verify current version before using

APPENDIX E. CONTINGENCY PLANNING LIMITATIONS

1. Point Identification. The proponent must submit contingency plans that address emergency recovery or flight termination of the unmanned aircraft (UA) in the event of unrecoverable system failure. These procedures will normally include Lost Link Points (LLP), Divert/Contingency Points (DCP) and Flight Termination Points (FTP) for each operation. LLPs and DCPs must be submitted in latitude/longitude (Lat/Long) format along with a graphic representation plotted on an aviation sectional chart (or similar format). FTPs or other accepted contingency planning measures must also be submitted in Lat/Long format along with a graphic representation plotted on an aviation sectional chart, or other graphic representation acceptable to the FAA. The FAA accepts the LLPs, DCPs, FTPs, and other contingency planning measures submitted by the proponent, but does not approve them. When conditions preclude the use of FTPs, the proponent must submit other contingency planning options for consideration and acceptance. At least one LLP, DCP, and FTP (or an acceptable alternative contingency planning measure) is required for each operation. The proponent must furnish this data with the initial Certification of Waiver or Authorization (COA) application. Any subsequent changes or modifications to this data must be provided to the Unmanned Aircraft Systems (UAS) Integration Office (AFS-80) for review and consideration no later than 30 days prior to proposed flight operations.

2. Risk Mitigation Plans. For all operations, the proponent must develop detailed plans to mitigate the risk of collision with other aircraft and the risk posed to persons and property on the ground in the event the UAS experiences a lost link, needs to divert, or the flight needs to be terminated. The proponent must take into consideration all airspace constructs and minimize risk to other aircraft by avoiding published airways, military training routes, Navigational Aids (NAVAIDS), and congested areas. In the event of a contingency divert or flight termination, the use of a chase aircraft is preferred when the UAS is operated outside of Restricted or Warning Areas. If time permits, the proponent should make every attempt to utilize a chase aircraft to monitor the aircraft to a DCP or to the FTP. In the event of a contingency divert or flight termination, the proponent will operate in Class A airspace and Special Use airspace to the maximum extent possible to reduce the risk of collision with non-participating air traffic.

a. LLP Procedures.

(1) LLPs are defined as a point, or sequence of points, where the aircraft will proceed and hold at a specified altitude, for a specified period of time, in the event the command and control link to the aircraft is lost. The aircraft will autonomously hold, or loiter, at the LLP until the communication link with the aircraft is restored or the specified time elapses. If the time period elapses, the aircraft may autoland, proceed to another LLP in an attempt to regain the communication link, or proceed to an FTP for flight termination. LLPs may be used as FTPs. In this case, the aircraft may loiter at the LLP/FTP until link is re-established or fuel exhaustion occurs.

(2) For areas where multiple or concurrent UAS operations are authorized in the same operational area, a segregation plan must be in place in the event of a simultaneous lost link scenario. The deconfliction plan may include altitude offsets and horizontal separation by using independent LLPs whenever possible.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

b. DCP Procedures.

(1) A DCP is defined as an alternate landing/recovery site to be used in the event of an abnormal condition that requires a precautionary landing. Each DCP must incorporate the means of communication with air traffic control (ATC) throughout the descent and landing (unless otherwise specified in the Special Provisions) as well as a plan for ground operations and securing/parking the aircraft on the ground. This includes the availability of control stations (CS) capable of launch/recovery, communication equipment, and an adequate power source to operate all required equipment.

(2) For local operations, the DCP specified will normally be the airport/facility used for launch and recovery; however, the proponent may specify additional DCPs as alternates.

(3) For transit and/or mission operations that are being conducted in Class A airspace or Class E airspace above flight level (FL) 600, DCPs will be identified during the flight to be no further than one hour of flight time at any given time, taking into consideration altitude, winds, fuel consumption, and other factors. If it is not possible to define DCPs along the entire flight plan route, the proponent must identify qualified FTPs along the entire route and be prepared to execute flight termination at one of the specified FTPs if a return to base (RTB) is not possible.

(4) It is preferred that specified DCPs are non-joint use military airfields, other government-owned airfields, or private-use airfields. However, the proponent may designate any suitable airfield for review and consideration.

c. Flight Termination Procedures.

(1) Flight termination is the intentional and deliberate process of performing controlled flight into terrain (CFIT). Flight termination must be executed in the event that all contingencies have been exhausted and further flight of the aircraft cannot be safely achieved or other potential hazards exist that require immediate discontinuation of flight. FTPs or alternative contingency planning measures must be located within power-off glide distance of the aircraft during all phases of flight and must be submitted for review and acceptance. The proponent must ensure sufficient FTPs or other contingency plan measures are defined to accommodate flight termination at any given point along the route of flight. The location of these points is based on the assumption of an unrecoverable system failure and must take into consideration altitude, winds, and other factors.

(2) Unless otherwise authorized, FTPs must be located in sparsely populated areas. Except for on- or near-airport operations, FTPs will be located no closer than five nautical miles (NM) from any airport, heliport, airfield, NAVAID, airway, populated area, major roadway, oil rig, power plant, or any other infrastructure. For offshore locations, the proponent must refer to appropriate United States Coast Guard (USCG) charts and other publications to avoid maritime obstructions, shipping lanes, and other hazards. Populated areas are defined as those areas depicted in yellow on a Visual Flight Rules (VFR) sectional chart or as determined from other sources.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

(a) It is preferred that flight termination occurs in Restricted or Warning Areas, government-owned land, or offshore locations that are restricted from routine civil use. However, the proponent may designate any suitable location for review and consideration.

(b) The proponent is required to survey all designated areas prior to their use as an FTP. All FTPs will be reviewed for suitability on a routine and periodic basis, not to exceed six months. The proponent assumes full risk and all liability associated with the selection and use of any designated FTP.

(c) It is desirable that the proponent receive prior permission from the land owner or using agency prior to designation of this area as an FTP. The proponent should clearly communicate the purpose and intent of the FTP.

(d) For each FTP, plans must incorporate the means of communication with ATC throughout the descent as well as a plan for retrieval/recovery of the aircraft.

(e) Contingency planning must take into consideration all airspace constructs and minimize risk to other aircraft by avoiding published airways, military training routes, NAVAIDS, and congested areas to the maximum extent possible.

(f) In the event of a contingency divert or flight termination, if time permits, the use of a chase aircraft is preferred when the UA is operated outside of Restricted or Warning Areas.

(g) In the event of a contingency divert or flight termination or other approved contingency measures, the proponent will operate in Class A airspace and Special Use airspace to the maximum extent possible to reduce the risk of collision with non-participating air traffic.

NOTICE

U.S. DEPARTMENT OF TRANSPORTATION
FEDERAL AVIATION ADMINISTRATION
Air Traffic Organization Policy

N JO 7210.766

Effective Date:
March 28, 2011

Cancellation Date:
March 27, 2012

SUBJ: Unmanned Aircraft Operations in the National Airspace System (NAS)

1. Purpose of This Notice. This notice provides information and interim guidance on air traffic policies and prescribes procedures for the planning, coordination, and services involving the operation of unmanned aircraft systems (UAS) in the NAS. These policies and procedures reflect current written directives and regulations and do not reflect any major changes. The intent of this notice is to consolidate all current directives and regulations into one document to assist with understanding UAS operations in the NAS.

2. Audience. This notice applies to the following Air Traffic Organization (ATO) service units: En Route and Oceanic, Terminal, Mission Support, and System Operations; the David J. Hurley Air Traffic Control System Command Center (ATCSCC); and the Flight Standards Service's divisions at Federal Aviation Administration (FAA) Washington headquarters and international field offices.

3. Where Can I Find This Notice? This notice is available on the MyFAA employee Web site at https://employees.faa.gov/tools_resources/orders_notices/ and on the air traffic publications Web site at http://www.faa.gov/air_traffic/publications.

4. Explanation of Changes. This notice is a continuation of N JO 7110.512, Unmanned Aircraft Operations in the National Airspace System, effective December 16, 2009, which was cancelled on December 15, 2010. Administrative changes (for example, website change and Air Force address) were made, and word meanings were clarified (for example, safety alerts were clarified to meet FAA Order JO 7110.65 standards). NOTAM requirements in the different classes of airspace, lost link requirements, guidance for the use of ATC visual clearances, and the requirement for the proponent to be responsible for strict compliance with the incident/accident and normal reporting provisions were added. This is to conform with the requirements in the certificate of waiver or authorization (COA) process. Also added is a clarification on the mixing of, or concurrent manned and unmanned aircraft operations in terminal airspace.

5. Action. Unmanned aircraft (UA) activities must be provided services following the policy, criteria, and procedures in this notice and other air traffic publications. When a conflict arises, supervisors must request a clarification from their respective service unit. Procedures/minima, applied jointly or otherwise, require the cooperation or concurrence of more than one facility/organization and must be documented in a letter of agreement (LOA). LOAs only supplement this notice. Any minima they specify must not be less than that specified in this notice unless appropriate military authority has authorized application of reduced separation between military aircraft. Additionally, the separation minima must not be less than authorized in the certificate of waiver or authorization (COA).

6. Certificate of Waiver or Authorization (COA). This section prescribes the policies, guidance, and procedures about COA applications for UAS operations.

a. Application Process. The ATO issues a COA to a public operator for a specific UA's activity. After a complete application is submitted, the FAA conducts a comprehensive operational and technical review. If necessary, provisions or limitations may be imposed as part of the approval to ensure the UA operates safely with other users.

b. Application Submission. Electronic applications should be submitted following the provisions provided on the following Web site:

http://www.faa.gov/about/office_org/headquarters_offices/ato/service_units/systemops/aaim/organizations/uas/.

c. Application Information. The FAA must obtain enough information to assess the proposed operations following current standards and procedures. Because of the dynamic changes in the development of UA technologies, the applicant is responsible for adequately describing the proposed operations so an appropriate safety assessment can be conducted by the FAA. For this purpose, the following information may be required in a COA application.

(1) Organizational and operational points of contact.

(2) Operational description (for example, method of navigation, see-and-avoid).

(3) Systems description (for example, airframe, control station, communications).

(4) Airframe performance characteristics.

(5) Airworthiness.

(6) Contingency procedures (for example, lost command/control link, lost communications, and emergency).

(7) Avionics equipment.

(8) Lighting.

(9) Frequency spectrum analysis.

(10) Method of air traffic control (ATC) communications.

(11) Surveillance capability (for example, electronic and visual).

(12) System monitoring/recording capability.

(13) Flightcrew qualifications.

(14) Flight operations description (flight plan).

(15) Special circumstances.

(16) Reports of past incidents or accidents (for those applicants who have previously held a COA).

d. Emergency and Urgent Applications. The FAA must ensure procedures are available to accommodate real-time applications that will directly support emergency and law enforcement-type operations. UA operations that reduce safety must not be approved in any case.

(1) An emergency UAS COA may be considered when all of the following conditions apply:

(a) There is a situation of such distress or urgency that the possibility of loss of life is great.

(b) Manned flight is not possible or practicable due to a hazard or the operation cannot be conducted safely with manned flight, or manned assets are not available.

(c) The proposed proponent and UAS are operating under a current approved COA.

NOTE-
Requests for UAS COAs that fall outside of these perimeters must be processed through the normal online COA application process.

(2) Emergency UAS COAs will not be considered for:

(a) Demonstration flights.

(b) Flights to test capabilities.

(c) Training.

(d) Flights in Class B airspace.

(e) Flights over populated areas.

7. Operations.

a. Types and Authority. Current FAA policy for UAS operations is that no person may operate a UAS in the NAS without specific authority.

(1) Public.

(a) FAA policy restricts COAs to public operations as defined in title 14, Code of Federal Regulations (CFR), Part 1, Definitions & Abbreviations.

(b) For UAS operating as public aircraft, the authority is the COA.

(2) Civil.

(a) Civil applicants must apply for a Special Airworthiness Certificate–Experimental Category.

(b) For UAS operating as civil aircraft, the authority is special airworthiness certificates.

(3) Hobbyist.

(a) Hobbyists should follow the guidance contained in Advisory Circular (AC) 91-57.

(b) For model aircraft, the authority is AC 91-57.

NOTE-
The FAA recognizes that people and companies other than modelers might be flying UAS with the mistaken understanding they are legally operating under the authority of AC 91–57. AC 91–57 only applies to modelers and specifically excludes its use by persons or companies for business purposes.

b. Operations. UAS operations should normally be conducted in the following areas:

(1) Within active restricted areas.

(2) Within active warning areas.

(3) Within active prohibited areas, when authorized.

NOTE-

1. *Procedures for nonjoint-use DOD airfield operations will be specified by the DOD and listed in the COA.*

2. *For those operations that cannot be conducted for private recreational use or cannot be contained wholly within active restricted areas or warning areas, the UAS operations must be conducted following procedures outlined in the issued COA or Special Airworthiness Certificate-Experimental Category.*

c. General Procedures. UAS operating outside of restricted areas and warning areas must comply with the following:

(1) At least 60 business days before the proposed start of UAS operations, the proponent must submit an application for a COA, using the online application system at:

http://oeusers.faa.gov/oeaaa/Welcome.jsp.

NOTE-

1. *Approvals for UAS operations require the proponent to provide the UAS with a method that provides an equivalent level of safety comparable to see-and-avoid requirements for manned aircraft. Methods to consider include, but are not limited to, radar observations, forward- or side-looking cameras, electronic detection systems, visual observation from one or more ground sites, monitoring by patrol or chase aircraft, or a combination thereof.*

2. *Risk mitigations that would depend on the establishment of new types and categories of airspace are not considered acceptable. The NAS is established and configured through a rigorous regulatory process. Risk mitigations that result in the prohibition of the public's right to transit airspace will not be considered.*

(2) COAs must have a termination date not more than 1 year from the effective date unless renewed or revalidated. The COA expires on the stated termination date unless sooner surrendered by the proponent or revoked by the issuing agency.

(3) UAs may be equipped with standard aircraft anticollision or navigation lights following criteria in 14 CFR, section 23.1401. If installed, these lights must be operating during all phases of flight to enhance flight safety.

(4) UAs required to be equipped with an altitude encoding transponder must meet the specifications of 14 CFR, section 91.215. If equipped, the transponder must be set to operate on a code assigned by ATC. Unless the use of a specific, special-use code is authorized, the UAS pilot-in-command must have the capability to reset the transponder code while the UA is airborne. If the transponder becomes inoperative, the mission may be canceled and/or recalled at the discretion of the affected service area or air traffic facility.

(5) The proponent and/or its representatives must be responsible at all times for collision avoidance maneuvers with nonparticipating aviation activities and the safety of persons or property on the surface.

(6) The proponent and/or its representatives are responsible for strict compliance with the Incident/Accident and Normal Reporting Provisions contained in the Special Provisions section of each COA. Further guidance can be found in FAA Order JO 7210.3, Facility Management, Chapter 18, Waivers, Authorizations, and Exemptions. The Certificate of Waiver or Authorization, FAA Form 7711-1, provides additional clarity regarding the strict observance of the terms and conditions set forth in the COA.

8. Procedures. UAS operations may occur within Class A, C, D, E, and/or G airspace. Current FAA policy does not allow UAS operations in Class B airspace; however, the FAA will consider exceptional circumstances. Nighttime operations, for all classes of terminal airspace, may be authorized if the proponent requests approval and a safety analysis for such operation is approved by the FAA.

a. Terminal.

(1) Class C airspace is to be used on a case-by-case basis only. When operating in Class C airspace, UA operators must comply with the following FAA requirements:

(a) Strict compliance with the provisions of the COA is required.

(b) Lost link procedures must be clearly defined. Lost link procedures will be pre-coordinated with the appropriate ATC facility and included in the COA. At a minimum, they will include: lost link route of flight, transponder use, lost link orbit points, communications procedures, and pre-planned flight termination points in the event recovery of the UAS is not feasible.

(c) In the event of lost link, the UA must squawk code 7600.

(d) Direct two-way radio communications with ATC and the UA pilot is required at all times.

(e) Compliance with ATC instructions for arrivals, departures, operations within, and through flight is required.

(f) Pilots/observers must have an appropriate FAA medical certificate or military/agency equivalent.

NOTE-
Pilots may not perform concurrent observer duties.

(g) Pilots must not conduct concurrent or simultaneous UAS operations in the presence of manned aircraft unless approved segregation procedures are written in a letter of agreement with the affected ATC facility and included in the COA.

(h) Use of visual separation by the UA pilot is not authorized.

(i) UA pilots and observers must be responsible for only one UA at a time.

(j) UA operations must not impede, delay, or divert manned operations (for example, excessive departure/arrival delays).

(k) UA operations must not be conducted over populated areas.

(l) All UA operations must be conducted during daylight hours unless authorized in the COA.

(m) Safety alerts will be issued in accordance with FAA Order JO 7110.65, paragraph 2-1-6.

(n) All operations must be conducted under visual meteorological conditions (VMC).

(o) Special VFR procedures are not authorized.

(p) A certified operating mode C/S transponder must be used.

(q) Compliance with mitigations identified in the FAA-approved safety analysis.

(r) A NOTAM issued by the proponent.

(2) UA operators using Class D airspace or operating with a control tower in Class E or G airspace must comply with the following FAA requirements:

NOTE-
All categories of Department of Defense (DOD) UAS operations that have a DOD Memorandum of Agreement (MOA) Class D COA will be conducted wholly within Class D airspace that has an associated DOD-controlled, non-joint-use airfield and must follow uniform air traffic control procedures at all locations. These procedures were developed in coordination with the FAA before implementation and a COA issued to the appropriate DOD air traffic facility.

(a) Strict compliance with the provisions of the COA is required.

(b) Lost link procedures must be clearly defined. Lost link procedures will be pre-coordinated with the appropriate ATC facility and included in the COA. At a minimum, they will include: lost link route of flight, transponder use, lost link orbit points, communications procedures, and pre-planned flight termination points in the event recovery of the UAS is not feasible.

(c) In the event of lost link, the UA must squawk code 7600, if transponder equipped.

(d) Direct two-way radio communications with ATC and the UA pilot is required at all times.

(e) Compliance with all ATC instructions is required.

(f) Dedicated ground/chase aircraft observers are required for all UA flights.

NOTE-
Pilot may not perform concurrent observer duties.

(g) Pilots/observers must have an appropriate FAA medical certificate or military/agency equivalent.

(h) Pilots must not conduct concurrent or simultaneous UAS operations in the presence of manned aircraft unless approved segregation procedures are written in a Letter of Agreement with the affected ATC facility and included in the COA.

(i) Use of visual separation by the UA pilot is not authorized.

(j) UA pilots and observers must be responsible for only one UA at a time.

(k) UA operations must not impede, delay, or divert manned operations (for example, excessive departure/arrival delays).

(l) UA operations must not be conducted over populated areas.

(m) All UA operations must be conducted during daylight hours unless authorized in the COA.

(n) All UA operations must be conducted under VMC.

(o) Special VFR procedures are not authorized.

(p) A NOTAM issued by the proponent.

(3) UA operators using Class E and G airspace must comply with the following FAA requirements:

NOTE-
DOD UAS that have been authorized by the Class G section of the DOD/FAA MOA must remain within clear visual range of the pilot or a certified observer in ready contact with the pilot to ensure separation from other aircraft.

(a) Strict compliance with the provisions of the COA or DOD MOA is required.

(b) Lost link procedures must be clearly defined. Lost link procedures will be pre-coordinated with the appropriate ATC facility and included in the COA. At a minimum, they will include: lost link route of flight, transponder use, lost link orbit points, communications procedures, and pre-planned flight termination points in the event recovery of the UAS is not feasible.

(c) In the event of lost link, the UA must squawk code 7600, if transponder equipped.

(d) Maintain direct two-way radio communication with ATC, when required in the COA.

(e) Compliance with all ATC instructions, if issued, is required.

(f) Dedicated ground/chase aircraft observers are required for all UA flights.

NOTE-
Pilot may not perform concurrent observer duties.

(g) Pilots/observers must have an appropriate FAA medical certificate or military/agency equivalent.

(h) Pilots must not conduct concurrent or simultaneous UAS operations in the presence of manned aircraft unless approved segregation procedures are written in a Letter of Agreement with the affected ATC facility and included in the COA.

(i) In the airport traffic pattern, the UA pilot is not authorized to use visual separation.

(j) UA pilots and observers must be responsible for only one UA at a time.

(k) UA operations must not have an adverse impact on manned operations (for example, excessive departure/arrival delays).

(l) UA operations must not be conducted over populated areas.

(m) All UA operations must be conducted during daylight hours unless authorized in the COA.

(n) Safety alerts will be issued in accordance with FAA Order JO 7110.65, paragraph 2-1-6.

(o) Additional services will be provided as workload and other conditions permit.

(p) All operations must be conducted in VMC.

(q) A NOTAM issued by the proponent.

b. En Route/Terminal Radar Approach Control (TRACON). UA flights in en route and TRACON airspace must be divided into two segments:

(1) Flight below flight level (FL) 180, including Class E and G airspace without a control tower, must comply with the following FAA regulations:

(a) Strict compliance with the provisions of the COA is required.

(b) Lost link procedures must be clearly defined.

(c) In the event of lost link, the UA must squawk code 7600, if transponder equipped.

(d) Direct two-way communications with the UA pilot is required at all times, unless not required in the COA.

(e) Compliance with all ATC instructions is required.

(f) Observers are required. Depending on the altitude of the UA operation, ground observers may be used.

(g) Chase aircraft acting as observers may be required.

(h) A dedicated chase pilot is required when specified.

(i) A dedicated observer is required when specified.

NOTE-
Pilot may not perform concurrent observer duties.

(j) Pilots/observers must have an appropriate FAA medical certificate or military/agency equivalent.

(k) In the airport traffic pattern, the UA pilot is not authorized to use visual separation, accept a clearance for a visual approach, or accept clearance to follow another aircraft.

(l) UA operations must not be conducted over populated areas.

(m) If installed, lights must be operational; night operations must have operational lights including anticollision and navigation lights, at a minimum.

(n) Safety alerts will be issued in accordance with FAA Order JO 7110.65, paragraph 2-1-6.

(o) All operations must be conducted in VMC.

(p) Operations may be conducted on an IFR flight plan or VFR.

(q) If operating IFR, a flight plan must be filed and followed once clearance is received.

(r) An operating mode C/S transponder must be used unless exempted by the COA.

(s) The COA may limit the number of UAs operating in a specific area.

(t) Operations in military operating areas and restricted areas require approval from the using agency.

(u) A NOTAM issued by the proponent.

(2) Flight above 18,000 feet MSL to FL 600, Class A airspace:

(a) The UA pilot must have direct two-way communications with each air traffic controller working the aircraft.

(b) Pilots/observers must have an appropriate FAA medical certificate or military/agency equivalent.

(c) Standard IFR separation will be applied unless noted in the COA.

(d) UA operations must not impede, delay, or divert manned operations.

(e) UA operations must not be conducted over populated areas.

(f) Safety alerts will be issued in accordance with FAA Order JO 7110.65, paragraph 2-1-6.

(g) All operations will be conducted on an IFR flight plan.

(h) An operating mode C/S transponder must be used.

(i) The UA should operate below or above reduced vertical separation minimum (RVSM) altitudes unless it is RVSM-certified. Requests for military non-RVSM-equipped UA in RVSM airspace remains at the discretion of each air traffic controller.

(j) Descent below 18,000 feet MSL in Class D, E, and/or G airspace without visual observers is not authorized.

(k) The pilot must be qualified for manned IFR flight.

(l) Whenever possible, the UA must enter Class A airspace from active restricted airspace. If restricted airspace is not available, a chase aircraft with a dedicated observer must be used until the UA has reached Class A airspace.

(m) Lost link procedures must be clearly defined. Lost link procedures will be pre-coordinated with the appropriate ATC facility and included in the COA. At a minimum, they will include: lost link route of flight, transponder use, lost link orbit points, communications procedures, and pre-planned flight termination points in the event recovery of the UAS is not feasible.

NOTE-
In all classes of airspace, a COA is required for UA flights outside of active restricted or warning areas. The COA will contain additional requirements and compliance is mandatory.

c. Military Operations Interface Offices.

If military operations or facilities are involved, prior coordination by the following appropriate headquarters is required for subsequent interface with FAA. (See FAA Order JO 7110.65, TBL 1-1-3.)

Military Operations Interface Offices

Branch	Address
U.S. Navy / U.S. Marine Corps	Department of the Navy Chief of Naval Operations N8853 2000 Navy Pentagon Washington, DC 20350-2000
U.S. Air Force	HQ AFFSA/A3A Bldg 4 Room 240 6500 S. MacArthur Blvd Oklahoma City, OK 73169 Email: hqaffsa.a3a@tinker.af.mil
U.S. Army	Headquarters USAASA 9325 Gunston Road, Suite N319 Fort Belvoir, VA 22060-5582

9. Distribution. This notice is distributed to the following ATO service units: En Route and Oceanic, Terminal, Mission Support, and System Operations; the ATO Office of Safety; the David J. Hurley ATCSCC; and the Flight Standards Service's divisions at FAA Washington headquarters and international field offices.

10. Background. During the past few years, UA technology has been developing rapidly, driving a profound increase in requested operations in the NAS. Traditionally, UA operations have been conducted by the DOD or other Government agencies within restricted and warning areas. In recent years, the combined increase in requests by Government agencies has tripled, and forecasts suggest the increase will continue for the next 4 years. This notice incorporates information from other publications and serves as a compilation of air traffic topics relating to unmanned aircraft. In many cases, the information contained in this notice is complemented by guidance and directives from the Unmanned Aircraft Program Office under Aviation Safety and other regulations.

11. Authority to Change this Notice. The contents of this notice will be periodically reviewed and updated as required. Exceptional or unusual requirements may dictate procedural deviations or supplementary procedures to this notice. If there are suggestions for revision or any procedural deviation that alters the level, quality, or degree of service, obtain approval from the Vice President, Mission Support Services, Attention: Airspace Services.

12. Definitions.

a. Airworthiness – the condition in which the UAS conforms to its type certification (or military equivalent) and is in condition for safe operation.

b. Altitude –

(1) Mean sea level, unless otherwise specified.

(2) Flight level when followed by "FL."

(3) Above ground level when followed by "AGL."

c. ATC Communications – the voice or data relay of instructions or information between the UAS pilot and the air traffic controller and other NAS users, normally conducted by radio.

d. Autonomous – not controlled by others or by outside forces; independent judgment.

e. Autonomy – the quality of being autonomous; self-determination.

f. Catastrophic – the loss of the UA, other aircraft and/or loss of life.

g. Certificate of Waiver or Authorization (COA) – an FAA grant for a specific UA operation.

h. Civil Aircraft – means aircraft other than public aircraft.

i. Command/Control Link – the systems supporting the exchange of information between the ground control station and the airframe of the flight control systems.

j. Communication Link – the systems supporting the communication between the pilot and ATC, other aircraft, observers, or NAS users.

k. Direct Visual Control – the means by which the UA is controlled and the pilot/observer exercises see-and-avoid responsibilities.

l. Equivalent Level of Safety – an evaluation of a system and/or operation to determine the acceptable risk to people and property.

m. Ground Control Station – the location and equipment used by a pilot.

n. Hobby – model aircraft used for sport and recreation only.

o. Latency – the time incurred between two particular interfaces (for example, data link/communications).

p. Lost Link – loss of command and control link between control station and aircraft. There are two types of link.

(1) Up link – transmits command instructions to the aircraft, and

(2) Down link – transmits the status of the aircraft and provides situational awareness to the pilot.

q. Observer – ground-based personnel or observers within a chase aircraft.

r. Proponent – the person or organization responsible for the COA and operation of the UA.

s. Public Aircraft – aircraft operations that are inherently governmental as defined in 14 CFR, Part 1, Definitions and Abbreviations, Section 1.1, General definitions.

t. Segregation – setting apart from other activities. Segregation is not synonymous with required ATC separation standards. Therefore, segregation does not prescribe or mandate criteria such as vertical, lateral, or longitudinal distances.

u. Unmanned Aircraft (UA) – an aircraft operated without the possibility of direct human intervention from within or on the aircraft.

v. Unmanned Aircraft System (UAS) – airframe, ground control station, command and control links, and crewmembers.

13. Word usage.

a. *May* (need not be followed by a verb) means a procedure is optional.

b. *Must* (followed by a verb or the use of an appropriate action verb in the imperative sense) means a procedure is mandatory.

c. *Should* (followed by a verb) means a procedure is recommended.

d. *Will* (followed by a verb) indicates futurity; not a requirement for application of a procedure.

e. Singular words include the plural and plural words include the singular.

14. Related Publications.

a. Title 14, Code of Federal Regulations, part 91

b. FAA Order JO 7110.65, Air Traffic Control

Unmanned Aircraft System Operations
Industry "Code of Conduct"

The emergence of unmanned aircraft systems (UAS) as a resource for a wide variety of public and private applications quite possibly represents one of the most significant advancements to aviation, the scientific community, and public service since the beginning of flight. Rapid advancements in the technology have presented unique challenges and opportunities to the growing UAS industry and to those who support it. The nature of UAS and the environments which they operate, when not managed properly, can and will create issues that need to be addressed. The future of UAS will be linked to the responsible and safe use of these systems. Our industry has an obligation to conduct our operations in a safe manner that minimizes risk and instills confidence in our systems.

For this reason, the Association for Unmanned Vehicle Systems International (AUVSI), offers this Code of Conduct on behalf of the UAS industry for UAS operation. This code is intended to provide our members, and those who design, test, and operate UAS for public and civil use, a set of guidelines and recommendations for safe, non-intrusive operations. Acceptance and adherence to this code will contribute to safety and professionalism and will accelerate public confidence in these systems.

The code is built on three specific themes: Safety, Professionalism, and Respect. Each theme and its associated recommendations represent a "common sense" approach to UAS operations and address many of the concerns expressed by the public and regulators. This code is meant to provide UAS industry manufacturers and users a convenient checklist for operations and a means to demonstrate their obligation to supporting the growth of our industry in a safe and responsible manner. By adopting this Code, UAS industry manufacturers and users commit to the following:

Safety

- We will not operate UAS in a manner that presents undue risk to persons or property on the surface or in the air.
- We will ensure UAS will be piloted by individuals who are properly trained and competent to operate the vehicle or its systems.
- We will ensure UAS flights will be conducted only after a thorough assessment of risks associated with the activity. This risks assessment will include, but is not limited to:
- Weather conditions relative to the performance capability of the system
- Identification of normally anticipated failure modes (lost link, power plant failures, loss of control, etc) and consequences of the failures
- Crew fitness for flight operations
- Overlying airspace, compliance with aviation regulations as appropriate to the operation, and off-nominal procedures
- Communication, command, control, and payload frequency spectrum requirements
- Reliability, performance, and airworthiness to established standards

Professionalism

- We will comply with all federal, state, and local laws, ordinances, covenants, and restrictions as they relate to UAS operations.
- We will operate our systems as responsible members of the aviation community.
- We will be responsive to the needs of the public.
- We will cooperate fully with federal, state, and local authorities in response to emergency deployments, mishap investigations, and media relations.
- We will establish contingency plans for all anticipated off-nominal events and share them openly with all appropriate authorities.

Respect

- We will respect the rights of other users of the airspace.
- We will respect the privacy of individuals.
- We will respect the concerns of the public as they relate to unmanned aircraft operations.
- We will support improving public awareness and education on the operation of UAS.

As an industry, it is incumbent upon us to hold ourselves and each other to a high professional and ethical standard. As with any revolutionary technology, there will be mishaps and abuses; however, in order to operate safely and gain public acceptance and trust, we should all act in accordance with these guiding themes and do so in an open and transparent manner. We hope the entire UAS industry will join AUVSI in

adopting this industry Code of Conduct.

INTERNATIONAL ASSOCIATION OF CHIEFS OF POLICE

AVIATION COMMITTEE

Recommended Guidelines for the use of Unmanned Aircraft

BACKGROUND:

Rapid advances in technology have led to the development and increased use of unmanned aircraft. That technology is now making its way into the hands of law enforcement officers nationwide.

We also live in a culture that is extremely sensitive to the idea of preventing unnecessary government intrusion into any facet of our lives. Personal rights are cherished and legally protected by the Constitution. Despite their proven effectiveness, concerns about privacy threaten to overshadow the benefits this technology promises to bring to public safety. From enhanced officer safety by exposing unseen dangers, to finding those most vulnerable who may have wandered away from their caregivers, the potential benefits are irrefutable. However, privacy concerns are an issue that must be dealt with effectively if a law enforcement agency expects the public to support the use of UA by their police.

The Aviation Committee has been involved in the development of unmanned aircraft policy and regulations for several years. The Committee recommends the following guidelines for use by any law enforcement agency contemplating the use of unmanned aircraft.

DEFINITIONS:

1. **Model Aircraft** - A remote controlled aircraft used by hobbyists, which is manufactured and operated for the purposes of sport, recreation and/or competition.
2. **Unmanned Aircraft (UA)** – An aircraft that is intended to navigate in the air without an on-board pilot. Also called Remote Piloted Aircraft and "drones."
3. **UA Flight Crewmember** - A pilot, visual observer, payload operator or other person assigned duties for a UA for the purpose of flight.
4. **Unmanned Aircraft Pilot** - A person exercising control over an unmanned aircraft during flight.

COMMUNITY ENGAGEMENT:

1. Law enforcement agencies desiring to use UA should first determine how they will use this technology, including the costs and benefits to be gained.
2. The agency should then engage their community early in the planning process, including their governing body and civil liberties advocates.
3. The agency should assure the community that it values the protections provided citizens by the U.S. Constitution. Further, that the agency will operate the aircraft in full compliance with the mandates of the Constitution, federal, state and local law governing search and seizure.
4. The community should be provided an opportunity to review and comment on agency procedures as they are being drafted. Where appropriate, recommendations should be considered for adoption in the policy.
5. As with the community, the news media should be brought into the process early in its development.

SYSTEM REQUIREMENTS:

1. The UA should have the ability to capture flight time by individual flight and cumulative over a period of time. The ability to reset the flight time counter should be restricted to a supervisor or administrator.
2. The aircraft itself should be painted in a high visibility paint scheme. This will facilitate line of sight control by the aircraft pilot and allow persons on the ground to monitor the location of the aircraft. This recommendation recognizes that in some cases where officer safety is a concern, such as high risk warrant service, high visibility may not be optimal. However, most situations of this type are conducted covertly and at night. Further, given the ability to observe a large area from an aerial vantage point, it may not be necessary to fly the aircraft directly over the target location.
3. Equipping the aircraft with weapons of any type is strongly discouraged. Given the current state of the technology, the ability to effectively deploy weapons from a small UA is doubtful. Further, public acceptance of airborne use of force is likewise doubtful and could result in unnecessary community resistance to the program.
4. The use of model aircraft, modified with cameras, or other sensors, is discouraged due to concerns over reliability and safety.

OPERATIONAL PROCEDURES:

1. UA operations require a Certificate of Authorization (COA) from the Federal Aviation Administration (FAA). A law enforcement agency contemplating the use of UA should contact the FAA early in the planning process to determine the requirements for obtaining a COA.
2. UA will only be operated by personnel, both pilots and crew members, who have been trained and certified in the operation of the system. All agency personnel with UA responsibilities, including command officers, will be provided training in the policies and procedures governing their use.
3. All flights will be approved by a supervisor and must be for a legitimate public safety mission, training, or demonstration purposes.
4. All flights will be documented on a form designed for that purpose and all flight time shall be accounted for on the form. The reason for the flight and name of the supervisor approving will also be documented.
5. An authorized supervisor/administrator will audit flight documentation at regular intervals. The results of the audit will be documented. Any changes to the flight time counter will be documented.
6. Unauthorized use of a UA will result in strict accountability.
7. Except for those instances where officer safety could be jeopardized, the agency should consider using a "Reverse 911" telephone system to alert those living and working in the vicinity of aircraft operations (if such a system is available). If such a system is not available, the use of patrol car public address systems should be considered. This will not only provide a level of safety should the aircraft make an uncontrolled landing, but citizens may also be able to assist with the incident.
8. Where there are specific and articulable grounds to believe that the UA will collect evidence of criminal wrongdoing and if the UA will intrude upon reasonable expectations of privacy, the agency will secure a search warrant prior to conducting the flight.

IMAGE RETENTION:

1. Unless required as evidence of a crime, as part of an on-going investigation, for training, or required by law, images captured by a UA should not be retained by the agency.
2. Unless exempt by law, retained images should be open for public inspection.

Association News

AUVSI Study Finds Unmanned Aircraft Industry Poised to Create 70,000 New Jobs in the U.S. in Three Years
New Study Finds Enormous Job Creation Potential Following Integration of Unmanned Aircraft into the National Airspace
12 March 2013

Today, AUVSI unveiled a new study, which finds that the unmanned aircraft industry is poised to create more than 70,000 new American jobs in the first three years following the integration of unmanned aircraft systems (UAS) into U.S. national airspace system (NAS). Integration is scheduled to take place in 2015. Beyond the first three years, the study projects that more than 100,000 new jobs will be created by 2025.

"This is an incredibly exciting time for an industry developing technology that will benefit society, as well as the economy," said Michael Toscano, president & CEO of AUVSI. "In recent years, unmanned aircraft technology has grown remarkably and is already proving useful in a range of domestic applications. Integrating UAS into the national airspace will lead to new and expanded uses, which means the creation of quality, high-paying American jobs."

Specifically, the study finds:

• In the first three years following integration into the NAS, more than 70,000 new jobs will be created.

• In the first three years following integration, the total economic impact stemming from the integration is projected to surpass $13.6 billion and will grow sustainably for the foreseeable future, cumulating in more than $82.1 billion in impact between 2015 and 2025. Economic impact includes the monies that flow to manufacturers and suppliers from the sale of new products as well as the taxes and monies that flow into communities and support the local businesses.

• The study projects integration will lead to 103,776 new jobs nationally by 2025. Many of these jobs are portable and will gravitate toward states with favorable regulatory structures and infrastructure. Future events – such as the establishment of FAA Test Sites – will ultimately determine where many of these new jobs will flow.

• Additional economic benefit will be seen through tax revenue to the states, which will total more than $482 million in the first decade following the integration.

• Every year that integration is delayed, the United States loses more than $10 billion in potential economic impact. This translates to a loss of $27.6 million per day that UAS are not integrated into the NAS.

The complete study, including state-by-state breakdowns of economic impact projections, is available at http://www.auvsi.org/econreport.

"While we project more than 100,000 new jobs by 2025, states that create favorable regulatory and business environments for the industry and the technology will likely siphon jobs away from states that do not," wrote the report's author, Darryl Jenkins, a past professor at George Washington University and Embry Riddle Aeronautical University.

Nationally, the precision agriculture industry is expected to be the largest market for UAS technology, the AUVSI study finds. UAS will help farmers monitor crops and distribute pesticides, which could not only help improve efficiency, but also reduce the total amount of pesticides sprayed, saving money and reducing environmental impact. The public safety sector is another area that will benefit from the tremendous potential for UAS technology. UAS have the capability to help police and firefighters— who put themselves into harm's way every day to protect the communities they serve — do their job safely and efficiently.

The report was commissioned by AUVSI and developed by Jenkins, an aviation industry economist with more than 30 years of experience. Mr. Jenkins is the author of the Handbook of Airline Economics and previously served as the director of the Aviation Institute at George Washington University in Washington, D.C.

AUVSI Joins New Coalition to Promote Innovation, Jobs and Safety
Virginia Poised to Attract FAA Test Site
4 March 2013

The Virginia Technology Alliance for Public Safety (VATAPS) announced its official launch as a grassroots coalition promoting the economic development and public safety benefits of new technology in the field of Unmanned Aircraft Systems (UAS). The organization will highlight new jobs and investments associated with encouraging responsible research, development and testing of UAS in the Commonwealth.

"This is an opportunity to bring jobs, innovation and more technology to Virginia at a time when the federal government is cutting other programs," says Michael Toscano, AUVSI president & CEO and member of the alliance. "These are good paying jobs that will save lives, save money as well as spawn research programs at Virginia's colleges and universities." A soon to be released study conducted by AUVSI indicates Virginia could see 2,380 new jobs and $460 million in economic investment if the state embraces programs to research, develop and test UAS. The study indicates many of those jobs would pay starting salaries in the $55,000 range.

The Federal Aviation Administration (FAA) has announced plans to designate six test sites for development of UAS. Virginia is currently pursuing an FAA designation as part of a coalition lead by Virginia Tech.

The formation of VATAPS follows the passage of legislation by the Virginia General Assembly in the form of House Bill 2012 (HB2012) and Senate Bill 1331 (SB 1331), which place a two year-moratorium on the use of UAS. The legislation allows an exception for search and rescue operations, but fails to recognize other public safety applications and embrace the economic benefits of promoting responsible UAS- related research and development in the state.

"The advantages and uses of unmanned aircraft systems for public safety are greatly misunderstood and often falsely associated with military drones," says

Robert Fitzgerald, president of Bosh Global Services in Newport News and member of the alliance. "We are developing small, lightweight UAS that can aid in assessing natural disasters, fires, hazardous spills and other dangerous situations remotely without putting additional lives at risk."

"The safety of public officers in Virginia and across the country is of paramount importance. There are examples where officers have been endangered but could have been protected by the use of UAVs," says John Jones, executive director of the Virginia Sheriffs Association and member of the alliance. "Any Virginia law on UAVs needs to address existing emergency situations and other non-emergency applications. It is imperative that Governor Bob McDonnell take a very close look at this issue and its implications before he agrees to sign the bill into law."

Toscano adds, "The six FAA test sites for unmanned aircraft are expected to be an economic windfall for the states that are selected. But states that are advancing overly-restrictive legislation to limit the use of this technology are hurting their chances of attracting high-quality jobs. There is no reason we cannot responsibly advance this technology while simultaneously ensuring Americans' rights are protected. We would encourage officials in all states, and especially those seeking test sites, to work collaboratively to ensure that legislation doesn't undermine the job creation potential of unmanned aircraft or their state's ability to compete for a test site."

Charter members of VATAPS include aeronautics technology companies along with public safety and law enforcement agencies. VATAPS plans to launch an educational awareness and public information campaign as it recruits additional members.

AUVSI Statement on FAA's Request for Proposals to Receive an FAA UAS Test Site
14 February 2013

Today, AUVSI President & CEO Michael Toscano released the following statement on the Federal Aviation Administration's (FAA) request for proposals to develop and test unmanned aircraft systems (UAS) at six sites around the country:

"Today's announcement by the FAA is an important milestone on the path toward unlocking the potential of unmanned aircraft, and creating thousands of American jobs. Whether it is helping search and rescue teams, assisting in disaster response, or aiding scientific research, unmanned aircraft extend the human reach and allow us to accomplish dangerous and difficult tasks safely and efficiently.

"States across the country have been eager to receive this FAA designation because they recognize the incredible economic and job creation potential it would bring with it. While we would prefer the FAA not limit the number of test sites, we applaud the agency for finally taking this important step, which will help create jobs and ensure the U.S. remains a global leader in aviation innovation."

The FAA's announcement, which can be found here announcement, is part of the process to integrate UAS into the National Airspace System by 2015 as required by the FAA Modernization and Reform Act, which was signed into law on 14 Feb. 2012. AUVSI does not endorse any individual test site proposal.

With the demand for UAS on the rise, the industry recently released a Code of Conduct for UAS manufacturers and operators to ensure the safe, professional and respectful use of unmanned aircraft. The International Association of Chiefs of Police also released a set of guidelines last year for the use of unmanned aircraft, which addressed issues such as search warrants and image retention, and encouraged community engagement.

AUVSI Chairman Cautions Va. Governor on Pending UAS Moratorium Legislation
8 February 2013

AUVSI Chairman Peter Bale wrote a letter to Virginia Gov. Bob McDonnell regarding pending legislation that would impose a moratorium on the use of unmanned aerial vehicles by public agencies in Virginia. In the letter, Bale writes how the proposed moratorium will not only deny public safety officers the use of potentially life-saving technology, but also hurt Virginia's economy and potentially impede scientific endeavors at Virginia universities. Read the text of the letter is below.

Dear Governor McDonnell,

I would like to express serious concern with two pieces of pending legislation, Virginia House Bill 2012 and Virginia Senate Bill 1331, which would impose a two-year moratorium on the use of unmanned aerial systems (UAS) by police and government agencies in Virginia. As Chairman of the Association for Unmanned Vehicle Systems International (AUVSI), the world's largest non-profit organization devoted exclusively to advancing unmanned systems, I believe this proposed moratorium will not only hinder the ability of UAS to assist police, firefighters and other first responders in keeping Virginia communities safe, but also jeopardize current and future manufacturing jobs in the Commonwealth in the rapidly growing unmanned systems sector.

As you are well aware, public safety agencies see tremendous benefits in using UAS. They have the capability to help police and firefighters, who put themselves into harm's way every day in order to protect the communities they serve, do their job safely and efficiently. A UAS flying over a structure fire can provide firefighters with critical situational awareness, while reducing the danger to which they are exposed. A UAS flying over a wooded area can help police searching for a missing child quickly, when time is of the essence. And in times of tight budgets, UAS can provide the same capability of a manned helicopter at a fraction of the operational cost, saving taxpayer dollars.

However, the proposed moratorium would hinder these public safety agencies from using UAS.

I am also greatly concerned about the impact of this legislation on Virginia's economy. A forthcoming study commissioned by my organization projects that in the first three years following the integration of UAS into the national airspace, Virginia stands to gain 2380 new jobs and more than $460 million in economic impact.

Additionally, as you know, Virginia is interested in joining Maryland and New Jersey in putting forth a joint-bid for one of six test sites designated by the Federal Aviation Administration for the development of UAS. These test sites would most certainly be job creators and bring economic activity to the Commonwealth. However, if the moratorium were to become law, the plan for a test site, and the economic benefit that would come with it, will most certainly be in jeopardy.

Not only would future job prospects dim, but current businesses and those they employ would be at risk. More than 50 companies that manufacture UAS have a footprint in Virginia. A moratorium would create an unfriendly environment for these companies, which as a result might look to take their business, as well as jobs, elsewhere.

If the moratorium passes, scientific research could join public safety as a casualty. Right now, students at Virginia Tech are using UAS to research the spread of disease among plants and animals. Students at the University of Virginia are using 3D-printing to create an inexpensive UAS that could be quickly produced and deployed to respond to emergencies. These and other research pursuits by public institutions could be curbed by a moratorium.

As Governor, you have been an outstanding advocate for the potential of UAS. We greatly appreciate your support for the advancement of UAS technology as a tool to save time, save money and even save lives. We ask that you do everything you can to oppose this moratorium, which will hinder a remarkable technology and everyone who might one day be helped by it.

Sincerely,
Peter Bale
Chairman
Association for Unmanned Vehicle Systems International

AUVSI Congratulates Michael Huerta on his FAA Administrator Confirmation
3 January 2013

AUVSI President & CEO Michael Toscano today congratulated Michael Huerta on his confirmation as the administrator of the Federal Aviation Administration (FAA).

"For more than a year, Michael Huerta has led the FAA admirably as acting administrator, and we are pleased to see Congress make his appointment official," Toscano said. "These next several years are important ones for the FAA, as the agency moves forward with the integration of unmanned aerial systems (UAS) into the National Airspace System (NAS) and continues to develop the NextGen air traffic control system."

Toscano said, "This is a critical time for the FAA and the aerospace industry, and it is important that the FAA have a permanent leader to advance these priorities, especially the integration of UAS. This technology holds tremendous potential to save money, save time and, most importantly, save lives. Strong

and clear leadership is needed to make sure that the process stays on track, and Huerta's confirmation is a step in the right direction."

"We look forward to working with Administrator Huerta in the coming months and years to advance these innovations in a safe manner, in keeping with the FAA's primary mission. We are confident that under Administrator Huerta's leadership, the FAA will continue to ensure that the United States aerospace industry stays at the forefront of aviation safety and technological advances," Toscano said.

AUVSI to FAA: Focus on your Mission, Proceed with UAS Integration
28 November 2011

Selection of six UAS test sites more than three months delayed...and counting

AUVSI Chairman of the Board Peter Bale and President & CEO Michael Toscano today requested the Federal Aviation Administration (FAA) focus on its commitment to innovative partnerships and proceed with the integration of unmanned aerial systems (UAS) into the National Airspace System (NAS). The selection of six UAS test sites has been delayed by more than three months so far, despite a congressionally mandated timetable for the site selection process and overall integration.
Recently, the FAA has begun citing privacy issues as a reason for delaying UAS integration. However, the primary mission of the FAA is safety. The establishment of UAS test sites will help the FAA establish safety criteria for UAS, which is a completely separate issue from privacy concerns. Yet, in a letter to Rep. Howard McKeon (R-Calif.) earlier this month, Acting FAA Admistrator Michael Huerta wrote that the FAA must fulfill its obligations in a manner that, among other goals, "addresses privacy issues."

AUVSI Chairman of the Board Peter Bale and President & CEO Michael Toscano today released the following statement:

"Unmanned Aerial Systems (UAS) hold tremendous potential to keep the public safe, create lasting jobs, boost local economies and further advance the U.S. as a leader in technology and innovation. That's why, in February of this year, Congress required the FAA to safely integrate UAS into the U.S. airspace by September 2015.

"Congress had the foresight to lay out a multi-year timetable for the integration of UAS, so all stakeholders would have time to work collaboratively to advance this technology in a safe and responsible manner. The FAA should adhere to the will of Congress as well as focus on the agency's stated mission of providing 'the safest, most efficient aerospace system in the world.'

"AUVSI and its members are committed to working with all stakeholders to ensure privacy concerns are addressed while advancing this beneficial technology, and work is ongoing in this area. To date, AUVSI has met with a nearly a dozen privacy and civil liberties organizations, in addition to over 100 congressional offices, and AUVSI recently adopted an industry code of conduct that addresses privacy.

"There is also already a growing consensus among law enforcement agencies about the proper use of UAS. The International Association of Chiefs of Police (IACP) adopted UAS guidelines that have won praise from the ACLU. Three other law enforcement associations subsequently endorsed the IACP guidelines.

"As an industry, we support a continued, civil dialogue on privacy, but any such conversations should take place concurrent with the integration. The selection process for the six test sites are a separate issue and should be treated as such. Meanwhile, the FAA should adhere to its mission and do what it does best – focus on the safety of the U.S. airspace – while other, more appropriate institutions consider privacy issues.

"We request the FAA to immediately announce its UAS test site selection process to move UAS integration forward without further delay."

- Link to AUVSI's previous letter to the FAA on the site selection delay

AUVSI Launches New Industry Career Center
19 November 2012

AUVSI launched a new industry Career Center today. AUVSI's Career Center is the leading employment resource for job-seekers and employers in the unmanned systems industry. Browse job listings or post a position today!

AUVSI Corporate Members can post unlimited jobs in the new career center for free!

AUVSI Launches Public Education Website to Highlight Benefits of Unmanned Systems
2 November 2012

Today AUVSI launched a public education website, www.increasinghumanpotential.org, to highlight the valuable and endless benefits of all unmanned systems and robotics.

The website shows how the unmanned systems and robotics industry literally increases human potential by working for the human in dull, dirty, dangerous and difficult tasks.

The site promotes the use of unmanned systems and robotics in the following categories:

By Land, Air and Sea
Jobs and Economy
Enhancing Public Safety
Mitigating and Monitoring Disasters
Helping the Environment
Fostering Education and Learning
Increasing Efficiency in Agriculture
FAA Flight Restrictions

Visit www.increasinghumanpotential.org today to learn more about the endless applications of unmanned systems and robotics.

AUVSI's Executive Vice President Gretchen West Testifies at Rep. Poe's Field Hearing on Privacy, Spoofing
25 October 2012

AUVSI's Executive Vice President Gretchen West testified at Rep. Ted Poe's (R-Texas) field hearing at Rice University on UAS privacy issues and spoofing.

Read West's opening statement:

Congressman Poe, I want to thank you, and the rest of the members for the opportunity to participate in today's forum on unmanned aircraft systems (UAS). I also want to thank Rice University for hosting this event, and congratulate President Leebron for his school's prowess in last year's NASA design showcase. In this prestigious event, Rice students won top awards for designing and building unmanned aircraft systems; this is one example of significant contributions American universities are making to the dynamic global aerospace industry.

There is a lot I would like to say about the tremendous potential of this technology, but before I do, let me first say a few words about the Association for Unmanned Vehicle Systems International – or AUVSI.

AUVSI is the world's largest non-profit organization devoted exclusively to advancing the unmanned systems and robotics community. We have more than 6,300 members in the United States, including 225 here in Texas, such as BAE Systems, Lockheed Martin, L-3 Communications, Raytheon and Rockwell Collins. Many other members are small businesses that support and supply this high-tech industry.

For years, AUVSI has been a leading advocate for the safe integration of unmanned aircraft into the United States National Airspace System. That's why we were delighted earlier this year when Congress recognized what those of us in the industry have known for a long time – that unmanned aircraft bring a host of positive benefits for our society and hold the remarkable potential to create jobs.

Whether it is helping search and rescue teams find a lost child, providing agricultural benefits or helping to fight wildfires, the applications of unmanned aircraft in the United States are virtually limitless. The benefits of UAS aren't just theoretical, however; the technology is already demonstrating its value in the United States, and its value to Texas. Let me provide just a few examples:

• U.S. Customs and Border Protection (CBP) currently uses unmanned aircraft to monitor the U.S. border, including the 1,241 mile border that Texas shares with Mexico. According to the CBP, unmanned aircraft in 2011 assisted with the seizure of thousands of pounds of narcotics and the apprehension of dozens of individuals taking part in illegal activities along the border.

• Texas is home to some of the world's largest energy companies, and several – including Shell, BP and ConocoPhillips – want to use UAS to more cost-effectively monitor critical energy infrastructure.

• Around June of each year, Texas and the Gulf Coast brace for hurricane season. Now, researchers at NASA are flying unmanned aircraft into and above hurricanes, something which is often too dangerous or difficult for manned aviation, to study how these storms form and develop to better predict hurricane tracks and make earlier evacuation decisions. As a result of UAS, Texas residents along the Gulf Coast will be much safer in the years to come.

These are just a few examples of the real-world applications of UAS. And there are many, many more.

In addition to the societal benefits of unmanned aircraft, the expansion of this technology will help drive economic growth in Texas and around the country. A 2010 study by our organization found that the integration of UAS into national airspace could add at least 23,000 new jobs by 2025, translating into roughly $107 million in wages each year.

The state of Texas, with an already thriving aerospace industry, is well positioned to reap these economic benefits. Texas has the human capital, with more than 200,000 aerospace and aviation industry workers currently employed at 1,665 companies. Meanwhile, the state is already hard at work attracting new aerospace jobs and investment including jobs in unmanned systems. The Texas Enterprise Fund, spearheaded by Gov. Rick Perry, has infused more than $44 million into aerospace-related projects since the fund was established in 2003.

As this technology advances, we are also mindful that unmanned aircraft must be operated in a safe and responsible manner. Safety has always been a top priority for our industry. In fact, safety is also one of three main pillars of the industry's new Code of Conduct, which was published this summer. We are in regular contact with the Federal Aviation Administration (FAA) and we have met with, and continue to maintain an open dialogue with, representatives from the pilot community, air traffic controllers and others with an interest in aviation safety.

We also steadfastly support Americans' right to privacy. And just like other new technologies such as cell phones, GPS and even social networking websites like "Facebook," a reasonable conversation about the implications of a new technology is entirely appropriate. That is why AUVSI has fostered a dialogue with privacy advocates and civil liberties organizations to discuss how we can ensure Americans' rights are protected as the use of this technology advances. In July, AUVSI endorsed federal privacy legislation that reaffirms citizens' Fourth Amendment rights with regard to the use of UAS. Our Code of Conduct also articulates our commitment to respecting individuals' privacy.

As we embark on this discussion of law enforcement's use of unmanned aircraft, it is important to emphasize that law enforcement already uses existing and developing technologies on manned aircraft. Unmanned aircraft simply offer a new platform for these technologies. I would also like to take a minute to recognize and applaud the proactive steps law enforcement officials have taken to ensure the safe and responsible use of UAS. Notably, the International Association of Chiefs of Police (IACP) last summer released its own detailed guidelines for UAS operations, which were quickly adopted by several other law enforcement organizations. The guidelines – which address privacy, the use of warrants and data retention – were not only praised by our industry, but the ACLU as well.

Law enforcement entities are already demonstrating a commitment to safety and privacy. Here again, Texas is leading the way.

Less than 300 miles from where we sit today, the Arlington Texas Police Department is developing what could one day be the model for law enforcement UAS programs across the country. The department has created a comprehensive framework for UAS operations that includes pre-flight checklists, flight and maintenance logs, training protocols and standard operating procedures for all UAS flights. Arlington plans to use UAS to survey multi-car crashes on interstate highways, to reduce the time officers spend roadside, cut down on pollution and clear congestion more quickly.

Clearly, we are just beginning to realize and unlock the tremendous potential of this technology. Unmanned aircraft extend our human potential and allow us to execute dangerous or difficult tasks safely and efficiently, saving time, saving money and, most importantly, saving lives.

As an industry, we believe all stakeholders can work together to advance this technology in a thoughtful way that recognizes the benefits and creates jobs while protecting Americans' safety, as well as their individual rights to privacy.

Thank you, and I look forward to your questions.

AUVSI Welcomes Formation of Senate Unmanned Aerial Systems Caucus
28 September 2012

Sens. Inhofe, Manchin Form Bipartisan Caucus to Educate Senators about the Potential Applications of Unmanned Systems

AUVSI welcomed the announcement from Capitol Hill that Sens. Jim Inhofe (R-Okla.) and Joe Manchin (D-W.Va.) formed the Senate Unmanned Aerial Systems Caucus. The mission of the bipartisan caucus will be to educate senators and staffers on the capabilities of unmanned systems and work closely together to best shape the unmanned systems policymaking process.

"I would like to commend Senators Inhofe and Manchin for their leadership and commitment in establishing the caucus, which will enable AUVSI to work with the Senate and stakeholders on the important issues that face the unmanned systems community as the expanded use of the technology transitions to the civil and commercial markets," said AUVSI President & CEO Michael Toscano. "It is our hope to establish the same open dialogue with the Senate caucus as we have for the past three years with the House Unmanned Systems Caucus."

Unmanned systems extend human potential, allowing us to execute dangerous or difficult tasks safely and efficiently. Whether bolstering search and rescue efforts; studying and aiding in natural and man-made disasters; or supporting security missions and protecting the environment, unmanned systems are capable of saving time, saving money and, more importantly, saving lives.

"I am enthusiastic about the announcement that Senator Manchin (D-W.V.) and I were able to introduce and will co-chair the Senate Unmanned Aerial Systems Caucus," said Sen. Inhofe. "The caucus will help educate senators and staff on the importance of all unmanned systems, including air, land and sea-based platforms. Federal policies and legislation relating to unmanned systems are still in its infancy and concerns of the platforms need to be addressed. This caucus will help develop and direct responsible policy to best serve the interests of U.S. national defense and emergency response, and work to address any concerns from senators, staff and their constituents. I hope that all of our colleagues in the Senate will join and participate in this bipartisan caucus."

Over the next decade, there will be an exponential growth in unmanned systems technology and operations. Congress will play a critical role in writing and passing laws that will set policy, direct oversight and provide direction for unmanned systems integration, development and utilization. The Senate Unmanned Aerial Systems Caucus will serve as a venue to discuss issues.

"The increased use of unmanned aerial systems carries great potential – and great risk," Sen. Manchin said. "It's important for all of us to understand how we can use this advancing technology to strengthen our national security and improve our ability to respond in case of natural or man-made disasters, while at the same time ensuring the privacy of all of our law-abiding American citizens. I am so appreciative of Senator Inhofe's work on this issue, and I look forward to working together in a bipartisan way to keep our colleagues updated on the emerging policy issues involving this technology."

AUVSI Holds Largest Gathering of Unmanned Systems, Robotics Technology in the World
20 August 2012

The Association for Unmanned Vehicle Systems International turned the Mandalay Bay Convention Center into a robotics playground 6-9 August, when it brought together the largest display of unmanned systems and robotics technology in the world.

With more than 550 exhibitors and 7,400 attendees, AUVSI's Unmanned Systems North America 2012 highlighted the future of unmanned systems in military, civilian and commercial applications.

Highlights from the conference include affirmation for unmanned systems in life saving applications in the military; a commitment to integrate unmanned systems into the U.S. National Airspace System; and a pledge from the industry to work with government, civil liberties groups and others to ensure integration is done safely with respect to privacy.

Day one of the convention opened with Federal Aviation Administration (FAA) Acting Administrator Michael Huerta highlighting the progress his agency has made in working to integrate unmanned air vehicles into the national airspace.

Part of the framework to integrate UAS is moving ahead, he said, with the FAA due to soon ask for proposals to manage the upcoming six test sites still currently under selection.

"We need to make sure we use these sites to obtain the very best data that we possibly can," he said.

The agency has also streamlined its certificate of authorization process, with the average non-emergency COA approval down to 60 days, and the FAA now provides two-year authorizations instead of one. This expedited process has been possible due to an internal reorganization that moved all the FAA's unmanned work into its new Unmanned Aviation Systems Integration Office.

Though the agency has come a long way, Huerta said it still has more to go.

"We need to change the way we do business as well," he said.

Huerta highlighted three core areas the FAA needs to work on: make the airspace system smarter and safer, bring technology benefits to the users, and task employees to think creatively and innovatively in a tight budget.

"There's a lot of work that needs to be done to move integration for all UAS forward, but I'm very, very optimistic that we will get there."

Day two kicked off with an affirmation of the life saving capabilities of unmanned systems when Navy Seal Lt. Cmdr Rorke Denver addressed attendees.

Denver has seen action in the Middle East, Africa and Latin America, and has made use of unmanned aircraft and unmanned underwater vehicles.

"The fact of the matter is ... I have been a benefactor from the technologies and the things that have been developed" by the people in the room, he said.

He has thrown a Raven into the air, similar to a scene in the movie, and "I've had ScanEagle, Tiger Shark, all kinds of Predators above my head helping leverage those technologies in a way that protected my guys, it made us win on the battlefield when we might not have otherwise."

He said he also made use of an unmanned underwater vehicle off the coast of Monrovia.

"We're in there with these lead lines and slates doing this classical SEAL UDT mission and this EMD guy comes walking up" with a vehicle that looks like a torpedo.

It was an unmanned underwater vehicle, "somebody probably made it in here," he said. "You throw this thing in the water and it's got side-scan radar ... an hour later it pops onto the surface, we plug it into a laptop and up pops a map" and the team was able to plot its path.

"Just remarkable technology," he said.

Chairman's Address

Finally, AUVSI Chairman of the Board Peter Bale promised attendees that the industry will, in time, figure out how to make these advances and respect all values.

"I don't want to look back on the process of figuring this out and have regrets that we learned lessons with blood or scandal that could have been avoided," Bale said. "The technology has arrived and is ready. That means it is time to figure out the public safety and civil rights issues."

Bale went on to say, "The FAA test ranges and the window until September of 2015 represent our chance to get this right on the front end. None of us, in or out of government, are quite sure how this process will unfold but I am pledging this organization's support and asking for your personal and professional assistance in answering these questions.

"Parallel with the FAA test range process that figures out the flight safety procedures and standards, I want to ask the law enforcement, criminal justice and civil rights communities to use these three years to help sort out the civil rights issues. I am pledging myself and this organization to engage in a serious dialogue with any and all concerned.

"Politics does not have to be zero sum. This is not a choice between embracing technology or respecting deeply cherished values — we can do both. I look forward to the process and let's get it right. There is too much at stake not to."

SAVE THE DATE: AUVSI's Unmanned Systems 2013 will be held in Washington, DC at the Walter E. Washington Convention Center, 12-15 August 2013.

AUVSI Applauds Police Chiefs for Adopting Guidelines for the Safe and Responsible Use of Unmanned Aircraft
16 August 2012

Today, AUVSI applauded the International Association of Chiefs of Police (IACP) for adopting guidelines for the use of unmanned aircraft systems (UAS). The guidelines provide law enforcement agencies an outline of how to use UAS safely and responsibly, and with respect to individuals' privacy. The adoption of the IACP guidelines follows the recent adoption of AUVSI's "Code of Conduct" for those who design, test and operate UAS.

"We applaud the IACP for putting forward these guidelines as part of law enforcement's simultaneous commitment to protect communities, as well as the rights of the members of those communities," said Michael Toscano, president and CEO of AUVSI. "Unmanned aircraft could help law enforcement agencies with missions such as search and rescue or crime scene photography, often at a lower cost than manned aircraft. The more the law enforcement community, privacy advocates, government and other stakeholders work together to address issues such as privacy, the faster we can unlock the incredible potential of unmanned aircraft to help save time, save money and most importantly, save lives."

The IACP guidelines, which can be found here, cover community engagement, system requirements, operational procedures and image retention. They direct law enforcement agencies to engage with the community, specifically their governing body and civil liberties advocates, about how UAS will be used and protections put in place to uphold citizens' rights. The guidelines also encourage notifying those living and working in the vicinity of aircraft operations, when possible. The guidelines call for a transparent implementation process for agencies desiring UAS, including a period of public comment.

The guidelines include specific steps law enforcement should take to respect the privacy of individuals:
• Where there are specific and articulable grounds to believe that the (unmanned aircraft) will collect evidence of criminal wrongdoing and if the (unmanned aircraft) will intrude upon reasonable expectations of privacy, the agency will secure a search warrant prior to conducting the flight.
• Unless required as evidence of a crime, as part of an on-going investigation, for training, or required by law, images captured by a UAS should not be retained by the agency.
• Unless exempt by law, retained images should be open for public inspection.

A poll conducted earlier this year by Monmouth University found strong public support for law enforcement's use of UAS in search and rescue missions, tracking runaway criminals, protecting U.S. borders and controlling illegal immigration. Currently, however, fewer than 3% of law enforcement units have aviation assets because of the high operating costs of manned aircraft. UAS provide a cost-effective alternative. The Sheriff's Office in Mesa County, Colo., operates an unmanned aircraft at the cost of $3.36 per hour, compared to $250 to $600 per hour for a manned aircraft. The purchase price of a UAS is also significantly less than a manned aircraft, costing about the price of a patrol car with standard police gear. The vast majority of UAS currently flying in the U.S. are small models that weigh less than 25 lbs and can fit in the trunk of a car.

Read more about how law enforcement agencies around the country are using UAS:
• The New Eye in the Sky over Mesa County – 9News, Denver
• Arlington PD Testing Unmanned Aircraft – KXAS, Dallas
• Drones tested as tools for police and firefighters – *Los Angeles Times*

AUVSI Announces Newly Elected Board of Directors
31 July 2012

AUVSI announces its newly elected leaders on its Board of Directors.

Officers elected for the 2012-2013 term are Peter Bale, chairman; John Lademan, executive vice chairman; Ralph Alderson, first vice chairman and Joe Brannan, treasurer. Additionally, John Lambert continues as immediate past chairman for this term.

Newly elected to the AUVSI Board of Directors:
Jason Grabinsky
Heather Griffith
Steve Pennington
Chad Partridge
Dave Seagle
Michelle Kalphat

Continuing AUVSI Board of Directors:
Virginia Young
Grant Begley
Matt England
Gene Fraser
Stephen Newton
David Place
Peter Smith
Tim Heely
Neil Hunter
Rick Lynch
Mark Patterson

"These officers and directors represent a wide range of companies and institutions in the global unmanned systems and robotics community, bringing expertise in technology, applications and markets related to this rapidly emerging industry," said AUVSI Chairman of Board of Directors Peter Bale. "We congratulate those elected and look forward to their service on the board."

The new term of office for the board of directors starts at AUVSI's Unmanned Systems North America 2012 in Las Vegas, 6-9 August, where more than 8,000 attendees from 40 countries will see 550+ exhibits and participate in 100+ educational sessions, showcasing the present and future capabilities of unmanned systems and robotics technology.

Unmanned Aircraft Industry Backs Privacy Legislation
By Melanie Hinton
19 July 2012

Today, the Association for Unmanned Vehicle Systems International (AUVSI) announced support for legislation to reaffirm individuals' Constitutional protections against unreasonable searches. An amendment included in the Department of Defense Appropriations bill, introduced by Rep. Frank LoBiondo, R-N.J., only allows funding for the operation of UAS "in accordance" with the Fourth Amendment.

"The unmanned aircraft systems industry strongly supports Rep. LoBiondo's amendment included in the Defense Appropriations bill, which reaffirms Americans' Constitutional rights. Unmanned aircraft can help our police, fire fighters and first responders save time, save money and most importantly, save lives, while fully respecting Americans' rights to privacy. This amendment is right inline with our commitment to the safe and responsible integration of unmanned aircraft into our skies," said Michael Toscano, president & CEO of AUVSI.

Earlier this year, Congress passed, and the president signed into law, legislation requiring the Federal Aviation Administration to plan for the integration of unmanned aircraft into the National Airspace System by 2015. Since then, AUVSI has met with a variety of stakeholders, including nearly a dozen privacy advocates and civil rights groups, to listen to their concerns and begin working toward solutions.

The industry's backing of the privacy legislation is just the latest example of its commitment to the safe and responsible integration of UAS into the National Airspace System. The industry recently released a Code of Conduct for UAS manufacturers and operators to ensure the safe, professional and respectful use of unmanned aircraft. The Code of Conduct set forth guidelines to provide AUVSI members - and those who design, test and operate UAS for public and civil use - with recommendations for their safe, non-intrusive operation, including respect for the privacy of individuals.

"Like with any merging technology, it is important that a commitment to safety, professionalism and respect is part of the foundation of its use. The Code of Conduct reflects how the rights of individuals and the safety of all users of civil airspace are our top priority as we work to unlock the incredible potential this technology holds," Toscano said.

AUVSI Submits Testimony for Congressional Subcommittee Hearing on Using UAS in the Homeland
18 July 2012
On 18 July, AUVSI released prepared testimony from Michael Toscano for the House Homeland Security – Subcommittee on Oversight, Investigations and Management hearing, "Using Unmanned Aerial Systems Within the Homeland: Security Game Changer? " scheduled for Thursday, 19 July at 9:30 a.m.

In the testimony, Mr. Toscano discusses the many potential uses for unmanned aircraft systems (UAS), and the industry's efforts to ensure a safe and responsible integration of UAS into the national airspace. The testimony lays out the UAS industry's commitment to safety, highlighted by the industry's recently released "Code of Conduct," as well as the technological advancements to help ensure their safe operation.

AUVSI Releases "Code of Conduct" for Unmanned Aircraft Systems Operations
Promotes Safe, Responsible Use as Integration into Airspace Proceeds
02 July 2012
AUVSI published the "Unmanned Aircraft System Operations Industry Code of Conduct" www.auvsi.org/conduct, a set of guidelines to provide AUVSI members – and those who design, test and operate UAS for public and civil use – with recommendations for their safe, non-intrusive operation.

Central to the "Code of Conduct" is the need for "safety, professionalism and respect" in all uses of UAS. This code is meant to provide UAS industry manufacturers and users a convenient checklist for operations and a means to demonstrate their obligation to supporting the growth of the industry in a safe and responsible manner.

"The emergence of unmanned aircraft systems represents one of the most significant advancements to aviation, the scientific community, and public service since the beginning of flight," said Michael Toscano, President and CEO of AUVSI. "With a commitment to safety, professionalism and respect, we can ensure unmanned aircraft are integrated responsibly into civil airspace."

The guidelines recommend when and by whom UAS should be flown, to minimize risk. They commit to complying with all federal, state and local laws and cooperating with authorities at all levels. The guidelines also commit to respecting other users of the airspace, the privacy of individuals, the concerns of the public and improving public awareness of UAS.

"By proactively adhering to these guidelines, we want to demonstrate how the rights of individuals and the safety of all users of civil airspace are our top priority, as we work to unlock the incredible potential this technology holds," Toscano said.

The FAA Modernization and Reform Act signed into law on February 14, 2012, included a provision requiring the FAA to safely integrate UAS into the national airspace. The law created a number of deadlines for the FAA to meet on its way to the safe integration of UAS by September 2015.

Unmanned aircraft systems extend human potential, allowing individuals to execute dangerous and often difficult tasks safely and efficiently. Whether it is aiding search and rescue efforts, navigating through airspace too hazardous for manned vehicles, or furthering scientific research, UAS are capable of saving time, saving money and most importantly, saving lives.

To view the Code of Conduct, visit www.auvsi.org/conduct.

AUVSI Rejects Calls for Unlawful Destruction of Unmanned Aerial Systems
18 May 2012
Today, the Association for Unmanned Vehicle Systems International (AUVSI) released the following statement from President and CEO Michael Toscano in response to recent depictions in the media that put the unlawful destruction of unmanned aerial systems in a positive light:

"To advocate for people to shoot down any object from U.S. airspace is irresponsible, dangerous and unlawful. Unmanned aerial systems are being designed to serve the public good, such as helping search and rescue officers find missing children, monitor weather and wildlife, provide disaster relief and respond to emergencies, as they did in the Fukushima nuclear crisis in Japan last year. The myriad of important uses will be imperiled if they become targets. Meanwhile, the suggestion that Americans take up arms against unmanned aircraft also endangers citizens on the ground.

"AUVSI welcomes civil discussions about privacy and the proper uses of unmanned aircraft, but it cannot and does not condone violence against technology intended to keep citizens safe while saving taxpayer dollars."

Syndicated columnist Charles Krauthammer recently stated that unmanned aircraft should be banned entirely in the United States, and said that "I would predict — I'm not encouraging, but I would predict, the first guy who uses a Second Amendment weapon to bring down a drone that's hovering over his house is gonna be a folk hero in this country."

The NBC television show "Harry's Law" also recently portrayed its main character shooting down a "drone" in just such a situation.

Under New Leadership, FAA's Unmanned Aircraft Systems Integration Office Meets Its Deadline
by Timothy Adelman, Aviation Attorney
14 May 2012

The FAA's Unmanned Aircraft Systems Integration Office (formally the UAPO) and the Department of Justice's National Institute of Justice's Aviation Technology Program (NIJ) have worked diligently over the past 18 months to identify the hurdles to public safety unmanned aircraft operations in the National Airspace System (NAS) and to provide solutions to those hurdles. With the help of the Congressional Unmanned Systems Caucus, chaired by Reps. Buck McKeon (R-Calif.) and Henry Cuellar (D-Texas), the FAA's Reauthorization Bill provided language for a roadmap to lessen the hurdles associated with the deployment of small unmanned aircraft systems (sUAS) by public safety.

When the FAA's Reauthorization Bill was signed into law by President Obama on 14 February 2012, the FAA was faced with a deadline to enter into agreements with appropriate government agencies to simplify the process for issuing Certificates of Waiver or Authorization (COAs) to operate sUAS public aircraft. While the UAS Integration Office had already been working on a solution in advance of the Bill, the 90-day deadline turned up the heat to get the solution completed. Under its new leadership by James Williams, head of the FAA's Unmanned Aircraft Systems Integration Office and in direct coordination with NIJ, the FAA has developed a streamlined COA process for public safety.

With more than 18,000 domestic law enforcement agencies in the United States and many more public safety agencies, including fire service and emergency response teams, the potential demand for aviation assets is high. Through various studies over the years, there are less than 400 law enforcement aviation units. In other words, less than 3% of all law enforcement organizations have aviation assets to support their daily operations. Why so few? Largely because of the cost and complexity of operating manned aircraft.

In 2007 the Bureau of Justice Statistics published a report that examined the use of aviation assets in large law enforcement organizations (100 officers or more). They identified 201 aviation units operating in 46 states. Those units spend more than $300 million in one year on aircraft purchases, leasing, financing, maintenance and fuel, an average of $1.5 million per aviation unit. While almost all law enforcement agencies would benefit from aviation units, not many can afford them.

Unmanned Aircraft Systems (UAS) provide an affordable solution to those agencies that need "eyes in the sky" but don't have the budget or for those agencies that need to supplement their current aviation units with more cost effective aircraft for specific missions. In December 2009, NIJ hosted a conference for all public safety agencies interested or currently using UAS. During that conference, the agencies identified the anticipated scenarios for which UAS could provide vital support: tactical teams, forensics, fire safety, high-risk warrants, marijuana eradication, photographing critical infrastructure, corrections, traffic for ingress/egress under special conditions, payload detection of HazMat, aid in evacuation after natural disasters, critical incidents, and post-event forensics.

Most domestic public safety agencies are looking for small UAS (sUAS) to provide immediate eyes in the sky in response to a defined incident. The anticipated use of sUAS does not include routine patrol, which would require flight for extended distances over an extended time period. Operations would occur within "defined incident perimeter" in close proximity to the individual controlling the aircraft on the ground and most operations would be for a relatively short duration, i.e. less than an hour. Therefore, the FAA's UAS Integration Office in collaboration with NIJ designed a solution that would permit the operation of sUAS in a less restrictive manner than current FAA policy.

While the COA process will continue, many of its barriers will be reduced. COAs will be available for operations within a defined incident perimeter throughout an agency's jurisdiction. There will be no need to obtain an emergency COA for a specific mission. As long as the agency operates within its COA, it can fly when it wants and where it wants. COAs will require line of sight operations under 400' AGL during VFR conditions. The COA will permit certain operations within Class C, D, E and G airspace. In addition, and with certain restrictions, agencies can get a COA that would involve operations within 5nm of an airport.

The FAA's UAS Integration Office and NIJ will develop a knowledge base exam for those operators that do not have an FAA issued airman certificate. This exam will help agencies demonstrate an adequate level of airman knowledge to ensure the safe operation of UAS, a tremendous asset for individual agencies risk management programs. The COA process will also provide a sample Safety Risk Analysis Plan ("SRAP") to help the agency identify its areas of risk and ensure safe operating procedures.

The FAA is working to streamline the current online application to lessen the burden on agencies applying for COAs and to help expedite review. The COA process currently requires a lot of technical detail on the aircraft and equipment. The FAA, through its work with NIJ, will develop a master list of sUAS that an agency can use to simply select the aircraft with appropriate equipment. Manufacturers will be able to have their aircraft included in this master list through an independent assessment process.

With model standard operating procedures, SRAP, operating limitations and training curriculum, agencies will have an easier time applying for COAs. The streamlined process will eliminate the need to recreate the wheel and simply provide agencies with best practices for sUAS operations.

The news for public safety agencies and manufacturers is good. The FAA was once considered a major hurdle for public safety operations. While I still hear agencies and manufacturers claim that the barrier to sUAS operations is the FAA, that is no longer an accurate statement. The FAA has already issued operational COAs for specific jurisdictions to a number of agencies. Building upon that experience and through discussions with NIJ and public safety officers, the FAA created the new COA process to help reduce the administrative burden for agencies while at the same time ensure adequate safety.

While the new "Common Strategy" which streamlines the COA process has been agreed upon, there remains an ongoing implementation process. A few of these implementation steps include:

- Creating an online knowledge exam for operators.
- Creating a sample SRAP for agencies to use when applying for a COA.
- Revising the on-line COA application website to incorporate the streamlined process.
- Educating manufacturers and end-users on the new process.

The FAA, DOJ and DHS Science and Technology Directorate are working together to host a multiday sUAS focused conference that will include both educational seminars and live sUAS demonstrations by active law enforcement sUAS units. This conference will mark the kickoff for the new "Common Strategy" and it's streamlined COA process. Attendees will have an opportunity to hear from the FAA, DHS S&T and DOJ regarding sUAS operations. Seminars will include information about the new streamlined process, best practices for operating sUAS in a public safety mission, examples of how to develop your own SRAP, and much more. The conference is anticipated to occur in the middle of September. Stayed tuned for more information about dates and locations.

Having had a chance to participate in many of the discussions with the FAA and NIJ about the new streamlined COA process and having had the chance to discuss operations with many public safety entities, I am confident that the "Common Strategy" will be a significant step forward in the employment of sUAS by public safety agencies. There appears to be a fundamental shift in the FAA's perception of public safety operations. Initially, the FAA feared operations by public safety agencies that did not have adequate aviation knowledge, thereby creating a risk in the National Airspace System. Now, the FAA is focused on providing the tools necessary to help those public safety agencies conduct safe operations in the National Airspace System. Many of the new requirements in the streamlined COA process will help agencies identify the risk of operations and implement proper mitigating steps to limit those risks which seems to be in

alignment with the FAA's desire to introduce Safety Management Systems concepts. In the end, the goal is to increase our public safety agencies' effectiveness through technology without unnecessarily increasing the risk to persons or property.

The Case for Driverless Cars
10 May 2012

AUVSI recently released a new white paper: The Case for Driverless Cars.

Driverless cars have been a dream for drivers around the world since the invention of the automobile more than 100 years ago, but have yet to be realized on a mass scale. Recent demonstrations and competitions, utilizing corporate and government investments, have shown that driverless car technology is maturing to the point where such vehicles may be commercially viable within a decade.

A variety of non-technical issues remain in order to field driverless cars. Legal, liability, regulatory, culture, and privacy concerns all need to be addressed for consumers to be able to use, and desire to use, driverless cars.

The paper goes into detail in these issues, the potential American consumer market, and technical aspects of driverless cars. The paper is written for people without a strong background in driverless cars looking for more information and is a good background for people interested in the Driverless Car Summit.

AUVSI Presses DOT to Release Small UAS Proposed Rule
4 May 2012

On 4 May, AUVSI President & CEO Michael Toscano sent a letter to U.S. Secretary of Transportation Ray LaHood asking him to expedite the publication of the small unmanned aircraft system (UAS) notice of proposed rulemaking.

The Federal Aviation Administration (FAA) has been examining the issue of allowing small UAS to fly in the airspace since 2008, when it formed an aviation rulemaking committee (ARC) to examine the issue. Although the ARC issued recommendations in 2009, the FAA has not yet released a proposed rule for public comment on how it will safely allow small UAS to fly in the civil airspace.

Congress, in the FAA Modernization and Reform Act of 2012 - which was passed into law on 14 February - requires the secretary of Transportation to publish a final rule on allowing small UAS to fly in the airspace by mid-2014, with the safe integration of all civil UAS by 30 Sept. 2015.

"The UAS industry believes the pending rule is urgently needed and will provide meaningful guidance to manufacturers and end users for design, construction and operation of small UAS to safely operate and deliver crucial services to law enforcement, agriculture and other sectors of the American economy." said Toscano in a letter to Secretary LaHood. "UAS will be the next big revolution in aviation; however, before this industry can really take off, we need rules from the FAA on how to safely operate alongside manned aircraft."

AUVSI continues to actively engage with members of Congress, federal regulators, aviation stakeholders, potential users, and privacy groups to help educate about the importance of unmanned systems.

About the Authors

Darryl Jenkins, author of "The Handbook of Airline Economics," is an airline analyst with more than 30 years of experience in the aviation industry. Jenkins also served as director of the Aviation Institute at George Washington University for more than 15 years. As an independent aviation consultant, Jenkins has worked for the majority of the world's top 50 airlines. In addition, he has consulted for the FAA, DOT, NTSB and other U.S. government agencies as well as many foreign countries. Jenkins also is the author of several aviation books and is a regular commentator for major media including ABC, CBS, NBC, MSNBC, CNN, FOX and major print publications. Jenkins was a member of the Executive Committee of the White House Conference on Aviation Safety and Security.

Dr. Bijan Vasigh is professor of economics and finance in the Department of Business Administration at Embry-Riddle Aeronautical University in Daytona Beach, Florida, and a managing director at Aviation Consulting Group LLC. Vasigh received a Ph.D. in economics from the State University of New York in 1984, and he has written and published many articles concerning the aviation industry. The articles have been published in numerous academic journals such as the "Handbook of Airline Economics," "Journal of Economics and Finance," "Journal of Transportation Management," "Transportation Quarterly," "Airport Business," "Journal of Business and Economics" and "Journal of Travel Research." He was a consultant with the International Civil Aviation Organization and provided assistance on the evolution of aeronautical charge structure for the Brazilian Institute of Civil Aviation. He is a member of the editorial board of "Journal of Air Transport Management," the "Southwest Journal of Pure and Applied Mathematics" and "Journal of Air Transportation World Wide." He is currently a member of the international faculty at the IATA Learning Center, where he is faculty leader of the Airline Finance and Accounting Management division.

