The LTFUAS also felt that some of the public awareness would be provided through the extended duties of the LTFUAS as they deliberate the issues surrounding UAS flights in Alaska.

3.3.6 Market Alaska "Open for Business" for UAS

The Department of Commerce, Community, and Economic Development is partnering with the Fairbanks Economic Development Council to prepare an education booth for Alaska at the next AUVSI convention in Florida in May 2014.

Now that Alaska has been selected as a test site, many manufacturers and associated businesses will seek out the University to begin using test ranges and conduct business in and around the state. If fact, at least one UAS services business has already indicated an intent to open an office here in Alaska.

3.3.7 Benefits to the Public Safety Statewide

- UAS do not require a pilot on board to operate the aircraft or attached equipment. UAS operators and system operators remain safely on the ground, reducing their exposure to threats.
- UAS are able to enter environments that may be hazardous to pilots of manned aircraft.
- UAS provide superior situational awareness while minimizing the danger to which operators are exposed.
- UAS and trained operators minimize response time to most emergency situations.
- Community safety is enhanced by the rapid response of air assets to an emergency. In most cases, manned aircraft must take off and land at airports where UAS can launch from nearly anywhere within minutes.

3.4 Audits of Missions

FAA Privacy Policy requires the test site to report a variety of data on the flights occurring in the test ranges.

At this time, the LTFUAS does not believe there should be an additional requirement for reporting other than what is required by the FAA.

3.5 Test Site Operations Manager Position

The FAA Privacy Policy requirement also requires a Chief Privacy Officer at the test site. The University is refining the duties of the Director of the Test Site to encompass all the responsibilities of managing the test ranges. This officer will be developing privacy policies to govern all activities conducted by the test site, make privacy policies publicly available, and establish a mechanism to receive and consider comments from the public. Annually, the privacy officer will review test site

operations to verify compliance with the policies and practices and share those outcomes in a public forum.

3.6 Incentive Grants

Many businesses have asked the LTFUAS if Alaska will offer any incentives to conduct business in the state. Given the reduced General Fund income to Alaska, the LTFUAS did not consider any financial incentives for potential business startups in Alaska.

The LTFUAS did discuss the advantages of being selected as a test site and the expedited administrative support for conducting UAS business in Alaska. It was agreed that the opportunity will offer many benefits to our state (see Section 3.3).

3.7 Research Appropriation to University of Alaska Fairbanks

While the LTFUAS would like to support the University financially, it was determined that funding may not be available at this time. The FAA states that no additional funding will be provided in conjunction with test site selection, but we are confident that federal funding may follow as integration into the NAS will require additional management.

4. FINAL RECOMMENDATIONS

The LTFUAS supports its recommendations to the Legislature by considering and adopting general guidelines from the following reports from the FAA:

- Guidelines for Operations of UAS (N 8900.227)
- Comprehensive Plan to Integrate UAS in National Airspace
- Final Privacy Requirements

The LTFUAS also adopted the IACP UAS Guidelines as appropriate for law enforcement in Alaska (Appendix B).

In addition to the FAA documents, the LTFUAS considered a report from Legislative Legal Services that identified Alaska's privacy laws and Constitutional protections of privacy to determine if there might be a scenario created through the use of UAS that would not be protected by existing privacy laws. The LTFUAS also recognized that because Alaska has been chosen as an FAA UAS Test Site for UAS Integration, an emphasis on management of the test ranges, economic development, and public education need immediate attention.

The LTFUAS made the following conclusions:

- It is the opinion of the LTFUAS that no additional statutory or regulatory requirements are needed for FAA-approved missions.
- It is the opinion of the LTFUAS that privacy policy is adequate through the FAA requirements for the use of UAS in the test sites.
- The LTFUAS does not intend to adopt requirements of hobbyist activities using UAS in the same manner that the FAA does not regulate model aeronautics.
- It is the opinion of the LTFUAS that the Department of Administration should review its data retention schedules with particular emphasis on law enforcement data captured inadvertently and allowing that data to be destroyed.
- It is the opinion of the LTFUAS that existing privacy laws are adequate to govern the use of unmanned aircraft
- The LTFUAS is confident in the FAA guidelines in protecting the safety of the national airspace.

Based on these findings, the final recommendations of the LTFUAS are the following:

1. Require all state and local law enforcement entities to adopt the IACP guidelines to help ensure privacy protection for Alaskans.

2. Require all law enforcement entities to first obtain a court order to use UAS over private property for criminal investigation against any person.

3. Encourage use of high-visibility marking or navigational lighting on law enforcement UAS as appropriate.

4. Convey a clear message to industry that Alaska is open for business to harness the beneficial uses of UAS, to encourage the growth of this economic sector, and to allow Alaska to continue to lead the nation in aviation innovation.

5. Encourage private and public UAS training programs.

6. Report all UAS incidents/accidents of aircraft larger than 55 pounds to the University of Alaska and/or Alaska Aviation Coordination Council.

7. Extend LTFUAS until June 30, 2017, and expand the duties of the Task Force with the addition of one member representing the Alaska Department of Transportation/Public Facilities (DOT/PF) and one public member, for the following reasons:

    - During this transitional phase of growing use of UAS in Alaska, the LTFUAS should be extended to continue to monitor it and any privacy matters that may arise that are not already covered by existing law. Because Alaska currently has a strong set of privacy laws, rather than recommend prohibitions be incorporated into statute that might inhibit industry, the LTFUAS recommends it continue to review UAS operations in light of current statutes and only recommend changes in statute as necessary.

    - Because FAA will be updating and issuing new guidelines based on the work of the new FAA UAS Test Sites announced on December 30, 2013, it is necessary for the LTFUAS to continue to review FAA policies to determine their impact and whether any additional policy changes at the state level may be necessary in response.

    - With Alaska's recent selection as one of the nation's six FAA UAS Test Sites through the University of Alaska's application (in conjunction with Oregon and Hawaii), the LTFUAS will meet part of the test site's requirement as a public forum where concerns regarding privacy and data matters can be collected and evaluated.

As we move forward, and particularly in light of the fact that Alaska has been selected as an FAA test site for UAS integration, and with the extension and expansion of duties of the Task Force, the LTFUAS further recommends immediate emphasis on the following:

1. management of the test ranges,

2. economic development opportunities,

3. public education and public relations regarding UAS, and

4. difference of model aircraft from UAS.

In addition to the above seven recommendations, the Task Force also recommends the following:

1. each department of the State of Alaska identify a point of contact for UAS to coordinate with the LTFUAS and provide information regarding department policy and procedures to ensure accountability and privacy in regard to UAS use, and

1) the Alaska Department of Administration review and update its data retention policies particularly in the area of inadvertent captured data that is not relevant to a state agency.

5. DEFINITIONS

TERMINOLOGY	DEFINITION	SOURCE
Autonomous Operations	It is generally understood that most UAS have some level of autonomy associated with its operation. Although it is possible to have a completely manual UAS, which requires a pilot-in-the-loop, the majority of UAS are autonomous to a certain degree. Only those UAS that have the capability of pilot intervention, or pilot-on-the-loop, shall be allowed in the NAS outside of Restricted, Prohibited, or Warning areas. UAS that are designed to be completely autonomous, with no capability of pilot intervention, are not authorized in the national airspace system. Although the pilot may be technically considered out-of-the-loop in a lost link scenario, this restriction does not apply to UAS operating under lost link.	1
Certificate of Waiver or Authorization (COA)	An FAA grant of approval for a specific flight operation. The authorization to operate a UAS in the National Airspace System as a public aircraft outside of Restricted, Warning, or Prohibited areas approved for aviation activities.	2
Civil Aircraft	Aircraft other than public aircraft.	2
Crewmember [UAS]	In addition to the crewmembers identified in 14 CFR Part 1, a UAS flightcrew member includes pilots, sensor/payload operators, and visual observers, but may include other persons as appropriate or required to ensure safe operation of the aircraft.	2
Detect and Avoid	Term used instead of Sense and Avoid in the Terms of Reference for RTCA Special Committee 228. This new term has not been defined by RTCA and may be considered to have the same definition as Sense and Avoid when used in this document.	2
International Civil Aviation Organization (ICAO)	A specialized agency of the United Nations whose objective is to develop the principles and techniques of international air navigation and to foster planning and development of international civil air transport.	2
Manned Aircraft	Aircraft piloted by a human onboard.	2
Model Aircraft	An unmanned aircraft that is capable of sustained flight in the atmosphere; flown within visual line-of-sight of the person operating the aircraft and flown for hobby or recreational purposes.	2
National Airspace System	The common network of U.S. airspace; air navigation facilities, equipment and services, airports or landing areas; aeronautical charts, information and services; rules, regulations and procedures, technical information, and manpower and material. Included are system components shared jointly with the military.	2
Personal Information Privacy Act (PIPA)	An Act relating to breaches of security involving personal information, credit report and credit score security freezes, protection of social security numbers, care of records, disposal of records, identity theft, credit cards, and debit cards, disclosure of the names and addresses of permanent fund dividend applicants, and to the jurisdiction of the office of administrative hearings; amending Rules 60 and 82, Alaska Rules of Civil Procedure; and providing for an effective date.	3

TERMINOLOGY	DEFINITION	SOURCE
Pilot-in-Command	Pilot-in-command means the person who: 1) has final authority and responsibility for the operation and safety of the flight; 2) has been designated as pilot-in-command before or during the flight; and 3) holds the appropriate category, class, and type rating, if appropriate, for the conduct of the flight.	2
Public Aircraft	An aircraft operated by a governmental entity (including federal, state, or local governments, and the U.S. Department of Defense and its military branches) for certain purposes as described in 49 U.S.C. §§ 40102(a)(41) and 40125. Public aircraft status is determined on an operation by operation basis. See 14 CFR Part 1, § 1.1 for a complete definition of a public aircraft.	2
Sense and Avoid	The capability of a UAS to remain well clear from and avoid collisions with other airborne traffic. Sense and Avoid provides the functions of self-separation and collision avoidance to establish an analogous capability to "see and avoid" required by manned aircraft.	2
Test Range	A defined geographic area where research and development are conducted in accordance with Sections 332 and 334 of the FMRA. Test ranges are also known as test sites in related documents such as the FAA's Screening Information Request.	2
Unmanned Aircraft	1) A device used or intended to be used for flight in the air that has no onboard pilot. This devise excludes missiles, weapons, or exploding warheads, but includes all classes of airplanes, helicopters, airships, and powered-lift aircraft without an onboard pilot. UA do not include traditional balloons (see 14 CFR Part 101), rockets, tethered aircraft and unpowered gliders. 2) An aircraft that is operated without the possibility of direct human intervention from within or on the aircraft.	2
Unmanned Aircraft System	An unmanned aircraft and its associated elements related to safe operations, which may include control stations (ground, ship, or air-based), control links, support equipment, payloads, flight termination systems, and launch/recovery equipment. An unmanned aircraft and associated elements (including communications links and the components that control the unmanned aircraft) that are required for the pilot-in-command to operate safely and efficiently in the national airspace system.	2
Visual Line-of-Sight	Unaided (corrective lenses and/or sunglasses exempted) visual contact between a pilot-in-command or a visual observer and a UAS sufficient to maintain safe operational control of the aircraft, know its location, and be able to scan the airspace in which it is operating to see and avoid other air traffic or objects aloft or on the ground.	2

APPENDIX A

FAA FINAL PRIVACY REQUIREMENTS NOVEMBER 7, 2013

[4910-13]

DEPARTMENT OF TRANSPORTATION

Federal Aviation Administration

14 CFR Part 91

[Docket No.: FAA-2013-0061]

Unmanned Aircraft System Test Site Program

AGENCY: Federal Aviation Administration (FAA), DOT.

ACTION: Notice of availability of final privacy requirements for the unmanned aircraft system ("UAS") test site program; response to comments

SUMMARY: On February 22, 2013 the FAA published and requested public comment on the proposed privacy requirements (the "Draft Privacy Requirements") for UAS test sites (the "Test Sites") that the FAA will establish pursuant to the FAA Modernization and Reform Act of 2012 ("FMRA"). This notice responds to the public comments received and publishes the FAA's final privacy requirements for the Test Sites (the "Final Privacy Requirements").

ADDRESSES: You may review the public docket for this rulemaking (Docket No. FAA-2013-0061) on the Internet at http://www.regulations.gov. You may also review the public docket at the Docket Management Facility in Room W12-140 of the West Building Ground Floor at 1200 New Jersey Avenue, SE., Washington, DC, 20590-0001 between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays.

FOR FURTHER INFORMATION CONTACT: For technical questions concerning the test site program, contact Elizabeth Soltys, Unmanned Aircraft Systems Integration Office, Federal Aviation Administration, 800 Independence Avenue SW., Washington, DC 20591; email: 9-ACT-UASTSS@faa.gov.

For legal questions concerning the FAA's privacy requirements for the Test Sites contact Carlos Siso, Office of the Chief Counsel, Federal Aviation Administration, 800 Independence Ave. SW., Washington, DC 20591; email: 9-AGC-UASPrivacy@faa.gov.

SUPPLEMENTARY INFORMATION

This notice summarizes and responds to the public comments received in response to the following Federal Register notices seeking public comment on the Draft Privacy Requirements for the Test Sites:

(i) Notice of availability and request for comments published in the Federal Register on February 22, 2013 (78 FR 12259), Docket No. FAA-2013-0061-0001; and

(ii) Notice of public engagement session published in the Federal Register on March 28, 2013 (78 FR 18932), Docket No. FAA-2013-0061-0050.

In addition, this notice publishes the FAA's Final Privacy Requirements for the Test Sites which are set forth under the "Conclusion" section below.

Discussion of Comments

The FAA received 99 comments through Regulations.gov and 53 comments through the public engagement session. A transcript of the public engagement session is available at: http://www.faa.gov/about/initiatives/uas/media/UAStranscription.pdf. Public comments ranged from recommending that the FAA not impose any privacy requirements on the Test Sites to recommending that the FAA impose extensive privacy requirements on the Test Sites. The FAA also received comments that were not responsive to the notice or that were unclear.

The FAA analyzed the responsive comments and grouped them into ten categories. The following sections address the comments by category.

1) The FAA should focus on its safety mission; it should not engage in regulating privacy.

The FAA received a number of comments advocating that the FAA should focus on its safety mission and should not engage in regulating privacy. The following comments were received:

- The FAA should focus on safety;
- Regulating privacy is outside the FAA's mission;
- The FAA does not have statutory authority to regulate privacy;
- The FAA does not have the authority to impose privacy requirements on the Test Sites;
- The FAA should allow privacy to be addressed by other more appropriate government bodies including: Federal agencies that have expertise and authority to deal with privacy concerns; Congress; state or local legislative bodies; and the judicial system;
- The Federal Government should not regulate privacy impacts of UAS; these issues should be left to states, cities, and counties to address;
- The FAA should only require compliance with privacy laws that are already in place and focus on developing safe operation of UAS;
- The FAA should not deny access to the national airspace for reasons other than safety;
- Existing privacy laws are sufficient to cover the responsible use of UAS. There already exist Federal, state and other laws that protect privacy. In addition, tort law may also provide avenues of recourse for plaintiffs to protect their privacy rights;
- The FAA should not implement privacy regulations that make entry into the market prohibitive for small businesses;
- The FAA should not allow privacy issues to hinder commercialization of UAS;
- There is no evidence that the operations at the Test Sites will harm privacy interests. Restricting activities at the test sites at this early stage will likely overprotect privacy at the expense of innovation;

- The FAA should afford adequate time for non-governmental solutions such as industry norms and practices to develop before intervening administratively to protect privacy. These less restrictive solutions will reduce the need for administrative intervention and will allow for increased innovation in the national airspace;
- Requiring Test Site operators to develop privacy policies that are informed by Fair Information Practice Principles is onerous for commercial operators of UAS and its cost will likely outweigh any hypothetical benefits;
- Requiring Test Site operators to issue privacy policies informed by Fair Information Practice Principles will limit the diversity of data that will inform integration of UAS into the national airspace. The FAA's approach would exclude an important possible alternative from the discussion: some operators might choose not to issue a privacy policy or adopt a non-FIPPs-compliant policy; and
- The FAA should treat data gathered by UAS no differently than data gathered by a manned aircraft or by other electronic means. There is no significant difference in terms of surveillance between a UAS and a manned aircraft, and manned aircraft are permitted to operate in the national airspace with cameras.

Response: The FAA's mission is to provide the safest, most efficient aerospace system in the world and does not include regulating privacy. At the same time, the FAA recognizes that there is substantial debate and difference of opinion among policy makers, industry, advocacy groups, and members of the public as to whether UAS operations at the Test Sites will raise novel privacy issues that are not adequately addressed by existing legal frameworks.

The FAA will require the Test Site operators to comply with the Final Privacy Requirements. Congress mandated that the FAA establish the Test Sites to further UAS integration into the national airspace system. The Final Privacy Requirements advance this purpose by helping inform the dialogue

among policymakers, privacy advocates, and industry regarding the impact of UAS technologies on privacy.

The FAA's authority for including the Final Privacy Requirements in the Test Site OTAs is set forth in 49 U.S.C. 106(l)(6). That statute authorizes the FAA Administrator to enter into an OTA "on such terms and conditions as the Administrator may consider appropriate." The FAA believes that it is appropriate to require Test Site operators to comply with the Final Privacy Requirements.

2) The FAA should require warrants before law enforcement can use UAS in the Test Sites to conduct surveillance or gather evidence.

The FAA received a variety of comments advocating that:

- The FAA should include provisions in the OTA that require warrants to be obtained when UAS are used to conduct surveillance or gather evidence within the Test Site; and
- The OTA include appropriate safeguards to protect Fourth Amendment rights at and around our national borders.

Response: The FAA's mission is to provide the safest, most efficient aerospace system in the world. The FAA is establishing the UAS Test Sites consistent with its mission and the direction in the FMRA. The FAA appreciates the commenters' concerns. Accordingly, the final privacy requirements provide that the Site Operator and its team members must comply with all applicable privacy laws.

3) The FAA should mandate specific privacy requirements for the Test Sites.

The FAA received a variety of comments advocating that the FAA mandate specific privacy requirements for the Test Sites. The recommendations included the following:

- The FAA should specify minimum privacy requirements and require each Test Site to comply with them;
- The FAA should mandate compliance with Fair Information Practice Principles for all Test Site operators;

- The FAA should establish prohibitions on where UAS can operate within a Test Site and the kinds of surveillance activities that UAS conduct at the Test Sites;
- The FAA should require all UAS flown at the Test Sites to have unencrypted down links so that all their data collection can be viewed by the public, including records contained onboard and recovered after landing;
- The FAA should require each Test Site operator to conduct a full Privacy Impact Assessment;
- The FAA should require each Test Site operator to establish a Chief Privacy Officer and centralize privacy responsibilities in that person;
- The FAA should require each Test Site operator to establish a privacy advisory committee to review proposed UAS research at the Test Sites for privacy concerns;
- The FAA should require each Test Site operator to provide a detailed response to public input it receives regarding the Test Site's privacy policy;
- The FAA should prohibit the sharing of recorded surveillance footage beyond the scope of its original purpose;
- The FAA should prohibit UAS in the Test Sites from flying below a minimum altitude;
- The FAA should prohibit UAS in the Test Sites from carrying any equipment that could be used to conduct surveillance;
- The FAA should limit the use of the data collected at the Test Sites;
- The FAA should prohibit (i) the use of Test Sites for government surveillance, and (ii) sharing data collected with law enforcement for the purpose of investigating or prosecuting a crime;

- The FAA should limit the type of data that can be collected by UAS at the Test Sites including limiting the resolution of visual imagery that UAS can collect, prohibiting recording of audio data, and restricting the ability to collect WiFi and cellular signals;
- The FAA should require Test Site operators to provide data on the payload of each UAS flown at the Test Site including specific information on the data the payload is capable of collecting;
- The FAA should mandate privacy policies that require deletion of collected data within a certain time period;
- The FAA should prohibit the Test Site operator and UAS operators at the Test Sites from retaining any data collected longer than is necessary to fulfill the purpose of the Test Site;
- The FAA should require UAS operators to file data collection statements with the FAA for UAS operations that involve remote sensing and signals surveillance from the UAS platform; and
- The FAA should require UAS operating at altitudes over 400 feet to carry an automatic dependent surveillance-broadcast transponder (ADS-B Out) so that UAS operations can be tracked.

Response: The FAA's mission is to provide the safest, most efficient aerospace system in the world. Although there is a long history of placing cameras and other sensors on aircraft for a variety of purposes—news helicopters, aerial surveys, film/television production, law enforcement, etc.—the FAA is not, through awarding and supervising these Test Sites, taking specific views on whether or how the Federal Government should regulate privacy or the scope of data that can be collected by manned or unmanned aircraft.

There was substantial difference of opinion among commenters as to whether UAS operations and manned aircraft operations present different privacy issues that justify imposing special privacy

restrictions on UAS operations at the Test Sites. In addition, there was substantial difference of opinion among commenters regarding what elements would be appropriate for a Test Site privacy policy. Based on the comments received, the FAA will require Test Sites to comply with the following requirements in addition to those described in the Draft Privacy Requirements:

(1) Test site operators must maintain a record of all UAS operating in the test sites;

(2) Test site operators must require every UAS operator in the Test Site to have a written plan for the operator's use and retention of data collected by the UAS; and

(3) Test site operators must conduct an annual review of test site operations to verify compliance with stated privacy policy and practices and share those outcomes annually in a public forum with an opportunity for public feedback.

The above are reflected in the Final Privacy Requirements.

The FAA has determined that it should not impose privacy requirements beyond those in the Final Privacy Requirements for the following reasons. *First*, there are many privacy laws and applications of tort law that may address some of the privacy issues that arise from UAS operations at the Test Sites.

Second, the FAA believes that Test Sites operators will be responsive to local stakeholders' privacy concerns and will develop privacy policies appropriately tailored to each Test Site. The selection criteria for the Test Sites specify that only a "public entity" can serve as a Test Site operator. The term "public entity" is defined in the selection criteria to mean "(A) any State or local government; (B) any department, agency, special purpose district, or other instrumentality of a State or States or local government; and (C) the National Railroad Passenger Corporation, and any commuter authority." The FAA expects that public entities will be responsive to stakeholder concerns.

Third, if UAS operations at a Test Site raise privacy concerns that are not adequately addressed by the Test Site's privacy policies, elected officials can weigh the benefits and costs of additional

privacy laws or regulations. Forty-three states have already enacted or are considering legislation regulating use of UAS. *See* Drone Legislation All the Rage: Varies Widely Across 43 States, According to WestlawNext, June 17, 2013, *available at*: http://thomsonreuters.com/ press-releases/062013/drone_legislation_varies_across_ states_according_to_Westlaw.

4) The FAA should conduct audits of the Test Sites to ensure compliance with privacy policies.

Various commenters recommended that the FAA should audit each Test Site to ensure compliance with the privacy policies in the OTA.

Response: Each Test Site will be operated by a public entity (see response to Category 3 above). The FAA expects that the public entity operating each test site will already be subject to oversight and audit requirements. The FAA does not believe that it is appropriate for the FAA to impose additional audit requirements on the Test Site operators.

5) The FAA should require Test Site operators to keep records that will allow for effective citizen participation and reporting of privacy violations.

One commenter recommended that the FAA require Test Site operators to keep accurate, detailed, frequent, and accessible records to allow for effective citizen participation and reporting of privacy violations.

Response: Each Test Site operator will be a public entity (see response to Category 3 above). Public entities are generally subject to laws that establish record keeping requirements and provide the public access to records. The FAA does not believe that it is appropriate for the FAA to impose additional record keeping requirements on the Test Site operators other than those specified in the Final Privacy Requirements.

6) The FAA should establish a searchable database or registry of UAS operators and operations at the Test Sites.

The FAA received a variety of comments advocating that:

- The FAA should create a public, searchable database or registry of all UAS operators. Some commenters recommended that the database include information about surveillance equipment used and the operator's data collection practices;
- The FAA should require UAS operators at the Test Sites to provide public statements describing the surveillance equipment that will be carried by a UAS, the geographical area where the UAS will be operated, and the purposes for which the UAS will be deployed; and
- The FAA should establish a means for the public to access the data on UAS flights collected by the FAA.

Response: The FAA believes that it is not appropriate for the FAA to create a public registry or database of UAS operations at the Test Sites. However, the FAA has included a contractual provision in the Final Privacy Requirements that will require each Test Site operator to maintain a record of all UAS operating at the Test Site.

7) The FAA should modify its Test Site selection criteria to take into account privacy concerns.

Various commenters recommended that the FAA revise its selection criteria. Suggestions included the following:

- The FAA should choose an applicant that has an established UAS research program with active engagement with UAS privacy issues;
- The FAA should choose at least one Test Site in a state with strong privacy protective UAS laws and regulations;
- The FAA should select one or more Test Sites in or near a densely populated urban area in order to avoid a bias towards privacy issues relevant for rural UAS operations; and

- The FAA should consider the privacy track record of applicants as part of the selection process.

Response: The FAA believes that it is not appropriate to modify the Test Site selection criteria to include the recommended privacy considerations. Applicants have already submitted complete applications based on the announced selection criteria and the application period has closed.

The FAA published the Test Site selection criteria and application instructions on February 14, 2013 on https://faaco.faa.gov under Solicitation number DTFACT-13-R-00002. The selection criteria incorporate the factors that Congress directed the FAA to consider in the FMRA, including, geographic and climatic diversity; location of ground infrastructure; and research needs. The FAA required applicants to submit seven volumes of extensive and detailed information that address a broad set of considerations including safety, airspace use, experience, research objectives, and risk considerations. This information will allow the FAA to make a selection based on the direction provided by Congress in the FMRA and on the FAA's mission.

The FAA developed the Test Site selection criteria after seeking public input and consulting with other agencies regarding what selection criteria would be appropriate. In March 2012, the FAA published a request for comment in the Federal Register and in April 2012, the FAA hosted two public webinars to obtain public input on the FAA's proposed selection criteria. Although there was significant public participation, the FAA did not receive comments advocating that privacy issues be used as a factor in choosing the Test Sites.

8) The FAA should require Test Site operators to conduct specific tests related to privacy and surveillance.

Commenters recommended that the FAA should:

- Require UAS operators at Test Sites to conduct specific tests related to surveillance and privacy;

- Require Test Site operators to design the sites— including the creation of "fake" houses or businesses—to allow UAS operators to test how accurate their surveillance systems are and test how much data those systems collect; and
- Develop and require Test Sites to implement a standard battery of privacy tests that each UAS operating within a Test Site should have to perform in order to collect data that the FAA can use to make decisions about privacy issues.

Response: The FAA is not planning to have the Test Site operators conduct specific research.

9) The FAA should not take punitive actions against a Test Site operator for privacy violations without due process.

One commenter noted that if charges are filed by law enforcement against a Test Site operator due to potential violations of privacy laws, the OTA allows the FAA to suspend or modify the relevant operational authority for a Test Site (e.g. Certificate of Operation, or OTA). That commenter recommended that a Test Site operator be entitled to due process before the operational authority be suspended or modified.

Response: A Test Site operator's rights to operate a Test Site are set forth in the OTA and are subject to the terms and conditions in the OTA. The FAA believes that it is appropriate to include contractual provisions in the Final Privacy Requirements that allow the FAA to protect the public interest by suspending or modifying the relevant operational authority for a Test Site if charges are filed by law enforcement against a Test Site operator due to potential violations of privacy laws.

10) The FAA should establish sanctions for violations of privacy policies or rights.

One commenter recommended that the FAA rescind the OTA for a Test Site where serious privacy violations have occurred and levy fines against operators that fail to comply with privacy policies.

Response: The Final Privacy Requirements provide that violations of privacy laws can result in suspension or termination of the OTA.

The FAA will not monitor a Test Site's compliance with its own privacy policies. The FAA expects the public entities operating the Tests Sites and their respective state/local oversight bodies to monitor and enforce a Test Site's compliance with its own policies.

Conclusion

Based on the comments submitted, the FAA intends to require each test site operator to comply with all of the privacy requirements included in the Draft Privacy Requirements as well as the following additional privacy requirements:

(1) Test site operators must maintain a record of all UAS operating in the test sites;

(2) Test site operators must require every UAS operator in the Test Site to have a written plan for the operator's use and retention of data collected by the UAS; and

(3) Test site operators must conduct an annual review of test site operations to verify compliance with stated privacy policy and practices and share those outcomes annually in a public forum with an opportunity for public feedback.

Accordingly, the FAA intends to include the following terms and conditions into Article 3 of the OTA:

"ARTICLE 3 PRIVACY; APPLICABLE LAW

a. Privacy Policies

The Site Operator must:

(i) Have privacy policies governing all activities conducted under the OTA, including the operation and relevant activities of the UAS authorized by the Site Operator.

(ii) Make its privacy policies publicly available;

(iii) Have a mechanism to receive and consider comments from the public on its privacy policies;

(iv) Conduct an annual review of test site operations to verify compliance with stated privacy policy and practices and share those outcomes annually in a public forum with an opportunity for public feedback;

(v) Update its privacy policies as necessary to remain operationally current and effective; and

(vi) Ensure the requirements of its privacy policies are applied to all operations conducted under the OTA.

The Site Operator's privacy policies should be informed by Fair Information Practice Principles.

b. Compliance With Applicable Privacy Laws

For purposes of this agreement, the term "Applicable Law" shall mean (i) a law, order, regulation, or rule of an administrative or legislative government body with jurisdiction over the matter in question, or (ii) a ruling, order, decision or judgment of a court with jurisdiction over the matter in question.

The Site Operator and its team members must operate in accordance with all Applicable Law regarding the protection of an individual's right to privacy (hereinafter referred to as "Privacy Laws").

If the U.S. Department of Justice or a state's law enforcement authority files criminal or civil charges over a potential violation of a Privacy Law, the FAA may take appropriate action including suspending or modifying the relevant operational authority (e.g., Certificate of Operation, or OTA) until the proceedings are completed. If the proceedings demonstrate the operation was in violation of the Privacy Law, the FAA may terminate the relevant operational authority.

c. Change in Law

If during the term of this Agreement an Applicable Law comes into effect which may have an impact on UAS, including impacts on the privacy interests of individuals or entities affected by any operation of any UAS operating at the Test Site, such Applicable Law will be applicable to the OTA and the FAA may update or amend the OTA to reflect these changes.

d. Transmission of Data to the FAA

The Site Operator should not provide or transmit to the FAA or its designees any data other than the data the data requested by the FAA pursuant to Article 5 of this OTA.

e. Other Requirements

The Site Operator must:

(i) Maintain a record of all UAS operating at the test sites; and

(ii) Require each UAS operator in the Test Site to have a written plan for the operator's use and retention of data collected by the UAS."

Issued in Washington, DC on November 7, 2013.

Marc L. Warren

Acting Chief Counsel, Federal Aviation Administration.

APPENDIX B

INTERNATIONAL ASSOCIATION OF CHIEFS OF POLICE RECOMMENDED GUIDELINES

INTERNATIONAL ASSOCIATION OF CHIEFS OF POLICE
AVIATION COMMITTEE

Recommended Guidelines for the use of Unmanned Aircraft

August 2012

BACKGROUND:

Rapid advances in technology have led to the development and increased use of unmanned aircraft. That technology is now making its way into the hands of law enforcement officers nationwide.

We also live in a culture that is extremely sensitive to the idea of preventing unnecessary government intrusion into any facet of our lives. Personal rights are cherished and legally protected by the Constitution. Despite their proven effectiveness, concerns about privacy threaten to overshadow the benefits this technology promises to bring to public safety. From enhanced officer safety by exposing unseen dangers, to finding those most vulnerable who may have wandered away from their caregivers, the potential benefits are irrefutable. However, privacy concerns are an issue that must be dealt with effectively if a law enforcement agency expects the public to support the use of UA by their police.

The Aviation Committee has been involved in the development of unmanned aircraft policy and regulations for several years. The Committee recommends the following guidelines for use by any law enforcement agency contemplating the use of unmanned aircraft.

DEFINITIONS:

1. **Model Aircraft** - A remote controlled aircraft used by hobbyists, which is manufactured and operated for the purposes of sport, recreation and/or competition.
2. **Unmanned Aircraft (UA)** – An aircraft that is intended to navigate in the air without an on-board pilot. Also called Remote Piloted Aircraft and "drones."
3. **UA Flight Crewmember** - A pilot, visual observer, payload operator or other person assigned duties for a UA for the purpose of flight.
4. **Unmanned Aircraft Pilot** - A person exercising control over an unmanned aircraft during flight.

COMMUNITY ENGAGEMENT:

1. Law enforcement agencies desiring to use UA should first determine how they will use this technology, including the costs and benefits to be gained.
2. The agency should then engage their community early in the planning process, including their governing body and civil liberties advocates.
3. The agency should assure the community that it values the protections provided citizens by the U.S. Constitution. Further, the agency will operate the aircraft in full compliance with the mandates of the Constitution, federal, state and local law governing search and seizure.
4. The community should be provided an opportunity to review and comment on agency procedures as they are being drafted. Where appropriate, recommendations should be considered for adoption in the policy.
5. As with the community, the news media should be brought into the process early in its development.

SYSTEM REQUIREMENTS:

1. The UA should have the ability to capture flight time by individual flight and cumulative over a period of time. The ability to reset the flight time counter should be restricted to a supervisor or administrator.
2. The aircraft itself should be painted in a high visibility paint scheme. This will facilitate line of sight control by the aircraft pilot and allow persons on the ground to monitor the location of the aircraft. This recommendation recognizes that in some cases where officer safety is a concern, such as high risk warrant service, high visibility may not be optimal. However, most situations of this type are conducted covertly and at night. Further, given the ability to observe a large area from an aerial vantage point, it may not be necessary to fly the aircraft directly over the target location.
3. Equipping the aircraft with weapons of any type is strongly discouraged. Given the current state of the technology, the ability to effectively deploy weapons from a small UA is doubtful. Further, public acceptance of airborne use of force is likewise doubtful and could result in unnecessary community resistance to the program.
4. The use of model aircraft, modified with cameras, or other sensors, is discouraged due to concerns over reliability and safety.

OPERATIONAL PROCEDURES:

1. UA operations require a Certificate of Authorization (COA) from the Federal Aviation Administration (FAA). A law enforcement agency contemplating the use of UA should contact the FAA early in the planning process to determine the requirements for obtaining a COA.
2. UA will only be operated by personnel, both pilots and crew members, who have been trained and certified in the operation of the system. All agency personnel with UA responsibilities, including command officers, will be provided training in the policies and procedures governing their use.
3. All flights will be approved by a supervisor and must be for a legitimate public safety mission, training, or demonstration purposes.
4. All flights will be documented on a form designed for that purpose and all flight time shall be accounted for on the form. The reason for the flight and name of the supervisor approving will also be documented.
5. An authorized supervisor/administrator will audit flight documentation at regular intervals. The results of the audit will be documented. Any changes to the flight time counter will be documented.
6. Unauthorized use of a UA will result in strict accountability.
7. Except for those instances where officer safety could be jeopardized, the agency should consider using a "Reverse 911" telephone system to alert those living and working in the vicinity of aircraft operations (if such a system is available). If such a system is not available, the use of patrol car public address systems should be considered. This will not only provide a level of safety should the aircraft make an uncontrolled landing, but citizens may also be able to assist with the incident.
8. Where there are specific and articulable grounds to believe that the UA will collect evidence of criminal wrongdoing and if the UA will intrude upon reasonable expectations of privacy, the agency will secure a search warrant prior to conducting the flight.

IMAGE RETENTION:

1. Unless required as evidence of a crime, as part of an on-going investigation, for training, or required by law, images captured by a UA should not be retained by the agency.
2. Unless exempt by law, retained images should be open for public inspection.

APPENDIX C

ACADEMY OF MODEL AERONAUTICS SAFETY CODES

Academy of Model Aeronautics National Model Aircraft Safety Code

Effective January 1, 2014

A. **GENERAL**: A model aircraft is a non-human-carrying aircraft capable of sustained flight in the atmosphere. It may not exceed limitations of this code and is intended exclusively for sport, recreation, education and/or competition. All model flights must be conducted in accordance with this safety code and any additional rules specific to the flying site.

1. Model aircraft will not be flown:
   (a) In a careless or reckless manner.
   (b) At a location where model aircraft activities are prohibited.
2. Model aircraft pilots will:
   (a) Yield the right of way to all human-carrying aircraft.
   (b) See and avoid all aircraft and a spotter must be used when appropriate. (AMA Document #540-D.)
   (c) Not fly higher than approximately 400 feet above ground level within three (3) miles of an airport without notifying the airport operator.
   (d) Not interfere with operations and traffic patterns at any airport, heliport or seaplane base except where there is a mixed use agreement.
   (e) Not exceed a takeoff weight, including fuel, of 55 pounds unless in compliance with the AMA Large Model Airplane program. (AMA Document 520-A.)
   (f) Ensure the aircraft is identified with the name and address or AMA number of the owner on the inside or affixed to the outside of the model aircraft. (This does not apply to model aircraft flown indoors.)
   (g) Not operate aircraft with metal-blade propellers or with gaseous boosts except for helicopters operated under the provisions of AMA Document #555.
   (h) Not operate model aircraft while under the influence of alcohol or while using any drug that could adversely affect the pilot's ability to safely control the model.
   (i) Not operate model aircraft carrying pyrotechnic devices that explode or burn, or any device which propels a projectile or drops any object that creates a hazard to persons or property.
   Exceptions:
   - Free Flight fuses or devices that burn producing smoke and are securely attached to the model aircraft during flight.
   - Rocket motors (using solid propellant) up to a G-series size may be used provided they remain attached to the model during flight. Model rockets may be flown in accordance with the National Model Rocketry Safety Code but may not be launched from model aircraft.
   - Officially designated AMA Air Show Teams (AST) are authorized to use devices and practices as defined within the Team AMA Program Document. (AMA Document #718.)

   (j) Not operate a turbine-powered aircraft, unless in compliance with the AMA turbine regulations. (AMA Document #510-A.)
3. Model aircraft will not be flown in AMA sanctioned events, air shows or model demonstrations unless:
   (a) The aircraft, control system and pilot skills have successfully demonstrated all maneuvers intended or anticipated prior to the specific event.
   (b) An inexperienced pilot is assisted by an experienced pilot.
4. When and where required by rule, helmets must be properly worn and fastened. They must be OSHA, DOT, ANSI, SNELL or NOCSAE approved or comply with comparable standards.

B. **RADIO CONTROL (RC)**

1. All pilots shall avoid flying directly over unprotected people, vessels, vehicles or structures and shall avoid endangerment of life and property of others.
2. A successful radio equipment ground-range check in accordance with manufacturer's recommendations will be completed before the first flight of a new or repaired model aircraft.
3. At all flying sites a safety line(s) must be established in front of which all flying takes place. (AMA Document #706.)
   (a) Only personnel associated with flying the model aircraft are allowed at or in front of the safety line.
   (b) At air shows or demonstrations, a straight safety line must be established.
   (c) An area away from the safety line must be maintained for spectators.
   (d) Intentional flying behind the safety line is prohibited.
4. RC model aircraft must use the radio-control frequencies currently allowed by the Federal Communications Commission (FCC). Only individuals properly licensed by the FCC are authorized to operate equipment on Amateur Band frequencies.
5. RC model aircraft will not knowingly operate within three (3) miles of any pre-existing flying site without a frequency-management agreement. (AMA Documents #922 and #923.)
6. With the exception of events flown under official AMA Competition Regulations, excluding takeoff and landing, no powered model may be flown outdoors closer than 25 feet to any individual, except for the pilot and the pilot's helper(s) located at the flightline.
7. Under no circumstances may a pilot or other person touch an outdoor model aircraft in flight while it is still under power, except to divert it from striking an individual.
8. RC night flying requires a lighting system providing the pilot with a clear view of the model's attitude and orientation at all times. Hand-held illumination systems are inadequate for night flying operations.
9. The pilot of an RC model aircraft shall:
   (a) Maintain control during the entire flight, maintaining visual contact without enhancement other than by corrective lenses prescribed for the pilot.
   (b) Fly using the assistance of a camera or First-Person View (FPV) only in accordance with the procedures outlined in AMA Document #550.
   (c) Fly using the assistance of autopilot or stabilization system only in accordance with the procedures outlined in AMA Document #560.

C. **FREE FLIGHT**

1. Must be at least 100 feet downwind of spectators and automobile parking when the model aircraft is launched.
2. Launch area must be clear of all individuals except mechanics, officials, and other fliers.
3. An effective device will be used to extinguish any fuse on the model aircraft after the fuse has completed its function.

D. **CONTROL LINE**

1. The complete control system (including the safety thong where applicable) must have an inspection and pull test prior to flying.
2. The pull test will be in accordance with the current Competition Regulations for the applicable model aircraft category.
3. Model aircraft not fitting a specific category shall use those pull-test requirements as indicated for Control Line Precision Aerobatics.
4. The flying area must be clear of all utility wires or poles and a model aircraft will not be flown closer than 50 feet to any above-ground electric utility lines.
5. The flying area must be clear of all nonessential participants and spectators before the engine is started.

Academy of Model Aeronautics **AMA Document #550**

Radio Controlled Model Aircraft Operation
Utilizing "First Person View" Systems

1. DEFINITION OF TERMS:

Please refer to Page 3, section 7 which contains an alphabetical listing of the definitions of the terms in italics that are used in this document.

2. GENERAL:

FPV flying of radio control model aircraft by AMA members is allowed only for noncommercial purposes as a hobby/recreational and/or competition activity and must be conducted in accordance with AMA's current National Model Aircraft Safety Code and any additional rules specific to a flying site/location.

3. OPERATIONS – REQUIREMENTS – LIMITATIONS:

a) AMA *FPV novice pilots* must use a buddy-box system with an *FPV spotter* while learning to fly *FPV*.

b) All *FPV* flights require an AMA *FPV pilot* to have an AMA *FPV spotter* next to him/her maintaining *VLOS* with the *FPV aircraft* throughout its flight.

c) The *FPV pilot* must brief the *FPV spotter* on the *FPV spotter's* duties, communications and hand-over control procedures before *FPV flight*.

d) The AMA *FPV spotter* must communicate with the *FPV pilot* to ensure the *FPV aircraft* remains within *VLOS*, warning the *FPV pilot* of approaching aircraft, and when avoidance techniques are necessary.

e) During an FPV flight, the FPV spotter must be prepared to acquire the transmitter/control from the FPV pilot and assume VLOS control of the model aircraft any time safe operation of the flight is in question.

f) If the *FPV pilot* experiences a problem due to a loss of video link, orientation, or is unable to safely fly, he/she must abandon *FPV* mode and fly *VLOS* or pass the RC transmitter to the *FPV spotter* to assume *VLOS* control of the model aircraft.

g) Before the initial *FPV* flight of an *FPV model aircraft* and/or after any changes or repairs *to essential flight systems*, the *FPV model aircraft* must have an *R/C test flight* by conventional *VLOS*.

h) *FPV model aircraft* must use frequencies approved by the FCC for both the RC system and the wireless video system. Pilots must meet applicable FCC licensing requirements if they choose to operate the RC flight control system or the wireless video system on Amateur Band frequencies.

4. RANGE – ALTITUDE – WEIGHT – SPEED:

a) One of the requirements in Federal Law (Public Law 112-95 Sec 336 (c) (2) February 14, 2012) for model aircraft to be excluded from FAA regulations is that model aircraft must be flown within *VLOS* of the operator.

b) Model aircraft flown using *FPV* must remain at or below 400 feet AGL when within 3 miles of an airport as specified in the AMA Safety Code.

c) Model aircraft flown *FPV* are limited to a weight (including fuel, batteries, and onboard *FPV* equipment) of 15lbs. and a speed of 70mph.

5. RECOMMENDATIONS & INFORMATION:

a) AMA *FPV novice pilots* should consider using a cockpit view flight simulator to become accustomed to *FPV* flight.

b) AMA *FPV pilots* should consider using a programmable *autopilot* (AMA Document #560) with a failsafe "return to launch" (RTL) feature that will maintain control of the aircraft in the event of signal loss.

c) An onboard camera equipped with a pan and tilt mount that is positioned by head tracking goggles, will improve the *FPV pilot's* situational awareness of airspace surrounding the *FPV aircraft* during flight, but does not replace the requirement for an AMA *FPV spotter*.

d) When purchasing *FPV* operational systems, always try to select quality equipment, verify its compatibility, install components for interference rejection, and determine that signal range is adequate for maximum VLOS range.

6. PRIVACY PROTECTION SAFEGUARDS:

The use of imaging technology for aerial surveillance with radio control model aircraft having the capability of obtaining high-resolution photographs and/or video, or using any types of sensors, for the collection, retention, or dissemination of surveillance data information on individuals, homes, businesses, or property at locations where there is a reasonable expectation of privacy is strictly prohibited by the AMA unless written expressed permission is obtained from the individual property owners or managers.

7. DEFINITIONS OF TERMS:

AMA FPV Pilot is an AMA member who is capable of maintaining stable flight of a model aircraft within its intended flight envelope when flown FPV without losing control or having a collision.

Buddy-Box System is a system that has one transmitter operating as the master controller, while a second transmitter is linked/slaved to it allowing dual control of an aircraft. The operator of the master transmitter allows one or the other transmitter to control the aircraft through the use of a spring-loaded switch. The switch provides instantaneous transfer of control from one transmitter to the other. The buddy-box system is an efficient and effective means of achieving a position transfer of control from one pilot to another. Although this system is commonly used for training novice fliers, it is also useful in situations where an experienced pilot may have an increased likelihood of needing a second pilot's assistance in maintaining control of the aircraft. The use of the buddy-box may be helpful in assisting pilots with physical limitations, flying in congested environments, during times of reduced visibility, or anytime during FPV when a timely transfer of control may be beneficial.

Essential Flight Systems are any systems or components necessary to maintain stable flight within a model aircraft's flight envelope. (This includes primary radio control systems and any stabilization or gyros required to maintain stability and heading in certain types of model aircraft that would be uncontrollable/unstable without their use).

First Person View (FPV) refers to the operation of a radio controlled (R/C) model aircraft using an onboard camera's cockpit view to orient and control the aircraft.

Flight Envelope is defined as the range of airspeeds, attitudes, and flight maneuvers which a model aircraft can safely perform/operate for its intended use.

FPV Aircraft is an RC model aircraft equipped with a video transmitter to send real-time video images from an onboard camera to a ground based receiver for display on a pilot's video monitor/goggles. (*FPV model aircraft* types include: Fixed Wing, Rotary Wing, and Multi-Rotor Platforms).

FPV Novice Pilot is an AMA member learning to fly *FPV* utilizing a buddy-box system with an experienced AMA *RC pilot* operating the master transmitter and serving as the *FPV spotter*.

FPV Spotter is an experienced AMA *RC pilot* who has been briefed by the *FPV pilot* on the tasks, responsibilities and procedures involved in being a spotter; is capable and mature enough to perform the duties and is able to assume conventional *VLOS* control of the aircraft.

Non-Essential Flight Systems are any systems or components that are not necessary to maintain stable flight within the model aircraft's *flight envelope*. (This includes *autopilot* or *stabilization systems* that can be activated and deactivated in flight by the pilot without affecting stable flight).

R/C Test Flight requires an *AMA Pilot* to manually operate an R/C transmitter to control a model aircraft's flight path and determine if the aircraft is capable of maintaining stable flight within its *flight envelope*.

Visual Line Of Sight (VLOS) is the distance at which the pilot is able to maintain visual

contact with the aircraft and determine its orientation without enhancements other than corrective lenses.

Radio Controlled Model Aircraft Operation Utilizing Failsafe, Stabilization and Autopilot Systems

1. DEFINITION OF TERMS:

Please refer to Page 3, section 7 which contains an alphabetical listing of the definitions of the terms in italics that are used in this document.

2. GENERAL:

All model aircraft flights utilizing *stabilization* and *autopilot* control systems must be conducted in accordance with AMA's current National Model Aircraft Safety Code and any additional rules specific to a flying site/location.

3. OPERATIONS – REQUIREMENTS – LIMITATIONS:

a) AMA members flying radio controlled model aircraft equipped with flight *stabilization* and *autopilot* systems must maintain *VLOS* with the aircraft at all times including programmed autopilot waypoint flight.

b) *AMA Pilots* must be able to instantaneously deactivate programmed flight of *autopilot systems* at any time during flight and resume manual control of the model aircraft.

c) *AMA Pilots* must perform an *R/C Test Flight* of a model aircraft before activating a newly installed *autopilot* or *stabilization system* and/or after any repairs or replacement of model aircraft *essential flight systems*.

d) Model aircraft exceeding 15lbs and/or 70mph may only use an *autopilot* for a programmed "return to launch" (RTL) flight and not for programmed waypoint flying of a predetermined course.

e) STABILIZATION & AUTOPILOT SYSTEMS MAY BE USED FOR/TO:

- Stabilization/automatically stabilize aircraft to level flight when control sticks are centered.
- Recovery/activate TRX switch to recover an out of control aircraft to level flight.
- Heading/activate TRX switch to hold a model aircraft's heading for precision flight path.
- Altitude/activate TRX switch to maintain fixed aircraft altitude while allowing directional control.
- Return GPS/activate TRX switch to return aircraft via GPS to launch point.
- Return FSS/failsafe activated from radio signal loss to return aircraft via GPS to launch point.
- Fixed circle/activate TRX switch to circle aircraft at point of activation at fixed altitude.
- Waypoint/activate TRX switch to initiate an autopilot programmed flight path via waypoints.
- Fencing/autopilot programed to display site unique boundaries on video monitor/goggles.

4. RANGE – ALTITUDE – WEIGHT – SPEED:

a) One of the requirements in Federal Law (Public Law 112-95 Sec 336 (c) (2) February 14, 2012) for model aircraft to be excluded from FAA regulations is that model aircraft be flown within *VLOS* of the operator.

b) Model aircraft must be flown at or below 400 feet AGL when within 3 miles of an airport as stated in the AMA Safety Code.

c) Model aircraft utilizing an *autopilot* for waypoint flying are limited to a maximum weight (including fuel, batteries, and onboard *autopilot systems*) of 15lbs and a speed of 70mph.

5. RECOMMENDATIONS & INFORMATION:

a) If your radio system lacks *failsafe* capability, consider using programmable digital servos or auxiliary *failsafe* modules. In the event of a radio signal failure these components will activate desired safe servo settings or an *autopilot* for return to base/launch (RTL).

b) When using an *autopilot system* the "return to launch" (RTL) feature should be programmed to return the aircraft to a safe location and safely terminate the flight should manual control of the aircraft be lost. When using RTL, pay particular attention to the manufacturer's throttle recommendations to prevent stalling.

c) The use of *stabilization systems* is recommended when flying FPV to improve flight stability and video quality.

d) Pilots usually choose to incorporate *stabilization* and *autopilot systems* for model aircraft flying to enhance flight performance, correct bad tendencies of the model aircraft, maintain stability in windy weather, establish precision heading holds for takeoffs/landings, flight training for novice pilots, create a steady flight platform for cameras, and generally just to make an airplane easier and safer to fly.

e) When purchasing *stabilization* and *autopilot systems*, always try to select quality equipment from reputable dealers, ensure for compatibility with other onboard systems, and install components according to manufacturers' instructions.

6. PRIVACY PROTECTION SAFEGUARDS:

The use of imaging technology for aerial surveillance with radio control model aircraft having the capability of obtaining high-resolution photographs and/or video, or using any types of sensors, for the collection, retention, or dissemination of surveillance data or information on individuals, homes, businesses, or property at locations where there is a reasonable expectation of privacy is strictly prohibited by the AMA unless written expressed permission is obtained from the individual property owners or managers.

7. DEFINITIONS OF TERMS:

AMA Pilot is an AMA member who is capable of manually operating an R/C transmitter to control a model aircraft's flight path within its safe intended *flight envelope* without losing control or having a collision.

Autopilot Systems incorporate programmable flight *stabilization* with an altitude sensor and a GPS receiver for accurate positioning and to navigate/control a radio controlled model aircraft's flight path. Advanced systems offer software for entering navigable waypoints. The flight data waypoints may be saved to autopilot's/GPS memory for programmed flight.

Essential Flight Systems are any systems or components necessary to maintain stable flight within a model aircraft's *flight envelope*. (This includes primary R/C systems and any *stabilization* or gyros required to maintain stability and heading in certain types of model aircraft that would be uncontrollable/unstable without their use).

Failsafe Systems are designed to minimize or prevent damage and safely terminate a flight when a radio controlled model aircraft loses radio signal. Modern radio systems can be programmed to position servos to a desired control setting in the event of radio signal failure.

First Person View (FPV) refers to the operation of a radio controlled (R/C) model aircraft using an onboard camera's cockpit view to orient and control the aircraft. (AMA Document #550).

Flight Envelope is defined as the range of airspeeds, attitudes and flight maneuvers which a model aircraft can safely perform/operate for its intended use.

Non-Essential Flight Systems are any systems or components that are not necessary to maintain stable flight within the model aircraft's intended flight envelope. (This includes *autopilot* or *stabilization systems* that can be activated and deactivated in flight by the pilot without affecting manually controlled stable flight).

R/C Test Flight requires an AMA Pilot to manually operate an R/C transmitter to control a model aircraft's flight path and determine if the aircraft is capable of maintaining stable flight within its safe intended *flight envelope*.

Stabilization Systems are designed to maintain intended model aircraft flight attitudes. The pilot can install, program and/or activate a system to stabilize yaw, pitch, or roll or any one attitude or combination of attitudes. Systems are often based on rate/heading hold gyros or inertial motion sensors utilizing multi-axis gyros and accelerometers for attitude stabilization.

Visual Line of Sight (VLOS) is the distance at which the pilot is able to maintain visual contact with the aircraft and determine its orientation and attitude without enhancements other than corrective lenses.

MEMORANDUM September 30, 2013

SUBJECT: Alaska Laws Protecting Privacy
(Work Order No. 28-LS0990)

TO: Representative Shelley Hughes
Attn: Ginger Blaisdell

FROM: Kathleen Strasbaugh
Legislative Counsel

You have asked for a review of Alaska's laws protecting individual privacy in preparation for a meeting of the Task Force on Unmanned Aircraft Systems. Among the Task Force's duties is providing written recommendations concerning, among other things, a state policy that protects privacy. 2013 Legislative Resolve No. 17 at 3. To that end, as I understand from Ms. Blaisdell, you would like to know what protections might already exist, with a view toward avoiding duplication of existing law. The Task Force has apparently expressed concern about how information gathered by unmanned aircraft could be used by private or public parties, and what use might be made of such information captured inadvertently.

This memo will outline constitutionally based protections of privacy and identify state statutes that might apply to conduct considered invasion of privacy. As you requested, this memo focuses on the protections afforded under Alaska law. A brief discussion of emerging federal law is included, but I haven't explored other states' case law, nor lower federal court cases that consider these issues. However, I have attached an excerpt of an *Alaska Law Review* which summarizes Alaska's privacy law as it has developed independently of federal constitutional law. I have also attached a recent *Harvard Law Review* article that specifically addresses this topic in great detail. The memo also briefly addresses scenarios set out in your request. Please note that it is very difficult to predict the outcome of litigation in this very new intersection of technology and privacy law.

1. Constitutional Protection of Privacy

The Constitution of the State of Alaska explicitly protects the right of privacy against government (but not private) intrusion. Art. I, sec. 22, provides:

> The right of the people to privacy is recognized and shall not be infringed. The legislature shall implement this section.

This protection, although not unlimited, has been held to be broader than the protection afforded by the United States Constitution. *Woods & Rohde, Inc. v. State, Department of Labor*, 565 P.2d 138, 149 (Alaska 1977).[1] Both the Alaska Constitution and the Fourth Amendment to the United States Constitution require a warrant by a governmental agency for the search of a place where a person has a reasonable expectation of privacy. *Beltz v. State*, 221 P.3d 328, 333, 337 (Alaska 2009) (search of garbage placed out on the street for collection did not require warrant; expectation of privacy found not reasonable.)

Neither the Alaska Supreme Court nor the United States Supreme Court has ruled on whether surveillance by a government operated unmanned aerial vehicle is a search under the Fourth Amendment. Based on available precedent, it is possible that the courts will decide that the use of an unmanned aerial vehicle constitutes a search requiring either a warrant, or the application of a recognized exception to the warrant requirement.

The United States Supreme Court has considered law enforcement or other government agency use of aerial surveillance and the use of technological devices for surveillance purposes. The Court found that surveillance by manned aircraft is not an intrusion into a private area that renders an overflight a search under the Fourth Amendment to the United States Constitution; however the placement of a global positioning device on a person's vehicle is an intrusion that constitutes a search. Here is a brief summary of some of these cases: *United States v. Jones*, 565 U.S. ___, 132 S.Ct. 945 (2012): Attachment of global positioning device to automobile parked in public place is a search under the Fourth Amendment.

Dow Chemical Co. v. United States, 476 U.S. 227 (1986) EPA aerial surveillance and photography of chemical plant is not a search where the aircraft was manned and operating at a lawful altitude.

California v. Ciraolo, 476 U.S. 207 (1986) Manned aerial surveillance of a backyard marijuana grow at lawful altitude did not violate the Fourth Amendment.

The Court might find the use of a technology that exceeds human observational capacity the sort of intrusion that constitutes a search requiring a warrant or an accepted exception:

> Where, as here, the Government uses a device that is not in general public use, to explore details of the home that would previously have been unknowable without physical intrusion, the surveillance is a "search" and is presumptively unreasonable without a warrant.

Kyllo v. United States, 533 U.S. 27, 40 (2001) (internal citations omitted) (thermal

---

[1] In Alaska, the right to privacy extends to protection of such activities as possession and use of marijuana in the home by an adult, which, while not a fundamental right, is protected because such possession and use does not implicate the public welfare in the manner that more harmful substances, or public ingestion, or use by minors might. *Ravin v. State*, 537 P.2d 494, 508-09 (Alaska 1975).

imaging of home from outside a search under the Fourth Amendment).

2. Alaska Statutory protections

There are a handful of criminal statutes that may apply to improper use of images obtained from unmanned aerial vehicle surveillance. These statutes would seem to apply for the most part to private actors. These are offenses that punish conduct that invades the privacy of a victim, and would require proof that images gathered by the unmanned aerial vehicle were disseminated. These offenses would probably not punish capturing the images inadvertently, although collecting and storing them might be a concern.

Alaska Statute	Charge	Penalty
11.41.270	Stalking in the second degree: nonconsensual conduct prohibited by statute prohibits monitoring by technical means.	Class A misdemeanor[2]
11.61.116	Sending an explicit image of a minor.	(1) class B misdemeanor if the person distributes the image to another person;[3] (2) a class A misdemeanor if the person distributes the image to an Internet website that is accessible to the public.
11.61.120(a)(6)	Harassment in the second degree: publishing or distributing images that show certain body parts or a sexual act.	Class B misdemeanor

[2] A class A misdemeanor is punishable by a fine of up to $10,000, and a sentence of imprisonment up to one year.

[3] A class B misdemeanor is punishable by a fine of up to $2,000, and a sentence of imprisonment up to 90 days.

11.61.123	Indecent viewing or photography (with certain law enforcement and security surveillance exceptions).	(1) class C felony if the person viewed or shown in a picture was, at the time of the viewing or production of the picture, a minor;[4] (2) class A misdemeanor if the person viewed or shown in the picture was, at the time of viewing or production of the picture, an adult.
11.76.113	Misconduct involving confidential information in the first degree: use of confidential information to commit a crime or obtain a benefit to which the person is not entitled to injure another, or deprive another of a benefit.	Class A misdemeanor
11.76.115	Misconduct involving confidential information in the second degree: knowingly and without legal authority obtaining confidential information about another.	Class B misdemeanor

In addition to the above criminal offenses, there are other provisions of law that might bear on the information obtained from data gathered by an unmanned aerial vehicles.

If the data is gathered by a government agency, it is a public record. However, AS 40.25.120 provides certain protections for private information. AS 40.25.120(a)(4) excepts records required by law to be kept confidential. *See Falcon v. APOC*, 570 P.2d 469 (Alaska 1977) (physician not required to disclose identity of certain patients to Alaska Public Offices Commission where the disclosure of the patients' identities might disclose the fact that they were being treated for conditions that patients would normally keep private); *Alaska Wildlife Alliance v. Rue*, 948 P.2d 976 (Alaska 1997) (payroll information may be kept private where disclosure might endanger employees or contractors, where those employees and contractors were threatened with harm). AS 40.25.120(a)(6)(C) protects information gathered by law enforcement the disclosure of which "could reasonably be expected to constitute an unwarranted invasion of the personal privacy of a suspect, defendant, victim, or witness."

---

[4] A Class C felony is punishable by a fine of up to $50,000, and a sentence of imprisonment up to five years. Presumptive sentences based on whether the offense is a first or subsequent offense are set out at AS 12.55.155(e).

There may be civil liability for obtaining (and subsequently misappropriating) information on trade secrets or patented processes. *See, generally.* AS 45.50.

In addition, a person who is subject to surveillance that is unreasonable or unlawful could sue for the tort of invasion of privacy. *Compare Wal-Mart v. Stewart*, 990 P.2d 626, 634 (Alaska 1999) (daily search of employee's bags held an unreasonable invasion of privacy where not part of a random, nondiscriminatory policy, and where the employee feared that refusing the search might result in others suspecting him of theft, or result in a police call or firing).

3. Particular scenarios

Inadvertent capture of evidence of illegal activity. Use of inadvertently captured information in a criminal prosecution may depend on who captures the information, and whether the person whose actions have been captured has a reasonable expectation of privacy. One of the scenarios mentioned in your request is the capture of evidence of poaching. Assuming that the poacher is a person taking game on property that is not the poacher's own, the poacher cannot reasonably expect privacy when present on another's land without authority.

If a law enforcement agency sends out an unmanned aerial vehicle for patrolling or surveillance, perhaps to look for illegal cultivation of marijuana or manufacture of methamphetamine on public land, and in the course of doing so, captures evidence of an industrial sized marijuana grow operation on private land, it might provide grounds to obtain a warrant to explore further.[5] Under Alaska law, if the observation of the event is lawful or in "plain view," the discovery inadvertent, and the incriminating nature of the evidence immediately apparent, a warrant might not be required. *Ahvakana v. State*, 283 P.3d 1284, 1288 (Alaska Ct. App. 2012) (entry into property where evidence found was authorized under the emergency aid exception to the warrant requirement). However, since the vehicle is not manned, the federal authorities discussed above suggest that the information might not be considered to be lawfully obtained unless some other exception to the requirement of a warrant is present. It is not clear to me whether and under what circumstances a court might grant a search warrant to follow up on information inadvertently obtained, but not in "plain view."

It is possible that the inadvertent capture of information that might otherwise be inadmissible under the exclusionary rule that bars admission of evidence obtained in violation of the United States Constitution will be treated as a good faith exception under *United States v. Leon*, 468 U.S. 897(1984). In *Leon*, the United States Supreme Court held that the Fourth Amendment exclusionary rule should not be applied so as to bar the use of evidence obtained by officers acting in reasonable reliance on a search warrant

---

[5] *But see State v. Crocker*, 97 P.3d 93 (Alaska Ct. App. 2004) holding that because the application for the warrant did not affirmatively disclose information that the marijuana cultivation was beyond what was permitted under *Ravin*, there was no probable cause for a warrant.

issued by a detached and neutral magistrate but ultimately found to be invalid. A court could determine that information inadvertently captured in otherwise lawful surveillance is likewise a good faith exception. However, Alaska's appellate courts have not decided whether to adopt this exception. *Deemer v. State*, 244 P.3d 69, 72 (Alaska Ct. App. 2010). Thus it is impossible to predict the outcome of litigation on this subject under Alaska law, and it is not at all clear, given the federal case law developments discussed elsewhere in this memorandum, that the United States Supreme Court would apply the exception in a situation where there was no warrant.

Person intentionally gathers private information for personal use or distribution. A number of the criminal charges listed above might be available. In addition, if the images obtained are used in child pornography, a number of federal and state criminal statutes might apply.

Please advise if you require further assistance in this matter.

Executive Summary

Purpose and Scope

In March 2013, the University of Alaska Fairbanks Center for Unmanned Aircraft Systems contracted with McDowell Group to analyze the economic conditions for unmanned aircraft systems (UASs) in Alaska and measure the projected economic impact of developing a Federal Aviation Administration (FAA) test site for UAS in Alaska. The economic impact assessment (EIA) in this report provides annual projections of the direct, indirect, and induced impacts to employment and wages as well as projections of output and value added related to the test site, called the Pan-Pacific UAS Test Range Complex (PPUTRC) – with test ranges located in Alaska, Hawaii, and Oregon. The EIA focuses on the additional economic activity that is expected in response to the PPUTRC test site selection. Additional information is provided in this report on the economic impact of the commercialization of UAS specifically in Alaska once UAS flights are allowed in the National Airspace System (NAS).

Summary

- UAS represent a new industry that is set to quickly grow once new government regulations increase access to designated test sites and then to the National Airspace System (NAS), the system of air traffic control that enables safe and efficient flight activity in the U.S.
- UAS applications are far reaching for civilian and military purposes; ranging from environmental monitoring to search and rescue to pipeline or powerline inspections.
- The FAA has limited the authorized use of UASs in the U.S. to efforts focused on the public interest. There are currently two ways to operate a UAS with the approval of the FAA (both of these options require that the flight takes place outside of densely-populated areas):
    - Certificate of Waiver or Authorization (COA) for public UAS
    - Special airworthiness certificate for private sector (civil) UAS
- However, the FAA is scheduled to designate six UAS test sites in the U.S., as required under the FAA Modernization and Reform Act of 2012. The sites will operate from January of 2014 to February 13, 2017 to provide opportunities for government agencies, industry, and researchers to access this airspace to aid in the integration of UASs in the NAS.
- According to the Association of Unmanned Vehicle Systems International (AUVSI), integration of UASs into the NAS will generate some $82 billion in activity in the U.S. between 2015 and 2025; employment impacts are estimated at just over 100,000 jobs by 2025.

- In an effort to bring additional UAS activity and related economic benefits to Alaska, UAF is leading the PPUTRC Test Site application process for 13 ranges in Alaska, Hawaii, and Oregon.
- Existing UAS activity in Alaska, Hawaii, and Oregon benefits from unique assets and opportunities, including government facilities (e.g. numerous military bases, universities, and maritime assets), wide-open airspace in largely unpopulated areas, and geographic diversity (e.g. tropical to arctic climates, oceanic or mountainous landscapes, and up/down weather fronts).
- In total, designation of PPUTRC as a UAS test site would be expected to generate 1,065 direct, indirect and induced jobs in 2014, increasing to over 1,400 jobs by 2017. Total labor income would climb from $57 million in 2014 to about $76 million in 2017.
- Output in the PPUTRC states attributable to test site designation would climb from $265 million in 2014 to $333 million in 2017.
- Value added would climb from $109 million to $134 million over the same period.
- Designation of the PPUTRC will provide a four-year total of $20 million of income tax revenue to Hawaii and Oregon.

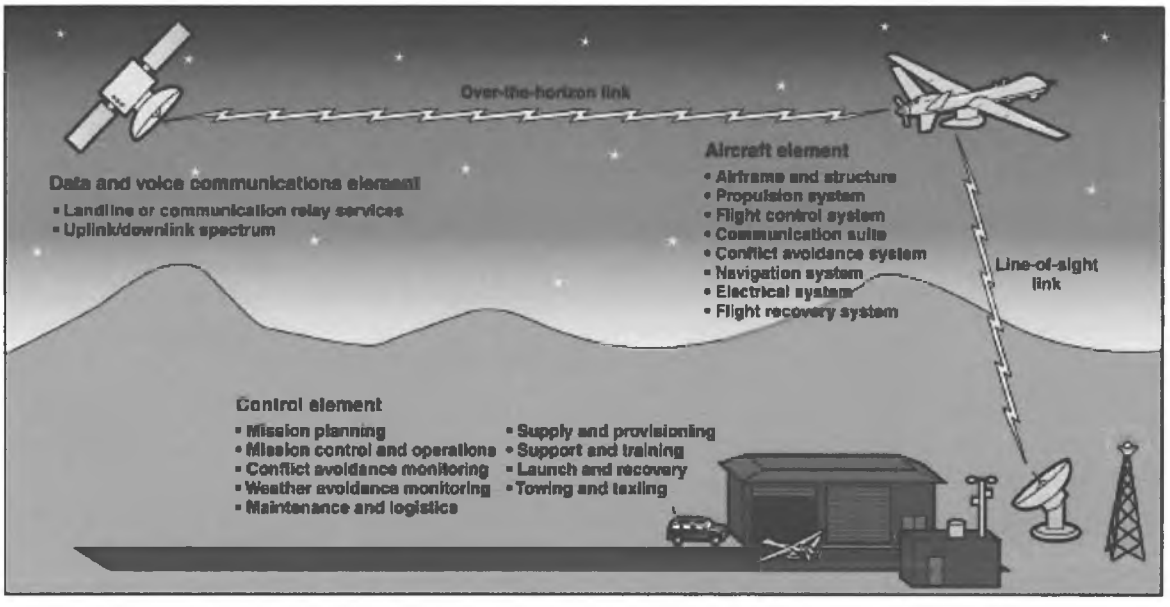
Chapter 1. Unmanned Aircraft Systems in the United States and the NAS

Background

Unmanned aerial vehicles (UAVs) were first described in the late-19th century. Early attempts to develop these UAVs, mostly for combat purposes, soon followed. These remotely piloted vehicles first entered U.S. combat in the mid-20th century to support missions focused on reconnaissance and surveillance, and sometimes they were also used as decoys. Throughout most of the 20th century UAVs lacked real-time data capability and instead focused on collecting images and video for surveillances purposes. Widespread adoption of the technology for U.S. military purposes did not begin until the 1990s and, to a much greater extent, the 2000s during the Afghanistan and Iraq conflicts. It was at this point that technological innovations related to onboard sensors, communication links, and data collection began drastically increasing the potential domestic uses of unmanned aircraft systems.

The increase in complexity for the UAVs required a systems approach to appropriately understand the interactions - and design each component from the start as an integratedsystem - among the on-the-ground control elements, the aircraft, and the communication links. This broader operational perspective is termed "unmanned aircraft system" (UAS). The image below provides a conceptual rendering of the interactions among key elements of a UAS flight.

Figure 1: Conceptual Rendering of an Unmanned Aircraft System



Source: GAO, 2013

UAS Applications

Unmanned aircraft often provide advantages in comparison to manned aircraft. For instance, flights that are dangerous or covert represent potential opportunities where an unmanned vehicle might be preferred over a manned vehicle. Similarly, dull tasks such as extended surveillance missions may be better suited for ground-based operators that can be relieved at the end of their shift. UAVs are often more fuel efficient, quieter, and less disruptive to their surroundings (in comparison to manned aircrafts) and, thus, can allow for fewer environmental disturbances as well as more accurate research results. Finally, initial costs, operating costs (e.g. maintenance costs, fuel costs, storage costs, etc.), and labor costs (e.g. wages, insurances, etc.) are all generally lower for UAVs (Source: Austin, 2010). UASs have already been shown to lead to arrests as well as saving lives during search and rescue missions (Source: The Verge, 2013).

The existing and potential applications for UASs are wide ranging for both civilian uses as well as for military purposes. The lists below provide an abbreviated look at how important this relatively new field may become to sectors throughout Alaska's economy (Source: Austin, 2010):

Civilian

- Aerial Photography - Film, video, stills, etc.
- Agriculture - Crop monitoring and spraying; herd monitoring and driving
- Coastguard – Search and rescue, coastline, and sea-lane monitoring
- Conservation – Pollution and land monitoring
- Customs and Excise – Surveillance for illegal imports
- Electricity Companies – Powerline inspection
- Fire Services and Forestry – Fire detection, incident control
- Fisheries – Fisheries protection
- Gas and Oil Supply Companies – Land survey and pipeline security
- Information Services – News information and pictures, feature pictures (e.g. wildlife)
- Lifeboat Institutions – Incident investigation, guidance, and control
- Local Authorities – Survey, disaster control
- Meteorological Services – Sampling and analysis of atmosphere for forecasting, etc.
- Oil Companies – Pipeline security
- Ordinance Survey – Aerial photography for mapping
- Police Authorities – Search for missing persons, security and incident surveillance
- Rivers Authorities –Water course and level monitoring, flood and pollution control
- Survey Organizations – Geographical, geological, and archaeological survey
- Traffic Agencies – Monitoring and control of road traffic
- Water Boards – Reservoir and pipeline monitoring

Military

- Navy
    - Shadowing enemy fleets

    - Decoying missiles by the emission of artificial signatures
    - Electron intelligence
    - Relaying radio signals
    - Protection of ports from offshore attack
    - Placement and monitoring of sonar buoys and possibly other forms of anti-submarine warfare
- Army
    - Reconnaissance
    - Surveillance of enemy activity
    - Monitoring of nuclear, biological, or chemical (NBC) contamination
    - Electronic intelligence
    - Target designation and monitoring
    - Location and destruction of land mines
- Air Force
    - Long-range, high-altitude surveillance
    - Radar system jamming and destruction
    - Electronic intelligence
    - Airfield base security
    - Airfield damage assessment
    - Elimination of unexploded bombs

UAS Categories

UASs are typically categorized based on the size or capability of the UAV. The five categories below provide a common categorization of UAS that helps simplify requirement assessments and costing estimates (Source: Teal Group, 2008):

- Micro or Mini – A small UAV that ranges in size from something that can be held in the palm of the hand to a UAV that can be carried on your back and launched by hand.
- Naval – A tactical UAV is generally operated with simpler systems over a radius between 100 and 300 km.
- Tactical – A reconnaissance UAV used by the Army for endurance missions ranging several hours over an operating radius up to 200 km.
- MALE – Medium Altitude Long Endurance reconnaissance UAVs fly between 5,000 and 15,000 meters in altitude for approximately 24 hours.
- HALE – High Altitude Long Endurance reconnaissance and surveillance UAVs are usually operated by Air Forces at altitudes over 15,000 meters for periods longer than 24 hours.

National Airspace System

The NAS was developed to allow for safe and efficient commercial aviation. However, commercial UAS flights are currently not allowed in the NAS due to concerns over (1) "the inability to detect, sense, and avoid other aircraft and airborne objects in a manner similar to 'see and avoid' by a pilot in a manned aircraft, (2) vulnerabilities in the command and control of UAS operations, (3) the lack of technological and operational standards needed to guide the safe and consistent performance of UAS, and (4) the lack of final regulations to accelerate the safe integration of UAS into the national airspace" (Source: U.S. GAO, 2012 and Waggoner, 2013).

The first authorized use of UASs in the NAS in the U.S. was permitted by FAA in 1990. Over the past 23 years, the FAA has limited the authorized use of UAS in the U.S. to efforts focused on the public interest. These missions have included border patrol, military training, disaster relief, firefighting, search and rescue, law enforcement, and testing and evaluation. According to the FAA, the Department of Homeland Security currently utilize UASs for border and port surveillance; NASA and NOAA utilize UAS to help with scientific research and environmental monitoring; law enforcement agencies utilize UASs to support public safety; and state universities use UASs to conduct research (Source: FAA Fact Sheet 2013). These efforts are limited to areas outside of major urban areas at elevations less than 50,000 feet. The aircraft range in size from a hummingbird to a wingspan as large as a Boeing 737; although many are the size of a remote-control plane or helicopter. Recreational use of airspace is allowed away from airports and air traffic and below 400 feet above ground level – informal flights for business purposes are specifically excluded (Source: FAA Advisory Circular 91-57).

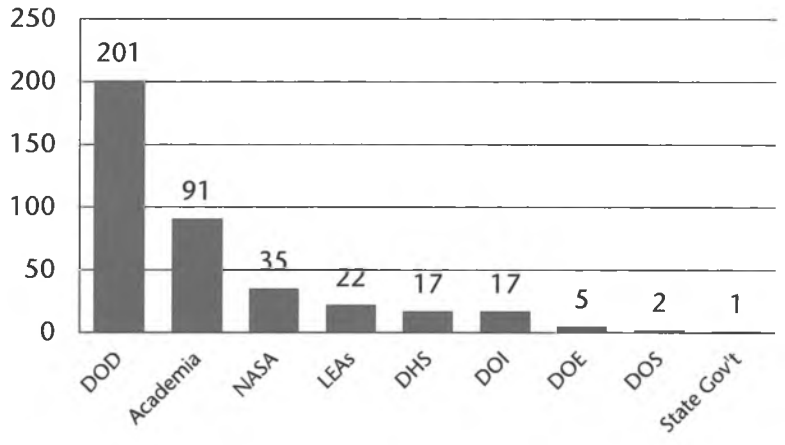
As of 2013, there are currently two ways to operate a UAS with the approval of the FAA: (1) Certificate of Waiver or Authorization (COA) for public UAS's and (2) special airworthiness certificate for private sector (civil) UAS's – both of these options require that the flight takes place outside of densely-populated areas.

Certificate of Waiver or Authorization (COA)

COAs allow public entities to fly UASs in a defined block of civil airspace. The FAA issued the first COAs in January 2007. With COAs, the UAV must remain in view, either of the ground crew or via a chase plane, since UAS technology cannot currently comply with 'See and Avoid' rules. COAs usually require between six and 24 months for approval and cost $40,000 to $60,000 (Source: Economic Development of Central Oregon, 2011). Most of the cost is for specialists in the testing protocols, documentation, and in managing the process through the FAA. Common applications by COA holders include firefighting, border patrol, disaster relief, search and rescue, military training, and other government operational missions (Source: FAA 2013b). The number of COAs issued has increased since 2009, with 146 in 2009, 298 in 2010, and 313 in 2011 (Source: FAA 2013b). In 2012, the FAA issued 391 COAs to 121 federal, state, and local government entities in the U.S. A total of 1,428 COAs have been issued since January of 2007 (Source: GAO 2013). As of February 15, 2013, there were 327 active COAs (Source: FAA 2013b).

The graph below aggregates the 391 COAs issued in 2012 to nine types of entities: U.S. Department of Defense, academia, NASA, local law enforcement agencies, U.S. Department of Homeland Security, U.S. Department of the Interior, U.S. Department of Energy, U.S. Department of State, and state government.

Figure 2: Number of Approved COAs, 2012



Source: GAO, 2013

Special Airworthiness Certificate

Special airworthiness certificates are the only way for civil operators to fly UASs in the NAS at present. However, these certificates cannot be utilized to carry people or property for compensation or hire – they can only be issued for research and development, crew training, or market surveys (Source: FAA 2011).

Allowing UAS in the NAS

In recent years the FAA has made a concerted effort to integrate UAS regulations into the NAS. In 2009, the FAA, NASA, DoD, and the Department of Homeland Security began addressing pathways to integrating UAS regulations into the NAS through their UAS Executive Committee. Additionally, the FAA chartered a UAS Aviation Rulemaking Committee in 2011 to create operational procedures, regulatory standards, and policies related to UAS flights in the NAS. In 2012, the FAA Modernization and Reform Act of 2012 (FMRA of 2012) was passed by Congress to approve six test sites where UAS integration could be tested prior to a 2015 integration of UAS regulations in the NAS (Source: FAA 2012). Delays within the FAA due to technical, logistical, and public outreach concerns may contribute to a UAS integration date later than 2015. However, six test sites are still scheduled to run from January 1, 2014 to February 13, 2017.

Six UAS Test Sites

There is considerable competition over where test sites will be designated, since designation will provide immediate employment in the selected region and support a strong foundation for UAS activity prior to integration of UAS regulation in the NAS. As of March 5, 2013, 50 applicants from 37 states were granted access to the FAA test site application web portal (Source: FAA 2013b). The FAA will consider

five key items when deciding the location of the six test sites: (1) geographic and climatic diversity, (2) location of ground infrastructure and research needs, (3) consultation with NASA and DOD, (4) population density and air traffic density of the surrounding area of any proposed location as well as the potential impact areas in the event of incidents, such as "Fly away" given potential safety mitigations; and (5) identification of specific goals and objectives to be accomplished. Additionally, the test sites are expected to provide an environment and opportunity to test conventional takeoff and landing capability, high speed flight (greater than 250 knots indicated air speed), maritime (launch/maneuver/recovery) capability, operations at extremely high altitudes (Class A airspace and above), and evaluation of dissimilar aircraft (including a mix of manned and unmanned aircraft) in multiple altitude structures (Source: FAA 2013a).

The six test sites that are selected will support the following operations and programs:

- Safe designation of airspace for integrated manned and unmanned flight operations in the national airspace system;
- Development of certification standards and air traffic requirements for unmanned flight operations;
- Coordinating with and leveraging the resources of NASA and the Department of Defense;
- Addressing both civil and public unmanned aircraft systems;
- Ensuring that the program is coordinated with the Next Generation Air Transportation System; and
- Ensuring the safety of unmanned aircraft systems and related navigation procedures before they are integrated into the national airspace system (Source: FAA, 2013b).

The test site operators will provide opportunities for government agencies, industry, and researchers to access this airspace to aid in the integration of UAS regulations in the NAS. Additionally, data collection will support development and operations research and professional development opportunities will be available for inspectors, airspace managers, air traffic controllers, and others. The specific goals described by the PPUTRC applicants include (Source: PPUTRC, 2013):

- Develop a set of standards for select unmanned aircraft categories, for aircraft state monitoring, and navigation. PPUTRC goals and objectives work will augment ongoing standards work with research on categories of UAS not yet addressed, and evaluations needed to refine emerging standards under consideration;
- Validate FAA acceptable risk thresholds or safety management system standards for UAS operations;

- Identify safety factors in UAS design; validate certification standards, including protocols for air traffic control interaction. Define and qualify underlying assumptions and a minimum set of air vehicle characteristics critical to safety, reliability, etc.;
- Develop effective, compliant 'sense and avoid' systems to satisfy regulatory guidance;
- Identify gaps in federal and state statutory and case law protections for privacy and recommend policies or legislation to remedy;
- Directly support the federal mandate for "Expanding Use of UAS in the Arctic" (in Sec 332(d) of Public Law 112-95);
- Design experiments and provide data to support American Society for Testing and Materials (ASTM) F38 and Radio Technical Commission for Aeronautics Special Committee (RTCA SC) 203 to evaluate minimum training and operator qualification standards for crew licensing.

Economic Impact of UAS in the U.S.

The economic implications of integrating UAS regulations into the NAS are substantial. According to a study conducted for the Association for Unmanned Vehicle Systems International (AUVSI), integration will generate $82 billion in activity between 2015 and 2025. Employment impacts are estimated at just over 100,000 jobs by 2025.

The direct economic impact of UAS development in the U.S. is expected to climb from $1.1 billion in 2015 to over $5 billion annually by 2025, measured in terms of output. Including indirect and induced effects, the annual economic impact is expected to rise from $2.3 billion in 2015 to $10 billion in 2025 (Source: AUVSI, 2013).

Areas selected as UAS test sites will have an advantage in capturing these economic benefits; thus the fierce competition among the 50 applicants.

Chapter 2. Pan-Pacific Test Range Complex

In 2012, the Alaska Center for UAS Integration (ACUASI) at the University of Alaska Fairbanks Geophysical Institute began collaborating with Oregon State University and the University of Hawaii to propose a Pan-Pacific Test Range Complex (PPUTRC) as one of the six FAA test sites. This proposed PPUTRC contains 13 test ranges located in Alaska, Hawaii, and Oregon. Of the 13 ranges, six ranges are in Alaska (Denali, Kodiak, North Slope, Oliktok, Poker Flat, and Wainwright), three ranges are in Hawaii (Humuula-R-3103, Makua-R-3109, and Maku-R-3110), and four ranges are in Oregon (Juniper MOA, Pendleton, Tillamook Coastal, and Warm Spring).

Existing UAS activity in Alaska, Hawaii, and Oregon benefits from unique assets and opportunities, including government facilities (e.g. numerous military bases, universities, and maritime assets), wide open airspace in largely unpopulated areas, and geographic diversity (e.g. tropical to arctic climates, oceanic or mountainous landscapes, and up/down weather fronts). The diverse testing environments for the PPUTRC are included in the Table 1 below:

Table 1: Diversity of Potential Testing Environments for the PPUTRC

360 degree oceanic airspace access	Arctic landscape	Extreme low temperatures
Oceanic and sea-ice access	High arctic winds	High sea-salt corrosion effect
Able to fully matrix UAS into NextGen and air traffic operating both VFR and IFR; high and low altitude	Operations in all classes and categories of military SUA	Operations in Classes A through F international airspace in the oceanic environment
Class C, D, & E airspace within 5-nautical miles of airports	High and low-land vegetation tundra	Numerous inland waterways and lakes
High density airports integration studies and testing	Class C, D, & E airspace airport approaches/departures	High-humidity high and low-altitude
Hot and cold high-desert testing	Littoral coastal region mountainous area	Class E (high) airspace
Jungle conditions	Class A airspace	Mountainous terrain
Volcanic	Glacier	Ship traffic including open ocean and ports

UAS Activity in Alaska, Hawaii, and Oregon

There are currently 15 active COAs in the PPUTRC area as well as eight in-process COAs and 20 expired COAs.

Alaska

ACUASI at the University of Alaska Fairbanks (UAF) is the lead organization for the proposed PPUTRC. The formal PPUTRC team includes over 80 businesses, universities, tribes, and economic development organizations in Alaska. UAF has actively managed UAS operations since 2004.

ACUASI was formed in 2012 to enhance UAS research in Alaska. ACUASI and the UAF Geophysical Institute have developed and flown a variety of in-situ and remote sensing instruments on various UASs in Alaska and throughout the world. Scientific and research campaigns undertaken in Alaska over the past decade include using UASs to support observation and monitoring of sea lions in the Aleutian Islands, weather forecasting, volcanic plume monitoring, atmospheric sampling during wildfires, monitoring of sea ice build ups, and oil spill mapping. Commercial applications trialed in Alaska include whale monitoring, cadastral mapping, maritime navigation support, industrial plant monitoring, and environmental clean-up. This experience, coupled with the FAA's UAS test site status, would leverage a variety of new economic activities in Alaska.

The following table, which summarizes ACUASI activity in 2012, illustrates the variety of UAS activity supported by the organization. The table also provides revenue and staffing data for each UAS campaign.

Table 2: UAS Campaigns Supported by the University of Alaska Fairbanks in 2012

Client	Flight Locations	Type of UAS	Purpose of Flights	Revenue for Site Operator	Site Operator Staff	Flight Operator Staff
Aleutians	Aleutian Islands, AK	Aeryon Scout and Puma	Seal observation	$314,200	2 pilots	1 observer
Idaho	Lewiston, ID	Aeryon Scout	Salmon nest observation	$115,000	1 pilot	1 observer
Eglin Air Force Base	Fort Walton Beach, FL	ScanEagle and Aeryon Scout	Controlled burn experiment	$413,000	4 pilots	3 observers
Prudhoe Bay	Prudhoe Bay, AK	Aeryon Scout	British Petroleum flare stack monitoring	$190,000	1 pilot	1 observer
Nome	Nome, AK	Aeryon Scout	Harbor Ice monitoring for USCG	$30,000	1 pilot	1 observer
Ugak Island	Ugak Island, AK	Aeryon Scout	Seal population monitor	$6,500	1 Pilot	1 observer
Fort Greely	Fort Greely, AK	ScanEagle and Aeryon Scout	Flight test	$25,000	2 pilots	2 observers
Chile	Santiago, Chile	Aeryon Scout	Glacier Ice monitor	$9,000	1 pilot	1 observer
Belgium	Belgium	Gatewing	Flight training	$16,000	2 pilots	1 observer
Anchorage	Fort Richardson, AK	Aeryon Scout	Flight test and demonstration	$1,000	2 pilots	1 observer
Fairbanks	Poker Flat Research Range	ScanEagle	Payload test	$347,000	2 pilots	1 observer
Fairbanks	Poker Flat Research Range	Aeryon Scout	Payload test and demonstration	$30,000	2 pilots	1 observer
Fairbanks	Poker Flat Research Range	Raven	Flight test for avionics	$5,000	2 pilots	2 observers
Hawaii	Offshore Hawaiian Islands	Puma	Tsunami debris tracking	$95,000	1 pilot	1 observer

Hawaii

Hawaii offers many unique qualities that make UAS operations appealing. These include: (1) expansive over-water areas unencumbered by other aviation uses, (2) proximity to U.S. Pacific Command – a significant user of future UAS systems, (3) opportunities for joint operations with the Pacific Missile Range Facility – a major test range on Kauai, and (4) opportunities for long-range point-to-point tests with partner ranges in Alaska and Oregon. The Hawaii ranges have proven an important focus for the development of scientific applications of UAS, with significant milestones including test flights of the Aerovironment Pathfinder; Pathfinder Plus; and Helios solar-hybrid propulsion high altitude, long endurance UAS, between 1997 and 2001. Scientific applications led by U.S. federal agencies have recently seen Hawaii emerge as a focal point for NOAA's exploration of UAS as a tool for marine park surveillance. NOAA has utilized UAS to monitor Papahanaumokuakea Marine National Monument since 2007 and performed initial trials using small hand launched systems in mid-2012.

Oregon

The Oregon-based PPUTRC team members include 16 businesses, universities, tribes, and economic development organizations. Additionally, six committed team partners will convert to formal team members upon FAA test site designation award to PPUTRC. Engagements are also planned with a wide ranging network in Oregon – including the 111 AUVSI members and numerous startup companies, primarily in sensor, robotics, and other supporting technologies. In comparison to Alaska and Hawaii, Oregon has historically been more engaged in design, development, and manufacture of UAV systems and subsystems.

The two largest Oregon UAS firms are Insitu (design, development, and manufacture of UAS systems) and FLIR Systems (remote sensors). The main Oregon firm involved in UAS applications has been Near Space Corporation (NSC). NSC uses very high altitude unmanned balloons and gliders to perform scientific and commercial test activities, ranging from data gathering on behalf of government agencies to near-space testing of hardware and sensors for commercial firms. NSC is opening a new $6 million flight test and operations facility at the Tillamook Airport on the Oregon coast. Existing UAS activity also includes the Oregon Army National Guard operations in Pendleton. Oregon's UAS efforts are synergistic with a separately funded ground vehicle innovation initiative, Drive Oregon, which requires systems that can be spun out of UAS: quiet, efficient motors, lightweight composite designs, and navigation systems. The potential economic benefits of the test sites, as well as NAS integration, are particularly strong for Oregon's already significant aircraft manufacturing sector.

Recent UAS Funding in Alaska, Hawaii, and Oregon

Since 2004, nine Alaska contractors have received direct U.S. federal agency contracts for UAS goods and services. The largest federal contract in Alaska is a 5-year standing services award, worth $47 million, from the U.S. Navy to the University of Alaska in 2010 for UAS payload integration and flight test services. The second major award made since 2004 to an Alaska firm consists of a series of pacts totaling $17 million from the U.S. State Department to Anchorage-headquartered Kuk Construction (subsidiary of Olgoonik Development, an Alaskan Native Corporation) for the provision of UAS-based security surveillance services in Iraq in partnership with KBR, Inc. UAF has collaborated with commercial entities, such as Idaho Power Company, and manufacturers including AeroVironment to conduct surveys and observe environmental impacts. Additionally, UAF has collaborated with BP for oil spill response and flare stack monitoring, as well as projects focused on detecting and locating gas and oil pipeline leaks and developing new sensors and processes to identify leaks.

Hawaii's large military presence has resulted in defense spending as the primary source of federal funding to UAS vendors in the state. Direct defense contracts accounted for 94 percent of all awards in terms of obligated amounts from 2004-2012, rising to 97 percent when including awards placed by the General Services Administration on behalf of the U.S. Air Force. The remaining awards were placed with Honolulu-based Referentia Systems by NOAA as part of the Papahanaumokuakea Marine National Monument monitoring project. Hawaii supports a dedicated UAS development and manufacturing company, Williams Aerospace, a small firm currently developing new platforms in the fixed-wing, hand launched micro and medium altitude endurance classes. The state is also working to create two commercial UAS services arms, addressing the defense, homeland security, and precision agriculture markets.

In Oregon, a consortium of industry, academia, and public entities has created a 7-year strategic plan to double the size of the UAS industry in the state, with the help of a $2.5 million State of Oregon grant scheduled for the 2013-14 biennium and additional investments of at least $1.15 million from other sources for a total of $3.65 million. The plan specifically creates UAS solutions for commercial applications, and safely integrating those UAS solutions into the NAS. Projects include emergency response; weather; firefighting; search and rescue; wildlife and habitat management; law enforcement; physical and resource surveys (land and water); management of agriculture, livestock, and public lands; and management of public and private infrastructure. Oregon State University (OSU) has already begun UAS flights based on these research objectives.

Leveraging Current Research Institutes, Community Colleges, and Training Centers

ACUASI is collaborating with the UAF College of Engineering and Mines (CEM) and the Community and Technical College (CTC) to integrate UAS engineering, science, and technology into UAF's teaching, research, and service activities. Additionally, ACUASI is working with the CEM to fill a full-time tenure track engineering faculty position with a professor focused on UAS engineering, science, and technology. ACUASI and CTC also intend to include UAS technology courses in CTC's aviation curricula to train UAS developers, technicians, and pilots as well as to improve outreach to remote Alaskan villages that could benefit from UAS technologies. Cooperation with the CTC at UAA will add air traffic controller participation, offer training for UAS operators, and ultimately build a maintenance program similar to the Aircraft and Powerplant program currently offered.

The University of Hawaii is testing UASs in several of its research programs, evaluating the utility and impact of UAS through analysis of coastal resource management, terrestrial and aquatic environmental monitoring, natural source management and inventory, and human impact studies. University of Hawaii is also developing programs to train students and research professionals on UASs, and plans to integrate this capacity into accredited degree programs.

The new OSU industry-university UAS consortium will depend on test site facilities for collaborative research and development in all phases of operations and applications. Through the Colleges of Engineering, Science, Agriculture, Forestry and Earth, Ocean and Atmospheric Sciences, OSU has expertise and supports ongoing research on control theory and robotics, flexible airframes and flight, sensors, and signal processing, and numerous applications in natural and environmental sciences and environmental monitoring, measuring, and management. OSU-Cascades, located in Central Oregon near the Warm Springs and Juniper test ranges, offers programs in energy engineering, computer science, natural resources, and business, and plans to add programs designed in conjunction with the UAS industry. OSU-Cascades can also provide on-site facilities for OSU-Corvallis researchers leading projects in the region. Central Oregon Community College (COCC) has one of the largest aviation flight training programs on the West Coast – both fixed wing and rotary. COCC offers certifications for UAS flight training and plans to develop a program for data analysis of sensors, building on the school's strong geographic information systems program. Additionally, Blue Mountain Community College (BMCC) in Pendleton, Oregon is developing a UAS curriculum for instructional delivery and course certification. Oregon Institute of Technology (OIT) offers a variety of degrees in engineering and engineering technology, composite engineering, computer and software systems engineering, and electrical engineering, including a master's degree in manufacturing engineering. It offers degrees in professional land surveying and geographic information systems. OIT is collaborating with Rockwell Collins, the aviation electronics company, on real-world projects at a joint campus outside Portland and offers similar hands-on collaborations with other aerospace firms in the northwestern U.S.

Expansion of Existing Businesses and Attracting New Business Investment

The University of Alaska has spun off at least two companies who intend to test their products on the Pan-Pacific test range. These companies were created by University graduate students who were expanding their research in sensors for testing in UASs. UA recently received $5 million from the State of Alaska to support the development of a sustainable high-tech industry in Alaska. Already two companies have established satellite offices in Alaska to improve collaboration with the ACUASI.

Placement of a UAS test site in Hawaii will promote growth within Hawaii and reduce development cycles for manufacturers and researchers. Additionally, it would reduce or eliminate costs to ship sensors, and send knowledgeable staff, to mainland test sites to operate and demonstrate systems. Close proximity to a test site in Hawaii will greatly benefit firms such as BAE Systems, Williams Aerospace, and others – including many military and government contractors working with the Honolulu Fire Department, Honolulu Police Department, U.S. Civil Air Patrol, U.S. Coast Guard, U.S. Department of Defense, U.S. Department of Homeland Security, U.S. National Guard, and others.

In Oregon, more than a dozen companies have said that they will begin testing their sensor packages, propulsion systems, and airframes in Oregon if the Pan-Pacific UAS Test Area is designated as a national test site. Additionally, two companies have informally pledged to open satellite offices at a state test range. The PPUTRC will benefit UAS businesses in the Columbia River Gorge. Over the past seven years, the Gorge's UAS industry grew from a small core of 30 people to an employment base of more than 1,400 employees. Many of these new jobs were created by the UAS companies' suppliers. The two largest Oregon UAS manufacturers are Insitu, manufacturer of UAS platforms and subsystems, and FLIR Surveillance Systems, a manufacturer of electro-optic and infrared imaging systems. Insitu is a major global supplier of high endurance, runway-independent UAS. FLIR Surveillance provides more ER and IR imaging systems for unmanned aircraft, unmanned ground, and unmanned maritime platforms than any other company. Activity in the Gorge from firms such as Insitu, FLIR Surveillance Systems, Cloud Cap Technology, and UTC Aerospace has spun off more than 20 local companies. Central Oregon's general aviation aircraft manufacturing industry had a similar growth pattern over a 15-year period, expanding from a core company of about 30 employees (Lancair) to a cluster of 25 companies that now employs nearly 1,200 people. It is anticipated the PPUTRC will help expand these existing businesses in the Gorge and Central Oregon.

Infrastructure

Alaska expects to invest $1.5 million to construct a test site center at its Poker Flat Research Range, as well as develop and acquire mobile test infrastructure such as fixtures, data collection devices, and monitoring systems similar to its internet-Portable Aerial Surveillance System (iPASS), a web-based application that merges track information from radar, GPS, and a transponder interrogator/receiver. Additionally, large data collection requirements are expected to drive development of a data center for processing and storage.

Hawaii's test ranges link to military/restricted areas used for current UAS operations. These sites include the Pohakuloa training area on the Island of Hawaii, Bradshaw and Wheeler Army Airfields on Oahu, and the Pacific Missile Range Facility on Kauai. Other areas under consideration include Upolu and Dillingham Airfields (on the Big Island and Oahu, respectively). Test points within the ranges would be utilized to support both shore and ship-based development, testing and certification of new UASs, training and crew certification of operational UASs, and development of expanded and joint capabilities involving existing communications systems and operations tactics using UAS.

The budget for the $2.5 million Oregon innovation grant envisions spending at least $1.2 million at test ranges for new equipment and/or infrastructure, with the grant providing $300,000, private enterprise providing $750,000, and public entities providing $150,000. Possible infrastructure development proposed with this funding includes: portable ground radar units; an automatic dependent surveillance-broadcast ground station or a similar 'sense and avoid' technology system; one or more operations management buildings housing computers, calibration components, baseline sensors with a range of capabilities, data analysis equipment, supporting software, maintenance facilities and machine shops; and ground control stations, an observation tower, and ITAR facilities as needed. Additionally, as noted earlier, Near Space Corporation is preparing to open a new $6 million flight test and operations facility at the Tillamook airport.

Chapter 3. Potential Economic Impacts of the PPUTRC

Designation as one of the nation's six UAS test sites promises to have significant economic impacts in the areas where flight activity occurs and support services are provided. Private and public sector UAS activity that has been constrained by restricted access and a restrictive federal authorizing process will have much greater opportunity to conduct UAV flight operations. In this chapter the potential economic impacts in Alaska, Hawaii, and Oregon related to serving as a test site are quantified.

The following economic impact projections were developed by McDowell Group, Inc. utilizing flight activity, flight cost, and flight-related staffing data provided by PPUTRC team members. Direct economic activity was measured by approximating preflight administrative costs, site fees per day, operating costs per day, and total flight days from historical data provided by the applicant. Sector-level information was obtained from the applicant concerning the number of UAS-related firms and jobs per firm. Direct employment estimates were then coupled with multipliers obtained from the IMPLAN economic impact model to estimate total direct, indirect, and induced economic effects. Annual projections from 2014 to 2017 were calculated for each of the 13 ranges utilizing growth rates based on funding forecasts from the Teal Group UAS market profile and forecast report, historical flight activity, and projected growth in flight activity, research, and UAS-related manufacturing as provided by the applicant.

In total, designation of PPUTRC as a UAS test site would be expected to generate 1,065 direct, indirect, and induced jobs in 2014, increasing to over 1,400 jobs by 2017. Total labor income would climb from$57 million in 2014 to about $76 million in 2017.

Table 3: Summary Impacts of PPUTRC Test Site Designation, 2012-2017
Combined Impacts in Alaska, Hawaii and Oregon

Impact of Test Site Designation				
	2014	2015	2016	2017
Total Employment	**1,065**	**1,260**	**1,335**	**1,429**
Direct Employment	490	571	602	642
Indirect Employment	198	243	259	279
Induced Employment	377	447	474	508
Total Labor Income ($ million)	**$56.9**	**$66.9**	**$70.8**	**$75.6**
Direct Labor Income ($ million)	$26.4	$30.5	$32.2	$34.2
Indirect Labor Income ($ million)	$10.4	$12.5	$13.3	$14.4
Induced Labor Income ($ million)	$20.1	$23.8	$25.3	$27.1
Output ($ million)	**$265.0**	**$301.8**	**$315.9**	**$333.5**
Total Value Added ($ million)	**$109.3**	**$121.9**	**$127.1**	**$133.5**
State Income Taxes ($ million)	$4.3	$5.0	$5.3	$5.6

Employment Resulting from UAS and Test Site Operations

In 2014, with designation of PPURTC as a test site, UAS activity in Alaska, Hawaii, and Oregon is expected to account for 581 direct jobs and a total of 1,254 jobs - including direct, indirect, and induced jobs. Approximately 85 percent of that total employment (1,065 jobs) is attributable to test site designation. The remaining 15 percent (189 jobs) is expected to occur in the absence of PPUTRC test site designation. By 2017, employment will rise to an estimated 904 direct jobs and 1,991 total jobs - with 72 percent of that total employment (1,429) attributable to test site designation. A significant number of these direct jobs are expected in smaller communities that tend to have higher unemployment – thus test site designation for the PPUTRC will help improve opportunities where they will provide the most benefits.

Table 4: Direct Employment, 2012-2017

Direct Employment	2012	2013	2014	2015	2016	2017
Total Direct Employment						
PPUTRC	**74**	**82**	**581**	**712**	**801**	**904**
Alaska Ranges	43	47	129	142	157	173
Hawaii Ranges	-	-	-	72	95	126
Oregon Ranges	31	35	452	498	549	605
Impact of Test Site Designation						
PPUTRC	**-**	**-**	**490**	**571**	**602**	**642**
Alaska Ranges	-	-	77	82	86	91
Hawaii Ranges	-	-	-	72	95	126
Oregon Ranges	-	-	414	417	421	424

Oregon's relatively high direct employment numbers are due to the existing, well-developed aircraft manufacturing sector in Oregon. Oregon is well placed to supply the growing demand for UAS aircraft that will be triggered by UAS integration. Most of the new jobs created in Oregon due to PPUTRC designation include manufacturing jobs (many of which may be created due to designation of test sites anywhere in the U.S.). These numbers for Oregon are based on an analysis provided to McDowell Group by Economic Development for Central Oregon (EDCO).

In addition to direct jobs created from UAS firms, significant indirect and induced jobs will also be created. Indirect jobs represent jobs created throughout the supply chain to support the UAS industry and induced jobs represent jobs created due to changes in household consumption as a result of the UAS industry.

Table 5: Indirect Employment, 2012-2017

Note: Summation of columns may not match the total due to rounding

Labor Income Resulting from UAS and Test Site Operations

In 2014, UAS activity in Alaska, Hawaii, and Oregon is expected to account for $31 million in direct labor income and $67 million in total labor income - including direct, indirect, and induced - assuming the PPUTRC is awarded test site designation. Approximately 84 percent of that total labor income ($57 million) is attributable to test site designation, while the remaining 16 percent ($10 million) is expected to occur even if the proposed PPUTRC does not become a test site. By 2017, labor income is expected to include $106 million in total direct, indirect, and induced labor income - with 71 percent of that total labor income ($76 million) attributable to test site designation.

Oregon Ranges	-	-	$16.1	$16.3	$16.4	$16.6

Output, Value Added, & State Income Taxes Resulting from UAS and Test Site Operations

'Output' represents the value of industry production, and 'total value added' is the difference between an industry's total output and the cost of their intermediate inputs. Economic modeling conducted for the purposes of this study indicates output in the PPUTRC states attributable to test site designation would climb from $265 million in 2014 to $333 million in 2017. Value added would climb from $109 million to $134 million over the same period.

Table 10: Output, 2012-2017 ($ million)

	Output					
	2012	2013	2014	2015	2016	2017
Total Output						
PPUTRC	**$18.3**	**$20.2**	**$302.4**	**$366.8**	**$411.7**	**$463.6**
Alaska Ranges	$8.6	$9.5	$34.3	$37.8	$41.7	$46.0
Hawaii Ranges	-	-	-	$33.3	$44.1	$58.3
Oregon Ranges	$9.7	$10.7	$268.1	$295.6	$325.9	$359.3
Impact of Test Site Designation						
PPUTRC	-	-	**$280.1**	**$315.5**	**$328.4**	**$344.7**
Alaska Ranges	-	-	$23.8	$24.8	$25.8	$26.8
Hawaii Ranges	-	-	-	$33.3	$44.1	$58.3
Oregon Ranges	-	-	$256.3	$257.4	$258.5	$259.6

Table 11: Total Value Added, 2012-2017 ($ million)

	Value Added					
	2012	2013	2014	2015	2016	2017
Total Value Added						
PPUTRC	**$9.5**	**$10.5**	**$127.7**	**$151.8**	**$169.7**	**$190.3**
Alaska Ranges	$5.7	$6.3	$22.7	$25.0	$27.6	$30.4
Hawaii Ranges	-	-	-	$10.9	$14.5	$19.1
Oregon Ranges	$3.8	$4.2	$105.1	$115.8	$127.7	$140.8
Impact of Test Site Designation						
PPUTRC	-	-	**$116.2**	**$128.2**	**$132.8**	**$138.5**
Alaska Ranges	-	-	$15.8	$16.4	$17.1	$17.7
Hawaii Ranges	-	-	-	$10.9	$14.5	$19.1
Oregon Ranges	-	-	$100.4	$100.9	$101.3	$101.7

Designation of the PPUTRC will provide a combined four-year total of $20 million in income tax revenue to Hawaii and Oregon. The effective income tax rate for these calculations was approximated as 7.5 percent for Hawaii, and 9 percent for Oregon (Alaska has no income tax).

Table 12: State Income Taxes, 2012-2017 ($ million)

Hello Althea,

I'm just working on the final report of the 2013 task force (due in June). It will repeat much of the Interim report and include the two pieces of legislation that passed this session.

Industry folks who may be good to invite to your round table:

To: Ginger Blaisdell; Courtney Sanborn
Subject: FAA Director coming to Alaska (Confidential)

Categories: Red Category

Hello, Ginger,
We just got word the FAA director,

Michael Huerta, Administrator

is coming to Alaska this weekend. On Monday, in Anchorage, he will sign a Certificate of Authorization for UAF/GI's Pan-Pacific UAS Test Range Complex. Immediately following that, we will fly our first mission.

We are making plans for a two concurrent press conferences, one in Anchorage and one in Fairbanks. The FAA director will not be able to come to Fairbanks, but the mission will be held at UAF's Large Animal Research facility. The time is set at 11 a.m. so far.

Ginger, the reason I'm writing is because we want to make sure the task force members and industry people are aware and have the opportunity to witness the events, in Anchorage or Fairbanks.

Could you send Courtney Sanborn and me the names and contact information of the UAS task force members and industry people your office is aware of, please?

Of course, Rep. Hughes is top on our list.

As you can imagine, we at UAF are all pulling together for this historical event.

I'm arranging the logistics for Anchorage, so if you need to, give me a shout by email or phone.

Also, my cell is 322-7686.

Thank you.

d

EXECUTIVE SUMMARY

The Legislative Task Force on Unmanned Aircraft Systems (LTFUAS) was formed under House Concurrent Resolution No. 6 to review regulations and guidance regarding unmanned aircraft systems (UAS). The LTFUAS was tasked to provide recommendations for a comprehensive state policy for unmanned aircraft that protects privacy and allows the use of UAS for public and private commercial applications.

In response to public concern between May and December 2013, the LTFUAS reviewed multiple potential UAS scenarios focusing on privacy issues, economic development, public safety, anticipated mission types, and flight safety. LTFUAS evaluated existing privacy laws for Alaska to avoid recommending duplicative law for UAS; considered ways to encourage the economic development and safe uses of UAS in Alaska; and supported public education to address public reservations regarding UAS use in Alaska as well as provide information on the use of UAS for life-saving and other cost-saving and beneficial applications for dull, dirty, and dangerous tasks.

LTFUAS concluded that the Federal Aviation Administration (FAA) is adequately addressing the safety concerns of integrating UAS into the National Airspace System (NAS). FAA Guideline N 8900.227 clearly states the requirements for the aircraft, pilot training and responsibilities, and the expectations of the test sites for safe operations of UAS.[1] The FAA guidelines provided LTFUAS assurance that unmanned aircraft can be operated safely in Alaska.

After understanding the role of the FAA and safety goals for integration of UAS into the NAS, the LTFUAS made the following recommendations in its preliminary report submitted to the Alaska State Legislature on January 15, 2014.

1. All state and local law enforcement entities should adopt the International Association of Chiefs of Police (IACP) guidelines to help ensure privacy protection for Alaskans.

2. All law enforcement entities must first obtain a court order to use UAS over private property for criminal investigation against any person.

3. Encourage all law enforcement entities to use high-visibility marking or navigational lighting on law enforcement UAS as appropriate.

4. Convey a clear message to industry that Alaska is open for business to harness the beneficial uses of UAS, to encourage the growth of this economic sector, and to allow Alaska to continue to lead the nation in aviation innovation.

5. Encourage private and public UAS training programs.

6. Report all UAS incidents/accidents of aircraft larger than 55 pounds to the University of Alaska and/or Alaska Aviation Coordination Council.

[1] Notice N 8900.227, Subj: Unmanned Aircraft Systems (UAS) Operation Approval. Effective Date 7/30/13, Cancellation Date 7/30/14. Available at http://www.faa.gov/documentLibrary/media/Notice/N_8900.227.pdf

7. Extend LTFUAS until June 30, 2017, and expand the duties of the Task Force with the addition of one member representing the Alaska Department of Transportation/Public Facilities (DOT/PF) and one public member, for the following reasons:

    - During this transitional phase of growing use of UAS in Alaska, the LTFUAS should be extended to continue to monitor the integration of UAS into the NAS and any privacy matters that may arise that are not already covered by existing law. Because Alaska currently has a strong set of privacy laws, rather than recommend prohibitions be incorporated into statute that might inhibit industry, the LTFUAS recommends it continue to review UAS operations in light of current statutes and only recommend changes in statute as necessary.

    - Because FAA will be updating and issuing new guidelines based on the work of the new FAA UAS test sites announced on December 30, 2013, it is necessary for the LTFUAS to continue to review FAA policies to determine their impact and whether any additional policy changes at the state level may be necessary in response.

    - With Alaska's December 30, 2013, selection as one of the nation's six UAS test sites through the University of Alaska's application (in conjunction with Oregon and Hawaii), the LTFUAS will meet part of the test site's requirement as a public forum where concerns regarding privacy and data matters can be collected and evaluated.

The LTFUAS recommendations were addressed in either House Bill 255 (HB255) or House Concurrent Resolution 15 (HCR15) and in the University of Alaska Pan Pacific UAS Test Range Complex operating requirements as follows:

- Recommendations 2, 3, and 4 were addressed in HB255 passed by the Legislature.
- Recommendation 1 was adjusted. Instead of requiring law enforcement entities to adopt a specific publication, HB255 incorporated particular guidelines as requirements for law enforcement entities.
- Recommendations 4 and 7 were addressed in HCR15. In addition, two industry seats were added to the LTFUAS.
- Recommendation 6 was partially addressed by HB255 for reporting requirements of law enforcement. Other industries will need to be addressed as a continuing task for the LTFUAS.

As we move forward, and particularly in light of the fact that Alaska has been selected as an FAA test site for UAS integration, and with the extension and expansion of duties of the LTFUAS, we continue emphasis on:

1) management of the test ranges,
2) economic development opportunities,
3) public education and public relations regarding UAS,

4) rules for hobby and recreational use of model aircraft as outlined by the FAA, and

5) privacy issues including those related to data collection.

The LTFUAS recommended the following for further review:

1) each department of the State of Alaska identify a point of contact for UAS to coordinate with the LTFUAS and provide information regarding department policy and procedures to ensure accountability and privacy in regard to UAS use, and

2) the Alaska Department of Administration review and update its data retention policies particularly in the area of inadvertent captured data that are not relevant to a state agency.

Lastly, in May and June of 2014, notice of the three open seats (two industry, one public) on the LTFUAS have circulated by email, radio, meeting announcements, and newsletters. Co-Chair Shelley Hughes collected letters of interest and resumes from 13 applicants and submitted them to House Speaker Chenault and Senate President Huggins on June 24, 2014, for appointments to the LTFUAS to be expanded as of July 1, 2014.

Shelley Hughes

/s/

1. INTRODUCTION

House Concurrent Resolution No. 6 (HCR6) formed the Legislative Task Force on Unmanned Aircraft Systems (LTFUAS) to conduct the following tasks:

- review regulations and guidance from the Federal Aviation Administration (FAA) regarding unmanned aircraft systems (UAS);
- provide written recommendations, together with suggested legislation, for a comprehensive state policy for unmanned aircraft that protects privacy and allows the use of UAS for public and private applications; and
- submit a preliminary and final report to the Legislature.

The LTFUAS met in 2013 on July 24 and October 2 via teleconference and twice in person October 23-24 and November 26 to respond to the concerns Alaskans have raised regarding unmanned aircraft use in Alaska. The LTFUAS completed the following tasks:

- reviewed regulations and guidance from the FAA, International Association of Chiefs of Police (IACP), and multiple related recommendations for UAS operations;
- received hours of public testimony and written public testimony;
- compiled recommendations and suggested legislation for the use of UAS for public and private applications in Alaska that are protective of privacy; and
- submitted a preliminary report to the Alaska State Legislature on January 15, 2014, and a final report on June 30, 2014.

The LTFUAS considered two approaches to regulating the use of UAS in Alaska:

1. restrict the industry and adopt exemptions for specific kinds of approved uses, or
2. generally allow UAS operations in Alaska and adopt the necessary privacy, operations, and other guidelines that seem necessary to protect Alaskans.

The LTFUAS adopted the second approach and emphasized that educating the public will be an important part of integrating this technology safely and for the benefit of Alaskans.

The LTFUAS concluded that the FAA is adequately addressing the safety concerns of integrating UAS in the National Airspace System (NAS). FAA Guideline N 8900.227 spells out the details of operating UAS by clearly stating the requirements of the aircraft, pilot training and responsibilities, and the expectations of the FAA UAS Test Sites.[2] The rules outlined in the guidelines provided the LTFUAS assurance that unmanned aircraft can be operated safely in Alaska.

[2] Notice N 8900.227, Subj: Unmanned Aircraft Systems (UAS) Operation Approval. Effective Date 7/30/13, Cancellation Date 7/30/14. Available at http://www.faa.gov/documentLibrary/media/Notice/N_8900.227.pdf

The FAA also recently released its Final Privacy Requirements in November 2013. The privacy document from the FAA clearly identified that while it governs the NAS, local governments will assume the responsibility of addressing privacy concerns.

Alaskans are fortunate to have a state constitution and state law that provide some of the greatest privacy protections compared to other states. As the LTFUAS reviewed multiple scenarios for misuse of UAS, it determined that existing laws would apply, are sufficiently protective of privacy, and penalties are already in place to address inappropriate behavior.

When studying the many possible scenarios for misuse, the LTFUAS returned repeatedly to the premise that an unmanned aircraft is a tool; the operator needs to be considered for breaches of privacy or harming another.

This report presents the findings of the LTFUAS resulting from LTFUAS meetings, public testimony, research, and information from industry experts in pursuit of the assigned duties listed above.

1.1 Background and Planning

The earliest UAS was A.M. Low's "Aerial Target" of 1916 during World War I. The flight lasted 12 seconds. Over the last 50 years, rapid advances in aviation technology have transformed the world's skies. In the United States, the NAS has evolved to include a variety of fixed-wing and rotary aircraft operating across the country from metropolitan areas to remote airfields. As aircraft technology expands, so do the challenges associated with managing safe skies. UAS have created a critical integration challenge for the FAA as they are flown in an environment that was originally developed for manned aircraft.

1.1.1 Federal

In 2008, the Government Accountability Office (GAO) reported that the United States must develop a clear and common understanding of what is required to safely and routinely operate UAS in the NAS. Congress enacted the FAA Modernization and Reform Act of 2012 (FMRA). Through this act, Congress set forth a number of specific requirements for achieving UAS integration—namely a UAS Comprehensive Plan[3] and a 5-year Roadmap.[4]

In April 2012 under the guidance of the Next Generation Air Transportation System (NextGen) Implementation Plan Senior Policy Committee (SPC), the Joint Planning and Development Office assembled the Departments of Transportation (DOT), Defense (DoD), Commerce (DOC), and Homeland Security (DHS) as well as the National Aeronautics and Space Administration (NASA) and the FAA to develop the UAS Comprehensive Plan. The UAS Comprehensive Plan sets the

[3] Unmanned Aircraft Systems (UAS) Comprehensive Plan. September 2013. Prepared by the Joint Planning and Development Office. Available at http://www.faa.gov/about/office_org/headquarters_offices/agi/reports/media/UAS_Comprehensive_Plan.pdf

[4] Integration of Civil Unmanned Aircraft Systems (UAS) in the National Airspace System (NAS) Roadmap. First Edition–2013. U.S. Department of Transportation Federal Aviation Administration. Available at http://www.faa.gov/about/initiatives/uas/media/uas_roadmap_2013.pdf

overarching integration of UAS into the NAS. The plan also supports the coordination and integration of research and development necessary to achieve UAS integration goals by 2015 (Title 14 of the Code of Federal Regulations, Part 91 [14 CFR 91]; FAA Guideline N 8900.227).

1.1.2 Federal and State Collaboration

One part of the UAS Comprehensive Plan included a priority for UAS research and development. NextGen developed the *NextGen UAS Research, Development and Demonstration Roadmap,*[5] and the FAA initiated a program for test ranges in accordance with the FMRA. In response to the FAA's solicitation for applications, the University of Alaska Fairbanks (UAF) teamed with the States of Oregon and Hawaii and submitted the Pan-Pacific UAS Test Range Complex application.

On December 30, 2013, the FAA announced that Alaska was one of six states selected as a test site for safe operations and integration studies. UAF plans to work on state monitoring, navigation and safety standards.

1.1.3 State

Anticipating the integration of UAS in Alaska's NAS and the probable selection of Alaska as an FAA UAS test site, HCR6 was passed to establish a Task Force to consider the implications of bringing this new technology to Alaska as early as spring 2014.

The FAA also recently released its Final Privacy Requirements in November 2013. The privacy document from the FAA clearly identified that while it governs the NAS, local governments will assume the responsibility of addressing privacy concerns.

Flight safety will continue to be monitored by the FAA. The State of Alaska will develop additional safety rules that pertain to specific kinds of UAS operations and will address the concern of personal privacy.

The LTFUAS approach is to responsibly embrace the positive uses of UAS without overregulating the industry and thus hindering economic opportunity. In addition to accepting the use of UAS in Alaska, the LTFUAS recognizes that public perception is greatly influenced through media reports, such as military flights in war zones. The public has been hesitant to allow UAS in Alaska due to fear of invasion of personal privacy and overreaching law enforcement. Recent media reports have decreased public anxiety and increased public awareness of potential benefits of UAS, such as the publicity surrounding Amazon's consideration of "drone deliveries" in the future, YouTube videos showing beer delivered by a UAS to ice fishermen, and news reports of drones being used to identify hot spots in forest fires.

[5] Next Generation Air Transportation System, NextGen UAS Research, Development and Demonstration Roadmap. Version 1.0, March 15, 2012. Available at http://www.jpdo.gov/library/20120315_UAS%20RDandD%20Roadmap.pdf

1.2 Future of UAS in Our Skies

The FAA is expediting the planning and integration of UAS in the NAS because of the rapid advancements in this technology and the global response to the wide variety of uses by UAS. Unmanned aircraft will become part of our economy, transportation system, public safety, and much more.

Protecting the privacy of our citizens is the most important concern of the LTFUAS, and it remains at the forefront of each application of UAS missions. Alaska must respond quickly to this new technology in three ways: (1) support the integration of UAS in our airspace, (2) develop a forum to review concerns and recommend legislation, and (3) educate the public. All of these approaches must work in unison to be successful and maintain personal privacy.

1.2.1 LTFUAS Reauthorization

House Concurrent Resolution 15 (HCR15) reauthorized the LTFUAS for 3 more years, terminating June 30, 2017, and coinciding with the timing of the FAA UAS test site at the University of Alaska Fairbanks. The LTFUAS has added responsibilities as it continues its work; the duties of the Task Force shall include:

1. reviewing regulations and guidance from the FAA regarding UAS;
2. providing written recommendations, together with suggested legislation, for a comprehensive state policy for unmanned aircraft that protects privacy and allows the use of UAS for public and private applications;
3. evaluating complaints and concerns expressed to the LTFUAS;
4. identifying potential privacy and public safety concerns associated with UAS and determining whether legislation is necessary to address them;
5. considering recommendations for public education related to UAS;
6. studying the FAA's "Integration of Civil Unmanned Aircraft Systems (UAS) in the National Airspace System Roadmap," issued November 7, 2013 (1st ed. 2013) and its application to the development of UAS in Alaska;
7. conducting a public hearing concerning privacy and the capture of data by UAS at the University of Alaska's test site;
8. further studying the nonpublic use of UAS to encourage development of the private sector unmanned aircraft system industry; and
9. further studying and making recommendations with respect to ensuring unmanned aircraft users comply with applicable laws.

1.2.2 Law Enforcement Rules

House Bill 255 (HB255) established the rules by which law enforcement agencies throughout the state can use UAS to improve safety and reduce costs for the public benefit of Alaskans.

Under HB255, A law enforcement agency may use an unmanned aircraft system:

(1) to gather evidence in a criminal investigation (A) under the express terms of a search warrant issued by a court; or (B) in accordance with a judicially recognized exception to the warrant requirement; or

(2) in situations and for uses not involving a criminal investigation and not intended to lead to the production of evidence for use in a criminal investigation, if the use does not constitute an unwarranted invasion of personal privacy and is consistent with the procedures in AS 18.65.901.

The bill also requires law enforcement to:

- Maintain a record of each flight, including the time, date, and purpose of the flight, and the identity of the authorized official;
- Establish an auditable flight record system, including the documentation of a change in a flight time record;
- Establish a method of notifying the public of the operation of an unmanned aircraft system, unless notifying the public would endanger the safety of a person;
- Provide for community involvement in the development of the policies;
- Ensure that the flight of a UAS be for a public purpose;
- Obtain any authorization, permit, or certificate required by the FAA to operate the UAS;
- Allow operation only by trained and certified pilots and crews; and
- Dispose of images that are not required as part of an investigation, for prosecution or training.

The UAS industry is changing as quickly as your imagination can conjure a new application for use. Nearly every country on the planet is preparing for UAS in efforts that range from military actions and border patrol to research and development of UAS technology.

Alaska recognizes that the integration of this industry is already occurring, and we must respond proactively. We invite the appropriate use of UAS, and the LTFUAS will recommend rules, education, and reporting requirements for their approved use in the State of Alaska and continue to monitor any privacy issues that may arise, including those related to data collection.

2. FEDERAL AVIATION ADMINISTRATION—SAFETY AND PRIVACY

From *Integration of Civil Unmanned Aircraft Systems (UAS) in the National Airspace System (NAS) Roadmap*:

"Since the early 1990s, unmanned aircraft systems (UAS) have operated on a limited basis in the National Airspace System (NAS). Until recently, UAS mainly supported public operations, such as military and border security operations. The list of potential uses is now rapidly expanding to encompass a broad range of other activities, including aerial photography, surveying land and crops, communications and broadcast, monitoring forest fires and environmental conditions, and protecting critical infrastructures.

The FAA created the Unmanned Aircraft Systems Integration Office to facilitate integration of UAS safely and efficiently into the NAS. Toward that goal, the FAA is collaborating with a broad spectrum of stakeholders, which includes manufacturers, commercial vendors, industry trade associations, technical standards organizations, academic institutions, research and development centers, governmental agencies, and other regulators."[6]

FAA 'Roadmap'

"Ultimately, UAS must be integrated into the NAS without reducing existing capacity, decreasing safety, negatively impacting current operators, or increasing the risk to airspace users or persons and property on the ground any more than the integration of comparable new and novel technologies."

2.1 Safety Guidelines

The LTFUAS studied the FAA Guidelines for the Operations of Unmanned Aircraft Systems, participated in a presentation of the guidelines from Ro Bailey, Deputy Director of the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks, and sought comments from representatives of the FAA. FAA Guideline N 8900.227 provides the most current guidelines for federal approval of operating unmanned aircraft.[7]

The LTFUAS recognizes that the FAA manages the safety of the NAS and has adopted extensive guidelines regarding aircraft certification, pilot training and certification, and approval processes for flights (or missions). The FAA Guideline N 8900.227also provides detailed requirements for the operations of pending test sites and the current approval of flights in designated areas for specific purposes. The FAA pre-approves UAS missions and awards a Certificate of Authorization (COA) that identifies the details of the mission. This process is tightly scrutinized, and the entity flying the UAS is accountable to the FAA under the details of the COA.

---

[6] Integration of Civil Unmanned Aircraft Systems (UAS) in the National Airspace System (NAS) Roadmap. First Edition–2013. U.S. Department of Transportation Federal Aviation Administration. Available at http://www.faa.gov/about/initiatives/uas/media/uas_roadmap_2013.pdf

[7] Notice N 8900.227, Subj: Unmanned Aircraft Systems (UAS) Operation Approval. Effective Date 7/30/13, Cancellation Date 7/30/14. Available at http://www.faa.gov/documentLibrary/media/Notice/N_8900.227.pdf

The COA approval process gives the LTFUAS confidence that safety of the NAS is adequately considered and that UAS missions will not invade personal privacy or operate inappropriately.

It is the opinion of the LTFUAS that no additional statutory or regulatory requirements are needed for FAA-approved missions.

2.2 Privacy Concerns

2.2.1 FAA Final Privacy Requirements

The FAA recently published its Final Privacy Requirements, November 7, 2013 (Appendix A) regarding unmanned aircraft. The FAA recognizes that there is substantial debate and difference of opinion among policy makers, industry, advocacy groups, and members of the public as to whether UAS operations at the test sites will raise novel privacy issues that are not adequately addressed by existing legal frameworks.

FAA Final Privacy Requirements

On February 22, 2013, the FAA requested public comment on the proposed privacy requirements for UAS test sites that the FAA will establish pursuant to the FAA Modernization and Reform Act of 2012.

The FAA received 99 comments through Regulations.gov and 53 comments through the public engagement session.

The public comments were grouped into 10 categories, and the FAA provided a response to each category. You can view all categories, comments and responses in the document provided in Appendix A.

From the FAA Final Privacy Requirements:

There was substantial difference of opinion among commenters as to whether the UAS operations and manned aircraft operations present different privacy issues that justify imposing special privacy restrictions on UAS operations at the test sites. In addition, there was substantial difference of opinion regarding what elements would be appropriate for a test site privacy policy.

The FAA has determined that it should not impose privacy requirements beyond those in the Final Privacy Requirements for the following reasons.

First, there are many privacy laws and applications of tort law that may address some of the privacy issues that arise from UAS operations at the test sites.

Second, the FAA believes that the test site operators will be responsive to local stakeholders' privacy concerns and will develop privacy policies appropriately tailored to each test site.

Test Site Requirements

1. *Test site operators must maintain a record of all UAS operating in the test sites;*
2. *Test site operators must require every UAS operator in the Test Site to have a written plan for the operator's use and retention of data collected by the UAS; and*
3. *Test site operators must conduct an annual review of test site operations to verify compliance with stated privacy policy and practices and share those outcomes annually in a public forum with an opportunity for public feedback.*

Third, if UAS operations at a test site raise privacy concerns that are not adequately addressed by the test site's privacy policies, elected officials can weigh the benefits and costs of additional privacy laws or regulations. Forty-three states have already enacted or are considering legislation regulating use of UAS.

Conclusion: Based on the comments submitted, the FAA intends to require each test site operator to comply with all of the privacy requirements included in the Final Privacy Requirements as well as the following additional privacy requirements:

1. Test site operators must maintain a record of all UAS operating in the test sites;
2. Test site operators must require every UAS operator in the test site to have a written plan for the operator's use and retention of data collected by the UAS; and
3. Test site operators must conduct an annual review of test site operations to verify compliance with stated privacy policy and practices, and share those outcomes annually in a public forum with an opportunity for public feedback.

It is the opinion of the LTFUAS that privacy policy is adequate through the FAA requirements for the use of UAS in the test sites.

2.2.2 Privacy and Civil Liberties Consideration

The FAA is implementing a UAS Test Site Program to help the FAA gain better understanding of operational issues relating to UAS. Although the FAA's mission does not include developing or enforcing policies pertaining to privacy or civil liberties, experience with the FAA UAS test sites will present an opportunity to enhance the dialogue in the Interagency Policy Committee (IPC) and other interagency forums concerning the use of UAS technologies and the areas of privacy and civil liberties.

"The Fourth Amendment is central to the privacy issues with respect to government UAS operation. Although the Supreme Court has never explicitly considered the question of UAS privacy, there is a long list of relevant precedents. Among them are several cases from the 1980s that specifically considered aerial observations and the Fourth Amendment."[8]

2.2.3 Homeland Security Privacy Impact Assessment

U.S. Customs and Border Protection (CBP) is responsible for guarding nearly 7,000 miles of land border, 2,000 miles of coastal waters, and 95,000 miles of maritime border. CBP employs several types of aircraft to achieve its mission objectives including UAS. COAs have been authorized in Arizona, Texas, Florida, and North Dakota. When deploying resources for operations, the Office of Air and Marine must determine the availability of aircraft type and the integration of the requested activity into its flight operations.

[8] John Villasenor. 2013. Observations from Above: Unmanned Aircraft Systems and Privacy. Harvard Journal of Law & Public Policy. Available at http://www.harvard-jlpp.com/wp-content/uploads/2013/04/36_2_457_Villasenor.pdf

Homeland Security addressed privacy in the Privacy Impact Assessment published September 9, 2013.[9] A summary of privacy concerns addressed in their document includes:

Homeland Security

95,000 miles of maritime border security includes joint operations with the U.S. Coast Guard. Some of those miles include Alaska coastline.

- The collection and use of data from aerial surveillance remains within the scope of its authorities to protect the border and provide support for law enforcement activities while continuing to preserve a person's right to privacy.
- UAS present a perceived risk because they are able to fly for longer periods of time and conduct surveillance relatively undetected. While UAS can fly for longer periods of time, they are equipped with the same technology to conduct surveillance that is presently deployed on manned aircraft.
- Concern for the security of the UAS itself and the potential for hijacking of the unmanned aircraft are managed by the close monitoring of ground control and satellite communication by encrypted data. If one ground station were to lose contact, a second ground station is equipped to pick up the UAS and continue operations.

[9] Department of Homeland Security. 2013. Privacy Impact Assessment for the Aircraft Systems. DHS/CBP/PIA-018. September 9. Available at http://www.dhs.gov/sites/default/files/publications/privacy-pia-cbp-aircraft-systems-20130926.pdf

3. ALASKA STATE LAW—SAFETY AND PRIVACY

The LTFUAS is confident that the FAA will regulate safety of UAS flights in Alaska. While safety is critically important, the LTFUAS also recognizes that certain codes of conduct must be followed to ensure harmonious UAS operations in Alaska.

3.1.1 Self-Regulation by Three National Organizations

The LTFUAS considered the recommendations of the following three national organizations that have adopted rules and codes of conduct regarding UAS operations. The LTFUAS adopted the IACP rules in the legislation introduced during the legislative session. During the committee process, the decision was made that it would be ill advised to adopt a dated publication. Instead the bill incorporated applicable guidelines from the publication.

- **IACP:** International Association of Chiefs of Police Recommended Guidelines (Appendix B) for the use of Unmanned Aircraft was adopted in August 2012. The Alaska Department of Public Safety has also adopted these guidelines as their doctrine with the exception of increasing the flight approval responsibility from a "supervisor" to the director's office.

- **AUVSI:** Association for Unmanned Vehicle Systems International states: "As an industry, it is incumbent upon us to hold ourselves and each other to a high professional and ethical standard. As with any revolutionary technology, there will be mishaps and abuses; however, in order to operate safely and gain public acceptance and trust, we should all act in accordance with these guiding themes and do so in an open and transparent manner. We hope the entire UAS industry will join AUVSI in adopting this industry Code of Conduct."[10]

- **AMA**: Academy of Model Aeronautics' *AMA Policies for Radio Controlled Model Aircraft Operations Utilizing First Person View. Failsafe. Stabilization and Autopilot Systems* guides model aircraft operators.[11]

In the same manner that the FAA does not regulate model aeronautics, the LTFUAS does not intend to adopt requirements of hobbyist activities using UAS.

3.1.2 Model Aircraft Rules and Definitions

The technology differences between UAS and model aircraft used for sport or recreation use is narrowing each day. Technology is advancing by leaps and bounds, while at the same time becoming more affordable and integrated into off-the-shelf-systems for consumers and hobbyists. While there are many technical documents and references through the FAA Modernization and

[10] Unmanned Aircraft System Operations Industry "Code of Conduct." Accessed January 13, 2014. Available at http://www.auvsi.org/conduct

[11] AMA Policies for Radio Controlled Model Aircraft Operations Utilizing First Person View, Failsafe, Stabilization and Autopilot Systems. Revision 07/20/2013. AMA Advanced Flight Systems Committee Report 101. Available at http://www.modelaircraft.org/files/AFSCREPORT101.pdf

Reform Act, the general difference between UAS and model aeronautics is the operation and intent of the operator not the aircraft.

If the activity or intent of the activity is used for commercial operations or contributing to the creation of a product or service, it is considered commercial activity, and it is subject to the FAA regulations and rule as stated in the FAA Modernization and Reform Act of 2012 and FAA UAS Road Map 2013.

If the activity is for sport and recreation use as defined by FAA SEC 336 SPECIAL RULE FOR MODEL AIRCRAFT of the Modernization Act, it is controlled by a cooperative agreement between the FAA and a Community Based Organization (CBO), such as the Academy of Model Aeronautics (AMA).

The AMA has been successful in self-regulating operations for hobbyists and aviation safety for over 77 years. During those 77 years, the AMA faced many challenges of new technologies such as analog to digital radio, coordinating operations within the airspace and the ever changing aircraft designs and capabilities not unlike the latest multi-rotor and First Person View (FPV) capabilities. To address the current safety requirements and interest of model aircraft operators, the AMA has developed and updated its general safety code AMA Publication 105-Safety Code and advanced aircraft rules publication 550-First Person View and 560-Autopilot effective January 1, 2014, to keep up with the FAA rule making and technology advances. Refer to Appendix C.

Legal Services

Constitutional Protection of Privacy: *The Constitution of the State of Alaska explicitly protects the right of privacy against government intrusion. Art. I, sec. 22 provides: "The right of the people to privacy is recognized and shall not be infringed. The Legislature shall implement this section."*

Alaska Statutory Protections:

AS 11.41.270 Stalking, nonconsensual conduct prohibits monitoring by technical means

AS 11.61.116 Sending an explicit image of a minor

AS 11.61.120(a)(6) Harassment: publishing or distributing certain images

AS 11.61.123 Indecent viewing or photography

AS 11.76.113 Misconduct involving confidential information in the first degree

AS 11.76.115 Misconduct involving confidential information in the second degree

It was discussed that a notice should be provided at the time of purchase of each model aircraft to review the AMA flight operation guidelines for appropriate use of model aeronautics. The LTFUAS did not adopt a requirement for notice regarding hobbyists since so many aircraft are purchased outside of Alaska and would not be required to provide the notice.

3.1.3 Alaska State Law and Personal Privacy

The State of Alaska and its local governments cannot dictate the use of the NAS but can consider rules that better define the FAA guidelines, can consider legal repercussion for entities found in violation of adopted laws, and can provide for specific privacy laws regarding the use of UAS in Alaska.

The State of Alaska Constitution provides privacy protection, "although not unlimited, has been held to be broader than the protection afforded by the United States Constitution. Both the Alaska

Constitution and the Fourth Amendment to the United States Constitution require a warrant by a governmental agency for the search of a place where a person has a reasonable expectation of privacy."[12]

Although much attention regarding UAS privacy focuses on government use and the Fourth Amendment, it is non-governmental use that is likely to raise some of the most significant privacy challenges in coming years. For private entities, the key constitutional question is the extent of their First Amendment privilege to gather information.

Civil use of unmanned aircraft will fall under the federal and state laws including such provisions as trespassing, invasion of privacy, intrusion upon seclusion, publication of private facts, stalking and harassment, and business privacy.

The LTFUAS, with guidance from Legislative Legal Services, considered many scenarios of possible violations of state and federal law that might occur with the use of unmanned aircraft. Legislative Legal Services provided the document, *Observations from Above: Unmanned Aircraft Systems and Privacy*,[13] that presented a variety of scenarios that have been tried in court and some that should be discussed as they pertain to UAS and personal privacy. The Legal Services memo outlining the areas of statute that protect personal privacy can be found in Appendix D.

Privacy protection considerations reviewed by the LTFUAS include but are not limited to the following.

1. **If data is gathered by a government agency, it is a public record. However, AS 40.20.120 provides certain protections for private information. Use of inadvertently captured information in a criminal prosecution may depend on who captures the information and whether the person whose actions have been captured has a reasonable expectation of privacy.**

It was discussed that data captured by a government-operated UAS would be treated similarly to data captured by other technology such as cell phones, manned aircraft, satellite images, voice recorders, etc. Case law is substantial in determining if the person would be considered to have a reasonable expectation of privacy and when a warrant would be required to obtain and use any data collected.

CH 48 (HB65) SLA08 Personal Information Protection Act also addresses the collection, storage, and breach of privacy. This act would include any data captured by a UAS.

2. **As technology continues to advance beyond "normal" application of current laws, a balanced approach that recognizes the inherent difficulty in predicting the future must be adopted when drafting new laws.**

---

[12] Memorandum: Alaska Laws Protecting Privacy (Work Order No. 28-LS0990). September 30, 2013. Division of Legal and Research Services, Legislative Affairs Agency, State of Alaska, Juneau.

[13] John Villasenor. 2013. Observations from Above: Unmanned Aircraft Systems and Privacy. Harvard Journal of Law & Public Policy. Available at http://www.harvard-jlpp.com/wp-content/uploads/2013/04/36_2_457_Villasenor.pdf

The LTFUAS determined that we cannot foresee the future applications of technology (of UAS or other technologies); therefore, creating restrictions in law based on assumptions is not recommended.

Observations From Above: UAS and Privacy

This document was published in the Harvard Journal of Law and Public Privacy by John Villasenor, a senior fellow in Governance Studies and the Center for Technology Innovation, the Brookings Institution.

The Task Force discussed many of the scenarios posed by the author when considering the need for Alaska law.

3. How should Alaska manage unintentionally captured images or data?

Discussion as of December 2013 concluded that there are adequate statutes, case law, and data retention guidelines that resolved the concerns of the LTFUAS in the area of unintentionally captured images or data. Discussion during the legislative session of 2014 indicated that data collection will be an area the LTFUAS will need to continue to monitor.

Recommendation: The LTFUAS also requests that the Department of Administration review its data retention schedules with particular emphasis on law enforcement data captured inadvertently and allowing that data to be destroyed.

4. The tie between safety and privacy is tightest with respect to rules requiring the operator of a UAS to be able to see the aircraft at all times. Public UAS operated in association with the expedited authorizations in Section 334(c)(2)(C) of the FAA Modernization and Reform Act of 2012 (FMRA) have a "line of sight" requirement.

The LTFUAS assumes that FAA regulations adopted in the next several years will continue to require visual line-of-sight operation. "Sense and avoid" technology will become more mature and some non-line-of-sight missions may be permitted by the FAA. Non-line-of-sight operations and other unknown technological advances may bring new challenges that will require the Legislature to review industry guidelines and state laws in the future.

5. Unmanned aircraft may bring efficient advances to law enforcement; however, the public seems to be highly sensitive to law enforcement using unmanned aircraft.

After reviewing many possible uses of UAS, the LTFUAS determined that existing law already affords the public with adequate protections.

- **Routine Technology**: The use of UAS is treated much the same as any other technological tool used to protect the public. The Department of Public Safety has adopted the IACP Guidelines for UAS, and the LTFUAS found those guidelines to be superior for rules of law enforcement use.

Specific guidelines from the IACP were offered as a provision of the legislation.

- **Public Navigable Airspace:** The question of what constitutes "public navigable airspace" for UAS operated by the government is central to privacy policy. The LTFUAS found that almost every law enforcement scenario discussed was already protected by existing law.
- **Role of Imaging Technology:** Rules and case law exist that protect citizens from inappropriate use of capturing data that is "more than the human eye could ever see."
- **Extended Surveillance:** Law enforcement does not intend to use UAS for standard patrol activities at this time. Limiting flight hours was not seen as an acceptable control because long flights may be necessary in the event of search and rescue or natural disaster remediation operations.
- **Obtaining a Warrant:** After much discussion, it was decided that using UAS to gather data would require a warrant in similar situations as using any other data gathering device (such as voice recording, photography, and thermal imaging with manual technology). No additional laws are required to obtain a warrant for UAS data gathering.

Voluntary Approaches

The International Association of Chiefs of Police (IACP) adopted model guidelines for the use of UAS for law enforcement purposes.

The Association for Unmanned Vehicle Systems International (AUVSI) Code of Conduct calls for a commitment to "respect the privacy of individuals."

Academy of Model Aeronautics (AMA) has also adopted operational policies and guidelines for advanced flight systems used in radio-controlled model aircraft.

It is the understanding of the LTFUAS that all law enforcement entities must first obtain a court order to use UAS over private property for criminal investigation against any person. This will be offered as a provision of the recommended legislation.

- **Weaponized Aircraft:** FAA guidelines do not allow anything to be dropped from an unmanned aircraft.
- **Visibility**: Law enforcement is planning to use high-visibility marking on any UAS they will use. Application of navigational lighting and/or high-visibility paint is being considered.
- **Public Education**: It is apparent that public education is necessary for all agencies using UAS but sensitivity is heightened for law enforcement uses.

Law Enforcement

Public protection will benefit greatly from unmanned aircraft for the purposes of search and rescue, crash scene documentation time, natural disaster monitoring, wildfire management, amber and silver alerts, hostage situations, and other life safety extremes. Some efforts will require warrants to proceed and some will be allowed under a Certificate of Authorization (COA).

It is the opinion of the LTFUAS that existing privacy laws are adequate to govern the use of unmanned aircraft.

It is the opinion of the LTFUAS that since Alaska has been chosen as one of the FAA UAS Test Sites, we have the opportunity to participate in the use of UAS in a variety of ways that would put Alaska in the position to establish policy guiding the use of UAS for the rest of the United States to consider.

3.2 Technical Operations Guidelines

International Civil Aviation Organization (ICAO), a special agency of the United Nations, promotes "the safe and orderly development of international civil aviation throughout the world. It sets standards and regulations necessary for aviation safety, security, efficiency, and regularity, as well as aviation environmental protection."[14]

The goal of the ICAO in addressing unmanned aviation is to provide the fundamental international regulatory framework to support routine operation of UAS throughout the world in a safe, harmonized, and seamless manner comparable to that of manned operations.

> "A number of Civil Aviation Authorities have adopted the policy that UAS must meet the equivalent levels of safety as manned aircraft... In general, UAS should be operated in accordance with the rule governing the flight of manned aircraft and meet equipment requirements applicable to the class of airspace within which they intend to operate... To safely integrate UAS in non-segregated airspace, the UAS must act and respond as manned aircraft do. Air Traffic, Airspace and Airport standards should not be significantly changed. The UAS must be able to comply with existing provisions to the greatest extent possible."[15]

UAS Operations Guidelines

Technical rules for operating unmanned aircraft systems are clearly identified at a global and federal level. "A number of Civil Aviation Authorities have adopted the policy that UAS must meet the equivalent levels of safety as manned aircraft..."

FAA Guideline N 8900.227 specifically sets the rules for the technical operations of flying unmanned aircraft.

The FAA has established guidelines for the certification and airworthiness of the aircraft, certification of the pilot including additional instruction in operating specific UAS, flight operations with the test sites, management of the test site, and COAs for particular missions.

The LTFUAS is confident in the FAA guidelines in protecting the safety of the NAS.

First Edition–2013. U.S. Department of Transportation Federal Aviation Administration. Available at http://www.faa.gov/about/initiatives/uas/media/uas_roadmap_2013.pdf

4. BENEFITS TO ALASKA

The UAF Center for Unmanned Aircraft Systems Integration, Research, Testing, and Development (RT&D) is a nationally recognized program that has shown responsible use of UAS for more than 10 years. The University has been selected by the FAA to be one of the six federal test sites. The University proposal contained a diverse set of test site range locations in seven climatic zones as well as geographic diversity with test site range locations in Hawaii and Oregon. The research plan includes the development of a set of standards for unmanned aircraft categories, state monitoring and navigation, as well as safety standards for UAS operations.

Numerous benefits that can be realized as Alaska takes the lead on this new technology are:

- Economic
- Policy Development
- Expedited Timeline for Test Range Use and Approved Missions
- Encourage University Pilot Training Program for UAS
- Education—Public Awareness
- Market Alaska as "Open for Business" for UAS
- Public Safety Statewide

4.1 Economic Benefit

Test Site Selection: As part of the University of Alaska's application to the FAA for selection as a test site, the McDowell Group was contracted to complete an economic evaluation of unmanned aircraft benefits for Alaska. *Economic Impact of a Pan-Pacific Unmanned Aircraft Systems Test Site* was completed May 2013 (Appendix E). The highlights of this report include:

> "In total, designation of PPUTRC [Pan-Pacific UAS Test Range Complex] as a UAS test site would be expected to generate 1,065 direct, indirect, and induced jobs in 2014, increasing to over 1,400 jobs by 2017. Total labor income would climb from $57 million in 2014 to about $76 million in 2017.
>
> In addition to direct jobs created from UAS firms, significant indirect and induced jobs will also be created. Indirect jobs represent jobs created throughout the supply chain to support the UAS industry and induced jobs represent jobs created due to changes in household consumption as a result of the UAS industry."[16]

In addition to Test Site Selection: The cost savings to government agencies in both man hours and safety risk is immeasurable at this time, but the LTFUAS realizes there will be many efficiencies gained with the use of this technology. Examples include but are not limited to:

[16] Economic Impact of a Pan-Pacific Unmanned Aircraft Systems Test Site. May 2013. Prepared for Alaska Center for Unmanned Aircraft Systems Integration, University of Alaska Fairbanks. Prepared by McDowell Group.

- **More Accurate Biological Studies.** One specific marine mammal population count had been conducted by a single manned airplane flyover to film and later count the animals. The noise from the aircraft distressed the animals and many were on the move during the filming. With the UAS launched nearby, the animals were undisturbed and a more accurate count was completed. The more-accurate count gave biologists better data to determine such things as the health of the population and whether or not to include them on the endangered species list.
- **Rapid Response of Air Assets for Traffic Resolution.** Several incidents along the major highways in Alaska have resulted in extended road closures up to 6 hours. For example, manual photography and mapping documentation conducted from the ground can keep a road closed for approximately 3 hours. Using a UAS to map an accident from the air can result in the road being opened in approximately 1 hour.
- **Accurate Data Collection Leading to Cost Savings.** UAS were used to determine the functioning ability of oil field smoke stacks that resulted in accurate data provided in 20 minutes, and information that showed the needed replacement of only one of three catalytic converters, saving the oil company approximately $1 million.
- **Facilitate Search & Rescue and Other Life-Saving Missions.** Many examples were discussed where human life safety was at significant risk and that UAS could be used to complete the mission.
- **Significant Cost Savings in Public Safety.** Alaska's law enforcement aircraft costs an average hourly rate of $700 and one aircraft (Super Cub) costs approximately $800,000, and the A-Star helicopter is $3.6 million. The average hourly cost of operating a UAS ranges from $30 to $50 per hour, and the aircraft costs range from a few hundred dollars to over $40,000.

4.2 Policy Development

With Alaska being selected as one of the FAA UAS test sites, the opportunity to develop regulations and guidelines for UAS missions nationwide can be realized.

The test site operators will provide opportunities for government agencies, industry, and researchers to access this airspace to aid in the integration of UAS regulations in the NAS. Additionally, data collection will support development and operations research, and professional development opportunities will be available for inspectors, airspace managers, air traffic controllers, and others. The specific goals described by the PPUTRC applicants are listed below.

- Develop a set of standards for select unmanned aircraft categories, for aircraft state monitoring, and navigation. [PPUTRC goals and objectives work will augment ongoing standards work with research on categories of UAS not yet addressed, and evaluations needed to refine emerging standards under consideration.]

- Validate FAA acceptable risk thresholds or safety management system standards for UAS operations.
- Identify safety factors in UAS design.
- Validate certification standards, including protocols for air traffic control interaction.
- Define and qualify underlying assumptions and a minimum set of air vehicle characteristics critical to safety, reliability, etc.
- Develop effective, compliant "sense and avoid" systems to satisfy regulatory guidance.
- Identify gaps in federal and state statutory and case law protections for privacy and recommend policies or legislation to remedy.

UAF Center for Unmanned Aircraft Systems Integration, RT&D

UAF has been involved in UAS missions for more than 10 years. It has participated in research and data gathering operations from Prudhoe Bay to South Africa.

The Alaska Legislature indicated its support in the University's efforts by passage of HCR6 in the 2013 session. The resolution identified many of the good uses of UAS in Alaska and established this task force to recommend statutory changes.

- Directly support the federal mandate for "Expanding Use of UAS in the Arctic" (in Sec 332(d) of Public Law 112-95).
- Design experiments and provide data to support American Society for Testing and Materials (ASTM) F38 and Radio Technical Commission for Aeronautics Special Committee (RTCA SC) 203 to evaluate minimum training and operator qualification standards for crew licensing.[17]

4.3 Expedited Timeline for Test Range Use and Approved Missions

Currently, approved UAS missions (flights) require approval by the FAA through the COA process. This process requires the entity interested in operating UAS to complete a detailed flight plan and aircraft approval. This process takes approximately 6 months from application to flight.

Now that Alaska has been selected as a test site, specific areas of the state are expected to be pre-approved for flight testing, thus eliminating the extensive application process through the FAA. The University Center for Unmanned Aircraft Systems Integration RT&D will authorize and schedule UAS flights in the test ranges and other areas with expedited approval.

4.4 Encourage Pilot Training Program for UAS

One hurdle that aircraft manufacturers and pilots are experiencing is that while specific training is a requirement to fly a UAS, there is no UAS flight training program approved by the FAA. Alaska would like to lead the nation and become a training center for interested UAS pilots and crews.

The LTFUAS recognizes this as an opportunity for our state university in pilot training and as an economic benefit in the state. In addition, it will keep the University of Alaska in league with other U.S. universities that are developing pilot training programs.

[17] Ibid.

4.5 Education—Public Awareness

The LTFUAS discussed that each entity that would be using a UAS would also be responsible to educate the public on the purpose of the mission as well as provide contact information of a person who would be able to respond to inquiries.

Some of the public awareness also would be provided through the extended duties of the LTFUAS as they deliberate the issues surrounding UAS flights in Alaska.

4.6 Market Alaska "Open for Business" for UAS

The Department of Commerce, Community, and Economic Development (CDDED) partnered with the Fairbanks Economic Development Council and provided an education booth representing Alaska at the AUVSI convention in Florida in May 2014. A summary of responses from the DCCED representatives is that, based on meetings held during the AUVSI show, it is very likely there will be industry visits later this summer that will look closely at Alaska as a place for investment.

Since Alaska has been selected as a test site, many manufacturers and associated businesses will seek out the University to begin using test ranges and conduct business in and around the state. If fact, at least one UAS services business has already indicated an intent to open an office in Alaska. Alaska is a state with great UAS industry potential.

4.7 Benefits to the Public Safety Statewide

- UAS do not require a pilot on board to operate the aircraft or attached equipment. UAS operators and system operators remain safely on the ground, reducing their exposure to threats.
- UAS are able to enter environments that may be hazardous to pilots of manned aircraft.
- UAS provide superior situational awareness while minimizing the danger to which operators are exposed.
- UAS and trained operators minimize response time to most emergency situations.
- Community safety is enhanced by the rapid response of air assets to an emergency. In most cases, manned aircraft must take off and land at airports where UAS can launch from nearly anywhere within minutes.

4.8 Audits of Missions

FAA Privacy Policy requires the test site to report a variety of data on the flights occurring in the test ranges.

At this time, the LTFUAS does not believe there should be an additional requirement for reporting other than what is required by the FAA.

4.9 Test Site Operations Manager Position

The FAA Privacy Policy requirement also requires a Chief Privacy Officer at the UAS test site. The University is refining the duties of the Director of the Test Site to encompass all the responsibilities of managing the test ranges. This officer will be developing privacy policies to govern all activities conducted by the test site, make privacy policies publicly available, and establish a mechanism to receive and consider comments from the public. Annually, the privacy officer will review test site operations to verify compliance with the policies and practices and share those outcomes in a public forum.

4.10 Incentive Grants

Many businesses have asked the LTFUAS if Alaska will offer any incentives to conduct business in the state. Given the reduced General Fund income to Alaska, the LTFUAS did not consider any financial incentives for potential business startups in Alaska.

The LTFUAS did discuss the advantages of being selected as a test site and the expedited administrative support for conducting UAS business in Alaska. It was agreed that the opportunity will offer many benefits to our state (see Section 3.3).

4.11 Research Appropriation to University of Alaska Fairbanks

While the LTFUAS would like to support the University financially, it was determined that funding may not be available at this time. The FAA states that no additional funding will be provided in conjunction with test site selection, but we are confident that federal funding may follow as integration into the NAS will require additional management.

5. FINAL RECOMMENDATIONS

The LTFUAS supports its recommendations to the Legislature by considering and adopting general guidelines from the following reports from the FAA:

- Guidelines for Operations of UAS (FAA Guideline N 8900.227)
- Comprehensive Plan to Integrate UAS in the NAS
- Final Privacy Requirements (Appendix A)

The LTFUAS also adopted the IACP UAS Guidelines as appropriate for law enforcement in Alaska (Appendix B).

In addition to the FAA documents, the LTFUAS considered a report from Legislative Legal Services that identified Alaska's privacy laws and Constitutional protections of privacy to determine if there might be a scenario created through the use of UAS that would not be protected by existing privacy laws. The LTFUAS also recognized that because Alaska has been chosen as an FAA UAS Test Site for UAS Integration, an emphasis on management of the test ranges, economic development, and public education need immediate attention.

The LTFUAS made the following conclusions:

- It is the opinion of the LTFUAS that no additional statutory or regulatory requirements are needed for FAA-approved missions.
- It is the opinion of the LTFUAS that privacy policy is adequate through the FAA requirements for the use of UAS in the test sites.
- The LTFUAS does not intend to adopt requirements for hobbyist activities using UAS in the same manner that the FAA does not regulate model aeronautics.
- It is the opinion of the LTFUAS that the Department of Administration should review its data retention schedules with particular emphasis on law enforcement data captured inadvertently and allowing that data to be destroyed.
- It is the opinion of the LTFUAS that existing privacy laws are adequate to govern the use of unmanned aircraft.
- The LTFUAS is confident in the FAA guidelines in protecting the safety of the NAS.

Based on these findings, the final recommendations of the LTFUAS are the following:

1. Require all state and local law enforcement entities to adopt the IACP guidelines to help ensure privacy protection for Alaskans.

2. Require all law enforcement entities to first obtain a court order to use UAS over private property for criminal investigation against any person.

3. Encourage use of high-visibility marking or navigational lighting on law enforcement UAS as appropriate.

4. Convey a clear message to industry that Alaska is open for business to harness the beneficial uses of UAS, to encourage the growth of this economic sector, and to allow Alaska to continue to lead the nation in aviation innovation.

5. Encourage private and public UAS training programs.

6. Report all UAS incidents/accidents of aircraft larger than 55 pounds to the University of Alaska and/or Alaska Aviation Coordination Council.

7. Extend LTFUAS until June 30, 2017, and expand the duties of the Task Force, adding two industry seats and one public member seat, for the following reasons:

    - During this transitional phase of growing use of UAS in Alaska, the LTFUAS should be extended to continue to monitor the integration of UAS into the NAS and any privacy matters that may arise that are not already covered by existing law. Because Alaska currently has a strong set of privacy laws, rather than recommend prohibitions be incorporated into statute that might inhibit industry, the LTFUAS recommends it continue to review UAS operations in light of current statutes and only recommend changes in statute as necessary.

    - Because FAA will be updating and issuing new guidelines based on the work of the new FAA UAS Test Sites announced on December 30, 2013, it is necessary for the LTFUAS to continue to review FAA policies to determine their impact and whether any additional policy changes at the state level may be necessary in response.

    - With Alaska's December 30, 2013, selection as one of the nation's six FAA UAS Test Sites through the University of Alaska's application (in conjunction with Oregon and Hawaii), the LTFUAS will meet part of the test site's requirement as a public forum where concerns regarding privacy and data matters can be collected and evaluated.

As we move forward, and particularly in light of the fact that Alaska has been selected as an FAA test site for UAS integration, and with the extension and expansion of duties of the Task Force, the LTFUAS further recommends immediate emphasis on the following:

1. management of the test ranges,
2. economic development opportunities,
3. public education and public relations regarding UAS,
4. rules for hobby and recreational use of model aircraft as outlined by the FAA, and
5. privacy issues including those related to data collection.

In addition to the above recommendations, the LTFUAS also recommends the following:

- each department of the State of Alaska identify a point of contact for UAS to coordinate with the LTFUAS and provide information regarding department policy and procedures to ensure accountability and privacy in regard to UAS use, and
- the Alaska Department of Administration review and update its data retention policies particularly in the area of inadvertent captured data that are not relevant to a state agency.

6. DEFINITIONS

TERMINOLOGY	DEFINITION	SOURCE
Autonomous Operations	It is generally understood that most UAS have some level of autonomy associated with its operation. Although it is possible to have a completely manual UAS, which requires a pilot-in-the-loop, the majority of UAS are autonomous to a certain degree. Only those UAS that have the capability of pilot intervention, or pilot-on-the-loop, shall be allowed in the NAS outside of Restricted, Prohibited, or Warning areas. UAS that are designed to be completely autonomous, with no capability of pilot intervention, are not authorized in the National Airspace System. Although the pilot may be technically considered out-of-the-loop in a lost link scenario, this restriction does not apply to UAS operating under lost link.	1
Certificate of Waiver or Authorization (COA)	An FAA grant of approval for a specific flight operation. The authorization to operate a UAS in the National Airspace System as a public aircraft outside of Restricted, Warning, or Prohibited areas approved for aviation activities.	2
Civil Aircraft	Aircraft other than public aircraft.	2
Crewmember [UAS]	In addition to the crewmembers identified in 14 CFR Part 1, a UAS flightcrew member includes pilots, sensor/payload operators, and visual observers, but may include other persons as appropriate or required to ensure safe operation of the aircraft.	2
Detect and Avoid	Term used instead of Sense and Avoid in the Terms of Reference for RTCA Special Committee 228. This new term has not been defined by RTCA and may be considered to have the same definition as Sense and Avoid when used in this document.	2
International Civil Aviation Organization (ICAO)	A specialized agency of the United Nations whose objective is to develop the principles and techniques of international air navigation and to foster planning and development of international civil air transport.	2
Manned Aircraft	Aircraft piloted by a human onboard.	2
Model Aircraft	An unmanned aircraft that is capable of sustained flight in the atmosphere; flown within visual line-of-sight of the person operating the aircraft and flown for hobby or recreational purposes.	2
National Airspace System	The common network of U.S. airspace; air navigation facilities, equipment and services, airports or landing areas; aeronautical charts, information and services; rules, regulations and procedures, technical information, and manpower and material. Included are system components shared jointly with the military.	2
Personal Information Privacy Act (PIPA)	An Act relating to breaches of security involving personal information, credit report and credit score security freezes, protection of social security numbers, care of records, disposal of records, identity theft, credit cards, and debit cards, disclosure of the names and addresses of permanent fund dividend applicants, and to the jurisdiction of the office of administrative hearings; amending Rules 60 and 82, Alaska Rules of Civil Procedure; and providing for an effective date.	3

TERMINOLOGY	DEFINITION	SOURCE
Pilot-in-Command	Pilot-in-command means the person who: 1) has final authority and responsibility for the operation and safety of the flight; 2) has been designated as pilot-in-command before or during the flight; and 3) holds the appropriate category, class, and type rating, if appropriate, for the conduct of the flight.	2
Public Aircraft	An aircraft operated by a governmental entity (including federal, state, or local governments, and the U.S. Department of Defense and its military branches) for certain purposes as described in 49 U.S.C. §§ 40102(a)(41) and 40125. Public aircraft status is determined on an operation by operation basis. See 14 CFR Part 1, § 1.1 for a complete definition of a public aircraft.	2
Sense and Avoid	The capability of a UAS to remain well clear from and avoid collisions with other airborne traffic. Sense and Avoid provides the functions of self-separation and collision avoidance to establish an analogous capability to "see and avoid" required by manned aircraft.	2
Test Range	A defined geographic area where research and development are conducted in accordance with Sections 332 and 334 of the FMRA. Test ranges are also known as test sites in related documents such as the FAA's Screening Information Request.	2
Unmanned Aircraft	1) A device used or intended to be used for flight in the air that has no onboard pilot. This devise excludes missiles, weapons, or exploding warheads, but includes all classes of airplanes, helicopters, airships, and powered-lift aircraft without an onboard pilot. UA do not include traditional balloons (see 14 CFR Part 101), rockets, tethered aircraft and unpowered gliders. 2) An aircraft that is operated without the possibility of direct human intervention from within or on the aircraft.	2
Unmanned Aircraft System	An unmanned aircraft and its associated elements related to safe operations, which may include control stations (ground, ship, or air-based), control links, support equipment, payloads, flight termination systems, and launch/recovery equipment. An unmanned aircraft and associated elements (including communications links and the components that control the unmanned aircraft) that are required for the pilot-in-command to operate safely and efficiently in the National Airspace System.	2
Visual Line-of-Sight	Unaided (corrective lenses and/or sunglasses exempted) visual contact between a pilot-in-command or a visual observer and a UAS sufficient to maintain safe operational control of the aircraft, know its location, and be able to scan the airspace in which it is operating to see and avoid other air traffic or objects aloft or on the ground.	2

APPENDIX A

FAA FINAL PRIVACY REQUIREMENTS NOVEMBER 7, 2013

[4910-13]

DEPARTMENT OF TRANSPORTATION

Federal Aviation Administration

14 CFR Part 91

[Docket No.: FAA-2013-0061]

Unmanned Aircraft System Test Site Program

AGENCY: Federal Aviation Administration (FAA), DOT.

ACTION: Notice of availability of final privacy requirements for the unmanned aircraft system ("UAS") test site program; response to comments

SUMMARY: On February 22, 2013 the FAA published and requested public comment on the proposed privacy requirements (the "Draft Privacy Requirements") for UAS test sites (the "Test Sites") that the FAA will establish pursuant to the FAA Modernization and Reform Act of 2012 ("FMRA"). This notice responds to the public comments received and publishes the FAA's final privacy requirements for the Test Sites (the "Final Privacy Requirements").

ADDRESSES: You may review the public docket for this rulemaking (Docket No. FAA-2013-0061) on the Internet at http://www.regulations.gov. You may also review the public docket at the Docket Management Facility in Room W12-140 of the West Building Ground Floor at 1200 New Jersey Avenue, SE., Washington, DC, 20590-0001 between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays.

FOR FURTHER INFORMATION CONTACT: For technical questions concerning the test site program, contact Elizabeth Soltys, Unmanned Aircraft Systems Integration Office, Federal Aviation Administration, 800 Independence Avenue SW., Washington, DC 20591; email: 9-ACT-UASTSS@faa.gov.

For legal questions concerning the FAA's privacy requirements for the Test Sites contact Carlos Siso, Office of the Chief Counsel, Federal Aviation Administration, 800 Independence Ave. SW., Washington, DC 20591; email: 9-AGC-UASPrivacy@faa.gov.

SUPPLEMENTARY INFORMATION

This notice summarizes and responds to the public comments received in response to the following Federal Register notices seeking public comment on the Draft Privacy Requirements for the Test Sites:

(i) Notice of availability and request for comments published in the Federal Register on February 22, 2013 (78 FR 12259), Docket No. FAA-2013-0061-0001; and

(ii) Notice of public engagement session published in the Federal Register on March 28, 2013 (78 FR 18932), Docket No. FAA-2013-0061-0050.

In addition, this notice publishes the FAA's Final Privacy Requirements for the Test Sites which are set forth under the "Conclusion" section below.

Discussion of Comments

The FAA received 99 comments through Regulations.gov and 53 comments through the public engagement session. A transcript of the public engagement session is available at: http://www.faa.gov/about/initiatives/uas/media/UAStranscription.pdf. Public comments ranged from recommending that the FAA not impose any privacy requirements on the Test Sites to recommending that the FAA impose extensive privacy requirements on the Test Sites. The FAA also received comments that were not responsive to the notice or that were unclear.

The FAA analyzed the responsive comments and grouped them into ten categories. The following sections address the comments by category.

1) The FAA should focus on its safety mission; it should not engage in regulating privacy.

The FAA received a number of comments advocating that the FAA should focus on its safety mission and should not engage in regulating privacy. The following comments were received:

- The FAA should focus on safety;
- Regulating privacy is outside the FAA's mission;
- The FAA does not have statutory authority to regulate privacy;
- The FAA does not have the authority to impose privacy requirements on the Test Sites;
- The FAA should allow privacy to be addressed by other more appropriate government bodies including: Federal agencies that have expertise and authority to deal with privacy concerns; Congress; state or local legislative bodies; and the judicial system;
- The Federal Government should not regulate privacy impacts of UAS; these issues should be left to states, cities, and counties to address;
- The FAA should only require compliance with privacy laws that are already in place and focus on developing safe operation of UAS;
- The FAA should not deny access to the national airspace for reasons other than safety;
- Existing privacy laws are sufficient to cover the responsible use of UAS. There already exist Federal, state and other laws that protect privacy. In addition, tort law may also provide avenues of recourse for plaintiffs to protect their privacy rights;
- The FAA should not implement privacy regulations that make entry into the market prohibitive for small businesses;
- The FAA should not allow privacy issues to hinder commercialization of UAS;
- There is no evidence that the operations at the Test Sites will harm privacy interests. Restricting activities at the test sites at this early stage will likely overprotect privacy at the expense of innovation;

- The FAA should afford adequate time for non-governmental solutions such as industry norms and practices to develop before intervening administratively to protect privacy. These less restrictive solutions will reduce the need for administrative intervention and will allow for increased innovation in the national airspace;
- Requiring Test Site operators to develop privacy policies that are informed by Fair Information Practice Principles is onerous for commercial operators of UAS and its cost will likely outweigh any hypothetical benefits;
- Requiring Test Site operators to issue privacy policies informed by Fair Information Practice Principles will limit the diversity of data that will inform integration of UAS into the national airspace. The FAA's approach would exclude an important possible alternative from the discussion: some operators might choose not to issue a privacy policy or adopt a non-FIPPs-compliant policy; and
- The FAA should treat data gathered by UAS no differently than data gathered by a manned aircraft or by other electronic means. There is no significant difference in terms of surveillance between a UAS and a manned aircraft, and manned aircraft are permitted to operate in the national airspace with cameras.

Response: The FAA's mission is to provide the safest, most efficient aerospace system in the world and does not include regulating privacy. At the same time, the FAA recognizes that there is substantial debate and difference of opinion among policy makers, industry, advocacy groups, and members of the public as to whether UAS operations at the Test Sites will raise novel privacy issues that are not adequately addressed by existing legal frameworks.

The FAA will require the Test Site operators to comply with the Final Privacy Requirements. Congress mandated that the FAA establish the Test Sites to further UAS integration into the national airspace system. The Final Privacy Requirements advance this purpose by helping inform the dialogue

among policymakers, privacy advocates, and industry regarding the impact of UAS technologies on privacy.

The FAA's authority for including the Final Privacy Requirements in the Test Site OTAs is set forth in 49 U.S.C. 106(l)(6). That statute authorizes the FAA Administrator to enter into an OTA "on such terms and conditions as the Administrator may consider appropriate." The FAA believes that it is appropriate to require Test Site operators to comply with the Final Privacy Requirements.

2) The FAA should require warrants before law enforcement can use UAS in the Test Sites to conduct surveillance or gather evidence.

The FAA received a variety of comments advocating that:

- The FAA should include provisions in the OTA that require warrants to be obtained when UAS are used to conduct surveillance or gather evidence within the Test Site; and
- The OTA include appropriate safeguards to protect Fourth Amendment rights at and around our national borders.

Response: The FAA's mission is to provide the safest, most efficient aerospace system in the world. The FAA is establishing the UAS Test Sites consistent with its mission and the direction in the FMRA. The FAA appreciates the commenters' concerns. Accordingly, the final privacy requirements provide that the Site Operator and its team members must comply with all applicable privacy laws.

3) The FAA should mandate specific privacy requirements for the Test Sites.

The FAA received a variety of comments advocating that the FAA mandate specific privacy requirements for the Test Sites. The recommendations included the following:

- The FAA should specify minimum privacy requirements and require each Test Site to comply with them;
- The FAA should mandate compliance with Fair Information Practice Principles for all Test Site operators;

- The FAA should establish prohibitions on where UAS can operate within a Test Site and the kinds of surveillance activities that UAS conduct at the Test Sites;
- The FAA should require all UAS flown at the Test Sites to have unencrypted down links so that all their data collection can be viewed by the public, including records contained onboard and recovered after landing;
- The FAA should require each Test Site operator to conduct a full Privacy Impact Assessment;
- The FAA should require each Test Site operator to establish a Chief Privacy Officer and centralize privacy responsibilities in that person;
- The FAA should require each Test Site operator to establish a privacy advisory committee to review proposed UAS research at the Test Sites for privacy concerns;
- The FAA should require each Test Site operator to provide a detailed response to public input it receives regarding the Test Site's privacy policy;
- The FAA should prohibit the sharing of recorded surveillance footage beyond the scope of its original purpose;
- The FAA should prohibit UAS in the Test Sites from flying below a minimum altitude;
- The FAA should prohibit UAS in the Test Sites from carrying any equipment that could be used to conduct surveillance;
- The FAA should limit the use of the data collected at the Test Sites;
- The FAA should prohibit (i) the use of Test Sites for government surveillance, and (ii) sharing data collected with law enforcement for the purpose of investigating or prosecuting a crime;

- The FAA should limit the type of data that can be collected by UAS at the Test Sites including limiting the resolution of visual imagery that UAS can collect, prohibiting recording of audio data, and restricting the ability to collect WiFi and cellular signals;
- The FAA should require Test Site operators to provide data on the payload of each UAS flown at the Test Site including specific information on the data the payload is capable of collecting;
- The FAA should mandate privacy policies that require deletion of collected data within a certain time period;
- The FAA should prohibit the Test Site operator and UAS operators at the Test Sites from retaining any data collected longer than is necessary to fulfill the purpose of the Test Site;
- The FAA should require UAS operators to file data collection statements with the FAA for UAS operations that involve remote sensing and signals surveillance from the UAS platform; and
- The FAA should require UAS operating at altitudes over 400 feet to carry an automatic dependent surveillance-broadcast transponder (ADS-B Out) so that UAS operations can be tracked.

Response: The FAA's mission is to provide the safest, most efficient aerospace system in the world. Although there is a long history of placing cameras and other sensors on aircraft for a variety of purposes—news helicopters, aerial surveys, film/television production, law enforcement, etc.—the FAA is not, through awarding and supervising these Test Sites, taking specific views on whether or how the Federal Government should regulate privacy or the scope of data that can be collected by manned or unmanned aircraft.

There was substantial difference of opinion among commenters as to whether UAS operations and manned aircraft operations present different privacy issues that justify imposing special privacy

restrictions on UAS operations at the Test Sites. In addition, there was substantial difference of opinion among commenters regarding what elements would be appropriate for a Test Site privacy policy. Based on the comments received, the FAA will require Test Sites to comply with the following requirements in addition to those described in the Draft Privacy Requirements:

(1) Test site operators must maintain a record of all UAS operating in the test sites;

(2) Test site operators must require every UAS operator in the Test Site to have a written plan for the operator's use and retention of data collected by the UAS; and

(3) Test site operators must conduct an annual review of test site operations to verify compliance with stated privacy policy and practices and share those outcomes annually in a public forum with an opportunity for public feedback.

The above are reflected in the Final Privacy Requirements.

The FAA has determined that it should not impose privacy requirements beyond those in the Final Privacy Requirements for the following reasons. *First*, there are many privacy laws and applications of tort law that may address some of the privacy issues that arise from UAS operations at the Test Sites.

Second, the FAA believes that Test Sites operators will be responsive to local stakeholders' privacy concerns and will develop privacy policies appropriately tailored to each Test Site. The selection criteria for the Test Sites specify that only a "public entity" can serve as a Test Site operator. The term "public entity" is defined in the selection criteria to mean "(A) any State or local government; (B) any department, agency, special purpose district, or other instrumentality of a State or States or local government; and (C) the National Railroad Passenger Corporation, and any commuter authority." The FAA expects that public entities will be responsive to stakeholder concerns.

Third, if UAS operations at a Test Site raise privacy concerns that are not adequately addressed by the Test Site's privacy policies, elected officials can weigh the benefits and costs of additional

privacy laws or regulations. Forty-three states have already enacted or are considering legislation regulating use of UAS. *See* Drone Legislation All the Rage; Varies Widely Across 43 States, According to WestlawNext, June 17, 2013, *available at*: http://thomsonreuters.com/ press-releases/062013/drone_legislation_varies_across_ states_according_to_Westlaw.

4) The FAA should conduct audits of the Test Sites to ensure compliance with privacy policies.

Various commenters recommended that the FAA should audit each Test Site to ensure compliance with the privacy policies in the OTA.

Response: Each Test Site will be operated by a public entity (see response to Category 3 above). The FAA expects that the public entity operating each test site will already be subject to oversight and audit requirements. The FAA does not believe that it is appropriate for the FAA to impose additional audit requirements on the Test Site operators.

5) The FAA should require Test Site operators to keep records that will allow for effective citizen participation and reporting of privacy violations.

One commenter recommended that the FAA require Test Site operators to keep accurate, detailed, frequent, and accessible records to allow for effective citizen participation and reporting of privacy violations.

Response: Each Test Site operator will be a public entity (see response to Category 3 above). Public entities are generally subject to laws that establish record keeping requirements and provide the public access to records. The FAA does not believe that it is appropriate for the FAA to impose additional record keeping requirements on the Test Site operators other than those specified in the Final Privacy Requirements.

6) The FAA should establish a searchable database or registry of UAS operators and operations at the Test Sites.

The FAA received a variety of comments advocating that:

- The FAA should create a public, searchable database or registry of all UAS operators. Some commenters recommended that the database include information about surveillance equipment used and the operator's data collection practices;
- The FAA should require UAS operators at the Test Sites to provide public statements describing the surveillance equipment that will be carried by a UAS, the geographical area where the UAS will be operated, and the purposes for which the UAS will be deployed; and
- The FAA should establish a means for the public to access the data on UAS flights collected by the FAA.

Response: The FAA believes that it is not appropriate for the FAA to create a public registry or database of UAS operations at the Test Sites. However, the FAA has included a contractual provision in the Final Privacy Requirements that will require each Test Site operator to maintain a record of all UAS operating at the Test Site.

7) **The FAA should modify its Test Site selection criteria to take into account privacy concerns.**

Various commenters recommended that the FAA revise its selection criteria. Suggestions included the following:

- The FAA should choose an applicant that has an established UAS research program with active engagement with UAS privacy issues;
- The FAA should choose at least one Test Site in a state with strong privacy protective UAS laws and regulations;
- The FAA should select one or more Test Sites in or near a densely populated urban area in order to avoid a bias towards privacy issues relevant for rural UAS operations; and

- The FAA should consider the privacy track record of applicants as part of the selection process.

Response: The FAA believes that it is not appropriate to modify the Test Site selection criteria to include the recommended privacy considerations. Applicants have already submitted complete applications based on the announced selection criteria and the application period has closed.

The FAA published the Test Site selection criteria and application instructions on February 14, 2013 on https://faaco.faa.gov under Solicitation number DTFACT-13-R-00002. The selection criteria incorporate the factors that Congress directed the FAA to consider in the FMRA, including, geographic and climatic diversity; location of ground infrastructure; and research needs. The FAA required applicants to submit seven volumes of extensive and detailed information that address a broad set of considerations including safety, airspace use, experience, research objectives, and risk considerations. This information will allow the FAA to make a selection based on the direction provided by Congress in the FMRA and on the FAA's mission.

The FAA developed the Test Site selection criteria after seeking public input and consulting with other agencies regarding what selection criteria would be appropriate. In March 2012, the FAA published a request for comment in the Federal Register and in April 2012, the FAA hosted two public webinars to obtain public input on the FAA's proposed selection criteria. Although there was significant public participation, the FAA did not receive comments advocating that privacy issues be used as a factor in choosing the Test Sites.

8) The FAA should require Test Site operators to conduct specific tests related to privacy and surveillance.

Commenters recommended that the FAA should:

- Require UAS operators at Test Sites to conduct specific tests related to surveillance and privacy;

- Require Test Site operators to design the sites— including the creation of "fake" houses or businesses—to allow UAS operators to test how accurate their surveillance systems are and test how much data those systems collect; and
- Develop and require Test Sites to implement a standard battery of privacy tests that each UAS operating within a Test Site should have to perform in order to collect data that the FAA can use to make decisions about privacy issues.

Response: The FAA is not planning to have the Test Site operators conduct specific research.

9) The FAA should not take punitive actions against a Test Site operator for privacy violations without due process.

One commenter noted that if charges are filed by law enforcement against a Test Site operator due to potential violations of privacy laws, the OTA allows the FAA to suspend or modify the relevant operational authority for a Test Site (e.g. Certificate of Operation, or OTA). That commenter recommended that a Test Site operator be entitled to due process before the operational authority be suspended or modified.

Response: A Test Site operator's rights to operate a Test Site are set forth in the OTA and are subject to the terms and conditions in the OTA. The FAA believes that it is appropriate to include contractual provisions in the Final Privacy Requirements that allow the FAA to protect the public interest by suspending or modifying the relevant operational authority for a Test Site if charges are filed by law enforcement against a Test Site operator due to potential violations of privacy laws.

10) The FAA should establish sanctions for violations of privacy policies or rights.

One commenter recommended that the FAA rescind the OTA for a Test Site where serious privacy violations have occurred and levy fines against operators that fail to comply with privacy policies.

Response: The Final Privacy Requirements provide that violations of privacy laws can result in suspension or termination of the OTA.

The FAA will not monitor a Test Site's compliance with its own privacy policies. The FAA expects the public entities operating the Tests Sites and their respective state/local oversight bodies to monitor and enforce a Test Site's compliance with its own policies.

Conclusion

Based on the comments submitted, the FAA intends to require each test site operator to comply with all of the privacy requirements included in the Draft Privacy Requirements as well as the following additional privacy requirements:

(1) Test site operators must maintain a record of all UAS operating in the test sites;

(2) Test site operators must require every UAS operator in the Test Site to have a written plan for the operator's use and retention of data collected by the UAS; and

(3) Test site operators must conduct an annual review of test site operations to verify compliance with stated privacy policy and practices and share those outcomes annually in a public forum with an opportunity for public feedback.

Accordingly, the FAA intends to include the following terms and conditions into Article 3 of the OTA:

"ARTICLE 3 PRIVACY; APPLICABLE LAW

a. Privacy Policies

The Site Operator must:

(i) Have privacy policies governing all activities conducted under the OTA, including the operation and relevant activities of the UAS authorized by the Site Operator.

(ii) Make its privacy policies publicly available;

(iii) Have a mechanism to receive and consider comments from the public on its privacy policies;

(iv) Conduct an annual review of test site operations to verify compliance with stated privacy policy and practices and share those outcomes annually in a public forum with an opportunity for public feedback;

(v) Update its privacy policies as necessary to remain operationally current and effective; and

(vi) Ensure the requirements of its privacy policies are applied to all operations conducted under the OTA.

The Site Operator's privacy policies should be informed by Fair Information Practice Principles.

b. Compliance With Applicable Privacy Laws

For purposes of this agreement, the term "Applicable Law" shall mean (i) a law, order, regulation, or rule of an administrative or legislative government body with jurisdiction over the matter in question, or (ii) a ruling, order, decision or judgment of a court with jurisdiction over the matter in question. The Site Operator and its team members must operate in accordance with all Applicable Law regarding the protection of an individual's right to privacy (hereinafter referred to as "Privacy Laws").

If the U.S. Department of Justice or a state's law enforcement authority files criminal or civil charges over a potential violation of a Privacy Law, the FAA may take appropriate action including suspending or modifying the relevant operational authority (e.g., Certificate of Operation, or OTA) until the proceedings are completed. If the proceedings demonstrate the operation was in violation of the Privacy Law, the FAA may terminate the relevant operational authority.

c. Change in Law

If during the term of this Agreement an Applicable Law comes into effect which may have an impact on UAS, including impacts on the privacy interests of individuals or entities affected by any operation of any UAS operating at the Test Site, such Applicable Law will be applicable to the OTA and the FAA may update or amend the OTA to reflect these changes.

d. Transmission of Data to the FAA

The Site Operator should not provide or transmit to the FAA or its designees any data other than the data the data requested by the FAA pursuant to Article 5 of this OTA.

e. <u>Other Requirements</u>

The Site Operator must:

(i) Maintain a record of all UAS operating at the test sites; and

(ii) Require each UAS operator in the Test Site to have a written plan for the operator's use and retention of data collected by the UAS."

Issued in Washington, DC on November 7, 2013.

APPENDIX A

FAA FINAL PRIVACY REQUIREMENTS NOVEMBER 7, 2013

[4910-13]

DEPARTMENT OF TRANSPORTATION

Federal Aviation Administration

14 CFR Part 91

[Docket No.: FAA-2013-0061]

Unmanned Aircraft System Test Site Program

AGENCY: Federal Aviation Administration (FAA), DOT.

ACTION: Notice of availability of final privacy requirements for the unmanned aircraft system ("UAS") test site program; response to comments

SUMMARY: On February 22, 2013 the FAA published and requested public comment on the proposed privacy requirements (the "Draft Privacy Requirements") for UAS test sites (the "Test Sites") that the FAA will establish pursuant to the FAA Modernization and Reform Act of 2012 ("FMRA"). This notice responds to the public comments received and publishes the FAA's final privacy requirements for the Test Sites (the "Final Privacy Requirements").

ADDRESSES: You may review the public docket for this rulemaking (Docket No. FAA-2013-0061) on the Internet at http://www.regulations.gov. You may also review the public docket at the Docket Management Facility in Room W12-140 of the West Building Ground Floor at 1200 New Jersey Avenue, SE., Washington, DC, 20590-0001 between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays.

FOR FURTHER INFORMATION CONTACT: For technical questions concerning the test site program, contact Elizabeth Soltys, Unmanned Aircraft Systems Integration Office, Federal Aviation Administration, 800 Independence Avenue SW., Washington, DC 20591; email: 9-ACT-UASTSS@faa.gov.

For legal questions concerning the FAA's privacy requirements for the Test Sites contact Carlos Siso, Office of the Chief Counsel, Federal Aviation Administration, 800 Independence Ave. SW., Washington, DC 20591; email: 9-AGC-UASPrivacy@faa.gov.

SUPPLEMENTARY INFORMATION

This notice summarizes and responds to the public comments received in response to the following Federal Register notices seeking public comment on the Draft Privacy Requirements for the Test Sites:

(i) Notice of availability and request for comments published in the Federal Register on February 22, 2013 (78 FR 12259), Docket No. FAA-2013-0061-0001; and

(ii) Notice of public engagement session published in the Federal Register on March 28, 2013 (78 FR 18932), Docket No. FAA-2013-0061-0050.

In addition, this notice publishes the FAA's Final Privacy Requirements for the Test Sites which are set forth under the "Conclusion" section below.

Discussion of Comments

The FAA received 99 comments through Regulations.gov and 53 comments through the public engagement session. A transcript of the public engagement session is available at: http://www.faa.gov/about/initiatives/uas/media/UAStranscription.pdf. Public comments ranged from recommending that the FAA not impose any privacy requirements on the Test Sites to recommending that the FAA impose extensive privacy requirements on the Test Sites. The FAA also received comments that were not responsive to the notice or that were unclear.

The FAA analyzed the responsive comments and grouped them into ten categories. The following sections address the comments by category.

1) The FAA should focus on its safety mission; it should not engage in regulating privacy.

The FAA received a number of comments advocating that the FAA should focus on its safety mission and should not engage in regulating privacy. The following comments were received:

- The FAA should focus on safety;
- Regulating privacy is outside the FAA's mission;
- The FAA does not have statutory authority to regulate privacy;
- The FAA does not have the authority to impose privacy requirements on the Test Sites;
- The FAA should allow privacy to be addressed by other more appropriate government bodies including: Federal agencies that have expertise and authority to deal with privacy concerns; Congress; state or local legislative bodies; and the judicial system;
- The Federal Government should not regulate privacy impacts of UAS; these issues should be left to states, cities, and counties to address;
- The FAA should only require compliance with privacy laws that are already in place and focus on developing safe operation of UAS;
- The FAA should not deny access to the national airspace for reasons other than safety;
- Existing privacy laws are sufficient to cover the responsible use of UAS. There already exist Federal, state and other laws that protect privacy. In addition, tort law may also provide avenues of recourse for plaintiffs to protect their privacy rights;
- The FAA should not implement privacy regulations that make entry into the market prohibitive for small businesses;
- The FAA should not allow privacy issues to hinder commercialization of UAS;
- There is no evidence that the operations at the Test Sites will harm privacy interests. Restricting activities at the test sites at this early stage will likely overprotect privacy at the expense of innovation;

- The FAA should afford adequate time for non-governmental solutions such as industry norms and practices to develop before intervening administratively to protect privacy. These less restrictive solutions will reduce the need for administrative intervention and will allow for increased innovation in the national airspace;
- Requiring Test Site operators to develop privacy policies that are informed by Fair Information Practice Principles is onerous for commercial operators of UAS and its cost will likely outweigh any hypothetical benefits;
- Requiring Test Site operators to issue privacy policies informed by Fair Information Practice Principles will limit the diversity of data that will inform integration of UAS into the national airspace. The FAA's approach would exclude an important possible alternative from the discussion: some operators might choose not to issue a privacy policy or adopt a non-FIPPs-compliant policy; and
- The FAA should treat data gathered by UAS no differently than data gathered by a manned aircraft or by other electronic means. There is no significant difference in terms of surveillance between a UAS and a manned aircraft, and manned aircraft are permitted to operate in the national airspace with cameras.

Response: The FAA's mission is to provide the safest, most efficient aerospace system in the world and does not include regulating privacy. At the same time, the FAA recognizes that there is substantial debate and difference of opinion among policy makers, industry, advocacy groups, and members of the public as to whether UAS operations at the Test Sites will raise novel privacy issues that are not adequately addressed by existing legal frameworks.

The FAA will require the Test Site operators to comply with the Final Privacy Requirements. Congress mandated that the FAA establish the Test Sites to further UAS integration into the national airspace system. The Final Privacy Requirements advance this purpose by helping inform the dialogue

among policymakers, privacy advocates, and industry regarding the impact of UAS technologies on privacy.

