Ms. Chairman and Committee members, I am Stuart Thompson of District 10, a private Alaskan citizen and voter. I am here to testify concerning HCR 6 under the dominate authority of Alaska Constitution Article I, Sections 1&2. Start of my prepared 3 Minute testimony.

This resolution needs considerable work before you pass it out. It is typical of district special interest legislation. I've worked seasonally in Fairbanks before to know. The sponsors have not thought it through and it comes off as another parroted propaganda resolution. Please recall the embarrassing example of the one in 2002 that supported President Bush's manufactured justifications to go to war in Iraq.

Now I do whole-heartedly support establishing a task force to recommend state and federal regulation of unmanned aircraft systems. But it is dumb and unethical not to balance all the special interests currently placed on the task force with actual public representation – such as people with constitutionally-driven interests from, for example, the Interior Alaska Conservative Coalition and the ACLU. Get real please. The current task force membership are not competent, by legal definition, to advise on citizen privacy—openly admitted to be an issue.

On that note, I testify that the following section of the resolution is blatantly false:

"WHEREAS unmanned aircraft systems may present a substantial risk to privacy, but neither the Federal Aviation Administration nor any other state or federal agency currently has specific statutory authority to regulate privacy matters relating to unmanned Aircraft systems"

The sponsors overlook that constitutions are supreme statutory authority—clearly demonstrating the legitimacy of Rep. Wes Keller's Constitutional History Curriculum Bill now before the Senate Judiciary. Alaska's Constitution Article I, Section 14 (Searches & Seizures) & 22 (Right of Privacy) already regulate the use of unmanned aircraft in conducting population surveillance – in a word NOT AT ALL WITHOUT A PROPERLY ISSUED WARRANT. The sponsors also appear to ignore the US Constitution's 4th Amendment that covers the same thing.

Next, the US Constitution's Third Amendment, if given the same legal development that the Commerce Clause has enjoyed, would establish that privacy is the protected right—not just mere protection from forced support of military lodging. Americans have been continually forced to support the quartering of soldiers through their taxes—so the issue addressed by the Third Amendment cannot be an economic one. However, unrestricted quartering of soldiers in private homes is the simplest low-tech method of government surveillance of its population possible. This makes unregulated high tech surveillance just as unconstitutional, regardless of occasional benefits obtained.

This resolution as written starts another end run around our constitutions that you swore to uphold and defend. Please direct it back to the sponsors for substantial correction, or address my concerns in a committee work session.

HCR6 Unmanned Aircraft Task Force

Sponsor Statement

March 19, 2013

HCR6 recognizes the accomplishments of the University of Alaska Fairbanks, Center for Unmanned Aircraft Systems Integration and the research conducted to advance this technology in a safe manner. The research team at the Center has proven that unmanned aircraft can complete tasks more efficiently than traditional means, provide better information, and reduce life safety risks to animals and humans.

HCR6 also recognizes that with new technology comes the need to revisit certain laws to ensure the safety of our citizens and protect their privacy. This resolution forms a task force made up of legislators, government officials, and industry members. The task force will consider recommendations for privacy, appropriate use, and possible remedies for misuse. A preliminary report to the legislature is due in January 2014 and a final report of recommendations due January 2015.

While national news has sparked debate regarding the privacy concerns and the use of "drones" in U.S. National Airspace, Alaska has responsibly used unmanned aircraft for more than ten years. Some privacy concerns are due to limited understanding of this technology and some concerns are justified. The task force will consider regulation already in place by the Federal Aviation Administration and industry codes of conduct while reviewing Alaska state laws to determine the changes that may be necessary to protect the privacy of all Alaskans.

SPECIAL ORDERS: "**Sounds like the title for a new movie**"

Unmanned Aircraft VS Drones

In recent news, we've been saturated with articles about

- drones causing worldwide destruction and killing people,
- we've listened to hours of testimony, and
- even local news reported just yesterday on this seemingly hot topic.

The other side of the story may not be as newsworthy as death and filibustering but it's very exciting for Alaska.

Did you know that unmanned aircraft have been used in Alaska for some years?

This technology is known for taking care of the jobs that are determined "dull, dirty, and dangerous." Unmanned Aircraft Systems (UA Systems) helped with

- guiding the oil tanker to Nome to restock their tank farm for the winter,
- located a downed airplane near Bethel a few months ago, and
- they've even been used for counting sea lions that kept them from being placed on the endangered species list.

The missions UA Systems have successfully completed have protected pilots that would have been flying in inclement weather and have **conducted research in an economical fashion with reduced risk to human and animal lives**.

In the next couple of weeks, we will hear more from the University of Alaska Fairbanks and the ten years of work they've done with UA Systems and Alaska's opportunity to become selected as one of the nation's six test sites. A recent study indicated that the locations **selected as a NASA test site will bring significant growth in jobs, income, and in technological advancements in which Alaska can lead the nation.**

While "big brother" may be what many of us envision, miniature helicopters will not be recording us while singing in the shower. They may, however, fly over a car crash site to clear a highway in half the time of manual investigative methods.

What is the difference between unmanned aircraft systems and drones?

- UAS are aircraft operated without a pilot in or onboard the aircraft.
- Drones are a 'nickname' used by the military where UAS fly on a mission of military intent in a war zone.

I hope that you learn about unmanned aircraft systems with an open mind and an outlook for opportunity for our state. **I'll stop here before you think I'm "droning on" about this topic.**

Alaska Aviation Coordination Council >

About the Council

Purpose:

The Alaska Aviation Coordination Council promotes aviation in Alaska. The Council provides a forum for aviation organizations active in the state to interact with each other and with government organizations. The principle goals of the Council are to:

- Share information among aviation organizations active in Alaska
- Exchange information with government organizations that have responsibilities or impact upon aviation
- Study matters that impact the Alaskan aviation community
- Provide accurate information to government agencies, or other entities, including the general public, concerning the nature and needs of the Alaskan aviation community

Membership:

The Council shall be composed of groups, organizations and individuals representing aviation in Alaska. Each organization represented will have one vote, cast by its official member, who may vote on matters considered by the Council. Additional members may be added upon a majority vote of the Council.

Membership in this council is considered as a public service focusing on contributing to the advancement of aviation. For this reason, each member is expected to recuse him or herself when their personal circumstances are in actual or apparent conflict with the issue at hand.

Officers:

The Council will elect a Chair, Vice-Chair and Secretary from the industry members to serve terms of two-years.
Current officers are:

Chair	Jim Cieplak	Alaskan Aviation Safety Foundation	(907) 360-5544	jcieplak@gci.net
Vice Chair	Dave Palmer	Arctic ATC & Aviation Technologies	(907) 745-5227	arcticatc@mtaonline.net
Secretary	Jane Dale	Alaska Airports Association		jdale@alaska.com

SECTION ANALYSIS
LS0639 version N

An Act establishing a crime for certain uses of unmanned aircraft; restricting the use of unmanned aircraft for collection of information or investigation by peace officers; establishing a task force to study and provide recommendations on the use of unmanned aircraft systems; and providing for an effective date.

Section	Language	Effects of Language
Section 1	adds a new section of uncodified law	
	LEGISLATIVE FINDINGS:	
(1)	the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks has been designing and making control systems for unmanned aircraft systems since 1998 and is a leading research institution at the forefront of developing unmanned systems as cost-effective and readily available research tools;	(1) the UAF has been designing payloads and upgrades for unmanned aircraft systems, testing and evaluating their safety and effectiveness, developing new uses, demonstrating these uses for various potential users, working with the FAA for safe use as well as developing technology to improve safety since 2001. The University has become known throughout the country for its leadership in advancing the state of the art and the safe use of UAS. Recently the importance of this work to the State of Alaska was recognized by the Board of Regents who established the Alaska Center for Unmanned Aircraft Systems Integration - Research, Development, Test & Evaluation, hereafter known as ACUASI, to provide this work for the benefit of the entire State of Alaska. Rationale: UAF started its work in 2001, but ACUASI was only established in Dec 2012. Also, UAF has worked on much more than control systems.
(2)	as the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks has demonstrated, unmanned aircraft systems can be designed for gathering information necessary to protect human life in	(2) UAF is currently researching other technologies being developed and improved for many users including law enforcement, which could potentially use these technologies for a variety of missions including search and rescue, forensic

	search and rescue operations, aiding in the management of resources, including marine mammal and fisheries research, providing humanitarian assistance, providing a platform for scientific research on the Arctic, and for other private and public sector activities demonstrated by the use of an unmanned aircraft system by the Alaska Center for Unmanned Aircraft Systems Integration to assist the United States Coast Guard Cutter Healy and the Russian tanker Renda in delivering fuel to Nome, Alaska in 2012;	recording of scenes, and surveillance missions similarly to how manned aircraft are used today; Rationale: currently the language suggests only that law enforcement could use UAS for surveillance, yet the majority of potential uses for them are both beneficial and completely consistent with how manned aircraft are currently legally and appropriately used
(3)	while government agencies, including law enforcement agencies and universities, may operate unmanned aircraft systems using the Federal Aviation Administration Certificate of Authorization or Waiver process, a civil operator may only operate an unmanned aircraft system under a Federal Aviation Administration Special Airworthiness Certificate for experimental purposes, which does not provide for commercial operations; therefore, no unmanned aircraft systems are being lawfully deployed for commercial purposes;	FAA: UAS Interim Operational Approval Guidance 08-01 section 4.1 Certificate of Waiver or Authorization (COA). COAs are granted for a period of one year or less (for the length of use for a specific project) and each project is evaluated on its individual merits. GAO (Government Accountability Office) 12-889T Unmanned Aircraft Systems states that Using UAS for commercial purposes in not currently allowed in the national airspace.
(4)	the Federal Aviation Administration currently requires the designation of one pilot to be in command of an unmanned aircraft system at all times, and restricts the use by public agencies of unmanned aircraft systems to conduct routine flights over urban or populated areas, operations over heavily trafficked roads or open-air assemblies of people, discharge or drop objects while in flight, and operate without the capability of pilot intervention;	FAA: UAS Interim Operational Approval Guidance 08-01 section 4.1 Certificate of Waiver or Authorization (COA). Requirements and restrictions for use are expressed in section 8.0 Flight Operations.
(5)	the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks has demonstrated that the unmanned aircraft systems can be designed and operated for scientific research, saving human lives, and for use as cost-effective tools for both the public and private sector; however, since unmanned aircraft systems present a substantial risk to privacy when used by law enforcement for surveillance, and given that currently neither the Federal Aviation Administration nor any other state or federal agency has specific statutory authority to	Since unmanned aircraft systems may present new risks to privacy when used by law enforcement for surveillance, and given that updated rules have not yet been promulgated by the FAA or other federal agencies, the legislature finds that, until appropriate rulemaking is completed with input from user groups affected by unmanned aircraft systems, a moratorium on certain uses by law enforcement is appropriate while encouraging other uses of unmanned aircraft systems to proceed. Rationale: While the public believes that "UAS present a substantial risk to privacy"

	regulate privacy matters relating to unmanned aircraft systems, the legislature finds that, until a comprehensive statutory structure can be put in place to protect privacy, controls must be established to preclude the use of unmanned aircraft systems by law enforcement while allowing certain uses of unmanned aircraft systems to proceed.	and that there is a "current lack of controls in place to protect privacy", the basis for that belief is likely overstated. Current rules for law enforcement regarding admissibility of evidence in court and protection of privacy cover the vast majority of cases likely to arise. What we know is there may be gaps that need to be covered with statute, regulations, or ultimately, court cases, and this bill intends to protect against those gaps until better understanding is achieved.
Section 2	AS 11.61 is amended by adding a new section	AS 11 is Criminal Law
	Sec. 11.61.260. Unlawful use of unmanned aircraft.	Creates a new crime
(a)	A person commits the crime of unlawful use of an unmanned aircraft if the person knowingly operates an unmanned aircraft in or on the premises of another person or entity for the purposes of acquiring information by the use of a sensing device that is capable of acquiring data from its surroundings, including by a camera, microphone, thermal detector, chemical detector, radiation gauge, and wireless receiver.	
(b)	This section does not apply to the use of an unmanned aircraft to conduct a search	All law enforcement activity is unauthorized except for:
(1)	under the express terms of a search warrant issued under AS 12.35;	Court issued search warrant
(2)	in accordance with a judicially recognized exception to the warrant requirement in AS 12.35;	
(3)	to monitor public land or an international border;	Public land and international borders
(4)	to monitor private land with the consent of the land owner; or	Private land with consent of owner
(5)	if an imminent risk of harm to life or property exists.	Imminent risk to life or property
(c)	In this section, "unmanned aircraft" means an aircraft that is operated without the possibility of direct human intervention from inside or on the aircraft.	This definition is provided in Public Law 112-95 Sec 331.
(d)	Property used to aid a violation of (a) of this section may be forfeited to the state upon conviction of the offender.	Forfeiture of the aircraft and associated equipment
(e)	Unlawful use of an unmanned aircraft is a class A misdemeanor.	Sentence and fine up to one year in jail and up to $10,000

Section 3	AS 18.65 is amended by adding a new section	AS 18 is Police Protection
	Article 4A. Unmanned Aircraft	
	Sec. 18.65.380. Use of unmanned aircraft in law enforcement.	
(a)	A peace officer or law enforcement agency may not use unmanned aircraft, participate in an investigation in which unmanned aircraft are being used, use information gathered by unmanned aircraft, or otherwise direct the use of unmanned aircraft.	Law enforcement may not use unmanned aircraft
(b)	This section does not apply to the use of an unmanned aircraft for a purpose permitted under AS 11.61.260(b).	Law enforcement can use unmanned aircraft for the exceptions listed above.
(c)	In this section, "unmanned aircraft" means an aircraft that is operated without the possibility of direct human intervention from within or on the aircraft.	This definition is provided in Public Law 112-95 Sec 331.
Section 4	Adds a new section of uncodified law	
	UNMANNED AIRCRAFT SYSTEMS TASK FORCE	
(a)	The Unmanned Aircraft Systems Task Force is created in the legislative branch for the purpose of making recommendations for a statewide comprehensive plan to regulate that use of unmanned aircraft systems for public and private sector purposes.	
(b)	The task force consists of 10 members who, except for those in (1) and (2) of this subsection, shall be appointed jointly by the president of the senate and the speaker of the house of representatives as follows:	
(1)	One senator selected by the president of the senate, who shall serve as co-chair;	
(2)	One representative selected by the speaker of the house of representatives who shall serve as co-chair;	
(3)	The commissioner of transportation	
(4)	The commissioner of public safety	
(5)	The commissioner of natural resources	
(6)	One member representing municipal law enforcement	
(7)	The attorney general or the attorney general's designee	
(8)	The public defender or the public defender's designee	
(9)	The office of public advocacy	

(10)	One member representing the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks.	
(c)	The task force shall, not later than January 15, 2014, submit an initial report to the legislature, and not later than January 15, 2015, submit a final report to the legislature. The reports must include	
(1)	Policy options and recommendations to provide for the use of unmanned aircraft systems while protecting privacy when used by law enforcement, and allowing the use of unmanned aircraft systems for other public and private applications;	
(2)	Recommendations to the legislature and the governor, including draft legislation required to achieve the policy objectives proposed by the task force.	
(d)	The task force shall meet as frequently as necessary to carry out its responsibilities.	
(e)	The task force may request administrative and technical support from the University of Alaska Fairbanks.	
(f)	Members of the task force shall serve without compensation but are entitled to per diem and travel expenses authorized for boards and commissions under AS 39.20.180.	
(g)	The task force terminates on January 15, 2015.	
Section 5	**This act takes effect immediately under AS 01.10.070(c).**

Subject: Re: FW: drone legislation

We will have to look at the Hawaii bill. We had seen OR a bit ago.

While I'm not sure why they defined drones that way, we would not argue the point. However, the exact same definition works if you replace the word "drone" with "manned aircraft". The term weapon authorization is separate. Any aircraft, manned or unmanned, carries some sort of payload, ranging from passengers and baggage to sensors of various types, to weapons. Weapons on domestic aircraft that are not military are prohibited by the FAA Regulation Part 91.15, which specifically prohibits dropping objects from aircraft, and part 91.13 which prohibits careless and reckless use. As a matter of practice, even the law enforcement types we have talked with, nationwide, dismiss without consideration any weaponizing of UAS, and that includes the National Institute of Justice as well as the International Association of Chiefs of Police. So, it would be both unnecessary and redundant to forbid weapons on drones (or UAS, again, our preferred term).

In the military, weapons authorization is what must happen before an individual operator, pilot in this case, is permitted to engage an enemy with lethal force, whether it is a rifle, a shoulder-fired missile, or a bomb or missile from an aircraft. So, a fighter pilot would be given authorization both before takeoff and in flight, depending on the circumstances, to employ the weapons his or her aircraft carries. I'm not specifically knowledgeable on this for law enforcement, but I know they have rules of engagement which would also dictate when and how they use their personal weapons. Since weapons on UAS are categorically excluded by law, protocol, and practice, weapons authorization would not even come up.

Does that help?

Ro

On Wed, Mar 6, 2013 at 2:47 PM, Ginger Blaisdell <Ginger.Blaisdell@akleg.gov> wrote:

If you are entering into an application with HI and OR have you seen their recent legislation regarding drones?

Hawaii is SB783

What does it mean in the definitions of "drone" that it can carry a lethal or nonlethal payload? Is this the weapon authorization?

Thanks again,

Ginger

Hi, Ginger,

Thank you for contacting me. The University of Alaska, primarily Fairbanks, has been working with Unmanned Aircraft Systems for over 10 years. We are currently in the middle of a major proposal to the FAA,

leading the proposal effort for the state as directed by last year's session funding, to become one of six test sites where the FAA will study the safe and proper tools and procedures for integrating these systems into the national airspace. There is a great deal more to this than your questions draw out. Would you be available for a telephone conversation today? I'd like to explain more of the program and also get a more complete understanding of what you need.

Subject: drone legislation

Representative Hughes has requested that I prepare "drone" legislation and I need some basic feedback from your agencies.

What existing statutes authorize your respective agency the ability to use drones? (DOTPF might be FAA regulation)

What purposes do you currently use drones and what purposes would you anticipate the need for drone use?

What restrictions do you currently impose on drone use (size, power/speed, functional capacity such as, cameras, infrared, weapons, microphones/announcements, quieting technology, etc.)

I've read HB159 but it seems to focus more on admissible evidence where Rep Hughes would like to provide specific provisions for use of drones (and possibly include admissible evidence).

I need any feedback you can give by tomorrow as the bill drafters are beginning right away. We are hoping to introduce legislation next week.

Thank you

Ginger

Subject: RE: drone legislation

All aircraft are regulated by the FAA. Remotely Piloted Aircraft, RPAs, are specifically identified by the FAA.
There are altitude requirements that must be met. The University of Alaska operates a program dedicated to small RPAs. They fly under 500 feet and must be within sight of the operator, just like a remote controlled air plane operated by a hobbyist. They must also not fly within 3 miles of an active air field.
Any RPAs we operate are on federal military installations used for security of the base. Fort Greely is a good example. It is easier to patrol the fence with an RPA, and allows another way to keep eyes in the field without having the presence of a humvee or a sus-v.
We only have RPAs that are military property and operated under military command and control on a base. We do not have the ability to take that federal property outside the wire to use for State of Alaska needs.
I really think the issue is not flying an RPA, but what type of sensors are being used to gather information and where that information is going. I know there is a large remote control group in the Mat-Su that could be impacted by some legislation, so please consider them before you move forward.
Thanks.

Subject: drone legislation

Representative Hughes has requested that I prepare "drone" legislation and I need some basic feedback from your agencies.

What existing statutes authorize your respective agency the ability to use drones? (DOTPF might be FAA regulation)
What purposes do you currently use drones and what purposes would you anticipate the need for drone use?
What restrictions do you currently impose on drone use (size, power/speed, functional capacity such as, cameras, infrared, weapons, microphones/announcements, quieting technology, etc.)

I've read HB159 but it seems to focus more on admissible evidence where Rep Hughes would like to provide specific provisions for use of drones (and possibly include admissible evidence).

I need any feedback you can give by tomorrow as the bill drafters are beginning right away. We are hoping to introduce legislation next week.

Thank you
Ginger

Subject: RE: drone legislation

Esther,

Please see Tom's comments below and let us know if you need anything more. As you know, Tom is our Chief of Fire and Aviation at DOF, but the context might be helpful to Ginger.

Chris...this is what I wrote up this morning. It is "off the cuff" as I would talk directly with Poker Flat on this for more detail. However, let's see if this will work.

What *existing statutes authorize your respective agency the ability to use drones? (DOTPF might be FAA regulation)*

The Division of Forestry and the interagency wildland fire community works cooperatively with the University of Alaska at Poker Flats. Poke Flat is the operator of the drone(s) and has the authorization to do so.

What purposes do you currently use drones and what purposes would you anticipate the need for drone use?

The Division of Forestry's WIldland Fire Program has utilized drones on several occasions on an interagency basis on large fires. We also have worked cooperatively with the University of Alaska at Poker Flats to apply and improve drone application in fire management. There most important and only use has been on large fires when smoke or weather conditions have prohibited more conventional aerial support. Often times weather conditions that prohibit conventional flying and fire monitoring may persist for long periods of time. Using Forward Looking Infrared Technology (FLIR), a drone has allowed an incident management team to utilize data to search for fire perimeter growth and improve mapping capabilities.

Aerial reconnaissance for fire behavior, perimeter growth, and mapping are the current applications. In the future, fire detection, communications (repeater), suppression effectiveness (line construction) and weather monitoring are potential applications.

What restrictions do you currently impose on drone use (size, power/speed, functional capacity such as, cameras, infrared, weapons, microphones/announcements, quieting technology, etc.)

Drones provided to the Division of Forestry and the incident management teams have been small and self contained. The unit is launched and captured on incident. It is controlled by a mobile until and flown by computer with an operator on incident. Usage has been limited to remote areas where they have not interfered with regular air traffic.

One limitation we operate under:

When flying drones in support of fire reconnaissance, FAA regulations impose the same restrictions on pilots that are flying in conventional aircraft. A typical large fire has a significant "air show" in the form of helicopters,

air tankers, air attack, etc. We would typically limit any drone operation outside of our operational period of sixteen work hours. FAA regulations allow a pilot to fly eight hours within a fourteen hour availability day. Incorporating a drone operation in fire management within the timeframes most valuable for data collection, before the operational period and after the operational period, a drone operation then needs two operators. Two operators are not always available with the operation we use. This regulation limits our data collection opportunities.

Subject: FW: drone legislation

I may be way off base but I imagine the only divisions within DNR that might possibly even use drones would be DGGS, DMLW and DOF. If you do, can you answer the questions posed below and if you don't, just let me know ☺

VIRGINIA ACTS OF ASSEMBLY — CHAPTER

An Act to place a moratorium on the use of unmanned aircraft systems.

[S 1331]

Approved

Be it enacted by the General Assembly of Virginia:

1. *§ 1. No state or local agency or organization having jurisdiction over criminal law enforcement or regulatory violations, including but not limited to the Department of State Police, and no department of law enforcement as defined in § 15.2-836 of the Code of Virginia of any county, city, or town shall utilize an unmanned aircraft system before July 1, 2015.*

Notwithstanding the prohibition in this section, an unmanned aircraft system may be deployed before July 1, 2015, when an Amber Alert is activated pursuant to § 52-34.3 of the Code of Virginia, when a Senior Alert is activated pursuant to § 52-34.6 of the Code of Virginia, when a Blue Alert is activated pursuant to § 52-34.9 of the Code of Virginia, or for the purpose of a search and rescue operation. In no case may a weaponized unmanned aircraft system be deployed or its use facilitated by a state or local agency in Virginia.

The prohibitions in this section shall not apply to the Virginia National Guard while utilizing unmanned aircraft systems during training required to maintain readiness for its federal mission, when facilitating training for other United States Department of Defense units, or when such systems are utilized to support the Commonwealth for purposes other than law enforcement, including damage assessment, traffic assessment, flood stages, and wildfire assessment.

Subject: RE: Leg. Research: Drones
Attachments: FAA 91-57.pdf; FAA 4910-13.pdf; FAA Guidance 08-01.pdf

Hi Ginger –The FAA is in the process of developing classifications for drones but have not yet published direction to that end. The agency's current working definitions are below.

The distinguishing characteristics between drones (unmanned aircraft systems to the FAA) and model aircraft is not necessarily the vehicles but rather their intended use, although the FAA Reauthorization of 2012 prohibits the FAA from regulating vehicles flown for hobby or recreational use that are 55 pounds or less (details below). The classes of use are public (law enforcement, etc.), civil/commercial (private businesses), and model/hobby. Each of the three classes has different requirements (see attached FAA clarification document 4910-13), with public and civil/commercial uses strictly regulated and requiring certification by the FAA. By contrast, flight by hobbyists comes with fewer regulations; however, operators are barred from use in certain areas and are not allowed to charge for services.

There is no widely-accepted classification system or series of definitions for drones of which I am aware beyond calling them small, medium, and large. Legislative Legal may be better equipped to recommend definitions for potential legislation. Sorry I can't be more definitive than what the FAA has issued below.

From FAA Interim Operational Approval Guidance 08-01 (http://www.faa.gov/about/initiatives/uas/reg/media/uas_guidance08-01.pdf):

> **Unmanned Aircraft:** A device used or intended to be used for flight in the air that has no onboard pilot. This includes all classes of airplanes, helicopters, airships, and translational lift aircraft that have no onboard pilot. Unmanned aircraft are understood to include only those aircraft controllable in three axes and therefore, exclude traditional balloons.

From FAA website (http://www.faa.gov/news/fact_sheets/news_story.cfm?newsId=14153):

> **Model Aircraft**
> Recreational use of airspace by model aircraft is covered by FAA Advisory Circular 91-57, which generally limits operations to below 400 feet above ground level and away from airports and air traffic. In 2007, the FAA clarified that AC 91-57 only applies to modelers, and specifically excludes individuals or companies flying model aircraft for business purposes.

Expanded discussion of model aircraft makes from the FAA's clarification of policy under 14 CFR 91 regarding unmanned aircraft systems:

> In 1981, in recognition of the safety issues raised by the operation of model aircraft, the FAA published Advisory Circular (AC) 91-57, Model Aircraft Operating Standards for the purpose of providing guidance to persons interested in flying model aircraft as a hobby or for recreational use. This guidance encourages good judgment on the part of operators so that persons on the ground or other aircraft in flight will not be endangered. The AC contains among other things, guidance for site selection. Users are advised to avoid noise sensitive areas such as parks, schools, hospitals, and churches. Hobbyists are advised not to fly in the vicinity of spectators until they are confident that the model aircraft has been flight tested and proven airworthy. **Model aircraft should be flown below 400 feet** above the surface to avoid other aircraft in flight. **The FAA expects that hobbyists will**

> **operate these recreational model aircraft within visual line-of-sight.** While the AC 91-57 was developed for model aircraft, some operators have used the AC as the basis for commercial flight operations. [emphasis added]

Importantly, according to a report by the Government Accountability Office, the FAA Reauthorization Act of 2012 prohibits the agency from promulgating regulations where the aircraft in question is:

> (1) flown strictly for hobby or recreational use, (2) operated in accordance with a community-based set of safety guidelines and within the programming of a nationwide community-based organization, (3) limited to not more than 55 pounds (unless otherwise certified through a design, construction, inspection, flight test, and operational safety program administered by a community-based organization), (4) operated in a manner that does not interfere with and gives way to any manned aircraft, and (5) when flown within 5 miles of an airport, prior notice of the operation is given to the airport operator and the air traffic control tower. (GAO 12-889, http://homeland.house.gov/sites/homeland.house.gov/files/Testimony-Dillingham.pdf)

To be clear, however, the FAA currently has no codified regulations regarding model aircraft.

Guidance 08-01, Circular 91-57, and clarification document 4910-13 are attached.

HOUSE BILL NO. 159

IN THE LEGISLATURE OF THE STATE OF ALASKA

TWENTY-EIGHTH LEGISLATURE - FIRST SESSION

BY REPRESENTATIVES KAWASAKI, Tuck

Introduced: 3/5/13
Referred: State Affairs, Transportation, Judiciary, Finance

A BILL

FOR AN ACT ENTITLED

"An Act relating to the admissibility of evidence acquired through the use of an unmanned aerial vehicle; establishing a crime for certain uses of unmanned aerial vehicles; and restricting the use of unmanned aerial vehicles for collection of information or investigation by peace officers and other government agents."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

* **Section 1.** AS 09.25 is amended by adding a new section to read:

Sec. 09.25.052. Inadmissibility of information acquired by unmanned aerial vehicle. (a) In a civil action or proceeding, information obtained from the unlawful operation of an unmanned aerial vehicle is not admissible as evidence and may not be used for any purpose except as provided under AS 11.61.260 and AS 18.65.900.

(b) In this section, "unmanned aerial vehicle" has the meaning given in AS 11.61.260.

* **Sec. 2.** AS 11.61 is amended by adding a new section to read:

Sec. 11.61.260. Unlawful use of unmanned aerial vehicle. (a) A person commits the crime of unlawful use of an unmanned aerial vehicle if the person knowingly operates an unmanned aerial vehicle in or on the premises of another person or entity for the purpose of acquiring information by the use of a sensing device that is capable of acquiring data from its surroundings, including by a camera, microphone, thermal detector, chemical detector, radiation gauge, and wireless receiver.

(b) This section does not apply to the use of an unmanned aerial vehicle to conduct a search

(1) under the express terms of a search warrant issued under AS 12.35;

(2) in accordance with a judicially recognized exception to the warrant requirement in AS 12.35;

(3) to monitor public land or an international border; or

(4) to monitor private land with the consent of the landowner.

(c) In this section, "unmanned aerial vehicle" means an aircraft that is operated without direct human intervention from inside or on the aircraft.

(d) Unlawful use of an unmanned aerial vehicle is a class A misdemeanor.

* **Sec. 3.** AS 12.45 is amended by adding a new section to read:

Sec. 12.45.038. Inadmissibility of information acquired by unmanned aerial vehicle. (a) In a criminal action or proceeding, information obtained from the unlawful operation of an unmanned aerial vehicle is not admissible as evidence and may not be used for any purpose except as provided in AS 11.61.260 and AS 18.65.900.

(b) In this section, "unmanned aerial vehicle" has the meaning given in AS 11.61.260.

* **Sec. 4.** AS 18.65 is amended by adding a new section to read:

Article 13. Use of Unmanned Aerial Vehicles.

Sec. 18.65.900. Use of unmanned aerial vehicles. (a) Except as provided in (b) of this section, a government employee or agent, including a peace officer, may not participate in an investigation in which an unmanned aerial vehicle is being used, or otherwise direct the use of an unmanned aerial vehicle.

(b) This section does not apply to the use of an unmanned aerial vehicle for a purpose permitted under AS 11.61.260(b).

(c) In this section, "unmanned aerial vehicle" has the meaning given in AS 11.61.260.

Report Topic Use of drones by non-military authorities in the USA

If related to a bill, please provide the bill number:
Please provide a date if the report is needed for a hearing or meeting: ASAP for bill drafting

Type Your Question or Questions Below

Please provide as much information as possible; use additional sheets if necessary. (See Tips for Requesting Research).

I would like to know the use of drones by non-military authorities in the USA to use examples or definitions of use in legislation being drafted currently. Expedited research is desirable because Rep Hughes would like the bill drafted and introduced as soon as possible.

Please note that the more we know about the overall purpose behind the request, the better able we are to focus our approach and to judge whether what we're finding is relevant to your needs. We also appreciate your sharing any background information you've already found, such as names and phone numbers of authorities, and citations to, or copies of, pertinent documents.

Additional Information (Overall Objective, Sources contacted, etc.)

Research Brief

TO: Representative Shelley Hughes
FROM: Chuck Burnham, Legislative Analyst
DATE: March 6, 2013
RE: Drone Aircraft
LRS Report 13.269

You asked about measures to limit the use of unmanned aerial vehicles commonly known as "drones." Specifically, you wanted to know whether federal, state, and local governments have placed restrictions on the use of drones to collect data on citizens and if they have barred that information from being introduced as evidence in court proceedings. You also asked if states have restricted access to airspace for drones.

Briefly, neither Congress nor any state legislature has yet directly restricted the use of drones, although measures to do so are being considered across the country. At present, drone flight is closely regulated by the Federal Aviation Administration (FAA), which holds primacy over the use of the skies over all U.S. territory. In recent legislation Congress required the FAA to streamline the process by which unmanned aircraft are permitted; however, the Administration, like policymakers and other interested parties, is facing difficulty balancing security and privacy concerns with the practical and economic promise of drones.

As you know, unmanned aircraft systems (UAS), or "drones," have no onboard pilot and are operated remotely. Drones range from palm-size devices with a range of only a few dozen yards that must be flown within sight of the operator, to vehicles with wingspans as great as a Boeing 737 that can fly hundreds of miles at great speeds and at altitudes of greater than 60,000 feet using sophisticated satellite navigation systems monitored by operators on the other side of the globe. The possible applications of UAS include military and covert missions, law enforcement, search and rescue, weather and other scientific research, border surveillance, and others. The FAA expects the use of drones, particularly by law enforcement agencies, to expand rapidly in coming years as the devices become more readily available and their costs decrease.[1] The specter of the proliferation of drones for domestic surveillance has raised concern for advocates of privacy and civil liberties.

Federal Actions

Members of Congress have variously taken positions in favor and opposed to the domestic use of drones. Privacy concerns are represented by Senator Rand Paul's "Preserving Freedom from Unwarranted Surveillance Act" (S. 3287, 112th Congress, Second Session, 2012), which sought to prohibit the use of drones to gather evidence or other information unless pursuant to a legal warrant. The Act provides exceptions for drones used to patrol national borders, where "exigent circumstances" exist involving law enforcement possessing reasonable suspicion that swift action is necessary to protect life from imminent danger, and when high risk of a specific terrorist attack is identified by the Department of Homeland Security. Evidence collected in violation of the Act would be inadmissible as evidence in a criminal proceeding, and parties aggrieved by violations of the Act could bring civil action for relief or remedy.[2] The bill was referred to the Committee on the Judiciary but received no hearing. A similar bill was recently introduced in the new Congress (H.R. 637).[3]

Countervailing the privacy concerns of certain members of Congress is the recognition that drones hold great promise in domestic applications where the use of aircraft with onboard pilots is deemed impractical, too dangerous, or cost prohibitive.

---

[1] The FAA maintains a website on its activities regarding UAS at *http://www.faa.gov/about/initiatives/uas/*.

[2] More information on S. 3287 and companion legislation in the House of Representative (H.R. 5925), including full text of the measures, is available at *http://thomas.loc.gov/cgi-bin/thomas*.

[3] At the time of this writing the full text of H.R. 637, introduced Feb. 13, 2013, was not yet available from the Library of Congress. News media reports indicate that the measure is substantially similar to those that were before the 112th Congress (*http://thehill.com/blogs/transportation-report/aviation/283195-lawmakers-file-bill-to-limit-domestic-drone-flights*). The current resolution can be tracked at *http://thomas.loc.gov/cgi-bin/bdquery/D?d113:28:./temp/~bd9J4B::|/home/LegislativeData.php?n=BSS;c=113|*.

In an effort to realize this promise, Congress placed directives within the FAA Modernization and Reform Act of 2012 (P.L. 112-95, 49 USCS § 40101, et seq.) to streamline the process of obtaining permits for the use of UAS.[4]

FAA Authority

The FAA has primary authority over regulation of the National Airspace System (NAS), which includes essentially all of the atmosphere above U.S. territory extending 12 nautical miles offshore. Civilian use of UAS is tightly restricted, requiring the issuance of an experimental certificate from the FAA. Regulations for those certificates currently preclude carrying people or property for compensation, but allow research and development operations. Far more common is the use of drones by public agencies, which are required to obtain a Certificate of Waiver or Authorization (COA) from the Administration. Although COAs are typically more permissive than experimental certificates, strict regulation is maintained with flight restricted to a defined section of airspace and under specific circumstances, such as only during daylight hours and in the sight of the operator. The use of drones in densely populated areas is currently prohibited.[5] The COA process has been deemed by supporters of drone use to be overly restrictive, cumbersome, and time consuming. Congress included provisions to address those criticisms in its 2012 FAA reforms. Table 1 (attached), compiled by the U.S. Government Accountability Office (GAO), summarizes those provisions and the dates by which Congress expects the measures to be in place.[6]

Other Federal Issues: Jurisdiction, Security, and Privacy

The primary function of the FAA is to promote and maintain safety in the nation's skies. The major concerns of critics of drones are security and privacy. Interested observers, including the U.S. Government Accountability Office, believe that Congress' dependence on the FAA to manage these concerns is misplaced, urging that security and privacy are areas more appropriately under the purview of the Departments of Homeland Security and Justice, neither of which have taken significant steps to address the issue.

The legal questions regarding domestic drone use centers on the protections against unreasonable searches and seizures provided in the Fourth Amendment to the U.S. Constitution and related laws.[7] Although the jurisprudence on the general topic of privacy as relates to the Fourth Amendment is voluminous, the U.S. Supreme Court has not yet dealt specifically with the admissibility of information collected by drones into legal proceedings; however, previous decisions on privacy and related matters provide a framework on the topic. These issues are discussed in by the Congressional Research Services in its January 2013 report "Integration of Drones into Domestic Airspace: Selected Legal Issues," a copy of which we include as Attachment A. The FAA's concern over privacy issues has delayed implementation of a number of the Congressional benchmarks described in Table 1.[8]

State Opposition

Legislative measures opposing and/or restricting the use of drones are currently under consideration in at least 22 states. In two of these states—Montana and Virginia—a bill has been approved by one chamber of the legislature and, as is the case in a number of other states, news media suggests it is likely that the measures will ultimately be enacted. The impact of state actions will, however, be limited in scope by the primacy of the FAA in determining what sorts of vehicles are allowed in the National Airspace System and where they may fly. That is, states do not have the authority to simply prohibit drones in their skies. Instead, most of the measures we reviewed are substantively similar to those before Congress in that complete prohibitions are eschewed in favor of restricting who may use the drones and what can be done with the information gathered.

---

[4] Full text of the Act is available at *http://thomas.loc.gov/cgi-bin/query/z?c112:H.R.658:*.

[5] The FAA provides a fact sheet on UAS at *http://www.faa.gov/news/fact_sheets/news_story.cfm?newsId=14153#*.

[6] The GAO report on progress toward integrating UAS into the National Airspace System and associated privacy concern is available at *http://www.gao.gov/assets/650/648348.pdf*.

[7] Specifically, the Amendment reads, "The right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated, and no Warrants shall issue, but upon probable cause, supported by Oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized."

[8] For example, the program to establish six test ranges has been delayed (*http://www.businessweek.com/news/2013-02-14/drone-tests-must-adhere-to-privacy-rules-u-dot-s-dot-faa-says*).

The most common provisions in the state measures we reviewed bar state and local law enforcement from operating drones without a warrant or court order, prohibit information collected by UAS from being introduced in legal proceedings, and provide for civil actions brought by the targets of drones used in violation of the law. Exceptions to these restrictions are typically provided where there is reasonable suspicion that a crime is underway or is about to occur, where imminent danger to life exists, or for specific uses such as patrolling national borders. Certain measures, such as those before the legislatures of Hawaii and Maine, explicitly limit the duration of warrants obtained for drone use. Others, like those being considered in Indiana and Montana, provide for criminal penalties and/or fines for civilian use of UAS to monitor another person. A bill recently approved by the Virginia Assembly would place a moratorium until July 1, 2015, on the use of drones by state and local law enforcement agencies except as related to Amber, Senior, or Blue Alerts or rescue operations. Table 2 (following page) summarizes measures opposing or restricting the use of drones in 12 selected states. We include copies of the bills cited in Table 2 as Attachment B.

We hope this is helpful. If you have questions or need additional information, please let us know.

Table 1: Selected Federal Aviation Administration (FAA) Modernization and Reform Act of 2012 Requirements for Drone Regulation	
Approximate Deadline	**Requirement**
5/14/2012	Enter into agreements with appropriate government agencies to simplify the process for issuing Certificates of Authorization (COA) or waivers for public Unmanned Aircraft Systems (UAS).
8/12/2012	Establish a program to integrate UAS into the national airspace system at six test ranges. This program is to terminate 5 years after date of enactment.
8/12/2012	Develop an Arctic UAS operation plan and initiate a process to work with relevant federal agencies and national and international communities to designate permanent areas in the Arctic where small unmanned aircraft may operate 24 hours per day for research and commercial purposes.
8/12/2012	Determine whether certain UAS can fly safely in the national airspace system before the completion of the Act's requirements for a comprehensive plan and rulemaking to safely accelerate the integration of civil UAS into the national airspace system or the Act's requirement for issuance of guidance regarding the operation of public UAS including operating a UAS with a COA or waiver.
11/10/2012	Expedite the issuance of a COA for public safety entities.
11/10/2012	Develop a comprehensive plan to safely accelerate integration of civil UAS into national airspace system.
11/10/2012	Issue guidance regarding operation of civil UAS to expedite COA process; provide collaborative process with public agencies to allow an incremental expansion of access into the national airspace system as technology matures and the necessary safety analysis and data become available and until standards are completed and technology issues are resolved; facilitate capability of public entities to develop and use test ranges; provide guidance on public entities' responsibility for operation.
2/14/2013	Approve and make publically available a five-year road map for the introduction of civil UAS into national airspace system, to be updated annually.
2/14/2013	Submit to Congress a copy of the comprehensive plan.
2/12/2013	Make operational at least one project at a test range.
8/14/2014	Publish in the Federal Register the Final Rule on small UAS.
8/14/2014	Publish in the Federal Register a Notice of Proposed Rulemaking to implement recommendations of the comprehensive plan.
8/14/2014	Publish in the Federal Register an update to the Administration's policy statement on UAS in Docket No. FAA-2006-25714.
9/30/2015	Achieve safe integration of civil UAS into the national airspace system.
12/14/2015	Publish in the Federal Register a Final Rule to implement the recommendations of the comprehensive plan.
12/31/2015	Develop and implement operational and certification requirements for public UAS in national airspace system.
2/14/2017	Report to Congress on the test ranges.

Notes: The FAA has delayed a number of the deadlines in this table due to privacy concerns.

Table 2: Measures Impacting the Use of Unmanned Drones Currently Under Consideration in Selected States		
State	**Measure**	**Summary**
Arizona	HB 2574	Prohibits agencies of law enforcement, the state, or political subdivisions from using drones to gather evidence of any sort without a search warrant, and makes such evidence inadmissible in state or local legal proceedings. Bars monitoring persons in their homes, places of worship, or other locations where an expectation of privacy exists. Allows civil actions against law enforcement agencies in order to prevent, restrain, or remedy the unlawful use of drones.
Florida	HB 119	Prohibits law enforcement agencies from using drones to gather evidence; provides for civil actions in order to prevent or remedy violations; and makes such evidence inadmissible in state or local legal proceedings. Provides an exception for drones used to counter a terrorist attack deemed a high risk by the secretary of the U.S. Department of Homeland Security.
Florida	SB 92	Bars law enforcement agencies from using drones to gather evidence; provides for civil actions in order to prevent or remedy violations; and makes such evidence inadmissible in state or local legal proceedings. Provides exceptions for drones used to counter a terrorist attack deemed a high risk by the secretary of the U.S. Department of Homeland Security, and a warrant is obtained or reasonable suspicion is present that swift action is needed to prevent danger to life or property, escape of a suspect, or destruction of evidence.
Hawaii	SB 783	Prohibits state agencies from operating drones unless in certain emergency situations, pursuant to a warrant or court order. Any data collected on any person or area other than those legally targeted must remain confidential and be deleted within 24 hours. Limits the duration of warranted use to 48 hours before an extension must be requested. Requires a report to the legislature of any use of drones by state agencies, and related actions by courts.
Idaho	SB 1051	Prohibits any person, entity, or state agency from using drones to gather evidence or any information without a search warrant. Makes unlawful surveillance with drones of any individual, property, farm, or agricultural industry. Allows civil actions against law enforcement agencies in order to prevent, restrain, or remedy the unlawful use of drones. Provides an exception for use of a drone by law enforcement when "exigent circumstances" exist--that is, when there is reasonable suspicion that swift action is needed to prevent imminent danger to life.

Table 2: Measures Impacting the Use of Unmanned Drones Currently Under Consideration in Selected States (continued)		
State	**Measure**	**Summary**
Illinois	SR 792	Urges the United States Congress to repeal the provisions of the Federal Aviation Administration Modernization and Reform Act that require the FAA to develop a plan to expand the use of unmanned aircraft in the airspace above the continental United States and any other territory or possession of the United States, and thereby repeal the FAA's rules that have begun to implement the mandated plan.
Indiana	SB 20	Provides that a person who knowingly or intentionally uses an unmanned aerial vehicle to monitor a person, property, or thing without the written consent of the subject of the monitoring commits a Class D felony. Provides that images or communications obtained through the use of an unmanned aerial vehicle are not admissible as evidence. Provides that a person who possesses an image or communications obtained through the use of an unmanned aerial vehicle commits a Class A misdemeanor. Prohibits the use of public money to purchase an unmanned aerial vehicle.
Maryland	HB 1233	Prohibits law enforcement agencies from using drones to gather evidence; provides for civil actions in order to prevent or remedy violations; and makes such evidence inadmissible in state or local legal proceedings. Provides an exception for drones used to counter a terrorist attack deemed a high risk by the secretary of the U.S. Department of Homeland Security.
Maine	SB 72	Prohibits law enforcement agencies from using drones to gather evidence except in emergencies, in the face of threats to national security or imminent criminal activity, or in accordance with a warrant or a court order. Such use is restricted to 48 hours unless an extension not to exceed 30 days is granted. Bans the use of facial recognition or biometric technology and weaponry on drones. Any data collected on any person or area other than those legally targeted must remain confidential and be deleted within 24 hours. Authorizes civil action for violations. Requires reports by law enforcement agencies and the Attorney General of drone use.
Missouri	HB 46	Prohibits unwarranted intrusion through the use of unmanned aerial vehicles commonly known as drones; provides that no person, entity, or state agency shall use a drone or other unmanned aircraft to conduct surveillance of any individual, property owned by an individual, farm, or agricultural industry without the consent of that individual, property owner, farm or agricultural industry. Authorizes civil action for violations. Provides an exception for use of a drone by law enforcement when "exigent circumstances" exist--that is, when there is reasonable suspicion that swift action is needed to prevent imminent danger to life.

Table 2: Measures Impacting the Use of Unmanned Drones Currently Under Consideration in Selected States
(continued)

State	Measure	Summary
Montana	SB 150 (passed Senate 2/6/13)	Disallows introduction of information from drones in criminal proceedings. Prohibits any government agency from owning, using, or contracting an aerial vehicle containing an anti-personnel device. Provides for compensatory and punitive damages for a victim of a drone equipped with an anti-personnel device.
Montana	SB 196	Makes an offense for use of a drone for information collection in or upon the residence of another. Bars such information from being used as evidence in any proceeding, and provides a maximum fine of $500 for violation. Prohibits government agencies from operating drones except pursuant to a warrant, court order, to monitor public lands or international borders, or with consent of a private landowner.
North Dakota	HB 1373	Bars law enforcement agencies from using drones to gather evidence except pursuant to a warrant and only for investigation of felonies. Establishes conditions for such warrants. Provides exceptions for patrolling national borders, in exigent circumstances involving threats to life, and environmental catastrophes. Prohibits weaponry on drones, private surveillance uses, and law enforcement surveillance of lawfully assembled persons. Provides for civil actions. Prescribes uses of information from drones as evidence and the handling of that information. Requires documentation of drone use.
Virginia	HB 2012 (passed House 2/6/13)	Places a moratorium until July 1, 2015, on the use of drones by law enforcement agencies except in the case of Amber, Senior, or Blue Alerts or for search and rescue operations. In no circumstance may armed drones be deployed.

Notes: This table is not exhaustive of all measures currently under consideration that impact the use of drone aircraft.

CRS Report for Congress
Prepared for Members and Committees of Congress

Summary

Under the FAA Modernization and Reform Act of 2012, P.L. 112-95, Congress has tasked the Federal Aviation Administration (FAA) with integrating unmanned aircraft systems (UASs), sometimes referred to as unmanned aerial vehicles (UAVs) or drones, into the national airspace system by September 2015. Although the text of this act places safety as a predominant concern, it fails to establish how the FAA should resolve significant, and up to this point, largely unanswered legal questions.

For instance, several legal interests are implicated by drone flight over or near private property. Might such a flight constitute a trespass? A nuisance? If conducted by the government, a constitutional taking? In the past, the Latin maxim *cujus est solum ejus est usque ad coelum* (for whoever owns the soil owns to the heavens) was sufficient to resolve many of these types of questions, but the proliferation of air flight in the 20th century has made this proposition untenable. Instead, modern jurisprudence concerning air travel is significantly more nuanced, and often more confusing. Some courts have relied on the federal definition of "navigable airspace" to determine which flights could constitute a trespass. Others employ a nuisance theory to ask whether an overhead flight causes a substantial impairment of the use and enjoyment of one's property. Additionally, courts have struggled to determine when an overhead flight constitutes a government taking under the Fifth and Fourteenth Amendments.

With the ability to house surveillance sensors such as high-powered cameras and thermal-imaging devices, some argue that drone surveillance poses a significant threat to the privacy of American citizens. Because the Fourth Amendment's prohibition against unreasonable searches and seizures applies only to acts by government officials, surveillance by private actors such as the paparazzi, a commercial enterprise, or one's neighbor is instead regulated, if at all, by state and federal statutes and judicial decisions. Yet, however strong this interest in privacy may be, there are instances where the public's First Amendment rights to *gather* and *receive* news might outweigh an individual's interest in being let alone.

Additionally, there are a host of related legal issues that may arise with this introduction of drones in U.S. skies. These include whether a property owner may protect his property from a trespassing drone; how stalking, harassment, and other criminal laws should be applied to acts committed with the use of drones; and to what extent federal aviation law could preempt future state law.

Because drone use will occur largely in federal airspace, Congress has the authority or can permit various federal agencies to set federal policy on drone use in American skies. This may include the appropriate level of individual privacy protection, the balancing of property interests with the economic needs of private entities, and the appropriate safety standards required.

Introduction

The integration of drones into U.S. skies is expected by many to yield significant commercial and societal benefits.[1] Drones could be employed to inspect pipelines, survey crops, and monitor weather.[2] One newspaper has already used a drone to survey storm damage,[3] and real estate agents have used them to survey property.[4] In short, the extent of their potential domestic application is bound only by human ingenuity.

In an effort to accelerate this introduction, in the FAA Modernization and Reform Act of 2012, Congress tasked the Federal Aviation Administration (FAA) with safely integrating drones into the national airspace system by September 2015.[5] Likewise, sensing the opportunities that unmanned flight portend, lobbying groups and drone manufacturers have joined the chorus of those seeking a more rapid expansion of drones in the domestic market.[6]

Yet, the full-scale introduction of drones into U.S. skies will inevitably generate a host of legal issues. This report will explore some of those issues. To begin, this report will describe the regulatory framework for permitting the use of unmanned vehicles and the potential rulemaking that will occur over the next few years. Next, it will discuss theories of takings and property torts as they relate to drone flights over or near private property. It will then discuss the privacy interests implicated by drone surveillance conducted by private actors and the potential countervailing First Amendment rights to gather and receive news. Finally, this report will explore possible congressional responses to these privacy concerns and identify additional potential legal issues.

Development of Aviation Law and Regulations

The predominant theory of airspace rights applied before the advent of aviation derived from the Roman Law maxim *cujus est solum ejus est usque ad coelum*, meaning whoever owns the land

---

[1] A "drone" is simply an aircraft that can fly without a human operator. They are sometimes referred to as unmanned aerial vehicles (UAV), and the whole system—including the aircraft, the operator on the ground, and the digital network required to fly the aircraft—is referred to as an unmanned aircraft system (UAS). *See generally* CRS Report R42718, *Pilotless Drones: Background and Considerations for Congress Regarding Unmanned Aircraft Operations in the National Airspace System*, by Bart Elias.

possesses all the space above the land extending upwards into the heavens.[7] This maxim was adopted into English common law and eventually made its way into American common law.[8] At the advent of commercial aviation, Congress enacted the Air Commerce Act of 1926[9] and later the 1938 Civil Aeronautics Act.[10] These laws included provisions stating that "to the exclusion of all foreign nations, [the United States has] complete sovereignty of the airspace" over the country.[11] Additionally, Congress declared a "public right of freedom of transit in air commerce through the navigable airspace of the United States."[12] This right to travel in navigable airspace came into conflict with the common law idea that each landowner also owned the airspace above the surface in perpetuity. If the common law idea was followed faithfully, there could be no right to travel in navigable airspace without constantly trespassing in private property owners' airspace. This conflict was directly addressed by the Supreme Court in *United States v. Causby*, discussed extensively below.