Executive Summary

The purpose of this research is to document the economic benefits to the United States (U.S.) once Unmanned Aircraft Systems (UAS) are integrated into in the National Airspace System (NAS).

In 2012, the federal government tasked the Federal Aviation Administration (FAA) to determine how to integrate UAS into the NAS. In this research, we estimate the economic impact of this integration. In the event that these regulations are delayed or not enacted, this study also estimates the jobs and financial opportunity lost to the economy because of this inaction.

While there are multiple uses for UAS in the NAS, this research concludes that **precision agriculture** and **public safety** are the most promising commercial and civil markets. These two markets are thought to comprise **approximately 90%** of the known potential markets for UAS.

We conclude the following:

1. The economic impact of the integration of UAS into the NAS will total more than $13.6 billion (Table 19) in the first three years of integration and will grow sustainably for the foreseeable future, cumulating to more than $82.1 billion between 2015 and 2025 (Table 1);
2. Integration into the NAS will create more than 34,000 manufacturing jobs (Table 18) and more than 70,000 new jobs in the first three years (Table 19);
3. By 2025, total job creation is estimated at 103,776 (Table 1);
4. The manufacturing jobs created will be high paying ($40,000) and require technical baccalaureate degrees;
5. Tax revenue to the states will total more than $482 million in the first 11 years following integration (2015-2025); and
6. Every year that integration is delayed, the United States loses more than **$10 billion** in potential economic impact. This translates to a loss of **$27.6 million per day that UAS are not integrated into the NAS.**

Utility of UAS

The main inhibitor of U.S. commercial and civil development of the UAS is the lack of a regulatory structure. Because of current airspace restrictions, non-defense use of UAS has been extremely limited. However, the combination of greater flexibility, lower capital and lower operating costs could allow UAS to be a transformative technology in fields as diverse as urban infrastructure management, farming, and oil and gas exploration to name a few.

Present-day UAS have longer operational duration and require less maintenance than earlier models. In addition, they can be operated remotely using more fuel efficient technologies. These aircraft can be deployed in a number of different terrains and may be less dependent on prepared runways. Some argue the use of UAS in the future will be a more responsible approach to certain airspace operations from an environmental, ecological and human risk perspective.

UAS are already being used in a variety of applications, and many more areas will benefit by their use, such as[1]:

- **Wildfire mapping[2];**
- **Agricultural monitoring;**
- **Disaster management;**
- **Thermal infrared power line surveys;**
- **Law enforcement;**
- **Telecommunication;**
- **Weather monitoring;**
- **Aerial imaging/mapping;**
- **Television news coverage, sporting events, moviemaking[3];**
- **Environmental monitoring;**
- **Oil and gas exploration; and**
- **Freight transport.**

Applicable Markets

There are a number of different markets in which UAS can be used. This research is concentrated on the two markets, commercial and civil, with the largest potential. A third category (Other) summarizes all other markets:

1. Precision agriculture;
2. Public safety; and
3. Other.

> While we project more than 100,000 new jobs by 2025, states that create favorable regulatory and business environments for the industry and the technology will likely siphon jobs away from states that do not.

Public safety officials include police officers and professional firefighters in the U.S., as well as a variety of professional and volunteer emergency medical service providers who protect the public from events that pose significant danger, including natural disasters, man-made disasters and crimes.

Precision agriculture refers to two segments of the farm market: remote sensing and precision application. A variety of remote sensors are being used to scan plants for health problems, record growth rates and hydration, and locate disease outbreaks. Such sensors can be attached to ground vehicles, aerial vehicles and even aerospace satellites. Precision application, a practice especially useful for crop farmers and horticulturists, utilizes effective and efficient spray techniques to more selectively cover plants and fields. This allows farmers to provide only the needed pesticide or nutrient to each plant, reducing the total amount sprayed, and thus saving money and reducing environmental impacts.

As listed above, a large number of other markets will also use UAS once the airspace is integrated. We believe the impact of these other markets will be at least the size of the impact from public safety use.

With sensible regulations in place, we foresee few limitations to rapid growth in these industries. These products use off-the-shelf technology and thus impose few problems to rapidly ramping up production. The inputs (i.e., parts) to the UAS can be purchased from more than 100 different suppliers; therefore, prices will be stable and competitive. The inputs to the UAS can all be purchased within the U.S., although these products can be imported from any number of foreign countries without the need of an import license. UAS have a durable life span of approximately 11 years and are relatively easy to maintain. The manufacture of these products requires technical skills equivalent to a baccalaureate degree. Therefore, there will always be a plentiful market of job applicants willing to enter this market. In summary, there are no production problems on the horizon that will impact the manufacturing and output of this product. Most of the barriers of potential usage are governmental and regulatory. For this study, we assume necessary airspace integration in 2015, on par with current legislation.

Covering and justifying the cost of UAS is straightforward. In the precision agriculture market, the average price of the UAS is a fraction of the cost of a manned aircraft, such as a helicopter or crop duster, without any of the safety hazards. For public safety, the price of the product is approximately the price of a police squad car equipped with standard gear. It is also operated at a fraction of the cost of a manned aircraft, such as a helicopter, reducing the strain on agency budgets as well as the risk of bodily harm to the users in many difficult and dangerous situations. Therefore, the cost-benefit ratios of using UAS can be easily understood.

Economic Benefit

The economic benefits to the country are enormous and were estimated as follows. First, we forecast the number of sales in the three market categories. Next, we forecast the supplies needed to manufacture these products. Using estimated costs for labor, we forecast the number of direct jobs created. Using these factors, we forecast the tax revenue to the states.

In addition to direct jobs created by the manufacturing process, there is an additional economic benefit. The new jobs created and the income generated will be spread to local communities. As new jobs are created, additional money is spent at the local level, creating additional demand for local services which, in turn, creates even more jobs (i.e., grocery clerks, barbers, school teachers, home builders, etc.). These indirect and induced jobs are forecast and included in the total jobs created.

The economic benefits to individual states will not be evenly distributed. The following 10 states are predicted to see the most gains in terms of job creation and additional revenue as production of UAS increase, totaling more than $82 billion in economic impact from 2015-2025 (Table 1).

In rank order they are:

1) California
2) Washington
3) Texas
4) Florida
5) Arizona
6) Connecticut
7) Kansas
8) Virginia
9) New York
10) Pennsylvania

It is important to note that the projections contained in this report are based on the current airspace activity and infrastructure in a given state. As a result, states with an already thriving aerospace industry are projected to reap the most economic gains. However, a variety of factors—state laws, tax incentives, regulations, the establishment of test sites and the adoption of UAS technology by end users—will ultimately determine where jobs flow.

By 2025, we estimate more than 100,000 new jobs will be created nationally. For the purposes of this report, we base the 2025 state economic projections on the current aerospace employment in the states. We also presume that none of the states have enacted restrictive legislation or regulations that would limit the expansion of the technology. These landscapes will likely shift, however, as states work to attract UAS jobs in the years following integration. Future state laws and regulations could also cause some states to lose jobs while others stand to gain jobs. In conclusion, while we project more than 100,000 new jobs by 2025, states that create favorable regulatory and business environments for the industry and the technology will likely siphon jobs away from states that do not.

The trend in total spending, total economic impact and total employment impact was investigated for 2015 through 2025. The total spending in UAS development and total economic and employment impacts are expected to increase significantly in the next five years. This study demonstrates the significant contribution of UAS development and integration in the nation's airspace to the economic growth and job creation in the aerospace industry and to the social and economic progress of the citizens in the U.S. See Table 1 for the results of the total impact of UAS integration in the United States.

Nevada	$38	$0.00	196	$229	$0.00	290
New Hampshire	$85	$0.00	439	$514	$0.00	649
New Jersey	$263	$3.24	1,353	$1,582	$19.50	1,999
New Mexico	$101	$0.73	518	$606	$4.41	765
New York	$443	$4.66	2,276	$2,661	$28.05	3,363
North Carolina	$153	$1.79	785	$918	$10.75	1,160
North Dakota	$14	$0.07	71	$83	$0.40	105
Ohio	$359	$2.43	1,844	$2,156	$14.60	2,725
Oklahoma	$106	$0.93	545	$637	$5.61	805
Oregon	$81	$0.41	416	$486	$2.47	614
Pennsylvania	$393	$2.02	2,021	$2,363	$12.12	2,986
Rhode Island	$42	$0.38	217	$253	$2.28	320
South Carolina	$99	$1.16	507	$593	$6.99	749
South Dakota	$9	$0.00	48	$56	$0.00	71
Tennessee	$112	$0.00	578	$675	$0.00	853
Texas	$1,087	$0.00	5,588	$6,533	$0.00	8,256
Utah	$143	$1.21	735	$859	$7.26	1,085
Vermont	$36	$0.47	184	$215	$2.81	271
Virginia	$463	$4.47	2,380	$2,783	$26.86	3,517
Washington	$1,312	$0.00	6,746	$7,888	$0.00	9,967
West Virginia	$47	$0.47	240	$280	$2.83	354
Wisconsin	$88	$0.96	450	$527	$5.76	665
Wyoming	$5	$0.00	24	$28	$0.00	36
Total	$13,657	$80.22	70,240	$82,124	$482.39	103,776

Forecast

In this chapter, we describe the methodology for the forecasts we used as inputs to the economic benefits section. In accomplishing this task, we were fortunate to obtain and use comparable product sales from other countries. In making the forecasts, we relied on four different methods:

1) Comparable sales from other countries;
2) Survey results;
3) Land ratios; and
4) A literature search on rates of adoption of new technology.

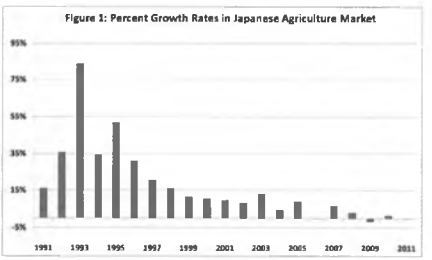
The four different methodologies yielded similar results and provide confidence in our final results.

Throughout this study, we use the following terms. When we use the term output, we are referring to the UAS. The inputs to the UAS are the parts and labor that go into making these products. In turn, the parts that go into the inputs we refer to as derived demand.

As part of this section, we provide a detailed discussion of the factors that may make our forecasts inaccurate and their potential impact. Our forecasts are for an 11-year period. That unit of measurement was chosen as that is the expected life of a UAS. We did not include maintenance, training or other revenue streams, which makes our overall estimates conservative. In addition, there are multiple options on sales including leasing the equipment and having third-party providers as an outsourced service, all of which add to our conservative estimates.

Sales in Foreign Countries

Other countries have already adopted UAS technology from a zero base (i.e., first year of adoption). By now, these technologies have been operational for more than two decades. The growth curve is found to be logistic with a rapid beginning and then a leveling off of the market (Figure 1). The issue is not whether these products will be adopted once the airspace is integrated, but at what rate(s). The experience in Japan started out at rates of growth in excess of 20% annually. This was from no unmanned vehicles in 1990 (i.e., the zero base), where neither the companies nor the consumers had previous experience with this technology (see Appendix A for detailed data).



As is readily apparent, the growth rates in the early years in Japan were very high. The question of interest is: How fast will growth occur in the U.S.? We chose a short time period for growth in the U.S. (doubling the first year, 50% growth the next year and thereafter a 5% growth rate). Our justification is as follows. First, there is considerable experience with these products. American farmers are not starting out from a zero-knowledge base as did Japan. Second, UAS are not sold in the U.S. domestic market only because FAA regulations prohibit them in the nation's airspace. It is noted that the dampening of the Japanese growth curve happened within six years. The literature review found higher initial rates of product acceptance than the previous Japanese experience and lower leveling off of rates.

Adoption Rates of New Technology

There are many factors that influence the rate at which new technologies are adopted and diffused into a society. We found considerable literature on this topic. The conclusion from the brief search we conducted is that new technologies are either accepted or rejected quickly. There is already a trade association that is doing outreach to the primary targets and showing products in their trade show(s). Because there is previous experience in this field, we reject the notion that these products will not be adopted. However, it is suggested that a follow up to this study be conducted on adoption of new technology. There is considerable literature on this topic, which needs to be investigated, and will help develop further adoption strategies.

Methodology

We performed three separate forecasts for this study:

1) The estimated number of sales by state;
2) The estimated sales by state for the inputs to the final product; and
3) The estimated sales by state for the derived demand for the final products.

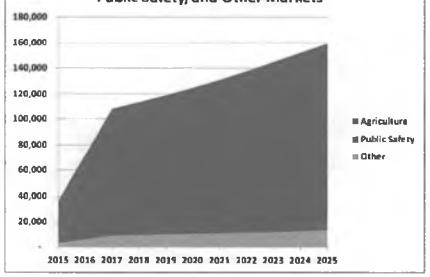
To complete these forecasts, we developed a telephone survey and pilot-tested it on five participants to refine our survey questions. We next conducted 30 telephone interviews with industry experts. An industry expert was defined as a person with more than three years of practical and relevant experience. Each interview lasted about 30 minutes. The participants were guaranteed confidentiality so we cannot divulge the individual results. However, we were able to obtain a reasonable estimate on what the group as a whole felt was the size of the market and the cost structure. Because there was considerable variance in these estimates, we ignored the outliers and calculated the average cost structure. We estimate that approximately 60% of the overall cost of a UAS is parts with an average annual labor cost of $37,000. In this report, we use $40,000 and hold it at a constant cost, as we do with the parts numbers. Thus the results can be interpreted as constant dollars over the entire term, as we are not forecasting the inflation rate. As for profitability, we consider this a competitive industry with a normal rate of return.

We found that almost all respondents considered agriculture to be far and above the largest market given that the public safety market is limited by the number of first-response teams. We next looked at some simple ratios between UAS sales in Japan and the amount of arable farmland and imputed these ratios to the United States. The survey results indicated an agricultural market of approximately 150,000 unit sales per year at maturity (i.e., 2020), and the Japanese land ratio indicated a market size of 165,000 unit sales per year. For the purposes of this forecast, we used 100,000 unit sales per year as a conservative benchmark. See Figure 2 for total expected sales for 2015-2025. Actual sales could be a multiple of this estimate.

As to the public safety market, the consensus was that the agriculture market will be at least 10 times the public safety market. Our follow-up task to the questionnaire was to find the number of first-response domestic teams and survey a small number of this group. We found their purchase issues to be minimal. They simply have a budget given to them by the local governmental unit that oversees them, and they work within it. Purchases of this size are not uncommon and public safety officials have all of the appearances of being early adopters, especially when safety is involved.

During the survey interviews, we discovered that there were unlimited uses of UAS. For example, many respondents discussed the potential uses of UAS for real estate purposes or for examining oil pipelines. In the case of oil pipelines, the consensus of the experts was that the total annual sale was approximately 1,000 units. For real estate personnel, there was not a consensus. From the surveys and follow-up calls with other professionals, we estimate that the aggregate size for other sales was approximately 10% of the total. In reality, this figure is a lower boundary and should be interpreted as at least 10% of the total. Depending on the promotions to this segment, the final price and, most importantly, the federal regulations, this segment could be significantly larger. We estimate the lower boundary at 10% to be conservative.

Figure 2: Annual UAS Sales for Agriculture, Public Safety, and Other Markets



In making the first round of forecasts, we tried several different methods but ultimately used a ratio of the number of direct aerospace and defense (A&D) industry employees in each state[4] to the total number of direct A&D industry employees in the U.S. For example, Alabama has an estimated 23,090 direct A&D industry employees out of a total of 1,040,796 direct A&D employees in the U.S., or 2.22% of the total. So we took the total forecast of agriculture sales and multiplied by 2.22% for Alabama. See Table 2 for a complete list of states and their estimated manufacturing distribution.

For the inputs, we find no constraints. There are plenty of manufacturers of these parts; they are off-the-shelf and require little lead time. If one supply line goes down, there are multiple sources as backups. For the input forecast, we relied on the size of the aerospace labor force in each state as the metric. These numbers were obtained from a Deloitte report, commissioned by the Aerospace Industries Association, titled "The Aerospace and Defense Industry in the U.S.: A Financial and Economic Impact Study"[5]. In this forecast, we also looked at employment and taxes. Using the estimated labor dollar amount, we simply divided by 40,000 to find the number of jobs. Subtracting adjacent years yields the number of new jobs created. We used marginal state tax rates for the $40,000 income range, the assumption being that states will hold this rate constant over time.

Table 2: Estimated Manufacturing Distribution

State	Manufacturing Distribution	State	Manufacturing Distribution
Alabama	2.22%	Montana	0.11%
Alaska	0.15%	Nebraska	0.19%
Arizona	4.10%	Nevada	0.30%
Arkansas	0.61%	New Hampshire	0.67%
California	15.58%	New Jersey	1.99%
Colorado	1.77%	New Mexico	0.78%
Connecticut	3.95%	New York	3.30%
Delaware	0.13%	North Carolina	1.17%
Florida	4.74%	North Dakota	0.11%
Georgia	2.83%	Ohio	2.71%
Hawaii	0.25%	Oklahoma	0.81%
Idaho	0.22%	Oregon	0.63%
Illinois	1.56%	Pennsylvania	3.00%
Indiana	1.59%	Rhode Island	0.32%
Iowa	1.24%	South Carolina	0.76%
Kansas	3.54%	South Dakota	0.07%
Kentucky	0.69%	Tennessee	0.81%
Louisiana	1.65%	Texas	8.43%
Maine	0.82%	Utah	1.10%
Maryland	2.53%	Vermont	0.27%
Massachusetts	2.90%	Virginia	3.55%
Michigan	1.44%	Washington	9.02%
Minnesota	1.09%	West Virginia	0.36%
Mississippi	1.25%	Wisconsin	0.67%
Missouri	1.97%	Wyoming	0.04%

4Deloitte, The Aerospace and Defense Industry in the U.S., A financial and economic impact study, March, 2012
5http://www.deloitte.com/view/en_US/us/Industries/Aerospace-Defense-Manufacturing/b4c8ae98118f5310VgnVCM3000001c56f00aRCRD.htm

Necessary Conditions for the Forecasts

We now turn our attention to the conditions that must happen to validate this forecast:

1) The FAA must develop new regulations integrating UAS into the nation's airspace;
2) Job growth distribution will mimic current aerospace manufacturing employment;
3) Creative destruction of existing jobs will have a net-zero impact;
4) There must be sufficient capital available to smaller manufacturing companies;
5) There must be financing available to UAS purchasers;
6) There must be insurance to cover liabilities;
7) Gross Domestic Product (GDP) needs to grow at least 3% annually over the designated time period;
8) The adoption rate(s) of this product in the U.S. will mimic Japan; and
9) Other unforeseen factors.

The FAA Must Develop New Regulations Integrating UAS into the Nation's Airspace

Perhaps the single most important aspect of this forecast is that the FAA develops new guidelines allowing the integration of UAS in the nation's airspace. In the absence of these guidelines, this report is simply the opportunity cost to the economy (new jobs, tax revenue, etc.) of a good idea that was hindered due to government interference or inaction. The FAA regulatory process, like all government entities, is slow and unpredictable.

Job Growth Distribution Will Mimic Current Aerospace Manufacturing Employment

The employment growth described in this report is all new employment, that is, jobs that do not currently exist. To project the statewide distribution of this employment, we used current aerospace manufacturing employment. However, there are many external factors that will affect this distribution that are impossible to predict in this report. These include, among other things, tax incentives, test sites and where new product development will actually occur.

Creative Destruction of Existing Jobs Will Have a Net Zero Impact

As UAS are introduced, some uses will replace existing capabilities, because there are efficiencies to be gained by using a UAS versus a traditional capability. As such, there is likely to be some job destruction from UAS. However, UAS will still need many similar capabilities to manned systems including training, maintenance and pilots. Any jobs that will be made immaterial by UAS will be transitioned to regular UAS operations. Because of the efficient use of UAS, there will be job creation in other areas. For instance, a farmer that saves money because he or she can use less pesticide since UAS can provide precision application will spend less money on pesticides and less on taxes due to pesticide use. That money back into the farmer's pocket will provide economic impact to the U.S. that is not calculated in this report. To simplify, we generalize that there will be a net-zero impact of job creation in the application of these systems. A detailed analysis of this potential job creation is recommended for further research.

There Must be Sufficient Capital Available to Smaller Manufacturing Companies

One of the biggest problems with growing companies is their access to capital. As companies grow, their need for capital to buy new equipment, hire additional personnel, rent extra space and all of the other requirements are seldom met from working capital. The need for short-term working capital to accommodate growth can stymie any otherwise well thought out business plan.

There Must be Financing Available to UAS Purchasers

While the costs of these purchases are not the same as other farm equipment, they are seldom made as a cash purchase. Farm implements, such as tractors, are usually bought with company financing as they do not have serial numbers like cars. Banks may finance a tractor, but usually at a higher interest rate with the credit worthiness of the person as the collateral. This means that the industry or consortia of companies will need to be created for these purchases. There is probably less of a need for these arrangements for public safety, but they are only a shadow market compared to the agriculture market. It is clear that offering financing from a small company standpoint, outside of normal banking realms, is impossible and impractical at this time. This may be one of the most important factors outside of regulation reform to move this industry forward.

Insurance to Cover Liabilities Must be Supplied

One of the many great unknowns about the infant commercial UAS industry is its product liability exposure. Suppose a UAS used by a public safety agency malfunctions and crashes into a building. The assumption is that this event is covered by the local government's umbrella insurance policy. What if this happens elsewhere? Perhaps the thrust of this argument is that the industry as a whole needs to start collecting relevant data in this realm. A Google search on this topic turned up little information, as governments use UAS mainly for wartime purposes. However, anything mechanical can malfunction, and a UAS is no exception. There will be issues of proper maintenance and liability, as there always are with aircraft of any type, in addition to workmen's compensation and other potential problems. The long-term issue is the need for industry-wide data collection.

GDP Needs to Grow at Least 3% Annually Over the Designated Time Period

All studies of this nature require GDP assumptions. The typical scenario is that over a longer time period, the economy will grow at 3% per year. This is our assumption as well. Our forecast is that with new and improved products, they will grow at a slightly higher rate.

There may be several problems with this assumption. First, the current economic stagnation may persist. If so, this may favor sunken capital over new capital. Thus, we may see growth, but at a much later date, and significantly slower growth thereafter. If this happens, it has the potential to make our forecast inaccurate.

The Adoption Rate(s) of this Product in the U.S. Will Mimic Japan

Consumers in different countries or even different segments of the same country can react differently to the same product offering. Our assumption is that consumers in both countries will react similarly.

Other Unforeseen Factors

Any researcher knows that economic analysis and forecasts may not include hundreds of unforeseen events that impact economic estimates that were not taken into account. Any of these may materially affect our forecast.

Discussion of Forecast Results

In this section, we will discuss the forecast results for the year 2015, which is the first forecast year. Table 3 shows the rank ordering of UAS manufacturing by state for agriculture uses in 2015, and Table 4 shows it for public safety. Other markets besides agriculture and public safety are estimated to have the same total economic impact as the public safety market, so in the following we only show the agriculture and public safety markets. Final economic impact calculations include agriculture, public safety and other markets (i.e., the public safety total economic impact multiplied by two to account for "other markets").

Table 3: 2015 Total UAS Agriculture Sales Inputs

State	Labor	Parts	Taxes	Employment
California	$65,438,414	$ 98,157,622	$2,094,029	1,636
Washington	$37,902,240	$ 56,853,360	$ -	948
Texas	$35,422,907	$ 53,134,361	$ -	886
Florida	$19,927,882	$ 29,891,823	$ -	498
Arizona	$17,225,796	$ 25,838,695	$ 396,882	431
Connecticut	$16,575,698	$ 24,863,547	$ 663,028	414
Virginia	$14,907,071	$ 22,360,607	$ 685,725	373
Kansas	$14,873,981	$ 22,310,972	$ 743,699	372
New York	$13,878,051	$ 20,817,077	$ 716,107	347
Pennsylvania	$12,598,434	$ 18,897,651	$ 309,418	315
Massachusetts	$12,175,124	$ 18,262,685	$ 516,225	304
Georgia	$11,882,156	$ 17,823,233	$ 570,343	297
Ohio	$11,362,400	$ 17,043,599	$ 372,687	284
Maryland	$10,645,314	$ 15,967,971	$ 404,522	266
Alabama	$ 9,317,676	$ 13,976,514	$ 372,707	233
New Jersey	$ 8,353,625	$ 12,530,438	$ 497,876	209
Missouri	$ 8,276,550	$ 12,414,825	$ 264,850	207
Colorado	$ 7,416,208	$ 11,124,313	$ 274,696	185
Louisiana	$ 6,918,647	$ 10,377,970	$ 221,397	173
Indiana	$ 6,686,613	$ 10,029,919	$ 181,876	167
Illinois	$ 6,571,201	$ 9,856,802	$ 262,848	164
Michigan	$ 6,060,323	$ 9,090,485	$ 210,899	152
Mississippi	$ 5,268,583	$ 7,902,874	$ 168,595	132
Iowa	$ 5,193,121	$ 7,789,682	$ 141,253	130
North Carolina	$ 4,898,943	$ 7,348,414	$ 274,341	122
Utah	$ 4,636,240	$ 6,954,360	$ 185,450	116
Minnesota	$ 4,561,989	$ 6,842,984	$ 257,296	114
Maine	$ 3,444,594	$ 5,166,891	$ 192,897	86
Oklahoma	$ 3,410,294	$ 5,115,440	$ 143,232	85
Tennessee	$ 3,390,117	$ 5,085,175	$ -	85
New Mexico	$ 3,271,880	$ 4,907,821	$ 112,553	82
South Carolina	$ 3,185,523	$ 4,778,285	$ 178,389	80
Kentucky	$ 2,877,624	$ 4,316,437	$ 138,176	72
Wisconsin	$ 2,825,568	$ 4,238,352	$ 146,930	71
New Hampshire	$ 2,817,497	$ 4,226,246	$ -	70
Oregon	$ 2,632,274	$ 3,948,411	$ 63,175	66
Arkansas	$ 2,565,690	$ 3,848,535	$ 143,679	64
West Virginia	$ 1,504,791	$ 2,257,186	$ 72,230	38
Rhode Island	$ 1,364,360	$ 2,046,539	$ 58,326	34
Nevada	$ 1,255,001	$ 1,882,501	$ -	31
Vermont	$ 1,150,888	$ 1,726,333	$ 71,815	29
Hawaii	$ 1,041,126	$ 1,561,689	$ 59,969	26
Idaho	$ 932,978	$ 1,399,467	$ 55,232	23
Nebraska	$ 807,478	$ 1,211,217	$ 33,074	20
Alaska	$ 611,763	$ 917,644	$ -	15
Delaware	$ 557,285	$ 835,928	$ 24,743	14
Montana	$ 462,857	$ 694,286	$ 23,328	12
North Dakota	$ 453,576	$ 680,364	$ 10,233	11
South Dakota	$ 305,881	$ 458,822	$ -	8
Wyoming	$ 155,765	$ 233,648	$ -	4

Table 4: 2015 Total UAS Public Safety Sales Inputs

Nebraska	$ 34,606	$ 51,909	$ 1,417	1
Alaska	$ 26,218	$ 39,328	$ -	1
Delaware	$ 23,884	$ 35,825	$ 1,060	1
Montana	$ 19,837	$ 29,755	$ 1,000	0
North Dakota	$ 19,439	$ 29,158	$ 439	0
South Dakota	$ 13,109	$ 19,664	$ -	0
Wyoming	$ 6,676	$ 10,013	$ -	0

The next series of tables we refer to as derived demand. The products that are used as inputs are manufactured by other companies, and the platform manufacturer must buy inputs for their finished goods. Table 5 shows the results for the derived demand for inputs for agriculture and Table 6 for public safety.

Table 5: 2015 Total UAS Agriculture Derived Demand

State	Labor	Parts	Taxes	Employment
California	$ 39,263,049	$ 58,894,573	$ 1,256,418	982
Washington	$ 22,741,344	$ 34,112,016	$ -	569
Texas	$ 21,253,744	$ 31,880,616	$ -	531
Florida	$ 11,956,729	$ 17,935,094	$ -	299
Arizona	$ 10,335,478	$ 15,503,217	$ 238,129	258
Connecticut	$ 9,945,419	$ 14,918,128	$ 397,817	249
Virginia	$ 8,944,243	$ 13,416,364	$ 411,435	224
Kansas	$ 8,924,389	$ 13,386,583	$ 446,219	223
New York	$ 8,326,831	$ 12,490,246	$ 429,664	208
Pennsylvania	$ 7,559,061	$ 11,338,591	$ 185,651	189
Massachusetts	$ 7,305,074	$ 10,957,611	$ 309,735	183
Georgia	$ 7,129,293	$ 10,693,940	$ 342,206	178
Ohio	$ 6,817,440	$ 10,226,160	$ 223,612	170
Maryland	$ 6,387,188	$ 9,580,782	$ 242,713	160
Alabama	$ 5,590,606	$ 8,385,908	$ 223,624	140

Forecast Conclusion

In this section, we outline the assumptions and methodology used in making our forecasts. We drew on experience in Japan for comparable sales. Japan and the U.S. are both countries that readily adapt new technologies. We conclude the following:

1) If the FAA adopts new rules allowing for commercial use of UAS in the nation's airspace, these products will be received rapidly into the marketplace;

2) The doubling rate can take place over either a three-year or six-year period. With the known rates of change in newer technologies, it is likely to be a three-year scenario given the fact that the potential marketplace is well aware of the product(s) unlike the introduction in Japan; and

3) The commercial agriculture market is by far the largest segment, dwarfing all others.

Agriculture is an important product group. It has the potential for bringing a more reliable, cost-effective and safe method to domestic farmers for a variety of uses. In the event that a new set of regulations is not enacted and UAS are not integrated in the U.S. National Airspace System (NAS), this study estimates the lost jobs, lost tax revenue, and total economic loss to the states and nation. In addition, a delay in airspace integration will impact the U.S. in terms of a lag in technology development, manufacturing, job development and economic stimulus. With U.S. integration of UAS, more than 103,000 good paying jobs with benefits will be created.

While this section shows the huge potential available to the nation, the exact calculations of these benefits are laid out in the next section, where we estimate the total economic impact of NAS integration.

Economic Impact Analysis

Economic impact is based on the theory that a dollar flowing into a local economy from the outside is a benefit to the regional economy. The financial return for residents is in the form of new jobs, more earnings and new tax revenues that follow because of the initial development of a new business organization, and through new spending, in the municipality due to the operation of such a business or industry. These earnings, for instance, are generated for residents who are not directly associated with the business but who are the beneficiaries of the positive externalities that the business or industry can provide to communities.

External benefits, or positive externalities, are those returns that are generated by a business but that are not captured by the business or local region. When the employees of a company spend money at local businesses, such as restaurants, gas stations and retail stores, their spending will benefit the owners and employees of those establishments, thereby creating a positive incremental impact.

According to Davis (1990) an impact analysis is purposely designed to produce quantitative results of the effects that a certain segment of an industry has in the local economy. From an industry's standpoint, these impact studies are based on the grounds of aggregate economic growth that may be derived from additional spending by the business. The range of the impact can be limited to the city, county, state or national levels.

There are various methodologies that aid the economic valuation of specific organizations in their local economies. From the literature review, we concluded that Economic Impact Analysis (EIA) mostly relies on input-output economic models. Economists evaluate the impact that one sector has on another in terms of indirect and induced effects. The total economic impact is then the sum of the direct, indirect and induced effects.

Direct Impacts

Direct impacts are consequences of economic activities carried out by a company or organization in the economy. For example, institutions (public or private) have a direct impact on the local economy because of the activities conducted by the institution, management, employees, visitors and other related events. Employing labor, purchasing locally produced goods and services, and contracting for construction and capital improvements are all examples of activities that generate direct impacts. Some direct impacts, such as UAS, occur on site. Others, such as local production of goods and services for use at the institution, may occur off site.

Expenditures by management, owners and visitors also generate direct impacts, but only those expenditures that lead to local business activity are relevant for a regional economic assessment. For this reason, it is important to distinguish between (a) the local value-added component of expenditures and (b) the regional import component. Thus, the manufacturers of UAS expenditures on utilities, supplies, professional services, meals and entertainment generate significant economic benefits to the local and national economy. In most parts of the country, only the former component is relevant for the analysis. The following is a list of local value-added components:

- Direct Spending Effects:
  Construction, maintenance, operations
- Direct Business Cost Savings:
  Value of user benefits
- Other Business Cost Savings:
  Logistics/inventory/ processing, scale economies
- Regional Business Markets:
  Tourism, business relocation effects
- Personal Cost Savings:
  Effect on disposable income

The distinguishing feature of a direct impact is that it is an immediate consequence of the manufacturers of UAS' economic activity.

Indirect Impacts

In addition to the direct effect of an economic activity, there are also indirect effects and induced effects. Indirect impacts derive from off-site economic activities that are attributable to the business activities of the manufacturers of UAS' presence. For example, if we are looking at the job impacts of a new UAS being manufactured in Arizona, the direct effect is the number of new jobs created by the company itself. The indirect effect is the number of new jobs created at those firms that supply ancillary services for individuals who are employed at the UAS manufacturing facility and for customers of the firm. These can include, but are not limited to, hotels, restaurants and other businesses that may expand because of the presence of the UAS manufacturing facility. These suppliers and clients employ labor, purchase locally produced goods and services, and invest in capital expansion and improvements. Indirect impacts differ from direct impacts in that they originate entirely off site.

Examples of indirect impacts would be:

- Ancillary business expansion due to the UAS firm;
- New capital investment in response to the UAS firm; and
- Supplies and equipment that may be purchased because of the new business opportunities created by the UAS manufacturing facility.

Induced Impacts

Induced impacts are the result of spending of the wages and salaries of the direct and indirect employees on items such as food, housing, transportation and medical services. In other words, induced effects are the multiplier effects caused by successive rounds of spending throughout the economy as a result of the direct and indirect effects discussed above.

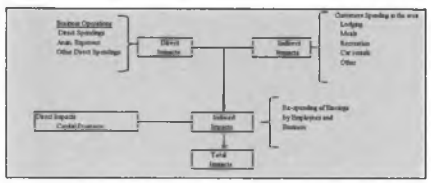
For example, most of the take-home income earned by the manufacturers of UAS employees is spent locally. Some of this spending becomes income to local businesses and their employees that provide services to the firm's employees. Then part of these second-round incomes are also spent locally and thus become income to another set of individuals. As successive rounds of spending occur, additional income is created. Although some of the induced impacts occur locally, some are felt outside the region because of the regional import components of the goods and services purchased. More economically self-sufficient regions have higher multipliers than do regions that are more dependent on regional imports, because more of the spending and respending is accomplished in the area. Similarly, two or more counties considered together as one economic region would have a higher multiplier than would each individual county.

Total Impact

The total impact is the sum of direct impacts, indirect impacts and induced impacts. Total impact is expressed in economic output, earnings or jobs.

Total Impacts = Direct Impacts + Indirect Impacts + Induced Impacts

Economic Impact Overview



Economists sometimes say that the direct economic impacts are "multiplied" through their indirect economic impacts. The ratio of the total (direct + indirect) economic impacts to the direct economic impacts is frequently referred to as the economic multiplier. The employment multiplier is the ratio of total employment to direct employment. The income multiplier is the ratio of total income to direct income created.

Multipliers are not directly observed; rather, they are inferred from an economic model. The direct measure is generally the most accurate since it can be measured more easily, but it only represents a part of the impact, so other multipliers are added to get the total. However, it should be emphasized that the sum of the multipliers is very important since these are virtually the only tools available to researchers attempting to identify the overall impact of activity within a regional economy.

Although a variety of methods can be used to generate economic multipliers, input-output (I-O) models are the most popular tool for such analysis and will be our focus. IMPLAN is a standard economic impact software package used to generate indirect, induced employment and sales estimates. IMPLAN utilizes user-supplied estimates of the direct sales and/or employment and provides associated indirect and induced effects estimates. Direct effects are the changes in the industries to which a final demand change was made; indirect effects are the changes in interindustry purchases as the response to demand of the directly affected industry; and induced effects generally reflect changes in household spending resulting from activity generated by the direct and indirect effects (MIG, p.102).

$$Multiplier = \frac{indirect\ impacts}{direct\ impacts}$$

Previous Economic Impact Studies

Conducting an economic impact study is important, because it is a useful tool to evaluate the economic impact of a business in a community in terms of jobs, income and tax revenue. Ten studies were selected from the literature to illustrate the different facets of economic impact and approaches used to assess impact. The purpose is to illustrate the range of values that may be achieved by different economic entities. The 10 examples are listed below:

- Marshall County Hospital Impact in Marshall County, Kentucky;
- Port of Baltimore impact in Maryland;
- University of Florida in Florida;
- Intel impact in Washington County;
- Intel impact in Oregon;
- Intel impact in Portland, Oregon Metro;
- Boeing impact in Arizona;
- All Acute Care Hospital Systems impact in New Hampshire;
- National Aeronautics and Space Administration (NASA) impact in Florida; and
- Nike impact in Oregon.

Methodology

The aircraft industry, undoubtedly, provides significant economic and social benefits for the regional, state and national economies. Most economic impact analyses utilize input-output models to provide detailed descriptions on how money invested in an economy travels and, through multiplier effects, creates additional employment and income. The basis of these input-output models is a summation of expenditures of the manufacturer (operations, capital and payroll) and the application of the multipliers to account for the interdependency of economic activity in a local economy (Siegfried et al., 2007). There are two well-known input-output programs: Regional Input-Output Modeling System (RIMS II) and the more advanced Impact Analysis for Planning (IMPLAN) software.

To more effectively use the multipliers for impact analysis, users must provide geographically and industrially detailed information

on the initial changes in output, earnings or employment that are associated with the project or program under study.

RIMS II was developed by the Bureau of Economic Analysis (BEA) and is based on an accounting framework called an I-O table, which shows the industrial distribution of inputs purchased and outputs sold for each industry (BEA, 2010). There are two sources for the I-O table: BEA's national I-O table, which shows the input and output structure of nearly 500 U.S. industries, and BEA's regional economic accounts, which are used to adjust the national I-O table to show a region's industrial structure and trading patterns. RIMS II has several advantages:

- Multipliers can be estimated for any region and for any industry;
- Low-cost estimates of regional multipliers because of data source accessibility are available; and
- Expensive surveys and RIMS II-based estimates are similar in magnitude.

IMPLAN is a more specialized software; it captures the actual dollar amounts of all business transactions taking place in a regional economy by utilizing Social Accounting Matrices (SAMs) accounts (IMPLAN, 2011). IMPLAN's advantages are:

- SAMs are a better measure of economic flow as they include "nonmarket" transactions (i.e., taxes and unemployment benefits);
- Multiplier Models are built directly from the region-specific SAMs, which reflect the region's unique structure;
- Trade Flows Method tracks regional purchases by estimating trade flows, allowing for more accurate capturing of indirect effects; and
- Data accessibility is cost effective and efficient.

For this study, we have utilized IMPLAN's input-output software to estimate the direct, indirect and induced effects of UAS integration in the NAS upon the local economy. The estimated economic impacts of this integration for each of the 50 states are provided in Appendix B.

Data

The most common economic measures used in economic impact analysis are:

- Employment [broken down to include full-time equivalents (FTEs)];
- Annual labor income;
- Taxes; and
- Total output or revenue.

This analysis is based on the following data provided by our own forecasts for the 50 states from 2015 through 2025:

1) Total spending by agriculture and public safety in payroll, parts, and taxes;

2) Total direct employment by agriculture and public safety; and

3) State adjustment factors.

Results

For this study, we used IMPLAN's input-output software to estimate the direct, indirect, induced and total effects of UAS integration on the economy of the state of Arizona. Because of the unique nature of manufacturing UAS and the specialized type of workers required, specific project payroll, parts, and taxes for agriculture and public safety were provided. Using the parts manufacturing distribution data in Table 7, we subtracted 4.10% (Arizona) from all values to get a distribution relative to Arizona. We then used this to modify the existing IMPLAN model for the rest of the states. Table 7 shows the adjustment factors to modify the multipliers for all states based on the Arizona multipliers that were derived from the IMPLAN's input output software.

Table 7: Multiplier Adjustment Factors Based on State Arizona's Multiplier

Total Economic and Employment Impacts of Agriculture Spending

Table 8 presents the estimated total economic and employment impacts of agriculture spending in all 50 states in 2015. The total economic impact in all 50 states is $2,096.5 million with total job creation of 21,565. The state with the largest economic and employment impacts is California with a total economic impact of about $366.9 million and creation of 3,774 new jobs. Following California are Washington, Texas, Florida and Arizona. The state with the least economic and employment impacts is Wyoming with an estimated $723,647 and creation of seven new jobs.

The average economic and employment impacts of agriculture spending per state are $41,929,742 and creation of 431 new jobs. The standard deviation of economic and employment impacts of agriculture spending are $61,565,404 and 633 new jobs. The large standard deviation indicates the wide variability (spread) of economic and employment impacts among states.

Table 8: 2015 Total Economic Employment Impacts of Agriculture Spending

State	Direct Spending				State + Local Multipliers	Total Economic Impact	Total Employment Impact
	Payroll	Parts	Taxes	Total			
Alabama	$8,371,475	$13,876,974	$312,707	$22,561,157	1.8693	$42,163,812	488

Total Economic and Employment Impacts of Public Safety and Other Spending

Table 9 presents the estimated total economic and employment impacts in 2015 of public safety spending in all 50 states. Since the total spending for "other markets" is considered equivalent to the public safety estimates, these data are not repeated. The total economic impact of the public safety market in all 50 states is approximately $89.8 million with creation of 924 new jobs. As with agriculture spending, the state with the largest economic and employment impacts is California with a total of more than $15.7 million and creation of 162 new jobs. This is followed in descending order by the states of Washington, Texas, Florida and Arizona. The state of Wyoming has the least economic and employment impacts with $31,013 and no new jobs created.

The average economic and employment impacts of public safety spending per state are $1,796,989 and creation of 18 new jobs. The standard deviation of economic and employment impacts of public safety spending is $2,638,517 and creation of 27 new jobs. The large standard deviation again indicates the wide variability among states.

Table 9: 2015 Total Economic Employment Impacts of Public Safety Spending

Total Economic and Employment Impacts of Agriculture, Public Safety and Other Spending

Table 10 presents the estimated total economic and employment impacts of agriculture, public safety and other spending in 2015 all 50 states. The total economic impact of these markets in all 50 states is more than $2,276 million with total job creation of 23,413. The state with the largest economic and employment impact is California with a total of more than $398.3 million and creation of 4,097 new jobs. Following California in descending rank order are Washington, Texas, Florida and Arizona. In addition, the order of job creation was similar to estimated total economic impact. Wyoming has the least economic and employment impacts with $785,674 and eight new jobs created.

The average economic and employment impacts of agriculture, public safety and other spending per state are approximately $45.5 million and creation of 468 new jobs. The standard deviation of economic and employment impacts is approximately $66.8 million and 688 new jobs created. As with agriculture, public safety and other state estimates, there is a wide variability of economic and employment impacts and job creation among states.

Table 10: 2015 Total Economic & Employment Impacts of Agriculture, Public Safety and Other Spending

State	Direct Spending				State Total Multiplier	Total Economic Impact	Total Employment Impact

Total Economic and Employment Impacts of Agriculture Direct Spending

Tables 11, 12 and 13 show the 2015 direct, indirect and induced impacts respectively, of agriculture spending. Table 11 presents the total economic and employment impacts of direct agriculture spending in all 50 states. The nationwide total economic impact is an estimated $1,058,841,630 with about 11,094 newly created jobs. The largest economic and employment impacts of direct agriculture spending is in California with total economic impact of more than $185,307,769 and creation of 1,942 new jobs. As before, the order of job creation was similar to overall economic impact. The state with least economic and employment impacts is Wyoming with $365,503 and four newly created jobs.

The average economic and employment impacts of direct agriculture spending per state are approximately $21,176,833 and an estimated 222 new jobs. The standard deviation of economic and employment impacts of direct agriculture spending is approximately $31,094,684 and new job creation of 326. This again reflects the wide spread of economic and employment impacts among states.

Total Economic and Employment Impacts of Agriculture Indirect Spending

The total economic and employment impact of indirect agriculture spending in all 50 states is shown in Table 12. The nationwide total economic impact is approximately $487,060,836, with an estimated 5,103 new jobs. The largest economic and employment impacts of indirect agriculture spending is in the state of California with a total economic impact of approximately $85,230,970 and creation of 893 new jobs. The order of job creation was similar to overall economic impact. Wyoming has the least economic and employment impact with $168,110 and creation of two new jobs.

The average economic and employment impacts of indirect agriculture spending per state are $9,741,217 and creation of 102 jobs. The standard deviation of economic and employment impacts of indirect agriculture spending is $14,302,673 and job creation of 150. The large standard deviation indicates the wide variability of economic and employment impacts among states.

Table 12: 2015 Indirect Economic & Employment Impacts of Agriculture Spending

Total Economic and Employment Impacts of Agriculture Induced Spending

Table 13 presents the total economic and employment impacts of induced agriculture spending in 2015 in all 50 states. The estimated nationwide total economic impact is $550,584,654 with the creation of 5,770 new jobs. The largest economic and employment impacts of induced agriculture spending is in the state of California with a total economic impact of approximately $96,348,773 and creation of 1,010 new jobs. The order of job creation was similar to economic impact. The state of Wyoming has the least amount economic and employment impact with $190,034 and the creation of two new jobs. The average economic and employment impacts of induced agriculture spending per state are an estimated 11,011,693 and creation of 115 jobs. The standard deviation of economic and employment impacts of induced agriculture spending is approximately $16,168,047 and 169 jobs. There is wide variability in economic and employment impacts among states as is evidenced by the large standard deviation.

Table 13: Economic & Employment Impacts of Agriculture Spending

State	Direct Spending				State Induced Multiplier	Induced Economic Impact	Induced Employment Impact

Total Economic and Employment Impacts of Public Safety and Other Direct Spending

Tables 14, 15, and 16 show the 2015 direct, indirect, and induced impacts respectively, of public safety spending. Since the impacts to "other" markets are equivalent to public safety, that data is not presented. Table 14 presents the total economic and employment impacts of direct public safety spending in all 50 states. The total economic impact is approximately $45,378,927 with a total job creation of 475. The largest economic and employment impacts of direct public safety spending is in the state of California with a total economic impact of $7,941,762 and creation of 83 new jobs. The state of Wyoming has the least economic and employment impacts among public safety direct spending with $15,664 and no new jobs created. The average economic and employment impacts of direct public safety spending per state are approximately $907,579 and creation of 10 new jobs. The standard deviation of economic and employment impacts of direct public safety spending are approximately $1,332,629 and new job creation of 14. The large standard deviation again indicates the variability of economic and employment impacts of direct public safety spending among states.

Table 14: Direct Economic & Employment Impacts of Public Safety Spending

Total Economic and Employment Impacts of Public Safety and Other Indirect Spending

The total economic and employment impact of indirect public safety spending in 2015 in all 50 states is shown in Table 15. The nationwide total economic impact is approximately $20,874,036 creation of an estimated 219 new jobs. The largest economic and employment impacts of indirect public safety spending is in the state of California with total economic impact of more than $3,652,756 and creation of 38 new jobs. Wyoming has the least economic and employment impacts with $7,205 and no new jobs created.

The economic and employment impacts of indirect public safety spending per state averages approximately $417,481 and creation of four new jobs. The standard deviation of economic and employment impacts of indirect public safety spending are $612,972 creation of six new jobs. As with public safety direct spending, there is a wide variability of economic and employment impacts among the states.

Table 15: Indirect Economic & Employment Impacts of Public Safety Spending

State	Direct Spending				State Indirect Multipliers	Indirect Economic Impact	Indirect Employment Impact
	Payroll	Perts	Taxes	Total

Total Economic and Employment Impacts of Public Safety and Other Induced Spending

Table 16 presents the total economic and employment impacts of induced public safety spending in 2015 in all 50 states. The total economic impact is estimated to be $23,596,485 with total new job creation of 247. The largest economic and employment impacts of induced public safety spending is in the state of California with a total economic impact of approximately $4,129,233 and creation of 43 new jobs. Following California are the states of Washington, Texas, Florida and Arizona. The order of job creation was similar to economic impact. The state with least economic and employment impacts is Wyoming with $8,144 and no new jobs created.

The average economic and employment impacts of induced public safety spending per state are an estimated $471,930 and creation of five jobs. The standard deviation of economic and employment impacts of induced public safety spending are approximately $692,916 and creation of seven new jobs. The large standard deviation indicates the wide variability of economic and employment impacts among states.

Table 16: 2015 Induced Economic & Employment Impacts of Induced Safety Spending

State	Direct Spending				State Induced Multipliers	Induced Economic Impact	Induced Employment Impact
	Payroll	Rents	Taxes	Total

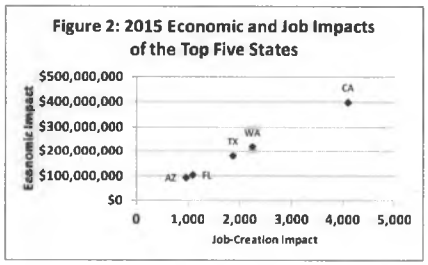
Total Economic and Employment Impacts of UAS Development in the Top Five States

A comparison of the total economic and job creation impacts of UAS integration in the U.S. in the top five states is presented in Table 17. The orders of output and job multipliers are consistent with the order of the states in terms of direct spending. California is the number one state with the highest direct spending of $179,892,071 and the highest direct employment of 2,108, which resulted in the highest contribution to total economic impact of approximately $398,335,013 and total new job creation impact of approximately 4,097. In addition, California has the highest multipliers for job and output creation. Figure 2 graphically shows the total economic and job creation impacts of the top five states in the U.S.

Table 17: 2015 Total Economic and Employment Impacts of UAS Development in the Top Five States

State	Direct jobs	Total job Creation Impact	Job multiplier	Direct spending	Total Economic Impact	Output multiplier
California	2108	4,097	1.94	179,892,071	398,335,013	2.21
Washington	1157	2,249	1.94	102,877,509	218,614,707	2.13
Texas	958	1,863	1.94	96,147,891	181,084,937	1.88
Florida	557	1,084	1.94	54,089,966	105,351,026	1.95
Arizona	494	961	1.94	47,186,634	93,429,535	1.98



Total Economic and Employment Impacts of UAS Development in the United States From 2015-2025

UAS integration into the NAS will have tremendous economic and job creation impacts on the aerospace industry and aid in driving economic development in many states across the country. In today's economic environment, job creation will continue to be extremely important for the aerospace industry and the U.S. economy. Note that the economic impact of UAS integration will not stop with the primary UAS market. Similar to other industries, job growth will stretch into many additional sectors, and the economic growth in the aerospace industry will support the growth in many other businesses across multiple U.S. industries, including the hospitality and entertainment industries.

The total direct spending in UAS development and the total economic and employment impacts are expected to increase significantly in the next 11 years from 2015 through 2025, as seen in Table 18. The expected total direct spending in UAS development in 2015 is an estimated $1,153,370,225. This amount is expected to increase by 100% in 2016 to approximately $2,306,740,450. In 2017, total direct spending is expected to increase by 50% to an estimated $3,460,110,675. This rate of growth is expected to decrease in 2018 to approximately 5% with total spending of $3,633,116,209 and to level off at 5% between 2019 and 2025, with total spending in 2025 of 5,112,159,353.

Table 18: Direct Spending and Employment in The U.S. from 2015-2025

Year	Total Direct Spending	Total Direct Employment	Percent Change Over Previous Year
2015	$ 1,153,370,225	11,400	
2016	$ 2,306,740,450	22,800	100%
2017	$ 3,460,110,675	34,200	50%
2018	$ 3,633,116,209	35,910	5%
2019	$ 3,814,772,019	37,706	5%
2020	$ 4,005,510,620	39,591	5%
2021	$ 4,205,786,151	41,570	5%
2022	$ 4,416,075,459	43,649	5%
2023	$ 4,636,879,232	45,831	5%
2024	$ 4,868,723,193	48,123	5%
2025	$ 5,112,159,353	50,529	5%

The expected total economic and employment impacts in the U.S. for UAS integration for the 11-year period from 2015 through 2025 is shown in Table 19. In 2015, the expected total economic and employment impacts are estimated to be $2,276,186,016 with creation of 23,413 jobs. These amounts are expected to increase by 100% in 2016 (from 2015) to approximately $4,552,372,033 in economic impact and job creation of 46,826. In 2017, the economic and employment impacts are expected to increase by approximately 50% to $6,828,558,049 and 70,240 jobs. This rate of growth is expected to decrease in 2018 to approximately 5% and level off at 5% through 2025. By 2025, the expected total economic impact is estimated to be $10,088,890,263 and total employment impact 103,776.

Table 19: Economic & Employment Impacts in The U.S. from 2015-2025

Year	Total Direct Spending	Total Economic Impact	Total Employment Impact	Percent Change Over Previous Year
2015	$1,153,370,225	$ 2,276,186,016	23,413	
2016	$2,306,740,450	$ 4,552,372,033	46,826	100%
2017	$3,460,110,675	$ 6,828,558,049	70,240	50%
2018	$3,633,116,209	$ 7,169,985,952	73,752	5%
2019	$3,814,772,019	$ 7,528,485,249	77,439	5%

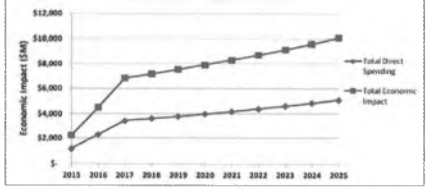
2024	$4,868,723,193	$ 9,608,466,917	98,834	5%
2025	$5,112,159,353	$10,088,890,263	103,776	5%

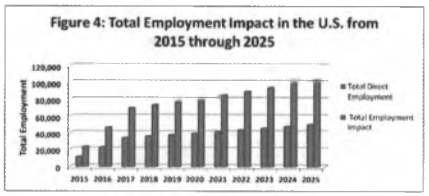
Figure 3 graphically compares total spending and economic impacts from 2015 to 2025. There are high growth rates for both spending and total economic impact in the first three years (2015-2017) but both spending and total economic impact growth are expected to decrease to 5% in 2018 and level off at 5% through 2025.

Figure 3: Total Spending and Economic Impact in the U.S. from 2015 - 2025



Direct employment and total employment impact from 2015 to 2025 are compared in Figure 4. There are high growth rates for both direct and total employment impacts in the first three years (2015-2017) to approximately 100% and 50% in 2016 and 2017, respectively. The growth rate of both direct employment and total employment impacts are expected to decrease to 5% in 2018 and level off at 5% through 2025.

Figure 4: Total Employment Impact in the U.S. from 2015 through 2025



Conclusion

UAS integration into the NAS is expected to have enormous economic and job creation impacts in the United States. These impacts have been demonstrated to be due to direct, indirect and induced effects of total spending in UAS development. The results of these economic impacts are as follows:

During the 11-year period 2015-2025:

- UAS integration is expected to contribute $82.1 billion to the nation's economy by agriculture, public safety and other activities;
- 103,776 new jobs will be created, with 844,741 job years worked over the time period;
- UAS integration is expected to contribute $75.6 billion economic impact by agriculture, $3.2 billion by public safety and $3.2 billion by other activities;
- The manufacturing jobs created will be high paying ($40,000) and require technical baccalaureate degrees; and
- In the first three years, U.S. airspace integration will create more than 34,000 manufacturing jobs and more than 70,000 new jobs.

This study demonstrates the significant contribution of UAS integration to the economic growth and job creation in the aerospace industry and to the social and economic progress of the citizens in the United States.

AUVSI FAST FACTS

MISSION

The mission of AUVSI is to advance the unmanned systems and robotics community through education, advocacy and leadership.

MEMBERS

AUVSI represents more than 7,000 individual members and more than 600 corporate members from 60+ allied countries involved in the fields of government, industry and academia. AUVSI members work in the defense, civil and commercial markets.

AUVSI ACTIVITIES

EVENTS

- **AUVSI's Unmanned Systems Conference and Exhibition** – More than 8,000 attendees and 600+ exhibitors from more than 40 countries and an average annual growth rate of 20% make this the leading event for the global unmanned systems and robotics marketplace. www.auvsishow.org
- **AUVSI's Unmanned Systems Program Review** – Providing the latest information on government and industry programs for ground, air and maritime systems, this annual event is one of the most important to the unmanned systems community. This is one event where business happens.
- **Networking Events** – AUVSI hosts meetings and events worldwide, providing education and networking opportunities for key industry leaders, including AUVSI's Driverless Car Summit.

ADVOCACY

AUVSI works with its membership to shape policy by advocating on behalf of the unmanned systems industry, monitoring legislation and assessing the impact of the industry. AUVSI plays a key role in addressing critical industry issues, such as National Airspace Access, Frequency Spectrum (GPS), NextGen/SESAR, Coalition Building and First Responder Grants. AUVSI works to influence legislation, including the FAA Reauthorization, Transportation Bill, DOD Reauthorization and Homeland Security Reauthorization.

EDUCATION CAMPAIGN

AUVSI is working hard to change the public perception of the unmanned systems and robotics industry through promotion of our members and the endless applications and benefits of their systems. Part of this campaign includes a public website: www.increasinghumanpotential.org.

PUBLICATIONS

- **Print** - *Unmanned Systems* magazine – A monthly magazine providing current industry news, trends and emerging developments; *Unmanned Systems: Mission Critical* – A quarterly supplement dedicated to unmanned systems sectors that, once tapped, will change the way the world works.
- **Electronic** – *AUVSI's Unmanned Systems eBrief* – A weekly electronic newsletter that includes the latest global industry and association news and information; Flight Unmanned – A biweekly electronic publication of the association for AUVSI members.

ONLINE CAREER CENTER

A leading resource for job-seekers and employers in the unmanned systems and robotics market.

KNOWLEDGE RESOURCES

Through its knowledge services AUVSI promotes vision, intellectual leadership and education in unmanned systems. AUVSI's Knowledge Vault provides AUVSI members a one-stop shop for all AUVSI event proceedings and publications.

AUVSI FOUNDATION

The AUVSI Foundation is a tax-exempt 501(c)3 public charity established to support educational initiatives such as AUVSI's Youth Education Program, discussion groups, forums and other programs. The foundation has provided more than $500,000 to educational programs worldwide. Each year, the AUVSI Foundation hosts and sponsors competitions to challenge students to design, build and deploy autonomous air, ground and maritime systems.

Unmanned Aircraft System Operations

Industry "Code of Conduct"

The emergence of unmanned aircraft systems (UAS) as a resource for a wide variety of public and private applications quite possibly represents one of the most significant advancements to aviation, the scientific community, and public service since the beginning of flight. Rapid advancements in the technology have presented unique challenges and opportunities to the growing UAS industry and to those who support it. The nature of UAS and the environments which they operate, when not managed properly, can and will create issues that need to be addressed. The future of UAS will be linked to the responsible and safe use of these systems. Our industry has an obligation to conduct our operations in a safe manner that minimizes risk and instills confidence in our systems.

For this reason, the Association for Unmanned Vehicle Systems International (AUVSI), offers this Code of Conduct on behalf of the UAS industry for UAS operation. This code is intended to provide our members, and those who design, test, and operate UAS for public and civil use, a set of guidelines and recommendations for safe, non-intrusive operations. Acceptance and adherence to this code will contribute to safety and professionalism and will accelerate public confidence in these systems.

The code is built on three specific themes: Safety, Professionalism, and Respect. Each theme and its associated recommendations represent a "common sense" approach to UAS operations and address many of the concerns expressed by the public and regulators. This code is meant to provide UAS industry manufacturers and users a convenient checklist for operations and a means to demonstrate their obligation to supporting the growth of our industry in a safe and responsible manner. By adopting this Code, UAS industry manufacturers and users commit to the following:

Safety

- We will not operate UAS in a manner that presents undue risk to persons or property on the surface or in the air.
- We will ensure UAS will be piloted by individuals who are properly trained and competent to operate the vehicle or its systems.
- We will ensure UAS flights will be conducted only after a thorough assessment of risks associated with the activity. This risks assessment will include, but is not limited to:
    - Weather conditions relative to the performance capability of the system

- Identification of normally anticipated failure modes (lost link, power plant failures, loss of control, etc) and consequences of the failures
- Crew fitness for flight operations
- Overlying airspace, compliance with aviation regulations as appropriate to the operation, and off-nominal procedures
- Communication, command, control, and payload frequency spectrum requirements
- Reliability, performance, and airworthiness to established standards

Professionalism

- We will comply with all federal, state, and local laws, ordinances, covenants, and restrictions as they relate to UAS operations.
- We will operate our systems as responsible members of the aviation community.
- We will be responsive to the needs of the public.
- We will cooperate fully with federal, state, and local authorities in response to emergency deployments, mishap investigations, and media relations.
- We will establish contingency plans for all anticipated off-nominal events and share them openly with all appropriate authorities.

Respect

- We will respect the rights of other users of the airspace.
- We will respect the privacy of individuals.
- We will respect the concerns of the public as they relate to unmanned aircraft operations.
- We will support improving public awareness and education on the operation of UAS.

As an industry, it is incumbent upon us to hold ourselves and each other to a high professional and ethical standard. As with any revolutionary technology, there will be mishaps and abuses; however, in order to operate safely and gain public acceptance and trust, we should all act in accordance with these guiding themes and do so in an open and transparent manner. We hope the entire UAS industry will join AUVSI in adopting this industry Code of Conduct.

AUVSI PRIVACY RIGHTS STATEMENT

AUVSI Statement on U.S. Constitutional Privacy Rights

The Association for Unmanned Vehicle Systems International (AUVSI) supports the expanded use of unmanned systems, and believes unmanned systems can be used lawfully and responsibly to avoid infringing upon Constitutional rights protecting privacy. AUVSI encourages an open dialogue at the national, state, and local level with all parties, including the police, citizens and advocacy groups, to address the concerns about the use of unmanned systems.

Summary

Unmanned systems, in particular, unmanned aircraft systems (UAS), are a tool to do tasks that are too difficult, dangerous, dull, or expensive for manned aviation. An unmanned aircraft is simply a vehicle on which to house and use some sort of system payload, such as a camera.

Although the use of the system payload onboard an unmanned aircraft defines its purpose, differentiating it from hobby or model aircraft, the system payload itself is not a new technology. Manned aircraft have been using cameras and sensors for decades.

AUVSI believes there is already a robust legal framework to allow unmanned systems to operate without infringing upon Constitutional rights protecting privacy. As with any new technology, there exists the possibility of abuse (i.e. computers, the internet, cell phones, GPS, satellites, etc.); however, used properly, in accordance with established rules and precedent, unmanned systems have the potential to greatly enhance public safety while also allowing for an entirely new industry to be formed.

Non-Military Applications

There are currently dozens of non-military uses of unmanned systems, including the use for law enforcement, firefighting, border surveillance, disaster surveillance, aerial photography, wildlife monitoring, agriculture applications, news coverage, mapping and more. The field of unmanned systems is changing rapidly, and it is likely that we have not fully comprehended all of the potential uses for unmanned systems. One thing is clear however, unmanned systems are here to stay.

Public Safety Use

Air support is an invaluable tool for public safety agencies, and the increased use of public UAS will undoubtedly save lives.

The objective of public UAS technology is to give an incident commander (whether it be police, fire, search and rescue, disaster response, or the military) access to the aerial imagery and other pertinent data necessary to efficiently and effectively bring an event to a successful conclusion. The end result is increased public safety.

The relatively small size and low cost of UAS will allow most, if not all, local public safety departments the ability to access aerial imagery. Law enforcement and first responders want to use small UAS (weighing less than 55 pounds) to give them situational awareness. These systems are very different than their larger military cousins (which can weigh tens of thousands of pounds and carry weapons) which many people picture when they think of an unmanned aircraft.

Rather than spending millions of dollars on manned helicopters and aviation units, law enforcement can use a small UAS to gain a lot of the same benefit of a manned aviation asset at a fraction of the cost. Although still expensive, small UAS will cost about the same as a police cruiser.

According to the U.S. Federal Bureau of Investigation, there are approximately 18,000 local police and sheriff departments in the United States; however, according to the Airborne Law Enforcement Association, less than 300 currently have aviation units (either fixed wing or rotary wing). According to the U.S. Fire Administration, there are approximately 30,000 fire departments in the United States; however, there are less than a dozen municipal or county fire aviation units. Because UAS are typically cheaper than manned assets, and because they can operate in dangerous environments, where manned aviation might not be feasible, UAS can provide great value to those agencies that want air assets, but cannot afford them.

In 2009, according to the National Fire Protection Association, there were more than 362,000 home fires. According to the National Interagency Fire Center, between 1 January 2010 and 4 October 2010, there were more than 57,000 wildfires, which burned nearly 3 million acres. In 2009, fires took more lives than all other natural disasters combined, with approximately 3,000 individuals and 90 firefighters dying as a result.

Some of the potential uses of UAS in firefighting include: persistent aerial surveillance, mapping, chemical sniffing, hot spot detection, designating water or suppressant drop areas, providing communication relays, search and rescue, medical evacuation, resupply, and weather monitoring. For law enforcement, UAS uses include aerial surveillance, suspect tracking, crash/crime scene photography, incident scene management, threat assessment of inaccessible areas, and emergency broadcast messaging.

Situational awareness is crucial for first responders and public safety agencies, and oftentimes, the best way to get situational information is from above. The development and use of UAS has the potential to increase public safety by allowing most, if not all, public safety agencies to acquire aerial surveillance equipment.

An Open and Transparent Discussion

Throughout the years, law enforcement agencies have proven their ability to use new technologies, even technologies with the capability to invade privacy, and use them in a safe and appropriate manner to increase public safety while still ensuring privacy protection. A few examples include manned helicopters, thermal imaging cameras, wire surveillance, GPS tracking, vast online databases, and CCTVs.

Law enforcement is able to ensure privacy rights are protected by adopting policies and procedures that govern their use. They can provide training, and they can hold people accountable if there is inappropriate behavior. They are also ultimately accountable to local elected officials and the community. AUVSI believes the easiest way to gain public support for UAS is to be forthright and open, and to invite a public discussion about the use of new technologies. Agencies that want to use UAS technology are encouraged to work with their communities to address any *reasonable* concerns and to tailor their policies and procedures to address them.

AUVSI plans on working with other law enforcement associations, such as the International Association of Chiefs of Police, the Airborne Law Enforcement Association, and the National Sheriff's Association to draft a model policy for the use of UAS by law enforcement agencies across the United States.

Existing Legal Framework

The Fourth Amendment of the U.S. Constitution prohibits unreasonable searches and seizures and requires search warrants to be based upon probable cause. The U.S. Supreme Court has interpreted the law and issued rulings that restrict the actions of police and their use of technology of all types. Courts, including the U.S. Supreme Court, have repeatedly held that airborne technology cannot be used to invade Constitutionally protected areas.

So far, in determining what is a Constitutionally protected area, the U.S. Supreme Court has distinguished between three types of areas: businesses, open fields, and homes. The Court has held that the expectation of privacy outside a home or outside a business is less than that for inside a residence.

In *Kyllo v. United States*, a case involving the use of thermal imaging by police, the U.S. Supreme Court held that all details, with respect to a home, are "intimate details" and that the use of "sense-enhancing technology" to gather information about a home, in this case forward-looking infrared imaging, is considered a search and cannot be done without a warrant. In the words of the court, "we think that obtaining by sense-enhancing technology any information regarding the interior of the home that could not otherwise have been obtained without physical intrusion into a constitutionally protected area ... constitutes a search." In other words, the court prohibits the use of airborne technology to invade Constitutionally protected areas without a

search warrant.

However, the Court has a differing view on the reasonable expectation of privacy in outdoor business property, and open fields and curtilage surrounding a residence, when observations can be made from a place where the observer has a legal right to be and the item or area is in "plain view".

In *Dow Chemical Company v. United States*, another case involving the airborne use of thermal imaging, the Court held that a Fourth Amendment protection does not include the open area of an industrial complex where there was no legitimate demand for privacy. The Court compared the aerial observations of the business with the lawful observations made over an "open field", where an individual also does not have a legitimate expectation of privacy.

With regards to the "open fields" doctrine, in *California v. Ciraolo*, the U.S. Supreme Court held that the police did not have to obtain a search warrant when observing a person's backyard or curtilage from an airplane more than 1,000 feet in altitude, and the Court went further in *Florida v. Riley*, when it held that police officers do not need a search warrant when flying a helicopter above 400 feet in altitude.

These cases can serve as the template for how law enforcement should use UAS. Because most small UAS will likely only be allowed to operate at or below 400 feet in altitude, it is likely that law enforcement will have to obtain a search warrant when using a UAS, absent exigent circumstances.

UAS Integration into the National Airspace

The Federal Aviation Administration's (FAA) mission is to "provide the safest, most efficient aerospace system in the world." The FAA's task for unmanned aircraft is coming up with the rules and regulations allowing for the safe operation and integration of UAS in the national airspace system. The UAS industry has, and will continue, to work with the FAA and other aviation stakeholders on establishing appropriate aviation safety standards.

That being said, the FAA should not be in the position to approve or deny a UAS operation based upon anything other than the safety of the airspace. Therefore, it would be inappropriate for the FAA to restrict UAS access based on anything other than aviation safety or airworthiness. Manned aviation does not need prior authorization to fly, and neither should UAS once safety standards are established and met.

On 14 February 2012, Congress passed an FAA bill into law, which requires the FAA to integrate all UAS by 30 September 2015. The bill mandates that small UAS (weighing less than 55 pounds) be integrated earlier, by the spring of 2014. The bill also instructs the FAA to expedite the access for public safety operators, and calls for the FAA to allow the use of very small UAS, weighing less than 4.4 pounds, by public safety agencies, by the middle of March 2012.

Conclusion

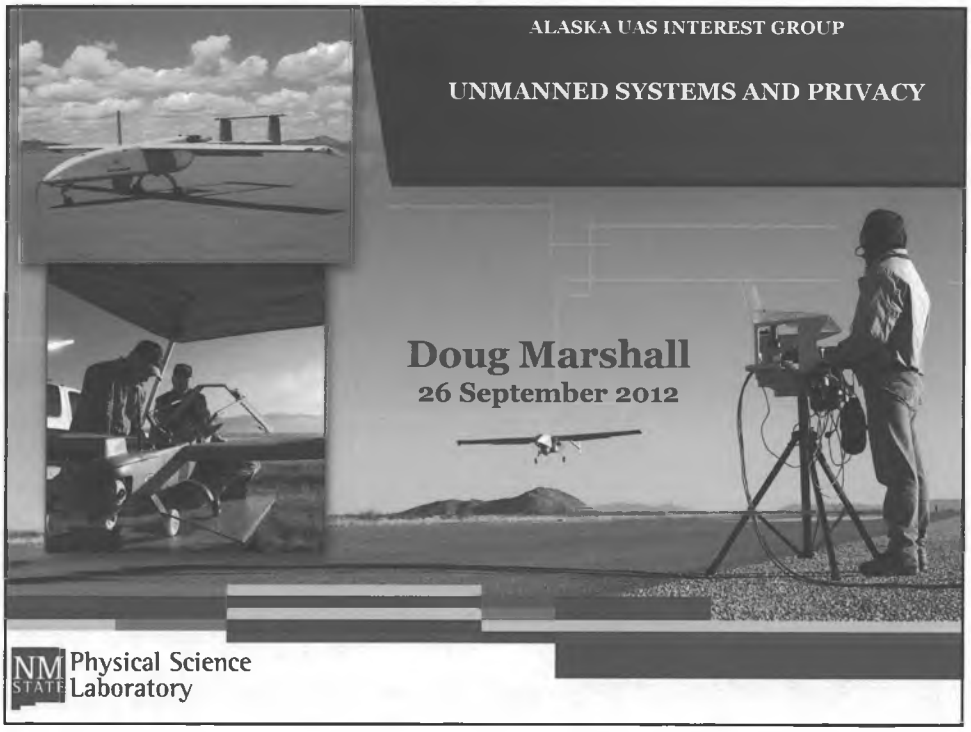
Unmanned aircraft systems will be the next major revolution in the aerospace industry, and UAS will likely change the way we think about aviation. AUVSI, as the industry's representative,

plans on playing a constructive role to ensure UAS are operated safely in the airspace and in a way that does not infringe upon Constitutionally protected privacy.

AUVSI welcomes feedback or suggestions at advocacy@auvsi.org.

###

The Association for Unmanned Vehicle Systems International (AUVSI) - the world's largest non-profit organization dedicated to the advancement of unmanned systems – represents more than 7,000 members from 55 allied countries and 2,500 organizations involved in the fields of government, industry and academia.



Privacy Cases

Key words and phrases:

- "Fourth Amendment"
- "Curtilage"
- "Reasonable/subjective Expectations of Privacy"
- "Constitutionally Protected Area"
- "Plain View"
- "Open Fields"
- "Intimate Details"
- "General Public Use"
- "Eavesdropping"
- "Routine flights on public airways"

Katz v. United States
389 U.S. 347 (1967)

- Listening device on a phone booth
- "Eavesdropping"
- "Fourth Amendment search occurs when the government violates a subjective expectation of privacy that society recognizes as reasonable"
- "These considerations do not vanish when the search in question is transferred from the setting of a home, an office, or a hotel room to that of a telephone booth. Wherever a man may be, he is entitled to know that he will remain free from unreasonable searches and seizures."

California v. Ciraolo
476 U.S. 207 (1986)

- Ciraolo grew marijuana plants in back yard
- Shielded from view by two fences
- Based on anonymous tip Santa Clara police flew over in private aircraft at 1,000 ft. and photographed house
- On evidence of naked eye observation, search warrant issued
- "The Fourth Amendment simply does not require the police traveling in the public airways at this altitude to obtain a warrant in order to observe what is visible to the naked eye."
- Reversed CA SCt's grant of motion to suppress.

Dow Chemical Company v. United States

476 U.S. 227 (1986)

- Environmental Protection Agency's aerial observation of Dow's plant complex
- EPA hired commercial aerial photographer, using a standard floor-mounted, precision aerial mapping camera, to take photographs of the facility from altitudes of 12,000, 3,000, and 1,200 feet.
- At all times the aircraft was lawfully within navigable airspace
- Held EPA's aerial photography of petitioner's 2,000-acre plant complex without a warrant was not a search under the Fourth Amendment
- Not "industrial curtilage", but an "open field"

Florida v. Riley

488 U.S. 445 (1989)

- Rural property, growing marijuana
- Unable to see inside a greenhouse behind Riley's mobile home
- Circled with helicopter at 400 ft., saw through two missing panels
- Held that police officials do not need a warrant to observe an individual's property from public airspace
- Any member of the public could legally have been flying over Riley's property in a helicopter at the altitude of 400 feet and could have observed Riley's greenhouse. The police officer did no more.
- Helicopter did not interfere with the normal use of the property (noise, dust, wind, etc.)
- Brennan's dissent worth reading w/ reference to UAS

Kyllo v. United States

533 U.S. 27 (2001)

- Use of a thermal imaging device from a public vantage point by agent of DOI to monitor the radiation of heat from person's home was a search within the meaning of the 4th Amendment and thus required a search warrant.
- The Agema 210 "is a non-intrusive device which emits no rays or beams and shows a crude visual image of the heat being radiated from the outside of the house"
- Because police did not have a warrant, the conviction for possession of marijuana was reversed.
- The question is what limits there are upon this power of technology to shrink the realm of guaranteed privacy.
- "....at the mercy of advancing technology – including imaging technology that could discern all human activity in the home."

U.S. v. Jones

- GPS tracking device attached to vehicle
- 4th Amendment violation because no warrant
- Justice Scalia stated that extended electronic surveillance "without an accompanying trespass" may be unconstitutional.
- Justice Alito: "…the use of longer term GPS monitoring in investigations of most offenses impinges on expectations of privacy.
- Could apply to UAS technology

GAO Report ("Not Ready for Prime Time")

- A June 2012 poll by Monmouth University found that 42 percent of Americans would be "very concerned" about their privacy if law enforcement started using drones, and just 15 percent said they wouldn't be concerned at all.
- "Many stakeholders believe that there should be federal regulations … to specifically protect the privacy of individuals," the report says. But "it is not clear what entity should be responsible for addressing privacy concerns across the federal government"

A gross invasion of privacy?

Does she lose her right to privacy because she is a "public figure"?

Backup Slides

Privacy and Public Policy Concerns for the UAS Owner/Operator

What types of current legal safeguards exist to protect us from misuse of UAS?

Privacy and Public Policy Concerns for the UAS Owner/Operator

- **Is there a right to privacy in the U.S.?**
- **If so, how could a UA operator violate that right?**
- **If a violation, what are the victim's remedies?**
- **How can the operator avoid liability and/or prosecution?**
- **How does the mandate to "do no harm" fit in?**

Privacy and Public Policy Concerns for the UAS Owner/Operator

- Louis Brandeis/Samuel Warren and the "right to be let alone" (1890-Harvard Law Review)
- Dean Prosser' s four privacy tort claims (1960-Prosser, The Law of Torts)
- The Impact of the Internet

Privacy and Public Policy Concerns for the UAS Owner/Operator

- Unguarded (or indiscreet) moments between friends can be captured in pictures and be instantly available across the world in digital form.
- A computer can identify the faces in each picture to create a searchable database - a fully indexed catalog of life, captured in still frames.
- The technology is here.

Privacy and Public Policy Concerns for the UAS Owner/Operator

- Facial recognition search engines
- This technology creates an automatic, searchable pictorial documentary of one's life
- Flickr and Shutterfly were created to help anyone with a camera share pictures over the Internet.
- Flickr alone now catalogues over 325 million digital photos.

Privacy and Public Policy Concerns for the UAS Owner/Operator

- The new facial recognition systems (Polar Rose, Riva, Google Picasa, Facebook) make it possible for computers to tag photos with names even if the uploader and the subject are complete strangers
- For several reasons, existing privacy law may be ill-suited for this new technology

Privacy and Public Policy Concerns for the UAS Owner/Operator

- Traditional tort law does not recognize invasions of privacy that occur in public, such as the taking of a photo in any public location.
- The few "public invasions" that do constitute torts involve celebrities or other individuals who have commercial interests in their likenesses.
- Courts have severely limited privacy protections to ensure that privacy claims do not limit the free flow of ideas.

Privacy and Public Policy Concerns for the UAS Owner/Operator

- Dean Prosser's torts:
  - Intrusion upon seclusion
  - Public disclosure
  - False light
  - Misappropriation (the right of publicity)

Privacy and Public Policy Concerns for the UAS Owner/Operator

- "Intrusion upon seclusion" is an intrusion into "a private place or matter as to which a person would have a reasonable expectation of privacy.
- "Public disclosure" punishes those who reveal private information "that would be objectionable to a reasonable person of ordinary sensibilities."
- "False light" makes liable someone who falsely claims another person made certain statements or actions

Privacy and Public Policy Concerns for the UAS Owner/Operator

- These three torts probably don't apply to those photos taken in public spaces and then uploaded to the Internet.
- The fact that an image is snapped at a party, a restaurant, a park, or a bar would doom the claim.
- The torts do "not apply to matters which occur in a public place or a place otherwise open to the public eye."
- Intrusion upon seclusion" is an intrusion into "a private place or matter as to which a person would have a reasonable expectation of privacy

Privacy and Public Policy Concerns for the UAS Owner/Operator

The UAS problem is with images taken of people who are in situations where they have a reasonable expectation of privacy:

- Their own property
- In the wilderness
- On a boat
- Use your imagination...

Privacy and Public Policy Concerns for the UAS Owner/Operator

Misappropriation (the right of publicity)

- Only applies to those whose names and faces are well recognized
- Have commercial value that could be exploited
- Celebrities, usually
- A small UA that just happens to get an image of a famous person sun bathing on a "deserted" beach

Privacy and Public Policy Concerns for the UAS Owner/Operator

- When the lives of ordinary citizens are suddenly searchable, private or indiscreet moments can become lasting reminders open to the entire world
- The ability to keep parts of our lives private is central to our individual uniqueness

Privacy and Public Policy Concerns for the UAS Owner/Operator

- Possible privacy scenarios :
  - Aerial photography
  - Remote sensing that records images
  - Surveillance activities over public (and private) land
  - Scientific payload with imaging capability
  - Scientific payload on a CBP or DoD UAS in a joint use arrangement

Privacy and Public Policy Concerns for the UAS Owner/Operator

- Other issues:
  - Who owns the images?
  - Who is liable in case of "inadvertent" capture of images that somehow result in harm to the person depicted?
  - How to ensure security of data capture?
  - In joint-use situations, what are obligations/duties of operator, pilot, contractor to share digital data that may show criminal behavior?
  - What if a sensor operator puts an image or video on the Internet?

Privacy and Public Policy Concerns for the UAS Owner/Operator

- Other issues:
  - If the potential for misuse of imaging is real, how to ensure that the system or operator "does no harm"?
  - For joint scientific, DHS/CBP and DoD operations, if law enforcement captures data on a science pod, can the data be legally used in prosecution?
  - Can owner/operator be civilly liable for turning over images or data to law enforcement?

Privacy and Public Policy Concerns for the UAS Owner/Operator

- In the law, there is the concept of "foreseeability"
- If it can happen, it probably will
- Possible solutions:
  - Courts or legislatures can expand "privacy" into public places
  - Legislative Intervention
    - Government regulation may be preferable to tort litigation in this circumstance

Privacy and Public Policy Concerns for the UAS Owner/Operator

- Some objections to any legislative intervention:
  - concern for the First Amendment
  - a desire for full information
  - faith in the market
  - anxiety about government interference with emerging technology
- Caveat-there is no good precedent for any of this....

CRS Report for Congress
Prepared for Members and Committees of Congress

Summary

Under the FAA Modernization and Reform Act of 2012, P.L. 112-95, Congress has tasked the Federal Aviation Administration (FAA) with integrating unmanned aircraft systems (UASs), sometimes referred to as unmanned aerial vehicles (UAVs) or drones, into the national airspace system by September 2015. Although the text of this act places safety as a predominant concern, it fails to establish how the FAA should resolve significant, and up to this point, largely unanswered legal questions.

For instance, several legal interests are implicated by drone flight over or near private property. Might such a flight constitute a trespass? A nuisance? If conducted by the government, a constitutional taking? In the past, the Latin maxim *cujus est solum ejus est usque ad coelum* (for whoever owns the soil owns to the heavens) was sufficient to resolve many of these types of questions, but the proliferation of air flight in the 20th century has made this proposition untenable. Instead, modern jurisprudence concerning air travel is significantly more nuanced, and often more confusing. Some courts have relied on the federal definition of "navigable airspace" to determine which flights could constitute a trespass. Others employ a nuisance theory to ask whether an overhead flight causes a substantial impairment of the use and enjoyment of one's property. Additionally, courts have struggled to determine when an overhead flight constitutes a government taking under the Fifth and Fourteenth Amendments.

With the ability to house surveillance sensors such as high-powered cameras and thermal-imaging devices, some argue that drone surveillance poses a significant threat to the privacy of American citizens. Because the Fourth Amendment's prohibition against unreasonable searches and seizures applies only to acts by government officials, surveillance by private actors such as the paparazzi, a commercial enterprise, or one's neighbor is instead regulated, if at all, by state and federal statutes and judicial decisions. Yet, however strong this interest in privacy may be, there are instances where the public's First Amendment rights to *gather* and *receive* news might outweigh an individual's interest in being let alone.

Additionally, there are a host of related legal issues that may arise with this introduction of drones in U.S. skies. These include whether a property owner may protect his property from a trespassing drone; how stalking, harassment, and other criminal laws should be applied to acts committed with the use of drones; and to what extent federal aviation law could preempt future state law.

Because drone use will occur largely in federal airspace, Congress has the authority or can permit various federal agencies to set federal policy on drone use in American skies. This may include the appropriate level of individual privacy protection, the balancing of property interests with the economic needs of private entities, and the appropriate safety standards required.

Introduction

The integration of drones into U.S. skies is expected by many to yield significant commercial and societal benefits.[1] Drones could be employed to inspect pipelines, survey crops, and monitor weather.[2] One newspaper has already used a drone to survey storm damage, [3] and real estate agents have used them to survey property.[4] In short, the extent of their potential domestic application is bound only by human ingenuity.