The FAA's authority for including the Final Privacy Requirements in the Test Site OTAs is set forth in 49 U.S.C. 106(l)(6). That statute authorizes the FAA Administrator to enter into an OTA "on such terms and conditions as the Administrator may consider appropriate." The FAA believes that it is appropriate to require Test Site operators to comply with the Final Privacy Requirements.

2) The FAA should require warrants before law enforcement can use UAS in the Test Sites to conduct surveillance or gather evidence.

The FAA received a variety of comments advocating that:

- The FAA should include provisions in the OTA that require warrants to be obtained when UAS are used to conduct surveillance or gather evidence within the Test Site; and
- The OTA include appropriate safeguards to protect Fourth Amendment rights at and around our national borders.

Response: The FAA's mission is to provide the safest, most efficient aerospace system in the world. The FAA is establishing the UAS Test Sites consistent with its mission and the direction in the FMRA. The FAA appreciates the commenters' concerns. Accordingly, the final privacy requirements provide that the Site Operator and its team members must comply with all applicable privacy laws.

3) The FAA should mandate specific privacy requirements for the Test Sites.

The FAA received a variety of comments advocating that the FAA mandate specific privacy requirements for the Test Sites. The recommendations included the following:

- The FAA should specify minimum privacy requirements and require each Test Site to comply with them;
- The FAA should mandate compliance with Fair Information Practice Principles for all Test Site operators;

- The FAA should establish prohibitions on where UAS can operate within a Test Site and the kinds of surveillance activities that UAS conduct at the Test Sites;
- The FAA should require all UAS flown at the Test Sites to have unencrypted down links so that all their data collection can be viewed by the public, including records contained onboard and recovered after landing;
- The FAA should require each Test Site operator to conduct a full Privacy Impact Assessment;
- The FAA should require each Test Site operator to establish a Chief Privacy Officer and centralize privacy responsibilities in that person;
- The FAA should require each Test Site operator to establish a privacy advisory committee to review proposed UAS research at the Test Sites for privacy concerns;
- The FAA should require each Test Site operator to provide a detailed response to public input it receives regarding the Test Site's privacy policy;
- The FAA should prohibit the sharing of recorded surveillance footage beyond the scope of its original purpose;
- The FAA should prohibit UAS in the Test Sites from flying below a minimum altitude;
- The FAA should prohibit UAS in the Test Sites from carrying any equipment that could be used to conduct surveillance;
- The FAA should limit the use of the data collected at the Test Sites;
- The FAA should prohibit (i) the use of Test Sites for government surveillance, and (ii) sharing data collected with law enforcement for the purpose of investigating or prosecuting a crime;

- The FAA should limit the type of data that can be collected by UAS at the Test Sites including limiting the resolution of visual imagery that UAS can collect, prohibiting recording of audio data, and restricting the ability to collect WiFi and cellular signals;
- The FAA should require Test Site operators to provide data on the payload of each UAS flown at the Test Site including specific information on the data the payload is capable of collecting;
- The FAA should mandate privacy policies that require deletion of collected data within a certain time period;
- The FAA should prohibit the Test Site operator and UAS operators at the Test Sites from retaining any data collected longer than is necessary to fulfill the purpose of the Test Site;
- The FAA should require UAS operators to file data collection statements with the FAA for UAS operations that involve remote sensing and signals surveillance from the UAS platform; and
- The FAA should require UAS operating at altitudes over 400 feet to carry an automatic dependent surveillance-broadcast transponder (ADS-B Out) so that UAS operations can be tracked.

Response: The FAA's mission is to provide the safest, most efficient aerospace system in the world. Although there is a long history of placing cameras and other sensors on aircraft for a variety of purposes—news helicopters, aerial surveys, film/television production, law enforcement, etc.—the FAA is not, through awarding and supervising these Test Sites, taking specific views on whether or how the Federal Government should regulate privacy or the scope of data that can be collected by manned or unmanned aircraft.

There was substantial difference of opinion among commenters as to whether UAS operations and manned aircraft operations present different privacy issues that justify imposing special privacy

restrictions on UAS operations at the Test Sites. In addition, there was substantial difference of opinion among commenters regarding what elements would be appropriate for a Test Site privacy policy. Based on the comments received, the FAA will require Test Sites to comply with the following requirements in addition to those described in the Draft Privacy Requirements:

(1) Test site operators must maintain a record of all UAS operating in the test sites;

(2) Test site operators must require every UAS operator in the Test Site to have a written plan for the operator's use and retention of data collected by the UAS; and

(3) Test site operators must conduct an annual review of test site operations to verify compliance with stated privacy policy and practices and share those outcomes annually in a public forum with an opportunity for public feedback.

The above are reflected in the Final Privacy Requirements.

The FAA has determined that it should not impose privacy requirements beyond those in the Final Privacy Requirements for the following reasons. *First*, there are many privacy laws and applications of tort law that may address some of the privacy issues that arise from UAS operations at the Test Sites.

Second, the FAA believes that Test Sites operators will be responsive to local stakeholders' privacy concerns and will develop privacy policies appropriately tailored to each Test Site. The selection criteria for the Test Sites specify that only a "public entity" can serve as a Test Site operator. The term "public entity" is defined in the selection criteria to mean "(A) any State or local government; (B) any department, agency, special purpose district, or other instrumentality of a State or States or local government; and (C) the National Railroad Passenger Corporation, and any commuter authority." The FAA expects that public entities will be responsive to stakeholder concerns.

Third, if UAS operations at a Test Site raise privacy concerns that are not adequately addressed by the Test Site's privacy policies, elected officials can weigh the benefits and costs of additional

privacy laws or regulations. Forty-three states have already enacted or are considering legislation regulating use of UAS. *See* Drone Legislation All the Rage; Varies Widely Across 43 States, According to WestlawNext, June 17, 2013, *available at*: http://thomsonreuters.com/ press-releases/062013/drone_legislation_varies_across_ states_according_to_Westlaw.

4) The FAA should conduct audits of the Test Sites to ensure compliance with privacy policies.

Various commenters recommended that the FAA should audit each Test Site to ensure compliance with the privacy policies in the OTA.

Response: Each Test Site will be operated by a public entity (see response to Category 3 above). The FAA expects that the public entity operating each test site will already be subject to oversight and audit requirements. The FAA does not believe that it is appropriate for the FAA to impose additional audit requirements on the Test Site operators.

5) The FAA should require Test Site operators to keep records that will allow for effective citizen participation and reporting of privacy violations.

One commenter recommended that the FAA require Test Site operators to keep accurate, detailed, frequent, and accessible records to allow for effective citizen participation and reporting of privacy violations.

Response: Each Test Site operator will be a public entity (see response to Category 3 above). Public entities are generally subject to laws that establish record keeping requirements and provide the public access to records. The FAA does not believe that it is appropriate for the FAA to impose additional record keeping requirements on the Test Site operators other than those specified in the Final Privacy Requirements.

6) The FAA should establish a searchable database or registry of UAS operators and operations at the Test Sites.

The FAA received a variety of comments advocating that:

- The FAA should create a public, searchable database or registry of all UAS operators. Some commenters recommended that the database include information about surveillance equipment used and the operator's data collection practices;
- The FAA should require UAS operators at the Test Sites to provide public statements describing the surveillance equipment that will be carried by a UAS, the geographical area where the UAS will be operated, and the purposes for which the UAS will be deployed; and
- The FAA should establish a means for the public to access the data on UAS flights collected by the FAA.

Response: The FAA believes that it is not appropriate for the FAA to create a public registry or database of UAS operations at the Test Sites. However, the FAA has included a contractual provision in the Final Privacy Requirements that will require each Test Site operator to maintain a record of all UAS operating at the Test Site.

7) **The FAA should modify its Test Site selection criteria to take into account privacy concerns.**

Various commenters recommended that the FAA revise its selection criteria. Suggestions included the following:

- The FAA should choose an applicant that has an established UAS research program with active engagement with UAS privacy issues;
- The FAA should choose at least one Test Site in a state with strong privacy protective UAS laws and regulations;
- The FAA should select one or more Test Sites in or near a densely populated urban area in order to avoid a bias towards privacy issues relevant for rural UAS operations; and

- The FAA should consider the privacy track record of applicants as part of the selection process.

Response: The FAA believes that it is not appropriate to modify the Test Site selection criteria to include the recommended privacy considerations. Applicants have already submitted complete applications based on the announced selection criteria and the application period has closed.

The FAA published the Test Site selection criteria and application instructions on February 14, 2013 on https://faaco.faa.gov under Solicitation number DTFACT-13-R-00002. The selection criteria incorporate the factors that Congress directed the FAA to consider in the FMRA, including, geographic and climatic diversity; location of ground infrastructure; and research needs. The FAA required applicants to submit seven volumes of extensive and detailed information that address a broad set of considerations including safety, airspace use, experience, research objectives, and risk considerations. This information will allow the FAA to make a selection based on the direction provided by Congress in the FMRA and on the FAA's mission.

The FAA developed the Test Site selection criteria after seeking public input and consulting with other agencies regarding what selection criteria would be appropriate. In March 2012, the FAA published a request for comment in the Federal Register and in April 2012, the FAA hosted two public webinars to obtain public input on the FAA's proposed selection criteria. Although there was significant public participation, the FAA did not receive comments advocating that privacy issues be used as a factor in choosing the Test Sites.

8) The FAA should require Test Site operators to conduct specific tests related to privacy and surveillance.

Commenters recommended that the FAA should:

- Require UAS operators at Test Sites to conduct specific tests related to surveillance and privacy;

- Require Test Site operators to design the sites— including the creation of "fake" houses or businesses—to allow UAS operators to test how accurate their surveillance systems are and test how much data those systems collect; and
- Develop and require Test Sites to implement a standard battery of privacy tests that each UAS operating within a Test Site should have to perform in order to collect data that the FAA can use to make decisions about privacy issues.

Response: The FAA is not planning to have the Test Site operators conduct specific research.

9) The FAA should not take punitive actions against a Test Site operator for privacy violations without due process.

One commenter noted that if charges are filed by law enforcement against a Test Site operator due to potential violations of privacy laws, the OTA allows the FAA to suspend or modify the relevant operational authority for a Test Site (e.g. Certificate of Operation, or OTA). That commenter recommended that a Test Site operator be entitled to due process before the operational authority be suspended or modified.

Response: A Test Site operator's rights to operate a Test Site are set forth in the OTA and are subject to the terms and conditions in the OTA. The FAA believes that it is appropriate to include contractual provisions in the Final Privacy Requirements that allow the FAA to protect the public interest by suspending or modifying the relevant operational authority for a Test Site if charges are filed by law enforcement against a Test Site operator due to potential violations of privacy laws.

10) The FAA should establish sanctions for violations of privacy policies or rights.

One commenter recommended that the FAA rescind the OTA for a Test Site where serious privacy violations have occurred and levy fines against operators that fail to comply with privacy policies.

Response: The Final Privacy Requirements provide that violations of privacy laws can result in suspension or termination of the OTA.

The FAA will not monitor a Test Site's compliance with its own privacy policies. The FAA expects the public entities operating the Tests Sites and their respective state/local oversight bodies to monitor and enforce a Test Site's compliance with its own policies.

Conclusion

Based on the comments submitted, the FAA intends to require each test site operator to comply with all of the privacy requirements included in the Draft Privacy Requirements as well as the following additional privacy requirements:

(1) Test site operators must maintain a record of all UAS operating in the test sites;

(2) Test site operators must require every UAS operator in the Test Site to have a written plan for the operator's use and retention of data collected by the UAS; and

(3) Test site operators must conduct an annual review of test site operations to verify compliance with stated privacy policy and practices and share those outcomes annually in a public forum with an opportunity for public feedback.

Accordingly, the FAA intends to include the following terms and conditions into Article 3 of the OTA:

"ARTICLE 3 PRIVACY; APPLICABLE LAW

a. Privacy Policies

The Site Operator must:

(i) Have privacy policies governing all activities conducted under the OTA, including the operation and relevant activities of the UAS authorized by the Site Operator.

(ii) Make its privacy policies publicly available;

(iii) Have a mechanism to receive and consider comments from the public on its privacy policies;

(iv) Conduct an annual review of test site operations to verify compliance with stated privacy policy and practices and share those outcomes annually in a public forum with an opportunity for public feedback;

(v) Update its privacy policies as necessary to remain operationally current and effective; and

(vi) Ensure the requirements of its privacy policies are applied to all operations conducted under the OTA.

The Site Operator's privacy policies should be informed by Fair Information Practice Principles.

b. Compliance With Applicable Privacy Laws

For purposes of this agreement, the term "Applicable Law" shall mean (i) a law, order, regulation, or rule of an administrative or legislative government body with jurisdiction over the matter in question, or (ii) a ruling, order, decision or judgment of a court with jurisdiction over the matter in question.

The Site Operator and its team members must operate in accordance with all Applicable Law regarding the protection of an individual's right to privacy (hereinafter referred to as "Privacy Laws").

If the U.S. Department of Justice or a state's law enforcement authority files criminal or civil charges over a potential violation of a Privacy Law, the FAA may take appropriate action including suspending or modifying the relevant operational authority (e.g., Certificate of Operation, or OTA) until the proceedings are completed. If the proceedings demonstrate the operation was in violation of the Privacy Law, the FAA may terminate the relevant operational authority.

c. Change in Law

If during the term of this Agreement an Applicable Law comes into effect which may have an impact on UAS, including impacts on the privacy interests of individuals or entities affected by any operation of any UAS operating at the Test Site, such Applicable Law will be applicable to the OTA and the FAA may update or amend the OTA to reflect these changes.

d. Transmission of Data to the FAA

The Site Operator should not provide or transmit to the FAA or its designees any data other than the data the data requested by the FAA pursuant to Article 5 of this OTA.

e. Other Requirements

The Site Operator must:

(i) Maintain a record of all UAS operating at the test sites; and

(ii) Require each UAS operator in the Test Site to have a written plan for the operator's use and retention of data collected by the UAS."

Issued in Washington, DC on November 7, 2013.

Acting Chief Counsel, Federal Aviation Administration.

APPENDIX B

INTERNATIONAL ASSOCIATION OF CHIEFS OF POLICE RECOMMENDED GUIDELINES

INTERNATIONAL ASSOCIATION OF CHIEFS OF POLICE
AVIATION COMMITTEE

Recommended Guidelines for the use of Unmanned Aircraft

August 2012

BACKGROUND:

Rapid advances in technology have led to the development and increased use of unmanned aircraft. That technology is now making its way into the hands of law enforcement officers nationwide.

We also live in a culture that is extremely sensitive to the idea of preventing unnecessary government intrusion into any facet of our lives. Personal rights are cherished and legally protected by the Constitution. Despite their proven effectiveness, concerns about privacy threaten to overshadow the benefits this technology promises to bring to public safety. From enhanced officer safety by exposing unseen dangers, to finding those most vulnerable who may have wandered away from their caregivers, the potential benefits are irrefutable. However, privacy concerns are an issue that must be dealt with effectively if a law enforcement agency expects the public to support the use of UA by their police.

The Aviation Committee has been involved in the development of unmanned aircraft policy and regulations for several years. The Committee recommends the following guidelines for use by any law enforcement agency contemplating the use of unmanned aircraft.

DEFINITIONS:

1. **Model Aircraft** - A remote controlled aircraft used by hobbyists, which is manufactured and operated for the purposes of sport, recreation and/or competition.
2. **Unmanned Aircraft (UA)** – An aircraft that is intended to navigate in the air without an on-board pilot. Also called Remote Piloted Aircraft and "drones."
3. **UA Flight Crewmember** - A pilot, visual observer, payload operator or other person assigned duties for a UA for the purpose of flight.
4. **Unmanned Aircraft Pilot** - A person exercising control over an unmanned aircraft during flight.

COMMUNITY ENGAGEMENT:

1. Law enforcement agencies desiring to use UA should first determine how they will use this technology, including the costs and benefits to be gained.
2. The agency should then engage their community early in the planning process, including their governing body and civil liberties advocates.
3. The agency should assure the community that it values the protections provided citizens by the U.S. Constitution. Further, the agency will operate the aircraft in full compliance with the mandates of the Constitution, federal, state and local law governing search and seizure.
4. The community should be provided an opportunity to review and comment on agency procedures as they are being drafted. Where appropriate, recommendations should be considered for adoption in the policy.
5. As with the community, the news media should be brought into the process early in its development.

SYSTEM REQUIREMENTS:

1. The UA should have the ability to capture flight time by individual flight and cumulative over a period of time. The ability to reset the flight time counter should be restricted to a supervisor or administrator.
2. The aircraft itself should be painted in a high visibility paint scheme. This will facilitate line of sight control by the aircraft pilot and allow persons on the ground to monitor the location of the aircraft. This recommendation recognizes that in some cases where officer safety is a concern, such as high risk warrant service, high visibility may not be optimal. However, most situations of this type are conducted covertly and at night. Further, given the ability to observe a large area from an aerial vantage point, it may not be necessary to fly the aircraft directly over the target location.
3. Equipping the aircraft with weapons of any type is strongly discouraged. Given the current state of the technology, the ability to effectively deploy weapons from a small UA is doubtful. Further, public acceptance of airborne use of force is likewise doubtful and could result in unnecessary community resistance to the program.
4. The use of model aircraft, modified with cameras, or other sensors, is discouraged due to concerns over reliability and safety.

OPERATIONAL PROCEDURES:

1. UA operations require a Certificate of Authorization (COA) from the Federal Aviation Administration (FAA). A law enforcement agency contemplating the use of UA should contact the FAA early in the planning process to determine the requirements for obtaining a COA.
2. UA will only be operated by personnel, both pilots and crew members, who have been trained and certified in the operation of the system. All agency personnel with UA responsibilities, including command officers, will be provided training in the policies and procedures governing their use.
3. All flights will be approved by a supervisor and must be for a legitimate public safety mission, training, or demonstration purposes.
4. All flights will be documented on a form designed for that purpose and all flight time shall be accounted for on the form. The reason for the flight and name of the supervisor approving will also be documented.
5. An authorized supervisor/administrator will audit flight documentation at regular intervals. The results of the audit will be documented. Any changes to the flight time counter will be documented.
6. Unauthorized use of a UA will result in strict accountability.
7. Except for those instances where officer safety could be jeopardized, the agency should consider using a "Reverse 911" telephone system to alert those living and working in the vicinity of aircraft operations (if such a system is available). If such a system is not available, the use of patrol car public address systems should be considered. This will not only provide a level of safety should the aircraft make an uncontrolled landing, but citizens may also be able to assist with the incident.
8. Where there are specific and articulable grounds to believe that the UA will collect evidence of criminal wrongdoing and if the UA will intrude upon reasonable expectations of privacy, the agency will secure a search warrant prior to conducting the flight.

IMAGE RETENTION:

1. Unless required as evidence of a crime, as part of an on-going investigation, for training, or required by law, images captured by a UA should not be retained by the agency.
2. Unless exempt by law, retained images should be open for public inspection.

INTERNATIONAL ASSOCIATION OF CHIEFS OF POLICE

AVIATION COMMITTEE

Recommended Guidelines for the use of Unmanned Aircraft

BACKGROUND:

Rapid advances in technology have led to the development and increased use of unmanned aircraft. That technology is now making its way into the hands of law enforcement officers nationwide.

We also live in a culture that is extremely sensitive to the idea of preventing unnecessary government intrusion into any facet of our lives. Personal rights are cherished and legally protected by the Constitution. Despite their proven effectiveness, concerns about privacy threaten to overshadow the benefits this technology promises to bring to public safety. From enhanced officer safety by exposing unseen dangers, to finding those most vulnerable who may have wandered away from their caregivers, the potential benefits are irrefutable. However, privacy concerns are an issue that must be dealt with effectively if a law enforcement agency expects the public to support the use of UA by their police.

The Aviation Committee has been involved in the development of unmanned aircraft policy and regulations for several years. The Committee recommends the following guidelines for use by any law enforcement agency contemplating the use of unmanned aircraft.

DEFINITIONS:

1. **Model Aircraft** - A remote controlled aircraft used by hobbyists, which is manufactured and operated for the purposes of sport, recreation and/or competition.
2. **Unmanned Aircraft (UA)** – An aircraft that is intended to navigate in the air without an on-board pilot. Also called Remote Piloted Aircraft and "drones."
3. **UA Flight Crewmember** - A pilot, visual observer, payload operator or other person assigned duties for a UA for the purpose of flight.
4. **Unmanned Aircraft Pilot** - A person exercising control over an unmanned aircraft during flight.

COMMUNITY ENGAGEMENT:

1. Law enforcement agencies desiring to use UA should first determine how they will use this technology, including the costs and benefits to be gained.
2. The agency should then engage their community early in the planning process, including their governing body and civil liberties advocates.
3. The agency should assure the community that it values the protections provided citizens by the U.S. Constitution. Further, that the agency will operate the aircraft in full compliance with the mandates of the Constitution, federal, state and local law governing search and seizure.
4. The community should be provided an opportunity to review and comment on agency procedures as they are being drafted. Where appropriate, recommendations should be considered for adoption in the policy.
5. As with the community, the news media should be brought into the process early in its development.

SYSTEM REQUIREMENTS:

1. The UA should have the ability to capture flight time by individual flight and cumulative over a period of time. The ability to reset the flight time counter should be restricted to a supervisor or administrator.
2. The aircraft itself should be painted in a high visibility paint scheme. This will facilitate line of sight control by the aircraft pilot and allow persons on the ground to monitor the location of the aircraft. This recommendation recognizes that in some cases where officer safety is a concern, such as high risk warrant service, high visibility may not be optimal. However, most situations of this type are conducted covertly and at night. Further, given the ability to observe a large area from an aerial vantage point, it may not be necessary to fly the aircraft directly over the target location.
3. Equipping the aircraft with weapons of any type is strongly discouraged. Given the current state of the technology, the ability to effectively deploy weapons from a small UA is doubtful. Further, public acceptance of airborne use of force is likewise doubtful and could result in unnecessary community resistance to the program.
4. The use of model aircraft, modified with cameras, or other sensors, is discouraged due to concerns over reliability and safety.

OPERATIONAL PROCEDURES:

1. UA operations require a Certificate of Authorization (COA) from the Federal Aviation Administration (FAA). A law enforcement agency contemplating the use of UA should contact the FAA early in the planning process to determine the requirements for obtaining a COA.
2. UA will only be operated by personnel, both pilots and crew members, who have been trained and certified in the operation of the system. All agency personnel with UA responsibilities, including command officers, will be provided training in the policies and procedures governing their use.
3. All flights will be approved by a supervisor and must be for a legitimate public safety mission, training, or demonstration purposes.
4. All flights will be documented on a form designed for that purpose and all flight time shall be accounted for on the form. The reason for the flight and name of the supervisor approving will also be documented.
5. An authorized supervisor/administrator will audit flight documentation at regular intervals. The results of the audit will be documented. Any changes to the flight time counter will be documented.
6. Unauthorized use of a UA will result in strict accountability.
7. Except for those instances where officer safety could be jeopardized, the agency should consider using a "Reverse 911" telephone system to alert those living and working in the vicinity of aircraft operations (if such a system is available). If such a system is not available, the use of patrol car public address systems should be considered. This will not only provide a level of safety should the aircraft make an uncontrolled landing, but citizens may also be able to assist with the incident.
8. Where there are specific and articulable grounds to believe that the UA will collect evidence of criminal wrongdoing and if the UA will intrude upon reasonable expectations of privacy, the agency will secure a search warrant prior to conducting the flight.

IMAGE RETENTION:

1. Unless required as evidence of a crime, as part of an on-going investigation, for training, or required by law, images captured by a UA should not be retained by the agency.
2. Unless exempt by law, retained images should be open for public inspection.

APPENDIX C

ACADEMY OF MODEL AERONAUTICS SAFETY CODES

Academy of Model Aeronautics National Model Aircraft Safety Code

Effective January 1, 2014

A. **GENERAL**: A model aircraft is a non-human-carrying aircraft capable of sustained flight in the atmosphere. It may not exceed limitations of this code and is intended exclusively for sport, recreation, education and/or competition. All model flights must be conducted in accordance with this safety code and any additional rules specific to the flying site.

1. Model aircraft will not be flown:
   (a) In a careless or reckless manner.
   (b) At a location where model aircraft activities are prohibited.
2. Model aircraft pilots will:
   (a) Yield the right of way to all human-carrying aircraft.
   (b) See and avoid all aircraft and a spotter must be used when appropriate. (AMA Document #540-D.)
   (c) Not fly higher than approximately 400 feet above ground level within three (3) miles of an airport without notifying the airport operator.
   (d) Not interfere with operations and traffic patterns at any airport, heliport or seaplane base except where there is a mixed use agreement.
   (e) Not exceed a takeoff weight, including fuel, of 55 pounds unless in compliance with the AMA Large Model Airplane program. (AMA Document 520-A.)
   (f) Ensure the aircraft is identified with the name and address or AMA number of the owner on the inside or affixed to the outside of the model aircraft. (This does not apply to model aircraft flown indoors.)
   (g) Not operate aircraft with metal-blade propellers or with gaseous boosts except for helicopters operated under the provisions of AMA Document #555.
   (h) Not operate model aircraft while under the influence of alcohol or while using any drug that could adversely affect the pilot's ability to safely control the model.
   (i) Not operate model aircraft carrying pyrotechnic devices that explode or burn, or any device which propels a projectile or drops any object that creates a hazard to persons or property.
   Exceptions:
   - Free Flight fuses or devices that burn producing smoke and are securely attached to the model aircraft during flight.
   - Rocket motors (using solid propellant) up to a G-series size may be used provided they remain attached to the model during flight. Model rockets may be flown in accordance with the National Model Rocketry Safety Code but may not be launched from model aircraft.
   - Officially designated AMA Air Show Teams (AST) are authorized to use devices and practices as defined within the Team AMA Program Document. (AMA Document #718.)

   (j) Not operate a turbine-powered aircraft, unless in compliance with the AMA turbine regulations. (AMA Document #510-A.)
3. Model aircraft will not be flown in AMA sanctioned events, air shows or model demonstrations unless:
   (a) The aircraft, control system and pilot skills have successfully demonstrated all maneuvers intended or anticipated prior to the specific event.
   (b) An inexperienced pilot is assisted by an experienced pilot.
4. When and where required by rule, helmets must be properly worn and fastened. They must be OSHA, DOT, ANSI, SNELL or NOCSAE approved or comply with comparable standards.

B. **RADIO CONTROL (RC)**

1. All pilots shall avoid flying directly over unprotected people, vessels, vehicles or structures and shall avoid endangerment of life and property of others.
2. A successful radio equipment ground-range check in accordance with manufacturer's recommendations will be completed before the first flight of a new or repaired model aircraft.
3. At all flying sites a safety line(s) must be established in front of which all flying takes place. (AMA Document #706.)
   (a) Only personnel associated with flying the model aircraft are allowed at or in front of the safety line.
   (b) At air shows or demonstrations, a straight safety line must be established.
   (c) An area away from the safety line must be maintained for spectators.
   (d) Intentional flying behind the safety line is prohibited.
4. RC model aircraft must use the radio-control frequencies currently allowed by the Federal Communications Commission (FCC). Only individuals properly licensed by the FCC are authorized to operate equipment on Amateur Band frequencies.
5. RC model aircraft will not knowingly operate within three (3) miles of any pre-existing flying site without a frequency-management agreement. (AMA Documents #922 and #923.)
6. With the exception of events flown under official AMA Competition Regulations, excluding takeoff and landing, no powered model may be flown outdoors closer than 25 feet to any individual, except for the pilot and the pilot's helper(s) located at the flightline.
7. Under no circumstances may a pilot or other person touch an outdoor model aircraft in flight while it is still under power, except to divert it from striking an individual.
8. RC night flying requires a lighting system providing the pilot with a clear view of the model's attitude and orientation at all times. Hand-held illumination systems are inadequate for night flying operations.
9. The pilot of an RC model aircraft shall:
   (a) Maintain control during the entire flight, maintaining visual contact without enhancement other than by corrective lenses prescribed for the pilot.
   (b) Fly using the assistance of a camera or First-Person View (FPV) only in accordance with the procedures outlined in AMA Document #550.
   (c) Fly using the assistance of autopilot or stabilization system only in accordance with the procedures outlined in AMA Document #560.

C. **FREE FLIGHT**

1. Must be at least 100 feet downwind of spectators and automobile parking when the model aircraft is launched.
2. Launch area must be clear of all individuals except mechanics, officials, and other fliers.
3. An effective device will be used to extinguish any fuse on the model aircraft after the fuse has completed its function.

D. **CONTROL LINE**

1. The complete control system (including the safety thong where applicable) must have an inspection and pull test prior to flying.
2. The pull test will be in accordance with the current Competition Regulations for the applicable model aircraft category.
3. Model aircraft not fitting a specific category shall use those pull-test requirements as indicated for Control Line Precision Aerobatics.
4. The flying area must be clear of all utility wires or poles and a model aircraft will not be flown closer than 50 feet to any above-ground electric utility lines.
5. The flying area must be clear of all nonessential participants and spectators before the engine is started.

Academy of Model Aeronautics **AMA Document #550**
"AMA Advanced Flight Systems Committee"
amaflightsystems@gmail.com

Radio Controlled Model Aircraft Operation Utilizing "First Person View" Systems

1. DEFINITION OF TERMS:

Please refer to Page 3, section 7 which contains an alphabetical listing of the definitions of the terms in italics that are used in this document.

2. GENERAL:

FPV flying of radio control model aircraft by AMA members is allowed only for noncommercial purposes as a hobby/recreational and/or competition activity and must be conducted in accordance with AMA's current National Model Aircraft Safety Code and any additional rules specific to a flying site/location.

3. OPERATIONS – REQUIREMENTS – LIMITATIONS:

a) AMA *FPV novice pilots* must use a buddy-box system with an *FPV spotter* while learning to fly *FPV*.

b) All *FPV* flights require an AMA *FPV pilot* to have an AMA *FPV spotter* next to him/her maintaining *VLOS* with the *FPV aircraft* throughout its flight.

c) The *FPV pilot* must brief the *FPV spotter* on the *FPV spotter's* duties, communications and hand-over control procedures before *FPV flight*.

d) The AMA *FPV spotter* must communicate with the *FPV pilot* to ensure the *FPV aircraft* remains within *VLOS*, warning the *FPV pilot* of approaching aircraft, and when avoidance techniques are necessary.

e) During an FPV flight, the FPV spotter must be prepared to acquire the transmitter/control from the FPV pilot and assume VLOS control of the model aircraft any time safe operation of the flight is in question.

f) If the *FPV pilot* experiences a problem due to a loss of video link, orientation, or is unable to safely fly, he/she must abandon *FPV* mode and fly *VLOS* or pass the RC transmitter to the *FPV spotter* to assume *VLOS* control of the model aircraft.

g) Before the initial *FPV* flight of an *FPV model aircraft* and/or after any changes or repairs *to essential flight systems*, the *FPV model aircraft* must have an *R/C test flight* by conventional *VLOS*.

h) *FPV model aircraft* must use frequencies approved by the FCC for both the RC system and the wireless video system. Pilots must meet applicable FCC licensing requirements if they choose to operate the RC flight control system or the wireless video system on Amateur Band frequencies.

4. RANGE – ALTITUDE – WEIGHT – SPEED:

a) One of the requirements in Federal Law (Public Law 112-95 Sec 336 (c) (2) February 14, 2012) for model aircraft to be excluded from FAA regulations is that model aircraft must be flown within *VLOS* of the operator.

b) Model aircraft flown using *FPV* must remain at or below 400 feet AGL when within 3 miles of an airport as specified in the AMA Safety Code.

c) Model aircraft flown *FPV* are limited to a weight (including fuel, batteries, and onboard *FPV* equipment) of 15lbs. and a speed of 70mph.

5. RECOMMENDATIONS & INFORMATION:

a) AMA *FPV novice pilots* should consider using a cockpit view flight simulator to become accustomed to *FPV* flight.

b) AMA *FPV pilots* should consider using a programmable *autopilot* (AMA Document #560) with a failsafe "return to launch" (RTL) feature that will maintain control of the aircraft in the event of signal loss.

c) An onboard camera equipped with a pan and tilt mount that is positioned by head tracking goggles, will improve the *FPV pilot's* situational awareness of airspace surrounding the *FPV aircraft* during flight, but does not replace the requirement for an AMA *FPV spotter*.

d) When purchasing *FPV* operational systems, always try to select quality equipment, verify its compatibility, install components for interference rejection, and determine that signal range is adequate for maximum VLOS range.

6. PRIVACY PROTECTION SAFEGUARDS:

The use of imaging technology for aerial surveillance with radio control model aircraft having the capability of obtaining high-resolution photographs and/or video, or using any types of sensors, for the collection, retention, or dissemination of surveillance data information on individuals, homes, businesses, or property at locations where there is a reasonable expectation of privacy is strictly prohibited by the AMA unless written expressed permission is obtained from the individual property owners or managers.

7. DEFINITIONS OF TERMS:

AMA FPV Pilot is an AMA member who is capable of maintaining stable flight of a model aircraft within its intended flight envelope when flown FPV without losing control or having a collision.

Buddy-Box System is a system that has one transmitter operating as the master controller, while a second transmitter is linked/slaved to it allowing dual control of an aircraft. The operator of the master transmitter allows one or the other transmitter to control the aircraft through the use of a spring-loaded switch. The switch provides instantaneous transfer of control from one transmitter to the other. The buddy-box system is an efficient and effective means of achieving a position transfer of control from one pilot to another. Although this system is commonly used for training novice fliers, it is also useful in situations where an experienced pilot may have an increased likelihood of needing a second pilot's assistance in maintaining control of the aircraft. The use of the buddy-box may be helpful in assisting pilots with physical limitations, flying in congested environments, during times of reduced visibility, or anytime during FPV when a timely transfer of control may be beneficial.

Essential Flight Systems are any systems or components necessary to maintain stable flight within a model aircraft's flight envelope. (This includes primary radio control systems and any stabilization or gyros required to maintain stability and heading in certain types of model aircraft that would be uncontrollable/unstable without their use).

First Person View (FPV) refers to the operation of a radio controlled (R/C) model aircraft using an onboard camera's cockpit view to orient and control the aircraft.

Flight Envelope is defined as the range of airspeeds, attitudes, and flight maneuvers which a model aircraft can safely perform/operate for its intended use.

FPV Aircraft is an RC model aircraft equipped with a video transmitter to send real-time video images from an onboard camera to a ground based receiver for display on a pilot's video monitor/goggles. (*FPV model aircraft* types include: Fixed Wing, Rotary Wing, and Multi-Rotor Platforms).

FPV Novice Pilot is an AMA member learning to fly *FPV* utilizing a buddy-box system with an experienced AMA *RC pilot* operating the master transmitter and serving as the *FPV spotter*.

FPV Spotter is an experienced AMA *RC pilot* who has been briefed by the *FPV pilot* on the tasks, responsibilities and procedures involved in being a spotter; is capable and mature enough to perform the duties and is able to assume conventional *VLOS* control of the aircraft.

Non-Essential Flight Systems are any systems or components that are not necessary to maintain stable flight within the model aircraft's *flight envelope*. (This includes *autopilot* or *stabilization systems* that can be activated and deactivated in flight by the pilot without affecting stable flight).

R/C Test Flight requires an *AMA Pilot* to manually operate an R/C transmitter to control a model aircraft's flight path and determine if the aircraft is capable of maintaining stable flight within its *flight envelope*.

Visual Line Of Sight (VLOS) is the distance at which the pilot is able to maintain visual

contact with the aircraft and determine its orientation without enhancements other than corrective lenses.

Radio Controlled Model Aircraft Operation Utilizing Failsafe, Stabilization and Autopilot Systems

1. DEFINITION OF TERMS:

Please refer to Page 3, section 7 which contains an alphabetical listing of the definitions of the terms in italics that are used in this document.

2. GENERAL:

All model aircraft flights utilizing *stabilization* and *autopilot* control systems must be conducted in accordance with AMA's current National Model Aircraft Safety Code and any additional rules specific to a flying site/location.

3. OPERATIONS – REQUIREMENTS – LIMITATIONS:

a) AMA members flying radio controlled model aircraft equipped with flight *stabilization* and *autopilot* systems must maintain *VLOS* with the aircraft at all times including programmed autopilot waypoint flight.

b) *AMA Pilots* must be able to instantaneously deactivate programmed flight of *autopilot systems* at any time during flight and resume manual control of the model aircraft.

c) *AMA Pilots* must perform an *R/C Test Flight* of a model aircraft before activating a newly installed *autopilot* or *stabilization system* and/or after any repairs or replacement of model aircraft *essential flight systems*.

d) Model aircraft exceeding 15lbs and/or 70mph may only use an *autopilot* for a programmed "return to launch" (RTL) flight and not for programmed waypoint flying of a predetermined course.

e) STABILIZATION & AUTOPILOT SYSTEMS MAY BE USED FOR/TO:

- Stabilization/automatically stabilize aircraft to level flight when control sticks are centered.
- Recovery/activate TRX switch to recover an out of control aircraft to level flight.
- Heading/activate TRX switch to hold a model aircraft's heading for precision flight path.
- Altitude/activate TRX switch to maintain fixed aircraft altitude while allowing directional control.
- Return GPS/activate TRX switch to return aircraft via GPS to launch point.
- Return FSS/failsafe activated from radio signal loss to return aircraft via GPS to launch point.
- Fixed circle/activate TRX switch to circle aircraft at point of activation at fixed altitude.
- Waypoint/activate TRX switch to initiate an autopilot programmed flight path via waypoints.
- Fencing/autopilot programed to display site unique boundaries on video monitor/goggles.

4. RANGE – ALTITUDE – WEIGHT – SPEED:

a) One of the requirements in Federal Law (Public Law 112-95 Sec 336 (c) (2) February 14, 2012) for model aircraft to be excluded from FAA regulations is that model aircraft be flown within *VLOS* of the operator.

b) Model aircraft must be flown at or below 400 feet AGL when within 3 miles of an airport as stated in the AMA Safety Code.

c) Model aircraft utilizing an *autopilot* for waypoint flying are limited to a maximum weight (including fuel, batteries, and onboard *autopilot systems*) of 15lbs and a speed of 70mph.

5. RECOMMENDATIONS & INFORMATION:

a) If your radio system lacks *failsafe* capability, consider using programmable digital servos or auxiliary *failsafe* modules. In the event of a radio signal failure these components will activate desired safe servo settings or an *autopilot* for return to base/launch (RTL).

b) When using an *autopilot system* the "return to launch" (RTL) feature should be programmed to return the aircraft to a safe location and safely terminate the flight should manual control of the aircraft be lost. When using RTL, pay particular attention to the manufacturer's throttle recommendations to prevent stalling.

c) The use of *stabilization systems* is recommended when flying FPV to improve flight stability and video quality.

d) Pilots usually choose to incorporate *stabilization* and *autopilot systems* for model aircraft flying to enhance flight performance, correct bad tendencies of the model aircraft, maintain stability in windy weather, establish precision heading holds for takeoffs/landings, flight training for novice pilots, create a steady flight platform for cameras, and generally just to make an airplane easier and safer to fly.

e) When purchasing *stabilization* and *autopilot systems*, always try to select quality equipment from reputable dealers, ensure for compatibility with other onboard systems, and install components according to manufacturers' instructions.

6. PRIVACY PROTECTION SAFEGUARDS:

The use of imaging technology for aerial surveillance with radio control model aircraft having the capability of obtaining high-resolution photographs and/or video, or using any types of sensors, for the collection, retention, or dissemination of surveillance data or information on individuals, homes, businesses, or property at locations where there is a reasonable expectation of privacy is strictly prohibited by the AMA unless written expressed permission is obtained from the individual property owners or managers.

7. DEFINITIONS OF TERMS:

AMA Pilot is an AMA member who is capable of manually operating an R/C transmitter to control a model aircraft's flight path within its safe intended *flight envelope* without losing control or having a collision.

Autopilot Systems incorporate programmable flight *stabilization* with an altitude sensor and a GPS receiver for accurate positioning and to navigate/control a radio controlled model aircraft's flight path. Advanced systems offer software for entering navigable waypoints. The flight data waypoints may be saved to autopilot's/GPS memory for programmed flight.

Essential Flight Systems are any systems or components necessary to maintain stable flight within a model aircraft's *flight envelope*. (This includes primary R/C systems and any *stabilization* or gyros required to maintain stability and heading in certain types of model aircraft that would be uncontrollable/unstable without their use).

Failsafe Systems are designed to minimize or prevent damage and safely terminate a flight when a radio controlled model aircraft loses radio signal. Modern radio systems can be programmed to position servos to a desired control setting in the event of radio signal failure.

First Person View (FPV) refers to the operation of a radio controlled (R/C) model aircraft using an onboard camera's cockpit view to orient and control the aircraft. (AMA Document #550).

Flight Envelope is defined as the range of airspeeds, attitudes and flight maneuvers which a model aircraft can safely perform/operate for its intended use.

Non-Essential Flight Systems are any systems or components that are not necessary to maintain stable flight within the model aircraft's intended flight envelope. (This includes *autopilot* or *stabilization systems* that can be activated and deactivated in flight by the pilot without affecting manually controlled stable flight).

R/C Test Flight requires an AMA Pilot to manually operate an R/C transmitter to control a model aircraft's flight path and determine if the aircraft is capable of maintaining stable flight within its safe intended *flight envelope*.

Stabilization Systems are designed to maintain intended model aircraft flight attitudes. The pilot can install, program and/or activate a system to stabilize yaw, pitch, or roll or any one attitude or combination of attitudes. Systems are often based on rate/heading hold gyros or inertial motion sensors utilizing multi-axis gyros and accelerometers for attitude stabilization.

Visual Line of Sight (VLOS) is the distance at which the pilot is able to maintain visual contact with the aircraft and determine its orientation and attitude without enhancements other than corrective lenses.

MEMORANDUM September 30, 2013

SUBJECT: Alaska Laws Protecting Privacy
(Work Order No. 28-LS0990)

TO: Representative Shelley Hughes
Attn: Ginger Blaisdell

FROM: Kathleen Strasbaugh
Legislative Counsel

You have asked for a review of Alaska's laws protecting individual privacy in preparation for a meeting of the Task Force on Unmanned Aircraft Systems. Among the Task Force's duties is providing written recommendations concerning, among other things, a state policy that protects privacy. 2013 Legislative Resolve No. 17 at 3. To that end, as I understand from Ms. Blaisdell, you would like to know what protections might already exist, with a view toward avoiding duplication of existing law. The Task Force has apparently expressed concern about how information gathered by unmanned aircraft could be used by private or public parties, and what use might be made of such information captured inadvertently.

This memo will outline constitutionally based protections of privacy and identify state statutes that might apply to conduct considered invasion of privacy. As you requested, this memo focuses on the protections afforded under Alaska law. A brief discussion of emerging federal law is included, but I haven't explored other states' case law, nor lower federal court cases that consider these issues. However, I have attached an excerpt of an *Alaska Law Review* which summarizes Alaska's privacy law as it has developed independently of federal constitutional law. I have also attached a recent *Harvard Law Review* article that specifically addresses this topic in great detail. The memo also briefly addresses scenarios set out in your request. Please note that it is very difficult to predict the outcome of litigation in this very new intersection of technology and privacy law.

1. Constitutional Protection of Privacy

The Constitution of the State of Alaska explicitly protects the right of privacy against government (but not private) intrusion. Art. I, sec. 22, provides:

> The right of the people to privacy is recognized and shall not be infringed. The legislature shall implement this section.

This protection, although not unlimited, has been held to be broader than the protection afforded by the United States Constitution. *Woods & Rohde, Inc. v. State, Department of Labor*, 565 P.2d 138, 149 (Alaska 1977).[1] Both the Alaska Constitution and the Fourth Amendment to the United States Constitution require a warrant by a governmental agency for the search of a place where a person has a reasonable expectation of privacy. *Beltz v. State*, 221 P.3d 328, 333, 337 (Alaska 2009) (search of garbage placed out on the street for collection did not require warrant; expectation of privacy found not reasonable.)

Neither the Alaska Supreme Court nor the United States Supreme Court has ruled on whether surveillance by a government operated unmanned aerial vehicle is a search under the Fourth Amendment. Based on available precedent, it is possible that the courts will decide that the use of an unmanned aerial vehicle constitutes a search requiring either a warrant, or the application of a recognized exception to the warrant requirement.

The United States Supreme Court has considered law enforcement or other government agency use of aerial surveillance and the use of technological devices for surveillance purposes. The Court found that surveillance by manned aircraft is not an intrusion into a private area that renders an overflight a search under the Fourth Amendment to the United States Constitution; however the placement of a global positioning device on a person's vehicle is an intrusion that constitutes a search. Here is a brief summary of some of these cases: *United States v. Jones*, 565 U.S. ___, 132 S.Ct. 945 (2012): Attachment of global positioning device to automobile parked in public place is a search under the Fourth Amendment.

Dow Chemical Co. v. United States, 476 U.S. 227 (1986) EPA aerial surveillance and photography of chemical plant is not a search where the aircraft was manned and operating at a lawful altitude.

California v. Ciraolo, 476 U.S. 207 (1986) Manned aerial surveillance of a backyard marijuana grow at lawful altitude did not violate the Fourth Amendment.

The Court might find the use of a technology that exceeds human observational capacity the sort of intrusion that constitutes a search requiring a warrant or an accepted exception:

> Where, as here, the Government uses a device that is not in general public use, to explore details of the home that would previously have been unknowable without physical intrusion, the surveillance is a "search" and is presumptively unreasonable without a warrant.

Kyllo v. United States, 533 U.S. 27, 40 (2001) (internal citations omitted) (thermal

---

[1] In Alaska, the right to privacy extends to protection of such activities as possession and use of marijuana in the home by an adult, which, while not a fundamental right, is protected because such possession and use does not implicate the public welfare in the manner that more harmful substances, or public ingestion, or use by minors might. *Ravin v. State*, 537 P.2d 494, 508-09 (Alaska 1975).

imaging of home from outside a search under the Fourth Amendment).

2. Alaska Statutory protections

There are a handful of criminal statutes that may apply to improper use of images obtained from unmanned aerial vehicle surveillance. These statutes would seem to apply for the most part to private actors. These are offenses that punish conduct that invades the privacy of a victim, and would require proof that images gathered by the unmanned aerial vehicle were disseminated. These offenses would probably not punish capturing the images inadvertently, although collecting and storing them might be a concern.

Alaska Statute	Charge	Penalty
11.41.270	Stalking in the second degree: nonconsensual conduct prohibited by statute prohibits monitoring by technical means.	Class A misdemeanor[2]
11.61.116	Sending an explicit image of a minor.	(1) class B misdemeanor if the person distributes the image to another person;[3] (2) a class A misdemeanor if the person distributes the image to an Internet website that is accessible to the public.
11.61.120(a)(6)	Harassment in the second degree: publishing or distributing images that show certain body parts or a sexual act.	Class B misdemeanor

[2] A class A misdemeanor is punishable by a fine of up to $10,000, and a sentence of imprisonment up to one year.

[3] A class B misdemeanor is punishable by a fine of up to $2,000, and a sentence of imprisonment up to 90 days.

11.61.123	Indecent viewing or photography (with certain law enforcement and security surveillance exceptions).	(1) class C felony if the person viewed or shown in a picture was, at the time of the viewing or production of the picture, a minor;[4] (2) class A misdemeanor if the person viewed or shown in the picture was, at the time of viewing or production of the picture, an adult.
11.76.113	Misconduct involving confidential information in the first degree: use of confidential information to commit a crime or obtain a benefit to which the person is not entitled to injure another, or deprive another of a benefit.	Class A misdemeanor
11.76.115	Misconduct involving confidential information in the second degree: knowingly and without legal authority obtaining confidential information about another.	Class B misdemeanor

In addition to the above criminal offenses, there are other provisions of law that might bear on the information obtained from data gathered by an unmanned aerial vehicles.

If the data is gathered by a government agency, it is a public record. However, AS 40.25.120 provides certain protections for private information. AS 40.25.120(a)(4) excepts records required by law to be kept confidential. *See Falcon v. APOC*, 570 P.2d 469 (Alaska 1977) (physician not required to disclose identity of certain patients to Alaska Public Offices Commission where the disclosure of the patients' identities might disclose the fact that they were being treated for conditions that patients would normally keep private); *Alaska Wildlife Alliance v. Rue*, 948 P.2d 976 (Alaska 1997) (payroll information may be kept private where disclosure might endanger employees or contractors, where those employees and contractors were threatened with harm). AS 40.25.120(a)(6)(C) protects information gathered by law enforcement the disclosure of which "could reasonably be expected to constitute an unwarranted invasion of the personal privacy of a suspect, defendant, victim, or witness."

---

[4] A Class C felony is punishable by a fine of up to $50,000, and a sentence of imprisonment up to five years. Presumptive sentences based on whether the offense is a first or subsequent offense are set out at AS 12.55.155(e).

There may be civil liability for obtaining (and subsequently misappropriating) information on trade secrets or patented processes. *See, generally.* AS 45.50.

In addition, a person who is subject to surveillance that is unreasonable or unlawful could sue for the tort of invasion of privacy. *Compare Wal-Mart v. Stewart*, 990 P.2d 626, 634 (Alaska 1999) (daily search of employee's bags held an unreasonable invasion of privacy where not part of a random, nondiscriminatory policy, and where the employee feared that refusing the search might result in others suspecting him of theft, or result in a police call or firing).

3. Particular scenarios

Inadvertent capture of evidence of illegal activity. Use of inadvertently captured information in a criminal prosecution may depend on who captures the information, and whether the person whose actions have been captured has a reasonable expectation of privacy. One of the scenarios mentioned in your request is the capture of evidence of poaching. Assuming that the poacher is a person taking game on property that is not the poacher's own, the poacher cannot reasonably expect privacy when present on another's land without authority.

If a law enforcement agency sends out an unmanned aerial vehicle for patrolling or surveillance, perhaps to look for illegal cultivation of marijuana or manufacture of methamphetamine on public land, and in the course of doing so, captures evidence of an industrial sized marijuana grow operation on private land, it might provide grounds to obtain a warrant to explore further.[5] Under Alaska law, if the observation of the event is lawful or in "plain view," the discovery inadvertent, and the incriminating nature of the evidence immediately apparent, a warrant might not be required. *Ahvakana v. State*, 283 P.3d 1284, 1288 (Alaska Ct. App. 2012) (entry into property where evidence found was authorized under the emergency aid exception to the warrant requirement). However, since the vehicle is not manned, the federal authorities discussed above suggest that the information might not be considered to be lawfully obtained unless some other exception to the requirement of a warrant is present. It is not clear to me whether and under what circumstances a court might grant a search warrant to follow up on information inadvertently obtained, but not in "plain view."

It is possible that the inadvertent capture of information that might otherwise be inadmissible under the exclusionary rule that bars admission of evidence obtained in violation of the United States Constitution will be treated as a good faith exception under *United States v. Leon*, 468 U.S. 897(1984). In *Leon*, the United States Supreme Court held that the Fourth Amendment exclusionary rule should not be applied so as to bar the use of evidence obtained by officers acting in reasonable reliance on a search warrant

---

[5] *But see State v. Crocker*, 97 P.3d 93 (Alaska Ct. App. 2004) holding that because the application for the warrant did not affirmatively disclose information that the marijuana cultivation was beyond what was permitted under *Ravin*, there was no probable cause for a warrant.

issued by a detached and neutral magistrate but ultimately found to be invalid. A court could determine that information inadvertently captured in otherwise lawful surveillance is likewise a good faith exception. However, Alaska's appellate courts have not decided whether to adopt this exception. *Deemer v. State*, 244 P.3d 69, 72 (Alaska Ct. App. 2010). Thus it is impossible to predict the outcome of litigation on this subject under Alaska law, and it is not at all clear, given the federal case law developments discussed elsewhere in this memorandum, that the United States Supreme Court would apply the exception in a situation where there was no warrant.

Person intentionally gathers private information for personal use or distribution. A number of the criminal charges listed above might be available. In addition, if the images obtained are used in child pornography, a number of federal and state criminal statutes might apply.

Please advise if you require further assistance in this matter.

Executive Summary

Purpose and Scope

In March 2013, the University of Alaska Fairbanks Center for Unmanned Aircraft Systems contracted with McDowell Group to analyze the economic conditions for unmanned aircraft systems (UASs) in Alaska and measure the projected economic impact of developing a Federal Aviation Administration (FAA) test site for UAS in Alaska. The economic impact assessment (EIA) in this report provides annual projections of the direct, indirect, and induced impacts to employment and wages as well as projections of output and value added related to the test site, called the Pan-Pacific UAS Test Range Complex (PPUTRC) – with test ranges located in Alaska, Hawaii, and Oregon. The EIA focuses on the additional economic activity that is expected in response to the PPUTRC test site selection. Additional information is provided in this report on the economic impact of the commercialization of UAS specifically in Alaska once UAS flights are allowed in the National Airspace System (NAS).

Summary

- UAS represent a new industry that is set to quickly grow once new government regulations increase access to designated test sites and then to the National Airspace System (NAS), the system of air traffic control that enables safe and efficient flight activity in the U.S.
- UAS applications are far reaching for civilian and military purposes; ranging from environmental monitoring to search and rescue to pipeline or powerline inspections.
- The FAA has limited the authorized use of UASs in the U.S. to efforts focused on the public interest. There are currently two ways to operate a UAS with the approval of the FAA (both of these options require that the flight takes place outside of densely-populated areas):
    - Certificate of Waiver or Authorization (COA) for public UAS
    - Special airworthiness certificate for private sector (civil) UAS
- However, the FAA is scheduled to designate six UAS test sites in the U.S., as required under the FAA Modernization and Reform Act of 2012. The sites will operate from January of 2014 to February 13, 2017 to provide opportunities for government agencies, industry, and researchers to access this airspace to aid in the integration of UASs in the NAS.
- According to the Association of Unmanned Vehicle Systems International (AUVSI), integration of UASs into the NAS will generate some $82 billion in activity in the U.S. between 2015 and 2025; employment impacts are estimated at just over 100,000 jobs by 2025.

- In an effort to bring additional UAS activity and related economic benefits to Alaska, UAF is leading the PPUTRC Test Site application process for 13 ranges in Alaska, Hawaii, and Oregon.
- Existing UAS activity in Alaska, Hawaii, and Oregon benefits from unique assets and opportunities, including government facilities (e.g. numerous military bases, universities, and maritime assets), wide-open airspace in largely unpopulated areas, and geographic diversity (e.g. tropical to arctic climates, oceanic or mountainous landscapes, and up/down weather fronts).
- In total, designation of PPUTRC as a UAS test site would be expected to generate 1,065 direct, indirect and induced jobs in 2014, increasing to over 1,400 jobs by 2017. Total labor income would climb from $57 million in 2014 to about $76 million in 2017.
- Output in the PPUTRC states attributable to test site designation would climb from $265 million in 2014 to $333 million in 2017.
- Value added would climb from $109 million to $134 million over the same period.
- Designation of the PPUTRC will provide a four-year total of $20 million of income tax revenue to Hawaii and Oregon.

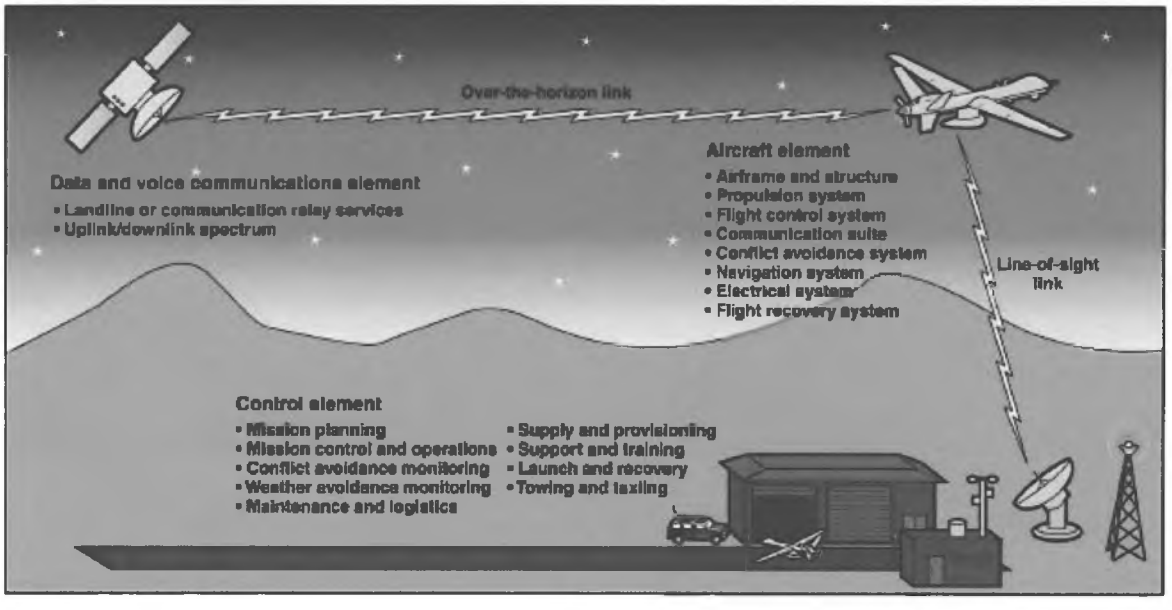
Chapter 1. Unmanned Aircraft Systems in the United States and the NAS

Background

Unmanned aerial vehicles (UAVs) were first described in the late-19th century. Early attempts to develop these UAVs, mostly for combat purposes, soon followed. These remotely piloted vehicles first entered U.S. combat in the mid-20th century to support missions focused on reconnaissance and surveillance, and sometimes they were also used as decoys. Throughout most of the 20th century UAVs lacked real-time data capability and instead focused on collecting images and video for surveillances purposes. Widespread adoption of the technology for U.S. military purposes did not begin until the 1990s and, to a much greater extent, the 2000s during the Afghanistan and Iraq conflicts. It was at this point that technological innovations related to onboard sensors, communication links, and data collection began drastically increasing the potential domestic uses of unmanned aircraft systems.

The increase in complexity for the UAVs required a systems approach to appropriately understand the interactions - and design each component from the start as an integratedsystem - among the on-the-ground control elements, the aircraft, and the communication links. This broader operational perspective is termed "unmanned aircraft system" (UAS). The image below provides a conceptual rendering of the interactions among key elements of a UAS flight.

Figure 1: Conceptual Rendering of an Unmanned Aircraft System



Source: GAO, 2013

UAS Applications

Unmanned aircraft often provide advantages in comparison to manned aircraft. For instance, flights that are dangerous or covert represent potential opportunities where an unmanned vehicle might be preferred over a manned vehicle. Similarly, dull tasks such as extended surveillance missions may be better suited for ground-based operators that can be relieved at the end of their shift. UAVs are often more fuel efficient, quieter, and less disruptive to their surroundings (in comparison to manned aircrafts) and, thus, can allow for fewer environmental disturbances as well as more accurate research results. Finally, initial costs, operating costs (e.g. maintenance costs, fuel costs, storage costs, etc.), and labor costs (e.g. wages, insurances, etc.) are all generally lower for UAVs (Source: Austin, 2010). UASs have already been shown to lead to arrests as well as saving lives during search and rescue missions (Source: The Verge, 2013).

The existing and potential applications for UASs are wide ranging for both civilian uses as well as for military purposes. The lists below provide an abbreviated look at how important this relatively new field may become to sectors throughout Alaska's economy (Source: Austin, 2010):

Civilian

- Aerial Photography - Film, video, stills, etc.
- Agriculture - Crop monitoring and spraying; herd monitoring and driving
- Coastguard – Search and rescue, coastline, and sea-lane monitoring
- Conservation – Pollution and land monitoring
- Customs and Excise – Surveillance for illegal imports
- Electricity Companies – Powerline inspection
- Fire Services and Forestry – Fire detection, incident control
- Fisheries – Fisheries protection
- Gas and Oil Supply Companies – Land survey and pipeline security
- Information Services – News information and pictures, feature pictures (e.g. wildlife)
- Lifeboat Institutions – Incident investigation, guidance, and control
- Local Authorities – Survey, disaster control
- Meteorological Services – Sampling and analysis of atmosphere for forecasting, etc.
- Oil Companies – Pipeline security
- Ordinance Survey – Aerial photography for mapping
- Police Authorities – Search for missing persons, security and incident surveillance
- Rivers Authorities –Water course and level monitoring, flood and pollution control
- Survey Organizations – Geographical, geological, and archaeological survey
- Traffic Agencies – Monitoring and control of road traffic
- Water Boards – Reservoir and pipeline monitoring

Military

- Navy
    - Shadowing enemy fleets

    - Decoying missiles by the emission of artificial signatures
    - Electron intelligence
    - Relaying radio signals
    - Protection of ports from offshore attack
    - Placement and monitoring of sonar buoys and possibly other forms of anti-submarine warfare
- Army
    - Reconnaissance
    - Surveillance of enemy activity
    - Monitoring of nuclear, biological, or chemical (NBC) contamination
    - Electronic intelligence
    - Target designation and monitoring
    - Location and destruction of land mines
- Air Force
    - Long-range, high-altitude surveillance
    - Radar system jamming and destruction
    - Electronic intelligence
    - Airfield base security
    - Airfield damage assessment
    - Elimination of unexploded bombs

UAS Categories

UASs are typically categorized based on the size or capability of the UAV. The five categories below provide a common categorization of UAS that helps simplify requirement assessments and costing estimates (Source: Teal Group, 2008):

- Micro or Mini – A small UAV that ranges in size from something that can be held in the palm of the hand to a UAV that can be carried on your back and launched by hand.
- Naval – A tactical UAV is generally operated with simpler systems over a radius between 100 and 300 km.
- Tactical – A reconnaissance UAV used by the Army for endurance missions ranging several hours over an operating radius up to 200 km.
- MALE – Medium Altitude Long Endurance reconnaissance UAVs fly between 5,000 and 15,000 meters in altitude for approximately 24 hours.
- HALE – High Altitude Long Endurance reconnaissance and surveillance UAVs are usually operated by Air Forces at altitudes over 15,000 meters for periods longer than 24 hours.

National Airspace System

The NAS was developed to allow for safe and efficient commercial aviation. However, commercial UAS flights are currently not allowed in the NAS due to concerns over (1) "the inability to detect, sense, and avoid other aircraft and airborne objects in a manner similar to 'see and avoid' by a pilot in a manned aircraft, (2) vulnerabilities in the command and control of UAS operations, (3) the lack of technological and operational standards needed to guide the safe and consistent performance of UAS, and (4) the lack of final regulations to accelerate the safe integration of UAS into the national airspace" (Source: U.S. GAO, 2012 and Waggoner, 2013).

The first authorized use of UASs in the NAS in the U.S. was permitted by FAA in 1990. Over the past 23 years, the FAA has limited the authorized use of UAS in the U.S. to efforts focused on the public interest. These missions have included border patrol, military training, disaster relief, firefighting, search and rescue, law enforcement, and testing and evaluation. According to the FAA, the Department of Homeland Security currently utilize UASs for border and port surveillance; NASA and NOAA utilize UAS to help with scientific research and environmental monitoring; law enforcement agencies utilize UASs to support public safety; and state universities use UASs to conduct research (Source: FAA Fact Sheet 2013). These efforts are limited to areas outside of major urban areas at elevations less than 50,000 feet. The aircraft range in size from a hummingbird to a wingspan as large as a Boeing 737; although many are the size of a remote-control plane or helicopter. Recreational use of airspace is allowed away from airports and air traffic and below 400 feet above ground level – informal flights for business purposes are specifically excluded (Source: FAA Advisory Circular 91-57).

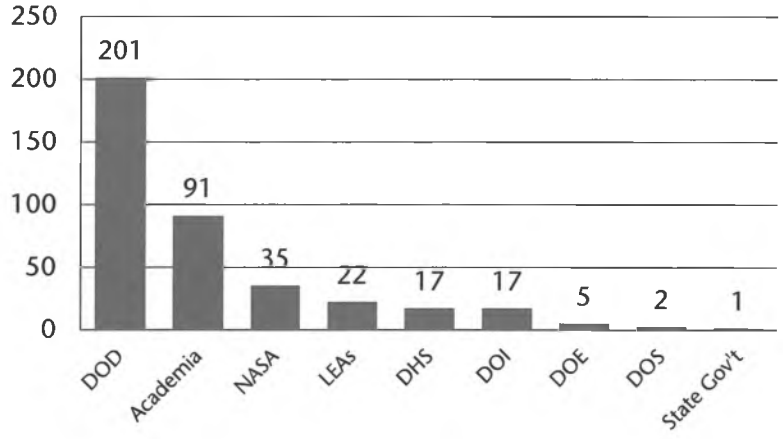
As of 2013, there are currently two ways to operate a UAS with the approval of the FAA: (1) Certificate of Waiver or Authorization (COA) for public UAS's and (2) special airworthiness certificate for private sector (civil) UAS's – both of these options require that the flight takes place outside of densely-populated areas.

Certificate of Waiver or Authorization (COA)

COAs allow public entities to fly UASs in a defined block of civil airspace. The FAA issued the first COAs in January 2007. With COAs, the UAV must remain in view, either of the ground crew or via a chase plane, since UAS technology cannot currently comply with 'See and Avoid' rules. COAs usually require between six and 24 months for approval and cost $40,000 to $60,000 (Source: Economic Development of Central Oregon, 2011). Most of the cost is for specialists in the testing protocols, documentation, and in managing the process through the FAA. Common applications by COA holders include firefighting, border patrol, disaster relief, search and rescue, military training, and other government operational missions (Source: FAA 2013b). The number of COAs issued has increased since 2009, with 146 in 2009, 298 in 2010, and 313 in 2011 (Source: FAA 2013b). In 2012, the FAA issued 391 COAs to 121 federal, state, and local government entities in the U.S. A total of 1,428 COAs have been issued since January of 2007 (Source: GAO 2013). As of February 15, 2013, there were 327 active COAs (Source: FAA 2013b).

The graph below aggregates the 391 COAs issued in 2012 to nine types of entities: U.S. Department of Defense, academia, NASA, local law enforcement agencies, U.S. Department of Homeland Security, U.S. Department of the Interior, U.S. Department of Energy, U.S. Department of State, and state government.

Figure 2: Number of Approved COAs, 2012



Source: GAO, 2013

Special Airworthiness Certificate

Special airworthiness certificates are the only way for civil operators to fly UASs in the NAS at present. However, these certificates cannot be utilized to carry people or property for compensation or hire – they can only be issued for research and development, crew training, or market surveys (Source: FAA 2011).

Allowing UAS in the NAS

In recent years the FAA has made a concerted effort to integrate UAS regulations into the NAS. In 2009, the FAA, NASA, DoD, and the Department of Homeland Security began addressing pathways to integrating UAS regulations into the NAS through their UAS Executive Committee. Additionally, the FAA chartered a UAS Aviation Rulemaking Committee in 2011 to create operational procedures, regulatory standards, and policies related to UAS flights in the NAS. In 2012, the FAA Modernization and Reform Act of 2012 (FMRA of 2012) was passed by Congress to approve six test sites where UAS integration could be tested prior to a 2015 integration of UAS regulations in the NAS (Source: FAA 2012). Delays within the FAA due to technical, logistical, and public outreach concerns may contribute to a UAS integration date later than 2015. However, six test sites are still scheduled to run from January 1, 2014 to February 13, 2017.

Six UAS Test Sites

There is considerable competition over where test sites will be designated, since designation will provide immediate employment in the selected region and support a strong foundation for UAS activity prior to integration of UAS regulation in the NAS. As of March 5, 2013, 50 applicants from 37 states were granted access to the FAA test site application web portal (Source: FAA 2013b). The FAA will consider

five key items when deciding the location of the six test sites: (1) geographic and climatic diversity, (2) location of ground infrastructure and research needs, (3) consultation with NASA and DOD, (4) population density and air traffic density of the surrounding area of any proposed location as well as the potential impact areas in the event of incidents, such as "Fly away" given potential safety mitigations; and (5) identification of specific goals and objectives to be accomplished. Additionally, the test sites are expected to provide an environment and opportunity to test conventional takeoff and landing capability, high speed flight (greater than 250 knots indicated air speed), maritime (launch/maneuver/recovery) capability, operations at extremely high altitudes (Class A airspace and above), and evaluation of dissimilar aircraft (including a mix of manned and unmanned aircraft) in multiple altitude structures (Source: FAA 2013a).

The six test sites that are selected will support the following operations and programs:

- Safe designation of airspace for integrated manned and unmanned flight operations in the national airspace system;
- Development of certification standards and air traffic requirements for unmanned flight operations;
- Coordinating with and leveraging the resources of NASA and the Department of Defense;
- Addressing both civil and public unmanned aircraft systems;
- Ensuring that the program is coordinated with the Next Generation Air Transportation System; and
- Ensuring the safety of unmanned aircraft systems and related navigation procedures before they are integrated into the national airspace system (Source: FAA, 2013b).

The test site operators will provide opportunities for government agencies, industry, and researchers to access this airspace to aid in the integration of UAS regulations in the NAS. Additionally, data collection will support development and operations research and professional development opportunities will be available for inspectors, airspace managers, air traffic controllers, and others. The specific goals described by the PPUTRC applicants include (Source: PPUTRC, 2013):

- Develop a set of standards for select unmanned aircraft categories, for aircraft state monitoring, and navigation. PPUTRC goals and objectives work will augment ongoing standards work with research on categories of UAS not yet addressed, and evaluations needed to refine emerging standards under consideration;
- Validate FAA acceptable risk thresholds or safety management system standards for UAS operations;

- Identify safety factors in UAS design; validate certification standards, including protocols for air traffic control interaction. Define and qualify underlying assumptions and a minimum set of air vehicle characteristics critical to safety, reliability, etc.;
- Develop effective, compliant 'sense and avoid' systems to satisfy regulatory guidance;
- Identify gaps in federal and state statutory and case law protections for privacy and recommend policies or legislation to remedy;
- Directly support the federal mandate for "Expanding Use of UAS in the Arctic" (in Sec 332(d) of Public Law 112-95);
- Design experiments and provide data to support American Society for Testing and Materials (ASTM) F38 and Radio Technical Commission for Aeronautics Special Committee (RTCA SC) 203 to evaluate minimum training and operator qualification standards for crew licensing.

Economic Impact of UAS in the U.S.

The economic implications of integrating UAS regulations into the NAS are substantial. According to a study conducted for the Association for Unmanned Vehicle Systems International (AUVSI), integration will generate $82 billion in activity between 2015 and 2025. Employment impacts are estimated at just over 100,000 jobs by 2025.

The direct economic impact of UAS development in the U.S. is expected to climb from $1.1 billion in 2015 to over $5 billion annually by 2025, measured in terms of output. Including indirect and induced effects, the annual economic impact is expected to rise from $2.3 billion in 2015 to $10 billion in 2025 (Source: AUVSI, 2013).

Areas selected as UAS test sites will have an advantage in capturing these economic benefits; thus the fierce competition among the 50 applicants.

Chapter 2. Pan-Pacific Test Range Complex

In 2012, the Alaska Center for UAS Integration (ACUASI) at the University of Alaska Fairbanks Geophysical Institute began collaborating with Oregon State University and the University of Hawaii to propose a Pan-Pacific Test Range Complex (PPUTRC) as one of the six FAA test sites. This proposed PPUTRC contains 13 test ranges located in Alaska, Hawaii, and Oregon. Of the 13 ranges, six ranges are in Alaska (Denali, Kodiak, North Slope, Oliktok, Poker Flat, and Wainwright), three ranges are in Hawaii (Humuula-R-3103, Makua-R-3109, and Maku-R-3110), and four ranges are in Oregon (Juniper MOA, Pendleton, Tillamook Coastal, and Warm Spring).

Existing UAS activity in Alaska, Hawaii, and Oregon benefits from unique assets and opportunities, including government facilities (e.g. numerous military bases, universities, and maritime assets), wide open airspace in largely unpopulated areas, and geographic diversity (e.g. tropical to arctic climates, oceanic or mountainous landscapes, and up/down weather fronts). The diverse testing environments for the PPUTRC are included in the Table 1 below:

Table 1: Diversity of Potential Testing Environments for the PPUTRC

360 degree oceanic airspace access	Arctic landscape	Extreme low temperatures
Oceanic and sea-ice access	High arctic winds	High sea-salt corrosion effect
Able to fully matrix UAS into NextGen and air traffic operating both VFR and IFR; high and low altitude	Operations in all classes and categories of military SUA	Operations in Classes A through F international airspace in the oceanic environment
Class C, D, & E airspace within 5-nautical miles of airports	High and low-land vegetation tundra	Numerous inland waterways and lakes
High density airports integration studies and testing	Class C, D, & E airspace airport approaches/departures	High-humidity high and low-altitude
Hot and cold high-desert testing	Littoral coastal region mountainous area	Class E (high) airspace
Jungle conditions	Class A airspace	Mountainous terrain
Volcanic	Glacier	Ship traffic including open ocean and ports

UAS Activity in Alaska, Hawaii, and Oregon

There are currently 15 active COAs in the PPUTRC area as well as eight in-process COAs and 20 expired COAs.

Alaska

ACUASI at the University of Alaska Fairbanks (UAF) is the lead organization for the proposed PPUTRC. The formal PPUTRC team includes over 80 businesses, universities, tribes, and economic development organizations in Alaska. UAF has actively managed UAS operations since 2004.

ACUASI was formed in 2012 to enhance UAS research in Alaska. ACUASI and the UAF Geophysical Institute have developed and flown a variety of in-situ and remote sensing instruments on various UASs in Alaska and throughout the world. Scientific and research campaigns undertaken in Alaska over the past decade include using UASs to support observation and monitoring of sea lions in the Aleutian Islands, weather forecasting, volcanic plume monitoring, atmospheric sampling during wildfires, monitoring of sea ice build ups, and oil spill mapping. Commercial applications trialed in Alaska include whale monitoring, cadastral mapping, maritime navigation support, industrial plant monitoring, and environmental clean-up. This experience, coupled with the FAA's UAS test site status, would leverage a variety of new economic activities in Alaska.

The following table, which summarizes ACUASI activity in 2012, illustrates the variety of UAS activity supported by the organization. The table also provides revenue and staffing data for each UAS campaign.

Table 2: UAS Campaigns Supported by the University of Alaska Fairbanks in 2012

Client	Flight Locations	Type of UAS	Purpose of Flights	Revenue for Site Operator	Site Operator Staff	Flight Operator Staff
Aleutians	Aleutian Islands, AK	Aeryon Scout and Puma	Seal observation	$314,200	2 pilots	1 observer
Idaho	Lewiston, ID	Aeryon Scout	Salmon nest observation	$115,000	1 pilot	1 observer
Eglin Air Force Base	Fort Walton Beach, FL	ScanEagle and Aeryon Scout	Controlled burn experiment	$413,000	4 pilots	3 observers
Prudhoe Bay	Prudhoe Bay, AK	Aeryon Scout	British Petroleum flare stack monitoring	$190,000	1 pilot	1 observer
Nome	Nome, AK	Aeryon Scout	Harbor Ice monitoring for USCG	$30,000	1 pilot	1 observer
Ugak Island	Ugak Island, AK	Aeryon Scout	Seal population monitor	$6,500	1 Pilot	1 observer
Fort Greely	Fort Greely, AK	ScanEagle and Aeryon Scout	Flight test	$25,000	2 pilots	2 observers
Chile	Santiago, Chile	Aeryon Scout	Glacier Ice monitor	$9,000	1 pilot	1 observer
Belgium	Belgium	Gatewing	Flight training	$16,000	2 pilots	1 observer
Anchorage	Fort Richardson, AK	Aeryon Scout	Flight test and demonstration	$1,000	2 pilots	1 observer
Fairbanks	Poker Flat Research Range	ScanEagle	Payload test	$347,000	2 pilots	1 observer
Fairbanks	Poker Flat Research Range	Aeryon Scout	Payload test and demonstration	$30,000	2 pilots	1 observer
Fairbanks	Poker Flat Research Range	Raven	Flight test for avionics	$5,000	2 pilots	2 observers
Hawaii	Offshore Hawaiian Islands	Puma	Tsunami debris tracking	$95,000	1 pilot	1 observer

Hawaii

Hawaii offers many unique qualities that make UAS operations appealing. These include: (1) expansive over-water areas unencumbered by other aviation uses, (2) proximity to U.S. Pacific Command – a significant user of future UAS systems, (3) opportunities for joint operations with the Pacific Missile Range Facility – a major test range on Kauai, and (4) opportunities for long-range point-to-point tests with partner ranges in Alaska and Oregon. The Hawaii ranges have proven an important focus for the development of scientific applications of UAS, with significant milestones including test flights of the Aerovironment Pathfinder; Pathfinder Plus; and Helios solar-hybrid propulsion high altitude, long endurance UAS, between 1997 and 2001. Scientific applications led by U.S. federal agencies have recently seen Hawaii emerge as a focal point for NOAA's exploration of UAS as a tool for marine park surveillance. NOAA has utilized UAS to monitor Papahanaumokuakea Marine National Monument since 2007 and performed initial trials using small hand launched systems in mid-2012.

Oregon

The Oregon-based PPUTRC team members include 16 businesses, universities, tribes, and economic development organizations. Additionally, six committed team partners will convert to formal team members upon FAA test site designation award to PPUTRC. Engagements are also planned with a wide ranging network in Oregon – including the 111 AUVSI members and numerous startup companies, primarily in sensor, robotics, and other supporting technologies. In comparison to Alaska and Hawaii, Oregon has historically been more engaged in design, development, and manufacture of UAV systems and subsystems.

The two largest Oregon UAS firms are Insitu (design, development, and manufacture of UAS systems) and FLIR Systems (remote sensors). The main Oregon firm involved in UAS applications has been Near Space Corporation (NSC). NSC uses very high altitude unmanned balloons and gliders to perform scientific and commercial test activities, ranging from data gathering on behalf of government agencies to near-space testing of hardware and sensors for commercial firms. NSC is opening a new $6 million flight test and operations facility at the Tillamook Airport on the Oregon coast. Existing UAS activity also includes the Oregon Army National Guard operations in Pendleton. Oregon's UAS efforts are synergistic with a separately funded ground vehicle innovation initiative, Drive Oregon, which requires systems that can be spun out of UAS: quiet, efficient motors, lightweight composite designs, and navigation systems. The potential economic benefits of the test sites, as well as NAS integration, are particularly strong for Oregon's already significant aircraft manufacturing sector.

Recent UAS Funding in Alaska, Hawaii, and Oregon

Since 2004, nine Alaska contractors have received direct U.S. federal agency contracts for UAS goods and services. The largest federal contract in Alaska is a 5-year standing services award, worth $47 million, from the U.S. Navy to the University of Alaska in 2010 for UAS payload integration and flight test services. The second major award made since 2004 to an Alaska firm consists of a series of pacts totaling $17 million from the U.S. State Department to Anchorage-headquartered Kuk Construction (subsidiary of Olgoonik Development, an Alaskan Native Corporation) for the provision of UAS-based security surveillance services in Iraq in partnership with KBR, Inc. UAF has collaborated with commercial entities, such as Idaho Power Company, and manufacturers including AeroVironment to conduct surveys and observe environmental impacts. Additionally, UAF has collaborated with BP for oil spill response and flare stack monitoring, as well as projects focused on detecting and locating gas and oil pipeline leaks and developing new sensors and processes to identify leaks.

Hawaii's large military presence has resulted in defense spending as the primary source of federal funding to UAS vendors in the state. Direct defense contracts accounted for 94 percent of all awards in terms of obligated amounts from 2004-2012, rising to 97 percent when including awards placed by the General Services Administration on behalf of the U.S. Air Force. The remaining awards were placed with Honolulu-based Referentia Systems by NOAA as part of the Papahanaumokuakea Marine National Monument monitoring project. Hawaii supports a dedicated UAS development and manufacturing company, Williams Aerospace, a small firm currently developing new platforms in the fixed-wing, hand launched micro and medium altitude endurance classes. The state is also working to create two commercial UAS services arms, addressing the defense, homeland security, and precision agriculture markets.

In Oregon, a consortium of industry, academia, and public entities has created a 7-year strategic plan to double the size of the UAS industry in the state, with the help of a $2.5 million State of Oregon grant scheduled for the 2013-14 biennium and additional investments of at least $1.15 million from other sources for a total of $3.65 million. The plan specifically creates UAS solutions for commercial applications, and safely integrating those UAS solutions into the NAS. Projects include emergency response; weather; firefighting; search and rescue; wildlife and habitat management; law enforcement; physical and resource surveys (land and water); management of agriculture, livestock, and public lands; and management of public and private infrastructure. Oregon State University (OSU) has already begun UAS flights based on these research objectives.

Leveraging Current Research Institutes, Community Colleges, and Training Centers

ACUASI is collaborating with the UAF College of Engineering and Mines (CEM) and the Community and Technical College (CTC) to integrate UAS engineering, science, and technology into UAF's teaching, research, and service activities. Additionally, ACUASI is working with the CEM to fill a full-time tenure track engineering faculty position with a professor focused on UAS engineering, science, and technology. ACUASI and CTC also intend to include UAS technology courses in CTC's aviation curricula to train UAS developers, technicians, and pilots as well as to improve outreach to remote Alaskan villages that could benefit from UAS technologies. Cooperation with the CTC at UAA will add air traffic controller participation, offer training for UAS operators, and ultimately build a maintenance program similar to the Aircraft and Powerplant program currently offered.

The University of Hawaii is testing UASs in several of its research programs, evaluating the utility and impact of UAS through analysis of coastal resource management, terrestrial and aquatic environmental monitoring, natural source management and inventory, and human impact studies. University of Hawaii is also developing programs to train students and research professionals on UASs, and plans to integrate this capacity into accredited degree programs.

The new OSU industry-university UAS consortium will depend on test site facilities for collaborative research and development in all phases of operations and applications. Through the Colleges of Engineering, Science, Agriculture, Forestry and Earth, Ocean and Atmospheric Sciences, OSU has expertise and supports ongoing research on control theory and robotics, flexible airframes and flight, sensors, and signal processing, and numerous applications in natural and environmental sciences and environmental monitoring, measuring, and management. OSU-Cascades, located in Central Oregon near the Warm Springs and Juniper test ranges, offers programs in energy engineering, computer science, natural resources, and business, and plans to add programs designed in conjunction with the UAS industry. OSU-Cascades can also provide on-site facilities for OSU-Corvallis researchers leading projects in the region. Central Oregon Community College (COCC) has one of the largest aviation flight training programs on the West Coast – both fixed wing and rotary. COCC offers certifications for UAS flight training and plans to develop a program for data analysis of sensors, building on the school's strong geographic information systems program. Additionally, Blue Mountain Community College (BMCC) in Pendleton, Oregon is developing a UAS curriculum for instructional delivery and course certification. Oregon Institute of Technology (OIT) offers a variety of degrees in engineering and engineering technology, composite engineering, computer and software systems engineering, and electrical engineering, including a master's degree in manufacturing engineering. It offers degrees in professional land surveying and geographic information systems. OIT is collaborating with Rockwell Collins, the aviation electronics company, on real-world projects at a joint campus outside Portland and offers similar hands-on collaborations with other aerospace firms in the northwestern U.S.

Expansion of Existing Businesses and Attracting New Business Investment

The University of Alaska has spun off at least two companies who intend to test their products on the Pan-Pacific test range. These companies were created by University graduate students who were expanding their research in sensors for testing in UASs. UA recently received $5 million from the State of Alaska to support the development of a sustainable high-tech industry in Alaska. Already two companies have established satellite offices in Alaska to improve collaboration with the ACUASI.

Placement of a UAS test site in Hawaii will promote growth within Hawaii and reduce development cycles for manufacturers and researchers. Additionally, it would reduce or eliminate costs to ship sensors, and send knowledgeable staff, to mainland test sites to operate and demonstrate systems. Close proximity to a test site in Hawaii will greatly benefit firms such as BAE Systems, Williams Aerospace, and others – including many military and government contractors working with the Honolulu Fire Department, Honolulu Police Department, U.S. Civil Air Patrol, U.S. Coast Guard, U.S. Department of Defense, U.S. Department of Homeland Security, U.S. National Guard, and others.

In Oregon, more than a dozen companies have said that they will begin testing their sensor packages, propulsion systems, and airframes in Oregon if the Pan-Pacific UAS Test Area is designated as a national test site. Additionally, two companies have informally pledged to open satellite offices at a state test range. The PPUTRC will benefit UAS businesses in the Columbia River Gorge. Over the past seven years, the Gorge's UAS industry grew from a small core of 30 people to an employment base of more than 1,400 employees. Many of these new jobs were created by the UAS companies' suppliers. The two largest Oregon UAS manufacturers are Insitu, manufacturer of UAS platforms and subsystems, and FLIR Surveillance Systems, a manufacturer of electro-optic and infrared imaging systems. Insitu is a major global supplier of high endurance, runway-independent UAS. FLIR Surveillance provides more ER and IR imaging systems for unmanned aircraft, unmanned ground, and unmanned maritime platforms than any other company. Activity in the Gorge from firms such as Insitu, FLIR Surveillance Systems, Cloud Cap Technology, and UTC Aerospace has spun off more than 20 local companies. Central Oregon's general aviation aircraft manufacturing industry had a similar growth pattern over a 15-year period, expanding from a core company of about 30 employees (Lancair) to a cluster of 25 companies that now employs nearly 1,200 people. It is anticipated the PPUTRC will help expand these existing businesses in the Gorge and Central Oregon.

Infrastructure

Alaska expects to invest $1.5 million to construct a test site center at its Poker Flat Research Range, as well as develop and acquire mobile test infrastructure such as fixtures, data collection devices, and monitoring systems similar to its internet-Portable Aerial Surveillance System (iPASS), a web-based application that merges track information from radar, GPS, and a transponder interrogator/receiver. Additionally, large data collection requirements are expected to drive development of a data center for processing and storage.

Hawaii's test ranges link to military/restricted areas used for current UAS operations. These sites include the Pohakuloa training area on the Island of Hawaii, Bradshaw and Wheeler Army Airfields on Oahu, and the Pacific Missile Range Facility on Kauai. Other areas under consideration include Upolu and Dillingham Airfields (on the Big Island and Oahu, respectively). Test points within the ranges would be utilized to support both shore and ship-based development, testing and certification of new UASs, training and crew certification of operational UASs, and development of expanded and joint capabilities involving existing communications systems and operations tactics using UAS.

The budget for the $2.5 million Oregon innovation grant envisions spending at least $1.2 million at test ranges for new equipment and/or infrastructure, with the grant providing $300,000, private enterprise providing $750,000, and public entities providing $150,000. Possible infrastructure development proposed with this funding includes: portable ground radar units; an automatic dependent surveillance-broadcast ground station or a similar 'sense and avoid' technology system; one or more operations management buildings housing computers, calibration components, baseline sensors with a range of capabilities, data analysis equipment, supporting software, maintenance facilities and machine shops; and ground control stations, an observation tower, and ITAR facilities as needed. Additionally, as noted earlier, Near Space Corporation is preparing to open a new $6 million flight test and operations facility at the Tillamook airport.

Chapter 3. Potential Economic Impacts of the PPUTRC

Designation as one of the nation's six UAS test sites promises to have significant economic impacts in the areas where flight activity occurs and support services are provided. Private and public sector UAS activity that has been constrained by restricted access and a restrictive federal authorizing process will have much greater opportunity to conduct UAV flight operations. In this chapter the potential economic impacts in Alaska, Hawaii, and Oregon related to serving as a test site are quantified.

The following economic impact projections were developed by McDowell Group, Inc. utilizing flight activity, flight cost, and flight-related staffing data provided by PPUTRC team members. Direct economic activity was measured by approximating preflight administrative costs, site fees per day, operating costs per day, and total flight days from historical data provided by the applicant. Sector-level information was obtained from the applicant concerning the number of UAS-related firms and jobs per firm. Direct employment estimates were then coupled with multipliers obtained from the IMPLAN economic impact model to estimate total direct, indirect, and induced economic effects. Annual projections from 2014 to 2017 were calculated for each of the 13 ranges utilizing growth rates based on funding forecasts from the Teal Group UAS market profile and forecast report, historical flight activity, and projected growth in flight activity, research, and UAS-related manufacturing as provided by the applicant.

In total, designation of PPUTRC as a UAS test site would be expected to generate 1,065 direct, indirect, and induced jobs in 2014, increasing to over 1,400 jobs by 2017. Total labor income would climb from$57 million in 2014 to about $76 million in 2017.

Table 3: Summary Impacts of PPUTRC Test Site Designation, 2012-2017
Combined Impacts in Alaska, Hawaii and Oregon

Impact of Test Site Designation	2014	2015	2016	2017
Total Employment	**1,065**	**1,260**	**1,335**	**1,429**
Direct Employment	490	571	602	642
Indirect Employment	198	243	259	279
Induced Employment	377	447	474	508
Total Labor Income ($ million)	**$56.9**	**$66.9**	**$70.8**	**$75.6**
Direct Labor Income ($ million)	$26.4	$30.5	$32.2	$34.2
Indirect Labor Income ($ million)	$10.4	$12.5	$13.3	$14.4
Induced Labor Income ($ million)	$20.1	$23.8	$25.3	$27.1
Output ($ million)	**$265.0**	**$301.8**	**$315.9**	**$333.5**
Total Value Added ($ million)	**$109.3**	**$121.9**	**$127.1**	**$133.5**
State Income Taxes ($ million)	$4.3	$5.0	$5.3	$5.6

Employment Resulting from UAS and Test Site Operations

In 2014, with designation of PPURTC as a test site, UAS activity in Alaska, Hawaii, and Oregon is expected to account for 581 direct jobs and a total of 1,254 jobs - including direct, indirect, and induced jobs. Approximately 85 percent of that total employment (1,065 jobs) is attributable to test site designation. The remaining 15 percent (189 jobs) is expected to occur in the absence of PPUTRC test site designation. By 2017, employment will rise to an estimated 904 direct jobs and 1,991 total jobs - with 72 percent of that total employment (1,429) attributable to test site designation. A significant number of these direct jobs are expected in smaller communities that tend to have higher unemployment – thus test site designation for the PPUTRC will help improve opportunities where they will provide the most benefits.

Table 4: Direct Employment, 2012-2017

Direct Employment						
	2012	2013	2014	2015	2016	2017
Total Direct Employment						
PPUTRC	**74**	**82**	**581**	**712**	**801**	**904**
Alaska Ranges	43	47	129	142	157	173
Hawaii Ranges	-	-	-	72	95	126
Oregon Ranges	31	35	452	498	549	605
Impact of Test Site Designation						
PPUTRC	-	-	**490**	**571**	**602**	**642**
Alaska Ranges	-	-	77	82	86	91
Hawaii Ranges	-	-	-	72	95	126
Oregon Ranges	-	-	414	417	421	424

Oregon's relatively high direct employment numbers are due to the existing, well-developed aircraft manufacturing sector in Oregon. Oregon is well placed to supply the growing demand for UAS aircraft that will be triggered by UAS integration. Most of the new jobs created in Oregon due to PPUTRC designation include manufacturing jobs (many of which may be created due to designation of test sites anywhere in the U.S.). These numbers for Oregon are based on an analysis provided to McDowell Group by Economic Development for Central Oregon (EDCO).

In addition to direct jobs created from UAS firms, significant indirect and induced jobs will also be created. Indirect jobs represent jobs created throughout the supply chain to support the UAS industry and induced jobs represent jobs created due to changes in household consumption as a result of the UAS industry.

Table 5: Indirect Employment, 2012-2017

Indirect Employment	2012	2013	2014	2015	2016	2017

Alaska Ranges	-	-	63	67	71	75
Hawaii Ranges	-	-	-	64	84	111
Oregon Ranges	-	-	313	316	319	321

Note: Summation of columns may not match the total due to rounding

Labor Income Resulting from UAS and Test Site Operations

In 2014, UAS activity in Alaska, Hawaii, and Oregon is expected to account for $31 million in direct labor income and $67 million in total labor income - including direct, indirect, and induced - assuming the PPUTRC is awarded test site designation. Approximately 84 percent of that total labor income ($57 million) is attributable to test site designation, while the remaining 16 percent ($10 million) is expected to occur even if the proposed PPUTRC does not become a test site. By 2017, labor income is expected to include $106 million in total direct, indirect, and induced labor income - with 71 percent of that total labor income ($76 million) attributable to test site designation.

Table 7: Direct Income, 2012-2017 ($ million)

	Direct Income					
	2012	2013	2014	2015	2016	2017

Oregon Ranges	-	-	$16.1	$16.3	$16.4	$16.6

Output, Value Added, & State Income Taxes Resulting from UAS and Test Site Operations

'Output' represents the value of industry production, and 'total value added' is the difference between an industry's total output and the cost of their intermediate inputs. Economic modeling conducted for the purposes of this study indicates output in the PPUTRC states attributable to test site designation would climb from $265 million in 2014 to $333 million in 2017. Value added would climb from $109 million to $134 million over the same period.

Table 10: Output, 2012-2017 ($ million)

	Output					
	2012	2013	2014	2015	2016	2017
Total Output						
PPUTRC	**$18.3**	**$20.2**	**$302.4**	**$366.8**	**$411.7**	**$463.6**
Alaska Ranges	$8.6	$9.5	$34.3	$37.8	$41.7	$46.0
Hawaii Ranges	-	-	-	$33.3	$44.1	$58.3
Oregon Ranges	$9.7	$10.7	$268.1	$295.6	$325.9	$359.3
Impact of Test Site Designation						
PPUTRC	-	-	**$280.1**	**$315.5**	**$328.4**	**$344.7**
Alaska Ranges	-	-	$23.8	$24.8	$25.8	$26.8
Hawaii Ranges	-	-	-	$33.3	$44.1	$58.3
Oregon Ranges	-	-	$256.3	$257.4	$258.5	$259.6

Table 11: Total Value Added, 2012-2017 ($ million)

	Value Added					
	2012	2013	2014	2015	2016	2017
Total Value Added						
PPUTRC	**$9.5**	**$10.5**	**$127.7**	**$151.8**	**$169.7**	**$190.3**
Alaska Ranges	$5.7	$6.3	$22.7	$25.0	$27.6	$30.4
Hawaii Ranges	-	-	-	$10.9	$14.5	$19.1
Oregon Ranges	$3.8	$4.2	$105.1	$115.8	$127.7	$140.8
Impact of Test Site Designation						
PPUTRC	-	-	**$116.2**	**$128.2**	**$132.8**	**$138.5**
Alaska Ranges	-	-	$15.8	$16.4	$17.1	$17.7
Hawaii Ranges	-	-	-	$10.9	$14.5	$19.1
Oregon Ranges	-	-	$100.4	$100.9	$101.3	$101.7

Designation of the PPUTRC will provide a combined four-year total of $20 million in income tax revenue to Hawaii and Oregon. The effective income tax rate for these calculations was approximated as 7.5 percent for Hawaii, and 9 percent for Oregon (Alaska has no income tax).

Table 12: State Income Taxes, 2012-2017 ($ million)

State Income Taxes

From: Representative Shelley Hughes, Co-Chair

Shelley Hughes

Date: September 3, 2014

Re: Committee Schedule for September 18-19, 2014

The Legislative Task Force on Unmanned Aircraft Systems will meet at the Anchorage Downtown Hilton hotel (room number will be posted at the hotel) as part of the University of Alaska UAS Interest Group Meeting for purposes of accepting public testimony.

Thursday, September 18, 2014

3:00pm – 5:00pm
Accepting public testimony
(this portion of the task force meeting will NOT be teleconferenced or available for akl.tv)

The Legislative Task Force on Unmanned Aircraft Systems will meet at the temporary Anchorage Legislative Information Office, 733 West 4th Ave., 1st Floor Conference Room.

Friday, September 19, 2014

9:00am – 12:00pm
Discussion of unmanned aircraft systems matrix and education campaign
Accepting public testimony as time allows
+ Teleconferenced and akl.tv

To: Bob May (bob@gallerylodge.com); Com Folger; Com Kemp; Connie McKenzie; David Scott; General Katkus; Ginger Blaisdell; Howell, Kelly A (DPS); Joe Jacobson; John Binder - Dep Com DOT; John Parker; Lt. Steve Adams; Margaret Sharpe; McHugh Pierre; Micaela Fowler; Mike O'Hare; Rep. Shelley Hughes; Ro Bailey; Sen. Donny Olson; Steve Colligan - Model Aeronautics; Steve Strait (steve@straitmedia.us); Steve Wackowski; Susan Bell
Subject: task force meeting announcement
Attachments: chief clerk announcement.docx

Please let me know if you will or will not be attending any portion of the UAS Interest Group meeting on Sept 16-18 (in addition to the public testimony on the afternoon of Thursday Sept 18). I am working with the University to reserve spaces for task force members.

I will send an information packet on Monday September 8 when I finish gathering information.
Let me know if you want anything specific on the agenda:

- UAS matrix
- Education campaign
- Update from Joe Josephson and invited guest(s)

Thank you
Ginger Blaisdell

Legislative Task Force on Unmanned Aircraft Systems
September 19, 2014 Meeting at 733 West 4th Ave
Temporary Anchorage Legislative Information Office

9:00am – 12:00pm

Task Force Members:

- Representative Shelley Hughes, Co-Chair
- Senator Donny Olson, Co-Chair
- Joe Jacobson, Commissioner Designee, Department of Commerce, Community Economic Devel.
- Mike O'Hare, Commissioner Designee, Department of Military and Veterans' Affairs
- Lieutenant Steve Adams, Commissioner Designee, Department of Public Safety
- John Binder, Commissioner Designee, Department of Transportation, Public Facilities
- Ro Bailey, University of Alaska Fairbanks
- Steve Strait, Aviation Advisory Board, Governor's Office and DOT/PF
- Steve Colligan, Representative Member for the Academy of Model Aeronautics
- John Parker, Integrated Robotics Imaging Systems
- Steve Wackowski, Tulugaq II
- Bob May, Gallery Lodge, Kasilof

- Ginger Blaisdell, Staff to Rep. Hughes
- David Scott, Staff to Senator Donny Olson

Guest Attendee(s):

Kerry Long, FAA Chief

AGENDA

9:00am Welcome and Introductions .....Representative Shelley Hughes

- Comments on UAA Interest Group Meetings
- Review of Meeting Summary from August 1, 2014
- Invited Guest(s): Kerry Long, FAA Chief
- Today's discussion topic: Education Campaign
- DRAFT Letter to Commissioners
- Public Testimony (as time allows)
- Adjournment

Task Force Responsibilities per HCR15 and Review of Resolution

The duties of the task force shall include

1. reviewing regulations and guidance from the Federal Aviation Administration regarding unmanned aircraft systems;
2. providing written recommendations, together with suggested legislation, for a comprehensive state policy for unmanned aircraft that protects privacy and allows the use of unmanned aircraft systems for public and private applications;
3. evaluating complaints and concerns expressed to the task force;
4. identifying potential privacy and public safety concerns associated with unmanned aircraft systems and determining whether legislation is necessary to address them;
5. considering recommendations for public education related to unmanned aircraft systems;
6. studying the Federal Aviation Administration's "Integration of Civil Unmanned Aircraft Systems (UAS) in the National Airspace System Roadmap," issued November 7, 2013 (1st ed. 2013) and its application to the development of unmanned aircraft systems in the state;
7. conducting a public hearing concerning privacy and the capture of data by unmanned aircraft systems at the University of Alaska's test site;
8. further studying the nonpublic use of unmanned aircraft systems to encourage development of the private sector unmanned aircraft system industry; and
9. further studying and making recommendations with respect to ensuring unmanned aircraft users comply with applicable laws.

Provided Documents .....Ginger Blaisdell

- News Article UAS Vision 9-10-2014: Amazon.com Unveils 'Drone Store' and documents
- AMA matrix documents provided by Steve Colligan
- Type and Purpose matrix draft by Ginger Blaisdell
- Pilot skills matrix drafted by Jay Skaggs
- DRAFT Letter to Commissioners

Future Agenda Items .....as listed in August

- Responses to FAA rules in Oct/Nov
- PPUTRC public meeting on privacy policy at the September meeting will meet the FAA requirements of the test site for this year
- Data retention
- Invitation to AMA officials on education
- Define framework – training and education
- Dept Public Safety guidance document on enforcement of UAS
- Integration not segregation of airspace: invite DOI, FAA, Military, BP/Exxon, etc
- System for gathering citizen complaints

Follow Up – To Do ..... **as listed in August**

- Military mission in Alaska – process and plans
- Letter to Commissioners of state agencies on UAS re: point of contact for their department
- Italy data protection laws
- Who to contact? Complaint / enforcement system / responses
- FAA enforcement
- Doug Marshall UND privacy
- UTMS – unmanned traffic management system
- FAQs could be discussed at a teleconference meeting of the task force

Adjourn ..... **Representative Shelley Hughes**

Legislative Task Force on Unmanned Aircraft Systems
August 1, 2014 Meeting at 733 West 4th Ave
Temporary Anchorage Legislative Information Office

9:00am – 4:00pm

Task Force Members:

- Representative Shelley Hughes, Co-Chair
- Senator Donny Olson, Co-Chair (not in attendance)
- Joe Jacobson, Commissioner Designee, Department of Commerce, Community Economic Devel.
- Mike O'Hare, Commissioner Designee, Department of Military and Veterans' Affairs
- Lieutenant Steve Adams, Commissioner Designee, Department of Public Safety
- John Binder, Commissioner Designee, Department of Transportation, Public Facilities
- Ro Bailey, University of Alaska Fairbanks
- Steve Strait, Aviation Advisory Board, Governor's Office and DOT/PF
- Steve Colligan, Representative Member for the Academy of Model Aeronautics
- John Parker, Integrated Robotics Imaging Systems
- Steve Wackowski, Tulugaq II (called in)
- Bob May, Gallery Lodge, Kasilof

- Ginger Blaisdell, Staff to Rep. Hughes
- Syndey Seay, Staff to Senator Donny Olson (called in)

Invited Attendee:

- Kathleen Strasbaugh, Legislative Legal (called in for questions)

Meeting attendees:

- Gary Williams, Aero Forensics
- Jeff Yates, Dat/Em Systems International
- Brandon Anderson, Alaska Aerial Technology
- Jay Skaggs, FAA
- Pete Adams, ENI Petroleum
- Mike Pannone, Aero Forensics
- Carole Anderson, UAA Student Aviation Administration

MEETING SUMMARY

9:00am Welcome and Introductions .....Representative Shelley Hughes

- Round table discussion of expectations from each task force member; specific outcomes include:
  1. Ensure that safety is the utmost priority, and also that there be a cooperative effort between all facets of not only the industry, but the public and federal and state government to foster the growth of the industry in the right way.
  2. Consider an internship program introduced into the university system.
  3. Recognizes a wide range of uses for UAS, but must be very mindful of public safety and public trust. Must not infringe on the privacy of the public.
  4. Oct,Nov the initial draft will be out from FAA and the Task Force may want to consider weighing in during the public comment section.
- Each member discussed his/her background and personal experience with unmanned aircraft systems, and some general comments about what the task force can do for Alaska.

Task Force Responsibilities per HCR15 and Review of Resolution

The duties of the task force shall include

1. reviewing regulations and guidance from the Federal Aviation Administration regarding unmanned aircraft systems;
2. studying the Federal Aviation Administration's "Integration of Civil Unmanned Aircraft Systems (UAS) in the National Airspace System Roadmap," issued November 7, 2013 (1st ed. 2013) and its application to the development of unmanned aircraft systems in the state;
3. conducting a public hearing concerning privacy and the capture of data by unmanned aircraft systems at the University of Alaska's test site;
4. evaluating complaints and concerns expressed to the task force;
5. identifying potential privacy and public safety concerns associated with unmanned aircraft systems and determining whether legislation is necessary to address them;
6. further studying the nonpublic use of unmanned aircraft systems to encourage development of the private sector unmanned aircraft system industry;
7. considering recommendations for public education related to unmanned aircraft systems;
8. further studying and making recommendations with respect to ensuring unmanned aircraft users comply with applicable laws; and
9. providing written recommendations, together with suggested legislation, for a comprehensive state policy for unmanned aircraft that protects privacy and allows the use of unmanned aircraft systems for public and private applications.

Review of HB255 ..... Lt. Steve Adams

- Lt Adams read through HB255 and discussed the applicability of the law.
- Current update on Department of Public Safety using UAS
    - DPS does not currently have a program for UAS, have been working towards establishing one for the past two years. The missions when UAS would be used would likely include:
        1. FIRST: search and rescue, within defined incident perimeter
        2. SECOND: Lost children or vulnerable people
        3. THIRD: Mapping or examination of traffic incidents that may not be accessible
        4. FOURTH: Mapping of hostile crime scenes.
        5. FIFTH: Officer safety during tactical operation
        6. SIXTH: Natural disasters and hazardous materials operations, in areas
    - Will not turn these into "speed monitors" - These are public safety monitors, not law enforcement monitors.
    - DPS is hoping to acquire a UAS in the very near future. Due to short-staffing and lack of funding, DPS is probably another year out from purchasing a UAS.

Earlier this month the Fairbanks area conducted multiple mock scenarios where traditional methods and UAS were used.

TRAFFIC: for 3D mapping of a traffic accident and how the data was implemented to draw lines between points of impact etc. Current equipment took one hour for imaging the scene and 3 hours to process the data before evidence could be moved. Mapping by using the Scout UAS took about ten minutes on scene and an hour and half to process the data.

- UAS will dramatically reduce traffic blockage time during incident management. Mapping of the entirety of an incident scene is a slow process due to the spread of evidence items after collision. Expectations are that UAS will allow for more immediate clearing of a crash scene and could reduce process time by up to three hours.
- It was also added that officer safety, overall traffic monitoring of flow into an incident area can also be greatly improved by UAS implementation.

Active Shooter in a Multi-story Building: UAS flew over the building with a body-temp monitoring tech to monitor for heat signatures within the building. The UAS relayed info to commander as to the location of the gunman. SWAT team was able to assess the situation better and complete action more safely by understanding the movement of the gunman.

FIRE: UAS was able to identify the hottest spot of the fire within an insulated training building, and the UAS was able to identify the "hot spots" and communicate that to the officers.

If we have a UAS for Department of Public Safety, is the Certificate of Authorization (COA) needed for every incident? Or is it a one-time COA?

- Lt Adams: First, we need a training COA to be able to demonstrate safe operation, then a jurisdictional COA, then on a case-by-case basis we would need to evaluate whether it is feasible and safe to use UAS.
- There are states/counties currently operating UAS under jurisdictional COAs.

FAA Reg 8900.268 addresses the inappropriate use of UAS, gives some idea to the field offices as to what they can do. Currently, there are no state statutes that are specific to UAS.

Review of Status of PPUTRC ..... Ro Bailey

- Update from Ro Bailey on test site and range activity

On December 30, 2013, Alaska was announced as a Test site location by the FAA. To become operational, Alaska had to complete flight planning guide, improve privacy, and apply for COA.

The finalization process culminated in Michael Huerta, FAA Administrator, coming to Alaska in early May and signing the COA. At the same time, PPUTRC launched the Aryan Scout flight in Fairbanks conducting a mission over the large-animal science facility.

- Goals of research was to study how the drone affects the animals, does it disturb them, etc...
- Test site will be taking "baby steps" alongside FAA to make sure that everything they do is both advancing the state of knowledge, while meeting all of the required regulations.

PPUTRC Expectations:

- Anticipating COAs for multiple aircraft under one COA, takes about 90 days to get a COA approved, barring any major setbacks.
- Air-worthiness: there are no "standards" to declare airworthiness. The FAA will establish a special airworthiness program for the test sites. Will be performance standards for airworthiness, rather than design standards. Tests will be performed on UAS in the test site to determine airworthiness based on performance.
- It's about building confidence with the FAA, building a trust, as that increases the test site may gain the ability to produce its own COAs.

What is the interest level for use within the test site, now that AK is officially a site?

"Almost overwhelming interest, way more industry users are interested now", including local and state aviation entities. Many entities are recruiting commercial pilots to become UAS pilots.

Without federal funding, how are you supporting the test site?

ACUASI has the initial funding provided by the legislature ($5 million FY2012), "still living on that, but it's going – fast". The test site business model provides for directly charging for use of the test site for private users, industry testing, as well as government missions and grants.

- **Possibility of UAF becoming an FAA Center of Excellence**

  FAA Center of Excellence, Univ of Mississippi and Alaska are partnering in the application process, and if they are chosen, the state would receive funding from the center for research. Process of selection is in beginning stages.

Ro was asked to describe the process of how UAS were used in the Kenai wildfire.

Too many steps to discuss all but in summary, we got a phone call from a member of the national guard, saying they may want to use UAS on Funny River fire. The Scan Eagle was needed for the mission. After receiving the verbal go-ahead, Ro called the FAA and requested an emergency COA on Monday, Memorial Day. Team was dispatched immediately to Kenai. COA was approved in less than 24 hours.

DMVA: *"This was a great exercise in the process of HOW to get a mission like this approved, an exercise in process and futility."*

The flight took part at night, to scan thermal hotspots of the fire and map the hot spots, pass the information onto the firefighting team leads for access from mobile phones. The information allowed the crews to knock down a number of hot spots.

The real cost-saving potential is more eventual than anything, when we have the resources (models of UAS) that we need for a range of scenarios (fires, search and rescue, etc...) Once we have the proper tools for the proper scenario, that's when the real cost savings will be seen. Matching the right UAS with the right scenario is KEY.

Will there be a debriefing process after the use of UAVs in real situations?

DMVA: Yes, we do have debriefs to address needs to make improvements and better the process.

Report on AUVSI Conference in Florida May 2014 .....Joe Jacobson

- Copy of flyer that was developed for the AUVSI conference is provided
- Update from the DCCED efforts in promoting UAS industry in Alaska:

AUVSI event in Florida May 2014: Over 8000 attendees, majority being aviation vehicles, some ground and under-water. The Department had a booth to share info about why AK is leading the nation in advancing UAS industry. Industry follow up: generated about 40 industry contacts. PPUTRC is confident that the connections made at this event have possibility of future contracts.

Panel discussion at AUVSI took place with AK reps. Follow-up interviews resulted as well as the possibility of a PBS-funded tv documentary series on Alaska UAS.

The group of AK reps at the event met with a global simulation training company to discuss opportunity to establish a UAS training facility in AK. That company has been in Alaska this week to tour possible locations and learn what AK has to offer.

Report on Military and Alaska Aerospace Corporation Consideration of UAS ..... Mike O'Hare

- What are the military plans for UAS in Alaska?

  AK National Guard, AK Aerospace, Homeland Security all fall under DMVA. Department Of Deffense plans to incorporate the Gray-Eagle UAS (predecessor to the predator drone) to the into Alaska for long-range training; NOT a military mission. The FAA regulates the process and COAs are still required for all missions.

  Weaponization of UAS on the domestic front has never been discussed for the National Air Space. There is a clear line between commercial use and battle-use.

  AK National Guard is not interested in actually owning the platforms, but are interested in training pilots for UAS.

  Emergency Management, Homeland Security perspective: No ownership of platforms, but will contract out services to UAS industry for emergency response and management.

  Same COA process for Gray Eagles, but does that include flights over military airspace?

  DMVA: No, for flights over military airspace during training, no COA, but for any missions that take place outside of that space it will require COAs (for emergency response missions etc...). The military will "have to look at the capabilities, the time associated with the process, and the cost. If it's less expensive to have satellite imagery available, we'll use that but it is always good to have options."

- What are the AAC plans for UAS in Alaska?

  AK Aerospace Corp will be working with the university to implement training sites and programs. Kodiak may become a training range. AK Aerospace Corp will not be purchasing any platforms, but is interested in operating the facilities.

Report on Department of Transportation .....John Binder

- Exploring uses of UAS by DOT, opportunities available. State is very excited about the possibility of using UAS to develop the GIS system for the state for mapping and geography.

- Concern with the integration process. A lot of traffic in our skies, "big sky becomes not so big". Recovery of aircraft is another point of concern.
- Biggest factor is proper communication between users and UAS pilots, and the airports and state.

Introduction of Items in Notebook .....Ginger Blaisdell

Tab 1

- Final Report to the Legislature, June 30, 2014
- HCR15
- HB255

Tab 2 – **Up to date with industry**

- Newsworthy comments – pulse of the industry – What's happening with UAS policy worldwide

All documents were provided to stimulate dialogue and consider others' good ideas.

Documents included a summary of ten of the most notable UAS currently in the news and a blog with good info graphics for consumers. The FAA published a fact sheet January 6, 2014 that succinctly described Civil UAS, Public UAS and Model Aircraft. Australian Certified UAV Operators Inc comments on Australia's legislative recommendations – many are similar to Alaska's concerns. UK Civil Aviation Authority is establishing a case-by-case review for approving UAS. Philippines issued UAS regulations that are very restrictive. News article on South Africa using the term "RPAS" rather than UAS to bring the "pilot" back into the acronym to identify that a human is involved. Fully autonomous aircraft are not being considered at this point. And finally an announcement that the FAA is on track to meet its Sept 2015 deadline of integrating UAS into the National Air Space.

UNIV: Fully autonomous UAVs are currently banned by the FAA. Related the conversation back to the technology being implemented in automobiles (ABS braking, parallel parking, etc...) and how it takes some work for the public to become comfortable with this type of technology.

Tab 3 – **Hobby Fliers**

All documents were provided to stimulate dialogue and consider others' good ideas.

- Guidelines for Hobby Fliers – prepared by the Academy of Model Aeronautics entitled "What Can I Do With My Model Aircraft?"
- FAA Interpretation of the Special Rule for Model Aircraft
- P.L. 112-95 Sec 336. Special Rule for Model Aircraft

AMA: The Academy of Model Aeronautics has also prepared a matrix of UAS platforms, their intended uses and requirements.

Hobbyists' perspective: through this entire process, you learn the methods of procedure. AMA's mission is to promote safety, regulations and responsibility for our youth. Regardless of whether they go into the UAS field, the process will teach give them valuable experience and prepare them for professional life." STEM education, training, and igniting the interest in our youth should be a priority.

AMA is preparing to roll out a hobby self-certification system. To obtain special classification for aircraft over 55 lbs you need to prove that you have the ability to safely fly an aircraft over 55 lbs. AMA will provide training programs for certification. AMA offers special waivers and training programs for many different types of UAS.

Tab 4 – **Commercial Fliers**

All documents were provided to stimulate dialogue

- FAA expediting commercial use for film production, precision agriculture, power line and pipeline inspection, and oil and gas flare stack inspection
- Perception that FAA Does not/Cannot Enforce
- Hollywood cinematography exemption
- UAS used by private investigators
- Industry already solving issues before UAS are approved for commercial use: flight tracking software, no-fly-zone software around airports, auto-parachute for system failure, and more. **Industry**: Patent on sensory avoidance technology, a radar system that weighs about 12.6 ounces, and when it is finished and ready for production it will weigh closer to 6 ounces.

Tab 5 – **Privacy and Safety Concerns**

All documents were provided to stimulate dialogue

- Revisit Legislative Legal Services memo on existing privacy laws
- New memo from Legislative Legal Services regarding private investigators using UAS
- Obama issues executive order for National Telecommunications and Information Administration to develop guidelines for UAS privacy.
- Definition of "reasonable expectation of privacy"
- Australia's power point on Commercial RPAS and Privacy

Tab 6 – **Public Education, Evaluating Complaints, General Operations, Certification, Insurance/Liability, Consequences**

AMA: Within discussions about large operators and industry advancement is the opportunity for STEM education for our youth. UAS provide a great opportunity to get our kids engaged in engineering, science and technology. Engaging the general public is crucial for the process of integration. We need to define the broad spectrum of usage and educate the public on UAS, the rules. "It's happening, and we need to get out in front of it."

UNIV: discussed the intern program they have at UAF currently, four interns now and discussion of future private sponsorship for "co-op" program.

Public: As a commercial pilot, the fact was discussed that large aircraft are currently almost fully autonomous. Human pilot takes off, programs the route into mapping system and the plane can fly and land itself with very minimal human interaction. Emphasis that in order to gain the public trust and comfort level with UAS in commercial airspace, they need to rely on the positive stories (the search and rescue success, fire-fighting, etc.) The task force cannot move too quickly and risk a negative outcome.

Flip chart pages on walls summarized these discussion points

- Industry Needs:

    1. Require manufacturers to include safety flyer in all hobby/commercial aircraft sold
    2. Signage when flying for commercial purposes (such as real estate or agriculture) - "unmanned aircraft in flight"
    3. Idea of a "fishing license" would not be needed for commercial use because of other certifications and licensure. The license would include a sticker for the aircraft so it could be tracked back to the responsible owner – maybe for hobby

    AMA: From the hobbyist's perspective, we are required to have identification stickers on aircraft. The real question is how to define and separate the levels of the airspace to determine the regulated differences between commercial and hobbyist UAVs. Does the general hobbyist know this or just active AMA members?

    UNIV: The FAA is working on licensing requirements right now. There is a requirement to register aircraft now, just like any other manned aircraft. This allows the UAS to be traced back to the owner. In the commercial/industry sector, insurance companies require UASs to be stickered for ID.

- Future Meeting Agenda:

    1. Responses to FAA rules in Oct/Nov
    2. PPUTRC public meeting on privacy policy at the September meeting will meet the FAA requirements of the test site for this year
    3. Data retention
    4. Invitation to AMA officials on education

5. Define framework – training and education
6. Dept Public Safety guidance document on enforcement of UAS
7. Integration not segregation of airspace: invite DOI, FAA, Military, BP/Exxon, etc

- Public Education and Outreach:

1. Public Trust
2. AMA certification program
3. UAA – UAS course taught by Harry Kieling Wed nights beginning Aug 27
4. Plus or minus 55 lbs: civil ~ public ~ hobby
5. Sizes and purpose
6. Develop matrix for the common person ~ Define what a UAS is, what a model aircraft is. What their purposes are. Where, when how can they fly?
7. Competition and award for best government use

- Public Information and Education Campaign: Possibly start the process at a very young age via education and school system.

1. User polls?
2. Hobby transition to professional
3. Intent and use matrix ~ including categories and distinct lines of separation as to the types of operations and the regulations associated with each category
4. Web presence
5. Pamphlet
6. Successful uses
7. Challenges
8. Privacy
9. STEM / voc tech
10. Public relations: who's doing what? Government, industry, hobby
11. Op Ed in publications
12. Social media
13. DCCED marketing assistance

- Follow Up – To Do

1. Military mission in Alaska – process and plans
2. Letter to Commissioners of state agencies on UAS re: point of contact for their department
3. Italy data protection laws
4. Who to contact? Complaint / enforcement system / responses
5. FAA enforcement
6. Doug Marshall UND privacy
7. UTMS – unmanned traffic management system
8. FAQs could be discussed at a teleconference meeting of the task force

Tab 7 – **Written public testimony**

- No written testimony provided
- Public attendees provided comments as requested throughout the day

3:30pm **Closing Remarks and Adjourn**

FINAL THOUGHTS:

Ro: Interest Group meeting coming up in September. What we're doing, Test site info, FAA, usergroups Sep 16-18.

Steve Strait: important to focus on integration of the airspace, not segregation. Need to reach beyond just the entities that we represent here on this TF. Inclusion of the military in the discussion. Education, we should do our best to mitigate accidents via education of the public to hopefully minimize incidents.

John Parker: Public education is vital. With an informed public, we are more likely to be successful in integrating UASs.

Bob: Education of controllers, maintainers, operators and the public. Continuous evaluation of the industry and policing it.

Steve Colligan: I agree with education, but we have to define it. Public Relations, the industry and oil companies and those who are using this tech are responsible for telling the stories of the good that is being done with UASs.

John Binder: Supported Colligan's idea of a framework/matrix.

Mike O'Hare: Education. What we've done, are doing and should do with UAVs and allow for feedback to address major concerns. Mike can arrange a military contact or provide updates on how the military is using the technology.

Joe Jacobson: Prioritization of what the TF can reasonably accomplish by taking an approach that things can be taken on one at a time and accomplished. Not becoming overwhelmed by too much information. Need to be good and strategic about what our messaging is going to be. A public awareness campaign, budget action to promote the work of this TF and information to the public.

ALASKA
UAS Interest Group

2014 | Alaska UAS Interest Group Annual Meeting

Sept. 15-18, 2014 | Anchorage Hilton Hotel

A forum for civil, commercial and government technologists, engineers, users and stakeholders.

- Learn about the Pan Pacific UAS Test Range Complex
- Examine the potential impacts of UAS activity in the Arctic
- Explore UAS applications to education, research, natural resource management and emergency response
- Hear about how NOAA will use UAS to monitor rivers

New Alaska FAA chief focused on safety

ELWOOD BREHMER, ALASKA JOURNAL OF COMMERCE

LONG

As the new head of the Federal Aviation Administration in Alaska, Kerry Long is focused on one word: safety.

The fact that other topics sometimes overshadow the agency's core mission of promoting safe flying is a testament to how effective the FAA is and should not be forgotten, he said.

"I'm pleased that we can focus on issues of efficiency, on issues of getting somewhere late, where we don't have to worry about if we're going to get there," he said. "I think that gets lost in translation. Aviation is still by far the safest mode of transportation."

Long took over as the FAA Alaska Region Administrator July 28. Since then, he has immersed himself in the unique needs of the state's aviators and how the federal agency with oversight of those needs can best meet them.

First and foremost is making sure new and existing users of the skies can operate side by side, as well as advancing how they are monitored.

"My priorities here are NextGen and the UAS test site," Long said.

The UAS, or Unmanned Aerial System, test site sponsored by the University of Alaska Fairbanks Long referred to is one of six nationwide chosen by the FAA to help the agency meet its congressional mandate to develop regulations to integrate unmanned aircraft into the national airspace by the Sept. 30, 2015.

The Pan-Pacific UAS Test Range Complex, headquartered in Fairbanks, includes not only the vast tracts of airspace above Alaska, but also areas of Hawaii and Oregon that afford industry the option to test technology in the Arctic, tropics, or somewhere in between.

Long said the uniqueness of the Alaska test site, combined with the support, financially and otherwise, it has received from the state, has helped push it to the front of the group.

The Legislature appropriated $5 million to UAF's Geophysical Institute in fiscal year 2012 to advance UAS testing. With continued state support, he wants to do whatever the FAA's regional office can to help keep Alaska at the forefront of UAS testing, Long said.

"We can, I think, significantly support UAF and the test site, to be specific, in how we think they ought to be staffed to be able to effectively run this dispersed program they have in Hawaii and Oregon and here," he said.

It will be a challenge for the FAA to do much more because the federal regulation mandate did not come with money.

"Our goal at the FAA is to support these test sites the best we can, but unfortunately we have a mandate but no funding, which is a tough combination," Long noted.

FAA test site evaluators that visited Fairbanks in August were impressed with the safe and efficient operations going on there, Long said from his Anchorage office Aug 29.

While the UAS test site evaluation group was in Fairbanks, the test site staff was able to show first-hand the capability of small unmanned aircraft in a practical setting, he said.

"There was a traffic accident and we happened to have the evaluation team that has been going from test site to test site making sure that everybody is following best practices and that sort of thing," Long described. "One of the folks was the gentlemen responsible for approving any emergency requests for a (certificate of authorization) and he was able to approve the use of a UAS to demonstrate to the team how it would be used with a traffic accident and how much more efficient it is to use a UAS to do the photography work."

Prior to taking the regional administrator position, Long served as the FAA's chief counsel under President George W. Bush from 2007-09. More recently, he was a lead ethics official with the National Transportation Safety Board. Before his public service began, Long was a large aircraft transaction attorney, working primarily for Boeing and Rolls Royce, he said.

He emphasized that communication is key in his new position.

Long met with Rep. Don Young, Sen. Lisa Murkowski, state Transportation Department Deputy Commissioner of Aviation John Binder and private industry representatives to gain perspective about what the state needs from the FAA in his first weeks in Alaska.

Long said he assured the congressional delegation members that, "I will be as candid as we can be as an agency with what's going on."

His experience in other parts of the federal government will help him bridge the gap that all-too-often exists between Alaska and Washington, D.C., he said.

"Not only do you need an effective advocate for the FAA in Alaska, you need an effective advocate for Alaska at the FAA in Washington," Long remarked. "I've been to Washington; I've spent my time there and I've cut my teeth there on many of the issues we face up here.

"I've learned what fights can be won."

He plans on hosting as many Outside federal officials as will travel to Alaska so they can better understand what the state's aviation industry needs, he said.

A visit from FAA Deputy Administrator Michael Whitaker, who is leading implementation of the agency's NextGen air traffic monitoring program, was scheduled for early this month.

NextGen, the "next generation" of aircraft tracking, is a satellite-based system that is designed to update aircraft location quicker than radar, allowing for more efficient flight paths and safer operations at crowded airports.

Within five to 10 years, the FAA hopes NextGen will be installed across the country.

"The bottom line is we are all counting on NextGen into the future to be the answer to the inefficiencies of dealing with ground-based navigation," Long said.

"It's one of the most massive programs undertaken by the government, certainly ever by the FAA.

Beyond engaging with other federal officials, Long said he is happy to talk about the agency's mission in Alaska, whether that's a group of school children or state leaders. It's a vital part of the job he enjoys, and best of all, it hardly costs anything, he said.

"I'm free. I'll go anywhere and I'll talk to anyone about aviation safety and the role of the agency and there's lots of people around here that will do that with me," Long said. "As far as I'm concerned no group is to small as long as they're interested and can help us promote aviation safety."

Elwood Brehmer can be reached at elwood.brehmer@alaskajournal.com.

Amazon.com Unveils 'Drone Store'

Amazon isn't just interested in making its own drones to deliver items — now the company has opened up an online storefront for people interested in buying UAVs, too.Amazon has unveiled the "Drone Store," which features a handful of robotic vehicles and related accessories available to purchase. There's also "Buying Guide" page and a "Fly Responsibly" section that includes links to the Association for Unmanned Vehicle Systems International and the Academy of Model Aeronautics.

Amazon announced its foray into drone delivery, named Prime Air, late last year. The company has recently petitioned the U.S. Federal Aviation Administration to allow it to test its package-delivering robots at an airfield near Seattle, and said it's testing its 8th and 9th generation of aircraft.

AMA National Model Aircraft Safety Code 11

Foreward

If this is your first purchase of a recreational small Unmanned Aircraft System (drone) or the first time you've ventured into the world of model aviation, welcome! Welcome to the stimulating and enjoyable world of model aviation and a community of thousands of aeromodeling enthusiasts who for more than 100 years have enjoyed the fascination and allure of virtual flight through model aircraft.

Model aircraft have operated in the National Airspace System (NAS) for decades and have done so safely and responsibly. The aeromodeling activity conducted within the safety guidelines of the Academy of Model Aeronautics has achieved an excellent safety record, a record that surpasses most other forms of aviation. The success of this community was recently recognized by Congress in the FAA Modernization and Reform Act of 2012 with the addition of the Special Rule for Model Aircraft, now Public Law 112-95, Sec. 336.

The establishment of this Special Rule reflects Congress' recognition of community-based programming as an effective and sensible means of managing the recreational small unmanned aircraft activity, and it was Congress' intent to protect this community from onerous and unnecessary federal regulation.

The key to the success of the community and the longevity of the aeromodeling activity is the individual commitment to operating their aircraft in a safe and responsible manner and in accordance with a community-based set of standards.

sUAS are defined as being less than 55 pounds; however, the majority of the platforms in use today are less than 20 pounds, and most are less than 10 pounds. This safety guide is intended to help the sUAS operator to fly his or her aircraft in a safe and responsible manner.

Flying sUAS in a safe and responsible manner certainly means doing so in way that does not endanger persons or property. But, it also means operating your device in a manner that is respectful of community standards, the concerns of others, property and privacy rights, and flying in a community friendly manner. As a general rule:

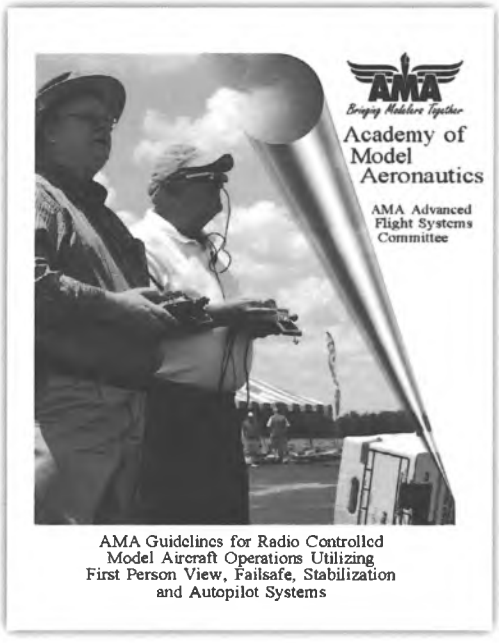
- Don't operate on or fly over private property without first obtaining permission from the property owner and/or the property tenant.
- Don't fly where the operation of radio control aircraft is prohibited.
- Don't fly near open assemblies of people without first obtaining permission or otherwise making prior arrangements to do so.
- Don't fly near or over sensitive infrastructure or property such as power stations, water treatment facilities, correctional facilities, heavily traveled roadways, government facilities, etc. without making prior arrangements to do so.

Fly friendly, fly safely, and enjoy the hobby!

Academy of Model Aeronautics

Basic sUAS Safety Principles

- Do not interfere with manned aircraft operations.
- Yield right of way to manned aircraft. See and avoid other aircraft at all times (AMA Doc #540-D).
- Do not endanger persons or property. No intentional overflight of moving vehicles or unprotect persons. Fly no closer than 25 feet.
- Fly no higher than necessary (less than 400 feet). Remain below surrounding obstacles when possible.
- Avoid operations in close proximity to airports. When within 5 miles of an airport, contact the airport/Air Traffic Control (ATC).
- Enssure pilot competency/proficiency and the safe operation of the aircraft.
- Remain within visual line of sight (VLOS). Use a spotter when necessary/appropriate.



AMA Guidelines for Radio Controlled Model Aircraft Operations Utilizing First Person View, Failsafe, Stabilization and Autopilot Systems

AMA's Privacy Policy

"The use of imaging technology for aerial surveillance with radio control model aircraft having the capability of obtaining high-resolution photographs and/or video, or using any types of sensors, for the collection, retention, or dissemination of surveillance data or information on individuals, homes, businesses, or property at locations where there is a reasonable expectation of privacy is strictly prohibited by the AMA unless written expressed permission is obtained from the individual property owners or managers."

"SEE AND AVOID" GUIDANCE

A. General:

1. The primary means to avoid collisions between all aircraft flying within our National Airspace System (NAS) is "See and Avoid."

2. Vigilance must be maintained by each person operating an aircraft (whether model or manned) so as to "see and avoid" other aircraft.

3. Model aircraft must avoid manned aircraft. Our privilege to fly model aircraft in the NAS depends on our commitment to remain "well clear" of manned aircraft.

4. Simply avoiding an actual collision is not enough. A "near miss" is not acceptable.

5. Unless flying at a mixed-use site where manned and model aircraft routinely share airspace through their own site-specific rules, model aircraft must fly sufficiently far away from manned aircraft so as not to create a collision hazard.

6. Model aircraft flying must not only be safe, it must be perceived to be safe by the greater manned aviation community. Modelers must continually demonstrate their respect for the safety of manned aircraft by remaining vigilant and well clear.

7. Whenever a potential conflict arises between model aircraft and manned aircraft, the pilot of the model aircraft must always give way to the manned aircraft.

8. The pilot of a model aircraft must never assume the pilot of a manned aircraft can see the model or will perform any maneuver to avoid the model's flight path.

9. Visual Line of Sight is required by the Safety Code. It means that visual contact with the aircraft must be maintained without enhancement other than by corrective lenses prescribed for the model aircraft pilot. All RC flying must remain clear of clouds smoke or any other obstruction to the line of sight.

10. "Blue Sky" is a term used to explain the method used to increase separation between a model and a manned aircraft in the same vicinity. The modeler should maneuver the aircraft in such a way as to increase the amount of *blue sky* perceived between the model and the manned aircraft. By increasing the blue sky separation, the question about depth perception is taken out of the equation and the modeler need not worry whether the model is closer to him than the manned aircraft or further away. Increasing the blue sky between the model and the manned aircraft automatically increases separation between them.

11. A modeler should never place any consideration for the well-being of the model aircraft above the safety of manned aircraft. Maneuvering to avoid the conflict may require that the model aircraft be sacrificed.

12. Free flight models should not be launched with relatively low altitude manned aircraft in sight and downwind or headed downwind from the launch site.

B. Spotters:

1. Before a flight, the pilot must insure that the spotter understands his/her duties and expectations.

2. A spotter should be used to assist in monitoring the surrounding airspace for manned aircraft whenever a flight is expected to exceed 400 feet above the ground and that operation is expected to be in proximity to known manned aircraft traffic such as at a mixed-use facility or within three miles of an airport. The spotter must have sufficient visual acuity and be mature enough to take this responsibility very seriously.

3. A spotter should also be prepared to assist his/her pilot in the event that another model aircraft or spectators become endangered or in turn are perceived to be a danger to the pilot or the pilot's model aircraft.

4. If a model aircraft pilot experiences what he or she considers a near miss with a manned aircraft, that model aircraft pilot should notify AMA Headquarters with a written report of the incident, including action taken by the model aircraft pilot to avoid the manned aircraft. This report is intended to help the modeler, the club, and the AMA capture as much detail as possible so that it may be used to assist all parties in recalling the particulars of the incident at a later time. Call 1-800-435-9262 (1-800-IFLYAMA) extension 230 or 251 for assistance with this report.

Radio Controlled Model Aircraft Operation Utilizing "First Person View" Systems

1. DEFINITION OF TERMS:

Please refer to Page 5 section 7 which contains an alphabetical listing of the definitions of the terms in italics that are used in this document.

2. GENERAL:

FPV flying of radio control model aircraft by AMA members is allowed only for noncommercial purposes as a hobby/recreational and/or competition activity and must be conducted in accordance with AMA's current National Model Aircraft Safety Code and any additional rules specific to a flying site/location.

3. OPERATIONS – REQUIREMENTS – LIMITATIONS:

a) *FPV novice pilots* undergoing training at low altitude must use a buddy-box system with an *FPV spotter,* or must go to a safer altitude if no buddy-box system is used.

b) All *FPV* flights require an AMA *FPV pilot* to have an AMA *FPV spotter* next to him/her maintaining *VLOS* with the *FPV aircraft* throughout its flight.

c) The *FPV pilot* must brief the *FPV spotter* on the *FPV spotter's* duties, communications and hand-over control procedures before *FPV flight.*

d) The AMA *FPV spotter* must communicate with the *FPV pilot* to ensure the *FPV aircraft* remains within *VLOS*, warning the *FPV pilot* of approaching aircraft, and when avoidance techniques are necessary.

e) During an FPV flight, the FPV spotter must be prepared to acquire the transmitter/control from the *FPV pilot* and assume *VLOS* control of the model aircraft at any time safe operation of the flight is in question.

f) If an *FPV pilot* experiences a safety issue that does not appear to be a brief glitch, they must abandon *FPV* mode and fly *VLOS.*

g) Before the initial *FPV* flight of an *FPV model aircraft* and/or after any changes or repairs *to essential flight systems*, the *FPV model aircraft* must have an *R/C test flight* by conventional *VLOS.*

h) *FPV model aircraft* must use frequencies approved by the FCC for both the RC system and the wireless video system. Pilots must meet applicable FCC licensing requirements if they choose to operate the RC flight control system or the wireless video system on Amateur Band frequencies.

i) AMA *FPV pilots* must first be capable of flying their FPV model aircraft manually before utilizing *FPV* flight.

4. RANGE – ALTITUDE – WEIGHT – SPEED:

a) One of the requirements in Federal Law (Public Law 112-95 Sec 336 (c) (2) February 14, 2012) for model aircraft to be excluded from FAA regulations is that model aircraft must be flown within *VLOS* of the operator.

b) Model aircraft flown using *FPV* must remain at or below 400 feet AGL when within 3 miles of an airport as specified in the AMA Safety Code.

c) Model aircraft flown *FPV* are limited to a weight (including fuel, batteries, and onboard *FPV* equipment) of 15lbs. and a speed of 70mph.

5. RECOMMENDATIONS & INFORMATION:

a) AMA *FPV novice pilots* should consider using a cockpit view flight simulator to become accustomed to *FPV* flight.

b) AMA *FPV pilots* should consider using a programmable *autopilot* (AMA Document #560) with a failsafe "return to launch" (RTL) feature that will maintain control of the aircraft in the event of signal loss.

c) When purchasing *FPV* operational systems, always try to select quality equipment, verify its compatibility, install components for interference rejection, and determine that signal range is adequate for maximum VLOS range.

6. PRIVACY PROTECTION SAFEGUARDS:

The use of imaging technology for aerial surveillance with radio control model aircraft having the capability of obtaining high-resolution photographs and/or video, or using any types of sensors, for the collection, retention, or dissemination of surveillance data information on individuals, homes, businesses, or property at locations where there is a reasonable expectation of privacy is strictly prohibited by the AMA unless written expressed permission is obtained from the individual property owners or managers.

7. DEFINITIONS OF TERMS:

AMA FPV Pilot is an AMA member who is capable of maintaining stable flight of a model aircraft within its intended flight envelope when flown FPV without losing control or having a collision.

Buddy-Box System is a system that has one transmitter operating as the master controller, while a second transmitter is linked/slaved to it allowing dual control of an aircraft. The operator of the master transmitter allows one or the other transmitter to control the aircraft through the use of a spring-loaded switch. The switch provides instantaneous transfer of control from one transmitter to the other. The buddy-box system is an efficient and effective means of achieving a position transfer of control from one pilot to another.

Although this system is commonly used for training novice fliers, it is also useful in situations where an experienced pilot may have an increased likelihood of needing a second pilot's assistance in maintaining control of the aircraft. The use of the buddy-box may be helpful in assisting pilots with physical limitations, flying in congested environments, during times of reduced visibility, or anytime during FPV when a timely transfer of control may be beneficial.

Essential Flight Systems are any systems or components necessary to maintain stable flight within a model aircraft's flight envelope. (This includes primary radio control systems and any stabilization or gyros required to maintain stability and heading in certain types of model aircraft that would be uncontrollable/unstable without their use).

First Person View (FPV) refers to the operation of a radio controlled (R/C) model aircraft using an onboard camera's cockpit view to orient and control the aircraft.

Flight Envelope is defined as the range of airspeeds, attitudes, and flight maneuvers which a model aircraft can safely perform/operate for its intended use.

FPV Aircraft is an RC model aircraft equipped with a video transmitter to send real-time video images from an onboard camera to a ground based receiver for display on a pilot's video monitor/goggles. (*FPV model aircraft* types include: Fixed Wing, Rotary Wing, and Multi-Rotor Platforms).

FPV Novice Pilot is an AMA member learning to fly *FPV* utilizing a buddy-box system with an experienced AMA *RC pilot* operating the master transmitter and serving as the *FPV spotter*.

FPV Spotter is an experienced AMA *RC pilot* who has been briefed by the *FPV pilot* on the tasks, responsibilities and procedures involved in being a spotter; is capable and mature enough to perform the duties and is able to assume conventional *VLOS* control of the aircraft.

Non-Essential Flight Systems are any systems or components that are not necessary to maintain stable flight within the model aircraft's *flight envelope*. (This includes *autopilot* or *stabilization systems* that can be activated and deactivated in flight by the pilot without affecting stable flight).

R/C Test Flight requires an *AMA Pilot* to manually operate an R/C transmitter to control a model aircraft's flight path and determine if the aircraft is capable of maintaining stable flight within its *flight envelope*.

Visual Line Of Sight (VLOS) is the distance at which the pilot is able to maintain visual contact with the aircraft and determine its orientation without enhancements other than corrective lenses.

Radio Controlled Model Aircraft Operation Utilizing Failsafe, Stabilization and Autopilot Systems

1. DEFINITION OF TERMS:

Please refer to Page 3, section 7 which contains an alphabetical listing of the definitions of the terms in italics that are used in this document.

2. GENERAL:

All model aircraft flights utilizing *stabilization* and *autopilot* control systems must be conducted in accordance with AMA's current National Model Aircraft Safety Code and any additional rules specific to a flying site/location.

3. OPERATIONS – REQUIREMENTS – LIMITATIONS:

a) AMA members flying radio controlled model aircraft equipped with flight *stabilization* and *autopilot* systems must maintain *VLOS* with the aircraft at all times including programmed autopilot waypoint flight.

b) *AMA Pilots* must be able to instantaneously deactivate programmed flight of *autopilot systems* at any time during flight and resume manual control of the model aircraft.

c) *AMA Pilots* must perform an *R/C Test Flight* of a model aircraft before activating a newly installed *autopilot* or *stabilization system* and/or after any repairs or replacement of model aircraft *essential flight systems*.

d) Model aircraft exceeding 15lbs and/or 70mph may only use an *autopilot* for a programmed "return to launch" (RTL) flight and not for programmed waypoint flying of a predetermined course.

e) STABILIZATION & AUTOPILOT SYSTEMS MAY BE USED FOR/TO:

- Stabilization/automatically stabilize aircraft to level flight when control sticks are centered.
- Recovery/activate TRX switch to recover an out of control aircraft to level flight.
- Heading/activate TRX switch to hold a model aircraft's heading for precision flight path.
- Altitude/activate TRX switch to maintain fixed aircraft altitude while allowing directional control.
- Return GPS/activate TRX switch to return aircraft via GPS to launch point.
- Return FSS/failsafe activated from radio signal loss to return aircraft via GPS to launch point.
- Fixed circle/activate TRX switch to circle aircraft at point of activation at fixed altitude.
- Waypoint/activate TRX switch to initiate an autopilot programmed flight path via waypoints.
- Fencing/autopilot programed to display site unique boundaries on video monitor/goggles.

4. RANGE – ALTITUDE – WEIGHT – SPEED:

a) One of the requirements in Federal Law (Public Law 112-95 Sec 336 (c) (2) February 14, 2012) for model aircraft to be excluded from FAA regulations is that model aircraft be flown within *VLOS* of the operator.

b) Model aircraft must be flown at or below 400 feet AGL when within 3 miles of an airport as stated in the AMA Safety Code.

c) Model aircraft utilizing an *autopilot* for waypoint flying are limited to a maximum weight (including fuel, batteries, and onboard *autopilot systems*) of 15lbs and a speed of 70mph.

5. RECOMMENDATIONS & INFORMATION:

a) If your radio system lacks *failsafe* capability, consider using programmable digital servos or auxiliary *failsafe* modules. In the event of a radio signal failure these components will activate desired safe servo settings or an *autopilot* for return to base/launch (RTL).

b) When using an *autopilot system* the "return to launch" (RTL) feature should be programmed to return the aircraft to a safe location and safely terminate the flight should manual control of the aircraft be lost. When using RTL, pay particular attention to the manufacturer's throttle recommendations to prevent stalling.

c) The use of *stabilization systems* is recommended when flying FPV to improve flight stability and video quality.

d) Pilots usually choose to incorporate *stabilization* and *autopilot systems* for model aircraft flying to enhance flight performance, correct bad tendencies of the model aircraft, maintain stability in windy weather, establish precision heading holds for takeoffs/landings, flight training for novice pilots, create a steady flight platform for cameras, and generally just to make an airplane easier and safer to fly.

e) When purchasing *stabilization* and *autopilot systems*, always try to select quality equipment from reputable dealers, ensure for compatibility with other onboard systems, and install components according to manufacturers' instructions.

6. PRIVACY PROTECTION SAFEGUARDS:

The use of imaging technology for aerial surveillance with radio control model aircraft having the capability of obtaining high-resolution photographs and/or video, or using any types of sensors, for the collection, retention, or dissemination of surveillance data or information on individuals, homes, businesses, or property at locations where there is a reasonable expectation of privacy is strictly prohibited by the AMA unless written expressed permission is obtained from the individual property owners or managers.

7. DEFINITIONS OF TERMS:

AMA Pilot is an AMA member who is capable of manually operating an R/C transmitter to control a model aircraft's flight path within its safe intended *flight envelope* without losing control or having a collision.

Autopilot Systems incorporate programmable flight *stabilization* with an altitude sensor and a GPS receiver for accurate positioning and to navigate/control a radio controlled model aircraft's flight path. Advanced systems offer software for entering navigable waypoints. The flight data waypoints may be saved to autopilot's/GPS memory for programmed flight.

Essential Flight Systems are any systems or components necessary to maintain stable flight within a model aircraft's *flight envelope*. (This includes primary R/C systems and any *stabilization* or gyros required to maintain stability and heading in certain types of model aircraft that would be uncontrollable/unstable without their use).

Failsafe Systems are designed to minimize or prevent damage and safely terminate a flight when a radio controlled model aircraft loses radio signal. Modern radio systems can be programmed to position servos to a desired control setting in the event of radio signal failure.

First Person View (FPV) refers to the operation of a radio controlled (R/C) model aircraft using an onboard camera's cockpit view to orient and control the aircraft. (AMA Document #550).

Flight Envelope is defined as the range of airspeeds, attitudes and flight maneuvers which a model aircraft can safely perform/operate for its intended use.

Non-Essential Flight Systems are any systems or components that are not necessary to maintain stable flight within the model aircraft's intended flight envelope. (This includes *autopilot* or *stabilization systems* that can be activated and deactivated in flight by the pilot without affecting manually controlled stable flight).

R/C Test Flight requires an AMA Pilot to manually operate an R/C transmitter to control a model aircraft's flight path and determine if the aircraft is capable of maintaining stable flight within its safe intended *flight envelope*.

Stabilization Systems are designed to maintain intended model aircraft flight attitudes. The pilot can install, program and/or activate a system to stabilize yaw, pitch, or roll or any one attitude or combination of attitudes. Systems are often based on rate/heading hold gyros or inertial motion sensors utilizing multi-axis gyros and accelerometers for attitude stabilization.

Visual Line of Sight (VLOS) is the distance at which the pilot is able to maintain visual contact with the aircraft and determine its orientation and attitude without enhancements other than corrective lenses.

Academy of Model Aeronautics National Model Aircraft Safety Code

Effective January 1, 2014

A. **GENERAL**: A model aircraft is a non-human-carrying aircraft capable of sustained flight in the atmosphere. It may not exceed limitations of this code and is intended exclusively for sport, recreation, education and/or competition. All model flights must be conducted in accordance with this safety code and any additional rules specific to the flying site.

1. Model aircraft will not be flown:
   (a) In a careless or reckless manner.
   (b) At a location where model aircraft activities are prohibited.
2. Model aircraft pilots will:
   (a) Yield the right of way to all human-carrying aircraft.
   (b) See and avoid all aircraft and a spotter must be used when appropriate. (AMA Document #540-D.)
   (c) Not fly higher than approximately 400 feet above ground level within three (3) miles of an airport without notifying the airport operator.
   (d) Not interfere with operations and traffic patterns at any airport, heliport or seaplane base except where there is a mixed use agreement.
   (e) Not exceed a takeoff weight, including fuel, of 55 pounds unless in compliance with the AMA Large Model Airplane program. (AMA Document 520-A.)
   (f) Ensure the aircraft is identified with the name and address or AMA number of the owner on the inside or affixed to the outside of the model aircraft. (This does not apply to model aircraft flown indoors.)
   (g) Not operate aircraft with metal-blade propellers or with gaseous boosts except for helicopters operated under the provisions of AMA Document #555.
   (h) Not operate model aircraft while under the influence of alcohol or while using any drug that could adversely affect the pilot's ability to safely control the model.
   (i) Not operate model aircraft carrying pyrotechnic devices that explode or burn, or any device which propels a projectile or drops any object that creates a hazard to persons or property.
   Exceptions:
   - Free Flight fuses or devices that burn producing smoke and are securely attached to the model aircraft during flight.
   - Rocket motors (using solid propellant) up to a G-series size may be used provided they remain attached to the model during flight. Model rockets may be flown in accordance with the National Model Rocketry Safety Code but may not be launched from model aircraft.
   - Officially designated AMA Air Show Teams (AST) are authorized to use devices and practices as defined within the Team AMA Program Document. (AMA Document #718.)

   (j) Not operate a turbine-powered aircraft, unless in compliance with the AMA turbine regulations. (AMA Document #510-A.)
3. Model aircraft will not be flown in AMA sanctioned events, air shows or model demonstrations unless:
   (a) The aircraft, control system and pilot skills have successfully demonstrated all maneuvers intended or anticipated prior to the specific event.
   (b) An inexperienced pilot is assisted by an experienced pilot.
4. When and where required by rule, helmets must be properly worn and fastened. They must be OSHA, DOT, ANSI, SNELL or NOCSAE approved or comply with comparable standards.

B. **RADIO CONTROL (RC)**

1. All pilots shall avoid flying directly over unprotected people, vessels, vehicles or structures and shall avoid endangerment of life and property of others.
2. A successful radio equipment ground-range check in accordance with manufacturer's recommendations will be completed before the first flight of a new or repaired model aircraft.
3. At all flying sites a safety line(s) must be established in front of which all flying takes place. (AMA Document #706.)
   (a) Only personnel associated with flying the model aircraft are allowed at or in front of the safety line.
   (b) At air shows or demonstrations, a straight safety line must be established.
   (c) An area away from the safety line must be maintained for spectators.
   (d) Intentional flying behind the safety line is prohibited.
4. RC model aircraft must use the radio-control frequencies currently allowed by the Federal Communications Commission (FCC). Only individuals properly licensed by the FCC are authorized to operate equipment on Amateur Band frequencies.
5. RC model aircraft will not knowingly operate within three (3) miles of any pre-existing flying site without a frequency-management agreement. (AMA Documents #922 and #923.)
6. With the exception of events flown under official AMA Competition Regulations, excluding takeoff and landing, no powered model may be flown outdoors closer than 25 feet to any individual, except for the pilot and the pilot's helper(s) located at the flightline.
7. Under no circumstances may a pilot or other person touch an outdoor model aircraft in flight while it is still under power, except to divert it from striking an individual.
8. RC night flying requires a lighting system providing the pilot with a clear view of the model's attitude and orientation at all times. Hand-held illumination systems are inadequate for night flying operations.
9. The pilot of an RC model aircraft shall:
   (a) Maintain control during the entire flight, maintaining visual contact without enhancement other than by corrective lenses prescribed for the pilot.
   (b) Fly using the assistance of a camera or First-Person View (FPV) only in accordance with the procedures outlined in AMA Document #550.
   (c) Fly using the assistance of autopilot or stabilization system only in accordance with the procedures outlined in AMA Document #560.

C. **FREE FLIGHT**

1. Must be at least 100 feet downwind of spectators and automobile parking when the model aircraft is launched.
2. Launch area must be clear of all individuals except mechanics, officials, and other fliers.
3. An effective device will be used to extinguish any fuse on the model aircraft after the fuse has completed its function.

D. **CONTROL LINE**

1. The complete control system (including the safety thong where applicable) must have an inspection and pull test prior to flying.
2. The pull test will be in accordance with the current Competition Regulations for the applicable model aircraft category.
3. Model aircraft not fitting a specific category shall use those pull-test requirements as indicated for Control Line Precision Aerobatics.
4. The flying area must be clear of all utility wires or poles and a model aircraft will not be flown closer than 50 feet to any above-ground electric utility lines.
5. The flying area must be clear of all nonessential participants and spectators before the engine is started.

About AMA

We stand on our own for our members and for the future of aeromodeling.

The Academy of Model Aeronautics is the world's largest model aviation association. It is the official sanctioning body for model aviation in the United States, representing the interests of aeromodeling across the United States and around the world. As a self-supporting, nonprofit organization, its purpose is to promote the development of model aviation as a recognized hobby, sport, and family recreational activity that is both fun and educational.

Founded in 1936, the Academy of Model Aeronautics was charged with promoting the popularity of aeromodeling and associated contests, which coincided with the development and advancement of commercial and military aircraft design, engineering, and manufacturing. Today, the AMA still fosters the innovation born from competition on an international scale through the sanctioning of more than 2,000 aeromodeling competitions each year.

Government relations

The AMA has a long and successful history of advocating for the flying privileges of the aeromodeling community. As the liaison with the Federal Aviation Administration, Federal Communications Commission, Environmental Protection Agency, and other governmental entities, AMA works diligently with some of the most respected organizations in aviation and government to protect modelers' right to fly in the national airspace while providing an exceptional safety program.

Educational outreach

Our active educational outreach program assists teachers who utilize aviation activities in support of science, technology, engineering, and math curricula. Additionally, AMA has awarded more than $800,000 dollars in scholarships to hundreds of students in pursuit of study in the fields of aerospace design and engineering along with other aviation-related fields.

To learn more about the Academy of Model Aeronautics, or to become a member, visit **www.modelaircraft.org** or call **1-800-I-FLY-AMA.**

AUVSI®

DO'S AND DONT'S

Stay up-to-date with the latest operations limits.

PRIVACY STATEMENT

AUVSI supports the expanded use of unmanned aircraft systems (UAS) and encourages open discussion of privacy concerns and proposed changes to existing rules, regulations and laws.

AUVSI CODE OF CONDUCT

This code is intended to provide those who design, test, and operate UAS for public and civil use, a set of guidelines and recommendations for safe, non-intrusive operations.

FAA UAS WEBSITE

The Federal Aviation Administration is the national aviation authority of the United States. The use of unmanned aircraft systems (UAS) in civil airspace raises many technical, policy and procedure questions. Visit the FAA website to better understand how unmanned aircraft can be integrated into the National Airspace System.

Who will be flying the UAS?

A business (e.g. photography, filmmaking, agriculture), recreational user (e.g. hobbyists, modelers) or a public agency/university (e.g. first responders, university researchers)?

A Business | Recreational User | Public Agency or University

A Business

You must check with the FAA to obtain approval to fly. It's possible you may qualify for either a special airworthiness certificate or a commercial exemption.

The FAA grants two types of special airworthiness certificates: special flight permits and experimental certificates. Special flight permits are issued for production flight testing new production aircraft. Experimental certificates are issued only for the purposes of research and development, crew training and market surveys.

In addition, in May 2014, the FAA announced that it would consider granting exemptions for certain low-risk commercial applications such as precision agriculture, power line inspections, and movie production.

If you receive any of the above certifications or exemptions, you may fly.

To learn more about requesting a special airworthiness certificate from the FAA, click here.

To learn more about requesting a commercial exemption from the FAA, click here.

Home

AUVSI.org Increasing Human Potential FAA Request Information

Recreational User

Hobby or recreational flying (not for hire or as part of business) can be done without FAA approval, but operators should check local or state laws for usage restrictions and/or privacy rules and must follow safety guidelines including:

- Follow community-based safety guidelines
- Fly under 400 feet and within line of sight of the operator
- Not fly near manned aircraft
- Contacting the airport or control tower before flying within five miles of an airport

To learn more about these safety guidelines from the FAA, click here.

Home

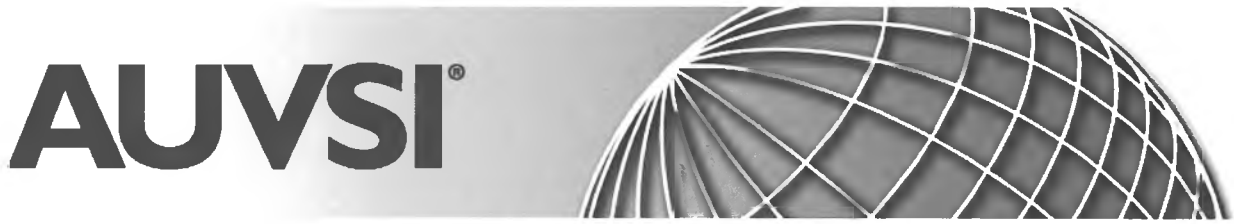
Public Agency or University

If you are a public agency or university, you must apply for a Certificate of Waiver or Authorization (COA) from the FAA. COAs allow use of UAS in a defined block of airspace and include special provisions unique to the proposed operation.

If you receive the above certifications or exemptions, you may fly.

To learn more about applying for a COA from the FAA, click here.

Home



PRIVACY STATEMENT

I. EXECUTIVE SUMMARY

The Association for Unmanned Vehicle Systems International (AUVSI)[1] supports the expanded use of unmanned aircraft systems (UAS) and encourages open discussion of privacy concerns and proposed changes to existing rules, regulations, and laws. These discussions should occur concurrently with the integration of UAS into the National Airspace System (NAS)[2] in order to fully realize the benefits of rapidly advancing UAS technology and so that a greater understanding of UAS technology's potentialcan be achieved. Enactment of legislation now – before sufficient experience with integration of UAS into the NAS exists – is premature, and will hinder the creation and development of this new industry. Barring unnecessary delays, AUVSI estimates that this new industry is poised to create over 70,000 new jobs and $13.6 billion in economic impact within the first three years of integration alone.[3]

New legislation at the federal or state level that is not technology neutral or that is inconsistent with existing privacy rules, regulations, and laws would stifle innovation and cause delay, and may prevent or discourage the use of UAS by public safety agencies and other potential users. Fourth Amendment jurisprudence, existing federal and state privacy laws, and comprehensive Federal Aviation Administration (FAA) regulations already provide extensive guidance that would allow for initial integration of UAS operations. The FAA, for example, has taken steps to address privacy concerns relating to the use of UAS at test sites, which will help gather knowledge and best practices about UAS operations. If the FAA completes its required and pending rulemaking activities for UAS integration, there will be ample opportunities for multi-stakeholder input.

II. EXISTING FOURTH AMENDMENT PROTECTIONS

The Fourth Amendment and related case law already governs UAS operations by government users, ensures accountability, and guides the use of aircraft in which the cockpit and pilot are on the ground. Federal, state, and local government agents must obtain search warrants when their use of any technology, including UAS, may violate an individual's reasonable expectation of privacy protected by the Fourth Amendment.[4] These protections are well-established and address many different privacy concerns relating to government adoption and use of advancing technologies, such as UAS. For more than 220 years, the Fourth Amendment has been applied to new technologies used in warrantless observations – including several Supreme Court decisions on aerial observationss and, more recently, thermal imaging[6] and GPS technologies[7] – and it will continue to be applied to UAS and other future technologies that have not yet been invented. The Court, in a 2013 decision, held that law enforcement use of a highly-trained drug sniffing dog, roaming outside a home, was "an unlicensed physical intrusion" distinguishable from "Girl Scouts and trick-or-treaters," and was thus an unreasonable search.[8] UAS technology is not so distinct from other advanced technologies as to require supplemental legislation.[9] On the contrary, UAS-specific legislation and laws may have unintended effects, including confusing and complicating the application of existing search warrant requirements[10] that have been carefully developed over two centuries.

AUVSI strongly supports the International Association of Chiefs of Police (IACP) recommended guidelines for UAS operations and associated data collection,[11] which the Airborne Law Enforcement Assocation (ALEA)[12] and others have adopted and even the American Civil Liberties Union (ACLU) has praised.[13] Like IACP, AUVSI recognizes the "proven effectiveness" of UAS and that the "potential benefits [to public safety] are irrefutable."[14] AUVSI opposes any legislation that hamstrings first-responders.

III. FAA'S APPROACH TO PRIVACY AND RULEMAKING

The Congressionally-mandated FAA rulemaking processes for the integration of small UAS (sUAS) will provide ample opportunities for the public to comment on privacy issues relating to UAS operations.[15] Unlike government operators, who are permitted to operate UAS, albeit through a cumbersome process,[16] civilian operators have no practical, legal means of doing so until the FAA completes its legally required, and long-delayed, rulemakings.[17] Recognizing the importance of addressing privacy concerns, the FAA has taken extraordinary measures to permit public participation in determining the privacy policies that will govern UAS test sites – the agency's first major step toward integration.[18] Indeed, FAA "aim[ed] to assure maximum transparency of privacy policies associated with UAS test site operations in order to engage all stakeholders in discussion about which privacy issues are raised by UAS

operations and how law, public policy, and operators should respond to those issues in the long run."[19] Rather than passing uninformed[20] and potentially unenforceable[21] legislation now, Congress and state lawmakers should wait for the FAA to complete its rulemaking processes.

The FAA's primary mission is, and must remain, aviation safety. Still, insofar as privacy issues are inextricably linked to the agency's creation of a regulatory framework for the integration and operation of UAS, the FAA rulemaking process is the appropriate forum to address privacy concerns. The FAA has properly recognized the role that federal and state law enforcement agencies play in enforcing laws regarding the protection of an individual's right to privacy, as well as its complementary authority to revoke or suspend a UAS operator's license. Like the Fourth Amendment jurisprudence applicable to public UAS operators, analogous state laws relevant to civil operators that "address trespass, invasion of privacy, harassment, and stalking [are] well established."[22] AUVSI supports the FAA's position that Fair Information Practice Principles (FIPPs) should inform UAS privacy policies on the collection, storage, and use of data.[23] Clearly, the registration of certain UAS and pilots with the FAA, the equipage of UAS with identification/position broadcast capability, and the guidelines set forth in AUVSI's UAS Operations Code of Conduct[24] could all contribute to the creation of an overall approach to managing privacy concerns. FAA rulemaking proceedings are the proper forum to address all of these important considerations.

CONCLUSION

AUVSI supports the integration of UAS into the NAS in a safe and responsible manner, while safeguarding the existing right to privacy and ensuring transparency and accountability. Existing federal and state privacy protections should extend to the operations of UAS, just as they do to the operations of any other advanced technology. But before consideration of any supplemental technology neutral privacy legislation, the FAA should be allowed to gain experience through the UAS test site program and to then complete the well-established regulatory processes for UAS integrationthat Congress has already mandated. Fourth Amendment jurisprudence, federal and state privacy protections, and other existing laws and regulations are sufficiently robust to guide this effort.

---

1 AUVSI – the world's largest non-profit organization dedicated to the advancement of unmanned systems – represents more than 7,000 members from 55 allied countries and 2,500 organizations involved in fields of government, industry and academia.

2 The FAA Modernization and Reform Act of 2012 requires FAA to safely integrate UAS into the NAS by September 2015, and mandates, among other things, the creation of UAS test sites and rulemaking proceedings addressing the integration of civil UAS operations. P.L. 112-95, §§ 331-334, 126 Stat. 11, 72-77 (2012).

UNMANNED AIRCRAFT SYSTEM OPERATIONS INDUSTRY "CODE OF CONDUCT"

The emergence of unmanned aircraft systems (UAS) as a resource for a wide variety of public and private applications quite possibly represents one of the most significant advancements to aviation, the scientific community, and public service since the beginning of flight. Rapid advancements in the technology have presented unique challenges and opportunities to the growing UAS industry and to those who support it. The nature of UAS and the environments which they operate, when not managed properly, can and will create issues that need to be addressed. The future of UAS will be linked to the responsible and safe use of these systems. Our industry has an obligation to conduct our operations in a safe manner that minimizes risk and instills confidence in our systems.

For this reason, the Association for Unmanned Vehicle Systems International (AUVSI), offers this Code of Conduct on behalf of the UAS industry for UAS operation. This code is intended to provide our members, and those who design, test, and operate UAS for public and civil use, a set of guidelines and recommendations for safe, non-intrusive operations. Acceptance and adherence to this code will contribute to safety and professionalism and will accelerate public confidence in these systems.

The code is built on three specific themes: Safety, Professionalism, and Respect. Each theme and its associated recommendations represent a "common sense" approach to UAS operations and address many of the concerns expressed by the public and regulators. This code is meant to provide UAS industry manufacturers and users a convenient checklist for operations and a means to demonstrate their obligation to supporting the growth of our industry in a safe and responsible manner. By adopting this Code, UAS industry manufacturers and users commit to the following:

SAFETY

- We will not operate UAS in a manner that presents undue risk to persons or property on the surface or in the air.
- We will ensure UAS will be piloted by individuals who are properly trained and competent to operate the vehicle or its systems.
- We will ensure UAS flights will be conducted only after a thorough assessment of risks associated with the activity. This risks assessment will include, but is not limited to:
    - Weather conditions relative to the performance capability of the system
    - Identification of normally anticipated failure modes (lost link, power plant failures, loss of control, etc.) and consequences of the failures
    - Crew fitness for flight operations
    - Overlying airspace, compliance with aviation regulations as appropriate to the operation, and off-normal procedures
    - Communication, command, control, and payload frequency spectrum requirements
    - Reliability, performance, and airworthiness to established standards

PROFESSIONALISM

- We will comply with all federal, state, and local laws, ordinances, covenants, and restrictions as they relate to UAS operations.
- We will operate our systems as responsible members of the aviation community.
- We will be responsive to the needs of the public.
- We will cooperate fully with federal, state, and local authorities in response to emergency deployments, mishap investigations, and media relations.
- We will establish contingency plans for all anticipated off-nominal events and share them openly with all appropriate authorities.

RESPECT

- We will respect the rights of other users in the airspace.
- We will respect the privacy of individuals.

- We will respect the concerns of the public as they relate to unmanned aircraft operations.
- We will support improving public awareness and education of the operation of UAS.

As an industry, it is incumbent upon us to hold ourselves and each other to a high professional and ethical standard. As with any revolutionary technology, there will be mishaps and abuses; however, in order to operate safely and gain public acceptance and trust, we should all act in accordance with these guiding themes and do so in an open and transparent manner. We hope the entire UAS industry will join AUVSI in adopting this industry Code of Conduct.

FAA Announces Virginia Tech UAS Test Site Now Operational
(http://www.faa.gov/news/press_release newsId=16875)

Research in Virginia, New Jersey and Maryland to benefit technology development. Photo: VA Tech

Safety is the FAA's top mission, and the agency maintains the world's safest aviation system. The FAA first authorized use of unmanned aircraft in the National Airspace System (NAS) in 1990.

Today, unmanned aircraft are flying in the NAS under very controlled conditions, performing border and port surveillance by the Department of Homeland Security, helping with scientific research and environmental monitoring by NASA and NOAA, supporting public safety by law enforcement agencies, helping state universities conduct research, and supporting various other missions for public (government) entities. Operations range from ground level to above 50,000 feet, depending on the specific type of aircraft. However, UAS operations are currently not authorized in Class B airspace (http://www.faa.gov/regulations_policies/handbooks_manuals/aviation/pilot_handbook/media/PHAK%20-%20Chapter%2014.pdf) (PDF), which exists over major urban areas and contains the highest density of manned aircraft in the National Airspace System.

What are the different types of UAS operations?

There are three types of unmanned aircraft system operations: Civil, Public and Model Aircraft.

- **Civil UAS**

  Obtaining a Special Airworthiness Certificate (http://www.faa.gov/aircraft/air_cert/airworthiness_certification/sp_awcert/experiment/sac/) in the experimental category for a particular UAS is currently the only way civil operators of unmanned aircraft are accessing the NAS. Experimental certificate regulations preclude carrying people or property for compensation or hire, but do allow operations for research and development, flight and sales demonstrations and crew training. The FAA is working with civilian operators to collect technical and operational data that will help refine the UAS airworthiness certification process. The agency is currently developing a future path for safe integration of civil UAS into the NAS as part of NextGen implementation. Read more about Civil Operations (civil_operations/).

  The FAA has been working for several months to implement the provisions of Section 333 (legislative_programs/section_333/) of the FAA Modernization and Reform Act of 2012, "Special Rules for Certain Unmanned Aircraft Systems," which will allow for commercial operations in low-risk, controlled environments. Read more about Section 333 (legislative_programs/section_333/).

- **Public UAS**

  COAs (http://www.faa.gov/about/office_org/headquarters_offices/ato/service_units/systemops/aaim/organizations/uas/coa/) are available to public entities that want to fly a UAS in civil airspace. Common uses today include law enforcement, firefighting, border patrol, disaster relief, search and rescue, military training, and other government operational missions. Applicants make their request through an online process (http://www.faa.gov/about/office_org/headquarters_offices/ato/service_units/systemops/aaim/organizations/uas/coa/) and the FAA evaluates the proposed operation to see if it can be conducted safely. Read more about Public Operations (public_operations/).

- **Model Aircraft**

  Recreational use of airspace by model aircraft is covered by FAA Advisory Circular 91-57 (http://www.faa.gov/documentLibrary/media/Advisory_Circular/91-57.pdf) (PDF), which generally limits operations for hobby and recreation to below 400 feet, away from airports and air traffic, and within sight of the operator. In June 2014, the FAA published a Federal Register notice (media/model_aircraft_spec_rule.pdf) (PDF) on its interpretation of the statutory special rules for model aircraft in the FAA Modernization and Reform Act of 2012. The law is clear that the FAA may take enforcement action against model aircraft operators who operate their aircraft in a manner that endangers the safety of the national airspace system. In the notice, the FAA explains that this enforcement authority is designed to protect users of the airspace as well as people and property on the ground. Read the full press release (http://www.faa.gov/news/press_releases/news_story.cfm?newsId=16474). Read more about Model Aircraft Operations (publications/model_aircraft_operators/).

What can I do with my model aircraft?

Having fun means flying safely! Hobby or recreational flying doesn't require FAA approval but you must follow safety guidelines. Any other use requires FAA authorization. Here is a list of Do's and Don'ts for flying model aircraft (publications/model_aircraft_operators).

Contact Us (contacts/)

The agency wants the public to know how and when to contact the FAA regarding safety concerns with UAS operations. You can visit the Agency's Aviation Safety Hotline website (http://www.faa.gov/contact/safety_hotline/) or call 1-866-835-5322, Option 4.

Page last modified: August 20, 2014 10:50:40 AM EDT

This page was published at: http://www.faa.gov/uas/

Federal Aviation Administration

What Can I Do With My Model Aircraft?
Hobby/Recreational Flying

Having fun means flying safely! Hobby or recreational flying doesn't require FAA approval but you must follow safety guidelines. Any other use requires FAA authorization.

Avoid doing anything hazardous to other airplanes or people and property on the ground.

"Dos"

- **Do** fly a model aircraft/UAS at the local model aircraft club
- **Do** take lessons and learn to fly safely
- **Do** contact the airport or control tower when flying within 5 miles of the airport
- **Do** fly a model aircraft for personal enjoyment

"Don'ts"

- **Don't** fly near manned aircraft
- **Don't** fly beyond line of sight of the operator
- **Don't** fly an aircraft weighing more than 55 lbs unless it's certified by an aeromodeling community-based organization
- **Don't** fly contrary to your aeromodeling community-based safety guidelines
- **Don't** fly model aircraft for payment or commercial purposes

Model Aircraft Operations Limits

According to the FAA Modernization and Reform Act of 2012 as (1) the aircraft is flown strictly for hobby or recreational use; (2) the aircraft is operated in accordance with a community-based set of safety guidelines and within the programming of a nationwide community-based organization; (3) the aircraft is limited to not more than 55 pounds unless otherwise certified through a design, construction, inspection, flight test, and operational safety program administered by a community-based organization; (4) the aircraft is operated in a manner that does not interfere with and gives way to any manned aircraft; (5) when flown within 5 miles of an airport, the operator of the aircraft provides the airport operator and the airport air traffic control tower…with prior notice of the operation; and (6) the aircraft is flown within visual line sight of the operator.

- More information about safety and training guidelines

The FAA welcomes comments from the public on its Interpretation of the Special Rule for Model Aircraft, which may help further inform its interpretation of the statutory language in Section 336 of the FAA Modernization and Reform Act of 2012 regarding Model Aircraft operations. Please visit the Federal Rulemaking Portal (http://www.regulations.gov/#!submitComment;D=FAA-2014-0396-0781) and follow the instructions for sending your comments electronically.

September 19, 2014

Dear Commissioner,

The Legislative Task Force on Unmanned Aircraft Systems has identified the need for public awareness in the use of small unmanned aircraft systems (UAS) by government agencies. The Task Force respectfully requests that each State agency that intends to use UAS in its work, to provide the task force with a point of contact for your agency. We ask for this point of contact to be provided by January 1, 2015 or prior to a scheduled UAS mission if it will occur prior to January.

The Task Force is currently developing a public education strategy so that all users and observers of UAS understand the rules and expectations thereby, eliminating fear and reducing opportunity for inappropriate use of these aircraft. State agency participation is vital to the education campaign and will provide the Task Force with a better understanding of how our government agencies are planning to use UAS.

Thank you for time.

Sincerely,
Representative Shelley Hughes
Senator Donny Olson

Task Force:

- Is there anything additional that needs to be included in this request?
- Is January 1, 2015 an appropriate date?
- Address the letter to each commissioner or in general with a list in the CC:
- How should the header read?

ALASKA STATE LEGISLATURE

Please enter into the record my testimony to the Legislative Task Force on Unmanned Aircraft Systems
Committee Name

Committee on "Education Campaign"? Dated 9/19/14
Bill / Subject

Thank you for your work & attention to the need to protect the public in this fast-growing industry. It appears that industry and the desire of officials to bring industry $ to the state are leading the discussion.

Please remember that the legislature is to serve the public - the individual people of Alaska, and that other concerns are more important than $:

- Privacy, as explicitly protected by Article I-10 of our Alaska Constitution and as also protected by the 4th Amendment to the U.S. Constitution dealing with illegal search + seizure. This needs to be protected before ~~addres~~ collection, not just later.
- Safety vs. manned aircraft, including private small craft.
- Compliance with morals and international law banning use of illegal weapons systems.
- I object to our state dedicating funding and making regulatory exceptions to promoting the drone tech site.

SIGNED: Heather Kroshen

Testifier Alaska Peace Center

Representing

687 Chena Ridge, Fbks 99709 479-0981

Address / Phone Number

Thanks for Skaggs' expertise + Colligan's remarks to protect public.

→ I would like to be provided copies of letters authored by this committee.

LTFUAS PUBLIC COMMENT 9-18-14

Introductions of Task Force members.

1.) **Gary Williams**, AeroForensics, Anchorage, AK: What infrastructure currently exists to support this program, what hardware exists at the test site? What do you anticipate existing "test site to me means facilities on site, hardware, vehicles, etc..."
RO: infrastructure of PanPacific Test Site, 3 different ranges: AK, Hawaii, Oregon. A few different ranges in AK are currently available – Kodiak, Poker Flats. What we don't have is a whole lot of hardware, we have a radar system, but the system is not certified. We have eight different types of UAS, a total of over 100 items. I don't anticipate our test site will ever look like an airforce base...but we will be deployable and can meet the needs of industry.
Gary: So we obviously have the airspace, but will there will be a permanent deployable location?
Ro: Poker Flats is semi-permanent, we have facilities and a few vehicles.
Gary: How many people dedicated full time?
Ro: 21 right now, more to come. A few temporary, part-time employees.

2.) **Bernie Zak** - Sandia National Laboratory, Engineering Laboratory that is contracted through the Department of Energy: Testifying on behalf of his interest of UAF work, talked about Sandia's operations in Barrow and Ilikotok, where they study climate change and have about 100 instruments used. Sandia has operated closely with UAF for over two decades now. Glad to see these developments in regard to state involvement. Sandi/DOE now has restricted airspace over Iliktok. The main purpose of their facilities are climate research. Facilities are for public use and they have had dozens of applications for use of their Barrow and Iliktok facilities.
    - Steve Wachowski Comment: his company FairWeather has worked with Sandia in the past.

3.) **Rob Mulford**, Fairbanks, with Veterans for Peace: against military and government encroachment: talked about UAS conferences he attended where DOD and Military officials detailed the "plans" for drone roll out and future of drones in military. Went into "Network-Centric" warfare and the use of ground to air symmetry. Attended a conference in Arlington, VA: an intelligence surveillance conference, where they thanked Lockhead Martin for their production of high-frequency sensors. Concerned with privacy and assassinations on US soil via drone targeting technology. Very skeptical of the use of UAVs in commercial airspace, referred to them as "monsters in the sky."

4.) Letter form **Brandon Anderson**: concerned with outside companies crowding the market for UAS in Alaska, hopes that those who guide the development of the market will allow for Alaska's talented companies who are already here to get their fair chance at the market. Also introduced plans to base a UAS activity hub out of Seward, AK.
    - Wachowski adds that hiring of Alaska Natives is a priority of FairWeather, considering they are a subsidiary of a Native Corporation. Believes it will remain that way and is optimistic that Alaskans will have ample opportunity in the industry.

    - Steve Colligan addresses the importance of making the industry and STEM education more appealing for the younger generation. Transferability from xbox and gaming to actually flying UAS and using the tech is very possible.

5.) **Jeff Robins**, Alaska Aerospace, Palmer, AK – Are there any potential tax incentives being discussed to attract business to the state, similar to the film industry?
RO: In a military zone (set up during this past legislative session) there are tax incentives currently set up for business development within these military zones. This would include UAS related businesses. Fairbanks Northstar Borough is pushing this very hard. Slow process, but it's in the works.

- Joe Jacobson Response: Doesn't think it's a good comparison between film industry and UAS industry, but he believes that the state could possibly partner with a company like Lockhead Martin or others. Does not foresee tax subsidies as a necessity for this industry because the industry is budding and has potential to attract investment without needing incentives.
- Mike O'Hare: spoke on the fact that the incentives for UAS development in Alaska are the fact that we have so much airspace and we are a UAS friendly state.

6.) **Barbara Johnson**: Special Assistant to Mayor Hopkins: Spoke about the Military Facility Zones and Rep. Thompson's bill. They are pursuing a "tech park" in Fairbanks area with partners from both the industry and the state. Very optimistic about Alaska UAV future.

Closed meeting.

Small but Powerful Workhorse

The Aeryon Scout™ is an easy-to-use, battery powered Vertical Take-Off and Landing (VTOL) sUAS. The Scout can fly lower and slower than manned aircraft and in confined environments where fixed-wing UAVs cannot operate safely. It offers reliable flight performance even in the most demanding conditions. The Scout uses a Photo 3S EO Camera, IR FLIR Tau core camera as well as the latest and powerful GoPro Hero 3.

Performance

- Point-and-click controls, advanced features
- Advanced fly-safe features
- Weighs less than 3 lbs (1.4 kg)
- Up to 20-min flight time with payload
- Sustained winds up to 30 mph (50 kph)
- Wind gusts up to 50 mph (80 kph)
- Transport in a small case or backpack
- Altitude 100 ft – 10,000 ft (ASL)

Products made from the images include

- 3D Mosaic
- Point Cloud
- Geo-Referenced/GeoTIFF
- KML files to be used with Google Earth
- Digital Surface Models
- Stitched Aerial Images

PPUTRC is a team of 58 partners that competed and won one of the FAA's six test sites. Its three key partners--Alaska, Oregon, and Hawaii--offer unique environmental and terrain conditions as well as remote locations for safe and effective testing of UAS. Combined with the normal research operations of ACUASI, this site offers extraordinary breadth of missions for collecting FAA's data needs for the establishing of UAS regulations, policies, procedures, and standards. A recent state appropriation supplements significant external funding to support creation and operation of this unique center.

PPUTRC will assist with the implementation of the Arctic airspace provisions embodied in the 2012 FAA Reauthorization Act by offering a pathway for operators planning to work in the Arctic.

Serving Alaska

With Alaska's vast size and abundance of natural resources, tremendous opportunities exist for developing and exploiting UAS technologies to benefit the State, particularly in the areas of resource mapping and wildfire monitoring.

Serving the Nation

Based in Alaska, PPUTRC is ideally situated to aid in working out the issues of separating and integrating the emerging UAS airspace from the existing National Airspace System (NAS).

Serving the Research Community

Unmanned systems are well suited to ecological and geophysical research applications, such as monitoring marine mammals and mapping glaciers and sea ice.

ACUASI is focused on application of unmanned aircraft systems into civil commercial and scientific endeavors. The Geophysical Institute began experimenting with these technologies several years ago and is rapidly becoming a world leader in this field. A recent state appropriation has supplemented significant external funding to support creation of this unique center.

ACUASI is equipped to fly a variety of in-situ and remote sensing instruments on several types and sizes of unmanned aircraft at multiple locations in Alaska and around the globe.

Serving Alaska

With Alaska's vast size and abundance of natural resources, tremendous opportunities exist for developing and exploiting UAS technologies to benefit the State, particularly in the areas of resource mapping and wildfire monitoring.

Serving the Nation

Based in Alaska, ACUASI is ideally situated to aid in working out the issues of separating and integrating the emerging UAS airspace from the existing National Airspace System (NAS).

Serving the Research Community

Unmanned systems are well suited to ecological and geophysical research applications, such as monitoring marine mammals and mapping glaciers and sea ice.

UNIVERSITY OF ALASKA FAIRBANKS
UAF is an AA/EO employer and educational institution.

Alaska Center for Unmanned Aircraft Systems & Integration

Photo by GI Design Services

ACUASI develops and demonstrates new UAS capabilities and applications research data needs, civil support such as disaster damage assessment and search and rescue, and educational outreach for students from K-12 through post-graduate work. It focuses on Alaska and her people, high latitude issues and projects that are dangerous, difficult, or impossible by other means. Exploring commercial opportunities will assist integration into the National Airspace System for future routine flight.

Geophysical Institute

UAF photo by Todd Paris

Established in 1946, the Geophysical Institute is internationally renowned for studying Earth and its physical environment at high latitudes. Research is organized into the following disciplinary groups:

Atmospheric Sciences

Earth and Planetary Remote Sensing

Seismology and Geodesy

Snow, Ice and Permafrost

Space Physics and Aeronomy

Tectonics and Sedimentation

Volcanology

Operational facilities at the Institute include:

Alaska Center for Unmanned Aircraft Systems and Integration

Alaska Earthquake Center

Alaska Satellite Facility

Alaska Volcano Observatory

Poker Flat Research Range

Legislative Task Force on Unmanned Aircraft Systems
December 5, 2014 Meeting at 733 West 4th Ave
Temporary Anchorage Legislative Information Office

9:00am – 12:00pm

Task Force Members:

- Representative Shelley Hughes, Co-Chair
  - Ginger Blaisdell, Staff to Rep. Hughes
- Senator Donny Olson, Co-Chair
- Joe Jacobson, Commissioner Designee, Department of Commerce, Community Economic Devel.
- Mike O'Hare, Commissioner Designee, Department of Military and Veterans' Affairs
- Lieutenant Steve Adams, Commissioner Designee, Department of Public Safety
- John Binder, Commissioner Designee, Department of Transportation, Public Facilities
- Ro Bailey, University of Alaska Fairbanks
- Steve Strait, Aviation Advisory Board, Governor's Office and DOT/PF
- Steve Colligan, Representative Member for the Academy of Model Aeronautics
- John Parker, Integrated Robotics Imaging Systems
- Steve Wackowski, Tulugaq II
- Bob May, Gallery Lodge, Kasilof

Task Force Responsibilities per HCR15

The duties of the task force shall include

1. reviewing regulations and guidance from the Federal Aviation Administration regarding unmanned aircraft systems;
2. providing written recommendations, together with suggested legislation, for a comprehensive state policy for unmanned aircraft that protects privacy and allows the use of unmanned aircraft systems for public and private applications;
3. evaluating complaints and concerns expressed to the task force;
4. identifying potential privacy and public safety concerns associated with unmanned aircraft systems and determining whether legislation is necessary to address them;
5. considering recommendations for public education related to unmanned aircraft systems;
6. studying the Federal Aviation Administration's "Integration of Civil Unmanned Aircraft Systems (UAS) in the National Airspace System Roadmap," issued November 7, 2013 (1st ed. 2013) and its application to the development of unmanned aircraft systems in the state;
7. conducting a public hearing concerning privacy and the capture of data by unmanned aircraft systems at the University of Alaska's test site;
8. further studying the nonpublic use of unmanned aircraft systems to encourage development of the private sector unmanned aircraft system industry; and
9. further studying and making recommendations with respect to ensuring unmanned aircraft users comply with applicable laws.

AGENDA

9:00am Welcome and Introductions .....Representative Shelley Hughes

- Comments on Task Force upcoming meetings
- Review of Meeting Summary from September 9, 2014
- Introduction of Guests
- Current Events: News Articles (attached list)

AGENDA

- DRAFT Letters to Governor and Commissioners
- Mike O'Hare: Military UAS update
- Jay Skaggs: FAA update
- Type and Purpose matrix draft by Ginger Blaisdell and Steve Strait
- Press Release re: Christmas Top Ten Gift List
- Today's discussion topic: AMA Representatives on Education of Flyers
    - Steve Colligan: Interpretation of the Special Rule for Model Aircraft
- Public Testimony (as time allows)

Future Agenda Items .....as listed in September

- Data retention
- Define framework – training and education
- Dept Public Safety guidance document on enforcement of UAS
- Integration not segregation of airspace: invite DOI, FAA, Military, BP/Exxon, etc
- System for gathering citizen complaints

Follow Up – To Do .....as listed in September

- Military mission in Alaska – process and plans
- Italy data protection laws
- Who to contact? Complaint / enforcement system / responses
- FAA enforcement
- Doug Marshall UND privacy
- UTMS – unmanned traffic management system
- FAQs could be discussed at a teleconference meeting of the task force

Adjourn .....Representative Shelley Hughes

Attachments:

- Motion Picture Association of America welcomes exemption 1
- A Drone by Any Other Name... 2-4
- DHS Flew Drones for 1,726 Hours Over Interior of US 5-6
- Russia to Open Arctic Military Drone Base 420 Miles from Alaska 7-9
- FAA says Air Traffic Control isn't Ready for UAS 10-12
- FAA Issues Requirement for All UAS to Show Aircraft Registration Number 13
- US National Transportation Safety Board Rules that Drones are Aircraft 14-15
- Canada Issues Clear Guidelines for UAS Flying 16-50
- Don't Fly Drones Here – UK Edition 51-56
- Drones and Everything After 57-70
- Model Aircraft Rule 71-80

Legislative Task Force on Unmanned Aircraft Systems
September 19, 2014 Meeting at 733 West 4th Ave
Temporary Anchorage Legislative Information Office

9:00am – 12:00pm

Task Force Members:

- Representative Shelley Hughes, Co-Chair
- Senator Donny Olson, Co-Chair (not in attendance)
- Joe Jacobson, Commissioner Designee, Department of Commerce, Community Economic Devel.
- Mike O'Hare, Commissioner Designee, Department of Military and Veterans' Affairs
- Lieutenant Steve Adams, Commissioner Designee, Department of Public Safety
- John Binder, Commissioner Designee, Department of Transportation, Public Facilities
- Ro Bailey, University of Alaska Fairbanks
- Steve Strait, Aviation Advisory Board, Governor's Office and DOT/PF
- Steve Colligan, Representative Member for the Academy of Model Aeronautics
- John Parker, Integrated Robotics Imaging Systems
- Steve Wackowski, Tulugaq II (called in)
- Bob May, Gallery Lodge, Kasilof

- Ginger Blaisdell, Staff to Rep. Hughes

Invited Attendees:

- Director Kerry Long and Jay Skaggs, FAA

Public testimony was received at the end of the meeting.

MEETING SUMMARY

9:00am Welcome and Introductions .....Representative Shelley Hughes

- Round table discussion of remarks following UAS Interest Group Meetings:
  1. Discussion positive overall and good turnout indicates increased positive potential
  2. FAA mission expressed was good to hear
  3. Recognized that Alaska has strongest privacy laws in place
  4. Got the word out that Alaska is "Open for Business"
- Introduction of Kerry Long and Jay Skaggs of the FAA.

Presentation by Kerry Long and Jay Skaggs

Highights:

1. Alaska has the freest and safest national airspace in the world.
2. Movie exemption is coming. It has been shown that UAS filming is safer than manned aircraft in many movie scenes where the industry is pushing the limits of safe flight.
3. Iceland as a partner with Alaska FAA test site will provide additional opportunities for testing in unrestricted airspace and provides an international range.
4. Amazon is selling 18-20,000 unmanned aircraft per month with more than 10,000 of those being the DJI Phantom. The DJI aircraft have been improving their internal systems by programming timeware, GPS restrictions and other safety measures.
5. UAS are a "disruptive technology" – the AMA is a community-based organization and is working with the FAA to educate the public.
6. Model aircraft is an aircraft and therefore subject to regulations.
7. Model VS its intent and operation
8. The FAA has the authority to use regulations that are available and can enforce reckless and careless endangerment for misuse of UAS
9. The FAA and industry have done a good job in reaching out to airmen.
10. At this time there is no federal funding for the test sites – burden is on state funding of sites. It was noted that all 6 states are seeking funding. Alaska is the only test site that is unfunded.

Steve Wackowski noted that safety accidents sometimes are directly linked to underfunding. Director Kerry reiterated that he can't get federal funding for test sites. Wackowski recommended that a funding request letter be sent to congress.