With the passage of the Federal Aviation Act in 1958,[13] the administrator of the FAA was given "full responsibility and authority for the advancement and promulgation of civil aeronautics generally.... "[14] This centralization of responsibility and creation of a uniform set of rules recognized that "aviation is unique among transportation industries in its relation to the federal government—it is the only one whose operations are conducted almost wholly within federal jurisdiction.... "[15] The FAA continues to set uniform rules for the operation of aircraft in the national airspace. In the FAA Modernization and Reform Act of 2012, Congress instructed the FAA to "develop a comprehensive plan to safely accelerate the integration of civil unmanned aircraft systems into the national airspace system."[16] These regulations must provide for this integration "as soon as practicable, but not later than September 30, 2015."[17]

Current FAA Regulations of Navigable Airspace

Fixed-Wing Aircraft

FAA regulations define the minimum safe operating altitudes for different kinds of aircraft. Generally, outside of takeoff and landing fixed-wing aircraft must be operated at an altitude that allows the aircraft to conduct an emergency landing "without undue hazard to persons or property on the surface."[18] In a congested area, the aircraft must operate at least "1,000 feet above the highest obstacle within a horizontal radius of 2,000 feet of the aircraft."[19] The minimum safe

operating altitude over non-congested areas is "500 feet above the surface."[20] Over open water or sparsely populated areas, aircraft "may not be operated closer than 500 feet to any person, vessel, vehicle, or structure."[21] Navigable airspace is defined in statute as the airspace above the minimum safe operating altitudes, including airspace needed for safe takeoff and landing.[22]

Helicopters

While fixed-wing aircraft are subject to specific minimum safe operating altitudes based on where it is flying, regulation of helicopter minimum altitudes is less rigid. According to FAA regulations, a helicopter may fly below the minimum safe altitudes prescribed for fixed-wing aircraft if it is operated "without hazard to person or property on the surface."[23] Therefore, arguably a helicopter may be lawfully operated outside the zone defined in statute as navigable airspace.[24]

Current FAA Regulation of Drones

Public and Commercial Operators

Drones operated by federal, state, or local agencies must obtain a certificate of authorization or waiver (COA) from the FAA. After receiving COA applications, the FAA conducts a comprehensive operational and technical review of the drone and can place limits on its operation in order to ensure its safe use in airspace.[25] In response to a directive in the FAA Modernization and Reform Act of 2012, the FAA recently streamlined the process for obtaining COAs, making it easier to apply on their website.[26] It also employs expedited procedures allowing grants for temporary COAs if needed for time-sensitive mission.[27]

Private commercial operators must receive a special airworthiness certificate in the experimental category in order to operate.[28] These certificates have been issued on a limited basis for flight tests, demonstrations, and training. Presently, there is no other method of obtaining FAA approval to fly drones for commercial purposes. It appears these restrictions will be loosened in the coming

years, since the FAA has been instructed to issue a rulemaking that will lead to the phased-in integration of civilian unmanned aircraft into national airspace.[29]

Recreational Users

The FAA encourages recreational users of model aircraft, which certain types of drones could fall under, to follow a 1981 advisory circular. Under the circular, users are instructed to fly a sufficient distance from populated areas and away from noise-sensitive areas like parks, schools, hospitals, or churches. Additionally, users should avoid flying in the vicinity of full-scale aircraft and not fly more than 400 feet above the surface. When flying within three miles of an airport, users should notify the air traffic control tower, airport operator, or flight service station. Compliance with these guidelines is voluntary. In the FAA Modernization and Reform Act of 2012, the FAA was prohibited from promulgating rules regarding certain kinds of model aircraft flown for hobby or recreational use. This prohibition applies if the model aircraft is less than 55 pounds, does not interfere with any manned aircraft, and is flown in accordance with a community-based set of safety guidelines. If flown within five miles of an airport, the operator of the model aircraft must notify both the airport operator and air traffic control tower.[30]

Safe Minimum Flying Altitude

The FAA does not currently regulate safe minimum operating altitudes for drones as it does for other kinds of aircraft. This may be one way that the FAA responds to Congress's instruction to write rules allowing for civil operation of small unmanned aircraft systems in the national airspace.[31] One possibility is for the FAA to create different classes of drones based on their size and capabilities. Larger drones that physically resemble fixed-wing aircraft could be subject to similar safe minimum operating altitude requirements whereas smaller drones could be regulated similar to helicopters.

Airspace and Property Rights

Since the popularization of aviation, courts have had to balance the need for unobstructed air travel and commerce with the rights of private property owners. The foundational case in explaining airspace ownership rights is *United States v. Causby*.[32]

United States v. Causby

In *United States v. Causby*, the Supreme Court directly confronted the question of who owns the airspace above private property.[33] The plaintiffs filed suit against the U.S. government arguing a violation of the Fifth Amendment Takings Clause, which states that private property shall not "be taken for public use, without just compensation." Generally, takings suits can only be filed

[29] P.L. 112-95, § 332(2).

[30] P.L. 112-95 § 336.

[31] *See id.* at § 332(b).

[33] *Id.*

against the government when a government actor, as opposed to a private part, causes the alleged harm.[34]

Causby owned a chicken farm outside of Greensboro, North Carolina that was located near an airport regularly used by the military. The proximity of the airport and the configuration of the farm's structures led the military planes to pass over the property at 83 feet above the surface, which was only 67 feet above the house, 63 feet above the barn, and 18 feet above the tallest tree.[35] While this take-off and landing pattern was conducted according to the Civil Aeronautics Authority guidelines, the planes caused "startling" noises and bright glare at night.

As the Court explained, "as a result of the noise, respondents had to give up their chicken business. As many as six to ten of their chickens were killed in one day by flying into the walls from fright. The total chickens lost in this manner was about 150.... The result was the destruction of the use of the property as a commercial chicken farm."[36] The Court had to determine whether this loss of property constituted a taking without just compensation.

At the outset, the Court directly rejected the common law conception of airspace ownership: "It is ancient doctrine that at common law ownership of the land extended to the periphery of the universe—*Cujus solum ejus est usque ad coelum.* But that doctrine has no place in the modern world."[37] The Court noted that Congress had previously declared a public right of transit in air commerce in navigable airspace and national sovereignty in the airspace.[38] These statutes could not be reconciled with the common law doctrine without subjecting aircraft operators to countless trespass suits. In the Court's words, "common sense revolts at the idea."[39]

Even though it rejected the idea that the Causbys held complete ownership of the air up to the heavens, the Court still had to determine if they owned any portion of the space in which the planes flew such that a takings could occur. The government argued that flights within navigable airspace that do not physically invade the surface cannot lead to a taking. It also argued that the landowner does not own any airspace adjacent to the surface "which he has not subjected to possession by the erection of structures or other occupancy."[40]

The Court did not adopt this reasoning, finding instead that "the landowner owns at least as much space above the ground as he can occupy or use in connection with the land. The fact that he does not occupy it in a physical sense—by the erection of building and the like—is not material."[41] Therefore, it found that the landowner owns the airspace in the immediate reaches of the surface necessary to use and enjoy the land and invasions of this space "are in the same category as invasions of the surface."[42] Above these immediate reaches, the airspace is part of the public

---

[34] Takings claims filed against state government actors would not be filed under the Fifth Amendment. Rather, they would arise as state constitutional claims. For more information on takings, *see* CRS Report RS20741, *The Constitutional Law of Property Rights "Takings": An Introduction*, by Robert Meltz.

domain, but the Court declined to draw a clear line. The Court also noted that the government's argument regarding the impossibility of a taking based on flights in navigable airspace was inapplicable in this case because the flights over Causby's land were not within navigable airspace.[43] At the time, federal law defined navigable airspace as space above the minimum safe flying altitudes for specific areas, but did not include the space needed to take off and land. Even though these flights were not within navigable airspace, the Court seemed to suggest that if they were, the inquiry would not immediately end. Instead, the Court would then have to determine when the regulation itself, defining the navigable airspace, was valid.[44]

Ultimately, in the context of a taking claim, the Court concluded that "flights over private land are not a taking, unless they are so low and so frequent to be a direct and immediate interference with the enjoyment and use of the land."[45] With regard to the Causbys' chicken farm, the Court concluded that the military flights had imposed a servitude upon the land, similar to an easement, based on the interference with the use and enjoyment of their property. Although the land did not lose all its economic value, the lower court's finding clearly established the flights led directly to a diminution in the value of the property, since it could no longer be used for its primary purpose as a chicken farm.

Post-*Causby* Theories of Airspace Ownership

Causby clearly abandoned the ancient idea that private landowners each owned their vertical slice of the airspace above the surface in perpetuity as incompatible with modern life. The case set up three factors to examine in a taking claim that courts still utilize today: (1) whether the planes flew directly over the plaintiff's land; (2) the altitude and frequency of the flights; and (3) whether the flights directly and immediately interfered with the plaintiff's use and enjoyment of the surface land.[46]

However, it left many questions unanswered. Where is the dividing line between the "immediate reaches" of the surface and public domain airspace? Can navigable airspace intersect with the "immediate reaches" belonging to the private property? Can aircraft flying wholly within navigable airspace, as defined by federal law, ever lead to a successful takings claim? How does one assess claims based on lawfully operated aircraft, such as helicopters, flying below navigable airspace?

Subsequent cases have been brought using many different legal claims, including trespass and nuisance, as discussed below, and various ways of describing the resulting injury. Claims could include an "inverse condemnation," another way of describing a taking, or the establishment of an avigation, air, or flying easement. While these legal claims may have different names, it appears that courts use *Causby* as the starting point for analyzing all property-based challenges to

[43] *Id.* at 264.

[44] *Id.* at 263.

[45] *Id.* at 266.

[46] *See e.g.*, Andrews v. United States, 2012 U.S. Claims LEXIS 1644, *10 (explaining that the "The United States Court of Appeals for the Federal Circuit (Federal Circuit) has derived from Causby three factors for consideration 'in determining whether noise and other effects from overflights ... constitute a taking.... '"). *But see* Argent v. United States, 124 F.3d 1277, 1284 (1997) (finding a taking claim may be based on "a peculiarly burdensome pattern of activity, including both intrusive and non-intrusive flights").

intrusions upon airspace. Several different interpretations of *Causby* have emerged in the attempt to articulate an airspace ownership standard, a few of which are described here.

Following *Causby*, several lower courts employed a fixed-height theory and interpreted the decision as creating two distinct categories of airspace. On the one hand, the stratum of airspace that was defined in federal law as "navigable airspace" was always a part of the public domain. Therefore, flights in this navigable airspace could not lead to a successful property-right based action like a takings or trespass claim because the property owner never owned the airspace in the public domain. On the other hand, the airspace below what is defined as navigable airspace could be "owned" by the surface owner and, therefore, intrusions upon it could lead to a successful takings or property tort claim. Since this fixed-height theory of airspace ownership relies heavily on the definition of navigable airspace, the expansion of the federal definition of "navigable airspace" to include the airspace needed to take-off and land[47] greatly impacts what airspace a property owner could claim.

This strict separation between navigable airspace and the airspace a landowner can claim seems to have been disavowed by the Supreme Court. First, in dicta in *Braniff Airways v. Nebraska State Bd. of Equalization & Assessment*,[48] a case primarily dealing with the question of federal preemption of state airline regulations, the Court left open the possibility of a taking based on flights occurring in navigable airspace. It summarized *Causby* as holding "that the owner of land might recover for a taking by national use of navigable air space resulting in destruction in whole or in part of the usefulness of the land property."[49] Next, in *Griggs v. Allegheny County* the Supreme Court found that the low flight of planes over the plaintiff's property, taking off from and landing at a nearby airport's newly constructed runway, constituted a taking that had to be compensated under the Fifth Amendment.[50] The noise and fear of a plane crash caused by the low overhead flights made the property "'undesirable and unbearable'" for residential use, making it impossible for people in the house to converse or sleep.[51] The Court reached this conclusion that a taking occurred based on this injury, despite the fact that the flights were operated properly under federal regulations and never flew outside of navigable airspace.[52] Despite this holding, some lower courts have continued to lend credence to a fixed-height ownership theory as a reasonable interpretation of *Causby*.[53]

Another interpretation of *Causby* essentially creates a presumption of a non-taking when overhead flights occur in navigable airspace. This presumption would recognize the importance of unimpeded travel of air commerce and that Congress placed navigable airspace in the public domain. However, the presumption could be rebutted by evidence that the flights, while in navigable airspace, interfered with the owner's use and enjoyment of the surface enough to justify compensation. As one court reasoned, "as the height of the overflight increases... the Government's interest in maintaining sovereignty becomes weightier while the landowner's

interest diminishes, so that the damage showing required increases in a continuum toward showing absolute destruction of all uses of the property."[54]

Finally, some courts have concluded that the altitude of the overhead flight has no determinative impact on whether a taking has occurred. One federal court noted that the government's liability for a taking is not impacted "merely because the flights of Government aircraft are in what Congress has declared to be navigable airspace and subject to its regulation."[55] Under this approach, "although the navigable airspace has been declared to be in the public domain, 'regardless of any congressional limitations, the land owner, as an incident to his ownership, has a claim to the superjacent airspace to the extent that a reasonable use of his land involves such space.'"[56] Under this theory, the court would only need to examine the effect of the overhead flights on the use and enjoyment of the land, and would not need to determine if the flight occurred in navigable airspace.

While the definition of navigable airspace impacts each theory differently, it is clear that under the current interpretation a showing of interference with the use and enjoyment of property is required. Cases have clearly established that overhead flights leading to impairment of the owner's livelihood or cause physical damage qualify as an interference with use and enjoyment of property.[57] Additionally, flights that cause the surface to become impractical for its intended use by the current owner also satisfy the use and enjoyment requirement.[58] For example, in *Griggs*, the noise, vibration, and fear of damage caused by overhead flights made it impossible for the plaintiffs to converse with others or sleep within their house, leading to their retreat from the property, which had become "undesirable and unbearable for their residential use."[59] Some courts have recognized a reduction in the potential resale value of the property as an interference with its use and enjoyment, even if the property continues to be suitable for the purposes for which it is currently used.[60] One court explained: "Enjoyment of property at common law contemplated the entire bundle of rights and privileges that attached to the ownership of land ... Owners of fee simple estates ... clearly enjoy not only the right to put their land to a particular present use, but also to hold the land for investment and appreciation.... "[61] However, other courts have rejected the idea that restrictions on uses by future inhabitants, without showing loss of property value, are relevant to a determination of the owner's own use and enjoyment of the property.[62]

Trespass and Nuisance Claims Against Private Actors

Although *Causby* arose from a Fifth Amendment takings claim, its articulation of airspace ownership standards is also often used in determining state law tort claims such as trespass and nuisance. These state law tort claims could be used to establish liability for overhead flights

[62] Stephens v. United States, 11 Cl. Ct. 352 (1986).

operated by private actors, where a lack of government involvement precludes a takings claim. Generally, trespass is any physical intrusion upon property owned by another. However, unlike with surface trespass claims, simply proving that an object or person was physically present in the airspace vertically above the landowner's property is generally not enough to establish a trespass in airspace. Since *Causby* struck down the common law idea of *ad coelum*, landowners generally do not have an absolute possessory right to the airspace above the surface into perpetuity. Instead, airspace trespass claims are often assessed using the same requirements laid out in the *Causby* takings claim. Arguably, these standards are used in property tort claims because there can be no trespass in airspace unless the property owner has some possessory right to the airspace, which was the same question at issue in *Causby*.

To allege an actionable trespass to airspace, the property owner must not only prove that the interference occurred within the immediate reaches of the land, or the airspace that the owner can possess under *Causby*, but also that its presence interferes with the actual use of his land. As one court explained, "a property owner owns only as much air space above his property as he can practicable use. And to constitute an actionable trespass, an intrusion has to be such as to subtract from the owner's use of the property."[63] This standard for airspace trespass was also adopted by the Restatement (Second) of Torts.[64]

Nuisance is a state law tort claim that is not based on possessory rights to property, like trespass, but is rooted in the right to use and enjoy land.[65] Trespass and nuisance claims arising from airspace use are quite similar, since trespass to airspace claims generally require a showing that the object in airspace interfered with use and enjoyment of land. However, unlike trespass, nuisance claims do not require a showing that the interference actually occupied the owner's airspace. Instead, a nuisance claim can succeed even if the interference flew over adjoining lands and never directly over the plaintiff's land, as long as the flight constitutes a substantial and unreasonable interference with the use and enjoyment of the land.

Potential Liability Arising from Civilian Drone Use

The integration of drones into domestic airspace will raise novel questions of how to apply existing airspace ownership law to this new technology. How courts may apply the various interpretations of *Causby*, discussed above, to drones will likely be greatly impacted by the FAA's definition of navigable airspace for drones.

The potential for successful takings, trespass, or nuisance claims from drone use will also be impacted by the physical characteristics of the drone, especially given that current case law heavily emphasizes the impact of the flight on use and enjoyment of the surface property. Several characteristics of drones may make their operation in airspace less likely to lead to liability for drone operators than for aircraft operators. First, the noise attributed to drone use may be significantly less than noise created by helicopters or planes powered by jet engines. Second, drones commonly used for civilian purposes could be much smaller than common aircraft used today. This decreased size is likely to lead to fewer physical impacts upon surface land such as

[63] Geller v. Brownstone Condominium, 82 Ill. App. 3d 334, 336-37 (1980).

[64] RESTATEMENT (SECOND) OF TORTS § 159(2) (1965) (stating that "Flights by aircraft in the airspace above the land of another is a trespass if, but only if, (a) it enters into the immediate reaches of the airspace next to the land, and (b) it interferes substantially with the other's use and enjoyment of the land.").

[65] RESTATEMENT (SECOND) OF TORTS § 821D (1979); 2 DAN B DOBBS, ET AL. THE LAW OF TORTS § 398 (2d ed. 2011).

vibration and dust, which are common complaints arising from overhead aircraft and helicopter flights. Finally, it is unknown at this time how most drones will be deployed into flight. Will drone "airports" be used to launch the aircraft or will they take off and land primarily from individual property? If drone use remains decentralized and is not organized around an "airport," then drones are less likely to repeatedly fly over the same piece of property, creating fewer potential takings, trespass, or nuisance claims. Additionally, the majority of drones are more likely to operate like helicopters, taking off and landing vertically, than like traditional fixed-wing aircraft. This method of takeoff reduces the amount of surface the aircraft would have to fly over before reaching its desired flying altitude, minimizing the potential number of property owners alleging physical invasion of the immediate reaches of their surface property.

Alternatively, the potential ability for drones to fly safely at much lower altitudes than fixed-wing aircraft or helicopters could lead to a larger number of property-based claims. Low-flying drones are more likely to invade the immediate reaches of the surface property, thus satisfying part of the requirement for a takings or trespass claim.

Privacy

Perhaps the most contentious issue concerning the introduction of drones into U.S. airspace is the threat that this technology will be used to spy on American citizens. With the ability to house high-powered cameras, infrared sensors, facial recognition technology, and license plate readers, some argue that drones present a substantial privacy risk.[66] Undoubtedly, the government's use of drones for domestic surveillance operations implicates the Fourth Amendment and other applicable laws.[67] In like manner, privacy advocates have warned that private actors might use drones in a way that could infringe upon fundamental privacy rights.[68] This section will focus on the privacy issues associated with the use of drones by private, non-governmental actors. It will provide a general history of privacy law in the United States and survey the various privacy torts, including intrusion upon seclusion, the privacy tort most applicable to drone surveillance. It will then explore the First Amendment right to gather news. Application of these theories to drone surveillance will be discussed in the section titled "Congressional Response."

> Drones are already flying in U.S. airspace – with thousands more to come – but with no privacy protections or transparency measures in place. We are entering a brave new world, and just because a company soon will be able to register a drone license shouldn't mean that company can turn it into a cash register by selling consumer information. Currently, there are no privacy protections or guidelines and no way for the public to know who is flying drones, where, and why. The time to implement privacy protections is now.

Early Privacy Jurisprudence

Although early Anglo-Saxon law lacked express privacy protections, property law and trespass theories served as proxy for the protection of individual privacy. Lord Coke pronounced in 1605 that "the house of everyone is to him as his castle and fortress, as well for his defence against injury and violence, as for his respose[.]"[69] This proposition that individuals are entitled to privacy while in their homes crossed the Atlantic with the colonists and appeared prominently in early revolutionary thinking.[70] In one early American common law decision, the court noted that "[t]he law is clearly settled, that an officer cannot justify the breaking open an outward door or window, in order to execute process in a civil suit; if he doth, he is a trespasser."[71] In cases lacking physical trespass, prosecutors relied on an eavesdropping theory, which protected the privacy of individuals' conversations while in their home.[72]

These century-old theories of trespass and eavesdropping, however, failed to keep up with a rapidly changing society fueled by advancing technologies. As with today's celebrity-obsessed society, late-19th century society experienced the birth and spread of "yellow journalism," a new media aimed at emphasizing the "curious, dramatic, and unusual, providing readers a 'palliative of sin, sex, and violence.'"[73] Faster presses and instantaneous photography enabled journalists to exploit and spread gossip.[74] Louis D. Brandeis (then a private attorney) and Samuel Warren were bothered with the press's constant intrusions into the private affairs of prominent Bostonians.[75] In 1890, they published a seminal law review article formulating a new legal theory—the right to be let alone.[76] Brandeis and Warren understood that existing tort doctrines such as trespass and libel were insufficient to protect privacy rights, as "only a part of the pain, pleasure, and profit of life lay in physical things."[77] They noted that this new right to privacy derived not from "the principle of private property, but that of an inviolate personality."[78] The authors observed that "instantaneous photographs and newspaper enterprise have invaded the sacred precincts of private and domestic life; and numerous mechanical devices threaten to make good the prediction that 'what is whispered in the closet shall be proclaimed from the house-tops.'"[79] Although this new theory had its detractors,[80] it found its way into the common law of several states.[81]

Privacy Torts

In 1939, the First Restatement of Torts (a set of model rules intended for adoption by the states) created a general tort for invasion of privacy.[82] By 1940, a minority of states had adopted some right of privacy either by statute or judicial decision, and six states had expressly refused to adopt such a right.[83] Twenty years later, Dean William Prosser surveyed the case law surrounding this right and concluded that the right to privacy entailed four distinct (yet, sometimes overlapping) rights: (1) intrusion upon seclusion; (2) public disclosure of private facts; (3) publicity which puts the target in a false light; and (4) appropriation of one's likeness.[84] These four categories were incorporated into the Restatement (Second) of Torts.[85]

Section 652B of the Restatement (Second) of Torts creates a cause of action for intrusion upon seclusion,[86] the privacy tort most likely to apply to drone surveillance.[87] It has been adopted either by common law or statute in an overwhelming majority of the states.[88] Section 652B provides: "One who intentionally intrudes, physically or otherwise, upon the solitude or seclusion of another or his private affairs or concerns, is subject to liability to the other for invasion of his privacy, if the intrusion would be highly offensive to a reasonable person."[89] Courts have developed a set of rules for applying § 652B. First, it requires an objective person standard, testing whether a person of "ordinary sensibilities" would be offended by the alleged invasion.[90] Thus, someone with an idiosyncratic sensitivity—say, an aversion to cameras—could not satisfy this standard by simply having his photograph taken. Likewise, the intrusion must not only be offensive, but "*highly* offensive,"[91] or as one court put it, "outrageously unreasonable conduct."[92] Generally, a single incident will not suffice; instead, the intrusion must be "repeated with such persistence and frequency as to amount to a course of hounding" and "becomes a burden to his existence.... "[93] However, in a few cases a single intrusion was adequate.[94] The invasion of

privacy must been intentional, meaning the defendant must desire that the intrusion would occur, or as with other torts, [95] knew with a substantial certainty that such an invasion would result from his actions.[96] An accidental intrusion is not actionable. Finally, in some states, the intrusion must cause mental suffering, shame, or humiliation to permit recovery.[97]

A review of the case law demonstrates that the location of the target of the surveillance is, in many cases, determinative of whether someone has a viable claim for intrusion upon seclusion. For the most part, conducting surveillance of a person while within the confines of his home will constitute an intrusion upon seclusion.[98] The illustrations to § 652B offer an example of a private detective who photographs an individual while in his home with a telescopic camera as a viable claim.[99] Likewise, as one court observed, "when a picture is taken of a plaintiff while he is in the privacy of his home, ... the taking of the picture may be considered an intrusion into the plaintiff's privacy just as eavesdropping or looking into his upstairs windows with binoculars are considered an invasion of his privacy."[100]

The likelihood of a successful claim is diminished if the surveillance is conducted in a public place. The comments to § 652B explain that there is generally no liability for photographing or observing a person while in public "since he is not then in seclusion, and his appearance is public and open to the public eye."[101] Likewise, Prosser observed:

> On the public street, or in any other public place, the plaintiff has no right to be alone, and it is no invasion of his privacy to do no more than follow him about. Neither is it such an invasion to take a photograph in such a place, since this amounts to nothing more than making a record, not differing essentially from a full written description, of a public sight which anyone present would be free to see.[102]

The case law also supports this proposition. The Alabama Supreme Court dismissed a claim of wrongful intrusion against operators of a race track who photographed the plaintiffs while they were in the "winner's circle" at the track.[103] Similarly, a federal district court dismissed a claim by a husband and wife who had been photographed by Forbes Magazine while waiting in line at the Miami International Airport as it was taken in "a place open to the general public."[104] Likewise, a Vietnam veteran lost a claim for invasion of privacy based on photographs that depicted him and

other soldiers during a combat mission in Vietnam—again, a public setting.[105] Other examples include the recording of license plate numbers of cars parked in a public parking lot[106] and photographing a person while walking on a public sidewalk.[107]

Indeed, even plaintiffs who were videotaped or photographed while on their own property have generally been unsuccessful in their privacy claims so long as they could be viewed from a public vantage point. Rejecting one plaintiff's claim for intrusion upon seclusion, the Supreme Court of Oregon held that even though the investigators trespassed on the plaintiff's property to film him, the investigation did not "constitute an unreasonable surveillance 'highly offensive to a reasonable man[,]'"[108] as the plaintiff could have been viewed from the road by his neighbors or passersby.[109] In another case, the wife of a prominent Puerto Rican politician sought damages from a newspaper for invasion of privacy allegedly committed when an agent of the newspaper photographed her house as part of a news story about her husband.[110] The court dismissed her claim as the photographers were not "unreasonably intrusive," and the photographs depicted only the outside of the home and no persons were photographed. [111] Similarly, in one case a couple sued a cell phone company for intrusion upon seclusion when the company's workers looked onto their property each time they serviced a nearby cell tower.[112] The court rejected their claim, holding that '[t]he mere fact that maintenance workers come to an adjoining property as part of their work and look over into the adjoining yard is legally insufficient evidence of highly offensive conduct."[113] There are many other examples.[114]

However, there have been some successful claims for intrusion upon seclusion involving surveillance conducted in public.[115] The comments to § 652B explain: "Even in a public place, however, there may be some matters about the plaintiff, such as his underwear or lack of it, that are not exhibited to the public gaze, and there may still be invasion of privacy when there is intrusion upon these matters."[116] One of the most famous cases concerning this "public gaze" theory involved a suit for invasion of privacy against a newspaper when it published a picture of

[116] RESTATEMENT (SECOND) OF TORTS § 652B cmt. c.

the plaintiff with her dress blown up as she was leaving a fun house at a county fair.[117] In upholding the plaintiff's claim, the court observed: "To hold that one who is involuntarily and instantaneously enmeshed in an embarrassing pose forfeits her right of privacy merely because she happened at the moment to be part of a public scene would be illogical, wrong, and unjust."[118] In *Huskey v. National Broadcasting Co. Inc.*, a prisoner sued NBC, a television broadcasting company, alleging that by filming him without consent while he was working out in the exercise yard at the prison, NBC invaded his privacy.[119] NBC countered that depictions of persons in a "publicly visible area" could not support the claim for invasion of seclusion.[120] Ultimately, the court permitted the prisoner's claim to go forward, observing that "[o]f course [the prisoner] could be seen by guards, prison personnel and inmates, and obviously he was in fact seen by NBC's camera operator. But the mere fact a person can be seen by others does not mean that person cannot legally be 'secluded.'"[121] Although relief is available for certain cases of public surveillance, recovery seems to be the exception rather than the norm.[122]

First Amendment and Newsgathering Activities

Based on the foregoing discussion, safeguarding privacy from intrusive drone surveillance is clearly an important societal interest. However, this interest must be weighed against the public's countervailing concern in securing the free flow of information that inevitably feeds the "free trade of ideas."[123] Unmanned aircraft can improve the press and the public's ability to gather news: they can operate in dangerous areas without putting a human operator at risk of danger; can carry sophisticated surveillance technology; can fly in areas not currently accessible by traditional aircraft; and can stay in flight for long durations. However, challenges arise in attempting to find an appropriate balance between this interest in newsgathering and the competing privacy interests at stake.

The First Amendment to the United States Constitution provides that "Congress shall make no law ... abridging the freedom of speech, or of the press.... "[124] The Court has construed this phrase to cover not only traditional forms of speech, such as political speeches or polemical articles, but also conduct that is "necessary for, or integrally tied to, acts of expression,"[125] such as distribution of political literature[126] or door-to-door solicitation.[127] Additionally, the Court has pulled within

the First Amendment's protection other conduct that is not expressive in itself, but is "necessary to accord full meaning and substance to those guarantees."[128] For example, the Court has said that the public is entitled to a "right to receive news" as a correlative of the right to free expression.[129]

Like this right to receive news, the Court has intimated in a series of cases beginning in the 1960s that the public and the press may be entitled to *a right to gather news* under the First Amendment. Initially, in *Zemel v. Rusk*, the Court observed that the right "to speak and publish does not carry with it the unrestrained right to gather information."[130] The Court's reluctance to extend this right may have signaled its concern that an unconditional newsgathering right could subsume almost any government regulation that places a slight restriction on the ability to gather news.[131] However, several years later the Court indicated in *Branzburg v. Hayes* that although laws of general applicability apply equally to the press as to the general public, that "[n]ews gathering is not without its First Amendment protections,"[132] and that "without some protection for seeking out the news, freedom of the press could be eviscerated."[133] The Court, however, failed to clearly delineate the parameters of such a protection. In the Court's most recent case, *Cohen v. Cowles Media Co.*, the Court adhered to the "well-established line of decisions holding that generally applicable laws do not offend the First Amendment simply because their enforcement against the press has incidental effects on its ability to gather and report the news."[134] The Court noted that it is "beyond dispute 'that the publisher of a newspaper has no special immunity from the application of general laws. He has no special privilege to invade the rights of others.'"[135]

The lower federal courts have explored this right to gather news in the context of photographing or video recording. In *Dietemann v. Time, Inc.* the Ninth Circuit Court of Appeals explored the extent to which reporters could use surreptitious means to carry out their newsgathering.[136] There, defendants Time Life sent undercover reporters to a man's house where he claimed to use minerals and other materials to heal the sick. The reporters used a hidden camera to take pictures of the man, and a hidden microphone to transmit the conversation to other operatives. The defendants claimed that the First Amendment's right to freedom of the press shielded its newsgathering activities. In rejecting this claim, the court observed that although an individual accepts the risk when inviting a person into his home that the visitor may repeat the conversation to a third party, "he does not and should not be required to take the risk that what is heard and seen will be transmitted by photograph or recording, or in our modern world, in full living color and hi-fi to the public at large or to any segment of it that the visitor may select."[137] The court held that "hidden mechanical contrivances" are not indispensable tools of investigative reporting, and that the "First Amendment has never been construed to accord newsman immunity from torts

or crimes committed during the course of newsgathering."[138] In *Galella v. Onassis*, Galella, a self-proclaimed "paparazzo," constantly followed around, harassed, and photographed Jacqueline Kennedy Onassis and her children.[139] As part of an ongoing lawsuit, Onassis sued Galella for, *inter alia*, invasion of her and her family's privacy. Galella argued that he was entitled to the absolute "wall of immunity" that protects newsmen under the First Amendment. The Second Circuit Court of Appeals quickly rejected this absolutist position: "There is no such scope to the First Amendment right. Crimes and torts committed in news gathering are not protected. There is no threat to a free press in requiring its agents to act within the law."[140] By contrast, the Seventh Circuit in *Desnick v. American Broadcast Companies, Inc.* held that surreptitious recording was not a privacy invasion because the target of the surveillance was a party to the conversation, thereby vitiating any claim to privacy in those conversations.[141]

Congressional Response

If Congress chooses to act, it could create privacy protections to protect individuals from intrusive drone surveillance conducted by private actors. Such proposals would be considered in the context of the First Amendment rights to gather and receive news. Several bills were introduced in the 112th Congress that would regulate the private use of drones. Additionally, there are other measures Congress could adopt.

In the 112th Congress, Representative Ed Markey introduced the Drone Aircraft Privacy and Transparency Act of 2012 (H.R. 6676).[142] This bill would amend the FAA Modernization and Reform Act of 2012 to create a comprehensive scheme to regulate the private use of drones, including data collection requirements and enforcement mechanisms. First, this bill would require the Secretary of Transportation, with input from the Secretary of Commerce, the Chairman of the Federal Trade Commission, and the Chief Privacy Officer of the Department of Homeland Security, to study any potential threats to privacy protections posed by the introduction of drones in the national airspace. Next, the bill would prohibit the FAA from issuing a license to operate a drone unless the application for such use included a "data collection statement." This statement would require the following items: a list of individuals who would have the authority to operate the drone; the location in which the drone will be used; the maximum period it will be used; and whether the drone would be collecting information about individuals. If the drone will be used to collect personal information, the statement must include the circumstances in which such information will be used; the kinds of information collected and the conclusions drawn from it; the type of data minimization procedures to be employed; whether the information will be sold, and if so, under what circumstances; how long the information would be stored; and procedures for destroying irrelevant data. The statement must also include information about the possible impact on privacy protections posed by the operation under that license and steps to be taken to mitigate this impact. Additionally, the statement must include the contact information of the drone operator; a process for determining what information has been collected about an individual; and a process for challenging the accuracy of such data. Finally, the FAA would be required to post the data collection statement on the Internet.

[139] Galella v. Onassis, 487 F.2d 986, 991-92 (2d Cir. 1973).

[140] *Id.* at 996-97 (internal citations omitted).

[141] Desnick v. American Broadcast Corporation, 44 F.3d 1345, 1353 (7th Cir. 1995).

[142] H.R. 6676, 112th Cong. 2d Sess. (2012).

H.R. 6676 includes several enforcement mechanisms. First, the FAA may revoke any license of a user that does not comply with these requirements. The Federal Trade Commission would have the primary authority to enforce the data collection requirements just stated. Additionally, the Attorney General of each state, or an official or agency of a state, is empowered to file a civil suit if there is reason to believe that the privacy interests of residents of that state have been threatened or adversely affected. H.R. 6676 would also create a private right of action for a person injured by a violation of this legislation.

Representative Ted Poe introduced the Preserving American Privacy Act of 2012 (H.R. 6199).[143] This bill would prevent any private actor from using a drone to conduct surveillance on any other private person without the consent of that other person. This ban on the private use of drones to record other private persons could present First Amendment concerns. First, a reviewing court would, in all likelihood, test whether this ban constituted a rule of general applicability under the *Cohen* and *Branzburg* line of cases.[144] In *Bartnicki v. Vopper*, the Supreme Court held that the wiretapping laws in question were of general applicability.[145] The Court observed that the statutes were designed to protect privacy and did not distinguish based on the content of the intercepted conversation. Instead, the communications were "singled out by virtue of the fact that they were illegally intercepted—by virtue of the source, rather than the subject matter."[146] This same argument could shield H.R. 6199 from a First Amendment challenge. Its purpose is to protect privacy,[147] and it does not distinguish between the subject matter of the drone surveillance, but instead bans any instance of private surveillance when the target has not consented to such monitoring. Additionally, this bill does not curtail the freedom to *publish* information,[148] but instead restricts the methods of collection. The public or media would have other avenues for obtaining the information sought. On the other hand, this measure could hinder the free flow of information, including coverage of newsworthy events, in contradiction to public's right to receive news and the Supreme Court's dicta in *Branzburg* that "[n]ews gathering is not without its First Amendment protections,"[149] and that "without some protection for seeking out the news, freedom of the press could be eviscerated."[150]

Additionally, Congress could create a cause of action for surveillance conducted by drones similar to the intrusion upon seclusion tort provided under Restatement § 652B.[151] How would a

National Labor Relations Board, 301 U.S. 103, 133 (1937) (applying the National Labor Relations Act to the Associated press, the Court noted that the regulation in no way "circumscribes the full freedom and liberty of the [A.P.] to publish the news as it desires it published").

[149] Branzburg v. Hayes, 408 U.S. 665, 707 (1972).

[150] *See id.* at 707.

[151] As with the enactment of any federal statute, Congress must act within one of its constitutionally delegated powers when creating a federal privacy tort or a crime based on intrusion of privacy. It would appear that Congress could regulate this area under its Commerce Clause power, U.S. Const. art. I, § 8, cl. 3, which it acts under when regulating similar federal airspace issues. *See* Braniff Airways v. Nebraska Bd. of Equalization and Assessment, 347 U.S. 590 (1954); United States v. Helsley, 615 F.2d 784 (9th Cir. 1979).

court assess whether drone surveillance violated this type of tort? First, generally speaking, the location of the search would be determinative of whether a person is entitled to an expectation of privacy. Although courts have posited that the common law, like the Fourth Amendment, is intended to "protect people, not places[,]"[152] the *location* of an alleged intrusion factors heavily in a privacy analysis. The greatest chance for liability occurs when a person photographs or videotapes another while in the seclusion of his home. While technology has increasingly shrunk other spheres of privacy in the digital age, the home is still accorded significant legal protection. Using a drone to peer inside the home of another—whether looking through a window or utilizing extra-sensory technology such as thermal imaging—would likely constitute an intrusion upon seclusion. Moving from the home to a public space, or even a space on private property where one can be seen from a public vantage point, significantly reduces the chance of tort liability. However, certain instances of highly offensive surveillance in public may be actionable.

This leads to the second factor that will inform a reviewing court's analysis: the degree of offensiveness of the surveillance. The Ninth Circuit Court of Appeals, applying California law, observed that, in determining offensiveness, "common law courts consider, among other things: 'the degree of intrusion, the context, conduct and circumstances surrounding the intrusion as well as the intruder's motives and objectives, the setting into which he intrudes, and the expectations of those whose privacy is invaded.'" Several of these factors—especially, the context of the intrusion and the motive of the intruder—are fact intensive and require application in a particular case to fully understand. However, some generalizations can be made. The cases discussed above that did find an intrusion upon seclusion in a public place required highly offensive activity, such as closely following another person for an extended period or photographing another in a highly embarrassing shot. Likewise, a court might recognize liability if one were to use a drone to follow another for an extended period of time, particularly at a close distance. It is not clear, however, whether knowledge of being surveilled makes the monitoring more or less offensive. For example, one court seemed to rely on the fact that the defendant was unaware that her house was being photographed to hold that she did not have a viable privacy claim.[153] A drone flying at several thousand feet may not significantly disturb the target of the surveillance and could fall within this rationale. Nevertheless, filming someone in a compromising or embarrassing situation without his knowledge can be equally offensive. Here, the facts of the particular case would determine liability.

Congress could also create a privacy statute tailored to drone use similar to the anti-voyeurism statutes, or "Peeping Tom" laws, enacted in many states.[154] These laws prohibit persons from surreptitiously filming others in various circumstances and places.[155] Some states prohibit surreptitious surveillance of a person while on private property, usually a private residence.[156]

---

[152] Pearson v. Dodd, 410 F.2d 701, 704 (D.C. Cir. 1969) (quoting Katz v. United States, 389 U.S. 347, 351 (1967)).

[153] Mojica Escobar v. Roca, 926 F. Supp. 30, 35 (D.P.R. 1996).

[154] Federal law does prohibit certain acts of voyeurism on federal property. Section 1801, Title 18 provides: "Whoever, in the special maritime and territorial jurisdiction of the United States, has the intent to capture an image of a private area of an individual without their consent, and knowingly does so under circumstances in which the individual has a reasonable expectation of privacy, shall be fined under this title or imprisoned not more than one year, or both." 18 U.S.C. § 1801(a). As discussed in note 151, *supra*, it appears Congress would have the authority to extend this section to voyeurism committed not only on federal property but that committed from federal airspace.

[155] Timothy J. Hortstmann, *Protecting Traditional Privacy Rights in Brave New Digital World: The Threat Posed by Cellular Phone-Cameras and What States Should Do to Stop It*, 111 PENN. ST. L. REV. 739, 742 (2007).

[156] *See, e.g*, GA. CODE ANN. § 16-11-61; MONT. CODE ANN. § 45-5-223.

Nevada employs this model, prohibiting a person from entering the property of another with the intent to peep through a window of the building.[157] Likewise, New Jersey prohibits a person from peering into the window of the dwelling of another "under circumstances in which a reasonable person in the dwelling would not expect to be observed."[158] Other states require a prurient intent when conducting the surveillance. Under Washington State's statute, a person commits the crime of voyeurism if, for the purpose of arousing or gratifying his sexual desire, he films or photographs (1) a person in a place where he or she would expect privacy; or (2) the intimate areas of another person, whether he or she is in a public or private place.[159]

Similarly, Congress could adopt an "anti-paparazzi" statute, like that enacted in California, to prevent intrusive drone surveillance.[160] In fact, Congress considered a similar measure in the 105th Congress. The Privacy Protection Act of 1998 and the Personal Intrusion Act of 1998 would have made it unlawful to persistently follow or chase another person for the purpose of obtaining a visual image of that person if the plaintiff met the following elements: (1) the image was transferred in interstate commerce or the person taking the photograph traveled in interstate commerce; (2) the person had a reasonable expectation of privacy from such intrusion; (3) the person feared death or bodily injury from being chased; and (4) the taking of the image was for commercial purposes.[161] Also, these bills would have created a civil remedy for an individual whose privacy was intruded upon. Congress could use this model to make it unlawful to persistently monitor another person using drone surveillance.

Related Legal Issues

In addition to the legal issues described above, there are a host of other issues that may arise when introducing drones into United States national airspace system.

Right to Protect Property from Trespassing Drones. There may be instances where a landowner is entitled to protect his property from intrusion by a drone. Under Restatement (Second) of Torts § 260, "one is privileged to commit an act which would otherwise be a trespass to a chattel or a conversion if the act is, or is reasonably believed to be, necessary to protect the actor's land or chattels or his possession of them, and the harm inflicted is not unreasonable as compared with the harm threatened."[162] What this means is, in certain instances, a landowner would not be liable to the owner of a drone for damage necessarily or accidentally resulting from removing it from his property. However, there appear to be no cases where a landowner was

[157] NEV. REV. STAT. § 200.603.

[158] N.J. STAT. ANN. § 2C:18-3c.

[159] WASH. REV. CODE § 9A.44.115; *see also* CAL. PENAL CODE § 647; R.I. GEN. LAWS § 11-64-2.

[160] California Civil Code § 1708.8 provides:

> A person is liable for constructive invasion of privacy when the defendant attempts to capture, in a manner that is offensive to a reasonable person, any type of visual image, sound recording, or other physical impression of the plaintiff engaging in a personal or familial activity under circumstances in which the plaintiff had a reasonable expectation of privacy, through the use of a visual or auditory enhancing device, regardless of whether there is a physical trespass, if this image, sound recording, or other physical impression could not have been achieved without a trespass unless the visual or auditory enhancing device was used.

[161] H.R. 3224, H.R. 2448, 105th Cong., 2d sess. (1998).

[162] RESTATEMENT (SECOND) OF TORTS § 260.

permitted to use force to prevent or remove an aircraft from his property. Additionally, as discussed above, determining whether a drone in flight is trespassing upon one's property may be unusually challenging.

Stalking, Harassment, and Other Crimes. Traditional crimes such as stalking, harassment, voyeurism, and wiretapping may all be committed through the operation of a drone. As drones are further introduced into the national airspace, courts will have to work this new form of technology into their jurisprudence, and legislatures might amend these various statutes to expressly include crimes committed with a drone.

Wiretap Laws. Under the federal wiretap statute, it is unlawful to intentionally intercept an "oral communication"[163] by a person "exhibiting an expectation that such communication is not subject to interception under circumstances justifying such expectation.... "[164] Currently, commercial microphones can record sounds upwards of 300 feet.[165] Use of such a microphone on a drone to record private conversations could implicate the federal wiretap statute.

Preemption of State Aviation Regulations. The increased presence of drones in domestic airspace raises the question of which aspects of drone use states may be able to individually regulate. The Supreme Court has stated that federal preemption of state laws and regulations occurs where "the pervasiveness of the federal regulation precludes supplementation by the States, where the federal interest in the field is sufficiently dominant, or where the object sought to be obtained by the federal law and the character of obligations imposed by it reveal the same purpose."[166] Congress vested sole responsibility for the aviation industry and domestic airspace with the federal government in the Federal Aviation Act of 1958.[167] According to the legislative history, the FAA was to have "full responsibility and authority for the advancement and promulgation of civil aeronautics generally, including promulgation and enforcement of safety regulations."[168]

Generally, state regulations of aviation safety, airspace management, and aviation noise are preempted by federal laws and regulations.[169] In *City of Burbank v. Lockheed Air Terminal, Inc.*, the Supreme Court struck down a local city ordinance that prohibited planes from taking off during certain hours of the day as preempted by the federal regulatory scheme.[170] Expressing its fear regarding local control of airspace, the Court stated, "If we were to uphold the Burbank ordinance and a significant number of municipalities followed suit, it is obvious that fractionalized control of the timing of takeoffs and landings would severely limit the flexibility of

[170] *City of Burbank*, 411 U.S. at 639.

the FAA in controlling air traffic flow."[171] The Supreme Court has, however, upheld state regulations imposing taxes on aircraft equipment located within the state.[172]

Conclusion

The legal issues discussed in this report will likely remain unresolved until the civilian use of drones becomes more widespread. To that end, the FAA has been tasked with developing "a comprehensive plan to safely accelerate the integration" of drones into the national airspace, which focuses on the safety of the drone technology and operator certification. While the deadline for development of the plan has already elapsed, the FAA has until the end of FY2015 to implement such a plan.[173] Additionally, the FAA must identify six test ranges where it will integrate drones into the national airspace. This deadline, 180 days after enactment of the act, has also elapsed without FAA compliance. Once these regulations are tested and promulgated, the unique legal challenges that could arise based on the operational differences between drones and already ubiquitous fixed-wing aircraft and helicopters may come into sharper focus.

AN ACT

AMENDING TITLE 13, CHAPTER 30, ARIZONA REVISED STATUTES, BY ADDING SECTION 13-3007; RELATING TO DRONE SURVEILLANCE.

(TEXT OF BILL BEGINS ON NEXT PAGE)

Be it enacted by the Legislature of the State of Arizona:

Section 1. Title 13, chapter 30, Arizona Revised Statutes, is amended by adding section 13-3007, to read:

13-3007. Unlawful use of drones: admissibility of evidence; civil action: classification: definitions

A. IT IS UNLAWFUL FOR A LAW ENFORCEMENT AGENCY OR A STATE, COUNTY OR MUNICIPAL AGENCY TO USE A DRONE TO GATHER, STORE OR COLLECT EVIDENCE OF ANY TYPE, INCLUDING AUDIO OR VIDEO RECORDINGS, OR BOTH, OR OTHER INFORMATION THAT IS NOT SPECIFICALLY OUTLINED IN A SEARCH WARRANT. A LAW ENFORCEMENT AGENCY MAY NOT USE DRONES FOR SURVEILLANCE OF CITIZENS UNLESS THE CITIZEN IS SPECIFICALLY NAMED ON A VALID SEARCH WARRANT.

B. IT IS UNLAWFUL FOR A PERSON TO USE DRONES TO MONITOR OTHER PERSONS INSIDE THEIR HOMES OR PLACES OF WORSHIP OR WITHIN THE CLOSED CONFINES OF THEIR PROPERTY OR OTHER LOCATIONS WHERE A PERSON WOULD HAVE AN EXPECTATION OF PRIVACY.

C. EVIDENCE THAT IS OBTAINED OR COLLECTED IN VIOLATION OF THIS SECTION IS NOT ADMISSIBLE IN ANY CIVIL OR CRIMINAL PROCEEDING AND MAY NOT BE USED AGAINST A CITIZEN, CORPORATION OR ORGANIZATION IN ANY FORMAL PROCEEDING WITHIN THIS STATE FOR THE PURPOSE OF ENFORCING STATE OR LOCAL LAW.

D. THIS SECTION DOES NOT PROHIBIT EITHER:

1. THE USE OF A DRONE BY A LAW ENFORCEMENT AGENCY IF THE LAW ENFORCEMENT AGENCY FIRST OBTAINS A SEARCH WARRANT THAT AUTHORIZES THE USE OF A DRONE AND THE USE OF THE DRONE IS USED ONLY TO OBTAIN EVIDENCE ON THE PERSON NAMED IN THE WARRANT.

2. THE USE OF A DRONE BY A LAW ENFORCEMENT AGENCY THAT IS ACTIVELY ENGAGED IN THE ENFORCEMENT OF CHAPTER 34 OF THIS TITLE OR SECTION 13-2319 ON PUBLIC LANDS AS DEFINED IN SECTION 37-901 OR ON PRIVATE LAND WITH THE WRITTEN PERMISSION FROM THE LANDOWNER.

3. A CITIZEN FROM OWNING OR OPERATING A DRONE FOR LAWFUL PURPOSES.

E. AN AGGRIEVED PARTY MAY INITIATE A CIVIL ACTION AGAINST A LAW ENFORCEMENT AGENCY TO OBTAIN ALL APPROPRIATE RELIEF IN ORDER TO PREVENT, RESTRAIN OR REMEDY A VIOLATION OF THIS SECTION.

F. A PERSON WHO VIOLATES THIS SECTION IS GUILTY OF A CLASS 6 FELONY.

G. FOR THE PURPOSES OF THIS SECTION:

1. "DRONE" MEANS A POWERED OR AN UNPOWERED AERIAL VEHICLE OR A BALLOON FLOAT OR OTHER DEVICE THAT:

(a) DOES NOT CARRY A HUMAN OPERATOR.

(b) USES AERODYNAMIC FORCES OR GASES TO PROVIDE LIFT.

(c) CAN FLY AUTONOMOUSLY OR BE PILOTED REMOTELY.

(d) CAN BE EXPENDABLE OR RECOVERABLE.

(e) CAN CARRY A LETHAL OR NONLETHAL PAYLOAD.

2. "LAW ENFORCEMENT AGENCY" MEANS A LAWFULLY ESTABLISHED STATE OR LOCAL PUBLIC AGENCY THAT IS RESPONSIBLE FOR THE PREVENTION AND DETECTION OF CRIME, THE ENFORCEMENT OF LOCAL GOVERNMENT CODES AND THE ENFORCEMENT OF

PENAL, TRAFFIC, REGULATORY, GAME OR CONTROLLED SUBSTANCE LAWS AND INCLUDES AN AGENT OF THE LAW ENFORCEMENT AGENCY.

Sec. 2. Severability

If a provision of this act or its application to any person or circumstance is held invalid, the invalidity does not affect other provisions or applications of the act that can be given effect without the invalid provision or application, and to this end the provisions of this act are severable.

Sec. 3. Short title

Section 13-3007, Arizona Revised Statutes, as added by this act, may be cited as the "Citizens Protection From Unwarranted Surveillance Act".

A bill to be entitled

An act relating to searches and seizures; creating the "Freedom from Unwarranted Surveillance Act"; defining the terms "drone" and "law enforcement agency"; prohibiting a law enforcement agency from using a drone to gather evidence or other information; providing an exception; authorizing an aggrieved party to initiate a civil action in order to prevent or remedy a violation of the act; prohibiting use of evidence obtained or collected in violation of the act in any criminal prosecution in any court of law in this state; providing an effective date.

Be It Enacted by the Legislature of the State of Florida:

Section 1. Searches and seizure using a drone.—

(1) SHORT TITLE.—This act may be cited as the "Freedom from Unwarranted Surveillance Act."

(2) DEFINITIONS.—As used in this act, the term:

(a) "Drone" means a powered, aerial vehicle that:

1. Does not carry a human operator;

2. Uses aerodynamic forces to provide vehicle lift;

3. Can fly autonomously or be piloted remotely;

4. Can be expendable or recoverable; and

5. Can carry a lethal or nonlethal payload.

(b) "Law enforcement agency" means a lawfully established state or local public agency that is responsible for the prevention and detection of crime and the enforcement of penal,

CODING: Words stricken are deletions; words underlined are additions.

traffic, regulatory, game, or controlled substance laws.

(3) PROHIBITED USE OF DRONES.—A law enforcement agency may not use a drone to gather evidence or other information.