In an effort to accelerate this introduction, in the FAA Modernization and Reform Act of 2012, Congress tasked the Federal Aviation Administration (FAA) with safely integrating drones into the national airspace system by September 2015.[5] Likewise, sensing the opportunities that unmanned flight portend, lobbying groups and drone manufacturers have joined the chorus of those seeking a more rapid expansion of drones in the domestic market.[6]

Yet, the full-scale introduction of drones into U.S. skies will inevitably generate a host of legal issues. This report will explore some of those issues. To begin, this report will describe the regulatory framework for permitting the use of unmanned vehicles and the potential rulemaking that will occur over the next few years. Next, it will discuss theories of takings and property torts as they relate to drone flights over or near private property. It will then discuss the privacy interests implicated by drone surveillance conducted by private actors and the potential countervailing First Amendment rights to gather and receive news. Finally, this report will explore possible congressional responses to these privacy concerns and identify additional potential legal issues.

Development of Aviation Law and Regulations

The predominant theory of airspace rights applied before the advent of aviation derived from the Roman Law maxim *cujus est solum ejus est usque ad coelum*, meaning whoever owns the land

[1] A "drone" is simply an aircraft that can fly without a human operator. They are sometimes referred to as unmanned aerial vehicles (UAV), and the whole system—including the aircraft, the operator on the ground, and the digital network required to fly the aircraft—is referred to as an unmanned aircraft system (UAS). *See generally* CRS Report R42718, *Pilotless Drones: Background and Considerations for Congress Regarding Unmanned Aircraft Operations in the National Airspace System*, by Bart Elias.

possesses all the space above the land extending upwards into the heavens.[7] This maxim was adopted into English common law and eventually made its way into American common law.[8] At the advent of commercial aviation, Congress enacted the Air Commerce Act of 1926[9] and later the 1938 Civil Aeronautics Act.[10] These laws included provisions stating that "to the exclusion of all foreign nations, [the United States has] complete sovereignty of the airspace" over the country.[11] Additionally, Congress declared a "public right of freedom of transit in air commerce through the navigable airspace of the United States."[12] This right to travel in navigable airspace came into conflict with the common law idea that each landowner also owned the airspace above the surface in perpetuity. If the common law idea was followed faithfully, there could be no right to travel in navigable airspace without constantly trespassing in private property owners' airspace. This conflict was directly addressed by the Supreme Court in *United States v. Causby*, discussed extensively below.

With the passage of the Federal Aviation Act in 1958,[13] the administrator of the FAA was given "full responsibility and authority for the advancement and promulgation of civil aeronautics generally.... "[14] This centralization of responsibility and creation of a uniform set of rules recognized that "aviation is unique among transportation industries in its relation to the federal government—it is the only one whose operations are conducted almost wholly within federal jurisdiction.... "[15] The FAA continues to set uniform rules for the operation of aircraft in the national airspace. In the FAA Modernization and Reform Act of 2012, Congress instructed the FAA to "develop a comprehensive plan to safely accelerate the integration of civil unmanned aircraft systems into the national airspace system."[16] These regulations must provide for this integration "as soon as practicable, but not later than September 30, 2015."[17]

Current FAA Regulations of Navigable Airspace

Fixed-Wing Aircraft

FAA regulations define the minimum safe operating altitudes for different kinds of aircraft. Generally, outside of takeoff and landing fixed-wing aircraft must be operated at an altitude that allows the aircraft to conduct an emergency landing "without undue hazard to persons or property on the surface."[18] In a congested area, the aircraft must operate at least "1,000 feet above the highest obstacle within a horizontal radius of 2,000 feet of the aircraft."[19] The minimum safe

operating altitude over non-congested areas is "500 feet above the surface."[20] Over open water or sparsely populated areas, aircraft "may not be operated closer than 500 feet to any person, vessel, vehicle, or structure."[21] Navigable airspace is defined in statute as the airspace above the minimum safe operating altitudes, including airspace needed for safe takeoff and landing.[22]

Helicopters

While fixed-wing aircraft are subject to specific minimum safe operating altitudes based on where it is flying, regulation of helicopter minimum altitudes is less rigid. According to FAA regulations, a helicopter may fly below the minimum safe altitudes prescribed for fixed-wing aircraft if it is operated "without hazard to person or property on the surface."[23] Therefore, arguably a helicopter may be lawfully operated outside the zone defined in statute as navigable airspace.[24]

Current FAA Regulation of Drones

Public and Commercial Operators

Drones operated by federal, state, or local agencies must obtain a certificate of authorization or waiver (COA) from the FAA. After receiving COA applications, the FAA conducts a comprehensive operational and technical review of the drone and can place limits on its operation in order to ensure its safe use in airspace.[25] In response to a directive in the FAA Modernization and Reform Act of 2012, the FAA recently streamlined the process for obtaining COAs, making it easier to apply on their website.[26] It also employs expedited procedures allowing grants for temporary COAs if needed for time-sensitive mission.[27]

Private commercial operators must receive a special airworthiness certificate in the experimental category in order to operate.[28] These certificates have been issued on a limited basis for flight tests, demonstrations, and training. Presently, there is no other method of obtaining FAA approval to fly drones for commercial purposes. It appears these restrictions will be loosened in the coming

years, since the FAA has been instructed to issue a rulemaking that will lead to the phased-in integration of civilian unmanned aircraft into national airspace.[29]

Recreational Users

The FAA encourages recreational users of model aircraft, which certain types of drones could fall under, to follow a 1981 advisory circular. Under the circular, users are instructed to fly a sufficient distance from populated areas and away from noise-sensitive areas like parks, schools, hospitals, or churches. Additionally, users should avoid flying in the vicinity of full-scale aircraft and not fly more than 400 feet above the surface. When flying within three miles of an airport, users should notify the air traffic control tower, airport operator, or flight service station. Compliance with these guidelines is voluntary. In the FAA Modernization and Reform Act of 2012, the FAA was prohibited from promulgating rules regarding certain kinds of model aircraft flown for hobby or recreational use. This prohibition applies if the model aircraft is less than 55 pounds, does not interfere with any manned aircraft, and is flown in accordance with a community-based set of safety guidelines. If flown within five miles of an airport, the operator of the model aircraft must notify both the airport operator and air traffic control tower.[30]

Safe Minimum Flying Altitude

The FAA does not currently regulate safe minimum operating altitudes for drones as it does for other kinds of aircraft. This may be one way that the FAA responds to Congress's instruction to write rules allowing for civil operation of small unmanned aircraft systems in the national airspace.[31] One possibility is for the FAA to create different classes of drones based on their size and capabilities. Larger drones that physically resemble fixed-wing aircraft could be subject to similar safe minimum operating altitude requirements whereas smaller drones could be regulated similar to helicopters.

Airspace and Property Rights

Since the popularization of aviation, courts have had to balance the need for unobstructed air travel and commerce with the rights of private property owners. The foundational case in explaining airspace ownership rights is *United States v. Causby*.[32]

United States v. Causby

In *United States v. Causby*, the Supreme Court directly confronted the question of who owns the airspace above private property.[33] The plaintiffs filed suit against the U.S. government arguing a violation of the Fifth Amendment Takings Clause, which states that private property shall not "be taken for public use, without just compensation." Generally, takings suits can only be filed

[33] *Id.*

against the government when a government actor, as opposed to a private part, causes the alleged harm.[34]

Causby owned a chicken farm outside of Greensboro, North Carolina that was located near an airport regularly used by the military. The proximity of the airport and the configuration of the farm's structures led the military planes to pass over the property at 83 feet above the surface, which was only 67 feet above the house, 63 feet above the barn, and 18 feet above the tallest tree.[35] While this take-off and landing pattern was conducted according to the Civil Aeronautics Authority guidelines, the planes caused "startling" noises and bright glare at night.

As the Court explained, "as a result of the noise, respondents had to give up their chicken business. As many as six to ten of their chickens were killed in one day by flying into the walls from fright. The total chickens lost in this manner was about 150.... The result was the destruction of the use of the property as a commercial chicken farm."[36] The Court had to determine whether this loss of property constituted a taking without just compensation.

At the outset, the Court directly rejected the common law conception of airspace ownership: "It is ancient doctrine that at common law ownership of the land extended to the periphery of the universe—*Cujus solum ejus est usque ad coelum.* But that doctrine has no place in the modern world."[37] The Court noted that Congress had previously declared a public right of transit in air commerce in navigable airspace and national sovereignty in the airspace.[38] These statutes could not be reconciled with the common law doctrine without subjecting aircraft operators to countless trespass suits. In the Court's words, "common sense revolts at the idea."[39]

Even though it rejected the idea that the Causbys held complete ownership of the air up to the heavens, the Court still had to determine if they owned any portion of the space in which the planes flew such that a takings could occur. The government argued that flights within navigable airspace that do not physically invade the surface cannot lead to a taking. It also argued that the landowner does not own any airspace adjacent to the surface "which he has not subjected to possession by the erection of structures or other occupancy."[40]

The Court did not adopt this reasoning, finding instead that "the landowner owns at least as much space above the ground as he can occupy or use in connection with the land. The fact that he does not occupy it in a physical sense—by the erection of building and the like—is not material."[41] Therefore, it found that the landowner owns the airspace in the immediate reaches of the surface necessary to use and enjoy the land and invasions of this space "are in the same category as invasions of the surface."[42] Above these immediate reaches, the airspace is part of the public

---

[34] Takings claims filed against state government actors would not be filed under the Fifth Amendment. Rather, they would arise as state constitutional claims. For more information on takings, *see* CRS Report RS20741, *The Constitutional Law of Property Rights "Takings": An Introduction*, by Robert Meltz.

domain, but the Court declined to draw a clear line. The Court also noted that the government's argument regarding the impossibility of a taking based on flights in navigable airspace was inapplicable in this case because the flights over Causby's land were not within navigable airspace.[43] At the time, federal law defined navigable airspace as space above the minimum safe flying altitudes for specific areas, but did not include the space needed to take off and land. Even though these flights were not within navigable airspace, the Court seemed to suggest that if they were, the inquiry would not immediately end. Instead, the Court would then have to determine when the regulation itself, defining the navigable airspace, was valid.[44]

Ultimately, in the context of a taking claim, the Court concluded that "flights over private land are not a taking, unless they are so low and so frequent to be a direct and immediate interference with the enjoyment and use of the land."[45] With regard to the Causbys' chicken farm, the Court concluded that the military flights had imposed a servitude upon the land, similar to an easement, based on the interference with the use and enjoyment of their property. Although the land did not lose all its economic value, the lower court's finding clearly established the flights led directly to a diminution in the value of the property, since it could no longer be used for its primary purpose as a chicken farm.

Post-*Causby* Theories of Airspace Ownership

Causby clearly abandoned the ancient idea that private landowners each owned their vertical slice of the airspace above the surface in perpetuity as incompatible with modern life. The case set up three factors to examine in a taking claim that courts still utilize today: (1) whether the planes flew directly over the plaintiff's land; (2) the altitude and frequency of the flights; and (3) whether the flights directly and immediately interfered with the plaintiff's use and enjoyment of the surface land.[46]

However, it left many questions unanswered. Where is the dividing line between the "immediate reaches" of the surface and public domain airspace? Can navigable airspace intersect with the "immediate reaches" belonging to the private property? Can aircraft flying wholly within navigable airspace, as defined by federal law, ever lead to a successful takings claim? How does one assess claims based on lawfully operated aircraft, such as helicopters, flying below navigable airspace?

Subsequent cases have been brought using many different legal claims, including trespass and nuisance, as discussed below, and various ways of describing the resulting injury. Claims could include an "inverse condemnation," another way of describing a taking, or the establishment of an avigation, air, or flying easement. While these legal claims may have different names, it appears that courts use *Causby* as the starting point for analyzing all property-based challenges to

[43] *Id.* at 264.

[44] *Id.* at 263.

[45] *Id.* at 266.

[46] *See e.g.*, Andrews v. United States, 2012 U.S. Claims LEXIS 1644, *10 (explaining that the "The United States Court of Appeals for the Federal Circuit (Federal Circuit) has derived from Causby three factors for consideration 'in determining whether noise and other effects from overflights ... constitute a taking.... '"). *But see* Argent v. United States, 124 F.3d 1277, 1284 (1997) (finding a taking claim may be based on "a peculiarly burdensome pattern of activity, including both intrusive and non-intrusive flights").

intrusions upon airspace. Several different interpretations of *Causby* have emerged in the attempt to articulate an airspace ownership standard, a few of which are described here.

Following *Causby*, several lower courts employed a fixed-height theory and interpreted the decision as creating two distinct categories of airspace. On the one hand, the stratum of airspace that was defined in federal law as "navigable airspace" was always a part of the public domain. Therefore, flights in this navigable airspace could not lead to a successful property-right based action like a takings or trespass claim because the property owner never owned the airspace in the public domain. On the other hand, the airspace below what is defined as navigable airspace could be "owned" by the surface owner and, therefore, intrusions upon it could lead to a successful takings or property tort claim. Since this fixed-height theory of airspace ownership relies heavily on the definition of navigable airspace, the expansion of the federal definition of "navigable airspace" to include the airspace needed to take-off and land[47] greatly impacts what airspace a property owner could claim.

This strict separation between navigable airspace and the airspace a landowner can claim seems to have been disavowed by the Supreme Court. First, in dicta in *Braniff Airways v. Nebraska State Bd. of Equalization & Assessment*,[48] a case primarily dealing with the question of federal preemption of state airline regulations, the Court left open the possibility of a taking based on flights occurring in navigable airspace. It summarized *Causby* as holding "that the owner of land might recover for a taking by national use of navigable air space resulting in destruction in whole or in part of the usefulness of the land property."[49] Next, in *Griggs v. Allegheny County* the Supreme Court found that the low flight of planes over the plaintiff's property, taking off from and landing at a nearby airport's newly constructed runway, constituted a taking that had to be compensated under the Fifth Amendment.[50] The noise and fear of a plane crash caused by the low overhead flights made the property "'undesirable and unbearable'" for residential use, making it impossible for people in the house to converse or sleep.[51] The Court reached this conclusion that a taking occurred based on this injury, despite the fact that the flights were operated properly under federal regulations and never flew outside of navigable airspace.[52] Despite this holding, some lower courts have continued to lend credence to a fixed-height ownership theory as a reasonable interpretation of *Causby*.[53]

Another interpretation of *Causby* essentially creates a presumption of a non-taking when overhead flights occur in navigable airspace. This presumption would recognize the importance of unimpeded travel of air commerce and that Congress placed navigable airspace in the public domain. However, the presumption could be rebutted by evidence that the flights, while in navigable airspace, interfered with the owner's use and enjoyment of the surface enough to justify compensation. As one court reasoned, "as the height of the overflight increases... the Government's interest in maintaining sovereignty becomes weightier while the landowner's

[49] *Id.* at 596.

[50] Griggs v. Allegheny County, 369 U.S. 84, 90 (1962).

[51] *Id.* at 87.

[52] *Id.* at 86-89.

[53] *See, e.g.*, Aaron v. United States, 311 F.2d 798 (Ct. Cl. 1963); Powell v. United States, 1 Cl. Ct. 669 (1983).

interest diminishes, so that the damage showing required increases in a continuum toward showing absolute destruction of all uses of the property."[54]

Finally, some courts have concluded that the altitude of the overhead flight has no determinative impact on whether a taking has occurred. One federal court noted that the government's liability for a taking is not impacted "merely because the flights of Government aircraft are in what Congress has declared to be navigable airspace and subject to its regulation."[55] Under this approach, "although the navigable airspace has been declared to be in the public domain, 'regardless of any congressional limitations, the land owner, as an incident to his ownership, has a claim to the superjacent airspace to the extent that a reasonable use of his land involves such space.'"[56] Under this theory, the court would only need to examine the effect of the overhead flights on the use and enjoyment of the land, and would not need to determine if the flight occurred in navigable airspace.

While the definition of navigable airspace impacts each theory differently, it is clear that under the current interpretation a showing of interference with the use and enjoyment of property is required. Cases have clearly established that overhead flights leading to impairment of the owner's livelihood or cause physical damage qualify as an interference with use and enjoyment of property.[57] Additionally, flights that cause the surface to become impractical for its intended use by the current owner also satisfy the use and enjoyment requirement.[58] For example, in *Griggs*, the noise, vibration, and fear of damage caused by overhead flights made it impossible for the plaintiffs to converse with others or sleep within their house, leading to their retreat from the property, which had become "undesirable and unbearable for their residential use."[59] Some courts have recognized a reduction in the potential resale value of the property as an interference with its use and enjoyment, even if the property continues to be suitable for the purposes for which it is currently used.[60] One court explained: "Enjoyment of property at common law contemplated the entire bundle of rights and privileges that attached to the ownership of land ... Owners of fee simple estates ... clearly enjoy not only the right to put their land to a particular present use, but also to hold the land for investment and appreciation.... "[61] However, other courts have rejected the idea that restrictions on uses by future inhabitants, without showing loss of property value, are relevant to a determination of the owner's own use and enjoyment of the property.[62]

Trespass and Nuisance Claims Against Private Actors

Although *Causby* arose from a Fifth Amendment takings claim, its articulation of airspace ownership standards is also often used in determining state law tort claims such as trespass and nuisance. These state law tort claims could be used to establish liability for overhead flights

[62] Stephens v. United States, 11 Cl. Ct. 352 (1986).

operated by private actors, where a lack of government involvement precludes a takings claim. Generally, trespass is any physical intrusion upon property owned by another. However, unlike with surface trespass claims, simply proving that an object or person was physically present in the airspace vertically above the landowner's property is generally not enough to establish a trespass in airspace. Since *Causby* struck down the common law idea of *ad coelum*, landowners generally do not have an absolute possessory right to the airspace above the surface into perpetuity. Instead, airspace trespass claims are often assessed using the same requirements laid out in the *Causby* takings claim. Arguably, these standards are used in property tort claims because there can be no trespass in airspace unless the property owner has some possessory right to the airspace, which was the same question at issue in *Causby*.

To allege an actionable trespass to airspace, the property owner must not only prove that the interference occurred within the immediate reaches of the land, or the airspace that the owner can possess under *Causby*, but also that its presence interferes with the actual use of his land. As one court explained, "a property owner owns only as much air space above his property as he can practicable use. And to constitute an actionable trespass, an intrusion has to be such as to subtract from the owner's use of the property."[63] This standard for airspace trespass was also adopted by the Restatement (Second) of Torts.[64]

Nuisance is a state law tort claim that is not based on possessory rights to property, like trespass, but is rooted in the right to use and enjoy land.[65] Trespass and nuisance claims arising from airspace use are quite similar, since trespass to airspace claims generally require a showing that the object in airspace interfered with use and enjoyment of land. However, unlike trespass, nuisance claims do not require a showing that the interference actually occupied the owner's airspace. Instead, a nuisance claim can succeed even if the interference flew over adjoining lands and never directly over the plaintiff's land, as long as the flight constitutes a substantial and unreasonable interference with the use and enjoyment of the land.

Potential Liability Arising from Civilian Drone Use

The integration of drones into domestic airspace will raise novel questions of how to apply existing airspace ownership law to this new technology. How courts may apply the various interpretations of *Causby*, discussed above, to drones will likely be greatly impacted by the FAA's definition of navigable airspace for drones.

The potential for successful takings, trespass, or nuisance claims from drone use will also be impacted by the physical characteristics of the drone, especially given that current case law heavily emphasizes the impact of the flight on use and enjoyment of the surface property. Several characteristics of drones may make their operation in airspace less likely to lead to liability for drone operators than for aircraft operators. First, the noise attributed to drone use may be significantly less than noise created by helicopters or planes powered by jet engines. Second, drones commonly used for civilian purposes could be much smaller than common aircraft used today. This decreased size is likely to lead to fewer physical impacts upon surface land such as

[63] Geller v. Brownstone Condominium, 82 Ill. App. 3d 334, 336-37 (1980).

[64] RESTATEMENT (SECOND) OF TORTS § 159(2) (1965) (stating that "Flights by aircraft in the airspace above the land of another is a trespass if, but only if, (a) it enters into the immediate reaches of the airspace next to the land, and (b) it interferes substantially with the other's use and enjoyment of the land.").

[65] RESTATEMENT (SECOND) OF TORTS § 821D (1979); 2 DAN B DOBBS, ET AL. THE LAW OF TORTS § 398 (2d ed. 2011).

vibration and dust, which are common complaints arising from overhead aircraft and helicopter flights. Finally, it is unknown at this time how most drones will be deployed into flight. Will drone "airports" be used to launch the aircraft or will they take off and land primarily from individual property? If drone use remains decentralized and is not organized around an "airport," then drones are less likely to repeatedly fly over the same piece of property, creating fewer potential takings, trespass, or nuisance claims. Additionally, the majority of drones are more likely to operate like helicopters, taking off and landing vertically, than like traditional fixed-wing aircraft. This method of takeoff reduces the amount of surface the aircraft would have to fly over before reaching its desired flying altitude, minimizing the potential number of property owners alleging physical invasion of the immediate reaches of their surface property.

Alternatively, the potential ability for drones to fly safely at much lower altitudes than fixed-wing aircraft or helicopters could lead to a larger number of property-based claims. Low-flying drones are more likely to invade the immediate reaches of the surface property, thus satisfying part of the requirement for a takings or trespass claim.

Privacy

Perhaps the most contentious issue concerning the introduction of drones into U.S. airspace is the threat that this technology will be used to spy on American citizens. With the ability to house high-powered cameras, infrared sensors, facial recognition technology, and license plate readers, some argue that drones present a substantial privacy risk.[66] Undoubtedly, the government's use of drones for domestic surveillance operations implicates the Fourth Amendment and other applicable laws.[67] In like manner, privacy advocates have warned that private actors might use drones in a way that could infringe upon fundamental privacy rights.[68] This section will focus on the privacy issues associated with the use of drones by private, non-governmental actors. It will provide a general history of privacy law in the United States and survey the various privacy torts, including intrusion upon seclusion, the privacy tort most applicable to drone surveillance. It will then explore the First Amendment right to gather news. Application of these theories to drone surveillance will be discussed in the section titled "Congressional Response."

> Drones are already flying in U.S. airspace – with thousands more to come – but with no privacy protections or transparency measures in place. We are entering a brave new world, and just because a company soon will be able to register a drone license shouldn't mean that company can turn it into a cash register by selling consumer information. Currently, there are no privacy protections or guidelines and no way for the public to know who is flying drones, where, and why. The time to implement privacy protections is now.

Id.

Early Privacy Jurisprudence

Although early Anglo-Saxon law lacked express privacy protections, property law and trespass theories served as proxy for the protection of individual privacy. Lord Coke pronounced in 1605 that "the house of everyone is to him as his castle and fortress, as well for his defence against injury and violence, as for his respose[.]"[69] This proposition that individuals are entitled to privacy while in their homes crossed the Atlantic with the colonists and appeared prominently in early revolutionary thinking.[70] In one early American common law decision, the court noted that "[t]he law is clearly settled, that an officer cannot justify the breaking open an outward door or window, in order to execute process in a civil suit; if he doth, he is a trespasser."[71] In cases lacking physical trespass, prosecutors relied on an eavesdropping theory, which protected the privacy of individuals' conversations while in their home.[72]

These century-old theories of trespass and eavesdropping, however, failed to keep up with a rapidly changing society fueled by advancing technologies. As with today's celebrity-obsessed society, late-19th century society experienced the birth and spread of "yellow journalism," a new media aimed at emphasizing the "curious, dramatic, and unusual, providing readers a 'palliative of sin, sex, and violence.'"[73] Faster presses and instantaneous photography enabled journalists to exploit and spread gossip.[74] Louis D. Brandeis (then a private attorney) and Samuel Warren were bothered with the press's constant intrusions into the private affairs of prominent Bostonians.[75] In 1890, they published a seminal law review article formulating a new legal theory—the right to be let alone.[76] Brandeis and Warren understood that existing tort doctrines such as trespass and libel were insufficient to protect privacy rights, as "only a part of the pain, pleasure, and profit of life lay in physical things."[77] They noted that this new right to privacy derived not from "the principle of private property, but that of an inviolate personality."[78] The authors observed that "instantaneous photographs and newspaper enterprise have invaded the sacred precincts of private and domestic life; and numerous mechanical devices threaten to make good the prediction that 'what is whispered in the closet shall be proclaimed from the house-tops.'"[79] Although this new theory had its detractors,[80] it found its way into the common law of several states.[81]

Privacy Torts

In 1939, the First Restatement of Torts (a set of model rules intended for adoption by the states) created a general tort for invasion of privacy.[82] By 1940, a minority of states had adopted some right of privacy either by statute or judicial decision, and six states had expressly refused to adopt such a right.[83] Twenty years later, Dean William Prosser surveyed the case law surrounding this right and concluded that the right to privacy entailed four distinct (yet, sometimes overlapping) rights: (1) intrusion upon seclusion; (2) public disclosure of private facts; (3) publicity which puts the target in a false light; and (4) appropriation of one's likeness.[84] These four categories were incorporated into the Restatement (Second) of Torts.[85]

Section 652B of the Restatement (Second) of Torts creates a cause of action for intrusion upon seclusion,[86] the privacy tort most likely to apply to drone surveillance.[87] It has been adopted either by common law or statute in an overwhelming majority of the states.[88] Section 652B provides: "One who intentionally intrudes, physically or otherwise, upon the solitude or seclusion of another or his private affairs or concerns, is subject to liability to the other for invasion of his privacy, if the intrusion would be highly offensive to a reasonable person."[89] Courts have developed a set of rules for applying § 652B. First, it requires an objective person standard, testing whether a person of "ordinary sensibilities" would be offended by the alleged invasion.[90] Thus, someone with an idiosyncratic sensitivity—say, an aversion to cameras—could not satisfy this standard by simply having his photograph taken. Likewise, the intrusion must not only be offensive, but "*highly* offensive,"[91] or as one court put it, "outrageously unreasonable conduct."[92] Generally, a single incident will not suffice; instead, the intrusion must be "repeated with such persistence and frequency as to amount to a course of hounding" and "becomes a burden to his existence.... "[93] However, in a few cases a single intrusion was adequate.[94] The invasion of

privacy must been intentional, meaning the defendant must desire that the intrusion would occur, or as with other torts, [95] knew with a substantial certainty that such an invasion would result from his actions.[96] An accidental intrusion is not actionable. Finally, in some states, the intrusion must cause mental suffering, shame, or humiliation to permit recovery.[97]

A review of the case law demonstrates that the location of the target of the surveillance is, in many cases, determinative of whether someone has a viable claim for intrusion upon seclusion. For the most part, conducting surveillance of a person while within the confines of his home will constitute an intrusion upon seclusion.[98] The illustrations to § 652B offer an example of a private detective who photographs an individual while in his home with a telescopic camera as a viable claim.[99] Likewise, as one court observed, "when a picture is taken of a plaintiff while he is in the privacy of his home, ... the taking of the picture may be considered an intrusion into the plaintiff's privacy just as eavesdropping or looking into his upstairs windows with binoculars are considered an invasion of his privacy."[100]

The likelihood of a successful claim is diminished if the surveillance is conducted in a public place. The comments to § 652B explain that there is generally no liability for photographing or observing a person while in public "since he is not then in seclusion, and his appearance is public and open to the public eye."[101] Likewise, Prosser observed:

> On the public street, or in any other public place, the plaintiff has no right to be alone, and it is no invasion of his privacy to do no more than follow him about. Neither is it such an invasion to take a photograph in such a place, since this amounts to nothing more than making a record, not differing essentially from a full written description, of a public sight which anyone present would be free to see.[102]

The case law also supports this proposition. The Alabama Supreme Court dismissed a claim of wrongful intrusion against operators of a race track who photographed the plaintiffs while they were in the "winner's circle" at the track.[103] Similarly, a federal district court dismissed a claim by a husband and wife who had been photographed by Forbes Magazine while waiting in line at the Miami International Airport as it was taken in "a place open to the general public."[104] Likewise, a Vietnam veteran lost a claim for invasion of privacy based on photographs that depicted him and

other soldiers during a combat mission in Vietnam—again, a public setting.[105] Other examples include the recording of license plate numbers of cars parked in a public parking lot[106] and photographing a person while walking on a public sidewalk.[107]

Indeed, even plaintiffs who were videotaped or photographed while on their own property have generally been unsuccessful in their privacy claims so long as they could be viewed from a public vantage point. Rejecting one plaintiff's claim for intrusion upon seclusion, the Supreme Court of Oregon held that even though the investigators trespassed on the plaintiff's property to film him, the investigation did not "constitute an unreasonable surveillance 'highly offensive to a reasonable man[,]'"[108] as the plaintiff could have been viewed from the road by his neighbors or passersby.[109] In another case, the wife of a prominent Puerto Rican politician sought damages from a newspaper for invasion of privacy allegedly committed when an agent of the newspaper photographed her house as part of a news story about her husband.[110] The court dismissed her claim as the photographers were not "unreasonably intrusive," and the photographs depicted only the outside of the home and no persons were photographed. [111] Similarly, in one case a couple sued a cell phone company for intrusion upon seclusion when the company's workers looked onto their property each time they serviced a nearby cell tower.[112] The court rejected their claim, holding that '[t]he mere fact that maintenance workers come to an adjoining property as part of their work and look over into the adjoining yard is legally insufficient evidence of highly offensive conduct."[113] There are many other examples.[114]

However, there have been some successful claims for intrusion upon seclusion involving surveillance conducted in public.[115] The comments to § 652B explain: "Even in a public place, however, there may be some matters about the plaintiff, such as his underwear or lack of it, that are not exhibited to the public gaze, and there may still be invasion of privacy when there is intrusion upon these matters."[116] One of the most famous cases concerning this "public gaze" theory involved a suit for invasion of privacy against a newspaper when it published a picture of

[116] RESTATEMENT (SECOND) OF TORTS § 652B cmt. c.

the plaintiff with her dress blown up as she was leaving a fun house at a county fair.[117] In upholding the plaintiff's claim, the court observed: "To hold that one who is involuntarily and instantaneously enmeshed in an embarrassing pose forfeits her right of privacy merely because she happened at the moment to be part of a public scene would be illogical, wrong, and unjust."[118] In *Huskey v. National Broadcasting Co. Inc.*, a prisoner sued NBC, a television broadcasting company, alleging that by filming him without consent while he was working out in the exercise yard at the prison, NBC invaded his privacy.[119] NBC countered that depictions of persons in a "publicly visible area" could not support the claim for invasion of seclusion.[120] Ultimately, the court permitted the prisoner's claim to go forward, observing that "[o]f course [the prisoner] could be seen by guards, prison personnel and inmates, and obviously he was in fact seen by NBC's camera operator. But the mere fact a person can be seen by others does not mean that person cannot legally be 'secluded.'"[121] Although relief is available for certain cases of public surveillance, recovery seems to be the exception rather than the norm.[122]

First Amendment and Newsgathering Activities

Based on the foregoing discussion, safeguarding privacy from intrusive drone surveillance is clearly an important societal interest. However, this interest must be weighed against the public's countervailing concern in securing the free flow of information that inevitably feeds the "free trade of ideas."[123] Unmanned aircraft can improve the press and the public's ability to gather news: they can operate in dangerous areas without putting a human operator at risk of danger; can carry sophisticated surveillance technology; can fly in areas not currently accessible by traditional aircraft; and can stay in flight for long durations. However, challenges arise in attempting to find an appropriate balance between this interest in newsgathering and the competing privacy interests at stake.

The First Amendment to the United States Constitution provides that "Congress shall make no law ... abridging the freedom of speech, or of the press.... "[124] The Court has construed this phrase to cover not only traditional forms of speech, such as political speeches or polemical articles, but also conduct that is "necessary for, or integrally tied to, acts of expression,"[125] such as distribution of political literature[126] or door-to-door solicitation.[127] Additionally, the Court has pulled within

the First Amendment's protection other conduct that is not expressive in itself, but is "necessary to accord full meaning and substance to those guarantees."[128] For example, the Court has said that the public is entitled to a "right to receive news" as a correlative of the right to free expression.[129]

Like this right to receive news, the Court has intimated in a series of cases beginning in the 1960s that the public and the press may be entitled to *a right to gather news* under the First Amendment. Initially, in *Zemel v. Rusk*, the Court observed that the right "to speak and publish does not carry with it the unrestrained right to gather information."[130] The Court's reluctance to extend this right may have signaled its concern that an unconditional newsgathering right could subsume almost any government regulation that places a slight restriction on the ability to gather news.[131] However, several years later the Court indicated in *Branzburg v. Hayes* that although laws of general applicability apply equally to the press as to the general public, that "[n]ews gathering is not without its First Amendment protections,"[132] and that "without some protection for seeking out the news, freedom of the press could be eviscerated."[133] The Court, however, failed to clearly delineate the parameters of such a protection. In the Court's most recent case, *Cohen v. Cowles Media Co.*, the Court adhered to the "well-established line of decisions holding that generally applicable laws do not offend the First Amendment simply because their enforcement against the press has incidental effects on its ability to gather and report the news."[134] The Court noted that it is "beyond dispute 'that the publisher of a newspaper has no special immunity from the application of general laws. He has no special privilege to invade the rights of others.'"[135]

The lower federal courts have explored this right to gather news in the context of photographing or video recording. In *Dietemann v. Time, Inc.* the Ninth Circuit Court of Appeals explored the extent to which reporters could use surreptitious means to carry out their newsgathering.[136] There, defendants Time Life sent undercover reporters to a man's house where he claimed to use minerals and other materials to heal the sick. The reporters used a hidden camera to take pictures of the man, and a hidden microphone to transmit the conversation to other operatives. The defendants claimed that the First Amendment's right to freedom of the press shielded its newsgathering activities. In rejecting this claim, the court observed that although an individual accepts the risk when inviting a person into his home that the visitor may repeat the conversation to a third party, "he does not and should not be required to take the risk that what is heard and seen will be transmitted by photograph or recording, or in our modern world, in full living color and hi-fi to the public at large or to any segment of it that the visitor may select."[137] The court held that "hidden mechanical contrivances" are not indispensable tools of investigative reporting, and that the "First Amendment has never been construed to accord newsman immunity from torts

or crimes committed during the course of newsgathering."[138] In *Galella v. Onassis*, Galella, a self-proclaimed "paparazzo," constantly followed around, harassed, and photographed Jacqueline Kennedy Onassis and her children.[139] As part of an ongoing lawsuit, Onassis sued Galella for, *inter alia*, invasion of her and her family's privacy. Galella argued that he was entitled to the absolute "wall of immunity" that protects newsmen under the First Amendment. The Second Circuit Court of Appeals quickly rejected this absolutist position: "There is no such scope to the First Amendment right. Crimes and torts committed in news gathering are not protected. There is no threat to a free press in requiring its agents to act within the law."[140] By contrast, the Seventh Circuit in *Desnick v. American Broadcast Companies, Inc.* held that surreptitious recording was not a privacy invasion because the target of the surveillance was a party to the conversation, thereby vitiating any claim to privacy in those conversations.[141]

Congressional Response

If Congress chooses to act, it could create privacy protections to protect individuals from intrusive drone surveillance conducted by private actors. Such proposals would be considered in the context of the First Amendment rights to gather and receive news. Several bills were introduced in the 112th Congress that would regulate the private use of drones. Additionally, there are other measures Congress could adopt.

In the 112th Congress, Representative Ed Markey introduced the Drone Aircraft Privacy and Transparency Act of 2012 (H.R. 6676).[142] This bill would amend the FAA Modernization and Reform Act of 2012 to create a comprehensive scheme to regulate the private use of drones, including data collection requirements and enforcement mechanisms. First, this bill would require the Secretary of Transportation, with input from the Secretary of Commerce, the Chairman of the Federal Trade Commission, and the Chief Privacy Officer of the Department of Homeland Security, to study any potential threats to privacy protections posed by the introduction of drones in the national airspace. Next, the bill would prohibit the FAA from issuing a license to operate a drone unless the application for such use included a "data collection statement." This statement would require the following items: a list of individuals who would have the authority to operate the drone; the location in which the drone will be used; the maximum period it will be used; and whether the drone would be collecting information about individuals. If the drone will be used to collect personal information, the statement must include the circumstances in which such information will be used; the kinds of information collected and the conclusions drawn from it; the type of data minimization procedures to be employed; whether the information will be sold, and if so, under what circumstances; how long the information would be stored; and procedures for destroying irrelevant data. The statement must also include information about the possible impact on privacy protections posed by the operation under that license and steps to be taken to mitigate this impact. Additionally, the statement must include the contact information of the drone operator; a process for determining what information has been collected about an individual; and a process for challenging the accuracy of such data. Finally, the FAA would be required to post the data collection statement on the Internet.

[140] *Id.* at 996-97 (internal citations omitted).

[141] Desnick v. American Broadcast Corporation, 44 F.3d 1345, 1353 (7th Cir. 1995).

[142] H.R. 6676, 112th Cong. 2d Sess. (2012).

H.R. 6676 includes several enforcement mechanisms. First, the FAA may revoke any license of a user that does not comply with these requirements. The Federal Trade Commission would have the primary authority to enforce the data collection requirements just stated. Additionally, the Attorney General of each state, or an official or agency of a state, is empowered to file a civil suit if there is reason to believe that the privacy interests of residents of that state have been threatened or adversely affected. H.R. 6676 would also create a private right of action for a person injured by a violation of this legislation.

Representative Ted Poe introduced the Preserving American Privacy Act of 2012 (H.R. 6199).[143] This bill would prevent any private actor from using a drone to conduct surveillance on any other private person without the consent of that other person. This ban on the private use of drones to record other private persons could present First Amendment concerns. First, a reviewing court would, in all likelihood, test whether this ban constituted a rule of general applicability under the *Cohen* and *Branzburg* line of cases.[144] In *Bartnicki v. Vopper*, the Supreme Court held that the wiretapping laws in question were of general applicability.[145] The Court observed that the statutes were designed to protect privacy and did not distinguish based on the content of the intercepted conversation. Instead, the communications were "singled out by virtue of the fact that they were illegally intercepted—by virtue of the source, rather than the subject matter."[146] This same argument could shield H.R. 6199 from a First Amendment challenge. Its purpose is to protect privacy,[147] and it does not distinguish between the subject matter of the drone surveillance, but instead bans any instance of private surveillance when the target has not consented to such monitoring. Additionally, this bill does not curtail the freedom to *publish* information,[148] but instead restricts the methods of collection. The public or media would have other avenues for obtaining the information sought. On the other hand, this measure could hinder the free flow of information, including coverage of newsworthy events, in contradiction to public's right to receive news and the Supreme Court's dicta in *Branzburg* that "[n]ews gathering is not without its First Amendment protections,"[149] and that "without some protection for seeking out the news, freedom of the press could be eviscerated."[150]

Additionally, Congress could create a cause of action for surveillance conducted by drones similar to the intrusion upon seclusion tort provided under Restatement § 652B.[151] How would a

[148] *See* Associated Press v. National Labor Relations Board, 301 U.S. 103, 133 (1937) (applying the National Labor Relations Act to the Associated press, the Court noted that the regulation in no way "circumscribes the full freedom and liberty of the [A.P.] to publish the news as it desires it published").

[149] Branzburg v. Hayes, 408 U.S. 665, 707 (1972).

[150] *See id.* at 707.

[151] As with the enactment of any federal statute, Congress must act within one of its constitutionally delegated powers when creating a federal privacy tort or a crime based on intrusion of privacy. It would appear that Congress could regulate this area under its Commerce Clause power, U.S. Const. art. I, § 8, cl. 3, which it acts under when regulating similar federal airspace issues. *See* Braniff Airways v. Nebraska Bd. of Equalization and Assessment, 347 U.S. 590 (1954); United States v. Helsley, 615 F.2d 784 (9th Cir. 1979).

court assess whether drone surveillance violated this type of tort? First, generally speaking, the location of the search would be determinative of whether a person is entitled to an expectation of privacy. Although courts have posited that the common law, like the Fourth Amendment, is intended to "protect people, not places[,]"[152] the *location* of an alleged intrusion factors heavily in a privacy analysis. The greatest chance for liability occurs when a person photographs or videotapes another while in the seclusion of his home. While technology has increasingly shrunk other spheres of privacy in the digital age, the home is still accorded significant legal protection. Using a drone to peer inside the home of another—whether looking through a window or utilizing extra-sensory technology such as thermal imaging—would likely constitute an intrusion upon seclusion. Moving from the home to a public space, or even a space on private property where one can be seen from a public vantage point, significantly reduces the chance of tort liability. However, certain instances of highly offensive surveillance in public may be actionable.

This leads to the second factor that will inform a reviewing court's analysis: the degree of offensiveness of the surveillance. The Ninth Circuit Court of Appeals, applying California law, observed that, in determining offensiveness, "common law courts consider, among other things: 'the degree of intrusion, the context, conduct and circumstances surrounding the intrusion as well as the intruder's motives and objectives, the setting into which he intrudes, and the expectations of those whose privacy is invaded.'" Several of these factors—especially, the context of the intrusion and the motive of the intruder—are fact intensive and require application in a particular case to fully understand. However, some generalizations can be made. The cases discussed above that did find an intrusion upon seclusion in a public place required highly offensive activity, such as closely following another person for an extended period or photographing another in a highly embarrassing shot. Likewise, a court might recognize liability if one were to use a drone to follow another for an extended period of time, particularly at a close distance. It is not clear, however, whether knowledge of being surveilled makes the monitoring more or less offensive. For example, one court seemed to rely on the fact that the defendant was unaware that her house was being photographed to hold that she did not have a viable privacy claim.[153] A drone flying at several thousand feet may not significantly disturb the target of the surveillance and could fall within this rationale. Nevertheless, filming someone in a compromising or embarrassing situation without his knowledge can be equally offensive. Here, the facts of the particular case would determine liability.

Congress could also create a privacy statute tailored to drone use similar to the anti-voyeurism statutes, or "Peeping Tom" laws, enacted in many states.[154] These laws prohibit persons from surreptitiously filming others in various circumstances and places.[155] Some states prohibit surreptitious surveillance of a person while on private property, usually a private residence.[156]

---

[152] Pearson v. Dodd, 410 F.2d 701, 704 (D.C. Cir. 1969) (quoting Katz v. United States, 389 U.S. 347, 351 (1967)).

[153] Mojica Escobar v. Roca, 926 F. Supp. 30, 35 (D.P.R. 1996).

[154] Federal law does prohibit certain acts of voyeurism on federal property. Section 1801, Title 18 provides: "Whoever, in the special maritime and territorial jurisdiction of the United States, has the intent to capture an image of a private area of an individual without their consent, and knowingly does so under circumstances in which the individual has a reasonable expectation of privacy, shall be fined under this title or imprisoned not more than one year, or both." 18 U.S.C. § 1801(a). As discussed in note 151, *supra*, it appears Congress would have the authority to extend this section to voyeurism committed not only on federal property but that committed from federal airspace.

[155] Timothy J. Hortstmann, *Protecting Traditional Privacy Rights in Brave New Digital World: The Threat Posed by Cellular Phone-Cameras and What States Should Do to Stop It*, 111 PENN. ST. L. REV. 739, 742 (2007).

[156] *See, e.g*, GA. CODE ANN. § 16-11-61; MONT. CODE ANN. § 45-5-223.

Nevada employs this model, prohibiting a person from entering the property of another with the intent to peep through a window of the building.[157] Likewise, New Jersey prohibits a person from peering into the window of the dwelling of another "under circumstances in which a reasonable person in the dwelling would not expect to be observed."[158] Other states require a prurient intent when conducting the surveillance. Under Washington State's statute, a person commits the crime of voyeurism if, for the purpose of arousing or gratifying his sexual desire, he films or photographs (1) a person in a place where he or she would expect privacy; or (2) the intimate areas of another person, whether he or she is in a public or private place.[159]

Similarly, Congress could adopt an "anti-paparazzi" statute, like that enacted in California, to prevent intrusive drone surveillance.[160] In fact, Congress considered a similar measure in the 105th Congress. The Privacy Protection Act of 1998 and the Personal Intrusion Act of 1998 would have made it unlawful to persistently follow or chase another person for the purpose of obtaining a visual image of that person if the plaintiff met the following elements: (1) the image was transferred in interstate commerce or the person taking the photograph traveled in interstate commerce; (2) the person had a reasonable expectation of privacy from such intrusion; (3) the person feared death or bodily injury from being chased; and (4) the taking of the image was for commercial purposes.[161] Also, these bills would have created a civil remedy for an individual whose privacy was intruded upon. Congress could use this model to make it unlawful to persistently monitor another person using drone surveillance.

Related Legal Issues

In addition to the legal issues described above, there are a host of other issues that may arise when introducing drones into United States national airspace system.

Right to Protect Property from Trespassing Drones. There may be instances where a landowner is entitled to protect his property from intrusion by a drone. Under Restatement (Second) of Torts § 260, "one is privileged to commit an act which would otherwise be a trespass to a chattel or a conversion if the act is, or is reasonably believed to be, necessary to protect the actor's land or chattels or his possession of them, and the harm inflicted is not unreasonable as compared with the harm threatened."[162] What this means is, in certain instances, a landowner would not be liable to the owner of a drone for damage necessarily or accidentally resulting from removing it from his property. However, there appear to be no cases where a landowner was

---

[157] NEV. REV. STAT. § 200.603.

[158] N.J. STAT. ANN. § 2C:18-3c.

[159] WASH. REV. CODE § 9A.44.115; *see also* CAL. PENAL CODE § 647; R.I. GEN. LAWS § 11-64-2.

[160] California Civil Code § 1708.8 provides:

> A person is liable for constructive invasion of privacy when the defendant attempts to capture, in a manner that is offensive to a reasonable person, any type of visual image, sound recording, or other physical impression of the plaintiff engaging in a personal or familial activity under circumstances in which the plaintiff had a reasonable expectation of privacy, through the use of a visual or auditory enhancing device, regardless of whether there is a physical trespass, if this image, sound recording, or other physical impression could not have been achieved without a trespass unless the visual or auditory enhancing device was used.

[161] H.R. 3224, H.R. 2448, 105th Cong., 2d sess. (1998).

[162] RESTATEMENT (SECOND) OF TORTS § 260.

permitted to use force to prevent or remove an aircraft from his property. Additionally, as discussed above, determining whether a drone in flight is trespassing upon one's property may be unusually challenging.

Stalking, Harassment, and Other Crimes. Traditional crimes such as stalking, harassment, voyeurism, and wiretapping may all be committed through the operation of a drone. As drones are further introduced into the national airspace, courts will have to work this new form of technology into their jurisprudence, and legislatures might amend these various statutes to expressly include crimes committed with a drone.

Wiretap Laws. Under the federal wiretap statute, it is unlawful to intentionally intercept an "oral communication"[163] by a person "exhibiting an expectation that such communication is not subject to interception under circumstances justifying such expectation.... "[164] Currently, commercial microphones can record sounds upwards of 300 feet.[165] Use of such a microphone on a drone to record private conversations could implicate the federal wiretap statute.

Preemption of State Aviation Regulations. The increased presence of drones in domestic airspace raises the question of which aspects of drone use states may be able to individually regulate. The Supreme Court has stated that federal preemption of state laws and regulations occurs where "the pervasiveness of the federal regulation precludes supplementation by the States, where the federal interest in the field is sufficiently dominant, or where the object sought to be obtained by the federal law and the character of obligations imposed by it reveal the same purpose."[166] Congress vested sole responsibility for the aviation industry and domestic airspace with the federal government in the Federal Aviation Act of 1958.[167] According to the legislative history, the FAA was to have "full responsibility and authority for the advancement and promulgation of civil aeronautics generally, including promulgation and enforcement of safety regulations."[168]

Generally, state regulations of aviation safety, airspace management, and aviation noise are preempted by federal laws and regulations.[169] In *City of Burbank v. Lockheed Air Terminal, Inc.*, the Supreme Court struck down a local city ordinance that prohibited planes from taking off during certain hours of the day as preempted by the federal regulatory scheme.[170] Expressing its fear regarding local control of airspace, the Court stated, "If we were to uphold the Burbank ordinance and a significant number of municipalities followed suit, it is obvious that fractionalized control of the timing of takeoffs and landings would severely limit the flexibility of

[170] *City of Burbank*, 411 U.S. at 639.

the FAA in controlling air traffic flow."[171] The Supreme Court has, however, upheld state regulations imposing taxes on aircraft equipment located within the state.[172]

Conclusion

The legal issues discussed in this report will likely remain unresolved until the civilian use of drones becomes more widespread. To that end, the FAA has been tasked with developing "a comprehensive plan to safely accelerate the integration" of drones into the national airspace, which focuses on the safety of the drone technology and operator certification. While the deadline for development of the plan has already elapsed, the FAA has until the end of FY2015 to implement such a plan.[173] Additionally, the FAA must identify six test ranges where it will integrate drones into the national airspace. This deadline, 180 days after enactment of the act, has also elapsed without FAA compliance. Once these regulations are tested and promulgated, the unique legal challenges that could arise based on the operational differences between drones and already ubiquitous fixed-wing aircraft and helicopters may come into sharper focus.

<TARGET><BILL></BILL><SUBJECT>Misc. Meeting Notes - No Date</SUBJECT><COMM><TARGET></COMM></TARGET>

need sept + Nov June 2015

minutes | summary

DOD UAS Briefing

12 gray eagles in in AK currently – $20mil a pop

Fort Wainwright has a platoon of Shadows – four aircraft, and 48 Ravens

Gray Eagles will be employed with Apache helicopters, can transfer control from Gray Eagles to Apaches and the GEs can fly up to 90 miles in front of the Apaches, guiding them. US Army implementation.

Joint Alaska Pacific Range is the primary deployment area – restricted air space. Can be employed in ANY airspace with proper

Sensors on Gray Eagle – Synthetic Aperture Radar – can sense footprints or imprints based on what is moving on the ground – could be great for search and rescue. EO = Electrical Optical and IR = infrared

SHADOW SYSTEM: can be used as a "private satellite" for coms purposes.

Question: Runway for Gray Eagle to land, but do you need one for a Shadow?

Answer: trailer launch catapult for shadow. Can land on 2-300 foot runway or can be captured in a smaller area.

ARMY UAS are controlled by the ground/helicopter. AIR FORCE UAS are operated from space/satellites

Satellites are very expensive in terms of bandwith.

AK has not done any mission planning yet outside of their established ground control and training arena.

Only reason gray eagle is here in AK = only location in Pacific AOR, where PayCom commander (four star admiral) in Hawaii could have access to the assets within the Pacific footprint.

Satellite system called Open Source currently in operation to increase communication in the Northern Hemisphere.

US Army in AK has balloons that operate at 80,000 feet with transmitters that allow for fully operational communications within Alaska.

OSRVT – One system remote viewing terminal

Feb 2017 – will have Gray Eagle Operations mission ready.

Ro Bailey – requests that after this fire season, we get the right people in the same room to discuss prepping for next season for planning and use of UAS in fire response so that the capability of UAS implementation is there.

***SSH generate a letter requesting that the state, UAF test site, emergency responders coordinate for situations like Sockeye fire etc..

Search and Rescue is different form DSCA. In Alaska, General Handy is the decision-maker when it comes to DOD response in search and rescue situations. DOD assets are on alert for Search and rescue situations – only place in the states where this happens.

Incident Awareness and Assessment = what DoD UAS can do in Alaska.

Imagery will be taken over general areas, never of specific people or businsesses, when in the US.

"Incidental Collect" imagery taken during, for example, an earthquake. There will be incidental collect of images of people, businesses, etc... there is a very restrictive guideline in place that places limits on how long DoD can keep information, what they can do with it and when to protect the rights of individuals. Sensitivity level is so high, that even state National Guard requires Secretary of Defense approval for use.

Proper Use Memorandum (PUM) is required for any DoD assistance to the state ops in Alaska – anything involving UAS requires SECDEF approval.

Standard Collection - Infrared, electronic imaging, thermal

Special Collection – collecting electrons, cell phone signals, etc, "stuff that starts to scare people" – typically NEVER used on US soil.

LTFUAS Meeting Notes

Ginger – UAVs in the media update:

Sam's Club is gearing up for drones to be one of their top selling gift items this year.

Unmanned Aircraft encounters with manned aircraft are on the rise – summer months lead to increase in UAS recreational flight.

Second round of million $ UAE drone innovation contest.

New investment funds through DJI SkyFund

AMA online flight school being offered.

FAA National Policy: Aviation related videos or other electronic media on the Internet –

- Lt. Adams asked if law enforcement have encountered anything involving drone video and what the can be done.
- Adams – We would not file any charges, no statutes currently that would allow for charges.

Alaska Aerial Media – Ryan Marlow

Integration of UAS into public safety at an affordable rate is their main goal.

Main uses thus far –

1. documenting historical landmarks in Alaska –
2. Next big push: Emergency Services – search and rescue, fire, flood. Insurance issues are the biggest hurdles for UAS implementation in emergency response

Ro Bailey: Need an emergency COA for flight in non-COA'd

Alaska Aerial Media has a new COA for up to 400 feet now, with new stipulations for communication with the FAA.

3. Construction, Project inspection and risk mitigation.
4. Thermal Scanning – Search and rescue, inspection (pipeline). Response time can be dramatically reduced with thermal scanning from UAV during search and rescue scenario.
5. Equipment/facility/mechanical inspection – power lines etc...
6. Surveying: Digital Surface Models, Orthomosaics, volumetric scans.
7. Wildlife Monitoring: thermal equipment used for monitoring Beluga whale, data collected from this can help solve mystery of why whales are beaching themselves.
8. Media – lives streaming events – Iditarod, irondog.

These are examples of Alaska's Aerial Media is involved with currently.

Backgrounds of Ryan, Beau and Tyler – software engineering, electrical engineering.

AAM received their latest COA recently for 400 feet anywhere outside of Class C and D airspace. None of their equipment have "Mode C" transponders currently. No longer call into tower, now use Kenai Flight Services. Flight planning still needs to be done beforehand. Fly in airspace, but not restricted by the five mile from airport rule anymore.

AAM currently has five UAVs, but only one listed in their COA.

Ethan Tyler Question: From a business perpective, what would you say are the barriers you're currently running into, as far as growth?

Ryan: Turn-around time for the COA. Red tape and paperwork really slows down the process.

Beau: An example of a hurdle: "we got an email from a Peter Greenberg production company job, they wanted some filming help" but because of the COA and airspace restrictions – they are losing these jobs to people from out of state coming up and taking these jobs by not following the rules.

John Parker Question: Can you run us through the 333 exemption. When did you get it? How long did it take?

Answer: 333 exempts them from commercial UAV operation, must have a COA, and adhere to airspace requirements. Applied for the COA in October of 2014, took 60 days for a response, told they had to submit more paperwork and make some changes. In total, about 5-6 months. Tyler, Beau, and Ryan all filed separately as pilots for 333 waivers, but only Ryan has received the waiver thus far.

John Parker: 333 waiver exempts you from certain regulations.

Steve Wackowski – Hollywood has been operating UAVs illegally for years. The FAA is putting a lot of onus on these guys, but not going after these Hollywood companies.

Ro Bailey: Are you actually doing all of the things listed in the presentation?

Ryan: our COA says we are certified for "scanning" we are more just researching where and how we can operate I those areas.

Ro: I applaud your patience and willingness to work within the rules because the FAA will trust you and eventually entrust you with more responsibility.

Alaska Aerial Media has a $2 million liability insurance policy, as well as coverage on their UAVs.

Bob May: Would like to see some action from the state to require companies that come into Alaska to film for a profit to operate with the proper waiver, certifications, insurance coverage.

Lt. Adams: These companies who are filming without proper licensing or coverage are violating a civil action, unless they are operating their equipment in a manner that is reckless, there are no laws that we can charge them criminally on.

***Ro Bailey: A simple fix would be to require any operator hired by an agency to provide PROOF of a COA in order to operate commercially in Alaska – without a COA, they won't have the other required certs.

Captain Cook – Anchorage Police Department

One bad experience with an individual in Eagle River. Following kids home from school, multiple occasions since then. Could not do any civil action against the man because it is a civil issue. FAA could not act on the issue either, as the man was operating within the regs – far enough away from airports, height, etc.. APD will now be able to pursue trespassing charges for future occurrences via a trespassing charge if it is in fact, evident that drones are used to look into windows.

SSH: Why was a search warrant not obtained in this situation?

Capt. Cook: We believe that the situation was handled sufficiently in the end, but if there are any future occurrences with the same individual you will see a much more aggressive handling.

Capt. Cook: Outside of that circumstance, the majority of our encounters with drone operators has been very positive. Operators are very concerned for the well-being of the industry and do not take kindly to these outlier type abuses of the technology (in regard to the eagle river situation).

DRONE PRIVACY DOCUMENT:

1.) Include the term UAS or Unmanned Aircraft System, with or without using drone. Insert "(UAS)" after drone on title line, page 1. Insert "FAQ about Privacy"
2.) Delete "Frequently Asked Questions on Unmanned Aircraft Systems"
3.) Bottom of page 2, include "causing damage" rather than "shooting down"
4.) Possibly add a statement at the beginning of this document to address what is the national air space. (referenced on Page 2).
5.) Move the crowd issue listed on page 6 closer to the front of the document, page 2 possibly?

Jay Skaggs: There is a public law that says it is illegal to damage aircraft. Legal interpretation that does include model aircraft as aircraft.

Skaggs: Issue comes down to structuring language that protects both the operator flying UAVs and the privacy of individuals, when it comes to instances like the Eagle River issue.

John Parker question: AMA drones – are they certified by the FAA in any way?

Skaggs: FAA is prohibited by public law to certify or regulate model aircraft. Model aircraft, right now, we're saying that if they create a moderate threat to the NAS (near-miss or mid-air collision) then we will pursue enforcement. If not a moderate threat, then we are pursuing education first. If person continues to operate contrary to regs after letter of education, then they will pursue enforcement.

Update on the FAA's know before you fly app? Skaggs had no info, but good idea to ask if Alaska can be the first to roll out the app when its completed.

Steve Strait Question to Ro: What do think the university's role will be going forward with changes in FAA regs, funding form legislature.

Ro: recently acquired a 250 pound SeaHunter UAV, testing nanotechnology for deicing of aircraft, numerous other research projects. All of the aspects of big systems, and operating out of airports is still ahead of us. Bridge inspection work done with UAVS, pipeline inspection work slated, acquired a single-rotor helicopter for heavy payloads.

Updates:

John Binder: DOT Airport Managers training – where UAS training was involved in the statewide manager training. Educate them on current regs, what to do when UAS operators call them. What to do when they encounter people are not abiding by the rules. The session was geared toward education, the Know Before You Fly documents was distributed.

Steve Wackowski: Seattle Robotics Conference. University of Washington Law review of UAS impact on laws and regs. Disappointing to see how rule-abiding companies and individuals are left scratching their heads and stalled while other companies go around the rules.

Ethan Tyler: Division of Economic Development secured a booth at the AUVSI trade show. Collaborative effort with multiple agencies at the booth to showcase Alaska as a great place to do business.

Ro: UAV demonstration at the Fairbanks fire training center near the hotel for September interest group meeting dates.

SSH: talked to barb Johnson about dinner during the Interest Group meeting to debrief.

September 3 public testimony.

NEXT MEETING: Look into statute changes pertaining defining geographic location that determines whether a UAV is on a person's property and how. Statutes related to stalking. Lt. Adams believes it is time for statute changes to make charges a "slam dunk" in terms of when and where you CANNOT operate a UAV.

Board of Game, Board of Fish regs banning drone use for scouting.

Letter to congressional delegation regarding funding for FAA test site. Crafting a letter to congressional delegation, what are we asking for? Ro: we may not need to pursue this task any more. We have very strong support from all three of our members of congress. Working on the FAA Reauthorization Act. Conversing with the test sites to see what can make their operations easier. The FAA won't tell them what areas they would like them to research because they don't have the money to pay for them.

Ethan Tyler: we work with the Alaska Minerals commission. They share their recommendations to the state on actions they'd like to see taken each year. For this group, perhaps a goal for the next meeting would be to put together some recommendations for both state and federal needs. Three-five issues identified by this group to better articulate the needs for this industry to grow and be beneficial to

Alaskans. Would be willing to dedicate some staff time to put together a document to distribute to both the state legislature and the federal delegation.

***Crafting a general letter in support of the FAA Reauthorization Act.

FOR SEP MEETING: put together a list of Federal priorities/needs in Alaska for UAS industry.

Steve Colligan: AMA resolution notification. Was there a letter provided to those listed in the resolution or interested in the legislation? Liet gov's office sends letters to each entity listed in the resolution. Colligan: would be good to see our logo (state seal or whatever works) to see our state included in national Know Before You Fly initiative. Governor's office is ready for the Task Force document, we just need to get it to them.

NEXT MEETING: Josh Waite presentation possibility.

Steve Strait: Do we have the issue of drafting some kind of statutory language in the next meeting? Yes.

Skaggs: with the recent emergency management issues, the state does not have a COA filed with the FAA so they can exercise operational control to hire someone to do their flying as a public entity. That COA could be used for other things for the states, such as surveying construction projects, AK airports to save money for the state on the operations side. Would like to see the state file for a COA so we can use UAVs for state operations.

SSH: John Binder, Mike O'Hare, many other agencies would be involved in portions of the COA.

Wackowski: Would be smart to establish a primary POC for the state of Alaska.

***RO: maybe a subcommittee – Mike O'Hare John Binder, Lt. Adams, Ro, Jay Skggs, to work on filing a COA for the state prior to the next meeting? All of the people representing the various departments should be involved. NEXT MEETING: have an agenda item for a report from this subcommittee.

MOA between USDOT, FAA, UAS Integration Office, US Dept. of Justice

<TARGET><BILL></BILL><SUBJECT>MOA between USDOT, FAA, UAS Integration Office, US Dept. of Justice</SUBJECT><COMM><TARGET></COMM></TARGET>

MEMORANDUM OF UNDERSTANDING
BETWEEN
FEDERAL AVIATION ADMINISTRATION,
UNMANNED AIRCRAFT SYSTEMS INTEGRATION OFFICE
AND
THE U.S. DEPARTMENT OF JUSTICE,
OFFICE OF JUSTICE PROGRAMS,
NATIONAL INSTITUTE OF JUSTICE
CONCERNING
OPERATION OF UNMANNED AIRCRAFT SYSTEMS
BY LAW ENFORCEMENT AGENCIES

I. PURPOSE: This Memorandum of Understanding (MOU) sets forth an agreement between the Department of Transportation, Federal Aviation Administration (FAA) Unmanned Aircraft Systems Integration Office, and the Department of Justice (DOJ), Office of Justice Programs (OJP), National Institute of Justice (NIJ), hereinafter, "the Parties," to implement a streamlined training and authorization process to enable nonfederal law enforcement agencies (LEAs) to operate unmanned aircraft systems (UAS) within the United States safely, effectively, and lawfully.

II. AUTHORITY: This MOU is entered into on the part of NIJ pursuant to Titles II, III, and V of the Homeland Security Act of 2002 (6 U.S.C. §§ 121 *et seq.* and 182 *et seq.*); and Title I of the Omnibus Crime Control and Safe Streets Act of 1968 (42 U.S.C. §§ 3711 *et seq.*), and on the part of the FAA pursuant to the Federal Aviation Act of 1958 (49 U.S.C. §§ 40101, 40103, and §§ 44701-44735).

III. BACKGROUND:

The FAA is charged with regulating the use of U.S. airspace to ensure its safety and efficient use. With regard to public UAS, including those used by LEAS and other public safety agencies, Public Law 112-95, the FAA Modernization and Reform Act of 2012, directs the FAA to issue guidance regarding the operation of public UAS to—

1) Expedite the issuance of a certificate of authorization (COA) process.
2) Provide for a collaborative process with public agencies to allow for an incremental expansion of access to the national airspace system as technology matures and the necessary safety analysis and data become available and until standards are completed and technology issues are resolved.
3) Facilitate the capability of public agencies to develop and use test ranges, subject to operating restrictions required by the FAA, to test and operate unmanned aircraft systems.
4) Provide guidance on a public entity's responsibility when operating an unmanned aircraft without a civil airworthiness certificate issued by the FAA.

It further requires that the FAA shall, not later than December 31, 2015, develop and implement operational and certification requirements for the operation of public UAS in the national airspace system.

NIJ is the research, development, and evaluation arm of the U.S. Department of Justice and is dedicated to researching crime control and justice issues. NIJ provides objective, independent, evidence-based knowledge and tools to meet the challenges of crime and justice particularly at the state and local level. Through its Office of Science and Technology, NIJ, in part, serves as the national focal point for research, development, testing, and evaluation of technology for law enforcement. NIJ identifies the needs of the law enforcement community for new technologies and tools and develops solutions. NIJ develops standards and conducts testing to evaluate technologies that may be used by law enforcement agencies. NIJ works with other federal agencies to establish a coordinated federal approach on issues relevant to law enforcement and with government agencies at all levels and professional associations to foster the adoption into practice of new tools and technologies. The activities NIJ sponsors in this regard include development of relevant training materials, best practice guides, and policies.

Through a research project aimed at identifying low-cost aviation solutions for small and rural agencies that cannot afford the costs associated with operating traditional fixed-rotary-wing aircraft, NIJ determined that UAS could provide an affordable solution for those agencies that need "eyes in the sky" but lack the budget or for those agencies that need to supplement their current aviation units with more cost effective aircraft for specific missions.

NIJ and the FAA have a shared mission to ensure the safe and effective use of UAS in public aircraft operations. It is in the interest of both agencies to meet or exceed the goal set by Congress to develop and implement operational and certification requirements for the operation of public UAS in the national airspace system (NAS). To that end, they have collaborated since 2005 to develop the attached streamlined training and authorization process, which reflects the input of the state, local and federal law enforcement community gathered and represented by NIJ. The result of this collaboration will allow for real-time access to the (NAS) for agencies responding to emergency circumstances.

IV. SCOPE: To further this shared mission, the parties will now collaborate to implement the attached streamlined training and authorization process for LEAs' use of UAS, particularly those agencies without prior aviation experience.

V. IMPLEMENTATION:

A. NIJ will:

1. Prepare and coordinate with the FAA UAS Integration Office (FAA UASIO) and the Department of Homeland Security Science and Technology (DHS S&T) the distribution of a technical bulletin that addresses the utilization of UAS in the NAS for LEAs and other public safety agencies, which NIJ will maintain and update as

necessary.

2. In coordination with FAA UASIO, develop and promulgate a process for collecting, analyzing and publishing UAS training and operational mission data that specifically captures and assesses mission capability of the technology (to include "Lessons Learned").

B. The FAA UASIO will:

Through the COA validation process, FAA will assess each LEA applying to operate under this agreement to ensure that it demonstrates a level of capability to operate its specific UAS safely and competently within the NAS. The FAA assessment of the proposed UAS operations' impact on the level of safety in the NAS will evaluate whether adequate mitigations are available to compensate for any inability to comply with 14 CFR §§ 91.111 and 91.113(b).

C. Each Party to this MOU will fund its expenses associated with participation covered by this MOU. This MOU in no way restricts any Party from participating in similar activities or arrangements with other public or private agencies, organizations or individuals.

D. Each Party will provide personnel and resources as appropriate to implement its responsibilities under this MOU.

E. Each Party will take appropriate steps to ensure that its employees, agents, contractors, and consultants involved in projects conducted under this MOU comply with any pertinent provisions of this MOU.

F. Each Party will handle and expend its own funds. The responsibilities each Party assumes under this MOU are subject to the availability of funds for such purposes. Nothing in this MOU, in and of itself, obligates any Party to expend appropriations or to enter into any contract, assistance agreement, interagency agreement or other financial obligations. Any endeavor involving reimbursement or contribution of funds between the Parties will be handled in accordance with applicable laws, regulations and procedures, and will be subject to separate interagency agreements that will be effected in writing by representatives of the Parties.

G. Management Points of Contact. The Parties designate the following individuals to serve as their management points of contact for matters related to this MOU. Each Party may change the individual designated as its management point of contact upon notice to the other Parties of such change.

National Institute of Justice
Office of Science and Technology
Program Manager
202-305-7954

Federal Aviation Administration
UAS Integration Office
Air Traffic Manager
202-385-4661

VIII. MODIFICATION AND TERMINATION:

A. Amendments or modifications to this MOU must be approved by each of the Parties in writing in accordance with applicable policies, procedures and legal requirements.

B. Any Party may terminate its participation in this MOU at any time, but should provide thirty (30) days written notice to the other Party. Disposition of any efforts in progress at the time of notification will be determined by agreement of the Parties.

C. In the event of disagreement between the Parties with respect to this MOU, the Parties will each undertake to attempt a good faith effort to resolve the disagreement. Nothing in this MOU, however, will take precedence over, or negate or affect in any way, the policies, procedures and directives of the respective Parties or any applicable laws or regulations. If a disagreement cannot be resolved, the parties may modify or terminate this MOU.

IX. NATIONAL SECURITY INFORMATION: Security classification guidance for activities undertaken pursuant to a subsequent interagency agreement will be determined in accordance with the laws, regulations and policies governing the lead agency for those activities.

X. PUBLIC INFORMATION COORDINATION: Public disclosures of information regarding projects and activities conducted under this MOU are subject to the Freedom of Information Act (5 U.S.C. § 552). The Parties will consult with each other prior to any public disclosure of information.

XI. EFFECTIVE DATE: The provisions of this MOU become effective as of the date of the last signature hereunder, and will remain in effect for five (5) years, unless terminated earlier in accordance with the provisions of this MOU.

Agreed:

James H. (Jim) Williams
Unmanned Aircraft Systems Integration Office
FAA Aviation Safety Organization
Federal Aviation Administration

ATTACHMENT TO THE MEMORANDUM OF UNDERSTANDING
BETWEEN
FEDERAL AVIATION ADMINISTRATION,
UNMANNED AIRCRAFT SYSTEMS INTEGRATION OFFICE
AND
THE U.S. DEPARTMENT OF JUSTICE,
OFFICE OF JUSTICE PROGRAMS,
NATIONAL INSTITUTE OF JUSTICE
CONCERNING
OPERATION OF UNMANNED AIRCRAFT SYSTEMS
BY LAW ENFORCEMENT AGENCIES

PART 1 — LEA UAS Operational Requirements, Elements, and Procedures

I. UAS Safety Risk Analysis Plan (SRAP) and Defined Incident Perimeter

a. For the purpose of identifying and mitigating risks arising from UAS operations, any LEA wanting to use the streamlined LEA UAS authorization process would be required to submit a formal SRAP as an attachment to its Certificate of Waiver or Authorization (COA) application that specifically identifies the boundaries of the agency's jurisdiction and all unique operational areas within that jurisdiction and attendant hazards *(e.g., airports, motor speedways, large sports complexes, major highways, strategic/sensitive infrastructures, university campuses with airspace, obstruction clearance, public access, evacuation mitigation, rush hour heavily trafficked roads, or other incumbent hazards)*. The SRAP must include a description of specific risk controls to be employed to mitigate any attendant hazard for UAS operations within the jurisdiction in the vicinity of those identified unique operational areas.

b. All UAS operations will be conducted within the boundaries specified in the LEA's COA. These boundaries will fall within the area of the LEA's jurisdictional control. Further, the operation will be conducted within a nonmoving "Defined Incident Perimeter" that is controlled by the LEA and identified by geographic coordinates (pursuit missions are not authorized).

c. The use of the streamlined LEA UAS authorization process may be used only by LEA's deploying UAS with a gross take-off weight that does not exceed 25 lbs.

II. UAS Airworthiness, Employment, and Safety of Operations

a. The accountable executive (e.g., agency head) of each LEA will acknowledge in writing that the UAS the LEA intends to deploy is airworthy and in a condition for safe operation based on the manufacturer's specifications, maintenance recommendations and operating procedures of the aircraft, control station, communications links and lost link procedures. This process does not constitute an Airworthiness Certification by the FAA.

b. Upon the first application by each LEA, the applicant must submit a legal determination that it is eligible to operate a public aircraft under the applicable paragraph of 49 U.S.C. § 40102(a)(41) (citing the applicable paragraph and support in its determination), that the UAS will be operated in accordance with 49 U.S.C. § 40125 (will not receive compensation or reimbursement for operation except as specified in the statute) and will not operate the aircraft in any manner that endangers life or property in accordance with 14 CFR § 91.13.

c. These airworthiness, operational safety and public aircraft statements will be on LEA letterhead stationery, signed and dated by the agency head making the acknowledgements, and must be included as an attachment to the COA application. In the event of a LEA leadership change, a new or revised statement must be submitted to ensure that the new leadership is fully aware and informed of the COA.

III. Pilot & Observer Qualifications for UAS operations at and below 400 feet AGL

a. Each UAS pilot must be an FAA-certificated airman or successfully pass either the FAA's pilot knowledge exam or complete an FAA-approved UAS pilot training curriculum. If operating in an area that requires Air Traffic Controller (ATC) communication, additional pilot training may be required if the UAS pilot is not a certificated manned-aircraft airman.

b. Pilots will receive training specific to the UAS to be operated. This training must be conducted and documented by a qualified instructor designated by the proponent as being the individual(s) trained and certified by the manufacturer to provide training on the specified UAS.

c. Pilots are prohibited from flying any public safety mission without having completed three UAS flight events within the preceding 90 days.

d. Observers must successfully complete a UAS observer training curriculum that includes, at a minimum, instruction on rules and responsibilities described in 14 CFR § 91.111, Operating Near Other Aircraft, 14 CFR § 91.113, Right of Way Rules, Cloud Clearances, and that emphasizes "See and Avoid" concepts and fundamental radio communications, including standard ATC phraseology. Observer training must include thorough instruction regarding manned aircraft traffic conflicts and pilot communications for any maneuvers/actions required to avoid traffic conflicts.

e. Pilots and observers must not perform duties for more than one UAS at a time and are not allowed to perform concurrent duties both as pilot and observer.

f. LEA standard operating procedures (SOP) must include Crew Resource Management (CRM) techniques to ensure the highest possible situational awareness and effective communication by pilots and observers during each flight operation. Pilots and observers must be trained in these procedures and techniques.

g. All pilot and observer training must be conducted and documented by a qualified instructor designated by the proponent as being an individual trained and certified by the manufacturer to provide training on the specified UAS.

h. Pilots and observers must be medically qualified and have in their possession a second class (or higher) airman medical certificate that has been issued under 14 CFR Part 67, Medical Standards and Certification.[1]

i. 14 CFR § 91.17, Alcohol and Drugs, applies to UAS pilots and observers.

[1] The FAA, at the request of DOJ/NIJ, is working to change the requirement for a second-class airman medical certification to "self-certification" as to being healthy to fly and a letter from a competent medical authority confirming the operator's eyesight to the second-class medical certification requirements of correctable to 20/20.

IV. UAS Flight Operations

a. The pilot-in-command (PIC) will conduct a thorough premission briefing prior to commencing any UAS flight operation. At a minimum, the briefing must include a review of the SRAP for the specific hazards within the area of operations, the LEA's standard operating policies and procedures, specific objective(s) of the mission, expected duration of the mission, operating limitations/restrictions, specific duties of each crew member, specific communications plan including a lost communications procedure, and emergency procedures.

b. UAS operations, within the area of jurisdiction, must remain within a nonmoving "Defined Incident Perimeter" at or below 400 feet above ground level (AGL). The LEA will identify and manage all potential air and ground hazards inside the "Defined Incident Perimeter," especially concerning overflight of people and private property. "See and Avoid" is paramount to safe UAS operations, and all flights will remain within the visual line of sight of the pilot and employ at least one observer, not including the PIC. All of the risks and associated liabilities that exist within the "Defined Incident Perimeter" must be legitimately mitigated, and the safety of people and property assured.

c. UAS flight operations will only be conducted during daylight hours and must adhere to Day Visual Flight Rules (VFR) with Visual Meteorological Conditions (VMC) with visibility and cloud clearances specified for Class E airspace.

d. Use of visual observers in a linear fashion away from the control station (daisy chaining) is prohibited.

e. Moving "Defined Incident Perimeters" to accommodate pursuit missions are prohibited. UAS pursuit missions are NOT authorized outside of the "Defined Incident Perimeter."

f. Only one LEA UAS will be flown at a time within the "Defined Incident Perimeter."

g. The UAS will not fly over outdoor assemblies of people or heavily trafficked roadways. LEA UAS flight operations must be offset as needed to ensure the orbit or flight path of the UAS does not incur a risk of injury to persons or property along its flight path. A mitigation strategy may include, but is not limited to,

evacuation of persons from within the defined incident perimeter by legal police authority.

h. The PIC shall comply with all ATC instructions and/or clearances.

i. Operations within Class A and B airspace are prohibited. *(Note: A description of classes of airspace is included as an attachment at the end of this document)*

j. UAS operations within Class C and D airspace are prohibited, unless the LEA has a Letter of Agreement (LOA)/procedure with the controlling ATC facility, the ATC facility has given the proponent specific approval to operate without a transponder at the time of the notification of the operation, two-way communications are maintained with the ATC for the duration of the UAS operation, and the UAS is configured with an independent flight termination system.

k. The PIC or his designee will monitor Universal Communications (UNICOM) or appropriate ATC frequencies during all flights. The LEA will not fly in airspace other than Class G inside the area of jurisdiction without the approval of the managing ATC facility.

l. The PIC will maintain two-way radio communications when flying within five nautical miles of an operational control tower. During the period of time a control tower is closed, the PIC will monitor the appropriate UNICOM or Common Traffic Advisory Frequency (CTAF). Operations will not be conducted within a one-half-mile radius of noncontrolled airports, heliports or water landing areas without ATC or airport management approval.

m. For operations within 5 NM from any airport or heliport, the PIC shall hold, at a minimum, an FAA private pilot certificate.

n. In accordance with 14 CFR § 91.3 and § 91.111, the PIC is responsible at all times for collision avoidance with other aircraft and the safety of all operations, persons and property. In the event of a potential conflict with other aircraft, the PIC will immediately terminate the flight and land the UAS to ensure safety. LEA will not conduct UAS flight operations if a manned LEA aircraft is operating within the "Defined Incident Perimeter."

o. The PIC must coordinate with the ATC facility having jurisdiction over the airspace above the "Defined Incident Perimeter" no less than 2 hours prior to commencement of flight operations for routine (noncritical and training) missions and normally 60 minutes, but no less than 30 minutes, for missions requiring critical/immediate response.

V. Requirements

It is understood that because of the immediacy of some tactical operations, the timeliness of Notice to Airmen (NOTAM) notification may need to be reduced to accommodate the criticality of the mission. For those missions where response to the event is critical, a distance (D) NOTAM must be filed with ATC no later than 1 hour prior to commencing UAS flight operations. This NOTAM must provide:

a. Name and contact data of entity conducting UAS operations.
b. Location and altitude of the specific operating area ("defined incident perimeter").
c. Name of PIC.
d. Time and nature of the UAS activity.

Additionally, to use the 1-hour notification timeframe for these critical operations, the proponent must place a notice in the Airport Facility Directory (AFD) advising of the possibility of Unmanned Aircraft Operations in the operational area during the period of time this COA is valid. Until the AFD entry is published, the 48-hour minimum NOTAM requirement remains in effect, unless otherwise authorized. For all UAS missions NOT classified as a critical or immediate response (e.g., currency/proficiency or training missions), a distance (D) NOTAM shall be issued 48 to 72 hours prior to normal unmanned aircraft operations being conducted.

An LEA does not need to file a NOTAM for a specific mission if it is determined that issuing the NOTAM could reasonably place the safety of officers or the success of the mission at jeopardy. Such determination shall be documented in the UAS flight log. Immediate, critical operations below 100 feet AGL, not exceeding 15 minutes in duration, are authorized provided a notice of UAS operations within the jurisdiction has been published in the AFD, UAS operations will not commence within 5 NMs of an airport or heliport without ATC coordination, and UAS operations are not being conducted within Class B airspace. The proponent must contact the appropriate ATC facility prior to the operation to obtain approval.

VI. Formal Training Program

a. Each LEA shall establish a training program that addresses the initial and refresher training of all pilots and observers assigned to the UAS program, crew members, or individuals who may be used for missions of the LEA UAS program. The training program will include the identification/location of a UAS training site that is confined to Class G airspace remaining well clear (as specified in the minimum requirements of 14 CFR § 91.119) of housing areas, roads, and any persons or watercraft within the specific operating location. This training site will be used for the development and exercising of scenarios that address the utilization of the UAS technology integrated with other internal and external agencies and organizations that may use the UAS technology for operational missions.

b. Each LEA's formal training program for UAS crew members and ground crew will concentrate on scenario based training exercises that focus on, but are not limited to; Standard Operating Procedures (SOP), Crew Resource Management (CRM), emergency and abnormal procedures, and coordination and communication between operational elements. All pilot, observer and crew member training must be formally documented, including initial manufacturer training and LEA training and currency. Instructors and evaluators must be designated by LEA in writing, including manufacturer personnel.

c. Initially, the COA will restrict LEA UAS operations to the training and evaluation of LEA pilots, observers and crew members using the UAS technology. When the LEA believes its personnel are sufficiently proficient to safely conduct LEA operational missions, the LEA will request the FAA to conduct a thorough program review, including a review of all training records, flight manuals, standard operating procedures and other supporting program documentation. The FAA will work to conduct an onsite evaluation of a LEA UAS exercise to demonstrate the competency and safety of the LEA UAS program and the coordination and control among LEA supporting elements within 30 days of notification by the agency. After a successful program review and evaluation by the FAA of an actual exercise for safety and competency, the FAA will issue an operational COA approving UAS operation within the jurisdictional boundaries. It is understood that training of ATC personnel may need to precede the implementation of the COA.

VII. Standard Operating Procedures

SOPs are essential to the successful growth and maturity of a safe program. LEAs must create, distribute, implement and provide training on UAS SOPs for each phase of flight operation from notification for deployment through preflight, launch, recovery, postflight and mission recordkeeping. Effective SOPs must include, at a minimum, emergency procedures and standards for expected scenarios (e.g., lost link, lost communications between observers and the (PIC) or between the PIC and the ATC, medical emergencies), CRM, sterile cockpit protocols, standard communications between the PIC and the observer, and any special mitigation procedures.

VIII. Safety/Mission Analysis

a. In an effort to assist NIJ in gathering technology application data regarding the integration of UAS in the NAS, the LEA will provide NIJ with an Unmanned Aircraft Aviation Operations Report (AOR) that includes the description of the operations; the areas of operations, the nature, dates and flight durations of the missions; and any system malfunctions, discrepancies or incidents (e.g., lost communications, lost link, flyaway or unintentional termination of flight where no damage was sustained by the UAS, CRM breakdowns, UAS issues) noted during a mission. Additionally, to assist the FAA in gathering safety data regarding the integration of UAS in the NAS, the AOR will include a "Lessons Learned" section that contains specific issues experienced or discovered during each UAS flight operation (training or operational). This reporting requirement is in addition to the requirements related to incident/accident and normal operational reporting provisions currently required on all COAs.

b. In the event of a UAS accident or incident (i.e., damage to property, the UAS or other aircraft; injury to persons; or fatality), the LEA shall immediately notify the appropriate regional FAA office and the UAS Integration Office via the Washington Operations Control Center at 202-493-4170 or 202-267-3333, and provide the LEA activity name, address and contact information, date, time,

location, and UAS nomenclature, along with a brief preliminary description of the circumstances. A summary response will be provided to FAA via the COA online procedures.

PART 2 — FAA Administrative Strategy Supporting Streamlined UAS Authorization Process

I. **LEA-Centric Streamlined COA Application Process**

a. In order for LEAs to achieve more rapid authorization for the employment of UAS technology within their respective jurisdictions, the current COA authorization process may be restructured or "streamlined" to address unique LEA operational constraints which would permit LEAs to provide only specific operational and administrative information in the online filing of the COA application. This streamlined process would recognize an acceptable, predefined, UAS description, performance characteristics and operational avionics/equipment technologies verified by an approved third party testing organization. These approved technologies would be contained and maintained within a data library contained and updated within a DOJ and/or DHS online library.

b. The particular UAS to be employed would be selectable via the library. The "streamlined" LEA-unique COA authorization process would also include standardized operational elements. LEAs would be required to formally acknowledge their agreement to accept and abide by preapproved operational guidelines that would include predetermined flight operations processes, procedural and operating limitations or restrictions, pilot and observer qualifications, a LEA certification airworthiness statement, and qualification/remedial/recurring training and recordkeeping. These processes, procedures and operating limitations/restrictions would be standardized, would apply to all LEAs, and would be similar to mitigation provisions already imposed in various other UAS COA approvals.