Kristi Bell, University of Alaska Anchorage

1. With Joe Jacobson, Department of Community and Economic Development, drafted a report identifying how Alaska is well positioned for this industry.
2. The University and DCCED are working collaboratively to prove that UAS is economically viable in Alaska.
3. The report will be made available to the Task Force when it is further along in its draft – likely at the next Task Force meeting in December.

Ginger provided a review of the documents in members' packets:
Amazon.com "drone store" includes a fly responsibility bulletin; however it takes 18 clicks to get to the rules of flying for hobbyists

- Don't reinvent the wheel but make it more accessible to the general public
- Scatter diagram or table of commercial VS hobbyist
- Joe Jacobson offered to help with public relations work on UAS public awareness
- Rep Hughes mentioned PSAs and an education campaign
- Jay Skaggs and Mike O'Hare mention that the education campaign have a broad scope beyond UAS to include robots and robotics and include the maritime and self-drive automobiles as well

Future Meeting Agenda:

1. Letter to Alaska Congressional delegation for test site funding and issues of underfunding
2. Letter to AUVSI for clarification on Alaska passing "anti-drone" legislation
3. Letter to Commissioners on point of contact for UAS missions
4. Letter to Governor regarding data retention policies
5. Letter to FAA stating that AMA be designated as community-based organization over hobby use in Alaska with the intent for personal and recreation use, not commercial.
    - Might be a resolution
    - AMA to present at a later meeting

- Next meeting:

1. Matrix
2. Education Plan

- Follow Up – To Do

1. Military mission in Alaska – process and plans
2. Italy data protection laws
3. Who to contact? Complaint / enforcement system / responses
4. UTMS – unmanned traffic management system

DRAFT

Dear Mr. Toscano,

The Alaska Legislative Task Force on Unmanned Aircraft Systems was formed under legislative resolve in 2012. The Task Force is made up of government agency representatives and public members and is working to advance this technology to attract economic opportunities and ~~more importantly~~ to protect Alaskans' personal privacy through public awareness in the use of ~~small~~ unmanned aircraft systems (UAS) ~~by government agencies and hobbyists.~~

I attended the Alaska Interest Group UAS meetings in September and spoke up following your key note address to the attendees. My remarks were specific to the slide in your presentation that identified the states that had passed negative legislation with regard to unmanned aircraft policy. My specific request is that the color coded slide of the 50 states appropriately reflect that Alaska is very optimistic about the use of UAS and the legislation passed regarding law enforcement use of UAS encourages the use of UAS and clarified how the data gathered could be used in a court of law. The bill was drafted with the Department of Pubic Safety's support and is viewed as a positive step toward incorporating UAS in a wide variety of missions in law enforcement.

I simply ask that the slide in your presentation be corrected so not to represent Alaska in a negative light.

Thank you for time.

Sincerely,
Representative Shelley Hughes
Senator Donny Olson

Honorable Governor Bill Walker
3rd Floor State Capitol
Juneau, AK 99811-0100

DRAFT

Dear Governor Walker,

The Legislative Task Force on Unmanned Aircraft Systems was formed under legislative resolve in 2012. The Task Force is made up of government agency representatives and public members and is working to advance this technology to attract economic opportunities and more importantly to protect Alaskans' personal privacy through public awareness in the use of small unmanned aircraft systems (UAS) by government agencies and hobbyists.

During our review of existing statutes, the Task Force recognizes that the State's data retention policies need immediate attention and review as technology is presenting new challenges for state agencies. The Legislative Task Force on Unmanned Aircraft Systems respectfully requests that data retention policies be reviewed and revised with the use of data imagery storage be considered specifically for cost benefit analysis as well as personal privacy.

The Task Force is currently developing a public education strategy so that all users and observers of UAS understand the rules and expectations thereby, eliminating fear and reducing opportunity for inappropriate use of these aircraft.

Thank you for time.

Sincerely,
Representative Shelley Hughes
Senator Donny Olson

we are asking for point of contact @ each dept.

Task Force:

- Is there anything additional that needs to be included in this request?
- Should there be an anticipated due date for retention policy update to be completed?

Send Jan.

DRAFT

Dear Commissioner,

The Legislative Task Force on Unmanned Aircraft Systems has identified the need for public awareness in the use of small unmanned aircraft systems (UAS) by government agencies. The Task Force respectfully requests that each State agency that intends to use UAS in its work, to provide the task force with a point of contact for your agency. We ask for this point of contact to be provided by January 1, 2015 or prior to a scheduled UAS mission if it will occur prior to January.

The Task Force is currently developing a public education strategy so that all users and observers of UAS understand the rules and expectations thereby, eliminating fear and reducing opportunity for inappropriate use of these aircraft. State agency participation is vital to the education campaign and will provide the Task Force with a better understanding of how our government agencies are planning to use UAS.

Thank you for time.

Sincerely,
Representative Shelley Hughes
Senator Donny Olson

Task Force:

- Is there anything additional that needs to be included in this request?
- Is January 1, 2015 an appropriate date?
- Address the letter to each commissioner or in general with a list in the CC:
- How should the header read?

Recreational Use of UAS

Currently, the FAA allows the operation of small unmanned aircraft systems (sUAS) for hobby and recreational purposes under specific safety guidelines. Small UAS flown for recreational purposes are typically known as model aircraft.

Under the Special Rule for Model Aircraft, recreational UAS must be operated in accordance with a community-based safety program. Operators not operating within the safety program of a community-based organization should follow the FAA's guidance in Advisory Circular 91-57.

What is recreational use of a sUAS (Drones)?

The recreational use of sUAS is the operation of an unmanned aircraft for personal interests and enjoyment, and not for compensation or hire. For example, using a sUAS to take photographs for your own personal use would be considered recreational; using the same device to take photographs or videos for compensation or sale to another individual would be considered commercial. You should check with the FAA for further determination as to what constitutes commercial sUAS operation.

What are the safety guidelines for recreational users of sUAS (Drones)?

- Users should follow community-based safety guidelines, as developed by organizations such as the Academy of Model Aeronautics (AMA)
- Users should fly no higher than 400 feet and remain below any surrounding obstacles when possible
- Users must be able to see their sUAS at all times, and use an observer to assist them if needed
- Users should remain well clear and must not interfere with manned aircraft operations, and must see and avoid other aircraft and obstacles at all times
- Users must not intentionally fly over unprotected persons or moving vehicles, and should remain at least 25 feet away from individuals and vulnerable property
- Users must contact the airport or control tower before flying within five miles of an airport
- Users should not fly in adverse weather conditions such as in high winds or reduced visibility
- Users must not fly under the influence of alcohol or drugs
- Users should ensure the operating environment is safe and that the operator is competent and proficient in the operation of the sUAS
- Users should not operate on or fly over private property without first obtaining permission from the property owner and/or tenant
- Users should not fly near or over sensitive infrastructure or property such as power stations, water treatment facilities, correctional facilities, heavily traveled roadways, government facilities, etc.
- Users should not conduct surveillance or photograph persons in areas where there is an expectation of privacy without the individual's permission (See AMA's privacy policy)

If you want to use a model aircraft for recreational purpose, we encourage you to read the AMA's Model Aircraft Safety Code and Community-Based Guidelines.

To learn more about these and additional safety guidelines from the FAA, click here.

December 3, 2014

Mr. Michael P. Huerta
Administrator
Federal Aviation Administration
800 Independence Avenue, SW
Washington, DC 20591

Dear Administrator Huerta:

The recent reports of near-collisions between drones and manned aircraft in our nation's airspace are alarming. I urge you to vigorously enforce safety laws and regulations against the unsafe operation of drones and to warn operators about the potential hazards and consequences of their reckless behavior.

In July, I wrote to express my d adopt gers posed by expanded domestic drone use in the national airs Know Before You Fly n the Federal Aviation Administration so I could get a full se with date on it . Last week, I received data from your staff that corroborated led domestic drone use.

According to this data, Military update reported to the FAA over the last nine months. Sin e more than one incident per day. These numbers include n ar mid-air collisions with other aircraft and more th in proximity to other aircraft. In addition, the repor , overflights of stadiums and a power plant, and unlawf m this year include:

FAA - Jay Skaggs
- enforcement
- certification of pilots
exemption
9 movie co exempt

- October 12: an aircraft came e and took evasive action to avoid collision at 4,800 feet a City.

- September 30: an aircraft inbound to LaGuardia Airport reported a drone that "almost hit" the aircraft at 4,000 feet in elevation;

- August 23: in Burbank, California, an aircraft reported a drone "off [its] left wing passing opposite direction while [north] bound at 8,000 feet";

- May 29: two aircraft on approach to Los Angeles International Airport (LAX) reported seeing a "trash can sized" drone at 6,500 feet;

It is clear that we have a serious potential safety problem which could cause a serious threat to life. Yet, very few of these incidents resulted in FAA enforcement actions, according to reports, even though the drones' operations appear to have been plainly illegal. For example, many reports indicate commercial activity, flights above 400 feet in elevation, operation within 5 miles of an airport without authorization, flights outside the operator's line of sight, or careless and reckless activity.

I recognize that the proliferation of highly-capable, inexpensive drones operated by untrained individuals is a new challenge. But the FAA is responsible for the safety of the airspace, and it must aggressively confront this challenge now, before an airliner is brought down. I urge you to pursue vigorous enforcement and strong safety regulations, and to warn operators about the consequences of their behavior.

It is my intent to introduce legislation to codify and expand the moratorium on private drone use without specific authority from the FAA that is already in place. This expanded moratorium would cover any such use that could threaten the airspace, it would require a safety certification for expansions of private drone use, and it would be backed up by substantial criminal penalties if manned aircraft or people are put at risk. I would very much appreciate your comments and technical assistance on such legislation.

Thank you for your full attention to this matter. Please respond to this letter by no later than December 15, 2014.

Sincerely,

Dianne Feinstein
United States Senator

About this Industry

Industry Definition

Industry firms manufacture and design unmanned aerial vehicles (UAVs) and related control systems for civilian and military applications. UAVs can be either autonomous or remote controlled, and are used in situations where the use of a human pilot is undesirable or dangerous.

Main Activities

The primary activities of this industry are

- Manufacturing UAVs for armed attack
- Manufacturing UAVs for surveillance
- Manufacturing UAVs for research
- UAV research and development

The major products and services in this industry are

- High altitude UAVs
- Low altitude UAVs
- Medium altitude UAVs

Similar Industries

33641a Aircraft, Engine & Parts Manufacturing in the US
Some operators in the larger aircraft manufacturing industry produce UAVs.

33641b Space Vehicle & Missile Manufacturing in the US
UAVs are similar to some spacecraft and missiles in that they are unmanned and either autonomous or remote-controlled.

33661a Ship Building in the US
Like the UAV industry, US shipbuilders mostly manufacture military equipment.

33699b Tank & Armored Vehicle Manufacturing in the US
Like tanks and armored vehicles, UAVs a primarily manufactured for the military.

Industry Performance

Executive Summary | Key External Drivers | Current Performance
Industry Outlook | Life Cycle Stage

Executive Summary

Over the past five years the Unmanned Aerial Vehicle (UAV) Manufacturing industry experienced strong growth and sharp declines. Industry players develop and manufacture remotely piloted and autonomously operated aircraft typically called UAVs or drones. From 2009 to 2010, the industry experienced a boom in demand as the Department of Defense (DoD) poured billions of dollars on the acquisition and development of drones for surveillance and strike missions. However, with combat operations in the Middle East coming to an end and the government attempting to reduce the nation's debt, federal funding for defense began to decline. As a result, funding for industry projects began to be cut and industry revenue declined. Revenue is expected to drop 13.8% in 2014 alone. Nonetheless, the earlier surge in DoD spending, combined with continued military funding for UAV development and procurement, has meant that industry revenue is still greater than 2009 levels. Therefore, in the five years to 2014, industry revenue is expected to increase an annualized 2.7% to $3.4 billion.

Conflicts in the Middle East and the need for homeland security have bolstered revenue

Outside the defense market, industry players have increased the focus on the development of UAVs for domestic use. Potential domestic uses for drones include border enforcement, humanitarian relief, search and rescue, scientific research, meteorology, firefighting, precision agriculture, infrastructure surveying, police surveillance, freight delivery and communication signals relaying. However, domestic operations of drones is highly restricted by the Federal Aviation Administration (FAA). As a result, in 2012, Congress ordered the FAA to establish rules by which UAVs can be integrated into domestic airspace by 2015.

In the five years to 2019, industry revenue is forecast to climb at an annualized 3.7% to $4.1 billion, almost recovering from recent defense funding cuts. While, the defense spending situation is only projected to improve towards the end of the next five years, the DoD is still anticipated to pour billions into industry projects. In particular, the government will seek to develop and procure next generation UAVs that will be able to operate in "contested" airspace. With the FAA anticipated to establish regulations for the domestic use of drones, demand from the civil market is projected to boom. Consequently, the number of industry enterprises is set to continue rising.

Key External Drivers

Federal funding for defense

The United States military accounts for the vast majority of funding for unmanned aerial vehicle (UAV) development and procurement. As a result, when defense spending increases, so does demand for industry products. Federal funding for defense is expected to decline in 2014, representing a potential threat to the industry.

Price of semiconductor and electronic components

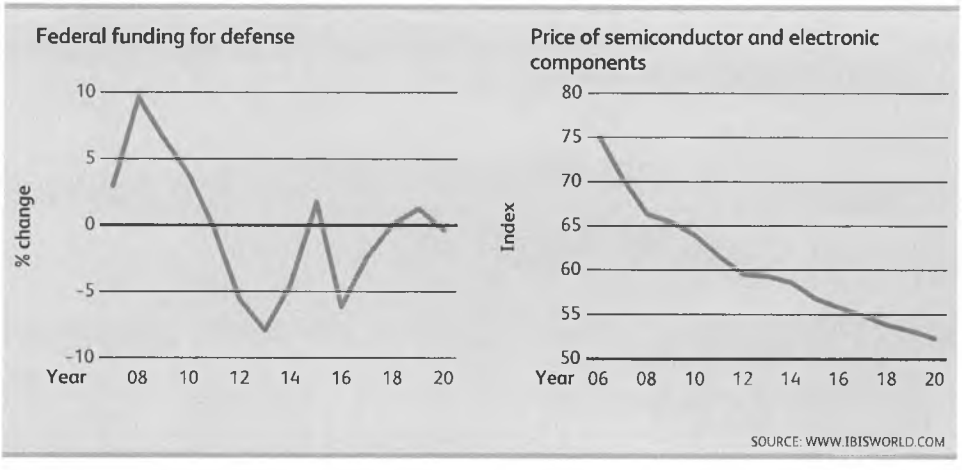
UAVs require a significant amount of electronic components for data recording and transmission purposes, as well as avionic functions. The price of semiconductors and electronic components is expected to decrease in 2014, representing a potential opportunity for the industry.

Industry Performance

Key External Drivers continued

World price of aluminum
Aluminum is one of the most commonly used raw materials in the manufacturing of UAV. When the price of aluminum increase, operators have to either pass on increasing costs to customers in the form of higher prices or reduce profit margins. The world price of aluminum is expected to decline in 2014.

Federal funding for homeland security
The Department of Homeland Security provides federal funding for domestic emergencies, including terrorism and environmental disasters. In addition, the department oversees federal agencies dealing with border security, an emerging application for UAVs. Federal funding for homeland security is expected to decrease during 2014.



Industry Performance

Current Performance

Over the past five years, the Unmanned Aerial Vehicles (UAV) Manufacturing industry has begun a slow descent after reaching new heights. Industry players manufacture UAV, or drones, which are remotely piloted and autonomously operated aircraft. From its inception, the industry has primarily relied on military funding for the development and procurement of its aircraft. At the early stage of the past five years, increased military use of drones for anti-terrorist, combat and surveillance missions led to a surge in demand for industry products and their further development. However, as US combat operations in the Middle East began to wind down and rising federal debt levels forced the government to reduce spending, federal funding for defense declined, with the Department of Defense (DoD) UAV budget shrinking. As a result, industry revenue began to descend. Nonetheless, the earlier surge in DoD spending, combined with continued military funding for UAV development and procurement has meant that industry revenue is still above 2009 levels. Therefore, in the five years to 2014, industry revenue is expected to increase at an annualized 2.7% to $3.4 billion.

Defense spending drives demand

The DoD accounts for the vast majority of spending on industry products and development, with nearly 90.0% of industry revenue coming from the United States Air Force, Army, Navy and Marine Corps. Since UAVs are unmanned and can be operated remotely or function autonomously, they reduce the risk of military casualties for troops that would otherwise have their boots on the ground or fly the required missions themselves. In addition, because there is no pilot in the aircraft, drones are typically less expensive to operate and can loiter in the air relatively undetected, making them ideal for surveillance, reconnaissance and strike missions. As a result, when the United States began its wars in the Middle East and antiterrorist operations, the Pentagon poured billions of dollars into the industry, with revenue skyrocketing 51.9% in 2010 alone. In particular, the military prioritized acquisition of new UAV platforms. This included the medium to high altitude, long endurance, Gray Eagle and Reaper surveillance and strike drones (helping replace the Predator), as well as the smaller Shadow and Raven drones that are used at a more tactical level. The military also stepped up the development and procurement of the high altitude Global Hawk surveillance UAV.

Defense funding skyrocketed, creating a boon for industry establishments

However, the boom in military spending eventually came to a halt. The combination of reduced combat operations in the Middle East and Congress' attempts to cut the deficit (including sequestration) caused military spending to decline, with federal funding for defense expected to fall at an annualized 3.0% to $620.6 billion in the five years to 2014. With US forces withdrawing from Iraq in 2011 and winding down operations in Afghanistan, the operational need for UAVs began to slowly decline. Moreover, years of drone procurement left the military enough UAVs to meet its current need, further reducing UAV procurement amid the recent budget cuts. As a result, industry revenue began to decline in 2011 and is expected to continue to do so in 2014, plunging

Industry Performance

Defense spending drives demand continued

13.8%. Nonetheless, despite the cuts, the military has continued to spend billions on UAV development and programs, including the Global Hawk, stealth combat and surveillance dorms, aircraft carrier launched drones and many other initiatives, including top secret projects.

The domestic and commercial market

The domestic and commercial applications of UAVs seem unlimited, with new platforms being developed each year. Applications include border enforcement, humanitarian relief, search and rescue, scientific research, meteorology, firefighting, precision agriculture, infrastructure surveying, police surveillance, freight delivery and communication signals relaying. However, stringent regulations have prevented the domestic market for drones from taking off. Currently, regulators fear that drones can't adequately interact with other aircraft and objects, heightening the chances of a collision or crash. As a result, drone operators have to obtain special authorization and certification from the Federal Aviation Administration (FAA) to operate UAVs in US airspace. However, in 2012, Congress ordered the FAA to create rules for the integration of UAVs into domestic airspace by 2015. Consequently, the FAA rolled out a "roadmap" for UAV integration, by which it plans to phase in domestic use of UAV by creating new regulation and certifications. The domestic use of industry products has also come under greater public scrutiny, with many worried that surveillance drones may infringe of peoples' privacy rights.

Despite some cuts in 2010, Homeland security will still bring revenue as borders are closely monitored

Despite regulatory restriction, domestic UAV use has greatly increased over the past five years. The Department of Homeland Security has been using drones to monitor the United States border for illegal immigration and drug trafficking, as well as in disaster relief operations (although the recent reduction in federal funding for homeland security is expected to stifle this demand). Other notable examples of civil UAV applications include the NASA missions in which a Global Hawk UAV was flown over tropical storms in partnership with the National Oceanic and Atmospheric Administration to collect data on severe weather information and the Department of Agriculture and NASA's wildfire support efforts. Moreover, earlier this year, BP became the first company to domestically use UAVs for commercial purposes after the FAA allowed it to use small drones to monitor its Alaskan oil pipelines.

Profitability and other trends

Due to recent reduction in government funding for UAV projects, industry profit is expected to decline from 11.8% in 2009 to 11.5% in 2014. Although, recent declines in the world price of aluminum and the price of semiconductor and electronic components (all major manufacturing inputs) have relieved some margin pressure. Moreover, defense cuts have forced some manufacturers to lay off staff, with industry employment expected to decline

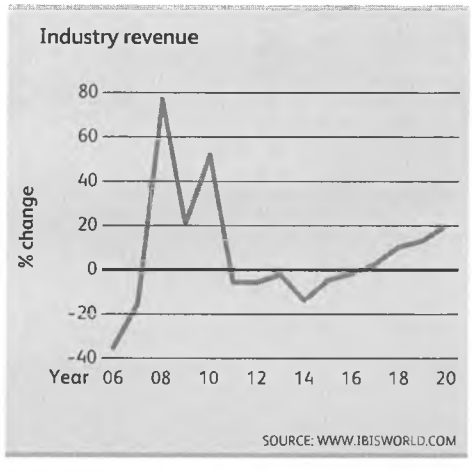
Industry Performance

Profitability and other trends continued

at an annualized 0.4% to 7,616 in the five years to 2014. However, the number of industry enterprise is expected to rise at an annualized 2.8% to 63 over the same period, as small startup companies develop new UAVs for commercial applications.

Industry Outlook

Over the next five years, the Unmanned Aerial Vehicles (UAV) Manufacturing industry is anticipated to nearly recover from recent declines. For most of the near future, the industry will continue to come under pressure from reduced defense spending. However, the military is still anticipated to invest substantial resources into UAV projects, with spending eventually increasing towards the last few years of the five-year period. Moreover, as new regulations are established, the domestic market for drones is finally projected to take off in a substantial manner. Lastly, operators will look to offset lackluster military demand at home with foreign sales. Therefore, in the five years to 2019, industry revenue is forecast to climb at an annualized 3.7% to $4.1 billion.



The defense market

As the United States reduces its presence in Afghanistan, pursues a less interventionist foreign policy and attempts to reduce the federal debt, federal funding on defense is forecast to decline at an annualized 1.1% to $585.8 billion in the five years to 2019. Consequently, Department of Defense (DoD) spending on industry projects is projected to continue falling in the near future. However, despite these cuts, the military will continue to invest significant resources into UAV development and procurement. For instance, Northrup Grumman's Global Hawk surveillance drone will continue to be further developed, with a maritime version being created for the Navy.

In particular, funding on industry projects will reflect the DoD's transition from the current generation of UAVs (whose acquisition the military is slowing down) to the development and eventual procurement of next generation systems that will be more autonomous and able to operate in "contested" airspace. For instance, Northrup Grumman is developing a stealthy surveillance (and potentially strike) UAV for the Air Force, dubbed the RQ-180. The aircraft's stealth features and other technology will allow it to operate in airspace that is too heavily defended for traditional UAVs. The Navy is also attempting to develop a next generation, aircraft carrier launched UAV through its Unmanned Carrier-Launched Airborne Surveillance and Strike (UCLASS) program. Northrop Grumman, Lockheed Martin, Boeing and General Atomics have all proposed aircraft, such as the X-47B and Sea Avenger. However, the program has not been spared from budget controversy. The Navy has recently changed its original proposal for

Industry Performance

The defense market continued

a highly stealthy, strike and surveillance drone to a more affordable, less risky, but less capable one. In response, members of Congress are attempting to stall the program and have its requirement changed to a higher end model.

In order to offset lackluster demand from the DoD, manufacturers are anticipated to increasingly seek foreign orders. For instance, Northrup Grumman is currently developing a Global Hawk model for the North Atlantic Treaty Organization (NATO). The company is also anticipated to deliver the Global Hawk to South Korea, with countries including Australia and Japan also showing great interest. However, major regulatory obstacles remain. Many UAVs and related components are subject to International Traffic in Arms Regulations (ITAR), which require exports to receive State Department approval. Moreover, UAVs are also covered by the Missile Technology Control Regime (MTCR), which greatly restricts the exports of UAVs. As a result, UAV exports are often carried out through the military.

Domestic market

Over the next five years, the highest growth area for the industry is projected to be the commercial and domestic markets. By 2015, the Federal Aviation Administration (FAA) is anticipated to release rules and procedures on how to integrate UAVs into domestic airspace operation. As a result, demand from markets like border enforcement, humanitarian relief, search and rescue, scientific research, meteorology, firefighting, precision agriculture, infrastructure surveying, police surveillance, freight delivery and communication signals relaying is projected to boom. However, the necessary regulations are still far from full development and many technological and political obstacles remain. Consequently, despite strong growth, the civil market for UAV is still projected to be a fraction of the defense market.

The highest growth area for the industry is projected to be the commercial and domestic markets.

Profitability and other trends

As manufacturers adjust to more lackluster demand from the military and increased prospects for commercial sales, industry profit is forecast to rise from 11.5% in 2014 to 12.8% in 2019. Additionally, the projected decline in the price of semiconductor and electronic components will further ease profit pressure. The anticipated boom in the civil UAV market is also expected to lead to more companies and workers entering the industry and offsetting defense related cuts. As a result, over the five years to 2019, industry employment is forecast to rise at an annualized 3.2% to 8,908 people, while the number of enterprises will climb at an annualized 3.8% to 76. Furthermore, merger and acquisition activity is projected to climb as aerospace and defense companies attempt to acquire smaller players to diversify into the commercial UAV market.

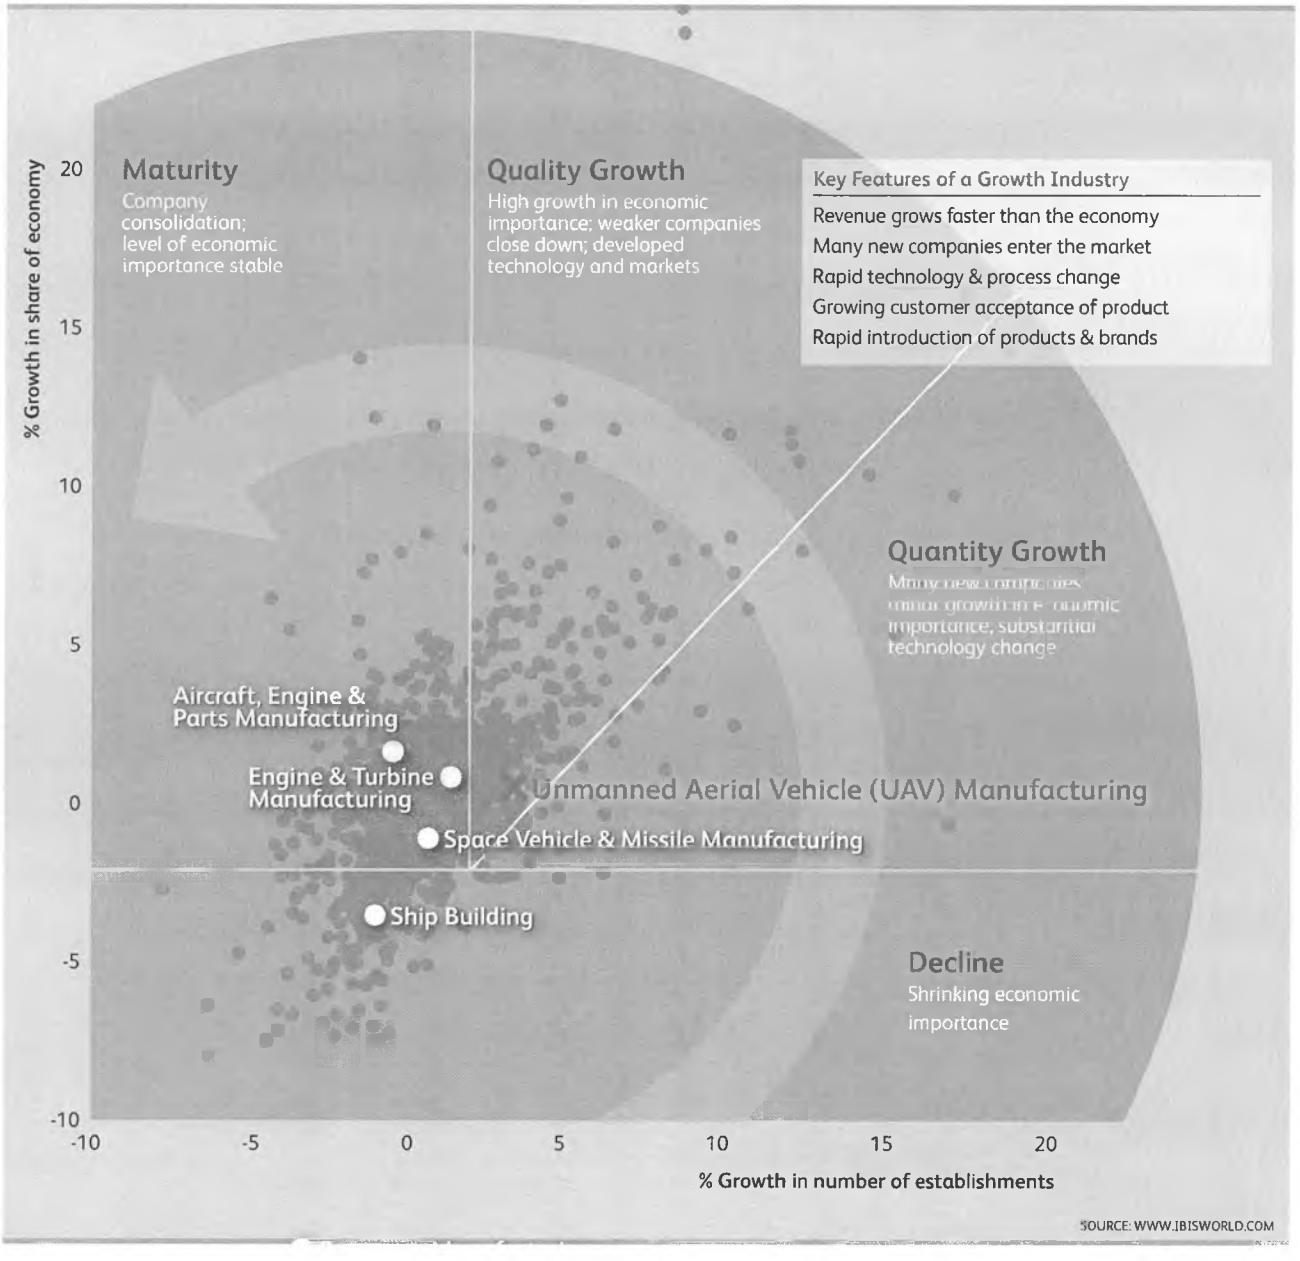
Industry Performance

Life Cycle Stage

Industry value-added is forecast to pass GDP

Industry products are being developed for new markets

Technological innovation is ongoing



Industry Performance

Industry Life Cycle

This industry is **Growing**

The Unmanned Aerial Vehicle (UAV) Manufacturing industry is in a growth stage of its life cycle. Over the 10 years to 2019, industry value added (IVA), which measures the industry's contribution to the US economy, is forecast to rise at an average rate of 3.2% per year. In comparison, US GDP is forecast to rise at an average rate of 2.7% annually during the same period. Typically, IVA growth greater than GDP indicates a growing industry. However, even this IVA performance, which was reduced by declining defense spending, underrepresents the rapid development of this industry.

Despite the military's recent funding reduction for UAV programs, the government continues to invest billions of dollars into new platforms and technologies. This includes the development of UAVs for fighter combat, stealth missions, aircraft carrier operations, surveillance and communications. The size of UAVs now varies from just a few inches to aircraft with a wingspan of 400 feet. Alternative propulsion systems have also been created, including solar and hydrogen power.

The development of commercial UAVs has also greatly expanded, with aircraft being developed for the communications, agriculture, public sector, surveying and other markets. Nonetheless, the defense sector is projected to remain the primary market for industry operators into the foreseeable future.

Another factor that indicates that this industry is in a growth stage is the increasing number of industry players, with the number of enterprises forecast to rise at an annualized 3.3% over the 10 years to 2019. Despite large defense contractors and other companies' acquisitions for smaller UAV producers, the number of operators continues to expand as companies develop UAVs for the potentially vast commercial market.

Products & Markets

Supply Chain | Products & Services | Demand Determinants
Major Markets | International Trade | Business Locations

Supply Chain

KEY BUYING INDUSTRIES

54	**Professional, Scientific and Technical Services in the US** Various surveillance, exploration, scientific and technical service firms use UAVs for civilian commercial purposes.
92	**Public Administration in the US** Government establishments in the US Department of Defense (DOD) and other government agencies purchase UAVs for defense and safety purposes.

KEY SELLING INDUSTRIES

33361a	**Engine & Turbine Manufacturing in the US** Unmanned aerial vehicles (UAVs) are powered with engines, often purchased from outside suppliers.
33411a	**Computer Manufacturing in the US** UAVs are typically controlled autonomously using computers installed within the vehicle.
33441b	**Circuit Board & Electronic Component Manufacturing in the US** Various circuits, semiconductors and related electronic components are used in the manufacture of UAVs.

Products & Services

The Unmanned Aerial Vehicle (UAV) Manufacturing industry manufactures UAVs, also commonly referred to as unmanned aerial systems (UAS), are aerial vehicles and equipment that do not carry a human operator, but instead fly autonomously or are remotely piloted.

There are various types of UAVs serving the military and civilian markets, but there is currently no widely accepted classification system for these vehicles, which vary by capability, size, weight, altitude and general operating characteristics, among other factors. In terms of function, UAVs generally fall within one of six categories: target and decoy, reconnaissance, combat, logistics, research and development (R&D), civil and commercial. Target and decoy UAVs are typically used for military training purposes, providing ground and aerial forces a target that simulates an enemy aircraft or missile. Reconnaissance and combat UAVs are used in the battlefield for intelligence attack capability in high-risk missions. Logistics UAVs are used for cargo and logistics operations, while R&D UAVs are used to further develop UAV technologies. Civil and commercial-application UAVs range from purposes of surveillance and reconnaissance to scientific data gathering or delivery of services (e.g. crop dusting and telecommunication relays).

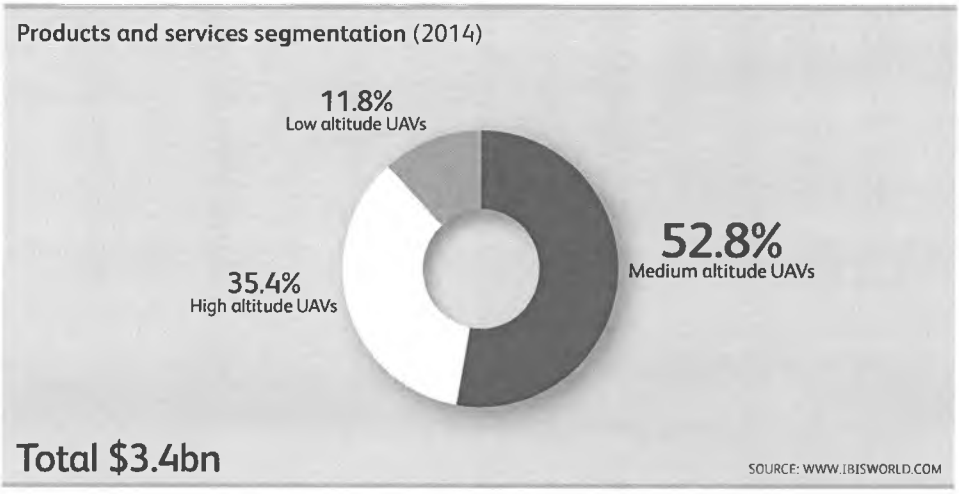
IBISWorld estimates that about 43.2% of the government's modernization spending on UAVs goes towards research development, testing and evaluation, while 56.8% goes towards procurement. Moreover, industry products can be broken down by systems components. For instance, according to Congressional Research Service, 46.0% of industry revenue comes from actual UAVs, 38.0% comes from payloads, such as surveillance components and 16.0% comes from ground control equipment.

Medium altitude UAVs

UAVs operating at a medium altitude account for about 52.8% of industry revenue. Medium altitude UAVs such as General Atomics' Predator drones are the workhorses of the military's UAV fleet, operating on intelligence, surveillance, target acquisition, reconnaissance and attack missions. These UAVs can typically fly for a relatively long time and

Products & Markets

Products & Services continued



can cover medium to sometimes long distances. Over the past five years, this segment's share of revenue has increased due to their heavy use.

High altitude UAVs

High altitude UAVs account for 35.4% of industry revenue. These UAVs fly at altitudes of above 50,000 feet and are primarily used surveillance operations, with some used for scientific purposes. The product category is dominated by Northrup Grumman's Global Hawk, which accounts for the majority of this segment's revenue. While, only a small number of Global Hawks have been built compared to medium altitude UAVs, their more sophisticated nature and developmental stage makes them a more expensive product, significantly increasing their share of revenue. Over the past five years this segment's share of revenue has declined due to defense budget cuts and a reduction in procurement.

Low altitude UAVs

Low altitude UAVs account for about 11.8% of industry revenue. UAV in this category are small, with many, like AeroVironment's Wasp, being hand launched. Their small size makes them a useful surveillance tool for unit level military groups and Special Forces. Moreover, their low price range also means they are among the most prolific types of UAVs used around the world. According to AeroVironment, one of the leaders in the low-altitude small UAV segment, the market for military small UAS is evolving rapidly and subject to changing technologies, shifting customer needs and expectations and the potential introduction of new products. Commercial applications for low altitude UAVs continue to grow, and include photography, communications and environmental and traffic monitoring. Many of these technologies, however, remain in development stages.

Products & Markets

Demand Determinants

The primary factors influencing demand for UAVs include defense funding and technological innovation. The United States Department of Defense (DoD) continues to lead the development, ownership and operation of UAVs on a global scale. The DoD has more than 10,000 UAVs in its inventory, ranging from small, hand launched UAVs to high altitude ones. The majority of these aircrafts are currently being used in support of ongoing operations overseas.

Because defense funding is the primary source of industry revenue, industry demand is highly correlated with factors that influence this funding. Increased geopolitical tensions and war both typically lead to higher defense spending and thus funding for industry projects. Moreover, increased UAV use during combat operations tends to increase wear and tear among operational UAVs, leading to more spending on parts and replacement products. Defense spending is also influenced by the economic conditions of the country. In recent years, rising federal debt levels, combined with the wind down of combat operations in the Middle East have led to a reduction in military spending. In addition, sequestration (an all across cut in government spending) has further reduced military spending, with the President's fiscal 2015 defense budget requesting nearly 40.0% less on the research development, testing, evaluation and procurement of UAVs than the fiscal 2012 request.

Technological developments are another major demand determinant for industry products. The development of new technologies like smaller UAVs or UAVs with stealth features, increase the likelihood that the DoD will buy such systems in order to expand capabilities. Spending and technological breakthroughs by foreign UAV programs also increase demand for industry products as the military attempts to maintain an edge over potential competitors.

Demand for commercial UAVs is still limited by regulations and public opinion. As of this moment, regulations prevent wide spread commercial use of UAV due to concerns about collisions with other aircraft and airworthiness. Moreover, public opinion has also been mixed, with many fearing that domestic use of surveillance UAV poses a threat to privacy.

Major Markets

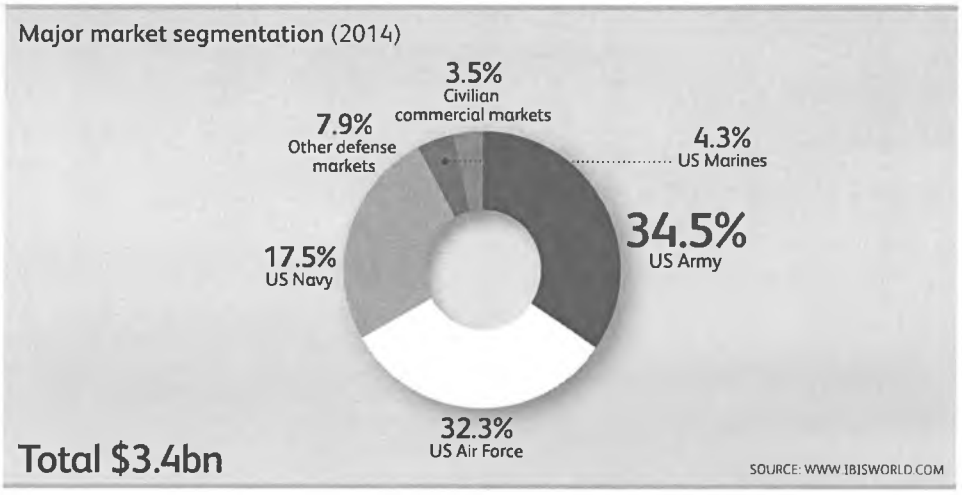
Department of Defense (DoD)

The DoD accounts for the vast majority of spending on US Unmanned aerial vehicle (UAV) research and development (R&D) and procurement. Slightly over half of DoD spending goes on procurement, with the rest going towards R&D projects. Unmanned aerial vehicle (UAVs) are considered a key component of US defense transformation and an integral part of US military strategy. Currently intelligence, surveillance, reconnaissance (ISR) and precision strikes are the predominant UAV missions, but the US Department of Defense (DOD) is closely working with the industry to develop new capabilities that will greatly enhance these systems in the future.

The United States Army accounts for 34.5% of the industry's market, mostly focusing on acquiring medium altitude or tactical UAVs. According to the Fiscal 2015 Presidential budget request, most of the Army's UAV budget is allocated towards the procurement of General Atomics' medium altitude, long endurance, Gray Eagle and the Textron's tactical, Shadow UAV. The United States Air Force (USAF) accounts for about 32.3% of industry revenue and puts more

Products & Markets

Major Markets continued



emphasis on high altitude surveillance and strike UAVs. According to the fiscal 2015 budget request, most of the USAF's budget is allocated towards the development and acquisition of General Atomics' Reaper UAV. The USAF is also one of the primary funders of Northrup Grumman's high-attitude Global Hawk surveillance UAVs. This branch is usually the largest buyer of UAVs, but has recently slowed down the procurement of the Reaper and Global Hawk drones. The United States Navy (USN) is expected to account for 17.5% of industry revenue. The USN's share of industry revenue has rapidly increased over the past five years as it began to fund the development of a maritime version of the Global Hawk, dubbed the Triton. The USN is also currently funding the Unmanned Carrier-Launched Airborne Surveillance and Strike (UCLASS) program, which seeks to develop a UAV able to be launched of Aircraft Carriers and operate in contested air space. Finally, the Marine Corps accounts for 4.3% of industry revenue, with most funding going on Boeing's Blackjack and AeroVironment's Raven UAVs.

Other defense markets

Defense markets outside the DoD account for about 7.9% of industry revenue. They include the Department of Homeland Security, which uses UAVs for border and coast guard patrol functions. The industry also sells UAVs to allied militaries and governments, but these purchases are typically made through the US military due to regulatory and liability issues. For instance, a North Atlantic Treaty Organization (NATO) version of the Global Hawk is currently being developed through the DoD. Most UAV exports are made up of small and tactical UAVs.

Civilian commercial markets

The civilian commercial market accounts for about 3.5% of industry revenue. Commercial applications for UAVs have grown at a rapid pace, but many remain in development stages. Civil applications include scientific research, environmental protection (e.g., oil field observation), communications (e.g., UAVs substituting satellites), disaster prevention and management and infrastructure protection (e.g., pipeline monitoring). Notable examples of civil applications include the 2010 NASA mission in which a Global Hawk (Northrop Grumman) was flown over tropical storms in partnership with the National Oceanic and Atmospheric Administration to collect data on severe weather information and the Department of Agriculture and

Products & Markets

Major Markets continued

NASA's wildfire support efforts. Other commercial applications are in use in agriculture, satellite imaging and mineral exploration. While this market has rapidly grown over the past five years, regulations and public opinion concerning the domestic use of UAV has hindered market growth. Nonetheless, this market's share of revenue is expected to continue to grow over the next five years as regulations loosen. (For more on regulation, please refer to the Regulation and Policy section).

International Trade

The Unmanned Aerial Vehicle (UAV) Manufacturing industry engages minimally in international trade, largely due to government regulations regarding the export of UAVs and dependence of industry operators on US military research funding and overall demand. In general, many UAV platforms and components are subject to International Traffic in Arms Regulations (ITAR), which require exports to receive State Department approval. However, the Obama administration has recently moved some UAV components off the ITAR list, putting them under less stringent Commerce Department oversight. Many UAVs are also covered by the Missile Technology Control Regime (MTCR), which greatly restricts the exports of UAVs. For instance, AeroVironment, generates about 15.0% of its revenue from international markets, cites in its 2013 10-K that "the unavailability of, or difficulties in obtaining any, necessary governmental authorizations for the export of our UAS products to certain foreign jurisdictions" hinders further international sales. Moreover, trade data is often not counted within the industry, as the movement of industry goods (especially complete UAV) overseas often occurs through the US government and not directly between manufacturers and customers.

Products & Markets

Business Locations 2014

SOURCE: WWW.IBISWORLD.COM

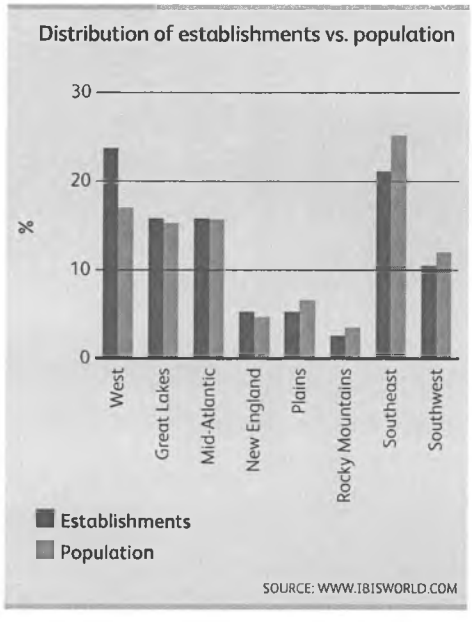
Products & Markets

Business Locations

The industry's geographical spread has not changed significantly during the past few years due to its low number of establishments (72 in 2014). The industry is mainly concentrated in states with high-tech industries and locations that are close to suppliers and highly skilled labor. As a result, companies tend to cluster around aerospace industry hubs.

The industry is concentrated in the West, which accounts for 23.7% of all industry establishments. Within this region, a large portion of industry activity is located in California, which is consistent with the state's high population. This region's dominance also reflects the historic prevalence of defense contractor activities in California. Major companies General Atomics and Northrop Grumman's Aerospace Systems subsidiary are based in California. UAV manufacturer AeroVironment is also based in California.

This industry is also prevalent in the Southeast and Mid-Atlantic regions. The Mid-Atlantic includes the Washington, DC region, while the Southeast includes Virginia where many defense contractors operate to be close to their main customer, the United States government. States in the Mid-Atlantic are home to respected universities, research institutes and organizations that support the development of highly advanced technology like UAVs.



Competitive Landscape

Market Share Concentration | Key Success Factors | Cost Structure Benchmarks
Basis of Competition | Barriers to Entry | Industry Globalization

Market Share Concentration

Level
Concentration in this industry is **Medium**

The Unmanned Aerial Vehicle (UAV) Manufacturing industry is characterized by a moderate, but nearly high level of concentration. In 2014, the four largest industry players are expected to generate 61.5% of industry revenue. The overall industry comprises about 63 companies with 72 facilities. The top two companies, Northrop Grumman and General Atomics Aeronautical Systems alone generate about 45.0% of the industry's revenue. High barriers to entry play a large role in determining concentration level, as the vast majority of industry revenue is granted through US military contracts. In addition, the costs and required knowhow associated with developing and producing sophisticated UAV systems are very high. Contracts are usually awarded to existing players in similar fields or those with a previous successful relationship with the US Department of Defense (DoD).

However, over the past five years industry concentration has declined, as the DoD began to switch from acquisition of existing UAV platforms, which are producers by the major players, to development of newer systems, which involve more players. Moreover, despite recent defense budget cuts cutting into major player's revenue, the number of industry players have increased. New startup companies continue to enter the market, developing UAVs for both defense and commercial purposes. However, because most of these companies are still in the developmental stage they account for an insignificant share of the market.

Key Success Factors

IBISWorld identifies 250 Key Success Factors for a business. The most important for this industry are:

Ability to quickly adopt new technology
UAV manufacturers increasingly compete on the basis of technical innovation. Successful firms are able to adapt quickly to technological changes and upgrade products on a regular basis.

Ability to take advantage of government subsidies and other grants
Government subsidies, contracts and grants keep the industry alive. The ability to pitch for and win these contracts is pivotal to companies in the industry. Successful approaches to winning contracts are highly regarded in the industry.

Well-developed internal processes
Good inventory and cost management systems can help firms be more competitive. As the value of goods in this industry is typically very high, businesses aim to keep inventories low.

Undertaking technical research and development
Future revenue streams are based on significant investment in research and development, which can result in successful product launches.

Cost Structure Benchmarks

Profit
Industry profit, defined as earnings before interest and tax expenses, accounts for about 11.5% of industry revenue. In general, because just a few companies dominate the industry (reducing competition) and most unmanned aerial vehicles (UAVs) are highly advanced and unique, industry profit is relatively high. Receiving long-term contracts from the government can ensure a positive source of downstream demand, but unfunded programs risk termination and revenue loss. Some of

Competitive Landscape

Cost Structure Benchmarks continued

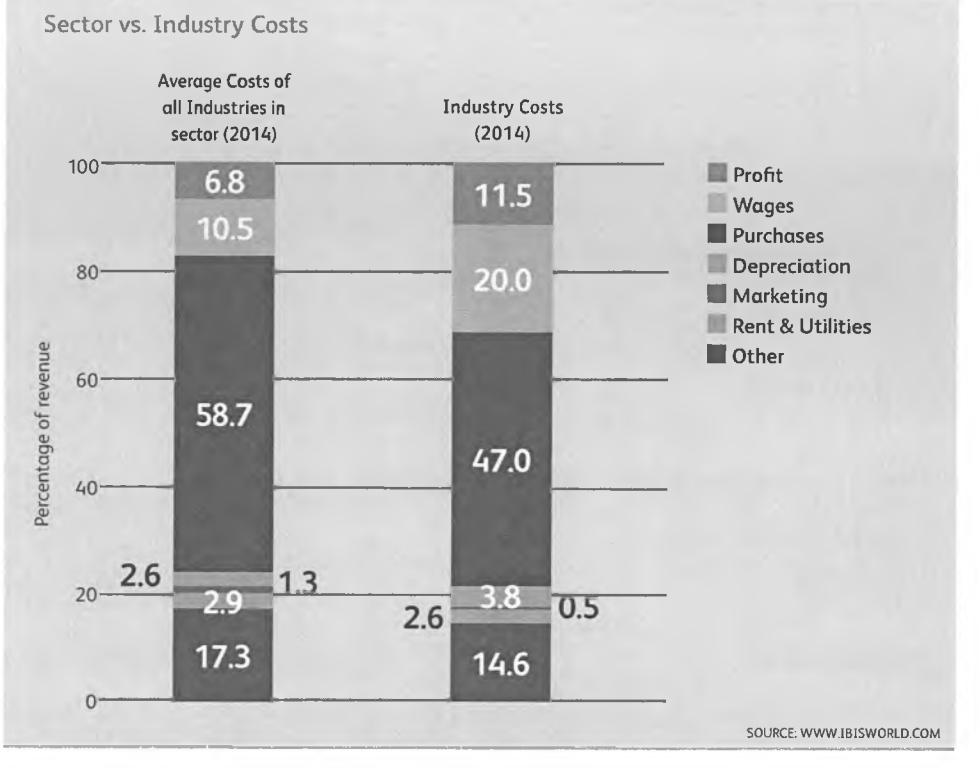
the industry's smaller companies have yet to release a production UAV and are thus not making any profit at all, instead relying on government subsidies or outside investment. Over the past five years, industry profit has slightly declined as the department of defense cut its UAV budget, while increasing emphasis on project costs.

Purchases

Purchases are the largest industry expense, consuming about 47.0% of revenue in 2014, and include the acquisition of equipment components, parts and materials (e.g. steel plates, copper tubing, and aluminum, ferrous and nonferrous castings). Operators typically source components from third party suppliers who specialize in relevant aircraft parts. However, because of the complex and often nontransparent nature of the aerospace supply chain, component purchases tend to be relatively expensive for an industry where there are only a few original equipment manufacturers.

Wages

Industry wages account for about 20.0% of industry revenue. Industry wages are relatively high due to the use of highly skilled labor in the development of sophisticated UAV products. A large portion of workers have backgrounds in engineering and science and typically demand higher pay. There has also been a shortage of people in these fields, which has increased competition for such labor not only between industry operators, but also other high-tech industries. While wages share of revenue has declined from 2009 levels, for most of the past five years it has been increasing. This is primarily due to revenue declining at a faster rate than



Competitive Landscape

Cost Structure Benchmarks continued

wages, which are protected by the high demand for skilled labor.

Depreciation, rent, utilities and marketing

Depreciation accounts for about 3.8% of industry revenue. Depreciation costs account for machinery, communication equipment, office equipment, technology and software. Operators often use some of the most advanced manufacturing equipment, including robotics, 3D printers, computer numerical control machines and other computer aided equipment. Rent and utility expenses account for about 2.6% of revenue, with many manufacturers leasing their facilities. Marketing only accounts for 0.5% of revenue because operators do not sell to consumers.

Other expenses

Other expenses such as research and development (R&D) costs, insurance, administrative costs, transport and warehousing account for about 14.6% of revenue. In particular, the high-tech and ever evolving nature of the industry means that operators spend a substantial amount of money on R&D.

Basis of Competition

Level & Trend
Competition in this industry is **High** and the trend is **Steady**

Internal competition

The Unmanned Aerial Vehicle (UAV) Manufacturing industry is highly competitive. Although initial investment is high, competition from new entrants remains, as new technologies continue to be developed for new applications, particularly in the commercial market. Major competitive factors among industry firms include: product performance, features, acquisition cost, lifetime operating cost, including maintenance and support, ease of use, integration with existing equipment, quality, reliability, customer support, brand and reputation.

Defense contracts, which account for the vast majority of industry revenue, are typically negotiated and awarded through a bid process with price being a major factor (although the bid process is sometimes avoided). Because of the technological knowhow, resources and compliance requirements required to fulfill major defense contracts, only a few companies have the capabilities to compete for them. Moreover, the government prefers to award contracts to operators with a proven track record, putting new entrants at a disadvantage. Nonetheless, although the number of industry participants is small, competition among the top players is still relatively high as the number of defense contracts is limited. In addition, new entrants that can develop a new technology have an increased chance of outcompeting larger contractors.

In the commercial sector, competition is more intense as the technological and resource requirements needed to enter the market are smaller. Moreover, commercial applications for UAVs are greater than for the defense sector, allowing for more segments in which companies can compete. Nonetheless, leaders in the defense sector still have the lead when it comes to commercial applications because they already have established platforms and facilities, which can be adjusted to serve commercial customers. However, the commercial sector of the UAV industry is still in its nascent stage, with many firms just beginning to develop viable UAV platforms.

External competition

UAVs are still are relatively new technology and often face competition from manned systems such as planes and helicopters. Moreover, with the United

Competitive Landscape

Basis of Competition continued

States' defense budget shrinking, UAV projects are having to compete with other defense programs for funding. These competitive factors can be seen in the Northrup Grumman's Global Hawk program. The Global Hawk was developed as a high-altitude surveillance drone, with similar capabilities to the manned U-2 aircraft. When the cost of the Black 30 Global Hawk began to rise, while the defense budget began to shrink, the Pentagon decided to scrap the Block 30s, while keeping the less risky and overall more capable and reliable U-2. However, Congress blocked the decision and the Pentagon's recent budget plan seeks to scarp the U-2 and keep the Block 30s, with the military claiming the operational costs of the Block 30s are lower than the U-2s.

Barriers to Entry

Level & Trend
Barriers to Entry in this industry are **High** and **Steady**

The Unmanned Aerial Vehicle (UAV) Manufacturing industry exhibits barriers to entry. The technological knowhow, resources and capital investment required to develop and manufacture UAVs is high. Manufacturing and testing facilities are typically state of the art, using the latest equipment and software. Operators also have to compete over highly skilled labor, which increases labor costs. The industry's competitive nature requires significant investment in research and development (R&D) and leveraging the expertise of employees. Companies that want to enter the industry must overcome existing R&D and come out with their own patented UAV product in order to compete.

Companies wishing to win defense contracts, which account for the majority of industry revenue, face especially high barriers to entry. UAVs developed for the military are especially advanced, requiring substantial investment into R&D, labor and advanced facilities. As a result, of these resource requirements the defense sector is dominated by a handful of large aerospace and defense companies, making it difficult for smaller players to enter. Moreover, the government typically prefers to award contracts to companies with proven track records and capabilities, making it hard for new companies to compete.

Barriers to Entry checklist	Level
Competition	High
Concentration	Medium
Life Cycle Stage	Growth
Capital Intensity	Medium
Technology Change	High
Regulation & Policy	Heavy
Industry Assistance	High

SOURCE: WWW.IBISWORLD.COM

Industry Globalization

Level & Trend
Globalization in this industry is **Low** and the trend is **Increasing**

Globalization within the Unmanned Aerial Vehicle (UAV) Manufacturing industry is low, with international trade being minimal and most of the industry's companies based in the United States. Although UAV development is global, US manufacturers primarily serve US military markets. The miniscule scope of export and imports reflects regulations limiting the trade of military technologies and preferences given to domestic contractors.

However, globalization is anticipated to increase over the next few years. Manufacturers of military UAVs are expected to look to exports to help offset declining defense spending at home. For instance, Northrup Grumman developed its Global Hawk

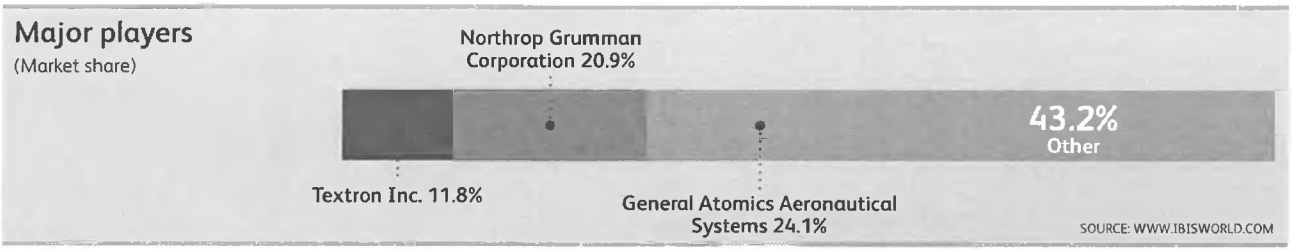
Competitive Landscape

Industry Globalization continued

UAV for Germany, collaborating with Europe based-Airbus. The company is also expected to deliver the Global Hawk to South Korea, with countries such as Australia and Japan also showing great interest.

Major Companies

General Atomics Aeronautical Systems | Northrop Grumman Corporation
Textron Inc. | Other Companies



Player Performance

General Atomics Aeronautical Systems
Market share: 24.1 %

General Atomic Aeronautical Systems (GA-ASI) is a premier developer and manufacturer of unmanned aircraft vehicles (UAVs) and related equipment. The company is a subsidiary of privately held and San Diego, CA-based General Atomics, one of the world's leading resources for high-technology systems including UAVs, nuclear fuel cycle, electromagnetic systems, airborne sensors and other advanced electronic, wireless and laser technologies. GA-ASI's employs over 6,000 personnel in San Diego and other parts of California.

The company's operations are divided into the aircraft systems and mission systems business units. Aircraft systems produces UAVs and their ground control stations, in addition to providing related services, such as pilot training and field maintenance. The mission systems unit develops airborne sensor packages, such as sensor control systems, lasers and data links for unmanned and manned aircraft.

The company's most famous product is the world renowned Predator UAV. In operational use since 1995, this remotely piloted UAV is one of the most combat proven products in the industry, providing intelligence, surveillance and reconnaissance (ISR), targeting, forward air control, laser designation, attack and bomb damage assessment mission capabilities. Multiple Predator derivatives have been developed since its inception, including the MQ-9 Reaper (a large and heavier Predator designed for long-endurance, high-altitude missions) and the Gray Eagle (a more efficient and powerful Predator). In 2009, GA-ASI test flew its new Avenger UAV for the first time. The high-altitude, high-endurance (HALE) Avenger and its naval version, the Sea Avenger, are developed from the Reaper, but are powered by jet engines (previous UAVs used turboprop engines) and include stealth features, such as an internal weapons bay.

Major Companies

Player Performance continued

Financial performance

In the five years to 2014, GA-ASI's industry-specific revenue is expected to decrease an annualized 1.9% to $821.8 million. For most of the period, the company enjoyed very strong revenue and operating income growth as the Predators/Reapers family's dominance in the medium-range, long-endurance (MALE) market segment, meant that it was the prime beneficiary of the United States' increased use of UAV for combat and ISR missions in the Middle East and other regions. However, since last year, funding for the company's products was drastically cut due to ongoing defense budget cuts (including sequestration), winding down of combat operation in the Middle East and a reduced need for new UAVs after years of procurement. As a result, the company's revenue is expected to decline 37.7% in 2014 alone.

Player Performance

Northrop Grumman Corporation
Market share: 20.9 %

Founded in 1939, Northrup Grumman is one of the world's largest aerospace and defense contractors. The company provides products, services, and integrated solutions in aerospace, electronics and information services to high priority defense and government services technology programs. Its four divisions, aerospace systems, electronic systems, information systems and customer services employed 65,300 people and generated $24.7 billion in 2013.

The company's industry-specific operations take place under the aerospace division's unmanned systems business unit. The unit develops and produces unmanned systems including UAVs, as well as land, sea and related unmanned vehicles and equipment. In particular, it focuses on developing ISR capable systems. Industry-specific products include the Fire Scout unmanned helicopter and the jet powered Global Hawk. The Global Hawk family especially dominates the company's industry-specific portfolio, accounting for the majority of unmanned system's revenue. The Global Hawk is a HALE UAV designed primarily for ISR missions and is currently the highest flying UAV in operation with US armed forces. The Global Hawk comes in a number of varieties; the current Block 30s are equipped with signals intelligence capabilities, while Block 40s, which are currently finishing development, are equipped with an active electronically scanned array radar, which provides greater air and ground detections and is less detectable. The Triton is a naval version of the Global Hawk currently under development and is designed for maritime ISR missions. The Global Hawk is also operated by NASA for science missions. Northrup Grumman has also developed Global Hawks for Germany and the North Atlantic Treaty Organization (NATO).

Despite the company's dominance in HALE type systems, its Global Hawk platform has gone through some controversy in recent years. Until recently, the Pentagon planned to terminate the Block 30 version of the Global Hawk due to its high cost, instead relying on the manned U-2 high altitude reconnaissance aircraft jet. However, Congress ordered the military to operate both the Block 30s and U-2 instead. In the fiscal 2015 Presidential budget request, the Pentagon has asked to continue operating the Block 30s while scrapping the U-2 and using its ISR equipment for the Global Hawks, citing dropping Global Hawk costs as its reason. Northrup Grumman is also developing the RQ-180, a surveillance UAV capable of aircraft carrier takeoff

Major Companies

Player Performance continued

and landing in addition to having stealth capabilities.

Financial performance

Over the five years to 2014, Northrup Grumman's industry-specific revenue is expected to decline at an annualized 7.2% to $714.4 million. One of the main reasons for the decline is the reduction in the procurement of Global Hawks as contracts were fulfilled. Recent defense spending cuts have also reduced the amount of spending allocated towards the Global Hawk program. Moreover, because many derivatives of the Global Hawk are still in the development stage, funding is subjects to volatility. Nonetheless, the company's revenue is expected to recover over the next few years as new derivatives of the Global Hawk enter full-scale production, while the development of NATO's version of the UAV steps up. Lastly, the company is also expected to secure exports orders from multiple countries, including South Korea, Japan, Australia, Canada and Norway.

Northrop Grumman (industry-specific) – financial performance*

Year	Revenue ($ million)	(% change)	Operating Income ($ million)	(% change)

SOURCE: ANNUAL REPORT AND IBISWORLD

Player Performance

Textron Inc.
Market share: 11.8%

Providence, RI-based Textron Inc. (Textron) is a leading player in the aircraft, defense, industrial and finance industries. Founded in 1923, the company employed about 32,000 people and generated $12.1 billion in revenue in 2013. The company operates through five segments: Textron aviation (which produces general aviation aircraft), Bell (a supplier of military and commercial helicopters), Textron systems (a supplier of defense and aviation equipment), industrial (a manufacturer of industrial tools and transportation equipment) and finance (which finances the purchase of the company's products).

The company operates in the Unmanned Aerial Vehicle (UAV) Manufacturing industry through its Textron systems segment, which accounts for 14.0% of the company's overall revenue. In 2007, Textron acquired UAV developer, AAI Corporation, eventually forming Textron system's unmanned aircraft systems business unit. AAI UAV designs and manufactures UAVs, while AAI Logistics & Technical Services provides logistical, training and supply chain services for UAV customers. However, only AAI UAV's operations are industry-relevant.

The company's primary UAV product is the Shadow and Shadow M2. These medium altitude UAVs are deployed on the brigade level, allowing for tactical application of UAV system for ISR,

Major Companies

Player Performance continued

targeting and assessment missions. The primary users of the Shadow vehicles are the United States Army and Marine Corps, as well as the Australian and Swedish armies.

Financial performance

In the five years to 2014, Textron's industry specific revenue is expected to decline at an annualized 2.3% to $402.2 million. The company's revenue initially increased by 23.8% in 2010 as procurement of its shadow UAV reached its peak. Since then, however, revenue and operating income have declined as demand for the shadow was satisfied, development completed and defense spending cuts reduced available funding. As a result, company revenue is expected to decline 15.4% in 2014 alone.

Textron Inc. (industry-specific) – financial performance*

Year	Revenue ($ million)	(% change)	Operating Income ($ million)	(% change)
2009	452.5	NA	57.2	NA
2010	560.3	23.8	65.1	13.8
2011	500.3	-10.7	37.7	-42.1
2012	495.3	-1.0	37.6	-0.3
2013	475.3	-4.0	42.0	11.7
2014	402.2	-15.4	43.1	2.6

SOURCE: ANNUAL REPORT AND IBISWORLD

Other Companies

Outside of the major players there are a number of other companies with substantial UAV programs. However, estimating revenue generated by these operations can often be very difficult due to the developmental and secretive nature of these programs. For instance, Boeing has a number of UAV in operation or under development, including the small ScanEagle, Unmanned Little Bird and A160 Hummingbird helicopters and the stealth-like X-45C combat UAV. The company also has UAV that use alternative fuel sources, such as the liquid hydrogen powered Phantom Eye and the solar powered SolarEagle. Lockheed Martin is also developing a number of UAV, including the Unmanned Carrier Launched Airborne Surveillance and Strike (UCLASS) drone (developed from the RQ-170) and the operational Desert Hawk and Stalker, both of which are hand launched. Most of the remaining competitors in the Unmanned Aerial Vehicle (UAV) Manufacturing industry are small startup companies whose products are still in the development and testing stage.

AeroVironment, Inc.

Estimated Market Share: 4.8 %

Headquartered in Monrovia, CA, AeroVironment designs, develops, produces and supports unmanned aircraft systems (UAS) and related services. AeroVironment also supplies charging systems and services for electrical vehicles and power cycling and test systems to commercial, consumer and government customers. The company primarily contributes to the industry through its UAS business

Major Companies

Other Companies continued

segment, which focuses on the design, development, production and support of UAS used for situational awareness and other mission objectives. In particular, the company is famous for its small UAVs, such as the Raven, Wasp AE and Puma, many of which can be hand launched. The company is also developing a number of other UAV's such as the Global Observer (a HALE UAV) and the Tier II Unmanned Aircraft System (an unmanned helicopter). In 2014, the company is expected to generate $162.5 million in industry-specific revenue.

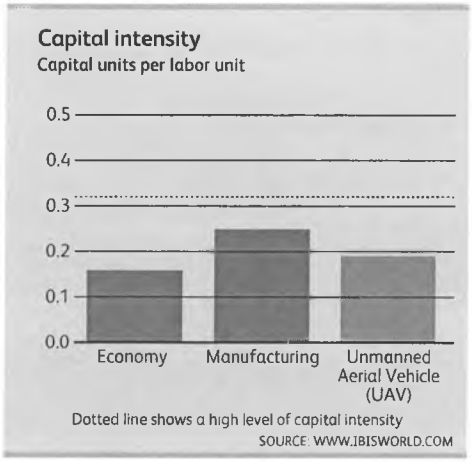
Operating Conditions

Capital Intensity | Technology & Systems | Revenue Volatility
Regulation & Policy | Industry Assistance

Capital Intensity

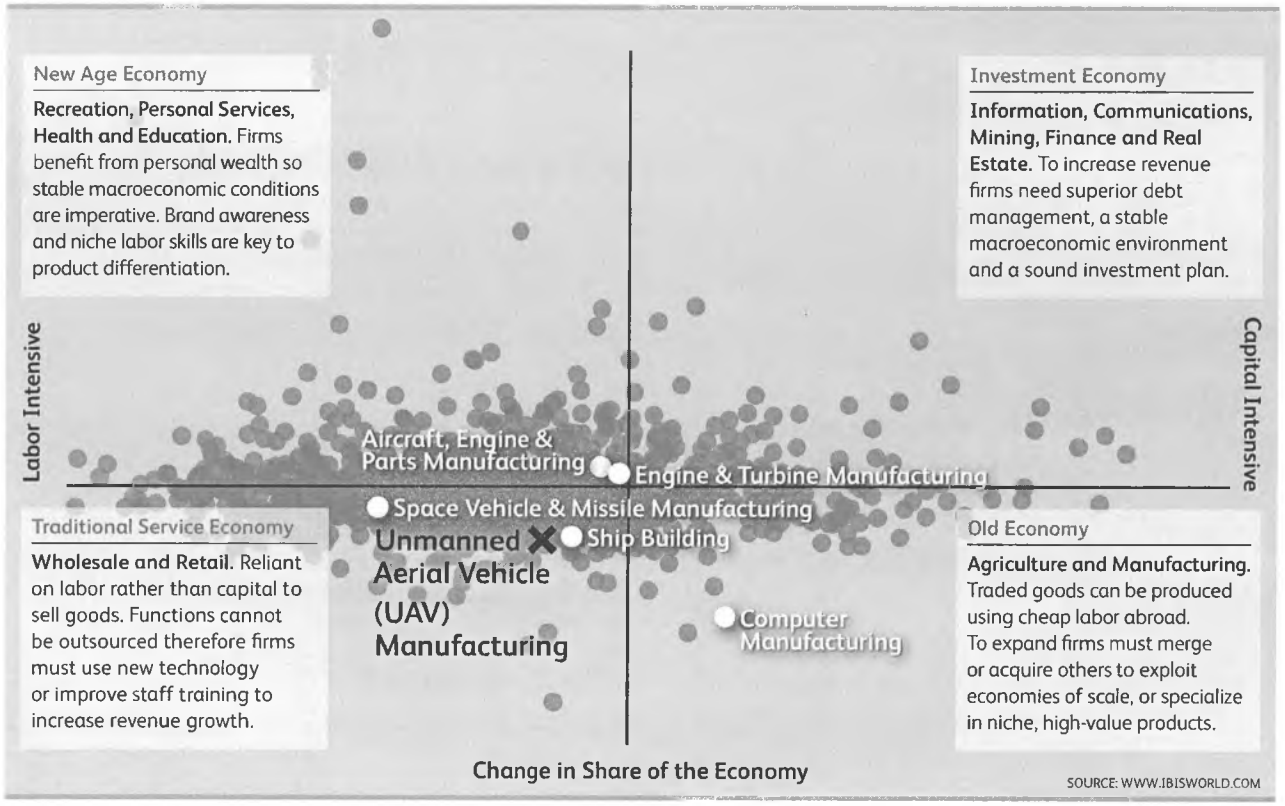
Level
The level of capital intensity is **Medium**

The Unmanned Aerial Vehicle (UAV) Manufacturing industry is characterized by a moderate level of capital intensity. In 2014, for every dollar industry operators spend on labor, an estimated $0.19 will be spent on capital. The industry requires significant investment into advanced machinery and equipment, which is used for researching, developing, manufacturing and testing new UAV systems. However, the industry also strongly depends on highly skilled labor, with many employees having engineering and other sciences backgrounds. As a result, of this highly skilled labor force, average industry wages are expected to reach nearly $90,000 in 2014.



Over the past five years, capital intensity has greatly increased.

Tools of the Trade: Growth Strategies for Success



Operating Conditions

Capital Intensity continued

Companies have invested into new facilities and equipment, including new design software and automated factories. At the same time, wage growth has stagnated as recent defense budget cuts have forced some companies to cut their labor force.

Technology & Systems

Level
The level of Technology Change is **High**

The technology behind unmanned aerial vehicles (UAVs) is rapidly evolving, with new platforms constantly being developed. The Department of Defense (DoD) is expected to spend about 43.0% of its UAV modernization budget on research, development, testing and evaluation.

Most UAVs are remotely controlled through some form of ground station. While there have been development in UAV communication technology (The Reaper UAV can be controlled anywhere in the world from within the United States via satellite links) , remotely controlled UAVs are still limited in their ability to respond to rapidly changing environments as ground pilots lack the same level of situational awareness as pilots within an aircraft. As a result, the military has invested in the development of autonomous UAV. Most current autonomous UAVs have to be preprogrammed, but UAVs such as BAE System's Taranis are being developed with software that allows the aircraft to make its own decisions. UAVs are also being designed to able to communicate with each other, thus creating swarms which can coordinate tasks.

Today's operational UAVs encompass a wide range of sizes, weights, speeds and operating altitudes (see Products and Services chapter). One of the smallest operational UAVs is the four-pound Raven that flies for about one hour at 50 knots and normally below 1000 feet. The largest operational; UAV is the Northrop Grumman Global Hawk, which weighs about 15,000 pounds, and flies at 400 knots for more than 30 hours at 65,000 feet. However, there has also been substantial progress in the development of micro UAVs. One of the smallest such UAVs is Harvard University's Robobee, which weight 80mg and has a mere 3cm wingspan.

The mission capabilities of UAVs are also rapidly changing. Currently, most operational military UAVs are used on intelligence, surveillance, reconnaissance and precision strike missions. However, they are relatively easy to detect and defeat, making them vulnerable in "contested" airspace. As a result, the military has invested into developing UAVs that can operate in such airspace. For instance, General Atomics' Avenger and Northrup Grumman's RQ-180 include stealth features such as internal weapon bays and special materials, which reduce their chance of being picked up on radar. However, even such UAVs can still be vulnerable. For instance, in 2011 Iran captured Lockheed Martin's stealthy RQ-170, claiming that it was brought down by a cyber-attack. Along with increased stealth, new military UAVs are also taking on increased combat roles. BAE's Taranis is being developed as the first unmanned jet fighter, being able to attack both ground and air targets. On the commercial front UAVs are being develop that can monitor weather, act as communication relays (also used for the military), deliver cargo and carry our search and rescue missions, among other tasks.

The propulsion systems UAVs are using are also changing. Currently, most UAVs are powered by either gasoline or electric turboprop engines. However, the development of UAVs for higher altitude or "contested" airspace mission has increased the use of jet engines (i.e. the Avenger and Global Hawk).

Operating Conditions

Technology & Systems continued

Manufacturers are also increasingly turning to alternative sources of propulsion. For instance, Boeing, AeroVironment and Lockeed Martin have developed products that use solar power, allowing their aircraft to eventually fly for months if not years without landing. Boeing and AeroVironment are also developing hydrogen powered UAVs.

On the manufacturing front companies are increasingly using automated facilities using robotics, 3D printers, computer numerical control machines and other computer aided equipment. UAV development has also been boosted by the use of advanced computer-aided design software that allow manufacturers to design and test products before building actual models.

Revenue Volatility

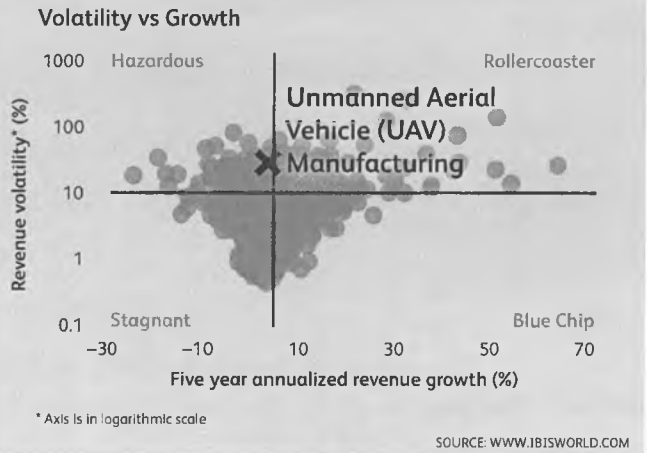
Level
The level of Volatility is **Very High**

IBISWorld analysis reveals the Unmanned Aerial Vehicle (UAV) Manufacturing industry exhibits a very high level of revenue volatility. Revenue is most closely linked to changes in federal funding for defense and congressional budget allocations to the Department of Homeland Security. As a result, the industry revenue grew by as much as 51.9% in 2010, as the government expanded the military use of UAVs. However, in more recent years revenue has gone from growth to decline due to defense budget cuts, sequestration and the wind down of combat operation in the Middle East.

In general, industry volatility can be lowered through long-term development contracts and UAV platform diversification. Over the next few years, volatility is projected to decline as the defense budget stabilizes, new UAVs are developed and the commercial market grows.

A higher level of revenue volatility implies greater industry risk. Volatility can negatively affect long-term strategic decisions, such as the time frame for capital investment.

When a firm makes poor investment decisions it may face underutilized capacity if demand suddenly falls, or capacity constraints if it rises quickly.



Regulation & Policy

The Unmanned Aerial Vehicle (UAV) Manufacturing industry is subject to a high level of regulation. UAV manufacturers, that sell most of their products to the US government, are subject to regulations that concern these contractual arrangements. These regulations include government contracts

Operating Conditions

Regulation & Policy continued

Level & Trend
The level of Regulation is **Heavy** and the trend is **Steady**

that are subject to oversight audits by government representatives. They also contain provisions that permit termination, in whole or in part, at the government's convenience or for default. If a contract is terminated at the convenience of the US government, a contractor can receive payments for its allowable costs and the proportionate share of fees or earnings for the work done. Contracts that are terminated for default generally provide that the government only pays for the work it has accepted. Therefore, they may require the contractor to pay other costs and damages. Government business is also subject to specific procurement regulations. Failure to comply with these regulations and requirements can lead to suspension from government contracting or subcontracting.

The industry is also subject to various trade regulations that have generally limited the possibility of international market expansion. Under current US export control policy, some UAVs are subject to the International Traffic in Arms Regulations (ITAR), which authorizes the State Department to control the export and import of defense articles and defense services. However, the Obama administration has recently moved thousands of defense related parts, including some UAV components, from the ITAR list and stringent State Department oversight, to more lax Commerce Department oversight. Many UAVs are also covered by the Missile Technology Control Regime (MTCR), which an informal grouping of 34 countries designed to prevent the proliferation of systems capable of delivering weapons of mass destruction. The regimes requires State and Commerice Department authorization to exports UAVs that can fly farther than 300 kilometers and carry more than 500 kilograms. Under MTCR guidelines, export of UAVs carries a "strong presumption of denial" of an export license.

The domestic use of UAVs is also heavily regulated and is widely seen as the number one deterrent in growing the commercial UAV market. Currently, UAV flight are regulated by the Federal Aviation Administration (FAA), while their wireless communications are regulated by the National Telecommunications and Information Administration (NTIA) and Federal Communications Commission (FCC). The FAA requires all that a public UAV operator must receive a Certificate of Authorization (COA), which includes certification of airworthiness of the aircraft for its intended mission as well as certification that a collision with another aircraft is extremely improbable, that the aircraft system complies with appropriate cloud and terrain clearances and that the operator or spotter of the small unmanned aircraft system is generally within one half-mile laterally and 400 feet vertically of the small unmanned aircraft system while in operation. For civil use, operators must obtain a Special Airworthiness Certificate, Experimental Category "by demonstrating that their unmanned aircraft system can operate safely within an assigned flight test area and cause no harm to the public. Applicants must be able to describe how their system is designed, constructed and manufactured".

In 2012, Congress ordered the FAA to set up rules for the integration of UAV systems into domestic airspace by 2015. As a result, the FAA has rolled out a "roadmap" for UAV integrations, by which it plans to phase in domestic use of UAV by creating new regulation and certifications. Earlier this year, BP became the first company to use commercial UAVs after the FAA allowed

Operating Conditions

Regulation & Policy continued

it to use small UAVs to monitor its Alaskan oil pipelines. The domestic use of industry products has also come under greater public scrutiny, with many worried that surveillance drones may infringe of peoples' privacy rights.

Industry Assistance

Level & Trend
The level of Industry Assistance is **High** and the trend is **Steady**

The industry is characterized by a high level of government assistance, as the vast majority of its revenue comes from the US military. Research and development activities for UAV technological development performed or funded by the US government also serve as direct government assistance. Changes in defense funding, particularly within the UAV program, have a significant impact on industry performance. The Department of Defense (DoD) plans to invest billions of dollars in the development and procurement of UAVs over the next five years.

Jargon & Glossary

Industry Jargon

STEALTH Technology designed to reduce an aircraft's radar cross section.

UNMANNED AERIAL VEHICLE (UAV) Also known as drones, any aircraft without a pilot that operates either autonomously or via remote control to perform missions considered too dangerous or tedious for human pilots.

UNMANNED AIRCRAFT SYSTEM (UAS) The sum of the components required to operate UAVs, including the unmanned aircraft, control system, control link or specialized datalink and other equipment.

UNMANNED COMBAT AIR VEHICLE (UCAV) A UAV with offensive capabilities, such as onboard missiles that can be fired remotely.

IBISWorld Glossary

BARRIERS TO ENTRY High barriers to entry mean that new companies struggle to enter an industry, while low barriers mean it is easy for new companies to enter an industry.

CAPITAL INTENSITY Compares the amount of money spent on capital (plant, machinery and equipment) with that spent on labor. IBISWorld uses the ratio of depreciation to wages as a proxy for capital intensity. High capital intensity is more than $0.333 of capital to $1 of labor; medium is $0.125 to $0.333 of capital to $1 of labor; low is less than $0.125 of capital for every $1 of labor.

CONSTANT PRICES The dollar figures in the Key Statistics table, including forecasts, are adjusted for inflation using the current year (i.e. year published) as the base year. This removes the impact of changes in the purchasing power of the dollar, leaving only the "real" growth or decline in industry metrics. The inflation adjustments in IBISWorld's reports are made using the US Bureau of Economic Analysis' implicit GDP price deflator.

DOMESTIC DEMAND Spending on industry goods and services within the United States, regardless of their country of origin. It is derived by adding imports to industry revenue, and then subtracting exports.

EMPLOYMENT The number of permanent, part-time, temporary and seasonal employees, working proprietors, partners, managers and executives within the industry.

ENTERPRISE A division that is separately managed and keeps management accounts. Each enterprise consists of one or more establishments that are under common ownership or control.

ESTABLISHMENT The smallest type of accounting unit within an enterprise, an establishment is a single physical location where business is conducted or where services or industrial operations are performed. Multiple establishments under common control make up an enterprise.

EXPORTS Total value of industry goods and services sold by US companies to customers abroad.

IMPORTS Total value of industry goods and services brought in from foreign countries to be sold in the United States.

INDUSTRY CONCENTRATION An indicator of the dominance of the top four players in an industry. Concentration is considered high if the top players account for more than 70% of industry revenue. Medium is 40% to 70% of industry revenue. Low is less than 40%.

INDUSTRY REVENUE The total sales of industry goods and services (exclusive of excise and sales tax); subsidies on production; all other operating income from outside the firm (such as commission income, repair and service income, and rent, leasing and hiring income); and capital work done by rental or lease. Receipts from interest royalties, dividends and the sale of fixed tangible assets are excluded.

INDUSTRY VALUE ADDED (IVA) The market value of goods and services produced by the industry minus the cost of goods and services used in production. IVA is also described as the industry's contribution to GDP, or profit plus wages and depreciation.

INTERNATIONAL TRADE The level of international trade is determined by ratios of exports to revenue and imports to domestic demand. For exports/revenue: low is less than 5%, medium is 5% to 20%, and high is more than 20%. Imports/domestic demand: low is less than 5%, medium is 5% to 35%, and high is more than 35%.

LIFE CYCLE All industries go through periods of growth, maturity and decline. IBISWorld determines an industry's life cycle by considering its growth rate (measured by IVA) compared with GDP; the growth rate of the number of establishments; the amount of change the industry's products are undergoing; the rate of technological change; and the level of customer acceptance of industry products and services.

NONEMPLOYING ESTABLISHMENT Businesses with no paid employment or payroll, also known as nonemployers. These are mostly set up by self-employed individuals.

Jargon & Glossary

IBISWorld Glossary continued

PROFIT IBISWorld uses earnings before interest and tax (EBIT) as an indicator of a company's profitability. It is calculated as revenue minus expenses, excluding interest and tax.

VOLATILITY The level of volatility is determined by averaging the absolute change in revenue in each of the past five years. Volatility levels: very high is more than ±20%; high volatility is ±10% to ±20%; moderate volatility is ±3% to ±10%; and low volatility is less than ±3%.

WAGES The gross total wages and salaries of all employees in the industry. The cost of benefits is also included in this figure.

SENATOR DODD WELCOMES FAA APPROVAL OF OPERATOR EXEMPTIONS TO USE SUAS FOR FILMING

WASHINGTON — *The following is a statement from Senator Chris Dodd, Chairman and CEO of the Motion Picture Association of America, Inc., on today's announcement that the FAA has approved operator exemptions to use small unmanned aircraft systems for filming motion pictures and television:*

"Today's announcement is a victory for audiences everywhere as it gives filmmakers yet another way to push creative boundaries and create the kinds of scenes and shots we could only imagine just a few years ago. Our industry has a history of successfully using this innovative technology overseas – making movies like "Skyfall" and "Transformers: Age of Extinction," to name a couple – and we are proud to now be on the leading edge of its safe commercial use here at home. By creating a climate that further encourages more movie and TV production in the US, today's decision also supports job creation and revenue growth around the country. I commend and thank Secretary Foxx, Administrator Huerta and everyone at the FAA for their leadership and commitment to achieving this great result."

About the MPAA
The Motion Picture Association of America, Inc. (MPAA) serves as the voice and advocate of the American motion picture, home video and television industries from its offices in Los Angeles and Washington, D.C. Its members include: Walt Disney Studios Motion Pictures; Paramount Pictures Corporation; Sony Pictures Entertainment Inc.; Twentieth Century Fox Film Corporation; Universal City Studios LLC; and Warner Bros. Entertainment Inc.

A Drone By Any Other Name...

At a drone conference in Washington, D.C., last year, the trade group running the event sent a not-so-subtle message to the journalists there: The Wi-Fi password was DONTSAYDRONES in the press room.

As the drone industry takes off, many people in it say it needs a different name. They say "drone" suggests the devices are dumb, it is technically inaccurate and now has a militaristic reputation. Unmanned-aircraft advocates scold reporters and even congressmen who use the term.

But they have another problem: Few of them agree on what the devices should be called.

"Maybe we call it the 'crone' for commercial drone?" said John Mulcahy, a patent attorney with clients in the commercial-drone industry.

The alternatives are an alphabet soup. There is "UAV" (unmanned aerial vehicle), "RPA" (remotely piloted aircraft), and "UAS" (unmanned aircraft system). Some prefer the more digestible "unmanned aircraft," or just "robot," while European Union officials opt for the bulkier "RPAS," or remotely piloted aircraft systems.

"We need another name for it, but I'm not sure what that new name should be," said Zack Porter, a venture-capital executive considering investments in commercial drones.

The Federal Aviation Administration is still working out rules for the commercial use of drones—which U.S. farmers, filmmakers and others have been flying in growing numbers, even

without permission. But both the agency and Congress have settled on a name: they use UAS in legislation and official documents.

"If the FAA calls these things bullfrogs, then I'll call them bullfrogs," said Michael Toscano, chief executive for the Association for Unmanned Vehicle Systems International, the trade group that urged reporters not to say "drones" last year.

Mr. Toscano said the term drone makes most people think "weaponized, hostile, large and autonomous." He prefers UAS because it encompasses the entire system, including "the technology on the ground with the human at the controls," he told Congress last year. "As I like to say, there's nothing unmanned about unmanned systems."

Sen. Patrick Leahy (D., Vt.) responded at that hearing: "I appreciate you telling us what we should call them, but...why don't you leave that decision to us? We'll decide what we'll call them. You call them whatever you'd like to call them."

But it isn't hard to find advocates who drone on about why they don't like the term UAS and its "unmanned" cousins. "I hate the word unmanned," said Don Wirthlin, a drone-pilot instructor in Douglas, Ariz. "Last time I checked, I was a human flying a UAV."

Ben Gielow, the former general counsel of the unmanned-aircraft trade group, said that "unmanned" isn't ideal. "We have to stop defining the technology by what it's not," he said. "They used to call the car a horseless carriage."

Some of the aerospace companies that shy away from using "drone" assign their devices intimidating-sounding names such as the Wasp, TigerShark, Predator and Reaper.

Other technical names for the devices touch on the number of propellers they have, such as a quadcopter or an octocopter. And then there's Deutsche Post DHL's delivery drone, which the company calls the Paketkopter.

The name confusion is a headache for some. "You try to explain what you do to your families on Thanksgiving...and no one knows what the hell a UAV is," said Zach Rosenberg, a freelance journalist who covers drones.

Even the military can't seem to agree on a name. For example, on their websites, the Army has used drone, the Navy has used UAV and the Coast Guard has used UAS. The Air Force's preferred term, RPA, recently received endorsement from top brass.

"You will never hear me use the word 'drone,' and you'll never hear me use the term 'unmanned aerial systems,' " Gen. Martin Dempsey, chairman of the Joint Chiefs of Staff, told reporters in May. "Because they are not. They are remotely piloted aircraft."

However, it was the military that originally nicknamed the devices "drones," said Ben Zimmer, a lexicographer who has researched the history of the term. In 1935, the U.S. Navy began using unmanned aircraft as aerial targets for shooting practice. The British Royal Navy had named its unmanned target aircraft the Queen Bee, Mr. Zimmer said, so in homage, the Navy called its targets "drones," which means male bee.

Many unmanned-aircraft enthusiasts say that is why the term drone is inaccurate—because it should refer only to aircraft used for target practice. But Mr. Zimmer disagrees, saying the military began arming unmanned aircraft and calling them "assault drones" in World War II.

As early as 1946, the media had picked up the term. "Drones, as the radio-controlled aircraft are called, have many potentialities, civilian and military," the magazine Popular Science wrote that year.

During a question-and-answer session with U.S. Rep. Frank LoBiondo (R., N.J.) at a drone conference this year, Dick Rumpf, head of a consulting firm, took the congressman to task for using the term drone. "If you guys stop using the word drone...the press won't poison the minds of John Q. Public with thinking we're going to be hitting them with weapons," he said to applause.

"I totally agree with you," Rep. LoBiondo replied. "I will try to sensitize my colleagues."

Not everyone in the industry dislikes the word. Andrew Petersen, a drone videographer, named his Los Angeles company Drone Dudes. Sven Juerss, CEO of German drone maker Microdrones GmbH, said having the word in a company name helps customers find a firm. "Everyone types drones into Google, not UAS," he said.

U.S. residents generally searched more for the term UAV than drone from 2004 through 2009, according to data from Google Trends, which tracks search-term volume. But in 2010, Google searches for "drone" soared past the alternatives and the term remains by far the top choice today, the data show.

Popular Science writer Kelsey Atherton, who writes weekly roundups of unmanned-aircraft news called "Keeping up with the droneses," said opponents of the term should give up. "The battle is over and drone won," he said.

I wouldn't get too worked up about acronyms.
The military are horrible for making names of a system ofr action based on how the acronym sounds.
They even make up names so they sound cool and use the same acronym three times or steal ones from Commercial acronym lists to really confuse things.
Legislation was passed in Canada calling them UAV's
Now they want to change it to UAS because big brother USA is calling them that
I own a Drone company and consider them Drones, UAV , UAS
I will consider Bullfrogs at a later date
I am not changing the name of my company because some pencil pushing bureaucrat sitting at a desk has nothing better to do than come up with new flashy names instead of getting the FAA to pull its head out of the sand and write some FAR's for commercial operations.

THE RIGHT NEWS. RIGHT NOW.

GAO: DHS Flew Drones for 1,726 Hours Over Interior of U.S.

October 3, 2014 - 2:45 PM
By Brittany M. Hughes

(CNSNews.com) - The Department of Homeland Security flew drones equipped with video cameras over the United States--away from border and coastal areas--for 1,726 hours from fiscal 2011 through this April, according to the Government Accountability Office.

At times, the drones--or Unmanned Aerial Systems (UAS)--were being used for purposes other than border or immigration enforcement. But the GAO does not have a full accounting of when and where the drones were flown, or what they were used for during the flight hours spent in "other airspace."

In a series of briefing slides provided in August to the staffs of the House and Senate appropriations subcommittees on homeland security (and publicly released this week), the GAO examined whether DHS's use of drones complied with U.S. privacy and civil liberty laws. In the slides, the GAO noted that DHS border patrol drones, which are primarily used to "support border security operations," were sometimes flown away from the border "in support of other federal, state or local law enforcement activities and for emergency humanitarian efforts."

"DHS's review reported that CBP operates UAS in accordance with its authorities, which do not limit use to border and coastal areas," the GAO reported on briefing slide No. 2. "The location of UAS operations is limited by FAA requirements and CPB policies and procedures."

These flights included missions to "provide aerial support for local law enforcement activities and investigations," to agencies including the FBI and multi-agency task forces, and to "provide aerial support for monitoring natural disasters," the report added on slide No. 11.

The GAO also referenced the 639-page Consolidated Appropriations Act of 2014 -- the law that Congress passed with bipartisan support in January that fully funded the federal government for the remainder of fiscal 2014. Buried on page 250 of that law is verbiage that provides DHS with the authority to fly border patrol drones inside the United States for purposes other than border or immigration enforcement at the "discretion of the Secretary of Homeland Security."

On briefing slide No. 27, the GAO quoted the Consolidated Appropriations Act, which states: "For necessary expenses for the operations, maintenance, and procurement of marine vessels, aircraft, unmanned aircraft systems, and other related equipment of the air and marine program, including salaries and expenses, operational training, and mission-related travel, the operations of which include the following: the interdiction of narcotics and other goods; the provision of support to Federal, State, and local agencies in the enforcement or administration of laws enforced by the Department of Homeland Security; and, at the discretion of the Secretary of Homeland Security, the provision of assistance to Federal, State, and local agencies in other law enforcement and emergency humanitarian efforts."

This language has been included in annual appropriations bills since at least fiscal 2011, and was most recently included in the Consolidated Appropriations Act signed into law in January.

Between Fiscal Year 2011 and last April, border patrol drones logged 18,089 flight hours, the GAO reported. Of these, 3,184 hours, or 18 percent, were spent at the Northern border from Michigan to Washington. Another 10,396 hours, or 57 percent, were flown at the Southwest border, while 1,189 hours, or 7 percent, came from the Southeast border off the coast of Florida.

Another 1,594 hours, or 9 percent, were used for non-operational purposes such as training and transit.

An additional 1,726, or 9 percent, were used in "other airspace" outside of a border zone.

Responding to CNSNews.com's email request for a more detailed breakdown of the "other airspace" flight hours logged by CBP drones, Rebecca Gambler, director for Homeland Security and Justice for the Government Accountability Office, stated: "We do not have a further breakdown of the UAS flight hours (9 percent/1,726 hours) listed in our report as 'other airspace.'"

According to the GAO, CBP has nine drones equipped with a video camera, infrared cameras, radar to detect movement, imaging systems to show terrain and buildings, and radar used to detect images of maritime vessels, the report stated.

The GAO added that the video recorded by drones is stored for a maximum of five years "to use in analysis and intelligence products."

While the GAO found that drones "do not have the capability to collect images from nonpublic areas, such as the interior of homes or business," the report does not mention whether air surveillance is taken of backyards or other outdoor private property.

Of the nine drones, three of the drones are located in Sierra Vista, Ariz., three are in Grand Forks, N.D., and three are in Corpus Christi, Texas. A center in Jacksonville, Fla., "remotely operates aircraft launched from other [centers]," the report stated.

The GAO reported CBP began using drones in 2006, with all four centers operational by Fiscal Year 2011. The report added the CBP is allowed to use the drones only in airspace and locations defined by the FAA."

The report also noted a recent review of CBP drone use by DHS "did not address the extent to which CBP use of UAS is within border and coastal areas."

5

The GAO also stated that CPB utilizes an "oversight framework and procedures" to ensure compliance with all privacy laws, as well as a "Working Group" tasked with "identifying potential privacy, civil rights and civil liberties concerns with current or planned UAS uses."

Russia Establishes Military UAV Unit

Russia has reportedly established a dedicated unmanned air vehicle unit in the eastern region of Chukotka, believed to stem from a $9.2 billion investment in the technology pledged by the nation's defence ministry in May.

According to the state-owned Sputnik news agency, Alexander Gordeev, spokesperson for the Russian Eastern Military District (EMD), says the unit was formed at the Ugolny military and civil airfield, and it is expecting to receive a number of indigenously-designed Orlan-10 surveillance UAVs by the end of the year.

Flight testing with the type in cold conditions is expected to take place in early 2015, and the type will be operated by Orlan to begin with, until the military unit is fully trained on the aircraft.

On 20 May, the Russian defence ministry said it would invest some $9.2 billion on UAVs by 2020.

Separately, President Vladimir Putin has ordered the establishment of a public body responsible for the implementation of Russian policies in the Arctic, Sputnik says. Putin also requires that a naval force of warships and submarines be positioned near the Arctic to bolster the country's border defence in the region.

In August it was reported that EMD personnel had started assembling Russian-built Forpost UAVs, which were to carry out patrol missions over Russia's Kamchatka peninsula.

The unit was to operate six of the type, which entered service at the beginning of 2015, and as of August operators had already completed a training course on the system, Sputnik says.

The use of unmanned technology by Russia is prevalent. This is demonstrated by the reported Russian use of UAVs over Ukraine, as observed by the Organization for Security and Co-operation in Europe's special monitoring mission (SMM) to the country.

According to the OSCE, the SMM visited Strelkov on the Arabat Spit on 1 December to meet with representatives of the Ukrainian army, who said they had observed military activities on the Crimean side of the peninsula, with a UAV flying every 2-3 days. The SMM could not verify this information, however.

These flights, the National Security and Defence Council of Ukraine says, are increasing. Seven flights took place - alongside terrorist attacks - on 24 November alone.

On 28 November, the NSDC said a Russian UAV was shot down in the Shchastya region of Ukraine, using a ZU-23-2 anti-aircraft weapon.

Russia to Open Arctic Military Drone Base 420 Miles from Alaska

Russia has announced plans to build a drone base for military reconnaissance in a town just 420 miles off mainland Alaska and just over 300 miles off the US state's St Lawrence Island, Russia's state news agency reported.

"The command of the eastern military district in charge of the military development of the Arctic zone has moved forward with plans to form an unmanned aerial vehicle division," Alexandr Gordeev, spokesperson for the district said.

Gordeev explained the base will be stationed around the Russian town of Anadyr, considered the administrative centre of the country's eastern-most region of Chukotka and currently recruitment is underway for experienced personnel to be sent there.

According to Gordeev beside functioning as an air drone base, the facility will also be equipped with other "mobile units" operated by entirely by professional servicemen as opposed to conscripts, who still make up a large proportion of Russia's ground forces.

The new base's key objective will be to provide air reconnaissance for the Russian navy in its eastern waters which directly border U.S. waters.

Since last year Russia has been in an ongoing territorial dispute with Canada over both countries' presence in the Arctic. Following an appeal from Canada to the UN for increased control over the

Arctic, which the North American nation currently shares with Russia, the US, Denmark and Norway, Russia responded by strengthening military presence in its regions close to the North Pole.

The stretch of land known as the continental shelf which remains out of the reach of any of the five countries is speculated to be rich in gas and oil.

This latest move is also part of a long-term strategy on Russia's part of modernising its military with unmanned air vehicles. General major Edward Cherkasov also announced today the armed forces' Chemical Corps is also developing a drone programme.

Moscow intends to modernise its specialist branch, which deals with chemical, biological and nuclear threats, by updating 70% of its facilities to improve efficiency of operation and long distance reconnaissance, Cherkasov added.

Last month, Russian armed forces presented the latest addition to their drone arsenal in the form of the "weatherproof" Zala 421-08M, developed to be easily carried by land infantry and remain airborne for up to 100 hours at a time.

Larger drones for the Russian military are also under development, with a 30kg version of the Zala which can stay airborne for longer carrying more weight, while earlier this spring Russian state television unveiled a long endurance, army drone with the capability of performing strike missions called the UAV Altius 001.

The announcement comes a day after the Russian air force announced that it plans to fly patrol missions around the world, including sending bomber flights above the Gulf of Mexico. According to NATO, Russian incursions into European airspace have increased by 300% in the last year, with bomber flights spotted as far west as Portugal.

Safety concerns over the military posturing have been raised after a Russian reconnaissance plane with its transponder turned off came within 90 metres of a passenger jet taking off from Copenhagen airport.

FAA says Air Traffic Control isn't Ready for UAS

The Federal Aviation Administration is facing significant problems with integrating UASinto US airspace. The AP reports that plans for modernizing air traffic control can't cover the unique challenges posed by unmanned aerial vehicles (UAVs), given that they were made years before UAVs were used for more than military missions. "It's becoming painfully apparent that in order to get [drones] in there, there is going to have to be a fair amount of accommodation, at least in the beginning," National Air Traffic Controllers Association representative Chris Stephenson is quoted as saying.

That's going to add yet another set of goals for NextGen, an FAA programme that promises to create a nationwide satellite-based location tracking system, provide better tools for sharing information, and update aging technology. Launched in 2004, NextGen has made progress on these projects, but it's also been consistently over budget and behind schedule. And large drones — which are currently mostly used for surveillance but could also carry commercial cargo or even wireless internet signals — throw a wrench in its current plans. "We didn't understand the magnitude to which [drones] would be an oncoming tidal wave, something that must be dealt with, and quickly," says NextGen administrator Ed Bolton.

Congress passed legislation creating NextGen in 2003, and directed the agency to accommodate all types of aircraft, including drones.

The programme, which is not expected to be completed for at least another decade, is replacing radar and radio communications, technologies rooted in the early 20th century, with satellite-based navigation and digital communications.

The FAA has spent more than $5 billion on the complex programme and is nearly finished installing hardware and software for several key systems. But the further it progresses, the more difficult it becomes to make changes.

Government and industry officials have long maintained that drones must meet the same rules that apply to manned aircraft if they are to share the sky. That is changing, however, said Chris Stephenson, who represents the National Air Traffic Controllers Association on several U.S. and international unmanned aircraft committees.

"It's becoming painfully apparent that in order to get (drones) in there, there is going to have to be a fair amount of accommodation, at least in the beginning," he said.

Michael Whitaker, the FAA's deputy administrator, acknowledged that drones "weren't really part of the equation when you go back to the origin of NextGen."

The NextGen plans for the next five years do not address how drones will fit into a system designed for planes with pilots on board, but the agency will have to consider whether to do that,

Whitaker told a recent meeting of the NextGen Institute, a nonprofit association sponsored by the FAA so that industry can assist with research.

Most of the initial demand to fly unmanned aircraft came from the departments of Defense and Homeland Security, which wanted to test military drones or use them to monitor U.S. borders.

Later, interest began to build around potential uses for smaller drones, especially by police departments, but also for those wanting to spray crops, monitor pipelines and inspect offshore oil platforms. These drones can weigh anywhere from a few pounds to several hundred.

More recently, commercial demand has soared - from wedding videographers and real estate agents to Amazon and Google, eyeing potential package deliveries.

The FAA bans commercial drone operations with a few, limited exceptions. That ban, however, is undermined almost daily by frustrated small drone operators.

Bolton, also addressing the institute, said the NextGen office is working closely with a drone research team at the FAA's technical center in Atlantic City, New Jersey.

FAA officials are under pressure from Congress and industry to loosen restrictions on smaller drones. The agency is expected to propose safety rules in November for businesses that want to operate them.

Smaller drones are less an issue for NextGen because the FAA is expected to limit their altitudes to less than 400 feet. Air traffic controllers generally don't separate aircraft at such low altitudes, except near airports.

But there is also concern about potential traffic and collisions with low-flying smaller drones. NASA researchers are working with the FAA and industry to develop an air traffic control system for aircraft flying at 500 feet or lower. There is no such system today except around airports.

Medium to large drones that are eventually expected fly in "Class A" airspace - over 18,000 feet, where they must be able to avoid collisions with other aircraft - are more of a problem for NextGen.

They will be controlled by a ground pilot, who will be able to see where the drone is on a computer screen and can communicate with controllers. But there won't be a pilot on board who can look out and adjust course to avoid a collision.

There are other differences as well.

Pilots who fly in Class A airspace file flight plans identifying their routes. But some larger drones are expected to stay aloft at high altitudes for days or weeks at a time, and their flight plans will be much more complex.

ERAM, a NextGen computer system that controllers use to guide high-altitude air traffic, won't be able to handle such voluminous flight plans and will have to be adjusted, aviation experts said. ERAM is already over budget and years overdue.

A greater concern is that drones fly much slower than other planes in Class A airspace, Stephenson said.

Planes at high altitudes are supposed follow designated highways in the sky to avoid collisions. A typical airliner on that highway might fly at over 500 mph, while a drone at the same altitude might fly at only 175 mph, he said. The more drones, the worse the traffic jam.

"Some people think you won't be able to see the sun anymore because of all the (drones) that are going to be up there," Stephenson said. "Other people say, `No, it's just going to be a few. It's no big deal.' "

MICRO SYSTEMS GETS $5M US NAVY CONTROL SYSTEM ORDER →

ONE COMMENT

Werner von Stein
September 30, 2014 at 18:31

The FAA is working on this NEXT Gen... stuff since 2004. Well I am sure even before then.
I just checked my calendar.... that is more than 10 years ago.

If this keep going we have a real problem on our hands. I am not sure but I think we are using the wrong guys to implement something which can and should be done in MONTHS not years.

I am sure you all know the KISS system " keep it simple stupid "

First of all point or add the cell network transmitters so that they cover up to 1100 feet or so into the air. Then make sure every low flying UAV or UAS has a bidirectional black box on it so that it can and receive data from a cloud based data base. this way you know where any UAV or UAS is in space when covered by the cell phone network..... This system would allow you to track, file and force the UAS to fly or land. At the same time to have an interface running with the big planes when or before they hit the 1100 feet or higher that they know that there are other smaller planes in the area....

This is stuff which can been done thanks to the smart phone technology in months not years..... you could even use SAT phones for higher or low flying aircraft's....

This is all basic stuff.....

You will see this sense and avoid stuff is just basic stuff as GPS is much more important for longer flight as sensor can only really work larger aircraft's.

only my two sense.

FAA Issues Requirement for All UAS to Show Aircraft Registration Number

The FAA UAS Integration Office issued an email to the industry outlining the requirement for all commercial UAS to bear an aircraft registration number when applying for a COA:

UAS, other than those owned by the Armed Forces, intended to operate under a new COA must be registered and marked prior to COA application. The aircraft registration number (N-number) must be entered into the "Aircraft Registration" field, of the System Description section in COA on-line.

Additionally, UAS, other than those owned by the Armed Forces, currently operating under an existing COA must be registered and marked within 90 days of the date of this email. COA holders will confirm their aircraft have been registered by entering the registration number, (N-number) in the Monthly Operational Report, in the block labeled, "Describe any other Operational / Coordination Issued". Failure to comply with the registration requirements within the prescribed timeframe may result in a suspension of the COA.

UAS must be marked with their U.S. nationality and registration marks (N-Number) in accordance with 14 CFR Part 45. The marks must be painted on the aircraft or affixed by any other means ensuring a similar degree of permanence (§45.21(c) (1), General).

Most full scale UAS are able to comply with the marking requirements, including size and location of the N-Number on the aircraft. Sub-scale or small UAS, or UAS of an un-conventional shape such as a multi-rotor (quad-copter, octo-copter, etc.) or ducted fan may not be able to comply with Part 45 or the guidance in AC 45-2D because of size or space limitations on the aircraft. In these cases, 14 CFR, §45.22(d) allows the UAS owner or operator to propose an alternative marking procedure to the FAA. Alternate marking approvals may be issued to public aircraft by FAA UAS Integration Office (AFS-80). If alternative markings were required, a copy of the Alternative Marking approval letter should be attached to application in the "Aircraft Registration" field.

Complete details for registering your UAS and reserving an N-number are provided online at www.faa.gov.

A formal letter from the FAA UAS Integration further outlining this requirement will follow this email correspondence.

US National Transportation Safety Board Rules that Drones are Aircraft

The US National Transportation Safety Board has issued a new ruling stating that drones are, in fact, aircraft. The NTSB ruling means there could be fines for anyone operating a drone in a manner that the Federal Aviation Administration deems reckless or careless.

The ruling stems from an incident in 2011, but it could set a precedent for drones for a long time.

The FAA is still considering how to regulate the commercial use of drones, but the NTSB's ruling appears to give the agency the authority to punish operators who don't fly drones safely. The agency compared drones — or unmanned aircraft systems — to planes, which are regulated by the FAA.

Board members determined that an "aircraft" is any "device... used for flight in the air," a definition that includes, "manned or unmanned, large or small."

That could apply to the drone that led to the court case in the first place. It was flown above the University of Virginia in 2011 by Raphael Pirker, who was using it for commercial purposes to capture images of the campus. The FAA fined him $10,000, but he fought it in court and won. The FAA then appealed to the NTSB who ruled in their favor, sending the case back to an administrative law judge for further review.

The uncertainty surrounding the regulations is having a ripple effect.

Law enforcement officers can make arrests, but prosecuting cases where drones fly in restricted airspace has been difficult.

Businesses large and small are also waiting for guidelines that will allow the use of unmanned aircraft to deliver packages and even food.

By some estimates, when drone use really takes off, it will create an industry that can support more than 70,000 jobs with an economic impact totaling more than $13 billion.

But Michael Toscano, the president and CEO of the Association of Unmanned Vehicle Systems International, said that won't happen until the FAA's rules and regulations are in place.

"It's important to have regulatory structure in place to allow for the utilization of this technology. People say well the technology has outpaced the regulatory," Toscano said. "That's true with any revolutionary type technology, so you've hit upon what has to be done — we need to have rules in place. This is one of the few industries that wants to be regulated."

Toscano said the Pirker ruling highlights unanswered questions that still exist about using drones.

Pirker, the man who went to battle with the FAA, declined CBS News' requests for an interview, but his attorney told CBS News they "disagree with the decision" and they are "reviewing the options for their next steps."

The full ruling can be downloaded here.

Canada Issues Clear Guidelines for UAS Flying

Transport Canada has released the details of its new rules governing the commercial use of unmanned aerial systems. Last month, the agency, the equivalent of the FAA, announced a significant liberalization of so-called "low threat" UAS operations. Those were generally described as line-of-sight operations below 300 feet in rural areas away from airports by UASs weighing less than 4.4 pounds and up to 55 pounds. The advisory circular fills in the blanks, explicitly laying out the responsibilities of owners and operators and acknowledging operational circumstances in which some compromise is appropriate. It also clearly shows that Canada isn't requiring UAS pilots to be licensed per se, but they do have to complete a ground school course to fly the larger class of UAS.

The agency has also published a consumer-friendly part of its web site that guides users easily through the regulations on flying an unmanned aircraft.

APPENDIX A: EXEMPTION FOR UNMANNED AIR VEHICLES WITH A MAXIMUM TAKE-OFF WEIGHT NOT EXCEEDING 2 KILOGRAMS, OPERATED WITHIN VISUAL LINE-OF-SIGHT 17

APPENDIX B: EXEMPTION FOR UNMANNED AIR VEHICLES WITH A MAXIMUM TAKE-OFF WEIGHT EXCEEDING 2 KILOGRAMS BUT NOT EXCEEDING 25 KILOGRAMS, WITH A MAXIMUM CALIBRATED AIRSPEED OF 87 KNOTS OR LESS, OPERATED WITHIN VISUAL LINE-OF-SIGHT 25

ANNEX A: EXCERPTS FROM THE *CANADIAN AVIATION REGULATIONS* 31

1.0 INTRODUCTION

1.1 Purpose

(1) An Advisory Circular (AC) provides information and guidance with regards to a specific issue or law. In this case, it provides general guidance, safety practices and explanatory information for operators of unmanned air vehicle (UAV) systems operating under an exemption to Sections 602.41 and 603.66 of the *Canadian Aviation Regulations* (CARs).

1.2 Terminology

(1) While media and manufacturers may use different terms when describing a remotely controlled aircraft, the aviation industry and its regulations use the term UAV system.

1.3 Applicability

(1) This document and the associated UAV exemptions apply to members of the public who operate a UAV only if:

a) it has a maximum take-off weight not exceeding 2 kilograms (4.4pounds);

or

b) it has a maximum take-off weight exceeding 2 kilograms (4.4 pounds), but not exceeding 25 kilograms (55 pounds).

(2) If you cannot or choose not to operate under the either exemption listed above you must apply for a Special Flight Operations Certificate (SFOC) if:

a) you plan to operate a UAV for any non-recreational purpose such as aerial photography, geomatic surveying, crop observation, advertising, research and development, etc.;

or

b) you want to operate a model aircraft that weighs more than 35 kilograms (77 pounds) regardless of the purpose it is used for.

1.4 Description of Changes

Not applicable.

2.0 REFERENCES AND LEGAL REQUIREMENTS

2.1 Reference Documents

(1) Although this AC provides information and guidance regarding the two (2) UAV exemptions issued by Transport Canada, UAV operators are reminded that in order to operate under the exemptions they must possess a copy of the actual exemption while operating. The applicable exemptions can be found at http://www.tc.gc.ca/civilaviation/regserv/affairs/exemptions/docs/en/2879.htm and http://www.tc.gc.ca/civilaviation/regserv/affairs/exemptions/docs/en/2880.htm.

(2) This AC should be used in conjunction with the AC on Applying for a Special Flight Operations Certificate for Unmanned Air Vehicle Systems.

(3) The aviation laws that govern the use of UAV systems in Canadian airspace are the:

(a) *Aeronautics Act;* and

(b) *Canadian Aviation Regulations.*

(4) In addition, it is your responsibility to know the other Canadian laws that might apply such as the:

(a) Canadian Transportation Accident Investigation and Safety Board Act;

(b) Charter of Rights and Freedoms,

(c) Criminal Code of Canada;

(d) Customs Act;

(e) Environmental Protection Act;

(f) National Parks Aircraft Access Regulations;

(g) Personal Information Protection and Electronic Document Act;

(h) Privacy Act;

(i) Radiocommunication Act;

(j) Transportation of Dangerous Goods Act; and

(k) Trespass Act.

2.2 Cancelled Documents

(1) The publication of a new issue of the AC on Guidance Material for Operating Unmanned Air Vehicle Systems under an Exemption renders this document null and void.

2.3 Definitions

(1) The following **definitions** are used in this document:

(a) Maximum Take-off Weight – means the weight of the aircraft at the time of the operation, including the weight of any payload (e.g. a camera) and fuel.

(b) Model Aircraft – means an aircraft with a total weight not exceeding 35 kg (77 lbs) that is mechanically driven or launched into flight for recreational purposes and that is not designed to carry persons or other living creatures.

(c) Special Flight Operations Certificate – is a Canadian aviation document required for operating an unmanned air vehicle system.

(d) Unmanned Air Vehicle – means a power-driven aircraft, other than a model aircraft, that is designed to fly without a human operator onboard. Unmanned air vehicles exclude fireworks, kites, rockets and large unmanned free balloons.

(e) Visual Line-of-Sight – means unaided (corrective lenses and/or sunglasses exempted) visual contact with the unmanned air vehicle sufficient to maintain operational control of the aircraft, know its location, and be able to scan the airspace to see and avoid traffic.

3.0 BACKGROUND

(1) Greater numbers of people in Canada are flying UAVs that, by design, are flown without a pilot on board and controlled through an external device such as a remote control, tablet, smart phone, etc.

(2) For everyone's safety, aviation is governed by strict rules similar to when operating a car or a boat.

(3) While UAV systems are legitimate airspace users, they must integrate into Canada's national airspace in a safe manner to ensure the safety of other airspace users and people and property on the ground.

4.0 REQUIREMENTS

The mandatory safety conditions required to operate under either of the two (2) exemptions can be found in Appendix A (not exceeding 2kg) and Appendix B (above 2kg but not exceeding 25kgs), depending on the specific exemption you intend to operate under. You must observe and comply with all the conditions included in the applicable exemption in order to use the exemption as your authority to operate a UAV. If not you could be subject to penalties/fines.

In order for UAV operators to understand the meaning/purpose of the various exemption conditions, the following additional guidance and explanatory materials are provided.

The information below follows the format of the 2kg-25kg exemption; however the explanatory information is pertinent to both Transport Canada UAV exemptions.

When the term "Any person" is used, it signifies that anyone associated with the operation may conduct the particular task or comply with the condition. When the term "The pilot" is used, the UAV pilot is specifically responsible for conducting that task or for complying with the condition.

4.1 General Conditions

(1) Any person conducting operations under this exemption shall conduct a safe operation and shall not pose a risk to aviation safety.

> **Note:** This principle is the basis for all flight operations. Understanding and complying with the conditions contained in the applicable exemption under which you are operating will enhance your ability to conduct a safe operation.

(2) Any person operating under this exemption shall not operate a UAV system in such a reckless or negligent manner so as to endanger or be likely to endanger the life or property of any person.

> **Note:** The same principle as the condition above but is applicable to persons and property on the ground. Operating in a reckless or negligent manner can result in fine of $5,000 for individuals or $25,000 for corporations.

(3) Any person conducting operations under this exemption shall be a minimum of 18 years of age.

> **Note:** This condition is consistent with the CARs which requires pilots to be 18 years of age in order to conduct commercial aviation operations. A certain level of maturity is required to make business decisions that will not affect aviation safety. Due to the decreased risk of operating a UAV that does not exceed 2kg, a provision has been added that reduced the age to 16 for academic activities. The reduction to 16 years of age assumes that there will be adult supervision of these activities.

(4) Any person conducting operations under this exemption shall subscribe for liability insurance covering risks of public liability at the levels described in subsection 606.02 (8) of the Canadian Aviation Regulations and in any case shall have no less than $100,000 in liability insurance coverage pertaining to the operation of the UAV.

Note: Section 606.02 of the CARs sets out liability insurance requirements for all aviation activities. It should be noted that most general liability insurance policies do not cover aviation related activities. UAV operators must ensure that they possess insurance that covers third party liability for aviation related activities prior to operating under either exemption.

(5) The pilot operating under this exemption shall not operate the controls of a UAV if they have any reason to believe that they are suffering or are likely to suffer from fatigue, or suffering from any other condition which would render them unfit to perform their duties.

Note: This condition addresses risk posed by fatigue or any other situation that may impair the UAV pilot's ability to safely operate the UAV or make safety based decisions.

(6) The pilot operating under this exemption shall not operate a UAV system within eight (8) hours after consuming an alcoholic beverage or while under the influence of alcohol or while using any drug that impairs the person faculties to the extent that the safety of the operation is endangered in any way.

Note: A UAV pilot operating a UAV system while impaired or while their ability to make sound safety decisions was compromised, could lead to drastic consequences. As such, it imperative that no one operate a UAV while their judgment is impaired. Impairment from drugs could include illicit drugs or prescription and over the counter medication.

(7) Any person conducting operations under this exemption shall be familiar with the relevant aeronautical information that is appropriate to the intended flight, before commencing a flight.

Note: Sections 602.71 and 602.72 of the CARs require pilots to obtain and review all the appropriate information that is relevant for the proposed flight, prior to take-off. This requirement is also applicable UAV operations to ensure that the information required to safely conduct the flight is obtained prior to flight. Aeronautical products such as aeronautical maps and the Canadian Flight Supplement can be found at: http://www.navcanada.ca/EN/products-and-services/Pages/flight-planning.aspx Weather and NOTAM (notice to airmen) information can be found at: https://flightplanning.navcanada.ca/cgi-bin/CreePage.pl?Langue=anglais&NoSession=&Page=Fore-obs/notam&TypeDoc=html

(8) Any person operating under this exemption shall not operate a UAV in any special aviation event requiring an SFOC under Part VI, Subpart 3, Division 1 of the CARs.

Note: Participation in an air show is considered a higher risk activity for UAVs. As such participation in air shows is prohibited under either of the two (2) exemptions. Should a UAV operator wish to participate in an air show or conduct product/capability demonstration activities they would be required to obtain an SFOC.

(9) Any person conducting operations under this exemption shall obtain permission from the owner(s) of the property on which a UAV intends to take-off/launch from and/or land/recover on.

Note: operators/pilots must be aware of the need to observe the regulation imposed by the Trespass Act when conducting take-offs and landings of their UAV. Although operations over private land may be permitted, if you were to conduct operations on private property or needed to retrieve a UAV that may have strayed onto private property, you must request the property owner's permission.

(10) Any person conducting operations under this exemption shall, prior to commencing operations, perform a site survey to assess the suitability of each location and confirm that safe operations can be conducted.

Note: Pilots will be responsible for conducting an assessment of the suitability of each site, prior to conducting operations, to ensure such operations can be conducted safely. Typical elements that should be assessed would include, but are not limited to:

- Defining the boundaries of the area where the actual operation will be carried out;
- Class of airspace and specific provisions of the airspace (e.g. controlled airspace);
- Altitudes and routes to be used on the approach and departure to and from the area where the operation will be carried out;
- Other aircraft operations (e.g. proximity of aerodromes including heliports and seaplane bases, or other operating sites);
- Hazards associated with nearby industrial sites;
- Areas of high-intensity radio transmissions or electromagnetic interference (e.g. radar sites);
- Limitations and/or restrictions of local by-laws;
- Location and height of obstacles (e.g. wires, masts, buildings, cell phone towers, wind turbines, etc.);
- Airspace restrictions such as restrictions around nuclear facilities or military bases;
- Built-up areas, major roadways and recreational activity sites;
- Security provisions to limit public access;
- Predominant weather conditions for the site and proposed operating areas; and
- Minimum separation distances from persons, vehicles and structures.

(11) Any person conducting operations under this exemption shall cease operations if at any time the safety of other airspace users or persons or property on the ground is in jeopardy, or if the person conducting operations is unable to comply with the conditions of this exemption.

Note: It is expected that anytime the operation is deemed to be a risk to other airspace users or people and property on the ground, the operation will need to cease until such time as the issues that were causing the unsafe conditions are addressed/remedied. Flight operations should not resume until the issues are resolved.

(12) A copy of the following documents shall be accessible to any person conducting operations under this exemption.

(a) This exemption;

(b) Proof of liability insurance coverage;

(c) Name, address and telephone number of the UAV operator; and

(d) A copy of the UAV system operating limitations

Note: In order to provide Transport Canada Inspectors and police authorities the ability to fulfill their duties to ensure public safety, the UAV pilot/operator is required to have immediate access to the above noted documentation at the location where the UAV is

being controlled from. It is expected that a hard copy of the appropriate exemption is on site.

(13) A person conducting operations under this exemption shall immediately produce any of the documents and/or information listed in condition 12 above to a peace officer, police officer, or Transport Canada inspector upon request.

Note: This condition simply provides clarification to the pilot/operator that Transport Canada Inspectors or peace/police officers have authority to request that adequate documentation be provided so that they can verify that operations are being conducted legally

(14) No person operating under this exemption is relieved from complying with the provisions of any other relevant Acts, Regulations or laws or from any level of government.

Note: This condition reinforces the idea that there are numerous other Acts and regulations that may apply when conducting UAV operations, such as the Criminal Code of Canada, Privacy Act, Personal Information Protection and Electronic Documents Act, National Parks Aircraft Access Regulations and the Transportation Accident Investigation and Safety Board Act, to name but a few. UAV operators/pilots must ensure that they abide by applicable rules, regulations, laws and bylaws from municipal, city, provincial and national authorities.

4.2 Flight Conditions

(15) The pilot operating under this exemption shall maintain continuous unaided visual contact with the UAV sufficient to be able to maintain operational control of the UAV, know its location and be able to scan the airspace in which it is operating to decisively see and avoid other air traffic or objects.

Note: As no "sense and avoid" capability is currently available to permit safe beyond visual line-of-sight operations, both exemptions limit operations to within visual line-of-sight. This means that the pilot must keep the UAV within eyesight at all times. Vision enhancing devices such as binoculars, night visual goggles, powered vision magnifying devices and goggles designed to provide a first person view are not considered "unaided visual contact", and are therefore prohibited under the exemptions. In determining the range that will ensure the UAV can be seen, consideration must be given to the pilot's capabilities, the meteorological conditions, the size and conspicuity of the UAV and any other relevant factors

(16) The pilot operating under this exemption shall not use a first person view device.

Note: First person view (FPV) devices generate and transmit a streaming video image to a ground station display or monitor giving the pilot who is viewing this video, the illusion of actually flying the aircraft from an onboard pilot's perspective. FPV devices do not provide an adequate capability to ensure safe traffic separation and compliance with right of way requirements. An inadequate field of regard, the lack of depth perception and the inability for these systems to operate in a lost link situation all detract from the ability of FPV devices from being an adequate substitute for a see and avoid capability.

(17) The pilot operating under this exemption shall only operate a UAV from a single control station and control relays or visual observers to extend the operational area are prohibited.

Note: Due to the additional communications and coordination requirements, extended range operations using visual observers introduce a higher risk to other airspace users and people and property on the ground. As such the operator would be required to apply for an SFOC in order to determine the additional safety conditions required to mitigate the associated increased risks

(18) The pilot shall operate no more than one UAV at any one time.

Note: No research has been conducted to determine the increased risk of a single operator controlling more than one UAV in either normal or emergency situations. The ability to conduct the sense and avoid function, visually observe the UAV and deconflict from other air traffic would be greatly reduced where more than one UAV is operated, thereby increasing the risk to other airspace users and requiring a specific review of the operation through the application for an SFOC.

(19) The pilot operating a UAV shall give way to manned aircraft at all times.

Note: Given the small size and lack of visual conspicuity of the UAVs to be operated under this exemption, and the likelihood that the pilots of manned aircraft would be unable to see the UAV, it is the UAV pilot's responsibility to always give way to all other aircraft. This would include all manned aircraft (i.e. aeroplanes, helicopters, gliders, ultra-lights, hot air balloons, etc). It is expected that the UAV pilot would land the UAV anytime a manned aircraft entered or came in close proximity to the area in which the UAV is operating.

(20) The pilot operating under this exemption shall only operate a UAV during daylight hours.

Note: Allowing aircraft to be flown outside daylight hours requires specified procedures and aircraft lighting and results in a more complex operation. Where UAVs are equipped with lights, the ability of the pilot to control the UAV at night using only the onboard lights is extremely difficult, and as such, there could be a need for additional ground lighting/illumination conditions to mitigate the risks of night operations. To operate a UAV at night, an SFOC would be required.

(21) The pilot operating under this exemption shall operate a UAV at or below 300 feet above ground level (AGL).

Note: 300 feet AGL corresponds to the altitude at which obstacles are required to be lit and marked in accordance with the CARs. Operators of manned aircraft understand that below these altitudes, additional risks are present that may be difficult to see. It must be understood that at all times it is the UAV pilot's responsibility to avoid other aircraft. It is up to the UAV pilot/operators to ensure they have an effective method for ensuring they do not operate above 300 feet, such as a barometric altimeter or GPS based altitude system. Comparing the altitude of the UAV to surrounding buildings or structure could also be effective, provided that the exact height of those objects is known.

(22) The pilot conducting operations under this exemption shall only operate a UAV in Class G airspace.

Note: As these UAVs are not required to meet any mandatory communication, navigation, surveillance/air traffic management (CNS/ATM) equipment requirements, operations are limited to uncontrolled airspace (Class G). This equates to airspace in which no air traffic control is provided to pilots. Additionally, operations under this exemption are restricted from transponder airspace, restricted airspace, control zones, controlled airspace and areas with higher volumes of manned aviation where UAV operations pose a greater risk to other airspace users. For these types of operations an SFOC would be required. There are seven classes of airspace in Canada, each designated by a letter (A through G) and they are detailed below. The class of airspace can be determined through several sources including the Canadian Flight Supplement, the Canadian Aeronautical Information Manual (AIM) (TP14371E) http://www.tc.gc.ca/publications/en/tp14371/pdf/hr/tp14371e.pdf and various VFR and IFR maps/charts. In general terms,

- Class A airspace is controlled airspace and exists exclusively between flight level 180 and flight level 600 (this equates to approximately 18,000 ft to 60,000 ft above sea level (ASL)).

- Class B airspace is any controlled airspace between 12,500 ft and up to 18,000 ft ASL. Occasionally, Class B airspace exists in other locations (control zones and associated terminal control areas), although this is unusual.
- Class C airspace is controlled airspace and includes control zones (CZ) around large airports. These areas usually have a 7-10 nautical mile radius up to a height of 3,000 ft above aerodrome elevation (AAE).
- Class D airspace is controlled airspace and may include areas around smaller aerodromes that have a 5nauticalmile radius and a height of 3,000 ft AAE. Aerodromes with less busy airspace may have only a 3-nautical-mile radius control zone.
- Class E airspace is controlled airspace used for low-level flight routes and for aerodromes that need controlled airspace but do not meet the requirements for Classes A-. Air Traffic Control (ATC) is available for aircraft operating under instrument flight rules only
- Class F airspace is special use airspace. For entry into restricted Class F airspace, specific permission is required from the operating authority or user agency.
- Any airspace that is not designated, as described above, is classified as Class G airspace. This airspace is uncontrolled and any aircraft may fly in Class G airspace.

(23) The pilot operating under this exemption shall not operate a UAV over a forest fire area, or over any area that is located within five nautical miles of a forest fire area.

Note: Operations in forest fire areas are extremely high risk with many types of aircraft operating at very low level. Introducing UAVs into this airspace would add an unacceptable level of risk to manned aircraft operations. Forest fire areas are advertised through the NOTAM system and UAV pilots are expected to review applicable NOTAMs as part of their pre-flight planning requirements. As forest fires are unpredictable, a restriction of five (5) miles is included from the fire area for all aircraft, including UAVs.

(24) The pilot operating under this exemption shall not operate a UAV in airspace that has been restricted by the Minister under Section 5.1 of the Aeronautics Act.

Note: Under the *Aeronautics Act*, section 5.1, the Minister may prohibit or restrict the operation of any aircraft on or over any area or within any airspace, either absolutely or subject to any exceptions or conditions. This type of restricted airspace is implemented where a prohibition or restriction is necessary for aviation safety or security or the protection of the public. An example of such restrictions could include security operations such as a G8/G20 Conference, major sporting events (e.g. an Olympic event) or an active shooter situation. NOTAMs are issued whenever a 5.1 airspace restriction is issued. Prior to the flight, UAV pilots would be expected to ensure there are no airspace restrictions in place for the area in which they plan on operating.

(25) The pilot operating under this exemption shall only operate a UAV at least five (5) nautical miles away from the centre of any aerodrome.

Note: As the knowledge, experience and skill levels of the UAV pilots operating under these exemptions may not meet manned aviation standards and the aircraft are not required to meet any mandatory CNS/ATM equipment requirements, operations are not permitted near any aerodromes. Additionally, as these UAVs cannot integrate into the flow of air traffic arriving and departing at an aerodrome, UAV operations pose an increased risk to other airspace users in the aerodrome environment. As such, an SFOC would be required to operate in these areas. Airports, heliports, helipads and seaplane bases would all be considered aerodromes. There are several tools that can be used to

identify where aerodromes are located to include aviation maps, the Canadian Flight Supplement and potentially some on-line tools (provided they are kept up to date).

(26) The pilot operating under this exemption shall only operate a UAV at least five (5) nautical miles away from a built-up area.

Note: UAVs operated under these exemptions are not required to meet any technical airworthiness standards meaning that there is no assurance of the airworthiness or capabilities of the UAV system. This increases the risks to persons and property on the ground, therefore, UAVs must not be operated near populated areas. Built-up areas are considered areas with groups of buildings or dwellings including anything from small hamlets to major cities. Anything larger than a farmstead should be considered a built up area.

(27) The pilot operating under this exemption shall operate a UAV at a lateral distance of at least 500 feet from any building, structure, vehicle, vessel, animal or person unless:

(a) The building, structure, vehicle, vessel or animal is the subject of the aerial work; and

(b) Only persons inherent to the operation are present.

Note: This condition provides protection to person or property on the ground that are not part of the operation or have not accepted the risk of the UAV operating in their close proximity. It permits the use of the UAV closer than 500 feet from people or objects provided those people or objects are the specific reason for the operation and have accepted the risk associated with the operation (i.e. actors on a movie set, a vehicle used in a TV commercial, aerial inspection of buildings/structures, etc). This would not include activities such as filming people at an outdoor concert or sporting event. Due to the reduced risk of operating a UAV not exceeding 2kg, the lateral distances for UAVs not exceeding 2kg is reduced to 100 feet.

(28) The pilot operating under this exemption shall operate a UAV at a lateral distance of at least 500 feet from the general public, spectators, bystanders or any person not associated with the operation.

Note: For numerous reasons, the potential hazard of UAVs being flown near or over the general public and large crowds of people is significant. A security plan must be developed and adhered to in order to protect those people not involved with the UAV operation and to ensure that people do not interfere with the operation of the UAV. Due to the reduced risk of operating a UAV not exceeding 2kg, the lateral distances for UAVs not exceeding 2kg is reduced to 100 feet.

(29) The pilot operating under this exemption shall not operate a UAV over an open-air assembly of persons

Note: Similar to the previous condition, this provides protection to person or property on the ground that are not part of the operation and have not accepted the risk of the UAV operating in their close proximity.

(30) The pilot conducting operations under this exemption shall only operate a UAV under visual meteorological conditions, clear of cloud with not less than two (2) statute miles ground visibility.

Note: These weather limits are those required in Class G airspace for manned aircraft. The required visibility permits the UAV pilot to view, not only the UAV, but the surrounding airspace to ensure manned aircraft can be seen in sufficient time for the UAV pilot to take any required actions to avoid collisions. Additionally, it allows the UAV pilot to ensure that operations are kept clear of hazardous areas. The required weather forecasts and reports are accessible from several sources including the NAV CANADA

flight planning website http://www.navcanada.ca/EN/products-and-services/Pages/flight-planning.aspx

(31) The pilot conducting operations under this exemption shall be able to take immediate active control of a UAV at all times.

Note: Although the use of UAV automation is acceptable, fully autonomous systems which do not allow the pilot to intervene are not permitted due to the potential unpredictability of their flight profile. The pilot of a UAV must be able to override the pre-programmed systems at any time, should there be a technical issue with the UAV that requires pilot intervention.

(32) Any person conducting operations under this exemption shall establish and adhere to procedures to be followed in the event that control of the aircraft can no longer be maintained. Specifically:

(a) Procedures for contacting emergency responders;

(b) Procedures for landing/recovering the UAV safely;

(c) Procedures for contacting the appropriate air traffic service unit; and

(d) Name(s) of individuals responsible for following each of the above procedures.

Note: The UAV operator/pilot must have a complete set of pre-determined procedures in order to reduce the risks to other airspace users and people and property on the ground when a UAV fly-away occurs or the aircraft experiences an emergency or suffers a technical malfunction. To ensure appropriate actions are taken without delay, persons operating under this exemption must establish such procedures prior to commencement of flight operations. These procedures must be immediately available to the UAV pilot or any other individual assigned a task, so that there is no delay in the required actions being taken.

(33) Any person conducting operations under this exemption shall establish and adhere to an emergency contingency plan.

Note: Establishing and adhering to a security plan is mandatory to ensure that appropriate actions are taken without delay. This plan addresses the action to be taken should the UAV result in injury to third parties or damage to property. These procedures must be established prior to commencement of flight operations and actioned without delay.

(34) The pilot conducting operations under this exemption shall establish and follow normal, lost link and emergency procedures, including those established by the manufacturer.

Note: UAV pilots must have procedures that will address all normal operations of the UAV as well as abnormal and emergency situations. Failure to do so would impose hazards to both persons and property on the ground and other airspace users. Should the manufacturer stipulate procedures for specific occurrences, those procedures shall be followed unless they would result in an increased risk to other airspace users or people and property on the ground. Such procedures would generally be contained in standard operating procedures or checklists.

(35) Any person conducting operations under this exemption shall confirm that no unacceptable radio frequency interference to the UAV system is present prior to flight, nor is likely to be present during flight.

Note: Radio interference could come from many sources including high voltage power lines, transmission antennas and areas with large numbers of Wi-Fi transmitters or around radar dishes/antennas. Radio interference may render the UAV uncontrollable. As such the UAV

pilot/operator is responsible for confirming that no unacceptable radio interference to the UAV system exists prior to the operation of the aircraft.

(36) The pilot operating under this exemption shall not activate a flight termination system, if a UAV is so equipped, in such a manner as to endanger other airspace users or persons or property on the ground.

> **Note:** As an added safety feature, several UAVs are equipped with a flight termination system intended to bring the UAV to the ground safely during specific emergency situations. The pilot is responsible for ensuring when and where it is safe to initiate such a flight termination. If part of the emergency plans includes the use of a flight termination system, operation of the UAV should be limited to flight over areas where, should the flight termination be activated, there is no risk to persons and property on the ground.

(37) Any person operating under this exemption shall not conduct a take-off/launch of a UAV unless the risk involved with lost link circumstances has been assessed and a determination has been made as to when auto-recovery manoeuvres or flight termination shall be initiated.

> **Note:** Given the potential of UAVs to lose their communications links (lost-link) an assessment of these risks is essential. This assessment must address when it would be safe for the UAV to commence a pre-programmed "return home" manoeuvre (including routes and altitudes) or alternatively when the pilot would initiate flight termination.

(38) The pilot operating under this exemption shall operate a UAV in known or forecast icing conditions.

> **Note:** The degradation in aircraft performance and changes in flight characteristics when frozen contaminants are present are wide ranging and unpredictable. Contamination makes no distinction between large aircraft, small aircraft, helicopters or UAVs and the performance penalties can be significant. Additionally, there are no UAVs in these classes that are equipped with anti-ice or de-ice capabilities. These factors combined increase the risks associated with operating in icing conditions. Icing conditions can be experienced even when the temperatures are above the freezing mark and when no moisture is present on the ground.

(39) The pilot operating under this exemption shall not conduct a take-off/launch of a UAV that has frost, ice or snow adhering to any of its critical surfaces.

> **Note:** In addition to the issues addressed above, conducting a take-off with contaminates such as ice or snow adhering to the critical surfaces (propeller, rotors, wings, etc) will dramatically decrease flight performance resulting in an increased risk to persons and property on the ground.

(40) The pilot operating under this exemption shall not operate a UAV system unless it is operated in accordance with the operating limitation specified by the manufacturer.

> **Note:** The pilot is responsible for operating the UAV in accordance with any specifications, directions or instructions provided by the manufacturer and for ensuring that any operating limitations relating to the operation of the UAV are adhered to.

(41) The pilot operating under this exemption shall not permit the use of a portable electronic device at the control station of a UAV system where the device may impair the functioning of the systems or equipment.

> **Note:** Given the reliance on radio transmissions and off-the-shelf electronic devices, and the fact that no engineering testing has been conducted to determine the effects of portable electronic devices on the UAV, the pilot/operator must ensure that the operation of the UAV is not adversely affected by such devices. This would require that electronic devices (i.e. cell phones, tablets, two-way radios, etc), that are not part of the

UAV system, not be in the immediate vicinity of the device controlling the UAV or any radio transmission devices associated with the UAV system.

(42) The pilot operating under this exemption shall not conduct a take-off/launch of a UAV if explosive, corrosive, bio-hazard or bright light emitting (laser) payloads, or any payloads that can be jettisoned, dispersed or dropped, are carried onboard.

Note: The carriage of such payloads increases the risks associated with the operations. As such, if operational requirements require the UAV to carry such hazardous payloads, the operator would be required to apply for an SFOC. This would allow the associated risks to be assessed and the appropriate conditions imposed to ensure safe operations. Additionally, if there is intent to use a laser onboard the UAV, there are specific requirements in the CARs with regards to requesting permission to use a laser from an aircraft. The provision for "payloads that can be jettisoning, dispersing or dropping" is not included in the "Not to exceed 2kg" exemptions as the limit in aircraft weight will likely not permit such payloads to be carried. It should also be understood, that Lithium Ion and Lithium Polymer batteries are considered dangerous good. As such, should the UAV need to be shipped to another location, the operator would be required to comply with the Transportation of Dangerous Goods Act and various CARs applicable to transporting dangerous goods.

(43) A person operating under this exemption shall ensure the following operational and emergency equipment is immediately available:

(a) checklists or placards that enable a UAV system to be operated in accordance with the limitations specified by the manufacturer; and

(b) a hand-held fire extinguisher of a type suitable for extinguishing fires that are likely to occur.

Note: The pilot/operator must be prepared to handle any emergencies that occur as a result of operating the UAV (i.e. grass fire, injury to people of the ground, etc). This requires that the appropriate procedures be developed and the required equipment be immediately available to those conducting the operation

(44) The pilot conducting operations under this exemption shall remain clear of the take-off, approach and landing routes and the pattern of traffic formed by manned aircraft operating in the vicinity of aerodromes.

Note: The operation of this type of UAV in the vicinity of the traffic patterns used by manned aircraft is inherently dangerous and increases the risk to other airspace users. Although the UAVs operated under this exemption are required to remain outside 5nm from the centre of any aerodrome, there are many locations where manned aircraft can be on an instrument approach at low altitudes outside 5nm. As such, if the pilot intends to operate anywhere within 10 nm of an aerodrome it is highly recommended that they confirm where the instrument approaches and traffic patterns are located. This information could be found in various aeronautical information publications (i.e. Canadian Flight Supplement, instrument approach plates, etc), from a local flying school or an air traffic service unit service in that area.

(45) Any person conducting operations under this exemption shall ensure that the appropriate air traffic service unit(s) is advised immediately anytime the flight of a UAV inadvertently enters into controlled airspace.

Note: A UAV entering controlled airspace, without coordination/permission could present a significant risk to manned aviation. Should a fly-away occur that would result in the UAV entering controlled airspace, the UAV pilot/operator must immediately contact the applicable Air Traffic Control (ATC) facility in order to ensure that ATC can take appropriate actions and that the safety of other airspace users is addressed. The

boundaries of controlled airspace can be found on various aeronautical aviation products (i.e. Canadian Flight Supplement, visual navigation charts, terminal area charts, etc). If the pilot has not previously coordinated flight activities with the local air traffic service unit they should contact the NAV CANADA National Operations Centre at 613-563-5626 and provide the details of the situation (i.e. type of UAV, last known altitude, direction it was flying, remaining flight time, etc)

(46) The pilot operating a UAV under this exemption, before entering or operating within in the Canadian Air Defence Identification Zone (ADIZ), shall comply with section 601.145 of the CARs.

Note: The ADIZ is airspace of defined dimensions at which special procedures are required to identify aircraft entering or operating within that airspace. In order to ensure that the Air Traffic System (ATS) is aware that a UAV will be operating into or within the ADIZ, the ATS unit requires that pilots file a Defence Flight Plan or Flight Itinerary. Additional information can be found in the AIM). Failing to do so may result in the inadvertent activation/response of North American Aerospace Defense Command (NORAD) resources.

4.3 Pilot Training Conditions

(47) The pilot operating a UAV system under this exemption shall have successfully completed a pilot ground school program that provides instruction on the following subject areas:

(a) airspace classification and structure;

(b) meteorological and NOTAM reporting services;

(c) interpretation of aeronautical charts and the Canada Flight Supplement; and

(d) applicable content of the CARs.

Note: It is essential that the pilot of a UAV become knowledgeable on the items identified above in order to conduct safe flight operations. The training requirements described above are considered to be the minimum prerequisites for operating under the 2kg-25kg exemption. Such training could be provided by an existing flight training facility (manned or unmanned) or could be a self-administered training program. Unmanned Systems Canada may also be a useful resource in finding possible training programs in your area. The CARs and the) are also excellent sources of information to enhance one's understanding of aviation related activities. Pilots may also wish to refer to the document entitled, "Knowledge requirements for Pilots operating Unmanned Air Vehicle Systems (UAV) 25 Kg or less, Operating within visual line-of-sight" (TP15263E) http://www.tc.gc.ca/eng/civilaviation/publications/page-6557.html

(48) The pilot conducting operations under this exemption shall be appropriately trained and qualified for the area of operation and the type of operation.

Note: In addition to the basic knowledge requirements required in Condition 47, the pilot of a UAV must obtain training and be considered competent and proficient to operate the specific UAV system in the proposed area of operation. This would require knowledge training on the aircraft's system, the normal and emergency procedures and any limitations for the operation of the UAV. Additionally, practical training would be required to become competent with the actual flying of the UAV. This training could be provided by other pilots, manufacturers, UAV flight training organizations or could be self taught.

4.4 UAV Conditions

(49) Any person conducting operations under this exemption shall, prior to conducting a take-off/launch of a UAV, ensure that there is a means of:

(a) Controlling the flight of the UAV;

(b) Monitoring the UAV system;

(c) Navigation;

(d) Communication, as required by the CARs;

(e) Detecting hazardous environmental flight conditions;

(f) Mitigating the risk of loss of control of the UAV;

(g) Sensing and avoiding other aircraft;

(h) Avoiding flight into obstacles and terrain; and

(i) Remaining clear of cloud.

Note: Given the increased complexity and risk of operating a UAV with a maximum take-off weight of up to 25 Kg, there must be appropriate means to safely control and operate the UAV. The methods of compliance do not necessarily have to be technical solutions (e.g. sense and avoid and navigation may be conducted by the pilot using visual line-of-sight techniques).

(50) Any person conducting operations under this exemption shall ensure that a UAV system is in a fit and safe state for flight prior to take-off/launch.

Note: No aircraft, including UAVs, should be taken airborne if the aircraft is not in a condition to sustain safe flight. This would require preflight inspections and checks to ensure, among other things, that the UAV is not damaged, there is sufficient fuel/battery charge to last for the planned flight (with a reasonable reserve) and confirmation that the radio link is working properly.

(51) Any person conducting operations under this exemption shall ensure that a UAV is not flown if it has been subjected to any abnormal occurrence unless it has been inspected for damage and repaired, if needed to ensure safe operation.

Note: Should a UAV sustain any abnormal occurrence (i.e. a hard landing, crash, become wet, land in water,etc) it must not fly again until has been inspected for damage and has been repaired, including the replacement of any damaged parts/components.

(52) Any person conducting operations under this exemption shall ensure that all maintenance, servicing and disassembly-assembly of a UAV system and associated components are performed in accordance with procedures described in the manufacturer's specifications.

Note: It is critical for the safety of other airspace users and persons and property on the ground that any manufacturer specifications or instruction be followed when it comes to the repair, maintenance and assembly/disassembly of the UAV system. The pilot/operator is responsible for ensuring the any such direction is complied with.

(53) Any person conducting operations under this exemption shall ensure that the requirements of any airworthiness directives, or equivalent, issued by the manufacturer have been completed.

Note: Should the manufacturer/retailer of the UAV issue an airworthiness directive, product recall, or other such notice indicating that the UAV is defective or has a mechanical concern, the pilot/operator shall cease to operate the UAV until the issue

has been repaired/corrected. Any such repairs must be done in accordance with the guidance provided by the manufacturer/retailer.

(54) Any person operating under this exemption shall ensure that the UAV is not equipped with an emergency locator transmitter (ELT).

Note: ELTs are used to notify rescue officials of an aircraft crash and guide search and rescue (SAR) personnel to the sight of a downed aircraft so that the passengers and crew can be assisted. As UAVs carry neither passengers nor crew, it would be inappropriate to dispatch SAR assets as this would waste critical resources, unnecessarily place SAR personnel at risk and potential divert SAR assets from higher priority activities.

4.5 Reporting Conditions

(55) Any person operating under this exemption shall, prior to the commencement of operations, notify the Minister, in writing, of:

(a) Their name, address, telephone number and e-mail;

(b) The model of UAV(s) being operated including serial numbers, where appropriate;

(c) The type of work being conducted; and

(d) The geographic boundaries of the operation.

Note: This information allows Transport Canada the opportunity to assess the effectiveness of its regulatory activities and provides basic information on who is operating in various areas so that they can be contacted, should there be need to do so (e.g. recovery of a lost UAV). It is recommended that such notification be emailed to TC.UAVExemptionNotification-NotificationExemptionUAV.TC@tc.gc.ca.

(56) Any person operating under this exception shall notify the Minister within 10 working days of any change to the information provided in the above condition or upon the permanent cessation of UAV system operations.

Note: In order to ensure that the information above remains current and valid there is a requirement to notify the Minister of any changes to the original notification provided under condition 55 above. Operators should use the same email address provided above.

(57) Any person conducting operations under this exemption shall report to the closest Transport Canada Civil Aviation office, as soon as possible, details of any of the following aviation occurrences during the operation of a UAV system:

(a) Injuries to any person requiring medical attention;

(b) Unintended contact between a UAV and persons, livestock, vehicles, vessels or other structures;

(c) Unanticipated damage incurred to the airframe, control station, payload or command and control links that adversely affects the performance or flight characteristics of the UAV;

(d) Anytime the UAV is not kept within the geographic boundaries and/or altitude limits as outlined in this exemption;

(e) Any collision or risk of collision with another aircraft;

(f) Anytime the UAV becomes uncontrollable, experiences a fly-away or is missing; and

(g) Any other incident that results in a Canadian Aviation Daily Occurrence Report (CADORS).

Note: In addition to the operator's responsibilities under the *Canadian Transportation Accident Investigation and Safety Board Act*, they must also advise Transport Canada should any of the above occurrences (incidents or accidents) occur. This is to ensure that the cause of any such occurrence is determined and appropriate mitigation/corrective measures are implemented in order to reduce the likelihood of a reoccurrence.

(58) Any person conducting operations under this exemption shall, following any of the aviation occurrences listed above, cease operations until such time as the cause of the occurrence has been determined and corrective actions have been taken to eliminate the risk of reoccurrence.

Note: In order to reduce the risk to other airspace users and people and property on the ground, flight operations under this exemption must cease if one of the above occurrences is experienced.

4.6 Penalties

(1) Transport Canada is serious about safety. Using your UAV in a reckless and negligent manner (e.g. not complying with the conditions in the exemptions) could lead to penalties and fines. Additionally this type of negligence could cause fatalities, resulting in lawsuits, fines and jail time.

(2) Penalties may be assessed in the amount of $5,000 for individuals and $25,000 for corporations for those that should be operating under an SFOC, but are not.

(3) The *Criminal Code of Canada* describes several offences involving the dangerous operation of aircraft and endangering the safety of other aircraft. Committing such offences is punishable by monetary penalties and/or jail time including imprisonment for life.

(4) Other penalties may apply against other regulations outlined in section 2.1.

5.0 INFORMATION MANAGEMENT

Not applicable.

6.0 DOCUMENT HISTORY

Not applicable.

7.0 CONTACT OFFICE

For more information about the exemptions and conditions for operating your unmanned air vehicle or for operating it safely, contact the Transport Canada Civil Aviation Communications Centre:

Email: services@tc.gc.ca

APPENDIX A:

EXEMPTION FROM SECTIONS 602.41 AND 603.66 OF THE *CANADIAN AVIATION REGULATIONS*

Pursuant to Subsection 5.9(2) of the *Aeronautics Act*, and after having determined that the exemption is in the public interest and is not likely to adversely affect aviation safety, I hereby exempt persons conducting flight operations utilizing unmanned air vehicles (UAVs), with a maximum take-off weight not exceeding 2 kilograms, operated within visual line-of-sight, from the requirements of sections 602.41 and 603.66 of *the Canadian Aviation Regulations* (CARs), subject to the conditions set out below.

Excerpts from the CARs are included in Annex A to this exemption.

INTERPRETATION

For the purpose of this exemption:

Autonomous - means the ability to execute processes or missions using onboard decision-making capabilities. An autonomous UAV system is not designed to permit crew member intervention.

Command and Control (C2) Link – means the data link between the UAV and the control station for the purposes of managing the flight.

Control Station – means the facilities and/or equipment remote from the UAV from which the aircraft is controlled and/or monitored.

First Person View (FPV) Device – means a device that generates and transmits a streaming video image to a control station display or monitor giving the pilot who is viewing this video, the illusion of actually flying the UAV from an onboard pilot's perspective.

Lost Link - means the loss of command and control link contact with the UAV such that the pilot can no longer manage the aircraft's flight.

UAV Operator - means the person that has possession of the UAV system, as owner, lessee or otherwise.

UAV System – means a set of configurable elements consisting of an UAV, its associated control station(s), the required command and control links and any other elements as may be required, at any point during flight operation

Visual line-of-sight (VLOS) - means unaided (corrective lenses and/or sunglasses exempted) visual contact with the UAV sufficient to be able to maintain operational control of the aircraft, know its location, and be able to scan the airspace in which it is operating to decisively see and avoid other air traffic or objects.

Visual Observer - means a trained crew member, in visual line-of-sight of the UAV, who assists the pilot in the duties associated with collision avoidance and complying with the applicable rules of flight.

PURPOSE

This exemption relieves persons conducting non-recreational UAV system operations utilizing a UAV with a maximum take-off weight not exceeding 2 kilograms, operated within visual line-of-sight from the requirement to obtain a Special Flight Operations Certificate (SFOC) as required by sections 602.41 and the requirement to comply with the conditions of an SFOC as required by section 603.66 of the CARs.

The exemption will permit non-recreational UAVs with a maximum take-off weight not exceeding 2 kilograms to be operated away from built-up areas, controlled airspace, aerodromes, forest fire areas and other restricted locations. The exemption includes conditions which address the need for the safe and responsible use of certain UAV systems.

UAV operations conducted outside the terms and conditions of this exemption will be subject to the requirements for an SFOC.

APPLICATION

This exemption applies to any person conducting UAV system operations within Canadian Domestic Airspace utilizing **UAVs with a maximum take-off weight not exceeding 2 kilograms within visual line-of-sight.**

This exemption does <u>not</u> apply to:

a) **Operations of model aircraft;**
b) **Operations of an Autonomous UAV; or**
c) **Operations by a foreign UAV operator.**

CONDITIONS

<u>General Conditions</u>

1) Any person conducting operations under this exemption shall conduct a safe operation and shall not pose a risk to aviation safety.
2) Any person operating under this exemption shall not operate a UAV system in such a reckless or negligent manner so as to endanger or be likely to endanger the life or property of any person.
3) Any persons operating under this exemption shall be a minimum of 18 years of age, or be at least 16 years of age and conducting research under the supervision of an academic institution.
4) Any person conducting operations under this exemption shall subscribe for liability insurance covering risks of public liability at the levels described in subsection 606.02 (8) of the Canadian Aviation Regulations and in any case shall have no less than $100,000 in liability insurance coverage pertaining to the operation of the UAV system.

5) The pilot operating under this exemption shall not operate the controls of a UAV if they have any reason to believe that they are suffering or are likely to suffer from fatigue, or suffering from any other condition which would render them unfit to perform their duties.

6) The pilot operating under this exemption shall not operate a UAV system within eight (8) hours after consuming an alcoholic beverage or while under the influence of alcohol or while using any drug that impairs the person faculties to the extent that the safety of the operation is endangered in any way.

7) Any person conducting operations under this exemption shall be familiar with the relevant aeronautical information that is appropriate to the intended flight, before commencing a flight.

8) Any person operating under this exemption shall not operate a UAV in any special aviation event requiring an SFOC under Part VI, Subpart 3, Division 1 of the Canadian Aviation Regulations.

9) Any person conducting operations under this exemption shall obtain permission from the owner(s) of the property on which a UAV intends to take-off/launch from and/or land/recover on.

10) Any person conducting operations under this exemption shall, prior to commencing operations, perform a site survey to assess the suitability of each location and confirm that safe operations can be conducted.

11) Any person conducting operations under this exemption shall cease operations if at any time the safety of other airspace users or persons or property on the ground is in jeopardy, or if the person conducting operations is unable to comply with the conditions of this exemption.

12) A copy of the following documents shall be accessible to any person conducting operations under this exemption:

    a. This exemption;

    b. Proof of liability insurance coverage;

    c. Name, address and telephone number of the UAV operator; and

    d. A copy of the UAV system operating limitations.

13) A person conducting operations under this exemption shall immediately produce any of the documents and/or information listed in condition 12 to a peace officer, police officer, or Transport Canada inspector upon request.

14) No person operating under this exemption is relieved from complying with the provisions of any other relevant Acts, Regulations or laws or from any level of government.

Flight Conditions

15) The pilot operating under this exemption shall maintain continuous unaided visual contact with the UAV sufficient to be able to maintain operational control of the UAV, know its location and be able to scan the airspace in which it is operating to decisively see and avoid other air traffic or objects.

16) The pilot operating under this exemption shall not use a first person view device.

17) The pilot operating under this exemption shall only operate a UAV from a single control station and control relays or visual observers to extend the operational area are prohibited.

18) The pilot shall operate no more than one UAV at any one time.

19) The pilot operating a UAV shall give way to manned aircraft at all times.

20) The pilot conducting operations under this exemption shall only operate a UAV during daylight hours.

21) The pilot operating under this exemption shall operate a UAV at or below 300 feet above ground level (AGL).

22) The pilot conducting operations under this exemption shall only operate a UAV in Class G airspace.

23) The pilot operating under this exemption shall not operate a UAV over a forest fire area, or over any area that is located within five nautical miles of a forest fire area.

24) The pilot operating under this exemption shall not operate a UAV in airspace that has been restricted by the Minister under Section 5.1 of the Aeronautics Act.

25) The pilot operating under this exemption shall only operate a UAV at least five (5) nautical miles away from the centre of any aerodrome.

26) The pilot operating under this exemption shall only operate a UAV at least five (5) nautical miles from a built up area.

27) The pilot operating under this exemption shall operate a UAV at a lateral distance of at least 100 feet from any building, structure, vehicle, vessel or animal not associated with the operation and at least 100 feet from any person.

28) The pilot operating under this exemption shall not operate a UAV over an open-air assembly of persons.

29) The pilot conducting operations under this exemption shall only operate a UAV under visual meteorological conditions, clear of cloud with not less than two (2) statute miles ground visibility.

30) The pilot conducting operations under this exemption shall be able to take immediate active control of a UAV at all times.

31) The pilot conducting operations under this exemption shall establish and follow normal, lost link and emergency procedures, including those established by the manufacturer.

32) Any person conducting operations under this exemption shall confirm that no unacceptable radio frequency interference to the UAV system is present prior to flight, nor is likely to be present during flight.

33) The pilot operating under this exemption shall not operate a UAV system unless it is operated in accordance with the operating limitation specified by the manufacturer.

34) The pilot operating under this exemption shall not conduct a take-off/launch of a UAV if explosive, corrosive, bio-hazard or bright light emitting (laser) payloads are carried onboard.

35) Any person conducting operations under this exemption shall ensure that the appropriate air traffic service unit(s) is advised immediately anytime the flight of a UAV inadvertently enters into controlled airspace.

Pilot training Condition

36) The pilot conducting operations under this exemption shall be appropriately trained on the UAV system and qualified for the area and type of operation as referred to in Transport Canada guidance material.

UAV System Condition

37) Any person conducting operations under this exemption shall ensure that a UAV system is in a fit and safe state for flight prior to take-off/launch.

VALIDITY

This exemption is in effect until the earliest of the following:

a) December 21, 2016 at 23:59 (EST);

b) the date on which any one of the conditions set out in this exemption is breached;

c) the date on which this exemption is cancelled in writing by the Minister, where she is of the opinion that the exemption is no longer in the public interest, or that it is likely to adversely affect aviation safety.

Dated at Ottawa, Ontario, Canada this _____day of _____, 2014, on behalf of the Minister of Transport.

Martin J. Eley
Director General
Civil Aviation

APPENDIX B:

EXEMPTION FROM SECTIONS 602.41 AND 603.66 OF THE *CANADIAN AVIATION REGULATIONS*

Pursuant to Subsection 5.9(2) of the Aeronautics Act, and after having determined that the exemption is in the public interest and is not likely to adversely affect aviation safety, I hereby exempt persons conducting flight operations utilizing unmanned air vehicles (UAVs) with a maximum take-off weight exceeding 2 kilograms but not exceeding 25 kilograms, with a maximum calibrated airspeed of 87 knots or less, operated within visual line-of-sight from the requirements of sections 602.41 and 603.66 of the *Canadian Aviation Regulations* (*CARs*), subject to the conditions set out below.

Excerpts from the *CARs* are included in **Annex A**.

INTERPRETATION

For the purpose of this exemption:

Autonomous - means the ability to execute processes or missions using onboard decision making capabilities. An autonomous UAV system is not designed to permit crew member intervention.

Command and Control Link – means the data link between the UAV and the control station for the purposes of managing the flight

Control Station – means the facilities and/or equipment remote from the UAV from which the aircraft is controlled and/or monitored.

First Person View (FPV) Device – means a device that generates and transmits a streaming video image to a control station display or monitor giving the pilot who is viewing this video, the illusion of actually flying the UAV from an onboard pilot's perspective.

Flight Termination System - means the system that, upon initiation, terminates the flight of a UAV in a manner so as not to cause significant damage to property or severe injury to persons on the ground.

Fly-away - means an interruption or loss of the command and control link where the pilot is unable to affect control of the UAV and the aircraft is longer following its preprogrammed procedures resulting in the UAV not operating in a predictable or planned manner.

Lost Link - means the loss of command and control link contact with the UAV such that the pilot can no longer manage the aircraft's flight.

UAV Operator - means the person that has possession of the UAV system, as owner, lessee or otherwise.

UAV System – means a set of configurable elements consisting of an unmanned air vehicle, its associated control station(s), the required command and control links and any other elements as may be required, at any point during flight operation.

Visual line-of-sight (VLOS) - means unaided (corrective lenses and/or sunglasses exempted) visual contact with the UAV sufficient to be able to maintain operational control of the aircraft, know its location, and be able to scan the airspace in which it is operating to decisively see and avoid other air traffic or objects.

Visual Observer - means a trained crew member, in visual line-of-sight of the UAV, who assists the pilot in the duties associated with collision avoidance and complying with the applicable rules of flight.

PURPOSE

This exemption relieves persons conducting non-recreational UAV system operations utilizing a UAV with a maximum take-off weight exceeding 2kgs but not exceeding 25kgs, operated within visual line-of-sight from the requirement to obtain a Special Flight Operations Certificate (SFOC) as required by sections 602.41 and the requirement to comply with the conditions of an SFOC as required by section 603.66 of the CARs.

The exemption will permit non-recreational UAVs with a maximum take-off weight exceeding 2kgs but not exceeding 25kgs and with maximum calibrated airspeed of 87 knots or less to be operated away from built-up areas, airspace, controlled aerodromes, forest fire areas and other restricted locations. The exemption includes conditions which address the need for the safe and responsible use of certain UAV systems.

UAV operations conducted outside the terms and conditions of this exemption will be subject to the requirements for an SFOC.

APPLICATION

This exemption applies to any person conducting UAV system operations within Canadian Domestic Airspace utilizing a UAV with a maximum take-off weight exceeding 2kgs but not exceeding 25kgs operated within visual line-of-sight.

This exemption does not apply to:

a) Operations of model aircraft;
b) Operations of an Autonomous UAV; or
c) Operations by a foreign UAV operator.

CONDITIONS

General Conditions

1) Any person conducting operations under this exemption shall conduct a safe operation and shall not pose a risk to aviation safety.

2) Any person operating under this exemption shall not operate a UAV system in such a reckless or negligent manner so as to endanger or be likely to endanger the life or property of any person.

3) Any person conducting operations under this exemption shall be a minimum of 18 years of age.

4) Any person conducting operations under this exemption shall subscribe for liability insurance covering risks of public liability at the levels described in subsection 606.02 (8) of the *Canadian Aviation Regulations* and in any case shall have no less than $100,000 in liability insurance coverage pertaining to the operation of the UAV.

5) The pilot operating under this exemption shall not operate the controls of a UAV if they have any reason to believe that they are suffering or are likely to suffer from fatigue, or suffering from any other condition which would render them unfit to perform their duties.

6) The pilot operating under this exemption shall not operate a UAV system within eight (8) hours after consuming an alcoholic beverage or while under the influence of alcohol or while using any drug that impairs the person faculties to the extent that the safety of the operation is endangered in any way.

7) Any person conducting operations under this exemption shall be familiar with the relevant aeronautical information that is appropriate to the intended flight, before commencing a flight.

8) Any person operating under this exemption shall not operate a UAV in any special aviation event requiring an SFOC under Part VI, Subpart 3, Division 1 of the *Canadian Aviation Regulations*.

9) Any person conducting operations under this exemption shall obtain permission from the owner(s) of the property on which a UAV intends to take-off/launch from and/or land/recover on.

10) Any person conducting operations under this exemption shall, prior to commencing operations, perform a site survey to assess the suitability of each location and confirm that safe operations can be conducted.

11) Any person conducting operations under this exemption shall cease operations if at any time the safety of other airspace users or persons or property on the ground is in jeopardy, or if the person conducting operations is unable to comply with the conditions of this exemption.

12) A copy of the following documents shall be accessible to any person conducting operations under this exemption.

    a. This exemption;

    b. Proof of liability insurance coverage;

    c. Name, address and telephone number of the UAV operator; and

    d. A copy of the UAV system operating limitations.

13) A person conducting operations under this exemption shall immediately produce any of the documents and/or information listed in condition 12 to a peace officer, police officer, or Transport Canada inspector upon request.

14) No person operating under this exemption is relieved from complying with the provisions of any other relevant Acts, Regulations or laws or from any level of government.

Flight Conditions

15) The pilot operating under this exemption shall maintain continuous unaided visual contact with the UAV sufficient to be able to maintain operational control of the UAV, know its location and be able to scan the airspace in which it is operating to decisively see and avoid other air traffic or objects.

16) The pilot operating under this exemption shall not use a first person view device.

17) The pilot operating under this exemption shall only operate a UAV from a single control station and control relays or visual observers to extend the operational area are prohibited.

18) The pilot shall operate no more than one UAV at any one time.

19) The pilot operating a UAV shall give way to manned aircraft at all times.

20) The pilot operating under this exemption shall only operate a UAV during daylight hours.

21) The pilot operating under this exemption shall operate a UAV at or below 300 feet above ground level (AGL).

22) The pilot conducting operations under this exemption shall only operate a UAV in Class G airspace.

23) The pilot operating under this exemption shall not operate a UAV over a forest fire area, or over any area that is located within five nautical miles of a forest fire area.

24) The pilot operating under this exemption shall not operate a UAV in airspace that has been restricted by the Minister under Section 5.1 of the *Aeronautics Act*.

25) The pilot operating under this exemption shall only operate a UAV at least five (5) nautical miles away from the centre of any aerodrome.

26) The pilot operating under this exemption shall only operate a UAV at least five (5) nautical miles away from a built-up area.

27) The pilot operating under this exemption shall operate a UAV at a lateral distance of at least 100 feet from any building, structure, vehicle, vessel, animal or person unless:

    a. The building, structure, vehicle, vessel or animal is the subject of the aerial work; and

    b. Only persons inherent to the operation are present.

28) The pilot operating under this exemption shall operate a UAV at a lateral distance of at least 100 feet from the general public, spectators, bystanders or any person not associated with the operation.

29) The pilot operating under this exemption shall not operate a UAV over an open-air assembly of persons.

30) The pilot conducting operations under this exemption shall only operate a UAV under visual meteorological conditions, clear of cloud with not less than two (2) statute miles ground visibility.

31) The pilot conducting operations under this exemption shall be able to take immediate active control of a UAV at all times.

32) Any person conducting operations under this exemption shall establish and adhere to procedures to be followed in the event that control of the UAV can no longer be maintained. Specifically:

    a. Procedures for contacting emergency responders;

    b. Procedures for landing/recovering the UAV safely;

    c. Procedures for contacting the appropriate air traffic service unit; and

    d. Name(s) of individuals responsible for following each of the above procedures.

33) Any person conducting operations under this exemption shall establish and adhere to an emergency contingency plan.

34) The pilot conducting operations under this exemption shall establish and follow normal, lost link and emergency procedures, including those established by the manufacturer.

35) Any person conducting operations under this exemption shall confirm that no unacceptable radio frequency interference to the UAV system is present prior to flight, nor is likely to be present during flight.

36) The pilot operating under this exemption shall not activate a flight termination system, if a UAV is so equipped, in such a manner as to endanger other airspace users or persons or property on the ground.

37) Any person operating under this exemption shall not conduct a take-off/launch of a UAV unless the risk involved with lost link circumstances has been assessed and a determination has been made as to when auto-recovery manoeuvres or flight termination shall be initiated.

38) The pilot operating under this exemption shall not operate a UAV in known or forecast icing conditions.

39) The pilot operating under this exemption shall not conduct a take-off/launch of a UAV that has frost, ice or snow adhering to any of its critical surfaces.

40) The pilot operating under this exemption shall not operate a UAV system unless it is operated in accordance with the operating limitation specified by the manufacturer.

41) The pilot operating under this exemption shall not permit the use of a portable electronic device at the control station of a UAV system where the device may impair the functioning of the systems or equipment.

42) The pilot operating under this exemption shall not conduct a take-off/launch of a UAV if explosive, corrosive, bio-hazard or bright light emitting (laser) payloads, or any payloads that can be jettisoned, dispersed or dropped, are carried onboard.

43) The pilot operating under this exemption shall ensure the following operational and emergency equipment is immediately available:

    a. checklists or placards that enable a UAV system to be operated in accordance with the limitations specified by the manufacturer; and

    b. a hand-held fire extinguisher of a type suitable for extinguishing fires that are likely to occur.

44) The pilot conducting operations under this exemption shall remain clear of the take-off, approach and landing routes and the pattern of traffic formed by manned aircraft operating in the vicinity of aerodromes.

45) Any person conducting operations under this exemption shall ensure that the appropriate air traffic service unit(s) is advised immediately anytime the flight of a UAV inadvertently enters into controlled airspace.

46) The pilot operating a UAV under this exemption, before entering or operating within in the Canadian Air Defence Identification Zone (ADIZ), shall comply with section 601.145 of the *Canadian Aviation Regulations*.

Pilot Training Conditions

47) The pilot operating a UAV system under this exemption shall have successfully completed a pilot ground school program that provides instruction on the following subject areas:

    a. airspace classification and structure;
    b. meteorological and NOTAM reporting services;
    c. interpretation of aeronautical charts and the Canada Flight Supplement; and

43

d. applicable content of the *Canadian Aviation Regulations*;

48) The pilot conducting operations under this exemption shall be appropriately trained on the UAV system and qualified for the area and type of operation as referred to in Transport Canada guidance material.

UAV System Conditions

49) Any person conducting operations under this exemption shall, prior to conducting a take-off/launch of a UAV, ensure that there is a means of:

a. Controlling the flight of the UAV;

b. Monitoring the UAV system;

c. Navigation;

d. Communication, as required by the *Canadian Aviation Regulations*;

e. Detecting hazardous environmental flight conditions;

f. Mitigating the risk of loss of control of the UAV;

g. Sensing and avoiding other aircraft;

h. Avoiding flight into obstacles and terrain; and

i. Remaining clear of cloud.

50) Any person conducting operations under this exemption shall ensure that a UAV system is in a fit and safe state for flight prior to take-off/launch.

51) Any person conducting operations under this exemption shall ensure that a UAV is not flown if it has been subjected to any abnormal occurrence unless it has been inspected for damage and repaired, if needed to ensure safe operation.

52) Any person conducting operations under this exemption shall ensure that all maintenance, servicing and disassembly-assembly of a UAV system and associated components are performed in accordance with procedures described in the manufacturer's specifications.

53) Any person conducting operations under this exemption shall ensure that the requirements of any airworthiness directives, or equivalent, issued by the manufacturer have been completed.

54) Any person operating under this exemption shall ensure that the UAV is not equipped with an emergency locator transmitter (ELT).

55) Reporting Conditions

56) Any person operating under this exemption shall, prior to the commencement of operations, notify the Minister, in writing, of:

a. Their name, address, telephone number and e-mail;

b. The model of UAV(s) being operated including serial number(s), where appropriate;

c. The type of work being conducted; and

d. The geographic boundaries of the operation.

57) Any person operating under this exception shall notify the Minister within 10 working days of any change to the information provided in the above condition or upon the permanent cessation of UAV system operations.

58) Any person conducting operations under this exemption shall report to the closest Transport Canada Civil Aviation office, as soon as possible, details of any of the following aviation occurrences during the operation of a UAV system:

a. Injuries to any person requiring medical attention;

b. Unintended contact between a UAV and persons, livestock, vehicles, vessels or other structures;

c. Unanticipated damage incurred to the airframe, control station, payload or command and control links that adversely affects the performance or flight characteristics of the UAV;

d. Anytime the UAV is not kept within the geographic boundaries and/or altitude limits as outlined in this exemption;

e. Any collision or risk of collision with another aircraft;

f. Anytime the UAV becomes uncontrollable, experiences a fly-away or is missing; and

g. Any other incident that results in a Canadian Aviation Daily Occurrence Report (CADORS).

59) Any person conducting operations under this exemption shall, following any of the aviation occurrences listed above, cease operations until such time as the cause of the occurrence has been determined and corrective actions have been taken to eliminate the risk of reoccurrence.

VALIDITY

This exemption is in effect until the earliest of the following:

December 21, 2016 at 23:59 (EST);

the date on which any one of the conditions set out in this exemption is breached;

the date on which this exemption is cancelled in writing by the Minister, where he is of the opinion that the exemption is no longer in the public interest, or that it is likely to adversely affect aviation safety.

Dated at Ottawa, Ontario, Canada this _____day of _____, 2014, **on behalf of the Minister of Transport.**

ANNEX A: EXCERPTS FROM THE *CANADIAN AVIATION REGULATIONS*

101.01

"model aircraft"
"model aircraft" means an aircraft, the total weight of which does not exceed 35 kg (77.2 pounds), that is mechanically driven or launched into flight for recreational purposes and that is not designed to carry persons or other living creatures; (modèle réduit d'aéronef)

[...]

"unmanned air vehicle"
"unmanned air vehicle" means a power-driven aircraft, other than a model aircraft, that is designed to fly without a human operator on board; (véhicule aérien non habité)

[...]

602.41 No person shall operate an unmanned air vehicle in flight except in accordance with a special flight operations certificate or an air operator certificate.

[...]

603.65 This Division applies in respect of the following flight operations when not conducted under Part VII:

[...]

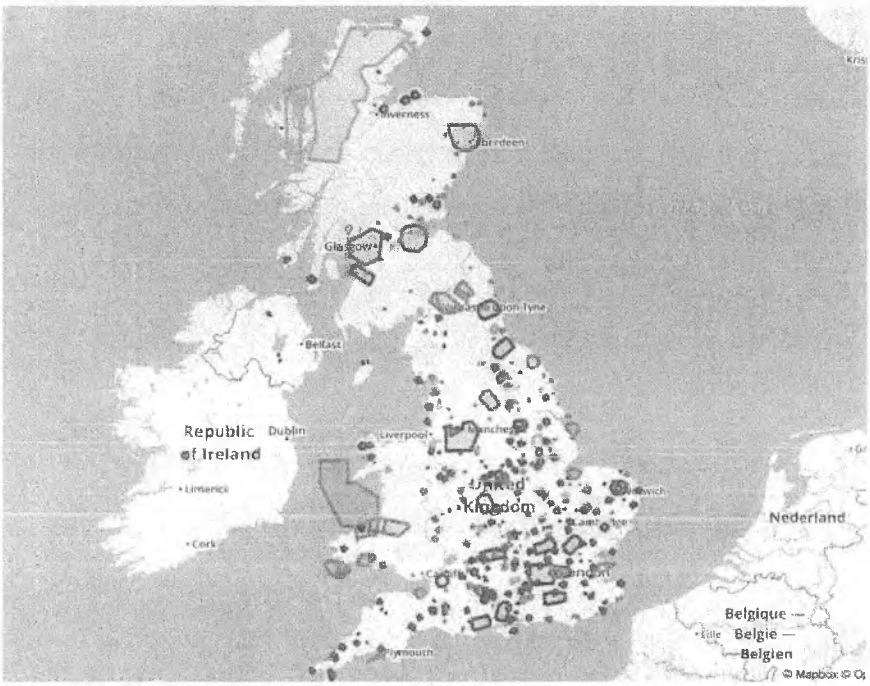
(*d*) the operation of an unmanned air vehicle;

[...]

603.66 No person shall conduct a flight operation referred to in section 603.65 unless the person complies with the provisions of a special flight operations certificate issued by the Minister pursuant to section 603.67.

603.67 Subject to section 6.71 of the Act, the Minister shall, on receipt of an application submitted in the form and manner required by the *Special Flight Operations Standards*, issue a special flight operations certificate to an applicant who demonstrates to the Minister the ability to conduct the flight operation in accordance with the *Special Flight Operations Standards*.

Don't Fly Drones Here – UK Edition



UK drone enthusiast James Harvey has created a free site, not for profit, called NoFlyDrones that just highlights the areas in the UK that RPAS operators should not operate in. He made it after he saw numerous complaints and difficulties that non aviation related people were having when reading aviation maps. So this puts the same information pertinent to RPAS operators on a simple interface.

To view an interactive version of the map, click here.

Drone Regulations in the UK are extremely mature when compared to the rest of the world, they are fair and proportionate enough to allow us to fly drones in some stunning locations across the country. The rules and regulations that do exist are in place to ensure the safety of other air-space users, third parties on the ground as well as locations of national security, such as high security prisons, royal residences and military danger areas. Breaches of these regulations are not taken lightly by the CAA and ignorance of the law is no excuse, so learn from the lessons of others and check the airspace before you fly.

This website's sole purpose is to provide drone operators with a quick and easy means of determining where they should and shouldn't be flying based on the airspace above them.

Map of No Fly Zones

Tweet 29 8+1 2

Unless flying in accordance with the current CAA general exemption for FPV flight, Small unmanned aircraft should be flown in accordance with the following:

- <400ft vertically
- Within line of sight (typically <500m horizontally)
- CAP393 Air Navigation Order (including by not limited to Article 166 and 167)

Only those airspace restrictions that extend below 400ft are shown on this map below.

Use the magnifying glass to search for a location by town, city or postcode.

Airspace Type	Description

53

Airspace Type	Description
Danger Areas and HIRTA's	Danger Areas are areas of military airspace often used for activities such as fighter pilot training, live ammunition training or weapons and systems testing (including GPS jamming exercises). The official definition is "An airspace of defined dimensions within which activities dangerous to the flight of aircraft may exist at specified time. HIRTA's are High Intensity Radio Transmission Areas, flying through these areas could interfere with the electronics on board your drone.
Prohibited Areas	Prohibited Areas are areas of airspace which for one reason or another have been prohibited from having aircraft enter them. The official definition is "An airspace of defined dimensions above the land areas or territorial waters of a State within which the flight of aircraft is prohibited" You will have to investigate the NATS AIP for more information about why the area is prohibited.
Controlled Airspace, Aerodromes and Airports	The round blue areas on the map indicate Aerodrome Traffic Zones, they surround smaller airports and aerodromes that do not have additional controlled airspace. Other areas of blue identify Controlled Airspace. If you are operating a drone above 7kg you must not fly in these areas without prior permission from the air traffic service provider controlling that airspace.If you are under 7kg, it is still strongly advised to notify the air traffic service provider of your activity.

54

Airspace Type	Description
Restricted Areas	Restricted Areas protect sensitive locations such as prisons and nuclear facilities. The official definition is "An airspace of defined dimensions above the land areas or territorial waters of a State within which the flight of aircraft is restricted in accordance with certain specified conditions"
Military Aerodrome Traffic Zones	Military Aerodrome Traffic Zones, similar to civil Aerodrome Traffic Zones, typically protect military aerodromes in the same way.

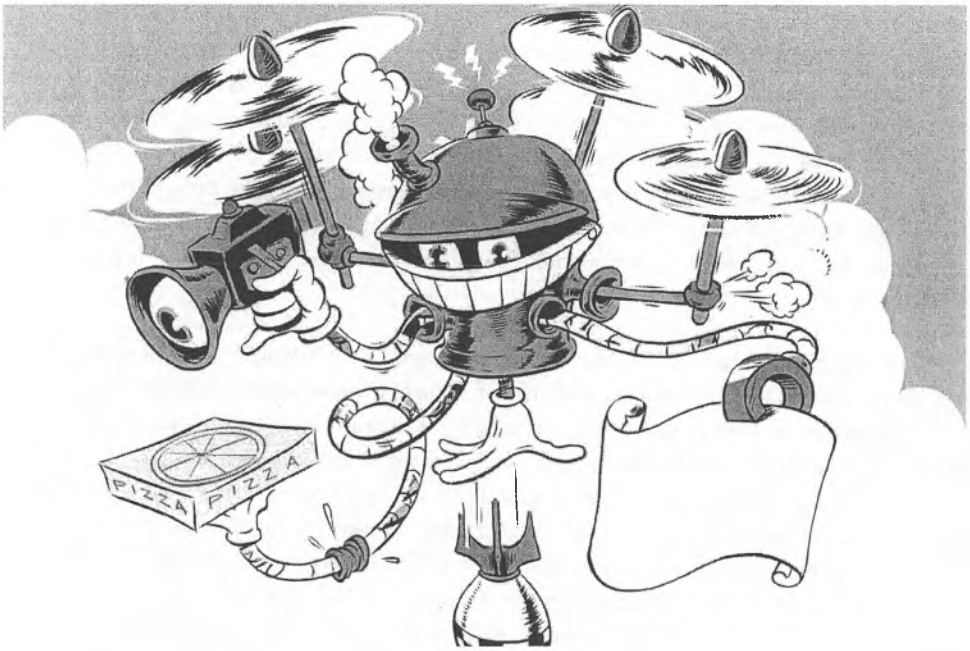
Drones and Everything After

By **Benjamin Wallace-Wells**



Drones AndEverythingAfter
The flying, spying, killing machines that are turning humans into superheroes.
By Benjamin Wallace-Wells
Illustrations by Andrew Rae

Recently, it has been getting harder to disappear on this planet. A surveilling drone began passing over the remote forests of northeastern Nigeria earlier this year, tracking the separatist group Boko Haram, catching glimpses of hasty encampments and escapes along dirt trails. When the militants kidnapped 200 schoolgirls this spring, a camera in the sky captured a large group of girls, sitting together in a clearing. Soon after, the cameras captured a similar group of girls elsewhere in the forest. Each time, the girls were moved before they could be spotted again, or rescued. What was left was just a spooky afterimage, like the impression made on a photographic plate: The most famous missing people on the planet, for an instant at least, found.

Late one afternoon in December, a drone armed with Hellfire missiles was flying low over the Yemeni desert, an audible buzzing presence, tracking a convoy of cars and trucks that were caterpillaring along a route between villages. Within the convoy were the members of two large families, escorting a bride from a wedding celebration in her own village to another in her groom's, and though they noticed the drone, its presence was not unusual. Then, while the group was stopped because of a flat tire, the noise from the drone grew louder, as if a decision had been reached, and it began to discharge missiles. Several men jumped from the fourth truck before it was destroyed, but as they fled the drone seemed to track them across the sand, and fired again, **according to Al Jazeera America**. An older sheikh ran from his car and found his son, dead and

bloodied, pierced by flying shrapnel in his face, neck, and chest. Twelve men were killed. They were farmers, shepherds, and migrant laborers, mostly. U.S. government officials would say later that the target had been a militant, affiliated with Al Qaeda, who managed to escape the attack. **A report by Human Rights Watch** suggested that he might never have been there at all.

In a hobby shop in Cupertino, California, last summer, a 13-year-old boy named Kyle Ettinger noticed a tiny Nano QX drone sitting on the shelves and thought to himself, "Oh my God, I've got to have it." The machine was a marvel. It was black and yellow, weighed less than an ounce, looked a little like a Disney bug, and yet it could fly. Ettinger learned to maneuver it through the air around his yard and neighborhood; he was hooked. Soon he bought two more drones, larger and more capable. One was outfitted with a first-person-view camera, so that through a pair of goggles he could see what the drone saw. He liked to pilot the machine out of view, so far that his father would get anxious that it might crash or get lost, then bring it soaring back toward them, like a hero. Ettinger would sometimes get motion sickness flying the drone. But through the goggles, Cupertino seemed to crack open. Flying a couple of blocks from the house in which he'd been raised all his life, Ettinger noticed a large electrical station he'd never known existed, an industrial mass in the midst of his suburb. He says, "You can see a different world from up there."

If you were creating, from scratch, a taxonomy to describe all machines, these drones would not belong to the same species. They would probably not belong to the same phylum. The technology of unmanned flight has diversified so rapidly that there are now 1,500 different *kinds* of drones being manufactured, and they are participants in nearly every type of human endeavor, composing a whole flying-robot ecology so vast that to call every one by the same name can seem absurd. But *drone*, an impossible word, is also a perfect one. Each of these machines gives its human operator the same power: It allows us to project our intelligence into the air and to exert our influence over vast expanses of space. Drones have become important to the pursuit of isis, the plans of Amazon and Google, the management of farmland in Asia, the **protection of pyramids in the Andes**. Just within the past two weeks, Facebook has announced a trial of a drone-based wireless internet, the delivery conglomerate DHL has revealed that it will use the machines to ship packages to isolated German islands in the North Sea, and **the U.S. government has decided to allow Hollywood production companies** to film from drones, making possible visual angles that have so far existed only in animation.

Drones are a different kind of new technology from what we're used to. The communications breakthroughs of the past two decades have multiplied the connections within society, but drones offer something else: the conquest of physical space, the extension of society's compass, the ability to be anywhere and see anything. This physical presence can be creepy when seen from the ground, in ways that echo the imaginings of science fiction. "Flying," says Illah Nourbakhsh, who ran the robotics program at NASA's Ames facility, "creates this dynamic where people are no longer on top." And yet to the drone pilot, maneuvering through the air, it is liberating.

It's an incredible thing, extreme elevation. It makes you feel both alone and unsurpassable. Send a drone up, equipped with a camera, the control in your hands and your laptop rigged to see what the camera sees, and what you feel is not displacement but extension. Each of these flying robots, more than anything else, changes your perspective. Now anyone with a drone can watch the Earth from a point of view that once implied great power. This summer, the pastor of a prominent Evangelical megachurch in Texas delivered a series of sermons comparing **God to a Predator** drone.

Lost in the concern that the drone is an authoritarian instrument is the possibility that it might simultaneously be a democratizing tool, enlarging not just the capacities of the state but also the reach of the individual — the private drone operator, the boy in Cupertino — whose view is profoundly altered and whose abilities are enhanced. "The idea I'm trying to work out to simplify this whole thing — surveillance, drones, robots — has to do with superhero ethics," says Patrick Lin, a technology ethicist at California Polytechnic State University. "It's about what humans do when they have superpowers. What happens then?"

61

It's an incredible thing, extreme elevation. It makes you feel both alone and unsurpassable.

In San Francisco, it no longer seems out of the ordinary for a drone to get lost in a tree. "Big thanks to the SF Fire Dept," one drone enthusiast tweeted recently over a photo of a **firefighter laboring up a ladder** to rescue a robot from a high branch. Drones have been disappearing into the playa at Burning Man. "It is white plastic with red and blue stripe stickers on the

propeller arms," ran the Craigslist post pleading for the machine's return. In Seattle, a drone saddled up to the 26th floor of an apartment building and peeped through a window, alarming the woman inside. In Los Angeles, a drone wandered high into the sky near LAX **and startled the pilot of a Canadian jetliner**; another hovered near the tenth floor of the LAPD's headquarters, drawing curious cops to the window. In Yosemite, the Park Service had to issue a ban to keep drones from spooking nesting peregrine falcons. These machines, in other words, have begun to display punkish, pubescent energies, as if we had entered drone adolescence.