(4) EXCEPTIONS.—This act does not prohibit the use of a drone to counter a high risk of a terrorist attack by a specific individual or organization if the United States Secretary of Homeland Security determines that credible intelligence indicates that there is such a risk.

(5) REMEDIES FOR VIOLATION.—An aggrieved party may initiate a civil action against a law enforcement agency to obtain all appropriate relief in order to prevent or remedy a violation of this act.

(6) PROHIBITION ON USE OF EVIDENCE.—Evidence obtained or collected in violation of this act is not admissible as evidence in a criminal prosecution in any court of law in this state.

Section 2. This act shall take effect July 1, 2013.

CODING: Words stricken are deletions; words underlined are additions.

By the Committee on Criminal Justice; and Senators Negron, Brandes, and Evers

THE SENATE
TWENTY-SEVENTH LEGISLATURE, 2013
STATE OF HAWAII

S.B. NO. 783

JAN 18 2013

A BILL FOR AN ACT

RELATING TO UNMANNED AERIAL VEHICLES.

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF HAWAII:

SECTION 1. The Hawaii Revised Statutes is amended by adding a new chapter to be appropriately designated and to read as follows:

"**CHAPTER 263B**

263B-1 Definition. The term 'unmanned aerial vehicle' means an aircraft that is operated without the possibility of direct human intervention from within or on the aircraft.

263B-2 Use of Unmanned Aerial Vehicles. (a) Any use of unmanned aerial vehicles must fully comply with all Federal Aviation Administration requirements and guidelines, and chapters 261, 262, 263, and 263A. Acquisition of unmanned aerial vehicles must be approved by the department of transportation.

(b) Except as provided in subsection (c), it is unlawful for an agent of the state or any political subdivision thereof, or an individual, association, organization, or corporation, to operate an unmanned aerial vehicle or to disclose or receive

information acquired through the operation of an unmanned aerial vehicle.

(c) Exceptions.

(1) Consent. It shall not be unlawful under this chapter to disclose or receive information about any person acquired through the operation of an unmanned aerial vehicle if such person has given written consent to such disclosure.

(2) Emergency Situations. It shall not be unlawful under this chapter for an agent of the state or any political subdivision thereof to operate an unmanned aerial vehicle, and for information from such operation to be disclosed or received if the unmanned aerial vehicle is used in circumstances in which it is reasonable to believe that there is an imminent threat to the life or safety of a person, to assist the person, provided that within 48 hours of the commencement of such operation, a supervisory official of the agent of the state or any political subdivision thereof, shall file a sworn statement with the circuit court of that

jurisdiction setting forth the grounds for the emergency access.

(3) Warrant or Order.

(A) Warrant. An unmanned aerial vehicle may be operated and information from such operation disclosed in order to collect information from a non-public area only pursuant to a warrant issued under chapter 803.

(B) Order. An unmanned aerial vehicle may be operated and information from such operation disclosed in order to collect information from a public area pursuant to a warrant authorized under subsection (3)(A) or pursuant to an order issued by any court that is a court of competent jurisdiction if the agent of the state or any political subdivision thereof offers specific facts demonstrating reasonable suspicion of criminal activity, that the operation of the public unmanned aircraft system is expected to uncover such activity, and that alternative methods of data collection are either cost-prohibitive or present a significant risk to any

person's bodily safety. Such an order shall not be issued for a period greater than 48 hours. Extensions of an order may be granted but shall be no longer than the authorizing judge deems necessary to achieve the purposes for which it was granted and in no event for longer than thirty days.

(d) When unmanned aerial vehicles are used pursuant to subsection (c), they shall be operated in a manner to collect data only on the target and to avoid data collection on individuals, homes, or areas other than the target. Neither facial recognition nor other biometric matching technology may be used on non-target data collected by an unmanned aerial vehicle.

(e) Unmanned aerial vehicles may not be equipped with weapons.

263B-3 Data retention and use. (a) No data collected on an individual, home, or area other than the target that justified deployment may be used, copied, or disclosed for any purpose. Such data must be deleted within twenty-four hours after collection.

(b) Whenever an agent of the state or any political subdivision thereof uses an unmanned aerial vehicle, no part of information acquired and no evidence derived therefrom may be received in evidence in any trial, hearing, or other proceeding in or before any court, grand jury, department, officer, agency, regulatory body, legislative committee, or other authority of the state or a political subdivision thereof if the disclosure of that information would be in violation of this chapter.

(c) Any willful disclosure or use by an agent of the state or any political subdivision thereof of information beyond the extent permitted by this chapter is a violation of this chapter, and is subject to administrative discipline as described in subsection 263B-6 below.

263B-4 Emergency situations exception. (a)Notwithstanding any other provision of this chapter, an agent of the state or any political subdivision thereof may operate an unmanned aerial vehicle and disclose information from such operation if

(1) Such agent of the state or any political subdivision thereof reasonably determines that an emergency situation exists that involves:

(A) Immediate danger of death or serious physical injury to any person;

(B) Conspiratorial activities threatening the national security interest; or

(C) Conspiratorial activities characteristic of organized crime;

(2) The operation of an unmanned aerial vehicle is required before a warrant or order authorizing such interception can, with due diligence, be obtained;

(3) There are grounds upon which such a warrant or order could be entered to authorize such operation; and

(4) An application for a warrant or order approving such operation is made within 48 hours after the operation has occurred or begins to occur.

(b) An operation of an unmanned aerial vehicle carried out under subsection (a) shall immediately terminate when the information sought is obtained or when the application for the warrant or order is denied, whichever is earlier.

(c) In the event an application for a warrant or order is denied, the information obtained from the operation of an unmanned aerial vehicle shall be treated as having been obtained in violation of this chapter and the evidence shall not be used.

263B-5 Delayed Notice. (a) An agent of the state or any political subdivision thereof, in seeking a court order or warrant, may request a delay on the notification required under section 803 for a period not to exceed ninety days, if there is reason to believe that notification of the existence of the court order may have an adverse result. For the purposes of this subsection, an "adverse result" is one that poses a risk of:

(1) Endangering the life or physical safety of an individual;

(2) Flight from prosecution;

(3) Destruction of or tampering with evidence;

(4) Intimidation of potential witnesses; or

(5) Otherwise seriously jeopardizing an investigation or unduly delaying a trial.

Extensions of the delay of notification of up to ninety days each may be granted by the court upon application, or by

certification by the agent of the state or any political subdivision thereof.

(b) Upon expiration of the period of delay of notification, the agent of the state or any political subdivision thereof shall serve upon or deliver by registered or first-class mail to, a copy of the warrant or order upon the person or persons upon whom information was collected together with a notice that

(1) States with reasonable specificity the nature of the law enforcement inquiry; and

(2) Informs the person or persons upon whom information was collected that notification of such customer or subscriber was delayed and which provision of this chapter allowed such delay; and

(3) The governmental entity or court which made the certification or determination of delay.

263B-6 Administrative discipline. If a court or appropriate department or agency determines that an agent of the state or any political subdivision thereof has violated any provision of this chapter, and that the circumstances surrounding the violation raise serious questions about whether or not the agent of the state or any political subdivision

thereof acted willfully or intentionally with respect to the violation, the department or agency shall, upon receipt of a true and correct copy of the decision and findings of the court or appropriate department or agency, promptly initiate a proceeding to determine whether disciplinary action against the agent of the state or any political subdivision thereof is warranted. If the head of the department or agency involved determines that disciplinary action is not warranted, such head shall notify the Attorney General with jurisdiction over the department or agency concerned and shall provide the Attorney General with the reasons for such determination.

263B-7 Reporting. (a) In January of each year, any agent of the state or political subdivision thereof that uses unmanned aerial vehicles shall report to the legislature on activity during the prior year, and shall provide a copy of the report to the office of the administrative director of the courts, information to include:

(1) The number of times an unmanned aerial vehicle was used, organized by the types of incidents and the types of justification for deployment;

(2) The number of crime investigations aided by the use of unmanned aerial vehicles, along with a

description of how the unmanned aerial vehicle was helpful to each investigation;

(3) The number of uses of unmanned aerial vehicles for reasons other than criminal investigations, along with a description of how the unmanned aerial vehicle was helpful in each instance;

(4) The frequency and type of data collected on individuals or areas other than targets; and

(5) The total cost of their unmanned aerial vehicle program.

(b) In January of each year, any judge who has in the prior year issued a warrant or order or an extension thereof, or denied approval of an application for a warrant or order, under this section, shall report to the office of the administrative director of the courts:

(1) The number and kind of orders or extensions applied for, granted, modified, or denied;

(2) The period of unmanned aerial vehicle use authorized by the orders, and the number and duration of any extensions of the orders;

(3) The offense specified in the order or application, or extension of an order; and

(4) The identity of the applying agent of the state or political subdivision thereof making the application and the person authorizing the application.

(c) In April of each year the office of the administrative director of the courts shall report to the legislature information for the prior year, including:

(1) A general description of the information gathered in orders or extensions under this section;

(2) The nature and frequency of incriminating conduct gathered;

(3) The number of persons upon whom information was gathered, and

(4) The nature, amount, and cost of the manpower and other resources used in the collection;

(5) The number of arrests resulting from information gathered and the offenses for which arrests were made;

(6) The number of trials resulting from such information;

(7) The number of motions to suppress made with respect to such information, and the number granted or denied; and

(8) The number of convictions resulting from such information and the offenses for which the convictions were obtained and a general assessment of the importance of the information.

SECTION 2. This Act shall take effect upon its approval.

S.B. NO. 783

Report Title:
Unmanned Aerial Vehicles; Ban on Surveillance by Drones

Description:
Creates new section relating to unmanned aerial vehicles.

The summary description of legislation appearing on this page is for informational purposes only and is not legislation or evidence of legislative intent.

LEGISLATURE OF THE STATE OF IDAHO

Sixty-second Legislature First Regular Session - 2013

IN THE SENATE

SENATE BILL NO. 1051

BY TRANSPORTATION COMMITTEE

AN ACT

RELATING TO AERONAUTICS; TO PROVIDE A SHORT TITLE; AMENDING CHAPTER 2, TITLE 21, IDAHO CODE, BY THE ADDITION OF A NEW SECTION 21-213, IDAHO CODE, TO PROVIDE DEFINITIONS; AMENDING CHAPTER 2, TITLE 21, IDAHO CODE, BY THE ADDITION OF A NEW SECTION 21-214, IDAHO CODE, TO ESTABLISH PROVISIONS RELATING TO RESTRICTIONS ON GATHERING EVIDENCE OR OTHER INFORMATION THROUGH THE USE OF A DRONE OR OTHER UNMANNED AIRCRAFT AND TO PROVIDE FOR CONSENT; AMENDING CHAPTER 2, TITLE 21, IDAHO CODE, BY THE ADDITION OF A NEW SECTION 21-215, IDAHO CODE, TO ESTABLISH PROVISIONS RELATING TO THE USE OF A DRONE BY A LAW ENFORCEMENT AGENCY WHEN EXIGENT CIRCUMSTANCES EXIST; AND AMENDING CHAPTER 2, TITLE 21, IDAHO CODE, BY THE ADDITION OF A NEW SECTION 21-216, IDAHO CODE, TO ESTABLISH PROVISIONS RELATING TO A CIVIL ACTION AND TO PROVIDE THAT NO INFORMATION OBTAINED IN VIOLATION OF THE PROVISIONS OF THIS ACT MAY BE ADMISSIBLE AS EVIDENCE IN CERTAIN PROCEEDINGS.

Be It Enacted by the Legislature of the State of Idaho:

SECTION 1. SHORT TITLE. This act may be cited as the "Preserving Freedom from Unwarranted Surveillance Act."

SECTION 2. That Chapter 2, Title 21, Idaho Code, be, and the same is hereby amended by the addition thereto of a NEW SECTION, to be known and designated as Section 21-213, Idaho Code, and to read as follows:

21-213. FREEDOM FROM UNWARRANTED SURVEILLANCE -- DEFINITIONS. For the purposes of sections 21-214, 21-215 and 21-216, Idaho Code, the following terms have the following meanings:

(1) "Drone" means any powered aerial vehicle that does not carry a human operator, uses aerodynamic forces to provide vehicle lift, can fly autonomously or be piloted remotely, can be expendable or recoverable and can carry a lethal or nonlethal payload.

(2) "Law enforcement agency" shall have the same meaning as provided for in section 18-4508, Idaho Code.

(3) "Unmanned aircraft" means an aircraft that is operated without the possibility of direct human intervention from within or on the aircraft.

SECTION 3. That Chapter 2, Title 21, Idaho Code, be, and the same is hereby amended by the addition thereto of a NEW SECTION, to be known and designated as Section 21-214, Idaho Code, and to read as follows:

21-214. RESTRICTIONS ON GATHERING OF EVIDENCE. (1) No person, entity or state agency shall use a drone or other unmanned aircraft to gather evidence or other information pertaining to criminal conduct or conduct in violation of a statute, ordinance, regulation or rule, except to the extent authorized in a warrant.

(2) No person, entity or state agency shall use a drone or other unmanned aircraft to conduct surveillance of any individual, property owned by an individual, farm or agricultural industry without the consent of that individual, property owner, farm or agricultural industry.

SECTION 4. That Chapter 2, Title 21, Idaho Code, be, and the same is hereby amended by the addition thereto of a NEW SECTION, to be known and designated as Section 21-215, Idaho Code, and to read as follows:

21-215. USE OF UNMANNED AIRCRAFT -- EXIGENT CIRCUMSTANCES. The provisions of this act do not prohibit the use of a drone by a law enforcement agency when exigent circumstances exist. For the purposes of this section, exigent circumstances exist if a law enforcement agency possesses reasonable suspicion that, under particular circumstances, swift action to prevent imminent danger to life is necessary.

SECTION 5. That Chapter 2, Title 21, Idaho Code, be, and the same is hereby amended by the addition thereto of a NEW SECTION, to be known and designated as Section 21-216, Idaho Code, and to read as follows:

21-216. REMEDIES FOR VIOLATION OF THE PROVISIONS OF THIS ACT -- USE OF INFORMATION OBTAINED. (1) In a civil action any aggrieved party may obtain all appropriate relief to prevent or remedy a violation of the provisions of this act.

(2) No information obtained or collected in violation of the provisions of this act may be admissible as evidence in a criminal proceeding in any court of law in the state or in an administrative hearing.

SENATE RESOLUTION

WHEREAS, Unmanned aircraft are aircraft that are operated without the possibility of direct human intervention or control from within or on the aircraft; and

WHEREAS, These unmanned aircraft are most commonly referred to as drones; and

WHEREAS, New developments in technology allow the creation of increasingly smaller unmanned aircraft that are undetectable by the naked eye; and

WHEREAS, The United States Congress enacted the Federal Aviation Administration Modernization and Reform Act ("the Act") which requires the Federal Aviation Administration to develop a plan to accelerate the integration of civil unmanned aircraft into the national airspace system by 2015; and

WHEREAS, Following the passage of the Act, the Federal Aviation Administration (FAA) began to issue rules to implement the Act's mandated plan, including rules that allow law enforcement agencies to operate small unmanned aerial vehicles; and

WHEREAS, Allowing an increased amount of small unmanned

aircraft to fly in the national airspace expands the government's aerial surveillance capability and threatens the protected privacy rights of Illinois citizens; therefore, be it

RESOLVED, BY THE SENATE OF THE NINETY-SEVENTH GENERAL ASSEMBLY OF THE STATE OF ILLINOIS, that we strongly urge the United States Congress to repeal the provisions of the Act that require the FAA to develop a plan to expand the use of unmanned aircraft in the airspace above the continental United States and any other territory or possession of the United States, and thereby repeal the FAA's rules that have begun to implement the mandated plan; and be it further

RESOLVED, That suitable copies of this resolution be delivered to the Speaker and Minority Leader of the United States House of Representatives, the Majority and Minority Leaders of the United States Senate, and the members of the Illinois congressional delegation.

SENATE BILL No. 20

DIGEST OF INTRODUCED BILL

Citations Affected: IC 35-46-10.

Synopsis: Use of unmanned aerial vehicles. Provides that a person who knowingly or intentionally uses an unmanned aerial vehicle to monitor a person, property, or thing without the written consent of the subject of the monitoring commits a Class D felony. Provides that images or communications obtained through the use of an unmanned aerial vehicle are not admissible as evidence. Provides that a person who possesses an image or communications obtained through the use of an unmanned aerial vehicle commits a Class A misdemeanor. Prohibits the use of public money to purchase an unmanned aerial vehicle.

Effective: July 1, 2013.

SENATE BILL No. 20

A BILL FOR AN ACT to amend the Indiana Code concerning criminal law and procedure.

Be it enacted by the General Assembly of the State of Indiana:

SECTION 1. IC 35-46-10 IS ADDED TO THE INDIANA CODE AS A **NEW** CHAPTER TO READ AS FOLLOWS [EFFECTIVE JULY 1, 2013]:

Chapter 10. Use of Unmanned Aerial Vehicles

Sec. 1. As used in this chapter, "person" includes a law enforcement officer.

Sec. 2. As used in this chapter, "unmanned aerial vehicle" means an aircraft that:

(1) does not carry a human operator; and

(2) is capable of flight under remote control or autonomous programming.

Sec. 3. As used in this chapter, "use of an unmanned aerial vehicle" means the use of an unmanned aerial vehicle to monitor or otherwise observe a person, property, or thing. The term includes:

(1) the interception of wire, electronic, or oral communications; or

(2) the capture, collection, monitoring, or viewing of images.

The term does not include the use of an unmanned aerial vehicle solely for recreational or hobby purposes.

Sec. 4. (a) A person may not make use of an unmanned aerial vehicle without the written consent of:

(1) the person; or

(2) the owner of the property or thing;

that is the subject of the use.

(b) A person who knowingly or intentionally makes use of an unmanned aerial vehicle in violation of subsection (a) commits a Class D felony.

Sec. 5. (a) The following are not admissible as evidence in an administrative or judicial proceeding:

(1) A communication or an image that is obtained through the use of an unmanned aerial vehicle in violation of section 4 of this chapter.

(2) Evidence derived from a communication or an image described in subdivision (1).

(b) A person who possesses a communication or an image described in subsection (a) commits a Class A misdemeanor.

Sec. 6. After June 30, 2013, a person may not use public money from any source to purchase or otherwise acquire an unmanned aerial vehicle.

Be it enacted by the People of the State of Maine as follows:

Sec. 1. 25 MRSA Pt. 12 is enacted to read:

PART 12

UNMANNED AERIAL VEHICLES

CHAPTER 551

REGULATION OF UNMANNED AERIAL VEHICLES

§4501. Definitions

As used in this chapter, unless the context otherwise indicates, the following terms have the following meanings.

1. Law enforcement agency. "Law enforcement agency" has the same meaning as in section 3701, subsection 1.

2. Unmanned aerial vehicle. "Unmanned aerial vehicle" means an aircraft that is operated without a physical human presence within or on the aircraft and guided by remote control.

§4502. Operation of unmanned aerial vehicles

1. Acquisition of unmanned aerial vehicles. The acquisition of an unmanned aerial vehicle must be approved by the governing body of the governmental unit overseeing the law enforcement agency seeking to make such an acquisition.

2. Operation of unmanned aerial vehicles. Operation of an unmanned aerial vehicle must fully comply with all Federal Aviation Administration requirements and guidelines. A law enforcement agency may not operate an unmanned aerial vehicle or collect, disclose or receive information acquired through the operation of an unmanned aerial vehicle except:

A. Pursuant to an emergency enforcement exception under section 4504;

B. To collect, disclose or receive information about a person or the person's residence, property or area if that person has given written consent;

C. To assist a person in an emergency circumstance in which it is reasonable to believe that there is an imminent threat to the life or safety of the person, subject to the following limitations:

(1) The law enforcement agency documents the factual basis for the emergency; and

(2) Not later than 48 hours after the emergency operation begins, a supervisory official for the law enforcement agency files a sworn statement setting forth the grounds for the emergency operation;

D. Pursuant to a warrant issued under Title 15, section 55; or

E. Pursuant to an order issued by a court of competent jurisdiction if a law enforcement agency offers specific and articulable facts demonstrating that there is a reasonable suspicion of criminal activity, that the operation of the unmanned aerial vehicle will uncover such activity and that alternative methods of collecting information either are cost-prohibitive or present a significant risk to a person's bodily safety. An order issued under this paragraph may not allow operation for a period greater than 48 hours. An extension of an order issued under this paragraph may be granted for a period no longer than the court determines necessary to achieve the purposes for which it was granted but not to exceed 30 days.

3. Restrictions on operation. The operation of an unmanned aerial vehicle may not:

A. Be conducted for a purpose other than a specific purpose allowed under subsection 2 or section 4504;

B. Be conducted by a person other than a law enforcement agency pursuant to this chapter or a person otherwise authorized by law;

C. Employ the use of facial recognition technology or other biometric technology; or

D. Collect information on a person, residence, property or area not related to a permitted purpose of operation under subsection 2.

An unmanned aerial vehicle may not be equipped with a weapon.

§4503. Retention of information

Information collected by an unmanned aerial vehicle may not be used, copied or disclosed for any purpose other than for a lawful purpose under section 4502, subsection 2. Information collected by an unmanned aerial vehicle for any purpose other than for a lawful purpose under section 4502, subsection 2 must be deleted as soon as possible and no later than 24 hours after collection. Information collected by an unmanned aerial vehicle under section 4502, subsection 2 may be received in evidence in a trial, hearing or other proceeding in or before a court, grand jury, department, officer, agency, regulatory body, legislative committee or other authority of the State or a municipality only if the use of that information as evidence was part of the lawful purpose allowing the unmanned aerial vehicle operation under section 4502, subsection 2.

§4504. Emergency enforcement exception

1. Emergency enforcement exception. A law enforcement agency may operate an unmanned aerial vehicle and collect, disclose or receive information from the operation if the law enforcement agency reasonably determines that an emergency enforcement exception is required because a situation exists:

A. That involves a conspiratorial activity that threatens the national security interest or that is characteristic of organized crime;

B. That requires the operation of an unmanned aerial vehicle before a warrant under section 4502, subsection 2, paragraph D or court order under section 4502, subsection 2, paragraph E with due diligence can be obtained;

C. In which there are grounds upon which a warrant under section 4502, subsection 2, paragraph D or court order under section 4502, subsection 2, paragraph E could be entered to authorize the operation of an unmanned aerial vehicle; and

D. For which an application for a warrant under section 4502, subsection 2, paragraph D or court order under section 4502, subsection 2, paragraph E approving the operation is made within 48 hours after the operation of an unmanned aerial vehicle has occurred.

2. Absence of a warrant or court order. If the information sought by the operation of an unmanned aerial vehicle is obtained prior to the issuance of a warrant or court order under subsection 1, the law enforcement agency shall immediately terminate the operation of the unmanned aerial vehicle.

3. Denial of warrant or court order. If the application for a warrant or court order under subsection 1 is denied, the operation of the unmanned aerial vehicle underlying the application must be immediately terminated and any information obtained from the operation of the unmanned aerial vehicle must be treated as having been obtained in violation of this chapter.

§4505. Delayed notice

1. Delayed notice. When a warrant or court order is sought under section 4502, subsection 2, paragraph D or E or section 4504, a law enforcement agency may request an order delaying the notice required under the Maine Rules of Criminal Procedure, Rule 41B(b)(4) for a period not to exceed 10 days. The court may grant the request if the court determines that the notification of the warrant or court order may have an adverse result under subsection 2.

2. Adverse result. An adverse result for the purposes of a delayed notice under subsection 1 includes the subject of the warrant or court order or other person of interest:

A. Endangering the life or physical safety of a person;

B. Fleeing from prosecution;

C. Destroying or tampering with evidence;

D. Intimidating potential witnesses; and

E. Otherwise seriously jeopardizing an investigation or unduly delaying a trial.

3. Extension. The court may grant an extension of the delayed notice under subsection 1 for up to 10 days for each extension upon application by the law enforcement agency.

4. Expiration of delayed notice. Upon expiration of the period of delayed notice under subsection 1, the law enforcement agency shall serve upon, or deliver by registered or first-class mail to, the person about whom information was collected a copy of the warrant or court order together with notice that:

A. States with reasonable specificity the nature of the law enforcement inquiry; and

B. Informs the person about whom information was collected:

(1) That notification of the warrant or court order was delayed;

(2) What law enforcement agency made the request for delayed notice;

(3) What court made the determination to delay notice; and

(4) Which provision of subsection 2 supported the court's determination.

§4506. Violations

1. Private right of action. If a law enforcement agency violates any provision of this chapter, the person about whom information was collected personally or as owner of a residence, property or area in violation of this chapter may institute and prosecute in that person's own name and on that person's behalf a civil action for legal or equitable relief. In addition to compensatory damages, a person whose rights have been violated by a violation of this chapter may recover no more than $5,000 plus reasonable attorney's fees and court costs.

2. Attorney General. The Attorney General may bring a civil action to enforce the provisions of this chapter.

3. Motion to suppress. A court may not allow to be received into evidence any information collected, disclosed or received in violation of this chapter and shall grant a motion to suppress as evidence any information collected, disclosed or received in violation of this chapter.

§4507. Reporting

1. Reporting by law enforcement agency. In June of each year, a law enforcement agency that uses an unmanned aerial vehicle shall report to the Legislature, retain for public viewing and post on its publicly accessible website, if one exists:

A. The number of times an unmanned aerial vehicle was operated, organized by the types of incidents and the types of justification for operation;

B. The number of criminal investigations aided by the operation of an unmanned aerial vehicle and a description of how the unmanned aerial vehicle aided each investigation;

C. The number of times an unmanned aerial vehicle was operated for reasons other than a criminal investigation and a description of how the unmanned aerial vehicle aided each operation;

D. The frequency and type of information collected on an individual, residence, property or area that was not the subject of an operation; and

E. The total cost of operating the unmanned aerial vehicle for the preceding 12 months.

2. Reporting by Attorney General to the court. In March of each year the Attorney General or the Attorney General's designee shall report to the Administrative Office of the Courts the number of applications for a warrant under section 4502,

subsection 2, paragraph D; court order under section 4502, subsection 2, paragraph E; order for delayed notice under section 4505, subsection 1; and extension of delayed notice under section 4505, subsection 3 made during the preceding calendar year. For each warrant, court order, order for delayed notice and extension of delayed notice reported pursuant to this subsection, the report must include:

A. A general description of the information collected under the warrant, court order, order for delayed notice or extension of delayed notice, including:

(1) The approximate nature and frequency of incriminating conduct;

(2) The approximate number of persons about whom information was collected; and

(3) The approximate nature, amount and cost of the personnel and other resources used in the collection;

B. The number of arrests resulting from the information collected and the offenses for which arrests were made;

C. The number of trials resulting from the information collected;

D. The number of motions to suppress made with respect to the information collected and the number of those motions granted or denied; and

E. The number of convictions resulting from the information collected and the offenses for which the convictions were obtained and a general assessment of the importance of the information.

3. Reporting by Attorney General to the Legislature and public. The Attorney General shall post in June of each year on the Attorney General's publicly accessible website and transmit to the Legislature a full and complete report listing the number of applications for warrants and court orders authorizing and approving operation of unmanned aerial vehicles and disclosure of information collected from the operation of unmanned aerial vehicles pursuant to this chapter and the number of warrants, court orders, orders for delayed notice and extensions of delayed notice granted and denied pursuant to this chapter during the preceding calendar year.

4. Record keeping. A law enforcement agency shall keep a detailed record about each operation of an unmanned aerial vehicle including all information required to be reported in this section and make this record available to the Attorney General.

SUMMARY

This bill regulates unmanned aerial vehicles, including their acquisition and lawful operation by law enforcement agencies in collecting, disclosing and receiving information and the retention of information collected. For the permitted operation of an unmanned aerial vehicle, the bill requires the consent of the subject person, a warrant or court order, an emergency situation that threatens life or serious bodily injury or an emergency enforcement situation that threatens national security or evinces conspiratorial criminal conduct requiring immediate operation of the vehicle before a warrant can be obtained. The bill also allows delayed service of a warrant or court order informing the

subject person until after the warrant's or order's issuance if necessary for avoiding certain adverse results. The bill provides for a private right of action or enforcement by the Attorney General for a violation and disallows the use of any information collected in violation as evidence in a hearing or court of law. The bill requires the Attorney General to report certain information concerning the use of unmanned aerial vehicles to the Legislature and the Administrative Office of the Courts and for law enforcement agencies and the Attorney General to post certain information on their publicly accessible websites.

HOUSE BILL 1233

E2, E4 3lr2070

By: **Delegates George, Dwyer, and W. Miller**
Introduced and read first time: February 8, 2013
Assigned to: Judiciary

A BILL ENTITLED

AN ACT concerning

Criminal Procedure – Law Enforcement Agencies – Use of Drones

FOR the purpose of prohibiting a law enforcement agency from using a drone to gather evidence or other information without a warrant, except under certain circumstances; authorizing an aggrieved party to initiate a certain civil action against a law enforcement agency; establishing that evidence obtained or collected in violation of this Act is not admissible as evidence in a criminal prosecution in a court of law in this State; defining certain terms; and generally relating to the use of drones by law enforcement.

BY adding to
Article – Criminal Procedure
Section 1–203.1
Annotated Code of Maryland
(2008 Replacement Volume and 2012 Supplement)

SECTION 1. BE IT ENACTED BY THE GENERAL ASSEMBLY OF MARYLAND, That the Laws of Maryland read as follows:

Article – Criminal Procedure

1–203.1.

(A) (1) IN THIS SECTION THE FOLLOWING WORDS HAVE THE MEANINGS INDICATED.

(2) "DRONE" MEANS A POWERED AERIAL VEHICLE THAT:

(I) DOES NOT CARRY A HUMAN OPERATOR;

EXPLANATION: **CAPITALS INDICATE MATTER ADDED TO EXISTING LAW.**
[Brackets] indicate matter deleted from existing law.

(II) USES AERODYNAMIC FORCES TO PROVIDE VEHICLE LIFT;

(III) CAN FLY AUTONOMOUSLY OR BE PILOTED REMOTELY; AND

(IV) IS EXPENDABLE OR RECOVERABLE.

(3) "EMERGENCY" HAS THE MEANING STATED IN § 2–412 OF THE PUBLIC SAFETY ARTICLE.

(4) "LAW ENFORCEMENT AGENCY" HAS THE MEANING STATED IN § 3–201 OF THE PUBLIC SAFETY ARTICLE.

(B) (1) EXCEPT AS PROVIDED IN PARAGRAPH (2) OF THIS SUBSECTION, A LAW ENFORCEMENT AGENCY MAY NOT USE A DRONE TO GATHER EVIDENCE OR OTHER INFORMATION WITHOUT A WARRANT ISSUED IN ACCORDANCE WITH § 1–203 OF THIS SUBTITLE.

(2) THE WARRANT REQUIREMENT CONTAINED IN PARAGRAPH (1) OF THIS SUBSECTION DOES NOT APPLY TO THE USE OF A DRONE TO:

(I) COUNTER A HIGH RISK OF A TERRORIST ATTACK BY A SPECIFIC INDIVIDUAL OR ORGANIZATION, IF THE UNITED STATES SECRETARY OF HOMELAND SECURITY DETERMINES THAT CREDIBLE INTELLIGENCE INDICATES THERE IS THAT RISK; OR

(II) RESPOND TO AN EMERGENCY.

(C) AN AGGRIEVED PARTY MAY INITIATE A CIVIL ACTION AGAINST A LAW ENFORCEMENT AGENCY TO OBTAIN ALL APPROPRIATE RELIEF TO PREVENT OR REMEDY A VIOLATION OF THIS SECTION.

(D) EVIDENCE OBTAINED OR COLLECTED IN VIOLATION OF THIS SECTION IS NOT ADMISSIBLE AS EVIDENCE IN A CRIMINAL PROSECUTION IN A COURT OF LAW IN THIS STATE.

SECTION 2. AND BE IT FURTHER ENACTED, That this Act shall take effect October 1, 2013.

FIRST REGULAR SESSION

HOUSE BILL NO. 46

97TH GENERAL ASSEMBLY

INTRODUCED BY REPRESENTATIVE GUERNSEY.

0371H.01I D. ADAM CRUMBLISS, Chief Clerk

AN ACT

To amend chapter 305, RSMo, by adding thereto four new sections relating to unmanned aerial surveillance.

Be it enacted by the General Assembly of the state of Missouri, as follows:

Section A. Chapter 305, RSMo, is amended by adding thereto four new sections, to be known as sections 305.635, 305.637, 305.639, and 305.641, to read as follows:

305.635. 1. Sections 305.635 to 305.641 shall be known and may be cited as the "Preserving Freedom from Unwarranted Surveillance Act".

2. As used in sections 305.635 to 305.641, the following terms shall mean:

(1) "Drone", any powered, aerial vehicle that:

(a) Does not carry a human operator;

(b) Uses aerodynamic forces to provide vehicle lift;

(c) Can fly autonomously or be piloted remotely;

(d) Can be expendable or recoverable; and

(e) Can carry a lethal or non-lethal payload.

(2) "Unmanned aircraft", an aircraft that is operated without the possibility of direct human intervention from within or on the aircraft.

(3) "Law enforcement agency", any state, county, or municipal law enforcement agency in the state. The term law enforcement agency shall not include the Missouri department of corrections, or any state, county, or municipal fire department.

305.637. 1. No person, entity, or state agency shall use a drone or other unmanned aircraft to gather evidence or other information pertaining to criminal conduct or conduct in violation of a statute or regulation except to the extent authorized in a warrant.

EXPLANATION — Matter enclosed in bold-faced brackets [thus] in the above bill is not enacted and is intended to be omitted from the law. Matter in **bold-face** type in the above bill is proposed language.

2. No person, entity, or state agency shall use a drone or other unmanned aircraft to conduct surveillance of any individual, property owned by an individual, farm, or agricultural industry without the consent of that individual, property owner, farm or agricultural industry.

305.639. This act does not prohibit the use of a drone by a law enforcement agency when exigent circumstances exist. For the purposes of this section, exigent circumstances exist if a law enforcement agency possesses reasonable suspicion that, under particular circumstances, swift action to prevent imminent danger to life is necessary.

305.641. 1. Any aggrieved party may in a civil action obtain all appropriate relief to prevent or remedy a violation of this act.

2. No information obtained or collected in violation of this act may be admissible as evidence in a criminal proceeding in any court of law in the state or in an administrative hearing.

✓

SENATE BILL NO. 196

INTRODUCED BY ROSENDALE, AUGARE, DICK BARRETT, BLEWETT, BOULANGER, BRENDEN, D. BROWN, FACEY, L. JONES, F. MOORE, OSMUNDSON, REICHNER, SALES, TAYLOR, THOMAS, VAN DYK, WALKER, WANZENRIED, WARBURTON, WINDY BOY, WITTICH

A BILL FOR AN ACT ENTITLED: "AN ACT LIMITING THE USE OF UNMANNED AERIAL VEHICLES BY LAW ENFORCEMENT AND PRIVATE USERS; PROHIBITING THE USE OF UNLAWFULLY OBTAINED INFORMATION AS EVIDENCE IN COURT; AND AMENDING SECTION 46-1-202, MCA."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF MONTANA:

NEW SECTION. **Section 1. Prohibition on use of unmanned aerial vehicles -- penalty.** (1) (a) A person commits the offense of unmanned aerial vehicle data collection if a person purposely or knowingly operates an unmanned aerial vehicle in or upon the premises of another for the purpose of acquiring information through the use of a sensing device that is capable of acquiring data from its surroundings, including but not limited to a camera, microphone, thermal detector, chemical detector, radiation gauge, and wireless receiver.

(b) Information obtained from the unlawful operation of an unmanned aerial vehicle is not admissible as evidence in any proceeding and may not be used for any purpose.

(c) A person convicted of the offense of unmanned aerial vehicle data collection shall be fined an amount not to exceed $500 or be incarcerated in the county jail for a term not to exceed 6 months, or both.

(2) For the purposes of this section, "unmanned aerial vehicle" means an aircraft that is operated without direct human intervention from on or within the aircraft.

NEW SECTION. **Section 2. Prohibition on use of unmanned aerial vehicles and use of evidence acquired -- exceptions.** (1) Except as provided in ~~subsections~~ SUBSECTION (2) ~~and (4)~~, it is unlawful for a ~~peace officer or law enforcement~~ GOVERNMENT agency to operate an unmanned aerial vehicle for the purpose of data collection.

(2) An unmanned aerial vehicle may be used: ~~only~~

(A) to conduct a search that is made:

~~(a)~~(I) pursuant to the authority of a search warrant; or

~~(b)~~(II) in accordance with judicially recognized exceptions to the warrant requirement;

(B) TO MONITOR PUBLIC LANDS OR INTERNATIONAL BORDERS; OR

(C) TO MONITOR PRIVATE LANDS WITH THE CONSENT OF THE LANDOWNER.

(3) Information obtained from the ~~unlawful~~ operation of an unmanned aerial vehicle is not admissible as evidence in any prosecution or proceeding and may not be used in an affidavit of probable cause in an effort to obtain a search warrant UNLESS THE INFORMATION WAS OBTAINED UNDER THE CIRCUMSTANCES DESCRIBED IN SUBSECTION (2)(A) OR (2)(C).

~~(4) It is lawful under this section for a state or federal agency to operate an unmanned aerial vehicle for the sole purpose of monitoring public lands and international borders, provided that no part of any personal information and no evidence derived from the operation may be received in evidence in any prosecution or proceeding unless the state or federal agency complies with the provisions of subsection (2).~~

Section 3. Section 46-1-202, MCA, is amended to read:

"46-1-202. Definitions. As used in this title, unless the context requires otherwise, the following definitions apply:

(1) "Advanced practice registered nurse" means an individual certified as an advanced practice registered nurse provided for in 37-8-202, with a clinical specialty in psychiatric mental health nursing.

(2) "Arraignment" means the formal act of calling the defendant into open court to enter a plea answering a charge.

(3) "Arrest" means taking a person into custody in the manner authorized by law.

(4) "Arrest warrant" means a written order from a court directed to a peace officer or to some other person specifically named commanding that officer or person to arrest another. The term includes the original warrant of arrest and a copy certified by the issuing court.

(5) "Bail" means the security given for the primary purpose of ensuring the presence of the defendant in a pending criminal proceeding.

(6) "Charge" means a written statement that accuses a person of the commission of an offense, that is presented to a court, and that is contained in a complaint, information, or indictment.

(7) "Conviction" means a judgment or sentence entered upon a guilty or nolo contendere plea or upon a verdict or finding of guilty rendered by a legally constituted jury or by a court of competent jurisdiction authorized to try the case without a jury.

(8) "Court" means a place where justice is judicially administered and includes the judge of the court.

(9) "Data collection" means acquiring information through the use of a sensing device that is capable of acquiring data from its surroundings, including but not limited to a camera, microphone, thermal detector, chemical detector, radiation gauge, and wireless receiver.

~~(9)~~(10) "Included offense" means an offense that:

(a) is established by proof of the same or less than all the facts required to establish the commission of the offense charged;

(b) consists of an attempt to commit the offense charged or to commit an offense otherwise included in the offense charged; or

(c) differs from the offense charged only in the respect that a less serious injury or risk to the same person, property, or public interest or a lesser kind of culpability suffices to establish its commission.

~~(10)~~(11) "Judge" means a person who is vested by law with the power to perform judicial functions.

~~(11)~~(12) "Judgment" means an adjudication by a court that the defendant is guilty or not guilty, and if the adjudication is that the defendant is guilty, it includes the sentence pronounced by the court.

~~(12)~~(13) "Make available for examination and reproduction" means to make material and information that is subject to disclosure available upon request at a designated place during specified reasonable times and to provide suitable facilities or arrangements for reproducing it. The term does not mean that the disclosing party is required to make copies at its expense, to deliver the materials or information to the other party, or to supply the facilities or materials required to carry out tests on disclosed items. The parties may by mutual consent make other or additional arrangements.

~~(13)~~(14) "New trial" means a reexamination of the issue in the same court before another jury after a verdict or finding has been rendered.

~~(14)~~(15) "Notice to appear" means a written direction that is issued by a peace officer and that requests a person to appear before a court at a stated time and place to answer a charge for the alleged commission of an offense.

~~(15)~~(16) "Offense" means a violation of any penal statute of this state or any ordinance of its political subdivisions.

~~(16)~~(17) "Parole" means the release to the community of a prisoner by a decision of the board of pardons and parole prior to the expiration of the prisoner's term subject to conditions imposed by the board of pardons and parole and the supervision of the department of corrections.

~~(17)~~(18) "Peace officer" means any person who by virtue of the person's office or public employment is vested by law with a duty to maintain public order and make arrests for offenses while acting within the scope of the person's authority.

~~(18)~~(19) "Persistent felony offender" means an offender who has previously been convicted of a felony and who is presently being sentenced for a second felony committed on a different occasion than the first. An offender is considered to have been previously convicted of a felony if:

(a) the previous felony conviction was for an offense committed in this state or any other jurisdiction for which a sentence of imprisonment in excess of 1 year could have been imposed;

(b) less than 5 years have elapsed between the commission of the present offense and either:

(i) the previous felony conviction; or

(ii) the offender's release on parole or otherwise from prison or other commitment imposed as a result of a previous felony conviction; and

(c) the offender has not been pardoned on the ground of innocence and the conviction has not been set aside at the postconviction hearing.

~~(19)~~(20) "Place of trial" means the geographical location and political subdivision in which the court that will hear the cause is situated.

~~(20)~~(21) "Preliminary examination" means a hearing before a judge for the purpose of determining if there is probable cause to believe a felony has been committed by the defendant.

~~(21)~~(22) "Probation" means release by the court without imprisonment of a defendant found guilty of a crime. The release is subject to the supervision of the department of corrections upon direction of the court.

~~(22)~~(23) "Prosecutor" means an elected or appointed attorney who is vested by law with the power to initiate and carry out criminal proceedings on behalf of the state or a political subdivision.

~~(23)~~(24) "Same transaction" means conduct consisting of a series of acts or omissions that are motivated by:

(a) a purpose to accomplish a criminal objective and that are necessary or incidental to the accomplishment of that objective; or

(b) a common purpose or plan that results in the repeated commission of the same offense or effect upon the same person or the property of the same person.

~~(24)~~(25) "Search warrant" means an order that is:

(a) in writing;

(b) in the name of the state;

(c) signed by a judge;

(d) a particular description of the place, object, or person to be searched and the evidence, contraband, or person to be seized; and

(e) directed to a peace officer and commands the peace officer to search for evidence, contraband, or persons.

~~(25)~~(26) "Sentence" means the judicial disposition of a criminal proceeding upon a plea of guilty or nolo contendere or upon a verdict or finding of guilty.

~~(26)~~(27) "Statement" means:

(a) a writing signed or otherwise adopted or approved by a person;

(b) a video or audio recording of a person's communications or a transcript of the communications; and

(c) a writing containing a summary of a person's oral communications or admissions.

~~(27)~~(28) "Summons" means a written order issued by the court that commands a person to appear before a court at a stated time and place to answer a charge for the offense set forth in the order.

~~(28)~~(29) "Superseded notes" means handwritten notes, including field notes, that have been substantially incorporated into a statement. The notes may not be considered a statement and are not subject to disclosure except as provided in 46-15-324.

~~(29)~~(30) "Temporary road block" means any structure, device, or means used by a peace officer for the purpose of controlling all traffic through a point on the highway where all vehicles may be slowed or stopped.

(31) "Unmanned aerial vehicle" means an aircraft that is operated without direct human intervention from on or within the aircraft.

~~(30)~~(32) "Witness" means a person whose testimony is desired in a proceeding or investigation by a grand jury or in a criminal action, prosecution, or proceeding.

~~(31)~~(33) "Work product" means legal research, records, correspondence, reports, and memoranda, both written and oral, to the extent that they contain the opinions, theories, and conclusions of the prosecutor, defense counsel, or their staff or investigators."

NEW SECTION. **Section 4. Codification instruction.** (1) [Section 1] is intended to be codified as an integral part of Title 45, chapter 5, part 2, and the provisions of Title 45, chapter 5, part 2, apply to [section 1].

(2) [Section 2] is intended to be codified as an integral part of Title 46, chapter 5, and the provisions of

Title 46, chapter 5, apply to [section 2].

- END -

Sixty-third
Legislative Assembly
of North Dakota

HOUSE BILL NO. 1373

Introduced by

Representatives Becker, Anderson, Beadle, Heilman, Hofstad, Monson, Rohr, Toman, Hanson

Senator Sitte

A BILL for an Act to provide for limitations on the use of unmanned aircraft for surveillance.

BE IT ENACTED BY THE LEGISLATIVE ASSEMBLY OF NORTH DAKOTA:

SECTION 1.

Definitions.

As used in this Act:

1. "Law enforcement agency" means a person authorized by law, or funded by the state, to investigate or prosecute offenses against the state.
2. "Unmanned aircraft" means any aircraft that is operated without the possibility of direct human intervention within or on the aircraft.
3. "Unmanned aircraft system" means an unmanned aircraft and associated elements, including communication links and the components that control the unmanned aircraft, which are required for the pilot in command to operate safely and efficiently in state airspace.

SECTION 2.

Prohibited use of unmanned aircraft system.

1. Except as provided in section 4 of this Act, a law enforcement agency may not use an unmanned aircraft for surveillance of a person within the state or for the surveillance of personal or business property located within the borders of the state to gather evidence or other information pertaining to criminal conduct, or conduct in violation of a statute or regulation except to the extent authorized in a warrant that satisfies the requirements of the Constitution of North Dakota.

2. Warrants to conduct surveillance with an unmanned aircraft may only be issued in the investigation of a felony. Unmanned aircraft may not be used to conduct investigations of misdemeanors, traffic infractions, or other violations of law.

SECTION 3.

Warrant requirement.

A warrant for the use of unmanned aircraft must satisfy the requirements of the Constitution of North Dakota. In addition, the warrant must contain a data collection statement that includes:

1. The persons that will have the power to authorize the use of the unmanned aircraft;
2. The locations in which the unmanned aircraft system will operate;
3. The maximum period for which the unmanned aircraft system will operate in each flight; and
4. Whether the unmanned aircraft system will collect information or data about individuals or groups of individuals, and if so:
   a. The circumstances under which the unmanned aircraft system will be used; and
   b. The specific kinds of information or data the unmanned aircraft system will collect about individuals and how that information or data, as well as conclusions drawn from that information or data, will be used, disclosed, and otherwise handled, including:
      (1) The period for which the information or data will be retained; and
      (2) Whether the information or data will be destroyed, and if so, when and how the information or data will be destroyed.

SECTION 4.

Exceptions.

This Act does not prohibit any use of an unmanned aircraft for surveillance during the course of:

1. Patrol of national borders. The use of an unmanned aircraft to patrol within twenty-five miles [40.23 kilometers] of a national border, for purposes of policing that border to prevent or deter the illegal entry of any person, illegal substance, or contraband.
2. Exigent circumstances. The use of an unmanned aircraft by a law enforcement agency is permitted when exigent circumstances exist. For the purposes of this subsection, exigent circumstances exist when a law enforcement agency possesses reasonable

suspicion that absent swift preventative action, there is an imminent danger to life or bodily harm.

3. An environmental or weather-related catastrophe. The use of an unmanned aircraft by state authorities to preserve public safety, protect property, or conduct surveillance for the assessment and evaluation of environmental or weather-related damage, erosion, flood, or contamination during a lawfully declared state of emergency.

SECTION 5.

Prohibited surveillance.

This Act prohibits any use of an unmanned aircraft for:

1. Use of force. A state agency may not authorize the use, including grant a permit to use, of an unmanned aircraft while armed with any lethal or nonlethal weapons, including firearms, pepper spray, bean bag guns, mace, and sound-based weapons.
2. Domestic use in private surveillance. A state agency may not authorize the use, including granting a permit to use, of an unmanned aircraft to permit any private person to conduct surveillance on any other private person without the express, informed consent of that other person or the owner of any real property on which that other private person is present.
3. Surveillance of the exercise of constitutional rights. A state agency may not authorize the use, including granting a permit to use, of an unmanned aircraft for the purpose of the surveillance of persons engaged in the lawful exercise of the constitutional right of freedom of speech and freedom of assembly.

SECTION 6.

Remedies for violation.

Any aggrieved party may obtain in a civil action all appropriate relief to prevent or remedy a violation of this Act.

SECTION 7.

Prohibitions on the conduct of unmanned aircraft surveillance and the use of acquired surveillance as evidence.

1. Evidence obtained or collected in violation of this Act is not admissible as evidence in a criminal prosecution, including use during trial, at sentencing, before a grand jury, as rebuttal evidence, or during administrative hearings in any court of law in the state.

2. Any imaging or other forms of observational data gathered by unmanned aircraft surveillance from or concerning the parties or places subjected to surveillance in violation of this Act may not be preserved by law enforcement or government agencies for any purpose unless required by a court of law.

3. Any imaging or any other forms of data lawfully obtained under this Act for which there is not a reasonable and articulable suspicion that those images or data contain evidence of a crime, or are relevant to an ongoing investigation or trial, may not be retained for more than ninety days, unless the retention is attendant to general agency guidelines regarding the retention of evidence in criminal cases. In those cases, the imaging or other data may not be distributed to agencies, entities, or individuals if the distribution is not necessary to meet general agency guidelines regarding the retention of evidence in criminal cases.

4. An unmanned aircraft may not conduct any type of surveillance that would violate state laws regarding the interception of aural communications, electronic messaging, personal location data, or acquire video or still images of a person within a home or place without first obtaining all required warrants in compliance with state statutes relevant to the interception of such voice communications, digital communications, physical surveillance data, or to capture the still or video images of a person or interior or a place for which a search warrant is prerequisite to its lawful search.

SECTION 8.

Documentation of unmanned aircraft surveillance.

1. The person authorized to conduct the surveillance under this Act shall document all use of unmanned aircraft for surveillance. The person shall document all surveillance flights as to duration, flight path, and mission objectives, including the names of place or persons authorized to be subject to surveillance.

2. The flight information must be certified as accurate and complete by the supervising person authorized by a court to conduct the surveillance.

3. The flight information required under this section must be retained for five years.

4. Except for the operational capabilities of the unmanned aircraft system and other operational information strictly related to the technical conduct and physical security of the surveillance operation, a person before a court of law who has been a target of

unmanned aircraft surveillance must be permitted to obtain by proper motion to the court all information relating to the person acquired in the course of the surveillance.

5. Other persons who have an interest in obtaining the documentation required by this section may obtain that documentation pursuant to chapter 44-04.

13104704D

HOUSE BILL NO. 2012

AMENDMENT IN THE NATURE OF A SUBSTITUTE

(Proposed by the House Committee for Courts of Justice)

(Patron Prior to Substitute—Delegate Cline [HB 1616])

House Amendments in [ ] — February 4, 2013

A BILL to place a moratorium on the use of unmanned aircraft systems.

Be it enacted by the General Assembly of Virginia:

1. *§ 1. No state or local agency or organization having jurisdiction over criminal law enforcement or regulatory violations, including but not limited to the Department of State Police, and no department of law enforcement as defined in § 15.2-836 of any county, city, or town shall utilize an unmanned aircraft system before July 1, 2015.*

[2. Notwithstanding the prohibition in paragraph A of this section, an unmanned aircraft system may be deployed before July 1, 2015 when an Amber Alert is activated pursuant to § 52-34.3, when a Senior Alert is activated pursuant to § 52-34.6, when a Blue Alert is activated pursuant to § 52-34.9, or for the purpose of a search and rescue operation. In no case may a weaponized unmanned aircraft system be deployed or its use facilitated by a state or local agency in Virginia.]

Legislative Resolve No.
17

Recognizing the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks as a national leader in unmanned aircraft research and development; and relating to a Task Force on Unmanned Aircraft Systems.