CONCLUSION 516

INTRODUCTION

Military aviation experts and model airplane hobbyists have known for decades that an airplane can be flown without a human in the cockpit. Until very recently, however, for most people the very concept of an aircraft was inextricably tied to that of the pilot it was presumed to carry. In the long run, that may turn out to be a historical aberration.

"Drones"—more accurately, unmanned aircraft—will dominate the future of aviation as thoroughly as manned aircraft have dominated its past. In the military the transition is well under way. In 2012, the United States military had close to 6,300 unmanned aircraft systems (UAS)[1] and is training hundreds of

1. UNDER SECRETARY OF DEFENSE FOR ACQUISITION, TECHNOLOGY AND LOGISTICS, DEPARTMENT OF DEFENSE REPORT TO CONGRESS ON FUTURE UNMANNED AIRCRAFT SYSTEMS TRAINING, OPERATIONS, AND SUSTAINABILITY 2 (2012), *available at* http://www.fas.org/irp/program/collect/uas-future.pdf. The

new pilots each year to fly them.[2] Civilian UAS use in the United States is also set to grow rapidly in the wake of a law enacted in February 2012 providing for the integration of unmanned aircraft into the national airspace over the next several years.[3]

UAS can be employed in an endless variety of civilian applications, the overwhelming majority of them beneficial. They can be used, for example, to help rescuers identify people in need of assistance following a natural disaster, or to provide vital overhead imagery to police officers attempting to defuse a hostage standoff. In the commercial world, UAS will be increasingly employed for tasks as diverse as surveying, crop spraying, and traffic congestion monitoring. Scientific applications include air quality assessment, wildlife tracking, and measuring the internal dynamics of violent storms. UAS will also generate a number of economic benefits, both by creating jobs that involve the design and production of UAS and by spurring advances in robotics that will apply well beyond aviation, in fields ranging from manufacturing to surgery.

However, like any technology, UAS can be misused. The most common concern regarding domestic UAS relates to their potential impact on privacy. This is a legitimate concern. Existing laws and jurisprudence provide an important foundation, but they also leave many questions unanswered. And although in some respects UAS simply represent one more manifestation of the always complex intersection between technology and privacy, they are also unique in making it possible, for the first time ever, to easily and inexpensively obtain observations from above.

As Justice Samuel Alito wrote in a concurrence in *United States v. Jones*, the January 2012 Supreme Court ruling that addressed the constitutionality of affixing a GPS tracking device

---

term unmanned aircraft system (UAS) refers to an unmanned aircraft as well as the associated communication and control components used in its operation. FAA Modernization and Reform Act of 2012 (FMRA), Pub. L. No. 112-95, § 331, 126 Stat. 11, 72 (2012). "UAS" is also sometimes expanded as "unmanned aerial system." The term unmanned aerial vehicle (UAV) refers to the aircraft itself. *See, e.g.*, Bart Elias, Pilotless Drones: Background and Considerations for Congress Regarding Unmanned Aircraft Operations in the National Airspace System 1 n. 1 (2012), *available at* http://www.fas.org/sgp/crs/natsec/R42718.pdf.

2. Elisabeth Bumiller, *A Day Job Waiting for a Kill Shot a World Away*, N.Y. TIMES, July 29, 2012, http://www.nytimes.com/2012/07/30/us/drone-pilots-waiting-for-a-kill-shot-7000-miles-away.html.

3. *See* FMRA §§ 331–336, 126 Stat. at 72–78.

to a vehicle without a valid warrant, "[i]n the pre-computer age, the greatest protections of privacy were neither constitutional nor statutory, but practical."[4] Although Justice Alito's statement was directed toward GPS tracking, it has direct relevance to UAS. In comparison with manned aircraft, UAS can be very inexpensive to procure and operate. As the practical barriers to obtaining aerial imagery fall away, the resulting privacy issues take on heightened importance.

This Article considers the constitutional, statutory, and common law frameworks that will inform privacy rights with respect to observations from unmanned aircraft.[5] The potential privacy challenges raised by unmanned aircraft are direct consequences of their capabilities and of the rules governing the manner in which they can be flown. Accordingly, Part I provides the historical context for UAS technology and describes the range of platforms available today. Part II addresses the current regulatory environment in the United States, with particular attention to those provisions of the FAA Modernization and Reform Act of 2012 (FMRA) that relate to UAS.

Part III discusses government operation of unmanned aircraft in light of the Supreme Court's Fourth Amendment jurisprudence. Although the Supreme Court has never specifically ruled on the question of UAS privacy, it has examined the Fourth Amendment implications of aerial surveillance on several occasions. Part III examines those cases in some detail, as well as *Jones*[6] and *Kyllo v. United States*,[7] and the interpretations they suggest with respect to the constitutionality of UAS observations.

Part IV addresses UAS operated by private entities, who are unconstrained by the Fourth Amendment restrictions that apply to the government. Private UAS users will enjoy strong First Amendment protections for gathering information in public spaces. But the rights conferred by the First Amendment are not unbounded, and it does not take much imagination to conclude

7. 533 U.S. 27 (2001).

that paparazzi, stalkers, and others could employ UAS in manners that pose clear violations of privacy. Part IV then explores some of the laws that can be used to address such behavior. Part V considers potential new voluntary and statutory privacy solutions and discusses some of the preemption issues that may arise when non-federal entities attempt to regulate UAS use.

Several overarching conclusions result from the analysis presented in this Article. First, a careful examination of Supreme Court privacy jurisprudence suggests that the Constitution will provide a much stronger measure of protection against government UAS privacy abuses than is widely appreciated. The Fourth Amendment has served us well since its ratification in 1791, and there is no reason to suspect it will be unable to do so in a world where unmanned aircraft are widely used. In addition, there are substantial statutory and common law protections that will limit the ability of non-government entities to violate privacy using unmanned aircraft.

This does not mean that there is no need for additional statutory UAS privacy protections. However, when drafting new laws it is critical to adopt a balanced approach that recognizes the inherent difficulty of predicting the future of any rapidly changing technology. In the early days of the Internet and mobile phones, it would have been nearly impossible to accurately foresee all of the uses—both positive and otherwise—to which these technologies have been applied. It is similarly difficult today to predict exactly how UAS will be used—or even what they will look like—in the coming decades. Although unmanned aircraft pose real and increasingly well recognized privacy concerns, they also offer real and much less widely appreciated benefits. A dialogue conducted with full awareness of this balance will be much more likely to lead to positive policy outcomes.

I. UNMANNED AIRCRAFT SYSTEMS TECHNOLOGY

In addressing UAS privacy, it is important to start with an understanding of the technology, including both the historical context and the range of platforms that exist today. Privacy approaches designed to address only the concerns raised by the larger unmanned aircraft that have dominated much of the current press coverage may be inadequate or inappropriate for unmanned aircraft weighing only a few pounds. And, as is clear from the history of unmanned aircraft, although near-

term predictions regarding emerging aviation technology are feasible, it can be exceedingly difficult to look more than a few years into the future.

A. Historical Context: The Nineteenth and Twentieth Centuries

Unmanned flight has a long history. In fact, early research in unmanned aviation laid some of the critical groundwork that was later used by pioneers in manned aviation,[8] including the Wright Brothers, who achieved sustained manned airplane flight in 1903.[9] As early as the 1830s, William Samuel Henson was exploring the fundamentals of airframe design,[10] and in 1848 John Stringfellow successfully carried out an indoor flight of a steam-powered unmanned airplane with a wingspan of ten feet.[11] In the 1870s Alphonse Penaud demonstrated the use of twisted rubber strands as an energy source for "model"-sized airplanes and helicopters.[12] In 1896, Samuel Pierpont Langley, then Secretary of the Smithsonian Institution, flew an unmanned twin-propeller, steam-engine-powered aircraft with a wingspan of slightly under fourteen feet.[13] The aircraft, called Aerodrome Number 5, was catapult launched from a houseboat on the Potomac River and made two test flights, in each case travelling several thousand feet before landing in the river.[14]

The Sperry Aerial Torpedo, developed during World War I and demonstrated in 1918, was a bomb-equipped biplane that used an on-board timer to shut off the engine and, in theory (it was never actually used in combat), send it diving onto a tar-

get.[15] This was a very early example of "autonomous" flight, in which a UAS is controlled from within the aircraft, without intervention from a human on the ground.

The first unmanned airplane to be successfully flown by radio remote control was a modified N9 Navy seaplane that remained aloft for about twelve minutes during a September 1924 test, sometimes at a distance of several miles from the transmitter held by the pilot on the ground.[16] By the late 1930s, radio-controlled unmanned aircraft had started to gain significant attention in the hobbyist community[17] and in the military. During the ten-year period starting in 1934, the British military purchased hundreds of radio-controlled unmanned "Queen Bee" biplanes to use for target practice;[18] in fact, the term "drone" may have originally arisen to describe the unmanned aircraft used for this purpose.[19]

In the United States, the Radioplane Company was founded in the late 1930s[20] and during World War II built over 15,000 "drones" for the U.S. military to use in training antiaircraft gunners.[21] Radioplane was acquired by Northrop in 1952,[22] and continued to supply the U.S. military with unmanned aerial vehicles including, in the 1950s, models equipped with an on-board film-based camera.[23] Other countries with unmanned aircraft programs in the years during or shortly following World War II included Russia, France, Italy, Germany, and Japan.[24]

In the 1960s, military reconnaissance use of unmanned aircraft became increasingly common. Ryan Aeronautical Company,

which won a contract with the U.S. Air Force in 1948,[25] was a major provider of U.S. military UAS for much of the 1950s and 1960s. Versions of the Ryan Firebee flew thousands of reconnaissance and electronic warfare missions over Vietnam.[26]

The 1970s and 1980s saw continued development of military UAS technology, with the United States, Russia, Canada, Israel, and Europe all possessing active programs.[27] In the conflict with Lebanon in 1982, Israel used a relatively small UAS called the Mastiff to provide reconnaissance imagery,[28] and during the 1991 Gulf War, the U.S. military flew over 500 missions using the Pioneer UAS.[29] The Gnat-750, a precursor to the Predator, was first flown in 1989 and was employed in the mid-1990s to acquire imagery during the conflict in the former Yugoslavia.[30]

B. Unmanned Aircraft Systems Today

Since 2000, worldwide UAS use for both military and civilian applications has increased dramatically. One key factor contributing to this growth is the continuing advance of computing, imaging, and communications technologies. Computational power and storage that would have filled multiple rooms in the 1960s can now easily fit within a single chip. In the context of UAS, this has made it possible to equip even very small platforms with sophisticated on-board computational systems for tasks such as navigation and image processing. The advent of high-resolution, low-cost digital imaging systems, when combined with high-bandwidth communications links, enables high-resolution images and video acquired by an unmanned aircraft to be transmitted in real time to an observer fifty feet—or 5000 miles—away. Thanks to continuing innovations in airframe design and flight control algorithms, the cameras that can be mounted on UAS are becoming smaller and more agile.

The American global positioning system (GPS),[31] which began development in 1973 and was completed in 1995,[32] has also helped to spur UAS growth. GPS makes it possible for UAS to determine their precise location using on-board systems, and therefore to perform missions involving much more complex navigational tasks than could be attempted in the pre-GPS era.[33]

Today, unmanned aircraft come in an incredible variety of shapes and sizes. Some, such as the Global Hawk used by the U.S. military, are as large and nearly as fast as business jets.[34] Others are small enough to fit in a backpack or even the palm of a hand. The video-capable Nano Hummingbird, developed by California-based AeroVironment, weighs only two-thirds of an ounce.[35] The solar-powered QinetiQ Zephyr, which weighs only slightly over 110 pounds despite having a wingspan of about 74 feet, stayed aloft for over two continuous weeks in Arizona during the summer of 2010.[36]

UAS can be controlled during flight in a variety of ways. A pilot on the ground who maintains visual contact with a UAS can fly it using a handheld or computer-based radio remote control interface. Alternatively, or in addition, in a "first-person-view" (FPV) system, a UAS-mounted camera transmits a real-time "cockpit" view to a pilot on the ground who flies

---

the aircraft as if he or she were physically on-board. If the radio link between the UAS and the pilot is sufficiently strong, the UAS can be flown beyond the visual line of sight.

Autonomous flight using information from an on-board GPS receiver to perform navigation without any human intervention can also be used. Many UAS have the capability to operate in multiple modes—for example, navigating semi-autonomously to a destination based on a set of GPS waypoints input by a pilot, who then takes over active control using an FPV system. Of course, what is possible technologically and what is permitted by regulations are two very different things. At present, with very limited exceptions,[37] the Federal Aviation Administration (FAA) does not permit UAS flights in which the operator on the ground is unable to maintain continuous visual contact with the aircraft.

The UAS industry today is large, global, and rapidly growing. According to the Association for Unmanned Vehicle Systems International (AUVSI), the largest international association for unmanned systems, there are now over 400 active manufacturers of UAS globally, including 150 in the United States.[38] Other countries with significant UAS development include Australia, Brazil, Canada, China, France, Germany, India, Iran, Israel, Japan, Pakistan, Turkey, Russia, and the United Kingdom.[39] The Teal Group, an aerospace and defense consultancy based in Virginia, predicts that global annual UAS spending will rise from an estimated $6.6 billion in 2012 to over $11 billion over the next decade, corresponding to a total ten-year expenditure of nearly $90 billion.[40]

Even as overall spending is increasing, per-unit costs for the smaller platforms are dropping. Large military surveillance

37. The FAA Modernization and Reform Act of 2012, discussed later in this Article, includes a provision (Section 332(d)) that will allow beyond-line-of-sight operation in the Arctic (northern Alaska). *See id.* at 11–15.

platforms such as the Global Hawk can cost many tens of millions of dollars or more to purchase[41] and require large teams of highly trained people using specialized equipment to fly.[42] However, there are increasing numbers of highly capable commercially available small UAS that can be purchased for under $1000. It is only a matter of time—and probably not much time—before GPS and video-equipped UAS drop below $100, and then below $10.

UAS can be used in law enforcement, search and rescue, surveying, scientific research, and many other civilian applications. Although many people equate the prospect of law enforcement use of UAS with surveillance, in practice this may be the exception rather than the rule. In this respect, the experience of the Mesa County, Colorado, Sheriff's Office is instructive. Mesa County has one of the only current FAA Certificates of Authorization for operational (as opposed to training) use of UAS.[43] The Mesa County Sheriff's Office has (as of February 2013) flown approximately 40 missions since 2011, and has never used them to perform surveillance.[44] Instead, typical operations have been for obtaining after-the-fact crime scene images, search and rescue, and providing imagery for structure fire suppression and arson investigations. Ben Miller, the Unmanned Aircraft Program Manager in Mesa County, puts the per-hour operating cost of Mesa County's UAS at $25;[45] a manned helicopter, by contrast, costs hundreds of dollars per hour to operate. The dramatically lower operating cost for unmanned aircraft provides a powerful economic incentive for their adoption. In addition, they can be used in circumstances where a manned helicopter would have been too dangerous or disruptive.

In Australia, where certain commercial operations using small unmanned aircraft have been permitted for over ten years,[46] applications have included mining surveys and transportation of equipment to drilling rigs.[47] In Japan, agricultural spraying is often performed using small unmanned helicopters.[48] In the United States, NASA researchers have used UAS for studying Hawaiian volcanoes.[49] UAS are also ideal platforms for identifying wildfire hotspots without putting a human pilot at risk.[50]

II. REGULATORY FRAMEWORK

A. The Federal Aviation Administration

When considering the regulatory framework applicable to UAS in the United States, it is helpful to start by briefly addressing how aircraft operations in general are regulated. The FAA, which was established in 1958 and has been part of the

Department of Transportation since the 1960s,[51] oversees nearly all[52] aircraft operations in the United States.[53] This is a complex task in a national airspace that has an "average of more than 100,000 aviation operations per day, including air carrier, air taxi, general aviation, and military aircraft."[54]

Like other administrative agencies of the United States government, the FAA makes and enforces rules to implement and interpret laws passed by Congress.[55] New rules,[56] such as those to be developed by the FAA to enable the integration of UAS into the airspace, are formulated through a rulemaking process that includes an internal drafting and review stage, publication of a draft rule in the Federal Register, a period of public comment, revisions based on the comments, and publication of a final rule.[57]

51. *A Brief History of the FAA*, FED. AVIATION ADMIN., http://www.faa.gov/about/history/brief%5Fhistory/http://www.faa.gov/about/history/brief_history/ (last visited Nov. 10, 2012) [hereinafter *Brief History*].

52. There are a few exceptions. For example, the FAA does not have any responsibility to ensure the separation of military aircraft operating within "MARSA" airspace. MARSA is an acronym for "Military Assumes Responsibility for Separation of Aircraft." FED. AVIATION ADMIN., AIR TRAFFIC ORG. POLICY ¶ 2-1-11 (2012), *available at* http://www.faa.gov/air_traffic/publications/atpubs/atc/atc0201.html. In addition, the FAA does not oversee model aircraft operated in accordance with FAA Advisory Circular 91-57 or with Section 336 of the FAA Modernization and Reform Act of 2012, which creates a special rule for model aircraft. *See* FED. AVIATION ADMIN., ADVISORY CIRCULAR 91-57, MODEL AIRCRAFT OPERATING STANDARDS (1981) [hereinafter ADVISORY CIRCULAR 91-57], *available at* http://www.faa.gov/documentLibrary/media/Advisory_Circular/91-57.pdf; FAA Modernization and Reform Act of 2012 (FMRA), Pub. L. No. 112-95, § 336, 126 Stat. 11, 77 (2012).

53. Brief History, supra note 51.

54. *Fact Sheet: Unmanned Aircraft Systems (UAS)*, FED. AVIATION ADMIN., http://www.faa.gov/about/initiatives/uas/media/uas_fact_sheet.pdf (last visited Jan. 28, 2013) [hereinafter *Fact Sheet*].

55. Formally, a "rule" is "the whole or a part of an agency statement of general or particular applicability and future effect designed to implement, interpret, or prescribe law or policy. . . ." Administrative Procedure Act § 1, 5 U.S.C. § 551(4) (2012).

56. FAA "rules" are also called "regulations." *See, e.g.*, 49 U.S.C. § 40103 (directing that the Administrator of the FAA promulgate "regulations" governing the flight of aircraft).

57. There are actually various forms of rulemaking in accordance with the Administrative Procedure Act, which was enacted in 1946. The steps described in the text (and provided in 5 U.S.C. § 553) occur in association with what is referred to as informal rulemaking, which is by far the most common form. There is also a formal rulemaking process under 5 U.S.C. §§ 556–557 that includes a hearing and

FAA regulations[58] classify aircraft, without regard to whether they are manned, as either "public"[59] or "civil."[60] Public aircraft are those operated by local, state, and federal public entities, including law enforcement agencies.[61] Civil aircraft, typically, are operated by private companies, individuals, and other non-government entities. The public-civil distinction is extremely important both generally and with respect to UAS.

B. The FAA and Unmanned Aircraft Systems

On February 14, 2012, President Obama signed the FAA Modernization and Reform Act of 2012 (FMRA)[62] into law. FMRA provides, among other things, a set of overlapping deadlines for the integration of UAS into the national airspace over the next three years.[63] Although UAS integration has been on the proverbial radar screen of the FAA for a number of years, FMRA represents the first significant congressional legislation addressing the domestic use of UAS.

---

a number of other steps. RAYMOND C. SPECIALE, FUNDAMENTALS OF AVIATION LAW 124–25 (2006).

58. FAA regulations are provided in the Code of Federal Regulations (CFR), Title 14 ("Aeronautics and Space"), Volumes 1–3, which comprise parts 1–199 (not all of the numbers in this range are currently used). "General Operating and Flight Rules" for aircraft are found in Volume 2, Subchapter F ("Air Traffic and General Operating Rules"), Part 91, denoted 14 C.F.R. § 91 and sometimes referred to as FAR Part 91. FAR is an acronym for "Federal Aviation Regulations." "General Definitions" are in 14 C.F.R. § 1.1. An unofficial version of the CFR is provided through the Electronic Code of Federal Regulations (e-CFR) by the government at http://ecfr.gov.

59. Section 331(4) of the FAA Modernization and Reform Act provides that "[t]he term 'public unmanned aircraft system' means an unmanned aircraft system that meets the qualifications and conditions required for operation of a public aircraft . . . ." FAA Modernization and Reform Act of 2012 (FMRA), Pub. L. No. 112-95, § 331, 126 Stat. 11, 72 (2012). The term "public aircraft" is defined in 49 U.S.C.A. § 40102(a)(41) (2012), as well as in 14 C.F.R. § 1.1 (2012).

60. *See* 49 U.S.C. § 40102(a)(16).

61. *See* § 40102(a)(41). Whether an aircraft has "public aircraft status" depends, in part, on how it is being used. An aircraft that is owned by a government entity but engaged in an operation that replicates a service that could be obtained from a commercial air carrier does not have public aircraft status during that operation. As used in this Article, "public aircraft" and "government aircraft" refer to aircraft that satisfy the statutory qualifications for public aircraft status under § 40125.

62. Pub. L. No. 112-95, 126 Stat. 11 (2012).

63. *Id.* §§ 331–336, 126 Stat. at 72–78.

Recognizing that UAS raise unique issues that "may differ substantially from manned aircraft operations and systems,"[64] the FAA created a new Unmanned Aircraft Program Office in early 2006.[65] In accordance with policies established well before the enactment of FMRA, operators of UAS engaged in public aircraft operations are required to obtain a Certificate of Authorization (COA).[66] Civil (i.e. private) UAS operators need a "special airworthiness certificate."[67] Use of UAS for commercial purposes is currently prohibited,[68] though that is expected to change by 2014.

According to data released in early 2012 in response to a Freedom of Information Act lawsuit filed by the Electronic Frontier Foundation, the FAA had issued "about 700–750 authorizations since the program began in 2006," of which approximately 300 remained active as of April 2012.[69] Public entities that have been issued COAs include the U.S. Air Force,

---

64. James Sizemore & Richard Posey, Fed. Aviation Admin., Unmanned Aircraft Systems (UAS) Certification Status 2 (2006), *available at* http://www.faa.gov/about/initiatives/uas/reg/media/uas_policyupdate.pdf.

65. *Id.* at 1.

66. *See* DEP'T. OF TRANSP., UNMANNED AIRCRAFT OPERATIONS IN THE NATIONAL AIRSPACE SYSTEM, DOCKET NO. FAA-2006-25714 (2007), *available at* http://www.faa.gov/about/initiatives/uas/reg/media/frnotice_uas.pdf. In addition to "Certificate of Authorization," COA is sometimes written in expanded form as "Certificate of Waiver or Authorization" or "Certificate of Authorization or Waiver." *See id.* An exception to the COA requirement is MARSA airspace. *See supra* note 52.

67. *See* 14 C.F.R. § 21.175 (2012). Although model aircraft are obviously unmanned, provided that they are flown for hobby or recreational use, they are not treated as "civil UAS" by the FAA. *See* ADVISORY CIRCULAR 91-57, *supra* note 52; FMRA § 336, 126 Stat. at 77.

68. Even though this prohibition is not explicit with respect to UAS, it is implicit in the list, provided in 14 C.F.R. § 21.191, of purposes for which experimental certificates can be issued. To date, special airworthiness certificates have been issued only in the experimental category. *Fact Sheet*, *supra* note 54, at 146 ("An SAC-EC is the only certification means available to civil operators for UAS and optionally-piloted aircraft (OPA)."). "SAC" is an acronym for special airworthiness certificate. The list in § 21.191 includes purposes such as "[r]esearch and development," "[a]ir racing," and "[c]rew training," but not commercial use. In addition, 14 C.F.R. § 91.319, which describes operating limitations for aircraft having experimental certificates, provides, among other things, that "[n]o person may operate an aircraft that has an experimental certificate—(1) For other than the purpose for which the certificate was issued; or (2) Carrying persons or property for compensation or hire."

69. Jennifer Lynch, *FAA Releases Lists of Drone Certificates—Many Questions Left Unanswered*, ELECTRONIC FRONTIER FOUNDATION, https://www.eff.org/deeplinks/2012/04/faa-releases-its-list-drone-certificates-leaves-many-questions-unanswered.

U.S. Army, the Defense Advanced Research Projects Agency (DARPA), FBI, NASA, some county and municipal law enforcement agencies, and various public universities.[70] The list of companies that have been issued special airworthiness certificates includes Raytheon, Honeywell, General Atomics, and other defense companies.[71]

COAs specify where and under what circumstances a UAS can be used. For example, a COA might require that the UAS only be flown during daylight hours, and only within the visual line of sight of the operator.[72] In the case of a UAS operated by a law enforcement agency, the COA might specify that flights must be performed only for training, as opposed to operational, purposes. In early 2008, the FAA began the process of developing recommendations for regulating "small" UAS (those weighing under fifty-five pounds).[73] Thus, by the time FMRA was signed into law in February 2012, the FAA had already been actively planning for UAS integration for several years.

FMRA sets a goal of integrating UAS into the national airspace system by late 2015.[74] Under the new law, public UAS operators have had access to expedited COAs since May 14, 2012.[75] UAS under these authorizations must weigh no more than twenty-five pounds[76] and be operated within the line of sight of the op-

73. In April 2008, the FAA created the Small Unmanned Aircraft System Aviation Rulemaking Committee. *See* FED. AVIATION ADMIN., ORDER 1110.150, SMALL UNMANNED AIRCRAFT SYSTEM AVIATION RULEMAKING COMMITTEE (2008), http://www.faa.gov/documentLibrary/media/Order/1110.150.pdf. This committee is often referred to using the acronym sUAS ARC, and has members from both government and industry. The sUAS ARC issued a set of recommendations for sUAS regulatory development in April 2009. *See* FED. AVIATION ADMIN., SMALL UNMANNED AIRCRAFT SYST. AVIATION RULEMAKING COMM., COMPREHENSIVE SET OF RECOMMENDATIONS FOR SUAS REGULATORY DEVELOPMENT (2009), *available* at http://www.modelaircraft.org/faa/recommendations.pdf.

74. FMRA, Pub. L. No. 112–95, § 332(a)(3), 126 Stat. 11, 73 (2012).

75. *See id.* § 334(c), 126 Stat. at 76.

76. *FAA Makes Progress with UAS Integration*, FED. AVIATION ADMIN., http://www.faa.gov/news/updates/?newsId=68004 (last visited Jan. 28, 2012). Interestingly, with respect to weight, the FAA went further than was required by

erator, less than 400 feet above the ground, and during daylight conditions.[77] By December 31, 2015, the FAA is required to "develop and implement operational and certification requirements for the operation of public unmanned aircraft systems in the national airspace system by September 30, 2015."[78]

For civil UAS, FMRA mandates the development of a "comprehensive plan" that will "provide for the safe integration of civil unmanned aircraft systems into the national airspace."[79] Additionally, regulations for the operation of small civil UAS (including allowing their use for commercial purposes) are due by August 2014.[80]

The FAA is in somewhat of a unique position with respect to deadlines laid out in legislation such as FMRA. FMRA requires that the FAA "provide for the safe integration of civil unmanned aircraft systems into the national airspace system as soon as practicable, but not later than September 30, 2015."[81] This language contains no explicit provision for what happens if, in the FAA's view, "as soon as practicable" is later than that date. However, Congress is unlikely to hold the FAA to a deadline that might risk jeopardizing airspace safety.

C. *The Impact of Safety Regulations on Privacy*

Though privacy and airspace safety are distinct UAS issues, they are in some respects closely intertwined. By placing limitations on where and how unmanned aircraft can be operated, airspace safety regulations can impact privacy.

For example, under the FAA regulations that prescribe "flight rules governing the operation of [both manned and un-

---

FMRA, which provided that the authorizations must "allow a government public safety agency to operate unmanned aircraft weighing 4.4 pounds or less." FMRA § 334(c)(2)(C), 126 Stat. at 77.

77. These requirements are among those provided in FMRA § 334(c)(2)(C). Additional requirements in this Section restrict operation to Class G (uncontrolled) airspace more than five miles from airports and other locations with aviation activities. *See id.*

78. *Id.* § 334(b), 126 Stat. at 76.

79. *Id.* § 332(a)(1).

80. *Id.* § 332(b)(1).

81. *Id.* § 332(a)(3).

manned] aircraft within the United States,"[82] it is illegal to operate an aircraft "in a careless or reckless manner so as to endanger the life or property of another."[83] Aircraft must also be operated at a sufficiently high altitude to allow "an emergency landing without undue hazard to persons or property on the surface" in the event of an engine failure.[84] Compliance with these rules, which apply to both manned and unmanned aircraft,[85] could be called into question, for example, in the monitoring of a peaceful protest if a UAS is flown (either by law enforcement or by a protester) at very low altitudes directly above a crowd of people.[86]

The tie between safety and privacy is tightest with respect to rules requiring the operator of a UAS to be able to see the aircraft at all times. Public UAS operated in association with the expedited authorizations in Section 334(c)(2)(C) of FMRA have a "line of sight" requirement.[87] The rules for civil small UAS due for implementation in August 2014 likely will also have this constraint. From the FAA's standpoint, any such requirement would be solely motivated by safety concerns related to the need to "sense and avoid" other aircraft and to problems that might arise if a UAS beyond the line of sight loses communication with its operator.[88] But there are privacy consequences as well.

It is easy for an operator standing on the street in front of a house to fly a UAS high enough to obtain overhead images of a fenced-in backyard while maintaining visual contact with the

82. Subpart B of part 91 applies to "the operation of aircraft within the United States and within 12 nautical miles from the coast of the United States." 14 C.F.R. § 91.101 (2012).

83. 14 C.F.R. § 91.13(a).

84. 14 C.F.R. § 91.119(a).

85. *See* 14 C.F.R. § 91.1(a) (stating that part 91 "govern[s] the operation of aircraft . . . within the United States.").

86. *See* 14 C.F.R. § 91.13(a).

87. FMRA § 334(c)(2)(c).

88. *See Fact Sheet*, *supra* note 54, at 2. Not everyone in the unmanned aviation community is in agreement regarding the safety value of a line of sight requirement. Opponents of such a requirement could argue, among other things, that a UAS beyond the visual line of sight that loses communication with an operator can be programmed to land itself safely. Opponents could also argue that even if a UAS is within visual line of sight, if the ability of the operator to communicate with it is lost, being able to see it does little to mitigate any resulting risks. Nonetheless, this is an area in which regulators are likely to act very conservatively.

aircraft. It is far harder, by contrast, to maintain visual line of sight while lowering the UAS into the yard to obtain eye-level images through the back windows of the house. Thus, the questions of if, when, and under what circumstances non-visual line of sight operation will be permitted will have an impact on privacy.[89]

Even assuming that FAA regulations adopted in the next several years continue to require visual line of sight operation, in the longer term this requirement is likely to be relaxed for some specific classes of UAS operations. Some of the most promising applications of UAS, by their very nature, require non-visual line of sight operation. For example, UAS have enormous potential for search and rescue in large part because they can enable an operator to quickly and safely examine many square miles of potentially inhospitable terrain. Surveying of pipelines, long-distance electric transmission lines, and other extended structures can also entail large separations between an operator and a UAS. As "sense and avoid" technologies become more mature, these sorts of non-line of sight operations may eventually be permitted. This will expand ways in which a UAS flown in compliance with FAA regulations might be used to violate privacy.

III. GOVERNMENT UNMANNED AIRCRAFT AND THE FOURTH AMENDMENT

The Fourth Amendment is central to the privacy issues with respect to government UAS operation. Although the Supreme Court has never explicitly considered the question of UAS privacy, there is a long list of relevant precedents.[90] Among them

89. The term "line of sight" is more complex than it first appears. Some people in the UAS community use "line of sight" to refer to operation in which a radio signal can be transmitted directly from an operator to a UAS, without being relayed through a satellite, other aircraft, or ground-based communications network (sometimes also called "electronic line of sight"). This does not ensure that the operator can necessarily see the UAS, as radio signals can easily pass through trees and other objects, sometimes traveling for miles. The term "*visual* line of sight," by contrast, is unambiguous: The operator must be able to see, with his or her eyes, the UAS.

90. In addition to the cases discussed at greater length in Part III of this Article, see, e.g., City of Indianapolis v. Edmond, 531 U.S. 32 (2000), Minnesota v. Carter, 525 U.S. 83 (1998), United States v Karo, 468 U.S. 705 (1984), Oliver v. United States, 466 U.S. 170 (1984), United States v. Knotts, 460 U.S. 276 (1983), Steagald v.

are several cases from the 1980s that specifically considered aerial observations and the Fourth Amendment. The 2001 *Kyllo v. United States*[91] and 2012 *United States v. Jones*[92] decisions are also pertinent.

A. Dow Chemical Co. v. United States

In 1978, the Environmental Protection Agency, without Dow Chemical's consent, contracted with a commercial aerial photographer to provide images of a 2000-acre Dow Chemical manufacturing facility from altitudes of 1200, 3000, and 12,000 feet.[93] When Dow Chemical became aware of this, it filed suit in Federal District Court, which granted summary judgment, finding the aerial photography to be a search in violation of the Fourth Amendment.[94] The Sixth Circuit reversed the decision, ruling that even though the company had taken precautions, including installing a perimeter fence and alarm system[95] that provided a subjective expectation of privacy from ground-level intrusions, it did not have such an expectation with respect to aerial surveillance.[96] Thus, the Sixth Circuit concluded, the acquisition of aerial images without a warrant was not a Fourth Amendment search.[97]

In reviewing this ruling on certiorari, the Supreme Court affirmed the Sixth Circuit's decision, concluding in a 1986 ruling that the open areas in the 2000-acre industrial facility were more akin to an "open field"[98] than to the curtilage of a home,

98. The Court wrote that "open fields do not provide the setting for those intimate activities that the [Fourth] Amendment is intended to shelter from governmental interference or surveillance" and that "an individual may not legitimately demand privacy for activities out of doors in fields, except in the area immedi-

and, as a result, were "open to the view and observation of persons in aircraft lawfully in the public airspace immediately above or sufficiently near the area for the reach of cameras."[99] The Court also noted the role of technology diffusion as a factor, writing that "surveillance of private property by using highly sophisticated surveillance equipment not generally available to the public, such as satellite technology, might be constitutionally proscribed absent a warrant."[100] However, the Court observed, "[a]ny person with an airplane and an aerial camera could readily duplicate"[101] the photographs at issue. "[T]he taking of aerial photographs of an industrial plant complex from navigable airspace is not a search prohibited by the Fourth Amendment."[102]

B. California v. Ciraolo

Ciraolo[103] was decided in 1986, on the same day as *Dow Chemical*. On September 2, 1982, police in Santa Clara, California, received a tip regarding backyard marijuana cultivation.[104] After finding the yard surrounded by high fencing obscuring the view from the street, they obtained a small airplane and flew over the residence at 1000 feet.[105] The officers on the airplane observed and photographed what they concluded to be marijuana plants growing in the backyard.[106] This evidence was used to obtain a search warrant to seize the plants.[107]

The Supreme Court granted certiorari after the California Court of Appeal ruled that the warrantless aerial observations violated the Fourth Amendment.[108] In May 1986, the Supreme Court issued a five-to-four decision reversing the lower court.[109] Writing for the majority, Chief Justice Burger framed

the analysis in terms of the "reasonable expectation of privacy"[110] articulated in Justice Harlan's concurrence in *Katz*.[111] For an expectation of privacy to be "reasonable" under *Katz*, two separate criteria must be satisfied. First, the person must "have exhibited an actual (subjective) expectation of privacy."[112] Second, the expectation must "be one that society is prepared to recognize as 'reasonable.'"[113]

With respect to the first criterion, the *Ciraolo* Court wrote that although the presence of fences clearly conveyed a "desire to maintain privacy," and indeed successfully did so with respect to "normal sidewalk traffic," the marijuana plants might well have been visible from a truck or two-level bus.[114] Thus, it was unclear that the respondent had "a subjective expectation of privacy from all observations of his backyard."[115]

With respect to the second criterion, the Court did not dispute that the backyard was in the curtilage of the home,[116] but noted that police observations of curtilage are not necessarily unconstitutional. "The Fourth Amendment protection of the home has never been extended to require law enforcement officers to shield their eyes when passing by a home on public thoroughfares."[117] Moreover, "the mere fact that an individual has taken measures to restrict some views of his activities [does not] preclude an officer's observations from a public vantage

110. *Id.* at 211.

111. Katz v. United States, 389 U.S. 347, 360 (1967) (Harlan, J., concurring).

112. *Id.* at 361.

113. *Id.* Much turns on the interpretation of "reasonable." For example, in *Illinois v. Caballes*, the Supreme Court explained that "the expectation 'that certain facts will not come to the attention of the authorities' is not the same as an interest in 'privacy that society is prepared to consider reasonable.'" 543 U.S. 405, 408–09 (2005) (quoting United States v. Jacobsen, 466 U.S. 109, 122 (1984)). In *Caballes*, the Court also distinguished between legitimate privacy expectations with respect to lawful, as opposed to unlawful, activity: "The legitimate expectation that information about perfectly lawful activity will remain private is categorically distinguishable from respondent's hopes or expectations concerning the nondetection of contraband in the trunk of his car." *Id.* at 410.

114. *Ciraolo*, 476 U.S. at 211.

115. *Id.* at 211–12.

116. *See, e.g.*, Oliver v. United States, 466 U.S. 170, 180 (1984) ("Thus, courts have extended Fourth Amendment protection to the curtilage; and they have defined the curtilage, as did the common law, by reference to the factors that determine whether an individual reasonably may expect that an area immediately adjacent to the home will remain private.").

117. *Ciraolo*, 476 U.S. at 213.

point where he has a right to be and which renders the activities clearly visible."[118] Because the observations were made from "public navigable airspace . . . in a physically nonintrusive manner," the respondent's expectation of privacy from such aerial observations was not one "that society is prepared to honor."[119] The Court concluded that "[i]n an age where private and commercial flight in the public airways is routine, it is unreasonable for respondent to expect that his marijuana plants were constitutionally protected from being observed with the naked eye from an altitude of 1,000 feet."[120]

The dissent, delivered by Justice Powell, criticized the Court's reliance on the absence of a "physical invasion of the curtilage" in finding no constitutional violation: "Since *Katz*, we have consistently held that the presence or absence of physical trespass by police is constitutionally irrelevant to the question whether society is prepared to recognize an asserted privacy interest as reasonable."[121] The dissent also disagreed with the Court's view that conducting an overflight with the specific goal of enabling trained officers to observe a suspect's backyard raised no more constitutional questions than overflights by members of the flying public: "[T]he actual risk to privacy from commercial or pleasure aircraft is virtually nonexistent. Travelers on commercial flights, as well as private planes used for business or personal reasons, normally obtain at most a fleeting, anonymous, and nondiscriminating glimpse of the landscape and buildings over which they pass."[122] And, in an observation that would foreshadow the *Kyllo* decision fifteen years later, Justice Powell warned that "[r]apidly advancing technology now permits police to conduct surveillance in the home itself, an area where privacy interests are most cherished in our society, without any physical trespass."[123]

C. Florida v. Riley

Just under three years after *Ciraolo*, the Supreme Court once again ruled on the constitutionality of aerial observations of a home's curtilage by law enforcement. Like *Ciraolo*, *Florida v. Riley*[124] arose from a tip involving marijuana cultivation behind a house, where the plants could not be seen from the street. In *Riley*, the observations were made from a helicopter at 400 feet, enabling officers to see the plants through openings in the roof and sides of a greenhouse located behind a mobile home.[125] A majority of the justices in *Riley* found these observations constitutional.

Writing for the plurality,[126] Justice White wrote that "our decision in *California v. Ciraolo* controls this case."[127] While Riley took steps that "protected against ground-level observation," "the sides and roof of his greenhouse were left partially open" and "what was growing in the greenhouse was subject to viewing from the air."[128] "Any member of the public could legally have been flying over Riley's property in a helicopter at the altitude of 400 feet and could have observed Riley's greenhouse. The police officer did no more."[129]

Despite Justice White's statement that "[w]e would have a different case if flying at that altitude had been contrary to law or regulation,"[130] his opinion also provided an important qualifier: "This is not to say that an inspection of the curtilage of a house from an aircraft will always pass muster under the Fourth Amendment simply because the plane is within the navigable airspace specified by law."[131] Specifically, in ruling that there was no violation of the Fourth Amendment in the present case, Justice White found it of note that "no intimate

125. *Id.* at 448.

126. The *Riley* decision comprised an opinion delivered by Justice White and joined by Chief Justice Rehnquist and Justices Scalia and Kennedy; an opinion from Justice O'Connor concurring in the judgment; a dissent from Justice Brennan joined by Justices Marshall and Stevens; and a separate dissent filed by Justice Blackmun. Thus, even though there was no majority opinion, a majority of the Justices found the observations constitutional.

details connected with the use of the home or curtilage were observed, and there was no undue noise, and no wind, dust, or threat of injury."[132]

In her opinion concurring in the judgment, Justice O'Connor raised concerns about relying on "compliance with FAA regulations alone" as a litmus test for privacy from overhead surveillance.[133] Rather, she wrote, "consistent with *Katz*, we must ask whether the helicopter was in the public airways at an altitude at which members of the public travel with sufficient regularity that Riley's expectation of privacy from aerial observation was not 'one that society is prepared to recognize as reasonable.'"[134] She then concluded that because there is "considerable public use of airspace at altitudes of 400 feet and above," Riley did not have a reasonable expectation of privacy from naked-eye observations from that altitude.[135] However, she wrote, "public use of altitudes lower than that—particularly public observations from helicopters circling over the curtilage of a home—may be sufficiently rare that police surveillance from such altitudes would violate reasonable expectations of privacy, despite compliance with FAA air safety regulations."[136]

Justice Brennan's dissent also took issue with the tie between FAA safety regulations and privacy: "It is a curious notion that the reach of the Fourth Amendment can be so largely defined by administrative regulations issued for purposes of flight safety."[137] He observed that the police officer's "ability to see over Riley's fence depended on his use of a very expensive and sophisticated piece of machinery to which few ordinary citizens have access."[138] The question, in Justice Brennan's view, was not whether the flights were in compliance with the FAA regulations, "but whether public observation of Riley's curtilage was so commonplace that Riley's expectation of privacy in his backyard could not be considered reasonable."[139] And while privately owned helicopters occasionally fly over populated areas

at 400 feet, "such flights are a rarity."[140] Justice Blackmun's dissent also cited the rarity of helicopter overflights at 400 feet and stated that for any observations below 1000 feet (the altitude of the fixed-wing aircraft in *Ciraolo*), the prosecution should have the burden of proving that a suspect whose curtilage was observed lacked a reasonable expectation of privacy.[141]

D. Kyllo v. United States

Although *Kyllo*[142] involved ground-based observations of a home, the case is nonetheless highly relevant to privacy from aerial observations; in fact, *Ciraolo* was invoked multiple times in the Court's 2001 *Kyllo* opinion. In January 1992, a government agent in a car used a thermal imaging device to measure the external temperature of the roof and outside wall of the home of Danny Lee Kyllo, who was suspected of growing marijuana.[143] The roof and wall were found to be abnormally warm, and a search warrant was issued based in part on this information.[144] Upon execution of the search warrant, marijuana plants were found and Kyllo was arrested.[145] A district court and the Ninth Circuit upheld the use of the thermal imager, in part on the grounds that it "merely indicated amorphous 'hot spots' on the roof and exterior wall and not the detailed images of private activity."[146]

The Supreme Court reversed the Ninth Circuit in a five-to-four opinion delivered by Justice Scalia.[147] The Court framed its analysis by noting that "well into the 20th century, our Fourth Amendment jurisprudence was tied to common-law trespass."[148] More recent rulings have "decoupled violation of a person's Fourth Amendment rights from trespassory violation of his property, but the lawfulness of warrantless visual surveillance of a home has still been preserved."[149] However, with

respect to searches of the interior of a home, "there is a ready criterion, with roots deep in the common law, of the minimal expectation of privacy that *exists*, and that is acknowledged to be *reasonable*."[150]

The Court expressed concern that allowing the government to freely collect any information "emanating from a house" would put people "at the mercy of advancing technology—including imaging technology that could discern all human activity in the home."[151] The Court also noted that "[w]hile the technology used in the present case was relatively crude, the rule we adopt must take account of more sophisticated systems that are already in use or in development."[152] The Court then concluded that when "the Government uses a device that is not in general public use, to explore details of the home that would previously have been unknowable without physical intrusion, the surveillance is a 'search' and is presumptively unreasonable without a warrant."[153]

In dissent, Justice Stevens criticized the Court for, in his view, failing to follow established principles providing that searches inside a home are presumptively unreasonable, while searches of property "in plain view" are not.[154] Justice Stevens also wrote that "any member of the public might notice that one part of a house is warmer than another part or a nearby building if, for example, rainwater evaporates or snow melts at different rates across its surfaces," and that "[h]eat waves, like aromas that are generated in a kitchen, or in a laboratory or opium den, enter the public domain if and when they leave a building."[155] Justice Stevens also criticized the Court's use of a standard that would diminish privacy protection as "intrusive equipment becomes more readily available."[156] Indeed, in the decade following *Kyllo*, thermal imagers have become less ex-

pensive and more widely available. Writing in 2010, Orin Kerr observed that "remote infrared temperature-sensing has become quite common in a wide range of applications" and "it seems to me that there's at least a plausible case that the police can now use thermal imaging devices—or at least the simple single-point infrared devices—without a warrant."[157]

E. United States v. Jones

The most recent major Supreme Court privacy ruling is *United States v. Jones*,[158] decided in January 2012. In September 2005, agents on a joint FBI and Metropolitan (Washington D.C.) Police Department task force installed, without a valid warrant,[159] a GPS tracking device on a vehicle used by a suspect in a narcotics investigation.[160] The GPS tracker collected location data for approximately one month, and was used to place the suspect, Antoine Jones, at a house at a date and time where drug sales allegedly occurred.[161] After two trials in the United States District Court for the District of Columbia (the first ended in a mistrial), Jones and another defendant were convicted on a drug conspiracy charge.[162]

On appeal, Jones' conviction was overturned.[163] While noting that a person's reasonable expectation of privacy is highest in his or her home, the District of Columbia Circuit Court of Appeal recognized that "[a] person does not leave his privacy behind when he walks out his front door . . . . On the contrary, in *Katz* the Court clearly stated 'what [one] seeks to preserve as private, even in an area accessible to the public, may be constitutionally

protected.'"[164] In using the warrantless GPS tracker to discover "the totality and pattern of his movements," the court concluded that the government violated the Fourth Amendment.[165]

The Supreme Court granted the government's petition of certiorari.[166] The Court's January 2012 decision was unanimous in finding the government's actions unconstitutional, but the Justices widely diverged in the bases for that finding. The majority opinion, delivered by Justice Scalia, found a Fourth Amendment violation in the physical trespass that occurred during the placement of the GPS device on the vehicle.[167] That intrusion, wrote Justice Scalia, "would have been considered a 'search' within the meaning of the Fourth Amendment when it was adopted."[168] The Court acknowledged that extended electronic surveillance "without an accompanying trespass" may be unconstitutional, but noted that the "present case does not require us to answer that question."[169]

In his opinion concurring in the judgment, Justice Alito criticized "the Court's reliance on the law of trespass" to decide the case.[170] Instead, he wrote, the question is whether the "respondent's reasonable expectations of privacy were violated by the long-term monitoring" of his vehicle.[171] Because "law enforcement agents tracked every movement that respondent made in the vehicle he was driving" for four weeks—a level of monitoring that Justice Alito felt impinged on reasonable expectations of privacy—Justice Alito concluded that the monitoring constituted a search.[172] Justice Sotomayor, in addition to joining the majority, provided a separate concurring opinion arguing that "the trespassory test . . . reflects an irreducible constitutional minimum."[173] Justice Sotomayor also expressed concern that the unchecked abil-

ity of the government to conduct long-term monitoring of "the sum of one's public movements" could enable it to obtain private information regarding political and religious beliefs.[174]

F. Privacy and Unmanned Aircraft Systems in Light of Supreme Court Jurisprudence

In *Ciraolo*, *Riley*, and *Kyllo*, the Supreme Court expressed a view that the extent to which an expectation of privacy is "reasonable" is tied, at least in part, to the level of technology diffusion. In addition, with respect to the specific question of the constitutionality of aerial observations, in *Ciraolo*, *Riley*, and *Dow Chemical*, the Court considered the use of public navigable airspace to be important, though not necessarily determinative. In those three rulings the Court also explicitly or implicitly distinguished overhead observations made using the naked eye or widely available camera technology from those made using less common imaging systems. For UAS privacy, these three tests—whether a technology is in general public use, whether the observations are made from public navigable airspace, and the nature of the imaging (or other information-gathering) system—will play fundamental roles.

Jones is most relevant to UAS in relation to extended surveillance. Today, tethered blimps called "aerostats" are being stationed in the sky in some places along the U.S.-Mexico border.[175] In addition, in the future, it will become practical to utilize fixed-wing unmanned aircraft for long-term surveillance. Thus, the types of constitutional questions considered (though not resolved) in *Jones* have direct implications for some categories of UAS.

Kathleen Hickey, *Former wartime blimp refitted for border surveillance*, GOV'T COMPUTER NEWS, Aug. 16, 2012, http://gcn.com/Articles/2012/08/16/CBP-aerostats-unmanned-blimps-border-surveillance.aspx.The government has increased search powers near the border. For example, within twenty-five miles of "any external boundary of the United States," 8 U.S.C. § 1357(a)(3) allows the government, without a warrant, "to have access to private lands, but not dwellings, for the purpose of patrolling the border to prevent the illegal entry of aliens into the United States."

1. Technology in "General Public Use"

In *Dow Chemical*, the Supreme Court wrote that warrantless "surveillance of private property by using highly sophisticated surveillance equipment *not generally available to the public*" may be unconstitutional.[176] But the Court also noted that the "photographs at issue in this case are essentially like those commonly used in mapmaking. Any person with an airplane and an aerial camera could readily duplicate them."[177]

In the *Ciraolo* ruling issued on the same day, the Court concluded that in an era when private and commercial flight is "routine," there is no reasonable expectation of privacy from naked-eye observations made from public navigable airspace.[178] The *Ciraolo* Court stopped short of stating whether or not similar overhead observations made using non-routine aircraft or imaging technology would pass constitutional muster.

Fifteen years later in *Kyllo*, the Court again viewed the extent to which a technology was publicly available as highly relevant to defining a Fourth Amendment "search." The *Kyllo* Court was clearly concerned about future developments that might enable the Government to "see" into the interior of the home from the outside.[179] This concern was reflected in the Court's expressed desire to protect people from "advancing technology" that might "discern all human activity in the home" and the resulting need to "adopt" a "rule" taking account "of more sophisticated systems that are already in use or in development."[180] Yet, in the end, the rule adopted was more narrowly crafted.

The *Kyllo* holding that a search occurs when "the Government uses a device that is not in general public use, to explore details

177. *Id.* at 231.

178. California v. Ciraolo, 476 U.S. 207, 215 (1986).

179. *See* Kyllo v. United States, 533 U.S. 27, 34 (2001). Recently, there have been significant advances in "terahertz" imaging, which refers to the formation of images using electromagnetic waves with a frequency on the order of one trillion times per second. As described in a conference paper published in early 2012, researchers at University of Texas at Dallas "have designed an imager chip that could turn mobile phones into devices that can see through walls, wood, pastics, paper and other objects." *New Research Could Mean Cellphones That Can See Through Walls*, UNIV. OF TEXAS AT DALLAS NEWS CENTER, Apr. 18, 2012, http://www.utdallas.edu/news/2012/4/18-17231_New-Research-Could-Mean-Cellphones-That-Can-See-Th_article-wide.html.

180. *Kyllo*, 533 U.S. at 35–36.

of the home that would previously have been unknowable without physical intrusion"[181] clearly bars the use of uncommon technology for this purpose. However, sophisticated and uncommon are two different things. Indeed, the *Kyllo* Court called the thermal imager in question "crude"[182] while also recognizing that it was nonetheless not in general public use. Furthermore, the district court in *Dow Chemical* had found a Fourth Amendment violation, in part, because the images were taken with "the finest precision aerial camera available," permitting capture of "a great deal more than the human eye could ever see."[183] In upholding the Sixth Circuit's reversal of this decision, the Supreme Court considered the wide public availability of the camera to be more relevant than its sophistication.[184]

So how does *Kyllo* bear on the issue of "routine" technology? As the dissent in *Kyllo* noted, the Court's language raises at least the possibility that the protection offered "dissipates as soon as the relevant technology is in general public use."[185] However, to conclude from *Kyllo* that use of a widely available technology to examine a home will necessarily be constitutional is not an entirely fair reading of Justice Scalia's opinion. As Justice Scalia stated in a footnote, in response to the dissent on this specific point, thermal imaging is not routine (or at least was not in 1992, the year in which law enforcement officers used the thermal imager at issue in *Kyllo*).[186] Based on existing Supreme Court precedent, that was sufficient to find its use unconstitutional. To the extent that there is a loophole through which overhead surveillance using "routine" (and possibly but not necessarily sophisticated) technologies might slip, it was created by *Ciraolo* and *Dow Chemical*, and the Court in *Kyllo* declined to revisit it.[187]

And what about technology *not* in general public use, which at least for the moment describes the state of UAS in the United

181. *Id.* at 40.

187. *See id.* ("Given that we can quite confidently say that thermal imaging is not 'routine,' we decline in this case to reexamine that factor.").

States? Under a fair reading of *Kyllo*, that fact alone would not automatically bar its use for surveillance of a home. *Kyllo* did not prevent government use of uncommon technology generally, but instead was focused on the use of such technology to "explore details of the home that would previously have been unknowable without physical intrusion."[188] Thus, although warrantless use of a UAS equipped with a sophisticated thermal imaging camera to "see" through the walls of a home would certainly run afoul of *Kyllo*, acquisition of visible-light images of a home's exterior or curtilage using a UAS-mounted consumer-grade, low-resolution imaging system in public navigable airspace would likely not. After all, the information those images would reveal could be acquired easily from manned aircraft, something that the Court has found multiple times to be constitutional. Perhaps most importantly, to the extent that a "not in general public use" test furnishes a measure of privacy protection with respect to UAS platforms, that protection inevitably will soon disappear as their use becomes more widespread.

2. *"Public Navigable Airspace"*

As is clear from *Ciraolo*, *Riley*, and *Dow Chemical*, the use of "public navigable airspace" is a threshold test for determining whether warrantless aerial observations are constitutional.[189] This does not imply that all such observations will be constitutional, but those that are made from outside public navigable airspace are almost certainly unconstitutional. The question of what constitutes "public navigable airspace" for UAS operated by the government is thus central to the privacy inquiry.

This is not as easy to answer as it might first appear. FAA regulations provide that, except as necessary for takeoff or landing, fixed-wing manned aircraft must generally operate above 1000 feet when over congested areas, and above 500 feet over most non-congested areas.[190] UAS operated above these

188. *Id.* at 40.

189. *See* Florida v. Riley, 488 U.S. 445, 450 (1989); California v. Ciraolo, 476 U.S. 207, 213–14 (1986); *Dow Chem. Co.*, 476 U.S. at 239.

190. 14 C.F.R. § 91.119(b)–(c) (2012). The full set of minimum altitude rules is more complex. For example, for congested areas, the minimum is 1000 feet above the highest obstacle within a horizontal radius of 2000 feet of the aircraft. § 91.119(b). For noncongested areas other than over open water or sparsely popu-

minimums therefore are certainly in public navigable airspace.[191] In addition, the altitude must always be sufficiently high to allow "an emergency landing without undue hazard to persons or property on the surface."[192]

But this is not the whole story. The FAA regulations specifically exempt helicopters[193] from the minimums if "the operation is conducted without hazard to persons or property on the surface."[194] FAA regulations nonetheless provide a *de facto* impediment to very low altitude operation of manned helicopters over residential areas: In the event of an engine failure, it would be difficult to claim that the pilot of a manned helicopter hovering fifty feet over a home could perform an emergency landing without endangering persons or property on the ground. For an unmanned helicopter (or fixed wing aircraft) weighing only a few pounds, however, the risks posed to persons on the ground by an emergency landing, though not nonexistent, are certainly modest compared to those posed by manned aircraft. Thus, the combination of the helicopter rules and the "emergency landing" provision in current FAA minimum safe altitude regulations have little or no protective power with respect to UAS privacy concerns.

An additional complicating factor is that for at least some categories of unmanned aircraft, the traditional paradigm is inverted and the FAA imposes altitude *maximums* instead of minimums. Public unmanned aircraft operated in accordance with Section 334(c)(2)(C) of FMRA must be operated at a height lower than 400 feet.[195] Unless FMRA paradoxically is read to mandate navigation outside of "navigable airspace," with respect to this class of aircraft, altitudes of 350 feet, 300 feet, and 250 feet would almost always be within public navigable airspace. However, just as

---

lated areas, the minimum is 500 feet. § 91.119(c). Over open water and sparsely populated areas, "the aircraft may not be operated closer than 500 feet to any person, vessel, vehicle, or structure." *Id.*

191. Provided, of course, that there are no other restrictions associated with the airspace.

192. § 91.119(a).

193. § 91.119(d). A helicopter is "a rotorcraft that, for its horizontal motion, depends principally on its engine-driven rotors"; a rotorcraft, in turn, is "a heavier-than-air aircraft that depends principally for its support in flight on the lift generated by one or more rotors." *Id.* § 1.1 (2012).

194. § 91.119(d).

195. FAA Modernization and Reform Act of 2012 (FMRA), Pub. L. No. 122-95, § 334(c)(2)(C), 126 Stat. 11, 77.

clearly, the air five feet above the ground in the backyard of a home is not within any reasonable definition of public navigable airspace. As the Supreme Court wrote in 1946 in *United States v. Causby*,[196] "[w]e have said that the airspace is a public highway. Yet it is obvious that if the landowner is to have full enjoyment of the land, he must have exclusive control of the immediate reaches of the enveloping atmosphere."[197]

Attempts to identify a precise boundary where the "immediate reaches" under the "exclusive control" of a landowner end and the area available to the public begins can lead to complex questions.[198] For example, it could be argued that a warrantless government-operated UAS that dips into a backyard at eye level to obtain photographs into the house through a back window would be operating outside of public navigable airspace, and that the images it acquired would be unconstitutional for that reason (among others).[199]

Interestingly, airspace that may not be "publicly navigable" can still be subject to governmental control. In places such as the Washington, D.C. Metropolitan Area Flight Restricted Zone, the FAA prohibits *all* outdoor flight operations (including UAS), at any altitude, unless authorized by the FAA/Transportation Security Administration.[200] Thus, the FAA can and does promulgate regulations that control the air all the way down to the ground, even over private property. However, that the government has a right to *prohibit* certain flight operations in the air a few feet above private land does not mean that the government (or a private party) has an affirma-

196. 328 U.S. 256 (1946).

197. *Id.* at 264.

198. The definition of "navigable airspace" in 49 U.S.C. § 40102 does little to resolve this question. "Navigable airspace" is defined as the "airspace above the minimum altitudes of flight prescribed by regulations under this subpart and subpart III of this part, including airspace needed to ensure safety in the takeoff and landing of aircraft." § 40102(a)(32).

199. The Supreme Court considered the more general question of whether looking into a home through a window constitutes a Fourth Amendment search in *Minnesota v. Carter*, 525 U.S. 83 (1998). In that case, police had observed of a drug transaction through a gap in the closed blinds of a window. Because the respondents "were essentially present for a business transaction and were only in the home a matter of hours," the relevant expectation of privacy was that tied to commercial premises, not residential property. As a result, the Court found that the police observations were not a Fourth Amendment violation. *Id.* at 90.

200. *See* 14 C.F.R. § 93.341 (2012).

tive right to *conduct* flight operations in that same airspace without the property owner's consent.

In the dense urban cores of cities such as New York, Chicago, and Boston, public navigable airspace can unquestionably extend *below* the level of many residences. In New York, for example, manned helicopters routinely fly over the Hudson River at altitudes significantly lower than the taller buildings in Manhattan. The air 550 feet over the Hudson River is in public navigable airspace.[201] But there is a good argument that the air six inches outside the window of a fiftieth-floor apartment in midtown Manhattan is not. As noted above, in *Causby* the Court recognized the importance of providing a landowner with "exclusive control of the immediate reaches of the enveloping atmosphere."[202] A high-rise apartment dweller should have at least as much control over the enveloping atmosphere of his or her home.[203] That control, however, will only extend a modest distance. Thus, a UAS operated at several hundred feet above the ground and at a reasonable horizontal standoff from any nearby buildings would almost always be in public navigable airspace.[204]

Will warrantless UAS surveillance from public navigable airspace always be constitutional? Certainly not. The holding in *Ciraolo* addressed naked eye observations from "public airways."[205] *Ciraolo* would provide little support for use of an imaging system capturing much more detail than could the human eye.[206] The opinions in the (slightly) more recent *Riley* decision also imply the existence of some limits. Both of the *Riley* opinions that found in favor of the government expressed concern about using operation in public navigable airspace as

---

201. Although the airspace 550 feet above the Hudson near Manhattan is publicly navigable, there are special flight rules that apply within the "Hudson River Exclusion." *See* 14 C.F.R. § 93.352 (2012). Altitudes below 1000 feet within the Hudson River Exclusion are available to aircraft conducting a "local operation" as defined in § 93.350(a).

202. *Causby*, 328 U.S. at 264.

203. An additional complication with respect to control over the air surrounding buildings in cities like New York relates to the "air rights" that are commonly transacted in association with real estate development. *See Zoning Glossary*, NEW YORK CITY DEPARTMENT OF CITY PLANNING, http://www.nyc.gov/html/dcp/html/zone/glossary.shtml#development_rights (last visited Jan. 29, 2013).

204. An exception would occur in locations subject to temporary or permanent flight restrictions.

205. California v. Ciraolo, 476 U.S. 207, 215 (1986).

206. *See id.* at 214–15.

the only threshold for constitutionality. Writing for the plurality, Justice White noted that "simply because the plane is within the navigable airspace specified by law," it does not follow that the observations it makes will always "pass muster under the Fourth Amendment."[207] Justice O'Connor also warned against relying on "compliance with FAA regulations alone,"[208] and Justice Brennan's dissent raised the same issue.[209]

Justice White's opinion in *Riley* also identifies some specific tests beyond simply being in public navigable airspace that might be applied. For example, the opinion implies that observations from legally operated aircraft that generated undue noise, wind, dust, or threat of injury could be unconstitutional.[210] Although a UAS weighing a few pounds or less would generate very little noise, wind, or dust, if it loses power it could certainly cause injuries. This could occur both directly, if it lands on a person, or indirectly, if it lands in traffic or becomes caught in power lines and initiates an injury causing event. Interestingly, the language of the opinion ties privacy expectations in part to the freedom from being subjected to a *threat* of injury, as distinct from an actual injury itself.

3. *The Role of Imaging Technology*

In *Ciraolo* and *Riley*, the aerial observations of the curtilage of a home were performed with the naked eye, a fact specifically noted by the *Ciraolo* Court[211] and by both of the *Riley* opinions that found against the government.[212] But in *Dow Chemical*, the use of a camera permitting capture of "a great deal more than the human eye could ever see" did not render the observations

---

207. Florida v. Riley, 488 U.S. 445, 451 (1989).

208. *Id.* at 453 (O'Connor, J., concurring in the judgment).

209. *Id.* at 464 (Brennan, J., dissenting).

210. *See id.* at 452 (plurality opinion).

211. "[I]t is unreasonable for respondent to expect that his marijuana plants were constitutionally protected from being observed with the naked eye from an altitude of 1,000 feet." *Ciraolo*, 476 U.S. at 215.

212. Justice White's opinion stated that the investigating officer in *Riley* "circled twice over respondent's property in a helicopter at the height of 400 feet. With his naked eye, he was able to see through the openings in the roof and one or more of the open sides of the greenhouse and to identify what he thought was marijuana growing in the structure." *Riley*, 488 U.S. at 448. Justice O'Connor wrote that "I conclude that Riley's expectation that his curtilage was protected from naked-eye aerial observation from that altitude was not a reasonable one." *Id.* at 455 (O'Connor, J., concurring in the judgment).

unconstitutional; it was the public availability of the camera that mattered.[213]

What is the constitutionality of warrantless use of an extremely high-resolution (but widely available) camera on a UAS to observe the curtilage of a suspect's home? The Court has never grappled with this specific question, and existing case law is unclear on this point. A suspect could find support in *Ciraolo* and *Riley* when arguing that a Fourth Amendment violation occurred; the government could also find support in *Ciraolo* as well as in *Dow Chemical* and *Kyllo* in arguing that it did not.[214] That *Kyllo* is more recent is not dispositive in light of, among other things, the discussion of *Ciraolo* it contains.

Imaging technology is also relevant given Justice White's opinion in *Riley* that found no Fourth Amendment violation in part because "no intimate details connected with the use of the home or curtilage were observed."[215] Even though he was not speaking for a majority, Justice White's language is nonetheless intriguing, as it indicates that there may be some level of detail beyond which warrantless UAS observations, even if conducted from public navigable airspace, may cross the line into a Fourth Amendment search.

With present-day imaging capabilities, it would be an easy matter to use a UAS (or a manned aircraft) within navigable airspace to acquire imagery that includes "intimate details." For example, a government UAS at an altitude of several hundred feet could identify the topic of an electronic or paper news article being read by a person sitting in his or her fenced-in backyard. A strong case could be made that these observations, even when made from public navigable airspace, would be unconstitutional in the absence of a warrant.

---

213. Dow Chem. Co. v. United States, 476 U.S. 227, 230 (1986) (quoting Dow Chem. Co. v. United States, 536 F. Supp. 1355, 1367 (E.D. Mich. 1982)) (internal quotation marks omitted). Another key factor in *Dow Chemical* was the Court's conclusion that the observed areas were more akin to "open fields" than to the curtilage of a home. *See id.* at 239.

214. Aspects of *Ciraolo* could be cited to support both positions. A suspect could cite the reference in *Ciraolo* to "naked eye" observations. The government could in response point to the *Ciraolo* language regarding the "routine" nature of the technology of flight, which was also referenced in *Kyllo*. *See Ciraolo*, 476 U.S. at 215; Kyllo v. United States, 533 U.S. 27, 39–40 n.6.

215. *Riley*, 488 U.S. at 452.

4. *Extended Surveillance Using Unmanned Aircraft in Light of* Jones

For financial, regulatory, and logistical reasons, law enforcement agencies will usually use small UAS. Today, these platforms generally have flight durations measured in hours, rendering their continuous use for days or weeks to perform surveillance impractical. But future developments will make long-term surveillance with UAS possible. In addition, at least along the U.S.-Mexico border, aerostats already are in use today.[216]

Some of the most vexing constitutional questions will arise in association with the use of high-altitude long-endurance (HALE) UAVs. These solar-powered UAVs can stay aloft for extraordinarily long periods of time. As noted above, the QinetiQ Zephyr stayed aloft for over two weeks in a 2010 demonstration.[217] Boeing is under contract with DARPA to develop the SolarEagle, which will be able to stay aloft in the stratosphere for five continuous years.[218] Because they fly at such high altitudes, HALE UAS could potentially track every car trip in a city, or the times when lights in residences were turned on and off.[219] It will likely be much later in the decade before HALE technology becomes sufficiently advanced and cost-effective to make it practical to install a permanent HALE presence above an American city. Currently, there is no indication that any government agency plans to do so.

No Supreme Court case is directly on point with respect to the type of extended surveillance that could be performed using a HALE platform, though some of the issues involved arose in *Jones*. The *Jones* opinions contain extensive discussion of the Court's 1983 holding in *United States v. Knotts* that a "person

---

217. Chuter, *supra* note 36.

218. Press Release, Boeing Co., Boeing Wins DARPA Vulture II Program (Sept. 15, 2010), *available at* http://boeing.mediaroom.com/index.php?s=43&item=1425.

219. Satellites are not well-suited to perform extended, continuous high-resolution surveillance. The only satellites that can remain in place over one spot are in geostationary orbits, which are over 22,000 miles above the Earth—much too far to gather images revealing details of a home or curtilage. Satellites in lower orbits can acquire very detailed images, but not on a continuous basis. *See Phoenix, Tactical Technology Office*, DARPA, http://www.darpa.mil/our_work/tto/programs/phoenix.aspx (last visited Feb. 8, 2013).

traveling in an automobile on public thoroughfares has no reasonable expectation of privacy in his movements."[220]

Justice Scalia's majority opinion in *Jones* states that performing extended surveillance "through electronic means, without an accompanying trespass" *may* be unconstitutional, "but the present case does not require us to answer that question."[221] In his concurrence in the judgment, Justice Alito expressed a view that extended electronic surveillance of public movements *is* unconstitutional, writing, "the use of longer term GPS monitoring in investigations of most offenses impinges on expectations of privacy."[222] Justice Sotomayor's concurrence also expressed doubts about the constitutionality of extended electronic surveillance: "I do not regard as dispositive the fact that the Government might obtain the fruits of GPS monitoring through lawful conventional surveillance techniques."[223] In the end, however, it was the physical trespass involved in installing the GPS tracker, not the tracking itself, that formed the basis for the *Jones* decision.[224]

While HALE UAS surveillance is like GPS tracking in that it gathers information using technology that would have required a "large team of agents"[225] in the past, in one respect it is very different: A GPS tracker only identifies the movement of the single vehicle or other object to which it is attached, whereas HALE platforms equipped with banks of cameras could easily capture images of all the vehicle movements in an entire city. The prospect that the government might be able to capture—and then use at will—this level of information about the travels of private individuals is sobering. But if that is unconstitutional, where does that leave the networks of ground-level cameras and license plate readers that are increasingly being deployed along public streets and intersections? Those ground-level systems collect information that, when aggregated, can

220. 460 U.S. 276, 276 (1983).

221. United States v. Jones, 132 S. Ct. 945, 954 (2012).

222. *Id.* at 964 (Alito, J., concurring in the judgment).

223. *Id.* at 956 (Sotomayor, J., concurring).

224. *See id.* at 949 (majority opinion).

225. In his concurrence in the judgment in *Jones*, Justice Alito wrote that "constant monitoring of the location of a vehicle for four weeks" using traditional surveillance methods from the pre-computer age "would have required a large team of agents, multiple vehicles, and perhaps aerial assistance." *Id.* at 963 (Alito, J., concurring in the judgment).

track automobile trips just as thoroughly as a solar-powered HALE UAS making slow circles in the stratosphere.[226] An argument against the constitutionality of HALE systems would need to be reconciled with the information available through aggregated street-level traffic surveillance data. If government tracking of effectively all traffic in a city is unconstitutional, that holding should apply regardless of whether the technology used is on the ground or in the air.[227]

In future years it may also be necessary to revisit the assumption that widely available small, low-altitude UAS can only stay aloft for several hours. UAV Factory, a company based in Latvia, announced in the summer of 2012 that its "Penguin B" small UAS had stayed aloft for over fifty-four hours.[228] Future technological advances presumably will lead to flights of even longer durations. From a purely technological standpoint, platforms such as these conceivably could be used to survey a target for several days. Whether this is likely to happen in practice is another matter. At least under current regulations, this UAS class can only be operated by a government agency within line of sight of an operator.[229] A law enforcement agency could thus use rotating shifts of operators to fly this class of small UAS for several continuous days.

---

226. Depending on where the cameras on the aerostats along the U.S.-Mexico border are aimed, similar questions regarding long-term surveillance are raised. An important difference between aerostats and HALE UAS is the altitude. HALE platforms fly many times higher, and can survey a much larger area than can aerostats.

227. Jurisprudence related to traffic checkpoints is relevant to this issue. In *City of Indianapolis v. Edmond*, the Court noted that it "is well established that a vehicle stop at a highway checkpoint effectuates a seizure within the meaning of the Fourth Amendment." 531 U.S. 32, 40 (2000). Recording a license plate of a passing car—or tracking the car using a HALE UAS—is certainly not a seizure. However, the *Edmond* ruling also noted that "stops can only be justified by some quantum of individualized suspicion," a test that would not be met by systems that perform pervasive tracking of all vehicles in a city. *Id.* at 47.

229. FAA Modernization and Reform Act of 2012 (FMRA), Pub. L. No. 112-95, § 334(c)(2)(C), 126 Stat. 11, 77.

5. *Residual Privacy Rights When a Warrant Is Obtained?*

When law enforcement officers wiretap a phone pursuant to a warrant, a great deal of privacy is lost, but ultimately some minimal privacy is still maintained. For example, a tapped phone does not provide images of the interior of a home.

But with UAS, the implication that a search warrant should have some limits is not unreasonable. Imagery acquired by UAS pursuant to a warrant could lead to profound violations of privacy for both a suspect and the other residents of a house. It is one thing for a wiretap to capture the private conversations of a suspect's spouse. It is quite another for a UAS, hovering in a backyard and taking pictures through a window (or in the future, hiding unseen inside the house), to acquire images that might show an occupant of the house in a state of undress. To assert that the government, even when armed with a warrant, has an unfettered right to acquire, store, and view such images raises significant concerns. Thus, questions of UAS privacy do not end with the issuance of a warrant.

IV. NON-GOVERNMENT UNMANNED AIRCRAFT AND THE FIRST AMENDMENT

Although much of the attention regarding UAS privacy has focused on government use and the Fourth Amendment, it is non-government use that is likely to raise some of the most significant privacy challenges in the coming years. For private entities, which are not bound by Fourth Amendment restrictions that apply to the government, the key constitutional question is the extent of their First Amendment privilege to gather information.

As the Supreme Court recognized in its 1972 *Branzburg v. Hayes* decision, "[w]ithout some protection for seeking out the news, freedom of the press could be eviscerated."[230] Furthermore, the freedom to gather information is not limited to the press. In a 2011 ruling upholding the right of a citizen to record the actions of police in a public space, the First Circuit wrote that "[i]t is firmly established that the First Amendment's aegis extends further than the text's proscription on laws 'abridging the freedom of speech,

230. 408 U.S. 665, 681 (1972).

or of the press,' and encompasses a range of conduct related to the gathering and dissemination of information."[231]

However, the freedoms conferred by the First Amendment are not unlimited. In *Branzburg*, for example, the Supreme Court recognized the existence of some bounds: "It is clear that the First Amendment does not invalidate every incidental burdening of the press that may result from the enforcement of civil and criminal statutes of general applicability."[232]

Even though almost all companies and individuals will endeavor to operate UAS responsibly, there undoubtedly exist some classes of potential UAS users who will perceive observe less restraint. If paparazzi are willing to engage in high-speed freeway chases to capture images of a celebrity,[233] it would be optimistic to the point of naïveté to expect them to always operate UAS in a manner respectful of privacy considerations and in compliance with FAA safety regulations. When, as will inevitably occur, a paparazzo or stalker flies a UAS into a backyard and takes pictures through a back window, what laws will come into play?

A. Trespassing

Common sense would suggest that a homeowner[234] has the right to prevent a UAS from being flown around his or her backyard at eye level. And indeed, in some states, trespassing statutes are worded in a manner that would encompass trespassory use of a UAS. In Arizona, for example, "entry" in association with criminal trespass is defined as "the intrusion of any part of any instrument or any part of a person's body inside the external boundaries of a structure or unit of real property."[235] Unless an argument could be made that a UAS is not an "instrument," this statute would cover intrusion by a UAS

231. Glik v. Cunniffe, 655 F.3d 78, 82 (2011).

232. 408 U.S. at 682.

233. For an example of one alleged such incident, see Kate Mather, *Photographer who allegedly chased Justin Bieber charged*, L.A. TIMES, July 26, 2012, http://articles.latimes.com/2012/jul/26/local/la-me-bieber-paparazzi-20120726.

234. Or other person legally occupying the property, such as a lessee.

235. ARIZ. REV. STAT. § 13-1501 (West 2012).

at extremely low altitudes (for example, at eye level) that are under the control of a property owner.[236]

In Oregon, by contrast, "enter" as defined in association with criminal trespass is, among other things, "[t]o enter or remain in or upon premises . . . when the entrant is not otherwise licensed or privileged to do so."[237] While this somewhat circular definition is clearly intended to criminalize unauthorized entry by a person, it leaves open the question of whether entry by a very low-flying UAS would be covered. California's trespassing laws prohibit driving a vehicle on another person's property without consent,[238] but define vehicle in a manner that excludes UAS.[239]

The general lack of attention to the potential trespassory use of UAS in current state criminal statutes is not at all surprising. In the future, it almost certainly will be necessary to add specific language to criminal trespassing statutes addressing UAS.

B. Invasion of Privacy

Use of a UAS to invade an individual's privacy could result in civil or criminal liability. With respect to civil liability, courts in most jurisdictions recognize the two forms of common law invasion of privacy most likely to arise in connection with UAS: intrusion upon seclusion and public disclosure of private

---

236. As discussed above, the question of the altitude at which a landowner's control over the air above the ground in his or her backyard ends, and the public's access begins, was at issue in *United States v. Causby*. Under any reasonable reading of *Causby* (and other relevant case law), the space in a backyard at eye level is certainly within the "immediate reaches of the enveloping atmosphere" that are under the "exclusive control" of the landowner. *See Causby*, 328 U.S. 256, 256 (1946). This interpretation is also supported by the manner in which overhanging tree branches from a neighbor's property are often handled. In many states, a homeowner has the right (subject to some exceptions) to trim tree branches in the air above his or her land. *See, e.g.*, Macero v. Busconi Corp., 12 Mass. L. Rep. 521 (Super. Ct. 2000) ("Massachusetts law recognizes a right of self-help by which a property owner can cut the limbs or branches of a tree that invade his property as long as such cutting is done at the property line.").

237. OR. REV. STAT. § 164.205(3)(a) (West 2012).

238. CAL. PENAL CODE § 602(n) (West 2012).

239. California Vehicle Code § 670, referenced in the criminal trespassing statute, defines a vehicle as "a device by which any person or property may be propelled, moved, or drawn upon a highway, excepting a device moved exclusively by human power or used exclusively upon stationary rails or tracks." CAL. VEH. CODE § 670 (West 2012).

facts.[240] In addition, some states also have civil or criminal statutes, or both, related to invasion of privacy.[241]

1. Intrusion Upon Seclusion

The potential of a UAS to intrude upon seclusion in the home is obvious. A person who is unwillingly photographed in his or her own home by a UAS hovering just outside an otherwise inaccessible window would have strong grounds for a valid cause of action. Even public figures, whose privacy rights are presumptively lower than those of private individuals,[242] can nonetheless reasonably expect views into the interior of their residences from their own backyards to be private.

Although privacy expectations are greatly reduced outside the home, the non-governmental use of a UAS to capture images and other information taken while the individual is in a public setting could nonetheless constitute an invasion of privacy. *Shulman v. Group W Productions, Inc.*,[243] a 1998 California Supreme Court ruling regarding filming that occurred following a car accident, is instructive in this regard. In *Shulman*, the victims of an accident were captured on video and audio recording, without their consent, for a television program called *On Scene: Emergency Response*.[244] The recording occurred both at the scene of the accident as well as in a rescue helicopter during transport to a hospital.[245]

The California Supreme Court affirmed the court of appeals' decision to reverse the trial court's summary judgment finding that the television program producers' activities were protected

---

240. Prosser articulated four forms of the common law invasion of privacy tort in 1960: (1) "[i]ntrusion upon the plaintiff's seclusion or solitude, or into his private affairs;" (2) "[p]ublic disclosure of embarrassing private facts about the plaintiff;" 3) "[p]ublicity which places the plaintiff in a false light in the public eye;" and 4) "[a]ppropriation, for the defendant's advantage, of the plaintiff's name or likeness." William L. Prosser, *Privacy*, 48 CALIF. L. REV. 383, 389 (1960); *see also* RESTATEMENT (SECOND) OF TORTS §§ 652A–652E (1997).

241. *See, e.g.*, CAL. CIV. CODE § 1708.8 (West 2011); N.J STAT. ANN. §§ 2C:14-9, 2A:58D-1 (2004).

242. *See generally* Hustler Magazine, Inc. v. Falwell, 485 U.S. 46 (1988); Gertz v. Robert Welch, Inc., 418 U.S. 323 (1974); New York Times Co. v. Sullivan, 376 U.S. 254 (1964).

243. 955 P.2d 469 (Cal. 1998).

244. *Id.* at 475.

245. *Id.* at 474–75.

under the First Amendment.[246] The court held that a woman injured in the accident "was entitled to a degree of privacy in her conversations with [the nurse] and other medical rescuers at the accident scene."[247] It was improper, the ruling stated, to conclude that the "plaintiffs had no reasonable expectation of privacy at the accident scene itself because the scene was within the sight and hearing of members of the public."[248] At the time of the rescue, the vehicle was located "in a ditch many yards from and below" a highway, rendering it "unlikely . . . that any passersby on the road could have heard" the conversation of the victim with the nurse and other rescuers.[249]

The *Shulman* decision provides important guidance regarding newsgathering and UAS with respect to intrusion upon seclusion by drawing a distinction between the information about a newsworthy event available to passersby and the potentially greater amount of information available only to those intimately involved in the event itself. Under some circumstances, there will be no difference: If a crowd of people has gathered around an assault victim who is being treated by paramedics, the conversation between the victim and the paramedics may well be audible to all, and the victim's reasonable expectation of privacy correspondingly lower. But there will be many cases in which, as in *Shulman*, passersby have far from complete information about an unfolding event. Using a UAS to fill in the gaps would carry a risk of crossing the line into intrusion.

Just as the First Amendment does not provide an impenetrable shield for all uses of video, audio, and other electronic monitoring in public areas, intrusion upon seclusion is not automatically implicated for all observations of activities occurring in a home. A passerby on the street at night who happens to glance up and notice that the light in a nearby home has just been turned off is certainly not violating privacy rights. Likewise, courts will be very unlikely to consider a fleeting, acci-

246. *See id.* at 497–98.

247. *Id.* at 491.

248. *Id.*

249. *Id.* In addition to considering whether the audio and video recorded at the scene of the accident intruded on the victim's expectation of privacy, the California Supreme Court also considered the recording that took place within the helicopter, ruling that the "Court of Appeal correctly found [that] triable issues exist as to whether defendants invaded plaintiffs' privacy by accompanying plaintiffs in the helicopter." *Id.* at 477.

dental capture of imagery of a home's curtilage or (through a window) interior acquired by a passing UAS to be an invasion of privacy. Although the specifics vary from state to state, to prevail in a common law or statutory intrusion upon seclusion claim, a plaintiff generally must establish, at a minimum, that the intrusion was intentional and that it would be "highly offensive to a reasonable person."[250]

Some highly offensive intrusions upon seclusion have nonetheless been protected under the First Amendment. Most notably, in *Snyder v. Phelps*[251] the Supreme Court ruled in favor of members of the Westboro Baptist Church who had picketed the funeral of a serviceman killed in Iraq. A jury in Maryland had found members of Westboro Baptist Church liable for damages based on claims including intrusion upon seclusion.[252] However, in affirming the Fourth Circuit's reversal, the Supreme Court ruled that "the First Amendment bars Snyder from recovery for intentional infliction of emotional distress or intrusion upon seclusion" against Westboro Baptist Church members and that "we must likewise hold that Snyder cannot recover for civil conspiracy based on those torts."[253]

2. *Publication of Private Facts*

Precedents from state court rulings unrelated to aviation indicate that UAS could also figure into invasion of privacy through the publication of private facts. This could be particularly important with respect to UAS images of private individuals who become involuntarily caught up in newsworthy events.

In September 1999, *Sports Illustrated* published a story entitled "Every Parent's Nightmare" that included a photograph of a Little League team.[254] There were eighteen people in the photograph, including a team manager who had been convicted of molestation

252. *Id.* at 1214. The District Court reduced the damages award but left the verdict intact. *Id.*

253. *Id.* at 1220.