It wasn't too long ago that to operate an unmanned aircraft meant standing in the middle of a field with a radio controller in your hand and toggling the vehicle through the sky — back and forth, up and down — as if tied to it by a tether. That this now seems ancient is thanks in part to the smartphone revolution, which made many of the components needed for autonomous flight (computer processors, GPS, tiny cameras, and sensors) far smaller, smarter, and cheaper. Within the past five years, these technologies have helped to produce affordable drones that can fly on their own, stabilizing themselves when the winds shift, heading for a point specified on GPS. We are deep enough into the entrepreneurial era that everyone can see a gold rush coming; hobbyists in the obscure world of radio control trade stories about cold-call emails from investors or government agents. "I have these buddies who would drop off into darpa-land for a few years, and you'd never hear from them," a Texan tinkerer named Gene Robinson says. "And then suddenly they reappear with a Ferrari, and they say, 'I can't tell you exactly what I've been working on. But it worked.' "

Robinson wanted in on the rush too. A decade ago, he was a somewhat burned-out IT guy in his mid-40s, recently divorced, and maybe a bit too garrulous for IT in the first place. He quit his job, worked to perfect his drone — a fixed-wing model that looked like a miniature Stealth Bomber — and tried to figure out how to make money on it. Robinson did the simplest thing he could think of: He stuck a Nikon camera onboard, its lens aimed down, and went searching for people who might pay for the point of view. Farmers, real-estate agents. Prospecting, and having had little luck, Robinson eventually connected with a volunteer group called Texas Equusearch, which scours rural stretches of the country on horses and ATVs looking for missing people and dead bodies. They were interested. They could see how a drone might be useful.

Robinson's first drone search was for a man named David Lee Pettiet, who had departed the modern grid in an especially barren spot of West Texas. Search parties had failed to find Pettiet for six months, long enough that the sheriff, according to Robinson, became convinced he was still alive and had begun to suspect he might be robbing banks around the county. Pettiet's sisters were despairing. The drone found him within a day—its aerial camera photographed two slashes of white, a foot apart, in a brambly clutch of downed trees, that turned out to be Pettiet's tennis shoes. The sheriff's deputies had passed just a few feet from Pettiet's body during a mounted horse search weeks earlier. But their perspective was wrong: too low.

Robinson has now flown drone searches in 31 states and several foreign countries, and this higher angle, 400 feet in the sky, has given him a view of a lot of human activities that might otherwise remain secret. Often he is called in after helicopter searches have failed; because his drone is cheaper and can stay in the air longer, it provides a more comprehensive view. It takes 15 minutes for his drone to photograph a square mile, every inch accounted for. "Human beings have left an awful lot of this world empty," Robinson says. But he has learned how to spot earth that has been churned to dig an impromptu grave, the way grass gets crushed and marked when a body is dragged through it, and the kinds of shelter that people seek when they are lost and alone. Some people he works with will try to press a suspect to confess by telling them campfire stories of what the drone can see. Robinson believes that to locate a dead body is to restore certainty to the family. **Your 2-year-old was not kidnapped; here is the spot where he drowned.** Here are the physical remains. It is as if he were reattaching stray pieces of society, putting things back in their place. Robinson says he had a devilish, misspent youth. "Now I'm earning my heaven points."

The privilege of seeing this way, and this much — it exists simply because he has a drone. Should it? Clarifying where drones are allowed to fly and under what circumstances has proved challenging. There are no consistent laws about whether police need a warrant to fly a drone over your property, searching for drugs or evidence. (A few state legislatures have passed laws requiring police to secure warrants, others have decided that cops do not need to, and most have set no guidelines at all.) It is even less clear how private operators, hobbyists, or governments should operate. The airspace above 500 feet is reserved for planes and other aircraft, but below that line the rules are "irregular and inconsistent," says Troy Rule, a law professor at Arizona State — there is little clarity, for instance, about whether a property owner can prevent her teenage neighbor from

flying a drone over her house. Congress has asked the Federal Aviation Administration to regulate the commercial use of drones by next September, but an agency audit has signaled it will likely miss its deadline. One mark of exactly how conflicted the government is about drones is that Robinson is at once a frequent collaborator with state agencies and a recipient of cease-and-desist letters from the FAA.

In Georgia once, searching for a missing woman, Robinson happened upon a huge marijuana crop, perfectly clear from the drone's camera. The local sheriff took the images and executed one of the biggest pot seizures in the state's history. (Courts have generally held that individuals have little reasonable expectation of privacy from aerial surveillance.) In Torrance, California, there is a man who uses his drone as a flying citizens' patrol, to photograph police in the act of pulling cars over or operating checkpoints, as a curb on abuses, so that cops in the Los Angeles area often find themselves subject to a scrutinizing eye in the sky. When science-fiction writers and critical theorists have warned of the surveillance future, they rarely imagined this chaos. The surveillance capacities of the state have grown. But so have these accidental private panopticons.

"It does make the libertarian side of you a little uncomfortable," Robinson allowed, when we were having lunch at a Mexican restaurant in Wimberley, Texas. He pushed across the table a drone image he'd shot in Oklahoma a few weeks earlier, in a search for a missing man, a square mile or so of empty parkland enclosed by a few houses and streets. With his thumb, he traced means of egress and ingress; there was a shopping center and power lines, evidence of the whole connected anthropological network of a town. "More people are seeing the world from that perspective," Robinson said. "Eventually, even more people will. You'll be driving a car down the road, and you'll have that aerial view in mind."

There is a four-minute shot that opens *Pretty Sweet*, a short skateboarding film from 2012 co-directed by Spike Jonze, shot entirely from a drone. The lens starts tight on a skateboarder's face — a gnarly and meaty face, the kind an Italian butcher might grab, cure, and slice. Then the camera begins to move, past him and across the street, tracking four new skaters as they jump out of a pickup truck and scale a fence, then following one skater razoring down a flight of stairs, then soaring past them and down to a bug's-eye view, another skater leaping, a girl tumbling, each figure quickly exchanged for the next but the movement continuous, as if the camera were working in cursive, until it lifts higher and disappears into a cloud of confetti. Money shot. "Even now I watch that and I get chills," says Randy Slavin, a commercial director who recently founded the first drone film festival. "There is literally no other way to get that shot. You can put a camera literally anywhere in three-dimensional space. You can design any shot."

In a movieFollowing skateboarders in Spike Jonze's *Pretty Sweet*.

Slavin bought a drone shortly after he saw that video, but it took him a while to get good enough to make much use of it. Certain moves turned out to be tricky. He wanted a shot that would track someone walking down the street, initially from the front but then turning as she passed and watching her from the back. That pivot was hard to perfect — you had to pull the camera back, dip it, and turn it all at once — and so he practiced it on a basketball court near his apartment in Tudor City. Soon, though, he could get the drone to run like a dog, low and fast along the street. He got it to skim over a swimming pool, like a bird hunting fish, and to stalk through gardens of friends' mansions in the Hamptons, **like a burglar**. On his laptop, Slavin showed me one of the most famous sequences in 20th-century film, the beginning of *The Shining*, where the camera follows a car deep into the wilderness. Kubrick shot these scenes from a helicopter — far more expensive than a drone, and also less nimble. "You can just hear Kubrick saying, 'Closer! Get closer!' " Slavin said. With a drone, you could always get closer; you could move back and forth between the intimate and the vast. "My dream," Slavin told me, "is to start a shot in a living room" — on a couple having an argument, maybe — "and then very quickly go out the window and up, so that you can see the whole city."

None of the early entrants in Slavin's festival, which will take place in February, were shot by Kubrick or Jonze. This is a novice's medium. In one infamous drone video, the camera swoops toward a bride and groom standing in a field with their foreheads touching and eyes closed. The drone flies under a flowery arch twined with flowers, then slams into the groom's head. On YouTube, there is evidence that the technique of many drone photographers is better, and there is some artistry too: **gorgeous overhead film of New Zealand's landscape**, for instance, and **one dramatic video from a drone flown into a fireworks celebration** in West Palm Beach, powder exploding all around the camera. "Pretty ballsy," Slavin said approvingly.

64

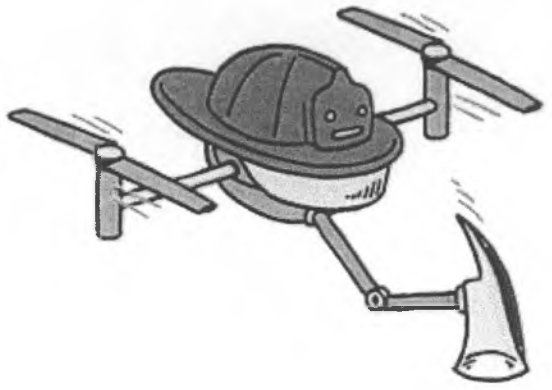
There is something uncanny about the drone perspective that creeps up on you, the more videos like this you watch. The drone's point of view emphasizes the mass scale over the individual. One of the early drone videos that got around, enough to collect nearly 2 million views, is a vision of last year's Burning Man, roving across the encampments — the huge sculptures, the big empty desert beyond. From high above the festival, individual distinctions blur and the people look almost choreographed. The man who shot it, a San Franciscan named Eddie Codel, had been going to the festival for years, and he told me he was intrigued by the way the drone removed you from the usual individual perspective — circumscribed, on the ground — and let you see the "organized chaos" of Burning Man as a whole.

Above the desertDocumenting the Burning Man festival.

When this perspective first began to proliferate through aerial photography nearly a century ago, it was greeted both with awe and alarm. Observing the world from above distanced the photographer, and the viewer, from their subject: "the God's-eye view," as the film historian Paula Amad calls it. Walter Benjamin believed there was violence inherent in this perspective — dehumanization and threat. (The Futurist poets, early theorists of Fascism, loved aerial photography.) Other intellectuals were convinced that it emphasized the essential interconnectedness of people. The aerial view resembled the perspective from which audiences gazed down on mass stadium spectacles, in which individuals become "mere building blocks and nothing more," the critic Siegfried Kracauer wrote in his famous essay "The Mass Ornament."

Both the beauty and the strangeness of drone art come from this point of view. The line of sight seduces photographers. It also affects them. There is a San Francisco outfitter called Photojojo that rents camera-equipped drones for the day, and the company's founder, Amit Gupta, told me that customers tend to take pictures of recognizable monuments from an unusual perspective, or to photograph themselves. The drone selfie has become a slightly ridiculous cultural artifact (at least since Twitter **persuaded Patrick Stewart** to take one in Cannes), but the perspective it provides is thrilling: a reminder of how small we are and how little we can see, of how awesome and humbling the God's-eye view can be.

Here, for instance, is **Gupta taking a video of himself from a drone**, a young man in a T-shirt and jeans standing on Bernal Hill, next to two of his friends. The drone hovers at eye level as if it were a fourth friend, and then Gupta touches the controller and the camera begins to back away and the frame extends; now it captures not just the three men but the whole hill they are standing on, and then the park. Then, the neighborhood, and then most all of San Francisco. And then, majestically, the bay beyond. The film lasts only 15 seconds, but in Gupta's hands the drone is not a tool of narcissism but a context machine. As the video ends, he is still in the center of the frame but his true subject has swelled all around him: San Francisco, the mass ornament.

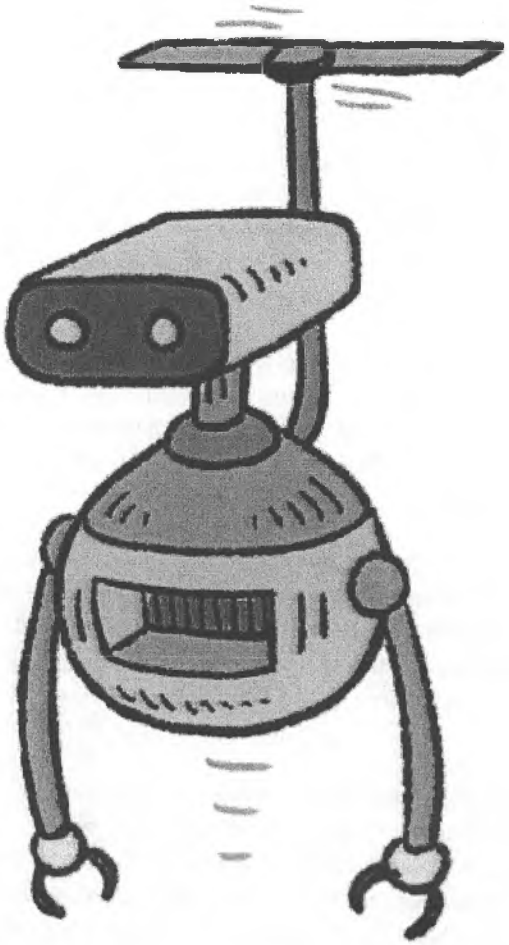


There are villages in the most remote tribal areas of Pakistan in which these context machines are such a constant, noisy presence that drones are sometimes called *bangana,* a Pashto word for wasp. While they linger, no one on the ground knows whether their mission is surveillance or assassination. It is this combination of inscrutability and remote power that makes them such a maddeningly seductive and destructive tool of foreign policy. In May 2012, a drone strike destroyed a

residential block in the Yemeni city of Jaar. Fifteen minutes later, the drone fired again, into the same houses, so that some people who had come to help the wounded were themselves killed. A pregnant woman died. A 65-year-old taxi driver, rushing to help members of his family after the first strike, saw "seven or eight" bodies scattered around him. No one seemed to really understand what, or whom, the drone had been pursuing, or even who was operating it. Some eyewitnesses who spoke with NPR were certain they had seen a gray American jet, "like an eagle." Those talking to the London *Times* were convinced the plane had been black and Saudi. Perhaps the aircraft they'd seen had nothing to do with the strike at all.

The places where drone strikes have been most common are places accustomed to violence and war. "In Pakistan, things fall out of the sky all the time," the country's former president Pervez Musharraf is supposed to have said. Things dropped from drones tend to fall more exactly in place. American drone strikes in Pakistan, Yemen, and Somalia have killed between 3,200 and 5,400 people since 2002, **according to the Bureau of Investigative Journalism**, by whose accounting about one-fifth have been civilians. In Pakistan's tribal areas, the strikes seem to have suppressed militant attacks on the local population and panicked terrorist leaders — but they haven't caused civilians to flee. Since the Pakistani army began destroying villages in North Waziristan in June, nearly 1 million people have fled their homes. But with drones there seems to be no assumption that any individual attack is likely to be followed by another. People stay put, says Christine Fair, a scholar of South Asian security at Georgetown. "There has never been a refugee crisis because of drones."

And yet something has changed. It is so much less risky to deploy drones than manned airplanes that the threat of a strike — the possibility of assassination — now exists everywhere in these zones. It is part of the everyday landscape even when no soldiers are near. A hovering weapon is sometimes the most visible image of America overseas. (And not just America: **Ukraine's government has bought drones to deploy** against Russian-backed insurgents, Chinese officials have disclosed that they'd considered sending an armed drone to assassinate a drug trafficker in Myanmar, and **Hezbollah has been flying drones**, likely provided by Iran, into Israeli airspace.) Survivors remember the strikes with a bewildered horror: "I found families ... wrapping up the body parts of people from the ground, from here and there, **putting them in grave clothes like lamb**." "A person leaves his house in the morning and he looks right and left, not knowing from where a blow might come that would be his end." "I can't think what possible connection my mother had with the Americans and why they had to kill her."



Before unmanned aircraft proliferated, the American military could track a target virtually anywhere on Earth, conducting surveillance and reconnaissance, but the cost and complexity of performing these missions limited their use and often required approval from very senior officers. Drone technology, says Ioannis Koskinas, a retired Air Force colonel, has given soldiers "at the smallest infantry level — the squad" — access to these tools. An ordinary soldier can, if the resources at that moment permit, learn what is happening in a dangerous area he is about to enter in something close to real time. His awareness is enhanced.

Pilots typically benefit from what psychologists call "the morality of altitude" — separated from their victims by thousands of feet of airspace, they tend to suffer far less post-traumatic stress than do their counterparts on the ground. But drones have collapsed that moral distance, bringing their operators into far greater intimacy with their targets. The details of how drone pilots work have, like the missions themselves, been largely classified, but by combing through unclassified medical studies of drone-operator stress, Peter Asaro of the New School has been able to pinpoint some of the changes. Asaro found that tasks that had been distributed through the military and intelligence bureaucracies (gathering intelligence on a target, conducting surveillance, weighing the risks of a targeted killing, navigating a plane, firing a missile, assessing what happened afterward) have now been concentrated, so that they are all performed by tiny teams often scattered at bases around the peacetime United States, working at night, monitoring targets halfway across the globe for whose survival or death they are responsible.

"A pilot traditionally might have to fly to a coordinate and drop a bomb, and that was it," Asaro says. "Now a drone operator has much more intimacy. Often he has to track a subject for weeks beforehand. The access to the intelligence is much greater. Sometimes they have to do damage assessment in the aftermath of an attack — to count the bodies pulled from the rubble." Two years ago, **a former drone-sensor operator named Brandon Bryant went public**, telling reporters about his difficulty shaking memories, including one of a strike in which he was sure that his crew had inadvertently killed children.

67

"They aren't really like pilots, and they certainly aren't like artillerymen, where you never see the target," Asaro says. "The better analogy is to snipers."

An anonymous drone operator, interviewed by the artist Omer Fast:

Five thousand feet is the best. I love it when we're sitting at 5,000 feet ... Plus, at 5,000 feet, I mean, I could tell you what type of shoes you're wearing ... I could tell you what type of clothes a person is wearing and if they have a beard, their hair color ... If someone sits down, let's say, on a cold surface for a while and then gets up, you'll still see the heat from the person for a long time. It kinda looks like a white blossom ... It's quite beautiful. I mean, heck, if you see somebody light up a cigarette, that's a huge beacon. You just see a very white glow coming from that area. And you're just on a preset path flying a circular orbit, watching them as they're smoking from about two to three miles away.

The great Silicon Valley TacoCopter Hoax kicked off with an announcement of a new product just futuristic enough, and just fratty enough, to drive tech websites into a state. "It's an unmanned drone shooting a taco from space down at you and your colleagues during lunchtime!" the Huffington Post's Jason Gilbert enthused. "The concept behind TacoCopter is very simple, and very American: You order tacos on your smartphone and also beam in your GPS location." You can imagine the rest. The hoaxers suggested that their "tireless" drones would soon be flying tacos to customers sitting at the beach.

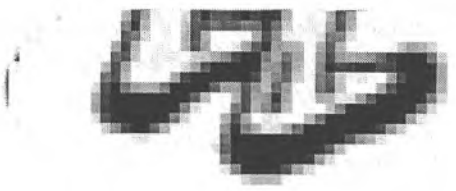
The idea that robots might serve as mechanical butlers has been around at least since the very first episode of *The Jetsons* aired on September 23, 1962, during the Kennedy administration, almost seven years before the moon landing. George and Jane become overwhelmed by the complexities of life in the SkyPad apartments and decide to buy a robot maid, Rosie. Under her watch, life runs more comically but also more smoothly: The meals get cooked, the house gets cleaned, and she cracks wise in almost exactly the manner and accent that Fran Drescher would, more than a quarter-century later. She helps with homework.

This notion — that a personal robot might hover near at hand, helping to ease life's small dilemmas and anxieties like a Seussian cleaning machine — tends to be the first instinct of would-be drone entrepreneurs. A roboticist in Boston named Helen Greiner envisions drones that would meet her midway through her run on the Boston Common bearing a water bottle. David Weekly, a San Francisco technologist who recently founded what he says is the first venture-capital fund devoted exclusively to drones, says that techies "think first about Follow-Me. They buy a Phantom 2 and immediately think, *Couldn't I get this to follow me around all the time and photograph me?*" Many of these drone-videography applications, Weekly believes, are prone to a looming hype-and-bust cycle. Weekly is more enthusiastic about projects that envision drones' operating on a larger scale, or in places that are hard for humans to reach: repairing and monitoring wind turbines and bridges, for instance, or cultivating large agricultural fields from the air.

Some of the most ambitious drone projects are already in trials. A few months ago, Andreas Raptopoulos, the co-founder of the Menlo Park company Matternet, raveled to Bhutan, where he has been working with its government to use drones to deliver medicine to health clinics isolated high in the Himalayas. **Raptopoulos is fond of noting** that one-seventh of the world's population — 1 billion people — are without access to roads for some part of the year. Drones, he believes, could serve to correct the geographic accidents of birth, to give people living in the most remote and often poorest corners of the globe a more tangible connection to the rest of civilization.

Bhutan had been tricky in ways that both reminded Raptopoulos of the problems he was trying to solve and suggested how difficult the solution would be. It takes up to 12 days for medicine to get up the mountains by road, or for blood samples to get down to a lab in the capital, and even driving to the mountain clinics was an anxious experience. Matternet's drones, cheap and light but with limited range, are meant to hopscotch up the mountain, each one handing off the package to the next, like a flying-robot Pony Express. The intention is for the handoff to be automated, but the technology wasn't quite there yet, and so Raptopoulos had stationed workers every 20 kilometers. The altitude posed special problems: "When you go up higher, the air is thinner, you need to spin your propellers more aggressively, and you lose some of your performance," Raptopoulos says. Flying through the Himalayan valleys, his drones couldn't always connect with cellular networks, but they were able to use their internal GPS to navigate back to their track. They made do. Medicine got up the mountain much more quickly. "We could do it in a couple of hours," he says. "Most of the time."

68



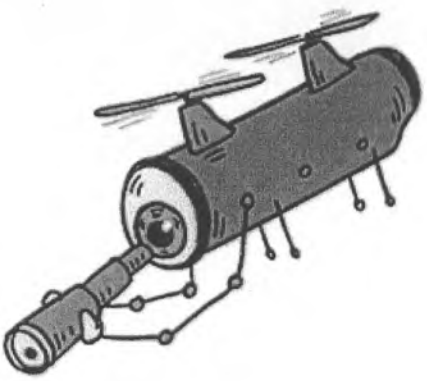
"Drone operators aren't really like pilots, and they certainly aren't like artillerymen. The better analogy is to snipers."

The interesting thing about projects like Matternet is that they suggest how a single human operator might control an entire system of drones. Vijay Kumar, a roboticist at the University of Pennsylvania, is experimenting with drone swarms, which would be more powerful and also, ironically, simpler, since in a swarm each individual drone could be assigned a different task. He showed me a video of an experiment he had run in which five drones had been given a blueprint of a skeletal structure and a row of construction materials. After a minute, the drones begin to zip over to the materials, each grabbing something in its hook, and then, a few feet away, adding the piece to a small structure that has begun to rise.

There is enough of this going around to think that swarms could be the drone's most plausible future. Both Amazon and Google have hinted at large networks of autonomous delivery drones, and Facebook recently suggested that its project would aim to have one human pilot for every 100 drones. An agricultural engineer at Georgia Tech is working to design large teams of drones and ground-based robots that can monitor and manage farmland with no human involvement.
A roboticist in Switzerland is working on designing drones that could on their own tie fibers together to create tensile structures — a rope bridge across a remote ravine, maybe, to be prepared before a human explorer arrived. Kumar has deployed his drone teams to map the destruction of Japanese buildings after the tsunami. "Think about 9/11 — those firefighters should not have run up those stairs, robots should have flown up them," Kumar says. "Who cares if you lose a hundred robots."

This humanitarian strain runs through many drone projects, and though it is often deeply felt, it also serves to disguise dramatic disparities of power. "People should not be dying because medicine cannot physically get to them," Raptopoulos says, and this is moving and true, though it is also a way to introduce what he says is his ultimate vision, of a for-profit package-delivery service. Part of the attraction of drones is that they allow their operators to tinker in faraway places—leapfrogging medicine over swamped roads, annihilating militants holed up in unreachable villages, discovering lost bodies—even though not every disruption is welcome.

And yet this is a complicated kind of privilege. Drones let you see so much more of the Earth, at once more fully and minutely, in ways that confuse the normal relationship between intimacy and distance. With a drone you roam in a peculiar disembodied manner; you move through the world a little less like an actor and a little more like a director. Your new powers make you a little less recognizably human. In some real but imperfect way you exist in more than one place at once.



One 102-degree afternoon just before Labor Day, I drove with Gene Robinson to an empty field in the Texas Hill Country to fly his drone. Robinson placed the machine on the flatbed of his truck and connected with it wirelessly, programming a flight

69

plan and a launch protocol. Then he walked out into the middle of the field, gave a crow's hop, and threw the drone up into the air. Until it was 60 feet in the air, it just climbed upward. Then, having situated itself in space, it adjusted and began a slower, looping climb up toward 400 feet, high enough that you could no longer hear it.

We lost sight of it quickly. There was a noise in the distance of an engine heading our way. "General aviation," Robinson murmured — an airplane, and he turned around to look for it. Drone operators know never to get in the way of airplanes, since that is one of the clear red lines that the FAA has set. I asked Robinson whether he was concerned. "Oh, no," he said. We could see both the drone and the plane now. "We're at 400 feet," Robinson explained, pointing to the drone. Then he pointed to the airplane. "He's at 20,000."

From the ground, they were just two tacks in the same pincushion; I could not have said which one was higher. One of Raptopoulos's drawings depicts a drone highway, a horizontal band of space a few hundred feet from the ground in which machines can travel through the air undisrupted by the traffic and chaos below. But then there is space for dozens of bands like that between Robinson's drone and the airplane passing overhead, maybe more. There is just so much empty room up there. ■

RE: Interpretation of the Special Rule for Model Aircraft, Docket No. FAA-2014-0396

To Whom It May Concern:

EAA (the Experimental Aircraft Association) is the world leader in recreational aviation. With an international membership of more than 180,000 people in over 100 nations, EAA brings together pilots, aircraft builders, owners, and aviation enthusiasts who are dedicated to sharing *the Spirit of Aviation* by promoting the continued growth of aviation, the preservation of its history and a commitment to its future.

EAA is commenting on the FAA's Interpretation of the Special Rule for Model Aircraft, published in the Federal Register as 79 FR 36172 and recognized as Docket Number FAA-2014-0396.

EAA recognizes the need for rulemaking regarding unmanned aerial systems (UAS). We understand that the FAA must draw a clear line between UAS and model aircraft before such rulemaking can be created and implemented. UAS operations are a growing safety concern to the manned aviation community, and EAA is committed to a UAS regulatory system that protects manned aircraft from collisions and ensures unhampered access to all airspace by manned aircraft. In order to protect manned aircraft, certain unmanned aircraft must be regulated. EAA applauds the FAA's ongoing commitment to ensuring the safety of the national airspace.

However, we are concerned that the FAA's current interpretation of Public Law 112-95, section 336 exempting "model aircraft" meeting enumerated criteria from FAA regulation, could have negative and unintended consequences for the model aircraft community. This is an important community for EAA because 1) a significant portion of our membership participates in model aviation, and 2) model aviation is a key aviation low-cost "pathway" to participation in traditional recreational aviation and personal flight. The FAA's proposed interpretation, if implemented as currently presented, would have wide-ranging and universally negative effects on the model aviation community.

EAA offers the following comments:

1) The model aircraft community has been safely and successfully self-regulated for approximately 90 years. The largest community-based organization in model aviation, the Academy of Model Aeronautics (AMA), was founded in 1936 and has established a clear and effective set of guidelines that govern model aircraft flying at AMA-sanctioned events.

These rules, combined with the FAA's AC 91-57 and common sense, are traditionally recognized by the model aircraft community for all operations, sanctioned or not, and have been tremendously successful in fostering and sustaining model aviation's notable safety record. EAA is very concerned that the FAA's proposed interpretation on the special rule for model aircraft will have the unintended effect of unraveling trust and reliance upon community-based organization guidelines by subjecting model aircraft operators to a host of regulations that are completely unfamiliar to the community, including but not limited to airspace restrictions.

2) EAA is concerned that many traditional and accepted facets of the model aviation industry might be suddenly and unnecessarily jeopardized by this proposed interpretation. The FAA's interpretation suggests that any flight operations that have a financial compensation element are not conducted "strictly for hobby or recreational use" and would fall outside the rubric of "model aviation." EAA strongly disagrees with that narrow and novel interpretation.

For decades, model aircraft manufacturers and distributors have had the ability to demonstrate their products for the purpose of promotion and sales at community events and trade shows without scrutiny or regulation. Demonstration flights by staff members of manufacturers and distributors educate the community about emergent safety techniques, products, and technology. Furthermore, many individual model aircraft operators are sponsored by manufacturers and/or distributors. EAA is concerned that their sponsored operations might be construed as "commercial" in nature and therefore jeopardized by this proposed interpretation. EAA is concerned that a prohibition of these operations, or a requirement that these sponsored operators have an "airworthy aircraft" plus airman and medical certificates, would cause great damage to the model aircraft community without any responding to any demonstrated need or offering any public safety benefit. EAA also notes that many people can and do earn compensation from "hobbies," for example, woodworking, painting, or sculpting. Therefore, sponsored and manufacturer-staffed operations are not in contravention of Congress' mandate that model aircraft be operated by a "hobbyist."

3) FAA's insistence that model aircraft are "aircraft that fall within the statutory and regulatory definitions of an aircraft, as they are contrivances or devices that are 'invented, used, or designed to navigate, or fly in, the air'" is troublesome to EAA because the standard of "designed to fly in the air" is overly broad and not supported by historical precedence for the purpose of FAA oversight and enforcement. EAA believes that the definition of "aircraft" found in 14 CFR 1.1 was never intended to include model aircraft.

Many things are designed to fly in the air but have never been considered "aircraft" or subject to FAA regulation, e.g. toy balsa gliders, boomerangs, model aircraft, and paper airplanes. Even ultralights, regulated under 14 CFR 103, which are clearly invented to fly in the air carrying the operator onboard are determined by historical precedent not to be "aircraft" but rather recreational "vehicles." EAA is concerned that if the FAA regards model aircraft and other

devices "invented, used, or designed to navigate, or fly in, the air" as legitimate "aircraft," operators of these articles will be subject to the broad sweep of FAA regulation including airspace designation, equipment and communication requirements, ATC clearances, minimum altitudes, Temporary Flight Restrictions, and VFR weather minimums to name a few. EAA believes that claiming a toy airplane is an "aircraft" in the same way a Cessna 172 is an "aircraft" makes little sense, and Congress did not express intent for this stance. Subjecting model aircraft operators to regulations designed for manned aircraft defies common sense.

4) The proposed interpretation explicitly states that "the rulemaking prohibition [found in P.L. 112-95, section 336(a)] would not apply in the case of general rules that the FAA may issue or modify that apply to all aircraft, such as rules addressing the use of airspace (e.g., the 2008 rule governing VFR operations in the Washington, DC area) for safety or security reasons." If this is truly the case, then the FAA is alleging, in the case of the example provided, that any child who wishes to operate a toy remote-control helicopter in a park within 60 miles of the nation's Capital must take "special awareness training" for acting as "pilot in command" of an aircraft flying under visual flight rules. No reasonable person would support this interpretation and the risible consequences it suggests. EAA believes that the FAA's interpretation, if consistently applied, opens the door to the potential of enforcement action being levied against any "aircraft" operator the agency sees fit, Congressional intent or not.

On a related note, EAA is very concerned that the FAA's broad interpretation of what constitutes an "aircraft," combined with the interpretation's assertion that the FAA can indeed regulate model aircraft operations so long as the applicable regulations "apply to all aircraft," might result in individuals holding airman certificates being subject to certificate action for model aircraft operations. Under this interpretation, it is conceivable that the FAA could pursue enforcement action against a pilot for flying a model airplane within a TFR, resulting in that pilot's airman certificate being suspended or revoked for an infraction that does not involve flight in a manned aircraft.

5) EAA disagrees with the FAA's proposed interpretation of "visual line of sight" (referenced in P.L. 112-95, section 336(c)(2)) that excludes so-called "first-person view" (FPV) operations. We believe that FPV operations, when conducted under the guidance of AMA Document 550, are a completely acceptable and safe use of model aircraft. EAA offers that the "visual line of sight" requirement is intended as a clause to limit distance of the model aircraft from its operator, rather than a literal mandate that the model aircraft operator have his own eyes focused on the model airplane. EAA believes that the FAA's interpretation adds nothing to public safety while harming the model aviation community by disallowing the responsible use of exciting new technology. If a spotter is used to maintain visual line of sight and see-and-avoid protections, as is mandated by AMA Document 550, then the distance from the operator intent of the law's language is met.

With these comments in mind, EAA recommends that:

1) The FAA define "model aircraft" as an unmanned device, operated in the atmosphere and maintaining "see-and-avoid" separation from manned aircraft, and operated within visual line and distance of sight of either the operator or the operator's spotter;

2) The FAA follow the plainly intended spirit and intent of P.L. 112-95 section 336 and refrain from imposing any regulations on operators of model aircraft or the model aircraft themselves, even if those regulations otherwise apply to "all aircraft;"
3) The FAA explicitly confirm the right of manufacturers, distributors and sponsored pilots to continue to operate model aircraft without regulatory oversight.

Once again, we thank the FAA for engaging the complex issue of UAS integration in its ongoing commitment to aviation safety and preservation of the National Airspace System. EAA appreciates the opportunity to offer comments on the FAA's proposed interpretation, and we welcome any questions or requests for amplification of any point made above.

Respectfully Submitted,

Sean Elliott
Vice President, Advocacy and Safety

Interpretation of the Special Rule for Model Aircraft, Docket No. FAA-2014-0396
Comments submitted by the Academy of Model Aeronautics (AMA)
September 22, 2014

Comments – Section I

The Interpretive Rule states: "Historically, the FAA has considered model aircraft to be aircraft that fall within the statutory and regulatory definitions of an aircraft."

In fact the opposite is the case. Advisory Circular 91-57, issued in 1981, clearly establishes FAA's expectations in terms of a voluntary level of compliance for model aircraft operations and makes no mention of any portion of the US Code or existing Code of Federal Regulations that are applicable to model aircraft. This was reinforced in the agency's unmanned aircraft policy statement in February 2007 concerning recreational use and was most recently stated in the agency's internal guidance document, N JO 7210.873, effective July 11, 2014, two weeks after the Interpretive Rule was published in the Federal Register.

Additionally, FAA's guidance document regarding the compliance criteria for federally obligated airports, AC 150/5190-6, lists model aircraft as an example of an activity that is not an aeronautical activity, aeronautics being the "design, construction and operation of aircraft." Other documents issued by the FAA over the past several decades confirm that the FAA has historically not considered model aircraft to fall within the statutory or regulatory definitions of "aircraft."

As was concluded by National Transportation Safety Board Administrative Law Judge Patrick Geraghty in the FAA v. Pirker case (currently on appeal), the FAA "has not issued an enforceable FAR regulatory rule governing model aircraft operation; has historically exempted model aircraft from the statutory FAR definitions of 'aircraft' by relegating model aircraft operations to voluntary compliance with the guidance expressed in AC 91-57." Although Mr. Pirker was apparently not operating his model aircraft pursuant to AMA guidelines or those of any community-based organization, the underlying principle contained in the decision about the nonregulation of model aircraft is correct in light of the history of model aviation in this country. This is a viewpoint that AMA shares.

Comments – Section II

The Interpretive Rule states: "Congress' intention to define model aircraft as aircraft is further established by section 331(8) of the Act, which defines an unmanned aircraft as 'an aircraft that is operated without the possibility of direct human intervention from within or on the aircraft.'"

This statement erroneously interprets the text and Congress' intention and does so without regard to the historical context upon which the Special Rule was developed.

In developing the Special Rule for Model Aircraft, Congress recognized the long-standing history and exceptional safety record achieved by model aviation and specifically the activity conducted within the safety programming of a community-based organization such as AMA. It was Congress' intent to protect the ongoing modeling activity conducted within a community-based organization from unnecessary, onerous, and overreaching regulation.

Section 336 of the Act entitled "Special Rule for Model Aircraft" is clearly intended to separate model aircraft from other Unmanned Aircraft Systems (UAS) and to establish a freestanding definition for the recreational and hobby use of unmanned aircraft. In this regard, the definition of model aircraft is intentionally detailed within the Special Rule for purposes of that section alone, and not within Section

331 of the Act, "Definitions" of Unmanned Aircraft Systems. Congress provided a complete standalone definition that does not refer to any other definition or reference, and quite frankly needs no interpretation. Though the descriptive term "unmanned aircraft" is used in the definition, it is simply descriptive, and is used to clarify that there are no human beings onboard the model aircraft directing its operation.

Section 336(a)(2) of the Special Rule clearly states that the provisions of this rule apply only to model aircraft that are "operated in accordance with a community-based set of safety guidelines and within the programming of a nationwide community-based organization." Both the text and clear intent of the statute is that the aeromodeling activity that occurs in accordance with a community-based set of safety guidelines and within the programming of a nationwide community-based organization be managed by the community-based organization such as AMA.

The Interpretive Rule states: "Congress directed that the FAA may not 'promulgate any rule or regulation regarding a model aircraft …"

The Interpretive Rule fails to recognize that Congress prohibited the promulgation of two clear and distinct items: "any rule - or - regulation." In clear language, this means any rule of any kind. By definition, FAA's Interpretation of the Special Rule for Model Aircraft purports to be just that, an Interpretive 'Rule.' In its intent and context, the Interpretive Rule is both a rule by definition and de facto regulation.

The Interpretive Rule states: "… the rulemaking prohibition would not apply in the case of general rules that the FAA may issue or modify that apply to all aircraft."

This again misstates Congress' intent and implies that the freestanding definition of "model aircraft" provided in Section 336 is intended to reference the definition of aircraft in 49 U.S.C. 40102; 14 CFR 1.1. It also twists the meaning of the word "regarding" so as to purportedly allow the FAA to actually regulate model aircraft as long as the words "model aircraft" do not appear specifically in new rules and regulations. That contradicts the clear intent of Congress, which passed Section 336 specifically to exempt aeromodeling from new rules and regulations.

The Act does allow that, "nothing in (the Act) shall be construed to limit the authority of the (FAA) to pursue enforcement action against persons operating model aircraft who endanger the safety of the national airspace system (NAS)."

The Academy of Model Aeronautics does not condone the operation of a model aircraft in a manner that endangers persons or property. The AMA further believes that current statutory provisions are adequate to address aberrant activity that endangers the safety of the NAS. Congress by no means intended to grant a free pass for individuals who operate their model aircraft in a manner that intentionally places manned aircraft in imminent peril. However, it clearly intended to leave risk mitigation and the development of appropriate safety guidelines for the operation of model aircraft devices themselves to the nationwide community-based organization.

The Interpretive Rule states: "…a model aircraft must be 'flown within visual line of sight of the person operating the aircraft.' P.L. 112-95, section 336(c)(2). Based on the plain language of the statute, the FAA interprets this requirement to mean that: (1) the aircraft must be visible at all times to

the operator; (2) that the operator must use his or her own natural vision (which includes vision corrected by standard eyeglasses or contact lenses) to observe the aircraft; and (3) people other than the operator may not be used in lieu of the operator for maintaining visual line of sight."

Throughout the Interpretive Rule, the agency takes great latitude in determining Congress' intentions and in placing tightly worded restrictions through its "plain-language" interpretation of the text. In this case the definition of model aircraft in the Act requires that, "model aircraft be flown within visual line of sight of the person operating the aircraft." From a safety perspective this means that the model aircraft must remain in visual range of the operating station so that the operator can maintain situational awareness, control the aircraft, and "see & avoid" other aircraft and obstacles. Congress did not intend this as a prescribed means of operating the aircraft, but rather the manner in which model aircraft are to be flown. It limits the distance from the operator that the model aircraft can be flown "within visual line of sight." There is no ambiguity in the language provided by Congress and no need for interpretation.

The Interpretive Rule uses the plain language doctrine to create a regulatory prohibition of the use of a specific type of technology: first-person view goggles. In this regard, the rule states, "The aircraft must be visible at all times to the operator" and "An operator could not rely on another person to satisfy the visual line of sight requirement." This is well outside of the congressional intent and is inconsistent with current and acceptable two-pilot manned aircraft operations. Under a number of circumstances, two-pilot operations are recognized where one pilot is allowed to monitor the external environment in compliance with 14 CFR 91.113, while the second pilot operates the aircraft and/or manages the aircraft systems. In the case of instrument training and airmen proficiency manned aircraft are flown in virtual instrument conditions through the use of a device that completely obstructs the pilot's view of the external environment while a second pilot is relied upon to maintain situational awareness and fulfill the requirement to see & avoid other aircraft. The FAA's extremely stringent interpretation of the law again overrides Congress' intent that the modeling activities be managed by the community-based organization, and appears to target and prohibit a specific type of modeling activity and technology.

The Interpretive Rule states: "The statute requires model aircraft to be flown strictly for hobby or recreational purposes. Because the statute and its legislative history do not elaborate on the intended meaning of 'hobby or recreational purposes,' we look to their ordinary meaning and also the FAA's previous interpretations to understand the direction provided by Congress."

The Interpretive Rule's overreaching interpretation of the language in the Congressional Act is also evident in the interpretation of the requirement that model aircraft be "flown strictly for hobby or recreational use." The application of this requirement is drastically narrowed by the examples provided in the Interpretive Rule.

Although the Interpretive Rule acknowledges that manned aviation flights that are incidental to a business are not considered commercial under the regulations, the Interpretive Rule contends that "model aircraft flights flown incidental to a business are not hobby or recreational due to the nexus between the flight and the business."

This is inconsistent with current regulatory premise and the assertions of other regulatory agencies such as the Internal Revenue Service. For instance, an individual who owns and operates a full-scale aircraft for personal pleasure and recreation is allowed to conduct aerial photography as a private civil operator whether or not he/she intends it as a business pursuit or intends to sell the photographs for personal

gain. However, under the Interpretive Rule, a model aircraft enthusiast who uses his/her model aircraft for aerial photography and subsequently sells the photograph to an interested party is no longer considered a hobbyist. Moreover, the IRS would not allow the deduction of the operating expense and aircraft acquisition cost based merely on the sale of a photograph. The IRS will also tell you that a business that is recreational in nature and does not turn a profit over time is in fact a hobby.

There are many other examples of hobby interests and individual avocational talents that are employed in conjunction with an unrelated profession and that are very much incidental to the business pursuit. There are also many hobbies that involve bartering, trading, or monetary transactions that would not be considered or otherwise regarded as a business enterprise.

The language in the Interpretive Rule is unnecessarily restrictive, overreaching, and totally unrelated to the safety aspects of operating model aircraft.

The Interpretive Rule also overlooks the Congress' clear intention to encompass the supporting aeromodeling industry within the provision of the Special Rule, "aircraft being developed as a model aircraft." The Interpretive Rule's strict interpretation of hobby versus business puts in question the endeavors of the principals, employees, and advocates of the billion dollar industry that supplies and supports the activity, an industry that is integral to the success and future wellbeing of the hobby.

The language in the Rule goes to great lengths and has the clear intent to minimize and restrict the hobbyists' use of unmanned aircraft to the extent the examples given are ridiculous in nature. For instance, a grower could use his/her model aircraft to monitor the condition of his/her crops provided he or she personally consumes the entirety of the harvest. However, that same hobbyist would not be allowed to use the hobby rules to operate the identical device for the same purpose should he/she trade, barter, or sell any portion of the produce to his or her neighbor.

Again, the language in the Rule is unnecessarily restrictive, overreaching, and totally unrelated to the safety aspects of operating model aircraft.

The Interpretive Rule states: "… the statute sets a requirement for model aircraft operating within 5 miles of an airport to notify the airport operator and control tower, where applicable, prior to operating. If the model aircraft operator provides notice of forthcoming operations which are then not authorized by air traffic or objected to by the airport operator, the FAA expects the model aircraft operator will not conduct the proposed flights. The FAA would consider flying model aircraft over the objections of FAA air traffic or airport operators to be endangering the safety of the NAS."

The Special Rule states that when model aircraft are "flown within 5 miles of an airport, the operator of the aircraft (is to) provide the airport operator and the airport air traffic control tower (when an air traffic facility is located at the airport) with prior notice of the operation. Model aircraft operators flying from a permanent location within 5 miles of an airport should establish a mutually-agreed upon operating procedure with the airport operator and the airport air traffic control tower (when an air traffic facility is located at the airport)."

Again, the congressional language is unambiguous. Although making notification to the airport and/or air traffic control could open a dialog as to whether the planned activity poses an objectionable risk or interferes with manned aircraft, and may open a discussion regarding employing specific procedures to

ensure the safety of the operation, there is no indication in the statute of any requirement to secure prior permission when an operator is operating a model aircraft pursuant to community-based standards. Such approval has never historically been required, and the statute does not require it either. This is a new rule or regulation regarding model aircraft—which is impermissible under the statute.

The Interpretive Rule is again overreaching and attempts to rewrites the law by saying, "The FAA would consider flying model aircraft over the objection of FAA air traffic or airport operators to be endangering the safety of the NAS." In other words, the model aircraft operator must gain permission before flying. The mere act of flying the model aircraft over the objections of a potentially intolerant or indifferent controller or airport authority would ostensibly trigger enforcement action, whether or not there was a true safety issue involved. The Interpretive Rule's requirement to seek permission opens the door to a less-than-constructive response from FAA field personnel who are often unfamiliar with model aircraft operations.

The intent of the Act is abundantly clear in that the model aircraft pilot must provide "prior notice" and that the means and decision to operate in a permanent location be "mutually-agreed upon."

Comments – Section III

The Interpretive Rule concluded: "Congress intended for the FAA to be able to rely on a range of … existing regulations to protect users of the airspace and people and property on the ground. Therefore, regardless of whether a model aircraft satisfies the statutory definition and operational requirements described [in the Interpretive Rule] …, if the model aircraft is operated in such a manner that endangers the safety of the NAS, the FAA may take enforcement action consistent with Congress' mandate."

Comments – Section IV

The Interpretive Rule further states: "The FAA could apply several regulations in part 91 when determining whether to take enforcement action against a model aircraft operator for endangering the NAS … other parts of the regulations, may apply to model aircraft operations, depending on the particular circumstances of the operation. The regulations cited … are not intended to be an exhaustive list of rules that could apply to model aircraft operations."

In Sections III and IV, the Interpretive Rule establishes new restrictions and prohibitions that are clearly outside of the scope and intent of the Special Rule and to which model aircraft have never been subject to in the past, i.e. "if an operator is unable to comply with the regulatory requirements for operating in a particular class of airspace, the operator would need authorization from air traffic control to operate in that area." Nothing in the Act, current policy, or FAA's operating standards for model aircraft, AC 91-57, makes such a requirement. The application of this "interpretation" would effectively prohibit model aircraft from operating in airspace where there are requirements intended for manned aircraft that are impractical if not impossible for model aircraft and model aircraft operators to meet.

For example, under 14 CFR 91.131, "No person may operate an aircraft within a Class B airspace area (unless) the operator … receive(s) an ATC clearance. No person may … operate a civil aircraft within a Class B airspace area unless the pilot in command holds a … pilot certificate." These are requirements to which model aircraft operators cannot reasonably comply, and it is doubtful that any authorization

and/or clearance will be forthcoming despite the Interpretive Rule's suggestion that, "modelers … obtain authorization from air traffic control prior to operating" in such airspace.

It should be noted that for decades thousands of AMA members have operated their model aircraft safely and responsibly in Class B airspace under AMA's Safety Program and FAA Advisory Circular 91-57. These operations have occurred without the requirement for authorization and without incidents, and have done so since before there *was* Class B airspace. Many AMA designated flying sites were established before the FAA came into existence in 1958.

Finally, the Interpretive Rule as a whole negates the entire Special Rule for Model Aircraft. The provisions within Sections III and IV in themselves make model aircraft enthusiasts ages 6 to 96 accountable to the entire litany of federal aviation regulations found in the Code of Federal Regulations, something that was never intended by Congress and heretofore never required by the FAA.

Moreover, the AMA believes the Interpretive Rule is, in essence, a backdoor approach to enacting new regulatory requirements without complying with the congressionally mandated Administrative Procedure Act. It is an abuse of the provision for Interpretive Rule under 5 U.S. Code § 553, and is contrary to the congressional prohibition in Public Law 112-95, Sec 336 which states, "the Federal Aviation Administration may not promulgate any rule or regulation regarding a model aircraft or an aircraft being developed as a model aircraft, if … the aircraft is operated in accordance with a community-based set of safety guidelines and within the programming of a nationwide community-based organization."

By specifically addressing the Special Rule and model aircraft operated within the safety programming of a nationwide community-based organization such as AMA, the Interpretive Rule rebukes and curtails the activity of the one community that, as Congress itself recognized, has been operating safely and responsibly for decades and does little to affect the aberrant behavior reportedly occurring outside of AMA's community-based program.

The First 75 Years

a supplement to *MODEL AVIATION*

8FG SUPER

"Super-sized"
with 14 channels — and CGY750 gyro support!

You gave the 8FG a standing "O" for offering high-end features — and superior FASST technology — at an unexpectedly low price. But don't sit down just yet.

For the same cost, now you can have six more channels AND new software with menus tailored to Futaba's super-fast CGY750. Introducing the 8FG Super... the first radio really to support flybarless helicopters, and a smart choice for any forward-looking flier.

Just ask three of the 8FG Super's biggest fans, Bobby Watts, Matt Botos and Kyle Stacy. And check out the video on the Hobbico YouTube Channel. Then tell your Futaba dealer: "Super-size me!"

2.4GHz FASST™ S.BUS™

FREE Software Upgrade

Attention 8FG Owners: Get the upgrade you need to make your system "Super" at NO charge! See futaba-rc.com today for details.

President's Perspective

SINCE OUR INCEPTION, I would venture to guess that we have had nearly a million modelers join us as AMA members. We have enjoyed a long and diverse history, which has resulted in many hours of happiness, relaxation, and launched several careers in aviation!

Throughout the years, modelers have stepped up to the plate to volunteer in so many ways to promote aviation by working with our youth and raising hundreds of thousands of dollars for charitable organizations. We were born in the Golden Age of Aviation and have had the staying power to be the unequaled, nationally recognized leader of this great hobby.

Your AMA is the collective voice for American aeromodeling for all stakeholders in the hobby and industry which has grown to be in excess of $1 billion annually.

While we celebrate an illustrious past, we exist today to ensure a healthy and productive future. The AMA looks to the future by providing a membership value proposition that has never been stronger as we source and protect flying fields and intensely advocate for freedom from federal regulations.

We have placed a highly respected man in the position to lead our talented staff and I am confident our next 75 years will far exceed our imagination. *MA*

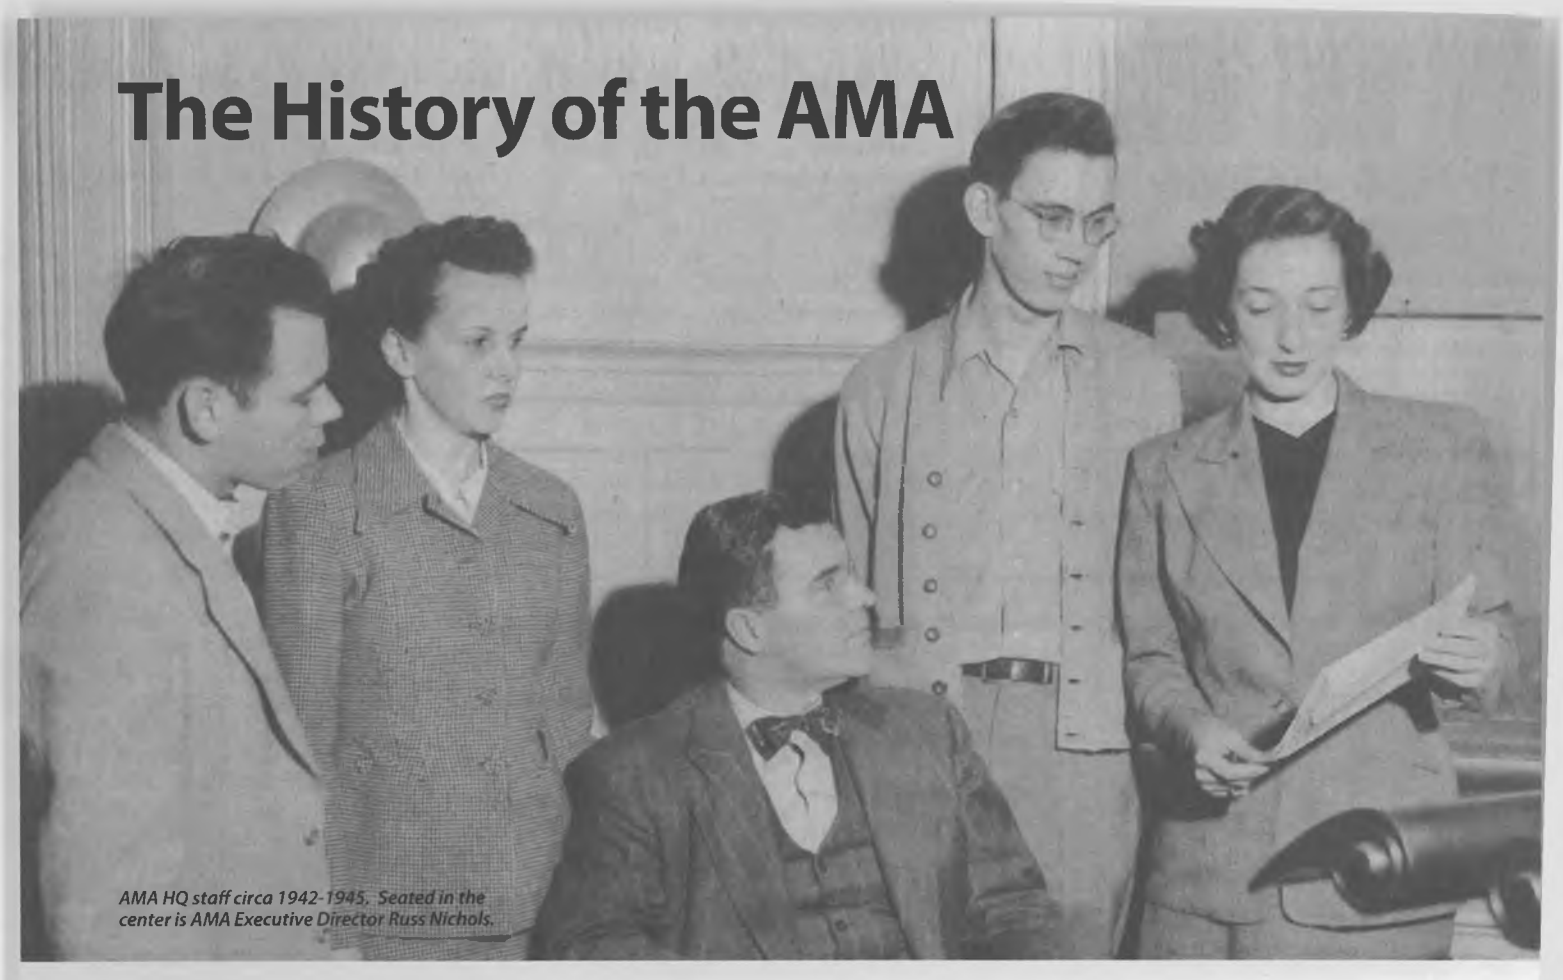
Model Aviation is an official publication of the Academy of Model Aeronautics, Inc., an associate member of the National Aeronautic Association (NAA). NAA is the official U.S. representative of the Fédération Aéronautique Internationale (FAI), the world governing body for sport aviation, and represents the U.S. at FAI meetings. NAA delegated to the AMA supervision of FAI related aeromodeling activities such as record attempts, competition sanctions, and selection of U.S. teams for World Championships. (ISSN 0744-5059, USPS 087-930 Publications Agreement No. 40688541) is owned exclusively by the Academy of Model Aeronautics, Inc., a nonprofit organization, and published monthly at 5161 E. Memorial Dr., Muncie IN 47302. Periodical rate postage paid at Muncie IN and at additional mailing offices. Canadian return address: Station A, PO Box 54, Windsor ON N9A 615

The History of the AMA



AMA HQ staff circa 1942-1945. Seated in the center is AMA Executive Director Russ Nichols.

SEVENTY-FIVE YEARS. For a human it marks the golden years of life, but for a company or an organization, especially in light of ever-changing technologies and environments, it represents a major accomplishment. In today's world it is becoming rare to see slogans such as "100 years in business," or "founded in 1870." In fact, just the other day, I saw a sign that said "founded in 1996." What does that say about longevity and a devoted clientele? For the Academy of Model Aeronautics (AMA), what does it mean to celebrate the 75th anniversary? From where have we come and where are we going?

Almost as soon as there were aeromodelers there were attempts to form a national organization. In 1910 the National Model Aero Club was formed to "promote the study of the problems of aeronautics as demonstrated by the model, to regulate and control all model contests in the United States, to promote exhibitions and contests and to secure the dissemination of the latest ideas and discoveries in the problem of flight as presented by models of either heavier or lighter than air models." (*Flying Machine Models*, *Aircraft* magazine, May 1910.)

Other similar groups emerged during the 1920s and '30s, such as the Airplane Model League of America, the McFadden Sky Cadets, the Jimmie Allen Flying Club, the Junior Birdman, and the Junior Aviators. All of these groups had hundreds of thousands of members and many even hosted their own national championships; however, none of the parent groups were capable of sustaining the organizations.

By the 1930s, events began to threaten the hobby while new technologies offered the chance to revolutionize it.

- The National Aeromodeling Championships (Nats), first held by the National Aeronautic Association (NAA) in 1923, were struggling each year to exist.
- Small, gas-pwered model airplane engines were being manufactured, but a movement to outlaw them was in full swing. In 1937, Connecticut and Massachusetts banned the flying of gas models. Massachusetts stipulated "that no gas model may be flown unless licensed, nor may it be flown by anyone unless that person is a licensed pilot." (*Model Airplane News* magazine, October 1937.) The US Department of Commerce also considered a potential national ban.
- Radio Control was beginning to grab modelers' attention, with articles appearing in various magazines and an official event appearing on the Nats schedule in 1936 (although no one participated).

The AMA logo has evolved in the past 75 years. While certain elements within the logo have changed, the torch of knowledge and the wings have remained a consistent symbol of the organization.

The blue logo on the left has primarily been in use since 1985, with only minor changes and varying tag lines. The white oval logo immediately to the right was designed during AMA's inaugural year, 1936. The red oval logo was introduced in 1940 and remained until 1949. From 1950 to 1985, the AMA logo shed its oval as the wings became more pronounced.

- News of models flown round-the-pole, tethered, whipped, or U-Control circulated as Max Sampson, Oba St. Clair, the Stanzel Brothers, and Jim Walker experimented with this form of control.
- The NAA tried to rejuvenate the nation's interest in aviation through the "Make America 'First in the Air' Campaign." It was noted that "proper appreciation of the importance of aviation in our national safety, return of the major air records to the United States, development of the interest of the nation's youth in model plane building and in model flying meets, and sponsorship of both local and national competitions … were referred to frequently as the major activities requiring immediate attention." (*NAA Junior Membership News, Model Airplane News,* August 1935.).

In October of 1933 the NAA, and in particular Lt. H.W. Alden, NAA Model Airplane Committee Chairman, and William Enyart, NAA Contest Committee Chairman, decided to take the first step in creating a national aeromodeling organization by revitalizing the NAA Junior Membership.

Alden, noted by many as the main driving force, began contacting leaders in the aeromodeling field to develop an aeromodeling advisory group for the NAA. Aeromodelers, given all the changes occurring in the hobby, realized they needed to work together and were willing to lend a hand.

Discussions were held during the 1934 Nats and more concrete plans were settled on during the 1935 Nats. The new Model Plane Council NAA Chapter was the "American Academy of Model Aeronautics (AAMA)," and its purpose "to advance model aeronautics as a science and sport and to aid constructive activities employing model aircraft as one means toward general aeronautic education." (*NAA Junior Membership News, Model Airplane News,* October 1935.)

The charter group included Capt. Willis C. Brown, Carl Goldberg, Gordon Light, Charles Tlush, John Stokes, Percy Pierce, Nathan Polk, Frank Zaic, Charles Grant, Bruno Marchi, Bill Brown, and Bert Pond.

At the 1936 Detroit Nats the first issue of *Model Aviation* introduced the new council to the aeromodeling community. The AAMA was to "consist of sincere builders and flyers, club directors, sponsors and patrons of the sport" and was to "act as a council to direct and supervise the contest and research activities of the many expert model flyers." (*Model Aviation* magazine, 1936, Volume 1, Number 1, page 3.)

During the annual technical meeting at the conclusion of the Nats, a provisional council and executive officers were approved and the membership requirements were outlined. Dues for those older than 21: $3, younger than 21: $1.50. In July 1937 the name was changed to the Academy of Model Aeronautics.

One of the first issues addressed by the new AMA was the problem with gas model airplanes. In concert with *Model Airplane News,* the International Gas Model Airplane Association, the AMA and the NAA met with the U.S. Department of Commerce.

Safety Rules were proposed, plus it was highlighted that there had not been any accidents between full-scale and gas model aircraft. The conference ended with the Department of Commerce not only refusing to ban gas models but issuing a statement of endorsement, setting out aeromodeling's value to youth.

With that battle won the NAA-AMA joined the Model Aircraft Commission of the Fédération Aéronautique (FAI), becoming the only body in the United States with the authority to represent aeromodelers worldwide.

The AMA took over responsibility for the Nats in 1938 and in 1940 the NAA leadership transferred authority of its model division. NAA announced, "It is acknowledged that model aviation in the United States has come of age, and that aeromodeling enthusiasts are at last charged with the conduct and supervision of official American model aviation activities." (*Model Airplane News*, April 1940.)

By 1941 membership had reached 12,000 and the AMA districts were established. In 1942 Russ Nichols became executive director, a post he would hold until 1963, and began additional improvements. Control Line (CL) models (G-Line, Tether, or U-Control) were

At left is Bruno Marchi, AMA's first Technical Director. Center is Madelaine Gaisser. At right is Al Lewis, AMA President (1938), Secretary-Treasurer (1939-1942), and Executive Director (1945-1946).

Trenton NJ, Senior NAA bus in route to 1938 Nats, the same year the AMA took over responsibility for the event.

officially recognized and these fliers were encouraged to participate in forming national rules.

With the outbreak of World War II the Nats were canceled from 1942 to 1945 and the election of AMA's national officers, previously held at the Nats, was for the first time held via mail ballot.

The 1946 "Victory Nationals," welcomed home modelers to the first Nats to feature Free Flight (FF), CL, and Radio Control (RC) events. Through a donation by the model industry all AMA members received *Model Aviation* magazine.

By 1947, the AMA's RC Committee, led by Dr. Walt Good, was able to work with the Federal Communications Commission (FCC) to open a single channel on the citizens band (27.255MHz) for RC flying. Radio operator's licenses were no longer required, as long as FCC-approved equipment was used.

In 1948 the U.S. Navy agreed to host its first Nats, beginning a relationship that would last until 1972, and be fondly remembered by all who attended.

Irwin Olson, Keith Storey, Claude McCullough, Frank Ehling, and Good helped carry the AMA through the 1940s and '50s and introduced new benefits including full-time legal liability coverage as part of an AMA member's regular license fee (as long as models were built and flown in accordance with AMA safety code).

Model Aviation was also mailed to all AMA members, not just leader members, clubs, and subscribers. Under their leadership and with the introduction of CL aeromodeling, membership reached 21,293 in 1958.

John Worth, first as AMA president in 1963 and then as executive director from 1964-1986, along with Maynard Hill, Cliff Weirick, John E. Clemmens, and John Grigg, would lead the AMA for the next several decades. During the 1960s the AMA became incorporated independent of the NAA, and through continued work with the FCC, five frequencies in the Class C citizens band were reserved for modelers.

In 1966, in search of ways to reduce costs and increase members, the AMA Executive Council agreed to provide all members with a subscription to *American Aircraft Modeler* (*AAM*) rather than continue *Model Aviation*. They hoped that by publishing in a separate magazine, AMA members would still receive their AMA news, but also read exciting modeling feature articles. They also hoped that more modelers would be exposed to AMA and become members. The membership grew to 52,000 from 16,000 between 1966 and 1975.

By the 1970s RC model aircraft, including the newly developed RC helicopters, replaced CL models as the most popular form of model aviation. The last Navy Nats was held at Glenview Naval Air Station in Illinois in 1972. AMA took over full responsibility for the Nats, and in an effort to duplicate the Navy's shifting of the event around the county, the AMA visited 27 different cities through the early 1990s.

Membership continued to rise with the 50,000th member, Robert Lockwood, joining in 1974. Following the bankruptcy of *AAM*, the AMA Executive Council decided to resurrect *Model Aviation* magazine in 1975. Under the leadership of Bill Winter and Carl Wheely, members were introduced to a new *Model Aviation*, one that is now AMA's flagship publication.

As the 1970s drew to a close, the AMA purchased slightly more than an acre of land in Reston, Virginia, for a new Headquarters and museum. A building fund was established and by 1982, individuals such as Leon Shulman, clubs such as the Toledo Weak Signals, and industry donors including Frank Garcher with Midwest Models, Sullivan Products, Top Flite, and Goldberg Models had surpassed the goal of $160,000. On September 24, 1983, a ribbon-cutting ceremony was held for the 3,000-square-foot, two-story building.

In 1985 the 100,000th member, Corbert J. Chaisson, joined the AMA and the following year the AMA celebrated its 50th anniversary.

It became apparent that additional RC frequencies would be needed. With the leadership of Bob Aberle, the Frequency Committee negotiated with the FCC for the rights to 50 RC channels, awarded in January 1983. In 1992, AMA members successfully defended these frequencies with a successful letter-writing campaign to the FCC.

With increasing concern over the loss of flying sites and increasing costs associated with traveling Nats, the AMA Executive Council formed a search committee in 1988 to locate a site for a new headquarters and national flying site. After reviewing more than 50 proposals, the Midwest was selected and in 1990 land was purchased in Muncie, Indiana.

In 1992, the new flying site hosted a grand opening, and the National Model Aviation Museum opened its doors in 1994. In 1995 the site's official name became the International Aeromodeling Center (IAC), and by 1996 AMA was in

Bill Winters, *Model Aviation* editor, and John Worth, AMA Executive Director, conferring during the mid-1970s on expanding the publication.

A rare photo of the AMA staff at the home offices in Reston VA. Front Row, third from the the right is Joyce Hager, currently AMA's most tenured staff member.

a position to host its 60th anniversary, the first "Celebration of Eagles," followed by the first complete outdoor Nats in Muncie.

The International Aeromodeling Center was improved with the addition of paved and grass runways, additional CL circles, paved roads, camping, and restrooms/showers. In 2001 a new AMA Headquarters building officially opened and the majority of the AMA's staff relocated across the drive. The space vacated in the museum building was quickly occupied by museum storage, additional exhibits, a museum theater, AMA Custom Products, and the AMA's model airplane Plans Service. The museum's Claude McCullough Education facility was completed in 2010.

The 1990s and 2000s saw the AMA address a number of major member concerns, foremost of which was the loss of flying sites. Sound, a major reason for these losses, was addressed by Howard Crispin in his ongoing *Sound and Model Aeronautics* articles in *Model Aviation* and the book of the same title.

In 1998, in an effort to further support flying site retention, the AMA created the position of Flying Site Assistance Coordinator and later developed the Flying Site Assistance Kit. Filled initially by Joe Beshar, and then assisted by Wes DeCou (representing the Western U.S.), the coordinators' regular "Flying Site Assistance" columns in *Model Aviation* featured information about key partnerships with groups such as the National Air Traffic Controllers Association, U.S. Fish and Wildlife Service and U.S. Department of the Interior.

It also highlighted when AMA representatives testified before the federal government and the signing of the Memorandum of Understanding between the AMA and the Environmental Protection Agency concerning Superfund Sites, which are landfills that have been closed and are available for alternative uses.

Another area to be addressed was improved communication. Originally print-based with *Model Aviation* magazine and newsletters such as the museum's *Cloud 9* and the *National Newsletter*, in the mid-1990s the AMA began moving toward online communication on its website: www.modelaircraft.org. Today online projects include emailed newsletters (*AMA Today* and the *AMA Insider*), an online e-zine *Sport Aviator* (http://masportaviator.com), and social media (Twitter, Facebook, and YouTube).

Updated publications such as the *NatsNews*, now available both in print form and on the Web, and new publications such as *Park Pilot*, are further improving the distribution of valuable information.

New, innovative communication tools.

In 1970, thanks to a large contribution from Matty Sullivan, plus money allocated from the AMA budget, a scholarship program was initiated and to date 236 scholarships totaling more than $758,000 have been awarded. In 1998 the Radio Controlled Hobby Trade Association made a generous contribution to help fund AMA's educational programs.

Education Committee activities have included regular attendance at the National Science Teachers Association Convention, work with the National Coalition for Aviation Education, Civil Air Patrol, Science Olympiad, NASA, Smithsonian National Air and Space Museum, the Children's Museum of Indianapolis, and the development of the Inventing Flight and AeroLab curriculums. The AMA's Youth Education Stipend Grant (YES), and now the Take-off-And-Grow (TAG) program are additional incentives developed to help clubs educate and promote aeromodeling.

The museum continues to collect items that document the history of aeromodeling. In 1996 Norm Rosenstock, as AMA historian, began to collect biographies of modelers. Today the museum has nearly 800 such stories posted online, plus more than 640 research files have been started for future biographies. The histories of 15 model airplane clubs, eight aeromodeling manufacturers, and six model aviation Special Interest Groups have also been collected.

The last two decades have witnessed many new technological advances that will significantly affect the future of aeromodeling including the introduction of the turbine engine, spread spectrum radio technology, and electric-powered aircraft. Both have the potential to open or reopen flying fields across the country to aeromodelers who have been forced from flying fields because of sound.

AMA is currently working with the U.S. Department of Homeland Security and the Federal Aviation Administration to ensure aeromodeling can be enjoyed long into the future.

Seventy-five years: a chance to reminisce and look toward exciting opportunities to come. It has been a long and arduous adventure, full of ups and downs, but thanks to a long list of dedicated and devoted individuals, both modelers and industry leaders, the organization has survived and continues to be "of, by, and for the modeler." MA

National Model Aviation Museum Director

DU-BRO

All of us at DU-BRO Products are proud of providing our quality hardware, accessories and tools to the modeling community for over 50 years. However, our success could not have been possible without the diligent efforts of the AMA and their service to the model aircraft industry. It is with our deepest sincerity and gratitude that we offer our congratulations to the AMA staff and volunteers for their work in maintaining and promoting this great hobby for 75 years!

National Aeromodeling Championships

AM I THE BEST? For those aeromodelers who ask themselves this question, competition is the key. Facing an opponent, and besting him or her is the only true way to know.

Aeromodeling contests began almost as soon as two people could fly a model airplane. In the early days competitions were regional affairs with exchange clubs, parks, business, and Young Men's Christian Associations sponsoring many events.

This changed in 1915 when the Aero Club of America sponsored the first national aeromodeling contest. (1) The contest was divided into three separate events: distance – launching from hand, duration – launching from water; and duration – launching from ground. Cash prizes were awarded to the individuals achieving the best scores each month and the Henry S. Villard Trophy was awarded to the club with members who had the highest collective scores. (2)

The Illinois Model Aero Club (IMAC) won the three years it was awarded, retaining the cup in 1919, and ending the only national aeromodeling event.

The IMAC recognized the need for a national event and encouraged the National Aeronautic Association (NAA) to hold an aeromodeling event. In 1923 Bernard Mulvihill, vice president of the NAA, agreed to offer prize money and a trophy if the St. Louis Air Board and the Air Race Contest Committee added the event to the schedule. After much work, Event No. 6, Mulvihill Trophy Duration Race for Model Airplanes was added to the National Air Race Program. (3)

For the next few years, it was a matter of who would sponsor the event as numerous groups came and went including the Playground and Recreation Association, the American Association of Model Aero Clubs with the First National Indoor Model Airplane Contest (4), and the Airplane Model League of America (AMLA).

When the Great Depression hit, the Nats seemed done for, but again interested modelers prevailed. With the leadership of Lt. H.W. Alden, chairman of the NAA Model Airplane Committee and financing from *Model Airplane News* magazine the Nats survived. (5) Radio control joined free flight in 1937 and following a brief halt during World War II, the "Victory" Nats were back in 1946 with almost 1,000 contestants flying in 23 events including Control Line.

For many contestants it was the Navy Nats, held from 1948-1972, that represented the glory years of the event. Each summer a different Naval Air station would host the grand event providing food, housing, manpower, and the most importantly; the great building hangars, with hundreds of tables set up for 24-hour repairs.

In 1973 the AMA took over responsibility for the entire Nats, and with the help of numerous groups and sponsors, put the show on the road. For the next 23 years, the Nats would stop in 16 cities across the country. Finally in 1996 the outdoor Nats found a home at the AMA's International Aeromodeling Center and the indoor events landed at the Mini-Dome in Johnson City, Tennessee. For the last 16 years, aeromodelers from around the world have gathered at these sites to continue the quest to see who is, indeed, the best.

Model Aviation's Time Capsule

WHEN THE Academy of Model Aeronautics Model Museum first opened to the public on September 24, 1983, it occupied the two-story center lobby space of the AMA Headquarters in Reston, Virginia. The model airplanes were displayed on mobiles hung from the ceiling and on folding tables. Modeling supplies, such as engines and radio equipment, and memorabilia such as patches and T-shirts, were displayed in glass cases that circled the center space.

The idea to display models and related objects had been suggested as early as 1946, but the project was stalled until AMA Executive President John Worth began corresponding with well-known modelers and discussing the possibility of donating items to the AMA. Although there were hints in the correspondence that items may actually have been donated earlier, the first official recorded donation was from Dr. Walt Good in February of 1978.

The collection quickly grew in the 1980s thanks to Curator Hurst Bowers, who convinced well-known modelers such as Joseph Kovel, Ed Packard, and George Clapp to donate items to the museum. Soon, the collection was growing so quickly it could not be contained in its designated space.

The move to Muncie, Indiana in 1992 meant that the museum had to be packed and shipped by truck to Indiana from Virginia. After unpacking the collection from the shipping containers and creating exhibits in the new space, the museum was again opened in 1994, along with the new Headquarters in the same building. The museum was then formally named the National Model Aviation Museum.

Unpacking in the new building in Muncie.

With roughly 7,000-square feet of gallery space, the exhibits varied from a recreation of a 1950s model hobby shop to models hanging from the ceiling, and window cases dedicated to various kit manufacturers.

During the 1990s, museum staff members focused on adding to the exhibits by collecting new models and memorabilia. Again, the museum collection outgrew its space.

In 2001, the AMA built a new Headquarters building on the property. The museum remained in the same location, nearly filling its building with the archives.

Curator-turned-Director Michael Smith has focused on improving the care given to the donations to ensure that they will last for multiple generations to see and enjoy. Work on the exhibits is continuous, and there are plans in motion to expand the hands-on exhibits and add multimedia presentations within the next year.

To help determine the museum's future, a consultant has been hired to assist in writing a long-term plan. No matter what the future holds, the museum will always be here to keep the stories of model aviation flying. MA

—Maria VanVreede
Museum Registrar

A good spot to view the museum collections in the Reston building was from the second floor balcony. The view offered a great look at the hanging models and other displays.

When the museum first opened in Muncie in 1994, it was incomplete. If you look closely in this picture, the cases set into the walls are empty. It is unclear when these were finished, but they currently display artifacts related to kit manufacturers.

The Good Brothers demonstrating their radio controlled aircraft.

A Brief History of Radio Control

WHEN I was just a small boy, I flew my rubber-powered Sleek Streak in the street in front of my house. I dreamed of somehow controlling it to keep it out of the trees and off the surrounding homes. I believe this same desire drove those who contributed to the design of radio control systems that began as very simple and evolved into the sophisticated designs we enjoy today.

Dr. Walt Good was, to say the least, one of the giants of RC history. Walt, along with his brother William, is credited with making the first radio-controlled (RC) flight. The model they used, the "Big Guff," is at the Smithsonian in Washington, D.C. There is also a model at the National Model Aviation Museum in Muncie, Indiana.

In the beginning, RC was not very reliable and was not anything like what we enjoy today! The first systems controlled the rudder only. These systems were very large and heavy and required a huge ground-based antenna to transmit signals to the receiver onboard the airplane. Such early systems were known as "relay-less reeds." The first designs may have come from Louis Scheel and Oliver Tremac in 1959, and the first commercial manufacturer was likely the Bonner Transmite.

The signal transmitters were not proportional, but rather full-travel signals, resulting in the rudder turning either full-left, full-right, or neutral. For the most part, these systems required very large Free Flight models. Many airplanes had wingspans of 6 feet or more to support the electronics and batteries required for operation.

In the late 1960s, Kraft systems introduced the multichannel proportional system. A pilot could now move the sticks and have the controls follow the movement, just as in a full-scale airplane! Finally modelers could fully control a model airplane. Along with Kraft, other companies such as Pro-Line, Orbit, EK, and World Engines sold the new system. As time went by, systems improved greatly in reliability and function.

When servo reversing came onboard, it was a great time saver for the modeler! No longer did one have to plan a radio installation so precisely. Now modelers could simply flip a switch to remedy a reverse-control situation.

American manufacturers, such as Kraft Systems and Pro-Line brought dual rates, endpoint adjustments, and slow-roll buttons to the market. The companies even introduced exponential to the world's competition fliers.

Virtually all of the future innovations were a direct result of competition modelers wanting more control. Coverage of competitions was the main goal of the model magazines of the time. Everyone wanted to know what Phil Kraft, Ron Chidgey, and Rhett Miller were using, flying, and winning with.

In the 1970s the first influence of Japanese systems penetrated the US market. Futaba and JR came onto the scene with reduced-price systems that caught the attention of American modelers. The pressure of these companies eventually spelled the end of US manufacturers in the radio market.

Futaba and JR increased productions and quickly brought more innovations to the modeler. As time went on, more companies joined the market.

During this time, the AMA was involved in procuring frequencies for modelers to use. We were blessed with obtaining 72 and 75 MHz for model use only. This was the result of many years of work by a number of individuals on the AMA Frequency Committee. We owe so much to them!

As time continues to march on, we see new things! 2.4 GHz spread spectrum equipment has brought a new excitement to RC that nearly everyone enjoys today. We eagerly await future advancements by RC manufacturers. The manufacturers' desire to improve the control on our models is much the same as our RC pioneers.

Thanks for all the fun, Mr. Good! MA

AMA Flying Site Assistance Coordinator

75 Years of Model Engine History

IN THE BEGINNING, there were working model engines such as the Atom and Arden .049 gas-ignition engines. We call them model engines because they were used in models, but it is more accurate to call them miniature engines! These power plants were engineering marvels in their own right.

To have an engine that small with a full ignition system was quite a feat when you consider the technology and materials that were available. They used big batteries, coil ignition, and capacitors with mechanical points to make the plug spark.

More powerful gas/ignition engines, such as the Foster Brothers .99 with dual-ignition speeds, soon came along. These were used in Free Flight airplanes and fueled the imaginations of many a small child and some of our future astronauts. The hobby of model aviation owes a lot to the inventors and advanced rapidly once miniature internal combustion was available.

A gasoline/oil mix was the main fuel being used until innovators such as Ray Anderson took out the spark plug and brought us the glow plug. These engines used the less-volatile methanol-and-oil mixture. The glow-plug engine immediately had a huge advantage, because once the engine was running, all of the batteries and wires could be removed. This saved much weight in the airplane.

Initially, engines were only required to run at a fixed speed and then quit. Airplanes were either Free Flight or tethered, as in Control Line (U-Control). The engines were just required to run at full bore until they ran out of fuel or a timer cut off the fuel supply. Amazingly so, these engines are still used today in their original form by many Old-Timer flying enthusiasts around the world.

When radio control systems became available, carburetors were added with throttle arms that allowed the operator to vary the engine speed. Now the flight of a full-size airplane could be faithfully and authentically reproduced. This led to an explosion in engine design and availability.

Added to this mix were some small diesel engines, but most people tended to run glow power. In the 1980s a new development of glow-ignition, four-cycle engines reached the US market. These were initially quite small (.40 size) and were much less powerful than their two-cycle equivalents. They did however, sound great and were an inspiration for many scale warbirds.

The four-cycle model engine was an amazing piece of engineering and created quite a revolution in Scale and Aerobatic competitions. They had gears that drove cams, which lifted valve heads smaller than your little fingernail. Even with all of the extra moving parts, they were not much heavier than their equivalent two-cycle counterparts.

All of the types of engines began to increase in capacity as radio systems became more powerful. It could have been the other way around; either way this chicken-or-egg scenario led to the development of huge RC airplanes with wingspans greater than 140 inches.

Then a strange phenomenon occurred. Gas-ignition engines came full circle and bounced back with a bang! If you go to any big Scale or International Miniature Aircraft Association (IMAA) event you will see Desert Aircraft and RCS 50cc ignition engines alongside four-cylinder, horizontally opposed O.S. four-cycle engines. Alternatively, they could be next to a big O.S. BGX or Mark 2.1 two-cycle-powered airplane.

Today you can buy a 250cc, four-cylinder ignition engine and fly an RC airplane twice your own size! I wonder if those early miniature-engine pioneers dreamed this would be the case 75 years ago.

Innovations are still happening today. You can buy a miniature O.S. Wankel engine that has no piston! There are RCV four-cycle engines that have no valves. The cylinder-liner is supported by ball bearings and geared to rotate at half of the speed of the crankshaft. While this happens the piston goes up and down in the rotating cylinder. How creative is that? That's pretty amazing stuff by any engineering standards.

There is one engine that uses nearly all of the above technology. The YS 1.70 engine is a four-cycle, supercharged ignition engine that runs on nitro-based fuel. The top of the engine is a four-cycle; the bottom half has a rotary-timed rear inlet disk. The fuel is pumped by the inlet valve pushrod and the fuel/air mix is supercharged by the down stroke of the piston. The valve cover chamber is evacuated every stroke of the piston, which opens the inlet valve to stoke the combustion chamber.

Each time one of these incredible engines is run, it could be said that it represents the ghosts of all who invented and made what we use today.

There was a time when a chauffeur had to be a mechanic to drive a car. At one time you almost had to be a mechanical engineer to get these little engines to run. Today, in a car we just turn the key and go. In the world of RC internal-combustion flying, we are fortunate to have had much of the hard work done for us. MA

The O.S. in-line four-cyclinder four-cycle that is almost too beautiful to run. It is even more beautiful when it does!

A Salute to Aeromodeling's Lindbergh

MANY HAVE SAID that if there was a Mount Rushmore for aeromodelers Maynard Hill would certainly be on it. He was one of a kind who passed away in June at age 85. Maynard will be sorely missed.

I had the distinct privilege of not only knowing him but also the honor of landing his TAM-5 RC aircraft on the coast of Ireland in August 2003. That airplane, designed by Maynard, had just spent 38 hours, 52 minutes, and 14 seconds, traveling 1,882 miles from Cape Spear, Newfoundland. It did what no other model aircraft had ever done. The TAM-5 crossed the Atlantic Ocean—on less than a gallon of fuel.

Only two ounces of Coleman Lantern fuel, slightly modified with a lubricant, remained in the tank. This fuel was Maynard's solution for long-term engine runs that he developed during years of research. No one had ever flown a model a third of that distance before. It was a giant leap for modelers everywhere.

Maynard Hill has been hailed as "aeromodeling's Lindbergh," and it's not much of a stretch. Crossing the Atlantic was another world record, his last, for an aeromodeler who has few peers at this level.

Maynard's records were in speed, altitude, and distance. Closed-course and cross-country records, powered flights or gliders—no record was safe from Maynard Hill.

Although Maynard accumulated 25 world records between 1963 and that day in 2003, he was much more than a record-breaker. He was a great innovator and a metallurgical

January 2001. Maynard Hill's building workshop. Photo by Barrett Joseph Foster.

August 2002. Cape Spear, Newfoundland. Maynard Hill and Nelson Sherren wait for launch time. Photo by Leroy Leslie Hamilton.

scientist, but mostly a tinkerer who could solve nearly any problem. He was also one of the greatest storytellers I've ever encountered. He could enthrall you for hours.

I think he was to aeromodeling who Goddard was to rocketry. His "backyard laboratory" and basement workshop were places of reverence for all who were privileged to enter.

Maynard took the propellers from all his record-breaking airplanes and nailed them to his workshop door like scalps. The display was his chronology of world records.

Maynard focused on surpassing whatever was the best at the time, especially if it was a record held by the Russians during the Space Race of the 1960s! He quipped, "Communism is very bad—no balsa wood!"

Visiting his basement was such a thrill. Aside from his records, Maynard was absolutely driven to develop practical and usable new technologies. His electrostatic autopilot invention was an incredible feat and a great service to the hobby and sport.

Maynard was an early pioneer in the development of unmanned aerial vehicles, or drones, for the military, presaging what has become a key component in our war on terror today. Many such projects were funded by Pentagon grants while he worked at the Johns Hopkins Applied Physics Lab.

Inspired by heroes such as Jimmy Doolittle, Wiley Post, and Amelia Earhart, Maynard grew up in the Golden Age of Aviation. He often said that he had acquired a serious addiction to balsa and glue before he was 10 years old!

Although he was partially deaf and legally blind for the last 10 years of his life, Maynard Hill saw possibilities where others didn't. If aeromodelers of the present generation have the forethought and ability to push beyond boundaries, it's because they stand on the shoulders of a giant: my friend, Maynard Hill. MA

Preserving Flying Sites

FROM ITS HUMBLE beginning, the Academy of Model Aeronautics (AMA) has grown in many areas to help modelers in the United States better enjoy their hobby. Standardizing competition rules created a level playing field for AMA members to be able to compete nationally.

When AMA began publishing *Model Aviation,* it provided a vehicle by which the Academy could better communicate with its members.

As AMA grew, it began to look for ways to better serve the membership. Surveys conducted by the Academy indicated that the number-one issue on modelers' minds was obtaining and retaining good, quality flying sites. Headquarters staff members did the best they could to help, but it soon became apparent that someone was needed to deal solely with this issue.

The Academy hired Joe Beshar and Wes De Cou to take on this responsibility. Joe handled issues east of the Mississippi River, and Wes took care of the western half of the country.

Although these two men had much success in helping clubs, the AMA found that most of these cases concerned clubs that had lost a site and needed assistance. The AMA Executive Council felt that many of these situations might have been avoided if the club had taken steps to avert the issues that lead to the loss of the field.

It appeared that part of the problem was club members' lack of education concerning how they could actually protect their flying sites. It was also the Executive Council's feelings that the program needed more structure and better accountability to AMA Headquarters.

A book called *Getting and Keeping Flying Sites* had been developed throughout the years. Although it was effective, the document had become dated. There were also more than 100 other documents, many dating from the 1960s, that needed updating.

In 2009, the AMA decided to change the operation of the Flying Site Assistance Coordinators (FSAC) and have a single person who would be more directly tied to HQ. After a search, I was selected to take over the FSAC operations and make the program more proactive.

Since that time, the *Getting and Keeping Flying Sites* book has been revised; many of the documents have been revised, deleted, or replaced. Several videos, including a video of the seminar on *Getting and Keeping Flying Sites* was created and is available to the membership on the AMA website (www.modelaircraft.org) on the Flying Site Assistance page.

We have a Memorandum of Understanding with the Environmental Protection Agency (EPA) which simply states that once the EPA completes the remediation of a Superfund Site, it is recommended that a good use for it is to allow AMA clubs to use it as a flying field. This has opened many doors to clubs; as a result, several new club sites have been created, and a search for new ones is in process.

We are working with the FAA to regain access to some sites that have been taken away because of a misunderstanding of FAA rules regarding model flying on active airports. Many clubs—especially several in California—have been impacted by this ruling. I am working with our Governmental and Regulatory Affairs representative, Rich Hanson, to get this resolved so any affected clubs can get access again to flying sites.

As I write this, 78 cases are open in the Flying Site Assistance files! The Academy is busier than ever assisting clubs in the quest to find new sites, as well as educating club members on how to better protect the sites they now enjoy. MA

AMA's current Headquarters building opened in March 2001.

IAC Opens Doors

IN THE LATE 1980s, members of the Academy of Model Aeronautics (AMA) Executive Council made the boldest move in Academy history … they decided to create the world's best flying site.

The concept was developed and a request for proposals was advertised. The Executive Council received more than 60 bids from communities throughout the United States. The proposals were narrowed down and the council chose Muncie, Indiana, as the location. The Muncie site included more than 1,200 acres of farmland.

The original plan was to begin construction of the AMA museum and a multipurpose flying site. The concept changed as it became clear that the AMA Headquarters operation would be more efficient and economical if it were moved from Reston, Virginia to Muncie. The museum building was designed to also house the Headquarters. By 1993, the museum, Headquarters, and flying site were all based in Muncie.

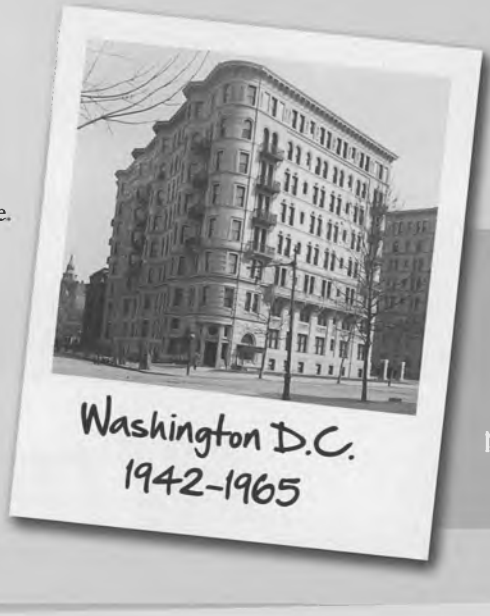
The original flying site was the L-pad, also known as Site 1. The design was intended to incorporate the needs of Control Line and Radio Control. In 1992 the Fédération Aéronautique Internationale (FAI) Scale World Championship was held at this site. The success of this event indicated that the International Aeromodeling Center fulfilled the Academy's dreams.

In 1994, the AMA Executive Council made another bold move by mandating that the National Aeromodeling Championships (Nats) be permanently held in Muncie. The Control Line speed circles and other features were created, and the 1995 Nats and Pylon World Championships were held in Muncie. The creation of Stage Center illustrated to the world how the ultimate Pylon site should be designed.

The growth of the Academy and its functions created the need for a larger and more functional Headquarters building. The concept and design of the current building were introduced in 1997. The dedication was held June 7, 2001.

Muncie could be considered the mecca for modelers throughout the world. Over the past decade many notable events have been held there, including world championships in Control Line, Scale, Pylon, Pattern, and Electric. Almost every day of the year, modelers have fun at the site. MA

—Bob Brown
AMA Executive Council member



The AMA called many places home before moving to Muncie.

Special Interest Groups (SIGs)

As the hobby and sport of model aviation continues to evolve, small communities of aviation pilots are joining together, united by a common passion. These Special Interest Groups provide an outlet for model aviators to communicate, share knowledge, learn new technologies, and compete within their particular field.

The following timeline pays tribute to the 23 AMA SIGs.

1967

NFFS
NATIONAL FREE FLIGHT SOCIETY

The National Free Flight Society (NFFS) is committed to the preservation and promotion of FF model aviation in all of is aspects and manifestations.

The National Free Flight Society is the only organization in the United States that serves the interests of all FF categories. The Society was formed more than 30 years ago to promote FF activities and continues as a vital, growing organization dedicated to the advancement of the FF hobby and sport.

1960

The Model Engine Collectors Association (MECA) promotes the interests of model engine collecting as a recreational, educational, and historical recording activity.

MECA provides information, assistance, training, and fellowship, and acts as a governing body for the hobby involving the association's members.

MODEL ENGINE COLLECTORS ASSN
MECA
AN INTERNATIONAL ORGANIZATION

1967

The Society of Antique Modelers (SAM) promotes the competition flying of FF and RC model aircraft of vintage design. The intention is to be casual, enjoyable, and interesting to both competitors and spectators. SAM's desire isn't to advance the state-of-the-art of aeromodeling, per se, other than to increase participation in the sport generally, or to reprove that which is already recorded in aeromodeling history books.

THE SOCIETY OF ANTIQUE MODELERS
SAM

1969

The League of Silent Flight (LSF) provides collective identification for active Radio Control Soaring enthusiasts throughout the world and recognize individual proficiency and accomplishment through a defined program of standard performance criteria for RC model sailplanes.

The secondary purpose of the LSF is to foster and support all phases of sporting and competitive activity for RC model sailplanes; to encourage personal and collective advancement in knowledge of aerodynamics and related arts and sciences; and to promote the general interest in Soaring.

1973

The National Society of Radio Controlled Aerobatics' (NSRCA) objective is to promote the construction and competitive flying of RC Precision Aerobatic model airplanes. To aid, insofar as possible, the Academy of Model Aeronautics and other AMA activities, to further the advancement of model aircraft aerobatics in all of its phases.

1973

The Precision Aerobatics Model Pilots Association (PAMPA) is a Special Interest Group (SIG) of the Academy of Model Aeronautics. It is an organization of approximately 800 members in 35 countries, whose common interest is model airplanes, specifically the kind that fly tethered on control lines, and perform stunts. The models are often very beautiful, and are carefully constructed from traditional materials such as balsa wood, silkspan, and dope. Top models are beautifully finished and extremely light and strong for their size.

The mission of PAMPA is to promote and improve Control Line Precision Aerobatics events.

1973

The Miniature Aircraft Combat Association (MACA) is a Control Line model aviation organization with a focus on CL Combat.

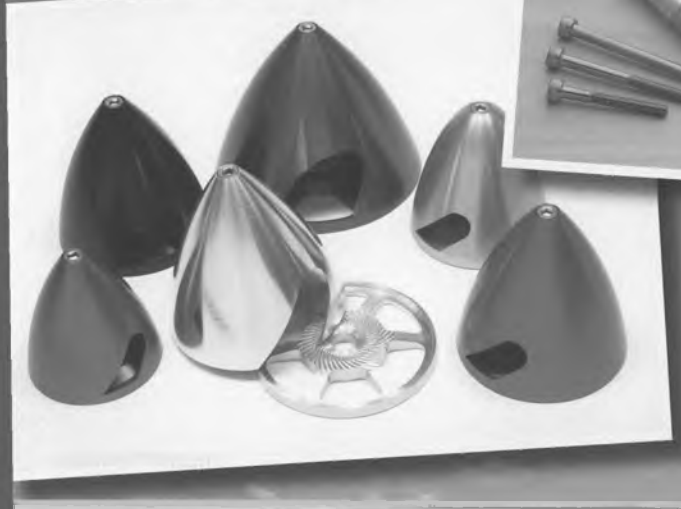
HAPPY 75TH BIRTHDAY AMA!

After sharing the past 25 years of Model Aviation history, the makers of Tru-Turn Precision model products salute your commitment to Safety and the Longevity of this great hobby.

Tru-Turn continues to offer precision American Craftsmanship with the same commitment to modeler safety.

We'll see you at the celebration!

Fly Safely!



TRU TURN

1977

The Navy Carrier Society (NCS) came into being in the early 1950's with the first Nats that including Carrier in 1952. This National Championship event was sponsored by the U. S. Navy.

Today the Carrier event is sponsored at the national level by the Navy Carrier Society, a group formed in 1977 to promote this activity.

The National Association of Scale Aeromodelers (NASA) aims to encourage, promote, and advance all phases of Scale aeromodeling, regardless of size, power, or mode of control.

NASA encourages the formation of Scale clubs, competition, training, the sharing of resources, and good relations with media and Academy of Model Aeronautics to further enhance the image of Scale aeromodeling.

1977

1980

IMAC
INTERNATIONAL MINIATURE AEROBATIC CLUB

The International Miniature Aerobatic Club (IMAC) is inspired by full-scale aerobatics. IMAC strives to fly Acale Aerobatic model aircraft in a competitive and realistic manner that is challenging for the contestants as well as interesting for spectators. At present, the IMAC standard is being used in more than 15 countries worldwide for Scale Aerobatics competition.

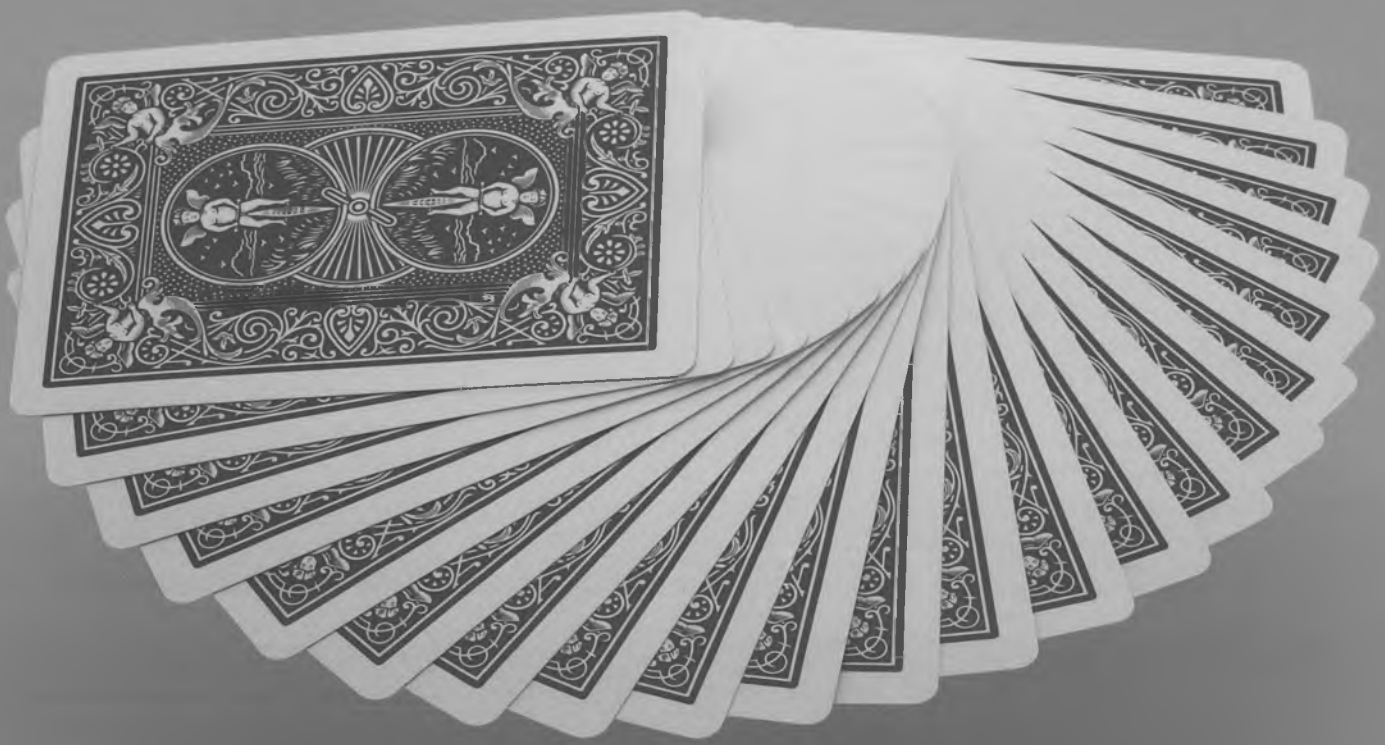
1983

The North American Speed Society (NASS) is the special interest group of Control Line Speed and is associated with the Academy of Model Aeronautics.

NASS helps formulate rules that promote the interest of the Speed fraternity as well as communicates your speed fliers' views and ideas to the AMA. The AMA has called upon the SIGs to run the Nats. NASS now runs the speed portion of the Nats.

The International Miniature Aircraft Association, Inc. (IMAA), was formed for the purpose of fostering and advancing the operation of large radio-controlled model aircraft in a setting where informality and safety of operations prevail. Additionally, IMAA was formed to create an atmosphere where pleasure, recreation, fellowship, and co-mingling can be fostered and found to exist among individuals enjoying the sport of building and flying large radio-controlled model aircraft.

1983



In Stock. No Illusions.

1989

The Jet Pilots Organization (JPO) was founded to promote and advance jet modeling technology, and the safe recreation and general fellowship of this fast-growing segment of our model aviation. JPO officially represents USA jet modelers to our national organization insurer, the AMA. JPO strives to support the interests, goals, and concerns of jet pilots at all levels.

1989

The Vintage Radio Control Society (VR/CS) is intended to preserve and promote the memory of Radio Control Aeromodeling activity as it was in the past.

1989

The International Radio Controlled Helicopter Association (IRCHA) was established as an organization by the pilots, for the pilots. IRCHA works to promote the continued growth of radio-controlled helicopters through education, representation, service, and special events. Radio-controlled helicopters are a dynamic, evolving segment of the AMA and as such IRCHA works closely with the AMA to foster growth and acceptance. Through these endeavors, IRCHA hopes to provide its members with the opportunity to enjoy the hobby, make many new friends, and expand their intellectual interests.

1991

The Senior Pattern Association (SPA) promotes the competition flying of Radio Control Vintage Pattern aircraft. SPA's intention is to be casual, enjoyable, and to renew old friendships. There is no intent to advance the state of the art. The intent is to increase participation in the sport, and to establish an equitable and simple framework of rules and regulations for competition purposes.

1992

The National Competition Fun Fly Assocation (NCFFA) was formed to standardize tasks for radio-controlled competition fun-fly contests. Additionally, it was formed to create an atmosphere where pleasure, recreation, and fellowship can be fostered and found to exist among individuals competing in fun-flys.

1991

The Scale Warbird Racing Association (SWRA) was formed for those individuals who are interested in the thrill, excitement, and nostalgia of racing radio-controlled model aircraft of piston-driven warbirds and replicas of the Unlimited "Reno" Racers.

1992

The National Control Line Racing Association (NCLRA) is an association for persons interested in the construction and operation of Control Line Racing aircraft.

1994

The Unlimited Scale Racing Association (USRA) is an organization dedicated to the competitive sport of radio-controlled Giant Scale racing competition, capturing the thrill and excitement of this fast motor sport.

The USRA is the official sanctioning and rules body for the sport of Giant Scale Air Racing.

1998

The National Miniature Pylon Racing Association (NMPRA) promotes the general interests and welfare of all engaged in the construction and flying of radio-controlled model racing airplanes, and to aid insofar as possible the national program of the AMA.

1997

The Radio Control Combat Association (RCCA) is a Special Interest Group of the AMA. The purpose of RCCA is to provide information and technical knowledge to model aviation enthusiasts who love the War Planes of World War II.

Members enjoy competition and a place to share information, views, and discussion with others who have similar interests.

1998

The World Miniature Warbird Association, Inc. (WMWA) is an organization dedicated to building and flying RC models built after the designs of the many aircraft used for combat and defense around the world. Model size, method of power, and construction are not an issue. WMWA is about friendship, about helping each other, and about introducing this fascinating hobby to young people.

The History of *Model Aviation*

THE ACADEMY of Model Aeronautics (AMA), as an organization, has always been very interested in informing its members of current aeromodeling activities. In fact, so much so that the first issue of *Model Aviation* (*MA*) was printed and distributed before the organization even officially existed. Issue 1, Volume 1, was provided to those attending the 1936 National Aeromodeling Championships (Nats) before the first official meeting held at the end of the competition. For the next two decades, *MA* was provided to AMA Leader Members and subscribers, and in 1954, all AMA members began to receive *MA* as part of their membership benefits.

In 1966, in search of ways to reduce costs and increase members, combined with a unique opportunity offered by new owners of the magazine *American Aircraft Modeler* (*AAM*), the AMA council agreed to provide all members with a subscription to *AAM* rather than continue with its own separate publication. As part of this agreement, AMA news and events were included in a special section of the magazine. For the AMA it was hoped that by publishing a separate magazine, AMA members would still receive their AMA news, but also read exciting modeling feature articles. They also hoped that more modelers could be exposed to AMA news and events, and might therefore become members.

For AAM, because of the nature of its new ownership, the reduction in paying subscribers verses the rising numbers of AMA members paying only a fraction of the subscription rate, was not a concern. Because of the bimonthly nature of *AAM* during 1966, special *MA* issues would be mailed to chartered clubs and contest directors until *AAM* began monthly publication in 1967. From 1966 to 1975 membership increased from 16,000 to 52,000.

This arrangement worked well for nine years, until *AAM* announced in February 1975 that it was filing for bankruptcy. Suddenly the AMA was going to be without a way to communicate with its members. "AMA officers saw most members preferring to receive a magazine with well-rounded features at reasonable cost instead of a small newsletter—and authorized the revival of *MA* with 80 pages." (*Model Aviation*, July 1975, pg. 3.)

With only two months to prepare, advertisers were located and contributing editors and columnists were approached. As result of this hard work, the first issue of the new *Model Aviation* magazine was published in July of 1975.

Today, after 36 years, *MA* is the flagship of the AMA publication efforts, continuing to provide members with aeromodeling news, event coverage, new product announcements, and district reports.

Going forward, *MA* will continue to evolve to better serve our membership without losing sight of our core mission which is to inspire, inform, and instruct enthusiasts who share a passion for aeromodeling. **MA**

A Life Lived Well, A Gift Much Appreciated

Gil in his workshop.

HE WAS KNOWN affectionately by his aeromodeling friends as "Mr. Second Place." A tenacious competitor in CL Combat, Gil Reedy of Mechanicsburg, Pennsylvania, co-founder of the Harrisburg Aeromodeling Society, had many local competition wins throughout his long career, but never first in the Nats. He loved all types of CL flying, but Gil was most avid about Combat.

Gil Reedy has passed away but his legacy lives on among the many AMA friends he has left behind, including his longtime combatant, Phil Cartier, who did win the CL Combat Nats on more than one occasion in an equally lengthy aeromodeling career.

"Gil was a real competitor," recalls Phil. "He was a great guy and a real gentleman, but when he was in the circle he was the Red Baron. I think we went to 20 out-of-state contests every year for more than 20 years."

The Academy received a generous gift from Gil's estate. The photo at left shows Gil with one of his last workshop creations. It is one of the many airplanes that gave much pleasure to him and another good friend and flying partner, Phil Spillman.

"The small P-40 was a trip down memory lane for Gil," says Phil. "It was a Monogram Speedi-Built model that many of us built when we were in fifth or sixth grade. These didn't fly well, but were still really neat to us!"

Gil was recognized in 2008 at the Brodak Annual Fly In, now the world's largest CL model competition with the Spirit of the Sport Award for "for individuals who both exemplify and promote control line."

Although Gil is gone, his legacy remains in the hearts of many friends. AMA is very pleased that he thought of the Academy with a generous gift. *MA*

—Chris Brooks, APR
Director of Public Relations

Gil testing one of his workshop CL creations.

Are you one of the 70% of Americans without a will?

Make sure your legacy is fully intact. We can help. Just call us at 1-800-I-FLY-AMA (435-9262) or write to development@modelaircraft.org. There are many ways to help the Academy serve its members, students and communities. Renewal notices to members include many options for additional support, including funds for Site Development, Scholarships, Member Helping Member, the Museum Patron Program and others.

You can also help AMA and future generations with a donation and purchase of a brick in the AMA Walk of Fame. The bricks are suitable for corporate sponsorships, family and individual contributions, special memorials, clubs and civic organizations. For a donation of $100 your presence on the Walk of Fame is a 4x8-inch custom-engraved paving brick with the AMA logo, and up to two lines of copy. A "Golden Wings" brick is available for $500, and an 8x8-inch black granite brick with five lines of copy is available for a donation of $1,000.

Teaching a new generation of pilots.

Investing in the Future

WHEN THE ACADEMY of Model Aeronautics (AMA) was founded in 1936, the name was chosen by the organization to acknowledge that learning about model building and flying was an important part of a young person's education.

During the so-called "Golden Age of Aviation," when the nation's youth closely followed the achievements of Charles Lindbergh and Amelia Earhart, building small-scale aircraft for competition in local, regional, and national flying events was viewed as a logical part of preparation for higher education in a variety of careers.

The "Academy" in the organization's name is no less relevant today because a major focus of the sport and hobby of aeromodeling is lifelong learning, whether a member is young or simply young at heart.

Model aviation has changed much in the last half-century. The revolution in micro technology now makes it possible for newcomers to the sport and hobby of model aviation to fly battery-powered, electric-powered Radio Control, Free Flight, and Control Line models literally in their own backyards. The recent dramatic increase in public access provides an opportunity for young people to actively engage in aviation without waiting to reach minimum-age requirements imposed by the FAA or incurring the expense involved in full-scale aviation. They can do so immediately at home, in their classrooms, in schoolyards and in local parks.

AMA is engaging classrooms across the country.

With the help of more than 140,000 AMA members in 2,400 chartered clubs, newcomers have the opportunity to become members in informal education "communities of learners," to acquire new skills in electronics, mechanical engineering, and aerodynamics, extending their reach to new horizons of achievement. *MA*

—Bill Pritchett
Director of Education

Join the Conversation

Members of the Academy of Model Aeronautics are the lifeblood of the hobby, sport, and educational pursuit of model aviation. We offer dozens of communciation outlets inviting every member to stay connected and share their thoughts. Our goal remains the same as it did during the development of this organization that "all become united in one advisory body, having a firm official standing ... to advance model aeronautics as a science and sport and to aid constructive activities employing model aircraft as one means toward general aeronautic education." (NAA Junior Membership News, *Model Airplane News*, Oct. 1935.)

Anchorage, AK

Introduction to AMA

AMA IS

- 170,000+ Members
- 2,400+ Charter clubs
- 2,000+ Affiliated Flying Sites
- $10 Million annual budget
- 50+ Employees
- 1,100 acre International Flying Site
- Member of the National Aeronautic Association

Little Known Facts About AMA

- AMA was established in 1936.
- Predates the FAA and the CAB which was established in 1938.
- AMA's 78 year Safety Program has achieved an exceptional safety record.
- In 1981 AMA incorporated the safety principles of AC 91-57 into the AMA Safety Program.

Little Known Facts About AMA

AMA's Liability Insurance Program

- For Members
- For Clubs
- For Site Owners

Covers members wherever they fly.

Members are required and agree to comply with AMA's safety guidelines as a condition of membership.

AMA Community Based Organization

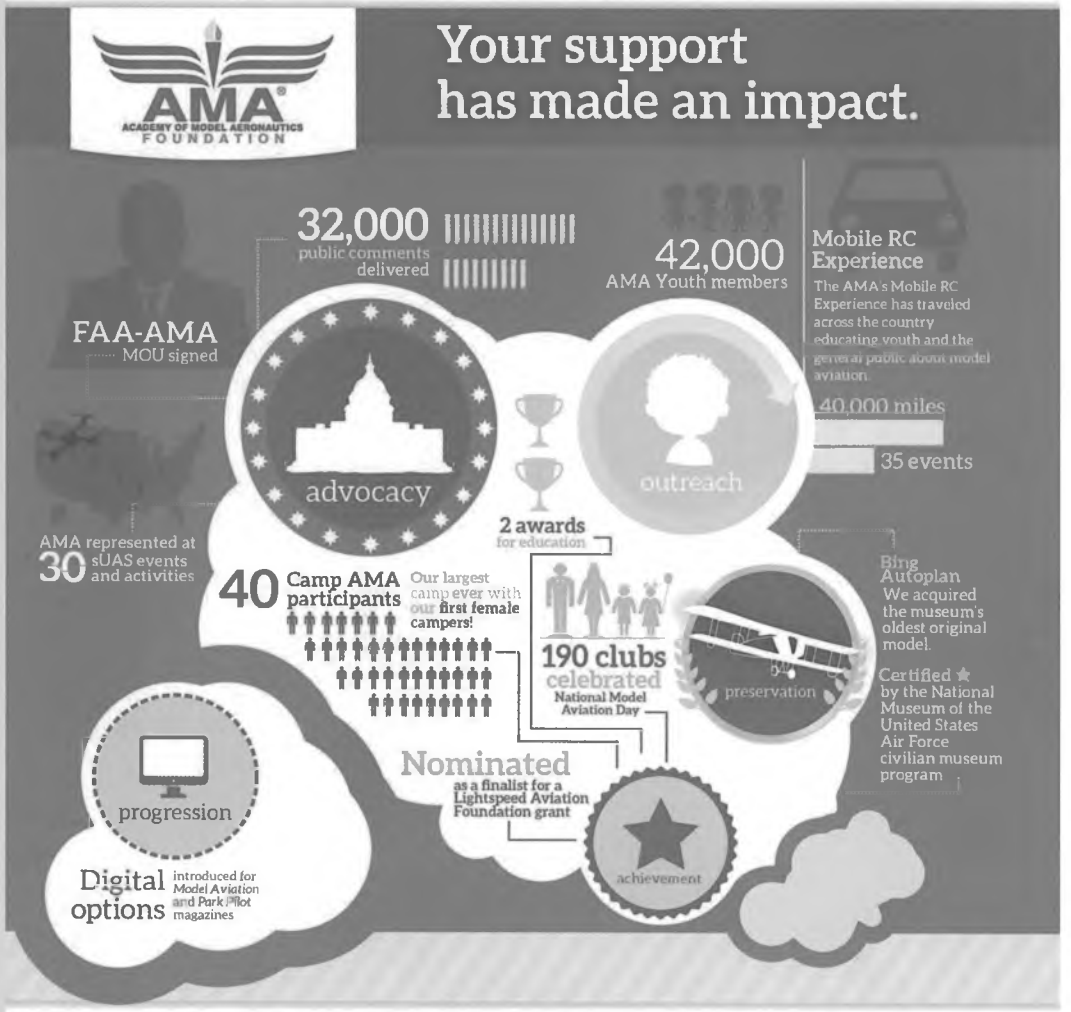
- Web presence
- YouTube, Facebook
- Marketing Outreach
- STEM Ed

AMA Foundation

What the AMA Foundation is About

The AMA Foundation exists to inspire the financial support of aeromodeling, a hobby, sport and scientific pursuit, as a legitimate and necessary component of the full aviation continuum, contributing significantly to the betterment of American society through a Congressionally-recognized community-based organization.

The AMA Foundation was established in 2013 to serve as a supporting organization that will fundraise and grant funds exclusively for and on behalf of the Academy of Model Aeronautics, founded in 1936



Donate by Dec. 31 and enjoy a tax incentive.*

In 2014, your contributions helped AMA reach out to the youth who are the future of our hobby, preserve timeless artifacts and memories, and fight to protect your right to fly.

Help us fuel the passion of flying. Donate by December 31 and enjoy a larger tax refund.

Learn more about the AMA Foundation and make a donation by visiting **amafoundation.modelaircraft.org.**

* The tax year ends at midnight on December 31. Donations must be received and/or postmarked before midnight on December 31.

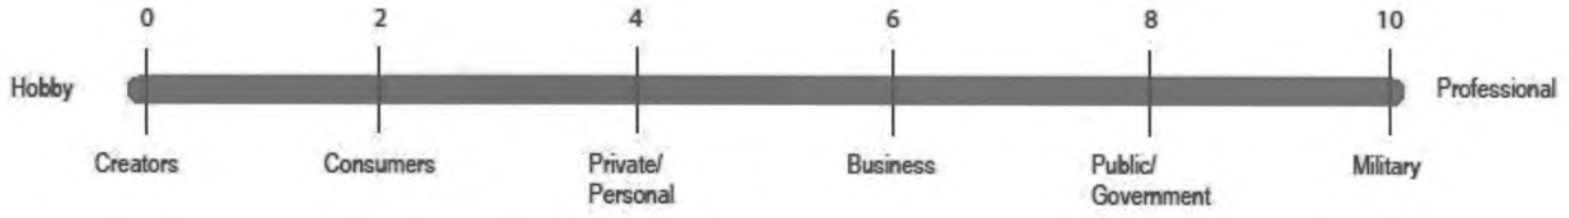
AMA
ACADEMY OF MODEL AERONAUTICS

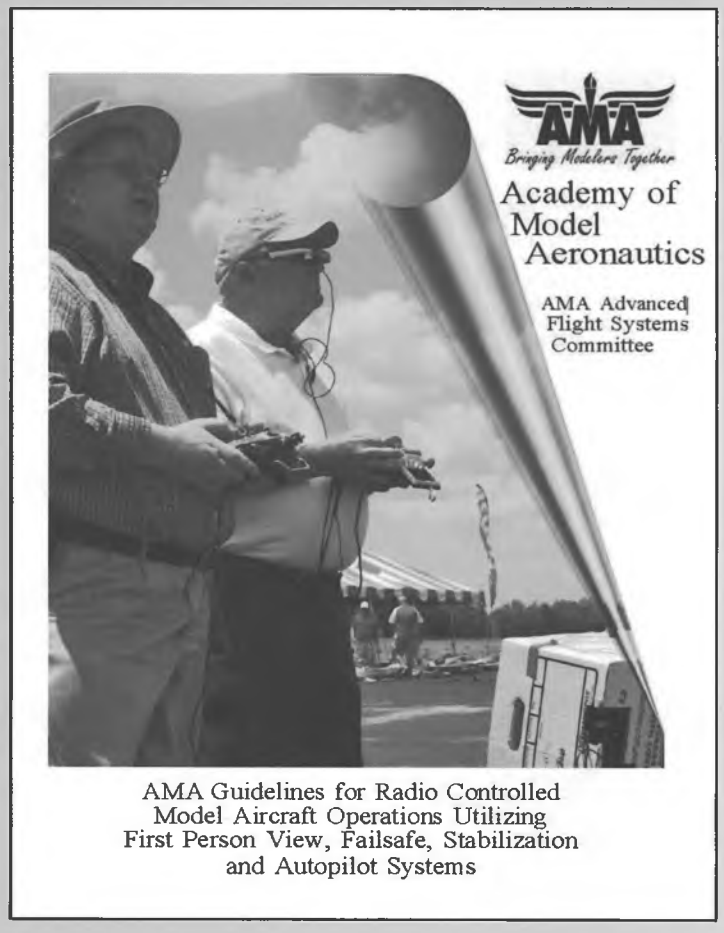
AMA Model Aircraft/Drone Positioning Assessment

Below is a chart describing the spectrum of model aircraft and drone usage.
Where on the chart do you believe that AMA's interest and influence stop?

AMA Government Relations



Where FPV and SAF Fit Into Current AMA Programming



AMA created its first program for First Person View Flight in late 2008.

In 2012 AMA created a program for the Semi-Autonomous (Automated) Community.

AMA is working with to expand its programming to incorporate the gap between recreational use and purposeful use, by working with other organizations such as AUVSI and FAA so that there is a clear public understanding from STEM education to professional use.

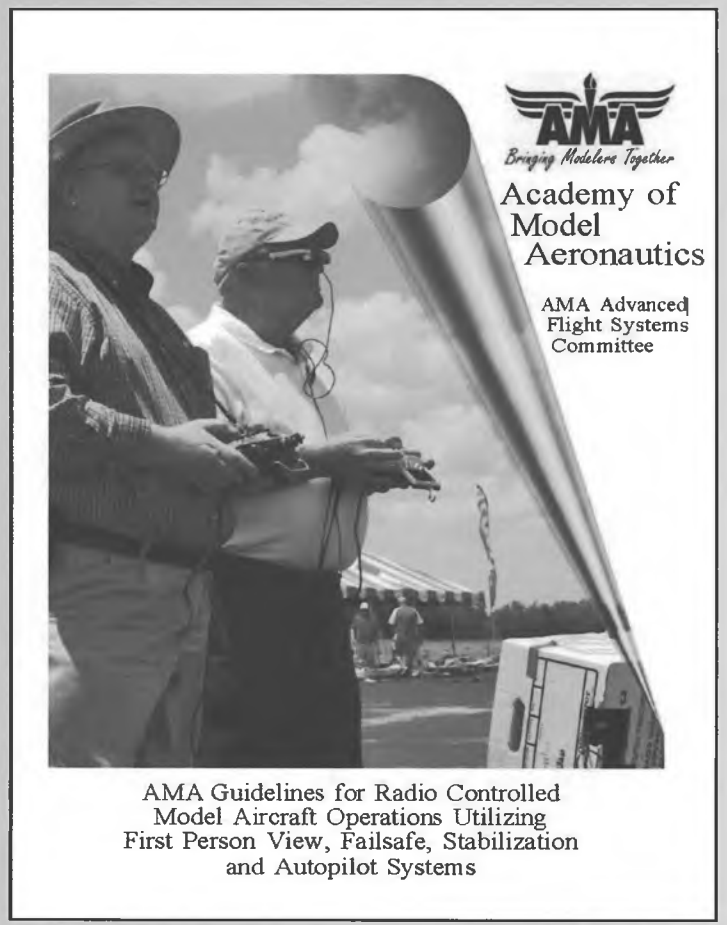
Flying Safely and Responsibly

- Don't operate on or fly over private property without first obtaining permission from the owner/authority and/or the property tenant.
- Don't fly where the operation of radio control aircraft are prohibited.
- Don't fly near open assemblies of people without first obtaining permission or otherwise making prior arrangements to do so.
- Don't fly near or over sensitive infrastructure or property such as power stations, water treatment facilities, correctional facilities, heavily traveled roadways, government facilities, etc. without making prior arrangements to do so.

sUAS (Drone) Safety

- Do not interfere with manned aircraft operations
- Yield right of way to manned aircraft. See & Avoid other aircraft at all times (AMA Doc #540-D)
- Do not endanger persons or property, no intentional overflight, no closer than 25 feet
- Fly no higher than necessary (≤ 400'). Remain below surrounding obstacles when possible
- Avoid operations in close proximity to airports. When within 5 miles of an airport, contact the airport/ATC
- Assure pilot competency/proficiency and the safe operation of the aircraft
- Remain within VLOS. Use a spotter when necessary/appropriate

AMA's Privacy Policy



"The use of imaging technology for aerial surveillance with radio control model aircraft having the capability of obtaining high-resolution photographs and/or video, or using any types of sensors, for the collection, retention, or dissemination of surveillance data or information on individuals, homes, businesses, or property at locations where there is a reasonable expectation of privacy is strictly prohibited by the AMA unless written expressed permission is obtained from the individual property owners or managers."

Questions?

New technologies enable state and local law enforcement agencies to investigate crimes in ways once thought impossible or impractical. Across the nation, lawmakers are debating and enacting legislation that addresses how police can use these innovative tools to maximize public safety while complying with the Fourth Amendment's prohibition against unlawful search and seizure. Unmanned aircraft systems (UAS) and cell phones are two technologies on which much recent legislative attention has focused.

Police Use of Unmanned Aircraft Systems

Warrant Requirements for UAS Use - Fourteen states have enacted laws that address police use of UAS, commonly called drones. Thirteen of those states enable police to use UAS pursuant to a warrant, while Virginia prohibits their use by law enforcement agencies until July 1, 2015. In Iowa, law prohibits UAS from being used to enforce traffic violations.

Operational Standards for Police use of UAS - Laws in at least five states require that agencies adopt standardized protocols for police use of UAS. Alaska's law requires that law enforcement agencies adopt procedures that ensure: the appropriate Federal Aviation Administration authorization is obtained; UAS operators are trained and certified; a record of all flights is kept and there is an opportunity for community involvement in the development of the policy. Similar laws in Iowa, Texas and Virginia require state agencies to develop protocols for law enforcement's use of UAS. In North Carolina, the law requires all state personnel that operate a UAS to complete a knowledge and skills test developed by the state Division of Aviation.

UAS Reporting Requirements - States are also implementing reporting requirements for UAS use by law enforcement. Utah's law requires law enforcement agencies to report annually on their use of UAS. Among other requirements, the report must include: the number of times an unmanned aircraft was used; the number of criminal investigations that were aided; the manner in which criminal investigations were aided; the cost of acquiring, maintaining, repairing, and operating each unmanned aircraft; and the data that was collected on any person, structure, or area. Similar reporting laws have been enacted in Illinois and Texas.

Two states, Oregon and North Carolina, require government UAS to be registered with certain state offices. Oregon's law requires all public entities using UAS to register them with their state Department of Aviation while North Carolina's law requires any state entity acquiring a UAS to get approval from the state chief information officer.

Data Collection and Retention Polices – At least two states, Illinois and Utah, have created statutory standards for the retention and deletion of data obtained using UAS. Illinois' law requires law enforcement agencies to destroy all information gathered by UAS within 30 days unless there is reasonable suspicion that the information shows evidence of criminal activity. Utah's law prevents law enforcement agencies from using UAS collected data related to any person, structure, or area that was not the specified target of an investigation or is not directly displaying criminal activity.

Third Party UAS Use and Data Sharing with Law Enforcement - Laws in Illinois and Utah address how private citizens or companies can share with police information obtained by use of their own UAS. Illinois' law requires police to follow warrant protocols to compel third parties to share information. If the information is voluntarily shared with police, authorities are required to follow the state's law governing UAS data retention and disclosure. In Utah, the public can share UAS obtained information with law enforcement if the data captures the commission of a crime or imminent or ongoing danger.

Police Use of Cell Phone Surveillance Technology

Cell phones, the information they contain, and the location data they transmit can significantly aid police during investigations. State and federal decision-makers have weighed in on the appropriate police use of cellular information. On June 25, 2014, the United States Supreme Court ruled in *Riley v. California* that warrants are generally required before police can search the contents of an arrestee's cell phone. In addition, at least 10 states have enacted warrant requirements for police before they are able to acquire location or stored data from cellular devices or telecommunication companies.

Under certain emergency situations law enforcement is able to collect information from cell phones, or obtain location data without first procuring a warrant. Under Indiana and Virginia law, if a police officer obtains location data based on exigent circumstances, they must obtain a court order within 72 of their initial use of the tracking device.

Reporting Requirements - Minnesota's law requires that each request for a warrant for location data be reported to and tracked by the state court administrator. The information collected by the state court administrator must include whether the warrant application was accepted or denied, the time period of its authorization, the nature of the monitoring and the identity of the police officer or agency requesting the warrant. This information is required to be reported to the Legislature biannually.

Notification Requirements - Utah's law requires police who obtain a warrant for location data to notify the owner of the targeted electronic device within 14 days of the conclusion of the operation. Law enforcement must notify the owner that a warrant was issued, of the time period for which data was collected and of the alleged offense.

Enhanced Protections for Journalists - In Indiana, when police request a warrant for location data for a member of the media, the journalist or news entity targeted must be given notice of the request and the ability to be heard in court concerning the issuance of the warrant. Police are not required to notify journalists if they are the target of a criminal investigation and notifying them would pose a risk to the integrity of the investigation.

Hobby / Recreational Flying

What Can I Do With My Model Aircraft?

Having fun means flying safely! Hobby or recreational flying doesn't require FAA approval but you must follow safety guidelines. Any other use requires FAA authorization.

AVOID DOING ANYTHING HAZARDOUS TO OTHER AIRPLANES OR PEOPLE AND PROPERTY ON THE GROUND.

- ✓ **DO** fly a model aircraft/UAS at the local model aircraft club
- ✓ **DO** take lessons and learn to fly safely
- ✓ **DO** contact the airport or control tower when flying within 5 miles of the airport
- ✓ **DO** fly a model aircraft for personal enjoyment

- ⊘ **DON'T** fly near manned aircraft
- ⊘ **DON'T** fly beyond line of sight of the operator
- ⊘ **DON'T** fly an aircraft weighing more than 55 lbs unless it's certified by an aeromodelling community-based organization
- ⊘ **DON'T** fly contrary to your aero-modelling community-based safety guidelines
- ⊘ **DON'T** fly model aircraft for payment or commercial purposes

MODEL AIRCRAFT OPERATIONS LIMITS

According to the FAA Modernization and Reform Act of 2012 as (1) the aircraft is flown strictly for hobby or recreational use; (2) the aircraft is operated in accordance with a community-based set of safety guidelines and within the programming of a nationwide community-based organization; (3) the aircraft is limited to not more than 55 pounds unless otherwise certified through a design, construction, inspection, flight test, and operational safety program administered by a community-based organization; (4) the aircraft is operated in a manner that does not interfere with and gives way to any manned aircraft; (5) when flown within 5 miles of an airport, the operator of the aircraft provides the airport operator and the airport air traffic control tower...with prior notice of the operation; and (6) the aircraft is flown within visual line of sight of the operator.

For more information about safety training and guidelines, visit **www.modelaircraft.org**

For more information, visit Federal Aviation

July 2014

Commercial

The FAA currently authorizes the use of unmanned aircraft systems (UAS) for commercial or business purposes on a case-by-case basis. You may not fly your UAS for commercial purpose without the express permission from the FAA. You should check with the FAA for further determination as to what constitutes a commercial or business use of small UAS.

What is a commercial use of UAS?

Any commercial use in connection with a business, including:

- Selling photos or videos taken from a UAS
- Using UAS to provide contract services, such as industrial equipment or factory inspection
- Using UAS to provide professional services, such as security or telecommunications

What are some examples of commercial uses of UAS?

- Professional real estate or wedding photography
- Professional cinema photography for a film or television production
- Providing contract services for mapping or land surveys

If you want to use UAS for a commercial purpose, you have a few options. You can apply for an exemption from the FAA to operate commercially. You can use UAS with an FAA airworthiness certificate and operate pursuant to FAA rules. In both cases you would also need an FAA Certificate of Authorization (COA). For more information about how to apply for an exemption, visit https://www.faa.gov/uas/legislative_programs/section_333/.

Recreational

Currently, small unmanned aircraft systems (sUAS) may be operated for hobby and recreational purposes under specific safety guidelines as established by Congress. Small UAS flown for recreational purposes are typically known as model aircraft.

Under the Special Rule for Model Aircraft, recreational UAS must be operated in accordance with several requirements, including a community-based set of safety guidelines and within the programming of a nationwide community-based organization such as the Academy of Model Aeronautics (AMA). Operators not operating within the safety program of a community-based organization should follow the FAA's guidance at http://www.faa.gov/uas/publications/model_aircraft_operators/.

What is recreational use of a sUAS?

The recreational use of sUAS is the operation of an unmanned aircraft for personal interests and enjoyment. For example, using a sUAS to take photographs for your own personal use would be considered recreational; using the same device to take photographs or videos for compensation or sale to another individual would be considered a commercial operation. You should check with the FAA for further determination as to what constitutes commercial or other non-hobby, non-recreational sUAS operations.

What are the safety guidelines for sUAS recreational users?

- Follow community-based safety guidelines, as developed by organizations such as the Academy of Model Aeronautics (AMA).
- Fly no higher than 400 feet and remain below any surrounding obstacles when possible.
- Keep your sUAS in eyesight at all times, and use an observer to assist if needed.
- Remain well clear of and do not interfere with manned aircraft operations, and you must see and avoid other aircraft and obstacles at all times.
- Do not intentionally fly over unprotected persons or moving vehicles, and remain at least 25 feet away from individuals and vulnerable property.
- Contact the airport or control tower before flying within five miles of an airport.
- Do not fly in adverse weather conditions such as in high winds or reduced visibility.
- Do not fly under the influence of alcohol or drugs.
- Ensure the operating environment is safe and that the operator is competent and proficient in the operation of the sUAS.
- Do not fly near or over sensitive infrastructure or property such as power stations, water treatment facilities, correctional facilities, heavily traveled roadways, government facilities, etc.
- Do not conduct surveillance or photograph persons in areas where there is an expectation of privacy without the individual's permission (see AMA's privacy policy).

If you want to use a model aircraft for recreational purpose, we encourage you to read the AMA's Model Aircraft Safety Code and Community-Based Guidelines.

Public Universities and Agencies

Public entities, which include publically funded universities, law enforcement, fire departments and other government agencies, may currently apply for a COA from the FAA in order to use sUAS in public aircraft operations.

Who can obtain a COA to operate public aircraft?

- Only government entities—such as federal and state government agencies, law enforcement agencies and public colleges and universities— can receive a COA for public UAS aircraft operations.
- Public aircraft operations must be conducted for a governmental function.
- COAs are most commonly issued to public (government) entities, but are also required for civil (private) operations.
- The FAA thoroughly evaluates each COA application to determine the safety of the proposal.
- COAs are issued for a specific period of time, usually two years, and include special provisions unique to each proposal, such as a defined block of airspace and time of day sUAS can be used.

How can I apply for a COA?

- Visit the FAA website for information on how to apply for a COA online
- Since 2009, the FAA has taken steps to streamline the application process by transitioning online
- The average authorization period is less than 60 days
- Expedited authorization is available in emergency and life-threatening situations

** For more information about public aircraft operations refer to 49 U.S.C. §§ 40102(a)(41), 40125, and FAA Advisory Circular 00-1.1A, Public Aircraft Operations (Feb. 12, 2014).*

FEDERAL AVIATION ADMINISTRATION

About Know Before You Fly

"Know Before You Fly" is an educational campaign that provides prospective unmanned aircraft users with the information and guidance they need to fly safely and responsibly.

About AUVSI

The Association for Unmanned Vehicle Systems International (AUVSI)—the world's largest nonprofit organization dedicated to the advancement of unmanned systems and robotics—represents more than 7,500 members from 60+ allied countries involved in the fields of government, industry and academia. AUVSI members work in the defense, civil and commercial markets.

AUVSI ASSOCIATION FOR UNMANNED VEHICLE SYSTEMS INTERNATIONAL

For more information, go to www.auvsi.org.

About AMA

The Academy of Model Aeronautics (AMA) is the premier community-based organization in the United States for model aviation enthusiasts. With 175,000 members, the AMA is dedicated to the advancement and safeguarding of modeling activities. The Academy provides leadership, organization, competition, protection, representation, education and scientific/technical development to the model aviation community.

AMA ACADEMY OF MODEL AERONAUTICS

For more information, go to www.modelaircraft.org.

About Small UAV Coalition

The Small UAV Coalition advocates for law and policy changes to permit the operation of small unmanned aerial vehicles (UAVs) beyond the line-of-sight, with varying degrees of autonomy, for commercial, civil and philanthropic purposes. Its members include the leading manufacturers, operators, and service providers of small UAVs.

SMALL UAV COALITION *A Partnership for Safety & Innovation*

For more information, go to www.smalluavcoalition.org.

About the FAA

The Federal Aviation Administration is committed to providing the safest, most efficient aerospace system in the world. The agency is executing a plan for safe and staged integration of unmanned aircraft systems into the National Airspace System.

02/11/15 Task Force Meeting: Presentations and Public Testimony

<TARGET><BILL></BILL><SUBJECT>02-11-15 Task Force Meeting Presentations and Public Testimony</SUBJECT><COMM><TARGET></COMM></TARGET>

Legislative Task Force on Unmanned Aircraft Systems
February 11, 2015 Meeting
State Capital, Juneau Alaska, Room 13

1:00 – 3:00pm

Task Force Members:

- Representative Shelley Hughes, Co-Chair
- Joe Jacobson, Commissioner Designee, Department of Commerce, Community Economic Devel.
- Mike O'Hare, Commissioner Designee, Department of Military and Veterans' Affairs
- Lieutenant Steve Adams, Commissioner Designee, Department of Public Safety
- Ro Bailey, University of Alaska Fairbanks
- Steve Colligan, Representative Member for the Academy of Model Aeronautics
- Steve Wackowski, Tulugaq II
- Bob May, Gallery Lodge, Kasilof
- Ginger Blaisdell, Staff to Rep. Hughes

Not in attendance:

- Senator Peter Micciche, Co-Chair
- John Binder, Commissioner Designee, Department of Transportation, Public Facilities
- John Parker, Integrated Robotics Imaging Systems
- Steve Strait, Aviation Advisory Board, Governor's Office and DOT/PF

MEETING SUMMARY

1:00pm Welcome and Introductions .....Representative Shelley Hughes

- Thank you all for coming to Juneau and attending the Lunch and Learn hosted by the University of Alaska Fairbanks and contributors

Items in meeting packets:

- Dec 5 meeting minutes – to be emailed
- Letters to department heads
- Letter to delegation
- Congressional bills introduced by Young and Murkowski – encourage public private partnerships to provide funding

- KBYF safety guidelines and the alaskadrones.org web site
- FAA is trying to ramp up drone education and regulation process
- You tube link to Swiss team 'cage' that won $1m from UAE
- FAA issued guidance for law enforcement
- UAS improvement act 2015 congressional legislation – procurement, homeland security, etc.
- Young and Murkowski bill
    a. Ro Bailey worked with congress on this legislation (Allison/Murkowski)
    b. Test sites are experiencing issues where the FAA is interpreting aspects of UAS research that makes the work they are doing very difficult
    c. Trying to break the FAA lose from restricting operations at the test sites
    d. Can't be paid to fly but can receive money for milestones

Joe Jacobson, Department of Commerce, Community and Economic Development

Update: final report on UAS economic advantages for Alaska is in today's packet

- Cultivating a resource, workforce, university program
- Entrepreneurial focus to attract them
- Canada forming alliances across industries (maritime and UAS)
- Recommending incentives to attract business without increasing cash outlay
- Job creation and revenue to the state

Barbara Johnson (past position with FNSB)

- Economic development work to establish military development zones
- Looked at a tech park near Salcha, now considering Hightop Park using University lands about 20 miles outside Fairbanks
- NOAA is very interested in what Alaska is doing
- Great opportunities in the Arctic

Steve Colligan, Academy of Model Aeronautics

- Hobby industry has the best you tube information on flying UAS you might want to see
- Safety is directly related to skills and knowledge
- "We" need to get information out there virally
- Know Before You Fly campaign
- Asks Task Force (alaskadrone.org) to "sign on" to national campaign Know Before You Fly – send a letter and a logo to the national campaign
- Discussion: letter to campaign, recommendation from Gov/Task Force?, what logo?, want all Alaska communities-agencies-vendors to 'sign on' to alaskadrones.org?, wants Gov to endorse, ask congressional delegation to draft letters
    - Joe and Steve Colligan will work with Gov office to request a letter
    - Knowbeforeyoufly.org

Bob May, Public member - Very interested in the privacy for Alaskans

Steve Wackowski, Fairweather Inc. – Top 40 Under 40

Mike O'Hare, Department of Military and Veterans' Affairs

- Offer to host next meeting on base
- Update on how military plans to use UAS

Ro Bailey, University of Alaska Fairbanks

- Interest Group Meeting
  - Interest group meeting begins on September 1, she would like the task force meeting to coincide with the interest group, consider meeting September 3 or 4 in Fairbanks
- Ro Bailey also noted that the Test Site now includes operations in Kansas and Tennessee for test site operating locations but not as a key partner

PRIVACY DOCUMENT _____

Privacy considerations for Alaskans

- Most privacy issues around the USA have been with regard to law enforcement privacy
- Ro Bailey: once we put the privacy document out, we should include the "who to call" info

Creating a document:

- Want the privacy document to fit on one page (similar to KBYF)
  - Who is the target audience?
  - How will this document be used?
  - Might be different audiences with different needs?
  - Hobby Use – Commercial Use – Law Enforcement
    - Semi-professional videographers occurring in Alaska already
    - Section 333 exemptions in the FAA reform act of 2012
- Guidelines vs Law?
- **FAQ version** of common questions to add to the web site – FAQ's would allow ginger to research statutes with legal services – questions provided to Ginger by Feb 15 - Generic or specific examples to use in the FAQs?
  - Who owns the airspace above your house?
  - How to apply the protections that Alaska already has in statute?
  - Reasonable expectation of privacy
  - How is data going to be used, stored and maintained?
  - Can I shoot it down if it's flying over my house? Destruction of another's property.
  - Circumstance: is it private or not?
  - What do I do if there's a drone flying over my house?
  - Can I use this for my business?
  - Noise ordinance?
  - Chasing my dog?
- "**Cartoon**" some of the scenarios to grab everyone's attention

Timing

- Get the information out to the public quickly and we can continue to refine
- Get our web site to the national level

New information to put on website

- Put the 5-page excerpt on the alaskadrones.org web site
- Why Alaska? Joe Jacobson has a great flyer developed
- Who do you contact and how do you contact re inappropriate drone flights?
    - Jay Skaggs – call me…
    - Get contact information on alaskadrones.org
    - Can individuals contact local police? – yes
    - DPS form/content to be made available on alaskadrones.org so individuals know what information to provide to local police (or forwarded on to FAA)
    - Don't dial 911

Public Testimony _____

Bill Tart, Arctic Slope Regional Corp – no testimony provided

Next meeting _____

- **June 19 in Anchorage on Base coordinated by Mike O'Hare – would like a UAS demo**
    - Would not be able to get the public on the base for a general meeting – look into the rules for this.
- FAA should kick out some rules by June
- Letter to congressional delegation regarding test site funding
- Matrix and Education plan to be worked on by Steve Strait and Ginger
    - KBYF one page document (and this privacy document) really delivers the education plan
- Military update
- Unmanned Traffic Management System – how do they fly, where do they fly, communication capabilities
    - Steve Colligan is aware of the relationship with NextGen, detect and avoid technology
    - Ro Bailey is under contract with NextGen working on airspace reservation information and ultimately integrate with manned aviation
    - Steve Wackowski is working with major entities and University, on the slope to be first to integrate the UTM in Alaska

Legislative Task Force on Unmanned Aircraft Systems
February 11, 2015 Meeting
Capitol Building Room 17

1:00pm – 3:00pm

Task Force Members:

- Representative Shelley Hughes, Co-Chair
    - Ginger Blaisdell, Staff to Rep. Hughes
- Senator Peter Micciche, Co-Chair
- Joe Jacobson, Commissioner Designee, Department of Commerce, Community Economic Devel.
- Mike O'Hare, Commissioner Designee, Department of Military and Veterans' Affairs
- Lieutenant Steve Adams, Commissioner Designee, Department of Public Safety
- John Binder, Commissioner Designee, Department of Transportation, Public Facilities
- Ro Bailey, University of Alaska Fairbanks
- Steve Strait, Aviation Advisory Board, Governor's Office and DOT/PF
- Steve Colligan, Representative Member for the Academy of Model Aeronautics
- John Parker, Integrated Robotics Imaging Systems
- Steve Wackowski, Tulugaq II
- Bob May, Gallery Lodge, Kasilof

Task Force Responsibilities per HCR15

The duties of the task force shall include

1. reviewing regulations and guidance from the Federal Aviation Administration regarding unmanned aircraft systems;
2. providing written recommendations, together with suggested legislation, for a comprehensive state policy for unmanned aircraft that protects privacy and allows the use of unmanned aircraft systems for public and private applications;
3. evaluating complaints and concerns expressed to the task force;
4. identifying potential privacy and public safety concerns associated with unmanned aircraft systems and determining whether legislation is necessary to address them;
5. considering recommendations for public education related to unmanned aircraft systems;
6. studying the Federal Aviation Administration's "Integration of Civil Unmanned Aircraft Systems (UAS) in the National Airspace System Roadmap," issued November 7, 2013 (1st ed. 2013) and its application to the development of unmanned aircraft systems in the state;
7. conducting a public hearing concerning privacy and the capture of data by unmanned aircraft systems at the University of Alaska's test site;
8. further studying the nonpublic use of unmanned aircraft systems to encourage development of the private sector unmanned aircraft system industry; and
9. further studying and making recommendations with respect to ensuring unmanned aircraft users comply with applicable laws.

AGENDA

1:00pm Welcome and Introductions .....Representative Shelley Hughes

- Review of Meeting Summary from December 5, 2014
- Introduction of Guests
- Letters sent to Department heads
- Current Events: News Articles (attached list)
  - Pages 1-40
  - Sen Murkowski drone bill
  - National Journal article

AGENDA

Five-Minute Updates:

- Joe Jacobson - Unmanned Aircraft Systems: An Economic Development Strategy for Alaska
- John Binder - Alaska Airports and Aviation 2014 Annual Report
- Steve Colligan – Know Before You Fly national campaign
- Shelley Hughes – HJR 5 hearing update and who will testify

Personal Privacy in Alaska

- One page document review on Drone Privacy

Future Meeting Agenda:

- Next meeting:
  1. Letter to Alaska Congressional delegation for test site funding and issues of underfunding
  2. Matrix
  3. Education Plan

Follow Up – To Do

Mike OHara

1. Military mission in Alaska – process and plans — next meeting DoD and Natl Guard
2. ~~Italy data protection laws~~
3. Who to contact? Complaint / enforcement system / responses — call local police
4. ~~UTMS – unmanned traffic management system~~ updates

June 19 UAS TF on base military

Sept 1-2 Interest Group - PDX
Tu We.
UAS TF Sep 3-4

Scenario 1

If data is gathered by a government agency, it is a public record. However, AS 40.20.120 provides certain protections for private information. Use of inadvertently captured information in a criminal prosecution may depend on who captures the information and whether the person whose actions have been captured has a reasonable expectation of privacy.

Government data capture is more clearly defined in statute and its intended use for public purpose. Data captured by a government-operated UAS would be treated similarly to data captured by other technology such as cell phones, manned aircraft, satellite images, voice recorders, etc. Case law is substantial in determining if the person would be considered to have a reasonable expectation of privacy and when a warrant would be required to obtain and use any data collected.

CH 48 (HB65) SLA08 Personal Information Protection Act also addresses the collection, storage, and breach of privacy. This act would include any data captured by a UAS.

Scenario 2

Can my neighbor fly his model aircraft over my fence and photograph my family?

The fear of being unknowingly watched and/or photographed is a legitimate public concern. "Reasonable expectation of privacy" is the term where you can self-analyze the public perception of your actions.

You would certainly have a reasonable expectation of privacy if you were inside your home with curtains drawn. If someone climbed the fence surrounding your home, stood outside the window and recorded your image or voice while you were inside, it is likely that person would be considered to have breached your "reasonable expectation of privacy".

What if the neighbor flies his model aircraft over my backyard during my child's birthday party? You might be able to argue that your fence creates a boundary identifying your personal space but it does not govern the air above your property. We could expect that aircraft hovering 10 feet above your head is more invasive than a manned airplane passing overhead but in reality, it's the level of technology that is in use that should be considered. We tend to accept satellite imagery as "part of life" even though it produces technologically advanced detailed imagery. The neighbor's quadcopter might just be an irritant (like a barking dog) or it could be recording your every move with high definition video and sound ~ this is a decision to be made by the courts if it comes to that.

A significant piece to this equation is "what is that person doing with the data captured"? Remember that it's not the aircraft at fault, but the operator who may be flying with suspicious intentions.

The tie between safety and privacy is tightest with respect to rules requiring the operator of a UAS to be able to see the aircraft at all times. Public UAS operated in association with the expedited authorizations in Section 334(c)(2)(C) of the FAA Modernization and Reform Act of 2012 (FMRA) have a "line of sight" requirement.

- **Public Navigable Airspace:** The question of what constitutes "public navigable airspace" for UAS operated by the government is central to privacy policy. The Task Force found that almost every law enforcement scenario discussed was already protected by existing law.
- **Role of Imaging Technology:** Rules and case law exist that protect citizens from inappropriate use of capturing data that is "more than the human eye could ever see."
- **Extended Surveillance:** Law enforcement does not intend to use UAS for standard patrol activities at this time. Limiting flight hours was not seen as an acceptable control because long flights may be necessary in the event of search and rescue or natural disaster remediation operations.
- **Obtaining a Warrant:** After much discussion, it was decided that using UAS to gather data would require a warrant in similar situations as using any other data gathering device (such as voice recording, photography, and thermal imaging with manual technology). No additional laws are required to obtain a warrant for UAS data gathering.

Legal Services

Constitutional Protection of Privacy: *The Constitution of the State of Alaska explicitly protects the right of privacy against government intrusion. Art. I, sec. 22 provides: "The right of the people to privacy is recognized and shall not be infringed. The Legislature shall implement this section."*

Alaska Statutory Protections:

AS 11.41.270 Stalking, nonconsensual conduct prohibits monitoring by technical means

AS 11.61.116 Sending an explicit image of a minor

AS 11.61.120(a)(6) Harassment: publishing or distributing certain images

AS 11.61.123 Indecent viewing or photography

AS 11.76.113 Misconduct involving confidential information in the first degree

AS 11.76.115 Misconduct involving confidential information in the second degree

The State of Alaska and its local governments cannot dictate the use of the NAS but can consider rules that better define the FAA guidelines, can consider legal repercussion for entities found in violation of adopted laws, and can provide for specific privacy laws regarding the use of UAS in Alaska.

The State of Alaska Constitution provides privacy protection, "although not unlimited, has been held to be broader than the protection afforded by the United States Constitution. Both the Alaska Constitution and the Fourth Amendment to the United States Constitution require a warrant by a governmental agency for the search of a place where a person has a reasonable expectation of privacy."

1. ALASKA STATE LAW—SAFETY AND PRIVACY

The LTFUAS is confident that the FAA will regulate safety of UAS flights in Alaska. While safety is critically important, the LTFUAS also recognizes that certain codes of conduct must be followed to ensure harmonious UAS operations in Alaska.

1.1.1 Self-Regulation by Three National Organizations

The LTFUAS considered the recommendations of the following three national organizations that have adopted rules and codes of conduct regarding UAS operations. The LTFUAS adopted the IACP rules in the legislation introduced during the legislative session. During the committee process, the decision was made that it would be ill advised to adopt a dated publication. Instead the bill incorporated applicable guidelines from the publication.

- **IACP:** International Association of Chiefs of Police Recommended Guidelines (Appendix B) for the use of Unmanned Aircraft was adopted in August 2012. The Alaska Department of Public Safety has also adopted these guidelines as their doctrine with the exception of increasing the flight approval responsibility from a "supervisor" to the director's office.

- **AUVSI:** Association for Unmanned Vehicle Systems International states: "As an industry, it is incumbent upon us to hold ourselves and each other to a high professional and ethical standard. As with any revolutionary technology, there will be mishaps and abuses; however, in order to operate safely and gain public acceptance and trust, we should all act in accordance with these guiding themes and do so in an open and transparent manner. We hope the entire UAS industry will join AUVSI in adopting this industry Code of Conduct."[1]

- **AMA**: Academy of Model Aeronautics' *AMA Policies for Radio Controlled Model Aircraft Operations Utilizing First Person View, Failsafe, Stabilization and Autopilot Systems* guides model aircraft operators.[2]

In the same manner that the FAA does not regulate model aeronautics, the LTFUAS does not intend to adopt requirements of hobbyist activities using UAS.

1.1.2 Model Aircraft Rules and Definitions

The technology differences between UAS and model aircraft used for sport or recreation use is narrowing each day. Technology is advancing by leaps and bounds, while at the same time becoming more affordable and integrated into off-the-shelf-systems for consumers and hobbyists. While there are many technical documents and references through the FAA Modernization and

---

[1] Unmanned Aircraft System Operations Industry "Code of Conduct." Accessed January 13, 2014. Available at http://www.auvsi.org/conduct

[2] AMA Policies for Radio Controlled Model Aircraft Operations Utilizing First Person View, Failsafe, Stabilization and Autopilot Systems. Revision 07/20/2013. AMA Advanced Flight Systems Committee Report 101. Available at http://www.modelaircraft.org/files/AFSCREPORT101.pdf

Reform Act, the general difference between UAS and model aeronautics is the operation and intent of the operator not the aircraft.

If the activity or intent of the activity is used for commercial operations or contributing to the creation of a product or service, it is considered commercial activity, and it is subject to the FAA regulations and rule as stated in the FAA Modernization and Reform Act of 2012 and FAA UAS Road Map 2013.

If the activity is for sport and recreation use as defined by FAA SEC 336 SPECIAL RULE FOR MODEL AIRCRAFT of the Modernization Act, it is controlled by a cooperative agreement between the FAA and a Community Based Organization (CBO), such as the Academy of Model Aeronautics (AMA).

The AMA has been successful in self-regulating operations for hobbyists and aviation safety for over 77 years. During those 77 years, the AMA faced many challenges of new technologies such as analog to digital radio, coordinating operations within the airspace and the ever changing aircraft designs and capabilities not unlike the latest multi-rotor and First Person View (FPV) capabilities. To address the current safety requirements and interest of model aircraft operators, the AMA has developed and updated its general safety code AMA Publication 105-Safety Code and advanced aircraft rules publication 550-First Person View and 560-Autopilot effective January 1, 2014, to keep up with the FAA rule making and technology advances. Refer to Appendix C.

Legal Services

Constitutional Protection of Privacy: *The Constitution of the State of Alaska explicitly protects the right of privacy against government intrusion. Art. I, sec. 22 provides: "The right of the people to privacy is recognized and shall not be infringed. The Legislature shall implement this section."*

Alaska Statutory Protections:

AS 11.41.270 Stalking, nonconsensual conduct prohibits monitoring by technical means

AS 11.61.116 Sending an explicit image of a minor

AS 11.61.120(a)(6) Harassment: publishing or distributing certain images

AS 11.61.123 Indecent viewing or photography

AS 11.76.113 Misconduct involving confidential information in the first degree

AS 11.76.115 Misconduct involving confidential information in the second degree

It was discussed that a notice should be provided at the time of purchase of each model aircraft to review the AMA flight operation guidelines for appropriate use of model aeronautics. The LTFUAS did not adopt a requirement for notice regarding hobbyists since so many aircraft are purchased outside of Alaska and would not be required to provide the notice.

1.1.3 Alaska State Law and Personal Privacy

The State of Alaska and its local governments cannot dictate the use of the NAS but can consider rules that better define the FAA guidelines, can consider legal repercussion for entities found in violation of adopted laws, and can provide for specific privacy laws regarding the use of UAS in Alaska.

The State of Alaska Constitution provides privacy protection, "although not unlimited, has been held to be broader than the protection afforded by the United States Constitution. Both the Alaska

Constitution and the Fourth Amendment to the United States Constitution require a warrant by a governmental agency for the search of a place where a person has a reasonable expectation of privacy."[3]

Although much attention regarding UAS privacy focuses on government use and the Fourth Amendment, it is non-governmental use that is likely to raise some of the most significant privacy challenges in coming years. For private entities, the key constitutional question is the extent of their First Amendment privilege to gather information.

Civil use of unmanned aircraft will fall under the federal and state laws including such provisions as trespassing, invasion of privacy, intrusion upon seclusion, publication of private facts, stalking and harassment, and business privacy.

The LTFUAS, with guidance from Legislative Legal Services, considered many scenarios of possible violations of state and federal law that might occur with the use of unmanned aircraft. Legislative Legal Services provided the document, *Observations from Above: Unmanned Aircraft Systems and Privacy*.[4] that presented a variety of scenarios that have been tried in court and some that should be discussed as they pertain to UAS and personal privacy. The Legal Services memo outlining the areas of statute that protect personal privacy can be found in Appendix D.

Privacy protection considerations reviewed by the LTFUAS include but are not limited to the following.

1. **If data is gathered by a government agency, it is a public record. However, AS 40.20.120 provides certain protections for private information. Use of inadvertently captured information in a criminal prosecution may depend on who captures the information and whether the person whose actions have been captured has a reasonable expectation of privacy.**

It was discussed that data captured by a government-operated UAS would be treated similarly to data captured by other technology such as cell phones, manned aircraft, satellite images, voice recorders, etc. Case law is substantial in determining if the person would be considered to have a reasonable expectation of privacy and when a warrant would be required to obtain and use any data collected.

CH 48 (HB65) SLA08 Personal Information Protection Act also addresses the collection, storage, and breach of privacy. This act would include any data captured by a UAS.

2. **As technology continues to advance beyond "normal" application of current laws, a balanced approach that recognizes the inherent difficulty in predicting the future must be adopted when drafting new laws.**

---

[3] Memorandum: Alaska Laws Protecting Privacy (Work Order No. 28-LS0990). September 30, 2013. Division of Legal and Research Services, Legislative Affairs Agency, State of Alaska, Juneau.

[4] John Villasenor. 2013. Observations from Above: Unmanned Aircraft Systems and Privacy. Harvard Journal of Law & Public Policy. Available at http://www.harvard-jlpp.com/wp-content/uploads/2013/04/36_2_457_Villasenor.pdf

The LTFUAS determined that we cannot foresee the future applications of technology (of UAS or other technologies); therefore, creating restrictions in law based on assumptions is not recommended.

Observations From Above: UAS and Privacy

This document was published in the Harvard Journal of Law and Public Privacy by John Villasenor, a senior fellow in Governance Studies and the Center for Technology Innovation, the Brookings Institution.

The Task Force discussed many of the scenarios posed by the author when considering the need for Alaska law.

3. **How should Alaska manage unintentionally captured images or data?**

Discussion as of December 2013 concluded that there are adequate statutes, case law, and data retention guidelines that resolved the concerns of the LTFUAS in the area of unintentionally captured images or data. Discussion during the legislative session of 2014 indicated that data collection will be an area the LTFUAS will need to continue to monitor.

Recommendation: The LTFUAS also requests that the Department of Administration review its data retention schedules with particular emphasis on law enforcement data captured inadvertently and allowing that data to be destroyed.

4. **The tie between safety and privacy is tightest with respect to rules requiring the operator of a UAS to be able to see the aircraft at all times. Public UAS operated in association with the expedited authorizations in Section 334(c)(2)(C) of the FAA Modernization and Reform Act of 2012 (FMRA) have a "line of sight" requirement.**

The LTFUAS assumes that FAA regulations adopted in the next several years will continue to require visual line-of-sight operation. "Sense and avoid" technology will become more mature and some non-line-of-sight missions may be permitted by the FAA. Non-line-of-sight operations and other unknown technological advances may bring new challenges that will require the Legislature to review industry guidelines and state laws in the future.

5. **Unmanned aircraft may bring efficient advances to law enforcement; however, the public seems to be highly sensitive to law enforcement using unmanned aircraft.**

After reviewing many possible uses of UAS, the LTFUAS determined that existing law already affords the public with adequate protections.

- **Routine Technology**: The use of UAS is treated much the same as any other technological tool used to protect the public. The Department of Public Safety has adopted the IACP Guidelines for UAS, and the LTFUAS found those guidelines to be superior for rules of law enforcement use.

Specific guidelines from the IACP were offered as a provision of the legislation.

- **Public Navigable Airspace:** The question of what constitutes "public navigable airspace" for UAS operated by the government is central to privacy policy. The LTFUAS found that almost every law enforcement scenario discussed was already protected by existing law.
- **Role of Imaging Technology:** Rules and case law exist that protect citizens from inappropriate use of capturing data that is "more than the human eye could ever see."
- **Extended Surveillance:** Law enforcement does not intend to use UAS for standard patrol activities at this time. Limiting flight hours was not seen as an acceptable control because long flights may be necessary in the event of search and rescue or natural disaster remediation operations.
- **Obtaining a Warrant:** After much discussion, it was decided that using UAS to gather data would require a warrant in similar situations as using any other data gathering device (such as voice recording, photography, and thermal imaging with manual technology). No additional laws are required to obtain a warrant for UAS data gathering.

Voluntary Approaches

The International Association of Chiefs of Police (IACP) adopted model guidelines for the use of UAS for law enforcement purposes.

The Association for Unmanned Vehicle Systems International (AUVSI) Code of Conduct calls for a commitment to "respect the privacy of individuals."

Academy of Model Aeronautics (AMA) has also adopted operational policies and guidelines for advanced flight systems used in radio-controlled model aircraft.

It is the understanding of the LTFUAS that all law enforcement entities must first obtain a court order to use UAS over private property for criminal investigation against any person. This will be offered as a provision of the recommended legislation.

- **Weaponized Aircraft:** FAA guidelines do not allow anything to be dropped from an unmanned aircraft.
- **Visibility**: Law enforcement is planning to use high-visibility marking on any UAS they will use. Application of navigational lighting and/or high-visibility paint is being considered.
- **Public Education**: It is apparent that public education is necessary for all agencies using UAS but sensitivity is heightened for law enforcement uses.

Law Enforcement

Public protection will benefit greatly from unmanned aircraft for the purposes of search and rescue, crash scene documentation time, natural disaster monitoring, wildfire management, amber and silver alerts, hostage situations, and other life safety extremes. Some efforts will require warrants to proceed and some will be allowed under a Certificate of Authorization (COA).

It is the opinion of the LTFUAS that existing privacy laws are adequate to govern the use of unmanned aircraft.

It is the opinion of the LTFUAS that since Alaska has been chosen as one of the FAA UAS Test Sites, we have the opportunity to participate in the use of UAS in a variety of ways that would put Alaska in the position to establish policy guiding the use of UAS for the rest of the United States to consider.

Hey Amateur Pilot, It's Time To Talk About Your Droning Problem

NEWS VIDEO *February 3, 2015 by DRONELIFE News - No comments*

We made it through the Super Bowl without a drone incident! I'll be honest, I was a little surprised.

But the threat of drone technology being grounded by poorly educated amateur pilots still looms large.

In response, The Globe and Mail has taken it upon themselves to provide new and future drone pilots with this preemptive intervention… and it's fantastic.

HOUSE OF REPRESENTATIVES

District 11 – Greater Palmer

February 11, 2015

Dear Commissioner,

The Unmanned Aircraft Systems Legislative Task Force has identified the need for public awareness in the use of small unmanned aircraft systems (UAS) by government agencies. The Task Force respectfully requests that each State agency that intends to use UAS in its work, to provide the task force with a point of contact for your agency. We ask for this point of contact to be provided by March 15, 2015 or prior to a scheduled UAS mission if it will occur prior to March 15, 2015.

The Task Force is currently developing a public education strategy so that all users and observers of UAS understand the rules and expectations thereby, eliminating fear and reducing opportunity for inappropriate use of these aircraft. State agency participation is vital to the education campaign and will provide the Task Force with a better understanding of how our government agencies are planning to use UAS.

Thank you for time.

Sincerely,

Shelley Hughes

Representative Shelley Hughes

Senator Peter Micciche

LUNCH AND LEARN

UAS Industry in Alaska and Alaska Center for Unmanned Aircraft Systems Integration

Unmanned aircraft can save money, time and lives across Alaska, while diversifying the state's economy. Prior years' state investment in this important initiative has launched Arctic scientific research and the use of unmanned systems to support community and industry needs. Alaska now holds the distinction of being one of six centers in the U.S. selected by the Federal Aviation Administration to integrate unmanned aircraft into the national airspace system.

Come learn about the potential for aerospace industry expansion right here in Alaska and the new applications in this technology cluster.

Wednesday
Feb. 11, 2015

Subject: Before you finish wrapping your gifts...
Attachments: AK_KBYF_Drone_Safety_Guidelines.pdf

If unable to view the image below and/or for live hyperlinks, please see the attached PDF.

Greetings,

As some of you may have noticed, drones or small Unmanned Aircraft Systems (UAS) have been "flying" off the shelves as one of the most popular gifts this Christmas and holiday season. If you happen to be one of the many who purchased a UAS as a gift, please stick a copy of the safety guidelines 1-pager below (and attached) in with the package before you wrap it. If you're the gift recipient (or the parent of a gift recipient!), please review it. The Unmanned Aircraft Systems Legislative Task Force created this sheet to help ensure that UAS operate safely in our skies in Alaska, and do not interfere with manned aircraft with pilots and passengers on board. We want Alaskans, whether on the ground or in our skies, to be safe. This is an amazing technology; responsible operation of UAS is a priority. One in four homes in America own a small drone. After this Christmas season, I wouldn't be surprised if it will be one in three – so please feel free to share this info with others! Thank you.

December 5, 2014

Alaska's Know-Before-You-Fly Drone Safety Guidelines

FAA allows the operation of model aircraft, also known as small Unmanned Aircraft Systems (sUAS) or drone recreational purposes under the Special Rule for Model Aircraft. Recreational UAS must be operated in accordance community-based safety program and the FAA's guidance in Advisory Circular 91-57.

What is recreational use of a sUAS (Drones)?

Recreational use is the operation of a sUAS for personal interests and enjoyment, and not for compensation or hir example, using a sUAS to take photographs for your own personal use would be considered recreational; using the device to take photographs or videos for compensation or sale to another individual would be considered comm You should check with the FAA for further determination as to what constitutes commercial sUAS operation.

SAFETY GUIDELINES FOR RECREATIONAL USERS OF sUAS (DRONES)

- Users should follow community-based safety guidelines, as developed by organizations such as the Academy Model Aeronautics (AMA)
- Users should fly no higher than 400 feet and remain below surrounding obstacles when possible
- Users must be able to see their sUAS at all times, and use an observer to assist them if needed
- Users should remain well clear and must not interfere with manned aircraft operations, must see and avoic other aircraft and obstacles at all times, must avoid any activity that would cause a manned aircraft pilot tc divert from planned operations, and must give way to all other aircraft at all times.
- Users must not intentionally fly over unprotected persons or moving vehicles, and should remain at least 25 away from individuals and vulnerable property
- Users must contact the airport or control tower before flying within five miles of an airport
- Users should be aware that in addition to public airports, Alaska has many private airstrips as well as bodies waters used for take-off and landing by float planes and should not fly a UAS in the vicinity of these location
- Users should not fly a UAS weighing more than 55 lbs unless it's certified by an aeromodelling community-b organization.
- Users should not fly in adverse weather conditions such as in high winds or reduced visibility
- Users must not fly under the influence of alcohol or drugs
- Users should ensure the operating environment is safe and that the operator is competent and proficient in operation of the sUAS
- Users should not operate on or fly over private property without first obtaining permission from the propert owner and/or tenant
- Users should not fly near or over sensitive infrastructure or property such as power stations, water treatmer facilities, correctional facilities, heavily traveled roadways, government facilities, etc.
- Users should not conduct surveillance or photograph persons in areas where there is an expectation of priva without the individual's permission (See AMA's privacy policy)

Additional safety resources:
AMA National Model Aircraft Safety Code
FAA What Can I Do With My Model Aircraft?

This hand-out is a public education resource provided by Alaska's Unmanned Aircraft Systems Legislative Task Force (UASLTF) to raise awareness by providing a brief summary of the laws applicable to sUAS. For more information, contact 907-376-3725 or Rep.Shelley.Hughes@akleg.gov . The UASLTF would like to thank Academy of Model Aeronautics and the Association of Unmann Vehicle Systems for their joint campaign to promote safe operations of UAS and for providing the safety guidelines listed above. sUAS operators are responsible for reviewing and complying with applicable state and federal laws that may apply to flying sUAS

For the most up-to-date information on the work being done by the UAS Legislative Task Force, please visit http://alaskadrones.org/

Warm Christmas and holiday wishes,

Shelley

THE GOVERNMENT SUMMIT SHAPING FUTURE GOVERNMENTS FEB 9-11, 2015 MADINAT JUMEIRA DUBAI, UNITED ARAB EMIRATES

FAA to ramp up drone education, regulation

By Sara Fischer, CNN

Updated 10:07 AM ET, Mon December 1, 2014

FAA on drones: Security always a concern 02:29

It's a bird, it's a plane, it's a ... drone?

Story highlights

4

More and more often, large commercial airliners are encountering small, unmanned aircraft flying through the sky, sometimes undetected by the human eye, and often invisible from the cockpit of a large airplane.

FAA Administrator Michael Huerta says increased drone regulations are needed to increase safety

Pilots have increasingly seen drones flying higher than the current limit of 400 feet

Drone education and regulation will help prevent accidents with aircrafts, Huerta says

According to Michael Huerta, head of the Federal Aviation Administration, regulations are in place to prevent drones from interfering with large aircraft -- but education about drone safety and regulation enforcement needs to be improved in order to actually keep airways safe.

"That is certainly a serious concern and it is something that I am concerned about," Huerta told Candy Crowley on CNN's "State of the Union" Sunday. "That's why we are very focused on education. That's why we're also focused on enforcement. We've enforced hundreds of these cases where we have seen someone operating one of these things carelessly and recklessly and posing the danger to aircraft, and that can't happen."

READ: Graham search highlights Virginia drone battle

Since drones have entered the commercial market, the FAA reports pilots have seen up to 25 cases per month of drones flying above the regulated limit of 400 feet, with some flying as high as 2,000 feet in the air. Huerta says the FAA is working to educate people about the dangers of flying drones that high, since enforcement of the small, unmanned aerial vehicles can be difficult.

"(A) big part of what we're doing is educating people," Huerta said. "These are very high performance aircraft, and they are difficult to see and this is one of the big challenges, and so that's why the rules require that people stay away from airports."

"We have been working with the Model Aeronautics Association, with the model community and clubs so we can educate people because these are not your typical pilots that may be flying one of these for the first time and they may be unfamiliar with the rules," he added.

In 2012, the FAA set a September 2015 deadline to lay out a concrete list of rules and regulations for flying commercial drones, many of which are operated from the ground by untrained civilians. The current rules prohibit owners from flying drones higher than 400

feet, near an airport, or out of eyesight. But enforcing those regulations can be difficult, especially in light of the increasing rate of commercial use.

Still, proponents of drone use argue the unmanned aerial vehicles have great potential for both surveillance and commercialism, a balance which Huerta says the FAA is working to achieve.

"Yes, there are proponents of unmanned aircraft and they really see huge potential with this technology and for them, we can't move fast enough," Huerta said. "What they would like to see is free and open use of unmanned aircraft as soon as we can get there."

"On the other side, you have pilots, commercial pilots, general aviation pilots, who are very concerned that these are difficult to see, they don't really have a good understanding of how they interact with other aircraft, and bedrock principle of aviation is a principle called see and avoid. The pilots take action to avoid one another. So it's for that reason that we have a plan for a staged and thoughtful integration of unmanned aircraft where we look at lower risk uses first, and then gradually work to others. "

Of course, the added technology also creates a new avenue for national security concerns, mainly terrorism. In response to that potential threat, Huerta says the FAA will be publishing a "rule-making" that takes into consideration the qualifications of the drone operator, and the certification of the aircraft.

"I can't say what is going to be in it but broadly speaking, what we are looking at are all the questions relating to how we certify the aircraft and what are the qualifications of the operator as well as what uses they can be put to," Huerta said.

Swiss Team Wins 'UAE Drones for Good' $1M Prize

The winners of the first 'UAE Drones for Good Award', the largest award of its kind in the world, were announced on Sunday in the presence of His Highness Mohammed bin Rashid Al Maktoum, UAE ministers and international dignitaries. The competition, launched at the 2014 Government Summit, took place in Dubai Internet City in front of a large crowd of visitors. The Government Summit focuses on how technology will radically reshape government and public services through the introduction of drones, robotics and other innovations; the 2015 Summit, occurring 9-11 February, will feature exciting new initiatives.

Flyability from Switzerland won the US$1 million grant in the International Competition. The Flyability team has developed Gimball, a drone that can enter confined spaces and safely fly close to humans, proving to be highly effective in rescue missions. It is protected by a rotating cage which makes it capable of colliding with obstacles in challenging environments without losing its stability.

Flyability team lead Patrick Thevoz said, "We struggled to find funding to develop our search and rescue drone but this UAE Government Summit initiative, Drones for Good, means we can commercially develop our project within a year, and with Flyability able to go where it is dangerous for rescuers, help save lives.

"The Drones for Good Award is the first of its kind. It is inspirational, because while there are many awards for academic research there aren't many for the social application of new technology. It allows passionate teams like us to move forward and make this a reality. The Drones for Good Award is a unique opportunity to help people realize that these flying machines are capable of positively impacting society," he added.

CLASS LEADING SWaPC

Over the course of the two-day event, 39 semi-finalists in three categories presented live demonstrations of their projects to a panel of international judges. There was also a division for national competitors who won AED 1 million.

"The UAE Drones for Good Award is a tangible outcome of the vision of His Highness Sheikh Mohammed bin Rashid Al Maktoum to make optimal use of innovation and technology for the service of humanity. The UAE Drones for Good award exemplifies our commitment to setting global benchmarks in this endeavor," said His Excellency Mohammed Abdullah Al Gergawi, UAE Minister of Cabinet Affairs.

"I congratulate the winners of this great competition, which showed the amazing ways we can use drones for good. All the entries have the capability to transform the world to make it a better place to live in and we are optimistic that they will continue to inspire new breakthroughs," H.E. Al Gergawi added.

The winners of the UAE Government Entities Award and the National Competition were Etisalat and Wadi Drones respectively.

Photo: The Drones for Good Award is presented by His Highness Mohammed bin Rashid Al Maktoum, Vice President and Prime Minister of the United Arab Emirates, to the winning team Flyability.

800 Entries for UAE Drones for Good Award

The UAE Drones for Good Award, launched by His Highness Shaikh Mohammad Bin Rashid Al Maktoum, Vice-President and Prime Minister of the UAE and Ruler of Dubai, during the second Government Summit last February, has received more than 800 local, Arab and international entries.

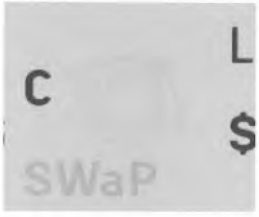
The award, which aims to make optimal use of technology to serve humanity and create happiness in the community, received submissions from 57 countries.

Spain topped the list with 62 entries, followed by the United States with 47 and India with 34 entries.

Saudi Arabia topped the list of Arab countries with 18 entries, followed by Egypt with eight entries.
The winners of the award will be announced in February based on the results of live demonstrations by qualifiers of the semi-final stage in front of the panel of judges.

Mohammad Abdullah Al Gergawi, Minister of Cabinet Affairs, praised the global response to the UAE Drones for Good Award and commended the creative level of the projects received, and the volume of entries from global educational institutions.

There were 154 entries from educational institutions with a strong presence from UAE universities, as well as international universities such as MIT, Stanford, and the University of Sanjulata.



7

Al Gergawi added that the ideas have the potential to improve services in areas such as health, education, civil defence, transport and communications, as well as government services, natural disaster relief, and humanitarian assistance.

The award is also expected to significantly contribute to reduced costs of many services as well as their increased efficiency.

"The UAE government has always been the first to launch initiatives that keep pace with global changes and has harnessed creativity and innovation to serve humanity, identifying them as the real wealth of developed societies," he said.

Relief services topped the list of the entries, accounting for 20 per cent of the entries. Civil defence services came in second with 15 per cent, followed by economic development and the environment at 14 per cent, respectively, and logistics accounting for 13 per cent.

Disclaimer

The following is an accumulation of a student lead research project. The conclusions and recommendations are that of our student team and do not represent the views or opinions of any university, government agency, political office, or commercial entity.

December 2014

Executive Summary

The United States is a leader in the unmanned aircraft industry through our military, but we wait in anticipation for the commercial implementation of unmanned aircraft into our national airspace system (NAS). Through this intensive analysis of the industry, regulation, and policy, our group was tasked with finding the most relevant issues within the unmanned aircraft industry and develop our own recommendations for the upcoming Federal Aviation Administration (FAA) proposed rulemaking standards for small unmanned aircraft systems (sUAS).

Through our research we have found that the integration of sUAS into the NAS is expected to represent an $89 billion industry by 2025 (Table 1 – Market Analysis). While the capability of this industry is virtually limitless; our research focused on the benefits sUAS would bring to private business and commercial operations. As a group we also analyzed the FAA mandated test sites in Alaska, New York, Texas, Virginia, and Nevada. These sites are each responsible for testing specific applications for UAS and through our analysis and interviews with test site directors we created several well rounded recommendations for sUAS implementation. Through our analysis of these policy changes our group developed training, certification, and licensing recommendations for sUAS implementation, piloting, operating, and maintenance. We researched the sUAS operations and regulations in other countries and evaluated the International Civil Aviation Organization (ICAO) policies to determine what did work and aligned with our goals in the United States.

Finally we turned our attention to the air traffic control procedures and sense and avoid tactics for sUAS to operate seamlessly with our manned aircraft in the NAS. We broke down the different technologies sUAS manufacturers are using for commercial applications and developed recommendations for requirements and procedures.

Through this presentation we will share our research and recommendations for the upcoming proposed rulemaking standards regarding sUAS implementation.

FAA Issues UAS Guidance for Law Enforcement

The proliferation of small, relatively inexpensive unmanned aircraft (UAS) presents the Federal Aviation Administration with a challenge in identifying people who don't follow the rules of the air or who endanger the nation's airspace. So, the agency is asking the law enforcement community for help.

The FAA released guidance to the law enforcement community explaining the legal framework for the agency's oversight of aviation safety in the U.S., including UAS operations. The guidance describes how UAS and model aircraft can be operated legally, and the options for legal enforcement actions against unauthorized or unsafe UAS operators. The document also discusses the law enforcement community's vital role in deterring, detecting and investigating unsafe operations.

State and local police are often in the best position to immediately investigate unauthorized UAS operations, and as appropriate, to stop them. The document explains how first responders and others can provide invaluable assistance to the FAA by:

- Identifying potential witnesses and conducting initial interviews
- Contacting the suspected operators of the UAS or model aircraft
- Viewing and recording the location of the event
- Collecting evidence
- Identifying if the UAS operation was in a sensitive location, event or activity
- Notifying one of the FAA's Regional Operation Centers about the operation as soon as possible

The FAA's goal is to promote voluntary compliance by educating individual UAS operators about how they can operate safely under current regulations and laws, but the guidance makes clear the agency's authority to pursue legal enforcement action against persons who endanger the safety of the National Airspace System.

The guidance stresses that while the FAA exercises caution not to mix criminal law enforcement with agency administrative safety enforcements, the public is best served by coordinating and fostering mutual understanding and cooperation between governmental entities with law enforcement responsibilities.

The complete guidance document can be seen here.

U.S. Department
of Transportation
Federal Aviation Administration

LAW ENFORCEMENT GUIDANCE FOR SUSPECTED UNAUTHORIZED UAS OPERATIONS

Issue

There is evidence of a considerable increase in the unauthorized use of small, inexpensive Unmanned Aircraft Systems (UAS) by individuals and organizations, including companies. The FAA retains the responsibility for enforcing Federal Aviation Regulations, including those applicable to the use of UAS. The agency recognizes though that State and local Law Enforcement Agencies (LEA) are often in the best position to deter, detect, immediately investigate,[1] and, as appropriate,[2] pursue enforcement actions to stop unauthorized or unsafe UAS operations. The information provided below is intended to support the partnership between the FAA and LEAs in addressing these activities.

Discussion

The general public, a wide variety of organizations, including private sector (e.g., commercial companies), non-governmental (e.g., volunteer organizations), and governmental entities (e.g., local agencies) continue to demonstrate significant interest in UAS. The benefits offered by this type of aircraft are substantial and the FAA is committed to integrating UAS into the National Airspace System (NAS). This introduction, however, must address important safety and security considerations. The increasing number of cases of unauthorized use of UAS is a serious concern for the FAA and, in terms of safety and security challenges, many of its interagency partners.

This document is intended to assist LEAs in understanding the legal framework that serves as the basis for FAA legal enforcement action against UAS operators for unauthorized and/or unsafe UAS operations (Section 1) and to provide guidance regarding the role of LEAs in deterring, detecting, and investigating unauthorized and/or unsafe UAS operations (Section 2).

SECTION 1.

Basic Legal Mandates

The FAA's safety mandate under 49 U.S.C. § 40103 requires it to regulate aircraft operations conducted in the NAS,[3] which include UAS operations, to protect persons and property on the

[1] At least in terms of initial contact with the suspected offender.

[2] Applying any laws falling within the enforcement authority of the LEA in question.

[3] The NAS is "the common network of U.S. airspace; air navigation facilities, equipment and services, airports or landing areas . . . . Included are system components shared jointly with the military." See FAA Pilot/Controller Glossary (Apr. 3, 2014), available at http://www.faa.gov/air_traffic/publications/media/pcg_4-03-14.pdf.

ground, and to prevent collisions between aircraft and other aircraft or objects. In addition, 49 U.S.C. § 44701(a) requires the agency to promote safe flight of civil aircraft in air commerce by prescribing, among other things, regulations and minimum standards for other practices, methods, and procedures the Administrator finds necessary for safety in air commerce and national security.[4]

A UAS is an Aircraft that Must Comply with Safety Requirements

A UAS is an "aircraft" as defined in the FAA's authorizing statutes and is therefore subject to regulation by the FAA. 49 U.S.C. § 40102(a)(6) defines an "aircraft" as "any contrivance invented, used, or designed to navigate or fly in the air." The FAA's regulations (14 C.F.R. § 1.1) similarly define an "aircraft" as "a device that is used or intended to be used for flight in the air." Because an unmanned aircraft is a contrivance/device that is invented, used, and designed to fly in the air, it meets the definition of "aircraft." The FAA has promulgated regulations that apply to the operation of all aircraft, whether manned or unmanned, and irrespective of the altitude at which the aircraft is operating. For example, 14 C.F.R. § 91.13 prohibits any person from operating an aircraft in a careless or reckless manner so as to endanger the life or property of another.

Model Aircraft Operations

An important distinction to be aware of is whether the UAS is being operated for hobby or recreational purposes or for some other purpose. This distinction is important because there are specific requirements in the FAA Modernization and Reform Act of 2012, Public Law 112-95, (the Act) that pertain to "Model Aircraft" operations, which are conducted solely for hobby or recreational purposes. While flying model aircraft for hobby or recreational purposes does not require FAA approval, all model aircraft operators must operate safely and in accordance with the law. The FAA provides guidance and information to individual UAS operators about how they can operate safely under current regulations and laws. Guidance may be found at: http://www.faa.gov/uas/publications/model_aircraft_operators/

Section 336(c) of the Act defines "Model Aircraft" as an unmanned aircraft that is –

(1) Capable of sustained flight in the atmosphere;

(2) Flown within visual line of sight of the person operating the aircraft; and

(3) Flown for hobby or recreational purposes.

Each element of this definition must be met for a UAS to be considered a Model Aircraft under the Act. Under Section 336(a) of the Act the FAA is restricted from conducting further rulemaking specific to Model Aircraft as defined in section 336(c) so long as the Model Aircraft operations are conducted in accordance with the requirements of section 336(a). Section 336(a) requires that—

[4] FAA action on these security concerns support and are informed by the national defense, homeland security, and law enforcement statutory responsibilities and authorities of our interagency partners.

(1) The aircraft is flown strictly for hobby or recreational use;

(2) The aircraft is operated in accordance with a community-based set of safety guidelines and within the programming of a nationwide community-based organization;

(3) The aircraft is limited to not more than 55 pounds unless otherwise certified through a design, construction, inspection, flight test, and operational safety program administered by a community-based organization;

(4) The aircraft is operated in a manner that does not interfere with and gives way to any manned aircraft; and

(5) When flown within 5 miles of an airport, the operator of the aircraft provides the airport operator and the airport air traffic control tower (when an air traffic facility is located at the airport) with prior notice of the operation (model aircraft operators flying from a permanent location within 5 miles of an airport should establish a mutually-agreed upon operating procedure with the airport operator and the airport air traffic control tower (when an air traffic facility is located at the airport)).

Model Aircraft that Operate in a Careless or Reckless Manner

Section 336(b) of the Act, however, makes clear that the FAA has the authority under its existing regulations to pursue legal enforcement action against persons operating Model Aircraft when the operations endanger the safety of the NAS, even if they are operating in accordance with section 336(a) and 336(c). So, for example, a Model Aircraft operation conducted in accordance with section 336(a) and (c) may be subject to an enforcement action for violation of 14 C.F.R. § 91.13 if the operation is conducted in a careless or reckless manner so as to endanger the life or property of another.

UAS Operations that are not Model Aircraft Operations

Operations of UAS that are not Model Aircraft operations as defined in section 336(c) of the Act and conducted in accordance with section 336(a) of the Act may only be operated with specific authorization from the FAA. The FAA currently authorizes non-hobby or recreational UAS operations through one of three avenues:

(1) The issuance of a Certificate of Waiver or Authorization, generally to a governmental entity operating a public aircraft;

(2) The issuance of an airworthiness certificate in conjunction with the issuance of a Certificate of Waiver or Authorization; or

(3) The issuance of an exemption under part 11 of title 14, Code of Federal Regulations that relies on section 333 (Special Rules for Certain Unmanned Aircraft Systems) of the Act for relief from the airworthiness certificate requirement, also in conjunction with the issuance of a Certificate of Waiver or Authorization.

It is important to understand that all UAS operations that are not operated as Model Aircraft under section 336 of the Act are subject to current and future FAA regulation. At a minimum, any such flights are currently required under the FAA's regulations to be operated with an

authorized aircraft (certificated or exempted), with a valid registration number ("N-number"), with a certificated pilot, and with specific FAA authorization (Certificate of Waiver or Authorization).

Regardless of the type of UAS operation, the FAA's statutes and the Federal Aviation Regulations prohibit any conduct that endangers individuals and property on the surface, other aircraft, or otherwise endangers the safe operation of other aircraft in the NAS. In addition, States and local governments are enacting their own laws regarding the operation of UAS, which may mean that UAS operations may also violate state and local laws specific to UAS operations, as well as broadly applicable laws such as assault, criminal trespass, or injury to persons or property.

UAS Compliance with Airspace Security Requirements

As an aircraft, UAS operations (including those involving Model Aircraft) must be conducted in accordance with the airspace-centric security requirements prescribed by the FAA's regulations and various implementation tools used by the FAA, specifically including airspace with special flight rules and Notices to Airmen (NOTAM) that define Temporary Flight Restrictions (TFR). It is important that UAS operators and LEAs be familiar with the airspace restrictions respectively relevant to their operations and their enforcement area of responsibility.

Flight restrictions are used to protect, but are not limited to, special security events, sensitive operations (e.g., select law enforcement activity, space flight operations, etc.), and Presidential movement. The most up-to-date list of TFRs is available at http://tfr.faa.gov/tfr2/list.html.

See Attachment A for reference resources.[5]

SECTION 2.

The Role of Law Enforcement

The FAA promotes voluntary compliance by educating individual UAS operators about how they can operate safely under current regulations and laws. The FAA also has a number of enforcement tools available including warning notices, letters of correction, and civil penalties. The FAA may take enforcement action against anyone who conducts an unauthorized UAS operation or operates a UAS in a way that endangers the safety of the national airspace system. This authority is designed to protect users of the airspace as well as people and property on the ground.

However, as noted above, State and local Law Enforcement Agencies (LEA) are often in the best position to deter, detect, immediately investigate,[6] and, as appropriate,[7] pursue

[5] Attachment A also includes a NOTAM concerning avoidance (including no loitering) over power plants, dams, refineries, industrial complexes, and military facilities. Although not a restriction, this TFR urges aircraft operators to avoid these locations.

[6] At least in terms of initial contact with the suspected offender.

[7] Applying any laws falling within the enforcement authority of the LEA in question.

enforcement actions to stop unauthorized UAS operations. Although the FAA retains the responsibility for enforcing FAAs regulations, FAA aviation safety inspectors, who are the agency's principal field elements responsible for following up on these unauthorized and/or unsafe activities, will often be unable to immediately travel to the location of an incident.

While the FAA must exercise caution not to mix criminal law enforcement with the FAA's administrative safety enforcement function, the public interest is best served by coordination and fostering mutual understanding and cooperation between governmental entities with law enforcement responsibilities. Although there are Federal criminal statutes that may be implicated by some UAS operations (see 49 U.S.C. § 44711), most violations of the FAA's regulations may be addressed through administrative enforcement measures. As with any other civil or criminal adjudication, successful enforcement will depend on development of a complete and accurate factual report contemporaneous with the event.

Although certainly not an exhaustive list, law enforcement officials, first responders and others can provide invaluable assistance to the FAA by taking the actions outlined below:

(1) **Witness Identification and Interviews.** Local law enforcement is in the best position to identify potential witnesses and conduct initial interviews, documenting what they observed while the event is still fresh in their minds. In addition, local law enforcement is in an optimum position to secure all information necessary for our safety inspectors to contact these witnesses in any subsequent FAA investigation. Administrative proceedings often involve very technical issues; therefore, we expect our own safety inspectors will need to re-interview most witnesses. We are mindful that in many jurisdictions, state law may prohibit the transmission of witness statements to third parties, including the FAA. In those circumstances it is extremely important that the FAA be able to locate and conduct independent interviews of these individuals.

(2) **Identification of Operators.** Law enforcement is in the best position to contact the suspected operators of the aircraft, and any participants or support personnel accompanying the operators. Our challenges in locating violators are marked in that very few of these systems are registered in any federal database and rarely will they have identifiable markings such as used for conventional manned aircraft. Likewise, information on few of the UAS operators will be archived in a pilot data base. Many operators advertise openly on the internet. However, in our enforcement proceedings, we bear the burden of proof, and showing who actually is operating the unmanned aircraft is critical. Therefore, evidentiary thresholds must be met even when using data or video acquired via the internet. Likewise, the purpose for the operation (such as in support of a commercial venture, to further some business interest, or to secure compensation for their services) may become an important element in determining what regulations, if any, may have been violated by the operation. Identification and interview of suspected operators early on will help immeasurably to advance enforcement efforts.

(3) **Viewing and Recording the Location of the Event.** Pictures taken in close proximity to the event are often helpful in describing light and weather conditions, any damage or injuries, and the number and density of people on the surface,

particularly at public events or in densely populated areas. During any witness interviews, use of fixed landmarks that may be depicted on maps, diagrams or photographs immeasurably help in fixing the position of the aircraft, and such landmarks also should be used as a way to describe lateral distances and altitude above the ground, structures or people (e.g. below the third floor of Building X, below the top of the oak tree located Y, anything that gives reference points for lay witnesses).