BE IT RESOLVED BY THE LEGISLATURE OF THE STATE OF ALASKA:

WHEREAS the Unmanned Aircraft Systems Program at the University of Alaska Fairbanks has, since 2001, been designing payloads and upgrades for unmanned aircraft systems, testing and evaluating their safety and effectiveness, developing and demonstrating new uses for various potential users, working with the Federal Aviation Administration to make the use of unmanned aircraft systems safe, and developing technology to improve safety and is known across the nation for its leadership in advancing the state of the art and the safe use of unmanned aircraft systems; and

WHEREAS the importance of the program's work to the state was recently recognized by the Board of Regents of the University of Alaska when the regents established the Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks to continue research and development of unmanned aircraft systems for the benefit of the

state; and

WHEREAS the legislature recognizes the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks as the state's leader in unmanned aircraft systems research, meeting the goals of industry, the Federal Aviation Administration, and government operations; and

WHEREAS the legislature has provided significant financial support to the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks to further the center's research initiatives, and to increase its capabilities for use as a possible Federal Aviation Administration test site; and

WHEREAS the State of Alaska, the University of Alaska, the Alaska Aerospace Corporation, the Alaska Aviation Safety Project, and other public and private institutions have developed cooperation with the National Aeronautics and Space Administration, the Federal Aviation Administration, the United States Department of the Interior, the United States Department of Defense, and others to further advance the research, development, and use of technology to benefit and support Alaskans and Americans with the safe use of unmanned aircraft systems; and

WHEREAS Alaska state government and the state's business and research community continue to work with the Federal Aviation Administration to promote the establishment of safe unmanned aircraft system ranges onshore and offshore Alaska, which will help establish procedures for the safe operation of unmanned aircraft systems in the National Airspace System; and

WHEREAS the Alaska Center for Unmanned Aircraft Systems Integration, by virtue of being located in Alaska, has access to an area of geographic and climatic diversity where the air and surface population density is desirable for conducting research and development of unmanned aircraft systems; and

WHEREAS the state has the highest per capita use of general aviation activity in the nation, and Alaska aviation organizations have helped the Federal Aviation Administration develop the next generation of air traffic control for the nation and the world, while making major gains for the state's aviation safety in the process; and

WHEREAS unmanned aircraft systems may present a risk to privacy, but neither the Federal Aviation Administration nor any other state or federal agency currently has specific

statutory authority to regulate privacy matters relating to unmanned aircraft systems;

BE IT RESOLVED that the Alaska State Legislature recognizes the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks as a leader in aviation pioneering and further recognizes the significant benefit to the state and nation the center provides in research and development of unmanned aircraft systems; and be it

FURTHER RESOLVED that the Alaska State Legislature fully supports the efforts of the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks to become one of the nation's six test sites for unmanned aircraft systems testing and research; and be it

FURTHER RESOLVED by the Alaska State Legislature that the Task Force on Unmanned Aircraft Systems is created in the legislative branch and shall consist of seven members, who, except for the member from the senate and the member from the house of representatives, shall be appointed jointly by the president of the senate and the speaker of the house of representatives, as follows:

(1) one senator selected by the president of the senate, who shall serve as co-chair;

(2) one representative selected by the speaker of the house of representatives, who shall serve as co-chair;

(3) the commissioner of public safety or the commissioner's designee;

(4) the adjutant general of the Department of Military and Veterans' Affairs or the adjutant general's designee;

(5) a member representing the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks;

(6) a member of the Academy of Model Aeronautics;

(7) a member from the state Aviation Advisory Board; and be it

FURTHER RESOLVED that a vacancy on the task force shall be filled in the manner of the original appointment; and be it

FURTHER RESOLVED that the duties of the task force shall include

(1) reviewing regulations and guidance from the Federal Aviation Administration regarding unmanned aircraft systems;

(2) providing written recommendations, together with suggested legislation,

for a comprehensive state policy for unmanned aircraft that protects privacy and allows the use of unmanned aircraft systems for public and private applications; and

(3) submitting, not later than January 15, 2014, an initial report to the legislature and, not later than July 1, 2014, submitting a final report to the legislature; and be it

FURTHER RESOLVED that the task force may meet as frequently as necessary to carry out its responsibilities; and be it

FURTHER RESOLVED that the task force may meet during and between legislative sessions and may request administrative and technical support from the University of Alaska Fairbanks; and be it

FURTHER RESOLVED that the public members of the task force serve without compensation but are entitled to per diem and travel expenses authorized for boards and commissions under AS 39.20.180; and be it

FURTHER RESOLVED that the task force terminates on July 1, 2014.

A RESOLUTION

Recognizing the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks as a national leader in unmanned aircraft research and development; and relating to a Task Force on Unmanned Aircraft Systems.

BE IT RESOLVED BY THE LEGISLATURE OF THE STATE OF ALASKA:

WHEREAS the Unmanned Aircraft Systems Program at the University of Alaska Fairbanks has, since 2001, been designing payloads and upgrades for unmanned aircraft systems, testing and evaluating their safety and effectiveness, developing and demonstrating new uses for various potential users, working with the Federal Aviation Administration to make the use of unmanned aircraft systems safe, and developing technology to improve safety and is known across the nation for its leadership in advancing the state of the art and the safe use of unmanned aircraft systems; and

WHEREAS the importance of the program's work to the state was recently recognized by the Board of Regents of the University of Alaska when the regents established the Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks to continue research and development of unmanned aircraft systems for the benefit of the

state; and

WHEREAS the legislature recognizes the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks as the state's leader in unmanned aircraft systems research, meeting the goals of industry, the Federal Aviation Administration, and government operations; and

WHEREAS the legislature has provided significant financial support to the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks to further the center's research initiatives, and to increase its capabilities for use as a possible Federal Aviation Administration test site; and

WHEREAS the State of Alaska, the University of Alaska, the Alaska Aerospace Corporation, the Alaska Aviation Safety Project, and other public and private institutions have developed cooperation with the National Aeronautics and Space Administration, the Federal Aviation Administration, the United States Department of the Interior, the United States Department of Defense, and others to further advance the research, development, and use of technology to benefit and support Alaskans and Americans with the safe use of unmanned aircraft systems; and

WHEREAS Alaska state government and the state's business and research community continue to work with the Federal Aviation Administration to promote the establishment of safe unmanned aircraft system ranges onshore and offshore Alaska, which will help establish procedures for the safe operation of unmanned aircraft systems in the National Airspace System; and

WHEREAS the Alaska Center for Unmanned Aircraft Systems Integration, by virtue of being located in Alaska, has access to an area of geographic and climatic diversity where the air and surface population density is desirable for conducting research and development of unmanned aircraft systems; and

WHEREAS the state has the highest per capita use of general aviation activity in the nation, and Alaska aviation organizations have helped the Federal Aviation Administration develop the next generation of air traffic control for the nation and the world, while making major gains for the state's aviation safety in the process; and

WHEREAS unmanned aircraft systems may present a risk to privacy, but neither the Federal Aviation Administration nor any other state or federal agency currently has specific

statutory authority to regulate privacy matters relating to unmanned aircraft systems;

BE IT RESOLVED that the Alaska State Legislature recognizes the Alaska Center for Unmanned Aircraft at the University of Alaska Fairbanks as a leader in aviation pioneering and further recognizes the significant benefit to the state and nation the center provides in research and development of unmanned aircraft systems; and be it

FURTHER RESOLVED that the Alaska State Legislature fully supports the efforts of the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks to become one of the nation's six test sites for unmanned aircraft systems testing and research; and be it

FURTHER RESOLVED by the Alaska State Legislature that the Task Force on Unmanned Aircraft Systems is created in the legislative branch and shall consist of 7 members, who, except for the member from the senate and the member from the house of representatives, shall be appointed jointly by the president of the senate and the speaker of the house of representatives, as follows:

(1) one senator selected by the president of the senate, who shall serve as co-chair;

(2) one representative selected by the speaker of the house of representatives, who shall serve as co-chair;

(3) the commissioner of public safety or the commissioner's designee;

(4) the adjutant general of the Department of Military and Veterans' Affairs or the adjutant general's designee;

(5) a member representing the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks;

(6) a member of the Academy of Model Aeronautics;

(7) a member from the state Aviation Advisory Board;

FURTHER RESOLVED that a vacancy on the task force shall be filled in the manner of the original appointment; and be it

FURTHER RESOLVED that the duties of the task force shall include

(1) reviewing regulations and guidance from the Federal Aviation Administration regarding unmanned aircraft systems;

(2) providing written recommendations, together with suggested legislation,

for a comprehensive state policy for unmanned aircraft that protects privacy and allows the use of unmanned aircraft systems for public and private applications; and

(3) submitting, not later than January 15, 2014, an initial report to the legislature and, not later than July 1, 2014, submitting a final report to the legislature; and be it

FURTHER RESOLVED that the task force may meet as frequently as necessary to carry out its responsibilities; and be it

FURTHER RESOLVED that the task force may meet during and between legislative sessions and may request administrative and technical support from the University of Alaska Fairbanks; and be it

FURTHER RESOLVED that the public members of the task force serve without compensation but are entitled to per diem and travel expenses authorized for boards and commissions under AS 39.20.180; and be it

FURTHER RESOLVED that the task force terminates on July 1, 2014.

If the Task Force is removed, we will work on intent language in the Governor's office.
Ginger

Subject: HCR6

The reason for the task force:
There are some user groups interested in unmanned aircraft that are not familiar with the FAA rules and guidelines for use. If these groups remain uninformed, they may break the law unknowingly and could be considered a privacy risk. Breaching privacy could interfere with the good uses of unmanned aircraft and the advancement of the technology. Including private aircraft operators and remote control operators on the task force is for education, safety and security considerations.

The task force is made up of a broad group of users who may be able to brainstorm uses in order for Alaska to implement well-thought-out law rather than adopting the possible model legislation that would have a generic national perspective. Alaskans are concerned for their privacy and the potential for violation of that privacy, particularly if used by law enforcement or "peeping toms."

Fear of military use is national and our citizens are becoming more concerned.

- The task force will help educate those interested in or already using unmanned aircraft
- Education will alleviate uninformed individuals from breaking the laws established for use of unmanned aircraft
- The task force will refine use in Alaska's airspace as well as fit in with the FAA guidelines – inappropriate use could result in aircraft crashes and loss of life.
- The task force will likely meet only once in person but may continue its work via electronic means. It is anticipated that most of the task force will reside in Anchorage. If the in-person meeting is held in Anchorage, travel costs will be negligible. All state agencies stated the costs could be absorbed within exiting budgets, Legislature would absorb within existing budget, and private attendees would receive travel and per diem from the legislative affairs agency.

Hope this summary helps

Hi,
Am still trying for you. My boss and a few other members do not want to hear HCR 6, however, in the off chance that they do, what do you think:

1 Yes **(1) one senator** selected by the president of the senate, who shall serve as co-

2 Yes **(2) one representative** selected by the speaker of the house of representatives,

who shall serve as co-chair;

delete **(3)** ~~**LT Gov Mead Treadwell or Gov Appointee(Treadwell already part of Aerospace States)**~~

~~(3) the commissioner of transportation and public facilities or the~~

~~commissioner's designee;~~

3 yes **(4) the commissioner of public safety or the commissioner's designee**; law enforcement

~~delete (5) the commissioner of natural resources or the commissioner's designee;~~

4 keep ~~(6) one member representing municipal law enforcement~~; law enforcement – could eliminate this one but APD is already considering using unmanned aircraft

delete ~~(7) the attorney general or the attorney general's designee~~;

~~delete (8) the commissioner of fish and game or the commissioner's designee;~~

5 yes **(9) the adjutant general of the Department of Military and Veterans' Affairs** or the adjutant general's designee; military

6 yes **(10) a member representing the Alaska Center for Unmanned Aircraft Systems Integration** at University of Alaska Fairbanks;

7 yes (11) a member of the Academy of Model Aeronautics; Steve Colligan remote control pilots are looking to use aircraft commercially against FAA rules now

8 yes (12) a member from the State Aviation Advisory Board this is a DOT/PF board of airports

9 yes ~~(13) a member from the Medallion Foundation;~~ private aircraft pilots

10 yes ~~(14) one member of the Aerospace States Association;~~ Lt Governor is Designee Member as well

11 yes ~~(15) one member of the Alaska UAS Interest Group; and be it~~ Already part of University Efforts one Univ person is on this board but includes the Dept of Interior and FAA and other federal members would suggest Harry Keiling

FISCAL NOTE ANALYSIS

STATE OF ALASKA
2013 LEGISLATIVE SESSION

BILL NO. HCR 6

Analysis

HCR6 creates a task force on unmanned aircraft systems within the legislative branch. The task force will have 15 members which will be comprised of one senator, appointed by the president of the senate and one representative, appointed by the speaker of the house and 7 public members and 6 executive branch members, appointed jointly by the presiding officers. The task force intends to meet as needed during and between sessions and will submit an initial report to the legislature not later than January 15, 2014 and a final report to the legislature not later than January 15, 2015. If meetings take place in between sessions, the task force anticipates being able to meet in Anchorage. With the majority of potential task force members residing in Anchorage, a meeting held there would be at a very minimal cost. It is anticipated that one in-person meeting per year would occur with information shared electronically within the task force membership as needed.

Because the task force intends to utilize existing resources, but the legislation could allow for an unknown cost, the fiscal impact on the legislature is indeterminate.

CS FOR HOUSE CONCURRENT RESOLUTION NO. 6(EDT)

IN THE LEGISLATURE OF THE STATE OF ALASKA

TWENTY-EIGHTH LEGISLATURE - FIRST SESSION

BY THE HOUSE SPECIAL COMMITTEE ON ECONOMIC DEVELOPMENT, TRADE, AND TOURISM

Offered:
Referred:

Sponsor(s): REPRESENTATIVES HUGHES, Kawasaki, Isaacson, Pruitt

A RESOLUTION

Recognizing the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks as a national leader in unmanned aircraft research and development; and relating to a Task Force on Unmanned Aircraft Systems.

BE IT RESOLVED BY THE LEGISLATURE OF THE STATE OF ALASKA:

WHEREAS the Unmanned Aircraft Systems Program at the University of Alaska Fairbanks has, since 2001, been designing payloads and upgrades for unmanned aircraft systems, testing and evaluating their safety and effectiveness, developing and demonstrating new uses for various potential users, working with the Federal Aviation Administration to make the use of unmanned aircraft systems safe, and developing technology to improve safety and is known across the nation for its leadership in advancing the state of the art and the safe use of unmanned aircraft systems; and

WHEREAS the importance of the program's work to the state was recently recognized by the Board of Regents of the University of Alaska when the regents established the Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks to continue research and development of unmanned aircraft systems for the benefit of the

state; and

WHEREAS the legislature recognizes the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks as the state's leader in unmanned aircraft systems research, meeting the goals of industry, the Federal Aviation Administration, and government operations; and

WHEREAS the legislature has provided significant financial support to the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks to further the center's research initiatives, and to increase its capabilities for use as a possible Federal Aviation Administration test site; and

WHEREAS the State of Alaska, the University of Alaska, the Alaska Aerospace Corporation, the Alaska Aviation Safety Project, and other public and private institutions have developed cooperation with the National Aeronautics and Space Administration, the Federal Aviation Administration, the United States Department of Interior, the United States Department of Defense, and others to further advance the research, development, and use of technology to benefit and support Alaskans and Americans with the safe use of unmanned aircraft systems; and

WHEREAS Alaska state government and the state's business and research community continue to work with the Federal Aviation Administration to promote the establishment of safe unmanned aircraft system ranges onshore and offshore Alaska, which will help establish procedures for the safe operation of unmanned aircraft systems in the National Airspace System; and

WHEREAS the Alaska Center for Unmanned Aircraft Systems Integration, by virtue of being located in Alaska, has access to an area of geographic and climatic diversity where the air and surface population density is desirable for conducting research and development of unmanned aircraft systems; and

WHEREAS the state has the highest per capita use of general aviation activity in the nation, and Alaska aviation organizations have helped the Federal Aviation Administration develop the next generation of air traffic control for the nation and the world, while making major gains for the state's aviation safety in the process; and

WHEREAS unmanned aircraft systems may present a risk to privacy, but neither the Federal Aviation Administration nor any other state or federal agency currently has specific

statutory authority to regulate privacy matters relating to unmanned aircraft systems;

BE IT RESOLVED that the Alaska State Legislature recognizes the Alaska Center for Unmanned Aircraft at the University of Alaska Fairbanks as a leader in aviation pioneering and further recognizes the significant benefit to the state and nation the center provides in research and development of unmanned aircraft systems; and be it

FURTHER RESOLVED that the Alaska State Legislature fully supports the efforts of the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks to become one of the nation's six test sites for unmanned aircraft systems testing and research; and be it

FURTHER RESOLVED by the Alaska State Legislature that the Task Force on Unmanned Aircraft Systems is created in the legislative branch and shall consist of 15 members, who, except for the member from the senate and the member from the house of representatives, shall be appointed jointly by the president of the senate and the speaker of the house of representatives, as follows:

(1) one senator selected by the president of the senate, who shall serve as co-chair;

(2) one representative selected by the speaker of the house of representatives, who shall serve as co-chair;

(3) the commissioner of transportation and public facilities or the commissioner's designee;

(4) the commissioner of public safety or the commissioner's designee;

(5) the commissioner of natural resources or the commissioner's designee;

(6) one member representing municipal law enforcement;

(7) the attorney general or the attorney general's designee;

(8) the commissioner of fish and game or the commissioner's designee;

(9) the adjutant general of the Department of Military and Veterans' Affairs or the adjunct general's designee;

(10) a member representing the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks;

(11) a member of the Academy of Model Aeronautics;

(12) a member from the Aviation Advisory Board;

(13) a member from the Medallion Foundation;

(14) one member of the Aerospace States Association;

(15) one member of the Alaska UAS Interest Group; and be it

FURTHER RESOLVED that a vacancy on the task force shall be filled in the manner of the original appointment; and be it

FURTHER RESOLVED that the public members of the task force serve without compensation but are entitled to per diem and travel expenses authorized for boards and commissions under AS 39.20.180; and be it

FURTHER RESOLVED that the task force terminates on January 15, 2015.

HOUSE CONCURRENT RESOLUTION NO. 6

IN THE LEGISLATURE OF THE STATE OF ALASKA

TWENTY-EIGHTH LEGISLATURE - FIRST SESSION

BY REPRESENTATIVES HUGHES, Kawasaki, Isaacson, Pruitt

Introduced: 3/15/13
Referred: House Special Committee on Economic Development, Trade, and Tourism

A RESOLUTION

Recognizing the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks as a national leader in unmanned aircraft research and development; and relating to a Task Force on Unmanned Aircraft Systems.

BE IT RESOLVED BY THE LEGISLATURE OF THE STATE OF ALASKA:

1A →
1B →
(2) **WHEREAS** the legislature recognizes the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks as the state's leader in unmanned aircraft systems research, meeting the goals of industry, the Federal Aviation Administration, and government operations; and

(3) **WHEREAS** the legislature has provided significant financial support to the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks to further the Center's research initiatives; and to increase capabilities as a possible FAA test site; and

(4) **WHEREAS** the State of Alaska, the University of Alaska, the Alaska Aerospace Corporation, the Alaska Aviation Safety Project, and other public and private institutions have developed cooperation with the National Aeronautics and Space Administration, the Federal Aviation Administration, the United States Department of Interior, the United States

Department of Defense, and others to further advance the research, development and use of technology to benefit and support Alaskans and Americans with the safe use of unmanned aircraft systems; and

(1A) **WHEREAS**, since 2001, the ~~Alaska Center for~~ Unmanned Aircraft Systems ~~Integration~~ Program at the University of Alaska Fairbanks has been designing payloads and upgrades for unmanned aircraft systems, testing and evaluating their safety and effectiveness, developing and demonstrating new uses for various potential users, working with the Federal Aviation Administration to make the use of unmanned aircraft systems safe, ~~and~~ developing technology to improve safety; and is

~~**WHEREAS** the University of Alaska Fairbanks has become~~ known across the nation for its leadership in advancing the state of the art and the safe use of unmanned aircraft systems; and

(1B) **WHEREAS** the importance of the ~~Center's~~ Program's work to the state was recently recognized by the Board of Regents of the University of Alaska when the regents established the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks to continue research and development of unmanned aircraft systems for the benefit of the state; and

WHEREAS, as the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks has demonstrated, unmanned aircraft systems can be designed for gathering information necessary to protect human life in search and rescue operations, aiding in the management of resources, including marine mammal and fisheries research, providing humanitarian assistance, providing a platform for scientific research in the Arctic, and for other private and public sector activities, as was demonstrated when the Center used an unmanned aircraft system to assist the United States Coast Guard Cutter Healy and the Russian tanker Renda in delivering fuel to Nome in 2012; and

(11) **WHEREAS** unmanned aircraft systems may present a ~~substantial~~ risk to privacy, but neither the Federal Aviation Administration nor any other state or federal agency currently has specific statutory authority to regulate privacy matters relating to unmanned aircraft systems; and

(1C) **WHEREAS** the Alaska Center for Unmanned Aircraft Systems Integration, ~~at the University of Alaska Fairbanks is located in~~ by virtue of being located in Alaska has access to an area of geographic and climatic diversity

where the air and surface population density is desirable for conducting research and development of unmanned aircraft systems; and

(10) **WHEREAS** the Federal Aviation Administration currently requires the designation of one pilot to be in command of an unmanned aircraft system at all times, restricts use of unmanned aircraft systems by public agencies to conduct routine flights over urban or populated areas and over heavily trafficked roads or open-air assemblies of people, the discharge or dropping of objects while in flight, and the operation of unmanned aircraft systems without the capability of pilot intervention;

rewritten on back page

(5) **WHEREAS** Alaska state government and the state's business and research community continue to work with the Federal Aviation Administration to promote the establishment of safe unmanned aircraft system ranges onshore and offshore Alaska, which will help establish procedures for the safe operation of unmanned aircraft systems in the National Airspace System; and

(7) **WHEREAS** the state has the highest per capita use of general aviation activity in the nation, and Alaska aviation organizations have helped the Federal Aviation Administration develop the next generation of air traffic control for the nation and the world, while making major gains for the state's aviation safety in the process; and

(8) **BE IT RESOLVED** that the Alaska State Legislature recognizes the Alaska Center for Unmanned Aircraft at the University of Alaska Fairbanks as a leader in aviation pioneering and further recognizes the significant benefit to the state and nation the Center provides in research and development of unmanned aircraft systems; and be it

(9) **FURTHER RESOLVED** that the Alaska State Legislature fully supports the efforts of the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks to become one of the nation's six test sites for unmanned aircraft systems testing and research; and be it

(12) **FURTHER RESOLVED** by the Alaska State Legislature that the Task Force on Unmanned Aircraft Systems is created in the legislative branch and shall consist of 15 members, who, except for the member from the senate and the member from the house of representatives, shall be appointed jointly by the president of the senate and the speaker of the house of representatives, as follows:

(1) one senator selected by the president of the senate, who shall serve as co-

chair;

(2) one representative selected by the speaker of the house of representatives, who shall serve as co-chair;

(3) the commissioner of transportation and public facilities or the commissioner's designee;

(4) the commissioner of public safety or the commissioner's designee;

(5) the commissioner of natural resources or the commissioner's designee;

(6) one member representing municipal law enforcement;

(7) the attorney general or the attorney general's designee;

(8) the commissioner of fish and game or the commissioner's designee;

(9) the adjutant general of the Department of Military and Veterans' Affairs or the adjunct general's designee;

(10) a member representing the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks;

(11) a member of the Academy of Model Aeronautics;

(12) a member from the Aviation Advisory Board;

(13) a member from the Medallion Foundation; ~~and be it~~

(14) one member of the Aerospace States Association;

(15) one member of the Alaska UAS Interest Group, ~~United States Department of the Interior~~; and be it

FURTHER RESOLVED that a vacancy on the task force shall be filled in the manner of the original appointment; and be it

FURTHER RESOLVED that the duties of the task force shall include

(1) reviewing regulations and guidance from the Federal Aviation Administration regarding unmanned aircraft systems;

(2) providing written recommendations, together with suggested legislation, for a comprehensive state policy for unmanned aircraft that protects privacy and allows the use of unmanned aircraft systems for public and private applications; and

(3) submitting, not later than January 15, 2014, an initial report to the legislature and, not later than January 15, 2015, submitting a final report to the legislature; and be it

FURTHER RESOLVED that the task force may meet as frequently as necessary to carry out its responsibilities; and be it

FURTHER RESOLVED that the task force may meet during and between legislative sessions and may request administrative and technical support from the University of Alaska Fairbanks; and be it

FURTHER RESOLVED that the public members of the task force serve without compensation but are entitled to per diem and travel expenses authorized for boards and commissions under AS 39.20.180; and be it

FURTHER RESOLVED that the task force terminates on January 15, 2015.

(10)

WHEREAS the United States Constitution protects the rights of citizens under the 4th Amendment, the Department of Homeland Security and the National Institute for Justice are protecting safety and privacy of all citizens, and the Federal Aviation Administration has established guidelines and grants authorization for appropriate use of unmanned aircraft; and

HOUSE CONCURRENT RESOLUTION NO. 12

IN THE LEGISLATURE OF THE STATE OF ALASKA

TWENTY-EIGHTH LEGISLATURE - FIRST SESSION

BY REPRESENTATIVE HUGHES

Introduced:
Referred:

A RESOLUTION

Recognizing the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks as a national leader in unmanned aircraft research and development; and relating to a Task Force on Unmanned Aircraft Systems.

BE IT RESOLVED BY THE LEGISLATURE OF THE STATE OF ALASKA:

WHEREAS the legislature recognizes the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks as the state's leader in unmanned aircraft systems research, meeting the goals of industry, the Federal Aviation Administration, and government operations; and

WHEREAS the legislature has provided significant financial support to the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks to further the Center's research initiatives; and

WHEREAS the State of Alaska, the University of Alaska, the Alaska Aerospace Corporation, the Alaska Aviation Safety Project, and other public and private institutions have developed cooperation with the National Aeronautics and Space Administration, the Federal Aviation Administration, the United States Department of Interior, the United States

Department of Defense, and others to further advance the research, development and use of technology to benefit and support Alaskans and Americans with the safe use of unmanned aircraft systems; and

WHEREAS, since 2001, the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks has been designing payloads and upgrades for unmanned aircraft systems, testing and evaluating their safety and effectiveness, developing and demonstrating new uses for various potential users, working with the Federal Aviation Administration to make the use of unmanned aircraft systems safe, and developing technology to improve safety; and

WHEREAS the University of Alaska Fairbanks has become known across the nation for its leadership in advancing the state of the art and the safe use of unmanned aircraft systems; and

WHEREAS the importance of the Center's work to the state was recently recognized by the Board of Regents of the University of Alaska when the regents established the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks to continue research and development of unmanned aircraft systems for the benefit of the state; and

WHEREAS, as the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks has demonstrated, unmanned aircraft systems can be designed for gathering information necessary to protect human life in search and rescue operations, aiding in the management of resources, including marine mammal and fisheries research, providing humanitarian assistance, providing a platform for scientific research in the Arctic, and for other private and public sector activities, as was demonstrated when the Center used an unmanned aircraft system to assist the United States Coast Guard Cutter Healy and the Russian tanker Renda in delivering fuel to Nome in 2012; and

WHEREAS unmanned aircraft systems may present a substantial risk to privacy, but neither the Federal Aviation Administration nor any other state or federal agency currently has specific statutory authority to regulate privacy matters relating to unmanned aircraft systems; and

WHEREAS the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks is located in an area of geographic and climatic diversity

where the air and surface population density is desirable for conducting research and development of unmanned aircraft systems; and

WHEREAS the Federal Aviation Administration currently requires the designation of one pilot to be in command of an unmanned aircraft system at all times, restricts use of unmanned aircraft systems by public agencies to conduct routine flights over urban or populated areas and over heavily trafficked roads or open-air assemblies of people, the discharge or dropping of objects while in flight, and the operation of unmanned aircraft systems without the capability of pilot intervention;

WHEREAS Alaska state government and the state's business and research community continue to work with the Federal Aviation Administration to promote the establishment of safe unmanned aircraft system ranges onshore and offshore Alaska, which will help establish procedures for the safe operation of unmanned aircraft systems in the National Airspace System; and

WHEREAS the state has the highest per capita use of general aviation activity in the nation, and Alaska aviation organizations have helped the Federal Aviation Administration develop the next generation of air traffic control for the nation and the world, while making major gains for the state's aviation safety in the process;

BE IT RESOLVED that the Alaska State Legislature recognizes the Alaska Center for Unmanned Aircraft at the University of Alaska Fairbanks as a leader in aviation pioneering and further recognizes the significant benefit to the state and nation the Center provides in research and development of unmanned aircraft systems; and be it

FURTHER RESOLVED that the Alaska State Legislature fully supports the efforts of the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks to become one of the nation's six test sites for unmanned aircraft systems testing and research; and be it

FURTHER RESOLVED by the Alaska State Legislature that the Task Force on Unmanned Aircraft Systems is created in the legislative branch and shall consist of 15 members, who, except for the member from the senate and the member from the house of representatives, shall be appointed jointly by the president of the senate and the speaker of the house of representatives, as follows:

(1) one senator selected by the president of the senate, who shall serve as co-

chair;

(2) one representative selected by the speaker of the house of representatives, who shall serve as co-chair;

(3) the commissioner of transportation and public facilities or the commissioner's designee;

(4) the commissioner of public safety or the commissioner's designee;

(5) the commissioner of natural resources or the commissioner's designee;

(6) one member representing municipal law enforcement;

(7) the attorney general or the attorney general's designee;

(8) the commissioner of fish and game or the commissioner's designee;

(9) the adjutant general of the Department of Military and Veterans' Affairs or the adjunct general's designee;

(10) a member representing the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks;

(11) a member of the Academy of Model Aeronautics;

(12) a member from the Aviation Advisory Board;

(13) a member from the Medallion Foundation; and be it

(14) one member of the Aerospace States Association;

(15) one member of the Alaska UAS Interest Group, United States Department of the Interior; and be it

FURTHER RESOLVED that a vacancy on the task force shall be filled in the manner of the original appointment; and be it

FURTHER RESOLVED that the duties of the task force shall include

(1) reviewing regulations and guidance from the Federal Aviation Administration regarding unmanned aircraft systems;

(2) providing written recommendations, together with suggested legislation, for a comprehensive state policy for unmanned aircraft that protects privacy and allows the use of unmanned aircraft systems for public and private applications; and

(3) submitting, not later than January 15, 2014, an initial report to the legislature and, not later than January 15, 2015, submitting a final report to the legislature; and be it

FURTHER RESOLVED that the task force may meet as frequently as necessary to carry out its responsibilities; and be it

FURTHER RESOLVED that the task force may meet during and between legislative sessions and may request administrative and technical support from the University of Alaska Fairbanks; and be it

FURTHER RESOLVED that the public members of the task force serve without compensation but are entitled to per diem and travel expenses authorized for boards and commissions under AS 39.20.180; and be it

FURTHER RESOLVED that the task force terminates on January 15, 2015.

HOUSE CONCURRENT RESOLUTION NO.

IN THE LEGISLATURE OF THE STATE OF ALASKA

TWENTY-EIGHTH LEGISLATURE - FIRST SESSION

BY REPRESENTATIVE HUGHES

Introduced:
Referred:

A RESOLUTION

Recognizing the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks as a national leader in unmanned aircraft research and development; and relating to a Task Force on Unmanned Aircraft Systems.

BE IT RESOLVED BY THE LEGISLATURE OF THE STATE OF ALASKA:

(1) **WHEREAS** the legislature recognizes the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks as the state's leader in unmanned aircraft systems research, meeting the goals of industry, the Federal Aviation Administration, and government operations; and

WHEREAS the legislature ~~recognizes~~ delete the Center for its benefit to the state through its historic role in aviation pioneering; and

(2) **WHEREAS** the legislature has provided significant financial support to the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks to further the Center's research initiatives; and

(4) **WHEREAS**, since 2001, the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks has been designing payloads and upgrades

(3) WHEREAS, the State of Alaska, the University of Alaska, Alaska Aerospace Development Corporation, the Alaska Aviation Safety Project and other public and private institutions have developed cooperation with NASA, the FAA, the Department of Interior, the Department of Defense and others to further advance the research, development and use of technology to benefit and support Alaskans and Americans with the safe use of Unmanned Aircraft Systems; and

for unmanned aircraft systems, testing and evaluating their safety and effectiveness, developing and demonstrating new uses for various potential users, working with the Federal Aviation Administration to make the use of unmanned aircraft systems safe, and developing technology to improve safety; and

(5) **WHEREAS** the University of Alaska Fairbanks has become known across the nation for its leadership in advancing the state of the art and the safe use of unmanned aircraft systems; and

(6) **WHEREAS** the importance of the Center's work to the state was recently recognized by the Board of Regents of the University of Alaska when the regents established the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks to continue research and development of unmanned aircraft systems for the benefit of the state; and

delete

WHEREAS the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks is currently researching other technologies that are being developed and improved for many users, including law enforcement, that could potentially use these technologies for a variety of missions, from search and rescue to forensic recording of scenes and surveillance, in a manner similar to how manned aircraft are used today; and

(7) **WHEREAS**, as the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks has demonstrated, unmanned aircraft systems can be designed for gathering information necessary to protect human life in search and rescue operations, aiding in the management of resources, including marine mammal and fisheries research, providing humanitarian assistance, providing a platform for scientific research in the Arctic, and for other private and public sector activities, as was demonstrated when the Center used an unmanned aircraft system to assist the United States Coast Guard Cutter Healy and the Russian tanker Renda in delivering fuel to Nome in 2012; and

delete

WHEREAS the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks has demonstrated that unmanned aircraft systems can be designed and operated for scientific research, saving human lives, and for use as cost-effective tools for both the public and private sector; and

delete

WHEREAS, while government agencies, including law enforcement agencies and universities, may operate unmanned aircraft systems using the Federal Aviation

Administration Certificate of Authorization or Waiver process, a civil operator may only operate an unmanned aircraft system under a Federal Aviation Administration Special Airworthiness Certificate for experimental purposes, which does not provide for commercial operations; therefore, no unmanned aircraft systems are being lawfully deployed for commercial purposes; and

(8) **WHEREAS** unmanned aircraft systems May present a substantial risk to privacy, but neither the Federal Aviation Administration nor any other state or federal agency currently has specific statutory authority to regulate privacy matters relating to unmanned aircraft systems; and

(9) **WHEREAS** the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks is located in an area of geographic and climatic diversity where the air and surface population density is desirable for conducting research and development of unmanned aircraft systems; and

(10) **WHEREAS** the Federal Aviation Administration currently requires the designation of one pilot to be in command of an unmanned aircraft system at all times, restricts use of unmanned aircraft systems by public agencies to conduct routine flights over urban or populated areas and over heavily trafficked roads or open-air assemblies of people, the discharge or dropping of objects while in flight, and the operation of unmanned aircraft systems without the capability of pilot intervention;

(11) WHEREAS, Alaska's state government and Alaska's business and research community continue to work with the Federal Aviation Administration to promote the establishment of safe UAS ranges onshore on offshore Alaska, which will help set procedures for the safe UAS use in the National Airspace System.

(12) WHEREAS, Alaska has the highest per capita use of general aviation activity in our nation, and Alaskan aviation organizations have helped the FAA develop the next generation of air traffic control for the nation and the world, while making major gains for Alaska's aviation safety in the process; and

[illegible] for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks to become one of the nation's six test sites for unmanned aircraft systems testing and research; and be it

(15) **FURTHER RESOLVED** by the Alaska State Legislature that the Task Force on Unmanned Aircraft Systems is created in the legislative branch and shall consist of 13 members, who, except for the member from the senate and the member from the house of representatives, shall be appointed jointly by the president of the senate and the speaker of the

house of representatives, as follows:

(1) one senator selected by the president of the senate, who shall serve as co-chair;

(2) one representative selected by the speaker of the house of representatives, who shall serve as co-chair; one ~~representative~~ member selected by the Governor as a representative of the administration

~~(3)~~ the commissioner of transportation and public facilities or the commissioner's designee; one member of the Aerospace States Association

~~(4)~~ the commissioner of public safety or the commissioner's designee;

~~(5)~~ the commissioner of natural resources or the commissioner's designee; one member of the Alaska UAS Interest Group, Dept. of the Interior

(6) one member representing municipal law enforcement;

(7) the attorney general or the attorney general's designee;

(8) the commissioner of fish and game or the commissioner's designee;

(9) the adjutant general of the Department of Military and Veterans' Affairs or the adjunct general's designee;

(10) a member representing the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks;

(11) a member of the Academy of Model Aeronautics;

(12) a member from the Aviation Advisory Board;

(13) a member from the Medallion Foundation; and be it

FURTHER RESOLVED that a vacancy on the task force shall be filled in the manner of the original appointment; and be it

FURTHER RESOLVED that the duties of the task force shall include

(1) reviewing regulations and guidance from the Federal Aviation Administration regarding unmanned aircraft systems;

(2) providing written recommendations, together with suggested legislation, for a comprehensive state policy for unmanned aircraft that protects privacy and allows the use of unmanned aircraft systems for public and private applications; and

(3) submitting, not later than January 15, 2014, an initial report to the legislature and, not later than January 15, 2015, submitting a final report to the legislature; and be it

FURTHER RESOLVED that the task force may meet as frequently as necessary to

carry out its responsibilities; and be it

FURTHER RESOLVED that the task force may meet during and between legislative sessions and may request administrative and technical support from the University of Alaska Fairbanks; and be it

FURTHER RESOLVED that the public members of the task force serve without compensation but are entitled to per diem and travel expenses authorized for boards and commissions under AS 39.20.180; and be it

FURTHER RESOLVED that the task force terminates on January 15, 2015.

Ginger Blaisdell

From: Ginger Blaisdell

To: LAA Legal
Subject: Doug Gardner - unmanned aircraft

So the Speaker does not want a "toothy" bill introduced and wants us to introduce a resolution with the 'findings' and establishing a task force.
LS0639 –
Sec 1 is the "whereas" section:

(1) **Replace with Ro Bailey's email** "the Alaska Center for Unmanned Aircraft Systems Integration at UAF has been designing payloads and upgrades for unmanned aircraft systems, testing and evaluating their safety and effectiveness, developing new uses, demonstrating these uses for various potential users, working with the FAA for safe use as well as developing technology to improve safety since 2001. The University has become known throughout the country for its leadership in advancing the state of the art and the safe use of UAS. Recently the importance of this work to the State of Alaska was recognized by the Board of Regents who established the Alaska Center for Unmanned Aircraft Systems Integration - Research, Development, Test & Evaluation, hereafter known as ACUASI, to provide this work for the benefit of the entire State of Alaska.

(2) **Incorporate the following**: UAF is currently researching other technologies being developed and improved for many users including law enforcement, which could potentially use these technologies for a variety of missions including search and rescue, forensic recording of scenes, and surveillance missions similarly to how manned aircraft are used today;

(3) **Can you reference FAA Rulings in the whereas?** FAA: UAS Interim Operational Approval Guidance 08-01 section 4.1 Certificate of Waiver or Authorization (COA). COAs are granted for a period of one year or less (for the length of use for a specific project) and each project is evaluated on its individual merits. GAO (Government Accountability Office) 12-889T Unmanned Aircraft Systems states that Using UAS for commercial purposes in not currently allowed in the national airspace.

(4) **Can you reference FAA Rulings in the whereas?** FAA: UAS Interim Operational Approval Guidance 08-01 section 4.1 Certificate of Waiver or Authorization (COA). Requirements and restrictions for use are expressed in section 8.0 Flight Operations.

(5) **Line 28 following place to protect privacy**, ... delete all/replace: one directive of the task force is to recommend statute, regulation or other policy directives to protect against the gaps currently in FAA rulings regarding privacy protection and law enforcement uses of UAS.

(6) **New finding insert after (1):**

Identify UAF as the lead in research meeting the goals of industry, FAA and the state. Recognize the benefit for State and historic role by Alaska in aviation pioneering.

(7) **New finding insert at the end:** UAF receives full support of the legislature in its efforts of application and consideration to be one of the nation's six test sites due to geographic and climactic diversity and the desirable air and surface population density for UAS testing and research.

Remove Sec 2

Task Force membership:
Remove public defender
Remove office of public advocacy
Remove transportation
Remove natural resources
Add one member for one of the departments including DOT, DNR, or DFG
Add Dept of Military and Veterans' Affairs
Add Aviation Advisory Board
Add Medallion Foundation

Add local active member of the Academy of Model Aeronautics

Thank you for all of your work on this
Ginger

HOUSE BILL NO.

IN THE LEGISLATURE OF THE STATE OF ALASKA

TWENTY-EIGHTH LEGISLATURE - FIRST SESSION

BY REPRESENTATIVE HUGHES

Introduced:
Referred:

SOFT

A BILL

FOR AN ACT ENTITLED

"An Act restricting the use of unmanned aircraft; establishing a task force to study and provide recommendations on the use of unmanned aircraft systems; and providing for an effective date."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

* **Section 1.** The uncodified law of the State of Alaska is amended by adding a new section to read:

LEGISLATIVE FINDINGS. The legislature finds that

(1) the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks has been designing and making control systems for unmanned aircraft systems since 1998 and is a leading research institution at the forefront of developing unmanned aircraft systems as cost-effective and readily available research tools;

(2) as the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks has demonstrated, unmanned aircraft systems can be designed for gathering information necessary to protect human life in search and rescue operations,

aiding in the management of resources, including marine mammal and fisheries research, providing humanitarian assistance, providing a platform for scientific research on the Arctic, and for other private and public sector activities demonstrated by the use of an unmanned aircraft system by the Alaska Center for Unmanned Aircraft Systems Integration to assist the United States Coast Guard Cutter Healy and the Russian tanker Renda in delivering fuel to Nome, Alaska, in 2012;

(3) while government agencies, including law enforcement agencies and universities, may operate unmanned aircraft systems using the FAA Certificate of Authorization or Waiver process, a civil operator may only operate an unmanned aircraft system under an FAA Special Airworthiness Certificate for experimental purposes, which does not provide for commercial operations; therefore, no unmanned aircraft systems are being lawfully deployed for commercial purposes;

#(4) from Version N to be added

(4) the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks has demonstrated that unmanned aircraft systems can be designed and operated for scientific research, saving human lives, and for use as cost-effective tools for both the public and private sector; however, since unmanned aircraft systems present a substantial risk to privacy when used by law enforcement for surveillance, and given that currently neither the FAA nor any other state or federal agency has specific statutory authority to regulate privacy matters relating to unmanned aircraft systems, the legislature finds that, until a comprehensive statutory structure can be put in place to protect privacy, controls must be established to preclude the use of unmanned aircraft systems by law enforcement while allowing certain uses of unmanned aircraft systems to proceed.

*** Sec. 2.** AS 18.65 is amended by adding a new section to read:

Article 4A. Use of Unmanned Aircraft.

Sec. 18.65.380. Unmanned aircraft. (a) A peace officer or law enforcement agency may not use unmanned aircraft, participate in an investigation in which unmanned aircraft are being used, use information gathered by unmanned aircraft, or otherwise direct the use of unmanned aircraft, unless an imminent risk of harm to life or property exists or the use of the unmanned aircraft is specifically authorized in a search warrant under AS 12.35.

(b) In this section, "unmanned aircraft" means an aircraft that is operated

without the possibility of direct human intervention from within or on the aircraft.

*** Sec. 3.** The uncodified law of the State of Alaska is amended by adding a new section to read:

UNMANNED AIRCRAFT SYSTEMS TASK FORCE. (a) The Unmanned Aircraft Systems Task Force is created in the legislative branch for the purpose of making recommendations for a statewide comprehensive plan to regulate the use of unmanned aircraft systems for public and private sector purposes.

(b) The task force consists of 10 members who, except for those in (1) and (2) of this subsection, shall be appointed jointly by the president of the senate and the speaker of the house of representatives as follows:

(1) one senator selected by the president of the senate, who shall serve as co-chair;

(2) one representative selected by the speaker of the house of representatives, who shall serve as co-chair;

(3) the commissioner of transportation;

(4) the commissioner of public safety;

(5) the commissioner of natural resources;

(6) one member representing municipal law enforcement;

(7) the attorney general or the attorney general's designee;

(8) the public defender or the public defender's designee;

(9) the office of public advocacy;

(10) one member representing the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks.

(c) The task force shall, not later than January 15, 2014, submit an initial report to the legislature, and not later than January 15, 2015, submit a final report to the legislature. The reports must include

(1) policy options and recommendations to provide for the use of unmanned aircraft systems while protecting privacy when used by law enforcement, and allowing the use of unmanned aircraft systems for other public and private applications;

(2) recommendations to the legislature and the governor, including draft legislation required to achieve the policy objectives proposed by the task force.

(d) The task force shall meet as frequently as necessary to carry out its responsibilities.

(e) The task force may request administrative and technical support from the University of Alaska Fairbanks.

(f) Members of the task force shall serve without compensation but are entitled to per diem and travel expenses authorized for boards and commissions under AS 39.20.180.

(g) The task force terminates on January 15, 2015.

*** Sec. 4.** This Act takes effect immediately under AS 01.10.070(c).

HOUSE BILL NO.

IN THE LEGISLATURE OF THE STATE OF ALASKA

TWENTY-EIGHTH LEGISLATURE - FIRST SESSION

BY REPRESENTATIVE HUGHES

Introduced:
Referred:

A BILL

FOR AN ACT ENTITLED

"An Act establishing a crime for certain uses of unmanned aircraft; restricting the use of unmanned aircraft for collection of information or investigation by peace officers; establishing a task force to study and provide recommendations on the use of unmanned aircraft systems; and providing for an effective date."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

* **Section 1.** The uncodified law of the State of Alaska is amended by adding a new section to read:

LEGISLATIVE FINDINGS. The legislature finds that

(1) the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks has been designing and making control systems for unmanned aircraft systems since 1998 and is a leading research institution at the forefront of developing unmanned aircraft systems as cost-effective and readily available research tools;

(2) as the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks has demonstrated, unmanned aircraft systems can be designed

for gathering information necessary to protect human life in search and rescue operations, aiding in the management of resources, including marine mammal and fisheries research, providing humanitarian assistance, providing a platform for scientific research on the Arctic, and for other private and public sector activities demonstrated by the use of an unmanned aircraft system by the Alaska Center for Unmanned Aircraft Systems Integration to assist the United States Coast Guard Cutter Healy and the Russian tanker Renda in delivering fuel to Nome, Alaska, in 2012;

(3) while government agencies, including law enforcement agencies and universities, may operate unmanned aircraft systems using the Federal Aviation Administration Certificate of Authorization or Waiver process, a civil operator may only operate an unmanned aircraft system under a Federal Aviation Administration Special Airworthiness Certificate for experimental purposes, which does not provide for commercial operations; therefore, no unmanned aircraft systems are being lawfully deployed for commercial purposes;

(4) the Federal Aviation Administration currently requires the designation of one pilot to be in command of an unmanned aircraft system at all times, and restricts the use by public agencies of unmanned aircraft systems to conduct routine flights over urban or populated areas, operations over heavily trafficked roads or open-air assemblies of people, discharge or drop objects while in flight, and operate without the capability of pilot intervention;

(5) the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks has demonstrated that unmanned aircraft systems can be designed and operated for scientific research, saving human lives, and for use as cost-effective tools for both the public and private sector; however, since unmanned aircraft systems present a substantial risk to privacy when used by law enforcement for surveillance, and given that currently neither the Federal Aviation Administration nor any other state or federal agency has specific statutory authority to regulate privacy matters relating to unmanned aircraft systems, the legislature finds that, until a comprehensive statutory structure can be put in place to protect privacy, controls must be established to preclude the use of unmanned aircraft systems by law enforcement while allowing certain uses of unmanned aircraft systems to proceed.

* **Sec. 2.** AS 11.61 is amended by adding a new section to read:

Sec. 11.61.260. Unlawful use of unmanned aircraft. (a) A person commits the crime of unlawful use of an unmanned aircraft if the person knowingly operates an unmanned aircraft in or on the premises of another person or entity for the purpose of acquiring information by the use of a sensing device that is capable of acquiring data from its surroundings, including by a camera, microphone, thermal detector, chemical detector, radiation gauge, and wireless receiver.

(b) This section does not apply to the use of an unmanned aircraft to conduct a search

(1) under the express terms of a search warrant issued under AS 12.35;

(2) in accordance with a judicially recognized exception to the warrant requirement in AS 12.35;

(3) to monitor public land or an international border;

(4) to monitor private land with the consent of the land owner; or

(5) if an imminent risk of harm to life or property exists.

(c) In this section, "unmanned aircraft" means an aircraft that is operated without the possibility of direct human intervention from inside or on the aircraft.

(d) Property used to aid a violation of (a) of this section may be forfeited to the state upon conviction of the offender.

(e) Unlawful use of an unmanned aircraft is a class A misdemeanor.

* **Sec. 3.** AS 18.65 is amended by adding a new section to read:

Article 4A. Unmanned Aircraft.

Sec. 18.65.380. Use of unmanned aircraft in law enforcement. (a) A peace officer or law enforcement agency may not use unmanned aircraft, participate in an investigation in which unmanned aircraft are being used, use information gathered by unmanned aircraft, or otherwise direct the use of unmanned aircraft.

(b) This section does not apply to the use of an unmanned aircraft for a purpose permitted under AS 11.61.260(b).

(c) In this section, "unmanned aircraft" means an aircraft that is operated without the possibility of direct human intervention from within or on the aircraft.

* **Sec. 4.** The uncodified law of the State of Alaska is amended by adding a new section to

read:

UNMANNED AIRCRAFT SYSTEMS TASK FORCE. (a) The Unmanned Aircraft Systems Task Force is created in the legislative branch for the purpose of making recommendations for a statewide comprehensive plan to regulate the use of unmanned aircraft systems for public and private sector purposes.

(b) The task force consists of 10 members who, except for those in (1) and (2) of this subsection, shall be appointed jointly by the president of the senate and the speaker of the house of representatives as follows:

(1) one senator selected by the president of the senate, who shall serve as co-chair;

(2) one representative selected by the speaker of the house of representatives, who shall serve as co-chair;

(3) the commissioner of transportation;

(4) the commissioner of public safety;

(5) the commissioner of natural resources;

(6) one member representing municipal law enforcement;

(7) the attorney general or the attorney general's designee;

(8) the public defender or the public defender's designee;

(9) the office of public advocacy;

(10) one member representing the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks.

(c) The task force shall, not later than January 15, 2014, submit an initial report to the legislature, and not later than January 15, 2015, submit a final report to the legislature. The reports must include

(1) policy options and recommendations to provide for the use of unmanned aircraft systems while protecting privacy when used by law enforcement, and allowing the use of unmanned aircraft systems for other public and private applications;

(2) recommendations to the legislature and the governor, including draft legislation required to achieve the policy objectives proposed by the task force.

(d) The task force shall meet as frequently as necessary to carry out its responsibilities.

(e) The task force may request administrative and technical support from the University of Alaska Fairbanks.

(f) Members of the task force shall serve without compensation but are entitled to per diem and travel expenses authorized for boards and commissions under AS 39.20.180.

(g) The task force terminates on January 15, 2015.

* **Sec. 5.** This Act takes effect immediately under AS 01.10.070(c).

HOUSE BILL NO.

IN THE LEGISLATURE OF THE STATE OF ALASKA

TWENTY-EIGHTH LEGISLATURE - FIRST SESSION

BY REPRESENTATIVE HUGHES

Introduced:
Referred:

A BILL

FOR AN ACT ENTITLED

"An Act restricting the use of unmanned aircraft; establishing a task force to study and provide recommendations on the use of unmanned aircraft systems; and providing for an effective date."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

*** Section 1.** The uncodified law of the State of Alaska is amended by adding a new section to read:

LEGISLATIVE FINDINGS. The legislature finds that

(1) the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks has been designing and making control systems for unmanned aircraft systems since 1998 and is a leading research institution at the forefront of developing unmanned aircraft systems as cost-effective and readily available research tools;

(2) as the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks has demonstrated, unmanned aircraft systems can be designed for gathering information necessary to protect human life in search and rescue operations,

aiding in the management of resources, including marine mammal and fisheries research, providing humanitarian assistance, providing a platform for scientific research on the Arctic, and for other private and public sector activities demonstrated by the use of an unmanned aircraft system by the Alaska Center for Unmanned Aircraft Systems Integration to assist the United States Coast Guard Cutter Healy and the Russian tanker Renda in delivering fuel to Nome, Alaska, in 2012;

(3) while government agencies, including law enforcement agencies and universities, may operate unmanned aircraft systems using the Federal Aviation Administration Certificate of Authorization or Waiver process, a civil operator may only operate an unmanned aircraft system under a Federal Aviation Administration Special Airworthiness Certificate for experimental purposes, which does not provide for commercial operations; therefore, no unmanned aircraft systems are being lawfully deployed for commercial purposes;

(4) the Federal Aviation Administration currently requires the designation of one pilot to be in command of an unmanned aircraft system at all times, restricts the use by public agencies of unmanned aircraft systems to conduct routine flights over urban or populated areas, operations over heavily trafficked roads or open-air assemblies of people, discharge or drop objects while in flight, and restricts operation of unmanned aircraft systems without the capability of pilot intervention;

(5) the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks has demonstrated that unmanned aircraft systems can be designed and operated for scientific research, saving human lives, and for use as cost-effective tools for both the public and private sector; however, since unmanned aircraft systems present a substantial risk to privacy when used by law enforcement for surveillance, and given that currently neither the Federal Aviation Administration nor any other state or federal agency has specific statutory authority to regulate privacy matters relating to unmanned aircraft systems, the legislature finds that, until a comprehensive statutory structure can be put in place to protect privacy, controls must be established to preclude the use of unmanned aircraft systems by law enforcement while allowing certain uses of unmanned aircraft systems to proceed.