254. William Nack & Don Yaeger, *Every Parent's Nightmare*, SPORTS ILLUSTRATED, Sept. 13, 1999, at 40, 42–43, *available at* http://sportsillustrated.cnn.com/vault/edb/reader.html?magID=SI&issueDate=19990913&mode=reader_vault.

charges in 1971 and who pled guilty in April 1998 to charges of molesting five of the children he coached in Little League.[255]

Ten of the people in the photograph filed suit against Time Warner, Inc., the then-owner of *Sports Illustrated*, for invasion of privacy and infliction of emotional distress.[256] In 2001, the California Court of Appeal upheld a lower court decision to deny Time Warner's motion to strike the complaint, writing that the "plaintiffs have demonstrated a prima facie case for invasion of privacy," particularly in relation to public disclosure of a private fact.[257] The court recognized that while the identity of the molester was publicly known and certainly newsworthy, the identities of the other coaches and the players on the team were not.[258]

Publication of private facts via imagery was also at issue in a Florida case involving a woman who suffered from a poorly performed plastic surgery.[259] The woman consented to be interviewed for a television program under the condition that the video would be edited to alter her voice and obscure her face.[260] When the broadcast took place without these two things occurring as promised, thereby revealing her identity, she filed suit.[261] In reversing a summary judgment in favor of the defendant, the Florida Court of Appeals held that "while the topic of the broadcast was of legitimate public concern, the plaintiff's identity was not."[262]

Images acquired by UAS could easily convey facts not previously known to the public, and, upon publication, could be an actionable invasion of privacy in many states. While news organizations are well aware of the tension between the privacy rights of their subjects and the organizations' First Amendment right to gather news, they will almost certainly need to reexamine existing policies in light of the unique imaging and other information gathering capabilities (such as monitoring of wire-

less signals) of UAS. In addition, given the ease with which anyone—not only news organizations—can now publish content, all users of UAS who contemplate publishing aerial images or other information from UAS would be well advised to give careful consideration to the common law and statutory invasion of privacy frameworks that apply in their jurisdictions.

C. Stalking and Harassment

In January 2009, the U.S. Department of Justice released a report based on data collected from over three million stalking victims and two million harassment victims.[263] About 245,000 of the stalking victims and 70,000 of the harassment victims stated that they had been subjected to electronic monitoring using one or more of the following devices: video or digital cameras, computer spyware, listening devices, and GPS tracking.[264] Stalkers will have no qualms about adding UAS to this list.

It was not until 1990 that California became the first state to criminalize stalking.[265] Today, statutes addressing stalking (and typically harassment) are now on the books in all fifty states and in Washington, D.C. Fortunately, many of these statutes are worded broadly enough that use of a UAS to persistently follow a person or peer into his or her car or home would be considered, at the very least, harassment. Stalking often carries the additional connotation of causing the victim to fear for his or her safety.[266] Under some circumstances, UAS use alone could constitute stalking (for example, if it is used to chase or corner a person).[267] More often, a stalker using a UAS would also be engaged in a larger constellation of behaviors consistent with stalking. To the extent that anti-harassment and anti-stalking statutes specifi-

265. *See* Christine B. Gregson, Comment, *California's Antistalking Statute: The Pivotal Role of Intent*, 28 GOLDEN GATE U. L. REV. 221, 221 (1998).

266. *See, e.g.*, CAL. PENAL CODE § 646.9 (West 2008): "Any person who willfully, maliciously, and repeatedly follows or willfully and maliciously harasses another person and who makes a credible threat with the intent to place that person in reasonable fear for his or her safety, or the safety of his or her immediate family is guilty of the crime of stalking . . . ."

267. Obviously, the other requirements of the legal definition of stalking must be met. As such, a child who momentarily chases his or her sibling using a 9-ounce toy remote control helicopter is clearly not engaging in stalking.

cally enumerate the technologies that might be exploited, UAS should be added to the list. If a stalker employing a UAS crosses state lines (or operates a UAS, with the assistance of someone local to the victim, from a different state), then federal anti-stalking statutes could also be implicated.[268]

D. Unmanned Aircraft and Business Privacy

In 2011, a Texas man flew an unmanned aircraft over land near a Dallas-area meat packing plant and acquired images appearing to show environmental violations.[269] He contacted the Coast Guard, and in early 2012 the Texas Environmental Crimes Task Force served a search warrant on the company.[270] Once on the property, investigators found a pipe that "originate[d] in the back of the slaughterhouse" that appeared to be channeling pigs' blood into a nearby river and "[was] not linked to a waste water system."[271]

Though few would rush to defend a slaughterhouse that may be in violation of environmental codes, the ability of private citizens or groups to easily inspect for such violations via overflights raises complex issues. To the extent that such overflights are lawfully conducted and reveal activities that may be endangering public health, they are obviously valuable. But what happens if a well-meaning but overzealous environmental group conducts daily flights over a large, fenced-in manufacturing facility and repeatedly reports "violations" to the government that turn out, after costly and time-consuming on-the-ground inspections, not to be violations after all? Does the company that owns the facility have grounds to ask a court to enjoin the environmental group from further overflights? What if the group posts pictures from its daily aerial surveillance missions on the Internet, and in doing so exposes information that the company regards as a trade secret? Could the group use a UAS to examine the interior of buildings at the facility using an advanced thermal imager that, if in government

270. *Id.*

271. *Id.*

hands and used to inspect a home, would be unconstitutional under *Kyllo*? More generally, to what extent does a corporation have common law or constitutional privacy rights that parallel those accorded to individuals?

This last question was raised but not fully resolved in a recent Supreme Court case, *FCC v. AT&T, Inc.*[272] While noting that "this case does not call upon us to pass on the scope of a corporation's 'privacy' interests as a matter of constitutional or common law,"[273] the Court ruled that the "protection in [the Freedom of Information Act] against disclosure of law enforcement information on the ground that it would constitute an unwarranted invasion of personal privacy does not extend to corporations."[274] The Court also expressed skepticism regarding arguments that corporations have a common law right to personal privacy, writing that "[o]n the contrary, treatises in print around the time that Congress drafted the exemptions at hand reflect the understanding that the specific concept of 'personal privacy,' at least as a matter of common law, did not apply to corporations."[275] Corporate privacy rights are related in part to the much broader question regarding the extent to which constitutional protections extend to corporations.[276] UAS represent one of the many ways in which those rights may be tested in the coming years.

The fact that UAS might be used to perform corporate espionage is another important issue. Observations of a competing company's facilities and activities—whether made from the ground or the air—are not necessarily illegal. For example, consider a person who drives by a competing company on public roads as part of his or her regular commute to work. If this person notices that there are suddenly far fewer cars in the company's parking lot than in previous months, he or she might infer that there have been significant layoffs. Under this scenario, visual observations have yielded potentially valuable information about a competitor without breaking any laws. Analogous scenarios involving incidentally acquired UAS imagery can also be envisioned.

By contrast, circling a UAS over the roof of a competing company to intercept wireless signals emanating from the building would represent something similar to an "illegal wiretap" and violate the Stored Communications Act.[277] Photographs taken from a UAS without authorization that both (1) convey a trade secret, and (2) are obtained for the purpose of benefiting a "foreign government, foreign instrumentality, or foreign agent" would violate economic espionage statutes.[278]

V. NEW FRAMEWORKS FOR UNMANNED AIRCRAFT SYSTEMS AND PRIVACY

Many of the most important UAS privacy questions relate directly to the scope and interpretation of the First and Fourth Amendments. Those questions will be addressed in the inevitable court tests that will arise with increased UAS use. But there are also proactive steps that can be taken, including the adoption of voluntary policies by law enforcement agencies as well as new federal, state, and local legislation.

A. Voluntary Approaches

Several voluntary approaches for addressing UAS privacy have been proposed. These include the Association for Unmanned Vehicle Systems International (AUVSI) Code of Conduct, which calls for a commitment to "respect the privacy of individuals,"[279] as well as a set of model guidelines released by the International Association of Chiefs of Police (IACP).[280]

Although the IACP guidelines are not binding, many American law enforcement agencies likely will adopt the guidelines or use them as a starting point to develop more extensive guidelines. The IACP guidelines recommend that "[w]here there are specific and articulable grounds to believe that the UA [unmanned aircraft] will collect evidence of criminal

wrongdoing and if the UA will intrude upon reasonable expectations of privacy, the agency will secure a search warrant prior to conducting the flight."[281] The guidelines also address data minimization, community involvement and feedback regarding policies for UAS use, and documentation of UAS flights.[282] Some of these recommendations are consistent with recommendations provided by the American Civil Liberties Union in a December 2011 report on "Protecting Privacy From Aerial Surveillance."[283] Voluntary frameworks will play a vital role in addressing UAS privacy concerns both directly, in terms of encouraging law enforcement agencies to use UAS responsibly, and indirectly, by spurring an important dialog between law enforcement agencies and their communities.

B. Federal Legislation

There were multiple bills related to UAS privacy introduced in the 112th Congress, though none were enacted.[284] In June 2012, Senator Rand Paul introduced the "Preserving Freedom from Unwarranted Surveillance Act of 2012,"[285] a bill that, subject to a small number of exceptions (such as preventing "imminent danger to life"), would have required a warrant for gov-

284. Some of these UAS privacy legislative initiatives, as well as more general Fourth Amendment UAS issues are discussed in Richard M. Thompson II, Cong. Research Serv., R42701, Drones in Domestic Surveillance Operations: Fourth Amendment Implications and Legislative Responses (2012), *available at* http://www.fas.org/sgp/crs/natsec/R42701.pdf.

285. Preserving Freedom from Unwarranted Surveillance Act of 2012, S. 3287, 112th Cong. (2012), *available at* http://www.govtrack.us/congress/bills/112/s3287. Essentially the same bill was introduced in the House by Representative Austin Scott. *See* Preserving Freedom from Unwarranted Surveillance Act of 2012, H.R. 5925, 112th Cong. (2012), *available at* http://www.govtrack.us/congress/bills/112/hr5925.

ernment use of UAS to "gather evidence or other information pertaining to criminal conduct or conduct in violation of a statute or regulation."[286] A week later, Representative Shelley Capito introduced H.R. 5961, which would have limited "aerial surveillance of agricultural land."[287] The next month, Representative Ted Poe introduced the "Preserving American Privacy Act of 2012,"[288] which would have prohibited the use of UAS "for law enforcement purposes or for surveillance of a United States national or real property owned by that national . . . except pursuant to warrant and in the investigation of a felony."[289]

In December 2012, Representative Edward J. Markey introduced the "Drone Aircraft Privacy and Transparency Act of 2012." The bill would have required all entities seeking a "grant of authority to operate an unmanned aircraft system in the national airspace system" to provide a "data collection statement" specifying, among other things, "whether the unmanned aircraft system will collect information or data about individuals or groups of individuals," and if so, how it will be used.[290] Applications from law enforcement agencies would also have had to provide a "data minimization statement" describing the agencies' policies for minimizing data collection unrelated to a crime investigation and "requir[ing] the destruction of such information and data, as well as of information and data collected by the unmanned aircraft system that is no longer relevant to the investigation of a crime under a warrant."[291] With some exceptions for exigent circumstances, the bill would also have required law enforcement agencies to obtain a warrant for "generalized surveillance."[292]

There will undoubtedly be a new set of UAS privacy bills and privacy related amendments introduced (or reintroduced) in the 113th Congress and beyond. It is relatively easy to draft

292. *Id.* § 341.

legislative language that will increase privacy from UAS observations. It is far harder to do so without negatively impacting the use of UAS in applications that raise few or no privacy concerns. For example, as part of an arson investigation, police might want to employ a UAS to acquire overhead images of a formerly vacant industrial building that has been damaged by a suspicious fire. Requiring police to first obtain a warrant would delay the investigation and increase the burden on the courts with no benefit to privacy.

When drafting legislation, it is also important to consider the role that could be played by unintentionally captured images. Suppose that a brutal assault that takes place on a sidewalk is captured on video by a government-operated UAS that happens to be monitoring traffic on the adjacent street. Suppose further that the video from the UAS turns out to be the only available evidence that can identify the perpetrator. It would defy common sense if the police or prosecutors were barred by new UAS privacy rules from making use of this information.

Legislation that would include a blanket prohibition on government use of private UAS data in criminal investigations would also be ill advised, as well as inconsistent with what routinely occurs in nonaviation settings. Investigators often use images collected from privately owned surveillance cameras to help solve crimes, including, in many cases, cameras that were not owned or operated by the victim of the crime. In June 2012, a man suspected of killing three people in New York was arrested thanks in large part to images captured by a surveillance camera down the street from the scene of the crime.[293] What mattered most was that the camera captured the images vital to identifying the suspect, not whether it was publicly or privately owned. If, in the example in the previous paragraph, the images of the assault on the street had been captured by a UAS operated by a television station instead of by the government, it would make no sense to place them beyond the legal reach of investigators.

Any new legislation should also recognize that images of public spaces from government (or private) UAS will sometimes also include images of nearby homes. Residences next to a freeway are often within the frame of view of video from

293. *Police arrest suspect accused of executing three men outside Columbia University*, MAILONLINE, June 23, 2012, http://www.dailymail.co.uk/news/article-2163776/Police-arrest-suspect-accused-executing-men-outside-Columbia-University.html.

manned traffic helicopters reporting on a freeway problem. Video from UAS used to monitor traffic will be no different. Thus, a law stating that no UAS images of any nonpublic spaces can ever be acquired by the government without a warrant would, at least on its face, effectively ban government UAS use in almost any suburban or urban setting.

UAS privacy legislation, either at the federal or state level, should also avoid creating collateral damage for the operation of model aircraft. The Academy of Model Aeronautics, which, with over 150,000 members,[294] constitutes the world's largest model aviation organization, has an exemplary seventy-five-year safety record and a safety code that requires pilots of radio-controlled model airplanes to "avoid flying directly over unprotected people, vessels, vehicles or structures."[295] Aircraft operated in this manner are ill-suited for surveillance. Impeding their operation in the name of privacy would benefit no one.

"Drone" hobbyists should similarly be protected from legislation that leaves them as collateral damage. If, five years from now, a parent and child acting in compliance with applicable FAA regulations wish to fly a very small UAS in a backyard or public park, new privacy laws should not force the parent to file paperwork with the government documenting the date, time, duration, location, and image collection status of every flight.

As is clear from the above, there is no shortage of unsuitable legislative approaches. The best solutions are those that increase privacy protections without impeding reasonable, non-privacy-violating uses. Laws addressing data retention by government UAS users are one possible example. It is also reasonable to require law enforcement agencies to keep thorough records identifying the details of flight operations, including the date and time, location, who was operating the aircraft, and what sort of data was collected.[296]

294. *What is AMA?*, ACAD. MODEL AERONAUTICS, http://www.modelaircraft.org/files/102.pdf (last visited Feb. 1, 2013).

295. *Academy of Model Aeronautics National Model Aircraft Safety Code* para. B(1), ACAD. MODEL AERONAUTICS, http://www.modelaircraft.org/files/105.pdf (last visited Feb. 1, 2013).

296. Laws specifically addressing UAS image data retention would raise the issue of consistency with respect to retention of data from ground-level, government-operated surveillance cameras.

C. *State and Local Legislation and the Scope of Federal Preemption*

The prospect of state and local UAS privacy regulation raises the issue of federal preemption.[297] Higher courts have repeatedly ruled that aircraft safety regulation has been preempted by the federal government. In 2007, the Ninth Circuit held that "[t]he [Federal Aviation Act] and regulations promulgated pursuant to it establish complete and thorough safety standards for air travel, which are not subject to supplementation by, or variation among, state laws."[298] Similarly, a 1999 Third Circuit ruling stated "[b]ecause the legislative history of the FAA and its judicial interpretation indicate that Congress's intent was to federally regulate aviation safety, we find that *any* state or territorial standards of care relating to aviation safety are federally preempted."[299]

Aircraft noise is another aviation-related field that has been federally preempted. In a 1973 decision involving Burbank's right to establish an airport curfew to address noise concerns, the Supreme Court ruled that the federal government "has full control over aircraft noise, preempting state and local control."[300] And in 1978, the Airline Deregulation Act included an express preemption prohibiting states from enacting laws "related to a price, route, or service of an air carrier that may provide air transportation."[301]

Yet this does not prevent states from passing any laws relating to how aircraft are flown. Reckless operation of aircraft is

---

297. As the Supreme Court explained in a 1987 ruling, "when acting within constitutional limits, Congress is empowered to pre-empt state law by so stating in express terms." Cal. Fed. Sav. & Loan Ass'n v. Guerra, 479 U.S. 272, 280 (1987). In addition, "congressional intent to pre-empt state law in a particular area may be inferred where the scheme of federal regulation is sufficiently comprehensive to make reasonable the inference that Congress 'left no room' for supplementary state regulation. . . . As a third alternative, in those areas where Congress has not completely displaced state regulation, federal law may nonetheless pre-empt state law to the extent it actually conflicts with federal law." *Id.* at 280–81 (citation omitted).

298. Montalvo v. Spirit Airlines, 508 F.3d 464, 468 (9th Cir. 2007).

299. Abdullah v. Am. Airlines, 181 F.3d 363, 371 (3d Cir. 1999).

300. City of Burbank v. Lockheed Air Terminal, Inc., 411 U.S. 624, 633 (1973).

301. 49 U.S.C. § 41713(b)(1) (2006); *see also* John Maggio & Allison M. Surcouf, *Federal Preemption in The Field of Aviation*, 78 J. TRANSP. L., LOGISTICS & POL'Y 243, 249–50 (2011).

prohibited by both FAA regulations[302] and criminal statutes in many states. In ruling that a Maryland law making it a crime to "operate an aircraft . . . in a careless or reckless manner so as to endanger the life or property of another"[303] was not preempted by federal law, the Maryland Court of Appeals wrote that it "would be incongruous indeed, in light of the federal purposes and objectives, if Maryland were to be constitutionally precluded from the criminal prosecution of a person for such conduct because a federal regulation authorized civil penalties."[304] More generally, the court observed, "[w]e have no difficulty whatever in deciding that Congress has not occupied the entire field of aeronautics by the Federal Aviation Act of 1958."[305] Thus, federal preemption is complex both generally[306] and with respect to aviation.[307]

A state does not have the authority to enact UAS privacy laws that would decrease the safety of flight operations. A state law aiming to prevent UAS from hovering for too long over a home by requiring a certain minimum speed would raise concerns with respect to airspace safety, and would be unlikely to withstand a legal challenge. On the other hand, although it would be unadvisable, a state or municipality could enact legislation forbidding the use of any public funds to purchase or operate unmanned aircraft. There is also a gray area between these two extremes. State laws attempting to limit where and how government UAS can be operated, the resolution of the cameras they carry, or the retention of the data they collect would almost certainly be subject to preemption challenges.

From a preemption standpoint, the safest legislative role for states with respect to UAS privacy lies in minimizing privacy abuses by non-government UAS operators. State power to address trespass, invasion of privacy, harassment, and stalking is well established. Current civil and criminal statutes in those areas were drafted in an era, which is now ending, when UAS

were not widely accessible to private citizens. As a result, in many cases these laws fail to anticipate some of the unique ways in which UAS in the hands of irresponsible operators could be used to threaten privacy. These statutes should be reexamined to identify and close any loopholes that might be exploited.

State UAS privacy regulations also run the risk of being undermined by the physics and geometry of flight. Consider a UAS operated over Maryland, at the Virginia border, and at a high enough altitude to obtain very precise imagery of activities in Virginia five miles south of the Potomac River.[308] While the operators of the UAS would certainly need to comply with federal and Maryland laws, they could very credibly argue that their data collection practices should not be subject to Virginia law.[309] The scenarios that could play out in relation to municipal-level regulations are even more varied. If Berkeley, California, were to prohibit its police department from purchasing or using UAS, a UAS owned and operated by the City of Oakland, which is adjacent to Berkeley, could easily remain over Oakland while acquiring video of portions of Berkeley. The Oakland UAS could also freely cross into the airspace over Berkeley.

The early months of 2013 have seen a significant increase in UAS-related legislative activity at the state and local levels. To cite some of the many examples, in February 2013 the Virginia General Assembly passed a bill that, if signed into law by the Governor, would place broad restrictions on state and local law enforcement UAS use until July 2015.[310] An Oregon Senate bill, if enacted, would prohibit certain UAS uses within what it defines as the "Airspace of Oregon"; that is, "the space above the ground that is not part of airspace governed by federal law." [311]

---

308. In this hypothetical scenario, it is assumed that the flight would occur outside the restricted zone in the Washington, D.C., area. *See Notice to Airmen 0/8326*, FED. AVIATION ADMIN., http://tfr.faa.gov/save_pages/detail_0_8326.html (last visited Feb. 1, 2013).

309. The ability of state law to reach high into the sky is questionable even in its "own" airspace. It is doubtful, for example, that a state could enact a valid law prohibiting passengers in commercial airliners flying over the state at 36,000 feet from taking pictures through the aircraft windows of the scenery below.

310. Jason Koebler, *Virginia Becomes First State to Pass Drone Regulations*, US NEWS, Feb. 5, 2013, http://www.usnews.com/news/articles/2013/02/05/virginia-becomes-first-state-to-pass-drone-regulations-.

311. S.B. 71, 77th Legis. Assemb., Reg. Sess. (Or. 2013), *available at* http://www.leg.state.or.us/13reg/measures/sb0001.dir/sb0071.intro.html.

Other states in which UAS-related measures have been introduced include California,[312] Florida,[313] and Texas.[314]

CONCLUSION

The only certain aspect of the debate about unmanned aircraft and privacy is that it will be contentious. Some people believe that there is no need to create new laws,[315] whereas others believe that UAS "could be just the visceral jolt society needs to drag privacy law into the twenty-first century."[316]

In the quarter of a century since *Ciraolo*, the cost of sophisticated imaging technology has plummeted. UAS will make it easy to put that technology in the air. Thus, the constitutionality of government UAS observations of a home or its curtilage using imaging technology that is both sophisticated and in general public use is certain to be tested.

None of the key Supreme Court precedents definitively resolve this issue. *Ciraolo* and *Riley* involved naked eye observations. *Dow Chemical* involved a camera that was both widely available and sophisticated for its time, but did not concern a home or curtilage. In *Kyllo*, the Court considered the thermal imager to be nonroutine. And *Jones* concerned GPS, not imaging.

In combination, however, these rulings indicate that the Fourth Amendment is likely to provide significantly more protection from government UAS observations than is commonly assumed. At the very least, the Court will not grant the government the unconstrained power to perform warrantless UAS surveillance. Instead, the Court is more likely to adopt a test tied to the amount of detail revealed as opposed to the level of technology diffusion. Under that standard, even unsophisticated imag-

ing technology might lead to a Fourth Amendment violation if it is misused in a low-flying government UAS, while images from a sophisticated camera flown at a high altitude might reveal very few details and raise no constitutional concerns.

When considering potential new statutory UAS privacy protections, it is helpful to keep in mind what has occurred with the Internet and mobile telephones, two technologies that are associated with privacy threats that are in some respects much more significant than those that will arise from unmanned aircraft. Both the Internet and mobile phones grew as fast as their underlying technologies enabled. As a result, the public and legislative dialogue regarding how best to address the privacy issues they raise has been conducted with a strong appreciation of their benefits. By contrast, while the privacy concerns associated with domestic UAS are real and deserving of attention, they are getting significant focus long before the potential benefits of the technology are widely recognized.

This early consideration creates both opportunities and risks. The opportunities lie in the ability to proactively address the privacy issues associated with a new technology before it becomes common. The risks lie in letting this information imbalance—in which the privacy downsides are well-known but the benefits are not—lead to correspondingly imbalanced legislative approaches.

If, in 1995, comprehensive legislation to protect Internet privacy had been enacted, it would have utterly failed to anticipate the complexities that arose after the turn of the century with the growth of social networking and location-based wireless services. The Internet has proven useful and valuable in ways that were difficult to imagine over a decade and a half ago, and it has created privacy challenges that were equally difficult to imagine. Legislative initiatives in the mid-1990s to heavily regulate the Internet in the name of privacy would likely have impeded its growth while also failing to address the more complex privacy issues that arose years later.

Thus, while it is important to proactively consider how to protect against the privacy abuses UAS could make possible, in doing so it is important to recognize the near impossibility of predicting all of the ways that a rapidly developing technology can be used—for good or for ill—in future years. Maintaining that perspective will be vital in achieving good UAS policy outcomes.

Pilotless Drones: Background and Considerations for Congress Regarding Unmanned Aircraft Operations in the National Airspace System

Bart Elias
Specialist in Aviation Policy

September 10, 2012

Congressional Research Service
7-5700
www.crs.gov
R42718

CRS Report for Congress
Prepared for Members and Committees of Congress

Summary

Growing interest in the use of unmanned aerial vehicles (UAVs), particularly for homeland security and law enforcement applications, has spurred considerable debate over how to accommodate these unmanned aircraft and keep them safely separated from other air traffic. Additionally, the use of these pilotless aircraft, popularly referred to as drones, for aerial surveillance and law enforcement purposes has raised specific concerns regarding privacy and Fourth Amendment rights and potential intrusiveness. These issues have come to the forefront in policy debate in response to provisions in the FAA Modernization and Reform Act of 2012 (P.L. 112-95) that require the Federal Aviation Administration (FAA) to begin integrating unmanned aircraft into the national airspace system by the end of FY2015.

While drones have been used extensively by the military and small radio-controlled model aircraft have been around for more than 50 years, advances in more complex vehicle controls and imaging sensor capabilities are spurring public sector and commercial interest in unmanned aircraft for a variety of purposes, including law enforcement, homeland security, aerial imaging, and scientific research. FAA currently approves public entities (such as federal agencies, public universities, and local police departments) to operate UAVs on a case-by-case basis, but growing interest is making this approach increasingly untenable. Moreover, commercial users are seeking authorization to fly drones, but so far FAA has only allowed test and demonstration flights by manufacturers. FAA faces a number of challenges to address anticipated growth in demand for civilian UAV operations and develop regulations governing the certification and operation of unmanned aircraft systems in domestic airspace.

Congress has generally supported efforts to integrate unmanned aircraft into the national airspace system and foster growth in the unmanned aircraft industry. It enacted extensive provisions in P.L. 112-95 that are designed to streamline and accelerate the operation of unmanned aircraft in domestic airspace by both public entities and commercial operators. Notably, that law requires FAA to issue regulations pertaining to the operation of small UAVs (weighing less than 55 pounds) and requires FAA to create and implement a plan to begin the integration of unmanned aircraft into the national airspace system by the end of FY2015. Toward that goal, the act requires FAA to establish six test ranges throughout the United States to study unmanned aircraft integration technical issues.

The act establishes an ambitious timeline for FAA to grapple with and resolve a number of complex issues regarding the safety and security of unmanned aircraft operations. Furthermore, aircraft operators have expressed specific concerns that drone operations should not result in airspace restrictions or other measures that could limit accessibility to the national airspace system.

In addition to these various challenges, the privacy implications and potential intrusiveness of drone operations have emerged as a significant issue before Congress. Civil liberties and privacy groups have cautioned that voluntary industry measures, including a code of conduct to, among other things, respect privacy, are inadequate to assure that drones will not be misused in ways that could infringe upon the privacy of individuals and intrude upon their daily activities. Moreover, FAA's authority over specific uses of civilian unmanned aircraft appears limited so long as safety and national security are not compromised, raising additional concerns that future drone operations could lead to complaints and lawsuits over noise, intrusiveness, and interference with the use and enjoyment of public or private property.

Background

In the early 2000s, military and intelligence use of unmanned aircraft systems (UASs)[1] in Afghanistan and Iraq spurred interest in potential domestic use of these systems. The safe integration of unmanned aircraft in the crowded airspace above the United States poses a number of regulatory challenges for the Federal Aviation Administration (FAA) and raises some unique legal and ethical questions. These issues have come to the forefront following enactment of the FAA Modernization and Reform Act of 2012 (P.L. 112-95), which requires FAA to begin integrating unmanned aircraft into the national airspace system by the end of FY2015.

Military Roots

While much of the policy debate surrounding civilian use of unmanned aircraft is new, unmanned aircraft have been used by the military since the early days of aviation. During World War I, the Navy funded research to develop a prototype flying bomb called the Hewitt-Sperry Automatic Airplane. Building on this concept, the first full-scale powered unmanned aerial vehicles, the Curtiss-Sperry Flying Bomb and the Kettering Aerial Torpedo, nicknamed the "Bug," were developed in 1918 as unpiloted bomb delivery platforms. The "Bug" was designed to fly a pre-set course, then shed its wings delivering an explosive payload that would detonate on impact. It was never used in combat, and further development was halted in the 1920s.[2] As evidenced by these early prototypes, the U.S. military has long had an interest in unmanned aircraft, which evolved into the development of several successful guided missile designs during World War II.

The military has used autonomous target drones and remotely piloted vehicles extensively since the 1950s. These vehicles first served as targets for training combat pilots and as decoys in combat arenas, but their roles evolved with advances in sensor technology, allowing them to take on more advanced aerial reconnaissance roles.

In the 1980s, spurred by Israeli initiatives, the military developed more sophisticated unmanned systems with extensive ground-based command and control capabilities. Unmanned aircraft were used by U.S. forces for intelligence missions in the Balkans in the late 1990s, and in Afghanistan and Iraq for reconnaissance and surveillance as well as, more recently, for combat missions.[3] In support of military research, development, testing, and training, the military now operates unmanned aircraft extensively in U.S. airspace. The military services work closely with FAA to designate special use airspace for conducting unmanned aircraft operations, typically over military bases or sparsely populated land.

[1] Unmanned aircraft systems (UASs) refer to aircraft that fly without onboard pilots along with ground control stations, networks, and personnel needed to operate these aircraft. Unmanned aerial vehicles (UAVs) refer to the unmanned aircraft in these systems, which are often referred to as drones in the media. The terms UAVs, unmanned aircraft, and drones are used interchangeably throughout this report.

From Longtime Hobby to a Burgeoning Civilian Market

Until recently, civilian interest in operating unmanned aircraft in U.S. airspace had largely been limited to long-standing hobbyist use of radio-controlled model aircraft. The Academy of Model Aeronautics, a national organization representing model aviation enthusiasts, was founded in 1936 and claims a membership of more than 150,000.[4] It serves as the chartering organization for more than 2,400 model airplane clubs across the United States. At present, radio-controlled model aircraft operate under a voluntary standard that generally permits flights only below 400 feet above the surface. These guidelines specify that model aircraft be flown away from populated areas and not in close proximity to full-scale aircraft. They further request coordination with air traffic facilities when planning operations within 3 miles of an airport and suggest that model aircraft be adequately flight tested before being operated in front of spectators.[5]

While most radio-controlled model aircraft are powered by small propeller engines and weigh only a few pounds, some are jet-powered scale models weighing over 100 pounds. The distinction between functional model aircraft and small unmanned aerial vehicles is, therefore, largely based on an aircraft's use rather than its size or capabilities: whereas model aircraft are regarded as being used for recreational purposes, UAVs serve public use missions, such as law enforcement and disaster relief, and commercial applications. The prospect of robust growth in use of UAVs had triggered more formal analysis of the process for granting approvals and development of regulations for UAV operations. The challenges associated with safely integrating civilian UAVs into domestic airspace are discussed in detail below (see "Domestic Airspace Integration Issues").

Flight missions considered to be "dirty, dull, or dangerous" are regarded as prime candidates for the use of unmanned aircraft. Examples include aerial surveillance missions for homeland security, border protection, and law enforcement; highway traffic monitoring; forest fire scouting; disaster response; aerial applications of pesticides; pipeline and transmission line inspection; aerial surveying and geospatial imaging; atmospheric and environmental science; wildlife and natural resources management; scientific data collection; and hurricane and severe storm monitoring. Some industry experts foresee eventual use of unmanned aircraft for cargo transport. At this point, however, passenger-carrying UAVs are not on the horizon.

Industry analysts anticipate a robust market for unmanned aircraft systems, although the extent to which civilian sales will contribute to this market is highly dependent on how the regulation of civilian drones proceeds. The Teal Group, an aviation and aerospace consulting firm, predicted that, over the next ten years, annual spending on unmanned aircraft systems and sensor payloads will increase by 73% and worldwide spending on unmanned aircraft systems will total $89 billion, with the United States accounting for 62% of the research and development spending and 55% of procurement totals.[6] Similarly, VisionGain, a UK-based business information provider, foresees strong demand for unmanned aircraft payloads and subsystems, as well for UAV flight training and simulation.[7]

Unmanned Aircraft Designs

Unmanned aircraft come in all shapes and sizes. They range in size from bug-sized "nano drones" to vehicles the size and weight of large business jets. Small UAVs have an upper weight limit of 55 pounds. Typical civilian drones are likely to fall in the range of a few pounds up to that weight limit, while medium-sized unmanned aircraft, like the MQ-9 Predator 2/Reaper (with a 65-foot wingspan and a maximum takeoff weight of about 10,000 pounds) may be used on more specialized, medium-altitude and high-altitude, long-duration missions like border and maritime patrols and environmental research missions. Unmanned aircraft include fixed-wing airplanes, helicopters, rotorcraft, and even blimps. Unmanned aircraft may also include certain vehicles, referred to as optionally piloted vehicles, that are capable of being flown by a pilot as a conventional aircraft or being operated remotely or autonomously depending on mission conditions, needs, and requirements. **Figure 1** provides a montage of various unmanned systems illustrating a range of different vehicle sizes and designs including (clockwise from top left) the hand-launched AeroVironment RQ-20 Puma; an unmanned version of the Kaman K-MAX external load helicopter operated by the U.S. Marine Corps; the Honeywell RQ-16 "Tarantula" T-Hawk; the AAI RQ-2 Pioneer; and the "Altair" variant of the General Atomics MQ-9 Predator 2/Reaper.

While a substantial portion of this market will be accounted for by the defense sector, manufacturers are increasingly looking toward the civilian sector, fearing that military sales may stagnate as operations in Afghanistan are scaled back and U.S. defense budgets grow tighter. However, some forecasters have concluded that growth in the civilian market is unlikely until a regulatory framework allowing routine UAS operations is established.[8] FAA anticipates that once such regulations are put in place, roughly 10,000 active civilian UASs will commence operations within the first five years.[9]

It is important to distinguish public-use missions from purely civilian activities involving UAVs, although certain commercial operations, such as utility line inspection, may serve a public benefit. The distinction matters because aircraft owned or leased by federal and state agencies, counties, and municipalities, are regulated differently from civil aircraft operated by private individuals and corporations.[10] Although the regulatory distinctions are complex, in general, FAA oversight and authority over public-use aircraft are more limited. For this reason, some public-sector entities, particularly homeland security and law enforcement agencies and public universities, are already making limited use of UAVs while the commercial market awaits FAA regulatory action.

Congressional Interest and Related Legislation

Congress has generally been supportive of efforts to integrate unmanned aircraft into the national airspace system and foster growth in the unmanned aircraft industry. Through oversight and legislation, it has pushed FAA to accelerate its regulatory processes regarding the certification and operation of unmanned aircraft.

UAVs in Vision 100—The Century of Aviation Reauthorization Act

In 2003, Congress included language in Vision 100—The Century of Aviation Reauthorization Act (P.L. 108-176) specifying that the Next Generation Air Transportation System (NextGen), which FAA is developing to handle air traffic control, shall "accommodate a wide range of aircraft operations, including airlines, air taxis, helicopters, general aviation, and *unmanned aerial vehicles*."[11] That language set the stage for ongoing policy and technical consideration of how to best accommodate unmanned aircraft in the future airspace system.

While unmanned aircraft were only briefly mentioned in the act, the specific language requiring that they be accommodated in the design of NextGen served as an important step toward recognizing that drones would likely play a significant role in the aviation system of the future. Nearly a decade later, unmanned aircraft have evolved considerably, and the importance of

considering them in aviation regulation and the design and operation of the national airspace system has become a major policy and technical consideration.

Provisions of the FAA Modernization and Reform Act of 2012

During debate over the most recent FAA reauthorization, the integration of unmanned aircraft in national airspace was an issue of considerable interest. The resulting legislation, the FAA Modernization and Reform Act of 2012 (P.L. 112-95) contained extensive provisions designed to promote and facilitate the use of civilian unmanned aircraft. These included mandates for

- development of an integration plan that is to commence by the end of FY2015, if not sooner, along with a five-year roadmap for achieving integration objectives;
- selection of six test sites to study UAV integration into the national airspace system;
- designation of certain permanent areas in the Arctic where small unmanned aircraft may operate 24 hours per day for commercial and research purposes, including flights conducted beyond line-of-sight;
- a simplified process for issuing authorizations for entities seeking to operate public UASs in the national airspace system;
- a collaborative process to incrementally expand airspace access as technology matures and safety data and analysis become available, and to facilitate public agency access to UAS test ranges;
- a requirement to develop and implement operational and certification requirements for public UASs by December 31, 2015; and
- an exemption from rules and regulations pertaining to the operation of unmanned aircraft for model aircraft weighing 55 pounds or less that are flown within visual line-of-sight strictly for hobby or recreation.

Current FAA Policy and Oversight

The provisions in P.L. 112-95 reflect a general view that FAA's slow progress to date on addressing regulatory requirements for unmanned aircraft may be a barrier to civilian drone operations. While FAA has been studying unmanned aircraft operations for almost a decade, it continues to address requests to operate unmanned aircraft on a case-by-case basis. This approach is becoming increasingly untenable as growing numbers of public and commercial entities seek authorization to operate unmanned aircraft in domestic airspace.

On February 13, 2007, FAA issued a notice of policy declaring that "no person may operate a UAS in the National Airspace System without specific authority."[12] This policy applies to both public and private unmanned aircraft. FAA currently has two methods for granting authority to operate unmanned aircraft, depending on whether the operator is a public or a private entity.

[12] Federal Aviation Administration, "Unmanned Aircraft Operations in the National Airspace System," *Federal Register*, 72(39), February 13, 2007, 6689-6690.

Current Approvals Process

Unmanned aircraft operated by the military or other federal, state, or local agencies must obtain a Certificate of Waiver or Authorization (COA) from FAA. Since 2006, FAA has issued COAs to more than 100 unique public entities throughout the United States, ranging from local fire departments to research laboratories. Since the COAs have narrow scopes and durations, entities must obtain new authorizations every few months. In 2009, FAA issued 146 such COAs. In 2010, the number of COAs issued grew to 298.[13] Although FAA has streamlined its approval process, as required by P.L. 112-95, growing interest in operating unmanned aircraft from public entities is expected to place strains on the current case-by-case approach to authorization.

Additionally, in much the same manner as manned aircraft developers and builders must obtain FAA certification to test fly their aircraft, a number of drone developers have received special airworthiness certificates in the experimental category. Special airworthiness certificates, which offer the only legal route for private entities to operate unmanned aircraft for commercial purposes, have been issued on a limited basis for flight tests, demonstrations, and training.

FAA has raised concerns that other civilian users are operating commercial UAVs under the voluntary guidelines issued in the early 1980s that were intended to apply only to recreational users of model aircraft. As previously described, these guidelines advise such users to maintain altitudes lower than 400 feet above the ground, select sites away from populated and noise-sensitive areas, give right of way to full-scale aircraft, and advise airport operators and air traffic facilities if operating within 3 miles of an airport. The FAA statement of policy clarifies that these general guidelines alone are not sufficient for commercial operators of unmanned aircraft, regardless of the size of such aircraft. The FAA did, however, indicate that it has undertaken a safety review to determine whether certain small, slow-moving unmanned aircraft could be safely operated under a similar set of guidelines without requiring special airworthiness certification.

Regulating Small Unmanned Aircraft

Developers of small-scale unmanned aircraft are concerned that FAA has been moving too slowly on measures to safely accommodate these types of aircraft. Since 2007, industry has been pushing for separate regulations for "ultralight, low-speed, short-life UASs that will not be flying over populated areas or in controlled airspace," arguing that a one-size-fits-all approach to regulation would not likely be effective given the wide range of systems being considered for civilian use.[14]

Other than streamlining the case-by-case approvals process, FAA has not taken any formal action addressing the regulation of civilian small unmanned aircraft. After several delays, FAA plans to release a proposed rule regarding the certification and operation of small unmanned aircraft systems (sUAS) in October 2012, as a step toward meeting the August 2014 statutory deadline for issuance of a final rule. Additionally, P.L. 112-95 directed FAA to assess whether certain unmanned aircraft operations do not pose a safety hazard or a threat to national security and can therefore safely be allowed. Actions to address this mandate are currently in progress.

[14] David Hughes, "Civil Use of Unmanned Aircraft Systems Could Grow Rapidly," *Aviation Week and Space Technology*, February 12, 2007, p. 49.

Wide Scale Integration of Unmanned Aircraft in Domestic Airspace

UAV manufacturers and users are seeking a regulatory structure for the certification of UAV systems and approval for operation in domestic airspace. Ideally, operators of approved systems want the ability to "file and fly," meaning that they would be granted vehicle certification with broad operating authority akin to current manned aircraft certification standards. Such regulation would potentially allow unmanned aircraft operators to file routine flight plans, or in some cases simply carry out flight operations without any specific notification requirements, much as manned aircraft do.[15] While FAA's approach to address the mandates set forth in P.L. 112-95 regarding unmanned aircraft integration into the national airspace system is yet to be defined, it is most likely that FAA regulation and oversight of UAVs will adopt an evolving, risk-based approach toward this end goal of seamless integration.

As a first step, P.L. 112-95 mandated that FAA identify six test sites to specifically test concepts and technologies for integrated unmanned aircraft operations. FAA held public meetings and webinars and solicited public comments on the selection of test sites in March 2012, but has not yet gone through a formal source selection process or announced further details regarding test site selection, even though it was mandated to identify the sites by the summer of 2012 and have at least one site operational by February 2013.

Under P.L. 112-95, FAA is also required to develop a comprehensive plan to safely accelerate integration of civilian unmanned aircraft into the national airspace system as soon as practical but not later than September 2015. Meeting this mandate will require extensive research and regulatory action over the next three years.

Domestic Airspace Integration Issues

Key challenges to drone integration in domestic airspace include safety concerns, potential security risks, and concerns regarding airspace restrictions and possible disruptions to manned flight operations.

Safety Concerns

Threshold criteria for integrated unmanned aircraft operations are that UAVs do not pose undue risk other aircraft or compromise safety to persons or property on the ground.[16] To meet safety objectives, UASs will require technology and standard procedures for sensing and avoiding other air traffic under all possible scenarios, including lost communications. System reliability and human factors are important systems design considerations, as are training and qualification standards for drone pilots, unmanned aircraft systems operators, and other safety-critical personnel.[17]

[17] *Drone pilots* refers to ground personnel responsible for direct flight control of the unmanned vehicle whereas the term *systems operators* refers to personnel responsible for operating sensor payloads or other aircraft systems, such as fuel systems, that do not involve direct manipulation of flight controls or flight guidance systems. Other safety critical (continued...)

Sensing and Avoiding Other Air Traffic

Domestic airspace accommodates more than 70,000 flights per day[18] at a variety of altitudes, including low- and high-altitude military training flights, high-altitude air carrier and business jet flights, medium-altitude commuter and general aviation flights, and low-altitude recreational and sightseeing flights and helicopter operations. The risk of collision between these users and unmanned aircraft must be adequately mitigated before unmanned aircraft can routinely utilize the national airspace system.

The Government Accountability Office (GAO) concluded that no suitable technology is currently available to provide unmanned aircraft, particularly small UAVs, with the detect, sense, and avoid requirements needed to safely operate within the national airspace system. GAO noted that small unmanned aircraft pose a particular challenge because they operate at low altitudes. Many other aircraft operating at these altitudes do not use electronic transponders to broadcast their position and altitude, and in any case many small UAVs lack the ability to receive transponder signals. The needed equipment is simply too large and heavy to install on many small UAVs.[19]

Currently, these limitations substantially restrict UAV operations to line-of-sight scenarios, where operators on the ground or spotters in chase planes can provide the necessary capabilities to detect and avoid other air traffic. FAA is currently evaluating options for routinely allowing small unmanned aircraft to use line-of-sight as an acceptable means to detect and avoid manned aircraft under a regulatory regime for small UAVs.

For more sophisticated medium and large-sized UAVs seeking approval for operations beyond line of sight, technology advancements are needed to assure safety in an environment shared with manned flights. Remote sensing capabilities, including onboard cameras, airborne radars, and equipment to interrogate aircraft transponder signals (similar to the traffic collision avoidance systems on jetliners) can combine to provide operators with robust air traffic information.

An emerging technology, Automated Dependent Surveillance-Broadcast (ADS-B) will be required on manned aircraft by 2020 and will serve as the principal means for aircraft tracking under NextGen. Using ADS-B, aircraft will broadcast precise global positioning system (GPS) location information to air traffic controllers and other air traffic, potentially including unmanned aircraft. While ADS-B may provide unmanned aircraft operators with the capability to gather precise position and flight path information for nearby air traffic in the future, backup systems will likely be needed because ADS-B transmission and reception may not be guaranteed all the time.

(...continued)

personnel may include maintenance personnel and equipment technicians that service the air vehicle, the ground station or command and control linkages between the vehicle and the ground station.

[18] Based on 2010 total combined aircraft operations at towered airports reported in Federal Aviation Administration, *FAA Aerospace Forecasts FY2012-2032.* This does not include activity at non-towered airports and, therefore, understates the total number of daily flights, for which there is no definitive count.

[19] U.S. Government Accountability Office, *Unmanned Aircraft Systems: Use in the National Airspace System and the Role of the Department of Homeland Security*, Statement of Gerald L. Dillingham, Ph.D., Director, Physical Infrastructure Issues, Before the Subcommittee on Oversight, Investigations, and Management, Committee on Homeland Security, House of Representatives, July 19, 2012, GAO-12-889T.

FAA has not specifically approved any technology or suite of technologies as being sufficient to provide acceptable "sense and avoid" capabilities.[20] Part of the challenge is that existing technologies do not assure avoidance capabilities under all operational conditions, including autonomous UAV operations or in situations when UAVs lose their command guidance links with ground control facilities. Standardized procedures for responding when UAV guidance has been lost are currently lacking, but will be needed to ensure that air traffic controllers and airspace managers can redirect nearby traffic and mitigate collision risks.

No single technology is likely to address the complex sense and avoid requirements that are critical for unmanned aircraft integration. FAA has been working closely with RTCA, Inc., which functions as a federal advisory committee on aviation technologies, to develop consensus standards regarding minimum aviation system performance standards for sense and avoid technologies as well as for command, control, and communications systems for unmanned aircraft systems.[21] RTCA has been performing this work under its standards committee on unmanned aircraft systems (SC-203), which is scheduled to complete its work on these issues by December 2013 and intends to publish recommended standards soon thereafter. These standards, along with findings from unmanned aircraft integration testing, will likely form the basis of FAA regulations and guidance regarding sense and avoid technologies and UAV operating procedures.

Mitigating Risks to Persons and Property on the Ground

In addition to risks to other air traffic, unmanned aircraft operations may pose a risk to persons and property on the ground. Thus far, unmanned aircraft testing and operational use, such as for military testing and training and for border and maritime patrol operations, have been conducted largely over sparsely populated areas. In the future, however, law enforcement and commercial users are expected to undertake flights over densely populated areas, a prospect which raises specific concerns over safety procedures. For example, to minimize the likelihood of a crash when communications, command, and control linkages between the vehicle and the ground control station are disrupted, UAVs may need the ability to autonomously return to base.

Drone crashes, such as the 2006 crash of an MQ-9 Predator B drone operated by Customs and Border Protection (CBP) near Nogales, NM, and the more recent crash of a Navy RQ-4A Global Hawk near Salisbury, MD in June, 2012, have raised public concern over the safety of unmanned aircraft operations. While drone safety has improved considerably over the past decade, the accident rate for unmanned aircraft is still far above that of manned aircraft, although direct comparisons are difficult, given that most drone operations examined have involved riskier flying during development and testing and in war and conflict zones.[22]

The risk posed to persons and property on the ground is a function of both crash likelihood and the potential consequences in terms of loss of life, injury, or property damage. While smaller

[20] "Sense and avoid" refers to technologies and capabilities allowing unmanned aircraft to reliably detect other air traffic and maneuver away from such traffic in a manner that adequately mitigates collision risks.

[21] RTCA was organized in 1935 as the Radio Technical Commission for Aeronautics. Today it operates as a private, not-for-profit corporation. Its recommendations are used by FAA as a basis for policy, program, and regulatory decisions.

[22] Roland E. Weibel and R. John Hansman, *Safety Considerations for Operation of Unmanned Aerial Vehicles in the National Airspace System*, MIT International Center for Air Transportation, Department of Aeronautics and Astronautics, Massachusetts Institute of Technology, Cambridge, MA, March 2005, Report No. ICAT-2005-1.

UAVs may be expected to crash more frequently, the potential for catastrophic consequences is less given that these vehicles do not weigh enough or carry enough fuel to cause major damage on the ground. On the other hand, larger UAVs, like the MQ-9 Reaper or the RQ-4 Global Hawk, can potentially cause as much damage as a mid- to large-sized corporate jet. However, safety considerations in the design and operation of these more complex systems may reduce the likelihood of a crash. Additional procedures that can be incorporated into safety regulations for unmanned aircraft systems may further mitigate flight risks. These procedures may include

- formal risk assessments for systems certification and mission planning;
- development of ground impact models and mitigation plans to reduce risks to persons and property on the ground;[23] and
- structured training and certification requirements for unmanned aircraft pilots, systems operators, and other safety critical personnel.

Human Factors Considerations

The issue of training and certification requirements for unmanned aircraft systems personnel raises a much broader issue regarding the role of humans in these systems. Indeed, the term *unmanned* aircraft system (UAS) is a misnomer: while the aircraft themselves may be unmanned, the systems needed to operate them safely depend extensively on human interaction. Although drones operate without a pilot on board, human performance is a major consideration in setting policy for the integration of unmanned aircraft systems in domestic airspace. Key human factors to be considered include operator interfaces and controls and the training and qualifications of drone pilots, systems operators, and other safety critical personnel.

The previously mentioned 2006 crash of a UAV operated by Customs and Border Protection (CBP) illustrates the importance of these human factors considerations. On April 25, 2006, a Predator B (MQ-9) drone crashed in a remote area along the U.S.-Mexico border near Nogales, AZ following a loss of engine power. The National Transportation Safety Board (NTSB) determined that the probable cause of the mishap was the drone pilot's failure to follow appropriate procedures when switching to an alternate control console in the ground control station following a computer malfunction.[24] The error resulted in the pilot inadvertently cutting off the vehicle's fuel supply.

CBP had only been operating the Predator B aircraft since September 2005, eight months prior to the mishap. NTSB concluded that during this time CBP was providing a minimal amount of operational oversight of its UAS program and cited its inadequate surveillance of the program as a contributing factor in the crash.

The NTSB investigation revealed that, despite repeated computer malfunctions, neither CBP nor its contractors had a program in place to ensure that maintenance tasks were performed correctly or that corrective measures were applied. The NTSB investigation also found that while the mishap pilot had only 27 hours of flight time with the Predator B model, and had only been given

[23] Ibid.

[24] National Transportation Safety Board, NTSB Identification: CHI06MA121, Aviation Accident Database & Synopses, Probable Cause Approval Date: October 31, 2007. Available at http://www.ntsb.gov/aviationquery/brief.aspx?ev_id=20060509X00531&key=1.

verbal approval to fly the vehicle accompanied by an instructor pilot, the instructor pilot was not present in the ground control station when the error occurred. NTSB further noted that the verbal approval was not standard practice for CBP.

The incident illustrates that, despite the lack of an onboard pilot, human performance considerations are critical in the design of unmanned aircraft systems. The failure that led to the crash was preventable had the system been designed and operated with certain safeguards in place to compensate for human fallibility. Greater attention to human factors considerations in the design and operation of unmanned aircraft systems and in the development of training programs and operational procedures could improve safety and facilitate the integration of unmanned aircraft in the national airspace system.

Operator Training and Qualification

One particularly important human factors consideration for regulators is a determination regarding training standards and minimum qualification requirements for personnel involved in flight operations. The appropriate training and qualifications may depend in part on the size of the aircraft and the complexity of the system, as a "one size fits all" approach may be inappropriate given the diversity among vehicles, systems, and operational missions.

Currently the U.S. Air Force requires its Predator/Reaper and Global Hawk pilots to be pilot-rated military officers.[25] The other military services do not require drones to be operated by rated pilots, but do require specialized training. It is uncertain how these different approaches may serve as a basis for FAA to develop training requirements and qualification standards for civilian UAV pilots and operators, as military approaches vary considerably and are tailored to specific systems and missions.

One approach would be for FAA to develop basic training and certification standards for operators of small UAVs, while requiring more elaborate training and certification requirements for personnel seeking to operate or maintain large, complex unmanned aircraft systems. The extent to which requirements for UAV personnel may overlap with requirements for piloting or maintaining manned aircraft remains uncertain but could have significant implications for the industry's development. One perceived advantage of unmanned aircraft over manned aircraft is lower operating costs, and mandating that unmanned systems have highly trained pilots and operators with specialized certifications could reduce that potential cost advantage.

Another issue may involve medical certification. Medical conditions or poor eyesight preclude some individuals from obtaining pilot certification, and the rigors of the flight environment demand stringent medical requirements. Given the significant differences in the work environment and the potential consequences of medical problems in an aircraft compared to inside a ground control station, FAA may choose to relax some medical requirements to allow certain individuals that would otherwise not be medically fit to fly to operate unmanned aircraft.

[25] See CRS Report R42136, *U.S. Unmanned Aerial Systems*, by Jeremiah Gertler.

Addressing Potential Security Risks

In addition to safety risks, the operation of civilian unmanned aircraft in domestic airspace raises potential security risks, including the possibility that terrorists could use a drone to carry out an attack against a ground target. It is also possible that drones themselves could be targeted by terrorists or cybercriminals seeking to tap into sensor data transmissions or to cause mayhem by hacking or jamming command and control signals.

Drone Weapons

Terrorists could potentially use drones to carry out small-scale attacks using explosives, or as platforms for chemical, biological, or radiological attacks. In September 2011, the FBI arrested Rezwan Ferdaus, a U.S. citizen from Ashland, MA, charging him in a terrorist plot to attack the Pentagon and the Capitol using large model aircraft packed with high explosives. While the small payload of the model aircraft may have limited the lethality of the explosions, Ferdaus planned to recruit others to use assault rifles to target people fleeing the Pentagon after the drone attack.[26] In July 2012, Ferdaus pleaded guilty to attempting to provide material support to terrorists and attempting to damage and destroy federal buildings by means of an explosive in a plea agreement under which additional charges were dropped. The incident has raised specific concerns about potential terrorist attacks using unmanned aircraft, although the payload capacities of small UAVs would limit the damage these attacks could inflict using only conventional explosives.

Intentional Hacking and Signal Jamming

Additionally, unmanned aircraft command and control links could potentially be intentionally jammed or hacked resulting in a loss or hostile takeover of control. For example, Todd Humphreys, an assistant professor at the University of Texas at Austin, demonstrated a remote hijacking of an unmanned aircraft by GPS guidance signals. In congressional testimony, he warned that advances in software-defined radio and the availability of GPS signal simulators may provide average hackers with the capability to interfere with unmanned aircraft operations.[27]

Humphreys recommended that non-recreational civilian unmanned aircraft weighing more than 18 pounds be required to have spoof-resistant navigation systems. More broadly, he recommended that GPS-based timing and navigation systems used in national critical infrastructure also be required to be spoof-resistant. He noted that while "[t]here is no quick, easy, and cheap fix for the civil GPS spoofing problem…reasonable, cost-effective spoofing defenses exist which, if implemented, will make successful spoofing much harder."[28] As a long-range solution, he further recommended that the Department of Homeland Security commit to funding the development and implementation of methods for performing cryptographic authentication of GPS signals, or at least for the augmented GPS signals used for civil aviation.

---

[26] Milton J. Valencia, "Ashland Man Faces Terrorism Charges," *Boston Globe*, September 29, 2011.

[27] Todd Humphreys, *Statement on the Vulnerability of Civil Unmanned Aerial Vehicles and Other Systems to Civil GPS Spoofing*, Submitted to the Subcommittee on Oversight, Investigations, and Management of the House Committee on Homeland Security, July 19, 2012.

[28] Ibid. In this context, spoofing refers to transmitting false navigation signals that could cause a drone or aircraft to veer off course.

Additionally, GAO noted that "low cost devices that jam GPS signals are prevalent."[29] However, it concluded that the issue could be mitigated by using additional navigation systems that do not rely on GPS, and/or by encrypting communications and telemetry signals.

Availability and Protection of Radiofrequency Spectrum

GAO also noted that the lack of dedicated radiofrequency spectrum for UAS operations raises the risk of lost communications links due to either unintentional or intentional signal interference.[30] Issues regarding dedicated radiofrequency spectrum for unmanned aircraft, which sometimes involve satellite control links, are typically addressed in an international forum to assure global harmonization. The appropriate forum for such determinations is International Telecommunication Union (ITU), the United Nations agency responsible for global information and communications technologies.

In December 2009, ITU issued guidance on spectrum requirements for safe operation of unmanned aircraft in non-segregated or integrated airspace. It concluded that unmanned aircraft operations will require radiofrequency spectrum for air traffic control, vehicle command and control, and sense and avoid capabilities.[31] In November 2011, it published specific guidance on the technical feasibility and advantages and disadvantages of several candidate frequency bands for beyond line of sight communications, command, and control for unmanned aircraft systems.[32] It did not formally consider or propose regulatory methods for how these frequency bands might be allocated, which would be left up to individual regulatory authorities such as the Federal Communications Commission (FCC) in the United States.

FCC has addressed radiofrequency licensing for UAVs on a case-by-case basis, much as FAA has done for certifying drone flight operations. With continued demand for spectrum from mobile broadband providers, securing dedicated radiofrequency spectrum for unmanned aircraft operations is likely to be an ongoing challenge. Moreover, the protection of radiofrequency signals to prevent potential hacking and spoofing through encryption and other methods has not yet been adequately addressed and remains a threat to the security of unmanned aircraft systems operations.

Responsibility for Security Issues

Under the Aviation and Transportation Security Act (ATSA, P.L. 107-71), responsibility for aviation security was transferred from FAA to the newly formed Transportation Security Administration (TSA) in 2001. TSA has not specifically addressed the potential security concerns arising from the operation of drones in domestic airspace.

With regard to matters involving hacking and signal jamming, responsibility for the regulation and oversight of system security is far more complex. While TSA maintains responsibility for airspace security, FAA has regulatory authority over the certification of air vehicles. FAA has not issued certification standards for unmanned aircraft and systems, but future FAA standards may include hardware and software security and reliability assurance requirements.

FAA has worked closely with RTCA and the European Organization for Civil Aviation Equipment (EUROCAE) to define software or information assurance criteria for aircraft systems, and RTCA has released specific guidance on software considerations for airborne systems and equipment. FAA has issued advisory information for aircraft and aircraft equipment manufacturers regarding systems security and software assurance. This information indicates that the RTCA document is only one guideline manufacturers may utilize in applying systems engineering principles to ensure that aircraft component hardware and software are reliable and robust against hacking, signal interference, and other threats.[33]

Additionally, the National Information Assurance Partnership (NIAP), a partnership between the National Security Agency (NSA) and the National Institute of Standards and Technology (NIST), has established common criteria for information technology systems evaluation. Systems meeting the highest levels in the testing process are regarded as having "high robustness," meaning that they have stringent failure protections and rigorous security measures. Some avionics systems for airliners are now being tested using these common criteria methods, although such testing is not currently required. As the issue of unmanned aircraft systems certification is addressed, specific requirements for hardware and software security could be put in place. Additionally or alternatively, drone manufacturers may voluntarily apply various systems engineering and information assurance methods, such as those specified in the RTCA guidance or in the NIAP common criteria methodology, to protect systems against various information security threats.

As with many aspects of unmanned systems, a "one size fits all" approach may not be suitable, and FAA and TSA may choose to adopt a risk-based approach in addressing security matters related to unmanned aircraft operations. Under a risk-based approach, larger, more complex unmanned aircraft may be required to adopt more specific systems security and software and information assurance requirements, while more basic operational security procedures may suffice for small UAVs weighing less than 55 pounds, for example.

In general, a comprehensive approach to security issues pertaining to unmanned aircraft systems operations will likely require close coordination between TSA, FAA, FCC, manufacturers, and operators to address security issues pertaining to systems hardware and software, radiofrequency communications, and flight operations.

Airspace Restrictions

Besides safety and security, the potential impact of drone operations on airspace accessibility for other aircraft has been raised as a specific concern, particularly among operators of smaller general aviation aircraft.

One significant difference between military unmanned aircraft and unmanned aircraft operated by other public agencies or by civilian users is that the military, for many years, has negotiated with FAA to set aside airspace designated for military training, testing, and other purposes. Military airspace consists of military operations areas, military training routes, test ranges, and other restricted or prohibited airspace. Military operations areas and training routes are typically located in remote areas. While not set aside exclusively for military use, these areas and routes are charted and documented, allowing other airspace users, especially smaller general aviation aircraft, to be alert for military flight operations, including operations involving unmanned aircraft. The military has also worked with FAA to set aside specific restricted and prohibited airspace (e.g., above test sites and bombing ranges) to accommodate operations that pose greater risks to other air traffic. This airspace is charted and documented to allow pilots to avoid these areas when restrictions designating them as off limits to non-military users are in effect.

Airspace restrictions can serve as an effective tool for mitigating risks to civilian air traffic. However, their use concerns some airspace users because they pose inconveniences and sometimes raise additional safety issues. With additional restrictions, civilian pilots may be forced to fly more circuitous routes, leaving pilots with fewer options to avoid bad weather or plan for fuel stops. The Aircraft Owners and Pilots Association (AOPA), which represents more than 400,000 general aviation pilots and aviation enthusiasts across the United States, has been particularly critical of the use of restricted airspace designations to separate unmanned aircraft operations from other air traffic. AOPA has asserted that unmanned aircraft operations should not have a negative impact on general aviation operations and should not require special airspace designations, such as restricted airspace, for their operation.[34] It, however, generally supports the integration of unmanned aircraft so long as they do no harm to current manned operations.[35]

AOPA has been particularly critical of FAA's issuance of temporary flight restrictions (TFRs) to separate CBP drone operations for border surveillance from other air traffic. Testifying before the House Subcommittee on Aviation at a March 2006 hearing, AOPA Executive Vice President for Government Affairs Andrew Cebula stated that "AOPA believes that the use of 'temporary' large-scale flight restrictions for yearlong UAV operations is not appropriate and the FAA needs to fully explore the alternatives available to allow CBP (or any other agency for that matter) to secure our borders without impacting the aviation community."[36]

[36] Aircraft Owners and Pilots Association, Statement of Andrew V. Cebula, Executive Vice President, Government Affairs Concerning Unmanned Aerial Vehicles in the National Airspace System, Before the Committee on Transportation and Infrastructure, Aviation Subcommittee, U.S. House of Representatives, March 29, 2006.

Industry Initiatives

The unmanned aircraft industry, collectively consisting of unmanned aircraft systems and system component manufacturers and system operators, has been cognizant of concerns regarding the operation of unmanned aircraft for civilian uses in domestic airspace. Collectively, the views of drone developers and operators worldwide are represented by the Association for Unmanned Vehicle Systems International (AUVSI). AVUSI has addressed many of the public concerns surrounding UAV operations in a voluntary industry code of conduct issued in July 2012, which is summarized in the text box below.

Voluntary Industry Code of Conduct for Drone Operations

In July 2012, the Association for Unmanned Vehicle Systems International (AUVSI) issued a voluntary industry code of conduct for the operation of unmanned aircraft systems. The code of conduct addresses concerns raised by the public and regulators regarding safety, professionalism, and respect.

With regard to safety, operators adopting the code commit to

- operating in a manner that will not present undue risk to persons or property on the surface or in the air;
- ensuring that vehicles are piloted by competent and properly trained individuals; and
- ensuring that flights are conducted only after thorough risk assessments, including consideration of weather conditions, potential failures and possible consequences, crew fitness for flight operations, airspace issues, applicable aviation regulations, frequency spectrum requirements, and the reliability, performance, and airworthiness of the aircraft.

With regard to professionalism, adopters of the code commit to

- complying with all federal, state, and local laws, ordinances, covenants, and restrictions pertaining to unmanned aircraft operations;
- operating systems as responsible members of the aviation community;
- being responsive to public needs;
- cooperating fully with federal, state, and local authorities in response to emergency deployments, mishap investigations, and media relations; and
- establishing contingency plans for all anticipated non-normal events and sharing these plans openly with all appropriate authorities.

Finally, with regard to respect, operators adopting the code commit to

- respecting the rights of other airspace users;
- respecting the privacy of individuals;
- respecting the concerns of the public regarding unmanned aircraft operations; and
- supporting improved public awareness and education regarding the operation of unmanned aircraft.

Eyes in the Sky: Sensor Payloads

A central issue surrounding the use of unmanned aircraft is the airborne sensors, particularly imaging sensors, that are mounted to the underbellies of these vehicles to gather data and collect images of the earth below. While these sensors may be utilized for a variety of beneficial applications, they have also raised considerable concerns regarding their potential intrusiveness, despite the aforementioned industry commitments to respect the privacy of individuals (see "Concerns over Privacy and Intrusiveness" below).

Cameras and Electro-Optical Imagers

Typical cameras and sensors placed on unmanned aircraft can collect data across a broad range of the electromagnetic spectrum, both within and beyond the range of human vision. They can provide aerial surveillance capabilities and spectral data under a wide range of lighting and atmospheric conditions. In many cases, small UAVs used in surveillance applications are simply equipped with commercial, off-the-shelf digital still photograph or video cameras. Usually, for aerial work, high-end digital cameras with image stabilization are needed to provide detailed resolution from a distance and avoid motion blur from the movement and vibration of the aircraft and the camera platform. UAVs used for detailed earth imaging are fitted with more advanced high resolution cameras. These cameras may have advanced optical features, including very large digital imaging arrays, large zoom lenses, and advanced image stabilization capabilities, allowing them to take highly detailed aerial photographs.

Captured videos and images may be transmitted for further processing or, in some cases, may be processed onboard by computer vision and video analytic software. Analytics may include tools such as scene motion detection and analysis, object detection capabilities, license plate readers, and, possibly in some cases, facial recognition software.

Drones may also be equipped with electro-optical sensors that are specifically designed for aerial operations. With regard to their imaging capabilities, electro-optical imagers are similar to high-end consumer digital cameras and typically take either still or video images within the visual electromagnetic spectrum, similar to human visual capabilities. Thus these sensors, like cameras, provide eyes in the sky when operated in good daylight and twilight visual conditions, when not obscured by clouds or fog.

Infrared Sensors

Cameras and electro-optical sensors cannot provide quality images during nighttime operations or when operating in low visibility, such as in clouds or in fog. Therefore, to augment electro-optical imaging capabilities and allow for imaging under a broader range of light conditions, sensor platforms often also include two-dimensional infrared (IR) imaging arrays. Since the longer wavelengths in the IR bands are not absorbed or attenuated by clouds or fog and are emitted by warm objects at night, IR sensors are capable of providing images beyond the capabilities or normal human sight. In the far infrared spectrum, passive millimeter wave sensors provide thermal imaging capabilities particularly for night vision and thermal imaging applications. The thermal sensing properties of IR sensors make them well suited for law enforcement and border security applications, for example, for providing eyes in the sky for foot pursuits. IR sensors are

also important for command and control of UAVs operated beyond line of sight, giving operators improved situational awareness at night and in poor visibility.

Electro-optical and infrared sensors, collectively known as EO/IR sensors, are often housed together in a turret pod with gyro-stabilized gimbals that allow the sensors to move, either at the direction of a preprogrammed mission plan or from commands issued by a sensor operator remotely controlling the device (see **Figure 2**).

Figure 2. An Electro-Optical/Infrared (EO/IR) Sensor Housed in a Pod Mounted on an MQ-9 Predator B/Reaper Drone Operated by Customs and Border Protection (CBP)

Source: Customs and Border Protection (CBP).

Synthetic Aperture Radar

In addition to passive EO/IR sensors, aircraft are sometimes fitted with active synthetic aperture radar (SAR) antennas, which measure reflections of emitted microwaves to generate sensor imagery. Real time SAR imagery can penetrate through rain, fog, smoke and dust, providing surveillance capabilities in poor weather and in maritime and desert environments that can augment or replace IR and millimeter wave sensors. Some civilian applications of SAR include maritime search and rescue in adverse conditions, fire line tracking in smoke, iceberg detection

and tracking, and oil spill monitoring.[37] While SAR platforms had only been available for large unmanned aircraft until recently, in 2008, defense contractors demonstrated a 2-pound SAR payload for small UAVs that was made commercially available in 2010.[38]

Specialized Sensors

Although cameras, EO/IR, and radars are the most typical types of sensors for UAV applications, unmanned aircraft can be equipped with other sensors for special applications. For example, chemical, biological, or radiological sensors may be used to collect air samples in hazardous environments. NOAA has equipped its UAVs with instruments to collect and analyze air samples.

Concerns over Privacy and Intrusiveness

While unmanned aircraft may carry a wide variety of sensor payloads for diverse applications, cameras and imaging sensors have raised particular concerns among privacy advocates who fear that widespread civilian unmanned aircraft operations could lead to abuses in monitoring, tracking, and surveilling people throughout the courses of their daily lives. Civil liberties and privacy groups including the American Civil Liberties Union (ACLU) and the Electronic Privacy Information Center (EPIC) argue that aerial drones pose a unique threat to privacy.[39] Proponents of drones have countered these arguments by underscoring the many potential benefits of domestic drone use. For example, aerial imaging of farm crops across multiple spectral bands can provide data on crop conditions and may provide critical information on the impacts of drought conditions or other factors affecting crop health. Drone proponents also contend that while unmanned aircraft have been singled out in public policy debate, the sensor technologies, imaging systems, and data collection capabilities in question are not unique to unmanned aircraft, as these devices could just as easily be installed on manned aircraft, or on utility poles, cell phone towers, and tall buildings.[40]

While the main focus of current public policy debate regarding drone use centers on the law enforcement and government use of UAVs for surveillance purposes, additional concerns have been raised regarding the commercial use of drones, including their potential use by marketing firms, private investigators, and paparazzi. While such uses may be considered intrusive by many, Fourth Amendment concerns would not specifically apply to data collections that are not conducted by or on behalf of governmental entities. Besides tracking and surveillance activities

that raise specific privacy concerns, civilian unmanned aircraft operations may raise additional concerns regarding their potential intrusiveness. Various potential commercial uses, such as aerial advertising (using drones to tow banners or display other targeted visual advertisements), may not raise privacy concerns per se, but may nonetheless be regarded by some as intrusive and a nuisance because of aircraft noise and visual distraction.

FAA's authority over specific uses for civilian unmanned aircraft appears limited. As a matter of law, aircraft have privileged access to navigable airspace. U.S. law generally maintains that equal access and availability of navigable airspace to all users are basic principles underlying the national airspace system, so long as safety and national security are not compromised. Notably, 49 U.S.C. Section 40101(c) (2) specifies that FAA, in carrying out its authority to regulate aviation, shall consider the public right of freedom of transit through the navigable airspace.

Navigable airspace is defined in statute as that airspace above minimum flight altitudes prescribed by regulation, including airspace needed to ensure safety during takeoff and landing.[41] Away from airports, minimum altitudes defining navigable airspace are largely predicated on safety concerns and depend on characteristics of the aircraft and risks posed to persons and property on the ground. In general, navigable airspace is considered to be 500 feet above ground level and higher, except in congested areas where the minimum safe altitude rises to 1,000 feet above the highest obstacle within a 2,000-foot radius of the aircraft's position at any given time.[42] In sparsely populated areas and over water, navigable airspace can be considered to be much lower, so long as operators assure that they can make an emergency landing after an engine failure without undue hazard to persons or property on the ground. Moreover, helicopters, powered parachutes, and powered hang gliders can be operated below established minimums so long as operations are conducted without hazard to persons or property on the ground, and so long as helicopters follow certain prescribed routes and altitudes when defined, usually for noise abatement purposes. Minimum altitudes for drones are yet to be defined. However, unregulated model aircraft are generally permitted below 400 feet, outside of navigable airspace for most manned aircraft.

Small low-flying drones may pose particular concerns regarding intrusiveness, especially if they become widely proliferated in urban and suburban areas. For example, it is imaginable that drones displaying advertising material might hover noisily above a beach, or that a magazine might deploy a drone equipped with high-resolution cameras to photograph a celebrity's garden party. As FAA is primarily concerned with balancing safety concerns with its obligation to facilitate access to navigable airspace, it is likely to tread lightly with regard to matters pertaining to the regulation of specific drone uses based upon their perceived intrusiveness.

Although FAA may be reluctant to address such issues, matters pertaining to the use of domestic airspace generally fall exclusively within its purview. 49 U.S.C. §40103(a)(1) specifies that the federal government has exclusive sovereignty of domestic airspace, thus significantly limiting state and local governments from promulgating laws, regulations, or ordinances affecting access to the national airspace system. This may make it particularly difficult for state and local governments to restrict or regulate the use of drones, including imposing limitations on noise.

[41] 49 U.S.C. §40102(a)(32).

[42] See 14 C.F.R. §91.119 Minimum safe altitudes: General.

On the federal level, landowner rights with regard to the navigable airspace above private property are similarly restricted. The Supreme Court has stated that "the air is a public highway, as Congress has declared. Were that not true, every transcontinental flight would subject the operator to countless trespass suits. Common sense revolts at the idea."[43]

While the concept of the air as a public highway has largely overturned the ancient Roman concept that the owner of a land also holds title to the air above, it does not preclude civilians from potentially seeking civil remedies in the courts against aircraft operators flying overhead or in close proximity to an individual's land. This may potentially include civil action against private or commercial drone operators, if damage or interference can be demonstrated. It may also include claims against federal drone operators if the operations are considered to constitute a taking of property by the government because the aviation activity results in a loss of use or a loss of enjoyment of the property. The Fifth Amendment, among other things, protects citizens from a taking of private property for public use without just compensation.

In these matters, case law relating to aircraft noise may have particular relevance to potential landowner actions in response to nuisances and interference caused by drone operations. Nuisance suits pertaining to aviation noise have allowed recovery for annoyance, inconvenience, discomfort, and mental and emotional distress, as well as for property damage. Additionally, citizens have been successful in actions against the federal government under the "just compensation" clause of the Fifth Amendment in cases where federal aviation operations, usually from military airbases or military training areas, have interfered with the use and enjoyment of private land, thereby constituting a "taking" of the land without any formal exercise of powers of eminent domain. To the extent that case law regarding aircraft noise from the early days of civil jet air transportation may bolster potential legal challenges to drone operations, history suggests that the introduction of civilian drones in the national airspace system is likely to be a highly contentious matter.

Subject: Alaska Drone taskforce

Representative Shelley Hughes,

I would like to be considered for one of the open positions for the drone taskforce here in Alaska. I a Mechanical Engineering student at UAA graduating in April 2015. I am very interested in finding the first of many solutions to the UAV addition to our airspace. I currently work several jobs one as Engineering Support at AMC Engineers where we specialize in schools, museums, and libraries. I also work as a handyman during the nights and weekends. I am a very driven person and am very good at finding solutions for issues whether they be mathematical, ethical or social. I could see myself in the future using drones for commercial and personal use as I enjoy the hobby. Alaska needs aerial photography which won't disturb the natural habitat but give us very useful data about what is going on in our very large state.

Thank you for considering me for this position,

Brandon Grimshaw
Engineering Support

OBJECTIVE | To assist the Alaska Drone task force in finding solutions to usage and safety of drones in Alaska's airspace.

SKILLS & ABILITIES | Mechanical Engineering student at UAA graduating April 2015

Eagle Scout (I continue to work with the BSA to strengthen the boys in my area)

Served Mormon mission in Thailand (speak Thai fluently 2002-2004)

Alaska resident for 14 years

Airplane, rocket, helicopter hobbyist

English as first language

Member of ASME, IEEE organizations

EXPERIENCE | **ENGINEERING SUPPORT** AMC ENGINEERS
2012-PRESENT

- Assist Engineers with Specifications on project work
- Aid with AutoCAD drafting in Electrical and Mechanical sets
- Support Engineers through-out each phase of project
- Calculate air change overs
- Involved in multi-million dollar projects through all phases to completion

HANDIMAN
2000-PRESENT

- Diagnose and repair electronic and mechanical systems
- Remodel kitchens and bathrooms
- Finish trim and painting houses
- Repair bicycles

To: 'daniel_hamm@hotmail.com';'akboatkeeper@yahoo.com'
Cc: Rep. Shelley Hughes
Subject: Legislative Task Force on Unmanned Aircraft

If you are interested in applying for a seat on the unmanned aircraft task force, please submit a letter/email of interest and a brief resume no later than Friday June 13. Representative Hughes will send the applicant packet to the President and Speaker on Monday June 16 for their appointments.

The following is the information I sent to the existing task force members for their comment but it is informative for prospective members as they express interest in applying to be a member:

HCR15 re-establishes the task force with five new members, the two departments will each assign a member and we are still receiving letters of interest/resume's for the industry and public seats. I encourage you to send a letter of interest and resume to Rep.Shelley.Hughes@akleg.gov by this **Friday, June 13**. Rep Hughes will forward the packet of interested folks to the President and Speaker for their appointment to the task force.

A TENTATIVE schedule for the Task Force could include the following:

July 8 teleconference to introduce new members to the task force and talk about agenda items to discuss at the upcoming task force meetings.

Task force is tasked with

1) Review FAA guidelines and rules
2) Suggest legislation
3) Evaluate complaints and concerns expressed to the task force (we need a system for this)
4) Identify privacy and safety concerns
5) Recommend public education on UAS
6) Study FAA integration of UAS in national air space
7) Conduct a public hearing concerning privacy and data collection
8) Study non-public use of UAS to encourage industry
9) Study existing laws to make sure UAS users comply with applicable laws

Embry Riddle Aeronautic University has offered to conduct a course designed for Alaska, regarding regulations and industry use of unmanned aircraft. They can offer the course on **July 30-31 (Wed/Thurs)** but need to know how many task force members would be available to attend at that time. The course would likely be offered on campus at UAA or at JBER and requires a tuition fee of $700 (some of which the task force budget may be able to pay). If we do not have enough interest from our task force members, Embry Riddle may not conduct the course – they need to know a approx. head count by this Friday.

- The Task Force would then have its first face-to-face meeting on **Friday, August 1 in Anchorage**.

The next event we'd like to tie into the Task Force schedule is the UAA/UAF Interest Group Meeting September 16-18 (Tues-Thurs). This meeting is scheduled to be held in Anchorage and many UAS folks attend to learn about the test ranges, industry use, new rules and regulations, networking, and much more. We would like to hold a Task Force meeting the day following the Interest Group meeting on **Friday September 19 in Anchorage**.

November meeting would be scheduled if the group determines we need to prepare legislation, request regulations, respond to citizen requests/concerns.

Possibly a winter meeting if the task force needs to respond to citizen requests/concerns.

The tentative schedule is what I've asked the existing task force members to review and comment on. None of the dates and events are confirmed but it's what we are looking at as far as commitment for task force member participation.

Subject: Unmanned Aircraft Advisory Task Force

I would like to be considered for appointment as a public advocate for citizen concerns on the above mentioned task force. The age of the drone is indeed upon us and it is incumbent that we act as good stewards for ours and future generations of Alaskans in managing this technology to the highest and best use taking the privacy of the people and adherence to the Constitution as prime consideration in formulation of regulations.
I was born in rural upstate New York and have an AAS in Business Administration from Jefferson Community College. I moved to Alaska in May 1972 and have lived and worked in Anchorage, Seward, Barrow and Prudhoe Bay. In 1998 I purchased a house in the Springer System where myself and my wife currently live. I am a retired member of Laborers Local 341 and was an ASEA labor steward when employed at AVTEC in Seward in the late 90's. Over the years I have worked in real estate, social services, talk radio and other diverse forms of employment. My life experience, I believe, makes me a strong and able candidate for the force. Should you desire more information or character references please contact me at your convenience.
Sincerely, David A. Jenkins

Ginger,

This is Tyler Hawker, with UMS3. I wanted to say thank you again for letting me know about the selection process for the two additional industry representative seats on the Legislative Task Force for Unmanned Aircraft Systems in Alaska. I hope everything is going well, and hopefully settling down now that the 2014 session is over.

Attached are a copy of my Resume summary and cover letter for Shelley for application for one of the two industry representative seats on the Legislative Task Force. I have also mailed a physical copy to President Huggins and Speaker Chenault.

Again, I appreciate you taking the time to update me about the Task Force and I appreciate Shelley's and your willingness to continue this Task Force to help build this new industry in Alaska. Please do not hesitate to contact me if you have any questions or concerns.

Thank you,
--Tyler Hawker

May 20, 2014

Senate President Charles Huggins
Speaker of the House Mike Chenault
Alaska State Legislature
733 W 4th Avenue, Suite 100
Anchorage, AK 99501

Dear President Huggins and Speaker Chenault,

This cover letter and attached summary resume are being submitted as a request that I be selected as one of the two appointments you will be making of industry representatives to the Task Force on Unmanned Aircraft Systems pursuant to HCR 15 recently passed by the 2014 Alaska legislature. I have the required participatory Unmanned Aircraft Systems (UAS) experience and am actively involved in developing the unmanned aircraft industry in Alaska and throughout the country. My qualifications have been developed through career experience designing, operating and training users of unmanned aircraft systems in hobby, commercial, and military environments.

My goal, as a member of the Task Force, is to work collaboratively with its other members, the University of Alaska, and the other federally recognized test sites, to develop a safe and successful private sector UAS industry and UAS industry jobs in Alaska and the continental US.

Currently I am the owner of an Unmanned Aircraft Systems (UAS) operating, engineering and consulting business based out of Fort Collins, Colorado, with a focus on opportunities to develop UAS applications in Alaska. My business, UMS_3, is a broad-range UAS consulting and services firm consisting of a team of individuals with extensive UAS, general aviation, and engineering background in Department of Defense and civil UAS operations, engineering, research and development, manufacturing, and training. My business and our partners around the country have been working to stand up UAS operational services in the State of Alaska and on the North Slope. We are currently in direct communication and/or working with the University of Alaska, other universities, Alaska Native Corporations, various private companies, and the oil and gas producers in Alaska and the continental US to provide UAS flight and engineering services and operational consulting advice. Last year, I participated and presented public testimony to the Alaska Legislative Task Force for UAS, have continued communications to Representative Hughes office, and am seeking to assist Christi Bell at the Alaska Center for Economic Development in Alaska's economic development of the private UAS industry across the state.

My commercial and military experience with autonomous Unmanned Aircraft began with the military as a civilian contractor providing flight services to the Navy, US Marine Corps, Air Force, and Special Forces through my then-employer AAI / Textron Systems. I am a fully qualified UAS Test and Engineering Operator (Pilot), Maintainer, Technician, Instructor Pilot, Emergency External Pilot, and Mission Commander with over 1,000 direct flight hours in high-stress, complex engineering flight test and combat environments with additional

11001 Glazanof Drive, Anchorage, AK 99511
2330 Rollingwood Drive, Fort Collins, CO 80525
(970) 420 – 6812 · tyler.hawker@ums3.com

over-sight flight hours as an instructor and operations flight director. I have flown UAS in many areas of the United States as well as in Afghanistan, having deployed in 2011 as a senior level operator and engineer to support the stand-up and success of AAI's DOD contracts.

My passion and involvement in UAS began many years ago when I began flying Remote Controlled (RC) Model Aircraft. Since then, I have been an avid RC pilot and supporter of the Academy of Model Aeronautics (AMA), competing at the highest levels in aerobatics as a professionally sponsored pilot. I have represented, through sponsorship, employment, and ownership, several radio controlled aircraft manufacturers, suppliers, and AMA Clubs and related organizations.

My commercial and military flight mission experience includes all forms of UAS from small electric quad-rotors, to medium-endurance, long-range military-oriented aircraft with payloads ranging from infrared to particle detection and data-acquisition for research and development. Most recently, my involvement with UAS has focused heavily on the commercial advancement of the technology, ranging from utilizing aircraft for civil uses, such as pipeline monitoring and security, public safety and disaster response, and heavy equipment inspection and monitoring.