(4) **Identifying Sensitive Locations, Events, or Activities.** The FAA maintains a variety of security-driven airspace restrictions around the country to help protect sensitive locations, events, and activities through Temporary Flight Restrictions (TFR), Prohibited Areas, and other mechanisms such as the Washington, DC Flight Restricted Zone (DC FRZ). UAS operations, including Model Aircraft flights, are generally prohibited within these defined volumes of airspace. LEAs should become familiar with the steady-state airspace restrictions active within their area of responsibility, along with as-needed TFRs, which could be instituted to help protect sensitive events (e.g., major gatherings of elected officials) and activities (e.g., Presidential movements). If there is any question as to whether a TFR has been established in a given location, contact the nearest air traffic facility or flight service station for further information or visit http://tfr.faa.gov/tfr2/list.html for a graphic representation of TFRs locatable by state and effective dates.

(5) **Notification.** Immediate notification of an incident, accident or other suspected violation to one of the FAA Regional Operation Centers (ROC) located around the country is valuable to the timely initiation of the FAA's investigation. These centers are manned 24 hours a day, 7 days a week with personnel who are trained in how to contact appropriate duty personnel during non-business hours when there has been an incident, accident or other matter that requires timely response by FAA employees. A list of these centers and telephone numbers is included as Attachment B to this letter.

(6) **Evidence Collection.** Identifying and preserving any public or private security systems that may provide photographic or other visual evidence of UAS operations, including video or still picture security systems can provide essential evidence to the FAA. Many times these systems do not permanently store information but erase it as the system recycles at a given interval. Local law enforcement is in the best position to inquire and make initial requests to identify and preserve this form of evidence or obtain legal process for securing this evidence in the context of an investigation of a possible violation of state criminal law. In addition, some UAS may be marked with identification numbers ("N-numbers") signifying FAA registration. The presence or lack of these identification numbers may be significant in an FAA investigation. For example, an operator may state that he or she is conducting an approved commercial activity, which usually requires registered aircraft. However, the absence of registration markings on the UAS may indicate that the aircraft is not registered, meaning the operation may not be authorized. Note that identification numbers may not be conspicuous from a distance because of the size and non-traditional configuration of some UAS. The registered owners

of UAS bearing identification numbers can be found by searching for the N-number on the FAA's website: www.faa.gov.

Virtually all of the items listed above are already in the tool box for law enforcement officers. Other investigative methods also may prove useful, such as consensual examination of the UAS, equipment trailers and the like. However, other law enforcement processes, such as arrest and detention or non-consensual searches almost always fall outside of the allowable methods to pursue administrative enforcement actions by the FAA unless they are truly a by-product of a state criminal investigation. We do not mean to discourage use of these methods and procedures where there is an independent basis for them under state or local law. We simply wish to emphasize that work products intended for FAA use generally should involve conventional administrative measures such as witness interviews, "stop and talk" sessions with suspected violators, consensual examination of vehicles and equipment, and other methods that do not involve court orders or the potential use of force by law enforcement personnel.

It is extremely difficult to provide a "one size fits all" guide to cooperative investigation of unauthorized UAS operations considering the myriad jurisdictions and the associated statutory and constitutional restraints and requirements. State and local officials are always urged to use their governmental unit's legal resources and their own management chain to develop acceptable protocols for dealing with these instances. In some situations, there may be legal bars to the sharing of some information or the use of databases designed for conventional law enforcement. However, with appropriate data collection during first responses and early reporting to the FAA, Federal, State and local agencies will be in the best position to both collect and share information that may be of interest to each jurisdiction. FAA aviation safety inspectors are adept at coordination with our own legal resources to ensure unauthorized operators are properly accountable for the potential risk they create to both people and property. In addition, we have specially trained inspectors within the FAA UAS Integration office who can provide expertise in this area.

If you have any questions or your agency would like to pursue advance planning on how to address these situations, please feel free to contact your local FAA Law Enforcement Assistance Special Agent or the FAA's Law Enforcement Assistance Program Office at (202) 267-4641 or (202) 267-9411.

Presidential Movements

FDC 4/7607 ZBW RI..AIRSPACE PROVIDENCE, RHODE ISLAND..TEMPORARY FLIGHT RESTRICTIONS. OCTOBER 16, 2014 LOCAL. THIS NOTAM REPLACES NOTAM 4/7600 DUE TO SCHEDULE CHANGE. PURSUANT TO 49 USC 40103(B THE FEDERAL AVIATION ADMINISTRATION (FAA) CLASSIFIES THE AIRSPACE DEFINED IN THIS NOTAM AS 'NATIONAL DEFENSE AIRSPACE'. PILOTS WHO DO NOT ADHERE TO THE FOLLOWING PROCEDURES MAY BE INTERCEPTED DETAINED AND INTERVIEWED BY LAW ENFORCEMENT/SECURITY PERSONNEL. ANY OF THE FOLLOWING ADDITIONAL ACTIONS MAY ALSO BE TAKEN AGAINST A PILOT WHO DOES NOT COMPLY WITH THE REQUIREMENTS OR ANY SPECIAL INSTRUCTIONS OR PROCEDURES ANNOUNCED IN THIS NOTAM:
A) THE FAA MAY TAKE ADMINISTRATIVE ACTION, INCLUDING IMPOSING CIVI PENALTIES AND THE SUSPENSION OR REVOCATION OF AIRMEN CERTIFICATES; OR
B) THE UNITED STATES GOVERNMENT MAY PURSUE CRIMINAL CHARGES, INCLUDING CHARGES UNDER TITLE 49 OF THE UNITED STATES CODE, SECTION 46307; OR
C) THE UNITED STATES GOVERNMENT MAY USE DEADLY FORCE AGAINST THE AIRBORNE AIRCRAFT, IF IT IS DETERMINED THAT THE AIRCRAFT POSE AN IMMINENT SECURITY THREAT.

...

C. THE FOLLOWING OPERATIONS ARE NOT AUTHORIZED WITHIN THIS TFR: FLIGHT TRAINING, PRACTICE INSTRUMENT APPROACHES, AEROBATIC FLIGHT, GLIDER OPERATIONS, SEAPLANE OPERATIONS, PARACHUTE OPERATIONS, ULTRALIGHT, HANG GLIDING, BALLOON OPERATIONS, AGRICULTURE/CROP DUSTING, ANIMAL POPULATION CONTROL FLIGHT OPERATIONS, BANNER TOWING OPERATIONS, SIGHTSEEING OPERATIONS,MAINTENANCE TEST FLIGHTS, MODEL AIRCRAFT OPERATIONS, MODEL ROCKETRY, UNMANNED AIRCRAFT SYSTEMS (UAS), AND UTILITY AND PIPELINE SURVEY OPERATIONS.

DC FRZ

FDC 0/8326 ZDC PART 1 OF 10 FLIGHT RESTRICTIONS, WASHINGTON, DC, EFFECTIVE 1012010401 UTC UNTIL FURTHER NOTICE. THIS NOTICE WILL REPLACE NOTAM 0/9477 DUE TO A CHANGE IN RESTRICTIONS. THIS NOTAM AND A NOTAM FOR THE LEESBURG MANEUVERING AREA SUPPLEMENT SUBPART V, 14 CFR PART 93 FOR THE WASHINGTON, D.C. SPECIAL FLIGHT RULES AREA (DC SFRA). PURSUANT TO 49 USC 40103(B), THE FAA HAS ESTABLISHED THE DC SFRA AREA AS 'NATIONAL DEFENSE AIRSPACE. ANY PERSON WHO DOES NOT COMPLY WITH THE REQUIREMENTS APPLICABLE TO THE DC SFRA MAY BE INTERCEPTED, DETAINED AND INTERVIEWED BY LAW ENFORCEMENT/SECURITY PERSONNEL. ANY OF THE FOLLOWING ADDITIONAL ACTIONS MAY ALSO BE TAKEN AGAINST A PILOT WHO DOES NOT COMPLY WITH THE REQUIREMENTS OR ANY SPECIAL INSTRUCTIONS OR PROCEDURES ANNOUNCED IN THIS NOTAM: A) THE FAA MAY TAKE ADMINISTRATIVE ACTION, INCLUDING IMPOSING CIVIL PENALTIES AND THE SUSPENSION OR REVOCATION OF AIRMEN CERTIFICATES; B) THE UNITED STATES GOVERNMENT MAY PURSUE CRIMINAL CHARGES, INCLUDING CHARGES UNDER TITLE 49 OF THE UNITED STATES CODE, SECTION 46307; C) THE UNITED STATES GOVERNMENT MAY USE DEADLY FORCE AGAINST THE AIRBORNE AIRCRAFT, IF IT IS DETERMINED THAT THE AIRCRAFT POSE: AN IMMINENT SECURITY THREAT.

...

A. THE FOLLOWING OPERATIONS ARE NOT AUTHORIZED WITHIN THE DC FRZ: FLIGHT TRAINING, AEROBATIC FLIGHT, PRACTICE INSTRUMENT APPROACHES, GLIDER OPERATIONS, PARACHUTE OPERATIONS, ULTRA LIGHT, HANG GLIDING, BALLOON OPERATIONS, TETHERED BALLOONS, AGRICULTURE/CROP DUSTING, ANIMAL POPULATION CONTROL FLIGHT OPERATIONS, BANNER TOWING OPERATIONS, MAINTENANCE TEST FLIGHTS, MODEL AIRCRAFT OPERATIONS, MODEL ROCKETRY, FLOAT PLANE OPERATIONS, UNMANNED AIRCRAFT SYSTEMS (UAS) AND AIRCRAFT/HELICOPTERS OPERATING FROM A SHIP OR PRIVATE/CORPORATE YACHT. B. IT IS HIGHLY RECOMMENDED THAT A PILOT CONTINUOUSLY MONITOR VHF FREQUENCY 121.5 OR UHF FREQUENCY 243.0 FOR EMERGENCY INSTRUCTIONS WHEN OPERATING AN AIRCRAFT IN THE DC FRZ, EITHER IN AN AIRCRAFT THAT IS SUITABLY EQUIPPED, OR BY USE OF PORTABLE EQUIPMENT.

Avoidance of Power Plans Etc. *(Applied to all Aircraft, including UAS)*

FDC 4/0811 SPECIAL NOTICE. THIS IS A RESTATEMENT OF A PREVIOUSLY ISSUED ADVISORY NOTICE. IN THE INTEREST OF NATIONAL SECURITY AND TO THE EXTENT PRACTICABLE, PILOTS ARE STRONGLY ADVISED TO AVOID THE AIRSPACE ABOVE, OR IN PROXIMITY TO SUCH SITES AS POWER PLANTS (NUCLEAR, HYDRO-ELECTRIC, OR COAL), DAMS, REFINERIES, INDUSTRIAL COMPLEXES, MILITARY FACILITIES AND OTHER SIMILAR FACILITIES. PILOTS SHOULD NOT CIRCLE AS TO LOITER IN THE VICINITY OVER THESE TYPES OF FACILITIES.

Select Sporting Events FDC 4/3621 FDC SPECIAL SECURITY NOTICE. SPORTING EVENTS. THIS NOTAM REPLACES FDC NOTAM 9/5151 TO REFLECT A TSA WEBSITE UPDATE AND ADDITIONAL INFORMATION CONCERNING AIRSPACE WAIVERS. FLIGHT RESTRICTIONS IN THIS NOTAM COMPLY WITH STATUTORY MANDATES DETAILED IN SECTION 352 OF PUBLIC LAW 108-7 AS AMENDED BY SECTION 521 OF PUBLIC LAW 108-199. PURSUANT TO 49 USC 40103(B), THE FEDERAL AVIATION ADMINISTRATION (FAA) CLASSIFIES THE AIRSPACE DEFINED IN THIS NOTAM AS 'NATIONAL DEFENSE AIRSPACE'. ANY PERSON WHO KNOWINGLY OR WILLFULLY VIOLATES THE RULES PERTAINING TO OPERATIONS IN THIS AIRSPACE MAY BE SUBJECT TO CERTAIN CRIMINAL PENALTIES UNDER 49 USC 46307. PILOTS WHO DO NOT ADHERE TO THE FOLLOWING PROCEDURES MAY BE INTERCEPTED, DETAINED AND INTERVIEWED BY LAW ENFORCEMENT/SECURITY PERSONNEL. PURSUANT TO 14 CFR SECTION 99.7, SPECIAL SECURITY INSTRUCTIONS, COMMENCING ONE HOUR BEFORE THE SCHEDULED TIME OF THE EVENT UNTIL ONE HOUR AFTER THE END OF THE EVENT. ALL AIRCRAFT OPERATIONS; INCLUDING PARACHUTE JUMPING, UNMANNED AIRCRAFT AND REMOTE CONTROLLED AIRCRAFT, ARE PROHIBITED WITHIN A 3 NMR UP TO AND INCLUDING 3000 F AGL OF ANY STADIUM HAVING A SEATING CAPACITY OF 30,000 OR MORE PEOPLE WHERE EITHER A REGULAR OR POST SEASON MAJOR LEAGUE BASEBALL, NATIONAL FOOTBALL LEAGUE, OR NCAA DIVISION ONE FOOTBALL GAME IS OCCURRING. THIS NOTAM ALSO APPLIES TO NASCAR SPRINT CUP, INDY CAR, AND CHAMP SERIES RACES EXCLUDING QUALIFYING AND PRE-RACE EVENTS. FLIGHTS CONDUCTED FOR OPERATIONAL PURPOSES OF ANY EVENT, STADIUM OR VENUE AND BROADCAST COVERAGE FOR THE BROADCAST RIGHTS HOLDER ARE AUTHORIZED WITH AN APPROVED AIRSPACE WAIVER. AN FAA AIRSPACE WAIVER DOES NOT RELIEVE OPERATORS FROM OBTAINING ALL OTHER NECESSARY AUTHORIZATIONS AND COMPLYING WITH ALL APPLICABLE FEDERAL AVIATION REGULATIONS. THE RESTRICTIONS DESCRIBED ABOVE DO NOT APPLY TO THOSE AIRCRAFT AUTHORIZED BY AND IN CONTACT WITH ATC FOR OPERATIONAL OR SAFETY OF FLIGHT PURPOSES, DEPARTMENT OF DEFENSE, LAW ENFORCEMENT, AND AIR AMBULANCE FLIGHT OPERATIONS. ALL PREVIOUSLY ISSUED WAIVERS TO FDC NOTAM 9/5151 REMAIN VALID UNTIL THE SPECIFIED END DATE BUT NOT TO EXCEED 90 DAYS FOLLOWING THE EFFECTIVE DATE OF THIS NOTAM. INFORMATION ABOUT AIRSPACE WAIVER APPLICATIONS AND TSA SECURITY AUTHORIZATIONS CAN BE FOUND AT HTTP://WWW.TSA.GOV/STAKEHOLDERS/AIRSPACE-WAIVERS-0 OR BY CALLING TSA AT 571-227-2071. Senators McCain, Flake and Ayotte Introduce UAS Improvement Act of 2015

U.S. Senators John McCain (R-AZ), Jeff Flake (R-AZ), and Kelly Ayotte (R-NH) have introduced *The Unmanned Aircraft System Improvement Act of 2015*, legislation that would provide critical reform to the U.S. Customs and Border Protection's (CBP) mismanaged Unmanned Aircraft System (UAS) programme.

The bill addresses concerns raised in a Department of Homeland Security (DHS) Inspector General Report released last month that highlighted the management failures of CBP's UAS programme to "achieve intended results or recognise all costs of operation." Specifically, the report found that the UAS programme is not meeting current flight hour goals; is not utilizing the most effective available resources; and is failing to accurately determine programme costs.

"Unmanned Aircraft Systems, when properly utilized, are critical in our fight to effectively secure the border," said Senator John McCain. "The findings released in the Inspector General Report highlight exactly where reform is needed, and this bill is an important step to ensuring our border security efforts are effective in preventing future waves of illegal border crossings."

Until DHS can better manage and utilize its current fleet of UAS, *The Unmanned Aircraft System Improvement Act of 2015* would prohibit the procurement of new UAS. In addition, the bill would require DHS to conduct continuous, 100 percent surveillance of the Southern border and coordinate with the Department of Defense to ensure the programme is utilizing "best management practices" to improve national security. Finally, the bill would require DHS to submit a detailed report to Congress regarding the programme's effectiveness.

114TH CONGRESS
1ST SESSION

S. _____

To improve the operation of the Department of Homeland Security's Unmanned Aircraft System Program.

IN THE SENATE OF THE UNITED STATES

Mr. MCCAIN (for himself, Mr. FLAKE, and Ms. AYOTTE) introduced the following bill; which was read twice and referred to the Committee on

---

A BILL

To improve the operation of the Department of Homeland Security's Unmanned Aircraft System Program.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

SECTION 1. DEFINITIONS.

In this Act:

(1) ILLEGAL BORDER ACTIVITIES.—The term "illegal border activities" means the illegal trafficking or smuggling of an individual or controlled substances or activities to further a Federal crime relating to United States immigration, customs, con-

trolled substances, agriculture, monetary instruments, or other border controls.

(2) SOUTHERN BORDER.—The term "Southern border" means the international border between the United States and Mexico.

(3) UAS.—The term "UAS" means unmanned aircraft systems.

SEC. 2. PERSISTENT SURVEILLANCE ALONG THE SOUTHERN BORDER.

(a) IN GENERAL.—The Department of Homeland Security shall fully utilize surveillance and detection capabilities developed or used by the various Federal departments and agencies for the purpose of enhancing the functioning and operational capability to conduct continuous and integrated manned or unmanned, monitoring, sensing, or surveillance of 100 percent of Southern border mileage or the immediate vicinity of the Southern border.

(b) PROCUREMENT OF ADDITIONAL UNMANNED AIRCRAFT SYSTEMS.—

(1) IN GENERAL.—The Secretary of Homeland Security may not procure any additional UAS until after the Secretary provides Congress with written certification that the Department of Homeland Security successfully operated its current fleet of UAS

at least 23,000 hours during the preceding calendar year.

(2) EXEMPTION.—The limitation set forth in paragraph (1) shall not apply to the procurement of unmanned aircraft that do not weigh more than 150 pounds.

(c) USE OF BEST AVAILABLE RADAR AND SURVEILLANCE TECHNOLOGY.—The Department of Homeland Security shall use the best available radar and surveillance technology—

(1) to increase awareness of illegal border activities along the Southern border; and

(2) to identify gaps in surveillance capabilities.

SEC. 3. REPORT TO CONGRESS.

Not later than 90 days after the date of the enactment of this Act, and biannually thereafter, the Secretary of Homeland Security shall submit a report to the Committee on Homeland Security and Governmental Affairs of the Senate and the Committee on Homeland Security of the House of Representatives that contains, for the reporting period—

(1) the total number of UAS hours required to provide persistent surveillance along the Southern border;

(2) the total number of UAS flight hours planned in support of any Federal or State department or agency;

(3) the number of planned UAS flight hours in support of the goal referred to in paragraph (1);

(4) the number of hours in which UAS were flown in support of the goal referred to in paragraph (1);

(5) the number of planned UAS flight hours in support of the goal referred to in paragraph (1) that were cancelled before takeoff, including the reason for such cancellations;

(6) performance measures regarding—

(A) the number of hours flown by the current fleet of UAS operated by the Department of Homeland Security;

(B) the number of subjects detected though the use of UAS;

(C) the number of apprehensions assisted by the use of UAS; and

(D) the number and quantity of illicit drug seizures assisted by the use of UAS; and

(7) all accumulated cost associated with the Unmanned Aircraft System Program within the Department of Homeland Security, including—

(A) salaries of pilots; and

(B) costs associated with radar and surveillance technology.

SEC. 4. INTERAGENCY COLLABORATION.

The Secretary of Homeland Security shall consult with the Secretary of Defense to identify the best practices used by the Department of Defense that could also be used by the Department of Homeland Security to improve the security of the Southern border by enhancing wide aerial surveillance and fulfilling the requirements set forth in section 2.

SEC. 5. SUNSET.

This Act shall be repealed on the date that is 5 years after the date of the enactment of this Act.

Categories: Drone

Ginger - Thought you might find the proposed California legislation linked below relating to UAS operation by public agencies interesting. Not in any way advocating for/against, but indicates the direction some states are moving on this issue. My interpretation is that state agency use in performing core missions would be unaffected, which probably begs the question of why then is legislation required?

Fodder for the next meeting.

Subject: Ask NASAO ~ Integration of UAS into the NAS

California is seeking your help. They are being asked to analyze a state bill on unmanned aerial systems and are seeking input from other states on any similar action you might be taking in regard to the integration of UAS into the NAS.

California Assembly Bill 37 Unmanned Aerial Systems, would generally prohibit public agencies from using unmanned aircraft systems, or contracting for the use of unmanned aircraft
systems: http://leginfo.legislature.ca.gov/faces/billNavClient.xhtml?bill_id=201520160AB37

There is a section on the analysis form that says: "What other states are doing" pertaining to this bill or one similar in other states.

Please respond with any information to Carol, carol.glatfelter@dot.ca.gov and copy me. Thank you!

California LEGISLATIVE INFORMATION

AB-37 Unmanned aircraft systems. (2015-2016)

CALIFORNIA LEGISLATURE— 2015–2016 REGULAR SESSION

ASSEMBLY BILL **No. 37**

Introduced by Assembly Member Campos

December 01, 2014

An act to add Section 6254.31 to the Government Code, and to add Title 14 (commencing with Section 14350) to Part 4 of the Penal Code, relating to unmanned aircraft systems.

LEGISLATIVE COUNSEL'S DIGEST

AB 37, as introduced, Campos. Unmanned aircraft systems.

Existing federal law, the Federal Aviation Administration Modernization and Reform Act of 2012, provides for the integration of civil unmanned aircraft systems, commonly known as drones, into the national airspace system by September 30, 2015. Existing federal law requires the Administrator of the Federal Aviation Administration to develop and implement operational and certification requirements for the operation of public unmanned aircraft systems in the national airspace system by December 31, 2015.

This bill would generally prohibit public agencies from using unmanned aircraft systems, or contracting for the use of unmanned aircraft systems, as defined, with certain exceptions applicable to law enforcement agencies and in certain other cases, including when the use or operation of the unmanned aircraft system achieves the core mission of the agency and the purpose is unrelated to the gathering of criminal intelligence, as defined.

The bill would require reasonable public notice to be provided by public agencies intending to deploy unmanned aircraft systems, as specified. The bill would require images, footage, or data obtained through the use of an unmanned aircraft system under these provisions to be permanently destroyed within one year, except as specified. The bill would generally prohibit images, footage, or data obtained through the use of an unmanned aircraft system under these provisions from being disseminated outside the collecting public agency, except as specified. Unless authorized by federal law, the bill would prohibit a person or entity, including a public agency subject to these provisions, or a person or entity under contract to a public agency, for the purpose of that contract, from equipping or arming an unmanned aircraft system with a weapon or other device that may be carried by or launched from an unmanned aircraft system and that is intended to cause bodily injury or death, or damage to, or the destruction of, real or personal property. The bill would also provide that specified surveillance restrictions on electronic devices apply to the use or operation of an unmanned aircraft system by a public agency.

The bill would apply its provisions to all public and private entities when contracting with a public agency for the use of an unmanned aircraft system.

37

Existing law, the California Public Records Act, requires state and local agencies to make public records available for inspection, subject to certain exceptions.

This bill would make certain images, footage, or data obtained through the use of an unmanned aircraft system under its provisions, or any related record, including, but not limited to, usage logs or logs that identify any person or entity that subsequently obtains or requests records of that system, subject to disclosure. The bill would except from disclosure above images, footage, data, and records obtained through the use of an unmanned aircraft system, if disclosure would endanger the safety of a person involved in an investigation, or would endanger the successful completion of the investigation.

Existing constitutional provisions require that a statute that limits the right of access to the meetings of public bodies or the writings of public officials and agencies be adopted with findings demonstrating the interest protected by the limitation and the need for protecting that interest.

This bill would make legislative findings to that effect.

Vote: majority Appropriation: no Fiscal Committee: yes Local Program: no

THE PEOPLE OF THE STATE OF CALIFORNIA DO ENACT AS FOLLOWS:

SECTION 1. Section 6254.31 is added to the Government Code, to read:

6254.31. (a) Notwithstanding any provision of this chapter, images, footage, or data obtained through the use of an unmanned aircraft system pursuant to Title 14 (commencing with Section 14350) of Part 4 of the Penal Code, or any related record, including, but not limited to, usage logs or logs that identify any person or entity that subsequently obtains or requests records of that system, are public records subject to disclosure.

(b) Notwithstanding subdivision (a), nothing in this chapter or any other law requires the disclosure of images, footage, or data obtained through the use of an unmanned aircraft system, or any related record, including, but not limited to, usage logs or logs that identify any person or entity that subsequently obtains or requests records of that system, to the extent that disclosure of the images, footage, data, or records would endanger the safety of a person involved in an investigation, or would endanger the successful completion of the investigation.

SEC. 2. Title 14 (commencing with Section 14350) is added to Part 4 of the Penal Code, to read:

TITLE 14. UNMANNED AIRCRAFT SYSTEMS

14350. (a) A public agency shall not use an unmanned aircraft system, or contract for the use of an unmanned aircraft system, except as provided in this title. This title shall apply to all public and private entities when contracting with a public agency for the use of an unmanned aircraft system.

(b) A law enforcement agency may use an unmanned aircraft system if it has obtained a warrant based on probable cause pursuant to this code.

(c) A law enforcement agency, without obtaining a warrant, may use an unmanned aircraft system in all of the following circumstances:

(1) In emergency situations if there is an imminent threat to life or of great bodily harm, including, but not limited to, fires, hostage crises, "hot pursuit" situations if reasonably necessary to prevent harm to law enforcement officers or others, and search and rescue operations on land or water.

(2) To assess the necessity of first responders in situations relating to traffic accidents.

(3) (A) To inspect state parks and wilderness areas for illegal vegetation or fires.

(B) For purposes of this paragraph, "wilderness areas" means public lands without permanent improvements or human habitation.

(4) To determine the appropriate response to an imminent or existing environmental emergency or disaster, including, but not limited to, oils spills or chemical spills.

(d) A public agency other than a law enforcement agency may use an unmanned aircraft system, or contract for the use of an unmanned aircraft system, to achieve the core mission of the agency provided that the purpose is unrelated to the gathering of criminal intelligence.

(e) A public agency that is not primarily a law enforcement agency, but that employs peace officers or performs functions related to criminal investigations, may use an unmanned aircraft system without obtaining a warrant to achieve the core mission of the agency provided that the purpose is unrelated to the gathering of criminal intelligence, and that the images, footage, or data are not used for any purpose other than that for which it was collected.

14351. A public agency that uses an unmanned aircraft system, or contracts for the use of an unmanned aircraft system, pursuant to this title shall first provide reasonable notice to the public. Reasonable notice shall, at a minimum, consist of a one-time announcement regarding the agency's intent to deploy unmanned aircraft system technology and a description of the technology's capabilities.

14352. (a) (1) (A) Except as permitted by this title, images, footage, or data obtained by a public agency, or any entity contracting with a public agency, pursuant to this title shall not be disseminated to a law enforcement agency unless the law enforcement agency has obtained a warrant for the images, footage, or data based on probable cause pursuant to this code, or the law enforcement agency would not have been required to obtain a warrant to collect the images, footage, or data itself, as specified in Section 14350.

(B) A public agency that is not primarily a law enforcement agency, but that employs peace officers or performs functions related to criminal investigations, may disseminate images, footage, or data collected pursuant to Section 14350 if the dissemination is to others within that agency.

(2) Except as permitted by this title, images, footage, or data obtained by a public agency, or any entity contracting with a public agency, through the use of an unmanned aircraft system shall not be disseminated outside the collecting public agency, unless one of the following circumstances applies:

(A) Images, footage, or data obtained by a public agency through the use of an unmanned aircraft system may be disseminated to another public agency that is not a law enforcement agency if the images, footage, or data are related to the core mission of both public agencies involved in the sending or receiving of the images, footage, or data.

(B) Images, footage, or data obtained by a public agency through the use of an unmanned aircraft system may be disseminated outside the collecting public agency if the images, footage, or data are evidence in any claim filed or any pending litigation.

(C) Images, footage, or data obtained by a public agency through the use of an unmanned aircraft system may be disseminated to a private entity if both of the following conditions are satisfied:

(i) The collecting public agency is not a law enforcement agency.

(ii) The images, footage, or data are related to the core function of the collecting public agency.

(3) A public agency may make available to the public images, footage, or data obtained by the public agency through the use of an unmanned aircraft system if both of the following conditions are satisfied:

(A) The images, footage, or data do not depict or describe any individual or group of individuals, or the activities of any individual or group of individuals whose identity or identities can be ascertained.

(B) The disclosure of the images, footage, or data is required to fulfill the public agency's statutory or mandatory obligations.

(b) Except as permitted by this title, images, footage, or data obtained by a public agency through the use of an unmanned aircraft system shall not be used by the public agency for any purpose other than that for which it was collected.

(c) (1) Images, footage, or data obtained through the use of an unmanned aircraft system shall be permanently destroyed within one year, except that a public agency may retain the images, footage, or data in all of the following circumstances:

(A) For training purposes. Images, footage, or data retained for training purposes shall be used only for the education and instruction of a public agency's employees in matters related to the mission of the public agency and for no other purpose.

(B) For academic research or teaching purposes. Images, footage, or data retained for academic research or teaching purposes shall be used only for the advancement of research and teaching conducted by an academic or research institution and matters related to the mission of the institution and for no other purpose.

(C) For purposes of monitoring material assets owned by the public agency.

(D) For environmental, public works, or land use management or planning by the public agency.

(2) Notwithstanding paragraph (1), a public agency may retain beyond one year images, footage, or data obtained through the use of an unmanned aircraft system in both of the following circumstances:

(A) If a warrant authorized the collection of the images, footage, or data.

(B) If the images, footage, or data are evidence in any claim filed or any pending litigation or enforcement proceeding.

14353. Unless authorized by federal law, a person or entity, including a public agency subject to Section 14350 or a person or entity under contract to a public agency, for the purpose of that contract, shall not equip or arm an unmanned aircraft system with a weapon or other device that may be carried by or launched from an unmanned aircraft system and that is intended to cause bodily injury or death, or damage to, or the destruction of, real or personal property.

14354. All unmanned aircraft systems shall be operated so as to minimize the collection of images, footage, or data of persons, places, or things not specified with particularity in the warrant authorizing the use of an unmanned aircraft system, or, if no warrant was obtained, for purposes unrelated to the justification for the operation.

14355. (a) This title is not intended to conflict with or supersede federal law, including rules and regulations of the Federal Aviation Administration.

(b) A local legislative body may adopt more restrictive policies on the acquisition or use of unmanned aircraft systems.

14356. For the purposes of this title, the following definitions shall apply:

(a) "Criminal intelligence" means information compiled, analyzed, or disseminated in an effort to anticipate, prevent, monitor, or investigate criminal activity.

(b) "Law enforcement agency" means the Attorney General of the State of California, each district attorney, and each agency of the State of California authorized by statute to investigate or prosecute law violators.

(c) "Public agency" means and includes each state agency and each local agency.

(d) "Unmanned aircraft system" means an unmanned aircraft and associated elements, including communication links and the components that control the unmanned aircraft, that are required for the pilot in command to operate safely and efficiently in the national airspace system.

14357. Except as provided in this title, the surveillance restrictions on electronic devices described in Chapter 1.5 (commencing with Section 630) of Title 15 of Part 1 shall apply to the use or operation of an unmanned aircraft system by a public agency.

SEC. 3. The Legislature finds and declares that Section 1 of this act, which adds Section 6254.31 of the Government Code, imposes a limitation on the public's right of access to the meetings of public bodies or the writings of public officials and agencies within the meaning of Section 3 of Article I of the California Constitution. Pursuant to that constitutional provision, the Legislature makes the following findings to demonstrate the interest protected by this limitation and the need for protecting that interest:

In order to ensure the safety of persons involved in investigations and to preserve the integrity of those investigations, it is necessary that this act take effect.

Murkowsk, Young Introduce Bicameral Bills Pushing for Safe Drone Usage

Lawmakers: Policies Needed to Establish "Rules of the Road,"

Bill Can Be "Game Changer" for Arctic Research Funding Opportunities

WASHINGTON, D.C. – Senator Lisa Murkowski and Congressman Don Young announced companion legislation in both chambers of Congress aimed at urging the Federal Aviation Administration to create policies for safe usage of unmanned aerial systems (UAS) across America's skies. Senator Lisa Murkowski introduced the bipartisan Safe Skies for Unmanned Aircraft Act of 2015 with co-sponsors Heidi Heitkamp (D-ND) and Ron Wyden (D-OR) in the Senate, and Congressman Young introduced legislation by the same name in the House of Representatives.

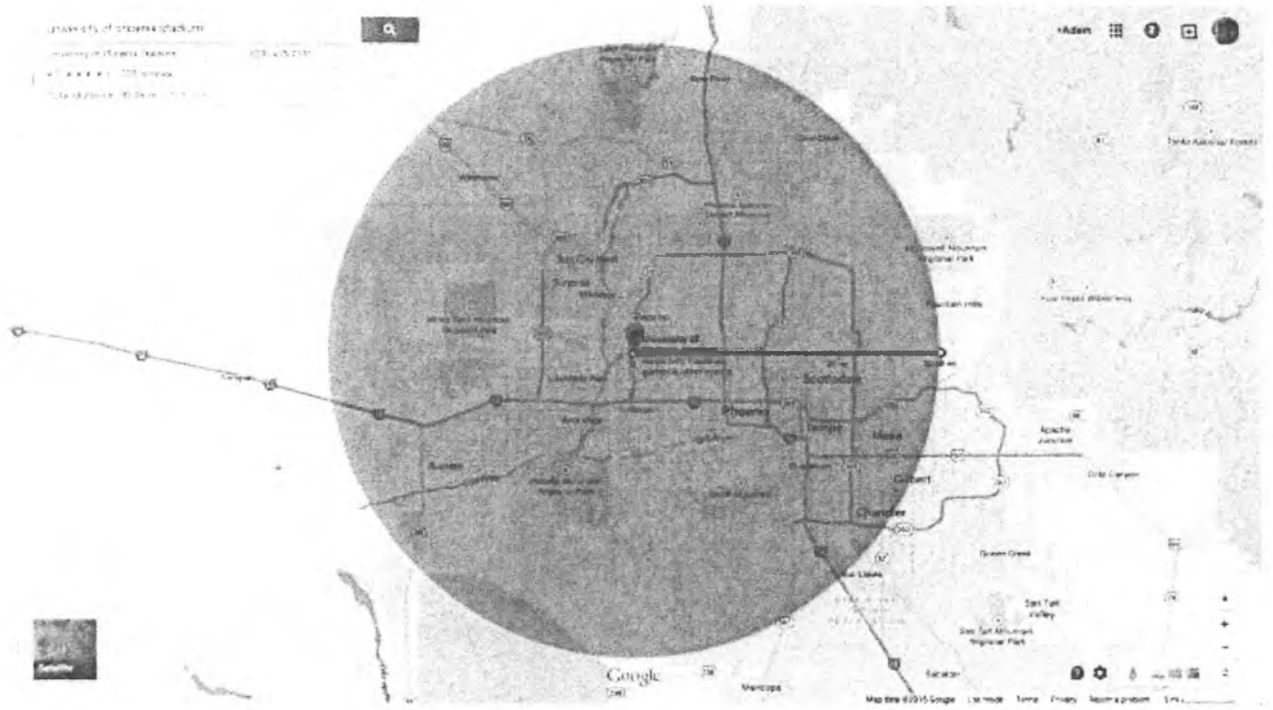
Beyond promoting safety in the air, the bill:

- Opens the door for public-private partnerships to support UAS research, allowing universities to accept research funding from the private sector, and saving American taxpayers money.
- Requires the FAA to remove bureaucratic hurdles to research operations for safe beyond 'line of sight' flying, an important research tool for medium- and long-distance applications.

"As we see more and more unmanned aircraft in use, it's critical that we lay out rules of the road – and this bill starts by telling the FAA to get to work," Murkowski said. "One of the most pressing items we discussed last week at the Arctic Encounter Symposium was how unmanned aerial systems can be game changers for Alaska, to work around our distances and lack of infrastructure. Arctic research, delivering goods in the Bush, fire-fighting and policing in rural areas are all new possibilities for us, and with the private sector investing in research today, we can all benefit tomorrow."

"In the last FAA reauthorization, Congress directed the creation of six regional UAS tests sites; however no funds were set aside to ensure their success," said Congressman Young. "Our legislation will clear significant roadblocks that stand in the way of successful research activities, and work to strengthen and empower UAS test sites for the benefit of the FAA and all stakeholders."

The lack of any rules or policies governing UAS was evident in last weekend's Super Bowl. Because the FAA had no laws to enforce, it was forced to create a "No Drone Zone" spanning 30 miles in all directions around the stadium – totaling over 2,800 square miles. (Larger than the state of Delaware.) Rules like those promoted by today's bill would help limit such overbroad restrictions.



(The "No Drone Zone" for the Super Bowl was larger than the Municipality of Anchorage and the State of Delaware.)

The Safe Skies for Unmanned Aircraft Act of 2015 aims to redefine how the FAA considers unmanned aerial systems – giving them greater autonomy and opportunities like those seen in commercial aviation. FAA's currently bans universities from working with private sponsors to develop and research unmanned aircraft technology applications. The delegation, working in conjunction with the University of Alaska Fairbanks, believe the private sector must be allowed and encouraged to invest and participate in research activities.

114TH CONGRESS
1ST SESSION

S. _____

To require the Administrator of the Federal Aviation Administration to use the definitions in section 40125 of title 49, United States Code, in determining whether an unmanned aircraft conducting aeronautical research flights qualifies for public aircraft status under that section, and for other purposes.

IN THE SENATE OF THE UNITED STATES

Ms. MURKOWSKI (for herself, Mr. WYDEN, and Ms. HEITKAMP) introduced the following bill; which was read twice and referred to the Committee on _____

A BILL

To require the Administrator of the Federal Aviation Administration to use the definitions in section 40125 of title 49, United States Code, in determining whether an unmanned aircraft conducting aeronautical research flights qualifies for public aircraft status under that section, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

SECTION 1. SHORT TITLE.

This Act may be cited as the "Safe Skies for Unmanned Aircraft Act of 2015".

SEC. 2. PUBLIC AIRCRAFT OPERATING STATUS OF UNMANNED AIRCRAFT USED IN AERONAUTICAL RESEARCH FLIGHTS; SAFETY PROCEDURES FOR SUCH FLIGHTS.

(a) PUBLIC AIRCRAFT OPERATING STATUS.—In determining whether an unmanned aircraft used in the conduct of aeronautical research qualifies as a public aircraft under section 40125 of title 49, United States Code, the Administrator of the Federal Aviation Administration shall—

(1) for purposes of determining whether the aircraft is used for a commercial purpose, use only the definition given that term in subsection (a) of such section; and

(2) for purposes of determining whether the aircraft, including airborne platforms and systems, is used for aeronautical research and platform-based research, include atmospheric and natural resources research, meteorological observation, and airborne astronomy as aeronautical research.

(b) PROCEDURES FOR BEYOND-LINE-OF-SIGHT OPERATIONS.—

(1) IN GENERAL.—Not later than 90 days after the date of the enactment of this Act, the Administrator shall develop and implement procedures for safe, beyond-line-of-sight operations in the national

airspace system by unmanned aircraft conducting aeronautical research.

(2) CONSIDERATIONS FOR APPROVAL.—In developing the procedures required by paragraph (1) relating to beyond-line-of-sight operations by unmanned aircraft described in that paragraph, the Administrator shall ensure that a decision to approve such an operation takes into consideration the safety of the entire operation, including whether any provisions required to be included in the certificate of authorization for the operation result in additional safety risk to any individual associated with the operation.

(c) UNMANNED AIRCRAFT DEFINED.—In this section, the term "unmanned aircraft" has the meaning given that term in section 331 of the FAA Modernization and Reform Act of 2012 (Public Law 112–95; 49 U.S.C. 40101 note).

PURPOSE

The State of Alaska Department of Commerce, Community, and Economic Development, Division of Economic Development, and the University of Alaska Center for Economic Development have developed this Unmanned Aircraft Systems (UAS) strategy document to guide the future expansion of the UAS-industry in Alaska.

The primary functions of the Division of Economic Development are research, business assistance, promotion, and development finance. These functions have influenced the focus of this study as the state hopes to leverage its existing competencies to develop UAS-related business opportunities.

This strategy document aims to advance the expansion of what is already an excellent economic opportunity for the state of Alaska. It focuses on growing related UAS industry sectors, advancing technologies in aerospace and aviation, and identifying opportunities for the Alaska workforce of the future.

Key long-term objectives related to the advancement of the UAS industry include the following:

1. Improve Alaska's unmanned system and aerospace industries business climate
2. Grow the UAS industry sector by encouraging private investment and job creation
3. Attract UAS sector anchor firms to Alaska
4. Promote UAS and aerospace research and development
5. Advance UAS and STEM education
6. Market and brand Alaska's UAS industry
7. Increase public sector education and engagement
8. Engage the FAA to produce a favorable regulatory framework for UAS operations.

The opportunities for Alaska's UAS sector are statewide. Alaska's existing geographic and technical assets, if developed in a strategic and intentional way, greatly increase the likelihood that the UAS industry will lead to economic opportunities and job creation for communities across the state.

As with any strategy document, this initial plan hopes to capture current thinking and data to frame the development of a strategy. This document is intended to be a living and changing plan and should be regularly revised and updated to reflect technological, political, and policy changes in both the public and private sectors.

This page intentionally left blank.

EXECUTIVE SUMMARY

Unmanned aircraft systems (UAS) are positioned to revolutionize the field of commercial aviation. This technology has already transformed the defense market and will soon have a similar impact in a variety of civilian industries. These devices can perform a number of tasks ranging from wildlife observation to search and rescue and pipeline inspection effectively, efficiently, and safely. With global UAS expenditures of $5.2 billion in 2013[1], industry analysts expect the market to more than double in the next decade, with a total value of $89 billion over the whole period. As an early leader in the testing and development of UAS regulations and applications, Alaska has the potential to benefit economically from this emerging sector. The state can increase benefits reaped by implementing investment strategies that encourage growth, innovation, and job creation.

Alaska offers unique advantages for the development of this new industry. First and foremost, the state has vast airspace available for testing UAS. While the Federal Aviation Administration (FAA) currently prohibits operating UAS in most civilian airspace, Alaska is a partner (with Hawaii and Oregon) in one of six FAA-designated test ranges across the country (see map below). Achieving this status is the culmination of a decade of path breaking research on UAS applications at the University of Alaska Fairbanks. Another regulatory advantage is the existence of the Arctic Airspace, a specially designated area over most of the Bering, Chukchi, and Beaufort Seas that will permit extensive UAS testing and some commercial operations. On the geographic front, Alaska provides a wide variety of landscapes and weather conditions for the testing and evaluation of aircraft over an immense area. Lastly, with the longstanding presence of resource development industries, military bases, civilian federal agencies, and other large actors, the state is home to a sizable potential market for UAS services.

Alaska test ranges, where FAA permits UAS testing

[1] "Teal Group Predicts Worldwide UAV Market Will Total $89 Billion in Its 2013 UAV Market Profile and Forecast" http://tealgroup.com/index.php/about-teal-group-corporation/press-releases/94-2013-uav-press-release

Despite these strengths, other states and nations see economic opportunities in the UAS industry as well. The intense competition requires that Alaska develop a competitive strategy that coordinates the efforts of numerous stakeholders within government, the University of Alaska system, private industry, and others. By 2017, the FAA will implement a regulatory framework that integrates UAS into the national airspace system (NAS), opening the skies to commercial UAS use and negating some of Alaska's current advantages. Most other states feature lower business costs and larger available workforces, as well as established incentive programs, to attract private investment. Capturing the economic benefit of a UAS industry in Alaska is thus a time-sensitive undertaking requiring strategic action.

RECOMMENDATIONS

A comprehensive strategy to grow and sustain a viable UAS industry for Alaska hinges on four major elements: business climate, innovation and entrepreneurship, workforce, and strategic partnerships.

Create a Strong UAS Business Climate

The business climate for UAS includes such elements as critical infrastructure, tax policies, and regulatory framework. Any strategies deployed to minimize taxes, finance infrastructure, and minimize the cost of doing business in Alaska will improve the overall business climate. Specific recommendations are as follows:

- **Strategically incentivize UAS investment to attract anchor firms.** Nationwide, most states and regions offer financial incentives (often in the form of tax credits or abatements) to attract businesses looking to expand or relocate. Alaska offers few incentives comparable to other states, but should consider them to offset the costs of doing business in the state. A state R&D tax credit, for instance, could provide businesses with corporate income tax relief.
- **Infrastructure investments.** Alaska must invest in critical infrastructure to support the continued development of the industry. This investment may include facilities, special use roads, airfields, or training centers. Infrastructure investments may be financed via public-private partnerships or such organizations as the Alaska Industrial Development Export Authority (AIDEA).
- **A coordinated, branded marketing effort.** Several states in competition with Alaska for UAS investment feature marketing efforts to attract investment in targeted industries, such as "Diversify Nevada." Such an effort would include a team to recruit companies and serve as business liaisons. Clearly presented financial incentives are an expected component.
- **Clear communication of the state's assets.** The state offers more airspace for UAS testing than any other, a long history with defense and aviation related industry, deeply rooted UAS expertise, and nationally-renowned aviation training programs. With a large and diverse land mass, Alaska is an excellent laboratory for testing UAS. These and other strengths need to be communicated clearly and effectively.
- **Business retention and expansion (BRE).** The State of Alaska DCCED has successfully launched a BRE initiative to identify the needs of the business community in the state and specific steps that can be taken to assist them. An aviation and UAS-specific BRE survey and engagement could yield information to encourage expansion of the industry.

- **State procurement of UAS services.** Where possible, state entities should consider employing UAS services in place of manned aircraft. This approach would be especially applicable for the Department of Natural Resources (DNR) or the Department of Environmental Conservation (DEC). In this way the state can promote UAS industry development while also realizing the greater efficiency and effectiveness of UAS.

Foster Innovation and Entrepreneurship

Alaska was an early leader in testing and evaluating UAS and has R&D capabilities within the University of Alaska system. The state and the university (along with other private sector stakeholders) must encourage spillovers of information that result in commercializing innovations. This can be accomplished through:

- **Targeted R&D efforts.** The University of Alaska system is well-suited to conduct R&D to further develop specific UAS applications, such as wildlife monitoring, search and rescue, or remote infrastructure inspection. These projects could be financed with a mix of public and private funds, with interested corporations sponsoring some of the R&D efforts. Public funding should support centers of innovation. Such centers could ensure the commercialization of research into viable products that will advance the industry. Several states have established technology funds for this purpose.
- **Development of a university research or technology park.** This real estate development integrates corporate R&D facilities into an area typically adjacent or in close proximity to a university campus. A key success factor is establishing a strong collaborative relationship between the university and industry partners. The corporations gain access to university facilities and brainpower. This access allows for the ability to recruit top graduates, and to sponsor targeted research. A business incubator or accelerator (a structured program to nurture early stage businesses) could be integrated into a research park with an emphasis on aviation and UAS-related firms.
- **Availability of early stage capital.** With the advent of the 49th State Angel Fund in Anchorage (and its spinoffs) and venture funds at UAA and UAF, the state has the capital availability to support high growth ventures. In addition to the Angel Fund, the state should consider other financing programs designed to provide early-stage capital to the state's most promising entrepreneurs. These different funding sources must be aligned to ensure that access to capital is achieved across Alaska.

Cultivate a Talented Workforce

The availability of skilled and semi-skilled workers has always been a challenge for Alaska's industrial development. A thriving UAS industry, however, requires a specialized workforce capable of piloting the vehicles as well as tending to the operational systems. A variety of ancillary services ranging from accounting to construction will also be necessary. Training and education needs can be met in the following ways:

- **Specialized coursework in UAS-related fields**. Both UAA and UAF offer aviation training

programs leading to degrees and certificates, including one course specific to UAS. Through the addition of UAS-related classes and the development of a certificate program targeted towards UAS, Alaska will be better poised as a training leader in unmanned aviation. The state will also benefit from the growth of a specialized workforce. Coursework and certificates for technicians in such fields as remote imaging and electronic systems will complement this training.

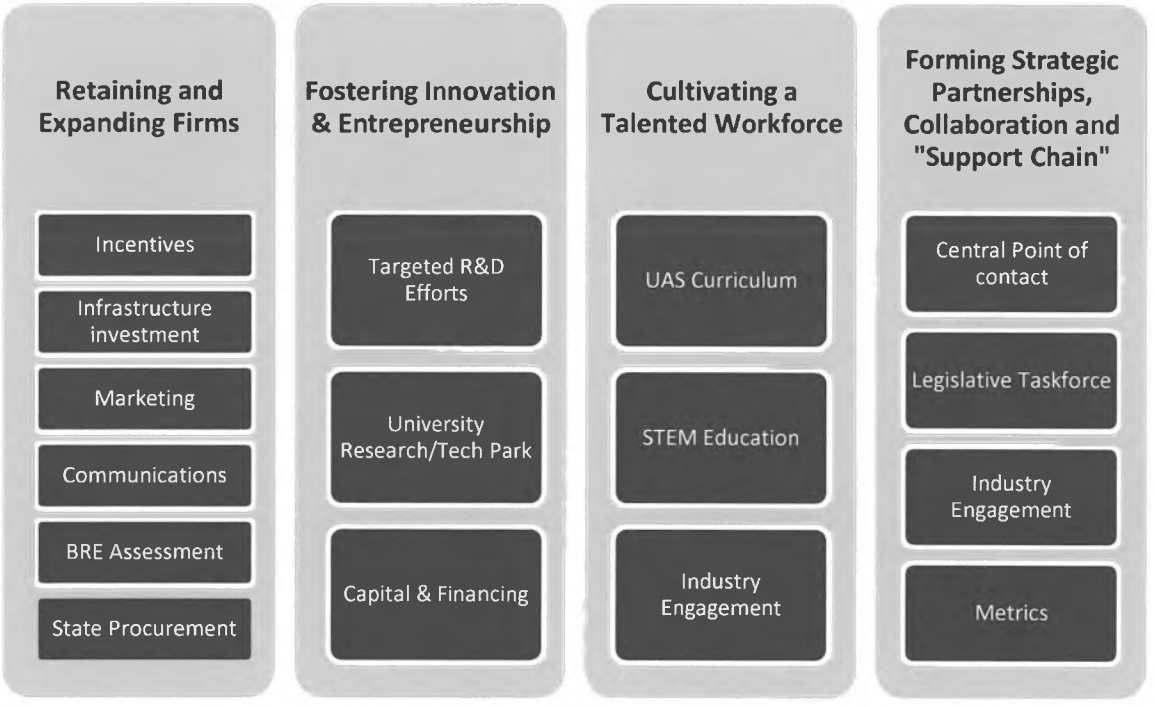
- **Invest in STEM education at all levels.** Activities could range from supporting youth robotics programs to expanding the Alaska Native Science and Engineering Program to ensure Alaska has a highly qualified workforce. Post-graduate education in advanced engineering disciplines will further help develop a specialized workforce. Funding is necessary for marketing and promotion materials dedicated to building a career in aviation-related industries.
- **Engage industry in determining needs and partnering to fund programming.** Establish an employer-driven, standardized core curriculum for post-secondary students. Provide tax incentives for specialized training programs funded by employers.

Improve Strategic Partnerships and Collaboration

Contributors to the development of the UAS strategy plan spoke to the importance of improved alignment between government, higher education institutes, and private industry to maximize the potential for successful industry development. The following strategies are recommended to improve collaboration:

- **Formalize the UAS Interest Group or create an office as a central point of contact to coordinate efforts related to UAS**. This office might initially coordinate the efforts of the major stakeholder groups to ensure that strategies are inclusive yet disciplined. It might also serve as a point of contact for private industry.
- **Continue and expand the legislative task force.** This body works to ensure policies and workforce training needs are adequately funded and aligned with industry needs. It should also make legislative recommendations on the development of incentive programs.
- **Engage industry leadership.** Promoting a dialogue with industry leaders can lead to productive and meaningful public sector activities. An industry association could help advocate for policies that encourage targeted and necessary investment.
- **Develop Metrics.** Outcome-based metrics can measure the impacts of incentives developed to support the UAS industry.

These strategies would position Alaska to compete as the UAS industry and related sectors evolve in the global marketplace. Alaska is in the enviable position of having several strong assets as it relates to leading in the UAS industry. Alaska must make a conscious decision to act in a strategic, orchestrated, and sustained way in order to stand out from competing regions across the globe.



The four major components of a UAS-centered economic development strategy for Alaska

This page intentionally left blank.

1. UAS Industry Background

Experiments with pilotless aircraft began at the end of World War I. These earlier aircraft were known as "aerial torpedoes" and "flying bombs" and used on an experimental or small-scale basis. Not unlike the manned aviation industry, the maturity of unmanned aircraft has sprung from military and special operations to civilian applications. These began with search and rescue before moving to non-military security, firefighting, pipeline surveillance, and agricultural applications. As the civilian industry has matured in recent years, the terminology has also evolved from "drones" to "unmanned aerial vehicles" (UAVs) to the now widely accepted term "unmanned aircraft systems" (UAS).

1.1 National UAS Background

Used sparingly in military operations prior to the Global War on Terrorism, UAS now make national headlines as they play supporting roles in both military and commercial efforts normally reserved for manned aircraft or satellites. For the past two decades, the Department of Defense (DoD) has driven the aerospace and defense industries to advance UAS related technologies with greater capabilities in the vehicles themselves as well as imaging technology. By 2009, the US Air Force (USAF) began to train more UAS pilots than manned fighter and bomber pilots.[2] Today, one-third of the USAF aircraft fleet is unmanned, and the US Army flew approximately 1 million UAS hours in 2010 alone. While the US reduces its presence in Iraq and Afghanistan, the number of UAS needed to support US military activity has remained constant, as DoD operations expand into Africa, the Philippines, and South America, and are incorporated into US and NATO maritime realms.

A note on terminology: drone, UAV, or UAS?
While unmanned aircraft are frequently referred to as "drones," unmanned aerial vehicle (UAV) is the established industry term. A UAV is defined by the *Dictionary of Military and Associated Terms* as a "powered, aerial vehicle that does not carry a human operator, uses aerodynamic forces to provide vehicle lift, can fly autonomously or be piloted remotely, can be expendable or recoverable, and can carry a lethal or nonlethal payload, or both." "Unmanned aircraft system" (UAS) describes not just the unmanned aircraft itself but all the other necessary components and infrastructure, such as the control system or ground control station, navigational equipment, communication control link or data link and ground-based pilot. For the remainder of this document, UAS will be the most frequently used term.

UAS come in a variety of sizes and configurations, ranging from those as small as an insect to as large as a commercial airliner. According to available research, small (under 55lbs) UAS constituted the vast majority of platforms in operation between 2005 and 2011 while

[2] Air Force Times http://www.airforcetimes.com/article/20090616/NEWS/906160319/More-training-UAVs-than-bombers-fighters

strategic (larger) UAS included some of the most versatile, typically operating up to 65,000 feet in altitude, with a maximum endurance (time in the sky) of more than 20 hours. The US Air Force categorizes UAS in five tiers, which will be referred to throughout this document:

- Tier N/A : Small/Micro, low altitude
- Tier 1: Low altitude, long endurance
- Tier 2: Medium altitude, long endurance
- Tier 2+: High altitude, long endurance conventional
- Tier 3: High altitude, long endurance low-observable

The success of US DoD applications for UAS has driven demand from other national governments to incorporate the technology into their own militaries. This trend is fueling a rapid growth in the international defense-related UAS marketplace.

In parallel, there is a growing understanding of non-military UAS capabilities and applications throughout civilian marketplaces to address "dull, dirty, and dangerous" or otherwise complicated tasks. UAS operations in the National Airspace System (NAS) has been primarily limited by the Federal Aviation Administration (FAA) to missions focused on public interest such as disaster relief, wildfire control, law enforcement, search and rescue, or related functions. Teal Group Corporation (a consultancy) reports indicate ***the primary challenges holding back commercial development are the lack of access to airspace for UAS research and development, as well as restrictive export control regulations for US manufacturers to other countries with more flexible airspace restrictions.***

Figure 1: Uses for UAS Technology

Non-Military UAS Applications	
Airworthiness Certification	**Provision of non-military Services**
Border surveillance	**Damage surveying**

Disaster response/relief	**Pipe/power line surveillance**
Damage assessment	**Agricultural applications**
Atmospheric/weather research	**Communications/broadcast**

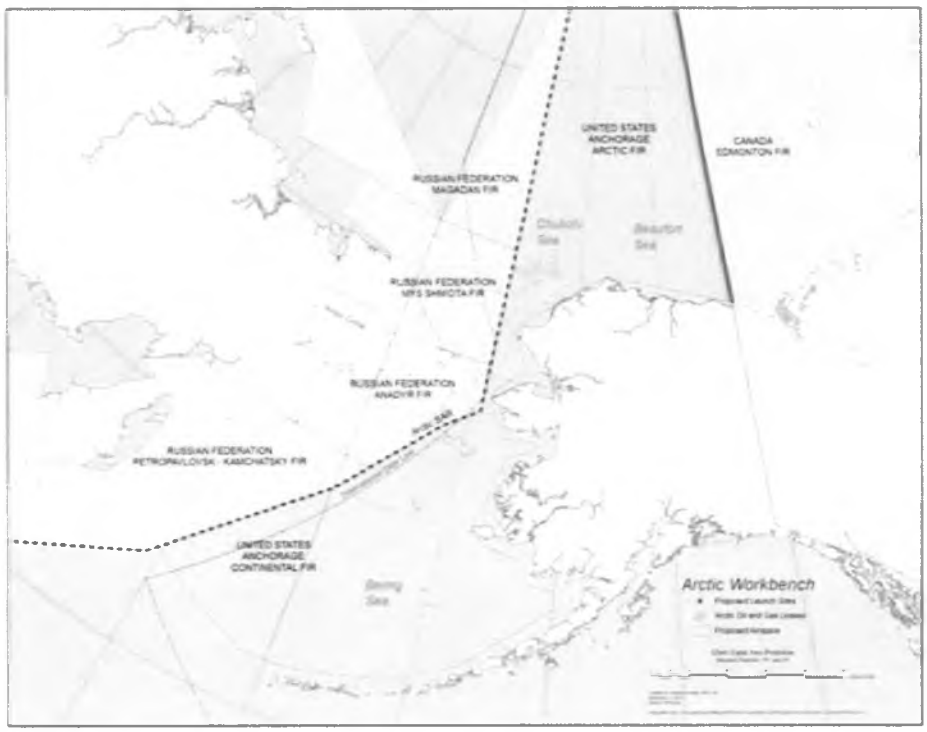
Critical infrastructure monitoring	**Movie production**
Aerial news coverage	**Flood mapping**
Mail/freight transport	**Real estate mapping**
Mining	**Sports event coverage**

Given increasing demand for use of UAS in domestic airspace, the FAA has taken initial steps to integrate UAS into the NAS, the largest, most complex air traffic system in the world. In the FAA Modernization and Reform Act of 2012 (FMRA), Congress directed the FAA to establish six "test ranges" to assist in developing the policies, procedures, and technologies required to integrate UAS into the NAS. In selecting the test ranges, the legislation mandated that the FAA, in consultation with the National Aeronautics and Space Administration (NASA) and the DoD, consider geographic diversity, climatic diversity, location of ground infrastructure and research needs in choosing the ranges.

Most significantly, the airspace encompassing Alaska's Arctic was given special consideration in the FMRA. Alaska was designated to be first in allowing commercial UAS. **In recognition of Alaska's role in UAS development, the act also established the Arctic Airspace, a unique region located off the coast of Alaska north of the Aleutians over the Bering, Chukchi, and Beaufort Seas up to at least 2000 feet, for 24-hour access by all types and users of UAS, with launch and recovery from selected coastal locations without the need for special permissions or waivers (see map below).**[3]

[3] The FAA is currently in the process of designating the Arctic Airspace, and as such the map reflects proposed areas.

Figure 2: Arctic Airspace



In 2013, the first commercial offshore UAS flights in the US were conducted about 50 miles northwest of Wainwright in the Chukchi Sea. Conoco Phillips, Insitu, and Olgoonik Fairweather conducted two commercial Scan Eagle flights from the R/V Westward Wind to investigate the viability of using UAS to conduct marine mammal surveys and ice reconnaissance. In the summer of 2014, BP and AeroVironment, Inc. conducted the first terrestrial UAS operations near Deadhorse, the center for Alaska's North Slope oil production. The UAS industry partnered with Alaska operators to conduct these historic flights and have scheduled many more promising operations to highlight the effectiveness of the technology.

The six FAA test ranges were announced in December 2013 and began operations in January 2014, initiating airspace access for researchers, government agencies, and industry towards assisting in the assimilation of requirements for integration of UAS into the NAS. The test range selection established range operators in Alaska, Nevada, New York, North Dakota, Texas, and Virginia. While the selection of test ranges does not provide wide-scale access to national airspace for commercial and civil purposes, the operational data collected will provide the FAA an opportunity to develop regulations for future commercial and civil uses in the NAS.[4]

[4] FAA UAS Fact Sheet - http://www.faa.gov/news/fact_sheets/news_story.cfm?newsid=15575

1.2 National UAS Economic Impact

UAS will likely become the most dynamic growth sector of the world aerospace industry this decade. UAS in civilian use will likely become a multi-billion dollar industry while opening new opportunities in scientific research and student education. The Teal Group Corporation, in its 2013 Small UAS (SUAS) Market Profile and Forecast, estimated that the global UAS market could be worth up to $89 billion over the next decade, and the US is expected to account for almost two-thirds of the world's research and development (R&D) investment in the field.[5] The same study predicts a UAS demand worldwide for R&D, testing, and procurement, rising from $6.6 billion in 2013 to $11.4 billion in 2022. Teal expects the US share of R&D to account for 62% of worldwide spending. In short, the development and manufacture of UAS for use by public entities and commercial consumers is expected to grow in the coming years despite the many regulatory and technical issues remaining to be addressed.

A number of US and international firms currently manufacture UAS for military and civil government operations. Depending on the mission, unmanned aircraft are typically equipped with payloads that provide multiple capabilities, including reconnaissance (surveillance and intelligence gathering) and in some cases attack capabilities. All UAS require a ground control component and a communications link to the unmanned aircraft. According to Forecast International, unmanned air vehicles will account for 46% of UAS spending, payloads for 38%, and ground control equipment for 16% during the next decade. US manufacturers with the largest share of the global UAS market are listed below.[6]

Figure 3: Global UAS Market Share (manufacturing)

Company	Global Market Share
General Atomics	20.4%
Northrop Grumman	18.9%
Boeing	1.5%
AAI	1.2%

The Association for Unmanned Vehicle Systems International (AUVSI) estimates that by 2029 more than 23,000 UAS jobs could be created in the US as the result of UAS integration into the NAS. New jobs will not only result with this industry growth, but also expand into academia, federal government agencies, and the civilian/commercial UAS support community. These new positions could translate into more than $1.6 billion in wages over the next 15 years. These jobs will emerge from the manufacturing sector; pilots and operators, data analysts, maintenance personnel, range and air traffic control management, and consultants will also

[5] World Unmanned Aerial Vehicle Systems. 2011 Market Profile and Forecast, The Teal Group Corporation, 2011.
[6] Graham Warwick and Larry Dickerson, "Cooling Down? Export and civil unmanned aircraft demand will grow, but mainstay military markets may slow." Aviation Week & Space Technology, December 31, 2012 p. 84

result. Universities are already developing curriculums targeted for these future positions and as preparation for related workforce training. Student demand has led to operator certification and maintenance programs. In a few instances, four-year professional degrees as well as advanced degrees are offered.

The increased demand for UAS will spur secondary employment growth in ancillary markets. For instance, sensor manufacturers, avionics providers, software developers, and composite manufacturers will add manufacturing and engineering personnel. Companies anticipate adding support staff, such as accountants, sales associates, managers, human resources specialists, insurers, and administrators to ensure business efficiency. Regions with a large UAS manufacturing or R&D presence will experience employment growth across employment sectors as spillover effects materialize.

An additional opportunity area—and perhaps the most relevant to Alaska—is an emerging market for UAS services. Large resource development companies and civilian government agencies have already exhibited need for a variety of imaging, mapping, and other services (Chapter 3 will describe several examples). The ability to operate UAS fleets and analyze data collected from unmanned aircraft will likely become a profitable business opportunity.

1.3 Alaska UAS Background

Within Alaska, UAS currently have an expansive breadth of applications. Several factors drive the use of UAS, including Alaska's vastness, abundance of natural resources, limited road access (and therefore remoteness), and extreme weather and terrain. These realities, coupled with Alaska's strong aviation-centric orientation (with six times more pilots per capita than the rest of the nation) have made the leap to UAS technologies a natural fit. UAS already support a wide array of activities, such as conducting scientific research and environmental monitoring by NASA and the National Oceanic and Atmospheric Administration (NOAA), oil spill mapping (response/environmental cleanup), weather forecasting, wildlife monitoring and counts, atmospheric sampling during wildfires, power line inspections, air quality monitoring and examination of sea ice build ups. Further applications tried in Alaska include whale observing, cadastral mapping, maritime navigation support, industrial plant and pipeline monitoring, oil and gas flare stack maintenance, and environmental cleanup response.[7] Furthermore, the opening of the Northwest Passage to shipping, the additional burden of providing potential assistance to those vessels, and related port developments lend themselves to UAS technologies. As evidenced by these examples, aviators, researchers, and industry collaborate

[7] Alaska Center for Unmanned Aircraft Systems Integration (ACUASI) presentations and interviews

closely to use unmanned aircraft for missions previously requiring manned aircraft at higher cost, greater risk, and with fewer capabilities.

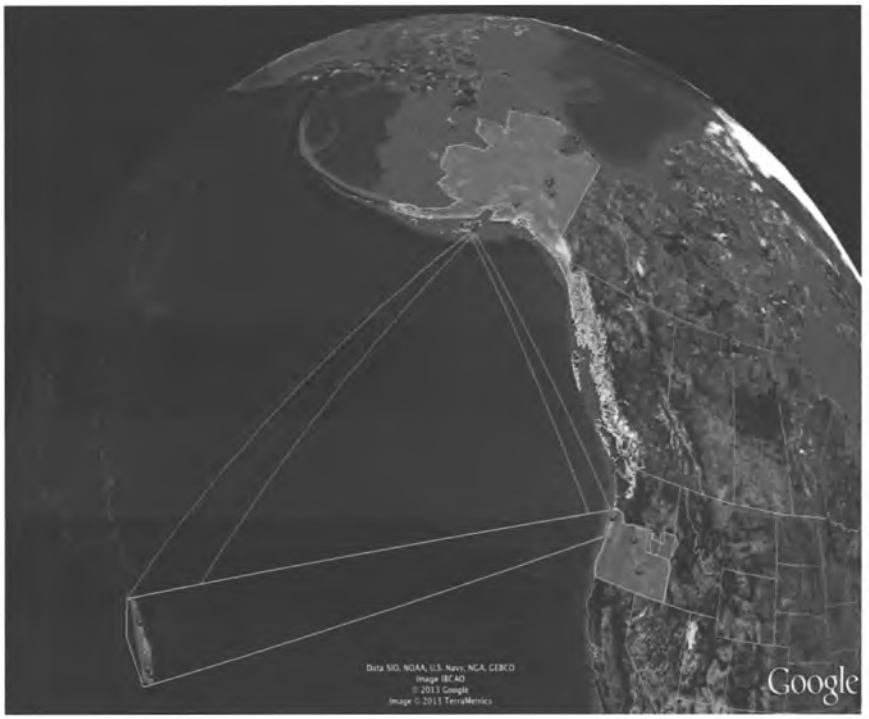
Throughout these initiatives, the Alaska Center for Unmanned Aircraft Systems Integration (ACUASI) at the University of Alaska Fairbanks Geophysical Institute has been instrumental in developing a world-class program and successfully securing one of the six FAA test ranges to further this capacity. ACUASI was formally established in December 2012 by the University of Alaska Board of Regents to advance the study of UAS capabilities. Program roots reach back to 2001; over the years it has expanded its scope, obtained more advanced equipment, and increased the variety and complexity of research executed. The ACUASI mission is to serve as a research center for small, unmanned aircraft systems providing integration of unique payloads and supporting pathfinder missions within the government and scientific communities, with special emphasis on the Arctic region. ACUASI has worked on UAS projects all across the world, including projects in Iceland, Chile, and South Africa. For instance, ACUASI led a trip to South Africa in which they deployed UAS technology in an effort to find rhinoceros and elephant poachers. In recognition of the important role of UAS in Alaska, the Legislature appropriated $5 million from the state Capital Budget in 2012 to the UAF for the specific purpose of "Research and Development of Unmanned Aircraft Systems" and to support the development of sustainable high-tech industry in Alaska.

Who can legally operate UAS?
Until the FAA fully integrates UAS into the National Airspace System, unmanned aircraft may only operate under certain highly controlled circumstances. Under current FAA rules, there are three types of UAS that can be operated: civil UAS, public UAS, and model aircraft. Flying Civil UAS requires a Special Airworthiness Certificate to be issued for experimental purposes, such as R&D. UAS may not be used to transport people or property for hire. Public UAS requires a Certificate of Airworthiness (COA) that may be issued to a public entity to carry out a public purpose, such as law enforcement or search and rescue. Model aircraft are those operated by hobbyists at 400 feet or less within sight of the operator.

In 2012, ACUASI began collaborating with Oregon State University, the University of Hawaii, and several industry and government entities to propose a Pan-Pacific UAS Test Range Complex (PPUTRC). The PPUTRC, led by ACUASI, proposed test range research targeted towards the development of standards for UAS categories, state monitoring and navigation, and safety standards for UAS operations. **In December 2013 the FAA announced that PPUTRC was successful in its bid, awarding approval for 9 of its 13 proposed test ranges located in Alaska, Hawaii, and Oregon.** Of the 13 proposed ranges, six ranges are in Alaska (Denali, Kodiak, North Slope, Oliktok Corridor, Poker Flat, and Wainwright Corridor), three ranges are in Hawaii, and three ranges are in Oregon. Since designation, the FAA has opened the opportunity for PPUTRC to propose additional locations, and several have already been approved. In late 2014, ACUASI

entered into an agreement to expand testing operations to Iceland. The FAA test range designation runs through February 2017 in accordance with the FMRA. However, the FAA has stated that it expects to grant an extension, and after expiration will view the test sites as continuing operations to support long-term testing of new design UAS and supporting systems. Another issue of strategic importance is that the FAA test range designation comes with no fiscal support.

Figure 4: Alaska, Hawaii, and Oregon, the three states that form the Pan-Pacific UAS Test Range Complex (PPUTRC).



While this strategy plan focus is UAS related activities, **the University of Alaska Fairbanks via its School of Fisheries and Ocean Sciences, is also developing expertise with Marine Autonomous Underwater Vehicles (AUV).** The AUV program is symbiotic and complementary to other work with which the University of Alaska system is engaged relating to UAS and may ultimately lead to some crossover research, innovation and commercialization opportunities. At a later update this strategy document may want to incorporate AUV strategies for the emerging AUV sector.

1.4 Strategic Considerations

As the nation races to transition UAS from military to civil and scientific applications, an opportunity exists for Alaska to participate in the development of this industry and benefit from the associated economic development resulting in additional jobs. As already presented, Alaska

has some clear advantages or assets to leverage when considering UAS industry expansion including:

- Access to comparatively vast airspace for UAS research and development;
- Location (Arctic Airspace, a unique region located off the coast of Alaska north of the Aleutians over the Bering, Chukchi, and Beaufort seas);
- Aviation-centric orientation;
- An engaged university (the Alaska Center for Unmanned Aircraft Systems Integration (ACUASI) at the University of Alaska Fairbanks within the Geophysical Institute has focused on UAS since 2001);
- FAA test range (the Pan-Pacific UAS Test Range Complex was awarded multiple test ranges located in Alaska, Hawaii, and Oregon).

While Alaska's position is enviable, unless the state strategically grows its opportunities from a nascent occurrence to an established industry, the potential value will not be realized. Over the next few years Alaska must transition from being a lead test range to an expanding center for UAS-related industries. Currently, all focus is on conducting missions and collecting the data the FAA needs to implement rules for the civil and commercial use of UAS. Simultaneously, more formal efforts to support the application of current UAS capabilities and development of new technologies and the advancement of uses for UAS are necessary. Other states with fewer strategic assets, even in some instances lacking a "test range" designation, are ramping up to further expand their presence.

Alaska has an opportunity to tap distinctive expertise and develop a new industry for the state, one that leverages its global position and unique competencies. Alaska has the potential to market and position itself as the best place nationally and globally to work out the issues of integrating the emerging UAS systems into the NAS, as well as commercializing technologies into private sector uses. Alaska must face the challenge of how best to link and align these assets to grow a prospering new industry.

2. Alaska's UAS-Anchor Assets

Alaska possesses key anchor assets which, if coordinated properly, can help the state to develop a thriving and integrated UAS industry. These assets come from a broad spectrum of organizations, including the University of Alaska, the US military, and several public sector stakeholder groups that have formed in response to the development of UAS within Alaska. The key moving forward will be to align the efforts of these diverse organizations as they work toward the common goal of building a strong UAS industry within Alaska.

2.1 University of Alaska

A key asset in developing its Unmanned Aircraft Systems industry is the University of Alaska system. The University of Alaska Fairbanks (UAF) and the University of Alaska Anchorage (UAA) both possess a number of core competencies that position them well in supporting the development of a UAS industry within the state. The two universities have significant experience in aviation, aviation maintenance, aerospace, and unmanned systems. In addition to offering coursework each possesses state-of-the-art facilities and training equipment. Through the Alaska Center for Unmanned Aircraft Systems Integration (ACUASI), the UA system has emerged as an early leader in testing and evaluating UAS.

Moreover, the University of Alaska system is committed to economic development and industry partnerships. The Shaping Alaska's Future Initiative details the commitment to continuous improvement and innovation. Relevant themes of the initiative include: Productive Partnerships with Public Entities and Private Industry; R&D to Enhance Alaska's Communities and Growth; and Accountability to the People of Alaska. Through these initiatives the UA system is working to modernize, streamline and improve by investing in areas of real need and eliminating areas of barrier. The following table outlines the major assets of both UAF and UAA in terms of their collective coursework, facilities, and other relevant attributes. This chapter also reviews Alaska's other anchor assets such as its UAS Interest Group, military presence, aviation/aerospace competencies, and Arctic location.

Figure 5: University System Anchor Assets

Entity	Asset	Details
University of Alaska Fairbanks	Alaska Center for Unmanned Aircraft Systems Integration (ACUASI)	A nationwide leader in the testing of UAS applications; one of the first centers of its kind and the lead entity in the Pan Pacific Test Range Complex
	Poker Flats Research Range	Largest land-based research rocket range in the world. Alaska's first UAS test site.

	Office of Intellectual Property and Commercialization (OIPC)	Leases university-owned patents to businesses. Also manages Nanook Tech Ventures spinoff, a venture capital fund.
	Aviation Program	Possesses large hangar and degree or certificate programs in aviation, airframe, and power plant maintenance.
University of Alaska Anchorage	Office of Technology Commercialization	Leases university-owned patents to businesses. Also manages Seawolf Venture Fund.
	Aviation Program	One of nation's top ranked aviation programs, with programs in air traffic control, professional piloting, aviation technology, and aviation administration. Under Center of Excellence designation, performs aviation safety research with other top aviation schools.
	Business Enterprise Institute	Hosts Center for Economic Development, Alaska Small Business Development Center and other entities. Serves as a bridge between academia and private industry.

2.1.1 University of Alaska Fairbanks

Leading the charge for the development of an unmanned aircraft systems industry in Alaska is the University of Alaska Fairbanks (UAF). The university is the official host of the Pan Pacific UAS Test Range Complex, and has a long history of working with UAS technology. In fact, UAF was one of the first universities in the country to begin working with unmanned systems. UAF took on a leadership role in establishing ACUASI, the only center of its kind in Alaska, and one of only a small number nationwide. ACUASI began its operations in 2001, when it began investigating UAS technology and potential applications. Since then, the center has conducted associated research and flight missions with the aid of UAS technology in a variety of areas including sea ice, fish and wildlife observations, firefighting, environmental cleanup, and climate research. ACUASI has conducted significant UAS-related research in Alaska, across the nation as well as internationally.

Another UAF asset is its Poker Flat Research Range, which serves as one of the state's six test ranges through the FAA test range selection. The Poker Flat Research Range is one of the

most advanced ranges of its kind anywhere. The range is the single largest land-based rocket range in the world and is the only high-latitude rocket range in the United States. The range first began its testing of UAS in 2004, and has scaled up its research activities since that time. The range is now home to more than two dozen UAS models, including everything from the 2.5 pound Aeryon Scout (the range's smallest UAS) to the 40 pound Insitu A-20, the range's largest. In addition to its core competencies directly related to UAS technology and research, the range is also unique in being the only university-owned rocket range in the world.

Poker Flat Research Range

UAF conducts approximately $120 million per year in research. The Office of Intellectual Property and Commercialization (OIPC) leads efforts to commercialize UAF research in direct support of business development and job creation. While OIPC develops and protects intellectual property for UAF, the separate nonprofit, Nanook Innovation Corporation (NIC), is charged with licensing new technologies to existing companies or creating startup companies through its subsidiary, Nanook Tech Ventures (NTV). In 2014 alone, 75 inventions were reported to OIPC, patent filings were up over 130% from FY13, 2 patents were granted, and 40 technologies were licensed through 6 licensing agreements from NIC to private companies. Royalties from NIC licenses are returned to the University to promote innovation and development. Also in FY14, NTV created the startup company ArcticFire Development Corporation that will commercialize unmanned aircraft software.

UAF is also a core partner of the proposed FAA UAS Center of Excellence team being led by Mississippi State University. This team, called the Alliance for System Safety of UAS through

Research Excellence (ASSURE), consists of eighteen of the world's leading research universities and roughly one hundred leading industry and government partners. ASSURE possesses the expertise, infrastructure, and outstanding track record of success that the FAA Center of Excellence for Unmanned Aircraft Systems requires. In addition to UAF, members include Oregon State University, the University of Kansas, and Auburn University. ASSURE members are core to three FAA UAS test sites, lead four FAA research centers, have seven airfields and a 340 UAS fleet—24 more UAS than the USAF. If ASSURE succeeds, each core University team member will receive a contract with the FAA to support UAS research in their individual areas of expertise. For Alaska this will include a focus on low altitude operations, efforts related to extreme climates, human factors, and pilot training and certification.

UAF's many resources and core competencies, including its expertise in rocketry, unmanned aircraft systems, technology transfer, and aviation maintenance, make it a strong resource in developing an integrated UAS industry in Alaska.

2.1.2 University of Alaska Anchorage

The University of Alaska Anchorage (UAA) possesses many core competencies allowing it to play a significant role in the UAS industry. UAA is especially well known for its aviation programs, which are often regarded as among the best in the nation. UAA also supports a growing research portfolio, is expanding its technology transfer competencies, and has decades of experience supporting industry through addressing technical assistance needs. Offering education, providing industry technical assistance, engaging in public policy needs and research related to unmanned aircraft systems are natural extensions of UAA's already existing programming.

UAA's aviation students can obtain degrees in air traffic control, professional piloting, aviation maintenance technology, and aviation administration or choose to minor in aviation technology. The FAA ranked UAA's air traffic control program 3rd out of 31 certified Collegiate Training Initiative (CTI) schools. CTI schools are those designated by the FAA for meeting the specific requirements necessary to produce certified air traffic controllers for the agency. A state-of-the-art air traffic control simulator is a central asset of the program, with a full 360-degree interface, and is one of only a handful worldwide.

UAA's specialties in the aviation and aviation maintenance fields feature several core competencies that have clear applications in the UAS field. Seeing this potential opportunity, UAA has taken on a leadership role in developing curriculum around unmanned aircraft systems. Starting in the fall 2014 semester, UAA became the first school in the state of Alaska to offer a UAS class. The class, "Introduction to Unmanned Aircraft Systems," provides students with an overview of UAS technology. The course informs students of present and future missions, as well as a detailed study of sensors and mission development. Further, the UAF ACUASI team helped develop the course.

Another program at UAA, the Business Enterprise Institute (BEI), links economic development programs across the UA system and supports businesses with technical assistance and the expansion of entrepreneurial capacities across Alaska. Providing economic development-related research and technical assistance, high-level professional education, small business development services and youth entrepreneurship programming, BEI serves as a bridge to expertise and talents throughout the UA system. BEI's programs, which include the Alaska Small Business Development Center and the Minority Business Development Agency, are becoming better versed in the needs and opportunities of UAS related business development and will assist both existing and startup firms with their business development needs. The UA Center for Economic Development also reports through BEI and provides technical assistance in the form of information, research, data and "know-how" in evaluating, shaping and implementing specific projects and programs that promote economic development.

UAA expertise in aviation and economic development, coupled with its leadership in establishing course offerings on UAS, position the university well to aid the coalition of organizations in helping to grow a UAS industry in Alaska.

2.2 Military[8]

The military represents a major sector of Alaska's overall economy, as military personnel routinely relocate to Alaska to receive specialized training. This strong influence on Alaska's economy is highlighted by the Department of Labor, which has pointed out that the military's influence on Alaska can be viewed as one of the state's leading exports, as troops positioned in Alaska bring new revenues to the state and thus provide large numbers of indirect jobs.

Beginning in 1993, the military presence in Alaska began declining from a peak of 30,800 personnel. The terrorist attacks of 2001 and the wars in Iraq and Afghanistan then led to a large influx of military to Alaska. While total troops fell to 17,631 in 2000, by 2009 the active duty count in Alaska climbed to 24,449. The vast majority of current UAS innovation and use is via the Army and Air Force, both of which have substantial installations in Alaska.

According to the *Alaska Economic Trends* magazine, the military's economic reach includes a large civilian workforce as well. In 2012 Alaska had more than 7,000 defense-related civilian jobs with a payroll of $452 million and average earnings of $62,278. Civilians provide base support ranging from highly technical skillsets to construction to retail workers in the commissaries. The Anchorage and Fairbanks areas are home to 90 percent of all Alaska-based uniformed military and their dependents.

[8] Alaska Economic Trends, December 2013 – The Military and Alaska's Economy

The military has increasingly outsourced or sought private contracting opportunities. In 2010 approximately $2.2 billion in military contracts were awarded in Alaska. In 2009, Arctic Slope Regional Corporation topped the Alaska contractors list at $151 million. These contracts include utilities, housing, security, specialized technical support, food services, and janitorial services.

In 2009, defense spending in Alaska totaled $44.9 billion, or about 10.77% of Alaska's total GDP. Procurement contracts account for approximately $2.2 billion or 45% of total defense spending, with salaries and wages accounting for $2.7 billion. On a national comparison, defense spending equated to $6,999 on a per capita basis as compared to $1,719 nationally.[9]

One strategy for Alaska is to work with the federal government through our Congressional Delegation not only to maintain, but also grow our military presence in Alaska by expanding its current focus to include UAS competencies and innovation. Similarly, targeting future defense spending toward UAS activities and capturing those dollars for Alaska will further strengthen UAS industry development. Alaska's strategic location and the opening of the Arctic call for expanded military and homeland security measures. While much work has already been placed here, it will be imperative to deploy strategies that focus on military expansion, particularly UAS-related business development strategies that involve federal investment.

Figure 6: Alaska's Military Anchor Assets

Entity	Asset	Details
US Army	Fort Richardson (now JBER)	62,000 acres, a helipad, and firing ranges. Located near Anchorage.
	Fort Greeley	Part of US missile defense system and home to Cold Regions Test Center for testing vehicles and weapons systems in cold climates. Located near Delta Junction in the state's Interior.
	Fort Wainwright	Long history as aviation testing center (Ladd Field) with large airfield. Located near Fairbanks.
US Air Force	Eielson AFB	Home to F-16 fighters and a candidate to receive F-35 fighters. Currently hosts Gray

[9] Source: Impact of Defense Spending: State by State Analysis, Bloomberg Government Study November 17, 2011.

		Eagle. Located near Fairbanks.
	Elmendorf AFB (now JBER)	Home to F-22 fighter and part of the Pacific Command. Located near Anchorage
US Coast Guard	Bases and support operations throughout coastal regions	Assets include bases in Ketchikan and Kodiak, air stations in Sitka and Kodiak, and cutters stationed in 13 communities.

2.3 Other Anchor Assets

In addition to its university and military assets, the State of Alaska also possesses many other key anchor assets that will support the development of a strong UAS industry. These assets include geographic and industry-related core competencies, as well as several public entities that have formed to guide leadership on UAS and other aviation-related issues.

One of Alaska's key anchor assets within the public sector is the Alaska UAS Interest Group. The group was formed in 2006 to bring together UAS industry members from both the public and private sectors. The interest group includes a broad cross section of entities, including the Department of Interior, the US military, FAA, Department of Energy, and several UAS manufacturers. The interest group has an immediate goal of building a stronger network of Alaska UAS entities and projects, and a longer goal of positioning Alaska as the UAS location and test range in the US for both commercial and military sectors.

Another asset for Alaska's UAS industry is the formation of the FAA Arctic Team. The team was formed to address the many changes occurring within the Arctic. Increasing global temperatures have caused the melting of Arctic sea ice. This rapid melting may provide an opportunity for the development of Arctic shipping lanes, and a need for research into the changing climactic conditions of Alaska's Arctic.

Within the FAA Modernization and Reform Act of 2012, specific language was included to address the expanding use of UAS technology within the Arctic. This UAS expansion in the Arctic will provide such benefits as increased scientific research, environmental analysis, fisheries and marine mammal observations, oil and gas leasehold management and maritime route planning. According the Act, the Secretary of Transportation must develop a plan to designate permanent areas in the Arctic where small UAS may operate 24 hours per day for research and commercial purposes. Having a specially-designated zone for UAS use within Alaska could prove crucial in attracting and developing a thriving UAS industry within the state.

Key stakeholder members of the FAA Arctic Team are as follows:

- National Oceanic and Atmospheric Administration (NOAA)
- United States Coast Guard
- National Aeronautics and Space Administration
- Department of Energy
- Department of Interior
- UAS Executive Committee Senior Steering Group
- Department of State
- Arctic Council and its member states
- Cross Polar Working Group
- Marine Mammal Commission
- International Civil Aviation Organization (ICAO)
- State of Alaska

Figure 7: Alaska's Public Entity Anchor Assets

Entity	Asset	Details
Alaska UAS Interest Group	Participants include FAA, Department of Interior, DoD, Department of Energy, ACUASI, and private industry	Group exists to provide leadership and coordinate UAS related activities.
FAA Arctic Team	Various public entities including Department of State, Department of Energy, Coast Guard, NASA, State of Alaska, Arctic Council, and others.	A stakeholder group advising on policies related to Arctic aviation
Alaska Aerospace Corporation	Kodiak Launch Complex	The only high-latitude rocket launch complex in US.

2.4 Strategic Considerations

Alaska is well positioned to lead the nation in the integration of UAS into the NAS. Such assets as the University of Alaska, the UAS Interest Group, the US Military, and its other public sector assets make Alaska a potential leader in research and testing, and in the establishment of a UAS education and business development system. As it relates to UAS education, there is great opportunity to design, test, and exhibit to FAA a proto-type UAS pilot certification program, which would include the following:

- Degree or Certification Completion Standards
- Practical Test Questions
- Manual System (similar to Part 141)

- Integration of UAS into existing degree programs (i.e. engineering or business)

Similarly, ACUASI and the UAA Business Enterprise Institute could align and become a stronger focal point for UAS industry development in support of leveraging the University of Alaska's other assets. Each of these programs is well versed in serving as the face of the university to public and private entities as well as to economic development organizations across Alaska. Each of these programs is also well situated to identify and secure additional sources of funding to support research, teaching expansion and business and economic development growth.

It is also recommended that the Alaska UAS interest group develop plans for a more formal organization. The Cascade Chapter of the Association of Unmanned Vehicle Systems International (AUVSI), which represents the states of Oregon and Washington, offers one model. The Cascade Chapter was established in 2009 with 25 members and is now the second largest chapter with just over 292 members in 2014. The Cascade Chapter has spurred the formation of working groups to address specific areas of industry development including: programming, membership, finance, government and media relations, and education initiatives. Ultimately this form of organization encouraged the sharing of resources to allow for the hiring of an executive director to promote and lead the industry working group. This level of organization has been significant in facilitating collaboration across industry, academia and government agencies. Supporting the transition of the UAS interest group towards becoming a standalone organization that has a sole purpose of linking and aligning industry members is recommended.

Figure 8: a UAS flight station

3 ALASKA UAS MARKET OPPORTUNITIES

One of Alaska's chief advantages for the development of a thriving UAS industry is the significant federal investment within the state. Many federal agencies have significant expenditures within Alaska because of the state's strong military presence, and the many natural resources under the federal government's control. As a whole, the state consistently ranks at or near the top nationally in federal expenditure per capita. (e.g. $17,762 in 2010) Defense spending accounted for over $7,000 in 2010, placing the state second nationally. These federal funding sources drive a substantial portion of the state's economy; they will likely be instrumental in the success or failure of a UAS industry within Alaska.

The oil and gas sector is another large potential customer for UAS services. As mentioned in Chapter 1, both ConocoPhilips and BP, Alaska's two largest oil companies, have used UAS to monitor wildlife and sea ice conditions. Other oil-and-gas related applications include pipeline inspection and emergency response.

The technology has high potential application within the state, with broad research and data collection needs possible from many agencies at both the federal and state level. This demand could spur the growth of the UAS industry. The potential for substantial demand within the government sector presents Alaska with an opportunity to grow its UAS capabilities and to build its core competencies, allowing the state to be ready to capture the private sector demand as it becomes available following the implementation of UAS into the NAS.

We anticipate that much of the statewide demand for UAS technology will come from research activities, including research into UAS capabilities and testing, and activities carried out by UAS, such as volcano monitoring and wildlife management. If the demand for the technology is great enough, it may become large enough to support some level of UAS components manufacturing and maintenance, as well as the operation of UAS services for government or the private sector

This chapter provides an overview of the existing and potential demand for UAS services in Alaska and includes a table that outlines the major likely customers for UAS technology.

3.1 FEDERAL MARKET DEMAND

One of the largest sources of market demand will continue to come from the federal side. Many federal agencies have unique demands currently serviced through UAS technology and could be expanded with Alaska in mind. **In order for Alaska to serve the federal marketplace, it will be important to identify those areas in which the state is best suited to compete. This will require an honest and ongoing assessment of the state's core competencies and weaknesses.** By focusing energy on those markets in which it has the best opportunity to succeed, the state will allow itself maximum return on investment for any

financial investments made. Within the federal sector, two areas show the most promise: agencies with a research emphasis and the military. Each will be discussed in turn.

3.1.1 Civilian Agency Demand

Government agencies outside of the DoD have pioneered several UAS applications in Alaska (although NASA falls under DoD, it is discussed separately from other military agencies). Some specific examples highlight the utility of UAS technology in the state and suggest a variety of applications that can be built into viable business opportunities:

- In 2009, NOAA began using Scan Eagle UAS developed by Insitu, a subsidiary of Boeing, to monitor sea lions in the Aleutian Islands as well as volcanic ash in multiple locations.[10] The Scan Eagle and Aeryon Scout UAS, both equipped with infrared image sensors and cameras were used to locate hot spots within wildfire perimeters.
- The Scan Eagle was also used to combat fires including the Crazy Mountain Complex fire of 2009[11] and the Funny River fire of 2014.[12]
- In 2010, NASA and Northrop Grumman partnered to launch the Global Hawk Advanced Concept Technology Demonstrator under NASA operation. NASA's Global Hawk Pacific environmental science campaign took the Global Hawk on its longest flight from California over Alaska and the Arctic Ocean.[13] In 2011, the Global Hawk was again used in Alaska to complete the Winter Storms and Pacific Atmospheric Rivers (WISPAR) research to explore atmospheric conditions and collect observations to improve weather forecasting.[14]
- In 2012, NASA also supported the Marginal Ice Zone Observations and Processes EXperiment (MIZOPEX) research, which was flown by UAF's Nanook version of the ScanEagle. The MIZOPEX mission collected data on ocean surface temperature and salinity by employing the unique capabilities of multiple UAS, including the NASA SIERRA, Scan Eagle and a micro UAS.[15]

UAS pared with heat sensing technology is used to count Stellar Sea Lions in the Aleutians for NOAA (photo courtesy of ACUASI).

The most promising agencies with regard to UAS technology use in Alaska are those with a dedicated research purpose, such as NOAA, NASA, and US Geological Survey, and those managing lands in the state, such as the National Park Service and US Forest Service.

3.1.2 U.S. Department of Defense (DOD) Demand

The DoD is charged with coordinating and supervising all agencies and functions of the government concerned directly with national security and the United States Armed Forces. Given the significant budget of the DoD, and historical activity within the industry, it is likely that the DoD will continue to be one of the largest buyers and operators of UAS technology in the coming years. The DoD will continue to require support from UAS platforms and services, particularly the platforms currently in use. It will also need significant airspace to test the technology across a variety of landscapes and conditions. Growing challenges around the world will drive the need for greater enhanced, long-range ISR (Intelligence, Surveillance, and Reconnaissance) capability while any troops on the ground will require light, flexible platforms and payloads.

The DoD currently uses a wide variety of platform and payloads to meet the needs of the Army, Air Force, Marines, and Navy. The Army currently employs AAI's RQ-7 Shadow in Alaska for ISR, target acquisition and battle damage assessment. **In 2015, the army will expand its operations by adding the Grey Eagle platform to Ft Wainwright. The Army and USAF are both likely to base additional UAS units in Alaska, particularly as the Arctic generates geopolitical and commercial interest.**

3.1.3 State Government Demand

While the bulk of demand for UAS technology has historically come from the federal level, an emerging market will be those agencies and organizations at the state level with similar or complementary purposes as their federal counterparts. These agencies (i.e. Environmental Conservation, Fish and Game, Natural Resources, etc.) may potentially benefit from incorporation of UAS technology. **Given the state's mission and efforts already underway**

to support the development of an Alaska-grown UAS industry, meeting the State of Alaska's own demands with the incorporation of UAS technology is a natural expectation. This strategy may prove an effective means to build core industry competencies, enable for testing of additional uses and ultimately position Alaska to better compete for increased market share out-of-state.

Opportunities may exist to support Alaska's Air National Guard, the Alaska State Troopers and municipal police programs. Given Alaska's geographic challenges, permitting Alaska State Troopers the use of UAS may be beneficial in addressing agency needs as well as testing and further proving uses for the emerging technology. Agencies such as, the Alaska Department of Fish and Game, which often use manned aircraft to accomplish wildlife management activities, may find value in augmenting their services with UAS and thereby improve safety as well as information access.

3.1.4 Oil & Natural Gas Development Demand

The security of pipeline infrastructure and emergency response support for oil spills directly affect US national security. Given the special importance placed on the security and proper operations of oil infrastructure, UAS technology may have potential application within the oil and gas industry. The oil and gas industry has been responsible for much of Alaska's economic growth for 40 years.[16] Oil revenues fund most state services including the education system, transportation infrastructure, public health, and safety services. Since statehood, Alaska has received $164 billion in revenues from oil. An industry of this size brings the need for continued exploration, risk mitigation, and security monitoring. For these reasons, Shell, Conoco Phillips, and others all await unrestricted use of UAS in the Arctic.

Currently, the oil companies employ aerial technology throughout the course of their operations, including some early use of UAS. The industry is expected to become a major customer for the technology once a regulatory framework is in place. State entities with a regulatory role in the oil and gas industry, such as the Departments of Environmental Conservation (CED) and Natural Resources (DNR), should work with the FAA to ensure their interests are represented.

[16] State of Alaska Resource Development Council, website, http://www.akrdc.org/issues/oilgas/overview.html

Figure 9: BP Utilized Aeryon Scout for Pipeline Inspections Jun 2013 [17]

Presently, oil companies have incorporated a variety of manned fixed wing and rotary platforms to collect data and monitor infrastructure. These firms have been early adopters and experimenters with varied UAS platforms. Current adoption seems restricted only by FAA regulations on their use.

3.1.5 International Market Demand

At present, the United States is the world's key market for UAS technology. However, the limited availability of airspace for UAS restricts market growth. Other countries are pursuing efforts to develop the technology for their own purposes, but are also eagerly awaiting the US, specifically the FAA's integration of UAS with manned aircraft. The current efforts toward development of a UAS industry in Alaska will continue to attract potential international market opportunities, particularly in high-interest nations such as Canada and Japan. The Canadian military continues to research UAS uses and programs, and opportunities exist for synergistic missions across the scientific research and environmental monitoring communities. Further, opportunities exist to launch flight simulation and other UAS training programs to reposition the US and Alaska as leaders in this arena. The successful implementation of a UAS industry within Alaska will need to focus on domestic customers, while at the same time expanding research, training and other opportunities via international markets.

3.2 Strategic Consideration

As reviewed throughout this chapter, significant market opportunity exists across Alaska from federal, state and private sector stakeholders. These industry players are already deriving mutual benefit from their proximity, shared needs, and connections.

A more structured UAS interest group will provide significant benefits to the advancement of the UAS industry sector in Alaska and spur the ability of Alaska to compete in the global UAS economy. The role of the UAS interest group will facilitate a stronger

[17] Alaska Uses Drones to Inspect Oil and Gas Pipelines at a Fraction of the Cost, The Raw Story, June 7, 2013, http://www.rawstory.com/rs/2013/06/07/alaska-uses-drones-to-inspect-oil-and-gas-pipelines-at-a-fraction-of-the-cost/

environment for success. The focus should be on expanding and growing the UAS industry strategically beyond its present state. The UAS interest group will need to act as the hub and in this role facilitate engaged and strategic conversations involving all stakeholders to improve production and sharing of information, logistics, workforce development, and the identification of infrastructure needs. Alaska must compete with the rest of the nation and the world by staying abreast of innovations and leading advancements in business and workforce development.

As previously noted, the Cascade Chapter of the Association of Unmanned Vehicle Systems International (AUVSI) representing the states of Oregon and Washington, may be an industry group to emulate. A significant outcome of the Cascade Chapter has been the collaboration of private sector leaders, elected officials, education leaders, and even interested non-governmental entities. Key has been the formation of working groups or initiative areas to address specific needs common to industry development including deepening skills and talent, aligning innovation investments, accelerating entrepreneurship, and raising global awareness of the industry. Membership with the industry group, however, is not enough to achieve industry expansion. A successful Alaska based industry group must use the platform to encourage tighter relationships between industry stakeholders and then leverage the relationships to drive forward shared actions, policies and programs for ultimate expansion of the industry.

The State of Alaska can aid in the development of a stronger industry group through supporting tax and incentive policies, targeting education, training and research investments, streamlining regulations, and encouraging greater access to seed and venture capital. Conversely, a strong industry group can advocate for UAS-friendly policies (such as those recommended in this report) within the Legislature. The appointment of a special liaison to the interest group will likely be beneficial until the group can afford its own executive director. While the state—through DED or another entity—can help spur the creation of a strong industry group, it must ultimately be led by the private sector.

Potential or Actual Customers for UAS Services

Market Segment	Customer	Current/Potential Usage	Other Information
Federal Government			
	Department of Defense	• Long range ISR(Intelligence, Surveillance, and Reconnaissance) • Target acquisition and battle damage assessment	• US Army currently uses UAS for ISR in Alaska. • One of the largest current buyers of UAS technology.
	NASA	• Climate/weather research • Volcano research and remote thermal sensing • UAS traffic management research	• NASA is exploring ways to integrate UAS into the NAS. Their Traffic Management Project is interested in testing in Alaska.
	NOAA/National Marine Fisheries Service	• Fisheries research/monitoring • Climate/weather research • Arctic sea ice monitoring • Oil spill surveys • Marine mammal surveys/monitoring	• NOAA/NMFS have a strong Alaska footprint • NOAA currently uses UAS technology in their scientific research
	Department of Homeland Security	• UAS for Alaska/Canada border patrol • Drug trade monitoring	• DHS currently uses UAS technology for border patrol with Mexico and Canada

	Bureau of Land Management	• Mineral and energy development • Land-use planning and monitoring • Fire management • Evaluation of stream & watershed enhancement projects • Water quality & habitat analysis • Climate change analysis • Management of fish and wildlife resources	• BLM currently uses manned aviation with visual scanning/counting techniques. Not currently using UAS technology. • BLM currently manages 1/5 of Alaska's surface lands and wetland areas
	Bureau of Ocean Energy Management	• Oil & Gas site identification for land leasing • Resource evaluation and assessment • Geological data acquisition • Environmental stewardship • Regulations and guidance	• BOEM uses collected data to create a database for environmental and mammal health trend analysis. • BOEM does not currently employ UAS technology. • BOEM currently uses manned aircraft w/ visual counting techniques.
	National Park Service	• Fire and aviation management • Lands management • Personnel transport • Law enforcement • Information technology • Resource/wildlife management • Visitor protection (search and rescue)	• Alaska has 60% of all land managed by NPS in the US. • NPS currently uses manned aircraft for visual monitoring and detection.
	US Geological Survey	• Climate change and land usage • Energy and minerals research • Environmental management • Natural hazard research	• USGS incorporates UAS technology into many data collection methods. • Most data collection is still generated through manned aircraft methods.
	US Department of Agriculture	• Precision agriculture • Vegetation mapping • Terrain extraction/monitoring	• USDA is currently experimenting with Tier I, small UAS for precision agriculture, vegetation mapping, and terrain extraction/monitoring.

	US Forest Service	• Land mapping • Forest management • Fire prevention/management	• USFS serves as the premier leader in wildland fire management operations, computer simulated fire management programs and sophisticated resource tracking systems. • USFS currently uses UAS equipped with low-cost digital cameras to acquire thousands of images. • USFS uses UAS technology to generate mosaics for the creation of vegetation maps of arid rangelands.
	Federal Emergency Management Agency	• Disaster response • Disaster assessment • Search and rescue	• FEMA currently uses manned aircraft, but does not has not yet incorporated UAS technology.
State/University			
	Alaska Air National Guard	• Combat search and rescue • Arctic shipping lane management	• AANG has expressed interest in hiring UAS services on an as-needed basis. • AANG currently uses manned aircraft for search and rescue. • AANG could potentially be used to identify soft areas of sea ice to improve ice breaker success in Arctic shipping lanes.
	Alaska State Troopers	• Emergency response • Search and rescue • Law enforcement	• AST do not currently implement UAS technology.
	Department of Fish and Game	• Wildlife monitoring/management • Fisheries data collection • Marine mammal detection	• DFG currently uses sonar for collection of fish counts. • Department is not currently implementing UAS technology.

	Department of Natural Resources	• Lands mapping • Environmental studies and assessments	• DNR is not currently implementing UAS technology.
	University of Alaska	• UAS and other applied research • Student/workforce training (for UAS operations)	• UAA offers a class specific to UAS technology. • University has potential to become a national leader in UAS training and research.
Private Sector/Other			
	Oil & Gas Industry	• Pipeline monitoring • Emergency spill response	• Industry has employed some UAS technology for pipeline monitoring. • Industry currently uses manned technology for data collection and infrastructure monitoring.
	Alaska Native Corporations	• Trespass detection • Land surveying	• Native Corporations hold roughly 13% of the state's land area which must be secured and surveyed periodically.

4 COMPETING LOCATIONS

The Federal Aviation Administration (FAA) is responsible for the integration of UAS into the National Airspace System (NAS). This integration requires the development of standards and protocols (regulation, policy, procedures, guidance material, training requirements, etc.) for all aspects of operation of UAS. In furtherance of this charge, and amid mounting pressure to expedite the integration, the FAA Modernization and Reform Act of 2012 directed the FAA, in coordination with NASA and the DoD, to designate six test ranges to research the safety and other operational aspects of the technology. This testing will ultimately inform and assist the regulatory process.

As in Alaska, leaders in each of the states hosting a test range hope to develop strong, local UAS-related economic opportunities. In addition, several states without a test range also hope to capture economic benefits from a homegrown UAS sector. This chapter discusses each of the states that have been identified as potential competitors, including the assets they offer to the emerging industry.

4.1 FAA TEST RANGE LOCATIONS

To accomplish safe integration of UAS into the NAS, the FAA needs to develop a specific regulatory framework as expediently as practical. These regulatory protocols will ultimately cover all aspects of UAS from aircraft design specification to pilot certification and comprehensive operational standards. The selected test ranges will address the agency's overarching UAS research goals: (1) system safety and data gathering, (2) aircraft certification, (3) command and control link issues, (4) control station layout and certification, (5) ground and airborne sense-and-avoid, and (6) environmental impacts.

Key among the range selection criteria was geographic and climatic diversity. While individual ranges may be more suited to specific research areas than others, they are each free to expand research and testing activities into multiple UAS applications. Following a 10-month process, the FAA awarded six test ranges from a field of more than 25 applications representing 24 states. A total of 19 teams were not chosen; some of these unsuccessful teams have abandoned UAS plans and others have joined forces with designated test ranges. The six ranges selected by the FAA to carry out its research goals include the following:

- University of Alaska
- State of Nevada
- New York's Griffiss International Airport
- North Dakota Department of Commerce
- Texas A&M University
- Virginia Polytechnic Institute

What follows is a more comprehensive profile of each of the six FAA test ranges. Each is identified by the lead for the range with the goal of providing a format for understanding each of the range's specific capabilities with respect to the FAA's goal of integrating UAS into the NAS. Each of the ranges selected by the FAA has a specific advantage or charge for the furtherance of UAS integration into the national airspace. Following the profiles a brief overview of non-FAA test range activity is also provided.

University of Alaska[18]

Lead Organization & Assets

The Pan-Pacific UAS Test Range Complex (PPUTRC) is the designation for this test range. The PPUTRC represents the largest of the FAA test ranges with 59 contributing partners as well as expansive geographic coverage. The PPUTRC spans seven climate zones, allowing UAS manufacturers and users to test their equipment in the Arctic, the tropics, and arid environments. The Alaska Center for Unmanned Aircraft Systems Integration (ACUASI) oversees all operations for the test range and in this role represents the entire PPUTRC, which includes test ranges in Alaska, Oregon and Hawaii.

The team proposed six test ranges in Alaska that included the Kodiak Range, Denali Range, Poker Flat, Oliktok Corridor, Wainwright Corridor, and the North Slope Range. Oregon proposed four ranges including Tillamook coastal, Warm Springs, Pendleton Range, and Juniper MOA. Lastly, Hawaii proposed three test sites at Humuula-R-3103, Makua-R-3109, and Maku-R-3110. After selection, the FAA initially approved a smaller set of ranges, but has since approved additional range locations.

Stakeholder Organizations

The University of Alaska (UA) leads the PPUTRC effort and has the most experience of any school in the country with regard to UAS technology. ACUASI was established in 2012 under the Geophysical Institute at UAF. The ACUASI team conducted UAS research for more than ten years prior to 2012 and has successfully managed more than 50 FAA Certificates of Authorization. Additionally, UA has strong pilot, air traffic control and mechanic training programs that directly align with UAS and range needs.

The PPUTRC represents a collaboration of academia, state agencies, Native organizations, private sector firms, economic development organizations, and related stakeholder organizations. Oregon State University is the primary research lead for Oregon and

http://higherlogicdownload.s3.amazonaws.com/AUVSI/656942e4-4448-41c3-877d-0c5f3ea40e63/UploadedImages/2013AprilSymposium/Pan-Pacific-UAS-Test-Site_OSU.pdf
http://www.faa.gov/uas/legislative_programs/test_sites/

University of Hawaii-Hilo is the primary research lead for Hawaii. These entities manage the ranges in their respective states, but both report to ACUASI as PPUTRC's lead organization.

The armed forces in Alaska represent a key stakeholder group. The RQ-7 Shadow is in use at Fort Richardson, Fort Greely/Allen Army Airfield, and Fort Wainwright/Ladd Army Airfield. The Army uses the unmanned Shadow for global reconnaissance, surveillance, and damage assessment. Fort Wainwright is also home to the RQ-11 Raven. These smaller, fixed wing systems can be hand launched, but have limited range and endurance due to their small size. The Army is preparing to host the Grey Eagle system at Ft Wainwright starting in 2015. These expansion plans should have an impact on PPUTRC.

Economic impact

The AUVSI has projected the following economic growth from the UAS industry for Alaska:

Year	Direct Employment	Total Employment Impact	Total Direct Spending ($M)	Total Economic Impact ($M)	Total Taxes ($K)	Percent Change Over Previous Year
2015	16	32	$41.21	$77.14	$0	
2016	33	64	$82.41	$154.28	$0	100.00%
2017	49	95	$123.62	$231.42	$0	50.00%
2018	52	100	$129.80	$242.99	$0	5.00%
2019	54	105	$136.29	$255.14	$0	5.00%
2020	57	110	$143.11	$267.89	$0	5.00%
2025	73	141	$182.64	$341.91	$0	5.00%

Incentive Structure

Alaska is still maturing in its creation of incentives for business expansion and attraction. The Alaska Industrial Development and Export Authority (AIDEA) provides financing to a wide range of commercial facilities and assets in the state. AIDEA's financing options include loan participations, revenue bonds, equity investment, and asset purchase. The 49th State Angel Fund, run by the Municipality of Anchorage, also makes venture capital available to firms operating in that city.

Oregon provides research tax credits for firms engaged in advanced computing and

materials, environmental assessment, and electronic device technology. The state also offers property tax breaks for new or expanding facilities and the potential for an income tax holiday spanning multiple years.

Hawaii offers a range of programs aimed at the attraction and development of high-tech firms. Blue Startups is Hawaii's venture accelerator and the state's technology incubator. Key components of Blue Startups include seed funding, mentorship, access to business expertise, product testing, peer review, pitch development, and introductions to investors. Twice a year, teams are selected to go through an intensive 12-week program, to kick-start their business. Businesses looking to make foreign sales can benefit from its foreign trade zone designation, reducing trade duties. Hawaii also hosts Mbloom, an incubator and early stage technology investment fund created as a public-private partnership.[19]

Each state exhibits a growing demand for incentives and programs to support business starts as well as to attract new innovative firms. States often align technical assistance providers and funds to sustain a start-up through the "valley of death," or the critical years between initial investment and sustainable cash flow.

Nevada

Nevada is sparsely populated, not unlike Alaska, which makes it attractive for UAS testing. The state hosts a large military presence, including Nellis Air Force Base, Fallon Naval Air Station, the Nellis Test and Training Range, and the Nevada National Security Site (NNSS). Also of interest, the federal government owns approximately 80% of the land in Nevada. Further, Creech Air Force Base is home to the premier UAS military support units. Creech personnel have logged more than 10 million hours of flight time in UAS platforms, training, experimental, and operational modes. Likely because of this, Nevada boasts the largest numbers of trained UAS pilots and sensor operators in the world.

Nevada has developed capabilities and infrastructure that will make it a strong competitor within the UAS industry. Many of the large UAS manufacturers, including Lockheed Martin, General Atomics, and Northrop Grumman, maintain operations within Nevada. Sierra Nevada Corporation, Arcata Associates, and Science Application International Corporation are other defense contractors located in Nevada. The University Nevada, Las Vegas, through the Desert Research Institute, is developing a Center of Excellence, an incubator designed to aid in the commercialization of UAS technology. **Furthermore, the University of Nevada, Reno offers an engineering minor in unmanned technology, and is working on the construction of the Nevada Advanced Autonomous Systems Innovation Center, a Reno-based UAS research hub.**[20]

New York – Griffiss International Airport

Griffiss International Airport is the official designee of the FAA test range. Griffiss is teamed with the Northeast UAS Airspace Integration Research Alliance (NUAIR), a New York nonprofit regional consortium of more than 50 private industry, academic, and military entities collaborating to support the testing of UAS in New York and Massachusetts. Griffiss International Airport in Rome, New York (a former Air Force base) and Joint Base Cape Cod in Massachusetts serve as the two approved test ranges. The range received its certificate of authorization (COA) by the FAA on August 7th 2014 and had its first unmanned aircraft test operation in early November 2014 for Lockheed Martin.

Griffiss International is charged with the development of sense and avoidance capabilities to prevent collisions with other aircraft. The specific UAS projects include detection of insects, weeds, diseases, crop characteristics, crop biomass, and background soil characteristics. Research at the range will evaluate methods for scouting agricultural fields using different types of sensors. The range also expects to manage agricultural research flights from Joint Base Cape Cod in Massachusetts. Combined, New York and Massachusetts offer more than 7,000 square miles of diverse airspace available for UAS testing.

North Dakota Department of Commerce

The FAA certified the Northern Plains UAS Test Site as the first range ready for operation in April, 2014. This range relies on various test sites in the Grand Forks area, including Grand Sky, Grand Forks AFB, Carrington, and Sullys Hill Game Preserve. Grand Sky in Grand Forks County provides a 217-acre site for potential development, testing, training, sensor technology development, data analysis, and management. The site is adjacent to Grand Forks AFB and thus provides access to runways for testing. To date, the state has invested over $19 million to advance UAS research and development and is collaborating with organizations statewide to expand this industry.

The University of North Dakota established the John D. Odegard School of Aerospace Sciences in the 1960s and, more recently, the Center for Unmanned Aircraft Systems. The Center leads the research, education, and training for UAS. The UND offers a BS degree in Aeronautics with a major in Unmanned Aircraft System Operation. The university was the first in the nation to offer a focus area in unmanned aircraft systems. University researchers are also developing a ground-based radar system capable of detecting low-flying aircraft such as sailplanes and hot air balloons. North Dakota State University, located in Fargo, is a partner as well, with a world-class engineering department specializing in electronic and electrical engineering, including nano and micro-scale electronics[21].

[21] A Range of Choices", Dee Ann Divis, Inside Unmanned Systems, Spring 2014, http://insideunmanned.epubxp.com/i/307674/0

Texas A&M University

The Texas FAA test range will focus its efforts on applications involving coastal and ocean areas (tracking of marine mammals, environmental monitoring, and drill platform assessment). Texas also offers a one-of-a-kind testing area for UAS emergency response applications. "Disaster City" is a recreated urban training environment composed of simulated rubble in which emergency response scenarios are executed for first responder personnel and technology insertion training[22]. The test range has developed a partnership with the University of Texas at Arlington Research Institute (UTARI), which is currently focusing on several facets of UAS research for commercial applications. UTARI is researching UAS command and control link operations, general system safety and data gathering, and sense and avoid technology, both in air and on the ground, as well as aerial refueling possibilities.

Virginia Polytechnic University (Virginia Tech)

VPU's primary goal as an FAA test range is to conduct individual and collaborative work with the FAA, as well as economic modeling and marketing for the commercial applications of UAS. Additionally, the group will focus on the research of failure mode testing as well as operational and technical risks specific to UAS. The Mid-Atlantic Aviation Partnership (MAAP) has several sites used for test flights including the Kentland experimental air station in Blacksburg, VA. The range had its first flight on August 13th, 2014, and is now fully operational.

MAAP is one of the largest UAS groups supporting the UAS integration into the NAS with ten universities, seven government departments, and dozens of industry and economic development firms as members of the core group. Since the universities and government agencies are spread over the East Coast (primarily Virginia, Maryland and New Jersey), MAAP expands the Virginia Tech test range borders well beyond simply the state of Virginia.

Virginia Tech does much of its research through the Virginia Center for Autonomous Systems (VaCAS), which has over a decade of experience working with UAS. The VaCAS UAS fleet is ever growing with systems constantly being built by students and faculty. One set of systems is the SPARROs, which help build on failure rate versus cost research. These systems are inexpensive to manufacture, but have sophisticated safeguards to accommodate failures. VaCAS has performed this variety of research since 2009. Other areas of research are vehicle guidance and control, sensing and navigation advancement, mobility and actuation development, dynamic vehicle modelling and analysis, and overall vehicle design.

5 MARKET DEVELOPMENT CONSIDERATIONS

Alaska's traditional industries, which include oil and gas extraction, mining, fishing and seafood processing, tourism and military operations, are part of complex ecosystems that developed gradually over time. Forestry and wood products form a declining industry while commentators point to logistics and international trade, advanced business services, specialized machinery and social services as emerging areas of opportunity. The current concentration on UAS activity has the potential to develop a strong economic base in Alaska, in part by leveraging a number of established industries of importance including military operations, and those oriented towards resource monitoring and extraction. A potential UAS industry also benefits from Arctic or "cold climate" competencies as well as rocket launch expertise. The following provides an overview explaining how an industry focus might be established.

5.1 ANCHOR TENANT

The introduction of an anchor tenant to a region will in many cases spur or advance an industry's development.[28] An anchor tenant will attract other firms. These co-located businesses will then benefit from greater innovation and economic performance due to the sheer proximity, resulting workforce, and even from the drawing of symbiotic players like venture capital investors to an area.

Definition of Anchor Tenant: An anchor tenant is a large firm, often engaged in R&D, which can promote the development of an industry concentration, encouraging smaller firms to locate in close proximity. For the purposes of UAS development, the role of an anchor tenant may be filled by the oil and gas industry or military. While these do not meet the conventional definition, they may support UAS by serving as large customers. Alternatively, the UAS industry in Alaska may benefit more from the attraction of a firm that is drawn by the FAA test site designation and has a sincere interest in engaging in and even serving as the champion for the development of a UAS industry.

An anchor tenant is considered one of the central elements necessary for stronger industry formation and ultimate growth. Attracting an anchor tenant for industry development purposes is not a new idea. This strategy has been borrowed from commercial real estate development practices, particularly for retail or mall developments. The classic anchor tenant is a large department store associated with a shopping mall. These department stores typically have name recognition and are known for creating demand, and thus generate traffic for the overall retail development. In many cases, a retail developer won't pursue a sites development

[28] Michael Porter, *Cluster and the New Economics of Competitions*, Harvard Business Review, Nov. – Dec. 1998

until an "anchor tenant" can be locked in for the site. As an initial step in encouraging growth of UAS industry in Alaska, an anchor tenant is an important component that may actually involve multiple tenants or the engagement of multiple key stakeholders. The attraction of a large or multiple smaller private sector firms is essential. Further, large public entities such as the University of Alaska and other institutes of higher learning, public laboratories and/or public entities with interest such as the FAA, all serve critical tenant roles, but are not typically an anchor tenant due to the need to integrate private sector capital and market practices into the mix. Similarly, national public stakeholders that will positively influence the dynamics of the emerging industry are also worth attracting if they are not already present (i.e. Department of Defense or NASA). In addition, the military bases and oil and gas companies may play the role of anchor tenant by serving as large potential customers of UAS services. The state itself can act as an anchor tenant by becoming a purchaser of UAS services.

In reviewing aerospace development activity across decades of the aircraft industry's existence, it is common to find companies from other sectors that acted as "incubators" by dedicating part of their activity to aircraft production. Afterwards, based on their performance, some of these incubators converted themselves entirely to aircraft production, while others returned to their previous activity, and closed or split their aircraft production unit, which continued to develop in an independent way.

These aviation industry anchor tenants positively influenced the innovation activity of a region (i.e. increasing number of patents and number of entrepreneurial firms) as well as attracted other innovators and smaller firms working in the same or related industries. Other examples were noted in which the anchor tenants attracted specialized suppliers when relevant to the industry sector, or when firms believed proximity would benefit their entry into the nascent industry. Once co-located within a region, these firms then attracted skilled labor with specialized training. As a result, it is important to understand the factors that will influence the decision of an anchor tenant, including:

- A pool of potential entrepreneurs or startup talent;
- A workforce or qualified manpower capable of understanding the complexity and satisfying the Requirements of the emerging industry;
- Access to capital – including both private and public sources of funds; and
- Inputs to research and development as well as manufacturing.
    - Further, based on the study of aerospace anchor tenants a UAS anchor tenant will also seek:
- Strategic military and or federal player engagement if it is believed the government will have a strong involvement in the financing and supervision of the ultimate development of the industry.

To encourage the development of healthy industry linkages, It will be useful to build a

collaborative regional strategy that emphasizes:

- Alignment of regional leaders in common direction and provides opportunity for collaboration;
- Promotion of skill and talent development as well as career advancement paths;
- Support for study tours, networking and learning exchanges;
- Direction of R&D funds and mobilizes capital to encourage UAS business starts; and
- Acceleration of a robust UAS related entrepreneurial ecosystem.

5.2 Incentive Structures

One of the most important aspects in attracting UAS industry investment or an anchor tenant to Alaska will be providing key incentive packages to private industry. Incentives are cash or cash equivalent forms of assistance provided to firms on a discretionary basis to attract or retain business operations. Popular incentives include property tax abatements, discretionary credits under the state's corporate income tax, low-interest financing, and even free land and buildings. Alaska is faced with a number of challenges that make business development and attraction difficult, particularly the high supply chain and labor costs when compared with other states. However, the state can offer many unique incentives that can help spur industry development within the state and create a more even and comparative business investment environment. (Please see appendix 3 for table summary of incentives.)

Given the many challenges that Alaska faces from a business attraction standpoint, the state already finds itself at a disadvantage compared to other test range locations. Alaska is not currently a major hub for defense contractors or aerospace manufacturing, like some competing test ranges are (Nevada, for example). These realities do not make it impossible to develop a thriving, successful, and integrated UAS industry within the state. They do, however, reduce the margin for error as the state moves forward with its efforts to grow the industry. **Making a concerted, coordinated attempt to customize incentives for private industry investment within the state is therefore paramount.** With the right incentive structure in place, Alaska can help mitigate its current challenges, while at the same time promote those positive attributes and resources that the state currently holds.

As detailed throughout this section, a number of states have begun (or are planning to begin) offering tax incentives to private industry. For instance, California introduced a bill that provides a tax credit to firms choosing to manufacture UAS within their state. This could be a major opportunity area for Alaska with its industry attraction efforts. The state's current corporate income tax rate, 9.4%, ranks as the 5th highest in the nation. This, coupled with the high supply chain and labor costs associated with Alaska, make it difficult to entice businesses to relocate or invest in the state. However, Alaska could begin offering targeted tax credits aimed at creating a positive business environment ripe for investment from the UAS industry.

These tax credits can come from the State, as well as from the respective Borough or Municipality. Possible tax credits at the State level that could be used to entice UAS industry investment include:

- **Research and development tax credits**. According to *Forbes*, 38 states offer an R&D tax credit as of 2013, thereby reducing state income tax liability for qualifying R&D expenses.[29] Under most accepted definitions, working to develop UAS technology for the market would qualify as R&D. Formulas for calculating the value of the credit vary widely from state to state, but generally include two components: a credit rate and a base level. The credit rate is the percentage of R&D expenses by which the tax liability is reduced. A base level is the minimum amount of expenditure before the credit applies. For instance, a state may offer a 10% R&D credit for qualified activity over $1M. Some states attempt to make the credit more lucrative for small businesses by reducing or eliminating the base level, or making other adjustments. To promote sustained R&D activity, some states require multiple years of R&D activity before the credit can be claimed; others offer a higher credit to companies with multiple years of qualified activity. The effectiveness of state R&D tax credits is the subject of some debate; a 2007 study by the San Francisco Federal Reserve found that the credits often increase the amount of R&D activity occurring within a state. The report added, however, that these gains are usually "zero-sum," meaning that they largely shift R&D activity between states rather than incentivizing new expenditure.[30]
- **Hiring tax credits**. This type of credit reduces a company's state income tax liability for hiring certain classes of employees. In Alaska, a credit could apply to specific skillsets such as aerospace engineers to advance the development of a UAS industry. As an example, the State of Mississippi offers a tax credit of $1,000 per employee each year for five years to companies that hire in scientific and technical fields and meet other requirements. Oklahoma also has incentives in place to spur their UAS industry. The state offers employers a tax credit of up to $12,500 per qualified employee per year for five years for each aerospace engineer it hires. The State also offers a separate $5,000 annual tax credit to each aerospace engineer who relocates to Oklahoma for their job, for up to five years. This provides incentives for both employers and employees to relocate to Oklahoma. This program is set to expire, however, on December 31, 2014.
- **Manufacturing tax credits**. These can take several different forms, including credits or exemptions for property, sales, or corporate income taxes. The State of Wisconsin, for instance, exempts manufacturing-specific machinery and equipment from property taxes. (The exemption does not extend to land or buildings associated with

[29] "Eight Myths That Keep Small Businesses From Claiming The R&D Tax Credit" http://www.forbes.com/sites/deanzerbe/2013/03/28/eight-myths-that-keep-small-businesses-from-claiming-the-rd-tax-credit/
[30] "Overview of Research and Development Tax Incentive Strategies," http://www.lbb.state.tx.us/Other_Pubs/Overview%20of%20Research%20and%20Development%20Tax%20Incentives.pdf

manufacturing, however.) Other states exempt manufacturing equipment purchases from sales tax, or provide credits against income taxes for such investments. It remains to be seen whether or not a UAS industry in Alaska would have a manufacturing component, but such credits could help to offset the cost of business if manufacturers show interest in locating production to the state. Given Alaska's current tax structure, however, the only manufacturing tax credits that would be available at the State level would be for corporate income taxes. Other taxes, such as property and sales taxes, would have to come at the Municipal or Borough level. An alternative option at the state level would be to replace any lost revenues to local governments who promote UAS development. This would provide additional incentives for local governments to help work with the state to develop a friendly climate for UAS development.

In addition to those tax credits and incentives offered at the State level, additional credits and incentives can be made at the Borough or Municipality level, including the following:

- **Property tax abatements** for businesses operating in "Military Facility Zones." A more specific type of incentive which the Alaska Legislature passed is an exemption or partial exemption from property taxes for up to 10 years if the property is in a military facility zone that creates or supports industry, development, or educational or training opportunities beneficial to a facility. HB 223, was introduced in January 2014, and signed into law September 2014. This bill permits local governments in the state to exempt businesses that serve military bases. Since the state does not levy a property tax, the exemptions are provided by municipalities or boroughs. As such, in this case municipalities and boroughs have the strongest ability to make UAS related investments more cost effective.
- **Manufacturing tax credits (local level).** As mentioned above, many states incorporate manufacturing tax credits through property and sales tax incentives. Given that within Alaska these taxes occur at the local level, these tax credits would need to come from boroughs and municipalities.
- **Sales tax abatements.** An additional form of tax incentive that can be offered at the borough or municipality level is a sales tax incentive. These would allow local governments to exempt particular purchases, or businesses within particular industries, from sales taxes. Local governments can craft these abatements in specific ways to help incentivize development of a UAS industry within their community.

On the whole, Alaska is positioned as one of the states with the best overall tax climate, despite having a relatively high corporate tax structure. The state levies no personal income or state sales tax, which offers great incentives for small businesses looking to establish within the state. However, the state's high corporate income tax will make it difficult to attract investment from the largest industry participants. By offering tax credits aimed at large corporate

investment within the state, Alaska can help to reduce some of the high costs of doing business in the state.

In addition to potential tax credits, the state can consider offering other useful incentives to help spur investment. As an example, Alaska could follow North Dakota's lead by offering matching research and development grants for businesses in the UAS industry sector. These grants could be focused on projects involving a joint effort between private industry and the University of Alaska. This would allow the state's university to receive targeted funding for projects of economic importance while at the same time aiding the industry's development. Alaska could also choose to focus on expansion of Small Business Innovation Research (SBIR) and Small Business Technology Transfer (STTR) grants or rather contract funding from various agencies of the US government. The purpose of these awards is to provide early-stage research and development funding to advance technology. The state could consider matching successful SBIR and STTR awardees.

One important incentive available within the state stems from the recent passage of HB 316 during the 27th Alaska Legislature. The bill allows for the designation of Military Facility Zones, which would allow the Alaska Industrial Development and Export Authority (AIDEA), as well as the Alaska Housing Finance Corporation (AHFC) to fund projects occurring within these zones. The MFZ designation would allow AIDEA to fund not only just the structures within the zones, but also for infrastructure development within the MFZ (such as sewers, sidewalks, and potential UAS infrastructure).

Other similar incentive opportunities include gap loans, equity financing, venture capital assistance, and interest rate buy downs. In some cases states are also developing targeted technical assistance support by providing information on how to start up a business, or make one more profitable within a specific industry. In these instances states are typically collaborating with existing technical assistance providers such as the Small Business Development Center to further bolster and support existing programs. The aim of state support in these instances is to reduce the overall risk and make the participating businesses more attractive for leverage of other resources.

Other incentives for consideration might include customized services targeted towards meeting the needs of individual businesses such as conducting relevant research, performing basic due diligence on high target locations for development, providing assistance programs to aid firms in navigating through state or local regulations, workforce development programs, and developing site-related infrastructure such as road access. Customized services are those incentives that will ultimately save firms in their development expenditures as well as convey a message to industry that Alaska is not only open for business, but keen in its understanding of what firms require to be successful in the UAS industry sector.

In order for Alaska to be competitive with attracting industry to the state, incentives will play a key role. Incentives will help to attract industry if they reduce costs associated with

development within the state as compared to other locations. Incentives alone will not be enough, however. Nor should Alaska ignore its other attributes that make it a prime candidate for corporate investment.

Economic development practitioners are often criticized for developing incentive packages without first critically taking into consideration if the incentives are in the best interest of the state and/or local government and actually relevant to the business being attracted. Incentives can become too costly for the jobs created and may actually result in hurting businesses that are already in the marketplace. As Alaska moves forward in developing incentives to attract UAS industry it may be beneficial to focus first on those incentives that bolster existing Alaska firms already in the industry and then on those incentives that target new business activities that will again further support and bolster existing firms or bring about desired performance by the firms being attracted. **In all cases, a more comprehensive cost-benefit analysis should be conducted along with the establishment of performance metrics associated with incentives to ascertain they are achieving desired results.**

5.3 Tech Park

One approach to commercializing the University of Alaska's expertise on UAS is through the formation of a university research or technical park. These developments, also referred to as research parks or tech parks, are a common means of spurring regional innovation by connecting business with the research assets of a university. The Association of University Research Parks (AURP) defines the term as "physical environments that can generate, attract and retain technology companies and talent in alignment with sponsoring research institutions (universities and public and private research laboratories)."[31] Famous examples include the Research Triangle Park in North Carolina (leveraging three large universities) and the Stanford Research Park in the heart of Silicon Valley. At the most basic level, these tech parks are real estate developments with leasable property for commercial tenants in targeted industries, allowing them to partner or affiliate with one or more universities. These research partnerships are a vital component to a successful tech park, as the availability of inexpensive real estate alone will not likely attract targeted industries. According to AURP, tech parks exhibit the following attributes:

- A property master plan designed for research and commercialization;
- Partnerships with at least one university or other research institution(s);
- Encouragement of the establishment and growth of new companies;
- Technology translation from the lab to the marketplace; and
- A focus on technology-led economic development.[32]

[31] https://aurp.memberclicks.net/assets/documents/aurp_batelllestudy2012-final.pdf
[32] https://aurp.memberclicks.net/assets/documents/aurp_batelllestudy2012-final.pdf, page 6.

The University of Alaska, in partnership with other public entities and private investors, may find that a tech park is a viable development vehicle. Companies wishing to establish R&D facilities related to UAS, ranging from large defense contractors or startup firms, would be potential tenants (parks often contain incubator components to support the startup of new firms). Chief benefits to the tenant include the ability to sponsor targeted research, access university labs and other facilities, utilize faculty as consultants, hire students and/or graduates, and license intellectual property. In essence, the university could act as an amplifier to the tenant firms' R&D operations, creating value for their intellectual property portfolios. As UAF has emerged as one of the nation's leaders in testing UAS in a variety of climates and geographies, it has also made itself a viable partner to industry for this purpose, and could leverage other assets in the Fairbanks area, including the four Interior military bases (Fort Wainwright, Eielson Air Force Base, Clear Air Force Station and Fort Greely) and access to runways and an international airport. Likewise, Anchorage would offer access to Joint Base Elmendorf Richardson, a university campus, as well as a large international airport. In either city, companies hoping to build a business around UAS would find adequate space to test the technology in consultation with leading experts.

Proximity to military bases would make a potential tech park attractive to defense contractors engaged in R&D. Of potential consideration, the US Army is expected to place one of its 17 Gray Eagle companies in Alaska. This company will have responsibility for 12 unmanned Gray Eagle aircraft, and includes a support staff of approximately 120 soldiers. The need to service and support these aircraft may present new business opportunities that dovetail with a tech park.

From the public sector standpoint, the benefits to a successful tech park are substantial. First the development would serve as the focal point for a new industry by building a knowledge center where expertise passes from university labs directly to interested firms. The park would provide a space for ideas to disseminate rapidly, helping to cement the state's status as a thought leader for UAS integration into the national airspace. Ultimately, the spillovers of knowledge—crucial to new industry formation—would spur the creation of new businesses statewide and bolster employment opportunities. Additional benefits include the generation of revenue through facility leases, and the enhancement of university stature. It should be noted, however, that success (defined as the attraction and retention of tenant firms, as well as formation of startups) depends on several critical factors. According to AURP, these include:

- Alignment between university competency and that of the targeted firms;
- Ability to assist early stage firms in commercialization;
- Access to investment capital for tenants;
- Access to university facilities, faculty, and students;
- Support of university leadership; and

- Support within the economic development community.[33]

Foremost among these factors is the strength of the university partnership. Numerous university tech parks nationwide have failed to attract commercial tenants because they treated the development purely as commercial property to be marketed and leased in a manner similar to other types of real estate. This approach fails to differentiate the tech park from other leasable property. Instead, businesses must see tangible value in the access to university facilities and expertise, and these are the features that should be used to attract commercial tenants. For this reason, the park should be physically an extension of the campus, intermingled closely with other university facilities to maximize the sharing of resources and knowledge. Locating a tech park far from its affiliated university can often doom it to irrelevance, as core university assets, including faculty, students, and research facilities, become less accessible.

The physical layout and location of the tech park are thus important elements of success. The type of leasable space available to firms is also a relevant consideration. While the Research Triangle Park was able to attract technology companies in the 1950s by offering inexpensive land on which to build their own facilities, this model has lost much of its effectiveness as many corporations have scaled back their R&D facilities. Instead, businesses are looking for less capital-intensive mixed-use space in shared buildings. Occupying this type of real estate requires less upfront cost and strengthens the offering, as well as provides an open, collaborative environment where knowledge can be shared and new ideas take form. Nationwide, innovative firms are choosing to co-locate with complementary firms, research labs, and universities so they can share ideas and practice "open innovation". Entrepreneurs and entrepreneurial firms increasingly seek to interact with like-minded firms and have efficient access to industry-specific guidance in addition to sophisticated equipment. New communication technologies make it possible for entrepreneurs to be successful nearly anywhere in the world, yet the "magic" occurs when entrepreneurs are able to leap forward due to shared thinking and utilization of space, workforce and innovations coming from an industry.

To help advance this type of innovation, university tech parks often include a business incubator or an accelerator to nurture startups. Both are facilities that provide physical space for new businesses, along with mentorship, assets such as laboratories and technology, and in some cases seed capital. Incubators generally host businesses for indefinite time periods (often years) until they are ready to "graduate" and leave the incubator. Accelerators, on the other hand, are designed to provide intensive guidance as part of a structured mentorship program for a fixed term, usually no more than 6 months. In either case, the operation may take equity in the startup businesses, or simply charge rent for use of the facilities. Incubators and

[33] https://aurp.memberclicks.net/assets/documents/aurp_batelllestudy2012-final.pdf, page 10.

accelerators can be centered on a specific type of industry segment, such as biotechnology or in this case, UAS. An operation of this sort might serve as an additional vehicle for commercializing university research, and established firms in the tech park could mentor, invest in, or ultimately acquire businesses started in an incubator.

As an additional note, Alaska's remote location will present challenges for the development of a university tech park, as with many other types of business developments. UAS technologies in particular can be operated from remote locations, so project leaders will need to focus on the strength and value proposition of a university partnership to attract companies, and emphasize features unavailable elsewhere, such as the airspace and unique expertise. These alone may not be enough, however, as several other states are exploring similar concepts. The state may also need to explore financial incentives to attract targeted firms to the tech park (or elsewhere in Alaska) as explored earlier in this chapter.

5.4 Strategic Considerations

- University tech parks are a common strategy to advance innovation for the purposes of regional economic development, and a possible option to advance UAS commercialization in Alaska.
- Tech parks encourage linkages between university expertise and businesses with complementary needs, and provide opportunities to move innovations into the marketplace.
- UAS industry development could benefit from the formation of a tech park and/or systems for establishing a core knowledge center. See appendix 2 – Central Oregon example.
- Alaska based private sector firms commented via interviews on their need for special use airspace to allow for experimental UAS flights to prove airworthiness – a tech park could address this need.
- Success hinges on several critical factors, including financial, political, and market feasibility, as well as alignment between university competencies and those of the targeted industry.
- Tech park development closely resembles that of any other real estate project, with phases including pre-development, feasibility, site development, financing, and construction. See appendix 3 – Real Estate Development Process defined for greater explanation.
- An incubator or accelerator to help launch startups to scale could be incorporated into a tech park as an additional means to commercialize UAS technology and create an innovative environment.

6 ALASKA UAS STRATEGIC ASSESSMENT

The successful development of a UAS industry in Alaska will benefit the Alaska economy in terms of high wage/high talent job creation and new private sector investment. In addition to building a core competency for the state (UAS research and development), a successful industry development strategy will also strengthen existing and emerging sectors within the state, such as metal fabrication, aviation, and resource development. Foundational to a development strategy is understanding the current position or conducting a strategic assessment outlining the current competitive position of Alaska as a player within the global UAS industry, including current strengths and weaknesses (internal factors), as well as opportunities and threats (external). These are summarized by the **Current Position** table below:

6.1 CURRENT POSITION

	Beneficial	Harmful
Internal	**Strengths** • Abundance of airspace for safe operations • Diversified need for this technology in the state – (public and private sector) • Strong aeronautical awareness (large number of pilots and aeronautic jobs) • Varied weather (good for R&D) • ACUASI leading UAS for over 10 years with great success • Strong legislative support for UAS development • UAS test range designation from FAA • FAA-certified aviation schools and strongly established maintenance and operation programs within these schools • Alaska UAS Interest Group	**Weaknesses** • High cost of logistics, energy, and labor • Limited road infrastructure (necessary for small UAVs) • Public skepticism (must educate public on positive uses of UAS) • Lack of formal structure to receive inquiries from prospective UAS range users • Lack of methodology to guide prospective UAS range users through range selection and scheduling

Although this strategy document has addressed the strengths and opportunities of a UAS industry in Alaska at length, threats and weaknesses must also be addressed and mitigated. These include a litany of common barriers to economic development in Alaska, such as high energy costs, a small workforce, long supply chains, and limited infrastructure (although this latter issue has probably helped spur the state's aviation competencies).

Alaska must identify the most significant obstacles to private sector investment in UAS-related enterprise, and explore policy solutions. Similarly, state entities such as the Alaska Industrial Development and Export Authority (AIDEA) and the Alaska Aerospace Corporation (AAC) can participate in financing critical infrastructure if such investments can be justified in terms of economic development and then tied to an overall strategic plan for the launch of a new UAS industry.

	Opportunities	Threats
External	• Education/informing the public as UAS are integrated in Alaska • Education/public schools system and University degree programs • Implementation in environmental monitoring, national security, and the oil industry • Opportunity to grow support industries (small aircraft maintenance, manufacturing, and metal and composite fabrication) • Ability to position Alaska on the cutting edge for UAS testing and implementation • Job creation and new investment	• Safety of airspace in Alaska. Need to establish rules governing integration in common airspace • Declining value of test site designation as UAS are accepted into NAS • Budget cuts at the state and university level • Possibility of value creation not benefitting state—UAS could be built and operated out-of-state, not benefitting local economy

6.2 Core Competencies and Competitive Advantages

A Leader in Small Aircraft Maintenance and Knowledge

Alaska has several distinct core competencies and competitive advantages which make it an ideal climate for the development of a strong, well-integrated UAS industry. The state has the largest number of pilots per capita, at a rate of three times the next highest state in the country. This high concentration of pilots has allowed the state to develop small aircraft and aviation as a core competency. Accordingly, the state's aviation support infrastructure and

expertise, including hundreds of remote airfields and aircraft service businesses, can be leveraged as assets for UAS development.

The importance of small aircraft has allowed this industry to develop within the state. The state possesses more than an adequate supply of trained small aircraft technicians and parts suppliers. Several specialized metal fabricators operate in Alaska that currently serve this niche market. For instance, one aircraft manufacturer in Southcentral Alaska manufactures components included on the Cessna Caravan, which are shipped all around the world to Africa, New Zealand, and Australia. This core competency also spills over into the state's educational institutions, which offer associate degrees and certifications related to aircraft maintenance and operations. When viewed in this context, the state of Alaska has the proper support infrastructure in place (relating to small aircraft) to compete effectively in the UAS industry.

A Harsh, Diverse Climate in America's Last Frontier

One of Alaska's greatest strengths is its harsh, varied climate and rugged topography, which make it a perfect testing site for emerging UAS technology and applications. Although these factors have historically inhibited economic development in Alaska, they provide nearly limitless applications for UAS technology. Such opportunities have been mentioned previously, and include the following:

- Volcano monitoring systems
- Oil pipeline monitoring
- Fish and Game monitoring
- Arctic weather deployment
- Mountain navigation and testing
- Extreme cold weather testing and innovation

Alaska provides opportunities for testing UAS in torrential rain (some Alaska locations receive the most rain in the US outside of Hawaii), extreme cold (temperatures in Interior Alaska can routinely reach -50 degrees Fahrenheit in winter), and in Arctic blizzards (a few of Alaska's cities can have extreme levels of snowfall compared to other locations in the US). This varied and extreme climate provides opportunities for the testing of UAS technology in some of the harshest of climates on Earth. This reality, combined with Alaska's other core competencies, makes it one of the best locations in the US for the development of this technology.

While the state can market its climate as a unique strength setting Alaska apart with regard to testing UAS capabilities, competitive locations will identify this as a disadvantage or weakness. Testing of UAS is typically conducted in clear, calm, dry locations. Poor weather conditions, icing, or strong winds may ultimately delay the ability to test UAS. Every day that testing is stalled costs associated with testing increase. Ultimately Alaska must communicate the benefits of unique mountainous terrain, cold weather, Arctic, and maritime testing

opportunities and work closely to assist industry with best times for testing.

Strong Leadership at the State Level

One of the chief advantages for Alaska with regard to the development of a strong UAS industry is the strong leadership shown at the state and university level. These entities have taken the lead to ensure that Alaska is among one of the six designated test ranges nationwide for UAS technology. This designation should ensure Alaska's place within this emerging industry. Furthermore, the state government has shown the necessary leadership to form a task force not only to identify opportunities and threats within the industry, but also to introduce proactive legislation to guide the industries development. This leadership has primed Alaska for success in the UAS industry.

Alaska's leadership has also played a prominent role in current efforts which strive to better understand the Arctic. Fran Ulmer (former Alaska Lt. Governor and UAA Chancellor) is Chair of the U.S. Arctic Research Commission. She was appointed by President Obama in March 2011. Additional state leaders are involved in the Arctic Council, an intergovernmental forum consisting of Arctic nations such as Canada, Denmark, Finland, and others. For instance, ACUASI's deputy sits on the UAS Expert Group, a committee of the Arctic Monitoring and Assessment Group, one of the standing committees of the Arctic Council. State leaders are also active in other Arctic groups such as Arctic Circle, a nonprofit organization which offers a dialogue for key Arctic stakeholders. Alaska's strong leadership in Arctic policy and Arctic issues will be a key asset in developing its UAS industry and furthering the Arctic applications and research of the technology.

In addition to a review of core competencies, a macro-marketing analysis was conducted to identify global and local factors that could potentially influence the UAS industry success in Alaska. This analysis is included as appendix 4.

6.3 Strategic Considerations

Critical to establishing an effective and growing UAS industry in Alaska is engaging all the players in a dialogue that purposefully focuses private sector firms along with economic development practitioners and public sector actors that with an interest in or the development of the industry. While the public sector should not be the driver of an emerging industry, **it is often the public sector that initiates the convening of industry members and may even fund an entity to serve as a public/private convening organization or designate staff to coordinate regular industry meetings.**

Pursuit of an anchor tenant or tenants is another strategy that often provides the ingredient for an industry to emerge. **Policymakers and economic development practitioners need to promote economic conditions supporting the emergence of a new industry via the**

attraction of firms interested in developing the industry. Business development practices might include support for academic programs, encouragement of a strong entrepreneurial climate, and even ensuring access to capital or incentives that may make the relocation of a firm to the area more economically viable.

Crucial to the establishment of an industry group is the interactions of competing and complementary firms. In Alaska, the leveraging of existing and mature industry sectors such as the military, aviation, and aerospace will provide crossovers when it comes to suppliers, professional service firms, distribution chains, customers. **It will be important to involve not just UAS related firms, but to reach across sectors to seek clear crossover competencies as well as other areas to be leveraged.** Key is ascertaining that firms and other economic actors derive some economic advantage from their proximity to and engagement with the various industry stakeholders.

7 STRATEGY AND POLICY CONSIDERATIONS

In light of Alaska's current strength in UAS and the economic potential, a strategic framework for the continued development of the industry is an essential next step. Timing is critical as other states implement their own strategies to grow and attract a UAS industry. Alaska must respond to this challenge.

Alaska has aspirations to achieve the following in an effort to grow the UAS industry sector:

- Promoting research, development, and innovation;
- Advancing education and human resource development;
- Infusing marketing and branding; and
- Educating and engaging the public sector.

To achieve the objective of moving Alaska's UAS industry toward global competitiveness leaders must advance six interrelated drivers concurrently. These drivers, listed below, and the following broad goal areas (innovation and entrepreneurship, education and training, communications, and public sector engagement) provide an actionable framework:

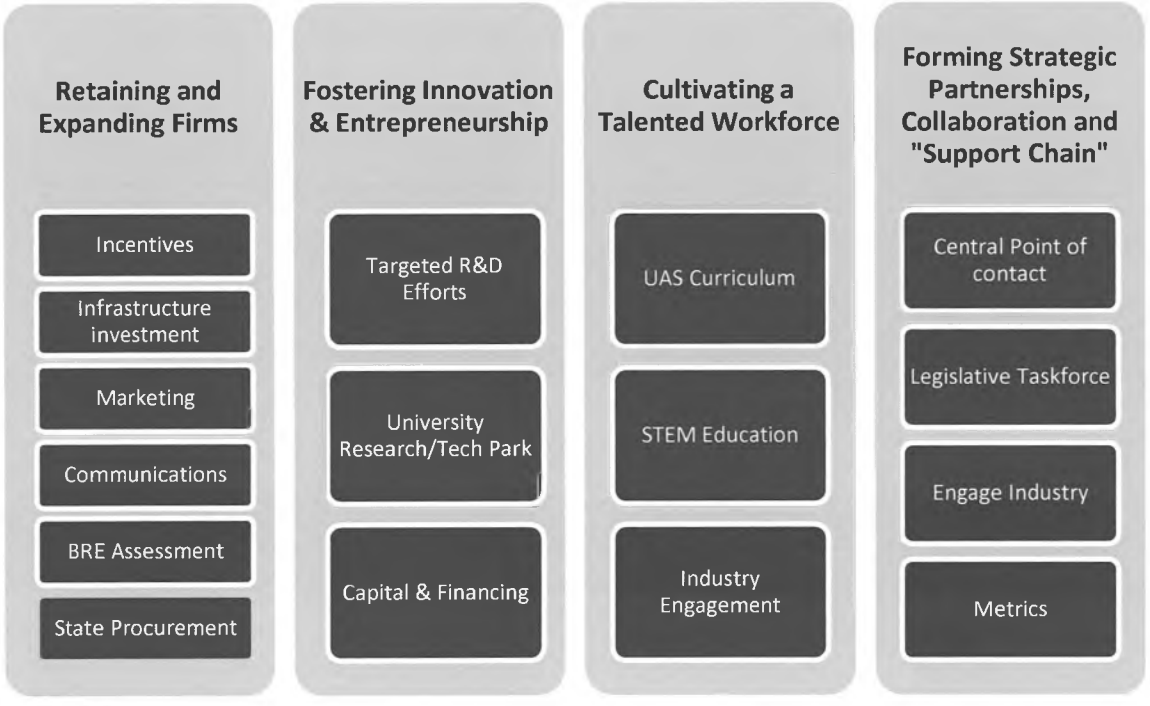
- Research and Networking
- Innovation and Technology
- Business Expansion
- Education and Training
- Commercial Cooperation
- Policy Action

The following strategies are intended to be implemented via a joint industry, government and university collaboration. The formation of an industry leadership council representative of these key anchors is an essential first step. The leadership council will further refine these strategies and then lead the implementation of critical actions. Implementing a joint industry, government and university strategy will bring cohesion and shared vision to growing the UAS sector.

The State of Alaska (including the Legislature) can play a role in convening the right leaders and industry stakeholders. The State of Alaska, specifically through its Department of Commerce, Community, and Economic Development, can serve a critical leadership role through the provision of staffing to the industry leadership council until the working council is firmly established. Over the long-term the leadership council will need to migrate towards self-structure.

A comprehensive strategy to grow and sustain a viable UAS industry for Alaska hinges

on four major elements: strengthening the overall business climate, fostering innovation and entrepreneurship, cultivating the talent of tomorrow, and growing strategic partnerships.



Collectively these strategies seek to create a stronger business climate via:

- **Strategically incentivizing UAS investment to attract anchor firms.** Nationwide, most states and regions offer financial incentives (often in the form of tax credits or abatements) to attract businesses seeking expansion and relocation.
- **Infrastructure investments.** Alaska must invest in critical infrastructure to support advancement of the industry: facilities, special use roads, airfields, or training centers.
- **A coordinated, branded marketing effort.** States in competition with Alaska for UAS investment feature marketing efforts to attract investment in targeted industries, such as "Diversify Nevada."
- **Clear communication of the state's assets.** The state offers more airspace for UAS testing than any other, a long history with defense and aviation related industry, deeply rooted UAS expertise, and nationally-renowned aviation training programs. These and other strengths need to be communicated clearly.

7.1 Goal Area #1 Retaining and Expanding Firms

The FAA test range designation is attracting major, mid-size, and small businesses wishing to expand their UAS presence in Alaska. As a result, Alaska must review its public policy and related business attraction tools to encourage a strong business climate which supports existing, and attracts greater, business investment. The development of a UAS industry in Alaska create a number of spillover effects, including the expansion of existing businesses with niche skills. Many small aircraft maintenance and fabrication shops, along with other types of support businesses, will likely benefit from a strong UAS industry in Alaska. There are also crossover applications from the small aircraft industry to the UAS industry, and these must be leveraged and expanded upon. While an industry development strategy will benefit small businesses, the reverse is also true: an industry cannot take shape without capacity expansion for the state's aviation-related firms. The following strategies aim to retain existing and expand on complementary firms that will support this sector.

To support an improved ability to attract outside firms, state and local governments could offer tax and other specialized incentives. Property tax abatement for new businesses at the borough or municipal level is one avenue. Recent legislation (HB 223) at the state level established a property tax exemption for Military Facility Zones, as mentioned earlier.

Infrastructure needs should be better documented and a plan established to address deficits. The Alaska Department of Transportation and Public Facilities has responsibility for managing and maintaining Alaska's aviation infrastructure, such as its international airports and airfields throughout the state. These are assets in a UAS industry development effort. A needs assessment should be undertaken to determine any deficits as well as a plan to address any discovered.

Establishing a UAS industry in Alaska will require stronger marketing. As one example, the State of Nevada is leading an aggressive marketing campaign to attract the interest of UAS businesses nationwide. The State of Nevada website (www.diversifynevada.com) is hosted through the Governor's Office of Economic Development. While web marketing and attraction efforts are not unique, the focus on UAS business development is. The UAS portion of the website focuses on the advantages of the state over its competitors. Further, Nevada has created an eight-page brochure on the multiple advantages and extensive history of UAS in Nevada.

While Alaska has attracted firms already due to our strong UAS assets and geographic location, improving efforts and producing more at-a-glance information packages will improve the overall understanding of Alaska for targeted firms. Marketing efforts should focus rebrand Alaska as the national and international leader for development of policies, procedures, and flight safety protocols relating to UAS entering the NAS.

Attraction of new firms is one aspect of economic development, but strengthening

existing businesses is another. A possible model for engagement is a traditional business retention and expansion (BR&E) effort, in which economic development organizations identify the needs of the business community through surveys or interviews and develop tailored strategies in response. To support this approach, the state must take inventory of such businesses to determine which are growth-oriented and what their specific needs are. The state should also provide these businesses with opportunities to participate in industry development efforts, as they will have a vested interest in its success.

Lastly, since state government has an interest in spurring private investment in UAS in Alaska, it should itself employ UAS services where appropriate. DNR, DEC, and the Department of Public Safety, for instance, all use manned aircraft for a variety of tasks related to their core missions. If the state began incorporating UAS, it could act as a large customer helping to develop the industry while realizing the increased safety and efficiency benefits provided by unmanned aircraft.

Focus Area	Strategy
Incentives	Incentives • Tax credits • Loans • Equity investments
	Venture Capital Competencies • Need to educate and develop potential VC's as investors make decisions locally
	AIDEA • Investment and Lending policies related to UAS
Infrastructure Investment	Airport(s) Readiness for UAS • Needs assessment
Marketing	UAS marketing presence through the State of Alaska or Public/Private entity marketing Alaska
	• Web presence
	• Collateral pieces (brochures, leaflets, etc.)

Communications	Clear, consistent and compelling messaging
BRE Assessment	Market access to airspace and varied environments. Develop financing and incentive programs.
	Identify private sector champions to support development. Seek avenues for industry participation (i.e. UAS Interest Group). Use BR&E approach to identify needs.
State Procurement of UAS	Create a policy of using UAS services as an alternative to manned aircraft for such activities as wildlife monitoring.

7.2 Goal Area #2 Fostering Innovation & Entrepreneurship

"Growing the Sector" & "Promoting Research"

This goal area requires that the state convey a clear message to industry that Alaska is open for business, encourage the growth of this economic sector, and allow Alaska to lead the country in aviation innovation.

A key driver for industry development will be Alaska's ability to develop useful technology related to UAS. **Although the state has been an early leader in the testing of UAS technologies, it must continue to innovate and harness the intellectual capital of the university system.** Alaska can build upon past successes by encouraging UAS manufacturers and operators to use Alaska as a laboratory, and partner with the university to benefit from its expertise. Alaska is well positioned to be on the front lines for research and innovation with regard to UAS deployment in a multitude of settings.

Each of the FAA test ranges relies heavily on the university system within their respective states. Further, each of the lead universities has developed partnerships with universities in other locations. UAF has partnerships with Oregon State University and the University of Hawaii, for instance. Increasing these partnerships will strengthen Alaska's position as a research hub. UAA would be a good choice as would other university systems in the Pacific Northwest (University of Oregon, Washington State University). The further development of international relationships may also prove beneficial.

Alaska will continue to serve as an important research laboratory for UAS testing, but

taking research forward to the point of commercialization will lay the groundwork for a sustainable future. The university and its research partners must seek avenues to connect this expertise to private sector firms in order to realize economic benefits. They could achieve these benefits through: assisting in the launch of startup businesses utilizing UAS, or making the expertise available to existing firms through customized trainings or technology licensing, if appropriate.

Focus Area	Strategy
Targeted R&D Efforts	Promote University of Alaska Research & Development • Data Collection • Data Analysis
	Become international hub for UAS research
	Pursue innovations (i.e. sensors, data collection, and data processing)
	Develop relationships and agreements with public entities and private sector firms to support shared research leading to commercialization
University Research & Technology Park	Pursue an FAA Center of Excellence designation for UAS
	Expand rapid prototyping capacity to provide support for UAS innovations (i.e. 3D printing, CNC millwork, CAD/CAM)
	Encourage growth of light manufacturing – critical UAS components and systems
	Establish a legislative increment to support research as well as technology transfer and commercialization operations at the UA system

Capital and Financing	Technology Park • Feasibility Study • Location Determination • Financial Plan Developed • Anchor Tenant(s) Identified • Business Plan
	Venture Capital Competencies • Develop potential VCs as investors make decisions locally
	AIDEA • Investment and lending policies related to UAS

7.3 Goal Area #3 Cultivating a Talented Workforce

The limited availability of skilled and semi-skilled workers has always been a challenge for Alaska's industrial development. A thriving UAS industry, however, requires a specialized workforce capable of piloting the vehicles as well as tending to the operational systems. The growth of the UAS industry in Alaska will require advancement of educational programs from pre-K through high school, vocational, and university levels.

Both UAA and UAF offer nationally recognized aviation-related coursework, including degree programs in piloting, aviation administration, air traffic control, and aircraft maintenance. The University of Alaska is already testing courses for the emerging UAS industry. The next step is to develop curriculum that will lead to a certificate or degree. A certificate or degree program will allow Alaska to better position itself as an educational leader, giving it a key competitive advantage over other regions.

The State of Alaska should undertake a labor needs assessment related to the UAS industry and identify ways in which the Department of Labor and Workforce Development can provide support.

Focus Area	Strategy
World-Class Training Infrastructure – Specialized coursework in UAS field	Support the targeted expansion of workforce training with objective of becoming international hub for training and education relating to aviation and in particular unmanned aircraft systems • Payload operators and pilots • Mechanics and maintenance workers • Technicians
Invest in STEM education	Strengthen STEM education focus throughout Pre-K to High School
Higher Education and Vocational-Technical	Establish clear programming and degrees for unmanned ground systems
Engage Industry - Statewide Workforce Development	Undertake needs assessment of workforce gaps. Explore development of apprenticeship programs related to UAS work, and make training funds available.
Training Legislation	Encourage legislation at the local and federal level to support diploma or airman certification prior to FAA regulations being in place.

Funding for Initiatives	Secure funding for a variety of training programs and infrastructure: • UAA aviation requires software change to add UAS component to ATC simulator • UAS component to 141 flight school • Performance Training Standard test • UAS staffing and staff training

7.4 Goal Area #4 Forming Strategic Partnerships, Collaboration and "Support Chain"

Alaska will need to act strategically to realize potential value from UAS industry development. In the coming years Alaska must transition from holding a lead test range designation to becoming a state recognized for its established UAS-industry. Other states with fewer strategic assets and even in some instances no test range designation are simultaneously ramping up to claim the mantle.

Alaska has a unique opportunity given its competencies as well as geographic location to advance strategic relationships and develop a new industry for the state. Alaska is well suited to position and market itself as a premier place to address the needs and challenges of integrating UAS systems into the NAS. In so doing, Alaska must link and align its assets to grow a prospering new industry that advances collectively all stakeholders.

A key component in the development of a UAS industry in Alaska will be establishing clear roles for both the private and public sector. The public sector must lead initially without competing with the private sector. Developing a framework by which the public sector can facilitate the success of the private sector will be of essential importance. Wherever possible, industry should champion and lead.

Establishing a central point of contact, such as formalizing the Alaska UAS Interest Group or establishing a like entity and providing it with the authority, responsibility and resources to lead will serve to further the industry in significant ways. A key scope of work envisioned for the organization is establishing working groups to address membership, finance, government and media relations, and workforce development initiatives. Ideally, this central point of contact would serve as chief liaison for the industry. This level of organization can facilitate a stronger collaboration across industry, academia and government agencies.

Working through the UAS Legislative Task Force, the State of Alaska (including the Legislature) can aid the solidification of a UAS industry in Alaska. Firms seeking to relocate or establish additional offices in Alaska will first review the state tax structure and incentives in place for industry. The Legislative Task Force can lead initiatives to establish or rewrite existing

incentive policies. Incentives should not only benefit industry, but also encourage behaviors desired of industry. For instance, incentives that support greater education and training investments, as well as research will serve to benefit anchors such as the university as well as industry. In addition to improving the structure of incentives, the UAS Legislative Task Force may also explore how to support industry having greater access to seed and venture capital as well as seeking to minimize any regulatory hurdles. Further, a special liaison to the central point of contact or UAS Interest Group will likely prove beneficial until the group can afford its own executive director.

Focus Area	Strategy
Central Point of Contact	Formalize UAS Interest Group or like entity – a standalone 501c3 model is envisioned • Programming – sharing of information • Membership – reaching stakeholders • Infrastructure needs • Capital and Financing • Government and Media Relations • Workforce Development
Legislative Taskforce	Provide recommendations and guidance to state policy to support UAS for public and private applications • Incentives • Seed and Venture Capital • Streamlining regulatory hurdles
Engage Industry	Seek ways to empower the private sector to lead
Metrics	Establish tool to ensure success measures are established and used • Incentive tracking

APPENDIX 1. UAS TIERS DEFINED

Prior to jumping into a full market consideration discussion it is first important to understand how UAS are typically classified as this classification system drives market behaviors. An "Unmanned Aircraft System" can be applied to a broad range of vehicle types, configurations, and sizes. For the DoD, "tiers" are used to differentiate UAV by size, speed, flight ceiling, functionality and capabilities. This tier system was developed by military planners to ensure integration of various models in an overall use plan. The US Air Force and Marine Corps each has its own tier system, and the two systems are themselves not integrated. Additionally the Army has designated UAS based on the nature of support received from other units. The US Air Force categorizes UAS in five tiers including:

- Tier : Small/Micro, low altitude
- Tier 1: Low altitude, long endurance
- Tier 2: Medium altitude, long endurance
- Tier 2+: High altitude, long endurance conventional
- Tier 3: High altitude, long endurance low-observable

Table A1.1. developed by Unmanned Aircraft Vehicles and System Services to classify UAS.

UAS Description	Weight (Pounds)	Size (Feet)	Mission (Altitude)	Mission (Speed M/Hr)	Mission Radius (Miles)	Mission Endurance (Hours)
Nano	<1	<1	<400	<25	<1	<1
Micro	1 to 4.5	<3	<3,000	10 to 25	1 to 5	1
Small UAS	4.5 to 55	<10	<10,000	50 to 75	5 to 25	1 to 4
Ultralight Aircraft	55 to 255	<30	<15,000	75 to 150	25 to 75	4 to 6
Light Sport Aircraft	255 to 1,320	<45	<18,000	75 to 150	50 to 100	6 to 12
Small Aircraft	1,320 to 12,500	<60	<25,000	100 to 200	100 to 200	24 to 36

Medium Aircraft	12,500 to 41,000	TBD	<100,000	TBD	TBD	TBD

FAA Defined Manned Aircraft Weight Categories

While already confusing, additional UAS Categories are also referenced by Grouping from 1 to 5 according to maximum gross takeoff weight, normal operating altitude and speed.

DoD Unmanned Aircraft Systems (As of 1 JULY 2011)

General Groupings	Depiction	Name	(Vehicles/GCS)	Capability/Mission	Command Level
Group 5 • > 1320 lbs • > FL180		•USAF/USN RQ-4A **Global Hawk/BAMS-D** Block 10	•9/3	•ISR/MDA (USN)	•JFACC/AOC-Theater
		•USAF RQ-4B **Global Hawk** Block 20/30	•20/6	•ISR	•JFACC/AOC-Theater
		•USAF RQ-4B **Global Hawk** Block 40	•5/2	•ISR/BMC	•JFACC/AOC-Theater
		•USAF MQ-9 **Reaper**	•73/85* *MQ-1/MQ-9 same GCS	•ISR/RSTA/EW/ STRIKE/FP	•JFACC/AOC- Support Corps, Div, Brig, SOF
Group 4 • > 1320 lbs • < FL180		•USAF MQ-1B **Predator**	•165/85*	•ISR/RSTA/STRIKE/FP	•JFACC/AOC-Support Corps, Div, Brig
		•USA MQ-1 **Warrior**/MQ-1C **Gray Eagle**	•31/11	•(MQ-1C Only-C3/LG)	•NA
		•USN **UCAS**- CVN Demo	•2/0	•Demonstration Only	•NA
		•USN MQ-8B **Fire Scout** VTUAV	•14/8	•ISR/RSTA/ASW/ ASUW/MIW/OMCM/ EOD/FP	•Fleet/Ship
		•SOCOM/DARPA/USA/USMC A160T **Hummingbird**	•8/3	•Demonstration Only	•NA
Group 3 • < 1320 lbs • < FL180 • < 250 knots		•USA MQ-5 **Hunter**	•45/21	•ISR/RSTA/BDA	•Corps, Div, Brig
		•USA/USMC/SOCOM RQ-7 **Shadow**	•368/265	•ISR/RSTA/BDA	•Brigade Combat Team
		•USN/USMC **STUAS**	•0/0	•Demonstration	•Small Unit
Group 2 • 21-55 lbs • < 3500 AGL • < 250 knots		•USN/SOCOM/USMC RQ-21A **ScanEagle**	•122/13	•ISR/RSTA/FORCE PROT	•Small Unit/Ship
Group 1 • 0-20 lbs • < 1200 AGL • < 100 knots		•USA / USN / USMC / SOCOM RQ-11 **Raven**	•5628/3752	•ISR/RSTA	•Small Unit
		•USMC/ SOCOM **Wasp**	•540/270	•ISR/RSTA	•Small Unit
		•SOCOM SUAS AECV **Puma**	•372/124	•ISR/RSTA	•Small Unit
		•USA gMAV / USN T-Hawk	•270/135	•ISR/RSTA/EOD	•Small Unit

Source: US Department of Defense

APPENDIX 2. CENTRAL OREGON EXAMPLE

The Columbia River Gorge/Hood River example is provided to give further detail to how a specific area of a state is benefiting economically from UAS industry development. Oregon offers three specific Ranges including Pendleton, Tillamook and Warm Springs. The range designations have boosted what was already becoming a UAS focused cluster of Oregon startups and established companies.

Pendleton: Located in eastern Oregon, the Pendleton UAS Range (PUR) is centered at the Eastern Oregon Regional Airport and City of Pendleton. The airport enjoys 347 visual flight days per year and can accommodate up to a Boeing 757. In addition to two conventional runways, the airport provides a 2,800 foot UAS dedicated strip and a full-service UAS operating area. Beyond the airport the range extends over 14,000 square miles: North to the Columbia River; east over the Blue Mountains and Umatilla National Forest; south into the Elkhorn Mountains; and west outlining the borders of Restricted Area 5701 to allow easy access for specialty testing.

Tillamook: Tillamook Range is managed by Near Space Corporation, specializing in engineering, manufacturing and stratospheric balloon operations. The Range spans across miles of Oregon coastline, home to a mild and wet climate with very little seasonal temperature variation due to its proximity to the Pacific Ocean offering interesting marine and coastal research options.

Warm Springs: This FAA designated airspace directly overlies Warm Springs Reservation in the central Oregon Cascade Range near Madras and is managed by the Warm Springs Tribe. The Range supports controlled access to 1,000 square miles from the surface to 18,000 MSL of high desert and forest for testing a variety of UAS missions.

Since 2010, Economic Development for Central Oregon (EDCO), the organization leading the region's economic and business development activities, has been spearheading an effort to create a local hub of unmanned aviation technology. The emphasis behind this effort comes from Central Oregon having expertise in aerospace and aircraft industry manufacturing since 1992, but following the economic recession new attention was placed here as a way to diversify the region's aviation industry. Initially focus was placed on manufacturing SUAS airframes, but shortly thereafter more emphasis was placed on manufacturing the equipment that rides on UAS as well as developing systems for obtaining data, including sensors and optics.

Central Oregon lies near the center of Oregon, encompassing the Deschutes River Basin. Central Oregon is separated from Western Oregon by the Cascade Mountain range, which extend from southern British Columbia through Washington and Oregon to Northern California. Central Oregon's weather is mostly dry and sunny in the summer, snowy and cold in the winter,

with light rainfalls and some cloud cover in the spring and fall. Central Oregon falls away from the Interstate-5 corridor nor does it provide access to a large population base, so resources had to be leveraged to draw in large companies. One of those resources is open air space.

Economic Development for Central Oregon launched the Oregon Unmanned Aircraft Systems Business Enterprise (OR-UAS), a 501(c)(6) nonprofit. Today, OR-UAS is known as SoarOregon. The intent of SoarOregon is to establish Oregon as a leader in civilian UAS development. The organization's goal is to create jobs and economic growth by capitalizing on the development of SUAS and their associated applications. One of the first activities of OR-UAS was to solicit grant proposals for projects that will create UAS-related jobs or generate other UAS-related long-term economic activity in Oregon.

SoarOregon's initial funding came from a two-year, $882,000 state grant from the Oregon Business Development Department and the Oregon Innovation Council, which was approved by the 2013 legislature. In the 2013-15 budget, the Legislature allocated $882,000 to create the Unmanned Aircraft Systems Center of Excellence — a research center and business incubator, that would include a flight-test site with proposed headquarters in Redmond or Bend. SoarOregon has worked to match this state funding with private investments, grants and other programs to get innovative projects off the ground and firmly establish a cluster of UAS activity.

The seed money provided by the state legislature to SoarOregon seeks to:

- Expand existing Oregon companies that support UAS technology;
- Assist Oregon companies in winning new contracts and grants;
- Recruit UAS firms to test vehicles, sensors, systems and applications in the state and to establish offices and facilities here; and
- Generate industry-leading applications that promote innovation

As Oregon hopes to position itself to be a national leader in the research, development, and manufacturing within the SUAS sector it has been working in close conjunction with its institutes of higher learning.

Oregon State University (OSU) has also raised the region's UAS profile, with about 20 faculty working on UAS-related research and technologies. OSU is working closely with Economic Development for Central Oregon, the US Department of Defense, OSU-Cascades Campus, the state of Oregon, Oregon Congressional leaders, private industry and others to help get the state involved. Specifically, Oregon State University's College of Engineering is growing its faculty expertise in this area, responding to burgeoning student interest, and offering the first SUAS engineering course in the Pacific Northwest this fall. "OSU's researchers are looking at unmanned vehicles for precision agriculture, forestry, snow pack observation, land-use

monitoring, wildlife tracking and oceanographic mapping," said Rick Spinrad, vice president for research at Oregon State University and board president of SoarOregon.

Similarly, Central Oregon Community College has established the Unmanned Aircraft Systems Degree Program. The Aviation Unmanned Aircraft Systems Operations (UAS) trains individuals to work as professional UAS operators in the national/ international arena. Students learn to operate UAS to include conducting mission and preflight planning, mission briefings, and programming. Students are also taught to perform limited UAS and ground support equipment testing, troubleshooting and maintenance.

Oregon is leveraging an advantage based on the growing cluster of UAS companies located in close proximity. Firms were initially concerned about not having product testing, but with the new test site designation that is no longer an issue. Not unlike the development of aviation systems in the early 1900's, the commercialization of UAS activity is taking off now as military uses are moving toward commercial uses.

Boeing-owned, Insitu Inc., which makes and designs unmanned aircraft systems including the Scan Eagle™, Integrator as well as other UAS systems, is the anchor tenant. The Bingen, Washington based company employs about 800 people in the Columbia Gorge region and has provided a pipeline of talented engineers and aviators who have spun out to create their own firms. Other UAS companies and those who supply the industry in the region include Aerovel, American Aerospace Engineering, Cloud Cap Technology, Hood Technology, Sagetech Corporation, Sightline Applications, Trillium Engineering, Custom Interface Inc., Innovative Composite Engineering, Prigel Machine and Fabrication, Real Carbon and Zepher. The Gorge Technology Alliance collected data regarding the economic impact of the UAS industry for the region and reported that the more than 1,000 employees working in the UAS industry enjoyed an average annual income of approximately $68,000 in 2012.

Oregon offers precision manufacturing, airframes, propulsion systems, applications and software from all corners of the state. From this core, suppliers followed and as aviation manufacturing slowed with the national recession, core competencies began focusing on UAS development.

The Portland metro area is also a rich hub for aviators. Companies include Columbia Helicopters in Aurora and Erickson Air-Crane Inc. in Portland. McMinnville-based Evergreen International Aviation operated both helicopter and UAV businesses before selling them off in advance of filing for bankruptcy protection. Outback Manufacturing currently boasts 20-40 percent of the company's business in manufacturing parts for the SUAS industry with this segment anticipated to increase in the coming years.

APPENDIX 3. INCENTIVES REVIEWED

	ED Incentive	Description	Advantages	Disadvantages
Tax Incentives	**Research and development tax credits (state level)**	The tax credit formula includes two components: • Credit rate (percentage of R&D expenses the tax liability is reduced;) • Base level (the minimum amount of an expenditure before the credit applies.)	• Increases the amount of R&D activity; • Helps attract businesses from other states; • Allows the private sector to decide about allocation of funds; • Usually neutral and not aimed at a specific industry;	• Shifts R&D activity between states rather than creating new expenditure; • Level-based R&D tax credits, with an increase in R&D expenses, the base level is also increasing every year and therefore it is more and more difficult to get a tax credit; • Aimed mostly at big companies rather than small businesses, as the base level is usually calculated based on reported average expenses in R&D. • May lead to projects with a low rate of return, unprofitable without tax credit.
Tax Incentives	**Hiring tax credits (state level)/Job Creation Tax Credit**	There are several variants of the hiring tax credit: • For employer: it may reduce a company's state income tax liability for hiring certain classes of employees or provide certain class jobs (rural, technology or high-wage) or enable hiring of certain employees with a specific level of payroll. • For employee: it may be provided to an employee for relocation to a particular state (may also exist in a shape of employee's relocation assistance program).	• Provides incentives for both employers and employees to relocate to the state; • Promotes efficient allocation of resources;	• Availability of tax incentives is only one factor among many that businesses consider when deciding about relocation, and it is not the main one. • Zero-sum game;

Tax Incentives	**Manufacturing tax credits**	Municipal or borough level: • Credits or exemptions for property; • Credits of exemptions for sales; State level; • Credits or exemptions for corporate income taxes;	• Allows tax money to stay in private hands and be used more efficiently; • Promotes efficient allocation of resources;	• Availability of tax incentives is only one factor among many that businesses consider when deciding about relocation, and it is not the main one; • Zero-sum game;
Tax Incentives	**Property tax abatements (municipal or borough level)**	In Alaska: an exemption or partial exemption from property taxes for up to 10 years if the property is in a military facility zone that creates or supports industry, development, or educational or training opportunities beneficial to a facility	• It is simpler and less restrictive than tax credit; • It is more useful for smaller projects. • Stimulates relocation of businesses to specific zones to which tax exemption is applied.	• Availability of tax abatements is usually limited.
Tax Incentives	**Sales tax abatements (municipal or borough level)**	These would allow local governments to exempt particular purchases, or businesses within particular industries, from sales taxes, if the company relocates and retains jobs within the state.	• It is simpler and less restrictive than a tax credit; • It is more useful for smaller projects.	• Availability of tax abatements is usually limited.

Investment incentives	Matching research and development grants	Funding from federal, state and private sources for research grants, research equipment acquisition, and product development/commercialization;	Promotes cooperative efforts between private businesses and the university system; Promotes early-stage research and development funding to advance technology;	Funding usually requires availability of matching funds.
Investment incentives	**Funding by AIDEA and the AHFC to projects within Military Facility Zones (MFZ).**	AIDEA has several financing programs: Loan Participation, Conduit Bonding authority, Loan Guarantees and Development Finance.	• Helps build UAS infrastructure within MFZ. • The trend of using these zones as a primary incentive tool has moved towards supplementing them with broader programs;	• Funding usually requires availability of matching funds.
Investment incentives	**Gap loans**	It is used when the banks and business owner are unable to secure funds necessary to complete the total project amount, leaving a "gap" between the two. Usually this type of financing is limited to specific geographical location.	• Provides business with cash to operate while waiting for the funding;	• Usually comes with high interest rate.
Investment incentives	**Equity financing**	The process includes selling shares of the company to raise capital. This incentive is efficient only if there are potential equity investors or business angels within the state.	• Cash infusion with flexible timeline to pay back; • Potential partnering with local professionals (business angels) which are aimed at positive financial results;	• Splitting profits with equity investor.
Investment incentives	**Venture capital assistance**	The process includes investing in startup companies, which are usually highly-technological. This incentive is efficient only if there are potential venture investors within the state. In Alaska one of the examples is Alaska Venture Partners, LLC.	• Potential investment is usually up to $5 million; • Access to knowledge and technical assistance.	• Venture investors expect large return on investment; • The necessity to share company equity.

Other Types of Incentives	**Job Creation Grants**	Depending on the industry, companies creating a minimum required a number of new jobs and making a minimum required capital investment is eligible to receive discretionary cash grants (e.g. job creation grants provided by SBA.)	• Stimulates small businesses to create new jobs.	• A lot of paper-work to apply for grant; • Competitive basis, so grant availability is not guaranteed.
Other Types of Incentives	**Energy Discounts**	Some utility providers may offer grants and reduced rates to projects resulting in new job creation and investment. This incentive may also exist in a view of energy incentive loan which includes a no interest loan to pay for energy costs for a particular period of time.	• Important incentive to stimulate businesses to relocate to Alaska as it helps reduce high energy costs; • Creates competitive advantage for the business;	• Usually limited to specific industries or projects.
Other Types of Incentives	**Free or discounted land**	Negotiated lease or sale of land owned by a locality or state, often at a below market cost. Approach is often used via a sole source contract to assist a company needed land for location or expansion.		
Other Types of Incentives	**Technical assistance**	Local economic development organizations may provide technical assistance for new businesses or companies relocating facilities.		

APPENDIX 4. REAL ESTATE DEVELOPMENT PROCESS DEFINED

The basic approach to developing a tech park is essentially similar to any business planning process. Elements include due diligence on the part of the owner and research surrounding market characteristics and product factors that then drive decisions surrounding the business venture. For a tech park in the Fairbanks area with an emphasis on UAS technology, these characteristics include land availability, access to airfields, and proximity to university facilities.

From an economic development practitioner's perspective, project planners must follow an established process to establish a tech park. Much like any real estate project, steps include:

1. Pre-development
2. Feasibility – (market; financial and political)
3. Site characteristics and considerations (site and engineering analysis)
4. Financing
5. Contractor selection (negotiations and public approval process precede)
6. Construction
7. Marketing
8. Facilities occupancy and ongoing management

The pre-development phase focuses on aligning a business development idea such as a tech park with a specific site or sites. Typically the businesses targeted for the tech park have an idea of what they want and can well describe their ideal location. This phase typically includes a pre-feasibility or basic low cost assessment, to determine whether the concept "pencils out." It is critically important to engage in conversations early with all key stakeholders including tenants, owners, lenders, and partner organizations.

The feasibility phase is about determining the market; political and financial viability of the proposed development. With regard to a UAS tech park, the key question to be addressed is whether market demand is sufficient to offset the development and operational costs associated with the project. Political feasibility requires determining if the local political climate will support the proposed development. For instance, some communities are more concerned about UAS activities than others (for example: has the community supported any bans on UAS or business development?). Financial feasibility requires identifying the various costs associated with business and site operations and factoring these into a pro forma or financial analysis to prove to investors (debt or equity) that risks associated with the financial investment are less than the ultimate reward of financial returns.

Site review and engineering assessments include working with local municipal permitting and regulatory entities to determine if characteristics associated with the site will ultimately impact operations and plans for site development. This includes researching and

seeking expert opinion on items such as environmental impacts, flood plain characteristics, run off patterns, earthquake zone, parking requirements, special restrictions, egress and ingress characteristics, and similar concerns.

Financing is a critical hurdle for nearly every real estate development project. In most cases, multiple investors will negotiate terms and ownership interests in the development. In the case of a UAS tech park, investors may include stakeholders such as city or borough governments, the University of Alaska, federal agencies, Native Corporations, or private sector anchor tenants. In many cases both debt and equity investments are necessary due to the high costs associated with real estate development. For a public-private project such as a tech park, highly sophisticated and hybrid financing packages are typically needed to meet these expenses.

Contractor selection can be challenging if the developer is new to real estate development, particularly when led by a public sector entity. In short, this involves outlining the type of construction to be undertaken and providing bidding contractors with architectural and engineering schematics to follow. In some cases, contactors are asked to design and build, which can result in a less expensive and at times higher use property if there is cohesion of vision between the contractor and the developer. The contractual process can also be driven by financing requirements. For instance, if the public sector is contributing funds, a competitive bidding process will most likely be required.

Marketing is often a forgotten element, but really should be started early on in the process and may require an ongoing effort to lease all available space. At times, marketing is also necessary to raise capital for construction. In all circumstances, outreach and relationship building are essential to ensuring initial contracts with key anchor tenants are in order and confirm base operational costs are covered. For a UAS tech park, marketing efforts may form one component of an attraction program to recruit new businesses to Alaska. In turn, this may require tax or financial incentives to draw firms to the state. Of crucial importance is the targeting of firms that complement existing university research efforts.

The ongoing management of the property, once it is developed, typically involves two critical areas: day to day management and then longer-term renewal, replacement and eventual sale of the property. Both of these factors are of particular importance if the developers do not have real estate professionals on staff.

Appendix 4. Macro Market Environment Review

A macro-marketing analysis was conducted to identify global and local factors that could potentially influence the UAS industry success in Alaska. These factors include: political, economic, social, technological, maintenance, concept of operations, environmental, and legal considerations.

Political Considerations

All types of UAS have US domestic and international applications for law enforcement, land surveillance, wildlife tracking, search and rescue operations, disaster response, border patrol and photography, among many other tasks. Federal agencies, along with most states and foreign countries, are debating if and how this emerging technology should be regulated; taking into account privacy concerns, the benefits of use, and business interests. As mentioned previously, FEMRA established the program to integrate UAS into civilian airspace, including the formation of the six test ranges. This was a highly competitive process with at least 50 primary teams representing 37 states requesting FAA-portal access for proposal submissions. The international effort to incorporate UAS into respective airspace is primarily led by the International Civil Aviation Organization (ICAO) which "mirrors" many of the policies engaged by the FAA, but is aggressively leading the manned - unmanned airspace integration effort thus far. There continues to be an ever-changing political landscape in the United States relating to and for UAS. A recent FAA list, spurred by Freedom of Information Act lawsuits, indicates that an additional 81 public agencies have applied to the FAA for authorization to use UAS. Pending State Legislative measures focus on a variety of issues including:[34]

- Definition of a drone or unmanned aerial vehicle;
- Use of unmanned aerial vehicles by law enforcement and other state agencies;
- Use of UAS by the general public;
- Formation of various study committees;
- Bans and moratoriums on operations; and
- Resolutions requesting to be an FAA test site.

The Alaska Legislature adopted a joint Concurrent Resolution (HCR006C) in 2013, creating a Legislative Task Force on Unmanned Aircraft Systems (LTFUAS) tasked with reviewing FAA regulations on drones and creating written recommendations and legislation that "protects privacy and allows for the use of unmanned aircraft systems for public and private applications." In addition to members of the legislature, the task force is comprised of members representing the commissioner of public safety; the Adjutant General of the Department of

[34] National Conference of State Legislatures, website, http://www.ncsl.org/issues-research/justice/unmanned-aerial-vehicles.aspx

Military and Veterans' Affairs (DMVA); the ACUASI at UAF; the Academy of Model Aeronautics, the state Aviation Advisory Board and most recently a public representative and two industry members. The task force provided a final report to the Legislature on June 30, 2014.[35] In this report, the LTFUAS concluded that the FAA is adequately addressing the safety concerns of integrating UAS into the National Airspace System (NAS).

Alaska has prime airspace to prove an assortment of civil applications for UAS. "Alaska's extreme and ever-changing environment can put these systems to the test," Lt Gov. Mead Treadwell stated, "and the technology, along with our university's new supercomputer, can show how unmanned aircraft can support Arctic science, help manage natural resources and respond to emergency situations." Treadwell continued, "The synergy between the two technologies here in Alaska keeps us on the cutting edge of aerospace development....and an investment of $5 million approved by Gov. Sean Parnell to further the University of Alaska's UAS research helps too."[36]

Political debate, discussion and efforts to understand the consequences of UAS operating in the NAS will continue. Most of the debate stems from concerns regarding use in the military to the potential for invasions of privacy. At the core of the debate surrounding UAS advancement is uncertainty associated with the widespread use of a relatively new technology, and the potential for misuse by government or industry. The emerging regulatory framework should mitigate most of these concerns.

Economic Considerations

Economic issues such as federal sequestration and the continuance of budget resolutions are expected to keep producing uncertainty in the marketplace. Federal sequestration legislative actions took place in FY 2014 (and are further scheduled for 2015-21). Fiscal politics in congress currently attempt to cap defense and non-defense discretionary spending; a rise in one area will generally be offset elsewhere, limiting grants or R&D funding with potential impacts on UAS.[37]

According to the Unmanned Vehicle Systems International (AUVSI) 2013 "New Economic Report,"[38] the main inhibitor of US commercial and civil development of UAS is the lack of a regulatory structure. Due to current airspace restrictions, non-defense use of UAS has been, and will continue to be, extremely limited. This primarily affects *Tier I and II platforms,

[35] Legislative Task force on Unmanned Aircraft Systems, Final Report to the Legislature as required by Legislative Resolve 17 SLA-13, June 30, 2014.
[36] Alaska can be Arctic Proving Ground for UAS, Office of Lt Gov Mead Treadwell, 2012
[37] Center on Budget and Policy Priorities, website, various articles, http://www.cbpp.org/cms/?fa=view&id=3635
[38] The Economic Impact of Unmanned Aircraft Systems Integration in the National Airspace, AUVSI, March 2013, http://higherlogicdownload.s3.amazonaws.com/AUVSI/958c920a-7f9b-4ad2-9807-f9a4e95d1ef1/UploadedImages/New_Economic%20Report%202013%20Full.pdf

whereas Tier III UAS is able to comply with FAA requirements for operations in the NAS with thorough coordination. **To better understand UAS tiers, please refer to appendix 1.*

AUVSI further projects an $82.1 billion infusion into the US economy due to UAS operations over the 10 years following the mandated 2015 integration deadline. Agricultural applications of UAS alone could pump $75.6 billion into the economy over the decade, according to an optimistic report published by AUVSI in March.[39] Public safety and "other applications, like natural resource management, will produce $3.2 billion each," the report claimed. The industry is projected to create just over 100,000 jobs during the same period, two-thirds of which will spring up in the first three years after integration into the NAS. Many of those jobs will be manufacturing positions that pay more than $40,000 annually.

AUVSI identifies the following criteria required before any viable UAS growth in the US:

- The FAA must develop new regulations integrating UAS into the nation's airspace; this effort is directly tied to the successful operation of the six test ranges.
- Job growth distribution in the US will mimic current aerospace manufacturing employment; reflective of UAS design/production and not necessarily applicable to UAS services support.
- There must be sufficient capital available to encourage smaller manufacturing companies.
- There must be financing available to UAS purchasers, foreign and domestic.
- There must be adequate insurance to cover liabilities associated with UAS design/production as well as operations.
- US Gross Domestic Product (GDP) needs to grow at least 3% annually over the designated time period for assumptions to hold.[40]
- Overall, NAS integration is the greatest factor effecting UAS market growth whereas Original Equipment Manufacturers (OEMs) will be more affected by the health of the economy.

Social Considerations

There are widespread public assumptions that domestic integration of UAS will result in "lethal war machines buzzing their neighborhoods" and personal privacy will diminish as result. Overcoming these fears will continue to be a challenge. Some opposition camps view the

[39] Booming Unmanned Aircraft Industry Straining to Break Free of Regulations, June 2013, http://www.nationaldefensemagazine.org/archive/2013/May/Pages/BoomingUnmannedAircraftIndustryStrainingtoBreakFreeofRegulations.aspx

[40] The Economic Impact of Unmanned Aircraft Systems Integration in the National Airspace, AUVSI, March 2013, http://higherlogicdownload.s3.amazonaws.com/AUVSI/958c920a-7f9b-4ad2-9807-f9a4e95d1ef1/UploadedImages/New_Economic%20Report%202013%20Full.pdf

aircraft as a "Big Brother" technology that will bring prying eyes into citizens' homes.[41] Consequently, there continues to be a significant effort by states to understand and regulate UAS operations. Conversely, there is a growing realization of the economic value of the domestic UAS marketplace and associated opportunities for applying this technology across federal, academic, and commercial arenas.