*** Sec. 2.** AS 18.65 is amended by adding a new section to read:

Article 4A. Use of Unmanned Aircraft.

Sec. 18.65.380. Unmanned aircraft. (a) A peace officer or law enforcement agency may not use unmanned aircraft, participate in an investigation in which unmanned aircraft are being used, use information gathered by unmanned aircraft, or otherwise direct the use of unmanned aircraft, unless an imminent risk of harm to life or property exists or the use of the unmanned aircraft is specifically authorized in a search warrant under AS 12.35.

(b) In this section, "unmanned aircraft" means an aircraft that is operated without the possibility of direct human intervention from within or on the aircraft.

*** Sec. 3.** The uncodified law of the State of Alaska is amended by adding a new section to read:

UNMANNED AIRCRAFT SYSTEMS TASK FORCE. (a) The Unmanned Aircraft Systems Task Force is created in the legislative branch for the purpose of making recommendations for a statewide comprehensive plan to regulate the use of unmanned aircraft systems for public and private sector purposes.

(b) The task force consists of 10 members who, except for those in (1) and (2) of this subsection, shall be appointed jointly by the president of the senate and the speaker of the house of representatives as follows:

(1) one senator selected by the president of the senate, who shall serve as co-chair;

(2) one representative selected by the speaker of the house of representatives, who shall serve as co-chair;

(3) the commissioner of transportation and public facilities;

(4) the commissioner of public safety;

(5) the commissioner of natural resources;

(6) one member representing municipal law enforcement;

(7) the attorney general or the attorney general's designee;

(8) the public defender or the public defender's designee;

(9) the office of public advocacy;

(10) one member representing the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks.

(c) The task force shall, not later than January 15, 2014, submit an initial report to the legislature, and not later than January 15, 2015, submit a final report to the legislature. The reports must include

(1) policy options and recommendations to provide for the use of unmanned aircraft systems while protecting privacy when used by law enforcement, and allowing the use of unmanned aircraft systems for other public and private applications;

(2) recommendations to the legislature and the governor, including draft legislation required to achieve the policy objectives proposed by the task force.

(d) The task force shall meet as frequently as necessary to carry out its responsibilities.

(e) The task force may request administrative and technical support from the University of Alaska Fairbanks.

(f) Members of the task force shall serve without compensation but are entitled to per diem and travel expenses authorized for boards and commissions under AS 39.20.180.

(g) The task force terminates on January 15, 2015.

*** Sec. 4.** This Act takes effect immediately under AS 01.10.070(c).

HOUSE BILL NO.

IN THE LEGISLATURE OF THE STATE OF ALASKA

TWENTY-EIGHTH LEGISLATURE - FIRST SESSION

BY REPRESENTATIVE HUGHES

Introduced:
Referred:

A BILL

FOR AN ACT ENTITLED

"An Act restricting the use of unmanned aircraft; establishing a task force to study and provide recommendations on the use of unmanned aircraft systems; and providing for an effective date."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

*** Section 1.** The uncodified law of the State of Alaska is amended by adding a new section to read:

LEGISLATIVE FINDINGS. The legislature finds that

(1) the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks has been designing and making control systems for unmanned aircraft systems since 1998 and is a leading research institution at the forefront of developing unmanned aircraft systems as cost-effective and readily available research tools;

(2) as the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks has demonstrated, unmanned aircraft systems can be designed for gathering information necessary to protect human life in search and rescue operations,

aiding in the management of resources, including marine mammal and fisheries research, providing humanitarian assistance, providing a platform for scientific research on the Arctic, and for other private and public sector activities demonstrated by the use of an unmanned aircraft system by the Alaska Center for Unmanned Aircraft Systems Integration to assist the United States Coast Guard Cutter Healy and the Russian tanker Renda in delivering fuel to Nome, Alaska, in 2012;

(3) while government agencies, including law enforcement agencies and universities, may operate unmanned aircraft systems using the FAA Certificate of Authorization or Waiver process, a civil operator may only operate an unmanned aircraft system under an FAA Special Airworthiness Certificate for experimental purposes, which does not provide for commercial operations; therefore, no unmanned aircraft systems are being lawfully deployed for commercial purposes;

(4) the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks has demonstrated that unmanned aircraft systems can be designed and operated for scientific research, saving human lives, and for use as cost-effective tools for both the public and private sector; however, since unmanned aircraft systems present a substantial risk to privacy when used by law enforcement for surveillance, and given that currently neither the FAA nor any other state or federal agency has specific statutory authority to regulate privacy matters relating to unmanned aircraft systems, the legislature finds that, until a comprehensive statutory structure can be put in place to protect privacy, controls must be established to preclude the use of unmanned aircraft systems by law enforcement while allowing certain uses of unmanned aircraft systems to proceed.

*** Sec. 2.** AS 18.65 is amended by adding a new section to read:

Article 4A. Use of Unmanned Aircraft.

Sec. 18.65.380. Unmanned aircraft. HOUSE BILL NO.

IN THE LEGISLATURE OF THE STATE OF ALASKA

TWENTY-EIGHTH LEGISLATURE - FIRST SESSION

BY REPRESENTATIVE HUGHES

Introduced:
Referred:

A BILL

FOR AN ACT ENTITLED

"An Act restricting the use of unmanned aircraft; establishing a task force to study and provide recommendations on the use of unmanned aircraft systems; and providing for an effective date."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

*** Section 1.** The uncodified law of the State of Alaska is amended by adding a new section to read:

LEGISLATIVE FINDINGS. The legislature finds that

(1) the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks has been designing and making control systems for unmanned aircraft systems since 1998 and is a leading research institution at the forefront of developing unmanned aircraft systems as cost-effective and readily available research tools;

(2) as the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks has demonstrated, unmanned aircraft systems can be designed for gathering information necessary to protect human life in search and rescue operations,

aiding in the management of resources, including marine mammal and fisheries research, providing humanitarian assistance, providing a platform for scientific research on the Arctic, and for other private and public sector activities demonstrated by the use of an unmanned aircraft system by the Alaska Center for Unmanned Aircraft Systems Integration to assist the United States Coast Guard Cutter Healy and the Russian tanker Renda in delivering fuel to Nome, Alaska, in 2012;

(3) in addition to research applications, unmanned aircraft systems, commonly referred to as "drones," which vary in size from four inches to a full-sized aircraft, have the capability to use global positioning, forward-looking infrared technology, and high resolution cameras, all of which are being developed and improved for use by law enforcement agencies to perform surveillance as technology rapidly advances;

(4) the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks has demonstrated that unmanned aircraft systems can be designed and operated for scientific research, saving human lives, and for use as cost-effective tools for both the public and private sector; however, since unmanned aircraft systems present a substantial risk to privacy when used by law enforcement for surveillance, and given the current lack of controls in place to protect privacy, the legislature finds that, until a comprehensive statutory structure can be put in place with input from all user groups affected by unmanned aircraft systems, to protect privacy, controls must be established to preclude the use of unmanned aircraft systems by law enforcement while allowing certain uses of unmanned aircraft systems to proceed.

*** Sec. 2.** AS 18.65 is amended by adding a new section to read:

Article 4A. Use of Unmanned Aircraft.

Sec. 18.65.380. Unmanned aircraft. (a) A peace officer or law enforcement agency may not use unmanned aircraft, participate in an investigation in which unmanned aircraft are being used, use information gathered by unmanned aircraft, or otherwise direct the use of unmanned aircraft, unless an imminent risk of harm to life or property exists or the use of the unmanned aircraft is specifically authorized in a search warrant under AS 12.35.

(b) In this section, "unmanned aircraft" means an aircraft that is operated without the possibility of direct human intervention from within or on the aircraft.

*** Sec. 3.** The uncodified law of the State of Alaska is amended by adding a new section to read:

UNMANNED AIRCRAFT SYSTEMS TASK FORCE. (a) The Unmanned Aircraft Systems Task Force is created in the legislative branch for the purpose of making recommendations for a statewide comprehensive plan to regulate the use of unmanned aircraft systems for public and private sector purposes.

(b) The task force consists of 10 members who, except for those in (1) and (2) of this subsection, shall be appointed jointly by the president of the senate and the speaker of the house of representatives as follows:

(1) one senator selected by the president of the senate, who shall serve as co-chair;

(2) one representative selected by the speaker of the house of representatives, who shall serve as co-chair;

(3) the commissioner of transportation;

(4) the commissioner of public safety;

(5) the commissioner of natural resources;

(6) one member representing municipal law enforcement;

(7) the attorney general or the attorney general's designee;

(8) the public defender or the public defender's designee;

(9) the office of public advocacy;

(10) one member representing the Alaska Center for Unmanned Aircraft Systems Integration at University of Alaska Fairbanks.

(c) The task force shall, not later than January 15, 2014, submit an initial report to the legislature and the governor, and not later than January 15, 2015, submit a final report to the governor. The reports must include

(1) policy options and recommendations to provide for the use of unmanned aircraft systems while protecting privacy when used by law enforcement, and allowing the use of unmanned aircraft systems for other public and private applications;

(2) recommendations to the legislature and the governor, including draft legislation required to achieve the policy objectives proposed by the task force.

(d) The task force shall meet as frequently as necessary to carry out its

responsibilities.

(e) The task force may request administrative and technical support from the University of Alaska Fairbanks.

(f) Members of the task force shall serve without compensation but are entitled to per diem and travel expenses authorized for boards and commissions under AS 39.20.180.

(g) The task force terminates on January 15, 2015.

*** Sec. 4.** This Act takes effect immediately under AS 01.10.070(c).

Be it enacted by the General Assembly of Virginia:

1. *No state or local agency or organization having jurisdiction over criminal law enforcement or regulatory violations, including but not limited to the Department of State Police, and no department of law enforcement as defined in § 15.2-836 of the Code of Virginia of any county, city, or town shall utilize an unmanned aircraft system before July 1, 2015.*

2. *Notwithstanding the prohibition in this section, an unmanned aircraft system may be deployed before July 1, 2015, when an Amber Alert is activated pursuant to § 52-34.3 of the Code of Virginia, when a Senior Alert is activated pursuant to § 52-34.6 of the Code of Virginia, when a Blue Alert is activated pursuant to § 52-34.9 of the Code of Virginia, or for the purpose of a search and rescue operation. In no case may a weaponized unmanned aircraft system be deployed or its use facilitated by a state or local agency in Virginia.*

3. *The prohibitions in this section shall not apply to the Virginia National Guard while utilizing unmanned aircraft systems during training required to maintain readiness for its federal mission, when facilitating training for other United States Department of Defense units, or when such systems are utilized to support the Commonwealth for purposes other than law enforcement, including damage assessment, traffic assessment, flood stages, and wildfire assessment.*

I would like the bill to:

- identify UAF as the lead agency in the research, operation and management of drone (UAS) technology for the State of Alaska (and the USA)
- place a moratorium on law enforcement to utilize UAS technology for discovering but would authorize use in the event of life and safety as part of the investigation of an event that has already occurred and must only be used in conjunction with a warrant
- any information gathered by a drone that is not specifically related to the project contract or warrant may not be used for law enforcement purposes
- prohibition for using any type of weapon using UAS technology for the duration of this moratorium excluding controlled testing as managed by UAF or the US Military in pre-established sites
- The UAS operation has to comply with FAA regulation
- Requires UAF approval/oversight for UAS purchase/use by any governmental agency
- Require a report to the legislature on July 1 and first day of legislative session. One legislator from each body assigned by Speaker and President will receive informal updates of UAS use.

Findings:
Drones can be as small as 4 inches in size (infrared technology seeing through walls) and as large as a full-sized aircraft; they are both gas and electric powered with newer technologies begin developed.
UAS must follow the requirement for marine mammal harassment agreement for aircraft to limit noise
UAF has been using UAS for more than ten years for humanitarian purposes
Economic development – the work by UAF seeks to bring a new industry to Alaska an benefitting existing industry such as fishing, safety, government data collection efforts, NOAA,
Laws of privacy already presumed for UAS use
Manned aircraft by law enforcement has been clearly defined and tried in court
The value of unmanned aircraft for dirty, dull or dangerous jobs saves lives while providing invaluable services to Alaska's citizens.

Non-government commercial use is banned by FAA regulations
Laws and regulations already exist regarding the collection of biometric data whether by human or technology (sight doctrine and warrants)
FAA has published RC guidelines that differentiates recreational use from UAS or manned aircraft.

- **Do not** include physical operation of UAS such as "no-fly" area or altitudes... this is taken care of by FAA and could change through research conducted by UAF
- **Do not** include private use of RC users because it is already governed by personal privacy laws
- Indiscriminant killing VS discriminant killing statement made in WA state went viral

Subject: FW: Alaska drones

What do you think? May be too "out there" - but then again, setting parameters pro-actively can sometimes be a good idea. My one hesitation is that the technology could possibly be developed for good purposes. Aerial infrared photos that we saw in Energy Comm showing heat loss from building come to mind.

Subject: Alaska drones

Dear Rep. Hughes,

There is an area of privacy that I am concerned about, especially the recent trend to use unmanned drone aircraft for domestic surveillance (see: http://www.washingtonguardian.com/drones-home). I really don't want this country to become a police-state, and feel like we need to take heed lest our freedoms slowly slip away. I see in the news (http://www.usnews.com/news/articles/2013/02/05/city-in-virginia-becomes-first-to-pass-anti-drone-legislation-) where a local jurisdiction has made an effort to ban the use of drones, or at least evidence obtained by them from court. This is probably really off the wall, but could it be time for us as a state to ban their use by local law enforcement?

George Sahlstrom

I like Virginia's language that it is for 2 years but drones can be used for life health & safety.

CITY OF CHARLOTTESVILLE,
VIRGINIA CITY COUNCIL AGENDA

Agenda Date:	February 4, 20122
Action Required:	Vote on Resolution
Presenter:	Maurice Jones
Staff Contacts:	Maurice Jones
Title:	**Anti-Drone Legislation**

Background:

Council requested that this be added to an agenda after a group of citizens spoke in support of passing an anti-drone resolution at the Council meeting on January 22, 2013.

A resolution was also submitted to Council by the Rutherford Institute on January 21, 2013.

Discussion:

Council received an email from David Swanson, as well as a proposed resolution

A New Model Drone Resolution
By David Swanson
http://warisacrime.org/content/new-model-drone-resolution

In the absence of state or federal laws, localities around the United States are proceeding to put unmanned aerial vehicles in our skies as they see fit. The federal government has authorized the flight of 30,000 drones, and the use of drones up to 400 feet by police departments, at least 300 of which already have surveillance drones in operation.

Concerns include the following: drones can crash into airplanes, buildings, and each other; drones can fall out of the sky; drones can produce noise pollution; drones can produce visual pollution if put to the same use that everything from brick walls to urinals has been put to, viz. advertising; drones can be used to spy on us whether by private or public entities; police surveillance with drones will violate our Fourth Amendment rights as all existing technologies are currently used to do; police forces that view the public as their enemy will deploy drones armed with rubber bullets, tear gas, or other weapons; and ultimately a program run by the U.S. military and the CIA that has targeted and murdered three U.S. citizens that we know of, along with thousands of other men, women, and children, may eventually find it acceptable to include U.S. soil in its otherwise unlimited field of operations.

Contrary concerns over banning or restricting drones include these: drones could conceivably be put to positive or non-offensive use by departments fighting forest fires, first responders in rural areas, farmers, artistic photographers, real estate agents, tourism offices, and hobbyists; states and localities are limited in their control of air space by federal law.

Few if any localities have thus far made their desires known or created ordinances to regulate the use of drones, but state legislatures, including the General Assembly here in Virginia, are taking up bills. With the City of Charlottesville, where I live, planning to address the issue on February 19th, I've taken a look at (and plagiarized liberally from) numerous draft resolutions, including those from several cities that are now considering taking action: Berkeley, Buffalo, Madison, Ft. Wayne, et alia, as well as a draft resolution from anti-drone activist Nick Mottern, and one from the Rutherford Institute. The result is the following draft resolution that I offer for consideration, comment, and modification:

DRAFT ANTI-DRONE RESOLUTION
(submitted by David Swanson)

WHEREAS, United States airspace is the busiest in the world, with up to 87,000 flights per day;
WHEREAS, unmanned aircraft (drones) have an accident rate seven times higher than general aviation and 353 times higher than commercial aviation;

WHEREAS, the Federal Aviation Administration Modernization and Reform Act of 2012 directs the FAA to create regulations that will enable drones to fly throughout U.S. airspace by September, 2015;

WHEREAS, small drones, 25 pounds or under, are now permitted to fly in general airspace below 400 feet for the use of police and first responders, with FAA permission;

WHEREAS, drones do not have the same capability to avoid other aircraft as aircraft piloted by humans;

WHEREAS, drones have at times gotten out of human control, in at least one instance having to be shot down, and drones are susceptible to electronic interference and having control seized electronically by unauthorized operators;

WHEREAS, drones can be used to film individuals or groups around the clock, in public spaces and through the windows of private homes, and to continuously monitor cell-phone and text messaging;

WHEREAS, drones are being developed that will use computerized facial images to target individuals and, once launched, to operate, autonomously, without further human involvement, to locate and kill those individuals;

WHEREAS, Vanguard Defense Industries has confirmed that its Shadowhawk drone, which is already being sold to law enforcement agencies throughout the country, will be outfitted with weapons, including a grenade launcher or a shotgun, tear gas, and rubber buckshot, and such aerial police weapons send a clear and chilling message to those attempting to exercise their First Amendment rights by taking to the streets and protesting government policies --the message: stay home;

WHEREAS, the rapid implementation of drone technology throughout the United States poses a serious threat to the privacy and constitutional rights of the American people, including the residents of Charlottesville;

WHEREAS, the federal government and the Commonwealth of Virginia have thus far failed to provide reasonable legal restrictions on the use of drones within the United States;

WHEREAS, police departments throughout the country have begun implementing drone technology absent any guidance or guidelines from law makers;

WHEREAS, the federal use of drones provides a poor precedent for their domestic use, drone wars having turned public opinion in Yemen and Pakistan dramatically against the U.S. government, drone strikes having killed far more non-targeted people than those targeted, targeted victims having included men, women, and children known by name and unknown, no targeted individual having been charged with any crime, no legislative or judicial or public oversight having been permitted, "double-tap" strikes having been used to target rescuers of

victims of previous strikes, children and adults having been traumatized by the presence of drones, over a million people having fled their homes in heavily droned areas, drones having killed Americans in accidental "friendly fire," drone operators having been targeted and killed on a base in Afghanistan, drone pilots having suffered post-traumatic stress disorder at a higher rate than other pilots as a result of watching families for long periods of time before killing them, and drones having proved a tremendously costly expense for taxpayers;

NOW, THEREFORE, BE IT RESOLVED, that the City Council of Charlottesville, Virginia, calls on the United States Congress and the General Assembly of the Commonwealth of Virginia, to adopt legislation prohibiting the use of drones for surveillance, and prohibiting information obtained from the domestic use of drones from being introduced into a Federal or State court, and precluding the domestic use of drones equipped with anti-personnel devices, meaning any projectile, chemical, electrical, directed-energy (visible or invisible), or other device designed to harm, incapacitate, or otherwise negatively impact a human being.

BE IT FURTHER RESOLVED, that the City Council of Charlottesville, Virginia, calls on the U.S. government to immediately end its practice of extrajudicial killing, whether by drone or any other means.

BE IT FURTHER RESOLVED, that the City Council of Charlottesville, Virginia, declares Charlottesville a No Drone Zone, and instructs the City Attorney to perform the necessary legal tasks to transform this declaration into an Ordinance wherein drones are hereby banned from airspace over the City of Charlottesville, including drones in transit, to the extent compatible with federal law.

BE IT FURTHER RESOLVED, that violation of the ordinance shall be considered a misdemeanor carrying a maximum penalty of up to one year in jail and a fine not to exceed $10,000, and each offense that is more than one offense of flying a drone within said airspace will be considered to be an additional misdemeanor, with jail time and fines based on the number of violations.

BE IT FURTHER RESOLVED, that exemptions will be made for hobbyists to fly remote controlled model aircraft and other unmanned aerial vehicles in specified areas, away from dwellings and the urban cityscape of people and buildings as long as those devices are not equipped to monitor any person or private residence or equipped with any weapon.

BE IT FURTHER RESOLVED, that drones will not be purchased, leased, borrowed, tested, contracted or otherwise used by any agency of the City of Charlottesville.

A RESOLUTION
(submitted by Rutherford Institute)

To encourage the General Assembly of Virginia to provide for limitations on the use of evidence obtained from the domestic use of drones and to preclude the domestic use of drones equipped with anti-personnel devices.

WHEREAS, the rapid implementation of drone technology throughout the United States poses a serious threat to the privacy and constitutional rights of the American people, including the residents of Charlottesville; and

WHEREAS, the federal government and the Commonwealth of Virginia have thus far failed to provide reasonable legal restrictions on the use of drones within the United States; and

WHEREAS, police departments throughout the country have begun implementing drone technology absent any guidance or guidelines from law makers;

NOW, THEREFORE, LET IT BE RESOLVED, that the City Council of Charlottesville, Virginia, calls on the United States Congress and the General Assembly of the Commonwealth of Virginia, to adopt legislation prohibiting information obtained from the domestic use of drones from being introduced into a Federal or State court, and precluding the domestic use of drones equipped with anti-personnel devices, meaning any projectile, chemical, electrical, directed-energy (visible or invisible), or other device designed to harm, incapacitate, or otherwise negatively impact a human being.

Freedom from Drone Surveillance Resolution

January 2013

While there are at least 63 active drone sites around the U.S.,[1] the Obama administration is calling for drone technology to be integrated into the national air space by 2015.[2] By 2020, just seven short years from now, it is estimated that at least 30,000 of these drones will be crisscrossing the nation's skies, serving a wide range of functions, both public and private, governmental and corporate. We will find ourselves operating under a new paradigm marked by round-the-clock surveillance and with little hope of real privacy.[3]

The Problem of Increasing Drone Surveillance

The legislative vehicle for this rapid transition into a surveillance state came in the guise of the Federal Aviation Administration (FAA) reauthorization bill signed into law by President Obama in February 2012.[4] It was enacted after intense corporate lobbying by drone makers and potential customers hoping to capitalize on the $12 - 30 billion per year industry. [5]

Drones will undoubtedly be put to a host of legitimate uses, such as helping to spot wildfires, monitoring illegal border crossings, and carrying out search-and-rescue missions; however, in the name of alleged efficiency and cost-effectiveness, law enforcement agencies will find a whole host of clever and innovative ways to use drones to invade our daily lives, not the least of which will be traffic enforcement and crowd control.

While the threat these drones pose to privacy is unprecedented, they are being unleashed on the American populace before any real protocols to protect our privacy rights have been put in place and in such a way as to completely alter the landscape of our lives and our freedoms. We are truly entering a new era. Drones are equipped with thermal imaging devices to see through walls[6] and outfitted with infrared cameras and radar[7] which allow the police to keep track of anyone walking around, regardless of the nature of their business.

This Resolution Will Encourage State and Federal Lawmakers To:

- **Protect Privacy Rights**
  - With the help of nanotechnology, scientists have been able to create ever-smaller drones that mimic the behavior of birds and insects and are almost undetectable.[8] Despite their diminutive size, these drones are capable of capturing and relaying vast amounts of data and high-definition video footage. It is inevitable that as more local police agencies acquire these spy flies, their surveillance efforts will expand to include not only those suspected of criminal activity but anyone within range of the cameras. In such a surveillance state, we shall all be treated as suspects.
  - An agency with the Department of Defense is working on turning insects into living unmanned aerial vehicles (UAVs or "cybugs"). By expanding upon the insects' natural abilities (e.g., bees' olfactory abilities being utilized for bomb detection, etc.), government agents hope to use these spy bugs to surreptitiously gather vast quantities of information. Researchers eventually hope to outfit June beetles with tiny backpacks complete with various detection devices, microphones, and cameras. These devices could be powered by the very energy produced by the bugs beating their wings, or the heat they give off while in flight.[9] There have already been reported sightings of dragonfly-like robotic drones monitoring protesters aerially in Washington, DC, as early as 2007.
- **Protect People's First Amendment Rights**
  - Drones will be outfitted with crowd control weapons. Vanguard Defense Industries has confirmed that its Shadowhawk drone, which is already being sold to law enforcement agencies throughout the country, will be outfitted with lethal weapons, including a grenade launcher or a shotgun, and weapons of compliance, such as tear gas[10] and rubber buckshot.[11] Such aerial police weapons send a clear and chilling message to those attempting to exercise their First Amendment rights by taking to the streets and protesting government policies—the message: stay home.
- **Protect against Fourth Amendment Violations**
  - There are many constitutional concerns presented by drones recording Americans' daily activities, with the most obvious being what it means for the Fourth Amendment protection against unreasonable searches and seizures by government agents. While it will certainly give rise to a whole new dialogue about where to draw the line when it comes to the government's ability to monitor one's public versus private life, the courts

have been notorious for their inability to keep pace with rapid advances in technology and its impact on our freedoms.

- With 56 government agencies now authorized to use drones, including 22 law enforcement agencies and 24 universities, the drones are not going away.[12] Included among the institutions authorized to fly drones are police departments in Arkansas, Utah and Florida[13] as well as Virginia Tech and the University of North Dakota. The University of North Dakota even has a degree program in unmanned vehicle flight with 78 majors.[14]

Re: Model Resolution to Protect Privacy in the Age of Drone Technology

Dear Mayor Huja:

The FAA Reauthorization Act, signed into law by President Obama in February 2012, has opened the door for unmanned aerial vehicles—commonly known as drones—to take to the skies over America. Once confined to the battlefields over Iraq and Afghanistan, these drones are now set to patrol the skies over our homeland. The Obama administration is calling for drone technology to be integrated into the national air space by 2015.[1] By 2020, just seven short years from now, it is estimated that at least 30,000 drones will be airbound, serving a wide range of functions, both public and private, governmental and corporate.

The Rutherford Institute[2] has been particularly vocal in warning against the unprecedented privacy and civil liberties threats posed by allowing drones to take to the skies domestically,[3] particularly when it comes to drones recording Americans' daily activities. Unfortunately, these drones—aerial, robotic threats to privacy and security—are being unleashed on the American populace before any real protocols to protect our privacy rights have been put in place and in such a way as to completely alter the landscape of our lives and our freedoms.

A recent editorial in *The Daily Progress* highlighted the pressing privacy concerns posed by drones, citing legislation put forth by Virginia State Senator Frank Ruff, which is intended to protect citizens engaged in hunting on their private property

[2] The Rutherford Institute is a non-profit civil liberties organization that provides free legal representation to individuals whose civil rights are threatened or infringed.
[3] HB 1160, http://lis.virginia.gov/cgi-bin/legp604.exe?121+ful+HB1160ER+pdf.

from drone surveillance by other private citizens.[4] This legislation is far too narrow in scope to have any serious impact on the widespread threat to privacy and civil liberties posed by drone technology, but it also proves that now is the time to start debating the matter and working to safeguard citizens from the prying eyes of this futuristic surveillance technology. I would also caution against providing law enforcement officials with greater leeway to use drones conditioned only on their first acquiring a court-issued warrant.

In the past, Charlottesville City Council has taken the lead in condemning various government policies which threaten the livelihood of all Americans, including the residents of Charlottesville. For example, in July 2003 the Council passed a resolution expressing opposition to the USA PATRIOT Act, the federal law which formed the basis for the rapid erosion of our civil liberties in the post-9/11 era.[5] Just a year ago, in January 2012, the Council passed a resolution expressing opposition to a potential war against Iran in addition to calling for the cessation of ongoing military conflicts abroad which redirect precious tax dollars away from our floundering economy.[6] Most recently, in May 2012, City Council recognized the injustice and inefficiencies of our nation's current drug policy, and so passed a resolution[7] encouraging the Commonwealth of Virginia to consider regulating marijuana in the same manner as alcohol.

Now City Council has another chance to take the lead in expressing its concern about the rapid implementation of drone technology across the United States. It is our hope that you not only give serious consideration to the dangers posed to our freedoms by these aerial devices but ensure that the people of Charlottesville are protected against any resulting incursions on their rights as protected under the U.S. Constitution. To that end, I am submitting to you a model resolution to encourage the Commonwealth of Virginia to take rapid action in regulating this technology and to prevent law enforcement agencies from employing drones equipped with anti-personnel devices and from using evidence gathered via drone surveillance technology in court. These two prohibitions will surely be a strong first step in securing our constitutional rights against potential violations by government agents utilizing this new technology. Also included is a concise factsheet explaining the gravity of the situation and why this model resolution is the best approach.

As Congressmen Edward Markey (D – MA) and Joe Barton (R – TX) pointed out in a letter to the Federal Aviation Administration (FAA) concerning the widespread implementation of drone technology in America:

> Many drones are designed to carry surveillance equipment, including video cameras, infrared thermal imagers, radar, and wireless network "sniffers." The surveillance power of drones is amplified when the information from onboard sensors is used in conjunction with facial recognition, behavior analysis, license plate recognition, or any other system that can identify and track individuals as they go about their daily lives.[8]

While drones will undoubtedly be put to some legitimate uses, such as helping to spot wildfires and carrying out search-and-rescue missions, their "beneficence" is a double-edged sword. Indeed, without proper safeguards, rules, and regulations, law enforcement agencies will find a whole host of clever and innovative ways to use drones to invade our daily lives and wreak havoc on our freedoms.

Undoubtedly, these devices, which are capable of videotaping the facial expressions of people on the ground from hundreds of feet in the air, will usher in a new age of surveillance in our society. No person, whether he is at a political rally, exiting a house of worship, or simply walking around downtown, will be safe from the prying eyes of these devices, some of which are deceptively small and agile as a bee.[9] Moreover, not even those indoors, in the privacy of their homes, will be safe from these aerial spies, which can be equipped with technology capable of peering through walls.[10]

Equally troubling, these devices, which are used for bombing campaigns abroad, will also be equipped with anti-personnel weapons for use domestically. Drone manufacturers have confirmed that they can be equipped with automatic weapons, grenade launchers, rubber buckshot,[11] tear gas[12] and tasers. These devices will place a whole new spin on the aggressive police activities witnessed across the nation during the Occupy Wall Street protests in late 2011.[13]

Aside from the very serious and grave implications for privacy and civil liberties, there are also a number of safety issues involved with drone technology, with the paramount concern being that drones have a history of malfunctioning mid-air. As David Zucchino reported in the *Los Angeles Times*, "The U.S. military often portrays its drone aircraft as high-tech marvels that can be operated seamlessly from thousands of miles away. But Pentagon accident reports reveal that the pilotless aircraft suffer from frequent system failures, computer glitches and human error."[14]

There's also the problem of drones being hacked into and potentially hijacked. In 2009, it was discovered that Shiite insurgents had hacked into Predator drones with a software program that cost only $26 and gained access to video footage shot by American spy planes.[15] One can only imagine what a technically proficient hacker in America might be able to do with the wealth of information he could potentially access from these drones, not to mention what a terrorist could do with a fully armed remote-controlled guided missile, which is what drones really happen to be.

Clearly, the present rapid adoption of drone technology before properly vetting the safety, privacy, and civil liberties issues involved can only be a disaster for the American people. Moreover, the potential for abuse by government agents of drone technology is high. At the very least, if the use of these machines by local police agencies is not regulated immediately, the First and Fourth Amendment rights of Charlottesville residents *will* suffer.[16]

Many local police departments throughout the country, including in Florida,[17] California, and Washington,[18] have already begun implementing drone technology, often without regulation or oversight. In response, ten state legislatures are in the process of considering legal limitations on the use of drone technology within their borders.[19] By preemptively resolving to prevent local police agencies from spying on or harassing the residents of Charlottesville with drone technology, Charlottesville City Council will

demonstrate that it is ahead of the curve in protecting the basic rights of the citizens it has been elected to serve.

Without a doubt, drone technology poses serious risks to Americans. It is our hope that you will send a strong message that the people of Charlottesville will not stand idly by as their basic civil liberties are threatened by an ever growing surveillance state. It is imperative that you and the members of the Charlottesville City Council adopt this resolution, assuring the citizens of Charlottesville that you intend to secure their privacy, safety, and civil liberties against those who would jeopardize them for the sake of expedience, economy and security.

Sincerely yours,

John W. Whitehead
President

Suzi Lowell
Chief Clerk

Liz Clark
Senate Secretary

The following individuals are appointed to the Unmanned Aircraft Systems Legislative Task Force as identified in Legislative Resolve No. 17 (SCS CSHCR6(FIN)) on April 14, 2013.

1. Senator Donny Olson is appointed as "one senator selected by the president of the senate, who shall serve as co-chair;"
2. Representative Shelley Hughes is appointed as "one representative selected by the speaker of the house of representatives who shall serve as co-chair;" and

The following members are appointed jointly by the President of the Senate and the Speaker of the House of Representatives:

3. Joseph Masters, or the commissioner's designee, is appointed as "the commissioner of public safety;"
4. General Thomas Katkus, or the adjutant general's designee, is appointed as "the adjutant general of the Department of Military and Veterans' Affairs;"
5. Douglas Walker, or a designated member of the University of Alaska Fairbanks Center for Unmanned Aircraft Systems Integration;
6. Steve Colligan, a member of the Academy of Model Aeronautics; and
7. Patrick Kemp, Commissioner of the Department of Transportation and Public Facilities, or another member of the state Aviation Advisory Board.

Each member of the task force was selected by the legislature for their use of unmanned aircraft systems in Alaska airspace.

The duties of the task force include:

1. Reviewing regulations and guidance from the Federal Aviation Administration regarding unmanned aircraft systems;
2. Providing written recommendations, together with suggested legislation, for a comprehensive state policy for unmanned aircraft that protects privacy and allows the use of unmanned aircraft systems for public and private applications; and

3. Submitting not later than January 15, 2014, an initial report to the legislature and, not later than July 1, 2014, submitting a final report to the legislature.

The Legislative Task Force on Unmanned Aircraft Systems terminates on July 14, 2014.

Sincerely,

Senator Charlie Huggins
Senate President

Representative Mike Chenault
Speaker of the House

CC: Governor Sean Parnell
Heather Brakes, Legislative Director
Jason Hooley, Director Boards and Commissions
Patrick Kemp, Commissioner Department of Transportation and Public Facilities
Joseph Masters, Commissioner Department of Public Safety
Thomas Katkus, Adjutant General Department of Military and Veterans' Affairs
Douglas Walker, Director of Center for Unmanned Aircraft Systems and Integration, UAF
Steve Colligan, Representative member of the Academy of Model Aeronautics

STATE OF ALASKA
THE LEGISLATURE

2013

Source
SCS CSHCR 6(FIN)

Legislative Resolve No.
17

Recognizing the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks as a national leader in unmanned aircraft research and development; and relating to a Task Force on Unmanned Aircraft Systems.

BE IT RESOLVED BY THE LEGISLATURE OF THE STATE OF ALASKA:

WHEREAS the Unmanned Aircraft Systems Program at the University of Alaska Fairbanks has, since 2001, been designing payloads and upgrades for unmanned aircraft systems, testing and evaluating their safety and effectiveness, developing and demonstrating new uses for various potential users, working with the Federal Aviation Administration to make the use of unmanned aircraft systems safe, and developing technology to improve safety and is known across the nation for its leadership in advancing the state of the art and the safe use of unmanned aircraft systems; and

WHEREAS the importance of the program's work to the state was recently recognized by the Board of Regents of the University of Alaska when the regents established the Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks to continue research and development of unmanned aircraft systems for the benefit of the

state; and

WHEREAS the legislature recognizes the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks as the state's leader in unmanned aircraft systems research, meeting the goals of industry, the Federal Aviation Administration, and government operations; and

WHEREAS the legislature has provided significant financial support to the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks to further the center's research initiatives, and to increase its capabilities for use as a possible Federal Aviation Administration test site; and

WHEREAS the State of Alaska, the University of Alaska, the Alaska Aerospace Corporation, the Alaska Aviation Safety Project, and other public and private institutions have developed cooperation with the National Aeronautics and Space Administration, the Federal Aviation Administration, the United States Department of the Interior, the United States Department of Defense, and others to further advance the research, development, and use of technology to benefit and support Alaskans and Americans with the safe use of unmanned aircraft systems; and

WHEREAS Alaska state government and the state's business and research community continue to work with the Federal Aviation Administration to promote the establishment of safe unmanned aircraft system ranges onshore and offshore Alaska, which will help establish procedures for the safe operation of unmanned aircraft systems in the National Airspace System; and

WHEREAS the Alaska Center for Unmanned Aircraft Systems Integration, by virtue of being located in Alaska, has access to an area of geographic and climatic diversity where the air and surface population density is desirable for conducting research and development of unmanned aircraft systems; and

WHEREAS the state has the highest per capita use of general aviation activity in the nation, and Alaska aviation organizations have helped the Federal Aviation Administration develop the next generation of air traffic control for the nation and the world, while making major gains for the state's aviation safety in the process; and

WHEREAS unmanned aircraft systems may present a risk to privacy, but neither the Federal Aviation Administration nor any other state or federal agency currently has specific

statutory authority to regulate privacy matters relating to unmanned aircraft systems;

BE IT RESOLVED that the Alaska State Legislature recognizes the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks as a leader in aviation pioneering and further recognizes the significant benefit to the state and nation the center provides in research and development of unmanned aircraft systems; and be it

FURTHER RESOLVED that the Alaska State Legislature fully supports the efforts of the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks to become one of the nation's six test sites for unmanned aircraft systems testing and research; and be it

FURTHER RESOLVED by the Alaska State Legislature that the Task Force on Unmanned Aircraft Systems is created in the legislative branch and shall consist of seven members, who, except for the member from the senate and the member from the house of representatives, shall be appointed jointly by the president of the senate and the speaker of the house of representatives, as follows:

(1) one senator selected by the president of the senate, who shall serve as co-chair;

(2) one representative selected by the speaker of the house of representatives, who shall serve as co-chair;

(3) the commissioner of public safety or the commissioner's designee;

(4) the adjutant general of the Department of Military and Veterans' Affairs or the adjutant general's designee;

(5) a member representing the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks;

(6) a member of the Academy of Model Aeronautics;

(7) a member from the state Aviation Advisory Board; and be it

FURTHER RESOLVED that a vacancy on the task force shall be filled in the manner of the original appointment; and be it

FURTHER RESOLVED that the duties of the task force shall include

(1) reviewing regulations and guidance from the Federal Aviation Administration regarding unmanned aircraft systems;

(2) providing written recommendations, together with suggested legislation,

for a comprehensive state policy for unmanned aircraft that protects privacy and allows the use of unmanned aircraft systems for public and private applications; and

(3) submitting, not later than January 15, 2014, an initial report to the legislature and, not later than July 1, 2014, submitting a final report to the legislature; and be it

FURTHER RESOLVED that the task force may meet as frequently as necessary to carry out its responsibilities; and be it

FURTHER RESOLVED that the task force may meet during and between legislative sessions and may request administrative and technical support from the University of Alaska Fairbanks; and be it

FURTHER RESOLVED that the public members of the task force serve without compensation but are entitled to per diem and travel expenses authorized for boards and commissions under AS 39.20.180; and be it

FURTHER RESOLVED that the task force terminates on July 1, 2014.

07/24/13 Task Force Meeting: Minutes and Background Information

<TARGET><BILL></BILL><SUBJECT>07-24-13 Task Force Meeting Minutes and Background Information</SUBJECT><COMM>JUNM28</COMM></TARGET>

Unmanned Aircraft Systems Legislative Task Force

July 24, 2013

10:00am – 11:00am

Teleconference Call-In Number 855-463-5009

A G E N D A

Task Force Members:

- Representative Shelley Hughes, Co-Chair
- Senator Donny Olson, Co-Chair
- Greg Walker, Director for the Center for Unmanned Aircraft Systems Integration UAF
    - Ro Bailey, Assistant Director (alternate for Greg Walker)
- Lieutenant Steve Adams, Commissioner Designee, Department of Public Safety
- McHugh Pierre, Deputy Commissioner, Department of Military and Veterans' Affairs
- Alaska Aviation Safety Board, Department of Transportation and Public Facilities
- Steve Colligan, Representative Member for the Academy of Model Aeronautics

Meeting Agenda:

I. Welcome and Introductions — Representative Shelley Hughes
   a. Task Force responsibilities per HCR6
   b. Aerospace States Association, August 14, Washington DC
   c. National Conference of State Legislatures, August 15, Atlanta GA

II. Brief Overview of UAS Work and Use in Alaska — Greg Walker

III. Brief Overview of FAA UAS Work and Timeline — Michaela Goertzen, on behalf of Lt. Governor Treadwell

IV. Task Force Member Input and Expectations (5minutes each):
   a. How is your organization using UAS now and how would you like to use UAS in the future to further your mission?
   b. What policy guidelines or recommendations are currently in place that impact your business practice and the general public?
   c. What policy should the State of Alaska consider in legislation regarding the use of UAS in Alaska, including related to commercial use of UAS and to privacy concerns?

V. Task Force Timeline and Next Meeting Date/Time

VI. Adjournment

Unmanned Aircraft Systems Legislative Task Force

Summarized Minutes of the July 24, 2013 Teleconference

Task Force Members in Attendance:

- Representative Shelley Hughes, Co-Chair
- Ginger Blaisdell, Staff to Rep. Hughes
- David Scott, Staff to Senator Donny Olson, Co-Chair
- Greg Walker, Director for the Center for Unmanned Aircraft Systems Integration UAF
- Ro Bailey, Assistant Director (alternate for Greg Walker)
- Lieutenant Steve Adams, Commissioner Designee, Department of Public Safety
- McHugh Pierre, Deputy Commissioner, Department of Military and Veterans' Affairs
- Mark Greby, Alaska Aerospace Corporation, Senior VP and Chief Operating Officer
- Wyatt Rehder, Alaska Aerospace Corporation, Aerospace Engineer
- Steve Colligan, Representative Member for the Academy of Model Aeronautics

Guest Attendee:

- Michaela Goertzen, Staff to Lt. Governor Mead Treadwell

- Not in attendance: Alaska Aviation Safety Board, DOT/PF

Meeting Summary:

I. Welcome and Introductions — Representative Shelley Hughes

Task Force responsibilities per HCR6

The duties of the task force shall include (1) reviewing regulations and guidance from the Federal Aviation Administration regarding unmanned aircraft systems; (2) providing written recommendations, together with suggested legislation, for a comprehensive state policy for unmanned aircraft that protects privacy and allows the use of unmanned aircraft systems for public and private applications; and (3) submitting, not later than January 15, 2014, an initial report to the legislature and, not later than July 1, 2014, submitting a final report to the legislature.

Upcoming national meetings

- **Aerospace States Association, August 14, Washington DC**

The ASA meeting was originally scheduled to be a round table discussion on the draft model legislation that will be made available to all states. At their last meeting, it was determined that the draft was nearly complete and ASA membership did not feel the need for an additional round table discussion on the topic. ASA is still discussing the possibility of a meeting for those who intended to attend the August 14 meeting. The meeting will be held in conjunction with the AUVSI Symposium, attached link:

Association for Unmanned Vehicle Systems International
http://www.auvsishow.org/auvsi13/public/enter.aspx

- **National Conference of State Legislatures, August 15, Atlanta GA**

Representative Hughes was invited to be part of a panel to discuss and answer questions from any of the fifty United States, about unmanned aircraft systems policy for states. She will be part of a panel of university professors, aerospace specialists, and other legislators who have been successful in passing bills in their respective states.

II. Brief Overview of UAS Work and Use in Alaska — Greg Walker

The AUVSI Symposium will have dedicated sessions regarding privacy considerations. Ro (Bailey) and Greg will be at the Symposium and will report back on what they learn.

UAS integration in Alaska began in the late 1990's when University of Colorado and Georgia Tech completed research missions. The Coast Guard used UAS for marine awareness. In 2001 University of Alaska Fairbanks (UAF) contracted to fly UAS for specific missions and research and in 2007 began to acquire its own equipment.

UAF uses unmanned aircraft for military, law enforcement, science and industry missions. The missions have ranged from wildfire monitoring, oil spill monitoring, NASA sea ice research, wildlife mapping, fisheries, measuring methane from decaying permafrost, geothermal activities, and many more.

The number one private industry use is by oil companies monitoring for oil leaks, infrastructure mapping and monitoring. The second prominent industry use is the growth of new companies developing new technology for UAS integration that can be used in Alaska as well as other states and worldwide. The leading technology development is working on sense and avoid and monitoring other aircraft in flight.

Alaska is a prime candidate to be selected as one of the FAA test sites because the application requires opening the Arctic Ocean for UAS missions. UAF has completed more bona fide missions than probably all of the other states combined.

III. Brief Overview of FAA UAS Work and Timeline — Michaela Goertzen, on behalf of Lt. Governor Treadwell

The Modernization and Reform Act of 2012 is a federal mandate that requires the FAA to establish six test sites by December 30, 2013, and incorporate UAS into American airspace with privacy concerns addressed nationwide by September 30, 2015.

In an April meeting, stakeholders did not think privacy policy should fall on the FAA but in a justice agency. House Appropriations Committee asked the FAA to collaborate with other federal agencies to sort out the privacy issue(s).

IV. Task Force Member Input and Expectations (5 minutes each):
   a. How is your organization using UAS now and how would you like to use UAS in the future to further your mission?
   b. What policy guidelines or recommendations are currently in place that impact your business practice and the general public?
   c. What policy should the State of Alaska consider in legislation regarding the use of UAS in Alaska, including related to commercial use of UAS and to privacy concerns?

Representative Hughes

- Some of the highlights noted in other states' bills and other publications include:
  - Definition of unmanned aircraft
  - Parameters for law enforcement use
  - Moratoriums for certain applications.

Steve Colligan, Representing Academy of Model Aeronautics

- Steve plans on using model aviation to enhance his business in mapping and satellite image capturing.
- Concerns with commercial UAS application and model aviation use
- Key role with University and developing industry
- How to use UAS responsibly in airspace

McHugh Pierre, DMVA, Mark Greby and Wyatt Rehder, AK Aerospace Corporation (AAC)

- DMVA and AAC are service providers primarily using high altitude long endurance aircraft such as global hawks and predators. They lease some aircraft from the Airforce and are looking to purchase their own and lease out for missions.
- To have UAF licenced (certified) as a test range would be good
- AAC sees themselves as a responder to flight needs. NASA/military has plans to bring large aircraft to Alaska but not for private or research use yet.
- When asked about the use of the large aircraft, Mark responded that the BLM used the global hawk for wildfire management.

Representative Shelley Hughes

- This issue was brought to her attention to address privacy concerns.
- She is generally interested in UAS but does not have the technical background in the technology.
- Most of her awareness comes through the news.

- She is interested in industry potential.

Lieutenant Steve Adams, Department of Public Safety (DPS)

Steve oversees Search and Rescue, Amber Alert/Silver Alert, and Emergency Management for the DPS.

DPS is creating a small UAS program; keeping equipment in line-of-sight, land-based search and rescue, Amber and Silver Alert searches, mapping road accidents, mapping outdoor crime scenes, use in hostage situations to move personnel safely, natural disasters, and in incidences involving hazardous materials.

DPS has a partnership with UAF for using UAS. They operate with a strict operations procedures manual, and the IACP and ACLU policy manuals. There are fewer than ten law enforcement agencies in the states using UAS for law enforcement.

Alaska is unique and the use of UAS is significantly beneficial to life safety.

DPS is identifying a training program for a certification with FAA (COA – certificate of authorization – is about a year away)

Policy concerns include:

- Operators flying without COA
- FAA is only regulatory, not an enforcement agency
- Some enforcement is necessary
- How to manage inadvertent images/data

Mark Greby, Alaska Aerospace Corporation

Their work would be primarily for the scientific or commercial market.

- With regard to the question of "What to do with the data that is collected as "inadvertent information" – some inadvertent data will be collected as part of their work.
- Policy needs to be crafted to address different kinds of missions

Greg Walker and Ro Bailey, UAF Center for Unmanned Aircraft Systems Integration

UAF's experience with FAA policy so far is that it implements a significant barrier for use.
Policy should reflect:

- Necessary restrictions and no more
- Need to keep industry attracted to Alaska for business
- Alaska's operating policy needs to be simple and clear for all potential users
- Existing privacy laws are on the books
- Policy for this technology might exploit gaps in existing laws (peeping tom laws...)
- Don't create a barrier for industry.

David Scott, Staff to Senator Donny Olson

Senator Olson's concerns include safety and privacy

- How will UAS be integrated into airspace safely, given how much aircraft there is in Alaska
- Privacy – UAS vs. Manned Aircraft – what is existing policy for manned aircraft

V. Task Force Timeline and Next Meeting Date/Time

Ginger will send out current documents regarding laws passed by other states, ASA model legislation and other information on unmanned aircraft system integration.

Ginger will ask Lt. Governor's office for an invitation to members of this task force to attend the AUVSI Symposium and possible ASA meeting in August.

Ginger will gather existing privacy laws for distribution to the task force.

All task force members with information to be distributed to the group can send the documents to Ginger and she will distribute to the group.

A second teleconference meeting of the task force will be during the 1st or 2nd week of September.

October 24th will be the next meeting of the task force. It will occur immediately following the Alaska UAS Interest Group Conference on October 22 and 23 in Anchorage. The afternoon of October 24th, the task force will take public comment.

Adjournment

Pending State-Level UAS Legislation

State	Bill	Sponsor	Status	Last Action	Introduced	Purpose
Alabama	SB 317	Sens. Sanford and Beason	Introduced	3/12/2013	3/12/2013	Warrant Required; Exceptions: Counter Terrorism, Exigent Circumstances

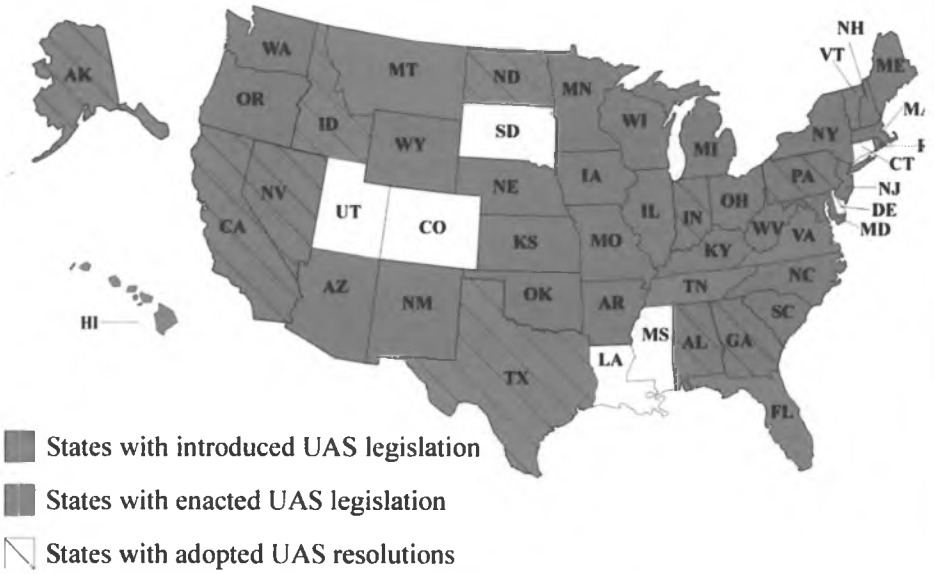
National Conference of State Legislatures
The Forum for America's Ideas

2013 ENACTMENTS FOR UNMANNED AIRCRAFT SYSTEM, UNMANNED AERIAL VEHICLE AND DRONE LEGISLATION

Unmanned aircraft systems (UAS), also commonly called unmanned aerial vehicles (UAV) or drones, have many applications for law enforcement, land surveillance, wildlife tracking, search and rescue operations, disaster response, border patrol and photography. In 2013, 43 states considered 115 bills and resolutions that address this emerging technology, considering privacy issues, the benefits of their use and their economic impact. As of July 17th, ten bills have been enacted in eight states, and thirteen resolutions have been adopted in ten states.



Defining UAS, UAV and Drones State enactments addressing this new technology identify them as either Unmanned Aircraft Systems, Unmanned Aerial Vehicles or Drones: 13 measures identify them as UAS, 5 as UAV and 3 as drones. Four of the enactments provide a detailed definition - Idaho SB 1134 (UAS), Montana SB 196 (UAV), Florida SB 92 (Drone) and Tennessee SB 796 (Drone). Common elements in the definitions include that it; is a powered aerial vehicle, does not carry a human operator, can fly autonomously or be piloted remotely and can be expendable or recoverable. Idaho's law specifically excludes model airplanes and rockets from their UAS definition, while Montana's UAV and Tennessee's drone definitions exclude satellites. Idaho also excludes UAS used in mapping and resource management from their definition.