With my background and involvement in UAS ranging from RC model aircraft, to commercial UAS, to military UAS, I will bring the experience and commitment Alaska is looking for in the members of the Task Force on Unmanned Aircraft Systems. I am extremely interested in the proper development of UAS-related legislation and regulations from business, public safety, and aviation industry perspectives. I believe my commitment to Alaska, and broad background and experience in UAS, as well as my connections, partnerships, and support from several other UAS manufacturers and service providers would make me a particularly good fit for the Alaska Legislative Task Force for Unmanned Aircraft Systems.

I appreciate you taking the time to review my resume for consideration for a position on the Alaska Legislative Task Force for Unmanned Aircraft Systems. Please do not hesitate to contact me if you have any further questions. I look forward to hearing from you in the near future.

Cordially,

Tyler Hawker

Objective

To work collaboratively with the Alaska Task Force on Unmanned Aircraft Systems members, the University of Alaska, and the other federally recognized test sites, to develop a safe and successful private sector UAS industry and UAS industry jobs in Alaska and the continental US.

Professional Experience

UMS_3, Inc. **2013 – Present**
Founder, VP, Operations and Product Development Colorado Springs, CO

Textron / AAI - Unmanned Aerial Systems (UAS) **2011 – 2013**
SUAS Engineering & SUAS Test Flight Crew Hunt Valley, MD

3D Hobby Shop **2010 – 2011**
Director of Operations and Demonstration Pilot Fredericksburg, TX

Intel Corporation **2004 – 2009**
Mask Design Engineering & Programming Fort Collins, CO

Hawker Technology Consultants **2003 – Present**
IT System Administration & Network Consultant Fort Collins, CO

Education

Colorado State University **2005 – 2010**
Electrical and Computer Engineering Fort Collins, CO
Academic Focus: Electrical Engineering, Computer Science, Math, Digital Logic Devices, DC/AC Analog Circuit Analysis, Business Information Technologies, Technical Journalism, and Economics

Front Range Community College **2004 – 2005**
Electrical Engineering Fort Collins, CO
Academic Focus: Electrical Engineering, DC / AC Circuit Analysis

Fort Collins High School **Graduated 2007**

Relevant Skills

Advanced Computing

Advanced in: Piccolo Command Center, Viewpoint, Mission Planner, Arduino Autopilot, Microsoft Windows, Unix / Linux; Mac OSX, iOS, Windows Networking

Proficient in: Global Mapper, Google Earth, AutoCAD 2012

Programming: Java, C, C++, Perl, HTML, CSS, PHP

Technical Skills & Qualifications

Electronics: PCB and Wire soldering & repair, Wiring harness assembly, Circuit analysis
Other: Composite repair, HAZMAT shipping, handling & storage

Remote Control Model Aviation

Build, fly, and maintain all varieties and sizes of model aircraft
Competed in Unlimited Class IMAC and Masters Class F3A Pattern
Demonstration and sponsored pilot for 3D Hobby Shop (2009 – 2011)

Sent: Wednesday, May 28, 2014 2:00 PM
To: Rep. Shelley Hughes
Subject: UAV advisory task force

Representative Hughes,

I'm interested in learning more about the task force that was mentioned on this morning's radio show. I have a 25 year background in crisis management, much of it in Alaska where my focus was primarily on tactical response decisions so aerial mapping, reconnaissance and image documentation was a priority.

Since 2005 I've operated one of the few companies in the world that specializes in 360° geo spatial imagery. We utilize full motion, high definition viewer controlled spherical video that can be matched to anything from Google Maps, smart phone apps and simple video players to proprietary project software. We collect imagery from the air, river boats/marine, backpack, underwater, helmets, ATV and other vehicles.

We were involved in some of the early development of StreetView and MapQuest360 tools and then took it into full motion, geo referenced video ground and aerial tools. You can see examples at one of our cloud sites www.im360.com, For the purposes of this note, the helicopter tours channel is probably the best one but you can see that the immersive world is here if you spend a few minutes looking at other channels.

We're also involved in the expansion of the 360 Hero's system which utilizes GoPro cameras and software to "stitch" them into spherical video. From there, it's a fairly small jump to the web. Lightweight, mass produced, easy to operate, cheap, understood by all ages from about 5 and up.

The immediate display of imagery is ubiquitous, we see it on mounted televisions in airports and our phones dozens of time a day. The capability to provide 180/360° video, live, viewer controlled and on the web is here. The hosting of immersive content for non live needs is a simple and for the most part, very economical process.

As the owner of an emerging and disruptive technology company, I'm pretty familiar with the issues that will push on the boundaries over the next few years. I've underlined the issue of viewer controlled because 50,000 (or a million, or…) people could be looking at whatever they wanted to, on the same clip, on the web, at the same time. All taken from a UAV, maybe live.

We're Alaskan based and have worked extensively in the state but provide our services around the world. I look forward to hearing from your office regarding the task force and their objectives or any questions you may have.

Respectfully,

Kenn Kadow

To: 'Kenn Kadow'
Subject: RE: UAV Task Force-follow up

Categories: Drone

Good morning Ken,
I'm just following up to see if you sent anything to Rep Hughes for the UAS Task Force.
I attaching the email that I've just sent to the existing task force members that includes some tasks, dates and times – ALL TENTATIVE

Ginger

If you are interested in applying for a seat on the unmanned aircraft task force, please submit a letter/email of interest and a brief resume no later than Friday June 13. Representative Hughes will send the applicant packet to the President and Speaker on Monday June 16 for their appointments.

The following is the information I sent to the existing task force members for their comment but it is informative for prospective members as they express interest in applying to be a member:

HCR15 re-establishes the task force with five new members, the two departments will each assign a member and we are still receiving letters of interest/resume's for the industry and public seats. I encourage you to send a letter of interest and resume to Rep.Shelley.Hughes@akleg.gov by this **Friday, June 13**. Rep Hughes will forward the packet of interested folks to the President and Speaker for their appointment to the task force.

A TENTATIVE schedule for the Task Force could include the following:

July 8 teleconference to introduce new members to the task force and talk about agenda items to discuss at the upcoming task force meetings.

Task force is tasked with

1) Review FAA guidelines and rules
2) Suggest legislation
3) Evaluate complaints and concerns expressed to the task force (we need a system for this)
4) Identify privacy and safety concerns
5) Recommend public education on UAS
6) Study FAA integration of UAS in national air space
7) Conduct a public hearing concerning privacy and data collection
8) Study non-public use of UAS to encourage industry
9) Study existing laws to make sure UAS users comply with applicable laws

Embry Riddle Aeronautic University has offered to conduct a course designed for Alaska, regarding regulations and industry use of unmanned aircraft. They can offer the course on **July 30-31 (Wed/Thurs)** but need to know how many task force members would be available to attend at that time. The course would likely be offered on campus at UAA or at JBER and requires a tuition fee of $700 (some of which the task force budget may be able to pay). If we do not have enough interest from our task force members, Embry Riddle may not conduct the course – they need to know a approx. head count by this Friday.

- The Task Force would then have its first face-to-face meeting on **Friday, August 1 in Anchorage.**

The next event we'd like to tie into the Task Force schedule is the UAA/UAF Interest Group Meeting September 16-18 (Tues-Thurs). This meeting is scheduled to be held in Anchorage and many UAS folks attend to learn about the test ranges, industry use, new rules and regulations, networking, and much more. We would like to hold a Task Force meeting the day following the Interest Group meeting on **Friday September 19 in Anchorage**.

November meeting would be scheduled if the group determines we need to prepare legislation, request regulations, respond to citizen requests/concerns.

Possibly a winter meeting if the task force needs to respond to citizen requests/concerns.

The tentative schedule is what I've asked the existing task force members to review and comment on. None of the dates and events are confirmed but it's what we are looking at as far as commitment for task force member participation.

Ms. Blaisdell,

Thank you for taking the time to explain the mission and history of the task force on UAV issues.

As a company that's heavily involved in the collection of aerial geospatial data, we have a strong interest in the regulations being promulgated in Alaska. Policy is often a reactive practice so I appreciate Representative Hughes interest in looking ahead at issues like this.

To good days and the people we share them with.

Shelly,
I wanted to provide you with some of my personal information for possible consideration for a position on the Legislative Task Force on Unmanned Aircraft Systems. I am very motivated to assist with this work and have the skills necessary to provide valuable input. The work being done by the task force will be critical to the development of my business. I strongly support sensible rules and regulations that will protect this industry and the individuals of our state. Please let me know if you need any additional information or if I can answer any questions that you might have.
Sincerely,

Dan Monarch

Shelly Hughes
Alaska State Legislature
Juneau, Alaska

Dear Representative Hughes,

I am interested in speaking with you and anyone else in the legislature about possible participation in the Legislative Task Force on Unmanned Aircraft Systems (UAS). I believe I have specific qualifications that meet the requirements for this role. I have over 25 years of experience in business covering numerous industries. This includes work at both private and public entities. I have started companies and worked for both large and small organizations. My roles at most of the organizations I worked for have been very technical in nature and typically involved emerging technologies.

Here are a few of my top qualifications:

- Strong Commitment to Service
- Solid Collaboration and Communications Skills
- Broad Industry Background
- Focused Project and Process Management Experience
- Technically Savvy Professional
- Self-Motivated, Results Oriented, Team Player
- Great Attitude!!

I am currently an Owner and Pilot at UpAngle Productions. We are starting to establish ourselves in the aerial photography industry and are very motivated in assisting with the adoption of rules and regulations that will allow us to continue. This industry is growing rapidly and that will continue as technologies improve and more uses for UAS are identified. UpAngle Productions strongly believes that UAS guidelines must be developed to protect our industry and to provide for safe operation and appropriate use of these platforms. I would appreciate an opportunity to meet with you to discuss how my experience could best meet your needs. I can be reached at 907-745-3326 if you would like to speak about how I might be able to help you out. I can also be reached by email at dan@upangle.com if you wish to contact me that way.

I look forward to discussing possible involvement with the task force.

Sincerely,

Daniel Monarch

Daniel Monarch

Alaska State Legislature

Integrated Robotics Imaging Systems

April 16, 2014

The Honorable Senator
Peter Micciche
District O
State Capital Room 125
Juneau, Alaska 99801

Re: Letter of Interest – Alaska UAS Task Force

Dear Senator Micciche:

In the past two years the Alaska UAS Task Force chaired by Representative Hughes has done outstanding work on behalf of the State of Alaska to address privacy issues in the operation of UAS and help Alaska become a leader in the commercialization of UAS's in the U.S.

The most recent version of HCR-15 (3/27/14) allows for, "two industry representatives who are participants in the unmanned aircraft system industry with experience operating unmanned aircraft systems who shall be appointed jointly by the President of the Senate and the Speaker of the House of Representatives."

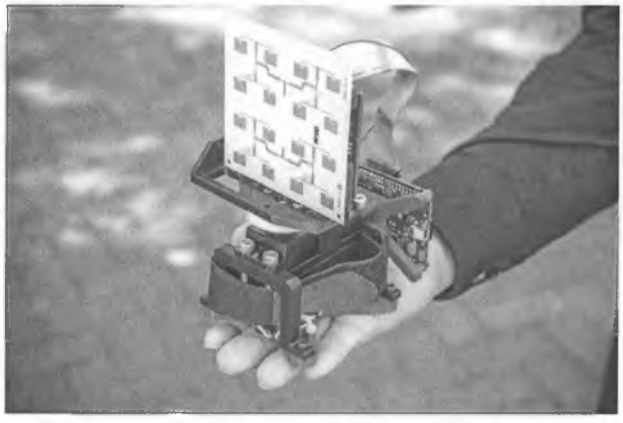
We would like to formally request that you submit our name as a member of the task force. Integrated Robotics was formed in late 2012 to provide advanced, versatile, mission capable unmanned aerial vehicles to meet real world challenges. We are the North American Manufacturer and Distributor's representative for a specialized UAV platform uniquely capable of performing in our arctic environment and in conditions not suitable for other small UAS's. Our platform is the Infotron IT180-5 electric or gas UAS.

This UAS weighs 14kg and has an endurance of ~1 hour in the electric version and ~3 hours in the gas version. Integrated Robotics will be manufacturing this UAS in Kenai within the next 3 years. We will also conduct research on the feasibility of using a recently patented Sodium Borohydride Fuel Cell to replace our current LiPo batteries. Our successful research will achieve two important things. We will increase the endurance of our UAS by approximately an order of magnitude. More importantly, we will be able to lower our carbon footprint by replacing our gas engine with the fuel cell.

Corporate Offices: 140 Main Street Loop - Kenai, Alaska 99611-7722 – USA Phone: +1 907-283-4223
Email: iris@uav-alaska.com Web: www.uav-alaska.com

Additionally, on April 9, 2014, Integrated Robotics acquired exclusive patent rights from the University of Denver, for a miniature, (8 oz.) collision avoidance radar specifically designed for small UAS. During the next 18 months we will be integrating this radar into our UAS, testing it at the Pan-Pacific UAS Test Range Complex (PPUTRC) in Fairbanks and working to certify it through the FAA. This will enable us to hire personnel and begin manufacturing the radar in Kenai, to make it available to other UAS industry stakeholders in Alaska, the lower 48 and globally.

Left to right Dr. Kimon Valavanis, Dr. Matt Rutherford, John C Parker and Dr. Allistair Moses – University of Denver.



Frequency Shift Keyed Continuous Wave Radar

As you can see we have a substantial stake in furthering the commercialization of UAS in the National Airspace and we feel that the Alaska UAS Task Force could benefit from the input that we can provide and we certainly would benefit from the views of the other members of the Task Force as well as the public.

Attached per your request is my personal resume and should you have any questions or require further information, please feel free to contact my office at your convenience.

Very truly yours,

John C. Parker, President
INTEGRATED ROBOTICS IMAGING SYSTEMS

PERSONAL

Born	September 8, 1943
Height	5'11"
Physical Condition	Excellent
Married	5/30/92
Wife's Name	Marie
Children	Two Sons 47, 46 and Two Daughters 37 from previous marriage

MILITARY

US ARMY	1964-1971
Rank	Sergeant E-5 (Warranted)
Duties	MP Criminal Investigator
Assignments	Southeast Asia & US
NATIONAL GUARD	1979-1981
Rank	Sergeant E-5 (Warranted)
Duties	MP Criminal Investigator
Assignments	Sacramento, California

EDUCATION

United States Armed Forces Institute – 2 years college
Columbia Pacific University – 126 Credits
American River College Placerville, CA – Admin. of Justice Courses
Sierra College Roseville, CA – Engineering Courses

LICENSES AND CERTIFICATES

Member Association of Unmanned Vehicle Systems International
Member Alaska Peace Officers Association
State of Alaska Licensed Insurance Investigator (1998-2005)
Nuclear Safety Certification-Troxler Laboratories
Licensed Pre-Trial Investigator (1982-1997)
Officer of the Court Third Judicial Dist. (1982-1998)
Member Alaska Association of Legal Assistants (Past)

WORK EXPERIENCE

July-'12-Present — ***President/COO*** — Integrated Robotics Imaging Systems, Ltd. 140 Main Street Loop Kenai, AK 99611

Unmanned aerial vehicle company. Specializing in providing advanced, versatile mission capable unmanned aerial systems to meet real world challenges. We also will be conducting research in collision avoidance and fuel cell technology. Our company holds exclusive patent rights for a miniature (8 oz.), collision avoidance radar designed for UAV's.

Aug '05 – Present — ***Owner – General Manager*** — Parker & Associates 140 Main Street Loop Kenai, AK 99611

Investigator handling a wide range of investigations including, commercial property, aviation, engineering, personal injury and product liability cases. Requires the ability to gather and correlate information and evidence, write concise reports of investigation and testify at trial.

Jan '05 – Present — ***President*** — Integrated Account Management, Inc. 140 Main Street Loop Kenai, AK 99611

Purchase and sale of Deed of Trust notes on the secondary investor market. Preparation of in-depth due diligence reports, negotiating with a wide range of investor clients for contract investing and management. Purchase, rehabilitation and sale of commercial real estate properties including creating and selling new first position notes for those properties.

Jun '98 - Present — ***President & Sr. Opns. Mngr.*** — Trustee Services of Alaska 140 Main Street Loop Kenai, AK 99611

Provide Trustee services to Professional Escrow Services, Inc., and real estate and title companies in the State of Alaska. Named as Trustee on all deeds of trust prepared by PESI to secure the performance of the obligation within the Trust Deed and administer foreclosures should the need arise.

John C. Parker

140 Main Street Loop - Kenai, Alaska 99611 (907) 283-3007

Jun '93 - Present

Corporate Officer – Scty/Treasurer Professional Escrow Services, Inc.
140 Main Street Loop
Kenai, AK 99611

Provide full service escrow closings and note servicing throughout the State of Alaska. Prepared all legal documents necessary to facilitate closing of real estate and other property transactions. Collection and auditing of portfolio notes for investors of Integrated Account Management, Inc.

Nov 98 – Aug '05

Insurance Investigator-Owner Parker & Associates
908 Highland Ave. Ste. 1
Kenai, Alaska 99611

Licensed through the State of Alaska Division of Insurance to provide insurance investigations of claims on behalf of insured's and insurers. Specialized in commercial aviation, marine, oil & gas and property losses throughout the State of Alaska, lower 48 states and abroad.

Apr '02- May '04

Code Enforcement Officer City of Kenai
210 Fidalgo Avenue
Kenai, Alaska 99611

Duties include investigation of City of Kenai Municipal Code violations, disposition of offenders and reports to the Chief of Police and City Attorney. Requires ability to write chronological reports, gather evidence, deal with citizens of the community in a professional manner and testify in court. This was a successful two year pilot program. I also authored a Policies & Procedures Manual for this position.

Jan '90 – Jun '92

Director of Security Indian Summer Mine, LTD
110 Trading Bay, Ste 130
Kenai, Alaska 99611

Duties included day to day security operations during the drilling program. I also worked directly with the CFO, in writing a $30M funding proposal which was presented to and accepted by investors from New York.

May '87 – Dec'89

President Lasernetics Research, Inc.
P.O. Box 1137
Kenai, AK 99611

Conducted primary feasibility research into laser energy project aimed at development of small laser/photovoltaic energy solution. Research failed to support initial cost/benefit claims.

May '82 – Nov '98 ***Pre-Trial Investigator-President*** Document Service Co., Inc.
908 Highland Ave. Ste. 1
Kenai, Alaska 99611

Investigations to prepare for trial including, gathering evidence, identifying plaintiffs, defendants and witnesses. Handling a range of technical cases including, personal injury, product liability and environmental investigations. Required a high degree of public contact, ability to correlate information, write concise reports and testify at trial.

Nov '81 – May '82 ***Electrician/Laborer*** Onis King A&S Company
52239 Myron Street
Nikiski, Alaska 99635

Responsible to supply explosion proof electrical lighting and loads to workers excavating and repairing oil pipeline at Mobil Oil Company Drift River Alaska field.

Mar '78 – Feb '81 ***Engineering Technician*** Terrasearch, Inc.
904 B Tribute Road
Sacramento, CA 95825

I invented a tool needed by this company to complete soil investigations and was subsequently offered a position in the company. My responsibilities included application of engineering requirements to field operations, ability to consult on a professional basis with engineers and contractors working on the construction of dams, commercial and residential structures. I also built and maintained a variety of lab equipment used in soil testing and investigations.

1970 – 1978 ***Owner/Partner*** Kerand Investments
P.O. Box 926
Placerville, CA 95667

Purchasing, building and re-selling small businesses. Required knowledge of all aspects of finance, business management and employee relations. Managed up to 50 employees. Many of the businesses purchased were distressed due to mismanagement. All were rehabilitated and sold at substantial profit.

John C. Parker

140 Main Street Loop - Kenai, Alaska 99611 (907) 283-3007

1974 – 1976 ***Police Officer*** Placerville Police Dept.
489 Main Street
Placerville, CA 95667

Patrol and investigative assignments as directed by shift supervisor. Follow-up investigations, evidence gathering and preparation for trail. I also worked as a dispatcher and training officer.

Dec '68 – May '69 ***Electronic Technician*** Varian Associates
611 Hansen Way
Palo Alto, CA 94305

I contracted my services to the University of Pennsylvania Applied Science Center for Archaeology through Varian Associates of Palo Alto, California. In consortium with the Mexican Government, I conducted a magnetic investigation of an Olmec archaeological site in the Yucatan Peninsula of Mexico. The investigation was performed using a Cesium Magnetometer. I also conducted prototype testing of a Proton Precession Magnetometer that led to the development of what is now the EG&G Geometrics G856AX magnetometer.

Rep Hughes-

Congratulations on getting your UAS legislation passed in the legislature. It is a testament to you and your staff's hard work and leadership that your team has been able to pass UAS legislation in several sessions.

I would like to submit myself for consideration to serve on the Task Force. As a lifelong Alaskan, I am thrilled at the opportunity Alaska has to be a leader in this blossoming industry. My company is Alaskan-owned and will be focusing on local hires and local work in the unmanned remote sensing industry. Furthermore, I am still serving in the Air Force Reserve and qualified as a SUAS operator and in my prior life as a staffer for Senators Stevens I worked on UAS policy and issues.

I've attached my resume. Please let me know if you need any more information to consider my nomination.

My Best,

Steve

TULUGAQ **Steve Wackowski** *Operations Manager, Tulugaq*

Main: 907-346-3247 Cell: 907-306-8007 Fax: 907-349-1920 steve.wackowski@fairweather.com

STEPHEN M. WACKOWSKI

3663 Mirage Cir, Anchorage, AK 99504

(907) 306-8007 | steve.wackowski@fairweather.com

PROFESSIONAL EXPERIENCE

TULUGAQ II, LLC. — **JULY 2013 – PRESENT**

Operations Manager | Anchorage, AK

Hand-picked by joint venture partners to lead and manage newly formed unmanned remote sensing company. Tulugaq II, owned by Kaktovik Inupiat Corporation, Olgoonik Oilfield Services, and Fairweather Science, LLC is home-based in Anchorage. The company is ANC majority-owned and is preparing for a major UAS operation staged from the North Slope this fall.

Selected Achievements

- Served on program management team for historic 2013 Conoco Phillips/Olgoonik Fairweather Scan Eagle flights over the Chukchi Sea
- Authored the Plan of Operations for 2013 CP/OF Scan Eagle flights
- Coordinates activities for manned/unmanned aerial survey working group
- Conducted outreach to Alaska AOPA on behalf of UAS community with ACUASI

CAPTAIN, UNITED STATES AIR FORCE RESERVE — **MAY 2005 – PRESENT**

Headquarters Air Force Intelligence Directorate's ISR Innovations Office | Pentagon, DC

Director of Battlefield Networking, UAS Operator

Directed multi-million dollar research and development efforts to improve and rapidly integrate emerging ISR technologies for the Global War on Terrorism. Trained, equipped, led, and deployed with ISR teams world-wide for contingency response, including in Afghanistan, Iraq, and Haiti. Drove public affairs strategy to highlight impact of Air Force ISR efforts in contingency operations. Executed over $30 million of USAF/DoD Research and Development, procurement, and contingency operation funds. Wrote requirements and contracting justifications for joint contingency R&D and procurement programs with Air Force Research Laboratory, the DoD ISR Task Force, and Joint Improvised Explosive Device Defeat Organization.

Selected Achievements

- Promoted from Deputy to Director of acclaimed Eagle Express Program, recipient of the 2009 Geospatial Intelligence Foundation's Military Achievement Award
- Highlighted in national press as manager and action officer for Project Robin Hood, saving U.S. Government over $12 million in IT equipment costs
- Coordinated humanitarian assistance for Operation Care, delivering aid directly to Afghanistan
- First ever to operate UAS in High Arctic, conducted shipborne flights of RQ-11s in support of DIA research
- Repurposed over $4 million in excess government UAS equipment for use as government-furnished equipment for university research
- Forged enduring joint R&D effort with NATO's Command, Control, and Communications Agency, delivering first-ever direct combat support to deployed NATO Geospatial Intelligence cells
- Conducted first-ever test flights of NASA's Dragon Eye UAS, enabling testing of prototype atmospheric sensors for remote sensing development

Additional Air Force Qualifications and Military Education

- Senior Cyberspace Operations Officer Qualified
- AM490 Free Fall/Basic Parachutist Qualified
- Special Operations Command Small UAS Operator Qualified
- Right-of-Line flight, In-residence Squadron Officer School Graduate (5% of Reserve Officers are selected)
- Joint Professional Military Education, In-Residence at National Intelligence University selectee
- Current Top Secret/Sensitive Compartmented Information clearance and indoctrination

LISA MURKOWSKI FOR U.S. SENATE **MAY 2010 – NOVEMBER 2010**

Communications Director and Spokesman | Anchorage, AK

Spokesman for Senator Murkowski's historic – and victorious – write-in campaign. Created, directed, and implemented press strategy for primary campaign. Represented campaign in both local and national media, in print, online, and television to include live interviews. Hired and managed team of six communications staff. Executed and managed earned media budgets for radio, print, and television.

Selected Achievements

- Senior staff member on both primary and write-in phases of campaign
- #1 in the US! Communications Team earned the Public Relations Society of America's Senior Anvil award
- Personal efforts on campaign highlighted in Alaska Dispatch's *Race of a Lifetime* series
- Spoke on campaign's behalf in national press, in print media and live television newscasts
- Singled out by Senator Murkowski during post-election victory rally as integral member of team

U.S. SENATE, OFFICE OF SENATOR TED STEVENS **JULY 2005 – JANUARY 2009**

Press Secretary and Special Assistant, Personal Office | Washington, DC

Last serving Press Secretary for Senator Ted Stevens of Alaska. Assumed roles as both traveling Press Secretary and DC spokesman. Coordinated crisis communications and press response to Alaska, national, and international press. Led communications team of two full-time staff and three interns.

Selected Achievements

- Credited with devising and co-writing the Rural Veterans Travel Benefit, Senator Stevens' amendment to the Post 9-11 GI Bill, which enabled reimbursement of highly rural veterans' travel costs for education.
- Official spokesman for Senator Stevens, spoke on-the-record in national and Alaska press

Professional Staff, Committee on Science, Commerce, and Transportation | Washington, DC

Legislative portfolio included Oceans, Atmosphere, and Maritime issues. Served as lead committee staff for oversight over the National Oceanic and Atmospheric Administration (NOAA) and U.S. Coast Guard. Oversaw passage of the U.S.-Russia International Treaty on Protection of Polar Bears. Tasked by Senator Stevens to coordinate directly with Alaska fisheries groups during passage of 2006 Magnuson-Stevens Fishery Conservation and Management Act. Vetted Coast Guard and NOAA nominees for Senate confirmation and managed several congressional fellows/interns.

Selected Achievements

- Lead staff for first-ever Commerce Committee hearing on non-military use of UAS in national airspace for disaster response, disaster mitigation, and threatened/endangered species monitoring
- Lead staff for first-ever joint hearing between the Commerce and Foreign Relations Committees on the International Polar Year
- Staff member of the U.S. State Department's delegation to the International Whaling Commission

EDUCATION

National Intelligence University **2010-Present (July 2014 graduation)**

Master of Science and Technology Intelligence

- Thesis work on Arctic ISR/UAS operations featured in press and presented at several scientific forums/conferences
- Recognized by NIU President and Dean of Students for outstanding field research in the Arctic
- By name requested for Intelligence Community wide briefs on Arctic UAS operations

Saint Mary's College of California **2000-2005**

Bachelor of Science, Computer Science and Politics/Minor, Philosophy

- Lifetime Member, National Society of Collegiate Scholars
- President, SMC Chapter of Knights of Columbus 2003-2005
- NCAA Division I-AA Football Letterman

Small Unmanned Aircraft System Aviation Rulemaking Committee

Comprehensive Set of Recommendations for sUAS Regulatory Development

April 1, 2009

Co-Chairs:

Bruce Tarbert, Federal Aviation Administration
Ted Wierzbanowski, AeroVironment, Inc

Aviation Rulemaking Committee Members

Ellis Chernoff, Air Line Pilots Association
Patrick Egan, Remote Control Aerial Photography Association
Mike Fagan, Association of Unmanned Vehicle Systems International
Carrie Haase, Auora Flight Sciences
Rob Hackman, Aircraft Owners and Pilots Association
Richard Hanson, Academy of Model Aeronautics
Andrew Lacher, The MITRE Corporation
Fred Marks, FMA
Douglas Marshall, University of North Dakota
Paul McDuffe, Boeing - Insitu
Tad McGeer, Aerovel Corporation
Mike O'Shea, Department of Justice
Andrew Roberts, National Aeronautics and Space Administration
Don Shinnamon, International Association of Chiefs of Police
Dan Schultz, ASTM International
LTC Wade Wheeler, Department of Defense—Policy Board for Federal Aviation
Ardyth Williams, Federal Aviation Administration
David York, Helicopter Association International

Unless flagged with a solid dot (●), the material contained in this document represents general consensus of the members of the Small Unmanned Aircraft System (sUAS) Aviation Rule-making Committee. When there is less than general consensus, alternative views are included along with their accompanying rationale.

Forward

The Small Unmanned Aircraft System (sUAS) Aviation Rulemaking Committee (ARC) was focused on making recommendations for Federal regulations for the operation of civil (commercial) sUAS. However it was understood by the members of the ARC that a public entity could fly under the provisions of any rule that might result from these recommendations in lieu of flying under the provisions of a Certificate of Authorization (COA) or in restricted, prohibited, or warning areas. In formulating the recommendations contained in this document, sUAS ARC used the following guiding principles:

1. Enable the operation of sUAS by mitigating, to an acceptable level of risk, the hazards posed to manned aircraft and other airborne objects operating in the National Airspace System (NAS) as well as the public on the surface.
2. The development of regulations authorizing specific operations of certain sUAS could provide a means for operators to request a waiver(s) from such a rule. Such an option is not available to operators today.
3. Visual "see and avoidance" will be used by the sUAS flight crew to mitigate the risk of collision with other aircraft and airborne objects.
4. The primary burden of maneuvering for potential collision risk avoidance should be on the sUAS flight crew.
5. All other aircraft have the right-of-way over sUAS.
6. The above two principles do not relieve burden upon any pilot to see and avoid other aircraft.
7. Operating limitations will be defined to reduce or minimize potential encounters between manned and unmanned aircraft and reduce vulnerability of those on the surface.
8. A formal Federal Aviation Administration (FAA) safety risk assessment will be used to determine whether proposed regulations are acceptable to the FAA from a safety perspective. If a specific recommendation is not acceptable from a safety perspective then the FAA may require additional mitigations and/or controls.
9. Mitigations and controls should be tied to the level of risk to avoid being overly burdensome on the application of sUAS technology. If a specific recommendation is overly excessive or burdensome then the FAA may elect to modify the recommendation in developing proposed regulations.
10. The recommended regulations should not be overly complex to facilitate analysis by the FAA and other stakeholders.
11. Recommendations will leverage existing standards and regulations which govern the operation of small unmanned and Model Aircraft.
12. Where feasible, the ARC will use existing definitions and regulations to develop recommendations.

13. sUAS ARC recommendations for an Special Federal Airworthiness Regulation (sFAR):
    - Are intended to enable some initial sUAS operations
    - Are not intended to cover all potential applications or aircraft
        - Existing processes such as COAs for public-use aircraft and Special Airworthiness Certificate will remain options.
        - Recommendations are directed at sUAS not necessarily all unmanned aircraft systems.

Overall the committee was focused on a layered approach to ensuring that the potential risks associated with mid-air collisions and/or injury to persons and property is within acceptable levels. Many of the committee's recommendations were made based upon experience with existing aviation operations and regulations and perceptions of risk. Overall, the committee was equally focused on protecting existing air traffic and persons/property on the surface. In general, the philosophy was to minimize encounters, keep sUAS separated from other aircraft and surface risks, avoid collisions, and minimize the impact of collisions that may happen. See Figure 1.

The committee perceives that the recommendations in this document combine together to enable sUAS operations at an acceptable level of risk. As more experience with sUAS is gained and more data generated, these recommendations should be revisited.

For the most part, the committee's recommendations are written in a language like proposed regulations. Rationale and commentary which explain the recommended regulations are imbedded throughout the document and appear inside boxes in italic text. Unless flagged with a solid dot (●), the material contained in this document represents general consensus of the members of the sUAS ARC. When there was less than general consensus, alternative views are included inside boxes in italic text along with their accompanying rationale.

23. Demonstration of Acceptable Level of Risk 53
Appendix A: Summary Matrix 55
Appendix B: Summary of Recommendations for System Standards 63

1. Definitions

The following definitions apply to all small unmanned aircraft systems (sUAS) referred to in this regulation.

Auto Flight Management: Pilot-in-Command (PIC) is able to maintain stable flight without constant direct intervention. To at least some degree, control surface movements result from sensors and software automation on-board the aircraft.

Collision Avoidance: Considered a last resort maneuver of an aircraft to avoid an imminent collision. Without the maneuver a collision might occur.

Conflict Avoidance: Activity which seeks to ensure that aircraft remain safely separated and well clear of each other as to not present a collision hazard.

Control Station: Equipment, not on the aircraft, used to maintain control, communicate, guide, or otherwise operate an unmanned aircraft.

Data Communications Links: All links between the unmanned aircraft and the Control Station which includes the command, status, communications, and payload links.

Launch/Recovery Equipment: Equipment, not on-board the aircraft, used to launch and recover an unmanned aircraft which could also include unique navigation and differential positioning equipment used for autonomous landing.

Model Aircraft: A sUAS used by hobbyists and flown within visual line-of-sight under direct control from the pilot, which can navigate the airspace, and which is manufactured or assembled, and operated for the purposes of sport, recreation and/or competition.

"Mode C Veil": The airspace within 30 nautical miles (NM) of an airport listed in Appendix D, Section 1 of 14 Code of Federal Regulations (CFR) Part 91 (generally primary airports within Class B airspace areas), from the surface upward to 10,000 feet mean sea level (MSL). Unless otherwise authorized by Air Traffic Control (ATC), aircraft operating within this airspace must be equipped with automatic pressure altitude reporting equipment having Mode C capability. However, an aircraft that was not originally certificated with an engine-driven electrical system or which has not subsequently been certified with a system installed may conduct operations within a Mode C veil provided the aircraft remains outside Class A, B, or C airspace; and below the altitude of the ceiling of a Class B or Class C airspace area designated for an airport or 10,000 feet MSL, whichever is lower. [Directly quoted from the Federal Aviation Administration's (FAA's) Aeronautical Information Manual: Official Guide to Basic Flight Information and ATC Procedures, February 14, 2008].

Pilot-in-Command: Same as 14 CFR 1.1

Manual Flight Control: PIC is able to directly control the aircraft such that control inputs made at the Control Station are translated directly into corresponding control surface positions. Augmentations which help maintain flight stability are permitted.

sUAS Flight Crewmember: A pilot, visual observer, payload operator or other person assigned duties for a sUAS for the purpose of flight.

sUAS Pilot: A person exercising control over an unmanned aircraft during flight.

Unmanned Aircraft: An aircraft (as defined by 14 CFR 1.1) that is intended to navigate in the air without an onboard pilot.

Unmanned Aircraft System (UAS): An unmanned aircraft and its associated elements related to flight operation which may include Control Stations, data communications links, support equipment, payloads, flight termination systems, and launch/recovery equipment.

Visual Line-of-Sight: Unaided (corrective lenses and/or sunglasses exempted) visual contact with aircraft sufficient to be able to maintain operational control of the aircraft, know its location, and be able to scan the airspace in which it is operating to decisively see and avoid other air traffic or objects.

Visual Observer: A sUAS flight crew member who assists the sUAS PIC in the duties associated with collision avoidance. This includes, but is not limited to, avoidance of other traffic, airborne objects, clouds, obstructions, and terrain.

Subpart A. Model Aircraft

2. Model Aircraft Operated in Accordance with FAA Accepted Standards

2.1 Applicability

Model Aircraft operations that are conducted in accordance with an FAA accepted set of standards established and administered by a community based association as discussed in Section 2.2, shall otherwise be exempt from the requirements of any Special Federal Airworthiness Regulation (SFAR) that results from this recommendation as long as they are operated by:

- Hobbyist for the sole purpose of sport, recreation and/or competition under the conditions of such an FAA accepted program
- Manufacturers which are flight testing aircraft intended to be operated for the sole purpose of sport, recreation, and/or competition and they are tested at an approved field as defined by and in accordance with an FAA accepted program with the approval of the community-based association responsible for the location
- Educational institutions and/or students for the sole purpose of education or research and they are operated at an approved field as defined by and in accordance with an FAA accepted program with the approval of the community-based association responsible for the location
- Manufacturers which are flight testing aircraft intended to be operated for other than sport, recreation, and/or competition and they are tested at an approved field as defined by and in accordance with an FAA accepted program with the approval of the community-based association responsible for the location

> ***RATIONALE:*** *Reflects FAA's concept of regulating model aviation by exempting Model Aircraft from regulation. Under this approach, modelers participating within an aeromodeling structure/organization such as the Academy of Model Aeronautics (AMA) may operate their Model Aircraft in accordance with an accepted set of standards and operating procedures. Based on a more rigorous attention to safety, risk assessment, and risk mitigation, the accepted standards may provide greater latitude in the Model Aircraft operations. Modelers not participating in the additional safety programming established in an accepted set of standards shall comply with the requirements of Section 3.*

COMMENTARY: *It is important that manufacturers of Model Aircraft are able to test fly their aircraft as they do today without having to adhere to sUAS regulations. In order to give educational institutions (e.g., universities) the flexibility to provide "hands on" instruction and training to students preparing for careers in the UAS and aviation industries they are allowed to fly these systems under the requirements for Model Aircraft. For consistency, manufacturers who develop sUAS that are functionally similar to Model Aircraft, are allowed to test at a location following a community-based and FAA-accepted program.*

2.2 Accepted Model Aircraft Standards and Procedures

Accepted Model Aircraft Standards and Procedures may be established and administered by a community-based association. An accepted set of standards shall be based upon accepted and recognized safety principles and will include but not be limited to the following:

RATIONALE: *Community based organizations, such as the AMA, that have credibility within the Model Aircraft community and that have an established safety record and have demonstrated the ability to influence participant compliance shall be afforded the opportunity to establish a set of safety standards that are more comprehensive than the requirements and limitations given for non participating modelers, and use these standards as an alternative means of compliance with any regulations which may results from these recommendations. Since such standards are more comprehensive, operations under such standards shall allow for a broad spectrum of operations and greater latitude in the AMA operations.*

(1) Prescribed safety program entailing oversight, assessment, risk mitigation, and accident/incident reporting.

(2) General safety guidelines and operating principles.

(3) Operating guidelines specific to the location and to the type, size, performance, and propulsion of the various Model Aircraft.

(4) Comprehensive programming addressing Model Aircraft having non standard weight, or identified as having unusual propulsion types or extraordinary flight characteristics.

(5) Programming to facilitate Model Aircraft events, competition, national and international record attempts, gatherings, and Model Aircraft demonstrations and exhibitions.

(6) Educational programming that assures participants are provided relevant safety information and validates the learning process.

(7) Educational programming that addresses essential piloting issues including:

- Recognition and avoidance of manned aircraft
- Safe operation near spectators and other non participants

- Safe and cooperative operation with other modelers
- Transitioning to higher performance and more complex models

(8) Methodology for establishing and designating dedicated Model Aircraft flying sites providing:

- Guidelines for flying site location, configuration and design layout applicable to its intended use and the type(s) of Model Aircraft flown, and which ensures Model Aircraft operations do not interfere with manned flight operations
- Safety guidelines that ensure the safety of the public and provide adequate separation of persons and property from the Model Aircraft operations
- Guidelines for coordinating and reviewing operating policies and procedures with the airspace controlling authority for those flying sites located within controlled airspace
- Guidelines for coordinating and reviewing operating policies and procedures with the airport and applicable airspace control authority for those flying sites located within 3 NM of a military or public-use airport, heliport, or seaplane base.
- Guidelines for establishing and disseminating flying site operating procedures, limitations and safety guidelines including the following:
  - Hours of Operation
  - Flying site operating procedures
  - Frequency control procedures (if applicable)
  - Traffic pattern and flight operations
  - Cooperation with other modelers
  - Applicable altitude restrictions
  - Applicable No-Fly zones and operating area limits
  - Flight line and pit area safety procedures
  - Spectator and public access policies
  - Emergency Procedures (e.g., Fire, First Aid)

3. Model Aircraft Not Operated in Accordance with Accepted Set of Standards ●

3.1 Applicability ●

The following general requirements and limitations apply to Model Aircraft which are not operated in accordance with an FAA accepted set of standards, but are operated by hobbyists for the sole purpose of sport, recreation, and/or competition.

ALTERNATIVE VIEW: Eliminate Section 3.0 in its entirety.

ALTERNATIVE RATIONALE: AMA believes this approach is flawed in that it fails to recognize the substantial diversity of the hobby, establishes unrealistic and unenforceable restrictions, and leaves absent a safety surveillance program to oversee the activities of those modelers who choose not to participate in a formal aeromodeling structure/organization More importantly, as a baseline set of standards, these limitations have the inherent potential of imposing a devastating impact on the aeromodeling activity and the hobby industry.

3.2 General Requirements ●

(1) Model Aircraft shall be flown in open spaces and in a manner that does not endanger the life and property of others.

(2) Model Aircraft shall yield the right of way to all manned aircraft.

(3) Model Aircraft shall not interfere with operations and traffic patterns at airports, heliports, and seaplane bases.

(4) Model Aircraft shall not be operated at locations where Model Aircraft activities are prohibited.

(5) Model Aircraft are limited to unaided visual line-of-sight operations. The Model Aircraft pilot must be able to see the aircraft throughout the entire flight well enough to maintain control, know its location, and watch the airspace it is operating in for other air traffic. Unaided visual line-of-sight does not preclude the use of prescribed corrective lenses.

(6) Model Aircraft shall be designed, equipped, maintained and/or operated in a manner in which the aircraft remains within the intended area of flight during all operations.

(7) Model Aircraft pilots may not intentionally drop any object from a Model Aircraft that creates a hazard to persons or property.

(8) Model Aircraft shall be operated in a manner that respects property rights and avoids the direct overflight of individuals, vessels, vehicles, or structures.

(9) Model Aircraft shall not be operated in a careless or reckless manner.

(10) Model Aircraft pilots shall not operate their aircraft while under the influence of alcohol or while using any drug that affects the person's faculties in any way contrary to safety.

(11) Model fixed-wing and rotorcraft aircraft shall not use metal-blade propellers.

(12) Model Aircraft shall not use gaseous boosts.

(13) Model Aircraft shall not use fuels containing tetranitronmethane or hydrazine.

(14) Model Aircraft shall not use turbine-powered engines (e.g., turbo-fan, turbo-jet) as a propulsion source. ●

RATIONALE: *Turbine powered aircraft are perceived by many members of the sUAS Aviation Rulemaking Committee (ARC) as being a higher risk.*

ALTERNATIVE VIEW: *Eliminate the limitation.*

ALTERNATIVE RATIONALE: *The blanket prohibition of turbine engines does not take into consideration the various and diverse turbine engines currently produced and impose an unjustified economic impact on the hobby industry.*

3.3 General Limitations ●

(1) Model Aircraft shall not exceed 55 pounds (lbs).

(2) Model Aircraft shall remain clear of clouds.

(3) Model Aircraft will not operate in Class B airspace without the permission of the ATC authority.

(4) Model Aircraft shall not be operated within 3 NM miles of an airport, heliport, or seaplane base without the permission of the ATC authority or airport manager.

(5) Model Aircraft shall operate in close proximity to the ground, at or below 400 feet (') above ground level (AGL), and shall at all times remain below and well clear of all manned aircraft. ●

RATIONALE: *By keeping Model Aircraft at or below 400' encounters with manned aircraft are reduced. This recommended general limitation is consistent with the current Model Aircraft guidance contained in AC91-57.*

ALTERNATIVE VIEW: Replace (5) with the following:

Model Aircraft shall operate in close proximity to the ground, shall stay at or below 400' AGL when within 3 NM of an airport, and shall at all times remain below and well clear of all manned aircraft.

ALTERNATIVE RATIONALE: *Though it is agreed that there needs to be some altitude limit on the modelers that are not participating in a structured safety program such as AMA's, AMA also knows from their experience that creating a hard and fast across the board altitude limit, such as 400' is unnecessarily restrictive, unrealistic, and arguably poses a greater risk to personnel on the ground. AMA's experience has shown that the greatest risk to other participants in the NAS and perhaps the only significant risk posed by model aviation is when Model Aircraft are operated within three miles of an airport. The language in the ATERNATIVE VIEW mirrors the current guidelines in the AMA Safety Code.*

(6) Notwithstanding the above limitations, Model Aircraft weighing less than or equal to two lbs incapable of reaching speeds greater than 60 miles per hour (mph) (52 knots), and powered by electric motor or mechanical stored energy (e.g.,

rubber-band powered) may operate within 3 NM of a military or public-use airport or heliport; if they remain a safe distance from the airport or heliport, remain well clear of all manned aircraft, and remain below 400' AGL.

RATIONALE for the above limitations:

(1) Currently accepted domestic weight limit and has international precedent as well.

(2) Is consistent with the concept of visual line-of-sight (VLOS).

(3) Class B is positive control. All aircraft are required to operate on a clearance. Gaining permission from ATC is equivalent to receiving a clearance.

(4) Model Aircraft permitted to operate within 3 NM of the airport will be provided applicable operating limitations.

(5) 400' is appropriate for Model Aircraft operations in Class C airspace without coordinating with ATC and is consistent with the intention of current domestic policy and with the UK, CASA, and Canada.

(6) This is consistent with the guidelines currently established by AC91-57.

(7) Makes a blanket exception for models weighing two lbs or less. This is an appropriate allowance for "Park Flier" and "toy" type models and allows them to use parks and small fields closer to airports.

(7) Model Aircraft will not be flown at an airspeed that would cause the aircraft to inadvertently leave the prescribed maneuvering area. ●

RATIONALE: *The pilot will be responsible for limiting their speed so that they can remain within the prescribed maneuvering area.*

ALTERNATIVE VIEW: Replace (7) with the following:

Model Aircraft cannot be operated at airspeeds which exceed 100 mph (87 knots).

ALTERNATIVE RATIONALE: *Restricting the speed of Model Aircraft not participating in an FAA-accepted safety program will mean that high-performance aircraft will not be operated by individuals that are not being scrutinized by their peers. Eliminating high-performance aircraft will also help to ensure that the operator will be able to keep their aircraft within the defined operational area (line-of-sight and below 400' AGL). Limiting the speed also will reduce the likelihood of turbine powered aircraft being operated without the guidance of an FAA-accepted safety program. Turbine powered aircraft are perceived by many members of the ARC as being a higher risk.*

(8) Model Aircraft cannot launch pyrotechnic devices which explode or burn.

(9) Excluding take-off and landing, no powered Model Aircraft may be flown closer than 25 feet to any individual, except for the pilot and the pilots helper located at the flight line.

This page intentionally left blank

Subpart B. Operating Rules

4. General Operating Limitations

The following general operating limitations determine the times, locations, and notification requirements for all sUAS operated under this regulation.

4.1 Daylight Operations

No person may operate a sUAS except between the hours of sunrise and sunset.

> ***RATIONALE:*** *Visual "see and avoid" is the primary mitigation for mid-air collisions.*

4.2 Visual Meteorological Conditions (VMC)

No person may operate a sUAS except in VMC with a minimal visibility of three miles.

> ***RATIONALE:*** *Visual "see and avoid" is the primary mitigation for mid-air collisions.*

4.3 Visual Line-of-Sight

No person may operate a sUAS unless they or another sUAS flight crew has sufficient unaided (corrective lenses exempted) visual contact with aircraft to be able to maintain operational control of the aircraft, know its location, and be able to scan the airspace in which it is operating for other air traffic.

> ***RATIONALE:*** *Visual "see and avoid" is the primary mitigation for mid-air collisions.*

4.4 Safety of Those on the Surface ●

(1) No person may operate an sUAS in a manner that endangers the safety of persons and property on the surface.

(2) No person may operate a sUAS directly over an open air assembly of people. ●

> ***ALTERNATIVE VIEW: Add text –*** *"unless the sUAS is certified to have reliability and lack of lethality equal to any aircraft certified by the FAA for operation over an open air assembly of people."*
>
> ***ALTERNATIVE RATIONALE:*** *The applicant must have an opportunity to offer evidence that his sUAS can operate over open air assemblies without creating a hazard for people in that crowd. Public safety could be enhanced by the presence of sUAS in situations in which manned aircraft cannot operate without risk to people on the ground.*

(3) During an emergency, the safety of people on the surface must be given priority over the sUAS.

RATIONALE: *Makes it clear that the sUAS PIC is responsible for the safety of persons on surface (whether on the ground or on the surface in a vessel or vehicle).*

(4) In an in-flight emergency requiring immediate action, the PIC may deviate from any rule of this part to the extent required to meet that emergency.

RATIONALE: *Consistency with 14 CFR 91.3b.*

4.5 Notifications—Air Traffic Coordination

(1) UAS PIC must establish communications with the ATC and notify the airport manager if planning to operate within 10 NM of an airport with an operating control tower. sUAS PICs must comply with ATC instruction regarding operations.

(2) When operating within 3 NM of a military or public-use airport, heliport, or seaplane base without an operating control tower, sUAS PIC must notify the airport manager, if available.

(3) For all flights which are intended to operate greater than 400' AGL and are either: a) expected to exceed 30 minutes in duration or b) there is an expectation of one or more additional flights within a four hour period, the PIC will request the issuance of a Notice to Airmen (NOTAM) for the length of the operation as far in advance as feasible (recommend more than 24 hours, but less than 48 hours) by notifying the nearest ATC facility or Flight Service Station (FSS).

RATIONALE: *Makes the responsibility clear when the ATC or airport manager needs to be aware of sUAS operations. The ATC would be aware of all sUAS operations in Class C and D airspace or near towered-airports. ATC or FSS awareness would enable the ability to issue a NOTAM. All operations over 400' AGL would be eligible for a NOTAM as well.*

The group did not intend that the PIC would be required to have access to two-way ATC communications in Class C airspace unless ATC requires such access.

4.6 Operational Area

No person may operate a sUAS in the following areas:

(1) In a prohibited, restricted, or warning area without permission from the using or controlling agency, as appropriate.

(2) In a Flight Restricted Zone (FRZ) or Washington, DC Metropolitan Area Special Flight Rules Area (SFRA).

(3) On a published low altitude Military Training Routes (MTRs) without prior authorization from the controlling authority.

(4) In Class B Airspace.

RATIONALE: *Keeps sUAS from operating in areas where there are restrictions on civil operations. Also, keeps sUAS from operating in Class B airspace due to the complexity of these operations. Avoiding low altitude MTRs helps to reduce risk of collision between a low-flying fast-moving military aircraft and a sUAS.*

5. Operational Considerations Regarding Other Aircraft

5.1 Proximity to Other Aircraft

No person may operate a sUAS so close to manned aircraft as to create a collision hazard.

5.2 Requirement for a Qualified Visual Observer ●

The PIC must determine if a visual observer is necessary. A visual observer is necessary:

(1) If the sUAS is operated by a PIC either in a shelter or "headsdown", the operation requires the use of a qualified visual observer.

(2) For operations >400' AGL one dedicated qualified visual observer is required. ●

(3) If the PIC determines that a visual observer is necessary to maintain the safety of the operation.

RATIONALE: *Visual see and avoid is the primary mechanism of ensuring safe separation and avoiding collisions. These considerations make it clear when additional qualified visual observers are required. Given that there is more likely to be other aircraft above 500'AGL increasing the probability of a collision, an additional visual observer is added for sUAS operations over 400' AGL to aid in the ability to* ***see*** *and thus avoid other aircraft.*

ALTERNATIVE VIEW: *Require* ***two*** *dedicated qualified visual observers when operating above 400' AGL.*

ALTERNATIVE RATIONALE: *Given that there is more likely to be other aircraft above 500'AGL increasing the probability of a collision a minimum of two visual observers should be used.*

5.3 Visual Observer Duties

A qualified visual observer must scan the airspace around the sUAS for other aircraft which may be potential collision hazards.

(1) PIC or qualified visual observer (close proximity of PIC) must maintain position of the sUAS through direct visual observation in order to avoid creating a collision hazard with other aircraft, airborne hazards, persons on the ground, terrain, or obstructions.

(2) The qualified visual observer, if used, must maintain effective two-way communications with the PIC.

> ***RATIONALE:*** *Clearly defines visual observer duties as being focused on the "seeing" component of "see and avoid". Emphasizes that the visual observer is not necessarily focused on the sUAS but focused on scanning the airspace with awareness of the sUAS's location.*

(3) When using other aids to vision, such as binoculars, field glasses, or telephoto television, qualified visual observers must use caution to ensure that the unmanned aircraft remains within the approved visual limitation distance. Due to field of view and distortion issues, the use of such aids can be used to augment the qualified visual observer's visual capability, but cannot be used as the primary means of visual contact.

5.4 Right-of-Way Rules

sUAS must yield the right-of-way to all other aircraft. UAS flight crews must assume that other pilots cannot see their aircraft and therefore the burden of maneuvering for potential collision risk shall be on the sUAS PIC.

(1) The PIC must yield the right-of-way and when a manned aircraft is detected, always maneuver early to prevent a potential conflict. The preferred means of conflict avoidance is to descend and maneuver closer to the landing area and the PIC and/or qualified visual observer.

(2) Although sUAS should descend as its primary means of collision avoidance; the PIC should use the most appropriate maneuver for the situation.

(3) During an emergency, the safety of manned aircraft must be given priority over the sUAS.

(4) For sUAS encounters with other sUAS, the right-of-way rules defined in 14 CFR 91.113 apply, except that all sUAS must yield the right-of-way to manned aircraft.

> ***RATIONALE:*** *Most sUAS approximate the size of birds. Manned pilots expect birds to dive when encountering an aircraft, thus sUAS should behave similarly. Given that the PIC and/or observer on the surface may not always be able to accurately determine relative altitude or relative lateral bearing, it was felt by the consensus of the group that by descending as close to the surface as possible, the risk of collision could be reduced to the maximum extent. The working group also wanted to make it clear that the prime responsibility for maneuvering was on the sUAS PIC and that the safety of manned aviation had priority.*
>
> ***COMMENTARY:*** *It is not the intent of the ARC to limit the options available to the PIC, but to offer guidance as what is likely to be the most appropriate maneuver.*
>
> ***COMMENTARY:*** *These recommendations will need to be updated pending the development of recommendations focused on Lighter-Than-Air (LTA) sUAS.*

5.5 Communications Monitoring

When operating in Class C and D airspace, a sUAS PIC or qualified visual observer shall monitor ATC voice communications as instructed by ATC.

> ***COMMENTARY:*** *If the Control Station is equipped with ATC communications radio, the PIC and/or qualified visual observer* ***should*** *monitor ATC voice communications when operating in Class E or G airspace in the "Mode C veil" to identify aircraft that could potentially enter the airspace in which the sUAS is operating.*
>
> *If the Control Station is equipped with a UNICOM radio (Frequencies Used For Aeronautical Advisory Services To Private Aircraft) or Common Traffic Advisory Frequency (CTAF), the PIC and/or qualified visual observer* ***should*** *monitor to identify aircraft that could potentially enter the airspace in which the sUAS is operating.*
>
> ***RATIONALE:*** *For added situational awareness, it was felt that monitoring appropriate frequencies would aid the PIC and/or visual observers in being aware of other aircraft potentially in the airspace. While there may be some costs associated with the capabilities required, the consensus of the group was that the added safety value warranted the investment.*
>
> *Using the term "monitor" was deliberate. It was not the group's intent that the PIC or visual observer would be transmitting via 2-way ATC communications. This was for the following reasons:*
>
> - *It is unclear that a transmitter located on the surface several miles from the ATC radio antenna would be effective*
> - *We did not want to increase the workload of ATC controllers and increase ATC frequency congestion with chatter from sUAS operators. If controllers need to instruct all sUAS operators to cease operations due to an emergency in their sector, they can simply broadcast on the ATC channel which would be monitored by the sUAS operators*

6. General Operational Considerations

6.1 Take-off and Landing Area

(1) The PIC must ensure that sufficient space is available at the flying location to conduct safe take-off and landings.

(2) The PIC must ensure that the take-off and landing area(s) is clear of persons and property not associated with the operation to which the aircraft could pose a hazard.

> ***COMMENTARY:*** *It may be appropriate to establish a consensus standard on how a manufacturer should go about determining the minimum space required for take-off and landing.*

6.2 Control Station Operations ●

No person may operate a sUAS unless there is a one-to-one correspondence between Control Station and the unmanned aircraft. Control may be transferred from one Control Station to another provided procedures exist to affect the transfer including clear and immediate designation of the PIC at all times. The following is prohibited under this regulation:

(1) Using a Control Station to control more than one unmanned aircraft at a time.

(2) Simultaneously controlling an unmanned aircraft from more than one Control Station. **NOTE:** This does not apply to control of a payload or sensor package provided that operation of the sensor package or payload is electrically isolated from the sUAS flight control systems and operation has no significant effect on the flight parameters of the sUAS.

(3) A second Control Station cannot be used to increase operational range. ●

> ***ALTERNATIVE VIEW: Replace (3) with the following:***
>
> *A second Control Station may be used to increase operational range if all other provisions of this regulation are met.*
>
> ***ALTERNATIVE RATIONALE:*** *If each Control Station is equipped manned and operated like the initiating station with the required observer, communication capability and conforms with all required airspace restrictions minimal additional risks are introduced by transferring control and extending the operational range. It would be analogous to the aircraft landing at close to its maximum range and then taking off again under control of a second Control Station with overlapping coverage.*

6.3 Pilot-in-Command

With the exception of those aircraft operated in accordance with the provisions described in Section 9, no person may operate a civil sUAS under this regulation without a PIC who is certified to operate a sUAS consistent with the requirements in 15.

> ***RATIONALE:*** *Operators of Group I sUAS will not require certification.*

6.4 Pre-flight Procedures

The PIC is responsible for the following pre-flight procedures:

(1) **Familiarization:** The PIC must become familiar with the following information concerning the intended flight:

- Available weather reports and forecasts
- Fuel requirements
- Take-off and landing minimum space requirements
- Landing alternatives and emergency ditching locations
- Potential ground hazards
- Location of personnel directly involved with the operation

- Restrictions or limitations associated with the airspace in which operations will occur
- Local air traffic activity
- Location of persons and property on the surface
- Weight and Balance

(2) **Crew Verification:** The PIC must verify that all persons involved in the operation are trained and sufficiently knowledgeable and skilled in their operational responsibilities and that they meet the appropriate certifications, currency requirements, and medical qualifications for the intended flight.

(3) **Environment Assessment:** The PIC must assess the operating environment considering risks to people and property in the immediate vicinity both on the surface and in the air. This assessment must include weather conditions, local air traffic activity, the location of persons and property on the surface, and other ground hazards.

(4) **Pre-Flight Briefing:** The PIC must ensure that all sUAS flight crew members receive a pre-flight briefing on the operating conditions, emergency procedures, contingency procedures, roles and responsibilities, and potential hazards.

(5) **Aircraft and Equipment Inspections:** The PIC must ensure that the aircraft, Control Station, and other flight critical equipment are inspected for damage and are ready for flight per manufacturer guidelines.

(6) **Communications Check:** The PIC must ensure that the command, control, and communications link is working properly.

(7) **Weight and Balance:** The PIC must ensure that the weight is appropriately distributed in order to maintain the aircraft center of gravity to ensure stable flight in accordance with manufacturer recommendations.

6.5 Crew Fitness for Duty

The PIC must ensure that all crew members are rested and fit for intended duty. For flight operations, 10 hours of consecutive rest in the 24 hour period preceding the planned completion of his duty time. Non-local travel and other work duties associated with the employer are not considered part of the rest period.

> ***RATIONALE:*** *As with any commercial operation, crew duty day limits will help ensure that the flight crew is alert to maintain appropriate safety vigilance.*

6.6 Alcohol or Drugs

No person may act as a crewmember of a sUAS under the following conditions:

(1) Within eight hours after the consumption of any alcoholic beverage.

(2) While under the influence of alcohol.

(3) While using any drug that affects the person's faculties in any way contrary to safety.

(4) While having an alcohol concentration of 0.04 or greater in a blood or breath specimen. Alcohol concentration means grams of alcohol per deciliter of blood or grams of alcohol per 210 liters of breath.

> ***RATIONALE:*** *Consistent with operational regulations contained in 14 CFR 91.17.*

6.7 Dropping Objects

No PIC of a sUAS may allow any object to be dropped from that aircraft in flight unless reasonable precautions are taken to avoid injury or damage to persons or property.

> ***RATIONALE:*** *Consistent with operational regulations contained in 14 CFR 91.15.*

6.8 Careless and Reckless

No person may operate a sUAS in a careless or reckless manner so as to endanger the life or property of another.

> ***RATIONALE:*** *Consistent with operational regulations contained in 14 CFR 91.13.*

6.9 Reserves

The PIC must ensure that there is enough fuel and/or battery charge to fly for the intended time period and for no less than five minutes of reserved power.

> ***RATIONALE:*** *This requirement is loosely based upon 14 CFR 91.151, fuel requirements for flight in Visual Flight Rules (VFR) conditions. By having a reserve requirement, helps to ensure that the PIC does not run out of fuel/power during flight resulting in an uncontrolled aircraft. 91.151 requires 20 minutes VFR fuel reserves for rotorcraft. Given that sUAS will not be flying far from their landing areas, will remain relatively close to the surface, and have flight duration that may be extremely short, the requirement was modified five minutes. The main purpose of the reserve is to ensure that there is sufficient power for the aircraft to return from its farthest point and to ensure that it can remain aloft for a sufficient time period to ensure that the landing area is clear of hazards.*

6.10 Cloud Clearance ●

The sUAS PIC must ensure that the aircraft remains at least 500 feet below and 2000 feet horizontal from clouds in Class C, D, and E airspace and clear of clouds in Class G airspace.

> ***RATIONALE:*** *Enables the sUAS PIC and/or visual observer an opportunity to visually identify potential collision threats which may emerge from the clouds.*

*ALTERNATIVE VIEW: The sUAS PIC must ensure that the aircraft remains at least 500 feet below and 2000 feet horizontal from clouds in **all classes** of airspace.*

ALTERNATIVE RATIONALE: The 500 feet below and 2000 feet horizontal distances are consistent with the ultra-light requirements in 14 CFR 103.23 and parachute cloud clearance requirements in 14 CFR 105.17.

6.11 Operation from a Moving Vehicle ●

No person may control a sUAS from a moving vehicle or aircraft.

***RATIONALE:** Ensures that the area of sUAS operation is contained and controlled. Operation from a vessel on the water is allowed provided that this vessel is not moving. It is envisioned that those who desire to operate from a moving marine vessel in open water (e.g., Ocean or Great Lakes) could petition the FAA for a waiver from this provision.*

***COMMENTARY:** The sense of the sUAS ARC was that operations in open ocean from a moving ship should not necessarily be a significant risk and should be enabled. Considerations should be made for existing air traffic density (e.g., Gulf of Mexico where there is significant rotorcraft operations associated with oil platforms).*

***ALTERNATIVE VIEW**: Eliminate restriction of operating from a moving vehicle.*

***ALTERNATIVE RATIONALE:** Military operators have found that operating a sUAS from a ground vehicle or vessel on the water is not significantly different than operating from a fixed location provided the PIC and/or visual observer is placed in a position in the vehicle or vessel where they have the same unobstructed view as they would if they were on the ground and "waypoint position relative" feature as discussed below is provided.*

"Waypoint position relative" feature rationale. Mobile operations are very different from stationary operations because navigation waypoints maintain a position relative to Earth, not the PIC at the ground station. A PIC at a control station will lose relative knowledge of position if the PIC and the control station move. Global Positioning System (GPS) reports absolute position but an interface can also be provided to calculate and report position relative to another position. Key waypoints for relative situational awareness do not move with the PIC and control station unless the particular system has some sort of "waypoint position relative" feature to manage this. The ground station also must have its own GPS or similar to keep track of its position in order to make relative aircraft position reports to the PIC and provide relative situation awareness such as range and bearing to the aircraft relative to PIC/ control station (situational

awareness during mobile operations are really difficult without this capability).

6.12 Airspeed

No person may operate a sUAS faster than an airspeed of 87 knots.

RATIONALE: *The AMA has determined that aircraft flying faster than 100 mph are considered a high performance aircraft. Faster aircraft are perceived as having greater risks.*

7. General Operational Capabilities

RATIONALE: *These operational capability and/or equipment provisions are analogous to the provisions contained in 14 CFR 91, subpart C, Equipment, Instrument, and Certificate Requirements.*

All sUAS operated under this regulation must have the following operational capabilities:

7.1 Command and Control Link

(1) The PIC must only operate a sUAS that employs appropriate technology to ensure reliability of communications control links and minimizes system vulnerability to radio frequency interference.

(2) When operating using 72-76 Megahertz (MHz) commonly used by the Model Aircraft community, the PIC must employ technology which ensures that there is no interference with Model Aircraft operations.

COMMENTARY: *Consensus standards will clearly define how to appropriately achieve the intended capabilities above. Thus, the defintion and specification of the appropriate technology will be left to consensus standards. The technology defined for 72-76 Mhz must ensure that the new transmission technology does not intefere with the legacy technology used by Model Aircraft today.*

7.2 Fly-away Protection

No person may operate a sUAS that does not employ a technical mechanism which automatically executes a strategy to retain the aircraft in the intended operational area in the event of the loss of control. The fly-away protection mechanism must return the sUAS safely to the surface, as soon as practical.

COMMENTARY: *Consensus standards will clearly define how to appropriately achieve the capabilities intended. Thus, the definition and specification of the appropriate technical mechanisms will be left to consensus standards.*

7.3 High Visibility

All sUAS operated under this regulation must be colored with a high-contrast scheme.

> ***RATIONALE:*** *Facilitates unmanned aircraft tracking by the PIC and visual observers as well as to increase the probability that it would be detected by pilots of manned aircraft.*
>
> ***COMMENTARY:*** *Consensus standards will clearly define how to appropriately achieve the capability intended. A single consensus standard could not only address coloring schemes for sUAS visibility, but also address the issue of identification markings (See Section 19.2). Thus, the sUAS ARC envisions a standard like "Standard Guide to the Visibility and Identification Markings of Small Unmanned Aircraft Systems for Commercial Use."*

7.4 Maneuverability ●

All sUAS must have the capability to descend 50 feet within five seconds of the PIC recognizing the need for an avoidance maneuver. Maneuver should be repeatable or the aircraft should return to the ground. ●

> ***RATIONALE:*** *Helps to ensure that the PIC can maneuver the sUAS to avoid potential conflicts and maneuver in the event of an imminent collisions threat. Capability could accommodate larger descents through repeat instruction or continued control surface deflection.*
>
> ***ALTERNATIVE VIEW:*** *To allow either a* ***climb*** *or descent of 50 feet within five seconds.*
>
> ***ALTERNATIVE RATIONALE:*** *Limiting an avoidance maneuver to only a descent may be impractical and could introduce risks. Circumstances may dictate that other options may be more appropriate. Having options may reduce risks.*

7.5 Position Reporting

If operating greater than 400' AGL all sUAS weighing over 4.4 lbs (2 kilograms (kgs)) must have the capability to display position and altitude information to the PIC.

> ***RATIONALE:*** *Helps the PIC maintain situational awareness and ensure that the aircraft remain within appropriate operating limits. If available, down-linked aircraft telemetry can be used by the PIC and/or qualified visual observers to aid in flight operation and visual acquisition.*
>
> ***COMMENTARY:*** *In the future, the FAA may want to consider having Automatic Dependent Surveillance-Broadcast (ADS-B) OUT either transmitting from on-board the aircraft or as a relay from the Control Station. This may assist manned aviation in the vicinity with situational awareness of the location of sUAS operations, especially as ADS-B IN utilization grows in the aviation community whom typically fly at low altitudes.*

8. Multiple Kinds of sUAS Operations

There are multiple kinds of operations for sUAS each with different operational limits and required operational capabilities determined by gross take-off weight, system robustness, and relative risk. The PIC is responsible for ensuring that operations are conducted consistent with these constraints. The five operating groups are summarized in the table below.

Group	Gross Take-Off Weight	Additional Operational Limits	Additional Required Operational Capabilities
I	≤ 4.4 lbs (2 kgs)	Section 9.2	Section 9.3
II	≤ 4.4 lbs (2 kgs)	Section 10.2	Section 10.3
III	≤ 19.8 lbs (9 kgs)	Section 11.2	Section 11.3
IV	≤ 55 lbs (25 kgs)	Section 12.2	Section 12.3
V	*LTA only*	Section 13 (Reserved)	Section 13 (Reserved)

9. Additional Provisions—Group I sUAS

Group I sUAS are very maneuverable, frangible, and slow moving aircraft which pose minimal risk to those on the surface and other aircraft.

9.1 Group I Physical Characteristics

The following physical characteristics apply to all Group I sUAS:

(1) Gross take-off weight equal to or less than 4.4 lbs (2 kgs) including fuel, batteries, and payload.

(2) Must not be capable of exceeding more than 30 knots calibrated airspeed at full power in level flight.

(3) Constructed in a frangible manner that would minimize injury to those on the surface and reduce damage to other aircraft in the event of a mid-air collision. A sUAS can be considered frangible if it is made of paper, wood, or breakable plastic and contains no substantial metal parts.

> ***RATIONALE:*** *A key differentiator between Group I and Group II sUAS is frangibility.*
>
> *Some alternatives discussed include the following:*
>
> - *Given that the word frangible means "breaks into pieces" the definition could focus on the nature of pieces such as the size of the largest hard piece or the frontal area of the largest piece*
> - *Ratio of plan view area to weight*
> - *Energy absorbing of the material*
>
> *With the "keep-it-simple" guidance in mind, the above definition is being proposed. The notion of frangibility is important in that the consequence*

of a collision between a sUAS and another aircraft or person/property on the surface is reduced if the sUAS itself is frangible.

COMMENTARY: *Consensus standards could be developed for how to construct a sUAS that would be considered frangible.*

9.2 Group I Additional Operational Limits ●

In addition to the limitations outlined in Sections 4, 5, and 6 of this regulation, a Group I sUAS must be operated:

(1) At or below 400' AGL in Class C, D, E, and G airspace.

RATIONALE: *Limiting Group I aircraft to at or below 400' mean that sUAS which are certified to a lower degree of robustness and operated by unlicensed PICs are less likely to encounter manned aircraft (since in the majority of airspace, manned aircraft must be at a minimum altitude of 500' or higher for fixed winged aircraft).*

(2) Within visual line-of-sight of the PIC and/or qualified visual observer or less than 1500' lateral distance from the location of the PIC and/or visual observer whichever is less.

(3) Greater than 3 NM of a military or public-use airport, heliport, or seaplane base.

RATIONALE: *Within 3 NM of an airport is the airspace where manned aircraft are likely to be operating close to the ground. To reduce encounters with unmanned aircraft which are certified to a lower degree of robustness and operated by unlicensed PICs, Group I aircraft are restricted from operating within 3 NM of an airport. The Group I sUAS is limited to specific operating areas.*

ALTERNATIVE VIEW: (Replace 9.2) with the following:

In addition to the limitations outlined in Sections 4, 5, and 6 of this regulation, a Group I small UAS must be operated:

(1) At or below 400' AGL in Class C, D, E, and G airspace.

(2) Within visual line-of-sight of the PIC and/or qualified visual observer or less than 1500' lateral distance from the location of the PIC and/or visual observer whichever is less.

(3) Greater than 3 NM of a charted public-use airport, heliport, or seaplane base unless the following requirements are met:

(a) The PIC, no less than one hour prior to beginning a flight, informs the controlling authority of all public use airports, heliports or seaplane bases within three miles of the area in which the flight will take place, the time and place of the flight operations, and inquires regarding any specific areas where sUAS flight shall be avoided.

(b) The PIC will initiate a call by cell phone to the nearest controlling authority to assure cell coverage and provide a call back number to facilitate contact of the PIC by the Controlling Authority if for any reason sUAS flight operations must suddenly be restricted or suspended.

(c) The sUAS shall operate no more than 200' higher than the maximum height of obstructions such as trees, power lines, structures, steep cliffs or bluffs within the flight area, or 400' AGL whichever is the lower altitude.

***ALTERNATIVE RATIONALE:** A distance of 3 miles from airport identified in this recommendation limits the commercial viability of sUAS employment for small business. It prohibits operation in the environment where nearly all the commercial opportunity exists. The mitigating factors in the alternate view establish definable and analyzable risk characteristics.*

9.3 Group I Additional Operational Capabilities ●

In addition to the operational capabilities outlined in Section 7 of this regulation the following capabilities are required:

(1) **Manual Flight Control:** Group I SUAS must be capable of only manual flight control, ensuring that PIC control inputs made in the Control Station are translated directly into corresponding control surface positions. ●

***RATIONALE:** The idea for Group I aircraft were that they are operated like a Model Aircraft for compensation and hire. Model Aircraft are not generally operated in any other manner than manual flight control. Such*

a system is likely to be less complex and thus easier for a non-license PIC to operate.

For operations requiring other than manual flight control (i.e., auto flight management) would thus have to be operated as Group II.

***ALTERNATIVE VIEW:** Group I sUAS should be allowed to utilize simple auto flight management systems as long as manual flight control can be assured.*

***ALTERNATIVE RATIONALE:** Technology has progressed to such a state that to preclude the use of simple auto flight management is unnecessarily restrictive. Consensus standards could be written to define such systems and the mechanisms to test and verify their performance.*

9.4 System Certification

The entire sUAS including airframe, communications link, and Control Station will be certified to standards outlined in Section 20.

***COMMENTARY:** The intent is that Group I sUAS will be certified to a lower level of robustness than other sUAS due to their relatively low perceived risk to people on the surface and other aircraft due to operational limits, frangibility requirements, short flight duration, stick-to-surface control, and low speed of operation. See Appendix B.*

10. Additional Provisions—Group II sUAS

Group II sUAS due to their small size, system robustness and maneuverability pose minimal risk to those on the surface and other aircraft.

10.1 Group II Physical Characteristics

The following physical characteristics apply to all Group II sUAS:

(1) Gross take-off weight equal to or less than 4.4 lbs (2 kgs) including fuel, batteries, and payload.

(2) Capable of less than 60 knots calibrated airspeed at full power in level flight.

(3) Cruise speed of less than 40 knots in level flight.

10.2 Group II Additional Operational Limits ●

In addition to the limitations outlined in Sections 4, 5, and 6 of this regulation, a Group II sUAS must be operated:

(1) At or below 400' AGL in Class C, D, E, and G airspace within 30 NM of an airport listed in Appendix D, Section 1 of 14 CFR Part 91 or within the lateral limits of Class B or Class C airspace area designated for an airport. ATC Notification is required per Section 4.5 for flights in Class C and D airspace or within 10 NM of an airport with an operating control tower or local airport advisory.

RATIONALE: *The operational area for Group II sUAS is similar for that of a Group I sUAS with the exception that a Group II can operate within 3 NM of a military or public-use airport, heliport, or seaplane base after coordination with ATC because the PIC is certified and the system has certified to a higher level of robustness.*

(2) At or below 700' AGL in Class G Airspace beyond 30 NM from an airport listed in Appendix D, Section 1 of 14 CFR Part 91 and not within the lateral limits of Class B or Class C airspace area designated for an airport (and operated consistent with the requirements in Sections 4.5 and 5.2).

RATIONALE: *Due to the added risk of operating above 400' AGL in Class G airspace, an additional visual observer and pilot notification via NOTAM is required. For all flights in Class C or D airspace or within 10 NM of an airport with a tower, ATC notification would enable a NOTAM to be issued as well.*

(3) Within the visual line-of-sight of the PIC and/or qualified visual observer or less than 1500' lateral distance from the location of the PIC and/or visual observer whichever is less. ●

ALTERNATIVE VIEW: *When position information is provided to the PIC, allow Group II sUAS flights to operate up to a lateral distance of ½ statute mile (sm) from the location of the PIC or qualified visual observer while still maintaining visual-line-of-sight.*

ALTERNATIVE RATIONALE: *Restricting Group II aircraft to visual line-of-sight or 1500' lateral distance from the PIC and/or qualified visual observer whichever is less is overly restrictive for systems capable of providing position information (bearing, range, and altitude) to the PIC. If this capability is provided the verification of the position of the aircraft is much easier than for a system that does not have this capability. Because this added capability ensures the PIC and/or qualified visual observer can quickly reacquire the aircraft after scanning the airspace for intruding aircraft it can be safely operated within visual line-of-sight of the PIC and/or qualified visual observer or less than ½ sm lateral distance from the location of the PIC and/or visual observer whichever is less.*

(4) If operating with 3 NM of a military or public-use airport, heliport, or seaplane base, the PIC must ensure coordination with ATC and/or the airport manager, if available.

10.3 Group II Additional Operational Capabilities

There are no additional operational capabilities required than those outlined in Section 7 of this regulation.

10.4 System Certification

The entire sUAS including airframe, communications link, and Control Station will be certified to standards outlined in Section 20.

> ***RATIONALE:*** *The intent is that all Group II sUAS will be fully certified and operated by fully certified flight crews.*

11. Additional Provisions—Group III sUAS

Group III sUAS are larger and thus pose a higher perceived risk than Groups I and II to those on the surface and their operations are restricted to sparsely populated regions.

11.1 Group III Physical Characteristics

(1) Gross take-off weight equal to or less than 19.8 lbs (9 kgs) including fuel, batteries, and payload.

> ***RATIONALE:*** *FAA-Department of Defense (DoD) Memorandum of Understanding for operation of sUAS involves a weight limit of 20 lbs.*

11.2 Group III Additional Operational Limits

In addition to the limitations outlined in Sections 4, 5, and 6 of this regulation, all Group III sUAS must be operated in the following manner:

(1) Not over populated places as depicted in "yellow" on sectional charts.

(2) At least 100 feet from any person, vessel, vehicle, or structure that is not associated with the operations.

(3) At or below 400' AGL in Class D, E, and G airspace within 30 NM of an airport listed in Appendix D, Section 1 of 14 CFR Section 91 or within the lateral limits of Class B or Class C airspace area designated for an airport. ATC Notification is required per Section 4.5 for flights in Class D airspace or within 10 NM of an airport with an operating control tower or local airport advisory.

> ***RATIONALE:*** *The operational area for Group III sUAS is similar for that of a Group II sUAS with the exception that, Group III sUAS cannot operate in Class C airspace.*

(4) At or below 700' AGL in Class G Airspace beyond 30 NM from an airport listed in Appendix D, Section 1 of 14 CFR Part 91 and not within the lateral limits of Class B or Class C airspace area designated for an airport (and operated consistent with the requirements in Sections 4.5 and 5.2).

> ***RATIONALE:*** *Due to the added risk of operating above 400' AGL in Class G airspace, an additional visual observer and pilot notification via NOTAM is required. For all flights in Class D airspace or within 10 NM of an airport with an operating tower, ATC notification would enable a NOTAM to be issued as well.*

(5) Within the visual line-of-sight of the PIC and/or qualified visual observer or less than ½ sm lateral distance from the location of the PIC and/or visual observer whichever is less.

(6) Greater than 3 NM of a military or public-use airport, heliport, or seaplane base.

(7) If operating beyond 1500 feet laterally from PIC, there must be at least one qualified visual observer in addition to the PIC.

11.3 Group III Additional Operational Capabilities

In addition to the operational capabilities outlined in Section 7 of this regulation the following capabilities are required for the operation of all Group III sUAS:

(1) **Position Reporting:** The sUAS must be capable of providing position and altitude data to the PIC.

> ***RATIONALE:*** *Knowing position and altitude information will assist the PIC in maintaining situational awareness and ability to adhere to operational limitations.*

(2) **Aviation Band Radio:** If operating within 5 NM of a non-towered airport, a qualified visual observer involved with the operation must monitor UNICOM or CTAF and announce sUAS activity on the frequency of the closest airport consistent with applicable procedures.

(3) **Electronic Position Reporting Capability:** All Group III sUAS operating beneath the floor of the lateral limits of Class C or B airspace, or within the Mode C veil, must be equipped and operate an electronic positioning reporting system consistent with 14 CFR 91.215 or acceptable to the Administrator.

> ***COMMENTARY:*** *The ARC feels that electronic position reporting is recommended if feasible for all Group III operations.*

11.4 System Certification

The entire sUAS including airframe, communications link, and Control Station will be certified to standards outlined in Section 20.

> ***RATIONALE:*** *The intent is that all Group III sUAS will be fully certified and operated by fully certified flight crews.*

12. Additional Provisions—Group IV sUAS

Group IV sUAS are the largest sUAS permitted to operate under this regulation. Because of their large size, their operation is restricted to extremely remote areas that pose minimal perceived risk to those on the surface.

12.1 Group IV Physical Characteristics

(1) Gross take-off weight equal to or less than 55 lbs (25 kgs) including fuel, batteries, and payload.

12.2 Group IV Additional Operational Limits ●

In addition to the limitations outlined in Sections 4, 5, and 6 of this regulation, a Group IV sUAS must be operated in the following manner:

(1) The PIC must obtain a Letter of Authorization (LOA) from the FAA verifying that the planned area of operation can be considered uninhabited and extremely remote.

> ***CRITERIA:*** *To be considered as uninhabited and extremely remote, the operational area must include all of the following characteristics:*
>
> - *Class G airspace*
> - *Outside of 30 NM of an airport listed in Appendix D, Section 1 of 14 CFR Part 91*
> - *At or below 700' AGL, must be at least 5 NM from a military or charted airport, heliport, or seaplane base* ●
> - *If operating above 700' AGL up to 1200' AGL, must be at least 10 NM from military or charted airport, heliport, or seaplane base*
> - *Not following published federal airways or MTRs (intent is not to prohibit sUAS from crossing airways or MTRs but to reduce encounters by minimizing exposure)*
> - *No occupied structures with the exception of structures inhabited by persons involved with the operation*
> - *Not over National Parks*
> - *Not under restricted areas or Military Operations Area (MOA)*
>
> *The FAA will need to determine the mechanism by which the FAA issues the LOA. The Operations Working Group envisions something like the local Flight Standards District Office (FSDO) applying the criteria above based upon an application from a potential operator. The criteria will be clearly communicated.*
>
> ***ALTERNATIVE VIEW:*** *Change above criteria to restrict operations to at least 10 NM from charted airport, heliport, or seaplane base.*

(2) The PIC must ensure that the Group IV sUAS is only operated in the area designated under the FAA LOA in (1) above.

(3) The PIC must not operate a Group IV sUAS within 100 feet from any person, vessel, vehicle, or structure that is not associated with the operations.

(4) The PIC must operate a Group IV sUAS at or below 1200' AGL.

(5) The PIC must ensure that the Group IV sUAS must remain within the visual line-of-sight of the PIC and/or qualified visual observer or less than 1sm lateral distance from the location of the PIC and/or visual observer whichever is less.

(6) There must be at least one qualified visual observer in addition to the PIC. If operating within 10 NM of a chartered airport, heliport, or seaplane base, two visual observers in addition to the PIC are required.

(7) If the sUAS is operated by a PIC either in a shelter or "headsdown", the operation requires the use of two qualified visual observers in addition to the PIC.

(8) The PIC must ensure that ATC is notified per Section 4.5.

12.3 Group IV Additional Operational Capabilities

> ***RATIONALE:*** *These operational capability and/or equipment provisions are analogous to the provisions contained in 14 CFR 91, subpart C, Equipment, Instrument, and Certificate Requirements.*

(1) **Position Reporting:** The sUAS must be capable of providing position and altitude data to the PIC.

> ***RATIONALE:*** *Knowing position and altitude information will assist the PIC in maintaining situational awareness and ability to adhere to operational limitations.*
>
> ***COMMENTARY:*** *The sUAS ARC discussed the potential value of Electronic Position Reporting Capability to enable manned aircraft that are appropriately equipped to maintain situation awareness of the sUAS operation. However, a concern was expressed that such equipment may not be available for sUAS and that the majority of manned aircraft likely to be operating in the vicinity may not be equipped. In the future, the FAA should consider requiring all Group IV sUAS to be equipped and operated with an electronic positioning reporting system consistent with 91.215 or acceptable to the Administrator (e.g., ADS-B).*

12.4 System Certification

The entire sUAS including airframe, communications link, and Control Station will be certified to standards outlined in Section 20.