Similar to the earliest days of manned aviation, increased education about UAS applications, cost-benefits, safe and regulated operations, and the ability to take the human risk out of the "dull, dirty and dangerous" jobs will eventually bring greater acceptance across society.

Technological Considerations

UAS technologies for UAS continue to develop rapidly. Small, *Tier I UAS appear to be generally developing faster than Tier II or III as manufacturers are able to enter the market more quickly and with less capital investment. Tier II UAS is led by Boeing-Insitu with their service-proven Scan Eagle™ mentioned previously, and follow-on program of record, "Integrator," primarily supporting DoD in the GWOT. The trend (for both Tiers I and II) is for vehicles that can carry an array of smaller, interchangeable, more capable sensor systems (Electro-optical, infrared, optical/Infrared/Multi or Hyperspectral); the addition of hard point for wing-mounted payloads; and standardized ground control systems. Tier III design has relatively slowed as the full range of capabilities have for the most part been demonstrated, and now the focus is on greater fidelity and expansion of sensor suites, along with reducing the overall operation and sustainment costs. There is also a significant cost barrier to enter the Tier III market, even as a service provider rather than an original equipment manufacturer (OEM).
**To better understand UAS tiers, please refer to appendix 1.*

Specific technology considerations include:

Vehicles: UAS can be fixed wing, rotary or a combination of both. Historically, the most common options have been fixed wing as these operate more quietly, with greater efficiency and longer duration. This is not necessarily true as technology is advancing rapidly. As an example, Rotary Tier I options are becoming more common in law enforcement (e.g. Aerovironet Qube) which can be tailored for low altitude/short range/short duration missions ranging from security support to precision agriculture.

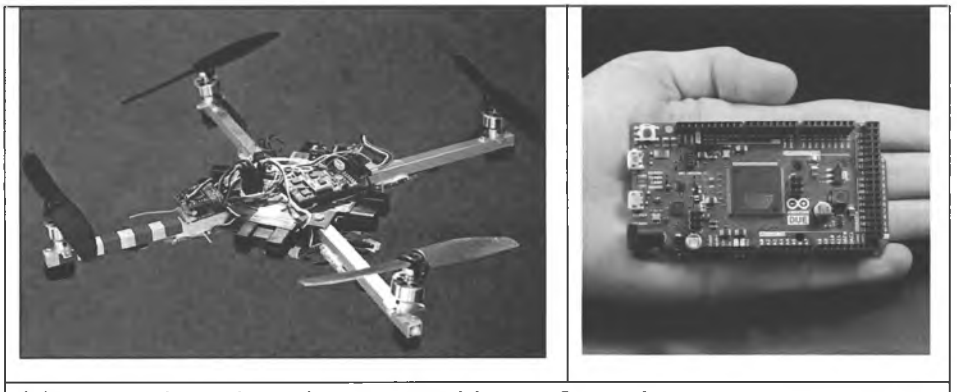
Payload/Sensor Suite: Primarily Electro-optical (EO), Infrared (IR), and Hyperspectral capabilities. Cameras are getting smaller, as well as integrated with higher fidelity. Synthetic Aperture Array-based Hyperspectral systems are rapidly being miniaturized

[41] Booming Unmanned Aircraft Industry Straining to Break Free of Regulations, June 2013, http://www.nationaldefensemagazine.org/archive/2013/May/Pages/BoomingUnmannedAircraftIndustryStrainingtoBreakFreeofRegulations.aspx

for small platforms. Overall, greater fidelity in data collection is being provided with smaller equipment, expanding the flexibility to meet customer needs.

Data storage/transfer/analysis/processing: Data storage (physical volume, weight, cost-per-Giga Byte) continues to plummet, which translates to a greater ability to collect and store more streams of data simultaneously aboard the platform. Likewise, data transfer algorithms and processing power have become more efficient (and compact). Manufacturers, universities and even hobbyists are now able to create sophisticated *Tier I UAS platforms (e.g. Tier I Quad Copter) using open-source processing (e.g. Arduino, Raspberry PI). This disruptive technology, is in essence aiding in the creation of a new market that may displace an earlier technology. As a result, this technology may produce similar changes in the UAS industry, like the introduction of personal computing over 40 years ago. **To better understand UAS tiers, please refer to appendix 1.*

Figure 10: Tier I Quad Copter



(L) – An Arduino based copter. Hobbyists & Academics are using open source hardware (R) that puts a computer in your hand. < $ 75 / unit via Amazon or Radio Shack.

Training/Simulators: The DoD's "Report to Congress on Future UAS Training, Operations, and Sustainability," of April 2012 provides details regarding the requirements and initiatives being addressed regarding UAS in the NAS for UAS Executive Committee (EXCOM) activities (DoD, DHS, FAA, and NASA) out to 2017.[42] Of note:

- UAS will not achieve their full potential or utility unless they can achieve the same freedom of navigation, responsiveness, and flexibility as manned aircraft.

[42] DoD Report to Congress on Unmanned Aircraft Systems Training, Operations, and Sustainability, Under Secretary of Defense for Acquisition, April 2012, https://www.fas.org/irp/program/collect/uas-future.pdf

- Many DoD UAS now require rapidly expanded access to the NAS and international civil airspace to support operations, training, testing, and broader governmental functions.

Traditional training provided by OEM as part of the UAS sale and sustainment logistics support, is giving way to smaller companies specializing in UAS training across a range of different UAS platforms (particularly with the standardization of ground control systems). Some customers (DoD and most foreign countries) are requiring the OEM to support a "train the trainers" approach so that training can be accomplished "in-house" to save money. Some of this is the result of DoD acquisition managers' efforts to reduce the life cycle sustainment costs of UAS developed under "programs of record" and by foreign countries to develop their own capabilities, avoiding the continued dependence on foreign OEMs. Simulators are quickly being developed to support training in lieu of having to coordinate limited airspace for flight time, affording operators and maintainers the opportunity for platform and payload training.

Maintenance Considerations

Logistics and field maintenance support became critical as UAS were incorporated into the battle force within combat zones. Consequently, focus expanded to include requisite field maintenance of software and hardware, requiring Subject Matter Expertise (SME) functions to be continuously available. Configuration management and field upgrades resulted in total integration of civilian contractors into the military combat environment. Those same contractors have brought their expertise back to the home front where they anxiously await integration into the NAS.

Concept of Operations Considerations

Two types of approaches are prevalent in the UAS marketplace: own/operate and fee for service (FFS). Own/operate follows the conventional model with direct purchase of a UAS product from an OEM (or a growing number of independent integrators tailoring specific UAS for customer needs, like UAV Factory (http://www.uavfactory.com/). Training and sustainment support derives from the OEM directly or thru certified vendors. Each OEM provides the customer a UAS product from a growing array of available platforms. Typically the systems are highly proprietary (not "plug & play") with various additional sensor packages/equipment purchases required. The customer, in this case is also responsible for upgrades, training and sustainment requirements.

The FFS model primarily grew from the incorporation of Boeing-Insitu's Tier II Scan Eagle™ and AAI's "Aerosonde" in support of the US Marine Corps operating out of Iraq in 2005, and expanded into Afghanistan and elsewhere around the world. This customer-focused approach requires the contractor or vendor to identify user mission requirements, or "end-product," and provide everything needed to meet those requirements: UAS platform and ground equipment, training, certification, sustainment/upgrades, and data collection/transfer

to the customer.

Overall, as UAS proliferate into non-DoD applications, mission profiles must also accommodate ever-changing requirements while minimizing costs to customers. A UAS program with customer-driven focus on securing requisite data of the highest quality at the least cost will require the right platform/sensor selection to meet mission requirements, and effective planning of sustainment costs.

Legal Considerations

The regulations and standards affecting the UAS community are in a rapid state of change and modernization.

The latest legal information regarding State legislative actions are found at: http://www.aclu.org/blog/technology-and-liberty/status-domestic-drone-legislation-states

Alaska Airports and Aviation
2014 Annual Report

Alaska Department of Transportation & Public Facilities
4111 Aviation Avenue • Anchorage, Alaska 99502
www.dot.alaska.gov

2014 Alaska Airports & Aviation Annual Report

Message from: John Binder Deputy Commissioner

2014 was another successful year in Alaska aviation. Despite a challenging winter characterized by multiple freeze/thaw events that brought unprecedented icy conditions, our Alaska Department of Transportation & Public Facilities (ADOT&PF) personnel continued to operate the nation's largest airport system and provide the aviation lifeline essential to Alaska. Several accomplishments and initiatives posture us well for what looks to be an equally challenging year.

Rural Airport System

Last year's rural aviation strategic plan provided a mechanism by which several key initiatives were achieved. Performance metrics were developed that will soon be incorporated into the Alaska Aviation System Plan (AASP) website, providing critical insight into those areas where we are performing well and those that can use improvement. An emphasis on employee development resulted in an annual training plan that is benefitting airport maintenance and operations (M&O) personnel statewide, both within and outside ADOT&PF. Finally, a refined communication plan will ensure consistent dialogue and collaboration between the myriad stakeholder groups critical to Alaska aviation.

2015 Statewide Aviation Strategic Plan

Purpose

To sustain and improve the quality of life throughout Alaska.

Core Values

Integrity, Innovation, Excellence, and Respect

Vision

By 2025 we will lead the world in rural aviation reliability, service, and safety management.

Initiatives/Improvement Projects

- Performance Scorecard Development
- Capital Project Optimization
- Airport Database
- Non-Standard Aircraft Policies
- Revenue Optimization

This year's initiatives will focus on adapting to new technologies, and optimizing both capital project development and revenue opportunities as we continue to be good stewards of our limited resources.

Working Together

As I mentioned with the airport training, ADOT&PF continues to make a concerted effort to partner with local, state, and federal agencies as we all advance our aviation interests. A ADOT&PF panel at the Alaska Air Carriers Association conference in February was able to facilitate valuable discussion on a variety of topics impacting the state from obstruction marking and lighting, to snow and ice control, to adjusting operating hours to accommodate industry needs. We truly do want to know about any issues or concerns the traveling public may have, and appreciate the opportunity to work together towards solutions.

A trip to Washington D.C. in February provided an opportunity to meet with FAA and TSA directors to address several national policies that present challenges to Alaska aviation. Meetings like these, and the subsequent opportunity to show several of our federal agencies the "real" Alaska during their travels this year, continue to be invaluable to ensuring strong partnerships and cooperation moving forward. As the fiscal climate becomes increasingly challenging at both the state and national level, cooperation is vital in maintaining a safe aviation system that continues to meet the needs of our residents.

The Great Alaska Aviation Gathering, a legislative trip to the Mat-Su valley, and several Governor's Aviation Advisory Board meetings provided many opportunities to hear from communities and stakeholder groups. A common theme is the increasing demand for airport development opportunity, particularly at those airports in the most rapidly growing regions of the state. DOT&PF will be looking closely at this issue and developing options for meeting the growing need.

Progress

On the capital project front, 2014 saw a better than expected allocation of FAA Airport Improvement Program (AIP) funding of ~$200 million that facilitated large Runway Safety Area projects in Kodiak, Nome, and Kotzebue as well as multiple runway rehabilitation projects in Hooper Bay, Koliganek, Ambler, Petersburg, Barrow and Juneau. In addition, multiple pieces of Aircraft Rescue & Fire Fighting equipment were purchased, Snow Removal Equipment Building projects begun, and several aviation planning studies initiated. Kudos to all of the people and sections responsible for another outstanding grant cycle.

Alaska International Airport System

The Fairbanks and Anchorage International Airports comprise the Alaska International Airport System (AIAS). Ted Stevens Anchorage International was honored for the second year in a row by Air Cargo World as the best cargo airport in North America. The award serves to acknowledge not only the tremendous airport staff, but also the partnership and dedication of the air carriers, ground handlers, and local community in making TSAIA such a great team.

Both Anchorage and Fairbanks finalized airport master plans culminating 18 months of rigorous public engagement, analysis, and planning to develop a common sense strategy for addressing forecast growth. These master plans were unique in that they incorporated "trigger points" for future capital improvements rather than focusing on a specific date. As the airports work in collaboration as an airport system, much of the analysis included how the airports can cooperate to accommodate cargo and passenger activity using current infrastructure, so as to maximize the system's potential prior to initiating new construction. The completed plans can be viewed at the following websites: www.ancmasterplan.com and www.pdcprojects.info/FAIMasterPlan
Lake Hood Seaplane Base just began its master plan process, which will continue throughout 2015. I encourage all Anchorage residents, pilots and passengers alike, to be involved in the process so that the final product represents the interests of all stakeholders.

Finally, while cargo activity through AIAS has continued to slip slightly year to year, I'm pleased to report that passenger traffic continues to rise. Furthermore, we were thrilled to hear that Dynamic Airways will begin weekly, international passenger service between Changsha (a community of 7 million people), in the Hunan Province of China, and ultimately Los Angeles, Las Vegas, Boston, and New York. Each flight will stop in Anchorage for refueling and for customs/immigration processing providing not only a tremendous tourism opportunity in Alaska for Changsha citizens, but also providing Alaskans non-stop service to several new cities both nationally and abroad. Beginning with charter operations, the flights will transition to regularly scheduled passenger service in the spring of 2015.

I close with sincere appreciation for the tremendous work our airport personnel do each day to keep our aviation system operating safely in the face of ever increasing challenges. It truly is the lifeline to most of our rural communities, and their professionalism each and every day sets an example to be emulated by all.

Fly safe Alaska and Happy New Year!

John

DOT&PF Maintenance & Operations Crews Efficient and Innovative

By Mike Coffey
Chief, Statewide Maintenance and Operations

The Department's Maintenance and Operations (M&O) personnel are responsible for the State's transportation system that includes over 5600 miles of state owned roadways, 254 airports, 845 bridges, 720 State owned and/or managed buildings, and over 7,000 State vehicles and equipment. Alaska's transportation system lies within one of the most extreme and challenging environments on the planet with temperatures ranging from 100F to -80F, snowfalls as high as 974 inches of snow at Thompson Pass, and 80% of the State is under laid by ice-rich permafrost.

M & O responsibilities include pavement maintenance and preservation, highway and airport anti-icing and deicing, snowplowing, snow hauling, avalanche hazard mitigation, vegetation management, guardrail repair, sign maintenance, street/traffic light repair, drainage structures, fence maintenance, airport light repair, airport rescue and firefighting, airport security, and facility repairs. It also includes responding to all emergency/weather related situations such as snow and ice removal, fallen trees, mud and landslides, and roadway/airport flooding.

The Department is continually promoting workplace efficiency; seeking innovative ideas; and providing training. The following are new programs and highlights from this year:

Everyday Lean Innovations & Ideas

The Everyday Lean Innovations and Ideas initiative was developed to promote sharing of innovations and ideas of the DOTPF workforce. An excellent example of a great employee innovation is the "Yeti" (shown below). The "Yeti" is the brainchild of John Frison, a Mechanic Auto Advanced Journeyman at the Fairbanks International Airport. The Yeti provides several benefits and efficiencies by allowing field maintenance staff to fracture ice and create pockets with a pathway to the underlying asphalt so the deicing chemical can get under the ice and start to work versus melting down through the ice. It will also help in the actual removal of ice by leaving pockets for sand to sit in and give texture to provide traction for aircraft operating on the active surfaces. Finally, the unit will be much easier to maintain as each individual tooth can be replaced separately. The width of the unit is approximately 9.5 feet and costs approximately $18,000 dollars to fabricate. The commercially available ice breaking units range in cost from $30,000 to $45,000 so this represents a significant cost savings to the department. This is just one example of the many outstanding innovations and ideas that are developed within the ranks of the ADOTPF workforce. Checkout the Everyday Lean Innovations and Ideas webpage at https://web.dot.state.ak.us/everydaylean/index.shtml.

The department is constantly exploring new technologies, procedures, and methods for accomplishing our mission in a more cost-effective and efficient manner. ADOT&PF is the first in the world to deploy a TowPlow to an airport. This winter the Kodiak Airport will be utilizing a TowPlow, a specialized piece of equipment that is towed behind a normal snow plow that allows one truck and operator to do the work of more than two conventional snow plow trucks. The TowPlow is also good for the environment. It reduces the number of vehicles required to clear a given airport/roadway and, in turn, reduces fuel usage.

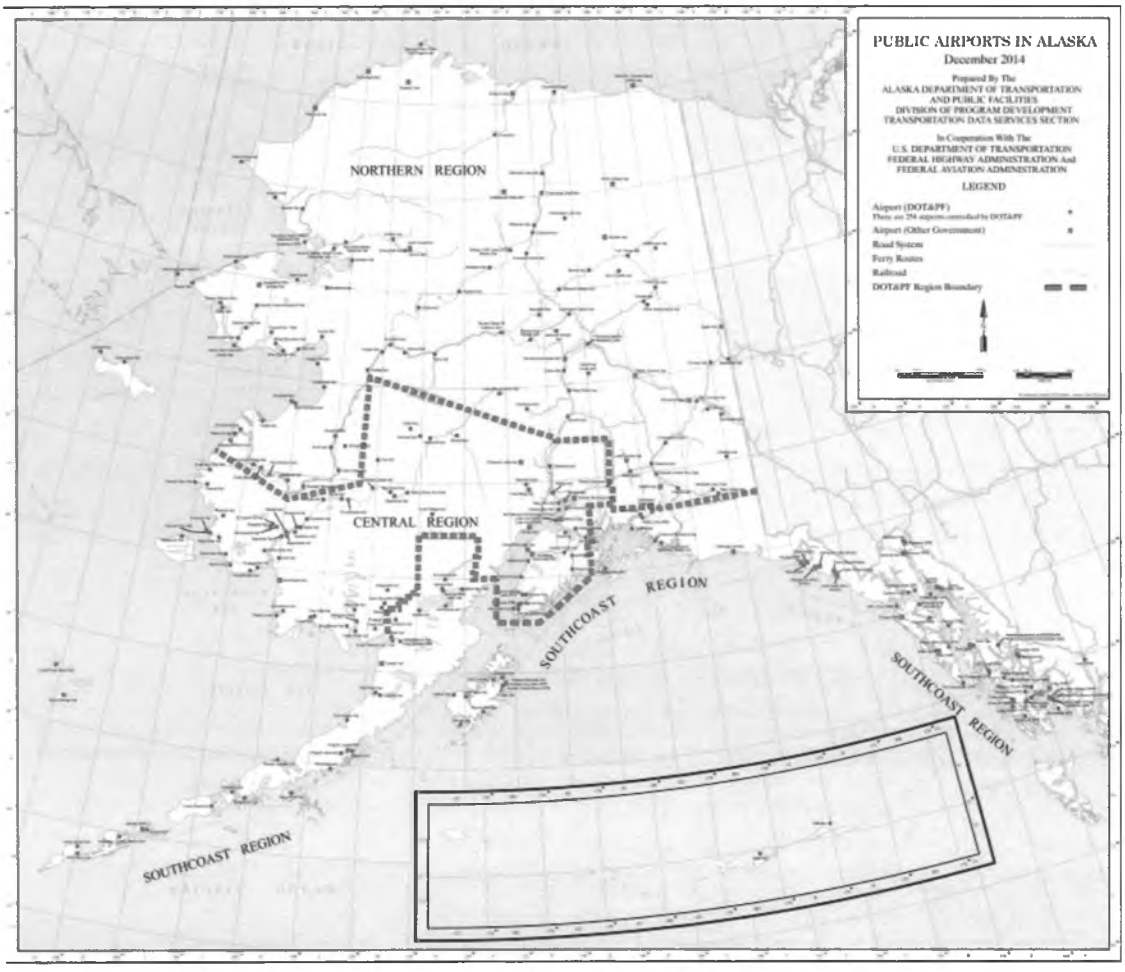
In an effort to mitigate the challenges associated with winter airport and highway maintenance decisions, the ADOTPF initiated a pilot program aimed at developing an Alaska specific winter enhanced Maintenance Decision Support System (eMDSS). The primary goal of the MDSS program is to provide objective guidance to winter road and airport maintenance decision-makers concerning the appropriate treatment strategies to employ to control snow and ice during adverse winter weather events. The eMDSS utilizes current weather observations and numerical model predictions from multiple sources to produce route/ airport-specific analyses and forecasts of environmental conditions. The broad needs met by the Alaska specific MDSS include the following:

Enhanced strategic planning capability
Improved tactical response capability
Improved adverse road weather notification
Operation-specific decision support

The department recently created a new maintenance foreman position in Bethel that combines the skills of an airport maintenance professional with that of a skilled aircraft pilot. By requiring the maintenance foreman to possess a pilot's license the department has been able to dramatically increase the Level of Service provided at the 64 rural airports in the Southwest District. Prior to the creation of this position, the SW District had attempted to inspect each remote rural airport once a year but tended to concentrate efforts on reacting to reported problems rather than being proactive. In the first six weeks after this position was filled, 26 airports were inspected and a vast amount of airport maintenance was performed to include; brush cutting, runway lighting repair, windsock repair, runway grading, beacon repair and contractor training. The airport inspections also included the equipment and buildings. State Equipment Fleet and Facilities have also utilized the aircraft when weather and schedules allow.

Photo - LJ Davis, DOT's Flying Maintenance Foreman at the Tuluksuk Airport. ADOT&PF leased a Cessna 182 to assist with airport maintenance in rural Alaska.

As part of its commitment to developing leaders for the agency, ADOTPF created the Alaska Maintenance Leadership Academy (AMLA). The AMLA is helping superintendents, foreman, airport managers, and lead men become more effective and efficient supervisors. The Academy is a five-day intensive, interactive series that prepares our leaders for the challenges of today and tomorrow. The first leadership academy was held in October 2012, and four have been completed to date. We are proud to say that approximately 110 of our leaders have graduated from AMLA.



New Southcoast Region

Southeast Region's boundaries are expanding to include the majority of southern coastal communities and will be renamed the "**Southcoast Region**." We are updating our website content to reflect this change as quickly as possible. This transition is on-going so your patience is appreciated. Fact sheet available online at www.dot.alaska.gov

Mail Delivery in Hooper Bay, Rich Sewell, ADOT&PF

Cargo Delivery at Galena Airport, Shawn Crites, ADOT&PF

Alaska Aviation System Plan

Being charged with the management of North America's largest airport system is no easy task. It takes a long range vision and extensive planning to ensure the safe, effective and efficient operation of Alaska's 251 state-owned airports. The FAA certainly sees the value in planning as they provide annual grants for ADOT&PF to build the Alaska Aviation System Plan (AASP), a compilation of policies and plans that guide the future design, maintenance and operations of our airports. The implementation of the AASP will address the many challenges facing aviation in the last frontier and lay the foundation for our vision to lead the nation in rural aviation reliability, service, and safety management by the year 2030.

An online report that covers the AASP's multiple studies and products from 2008 through mid-2013 is available at this link:
www.alaskaasp.com/media/998/aasp_final_report.pdf

An evaluation of the effectiveness and outcomes of prior AASP work is available at this link:
http://www.alaskaasp.com/media/1278/d61408.01.evalofprioraasps.tmm.lrh.062014.tjc.pdf

Key accomplishments of the AASP in 2014 include:

- Evaluation of the Prior AASP Efforts & Deliverables
- Pavement Classification Number (PCN) Reporting
- Capital Improvement & Maintenance Program (CIMP) (web-based)
- Rural Airport Rates & Fees Study
- Inventory Updates & Website Updates
- Airspace Coordination & Backcountry Airstrips Working Groups

Airport inspection in Holy Cross this past summer. Photo credit - Jason Sakalaskas, DOT&PF

The future of the AASP involves strategic planning and implementation of the plans goals, objectives, and recommendations. The plan will continue to include inter-agency and public coordination, special studies to address pertinent issues, development of the web-based information systems and tools, and periodic assessment of plan goals and performance measures.

The following tasks are proposed for future aviation system planning work:

- Strategic Planning
- Website Enhancement & Updates
- Weather Coordination Working Group
- Capital Improvement Plan (CIP) Development Integration
- APEB Automation
- Public Involvement
- Capital Improvement & Maintenance Program (CIMP)
- Performance Measures Scorecards

It's important that the story of aviation in Alaska be told to as many people, organizations, and agencies as possible, and to be told often. The AASP is a tool to tell that story as well as assist those working to make Alaska aviation stronger, safer, and more efficient now and in the future.

ALASKA
Aviation System Plan

2014 Alaska Airports & Aviation Annual Report

Alaska International Airport System (AIAS)

"To Keep Alaska Flying and Thriving"

The Alaska International Airport System - comprised of Ted Stevens Anchorage and Fairbanks International Airports - is home to over 30 international and domestic airlines providing passenger and cargo service throughout Alaska, the United States, Europe, and Asia. Both airports are equipped to handle any size and type aircraft, anytime, with state-of-the-art landing systems and terminal facilities. They are important economic engines; serving nearly 6 million passengers per year and accounting for 1 in 10 jobs in Anchorage and 1 in 20 jobs in Fairbanks.

Ted Stevens Anchorage International Airport (ANC)

ANC is renowned as the 6th largest airport in the world for cargo throughput and the 2nd largest in the United States for landed weight.

The airport was honored with the Air Cargo Excellence award as the best cargo airport in North America. A testament to the collaborative efforts in the cargo operations at the airport and its focus on providing first class service to the aviation community.

2014 Air Cargo Award

"As a carrier, UPS is proud of the outstanding partnership we have with the Ted Stevens Anchorage International Airport," said UPS Airport Properties Manager Kevin Hoffmann. "We are not surprised that Anchorage has won this award. Anchorage plays a vital role in our global network, helping us serve customers in more than 220 countries and territories around the world."

Lake Hood Seaplane Base

Lake Hood Seaplane Base (LHD) has been serving Alaska's general aviation needs for generations. On a busy summer day, LHD seaplane base and 2,200' gravel runway can see more than 400 operations by float and wheeled aircraft. A 2013 study found that LHD has a total economic impact of $42 million.

A Master Plan Update was initiated in 2014 to reassess LHD issues, needs, and priorities, and provide a blueprint for responsible airport development and operation for the next 20 years. Public involvement is critical and there will be multiple opportunities to participate in the coming months. More information and contacts available here: www.lhdmasterplan.com

Lake Hood - Busiest Seaplane Base in the World!

Construction projects were in full swing last summer at ANC - including reconstruction of Taxiway E2 (above), Taxiway M, Taxiway L, and Runway 7L.

Fairbanks International Airport (FAI)

As Alaska's second busiest passenger airport, FAI serves as a hub for more than 50 communities in Interior and Northern Alaska that rely upon air freight, mail, and commuter services.

The airport also plays a role in the state's tourism industry. In 2014, the airport documented more than 1,000,000 passengers at FAI. Passengers traveling to or through Anchorage, Seattle, and seasonal traffic to Minneapolis, Minnesota accounted for more than 80 percent of the traffic with the remaining traffic heading to outlying communities.

With the addition of the Holland America Princess flights to Dawson City, Yukon, FAI saw more than 14,000 passengers enplaned and deplaned for international flights, representing 1.4 percent of total passenger traffic at the airport.

Some of the larger projects this past year included completing the airport master plan, rehabilitating the Airport Rescue & Firefighting/warm storage building (ARFF), constructing a sand and chemical storage building, re-roofing the FAA Base/Tower building, remodeling the pilots lounge, and upgrading gate security.

ARFF building at FAI was rehabilitated in 2014

AIAS Business Report 2014

Overall, AIAS experienced a generally improved year. Our managers did a superb job of providing for a safe and enjoyable travel experience while remaining within budget. A significant increase in the cost of deicing chemicals made remaining within budget a noteworthy achievement. The diversification of airline customers generally continued with passenger traffic growing slightly better than 3%. Aircraft weight (our primary revenue driver) did not grow as fast due to continued airline efficiencies from higher load factors and fleet upgrades. In addition, cargo volume growth was generally flat for the year. Our capital improvement program tracked within expectations and AIAS was able to early retire approximately 7% ($35.7 million) of outstanding long-term bond debt.

This past year we focused on our vision of AIAS becoming a global AeroNexus for aviation-related commerce by the year 2030. Solid progress was made in areas such as business development, information technology, metrics development and employee engagement.

In the coming year, we expect continued moderate (1-2%) growth in passenger traffic and a partial recovery in the all-freighter cargo traffic due to lower fuel costs and continued West Coast port labor disputes and related congestion. Significant prolonged reduction in global energy costs over the next year would likely serve to stimulate both passenger travel and air cargo traffic volumes. Our main market remains the all-cargo freighter traffic travelling between Asia and the US. We have benefitted from significant growth in cargo freighter traffic between Asia and Mexico and are well positioned to support greater growth in trans-pacific. The majority of imports to Alaska via air cargo are perishables from the contiguous US. Very few exports travel by air, fresh fish exported to the contiguous US being the largest by weight. The type of imports and exports has not changed significantly in recent years.

2015 Major Rural Airport Projects

Adak Airport:
Construct runway safety area

Ambler Airport:
Rehabilitate all runway surfaces, extend the main runway, runway safety area work, replace runway lighting and new equipment building

Barrow Airport:
Runway 07 surface variation repair

Coldfoot Airport: Resurface all operational surfaces and install new lighting, clear brush and trees obstructing the airspace, and protect the runway and airport access road from imminent erosion by the Koyukuk River

Deadhorse Airport: Airport Fire & Rescue Bay addition with sand storage - Stage 1

Hooper Bay Airport:
Apron, runway and taxiway resurface

Koliganek Airport:
Apron, runway and taxiway resurface and access road realignment

Kodiak Airport:
Continue work on runway safety area

Kotzebue Airport:
Continue work on the runway safety area - Stage II, lighting system, wind cone installation, new gates, and North apron access road embankment and surface course placement, and security fence

Nome Airport:
Runway safety area and apron Improvements - completion date September 2016

Pilot Station Airport:
Complete design, survey, and purchase native allotments for proposed airport relocation

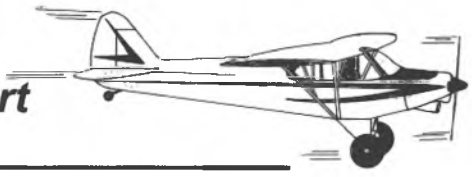
Shismaref Airport:
Resurface the runway, taxiway, and apron

Tununak Airport:
Continue work on airport relocation including new taxiway, apron, access road, snow removal equipment building, airport lighting and other improvements as needed

Kotzebue Airport - view of new runway safety area constructed on runway east end.
Photo credit - Neil Strandberg, DOT&PF

Nome Airport - new runway safety area constructed on Runway 3. DOT&PF Project Photo

2014 Completed Rural Airport Projects



Dillingham Airport:
Completed runway safety area

Ketchikan Airport:
Apron and taxiway paving and lighting repairs

Petersburg Airport:
Runway and taxiway paving

Platinum Airport:
Completed runway extension

Unalaska Airport:
Completed runway safety area

Aviation in Alaska is Huge!

- Alaska has 8,066 active pilots and 9,515 registered aircraft
- Aviation contributes $3.5 Billion to the state economy (includes operations of airports and direct spending associated)
- 47,000 jobs, represents 10% of all jobs in Alaska

What Are AIP Funds?

The Airport Improvement Program (AIP) provides grants to public agencies for the planning and development of public-use airports. Funds for the AIP come from the Airport and Airway Trust fund, which is supported by user fees, fuel taxes, and other similar revenue sources. In general, AIP funds are used for projects that enhance airport safety, capacity, security, and environmental concerns. Airport planning, surveying, design, construction and right-of-way acquisition are eligible for AIP funds.

How Does FAA Determine Which Projects Receive AIP Funds?

Because the demand for AIP funds exceeds the availability, the FAA and ADOT&PF fund projects based on each agencies highest priorities. Airports sponsors who accept a grant offer are also accepting conditions and obligations associated with the grant assurances. These include obligations to operate and maintain the airport in a safe and serviceable condition, not grant exclusive rights, mitigate hazards to airspace, and use airport revenue properly.

How Are Rural State Airport Projects Identified and Prioritized?

Airport projects are submitted by ADOT&PF regional planning sections with significant input from community representatives, the FAA, legislature, and aviation stakeholders.

After the airfield improvement projects have been identified they are evaluated and scored by the Airport Project Evaluation Board, a six member board that meets annually. After projects are scored, Statewide Aviation develops the rural airport system spending plan and reports.

KNOW BEFORE YOU FLY

Unmanned aircraft systems (UAS), or drones as they are often called, are increasingly available online and on store shelves. Prospective operators—from consumers to businesses—want to fly and fly safely, but many don't realize that, just because you can easily acquire a UAS, doesn't mean you can fly it anywhere, or for any purpose. "Know Before You Fly" is an educational campaign that provides prospective users with the information and guidance they need to fly safely and responsibly.

Among the basic guidelines is:

- Don't fly drones above 400 feet
- Keep your drone within eyesight at all times.
- Users MUST contact airport or control tower before flying within five miles of airport.

The Alaska Unmanned Aircraft Systems Legislative Task Force has issued a handout to help users and provide safety guidelines. This information and more is available at - www.alaskadrones.org

Know Before You Fly was founded by the three leading organizations with a stake in UAS safety – the Association for Unmanned Vehicle Systems International (AUVSI), the Academy of Model Aeronautics (AMA) and the Small UAV Coalition. The Federal Aviation Administration (FAA) is partnering with the founding members to spread the word about safe and responsible flying.

Additional safety resources:

FAA What Can I Do With My Model Aircraft?

AMA National Model Aircraft Safety Code

Airport Managers & Operators Receive Training

Alaska's airport managers and staff are receiving advanced airport technical training through certification programs offered by the American Association of Airport Executives (AAAE). AAAE trains thousands of airport employees each year, and our department has been working to bring these programs to Alaska.

Three programs were held in 2014; ACE Operations, ACE Trusted Agent, and Certified Member Academy. The trusted agent program focused on understanding the requirements for vetting, issuing, tracking and auditing airport credentials and TSA Security Directives. The CM Academy is a week-long comprehensive overview of airport management that keeps our airports and state in compliance with FAA and TSA regulations.

The ACE Operations program brought together 49 airport managers from across the state including many from non-ADOT&PF airports. The 5 day course covered all aspects of airfield operations including airport surfaces, safety areas, lighting, air traffic control, emergency response, and wildlife management. The program ended with a 3 hour written exam and ACE designation for those that pass.

Participants in the ACE Operations Program board the Anchorage International Airport bus for an airfield tour.

Tradeshows, Conferences, and Community Outreach Efforts

ADOT&PF Division of Aviation managers and staff can be found throughout the year at numerous trade shows, conferences, and events with the goal of educating, increasing communication, and providing better customer service. Aviation stakeholders, and the general public can find information on airport projects, aviation policy issues, airport activity surveys, contacts, business opportunities, and more at these events and on the Department's website - www.dot.alaska.gov You can also, sign up there to receive notifications, news alerts, and press releases.

Subscribe to Receive News & Updates

(L-R) Ms. Jane Tian, KPA Cargo Consultant and Trudy Wassel, Division Operations Manager for Anchorage International Airport at The International Air Cargo Association Exhibition in Seoul Korea. Staff from both ANC and FAI travel to Asia frequently to meet with existing customers and network with new industry contacts.

Members of the Birchwood Airport Association and ADOT&PF staff painted markings on the Goose Bay Runway to assist pilots wanting to practice short take-off and landings. Currently there are six airports around the state participating in this program. Volunteers are always needed - please contact Rich Sewell for more information - 269 -0725

One of the bigger events kicking off the summer flying season is the Valdez Fly-In. Over 300 aircraft from all over the state and lower 48 compete in a poker run, STOL competitions and Flour Bombing! Fly-ins are held at many airports around the state including Fairbanks, Anchorage, Talkeetna and Kenai Airports. Photo Credit - Melissa Osborn, ADOT&PF

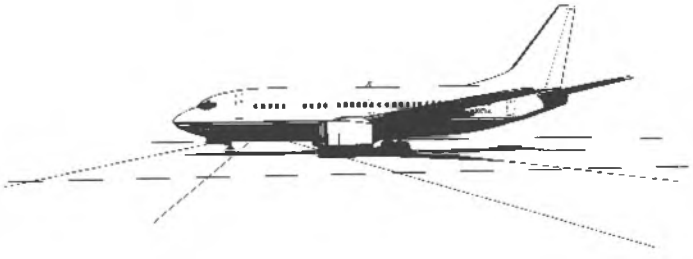
(L-R) Senator Huggins, Commissioner Kemp, Rep. Neuman, and Deputy Commissioner Binder participated in a briefing and tour of Mat-Su airports. ADOT&PF coordinates many airport visits and briefings for state and federal officials providing them with a first-hand look at challenges and issues facing Alaska's airports.

2014 Alaska Airports & Aviation Annual Report

Certificate of Compliance

Alaska Statute 02.40.020 Certification of Compliance of Air Carriers requires all air carriers operating in Alaska to have a Certificate of Compliance to show they have ample and current liability insurance. SWA manages the Certificate of Compliance and issued 157 Certificates to air carriers in 2014.

For more information please call (907) 269-0730 or email megan.byrd@alaska.gov



Statewide Airport Leasing

Statewide aviation leases property to the general public at rural airports owned by the State of Alaska. Leasing manages lands at over 200 rural airports. There is also a statewide tiedown program with spaces available for rent at these airports: Aniak, Homer, Nome City, Bethel, Iliamna Field, Big Lake, King Salmon Talkeetna, Birchwood, Kotzebue, Tok, Dillingham, McGrath, Unalakleet, Gulkana Nome, and Willow.

eLeasing - is the on-line system for processing applications for leases, building permits, land-use permits, mobile fuel dispensing permits, and aircraft tiedown permits at airports owned by the State of Alaska.

Information on leasing regulations, leasing and tiedown documents, concession fee report forms, and more is available on the leasing **webpage**.

AVIATION LEASING

Emergency Airport Lighting Program

Top –DLG's new runway lights trailer fits into smaller aircraft that serve rural airports.
Bottom - on a clear night emergency lights are visible 5 miles out on approach to the airport.

Cheaper, quicker, brighter! Our crew at the Dillingham Airport (DLG) reconfigured the trailer for our deployable emergency runway lights from a bulky four-wheel design to a slender two-wheel design. Previously the aircraft required to transport the 4-wheel trailer was a cargo aircraft such as a Skyvan, but now the lights packed in the two-wheel trailer will fit into more aircraft types, such as the smaller and less expensive Cessna 207.

Norm Heyano and John Dunson worked with Tom Eveslage, owner of Northern Welding & Machine to come up with the innovative design that not only saves money, but will ensure better service for our rural airports. Great job DLG!

Aviation Advisory Board

The Governor's Aviation Advisory Board (AAB) met four times in 2014 in Juneau, Anchorage, Nome, and Fairbanks. The board advises and provides recommendations to the Commissioner on public policy related to the department's exercise of its aviation functions assigned by law. The board represents many user groups and stay engaged with aviation stakeholders to ensure statewide aviation issues and concerns are known and addressed where possible.

The meeting in Nome included a tour of the Nome, Shismaref, Port Clarence, and Wales airports. Nome Airport is a state owned, public airport that functions as a critical element of the transportation network of the Bering Strait, serving over 59,000 passengers and 19,000 tons of cargo and mail annually.

Board members and the user groups they represent are as follows:

Jim Dodson
(Mayors of Fairbanks & North Star Borough)
Tom George
(Statewide organizations of pilots, aircraft owners & other aviation supporters)
Bob Hajdukovich
(Alaska Air Carriers Association)
David Karp
(Alaska International Airport System Operating Agreement Signatory Airlines)
Ken Lythgoe
(Non-Airline Tenants, Anchorage)
Dale Shaw
(All Cargo Air Carrier)
Frank Neitz
(Unorganized Borough)
Tom Nicolos
(Public)
Lee Ryan
(2nd Judicial District)
Mike Stedman
(Regional Air Carriers)
Steve Strait
(Mayor of the Municipality of Anchorage)

Lee Ryan is the Board Chair and can be contacted at ***dot.aviationadvisory@alaska.gov***

More information on the Board available here: ***www.dot.alaska.gov/stwdav/AAB.shtml***

(L-R) DOT&PF Commissioner Kemp, Shismaref Airport Manager Curtis Nayokpuk, and Deputy Commissioner Binder toured rural airports with the AAB during the Nome meeting.

The Board toured Lake Hood Seaplane Base (LHD) and met with tenants last April. LHD is undergoing a master planning effort that will help guide further development and reassess needs, issues, and priorities.

Few Privacy Limitations Exist on How Police Use Drones

Only 14 states require law enforcement get a warrant to use drones for surveillance.

BY KAVEH WADDELL

Follow on Twitter

+ An operator lands a commercial drone on July 4, 2014 in Sydney, Australia. (Brendon Thorne/Getty Images)

February 5, 2015 As drones become cheaper and more capable, more police departments across the country are asking for and getting federal approval to use them for law enforcement.

But the Federal Aviation Administration only takes safety into consideration when it grants a law enforcement agency approval to use drones, leaving privacy protections to legislation—which, depending on the state in question, may or may not exist.

Agencies as large as the Michigan State Police and as small as the Grand Forks County [N.D.] Sheriff's Department have received FAA approval to use drones. Most departments use them for missions like search-and-rescue or for photographing a crime scene or an accident site.

But unless a law enforcement agency is within one of the 14 states that have passed privacy legislation [http://www.ncsl.org/research/civil-and-criminal-justice/current-uas-state-law-landscape.aspx] limiting how police can use drones, there's little in theory keeping it from using a drone for a less innocuous end—such as surveillance without a warrant. "While the federal government retains responsibility for the airspace, under most circumstances a state/local government can impose restrictions on the agencies for which it's responsible," an FAA spokesperson said in an emailed statement.

Members in the House and Senate introduced bills in the previous Congress that would have required police everywhere in the country to obtain a warrant before using drones for surveillance, but the bills died at the end of the year.

ADVERTISEMENT

"In the states that don't require warrants, it's pretty much a Wild West" in terms of what's allowed, says Jay Stanley, senior policy analyst at the American Civil Liberties Union. "There's nothing stopping a police department from using [drones] in all kinds of ways to spy, except for the Constitution."

Within that unregulated "Wild West," police have very different approaches to their drone programs. One of the longest-running law enforcement drone programs is at the Mesa County Sheriff's Office in Colorado. Ben Miller, its director, says the department has a 17-page policy that outlines when and how it can use drones and for how long it retains data.

The department has never run a surveillance mission with its drones, Miller says, which are generally used for search-and-rescue and crime-scene photography. "If we had a need to look into an area where someone would have a legitimate expectation of privacy, we'd get a warrant," he says.

Colorado is one of the states [http://www.ncsl.org/research/civil-and-criminal-justice/current-uas-state-law-landscape.aspx] without any legislation about drones at all, according to the National Conference of State Legislatures, which means that the limitations on the Mesa County drone program were instituted at the department's prerogative.

Unlike the Mesa County Sheriff's Office, some law enforcement agencies have been less than forthcoming with their drone programs. Last year, the San Jose Police Department in California secretly bought [http://www.mercurynews.com/crime-courts/ci_26279254/san-jose-police-apologize-secret-drone-purchase-promise] a $7,000 drone, and was faced with uproar in the community when freedom-of-information requests brought the purchase to light six months later.

The police department said the drone was meant for helping bomb technicians access hard-to-reach places, but left the door open for using the drone to address "dangers such as active shooters, hostage taking, or other such tactical situations where lives might be in immediate danger."

And this December, the sheriff in Alameda County, Calif., revealed [http://www.sfgate.com/crime/article/Alameda-County-sheriff-reveals-that-he-s-bought-5930981.php] that he spent $97,000 of his own department's money to buy a pair of drones after he was barred from using federal funds to make the purchase. The sheriff told the *San Francisco Chronicle* that the drone won't be used for surveillance "in any shape, manner or form," but California, like Colorado, has no state law that requires warrants for surveillance.

The California state assembly passed a bill last year that would have required police to obtain a warrant to fly drones in any event other than an "emergency situation." But Gov. Jerry Brown vetoed it [http://www.cnet.com/news/california-police-can-fly-drones-without-a-warrant/] in September, because he said the exceptions the bill allowed "appear to be too narrow."

While advocates are worried that law enforcement could use drones in ways that violate citizens' privacy, there's little fear that they're being abused yet. "Safety restrictions are so strict that most police departments are still using them in quite limited ways," the ACLU's Stanley said. "This is still an issue of looking down the road to what we know is coming."

The technology is new enough that police groups are still grappling with its implications and limitations. "We're doing some research right now to come up with some model policy," said John Thompson, deputy executive director of the National Sheriffs' Association. "We don't have a statement or opinion on it at this point."

Miller, who runs the drone program at the sheriff's office in Mesa County, says he often hears from other law enforcement agencies who need help getting their drone program off the ground. But there's no formal coordination: "It's all very word-of-mouth," he said, and suggested that others find him simply by searching the Internet.

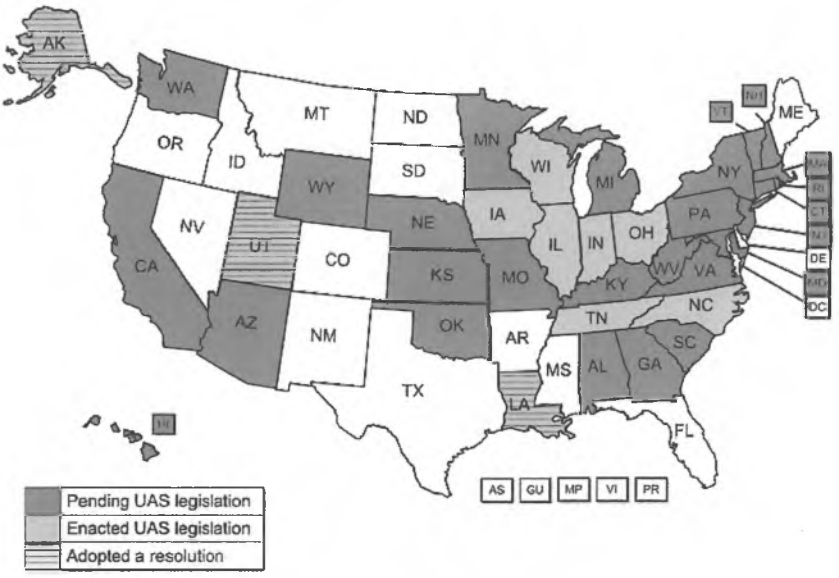
For the time being, privacy advocates are not focusing on fighting for federal legislation. "For activists, it's generally easier to do things at the local and state level," says Nadia Kayyali of the Electronic Frontier Foundation, a privacy and free speech advocacy organization. "Any fight at the local level is more likely to see results, but also does take a much more significant investment in time."

2014 STATE UNMANNED AIRCRAFT SYSTEMS (UAS) LEGISLATION

9/16/2014 Rich Williams

In 2014, 35 states considered UAS or UAV (also commonly called drones) bills and resolutions; 10 states enacted new laws.

State UAS Legislation



Alaska enacted HB 255 creating procedures and standards for law enforcement's use of unmanned aircraft, as well as, regulations for the retention of information collected with UAS. It requires law enforcement agencies to adopt procedures that ensure: the appropriate Federal Aviation Administration flight authorization is obtained; UAS operators are trained and certified; a record of all flights are kept and there is an opportunity for community involvement in the development of the agencies' procedures. Under the law, police may use UAS pursuant to a search warrant, pursuant to a judicially recognized exception to the warrant requirement and in situations not involving a criminal investigation. Images captured with UAS may be retained by police under the law for training purposes or if it is required as part of an investigation or prosecution. The law also authorizes the University of Alaska to develop a training program for operating UAS. The state senate also adopted a resolution HCR 15 to extend the operating time and expand the duties of the state UAS task force.

Illinois enacted SB 2937 creating regulations for how law enforcement can obtain and use information gathered from a private party's use of UAS. The law requires police to follow warrant protocols to compel third parties to share information, and if the information is voluntarily given to police, authorities are required to follow the state's law governing UAS data retention and disclosure. The law also loosens regulations around law enforcement's use of UAS during a disaster or public health emergency.

Indiana is the first state to enact a UAS law in 2014. HB 1009 creates warrant requirements and exceptions for the police use of unmanned aircraft and real time geo-location tracking devices. It also prohibits law enforcement from compelling individuals to reveal passwords for electronic devices without a warrant. If law enforcement obtains information from an electronic service provider pursuant to a warrant, the provider is immune from criminal or civil liability. The law provides that if police seek a warrant to compel information from media entities and personnel, then those individuals must be notified and given the opportunity to be heard by the court concerning issuance of the warrant. The new law also creates the crime of "Unlawful Photography and Surveillance on Private Property," making it a Class A misdemeanor. This crime is committed by a person who knowingly and intentionally electronically surveys the private property of another without permission. The law also requests that the state's legislative council study digital privacy during the 2014 interim.

Iowa enacted HF 2289, making it illegal for a state agency to use a UAS to enforce traffic laws. The new law requires a warrant, or other lawful means, to use information obtained with UAS in a civil or criminal court proceeding. It also requires the department of public safety to develop guidelines for the use of UAS and to determine whether changes to the criminal code are necessary. The department must report on their findings to the general assembly by Dec. 31, 2014.

Louisiana enacted HB 1029, creating the crime of unlawful use of an unmanned aircraft system. The new law defines the unlawful use of an unmanned aircraft system as the intentional use of a UAS to conduct surveillance of a targeted facility without the owner's prior written consent. The crime is punishable by a fine of up to 500 dollars and imprisonment for six months. A second offense can be punished by a fine up to 1000 dollars and one year imprisonment.

North Carolina enacted SB 744 creating regulations for the public, private and commercial use of UAS. The new law prohibits any entity from conducting UAS surveillance of a person or private property and also prohibits taking a photo of a person without their consent for the purpose of distributing it. The law creates a civil cause of action for those whose privacy is violated. In addition, the law authorizes different types of infrared and thermal imaging technology for certain commercial and private purposes including the evaluation of crops, mapping, scientific research and forest management. Under the law, the state Division of Aviation is required to create a knowledge and skills test for operating unmanned aircraft. All agents of the state who operate UAS must pass the Division's knowledge and skills test. The law enables law enforcement to use UAS pursuant to a warrant, to counter an act of terrorism, to oversee public gatherings, or gather information in a public space. The bill creates several new crimes: using UAS to interfere with manned aircraft, a class H felony; possessing an unmanned aircraft with an attached weapon, a class E felony; the unlawful fishing or hunting with UAS, a class 1 misdemeanor; harassing hunters or fisherman with a UAS, a class 1 misdemeanor; unlawful distribution of images obtained with a UAS, a class 1 misdemeanor for; and operating a UAS commercially without a license, a class 1 misdemeanor. The law addresses launch and recovery sites of UAS, prohibiting their launch or recovery from any State or private property without consent. In addition the law extends the state's current regulatory framework, administered by the chief information officer, for state use of UAS from July to December 31, 2015.

Ohio enacted HB 292 creating the aerospace and aviation technology committee. One of the committee's duties is to research and develop aviation technology including unmanned aerial vehicles.

Tennessee has enacted two new laws in 2014. The first, SB 1777, makes it a class C misdemeanor for any private entity to use a drone to conduct video surveillance of a person who is hunting or fishing without their consent. SB 1892 makes it a Class C misdemeanor for a person to use UAS to intentionally conduct surveillance of an individual or their property. It also makes it a crime to possess those images (Class C Misdemeanor) or distribute and otherwise use them (Class B Misdemeanor). The law also identifies 18 lawful uses of UAS, including the commercial use of UAS under FAA regulations, professional or scholarly research and for use in oil pipeline and well safety.

Utah enacted SB 167, regulating the use of UAS by state government entities. A warrant is now required for a law enforcement agency to "obtain, receive or use data" derived from the use of UAS. The law also establishes standards for when it is acceptable for an individual or other non-governmental entity to submit data to law enforcement. The new law provides standards for law enforcement's collection, use, storage, deletion and maintenance of data. If a law enforcement agency uses UAS, the measure requires that agency submit an annual report on their use to the Department of Public Safety and also to publish the report on the individual agency's website. The new law notes that it is not intended to "prohibit or impede the public and private research, development or manufacture of unmanned aerial vehicles."

Wisconsin enacted SB 196, requiring law enforcement to obtain a warrant before using drones in a place where an individual has a reasonable expectation of privacy. The law also creates two new crimes; "possession of a weaponized drone" and "use of a drone." Use of a drone creates a class A misdemeanor for a person who, with intent, observes another individual in a place where they have a reasonable expectation of privacy. Possession of a weaponized drone is a class H felony.

Police investigate complaints of drone following Eagle River children

Chris Klint, Senior Digital Producer, cklint@ktuu.com

POSTED: 12:24 PM AKDT Mar 26, 2015 | UPDATED: 01:27 PM AKDT Mar 26, 2015

Tweet 27 8+1 13

ANCHORAGE - Parents in Eagle River have complained to police about a small drone aircraft that they say has been spotted this week following school children and hovering near homes. The reports highlight growing concern over laws that govern how and where drones can be used in Alaska.

Concerned grandparent Patricia Bailey said her experience with the aerial intruder began Tuesday, when she saw the drone hovering above her and 2-year-old granddaughter as they stood in their driveway.

After speaking with other parents, Bailey learned that the craft, which she described as "a very elaborate drone" -- a quadcopter model equipped with a camera in a ball turret -- had also been spotted outside windows of homes in the area.

Bailey said the final straw came when she spoke with children returning home from Eagle River Elementary School.

"One of them asked, 'Did you see the drone?'" Bailey said. "I asked, "What drone?"'

"'The one that followed us home.'"

"That's what got me fired up," Bailey said.

When Bailey and other parents called Anchorage police, she said they were told that the letter of the law bars firing guns at drones, but that they were within their rights to throw rocks and fire slingshots at the device if they felt threatened.

Police investigate complaints of drone following Eagle River children

Adult remains confirmed from missing Kenai family members

Anchorage police spokeswoman Anita Shell says police took one call each Monday and Tuesday about the drone from residents near Eagle River Elementary. She said several people had apparently decided to have one person call police on behalf of the group.

"There were two separate calls that neighbors (made), about a drone following children home or near windows," Shell said.

Police told the parents involved that they spoke with the drone's operator and gave him a "very stern talking-to" about their concerns, Bailey said.

When the man complained about the potential risk of damage to his expensive drone, she said, officers told him that the best way to keep his drone safe was by not flying it over other people's property.

Bailey said the intervention by officers on parents' behalf had an apparent effect when people next saw the drone Wednesday.

"It wasn't following kids," Bailey said. "It was over the school, but it was high up."

Shell said police did speak to the drone operator but did not talk about specifics of the exchange.

"We did make contact with the drone owner," Shell said. "He was using the drone to practice for some upcoming business venture."

Police would not identify the drone operator Thursday, because Shell said he wasn't arrested or charged after officers contacted him.

"He wasn't committing a crime," Shell said. "There wasn't anything we could do but advise him of the neighbors' concerns about following children home or flying near windows."

Since then, Shell said, "We haven't received any other complaints on him."

Channel 2 on Thursday visited the operator's residence, as identified by Bailey, but an occupant said the man was not at home.

With the Federal Aviation Administration taking the lead in the emerging field of legislation governing drone use, Shell said the Eagle River incident highlighted the lack of local rules doing so.

"It's not a city law, it's not a state law," Shell said.

FAA spokesman Allen Kenitzer said in a Thursday email that the agency is investigating this week's Eagle River incident. The FAA is also looking into another Anchorage drone incident, involving a craft which entered airspace at Merrill Field.

One section of FAA regulations concerning drone use quoted by Kenitzer offers stern consequences for encroaching on manned aircraft, warning that the agency "may take enforcement action against anyone who operates a (drone) in a way that endangers the safety of the national airspace system." The excerpt doesn't directly address privacy concerns, however, citing a list of do's and don'ts released by the agency in June.

"In the notice, the FAA restates the law's definition of 'model aircraft,' including requirements that they not interfere with manned aircraft, be flown within sight of the operator and be operated only for hobby or recreational purposes," FAA officials wrote. "The agency also explains that model aircraft operators flying within five miles of an airport must notify the airport operator and air traffic control tower."

Privacy is being addressed on the state level, however, with lawmakers taking increasing interest in how to protect people from encroachments by drones. Ginger Blaisdell, the chief of staff for Rep. Shelley Hughes (R-Palmer), said Thursday that Hughes' office was aware of the Eagle River incident and had spoken with Bailey.

According to Blaisdell, flying a drone up to someone else's window doesn't currently violate state law -- unless it's equipped with a camera.

"That's not a criminal issue at all," Blaisdell said. "What is a criminal issue is peeking into people's windows and photographing them -- that could lean into harassment."

Hughes is entering her third year as a member of the Unmanned Aircraft Systems Legislative Task Force, a group which includes lawmakers as well as representatives from the FAA and the state Department of Public Safety. The task force hasn't specifically discussed the Eagle River incident, but Blaisdell said it has considered some very similar scenarios.

"(For instance), what if a person flies up and takes pictures of you changing your clothes?" Blaisdell said. "Should you close your curtains?"

The discussions accompany a rising wave of drone activity on the Last Frontier, with the FAA naming Alaska one of six states where it plans to develop test sites for drones in 2013 and the University of Alaska conducting drone research at an in-state flight range.

Despite that uptick in unmanned flights, Blaisdell said state activity on drone bills has been limited since last year, when then-Gov. Sean Parnell signed into law a bill governing the use of drones by law enforcement. She cited the FAA's lead on drone rules as a factor in that slowness.

"We haven't put together another actual bill this year," Blaisdell said. "They're really the ones establishing the regulations for drone use."

Back in Eagle River, Bailey said keeping drones like the one spotted this week from following her children is a victory in itself.

"As long as he stays high in the sky, I'm OK with him," Bailey said.

Editor's note: The sequence of events in Patricia Bailey's account of encounters involving the drone Tuesday has been corrected.

Channel 2's Dan Carpenter contributed information to this story.

Main Image Caption:
An Eagle River resident launches his DJI Inspire quadcopter drone off a landing pad on the front deck of his home on Wednesday, March 25, 2015.

A man operating his high-tech, remote-controlled quadcopter -- more commonly known as a drone -- caused a stir among residents of one Eagle River neighborhood earlier this week. Anchorage police were called to the area Tuesday after residents complained that a drone was following children home from a nearby school, but officers found no laws had been broken.

The incident has highlighted both the growing popularity of private drone use and the possible privacy and safety concerns the devices can raise for neighbors of drone enthusiasts.

Patricia Bailey-Ruiz, who lives near Eagle River Elementary School, said she was outside her home playing with her grandchildren at about 3:30 p.m. Tuesday when she heard a buzzing noise overhead.

"It came right down to us at the height of the light poles and just hovered there," Bailey-Ruiz said. "And it was making a clicking noise and it was shifting around in the sky."

Bailey-Ruiz said that's when a neighborhood child walked by her house on his way home from school.

"I said, 'Did you see the drone?' and he said, 'Oh, yeah, he has been out for a few days and he comes home with us from school, and follows kids to their houses,' " Bailey-Ruiz said. "And that's when I called Anchorage police."

A group of angry residents a few blocks away told officers where the drone operator lives.

Police said the man in the house told them that he was practicing flying his drone for an upcoming business venture. Officers told the man to stop flying his drone near the school or children and to respect people's privacy. But there was little else they could do.

"There is no state or local law for the misuse of drones," said APD spokeswoman Anita Shell. "Can we prove anything illegal has been done? No."

For three years, the Unmanned Aircraft Systems Legislative Task Force [3], a group made up of lawmakers and Federal Aviation Administration and state officials, has been considering how to craft laws that would regulate the private use of drones in Alaska. So far, no bill has been drafted because the group is waiting for federal regulators to weigh in on the issue. The only current state regulations addressing drones are bans against using them for hunting or to spot animals in preparation for a hunt.

The FAA regulates all aerial vehicles, including drones. Drone operation is currently banned for commercial purposes with some exceptions for closed movie sets and experimental programs -- like the one at the University of Alaska Fairbanks [4].

But there are few regulations for private drone use. Current guidelines [5], written in 1981 to cover the use of model and remote-controlled aircraft, suggest that operators fly at a safe height and away from crowds or airports.

Generally, remote-controlled aerial devices, including drones, are not allowed within 5 miles of airports and must not fly above 400 feet.

The FAA said it was working on clear rules for civilian drone use that could be finished by the end of this year.

FAA spokesperson Allen Kenitzer said the agency is investigating the Eagle River drone incident.

The man flying the drone was not identified by Anchorage police because he had broken no laws. After being contacted by Alaska Dispatch News on Wednesday, the man agreed to show reporters how the drone worked and flew it for about five minutes before accidentally crashing the $3,400 device, breaking a propeller and damaging its landing gear.

The drone operator asked not to be identified for this story because he said he was worried about escalating neighborhood tensions. He claims other drones operate in the area and denies that he has ever followed children or flown low enough to look into people's homes with his drone's camera. The man said he is considering painting his drone a bright, noticeable color so that it is easily identifiable and distinguishable from other drones. He also told Alaska Dispatch News that he would no longer fly his drone while children were walking home from school.

The man said he bought the drone -- a DJI Inspire [6] quadcopter -- online because he used to fly drones for the military and wanted to see what civilian models could do.

The FAA estimates there could be as many as 7,500 civilian drone users within the next four years. Highly publicized drone crashes -- including at the White House [7] -- and near misses with aircraft have heightened the need for a clear set of rules for drones. But for now, local police are on their own when it comes to deciding if any privacy laws have been broken by drone use in neighborhoods and around people.

"The technology is moving faster than the laws, basically," Shell said.

In the absence of legal restrictions about drone use, it remains up to the operator to make sure his device is being flown safely and ethically.

"You can't regulate stupid," said Alaska Zoo photographer and drone enthusiast John Gomes.

Gomes said he only flies his device away from people, usually in parks. Gomes said ethical operators always keep their drones in sight, never relying on the onboard cameras as the only means to see where they are.

Gomes said most drones don't have cameras with great resolution and that it would be difficult to use them to spy on people. He added that it's always a good idea to get a property owner's permission before flying over their land. Gomes said drones get a bad reputation because of people's fears and incidents like the one in Eagle River.

Still, Gomes claimed the aircraft are fun to fly and can be useful for photography and entertainment, if operated ethically.

06/19/15 Task Force Meeting

<TARGET><BILL></BILL><SUBJECT>06-19-15 Task Force Meeting</SUBJECT><COMM><TARGET></COMM></TARGET>

Legislative Task Force on Unmanned Aircraft Systems
June 19, 2015 Meeting
Anchorage Legislative Information Office ~ 716 W 4th Ave ~ Auditorium
1:00pm – 5:00pm

Task Force Members:

- Representative Shelley Hughes, Co-Chair
    - Ginger Blaisdell, Staff to Rep. Hughes
- Senator Peter Micciche, Co-Chair
- Ethan Tyler, Commissioner Designee, Department of Commerce, Community Economic Devel.
- Mike O'Hare, Commissioner Designee, Department of Military and Veterans' Affairs
- Lieutenant Steve Adams, Commissioner Designee, Department of Public Safety
- John Binder, Commissioner Designee, Department of Transportation, Public Facilities
- Ro Bailey, University of Alaska Fairbanks
- Steve Strait, Aviation Advisory Board, Governor's Office and DOT/PF
- Steve Colligan, Representative Member for the Academy of Model Aeronautics
- John Parker, Integrated Robotics Imaging Systems
- Steve Wackowski, Tulugaq II
- Bob May, Gallery Lodge, Kasilof

Task Force Responsibilities

The duties of the task force shall include

1. reviewing regulations and guidance from the Federal Aviation Administration regarding unmanned aircraft systems;
2. providing written recommendations, together with suggested legislation, for a comprehensive state policy for unmanned aircraft that protects privacy and allows the use of unmanned aircraft systems for public and private applications;
3. evaluating complaints and concerns expressed to the task force;
4. identifying potential privacy and public safety concerns associated with unmanned aircraft systems and determining whether legislation is necessary to address them;
5. considering recommendations for public education related to unmanned aircraft systems;
6. studying the Federal Aviation Administration's "Integration of Civil Unmanned Aircraft Systems (UAS) in the National Airspace System Roadmap," issued November 7, 2013 (1st ed. 2013) and its application to the development of unmanned aircraft systems in the state;
7. conducting a public hearing concerning privacy and the capture of data by unmanned aircraft systems at the University of Alaska's test site;
8. further studying the nonpublic use of unmanned aircraft systems to encourage development of the private sector unmanned aircraft system industry; and
9. further studying and making recommendations with respect to ensuring unmanned aircraft users comply with applicable laws.

AGENDA

1:00pm Welcome and Introductions ..... Representative Shelley Hughes

- Review of Meeting Summary from February 11, 2015
- Introduction of guests and new task force representative

AGENDA

1. Summary of military briefing – Pages 1 - 23
   - Russia to Deploy Military UAS to Monitor Arctic
   - Senators, Congressmen, Praise New UAS Research
   - Alaska Delegation: Fort Wainwright Soon Welcoming Gray Eagle "Sky Warriors"
   - Alaska Command PowerPoint: DoD UAS in Alaska
2. Current events:
   - News Articles Pages 24 – 37
   - FAA Articles Pages 38 – 52
   - Department of Justice Guidelines Pages 53 – 58
     - www.alaskadrones.org
3. Invited testimony
   - Ryan Marlow, Alaska Aerial Media
   - Captain Dave Koch, Anchorage Police Department
4. Privacy document and legal memo regarding privacy for Alaska citizens
     - www.alaskadrones.org
5. Drone insurance for commercial and recreational users
6. Public testimony
7. Wrap-up and adjourn
   - Future Meeting Agenda:
     - Next meeting: September 3rd 1 – 5pm
   - Follow Up – To Do
     - Letter to Congressional Delegation regarding funding of FAA Test Sites

Legislative Task Force on Unmanned Aircraft Systems
February 11, 2015 Meeting
State Capital, Juneau Alaska, Room 13
1:00 – 3:00pm

Task Force Members:

- Representative Shelley Hughes, Co-Chair
- Joe Jacobson, Commissioner Designee, Department of Commerce, Community Economic Devel.
- Mike O'Hare, Commissioner Designee, Department of Military and Veterans' Affairs
- Lieutenant Steve Adams, Commissioner Designee, Department of Public Safety
- Ro Bailey, University of Alaska Fairbanks
- Steve Colligan, Representative Member for the Academy of Model Aeronautics
- Steve Wackowski, Tulugaq II
- Bob May, Gallery Lodge, Kasilof
- Ginger Blaisdell, Staff to Rep. Hughes

Not in attendance:

- Senator Peter Micciche, Co-Chair
- John Binder, Commissioner Designee, Department of Transportation, Public Facilities
- John Parker, Integrated Robotics Imaging Systems
- Steve Strait, Aviation Advisory Board, Governor's Office and DOT/PF

MEETING SUMMARY

1:00pm Welcome and Introductions .....Representative Shelley Hughes

- Thank you all for coming to Juneau and attending the Lunch and Learn hosted by the University of Alaska Fairbanks and contributors

Items in meeting packets:

- Dec 5 meeting minutes – to be emailed
- Letters to department heads
- Letter to delegation
- Congressional bills introduced by Young and Murkowski – encourage public private partnerships to provide funding

- KBYF safety guidelines and the alaskadrones.org web site
- FAA is trying to ramp up drone education and regulation process
- You tube link to Swiss team 'cage' that won $1m from UAE
- FAA issued guidance for law enforcement
- UAS improvement act 2015 congressional legislation – procurement, homeland security, etc.
- Young and Murkowski bill
    a. Ro Bailey worked with congress on this legislation (Allison/Murkowski)
    b. Test sites are experiencing issues where the FAA is interpreting aspects of UAS research that makes the work they are doing very difficult
    c. Trying to break the FAA lose from restricting operations at the test sites
    d. Can't be paid to fly but can receive money for milestones

Joe Jacobson, Department of Commerce, Community and Economic Development

Update: final report on UAS economic advantages for Alaska is in today's packet

- Cultivating a resource, workforce, university program
- Entrepreneurial focus to attract them
- Canada forming alliances across industries (maritime and UAS)
- Recommending incentives to attract business without increasing cash outlay
- Job creation and revenue to the state

Barbara Johnson (past position with FNSB)

- Economic development work to establish military development zones
- Looked at a tech park near Salcha, now considering Hightop Park using University lands about 20 miles outside Fairbanks
- NOAA is very interested in what Alaska is doing
- Great opportunities in the Arctic

Steve Colligan, Academy of Model Aeronautics

- Hobby industry has the best you tube information on flying UAS you might want to see
- Safety is directly related to skills and knowledge
- "We" need to get information out there virally
- Know Before You Fly campaign
- Asks Task Force (alaskadrone.org) to "sign on" to national campaign Know Before You Fly – send a letter and a logo to the national campaign
- Discussion: letter to campaign, recommendation from Gov/Task Force?, what logo?, want all Alaska communities-agencies-vendors to 'sign on' to alaskadrones.org?, wants Gov to endorse, ask congressional delegation to draft letters
    - Joe and Steve Colligan will work with Gov office to request a letter
    - Knowbeforeyoufly.org

Bob May, Public member - Very interested in the privacy for Alaskans

Steve Wackowski, Fairweather Inc. – Top 40 Under 40

Mike O'Hare, Department of Military and Veterans' Affairs

- Offer to host next meeting on base
- Update on how military plans to use UAS

Ro Bailey, University of Alaska Fairbanks

- Interest Group Meeting
  - Interest group meeting begins on September 1, she would like the task force meeting to coincide with the interest group, consider meeting September 3 or 4 in Fairbanks
- Ro Bailey also noted that the Test Site now includes operations in Kansas and Tennessee for test site operating locations but not as a key partner

PRIVACY DOCUMENT _____

Privacy considerations for Alaskans

- Most privacy issues around the USA have been with regard to law enforcement privacy
- Ro Bailey: once we put the privacy document out, we should include the "who to call" info

Creating a document:

- Want the privacy document to fit on one page (similar to KBYF)
  - Who is the target audience?
  - How will this document be used?
  - Might be different audiences with different needs?
  - Hobby Use – Commercial Use – Law Enforcement
    - Semi-professional videographers occurring in Alaska already
    - Section 333 exemptions in the FAA reform act of 2012
- Guidelines vs Law?
- **FAQ version** of common questions to add to the web site – FAQ's would allow ginger to research statutes with legal services – questions provided to Ginger by Feb 15 - Generic or specific examples to use in the FAQs?
  - Who owns the airspace above your house?
  - How to apply the protections that Alaska already has in statute?
  - Reasonable expectation of privacy
  - How is data going to be used, stored and maintained?
  - Can I shoot it down if it's flying over my house? Destruction of another's property.
  - Circumstance: is it private or not?
  - What do I do if there's a drone flying over my house?
  - Can I use this for my business?
  - Noise ordinance?
  - Chasing my dog?
- "**Cartoon**" some of the scenarios to grab everyone's attention

Timing

- Get the information out to the public quickly and we can continue to refine
- Get our web site to the national level

New information to put on website

- Put the 5-page excerpt on the alaskadrones.org web site
- Why Alaska? Joe Jacobson has a great flyer developed
- Who do you contact and how do you contact re inappropriate drone flights?
    - Jay Skaggs – call me...
    - Get contact information on alaskadrones.org
    - Can individuals contact local police? – yes
    - DPS form/content to be made available on alaskadrones.org so individuals know what information to provide to local police (or forwarded on to FAA)
    - Don't dial 911

Public Testimony

Bill Tart, Arctic Slope Regional Corp – no testimony provided

Next meeting

- **June 19 in Anchorage on Base coordinated by Mike O'Hare – would like a UAS demo**
    - Would not be able to get the public on the base for a general meeting – look into the rules for this.
- FAA should kick out some rules by June
- Letter to congressional delegation regarding test site funding
- Matrix and Education plan to be worked on by Steve Strait and Ginger
    - KBYF one page document (and this privacy document) really delivers the education plan
- Military update
- Unmanned Traffic Management System – how do they fly, where do they fly, communication capabilities
    - Steve Colligan is aware of the relationship with NextGen, detect and avoid technology
    - Ro Bailey is under contract with NextGen working on airspace reservation information and ultimately integrate with manned aviation
    - Steve Wackowski is working with major entities and University, on the slope to be first to integrate the UTM in Alaska

Russia to Deploy Military UAS to Monitor Arctic

Russian drones will start monitoring the situation in the Arctic as well as on a part of the Northern Sea Route starting May 1, authorities announced. The vehicles can be used in navigation as well as in search and rescue missions.

"The drones' task is to maintain impartial control of the situation in the Russian sector of the Arctic, including the ecological and ice situation in the adjoining sea areas and along the Northern Sea Route," Colonel Aleksandr Gordeev said.

The division of UAV [Unmanned aerial vehicle] Orlan-10 of Eastern Military District will deploy in Chukotka [Peninsula] from May 1.

Produced at the Special Technological Centre of Saint Petersburg, the Orlan-10 drones are capable of reaching speeds of 90-150kph.

The drones will perform such tasks as *"managing objective control over the situation in the Russian Arctic,"* and section of the Northern Sea Route, Gordeev added.

The vehicles will be delivered aboard Mi-26 heavy transport helicopters to any area for monitoring the situation in the Russian Arctic, navigation as well as in search and rescue missions.

Plans to implement drones in the Arctic were revealed at the end of 2014. The test flights of Orlan-10 started in March 2015.

Russia has recently started developing its northern regions, which includes the production of hydrocarbons, with national companies developing the exploration and construction of drilling facilities.

Home to the largest icebreaker fleet in the world, Russia is the only nation to use nuclear-propelled icebreakers. With climate change making the Arctic region more accessible, Moscow sees its development a priority both for the sake of its natural resources and as a potential route for transport vessels from Asia to Europe.

Senators, Congressmen, Praise New UAS Research

Members of the U.S. Senate and House of Representatives pledged to continue their support for a newly-designated FAA Center of Excellence for Unmanned Aircraft Systems that will research and develop technologies and policies for the use of unmanned aerial systems, or drones, in the United States.

At a news conference Thursday, lawmakers praised the Federal Aviation Administration (FAA) selection of Alliance for System Safety of UAS through Research Excellence (ASSURE), a consortium of universities headed by Mississippi State University (MSU), to lead the UAS COE. ASSURE is tasked with identifying issues critical to the integration of unmanned aircraft systems (UAS) into the nation's airspace and engaging in research and policy development on the growing use of unmanned aerial systems.

FAA Administrator Michael Huerta, MSU President Mark Keenum and consortium members joined U.S. Senators Thad Cochran (R-Miss.), John Hoeven (R-N.D.), Lisa Murkowski (R-Alaska), Roger Wicker (R-Miss.), and U.S. Representatives Kevin Cramer (R-N.D.) and Gregg Harper (R-Miss.) at the event to discuss the next steps and goals for the COE UAS.

4

"Unmanned aircraft technology is here to stay, and we are all excited that our states will have an active role in figuring out the safest and most efficient way to incorporate this evolving technology into our airspace to assist on issues ranging from precision agriculture to disaster recovery," Senator Cochran said. "We are interested in continuing to support what will be a collaborative process to address the complicated nature of integrating unmanned aircraft into our national airspace system, as well as privacy and other issues that arise with their use."

"We are extremely pleased that UND is a key member of the UAS team selected for the Center of Excellence," Senator Hoeven said. "UND brings not only its resources as a premier school of aviation, but also the northern tier UAS test site and the Grand Sky Technology Park."

"From the Alaska perspective, unmanned aerial systems can be game changers for my state - to work around our vast distances and lack of infrastructure. Whether in the form of Arctic research, delivering goods in the Bush, fire-fighting or policing in rural areas, UAS deserve serious and thoughtful consideration as we map out an intelligent rule book for their use and applications," Senator Murkowski said.

"Advances in Unmanned Aircraft Systems are making a big impact on the ways we live and work - revolutionizing how we engage with the world," Senator Wicker said. "These technologies help create tens of thousands of jobs, grow our crops more efficiently, improve our response to humanitarian crises, and protect our troops. This consortium of research universities, led by Mississippi State University, will play a leading role in the future development of this exciting, emerging field."

"This alliance is its own evidence of excellence. In addition to the scientific and intellectual assets of these institutions, North Dakota brings the highest ethical standards born out of the culture of the prairies to be applied to the execution of technology," Congressman Cramer said.

"I commend FAA Administrator Huerta's search selection of the ASSURE consortium, headed by Mississippi State University, to lead the UAS Center of Excellence," Congressman Harper said. "Over the past decade and a half, we have seen UAS technology and capabilities grow exponentially and this selection speaks strongly to the important partnership between the FAA and academia. I applaud Senator Cochran's leadership on this issue. Dr. Keenum, Mississippi State University and ASSURE are uniquely positioned to be an integral part of the growth of UAS research and technological advancements."

The directive to the FAA to establish the national center has been included in congressional appropriations bills since FY2012, with Congress appropriating $5.0 million to support a five-year agreement with the COE UAS. Federal funding will be matched by ASSURE team members.

The FAA expects the COE to begin research in 2015 and be fully operational in 2016 in its exploration of evolving new technological developments regarding unmanned aircraft and their uses, including detect-and-avoid technology, low-altitude operations safety, privacy safeguards and other areas. Research will also involve the deployment of UAS for emergency response, bio-fuel and clean fuel technologies, law enforcement activities, and agricultural and environmental monitoring.

Moreover, the COE UAS will coordinate research and development activities with the National Aeronautics and Space Administration, the Department of Defense, the Department of Homeland Security, Department of Agriculture and other agencies. Its work will also lead to recommendations on aircraft certification, flight standards and air traffic requirements, and facilitate UAS technology transfer to other civilian and defense agencies.

In addition to Cochran, Hoeven, Murkowski and Wicker, other Senators who have been instrumental in supporting the formation of the COE UAS include Ron Wyden (D-Ore.), Pat Roberts (R-Kan.), Heidi Heitkamp (D-N.D.), Richard Shelby (R-Ala.), Jeff Sessions (R-Ala.), Bill Nelson (D-Fla.), Richard Burr (R-N.C.), Bob Casey (D-Pa.), Tom Udall (D-N.M.), Jeff Merkley (D-Ore.), Jerry Moran (R-Kan.), Martin Heinrich (D-N.M.), Jon Tester (D-Mont.).

ASSURE members include Mississippi State University, Drexel University, Embry-Riddle Aeronautical University, Kansas State University, Montana State University, New Mexico State University, North Carolina State University, Oregon State University, University of Alabama-Huntsville, University of Alaska-Fairbanks, University of Kansas, University of North Dakota, Wichita State University, Ohio State University, University of California-Davis, Auburn University (associate member), Concordia University (associate member), Indiana State University (associate member), Louisiana Tech University, Tuskegee University (associate member), and University of Southampton (associate member).

ALASKA CONGRESSIONAL DELEGATION

NEWS RELEASE

SENATOR LISA MURKOWSKI — Matthew Felling 202-224-9301
SENATOR DAN SULLIVAN — Mike Anderson 202-224-6727
CONGRESSMAN DON YOUNG — Matthew Shuckerow 202-225-0722

Alaska Delegation: Fort Wainwright Soon Welcoming Gray Eagle "Sky Warriors"

U.S. Army Informs Lawmakers of Basing Decision,

Further Reinforcing Alaska's Military Footprint

WASHINGTON, D.C. – Alaska's Congressional Delegation received good news today from the United States Army, that Fort Wainwright will be the home base for nine "Gray Eagle" Unmanned Combat Air Vehicles. This announcement solidifies the Department of Defense's investment of manpower and infrastructure in Alaska, the "most strategic location in the world."

The Gray Eagle Company will bring 128 military personnel and their families to Interior Alaska beginning next month, and represents a major addition of military hardware that complements Alaska's two combat infantry brigades, the Apache helicopters and Air Force assets.

The U.S. Army also informed the delegation that while the aircraft will be housed at an existing facility in the short-term, it plans to seek constructing for a UAV facility in the President's 2017 budget.

"Alaska is the tip of the spear when it comes to the Pentagon's strategic shift to the Asia-Pacific, but the Pentagon clearly sees it as a superior choice to also respond to increasing military activities in the Arctic region," said **Senator Lisa Murkowski.** "It was not too long ago that the Department of Defense was taking a closer look at its investment and presence in Alaska; it's now evident that officials came away from examining Alaska extremely impressed and convinced that we are the optimal location and community for men and women in uniform."

"Today's announcement from the Army is the latest in a string of good news for military basing and positioning in Alaska. The Gray Eagle Company will provide benefit to Alaskan service members by allowing them to train as they fight—with support from Gray Eagles, Apaches, and Air Force assets at JBER and Eielson," **said Congressman Don Young.** "I proudly supported the procurement of the Gray Eagle in this year and last year's National Defense Authorization, so I was thrilled to learn they would be positioned at Ft. Wainwright."

"In an increasingly dangerous world, Intelligence, Surveillance, and Reconnaissance (ISR) capability has never been in greater demand," **said Senator Sullivan.** "Now more than ever, ground commanders need to see and understand the battlefield, and the Gray Eagle is a critical component for the U.S. Army to do that. Importantly, basing the Gray Eagle at Ft. Wainwright, near the Joint Pacific Alaska Range Complex (JPARC), will give the U.S. Army access to some of the world's most expansive and robust training ranges. I am pleased to see a

7

company of Gray Eagles on its way to Alaska, and I am hopeful that the U.S. Army will continue to see value in the benefits of Alaska's great training ranges and strategic location, as the Senate Armed Services Committee already has."

Sam's Club Bets Drones Will Fly Off the Shelves at Christmas

NEWS NEWS REPORTS *June 11, 2015 by DRONELIFE News - No comments*

(Source: wsj.com)

Move over BB guns and videogames. Christmas morning may have a new menace.

Sam's Club is betting drones will be a popular holiday gift this year and plans to stock about a dozen kinds—from $100 models to $4,000 versions with high resolution cameras or the ability to pick up small objects, said Dawn vonBechmann, senior vice president of technology, entertainment and office products for the wholesale chain owned by Wal-Mart Stores Inc.

The move comes as drones are capturing attention at a time when little else in the battered consumer electronics market is clicking at the register. Sam's started thinking about expanding its drone line after noticing a $1,169 model with a digital camera was selling "like crazy" online, Ms. vonBechmann said.

Sam's surveyed customers earlier this year and found about half bought the pricey drone for professional reasons; real-estate agents taking bird's eye view pictures of their high-end properties, wedding photographers hoping to get a client's ceremony from a new angle—and at least one rancher who uses it to check whether perimeter fences are intact from the comfort of his home. The rest are buying it for fun, Ms. vonBechmann said.

The Bentonville, Ark.-based discount chain, with $58 billion in annual sales, is hoping it can grow sales and increase memberships by offering more new and unexpected products.

Sales at U.S. Sam's Club existing stores inched up 0.4% in the most recent quarter excluding gas, while competitor Costco Wholesale Corp. notched a 5% gain in the same period.

To boost its sales, Sam's Club needs more excitement and newness, "re-engaging there like we did when we first started Sam's Club," said Rosalind Brewer, chief executive of the retailer. Ms. Brewer spoke during a news conference ahead of Wal-Mart's annual meeting of shareholders last week.

Drones are a niche part of the consumer electronics market that includes emerging technologies such as 3-D printers, Ultra High Definition televisions, wearable fitness devices and smartwatches. Such sales are expected to reach almost $11 billion this year, according to trade group Consumer Electronics Association. Three years ago, those sales were too small to track, the association said.

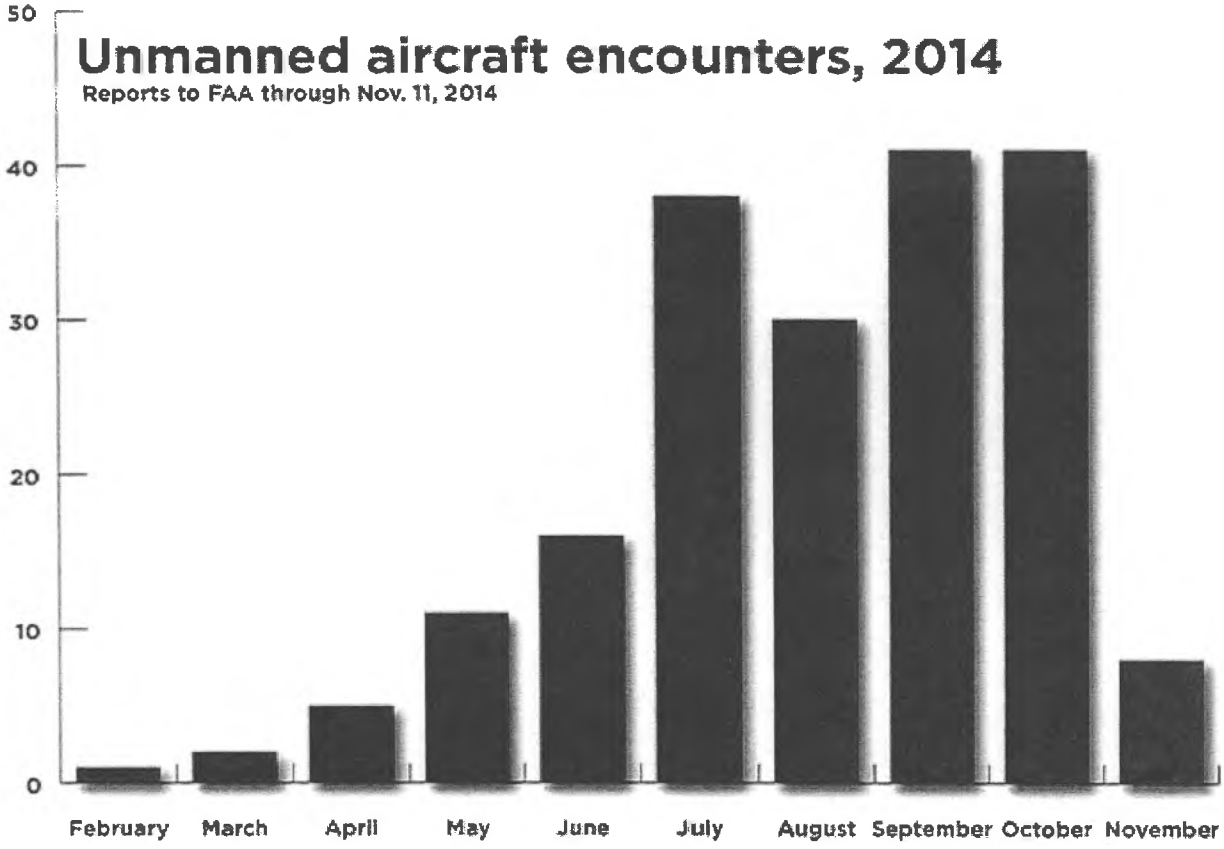
FEATURED VIDEO

Unmanned Aircraft Encounters Increasing in USA



Nearly 200 encounters with unmanned aircraft, ranging from amusing to chillingly dangerous, were reported to the FAA between February and November of 2014; a list published by a New Orleans television station May 26 documents the growing use of drones—authorized and otherwise—and their infiltration of the National Airspace System.

26

The U.S. Coast Guard reported that a DJI Phantom quadcopter operated by a photographer flew over the admiral's residence at Diamond Head Lighthouse on Nov. 8, though no property damage or National Airspace System penetration was noted. But many of the reports documented on the list published May 26 by Fox 8 News, a copy of which was sent to AOPA on request, detail more troubling encounters: unmanned aircraft flying much higher, in some cases near manned aircraft, airports, or navigation aids.

The reports were collected by various FAA facilities (most of them relayed through air traffic control, according to an FAA spokesman), and show a steady increase from just one report in February 2014 to 41 reports in July and August of 2014. The FAA is working to establish a systematic process for collecting these reports. So far they have been supplied by flight crews and public safety agencies on their own initiative. The FAA redacted the names and telephone numbers of those filing reports, a spokesman said, and "anything related to national security," but the reports are otherwise unaltered.

One report details unmanned aircraft activity being conducted on a runway in Joplin, Missouri, while the airport also hosted normal operations, though no notam was published for the unmanned operation. The person filing the report investigated and was told the activity was apparently illegal, and the operation ceased after the airport manager was notified. At least one aircraft in the pattern for the runway requested a different runway.

That same month, a report filed in Oklahoma documented an aircraft taking evasive action to avoid a small unmanned aircraft at 4,800 feet; the unmanned aircraft was described as two feet wide and black, with a camera attached. The pilot who took evasive action reported that the drone came within 10 to 20 feet of a collision.

Such near-misses were the exception, though several reports document unmanned aircraft operating well inside controlled airspace. In many cases the intention of the operators is unknown, though at least one military drone (a small, hand-held model) flew onward after losing data communication with the ground station. "The UAS last known altitude 650 feet, SW bound with a fuel exhaust time of approx 40 minutes. Expected to remain in the restricted area," the report, filed Oct. 24 in Columbus, Georgia, states.

In another case, operators lost control of an unmanned aircraft being used to record a high school football game in Madison, Mississippi, and it flew into controlled airspace. Local police investigated the incident, which resulted in no property damage or injuries, though that unmanned aircraft was spotted a mile from an airport by a passing pilot.

AOPA has long advocated for safety above all when it comes to unmanned operations, stressing the need for all aircraft operators to be able to "see and avoid" other aircraft at all times, whether the pilots are on the ground or in the air. AOPA participated on the FAA's Small Unmanned Aircraft Systems (UAS) Aviation Rulemaking Committee, which started meeting in 2008 to develop recommendations for the agency to integrate UAS safely. In 2009, the committee recommended that small UAS operators be required to keep the craft in sight and take training. In April, AOPA submitted formal comments on proposed rules, asking the FAA to limit commercial-use UAS to 400 feet agl to mirror the regulations already in place for model aircraft. AOPA asserted that lowering the ceiling for UAS from the FAA's proposed 500 feet to 400 feet would add a "small buffer between manned and unmanned operations in most areas."

The FAA is testing a smart phone application for unmanned aircraft operators designed to help them avoid dangerous or illegal operations; a link to that app, currently in testing, is posted online along with other information about current regulations, limitations, and other aspects of unmanned aircraft operations.

The AOPA Air Safety Institute offers a free online course, *Unmanned Aircraft and the National Airspace System*, to educate pilots on the different types of unmanned aircraft and how to safely coexist. AOPA has also joined with unmanned aircraft organizations to support the "Know Before You Fly" education campaign.

DJI and Accel Announce SkyFund

Accel invested $75 million into DJI this month, sparking this new partnership. Skyfund will make $250,000-plus investments in early stage drone startups through convertible notes or traditional seed and Series A rounds. DJI and Accel will have the option to make follow-on investments.

Along with a closer relationship with DJI's hardware business, portfolio companies will get access to expert advisors, including Dropcam founder Greg Duff, former head of Facebook product management Sam Lessin, Twitter director of developer platform Jeff Seibert, and Emmy award-winning TV producer Dick Wolf, who has used drones in shows like Law & Order.

Both Airware (with its recently announced investment fund) and DJI seem to have realized that the drone industry is too big and the use cases too broad for a single company to build the whole technology stack. Instead, both are trying to become platforms, making flexible core software and hardware that can be customized for niche needs in different verticals. Just like Apple or Facebook didn't try to build every end application, these drone giants are trying to become the foundation of an ecosystem.

Companies around the world are eager to replace dangerous and expensive helicopters, planes, and satellites, and dangling humans with drones. Airware and DJI could entrench themselves in this budding commercial drone business by building a network of startups around themselves. At this rate, Airware and DJI could emerge as the software and hardware titans of dronetech.

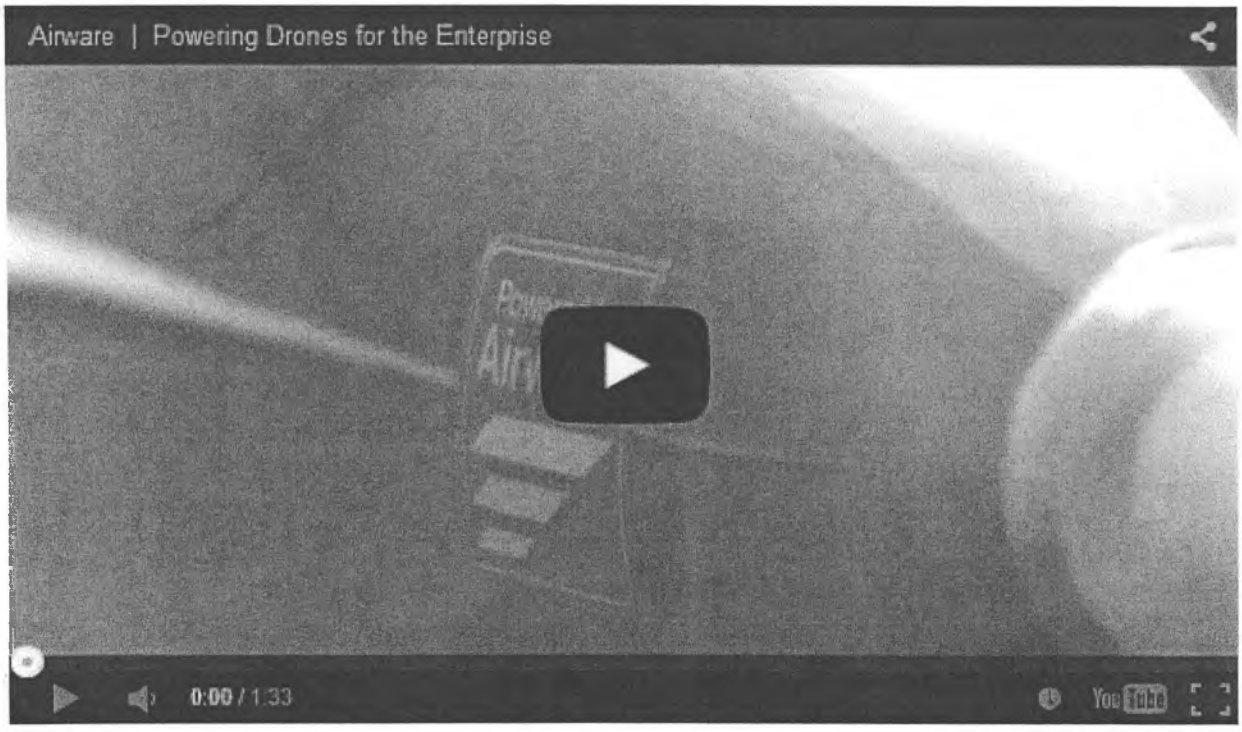
← US DRONE DOWN IN IRAQ AIRWARE LAUNCHES DRONE INVESTMENT FUND →

LEAVE A REPLY

Your email address will not be published. Required fields are marked *

Name *

Airware Launches Drone Investment Fund



Airware is announcing the Commercial Drone Fund, which will invest $250,000 to $1 million in dozens of early stage startups that are building out other components of the enterprise drone ecosystem. The fund's first two investments are in RedBird, a Paris-based drone data processing startup, and Sky-Futures, a London company that builds drone sensors for monitoring oil and gas infrastructure.

Airware has raised over $40 million to scale its drone flight computer, operation software, and cloud data system.

Rather than invest from its own balance sheet of venture capital, or simply co-invest with traditional firms, Airware raised a separate fund from a set of limited partners. Airware's founder and CEO Jonathan Downey will be its general partner. The fund's size and LPs aren't being disclosed, but the backers may include traditional VCs, as Downey says they're open to investing in follow-on growth rounds beyond the fund.

"In the same way Airware's platform is acting as a catalyst on the technology side of things for companies looking to deploy drones for commercial applications, we're launching the Commercial Drone Fund to help catalyze these companies in a different way — by investing directly into them" Downey tells me. "These are technologies that are critical to scaling commercial drones."

The commercial Drone Fund will concentrate on five areas over the next two to three years:

1. **Sensor Hardware** - to improve the precision, speed, cost, and scale of what data drone can collect
2. **Software Applications** - that make deploying commercial drones easier
3. **Cloud-Based Aerial Data Analysis Tools** - for pulling insights from the data collected
4. **Drone-Based Services** - including companies that fly drones or sell data
5. **Complete Solutions For Specific Industries** - that pull together different hardware and software systems into full packages for commercial customers

Portfolio companies will get access to Downey, who built drones for MIT and Boeing, and help raising additional funding. Airware's own investors, including Andreessen Horowitz, First Round, Kleiner Perkins, Google Ventures, and Felicis Ventures, give it plenty of connections to share.

AMA Provides sUAS Education Online

The Academy of Model Aeronautics (AMA), an organisation that promotes the development of model aviation, has announced the latest addition to its AMA Flight School online learning centre: small Unmanned Aircraft Systems (sUAS) education with partner Fly Robotics.

The Fly Robotics team brings with it an unprecedented portfolio of UAS experience and instruction. With multiple Department of Defense certified flight instructors and national champions, Fly Robotics will be an integral piece of AMA Flight School, serving as the sUAS online course and regional flight school provider. Additionally, Fly Robotics has provided basic safety and introductory sUAS content for anyone interested in learning more about drones.

Based upon the criteria presented in FAA's sUAS Notice of Proposed Rulemaking, this course will be of great value to anyone wanting to get a head start on the upcoming FAA sUAS commercial use certification test, or those wanting to learn safe unmanned aircraft operations.

The AMA celebrates nearly 80 years of safe operations in the National Airspace System and continues, through educational content, to provide the knowledge necessary to safely fly a drone or sUAS.

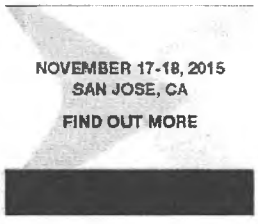
Unmanned Systems 2015



Alaska Researchers Use Drones to Study Otters

Scientists wanting to know what sea otters eat while floating far from shore have turned to the sky. During an April mission in Kachemak Bay, researchers tested unmanned drones to see if they could be used for future sea otter surveys. The project also used drones to study the prevalence of sea grass in intertidal flats.

Using drones for the intertidal flats mission was mostly to streamline the process, allowing a larger area to be surveyed in a shorter amount of time.

When it comes to otters, scientists want to know what the predators regularly eat to better understand how it may affect fisheries management. Current observation techniques are restricted to watching sea otters with high-powered spotting scopes. The practice is only viable on land, as swells and turbulent boats make scopes unfeasible.

Close to shore, otters eat clams, crab, octopus, fish and the occasional sea urchin or star fish. But in open water, scientists "have no idea what they're feeding on," Brenda Konar, professor of marine biology at the University of Alaska Fairbanks, said.

During the project, most drone flights were conducted from land so researchers could use spotting scopes to see if otters avoided the drones.

34

According to Konar, the project was "really successful," even without recording new feeding data. "At this point, all we did with them was to see how close we can get to them and see if the would try to freak out or not."

Konar said drones were able to be flown within about 10 feet of the otters, and most animals paid the quadcopters no attention.

Kachemak Bay's otter population is doing better than most around Alaska, Konar said. That is in contrast to the Bay's crab population. "They're not coming back the way people are hoping," Konar said of crabs. Konar hopes drones can help determine if otters' fishing habits contribute to low crab numbers.

Team members learned both from successes and challenges during the mission.

Sam Vanderwaal, project manager and drone pilot, said tricky technical issues arose. Maintaining connectivity with drones was problematic while trying to catch otters in the bay. Common issues — like recharging batteries in the field and keeping equipment dry — also popped up.

Vanderwaal is an embedded contractor at the Alaska Center for Unmanned Aircraft Systems Integration at UAF's Geophysical Institute. The Center for Unmanned Aircraft has a certificate of authorization from the Federal Aviation Administration to operate drones professionally.

The GoPro cameras equipped on the drones also lacked sufficient resolution for the tidal flats survey. A better camera would require drones with larger payloads.

When it came to otters, simple techniques were practiced to get drones as close as possible. As otters dove to find food drone operators would lower the aircraft for when the animal resurfaced. "We learned if you did it in steps the otter didn't seem to care," Konar said.

Konar is working to procure funding for the next mission, when she would like to get some actual feeding data.

FAA SELECTS MISSISSIPPI STATE-LED TEAM FOR UAS CENTER OF EXCELLENCE

FAA Selects Mississippi State-Led Team for UAS Center of Excellence
By AUVSI News posted Fri, May 08, 2015 07:41 PM

MSU demonstrates using UAS for a river survey in the Mississippi Delta in December 2014. Photo: AUVSI.

AUVSI President and CEO discusses unmanned systems with FAA Administrator Michael Huerta at AUVSI's Unmanned Systems 2015. Photo: Robb Cohen.

by AUVSI News

The U.S. Federal Aviation Administration has named a team led by Mississippi State University as its new Center of Excellence for Unmanned Aircraft Systems.

The new center will be run by MSU's Alliance for System Safety of UAS through Research Excellence, or ASSURE, which comprises top UAS research universities and over 100 government and industry partners. The COE will study technical issues needed for the successful introduction of UAS into the National Airspace System, including detect-and-avoid technology, low-altitude operations safety, control and communications, training and certification of UAS pilots, and compatibility with air traffic control operations. Other research areas may be added over time.

"This world-class, public-private partnership will help us focus on the challenges and opportunities of this cutting-edge technology," said U.S. Transportation Secretary Anthony Foxx. "We expect this team will help us to educate and train a cadre of unmanned aircraft professionals well into the future."

AUVSI President and CEO Brian Wynne congratulated the team and said AUVSI looks forward to working with ASSURE and the FAA to advance research and development on UAS.

"It's critical that we begin looking to the future now and laying the groundwork for more transformational uses of UAS technology, notably beyond-line-of-sight operations," Wynne said. "The Center of Excellence designation, the Pathfinder Program announced earlier this week and ongoing industry and government research efforts all point to a future where the possible will one day become reality."

The FAA announced at AUVSI's Unmanned Systems 2015 conference earlier this week that it has partnered with three companies to perform beyond-line-of-sight operations, which it called the Pathfinder Program.

The new Center of Excellence will coordinate with the six existing UAS test centers, but how that will be done hasn't yet been determined. When it issued the final solicitation for universities competing to house the center, the FAA said that process will be set up once the COE is selected and develops its own detailed research plans.

"This has been a six-year effort for Mississippi State and three years for our partner universities," said ASSURE executive director James Poss, also a retired major general from the Air Force. "We picked our team because they know unmanned systems and they know the FAA. That will make it easier to turn UAS research into FAA rules quickly."

Congress approved $5 million for the five-year agreement with the COE. The center's academic team members will match the federal grants dollar for dollar from nonfederal sources.

"This team has the capabilities and resources to quickly get up and running to help the FAA address the demands of this challenging technology over the next decade," said FAA Administrator Michael Huerta.

The FAA expects the COE will be able to begin research by September 2015 and be fully operational, with at "robust research agenda," by January 2016.

The center joins seven others set up by the FAA, which cover topics such as commercial space, general aviation, alternative jet fuels and the environment.

For more information about the members of ASSURE, visit the ASSURE website here.

Click here for more information on the MSU Center of Excellence and the university's plans.

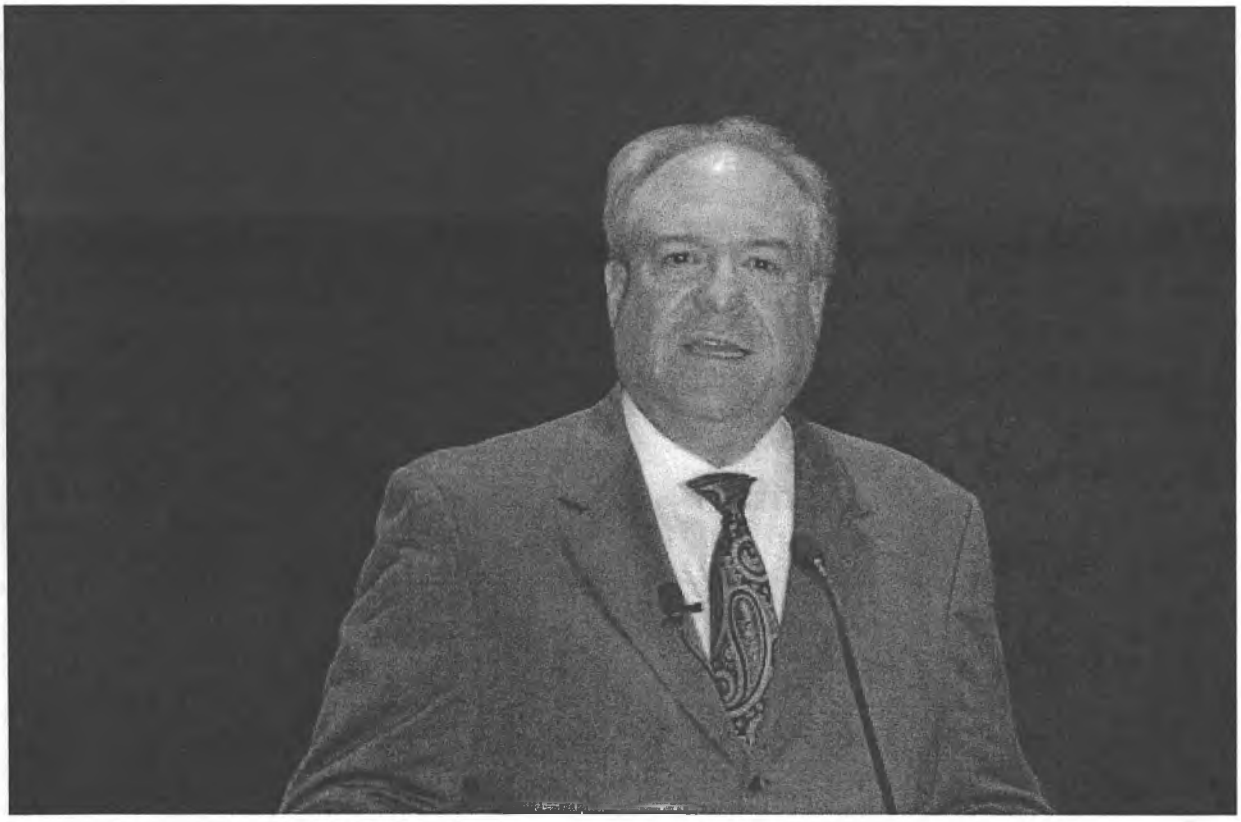
7 Insights from the FAA's Former Leader



Jim Williams, who managed the FAA office to integrate drones into the U.S. airspace, retired last week. Before departing for a vacation of visiting ballparks with his family, Williams spoke at McKenna Long & Aldrige's unmanned aircraft systems symposium in Washington, D.C.

38

Now that he is outside the FAA Williams can speak more freely about the path and challenges to drones operating safely in American skies. Here are some points that stood out as he reflected on his time at the FAA, and looked to the future of unmanned flight:

1. He expects drone package delivery in five years

"That'll be fairly routine, be it in rural areas. It's going to be real tough to do it in a built-up major metropolitan area outside of Washington, D.C., because how do you deal with the helicopters that are flying sort of randomly," Williams said. "When they figure that out I think it'll happen. There's no other reason, no other barrier to doing that."

2. Amazon's drone program is a juggernaut, but seems out of touch with the challenges of flying safely in cities

"They're pushing the envelope in every realm. They want a fully automated system. They want it to be able to take random routes to deliver wherever they want to deliver. It's really a big challenge," Williams said. "If the small rule [for commercial drone flight] is walking then they're sprinting."

Williams stressed the challenges of autonomous drones flights in major cities, particularly working around helicopters and small planes.

"I think their understanding of the difficulties is probably on the low end," Williams said. "But they're working hard. They're motivated, they're well funded."

3. He thinks we may eventually see unmanned cargo jets

"In 20 years, who knows, large cargo aircraft could be flying and hauling cargo — especially over the oceans — those long, boring flights," Williams said. "There's already a couple of the air carrier type cargo haulers that want to look at reducing the crew required during a long-haul cargo flight to one."

4. He described his former job as enough work for three people.

Williams said he was pleased to have convinced the FAA's program management agency to take on one aspect of his former duties, managing radio spectrum and allocating it fairly for unmanned commercial flights. Williams described this as a big problem for the agency to solve.

"It really is a full-time job," Williams said. "I was the only one who was really working that for about three years. And it really is a big barrier for the industry."

The rest of Williams's former duties are being divided between two new positions, which will split up internal and external work.

"The job was worthy of three people doing it," Williams said. "Not that I could do three people's work."

5. He would've liked to get the proposed rules for commercial drone flight done sooner

When moderator Mark Dombroff asked Williams about his greatest disappointment with respect to drones, he cited the time it took to release the proposed rules for drones weighing under 55 pounds. These missed deadlines were a point of frustration for many in the drone community.

"When I took over I thought we'd get it out in a few months," Williams said. "But the bottom line was what I inherited wasn't very good. And so it needed a lot of work. And what you see is I think a much better product than what I inherited when I took over."

6. Having the White House's attention isn't fun

"Everybody who thinks having the White House interested in your program is a great thing, no," Williams said. "Just a lot of scrutiny from them and everything is questioned about how it is going to fit in the bigger scheme of things. It's very much a blessing and a curse to have that level of attention."

After all of the delays, the FAA surprised observers by releasing its proposed drone rules on the Sunday morning of President's Day weekend. On that same Sunday, the White House issued a presidential directive ordering federal agencies to publicly disclose where they fly drones in the United States and what they do with the data from aerial surveillance.

7. He's not a big fan of the proposed drone legislation from Sen. Cory Booker (D-N.J.) and John Hoeven (R-N.D.)

"Their heart was in the right place. They really were trying to do what they could to help the FAA," Williams said. "They missed the mark. The good news is they did come to the FAA and ask what we thought of it. And we told them. So hopefully the bill — if there is one passed — it'll be different than the one that was proposed."

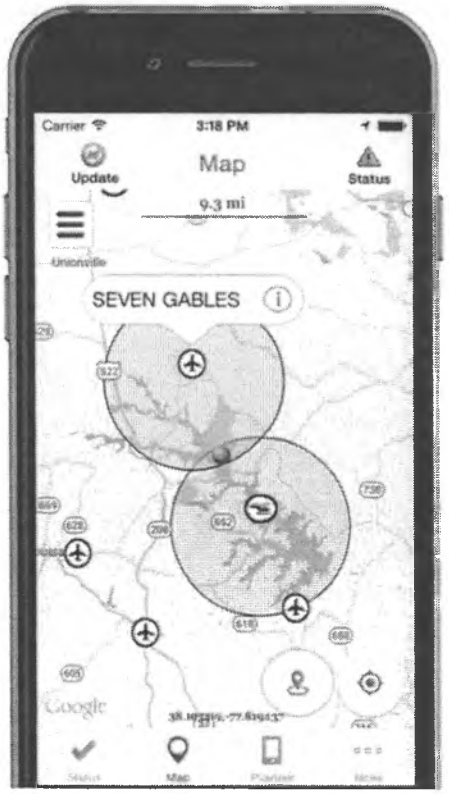
FAA Launches B4UFLY App for UAV Operators

The FAA has announced a smartphone application that aims to make it clear to Unmanned Aerial Vehicle (UAV) enthusiasts where it's legal to fly in the National Airspace System (NAS). The B4UFLY app, announced at the 2015 Association for Unmanned Vehicle Systems International (AUVSI) Conference in Atlanta, Ga. will allow hobbyists to determine whether there are any restrictions or requirements in effect at the location where they want to fly a UAV.

"It's a simple, easy-to-use app that answers a very basic safety question: is it safe and legal to fly my unmanned aircraft at a particular location?" FAA Administrator Michael Huerta explained to journalists during a press conference for the roll out of the new app. "Longtime members of the unmanned aircraft community may already know the answer to that question. Someone who got their first unmanned aircraft as a gift under the Christmas tree probably doesn't. That's a knowledge gap we need to fill."



That's a knowledge gap we need to fill. The United States has the most complicated airspace in the world. We need to make sure hobbyists and modelers know where it's okay to fly and where it isn't okay to fly - because there can be very real consequences if you don't. The incident on the White House lawn earlier this year is a good example.

We plan to make B4UFLY available to approximately 1,000 beta testers using Apple devices this summer, and we'll be working on an Android app in the future.

May 5-7 2015

Atlanta, GA

Booth 707

41

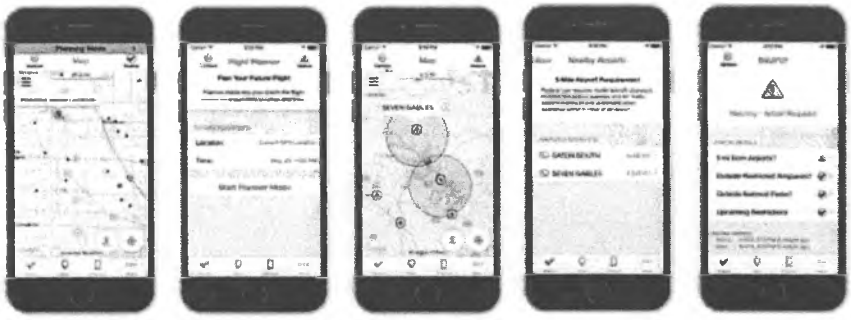
The B4UFLY app is the latest action the FAA has taken to encourage the responsible use of unmanned aircraft. In December, we partnered with the Academy of Model Aeronautics, the Small UAV Coalition, and our friends here at AUVSI to launch the "Know Before You Fly" campaign. This was an important first step in educating operators about the rules of the sky.

The B4UFLY app takes a lot of that information and puts it right in your pocket – available to use anytime, anywhere. It only takes a few taps to find out if you're cleared to fly. While other resources like this exist, we believe B4UFLY will have the most user-friendly interface with the most up-to-date information.

The agency is planning to release the app to an estimated 1,000 beta testers during the summer. Limited beta tests are expected to run for several months, after which the FAA will make the app available to the general public on Apple iOS devices, with an Android version to follow.

Key features of the B4UFLY app include:

- A clear "status" indicator that immediately informs operators about their current or planned location.
- Information on the parameters that drive the status indicator.
- A "Planner Mode" for future flights in different locations. Informative, interactive maps with filtering options.
- Contact information for nearby airports.
- Links to other FAA UAS resources and regulatory information.



click to enlarge

The app features interactive maps and a clear status indicator that immediately informs the operator about the area surrounding their current or planned flying location. For example, it would indicate that flying in Special Flight Rules Area around Washington, D.C. is prohibited and other similar restricted flight areas. It also provides information on such parameters that may restrict airspace, contact information for nearby airports and links to other FAA UAS resources and regulatory information to keep operators updated to the fullest extent.

NOTICE U.S. DEPARTMENT OF TRANSPORTATION
FEDERAL AVIATION ADMINISTRATION

N 8900.292

National Policy

Effective Date:
4/8/15

Cancellation Date:
4/8/16

SUBJ: Aviation-Related Videos or Other Electronic Media on the Internet

1. Purpose of This Notice. This notice provides guidance to aviation safety inspectors (ASI) regarding actions to be taken when notified of videos or other electronic media posted to the Internet depicting the operation of aircraft in the National Airspace System (NAS) that may be contrary to Title 14 of the Code of Federal Regulations (14 CFR) or statute.

2. Audience. The primary audience for this notice is all Flight Standards District Office (FSDO) ASIs, regional Flight Standards divisions (RFSD), and International Field Offices (IFO)/International Field Units (IFU). The secondary audience includes Flight Standards (AFS) branches and divisions in the regions and in headquarters (HQ).

3. Where You Can Find This Notice. You can find this notice on the MyFAA employee Web site at https://employees.faa.gov/tools_resources/orders_notices. Inspectors can access this notice through the Flight Standards Information Management System (FSIMS) at http://fsims.avs.faa.gov. Operators can find this notice on the Federal Aviation Administration's (FAA) Web site at http://fsims.faa.gov. This notice is available to the public at http://www.faa.gov/regulations_policies/orders_notices.

4. Background. There are an escalating number of videos or other electronic media posted to the Internet which depict aviation-related activities. Some of these posted videos may depict operations that are contrary to 14 CFR, statute, or safe operating practices. ASIs and other AFS personnel are expected to use critical thinking when addressing electronic media showing such activity. The FAA will use education to encourage voluntary compliance with applicable statutory and regulatory requirements when appropriate. However, the FAA will use administrative action or legal enforcement action to gain compliance if such action is necessary to maintain safety within the NAS.

5. Unmanned Aircraft Systems (UAS). UAS videos, in particular, are increasingly appearing on the Internet. UAS videos may depict aircraft being flown in a variety of classes of airspace and at varying altitudes. Inspectors are to follow the protocol below when receiving notification of videos with potentially noncompliant UAS operations posted to the Internet. This notice provides an outline and protocol for inspectors when initiating educational outreach. When responding to a notification that requires contact with a UAS operator, follow the guidance contained in FAA Notice N 8900.268, Education, Compliance, and Enforcement of Unauthorized Unmanned Aircraft Systems Operators. If counseling in the form of an informational letter is

warranted, send the UAS Informational Letter Template for Inspectors (see Appendix A). The letter must not be altered other than to fill in the appropriate address of the operator and FSDO along with your contact information and signature. If the educational outreach is ineffective in gaining compliance, the UAS operator is noncompliant or uncooperative, or the UAS operation resulted in a medium to high potential or actual endangerment to the NAS, the inspector is to continue their investigation as outlined in N 8900.268.

6. **Manned Aircraft.** When receiving notification of videos or other electronic media with potentially noncompliant manned aircraft operations posted to the Internet, inspectors are to follow guidance provided in FAA Order 8900.1, Flight Standards Information Management System (FSIMS), Volume 14; and the current edition of FAA Order 2150.3, FAA Compliance and Enforcement Program.

7. **Evidence.** In all cases, the FAA must have acceptable evidence in support of all alleged facts in order to take legal enforcement action. Inspectors are reminded that:

- Electronic media posted on the Internet is only one form of evidence which may be used to support an enforcement action and it must be authenticated;
- Electronic media posted on the Internet is ordinarily not sufficient evidence alone to determine that an operation is not in compliance with 14 CFR; however, electronic media may serve as evidence of possible violations and may be retained for future enforcement action; and
- Inspectors have no authority to direct or suggest that electronic media posted on the Internet must be removed.

  Note: Electronic media posted on a video Web site does not automatically constitute a commercial operation or commercial purpose, or other non-hobby or non-recreational use.

8. **Action.** Until further notice, the above procedures are in effect for gathering videos or other electronic media on the Internet as evidence and interpreting the status of a Web site that contains electronic media relevant to an investigation.

9. **Disposition.** We will incorporate the information in this notice into Order 8900.1 before this notice expires. Direct any questions concerning this notice to Ronald Forsyth, Commercial Operations Branch (AFS-820) at ronald.a.forsyth@faa.gov, (717) 774-8271 ext. 253.

Name
Address

Dear :

The purpose of this letter is to provide you with information about the laws and regulations regarding Unmanned Aircraft System (UAS) operations conducted within the National Airspace System (NAS). The NAS is "the common network of U.S. airspace; air navigation facilities, equipment and services, airports or landing areas . . . . Included are system components shared jointly with the military."[1] The Federal Aviation Administration's (FAA) safety mandate under Title 49 of the United States Code (49 U.S.C.) § 40103 requires it to regulate aircraft operations conducted in the NAS, which include UAS operations, to protect persons and property on the ground and to prevent collisions between aircraft and other aircraft or objects.

A UAS is an Aircraft

A UAS is an "aircraft" as defined in the FAA's authorizing statutes and is therefore subject to regulation by the FAA. Title 49 U.S.C. § 40102(a)(6) defines an "aircraft" as "any contrivance invented, used, or designed to navigate, or fly in, the air." The FAA's regulations (Title 14 of the Code of Federal Regulations (14 CFR) part 1, § 1.1) similarly define an "aircraft" as "a device that is used or intended to be used for flight in the air." Because an unmanned aircraft is a contrivance/device that is invented, used, and designed to fly in the air, it meets the definition of "aircraft." The FAA has promulgated regulations that apply to the operation of all aircraft, whether manned or unmanned, and irrespective of the altitude at which the aircraft is operating. For example, 14 CFR part 91, § 91.13 prohibits any person from operating an aircraft in a careless or reckless manner so as to endanger the life or property of another.

An important distinction for UAS operators to be aware of is whether the UAS is being operated for hobby or recreational purposes or for some other purpose. This distinction is important because there are specific requirements in the FAA Modernization and Reform Act of 2012,

[1] Refer to the FAA Pilot/Controller Glossary (Apr. 3, 2014), available at http://www.faa.gov/air_traffic/publications/media/pcg_4-03-14.pdf.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

Public Law (PL) 112-95 (the Act), that pertain to "Model Aircraft" operations, which are conducted solely for hobby or recreational purposes.

Model Aircraft Operations

Section 336(c) of the law defines "Model Aircraft" as ". . . an unmanned aircraft that is—

(1) capable of sustained flight in the atmosphere;
(2) flown within visual line of sight of the person operating the aircraft; and
(3) flown for hobby or recreational purposes."

Each element of this definition must be met for a UAS to be considered a Model Aircraft under the Act. Under Section 336(a) of the Act, the FAA is restricted from conducting further rulemaking specific to Model Aircraft as defined in section 336(c) so long as the Model Aircraft operations are conducted in accordance with the requirement of section 336(a). Section 336(a) requires that—

"(1) the aircraft is flown strictly for hobby or recreational use;
(2) the aircraft is operated in accordance with a community-based set of safety guidelines and within the programming of a nationwide community-based organization;
(3) the aircraft is limited to not more than 55 pounds unless otherwise certified through a design, construction, inspection, flight test, and operational safety program administered by a community-based organization;
(4) the aircraft is operated in a manner that does not interfere with and gives way to any manned aircraft; and
(5) when flown within 5 miles of an airport, the operator of the aircraft provides the airport operator and the airport air traffic control tower (when an air traffic facility is located at the airport) with prior notice of the operation (model aircraft operators flying from a permanent location within 5 miles of an airport should establish a mutually-agreed upon operating procedure with the airport operator and the airport air traffic control tower (when an air traffic facility is located at the airport))."

Section 336(b) of the law, however, makes clear that the FAA has the authority under its existing regulations to pursue legal enforcement action against persons operating Model Aircraft in accordance with section 336(a) and 336(c) when the operations endanger the safety of the NAS. Nothing in section 336 otherwise alters or restricts the FAA's statutory authority to pursue enforcement action against any UAS operator, even those whose operations are conducted in accordance with sections 336(a) and (c) that endanger the safety of the NAS. For example, a model aircraft operation conducted in accordance with section 336(a) and (c) may be subject to an enforcement action for violation of § 91.13 if the operation is conducted in a careless or reckless manner so as to endanger the life or property of another.

UAS Operations that are not Model Aircraft Operations

Operations of UASs that are not Model Aircraft operations as defined in section 336(c) of the law and conducted in accordance with section 336(a) of the law, may only be operated with specific authorization from the FAA. The FAA currently authorizes UAS operations that are not for hobby or recreational purposes through one of two avenues: 1) the issuance of Certificates of

Waiver or Authorization (COA); and 2) the issuance of special airworthiness certificates. The FAA also has a third avenue with which to potentially authorize UAS operations through its exemption process when it determines that such operations are in the public interest.

1. **COA.** In accordance with § 91.903, the FAA grants COAs to applicants waiving compliance with certain regulatory requirements listed in § 91.905. The applicants must be able to show that they are able to safely conduct operations in the NAS. The COA contains terms with which the applicant must comply in order to conduct operations. The FAA generally has restricted the issuance of these certificates to government entities that operate UASs as it implements the provisions in its Integration of Civil Unmanned Aircraft Systems (UAS) in the National Airspace System (NAS) Roadmap. The entire Roadmap is available on our Web site at: http://www.faa.gov/uas/media/UAS_Roadmap_2013.pdf. The FAA also issues COAs on an emergency basis when: 1) a situation exists in which there is distress or urgency and there is an extreme possibility of a loss of life; 2) the proponent has determined that manned flight operations cannot be conducted efficiently; and 3) the proposed UAS is operating under a current approved COA for a different purpose or location. The FAA is also using the COA process to expand the use of civil UASs in the arctic region as required under section 332 of the law.

2. **Airworthiness Certification.** For civil operators, you can apply for a special airworthiness certificate under 14 CFR part 21 (refer to the current edition of FAA Order 8130.34, Airworthiness Certification of Unmanned Aircraft Systems and Optionally Piloted Aircraft). The full civil type certification process allows for production and commercial operation of UAS and is a lengthy process typically undertaken by aircraft manufacturers.

3. **Issuance of Exemptions.** In accordance with 14 CFR part 11, §§ 11.15 and 11.61–11.103 and the FAA's authority in 49 U.S.C. § 44701(f), the FAA may grant exemptions from regulatory requirements. The exemption process allows for the submission of a petition to the FAA outlining why the granting of an exemption would be in the public interest, the need for the exemption, and the reasons why granting the petition would not adversely affect safety or would provide a level of safety equal to the rules from which the exemption is sought. The FAA has indicated its willingness to review petitions for exemption by civil UAS operators that want to operate for other than hobby or recreational purposes. Under section 333 of the Act, operators in appropriate circumstances can be exempted from airworthiness certification and other related regulatory provisions.

Finally, UAS operators must understand that all UAS operations that are not operated as Model Aircraft under section 336 of the Act are subject to current and future FAA regulation. At a minimum, any such flights are currently required under the FAA's regulations to be operated with a certificated aircraft, with a certificated pilot, and with specific FAA authorization.

For All UAS Operators

More information regarding UAS operations is available at the FAA UAS Integration Office's (AFS-80) Web site: http://www.faa.gov/uas/

If you require additional information please contact me at [contact information].

In conclusion, we hope the information provided to you in this letter will assist you in conducting safe UAS operations in compliance with the FAA's regulations.

Sincerely,

Aviation Safety Inspector—Operations

FAA Admits That They Shouldn't Be Ordering People To Delete Drone Videos

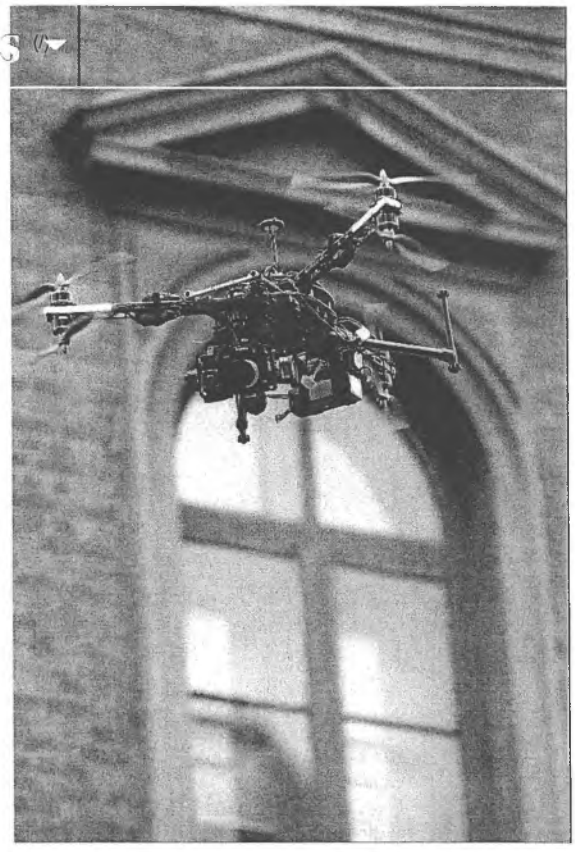
Comment Now Follow Comments

For more than a year, FAA officials have been engaged in a campaign of subtle threats and intimidation tactics that have persuaded many businesses to not use drone videos. This week, officials in Washington D.C. have finally weighed in on the legality of these tactics and in a published policy document

(https://www.faa.gov/documentLibrary/media/Notice/N_8900.292.pdf) have made clear that the intimidation tactics and take down orders must cease.

Previously, officials in various jurisdictions and across a range of use cases had been telling people that commercial use of drones was prohibited by FAA regulations, therefore, the use of drone videos was similarly prohibited by the FAA. On its face, the guidance amounted to intimidation tactics (undertaken mostly by FAA safety inspectors) and it was a clear violation of the First Amendment. Drone videos are not contraband, and the FAA has no authority to police what is posted to the internet, they only have the authority to enforce aviation regulations.

50



The FAA released updated guidance, informing their safety inspectors that they cannot order individuals to delete drone videos from the internet. (Photo by Christopher Furlong/Getty Images)

Nevertheless, the unsanctioned enforcement campaign succeeded in intimidating Coldwell Banker and other realtors (http://www.forbes.com/sites/gregorymcneal/2014/07/11/faa-intimidates-coldwell-banker-and-other-realtors-into-shunning-drone-photography/) to not use drone videos. The campaign raised questions about whether watching YouTube was a good use of safety inspector's time (https://www.facebook.com/GregorySMcNeal/posts/367542416769890) and as I noted back in January (https://www.facebook.com/GregorySMcNeal/posts/365779583612840), telling a publisher of a video to delete the video is akin to telling a bookstore or Amazon to stop selling a book with drone aerial images — it would be a clear First Amendment violation (see my comments (https://www.facebook.com/GregorySMcNeal/posts/365779583612840) to the FAA at CES on this point).

The new policy guidance (https://www.faa.gov/documentLibrary/media/Notice/N_8900.292.pdf) from the FAA, is directed primarily at Flight Standards District Office (FSDO) Aviation Safety Instructors (ASIs), regional Flight Standards divisions (RFSD), and International Field Offices (IFO)/International Field Units (IFU). The secondary audience includes Flight Standards (AFS) branches and divisions in the regions and in headquarters (HQ). The letter specifically states (emphasis added):

> **Inspectors have no authority to direct or suggest that electronic media posted on the Internet must be removed.** Note: Electronic media posted on a video Web site does not automatically constitute a commercial operation or commercial purpose, or other non-hobby or non-recreational use.

51

Importantly, the FAA is telling their inspectors that they can't modify a form letter that is included in the Appendix to the policy guidance, thus minimizing the possibility of intentional or inadvertent threats being communicated by FAA officials.

What this means is that the FAA is likely to only pursue the operators of unmanned aircraft who fly for commercial purposes without authorization. This is good news for individuals like realtors, publishers, journalists, and others who might use commercially derived imagery. It was never lawful for the FAA to go after the end users who were not part of the non-approved operation, it's nice to see them acknowledging that fact.

Department of Justice Establishes Policy Guidance on Domestic Use of Unmanned Aircraft Systems

The Department of Justice issued agency-wide policy guidance today on the use of Unmanned Aircraft Systems (UAS) that sets standards of use and management controls of UAS by the department and its components.

UAS are used at times by law enforcement agencies as cost-effective, efficient and potentially life-saving tools to support public safety efforts. The policy highlights protections of privacy, civil rights and liberties and makes clear that UAS use must be consistent with the protections afforded by the U.S. Constitution. Justice Department components are barred from using UAS solely for the purpose of monitoring activities protected by the First Amendment, and components can only operate UAS on properly authorized investigations and activities. The collection, retention and dissemination of information collected by UAS is also subject to Privacy Act protections.

To ensure accountability, the department will also require that personnel operating UAS are appropriately trained and supervised, including but not limited to a mandatory training on the department's policies. Annual privacy reviews will be conducted to ensure compliance with the department policy, existing laws and regulations and to identify potential privacy risks.

The guidance issued today is a result of various discussions and research – and meetings will continue to be held at least twice a year to ensure that the department strikes the appropriate balance between its law enforcement and national security missions and respect for civil rights and civil liberties.

Justice Department UAS Policy

Department of Justice Policy Guidance[1]

Domestic Use of Unmanned Aircraft Systems (UAS)

INTRODUCTION

The law enforcement agencies of the Department of Justice ("the Department") work diligently to protect the American people from national security threats, enforce our nation's laws, and ensure public safety. In doing so, these agencies use a wide variety of investigative methods. Some of these methods have been in use for decades; others are relatively new and rely on technological innovation. In all cases, investigations and other activities must be conducted consistent with the Constitution and the laws of the United States—and with our commitment to protecting privacy and civil liberties.

In recent years, Unmanned Aircraft Systems (UAS)[2] have emerged as a viable law enforcement tool. UAS have been used to support kidnapping investigations, search and rescue operations, drug interdictions, and fugitive investigations. While they are, in many ways, similar to the manned aircraft that have been in use for many years, they have the potential to provide law enforcement with additional flexibility and yield life-saving benefits. UAS also have the potential to be cost-effective in a time of shrinking government resources. For these reasons, UAS are likely to come into greater use.

As technology advances and enhances our ability to use these new tools, it is important to continue to assess how we use them. A Departmental working group[3] has studied the Department's use of UAS over the last several years and has considered how the technology is likely to evolve in the near future. This policy guidance flows from the working group's discussions and sets forth principles that will apply Department-wide. This policy also applies to

---

[1] This policy guidance is intended only to improve the internal management of the Department of Justice. It is not intended to and does not create any right, benefit, trust, or responsibility, whether substantive or procedural, enforceable at law or equity by a party against the United States, its departments, agencies, instrumentalities, entities, officers, employees, or agents, or any person, nor does it create any right of review in an administrative, judicial or any other proceeding.

[2] "Unmanned Aircraft System" means an unmanned aircraft (an aircraft that is operated without the possibility of direct human intervention from within or on the aircraft) and associated elements (including communication links and components that control the unmanned aircraft) that are required for the pilot or system operator in command to operate safely and efficiently in the National Airspace System. For purposes of this policy, reference to "UAS" includes all onboard sensor equipment.

[3] The Department's working group was led by the Office of Legal Policy and included the Department's Chief Privacy and Civil Liberties Officer and representatives of the Bureau of Alcohol, Tobacco, Firearms and Explosives, the Criminal Division, the Office of Community Oriented Policing, the Civil Rights Division, the Office of the Deputy Attorney General, the Drug Enforcement Administration, the Federal Bureau of Investigation, the National Security Division, the Executive Office for United States Attorneys, the Office of Justice Programs, the Office of Privacy and Civil Liberties, the United States Marshals Service, and the Office of the Chief Information Officer.

all instances in which Department components use UAS to support Federal agencies and/or State and Local law enforcement agencies.

This guidance will help ensure that the Department continues to carry out its law enforcement and national security missions while respecting individuals' privacy, civil rights, and civil liberties. It will also help ensure an appropriate level of accountability and transparency. This policy guidance does not replace, and is complementary to, the Federal Aviation Administration rules and regulations that control each and every UAS deployment and help ensure the safe operation of all aircraft, including UAS. This policy guidance is also consistent with the Presidential Memorandum, "Promoting Economic Competitiveness While Safeguarding Privacy, Civil Rights, and Civil Liberties in Domestic Use of Unmanned Aircraft Systems," issued by President Barack Obama on February 15, 2015.

RESPECT FOR CIVIL RIGHTS AND CIVIL LIBERTIES

Respect for civil rights and civil liberties is a core tenet of our democracy. In executing the Department's law enforcement and national security missions, personnel must rigorously support and defend the Constitution and continue to uphold the laws, regulations and policies that govern our activities and operations.

As with all investigative methods, UAS must be operated consistent with the U.S. Constitution. The Fourth Amendment protects individuals from unreasonable searches and seizures and generally requires law enforcement to seek a warrant in circumstances in which a person has a reasonable expectation of privacy. Moreover, Department personnel may never use UAS solely for the purpose of monitoring activities protected by the First Amendment or the lawful exercise of other rights secured by the Constitution and laws of the United States. Department personnel may never use UAS to engage in discrimination that runs counter to the Department's policies on race, ethnicity, gender, national origin, religion, sexual orientation, or gender identity. Department personnel must also be trained to understand and abide by all relevant federal legal standards applicable to the use of UAS, and to seek advice from legal counsel as necessary.

In addition, UAS may only be used in connection with properly authorized investigations and activities. Statutory authorities, the Attorney General's Guidelines, and other relevant agency policies and guidance define the scope of authorized investigations and activities and require regular supervisory review and approval. UAS must continue to be used within the context of these existing safeguards.

Further, even within the context of properly authorized activities, personnel often must choose among different investigative methods that are operationally sound, reasonable, and effective, but may be more or less intrusive relative to individuals' privacy and civil liberties. Prior to using UAS, Department personnel must assess the relative intrusiveness of the

proposed use of UAS, and balance it against the particular investigative need.[4] This is both a logical process and an exercise in judgment, but the overall principle remains: in deciding whether to use UAS, Department personnel must consider and, if reasonable based on the facts and circumstances of the investigation, use the least intrusive means to accomplish an operational need.

PROTECTION OF PRIVACY

The Department operates under a set of rules, policies, and laws that control the collection, retention, dissemination, and disposition of records that contain personally identifiable information. For example, the Privacy Act contains provisions on unauthorized use and disclosure of information about individuals, and imposes civil penalties on agencies and criminal penalties on agency personnel for violations of applicable requirements. As with personally identifiable information collected in the course of any investigation, these authorities apply to information collected via UAS. Consistent with applicable existing laws and requirements, the Department's use of UAS shall include the practices identified below.

As noted above, the Department shall only collect, use and disseminate information obtained from UAS for an authorized purpose. The Department shall not retain information collected using UAS that may contain personally identifiable information for more than 180 days unless retention of the information is determined to be necessary for an authorized purpose or is maintained in a system of records covered by the Privacy Act.

Data collected by UAS that is retained must be safeguarded in accordance with applicable Federal laws, Executive Orders, directives, policies, regulations, standards, and guidance. These authorities ensure that Department personnel with access to such data follow practices that are consistent with the protection of privacy and civil liberties. Use of all Department information systems may be monitored, recorded, and subject to audit, and unauthorized collection, retention, or dissemination of data is prohibited. Further, the Department has procedures in place to review, investigate, and address privacy and civil liberties complaints.

Senior Component Officials for Privacy in agencies using UAS must conduct annual privacy reviews of their agency's use of UAS to ensure compliance with existing laws, regulations, and Department policy, and to identify potential privacy risks. They must also, where appropriate, make recommendations to ensure that UAS will continue to be used in a manner consistent with the U.S. Constitution and all applicable laws, regulations, and policies, including those protecting privacy and civil liberties.

---

[4] In assessing the intrusiveness of UAS and the investigative need, personnel must consider factors such as whether the subject enjoys a reasonable expectation of privacy relative to the proposed use of UAS, the scope of the information sought, the scope of the proposed use of UAS, the risk of disclosure to the subject, the seriousness of the crime or national security threat, the strength and significance of the information to be obtained, the efficiency of the method and alternative means available, the amount of information already known about the subject, and the operational security needs of the investigation.

ACCOUNTABILITY

The Department promotes accountability by requiring its personnel to accept responsibility for the actions they undertake—and to evaluate the potential consequences of their decisions. The Department imposes codes of conduct to guide employees in the use of all investigative methods, including UAS. As with the use of any technology, there must continue to be mechanisms to hold the Department and its employees accountable.

Part of accountability is ensuring that Department personnel are appropriately trained and supervised. Department personnel whose responsibility it is to manage, supervise, maintain, fly, and/or otherwise use UAS must receive training on this policy and the underlying policies incorporated herein.

Moreover, approval authority for the use of UAS will be set at an appropriate and consistent level across the Department. At a minimum, each time UAS are deployed, approval must be granted (1) at the Assistant Special Agent in Charge-or-equivalent level at the relevant field office, and (2) by an executive level supervisor within the agency's aviation support unit or a designated executive level supervisor at the agency's headquarters. Additionally, since the Department may only operationally deploy UAS in connection with authorized investigations or activities, supervisors must ensure that the underlying investigations themselves have been authorized consistent with applicable guidelines and other Department policies.

Finally, federal records must be captured, managed, and retained in a manner consistent with the Federal Records Act and all other applicable authorities. As with federal records collected by other investigative tools, components are obligated to retain UAS-collected data in accordance with applicable records retention schedules.

ONGOING POLICY MANAGEMENT

As UAS technology evolves and improves, it is important that the Department continue to have adequate information about its use to ensure strategic alignment and proper evaluation of the Department's policy. To that end, this policy imposes certain new requirements.

Each component that uses UAS must designate a point of contact through which field offices will report the information outlined below to the component's headquarters and Department leadership on the use of UAS on an ongoing basis.

In addition, Department agencies that use UAS must report annually to the Deputy Attorney General on the use of UAS. The report should incorporate privacy reviews, as well as the number of UAS operational deployments (not including training or research and development flights) conducted during the reporting period and a brief description of types or categories of missions flown along with the number of each type of mission. Additionally, to the extent the agency sought assistance from, or provided assistance to, another federal, state, local, or tribal agency during the relevant time period, the number of these operational deployments and a brief

description of types or categories of missions flown along with the number of each type of mission should also be provided.

Components that have not previously disclosed any UAS operations as part of these annual reporting requirements, or that have discontinued UAS use for the duration of an annual reporting period, must notify the Deputy Attorney General prior to initiating or re-introducing UAS operations.

Department leadership will continue to engage in meaningful review of UAS as the technology advances. To facilitate this review, a standing committee comprised of a broad range of Department components will meet twice a year to evaluate any policy or regulatory changes that may be needed as a result of innovations or developments in UAS technology.

TRANSPARENCY

Rigorous adherence to the requirements set forth in this policy is not enough—to be successful in our law enforcement and national security missions, we must continue to facilitate relationships of trust with the communities we serve. Enhancing our transparency about agency operations, including how we operate UAS, creates an informed citizenry and greater confidence in the Department's decision-making.

Education of the public can enhance the Department's ability to fulfill its missions and serve the American people. As appropriate, while not revealing information that might compromise law enforcement or national security needs, the Department will update its website to reflect its current policy on UAS on an ongoing basis, and will provide a general summary of UAS operations conducted by the Department during the previous year, including a brief description of types or categories of missions flown and the number of times the Department provided assistance to other federal, state, local and tribal agencies or entities.

Alaska's Citizen Guidelines for Drone Privacy
Frequently Asked Questions

When is flying my drone a breach of privacy?

Alaskans are serious when it comes to personal privacy. How do you define privacy when it comes to drones? This question is being contemplated worldwide because with such new technology, new boundaries must be identified and defined. Safety is easier to tackle because a person can see the aircraft, operator and the effects of a flight. Privacy includes thoughts, sentiments and emotion.

Alaska's Constitution guarantees Alaskans the Right to Privacy. Article 1, Section 22 states, "The right of the people to privacy is recognized and shall not be infringed. The legislature shall implement this section." The legislature has a long-standing history of protecting Alaskans' privacy by instituting statutes regarding stalking, harassment, indecent viewing, sending explicit images, and misusing confidential information. The Legislative Task Force continues to review these protections particularly as they relate to unmanned aircraft systems.

For the purpose of Alaska's Drone Privacy Guidelines this document will imply that the definition of privacy includes the more specific individual interest of not permitting others to pry into personal affairs with which they have no legitimate concern, and exposing them against an individual's will. This concept has been recognized as "the right to be let alone."

Private Citizen: Please recognize that individuals experience different levels of sensitivity to interruption to privacy. Was the drone flight intentionally directed at you or just passing through? Do you believe the operator of the drone was flying in an inappropriate way? Be as specific as possible so that you can report the incident to local law enforcement.

Drone Operator: Might you be perceived as interrupting someone's freedom? Would you complete the same action in person as you are doing with your drone? Be courteous and respectful to others.

I have a "reasonable expectation of privacy."

Yes, all Alaskans have a reasonable expectation of privacy to live without fear of unwarranted personal invasion. With equal importance, Alaskans enjoy the right to be left alone.

The definition for **Reasonable Expectation of Privacy** directly relates to law enforcement requirements to obtain a warrant before actions of search and seizure.

United States Constitution provides:

First Amendment guarantees the right to peaceably assemble including the liberty for any group to associate in private.

Fourth Amendment forbids the government from performing warrantless and unreasonable searches of any area in which a person maintains a reasonable expectation of privacy.

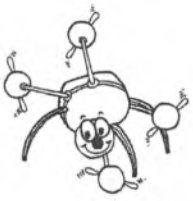
More sections of the Constitution support other areas of personal privacy.

Who owns the airspace above my house?

Private Citizen: The FAA governs the airspace from the ground up without limitations regarding private, public, government or other categories of property owners. While we enjoy the sense of privacy in our backyards for the most part, we do not control what happens in the air above our heads.

Drone Operator: Fly with respect. Don't fly your drone where people typically expect privacy. Don't use your drone to harass people. In public areas, don't invade people's personal space and their solitude.

I'm sunbathing on my deck and my son is flying his drone ...



The FAA governs the airspace from the ground up. Help your son understand courteous flying so he doesn't disturb the neighbors or fly somewhere he shouldn't.

Know Before You Fly provides recreational flying rules for hobby pilots. www.alaskadrones.org

Someone is flying their drone and interrupting my restful afternoon at the beach. They won't stop even when I "shoo" it away...

Try to identify from where the operator is controlling the drone. Provide as much information as possible to local law enforcement. This might be a situation of harassment. AS 11.16.120(a)(6)

Can I shoot it down if it's flying over my house?

Private Citizen: While news articles have referenced drones as "skeet," this presumption is not appropriate in Alaska. As a practical matter, the value associated with a recreational drone could be $25 to more than $1,000. As commercial use is rapidly becoming allowed by the FAA, that small drone you see could carry specialized equipment and cost more than $100,000. Both the hobby drone and the commercial drone may look very similar as you view it from the ground.

Drone Operator: Before you fly over private property, obtain the owner's permission and explain the purpose for your flight path. Generally, you should always fly away from populated areas.

Looks like a moving target to me!
Remember that drone is someone else's personal property.

It's best to know;

"Why is a drone flying over your property?"

" Is it engaged in a violation of law?"

"Who and where is the drone operator?"

If you shoot it down or damage it:
(Legislative Legal)
Destruction of property

Discharging a weapon in a restricted area

Cannot take the law into your own hands

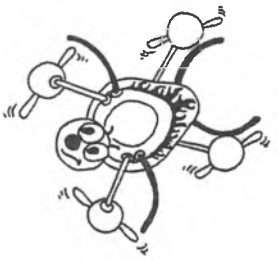
What can I do if the drone's "buzzing" annoys me? Noise Ordinance

Private Citizen: Many annoying noises are allowable in both public and private areas. The decibel limit separating acceptable noise level is generally compared to the noise from a standard lawn mower or small engine.

Drone Operator: The drone's "buzzing" may not be the only problem. The proximity of the aircraft to another person may be the primary issue of concern. Be courteous to others and stay away unless invited.

That buzzing sound is as irritating as a mosquito!

(Legislative Legal)
A drone typically makes less noise than a standard lawn mower.



I can't swat it away like a mosquito but I can call local authorities if it is a persistent pest.

If the drone is flown during locally recognized waking hours, a drone is probably not in violation of a noise ordinance.

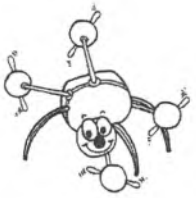
Because drones are relatively quiet, any noise you hear might instead be an alert to the bystander that the drone operator is flying too close to people and should be reported to the FAA for unsafe operations. This might be a situation of harassment. AS 11.16.120(a)(6)

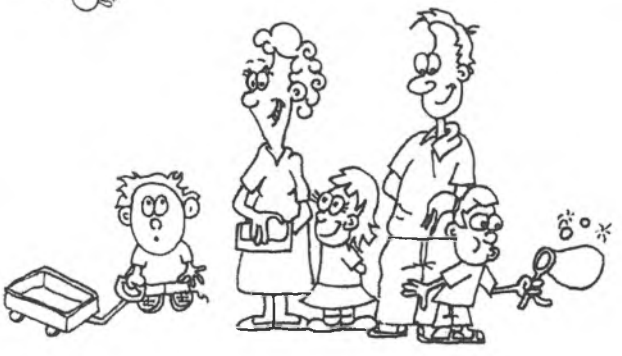
What do I do if a drone is photographing through my window or hovering around my house?

Private Citizen: A drone can be treated in the same way as another camera. If an individual is flying a drone in such a way that you feel violated, the local law enforcement can investigate for breach of privacy laws.

Drone Operator: Enjoy your drone with your family and friends who welcome its presence.

Welcomed Drone:
The family drone hovering and taking a portrait when grandma came to visit.





Unwelcomed Drone:
You weren't dreaming. And the buzzing sound was not your alarm clock. The drone was spying through the bedroom window. Who knows where the pilot is and how those pictures might be used.

The drone operator may be violating one or more of the following laws:

AS 11.41.270 Stalking, nonconsensual conduct prohibits monitoring by technical means
AS 11.61.120(a)(6) Harassment, publishing or distributing certain images
AS 11.61.123 indecent viewing or photography

The neighbor is chasing my dog with his drone!

Private Citizen: Know your animal control laws.

Drone Operator: Harassing an animal may come with criminal penalties.

Although the pet's owner may have introduced the dog to a flying toy, the noise and unfamiliarity of the neighbor's drone buzzing around could frighten Fido and could be considered harassment.

If the dog swats the drone out of the sky and chews it up, would it be considered damaging another's personal property or self defense by the dog?

Would this be governed by local ordinance or statute?

How will the photos/video be stored or used?

Private Citizen: Many recreational drone operators have posted video and pictures on social media sites. This is a great way to share interesting photography.

Drone Operator: If you are photographing something with your drone, in a place where you would not be welcomed if you were taking pictures in person, you shouldn't be there.

A drone is used to record your PIN over your shoulder while you are at the ATM.

A drone records images through your office window of a newly signed contract.

A drone peers through the window while your child is napping.

There are many examples of inappropriate use of photography or capturing information using technological devices that Alaskans are concerned about. If you believe someone has obtained unapproved images, contact local law enforcement.

Does the drone operator record the images for inappropriate purposes?

Was personal identification stolen?
AS 45 Personal Information Protection Act

Are images being posted in an inappropriate way?
AS 11.61.116 Sending an explicit image of a minor
AS 11.61.120(a)(6) Harassment: publishing or distributing certain images
AS 11.61.123 Indecent viewing or photography

Are the images being used for personal gain?
AS 11.76.113 and AS 11.76.115 Misconduct involving confidential information in the first and second degree

Can I use a drone for my business?

Private Citizen: I see lots of images on commercial web sites and social media where drones are used for business purposes. Can I use mine for business?

Drone Operator: Be aware that commercial use of unmanned aircraft systems has not been generally approved by the FAA. The time will come when all safety concerns have been well vetted and business use will become more commonplace. But remember, at this time, if you make money by using your drone, obtain authorization from the FAA.

Today, **the FAA prohibits commercial use of unmanned aircraft systems** unless the business has been granted a waiver to use the aircraft for specific purposes in the business. Businesses are beginning to receive authorization to use unmanned aircraft systems for commercial use. Thus far, the most common authorizations have been awarded for specific movie production and specific agriculture tasks.	Recreational aircraft continues to advance technologically and many people are waiting for the opportunity to use drones as part of business.

I understand the safety concerns for not flying a drone in traffic but what about privacy?

Private Citizen: Drones flying over moving traffic is dangerous but I also don't want GPS tracking and photographing me while driving.

Drone Operator: Flying over roads can cause distraction and potential automobile accidents on a road system. Electronic parenting is not yet allowed; you cannot follow your teenage driver with a drone without consent.

	A drone flying into traffic could distract drivers and create unsafe driving conditions; physical contact with an automobile could cause damage, and the distraction could distract a driver thus creating unsafe driving conditions. It is unlawful to use a GPS device to surveille an automobile without the driver's consent. AS ...

What privacy concerns can there be when you're in a crowd?

Private Citizen: Typically if you're in a crowd, privacy is limited. Although the safety concerns are paramount when a drone is flying above a crowd, the photography could identify something that a citizen would not want shared; like your secret fishing hole.

Drone Operator: Never fly above a crowd. As a drone operator, you know how easy the slightest wind change can cause your aircraft to change direction quickly or drop out of the sky. Although most recreational aircraft are very light weight, when it drops with propellers spinning, injury could occur.

Even a happy drone flying above a crowd can create quite a stir.

Safety: If the drone were to fall out of the sky it could injure a bystander. The drone could also inhibit the safety of the crowd by interfering with the activity, distracting people rendering them unaware of happenings nearby, and it could have a run-in with a pesky seagull.

Privacy: During the popular Kenai River fishing season, this drone inadvertently photographed Clyde's map to grandpa's secret fishing hole. Because the map was visible in a public area, the photo of the map can be shared with others. Clyde's secret fishing hole is no longer secret.

Sometimes photographing a crowd could result in the capture of **inadvertent images**. If the drone image shows Captain Blowhole with a catch beyond his limit, that image could be provided to the authorities for legal review.

What happens if a drone captures inadvertent images?

Private Citizen: What happens if a drone captures inadvertent images and those images are posted on social media or reveal something questionable? Photographing in a public area could result in capturing an image that may not have been planned. The image could be of a person not wanting to be photographed but would not be a breach of privacy since it occurred in a public place.

Drone Operator: Be aware of and be sensitive to what you are photographing. Are you capturing proprietary information; is the map to the secret fishing hole copyrighted? If you capture an image of someone appearing to break the law, you may want to surrender images to local authorities. Know your crowd. Some people may not want to be photographed and their sensitivity level to privacy could result in an angry situation.

MEMORANDUM June 8, 2015

SUBJECT: Unmanned Aircraft Systems (Work Order No. 29-LS0823)

TO: Representative Shelley Hughes
Attn: Ginger Blaisdell

FROM: Hilary V. Martin
Legislative Counsel

You have asked a number of questions related to unmanned aircraft systems (UAS) and privacy issues. Please be aware that any situation with a UAS will depend heavily on the specific circumstances of the particular situation. I have answered the questions you asked with the general statutes that might apply. If you have questions about a specific fact scenario, please let me know.

Can a person issue a no trespass or restraining order against the pilot of a UAS so the aircraft cannot be flown over private property?

There are a number of options a person can take regarding a UAS flying over the person's property.

If the activities of the UAS operator amount to stalking under AS 11.41.260 or 11.41.270[1], a person could obtain a protective order under AS 18.65.850 or AS 18.66.100. Using a UAS to follow, record, take pictures of, or otherwise harass someone with a protective order against the operator of a UAS would likely violate the terms of the protective order.

There are some situations where a person operating a UAS could be committing harassment[2] in the second degree under AS 11.61.120(a), which states:

---

[1] Under AS 11.41.270, a person commits the crime of second degree stalking when a person knowingly engages in repeated acts of nonconsensual contact that recklessly places another person in fear of death or physical injury. Nonconsensual contact includes "following or monitoring . . . with a global positioning device or similar technological means."

[2] AS 11.61.118, harassment in the first degree, prohibits specific types of offensive conduct that would not apply to a situation involving a UAS.

> (a) A person commits the crime of harassment in the second degree if, with intent to harass or annoy another person, that person
>
> (1) insults, taunts, or challenges another person in a manner likely to provoke an immediate violent response;
>
> (2) telephones another and fails to terminate the connection with intent to impair the ability of that person to place or receive telephone calls;
>
> (3) makes repeated telephone calls at extremely inconvenient hours;
>
> (4) makes an anonymous or obscene telephone call, an obscene electronic communication, or a telephone call or electronic communication that threatens physical injury or sexual contact;
>
> (5) subjects another person to offensive physical contact;
>
> (6) except as provided in AS 11.61.116, publishes or distributes electronic or printed photographs, pictures, or films that show the genitals, anus, or female breast of the other person or show that person engaged in a sexual act; or
>
> (7) repeatedly sends or publishes an electronic communication that insults, taunts, challenges, or intimidates a person under 18 years of age in a manner that places the person in reasonable fear of physical injury.

Under AS 09.45.230(a), a person could bring a civil action against a UAS operator to enjoin or abate a private nuisance. A "nuisance" is defined as "a substantial and unreasonable interference with the use or enjoyment of real property, including water."[3] If the person bringing the nuisance action prevails, a court will issue an order to abate the nuisance.[4] The person bringing the actions may also be entitled to damages.[5]

Is there a noise ordinance that pertains to UAS operation or is there a harassment law that might protect a person from the UAS operator?

There is no state statute that specifically regulates noise level. However, AS 11.61.110, relating to disorderly conduct, prohibits activity that involves "unreasonably loud noise." AS 11.61.110(a)(1) and (a)(2) state:

> (a) A person commits the crime of disorderly conduct if,
>
> (1) with intent to disturb the peace and privacy of another not physically on the same premises or with reckless disregard that the conduct is having that effect after being informed that it is having that

---

[3] AS 09.45.255.

[4] AS 09.45.240.

[5] AS 09.45.255.

> effect, the person makes unreasonably loud noise;
>
> (2) in a public place or in a private place of another without consent, and with intent to disturb the peace and privacy of another or with reckless disregard that the conduct is having that effect after being informed that it is having that effect, the person makes unreasonably loud noise . . . .

"Unreasonably loud noise" is defined in AS 11.61.110(b):

> As used in this section, "noise" is "unreasonably loud" if, considering the nature and purpose of the defendant's conduct and the circumstances known to the defendant, including the nature of the location and the time of day or night, the conduct involves a gross deviation from the standard of conduct that a reasonable person would follow in the same situation. "Noise" does not include speech that is constitutionally protected.

It is unclear if a UAS would be loud enough to be considered "unreasonably loud" under this statute.[6]

If the use of a UAS places a person in fear of death or physical injury, the operation of a UAS could potentially be considered stalking.[7] As mentioned above, using a UAS to follow, take pictures of, or otherwise harass a person could be prohibited by a protective order.

Should there be restrictions on UAS use to above fifty feet or the tallest roof line over private property without permission from the property owner?

You asked if the task force should consider a flight restriction to prohibit a UAS from flying below fifty feet or the tallest roof line over private property without permission from the property owner. While the state can pass laws related to UAS and restrictions on their flights, the law could be subject to a challenge on federal preemption grounds.

Under the Supremacy Clause of the U.S. Constitution, federal law may preclude a state from legislating in an area in four ways: (1) Congress may expressly state that state law is preempted; (2) the scheme of federal regulation may be sufficiently comprehensive so that there is a reasonable inference that federal law left no room for state law in that area; (3) if state law actually conflicts with federal law; or (4) state law may "stand[ ] as an

---

[6] Note that a number of municipalities regulate noise levels. *See, e.g.,* Juneau Ordinance 42.20.095, which prohibits disturbing the peace. The ordinance broadly prohibits a person from making an "unreasonable noise."

[7] AS 11.41.260 - 11.41.270.

obstacle to the accomplishment and execution of the full purposes and objectives of Congress."[8]

In the FAA Modernization and Reform Act of 2012,[9] the FAA was directed to write regulations to integrate the use of civil UAS into the national airspace. Section 336 of the law also set limits for recreational or hobby use of UAS. These limits include requirements that the UAS weigh less than 55 pounds, that the UAS be in the visual line-of-sight of the operator at all times, and that a UAS not fly within 5 miles of an airport.[10]

It is possible that this comprehensive scheme created by the FAA will preempt any state regulation in the area of UAS. However, this is a rapidly evolving area of the law, and there is very little federal law or regulation on the recreational or hobby use of UAS. Therefore, it is possible that the state could place limits on the recreational or hobby use of UAS, so long as the state law does not conflict with federal law or regulation.

The United States has ruled that a property owner owns only that much airspace above the ground as the owner can occupy or use in connection with the land.[11] Therefore, it is possible that if a UAS is flying at a level that does not interfere with the property owner's use of the land, then the UAS flight would be permissible. This holding, however, does not necessarily place any limits on the ability of the state to set a limit on how low a UAS can fly over private property.

As this is a constantly changing area of law, it is difficult to predict with any degree of certainty whether any state regulation would be preempted by federal law.

What happens if someone shoots down a UAS? What if a UAS crashes into a backyard and the property owner does not want to return the UAS?

Shooting a firearm at a UAS or shooting down a UAS would likely be a crime. There are a number of state laws that are implicated if a person shoots down a UAS, depending on the specific circumstances. If, for example, other people are nearby or in the trajectory of the firearm, the activity could potentially be reckless endangerment or assault.[12]

---

[8] *Hillsborough County, Fla. v. Automated Medical Laboratories, Inc.*, 471 U.S. 707, 713 (1985).

[9] Public Law 112-95.

[10] You may wish to review the information the FAA has provided regarding UAS on their website: www.faa.gov/uas.

[11] *United States v. Causby*, 328 U.S. 256, 265 (1946).

[12] AS 11.41.200 - 11.41.230 (assault statutes), and AS 11.41.250 (reckless endangerment).

Additionally, shooting down a UAS could be criminal mischief in the third, fourth, or fifth degree, depending on the amount and dollar value of damage to the UAS.[13] State and municipal law prohibit discharging a firearm in certain places that would prevent a person from attempting to shoot down a UAS.[14]

Depending on the particular circumstances, a person who shoots at or shoots down a UAS could potentially claim self-defense or defense of property and premises. Under AS 11.81.350(a):

> A person may use nondeadly force upon another when and to the extent the person reasonably believes it is necessary to terminate what the person reasonably believes to be the commission or attempted commission by the other of an unlawful taking or damaging of property or services.

A person could potentially also argue self-defense,[15] although again this would be highly fact dependent.

A person is not entitled to keep a UAS that is not theirs, even if the UAS crashes into their backyard. Refusing to return the UAS could be theft[16] or theft of lost or mislaid property.[17]

Any situation involving a UAS that is shot down or crashes into private property will be heavily fact dependent, so it is difficult to determine the consequences of such actions. However, it is very unlikely that a person could keep a UAS that crashed onto the person's property.

---

[13] AS 11.46.482 - 11.46.486.

[14] *See* AS 11.61.190 - 11.61.220 (misconduct involving weapons).

[15] AS 11.81.330(a) states in relevant part: "A person is justified in using nondeadly force upon another when and to the extent the person reasonably believes it is necessary for self-defense against what the person reasonably believes to be the use of unlawful force by the other person . . . . "

[16] AS 11.46.100.

[17] Under AS 11.46.160 a person commits theft of lost or mislaid property if the person obtains "property of another knowing that the property was lost, mislaid, or delivered under a mistake as to the nature or amount of the property or the identity of the recipient and the person fails to take reasonable measures to restore the property to the owner with intent to deprive the owner of the property."

Is there a reasonable expectation of privacy that could relate to a private person operating a UAS that invades another person's privacy?

The Constitution of the State of Alaska contains an express right to privacy.[18] However, the Alaska Supreme Court has so far refused to extend this right to apply against private actors.[19] In the same case, however, the Court found that the privacy clause in the Alaska Constitution does evidence a public policy supporting privacy,[20] and that there is a common law right to privacy.[21]

The Court recognized the tort of "intrusion upon seclusion" from the Restatement (Second) of Torts § 652B, which states:

> One who intentionally intrudes, physically or otherwise, upon the solitude or seclusion of another or his private affairs or concerns, is subject to liability to the other for invasion of his privacy, if the intrusion would be highly offensive to a reasonable person.[22]

Therefore, even though the right to privacy in the Constitution of the State of Alaska would likely not apply against a private UAS operator, a person could bring a civil suit against a UAS operator for the common law tort of intrusion upon seclusion.

Notes on "Alaska Privacy Guidelines for Drones"

You had asked for some feedback on the "Alaska Privacy Guidelines for Drones" that you sent. Many of the pictures and headings are blank with no commentary or

---

[18] Art. I, sec. 22, Constitution of the State of Alaska, which states in relevant part: "The right of the people to privacy is recognized and shall not be infringed."

[19] *Luedtke v. Nabors Alaska Drilling, Inc.*, 768 P.2d 1123, 1130 (Alaska 1989). The Court did leave open the possibility that the right could be extended against private actors:

> The parties in the case at bar have failed to produce evidence that Alaska's constitutional right to privacy was intended to operate as a bar to private action. . . . Absent a history demonstrating that the amendment was intended to proscribe private action, or a proscription of private action in the language of the amendment itself, we decline to extend the constitutional right to privacy to the actions of private parties.

[20] *Id.* at 1132 - 1133.

[21] *Id.* at 1133.

[22] *Id. quoting* The Restatement (Second) of Torts § 652B.

information. I have not addressed any of these "blank" pictures or headings. If you have a specific question about something to be covered by the handout, please let me know.

The first picture refers to AS 11.16.120(a)(6). This is an incorrect citation. If you are referring to the harassment statutes, the correct citation is AS 11.61.120. Additionally, AS 11.61.120(a)(6) only prohibits publishing or distributing "electronic or printed photographs, pictures, or films that show the genitals, anus, or female breast of the other person or show that person engaged in a sexual act." This is not a situation that would apply to every instance of a UAS flying over someone's private property.

If I may be of further assistance, please advise.

Research Brief

TO: Representative Shelley Hughes
FROM: Chuck Burnham, Legislative Analyst
DATE: April 6, 2015
RE: Legal Decisions on Drones and Privacy
LRS Report 15.367

You asked whether any courts have decided cases regarding citizens' expectation of privacy with regard to the use of unmanned aircraft systems.

As you know, unmanned aircraft systems (UAS), also variously referred to as unmanned aerial vehicles (UAV) and "drones," have no onboard pilot and are operated remotely. Drones range from palm-size devices with a range of only a few dozen yards that must be flown within sight of the operator, to vehicles with wingspans as great as a Boeing 737 that can fly hundreds of miles at great speeds and at altitudes of greater than 60,000 feet while using sophisticated satellite navigation, video, and detection systems monitored by operators on the other side of the globe. The possible applications of UAS include military and covert missions, law enforcement, search and rescue, weather and other scientific research, border surveillance, and others. The Federal Aviation Administration (FAA) expects the use of drones, particularly by law enforcement agencies, to expand rapidly in coming years as the devices become more readily available and their costs decrease.[1] The specter of the proliferation of drones for domestic surveillance has raised concern for advocates of privacy and civil liberties.

We located no court case that is precedential with regard specifically to the interaction between UAS and privacy rights. The American Civil Liberties Union (ACLU) is among the organizations advocating for stricter regulation of drones to ensure citizens' privacy rights are not infringed upon by the extraordinarily powerful surveillance systems on board certain UAS. In a 2011 report on the topic, the ACLU reviewed U.S. Supreme Court decisions on the use of *manned* aircraft and other methods of surveillance, and the variations from those decisions the Court may make in future cases involving UAS, as follows:

> In the 1986 decision *California v. Ciraolo* [476 U.S. 207 (1986)], the Supreme Court focused on whether an individual has a privacy interest in being free from aerial surveillance of his backyard. The police had received a tip that Dante *Ciraolo* was growing marijuana in his backyard, but high fences prevented them from viewing his backyard from the street. The police borrowed a plane, flew it over the backyard and easily spotted marijuana plants growing there. *Ciraolo* argued that his Fourth Amendment rights were violated because the government did not get a warrant. The Court rejected this argument, explaining that there was no intrusion into his privacy because "[a]ny member of the public flying in this airspace who glanced down could have seen everything that these officers observed."
>
> In *Dow Chemical Co. v. United States* [476 U.S. 227 (1986)], also decided in 1986, the Supreme Court addressed whether the Environmental Protection Agency violated Dow's Fourth Amendment rights when it employed a commercial aerial photographer to use a precision aerial mapping camera to take photographs of a chemical plant. The Court found no violation, in part because the camera the EPA used was a "conventional, albeit precise, commercial camera commonly used in mapmaking," and "the photographs here are not so revealing of intimate details as to raise constitutional concerns." However, the Court suggested that the use of more sophisticated, intrusive surveillance might justify a different result. It wrote, "surveillance of private property by using highly sophisticated surveillance equipment not generally available to the public, such as satellite technology, might be constitutionally proscribed absent a warrant."

[1] The FAA maintains a website on its activities regarding UAS at *http://www.faa.gov/about/initiatives/uas/*.

In *Florida v. Riley* [488 U.S. 445 (1989)], decided in 1989, the police had received a tip that Michael Riley was growing marijuana in a greenhouse on the property surrounding his home. The interior of the greenhouse was not visible from the ground outside the property, and the greenhouse had a ceiling, though two panels in the ceiling were missing. A police officer flew over the greenhouse and spotted marijuana through the openings in the roof. While no reasoning commanded a majority of the Court, four justices concluded that its decision in *Ciraolo* applied because Riley had left part of the greenhouse open to public view, and so the search was constitutional

Because of their potential for pervasive use in ordinary law enforcement operations and capacity for revealing far more than the naked eye, drones pose a more serious threat to privacy than do manned flights. There are good reasons to believe that they may implicate Fourth Amendment rights in ways that manned flights do not.

Government use of UAVs equipped with technology that dramatically improves on human vision or captures something humans cannot see (such thermal or x-ray images) should be scrutinized especially closely by the courts. This follows from the Supreme Court's statement in Dow Chemical that using sophisticated technology not generally available to the public may be considered a search under the Fourth Amendment. It is also suggested by the 2001 case *Kyllo v. United States* [533 U.S. 27 (2001)], in which the court rejected the use of thermal imaging devices to peer into a suspect's home without a warrant.

Further, the Supreme Court has suggested that the pervasive or continuous use of a surveillance technology may heighten Fourth Amendment concerns. In *United States v. Knotts* [460 U.S. 276, 283-84 (1983)], the Supreme Court addressed whether attaching primitive "beeper" tracking technology to a car violated the driver's Fourth Amendment rights. Although it concluded that the use of the beeper in that case did not violate the Fourth Amendment, it held that if "such dragnet type law enforcement practices" as "twenty-four hour surveillance of any citizen of this country" ever arose, it would determine if different constitutional principles would be applicable. Citing to this language in *Knotts*, the federal appeals court in Washington D.C. recently ruled that attaching a GPS device to a person's car and tracking his movements for 28 days fell into this category of dragnet-type surveillance and held that the government's warrantless tracking violated the Fourth Amendment [*United States v. Maynard*, 615 F.3d 544, 556 (2010)].[2]

The 2012 case *United States v. Jones* (132 S. Ct. 945, 949) addressed whether police can use a global position system (GPS) device to track the movement of a suspect without a warrant. The U.S. Supreme Court found the tactic to be an unlawful search and seizure. In separate concurring opinions, Justices Alito and Sotomayor indicated that the persistent surveillance enabled by rapid advances in technology may be constitutionally problematic. In a concurrence joined by three of his colleagues, Justice Alito wrote "in circumstances involving dramatic technological change, the best solution to privacy concerns may be legislative" (*Jones* at 964). As you know, numerous states have enacted or are considering legislation on drones, and several bills to increase federal oversight of UAS have been introduced in Congress in recent years.[3]

The cases discussed above deal with government use of drones. In circumstances involving the use of UAS by private businesses or individuals, FAA regulations on airspace may be implicated in addition to state and local laws on trespassing, stalking, harassment and other property and privacy issues, depending on the specific facts of the case in question. If you have question about the legality of the use of drones by private entities under specific scenarios, we recommend that you consult with Legislative Legal Services.

We hope this is helpful. If you have questions or need additional information, please let us know.

ALASKA UAS INTEREST GROUP

Alaska Unmanned Aircraft Systems Interest Group Annual Meeting

September 1-3, 2015, Fairbanks, Alaska

As the lead for the University of Alaska, Alaska Center for Unmanned Aircraft Systems Integration (ACUASI) and the Pan-Pacific UAS Test Range Complex, I cordially invite you to attend the 2015 Alaska Unmanned Aircraft Systems Interest Group annual three-day workshop and meeting from September 1–3, 2015. We are excited to host this year's event in Fairbanks where ACUASI and arctic research are located within the University of Alaska Fairbanks Geophysical Institute.

The meeting is open to interested government, industry, and private participants in all fields of unmanned systems and robotics, as well as potential users from a variety of agencies, associations, institutions, and commercial interests who might benefit from the use of these new and emerging technologies.

Themes will include:

- UAS operations in the Arctic; lessons learned, challenges, and opportunities
- The role of UAS in emergency response, interagency communications, and the path forward
- UAS Test Sites; what they mean to the UAS community, and how to work with them
- UAS outside the U.S.; what is happening in Canada and Europe, and what that means to us
- A requirements-driven future and economical and efficient use of UAS technology
- Understanding government, industry, and private unmanned systems and robotics needs and issues
- Exploration and identification of ways we can work together to safely achieve common goals
- The impact on civil and commercial manned and unmanned aircraft activity in Alaska
- The role of unmanned systems and robotics in education, research, science, natural resource management, natural disasters, emergency response, search and rescue and much more
- Working with educational institutions in transforming and shaping the minds of young people through the National Science Foundation's science, technology, engineering and mathematics (STEM) goals

In addition several special meetings will be occurring that you may want to attend:

- The U.S. Department of the Interior will be demonstrating the benefits of UAS for geophysical measurements and natural resource monitoring in Alaska and the Arctic with a full day of presentations on August 31st.
- The Alaska Legislative Task Force on Unmanned Aircraft Systems will convene on the final day of the UAS Interest Group meeting.

We expect the 2015 AUASIG meeting to be a fulfilling and informative event and hope that you will attend. We'll notify you when registration is available at http://www.uasalaska.org/. The venue, call for papers, cost and registration, hotel/lodging information, vendor information, and agenda will be announced shortly, as well.

Thank you all for your interest in the Alaska UAS Interest Group. We hope to see you all in Fairbanks this coming September.

Marty W. Rogers

Marty W. Rogers, Director
Alaska Center for Unmanned Aircraft Systems Integration
Geophysical Institute, University of Alaska Fairbanks

Ginger Blaisdell

Subject: Alaska UAS Interest Group meeting announced
Attachments: 2015 Save the Date.pdf

Associates, Colleagues & Friends – Mr. Marty Rogers, Director of the Alaska Center for UAS Integration (ACUASI) and the Pan Pacific UAS Test Range Complex (PPUTRC), has asked me to inform you of, and send you his personal invitation, regarding the 2015 Alaska UAS Interest Group meeting in Fairbanks Alaska this coming 1 thru 3 September.

Please find attached, Mr. Rogers' personal invitation, and please do not hesitate to ask any of us here at the ACUASI and PPUTRC for guidance on any matter regarding the planning of your travel to join us this year.

In addition to the Alaska UASIG Meeting, the Departments of both the Interior and Energy will host a full day event on Monday that same week. These two Federal Government agencies have much information to convey regarding ongoing and planned activities in Alaska and throughout the Arctic, and have asked that we extend to you an invitation to join them on Monday, 31 August.

Finally, be sure to plan your trip so that you can take advantage of your travel to Alaska. If time permits, might I suggest looking into taking the Alaskan Railroad's "Denali Star" either to or from Fairbanks to/from Anchorage. September is Autumn in Alaska, and while beauty abounds at that time of the year, the wildlife is in high gear getting prepared for Winter and can be seen most anywhere you look.

So please, open Mr. Roger's attached invitation, and join us so that we might see you in Fairbanks in September. And if you have any questions at all, feel free to contact myself, Barbara Johnson or Diana Campbell (CC'd), and I promise we'll get you an answer.

Respectfully, Leonard Ligon

You are receiving this email because you have expressed interest in Alaska's Unmanned Aircraft Systems Legislative Task Force meetings.

Friday June 19, 2015
Anchorage Legislative Information Office Building
716 West 4th Ave
1st floor Auditorium

Public meeting from 1:00pm – 5:00pm Alaska Time
Please watch on www.akltv.com or call in toll free at 844-586-9085 to listen or provide comment during public testimony
Public testimony will be taken between 4-5pm

The afternoon DRAFT agenda is as follows:
1:00pm welcome and announcements
1:15pm Drone insurance for commercial and recreational users
2:00pm Proposed FAA Rule for UAS – invited testimony
3:00pm Privacy document and legal memo regarding privacy for Alaska citizens
4:00pm Public testimony
5:00pm Adjourn

Documents and final agenda will be posted on Thursday June 18 at
http://www.akleg.gov/basis/Meeting/Detail?Meeting=HUNM 2015-06-19 12:00:00#tab1_4

Thank you for your interest in Alaska's UAS Task Force

Hi Ginger,
I was just running the March authorization balance numbers and I see the Task Force on Unmanned Aircraft Systems is almost out of money for FY15.
There is $518.13 left. Joanna has paid everything that has come over so far, but if it stays in the budget there will be new money in FY16 for any travel that takes place after July 1. Please let me know if you have questions or concerns.

Subject: UAS/UAV Legislative Task Force Meeting Tomorrow, June 19th

Hi Everyone,
Tomorrow's meeting will start at 9:00am and will be held in the Executive Conference Room (Room C-207) in the National Guard Armory on JBER. You will need to enter JBER via the Ft Richardson gate, but first you will need to stop at the visitor's center just prior to entering to give them your picture I.D., vehicle registration, and proof of vehicle insurance. They already have your name on a list which lists me as your sponsor. If you need further directions, or have any other questions, please don't hesitate to call me.
thanks

Marty Meyer
Special Assistant I
Department of Military & Veterans Affairs
Office of the Commissioner

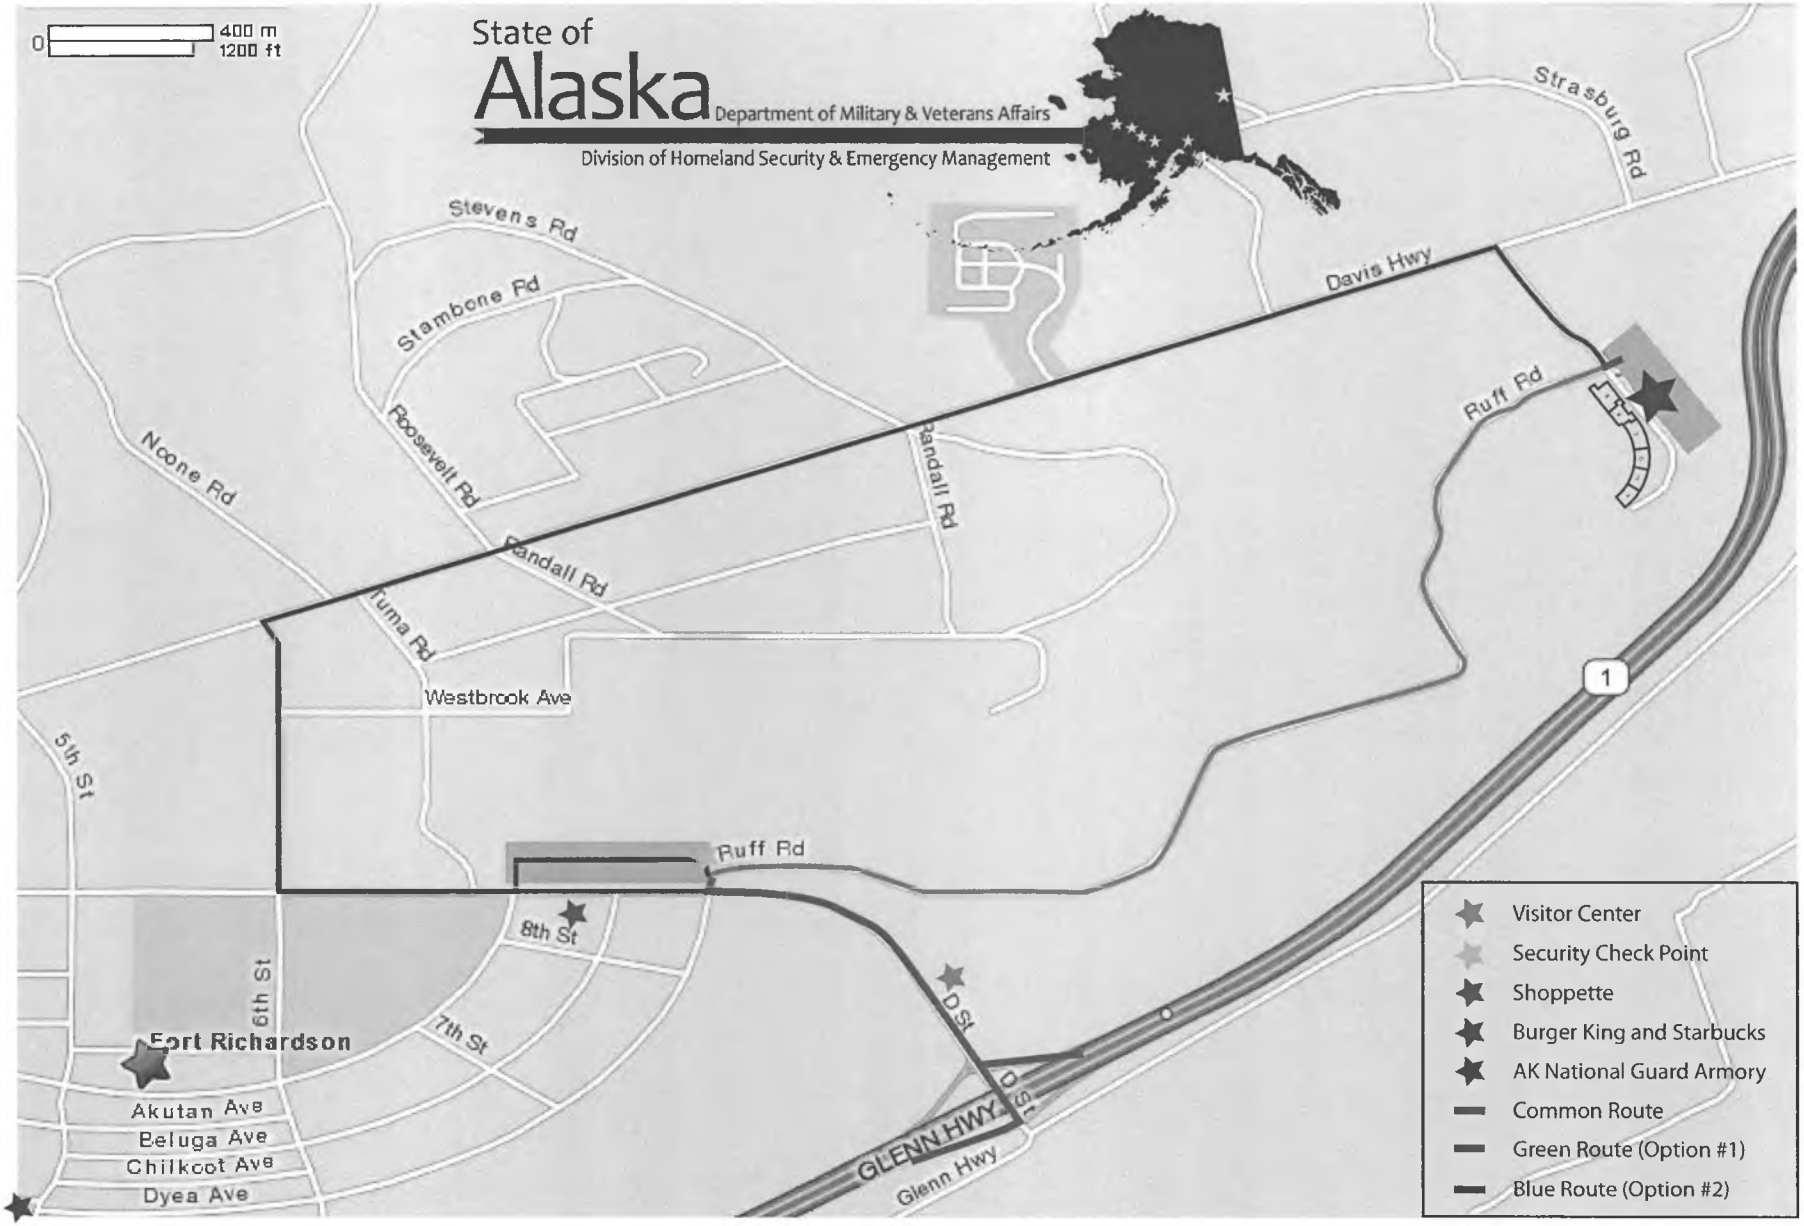
Fax: 907-428-6019

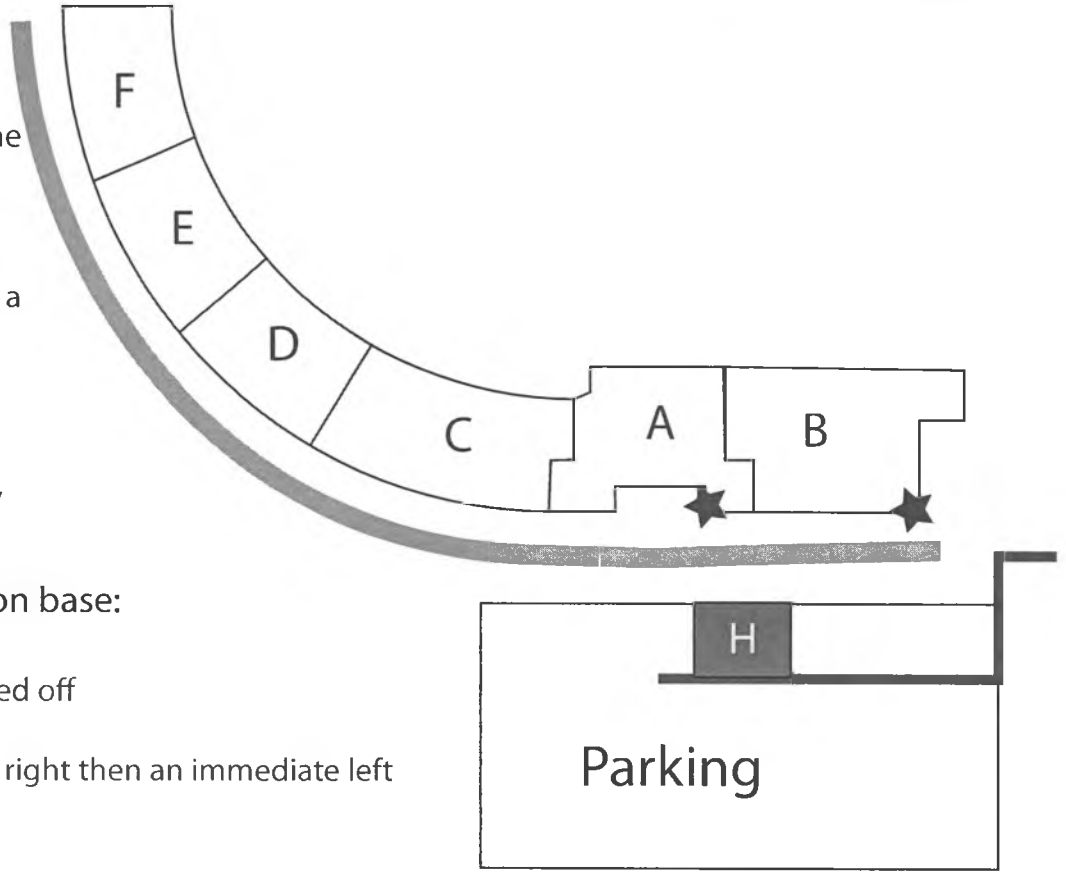
Directions to the Divsion of Homeland Security and Emergency Mangement

Located in the Alaska National Guard Armory - Ft. Richardson, AK



Directions to get to the Armory:

1. From the Glenn Highway: Take the Ft Richardson Exit. At the top of the ramp go left from Anchorage - right from the Valley
2. Stop at the Visitor's Center to get a pass.
   - You'll need the car's registration, proof of insurance and a valid ID
   - Your car may be subject to search
3. Get back onto the main road
4. Take the very first right and keep to the right – there are several lanes of k-rails - you may have to stop at a security check point.



Two options (due to construction or a security issue on base:

#1 - Green Route (indicated on map)

1.1 - Take a right at the first road you come to if it is not blocked off

1.2 - Follow the road for about 2 miles (enjoy the scenery).

1.3 - You will come to a T in the road with a Yield sign, make a right then an immediate left into the parking lot.

#2 - Blue Route (indicated on map)

2.1 - Veer left to exit the security check point then make an immediate right onto D Street.

2.2 - Make a right at the light. (6th Street)

2.3 - Make a right at the "T" in the road. (Davis Hwy)

2.4 - Follow the road about 2 miles.

2.5 - There will be a sign on the right directing you to the National Guard Armory (if you go through a gate in the fence you have passed it.

2.6 - Follow the road till you come the barrier, make a left into the parking area.

If you need handicap parking it is near the main entrance of the building.

Enter through the farthest door to the right as you look at the building or the right set of doors at the main entrance (marked with blue stars above).

Go upstairs, to room B-201; if you get lost or no one is there - ask to be directed to room B-214. Our wonderful admin staff will help direct you to the classroom.

If you have questions or get lost, call Admin at 428-7000.