Federal Aviation Administration The Federal Aviation Administration's (FAA) primary mission is to ensure the safety and efficiency of the nation's entire airspace. The FAA's current and future rules regarding UAS apply to all public and private entities that fly them in American airspace. When the FAA Modernization and Reform Act of 2012 became law, it charged the FAA with developing a plan for the safe integration of UAS into American airspace by 2015. As part of this process, the FAA will establish 6 UAS test ranges to study and provide answers for UAS related safety questions. Twenty four states have submitted applications to be one of the 6 test sites and 9 states have introduced measures that address the UAS integration process. A North Dakota law (SB 2018) grants $1,000,000 from the state general fund to pursue designation as a FAA unmanned aircraft systems test site. If selected, the law would grant an additional $4,000,000 to operate the test site. Four other states Alaska (HCR 6), Alabama (HR 381), Idaho (SCR 103) and Nevada (SCR 7) adopted measures that encourage partnerships between the FAA and their state for UAS testing.

UAS/Drone use by Law Enforcement This year 41 states considered how UAS/drone technology can be used by law enforcement within the parameters of the 4th Amendment. Tennessee's new law (SB 796) states that the use of a UAS/drone by law enforcement to gather information must comply with the Constitutions of the United States and Tennessee. The law also qualifies drone use as a search under the 4th Amendment.

In addition, warrants are now required for UAS/drone use by law enforcement in 5 states Florida (SB 92), Idaho (SB 1134), Montana (SB 196), Tennessee and Texas (HB 912). These new laws also include exceptions to the warrant requirement. For example, Montana allows law enforcement to use drones pursuant to any judicially recognized exception to the warrant requirement. Laws in Florida and Tennessee allow for UAS/drones to be used to counter a high risk terrorist attack or if swift action is needed to prevent imminent danger or loss of life. Texas's law provides a number of exceptions for their UAS warrant requirement, including use for investigating the scene of a human fatality, searching for a missing person and for conducting a high-risk tactical operation that poses a threat to human life.

Virginia law (HB 2012 and SB 1331) bans the use of UAS by state agencies with jurisdiction over criminal law enforcement or regulatory violations until July 1, 2015, but allows their use for certain situations including Amber Alerts, Blue Alerts, National Guard operations, higher education research and search and rescue operations.

Texas and Virginia laws also require agencies in their state to develop protocols for their use by law enforcement. In Texas it is the Department of Public Safety and in Virginia it is the Department of Criminal Justice Services in coordination with the Office of the Attorney General.

Data Collection and Retention States are considering and implementing reporting requirements for how UAS/drones are used by government agencies and for what information they can collect and retain. Texas's law (HB 912, HCR 217) now requires law enforcement agencies in communities with a population greater than 150,000, to report on their use of UAS every two years. The report must be issued to the governor, the lieutenant governor, each member of the legislature, be retained for public viewing and be made available on the law enforcement agency's website if they have one. Among other requirements, the report must include; the number of times an unmanned aircraft was used, the types of incidents it was used for, the justification for its use, the number of criminal investigations aided by its use, the dates and locations of its operation and the total cost of acquiring, maintaining, repairing, and operating or otherwise using each unmanned aircraft.

The legislatures in Illinois and Oregon have passed bills with reporting requirements; they are currently with their respective Governors.

Prohibition of Evidence Laws in Florida (SB 92) and Tennessee (SB 796) would prevent evidence from being entered in a criminal case if the information was collected by a UAS/drone outside of the scope of its statutorily or court granted authority. Similarly, Montana's law (SB 196) prevents information obtained from the operation of a UAV from being used in an affidavit of probable cause to obtain a search warrant. Sixty-six measures introduced by states this year considered evidence restrictions.

UAS/Drone use by the General Public So far in 2013, two states, Idaho (SB 1134) and Texas (HB 912) have enacted laws that address UAS/drone use by private entities. Idaho's law now states that no person, entity or state agency shall use a UAS to photograph or otherwise record an individual without their written consent for the purpose of publishing or disseminating a photograph or recording. Similarly, Texas created two new offenses, the illegal use of unmanned aircraft to capture an image and the possession, disclosure, display, distribution or use of such an image.

Economic Impact The Association for Unmanned Aircraft Systems International (AUVSI) released a report stating that through 2025, the UAS industry will create over 100,000 jobs and have an economic impact of $82 billion. Six states adopted resolutions – Alaska (HCR 6), California (SCR 16), Georgia, Idaho (SCR 103), North Dakota (HCR 3012) and Nevada (SCR 7) – noting the potential benefits for a thriving UAS industry on their economy. Georgia, for example, adopted three resolutions (HR 80, HR 81, SR 172) recognizing the aerospace industry in their state and applauding the collaborative efforts of the aerospace industry, academia, and state and local government to make Georgia a leader in the rapidly expanding unmanned aerial vehicles market.

Study Committees Adopted resolutions in Alaska (HCR 6) and Indiana (SR 27) create study committees or task forces to evaluate UAS/drone issues in their state. The Alaska resolution creates a legislative task force charged with reviewing FAA regulations and creating written recommendations and legislation that protects privacy while allowing UAS use for public and private applications. Indiana's adopted senate resolution urges their legislative council to establish an interim committee to study the use of UAV's with similar parameters as provided in Alaska.

SUBJECT: Legal issues related to unmanned aircraft systems

I. Introduction and background.

In your capacity as chair of the Aerospace States Association, you asked me to provide you with a brief description and analysis of the core legal issues related to the civilian use of Unmanned Aircraft Systems (UAS), also known as "drones." The context for your inquiry is the University of Alaska's pending application with the Federal Aviation Administration (FAA) to become one of a limited number of testing sites in the nation for UAS. Please note that this document is not legal opinion of the Office of the Attorney General, but rather simply a compendium of my research and a preliminary analysis.

UAS are unmanned aircraft designed to do tasks that are too difficult, dull, dangerous, or expensive for manned aviation, and are designed to carry a "system payload" such as a camera or sensor.[1] Traditionally, UAS have been used for military

---

[1] Association for Unmanned Vehicle Systems International ("AUVSI"), UAS Privacy Issues Document.

purposes, but they are being increasingly deployed in domestic civilian contexts such as law enforcement, disaster relief, fire-fighting, agriculture, energy, industry, wildlife tracking, and others.[2] Commercial use of UAS is currently prohibited, but that is expected to change by 2014.[3] UAS can range in size from smaller than a cell phone to larger than a commercial jetliner.[4] Research sponsored by the Association for Unmanned Vehicle Systems International (AUVSI), a non-profit trade association that supports the civilian use of UAS, concluded that the integration of UAS into the national airspace has the potential to create more than 100,000 new jobs and $82 billion of economic impact by 2025.[5]

The legal issues surrounding the civilian use of UAS relate mainly to privacy and property interests, and are relatively untested in the courts because of the novelty of the technology involved and the regulatory vacuum in which that technology operates. Fortunately, there has been significant legal scholarship as well as congressional reporting[6] in in this area, all of which I rely upon heavily in this memorandum. I have also reviewed all the materials Charles Huettner emailed me after our April 5th teleconference. Some limited case law also exists on the privacy concerns raised by aerial surveillance and similar technologies. These cases telegraph how the Supreme Court might view the privacy implications of UAS. Following is the requested description, summary, and analysis of the issues that have arisen and been analyzed by legal scholars to date. I also discuss the Alaska-specific implications of these issues, which are not discussed in any of the law reviews, journals, or reports.

II. Core legal issues raised by the use of UAS/drones.

The FAA oversees all aircraft operations in the United States and makes and

enforces rules to implement and interpret laws passed by Congress governing aviation.[7] Federal law enacted in February 2012 (The Federal Aviation Administration Modernization and Reform Act of 2012) requires the FAA to devise a comprehensive plan to integrate all civilian UAS into the national airspace system by September 30, 2015, appropriates billions of dollars in funding, and creates the six UAS test sites for which many states, including Alaska, are vying.[8]

The federal government is still struggling with the regulation of UAS, specifically, how to define these vehicles, how to clarify which—if any—existing regulations apply to them, how to craft future regulations to encompass vehicles not governed by existing regulations, and how to ensure that future regulations do not inadvertently regulate other industries such as model or hobby aircraft.[9] The FAA will need to identify technology (*e.g.* cameras and radar) that will obviate the need for regulations requiring pilots to "see and avoid" other aircraft, address appropriate training for UAS operators, devise proper procedures for when a UAS loses contact with an operator or is hacked, coordinate with other countries and agencies in adopting regulations, and ensure that there is sufficient wireless spectrum to accommodate the communication needs of these vehicles.[10] Presently, UAS operators engaged in both public aircraft operations and private operations are required to have special certifications from the FAA.[11]

There is no legislation yet governing UAS in Alaska, although there is model legislation that AUVSI is compiling, and according to news reports, at least one other state—Florida—has begun to legislate UAS. Two bills were introduced in Alaska last session that touch upon UAS: HB 159, "An Act relating to the admissibility of evidence acquired through the use of an unmanned aerial vehicle; establishing a crime for certain uses of unmanned aerial vehicles; and restricting the use of unmanned aerial vehicles for collection of information or investigation by peace officers and other government agents;" and HCR 6, "Recognizing the Alaska Center for Unmanned Aircraft Systems

11 Villasenor, *supra* note 2, at 471.

Integration at the University of Alaska Fairbanks as a national leader in unmanned aircraft research and development; and relating to a Task Force on Unmanned Aircraft Systems." Presumably, these bills could be revisited next session.

Any discussion of UAS legislation must also consider federal pre-emption and the interplay between state and federal law. Although aircraft safety, trade, and noise regulation is the established provenance of the federal government, states may still pass laws governing how aircraft are flown.[12] Both Alaska and federal law prohibit the reckless operation of aircraft, but Alaska could not enact privacy laws that would decrease or implicate in any way the safety of flight operations, such as laws governing aircraft speed or altitude.[13] From a pre-emption standpoint, the safest area for state legislation is in the realm of privacy laws aimed at non-government actors that address trespass, invasion of privacy, stalking, and harassment, because state power to legislate in this area is well-established.[14]

In short, there is both a mandate and pressing need to legislate and regulate UAS at both the state and federal level. However, the precise parameters and scope of that legislation and regulation remain nebulous at best.

III. Constitutional rights.

A. The Fourth Amendment.

Probably the biggest legal issue surrounding UAS is the implications of these devices for individual privacy rights. The Fourth Amendment to the United States Constitution guarantees to the people the right to be free from unreasonable search and seizure by the government.[15] The Alaska Constitution contains an analogous search and seizure provision, as well as an explicit clause guaranteeing to its citizens the right to privacy.[16] Because the FAA is primarily a regulating agency whose mandate is to ensure

14 *Id.*

15 *See* U.S. Const. amdt. IV.

16 Alaska Const. art. I, §§ 14 and 22. Note that these provisions bind only government actors—not private citizens.

the efficient and safe operation of U.S. airspace, questions have arisen whether this agency is really the appropriate entity to ensure that government actors using UAS are not violating these basic constitutional principles or whether constitutional privacy compliance should be spearheaded at the state or federal level by some other agency. It is clear, however, that no government actor may commit such violations.

The crucial inquiry for Fourth Amendment and state constitutional privacy purposes is whether a person has a reasonable expectation of privacy that society is prepared to recognize. One scholar notes that "[w]here a [UAS] captures images that could have been obtained from civilian aircraft traveling in a legally authorized manner, privacy claims are limited. Consumers lack a reasonable expectation of privacy with respect to areas already exposed to civilian over-flights."[17] However, novel imaging technologies such as thermal and infrared imaging could raise concerns. Indeed, as noted by another scholar who has examined the issue, "[t]he privacy issues raised by the potential ubiquity of [UAS] go beyond the current Fourth Amendment jurisprudence."[18] Indeed, "[t]here is no precedent that squarely addresses privacy implications of governmental use of a technology that allows essentially permanent, multi-dimensional, multi-sensory surveillance of citizens twenty-four hours a day."[19]

However, there has been some judicial guidance. *Katz v. U.S.*[20] was a landmark Fourth Amendment case in which the Supreme Court held for the first time that a Fourth Amendment violation could occur absent a physical intrusion—specifically, through a listening device the police had affixed to the outside of a public phone booth. This was the first "remote sensing" case, soon to be followed by a trilogy of key "aerial surveillance cases."

The "remote sensing" cases fall into two categories: "open fields" and "curtilage." Remote sensing in "open fields" does not implicate the Fourth Amendment because open

20 389 U.S. 347 (1967).

fields are areas of public and private property that "do not provide the setting for those intimate activities that the [Fourth] Amendment is intended to shelter from government surveillance or interference."[21] However, "curtilage" is a legal "penumbra" surrounding a home where the Fourth Amendment may be implicated.[22] Whether a given area constitutes "curtilage" depends on the proximity of the area to the home, whether the area is enclosed, the nature of the use to which the area is put, and the steps taken by the resident to protect the area from observation.[23] Although a person may have reasonable expectations of privacy in curtilage, remote sensing of curtilage "does not require law enforcement officers to shield their eyes when passing by a home on public thoroughfares."[24] The bottom line is that remote sensing will not implicate the Fourth Amendment "if it is done from a public vantage point where law enforcement officers can make open observations."[25]

The Supreme Court's "aerial surveillance" trilogy consists of *California v. Ciraolo*,[26] *Florida v. Riley*,[27] and *Dow Chemical Company v. U.S.*[28] All three cases were decided in the 1980s. Together, they stand for the proposition that aerial surveillance of any kind over private or commercial property from aircraft that are lawfully in navigable airspace is not a Fourth Amendment search, because there is no reasonable expectation of privacy in an area that is openly visible from above, regardless whether the area is curtilage or an open field.[29]

28 476 U.S. 227 (1986).

29 Vacek, *supra* note 18, at 682.

In *Ciraolo*, police flew a fixed-wing aircraft 1,000 feet over a defendant's backyard, the minimum safe altitude required by FAA regulations, and observed marijuana plants with the naked eye. The backyard was not visible due to an extensive fencing system, so the aerial search provided the basis for a search warrant and marijuana plants were found after a physical search. The Court held that a ground fence does not create an expectation of privacy to be free from aerial searches because routine flights exposed the backyard to public view.[30]

Riley reached the same holding when officers flew a helicopter 400 feet overhead to peer through openings in a greenhouse and determined marijuana was growing inside the defendant's fenced-in home. Again, the Court found that there was no reasonable expectation of privacy because helicopter flight in navigable airspace was a routine, expected occurrence.[31]

And in *Dow Chemical*, the Environmental Protection Agency, acting without a warrant, hired a private commercial pilot to fly over Dow's property to take aerial photos of suspected regulatory violations. The Court upheld this conduct because "such an industrial complex is more comparable to an open field and as such it is open to the view and observation of persons in aircraft lawfully in the public airspace."[32]

However, decades later in 2001, in *Kyllo v. United States*,[33] the Supreme Court reminded us that the Fourth Amendment protects people—not just places—from unreasonable searches and seizures. *Kyllo* involved law enforcement's warrantless use of thermal imaging to detect unusual amounts of heat radiating from the defendant's home, indicating the presence of marijuana. *Kyllo* held that this surveillance violated the Fourth Amendment because the technology was not in widespread use. Currently, *Kyllo* limits the ability of law enforcement to rely on infrared/thermal imaging technology, but because the Court's decision was directly linked to the prevalence of the technology, it's an open question whether the Court's limitation would persist if these technologies went into more "widespread use." As one scholar put it, "the test seems to turn on whether

---

31 488 U.S. at 450-51.

32 476 U.S. at 239.

33 553 U.S. 27 (2001).

Wal-Mart sells it or not."[34] Such a question would most likely be tested in a criminal context, where the prosecution seeks to admit evidence obtained through the use of these technologies.

Finally, just last year, in *United States v. Jones*,[35] the Supreme Court held that the installation of a GPS tracking device on a suspect's car for eight days constituted a search under the Fourth Amendment. Although *Jones* did not deal with aerial surveillance, the Court held that the placement of the device was a physical intrusion onto private property for the purposes of obtaining information, as well as the extended monitoring of a person in a public space, both of which constituted a Fourth Amendment "search." Some scholars have predicted that one potential result of *Jones* is that extended UAS surveillance could constitute a search within the meaning of the Fourth Amendment.[36]

It is clear from a review of the scholarship and the limited case law that the rate of advancement of these technologies often outpaces the ability of courts to rule upon the validity of their use under the Fourth Amendment. The overall conclusion so far is that aerial surveillance by any method, at a legal altitude, is constitutional if the technology is in general public use and does not trespass upon private property for extended periods of time. Still, the legal landscape has been characterized as "an aeronautical Wild West," and the current regulatory scheme as "inadequate to deal with the novel issues raised" by the use of UAS, particularly by law enforcement.[37]

In Alaska, we must consider an additional important factor: Article I, section 22 of the Alaska Constitution guarantees an explicit individual right to privacy. There is no state case law interpreting this clause (or any part of the state constitution) in the context of UAS. However, it is highly possible that the Alaska Supreme Court would interpret the right in favor of the individual asserting it as opposed to deferring to the government. For example, our Supreme Court has interpreted the privacy clause to create a constitutional right to privacy in garbage placed for collection, which contrasts with both state and

36 Kapnik, *supra* note 9, at 495.

37 Vacek, *supra* note 18, at 675-77.

federal case law on the Fourth Amendment.[38] The take-away point here is that government conduct that complies with the Fourth Amendment under either the state or federal constitution could *nonetheless* violate the state constitutional right to privacy. And in 2002, at least one member of the Alaska Court of Appeals, albeit in a concurring and unreported opinion, expressed constitutional skepticism at law enforcement's surreptitious use of infrared helicopter technology of the type prohibited under *Kyllo* the year before.[39]

B. The First Amendment & individual privacy.

In addition to the Fourth Amendment implications of government-operated UAS, these vehicles may also implicate the First Amendment rights of private citizens to collect and gather information. One scholar has recently addressed this issue, noting that for private entities and persons not bound by the Fourth Amendment, the key constitutional question is the extent of these persons' First Amendment right to access information.[40] The Supreme Court long ago held that the First Amendment protects the act of seeking out news, otherwise "freedom of the press could be eviscerated."[41] And at least one circuit court of appeals has recently held that the First Amendment permits a private citizen to record the actions of people in a public space.[42] Congress could potentially enact laws to protect individuals from intrusive UAS surveillance by private actors, which would be considered in a First Amendment context of the right to gather and receive information.[43] Such bills have been introduced, but none have yet been enacted.[44] Because the civilian use of UAS is nascent, and there is no controlling Supreme Court

44 *Id.*

case law, it remains to be seen how far First Amendment protections will extend in this area.

The privacy rights of individuals and businesses exist in perpetual tension with the First Amendment rights of non-government actors to gather information, and that tension could give rise to actionable claims for privacy violations. Common law invasions of privacy could occur if UAS use "intrudes upon seclusion" in the home or results in the "publication of private facts," which are the two main categories of invasion of privacy claims. Intrusion upon seclusion occurs where the intrusion was intentional and would be highly offensive to a reasonable person.[45] A publication of private facts claim could arise where a UAS takes images of private individuals involuntarily caught up in newsworthy events, and those images conveyed facts not previously known to the public.[46] Similarly, the use of UAS could potentially give rise to criminal liability under both federal and state anti-stalking and harassment laws.[47] Finally, UAS could be used by private citizens to investigate or monitor potential health and safety violations by businesses, or engage in corporate espionage. Such conduct raises complex and unanswered questions about a private citizen's right to do under the First Amendment what the government could not do under the Fourth.

In short, the above concepts are nothing new to the First Amendment and privacy arena, but they must and will be revisited in light of UAS enhanced imaging capabilities, ease of use, and ever-increasing availability. As discussed in detail above, the strong privacy protections of the Alaska Constitution make it highly likely that individual privacy rights implicated by UAS will be more zealously legislated and enforced in Alaska than in other jurisdictions.

C. Property rights, & tort liability; nuisance, trespass, & ground damage.

Property owners could potentially file tort claims for nuisance and/or trespass against operators of UAS. According to a preeminent torts treatise, a trespass claim against an aircraft operator is viable only when the aircraft "enters into the immediate reaches of the air space next to the land" and "interferes substantially with . . . the use and

---

45 Restatement (Second) of Torts § 625B (1977).

46 Villasenor, *supra* note 2, at 503.

47 *Id.* at 505.

enjoyment" of the property by the landowner."[48] The navigable airspace regulated by the FAA is considered a public highway, but it appears that anywhere between 50 to 150 feet above the property owner could be considered impermissible interference with private property.[49] Accordingly, UAS that operate within this window of airspace could potentially raise trespass claims, and UAS that generate noise, light, pollution, or vibration could lead to viable nuisance claims by homeowners.[50] Additional tort claims could arise if a UAS caused ground damage to personal or real property.

Title 2 of the Alaska Statutes is devoted entirely to the regulation and operation of aircraft ("Aeronautics"). Alaska Statute 02.30.030 provides that "A person may not operate an aircraft in the air or on the ground or water in a careless or reckless manner so as to endanger the property of another." This statute directs the court, when evaluating such claims, to consider "the standards for safe operation of aircraft prescribed by federal statutes or regulations governing aeronautics." The phrase "operate aircraft" is defined in AS 02.30.050 as "to use, navigate, pilot, or taxi an aircraft in the airspace over this state, or upon the land or water inside the state." This chapter does not contain a definition of "aircraft." However, "aircraft" is defined in the general provisions of Title 2 (Alaska Aeronautics Act of 1949) as "a contrivance used or designed for navigation of flight in the air,"[51] which could be read to include UAS, although this definition was enacted prior to the burgeoning use of civilian UAS. Accordingly, I am uncertain whether UAS would fit into the current statutory definition of "aircraft," and therefore I think it's an open question whether a court would find that the foregoing provisions regarding liability for aircraft operation would automatically apply to operation of UAS or whether additional statutory language would be necessary to expand that definition. My instinct is that UAS should be specifically legislated in this manner.

If Alaska chooses to enter this arena by passing laws or regulations, it is advisable for the legislature to also enact a statutory immunity provision. That way, the state may

---

49 Rapp, *supra* note 17, at 645 (citing *id.*). See also *United States v. Causby*, 328 U.S. 256 (1946) (rejecting the common law concept that a homeowner owns all the airspace above his property up to the heavens, but rather owns "at least that much space above the ground as he can occupy or use in connection with the land.").

50 *Id.*

51 AS 02.15.260(2).

avoid liability for damages in tort when two private UAS collide and fragments cause damage to people or property. Such immunity clauses are common and can deflect an argument that the state is liable simply because it has chosen to legislate in a particular topic area.[52]

D. Environmental concerns.

Scholars have observed the potential of UAS to generate environmental concerns, which could be starker in Alaska than elsewhere. Alaska is already a hotbed of environmental litigation. Many UAS contain batteries, circuitry, and chemicals that could leach into the ground, and the flight of UAS and the noise they cause could disrupt birds and other wildlife habitats.[53] Environmental groups and private citizens could potentially raise federal claims regarding the operation of UAS under the National Environmental Policy Act, the Endangered Species Act, or the Noise Control Act.[54]

In Alaska, to the extent UAS and the execution of implementing statutes interfere with state fish, wildlife, and waters, the government could be found in violation of the "common use" and "sustained yield" provisions of the Alaska Constitution, which provide, respectively, that the state, fish, wildlife and waters of the state are reserved to the people for their common use and that replenishable resources belonging to the state must be utilized, developed, and maintained according to the sustained yield principle.[55]

E. Communications interference.

UAS also have the potential to interfere with existing civilian communications systems used to operate cell phones, satellite TV signals, and other wireless and telecommunications technology.[56] Further, signal loss between UAS and its ground

---

54 *Id.*

55 Alaska Const. art. VIII, §§3, 4.

56 Rapp, *supra* note 17, at 640-41.

control operations could result in a mid-air collision or ground damage.[57] This problem could be somewhat mitigated by the assignation of UAS to specific frequencies once UAS are fully integrated into the national airspace, but the potential for interference still remains.[58]

Under state law, the Department of Transportation and Public Facilities is responsible for supervising, developing, and promoting "aeronautics and communications inside the state . . ."[59] The Department could be held responsible for ensuring, through properly adopted regulations and in conjunction with the federal government, that UAS do not unduly interfere with existing civilian communications systems in the state.

F. Mid-air collisions.

Finally, mid-air collisions of UAS with other aircraft and with each other are always a possibility. Most UAS lack the sophisticated collision avoidance systems required of many manned aircraft, and the absence of an on-board pilot who can physically observe other aircraft exacerbates the risk of a mid-air collision.[60] Furthermore, the "small size and radar profile of [UAS] create significant risk that such craft would damage civilian aircraft, causing both property loss and human casualties."[61]

As described above, individual citizens could file tort claims under state law for damages against operators of UAS or the government associated with such accidents. Collisions and near-collisions have already resulted from the use of UAS at the military level, and the scholarship predicts that "[i]t is hard to imagine widespread integration of [UAS] into populated airspace without some level of air-to-air accidents rising."[62]

62 *Id.*

IV. Conclusion.

There are many more questions than answers surrounding the increased civilian use and operation of UAS, because there is no case law that definitively resolves any of the issues discussed above, and there is a regulatory vacuum. Indeed, "[t]he only certain aspect of the debate about unmanned aircraft and privacy is that it will be contentious."[63] However, identifying and analyzing these issues at the executive level is the first step to crafting legislation that attempts to address them. Only when those laws are tested in the courts will we fully come to understand the interplay between the technological advantages offered by UAS, the reach of constitutional protections, and the scope of actionable legal claims.

www.crs.gov
R42940

CRS Report for Congress
Prepared for Members and Committees of Congress

Summary

Under the FAA Modernization and Reform Act of 2012, P.L. 112-95, Congress has tasked the Federal Aviation Administration (FAA) with integrating unmanned aircraft systems (UASs), sometimes referred to as unmanned aerial vehicles (UAVs) or drones, into the national airspace system by September 2015. Although the text of this act places safety as a predominant concern, it fails to address significant, and up to this point, largely unanswered legal questions.

For instance, several legal interests are implicated by drone flight over or near private property. Might such a flight constitute a trespass? A nuisance? If conducted by the government, a constitutional taking? In the past, the Latin maxim *cujus est solum ejus est usque ad coelum* (for whoever owns the soil owns to the heavens) was sufficient to resolve many of these types of questions, but the proliferation of air flight in the 20th century has made this proposition untenable. Instead, modern jurisprudence concerning air travel is significantly more nuanced, and often more confusing. Some courts have relied on the federal definition of "navigable airspace" to determine which flights could constitute a trespass. Others employ a nuisance theory to ask whether an overhead flight causes a substantial impairment of the use and enjoyment of one's property. Additionally, courts have struggled to determine when a government-operated overhead flight constitutes a taking under the Fifth and Fourteenth Amendments.

With the ability to house surveillance sensors such as high-powered cameras and thermal-imaging devices, some argue that drone surveillance poses a significant threat to the privacy of American citizens. Because the Fourth Amendment's prohibition against unreasonable searches and seizures applies only to acts by government officials, surveillance by private actors such as the paparazzi, a commercial enterprise, or one's neighbor is instead regulated, if at all, by state and federal statutes and judicial decisions. Yet, however strong this interest in privacy may be, there are instances where the public's First Amendment rights to *gather* and *receive* news might outweigh an individual's interest in being let alone.

Additionally, there are a host of related legal issues that may arise with this introduction of drones in U.S. skies. These include whether a property owner may protect his property from a trespassing drone; how stalking, harassment, and other criminal laws should be applied to acts committed with the use of drones; and to what extent federal aviation law could preempt future state law.

Because drone use will occur largely in federal airspace, Congress has the authority or can permit various federal agencies to set federal policy on drone use in American skies. This may include the appropriate level of individual privacy protection, the balancing of property interests with the economic needs of private entities, and the appropriate safety standards required.

Introduction

The integration of drones into U.S. skies is expected by many to yield significant commercial and societal benefits.[1] Drones could be employed to inspect pipelines, survey crops, and monitor the weather.[2] One newspaper has already used a drone to survey storm damage,[3] and real estate agents have used them to survey property.[4] In short, the extent of their potential domestic application is bound only by human ingenuity.

In an effort to accelerate this introduction, in the FAA Modernization and Reform Act of 2012, Congress tasked the Federal Aviation Administration (FAA) with safely integrating drones into the national airspace system by September 2015.[5] Likewise, sensing the opportunities that unmanned flight portend, lobbying groups and drone manufacturers have joined the chorus of those seeking a more rapid expansion of drones in the domestic market.[6]

Yet, the full-scale introduction of drones into U.S. skies will inevitably generate a host of legal issues. This report will explore some of those issues. To begin, this report will describe the regulatory framework for permitting the use of unmanned vehicles and the potential rulemaking that will occur over the next few years. Next, it will discuss theories of takings and property torts as they relate to drone flights over or near private property. It will then discuss the privacy interests implicated by drone surveillance conducted by private actors and the potential countervailing First Amendment rights to gather and receive news. Finally, this report will explore possible congressional responses to these privacy concerns, discuss how the FAA has approached these concerns, and identify additional potential legal issues.

Development of Aviation Law and Regulations

The predominant theory of airspace rights applied before the advent of aviation derived from the Roman Law maxim *cujus est solum ejus est usque ad coelum*, meaning whoever owns the land

---

[1] A "drone" is simply an aircraft that can fly without a human operator. They are sometimes referred to as unmanned aerial vehicles (UAV), and the whole system—including the aircraft, the operator on the ground, and the digital network required to fly the aircraft—is referred to as an unmanned aircraft system (UAS). *See generally* CRS Report R42718, *Pilotless Drones: Background and Considerations for Congress Regarding Unmanned Aircraft Operations in the National Airspace System*, by Bart Elias.

possesses all the space above the land extending upwards into the heavens.[7] This maxim was adopted into English common law and eventually made its way into American common law.[8] At the advent of commercial aviation, Congress enacted the Air Commerce Act of 1926[9] and later the 1938 Civil Aeronautics Act.[10] These laws included provisions stating that "to the exclusion of all foreign nations, [the United States has] complete sovereignty of the airspace" over the country.[11] Additionally, Congress declared a "public right of freedom of transit in air commerce through the navigable airspace of the United States."[12] This right to travel in navigable airspace came into conflict with the common law idea that each landowner owned the airspace above the surface in perpetuity. If the common law idea was to be followed faithfully, there could be no right to travel in navigable airspace without constantly trespassing in private property owners' airspace. This conflict was directly addressed by the Supreme Court in *United States v. Causby*, discussed extensively below.

With the passage of the Federal Aviation Act in 1958,[13] the administrator of the FAA was given "full responsibility and authority for the advancement and promulgation of civil aeronautics generally.... "[14] This centralization of responsibility and creation of a uniform set of rules recognized that "aviation is unique among transportation industries in its relation to the federal government—it is the only one whose operations are conducted almost wholly within federal jurisdiction.... "[15] The FAA continues to set uniform rules for the operation of aircraft in the national airspace. In the FAA Modernization and Reform Act of 2012 (FMRA), Congress instructed the FAA to "develop a comprehensive plan to safely accelerate the integration of civil unmanned aircraft systems into the national airspace system."[16] These regulations must provide for this integration "as soon as practicable, but not later than September 30, 2015."[17]

Current FAA Regulations of Navigable Airspace

Fixed-Wing Aircraft

FAA regulations define the minimum safe operating altitudes for different kinds of aircraft. Generally, outside of takeoff and landing, fixed-wing aircraft must be operated at an altitude that allows the aircraft to conduct an emergency landing "without undue hazard to persons or property on the surface."[18] In a congested area, the aircraft must operate at least "1,000 feet above the highest obstacle within a horizontal radius of 2,000 feet of the aircraft."[19] The minimum safe

operating altitude over non-congested areas is "500 feet above the surface."[20] Over open water or sparsely populated areas, aircraft "may not be operated closer than 500 feet to any person, vessel, vehicle, or structure."[21] Navigable airspace is defined in statute as the airspace above the minimum safe operating altitudes, including airspace needed for safe takeoff and landing.[22]

Helicopters

While a fixed-wing aircraft is subject to specific minimum safe operating altitudes based on where it is flying, regulation of helicopter minimum altitudes is less rigid. According to FAA regulations, a helicopter may fly below the minimum safe altitudes prescribed for fixed-wing aircraft if it is operated "without hazard to person or property on the surface."[23] Therefore, arguably a helicopter may be lawfully operated outside the zone defined in statute as navigable airspace.[24]

Drones

The FAA does not currently regulate safe minimum operating altitudes for drones as it does for other kinds of aircraft. Defining navigable airspace for drone operation may be one way that the FAA responds to Congress's instruction, in FMRA, to write rules integrating civil drones into the national airspace, which is discussed in more detail below.[25] One possibility is for the FAA to create different classes of drones based on their size and capabilities. Larger drones that physically resemble fixed-wing aircraft could be subject to similar safe minimum operating altitude requirements whereas smaller drones could be regulated similar to helicopters.

Current FAA Regulation of Drones

In 2007, the FAA issued a policy notice stating that "no person may operate a UAS in the National Airspace without specific authority."[26] Therefore, currently all drone operators who do not fall within the recreational use exemption discussed below must apply directly to the FAA for permission to fly.[27]

Public and Civil Operators

Drones operated by federal, state, or local agencies must obtain a certificate of authorization or waiver (COA) from the FAA.[28] After receiving COA applications, the FAA conducts a comprehensive operational and technical review of the drone and can place limits on its operation in order to ensure its safe use in airspace.[29] In response to a directive in FMRA, the FAA recently streamlined the process for obtaining COAs, making it easier to apply on their website.[30] It also employs expedited procedures allowing grants for temporary COAs if needed for time-sensitive missions.[31]

Civil operators, or private commercial operators, must receive a special airworthiness certificate in the experimental category in order to operate.[32] These certificates have been issued on a limited basis for flight tests, demonstrations, and training. Presently, there is no other method of obtaining FAA approval to fly drones for commercial purposes. It appears these restrictions will be loosened in the coming years, since the FAA has been instructed to issue a rulemaking that will lead to the phased-in integration of civilian unmanned aircraft into national airspace.[33]

Recreational Users

The FAA encourages recreational users of model aircraft, which certain types of drones could fall under, to follow a 1981 advisory circular.[34] Under the circular, users are instructed to fly a sufficient distance from populated areas and away from noise-sensitive areas like parks, schools, hospitals, or churches. Additionally, users should not fly in the vicinity of full-scale aircraft or more than 400 feet above the surface. When flying within three miles of an airport, users should notify the air traffic control tower, airport operator, or flight service station. Compliance with these guidelines is voluntary.

Future FAA Regulation of Drones

FMRA instructs the FAA to integrate civil unmanned aircraft systems into the national airspace by the end of FY2015 and implement new standards for public drone operators. This law included provisions describing the comprehensive plan and rulemaking the agency must create to address different aspects of integrating civil drones, restricting the FAA's ability to regulate "model aircraft," and requiring the creation of drone test sites.

Civil Operators

The statute instructs the FAA to create a "comprehensive plan to safely accelerate the integration of civil unmanned aircraft systems into the national airspace"[35] and submit the plan to Congress within one year of enactment.[36] The statute contains a non-exhaustive list of elements that the plan must address, including predictions on how future rulemaking will address the certification process for drones; drone sense and avoid capabilities; and establishing operator or pilot standards, including a licensing and registration system.[37] The plan must also include a timeline for a phased-in approach to integration and ways to ensure the safe operation of civil drones with publicly operated drones in the airspace.[38] The FAA has not yet submitted this comprehensive plan to Congress.

FMRA also directs the FAA to promulgate a series of rules, including rules governing the civil operation of small drones in the national airspace and rules implementing the comprehensive plan described above.[39] Additionally, the FAA must update its 2007 policy statement that established the current scheme of drone authorizations.[40]

Public Operators

As noted above, the FAA has already implemented a streamlined process for public operators to obtain COAs.[41] In addition to this streamlining, FMRA instructs the FAA to "develop and implement operations and certification requirements for the operation of public unmanned aircraft systems in the national airspace."[42] Similar to the provisions governing civil users, these standards must be in place by the end of 2015.

Recreational Users

In FMRA, the FAA was prohibited from promulgating rules regarding certain kinds of model aircraft flown for hobby or recreational use.[43] This prohibition applies if the model aircraft is less than 55 pounds, does not interfere with any manned aircraft, and is flown in accordance with a community-based set of safety guidelines.[44] Additionally, the aircraft must be flown within the line of sight of the operator and be used solely for hobby or recreational purposes.[45] If flown within five miles of an airport, the operator of the model aircraft must notify both the airport operator and air traffic control tower.[46] While the FAA is prohibited from writing rules or

regulations governing these aircraft, it is not prohibited from pursuing enforcement actions "against persons operating model aircraft who endanger the safety of the national airspace system."[47]

Test Ranges

As part of its efforts to integrate drones into the national airspace, FMRA also directed the FAA to establish six test ranges that will serve as integration pilot projects.[48] As part of the test range program, the FAA must designate airspace for the operation of both manned and unmanned flights, develop certification and air traffic standards for drones at the test ranges, and coordinate with both NASA and the Department of Defense during development. The test ranges should address both civil and public drone operations.[49]

In February 2013, the FAA published a notice in the Federal Register announcing the process for selection of the sites.[50] In its words, "The overall purpose of this test site program is to develop a body of data and operational experiences to inform integration and the safe operation of these aircraft in the National Airspace System."[51] As directed in the statute, factors for site selection include geographic and climactic diversity and a consideration of the location of the ground infrastructure needed to support the sites.[52] Additionally, in the notice the FAA announced privacy requirements that will be applicable to operations at test sites. These provisions are discussed in more detail below.[53]

The FAA received 50 applications spread across 37 states and is in the process of making its test range site selections.[54]

Airspace and Property Rights

Since the popularization of aviation, courts have had to balance the need for unobstructed air travel and commerce with the rights of private property owners. The foundational case in explaining airspace ownership rights is *United States v. Causby*.[55]

United States v. Causby

In *United States v. Causby*, the Supreme Court directly confronted the question of who owns the airspace above private property.[56] The plaintiffs filed suit against the U.S. government arguing

that flights of military planes over their property constituted a violation of the Fifth Amendment Takings Clause, which states that private property shall not "be taken for public use, without just compensation." Generally, takings suits can only be filed against the government when a government actor, as opposed to a private party, causes the alleged harm.[57]

Causby owned a chicken farm outside of Greensboro, North Carolina, that was located near an airport regularly used by the military. The proximity of the airport and the configuration of the farm's structures led the military planes to pass over the property at 83 feet above the surface, which was only 67 feet above the house, 63 feet above the barn, and 18 feet above the tallest tree.[58] While this take-off and landing pattern was conducted according to the Civil Aeronautics Authority guidelines, the planes caused "startling" noises and bright glare at night.

As the Court explained, "as a result of the noise, respondents had to give up their chicken business. As many as six to ten of their chickens were killed in one day by flying into the walls from fright. The total chickens lost in this manner was about 150.... The result was the destruction of the use of the property as a commercial chicken farm."[59] The Court had to determine whether this loss of property constituted a taking without just compensation.

At the outset, the Court directly rejected the common law conception of airspace ownership: "It is ancient doctrine that at common law ownership of the land extended to the periphery of the universe—*Cujus solum ejus est usque ad coelum.* But that doctrine has no place in the modern world."[60] The Court noted that Congress had previously declared a public right of transit in air commerce in navigable airspace and national sovereignty in the airspace.[61] These statutes could not be reconciled with the common law doctrine without subjecting aircraft operators to countless trespass suits. In the Court's words, "common sense revolts at the idea."[62]

Even though it rejected the idea that the Causbys held complete ownership of the air up to the heavens, the Court still had to determine if they owned any portion of the space in which the planes flew such that a takings could occur. The government argued that flights within navigable airspace that do not physically invade the surface cannot lead to a taking. It also argued that the landowner does not own any airspace adjacent to the surface "which he has not subjected to possession by the erection of structures or other occupancy."[63]

The Court did not adopt this reasoning, finding instead that "the landowner owns at least as much space above the ground as he can occupy or use in connection with the land. The fact that he does not occupy it in a physical sense—by the erection of building and the like—is not material."[64] Therefore, it found that the landowner owns the airspace in the immediate reaches of the surface necessary to use and enjoy the land and invasions of this space "are in the same category as

[57] Takings claims filed against state government actors would not be filed under the Fifth Amendment. Rather, they would arise as state constitutional claims. For more information on takings, *see* CRS Report RS20741, *The Constitutional Law of Property Rights "Takings": An Introduction*, by Robert Meltz.

invasions of the surface."[65] Above these immediate reaches, the airspace is part of the public domain, but the Court declined to draw a clear line. The Court also noted that the government's argument regarding the impossibility of a taking based on flights in navigable airspace was inapplicable in this case because the flights over Causby's land were not within navigable airspace.[66] At the time, federal law defined navigable airspace as the space above the minimum safe flying altitudes for specific areas, but did not include the space needed to take off and land. Even though these flights were not within navigable airspace, the Court seemed to suggest that if they were, the inquiry would not immediately end. Instead, the Court would then have to determine if the regulation itself, defining the navigable airspace, was valid.[67]

Ultimately, in the context of a taking claim, the Court concluded that "flights over private land are not a taking, unless they are so low and so frequent to be a direct and immediate interference with the enjoyment and use of the land."[68] With regard to the Causbys' chicken farm, the Court concluded that the military flights had imposed a servitude upon the land, similar to an easement, based on the interference with the use and enjoyment of their property. Although the land did not lose all its economic value, the lower court's findings clearly established the flights led directly to a diminution in the value of the property, since it could no longer be used for its primary purpose as a chicken farm.

Post-*Causby* Theories of Airspace Ownership

Causby clearly abandoned the ancient idea that private landowners each owned their vertical slice of the airspace above the surface in perpetuity as incompatible with modern life. The case set up three factors to examine in a takings claim that courts still utilize today: (1) whether the planes flew directly over the plaintiff's land; (2) the altitude and frequency of the flights; and (3) whether the flights directly and immediately interfered with the plaintiff's use and enjoyment of the surface land.[69]

However, it left many questions unanswered. Where is the dividing line between the "immediate reaches" of the surface and public domain airspace? Can navigable airspace intersect with the "immediate reaches" belonging to the private property? Can aircraft flying wholly within navigable airspace, as defined by federal law, ever lead to a successful takings claim? How does one assess claims based on lawfully operated aircraft, such as helicopters, flying below navigable airspace?

Subsequent cases have been brought using many different legal claims, including trespass and nuisance, as discussed below, and various ways of describing the resulting injury. Claims could include an "inverse condemnation," another way of describing a taking, or the establishment of an avigation, air, or flying easement. While these legal claims may have different names, it appears

[65] *Id.* at 265.

[66] *Id.* at 264.

[67] *Id.* at 263.

[68] *Id.* at 266.

[69] *See e.g.*, Andrews v. United States, 2012 U.S. Claims LEXIS 1644, *10 (explaining that the "The United States Court of Appeals for the Federal Circuit (Federal Circuit) has derived from Causby three factors for consideration 'in determining whether noise and other effects from overflights ... constitute a taking.... '"). *But see* Argent v. United States, 124 F.3d 1277, 1284 (Fed. Cir. 1997) (finding a taking claim may be based on "a peculiarly burdensome pattern of activity, including both intrusive and non-intrusive flights").

that courts use *Causby* as the starting point for analyzing all property-based challenges to intrusions upon airspace. Several different interpretations of *Causby* have emerged in the attempt to articulate an airspace ownership standard, a few of which are described here.

Following *Causby*, several lower courts employed a fixed-height theory and interpreted the decision as creating two distinct categories of airspace. On the one hand, the stratum of airspace that was defined in federal law as "navigable airspace" was always a part of the public domain. Therefore, flights in this navigable airspace could not lead to a successful property-right based action like a takings or trespass claim because the property owner never owned the airspace in the public domain. On the other hand, the airspace below what is defined as navigable airspace could be "owned" by the surface owner and, therefore, intrusions upon it could lead to a successful takings or property tort claim. Since this fixed-height theory of airspace ownership relies heavily on the definition of navigable airspace, the expansion of the federal definition of "navigable airspace" to include the airspace needed to take-off and land[70] greatly impacts what airspace a property owner could claim.

This strict separation between navigable airspace and the airspace a landowner can claim seems to have been disavowed by the Supreme Court. First, in dicta in *Braniff Airways v. Nebraska State Board of Equalization & Assessment*,[71] a case primarily dealing with the question of federal preemption of state airline regulations, the Court left open the possibility of a taking based on flights occurring in navigable airspace. It summarized *Causby* as holding "that the owner of land might recover for a taking by national use of navigable air space resulting in destruction in whole or in part of the usefulness of the land property."[72] Next, in *Griggs v. Allegheny County* the Supreme Court found that the low flight of planes over the plaintiff's property, taking off from and landing at a nearby airport's newly constructed runway, constituted a taking that had to be compensated under the Fifth Amendment.[73] The noise and fear of a plane crash caused by the low overhead flights made the property "'undesirable and unbearable'" for residential use, making it impossible for people in the house to converse or sleep.[74] The Court reached this conclusion that a taking occurred based on this injury, despite the fact that the flights were operated properly under federal regulations and never flew outside of navigable airspace.[75] Despite this holding, some lower courts have continued to lend credence to a fixed-height ownership theory as a reasonable interpretation of *Causby*.[76]

Another interpretation of *Causby* essentially creates a presumption of a non-taking when overhead flights occur in navigable airspace. This presumption would recognize the importance of unimpeded travel of air commerce and that Congress placed navigable airspace in the public domain. However, the presumption could be rebutted by evidence that the flights, while in navigable airspace, interfered with the owner's use and enjoyment of the surface enough to justify compensation. As one court reasoned, "as the height of the overflight increases... the Government's interest in maintaining sovereignty becomes weightier while the landowner's

[76] *See, e.g.*, Aaron v. United States, 311 F.2d 798 (Ct. Cl. 1963); Powell v. United States, 1 Cl. Ct. 669 (1983).

interest diminishes, so that the damage showing required increases in a continuum toward showing absolute destruction of all uses of the property."[77]

Finally, some courts have concluded that the altitude of the overhead flight has no determinative impact on whether a taking has occurred. One federal court noted that the government's liability for a taking is not impacted "merely because the flights of Government aircraft are in what Congress has declared to be navigable airspace and subject to its regulation."[78] Under this approach, "although the navigable airspace has been declared to be in the public domain, 'regardless of any congressional limitations, the land owner, as an incident to his ownership, has a claim to the superjacent airspace to the extent that a reasonable use of his land involves such space.'"[79] Under this theory, the court would only need to examine the effect of the overhead flights on the use and enjoyment of the land, and would not need to determine if the flight occurred in navigable airspace.

While the definition of navigable airspace impacts each theory differently, it is clear that under each interpretation a showing of interference with the use and enjoyment of property is required. Cases have clearly established that overhead flights leading to impairment of the owner's livelihood or that cause physical damage qualify as an interference with use and enjoyment of property.[80] Additionally, flights that cause the surface to become impractical for its intended use by the current owner also satisfy the use and enjoyment requirement.[81] For example, in *Griggs*, the noise, vibration, and fear of damage caused by overhead flights made it impossible for the plaintiffs to converse with others or sleep within their house, leading to their retreat from the property, which had become "undesirable and unbearable for their residential use."[82] Some courts have recognized a reduction in the potential resale value of the property as an interference with its use and enjoyment, even if the property continues to be suitable for the purposes for which it is currently used.[83] One court explained: "Enjoyment of property at common law contemplated the entire bundle of rights and privileges that attached to the ownership of land.... Owners of fee simple estates ... clearly enjoy not only the right to put their land to a particular present use, but also to hold the land for investment and appreciation.... "[84] However, other courts have rejected the idea that restrictions on uses by future inhabitants, without showing loss of property value, are relevant to a determination of the owner's own use and enjoyment of the property.[85]

Trespass and Nuisance Claims Against Private Actors

Although *Causby* arose from a Fifth Amendment takings claim, its articulation of airspace ownership standards is also often used in determining state law tort claims such as trespass and nuisance. These state law tort claims could be used to establish liability for overhead flights

operated by private actors, where a lack of government involvement precludes a takings claim. Generally, the tort of trespass is any physical intrusion upon property owned by another. However, unlike with surface trespass claims, simply proving that an object or person was physically present in the airspace vertically above the landowner's property is generally not enough to establish a trespass in airspace. Since *Causby* struck down the common law idea of *ad coelum*, landowners generally do not have an absolute possessory right to the airspace above the surface into perpetuity. Instead, airspace trespass claims are often assessed using the same requirements laid out in the *Causby* takings claim. Arguably, these standards are used in property tort claims because there can be no trespass in airspace unless the property owner has some possessory right to the airspace, which was the same question at issue in *Causby*.

To allege an actionable trespass to airspace, the property owner must not only prove that the interference occurred within the immediate reaches of the land, or the airspace that the owner can possess under *Causby*, but also that its presence interferes with the actual use of his land. As one court explained, "a property owner owns only as much air space above his property as he can practicable use. And to constitute an actionable trespass, an intrusion has to be such as to subtract from the owner's use of the property."[86] This standard for airspace trespass was also adopted by the Restatement (Second) of Torts.[87]

Nuisance is a state law tort claim that is not based on possessory rights to property, like trespass, but is rooted in the right to use and enjoy land.[88] Trespass and nuisance claims arising from airspace use are quite similar, since trespass to airspace claims generally require a showing that the object in airspace interfered with use and enjoyment of land. However, unlike trespass, nuisance claims do not require a showing that the interference actually occupied the owner's airspace. Instead, a nuisance claim can succeed even if the interference flew over adjoining lands and never directly over the plaintiff's land, as long as the flight constitutes a substantial and unreasonable interference with the use and enjoyment of the land.

Potential Liability Arising from Civilian Drone Use

The integration of drones into domestic airspace will raise novel questions of how to apply existing airspace ownership law to this new technology. How courts may apply the various interpretations of *Causby*, discussed above, to drones will likely be greatly impacted by the FAA's definition of navigable airspace for drones.

The potential for successful takings, trespass, or nuisance claims from drone use will also be impacted by the physical characteristics of the drone, especially given that current case law heavily emphasizes the impact of the flight on use and enjoyment of the surface property. Several characteristics of drones may make their operation in airspace less likely to lead to liability for drone operators than for aircraft operators. First, the noise attributed to drone use may be significantly less than noise created by helicopters or planes powered by jet engines. Second, drones commonly used for civilian purposes could be much smaller than common aircraft used today. This decreased size is likely to lead to fewer physical impacts upon surface land such as

[86] Geller v. Brownstone Condominium, 82 Ill. App. 3d 334, 336-37 (1980).

[87] RESTATEMENT (SECOND) OF TORTS §159(2) (1965) (stating that "Flights by aircraft in the airspace above the land of another is a trespass if, but only if, (a) it enters into the immediate reaches of the airspace next to the land, and (b) it interferes substantially with the other's use and enjoyment of the land.").

[88] RESTATEMENT (SECOND) OF TORTS §821D (1979); 2 DAN B DOBBS ET AL., THE LAW OF TORTS §398 (2d ed. 2011).

vibration and dust, which are common complaints arising from overhead aircraft and helicopter flights. Finally, it is unknown at this time how most drones will be deployed into flight. Will drone "airports" be used to launch the aircraft or will they take off and land primarily from individual property? If drone use remains decentralized and is not organized around an "airport," then drones are less likely to fly repeatedly over the same piece of property, creating fewer potential takings, trespass, or nuisance claims. Additionally, the majority of drones are more likely to operate like helicopters, taking off and landing vertically, than like traditional fixed-wing aircraft. This method of takeoff reduces the amount of surface the aircraft would have to fly over before reaching its desired flying altitude, minimizing the potential number of property owners alleging physical invasion of the immediate reaches of their surface property.

Alternatively, the potential ability for drones to fly safely at much lower altitudes than fixed-wing aircraft or helicopters could lead to a larger number of property-based claims. Low-flying drones are more likely to invade the immediate reaches of the surface property, thus satisfying part of the requirement for a takings or trespass claim.

Privacy

Perhaps the most contentious issue concerning the introduction of drones into U.S. airspace is the threat that this technology will be used to spy on American citizens. With the ability to house high-powered cameras, infrared sensors, facial recognition technology, and license plate readers, some argue that drones present a substantial privacy risk.[89] Undoubtedly, the government's use of drones for domestic surveillance operations implicates the Fourth Amendment and other applicable laws.[90] In like manner, privacy advocates have warned that private actors might use drones in a way that could infringe upon fundamental privacy rights.[91] This section will focus on the privacy issues associated with the use of drones by private, non-governmental actors. It will provide a general history of privacy law in the United States and survey the various privacy torts, including intrusion upon seclusion, the privacy tort most applicable to drone surveillance. It will then explore the First Amendment right to gather news. Application of these theories to drone surveillance will be discussed in the section titled "Congressional Response."