> ***RATIONALE:*** *The intent is that all Group IV sUAS will be fully certified and operated by fully certified flight crews.*

13. RESERVED: Additional Provisions—Group V Lighter-than-Air sUAS ●

> ***COMMENTARY:*** *The sense of the sUAS ARC is that the FAA should address provisions for LTA unmanned aircraft. During the sUAS ARC deliberations, an attempt to develop additional provisions for these systems was made. Although the ARC consulted with subject-matter experts to develop these provisions, the ARC felt that the membership did not have the adequate expertise to make appropriate judgments to provide specific LTA recommendations to the FAA.*

14. Provisions Concerning sUAS Operations in Designated Testing Areas

A sUAS Testing Area is a location designated for the purpose of test flying sUAS. Consists of an uninhabited and extremely remote surface area including a safety buffer zone where surface access is controlled and thus is free of non-participants.

14.1 Groups of sUAS Allowed

The following Groups of sUAS are allowed to operate in Designated sUAS Testing Areas: Group I, II, III, and IV.

14.2 Additional Operational Limits for Operations in Designated sUAS Testing Areas

In addition to the limitations outlined in Sections 4, 5, and 6 of this regulation, a sUAS operated in a designated test area must be operated in the following manner:

(1) The area must be designated as an sUAS Testing Area via an FAA LOA.

CRITERIA: *To be considered as uninhabited and extremely remote area suitable for designation as a sUAS Testing Area, the operational area must include all of the following characteristics:*

- *Class G airspace*
- *Outside of 30 NM of an airport listed in Appendix D, Section 1 of 14 CFR Part 91*
- *Outside of the lateral footprint of Class B and Class C airspace*
- *Not over surface area containing populated places depicted as "yellow" on sectional charts*
- *Must be at least 5 NM from military or charted airport, heliport, or seaplane base unless operating at a private airport with the explicit permission of the airport authority*
- *If the intended designated test area is closer than 10 NM from a chartered or military airport, heliport, or seaplane base, there must be a public comment period to seek input from local users similar to the obstruction review process outlined in AC 70/7460-2K: "Proposed Construction or Alteration of Objects that May Affect the Navigable Airspace" (1 March 2000). This would involve public notice to be distributed to those agencies, organizations, or individuals with known aeronautical interests to determine if the proposal would be a hazard to air navigation. State and local aviation authorities, as well as various military organizations of the Department of Defense, are also offered the opportunity to comment on the aeronautical effects of the proposed sUAS test area*
- *The sUAS Operator must control surface access to physical footprint which includes the operational area and a buffer zone. The buffer*

zone shall extended from the perimeter of the operational area by at least ½ the greatest distance across the operational area. Thus, if the intended operational area is a circle with a radius of one mile, the physical footprint which includes the operational area and buffer zone would have a radius of two miles. The sUAS operator must ensure that there are no un-authorized people in the physical footprint

- *No occupied structures with the exception of structures inhabited by persons involved with the operation*

***NOTE:** Test Area should be NOTAM'ed as an "alert area" and appear on sectional charts including operational hours and appropriate point-of-contact. If the test area activity would continue beyond a six month period. [There is some concern that it may not be feasible to chart test areas on sectional charts due to issues associated with clutter.] Other aircraft are not prevented from accessing the alert area but do so with the full knowledge of potential sUAS activity in the area. Alert area and area of surface access control should exceed the operational area (area where sUAS is flown) by 100 percent, effectively creating a buffer zone.*

The FAA will need to determine the mechanism by which the FAA issues the LOA. The Operations Working Group envisions something like the local FSDO applying the criteria above based upon an application from a potential operator. The criteria will be clearly communicated.

(2) The PIC must ensure that the sUAS is only operated in the area designated under the FAA LOA in (1) above.

(3) At least 100 feet from any person, vessel, vehicle, or structure that is not associated with the operations.

(4) The sUAS must remain at or below 1200' AGL.

(5) The sUAS must remain within the visual line-of-sight of the PIC and/or qualified visual observer or less than 1sm lateral distance from the location of the PIC and/or visual observer whichever is less.

(6) There must be two qualified visual observers in addition to the PIC.

(7) The PIC must ensure that ATC is notified per Section 4.5.

14.3 Operational Capabilities

All sUAS operating in a designated sUAS testing area must have the operational capabilities identified in Section 7 of this regulation as well as the additional operational capabilities as defined in the table below.

Gross Take-Off Weight	Additional Required Operational Capabilities
0 lbs < and ≤ 4.4 lbs	Section 9.3 or Section 10.3
4.4 lbs < and ≤ 19.8 lbs	Section 11.3
19.8 lbs < and ≤ 55 lbs	Section 12.3
Lighter-than-Air	Section 13 (reserved)

14.4 System Certification

The PIC of sUAS operating in a designed sUAS testing area shall be responsible for assuring the sUAS is airworthy and ready for flight testing.

> ***COMMENTARY:*** *Consensus standards should be established which define the criteria for determing a system is ready for flight testing. The ARC envisions a basic check list to ensure safety of flight system components prior to first flight.*

This page intentionally left blank

Subpart C. Personnel

15. Pilots

15.1 Applicability

This Section applies to all persons who seek to serve as PIC of sUASs. An approved training source as specified in this section can be one of the following:

(1) Certificated Instructor Pilot that meets the requirements of Section 17.

(2) Approved training program that meets the requirements of Section 18.

(3) PIC of an aircraft that has been flown under the provisions of Section 2.1, Section 14 or Section 23, or operating under a Certificate of Authorization (COA) or a Special Airworthiness Certificate

15.2 Certificate

Except as provided in Section 15.4, no person may act as PIC of a sUAS or in any capacity as a required pilot flight crewmember of a civil sUAS of the United States registry unless that person holds a valid pilot certificate issued under this recommendation in that persons possession or readily accessible when exercising the privileges of that pilot certificate.

15.3 Eligibility

To be eligible for a sUAS pilot certificate, a person must:

(1) Be at least 18 years of age.

(2) Be able to read, speak, write, and understand the English language.

(3) Complete an approved course of training on the aeronautical knowledge areas and on the areas of operation listed in this sub part.

(4) Pass the required knowledge test on the aeronautical knowledge areas listed in this sub part.

(5) Receive an endorsement from an approved training source.

RATIONALE: *Establishes eligibility requirements. The committee felt that establishing an age requirement of 18 was appropriate in that all manned aircraft commercial activity requires that minimum age.*

The committee also felt strongly that all sUAS pilots should complete sUAS specific written exam covering the knowledge areas specified as opposed to requiring completion of a Private Pilot written exam.

COMMENTARY: *The sUAS knowledge test should be the same for Groups I-IV.*

COMMENTARY: *The FAA should consider mechanisms to "grandfather" developers of sUAS and/or military personal who can present evidence of appropriate flight experience to a FSDO.*

15.4 Operations Not Requiring a Pilot Certificate

A person acting as PIC of a Group I aircraft as described in Section 9 does not require a pilot certificate. They must either pass a sUAS written knowledge test or complete an approved Group I sUAS training program which addresses the aeronautical knowledge areas listed in Section 15.5.

> ***COMMENTARY:*** *It is the intent of the sUAS ARC, that community-based organizations could establish and conduct the appropriate training program and associated testing for Group I sUAS student pilots.*

15.5 Aeronautical Knowledge Requirements

A person who applies for (a) a sUAS pilot certificate or (b) authorization to act as PIC of a sUAS satisfying the requirements in 15.4; must receive and log ground training from an authorized instructor or approved school and pass a knowledge test on the aeronautical knowledge areas listed below.

> ***COMMENTARY:*** *The FAA should develop an approach for giving credit to individuals that hold a current private, commercial, or airline transport pilot certificate or a person having passed the private pilot written.*
>
> ***RATIONALE:*** *The group felt that if sUAS of any size or performance characteristic was to be flown in the NAS for commercial purposes, the pilot should have demonstrated some level of knowledge appropriate to such operations. Again this is not intended to be a Private Pilot written exam. The committee expects that a knowledge test will be developed specifically for sUAS.*
>
> *These suggested knowledge areas are a watered down version of the knowledge areas required by Private Pilots. They have been established to reflect knowledge areas the group felt were appropriate to commercial operation of a sUAS.*
>
> *More specific details regarding these knowledge areas could be contained in a consensus standard to facilitate FAA approval of specific training programs.*

(1) Applicable regulations relating to sUAS pilot privileges, limitations, and flight operations.

(2) Incident/accident reporting requirements of the National Transportation Safety Board (NTSB) and FAA.

> ***RATIONALE:*** *Reporting of incidents/accidents are critical to the data gathering efforts.*

(3) Use of applicable portions of the aeronautical information manual and FAA advisory circulars.

(4) Use of aeronautical charts for VFR and Instrument Flight Rules (IFR) navigation, overlying airspace consideration, obstacle clearance requirements, and flight restrictions affecting sUAS operations.

RATIONALE: *Knowledge of aeronautical charts is essential for identifying airspace boundaries.*

(5) Recognition of critical weather situations from the surface that may affect safe sUAS operation. This would include procurement and use of aeronautical weather reports and forecasts.

RATIONALE: *General knowledge of hazardous weather will have a positive effect on accident/incident rates and reliability.*

(6) Safe and efficient operation of the sUAS including collision avoidance and recognition of hazardous in-flight situations.

RATIONALE: *To operate safely the PIC must understand collision avoidance procedures.*

(7) Effects of weather on sUAS performance.

RATIONALE: *Knowledge of temperature and altitude effects on sUAS performance is necessary for safe flight.*

(8) UAS configuration management including but not limited to weight and balance consideration or other factors affecting sUAS performance.

(9) Principles of aerodynamics, power plants, and aircraft systems appropriate to sUAS.

RATIONALE: *Fundamental understanding of aerodynamic principles and aircraft systems will contribute to reliability and better pilot performance.*

(10) Emergency procedures including recovery from unusual flight attitudes and recognition of stall/spins as applicable.

RATIONALE: *Stall/spin awareness and emergency procedures are an essential element to flight. Particularly to sUAS under direct pilot control.*

(11) Aeronautical decision making and risk management.

RATIONALE: *Decision making and risk assessment/management are essential elements in aviation.*

(12) Crew Resource Management.

RATIONALE: *Many sUAS operations will involve a PIC working with one or more visual observers.*

15.6 Flight Proficiency

A person who applies for an unmanned aircraft pilot certificate must have flown that aircraft under the provisions of Section 2.1, Section 14, Section 23, or under a COA or a Special Airworthiness Certificate, or must receive and log ground and flight training from an authorized instructor or approved school on the areas of operation listed below:

RATIONALE: *Establishes flight proficiency requirements for all system PICs regardless of aircraft size and performance. The committee left plenty of latitude for each operator/manufacturer to define how the training courses are constructed, left the number of training hours required out of the rule thereby allowing training to proficiency as determined by the school/instructor.*

These areas are modified extracts from 14 CFR Part 61 Private Pilot requirements. They have been tailored for sUAS operations and represent what the group felt were generic areas applicable to ALL platforms. The committee decided not to get overly specific due to the varied nature of the available systems and to provide ample latitude to instructors and schools to define training program's as they deem appropriate.

No reference to sensor package training requirements.

More specific details regarding flight proficiency could be contained in a consensus standard to facilitate FAA approval of specific training programs.

Flight proficiency requirements do not apply to perspective PICs of Group I sUAS.

(1) Preflight preparation.

(2) Preflight procedures.

(3) Range or operational area safety and risk assessment.

(4) Launches, recoveries, go-arounds, or wave-offs.

(5) Mission operations and management to include VFR navigation, adherence to prescribed flight plan, collision avoidance, and ATC communications.

(6) Flight and ground crew management as applicable.

(7) Emergency procedures as applicable to aircraft.

(8) Post-flight procedures.

15.7 Flight Review: Pilot-in-Command ●

(1) To operate a sUAS except if operated under Section 15.4, or Section 23, or under a COA or a Special Airworthiness Certificate, the PIC must complete a flight review administered by an authorized instructor or an approved school in the preceding 24 calendar months. ●

(2) The review must consist of a minimum of one hour of ground training including a review of current general operating rules for sUAS and applicable flight rules of 14 CFR 91 and; a minimum of one hour of flight training or of a duration equal to the operational limitation of the aircraft whichever is shorter and including at least one launch and recovery of the aircraft.

RATIONALE: The dynamic nature of the regulatory environment relating to sUAS operations in the NAS coupled with rapid technology changes makes it imperative that crews remain "current" and knowledgeable.

The flight review concept is an adaptation of the 14 CFR Part 61 requirements for manned aircraft. 14 CFR Part 61.56

ALTERNATIVE VIEW: Add a Recent Flight Experience Section, as follows: *(1) Except for flight training or to meet the proficiency requirements of this Part, no person may act as PIC of an unmanned aircraft unless that person has made a minimum of three successful flights including launch and recovery in the preceding 90 days. (2) For the purpose of meeting requirements of this part, the flights including launch and recovery can be accomplished in a training device approved by the Administrator.*

ALTERNATIVE RATIONALE: *Most segments of aviation require some form of PIC currency. There is concern that sUAS piloting skills will erode over time and thus increase risk. It is anticipated that the burden on the PIC would be minimal.*

15.8 Medical Certificate: Requirements and Duration

15.8.1 Operations Requiring a Medical Certificate ●

A person performing the duties of PIC of a sUAS shall:

(1) For all operations except those meeting the requirements of Section 15.4, possess at least a second class medical certificate with limitations for sUAS operations.

(2) As an alternative to (1) above, possess documentation from a licensed medical professional asserting that the individual has visual ability consistent with description contained in second class medical certificate requirements as defined in 14 CFR Part 67.203 and hearing consistent with the description contained in second class medical certificate requirements as define in 14 CFR 67.205.a.1. ●

(3) Have no physical limitation that would prevent carrying out the duties and responsibilities of an observer.

ALTERNATIVE VIEW: *Except as provided in Section 15.8.2 of this Part, a PIC must hold at least a second-class medical certificate with waivers as identified by designated medical examiner for sUAS operations as applicable.*

ALTERNATIVE RATIONALE: *Even an FAA medical certificate issued with limitations for sUAS privileges is more comprehensive than vision standards (i.e., reflexes, medical history, conditions, neurology, and pathology.)*

15.8.2 Operations Not Requiring a Medical Certificate

A person is not required to hold a medical certificate:

(1) When operating an aircraft that meets the requirements of 15.4 of this sub part.

(2) When acting as a sUAS instructor if that person is not acting as PIC.

(3) When taking a test for sUAS certification.

(4) When piloting a sUAS not as the PIC.

> ***RATIONALE:*** *It is the opinion of the sub group that medical certificates should be required of ALL sUAS PICs. However, under the "Group I" provisions and the realization that we are trying to afford opportunities to grow the light-weight side of the spectrum, the committee has agreed to waive the certification and medical requirements for Group I operations.*
>
> *The committee feels a second class medical was appropriate for all others in that these are operations for other than recreational purposes and the eyesight requirements for line-of-sight operations greater than 1500 feet away required a higher level of visual acuity.*
>
> *Driver's license eyesight requirements are too generous and inconsistent from state to state.*
>
> *(1) and (3) are consistent with manned aircraft operations.*

15.8.3 Duration of Medical Certificate ●

For sUAS operations under this sub part, a second-class medical certificate or medical examination expires at the end of the 36th month after the month of the date of the examination shown on the certificate. ●

> ***RATIONALE:*** *The group felt that extending the valid period for a second class medical for sUAS operations was appropriate given the nature of the operations and no passengers were involved.*
>
> *The third class medical duration is consistent with the newly released rules governing medical duration for pilots under 40 years of age. The committee thought this was appropriate for all sUAS observers regardless of age.*
>
> ***ALTERNATIVE VIEW:*** *The duration of the medical certificate should be consistent with the duration contained 14 CFR 61.23.*

15.9 Issuance of sUAS Certificate and Authorizations

An applicant for sUAS pilot certificate must comply with the requirements of Federal Aviation Regulations (FAR) Part 61.13 (a), (b). Additional requirements for sUAS group authorizations.

(1) Authorization to act as PIC of sUAS shall require instruction from an authorized instructor and demonstration of proficiency in all the flight proficiency areas of operation found in Section 15.5 of this sub part.

(2) Receive a logbook endorsement from an authorized instructor that the pilot has received the required instruction and been found competent to act as PIC of that style of aircraft.

RATIONALE: *This is general boiler plate establishing the requirement that states you must be a United States citizen or pay the necessary non citizen fee's to the government before a certificate can be issued.*

Requires that you apply for the certificate and be found competent to hold the certificate.

Clarifies the intent to permit operations of multiple aircraft types with a logbook endorsement.

16. Qualified Visual Observer

This Section applies to all persons who seek to serve in the capacity of a qualified visual observer per requirements outlined in Section 5.2.

16.1 Eligibility

To be eligible to perform the duties of visual observer for sUAS operations, a person must:

(1) Be at least 18 years of age.

(2) Be able to read, speak, write, and understand the English language.

(3) Been found competent by the PIC to serve in an observer capacity.

(4) Received training from a certificated sUAS pilot on the duties and responsibilities of an observer pertaining to the sUAS on which observer duty will be performed and on the aeronautical knowledge areas prescribed in Section 16.2 of this Subpart.

RATIONALE: *This Section delineates the requirements for observers as members of the sUAS flight crew. The committee does not advocate issuance of a certificate for this position, however we believe empowering the PIC with responsibility to train and "certify" an individual for observer duty is adequate.*

16.2 Aeronautical Knowledge Requirements

The PIC must ensure that any person serving as a qualified visual observer for sUAS operations has received instruction on the areas listed below:

(1) Regulations pertaining to operation of the sUAS.

(2) Use of aeronautical charts and FAA publications appropriate to the operation conducted.

(3) Determining ground or in flight visibility as appropriate and identification of hazardous weather conditions.

(4) Safe and efficient operation of the sUAS including collision avoidance and recognition of hazardous in flight conditions.

(5) Effective communication procedures including radio operations and direct, effective verbal communication with all sUAS flight crewmembers.

RATIONALE: *Because the qualified visual observer is essentially the "eyes and ears" of the PIC, the committee believes it appropriate that the visual observer be familiar with a sub set of the knowledge areas required of the pilot. The areas selected relate directly to the aircraft in flight and the environment in which it operates. The PIC retains full responsibility for the actions of the observer.*

16.3 Medical Requirements ●

A person performing the duties of visual observer when required by a sUAS shall:

(1) For operations meeting the requirements of Section 15.4, possess at least a third class medical certificate with limitations for sUAS operations.

(2) For all other operations, possess at least a second class medical certificate with limitations for sUAS operations.

(3) As an alternative to (1) and (2) above, possess documentation from a licensed medical professional asserting that the individual has visual ability consistent with description contained in second class medical certificate requirements as defined in 14 CFR Part 67.203 and hearing consistent with the description contained in second class medical certificate requirements as define in 14 CFR 67.205.a.1.

(4) Have no physical limitation that would prevent carrying out the duties and responsibilities of an observer.

RATIONALE: *Given that visual see and avoidance is a critical aspect of avoiding mid-air collisions and the visual observers primary function is to visually monitor the unmanned aircraft and the airspace around it for potential collision threats, it is critically important that their eyesight be professionally tested and verified. The recommended regulation makes it clear that either a third or second class medical certificate is required as appropriate or that there be some other form of documentation which indicates that the visual observer has the visual acuity consistent with the standards defined for a second class medical.*

COMMENTARY: *14 CFR Part 67.203 Contains the following visual standards for a second-class airman medical certificate:*

(1) Distant visual acuity of 20/20 or better in each eye separately, with or without corrective lenses. If corrective lenses (spectacles or contact lenses) are necessary for 20/20 vision, the person may be eligible only on the condition that corrective lenses are worn while exercising the privileges of an airman certificate.

(2) Near vision of 20/40 or better, Snellen equivalent, at 16 inches in each eye separately, with or without corrective lenses. If age 50 or older, near vision of 20/40 or better, Snellen equivalent, at both 16 inches and 32 inches in each eye separately, with or without corrective lenses.

(3) Ability to perceive those colors necessary for the safe performance of airman duties.

(4) Normal fields of vision.

(5) No acute or chronic pathological condition of either eye or adnexa that interferes with the proper function of an eye, that may reasonably be expected to progress to that degree, or that may reasonably be expected to be aggravated by flying.

(6) Bifoveal fixation and vergence-phoria relationship sufficient to prevent a break in fusion under conditions that may reasonably be expected to occur in performing airman duties. Tests for the factors named in this paragraph are not required except for persons found to have more than one prism diopter of hyperphoria, six prism diopters of esophoria, or six prism diopters of exophoria. If any of these values are exceeded, the Federal Air Surgeon may require the person to be examined by a qualified eye specialist to determine if there is bifoveal fixation and an adequate vergence-phoria relationship. However, if otherwise eligible, the person is issued a medical certificate pending the results of the examination.

COMMENTARY: *The existing "Guide for Aviation Medical Examiners Application Process for Medical Certification" could be used as testing criteria.*

ALTERNATIVE VIEW: *Accept a valid United States driver's license in lieu of a second-or third-class medical certificate.*

ALTERNATIVE RATIONALE: *In 14 CFR 61.303, a United States driver's license is accepted for the operation of light-sport aircraft.*

16.4 Duration of Medical Certificate ●

For sUAS operations under this sub part, a second-class medical certificate or medical examination expires at the end of the 36th month after the month of the date of the examination shown on the certificate. For operations requiring a 3rd class medical, the medical certificate expires at the end of the 60th month after the month of the date of the examination shown on the certificate. ●

RATIONALE: *The group felt that extending the valid period for a second class medical for sUAS operations was appropriate given the nature of the operations and no passengers were involved.*

The third class medical duration is consistent with the newly released rules governing medical duration for pilots under 40 years of age. The committee thought this was appropriate for all sUAS observers regardless of age.

ALTERNATIVE VIEW: *The duration of the medical certificate should be consistent with the duration contained 14 CFR 61.23.*

17. UAS Instructor

This Section prescribes the requirements for the issuance of sUAS instructor certificates, the conditions under which the certificate is necessary, and the limitations on the certificate.

17.1 Eligibility Requirements

To be eligible for a sUAS instructor certificate a person must:

(1) Be at least 18 years of age.

(2) Be able to read, speak, write, and understand the English language.

(3) Hold a sUAS pilot certificate.

(4) Pass a knowledge test on the aeronautical knowledge areas listed in 17.2 of this section unless the applicant:

- Holds a flight instructor certificate or ground instructor certificate issued under this part
- Holds a current teacher's certificate issued by a state, county, city, or municipality that authorizes the person to teach at an educational level of 7th grade or higher
- Is employed as teacher at an accredited college or university

> ***RATIONALE:*** *This recommendation is consistent with 14 CFR Part 61 instructor requirements for manned aircraft. 14 CFR Part 61.183. Provides for exemptions for an additional knowledge test.*
>
> ***COMMENTARY:*** *The FAA should consider mechanisms to "grandfather" developers of sUAS and/or military personal who can present evidence of appropriate flight experience to a FSDO.*

(5) Receive a logbook endorsement from an authorized instructor or aviation safety inspector on the areas of operation listed in Section 15.6.

(6) Logged at least 20 successful launch and recoveries with the sUAS to which instructor privileges are sought.

> ***RATIONALE:*** *The committee believes instructors need to have logged significant experience on a particular system. The committee wants to see consistent acceptable performance from the pilot, an ability to make good judgment calls, and know a system well enough to achieve a good track record of successful operations.*

17.2 Aeronautical Knowledge

Except as provided in Section 17.1 (4), a person who is applying for a sUAS instructor certificate must receive and log ground training from an authorized instructor on:

(1) The learning process.

(2) Elements of effective teaching.

(3) Student evaluation and testing.

(4) Course development.

(5) Lesson planning.

(6) Classroom training techniques.

17.3 Flight proficiency

17.3.1 Areas of Operation

A person who is applying for a sUAS instructor certificate must receive and log flight and ground training from an authorized instructor on the areas of operation listed below.

(1) Fundamentals of instructing.

(2) Technical subject areas.

(3) Preflight preparation.

(4) Preflight procedures.

(5) Range or operational area safety and risk management.

(6) Launches, recoveries, go-around's, or wave offs.

(7) Mission operations and management to include VFR navigation, adherence to prescribed flight plan, collision avoidance, and ATC communications.

(8) Flight and ground crew management as applicable.

(9) Emergency procedures as applicable to aircraft.

(10) Post-flight procedures.

> ***RATIONALE:*** *These areas are straight from 14 CFR Part 61. The FAA has a testing instrument in place which fits the bill for this part. Commercially available courseware is readily available to prepare an applicant for this test.*
>
> *This is an enhanced list of areas which include a requirement that the applicant demonstrate some teaching ability. All the areas are the same as those required for pilot certification.*

17.3.2 Endorsement

The applicant's logbook must contain an endorsement from an authorized instructor certifying the person is proficient in all the areas of operation and has been found qualified to hold a sUAS instructor certificate.

> ***RATIONALE:*** *This section provides for the certification of an instructor applicant with an endorsement by a qualified instructor. Again, like the sUAS Pilot Certificate, no additional practical test is required.*

17.4 sUAS Instructor Limitations and Qualifications

17.4.1 Hours of Training

In any 24 hour consecutive period, a sUAS instructor may not conduct more than 12 hours of instruction.

> ***RATIONALE:*** *As with manned aircraft instruction, the committee believes performance suffers when fatigue sets in. The committee felt it appropriate to limit instructor duty time to 12 hours per day. This is a longer duty day as compared to manned aircraft. 14 CFR Part 61.195 (a.)*

17.4.2 Aircraft Type Training

A sUAS instructor may not conduct instruction on a system for which the instructor does not hold a PIC endorsement.

> ***RATIONALE:*** *Fairly obvious that if you aren't qualified to fly a particular platform, you shouldn't instruct students on it.*

17.4.3 Limitations on Endorsements

A sUAS instructor may not endorse or recommend a student for a sUAS pilot certificate unless that instructor has given the instruction required by Section 15.5 of this subpart and/or found the student competent in all the prescribed knowledge and flight proficiency areas or; endorse a pilot's logbook for the flight review required by Section 15.6 of this subpart.

> ***RATIONALE:*** *The committee believes that it essential that an instructor take responsibility for a student from "cradle to grave". This rule mandates that before an endorsement is rendered, an instructor MUST provide the student with all the instruction or have the student demonstrate competency in the knowledge and skill areas. This is consistent with manned aircraft (14 CFR Part 61.195 (d)).*

17.4.4 Qualifications of the Instructor for Training First Time sUAS Instructor Applicants

The instruction provided to an initial applicant for a sUAS instructor certificate must be given by an authorized instructor who has held an instructor certificate for at least 12 months and has recommended at least three students for sUAS pilot certification.

> ***RATIONALE:*** *This rule is an attempt to insure that instructors who recommend other instructor applicants for a certificate have at least been performing the duties of an instructor for a reasonable amount of time. This is an attempt to insure quality and legitimacy to the instructor certification process. This is consistent with the requirements concept in 14 CFR Part 61.195 (h).*

18. sUAS Training Programs

This section describes the requirements for development and approval of training courses for sUAS pilots and instructors and the general operating rules for training programs and schools.

18.1 Requirements for Training Courses

An applicant for sUAS pilot training course approval must:

(1) Complete and submit application on a form prescribed by the administrator to the FAA FSDO having jurisdiction over the area where the training school is based.

> ***RATIONALE:*** *The committee is trying to capture the idea that community based organizations, operators and manufacturers have significant latitude in how to develop and administer training. This rule provides opportunity for individuals, organizations, or commercial training program developers to create sUAS training courses and deploy them. The work done by ASTM and others can certainly be leveraged. FAA will be responsible for "approving" the courses to make sure they comply with this sub part under guidance to be developed*

(2) For courses leading to a sUAS pilot certificate, submit a training course outline that includes:

- Lesson descriptions and content that covers all required knowledge and flight proficiency areas of operation found in 15.5 and 15.6 of this subpart
- A description of student evaluation criteria and all tests
- A description of the sUAS to be used in training
- For courses leading to a sUAS instructor certificate submit a training course outline that includes:
  - Lesson descriptions and content that covers all required knowledge and flight proficiency areas of operation found in 17.2 and 17.3 of this subpart
  - A description of student evaluation criteria and all tests

> ***RATIONALE:*** *This section identifies specific requirements all approved courses must contain prior to submittal. This is a subset of the requirements for training course outlines found in Part 141.*
>
> *This proposed rule provides opportunity for a school to hold authorizations to train on multiple platforms.*

18.2 Operating Rules and Limitations

This section describes the operating rules for approved sUAS training schools. An approved school includes any certified sUAS instructor or instructors who have submitted and received approval of a training course outline as prescribed in Section 18.1 of this subpart.

RATIONALE: *This section simply defines "approved school". An approved school could be a single instructor, community-based organization, university, sUAS manufacturer, or other appropriate entity. A school may be approved to train and qualify students for one or more Operating Group(s) of sUAS. Such approval shall involve progressive qualifications with Group I being the most basic and Group IV the most comprehensive.*

(3) No approved school may recommend an applicant for a sUAS pilot certificate or sUAS instructor certificate unless that student has completed the entire course of training and successfully passed all required examinations and tests.

(4) An approved school may train students on more than one sUAS.

(5) Training may be conducted in any suitable location at the discretion of the instructor but shall remain under the jurisdiction of the approving FAA FSDO.

RATIONALE: *This section puts some restrictions on schools and mandates that short-cuts are not allowed. Training to proficiency is permitted and encouraged but ALL the training must be completed prior to certification.*

Due to the nature of the business, it is conceivable that training could be offered in multiple locations by a single provider. This rule allows for this but the responsibility still lies with the approving FSDO.

Subpart D. Aircraft and Systems

19. Registration, Identification, and Marking

(1) All applicants for sUAS Certificates of Registration shall comply with Title 14, CFR, Part 47 unless that Part conflicts with this Subpart.

(2) sUAS registration shall be accomplished online via the FAA Aircraft Registry website. The aircraft is registered as of the date the online registration process is completed. A Certificate of sUAS Registration may be downloaded or printed following registration. The Certificate of Registration expires three years from the last day of the month in which the aircraft was registered. Renewal applications are accepted up to 90 days in advance of the expiration date of the current certificate. During flight operations the original or a copy of the Certificate of Registration will be located at the Control Station.

19.1 Registration Required

All civil sUAS shall be properly registered unless the aircraft is operated as defined in Subpart A.

19.2 Identification and Marking

All sUAS shall have its individual identification number on an identification plate and/or markings in accordance with the recognized consensus standards to ensure the identity of the aircraft can be determined following an incident or accident.

20. Initial Airworthiness Certification

COMMENTARY: *The General Aircraft provisions should account for mechanisms associated with certifying individual aircraft as well as aircraft production. Individual aircraft could be production models, kit built, or individual designs.*

Certification requirements should include the use of common language and consist of a program and regime that are applicable/attainable by small business (<5 persons).

If an aircraft is sold in kit form and/or the aircraft initial purchaser builds or assembles more than 51 percent of the aircraft, that individual shall be considered the first owner and the manufacturer.

20.1 Eligibility

For a civil sUAS to be eligible for a sUAS certificate

(1) An applicant must be able to provide the FAA upon request with the following:

- The system's operating instructions
- The system's maintenance and inspection procedures
- The manufacturer's statement of compliance with Section (3)

(2) The system must be inspected and found to be in a condition for safe operation by the applicant.

(3) The manufacturer must provide a statement of compliance which:

- Identifies the sUAS by make and model, serial number, date of manufacture, and any consensus standard used.
- State that the system meets the provisions of the identified consensus standard.
- State that the manufacturer will make available to any interested person the following documents that meet the identified consensus standard:
  - The system's operating instructions
  - The system's maintenance and inspection procedures

RATIONALE: *Following the Light Sport Aircraft approach, the sUAS ARC is recommending that details for certification be moved to consensus standards. The text above is modeled on the Light Sport Aircraft regulatory language contained in 21.190. The text above directs the use of consensus standards for declaring compliance for certification.*

Using the output from the System Certification Working Group and the thinking regarding system maturity from the Operations Working Group the ARC should include recommendations for consensus standards that follow the specifics outlined in Appendix B.

There may need to be Design and Construction standards for the following:

- *Aircraft (Fixed Wing, Lighter-than-Air, Rotorcraft, Power lift)*
- *Control Stations*
- *Command, Control, and Communications*
- *Launch and Recovery Systems*

In addition, consensus standards are needed to offer guidelines for test and evaluation including flight testing and production testing.

20.2 Initial Test and Evaluation

The person who registers the sUAS must ensure that equipment requirements and design provisions described in FAA accepted standards have been successfully tested.

> ***COMMENTARY:*** *Consensus standards will offer guidelines on appropriate processes and procedures for acceptance testing. See section 14.4.*

20.3 Production Approval

The production of multiple copies of a single sUAS for sale for commercial purposes shall follow production acceptance and quality assurance procedures as outlined in recognized consensus standards.

(1) For each system completed, the manufacturer shall state that he has complied with the production acceptance and quality assurance standards including:

- Ground and flight testing the aircraft
- Found the system performance acceptable
- Determined that the system is in a condition for safe operation

(2) The manufacturer will establish a monitoring program in order to identify and correct safety-of-flight issues.

> ***COMMENTARY:*** *The manufacturer should set up a monitoring program in accordance with established consensus standards.*

(3) On an annual basis, the manufacturer will report to the FAA relevant information regarding operational safety of their systems.

> ***COMMENTARY:*** *The FAA will need to define when and how and the content of such reporting.*

21. Continued Airworthiness

21.1 Inspection and Maintenance

The PIC will ensure that the sUAS has been inspected and maintained in accordance with manufacturer's procedures.

21.2 Record Keeping

The PIC is responsible for recording hours of operation, number of takeoffs/launches and landings/recoveries as well as mechanical discrepancies discovered during operation. The owner/operator is responsible for maintaining a log of repairs, alterations, and replacements.

21.3 Repairs and Modifications

Systems that are new, modified, suspected of damage, or that have undergone major maintenance or repair should be re-inspected in accordance with manufacturer's procedures.

> ***COMMENTARY:*** *The sUAS ARC recommends that consensus standards shall establish guidelines for manufacturer's inspection and maintenance procedures, record keeping, and repair and modification procedures.*

22. Reporting

22.1 Operational Safety Monitoring

The PIC will ensure that any equipment malfunctions are logged along with their effect on the operation and reported to the manufacturer in a timely fashion.

22.2 Annual Flight Hour Reporting

The certificate holder is responsible for reporting all flight hours on an annual basis to the FAA.

22.3 UAS Incident Reporting

COMMENTARY: *A definition of a reportable incident is needed. Some members of the ARC felt that that it is vital, in order to evaluate the sUAS safety case, that the FAA must list certain errors, failures and incidents that must be reported in short course such as typically done for flight interruption reports, flight reliability reporting etc. In addition, certain members of the ARC also felt that malfunctions such as failure of the aircraft to respond to flight commands from the control unit, failure of the flyaway protection system, failure of the lost link program, in-flight collision with another aircraft, structure, or person etc. should be reported immediately to FAA. It was also recommended by the ARC that the FAA should develop a sUAS safety program that would allow for data analysis that could enable safety-based data decisions to lead to future sUAS regulatory changes.*

Subpart E. Alternative Means of Compliance

23. Demonstration of Acceptable Level of Risk

Any sUAS may be operated in such a manner that the associated risk of harm to persons and property not participating in the operation is expected to be less than acceptable threshold value(s) as specified by the Administrator. Estimates of risk of harm shall be made according to recognized consensus standards acceptable to the Administrator. Aircraft operated in compliance with this provision need not comply with the provisions of Subpart B.

RATIONALE: *The intent of this recommendation is to enable non-model sUAS operations while bounding the associated risk of harm to manned aircraft, and to people and property on the surface. Accordingly, the regulations should exclude those operations which have excessive risk of harm, and permit those operations which have sufficiently low risk of harm—within the limits imposed by the FAA's overall terms of reference. To a much greater extent than for manned aircraft, this means that regulation must allow reliability and hazard-mitigation measures to vary from mission to mission, with the required reliability and mitigation increasing with density of traffic and population. A "risk-based" means of compliance provides the necessary flexibility, allowing designers and operators to deploy technology and procedures as appropriate to their intended applications.*

The committee considered the alternative of a waiver process for designs and applications not covered by the "bins and boxes" of other subparts. The waiver process has the disadvantages of relatively high cost to the FAA, lack of standardization, and uncertainty of outcome for designers and operators. An affirmative compliance path instead offers standardization, transparency, and predictability, which is essential for encouraging new investment and applications.

This subpart invites industry, academia, and government to apply analysis and experience to establishment of practical standards for risk estimation, which the FAA can choose to accept or reject. Any accepted standard(s) can effectively be made part of the regulations by Notice of Acceptability. Such action would enable use of this subpart. Implementation would involve relatively low cost for the FAA, liability would fall under the blanket of the standard, and modifications can be made as indicated by experience.

Appendix B: Summary of Recommendations for System Standards

Technical Requirements	Group I	Group II, III, and IV
Structural Integrity: The aircraft should be designed so that it maintains structural integrity for intended flight.	X	X
Adhering to Manufacturer's Specification: The system should be designed such that no component used in the system exceeds the manufacturer's maximum rating(s) for that component under normal operating conditions, if any.	X	X
Safe System Start-up: The system should be designed to initialize in a known, safe state upon power up.	X	X
Flight Control Cables: The aircraft should be designed such that flight control cables will not bind, jam, or chafe under all intended flight conditions.	X	X
Fire Protection: The system should be designed to minimize the likelihood of fire in the event of a crash.	X	X
Connectors: The aircraft should be designed such that control surface actuators, linkages, and control horns, if so equipped, and electrical connectors to flight critical components, if any, cannot disconnect due to normal or expected operations.	X	X
Control Station Synchronization: The system should provide a means to verify the Control Station software and the on-board systems are compatible and synchronized prior to flight.	X	X
Communications Range Test:		X
Operators Manuals: All sUAS must have an Operator's Manual that contains all of the information necessary for flight as identified in the recognized consensus standard. The Operator's Manual must be readily accessible to the PIC. The operator's manual should contain instructions, methods, and procedures to safely operate the system.		X

Technical Requirements	Group I	Group II, III, and IV
Maintenance and Inspection Procedures: All sUAS should have procedures for maintenance and inspection for the entire system to ensure continued airworthiness. The procedures should include applicable check lists for annual condition inspections and pre-flight inspection.		X
Component Failure Protection: The system should be designed such that in the event of any single component or system failure other than primary structure, the aircraft either remains controllable or a technical mechanism will automatically execute to ensure aircraft returns safely to the surface as soon as practical.		X
Powerplant Fail Safe: The aircraft should be designed such that a failure of the primary powerplant shall not result in the failure of primary flight control systems.		X
Fuel / Power Information: The system should provide a means of determining the amount of available on-board fuel or primary battery capacity for the primary propulsion unit and if equipped battery capacity for control power battery.		X
Fuel / Power Markings: The aircraft must have clear markings to indicate the type of fuel required (if any) and the polarity, type, and proper installation of batteries.		X
Prevention of Commands Which Exceed Structural Limits: The system should be designed to prevent control commands which would cause the aircraft to exceed structural limits of the airframe and control surfaces within the entire operating envelop.		X
Weight and Balance: The system should be designed to account for the weight and balance of intended payloads, fuel, batteries, etc., to ensure that the center of gravity is maintained in a manner that would enable stable flight.		X
Materials: The aircraft should be constructed of materials that will not break-up in flight when operated within the intended flight envelop.		X

20 states have introduced UAS legislation

moratorium for law enforcement for 2 years

Reps. Zoe Lofgren and Ted Poe Introduce Bipartisan Bill to Protect Americans' Privacy Rights from Domestic Drones

WASHINGTON, D.C. - Reps. Zoe Lofgren (D-CA) and Ted Poe (R-TX) have introduced legislation, H.R. 637, The Preserving American Privacy Act, to establish due process protections for Americans against government-operated unmanned aircraft systems (UAS) in U.S. airspace. The bipartisan legislation would also forbid law enforcement and private UAS from being armed with firearms or explosives while operating within U.S. airspace.

"The expanded use of drones on U.S. soil raises serious Constitutional and civil liberties issues that Congress needs to address," Rep. Lofgren said. "These devices should be used in a safe, open, and responsible manner. This bill would ensure that drones follow strict guidelines to protect Americans' privacy while still realizing their practical applications for science, border security, public safety, and commercial development."

"As we enter this uncharted world of drone technology, Congress must be proactive and establish boundaries for drone use that safeguard the Constitutional rights of Americans," Rep. Poe said. "Individuals are rightfully concerned that these new eyes in the sky may threaten their privacy. It is the obligation of Congress to ensure that this does not happen. Just because Big Brother can look into someone's backyard doesn't mean it should. Technology may change, but the Constitution does not."

Specific provisions governing the use of UAS in the Preserving American Privacy Act include:

- Government-operated UAS must obtain a warrant to collect information that can identify individuals in a private area;
- Government-operated UAS must obtain a court order and provide public notice beforehand to collect information that can identify individuals in defined public areas;
- The warrant and court order requirements are subject to exceptions for emergencies, border security, and consent;
- Private UAS cannot capture visual images or sound recordings of individuals engaging in personal activities in certain circumstances in which the individual has a reasonable expectation of privacy;
- State laws on the use of UAS in the airspace of the state are not preempted;
- Private and law enforcement UAS cannot use or operate UAS equipped with firearms or explosives in U.S. airspace.

Section-by-Section Summary of H.R. 637 – The "Preserving American Privacy Act"

Section 2 – Use of Unmanned Aircraft Systems

- The bill creates a new Chapter 205A in Title 18 of the United States Code.

Section A – Definitions

- "Covered information" means information that is reasonably likely to enable identification of an individual, or information about an individual's property that is not in plain view.
- "Public unmanned aircraft system" (public UAS) means a UAS operated by a governmental entity, such as an agency of the federal, state, or municipal governments.

Section B – Use of Public Unmanned Aircraft Systems

- Governmental entities must operate public UAS in accordance with this Act.
- Governmental entities operating public UAS must minimize, to the extent practicable, the collection or disclosure of covered information.
- Governmental entities that seek a license or certificate to operate a public UAS must submit to the Dept. of Justice (DOJ) a data collection statement that includes following: the purpose for which the UAS will be used, whether the UAS is capable of collecting covered information, the length of time for which collected information will be retained, the unit of the governmental entity that is responsible for safe and appropriate use of the UAS, an individual point of contact for citizen feedback, the rank and title of the individual who can authorize the use of the UAS, the applicable data minimization policies, and applicable audit and oversight procedures.
- The DOJ may request that the Secretary of Transportation revoke a certificate or license to operate a public UAS if the operator's activity contravenes the data collection statement.
- The Attorney General must issue regulations to establish a publicly accessible database indexing the certificates or licenses and associated data collection statements for public UAS.

Section C – Use of Covered Information as Evidence

- Covered information collected by a governmental entity's operation of a public UAS in violation of this Act cannot be used as evidence against any individual at any trial, hearing or other procedure before any court, agency, regulatory body, or other authority of the United States.

- A governmental entity may not operate a public UAS for a law enforcement purpose, or collect or disclose covered information through such operation.

- A governmental entity may operate a public UAS and collect or disclose covered information for a law enforcement purpose under the following circumstances:

    - Pursuant to a warrant, and within ten days of the execution of the warrant serves a copy of the warrant to each person on whom covered information was collected – unless the notice would seriously jeopardize an ongoing criminal or national security investigation;

    - Pursuant to a court order based on specific and articulable facts supporting reasonable suspicion of criminal activity, the public UAS will operate only in a stipulated public area for a period of not more than 48 hours, and

        1. The governmental entity serves a copy of the warrant to each person on whom covered information was collected within ten days of the execution of the warrant, OR

        2. The governmental entity posts public notification 48 hours prior to the UAS operation, either via public signage in the area in which the operation takes place, notice in a major publication (circulation of at least 1,000) serving the area, or notice on the entity's public website.

    - If the public UAS is operated within 25 miles of any external land boundary of the U.S. for the purpose of patrolling or securing the border;

    - If the individuals on whom the covered information is collected or disclosed provide prior written consent;

    - An investigative or law enforcement office reasonably believes an emergency situation exists involving immediate danger of death or physical injury, conspiratorial activities threatening the national security, conspiratorial activities characteristic of organized crime – and the officer must apply for a warrant not later than 48 hours after the operation.

Section D – Administrative Discipline

- The section allows for oversight and administrative discipline of governmental entities that intentionally violate the provisions of the bill.

Section E – Reporting

- Once a year all Federal judges who have issued an order or warrant under this Act must report the following: the fact the warrant or order was applied for, if the application was granted or denied, the time period of UAS operation requested, the offense the application was in relation to, and the identity of the governmental entity that made the application.

- Once a year the Attorney General (Federal and State) must report, in addition to the above information, the following: a general description of information gathered under the warrant or order, the approximate nature and frequency of incriminating conduct observed, the approximate number of persons on whom covered information was gathered, the approximate cost of manpower and other resources used in public UAS operation, and the number of arrests, trials, motions to suppress, and convictions resulting from public UAS operation.

Section F – Private Use of Unmanned Aircraft Systems

- It shall be unlawful to use a private UAS equipped with a visual or auditory enhancing device to capture, in a manner that is highly offensive to a reasonable person, any type of visual image, sound recording, or other physical impression of a individual engaging in a personal or familial activity under circumstances in which the individual has a reasonable expectation of privacy – if the image, recording, or impression could not have been achieved without a trespass unless the visual or auditory enhancing device was used. This restriction applies regardless of whether there is a physical trespass.

- This provision is modeled on Cal. Civ. Code 1708.8.

Section G – No preemption of 18 USC Chapter 119

- This law does not preempt federal laws on wire and electronic communications interception.

Section H – Ban on Weaponization

- It is unlawful for private individuals or law enforcement officers to use or operate an unmanned aircraft system that is armed with a firearm (includes explosives) in the national airspace of the United States.

Section I – No State Preemption

- This law does not preempt state laws on the use of UAS exclusively in the airspace of the state.

END

Subject: AACC Participation in Unmanned Aircraft Systems Task Force.
Attachments: AACC Documents - Excerpts.docx

To: Ginger Blaisdell, Reference your Request for Participation.

Mr. Jim Cieplak forwarded your request to me, and after considerable discussion amongst the Executive Committee of the Alaskan Aviation Coordination Council (AACC) we feel that the AACC must decline direct participation in the Task Force. This pertains to AACC participation in the work of the Task Force as a distinct and separate entity. We do not represent the individual members of the Council outside of that forum, and as such have no direct legal, administrative, or policy influence over the conduct and activities of our members. I have attached a short document containing several excerpts from our website which may be of use to you. We provide a discussion forum for subjects of mutual interest among members of the Aviation Community. The AACC is a government/industry partnership group, and affords the opportunity for information sharing on the strategic level - useful for all parties in understanding and responding to subjects impacting within Alaskan Aviation. As a group we do not advocate for or against specific issues, rather we focus on the coordination and sharing of information so that appropriate organizations/entities can identify and resolve issues in an expedient manner. As the Task Force "stands-up" and determines its agenda we may be able to assist with some elements of coordination and would look forward to that discussion in the future. Please contact me at ArcticATC@mtaonline.net or my cell 907-354-2399 if you have questions or concerns regarding this information.

Thanks! /Dave Palmer

Subject: Unmanned Aircraft Task Force

Thank you for considering being part of this policy directive group. The tasks of the group would be:

The Unmanned Aircraft Systems Task Force is created in the legislative branch for the purpose of making recommendations for a statewide comprehensive plan to regulate that use of unmanned aircraft systems for public and private sector purposes. The task force would be made of approximately 11 members (one from each legislative body and 9 govt agency and industry folks).

The task force shall, not later than January 15, 2014, submit an initial report to the legislature, and not later than Jan 2015, submit a final report to the legislature. The reports must include
Policy options and recommendations to provide for the use of unmanned aircraft systems while protecting privacy w by law enforcement, and allowing the use of unmanned aircraft systems for other public and private applications;
Recommendations to the legislature and the governor, including draft legislation required to achieve the policy objec proposed by the task force.
The task force shall meet as frequently as necessary to carry out its responsibilities.
The task force may request administrative and technical support from the University of Alaska Fairbanks.
Members of the task force shall serve without compensation but are entitled to per diem and travel expenses authoriz boards and commissions under AS 39.20.180.
The task force terminates on January 15, 2015.

Thank you for thinking about being part of this group.

HUGHES INTROS RESOLUTION CREATING LEGISLATIVE TASK FORCE

HCR 6 establishes task force on Unmanned Aircraft Systems

Friday, March 15, 2013, Juneau, Alaska – Representative Shelley Hughes today introduced House Concurrent Resolution 6 which would establish a Task Force on Unmanned Aircraft Systems and recognizes the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks.

"We've been saturated recently with news about drones causing destruction and killing people, and we've been listening to hours of testimony nationally," Hughes, R-Palmer, said. "Even local news reported just yesterday on this seemingly hot topic. The other side of the story may not be as newsworthy as death and filibustering, but it's very important for Alaska."

Unmanned aircraft have been used in Alaska for some years doing jobs that are determined "dull, dirty, and dangerous." Unmanned Aircraft Systems (UA Systems) helped with guiding the oil tanker to Nome to restock their tank farm in the winter, locating a downed airplane near Bethel a few months ago, and have even been used for accurately counting sea lions that kept them off of the endangered species list. The missions that UA Systems have successfully completed have protected pilots that would have been flying in inclement weather and have conducted research in an economical fashion with reduced risk to human and animal lives.

At the same time, privacy concerns will not be ignored, according to Hughes. "Miniature helicopters will not be recording us while singing in the shower," Hughes said. "But we won't toss the baby out with the bath water. We can work to address those concerns and still embrace the technology that's moving forward."

HCR 6 has a referral to the House Special Committee on Economic Development, Trade and Tourism.

Arianna Huffington: Drone damage is political as well as human

Ariana Huffington: Drone damage is political as well as human

Published: March 14, 2013 Updated 11 hours ago

By Arianna Huffington — comment

It's become accepted wisdom that Washington has become pathologically polarized and partisan, with every new debate inevitably breaking down along party lines. That's why it was so remarkable when Rand Paul's old-fashioned talking filibuster last week scrambled the even more old-fashioned right-vs.-left way of looking at the world. The Paul-provoked debate on the confirmation of John Brennan to head the CIA in turn provoked a wider and critical debate about the use of drones — a debate that needs to continue well beyond Brennan's confirmation.

In February, Paul had sent Brennan a letter asking, "Do you believe that the president has the power to authorize lethal force, such as a drone strike, against a U.S. citizen on U.S. soil?"

A few weeks later, Attorney General Holder replied:

"The question you have posed is therefore entirely hypothetical. … It is possible, I suppose, to imagine an extraordinary circumstance in which it would be necessary and appropriate under the Constitution and applicable laws of the United States for the president to authorize the military to use lethal force within the territory of the United States."

And so Paul took to the floor to mount the first talking filibuster since 2010.

Democrat Ron Wyden soon joined the filibuster. "The executive branch should not be allowed to conduct such a serious and far-reaching program by themselves without any scrutiny because that's not how American democracy works," said Wyden.

On the other side of the aisle, Lindsey Graham called the idea of the U.S. using drones to kill American citizens on U.S. soil "ridiculous," and said the controversy was the result of "paranoia between the libertarians and the hard left that is unjustified," while his frequent ally John McCain, went the other way, calling Paul and fellow filibusterers "wacko birds" (which sounds like a good name for a cereal). Right vs. left was suddenly scrambled.

Not surprisingly, the poles of the debate were only partly dislodged from party affiliation, as Wyden was the only Democrat to join Paul — though Democrats Patrick Leahy and Jeff Merkley, along with Independent Bernie Sanders, did ultimately vote against Brennan.

But even if the terms of the debate on drones were only partly rearranged, it was still a step in the right direction. We need to stop framing the debate as a question of national security vs. human rights. Those in favor of drone strikes have simply assumed for themselves the national security position. From their perspective, it's unquestionable that drones make us safer, so those arguing against them a) don't care about protecting us, and b) must come up with some other — and softer — rationale for their opposition. The problem is that this line of reasoning just isn't true.

Until Paul vs. Holder, the debate was largely about drone use overseas. Bringing the question to the U.S. definitely served to heighten the legal arguments, but the questions we are facing with the use of drones overseas are anything but "hypothetical."

First, there's the right/left-scrambling statistic that President Obama has authorized six times more drone strikes than President Bush — his 300th was on Dec. 1 of last year. And what kind of national security return are we getting for all those aerial attacks? Since 2004, only 2 percent of those killed have been confirmed as militant leaders.

Even more sobering were numbers from a study by professors from NYU and Stanford last year. Relying on data from the Bureau of Investigative Journalism, they found that from mid-2004 to mid-2012, between 474 and 881 civilians were killed in Pakistan. This includes 176 children. While "we may not have declared war on Pakistan, the people living in Northwest Pakistan under drones," might as well be "in a war zone."

And when people feel like war has been declared on them, they tend to mirror the feeling back.

"What scares me about drone strikes is how they are perceived around the world," said retired Gen. Stanley McChrystal in January. "The resentment created by American use of unmanned strikes ... is much greater than the average American appreciates. They are hated on a visceral level, even by people who've never seen one or seen the effects of one."

Visceral-level hate — not exactly an effective "hearts and minds" strategy. In Iraq, it finally became conventional wisdom that we couldn't win with a military strategy alone. But this kind of thinking has yet to penetrate the conventional wisdom on drones. We euphemistically call them "targeted strikes" but the collateral damage they inflict is political as well as human.

So do drone strikes make us more safe or less safe? Those in favor of them, especially those ordering them and charged with their oversight, seem to think the answer is so obvious that it needs no justification. Maybe this is because they won't even acknowledge the facts in the first place. And, as we saw in Iraq, the combination of refusing to look at the facts and allowing claims of national security to go unquestioned can be toxic.

Arguing against drone strikes on the basis of their legality is certainly important, but there's no reason to cede the national security card to the pro-droners. Even those who care deeply about civil liberties need to push back against the idea that this is a trade-off between civil liberties and our safety. The drone debate may have ended on the Senate floor, but let's keep it going everywhere else.

Judiciary Committee Opens Domestic Drone Hearing

By Luca Gattoni-Celli on 3.20.13 @ 11:15AM

I'm live at a Senate Judiciary Committee hearingentitled "The Future of Drones in America: Law Enforcement and Privacy Considerations."

Chairman Leahy stated that the committee will attempt to conduct the hearing while members rotate in and out to take votes.

An excerpt from Chairman Patrick Leahy's (D-VT) opening statement follows (emphasis added):

> The focus of today's hearing is on the domestic, non-military use of drones. Recently, the debate about the use of unmanned aerial vehicles, or "drones", has largely focused on the lethal targeting of suspected terrorists, including Americans. **I continue to have deep concerns about the constitutional and legal implications of such targeted killings.** I have spoken with Senator Durbin, and next month he will chair a hearing in the Constitution subcommittee that will examine these issues carefully. In addition, I will continue to press the administration to provide this Committee with all relevant Office of Legal Counsel opinions related to the use of drones to conduct targeted killings.
>
> As I noted at the beginning of this Congress, I am convinced that the domestic use of drones to conduct surveillance and collect other information will have a broad and significant impact on the everyday lives of millions of Americans going forward.
>
> ...
>
> On this issue, we cannot take a short-sighted view, and we must realize that technology in this area will advance at an incredible rate. This topic is of significant interest to many members of our Committee, and I hope that this hearing will be just the beginning of an ongoing dialogue as to how best to manage the unique privacy threats associated with this modern technology, while not stifling this nascent industry that has enormous potential to improve our lives.

Before giving his own statement, Ranking Member Sen. Chuck Grassley (R-IA) said to Leahy that, "I don't think there are any differences between your concern and my concern on this issue." His worries were similar: "We must remember that the power of new technology creates greater responsibility" to protect the rights of our citizens. "Just because the government [observes] the constitution does not mean it can" surveill citizens constantly. He invoked "Big Brother" and asserted that constant monitoring is incompatible with the ideal of living in a free society. Another topic of discussion was the potential for prosecutorial use and abuse of unmanned systems. "It's very important that the American people know when and how the Justice Department will use these machines."

Reflecting the uncertainty and controversy surrounding drones, one of the witnesses, Michael Toscano, took exception to the term, which he said carries an unduly negative connotation.

Drones will require new privacy laws, Senate told

By JOAN LOWY
Associated Press / March 20, 2013

WASHINGTON (AP) — Privacy laws urgently need to be updated to protect the public from information-gathering by the thousands of civilian drones expected to be flying in U.S. skies in the next decade or so, legal experts told a Senate panel Wednesday.

A budding commercial drone industry is poised to put mostly small, unmanned aircraft to countless uses, from monitoring crops to acting as lookouts for police SWAT teams, but federal and state privacy laws have been outpaced by advances in drone technology, said experts appearing at a Senate hearing.

Current privacy protections from aerial surveillance are based on court decisions from the 1980s, the committee was told, before the widespread drone use was anticipated. In general, manned helicopters and planes already have the potential to do the same kinds of surveillance and intrusive information gathering as drones, but drones can be flown more cheaply, for longer periods of time and at less risk to human life. That makes it likely that surveillance and information-gathering will become much more widespread, legal experts said.

The Federal Aviation Administration recently predicted about 7,500 civilian drones will be in use within five years after the agency grants them greater access to U.S. skies. Congress has directed the FAA to provide drones with widespread access to domestic airspace by 2015, but the agency is behind in its development of safety regulations and isn't expected to meet that deadline.

If Americans' privacy concerns aren't addressed first, the benefits of potentially "transformative" drone technology may not be realized, Ryan Calo, a University of Washington law professor, told the Judiciary Committee.

But experts were divided on whether Congress should update federal privacy laws to set a national standard, or whether the responsibility should be left to state lawmakers to craft their own solutions. Several bills have been introduced in Congress that would, among other things, require warrants before drones could be used for surveillance.

A variety of drone-related bills have been introduced this year in more than 30 state legislatures.

There is already limited civilian drone use. The FAA has granted several hundred permits to state and local governments, police departments, universities and others to experiment with using small drones.

Initially, most civilian drones are expected to be around the size of backpack or smaller, weighing less than 55 pounds and unable to fly higher than most birds. The U.S. military, on the other hand, uses everything from unarmed, hand-launched drones like the 2.9-pound Wasp to systems like the MQ-9 Reaper that flies up to 50,000 feet, has a 66-foot wingspan, weighs up to 10,500 pounds and can fire Hellfire missiles and guided bombs.

"I am convinced that the domestic use of drones to conduct surveillance and collect other information will have a broad and significant impact on the everyday lives of millions of Americans going forward," said the committee's chairman, Sen. Patrick Leahy, D-Vt.

"Small, quiet unmanned aircraft can easily be built or purchased online for only a few hundred dollars, and equipped with high-definition video cameras while flying in areas impossible for manned aircraft to operate without being detected," Leahy said. "It is not hard to imagine the serious privacy problems that this type of technology could cause."

Earlier this year, the FAA solicited proposals to create six drone test sites around the country. With a nod to privacy concerns, the FAA said test site applicants will be required to follow federal and state privacy laws and to make a privacy policy publicly available.

The test sites are supposed to evaluate what requirements are needed to ensure the drones don't collide with planes or endanger people or property on the ground. Remotely controlled drones don't have a pilot who can see other aircraft the way an onboard plane or helicopter pilot can.

The agency has received 50 applications to create test sites in 37 states. Eventually, every state may have a test site, said Michael Toscano, president and CEO of the Association for Unmanned Vehicle Systems International, a trade association for the domestic drone industry.

Bill would put tight restrictions on drone use in state

A bill introduced Friday in Olympia would severely restrict the purchase and use of aerial drones by law-enforcement and state departments.

The Associated Press

A new bill introduced by a Republican lawmaker in Olympia would put strict restrictions on how law-enforcement agencies and state departments can buy and deploy aerial drones.

Rep. David Taylor's proposal was introduced Friday, a day after Seattle Mayor Mike McGinn ordered the city's Police Department to abandon its nascent drone program, which had received approval from the Federal Aviation Administration but was awaiting the go-ahead from the City Council.

Taylor's extensive bill covers the purchase of drones, data collection by the unmanned aerial vehicles, search-warrant requirements and mandated audits.

The Moxee, Yakima County, lawmaker worked for about two months on the measure, which would regulate drones for both law-enforcement and state agencies, such as the Department of Ecology or the Department of Transportation.

"One reason to write this bill was to open dialogue," Taylor said. "We need to understand where we're heading."

Lawmakers in at least 11 states are looking at plans to restrict the use of drones over their skies amid concerns the vehicles could be exploited to spy on Americans. Concerns have increased since the FAA began establishing safety standards for civilian drones, which are becoming increasingly affordable and small in size.

The Seattle Police Department bought two Draganflyer X6 vehicles through a federal grant without public input. The Draganflyer X6 vehicle is 36 inches wide and is 33.5 inches long, and stands just under a foot.

Taylor's bill immediately gained the backing of the Washington state chapter of the American Civil Liberties Union, which spearheaded the opposition to Seattle police drones.

"Aerial drones can provide law-enforcement agencies with unprecedented capabilities to engage in surveillance and intrude on people's privacy," ACLU spokesman Doug Honig said in an email.

So far Taylor's bill has only Republican backers, but that's expected to change. Across the country, opposition to the use of domestic drones has come from opposite sides of the political spectrum, including civil-liberties advocates and those worried about government intrusion.

Taylor's measure would require legislative approval from local or state lawmakers before a corresponding police agency obtains a drone, meaning a city council would have to vote before its police department could acquire a drone.

Under the bill's provisions, an agency must have a warrant to use a drone unless there are exigent circumstances, such as search-and-rescue or hostage situations. Such situations still would require retroactive warrants.

The measure calls for deletion of data gathered within 30 days if no criminal activity is recorded. It requires erasing data collected from people who are not the target of a drone deployment within 24 hours. It also calls for an annual report from law-enforcement agencies and courts showing how drones have been used, as well as an annual audit for each agency that uses drones.

Taylor said the bill is aimed at protecting privacy and reducing the liability of any Washington agencies that use the vehicles. He added that should the bill get a hearing in committee, he expects to hear from law-enforcement agencies on how they would use drones.

U.S. Department of Homeland Security drones do enter Washington airspace occasionally, patrolling the Canadian border east of the Cascade mountains. The two Predator-B aircraft are based in North Dakota.

BRUCE GJOVIG: Don't strap tie-downs on N.D.'s chance to soar

House Bill 1373 is a bill to limit the use of unmanned aircraft systems for surveillance by law enforcement except by use of search warrant.

By: **Bruce Gjovig**, Grand Forks Herald

GRAND FORKS — House Bill 1373 is a bill to limit the use of unmanned aircraft systems for surveillance by law enforcement except by use of search warrant.

This bill sends the wrong message to the Federal Aviation Administration at a time when North Dakota is heavily invested in UAS and wants to secure one of six UAS integration test sites.

These sites will lead the way in the testing, development and maintenance of UAS and the training of the systems' operators.

Even negative publicity can hurt that application in the next few months as the FAA is looking for any reason to narrow the pool of applicants.

The FAA wants to send UAS integration activity to states where the UAS innovation and technology are welcomed, not fought. That is good government policy to pave the way for safe, efficient and prudent integration of UASs in the future.

FAA application guidelines for the UAS integrations test site say the agency's preference is for a state without laws limiting aircraft operations within the proposed test site area. That could be interpreted to include HB 1373.

The FAA's "Unmanned Aircraft Systems Test Site Selection" document states, "Applicants that declare there are no local/state statutes limiting aircraft operations within the proposed Test Site area would be scored highest."

Let the Airspace Integration Team in North Dakota submit an application in 2013 that is unfettered with unnecessary limitations.

Tough competition

The FAA competition is going to be tough, as more than 28 states are competing for six UAS designations. A state law that regulates and restricts drone use likely will hurt North Dakota's chances by lowering the state's score.

Let us not chance it for a law that is premature at best — likely totally unneeded and based on fear, not facts.

Being one of six test sites is tantamount to being one of the hubs of this emerging industry. North Dakota is well positioned to welcome and attract many UAS-related companies and their high-paying, high-tech jobs.

Grand Forks is committing to a 220-acre UAS Business Park to provide up to 1.2 million square feet of facilities and infrastructure and a dynamic community in which to develop the UAS industry.

Over five to 10 years, it is projected this UAS Business Park will support 3,700 jobs related to the UAS industry.

Ultimately, this is about innovation, high-paying jobs, economic development and significant uses for unmanned systems in agriculture, energy and so on.

For example:

• UAS will be used in precision farming to offer lower cost, higher resolution and more efficient monitoring and detection of diseases and stress in valuable crops such as corn, soybeans, sugar beets, potatoes, wheat and more.

The earlier the detection of insects and disease, the fewer chemicals can be used, a fact that's good for farmers and consumers alike.

North Dakota has been a leader in adapting precision agriculture to maximize quality, efficiency and profitability on farms. North Dakota farmers want to pioneer the use of unmanned aircraft systems.

A UAS test site will allow that.

• UAS will be used to monitor and inspect hundreds of miles of pipelines and transmission lines, doing a better job at less cost.

UAS can inspect and monitor flared gas sites and test for chemicals that can be harmful or even deadly. UAS are best used for tasks that are "dirty, dangerous or dull."

Let us be a leader in the development of this innovative technology for commercial uses.

• UAS can monitor and count wildlife at a safe distance to cause the least disruption.

• Perhaps a UAS will deliver a pizza to your door someday, but I am not betting on that one.

Another problem with HB1373 is that the bill would create a new legal framework that would treat the use of unmanned aircraft differently than the use of manned aircraft. Law enforcement has employed manned aircraft for decades and with the full approval of the U.S. Supreme Court.

So, passing entirely new laws makes no sense. Police officers know they are under a microscope on the use of unmanned aircraft, and they are very cautious because they see the great potential to enhance safety, help with search and rescue missions and save lives.

They will not be reckless as this is a tool for safety.

Phone vs. drone

We have more to fear from a camera phone than a camera drone when it comes to invasions of privacy. It was a camera phone, not a drone, that caught Prince Harry with his pants down.

Privacy concerns need to be respected and will be. The International Association of Chiefs of Police, the world's largest police organization, issued recommended policies and procedures for law enforcement's use of UAS to ensure the technology is used safely, responsibly and in a way that respects privacy.

Rather than banning the use of UAS and the benefits the aircraft provide, law enforcement should be encouraged to adopt these regulations, which won praise even from the American Civil Liberties Union.

Likewise, the Association for Unmanned Vehicle Systems International, the trade association for the UAS industry, put out a code of conduct that addresses the safe and responsible use of UAS.

Wrong law, wrong time

In other words, the rules of the road are being put into place. But seat belt laws did not come about before cars even were on the road.

There are ways to meet people's privacy concerns, and Congress is reviewing those proposals now. North Dakota does not need to duplicate or replicate what Congress is doing.

If state laws still are needed, they can be passed two years from now. There is no rush.

Please kill HB 1373 before it kills innovation.

Gjovig is entrepreneur coach and CEO at the UND Center for Innovation.

SHERIFF ROBERT W ROST

Don't try to fix something that is not broken...

We must have missed something...Has there been a sudden rash of invasion of privacy cases involving unmanned aircraft systems (UAS, the devices the media has dubbed "drones") in North Dakota? North Dakota House Bill 1373 would lead one to believe that this is the case. HB-1373 is a North Dakota House Bill, aimed at unmanned aircraft systems, which is currently being reviewed by the North Dakota Senate Judiciary Committee. The proposed law imposes unnecessary reporting requirements on law enforcement; fails to identify the agency responsible for monitoring compliance; and will discourage North Dakota law enforcement agencies from establishing UAS Units. The end result will be that the citizens of North Dakota are deprived of a valuable technological resource that could assist in locating lost persons, monitor disasters, and help apprehend dangerous criminals.

The privacy protection detailed in HB 1373 already exists. This important protection was granted by the U.S. Supreme Court 99 years ago in the case of Weeks vs. U.S. (232 U.S 383) and later applied to all states in Mapp v. Ohio (367 U.S. 643). The ensuing legal concept is called the "exclusionary rule" and prohibits the admission of illegally obtained evidence in a criminal trial. The exclusionary rule places the question of evidence admissibility before the courts, the branch of government our founding fathers charged with the responsibility of deciding such important matters.

HB-1373 is clearly focused on law enforcement use of UAS and almost completely ignores the significant risks of privacy infringements by non-law enforcement entities such as the news media or the voyeuristic neighbor who enjoys flying his UAS over your home. The true risk of invasion of privacy rests with private individuals who are not subject to the proposed law, Federal Aviation Administration regulations, or well-developed policies and procedures.

The proposed law dictates that search warrants permitting use of UAS may only be issued in criminal investigations. This requirement would prohibit a state or local agency from obtaining a search warrant to conduct an administrative investigation focused on suspicion of an administrative violation such as dumping toxins into our beautiful North Dakota lakes and rivers. Why?

The idea the U.S. Congress, or a state legislature, passing legislation to attempt to control a technology, such as UAS, that is still maturing and growing is premature and ill-advised. It is unprecedented in any other technology including telephones and computers. Each of those technologies was allowed to mature prior to the enacting of privacy related legislation. And, such legislation was only enacted when problems with privacy protection related to those technologies arose. Enacting UAS related privacy legislation will have a chilling effect on the

development of UAS technology. Slowing the development of UAS technology will deprive North Dakotans of the significant public safety missions that UAS can perform.

The reality is that only two law enforcement agencies in the State of North Dakota (U.S. Customs and Border Protection and the Grand Forks County Sheriff's Department) have received authorization from the Federal Aviation Administration to operate unmanned aircraft systems. I cannot address U.S. Customs and Border Protection policies regarding UAS. However, as the Sheriff of Grand Forks County, I can provide a synopsis of Grand Forks County Sheriff's Department (GFSD) policies and procedures related to the operation of UAS. The GFSD UAS Unit is a collaborative research effort with the University of North Dakota and two UAS manufacturers, Aerovironment and Draganfly Innovations. The UAS research project goals focus on determining if UAS can be used effectively in public safety missions. The GFSD UAS Unit is subject to the "GFSD UAS Unit Policy and Procedures Manual" which dictates strict safety and privacy protections. The GFSD intends to utilize UAS for essential public safety missions such as searching for lost people, post-disaster damage assessments, crime and traffic accident scene photography, and searches for dangerous criminals. There are no plans to utilize the aircraft for covert surveillances. In fact, the limited flight duration and line-of-sight limitations of the UAS we utilize make them very poor platforms for that type of mission. In addition to adherence with internal policies and procedures, our UAS operations must comply with numerous Federal Aviation Administration requirements including remaining at or below 400' above-ground-level and within line-of-sight of the UAS pilot. These requirements effectively limit UAS flights to within ½ mile of the operator. One final check and balance is the review of all UAS research project mission sets by the University of North Dakota's Unmanned Aircraft Systems Research Compliance Committee. This committee is composed of fifteen members representing local government, local citizens, UND faculty and administrators, and local public safety agencies. The committee is charged with the duty of applying community standards and values when evaluating all UND UAS research projects. No UAS mission is launched unless it has been pre-approved by the committee.

An interesting aspect of UAS operations is the need to comply with all of the previously listed privacy requirements. If GFSD had chosen to purchase a small manned aircraft, none of the listed requirements would apply. In fact, anyone is free to fly over almost any location and make observations from a manned aircraft. The important message here is that unmanned aircraft systems operated by government agencies are already subject to significant additional scrutiny in contrast to manned aircraft operated by law enforcement agencies.

In an opinion piece, appearing on the editorial page of the March 8, 2013 edition of the *Grand Forks Herald*, Steve Morrison makes some seriously misleading statements that require correction. Mr. Morrison says that "Drones are, essentially, highly sophisticated remote control

aircraft. They range in size from the largest military drones like the Predator down to drones that look like a mosquito." The reality is that most small UAS have about the same sophistication as a RC model aircraft purchased from a hobby store and none are as small as a mosquito. Later in the article, Mr. Morrison states that small UAS payloads can carry "small weapons." It is this type of unfounded and sensationalized statement that causes the public concern. Again, the reality is that Small UAS are woefully inadequate platforms for weapons. No law enforcement agency is currently arming small UAS and arming of our UAS is expressly prohibited by Grand Forks County Sheriff's Department policies and procedures. If law enforcement agencies wished to arm aircraft wouldn't the over 200 local and state law enforcement agencies that use manned aircraft have armed them? Again, the reality is that there are no non-federal U.S. law enforcement agencies operating armed aircraft, unmanned or manned, and no agency has expressed a plan to do so in the future.

Small unmanned aircraft systems have a yet to be determined number of applications to both humanitarian and law enforcement missions. North Dakota is positioned to be a leader in this exciting new field. Enacting laws which limit the use of unmanned aircraft systems is an attempt to fix something that is not broken. It sends the wrong message to the Federal Aviation Administration who will, in the near future, be reviewing North Dakota's proposal to be selected as one of six UAS national test sites. Retirement of HB-1373 and creation of a legislative study session group to research UAS is a much more logical and measured approach to this issue.

Domestic drones are already reshaping US crime-fighting

Last updated: Monday, March 04, 2013 12:13 AM

GRAND JUNCTION, COLO. — As US authorities grapple with how to regulate the use of unarmed drones in US skies, a small network of police, first responders and experts is already flying unmanned aircraft.

These operators say rapidly evolving drone technology is already reshaping disaster response, crime scene reconstruction, crisis management and tactical operations. Critics of US domestic drone use worry about privacy and safety.

Several dozen local police departments, federal agencies and universities have special FAA permits to fly drones in US airspace.

"Like a lot of law enforcement agencies, our first thoughts were, 'Cool! Let's use it for tactical missions – for chasing bad guys across the county,'" said Ben Miller, a Mesa County, Colorado, sheriff's deputy. "But the reality is you'll have a mission like that once or twice a year," he said. "The real utility of unmanned aerial systems is not the sexy stuff. It's the crime scene and accident reconstruction."

Miller's department in rural western Colorado has the widest approval to fly drones of any local law enforcement agency in the US.

Mesa has flown 40 missions in just over three years, "none of them surveillance," said Miller, who crafted the department's drone program and spent a year devising training protocol for fellow deputies before receiving FAA approval. "We can now bring the crime scene right into the jury box, and literally re-enact the crime for jurors," he said.

Recent applications to the FAA, obtained by the civil liberties group Electronic Freedom Foundation, indicate many police want drones for drug investigations, covert surveillance and high-risk tactical operations.

Domestic drones currently cost anywhere from $10,000 to $20,000 for a small system like the DraganflyerX6, which stays aloft only 15 minutes, to more than $1 million for sophisticated fixed-wing drones that can remain aloft for hours.

Military models are also being used by the Department of Homeland Security, which has a fleet of at least 10 unarmed Predator drones, powerful enough to identify a tennis shoe from 60,000 feet up.

First-generation drones can't yet carry an onboard sense-and-avoid system, a requirement of manned aircraft. Experts said mass-produced, drone-mounted sense-and-avoid technology is still two to five years away. FAA officials are required to open US skies in 2015 to widespread use of unmanned aircraft by public agencies and private industry.

The boom in drone use, both private and public, is also raising privacy concerns.

Civil liberties groups are urging federal and state legislators to place immediate restrictions on drone use by US law enforcement agencies. At least 15 states have drafted legislation that would restrict drone use. In Seattle last month, a public outcry prompted the mayor to order the police chief to return the department's two new drones to their manufacturer. — Agencies

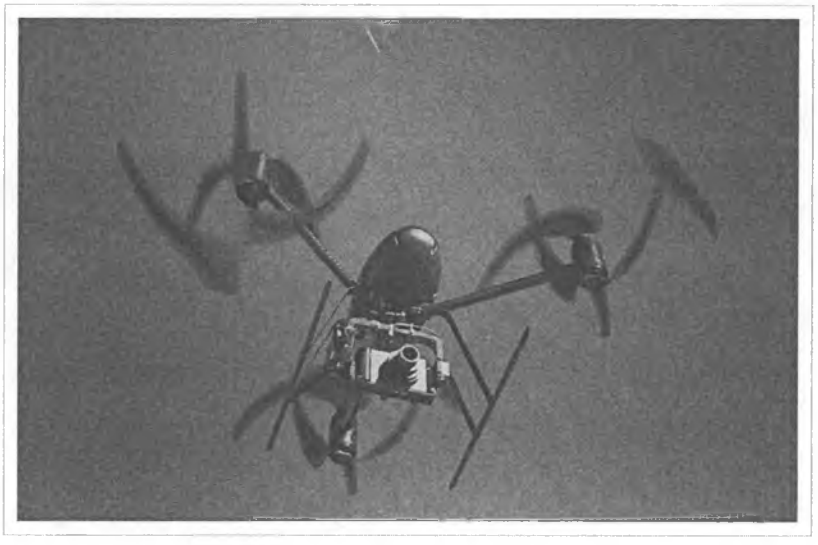
Damn the regulations! Drones plying US skies without waiting for FAA rules



Chris Francescani / Reuters

A Draganflyer X6, six-rotor remote controlled helicopter, which can fly up to 20 mph and travel a quarter mile, is pictured at the Grand Valley Model Airfield in Mesa County, Colo. The Draganflyer X6 is a property of Mesa County Sheriff's Department.

By Chris Francescani
Reuters

NEW YORK -- They hover over Hollywood film sets and professional sports events. They track wildfires in Colorado, survey Kansas farm crops and vineyards in California. They inspect miles of industrial pipeline and monitor wildlife, river temperatures and volcanic activity.

They also locate marijuana fields, reconstruct crime scenes and spot illegal immigrants breaching U.S. borders.

Tens of thousands of domestic drones are zipping through U.S. skies, often flouting tight federal

advertisement

Ten years of war have given robot developers a chance to refine and improve their bots. Now the robots are finding all sorts of new jobs on the homefront.

For decades, model airplane hobbyists have been allowed to fly small, remote-controlled aircraft up to 400 feet and at least a quarter mile from any airport. While public agencies can get permission to use unarmed drones, all commercial use remains banned.

"As a hobbyist - I can do whatever I want right now, within remote-control guidelines," said Bateson, the aerial photographer. "But as soon as you turn it into a business ... the FAA says you are violating the national airspace."

Bateson said that whether his drone shoots video for fun or for profit, "There is no greater danger to the national airspace."

Last year the National Football League petitioned the FAA to speed the licensing of commercial drones, joining Hollywood's Motion Picture Association of America, which has been lobbying the agency for several years, an MPAA spokesman told the drone news website UAS Vision.

The FAA has issued 1,428 drone permits to universities, law enforcement and other public agencies since 2007, when the agency formally banned commercial drone use. Of those, 327 permits remain active, said FAA spokesman Les Dorr.

Tough to enforce

Bateson flies a customized 48-inch-wide Styrofoam fixed-wing remote-controlled aircraft that cost about $20,000 - compared with up to $1 million for a helicopter. He said his aircraft has logged 1,800 miles and has recorded 60 hours of high-resolution video. He said he has never run into trouble with the FAA.

Patrick Egan, an unmanned aircraft consultant to the U.S. military and editor of sUAS News, a drone news website, said the FAA's commercial ban on drones is unenforceable.

"How do you possibly enforce these regulations?" he said.

Earlier this year, Connecticut marketing firm ImageMark Strategy and Design launched a drone-powered aerial photo and video service to offer to its existing clients, which include universities, golf resorts and real estate firms.

Partner Scott Benton said his company invested about $20,000 in remote-controlled multi-rotor copters equipped to carry camcorders or SLR digital cameras with swivel tilts. Benton said he wasn't even aware of FAA restrictions on commercial drone use until after he purchased all the equipment.

He said his company plans to charge clients for editing and post-production work, not the drone flights.

Many commercial drone operators offer similar arguments. Some say they operate only on private land. Others say they are selling data, not drone flight time.

Advertise | AdChoices

Still others say they will simply take their chances.

"Honestly?" said one commercial operator, who requested anonymity to protect his business. "My hope is that I'm far afield enough and small enough potatoes to the FAA that I can fly under the radar on this one."

Privacy concerns

In 2011, News Corp's tablet news site, the Daily, sent a Microdrone MD4-1000 into the skies over Alabama, Missouri and North Dakota to capture dramatic aerial footage of flood damage. A subsequent FAA investigation resulted in a warning, an FAA spokesman told Reuters. A News Corp spokesman declined to comment.

Last fall, a collective shudder rose up from Hollywood when false reports surfaced that the aggressive tabloid news website TMZ was seeking permission to fly its own drone.

The report was false, but it raised concerns.

"I'm less worried about the police getting a fleet of drones than I am about the news media," said Egan.

"Imagine what it will be like when the paparazzi can send a fleet of drones into the Hollywood hills."

The boom in drone use, both private and public, is also raising privacy concerns.

Civil liberties groups are urging federal and state legislators to place immediate restrictions on drone use by U.S. law enforcement agencies, which have historically been quick to capitalize on emerging technology like cell phone tracking.

At least 15 states have drafted legislation that would restrict drone use. In Seattle last month, a public outcry prompted the mayor to order the police chief to return the department's two new drones to their manufacturer.

Blacksheep drones

An even bigger concern for many is security. The activities of some drone operators are fueling fears about the potential for terrorism or that drones could interfere with manned air traffic and cause an accident.

A group of skilled drone operators using "first person view," or FPV, technology, has sent Ritewing Zephyr drones that capture high-quality video of visual thrill rides around some of the world's most famous landmarks.

The group, known as Team Blacksheep, has made a series of videos using drones circling the torch on New York City's Statue of Liberty and London's Big Ben clock tower. Team Blacksheep's FPV drones have darted through the arches of the Golden Gate Bridge and buzzed the peak of the Matterhorn.

The videos, captured at dizzying angles, are wildly popular online, but hobbyists and other drone enthusiasts worry that such videos give the industry a bad name.

"Those are the people the FAA should be going after," Bateson said.

A Team Blacksheep founder did not respond to requests for comment on security concerns.

Would-be attackers have already tried to exploit drones. Last fall, a Massachusetts man was sentenced to 17 years in prison for plotting to attack Washington, D.C., with three remote-controlled airplanes carrying C-4 explosives.

Anticipating domestic boom, colleges rev up drone piloting programs

Drones may also be vulnerable to hacking.

Last summer, Department of Homeland Security officials challenged Texas aerospace engineering professor Todd Humphreys and his class to try to "spoof" a DHS drone's GPS system.

GPS "spoofing" is a technique by which a vehicle's GPS receiver can be tricked and taken over by a slightly more powerful signal that mimics the attributes of the original signal - essentially an airborne hack.

Humphreys and his students succeeded in hacking the drone and took control of its flight path.

If a college class "can spoof the GPS, what can other nation states or terrorist groups do?" Representative Paul Broun (R-Ga.) asked at a recent congressional hearing on domestic drones.

Chinese espionage?

Some U.S. drone designers worry about the consequences of what they see as a slow U.S. response to a rapidly evolving technology.

"The Chinese are going to kill us," said Texas pilot Gene Robinson, who spent $20,000 designing an innovative fixed-wing drone for search-and-rescue missions. "They have copied every single design, including mine, that they can get their hands on."

Robinson said he installed Web-tracking software on his drone design Web page and then watched last spring as a Chinese design company "spent a month on my Web page ... reverse-engineered my design" and began selling mass-produced copies in December - for $169.

Side-by-side pictures of Robinson's model and the Chinese model that he showed a reporter look virtually identical.

Robinson went online and ordered one of Chinese models - to see if he could attach his equipment to the cheaper version.

"It was a dog, a pig," he said. "It didn't fly worth a damn."

Visions of Drones Swarming U.S. Skies Hit Bipartisan Nerve

By SCOTT SHANE and MICHAEL D. SHEAR

WASHINGTON — The debate goes to the heart of a deeply rooted American suspicion about the government, the military and the surveillance state: the specter of drones streaking through the skies above American cities and towns, controlled by faceless bureaucrats and equipped to spy or kill.