DEPUTY SECRETARY OF DEFENSE
1010 DEFENSE PENTAGON
WASHINGTON, DC 20301-1010

February 17, 2015

MEMORANDUM FOR SECRETARIES OF THE MILITARY DEPARTMENTS
CHAIRMAN OF THE JOINT CHIEFS OF STAFF
UNDER SECRETARY OF DEFENSE FOR ACQUISITION, TECHNOLOGY, AND LOGISTICS
UNDER SECRETARY OF DEFENSE FOR POLICY
UNDER SECRETARY OF DEFENSE FOR PERSONNEL AND READINESS
UNDER SECRETARY OF DEFENSE FOR INTELLIGENCE
COMMANDER, U.S. NORTHERN COMMAND
COMMANDER, U.S. PACIFIC COMMAND
CHIEF, NATIONAL GUARD BUREAU
GENERAL COUNSEL OF THE DEPARTMENT OF DEFENSE
ASSISTANT SECRETARY OF DEFENSE FOR LEGISLATIVE AFFAIRS
DEPARTMENT OF DEFENSE CHIEF INFORMATION OFFICER
ASSISTANT TO THE SECRETARY OF DEFENSE FOR PUBLIC AFFAIRS
SENIOR INTELLIGENCE OVERSIGHT OFFICER

SUBJECT: Policy Memorandum 15-002, "Guidance for the Domestic Use of Unmanned Aircraft Systems"

EXPIRATION DATE: February 17, 2018

POINT OF CONTACT: For more information, contact OASD(HD&GS) at (571) 256-8322.

This policy memorandum provides guidance for the domestic use of unmanned aircraft systems (UAS) to ensure that Department of Defense (DoD) UAS are used in accordance with U.S. law and DoD policy, and to ensure the appropriate use of DoD UAS assets in domestic operations, training, exercises, and testing.

DoD domestic aviation operations support Homeland Defense (HD), Defense Support of Civil Authorities (DSCA), and military training and exercises. Unless specifically provided for in this policy, law, or other guidance, the approval of the Secretary of Defense is required for all domestic UAS operations (including HD, DSCA, and National Guard (NG) State support operations, including DoD UAS operated by NG personnel in Title 32 or State Active Duty status). Any domestic use of UAS requires consultation with the Federal Aviation Administration (FAA) and must be consistent with applicable laws, regulations, and memoranda of agreement concerning the operations of UAS in the National Airspace System (NAS). This guidance applies to all DoD UAS use in the United States (hereafter "domestic use" or "domestic

operations"), whether operated by or under contract to Active or Reserve Component military personnel, or by other DoD personnel.

Unless permitted by law and approved by the Secretary of Defense, any DoD personnel using UAS for domestic operations, whether or not the DoD UAS use is related to an intelligence activity, may not conduct surveillance on U.S. persons. This restriction includes using any domestic DoD UAS as part of an authorized DoD response to a lawful request from another Federal department or agency. Consistent with DoD Directive 5200.27[1] and applying the oversight guidance contained in DoD 5240.1-R[2] to intelligence and non-intelligence related domestic UAS use, all UAS acquisition, collection, retention, and dissemination of information during domestic DoD UAS employment will be in accordance with standing DoD and DoD Component intelligence oversight guidance and will require coordination and review of a proper use memorandum (PUM).

The following guidance on the domestic use of UAS is effective immediately.

DoD Operations

In appropriate circumstances, UAS may be used in lieu of manned aircraft for domestic missions. Appropriate circumstances may include when:

- sustained endurance efforts are required;
- unmanned aircraft provide superior capabilities; or
- physical infrastructure limitations prohibit the use of manned rotary- or fixed-wing aircraft.

DoD UAS in the United States may only be used for HD, DSCA, and NG State support operations, including operations to support Federal, State, local, and tribal government organizations, if approved by the Secretary of Defense. DoD UAS may not be used for Federal, State, or local immediate response.

Armed DoD UAS may not be used in the United States for other than training, exercises, and testing purposes.

In the event of a request for Federal support, the Chairman of the Joint Chiefs of Staff, in consultation with the appropriate geographic Combatant Commanders, will provide a recommendation to the Secretary of Defense concerning the use of DoD UAS. To seek approval for other missions, DoD Components should use the approval authorities, procedures, and reporting requirements contained in applicable laws and regulations, such as CJCS Instruction 3710.01B, "DoD Counterdrug Support." Support will be provided on a reimbursable basis unless otherwise required by law, or on a non-reimbursable basis if such support is both authorized by law and approved by the Secretary of Defense.

---

[1] DoD Directive 5200.27, Acquisition of Information Concerning Persons and Organizations Not Affiliated with the Department of Defense.

[2] DoD 5240.1-R, Procedures Governing the Activities of DoD Intelligence Components that Affect United States Persons.

State/National Guard Operations

Governors in States where DoD UAS assets are fielded to the State's National Guard may not employ DoD UAS without the approval of the Secretary of Defense; however, these Governors may consider DoD UAS employment in their planning for disaster response activities. Governors who seek to use DoD UAS assets in support of State disaster response should submit a formal request in writing to the Secretary of Defense. Such requests should contain the analysis conducted that determined that other manned air assets were not appropriate. The Chairman of the Joint Chiefs of Staff, in consultation with the appropriate geographic Combatant Commander, the Chief of the National Guard Bureau (NGB), and the appropriate Military Department Secretary, will provide a recommendation to the Secretary of Defense concerning the use of DoD UAS in support of a State request.

Plans should factor in the procedures and time required for FAA consultation for access to the necessary airspace and to obtain Secretary of Defense authorization. In concert with Federal Emergency Management Agency-coordinated regional planning, any State that proposes the use of DoD UAS in its plans should consult with the corresponding geographic Combatant Commander to ensure that State and DoD plans maximize unity of effort and efficiency.

Search and Rescue Exception

The only exception to the requirement for approval by the Secretary of Defense for the use of DoD UAS for domestic operations are search and rescue (SAR) missions involving distress and potential loss of life that are coordinated by the Air Force Rescue Coordination Center (AFRCC), Alaska Rescue Coordination Center (AKRCC), or Joint Rescue Coordination Center (JRCC)-Pacific. Specifically, the following commanders may approve the use of DoD UAS on an AFRCC/AKRCC/JRCC-Pacific coordinated mission with a properly issued SAR mission number after a determination that UAS would be the best platform to assist in the SAR mission and that its use would not interfere with the primary military duties of the unit concerned:

- Commander, U.S. Northern Command, through the Commander, Air Forces Northern, in the delegated role of Inland SAR Operations Coordinator for the continental United States Search and Rescue Region;
- Commander, U.S. Northern Command, through the Commander, Alaskan Command, as SAR Operations Coordinator for the Elmendorf Search and Rescue Region, landmass of Alaska; or
- Commander, U.S. Pacific Command, in the role of SAR Coordinator for the landmass of Hawaii, in close coordination with the U.S. Coast Guard.

Each commander will ensure that all legal, intelligence oversight (including the requirement to obtain a PUM), Privacy Act, and airspace issues are properly addressed. Each commander will promptly inform the Secretary of Defense, through appropriate channels, after the use of DoD UAS has been approved.

The Assistant Secretary of Defense for Homeland Defense and Global Security (ASD(HD&GS)) will include this SAR exception in the next revision of DoD Directive 3025.18, "Defense Support of Civil Authorities."

DoD-Required Training and Exercises

The primary purpose of domestic UAS training and exercises is for DoD forces to conduct realistic training in their core Federal military mission areas. DoD UAS used in training and exercises will not acquire or collect information (except for incidental collection) about specified U.S. persons or non-DoD controlled property or facilities located outside DoD-controlled installations without consent. All UAS acquisition, collection, retention, and dissemination of information will be in accordance with standing DoD regulations and policy, including DoD Component intelligence oversight guidance, and will require a PUM.

Use of DoD UAS assets in domestic training and exercises requires:

- Prior notification to the Secretary of Defense if the platform is a large DoD UAS[3] and is to be used in training and exercises outside DoD-scheduled special use airspace (SUA);[4]
- Prior approval by the Secretary of Defense if the UAS is armed and will be used in a training, exercise, or testing event outside DoD SUA; and
- Prior approval by the Secretary of Defense for any DoD UAS training and exercises conducted with Federal, State, or local law enforcement agencies (LEAs), including any DoD UAS training and exercises planned in coordination with LEAs to meet LEA information needs in accordance with 10 U.S.C. § 371(b).

The notification to or request for approval by the Secretary of Defense required by this section will be submitted to the Secretary at least 30 days prior to the training, exercise, or testing event through appropriate Military Department/Service, Combatant Command, or NGB channels via the Joint Staff (J-3), and may be submitted either on a case-by-case basis or in batch format for periods not to exceed one calendar year in advance of the proposed exercise or training.

Exercises, Training, and Activities Not Required by DoD

Although DoD equipment issued to the NG is often available for use by State Governors for non-DoD purposes, Secretary of Defense approval is required for the use of DoD UAS assets for non-DoD purposes, for DSCA training and exercises, or for NG UAS training and exercises that provide incidental support to civil authorities. This includes DoD UAS operated by forces in Title 10 status and National Guard personnel in Title 32 or State Active Duty status.

---

[3] Group 4/5 UAS, as currently defined in CJCSI 3255.01, *Joint Unmanned Aircraft System Minimum Training Standards, Incorporating Change 1*, para. 9(a)(1)-(5) (October 31, 2011) and Joint Publication 3-30, *Command and Control of Joint Air Operations*, Figure III-15, page III-30 (February 10, 2014).

[4] DoD Scheduled Special Use Airspace (SUA): Warning Areas, Restricted Areas, Military Operations Area (MOA), Prohibited Areas, Controlled Firing Areas, and National Security Areas. For purposes of this Guidance, FAA-designated military training routes are also included. It is acknowledged that DoD UAS, in some cases, may have to transit the NAS from their departure/arrival airfield to DoD SUA to conduct their assigned mission. In all cases, appropriate airspace approval is required.

State officials who wish to propose the use of DoD UAS in support of major State disaster response exercises (or training requiring approval by the Secretary of Defense) should factor in the procedures and time required to consult with the FAA for access to the necessary airspace and to obtain Secretary of Defense approval. States in which DoD UAS assets are fielded that have a requirement for their use in these exercises (or training requiring approval by the Secretary of Defense) will submit the Governor's request in writing at least 30 days in advance to the Secretary of Defense through appropriate Military Department/Service, Combatant Command, or NGB channels via the Joint Staff (J-3), and may submit such requests either on a case-by-case basis or in batch format for periods not to exceed one (1) calendar year in advance of the proposed exercise or training.

Access to the U.S. National Airspace System

In order to conduct domestic operations, exercises, and training, DoD UAS operations will likely not be confined to segregated airspace; therefore, routine access to the national airspace will likely be required. The Department must continue to make progress in advancing regulatory policy and guidance associated with UAS operations in the NAS, as well as in aggressively developing detect-and-avoid technology to ensure safe operation of UAS in unsegregated airspace.

The Chair of the DoD Policy Board on Federal Aviation (PBFA) will lead the Department's efforts to advocate for the elimination of unnecessary regulatory restrictions that prevent routine access to the NAS for DoD UAS. The PBFA Chair will work through the multi-agency UAS Executive Committee to pursue regulatory changes and/or arrangements and develop reasonable standards of safety that address liability and take into account the excellent safety record of the Department's global UAS operations.

DoD will continue to promote the development of technologies, standardized operating procedures, and policies that ensure that DoD UAS are able to operate safely within the national airspace while also balancing and protecting personal privacy.

Other Designated Responsibilities

Under Secretary of Defense for Policy

The Under Secretary of Defense for Policy (USD(P)) is authorized to establish the appropriate policy for domestic use of UAS for force protection and protection of other DoD assets, whether in DoD Instruction 2000.16, "DoD Antiterrorism Standards," or other appropriate DoD issuance.

Assistant Secretary of Defense for Homeland Defense and Global Security

The ASD(HD&GS), under the authority, direction, and control of the USD(P), is the principal civilian advisor to the Secretary of Defense for the domestic use of DoD UAS. The ASD(HD&GS) will conduct a comprehensive review of this policy every three years and seek approval of appropriate revisions, if required. All policy development will be coordinated with

the Chairman of the Joint Chiefs of Staff, the DoD General Counsel, the Assistant Secretary of Defense for Special Operations and Low-Intensity Conflict, and the heads of other appropriate DoD organizations.

Assistant to the Secretary of Defense for Public Affairs

The Assistant to the Secretary of Defense for Public Affairs (ATSD(PA)) is responsible for coordinating public affairs inquiries with the Military Departments/Services, Joint Staff, Combatant Commands, National Guard Bureau, State departments and agencies, and other Federal departments and agencies as required. The ATSD(PA) is the lead DoD official for establishing public affairs guidance on domestic use of DoD UAS. Additionally, to promote transparency, the ATSD(PA) will work with the PBFA and the ASD(HD&GS) to develop a webpage outlining DoD UAS domestic operations.

This guidance replaces and rescinds the Deputy Secretary of Defense Memorandum, "Interim Guidance for the Domestic Use of Unmanned Aircraft Systems," September 28, 2006.[5]

[5] New operational and training requests/notification requirements take effect 60 days after the date that this policy memorandum is signed.

09/03/15 Task Force Meeting

<TARGET><BILL></BILL><SUBJECT>09-03-15 Task Force Meeting</SUBJECT><COMM><TARGET></COMM></TARGET>

Legislative Task Force on Unmanned Aircraft Systems
September 3, 2015 Meeting at 813 Noble Street, Fairbanks
Westmark Hotel Fairbanks

1:00pm - 4:45pm

Task Force Members:

- Representative Shelley Hughes, Co-Chair
- Senator Peter Micciche, Co-Chair
- Ethan Tyler, Commissioner Designee, Department of Commerce, Community Economic Devel.
- Mike O'Hare, Commissioner Designee, Department of Military and Veterans' Affairs
- Lieutenant Steve Adams, Commissioner Designee, Department of Public Safety
- John Binder, Commissioner Designee, Department of Transportation, Public Facilities
- Ro Bailey, University of Alaska Fairbanks
- Steve Strait, Aviation Advisory Board, Governor's Office and DOT/PF
- Steve Colligan, Representative Member for the Academy of Model Aeronautics
- John Parker, Integrated Robotics Imaging Systems
- Steve Wackowski, Tulugaq II
- Bob May, Gallery Lodge, Kasilof

- Ginger Blaisdell, Staff to Rep. Hughes
- Chuck Kopp, Staff to Senator Micciche

Task Force Responsibilities per HCR15 and Review of Resolution

The duties of the task force shall include

1. reviewing regulations and guidance from the Federal Aviation Administration regarding unmanned aircraft systems;
2. providing written recommendations, together with suggested legislation, for a comprehensive state policy for unmanned aircraft that protects privacy and allows the use of unmanned aircraft systems for public and private applications;
3. evaluating complaints and concerns expressed to the task force;
4. identifying potential privacy and public safety concerns associated with unmanned aircraft systems and determining whether legislation is necessary to address them;
5. considering recommendations for public education related to unmanned aircraft systems;
6. studying the Federal Aviation Administration's "Integration of Civil Unmanned Aircraft Systems (UAS) in the National Airspace System Roadmap," issued November 7, 2013 (1st ed. 2013) and its application to the development of unmanned aircraft systems in the state;

7. conducting a public hearing concerning privacy and the capture of data by unmanned aircraft systems at the University of Alaska's test site;
8. further studying the nonpublic use of unmanned aircraft systems to encourage development of the private sector unmanned aircraft system industry; and
9. further studying and making recommendations with respect to ensuring unmanned aircraft users comply with applicable laws.

AGENDA

1:00pm Welcome and Introductions .....Representative Shelley Hughes

- News review and task force updates
- Public Testimony
- Josh Waite – presentation on UAS integration and safety
- UAS and Personal Privacy Guidelines document
- Discussion on final actions of the UASLTF

4:45pm Adjournment - members may join the Interest Group Meeting closing remarks from Marty Rogers followed by no host dinner on the Riverboat Discovery Dinner cruise beginning at 6:30pm

Invitation to attend:

9:30am - Friday, September 4 - Ro Bailey and ACUASI have made arrangements for demonstration flights of UAS downtown Fairbanks at the Fire Training facility for the benefit of the UAS Task Force to see working drones in action. Interest Group Meeting participants are invited to attend.

Governor Bill Walker
STATE OF ALASKA

September 3, 2015

Mr. Dave Mathewson
Executive Director
Academy of Model Aeronautics
5161 East Memorial Drive
Muncie, IN 47302

Dear Director Mathewson:

Thank you for leading the Academy of Model Aeronautics (AMA) in their quest to educate recreational aircraft pilots about safety and the responsibilities of flying and fully enjoying model aircraft. With the integration of unmanned aircraft systems (UAS) into the National Air Space, the public's attention on, and awareness of, government, commercial, and hobby pilots has increased dramatically. The AMA's role in educating the public by publishing safety guidelines is critical to keeping both our skies above, and the ground below, free from tragic accidents.

Alaska is known for its vast land mass and few roads. Many of our communities are not on the road system and are only primarily accessible by air. Alaska has the highest number of private pilots per capita (2006). It is estimated that 45 percent of all jobs in Alaska are related to the aviation industry in some way, according to a statement by the former Alaska Lt. Governor. Given these factors, it is quite realistic to assume that UAS will have a significant impact on Alaska, on our lives and our well-being. Generally, Alaskans are very receptive to UAS and are eager to receive the safety, cost savings, and improved data capture benefits of UAS. UAS are used not just for recreational purposes, but also practical public and business purposes such as search and rescue, wildlife counts, infrastructure monitoring, mapping, fire and disaster relief, real estate, surveying, photography and videography, oil and gas exploration and development, and mining.

The Alaska State Legislature established the Unmanned Aircraft Systems Legislative Task Force in 2012 to review existing laws regarding safety and privacy applicable to UAS. The Task Force is made up of 12 members including legislators, State of Alaska department designees, industry and public members, and a representative of the Academy of Model Aeronautics. The Task Force was instrumental in the passage of legislation pertaining to the parameters for law enforcement use of UAS, to provisions for public input, to the authority for training programs at the University of Alaska, and to the duty of the Task Force to report recommendations regarding privacy and other policy related to UAS to the Legislature each year.

I want to thank your organization for its assistance to the Task Force in creating and distributing a safety flyer during the last holiday season as small UAS were flying off the shelves as gift purchases. The Task Force is currently working on privacy guidelines flyer for operators and other interested

Alaskans. Lastly, the Task Force holds quarterly meetings to receive updates on UAS topics, address current issues, consider policy recommendations, and provide regular opportunities for public input.

House Joint Resolution 5, passed by the Alaska State Legislature this year, recognizes the important role of the Academy of Model Aeronautics in educating the public on safety and privacy guidelines. The AMA reaches a broad audience of interested pilots around the world. Alaska is proud to recognize your organization as a leader in model aeronautics and in the promotion of safe operations and privacy rights. While the State's policies regarding use of the Alaska State prevent our inclusion of the State Seal in your "Know Before You Fly" safety publications and your web page relating to the materials, we encourage you to utilize the Alaska Flag or outline of the state to symbolize my administration's support of your work. As Alaska has a great history and appreciation of aviation, it is appropriate that it be the first state to offer such support.

Sincerely,

Bill Walker
Governor

Commissioner XXXXXX XXXXXXXXXX
Department of YYYYYYYYYYYYY
ADDRESS
CITY, Alaska 99ZZZ

June 26, 2015

Dear Commissioner,

The Unmanned Aircraft Systems (UAS) Legislative Task Force has been considering policy the last two years regarding the use of UAS by public entities as well as by commercial users and recreational operators. This rapidly advancing technology is becoming more and more common place as one in every four homes in America now owns a small UAS, and the Federal Aviation Authority is beginning to grant authorizations for commercial users to employ UAS for business purposes. Our goal as a Task Force is to harness this tool for good in Alaska, always keeping safety and the privacy rights of Alaskans as top priorities.

As Co-Chair, I am relaying a request of the Unmanned Aircraft Systems Legislative Task Force, asking that you provide a contact at your department, the name of a point person with whom we can communicate regarding UAS as it relates to your department and state business. At this present time, no one department of the State of Alaska is a central contact for UAS, and until such time that one may be designated in the future, as the Task Force, we want to ensure good communications are occurring. We foresee that the list will be used only for information updates as UAS pertain to government operations or citizen inquiries regarding a specific departments' UAS activity. We also hope that the point of contact at your department would communicate with the Task Force when activities related to UAS occur.

I would like to have a contact for each department compiled into a list by the next Task Force meeting on September 3, 2015. Please forward your contact person's name, email and phone number to Ginger Blaisdell at ginger.blaisdell@akleg.gov by August 24, 2015.

The Task Force would also like you to be aware that we have developed a web site www.alaskadrones.org to help keep the public informed about UAS, particularly in regard to safe operations of small UAS and the privacy rights of Alaskans. We welcome any suggestions to make the website and information user-friendly and easy to understand.

Sincerely,

Representative Shelley Hughes

Risks of UAS Integration

EXCERPTS FROM NPRM RESPONSE

JOSH WAITE

Aircraft

Current

- Section 333 Exemption
  - Airworthiness requirement is waived
- Amateur
  - Airworthiness is self-determined

Proposed

- Airworthiness inspection / certification not required
- No standard

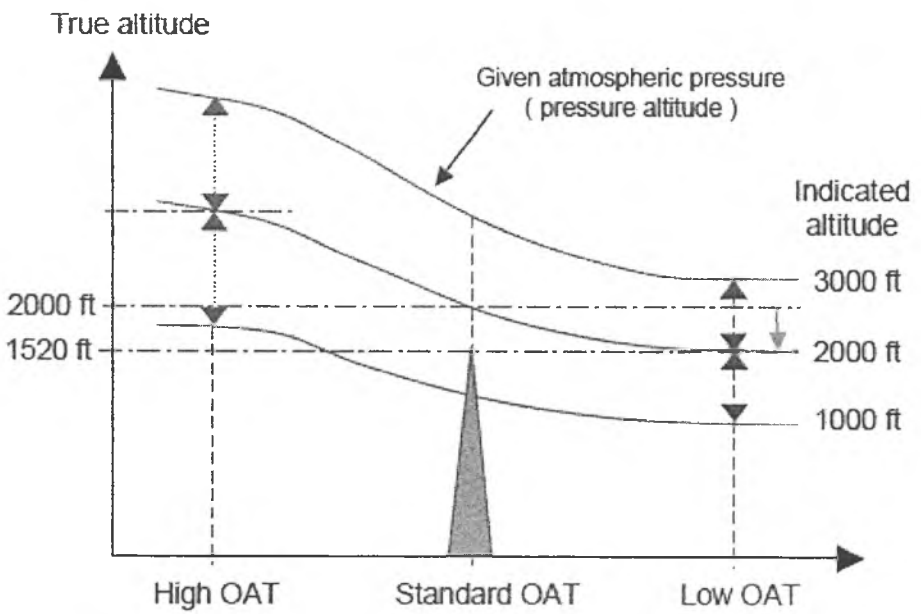
"Standard" Design Concerns

GPS Altimeter

Lack of Certified ADS-B & Transponder

GPS-derived altitude vs Barometric Altitude

- GPS reports true altitude vs barometric
- GPS altitude error ~1.5x the horizontal error



"Standard" Design Concerns

GPS Altimeter

Lack of Certified ADS-B & Transponder

Non-certified Alerting equipment

- ADS-B
- Transponder

FAA cites Size / Weight / Availability

- Multiple versions of <.25 lb ADS-B units
- Including Mode S Transponder / ADS-B out / Integrated GPS
- DoD has issued AIMS Transponder Certification
  - This includes performance / interoperability evaluation and certification of systems and sub-systems at both the end item and integrated platform level.

Risks Without Testing & Certification

Loss of Positive Control (Flyaway)

Single Points of Failure Unidentified

e.g. Electrical System Failures

- Concurrent Loss of Link and Loss of Navigation

Signal Strength, Latency, Direction

Airspace

FAA Proposal would allow commercial UAV use of airspace up to 500' AGL,

Proximity to airports is limited to:

- 5 nautical miles (nm) from an airport having an operational control tower; or
- 3 nm from an airport with a published instrument flight procedure, but not an operational tower; or
- 2 nm from an airport without a published instrument flight procedure or an operational tower; or
- 2 nm from a heliport with a published instrument flight procedure.

Highest Risk Airspace

Near Airports

Low Altitude Traffic

Military Training Routes

Airports

An aircraft on a 3° approach will be at 600' AGL in 2nm. There is no requirement for every approach to be 3°.

Low altitude traffic (14 CFR 91.119)

- "Other than congested areas"
  - 500' AGL limit
- "Sparsely populated areas"
  - 500' from person, vessel, vehicle or structure
  - Agriculture, helicopters, cub pilots

Military Training Routes

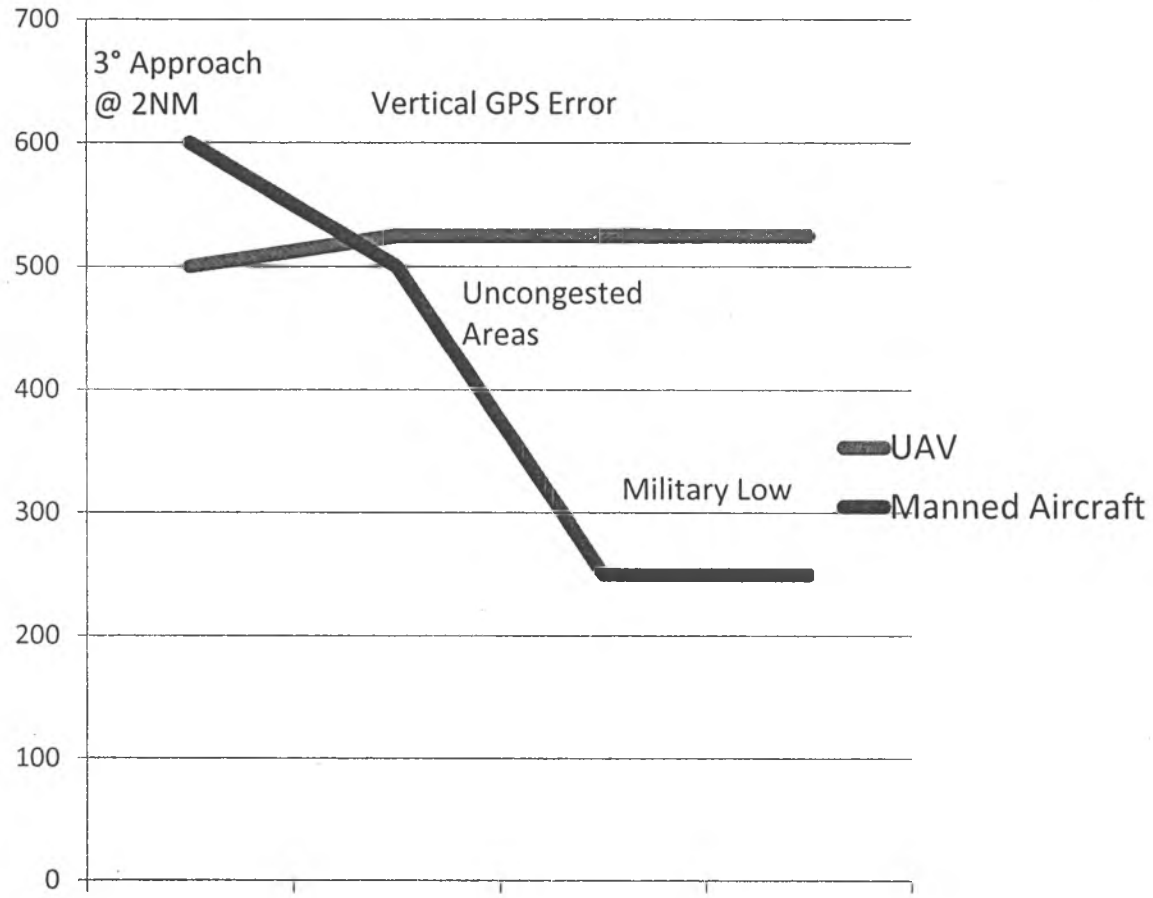
- Military aircraft low-level training (~300' AGL and higher)
- In excess of 250 kts (may be up to 420 kts)

Highest Risk Airspace

Near Airports

Low Altitude Traffic

Military Training Routes



Airman

Lack of Formal Training

Insufficient Testing

No Insurance

Risk Assessment

Training Vs Cost

Formal Training

Knowledge Test

Liability Insurance

Risk Assessment

"Formal training is too great a burden for operators wishing to commercially operate small UAS in the NAS" (from NPRM)

Training requirements for other commercial operations

- commercial drivers
- commercial vessel captains
- commercial pilots

Knowledge Test "would not require any specific form of training or studying in order to pass" (from NPRM)

- What is covered?

Lack of liability Insurance requirement

- No insurance-driven mitigations

Risk Assessment

- Lack of full understanding of the situation

Math $KE = \frac{1}{2} MV^2$

Analysis shows that KE of ~30,000 ft/lb can cause structural damage to large aircraft

KE of a 55lb object moving at 87 kts (100 mph) is 18,386.1 ft/lb

Analysis of aircraft damage and pictures from *Kinetic Energy of Bird Strikes & Damage to Aircraft* by Roger Nicholson, PhD

Bird Strike Requirements

KE Analysis

Assumptions
55 lb UAV at 87 kts
130 kt approach speed of airliner

Same Direction

Crossing

Head-On

MTR

Same Direction

- closure rate of 43 kts – KE of the UAS is **4,502 ft-lb**

Crossing

- Closure Rate of 130 kts – KE is **41,149 ft-lb**

Head-On (Airliner)

- Closure Rate of 217 kts – KE is **114,655 ft-lb**

Head-On (Military Aircraft @ 240 kts)

- Closure Rate of 327 kts – KE is **260,357 ft-lb**

Head-On (Military Aircraft @ 400 kts)

- Closure Rate of 487 kts – KE is **577,473 ft-lb**

KE Analysis

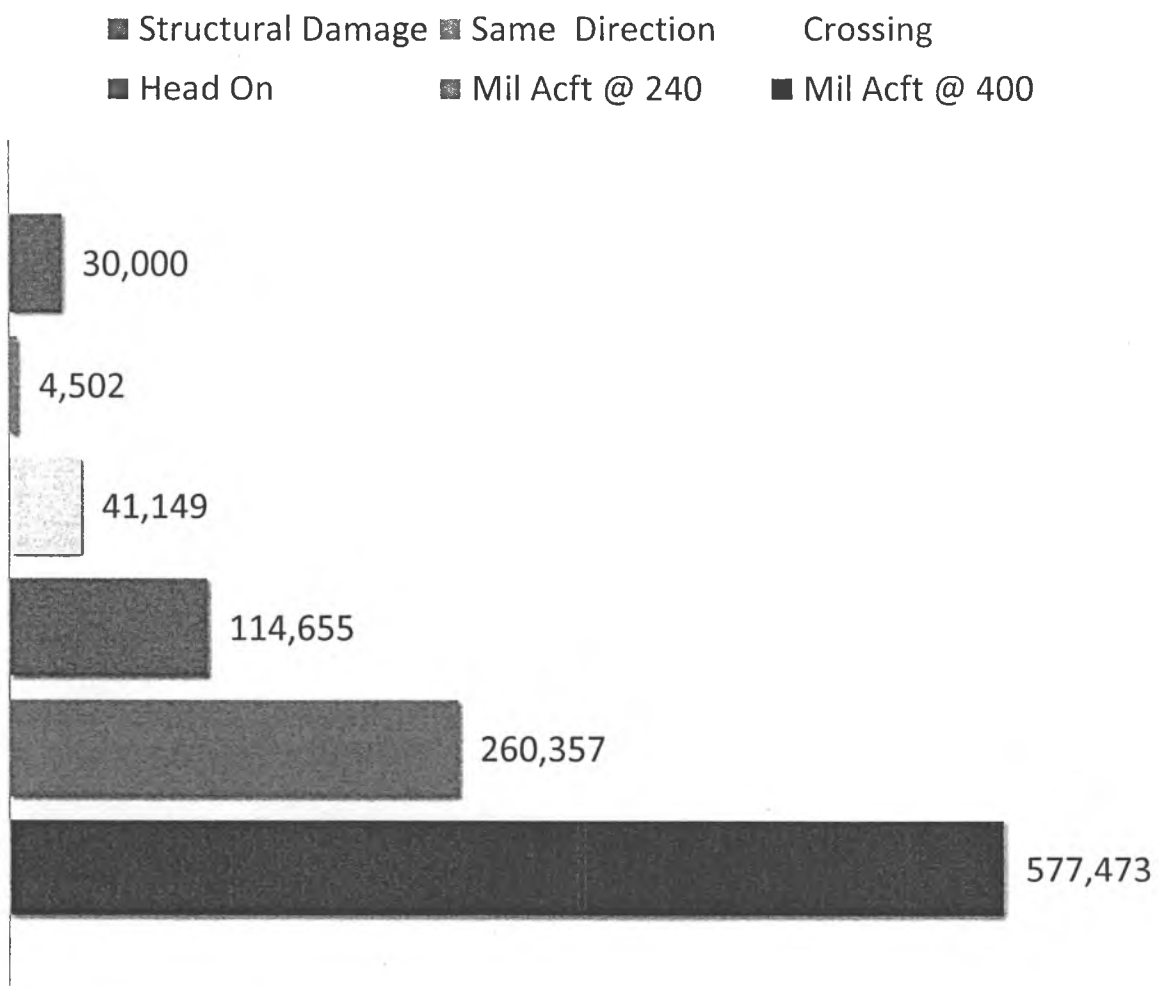
Assumptions
--55 lb UAV at 87 kts
--130 kts approach speed of airliner

Same Direction

Crossing

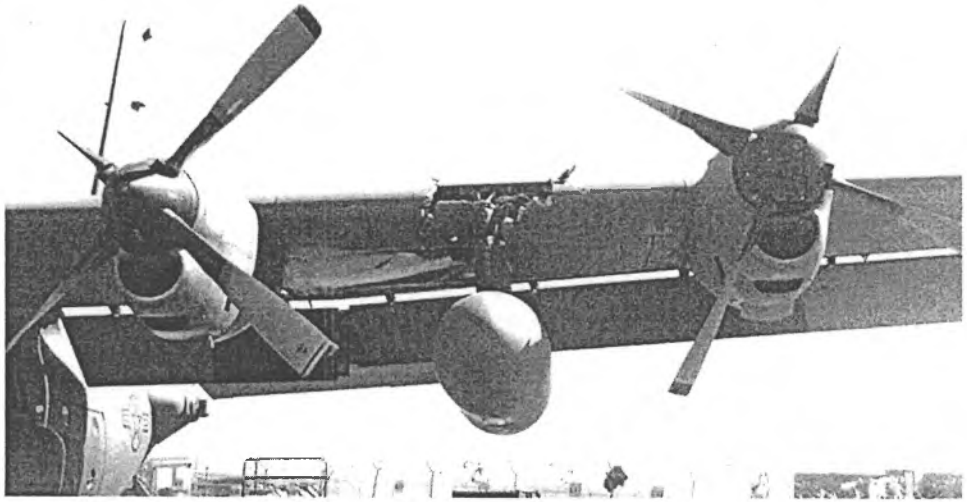
Head-On

MTR



- 375 lb UAV impacted C-130 head on
- Closure rate ~300 kts.
- KE was on the order of 1.5 million ft-lb

- UAV was almost 7 times larger than the small category
- UAV struck the C-130 directly in the wing (through the spar and into the fuel tank)
- C-130 is engineered for ruggedness more than efficiency
- C-130 has a fuel tank designed to limit the possibility of internal fires
- The strike was not directly into an engine or the cockpit



Mitigations

Aircraft

- Airworthiness standards and testing
- Required equipment

Airspace

- 250' AGL max with exceptions for obstacles and obstructions (towers, wind turbines, etc)
- 60 kts limit
- Notification / approval for any higher altitude

Airman

- Training & Certification (pilot license, in-seat training, checkrides)
- Liability insurance

Mitigations

Airworthiness Standards and Testing

- Required Equipment

Lower Altitudes and Airspeeds

- Notification for exceptions

Training and Certification

- Liability Insurance

Dave Mathewson, Executive Director
Academy of Model Aeronautics
5161 E Memorial Drive
Muncie, Indiana 47302

September XX, 2015

Dear Director Mathewson,

Thank you for leading the Academy of Model Aeronautics (AMA) in their quest to educate recreational aircraft pilots about safety and the responsibilities of flying and fully enjoying model aircraft. With the integration of unmanned aircraft systems (UAS) into the National Air Space, the public's attention on, and awareness of, government, commercial and hobby pilots has increased dramatically. The AMA's role in educating the public by publishing safety guidelines is critical to keeping both our skies above, and the ground below, free from tragic accidents.

Alaska is known for its vast land mass and few roads. Many of our communities are not on the road system and are only primarily accessible by air. Alaska has the highest number of private pilots per capita (2006). It is estimated that 45% of all jobs in Alaska are related to the airline industry in some way, according to a statement by the former Alaska Lt. Governor. Given these factors, it is quite realistic to assume that UAS will have a significant impact on Alaska, on our lives and our well-being. Generally, Alaskans are very receptive to UAS and are eager to receive the safety, cost savings, and improved data capture benefits of UAS as they are used not just for recreational purposes but also practical public and business purposes such as search and rescue, wildlife counts, infrastructure monitoring, mapping, fire and disaster relief, real estate, surveying, photography and videography, oil, and mining.

The Alaska State Legislature established the Unmanned Aircraft Systems Legislative Task Force in 2012 to review existing laws regarding safety and privacy applicable to UAS. The Task Force is made up of 12 members including legislators, state department designees, industry and public members, and a representative of the Academy of Model Aeronautics. The Task Force was instrumental in the passage of legislation pertaining to the parameters for law enforcement use of UAS, to provisions for public input, to the authority for training programs at the University of Alaska, and to the duty of the Task Force to report recommendations regarding privacy and other policy related to UAS to the legislature each year.

I want to thank your organization for its assistance to the Task Force in creating and distributing a safety flyer during the last holiday season as small UAS were flying off the shelves as gift

purchases. The Task Force is currently working on privacy guidelines flyer for operators and other interested Alaskans. Lastly, the Task Force holds quarterly meetings to receive updates on UAS topics, address current issues, consider policy recommendations, and provide regular opportunities for public input.

House Joint Resolution 5, passed by the Alaska State Legislature this year recognizes the important role of the Academy of Model Aeronautics in educating the public on safety and privacy guidelines. The AMA reaches a broad audience of interested pilots around the world. Alaska is proud to recognize your organization as a leader in model aeronautics and in the promotion of safe operations and privacy rights. While the State's policies regarding use of the Alaska State prevent out inclusion of the state seal in your "Know Before You Fly" safety publications and your web page relating to the materials, we encourage you to utilize the Alaska Flag or outline of the state to symbolize my administrations support of your work. As Alaska has a great history of, and appreciation of aviation, it is appropriate that it be the first state to offer such support.

we hope to

Sincerely,

Bill Walker
Governor

Alaska Drone Ban in Effect Next Week (Aug 31-Sept 2) – FA Airspace Restrictions Due to President's Visit Extend to Recreational Users

Thank you for visiting our website. It is a public education resource provided by Alaska's Unmanned Aircraft Systems Legislative Task For (UASLTF) to raise public awareness of the laws applicable to sUAS.

Shelley A. Hughes Representative Shelley Hughes

December 5, 2014

Alaska's Know-Before-You-Fly Drone Safety Guidelines

FAA allows the operation of model aircraft, also known as small Unmanned Aircraft Systems (sUAS) or drones, f recreational purposes under the Special Rule for Model Aircraft. Recreational UAS must be operated in accordance with community-based safety program and the FAA's guidance in Advisory Circular 91-57.

What is recreational use of a sUAS (Drones)?

Recreational use is the operation of a sUAS for personal interests and enjoyment, and not for compensation or hire. F example, using a sUAS to take photographs for your own personal use would be considered recreational; using the sam device to take photographs or videos for compensation or sale to another individual would be considered commercia You should check with the FAA for further determination as to what constitutes commercial sUAS operation.

SAFETY GUIDELINES FOR RECREATIONAL USERS OF sUAS (DRONES)

- Users should follow community-based safety guidelines, as developed by organizations such as the Academy of Model Aeronautics (AMA)
- Users should fly no higher than 400 feet and remain below surrounding obstacles when possible
- Users must be able to see their sUAS at all times, and use an observer to assist them if needed
- Users should remain well clear and must not interfere with manned aircraft operations, must see and avoid other aircraft and obstacles at all times, must avoid any activity that would cause a manned aircraft pilot to divert from planned operations, and must give way to all other aircraft at all times.
- Users must not intentionally fly over unprotected persons or moving vehicles, and should remain at least 25 feet away from individuals and vulnerable property
- Users must contact the airport or control tower before flying within five miles of an airport
- Users should be aware that in addition to public airports, Alaska has many private airstrips as well as bodies of waters used for take-off and landing by float planes and should not fly a UAS in the vicinity of these locations
- Users should not fly a UAS weighing more than 55 lbs unless it's certified by an aeromodelling community-based organization.

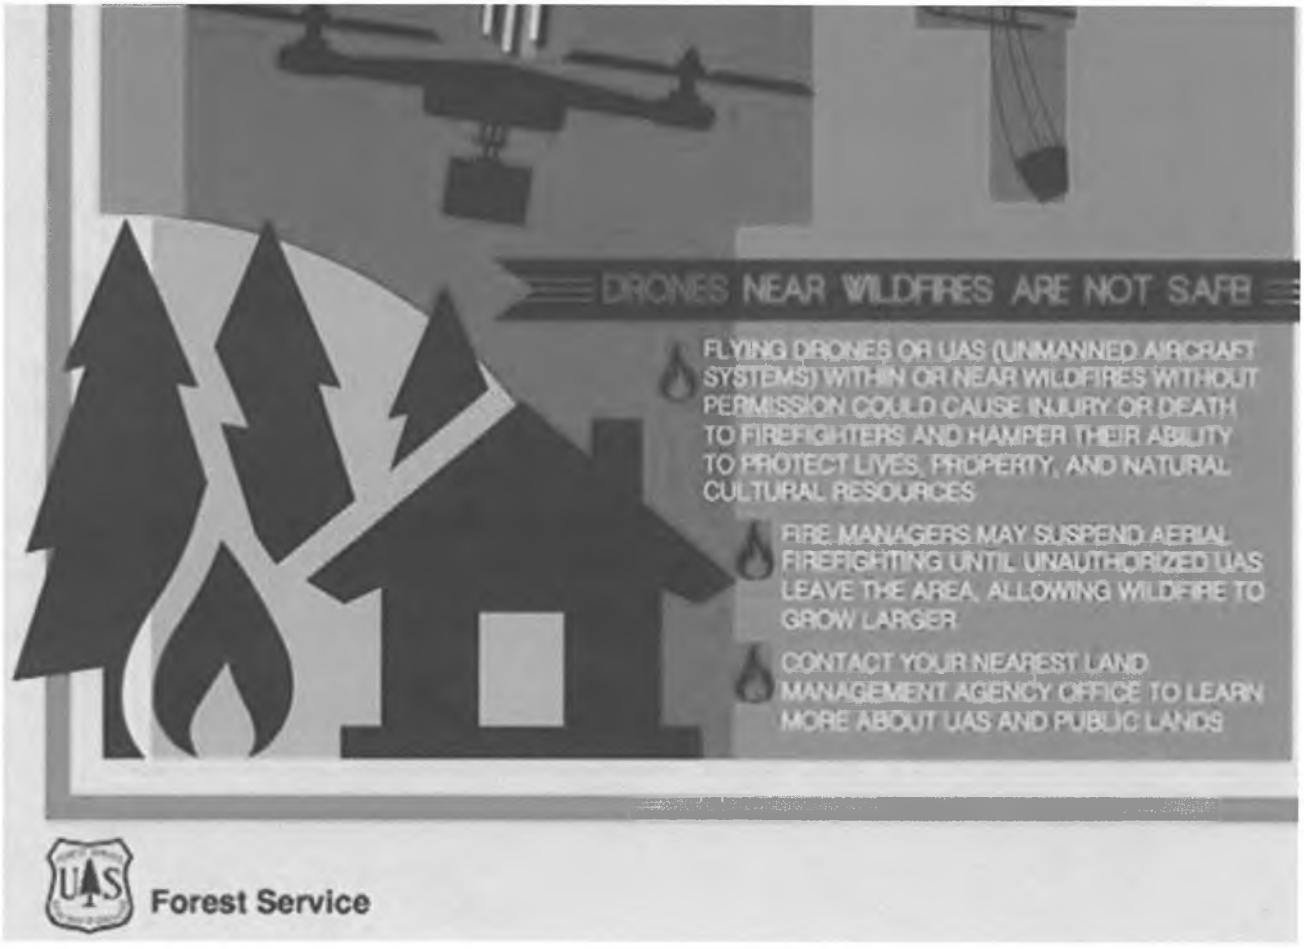
- Users should not fly in adverse weather conditions such as in high winds or reduced visibility
- Users must not fly under the influence of alcohol or drugs
- Users should ensure the operating environment is safe and that the operator is competent and proficient in the operation of the sUAS
- Users should not operate on or fly over private property without first obtaining permission from the property owner and/or tenant
- Users should not fly near or over sensitive infrastructure or property such as power stations, water treatment facilities, correctional facilities, heavily traveled roadways, government facilities, etc.
- Users should not conduct surveillance or photograph persons in areas where there is an expectation of privacy without the individual's permission (See AMA's privacy policy)

Additional safety resources:
AMA National Model Aircraft Safety Code
FAA What Can I Do With My Model Aircraft?

This hand-out is a public education resource provided by Alaska's Unmanned Aircraft Systems Legislative Task Force (UASLTF) to raise awareness by providing a brief summary of the laws applicable to sUAS. For more information, contact 907-376-3725 or Rep.Shelley.Hughes@akleg.gov . The UASLTF would like to thank Academy of Model Aeronautics and the Association of Unmanned Vehicle Systems for their joint campaign to promote safe operations of UAS and for providing the safety guidelines listed above. All sUAS operators are responsible for reviewing and complying with applicable state and federal laws that may apply to flying sUAS. While this hand-out provides a summary of the laws applicable to sUAS, users of sUAS should not rely on this hand-out for a full understanding of applicable laws and are responsible for independently reviewing federal and state law before flying sUAS.

USDA

United States Department of Agriculture



The Unmanned Aircraft Systems Legislative Task Force encourages prospective drone operators to review the following important safety sheet to know where you are authorized to fly, for what purposes, an other safety guidelines. This sheet is also for drone vendors, drone purchasers, drone owners, and others to make available to those wh may or will be flying UAS/drones.

- Alaska "Know Before You Fly" Safety Guidelines.
- FAA "What Can I Do With My Model Aircraft?"
- Local hobby clubs. (slow loading)
- FAA's Model Aircraft Operating Standards Advisory Circular – 91-5

- Academy of Model Aeronautics' (AMA) Privacy Policy and Guideline Conduct Surveillance or Photograph Where There is an Expectatio Privacy.
- Contact the FAA to determine if your operations fall under FAA's recreational or commercial rules.

Drone/UAS Operator Safety Guidelines and FAQ's about Privacy

Prepared by the UAS Legislative Task Force
29th Alaska State legislature

Alaskans guard their personal privacy very seriously. How do we define privacy when it comes to Unmanned Aircraft Systems (UAS) commonly known as drones? Because of the rapid development of UAS technology, this question is being contemplated worldwide, and new boundaries must be identified. A threat to safety can be pinpointed more easily because a person can see the aircraft, operator and its effects; on the other hand, a threat to privacy is not so easily pinpointed because it involves thought, sentiment, emotion and perception.

disclaimer . . .

left side

blue font

1. When does a flying drone breach privacy?

All Alaskans have a reasonable expectation of privacy to live without fear of unwarranted personal invasion. With equal importance, Alaskans enjoy the right to be left alone. The definition for **Reasonable Expectation of Privacy** directly relates to law enforcement requirements to obtain a warrant before actions of search and seizure.

The **United States Constitution Fourth Amendment** forbids the government from performing warrantless and unreasonable searches of any area in which a person maintains a reasonable expectation of privacy.

Alaska's Constitution guarantees Alaskans the right to privacy. Article 1, Section 22 states, "The right of the people to privacy is recognized and shall not be infringed. The legislature shall implement this section." The legislature has a long-standing history of protecting Alaskans' privacy by instituting **statutes** regarding stalking, harassment, indecent viewing, sending explicit images, and misusing confidential information. The UAS Legislative Task Force (UASLTF) continues to review these protections particularly as they relate to unmanned aircraft systems.

The UASLTF has prepared this document to address privacy guidelines with respect to drones and to educate UAS operators and citizens. We will look at privacy as it pertains to the specific act of intrusion into another's privacy, the prevention of intrusion into one's own privacy, and/or the act of exposing elements of one's privacy against an individual's will. This concept is recognized as **"the right to be left alone."**

Private Citizen: Please recognize that individuals experience different levels of sensitivity to interruption to privacy. Was the drone flight intentionally directed at you or just passing through? Do you believe the operator of the drone was flying in an inappropriate way? Be as specific as possible so that you can report the incident to local law enforcement.

Drone Operator: Will you be perceived as intruding on someone's privacy? Would you act in person as you do with your drone? Be courteous and respectful to others.

DISCLAIMER: The purpose of this publication, "Drone/UAS Operator Guidelines FAQs about Privacy" is to provide informational aid and overview of certain federal and state laws that may apply to drone/UAS operation. This publication is not intended to provide legal advice or a comprehensive review of all federal and state laws relating to drone/UAS operation. Laws will almost certainly change, particularly in the rapidly developing areas of the law at the federal and state level regarding drone/UAS operation. Before a person operates a drone/UAS, or pursues a legal claim related to drone/UAS operation, it is the sole responsibility of that person to review applicable laws, and seek legal advice if necessary, regarding the person's rights and liabilities. The publishers of this publication disclaim all liability and are not responsible for damages related to the contents of this publication.

Right side

New page:

FAA and the Role of Law Enforcement

The FAA promotes voluntary compliance by educating individual UAS operators about how they can operate safely under current regulations and laws. The FAA also has a number of enforcement tools available including warning notices, letters of correction, and civil penalties. The FAA may take enforcement action against anyone who conducts an unauthorized UAS operation or operates a UAS in a way that endangers the safety of the national airspace system. This authority is designed to protect users of the airspace as well as people and property on the ground.

However, State and local Law Enforcement Agencies (LEA) are often in the best position to deter, detect, immediately investigate, and, as appropriate, pursue enforcement actions to stop unauthorized UAS operations. Although the FAA retains the responsibility for enforcing FAAs regulations, FAA aviation safety inspectors, who are the agency's principal field elements responsible for following up on these unauthorized and/or unsafe activities, will often be unable to immediately travel to the location of an incident.

While the FAA must exercise caution not to mix criminal law enforcement with the FAA's administrative safety enforcement function, the public interest is best served by coordination and fostering mutual understanding and cooperation between governmental entities with law enforcement responsibilities. Although there are Federal criminal statutes that may be implicated by some UAS operations (see 49 U.S.C. § 44711), most violations of the FAA's regulations may be addressed through administrative enforcement measures. As with any other civil or criminal adjudication, successful enforcement will depend on development of a complete and accurate factual report contemporaneous with the event.

Although certainly not an exhaustive list, law enforcement officials, first responders and others can provide invaluable assistance to the FAA by taking the actions outlined below:

(1) **Witness Identification and Interviews.** Local law enforcement is in the best position to identify potential witnesses and conduct initial interviews, documenting what they observed while the event is still fresh in their minds.

(2) **Identification of Operators.** Law enforcement is in the best position to contact the suspected operators of the aircraft, and any participants or support personnel accompanying the operators. Our challenges in locating violators are marked in that very few of these systems are registered in any federal database and rarely will they have identifiable markings such as used for conventional manned aircraft.

(3) **Viewing and Recording the Location of the Event.** Pictures taken in close proximity to the event are often helpful in describing light and weather conditions, any damage or injuries, and the number and density of people on the surface, particularly at public events or in densely populated areas. During any witness interviews, use of fixed landmarks that may be depicted on maps, diagrams or photographs immeasurably help in fixing the position of the aircraft, and such landmarks also should be used as a way to describe lateral distances and altitude above the ground, structures or people.

(4) **Identifying Sensitive Locations, Events, or Activities.** The FAA maintains a variety of security-driven airspace restrictions around the country to help protect sensitive locations, events, and activities through Temporary Flight Restrictions (TFR), Prohibited Areas, and other mechanisms such as the Washington, DC Flight Restricted Zone (DC FRZ). UAS operations, including Model Aircraft flights, are generally prohibited within these defined volumes of airspace.

(5) **Notification.** Immediate notification of an incident, accident or other suspected violation to one of the FAA Regional Operation Centers (ROC) located around the country is valuable to the timely initiation of the FAA's investigation.

(6) **Evidence Collection.** Identifying and preserving any public or private security systems that may provide photographic or other visual evidence of UAS operations, including video or still picture security systems can provide essential evidence to the FAA.

left side

~~2.~~ My neighbor is sunbathing on her deck and my son is flying his drone...

Although the FAA governs the airspace from the ground up, help your son understand courteous flying so he doesn't disturb the neighbors or fly somewhere he shouldn't. He should never hover over your neighbor's yard.

Know Before You Fly provides recreational flying rules for hobby pilots: www.alaskadrones.org.

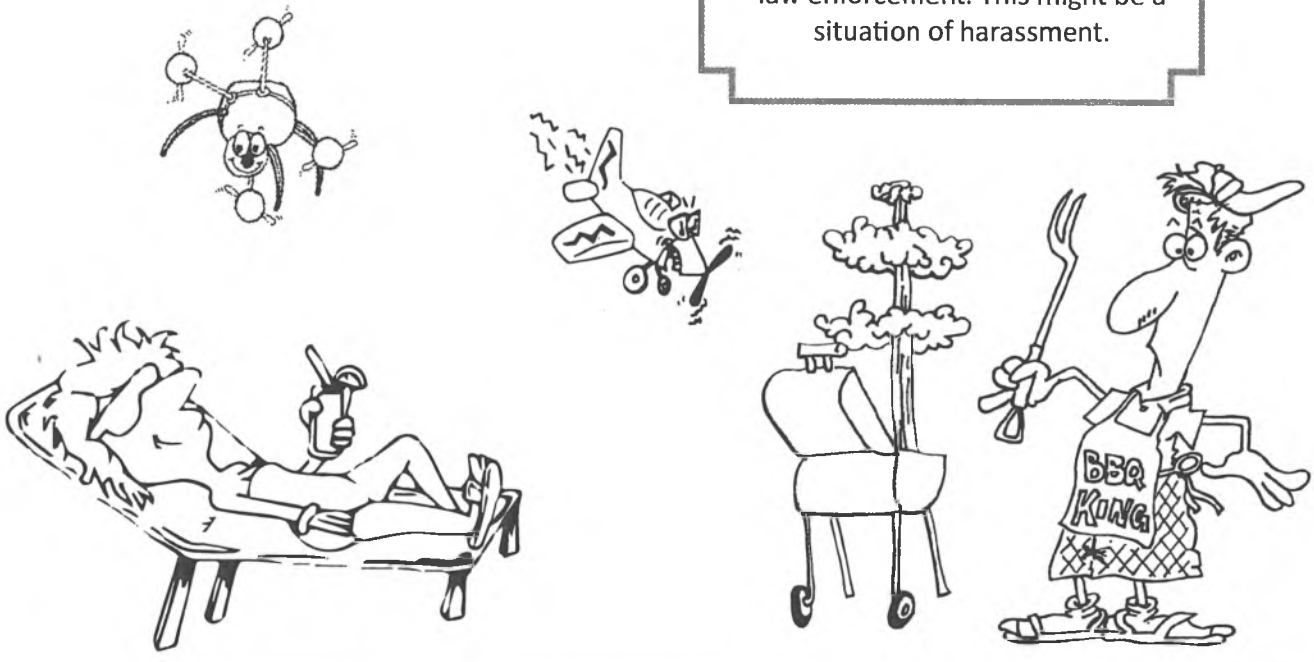
Private Citizen: The FAA governs the airspace from the ground up regardless of whether the property owner is private, public, corporate, or government. While we enjoy the sense of privacy on our property, we may not control what occurs above our heads.

Drone Operator: Fly with respect. Don't fly your drone where people typically expect privacy. Don't use your drone to harass people. In public areas, don't invade people's personal space and their solitude.

EXAMPLE

Someone is flying their drone and interrupting my relaxing evening barbequing in my backyard. They won't stop even when I "shoo" it away...

Try to identify where the drone operator is located. Provide as much information as possible to local law enforcement. This might be a situation of harassment.



DISCLAIMER: The purpose of this publication, "Drone/UAS Operator Guidelines FAQs about Privacy" is to provide informational aid and overview of certain federal and state laws that may apply to drone/UAS operation. This publication is not intended to provide legal advice or a comprehensive review of all federal and state laws relating to drone/UAS operation. Laws will almost certainly change, particularly in the rapidly developing areas of the law at the federal and state level regarding drone/UAS operation. Before a person operates a drone/UAS, or pursues a legal claim related to drone/UAS operation, it is the sole responsibility of that person to review applicable laws, and seek legal advice if necessary, regarding the person's rights and liabilities. The publishers of this publication disclaim all liability and are not responsible for damages related to the contents of this publication.

Alaska's Know-Before-You-Fly Drone Safety Guidelines

FAA allows the operation of model aircraft, also known as small Unmanned Aircraft Systems (sUAS) or drones, for recreational purposes under the Special Rule for Model Aircraft. Recreational UAS must be operated in accordance with a community-based safety program and the FAA's guidance in Advisory Circular 91-57.

What is recreational use of a sUAS (Drones)?

Recreational use is the operation of a sUAS for personal interests and enjoyment, and not for compensation or hire. For example, using a sUAS to take photographs for your own personal use would be considered recreational; using the same device to take photographs or videos for compensation or sale to another individual would be considered commercial. You should check with the FAA for further determination as to what constitutes commercial sUAS operation.

SAFETY GUIDELINES FOR RECREATIONAL USERS OF sUAS (DRONES)

- Users should follow community-based safety guidelines, as developed by organizations such as the Academy of Model Aeronautics (AMA)
- Users should fly no higher than 400 feet and remain below surrounding obstacles when possible
- Users must be able to see their sUAS at all times, and use an observer to assist them if needed
- Users should remain well clear and must not interfere with manned aircraft operations, must see and avoid other aircraft and obstacles at all times, must avoid any activity that would cause a manned aircraft pilot to divert from planned operations, and must give way to all other aircraft at all times.
- Users must not intentionally fly over unprotected persons or moving vehicles, and should remain at least 25 feet away from individuals and vulnerable property
- Users must contact the airport or control tower before flying within five miles of an airport
- Users should be aware that in addition to public airports, Alaska has many private airstrips as well as bodies of waters used for take-off and landing by float planes and should not fly a UAS in the vicinity of these locations
- Users should not fly a UAS weighing more than 55 lbs unless it's certified by an aeromodelling community-based organization.
- Users should not fly in adverse weather conditions such as in high winds or reduced visibility
- Users must not fly under the influence of alcohol or drugs
- Users should ensure the operating environment is safe and that the operator is competent and proficient in the operation of the sUAS
- Users should not operate on or fly over private property without first obtaining permission from the property owner and/or tenant
- Users should not fly near or over sensitive infrastructure or property such as power stations, water treatment facilities, correctional facilities, heavily traveled roadways, government facilities, etc.
- Users should not conduct surveillance or photograph persons in areas where there is an expectation of privacy without the individual's permission (See AMA's privacy policy)

Additional safety resources:

AMA National Model Aircraft Safety Code FAA What Can I Do With My Model Aircraft?

This hand-out is a public education resource provided by Alaska's Unmanned Aircraft Systems Legislative Task Force (UASLTF) to raise awareness by providing a brief summary of the laws applicable to sUAS. For more information, contact 907-376-3725 or Rep.Shelley.Hughes@akleg.gov . The UASLTF would like to thank Academy of Model Aeronautics and the Association of Unmanned Vehicle Systems for their joint campaign to promote safe operations of UAS and for providing the safety guidelines listed above. All sUAS operators are responsible for

3. Can I shoot it down if it's flying over my house?

Remember that drone is someone else's personal property. It's best to know:

- "Why is a drone flying over your property?"
- "Is it violating the law?"
- "Who and where is the drone operator?"

If you shoot it down or damage it, you may be liable for:

- Destruction of property
- Discharging a weapon in a restricted area
- If you think a drone operator is in violation of the law, immediately contact your local law enforcement agency, and provide as much detail as you can about the encounter.

Private Citizen: The value associated with a recreational drone could be $25 to much more than $1,000. The FAA is rapidly authorizing commercial use, so that a small drone could be carrying specialized equipment and cost more than $100,000. Both the hobby drone and the commercial drone may look very similar as you view it from the ground.

Drone Operator: Before you fly over private property, consider the impact of your flight on someone's privacy. Obtain the owner's permission if you plan to hover and take photos or video. If you do not have permission, data you capture should not exceed what a smart phone could capture from a public viewpoint or area nearby. Avoid flying over populated areas.

"Looks like a moving target to me!"

DISCLAIMER: The purpose of this publication, "Drone/UAS Operator Guidelines FAQs about Privacy" is to provide informational aid and overview of certain federal and state laws that may apply to drone/UAS operation. This publication is not intended to provide legal advice or a comprehensive review of all federal and state laws relating to drone/UAS operation. Laws will almost certainly change, particularly in the rapidly developing areas of the law at the federal and state level regarding drone/UAS operation. Before a person operates a drone/UAS, or pursues a legal claim related to drone/UAS operation, it is the sole responsibility of that person to review applicable laws, and seek legal advice if necessary, regarding the person's rights and liabilities. The publishers of this publication disclaim all liability and are not responsible for damages related to the contents of this publication.

4. What if a drone is photographing through my window or hovering around my house?

If you feel threatened or concerned, contact local law enforcement. Alaska has laws that address stalking and "peeping Tom" activities.

Private Citizen: A camera mounted on a drone may be treated in the same way as another camera. If an individual is flying a drone in such a way that you feel violated, local law enforcement should be contacted.

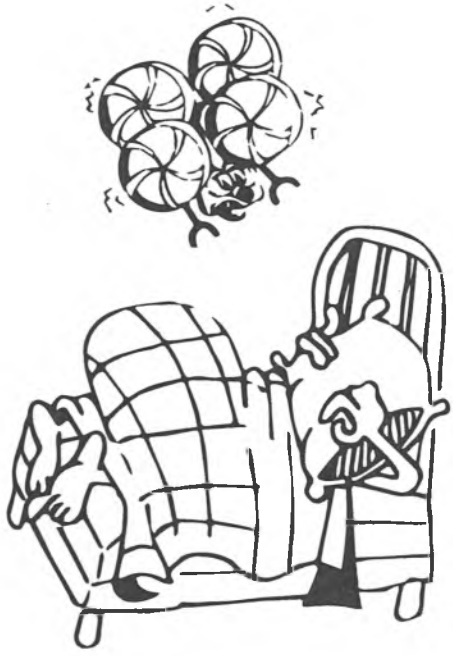
Drone Operator: Enjoy your drone with your family and friends who welcome its presence. When you don't have permission, don't hover and capture images that you couldn't capture on your smart phone while walking down the street, or from a nearby building, or from a manned aircraft overhead.

Welcomed Drone

The family drone hovering and taking a portrait when grandma came to visit.

Unwelcomed Drone

You weren't dreaming and the buzzing sound was not your alarm clock. The drone was spying through the bedroom window. Who knows where the pilot is and how those pictures might be used?



DISCLAIMER: The purpose of this publication, "Drone/UAS Operator Guidelines FAQs about Privacy" is to provide informational aid and overview of certain federal and state laws that may apply to drone/UAS operation. This publication is not intended to provide legal advice or a comprehensive review of all federal and state laws relating to drone/UAS operation. The publishers of this publication disclaim all liability and are not responsible for damages related to the contents of this publication.

Right side

5. The neighbor is chasing my dog with his drone!

Although the pet's owner may have introduced the dog to a flying toy, the noise and unfamiliarity of the neighbor's drone buzzing around could frighten Fido and could be considered harassment. If the dog swats the drone out of the sky and chews it up, would it be considered damaging another's personal property or self defense by the dog? Who is harrassing who? Did it occur on the dog owner's property or in a public place? There are many factors to consider.

Private Citizen: Know and follow your local animal control laws. If you're in a public area such as a local park, keep your pet away from people flying model aircraft and drones.

Drone Operator: Harassing an animal may come with criminal penalties. Be smart and protect your expensive piece of technology from animals that might view your drone as a threat and attack it.

left side

DISCLAIMER: The purpose of this publication, "Drone/UAS Operator Guidelines FAQs about Privacy" is to provide informational aid and overview of certain federal and state laws that may apply to drone/UAS operation. This publication is not intended to provide legal advice or a comprehensive review of all federal and state laws relating to drone/UAS operation. Laws will almost certainly change, particularly in the rapidly developing areas of the law at the federal and state level regarding drone/UAS operation. The publishers of this publication disclaim all liability and are not responsible for damages related to the contents of this publication.

6. What can I do if the drone's "buzzing" is annoying me?

A drone typically makes less noise than a standard lawn mower, so fortunately you probably won't find the noise overbearing. But if the noise is annoying, likely the drone is too "near ears" and should be redirected away from people. If the drone is flown during locally recognized waking hours, a drone is probably not in violation of a noise ordinance. Because drones are relatively quiet, any noise you hear might instead be an alert to the bystander that the drone operator is flying too close to people and should be reported to the FAA for unsafe operations. This might be a situation of harassment.

Private Citizen: Many annoying noises are allowable in both public and private areas. The decibel limit separating acceptable noise level is generally compared to the noise of a standard lawn mower or small engine.

Drone Operator: The drone's "buzzing" may not be the only problem. The proximity of the aircraft to another person and the length of time in that proximity may be the real issue. Be courteous to others, don't hover your UAS "near ears," and stay away unless invited.

left side

I understand why it's not safe to fly a drone near heavy traffic but what about privacy?

A drone flying near traffic could distract drivers and create unsafe driving conditions including accidents. Drivers should keep their eyes on the road, and drone operators should keep their UAS away from traffic.

Private Citizen: Not only are drones dangerous over busy traffic but most drivers don't want to be GPS tracked and photographed. If you see one, keep your eyes on the road. Pull over to report it to local law enforcement if you think it's creating unsafe conditions or collecting data inappropriately.

Drone Operator: Flying over roads can cause distraction and potential automobile accidents on a road system. Don't fly your drone near high traffic roadways.

DISCLAIMER: The purpose of this publication, "Drone/UAS Operator Guidelines FAQs about Privacy" is to provide informational aid and overview of certain federal and state laws that may apply to drone/UAS operation. left side

8. What safety and privacy concerns can there be when you're in a crowd?

Sometimes photographing a crowd could result in the capture of inadvertent images. If the drone image shows Captain Blowhole with a catch beyond his limit, that image could be provided to the authorities for legal review.

Private Citizen: Typically, if you're in a crowd, privacy is limited. Although the safety concerns are paramount when a drone is flying above a crowd, the photography could identify something that a citizen would not want shared, such as your secret fishing hole.

Drone Operator: Never fly above a crowd; even a happy drone can create quite a stir. As a drone operator, you know how easy the slightest wind change can cause your aircraft to change direction quickly or drop out of the sky. Although most recreational drones are very light weight, spinning propellers can cause injury.

Safety

If the drone were to fall out of the sky it could injure a bystander. The drone could also compromise the safety of the crowd by interfering with the activity or distracting people, thus rendering them unaware of happenings nearby.

Privacy

During fishing season, this drone inadvertently photographed Clyde's map to Grandpa's secret fishing hole. Because the map was visible in a public area, the photo of the map might be shared with others. Clyde's secret fishing hole is no longer secret.

DISCLAIMER: The purpose of this publication, "Drone/UAS Operator Guidelines FAQs about Privacy" is to provide informational aid and overview of certain federal and state laws that may apply to drone/UAS operation. Right side

How will the photos/video be stored or used?

Inappropriate use of images or data captured by technological devices concern Alaskans. If you believe someone has obtained images or data illegally or plans to use them illegally, contact local law enforcement. Be able to answer the following questions: Is the drone operator using the images for inappropriate purposes? Are images being posted in an inappropriate way? Are the images being used for personal gain? Was personal identification stolen?

Private Citizen: Many recreational drone operators have posted video and pictures on social media sites. Enjoy this new interesting form of photography. If you come across footage that you believe may be a violation of privacy, contact local law enforcement.

Drone Operator: If you are photographing something with your drone in a place where you would not be welcomed if you were taking pictures in person, you shouldn't be there. Make sure you don't save or post footage that breaches someone's privacy. If you don't want someone else posting similar footage of you or your property, destroy the footage. Don't post it.

EXAMPLE

A drone is used to record your PIN over your shoulder while you are at the ATM.

A drone records images through your office window of a newly signed contract.

A drone peers through the window while your child is napping.

DISCLAIMER: The purpose of this publication, "Drone/UAS Operator Guidelines FAQs about Privacy" is to provide informational aid and overview of certain federal and state laws that may apply to drone/UAS operation. 10. What happens if a drone captures inadvertent images?

Private Citizen: What happens if a drone captures inadvertent images and those images are posted on social media or reveal something questionable? Photographing in a public area could result in capturing an image that may not have been planned. The image could be of a person not wanting to be photographed but may not be a breach of privacy since it occurred in a public place.

Drone Operator: Be aware of and be sensitive to what you are photographing. Are you capturing proprietary information? If you capture an image of someone appearing to break the law, you may want to surrender images to local authorities. Some people may not want to be photographed and their expectation of privacy could result in an angry situation. Again, if you are photographing something with your drone, in a place where you would not be welcomed if you were taking pictures in person, redirect your drone elsewhere.

DISCLAIMER: The purpose of this publication, "Drone/UAS Operator Guidelines FAQs about Privacy" is to provide informational aid and overview of certain federal and state laws that may apply to drone/UAS operation. This publication is not intended to provide legal advice or a comprehensive review of all federal and state laws relating to drone/UAS operation. Right side

Not about privacy, but another common question...

~~11.~~ Can I use a drone for my business?

Today, the FAA prohibits commercial use of unmanned aircraft systems unless the business has been granted a waiver to use the aircraft for specific purposes in the business. Businesses are beginning to receive authorization to use Unmanned Aircraft Systems for commercial use. Thus far, the most common authorizations have been awarded for specific movie production and specific agriculture tasks.

Aircraft continue to advance technologically and many people are waiting for the opportunity to use drones as part of business.

You must obtain authorization from the FAA if you want to use your drone for commercial purposes. The time will come when safety concerns have been well vetted and business use will become commonplace, but at this time, any commercial use of your drone must be authorized by the FAA at the Aviation Safety Hotline 866-835-5322 option 4 for unmanned aircraft reporting and information or online at FAA.gov/contact/safety.

I DID NOT SEE ANYTHING ON RADAR OR OUT THE WINDOWS. EPPD CALLED FCMT ON THE TOWER DISPATCH RADIO ADVISING THAT THEY NOW KNOW WHERE IT LANDED. DEN NOTIFIED AND ADVISED TO SEND AN OFFICER TO SPEAK WITH THE "PILOT" OF THE DRONE. NO TRAFFIC WAS AFFECTED.	Item	FocusAreas/AFS/AFS-80/Lists/UAS_Reports_Database

Legislative Task Force on Unmanned Aircraft Systems
September 3, 2015 Meeting at 813 Noble Street, Fairbanks
Westmark Hotel Fairbanks

1:00pm - 4:45pm

President Obama

Task Force Members:

- Representative Shelley Hughes, Co-Chair
- Senator Peter Micciche, Co-Chair
- Ethan Tyler, Commissioner Designee, Department of Commerce, Community Economic Devel.
- Mike O'Hare, Commissioner Designee, Department of Military and Veterans' Affairs
- Lieutenant Steve Adams, Commissioner Designee, Department of Public Safety
- John Binder, Commissioner Designee, Department of Transportation, Public Facilities
- Ro Bailey, University of Alaska Fairbanks
- Steve Strait, Aviation Advisory Board, Governor's Office and DOT/PF
- Steve Colligan, Representative Member for the Academy of Model Aeronautics
- John Parker, Integrated Robotics Imaging Systems
- Steve Wackowski, Tulugaq II
- Bob May, Gallery Lodge, Kasilof

- Ginger Blaisdell, Staff to Rep. Hughes
- Chuck Kopp, Staff to Senator Micciche

Guest Attendee(s):

Agency COA group questions
RO - future privacy
Air Fire season
△ Chief of Police meeting Oct
· letter from Gov to AMA
△ Agency contact list POC

Privacy doc incorporate safety guideline animated
John Binder - DOT ~~safe~~ airport brief.

3-3:30 break

AGENDA

1:00pm Welcome and Introductions .....Representative Shelley Hughes

- News review and task force updates

NEW legislation –
- ongoing committee or board/task force
- creating rules for air space on private property
- safety guidelines in statute
- certification requirement for hobbyists

Task Force Responsibilities per HCR15 and Review of Resolution

The duties of the task force shall include

1. reviewing regulations and guidance from the Federal Aviation Administration regarding unmanned aircraft systems;
2. providing written recommendations, together with suggested legislation, for a comprehensive state policy for unmanned aircraft that protects privacy and allows the use of unmanned aircraft systems for public and private applications;
3. evaluating complaints and concerns expressed to the task force;
4. identifying potential privacy and public safety concerns associated with unmanned aircraft systems and determining whether legislation is necessary to address them;
5. considering recommendations for public education related to unmanned aircraft systems;
6. studying the Federal Aviation Administration's "Integration of Civil Unmanned Aircraft Systems (UAS) in the National Airspace System Roadmap," issued November 7, 2013 (1st ed. 2013) and its application to the development of unmanned aircraft systems in the state;
7. conducting a public hearing concerning privacy and the capture of data by unmanned aircraft systems at the University of Alaska's test site;
8. further studying the nonpublic use of unmanned aircraft systems to encourage development of the private sector unmanned aircraft system industry; and
9. further studying and making recommendations with respect to ensuring unmanned aircraft users comply with applicable laws.

AGENDA

- Public Testimony
- Josh Waite – presentation on UAS integration and safety
- UAS and Personal Privacy Guidelines document
- Discussion on final actions of the UASLTF

4:45pm Adjournment - members may join the Interest Group Meeting closing remarks from Marty Rogers followed by no host dinner on the Riverboat Discovery Dinner cruise beginning at 6:30pm

Invitation to attend:

9:30am - Friday, September 4 - Ro Bailey and ACUASI have made arrangements for demonstration flights of UAS downtown Fairbanks at the Fire Training facility for the benefit of the UAS Task Force to see working drones in action. Interest Group Meeting participants are invited to attend.

Subject: tentative agenda for September 3 Fairbanks

Most of you have already signed up for the Interest Group Meeting hosted by the UAF/ACUASI and will be in Fairbanks from Aug 31 – Sep 3.
If you are only attending the UAS task force meetings in the afternoon of September 3rd, there is no need to sign up for the conference.

If you are not able to attend the task force meeting or would like to call in, please let Ginger know.

Here is what we have tentatively planned:

Wednesday, September 2 is an open evening for Interest Group participants.

- I am happy to make dinner reservations at LaVelle's for 6:30pm and just need a head count (we'll probably have a few more from the conference join our reservation)

Thursday, September 3

- 12:30 – 1:00pm Rep Hughes and Sen Micciche will provide an update on the activities of the UAS Task Force and invite attendees to attend (all or part) of the Task Force meeting beginning at 1:00pm – We are intending to have the privacy document available for all attendees at this time

- 1:00pm TENTATIVE agenda
  News review and task force updates
  Public Testimony
  Josh Waite – presentation on UAS integration and safety
  UAS and Personal Privacy Guidelines document

4:45pm we will adjourn so that members may join the Interest Group Meeting closing remarks from Marty Rogers followed by no host dinner on the Riverboat Discovery Dinner cruise beginning at 6:30pm

Friday, September 4

- 9:30am Ro Bailey and ACUASI have made arrangements for demonstration flights of UAS downtown Fairbanks at the Fire Training facility for the benefit of the UAS Task Force to see working drones in action. Ro may invite commercial UAS operators to participate in the demonstration. We will need to coordinate transportation across town for the demonstration event – if you are planning to attend, do you have the ability to help transport?

I hope this provides you with a bit more detail as you make plans to attend.

HOUSE OF REPRESENTATIVES

District 11 - Greater Palmer

To: Unmanned Aircraft Systems Legislative Task Force

From: Representative Shelley Hughes, Co-Chair

Shelley Hughes

Date: August 21, 2015

Re: Committee Schedule for September 3, 2015

The Unmanned Aircraft Systems Legislative Task Force will meet at the Westmark Fairbanks Hotel, 813 Noble St, Fairbanks, room number to be posted at hotel.

Thursday, September 3, 2015

* 1:00pm – 4:45pm
News review and task force updates
Public Testimony
Josh Waite – presentation on US integration safety
UAS and Personal Privacy Guidelines

* This meeting will be teleconferenced for anyone to call in to listen or provide public testimony. Legislative Information Office services are not available at this conference site. AKLEG.tv is not available at this conference site.

Subject: DRAFT agenda UAS LTF

Categories: Drone

I'm waiting to hear back from RO on the demonstration for Friday and about housing/hotel options

1:00pm - 1:15pm Welcome and updates

- June 19 minutes
- List of department contacts for UAS
- Notes from department COA group
- National news update (very brief since most will be updated during conference)

1:15pm - 2:30pm Review privacy document
Finalize the document to put up on www.alaskadrones.org
Is the group comfortable with the "good citizen" management of privacy or should there be a bill drafted to regulate when a breach of privacy may occur?

- particularly, prohibiting a UAS from hovering over individuals or above their personal property without consent
- public places are just that - so citizenship should govern

2:30pm - 3:00pm Report from department COA group
Ro Bailey can talk about the law enforcement COA currently under development for law enforcement entities statewide
Strategy for the other departments to complete the COA application - if that's the appropriate next step

3:00pm - 4:30pm public testimony

4:30pm discussion and next meeting planning
discussion regarding any public testimony heard
should there be any legislation drafted
next meeting
final product since task force ends on June 30, 2016

5:00pm adjournment

6:30pm dinner at Lavelles Bistro (still waiting confirmation)

A good location for your dinner would be Lavelle's downtown. They have excellent food: http://www.lavellesbistro.com/. They are located at 575 First Avenue, Fairbanks, AK. The conference is at the Westmark on 10th.

To book the dinner reservation, their contact information is: (907) 450-0555. You can leave a message during the day or try them beginning at 4:30 p.m.

Friday **TENTATIVE**

UAS demonstrations beginning 9:00am in downtown location - Ro Bailey

Afternoon tour at Poker Flats (Ro said there wasn't a whole lot to see there...)

- the test site office(s) is unmarked - it's just offices because the flights occur in a variety of locations around the state
- we could look at the rocket launch facility (30 minutes) but it's not part of the ACUASI / test site

ALASKA UAS
INTEREST GROUP

2015 Annual Meeting – Workshop Agenda

Arctic Theme – Tuesday, September 1

With the U.S. assuming chairmanship of the Arctic Council from April 2015 to April 2017, an Arctic theme is featured the first day with presentations by Alaska corporations on commercialization of the industry and by the university on recent unmanned aircraft missions such as oil spill research, and sea ice, sea grass, and otter surveys. Likewise, several of the university's global partners will be speaking on this day as well.

08:30 – 09:00	**Welcome and Introduction – Overview of UAS Program: Past, Present, and Future** Pat Gamble, former President, University of Alaska Jim Johnsen, President, University of Alaska Dr. Bob McCoy, Director, Geophysical Institute, University of Alaska Fairbanks (UAF) Marty Rogers, Director, Alaska Center for UAS Integration (ACUASI)
09:00 – 09:15	**Keynote Speaker** Senator Pete Kelly, Co-Chair Senate Finance, Alaska State Legislature
09:15 – 09:45	**Arctic Slope Regional Corporation (ASRC) - Federal** Bill "Sweet" Tart, Senior Director, Unmanned Systems and Robotics Kevin "Stenny" Stenstrom, Senior Director, Business Development ASRC Federal ○ *One Alaskan Native Corporation's perspective on the UAS industry*
9:45 – 10:30	**Pogo Mine** David Larimer, Chief Geologist, Sumitomo Metal Mining Pogo LLC ○ *Unmanned Reconnaissance Systems in Underground Mine Rescue Actions* Dr. Mike Hatfield, Assistant Professor, University of Alaska Fairbanks ○ *Unmanned Vehicles for Mine Safety Rescue & Training*
10:30 – 11:00	**Morning Networking Break**
11:00 – 11:45	**University of Alaska Fairbanks and Alaska Center for UAS Integration** Jessica Garron, Senior Science Consultant at Alaska Satellite Facility, UAF Matt Westhoff, UAS Pilot, ACUASI ○ *Aerial Operations for Arctic Oil Spill Response*
11:45 – 12:15	**University of Alaska Fairbanks and Alaska Center for UAS Integration** Dyre "Oliver" Dammann, graduate student in geophysics, University of Alaska Fairbanks Eyal Saiet, Remote Sensing Specialist, ACUASI ○ *Sea Ice Survey Using Unmanned Aircraft Near Barrow, Alaska*
11:45 – 13:15	**Working Lunch** - Enjoy the buffet lunch while the meeting continues

12:15 - 12:45	**Bureau of Ocean Energy Management and Alaska Center for UAS Integration** Rick Raymond, Wildlife Biologist, BOEM Sam Vanderwaal, Systems Integration & Engineering, ACUASI ○ *Testing the use of Unmanned Aircraft Systems for Intertidal Surveys - proof of concept*
12:45 – 13:15	**U.S. Geological Survey, Alaska Science Center** Dr. Brian Battaile, Research Wildlife Biologist ○ *Testing the use of Unmanned Aircraft Systems for Walrus Surveys - proof of concept*
12:45 – 14:00	**National Oceanic Atmospheric Administration (NOAA)** John "JC" Coffey, Director, Unmanned Systems, Cherokee Nation Technologies, NOAA UAS Program Office ○ *NOAA Atmospheric, Marine and Arctic Monitoring Using UASs (including Rapid Response)*
14:00 – 14:30	**URS/AECOM Australia** Dr. Catherine Ball, Regional Unmanned Aerial Systems Lead ○ *World first UAS based environmental and engineering surveys* ○ *The antipodean appetite for UAS* ○ *The good, the bad, and the not so ugly*
14:30 – 15:00	**Afternoon Networking Break**
15:00 – 15:45	**National Oceanic Atmospheric Administration (NOAA)/National Marine Fisheries Sciences (NMFS)** Dr. Robyn Angliss, Deputy Director, NOAA/NMFS ○ *Comparing Manned and Unmanned Aircraft System Surveys for Cetacean Monitoring in the Arctic*
15:45 – 16:30	**Transport Canada & National Research Council Canada** Fernando Mojica, Project Director UAS, Transport Canada / Aircraft Services Directorate (AAF) Paul Truant, Project Manager, UAS Project, Transport Canada Iraj Mantegh, Program Leader, Civil Unmanned Aerial Systems, NRC Canada-Aerospace ○ *Unmanned Aerial Systems in Canada - Transport Canada, National Research Council Canada, and Canadian Coast Guard are Exploring Exciting New Opportunities for the Use of UAS for Civilian Government Applications*
16:30 – 17:00	**University of Hawaii** Ted Ralston, Consultant (Retired aerospace executive) Dilmurat Azimov, PhD, Assistant Professor of Mechanical Engineering ○ *Integrated Sensor Fusion, Targeting, Guidance and Control Framework and Algorithms for Autonomous Unmanned Aerial Systems*
17:00 – 17:05	**Meeting Conclusion and Announcements** Marty Rogers, Director, ACUASI
18:30 – 21:30	**Networking Reception at Fountainhead Antique Auto Museum** 212 Wedgewood Drive, Fairbanks, Alaska 99701. Phone: 907-450-2100 Business networking at its best. Enjoy an evening surrounded by a collection of over 80 vehicles, including horseless carriages, steamers, electric cars, speedsters, cyclecars, midget racers and 30s classics. Featuring rarities such as an 1898 Hay Motor Vehicle, 1906 Compound, 1920 Argonne and 1921 Heine-Velox Victoria.

Technical Theme – Wednesday, September 2

Technical presentations on emerging technologies will be provided by the military, government, industry, and private participants on a wide variety of unmanned systems on topics including UAS traffic management (UTM), environmental science, emergency response in firefighting, precision integrated programs, and image processing from UAS sensor data.

08:30 – 08:45	**Fort Wainwright, U.S. Army Garrison and U.S. Army Alaska** **COL Sean Williams, Garrison Commander** ○ *Arctic Security and Gray Eagles in Alaska*
08:45 – 09:15	**Keynote Speaker** Senator John Coghill, Majority Leader, Alaska State Legislature
09:15 – 10:00	**Lockheed Martin** Mike Glasgow, Lockheed Martin Fellow, Chief Architect for Aviation Services ○ *UAS Traffic Management (UTM): Enabling UAS Operations*
10:00 – 10:30	**Morning Networking Break**
10:30 - 11:30	**Northrop Grumman Aerospace Systems** Bill Walker, Business Development, HALE Unmanned Systems ○ *Global Hawk in Environmental Science*
11:30 – 12:00	**Bureau of Ocean Energy Management (BOEM)** Rick Raymond, Wildlife Biologist ○ *BOEM Alaska Environmental Studies Program*
11:45 – 13:15	**Working Lunch** - Enjoy the buffet lunch while the meeting continues
12:00 - 13:00	**Airware** Mark Davis, Vice President of Sales ○ *Putting Drones to Work: Meeting the Needs of Enterprises*
13:00 – 14:00	**Aerobat Aviation, Inc.** Travis Shannon, Chairman & CEO ○ *Emergency Response to Wildfires with UAS (data capture in Montana, August 2015)*
14:00 – 15:00	**PEDMAS Technologies & Innovations** John Shepley, Chief Technology Officer ○ *Improving Environmental Situational Awareness for UAV Operations*
15:00 – 15:30	**Afternoon Networking Break**
15:30 – 16:15	**Precision Aviation** Matt Parker, UAS Operations Director ○ *Diversified Operations - An Operator's Perspective*
16:15 – 16:45	**Brainlike – Smart Sensing Solutions** Dr. Robert "Bob" Jannarone, CEO, Brainlike ○ *Image Processing from UAS Sensor Data: Wildlife Survey Prospects*
16:45 – 17:00	**Meeting Conclusion and Announcements** Marty Rogers, Director, ACUASI

Policy Theme – Thursday, September 3

With the dynamic changes over the past year, lead representatives from the Federal Aviation Administration (FAA), the UAS Center of Excellence for Unmanned Aircraft Systems, the FAA's six unmanned aircraft test sites, and others will describe how the unmanned aircraft industry is being shaped. In the afternoon, technical presentations will be provided on miniature surveillance avionics, oil spill response, meeting the needs of enterprises, improving environmental situational awareness, applying complexity leadership theory to drone airspace integration, and developing payloads for climate research in Alaska. At 1:00 p.m., Alaska's Unmanned Aircraft Systems Legislative Task Force will convene a meeting adjacent to the conference that will be open to the public.

08:30 – 08:40 **University of Alaska Fairbanks**
Dr. Bob McCoy, Director, Geophysical Institute
- *Opening and Introductions*

08:40 – 09:00 **Keynote Speaker**
Representative Steve Thompson, Co-Chair House Finance, Alaska State Legislature

09:00 – 09:30 **Federal Aviation Administration (FAA)**
Unmanned Aircraft Systems (UAS) Integration Office, Washington, DC
Bill Crozier, Assistant Manager for Flight Standards
- *Major Strides Forward for Research and Commercialization in 2015*

09:30 – 10:00 **FAA's Center of Excellence on UAS**
Marty Rogers, Vice Director of ASSURE (FAA COE)
- *Universities and Corporations Collaborating for Success for Integration of UAS into the National Airspace System (NAS)*

10:00 – 10:30 **Morning Networking Break**

10:30 - 11:30 **FAA's Six Test Sites to Integrate UAS into the NAS – Technical Panel**
Elizabeth Soltys, Engineer and Manager Unmanned Aircraft Systems Test Sites
- *Discussion of achievements and pathway forward*

11:30 – 12:30 **Federal Aviation Administration**
JoAnn Ford, Manager, FAA Navigation Services Systems Engineer
- *Comparing GPS to WAAS tools that are coming from the NextGen upgrades to the overall NAS systems*

11:45 – 13:15 **Working Lunch** - Enjoy the buffet lunch while the meeting continues

12:30 - 13:00 **Alaska State Legislature**
Unmanned Aircraft Systems Legislative Task Force
Senator Peter Micciche, Co-Chair
Representative Shelley Hughes, Co-Chair,
- *Update on task force efforts from 2014 to 2015*

13:00 – 17:00 **Unmanned Aircraft Systems Legislative Task Force Meeting**
(Adjacent to main conference room directly following the lunch hour)

13:00 – 13:30 **Sagetech Corporation**
Jim Davis, Engineering Director
- *Miniature Surveillance Avionics for sUAS*

13:30 – 14:30 **Trumbull Unmanned**
Dyan Gibbens, Founder & CEO
- *UAVs for Oil Spill Response & Flying Indoors*

14:30 – 15:00 **State of Alaska Department of Transportation**
Jeff Roach, Northern Region Planning Manager, Aviation and Highways
- *UAS from an Airport Perspective*

15:00 – 15:30 **Afternoon Networking Break**

15:30 – 16:15 **University of Alaska Fairbanks, International Arctic Research Center**
Dr. Jessica Cherry
- *Developing payloads for climate research in Alaska*

16:15 – 16:45 **Department of the Interior (DOI)**
Harry Kieling, Alaska Regional Director, Office of Aviation Services (OAS)
- *The Evolution of the Unmanned Aircraft Industry: Then and Now*

16:45 – 17:00 **Meeting Conclusion and Announcements**
Marty Rogers, Director, ACUASI

18:30 – 21:30 **Alaska Riverboat Discovery – Dinner Cruise**
975 Discovery Drive, Fairbanks, Alaska 99709
(907) 479-6673

Enjoy a relaxing dinner cruising into the heart of Alaska introducing you to the culture and way of life in the "Last Frontier". The narration covers the gambit of anthropology, culture, geology, glaciology, history, with even a little hydrology and engineering thrown in for good measure!

Josh Waite
presenter

These responses are based on several years of experience flying in military airspace integrated with UAS and current participation in the UAS industry. I am a military pilot with roughly 2,000 flight hours in Iraq and Afghanistan. And I currently participate in management of an FAA-designated UAS Test Site. 9-3-2015

Effect on Safety of Air Traffic.

1. The proposed rule suggest 500 feet AGL as the limit for small UAS operations. There are two concerns with this altitude: first, the variance in barometric altimeter readings (of manned aircraft) and GPS derived altimeter readings (on most UAS), and second, the lack of sufficient buffer with potential manned aircraft operations.

The difference in altimeter readings is the result of two issues. GPS reception issues reduce the accuracy significantly, and the product is a true altitude, as opposed to the rough relative altitude of a barometric altimeter. I have personally witnessed a UAS reporting that it was below me, but was actually above – a difference of greater than 500 feet from what was reported.

Add to this uncertainty of position the fact that most of the U.S. is "uncongested" area. Therefore, manned flight over most of the National Airspace (NAS) is limited to 500 feet AGL by 14 CFR 91.119. Or, in the case of sparsely populated areas, 500 feet from the nearest person, vessel, vehicle or structure. Meaning that most of the NAS has a buffer of zero on paper, and the altimeter discrepancies have made the situation worse.

In addition, there are many Military Training Routes throughout the NAS. In most cases, this involves fast flight at low altitudes (300 feet AGL in many cases). A UAS operation in one of these areas could encounter a C-130 at 180 to 250 kts, or a much faster aircraft.

I propose a maximum altitude of 250 feet AGL, with exception for towers and other infrastructure of 50 feet above the height of the structure, in a 100 foot radius.

2. The proposed rule suggests a maximum airspeed of 100 mph (87 kts) for small UAS. The kinetic energy (KE) of a 55lb object moving at 100 mph is 18,386.1 ft/lb. KE of ~20,000 ft/lb can cause structural damage to large aircraft. This assumes the large aircraft is standing still. As a UAS strike from the rear of an aircraft is unlikely, we shall discuss only front aspect collisions. In this case, the best scenario of a UAS strike is where the UAS is crossing the path of the aircraft. KE is dependent on the velocity (V) of the aircraft then, and we will use 130 kts as approach speed. And $KE = 1/2MV^2$, so the kinetic energy of the UAS is $\frac{1}{2}*(55lbs)*(130kts)^2 = 41,149$ ft/lb. That's twice the expectation of structural damage.

14 CFR requires certain structural limits in case of bird strikes:

a. 14 CFR Part 25-631: Transport category airplanes must be capable of continued safe flight and a subsequent normal landing after the *empennage structure* has been impacted by an 8 lb bird at cruise speed at mean sea level.
b. 14 CFR Part 23.775: Normal, utility, acrobatic and commuter category airplanes are required to have limited *windshield* integrity to withstand a 2 lb bird impact at maximum approach flap speed and at least one pane with sufficient forward vision remaining to allow continued safe flight.

c. 14 CFR Part 29-631: Transport category rotorcraft are required to have a *structure* which will ensure that continued safe flight and landing is possible after impact with a bird of up to 1 kg (at the lesser of Vne and Vh at 8000 feet above mean sea level.
d. 14 CFR Part 25.571: Transport category airplanes must be capable of successfully completing a flight during which likely *structural damage* occurs as a result of impact with a 4 lb bird with a relative velocity of Vc at sea level or 0.85Vc at 8,000 feet, whichever is more critical.

Today's aircraft are built to withstand 2, 4, and 8 lb birds. Not 55 lb pieces of machinery that shatter rather than squish on impact.

Now, consider again the C-130 at 250 kts or the B-1 at 400 kts and 300 feet AGL.

I propose reducing the altitude limit to 250 feet AGL, and the airspeed limit to 50 mph (44 kts).

Please refer to Attachment 1 *Kinetic Energy of Bird Strikes & Damage to Aircraft* by Roger Nicholson, PhD and Attachment 2 *Bird Strike Airworthiness Standards*

3. The Proposed rule makes no mention of visibility-increasing measures.

I propose the requirement for a high-visibility paint scheme, such as asymmetrical international orange.

4. The proposed rule states that "pilots must have an ATC clearance to enter certain controlled airspace. In other words, the FAA requires ATC to have knowledge of aviation operations in the airspace due to the greater amount of activity in that area compared to uncontrolled airspace." However, no mention is given to proximity to uncontrolled airports. The lack of ATC facilities can make UAS operations in these areas even less safe.

I propose that small UAS operations are not permitted within 10 miles of any airport without an active NOTAM and continuing radio communication with the controlling ATC or with CTAF.

5. The proposal indicates that the only requirement for accident / incident notification is a report due within 10 days of the occurrence. While the referred 49 CFR 830.15(a) does provide for a 10-day timeframe to submit a report, 49 CFR 830.5 requires immediate notification.

I propose correcting the rule to be in accordance with 49 CFR 830.5.

Airworthiness

1. The Proposed rule eliminates the requirement for Airworthiness Certification, yet also identifies that the model aircraft standards of testing are higher and are operations are limited to 400 feet AGL (AC 91-57).

While the proposal has identified the shortcomings of applying the current manned aircraft processes to UAS, I do not believe deleting all the requirements is a viable option. A standard airworthiness certificate may be more than necessary for a small UAS, an experimental – type certificate would be more acceptable. It would ensure an airworthiness review and reduce the excessive burden on manufacturers. The FAA has only just begun the Designated Airworthiness Representative (DAR)

process with UAS. This should be more widely addressed and expanded to include Designated Engineering Representatives (DERs) as well. And as the experimental process has its limitations, I propose that experimental certification is a path to a UAS type certificate covered in a separate Part of 14 CFR to address UAS.

2. The proposal uses the comparison of potential damage from a 55lb UAS and a 6600lb manned aircraft, asserting that the UAS is safer. Given the fact that the 6600lb aircraft has been through rigorous analytical, bench and flight testing, over a period of 3-5 years, I would take exception with that assertion. "Mean Time Between Failures" are known quantities and inspections are directed. The larger, manned aircraft is proven, whereas the untested small UAS is not. Please view the many "drone crash videos" online right now, some of these are operator error, and some are system failure.

3. The proposal identifies Loss of Positive Control as one of the greatest risks, and that confining airspace to that within line-of-sight as the mitigating treatment for that risk. There is no discussion of Loss of Link and Loss of GPS occurring at the same time. The occurrence of these two failures at the same time cannot be excluded due to the fact that no testing and certification is required. There are a number of electrical issues that can easily render both receivers inoperable.

I assert that a confined area, alone, does not satisfactorily reduce risk of Loss of Positive Control and propose that flight testing is required, and that DAR / DERs are utilized for that task. I propose that requirements for Flight Termination Systems or Procedures are utilized as treatments for risk mitigation by Designees in evaluating new systems.

4. The proposal states that transponders and Traffic Collision Avoidance Systems are helpful in reducing mid-air collisions, but they are too large and heavy to be used in small UAS. With regard to transponders, this is an inaccurate statement. There are transponder / ADS-B units today that are designed for small UAS and weigh 100 grams. And regarding TCAS, the statement is disingenuous, as FAA Order 8900.1, Volume 16, *Unmanned Aircraft Systems* states that TCAS cannot be used as a method for see and avoid, and the FAA has issued COAs which prohibit the use of TCAS by UAS.

Both of these traffic sensing systems would be very useful in avoiding potential conflicts, and there use should not be discounted. I propose that ADS-B, at a minimum, is required for all operations above 100 feet AGL.

5. The proposed method of determining function and operability is for the operator to ensure the UAS is safe for flight. But there is no definition of "safe for flight." It implies that operators will instinctively know what is meant by "safe for flight," even without specific training or guidance. Also, discussions were made regarding potential annual inspection requirements, without addition to the proposed rule.

While many operators will exercise "common sense," not all will have the required level of understanding, and the FAA historically does not rely on this approach. . I propose a requirement for training in small UAS operations and maintenance prior to certification, and a requirement for annual inspections for the UAS.

Airman Certification

The proposal suggests that formal training is too great a burden for operators wishing to commercially operate small UAS in the NAS, though the requirements for operating any other vehicle for commercial purposes are much greater – commercial drivers, commercial vessel captains, and commercial pilots. It appears the position held by the FAA throughout this proposal is focused on the "burden" at the expense of safe operation.

1. The proposal suggests small UAS have operators (as opposed to pilots) in order to avoid pilot training requirements. While this shift may reduce the time and dollar burden on the operator, it comes at the cost of air sense. As the proposal states that the rule "would not require any specific form of training or studying in order to pass a knowledge test", there is no consideration to the airman's understanding of air traffic and procedures, nor soft skills such as decision making, situational awareness, checklist procedures, human factors, risk assessment and risk management. Yet the proposal requires the airman to assess risks without specific training or procedures.

I propose that a Commercial Pilots License for UAS be required for all commercial operations of a UAS, where half of the 250 hour requirement to be accomplished in a manned aircraft and the remaining 125 hours with a UAS (less expensive than the standard commercial rating). Recommend this license would have a "UAS-only" limitation for commercial operations.

2. The proposal states that there is no need for PIC designation. Most UAS have the ability to be operated in either autonomous or manual (remote control) mode. This allows for the possibility that separate operators are at each set of controls. If there is such a possibility, then an "in-charge" must be designated or this situation must be excluded by rule. However, excluding such an operation greatly reduces the ability to train a new UAS operator. I submit that a PIC must be designated for each flight as the responsible individual.

3. The FAA proposes not to provide an operator with the emergency powers available to the PIC under § 91.3(b). A designated PIC without training in the applicable regulations and operations is a liability. This is yet another reason to require training of airmen.

4. The proposal states the intent to exempt military and former military pilots based on experience from the full, initial small UAS operator test. At another point in the proposal, the same verbiage is used for allowing current or former military operators of unmanned aircraft to take a more limited test. Given the delineation the FAA has made in this proposal between pilots and operators, is the intent to exempt both?

Military experience in UAS is in *military* airspace, almost exclusively. The burden to the operator in taking the longer initial course is near zero, and not worth the short cut. As a military pilot, I propose that no one – military pilot or UAS operator – is exempt from the longer test.

5. The proposal aims to allow operators to self-certify, at the time of their airman application and attest that they do not have a medical condition that could interfere with the safe operation of a small UAS. Further, it would prohibit a person from acting as an operator or visual observer if he or she knows or has reason to know of any physical or mental condition that would interfere with the safe operation of a

small UAS. The verbiage used is based on Sport Pilot requirements, but will be applied to commercial operations.

While there are opinions as to what such conditions might be, there is no clear listing of such. I propose a list of limiting conditions is specified within the rule. For such a list, I suggest:

- angina
- coronary heart disease that is symptomatic or clinically significant
- psychosis
- bipolar disorder
- personality disorder that is severe enough to have repeatedly manifested itself by overt acts
- substance abuse or dependence (drugs or alcohol)
- epilepsy
- disturbances of consciousness without satisfactory explanation of cause
- transient loss of control of nervous system function without satisfactory explanation of cause.

6. While this proposed rule limits small UAS operation to visual line-of-sight, it does not require vision to be corrected to 20/20.

I propose that vision is required to be corrected to 20/20 to operate a UAS.

7. The proposed rule requires an applicant to be 17 years of age, and cites regulation allowing glider and balloon pilots at 16 years. However, commercial glider and balloon pilots must be 18 years old.

I propose that the minimum age for commercial operations keep in line with all other types of flight operation – 18 years of age.

Line of Sight and VO

1. The proposed rule requires that any Visual Observer maintain visual contact with the small unmanned aircraft and the surrounding airspace and communicate to the operator the flight status of the small UAS and any hazards which may enter the area of operation so that the operator can take appropriate action. While the VO is performing a key pilot-function they would not be required to have training of any kind. Further, accurate estimation of relative motion from a third position is very difficult, and mistakes can make a bad situation worse.

I propose that VOs are required to be trained on the applicable sections of part 91, as is the current standard of governmental entities operating UAS, and also in visual observation techniques.

2. The FAA acknowledges in this proposal that visual observation "is a concentration-intensive activity," but does not address time limits for such an operation. A long period without rest in this type of activity will result in loss of concentration and may result in loss of visual contact or loss of situational awareness. Either of these situations would pose a safety risk.

I propose a maximum duration of operation as a VO to be 45 minutes followed by a break of at least 15 minutes.

Micro UAS

1. The FAA has proposed the Micro UAS class with even less restriction. While this class is smaller, it is still the same size (4.4 lbs) as the birds considered for structural engineering, and at a 100 mph limit, will still carry a significant amount of energy. Even with the proposed frangible materials, parts such as propellers, moving at high speeds can injure people.

The allowance of these UAS to fly over any person, including those not involved, is unsafe and negligent. Training and certification should be defined and required.I propose the following changes to limits in accordance with discussions above:

- Maximum altitude – 250 feet AGL, except 50 feet above a structure within a 100 foot radius of that structure
- Operator ground and flight training, written and practical test required
- Visual Observer training required
- Distance from people and structure would be the same as small UAS – operations not allowed over any person not involved in the operations (unless under a covered structure)

Insurance

This proposal does not define requirements for liability insurance. (while also allowing flight in congested areas over persons and structures). Liability insurance is required of aircraft operators in every other category of flight, in private operations and commercial. Given the risks and early technology stated of the UAS industry, liability insurance should be a requirement.

I propose the same insurance minimums currently required for private and commercial manned flight operations.

N-number

The current and proposed requirements for UAS registration include obtaining an N-number. First, the number of available N-numbers is finite and will struggle to keep up with the volume of UAS entering the market. Second, there is currently no differentiation between manned aircraft and UAS in the assigned N-number. Third, the process for obtaining a registration is antiquated and cumbersome – carbon-copy and regular mail.

I propose a new numbering system for UAS, utilizing "NU" for UAS, similar to the older method of "NX" for experimental. I also propose a web-based system for obtaining a registration, which would greatly expedite the process.

Enforcement

With no need for operations based at an airfield, no requirement for flight plan or NOTAM filing, and the small footprint of a UAS operation, how will the FAA know where to go for compliance inspections?

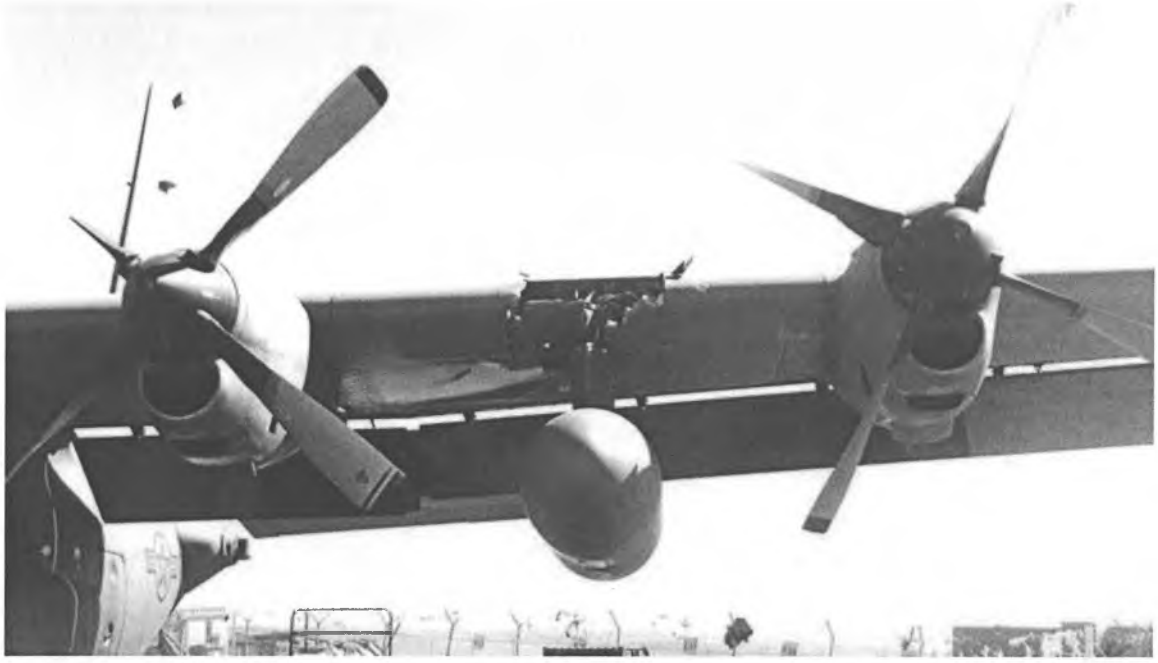
Further, what is at stake for a commercial UAS operation? A near-zero burden reduces the cost for the operator, but in doing so also reduces the incentive to operate in compliance with regulations. Cost of doing business is the incentive keeping most businesses in compliance with regulation, as loss of the ability to operate comes with a significant potential loss in capital. While commercial UAS operations will inherently be cheaper than manned flight, it should not be at the expense of safety with little to no proposed training requirements, no airworthiness inspection / certification, no insurance, and minimal regulation.

Trusting airspace limitations as the only mitigating factor is extremely risky. How are these airspace parameters of operation enforced? When a near-miss incident is reported, who do authorities go to for answers?

I propose mandatory flight plan filing for UAS operations to ensure oversight is possible, and mandatory NOTAM filing for UAS operations within 10 miles of an airfield, and other high-traffic areas.

General Thoughts

1. The proposed rule considers injury and damage to ground-based persons and property, but little for air traffic. As a military aviator with roughly 2,000 flight hours in the combat airspace shared with UAS, I have had several near-misses with unmanned aircraft. Additionally, friends of mine endured a mid-air collision between the C-130 they were flying and a 375 lb UAS. Luckily, they were on 5-mile final to the airport as the impact caused great damage and the aircraft could have become uncontrollable if not for the proximity to landing and quick corrective actions of the crew. Photos of the damage are available online, but a full report of the incident and damage sustained by this ~130,000 lb aircraft can be obtained from the USAF.



If we compare the structural damage to a combat aircraft weighing ~130,000 lbs by a 375 lb UAS to the potential damage to a 1,300 lb general aviation aircraft by a 37.5 lb UAS, the kinetic energy of the impact would be an order of magnitude greater. Without the proper regulations, training, certification and compliance in place, it's not a matter of if, it's a matter of when.

2. The FAA proposal currently rests on "limiting airspace" as a single treatment to mitigate all risks and does not thoroughly consider the potential for uncertified / untested aircraft to exceed those airspace boundaries (due to fault or failure). I understand that there is political pressure to integrate UAS into the national airspace system, but it should not be at the risk of life, limb or property. There have been a significant amount of near-miss incidents between UAS and manned aircraft in the last few years. The 26 Nov 2014 FAA report on near collisions indicated 25 incidents from 1 June 2014 until the report in which a UAS was within 10 seconds (or a few feet) of impacting a manned aircraft.

A few of my personal experiences, with experienced UAS operators in military airspace are described below:

- While flying in the traffic pattern at 1000' AGL in a small aircraft, a 375 lb UAV was launched below me without authorization. I had to maneuver to avoid the UAS and it passed within 500' vertical and less than 1/4 mile lateral. The aircraft I was flying was not equipped with TCAS, and I had to rely on the ATC Tower controllers' direction for initial avoidance maneuvering.
- Flying a medium sized aircraft on 3 mile ILS final, in marginal weather, a 40 lb UAS flew in opposite direction *just* off of centerline. I had to maneuver to avoid the UAS and it passed within 100' vertical and less than 1/2 mile lateral. The UAS was intermittently showing on TCAS, with significant gaps in display.
- In a medium sized aircraft, established at FL220, I was instructed by ATC to descend for a large UAS with lost link. Once I was established at FL210 (within 5 miles of the UAS and opposite

direction) the UAS Lost Link Flightplan commanded it to descend. I had to maneuver to avoid conflict and passed within 500' vertical and 1 mile lateral. This UAS did display on TCAS.

- In a medium sized aircraft, established at FL 200 at night, a large UAS passed less than 500 feet directly beneath me. It was not squawking and passed between my aircraft and another established at FL210. The operator was not talking to anyone on the radio. The UAS was visually acquired.
- In clear conditions, I had visually contacted a UAS above my aircraft, when the UAS showed up on my TCAS display as a traffic alert, it was reporting below my aircraft by ~200 feet. The differences in settings and use of GPS derived altimeter likely contributed to the situation.

Some of these issues were based on communications, some on GPS altimeters, o thers on procedures and understanding of airspace. The thought of UAS flight operations with extremely limited understanding of the operation, air traffic, limited training, no investment, and nothing at stake SCARES ME and should scare every pilot with skin in the game.

As a manned aviator and experienced member of the UAS industry, I am very concerned about current political and industry pressure outweighing safety concerns and risk mitigation.

4. The UAS Test Site program was initiated to assist in UAS integration; providing data and feedback to the FAA. However, due to the lack of funding, limited support, and process management gaps, very few resources have been directly and solely assigned to this program. This has resulted in little progress and the Test Sites continue to wrestle with the FAA to accomplish congressional goals. I recommend prioritization, simplification and wide research scope be established at the Test Sites if we are to expect successful data/results to come from this initiative and assist the FAA in the safe integration of UAS into the NAS.

5. On a final note, a 60 day proposal response window is a very short time period to provide meaningful, constructive responses. The potential impacts of this proposal are vast and daunting. I propose the window is reopened for another 30 days to allow for further collaboration in responses and suggested fixes. This is a matter that could have significant adverse safety impacts.

Kinetic Energy of Bird Strikes & Damage to Aircraft

A Visual Analytics Approach using
Bird Species & Kinetic Energy in a Flight Envelope of Strikes
(US FAA National Wildlife Strike Database)

Roger Nicholson PhD
Associate Technical Fellow
Boeing Commercial Airplanes
Roger.Nicholson@Boeing.com
Bird Strike Committee USA Conference & Annual Meeting
August 13-16, Memphis, Tennessee

Outline

- Bird Strike Regulations
- Kinetic Energy
- Flight Envelope: Altitude vs. Speed
- Bird species, size and weight, 0-4lb, 4-8lb, 8-12lb, 12-30lb
- Fatal accidents, hull losses, and significant strikes
- Airplane component damage

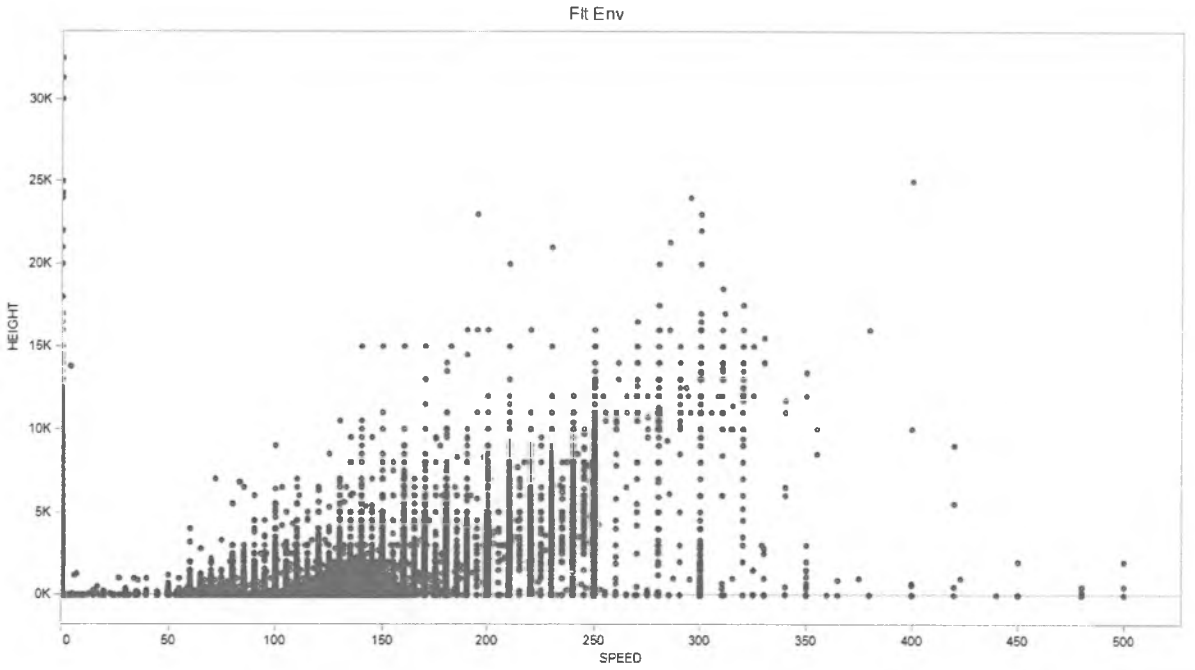
Federal Aviation Requirements (FARs) for Bird Strike, 14 CFR 25

- 25.571 (general structure): 4-lb bird at Vc, airplane cruise speed, 0.85 Vc at 8,000ft
- 25.631 (empennage): 8-lb bird at airplane cruise speed Vc
- Requirements for physical separation of airspeed sensors
- Power plant requirements, Part 33

Kinetic Energy, KE=1/2mV^2

- m, bird mass, obtained from SPECIES table, used average of mean mass of female and mean mass of male, pounds or kilograms
- V, true air speed, knots , derived from pressure altitude and calibrated airspeed, converted to feet/sec or metre/sec
- KE in units of ft-lb, or kilojoule
- Structural damage when KE => 20,000 ft-lb
- Canada goose (9.2-lb), At 250kt, 10,000ft altitude, KE ~ 33,900 ft-lb

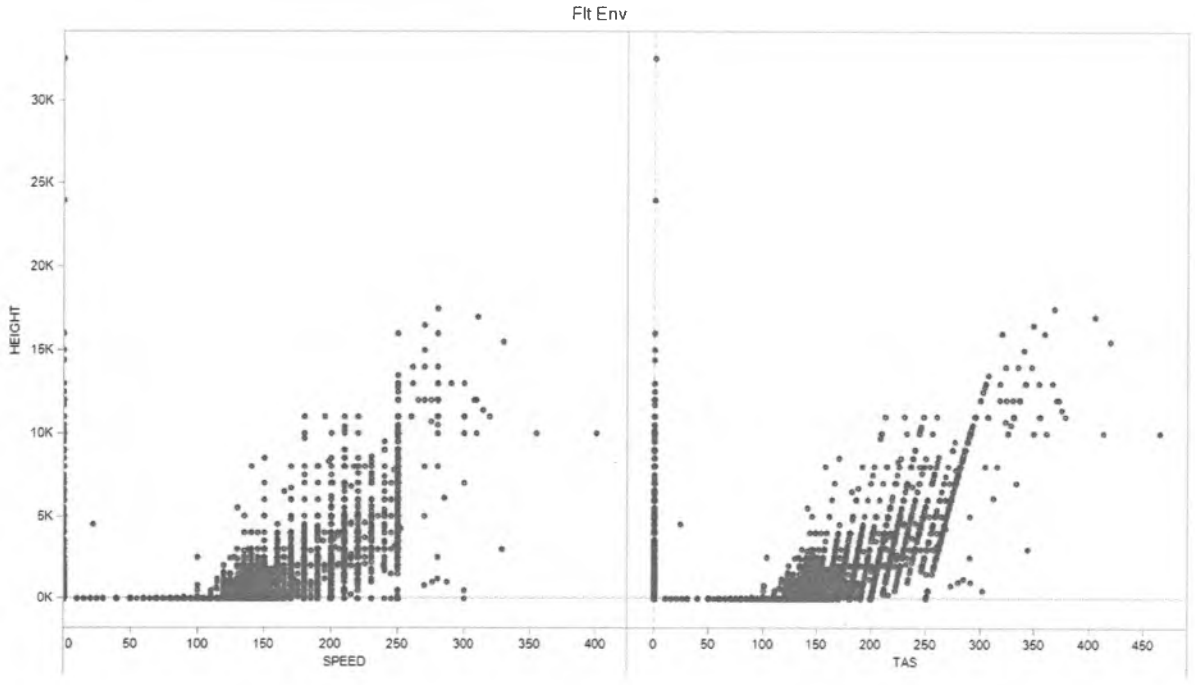
Flight Envelope: NWSDB fields of HEIGHT (above ground level, AGL, ft) & SPEED (indicated air speed, IAS, kt)



Flight Envelope:

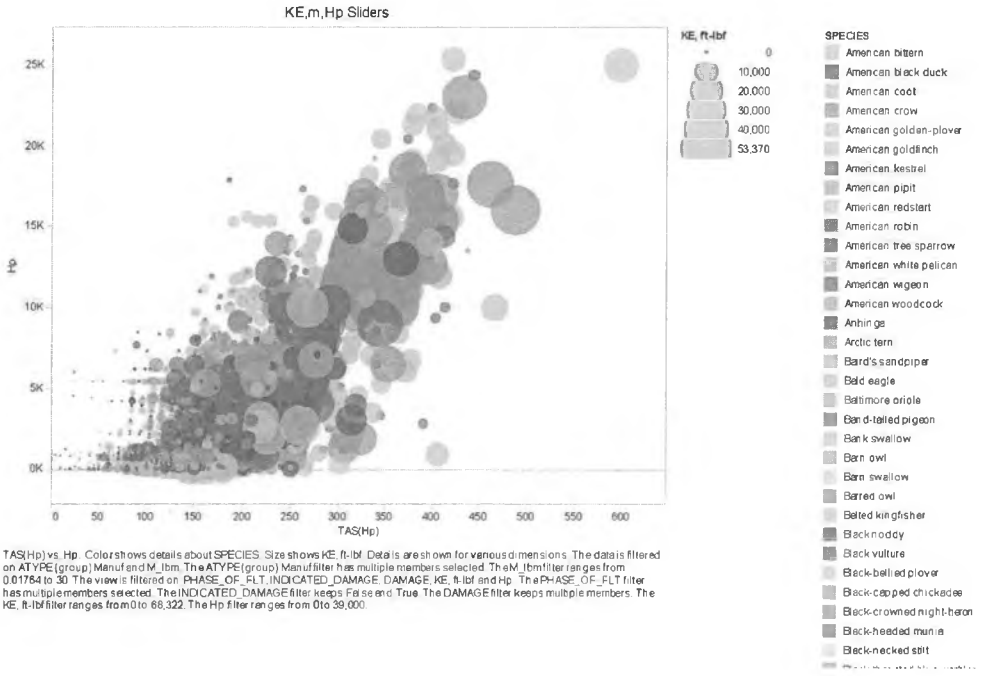
Hp (Pressure altitude) = Height (AGL) + Field Elevation

TAS (True air speed) ~ IAS + (0.02 x IAS x Altitude in 1000ft)



Flight Envelope: Part 121 Strikes

Color: species->mass; Size: kinetic energy



TAS(Hp) vs. Hp. Color shows details about SPECIES. Size shows KE, ft-lbf. Details are shown for various dimensions. The data is filtered on ATYPE (group) Manuf and M_lbm. AOA, TAT, Pitot, WXR, ILS

Flight Crew Response to Bird Strike

Boeing *AERO* Magazine 2011 Qtr 3
Strategies for Prevention of Bird-Strike Events

http://www.boeing.com/commercial/aeromagazine/articles/2011_q3/4/

The suggested strategies are based on visual analytic methods

Visual Analytics & Bird Strike

- Visual Analytics has greatly improved Boeing's understanding of the aviation wildlife hazard
- Multiple live sessions conducted with design engineers, working with online data (132,000 records), and examining strikes to radome, windshield, tail, landing gear, sensors, engines
- Promoting use of VA tools to wildlife community via US Bird Strike Committee, improve reporting, species identification, enhancement of annual wildlife strike report
- Practical wildlife hazard information for pilots

Visual Analytics Tool Applications for FOD & Bird Strike Prevention

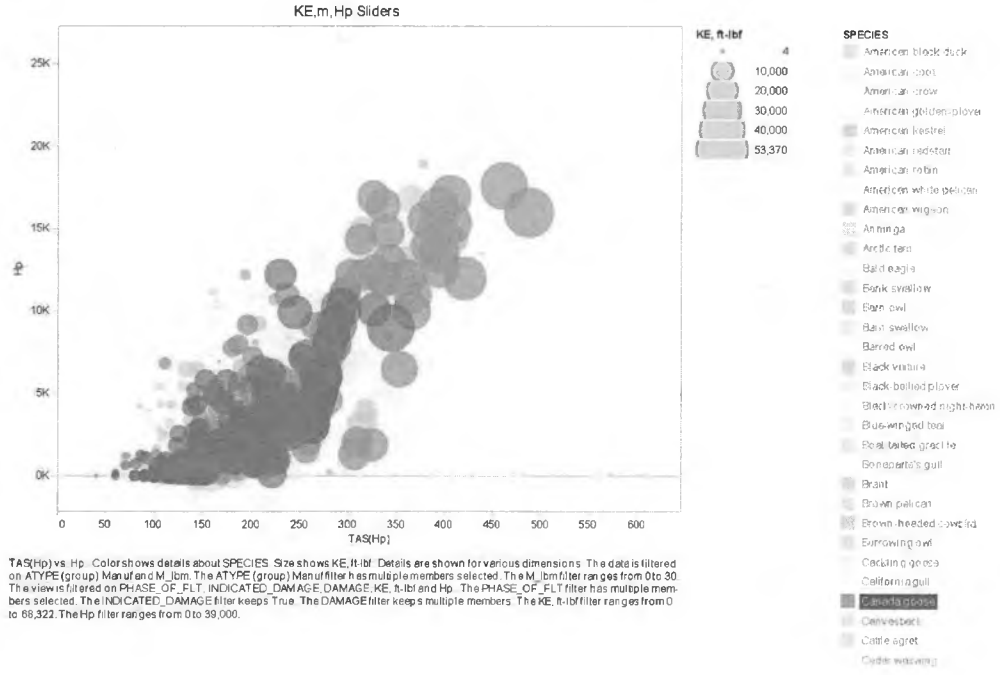
- Wildlife Strike Report Data Analysis
- Wildlife Surveys
- Vegetation Surveys
- Land Use Surveys
- FOD Report Data Analysis
- FOD Mapping

Visual Analytic tools facilitate analysis of multiple & massive sources of data

Aviation Wildlife Hazard Issues

- Voluntary Reporting of Wildlife Strikes in US
- Species Identification, particularly “Unknown Bird Large”
- Safety Requirements and Certification Requirements, Windshields, Nose Structure, Landing Gear, Tail, Lights, Sensors, Engines
- Multiple strikes, multiple engines struck

Species Identification
Canada Goose & “Unknown Bird Large”



TAS(Hp) vs. Hp. Color shows details about SPECIES. Size shows KE, ft-lbf. Details are shown for various dimensions. The data is filtered on ATYPE (group) Manuf and M_lbm. Advocacy News

California Assembly passes SB 142, could stymie UAS industry

Brian Wynne (8/25/2015)

Brian Wynne, president & CEO of AUVSI, today released the following statement on the passage of SB 142 in the California Assembly. The legislation would restrict UAS from flying below 350 feet over private property.

"AUVSI is deeply disappointed with the passage of SB 142 in the California Assembly. While the industry supports the safe, non-intrusive use of UAS technology, SB 142 creates inconsistencies with federal law that has the potential to further confuse UAS users and stifle economic growth in California. The Supreme Court has ruled that property rights do not extend infinitely into the sky. Only the FAA can regulate airspace; states and municipalities can't."

If passed, SB 142 has the potential to limit the societal and economic benefits of UAS technology in the state. From filmmaking to real estate, California industries are already successfully using UAS technology

through more than 100 commercial exemptions granted by the FAA, more than any other state. Once the U.S. airspace is fully opened to UAS, California stands to gain more than 18,100 jobs and more than $14 billion in economic impact within a decade.

Earlier this week, AUVSI President and CEO Brian Wynne penned an op-ed in the Sacramento Bee urging the California Legislature to reject SB 142. We urge you to contact your elected representatives in the California State Assembly and Senate and ask them to oppose SB 142 and allow the FAA — the appropriate authority to regulate airspace — to finalize its rules that govern UAS technology.

AMENDED IN ASSEMBLY JUNE 30, 2015

AMENDED IN ASSEMBLY JUNE 3, 2015

AMENDED IN SENATE APRIL 14, 2015

SENATE BILL No. 142

Introduced by Senator Jackson
(Principal coauthor: Assembly Member Calderon)

January 26, 2015

An act to add Section 1708.83 to the Civil Code, *and to amend Section 21012 of the Public Utilities Code,* relating to civil law.

LEGISLATIVE COUNSEL'S DIGEST

SB 142, as amended, Jackson. Civil law: unmanned aerial vehicles.

Existing federal law, the FAA Modernization and Reform Act of 2012, provides for the integration of civil unmanned aircraft systems, commonly known as drones, into the national airspace system by September 30, 2015. Existing federal law requires the Administrator of the Federal Aviation Administration to develop and implement operational and certification requirements for the operation of public unmanned aircraft systems in the national airspace system by December 31, 2015.

~~Existing law imposes liability for physical invasion of privacy, if a person knowingly enters onto the land of another without permission or otherwise commits a trespass in order to capture any image or recording of the plaintiff engaging in a private activity and the invasion is offensive to a reasonable person.~~

~~This bill would define knowing entry upon the land of another also to include operation of an unmanned aerial vehicle below the navigable airspace overlaying the real property or operation of an unmanned aerial~~

~~vehicle less than 350 feet above ground level within the airspace overlaying the real property, without the consent of the landowner or without legal authority.~~

Existing law deems the detriment caused by wrongful occupation of real property to be the value of the use of the property for the time of the wrongful occupation, the reasonable cost of repair or restoration of the property, and the costs of recovering the possession.

This bill would extend liability for wrongful occupation of real property and damages to a person who operates an unmanned ~~aerial vehicle below the navigable airspace overlaying the real property or operation of an unmanned aerial vehicle~~ *aircraft or unmanned aircraft system, as defined,* less than 350 feet above ground level within the airspace overlaying the real property, without the ~~consent of the landowner~~ *express permission of the person or entity with the legal authority to grant access* or without legal authority.

Vote: majority. Appropriation: no. Fiscal committee: no. State-mandated local program: no.

The people of the State of California do enact as follows:

SECTION 1. Section 1708.83 is added to the Civil Code, to read:

~~1708.83. (a) A person knowingly enters onto the land of another person pursuant to subdivision (a) of Section 1708.8 if, without the consent of the landowner or without legal authority, he or she does either of the following:~~

~~(1) Operates an unmanned aerial vehicle below the navigable airspace, as defined in paragraph (32) of subsection (a) of Section 40102 of Title 49 of the United States Code, overlaying the real property.~~

~~(2) Operates an unmanned aerial vehicle less than 350 feet above ground level within the airspace overlaying the real property.~~

~~(b) A person wrongfully occupies real property and is liable for damages pursuant to Section 3334 if, without the consent of the landowner or without legal authority, he or she does either of the following:~~

~~(1) Operates an unmanned aerial vehicle below the navigable airspace, as defined in paragraph (32) of subsection (a) of Section 40102 of Title 49 of the United States Code, overlaying the real property.~~

~~(2) Operates an unmanned aerial vehicle less than 350 feet above ground level within the airspace overlaying the real property.~~

1708.83. (a) A person wrongfully occupies real property and is liable for damages pursuant to Section 3334 if, without express permission of the person or entity with the legal authority to grant access or without legal authority, he or she operates an unmanned aircraft or unmanned aircraft system less than 350 feet above ground level within the airspace overlaying the real property.

(b) For purposes of this section:

(1) "Unmanned aircraft" means an aircraft that is operated without the possibility of direct human intervention from within or on the aircraft.

(2) "Unmanned aircraft system" means an unmanned aircraft and associated elements, including communication links and the components that control the unmanned aircraft, that are required for the pilot in command to operate safely and efficiently in the national airspace system.

~~(3)~~

(c) This section shall not be construed to impair or limit any otherwise lawful activities of law enforcement personnel or employees of governmental agencies or other public or private entities that may have the right to enter land by operating an ~~unmanned aerial vehicle~~ *unmanned aircraft or unmanned aircraft system* within the airspace overlaying the real property of another, including the right to use private lands acquired pursuant to subdivision (d) of Section 1009.

(d) Nothing in this section is intended to limit the rights and defenses available at common law under a claim of liability for wrongful occupation of real property.

SEC. 2. Section 21012 of the Public Utilities Code is amended to read:

21012. "Aircraft" means any manned contrivance used or designed for navigation of, or flight in, the air requiring certification and registration as prescribed by federal statute or regulation. Notwithstanding the foregoing provisions of this section, manned lighter-than-air balloons and ultralight vehicles as defined in the regulations of the Federal Aviation Administration (14 C.F.R. Part 103), whether or not certificated by the Federal Aviation Administration, shall not be considered to be aircraft for purposes of this part. *"Aircraft" shall not include an unmanned*

aircraft that is operated without the possibility of direct human intervention from within or on the aircraft.

SOAPBOX AUGUST 23, 2015

Don't prematurely limit the potential of aerial drones

HIGHLIGHTS

Legislature considering bill, but it should let FAA set nationwide rules

Drone companies could expand dramatically and create jobs in California

Film industry and real estate agents already capitalizing on technology

BY BRIAN WYNNE
Special to The Bee

From Silicon Valley to Hollywood, unmanned aircraft are transforming how California industries operate and are creating several new ones as well.

But as more and more businesses receive waivers from the Federal Aviation Administration to fly drones commercially, legislators are considering Senate Bill 142, which would restrict drones from flying below 350 feet over private property.

While the industry supports the safe, nonintrusive use of drone technology, passage of SB 142 would create inconsistencies with federal law. The Supreme Court ruled that property rights do not extend infinitely into the sky. In other words, only the FAA can regulate airspace; states and municipalities can't.

Legislation like SB 142 isn't unique to California. Many states have been considering proposals that would prematurely and unnecessarily limit the tremendous societal and economic benefits that drone technology will bring. But until the FAA finalizes its long awaited rules on small unmanned aircraft systems, there is much uncertainty about where operators should and shouldn't fly and for what purpose. For the safety of our skies, we need Washington to make finalizing these rules a top priority.

There is strong evidence that a burgeoning market is waiting to be unleashed once regulations are established. Since the FAA announced in May 2014 that it would grant exemptions for certain low-risk commercial drones, more than 1,100 businesses, including dozens in California, have received permission.

The Association for Unmanned Vehicle Systems International recently examined the first 500 approved petitions and found that California led the way with 70. Unmanned aircraft are being used in many of the state's top industries, including film and television, real estate and agriculture.

For example, Carlsbad-based Aerial Mob was one of the first to receive a commercial exemption from the FAA. An innovator in cinematography and technology, Aerial Mob is also considered a pioneer in safety standards. The company performed the first ever FAA-approved film production project with a major studio on the set of the CBS show "The Mentalist." The company has since filmed Super Bowl promos for NBC, a promo for a new show on Amazon Prime and even helped Apple film a commercial.

Drones are also very popular in California's resurgent real estate industry. Real estate agents see an opportunity to capture unique aerial perspectives for their listings. The FAA has issued 15 exemptions to real estate companies in the state and more than 200 nationwide, according to the National Association of Realtors.

The large number of commercial exemptions granted in California shows that its commercial drone market is waiting to be unleashed. However, the current system of case-by-case approvals isn't a long-term solution. Once the FAA finalizes its rules, any drone operator who follows the rules can fly, opening the door to even more commercial use in California.

A study by our association estimated that in the first decade following drone integration into the national airspace system, California's economy would gain more than 18,100 jobs and more than $14 billion in economic impact. Under the right regulatory environment, there's no question these numbers could go even higher.

Drone technology is developing rapidly and the next innovative use may be just around the corner. To continue reaping the economic benefits, we need to do all we can to support the growth and development of this industry rather than restrict it. Otherwise, California risks losing its innovation edge, plus billions of dollars of economic impact.

Brian Wynne is president and CEO of the Association for Unmanned Vehicle Systems International.

GAO Reviews FAA Progress on UAS Integration

Federal aviation regulators by September expect to develop a foundation for a detailed plan to integrate drones into U.S. airspace, and then enact it in December, congressional investigators said in a new report.

The Government Accountability Office publicly released a report on Aug. 17 that reviewed the Federal Aviation Administration's progress on drone - or unmanned aerial system, or UAS - integration.

Additionally, the report covered drone challenges as well as the agency's case-by-case approval of drone operations, use of six designated sites to conduct tests, and drone regulations in other countries.

According to the report, which was actually published a month before, FAA is working with the MITRE Corp. to develop a foundation for the implementation plan that would contain several hundred activities to complete the integration process, which is needed as the government and commercial sectors are increasingly using unmanned aircraft for various purposes.

The GAO noted in a footnote that the implementation plan, however, is not expected to be made public.

A federal law enacted in 2012 required that the FAA integrate drones into the national airspace by Sept. 30, 2015, but the regulatory process in drafting and reviewing the rules has been slow.

In the meantime, the FAA issued proposed rules in February for the operations of small drones weighing less than 55 pounds and received more then 4,500 comments in late April. A final rule may not be developed until 2016 or 2017, the GAO report said, reiterating what has been previously reported.

Regarding the six test sites, which were established in 2014 to conduct research and development on drone operations and safety that the FAA reviews, more than 195 test flights have taken place as of March. The report also listed the challenges that these sites faced and their future use.

The report also compared proposed U.S. regulations to those in other countries such as Australia, Canada, France and the United Kingdom, which all have similar, but well-established rules for commercial operations.

"While the United States has not finalized UAS regulations, the provisions of FAA's proposed rules are similar to those in the countries GAO examined," the report said." However, FAA may not issue a final rule for UASs until late 2016 or early 2017, and rules in some of these countries continue to evolve."

All countries face similar challenges, too. For example, the report listed technology concerns regarding detection and avoidance of other aircrafts, lack of standards for command and control systems and the lack of a dedicated and secure spectrum.

In comments about the report, the Transportation Department said GAO addressed many of the challenges, but it did not discuss environmental concerns. The watchdog agency said that it was outside the scope of this report.

The department said that FAA is conducting research to understand the environmental impacts of drone integration, the role of such unmanned vehicles in complying with federal law and the how noise standards apply to them.

FAA Continues Progress toward Integration into the National Airspace

GAO-15-610

July 2015

UNMANNED AERIAL SYSTEMS

FAA Continues Progress toward Integration into the National Airspace

GAO Highlights

Highlights of GAO-15-610, a report to congressional committees

Why GAO Did This Study

UASs are aircraft that do not carry a pilot aboard, but instead operate on pre-programmed routes or are manually controlled by following commands from pilot-operated ground control stations. Unauthorized UAS operations have, in some instances, compromised safety. The FAA Modernization and Reform Act of 2012 directed FAA to take actions to safely integrate UASs into the national airspace. In response, FAA developed a phased approach to facilitate integration and established test sites among other things.

GAO was asked to review FAA's progress in integrating UASs. This report addresses (1) the status of FAA's progress toward safe integration of UASs into the national airspace, (2) research and development support from FAA's test sites and other resources, and (3) how other countries have progressed toward UAS integration into their airspace for commercial purposes. GAO reviewed and analyzed FAA's integration-planning documents; interviewed officials from FAA and UAS industry stakeholders; and met with the civil aviation authorities from Australia, Canada, France, and the United Kingdom. These countries were selected based on several factors including whether they have regulatory requirements for commercial UASs, operations beyond the view of the pilot, and whether non-military UAS are allowed to operate in the airspace. In comments on this report, the Department of Transportation noted that GAO did not address environmental considerations of UAS integration; such considerations were outside the scope of this report.

View GAO-15-610. For more information, contact Gerald Dillingham at (202) 512-2834 or dillinghamg@gao.gov.

What GAO Found

The Federal Aviation Administration (FAA) has progressed toward its goal of seamlessly integrating unmanned aerial system (UAS) flights into the national airspace. FAA has issued its *UAS Comprehensive Plan* and *UAS Integration Roadmap*, which provide broad plans for integration. However, according to FAA, it is working with MITRE to develop a foundation for an implementation plan; FAA then expects to enact a plan by December 2015. While FAA still approves all UAS operations on a case-by-case basis, in recent years it has increased approvals for UAS operations. Specifically, the total number of approvals for UAS operations has increased each year since 2010, and over the past year has included approvals for commercial UAS operations for the first time. In addition, FAA has issued a Notice of Proposed Rulemaking that proposes regulations for small UASs (less than 55 pounds).

The FAA's six designated test sites have become operational but have had to address various challenges during the process. The designated test sites became operational in 2014, and as of March 2015, over 195 test flights had taken place. These flights provide operations and safety data to FAA in support of UAS integration. In addition, FAA has provided all test sites with a Certificate of Waiver or Authorization allowing small UAS operations below 200 feet anywhere in the United States. However, during the first year of operations, the test sites faced some challenges. Specifically, the test sites sought additional guidance regarding the type of research they should conduct. According to FAA, it cannot direct the test sites, which receive no federal funding, to conduct specific research. However, FAA did provide a list of potential research areas to the test sites to provide some guidance on areas for research. FAA has conducted other UAS research through agreements with MITRE and some universities, and in May 2015 named the location of the UAS Center of Excellence—a partnership among academia, industry, and government conducting additional UAS research. Unlike FAA's agreements with the test sites, many of these arrangements have language specifically addressing the sharing of research and data.

Around the world, countries have been allowing UAS operations in their airspace for purposes such as agricultural applications and aerial surveying. Unlike in the United States, countries GAO examined—Australia, Canada, France, and the United Kingdom—have well-established UAS regulations. Also, Canada and France currently allow more commercial operations than the United States. While the United States has not finalized UAS regulations, the provisions of FAA's proposed rules are similar to those in the countries GAO examined. However, FAA may not issue a final rule for UASs until late 2016 or early 2017, and rules in some of these countries continue to evolve. Meanwhile, unlike under FAA's proposed rule, Canada has created exemptions for commercial use of small UASs in two categories that allow operations without a government-issued certification, and France and Australia are approving limited beyond line-of-sight operations. Similar to the United States, other countries are facing technology shortfalls, such as the ability to detect and avoid other aircraft and obstacles, as well as unresolved issues involving limited spectrum that limit the progress toward full integration of UASs into the airspace in these countries.

Congressional Committees

Since the early 1990s, unmanned aerial systems (UAS) have operated on a limited basis in the national airspace system, primarily supporting public uses, such as military and border-security operations.[1] The list of potential uses is now rapidly expanding to include a broad range of UAS operations, including assisting in search and rescue operations, inspecting pipelines, photographing real estate, surveying land and crops, disaster assistance, gathering news, and filming movies. According to a 2013 report by a UAS industry group, the economic benefit of fully integrating UASs into the national airspace system will total more than $13.6 billion in the first 3 years of integration and grow to more than $82.1 billion from 2015 through 2025.

The Federal Aviation Administration's (FAA) goal is to seamlessly integrate all UAS operations into the national airspace. While FAA is developing regulations to allow routine UAS commercial operations, it currently only allows them in the national airspace after a case-by-case safety review and approval. At the same time, the safety of the national airspace is threatened on a nearly daily basis by UASs' operating without approval. For example, one UAS nearly collided with a New York Police Department helicopter over New York City, another came dangerously close to a US Airways regional jet over the Florida panhandle, and numerous UASs have been spotted flying over professional and college football stadiums full of people. The FAA has stated the number of reported incidents has increased recently, with 97 incidents reported from February through March 2015, compared to just 3 incidents reported

[1]See GAO, *Unmanned Aerial Systems: Department of Homeland Security's Review of U.S. Customs and Border Protection's Use and Compliance with Privacy and Civil Liberty Laws and Standards*, GAO-14-849R (Washington, DC: Sept. 30, 2014). UAS aircrafts do not carry a pilot onboard, but instead operate by following commands from pilot-operated ground control stations or pre-programmed routes. UASs are also referred to as "unmanned aerial vehicles," "unmanned aircraft systems," "remotely piloted aircraft," "unmanned aircraft," or "drones." The term "unmanned aerial system" is used to recognize that UASs include not only the airframe and its power source, such as a battery or combustible engine, but also associated elements such as a ground control station and communications links.

during the same period in 2014. FAA believes the increase is due to more awareness about UASs and the need to report incidents, but the extent these factors contribute to the increase is not clear.

As UAS operations in the national airspace continue to increase, members of Congress have raised questions about the safe and efficient integration of UASs into the national airspace system and asked us to examine the progress of UAS integration. This report examines (1) the status of FAA's progress toward safe integration of UASs into the national airspace, (2) research and development support from FAA's test sites and other resources, and (3) how other countries have progressed toward UAS integration into their airspace for commercial purposes.

To address all the objectives, we reviewed FAA reports and prior GAO work[2] related to integrating UASs in the national airspace system, reviewing such work as FAA's framework for UAS integration and our prior work on UAS research and development, efforts by FAA to accommodate ongoing research and commercial UAS use, and UASs' technology challenges.[3] We also reviewed provisions of the FAA Modernization and Reform Act of 2012[4] (the 2012 Act), and the Notice of Proposed Rulemaking for small UAS operations.[5] To determine FAA's progress toward safe integration of UASs into the national airspace, we reviewed and analyzed documents provided by various stakeholders and conducted semi-structured interviews with these stakeholders, including government—FAA, Department of Defense (DOD), National Aeronautics and Space Administration (NASA), and the Department of Homeland Security—academics researching UAS technology, industry trade associations, and others from the UAS industry including a manufacturer and a commercial operator. We selected the private-sector stakeholders,

[2]GAO, *Unmanned Aircraft Systems: Continued Coordination, Operational Data, and Performance Standards Needed to Guide Research and Development*, GAO-13-346T (Washington, DC: Feb. 15, 2013); *Unmanned Aircraft Systems: Measuring Progress and Addressing Potential Privacy Concerns Would Facilitate Integration into the National Airspace System*, GAO-12-981 (Washington, DC: Sept. 14, 2012); and *FAA Reauthorization Act: Progress and Challenges Implementing Various Provisions of the 2012 Act*, GAO-14-285T (Washington, DC: Feb. 5, 2014).

[3]We did not review the environmental challenges of UAS integration.

[4]Pub. L. No. 112-95, 126 Stat. 11.

[5]80 Fed. Reg. 9544 (Feb. 23, 2015).

such as RTCA and ASTM International, based on their involvement within UAS standards groups.[6] To identify research and development support from FAA's test sites and other resources, we reviewed and analyzed documents provided by officials at each of FAA's six test sites and conducted semi-structured interviews with officials from each of the six, including the applications submitted by the selected test sites and quarterly reports provided to FAA. We also interviewed FAA officials managing the test site program and those managing other research and development efforts related to UASs. To identify how other countries have progressed toward UAS integration into their airspace for commercial purposes, we obtained the UAS regulations of authorities in France, the United Kingdom, Australia, and Canada and interviewed the civil aviation authorities in them. We selected these countries based on several factors including whether they have regulatory requirements for commercial UASs, operations beyond the view of the pilot, and whether the country allows non-military UAS to operate in the airspace. We also reviewed key documents and interviewed international aviation entities including the International Civil Aviation Organization (ICAO).[7] More details on our scope and methodology can be found in appendix I.

We conducted this performance audit from January 2014 to July 2015 in accordance with generally accepted government auditing standards. Those standards require that we plan and perform the audit to obtain sufficient, appropriate evidence to provide a reasonable basis for our findings and conclusions based on our audit objectives. We believe that the evidence obtained provides a reasonable basis for our findings and conclusions based on our audit objectives.

Background

UASs can be categorized by both size and mission, as shown in figure 1.

- For the purposes of this report, in terms of size, we use the broad categories of "small" and "large" UASs. Small UASs typically weigh less than 55 pounds and can be used for a variety of commercial purposes including photography and package delivery. According to

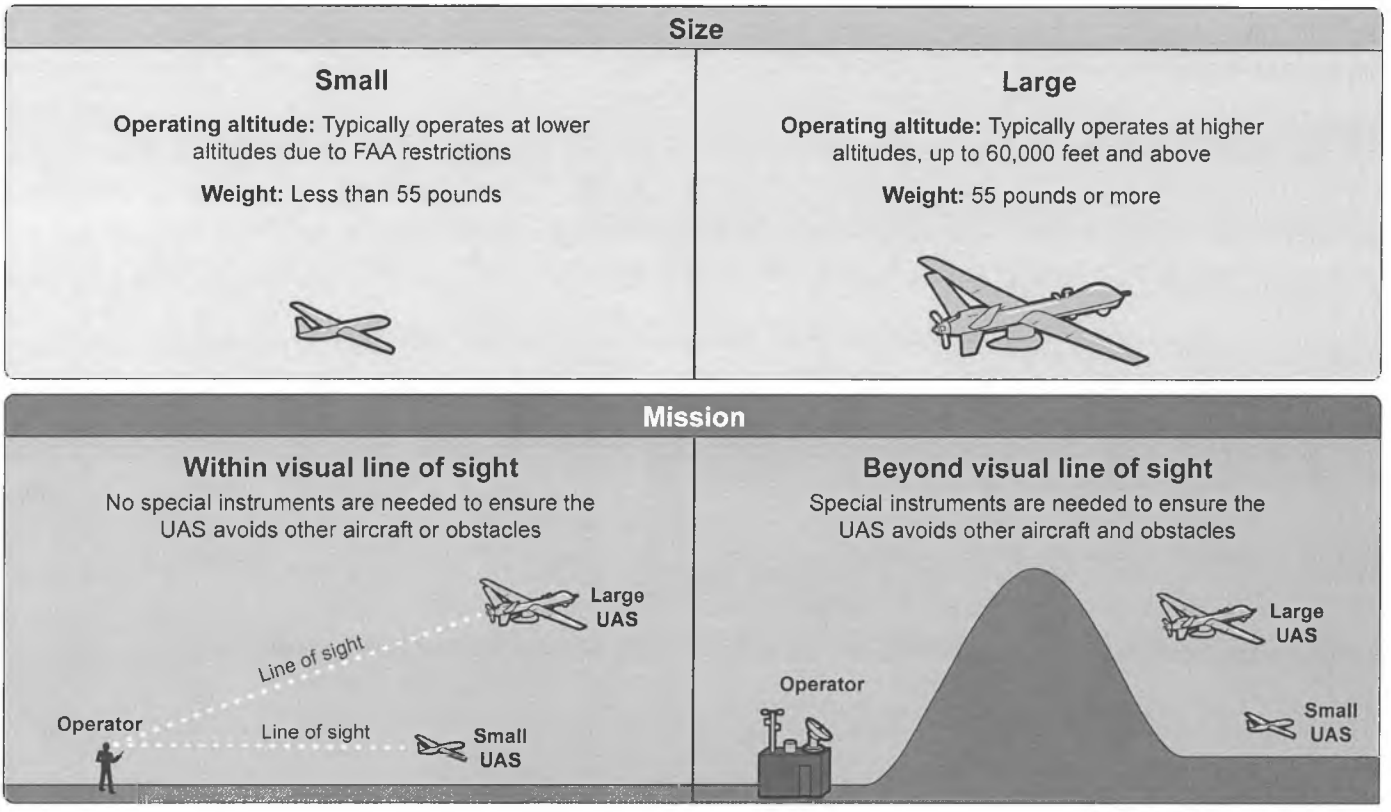
[6]RTCA was formerly known as the Radio Technical Commission for Aeronautics. ASTM International was formerly known as the American Society for Testing and Materials.

[7]ICAO is the international body that, among other things, promulgates international standards and recommended practices in an effort to harmonize global aviation standards.

an industry association, small UASs are expected to comprise the majority of UASs that will operate in the national airspace system. Large UASs, depending on their size and purpose, generally fly at higher altitudes and are used for the purposes of surveillance, data gathering, and communications relay.

- UAS operations are also categorized by how they are being used—their mission—within line of sight of the operator or beyond the line of sight of the operator. For UAS operations within the operator's line of sight—for example a real estate agent taking photographs of a house—the operator relies only on their vision to avoid colliding with other objects. On the other hand, UAS operations occurring beyond the line of sight of the operator—for example conducting rail or pipeline inspections—requires that FAA segregate the airspace or that the UAS needs instruments to sense other aircraft and obstacles and avoid those obstacles, as well as, other technologies that will keep the aircraft safely operating during its mission.

Figure 1: Unmanned Aerial Systems (UAS) Size and Mission Categories



Source: GAO. | GAO-15-610

The FAA plays two major roles in integrating UASs into the national airspace—a regulator and a service provider. As the regulator, the FAA seeks to ensure the safety of persons and property in the air and on the ground in part by requiring that UAS operators and manufactures follow specific operation and manufacturing standards. As the service provider, the FAA is responsible for providing safe and efficient air-traffic control services in the national airspace system and the other portions of global airspace. In addition to FAA, many federal and private sector entities have roles in the effort to integrate UAS into the national airspace system. See table 1 for UAS stakeholders and their responsibilities.

Table 1: Unmanned Aerial Systems (UAS) Stakeholders and Their Responsibilities

Agency	Responsibility
Federal Aviation Administration (FAA)	FAA's UAS Integration Office is responsible for ensuring that Unmanned Aerial Systems (UAS) operate safely in the national airspace system and for providing safe and efficient air traffic control.
Department of Defense (DOD)	DOD provides FAA with UAS operational and safety data, as well as research and development support.
National Aeronautics and Space Administration (NASA)	NASA provides research and development and testing on UAS integration efforts.
Department of Homeland Security (DHS)	DHS's Customs and Border Protection has provided flight demonstrations to FAA's Next Generation Air Transportation System (NextGen) Office.
UAS Executive Committee[a]	The UAS Executive Committee is composed of senior executives from federal agencies including FAA, DOD, NASA, and DHS and is responsible for identifying solutions to the range of technical, procedural, and policy concerns arising from UAS integration.
UAS Aviation Rulemaking Committee	The UAS Aviation Rulemaking Committee was chartered in 2011 to provide a mechanism for industry and academic stakeholders as well as other federal, state, and local government entities to provide recommendations and standards to FAA on issues related to UAS integration.[b]
RTCA Special Committee 228	RTCA is a private, not-for-profit organization consisting of industry experts. Special Committee 228 is responsible for developing standards for UASs to avoid objects and other aircraft, and supporting the radio controls of a UAS.
ASTM International Committee F38[c]	ASTM International Committee F38 is a committee consisting of industry experts that are responsible for developing standards and consensus based recommendations for small UAS integration into the national airspace system and worldwide.

Source: GAO. | GAO-15-610

[a]The UAS Executive Committee was formed as a result of the National Defense Authorization Act for Fiscal Year 2010 (Pub. L. No. 111-84, 123 Stat. 2190 (2009)). Section 935 of the 2010 National Defense Authorization Act states that "The Secretary of Defense and the Secretary of Transportation shall, after consultation with the Secretary of Homeland Security, jointly develop a plan for providing expanded access to the national airspace system for unmanned aircraft systems of the Department of Defense" and requires the Executive Committee members to provide Congress with, among other things, a communications plan, specific milestones for expanded access to the national airspace system, and a report on their efforts.

[b]FAA extended the Aviation Rulemaking Committee's charter through June 17, 2016, requesting the Committee continue to provide information, advice, and recommendations to the FAA for UAS integration.

[c]ASTM International, formerly known as the American Society for Testing and Materials, works to deliver the test methods, specifications, guides, and practices that support industries and governments worldwide.

FAA also partners with a range of industry, federal research entities, universities, and international organizations for research and development on UAS issues.

- Federally Funded Research and Development Centers[8] and Cooperative Research and Development Agreements typically require an agency, organization, or company to perform specific research and provide FAA with data in exchange for funding. FAA uses these types of agreements to support research and development in critical technologies needed for UAS integration including "detect and avoid" and "command and control" as well as for the dedicated radio-frequency spectrum and "human factors."[9]

- Some other partnerships use Other Transaction Agreements to establish the research and development relationship.[10] However, these take many forms and are subject to requirements that may differ from the federal laws and regulations that apply to contracts, grants, or cooperative agreements, and therefore might not include a requirement to share research results with FAA.

Currently, most UAS operations must remain within visual line of sight of the UAS operator. FAA's long-term goal is to pursue research and development that will advance technology in these critical areas, such as detect and avoid, and supporting beyond-visual-line-of-sight operations. These types of operations, according to an industry group, have the most potential for commercial purposes.

In response to the 2012 Act, FAA has been planning for UAS integration into the national airspace and has been taking steps toward increasing

[8]FAA's Federally Funded Research and Development Centers are located at MITRE, MIT's Lincoln Laboratory, and the Air Force Research Laboratory.

[9]"Detect and avoid" is needed to provide UAS with the capability to operate near other aircrafts and objects, yet avoid collisions. "Command and control" addressed the ability to maintain the integrity of radio signals to ensure that the UAS operates as expected and as intended. Dedicated radio-frequency spectrum is important because spectrum is a key security and safety vulnerability and because intentional or unintentional interruption of radio transmissions can sever the UAS's only means of control. The study of the "human factors" affecting UAS operators is important because the separation of pilot and aircraft 1) removes sensory cues needed for flight control, and 2) creates difficulties in scanning the visual environment surrounding the unmanned aircraft.

[10]Other Transaction Agreements are administrative vehicles used by a federal agency. Other Transaction Agreements generally enable the federal government and others entering into these agreements to freely negotiate provisions that are mutually agreeable. FAA's Other Transaction Agreement authority, at 49 U.S.C. § 106(l)(6) provides, in part, that the Administrator may enter into other transactions with any federal agency, among others, on such terms and conditions as the Administrator may consider appropriate.

UAS operations.[11] The 2012 Act outlined 17 date specific requirements and set deadlines for FAA to achieve safe UAS integration by September 2015. These requirements included developing two planning documents - UAS Comprehensive Plan and the UAS Roadmap. FAA has completed these two requirements in addition to naming six test sites where research and development will occur.[12] However, we found in December 2014 that several other requirements, some key ones, including the publication of a final rule on small UAS operations, had not been completed (see app. II).[13]

As part of its role in supporting UAS integration, FAA authorizes all UAS operations (access to the airspace as well as the aircraft itself) in the national airspace system—military; public (academic institutions and, federal, state, and local governments including law enforcement organizations); and civil (non-government including commercial).[14] Depending on the type of user, public or civil, the process for accessing the airspace may be different (see table 2).

Table 2: Federal Aviation Administration (FAA) Approvals Required for Unmanned Aerial Systems to Access the National Airspace

Type of operations	Airspace approval	Equipment approval
Public (academic institutions and federal, state, and local governments including law enforcement organizations)	Public Certificates of Waiver or Authorization (COA)	Public COA
Civil (non-government, including commercial)	Civil COA	Section 333 exemption, Special Airworthiness Certificates in the Experimental Category

Source: GAO presentation of FAA information | GAO-15-610

[11]Pub. L. No. 112-95, §§ 331 – 335, 126 Stat. 11.

[12]The test sites are located at the University of Alaska (includes test ranges in Hawaii, Oregon, and Iceland); State of Nevada; New York's Griffiss International Airport (includes test range locations in Massachusetts); North Dakota Department of Commerce; Texas A&M University–Corpus Christi; and Virginia Polytechnic Institute and State University (Virginia Tech) (includes test ranges in Maryland, partnered with the University of Maryland, and New Jersey, partnered with Rutgers University).

[13]GAO, *Unmanned Aerial Systems: Efforts Made toward Integration into the National Airspace Continue, but Many Actions Still Required,* GAO-15-254T (Washington, DC: Dec. 10, 2014).

[14]The integration or use of military aircraft was outside the scope of this review.

Currently, since a final rulemaking is not yet completed, FAA only approves UASs access to the national airspace on a case-by-case basis. FAA provides this approval through three different means:

- Public or Civil Certificates of Waiver or Authorization (COA): A COA is an authorization, generally for up to 2 years, issued by the FAA to an operator for a specific UAS activity. Public entities, including FAA-designated test sites (described in more detail later), and civil entities may apply for a COA to obtain authorized access to the airspace. FAA has a goal to review and approve all COAs within 60 days of being received.

- Section 333 exemptions: Since September 2014, commercial entities have applied to FAA for exemptions under section 333 of the 2012 Act, Special Rules for Certain Unmanned Aircraft Systems. This exemption requires the Secretary of Transportation to determine if certain UASs may operate safely in the national airspace system prior to the completion of UAS rulemakings.

- Special Airworthiness Certificates in the Experimental Category and the Restricted Category (Experimental Certificate): Civil entities, including commercial interests, may apply for experimental certificates, which may be used for research and development, commercial operations, training, or demonstrations by manufacturers.

While FAA has proceeded in planning for integration, foreign countries are also experiencing an increase in UAS use and planning for integration, and some have begun to allow commercial entities to fly UASs under limited circumstances. Some countries have already established regulations for flying UASs or formal processes for exemptions, while others have taken steps to completely ban all UAS operations. While some countries have worked independently to integrate UAS operations, some international groups, such as the ICAO, are working to harmonize UAS regulations and standards across borders.

FAA Has Made Progress in the First Phase of UAS Integration

Developing Planning Documents

FAA has taken a number of steps to move toward further safe integration of UAS in the national airspace in response to key requirements of the 2012 Act. FAA has developed the following planning documents:

- In November 2013, FAA issued the *UAS Comprehensive Plan*[15] identifying six high-level strategic goals for integrating UAS into the national airspace, including routine public operation and routine civil operations.[16] The *Comprehensive Plan* provides a phased-in approach for achieving these goals, which will initially focus on public UAS operations, but ultimately will provide a framework for civil UAS operations. According to the plan, each partner agency will work to achieve these national goals and may develop agency-specific plans that are aligned to the national goals and objectives. The DOD's *Unmanned Systems Integrated Roadmap* and FAA's *UAS Integration Roadmap*, described below, are examples of such plans.[17]

- In November 2013, FAA also issued the *UAS Integration Roadmap*, which identified a broad three phase approach to UAS integration—accommodation, integration, and evolution—with associated priorities for each phase.[18] These priorities provide insight into FAA's near-, mid-, and far-term goals for UAS integration, as shown in figure 2. FAA intends to use this approach to facilitate further incremental steps toward its goal of seamlessly integrating UAS flight into the national airspace. Under this approach, FAA's initial focus during the accommodation phase will be on safely allowing for the expanded operation of UASs by selectively accommodating some use and demonstrating progress by increasing operations throughout the phase. In the integration phase, FAA plans to develop new operational rules, standards, and guidance, shifting its emphasis

[15]Joint Planning and Development Office, *Unmanned Aircraft Systems (UAS) Comprehensive Plan: A Report on the Nation's UAS Path Forward* (Washington, D.C.: Sept., 2013).

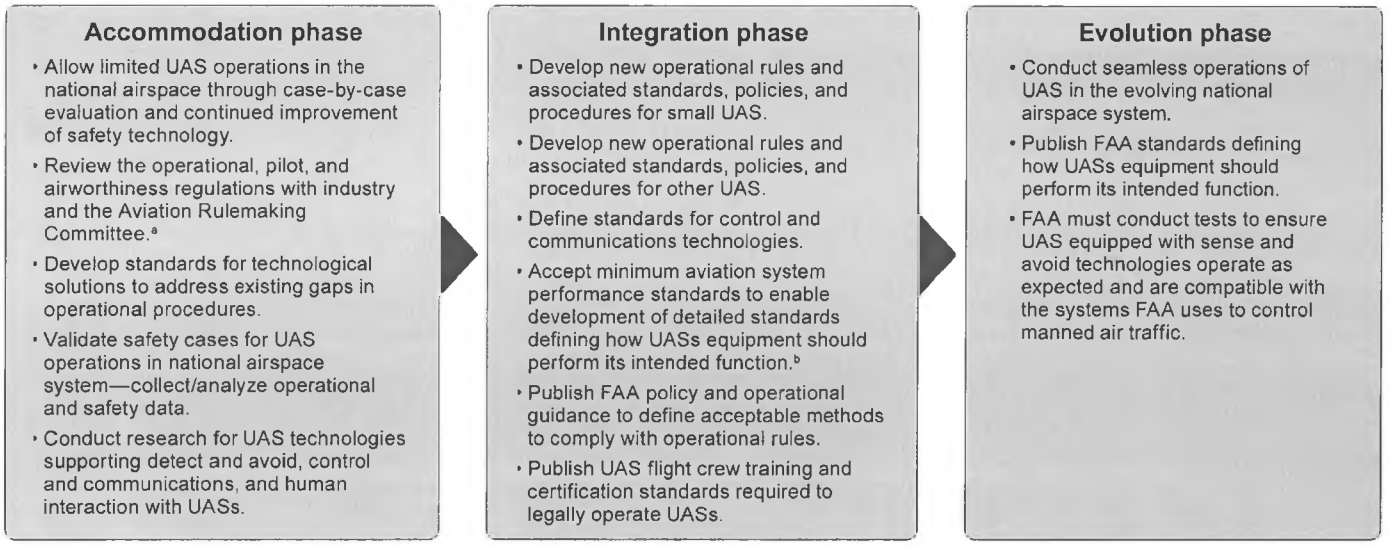
[16]The six goals address small UAS (under 55 pounds) operating within visual line-of-sight, larger UASs and operations beyond visual line-of-sight, planning and managing growing automation capabilities through research, and the opportunity for the U.S. to remain world leaders in UAS technology.

[17]DOD, *Unmanned Systems Integrated Roadmap FY2013-2038* (Washington, D.C.: 2013).

[18]FAA, *Integration of Civil Unmanned Aircraft Systems (UAS) in the National Airspace System (NAS) Roadmap: First Edition—2013* (Washington, D.C.: Nov. 2013).

toward moving beyond case-by-case approval for UAS use, once technology can support safe operations. Finally, in the evolution phase, FAA plans to focus on revising its regulations, policy, and standards based on the changing needs of the airspace. This phased approach has been supported by stakeholders across both academia and industry. The 2012 Act requires the Roadmap to be updated annually, but as of May 2015 FAA has only issued one version of the Roadmap. FAA intends to update the *Roadmap* by September 2015 and send it to the Office of Management and Budget for additional review before it is publicly released.

Figure 2: Priorities for Federal Aviation Administration's (FAA) Three Phases of Unmanned Aircraft Systems (UAS) Integration as Described in the *UAS Integration Roadmap*



Source: Federal Aviation Administration (FAA) UAS Roadmap. | GAO-15-610

[a]FAA's aviation policies and regulations focus on overall safety being addressed through three primary areas: equipment (airworthiness), personnel (pilot), and operations. Each of these areas has standards and minimum levels of safety that must be met independent of each other. Since these policies and regulations were not designed with UAS in mind, they must be reviewed and revised to safely accommodate UAS in the national airspace.

[b]Minimum aviation-system performance standards specify characteristics that are useful to designers, installers, manufacturers, service providers, and users of systems intended for operational use within a defined airspace.

While these planning documents provide a broad framework for integration, FAA is still in process of developing an implementation plan for integrating UASs. FAA's Comprehensive Plan and Roadmap provide broad plans for integration, but are not detailed implementation plans that predict with any certainty when full integration will occur and what

resources will be needed. The Department of Transportation's Inspector General issued a report in June 2014 that recommended FAA develop an implementation plan.[19]

Two reports—one from the UAS Aviation Rulemaking Committee and a second internal FAA report—have discussed the importance of an implementation plan and information to include as part of such a plan. The UAS Aviation Rulemaking Committee has emphasized that FAA needs an implementation plan that would identify the means, necessary resources, and schedule to safely and expeditiously integrate civil UAS into the national airspace. The proposed implementation plan contains several hundred tasks and other activities needed to complete the UAS integration process, including:

- identifying gaps in current UAS technologies, regulations, standards, policies, or procedures;
- developing new technologies, regulations, standards, policies, and procedures that would support safe UAS operations; and
- identifying necessary activities to advance routine UAS operations in the national airspace, including the development of guidance materials, training, and procedures for certification of aircraft.

An internal FAA report from August 2014 prepared by MITRE Corporation (MITRE) was intended to assist FAA's development of the key components of an implementation plan.[20] This report suggested that among other actions FAA's implementation plan should:

- identify the tasks necessary, responsibilities, resources, and expected time frames for incremental expansion of UAS operations;
- clarify the priorities for aligning internal resources in support of near-term and long-term integration efforts and provide consistent

[19]Department of Transportation Office of Inspector General, *FAA Faces Significant Barriers to Safely Integrate Unmanned Aircraft Systems into the National Airspace System*, Report Number AV-2014-061 (Washington, D.C.: June 2014).

[20]Deborah Kirkman, *Inputs and Recommendations for the Federal Aviation Administration UAS Integration Strategy: 2014–2019*, MITRE Corporation (August: 2014).

communication with external stakeholders on the expected progress, cost, and extent of UAS integration during these time periods;

- align resources supporting UAS integration including allocation of FAA personnel and funds used for contracts and to acquire systems and services in support of integration; and
- establish the operational, performance, and safety data needed and also the associated infrastructure for collecting, storing, disseminating, and analyzing data, actions that could be a component of an implementation plan.

According to FAA, it continues to work with MITRE developing the foundation for a detailed implementation plan. FAA expects MITRE to complete this by September 2015 and FAA to enact the plan by December 2015.[21] According to FAA, the agency used the Aviation Rulemaking Committee's report when writing the *Roadmap* and is applying the report prepared by MITRE to help develop the detailed implementation plan.

Issuing a Final Rule for Small UAS Operations

In February 2015, FAA made progress toward the 2012 Act's requirement to issue a final rule for the operations of small UASs—those weighing less than 55 pounds—by issuing a Notice of Proposed Rulemaking (NPRM) that could, once finalized, allow greater access to the national airspace.[22] To mitigate risk, the proposed rule would limit small UASs to daylight-only operations, confined areas of operation, and visual-line-of-sight operations. This proposed rule also addressed other issues pertinent to UAS operations including aircraft registration, operations in the national airspace, and operator certification. See table 3 for a summary of the rule's major provisions. FAA's release of this proposed rule for small UAS operations started the process of addressing remaining requirements of the 2012 Act.

[21]FAA told us they do intend to publicly issue the implementation plan.

[22]80 Fed. Reg. 9544 (Feb. 23, 2015).

Table 3: Selected Provisions of Proposed Rule for Small Unmanned Aircraft Systems (UAS) Operations, by Major Category

Category	Summary of proposed requirements
Operational limitations	• Must weigh less than 55 lbs. (25 kg). • Must operate within visual line of sight only. • May not operate above any persons not directly involved in the operation. • Must only operate during the day, no nighttime operations. • Maximum airspeed of 100 mph. • Maximum altitude of 500 feet above ground level. • Must not operate carelessly or recklessly. • Establishment of a micro-UAS category (4.4 lbs. or less). • Must yield right-of-way to other aircraft, manned or unmanned.
Operator certification and responsibilities	• Must pass a knowledge test initially and every 24 months. • Must be vetted by the Transportation Security Administration. • Must obtain an unmanned-aircraft operator's certificate with a small UAS rating.
Aircraft requirements	• Federal Aviation Administration (FAA) airworthiness certification not required, but operator must inspect the UAS to ensure that it is in a condition for safe operation. • Aircraft markings required; if aircraft is too small to display markings in standard size, then the aircraft simply needs to display markings in the largest practicable manner.
Model aircraft	• Would not apply to model aircraft that satisfy all of the criteria specified in section 336 of Public Law 112-95. • Would incorporate a 2012 Act provision that preserves the FAA's enforcement authority to pursue enforcement against model aircraft operators who endanger the safety of the national airspace system.

Source: Notice of Proposed Rulemaking for small UAS. | GAO-15-610

FAA's proposed rule also sought comments on a potential micro-UAS classification (4.4 pounds or less) that would apply to very small UAS being used for authorized purposes. This classification would be based on the UAS Aviation Rulemaking Committee's recommendations, as well as approaches adopted in other countries, that a separate set of regulations for micro-UASs be created. FAA is considering provisions for micro-UASs classification such as limiting operation airspeed to 30 knots, limiting flight to within visual line of sight, and having aircraft made out of materials that break on impact.

The proposed rule would not apply to model aircraft—unmanned aircraft that are flown for hobby or recreational purposes, capable of sustained flight in the atmosphere, and flown within visual line of site of the person

who is operating the aircraft—as specified in the 2012 Act.[23] Whether or not a UAS is considered a model aircraft or a small UAS depends upon its operation. For example, if the operator is flying an unmanned aircraft for recreational purposes the unmanned aircraft is considered a model aircraft. If the exact same type of unmanned aircraft is being operated for an authorized purpose such as a search and rescue mission, it is considered a small UAS.[24] The 2012 Act specifically prohibits FAA from promulgating rules regarding model aircraft that meet specific criteria, including model aircraft flown strictly for hobby or recreational use and operated in a manner that does not interfere with and gives way to any manned aircraft.[25] However, the proposed rule would incorporate the 2012 Act provisions that preserve FAA's authority to pursue enforcement against persons operating model aircraft who endanger the safety of the national airspace system.[26]

According to FAA, it may take 16 months to process the comments it receives on the NPRM and develop and issue the final rule for small UAS operations. If FAA takes 16 months, the final rule would be issued in late 2016 or early 2017, about two years beyond the requirement in the 2012

[23]See Pub. L. No. 112-95, §336(c), 126 Stat. 11, 77.

[24]FAA's *Advisory Circular 91-57* sets out model aircraft operating standards that encourage voluntary compliance with specified safety standards for model aircraft operators. In June 2014, FAA also clarified this guidance in its Notice of Interpretation of the 2012 Act's Special Rule for Model Aircraft. 79 Fed. Reg. 36172 (June 25, 2014). The Academy of Model Aeronautics has also published voluntary guidance documents for its members.

[25]More specifically, section 336(a) of the 2012 Act prohibits the FAA from promulgating rules regarding model aircraft that meet all of the following statutory criteria: The aircraft is flown strictly for hobby or recreational use; The aircraft is operated in accordance with a community-based set of safety guidelines and within the programming of a nationwide community-based organization; The aircraft is limited to not more than 55 pounds unless otherwise certified through a design, construction, inspection, flight test, and operational safety program administered by a community-based organization; The aircraft is operated in a manner that does not interfere with and gives way to any manned aircraft; and when flown within 5 miles of an airport, the operator of the aircraft provides the airport operator and the airport air traffic control tower (when an air traffic facility is located at the airport) with prior notice of the operation.

[26]Section 336(b) of the 2012 Act provides that "[n]othing in this section shall be construed to limit the authority of the Administrator to pursue enforcement action against persons operating model aircraft who endanger the safety of the national airspace system. The proposed rule provides that it is FAA's existing authority, under 49 U.S.C. §§ 40103(b) and 44701(a)(5) that provide the FAA with the power to pursue enforcement "against persons operating model aircraft who endanger the safety of the national airspace system."

Act. However, during the course of our work, FAA told us that the time needed to respond to a large number of comments could further extend the time to issue a final rule. When the comment period closed on April 24, 2015 FAA had received over 4,500 comments. FAA officials told us that it has taken a number of steps to develop a framework to efficiently process the comments it expects to receive. Specifically, they said that FAA has a team of employees assigned to lead the effort with contractor support to track and categorize the comments as soon as they are received.

Creating Test Sites

FAA has also met the requirement from the 2012 Act to create UAS test sites for research and development. Specifically, in December 2013 FAA selected six UAS test site locations, which all became operational between April 2014 and August 2014. According to FAA, these sites were chosen based on a number of factors including geography, climate, airspace use, and a proposed research portfolio that was part of the application. Under FAA policy, all UAS operations at a test site must be authorized by FAA through either the use of a COA or an experimental certificate. In addition, FAA does not provide funding to support the test sites. Thus, these sites rely upon revenue generated from entities, such as those in the UAS industry that are using the sites for UAS flights. The 2012 Act authorized the test sites to operate until February 14, 2017. FAA stated it is too early to assess the test sites' results and effectiveness and thus whether the test sites should be extended. According to FAA officials, FAA does not object to extending the test sites but may need additional resources if that happens.

Accommodating Limited UAS Operations

Although it still relies on case-by-case approvals, FAA has increased UAS operations during the accommodation phase of UAS integration. As we have previously noted, UAS operators can only gain access to the national airspace by obtaining a COA, an experimental certificate, or a section 333 exemption. From 2010 to 2014, the total number of COAs approved for public operations has increased each year, with FAA issuing 403 COAs thus far this year, as shown in table 4. Similarly, from 2011 to 2014, the total number of experimental certificates has increased each year, with FAA issuing 6 thus far this year.

Table 4: Total Number of Federal Aviation Administration-Issued Public Certificates of Waiver or Authorization (COA) and Special Airworthiness Certificates for Experimental Aircraft for Unmanned Aerial Systems

	2010	2011	2012	2013	2014	2015
Public COA	286	309	383	407	609	403[a]
Experimental certificate	15	14	18	26	39	6[b]

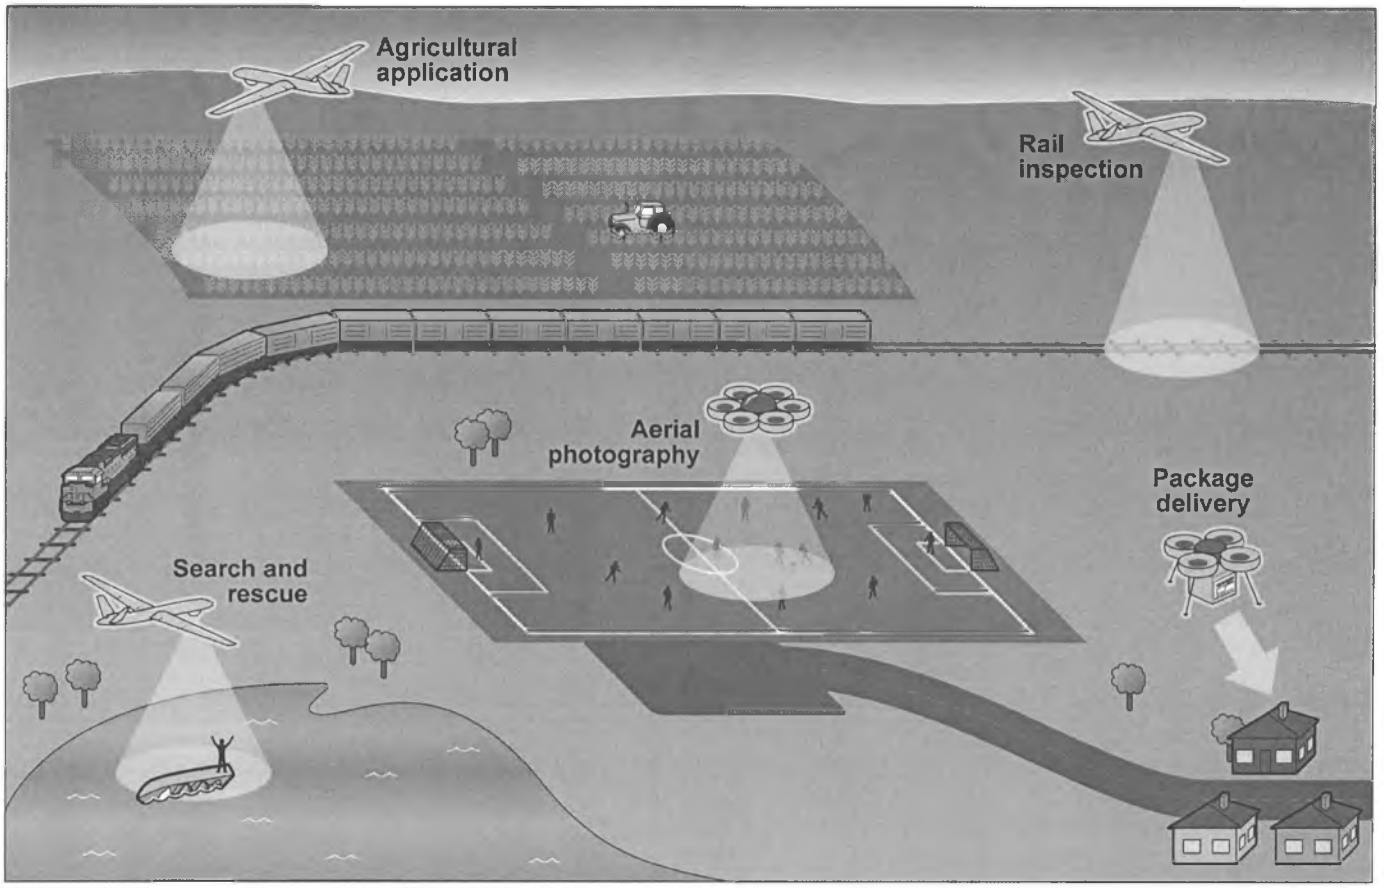
Source: FAA | GAO-15-610

[a]As of April 30, 2015.

[b]As of May 1, 2015.

In September 2014, FAA granted the first section 333 exemptions; at that time 6 total exemptions were granted for commercial UAS operations to movie and TV production companies. As of June 9, 2015, FAA had granted 548 section 333 exemptions to companies for a variety of additional commercial operations supporting the real estate, utility, and agriculture industries, among others. See figure 3 for examples of commercial uses, including some approved under section 333 exemptions.

Figure 3: Examples of Potential Commercial Unmanned Aerial Systems Operations



Source: GAO. | GAO-15-610

FAA has taken steps to make access easier for those operating UASs under a section 333 exemption. On March 23, 2015, FAA established an interim policy to speed up authorizations for certain commercial unmanned aircraft operators that request Section 333 exemptions. According to FAA, the new policy helps bridge the gap between the past "case-by-case" approval process, which evaluated every commercial UAS operation individually, and future operations after they publish a final version of the proposed small UAS rule. Under the new policy, the FAA will grant a COA for flights at or below 200 feet to any commercial UAS operator with a Section 333 exemption for aircraft that weigh less than 55 pounds, operate during the daytime, operate within visual line of sight of the pilots, and stay certain distances away from airports or heliports. According to FAA, the "blanket" 200-foot COA allows flights anywhere in

the country except restricted airspace and other areas, such as major cities, where the FAA prohibits commercial UAS operations.[27] The agency expects the new policy will allow companies and individuals who want to use UAS within these limitations to start flying much more quickly than before. A company wanting to operate above 200 feet, or outside the other rules set up by FAA, must obtain a separate COA.

FAA took additional steps in May 2015 to work with industry to safely expand UAS operations. FAA announced its Pathfinder Program that will partner FAA with companies to perform research in support of UAS integration. These companies will focus on using UAS for specific applications, such as news gathering and surveying crops. In addition, two will focus on applications for beyond the visual line of sight of the operator. One industry stakeholder stated the next step would be to develop additional mechanisms to allow UAS operations beyond the visual line of sight of the operator once technology supports greater use.

Potential Commercial Agriculture Use

The University of California-Davis has been conducting a demonstration project using a Yamaha RMAX helicopter to spray pesticides at its vineyard. The purpose of the project is to test the efficiency and safety of aerial spraying of grape crops. According to an official from Yamaha Motor Corporation, USA, initial tests have shown the RMAX can cover up to 12 times as much area in an hour compared with traditional spraying methods.

Source: Yamaha Motor Corporation, USA | GAO-15-610

While accommodating UAS access, FAA and industry have taken steps to educate UAS operators on how to safely operate. UAS industry stakeholders and FAA have begun an educational campaign that provides prospective users with information and guidance on flying safely and responsibly. Specifically, they launched an informational website for UAS operators to ease public concerns about privacy and support safer UAS operations in the national airspace.[28] In addition, in May 2015, FAA announced plans to develop the "B4UFLY" smartphone application designed to help UAS users, both model aircraft and recreational UAS operators, know where it is safe and legal to fly. The application is designed to let an operator know if it is safe and legal to fly in a specific location.

[27]Previously, an operator had to apply for and receive a COA for a particular block of airspace, a process that can take 60 days.

[28]Know Before You Fly (www.knowbeforeyoufly.org) was founded by three organizations with a stake in UAS safety: the Association for Unmanned Vehicle Systems International, the Academy of Model Aeronautics, and the Small UAV Coalition. The FAA is partnering with the founding members to spread the word about safe and responsible flying. FAA also stated that three manufacturers agreed to voluntarily include Know Before You Fly information for model aircraft operators in their packaging.

Collaborating with UAS Stakeholders

FAA has worked with federal and industry stakeholders to coordinate federal activities in support of conducting research and development and creating UAS standards to facilitate UAS integration. As with other large government-wide initiatives, achieving results for the nation increasingly requires that federal agencies and others work together. FAA has worked with the UAS Executive Committee to facilitate federal UAS activities and RTCA Special Committee 228, ASTM International Committee F38, and the UAS Aviation Rulemaking Committee to develop safety, reliability, and performance standards for UAS.

Each collaborative group has defined different long-term goals in support of UAS integration and has made progress toward the achieving these goals.

- The Executive Committee's long-term goals involve working to solve the broad range of technical, procedural, and policy issues affecting UAS integration into the national airspace. In support of this objective, the Executive Committee agencies, other public agencies, and industry have also developed processes and procedures to safely demonstrate small UAS operations in remote areas of the Arctic, including beyond-line-of-site operations. The UAS demonstration occurred in domestic and international airspace on and off the coast of Alaska.

- RTCA Special Committee 228 has set out its own goals across two phases. Currently working toward completion of the first phase, RTCA is developing minimum operational performance standards for detect and avoid and command and control technologies for UASs. RTCA has made progress toward this goal with help from the Executive Committee. Specifically, the Executive Committee's Science and Research Panel developed a definition of "well clear" to help inform RTCA Special Committee 228's work.[29]

- The UAS Aviation Rulemaking Committee has a goal to develop a report for FAA on its efforts to provide direction for UAS operational criteria, among other tasks, by April 18, 2016.

[29]The Federal Aviation Regulations generally require that pilots remain "well clear" of other aircraft when flying in the national airspace system. 14 C.F.R. §§ 91.115, 91.181. RTCA will use a definition of well clear provided by the UAS Executive Committee's Science and Research Panel as a baseline for detect and avoid standards.

- ASTM International F38's long-term goal involves developing and publishing voluntary consensus standards for small and large UASs as FAA requests them. ASTM International Committee F38 has developed standards and recommendations to support FAA's small UAS rulemaking that cover elements such as systems design, construction, and testing.

FAA has applied other interagency collaborative methods in support of UAS integration including memorandums of understanding or agreement (MOU)[30] and conferences. FAA entered into MOUs with DOD and NASA to expedite the COA process and ensure the availability of DOD's data.[31] According to FAA officials, the MOUs eased collaboration with DOD and NASA because the MOUs established roles and responsibilities for each agency as well as procedures for DOD to obtain COAs. In addition, FAA convenes meetings with test site officials and attends conferences where UAS issues are discussed. For example, FAA regularly holds conference calls and convenes technical interchange meetings with test site officials to address test site issues. According to FAA, the technical interchange meetings are opportunities for FAA to provide updates to the test sites and discuss common areas of research interest. The manager of the FAA's UAS Integration Office has presented information about its UAS efforts during industry conferences, such as the Association for Unmanned Vehicle Systems International's annual meeting. These conferences allow FAA to provide guidance and updates directly to the industry and public.

[30]A memorandum of understanding is a written agreement between more than one federal agency or department that defines the roles, responsibilities, and how each party will act for specific aspects of the relationship between the two participants.

[31]FAA also has UAS related memorandums of agreement or understanding with the U.S. Department of Justice, the U.S. Department of the Interior, the National Oceanic and Atmospheric Administration within the U.S. Department of Commerce, and the Academy of Model Aeronautics.

FAA's Designated Test Sites Have Conducted UAS Test Flights and Addressed Challenges

FAA's Designated Test Sites Are Operating and Conducting UAS Operations

Since being named in December 2013, the six designated test sites have become operational, applying for and receiving authorization from FAA to conduct test flights. Specifically, from April through August 2014, each of the six test sites became operational and signed an Other Transaction Agreement with FAA, establishing their research and development relationship. All flights at a test site must be authorized under the authority of a COA or an experimental certificate approved by FAA.[32] Since becoming operational, five of the six test sites received 48 COAs and one experimental certificate in support of UAS operations resulting in over 195 UAS flights across the five test sites. These flights provide the operations and safety data to FAA as required by the COA. While there are only a few contracts with industry thus far, according to test site operators, these will be important if the test sites are to generate sufficient revenue to remain in operation. Table 5 provides an overview of test-site activity since the sites became operational.

[32]All test sites are operated by public entities (academic institutions or federal, state, or local governments) and thus all aircraft must be public aircraft—unless they are operating under a special certificate.

Table 5: Overview of Activity at Five of Six Designated Unmanned Aerial Systems (UAS) Test Sites, as of March 2015

Type of test site activity	Overview since becoming operational in 2014
Total unmanned aerial systems (UAS) flights at FAA designated test sites	• Over 195 total UAS flights. • One test site has had over 80 UAS flights.
Number and types of certificates of waiver or authorizations (COA) received	• Five test sites hold 48 COAs. • One test site held 4 broad area COAs allowing flights over nearly the entire state by specific aircraft. • Four other test sites were seeking COAs for large flight ranges that could apply to any aircraft.
Number of special airworthiness certificates for experimental aircraft	• A certified representative reviewed and approved an aircraft to operate under an experimental certification at one test site. • Three test sites have representatives affiliated with the test site to review and approve aircraft for experimental certification.
Signed contracts with UAS companies	• Five test sites have 22 contracts with industry groups and companies to conduct UAS operations at their respective test site thus generating revenue for the test sites. • All test sites have additional negotiations with companies under way.

Source: FAA designated test sites. | GAO- 15-610

Note: Of FAA's six designated test sites, one— Texas A&M University-Corpus Christi test site—did not respond to our request for this information.

According to all test sites, FAA approval for access to the airspace can be a lengthy process taking 90 days or even longer. FAA and the test sites have found ways to allow quicker access to the test site airspace and relieve some administrative burden from FAA.

- In February 2015, FAA awarded the Northern Plains Test Site in North Dakota four broad area COAs that were aircraft specific. According to a test site official, these COAs allowed designated aircraft to fly over nearly the entire state of North Dakota and will make it easier to accommodate industry for research. Furthermore, these COAs were a positive step in allowing quicker access to the airspace at test sites. Reducing FAA's role in the process creates more certainty regarding how long it will take an operator to access airspace at the test sites. Specifically, the test site representative indicated FAA's role was reduced because there was a process that allowed aircraft to be added to these existing COAs that was simpler than applying for individual COAs.

- In May 2015, FAA approved a "blanket" COA allowing the test sites to conduct UAS operations at or below 200 feet anywhere in the national airspace, similar to the authority provided to Section 333 exemptions. In particular, these COAs will be for small UAS operations, during the

day, within line of sight of the operator, and the operations cannot occur in restricted airspace and areas close to airports. According to FAA, this will help improve UAS access allowing more operations in support of research that can further the UAS integration process. Previously, all UASs needed their own COA when operating at a test site but this action by FAA will allow any small UASs to operate at the test sites within the COA's requirements.