> Drones are already flying in U.S. airspace – with thousands more to come – but with no privacy protections or transparency measures in place. We are entering a brave new world, and just because a company soon will be able to register a drone license shouldn't mean that company can turn it into a cash register by selling consumer information. Currently, there are no privacy protections or guidelines and no way for the public to know who is flying drones, where, and why. The time to implement privacy protections is now.

Id.

Early Privacy Jurisprudence

Although early Anglo-Saxon law lacked express privacy protections, property law and trespass theories served as proxy for the protection of individual privacy. Lord Coke pronounced in 1605 that "the house of everyone is to him as his castle and fortress, as well for his defence against injury and violence, as for his respose[.]"[92] This proposition that individuals are entitled to privacy while in their homes crossed the Atlantic with the colonists and appeared prominently in early revolutionary thinking.[93] In one early American common law decision, the court noted that "[t]he law is clearly settled, that an officer cannot justify the breaking open an outward door or window, in order to execute process in a civil suit; if he doth, he is a trespasser."[94] In cases lacking physical trespass, prosecutors relied on an eavesdropping theory, which protected the privacy of individuals' conversations while in their home.[95]

These century-old theories of trespass and eavesdropping, however, failed to keep up with a rapidly changing society fueled by advancing technologies. As with today's celebrity-obsessed society, late-19th century society experienced the birth and spread of "yellow journalism," a new media aimed at emphasizing the "curious, dramatic, and unusual, providing readers a 'palliative of sin, sex, and violence.'"[96] Faster presses and instantaneous photography enabled journalists to exploit and spread gossip.[97] Louis D. Brandeis (then a private attorney) and Samuel Warren were bothered with the press's constant intrusions into the private affairs of prominent Bostonians.[98] In 1890, they published a seminal law review article formulating a new legal theory—the right to be let alone.[99] Brandeis and Warren understood that existing tort doctrines such as trespass and libel were insufficient to protect privacy rights, as "only a part of the pain, pleasure, and profit of life lay in physical things."[100] They noted that this new right to privacy derived not from "the principle of private property, but that of an inviolate personality."[101] The authors observed that "instantaneous photographs and newspaper enterprise have invaded the sacred precincts of private and domestic life; and numerous mechanical devices threaten to make good the prediction that 'what is whispered in the closet shall be proclaimed from the house-tops.'"[102] Although this new theory had its detractors,[103] it found its way into the common law of several states.[104]

Privacy Torts

In 1939, the First Restatement of Torts (a set of model rules intended for adoption by the states) created a general tort for invasion of privacy.[105] By 1940, a minority of states had adopted some right of privacy either by statute or judicial decision, and six states had expressly refused to adopt such a right.[106] Twenty years later, Dean William Prosser surveyed the case law surrounding this right and concluded that the right to privacy entailed four distinct (yet, sometimes overlapping) rights: (1) intrusion upon seclusion; (2) public disclosure of private facts; (3) publicity which puts the target in a false light; and (4) appropriation of one's likeness.[107] These four categories were incorporated into the Restatement (Second) of Torts.[108]

Section 652B of the Restatement (Second) of Torts creates a cause of action for intrusion upon seclusion,[109] the privacy tort most likely to apply to drone surveillance.[110] It has been adopted either by common law or statute in an overwhelming majority of the states.[111] Section 652B provides: "One who intentionally intrudes, physically or otherwise, upon the solitude or seclusion of another or his private affairs or concerns, is subject to liability to the other for invasion of his privacy, if the intrusion would be highly offensive to a reasonable person."[112] Courts have developed a set of rules for applying Section 652B. First, it requires an objective person standard, testing whether a person of "ordinary sensibilities" would be offended by the alleged invasion.[113] Thus, someone with an idiosyncratic sensitivity—say, an aversion to cameras—could not satisfy this standard by simply having his photograph taken. Likewise, the intrusion must not only be offensive, but "*highly* offensive,"[114] or as one court put it, "outrageously unreasonable conduct."[115] Generally, a single incident will not suffice; instead, the intrusion must be "repeated with such persistence and frequency as to amount to a course of hounding" and "becomes a burden to his existence.... "[116] However, in a few cases a single intrusion was adequate.[117] The

invasion of privacy must been intentional, meaning the defendant must desire that the intrusion would occur, or as with other torts,[118] knew with a substantial certainty that such an invasion would result from his actions.[119] An accidental intrusion is not actionable. Finally, in some states, the intrusion must cause mental suffering, shame, or humiliation to permit recovery.[120]

A review of the case law demonstrates that the location of the target of the surveillance is, in many cases, determinative of whether someone has a viable claim for intrusion upon seclusion. For the most part, conducting surveillance of a person while within the confines of his home will constitute an intrusion upon seclusion.[121] The illustrations to Section 652B offer an example of a private detective who photographs an individual while in his home with a telescopic camera as a viable claim.[122] Likewise, as one court observed, "when a picture is taken of a plaintiff while he is in the privacy of his home, ... the taking of the picture may be considered an intrusion into the plaintiff's privacy just as eavesdropping or looking into his upstairs windows with binoculars are considered an invasion of his privacy."[123]

The likelihood of a successful claim is diminished if the surveillance is conducted in a public place. The comments to Section 652B explain that there is generally no liability for photographing or observing a person while in public "since he is not then in seclusion, and his appearance is public and open to the public eye."[124] Likewise, Prosser observed:

> On the public street, or in any other public place, the plaintiff has no right to be alone, and it is no invasion of his privacy to do no more than follow him about. Neither is it such an invasion to take a photograph in such a place, since this amounts to nothing more than making a record, not differing essentially from a full written description, of a public sight which anyone present would be free to see.[125]

The case law also supports this proposition. The Alabama Supreme Court dismissed a claim of wrongful intrusion against operators of a race track who photographed the plaintiffs while they were in the "winner's circle" at the track.[126] Similarly, a federal district court dismissed a claim by a husband and wife who had been photographed by Forbes Magazine while waiting in line at the Miami International Airport as it was taken in "a place open to the general public."[127] Likewise, a Vietnam veteran lost a claim for invasion of privacy based on photographs that depicted him and

other soldiers during a combat mission in Vietnam—again, a public setting.[128] Other examples include the recording of license plate numbers of cars parked in a public parking lot[129] and photographing a person while walking on a public sidewalk.[130]

Indeed, even plaintiffs who were videotaped or photographed while on their own property have generally been unsuccessful in their privacy claims so long as they could be viewed from a public vantage point. Rejecting one plaintiff's claim for intrusion upon seclusion, the Supreme Court of Oregon held that even though the investigators trespassed on the plaintiff's property to film him, the investigation did not "constitute an unreasonable surveillance 'highly offensive to a reasonable man[,]'"[131] as the plaintiff could have been viewed from the road by his neighbors or passersby.[132] In another case, the wife of a prominent Puerto Rican politician sought damages from a newspaper for invasion of privacy allegedly committed when an agent of the newspaper photographed her house as part of a news story about her husband.[133] The court dismissed her claim as the photographers were not "unreasonably intrusive," and the photographs depicted only the outside of the home and no persons were photographed.[134] Similarly, in one case a couple sued a cell phone company for intrusion upon seclusion when the company's workers looked onto their property each time they serviced a nearby cell tower.[135] The court rejected their claim, holding that "[t]he mere fact that maintenance workers come to an adjoining property as part of their work and look over into the adjoining yard is legally insufficient evidence of highly offensive conduct."[136] There are many other examples.[137]

However, there have been some successful claims for intrusion upon seclusion involving surveillance conducted in public.[138] The comments to Section 652B explain: "Even in a public place, however, there may be some matters about the plaintiff, such as his underwear or lack of it, that are not exhibited to the public gaze, and there may still be invasion of privacy when there is intrusion upon these matters."[139] One of the most famous cases concerning this "public gaze" theory involved a suit for invasion of privacy against a newspaper when it published a picture of

[139] RESTATEMENT (SECOND) OF TORTS §652B cmt. c.

the plaintiff with her dress blown up as she was leaving a fun house at a county fair.[140] In upholding the plaintiff's claim, the court observed: "To hold that one who is involuntarily and instantaneously enmeshed in an embarrassing pose forfeits her right of privacy merely because she happened at the moment to be part of a public scene would be illogical, wrong, and unjust."[141] In *Huskey v. National Broadcasting Co. Inc.*, a prisoner sued NBC, a television broadcasting company, alleging that by filming him without consent while he was working out in the exercise yard at the prison, NBC invaded his privacy.[142] NBC countered that depictions of persons in a "publicly visible area" could not support the claim for invasion of seclusion.[143] Ultimately, the court permitted the prisoner's claim to go forward, observing that "[o]f course [the prisoner] could be seen by guards, prison personnel and inmates, and obviously he was in fact seen by NBC's camera operator. But the mere fact a person can be seen by others does not mean that person cannot legally be 'secluded.'"[144] Although relief is available for certain cases of public surveillance, recovery seems to be the exception rather than the norm.[145]

First Amendment and Newsgathering Activities

Based on the foregoing discussion, safeguarding privacy from intrusive drone surveillance is clearly an important societal interest. However, this interest must be weighed against the public's countervailing concern in securing the free flow of information that inevitably feeds the "free trade of ideas."[146] Unmanned aircraft can improve the press and the public's ability to gather news: they can operate in dangerous areas without putting a human operator at risk of danger; can carry sophisticated surveillance technology; can fly in areas not currently accessible by traditional aircraft; and can stay in flight for long durations. However, challenges arise in attempting to find an appropriate balance between this interest in newsgathering and the competing privacy interests at stake.

The First Amendment to the United States Constitution provides that "Congress shall make no law ... abridging the freedom of speech, or of the press.... "[147] The Court has construed this phrase to cover not only traditional forms of speech, such as political speeches or polemical articles, but also conduct that is "necessary for, or integrally tied to, acts of expression,"[148] such as distribution of political literature[149] or door-to-door solicitation.[150] Additionally, the Court has pulled within

the First Amendment's protection other conduct that is not expressive in itself, but is "necessary to accord full meaning and substance to those guarantees."[151] For example, the Court has said that the public is entitled to a "right to receive news" as a correlative of the right to free expression.[152]

Like this right to receive news, the Court has intimated in a series of cases beginning in the 1960s that the public and the press may be entitled to *a right to gather news* under the First Amendment. Initially, in *Zemel v. Rusk*, the Court observed that the right "to speak and publish does not carry with it the unrestrained right to gather information."[153] The Court's reluctance to extend this right may have signaled its concern that an unconditional newsgathering right could subsume almost any government regulation that places a slight restriction on the ability to gather news.[154] However, several years later the Court indicated in *Branzburg v. Hayes* that although laws of general applicability apply equally to the press as to the general public, that "[n]ews gathering is not without its First Amendment protections,"[155] and that "without some protection for seeking out the news, freedom of the press could be eviscerated."[156] The Court, however, failed to clearly delineate the parameters of such a protection. In the Court's most recent case, *Cohen v. Cowles Media Co.*, the Court adhered to the "well-established line of decisions holding that generally applicable laws do not offend the First Amendment simply because their enforcement against the press has incidental effects on its ability to gather and report the news."[157] The Court noted that it is "beyond dispute 'that the publisher of a newspaper has no special immunity from the application of general laws. He has no special privilege to invade the rights of others.'"[158]

The lower federal courts have explored this right to gather news in the context of photographing or video recording. In *Dietemann v. Time, Inc.* the Ninth Circuit Court of Appeals explored the extent to which reporters could use surreptitious means to carry out their newsgathering.[159] There, defendants Time Life sent undercover reporters to a man's house where he claimed to use minerals and other materials to heal the sick. The reporters used a hidden camera to take pictures of the man, and a hidden microphone to transmit the conversation to other operatives. The defendants claimed that the First Amendment's right to freedom of the press shielded its newsgathering activities. In rejecting this claim, the court observed that although an individual accepts the risk when inviting a person into his home that the visitor may repeat the conversation to a third party, "he does not and should not be required to take the risk that what is heard and seen will be transmitted by photograph or recording, or in our modern world, in full living color and hi-fi to the public at large or to any segment of it that the visitor may select."[160] The court held that "hidden mechanical contrivances" are not indispensable tools of investigative reporting, and that the "First Amendment has never been construed to accord newsman immunity from torts

or crimes committed during the course of newsgathering."[161] In *Galella v. Onassis*, Galella, a self-proclaimed "paparazzo," constantly followed around, harassed, and photographed Jacqueline Kennedy Onassis and her children.[162] As part of an ongoing lawsuit, Onassis sued Galella for, *inter alia*, invasion of her and her family's privacy. Galella argued that he was entitled to the absolute "wall of immunity" that protects newsmen under the First Amendment. The Second Circuit Court of Appeals quickly rejected this absolutist position: "There is no such scope to the First Amendment right. Crimes and torts committed in news gathering are not protected. There is no threat to a free press in requiring its agents to act within the law."[163] By contrast, the Seventh Circuit in *Desnick v. American Broadcast Companies, Inc.* held that surreptitious recording was not a privacy invasion because the target of the surveillance was a party to the conversation, thereby vitiating any claim to privacy in those conversations.[164]

Congressional Response

If Congress chooses to act, it could create privacy protections to protect individuals from intrusive drone surveillance conducted by private actors.[165] Such proposals would be considered in the context of the First Amendment rights to gather and receive news. Several bills have been introduced in the 113th Congress that would regulate the private use of drones. Additionally, there are other measures Congress could adopt.

Drone Aircraft Privacy and Transparency Act of 2013 (H.R. 1262)

In the 113th Congress, Representative Ed Markey introduced the Drone Aircraft Privacy and Transparency Act of 2013 (H.R. 1262).[166] This bill would amend FMRA to create a comprehensive scheme to regulate the private use of drones, including data collection requirements and enforcement mechanisms. First, this bill would require the Secretary of Transportation, with input from the Secretary of Commerce, the Chairman of the Federal Trade Commission, and the Chief Privacy Officer of the Department of Homeland Security, to study any potential threats to privacy protections posed by the introduction of drones in the national airspace. Next, the bill would prohibit the FAA from issuing a license to operate a drone unless the application for such use included a "data collection statement." This statement would require the following items: a list of individuals who would have the authority to operate the drone; the location in which the drone will be used; the maximum period it will be used; and whether the drone would be collecting information about individuals. If the drone will be used to collect personal information, the statement must include the circumstances in which such information will be used; the kinds of information collected and the conclusions drawn from it; the type of data minimization procedures to be employed; whether the information will be sold, and if so, under what circumstances; how long the information would be stored; and procedures for destroying irrelevant data. The statement must also include information about the possible impact on privacy protections posed by the operation under that license and steps to be taken to mitigate

this impact. Additionally, the statement must include the contact information of the drone operator; a process for determining what information has been collected about an individual; and a process for challenging the accuracy of such data. Finally, the FAA would be required to post the data collection statement on the Internet.

H.R. 1262 includes several enforcement mechanisms. First, the FAA may revoke any license of a user that does not comply with these requirements. The Federal Trade Commission would have the primary authority to enforce the data collection requirements just stated. Additionally, the Attorney General of each state, or an official or agency of a state, is empowered to file a civil suit if there is reason to believe that the privacy interests of residents of that state have been threatened or adversely affected. H.R. 1262 would also create a private right of action for a person injured by a violation of this legislation.

Preserving American Privacy Act of 2013 (H.R. 637)

Representative Poe introduced the Preserving American Act of 2013 (H.R. 637) which would prohibit the use of drones to capture images in a manner highly offensive to a reasonable person where the person is engaging in a personal or familial activity under circumstances in which the individual has a reasonable expectation of privacy, regardless of whether there is a physical trespass.[167]

Other Proposals

Additionally, Congress could create a cause of action for surveillance conducted by drones similar to the intrusion upon seclusion tort provided under Restatement Section 652B.[168] How would a court assess whether drone surveillance violated this type of tort? First, generally speaking, the location of the search would be determinative of whether a person is entitled to an expectation of privacy. Although courts have posited that the common law, like the Fourth Amendment, is intended to "protect people, not places[,]"[169] the *location* of an alleged intrusion factors heavily in a privacy analysis. The greatest chance for liability occurs when a person photographs or videotapes another while in the seclusion of his home. While technology has increasingly shrunk other spheres of privacy in the digital age, the home is still accorded significant legal protection. Using a drone to peer inside the home of another—whether looking through a window or utilizing extra-sensory technology such as thermal imaging—would likely constitute an intrusion upon seclusion. Moving from the home to a public space, or even a space on private property where one can be seen from a public vantage point, significantly reduces the chance of tort liability. However, certain instances of highly offensive surveillance in public may be actionable.

This leads to the second factor that will inform a reviewing court's analysis: the degree of offensiveness of the surveillance. The Ninth Circuit Court of Appeals, applying California law,

[167] H.R. 637, 113th Cong (1st Sess. 2013).

[168] As with the enactment of any federal statute, Congress must act within one of its constitutionally delegated powers when creating a federal privacy tort or a crime based on intrusion of privacy. It would appear that Congress could regulate this area under its Commerce Clause power, U.S. Const. art. I, §8, cl. 3, which it acts under when regulating similar federal airspace issues. *See* Braniff Airways v. Nebraska Bd. of Equalization and Assessment, 347 U.S. 590 (1954); United States v. Helsley, 615 F.2d 784 (9th Cir. 1979).

[169] Pearson v. Dodd, 410 F.2d 701, 704 (D.C. Cir. 1969) (quoting Katz v. United States, 389 U.S. 347, 351 (1967)).

observed that, in determining offensiveness, "common law courts consider, among other things: 'the degree of intrusion, the context, conduct and circumstances surrounding the intrusion as well as the intruder's motives and objectives, the setting into which he intrudes, and the expectations of those whose privacy is invaded.'" Several of these factors—especially, the context of the intrusion and the motive of the intruder—are fact intensive and require application in a particular case to fully understand. However, some generalizations can be made. The cases discussed above that did find an intrusion upon seclusion in a public place required highly offensive activity, such as closely following another person for an extended period or photographing another in a highly embarrassing shot. Likewise, a court might recognize liability if one were to use a drone to follow another for an extended period of time, particularly at a close distance. It is not clear, however, whether knowledge of being surveilled makes the monitoring more or less offensive. For example, one court seemed to rely on the fact that the defendant was unaware that her house was being photographed to hold that she did not have a viable privacy claim.[170] A drone flying at several thousand feet may not significantly disturb the target of the surveillance and could fall within this rationale. Nevertheless, filming someone in a compromising or embarrassing situation without his knowledge can be equally offensive. Here, the facts of the particular case would determine liability.

Congress could also create a privacy statute tailored to drone use similar to the anti-voyeurism statutes, or "Peeping Tom" laws, enacted in many states.[171] These laws prohibit persons from surreptitiously filming others in various circumstances and places.[172] Some states prohibit surreptitious surveillance of a person while on private property, usually a private residence.[173] Nevada employs this model, prohibiting a person from entering the property of another with the intent to peep through a window of the building.[174] Likewise, New Jersey prohibits a person from peering into the window of the dwelling of another "under circumstances in which a reasonable person in the dwelling would not expect to be observed."[175] Other states require a prurient intent when conducting the surveillance. Under Washington State's statute, a person commits the crime of voyeurism if, for the purpose of arousing or gratifying his sexual desire, he films or photographs (1) a person in a place where he or she would expect privacy; or (2) the intimate areas of another person, whether he or she is in a public or private place.[176]

Similarly, Congress could adopt an "anti-paparazzi" statute, like that enacted in California, to prevent intrusive drone surveillance.[177] In fact, Congress considered a similar measure in the 105th

---

[170] Mojica Escobar v. Roca, 926 F. Supp. 30, 35 (D.P.R. 1996).

[171] Federal law does prohibit certain acts of voyeurism on federal property. Section 1801, Title 18 provides: "Whoever, in the special maritime and territorial jurisdiction of the United States, has the intent to capture an image of a private area of an individual without their consent, and knowingly does so under circumstances in which the individual has a reasonable expectation of privacy, shall be fined under this title or imprisoned not more than one year, or both." 18 U.S.C. §1801(a). As discussed in note 168, *supra*, it appears Congress would have the authority to extend this section to voyeurism committed not only on federal property but that committed from federal airspace.

> A person is liable for constructive invasion of privacy when the defendant attempts to capture, in a manner that is offensive to a reasonable person, any type of visual image, sound recording, or other

(continued...)

Congress. The Privacy Protection Act of 1998 and the Personal Intrusion Act of 1998 would have made it unlawful to persistently follow or chase another person for the purpose of obtaining a visual image of that person if the plaintiff met the following elements: (1) the image was transferred in interstate commerce or the person taking the photograph traveled in interstate commerce; (2) the person had a reasonable expectation of privacy from such intrusion; (3) the person feared death or bodily injury from being chased; and (4) the taking of the image was for commercial purposes.[178] Also, these bills would have created a civil remedy for an individual whose privacy was intruded upon. Congress could use this model to make it unlawful to persistently monitor another person using drone surveillance.

FAA Regulation of Privacy

Some observers have questioned whether the FAA has the legal authority to create privacy protections as it begins to integrate drones in the national airspace.[179] This section will explore the FAA's legal authority to establish privacy protections when it engages in rulemaking and establishes the six drone test ranges as required under FMRA.

It is well settled that agencies do not wield inherent powers, and that any authority they do have must be delegated by Congress.[180] Thus, when engaging in rulemaking or any other administrative action, the agency must be able to identify a specific statutory source of authority. In *Chevron v. Natural Resources Defense Council*, the Supreme Court established a two-part test (now known as the *Chevron* two step) that assesses whether a federal agency should be accorded deference in interpreting and implementing its authorizing statute or a statute it administers.[181] First, this test asks "whether Congress has directly spoken to the precise question at issue."[182] If so, the analysis ends there and the court and the agency "must give effect to the unambiguously expressed intent of Congress."[183] If, however, "the statute is silent or ambiguous" the court must

[179] *See, e.g.*, Press Release, Association for Unmanned Vehicle Systems International, AUVSI to FAA: Focus on your Mission, Proceed with UAS Integration (Nov. 28, 2012) ("As an industry, we support a continued, civil dialogue on privacy, but any such conversations should take place concurrent with the integration. The selection process for the six test sites are a separate issue and should be treated as such. Meanwhile, the FAA should adhere to its mission and do what it does best – focus on the safety of the U.S. airspace – while other, more appropriate institutions consider privacy issues."), *available at* http://www.auvsi.org/AUVSINews/AssociationNews.

[180] *See* Louisiana Pub. Serv. Comm'n v. FCC, 476 U.S. 355, 374 (1986).

[181] Chevron v. Natural Resources Defense Council, 467 U.S. 837 (1984). It should be noted that there is a disagreement among the circuit courts as to whether *Chevron* deference should be accorded to an agency's interpretation of its own jurisdictional statute. *Compare* Hydro Res., Inc. v. EPA, 608 F.3d 1131, 1445-46 (10th Cir. 2010) (en banc) (applying *Chevron* deference) *with* N. Ill. Steel Supply Co. v. Sec'y of Labor, 294 F.3d 844, 846-47 (7th Cir. 2002) (applying de novo standard). The Supreme Court has granted a petition for writ of certiorari in *City of Arlington v. FCC*, 133 S. Ct. 524 (2012) and may potentially resolve this circuit split. *See* CRS Report WSLG373, *Can an Agency Determine the Scope of its Jurisdiction? Supreme Court Hears Argument Regarding Chevron Deference*, by Daniel T. Shedd.

[182] *Chevron*, 467 U.S. at 842.

[183] *Id.* at 843.

then determine if the agency's interpretation is a "permissible construction of the statute."[184] This type of *Chevron* analysis may be applied by a reviewing court if the FAA promulgated rules governing privacy, as part of the FMRA directed rulemaking and those rules were challenged.

Rulemaking Required by FMRA

FMRA directs the FAA to engage in two sets of rulemaking. The first rulemaking requires that by August 14, 2014, the FAA issue a final rule on integrating "small unmanned aircraft systems" into the national airspace system.[185] The second rulemaking requires the FAA to develop a "comprehensive plan to safely accelerate the integration of civil unmanned aircraft systems into the national airspace system[;]"[186] provide notice on proposed rulemaking to implement this comprehensive plan not later than August 14, 2014; and publish a final rule by December 14, 2015.[187]

As to the small drone rulemaking, FMRA provides little guidance on what factors should inform the agency's rulemaking. The act merely requires that the FAA issue a final rule "on small unmanned aircraft systems that will allow for civil operation of such systems in the national airspace system.... "[188] Applying the first step of *Chevron*, it is clear that Congress did not address the precise issue at question—that is, Congress did not expressly provide FAA authority to regulate privacy. Accordingly, a reviewing court would then have to assess under step two whether addressing privacy as part of rulemaking would be a reasonable interpretation of FMRA. There are plausible arguments on both sides of this question.

The Court asserted in *Chevron* that "the power of an administrative agency to administer a congressionally created ... program necessarily requires the formulation of policy and the making of rules to fill any gap left, implicitly or explicitly, by Congress."[189] Given that privacy has been a paramount concern of both the public and various Members of Congress, it would seem odd if Congress delegated the FAA rulemaking authority to integrate drones into the national airspace, but withheld the authority to regulate one of the most prominent and controversial issues surrounding this integration. Rather, one could argue that Congress would have inferred that the FAA would fill in these gaps with reasonable regulations, including those regulating privacy and data collection issues. Conversely, those who contend that the FAA has neither the legal authority nor the expertise to regulate privacy issues concerning drone use may point to the FAA's organic statute. This law provides the FAA authority to ensure the safety and efficiency of air travel,[190]

---

[184] *Id.*

[185] § 332 (b)(1).

[186] § 332(a)(1).

[187] § 332(b)(2).

[188] § 332(b)(1).

[189] *Chevron*, 467 U.S. at 843 (quoting Morton v. Ruiz, 415 U.S. 199, 231 (1974)).

[190] The policy section to FAA's authorizing statue provides that when implementing agency regulations, the FAA shall consider, among other things, the following:

> (1) assigning, maintaining, and enhancing safety and security as the highest priorities in air commerce.
>
> (2) regulating air commerce in a way that best promotes safety and fulfills national defense requirements.
>
> (3) encouraging and developing civil aeronautics, including new aviation technology.
>
> (4) controlling the use of the navigable airspace and regulating civil and military operations in that

(continued...)

but appears to contain no *express* authority to regulate privacy. They may further argue that the FAA has not historically regulated privacy as it pertains to persons or things on the ground in relation to traditional air flight, and currently does not have the technical expertise to undertake such regulations. These arguments could support the theory that Congress intentionally omitted privacy regulation from the FAA's purview when conducting this required rulemaking.

Next, as to the comprehensive plan rulemaking, Congress has provided some guidance as to the factors the FAA should take into consideration, but none of the factors discuss privacy concerns.[191] Thus, like the rulemaking for small drones, under the *Chevron* first step, Congress has not spoken directly to the issue in question. Moving to the second step, would it be reasonable for the FAA to include privacy regulations in its rulemaking implementing this comprehensive plan? First, the use of the term "at a minimum" as a preface to the list of factors to be considered in this comprehensive plan and rulemaking make it illustrative, not exhaustive. This phrasing

---

(...continued)

> airspace in the interest of the safety and efficiency of both of those operations.
>
> (5) consolidating research and development for air navigation facilities and the installation and operation of those facilities.
>
> (6) developing and operating a common system of air traffic control and navigation for military and civil aircraft.
>
> (7) providing assistance to law enforcement agencies in the enforcement of laws related to regulation of controlled substances, to the extent consistent with aviation safety.

49 U.S.C. § 40101(d).

[191] The "comprehensive plan" must contain, "at a minimum," recommendations on:

> (A) the rulemaking to be conducted under subsection (b), with specific recommendations on how the rulemaking will—
>
> (i) define the acceptable standards for operation and certification of civil unmanned aircraft systems;
>
> (ii) ensure that any civil unmanned aircraft system includes a sense and avoid capability; and
>
> (iii) establish standards and requirements for the operator and pilot of a civil unmanned aircraft system, including standards and requirements for registration
>
> and licensing;
>
> (B) the best methods to enhance the technologies and subsystems necessary to achieve the safe and routine operation of civil unmanned aircraft systems in the national
>
> airspace system;
>
> (C) a phased-in approach to the integration of civil unmanned aircraft systems into the national airspace system;
>
> (D) a timeline for the phased-in approach described under subparagraph (C);
>
> (E) creation of a safe
>
> (F) airspace designation for cooperative manned and unmanned flight operations in the national airspace
>
> system;
>
> (G) establishment of a process to develop certification,
>
> flight standards, and air traffic requirements for civil unmanned aircraft systems at test ranges where such systems are subject to testing;
>
> (H) the best methods to ensure the safe operation of civil unmanned aircraft systems and public unmanned aircraft systems simultaneously in the national airspace system; and
>
> (I) incorporation of the plan into the annual NextGen Implementation Plan document (or any successor document) of the Federal Aviation Administration.

§ 332(a).

arguably suggests that Congress understood that the FAA might address other factors, perhaps including privacy, beyond those enumerated in section 332. Second, section 332 provides that the FAA must "define the acceptable standards for operation and certification of civil unmanned aircraft systems."[192] Viewing this language in light of *Chevron* deference, a court could find that regulating requirements that protect privacy fall within the "acceptable standards for operation" of drones in the national airspace.

In sum, it appears that the open-ended nature of Congress's instructions to the FAA, coupled with the prominence of privacy concerns, would likely persuade a court that the FAA's potential regulation of privacy as part of formal rulemaking is a reasonable interpretation of FMRA that should be accorded deference under a *Chevron* analysis.

Test Ranges and Privacy

In addition to the rulemaking described above, section 332(c) of FMRA requires the FAA Administrator to "establish a program to integrate unmanned aircraft systems into the national airspace system at 6 test ranges."[193] On February 22, 2013, the FAA issued a request for comment on the privacy rules that will apply to test range operators.[194] In its request for comment, the FAA proposed several requirements that might apply to the operation of these test ranges.[195] Once the

---

[192] § 332(a)(2).

[193] P.L. 112-95, § 332(c)(1), 126 Stat. 11, 74.

[194] Unmanned Aircraft System Test Site Program, 78 Fed. Reg. 12259 (Feb. 22, 2013).

[195] The FAA has proposed that the OTA include the following privacy requirements:

> (1) The Site Operator must ensure that there are privacy policies governing all activities conducted under the OTA, including the operation and relevant activities of the UASs authorized by the Site Operator. Such privacy policies must be available publically, and the Site Operator must have a mechanism to receive and consider comments on its privacy policies. In addition, these policies should be informed by Fair Information Practice Principles. The privacy policies should be updated as necessary to remain operationally current and effective. The Site Operator must ensure the requirements of this paragraph are applied to all operations conducted under the OTA.
>
> (2) The Site Operator and its team members are required to operate in accordance with Federal, state, and other laws regarding the protection of an individual's right to privacy. Should criminal or civil charges be filed by the U.S. Department of Justice or a state's law enforcement authority over a potential violation of such laws, the FAA may take appropriate action, including suspending or modifying the relevant operational authority (e.g., Certificate of Operation, or OTA), until the proceedings are completed. If the proceedings demonstrate the operation was in violation of the law, the FAA may terminate the relevant operational authority.
>
> (3) If over the lifetime of this Agreement, any legislation or regulation, which may have an impact on UAS or to the privacy interests of entities affected by any operation of any UAS operating at the Test Site, is enacted or otherwise effectuated, such legislation or regulation will be applicable to the OTA and the FAA may update or amend the OTA to reflect these changes.
>
> (4) Transmission of data from the Site Operator to the FAA or its designee must only include those data listed in Appendix B to the OTA.

78 Fed. Reg. 12260. Appendix B to the OTA is available at https://faaco.faa.gov/index.cfm/attachment/download/29581.

The FAA notes that these rules are not permanent but are intended to:

> help inform the dialogue among policymakers, privacy advocates, and the industry regarding broader questions concerning the use of UAS technologies. The privacy requirements proposed here are not intended to pre-determine the long-term policy and regulatory framework under which commercial UASs would operate. Rather, they aim to assure maximum transparency of privacy policies associated with UAS test site operations in order to engage stakeholders in discussion

(continued...)

FAA selects the site operators, each must enter into an Other Transaction Agreement (OTA) with the FAA—a legally binding agreement setting out the terms and conditions under which the site will be operated. This request for comment is intended to provide the public the ability to comment on "potential privacy considerations, associated reporting requirements, and how the FAA can help ensure privacy considerations are addressed through mechanisms put in place as a result of the OTA."[196]

This FAA announcement raises another legal question: does the FAA have the authority to regulate privacy via OTA agreements entered into with the test range operators? As a threshold issue, it is not clear what level of deference a court would apply to this administrative action. In certain instances, agency actions that do not amount to formal rulemaking have not been accorded *Chevron* deference. In *Christensen v. Harris County*, the Supreme Court held that a Department of Labor opinion letter interpreting the Family Medical Leave Act was not entitled to deference under *Chevron*.[197] The Court observed that "[i]nterpretations such as those in opinion letters—like interpretations contained in policy statements, agency manuals, and enforcement guidelines, all of which lack the force of law—do not warrant *Chevron*-style deference."[198] Instead, interpretations contained in administrative pronouncements such as opinion letters are entitled to some deference under the rule pronounced in *Skidmore v. Swift & Co.*,[199] "but only to the extent that those interpretations have the 'power to persuade.'"[200] In *United States v. Mead*, the Court again ruled that *Skidmore*, not *Chevron*, deference applied to a United States Custom Service opinion letter setting tariff levels on certain imports.[201]

A reviewing court could apply the *Christensen-Mead* line of cases to hold that the lower level deference accorded under *Skidmore* should apply to the FAA's use of the OTAs in establishing the test ranges. As in those cases, the OTAs would not have the force of law and would not be the product of formal agency adjudication or rulemaking. These factors weigh against applying *Chevron*'s deferential approach.

However, *Mead* suggested that *Chevron* deference may be due when the agency conducts notice and comment procedures as part of its interpretive process, which were not utilized in either

---

[197] Christensen v. Harris County, 529 U.S. 576, 587 (2000).

[198] *Id.*

[199] Skidmore v. Swift & Co., 323 U.S. 134 (1944). In *Skidmore*, the Court was required to determine what level of deference should be accorded the Department of Labor in its issuance of bulletins interpreting a wage provision in the Fair Labor Standard Act. *Id.* at 138. The Court ruled:

> We consider that the rulings, interpretations and opinions of the Administrator under this Act, while not controlling upon the courts by reason of their authority, do constitute a body of experience and informed judgment to which courts and litigants may properly resort for guidance. The weight of such a judgment in a particular case will depend upon the thoroughness evident in its consideration, the validity of its reasoning, its consistency with earlier and later pronouncements, and all those factors which give it power to persuade, if lacking power to control.

Id. at 140.

[200] *Christensen*, 529 U.S. at 588 (citing *Skidmore*, 323 U.S. at 140).

[201] United States v. Mead, 533 U.S. 218 (2001).

Christensen or *Mead*.[202] Here, the FAA has issued a notice for comment on the proposed privacy regulations that will be included in the OTAs. This fact might persuade a court into applying the more deferential *Chevron* test.

Under either level of scrutiny, it is not at all clear whether the FAA would have the authority to regulate privacy as part of the OTAs. Congress did not speak to this issue in FMRA.[203] Thus, a reviewing court would have to determine if the agency's regulation of privacy is either a reasonable interpretation of the statute under *Chevron* or has the "power to persuade" under *Skidmore*. Some of the same factors that arguably support the inclusion of privacy in the formal rulemaking could apply equally to the test ranges. The idea that Congress left it to the FAA to fill in the gaps in establishing the test ranges, and that privacy is one of the primary concerns surrounding the integration of drones into U.S. airspace, could be offered as an argument to uphold the FAA's regulation of privacy. On the other side of the ledger, the act's enumerated list of factors to be addressed at these test ranges is primarily focused on safety issues and does not expressly permit the FAA to regulate privacy. One could argue that this formulation evinces Congress's intent for the FAA to focus on safety, the FAA's stock and trade, rather than privacy, an area in which the FAA appears to have little experience.

Related Legal Issues

In addition to the legal issues described above, there are a host of other issues that may arise when introducing drones into the U.S. national airspace system.

Preemption of State and Local Regulations. The increased presence of drones in domestic airspace raises the question of potential federal preemption of state or local efforts to regulate different aspects of drone use. The doctrine of preemption derives from the Supremacy Clause of the Constitution, which states that federal law, treaties, and the Constitution are the "supreme

---

[202] *Mead*, 533 U.S. at 230 ("The overwhelming number of our cases applying Chevron deference have reviewed the fruits of notice-and-comment rulemaking or formal adjudication."); *Christensen*, 529 U.S. at 587 ("Here, however, we confront an interpretation contained in an opinion letter, not one arrived at after, for example, a formal adjudication or notice-and-comment rulemaking.") *See also Mead*, 533 U.S. at 231 ("The authorization for classification rulings, and Custom's practice in making them, present a case far removed ... from notice-and-comment process.... ").

[203] The FAA Reform Act provides that in setting up the test sites, the Administrator shall:

> (A) safely designate airspace for integrated manned and unmanned flight operations in the national airspace system;
>
> (B) develop certification standards and air traffic requirements for unmanned flight operations at test ranges;
>
> (C) coordinate with and leverage the resources of the National Aeronautics and Space Administration and the Department of Defense;
>
> (D) address both civil and public unmanned aircraft systems;
>
> (E) ensure that the program is coordinated with the Next Generation Air Transportation System; and
>
> (F) provide verification of the safety of unmanned aircraft systems and related navigation procedures before integration into the national airspace system.[203]The second is FAA's mandate to come up with a comprehensive plan to integrate drones in the national airspace and subsequent rule-making based on this plan.

§ 332(c)(1).

Law of the Land."[204] A federal law may preempt state or local action in one of three ways: if the statute expressly states its intent to preempt state or local action (express preemption); if a court concludes that Congress intended to occupy the regulatory field, implicitly preventing state or local action in that area (field preemption); or if the state or local action directly conflicts with or frustrates the purpose of the federal provisions (conflict preemption).[205]

With regard to traditional aviation laws, generally, state regulations of aviation safety, airspace management, and aviation noise are preempted by federal laws and regulations.[206] Congress vested sole responsibility for the aviation industry and domestic airspace with the federal government in the Federal Aviation Act of 1958.[207] According to the legislative history, the FAA was to have "full responsibility and authority for the advancement and promulgation of civil aeronautics generally, including promulgation and enforcement of safety regulations."[208] In *City of Burbank v. Lockheed Air Terminal, Inc.*, the Supreme Court struck down a local city ordinance that prohibited planes from taking off during certain hours of the day as preempted by the federal regulatory scheme.[209] Expressing its fear regarding local control of airspace, the Court stated, "If we were to uphold the Burbank ordinance and a significant number of municipalities followed suit, it is obvious that fractionalized control of the timing of takeoffs and landings would severely limit the flexibility of the FAA in controlling air traffic flow."[210] The Supreme Court has, however, upheld state regulations imposing taxes on aircraft equipment located within the state.[211]

State proposals seeking to regulate the use of drones are currently pending in many state legislatures throughout the country.[212] The Virginia General Assembly has passed a two-year moratorium on the use of drones by state and local law enforcement.[213] The bill prohibits the use of drones by agencies with jurisdiction over criminal law enforcement or regulatory violations, but includes exceptions for emergency situations. Following passage of the bill, the Governor neither signed nor vetoed the bill, but rather sent it back to the General Assembly with amendments, where it now awaits further action. Several other states have introduced bills similarly targeting the use of drones for surveillance.[214] Other states, like Texas, have introduced

[213] "An Act to place a moratorium on the use of unmanned aircraft systems," HB2012, Virginia General Assembly, *available at* http://lis.virginia.gov/cgi-bin/legp604.exe?131+ful+HB2012ER+pdf.

[214] *See, e.g.*, S. 395, South Carolina General Assembly, 120th Session; S. 524, 77th Oregon Legislative Assembly, 2013 Regular Session; SB 92, Florida Legislature, 2013 Regular Session.

bills attempting to address privacy concerns related to widespread drone use. The Texas proposal would create a new state misdemeanor when a person uses a drone to capture an image without the consent of the landowner who owns the property captured in the image.[215]

If these proposals were implemented, questions about federal preemption may be raised. It appears that field preemption or conflict preemption would be the most likely grounds for finding preemption of such state regulations based on current federal law, if at all, since FMRA does not contain an express preemption clause. The extent to which the state can regulate drone use without being preempted by federal law may depend on the scope of the forthcoming federal regulations, the nature of the state regulations, and a reviewing court's analysis of whether Congress intended to "occupy the field" of regulation on that issue. The Court has determined that field preemption can be inferred when "the pervasiveness of the federal regulation precludes supplementation by the States, where the federal interest in the field is sufficiently dominant, or where the object sought to be obtained by the federal law and the character of obligations imposed by it reveal the same purpose."[216]

Right to Protect Property from Trespassing Drones. There may be instances where a landowner is entitled to protect his property from intrusion by a drone. Under Restatement (Second) of Torts Section 260, "one is privileged to commit an act which would otherwise be a trespass to a chattel or a conversion if the act is, or is reasonably believed to be, necessary to protect the actor's land or chattels or his possession of them, and the harm inflicted is not unreasonable as compared with the harm threatened."[217] What this means is, in certain instances, a landowner would not be liable to the owner of a drone for damage necessarily or accidentally resulting from removing it from his property. However, there appear to be no cases where a landowner was permitted to use force to prevent or remove an aircraft from his property. Additionally, as discussed above, determining whether a drone in flight is trespassing upon one's property may be unusually challenging.

Stalking, Harassment, and Other Crimes. Traditional crimes such as stalking, harassment, voyeurism, and wiretapping may all be committed through the operation of a drone. As drones are further introduced into the national airspace, courts will have to work this new form of technology into their jurisprudence, and legislatures might amend these various statutes to expressly include crimes committed with a drone.

Wiretap Laws. Under the federal wiretap statute, it is unlawful to intentionally intercept an "oral communication"[218] by a person "exhibiting an expectation that such communication is not subject to interception under circumstances justifying such expectation.... "[219] Currently, commercial microphones can record sounds upwards of 300 feet.[220] Use of such a microphone on a drone to record private conversations could implicate the federal wiretap statute.

Conclusion

The legal issues discussed in this report will likely remain unresolved until the civilian use of drones becomes more widespread. To that end, the FAA has been tasked with developing "a comprehensive plan to safely accelerate the integration" of drones into the national airspace, which focuses on the safety of the drone technology and operator certification. While the deadline for development of the plan has already elapsed, the FAA has until the end of FY2015 to implement such a plan.[221] Additionally, the FAA must identify six test ranges where it will integrate drones into the national airspace. This deadline, 180 days after enactment of the act, has also elapsed without FAA compliance. Once these regulations are tested and promulgated, the unique legal challenges that could arise based on the operational differences between drones and already ubiquitous fixed-wing aircraft and helicopters may come into sharper focus.

CRS Report for Congress
Prepared for Members and Committees of Congress

Summary

The prospect of drone use inside the United States raises far-reaching issues concerning the extent of government surveillance authority, the value of privacy in the digital age, and the role of Congress in reconciling these issues.

Drones, or unmanned aerial vehicles (UAVs), are aircraft that can fly without an onboard human operator. An unmanned aircraft system (UAS) is the entire system, including the aircraft, digital network, and personnel on the ground. Drones can fly either by remote control or on a predetermined flight path; can be as small as an insect and as large as a traditional jet; can be produced more cheaply than traditional aircraft; and can keep operators out of harm's way. These unmanned aircraft are most commonly known for their operations overseas in tracking down and killing suspected members of Al Qaeda and related organizations. In addition to these missions abroad, drones are being considered for use in domestic surveillance operations to protect the homeland, assist in crime fighting, disaster relief, immigration control, and environmental monitoring.

Although relatively few drones are currently flown over U.S. soil, the Federal Aviation Administration (FAA) predicts that 30,000 drones will fill the nation's skies in less than 20 years. Congress has played a large role in this expansion. In February 2012, Congress enacted the FAA Modernization and Reform Act (P.L. 112-95), which calls for the FAA to accelerate the integration of unmanned aircraft into the national airspace system by 2015. However, some Members of Congress and the public fear there are insufficient safeguards in place to ensure that drones are not used to spy on American citizens and unduly infringe upon their fundamental privacy. These observers caution that the FAA is primarily charged with ensuring air traffic safety, and is not adequately prepared to handle the issues of privacy and civil liberties raised by drone use.

This report assesses the use of drones under the Fourth Amendment right to be free from unreasonable searches and seizures. The touchstone of the Fourth Amendment is reasonableness. A reviewing court's determination of the reasonableness of a drone search would likely be informed by location of the search, the sophistication of the technology used, and society's conception of privacy in an age of rapid technological advancement. While individuals can expect substantial protections against warrantless government intrusions into their homes, the Fourth Amendment offers less robust restrictions upon government surveillance occurring in public places including areas immediately outside the home, such as in driveways or backyards. Concomitantly, as technology advances, the contours of what is reasonable under the Fourth Amendment may adjust as people's expectations of privacy evolve.

In the 113th Congress, several measures have been introduced that would restrict the use of drones at home. Several of the bills would require law enforcement to obtain a warrant before using drones for domestic surveillance, subject to several exceptions. Others would establish a regime under which the drone user must file a data collection statement stating when, where, how the drone will be used and how the user will minimize the collection of information protected by the legislation.

Introduction

The prospect of drone use in domestic surveillance operations has engendered considerable debate among Americans of various political ideologies.[1] Opponents of drone surveillance have complained that the use of unmanned aircraft on American soil infringes upon fundamental privacy interests and the ability to freely associate with others.[2] Some are specifically concerned about the possibility of turning military technology inward to surveil American citizens.[3] Proponents have responded by emphasizing their potential benefits, which may include protecting public safety, patrolling our nation's borders, and investigating and enforcing environmental and criminal law violations.[4]

The tension between security and privacy interests is not new, but has been heightened by the explosion of surveillance technology in recent decades.

The tension between security and privacy interests is not new, but has been heightened by the explosion of surveillance technology in recent decades. Police officers who were once relegated to naked eye observations may soon have, or in some cases already possess, the capability to see through walls or track an individual's movements from the sky.[5] One might question, then: What is the proper balance between the necessity of the government to keep people safe and the privacy needs of individuals? As some polls suggest, while the public supports drone usage in certain circumstances, they are less enthusiastic about using them as part of routine law enforcement activity.[6]

---

[1] The term "domestic drone surveillance" as used in this report is designed to cover a wide range of government uses including, but not limited to, investigating and deterring criminal or regulatory violations; conducting health and safety inspections; performing search and rescue missions; patrolling the national borders; and conducting environmental investigations.

[4] Some state and local officials have expressed interest in employment of drones for public safety and law enforcement purposes. *See, e.g.*, Brianne Carter, *Gov. Bob McDonnell supports drones policing Virginia*, ABC NEWS (May 30, 2012), *available at* http://www.wjla.com/articles/2012/05/gov-bob-mcdonnell-supports-drones-policing-virginia-76464.html; *Unmanned Aircraft Systems Within the Homeland: Security Game Changer? Hearing Before the Subcomm. on Oversight, Investigations, and Management of the H. Comm. on Homeland Sec.*, 112th Cong. 3 (2012) (statement of William R. McDaniel, Chief Deputy, Montgomery County Sheriff's Office, Conroe, TX) ("UAV systems for public safety agencies are extremely viable, effective, and economical means to enhance the public safety response to critical incidents.").

[5] The Supreme Court remarked in *Kyllo v. United States*, 533 U.S. 27, 37 (2001):

> The ability to 'see' through walls and other opaque barriers is a clear, and scientifically feasible, goal of law enforcement research and development. The National Law Enforcement and Corrections Technology Center, a program within the United States Department of Justice, features on its Internet Website projects that include a 'Radar-Based Through-the-Wall Surveillance System,' 'Handheld Ultrasound Through the Wall Surveillance,' and a 'Radar Flashlight' that 'will enable law officers to detect individuals through interior building walls.'

[6] *U.S. Supports Some Domestic Drone Use, But Public Registers Concern About Own Privacy* 1, Monmouth University Polling Institute (June 12, 2012), *available at* http://www.monmouth.edu.

The Fourth Amendment to the United States Constitution safeguards Americans' privacy and prevents excessive government intrusion by prohibiting "unreasonable searches and seizures."[7] Courts have long grappled with how to apply the text of this 18th century provision to 20th century technologies. Although the Supreme Court has the final say in the interpretation of the Fourth Amendment and other constitutional safeguards,[8] Congress and, in many cases, the President are free to institute more stringent restrictions upon government surveillance operations.[9]

This report first explores the potential uses of drones in the domestic sphere by federal, state, and local governments. It then surveys current Fourth Amendment jurisprudence, including cases surrounding privacy in the home, privacy in public spaces, location tracking, manned aerial surveillance, and those involving the national border. Next, it considers how existing jurisprudence may inform current and proposed drone uses. It then describes the various legislative measures introduced in the 113th Congress to address the legal and policy issues surrounding drones. Finally, it briefly identifies several alternative approaches that may constrain the potential scope of drone surveillance.

Background, Uses, and Drone Technology

Drones, also known as unmanned aerial vehicles (UAVs), are aircraft that do not carry a human operator and are capable of flight under remote control or autonomous programming.[10] An unmanned aircraft system (UAS) is the entire system, including the aircraft, digital network, and personnel on the ground.[11] Drones can range from the size of an insect—sometimes called nano drones or micro UAVs—to the size of a traditional jet.[12]

Drones are perhaps most commonly recognized from their missions abroad, including to target and kill suspected members of Al Qaeda and related groups, but they might be used for a variety of other purposes, including for both commercial and law enforcement activities within the United States. In fact, the FAA predicted that 30,000 unmanned aircraft could be flying in U.S. skies in less than 20 years.[13] One reason for this expansion has been a push by Congress for a

[7] U.S. CONST. amend IV.

[8] Cooper v. Aaron, 358 U.S. 1, 18 (1958) ("[Marbury v. Madison] declared the basic principle that the federal judiciary is supreme in the exposition of the law of the Constitution, and that principle has ever since been respected by this Court and the Country as a permanent and indispensable feature of our constitutional system.").

[9] In reaction to the Supreme Court's ruling in *United States v. Miller*, 425 U.S. 435 (1976), that the privacy of an individual's bank records were generally not protected by the Fourth Amendment, Congress enacted the Right to Financial Privacy Act, P.L. 95-630, 92 Stat. 3697 (codified at 12 U.S.C. §3401-3422), creating a statutory protection for such records.

[10] DEP'T OF DEFENSE, DICTIONARY OF MILITARY AND ASSOCIATED TERMS 331 (2012). Unless expressly mentioned, the terms "unmanned aerial vehicle," "UAV," "unmanned aircraft system," "UAS," and "drone" are used interchangeably in this report.

[11] *Id.*

[12] See CRS Report R42136, *U.S. Unmanned Aerial Systems*, by Jeremiah Gertler, for a description of the various types of drones currently operated in the United States.

[13] FEDERAL AVIATION ADMINISTRATION, FAA AEROSPACE FORECAST: FISCAL YEARS 2010-2030, at 48 (2010), *available at* http://www.faa.gov/data_research/aviation/aerospace_forecasts/2010-2030/media/2010%20Forecast%20Doc.pdf. The FAA has noted that "Federal agencies are planning to increase their use of UAS's. State and local governments envision using UAS's to aid in law enforcement and firefighting. Potential commercial uses are also possible, for example, in real estate photography or pipeline inspection. UAS's could perform some manned aircraft missions with less noise and fewer emissions." *Id.*

faster integration of UAVs into U.S. airspace.[14] Most recently, as part of the FAA Modernization and Reform Act of 2012, Congress mandated that the Federal Aviation Administration (FAA) "develop a comprehensive plan to safely accelerate the integration of civil unmanned aircraft systems into the national airspace system."[15] This plan shall provide for integration of UAVs by September 2015.

Drones have been employed domestically by federal, state, and local governments in a range of circumstances. The Department of Homeland Security (DHS) uses them to police the nation's borders to deter unlawful border crossings by unauthorized aliens, criminals, and terrorists, and to detect and interdict the smuggling of weapons, drugs, and other contraband into the country.[16] Within DHS, Customs and Border Protection's (CBP's) Office of Air and Marine (OAM) has flown missions to support federal and state agencies such as the Federal Bureau of Investigation (FBI), the Department of Defense (DOD), Immigration and Customs Enforcement (ICE), the U.S. Secret Service, and the Texas Rangers.[17] According to a recent disclosure by the FAA, several local police departments, state and private colleges, and small cities and towns have also received FAA Certificates of Authorization (COAs) to fly unmanned aircraft domestically.[18] Recently, a police force in North Dakota conducted the nation's first drone-assisted arrest.[19] DHS, in conjunction with local law enforcement agencies, has been testing drone capabilities in a host of other situations including detecting radiation, monitoring a hostage situation, tracking a gun tossed by a fleeing suspect, firefighting, and finding missing persons.[20]

Currently, drones can be outfitted with high-powered cameras,[21] thermal imaging devices,[22] license plate readers,[23] and laser radar (LADAR).[24] In the near future, law enforcement

[21] The U.S. Army recently acquired a 1.8 gigapixel camera for use on its drones. This camera offers 900 times the pixels of a 2 megapixel camera found in some cell phones. It can track objects on the ground 65 miles away from an altitude of 20,000 feet. *US Army unveils 1.8 gigapixel camera helicopter drone*, BBC NEWS (December 29, 2011 6:11 p.m.), http://www.bbc.com/news/technology-16358851.