That Big Brother imagery — conjured up by Senator Rand Paul of Kentucky during a more than 12-hour filibuster this week — has animated a surprisingly diverse swath of political interests that includes mainstream civil liberties groups, Republican and Democratic lawmakers, conservative research groups, liberal activists and right-wing conspiracy theorists.

They agree on little else. But Mr. Paul's soliloquy has tapped into a common anxiety on the left and the right about the dangers of unchecked government. And it has exposed fears about ultra-advanced technologies that are fueled by the increasingly fine line between science fiction and real life.

Drones have become the subject of urgent policy debates in Washington as lawmakers from both parties wrangle with President Obama over their use to prosecute the fight against terrorism from the skies above countries like Pakistan and Yemen.

But they are also a part of the popular culture — toys sold by Amazon; central plot points in "Homeland" and a dozen other television shows and movies; the subject of endless macabre humor, notably by The Onion; and even the subject of poetry. ("Ode to the MQ-9 Reaper," a serious work by the Brooklyn poet Joe Pan that was just published in the journal Epiphany, describes the drone as "ultra-cool & promo slick, a predatory dart" that is "as self-aware as silverware.")

Benjamin Wittes, a national security scholar at the Brookings Institution who has written extensively about drones, said he thought Mr. Paul's marathon was a "dumb publicity stunt." But he said it had touched a national nerve because the technology, with its myriad implications, had already deeply penetrated the culture.

"Over the last year or so, this thing that was the province of a small number of technologists and national security people has exploded into the larger public consciousness," Mr. Wittes said.

On the right, Mr. Paul has become an overnight hero since his filibuster. Self-proclaimed defenders of the Constitution have shouted their approval on Twitter, using the hashtag #StandWithRand and declaring him to be a welcomed member of their less-is-better-government club.

"The day that Rand Paul ignited Liberty's Torch inside the beltway!" one Tea Party activist wrote on Twitter. "May it never be extinguished!"

But even as the right swooned, the left did, too. Senator Ron Wyden of Oregon — the only Democrat to join Mr. Paul's filibuster — said the unexpected array of political forces was just the beginning, especially as Congress and the public face the new technologies of 21st-century warfare.

"I believe there is a new political movement emerging in this country that's shaking free of party moorings," Mr. Wyden said. "Americans want a better balance between protecting our security and protecting our liberty."

P. W. Singer, whose 2009 book "Wired for War: The Robotics Revolution and Conflict in the 21st Century" anticipated the broad impact of drones, said he believed they had shaken up politics because they were "a revolutionary technology, like the steam engine or the computer."

"The discussion doesn't fall along the usual partisan lines," he said. The dozen states that have passed laws restricting drones do not fall into conventional red-blue divisions, nor do the score of states competing to be the site of the Federal Aviation Administration's test sites for drones.

The serious issues raised by the government's lethal drones seem inextricably mixed with the ubiquitous appearance of the technology in art, commerce and satire.

A four-minute video by the Air Force Research Laboratory on "micro aerial vehicles" shows a futuristic bee-size drone flying in an open window and taking out an enemy sniper with a miniature explosive payload. Since it was posted in 2009, it has been viewed hundreds of thousands of times and reposted all over the Web.

When Amazon advertised a six-inch model of the Predator, made by Maisto, in its toy section, people wrote politically charged mock reviews that became Internet hits: "This goes well," one reviewer wrote, "with the Maisto Extraordinary Rendition playset, by the way — which gives you all the tools you need to kidnap the family pet and take him for interrogation at a neighbor's house,

where the rules of the Geneva Convention may not apply. Loads of fun!"

Senator John McCain, Republican of Arizona, was not laughing Thursday when he took to the Senate floor to chastise Mr. Paul and defend the use of drones. In an interview with The Huffington Post, Mr. McCain dismissed Mr. Paul and the other critics of drones as "the wacko birds on right and left that get the media megaphone."

But the issue is larger than Mr. Paul, whose ambitions may include a run for the presidency in 2016. For many, Mr. Paul gave voice to the dangers they whisper about to anyone who will listen: that the government is too powerful to be left unchecked.

"It's not merely the black helicopter crowd of the folks on the far right," said Mark Potok, a senior fellow at the Southern Poverty Law Center, which tracks extremist groups. "What Rand Paul had to say about drones absolutely fired up conspiracy theorists on the left as well as the right."

Human Rights Watch plans to join other groups next month in starting an effort called the Campaign to Stop Killer Robots. The technology, fully autonomous weapons that are still at the drawing-board stage, would find and fire at their programmed targets without requiring a human being to pull the trigger.

Some national security experts find the campaign overwrought, but Mary Wareham, the advocacy director for the arms division of Human Rights Watch, noted that the Defense Department in November issued a policy directive on autonomous weapons that recognized the challenges they pose.

At the same time, there are people like Everett Wilkinson, a Tea Party organizer and self-proclaimed conspiracy theorist in Florida, who is hailing Mr. Paul as a "rock star for the Constitution." On Mr. Wilkinson's Web site, Liberty.com, he warns that the United States government is building "internment camps" for political dissidents. He is wary of what comes next.

"First they said we are just going to use drones to observe stuff, and then they put Hellfire missiles on them," Mr. Wilkinson said. "How soon are we going to have drones overhead with Tasers on them?"

In Washington, Code Pink, a leftist group of antiwar activists, showed up with flowers and chocolates at Mr. Paul's Senate offices on Thursday to thank him for standing up against abuses of power. Known around Capitol Hill mainly for disrupting Congressional hearings, the group had found a new champion.

"People say: 'Oh, my God, Code Pink is praising Rand Paul. Hell has frozen over!' " said Medea Benjamin, a co-founder of the group. "But we were glued to C-Span to the bitter end of the filibuster. We were amazed to see the education of the public that was taking place, and that has never occurred before."

FAA to create 6 drone test sites in US

Major step toward opening American skies to unmanned aerial vehicles

UPDATED 18:11 PM EST, FEBRUARY 15, 2013 | JOAN LOWY, ASSOCIATED PRESS

WASHINGTON (AP) — In a major step toward opening U.S. skies to thousands of unmanned drones, federal officials Thursday solicited proposals to create six drone test sites around the country.

The Federal Aviation Administration also posted online a draft plan for protecting people's privacy from the eyes in the sky. The plan would require each test site to follow federal and state laws and make a privacy policy publicly available.

Privacy advocates worry that a proliferation of drones will lead to a "surveillance society" in which the movements of Americans are routinely monitored, tracked, recorded and scrutinized by the authorities.

The military has come to rely heavily on drones overseas. Now there is tremendous demand to use drones in the U.S. for all kinds of tasks that are too dirty, dull or dangerous for manned aircraft. Drones also are often cheaper than manned aircraft. The biggest market is expected to be state and local police departments.

The FAA is required by a law enacted a year ago to develop sites where civilian and military drones can be tested in preparation for integration into U.S. airspace that's currently limited to manned aircraft.

The law also requires that the FAA allow drones wide access to U.S. airspace by 2015, but the agency is behind schedule, and it's doubtful it will meet the deadline, the Transportation Department's inspector general said in a report last year.

The test sites are planned to evaluate what requirements are needed to ensure the drones don't collide with planes or endanger people or property on the ground. Remotely controlled drones don't have a pilot who can see other aircraft the way an onboard plane or helicopter pilot can.

There's also concern that links between drones and their on-the-ground operators can be broken or hacked, causing the operator to lose control of the drone. Military drones use encrypted GPS signals for navigation, which protects them from hacking, but the GPS signals used by civilian drones don't have that protection.

"Our focus is on maintaining and improving the safety and efficiency of the world's largest aviation system," Transportation Secretary Ray LaHood said in a statement. "This research will give us valuable information about how best to ensure the safe introduction of this advanced technology into our nation's skies."

The test sites are also expected to boost the local economy of the communities where they are located. About two dozen government-industry partnerships have been formed over the past year to compete for the sites.

"Today's announcement by the FAA is an important milestone on the path toward unlocking the potential of unmanned aircraft and creating thousands of American jobs," said Michael Toscano, president and CEO of the Association for Unmanned Vehicle Systems International.

"States across the country have been eager to receive this FAA designation because they recognize the incredible economic and job creation potential it would bring with it," he said in a statement.

Industry experts predict the takeoff of a multibillion-dollar market for civilian drones as soon as the FAA completes regulations to make sure they don't pose a safety hazard to other aircraft. Potential civilian users are as varied as the drones themselves. Power companies want them to monitor transmission lines. Farmers want to fly them over fields to detect which crops need water. Ranchers want them to count cows. Film companies want to use drones to help make movies. Journalists are exploring drones' newsgathering potential.

The FAA forecasts an estimated 10,000 civilian drones will be in use in the U.S. within five years.

The Defense Department says the demand for drones and their expanding missions requires routine and unfettered access to domestic airspace, including around airports and cities, for military testing and training. Currently, the military tests drones in specially designated swaths of airspace in mostly remote parts of the country where they are likely to encounter relatively few other aircraft.

The Customs and Border Patrol uses drones along the U.S.-Mexico border. And the FAA has granted several hundred permits to universities, police departments and other government agencies to use small, low-flying drones. For example, the sheriff's department in Montgomery County, Texas, has a 50-pound ShadowHawk helicopter drone intended to supplement its SWAT team.

The sheriff's department hasn't armed its drone, although the ShadowHawk can be equipped with a 40 mm grenade launcher and a 12-guage shotgun. The prospect of armed drones patrolling U.S. skies has alarmed some lawmakers and their constituents. More than a dozen bills have been introduced in Congress and state legislatures to curb drone use and protect privacy.

President Barack Obama was asked Thursday about concerns that the administrations believes it's legal to strike American citizens abroad with drones and whether that's allowed

against citizens in the U.S. If not, how would he create a legal framework to help citizens know drone strikes can't be used against them?

"There's never been a drone used on an American citizen on American soil," the president said, speaking during an online chat sponsored by Google in which he was promoting his policy initiatives.

"We respect and have a whole bunch of safeguards in terms of how we conduct counterterrorism operations outside of the United States. The rules outside of the United States are going to be different than the rules inside the United States, in part because our capacity, for example, to capture terrorists in the United States are very different than in the foothills or mountains of Afghanistan or Pakistan.

He said he would work with Congress to make sure the American public understands "what the constraints are, what the legal parameters are, and that's something that I take very seriously."

Earlier this week, an FAA official told a meeting of potential test site bidders that aviation regulations prohibit dropping anything from aircraft, which could be interpreted to bar arming civilian drones, according to an industry official present at the meeting who requested anonymity because he wasn't authorized to speak publicly.

Eric Holder: Drone strikes against Americans on U.S. soil are legal

March 5, 2013 | 4:09 pm | Modified: March 5, 2013 at 5:00 pm

1322 Comments

Joel Gehrke
Commentary Writer

Joel on FB

Attorney General Eric Holder can imagine a scenario in which it would be constitutional to carry out a drone strike against an American on American soil, he wrote in a letter to Sen. Rand Paul, R-Ky.

"It is possible, I suppose, to imagine an extraordinary circumstance in which it would be necessary and appropriate under the Constitution and applicable laws of the United States for the President to authorize the military to use lethal force within the territory of the United States," Holder replied in a letter yesterday to Paul's question about whether Obama "has the power to authorize lethal force, such as a drone strike, against a U.S. citizen on U.S. soil, and without trial."

Paul condemned the idea. "The U.S. Attorney General's refusal to rule out the possibility of drone strikes on American citizens and on American soil is more than frightening – it is an affront the Constitutional due process rights of all Americans," he said in a statement.

Sign Up for the Politics Digest newsletter!

Holder noted that Paul's question was "entirely hypothetical [and] unlikely to occur," but cited the September 11, 2001 terrorist attacks as the type of incidents that might provoke such a response.

"Were such an emergency to arise, I would examine the particular facts and circumstances before advising the President on the scope of his authority," he concluded.

Sen. Mike Lee, R-Utah, an attorney and Judiciary Committee member, told *The Washington Examiner* last month that the drone policy so far outlined by the administration is too vague.

"That has the potential to swallow the rule," Lee said after the drone program white paper was leaked. "If you're going to regard somebody as presenting an imminent threat of an attack on the U.S. simply because you have concluded that they are an 'operational leader' or they are involved in planning an attack in one way or another, you find yourself giving way to much discretion to the government."

Lee said that the White House should release the formal legal analysis underpinning the drone program. "We know that in some instances where the government has released it

House Minority Leader Nancy Pelosi, D-Calif., believes that President Obama doesn't necessarily have to announce that an American citizen suspected of terrorism has been killed in a drone strike.

"Maybe. It just depends," Pelosi replied when The Huffington Post asked her if "the administration should acknowledge when it targets a U.S. citizen in a drone strike." When Anwar al-Awlaki was killed in a drone strike, President Obama announced the killing within hours. "People just want to be protected," Pelosi also said. "And I saw that when we were fighting them on surveillance, the domestic surveillance. People just want to be protected: 'You go out there and do it. I'll criticize you, but I want to be protected.'"

Sen. Mike Lee, R-Utah, responded less blithely. "Anytime the government willfully executes a citizen, regardless of the circumstances, it is a very serious issue," Lee, a member of the Senate Judiciary Committee, said in a statement to *The Washington Examiner*. "As the body that oversees executive branch actions, at the very least, Congress should have a full accounting – even if it must sometimes be in a classified setting – of the specific considerations that went into the decision."

The top House Democrat suggested that the disclosure issue "depends on the timing, because that's right — it's all about timing, imminence. What is it that could be in jeopardy if people know that happened at this time? I just don't know."

Lee also acknowledged the possibility of some situations that need for congressional review. "Government should always e details public where they can," he said in his statement. "Whe concerns about releasing certain details, the appropriate com... perform oversight."

Pelosi suggested that she would have the same position if President George W. Bush were still in office. "Those opposed are pretty critical, and other people are just listening to see what this is and why this is necessary, because we're in a different world," she told HuffPo.

Lee wants Obama to reveal the Justice Department legal analysis underpinning the drone program to the Judiciary Committee, rather than just the intelligence committees in both chambers of Congress.

"If you're going to regard somebody as presenting an imminent threat of an attack on the U.S. simply because you have concluded that they are an 'operational leader' or they are involved in planning an attack in one way or another, you find yourself giving way to much discretion to the government," he told *The Examiner* in an interview after NBC revealed the DOJ white paper on the drone program.

"We know that in some instances where the government has released its legal analysis, it gets it wrong," Lee added.

President Obama's white paper justification for carrying out drone strikes against U.S. citizens suspected of terrorism could "swallow the rule" guaranteeing the due process rights of Americans, Sen. Mike Lee, R-Utah, suggested today.

"There is nothing more serious than the taking of the life of a U.S. citizen by the U.S. government," Lee said in a phone interview with *The Washington Examiner* while discussing the Justice Department white paper that explains some of the rationale behind the drone strike counter-terrorism program.

"You would think that consistent with the principles of due process, the government shouldn't be able to kill one of its own citizens without some kind of showing that they present an imminent threat," he continued. "But when you dig a little bit deeper into this white paper . . . they have sort of a loose [definition] of 'imminent'."

Sign Up for the Politics Digest newsletter!

NBC News reported that it had obtained an unclassified DOJ white paper that articulated a broader claim of power to kill U.S. citizens suspected of terrorist activities.

"The condition that an operational leader present an 'imminent' threat of violent attack against the United States does not require the United States to have clear evidence that a specific attack on U.S. persons and interests will take place in the immediate future," NBC quotes the memo as saying.

"That has the potential to swallow the rule," Lee warned. "If you're going to regard somebody as presenting an imminent threat of an attack on the U.S. simply because you have concluded that they are an 'operational leader' or they are involved in planning an attack in one way or another, you find yourself giving way to much discretion to the government."

Lee said the president needs to be more transparent with Congress about the drone strike program as pertaining to American citizens.

"I certainly think that Members of Congress ought to have the they make public," he said. "They have not made that availabl Judiciary Committee I think I ought to have access to it."

The Senate Judiciary Committee has oversight jurisdiction of given Senate Intelligence Committee members access to a m more detailed legal justification for the program. The lawmakers are not allowed to make copies, take notes, or reveal the memo to their staff.

"We know that in some instances where the government has released its legal analysis, it gets it wrong," Lee recalled, citing the D.C. Circuit Court of Appeals just repudiated the Obama Justice Department's legal analysis for making 'recess' appointments when Congress is in session.

The former appellate lawyer also criticized the White House for failing to identify a constitutional principle that would prevent the U.S. military from carrying out a drone strike on a suspected American terrorist in the United States.

"They ought to be able to articulate that," Lee told *The Examiner*. "To whatever extent they make a difference

White House Press Secretary Jay Carney could not identify a constitutional principle that would prevent President Obama from carrying out a drone strike on an American citizen in the United States.

"I am not a lawyer and these are the kinds of things that are probably best expressed and explained by lawyers," Carney said during the press briefing. "There are issues here about . . . feasibility of capture that I think are pertinent to that question."

The Fifth Amendment to the U.S. Constitution, in the Bill of Rights, says that "no person shall . . .be deprived of life, liberty, or property, without due process of law."

A Justice Department white paper emphasized the importance of believing that an American citizen overseas, such as terrorist leader Anwar al-Awlaki, is an imminent threat to Americans when debating a drone strike.

Sign Up for the Politics Digest newsletter!

"The condition that an operational leader present an 'imminent' threat of violent attack against the United States does not require the United States to have clear evidence that a specific attack on U.S. persons and interests will take place in the immediate future," the white paper, obtained by NBC News, said.

Carney also said that "These strikes are legal, they are ethical and they are wise," though he indicated that discussion of them at the upcoming CIA director confirmation hearings might not be legal.

"[D]iscussing classified matters in public hearings is generally not an appropriate thing to do or a legal thing to do," Carney said.

Representative Shelley Hughes
State Capitol Building
Room #409
Juneau, AK 99801

Dear Representative Hughes,

The Greater Fairbanks Chamber of Commerce represents over 700 businesses and organizations in the greater Fairbanks area and our mission is to ensure a healthy economic environment. The Chamber supports the Alaska House of Representatives Concurrent Resolution No. 6, recognizing the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks as a national leader in unmanned aircraft research and development, and establishing a legislative Task Force on Unmanned Aircraft Systems.

The University of Alaska has led the way for research on unmanned aircraft systems (UAS) and continues this pioneering work in its bid to become one of the nation's six test sites for aircraft systems testing and research. The Resolution recognizes this substantial effort. More significantly, it establishes a legislative Task Force to address potential impacts and opportunities of unmanned aircraft systems for our state.

Alaska's immense land mass and associated airspace presents opportunities no other state can offer for testing and flight training. Vast existing Military Operations Areas and expansive ground maneuver areas can easily support virtually all military applications for current and future UAS technology, and military UAS infrastructure can only complement civilian and commercial applications.

As with any new technology, a myriad of concerns must be addressed before unmanned aircraft become a common fixture in our National airspace. This resolution takes the necessary step to begin addressing those concerns to insure Alaska leads the way for this transformative and dynamic flight environment.

Sincerely,

Lisa Herbert

Federal Aviation Administration Proposes Unnecessary Privacy Regulations on Drone Test Sites

April 30, 2013

Unmanned aerial vehicles, commonly referred to as drones, have begun the slow transition from the military sector to the commercial sector. As part of the mandate from Congress, the Federal Aviation Administration (FAA) is charged with safely integrating civil drones into the existing airspace. The FAA is now seeking applications for establishing six test ranges but has recently proposed new privacy guidelines that would stifle innovation, say Jerry Brito, Eli Dourado and Adam Thierer of the Mercatus Center.

- As with any new technology, the public has been initially skeptical of this new technology but will likely adapt to it gradually as more than 10,000 drones enter the skies by 2020.
- Drone research and development is decentralized, meaning that many developers, from small companies to industry behemoths, are testing new capabilities.
- The FAA must find a balance between too many commercial restrictions, which will delay integration, and too few restrictions, which could pose safety risks.
- Drones have potential applications in law enforcement, national security, agricultural and earth science.

The FAA has proposed new privacy requirements for test range operators to address concerns about drones infringing on individuals' privacy.

- The FAA should refrain from making any guidelines on privacy because its expertise is solely in regulating aeronautics, not in Fourth Amendment jurisprudence, an area in which numerous laws already govern privacy, property and peeping toms.
- The fears about privacy infringements are also unsubstantiated, being based solely on hypothesized scenarios rather than actual events, the latter of which might require the courts, and not the FAA, to sort out.
- The FAA should allow nongovernmental privacy protection mechanisms to develop instead of stifling the creation of market-based solutions or voluntary codes of conduct.

The proposed privacy rules are inappropriate for this stage of development because they require the prohibitively expense action of full disclosure to an individual who is inadvertently captured on camera. While the proposed privacy regulations are supposed to be implemented for test sites only, there is a risk that they could serve as a baseline for future legislation and rulemaking as full integration nears.

Federal Aviation Administration: Unmanned Aircraft System Test Site Program

Jerry Brito [1], Eli Dourado [2], Adam Thierer [3] | Apr 23, 2013

In the FAA Modernization and Reform Act of 2012 (FMRA),[1] Congress tasked the Federal Aviation Administration (FAA) with integrating unmanned aircraft systems (UASs), sometimes referred to as unmanned aerial vehicles or drones, into the National Airspace System by September 2015. As part of that effort, Congress directed the FAA to establish six test ranges to serve as integration pilot projects.[2] On February 22, 2013, the FAA issued a notice in the Federal Register announcing the process for selection of the sites and a request for public comment on its "proposed approach for addressing the privacy questions raised by the public and Congress with regard to the operation of unmanned aircraft systems within the test site program."[3]

The Technology Policy Program (TPP) of the Mercatus Center at George Mason University is dedicated to advancing knowledge of the impact of regulation on society. As part of its mission, TPP conducts careful and independent analyses employing contemporary economic scholarship to assess rulemaking proposals from the perspective of the public interest. Therefore, this comment on the FAA's Notice of Availability and Request for Comments does not represent the views of any particular affected party or special interest group, but is designed to assist the administration as it carries out Congress's mandate to safely integrate UASs into the National Airspace System.

CONCEIVING OF AIRSPACE AS A PLATFORM FOR INNOVATION

In analyzing the proposed policies being developed to carry out Congress's mandate, it is important to remember that the purpose of the mandate is to open America's skies to commercial UAS use in order to reap the social benefits that such use will bring.[4] The commercial use of UASs is an important step toward the efficient utilization of airspace. When an important national resource like airspace arbitrarily excludes commercial uses, the social costs of such exclusion may not always be immediately evident. For example, until 1989, commercial use of the Internet was prohibited. As a 1982 MIT handbook for the use of ARPAnet, the progenitor of what would become the Internet, warned students:

> It is considered illegal to use the ARPAnet for anything which is not in direct support of government business...Sending electronic mail over the ARPAnet for commercial profit or political purposes is both anti-social and illegal. By sending such messages,

> you can offend many people, and it is possible to get MIT in serious trouble with the government agencies which manage the ARPAnet[5]

Undoubtedly, these commercial restrictions were put in place with the best of intentions. Had rulemakers understood the nature of the revolution that they were forestalling, they probably would never have imposed restrictions on commercial use of the Internet. They were simply unable to imagine the enormous benefits that would be generated by allowing the Internet to become an open platform for social and commercial innovation.

Vint Cerf, one of the "fathers of the Internet," credits "permissionless innovation" for the economic benefits that the Internet has generated.[6] As an open platform, the Internet allows entrepreneurs to try new business models and offer new services without seeking the approval of regulators beforehand.

Like the Internet, airspace is a platform for commercial and social innovation. We cannot accurately predict to what uses it will be put when restrictions on commercial use of UASs are lifted. Nevertheless, experience shows that it is vital that innovation and entrepreneurship be allowed to proceed without ex ante barriers imposed by regulators.[7] We therefore urge the FAA not to impose *any* prospective restrictions on the use of commercial UASs without clear evidence of actual, not merely hypothesized, harm.

PRIVACY AND COMMERCIAL UASS

The FAA's proposed privacy requirements for test range operators address concerns about hypothesized impositions on individual privacy. In view of the importance of "permissionless innovation" for the development of airspace as a platform for commercial and social entrepreneurship, we believe that the FAA should not impose any additional privacy rules for UAS Test Sites, for four reasons.

First, the FAA does not have the authority to impose such requirements. A plain reading of Subtitle B of the FMRA (the relevant section that covers UASs) reveals that Congress's charge to the FAA is simply to ensure the safe integration of UASs into the national airspace.[8] There are over 20 references to safety in the section, but not one reference to privacy or related concerns.[9] Additionally, the specific section mandating the establishment of test ranges lists six requirements that the administrator must meet in doing so.[10] These requirements exclude privacy considerations, suggesting that Congress did not intend to give the FAA any authority to include privacy consideration in its requirements. This view is buttressed by the fact that Congress is now considering the Drone Aircraft Privacy and Transparency Act of 2013, which would amend FMRA to require the FAA to develop privacy regulations in conjunction with the Federal Trade Commission and the Departments of Commerce and Homeland Security[11]. The implication is that at least some in Congress do not believe the FAA now has a privacy mandate. These facts comport with the FAA's history as a safety regulator. Indeed, the FAA's mission is "to provide the safest, most efficient aerospace system in the world,"[12] not to regulate for privacy.

Second, there is no evidence of a materialized harm that calls out for the proposed privacy requirements for test range operators. Prospective regulation at this juncture necessarily involves hypothesizing about the privacy violations that might arise. Since many of these

harms may never materialize, forward-looking regulation is likely to overprotect privacy at the expense of innovation.

Third, as the proposed privacy requirements make clear, there already exist "federal, state, and other laws regard- ing the protection of an individual's right to privacy."[13] If harms due to privacy violations can be shown in court, damages will be awarded to the victims of those violations. Property law already governs trespass, and new court rulings may well expand the body of such law to encompass trespass by commercial UASs by focusing on actual cases and controversies, not merely imaginary hypotheticals. In particular, state "peeping Tom" laws already prohibit spying into individual homes.[14] Privacy torts—including the tort of intrusion upon seclusion—may also evolve in response to technological change and provide more avenues of recourse to plaintiffs seeking to protect their privacy rights.[15]

Fourth, adequate time should be afforded for the development of nongovernmental privacy protection mechanisms, ranging from market-based solutions to voluntary codes of conduct to individual self-help. The UAS industry has already developed a set of industry best practices, which include respect for the privacy of individuals.[16] These guidelines will likely be refined over time to meet new challenges and concerns. Industry norms and practices will also be influenced by pressure from media, activists, and consumers. Such less-restrictive solutions can greatly reduce the need for administrative intervention and can therefore increase the "permissionlessness" of airspace as a platform for innovation.

SOCIAL ADAPTATION

Patience is also wise here not only because it provides breathing space for future innovation, but also because it provides an opportunity to observe both the evolution of societal attitudes toward this new technology and how citizens adapt to it. It is possible that citizen attitudes about UASs will follow a familiar cycle we have seen play out in other contexts of initial *resistance,* gradual *adaptation,* and then eventual *assimilation* of that new technology into society.[17] As technology author Larry Downes has observed, "after the initial panic, we almost always embrace the service that once violated our visceral sense of privacy."[18]

The introduction and evolution of the camera and photography provides a useful comparison in this regard. The camera was initially viewed as a highly disruptive force when photography became more widespread in the late 1800s. Indeed, the most important essay ever written on privacy law, Samuel D. Warren and Louis D. Brandeis's famous 1890 *Harvard Law Review* essay on "The Right to Privacy," decried the spread of the device.[19] The authors lamented that "instantaneous photographs and newspaper enterprise have invaded the sacred precincts of private and domestic life" and claimed that "numerous mechanical devices threaten to make good the prediction that 'what is whispered in the closet shall be proclaimed from the house-tops.'"[20]

Similar fears often animate criticisms of UASs today. But just as personal norms and cultural attitudes toward cameras and public photography evolved quite rapidly over a century ago, attitudes about UASs may evolve in coming years. Just as cameras and photography became an ingrained part of the human experience, UASs might, as well.

And just as social norms and etiquette evolved to address those who would use cameras in inappropriate, privacy-invasive ways, the same could happen for UASs.

Toward that end, just as we did not preemptively foreclose photographic innovation in the late 1800s, we should not foreclose UAS innovation today with overly prescriptive privacy regulations. Let innovation continue, and address tangible harms as they develop, if they do.

APPLICATION TO THE PROPOSED PRIVACY REQUIREMENTS

In light of these arguments, section (1) of the proposed privacy rules is inappropriate for the current stage of experimentation with commercial UASs. The requirement that site operators develop privacy policies that are informed by Fair Information Practice Principles is quite onerous for commercial operators of UASs, and its cost will likely outweigh any hypothetical benefits.

Consider, for example, a real estate agent that uses an UAS to create a detailed, three-dimensional photograph of the exterior of a property that is for sale. In doing so, the UAS inadvertently captures images of passersby in the street adjacent the property. According to so-called Fair Information Practice Principles,[21] must the UAS operator treat the passersby as potential victims of privacy violation? If so, then would the following requirements apply?

- To give all passersby notice of data collection before any photos are taken.
- To publicly identify the real estate agent before any photos are taken.
- To ensure that passersby understand that pictures of their faces and information about their whereabouts may be used on a real estate listing website.

- To give passersby a choice to opt-in or opt-out of such photography.
- To ensure that all inadvertently photographed passersby are given access to all photographs, including ones that are not used on the real estate listing website.
- To take expensive security measures to protect photos that were taken in a public place.

If adhered to strictly, Fair Information Practice Principles could make it prohibitively costly to use commercial UASs in applications as benign as taking photographs near public spaces. It is not clear that they could comply, in this context or any other, with Executive Order 13563, which requires that any regulation promulgated by an executive agency be cost-beneficial. It should also be noted that Fair Information Practice Principles are law nowhere else in the federal government.

CONCLUSION

While the FAA makes clear in its Notice that the privacy requirements it proposes are only applicable to the test site operators and "are not intended to pre-determine the long-term policy and regulatory framework under which commercial UASs would operate,"[22] it would be unreasonable to believe that the precedent set in this proceeding will not affect future deliberations. Indeed, the actions the FAA takes in this proceeding will begin to set the baseline for future UAS regulation.

The FAA further notes that the purpose of the privacy requirements are simply to "assure maximum transparency of privacy policies associated with UAS test site operations in order to engage all stakeholders in discussion about which privacy issues are raised by UAS operations and how law, public policy, and the industry practices should respond to those issues in the long run."[23] Unfortunately, by mandating that test site operators issue privacy policies and that those policies be informed by Fair Information Practice Principles, the FAA would be excluding an important possible alternative from the discussion: some operators might choose not to issue a privacy policy or adopt a non-FIPPs-compliant policy. If the true purpose of the pilot programs is "to develop a body of data and operational experiences to inform integration and the safe operation of these aircraft in the National Airspace System," then the FAA should seek not just geographic and climatic diversity, but policy diversity as well.

We therefore urge the FAA to strike section (1) of its proposed privacy regulations and rely exclusively on existing law and other mechanisms to protect individuals' privacy rights. We believe that such an approach would have the virtue of protecting individual rights, fostering the use of airspace as a platform for innovation, and allowing the scope of any necessary future privacy laws to be narrowly tailored by actual cases and controversies that emerge. To the extent that it remains the subject of public concern, the FAA should recognize its lack of authority on the matter, leaving further deliberations about the privacy implications of UASs to Congress, where elected officials can consider these concerns while weighing the benefits and costs of potential regulation.

Endnotes

7. As Brookings Institution senior fellow John Villasenor has recently explained,

When considering potential new statutory UAS privacy protections, it is helpful to keep in mind what has occurred with the Internet and mobile telephones, two technologies that are associated with privacy threats that are in some respects much more significant than those that will arise from unmanned aircraft. Both the Internet and mobile phones grew as fast as their underlying technologies enabled. As a result, the public and legislative dialogue regarding how best to address the privacy issues they raise has been conducted with a strong ap- preciation of their benefits. By contrast, while the privacy concerns associated with domestic UAS are real and deserving of attention, they are getting significant focus long before the potential benefits of the technology are widely recognized. . . .

If, in 1995, comprehensive legislation to protect Internet privacy had been enacted, it would have utterly failed to anticipate

the complexi- ties that arose after the turn of the century with the growth of social networking and location-based wireless services. The Internet has proven useful and valuable in ways that were difficult to imagine over a decade and a half ago, and it has created privacy challenges that were equally difficult to imagine. Legislative initiatives in the mid-1990s to heavily regulate the Internet in the name of privacy would likely have impeded its growth while also failing to address the more complex privacy issues that arose years later.

Bridging the gap between academic ideas and real-world problems

PUBLIC INTEREST COMMENT

FEDERAL AVIATION ADMINISTRATION
Unmanned Aircraft System Test Site Program
Docket No: FAA-2013-0061

By Jerry Brito, Eli Dourado, and Adam Thierer

In the FAA Modernization and Reform Act of 2012 (FMRA),[1] Congress tasked the Federal Aviation Administration (FAA) with integrating unmanned aircraft systems (UASs), sometimes referred to as unmanned aerial vehicles or drones, into the National Airspace System by September 2015. As part of that effort, Congress directed the FAA to establish six test ranges to serve as integration pilot projects.[2] On February 22, 2013, the FAA issued a notice in the Federal Register announcing the process for selection of the sites and a request for public comment on its "proposed approach for addressing the privacy questions raised by the public and Congress with regard to the operation of unmanned aircraft systems within the test site program."[3]

The Technology Policy Program (TPP) of the Mercatus Center at George Mason University is dedicated to advancing knowledge of the impact of regulation on society. As part of its mission, TPP conducts careful and independent analyses employing contemporary economic scholarship to assess rulemaking proposals from the perspective of the public interest. Therefore, this comment on the FAA's Notice of Availability and Request for Comments does not represent the views of any particular affected party or special interest group, but is designed to assist the administration as it carries out Congress's mandate to safely integrate UASs into the National Airspace System.

CONCEIVING OF AIRSPACE AS A PLATFORM FOR INNOVATION

In analyzing the proposed policies being developed to carry out Congress's mandate, it is important to remember that the purpose of the mandate is to open America's skies to commercial UAS use in order to reap the social benefits that such use will bring.[4] The commercial use of UASs is an important step toward the efficient utilization of airspace. When an important national resource like airspace arbitrarily excludes commercial uses, the social costs of such exclusion may not always be immediately evident. For example, until 1989, commercial use of the

The ideas presented in this document do not represent official positions of the Mercatus Center or George Mason University.

Internet was prohibited. As a 1982 MIT handbook for the use of ARPAnet, the progenitor of what would become the Internet, warned students:

> It is considered illegal to use the ARPAnet for anything which is not in direct support of government business...Sending electronic mail over the ARPAnet for commercial profit or political purposes is both anti-social and illegal. By sending such messages, you can offend many people, and it is possible to get MIT in serious trouble with the government agencies which manage the ARPAnet.[5]

Undoubtedly, these commercial restrictions were put in place with the best of intentions. Had rulemakers understood the nature of the revolution that they were forestalling, they probably would never have imposed restrictions on commercial use of the Internet. They were simply unable to imagine the enormous benefits that would be generated by allowing the Internet to become an open platform for social and commercial innovation.

Vint Cerf, one of the "fathers of the Internet," credits "permissionless innovation" for the economic benefits that the Internet has generated.[6] As an open platform, the Internet allows entrepreneurs to try new business models and offer new services without seeking the approval of regulators beforehand.

Like the Internet, airspace is a platform for commercial and social innovation. We cannot accurately predict to what uses it will be put when restrictions on commercial use of UASs are lifted. Nevertheless, experience shows that it is vital that innovation and entrepreneurship be allowed to proceed without ex ante barriers imposed by regulators.[7] We therefore urge the FAA not to impose *any* prospective restrictions on the use of commercial UASs without clear evidence of actual, not merely hypothesized, harm.

PRIVACY AND COMMERCIAL UASS

The FAA's proposed privacy requirements for test range operators address concerns about hypothesized impositions on individual privacy. In view of the importance of "permissionless innovation" for the development of airspace as a platform for commercial and social entrepreneurship, we believe that the FAA should not impose any additional privacy rules for UAS Test Sites, for four reasons.

First, the FAA does not have the authority to impose such requirements. A plain reading of Subtitle B of the

7. As Brookings Institution senior fellow John Villasenor has recently explained,

> When considering potential new statutory UAS privacy protections, it is helpful to keep in mind what has occurred with the Internet and mobile telephones, two technologies that are associated with privacy threats that are in some respects much more significant than those that will arise from unmanned aircraft. Both the Internet and mobile phones grew as fast as their underlying technologies enabled. As a result, the public and legislative dialogue regarding how best to address the privacy issues they raise has been conducted with a strong appreciation of their benefits. By contrast, while the privacy concerns associated with domestic UAS are real and deserving of attention, they are getting significant focus long before the potential benefits of the technology are widely recognized. . . .
>
> If, in 1995, comprehensive legislation to protect Internet privacy had been enacted, it would have utterly failed to anticipate the complexities that arose after the turn of the century with the growth of social networking and location-based wireless services. The Internet has proven useful and valuable in ways that were difficult to imagine over a decade and a half ago, and it has created privacy challenges that were equally difficult to imagine. Legislative initiatives in the mid-1990s to heavily regulate the Internet in the name of privacy would likely have impeded its growth while also failing to address the more complex privacy issues that arose years later.

John Villasenor, "Observations from Above: Unmanned Aircraft Systems and Privacy," *Harvard Journal of Law & Public Policy* 36, no. 2 (2013): 517.

FMRA (the relevant section that covers UASs) reveals that Congress's charge to the FAA is simply to ensure the safe integration of UASs into the national airspace.[8] There are over 20 references to safety in the section, but not one reference to privacy or related concerns.[9] Additionally, the specific section mandating the establishment of test ranges lists six requirements that the administrator must meet in doing so.[10] These requirements exclude privacy considerations, suggesting that Congress did not intend to give the FAA any authority to include privacy consideration in its requirements. This view is buttressed by the fact that Congress is now considering the Drone Aircraft Privacy and Transparency Act of 2013, which would amend FMRA to require the FAA to develop privacy regulations in conjunction with the Federal Trade Commission and the Departments of Commerce and Homeland Security.[11] The implication is that at least some in Congress do not believe the FAA now has a privacy mandate. These facts comport with the FAA's history as a safety regulator. Indeed, the FAA's mission is "to provide the safest, most efficient aerospace system in the world,"[12] not to regulate for privacy.

Second, there is no evidence of a materialized harm that calls out for the proposed privacy requirements for test range operators. Prospective regulation at this juncture necessarily involves hypothesizing about the privacy violations that might arise. Since many of these harms may never materialize, forward-looking regulation is likely to overprotect privacy at the expense of innovation.

Third, as the proposed privacy requirements make clear, there already exist "federal, state, and other laws regarding the protection of an individual's right to privacy."[13] If harms due to privacy violations can be shown in court, damages will be awarded to the victims of those violations. Property law already governs trespass, and new court rulings may well expand the body of such law to encompass trespass by commercial UASs by focusing on actual cases and controversies, not merely imaginary hypotheticals. In particular, state "peeping Tom" laws already prohibit spying into individual homes.[14] Privacy torts—including the tort of intrusion upon seclusion—may also evolve in response to technological change and provide more avenues of recourse to plaintiffs seeking to protect their privacy rights.[15]

Fourth, adequate time should be afforded for the development of nongovernmental privacy protection mechanisms, ranging from market-based solutions to voluntary codes of conduct to individual self-help. The UAS industry has already developed a set of industry best practices, which include respect for the privacy of individuals.[16] These guidelines will likely be refined over time to meet new challenges and concerns. Industry norms and practices will also be influenced by pressure from media, activists, and consumers. Such less-restrictive solutions can greatly reduce the need for administrative intervention and can therefore increase the "permissionlessness" of airspace as a platform for innovation.

SOCIAL ADAPTATION

Patience is also wise here not only because it provides breathing space for future innovation, but also because it provides an opportunity to observe both the evolution of societal attitudes toward this new technology and how citizens adapt to it. It is possible that citizen attitudes about UASs will follow a familiar cycle we have seen play out in other contexts of initial *resistance*, gradual *adaptation*, and then eventual *assimilation* of that new technology

into society.[17] As technology author Larry Downes has observed, "after the initial panic, we almost always embrace the service that once violated our visceral sense of privacy."[18]

The introduction and evolution of the camera and photography provides a useful comparison in this regard. The camera was initially viewed as a highly disruptive force when photography became more widespread in the late 1800s. Indeed, the most important essay ever written on privacy law, Samuel D. Warren and Louis D. Brandeis's famous 1890 *Harvard Law Review* essay on "The Right to Privacy," decried the spread of the device.[19] The authors lamented that "instantaneous photographs and newspaper enterprise have invaded the sacred precincts of private and domestic life" and claimed that "numerous mechanical devices threaten to make good the prediction that 'what is whispered in the closet shall be proclaimed from the house-tops.'"[20]

Similar fears often animate criticisms of UASs today. But just as personal norms and cultural attitudes toward cameras and public photography evolved quite rapidly over a century ago, attitudes about UASs may evolve in coming years. Just as cameras and photography became an ingrained part of the human experience, UASs might, as well. And just as social norms and etiquette evolved to address those who would use cameras in inappropriate, privacy-invasive ways, the same could happen for UASs.

Toward that end, just as we did not preemptively foreclose photographic innovation in the late 1800s, we should not foreclose UAS innovation today with overly prescriptive privacy regulations. Let innovation continue, and address tangible harms as they develop, if they do.

APPLICATION TO THE PROPOSED PRIVACY REQUIREMENTS

In light of these arguments, section (1) of the proposed privacy rules is inappropriate for the current stage of experimentation with commercial UASs. The requirement that site operators develop privacy policies that are informed by Fair Information Practice Principles is quite onerous for commercial operators of UASs, and its cost will likely outweigh any hypothetical benefits.

Consider, for example, a real estate agent that uses an UAS to create a detailed, three-dimensional photograph of the exterior of a property that is for sale. In doing so, the UAS inadvertently captures images of passersby in the street adjacent the property. According to so-called Fair Information Practice Principles,[21] must the UAS operator treat the passersby as potential victims of privacy violation? If so, then would the following requirements apply?

- To give all passersby notice of data collection before any photos are taken.
- To publicly identify the real estate agent before any photos are taken.
- To ensure that passersby understand that pictures of their faces and information about their whereabouts may be used on a real estate listing website.
- To give passersby a choice to opt-in or opt-out of such photography.
- To ensure that all inadvertently photographed passersby are given access to all photographs,

(listing as FIPPs: Transparency, Individual Control, Respect for Context, Security, Access, Accuracy, Focused Collection, and Accountability.)

including ones that are not used on the real estate listing website.

- To take expensive security measures to protect photos that were taken in a public place.

If adhered to strictly, Fair Information Practice Principles could make it prohibitively costly to use commercial UASs in applications as benign as taking photographs near public spaces. It is not clear that they could comply, in this context or any other, with Executive Order 13563, which requires that any regulation promulgated by an executive agency be cost-beneficial. It should also be noted that Fair Information Practice Principles are law nowhere else in the federal government.

CONCLUSION

While the FAA makes clear in its Notice that the privacy requirements it proposes are only applicable to the test site operators and "are not intended to pre-determine the long-term policy and regulatory framework under which commercial UASs would operate,"[22] it would be unreasonable to believe that the precedent set in this proceeding will not affect future deliberations. Indeed, the actions the FAA takes in this proceeding will begin to set the baseline for future UAS regulation.

The FAA further notes that the purpose of the privacy requirements are simply to "assure maximum transparency of privacy policies associated with UAS test site operations in order to engage all stakeholders in discussion about which privacy issues are raised by UAS operations and how law, public policy, and the industry practices should respond to those issues in the long run."[23] Unfortunately, by mandating that test site operators issue privacy policies and that those policies be informed by Fair Information Practice Principles, the FAA would be excluding an important possible alternative from the discussion: some operators might choose not to issue a privacy policy or adopt a non-FIPPs-compliant policy. If the true purpose of the pilot programs is "to develop a body of data and operational experiences to inform integration and the safe operation of these aircraft in the National Airspace System," then the FAA should seek not just geographic and climatic diversity, but policy diversity as well.

We therefore urge the FAA to strike section (1) of its proposed privacy regulations and rely exclusively on existing law and other mechanisms to protect individuals' privacy rights. We believe that such an approach would have the virtue of protecting individual rights, fostering the use of airspace as a platform for innovation, and allowing the scope of any necessary future privacy laws to be narrowly tailored by actual cases and controversies that emerge. To the extent that it remains the subject of public concern, the FAA should recognize its lack of authority on the matter, leaving further deliberations about the privacy implications of UASs to Congress, where elected officials can consider these concerns while weighing the benefits and costs of potential regulation.

States in a race to secure drone testing

Groups in 37 states are vying to become one of six federally designated sites for testing the remotely piloted crafts for use in the nation's airspace. They see a chance to generate jobs.

By Richard Simon, Los Angeles Times

3:30 AM PDT, April 8, 2013

advertisement

WASHINGTON — Although the prospect of drones flying over U.S. cities is generating cries of spies in the skies, groups from California to Florida are fiercely competing to become one of six federally designated sites for testing how the remotely piloted aircraft can safely be incorporated into the nation's airspace.

North Dakota boasts of its "minimal air traffic congestion." North Carolina, whose license plates read "First in Flight," cites its aviation history. California pitches its diverse geography: desert, mountains and ocean.

Technically, the designation itself offers no money, but 50 groups in 37 states have entered the Federal Aviation Administration competition. States see the designation as an opportunity to generate jobs from a burgeoning industry.

"Clearly, we wouldn't be interested unless we thought there was money," said Bob Knauff, a retired general leading a New York-Massachusetts bid.

And so the pitches keep coming. Oklahoma notes its experience in testing drones for the military. Arizona boasts of its nearly year-round "perfect flying weather." Florida, on the other hand, sees its sometimes severe weather a plus for testing drones in all kinds of conditions.

And the leader of a joint effort by Alaska, Hawaii and Oregon says, "We think we bring something to the table that is going to be hard to match," citing the diversity of environments and "massive amounts" of "relatively unpopulated airspace," especially up in the Last Frontier.

Not everyone, however, is so enthusiastic.

Even as the competition rages, lawmakers from city halls to Congress are writing legislation to restrict drone flights. The FAA also is getting an earful from a public anxious about drones invading their privacy.

"This is a highly visible step toward a Big Brother-like state," a Wisconsin resident complained to the FAA.

Those vying for test sites say that privacy concerns should be addressed separately from the testing. But they are aware of the concerns.

North Carolina has proposed testing in airspace over crops. "Corn doesn't care" about drones flying overhead, said Kyle Snyder, director of the NextGen Air Transportation Center at North Carolina State University. Still, the FAA has directed that existing privacy laws be obeyed during testing.

Those bidding for test sites — in many cases alliances of economic development groups, universities and aerospace companies — believe that if they land a test site, drone manufacturers will follow.

Aerospace research firm Teal Group Corp. estimated that worldwide drone spending will almost double over the next decade to $11.4 billion. Thousands of drones are expected to be deployed over the U.S. within the next five years for all sorts of chores, including inspecting pipelines, scouting film locations, searching for lost hikers, helping police track criminal suspects.

"Simply put, unmanned aircraft systems are the next big thing in the aerospace industry," California Assemblyman Al Muratsuchi (D-Torrance), chairman of the California Assembly Select Committee on Aerospace, said at a recent Sacramento hearing.

Florida, which is investing $1.4 million in its pitch, sees drones as a way to recover from the end of the space shuttle program. Nevada officials have said they see an opportunity to become the "Silicon Valley of unmanned aerial systems."

The FAA, which will select the six test sites by the end of the year, was directed by Congress to draw up rules by 2015 for drone flights in U.S. airspace. Among those pushing for the legislation was the 49-member Congressional Unmanned Systems Caucus, founded by Rep. Howard P. "Buck" McKeon (R-Santa Clarita), who has cited the potential for jobs and improvements to public safety and emergency response times from integrating drones into the nation's airspace.

The FAA has largely left it to the applicants to propose the parameters for the test sites.

North Carolina proposes a range just 14 miles long and four miles wide; other states propose ranges that take in hundreds of miles of restricted airspace, generally over lightly populated areas. Two California groups propose testing over the desert and ocean and at small airports.

In Maryland, a group led by the University System of Maryland has proposed testing over the Chesapeake Bay, among other places. New York and Massachusetts propose testing over the Adirondacks and Cape Cod.

Tests initially are expected to focus on small drones, typically 50 pounds or less, flying at altitudes of up to 5,000 to 10,000 feet, but eventually could include bigger drones like the ones used in combat — but unarmed.

Some states hoping to be named test sites have combined forces, seeing strength in numbers. Virginia and New Jersey are working together.

In California, groups based in Ventura and Kern counties, with partners from throughout the state, are bidding to become test sites, but state officials worry the intrastate competition could hurt California's chances.

Although states aren't saying much publicly about their bids for fear of helping their competitors, they are looking for any edge they can get.

North Dakota, to highlight its expertise on drones, noted that one of its universities was the first in the nation to offer a bachelor's degree in "unmanned aircraft systems operations." The governor has allocated $1 million for the state's bid and pledged an additional $4 million to support the testing if North Dakota is selected.

Ohio noted that it was home to development of the "world's first unmanned aerial system," a sort of flying bomb known as an "aerial torpedo" developed in 1918.

Subject: RE: Use of UAVs and Model aircraft

Sir –
Forgive me for replying yesterday but all my files on UAS are here in the office. There are several UAS groups that I am associated with or that I have addressed on potential UAS missions.

First, I attach my 2006 testimony on UAS in Alaska that I gave before Senator Stevens' Senate Commerce, Science, and Transportation Committee. I designed a concept of operations that included some aspects of privacy. I emphasized that UAS should not be developed, deployed, or operated entirely independently but as part of an enterprise with unified logistics, airspace coordination, privacy, and other difficult challenges.

Second, I attach the executive summary of the Unmanned Aircraft Systems Consortium and their Center for Innovation located in Arlington Texas. I addressed them last November on the UAS potential for science, safety, and security. In the audience were several involved with the Texas Governor's office through Texas A&M on private sector R&D and use of UAS.

Third, the U.S. Army at Redstone Arsenal has an office for unmanned aircraft systems that has a network with other government agencies to help establish and grow UAS programs within those organizations and agencies. I talked with them about the conops by telcon last December.

Fourth, there is an Alaska UAS Interest Group that holds periodic workshops with mostly federal agencies but some state and university agencies as well. It is coordinated by the Alaska Center for UAS Integration in the Department of the Interior here in Anchorage.

Fifth, New Mexico State University has the TAAC (Technical Analysis and Applications Center) that focuses on UAS potential – mostly federal agencies. They hold several conferences each year that are mostly technical but also have elements of societal and privacy considerations.

I have contact information for each of these groups.

As always, please do not hesitate to contact me if you have questions or need further information.

Subject: Use of UAVs and Model aircraft

Commissioners, I hope this finds you well. Quick question:

I chair the Aerospace States Assn., which is looking to develop model state legislation on privacy issues as they relate to model aircraft and UAV's. We are likely to partner with industry groups, the Council on State Governments, and privacy groups as we look at this. In your balliwicks – public safety commissioners or adjutant generals or emergency homeland security directors or transport/aviation authorities – are there national organizations we should have involved?

Virginia has a bill on the Governor's desk which restricts the use of UAVs in law enforcement, and almost two dozen other laws are pending across the country. ASA's presumption is we can work to protect privacy and civil rights and allow this tool to be used for its beneficial uses.

Thanks.

WRITTEN TESTIMONY OF
JOHN W. MADDEN
DEPUTY DIRECTOR FOR HOMELAND SECURITY
DIVISION OF HOMELAND SECURITY AND EMERGENCY MANAGEMENT
DEPARTMENT OF MILITARY AND VETERANS AFFAIRS
STATE OF ALASKA

HEARING ON
"UNMANNED AERIAL SYSTEMS IN ALASKA AND THE PACIFIC REGION: A FRAMEWORK FOR THE NATION"

BEFORE THE
COMMITTEE ON COMMERCE, SCIENCE, AND TRANSPORTATION
UNITED STATES SENATE
July 13, 2006

Introduction

Thank you, Mr. Chairman and Members of the Committee, for inviting me to present testimony on the potential use of unmanned aerial systems (UAS) in Alaska and the Pacific Region. I am the Deputy Director for Homeland Security for the State of Alaska and have held this position since September of 2005. Before beginning my service to the State of Alaska, I served 37 years in seven federal agencies, most recently three years with the Department of Homeland Security and Transportation Security Administration in Alaska. For eleven years before that, I worked with the Alaskan Region of Federal Aviation Administration (FAA). I also worked nine years with the Alaska Region of the National Weather Service and National Oceanic and Atmospheric Administration (NOAA).

Before transferring to Alaska from Washington, D.C. in 1982, I served with the headquarters of the Department of Energy working on fossil fuels research, the Joint Cruise Missile Project of the U.S. Navy and U.S. Air Force, several major defense programs, and on active duty with the U.S. Army in Vietnam and Washington, D.C.

With my experience in federal and state agencies with missions supporting science, safety, and security, I am in a position to analyze and describe the UAS initiative with a well rounded view.

Initial Concepts

In October 2005, I first learned of NOAA's interest in UAS in Alaska to conduct long-term climate research in the Arctic. I understood their objective to be regular and frequent flights over the Arctic Ocean taking atmospheric and other scientific measurements to improve the climate prediction models.

I immediately saw a possible dual mission for these flights. During the flights to and from the Arctic, the aircraft could monitor the critical infrastructure of the Trans Alaska Pipeline System (TAPS), the oil production fields of the North Slope, refineries, oil

storage facilities, and the Alaska Railroad. There was clearly a potential for one flight to accomplish two missions.

As I discussed this possibility with other state agencies and our federal partners, I realized that the range of potential missions was far broader than first evident. There was a clear need to examine the possibility of unmanned aerial systems achieving many missions on one flight – for science, safety, and security. Also, it was evident that while several organizations were interested in UAS, there was no forum for formal discussions and examination of the technology.

Workshop on Unmanned Aerial Systems in Alaska

On April 18, 2006, the State of Alaska hosted an open workshop on unmanned aerial systems. The 55 attendees represented 34 federal and state agencies, universities, private sector companies, and non-profit organizations. I have included a list of the attending agencies and organizations with my written testimony. At the workshop, we exchanged information on current UAS activities and technology around the world and identified potential uses of unmanned aircraft vehicles and systems in Alaska. There was a strong emphasis on the possibility of Alaska as a testbed for UAS technology and applications that may prove beneficial to the entire nation across a broad range of public service missions.

The attendees at the UAS workshop identified many potential mission areas broadly aligned along the themes of science, safety, and security. Some potential missions recurring during the workshop included Arctic climate and weather research, ecosystems and wildlife habitat, monitoring volcanoes and wildfires, emergency communications platform, monitoring of critical infrastructure, fisheries enforcement, emergency response management, and search and rescue. These are representative of the missions that, on first examination, seem incongruent and incompatible. However, we found these missions shared three common elements:

- UAS could improve the effectiveness of achieving the mission of each agency;
- an integrated UAS program would likely reduce the costs of many aspects of the individual missions; and
- UAS could reduce the risks to flight crews and aircraft often operating in very hazardous conditions.

Undoubtedly, there are several lists of potential mission areas prepared by other organizations. These lists should be seen as complementary rather than competitive. The civilian UAS industry is a new field and the ideas are emerging rapidly from many quarters. It is too soon to definitively include or exclude any single idea. Rather, that should be left for a later, more detailed review and planning process.

To describe each potential mission would require testimony of several hundred pages. As an expedient, I will describe a few areas that illustrate the range and diversity of missions. While I describe these missions from an Alaskan perspective, the conditions and challenges in Alaska will replicate those found in other states and regions throughout the country.

- Arctic Climate and Weather Research -- I leave it to my associates from NOAA to describe the scientific missions for UAS in Alaska. However, I emphasize that whatever conditions NOAA detects and whatever predictions arise from improved climate models, Alaska -- its people, economy, and culture -- will be affected first. This mission, as I understand it, requires a platform with intercontinental range, sensing packages, and delivery systems for sondes.

- Monitoring of Critical Infrastructure – A significantly large amount of critical infrastructure in Alaska is located in remote areas. This infrastructure is critical to the people and economy of Alaska and Nation. We Alaskans take this charge very seriously. We devote a significant amount of state, local and corporate resources to deter, detect, and defend against all hazards and threats. To protect just the energy sector – power generation and distribution, oil and gas production fields, pipeline, pump stations, refineries, rail transport, and storage facilities -- there are more than two dozen federal, state, and local agencies and private sector corporations providing some piece of the overall protection. Through the coordinated use of UAS, we could radically improve our ability to integrate all these protective activities and eliminate any gaps, seams, or overlaps in the security. To meet this mission, a variety of aircraft platforms would be needed.

- Fire Management and Response – In this area the diversity of UAS technology and missions is dramatically demonstrated. The rapidly changing nature of firefighting, constantly shifting and always threatening, is extremely challenging to the firefighters and those supporting them. In some future fire scenario, there will be an integrated use of specialized unmanned aerial systems. A high altitude platform continually captures the perimeter, damage, and direction of all fires within range and locates the hotspots within the fire. This information is transmitted real-time to the incident commander who develops and refines the strategy and tactics for the entire fire area. A medium altitude aircraft serves as an airborne radio communications base to ensure every element is in constant contact despite the terrain or ground based stations. A medium to low flying platform drops weather sondes around the fire for atmospheric readings critical to extremely accurate weather predictions down to the range of one kilometer. In the past two years, Alaska has lost more than 11 million acres to wildfires – as much as the rest of the nation combined. There will be no shortage of opportunities to test technology, tactics, and techniques in Alaska that will be immediately useful to other states with wildfires.

- Volcano monitoring – Alaska has about 40 volcanoes active in historical times. As recently as January of this year, Mt. Augustine threatened communities along Cook Inlet and the air routes over the Northern Pacific. In recent years, other eruptions from Mt. Spurr, Mt. Redoubt, and Mt. Augustine, disrupted commercial aircraft operations throughout the Pacific and half the country. While NOAA, the FAA, and the Alaska Volcano Observatory have greatly improved their ability to monitor and predict the movement of ash clouds, other information remains

difficult to obtain. During the UAS Workshop, there was speculation on the use of small, low-cost, sacrificial unmanned aerial vehicles to fly into volcanic ash clouds to gather and transmit information on the chemical composition and size of the particulate. Also, it would be of significant value to have an unmanned aircraft remain on station for hours or days to monitor and transmit visual and infrared information from the volcano. Again, a variety of unmanned aerial vehicles would supplement the ground and satellite based monitoring resources.

- River Ice and Flooding – Each spring as the ice on the Alaskan rivers begin to break up, dozens of river communities endure the uncertainty of if or when they may be flooded. During the Yukon River breakup in May 2006 – 150 miles of ice traveled downriver with the potential of blocking the river at any turn and flooding several communities. The river watch program of the National Weather Service and the State of Alaska flew small, piloted aircraft at slow speed and low elevation to monitor and assess the ice. This approach places pilot and crew at great personal risk and cannot stay on station for long. Similar conditions of seasonal flooding exist throughout the country. The process of gaining situational awareness of water conditions and rapidly identifying changes to predictions could immediately be exported to other states and regions.

Model for the Civilian UAS Testbed and Operations Center in Alaska

It was evident from discussions during and since the April workshop that no single type of UAS could meet all these missions. Rather, the ideal UAS test program would include several platform types – from the high altitude, long endurance aircraft requiring a long runway to very small aircraft capable of low and slow flight, launched pneumatically or by hand, and easily deployed. Also, the UAS initiative is more than the vehicles and technology. The unmanned aircraft are essentially tools to acquire data and information for the other elements of the system to analyze and distribute.

To accommodate this wide range of aircraft and missions, I envision an operations center at one of the hundreds of State owned airports. The center is operated by a federal government agency or contractor. The center has hangar and maintenance space for the aircraft along with a test area for assembly, test, fabrication, and modification of payload equipment and technology. Near the aircraft base is the center for communications, information processing, logistical, and administrative support for a range of clients – government, academia, and industry. The operations center is linked to the clients in Alaska and throughout the nation via high-speed, broadband fiber optic and satellite network. The center has sufficient computing power for processing, analysis, and archiving huge amounts of data and imagery. The center provides for the maximize productivity of each flight hour by aligning missions, equipment, sensing packages, and priorities from clients. Further, the center would safeguard the information from unauthorized access and use.

Depending on the missions, there may be UAS forward deployed to other locations during seasonal events such as flooding, fire, wildlife migration, fisheries seasons, and breakup of river ice. There would be accommodations for the actively participating

organizations as well as observers (real or virtual) from the private sector, other states, federal agencies, and even nations. These observers could learn first hand the UAS operations relevant to their needs and plans. Each could then make informed recommendations and decisions on the transfer of the UAS technology and procedures to their constituency or organization.

The center is governed by a charter that broadly prescribes how priorities are set, how conflicts are resolved, and how business is conducted. Through this governance, the participating agencies and organizations decide under what conditions to sacrifice a day of scientific observations to conduct a search and rescue operation or under what conditions to delay a wildlife census to monitor a threatening volcano.

Profile of One Flight with Many Missions

I will describe the flight and mission plan for one flight of an unmanned aerial vehicle should this initiative be realized. While it is unlikely that a single flight will ever perform all of these, this hypothetical flight contains several mission elements that, individually, would be extremely difficult, dangerous, or expensive with manned aircraft or through satellite observations.

1. A long-range unmanned aerial vehicle launches from a base in Southcentral Alaska with its primary mission to drop weather sondes over the Arctic Ocean. It is also equipped with optical and infrared sensors to accomplish several secondary missions along the way.
2. The aircraft quickly climbs above the general aviation operating altitudes and heads north on its programmed flight.
3. As scheduled, the aircraft flies over the Trans Alaska Pipeline System, the pump stations and river crossings. The imagery is relayed through a high speed, secure downlink to the pipeline security operations center.
4. The aircraft also flies over Ft. Greeley and the national missile defense base. The imagery is relayed to security forces.
5. The UAS Operations Center receives a report from Alaska State Troopers of a boat overdue from a trip on the Yukon River from Circle to Fort Yukon. The aircraft is directed to divert slightly to follow and monitor the Yukon River. The aircraft collects the imagery and transmits it to the UAS Control Center. The center quickly analyzes the imagery and relays to the Alaska State Troopers the locations of the most likely search areas. The search by manned aircraft is now more focused and effective.
6. Over the North Slope, the aircraft begins collecting imagery of a caribou herd for several federal and state agencies as well as universities researching the wildlife of that area. The imagery is retained onboard the aircraft for later forwarding to the client agencies and universities.
7. As the aircraft approaches the Arctic Ocean, it flies a scheduled path over the oil fields at Prudhoe Bay and takes optical and infrared images to detect hotspots indicative of leaks and the surrounding areas for unauthorized people and vehicles. The imagery is relayed real time to the pipeline operations center.

8. Over the next several hours, the aircraft conducts its primary mission of atmospheric observations over a large swath of the Arctic Ocean.
9. On its return to the mainland, the aircraft follows the flight plan along the pipeline from Prudhoe Bay to Fairbanks, again concentrating on pump stations, river crossings, and other critical elements. It relays imagery in real-time to the pipeline operations center.
10. The UAS Operations Center receives a report from the Alaska Rescue Coordination Center (RCC) in Anchorage of an emergency locator transmitter detected near Chandalar Lake in the Brooks Range above the Arctic Circle. The Control Center recalls a portion of the imagery already collected for pipeline security and reroutes it to the RCC for analysis and action.
11. The aircraft flies a planned route through the military special use airspace near Fairbanks to simulate a commercial aircraft deviating from flight plan. This provides a highly realistic test for the FAA and the North American Aerospace Defense Command to detect, identify, and intercept an aircraft under these conditions.
12. The flight plan includes a scheduled reconnaissance flight over an active fire area near Nenana. The infrared and optical imagery of the fires is relayed real time to the Alaska Fire Service in Fairbanks who matches it with information from other UAS on low-level flights.
13. The aircraft continues southward above the Alaska Railroad and monitors the remote rail bridges before the transport of a large shipment of highly hazardous materials. The imagery is sent real time to the railroad operations center.
14. The aircraft completes its one flight and its many missions and returns to base. The imagery, atmospheric observations, and other data are downloaded for archiving, distribution, and analysis.

Aviation Safety

I anticipate that the aviation community in Alaska may raise safety concerns about sharing airspace with unmanned aircraft. Alaska is the ideal venue to develop and test the standards for ensuring the safety of integrating UAS into the National Airspace System. While the per capita numbers of active pilots and registered aircraft in Alaska are the highest in the nation, there is still a great amount of airspace in Alaska. According to FAA records, there were about the same number of active pilot certificates in Alaska as in Maryland or Massachusetts, states with significantly larger populations but much smaller land area and airspace.

Also, Alaska has about the same number of registered aircraft – private, corporate, and commercial – as Ohio or Washington State, states with more population centers, fewer landing facilities, and more controlled airspace. I understand there are many other factors such as number of flights, distance and duration of flights, controlled and uncontrolled airspace, weather and radar coverage, and the limited road system. However, the risks of flying in Alaska are widely recognized and increasingly well documented.

It is often said, and I agree, that aviation is the lifeblood of Alaska – more so than any other state. Alaskans know and greatly appreciate the improvements in recent years in aviation safety and security. The collaboration between FAA, the aviation industry and associations, and the flying public is innovative, inclusive, and incredibly successful. The most notable programs in recent years are the Capstone program, the Medallion Foundation, the Circle of Safety, and the statewide system of weather cameras.

Aviation safety is and will remain vital to the state and worthy of the focus and resources afforded it. But there is strong need for the aviation community to collaborate on this initiative to confront other hazards that are just as threatening to our citizens. It is not enough to be safe while in flight as other imminent dangers – fires, floods, volcanoes, coastal and river erosion, terrorism – face our families and communities. The aviation community is a critical component of Alaskan life and it is critical to the thoughtful examination and implementation of UAS technology and operations in Alaska and across the Nation.

Benefits to the Nation from a UAS Testbed and Operations Center in Alaska

A civilian UAS operations center in Alaska will facilitate the methodical test and evaluation of existing and emerging technologies in challenging field conditions. It also is the perfect laboratory to find the best means and timetable for introducing unmanned aerial systems into the National Airspace System.

For the emerging UAS industry in the United States to establish itself in the world market, it must demonstrate reliable technology that meets business needs and government missions, and that operates in the widest range of environmental conditions, and with logistical support. Alaska is the right location for such a testbed because there is more of the world like Alaska than many parts of the United States.

Conclusion

My foremost duty is to provide for the safety and security for the people and economy of Alaska. The UAS initiative will significantly contribute to a safer and more secure Alaska. Just as importantly, I believe that a civilian testbed in Alaska also serves the best interests of other states and the Nation as a whole. Only in Alaska can we test the full range of potential missions of UAS without immediately confronting the complex airspace found in most of the National Airspace System. Only in Alaska can UAS be used to maximum efficiency through one flight conducting many missions – on each flight. Only in Alaska can the unmanned aerial system initiative be subjected to the most demanding climactic, environmental, logistical, and administrative challenges without dooming it to early and avoidable failure.

This concludes my prepared remarks. I stand ready to answer any questions you, or other Members of the Committee, may have.

Unmanned Aircraft Systems in Alaska: A Workshop on Safety, Science, and Security

Sponsored by the State of Alaska
Held at the Aviation Technology Center
University of Alaska Anchorage
Anchorage, Alaska

April 18, 2006

Participating Agencies and Organizations

State of Alaska Agencies:

Alaska Department of Commerce, Community, and Economic Development
Alaska Department of Environmental Conservation
Alaska Department of Military and Veterans Affairs
- Alaska State Defense Force
- Alaska Air and Army National Guard
- Division of Homeland Security and Emergency Management

Alaska Department of Natural Resources
- Division of Forestry

Alaska Department of Public Safety
- Alaska State Troopers

Alaska Department of Transportation and Public Facilities
- Ted Stevens Anchorage International Airport

Alaska Railroad

Federal Agencies:

Department of Commerce/National Oceanic and Atmospheric Administration
- National Weather Service, Alaska Region
- Earth Systems Research Laboratory

Department of Defense
- Alaskan Command/Joint Task Force-Alaska
- Space and Naval Warfare Systems Command, San Diego

Department of Energy
- Sandia National Laboratory

Department of Homeland Security
- U.S. Coast Guard

Department of Interior
- Bureau of Land Management/Alaska Fire Service
- U.S. Geological Survey/Alaska Volcano Observatory

National Aeronautics and Space Administration
- Jet Propulsion Laboratory

Academic Organizations:
Alaska Geophysical Institute
New Mexico State University
University of Alaska Anchorage
    Aviation Technology Division
University of Alaska Fairbanks
    Geophysical Institute

Private Sector:
ACS Alaska
Aerospace Missions
Alyeska Pipeline Service Company
BP
Conoco Phillips
GCI
Northrup Grumman

Other Organizations:
Alaska Airman's Association
Alaska Sealife Center

CENTER FOR innovation™

Unmanned Aircraft Systems Consortium (UASC)

Executive Summary

Introduction

The Center for Innovation's (CFI) Unmanned Aircraft Systems Consortium (UAS) is focused on the development of the Unmanned Aircraft Systems industry. It's primary purpose is to develop, implement and expand UAS technological and production capabilities.

CFI's Unmanned Aircraft Systems Consortium was established as a means of addressing one of the priority issues of three federal agencies CFI represents as a Federal Partnership Intermediary; the U.S. Departments of Agriculture, Defense, and Homeland Security.

A UAS is comprised of the unmanned aircraft, payload, human element, control element, weapons systems platform, display, communication architecture, life cycle logistics, and includes the supported soldiers or civilian ground crew. Unmanned aircraft are fixed or rotary winged aircraft or lighter-than-air vehicles, capable of flight without an onboard crew.

Background

In 2010, the Center for Innovation established TechComm at the invitation of the U.S. Department of Defense, as a "multi-agency" Federal Partnership Intermediary. As such, TechComm is responsible to support the formation of strategic "public-private" partnerships, facilitating and enabling the integration of industry, academic, and government research and discovery with venture capital and talent & know how. The ultimate goals; (1) enable the commercialization of patented technology discovered in federal labs; and (2) enable federal agencies to secure both technology and contract services from business and industry.

TechComm currently represents five federal agencies, including the U.S. Department of Defense (DoD), the U.S. Department of Agriculture (USDA), the U.S. Department of Homeland Security (DHS), the National Institutes of Health (NIH), and the U.S. Department of Energy. TechComm works with these agencies through their Offices of Technology Transfer and Transition, and the 272 labs they operate. These labs collectively spend $100 billion annually on research, employ 100,000 federal researchers and scientists, with 20,000 patents available for license by business and industry for their own use, manufacture, or production.

Premise and Rationale

CFI's rationale for establishing a UAS consortium is based on our contracts to represent the U.S. Departments of Agriculture, Defense, and Homeland Security as a Federal Partnership Intermediary, as all three are keenly interested in UAS.

Currently, the Department of Defense buys approximately 70 % of all unmanned aircraft vehicles produced in the world. The U.S. Department of Agriculture is interested in UAS for their work in assessing land use, crop density and production. UAS is also of strong interest to the U.S. Department of Homeland Security (DHS), and in a broader sense,

the nations' first responder community. In addition, UAS is a current focus of the Federal Aviation Administration (FAA), as it works to respond to a Congressional mandate to integrate UAV's into commercial airspace by 2015.

Critical Issues

- FAA –Creation of a five-year UAS roadmap
- Commercial Airspace – Full integration of UAS into national airspace by 2015
- Test Sites – Federal selection of six test sites nationally
- Certification – Need to develop standards and air traffic requirements for UAS
- Training – Need to develop training programs for civil and public UAS

UAS Opportunities

In the next 10 years, the Department of Defense (DoD) plans to purchase about 730 new medium-sized and large unmanned aircraft systems, based on designs currently in operation, while also improving the unmanned aircraft already in service. By Congressional Budget Office (CBO's) estimates, completing the investments in systems for which there are detailed plans will require about $36.9 billion through 2020. To do so will require $4.6 billion in annual procurement, compared to the current DoD budget for 2011 of $1.9 billion.

The Department of Defense's (DoD's) 2012 plan calls for purchasing more of the existing unmanned aircraft systems for current operations, improving the system already in service, and designing more-capable unmanned aircraft systems for the future.

Currently DoD is using their 6000 plus unmanned aircraft system to perform; reconnaissance missions; light attack; electronic warfare; search and rescue; mapping; bomb detection and destruction; firefighting; reconnaissance for nuclear; chemical; or biological weapons of mass destruction; support special operations; marine interdiction; emplacement of obstacles; such as mines; and psychological warfare. Because of these special technological needs for UAS by the DoD, the demand for the multiple of capabilities of each aircraft will increased over time.

UAS Consortium Strategic Objectives

The Center has established five strategic objectives for the UAS consortium:

Research, Development & Commercialization:

- Seek funding for research and product development to support the technology needs of the UAS industry;
- Enable efforts to commercialize new technologies;
- Expedite the transition of UAS technologies from federal agencies/labs into the commercial sector, as well as UAS technologies from the private and academic sectors.

Industry Sector Development:
- Provide support for prototype design and development;
- Create access to testing airspace for government, academic, and corporate research;
- Serve as a catalyst to develop the manufacturing capacity of unmanned aircraft solutions needed to meet emerging markets demand;
- Establish prototype supply chain, inclusive of suppliers and service providers.

Access to Capital
- Establish access to venture capital;
- Establish access to debt equity capital;
- Establish access to state and federal funding.

Education, Workforce Development & Training:
- Develop the curriculum necessary to support workforce development;
- Develop the training capacities and capabilities necessary to train the needed workforce in manufacture, repair and maintenance of UAS.

Policy & Standards Development:
- Actively seek and propose solutions for the safe and effective operation between manned and unmanned aircraft systems;
- Provide recommendations for public policy and standards development.

Consortium Partners (As of August, 2012)
Consortium partners include:

Industry Sector
- Adastral, LLC
- Aerial Specialties
- Bell Helicopter
- Legion Training & Simulation, LLC
- Lockheed Martin
- L-3 Unmanned Systems
- Process Data Control Corp
- Raytheon
- Sagan & Associates
- Unmanned Aviation Public Safety Association

Educational Sector
- Kaplan College
- Tarrant County College
- The University of Texas at Arlington

Federal Agency Advisors Include:

- Federal Aviation Administration (FAA)
- U.S. Department of Defense (DoD)
- U.S. Department of Homeland Security (DHS)
- U.S. Department of Agriculture (USDA)

Government Sector

- City of Arlington Police Department
- City of Mineral Wells
- DFW Airport
- Enid Regional Development Alliance
- North Central Texas Council of Governments
- North Texas Regional Airport
- Texas Emerging Technology Fund
- Texas Workforce Commission
- Wills Point Economic Development Corporation

The information furnished in this report is proprietary to the Center for Innovation at Arlington and, therefore, is privileged and confidential. It shall not be disclosed outside the Government for any reason (including Freedom of Information Act requests), without the prior written approval of The Center for Innovation, or duplicated, used, or disclosed, in whole or in part, for any other purpose than to evaluate the proposal, provided that if a contract, a Patent License Agreement, or Cooperative Research & Development Agreement secured, as a result, or in connection with the review, evaluation, or submission of any such information, the Government agencies represented by TechComm shall have the right to see, or to disclose this information to the extent provided in the contract. This restriction does not limit the Government's right to use data contained in such information if obtained from any other source without restrictions.

Resolution in Support of Safe and Effective Usage of Unmanned Aircraft Systems (UAS) in the State of Alaska.

WHEREAS, the advance of technologies for Unmanned Aircraft Systems has made it possible for Alaskans to use these tools to replace manned aircraft in a number of "dull, dirty and dangerous" tasks necessary to monitor the environment, respond to natural disasters, conduct research, advance public safety, and support natural resource development; and

WHEREAS, the State of Alaska, the University of Alaska, Alaska Aerospace Development Corporation, the Alaska Aviation Safety Project and other public and private institutions have developed cooperation with NASA, the FAA, the Department of Interior, the Department of Defense and others to further advance the research, development and use of technology to benefit and support Alaskans and Americans with the safe use of Unmanned Aircraft Systems; and

WHEREAS, The State of Alaska has embraced the use of Science Technology Engineering and Math programs (STEM) in schools and in extracurricular activity with our states' youth to help our next generation of leaders compete with greater literacy of math, science and engineering; and .

WHEREAS, many Alaskan hobbyists, aviators, and educators have had a long standing relationship with the Academy of Model Aeronautics, a national organization which has, for more than 75 years, promoted safe and effective operation of model aircraft through self-regulation, self-insurance, and development of its own safety and operations procedure; and

WHEREAS, through model aviation AMA has touched and inspired the lives of many young Alaskans and Americans to become scientists, engineers , astronauts and professional aviators; and AMA's has made a continuing contribution to Alaska's youth through Model Aviation School Clubs (MASC) around our state; and

WHEREAS, Alaskan officials play active and leading roles in the Aerospace States Association, the Council of State Governments, the National Emergency Management Association, and other interstate groups which promote the protection of privacy, the advancement of aviation and UAS technologies, and the provision of STEM education programs such as ASA's Real World Design Challenge; and

WHEREAS, the State of Alaska, under Governor Parnell in 2010, entered into a cooperative Space Act agreement with NASA AMES Research Center to address many needs statewide that can benefit from applications of NASA research, use of NASA education programs, or cooperation to advance our aerospace and aviation industries, including development of small "cubesat" affordable satellites, aviation technology information and communication systems to improve inflight systems and knowledge; aviation air traffic management research to improve the routing and scheduling systems for air cargo planes at Alaska's international airports, access and delivery of NASA STEM programs to Alaska schools, and help for rural Alaskans with onsite training, education, and technology transfer for clean water and sanitation; and

WHEREAS, Alaska's state government and Alaska's business and research community continue to work with the Federal Aviation Administration to promote the establishment of safe UAS ranges onshore on offshore Alaska, which will help set procedures for the safe UAS use in the National Airspace System.

WHEREAS, Alaska has the highest per capita use of general aviation activity in our nation, and Alaskan aviation organizations have helped the FAA develop the next generation of air traffic control for the nation and the world, while making major gains for Alaska's aviation safety in the process; and

WHEREAS, Alaska's "highways in the skies" are the lifeblood to many rural communities., and improving aviation safety in Alaska has been at the forefront of transportation planning efforts and coordination between Alaska user groups.

NOW THEREFORE LET IT BE RESOLVED, that the Alaska State Legislature is bound by the Constitution of the State of Alaska to defend the privacy rights of Alaska's citizens, and, accordingly, urges the Governor and State law enforcement officials to uphold the privacy of Alaskans under existing laws, and not to allow for the unauthorized use of UAS technology for unlawful activities that will compromise basic privacy or safety or civil rights; and

BE IT FURTHER RESOLVED, that the Alaska State Legislature encourages the aviation, UAS and Research Communities, University of Alaska, the Federal Aviation Administration, NASA AMES and Academy of Model Aeronautics and the Aerospace States Associations to cooperatively develop Model Rules and Operational Procedures for the integration of Unmanned Aircraft Systems (including model aviation) within the National Airspace System that this legislature and others can consider to adopt that will further protect the privacy, safety, and civil rights of Americans while promoting the advancement of this technology.

COPIES OF THIS RESOLUTION SHALL BE SENT TO the Honorable Sean Parnell, Governor of Alaska, the Honorable Mead Treadwell, Lt. Governor of Alaska and Chair of the Aerospace States Association; Sen. Gary Stevens, chair of the Council of State Governments; Government Affairs Division of AMA, ...

Subject: UAS Legislation - Resolution
Attachments: UAS Alaska Resolution v0.9.docx

Ginger, Attached is a rough draft of resolution we are looking at to be passed .vs legislation that is too preliminary

I am waiting for comments back from UAF and Greg Walker, but I wanted to let you know where we are at and where we are headed. I think, Greg is working on a stronger closing resolve that may benefit them in their application for UAS airspace project with the FAA.

This has been vetted by the Academy of Model Aeronautics, NASA and should have UAF comments back later today.

-Steve Colligan 907.230.3422

Resolution in Support of Safe and Effective Usage of Unmanned Aerial Systems (UAS) in the State of Alaska.

WHEREAS, The State of Alaska, the University of Alaska and Alaska education system has enacted several agreements with science based organizations and community based organization focused on the research, development and use of technology that will great benefit and support Alaskans and Americans including the use of Unmanned Aerial Systems.

WHEREAS, The State of Alaska has embraced the use of Science Technology Engineering and Math programs (STEM) in the classrooms to increase the interest and literacy of math and science in Alaska Schools.

WHEREAS, The Alaska community has had a long standing relationship with the Academy of Model Aeronautics which is a community based organization of more than 75 years, providing for safe and effective model aviation operation through its self-regulating, self-insured and development of its own safety and operations procedure. Through model aviation AMA has touched and inspired the lives of many young Americans to become scientists, engineers and professional aviators. Many Alaskans and American have become notable scientists, aviators and astronauts through their original interest in model aviation. AMA has been working as a community based organization with the Alaska Education system to deliver its STEM education programs and Model Aviation School Club (MASC) program for the benefit of Alaska's next generation of innovators.

WHEREAS, The State of Alaska has been involved with NASA for many years to solve scientific issues and cooperate on research missions. The State of Alaska, through Governor Parnell entered into a cooperative Space Act agreement with NASA AMES research center to address many needs in matters of science research and education to benefit Alaskans and our nation. NASA AMES has been working with Alaska science community to develop Small Cube Sat's the next generation of small affordable satellites; aviation technology information and communication systems to improve inflight systems and knowledge; Aviation Air traffic management research to improve the routing and scheduling systems for air cargo planes at Ted Stevens international Airport, access and delivery of NASA STEM program to Alaska schools, exciting the next generations of scientist about technology innovation, SPACE operations and exploration. NASA AMES has specifically included rural Alaskans by providing onsite training and curriculum and science camp and internship opportunities to rural Alaskans. NASA AMES has been the leader in safe use of unmanned aerial systems working with Alaska Science community on the operations of UAS for many research missions from volcano monitoring, wildlife and habitat research, to Arctic missions on Alaska's northern coast.

WHEREAS, Alaska legislature and State Government has invested in the Research and Development of UAS technology for support of many science based missions coordinated through the University of Alaska Fairbanks's, Geophysical Institute in areas of, search and rescue, environmental and resource monitoring, and exploration of the artic. These efforts continue to demonstrate the positive benefits of UAS operations, while reinforcing the use of UAS technology as a viable and cost effective tool. The

Alaska research community continues to work with the FAA, NASA AMES and aviation community on regulations and procedures for the safe UAS use in the National Airspace System.

WHEREAS, Alaska has the highest per capita use of general aviation activity in our nation. Alaskan aviation organizations in cooperation with the FAA have developed leading technology and innovations for navigation and aviation safety using Alaska as an effective testing and development grounds for the benefit the rest of the nation and the world.

WHEREAS, Aviation in Alaska and the "highways in the skies" are the lifeblood to many rural communities. Improving aviation safety in Alaska has been at the forefront of transportation planning efforts and coordination between Alaska user groups. To address these needs Alaska state government in cooperation with the FAA, NASA and other agencies are addressing aviation safety through a variety of means including but not limited to: Education and Training, Technology and Research, Improving of infrastructure and the development of terrain data and information with accuracy to support modern navigation systems.

RESOLVED, that the Alaska State Legislature supports the privacy rights of American citizens as provided for by the US constitution and will uphold the rights of Alaskans by enforcing existing laws and not allow for the unauthorized use of UAS technology for unlawful activities that will compromise basic privacy or safety.

RESOLVED, that the Alaska State Legislature encourages the aviation, UAS and Research Communities, the Federal Aviation Administration, NASA AMES and Academy of Model Aeronautics to cooperatively develop Model Rules and Operational Procedures for the integration of Unmanned Aerial Systems (including model aviation) within the NAS while maintaining the priority for manned aircraft systems.