- The use of designated airworthiness representatives by the test sites to review and approve experimental certificates may be quicker for industry and relieve some of FAA's workload.[33] Industry benefits from not having to lease its aircraft to the test site, as all test sites are operated by public entities (academic institutions or federal, state, or local governments) and thus all aircraft must be public aircraft, unless they are operating under a special certificate.[34] In addition, any industry group working with the test site would not have to go through FAA to receive the experimental certificate. The Nevada test site has affiliated itself with a designated airworthiness representative, who has approved an aircraft to operate under an experimental certificate for the Nevada test site. According to FAA, the use of a designated airworthiness representative allows it to better leverage its resources.

FAA officials and some test site officials told us that progress has been made in part because of FAA's and test sites' efforts to work together. Test site officials meet every 2 weeks with FAA officials to discuss current issues, challenges, and progress. According to meeting minutes, these meetings have been used to discuss many issues from training for designated airworthiness representatives to processing of COAs. In addition, the six test sites have developed operational and safety processes that have been reviewed by FAA. Thus, while FAA has no funding directed to the test sites to specifically support research and development activities, FAA dedicates time and resources to supporting the test sites, and FAA staff we spoke to believe test sites are a benefit to the integration process and worth this investment.

[33]Designated airworthiness representatives are individuals acting as a representative of FAA trained to examine, inspect, test and issue aircraft certificates.

[34]For a private company to operate under a public COA at a test site, it must lease the aircraft to the public entity. A concern of some private companies has been the protection of proprietary or sensitive data when they lease the aircraft to the public operator of the test site. The experimental certificate eliminates this concern of protecting proprietary technology.

Test Sites Faced Challenges during Their First Year

Despite the progress made since they began operating, according to test site operators, they faced a number of challenges in the first year of operations:

- Guidance on research: According to FAA, because the test sites receive no federal funding, FAA can neither direct specific research to be conducted nor direct the test sites to share specific research data, other than the operations and safety data required by the COA. The Other Transaction Agreement for each test site defines the purpose of the test sites as a place to conduct research and testing under FAA safety oversight to support UAS integration into the national airspace. The Other Transaction Agreement indicates the test sites will provide FAA with UAS research and operational data to support the development of procedures, standards, and regulations. However, FAA officials told us that the Antideficiency Act may prevent the agency from directing specific test site activities without providing compensation.[35] In October 2014, FAA provided a list of potential research areas to the test sites to guide the research that each test site may conduct. According to FAA, this document was not to be construed as a directive but more as guidance for possible research areas. However, three test sites told us this document was too broad to be considered guidance for the research test sites should conduct.

- Incentives for industry to use test sites: Five test sites told us that the UAS industry gains little advantage to using the test sites for research because they must follow similar processes to access the airspace anywhere. As previously indicated, all flights at a test site must be authorized under the authority of a COA or an experimental certificate, two means the industry can use to access the airspace anywhere, not just at the test sites. All six test sites are seeking to make it easier for companies to access the airspace at a test site rather than working external of the test sites. For example, all test sites told us a COA applicable to any aircraft and covering large flight areas would be beneficial. This would be similar to the two COAs previously discussed, the COA received by the Northern Plains test site and the "blanket" 200-foot COA recently authorized by FAA. However, representatives from two test sites indicated that the "blanket" 200-foot COA meets some of their needs as it is applicable only to public

[35]The Antideficiency Act prohibits federal officers and employees from, among other things, accepting voluntary services except for emergencies involving the safety of human life or the protection of property. 31 U.S.C. § 1342.

aircraft, meaning that civil operators still have to lease the aircraft to the test site for operations. But, as one test site representative stated a broad area COA, allowing civil operations at the test site would be even more beneficial. Another test site representative indicated that they will continue to work with FAA to make access easier allowing flights at higher altitude with different aircraft.

- Maintaining operations: While all the test sites had some level of initial funding, from either private industry or state legislatures, to become operational, they must attract UAS industry to the test sites to generate enough revenue to maintain operations. However, test site operators reported that test sites have additional requirements as opposed to operating outside the test sites, including leasing the aircraft to the test site to operate under the public COA. While test sites have signed 22 contracts, there is a chance that some test sites will not survive due to the financial burden. Some companies have made a decision to go to other countries to conduct UAS testing because they believe it takes less time to be approved for test flights. For example, Amazon has reported it has testing under way in multiple countries outside the United States, including a site in Canada. In an effort to attract some industry operators, the Pan Pacific Test Site has a location in Iceland where, according to the Director, review and approval for test flights can happen much faster, in as few as 10 days, relative to over 90 days a COA may take in this country. In addition, the UAS industry is conducting tests in this country outside the test sites. For example, CNN worked with Georgia Institute of Technology.

Companies Conducting Beyond-Visual-Line-of-Sight Testing Overseas

Insitu, Inc., a Boeing subsidiary, conducted beyond-visual-line-of-sight testing in Denmark in May, 2015 with a ScanEagle UAS. The flights took place in cooperation with the Danish Transport Authority as part of an agreement signed by Boeing and the airport to develop a UAS Test Center in Denmark, which is used for training, testing, and development. The activity included members of the public and private sector, including the UAS Denmark Consortium, a group of companies, government organizations, and other entities supporting UAS industry development. The testing demonstrated capabilities for a variety of industries, including agriculture and aerial surveying, emergency and natural-disaster response, and defense and Arctic surveillance.

FAA Supports Additional Research and Development Efforts

FAA has used cooperative research and development agreements, federally funded research and development centers, and grants to conduct other UAS research and development. These agreements for research are similar to the Other Transaction Agreement that directs the purpose and goals of the relationship between FAA and the research entities. However, unlike the Other Transaction Agreement in place for the test sites, according to FAA, many of these agreements have language specifically addressing the sharing of research and data. The following are examples of other resources FAA has devoted to UAS integration research and development:

- Cooperative research and development agreement: New Mexico State University has had a flight test center operating for several years under a cooperative research and development agreement with FAA. The center serves a similar purpose to the designated test sites but has been operating since 2007. The flight test center has conducted research in many areas including nighttime flying and more recently research into long-endurance UAS flights operating between 10,000 and 17,000 feet. According to an official, the New Mexico State University's flight test center has challenges with getting access to the airspace for customers because the process to receive a COA can be lengthy. In addition, this official told us the flight test center would like authority to approve COAs to operate at the test center because the FAA is backlogged and therefore approvals are delayed. Finally, according to the flight test center operators, FAA can get data from the research being conducted at the test site but does not direct them what to provide. While the flight test center has operated under a Cooperative Research and Development Agreement since 2007, in May 2015 the Flight Test Center switched to an Other Transaction Agreement to continue UAS testing.

- Federally funded research and development center: MITRE manages federal funded research and development centers for multiple federal agencies including FAA and DOD. MITRE has ongoing work supporting FAA's UAS integration effort by supporting UAS standards and rulemaking and supporting research planning and progress, among other efforts. MITRE brings together the federal agencies—FAA, NASA, DOD, DHS, and others—to advance UAS integration. In its role, according to MITRE officials, one of the biggest challenges is how to integrate all the UAS-related work across the federal government, academia, and private sector.

- Grants: In August 2014, FAA awarded two grants to Georgia Tech Research Corporation and the University of North Dakota to conduct literature reviews of UAS issues. Georgia Tech is collecting information on research being conducted on the effect of UAS collisions on other airborne and ground based objects. The University of North Dakota is looking at the UAS safety criteria and particularly if UASs could be deadly. According to FAA, both studies will support ongoing UAS research and help determine the applicability of past studies.

- Center of Excellence: In May 2015, FAA selected a team led by Mississippi State University as the Center of Excellence for UAS.[36] According to FAA, the goal of the Center of Excellence will be to create a cost-sharing relationship among academia, industry, and government that will focus on the primary research areas needed to support UAS integration. FAA hopes the center could provide both short- and long-term research through testing and analysis. In support of it serving this purpose, the Center of Excellence has an annual $500,000 budget for the next 10 years.

FAA also has additional resources to support the UAS integration, including facilities working on research and development and management of FAA's other research and development efforts for UAS integration. FAA's William J. Hughes Technical Center houses staff in charge of supporting and managing FAA's designated test sites.[37] While the test sites do not have specific funding, FAA has dedicated resources located at Hughes Technical Center to support the set up and ongoing operations of the test sites. For example, COA data are collected and analyzed at the Hughes Technical Center. In addition, FAA has participated in the twice-a-year technical interchange meetings with the test sites. These meetings have brought together the test sites and FAA to address issues in the set-up and operation of the test sites. Furthermore, FAA has staff supporting the test sites through review of test site operation and safety procedures and manuals to support the monthly reporting of the operational and safety data required by each COA.

[36]In addition to Mississippi State University, the other team members include: Drexel University; Embry Riddle Aeronautical University; Kansas State University; Kansas University; Montana State University; New Mexico State University; North Carolina State University; Oregon State University; University of Alabama, Huntsville; University of Alaska, Fairbanks; University of North Dakota; and Wichita State University.

[37]The William J. Hughes Technical Center is located in Atlantic City, New Jersey, and contains laboratories supporting aviation research, development, testing, and evaluation of air traffic control and aircraft safety among other aviation areas. It also serves as the primary facility supporting the Next Generation Air Traffic System.

Other Countries Have Established Regulations, and Some Allow More Commercial Operations Than the United States

Numerous Countries Allow UAS Operations

According to numerous studies and stakeholders we interviewed, many countries around the world, have been allowing commercial UAS operations in their airspace for differing purposes. We also identified a number of countries that allow commercial UAS operations and have done so for years. Specifically, Canada and Australia have regulations pertaining to UAS that have been in place since 1996 and 2002, respectively. According to a recent MITRE study, the types of commercial operations allowed vary by country and include aerial surveying, photography, and other lines of business.[38] For example, Japan has allowed UAS operations in the agriculture industry since the 1980's to help apply fertilizer and pesticide.[39]

In March 2015, the European Aviation Safety Agency (EASA) issued a proposal for UAS regulations that creates three categories of UAS operations—open, specific, and certified.[40] This proposal seeks the safe integration of UAS into national airspace, as well as support for the UAS industry in Europe. Generally, the open category would not require authorization from an aviation authority but would have basic restrictions including altitude and distance from people. The specific category would

[38]MITRE Corporation, *UAS International Harmonization: A Comparative Policy Assessment of Selected Countries*, Outcome 6, Output 4 (fiscal year 2014).

[39]According to the MITRE study, Japan's regulations also allow UAS operations for agricultural purposes with UASs weighing less than 220 pounds.

[40]EASA is the European Union Authority in aviation safety. The main activities of the organization include the strategy and safety management, the certification of aviation products and the oversight of approved organizations and EU Member States.

require a risk assessment of the proposed operation and an approval to operate under restrictions specific to the operation. The final proposed category, certified operations, would be required for those higher-risk operations, specifically when the risk rises to a level comparable to manned operations. This category goes beyond FAA's proposed rules by proposing regulations for large UAS operations and operations beyond the pilot's visual line of sight. As other countries work toward integration, standards organizations from Europe and the United States are coordinating to try and ensure harmonized standards. Specifically, RTCA and the European Organization for Civil Aviation Equipment (EUROCAE) have joint committees focused on harmonization of UAS standards.[41]

UAS Regulations in Australia, Canada, France, and the United Kingdom Are Similar to Each Other and to Proposed Regulations in This Country

We studied the UAS regulations of Australia, Canada, France, and the United Kingdom and found that these countries impose similar types of requirements and restrictions on commercial UAS operations. For example, all these countries except Canada require government-issued certification documents before UASs can operate commercially.[42] In addition, each country requires that UAS operators document how they ensure safety during flights and their UAS regulations go into significant detail on subjects such as remote pilot training and licensing requirements. For example, the United Kingdom has established "national qualified entities" that conduct assessments of operators and make recommendations to the Civil Aviation Authority as to whether to approve that operator. Similar regulations in these countries continue to evolve. In November 2014, Canada issued new rules creating exemptions for commercial use of small UASs weighing 4.4 pounds or less and from 4.4 pounds to 55 pounds. UASs in these categories can commercially operate without a government-issued certification but must still follow operational restrictions, such as a height restriction and a requirement to operate within line of sight. Transport Canada officials told us this arrangement allows them to use scarce resources to regulate situations

[41]RTCA is a private non-profit organization consisting of industry experts. RTCA provides a venue for public-private collaboration supporting consensus building on aviation modernization issues. EUROCAE is a non-profit organization dedicated to aviation standards. The organization is composed of members, who are specialized in technical fields of aeronautics.

[42]UASs lighter than 55 pounds are exempt from Canada's requirement to obtain a Special Flight Operations Certificate. Those heavier than 55 pounds or otherwise not complying with the exemption requirements must obtain a Special Flight Operations Certificate.

Firefighting with UASs In Australia

Firefighters in Western Australia have used small UASs during their firefighting operations. The UASs provide intelligence on hot spots and containment lines at night when manned aircraft are not permitted to fly.

[An unmanned Lockheed Martin/Kaman K-MAX helicopter extinguishes several fires, aided by the small unmanned Indago Quad Rotor, also from Lockheed Martin, during a demonstration.]

[The Lockheed Martin Indago Quad Rotor.]

of relatively high risk. Australia, in similar fashion, is considering relieving UASs lighter than 4.4 pounds from its requirement to obtain a UAS Operator's certificate. France's regulation describes 4 weight-based categories of UAS as well as 4 operational scenarios of increasing complexity. The regulations then discuss which UAS categories can operate in each scenario. FAA, by electing to focus on UASs up to 55 pounds in its Small UAS NPRM, has taken a similar risk-based approach.

The United States has not yet finalized regulations specifically addressing its small UAS operations, but if UASs were to begin flying today in the national airspace system under the provisions of FAA's proposed rules, their operating restrictions would be generally similar to regulations in these other four countries. However, there would be some differences in the details. For example, FAA proposes altitude restrictions of below 500 feet, while Australia, Canada, and the United Kingdom restrict operations to similar but slightly lower altitudes. Other proposed regulations require that FAA certify UAS pilots prior to commencing operations, while Canada and France do not require pilot certification in certain low risk scenarios. While FAA continues to finalize the small UAS rule—a process that could take until late 2016 or early 2017—other countries continue to move ahead with UAS integration. Thus, when the rule is finalized the operating restrictions in this country may be well behind what exists in other countries if the final rule reflects the proposed rule. Table 6 shows how FAA's proposed rules compare with the regulations of Australia, Canada, France, and the United Kingdom.

Table 6: Comparison of Regulatory Requirements for Commercial Unmanned Aerial Systems (UAS) Operations in Select Countries

Regulatory requirements for commercial Unmanned Aerial Systems (UAS)	United States (proposed)	Australia	Canada	France	United Kingdom
Weight classifications (in pounds)	< 55	≤ 0.2 0.2 < ≥ 331 > 331[a]	<4.4 4.4 <> 55 >55	<4.4 4.4 ≤> 55 55 ≤ > 331 ≥ 331	≤15 15 < ≥ 44 44 <> 331 ≥ 331
Government-issued documents for airspace access	Unmanned aircraft operator certificate	UAS operator certificate	None; meet specified conditions for < 55 lbs.[b]	Authorization	Permission from Civil Aviation Authority
Pilot training or certification required	Certification[c]	Certification	Training	Operator certifies pilot qualification[d]	Certification[e]
Pilot proficiency check	Biennially	Annually	Upon application	None[f]	Noneg
Airworthiness certification required	No	No, for < 331 lbs.	No, for < 55 lbs.	No < 55 lbs.	Depends upon the weight of the UAS [h]
Beyond line of sight operations allowed by regulation	No	Not specifically addressed in regulation[i]	No	No[j]	No[k]
Restrictions from congested or built-up area	May operate over congested area but not over any persons not involved with the operations.	Unless specifically authorized must fly at sufficient height where, if any of its components fail, it would be able to clear the area.	5.75 miles	Do not allow flying over these areas without special permission	Limited, based on case-by-case review
Altitude restrictions	500 ft.	Unless specifically authorized, 400 ft.	300 ft. if < 55 lbs.	492 ft.	400 ft.

Source: GAO analysis of UAS regulations in foreign countries. | GAO-15-610

Note: In certain instances, UASs may operate outside the requirements shown in this table with prior approval from the cognizant authority, e.g., the civil aviation authority or air traffic control. This table shows regulatory requirements for the UAS category used most frequently in each country.

[a]Regulations for large fixed-wing UASs (exceeding 331 pounds) apply to helicopters or rotary wing UASs heavier than 221 pounds.

[b]Operators must have certain documents available, including the exemption regulation and proof of liability insurance.

[c]Pilot must pass a test at an FAA-approved testing center.

[d]Owner of the UAS must self-certify that the UAS pilots have the required training.

[e]Pilot qualifications are determined on a case-by-case basis based a number of factors including pilot experience and aircraft weight. Permission is not required for aircraft 44 pounds or less being flown within direct unaided line of sight and away from people, property, and congested areas.

[f]Owner of the UAS must self-certify that the UAS pilots have the required training if the pilot has not flown the UAS in the preceding 12 months.

[g]Self-certification accepted using logbook entries unless the pilot changes aircraft type, or the pilot has less than 2-hours experience logged in preceding 3 months on same aircraft type.

[h]An airworthiness certification is not required for UAS weighing less than 44 pounds but is required for UAS weighing more than 44 pounds Exemptions may be available in specified circumstances.

[i]An Advisory Circular issued by Australia's Civil Aviation Safety Authority (AC 101-1(0)) provides for beyond line of sight operations under certain circumstances.

[j]UAS operations beyond line of sight are very limited and allowed only on a case-by-case basis, according to a French civil aviation official.

[k]Beyond line of sight operations are allowed with aircraft fitted with a detect-and-avoid system or, operated within a segregated airspace. The Civil Aviation Authority has noted that it is not aware of any detect-and-avoid system with adequate performance and reliability, but has several areas of segregated airspace.

While regulations in these countries generally require that UAS operations remain within the pilot's visual line of sight, some countries are moving toward allowing limited operations beyond the pilot's visual line of sight. For example, according to Australian civil aviation officials, they are developing a new UAS regulation that would allow operators to request a certificate allowing beyond-line-of-sight operations. However, use would be very limited and allowed only on a case-by-case basis. Similarly, according to a French civil aviation official, France approves on a case-by-case basis, very limited beyond-line-of-sight operations. Finally, in the United States, there have been beyond-line-of-sight operations in the Arctic, and NASA, FAA and the UAS industry have successfully demonstrated detect-and-avoid technology, which is necessary for beyond line-of-sight operations.

Like the United States, Australia, Canada, France, and the United Kingdom distinguish between recreational model aircraft and commercial UASs and have issued guidelines for safe operation.[43] For example, the United Kingdom defines model aircraft as any small unmanned aircraft, weighing less than 44 pounds, or large unmanned aircraft weighing more than 44 pounds, that is used for sporting and recreational purposes. Australia makes no practicable distinction between a small UAV and a model aircraft except that of use—model aircraft are flown only for the

[43]As discussed earlier, for the United States, the model aircraft definition is in the 2012 Act. Rules for flying model aircraft are advisory, and compliance is voluntary. However, FAA has enforcement authority over persons operating model aircraft who endanger the safety of the national airspace system.

sport of flying them. However, Australia also defines a giant model aircraft as one weighing between 55 pounds and 331 pounds.

Approvals for commercial UAS operations have increased in these four countries and some allow more commercial operations. Since 2011 the number of approvals for commercial operations in France has increased every year. According to a Civil Aviation Authority official, in 2014, there were about 3,600 commercial UAS operators. In Canada, according to a Transport Canada official, there were over 1,600 approvals for commercial and research related UAS operations in 2014. As previously mentioned, certain commercial operations in Canada do not need approval as of November 2014 and there may be even more UAS operations. The United Kingdom's Civil Aviation Authority attributes the growth to UASs in their country to the UASs' becoming less expensive and simpler to operate. In the United Kingdom, as of February 2015, there were 483 commercial UAS operators, and this number has increased every year since 2010. Similar to the United Kingdom, Australia has seen an increase in commercial UAS operators since 2010 with currently over 200 approved commercial operators. Australia's Parliament attributes the growth to improvements in UASs' piloting and control technologies, as well as reductions in UAS prices. With FAA's approvals for commercial exemptions exceeding 500 as of June 9, 2015, the United States has closed the gap with some other countries' level of commercial use.

Other Countries Face Common Challenges to UAS Integration

Other countries face challenges that are common across some countries, including the United States, trying to integrate UAS operations. Specifically, some of the challenges are:

- Technology shortfalls and unresolved spectrum issues. Technology needs and concerns about available spectrum constrain full integration of UASs into airspace with manned aircraft in the United States and in countries around the world. UASs' current inability to detect and avoid other aircraft, the lack of a standard for command and control systems, and no dedicated and secure frequency spectrum are technical challenges preventing full UAS integration into the national airspace. However, organizations around the world are looking to address these technology issues and develop standards to support safe UAS operations. At the worldwide level, the International Civil Aviation Organization is addressing how UAS integration would affect its existing standards. At the European level, the European UAS Roadmap contains a strategic research and development plan that

describes anticipated deliverables along with key milestones, timelines, and resources needed. Separate from the international organizations, researchers in individual countries are also addressing these challenges. For example, in February 2014, Australian researchers achieved what was then believed to be a world-first breakthrough for small UASs by developing an onboard system that has enabled a UAS to detect another aircraft using vision while in flight.

- Safe operations by recreational users. Countries around the world also face challenges in ensuring that UAS purchasers operate them safely. As UASs become more affordable, and increasingly available some individuals are conducting unsafe or illegal UAS operations. In July 2014, Australia's Parliament reported on testimony, from several witnesses, that UASs are being flown by operators who unknowingly break safety rules, thereby posing a safety risk to manned aircraft and persons on the ground. In response to unsafe operations, a few countries have placed outright bans on UAS operations. For example, in India, in response to the surge in interest for commercial and recreational use, the government placed an outright ban on any UAS use until its civil aviation agency issues regulations. Similar to the "Know Before You Fly" education campaign in this country, other countries have sought to educate operators. For example, the United Kingdom has developed and distributed a brochure describing safe flying practices. In Australia, UAS purchasers receive a similar document when they purchase the product. Canada has launched a national safety awareness campaign for UASs, which aims to help Canadians better understand the risks and responsibilities of flying UASs. In addition, Transport Canada has set up a web page that provides safe guidelines for flying UASs and answers frequently asked questions

While countries face some UAS integration challenges that are similar to the United States, other challenges such as airspace complexity and ease of regulatory change, can make integration in this country more difficult. Airspace complexity is one aspect in which the United States differs from other countries. According to FAA, the U.S. airspace is the busiest and most complex in the world, where UASs, after integration, would share with more than 300,000 general aviation aircraft, ranging from amateur-built aircraft, rotorcraft, and balloons, to highly sophisticated

turbojets (executive jets).[44] Introducing potentially large numbers of UAS by hobbyists, farmers, law enforcement agencies, and others would add to this complexity. In contrast, according to a study by MITRE, other countries have fewer aviation aircraft, a situation that may make integrating UAS easier. For example, the U.K. has about 20,000 registered general aviation aircraft, while Australia has around 8,400. A study conducted by MITRE for FAA indicated this factor as one that can affect the speed of change and adaptation in various aviation environments.

Agency Comments

We provided a draft of this report to Department of Transportation (DOT) for review and comment. In comments, which were provided in an email, DOT stated that the report addresses many of the challenges of UAS integration but does not address any environmental concerns and that the report should state that it did not examine the environmental considerations of UAS integration. DOT further noted that FAA is conducting research to understand the environmental impacts of UAS integration, the role that UASs play in National Environmental Policy Act compliance, and the applicability of noise standards regulations to UASs.[45] We did not examine the environmental considerations of UAS integration. The discussion of challenges in the report does not mention environmental concerns because it focuses on challenges the test sites faced during their first year of operation, as reported by the test site operators. We did clarify in our scope and methodology description that we did not cover environmental considerations of UAS integration. DOT also provided technical comments on the draft that we incorporated as appropriate.

As agreed with your offices, unless you publicly announce the contents of this report earlier, we plan no further distribution until 30 days from the report date. At that time, we will send copies to the Secretary of Transportation and the appropriate congressional committees. In addition, the report will be available at no charge on the GAO website at http://www.gao.gov.

[44]General aviation includes all civil aviation operations other than scheduled air services and non-scheduled air transport operations for remuneration or hire.

[45]14 CFR Part 36.

If you or your staff have any questions about this report, please contact me at (202) 512-2834 or dillinghamg@gao.gov. Contact points for our Offices of Congressional Relations and Public Affairs may be found on the last page of this report. GAO staff who made key contributions to this report are listed in appendix III.

Appendix I: Objectives, Scope, and Methodology

This report focuses on FAA's efforts to develop procedures to allow UAS use within the national airspace system. Specifically, we reviewed (1) the status of FAA's progress toward safe integration of UAS into the national airspace, (2) research and development support from FAA's test sites and other resources, and (3) how other countries have progressed toward UAS integration into their airspace for commercial purposes.

To address the three objectives, we reviewed and synthesized a range of published reports from GAO[1] and FAA that included general background information on a variety of related issues, such as FAA's framework for UAS integration, efforts to accommodate ongoing research and commercial UAS use, and UAS technology challenges.[2] We reviewed other relevant background literature on related issues, including results from databases, such as ProQuest® and Nexis®, trade publications, literature from industry stakeholder groups, and information from the Internet. We also reviewed provisions of the FAA Modernization and Reform Act of 2012,[3] and the Notice of Proposed Rulemaking for small UAS operations.[4] In addition, we reviewed more detailed and specific documentation related to the different objectives, as described below.

To determine FAA's progress toward safe integration of UAS into the national airspace, we:

- Reviewed documents provided by officials and conducted semi-structured interviews with officials at federal agencies, including the FAA's Unmanned Aircraft Systems Integration and Research and Development Offices, the Department of Defense (DOD), the National Aeronautics and Space Administration (NASA), and the Department

[1]GAO, *Unmanned Aircraft Systems: Continued Coordination, Operational Data, and Performance Standards Needed to Guide Research and Development*, GAO-13-346T (Washington, DC: Feb. 15, 2013); *Unmanned Aircraft Systems: Measuring Progress and Addressing Potential Privacy Concerns Would Facilitate Integration into the National Airspace System*, GAO-12-981 (Washington, DC: Sept. 14, 2012); and *FAA Reauthorization Act: Progress and Challenges Implementing Various Provisions of the 2012 Act*, GAO-14-285T (Washington, DC: Feb. 5, 2014).

[2]We did not review the environmental challenges of UAS integration.

[3]Pub. L. No. 112-95, 126 Stat. 11.

[4]80 Fed. Reg. 9544 (Feb. 23, 2015).

of Homeland Security. We reviewed FAA's Comprehensive Plan[5] and Roadmap for UAS integration.[6]

- Interviewed representatives from FAA's Joint Planning and Development Office, the UAS Aviation Rulemaking Committee, RTCA, and MITRE Corporation as well as voluntary standards development organization ASTM International. We interviewed representatives from the Association for Unmanned Vehicle Systems International, Aircraft Owners and Pilots Association, American Institute of Aeronautics and Astronautics, and the Academy of Model Aeronautics. We also obtained information on the Federal Modernization and Reform Act of 2012 Section 333 exemptions FAA granted from FAA and http://www.regulations.gov[7] from September 2014 to May 2015.

- Reviewed documents provided by and interviewed federal and industry representatives from the collaborative groups—the Executive Committee, RTCA Special Committee 228, UAS Aviation Rulemaking Committee, and ASTM International Committee F38—and industry groups that are involved in FAA's efforts to integrate UAS into the national airspace system

To identify research and development support from FAA's test sites and other resources, we:

- Reviewed and analyzed documents from each of the six test sites where FAA has recently allowed UAS operations including the applications submitted by the selected test sites and quarterly reports provided to FAA.

- Conducted semi-structured interviews with officials from the test sites, including the State of Nevada, the University of Alaska, the North Dakota Department of Commerce, Griffiss International Airport, the Virginia Polytechnic Institute & State University, and Texas A&M

[6]FAA, *Integration of Civil Unmanned Aircraft Systems in the National Airspace System Roadmap: First Edition—2013* (Washington, D.C.: November 2013).

[7]Regulations.gov is a website that allows the pubic to access and submit comments on agencies' regulatory documents published in the Federal Register.

University Corpus Christie to determine the issues encountered in an effort to become operational, conduct research, share the research results with FAA, and receive support or guidance from FAA.

- Spoke with representatives from other universities with centers of research on UAS technology and issues, including New Mexico State University, Massachusetts Institute of Technology Lincoln Laboratory, the Humans and Autonomy Lab at Duke University, and the Georgia Institute of Technology to obtain information about the resources FAA has dedicated to conducting other UAS research and development.

To identify how the United States compares to other countries in the progress and development of UAS use for commercial purposes, we:

- Developed case studies for four countries that have made progress in integrating UASs into their national airspace—France (Direction générale de l'aviation civile); the United Kingdom (UK Civil Aviation Authority); Australia (Australia Civil Aviation Safety Authority); and Canada (Transport Canada Civil Aviation). We selected these countries based on several factors including the status of regulatory requirements for commercial UASs, beyond-line-of-site activities, and whether the country allows non-military UAS to operate in the airspace. We obtained the UAS regulations of each country and interviewed civil aviation authorities in each to obtain additional information about the issues encountered with UAS.

- Interviewed other stakeholders familiar with the UAS activities currently occurring in other countries to determine the factors that influenced their country's policies regarding UASs including the International Civil Aviation Organization (ICAO).[8]

We conducted this performance audit from January 2014 to July 2015 in accordance with generally accepted government auditing standards. Those standards require that we plan and perform the audit to obtain sufficient, appropriate evidence to provide a reasonable basis for our findings and conclusions based on our audit objectives. We believe that the evidence obtained provides a reasonable basis for our findings and conclusions based on our audit objectives.

[8]ICAO is the international body that, among other things, promulgates international standards and recommended practices in an effort to harmonize global aviation standards.

Appendix II: Selected Requirements and Status for Unmanned Aerial Systems (UAS) Integration under the Federal Aviation Administration (FAA) Modernization and Reform Act of 2012, as of December 2014

Deadline	FAA Modernization and Reform Act of 2012 requirement	Status of action
05/14/2012	Enter into agreements with appropriate government agencies to simplify the process for issuing Certificates of Waiver or Authorization (COA) or waivers for public unmanned aerial systems (UAS).	In process—memorandum of agreement (MOA) with DOD signed Sept. 2013; MOA with Department of Justice signed Mar. 2013; MOA with NASA signed Mar. 2013; MOA with Department of Interior signed Jan. 2014; MOA with the Office of the Director, Operational Test and Evaluation (DOD) signed Mar. 2014; MOA with National Oceanic and Atmospheric Administration still in draft.
05/14/2012	Expedite the issuance of COAs for public safety entities	Completed
08/12/2012	Establish a program to integrate UASs into the national airspace at six test ranges. This program is to terminate 5 years after date of enactment.	Completed
08/12/2012	Develop an Arctic UAS operation plan and initiate a process to work with relevant federal agencies and national and international communities to designate permanent areas in the Arctic where small unmanned aircraft may operate 24 hours per day for research and commercial purposes.	Completed
08/12/2012	Determine whether certain UAS can fly safely in the national airspace before the completion of the Act's requirements for a comprehensive plan and rulemaking to safely accelerate the integration of civil UASs into the national airspace or the Act's requirement for issuance of guidance regarding the operation of public UASs including operating a UAS with a COA or waiver.	Completed
11/10/2012	Develop a comprehensive plan to safely accelerate integration of civil UASs into national airspace.	Completed
11/10/2012	Issue guidance regarding operation of civil UAS to expedite COA process; provide a collaborative process with public agencies to allow an incremental expansion of access into the national airspace as technology matures and the necessary safety analysis and data become available, until standards are completed and technology issues are resolved; facilitate capability of public entities to develop and use test ranges; provide guidance on public entities' responsibility for operation.	Completed
02/12/2013	Make operational at least one project at a test range.	Completed
02/14/2013	Approve and make publically available a 5-year road map for the introduction of civil UAS into national airspace, to be updated annually.	Completed
02/14/2013	Submit to Congress a copy of the comprehensive plan.	Completed
08/14/2014	Publish in the Federal Register the Final Rule on small UAS.	In process

Deadline	FAA Modernization and Reform Act of 2012 requirement	Status of action
08/14/2014	Publish in the Federal Register a Notice of Proposed Rulemaking to implement recommendations of the comprehensive plan.	None to date
08/14/2014	Publish in the Federal Register an update to the Administration's policy statement on UAS in Docket No. FAA-2006-25714.	None to date
09/30/2015	Achieve safe integration of civil UAS into the national airspace.	In process
12/14/2015	Publish in the Federal Register a Final Rule to implement the recommendations of the comprehensive plan.	None to date
12/31/2015	Develop and implement operational and certification requirements for public UAS in national airspace.	In process
05/14/2017	Report to Congress on the test ranges	None to date

11/15/15 Task Force Meeting

<TARGET><BILL></BILL><SUBJECT>11-15-15 Task Force Meeting</SUBJECT><COMM><TARGET></COMM></TARGET>

Ginger Blaisdell

From: Ginger Blaisdell
Sent: Thursday, November 05, 2015 10:09 AM
To: Rep. Shelley Hughes
Subject: agenda with notes in red

Call in 844-586-9085
Thursday Nov 5 @ 1pm (hoping to finish by 2pm)

AGENDA
Newsworthy updates

- USDOT requiring hobbyists to register drones
- Page 3: public comments regarding UAS registration are due tomorrow Nov 6 but will likely remain open longer
- Page 10: new drone air traffic control system under 500 feet may be the answer to drone delivery issues and hobby flights
- Page 12: insurance is becoming more readily available for drones
- Page 14: judge rules OK to man shooting down drone

Subcommittee reports from:

- Mike O'Hare – State COA
- Steve Colligan – hobbyist certification/licensure and retailer rules
- Steve Wackowski – 3-D Airspace zero to 500 feet
  Dan Wayne, Legal Svcs, will be available for comments on his research (documents to be final today)

Final version of "Alaska's Drone Operator Safety and Privacy Guidelines"

- Black and white copy will be sent to list serve with reference to www.alaskadrones.org for color copy due to file size

Upcoming events and meetings Nolan Klouda UAA

- Jay Skaggs Nov 18, Economic Interest Bar-b-Queue
  - Ethan Tyler and Christie Bell are working to host a morning presentation session
  - Afternoon at Jay's house with 5pm bar-b-queue
    - 15046 East Lake Ridge Drive, Eagle River 99577
    - Encourage everyone to attend – RSVP with Ginger or Jay
- AK Chiefs of Police Leadership meeting Nov 30-Dec 1
  - UAS LTF will have 15 minute session
    - Privacy guidelines
    - FAA law enforcement rules
    - State law (HB255)
    - How to enforce inappropriate drone operators

US to Require that Hobbyists Register Drones

Federal officials plan to announce on Monday that all drones will have to be registered with the U.S. Transportation Department, Fortune has learned.

U.S. Transportation Secretary Anthony Foxx and F.A.A. Administrator Michael Huerta will hold a press conference in Washington D.C. to explain the government's plans to create a new registration system that all drone buyers will be required to use, according to a source familiar with the situation.

The plan adds hobbyists to those who must register their drones with the government. Previously, only commercial drone users had to register their aircraft with the F.A.A. after getting the authorization to fly.

Drone industry leaders from trade groups and manufacturers will join government officials during the announcement. The plan calls for creating a task force that includes members of the government and the drone industry to create the registry, the source said.

The initiative to create a centralized system for collecting drone registrations has been in the works for the past few weeks. Government officials have been contacting drone makers and industry groups about it over the past few days, the source said.

The drone registration system is supposed to be debut around the Thanksgiving holiday.

The Transportation Department declined to comment on the specifics of the announcement to Fortune, but confirmed that the department will "make an important safety announcement about the use of Unmanned Aircraft Systems" on Monday.

It's unclear what penalties drone owners will face for failing to register their aircraft. Nor is it clear whether all drones must be registered or just ones that are beyond a certain size.

Michael Drobac, the executive director of the Small U.A.V. Coalition, a drone advocacy group whose members include Google, Amazon, and camera maker GoPro, told Fortune that he is concerned with the proposed regulations. Both Amazon and Google are working on drones for delivering products ordered online to customers' doorsteps.

"I have great concerns that the F.A.A. and D.O.T. won't come up with something that will help us move us forward as a country in advancing this technology on their own," Drobac said. "This has to be led by industry.

US DoT Seeks Public Comments on UAS Registration

In a surprise move, DOT just published a document, *Clarification of the Applicability of Aircraft Registration Requirements for UAS and Request for Information Regarding Electronic Registration for UAS*, to the Federal Register. DOT is soliciting recommendations on all aspects of the UAS registration process, including which UAS should be exempt from the registration requirement.

The clarification and request for information requests that comments be received within 15 days after publication in the Federal Register, which is November 6, although the comment period reportedly will remain open for the near future. Of course, given the Secretary's expedited timeline, comments submitted after November 6 will be less likely to influence the recommendations made by the UAS registration task force. Click here to access the original document and post a comment.

In addition to clarifying applicable statutory requirements regarding UAS registration, DOT is requesting "information and recommendations regarding what information and registration platform would be appropriate for UAS registration and ways to minimize the burden to the regulated community." DOT is also requesting comments on which UAS, in terms of weight or performance

3

capabilities, should remain exempt from the registration requirements because of the negligible risk they pose to the national airspace system (NAS).

To facilitate the task force's work in developing UAS registration procedures, DOT is requesting information and data from the public in areas such as:

- At what point should registration occur (e.g. point-of-sale or prior-to-operation)? How should transfers of ownership be addressed in registration?
- Consistent with past practice of discretion, should certain UAS be excluded from registration based on performance capabilities or other characteristics that could be associated with safety risk, such as weight, speed, altitude operating limitations, duration of flight? If so, please submit information or data to help support the suggestions, and whether any other criteria should be considered.
- How should a registration process be designed to minimize burdens and best protect innovation and encourage growth in the UAS industry?
- Should the registration be electronic or web-based? Are there existing tools that could support an electronic registration process?

Whether you are a UAS manufacturer, operator, or user, the comment period offers all industry stakeholders an opportunity to shape UAS regulation and policy.

FAA Administrator Opens UAS Registration Task Force Meeting

The Unmanned Aircraft Systems (UAS) Registration Task Force completed its first day of work. FAA Administrator Michael Huerta kicked off the Task Force with remarks that outlined the group's objectives and expectations. The FAA briefed participants on the current statutory requirements and international obligations for aircraft registration before the group began initial discussions on a streamlined registration process and minimum requirements for UAS that need to be registered. The Task Force will continue deliberating on Wednesday.

Here are FAA Administrator Michael Huerta's remarks as prepared:

Unmanned aircraft use has increased dramatically in recent years. With this surge in popularity has come growing concerns about their safe operation in our nation's airspace.

5

In recent months, we've seen an increase in reports of UAS coming too close to manned aircraft and airports. Some have interfered with wildfire fighting in California, and one crashed into a stadium during a U.S. Open tennis match.

These incidents make it clear: we must work harder to ensure a strong culture of safety and responsibility among unmanned aircraft enthusiasts.

There's no single solution for how we do this. The integration of unmanned aircraft is multi-faceted, and our approach must be as nimble as the technology itself.

One tool we're going to use is registration - and that's why we're here today.

Unmanned aircraft have countless potential uses - from package delivery to tasks that are dangerous for people or manned aircraft to perform. No one wants to see this promising technology overshadowed by an incident or accident that could easily be avoided with proper training and awareness of the safety principles that are now second nature in manned aviation.

We invited you to assist us on this task force because each of you brings extensive knowledge about unmanned aircraft, technology, public policy and the aviation industry. You represent a wide range of viewpoints. And you are all united by a common goal: the safe integration of unmanned aircraft.

We're hopeful this task force can provide the FAA guidance on some important questions as to how we determine the best way to register aircraft under 55 pounds:

- How do we make registration as easy as possible for consumers while providing accountability?
- What products should we exclude from registration based on weight, speed, altitude and flying time?
- What information should we collect during the registration process, and what should we do with the data?
- Should every unmanned aircraft sold have its own serial number, or how to tie particular aircraft to a particular user?
- Should the process include a formal education component before an aircraft can be registered?
- Should registration be retroactive and apply to unmanned aircraft that are now in the system?
- Should there be an age requirement for registration?

60

Ultimately, we want to make registration as easy as possible for consumers, to relieve them of the complexity associated with registering larger, manned aircraft.

Your recommendations will be invaluable as the FAA moves quickly to stand up this new system.

We're working on a tight timetable – Secretary Foxx set a deadline of November 20th for the task force to complete its recommendations. This reflects the urgency of the task at hand.

The holidays are weeks away, and unmanned aircraft are going to be a popular gift item. By some estimates, 700,000 new aircraft could be in the homes of consumers by the end of the year. This means unmanned aircraft could soon far outnumber manned aircraft operating in our nation's airspace.

Many of these new aircraft are bringing new users to aviation – most with little or no experience with aviation regulations.

Registration will give us an opportunity to educate new operators about airspace rules so they can use their unmanned aircraft safely. It will also help us more easily identify and take enforcement action against people who intentionally violate the rules or operate unsafely. A perfect example of this occurred last week, when a drone carrying mobile phones, drugs and hacksaw blades crashed into a prison yard in Oklahoma. Perhaps registration would have helped authorities quickly identify the owner.

We realize that most people want to use their aircraft safely for enjoyment. Registration benefits users and the government alike because it encourages education while providing a mechanism for helping the FAA fulfill its mission of keeping the nation's skies safe.

I recently announced the FAA's new Compliance Philosophy, which uses education and training to ensure we have safe operators.

At the same time, this doesn't mean we're going to go easy on enforcement.

But in cases where we find simple mistakes or a lack of understanding, we'll use tools like training and education to ensure compliance with the regulation and compliance with the standard.

This starts with giving operators the tools and knowledge they need to fly safely. Toward this end, we released the beta version of a new smartphone application called "B4UFLY," which alerts UAS operators to restrictions or requirements in effect at their current or planned flight location.

7

The FAA and its government and industry partners are also conducting outreach through the Know Before You Fly and No Drone Zone campaigns, most notably during the recent visit by the pope.

But for those who don't follow the rules, we need to continue our enforcement efforts.

Last month, the FAA proposed a $1.9 million civil penalty against a company that we allege knowingly conducted dozens of unauthorized flights over Chicago and New York. This sends a clear message to others who might pose a safety risk: Operate within the law or we will take action.

As registration, education and enforcement focus on enhancing safety around recreational use, we're also working to put a commercial regulatory framework in place.

Earlier this year, we proposed a rule that would routinely allow small unmanned aircraft operations we know to be safe, and we plan to finalize it by late spring.

Meanwhile, we're approving requests for commercial operations on a case-by-by-case basis. To date, we've approved more than 2,200 authorizations that allow unmanned aircraft to be used for a wide variety of different purposes.

Under our Pathfinder program, we're working with industry to determine how to safely expand unmanned aircraft operations beyond the parameters of our proposed rule. BNSF Railway recently used an unmanned aircraft to inspect miles of its tracks in New Mexico, demonstrating beyond visual-line of sight capabilities. The flight marked the first of what we hope will be many successful Pathfinder tests and flights.

Integrating unmanned aircraft into our nation's airspace is a big job, and it's one the FAA is determined to get right. We know that we need to work closely with our partners in government and the private sector for this to succeed. This task force is a sign of our commitment to that partnership and we thank you for your work.

Please think big, and think outside the box. Take the interests of all stakeholders, of everyone who will be affected by registration, into consideration, and you need to factor that into your conversations and deliberations. And please - do not worry about achieving perfection. Your ideas will enable us to lay the groundwork for registration, but by no means is it the last word on registration.

You have a lot to accomplish in the next three days. I have no doubt this group will be able to meet the challenge, and I look forward to your recommendations. Given the urgency of this issue,

8

the DOT and the FAA will move quickly to consider your suggestions as we create a registration system that works for the FAA, consumers, and the safety of our nation's airspace.

Thank you again for dedicating the time to this important undertaking.

DigitalGlobe Helps Create Drone Air Traffic Control

Data mined from DigitalGlobe's satellite images are at the center of a system that could change how drones operate in the U.S. and globally.

The Low Altitude Traffic and Airspace Safety, or LATAS, uses Verizon's LTE cellular network, Harris' satellite-based surveillance systems and information gleaned from Westminster-based DigitalGlobe's high-resolution Earth imagery to help unmanned aerial vehicles — or UAVs, more commonly called drones — identify and avoid obstacles and safely navigate the airspace.

10

LATAS, developed by Raleigh, N.C.-based PrecisionHawk, recently completed initial testing and is under review by the Federal Aviation Administration and NASA.

Think of LATAS as air traffic control for flying robots, complete with social media integration — it has real-time tracking, a "geofencing" feature that won't allow drone flight in prohibited airspaces, and even offers live streaming.

"Anybody can fly a drone — maybe not today, but it's trending in that direction — and we need a technological solution to keep them from running into each other, people, bridges, buildings and even into aircraft," Shay Har-Noy, DigitalGlobe's senior director of Geospatial Big Data, said in an interview.

DigitalGlobe has undergone a self-described "strategy shift" in recent months to target new ways to make money from its imagery.

One of these growth areas is the Geospatial Big Data program, or GBD, which is expanding as new applications are discovered. Although Har-Noy could not specify exact numbers, he said this will definitely result in job gains in Colorado.

GBD harnesses the power of DigitalGlobe's fleet of satellites, which capture photos of about 2 million square miles per day. Each image contains topographical and other information that can be used to guide LATAS.

"Instead of just these giant images of the state of Colorado, we can tell them where the trees are, where the water is, where the mountains are," Har-Noy said. "There are all these kinds of very practical concerns you can now solve."

For now, the next step for LATAS is to continue testing until it gains FAA blessing. The team has the ambitious goal to eventually develop and implement the system globally for safe, efficient operation of UAVs.

"We don't have all the answers," Har-Noy said. "We just want to have a path."

DigitalGlobe currently employs 1,256 people — about 1,200 in Colorado — and about 380 contractors across eight locations worldwide. It recently moved into a new 482,000-square-foot Westminster headquarters.

American International Group Offers Drone Insurance

American International Group, one of the nation's leading property/casualty insurance carriers, is taking on the emerging risk as more and more US retailers - including Amazon and Wal-Mart - seek and are granted FAA approval to operate drones.

In a conference Monday hosted by business software provider Oracle, AIG Chief Technology Officer Mike Brady announced that the insurer has started offering coverage for any damage caused by drones and injuries to drone operators.

"Clearly with that many drones in the airspace you run a risk, so AIG actually now offers drone insurance to our commercial customers," Brady said.

The policies are offered through AIG's excess and surplus subsidiary Lexington Insurance Company and bear many similarities to auto insurance plans, covering both "broad physical damage" and "third party liability coverage." However, as they are written especially for drones, the policies also cover drone "operators" and on-ground crew members, as well as electronic malfunctions and component failure.

The coverage excludes problems such as hijacking, unlawful seizure, hacking or "spoofing."

Drones weighing up to five pounds with a wingspan of up to three feet are covered, though pricing information is not immediately available.

The move to offer drone coverage comes just one month after a *Fortune* magazine report suggested that lack of viable insurance options could threaten the entire industry. And as it is already predicted to generate billions of dollars in economic impact over the next 10 years, it's important that market players come forward soon.

Previously, insurers have cited significantly liability and a lack of regulatory guidelines as making it difficult for underwriters to craft well-rounded products for drone manufacturers and operators.

K insurance house Lloyd's has even gone on record saying risk pricing for drones is extremely difficult in view of their emerging status and inherent issues like third-party liability for physical damage, to say nothing of a lack of meaningful data and risk metrics.

Others in the industry agree.

"Unfortunately, there are big questions and not enough answers," Tom Karol, a general counsel for the National Association of Mutual Insurance Companies, told *Fortune.*"There needs to be more clarity on how people will use these, and what will be allowed and won't be allowed is a big issue."

Those monitoring insurer appetites, however, suggest that carriers will not begin to embrace privacy concerns as part of drone liability policies until state and federal legislation becomes clearer on expectations and legality surrounding drones.

"I'm constantly following up with my standard carriers to see if their appetite for drones has changed," said Evan Garmon, a commercial insurance specialist with Harpenau Insurance in Louisville, Kentucky. "Until the regulation and laws in the United States surrounding the small unmanned aircraft systems industry stabilize, many standard insurance companies will stay out of the market.

"Once they do, I plan to be on top of the change to offer better policies for my clients."

Judge rules man had right to shoot down drone over his house

Technically Incorrect: A Kentucky judge dismisses all charges against William Merideth, saying the drone was an invasion of privacy.

by Chris Matyszczyk @ChrisMatyszczyk / October 28, 2015 11:13 AM PDT

Technically Incorrect offers a slightly twisted take on the tech that's taken over our lives.

William Merideth shot down a drone legally, a judge decides.

WDRB/TV screenshot by Chris Matyszczyk/CNET

It was a case that gripped the nation. Or at least Kentucky.

Should it have temporarily escaped your pressured memory, William Merideth in July said he saw a drone flying above his property in Hillview, Kentucky.

He believed it was spying on his 16-year-old daughter who was sunbathing in the garden. So he took out his shotgun and blasted the drone out of the sky. He was arrested for wanton endangerment and criminal mischief.

Now a Kentucky court has declared Merideth an innocent man. Bullitt County District Court Judge Rebecca Ward on Monday dismissed all charges against Merideth, reported local TV station WDRB-TV.

The drone's owner, David Boggs, had produced flight data that insisted his machine had been flying higher than Merideth had claimed.

The judge, however, seems not a fan of big data. She's a woman of the people. She declared that two human witnesses saw the drone below the tree line. This evidence was, to her, conclusive. To her, this was an invasion of Merideth's privacy.

Amateur drones hovering willy-nilly have disturbed more than just private citizens. Airline pilots' reports of drone close-calls on takeoff and landing have increased exponentially over the past year.

14

This summer, amateur drones flew over California wildfires, purely to capture dramatic pictures. This grounded helicopters which were desperately trying to drop water on the flames. There's still a $75,000 reward for anyone who leads authorities to those responsible.

The FAA's recommendations include not flying above 400 feet. "Don't be careless or reckless with your unmanned aircraft -- you could be fined for endangering people or other aircraft," the agency adds.

More Technically Incorrect

Microsoft wants to make you feel good about dumping your MacBook

Twitter launches a TV ad for Moments, and it's a touch crazy

Microsoft delighting almost as much as Apple, study says

For his part, Merideth believes his case should never have gone to court.

"I don't encourage people to just go out and start blasting stuff for no reason," he told WDRB. "But three times in one day, three times over the course of a year, six times total, over one property? That's not right, that's harassment."

Boggs is reportedly considering his legal options.

Once Amazon and other retailers begin their deliveries by drone, there will surely be an almost permanent buzzing in the sky. How will people know whether the thing that's overhead is spying on them or merely delivering fresh underwear or zucchini to the nice people next door.

Every time technology thinks it's solving a problem, or at least creating new forms of entertainment, it brings with it new annoyances and potential for conflict.

This isn't necessarily a good thing in a nation where so many people own guns.

Hobby / Retail

~ 11 pages

October 7, 2015 teleconference meeting of the UAS LTF subcommittee on Hobbyist Endorsements and Retailer Education Requirements:

Members attending meeting:

Bob May
Steve Colligan
Steve Wackowski
Ethan Tyler
Representative Hughes
John Nevadomsky
Ginger Blaisdell, task force staff

Invited Presenters:

Dave Matthewson, Executive Director AMA
Richard Hansen, AMA Government Affairs
Arthur Cunningham, AMA
Archie, AMA
Jay Skaggs, FAA Alaska

Meeting called to order by subcommittee chair, Steve Colligan at 10am via webinar presentation and teleconferencee.

Steve Colligan: Introduction and remarks

Richard Hansen:

Know Before You Fly campaign is focused on the consumer

- Manufacturers and distributors are beginning to include the flyers in packaging
- AMA is working with major retailers to provide the KBYF information to educate consumers on pilot safety

The AMA is focusing on the platform (aircraft equipment) that has the capability to go beyond visual line of sight for the next level of hobbyist education.

AMA is reviewing 2 classifications for pilots: rotary and fixed-wing. They are looking at liability insurance offerings to hobbyists, and safety awareness (knowledge and operational skills) endorsement.

Personal (hobby) use would fall under the AMA program while commercial applications are still governed by the FAA.

AMA is developing a computer-based education and endorsement on-line program. A pilot would take an on-line test to assess knowledge and includes questions to assess the individual's self-validation of operational skills. The on-line program will also allow for flight data downloads to manage flight records for hobbyists.

AMA Membership fees:

Annual cost of membership is $58 adult (being raised to $75 adult)

Annual cost of subscription for data and test/endorsement $19.95

> Recurring tests in continuing years will include law changes – frequency of testing to be determined

Model Aviation Student Clubs pay a flat fee for a set number of students – typically are universities and schools

Youth membership until age 19 is free (currently 50,000 student memberships nationwide)

Family membership is one adult at full annual fee, additional adult at $38.00 annually, children free

AMA is looking at sUAS pilot training programs around the US to encourage flight safety but will still require hobbyist to take proficiency and knowledge test through AMA to be endorsed. The United Kingdom requires an operator proficiency skills test – the AMA is looking into this.

An endorsement/ID card would be issued by AMA for qualifying hobby pilots.

AMA offers liability insurance (through an underwriter) after achieving knowledge and proficiency endorsement. Insurance underwriters have offered a discounted premium on those with the endorsement.

There is a grey area transitioning from hobby to business.

- AMA is focusing on the capabilities of the aircraft more than hobby VS business
- Beyond visual line of sight is the critical differentiator in capabilities

AMA will offer to register your aircraft through the membership website.

Is the registration data public information?

- It might be provided to the FAA upon request but not to general public
- Public could go through AMA to identify specific aircraft if requested
- Many platforms require the owner to register with the manufacturer in order to download the firmware – this would require personal ID of the aircraft owner
- How would the manufacturer data become available to law enforcement?

Field examiners offering proficiency tests:

- Are they volunteers or will there be additional costs?
- AMA is not convinced that this level of oversight is necessary for hobby pilots – they are leaning toward self-validation of competency.

Is there a pilot training center in Alaska?

- Steve Colligan is working on this as part of his business.

- UAF trains pilots and certifies them depending on what kind of platform they are operating.

Timeline for AMA endorsement is early January 2016 with the mapping and flight logging coming later in the year.

The primary difference between the Know Before You Fly and the AMA membership with endorsement is that KBYF is a "first blush" on safety and the endorsement is more advanced.

Meeting adjourned 11:07am

A followup meeting will be scheduled.

Academy of Model Aeronautics

October 7, 2015

AMA
ACADEMY OF
MODEL AERONAUTICS

sUAS Program For FPV and Semi-Automated Flight For Personal and Purposeful Use

Individual Elements

Legitimacy
Education
Training
Safety
Registration/Endorsement
Classification
Insurance
Program Support/Advocacy
Media
Marketing

Legitimacy

- Current FAA policy precludes the operation of sUAS for anything other than recreational purposes without specific authorization.
- The purposeful use of sUAS is becoming prevalent in the US and growing at an astounding rate.
- AMA believes the safety considerations for the use of sUAS are the same no matter if operated for recreational or purposeful use.
  - Similar to the Academy's existing MA safety program, AMA's sUAS community-based program will provide a safety structure that will allow the purposeful use of sUAS to occur in a safe and responsible manner.
  - AMA will petition the FAA to recognize AMA community-based program as an effective and accepted means of allowing the purposeful use of sUAS in the national airspace.

Education

- Public access to all safety guidelines.
- Computer based learning management system.
  - Member's Only access to the testing and endorsement system.
- Individual module topics would include.
  - Learning the NAS.
  - Current relevant regulations.
  - Safety.
  - Fly friendly (Ethical, noise, nuisance, privacy, surveillance).
  - Best practices for common applications (i.e. photography).
  - Community involvement (search & rescue, emergency Response, disaster relief, etc.)
  - Other non-regulatory or safety issues.

Education (continued)

- Online training syllabus for those that choose not to take an authorized training facility course.
  - Flight proficiency.
  - Flight test (fixed wing, single-rotor, multi-rotor).
- Develop University MASC program (UMASC) for universities & colleges.
- Educate clubs and members.

Training

- Create a nationwide network of AMA Affiliated Training Centers.
  - AMA would put the center on a list of recommended facilities.
  - AMA would review and endorse programs.
  - Center would have to teach to AMA minimum standards. Both written and practical (flying).
  - All participants in Training Center programs must be AMA members.
  - Program completion would be validated through AMA's online system.
  - Members would gain sUAS endorsements by participating in the program.

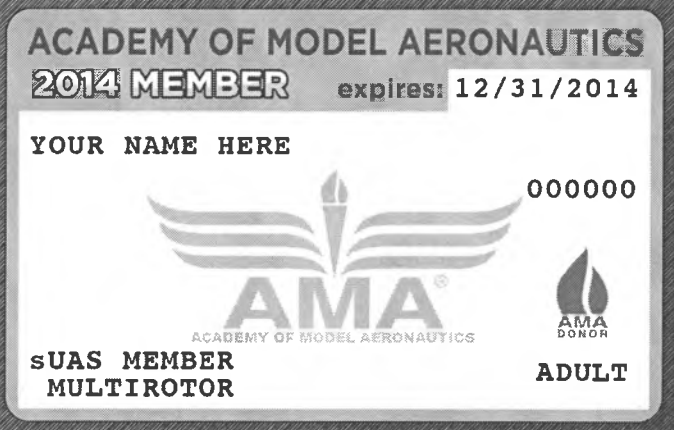
Safety Program

- Foundation will be AMA's existing safety guidelines.
- Stand alone (discipline specific) safety program for sUAS.
- Customized for specific use.
  - Personal use (filming family, recreational activities, special events, general photography).
  - Purposeful use (community service, search & rescue, public safety support, survey of personal property, casual journalism, amateur photography).

Endorsements

- Successful completion of online education program.
- Completion of affiliated training program.
- Review of AMA Safety Program content.
- Participatory based online testing.
- Cost aggregation with tuition at affiliated center.
- Individual endorsements for fixed wing, heli, and multi-rotor.
- Field validation (appointed field examiners).
- Self attestation.

sUAS Endorsements



Special sUAS Membership Classification

- Participatory based, annual renewal.
- Supplemental to AMA membership (Adult, Senior, Junior).
- Availability of sUAS endorsements.
- Access to affinity benefits (Insurance).
- Additional sUAS program benefits

Insurance

- Personal liability coverage for sUAS and MA operations.
  - $2.5 million coverage for recreational use.
- Individually customized policyholder coverage (liability/comprehensive) for sUAS business use through AMA's affinity partner.
  - AMA rate would be more favorable than might otherwise be achieved.
  - Additional discounts with endorsements and/or endorsements from an affiliated training center.

Program Support/Advocacy

- Increase advocacy reach to include this community.
- Dedicated staff to manage community.
- Increased involvement in conventions and seminars.
- Partner with AUVSI and other relevant organizations.

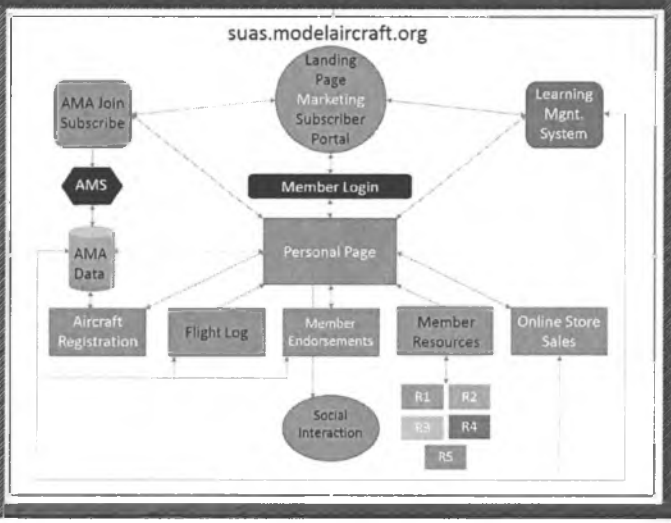
Media

- AMA Today style monthly E-Zine.
  - Auto-populated.
- Continued content in *Model Aviation* magazine.
- Continued content in *Park Pilot* magazine.
- Webinars/Podcasts on relevant topics.
- Instructional videos (potential topics could be terms, definitions, describe platforms, etc.)
- Blogs, videos and other member exclusive content available in the subscriber area.
- Social media / subscriber interaction within the subscriber area.

Marketing

- Join/Renew Landing Page.
- Join/Renew dedicated page (precursor to a microsite).
- Dedicated sUAS Microsite (suas.modelaircraft.org)
- Wherever you fly; Whatever you fly campaign to the community.
- Engagement of manufacturers.
- Outreach through drone user sites/media.
- Marketing in industry related but non MA publications.
- Possible agreements with AUVSI.
- AMA info in boxes pointing to AMA.
- Establish sUAS events, activities, and competitions.

sUAS Website



3-D Airspace

~7 pages

Members in attendance 3-D airspace subcommittee, October 12, 2015

Steve Wackowski, chair
Steve Colligan
Steve Strait
Representative Hughes
John Parker
Dan Wayne, Legislative Legal Svcs
Ginger Blaisdell, staff
Absent: Bob May, John Binder, Senator Micciche

At the last meeting of the UAS Task Force in Fairbanks, there was concern expressed by a member of the public who experienced low flying manned aircraft and was concerned about UAS flying over his private property.

Slide #2

Cuius est solum, eius est usque ad caelum et ad inferos

("*For whoever owns the soil, it is theirs up to Heaven and down to Hell.*")

- Until the early 1900's, this legal clause established precedence for managing airspace for landowners.
- Times have changed so airspace management has changed during the industrial era.

Slide #3

Is the US code that gives the FAA the mandate to manage the airspace

- Declares that a citizen, but not his property, can navigate the airspace.

Slide #4

The court held that all of the navigable airspace in this country is within the sole domain of federal regulation.

- "The United States government has exclusive sovereignty of airspace of the United States."
- Recommends clicking on the link provided and reading about the court case of US vs. Causby
    - Causby was a farmer with farmland next to a WWII training ground where aircraft were interfering with his farming activities (his chickens)

Slide #5

Shows an image of flight zones by altitude – this airspace chart was proposed by Amazon (similar to Google X)

- The X axis (bottom of the image) shows the model flying, rural, suburban, urban and airport airspace
- This concept is still in its infancy and will need more vetting and is predicated on sense and avoid technology

Slide #6

Generally, from the industry, "everyone stressed that one set of standards is preferred – even if state laws may be more favorable to industry.

- Big industry have and will likely lobby against any state that tries to introduce its own airspace standards/rights that differ from the FAA/national rules.
- E.g. lobbied for the Governor of California to veto latest drone bill

Maybe Leg Legal could research what Alaska could do to gain sovereignty over airspace?

Shelley Hughes – can we explore an 'opt in' clause

- 'down to the ground' isn't substantiated in slide #4 because it states "The act defines navigable airspace as airspace above the minimum altitudes of flight...including airspace needed to ensure the safety in the takeoff and landing of aircraft."
- Dan Wayne – statute says the US govt has exclusive sovereignty of airspace of the United States but that the citizen has right of transit through the navigable airspace – so it seems that the govt has authority over all airspace and citizens can transit above 500 feet (in some places it would be 1,000 feet)
- John Parker – the FAA claims domain to all airspace to the ground but they are relinquishing the non-navigable airspace (400' and below) through the 333 exemptions – we may need to talk with the FAA (RTCA) to better understand their intent over this airspace
- Steve Wackowski – assumes that the FAA would not be willing to give up their powers over safety in the airspace but understands that one concern is privacy rights of citizens. There may be the ability to beef up other laws, such as harassment and stalking, to incorporate UAVs.
- Shelley Hughes – there may not be consistency for industry if individual citizens choose to allow UAS traffic above their private property
- Steve Colligan – my fear is another level of bureaucracy over rights of way and public projects. We need to look at loitering and reasonable expectation of privacy, not to make industry projects more expensive.

Steve Wackowski – discussion on range space that allows industry to fly. Maybe ACUASI could elaborate more on the workings of the test range.

Shelley Hughes – met with law enforcement officials last week and loitering can occur in public and private areas and establishes different tolerances for loitering. Within the parameters of the FAA will there be loitering addressed?

- Can a property owner allow hovering, filming, recording over their private property? Excusing a UAS pilot from a loitering law? Maybe lease airspace to the industry?
- John Parker – wouldn't work because the cameras will extend beyond the boundaries of the property and it could extend into multiple properties and airspace leases.
- Steve Colligan – swath of data requires a 75% overlap so could extend into other property boundaries.

- Steve Colligan – would like a better clarification of laws regarding audio recording and video recording and loitering infringements whether in public or on private property compared to traveling across the property. Need legal clarification.
- Dan Wayne – one party conversation doesn't violate the law. Eavesdropping could constitute breaking a law. Videoing could be a greater concern.
- Doesn't matter if it's using a cell phone, recorder, camera or drone.

Steve Strait

1. Slide #5 does not provide an allowance for flight over water where there is no minimum altitude consideration
2. If a state were to take the lead it would be a cause for concern but we should be working with our congressional delegation to be active in the FAA regulations
3. Privacy, loitering; every incident seems to be unique and we may need to let the courts figure it out.

- John Parker said that he's been working with FAA and looking for ways to agree on airspace rulings

Shelley Hughes

- Private property has laws that have to be followed even on your private property.
- Can the private property owner own any of the space above his property but still follow the rules of the FAA?

Steve Wackowski – how were the federal highway system laws established (driver's licensing and road laws). This might be similar to the path of UAS in the NAS.

Request for Dan Wayne:

Is the ground up considered navigable airspace, court precedence vs statute?

- Causby case
- Does the flight interfere with use and enjoyment of your land? Altitude considerations?
- This is different than the question of privacy. A drone operator could meet the elements of an offense if there was a determination of harassment or stalking (explicit images, etc.).

Does the one party consent rule in Alaska include video as well as audio?

Shelley Hughes

We could introduce a resolution that promotes industry/economic development that declares that certain lands (airspace above lands) are open for UAS testing.

- Economic development driver over state lands.
- Bring in Fish and Game regarding animal harassment.
- Steve Colligan is currently leasing airspace over state lands – includes a COA approval – leasing land space contingent with COA approval for the airspace above that property
- Statements for inclusion in a resolution should be provided to Ginger sooner rather than later for bill drafting completed prior to session start in January 2016.

3-D Airspace Subcommittee Discussion Points

12 Oct 2015

State of Alaska UAS Task Force

Agenda

- Federal Statute
- Thoughts from Industry
- Others?
- Way forward

Cuius est solum, eius est usque ad caelum et ad inferos

("*For whoever owns the soil, it is theirs up to Heaven and down to Hell.*")

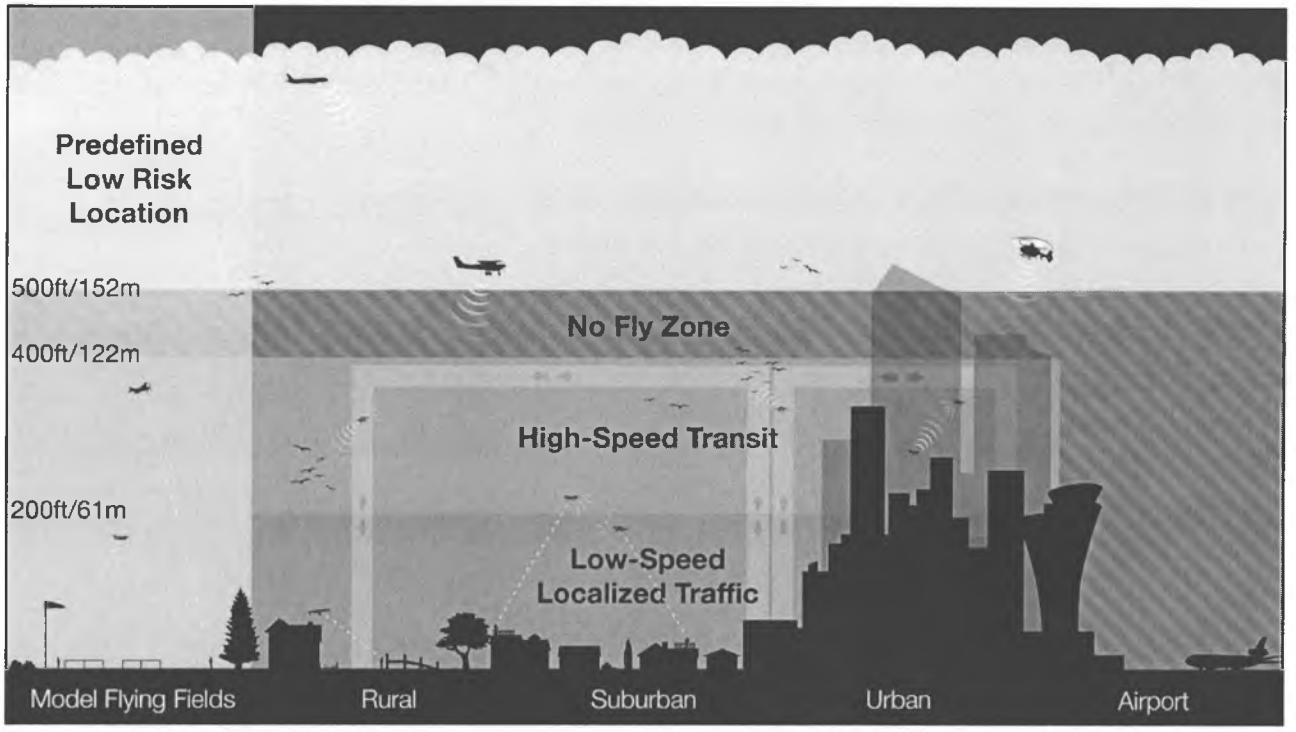
49 U.S. Code § 40103 - Sovereignty and use of airspace

(a) Sovereignty and Public Right of Transit.—
(1) The United States Government has exclusive sovereignty of airspace of the United States.
(2) A citizen of the United States has a public right of transit through the navigable airspace. To further that right, the Secretary of Transportation shall consult with the Architectural and Transportation Barriers Compliance Board established under section 502 of the Rehabilitation Act of 1973 (29 U.S.C. 792) before prescribing a regulation or issuing an order or procedure that will have a significant impact on the accessibility of commercial airports or commercial air transportation for handicapped individuals.
(b) Use of Airspace.—
(1) The Administrator of the Federal Aviation Administration shall develop plans and policy for the use of the navigable airspace and assign by regulation or order the use of the airspace necessary to ensure the safety of aircraft and the efficient use of airspace. The Administrator may modify or revoke an assignment when required in the public interest.
(2) The Administrator shall prescribe air traffic regulations on the flight of aircraft (including regulations on safe altitudes) for—
(A) navigating, protecting, and identifying aircraft;
(B) protecting individuals and property on the ground;
(C) using the navigable airspace efficiently; and
(D) preventing collision between aircraft, between aircraft and land or water vehicles, and between aircraft and airborne objects.
(3) To establish security provisions that will encourage and allow maximum use of the navigable airspace by civil aircraft consistent with national security, the Administrator, in consultation with the Secretary of Defense, shall—
(A) establish areas in the airspace the Administrator decides are necessary in the interest of national defense; and
(B) by regulation or order, restrict or prohibit flight of civil aircraft that the Administrator cannot identify, locate, and control with available facilities in those areas.
(4) Notwithstanding the military exception in section 553 (a)(1) of title 5, subchapter II of chapter 5 of title 5 applies to a regulation prescribed under this subsection.
(c) Foreign Aircraft.— A foreign aircraft, not part of the armed forces of a foreign country, may be navigated in the United States as provided in section 41703 of this title.
(d) Aircraft of Armed Forces of Foreign Countries.— Aircraft of the armed forces of a foreign country may be navigated in the United States only when authorized by the Secretary of State.
(e) No Exclusive Rights at Certain Facilities.— A person does not have an exclusive right to use an air navigation facility on which Government money has been expended. However, providing services at an airport by only one fixed-based operator is not an exclusive right if—
(1) it is unreasonably costly, burdensome, or impractical for more than one fixed-based operator to provide the services; and
(2) allowing more than one fixed-based operator to provide the services requires a reduction in space leased under an agreement existing on September 3, 1982, between the operator and the airport.

AOPA: "Small Airports and the Law"

The court held that all of the navigable airspace in this country is within the sole domain of federal regulation. It quoted the Federal Aviation Act that provides: "The United States Government has exclusive sovereignty of airspace of the United States." The act defines navigable airspace as "airspace above the minimum altitudes of flight…including airspace needed to ensure the safety in the takeoff and landing of aircraft."

**http://www.aopa.org/News-and-Video/All-News/2000/November/1/Pilot-Counsel-(11)*



Thoughts from Industry

- Spoke with Google, Amazon, AVUSI and others
  - *Everyone stressed that one set of standards is preferred – even if state laws may be more favorable to industry*

Other Input/Way Forward?

Subject: Re: Anchorage Meetings
To: "Burgess, Thomas" [redacted]

Hi, Tom,

Our Alaska Legislative UAS Task Force has just started a subcommittee to examine how best to set up the various involved state agencies with a UAS program for response to disasters. We had our first meeting (telecon) this afternoon, to start working on requirements, mission sets, who might do what, and funding. I told them about the Resilience work you were doing, and the expected resulting ability to use FEMA funding, but didn't have many details. Could I get a copy of the report? and regarding the FEMA funding, is that reimbursement only, or would it also potentially support costs of establishing the capability?

I will be in Anchorage next Mon-Wed for some appointments with a fair amount of free time. If you are in town and have some time, I'd love to meet you, bring you up to speed on what we are doing, and see what else I might learn about the resilience program.

All the best,

Alaska's Drone Operator Safety and Privacy Guidelines

SAFETY: FAA AND THE ROLE OF LAW ENFORCEMENT

The FAA promotes voluntary compliance by educating individual UAS operators about how they can operate safely under current regulations and laws. The FAA also has a number of enforcement tools available including warning notices, letters of correction, and civil penalties. The FAA may take enforcement action against anyone who conducts an unauthorized UAS operation or operates a UAS in a way that endangers the safety of the national airspace system. This authority is designed to protect users of the airspace as well as people and property on the ground.

However, State and local Law Enforcement Agencies (LEA) are often in the best position to deter, detect, immediately investigate, and, as appropriate, pursue enforcement actions to stop unauthorized UAS operations. Although the FAA retains the responsibility for enforcing FAA's regulations, FAA aviation safety inspectors, who are the agency's principal field elements responsible for following up on these unauthorized and/or unsafe activities, will often be unable to immediately travel to the location of an incident.

While the FAA must exercise caution not to mix criminal law enforcement with the FAA's administrative safety enforcement function, the public interest is best served by coordination and fostering mutual understanding and cooperation between governmental entities with law enforcement responsibilities. Although there are Federal criminal statutes that may be implicated by some UAS operations (see 49 U.S.C. § 44711), most violations of the FAA's regulations may be addressed through administrative enforcement measures. As with any other civil or criminal adjudication, successful enforcement will depend on development of a complete and accurate factual report contemporaneous with the event.

Although not an exhaustive list, law enforcement officials, first responders and others can provide invaluable assistance to the FAA by taking the following actions:

1. Witness identification and interviews
2. Identification of the drone operator
3. Viewing and recording the location of the event
4. Identifying sensitive locations, events, or activities
5. Notification to FAA Regional Operation Center
6. Evidence collection

ALASKA'S KNOW-BEFORE-YOU-FLY DRONE SAFETY GUIDELINES

What is recreational use of a sUAS (Drones)? Recreational use is the operation of a sUAS for personal interests and enjoyment, and not for compensation or hire. For example, using a sUAS to take photographs for your own personal use would be considered recreational; using the same device to take photographs or videos for compensation or sale to another individual would be considered commercial. You should check with the FAA for further determination as to what constitutes commercial sUAS operation.

SAFETY GUIDELINES FOR RECREATIONAL USERS OF sUAS (DRONES)

- Users should follow community-based safety guidelines, as developed by organizations such as the Academy of Model Aeronautics (AMA)
- Users should fly no higher than 400 feet and remain below surrounding obstacles when possible
- Users must be able to see their sUAS at all times, and use an observer to assist them if needed
- Users should remain well clear and must not interfere with manned aircraft operations, must see and avoid other aircraft and obstacles at all times, must avoid any activity that would cause a manned aircraft pilot to divert from planned operations, and must give way to all other aircraft at all times.
- Users must not intentionally fly over unprotected persons or moving vehicles, and should remain at least 25 feet away from individuals and vulnerable property
- Users must contact the airport or control tower before flying within five miles of an airport
- Users should be aware that in addition to public airports, Alaska has many private airstrips as well as bodies of waters used for take-off and landing by float planes and should not fly a UAS in the vicinity of these locations
- Users should not fly a UAS weighing more than 55 lbs unless it's certified by an aeromodelling community-based organization.
- Users should not fly in adverse weather conditions such as in high winds or reduced visibility
- Users must not fly under the influence of alcohol or drugs
- Users should ensure the operating environment is safe and that the operator is competent and proficient in the operation of the sUAS
- Users should not operate on or fly over private property without first obtaining permission from the property owner and/or tenant
- Users should not fly near or over sensitive infrastructure or property such as power stations, water treatment facilities, correctional facilities, heavily traveled roadways, government facilities, etc.
- Users should not conduct surveillance or photograph persons in areas where there is an expectation of privacy without the individual's permission (See AMA's privacy policy at http://www.modelaircraft.org/privacy.aspx).

Frequently Asked Questions: Privacy

FAQ 1 WHEN DOES A FLYING DRONE BREACH PRIVACY?

All Alaskans have a reasonable expectation of privacy to live without fear of unwarranted personal invasion. With equal importance, Alaskans enjoy the right to be left alone. The definition for **Reasonable Expectation of Privacy** directly relates to law enforcement requirements to obtain a warrant before actions of search and seizure.

The **United States Constitution Fourth Amendment** forbids the government from performing warrantless and unreasonable searches of any area in which a person maintains a reasonable expectation of privacy. **Alaska's Constitution** guarantees Alaskans the right to privacy. Article 1, Section 22 states, "The right of the people to privacy is recognized and shall not be infringed. The legislature shall implement this section." The legislature has a long-standing history of protecting Alaskans' privacy by instituting **statutes** regarding stalking, harassment, indecent viewing, sending explicit images, and misusing confidential information. The UAS Legislative Task Force (UASLTF) continues to review these protections particularly as they relate to unmanned aircraft systems.

The UASLTF has prepared this document to address privacy guidelines with respect to drones and to educate UAS operators and citizens. We will look at privacy as it pertains to the specific act of intrusion into another's privacy, the prevention of intrusion into one's own privacy, and/or the act of exposing elements of one's privacy against an individual's will. This concept is recognized as "**the right to be left alone.**"

Private Citizen: Please recognize that individuals experience different levels of sensitivity to interruption of privacy. Was the drone flight intentionally directed at you or just passing through? Do you believe the operator of the drone was flying in an inappropriate way? Be as specific as possible so that you can report the incident to local law enforcement.

Drone Operator: Will you be perceived as intruding on someone's privacy? Would you act in-person as you do with your drone? Be courteous and respectful to others.

Disclaimer: The purpose of this publication, "Drone/UAS Operator Safety Guidelines and FAQ's about Privacy" is to provide informational aid and overview of certain federal and state laws that may apply to drone/UAS operation. This publication is not intended to provide legal advice. Please see full disclaimer on first and final pages. Published: Nov 5, 2015

Incident Reporting: FAA Aviation Safety Hotline 907-271-2000 or contact your local law enforcement agency

FAQ 2 MY NEIGHBOR IS SUNBATHING ON HER DECK AND MY SON IS FLYING HIS DRONE...

Although the FAA governs the airspace from the ground up, help your son understand courteous flying so he doesn't disturb the neighbors or fly somewhere he shouldn't. He should never hover over your neighbor's yard.

Know Before You Fly provides recreational flying rules for hobby pilots: the complete rules can be found at www.alaskadrones.org.

Private Citizen: The FAA governs the airspace from the ground up regardless of whether the property owner is private, public, corporate, or government. While we enjoy a sense of privacy on our property, we may not control what occurs above our heads.

Drone Operator: Fly with respect. Don't fly your drone where people typically expect privacy. Don't use your drone to harass people. in public areas, don't invade people's personal space and their solitude.

Example: Someone is flying their drone and interrupting my relaxing evening barbequing in my backyard. They won't stop even when I "shoo" it away...

What Can I Do? Try to identify where the drone operator is located. Provide as much information as possible to local law enforcement. This might be a situation of harassment.

Disclaimer: The purpose of this publication, "Drone/UAS Operator Safety Guidelines and FAQ's about Privacy" is to provide informational aid and overview of certain federal and state laws that may apply to drone/UAS operation. This publication is not intended to provide legal advice. Please see full disclaimer on first and final pages. Published: Nov 5, 2015

Incident Reporting: FAA Aviation Safety Hotline 907-271-2000 or contact your local law enforcement agency

FAQ 3 CAN I SHOOT IT DOWN IF IT'S FLYING OVER MY HOUSE?

Remember that a drone is someone else's personal property. It's best to know:

- Why is a drone flying over your property?
- Is it violating the law?
- Who and where is the drone operator?

If you shoot it down or damage it, you may be liable for:

- Destruction of property
- Discharging a weapon in a restricted area

If you think a drone operator is in violation of the law, immediately contact your local law enforcement agency, and provide as much detail as you can about the encounter.

Private Citizen: The value associated with a recreational drone could be $25 to much more than $1,000. The FAA is rapidly authorizing commercial use, so that a small drone could be carrying specialized equipment and cost more than $100,000. Both the hobby drone and the commercial drone may look very similar as you view it from the ground.

Drone Operator: Before you fly over private property, consider the impact of your flight on someone's privacy. Obtain the owner's permission if you plan to hover and take photos or video. If you do not have permission, data you capture should not exceed what a smart phone could capture from a public viewpoint or area nearby. Avoid flying over populated areas.

What Does Federal Law Say?

18 U.S.C. § 32: Federal law governing the National Air Space states that it is a Federal Offense to discharge a firearm at or in the direction of an aircraft. In effect, anyone purposefully shooting at a UAS, is breaking Federal Law, not just State Law or Local Ordinance. 18 USC 32 states that a person shooting down a government or commercial drone would constitute a violation of 18 U.S.C. § 32, that anyone who damages or destroys any aircraft in flight in the United States has committed a crime punishable by up to twenty years in prison or a fine of up to $250,000.

Federal law states in part: "Whoever willfully…sets fire to, damages, destroys, disables, or wrecks any aircraft in the special aircraft jurisdiction of the United States or any civil aircraft used, operated, or employed in interstate, overseas, or foreign air commerce…shall be fined under this title or imprisoned not more than twenty years or both."

Incident Reporting: FAA Aviation Safety Hotline 907-271-2000 or contact your local law enforcement agency

FAQ 4 WHAT IF A DRONE IS PHOTOGRAPHING THROUGH MY WINDOW OR HOVERING AROUND MY HOUSE?

If you feel threatened or concerned, contact local law enforcement. Alaska has laws that address stalking and "peeping Tom" activities.

Private Citizen: A camera mounted on a drone may be treated in the same way as another camera. If an individual is flying a drone in such a way that you feel violated, local law enforcement should be contacted.

Drone Operator: Enjoy your drone with your family and friends who welcome its presence. When you don't have permission, don't hover and capture images that you couldn't capture on your smart phone while walking down the street, or from a nearby building, or from a manned aircraft overhead.

Welcomed Drone: The family drone hovering and taking a portrait when grandma comes to visit.

Unwelcomed Drone: It wasn't a bad dream and the buzzing sound was not your alarm clock. The drone was spying through the bedroom window. Who knows where the pilot is and how those pictures might be used?

FAQ 5 THE NEIGHBOR IS CHASING MY DOG WITH HIS DRONE!

Although the pet's owner may have introduced his dog to a flying toy, the noise and unfamiliarity of the neighbor's drone buzzing around could frighten Fido and could be considered harassment. If the dog swats the drone out of the sky and chews it up, would it be considered damaging another's personal property or self-defense by the dog? Who is harassing who? Did in incident occur on the dog owner's property or in a public place? There are many factors to consider.

Private Citizen: Know and follow your local animal control laws. If you are in a public area such as a local park, keep your pet away from people flying model aircraft.

Drone Operator: Harassing an animal may come with criminal penalties. Be smart and protect your expensive piece of technology from animals that might view your drone as a threat and attack it.

FAQ 6 WHAT CAN I DO IF THE DRONE'S "BUZZING" IS ANNOYING ME?

A drone typically makes less noise than a standard lawn mower, so fortunately you probably won't find the noise overbearing. But if the noise is annoying, likely the drone is too "near ears" and should be redirected away from people. If the drone is flown during locally recognized waking hours, a drone is probably not in violation of a noise ordinance. If the drone operator is flying too close to people he should be reported to the FAA or local law enforcement for unsafe operations or a situation of harassment.

Private Citizen: Many annoying noises are allowable in both public and private areas. The decibel limit separating acceptable noise level is generally compared to the noise of a standard lawn mower or small engine.

Drone Operator: The drone's buzzing may not be the only problem. The proximity of the aircraft to another person and the length of time in that proximity may be the real issue. **This could be a situation of harassment.**Be courteous to others, don't hover your UAS "near ears," and stay away unless invited.

Incident Reporting: FAA Aviation Safety Hotline 907-271-2000 or contact your local law enforcement agency

FAQ 7 I UNDERSTAND WHY IT'S NOT SAFE TO FLY A DRONE NEAR HEAVY TRAFFIC BUT WHAT ABOUT PRIVACY?

A drone flying near traffic could distract drivers and create unsafe driving conditions including accidents. Drivers should keep their eyes on the road, and drone operators should keep their UAS away from traffic.

Private Citizen: If you see one, keep your eyes on the road. Pull over to report it to local law enforcement if you think it's creating unsafe conditions or collecting data inappropriately.

Drone Operator: Flying over roads can cause distraction and potential automobile accidents on a road system. Not only are drones dangerous over busy traffic but most drivers don't want to be GPS tracked and photographed. Don't fly your drone near high traffic roadways.

FAQ 8 WHAT PRIVACY CONCERNS CAN THERE BE WHEN YOU'RE IN A CROWD?

Sometimes photographing a crowd could result in the capture of inadvertent images. If the drone photographs Captain Blowhole with a catch beyond his limit, that image could be provided to the authorities for legal review.

Private Citizen: Typically, if you're in a crowd, privacy is limited. Although the safety concerns are paramount when a drone is flying above a crowd, the photography could identify something that a citizen would not want shared, such as the map to Clyde's secret fishing hole.

Drone Operator: During the fishing season, don't photograph Clyde's map to his secret fishing hole! Even if something is visible in a public area, realize a person might not want a camera zooming in on him. Clyde would like his fishing hole to remain a secret.

Incident Reporting: FAA Aviation Safety Hotline 907-271-2000 or contact your local law enforcement agency

FAQ 9 WHAT SAFETY CONCERNS ARE MOST PREVALENT AROUND CROWDS?

"No Drone Zone" announcements have been made at public events to insure the safety of participants and the public. Drone operators have been asked to leave their drones at home during many major events such as: the Super Bowl, forest fires, Olympic qualifying meets, and many other crowd-gathering events.

If you want to find restrictions that may have been posted, check with the nearest FAA airport tower or look at https://pilotweb.nas.faa.gov/PilotWeb/ for notices to airmen (NOTAMs) for information regarding manned and unmanned flight events occurring in a designated area.

Private Citizen: Safety concerns are paramount when a drone is flying above a crowd. Many unforeseen circumstances can occur that might result in injury. If you see a drone, stay at least 25 feet away from it.

Drone Operator: If the drone was to fall out of the sky it could injure a bystander. The drone could also compromise the safety of the crowd by interfering with the activity or distracting people, thus rendering them unaware of happenings nearby. Keep your drone a minimum of 25 feet from a person. If a crowd is in the general vicinity of your flight, make sure your drone is far enough away that if the battery dies or you lose control of your UAS that it won't fall on anyone. Never fly your drone over or near a crowd intentionally.

FAQ 10 How will the photos or video be stored or used?

Inappropriate use of images or data captured by technological devices understandably concern Alaskans. If you believe someone has obtained images or data illegally or plans to use them illegally, contact local law enforcement. Be able to answer the following questions: Is the drone operator taking inappropriate images? Are images being used in an inappropriate way? Are the images being used for personal gain? Was personal information stolen?

Examples of inappropriate image gathering could include:

- A drone records your PIN over your shoulder while you are at the ATM.
- A drone records images through your office window of a newly signed contract.
- A drone peers through the window while your child is napping.

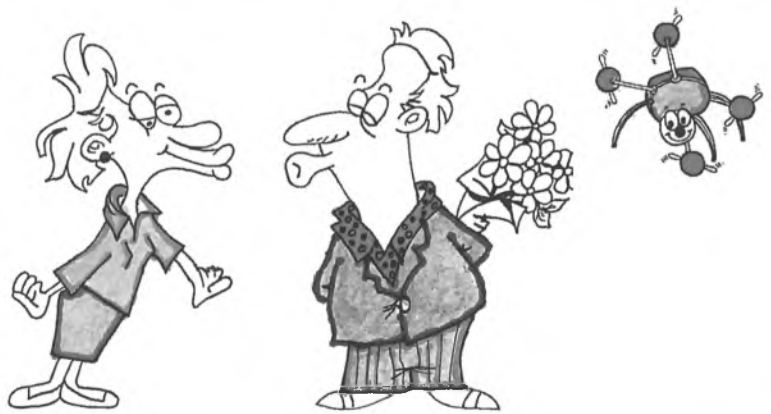
Private Citizen: Many recreational drone operators have posted video and pictures on social media sites. Enjoy this new interesting form of photography. If you come across footage that you believe may be a violation of privacy, contact local law enforcement.

Drone Operator: If you are photographing something with your drone in a place where you would not be welcomed if you were taking pictures in-person, your drone should not be there. Make sure you don't save or post footage that breaches someone's privacy.

FAQ 11 What happens if a drone captures inadvertent images?

Private Citizen: What happens if a drone captures inadvertent images and those images are posted on social media or reveal something questionable? Photographing in a public area could result in capturing an image that may not have been planned. The image of a person not wanting to be photographed may not be a breach of privacy since it occurred in public.

Drone Operator: Be aware of and be sensitive to what you are photographing. Are you capturing proprietary information? If you capture an image of someone appearing to break the law, you may want to surrender images to local authorities. Some people may not want to be photographed and their expectation of privacy could result in an angry situation. Again, if you are photographing something in a place where you would not be welcomed in-person, redirect your drone elsewhere.



Incident Reporting: FAA Aviation Safety Hotline 907-271-2000 or contact your local law enforcement agency

CAN I USE A DRONE FOR MY BUSINESS?

Aircraft continue to advance technologically and many people are waiting for the opportunity to use drones as part of business. Today, the FAA prohibits commercial use of Unmanned Aircraft Systems (UAS) unless the business has been granted a waiver to use the aircraft for specific purposes in the business. Businesses are beginning to receive authorization to use UAS for commercial use.

You must obtain authorization from the FAA if you want to use your drone for commercial purposes. The time will come when safety concerns have been well-vetted and business use will become commonplace, but at this time, you must have prior FAA approval.

Thank you for reviewing these guidelines!
Know your rights and your responsibilities.

Now go enjoy life in a world
where UAS technology is changing daily
and where the UASLTF continues to look out for you!

Incident Reporting: FAA Aviation Safety Hotline 907-271-2000 or contact your local law enforcement agency

Alaskans guard their personal privacy very seriously. How do we define privacy when it comes to Unmanned Aircraft Systems (UAS) commonly known as drones? Because of the rapid development of UAS technology, this question is being contemplated worldwide, and new boundaries must be identified. A threat to safety can be pinpointed more easily because a person can see the aircraft, operator and its effects; on the other hand, a threat to privacy is not so easily pinpointed because it involves thought, sentiment, emotion and perception. It is important operators and citizens understand drone guidelines. This publication was created by the State of Alaska Unmanned Aircraft Systems Legislative Task Force for this purpose.

Read. Share. Enjoy your drone!

MEMORANDUM November 4, 2015

SUBJECT: Airspace and video recording restrictions on unmanned aircraft systems (Work Order No. 29-LS1146)

TO: Representative Shelley Hughes
Attn: Ginger Blaisdell

FROM: Daniel C. Wayne
Legislative Counsel

You have asked two questions.

1. Does the federal government have jurisdiction over private airspace, including the airspace above private dwellings? The answer is yes. Under 49 U.S.C. 40103(a), "[T]he United States Government has exclusive sovereignty of airspace of the United States." In addition, 49 U.S.C. 40103(b)(2) reads, in part:

> **(2)** The Administrator shall prescribe air traffic regulations on the flight of aircraft (including regulations on safe altitudes) for--
>
> . . .
>
> **(B)** protecting individuals and property on the ground;
>
> . . .

Although it is sometimes argued that model aircraft are not "aircraft" for purposes of 49 U.S.C. 40103, the National Traffic Safety Board recently clarified otherwise, as follows:

> Title 49 U.S.C. § 40102(a)(6) defines "aircraft" as "any contrivance invented, used, or designed to navigate, or fly in, the air." Similarly, 14 C.F.R. § 1.1 defines "aircraft" for purposes of the FARs, including § 91.13, as "a device that is used or intended to be used for flight in the air." The definitions are clear on their face. Even if we were to accept the law judge's characterization of respondent's aircraft, allegedly used at altitudes up to 1,500 feet AGL for commercial purposes, as a "model aircraft," the definitions on their face do not exclude even a "model aircraft" from the meaning of "aircraft." Furthermore, the definitions draw no distinction between whether a device is manned or unmanned. An aircraft is "any"

> "device" that is "used for flight." We acknowledge the definitions are as broad as they are clear, but they are clear nonetheless.[1]

Although the federal government has jurisdiction to regulate airspace from the surface on up, private land owners retain certain rights in connection with airspace that is above their property. In *United States v. Causby*, the U.S. Military had begun flying as low as 83 feet above a chicken coop in the Causby family's yard, distressing the chickens so much that some of them died, prompting the family to allege an unconstitutional taking of their property. The U.S. Supreme Court held that a long established common-law rule—that private land owners owned the airspace above their land from the surface to a point extending indefinitely upward—had no place in the modern world.[2] However, the Court said that the military flights were "so low and so frequent as to be a direct and immediate interference with the enjoyment and use of the land."[3] The Court said:

> We have said that the airspace is a public highway. Yet it is obvious that if the landowner is to have full enjoyment of the land, he must have exclusive control of the immediate reaches of the enveloping atmosphere. Otherwise buildings could not be erected, trees could not be planted, and even fences could not be run. The principle is recognized when the law gives a remedy in case overhanging structures are erected on adjoining land.[4]

Gregory S. McNeal, author of *Drones and Aerial Surveillance: Considerations for Legislators* wrote recently of the decision:

> The *Causby* opinion thus created two types of airspace, the public navigable airspace, a "public highway" in which the landowner could not exclude aircraft from flying, and the airspace below that which extends downward to the surface, in which landowners held some right to exclude aircraft. This discussion brings into focus the possibility that a landowner may exclude others from entering the low altitude airspace above their property, and as such may exclude drones (whether government or civilian operated) from entering that airspace. But, if such rights in fact exist, at what altitude are such property rights triggered? Unfortunately there is very little clarity on this point. The Supreme Court referred to this airspace

PINKER

[1] *Huerta v. Pinker*, Docket CP-217, NTSB Order No. EA-5730 (November 17, 2014).

[2] *United States v. Causby*, 328 U.S. 256 (1946).

[4] *Id.*, 264 (1946).

> as the "immediate reaches" above the land, into which intrusions would "subtract from the owner's full enjoyment of the property."[5]

There may be other legal or constitutional protections from unmanned air systems. The U.S. Supreme Court has recognized that an expectation of privacy protecting persons from searches by the government extend to certain areas near a dwelling, including the adjacent "curtilage."[6] The Court described curtilage as follows:

> "At common law, the curtilage is the area to which extends the intimate activity associated with the 'sanctity of a man's home and the privacies of life.'" The protection afforded the curtilage is essentially a protection of families and personal privacy in an area intimately linked to the home, both physically and psychologically, where privacy expectations are most heightened.[7]

In that case, the Court upheld an aerial search by the government from a height of 1000 feet over Ciraulo's private property, however, based on a finding that 1000 feet is within "publically navigable airspace." The Court concluded:

> Any member of the public flying in this airspace who glanced down could have seen everything that these officers observed. On this record, we readily conclude that respondent's expectation that his garden was protected from such observation is unreasonable and is not an expectation that society is prepared to honor.[8]

A year later the U.S. Supreme Court explained that, with regard to curtilage questions, certain factors have bearing on the "centrally relevant consideration—whether the area in question is so intimately tied to the home itself that it should be placed under the home's 'umbrella' of Fourth Amendment protection." The Court said those factors include: (1) "the proximity of the area claimed to be curtilage to the home," (2) "whether the area is included within an enclosure surrounding the home," (3) "the nature of the uses to which the area is put," and (4) "the steps taken by the resident to protect the area from observation by people passing by."[9]

[9] *United States v. Dunn*, 480 U.S. 294, 301 (1987).

In 1986, during the same term as *Ciraulo*, (cited above) the Supreme Court in *Dow Chemical Co. v. United States* confronted the question of whether aerial photography by the government from above an industrial site was a search, and whether the search was subject to the warrant requirement under the Fourth Amendment of the U.S. Constitution.[10] The Court held that "the taking of aerial photographs of an industrial plant complex from navigable airspace is not a search prohibited by the Fourth Amendment."[11] The Court distinguished the facts in *Dow* from hypothetical future cases—where technology might be used to penetrate walls or windows to obtain information that an unaided human eye is not able to obtain—as follows:

> Here, EPA was not employing some unique sensory device that, for example, could penetrate the walls of buildings and record conversations in Dow's plants, offices, or laboratories, but rather a conventional, albeit precise, commercial camera commonly used in mapmaking. The Government asserts it has not yet enlarged the photographs to any significant degree, but Dow points out that simple magnification permits identification of objects such as wires as small as 1/2-inch in diameter.
>
> It may well be, as the Government concedes, that surveillance of private property by using highly sophisticated surveillance equipment not generally available to the public, such as satellite technology, might be constitutionally proscribed absent a warrant. But the photographs here are not so revealing of intimate details as to raise constitutional concerns. Although they undoubtedly give EPA more detailed information than naked-eye views, they remain limited to an outline of the facility's buildings and equipment. The mere fact that human vision is enhanced somewhat, at least to the degree here, does not give rise to constitutional problems. An electronic device to penetrate walls or windows so as to hear and record confidential discussions of chemical formulae or other trade secrets would raise very different and far more serious questions; other protections such as trade secret laws are available to protect commercial activities from private surveillance by competitors.

In some search and seizure cases where "naked-eye" observation was enhanced by technology, courts have found the search to be unreasonable and violative of the Fourth

---

[10] 476 U.S. 227 (1986).

[11] *Dow Chemical Co. v. United States*, 476 U.S. 227, 238 (1986). Note, however, that at least one court has declined to apply *Dow*, as well as *Ciraulo*, (cited above) to search and seizure cases involving an expectation of privacy within a residence, on the basis that a state constitution may provide greater protection of privacy than the protection provided by federal law. *People v. Mayoff*, 42 Cal. 3d 1302, 1310-14, 729 P.2d 166, 170-73 (1986).

Amendment to the U.S. Constitution. For example, as noted in the following excerpt from *Kyllo v. United States,* the Court found that the use of sense-enhancing technology (thermal imaging) to gather information regarding the interior of a home was a search—analogous to a physical intrusion into a home without a warrant—and therefore the evidence obtained should be suppressed. The Court said:

> The present case involves officers on a public street engaged in more than naked-eye surveillance of a home. We have previously reserved judgment as to how much technological enhancement of ordinary perception from such a vantage point, if any, is too much. While we upheld enhanced aerial photography of an industrial complex in *Dow Chemical,* we noted that we found "it important that this is *not* an area immediately adjacent to a private home, where privacy expectations are most heightened."
>
> It would be foolish to contend that the degree of privacy secured to citizens by the Fourth Amendment has been entirely unaffected by the advance of technology. For example, as the cases discussed above make clear, the technology enabling human flight has exposed to public view (and hence, we have said, to official observation) uncovered portions of the house and its curtilage that once were private. The question we confront today is what limits there are upon this power of technology to shrink the realm of guaranteed privacy.
>
> * * *
>
> Where, as here, the Government uses a device that is not in general public use, to explore details of the home that would previously have been unknowable without physical intrusion, the surveillance is a "search" and is presumptively unreasonable without a warrant.[12]

Interestingly, after *Dow* the Court held (in *Florida v. Jardines)* that even when law enforcement's observation of a dwelling is enhanced by a police dog sniffing for evidence after being dispatched to a location within the curtilage surrounding the dwelling, the observation is a search subject to the warrant requirement. The Court said:

> The Fourth Amendment "indicates with some precision the places and things encompassed by its protections": persons, houses, papers, and effects. The Fourth Amendment does not, therefore, prevent all investigations conducted on private property; for example, an officer may (subject to *Katz*) gather information in what we have called "open fields"—even if those fields are privately owned—because such fields are not enumerated in the Amendment's text.

---

[12] *Kyllo v. United States*, 533 U.S. 27, 33 - 41 (2001) (emphasis in original, internal citations omitted).

> But when it comes to the Fourth Amendment, the home is first among equals. At the Amendment's "very core" stands "the right of a man to retreat into his own home and there be free from unreasonable governmental intrusion." This right would be of little practical value if the State's agents could stand in a home's porch or side garden and trawl for evidence with impunity; the right to retreat would be significantly diminished if the police could enter a man's property to observe his repose from just outside the front window.
>
> We therefore regard the area "immediately surrounding and associated with the home"—what our cases call the curtilage—as "part of the home itself for Fourth Amendment purposes."[13]

In that case, the Court acknowledged that private individuals and law enforcement officers alike are free to approach the front door of a dwelling in many instances, without express permission or invitation, but explained limits on that freedom as follows:

> "A license may be implied from the habits of the country," notwithstanding the "strict rule of the English common law as to entry upon a close." We have accordingly recognized that "the knocker on the front door is treated as an invitation or license to attempt an entry, justifying ingress to the home by solicitors, hawkers and peddlers of all kinds." This implicit license typically permits the visitor to approach the home by the front path, knock promptly, wait briefly to be received, and then (absent invitation to linger longer) leave. Complying with the terms of that traditional invitation does not require fine-grained legal knowledge; it is generally managed without incident by the Nation's Girl Scouts and trick-or-treaters. Thus, a police officer not armed with a warrant may approach a home and knock, precisely because that is "no more than any private citizen might do."
>
> But introducing a trained police dog to explore the area around the home in hopes of discovering incriminating evidence is something else. There is no customary invitation to do *that*. An invitation to engage in canine forensic investigation assuredly does not inhere in the very act of hanging a knocker.[3] To find a visitor knocking on the door is routine (even if sometimes unwelcome); to spot that same visitor exploring the front path with a metal detector, or marching his bloodhound into the garden before saying hello and asking permission, would inspire most of us to—well, call the police. The scope of a license—express or implied—is limited not only to a particular area but also to a specific purpose. Consent at a traffic stop to an officer's checking out an anonymous tip that there is a body in

---

[13] *Florida v. Jardines,* 133 S. Ct. 1409, 1414 (2013) (internal citations omitted).

> the trunk does not permit the officer to rummage through the trunk for narcotics. Here, the background social norms that invite a visitor to the front door do not invite him there to conduct a search.[14]

A court may extend an analysis similar to the ones in *Kyllo* and *Florida v. Jardines* to the use of UAS to enhance naked-eye observation of a dwelling. If so, it may determine that an uninvited UAS has very limited legal license to enter the curtilage surrounding a dwelling or from there to observe or record images or sounds that are inside the dwelling.

In *Florida v. Riley*, the U.S. Supreme Court upheld the search of a greenhouse in someone's private yard, conducted from a helicopter flying 400 feet above the yard, partly because the helicopter was flying in what the Court determined was navigable airspace, and since any member of the public would be free to fly over the property and observe from that height, it was not unconstitutional for the government to do so as well.[15] In a concurring opinion, Justice Sandra Day O'Connor said:

> Because there is reason to believe that there is considerable public use of airspace at altitudes of 400 feet and above, and because Riley introduced no evidence to the contrary before the Florida courts, I conclude that Riley's expectation that his curtilage was protected from naked-eye aerial observation from that altitude was not a reasonable one. However, public use of altitudes lower than that—particularly public observations from helicopters circling over the curtilage of a home—may be sufficiently rare that police surveillance from such altitudes would violate reasonable expectations of privacy, despite compliance with FAA air safety regulations.[16]

Very recently, in a case in New Mexico involving an aerial search by the government with a manned aircraft, the New Mexico Supreme Court discussed *Riley* and said:

> First, unobtrusive aerial observations of space open to the public are generally permitted under the Fourth Amendment. Even a minor degree of annoyance or irritation on the ground will not change that result.
>
> . . .
>
> Our second conclusion, however, is that when low-flying aerial activity leads to more than just observation and actually causes an unreasonable intrusion on the ground—most commonly from an unreasonable amount of wind, dust, broken objects, noise, and sheer panic—then at some point

---

[14] *Id.*, 1415 -1416 (emphasis in the original) (internal citations and original footnotes omitted).

[16] *Id.*, 455.

> courts are compelled to step in and require a warrant before law enforcement engages in such activity.
>
> . . . as the U.S. Supreme Court said in *Riley,* an observation will not always be lawful under the Fourth Amendment simply because the plane is operating within navigable airspace. *Riley,* 488 U.S. at 451, 109 S.Ct. 693.
>
> . . .
>
> we conclude that the official conduct in this case went beyond a brief flyover to gather information. The prolonged hovering close enough to the ground to cause interference with Davis' property transformed this surveillance from a lawful observation of an area left open to public view to an unconstitutional intrusion into Davis' expectation of privacy. We think what happened in this case to Davis and other persons on the ground is precisely what *did not* occur in either *Ciraolo* or *Riley* and what *did* occur in both *Oglialoro* and *Pollock.* Accordingly, we hold that the aerial surveillance over Davis' property was an unwarranted search in violation of the Fourth Amendment.[17]

The New Mexico Supreme Court further noted in *Davis*, that New Mexico's state constitution explicitly creates a constitutional right of privacy in that state, and implied that consideration of privacy interests under that provision might require a different kind of analysis than one based on intrusiveness, in a case involving UAS. But the court declined to speculate further about UAS because the case before the Court involved surveillance by manned helicopters.[18] Under art. I, sec. 22, Constitution of the State of Alaska, the "right of the people to privacy is recognized and shall not be infringed," and under art. I, sec. 14, Constitution of the State of Alaska, "unreasonable searches and seizures" are prohibited.[19] The Alaska Supreme Court has held that the right to privacy

---

[17] *State v. Davis*, No. S-1-SC-34548, 2015 WL 6125580, at pages 10 - 13 (N.M. Oct. 19, 2015).

[18] *Id.*

[19] Generally, a warrant is required in order for the state to search private property in Alaska. Alaska courts have recognized exceptions, however, including a search of abandoned property, a search in pursuit of a fleeing felon, a search to avoid destruction of a known sizable item, a pre-incarceration "inventory" search, a search where voluntary consent has been granted, a search in rendering emergency aid, a "stop and frisk" search, and a search incident to arrest. Harrison, *Alaska's Constitution: A Citizen's Guide*, 5th Ed., at 32.

under the Alaska Constitution is broader in scope than that under the federal constitution.[20]

In my opinion, a court in Alaska would consider law enforcement use of a UAS to conduct surveillance inside a dwelling, from a location outside of the dwelling, is a search. Searching a person's home implicates the right to privacy and protection against unreasonable search and seizure under the United States Constitution and the Constitution of the State of Alaska. In *Ravin v. State*, the Alaska Supreme Court found the right to privacy in the home to be a right of the highest importance and most deserving of constitutional protection. In *Ravin*, the Court wrote "[T]he home, then, carries with it associations and meanings which make it particularly important as the situs of privacy. Privacy in the home is a fundamental right, under both the federal and Alaska constitutions."[21]

As noted by the US Supreme Court in *Florida v. Jardines*, cited above, there is a common law right for a member of the public, including a police officer, to approach a residence via the normal methods of ingress and egress. This right can apply even when "No Trespassing" signs have not been posted, according to the Alaska Court of Appeals, in *Michel v. State.*[22] The Court held that "the law presumes that a homeowner generally consents to 'allow visitors to take reasonable steps to make contact with the occupant,'" and this presumption "can be overcome only when a homeowner manifests a clear intent to prohibit all visitors from even approaching the house."[23] In *Michel*, a state trooper approached a residence that was not visible from the highway via a 300-yard-long driveway that had four "no trespassing" signs posted, knocked on the door, and eventually gained a search warrant based on observations made while talking to the homeowner. The court agreed with other state courts that found that "No Trespassing" signs do not, by themselves, manifest a homeowner's intent to keep away all visitors. Under the circumstances of *Michel*—a long driveway in rural Alaska—the court found that a visitor would reasonably conclude that the "No Trespassing" signs were aimed at people who might be tempted to use the driveway as an access route for their own purposes such as hunting, camping, or hiking, and were not directed at prohibiting entry by people visiting for social or commercial purposes.[24]

2. Does the one party consent exception to the legal prohibition on secretly recording a conversation apply to videos? The answer is yes, probably. Generally, the undisclosed recording by one party to a conversation is lawful in the State of Alaska.[25] However, it is difficult to see how this would be applicable to a recording made by a UAS since neither the UAS nor the person operating it is likely to be identifiable as a party to the recorded conversation. Furthermore, the rule applies only to conversations, not to private and nonverbal communication or activities.

According to one recent report:

> UAS, commonly referred to as "drones," can range from the size of an insect—sometimes called nano or micro drones—to the size of a traditional jet. Drones can be outfitted with an array of sensors, including high-powered cameras, thermal imaging devices, license plate readers, and laser radar (LADAR). In the near future, drones might be outfitted with facial recognition or soft biometric recognition, which can recognize and track individuals based on attributes such as height, age, gender, and skin color. In addition to their sophisticated sensors, the technical capability of drones is rapidly advancing.[26]

The evolving surveillance capabilities of drones, and the growth in their affordability and availability, raises a number of issues related to privacy, as it becomes possible for a person to be surveilled in their home by law enforcement and other persons, government and non-government, in a manner and to a degree that has not been possible until recently.

Margot E. Kaminski writes, in *Drone Federalism: Civilian Drones and the Things They Carry*:

> One intuition that frequently arises in privacy cases, both under tort law and under the Fourth Amendment, is that the location of the recording matters. A First Amendment right to record is most likely to outweigh privacy concerns in a public space, where one person's privacy collides with other peoples' experience and memory.[27]

Her prediction that a court may determine that a private individual has a first amendment right under the U.S. Constitution, to make an audio or video recording, is not without

---

[25] *State v. Murtagh*, 169 P.2d 200, 208 (Alaska Ct. App. 1997).

[26] *Congressional Research Report: "Domestic Drones and Privacy: A Primer*," page 3, by Richard M. Thompson II, Legislative Attorney (March 30, 2015).

[27] 4 California Law Review 57, 62 - 63 (2013).

support in case law. One federal court has said:

> "The act of making an audio or audiovisual recording is necessarily included within the First Amendment's guarantee of speech and press rights as a corollary of the right to disseminate the resulting recording. The right to publish or broadcast an audio or audiovisual recording would be insecure, or largely ineffective, if the antecedent act of making the recording is wholly unprotected."[28]

However, when it comes to recordings made by law enforcement, courts in Alaska have focused on the right to personal privacy, under art. I, sec. 22, Constitution of the State of Alaska, and the prohibition, under art. I, sec. 14, Constitution of the State of Alaska, on "unreasonable searches and seizures." In *State v. Glass*, a police informant took part in a private conversation with a suspected drug dealer, while wearing an electronic transmitter so the police could secretly record the conversation.[29] The Alaska Supreme Court upheld a warrant requirement, and holding that "one who engages in a private conversation is . . . entitled to assume that his words will not be broadcast or recorded absent his consent or a warrant."[30] The Court found that at the time of a conversation a party to it knows his or her words might be repeated later by another party who is present, but does foresee that his or her voice will be recorded or broadcast secretly.[31]

In *State v. Page*, the police secretly recorded a drug transaction between a police informant and a suspect, intentionally with only video, no audio, by hiding a camera in the informant's apartment ahead of time.[32] The Court held that a party in a private conversation has a right to visual privacy under the Constitution of the State of Alaska, and the police should have obtained a warrant even though the sound on the video camera was turned off.[33]

In a later case, involving the use of a hidden video camera in a workplace, the Alaska Supreme Court described a two part test for determining whether surveillance assisted by

---

[33] *Id.*

technology is a search. The Court said:

> The United States and Alaska Constitutions prohibit not only unreasonable physical searches, but also unreasonable technological searches. Thus placing a hidden video camera in a house in order to record activities there without a warrant is prohibited just as is a warrantless entry to search for evidence. But not all technological monitoring of places or individuals is regarded as a search for constitutional purposes. Photographing a person as she walks in a public park does not raise constitutional concerns. But photographing a person in an enclosed public restroom stall is a search.[34]
>
> The general test used to determine whether particular technological monitoring is a search is the expectation of privacy test. Under this test courts ask: "(1) did the person harbor an actual (subjective) expectation of privacy, and, if so, (2) is that expectation one that society is prepared to recognize as reasonable?"[35]

The Court said that answering the question posed in the second part of this test requires, in each case, considering the facts, including the police conduct involved, and "assessing the nature of a particular practice and the likely extent of its impact on the individual's sense of security balanced against the utility of the conduct as a technique of law enforcement." The Court determined that the public nature of the location in *Cowles* tipped the balance in favor of the government in that case, noting the following:

> Cowles's desk could be seen by members of the public through the ticket window and the open door, and by her fellow employees who were walking around the office almost continuously during the videotaping. Activities that are open to public observation are not generally protected by the Fourth Amendment. "What a person knowingly exposes to the public, even in his own home or office, is not a subject of fourth amendment protection."[36]

The Court also discussed the difference between private locations and public locations, and said:

> . . . a person engaging in illicit conduct in a doorless restroom stall may have a reasonable expectation that she will not be observed from a hidden vantage point above her, even though it would have been unreasonable for

---

[34] *Cowles v. State*, 23 P.3d 1168, 1170 (Alaska 2001) (internal citations omitted).

[35] *Id.*, (internal citations omitted).

[36] *Id.*, 1171 (internal citations omitted).

> her to expect that she would not be seen through the doorless opening. Where incriminating conduct occurs in a public area, however, participants in that conduct already risk observation, and so have "no constitutional right . . . to demand that such observation be made only by some person of whose presence they [are] aware."[37]

This suggests that in at least some circumstances a person in Alaska may have a right, regardless of the one-party consent exception, against an audio or video recording of their private conduct being made by a person of whose presence they are not aware. This may be further supported by the holding by the Alaska Court of Appeals, in *State v. Boceski*, that when a police officer eavesdrops using only the officer's natural senses, "the prevailing rule is that such uses of the senses 'made from a place where a police officer has a right to be do not amount to a search in the constitutional sense.'"[38] Under the federal wiretap statute, it is unlawful for anyone to intentionally intercept an "oral communication"[39] by a person "exhibiting an expectation that such communication is not subject to interception under circumstances justifying such expectation . . . . "[40] There are various exceptions to the prohibition, including exceptions for one party consent and law enforcement in some circumstances. Alaska has similar prohibitions under AS 42.20.300 - 42.20.390, and a similar exception for one party consent.[41] Nothing suggests that these

---

[37] *Id.*, 1172 (internal citations omitted).

[39] 18 U.S.C. 2511(1)(a).

[40] 18 U.S.C. 2510(2).

[41] AS 42.20.320(a) reads

> (a) Except for a party to a private conversation, a person who receives or assists in receiving, or who transmits or assists in transmitting, a private communication may not divulge or publish the existence, contents, substance, purport, effect, or meaning of the communication, except through authorized channels of transmission or reception
>
> (1) to the addressee or the agent or attorney of the addressee;
>
> (2) to a person employed or authorized to forward a communication to its destination;
>
> (3) to proper accounting or distributing officers of the various communicating centers over which the communication may be passed;
>
> (4) to the master of a ship under whom the person is serving;
>
> (5) to another on demand of lawful authority; or
>
> (6) in response to a subpoena issued or order entered by a court of competent jurisdiction.

prohibitions and (for recording conversations) the one party consent exception do not apply to UAS.

Under AS 12.37 law enforcement is granted authority to secretly intercept private communications and record them electronically, after obtaining a warrant, subject to certain limitations on the use and retention of the recorded information. The electronic recording can be audio or video. The Alaska Supreme Court has said that the legislative history of AS 12.37 was enacted to parallel the federal law under 18 U.S.C. §§ 2510 - 21, which provides for exceptions to the general prohibition against the interception of communications unless at least one party consents.[42] 18 U.S.C. 2511(2)(d) reads:

> (d) It shall not be unlawful under this chapter for a person not acting under color of law to intercept a wire, oral, or electronic communication where such person is a party to the communication or where one of the parties to the communication has given prior consent to such interception unless such communication is intercepted for the purpose of committing any criminal or tortious act in violation of the Constitution or laws of the United States or of any State.

AS 42.20.310 (Eavesdropping) reads:

> (a) A person may not
> (1) use an eavesdropping device to hear or record all or any part of an oral conversation without the consent of a party to the conversation;
> (2) use or divulge any information which the person knows or reasonably should know was obtained through the illegal use of an eavesdropping device for personal benefit or another's benefit;
> (3) publish the existence, contents, substance, purport, effect, or meaning of any conversation the person has heard through the illegal use of an eavesdropping device;
> (4) divulge, or publish the existence, contents, substance, purport, effect, or meaning of any conversation the person has become acquainted with after the person knows or reasonably should know that the conversation and the information contained in the conversation was obtained through the illegal use of an eavesdropping device.
> (b) In this section "eavesdropping device" means any device capable of being used to hear or record oral conversation whether the conversation is conducted in person, by telephone, or by any other means; provided that this definition does not include devices used for the restoration of the deaf or hard-of-hearing to normal or partial hearing.

[42] *Bachlet v. State*, 941 P.2d 200, 208 (Alaska Ct. App. 1997).

Although a one party consent exception under federal or state law may apply in particular circumstances, keep in mind, that, as with any recording made without the consent of all parties, the one-party consent exceptions do not allow unrestricted use of a recording, whether audio or video. And, keep in mind that the warrant requirements under state and federal constitutions, as discussed in *Glass*, *State v. Page*, *Cowles* and the other authorities cited above may further limit the use of a one party consent exception by law enforcement. Finally, notwithstanding the one-party consent, a person may be held liable, criminally or civilly, depending on the facts, for the misuse of recorded audio or video material; the one-party consent exception does not legalize stalking, harassment, or trespass when it would otherwise be a crime.[43]

The SciTech Lawyer (ISSN 1550-3003) is published quarterly as a service to its members by the Section of Science & Technology Law of the American Bar Association, 321 North Clark Street, Chicago, IL 60654-7598. It endeavors to provide information about current developments in law, science, medicine, and technology that is of professional interest to the members of the ABA Section of Science & Technology Law. Any member of the ABA may join the Section by paying its annual dues of $35. Subscriptions are available to nonmembers for $55 a year ($65 for foreign subscribers). Some back issues are available for $12 plus a $3.95 handling charge from the ABA Service Center, American Bar Association, 321 North Clark Street, Chicago, IL 60654-7598; 1-800-285-2221. Requests to reprint articles should be sent to ABA Copyrights & Contracts, copyright@americanbar.org; all other correspondence and manuscripts should be sent to *The SciTech Lawyer* Managing Editor at the address above. For more information, visit www.americanbar.org/publications/scitech_lawyer_home.html. The material published in *The SciTech Lawyer* reflects the views of the authors and has not been approved by the Section of Science & Technology Law, the Editorial Board, the House of Delegates or the Board of Governors of the ABA. MESSAGE FROM THE CHAIR

Michael Hawes

Legislators tend to take out the pen quickly when presented with technology bugaboos. Whether we refer to them as drones, unmanned aircraft, or human-free aerial vehicles (I am going to call them HFAVs, though it is far too late at this stage to coin a new term), the ever-shrinking creations of this flourishing industry face potential new laws and regulations aimed at safety, privacy, and other concerns.

Although HFAVs are not bringing about Orwell's dystopian *1984*, their military origins don't do much to quell concern. Casey Civiello gives us a starting point for understanding why the industry faces significant regulatory pressures in an excellent review of a book that details how HFAVs were developed. Of course, naming an example of a new technology "Predator" will have predictable consequences in the court of public opinion.

Knowing that history, our SciTech members then move to the upcoming challenges at this new intersection of science, technology, and law. Lois Mermelstein guides us through the FAA's proposal for new rules in this area. Before we buy a tiny quadcopter with a gyroscopically stabilized camera to film a family water skiing event, or advise a client who wants to do so, it pays to know the regulations that will soon apply to such toys. Matthew Henshon and Gil Whittemore also step in to help identify how to safely comply with new regulations.

Not sure that the quadcopter really has the capacity to do such filming? Donna Dulo helps us understand the technical capabilities of HFAVs. And, assuming it can, Richard Balough steps us through a possible encounter with a client who wants to be on the cutting-edge of assisted aerial photography. Clients who like to push forward at the technological edge are always in need of SciTech lawyers who keep them from falling. Our section, through *The SciTech Lawyer*, books, webinars, and live conferences, gives our members the tools to serve those clients.

After the clients who want to play come the clients who are concerned about the consequences—and the concern that is the current priority is privacy. Hillary Farber, Janna Lewis, and Lauren Caplan work together to present the different privacy issues resulting not only from an HFAV that can't get above a couple hundred feet in altitude, but also from aerial data collection platforms ranging as high as satellites that collect observation data of unprecedented accuracy. At SciTech, we want to make sure our members have access to the information needed to look at all sides of an issue, and this issue of *The SciTech Lawyer* certainly gives you that. ◆

DRONES ON THE HORIZON!

GETTING READY FOR UNMANNED AERIAL VEHICLES (UAVs)

Published in The SciTech Lawyer, Volume 11, Number 4, Summer 2015. © 2015 American Bar Association. Reproduced with permission. All rights reserved. This information or any portion thereof may not be copied or disseminated in any form or by any means or stored in an electronic database or retrieval system without the express written consent of the American Bar Association.

It is now likely that some of you will be advising clients within 12 months on how to safely and legally comply with new regulations governing unmanned aerial vehicles (UAVs, or more colloquially, "drones").

The UAV story begins back in the early part of the 20th century, but it has really accelerated in the past few years. In the last few months, UAVs have burst into the national consciousness. From General Atomics' Predators circling high above the tribal areas in Pakistan, to last summer's private operator flying his quadcopter through exploding July 4th fireworks,[1] new flying systems were seen everywhere. And from Amazon's proposed package delivery systems to a private operator crash-landing his DJI Phantom on the White House grounds, drones were also over the front-pages and home pages of America's news outlets.

Thanks to a 2012 bill, the Federal Aviation Administration (FAA) is in the process of accelerating the speed of introducing drones into the national airspace. As of press time, more than 489 one-off permits have already been granted. Also, in February the FAA unveiled proposed regulations for light (less than 55 pound) UAVs.

This issue of *The SciTech Lawyer* is designed to familiarize you quickly with drone issues, and to give you a sense of where the industry—and the legal landscape—is headed. We have compiled a diverse and qualified collection of authors to help you understand—from all 360 degrees—where drones are going:

- Privacy issues are often raised in connection with UAVs, and Professor Hillary Farber's "Eyes in the Sky and Privacy Concerns on the Ground" will provide a good primer, as well as touch on what states are doing to protect privacy.
- UAVs are not the only flying objects that can raise privacy issues, however. "Drones to Satellites: Should Commercial Aerial Data Collection Regulations Differ by Altitude?" by Janna Lewis and Lauren Caplan explores the differences—and the similarities—in regulating UAVs and satellites.
- In February, the Federal Aviation Administration published draft regulations for certain (less than 55 pound) UAVs. Lois Mermelstein's "FAA's New Draft Drone Rules" walks you through the proposed rules.
- Related to the draft regulations, the question of defining a UAV is surprisingly complex. Donna Dulo lays out the various classifications of UAVs (and unmanned aircraft systems (UASs) in her "Unmanned Aircraft Classifications: The Foundation for UAS Regulations in the National Airspace."
- Bringing all of these articles back to a real world scenario is the subject of Richard Balough's article, "'So, You Want to Legally Fly a Drone?' How to Counsel a Client."
- And to provide a sense of the history of UAV technology, Casey Civiello reviews the new book, *Predator: The Secret Origins of the Drone Revolution* (Henry Holt and Company, 2014).
- Surely, 2015 is the "Year of the Drone." In addition to this issue, the Artificial Intelligence and Robotics Committee (ST-AIRC) and the SciTech Section will be providing many more opportunities for continued education over the next few months:
  - Many of the authors featured in this issue of *The SciTech Lawyer* will be featured at the ABA Annual Meeting in a Showcase Program entitled "Drones Incoming! Are You Ready for Unmanned Aerial Vehicles (UAVs)?" The program will take place on **Saturday, August 1, 2015, from 8:00–9:30 a.m.**
  - Some of the same issues will be previewed in a CLE teleconference to be held June 22 from 1:00 p.m. to 2:30 p.m. EST. Visit the SciTech website[2] to register.
  - And finally, two[3] of the articles in this issue are in fact excerpted chapters from the forthcoming book from the ABA: *Unmanned Aircraft in the National Airspace: Critical Issues, Technology, and the Law.*[4]

All in all, it's an exciting time to be a lawyer working with technology. We hope that you enjoy this special issue of *The SciTech Lawyer*, and hope you will continue to stay involved in this fast-moving area.◆

Matthew Henshon is a partner in the boutique Boston firm of Henshon Klein LLP. He is chair of the Section's Artificial Intelligence and Robotics Committee and can be reached via email (mhenshon@henshon.com) or Twitter (@mhenshon). Gil Whittemore serves in an of counsel capacity in the Boston office of Rath, Young and Pignatelli, P.C. (www.rathlaw.com), and is a past Chair of the Section.

Unmanned aerial systems (UASs), as compared to planes and helicopters, can pose unique threats to society's expectation of privacy. The very essence of pervasive unmanned aerial surveillance enables users to track the movements of large numbers of people simultaneously, zeroing in on people and places on the streets, in their backyards, and even through the open blinds in their homes. The visual imagery gathered can be stored indefinitely, just like other digital data. In contrast to surveillance by manned aircraft, unmanned aerial vehicles (UAVs) are readily portable and have the ability to hover, fly at various altitudes, and stay aloft for hours or even days at a time. UAVs can be small enough that people on the ground are unaware that they are being watched. Moreover, the breadth and scope of the data a UAV can capture is far greater than the capability of traditional surveillance tools. These capabilities set these devices apart from planes and helicopters, or even closed circuit television (CCTV) and satellite surveillance. The aerospace and robotics industries are developing the technology faster than lawmakers and courts can regulate it. Without legislative action limiting aerial monitoring by unmanned aircraft, the privacy Americans have enjoyed in their movements and activities is threatened.

In 2012, Congress passed the Federal Aviation Administration Modernization and Reform Act, which required the Federal Aviation Administration (FAA) to promulgate regulations for the integration of UAVs into the national airspace.[1] In addition, the law directs the agency to create a five-year road map. In 2013, it was estimated that by 2020, there could be as many as 30,000 UASs occupying national airspace.[2] A significant portion of these remotely piloted vehicles will be owned and operated by law enforcement.

Because of the enhanced aerial perspective an unmanned system provides, law enforcement can amass large amounts of data concerning a target, as well as information on people and places about whom the police have no particularized suspicion. Moreover, the expense of operating and maintaining UAVs is estimated at one-fifth that of operating and maintaining manned aircraft.

Interest in using unmanned aircraft in the civil and commercial arenas is growing exponentially. Last year, Amazon,

one of the largest retail companies in the United States, revealed its intention to use unmanned aircraft to deliver packages as soon as the regulations permit. Film production companies, real estate agencies, farmers, and videographers are keenly interested in conducting aerial photography with unmanned systems. The Association for Unmanned Vehicle Systems International (AUVSI) has estimated that integrating UAVs into US airspace would have an economic effect worth more than $13.6 billion, and create more than 70,000 jobs in the first three years.[3]

The FAA has slowly responded to the chorus of manufacturers and owners of unmanned aircraft systems seeking an expansion of certificates for civil and commercial use. In June 2014, the FAA approved the first commercial use of an unmanned aircraft system for surveying the oil fields in and around the Alaskan pipeline.[4] Similarly, in September 2014 the FAA announced that it would permit six media aerial photo and visual production organizations to use unmanned aircraft.[5] Most notably, on February 15, 2015, the FAA set forth a framework of regulations for small UASs (less than 55 pounds) conducting nonrecreational operations.[6] This is discussed in detail by Lois Mermelstein in her article in this issue, found on page 14.

Federal and State Legislative Activity

While the FAA proceeds with its proposed regulations, there is also activity on the legislative front. Constraints on the use of these powerful aerial observers have been initiated by the White House and lawmakers. On the federal level there is bipartisan concern over the potential for unmanned aircraft to erode personal privacy and civil liberties.[7] Despite a number of Congressional hearings, at present there is no federal legislation regulating the use of unmanned aircraft systems. Perhaps the most comprehensive legislation pending before Congress is the Drone Aircraft Privacy and Transparency Act (DAPTA). DAPTA proscribes limits on the gathering, retention, and sharing of data collected by UAS. It would require that certain disclosures be made as part of the flight approval process, including the identity of the UAV operator; the flight path, the type of data to be collected, and

Published in The SciTech Lawyer, Volume 11, Number 4, Summer 2015. © 2015 American Bar Association. Reproduced with permission. All rights reserved. This information or any portion thereof may not be copied or disseminated in any form or by any means or stored in an electronic database or retrieval system without the express written consent of the American Bar Association.

how the data will be used. Law enforcement agencies would be required to file a "data minimization statement," which would explain how the agency will minimize the collection and retention of data unrelated to the criminal investigation. All this information would be available in a publicly searchable database, including the times and location of all UAV flights, along with disclosures of any data security breaches suffered by a licensee. Moreover, DAPTA would place restrictions on how long the data will be in the possession of the agency that collected it and whether the information can be sold, leased, or otherwise provided to third parties. These measures would add a layer of transparency and accountability to the deployment of unmanned aircraft.

States have responded more quickly than the federal government, all inclined toward restricting the scope and use of unmanned aircraft. At this writing, 18 states have enacted laws ranging from moratoriums on UAS to prohibiting any government official from using an unmanned aerial vehicle without first obtaining a warrant.[8] To date, all but two states have initiated bills and resolutions to regulate the use of unmanned aircraft systems. Efforts to create an enforceable privacy interest are evinced in the titles of the proposed bills: "Freedom From Unwanted Surveillance Act" (Florida),[9] "An Act Relating to Privacy Protection" (Vermont),[10] and "Freedom from Drone Surveillance Act" (Illinois).[11] Almost all of these proposed state laws would require a warrant for government surveillance, with some states allowing for exceptions, such as a high risk of a terrorist attack, search-and-rescue missions, preventing the escape of a suspect, imminent danger to life, or serious damage to property. Other provisions in the proposed laws would include barring the use of unlawfully obtained evidence from criminal prosecution, enforcing civil penalties for noncompliance, and limiting the time that data can be retained by law enforcement agencies.

Hillary B. Farber is an associate professor of law at the University of Massachusetts School of Law in Dartmouth. She can be reached at hfarber@umassd.edu.

More recently, lawmakers have sought to restrict use of unmanned aircraft by private users. Among the 18 states that have passed laws regulating unmanned aircraft, 10 states include restrictions on private deployment of unmanned aircraft.[12] More than half the UAS legislation introduced in 2014 proposed restrictions on private use of UAVs.

When federal regulation on unmanned aircraft systems is enacted, some of the state laws may be preempted by the federal government's intent to "occupy the field."[13] Because use of unmanned aircraft will exist largely in federal airspace, Congress has the authority to set policy over how UASs are operated. This will undoubtedly cause disruption in terms of the enforceability of particular state statutes.

Use of Aerial Surveillance by Law Enforcement and Current Fourth Amendment Jurisprudence

In addition to regulatory and statutory responses, there is also the Fourth Amendment and its application to unmanned aerial surveillance. The Fourth Amendment guarantees "the right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures."[14] If the police unreasonably intrude upon an individual's reasonable expectation of privacy without a warrant or probable cause, the evidence derived from the illegal search will be inadmissible. Conversely, if there has been no "search," then the Fourth Amendment is not implicated. In 1967 the Supreme Court in *Katz v. United States* declared that the Fourth Amendment protects "people not places," a major departure from the pre-existing property rights-based analysis.[15] The Court's decision transformed the way courts assess whether police conduct constitutes a search under Fourth Amendment principles. Justice Harlan's famous concurrence set forth the two-pronged "reasonable expectation of privacy" test. This doctrinal formulation makes investigatory searches by police constitutionally significant if (1) there is an actual expectation of privacy and (2) the expectation is deemed one that society is willing to recognize as reasonable.[16]

Some years following *Katz*, the Court applied its reasonable expectation analysis to observation from the sky. The Supreme Court decided three important aerial surveillance cases involving police-manned aircraft flying at altitudes of 400 and 1,000 feet, taking pictures of private property concealed from ground observation.[17] In all three cases, the Supreme Court found no reasonable expectation of privacy because the observations were made from public, navigable airspace. The Court reasoned that navigable airspace is the equivalent of a public thoroughfare, open to anyone who abides by the regulations governing air travel.[18]

In 2001, the Supreme Court addressed the constitutional relevance of sense-enhancing technology in *Kyllo v. United States*.[19] The case involved police use of a thermal imaging device. Federal agents suspecting the defendant of using high-intensity heat lamps to grow marijuana plants inside his home used a thermal imaging device to detect the heat levels from discrete areas inside his home. Coupled with other information, the police obtained a search warrant for the house and found marijuana plants growing inside. In this very close case the Court determined that the technology used to obtain information regarding the interior of the home was not in "general public use" and therefore constituted a search.

Unmanned aircraft systems and many of the technologies with which they can be equipped, by contrast, are in general public use. Although the regulations for UAS are still being developed, many people own and operate them.[20] One of the more basic platforms is the AR Parrot drone, which retails for under $300 and is available at many commercial outlets. As the price increases, the onboard instruments get more sophisticated, but the Parrot drone itself is equipped with live-streaming video capability and a 720-megapixel camera. The global proliferation of UASs may well dilute the protections enunciated in *Kyllo*, leaving Americans vulnerable to intrusions in and around their homes by government and neighbors alike.

It is plausible that the increased power that technology affords police could prove to be a significant factor in the Court's willingness to extend the reach

This information or any portion thereof may not be copied or disseminated in any form or by any means or stored in an electronic database or retrieval system without the express written consent of the American Bar Association.

of the Fourth Amendment.[21] In *United States v. Jones*, the Supreme Court considered whether the use of a GPS device to monitor Jones' movements constituted a search within the framework of the Fourth Amendment.[22] Five justices expressed a willingness to reassess the legal framework for evaluating long-term electronic monitoring of a person in public.[23] In two notable concurrences, the justices recognized the "quantum of intimate information about a person" that can be obtained from a GPS device with relative ease and little expense.[24]

Moreover, the qualitative and quantitative differences between digital data and physical objects may influence where the Court draws the line between personal privacy and the public domain. In an even more recent case, *Riley v. California*,[25] Chief Justice Roberts emphasized the pervasiveness of cell phones and their capacity to retain and transport the privacies of life. With such significant privacy interests at stake, the Court unanimously voted to require the police to obtain a warrant before searching a cell phone incident to arrest.

It will likely be some time before courts take on the novel legal issues posed by unmanned aircraft. In the meantime, unmanned aircraft systems are becoming a ubiquitous presence in our airspace. Because of the extraordinary capabilities of UAS, they may need their own set of specific legal controls to ensure privacy, avoid infringing upon First Amendment activities, and prevent discriminatory targeting. Striking the right balance is crucial so that society can enjoy the benefits of this technology without sacrificing the privacy and liberties Americans have relied upon for centuries. ◆

DRONES TO SATELLITES

SHOULD COMMERCIAL AERIAL DATA COLLECTION REGULATIONS DIFFER BY ALTITUDE?

BY JANNA J. LEWIS & LAUREN R. CAPLAN

The news and social media commentary of late reveals considerable discomfort with the idea that "drones," or unmanned aircraft systems (UASs), could be used to collect images and data for commercial purposes. The idea that a flying machine—say, a six-inch quadcopter equipped with tiny cameras—might track people or record images and data about their movements and habits strikes many as invasive.[1]

Yet, for all the recent attention on commercial drones, commercial aerial data collection is hardly a new concept. Private companies have been capturing and commercializing images of the Earth and its inhabitants for decades[2]—never mind that hobbyists have been flying cameras on model airplanes long before the term "drone" entered the public lexicon, or that governments have been peering at the planet from space since Sputnik first beeped across the skies.[3]

Indeed, a growing number of commercial operators are using satellites orbiting hundreds of miles above the Earth to gather data and images,[4] a feat generally referred to as "remote sensing." These operators process and sell the information to companies, research institutes, and even government agencies for various commercial and noncommercial uses.[5] Many of the uses are undeniably beneficial, such as weather forecasting and monitoring disaster zones. Other uses, such as monitoring farmland, livestock movements, and energy and mining resources, give businesses an operational edge, while still other uses of satellite data, such as location-based services and detection of traffic patterns for smartphone apps, are now a daily part of life for countless people.

Few would argue that satellites are as easily accessible or potentially intrusive as drones—satellites are much more expensive to develop, operate, and launch, and not nearly as agile as drones. However, with their increasingly sophisticated optics, sensors, and processing technologies, satellites can record places, events, and people with a degree of precision and pervasiveness that is worrisome for data privacy advocates. From the perspective of commercial satellite and drone operators, issues of data privacy and consumer consent to collection of personal data present significant business challenges.

Existing regulations and proposed rules do little to quell these concerns. Different government agencies

promulgate a patchwork of regulatory schemes and guidelines for operation of commercial drones and satellites, which do not consistently address personal data privacy protections.[6] This makes it difficult for private citizens and commercial operators, alike, to know their rights and duties with respect to collection, storage, and dissemination of personal data and images via commercial aerial platforms.

Yet, even as some federal agencies are considering privacy issues in relation to commercial drone use, questions arise as to whether enactment of privacy regulations for aerial data collection should even be a federal initiative.[16] Still, consistent and interoperable privacy protections cannot be achieved at any level if current initiatives do not contemplate all aerial data collection platforms.

To briefly explain, different regulations apply according to the type of aerial platform (such as satellite, aircraft, balloon, or UAS); the altitude at which it flies; the way it got there (such as self-propelled take-off or rocket launch); whether the platform is operated by a private individual, a commercial entity, or a public sector agency (such as the US military or local law enforcement); and the manner of use and distribution of the imagery and data collected. The Federal Aviation Administration (FAA) regulates commercial drones,[7] and an increasing number of states have proposed legislation to govern commercial drone use within state borders.[8] The federal agencies that regulate aspects of commercial satellite use include the National Oceanic and Atmospheric Administration (NOAA)[9] and Federal Communications Commission (FCC).[10]

Existing commercial satellite and drone regulations approach the issue of aerial data collection in various ways, emphasizing different security issues and priorities. However, none expressly contemplates the growing overlap of aerial data collection capabilities by different commercial aerial platforms. This overlap raises questions about whether privacy and data protections should differ according to the altitude at which a data collection platform flies.

Arguably, increased altitude does not mitigate privacy concerns. The 500-foot ceiling recently proposed by the FAA in its Notice of Proposed Rulemaking[11] (NOPR) for commercial operation of small UASs is not the upper limit of aerial data-capture capabilities.[12] Indeed, many commercial drones are capable of operating at altitudes above 500 feet, or even at suborbital altitudes,[13] well above the reach of data privacy regulations that might stem from the FAA's small UAS rules. At the same time, the resolution and quality of imagery and data captured by commercial satellites is steadily improving and increasingly in demand,[14] yet existing data security regulations do not expressly account for technological improvements that implicate personal privacy. It is not far-fetched to imagine that, soon, a single company could operate both satellites and drones for aerial data collection. Under the current regulatory trajectory, that company could be subject to different degrees of data privacy requirements, despite the feasible similarity in images and other data collected by its satellites and drones.[15]

Of course, it's a complicated issue, and there are no easy answers, but there are opportunities to start the discussion now. Privacy initiatives for protecting data collected by commercial drones are in formative stages and are receptive to input from all stakeholders, and there appear to be options for implementing privacy protections for data and imagery collected via commercial satellite without a complete overhaul of the regulations that currently govern commercial satellite systems.

At the request of President Obama,[17] the US Commerce Department's National Telecommunications and Information Administration (NTIA) recently issued a Request for Public Comment (RPC) on formulation of best practices for privacy, transparency, and accountability in the handling and collection of data by commercial and private drones.[18] Managing this effort will be no small task, and it may take years for a final policy to materialize. However, although the RPC is directed to commercial UAS data collection, NTIA provided a framework that could be used to prompt thoughtful discourse on implementing alighned safeguards for aerial data collection, retention, and dissemination, regardless of platform or altitude.

Likewise, although the existing regulations for commercial satellites heavily emphasize national security protections,[19] there might be ways to address privacy concerns about commercial satellite data collection and implement balanced protections through the existing regulatory process.

For example, NOAA, the agency charged with licensing and regulating US private remote sensing space systems,[20] can require specific and enforceable limitations on operational performance of commercial satellites, which can include limitations on data collection and dissemination.[21] Private satellite operators must submit a Data Protection Plan (DPP) as part of their license application to NOAA.[22] In a DPP, a commercial satellite operator must describe its process for protecting data and information through all stages of collection, storage, and dissemination. The DPP must meet certain minimum requirements, but the DPP can be adjusted to accommodate agency needs

and advancements in technology.[23] Just as NOAA requires private satellite operators to describe and adhere to their data security plans, NOAA could require operators to include privacy protections in their DPPs, or similar plans, for imagery and data collected by commercial satellites.[24]

The looming question, then, is what should overarching privacy principles for aerial data collection look like? Who should structure them, and under what mandate? Should commercial drone and satellite operators be required to obtain consent from every person detected by an aerial lens or sensor? If so, when and by what means that will minimize the burden on commercial operators? To avoid regulatory inconsistencies, they would need to be flexible enough to apply to data collected by drones, satellites, aircraft, and even gliders and balloons, and take into account the diverse views, roles, and interests of all stakeholders, public and private alike. They would need to be interoperable with, and deferential to, federal, state, and local regulations and constitutional principles, and should not restrict innovation or inappropriately restrain companies from pursuing commercial opportunities.[25]

There are numerous other important considerations that need attention and analysis, such as whether and under what circumstances compliance should be voluntary, the costs of implementation and management, issues of accountability and enforcement, as well as alignment with international treaties. Components of the existing regulatory framework can be used to address some of these issues, but the discussions need to go beyond commercial UAS operations to include other commercial aerial data collection capabilities.

To be sure, commercial drones and satellites hold tremendous economic potential, and already are spurring growth of vibrant and exciting industries. But the privacy concerns are real. All stakeholders will need to participate in proactive development of balanced rules and policies to address those concerns—ideally, ones that can be implemented consistently across all aerial data collection platforms, current and future, and regardless of altitude.

In principle, people have the right to control the collection, use, and disclosure of their personal data. In the context of online data collection, for example, notice and consent are considered integral elements of personal data protections. But it is not clear that notice and consent would be workable for aerial collection of personal data and imagery. For example, at what stage, and in what manner, should a commercial drone or satellite operator notify consumers that they will collect data, and how would those consumers manifest consent? What, realistically, should a commercial operator do if a consumer declines consent?

7. *See*, FAA Unmanned Aircraft System (UAS) Regulations and Policies, *available at* https://www.faa.gov/uas/regulations_policies/. The FAA also regulates the commercial space transport industry, including commercial satellite launches and reentry, *see, e.g.*, Commercial Space Launch Act, 51 U.S.C. Ch. 509, §§ 50901-23 (2011) and FAA Office of Commercial Space Transportation, Licenses, Permits & Approvals, *available at* http://www.faa.gov/about/office_org/headquarters_offices/ast/licenses_permits/. However, the FAA does not monitor payloads (such as commercial satellites) that are subject to regulation by the FCC or NOAA. Generally speaking, the FAA's jurisdiction ends where space begins.

FAA'S NEW DRAFT DRONE RULES

BY LOIS MERMELSTEIN

In February 2015, the Federal Aviation Administration (FAA) released its long-awaited draft rules for the operation of small unmanned aircraft systems (UASs), popularly known as "drones." Although it seems these systems are already being used everywhere, commercial uses are currently allowed only with individually granted waivers and other exemptions. Commercial uses, in FAA regulations, are generally those involving aircraft operations for compensation or hire (14 CFR 1.1). For drones, these commercial uses could include newsgathering; crop and wildlife monitoring; inspections of power lines, pipelines, bridges, and antennas; aerial photography; and other research and educational activities. The new proposed rules would apply to all of these activities.

The FAA already regulates manned aircraft through Code of Federal Regulations Title 14. Airplanes, helicopters, balloons, and other aircraft are all covered, as well as the pilots, mechanics, airlines, and others who interact with those aircraft. The FAA had also previously (in 1981) issued an Advisory Circular (AC 91-57) that covered recreational model aircraft. But neither type of regulation was appropriate for unmanned aircraft being used commercially. These new requirements would be added as a new part 107 to the existing rules.

For starters, the new rules set a weight limit—under 55 pounds or

Published in The SciTech Lawyer, Volume 11, Number 4, Summer 2015. © 2015 American Bar Association. Reproduced with permission. All rights reserved. This information or any portion thereof may not be copied or disseminated in any form or by any means or stored in an electronic database or retrieval system without the express written consent of the American Bar Association.

25 kilograms, for the aircraft itself and everything on board. Just as for larger aircraft, the responsibility for and ability to see and avoid other traffic is critical. For drones, this means the operator would be required to always keep the drone "in sight." And this means unaided sight—cameras on the drone, binoculars, and other aids (except glasses or contact lenses for the operator) do not count. The FAA clearly has concerns about drones getting too far from the operator and losing the control signal, does not yet trust cameras on the drone to be sufficient for see-and-avoid, and considers current electronic collision avoidance systems to be too heavy for drone applications. Drones would operate only in daylight and would have to avoid any other aircraft.

Conventional airplanes in uncontrolled airspace—away from airports and close to the ground—need only operate with one mile of visibility and clear of any clouds. But drones in the same airspace would have the stricter requirements—three miles visibility, at least 500 feet under and 2,000 feet horizontally from clouds—that are required of other aircraft only in controlled airspace. This is intended to give the drone operator more time to avoid a manned aircraft. For the same reasons, an operator would only be allowed to handle one drone at a time, and not from a moving vehicle or aircraft (although moving boats would be acceptable, because there are far fewer people, and there is less property, over water).

It's also important that drones not interfere with other aircraft operations. To that end, the rules propose they currently be limited to a maximum altitude of 500 feet, staying below where other (manned) aircraft are allowed to be. Drones could operate in controlled airspace (near most airports) only with air traffic controllers' permission, and no faster than 100 mph (or 87 knots). Drones would also have to stay out of restricted or prohibited airspace without permission, just as for larger aircraft.

All aircraft operators have a duty not to endanger the life or property of others by their operations. So, as is required for larger aircraft, no careless or reckless operations would be allowed; operators would have to do a preflight inspection before flight; and drones could not fly if the operator, aircraft, or environment was in a condition that would interfere with safe operation. One difference from larger aircraft is that drones could not operate over people uninvolved in their operation unless the people below were sufficiently protected from potentially falling drones. And while the prohibition against careless or reckless operations for larger aircraft has been in place long enough to accumulate a substantial body of regulatory and court precedent, what it will mean for drones has yet to be tested.

Drone pilots would now be called *operators*, and would be subject to their own rules. Like pilots of larger aircraft, they would have to pass an initial written test, be vetted by the Transportation Security Administration, and obtain an operator certificate. The test would cover regulations, airspace, obstacle clearance, weather, performance calculations for safe flight, aeronautical decision-making, airport operations, and drugs and alcohol—similar to other pilots' requirements, but adapted for drone operations. Just as other pilots are required to undergo periodic flight reviews, drone operators would have to take a written test every two years. Operators would have to be at least 17, like most other pilots, and have to comply with the same alcohol and drug rules as other pilots. All of this is intended to ensure that drone operators remain under the FAA's authority and operrate as other pilots, hopefully ensuring that everyone using the same airspace stays on the same page.

Drones would not need the types of airworthiness certification and maintenance that larger aircraft have. They would require registration and marking like their bigger cousins, though.

Some types of proposed drone operations would specifically not be allowed under the proposed rules. For example, package delivery via drone, such as Amazon has proposed, would be considered an "air carrier" operation that would not be allowed (even if otherwise under the 55-pound limit). However, the FAA is seeking comment on whether such operations could work within its other proposed constraints, such as line-of-sight operation and the ban on flights over uninvolved persons. External-load and towing operations would not be allowed either, but might be in the future. And any operation might still be possible if the FAA grants an individual waiver for it—as it already has in several instances.

Now that the rules are drafted, and more than 3,000 comments have been received, domestic drone operations are poised to expand rapidly. Even non-aviation lawyers should keep up with developments.

The complete proposed rules with FAA explanatory notes are available at https://www.faa.gov/regulations_policies/rulemaking/recently_published/media/2120-AJ60_NPRM_2-15-2015_joint_signature.pdf. ◆

UNMANNED AIRCRAFT CLASSIFICATIONS

The Foundation for UAS Regulations in the National Airspace

BY DONNA A. DULO

The unmanned aerial system (UAS) encompasses a wide range of technologies and aeronautical platforms from the highly sophisticated to the most basic models. The functions, cost, and ability for operators to acquire a UAS vary based on the level of sophistication for each system.

The potential use of UAS technology has grown exponentially over the past few years in the civilian sector. Incorporating lighter composites, advanced embedded electronics, and efficient computational algorithms, the UAS is becoming the platform of choice for increased aerial mobility and functionality for a wide range of operators including police departments monitoring crime to science departments mapping archaeological sites.

The key to UAS use is expanded operations in three-dimensional space. Current UAS technology allows operators to transverse three-dimensional space in a more rapid and customized manner that transcends the current military-based use of the UAS for operations that are too "dull, dirty, or dangerous" for a manned aircraft. Rather, new and innovative uses of unmanned aircraft technologies are facilitated due to the compact and relatively inexpensive nature of unmanned aircraft compared to their manned counterparts. This new-found aeronautical ability for operators enhances real-time situational awareness allowing information to be gathered and disseminated in an exponentially greater manner compared to the past.

The increased information intake allows for significant reductions in decision cycles that results in faster situational resolutions and reduced information product turnarounds. In

Published in The SciTech Lawyer, Volume 11, Number 4, Summer 2015. © 2015 American Bar Association. Reproduced with permission. All rights reserved. This information or any portion thereof may not be copied or disseminated in any form or by any means or stored in an electronic database or retrieval system without the express written consent of the American Bar Association.

essence, new civilian UAS technology has the potential to transform the manner in which agencies and operators do business through enhanced information gathering from a three-dimensional vantage point.

The FAA Modernization and Reform Act of 2012[1] mandates that a plan to integrate UAS technology into US national airspace be developed by the Secretary of Transportation in consultation with the aviation industry and applicable federal agencies. The types of UAS technology are not specified, but rather, the legislation states that agencies will be allowed access to the national airspace as "standards are completed and technology issues are resolved." This plan leaves the technological door open for a wide range of UAS platforms, payloads, and airframe uses in the national airspace. This plan allows for a wide range of flexibility for the FAA to implement the mandates.

FIGURE 1 A Fixed-Wing Unmanned Aircraft[2]

The most basic principle to understand is that a UAS is an aircraft that obeys the same aerodynamic principles as a manned aircraft. In fact, all aircraft theoretically can be remotely operated, ranging from large aircraft such as airliners to high-speed jets. However, unmanned aircraft are distinguished due to their technological design that does not center on a cockpit but rather on their potential mission functionality. Indeed, essentially all unmanned aircraft are designed around their payloads.

Without their payloads, unmanned aircraft would be classified as model aircraft or experimental units. Thus, unmanned aircraft tend to be crafted for specific missions that are evident from the design to implementation, yet their basic technological foundations mirror those of their manned counterparts. The following definitions demonstrate this principle.

The Federal Aviation Administration (FAA) defines an aircraft in the Federal Aviation Regulations (FAR) section 1.1 as, "A device that is used or intended to be used for flight in the air." This definition, which derives its authority from 49 U.S.C. 106(g), 40113, 44701, applies to both manned and unmanned aircraft. The definition of airplane, which emerges from the same authority, is "An engine-driven fixed-wing aircraft heavier than air, that is supported in flight by the dynamic reaction of the air against its wings." This definition rightly applies to both manned and unmanned systems. Exploring this concept a step further under the same authority, the definition of a rotorcraft is "A heavier-than-air aircraft that depends principally for its support in flight on the lift generated by one or more rotors."

Because a UAS can be composed of either fixed-wing or rotorcraft form, all of the above definitions apply perfectly to an unmanned aircraft, because the unmanned aircraft obeys the same three-dimensional aerodynamic principles as its manned counterpart and requires the same basic components to operate in the air. So where is the definitional variance? The definition of unmanned aircraft can be found in The FAA Modernization and Reform Act of 2012, Subtitle B §331:

> An aircraft that is operated without the possibility of direct human intervention from within or on the aircraft.

Thus, it is clear that the sole distinguishing factor of manned and unmanned aircraft from a legal definitional standpoint is the absence of a human pilot onboard the physical aircraft. This is a major legal point as well as a technological reality. Without the human on or inside of the aircraft, its legal role in the national airspace is vastly different than its manned counterpart although they both are aerodynamically and technologically similar.

Types of Unmanned Aerial Systems

There are several ways to classify an unmanned aircraft. Methods of classification vary between the military services, between the military and civilian sectors, and between different countries. In general, it is useful to classify an unmanned aircraft according to three specific criteria:

1. FAA Operational Categories
2. General Airframe Technologies
3. Functional Size Categories.

Each UAS will have a specification within each of the three criteria, allowing for a specific type of identification of the aircraft. This facilitates a general understanding of the performance, range, and maneuverability of the aircraft at an initial glance.

UAS Operational Categories

To begin the discussion of UAS technologies, the three types of civilian operational categories of the UAS as defined by the FAA are as follows:

- Experimental Unmanned Aircraft
- Model Unmanned Aircraft
- Public Unmanned Aircraft

These are the general categories of UAS that currently exist in the rapidly evolving realm of regulatory definitions. While each are considered unmanned aircraft, they have unique characteristics that warrant their own special category.

Experimental Aircraft

Experimental aircraft are unmanned aircraft that serve various experimental purposes such as airframe testing, payload testing, research and development, pilot and aircrew training, academic and educational training,

and systems demonstration aside from air shows and air racing events. Their technologies range from fixed-wing to rotorcraft, to a combination of the two with a plethora of propulsion and payload technologies. The FAA issues special UAS experimental category airworthiness certificates under FAR section 21.191 for operations of experimental aircraft. These aircraft must be operated with full FAA approval. In many cases these aircraft encompass the cutting-edge elements of aeronautical design and development.

Model Aircraft
Model aircraft are recreational unmanned aircraft, with technologies ranging from fixed-wing, to rotorcraft to lighter-than-air models, that are regulated by Advisory Circular AC 91-57 and more currently by the FAA Modernization and Reform Act of 2012 section 336 (Special Rule for Model Aircraft). Section 336 defines a model unmanned aircraft as:

1. capable of sustained flight in the atmosphere
2. flown within visual sight of the person operating the aircraft; and
3. flown for hobby or recreational purposes.

The guidelines for model aircraft in section 336 state that model aircraft are flown strictly for hobby or recreational use, are not more than 55 pounds unless otherwise certified, are operated in a manner that does not interfere with and gives way to manned aircraft, and, when flown within five miles of an airport, the airport operator and air traffic control tower are notified, and mutual arrangements are made. Model aircraft are flown within community-based sets of safety regulations that are based upon national community-based model aircraft organizations. These organizations design, develop, and implement their own safety programs for use in the model aircraft community.

Public Aircraft
Public unmanned aircraft are discussed in section 334 (Public Unmanned Aircraft Systems.) This section provides the provisions for the establishment of unmanned aircraft in the national airspace. While the ultimate size and limits of the aeronautical technologies of public unmanned aircraft are not defined in section 334, the section does permit government public safety agencies to operate small unmanned systems while the issues of the national airspace are being worked out legislatively. Section 334 allows for an agency to operate an unmanned aircraft weighing 4.4 pounds or less if operated:

1. within sight of the operator
2. less than 400 feet above the ground
3. during daylight hours
4. within class G airspace; and
5. outside of five statute miles from any airport, heliport, seaplane base, spaceport, or other location with aviation activities

The above operational categories are general classifications of UAS. These categories can encompass a wide variety of aeronautical designs and capabilities. These designs and capabilities revolve around the choice of airframe as well as the size the of aircraft being used for a particular mission.

UAS Airframe Technologies

When looking at an unmanned system, the airframe is the key determinant to the degree of maneuverability that the aircraft will have in three-dimensional airspace. The speed, range, and maneuverability requirements of a UAS will be key factors in determining the choice of technology used to achieve the required mobility for fulfilling the mission of the aircraft. The size and weight of the payload, too, will determine the choice of a UAS airframe technology, as well as time in air or "persistence" requirements. There are four basic types of UAS airframe technologies, as well as hybrid models, that agencies and organizations will be choosing from to achieve their maneuverability, speed, range, and payload requirements:

1. **Fixed-Wing UAS:** a rigid body aircraft with fixed wings, a fuselage, and empennage that uses forward motion to generate lift and move the UAS through the air.
2. **Rotorcraft UAS:** an aircraft that generates lift through rotating rotor blades that revolve around a mast. A rotorcraft can be in the standard single rotor "helicopter" frame, or the popular quad rotor (or more) airframe, where four or more masts and blade systems propel the aircraft.
3. **Tilt-Rotor UAS:** an airframe that uses a pair of powered rotors mounted on rotating shafts that are located at the end of a fixed aircraft wing. The wing of this aircraft is fixed, but the rotors and pylons on which they are mounted tilt in the order of a 90 degree or better range, allowing for various combinations of horizontal or vertical flight.
4. **Lighter-Than-Air UAS:** an aircraft that uses buoyancy to float through the use of one or more large gas bags or canopies.

The choice of UAS airframes, in addition to the payload requirements, will depend on a careful analysis of long-term mission requirements, cost, and pilot capabilities as well as ground station availability and location.

A good client calls you to ask if they should worry about the legal aspects of using a drone for photography. What do you say?

First, appreciate your client's perspective. Drones can take dramatic videos and digital images that could be used for selling real estate, inspecting construction sites, filmmaking, and finding missing persons.

However, unless the business has obtained special permission from the Federal Aviation Administration (FAA), all of these commercial uses currently are illegal in the United States.

The FAA currently prohibits using drones for any commercial purpose without a special permit, and only a few purposes have been approved. As described in more detail in the article by Lois Mermelstein on page 14 in this issue, the restrictions will continue for the remainder of 2015 as the FAA reviews comments on proposed rules to permit limited commercial use of drones. These proposed rules apply only to drones weighing less than 55 pounds. FAA rules for larger drones still are being developed.

Despite the legal obstacles, the desire to use drones will only increase. The cost of drones, technically unmanned aircraft systems (UASs), has decreased dramatically, and the quality of the onboard cameras continues to increase. Drones range from the very small (less than several ounces) to the size of a small airplane. Most personal drones weigh well under 55 pounds. They can fly several thousand feet in the air and out-of-sight of the operator.

Business Insider reports that over the next decade 12 percent of an estimated $98 billion in global spending on drones will be for commercial purposes.[1] Another report, from the Association for Unmanned Vehicle Systems International, claims that the industry will create more than 100,000 jobs in the United States in the next 10 years.[2]

With a camera attached, a small drone costing $1,000 or less provides a wide range of commercial functions. As functionality increases (such as more sophisticated cameras, infrared devices and the like), the price increases as well. Actual and announced uses for drones include:

- Photographing bridges to detect faults or areas where maintenance is required. Drones can do a more thorough job than an on-the-ground crew.
- Surveying and assessing damage caused by tornados or hurricanes by insurance carriers. Drones give the insurance adjusters access to the damage almost immediately without interfering with search, recovery, and clean-up operations.
- Inspecting oil and gas pipelines, electric transmission lines, and solar panels by flying closer to the pipelines, transmission lines, and solar panels at lower speeds.
- Providing journalists with overhead images of fires, disasters, and other news events.
- Managing crops. Not only can drones take photographs of crops to monitor crop health and development, but drones also may apply fertilizers, insecticides, and other treatments, reducing the need for large, manned crop duster planes.
- Searching for missing persons, especially where the terrain makes it difficult to cover on foot. A drone can cover far more territory in a shorter time.
- Mapping archaeological sites that are not easily surveyed by airplane.
- Photographing homes for real estate agents.
- Delivering packages, as has been announced by Amazon.com.

However, the increased amount and variety of uses raise both safety and legal issues. Although drones are small and lightweight, a collision with an aircraft might cause extensive damage to the aircraft. If a drone is sucked into a jet engine, it could cause engine failure. A drone flying into a helicopter tail rotor could cause the helicopter to go out of control and crash. As one pilot told the FAA, "If one of those things hits us, we're coming down."[3]

Incidents involving drones are increasing. Early this year, a wayward drone made headlines when it crashed on the White House lawn. In a response to a Freedom of Information Act request by the *Washington Post*, the FAA reported that in a five-month period, pilots and air traffic controllers reported 25 instances where drones came within a few seconds or feet of crashing into much larger aircraft, with many of the near misses occurring near large airports.[4]

Recently, the FAA sent cease-and-desist letters to:

- a commercial photographer who used a drone to take aerial photographs of a house for a real estate company.[5]
- a photographer who posted and offered to sell aerial shots taken with a drone of a concert in Chicago's Grant Park.[6]
- a search and rescue organization that used drones to help find missing persons when ground and horseback searches were not successful or the terrain was too difficult for other methods.[7] The FAA argued that, because the organization took donations, it was involved in a commercial operation.
- two journalism schools that were using drones to take pictures for class stories.

According to the FAA, each of the above uses is a *commercial* use subject to FAA regulation. However, if the commercial aspect of the transaction could be eliminated, these actions would be unregulated by the FAA,

Richard C. Balough is the Co-Chair of the Global and Connected Devices Subcommittee of the ABA Cyberspace Law Committee. He is a founding member of Balough Law Offices, LLC, in Chicago, Illinois. He has written extensively on technology and privacy issues, and can be reached at rbalough@balough.com.

although the potential hazard might remain the same. The regulatory category of *commercial* may no longer work.

The ban against commercial drones dates back to a 2007 FAA order, which allows the commercial use of drones only if the operator obtains special FAA permission. In 2012 Congress passed the FAA Modernization and Reform Act, requiring the FAA to integrate drones into the National Airspace System (NAS). The Act directed the FAA to develop a five-year road map for introducing drones into the NAS, to initiate a rulemaking on small unmanned aircraft, and to establish pilot projects.

Some proponents of commercial drones argue that the small craft should be given the same treatment as model aircraft, which are covered by FAA Advisory Circular 91-57, issued in 1981. This circular generally limits operations for hobby and recreational use to below 400 feet, away from airports and air traffic, and within sight of the operator. Some argue that the 2012 Modernization Act confirms drones are model aircraft exempt from regulation if they are flown strictly for hobby or recreational use, weigh less than 55 pounds, are operated in a manner that does not interfere with any manned aircraft, and are flown within visual line of sight of the person operating the aircraft.[8] The distinction between hobby and commercial drones was recognized by the FAA in its initial proposed rules for drones published in February 2015. However, the FAA maintains the right to take enforcement action against model aircraft to protect people and property on the ground. The FAA argues that the model aircraft rules do not apply to commercial uses of drones, regardless of how low they are flying. In other words, *hobby/recreational* and *commercial* may now be overlapping regulatory categories, creating confusion.

In the proposed rules,[9] the FAA attempts to allow the commercial use of drones under 55 pounds while protecting the public and aircraft. The proposed rules limit small UAS to daytime flights, require visual-line-of-sight operations, and restrict altitude to lower than 500 feet.

Because on one hand the FAA does not assert any jurisdiction over the noncommercial use of drones, but on the other hand asserts total jurisdiction over commercial drones, it raises the interesting dichotomy where, if an individual flies a drone to take pictures of her house, her action is not regulated. At the same time, if the same photographs were taken by a commercial photographer for use by a real estate agent selling the house, the activity would be regulated, and—under today's FAA regulations—it would be illegal unless an FAA permit had been obtained. Yet the hazards would be the same.

Until the formal rules on commercial use are finally adopted, businesses may apply to the FAA for special use exemptions, which are subject to public notice and public comment. The FAA has granted authority to several aerial photo and video production companies in the film and television industry to use drones, which weigh about 50 pounds, for their filming. The certificates require that the operators hold private pilot certificates, keep the drones within line of sight at all times, restrict the flights to the "sterile area" on the set, conduct an inspection of the aircraft before each flight, and prohibit operations at night. There are scores of other requests pending.

The ban on commercial drones also grounds drones for news gathering. This has drawn the ire of the media, which argue that the ban violates the First Amendment because news gathering is not a "commercial" use. Rather, the media argue, use of drones benefits the public because the lower-cost aerial photography would help newsrooms bring more accurate and useful information to the public.

Journalists also are concerned about some state laws on drones. For example, Utah criminalizes interference with agriculture operations, which includes "knowingly or intentionally" recording an image of an agriculture operation.[10] This could prevent investigative journalists from photographing a farm as part of an investigative story on agribusiness. Texas prohibits taking photographs of private property "with the intent to conduct surveillance," which might prohibit investigative journalists from using drones over private property.[11]

Several states have enacted legislation regarding the private use of drones. In an interesting twist, Illinois has made it a crime to use a drone "that interferes with another person's lawful taking of wildlife or aquatic life."[12] (For other examples of state regulation of UAVs, see Hillary Farber's article on page 6.) When the FAA does allow commercial use for drones, the use will be subject to laws governing right of privacy, intrusion upon seclusion, and right of publicity for images captured by the drones.

What, then, should a lawyer tell a client who wants to use drones for a commercial use?

The client should be told that the FAA currently bans commercial use of drones in the United States. The client may apply to the FAA for an exception by obtaining a special airworthiness certificate or for a certificate of waiver and authorization. Either process requires a detailed filing, public input, and time. If client does not want to file for a waiver, it could develop the commercial use outside the United States in countries that allow commercial use of drones. Or the client could wait until the FAA's rules on commercial drones are adopted and hope that no one develops and pre-empts the client's use in the interim. ◆

Unmanned Aircraft Classifications

continued from page 18

UAS Size Categorizations

A final category of UAS is the functional-size categorization. This category is particularly important in the legal arena as future airspace operations regulations are likely to revolve around UAS size as well as operational category and airframe. The functional size of a UAS not only determines its robustness in terms of aeronautical capabilities and payload abilities, but also its visibility in the air and its maneuverability. Both of these factors contribute to the safe operation of the aircraft.

FIGURE 2 A Medium-Sized Fixed-Wing UAS[3]

The functional-size categories in the civilian world are arbitrary, except for the small category, which is specifically defined in the FAA Modernization and Reform Act of 2012. The categories are as follows:

- Large UAS
- Medium UAS
- Small UAS
- Micro/Mini UAS
- Nano UAS

These categories cover all airframe types. Additionally, lighter-than-air unmanned aircraft tend to be larger by nature and as such are usually categorized by their specific volume as well as size.

Conclusion

The classification and categorization of the UAS are vital in understanding the operational capabilities of the aircraft. They are also important for understanding the capability, maneuverability, range, and endurance specifications of unmanned aircraft models and airframes. By understanding the operational and size categories, as well as the airframe technologies of UASs, a defined picture of system capabilities can be drawn in order to understand specific applications of unmanned aircraft.

Understanding the technical capabilities of a UAS also aids the legal practitioner in understanding the legal ramifications of the use and implementation of the specific UAS technology. Each airframe as well as airframe-size classification poses specific legal challenges and issues. By understanding these technological specifications, a clearer picture of emerging legal challenges can be gained. ◆

Privacy, Security, and the Internet of Things: The Looming Crisis

— WEBINAR SUMMARY —

REPORTED BY JARED CHANEY

Trying to determine the market size of the Internet of Things is like trying to calculate the market for plastics, circa 1940.
—Michael Nelson, Bloomberg Government & Georgetown University

To address this hot area, the ABA Section of Science & Technology Law presented a webinar, "Privacy, Security, and the Internet of Things: The Looming Crisis," on Tuesday, March 10, 2015.

Jeff Greene moderated the panel. He is senior policy counsel and covers issues including cybersecurity, identity management, and privacy, and works extensively with industry and the government. Jeff currently serves as Vice-Chair of the Homeland Security Committee of the American Bar Association's Section of Science & Technology Law and Co-Chair of the Supply Chain Working Group on the Information Technology Sector Coordinating Council. The panel included the following faculty members.

- Martha Chemas is an attorney, Internet presenter, and blogger. She has worked with Sullivan & Cromwell LLP, Shearman & Sterling LLP, and Covington & Burling LLP in New York and has taught law with Lawline. She is the Co-Chair of the Information Security Committee of the American Bar Association.
- Cheryl A. Falvey is a Washington, DC-based partner and Co-Chair of Crowell & Moring's Advertising & Product Risk Management Group. An experienced trial lawyer, she provides litigation and counseling services, with a focus on brand and consumer protection matters, including product safety, privacy, anticounterfeiting, sweepstakes, promotions, and advertising.
- Kristen Anderson is a staff attorney at the Federal Trade Commission, in the Bureau of Consumer Protection's Division of Privacy and Identity Protection. Her practice focuses on consumer privacy and data security. She has investigated and pursued cases against advertising companies, financial services companies, and others for violations of the FTC Act, Fair Credit Reporting Act, and Gramm-Leach-Bliley Act.

The panel addressed how so many systems on the Internet of Things (IOT) are venerable to infiltration—not only when there are defects that make them susceptible to hacking, but also when the security features are not utilized. Often infiltrations occur when default credentials are used after the initial setup, or when simple passwords, such as 1234, are used. It is often very hard to get people to change or even set up passwords. The number of essential systems that are vulnerable is staggering, from water treatment plants to a range of medical devices. There are very basic things that are not being done to secure the infrastructure of essential systems.

As new devices and systems are being built, they need to be designed with integral security systems. There are several groups and agencies that are looking into how to encourage data security in the next generation of systems. The potential areas of law that will depend on this type of security range from products liability to patents.

In order to prevent, or at least limit, catastrophe, the next generation will need to bring a new understanding to product design. Companies should not only design precautionary safety measures into products, but also include features to detect security breaches. Furthermore, when a manufacturer designs a new product, it must also determine the effective life of the product and exactly how long it is willing to provide support and upgrades. The risk profile for these issue and concerns does not only affect litigation for product issues and regulation enforcement, but also can cause damage to a client's brand.

When examining these issues, it will be important to understand how the government will control its oversight. The FTC is looking at security vulnerabilities for the IOT. The FTC is focused on the rights and security of the consumers' data. They are trying to make sure that no company is violating or failing to safeguard consumers' data security. Because the FTC's goal is not punishment but compliance, after they settle a case they also monitor the company's compliance with the orders.

Overall, security developments in the Internet of Things will have far-reaching ramifications. As new products are developed, privacy and security will have to be built into those products and services at the outset. Transparency and duty to consumers will have to be considered as data security for the IOT with every new development. With more than 100 billion devices expected to be connected to the Internet in the near future, the benefit to consumers will be immense, but data security and privacy legislation will have to develop along with it.

A full recording of the presentation, along with the CLE materials, can be purchased from the ABA at www.americanbar.org/groups/science_technology/events_cle.html. ◆

Jared Chaney is a Material Science Engineer, a law student at St. Thomas School of Law, and a law clerk with Kinney & Lange P.A. He also serves the SciTech Section as Student Liaison. He can be reached at chan7393@stthomas.edu.

ABA SECTION OF SCIENCE & TECHNOLOGY LAW NOMINEES FOR 2015–2016 SECTION OFFICER AND COUNCIL POSITIONS

The Nominating Committee, chaired by Cynthia Cwik, is pleased to announce the following slate of nominees for 2015–2016 Officer and Council positions in the Section of Science & Technology Law.

The Section membership will vote on the slate of candidates during the Section's Annual Business Meeting, which immediately follows the Council Meeting on Friday, July 31, 2015, during the ABA Annual Meeting in Chicago, IL.

Cynthia Cwik will automatically succeed to the position of Section Chair at the completion of the ABA Annual Meeting in Chicago.

CHAIR-ELECT	VICE-CHAIR	SECRETARY	BUDGET OFFICER	DELEGATE	COUNCIL	COUNCIL	COUNCIL
Eileen Smith Ewing	David Z. Bodenheimer	William B. Baker	Garth B. Jacobson	Bonnie Fought	Katherine E. Lewis	Lisa R. Lifshiftz	Joe Pennell

Incoming Section Chair

Cynthia Cwik is a partner with the San Diego office of Jones Day. She has extensive experience in complex litigation and class actions, including mass tort and product liability cases, consumer class actions, and environmental cases. She has particular expertise with cases involving health and science issues, and she has had significant victories in high-profile matters. In one case, Cynthia won motions to exclude the testimony of five of the plaintiffs' experts and had the claims of all of the trial plaintiffs dismissed. A journalist described Cynthia as "formidable" and "the mastermind behind the team's savvy attack." She has been selected seven times as a California "Top Female Litigator" by *The Los Angeles/San Francisco Daily Journal*, and she has been included in *Best Lawyers of America*.

Cynthia is currently Chair-Elect of the ABA Section of Science & Technology Law, Vice-Chair of the Long Range Planning Committee and a member of the Section Council. She has served the Section in various leadership roles, including as Life & Physical Sciences Division Co-Chair and coeditor of the ABA SciTech Section book *Scientific Evidence Review: Monograph No. 9*, published in 2013.

She has been active in other bar and community organizations, including serving as Chair of the Executive Committee of the Yale Law School Association and President of the San Diego Chapter of the Federal Bar Association. Cynthia has made presentations to many organizations, including the Association of General Counsel and the National Judicial College.

Cynthia graduated from Yale College in 1983 (summa cum laude) and from Yale Law School in 1987. She served as a judicial clerk to the Honorable Thomas Meskill on the Court of Appeals for the Second Circuit.

Section Chair-Elect

Eileen Smith Ewing practices law in Boston, where she counsels her life sciences clients on a variety of business transactions, ranging from traditional mergers, acquisitions, and capital financing to complex, cutting-edge product development collaborations and other strategic alliances.

Eileen publishes and lectures frequently on legal issues of interest to the biopharmaceutical and medical device sectors. She is the author of more than 50 publications. Eileen served as coeditor-in-chief and a chapter author of the ABA SciTech Section book *Biotechnology and the Law: A Primer*. She also contributed chapters to two books in the Aspatore Press *Inside the Minds* series: *Life Sciences Mergers and Acquisitions* and *Winning Legal Strategies for Life Sciences Settlements and Negotiations*. Legal Media Group/Euromoney has named Eileen a 2012 and 2013 "Life Sciences Star" in the Financial & Transactional category.

Eileen currently serves as Vice-Chair of the ABA Section of Science & Technology Law, Chair of the Administration Division, Vice-Chair of the Long Range Planning Committee, a member of the Section Council, and a member of the Finance Committee. Past ABA positions include Chair and Co-Chair of the Section's Life and Physical Sciences Division, Chair of the Section's Biotechnology Committee, and member of the ABA Special Committee on Bioethics and the Law. Eileen is an American Bar Foundation Fellow and serves as Co-Chair of the Board of the National Conference of Lawyers and Scientists (American Academy for the Advancement of Sciences).

Eileen received her A.B. in East Asian Studies, summa cum laude, from Harvard University and her J.D. from Columbia University School of Law.

Section Vice-Chair

David Z. Bodenheimer is a Government Contracts partner and litigator in Crowell & Moring LLP's Washington, DC, office, where he heads the Homeland Security practice.

Published in The SciTech Lawyer, Volume 11, Number 4, Summer 2015. © 2015 American Bar Association. Reproduced with permission. All rights reserved. This information or any portion thereof may not be copied or disseminated in any form or by any means or stored in an electronic database or retrieval system without the express written consent of the American Bar Association.

Representing all sizes of technology clients for 32 years, David litigates, counsels, and resolves the full range of issues confronting clients selling to the government. *See, e.g., US v. UTC* (6th Cir. 2015) ($657 million False Claims Act litigation); *BAE Systems*, 2013 CPD § 278 (NextGen airborne jammer protest litigation); *Supreme Foodservice GmbH v. United States*, 109 Fed. Cl. 369 (2013) (injunctive action on $8 billion acquisition); *Health Net Federal Services*, 2009 CPD § 220 ($16 billion protest litigation); *Wynne v. UTC*, 463 F.3d 1261 (Fed. Cir. 2006) ($299 million defective pricing trial/appeal). He authored the *Defective Pricing Handbook* (Thomson West, 2014–15 ed.) and regularly lectures on government contracting, pricing, and fraud matters.

Nationally recognized by Chambers USA in Government Contracts as "a leading lawyer within the cybersecurity space," he advises and trains Fortune 500 companies on cyberlaw and security (NIST standards, cloud, FedRAMP, APT breaches, network audits, and cyber disputes), handles protest litigation on cyber issues, testifies before Congress on cybersecurity, teaches cybercontracting for Federal Publications, and publishes extensively. He currently serves as ABA SciTech Section Secretary; Co-Chair of the Security, Privacy, and Information Law Division; Co-Chair of the Homeland Security Committee; and a member of the Section Council. He also serves as a Public Contract Law Section Committee Co-Chair (Cybersecurity, Privacy, and Data Protection) and as a member of the ABA President's Cybersecurity Legal Task Force.

Section Secretary

William B. Baker is a partner in the Potomac Law Group, PLLC, a Washington, DC-based law firm. He has practiced for more than 30 years in the areas of communications, technology, and postal law, with particular interest in privacy, information law, and marketing communications. He is a frequent author and lecturer on privacy and postal matters. He previously practiced for more than 30 years in the Washington, DC, law firm Wiley Rein LLP.

Bill has served as Budget Officer of the Section of Science & Technology Law since 2012 and as Assistant Budget Officer prior to that. He has served on the Section's Council since 2008. He has chaired or co-chaired several Section committees, including the committee on Telecommunications and Information Services from 1998–2002, the ePrivacy Law Committee from 2003–2008, and the Data Property Rights Committee since 2013. He is a Fellow of the American Bar Foundation.

He has written numerous articles on privacy and technology issues, contributed to several Section publications, and served as a moderator or panelist on a number of Section programs. Bill chaired the Government Affairs Committee of the Northern Virginia Technology Council from 2001–2005 and served on Advisory Committees to the Virginia General Assembly's Joint Commission on Technology and Science from 1997–2005.

Bill holds a bachelor of arts degree in economics, and a juris doctor degree, both from the University of Virginia. He lives in Arlington, Virginia.

Section Budget Officer

Garth B. Jacobson serves as a Senior Government Relations Attorney for CT Corporation. Previous positions include working as an attorney at Preston Gates and Ellis LLP and chief legal counsel to the Montana Secretary of State. As chief legal counsel, he successfully litigated election law cases before the state trial and appellant courts and federal courts. During that tenure, he also served on the state bar committees that drafted business entity legislation including profit and nonprofit corporate acts, revisions to the partnership laws, and the limited liability company act. Additionally, he developed and administered alternative dispute resolution of business name infringements. He served on the Montana Ethics Advisory Commission, on the Board of Trustees of the State Bar of Montana, and as president of the First Judicial District Bar Association.

Garth served as an observer/advisor to various Uniform Laws Commission business entity drafting committees. Currently he participates as an "observer" on the Series LLC drafting committee and the ABA advisor on the Wage Garnishment Committee. He is a member of the ABA Business Law and the Science & Technology Law sections where he serves as co-chair on both ULC Committee and E-filing Committee and LLC Committee subcommittee chair. Garth also serves as SciTech's Assistant Budget Officer. He coauthored an article, "Electronic Service of Process," published in the Spring 2008 *SciTech Lawyer*.

Garth has many years' experience with legal education as a presenter, organizer, or moderator of numerous continuing legal education (CLE) programs. He conducted programs on a variety of topics, including tax law, corporations, LLCs, UCC, service of process, and legal ethics. He also taught business law classes at Carroll College as an adjunct professor, in Helena, Montana.

Garth received a bachelor of arts degree in economics and philosophy, a juris doctorate and a master's degree in public administration from the University of Montana. Additionally, he holds an LLM in Taxation from the University of Washington. He is a member the bar in Washington and Montana. The Counsel of State Governments named him a Toll Fellow. This prestigious national award recognizes outstanding leadership and service in state government.

Garth enjoys rock, alpine, and ice climbing. His climbing resume includes summits of Mt. Rainier, Mt. Hood, Mt. Adams, Mt. Baker, Castleton Tower, and the Snake Dike route on Half Dome, Yosemite. He is a member of the Seattle Mountaineers' climbing program. Additionally, he often creates pottery at Pottery Northwest, where he completed a 10-year term on its board of directors.

Section Delegate to the ABA House of Delegates

Bonnie Fought was a founder and member of the executive team of Connectix Corporation for more than 15 years and served as its chief financial officer, general counsel, and later chief operating officer. Connectix designed, manufactured, and marketed an array of computer software and hardware products. After licensing and selling various technologies, Connectix's primary technology was sold to Microsoft Corporation in 2003.

For the past six years, Bonnie has served as the Section Delegate in the House of Delegates for the Section of Science & Technology Law. In addition, Bonnie is a Past Chair of the ABA Section of Science & Technology Law. She served as the Chair of its Book Publishing Board for three years and as the Section's Budget Officer for three years. Bonnie also served as a member of the ABA's Standing Committee on Technology and Information Systems from 1999–2002, the Standing Committee on Publishing Oversight from 2011–2014 and currently serves on Standing Committee on Continuing Legal Education. Bonnie also serves as the Co-Chair of the SOC Decennial Governance Review Committee.

Bonnie has a J.D from the University of California at Berkeley (Boalt Hall) and was admitted to the California State Bar in 1990.

Section Council

Katherine E. Lewis has worked as an attorney-advisor at the Smithsonian Institution's Office of Contracting since 2012. Prior to working with the Smithsonian, Katherine had a private practice in New York working with solo practitioners, small firms, and large firms on e-discovery matters in addition to representing clients in a variety of practice areas, including copyright and trademark law. Katherine is an active member of the ABA Section of Science & Technology Law. She has been Chair of the Museums and Arts Committee since 2013 and also serves as Vice-Chair of the Program Committee. Katherine was recently recognized as a Rising Star in the Winter 2015 edition of *The SciTech Lawyer*. She previously served as Vice-Chair of the Museums and the Arts Committee and member of the FY2015 Nominating Committee. She is a frequent speaker and guest lecturer and has published articles and essays on matters related to intellectual property, social media, and information technology. Katherine earned her J.D. and LL.M in intellectual property law from the University of New Hampshire School of Law and is licensed to practice in New York, Massachusetts, New Hampshire, and Washington, DC. She earned a bachelor of arts in art history at the University of Connecticut.

Lisa R. Lifshitz is head of Torkin Manes's Technology, Privacy and Data Management Group and a partner in the Business Law Group. She has extensive expertise in preparing and negotiating technology licenses and agreements, including software license, cloud computing, system acquisition and Internet/e-commerce/m-commerce-related contracts. She advises on compliance with Canadian federal and provincial private sector privacy legislation and data management issues. Lisa also provides export control and open source advice on cross-border deals. She has considerable experience helping non-Canadian companies, especially American entities, create appropriate legal agreements for their entry into the Canadian marketplace. Lisa is currently the President of the Canadian IT Association, Canada's national technology law association; Chair of the ABA Business Law Section's Technology Committee; and is a member of the ABA Standing Committee on Technology and Information Systems. Lisa is also on the editorial boards of the ABA's *Business Law Today* and *The SciTech Lawyer*. Lisa is a member of the Section of Science & Technology Law (SciTech) Membership and Diversity Committee and serves as SciTech's Liaison to the Business Law Section. Lisa is a prolific speaker and writer and is the author of the monthly technology column, "IT Girl," for *Canadian Lawyer* magazine. Ranked as a recommended lawyer in Computer & IT Law and Technology Transactions in *The Canadian Legal Lexpert Directory* since 2005, Lisa is also recommended for information technology in *Chambers Global 2015*; recognized by *Best Lawyers in Canada 2015* for Technology Law; as a leading Internet & e-commerce lawyer by *Who's Who Legal: Canada* and *The International Who's Who of Business Lawyers*. In her spare time she sings (badly) in a community choir and loves to travel to remote venues.

Joe Pennell is a senior associate in the Business & Technology Sourcing practice in Mayer Brown's Chicago office. Joe focuses his practice on information technology and managed services transactions, including cloud computing, software licensing and development, and the outsourcing of finance and accounting services, IT infrastructure services and support, managed network services, and application development and maintenance. He is a Co-Chair of the ABA Section of Science & Technology Law's Cloud Computing Committee. Joe was recently recognized as a Rising Star in the Winter 2015 edition of *The SciTech Lawyer*. He graduated from Harvard Law School in 2008 and earned his undergraduate degree in electrical engineering (with high honors) from Michigan State University.

BOOK REVIEW

PREDATOR: THE SECRET ORIGINS OF THE DRONE REVOLUTION

BY RICHARD WHITTLE

Reviewed by Casey Civiello

The date is September 4, 2001, less than a year after the suicide attack on the *USS Cole* in the Yemeni port of Aden. President George W. Bush is holding his first National Security Council Principals Committee meeting since his election. Just prior, the top counterterrorism official at the time, Richard Clarke, directs a note to then-National Security Advisor Condoleezza Rice pleading to extend drone usage beyond mere intelligence gathering by arming the aircraft. Clarke alludes to a feared (and, as we now know, actual) imminent al-Qaeda attack on American lives, warning: "What would those decision makers wish that they had done earlier? That future day could happen at any time" (page 226).

On multiple occasions in the preceding year, Predator unmanned aerial systems, (UASs, or more colloquially, "drones") had silently stalked and captured footage of Osama bin Laden, who was on the verge of becoming an infamous household name. In the months prior the 9/11 attacks, members of "Big Safari," a quasi-secret United States Air Force group of engineers, had scrambled to weaponize the drone with laser-guided Hellfire missiles, and Clarke was determined to cut through bureaucracy and gain authority and guidelines for use of these missiles to kill terrorist threats. The technology remained an afterthought by hardened military officials, viewed as more gimmick than as a functional tool. Pilots directed to Indian Springs, Nevada, to remotely fly the early Predator view the assignment as punishment, sarcastically referring to it as "life at One G." But after 9/11, a new attitude emerged.

In *Predator*, Richard Whittle invites the reader behind the curtain of secrecy surrounding the drone warfare program. He traces the documents and influential players in the struggle to capture funding and implement drone technology, juxtaposed against the rise of al-Qaeda in the Middle East. The account of events humanizes the creation of a silent stalker; balancing a sequential story with technical jargon among a colorful cast of engineers, government officials, and political fixers who together transformed the Predator from a military afterthought to perhaps the world's most valuable intelligence gathering and fear-inducing active weapon, capable of silently stalking and destroying targets anywhere on earth.