[22] Infrared cameras, also known as thermal imaging, can see objects through walls based on the relative levels of heat produced by the objects. *See* Draganflyer X6, Thermal Infrared Camera, http://www.draganfly.com/uav-helicopter/draganflyer-x6/features/flir-camera.php.

[23] This sensor can recognize and permit drones to track vehicles based on license plate numbers. Customs and Border (continued...)

organizations might seek to outfit drones with facial recognition or soft biometric recognition, which can recognize and track individuals based on attributes such as height, age, gender, and skin color.[25] As explained below, the relative sophistication of drones contrasted with traditional surveillance technology may influence a court's decision whether domestic drone use is lawful under the Fourth Amendment.

Fourth Amendment "Search" Jurisprudence

The Fourth Amendment's story is one of continuity and change. Core values such as privacy and protection from excessive and arbitrary government intrusion are always within its sweep. A continuing question, though, is how the demands of its protection apply to an ever-changing society in which new and pervasive forms of technology are increasingly common. Although there are numerous rules and exceptions throughout the Supreme Court's Fourth Amendment jurisprudence, this section will explore those most pertinent to domestic drone use.

In short, the Fourth Amendment regulates when, where, and how the government may conduct searches and seizures. The Amendment provides, in relevant part: "The right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated[.]"[26] The Fourth Amendment does not apply to all government acts, but only to those that constitute a search. So when does government monitoring constitute a Fourth Amendment "search" for which a warrant is generally required? Initially, courts' assessment focused on the specific area being investigated. Consider the 1928 case *Olmstead v. United States*.[27] There, the Supreme Court held that police wiretaps of the defendant's home telephone did not constitute a Fourth Amendment search because the police did not trespass onto Olmstead's property to intercept his conversation.[28] The Court's thinking at the time was that if the person's home, tangible property, or papers were not physically invaded, then no search in the constitutional sense occurred. Almost 40 years later, the Court shifted focus from property to privacy interests.[29] In *Katz v. United States*, decided in 1967, the Court held that an FBI agent's use of a bug to listen to the private conversations of Mr. Katz while in a telephone booth violated his Fourth Amendment rights.[30] Although he was in a public telephone booth and there was no physical invasion, the Court noted that what a person "seeks to preserve private, even in an area accessible to the public, may be constitutionally protected."[31] One of the modern Fourth

Amendment tests relied upon by courts in assessing whether government monitoring constitutes a "search" derives from Justice Harlan's concurrence in *Katz*. It considers whether the person has a subjective expectation of privacy in the area to be searched and whether society is prepared to deem that expectation reasonable.[32]

Although the Court said in *Katz* that the Fourth Amendment "protects people not places,"[33] Justice Harlan noted that determining what "protection it affords people ... requires reference to a '*place*.'"[34] And as Justice Scalia observed when writing for a majority of the Court in *United States v. Jones*, a Fourth Amendment search occurs, "at a minimum," where "the Government obtains information by physically intruding on a constitutionally protected area."[35] The majority in *Jones* indicated that the reasonable expectation of privacy test was never intended to replace the property-based approach used in earlier cases, but merely augment it.[36] So where do individuals enjoy the most Fourth Amendment protection? The least? Why does the location dictate the level of protection? And how does technology affect society's expectation of privacy?

When analyzing domestic drone use under the Fourth Amendment, a reviewing court may be informed by cases surrounding privacy in the home, privacy in public spaces, location tracking, manned aerial surveillance, those involving the national border, and warrantless searches under the special needs doctrine.

Privacy in the Home

The home has always held a central place in American life, and remains the area accorded the greatest Fourth Amendment protection.[37] The Fourth Amendment protects this zone of privacy by ensuring that "the right of the people to be secure in their ... houses ... against unreasonable search and seizure, shall not be violated[.]"[38] In most instances, the Supreme Court has rigorously adhered to this safeguard.[39] For instance, although police officers may make a warrantless arrest of an individual for a felony offense committed in public,[40] they may not step inside his home without a warrant, barring any recognized exception.[41]

> "The right of the people to be secure in their ... houses ... against unreasonable search and seizure, shall not be violated[.]" U.S. CONST. amend IV.

In addition to a physical entry and search of the home, police are likewise prohibited from using certain technology to pierce this zone of privacy. In *Kyllo v. United States*, government agents used a thermal-imaging device to determine heat patterns inside the home of Danny Kyllo.[42] The Court began with the presumption that a warrantless search of a home is unreasonable.[43] Ultimately, the Court protected this "realm of guaranteed privacy" by holding that obtaining information about the inside of a home that could not otherwise be obtained except by entering the home, through the use of technology not in "general public use," is a "search" covered by the Fourth Amendment.[44]

The home, however, does not provide an absolute shield against government surveillance. As Justice Harlan emphasized in *Katz*, "[A] man's home is, for most purposes, a place where he expects privacy, but objects, activities, or statements that he exposes to the plain view of outsiders are not 'protected' because no intention to keep them to himself has been exhibited." Indeed, in certain instances, police may use their natural senses to conduct warrantless searches of the inside of a home.[45] To fall under this exception—known as the "plain view" doctrine—the police must be in a lawful vantage point when they conduct the surveillance, and the incriminating nature of the evidence must be readily apparent.[46]

[45] In one case, police observation of marijuana plants through a crack in the house's siding did not constitute an unlawful search. *United States v. Hammett*, 236 F.3d 1054, 1061 (9th Cir. 2001). In another, the court held that the police officer's observation of contraband through the front dining room window was not unlawful. *United States v. Taylor*, 90 F.3d 903, 909 (4th Cir. 1996).

[46] Coolidge v. New Hampshire, 403 U.S. 443, 466 (1971).

Curtilage and Open Fields

Once an individual moves from the confines of the home, he is entitled to different Fourth Amendment considerations. Depending on a host of varying factors, areas outside of the home may be considered "curtilage" or "open fields."[47] The curtilage is the area immediately surrounding the home—an area the Court has granted similar protections as the inside of the home.[48] To determine if an area is curtilage, a court will look at how close the area is to the home; whether the area is within a fence surrounding the home; how the area is used; and whether the area is protected from observation by passersby.[49] Although an area may be deemed curtilage—as with the home—it is not veiled with unconditional constitutional protection. As the Court noted in one aerial surveillance case:

> The Fourth Amendment protection of the home has never been extended to require law enforcement officers to shield their eyes when passing by a home on public thoroughfares. Nor does the mere fact that an individual has taken measures to restrict some views of his activities preclude an officer's observations from a public vantage point where he has a right to be and which renders the activities clearly visible.[50]

On the other hand, the area outside the curtilage is sometimes considered "open fields," which "do not provide the setting for those intimate activities that the Amendment is intended to shelter from governmental interference or surveillance,"[51] and thus are not given similar Fourth Amendment protections. Differentiating between the two is no easy task. In one case, for example, the Ninth Circuit Court of Appeals determined that the defendant's driveway was not curtilage as he had taken no affirmative steps to block it from observation by passers-by.[52] Furthermore, in the fly-over cases discussed *infra*, the Supreme Court has permitted similar searches in both open fields and the curtilage, to some extent eliminating any constitutional difference between the two.

Manned Aerial Surveillance

In a series of cases that provide the closest analogy to UAVs, the Supreme Court addressed the use of *manned* aircraft to conduct domestic surveillance over residential and industrial areas. In each, the Court held that the fly-over at issue was not a search prohibited by the Fourth Amendment, as the areas surveilled were open to public view.

[47] United States v. Hester, 365 U.S 57 (1924) (distinguishing between the doctrines of curtilage and open fields).

[48] The Court has defined curtilage as "the area to which extends the intimate activity associated with the 'sanctity of a man's home and the privacies of life.'" Oliver v. United States, 466 U.S. 170, 180 (1984) (quoting Boyd v. United States, 116 U.S. 616, 630 (1886)).

[49] United States v. Dunn, 480 U.S. 294, 301 (1987).

[50] California v. Ciraolo, 476 U.S. 207, 213 (1986).

[51] Dow Chemical Co. v. United States, 476 U.S. 227, 234-35 (1986) (quoting *Oliver*, 466 U.S. at 179).

[52] Maisano v. Welcher, 940 F.2d 499 (9th Cir. 1991).

In *California v. Ciraolo*, police received a tip that an individual was growing marijuana in his backyard next to his suburban home.[54] Because two fences blocked their view of the yard, officers flew a fixed-wing aircraft at an altitude of 1,000 feet over the property to conduct a visual inspection. From this vantage point, the officers readily identified with the naked eye marijuana plants growing in the defendant's yard. The Court held that the defendant's expectation of privacy in the area immediately surrounding his home was not reasonable, since "what a person knowingly exposes to the public ... is not a subject of Fourth Amendment protection."[55] "Any member of the public flying in this airspace who glanced down could have seen everything these officers observed," the Court remarked.[56] Much weight was placed on the fact that the plane was at all times in navigable airspace as defined by federal statute.[57]

> "What a person knowingly exposes to the public ... is not a subject of Fourth Amendment protection."[53]

Similarly, in *Florida v. Riley*, local police received a tip that an individual was growing marijuana in a greenhouse located 10 to 20 feet away from his mobile home.[58] The officers could not see the contents of the greenhouse from the ground, so they flew a helicopter over the defendant's backyard at an altitude of 400 feet. While overhead, an officer saw marijuana plants through a crack in the greenhouse roof. Because the helicopter, like the plane in *Ciraolo*, was in navigable airspace—where any member of the public could have flown—the Court did not consider this a search for which a warrant was required.[59]

In the final case of the series, *Dow Chemical v. United States*, the Court was asked whether a theory of "industrial curtilage" would prevent a government agency from conducting aerial surveillance over a 2,000-acre commercial plant.[60] There, after Dow Chemical Co. refused access to the Environmental Protection Agency (EPA), the EPA hired a commercial aerial photographer to take photos of the facility using a precision aerial mapping camera. Having ruled out the argument that the areas surrounding an industrial complex are entitled to the same protection as similar areas surrounding a home, the Court concluded that photographing the plant from navigable airspace was not a search.[61]

Government Tracking

Like the aerial surveillance cases, individuals have reduced—and in some contexts no—Fourth Amendment protection from government tracking of their travel in public places. This has permitted the government to conduct warrantless tracking of a vehicle's movements while traveling on public streets. However, once people enter a private residence, the tracking must

cease. Also, using technology to perform pervasive tracking might not meet Fourth Amendment muster.

Consider, for example, these two government tracking cases, *United States v. Knotts* and *United States v. Karo*.[62] In both cases, the government hid a location monitoring device in an item that was then given to the suspects. In *Knotts*, the police tracked the suspect's movements solely while traveling on public roadways.[63] The Court held that people have no reasonable expectation of privacy in their movements on public streets. As such, no Fourth Amendment search occurred, thus no warrant was required. By contrast, in *Karo*, the police tracked a beeper device on public streets *and* while the beeper was in a private residence—a "location not open to visual surveillance."[64] "Indiscriminate monitoring of property that has been withdrawn from public view," the Court declared, "would present far too serious a threat to privacy interests in the home to escape entirely some sort of Fourth Amendment oversight."[65] The Court held the search unlawful.

Although surveillance in public is generally not considered a search, pervasive tracking may cross the line. Take, for instance, the Supreme Court's recent decision in the GPS tracking case *United States v. Jones*.[66] In that case, the Court held that the attachment and monthlong tracking of a GPS device on an individual's vehicle constituted a trespass, and hence a Fourth Amendment search.[67] The Court grounded its decision in the property-based approach to assessing what constitutes a "search" under the Fourth Amendment, which had been more prevalent in the late 19th and early 20th century cases involving relatively unsophisticated technology.

The Court's focus on whether the attachment of a tracking device constitutes a trespass triggering Fourth Amendment protections is not necessarily applicable to drone surveillance. However, in two separate concurring opinions that together made up five members of the Court, an alternative framework was proposed that may have more far-reaching implications for the domestic use of UAVs.

Justice Alito, concurring in the Court's judgment, and joined by Justices Ginsburg, Breyer, and Kagan, would have held that "the use of longer term GPS monitoring in investigations of most offenses impinges on expectations of privacy. For such offenses, society's expectation has been that law enforcement agents and others would not—and indeed, in the main, simply could not—secretly monitor and catalogue every single movement of an individual's car for a very long period." Justice Sotomayor, joining the controlling opinion in *Jones*, but also concurring separately, noted that although following people for a short period of time conveys little information about them, tracking an

> Tracking an individual for an extended period "reflects a wealth of detail about her familial, political, professional, religious, and sexual associations."[68]

individual for an extended period "reflects a wealth of detail about her familial, political, professional, religious, and sexual associations."[69] Thus, the length of time an individual is kept under surveillance and the breadth of data collected through such surveillance may inform a reviewing court whether a particular surveillance practice constitutes a Fourth Amendment search.[70]

Border Searches

Even more so than surveillance of public places generally, law enforcement agencies are granted significant deference to conduct surveillance at or near American borders. The federal government has a significant interest in protecting American borders from crossings by persons attempting to enter unlawfully, drug trafficking, and, perhaps most importantly, the transit of weapons and persons seeking to do harm to American people and infrastructure.

Congress has granted federal law enforcement agencies significant search powers at the border. Section 287 of the Immigration and Nationality Act (INA), codified at 8 U.S.C. Section 1357, authorizes immigration officers to conduct warrantless searches of any vessel within a reasonable distance from the United States border and any vehicle within 25 miles from a border for the "purpose of patrolling the border to prevent the illegal entry of aliens into the United States."[71] Similarly, 19 U.S.C. Section 482 authorizes customs officers to search vehicles and persons on which or whom they have reasonable cause to believe are carrying goods unlawfully into the United States.[72]

The Supreme Court has likewise acknowledged this federal interest in the borders, observing that "[t]he Government's interest in preventing the entry of unwanted persons and effects is at its zenith at the international border."[73] Again, the touchstone in every Fourth Amendment case is whether the search is *reasonable*.[74] The Court observed in *United States v. Montoya De Hernandez* that "the Fourth Amendment balance of reasonableness is qualitatively different at the international border."[75] "Routine searches," the Court continued, "are not subject to any requirement of reasonable suspicion, probable cause, or warrant."[76] "Routine" searches have included pat downs for weapons or contraband,[77] the use of drug sniffing dogs,[78] and the

inspection of luggage.[79] By contrast, "non-routine" searches are those that go beyond a limited intrusion, and require the government official to have (at a minimum) "reasonable suspicion" of wrongdoing.[80] Prolonged detentions,[81] strip searches,[82] and body cavity searches[83] have all been considered non-routine searches.

Unlike searches directly at the border, the Court has shown more reticence in granting law enforcement unfettered discretion to conduct searches near, but not directly at, the border. In *Almeida-Sanchez v. United States*, the defendant's vehicle was stopped and searched by U.S. Border Patrol agents 25 miles north of the U.S.-Mexico border.[84] The agents had neither a warrant nor probable cause, nor even reasonable suspicion, to conduct the search. The government argued that the search was permissible under Section 287 of the Immigration and Nationality Act. A federal statute, the Court noted, cannot trump the Constitution. The Court refused to permit this suspicionless search, as it was conducted neither at the border nor at its "functional equivalent."[85]

Warrants, Suspicionless Searches, and Special Needs

The baseline rule in Fourth Amendment cases is that police must obtain a warrant to search an individual or their property in all but a few limited instances.[86] This rule ensures that an independent judicial officer, rather than a police officer in the field, is determining whether there is probable cause to conduct a search or seizure.[87] Over time, however, the Court has loosened this warrant requirement in instances where a strict showing of individualized suspicion of probable cause would hinder the government from addressing health and safety concerns.[88] In two lines of overlapping cases—administrative searches and "special needs" cases—the Court has balanced the individual's privacy interest against the government's interest to determine if a

[84] Almeida-Sanchez v. United States, 413 U.S. 266, 267-68 (1973).

[85] *Id.* at 272-73 ("For example, searches at an established station near the border, at a point marking the confluence of two or more roads that extend from the border, might be functional equivalents from border searches. For another example, a search of the passengers and cargo of an airplane arriving at a St. Louis airport after a nonstop flight from Mexico would clearly be the functional equivalent of a border search."). Like *Almeida-Sanchez*, Border Patrol agents in *United States v. Brignoni-Ponce* stopped an individual's vehicle as part of a roving patrol solely because the occupants appeared to be of Mexican descent, with no proof of illegal activity. *United States v. Brignoni-Ponce*, 422 U.S. 873, 874-75 (1975). Again, the Court struck down this practice of suspicionless stops, remarking that "[i]n the context of border area stops, the reasonableness requirement of the Fourth Amendment demands something more than the broad and unlimited discretion sought by the Government. Roads near the border carry not only aliens seeking to enter the country illegally, but a large volume of legitimate traffic as well." *Id.* at 882.

[86] Mincey v. Arizona, 437 U.S. 385, 390 (1978) (citation omitted).

[87] Johnson v. Untied States, 333 U.S. 10, 14 (1948) ("The right of officers to thrust themselves into a home is also a grave concern, not only to the individual but to a society which chooses to dwell in reasonable security and freedom from surveillance. When the right of privacy must reasonably yield to the right of search is, as a rule, to be decided by a judicial officer, not by a policeman or government enforcement agent."). Probable cause is found when, looking at the "totality-of-the-circumstances" there "is a fair probability that contraband or evidence of a crime will be found in a particular place." Illinois v. Gates, 462 U.S. 213, 238 (1983).

[88] Eve Brensike Primus, *Disentangling Administrative Searches*, 111 COLUM. L. REV. 254, 256 (2011).

warrant or any individualized suspicion is required.[89] These two theories permit law enforcement to conduct dragnet searches in certain instances.

Suspicionless general searches are ones "in which the government searches or seizes every person, place, or thing in a specific location or involved in a specific activity based only on a showing of a generalized government interest."[90] Suspicionless searches have been conducted at the national border,[91] private businesses,[92] and police roadblocks.[93] In the roadblock cases, the Court has balanced the government's interest against the individual's privacy interest to determine whether police may stop and question drivers without a warrant or any suspicion of criminal wrongdoing. In *Michigan Dep't of State Police v. Sitz*, the Court upheld the suspicionless stopping and examination of drivers for intoxication at sobriety checkpoints.[94] The Court reasoned that the high incidence of drunk driving balanced against the minimal intrusion on drivers permitted suspicionless checkpoints. In *City of Indianapolis v. Edmund*, however, law enforcement was not permitted to set up a drug interdiction checkpoint.[95] The Court held that searches such as this violated the Fourth Amendment when their "primary purpose" is "to uncover evidence of ordinary criminal wrongdoing."[96] Justice O'Connor observed that if this type of roadblock were allowed "the Fourth Amendment would do little to prevent such intrusions from becoming a routine part of American life."[97]

Application of Fourth Amendment to Drone Surveillance

As evidenced by the foregoing, the constitutionality of domestic drone surveillance may depend upon the context in which such surveillance takes place. Whether a targeted individual is at home, in his backyard, in the public square, or near a national border will play a large role in determining whether he is entitled to privacy. Equally important is the sophistication of the technology used by law enforcement and the duration of the surveillance. Both of these factors will likely inform a reviewing court's reasoning as to whether the government's surveillance constitutes an unreasonable search in violation of the Fourth Amendment.

Location of Search

Based on existing case law, it is reasonable to assume that surveillance of an individual while in his home—an area accorded the greatest Fourth Amendment protection—using technology not in general public use would be an unlawful search absent a search warrant. The Supreme Court in *Kyllo* was particularly concerned about law enforcement's use of powerful equipment to peer inside an individual's home. Currently, UAVs carry high-megapixel cameras and thermal imaging, and will soon have the capacity to see through walls and ceilings.[98] These technologies are not generally available to the public, and under current jurisprudence, their use by law enforcement would probably constitute a search covered by the Fourth Amendment. However, the use of low-powered cameras or other unsophisticated technology to view people and objects in plain view while in their home might not trigger Fourth Amendment protections. The rationale for this notion is that officers are not required to avert their eyes when they see illegal activity in plain view, especially when the subject of the search has taken no affirmative efforts to hide their activity from public view.

Moving beyond the home, it is unclear whether circumstances exist in which the area immediately surrounding the home—for instance, a backyard, a swimming pool, a deck, or a porch—would receive similar protections as the interior of the home if surveilled by drones or other aerial vehicles.[99] Although the Supreme Court has recited on many occasions that a person located in a home's curtilage is accorded similar privacy protections as when inside the home, the aerial surveillance cases arguably constitute an exception to this general principle. In the two aerial cases, *Riley* and *Ciraolo*, the area surveilled was within close proximity of the home, yet the police surveillance at altitudes of 400 and 1,000 feet were not considered a search.

Based on the aerial surveillance cases, it may be reasonable to presume a warrant would *not* be required (nor, perhaps, any suspicion, for that matter) to conduct drone surveillance of most public places for a relatively short period of time. The Supreme Court remarked in *Ciraolo* that the "Fourth Amendment simply does not require the police traveling in the public airways at [1,000 feet] to obtain a warrant to observe what is visible to the naked eye."[100] However, the rarity of drone flights may distinguish their use from surveillance by the piloted aircraft used in the three aerial cases decided by the Court. All three of these cases were premised on the fact that each aircraft was flying in navigable airspace, and that these flights were not "sufficiently rare" to provide a reasonable expectation of privacy in the area to be searched. To this point, Justice White remarked in *Riley* that "there is nothing in the record or before us to suggest that helicopters flying at 400 feet are sufficiently rare in this country to lend substance to respondent's claim that he reasonably anticipated that his greenhouse would not be subject to observation from that altitude."[101] Presently, use of UAVs in U.S. airspace is considerably less common. The FAA has issued only approximately 300 licenses for drone use in U.S. airspace.[102] The general public

[102] Federal Aviation Administration, *supra* note 18.

would likely find it exceedingly unusual for a drone to fly over their homes taking surveillance photographs. This rarity might factor into a reviewing court's determination of whether individuals have a legitimate expectation of privacy from various forms of drone surveillance while in a public place.[103]

The federal government's authority to use unmanned aircraft is undoubtedly at its maximum near U.S. borders. One of the federal government's only affirmative duties is to protect citizens from external harm.[104] This includes securing the borders. The Court has hesitated from interfering with the performance of this duty, and it would in all likelihood demonstrate the same deference when it comes to the use of UAVs. Moreover, the Supreme Court's rulings in border cases have all involved active searches—either a physical search of a vehicle or stopping and questioning a vehicle's passenger. Surveillance by UAVs, on the other hand, may be considered more passive and therefore may be even less likely to run afoul of Fourth Amendment requirements. Drone surveillance does not require any physical manipulation of a person or his things. UAVs also do not require the seizure of a person for any period of time (though drone surveillance may lead to law enforcement physically apprehending a person who is seen engaging in suspected illegal activity). However, the Court has shown some reticence about giving law enforcement carte blanche search power at the border. Roving vehicle patrols and indiscriminate searches in *Almeida-Sanchez v. United States* and *United States v. Brignoni-Ponce* were deemed unconstitutional.[105] It is unclear whether this reticence would extend to drone surveillance along the border if it were to become significantly widespread.

Technology Used

Like location, the technology used by UAVs may be a decisive factor considered by courts in determining whether individuals have a legitimate expectation of privacy in the object or area of the challenged drone search. Technological developments make it increasingly easy to share and acquire personal information about others, oftentimes without their direct knowledge or consent. As surveillance technology advances and becomes ever-present in Americans' lives, people's conception of privacy may tend to oscillate. Justice Scalia, writing for the majority in *Kyllo v. United States*, remarked on this trend:

> It would be foolish to contend that the degree of privacy secured to citizens by the Fourth Amendment has been entirely unaffected by the advance of technology. For example, ... the technology enabling human flight has exposed to public view (and hence, we have said, to official observation) uncovered portions of the house and its curtilage that once were private. The question we confront today is what limits there are upon this power of technology to shrink the realm of guaranteed privacy.[106]

Justice Alito, joined by three other Justices in his *United States v. Jones* concurrence, likewise observed:

---

[103] *Ciraolo*, 476 U.S. at 212. However, in determining society's privacy expectations, a reviewing court might also take into consideration the proliferation of aerial mapping such as Google Maps and Google Earth conducted by private actors. *See generally* Google Maps, Street View, http://www.google.com/streetview.

[104] U.S. CONST. art. IV, §4 ("The United States shall guarantee to every State in this Union a Republican Form of Government, and shall protect each of them against Invasion[.]").

[105] Almeida-Sanchez v. United States, 413 U.S. 266 (1973); United States v. Brignoni-Ponce, 422 U.S. 873 (1975).

[106] Kyllo v. United States, 533 U.S. 27, 33-34 (2001).

> The *Katz* test rests on the assumption that this hypothetical reasonable person has a well-developed and stable set of privacy expectations. But technology can change those expectations. Dramatic technological change may lead to periods in which popular expectations are in flux and may ultimately produce significant changes in popular attitudes. New technology may provide increased convenience or security at the expense of privacy, and many people may find the tradeoff worthwhile. And even if the public does not welcome the diminution of privacy that new technology entails, they may eventually reconcile themselves to this development as inevitable.[107]

The crucial question, then, is whether drones have the potential to be significantly more invasive than traditional surveillance technologies such as manned aircraft or low-powered cameras—technologies that have been upheld in previous cases. In this vein, some have asked whether using sophisticated digital platforms on a drone is any different from attaching the same instrument to a lamppost or traditional aircraft.[108] Take, for example, the tracking of license plates. Currently, many states and municipalities employ automatic license plate readers (ALPRs), which are usually mounted on police vehicles or stationary objects along the streets, to take a snapshot of a license plate as a car drives by, and store this information in a large database for possible later use by law enforcement.[109] It is alleged that these devices can be used to track a person's movements when police aggregate the data from a multitude of ALPR stations.[110] A majority of the reviewing federal circuit courts have held that a person has no reasonable expectation of privacy in his license plate number.[111]

However, it appears that no federal court has addressed the constitutionality of the use of ALPRs (whether attached to a drone, manned vehicle, or a stationary device), as opposed to plate numbers collected by a human observer. Nonetheless, the question remains whether attaching an ALPR—or any similar sophisticated technology—to a drone would alter the constitutionality of its use by law enforcement. Some say yes, arguing that the sophistication of drone technology in and of itself "present[s] a unique threat to privacy."[112] Drones are smaller, can fly longer, and can be built more cheaply than traditional aircraft. For instance, defense firm Lockheed Martin's Stalker—a small, electrically powered drone—can be recharged from the ground using a laser.[113] It now has a flight time of more than 48 hours. As this technology advances, it is reported that

[113] Mark Brown, *Lockheed uses ground-based laser to recharge drone mid-flight*, WIRED (July 12, 2012), *available at* http://www.wired.co.uk/news/archive/2012-07/12/lockheed-lasers.

some drones could theoretically "stay in the air forever."[114] Unlike a stationary license plate tracker or video camera, drones can lock on a target's every move for days, and possibly weeks and months. This ability to closely monitor an individual's movements with pinpoint accuracy may raise more significant constitutional concerns than some other types of surveillance technology.

Furthermore, the technology and sophistication of drones may mark a considerable departure from the traditional technologies used in the three manned aerial surveillance cases decided by the Supreme Court. First, all three holdings in *Ciraolo*, *Riley*, and *Dow Chemical* were premised on naked-eye searches. Chief Justice Burger remarked in *Dow Chemical*: "It may well be, as the government concedes, that surveillance of private property using highly sophisticated surveillance equipment not generally available to the public, such as satellite technology, might be constitutionally proscribed absent a warrant."[115] As noted above, the sophistication of surveillance technology available to drones, such as facial recognition or laser radar which can "see" through walls, may lead some to question the relevance of prior Fourth Amendment jurisprudence concerning more rudimentary forms of surveillance technology.

The sophistication of drones also has the ability to break down any practical privacy safeguard. In the pre-computer age, the greatest privacy protections were neither constitutional nor statutory, but practical. Putting officers everywhere in the community cost too much for local police departments. This acted as a natural barrier to excessive police presence. Drones are not hindered by similar limitations. This is similar to the expansion of GPS technology observed by the five concurring Justices in *United States v. Jones*. There, Justice Sotomayor, writing for herself, noted that because GPS technology was cheaper and performed in a surreptitious manner, it "evades the ordinary checks that constrain abusive law enforcement practices: limited police resources and community hostility."[116] Justice Alito sounded a similar note in *Jones*: "Traditional surveillance for any extended period of time was difficult and costly and therefore rarely undertaken. [GPS devices] make long-term monitoring relatively easy and cheap."[117] Instead of putting more officers in the field, a police force could put drones in the sky for potentially less expense. Already, drones with video capabilities can be purchased from private vendors for a few hundred dollars.[118] This access to inexpensive technology may significantly reduce budgetary concerns that once checked the government from widespread surveillance.

This access to inexpensive technology may significantly reduce budgetary concerns that once checked the government from widespread surveillance.

The duration and pervasiveness of drone surveillance—two factors closely associated with the technology employed by law enforcement—may also influence a court's Fourth Amendment analysis. Consider the Fifth Circuit Court of Appeals' ruling in *United States v. Cuevas-Sanchez*.[119] In that case, federal law enforcement agents suspected the defendant was using his home as a drop house for drug traffickers. After obtaining a court order, the agents installed a

video camera on a utility pole overlooking the defendant's 10-foot high fence surrounding his back yard. The officers observed the removal of drugs from the gas tanks of several cars parked in the defendant's yard. Based on these observations, the defendant was arrested whereupon the police seized a large amount of marijuana. At trial, the defendant moved to suppress the evidence on the basis that the warrant was defective. However, the court first addressed whether the video surveillance was a search under the Fourth Amendment. In determining that the video surveillance was a search, the panel noted that this "was not a one-time overhead flight or a glance over the fence by a passer-by.... It does not follow that *Ciraolo* authorizes any type of surveillance whatever just because one type of minimally-intrusive aerial observation is possible."[120] Drones have the capability to stay in the air for long periods of time and can hover in one location. Similar to the mounted camera in *Cuevas-Sanchez*, this permits law enforcement to employ drones in prolonged surveillance operations. This capability may sway a court's determination of whether certain types of warrantless drone surveillance are compatible with the Fourth Amendment.

Warrant Requirement and Suspicionless Drone Searches

Applying the Fourth Amendment to drones requires application of the threshold question: was there a search? Again, this will depend on all the factors discussed above—the area of the search, the technology used, and whether society would respect the target's expectation of privacy in the place searched. If a reviewing court concludes that the drone surveillance was not a search, neither a warrant nor any degree of individualized suspicion would be required. If, however, the court concluded there was a search, then a court would ask whether a warrant is required, if one of the exceptions apply, and what level of suspicion, if any, is necessary to uphold the search.

Unless a meaningful distinction can be made between drone surveillance and more traditional forms of government tracking, existing jurisprudence suggests that a reviewing court would likely uphold drone surveillance conducted with no individualized suspicion when conducted for purposes other than strict law enforcement. The Supreme Court has hesitated from interfering in what they see as the executive's function in protecting the health and safety of the American population. As Chief Justice Rehnquist noted in the *Sitz*, the Court does not want

> to transfer from politically accountable officials to the courts the decision as to which among reasonable alternative law enforcement techniques should be employed to deal with serious public danger.... [F]or purposes of Fourth Amendment analysis, the choice among such reasonable alternatives remains with the governmental officials who have a unique understanding of, and a responsibility for, limited public resources, including a finite number of police officers.[121]

The Court may defer to law enforcement officials in the drone context also. There are countless instances where the government may seek to utilize drones for health and safety purposes that go beyond mere law enforcement. These may include firefighting, search and rescue missions, traffic safety enforcement, or environmental protection. If, on other hand, surveillance is conducted primarily to enforce the law, a warrant may be required, unless one of the exceptions to the warrant requirement applies.

Legislative Proposals in the 113th Congress to Constrain Domestic Use of Drones

Although the Supreme Court is the final arbiter of the Constitution, Congress and the President can provide for greater regulation of drones than the Fourth Amendment requires. Congress has taken such steps over the years to address government surveillance of communications in transit (commonly known as wiretapping),[122] communications in storage such as e-mails,[123] bank records,[124] and health records,[125] among a host of other private information. Several measures have been introduced in the 113th Congress that would restrict the domestic use of drones, and establish arguably greater constraints on their usage than the Fourth Amendment requires. Several bills were prompted by a general concern for potential privacy intrusions by federal and state law enforcement and executive agencies.[126]

Preserving Freedom from Unwarranted Surveillance Act of 2013 (H.R. 972)

In the 113th Congress, Representative Austin Scott has introduced the Preserving Freedom from Unwarranted Surveillance Act of 2013 (H.R. 972).[127] This bill would require any entity acting under the authority of the federal government to obtain a warrant based upon probable cause before conducting drone surveillance to investigate violations of criminal law or regulations. There are, however, several exceptions to this warrant requirement: (1) to prevent or deter illegal entry of any persons or illegal substances into the United States; (2) when a law enforcement officer possesses reasonable suspicion that under particular circumstances "swift action to prevent imminent danger to life or serious damage to property, or to forestall the imminent escape of a suspect, or destruction of evidence" is necessary; or (3) when the Secretary of Homeland Security determines credible intelligence indicates a high risk of a terrorist attack by a specific individual or organization. H.R. 972 would create a right to sue for any violation of its prohibitions.

Preserving American Privacy Act of 2013 (H.R. 637)

Representative Ted Poe introduced the Preserving American Privacy Act of 2013 (H.R. 637), which would restrict the domestic use of drones.[128] To begin, the bill regulates surveillance of "covered information," which means "information that is reasonably likely to enable

---

[122] Omnibus Crime Control and Safe Streets Act of 1968, P.L. 90-351, 87 Stat. 197, 211 (codified at 18 U.S.C. §2510-2522).

[123] Electronic Communications Privacy Act of 1986, P.L. 99-508, 100 Stat. 1848 (codified at 18 U.S.C. §2701-2712).

[124] Right to Financial Privacy Act, P.L. 95-630, 92 Stat. 3697 (codified at 12 U.S.C. §3401-3422).

[125] Health Insurance Portability and Accountability Act of 1996, P.L. 104-191, 110 Stat. 1936.

[126] Several bills introduced in the 113th Congress aim to restrict the government's use of drones to lethally target U.S. citizens on U.S. soil. See, e.g., No Armed Drones Act of 2013, H.R. 1083, 113th Cong (1st Sess. 2013); S. 505, 113th Cong. (1st Sess. 2013). These bills, however, are beyond the scope of this report.

[127] H.R. 972, 113th Cong. (1st Sess. 2013). Senator Rand Paul filed similar legislation in the 112th Congress, but has not re-introduced it in the 113th Congress. *See* S. 3287, 112th Cong. (2d Sess. 2012). Unlike H.R. 972, S. 3287 included an express exclusionary rule for evidence obtained in violation of the act.

[128] H.R. 637, 113th Cong. (1st Sess. 2013).

identification of an individual" or "information about an individual's property that is not in plain view." H.R. 637 would create a general prohibition on the use of drones to collect covered information or disclose covered information so collected. It does, however, provide the following exceptions:

- *Warrant*. Law enforcement obtains a court-issued warrant and serves a copy of the warrant on the target of the search within 10 days of the surveillance. However, notice need not be provided if it would jeopardize an ongoing criminal or national security investigation.
- *General Order*. Law enforcement obtains a court-issued order based upon "specific and articulable facts showing a reasonable suspicion of criminal activity and a reasonable probability" that the operation "will provide evidence of such criminal activity." The order may authorize surveillance in a stipulated public area for no more than 48 hours which may be renewed for a total of 30 days. Notice of the operation must be provided to the target no later than 10 days after the operation. Alternatively, notice may be provided not less than 48 hours before the operation in a major publication, on a government website, or with signs posted in the area of the operation.
- *Border searches*. Operation is within 25 miles of national border.
- *Consent*. The targeted individual has provided prior written consent.
- *Emergencies*. Emergency situation involves danger of death or serious physical injury, conspiratorial activities threatening the national security interest, or conspiratorial activities characteristic of organized crime, where a warrant cannot be obtained with due diligence. Law enforcement must then obtain a warrant within 48 hours of such operation.

Any evidence obtained in violation of this act is not admissible in any trial or adjudicative proceeding. Additionally, H.R. 637 requires any governmental entity applying for a certificate or license to operate a UAS to also file a data collection statement with the Attorney General. The statement must include the following:

- Purpose for which the UAS will be used
- Whether the UAS is capable of collecting covered information
- The length of time the information will be retained
- A point of contact for citizen feedback
- The particular unit of governmental entity responsible for safe and appropriate operation of the UAS
- The rank and title of the individual who may authorize the operation of the UAS
- The applicable data minimization policies barring the collection of covered information unrelated to the investigation of crime and requiring the destruction of covered information that is no longer relevant to the investigation of a crime
- Applicable audit and oversight procedures.

Under H.R. 637, the Attorney General may request that the Secretary of Transportation revoke the license or certificate of any entity that fails to file a data collection statement. Further, H.R. 637

contains a provision permitting administrative discipline against an officer who intentionally violates a provision of this act.

Drone Aircraft Privacy and Transparency Act of 2013 (H.R. 1262)

Representative Ed Markey introduced the Drone Aircraft Privacy and Transparency Act of 2013 (H.R. 1262).[129] This bill would amend the FAA Modernization and Reform Act of 2012 to create a comprehensive scheme to regulate government actors' use of drones, including data collection requirements and enforcement mechanisms.

First, this bill would require the Secretary of Transportation, with input from the Secretary of Commerce, the Chairman of the Federal Trade Commission, and the Chief Privacy Officer of the Department of Homeland Security, to study any potential threats to privacy protections posed by the introduction of drones in the national airspace. Next, the bill would prohibit the FAA from issuing a license to operate a drone unless the application for such use included a "data collection statement." This statement would require the following items:

- A list of individuals who would have the authority to operate the drone
- The location in which the drone will be used
- The maximum period it will be used
- Whether the drone would be collecting information about individuals

If the drone will be used to collect personal information, the statement must include the following:

- The circumstances in which such information will be used
- The kinds of information collected and the conclusions drawn from it
- The type of data minimization procedures to be employed
- Whether the information will be sold, and if so, under what circumstances
- How long the information would be stored
- Procedures for destroying irrelevant data.

The statement must also include information about the possible impact on privacy protections posed by the operation under that license and steps to be taken to mitigate this impact. Additionally, the statement must include the contact information of the drone operator; a process for determining what information has been collected about an individual; and a process for challenging the accuracy of such data. Finally, the FAA would be required to post the data collection statement on the Internet.

In addition to the data collection statement, any law enforcement agency which operates a drone must file with the FAA a "data minimization statement." This statement must include policies adopted by the agency that

[129] H.R. 1262, 113th Cong. (2d Sess. 2013).

- minimize the collection of information and data unrelated to the investigation of a crime under a warrant,
- require the destruction of data that is no longer relevant to the investigation of a crime,
- establish procedures for the method of such destruction, and
- establish oversight and audit procedures to ensure the agency operates a UAS in accordance with the data collection statement filed with the FAA.

H.R. 1262 includes several enforcement mechanisms. First, the FAA may revoke a license of a user that does not comply with these requirements. The Federal Trade Commission would have the primary authority to enforce the data collection requirements just stated. Additionally, the Attorney General of each state, or an official or agency of a state, is empowered to file a civil suit if there is reason to believe that the privacy interests of residents of that state have been threatened or adversely affected. H.R. 1262 would also create a private right of action for a person injured by a violation of this legislation.

Conclusion

The introduction of drones into American airspace raises many legal and policy questions. For instance, how far can the government go in its attempts to maintain security and ensure that laws are enforced? What level of privacy should Americans expect in an age where technology facilitating the acquisition of personal information expands at a phenomenal pace? Currently, there is a vast body of Fourth Amendment law that governs the circumstances in which law enforcement must obtain a warrant before conducting surveillance. However, the sheer sophistication of drone technology and the sensors they can carry may remove drones from this traditional Fourth Amendment framework. Beyond the courts and the Constitution, what role should Congress and the President play in regulating the introduction of drones inside the United States? As the integration of drones for domestic surveillance operations quickly accelerates, these questions and others will be posed to the American people and their political leaders.

UAS State Privacy Considerations

Unmanned Aircraft Systems (UAS) are emerging technologies that have the potential to transform America providing wide ranging economic, environmental, and safety benefits. A recent study[i] conservatively estimates that 103,776 high paying jobs could be created and state tax revenue could exceed $482 million by 2025. Every year the integration of UAS into the aviation system[ii] is delayed, America will lose more than $10 billion in potential economic impact. Yet, over 40 states have drafted or passed UAS privacy regulations that would prohibit the use of UAS.

UAS applications include: firefighting, chemical and HAZMAT detection, crop dusting, agricultural development, monitoring of pollution, pipelines, wildlife, traffic, and floods, search and rescue, aerial news coverage, delivering medical supplies to remote areas, aerial photography, filmmaking, communications, broadcasting, arctic and volcanic research, forensic photography, damage assessment, cargo transportation, port, border, and event security, real-estate photography, etc. In addition to these direct benefits, UAS implementation will spawn many new industries and provide an incredible array of manufacturing, operation, and other high paying job opportunities.

Along with these benefits come concerns about individual privacy. There is an existing body of federal, state and local law relating to privacy. The question is whether existing law is adequate, absent extensive judicial review, to alleviate the concerns of state legislators and citizens regarding privacy rights in light of this new technology. Because this technology can use a variety of sensors and some can potentially loiter for long periods of time without detection, there is a fear that government can use these systems to monitor individuals in a way that was not imagined in Supreme Court 4th Amendment rulings based on the presumption of privacy[iii]. Because state law interacts with Federal 4th Amendment rulings, it is appropriate for states to enact legislation addressing this issue. The challenge is to provide privacy protection without impeding the use of UAS in order to achieve UAS' many benefits.

Because of the complexity of this issue and the importance of privacy to citizens in every state, representatives of the Aerospace States Association (ASA)[iv], the Council of State Governments (CSG)[v], and the National Conference of State Legislatures (NCSL)[vi] have joined together to create considerations for states to evaluate in developing UAS legislation. As part of our impartial deliberative process, UAS privacy stakeholder associations including the ACLU, EPIC, and IACPvii, along with AUVSI – the industry trade associationviii -- and academicsix responded to our request to submit their suggestions for state privacy legislation to an independent law firm, Cadwalader, Wickersham & Taft LLPx.[xi] Their submissions can be seen at www.Aerostates.org/privacy. After deliberation, ASA, ASG, and NCSL provide the following considerations:

1. Warrants: A warrant should be required for government surveillance of an individual or their property where the individual is specifically targeted for surveillance in advance without their permission. All other observation activities should not require a warrant, to the extent allowed under Supreme Court rulings.[xii] Additionally, if there is not a specific person identified for surveillance in advance it is generally not possible to obtain a warrant. Requiring one would eliminate UAS benefits.

2. Information collected for commercial use should not be used for law enforcement purposes, without a warrant.
3. Commercial UAS and model aircraft flights should not track specific individuals without their consent.
4. No weapons should be permitted to be carried by any UAS.
5. Any images recorded during a civil or commercial UAS flight must be time- and date-stamped and show relevant GPS designations. If retained, these records must be corroborated with flight records for the UAS, show the purpose of the information collection, and be available for public viewing on request.
6. States should endorse The International Association of Chiefs of Police (IACP) "Recommended Guidelines for the use of Unmanned Aircraft"[xiii]. These guidelines define UAS and provide guidance for community engagement, system requirements, operational procedures, and image retention for UAS operations by law enforcement organizations.
7. Commercial UAS must be operated according to FAA safety and air traffic regulations[xiv] and in a manner not to present a nuisance to people or property.

End Notes

[i] Economic Impact of Unmanned Aircraft Systems in the United States, March 2013, http://qzprod.files.wordpress.com/2013/03/econ_report_full2.pdf.

[ii] The Federal Aviation Administration regulates all civil airspace, vehicles, and operators within the U.S. for safety and efficient airspace use through federal preemption. UAS safety regulations are being developed by the FAA. Until such regulations are in place, civil UAS operations must be specifically approved by the FAA. Government operations must comply with civil air traffic control directives. A lack of FAA permissive regulation and state prohibitions of UAS use delay integration of UAS into the aviation system and adversely affect America's global competitiveness in the development of this industry.

iii The crucial inquiry for Fourth Amendment protection is whether a person has a reasonable expectation of privacy that society is prepared to recognize. Courts have found that individuals may have a Fourth Amendment right against the unreasonable search and seizure of the area surrounding a house, referred to as the "curtilage." The Supreme Court has found that aerial surveillance over private property does not violate the Fourth Amendment if conducted by an aircraft in legally navigable airspace. However, this holding might not apply to UAVs and their unique capabilities, and arguably remains an open question.

[iv] ASA is a bipartisan organization that represents the grass roots of American aerospace. It is a 501(c)(3) scientific and educational organization of lieutenant governors, governor-appointed delegates, and associate members from industry and academia. ASA was formed to promote a state-based perspective in federal aerospace policy development and to support education outreach and economic development opportunities.

Draft

[v] Founded in 1933, The Council of State Governments is our nation's only organization serving all three branches of state government. CSG is a region-based forum that fosters the exchange of insights and ideas to help state officials shape public policy. This offers unparalleled regional, national and international opportunities to network, develop leaders, collaborate and create problem-solving partnerships.

[vi] The National Conference of State Legislatures is a bipartisan organization that serves the legislators and staffs of the nation's 50 states, its commonwealths and territories. NCSL provides research, technical assistance and opportunities for policymakers to exchange ideas on the most pressing state issues. NCSL is an effective and respected advocate for the interests of state governments before Congress and federal agencies.

[vii] In response to our request for information, papers were received from the Airborne Law Enforcement Association (including and referencing the guidelines from the International Association of Chiefs of Police Aviation Committee), the American Civil Liberties Union, the American Legislative Exchange Council, the Electronic Frontier Foundation, the Electronic Privacy Information Center and the National Association of Criminal Defense Lawyers. In addition, the State of Alaska Department of Law provided legal analysis.

[viii] The Association for Unmanned Vehicle Systems International is the world's largest non-profit organization devoted exclusively to advancing the unmanned systems and robotics community. Serving more than 7,500 members from government organizations, industry and academia, AUVSI is committed to fostering, developing, and promoting unmanned systems and robotic technologies. AUVSI members support defense, civil and commercial sectors.

[ix] Douglas Marshall, New Mexico State University, and Paul Voss, Smith College responded to our requests.

[x] Cadwalader, Wickersham & Taft LLP (www.cadwalader.com), established in 1792, is one of the world's leading international law firms, with offices in New York, Washington, D.C., Charlotte, Houston, London, Hong Kong, Beijing and Brussels. Cadwalader has provided pro bono legal services to ASA for over 20 years.

[xi] Our review also included the Congressional Research Service's report "Integration of Drones into Domestic Airspace: Selected Legal Issues, April 4, 2013 and Office of Civil Rights and Civil Liberties, U.S. Department of Homeland Security September 14, 2012 Memorandum for the Secretary.

[xii] Under current law any aircraft can photograph anything outside a home or building. While the surveillance capabilities of UAS are not significantly different

DRAFT

from other surveillance means, we believe that it is prudent to require a warrant for surveillance of a person specifically targeted because of the unique characteristics of UAS.

ALEC | American Legislative Exchange Council

LIMITED GOVERNMENT • FREE MARKETS • FEDERALISM

Proposal for American Legislative Exchange Council (ALEC)
Unmanned Aerial Vehicle Proposal

Program Objective

The objective of ALEC's Unmanned Aerial Vehicle (UAV) program is to educate our policy makers about the issues surrounding the use of UAVs for domestic purposes. We will inform our state legislator members about considered uses for UAVs in law enforcement, border control, firefighting, search and rescue operations and myriad other uses. We will explore the privacy issues involved and would like to present our members a balanced overview of the topic that addresses some of the misconceptions about UAV capabilities and the benefits of UAV use in the domestic sphere.

Situational Overview

State legislatures are rapidly enacting legislation on domestic UAV use without a complete understanding of the issues involved. As of this writing, 35 states had considered or were considering legislation, including Virginia which passed legislation restricting the use of UAVs, including a two-year moratorium on using UAVs except in university research and search and rescue missions.

State legislators are concerned that UAV surveillance could threaten the civil liberties, especially the privacy of their constituents, so the trend in the legislatures is to err on the side of highly restrictive regulations. Unfortunately, these restrictions might ultimately prevent civilian institutions from taking advantage of UAVs as a cost-effective tool to perform their duties more efficiently during a time of shrinking state budgets. In many cases, ALEC legislators are spearheading these restrictive policies, often due to an incomplete understanding of the issues involved and UAV capabilities.

If misconceptions are not corrected in the immediate future, misguided policy will continue to proliferate throughout state legislatures, and this policy is likely to inform future *national* policy on the domestic use of UAVs. As appropriate UAV implementation could help states meet their public safety objectives in a fiscally responsible way, we would like to see the issues surrounding their use explored in a complete and objective manner.

Program Description

A two-pronged approach would be the most effective way to deal with the issue.

ALEC International Relations Task Force (IRTF) Membership

Model policy on the domestic use of UAVs falls under the jurisdiction of ALEC's International Relations Task Force/National Security Subcommittee, and we anticipate that the task force will consider such policy in the very near future. Issues that capture our members' attention the way this one has are generally brought to ALEC. ALEC task force membership would afford the member

the opportunity to participate in the discussions on the model policy and to inform and enrich the debate. The IRTF is relatively small (well over 100 legislators and 6 private sector members) and has the flexibility to consider and vote on model policy for domestic UAV use rapidly. If this policy is passed within the task force and approved by ALEC's Legislative Board of Directors, it becomes official ALEC model policy and can be accessed by all of our state legislators. Other issues that the task force has explored and continues to discuss include Sequestration, Civilian/Commercial Applications for NASA Research, Sustainable Energy Best Practices in the Military and Overseas, H1B visa expansion, Earth Observation, Expanding the Commercial Marketplace for Space Launches, etc.

The issue of our bimonthly magazine *Inside ALEC* that will be distributed at our Annual Meeting in August 2013 in Chicago will focus on International and Energy issues. An article on domestic uses for UAVs would be a welcome addition to the magazine and would automatically be distributed to those in attendance at the meeting – roughly 1,000 state legislators as well as 1,000 policy and business leaders from across the country. Such distribution would give the issue a deserved spotlight. An article in ALEC's blog, *The American Legislator*, could appear before the Annual Meeting.

UAV Educational Sponsorship Opportunity at ALEC Spring Task Force Summit
ALEC's Communications and Technology Task Force will host a panel discussion/lunch to explore the domestic uses of UAVs at ALEC's Spring Task Force Summit on May 3 in Oklahoma City, OK. We expect 30-40 state legislators to attend. Two speakers who favor more restrictions on the use of UAVs have already been confirmed – Jim Harper a noted privacy expert from the Cato Institute and Ryan Kiesel a noted privacy advocate from the American Civil Liberties Union (ACLU). Both will thoroughly cover the privacy challenges UAV technology poses. This will be our members' first exposure to this issue at an ALEC event, and ALEC wants to ensure that we approach the issue in a balanced fashion. We will have presenters who will emphasize some of the benefits of the domestic uses of UAVs, and the sponsor would be able to select two presenters that would offer this point of view. We would also ask the additional panelists to address the general aviation challenges facing domestic UAVs. We would provide travel expenses for four additional ALEC public sector members from the International Relations Task Force to attend and/or moderate the panel from select states currently considering UAV policy.

Annual Meeting Workshop Sponsorship
This year's Annual Meeting will take place in Chicago, IL August 7-10, 2013 where we expect roughly 2,000 state legislators, policy experts and business leaders to be in attendance. Workshops are panel discussions open to all attendees at our Annual Meeting, and we are confident that a panel discussion on the domestic uses of UAVs would be exceedingly popular. We also have workshop sponsorships at our States and Nation Policy Summit in early December 2013 which generally has attendance of 700-800 state legislators, policy experts and business leaders.

Additional Thoughts
This is a timely issue where our members need a better understanding to make informed decisions. However, this topic is also an excellent opportunity to introduce the concept of civilian applications for products that were originally intended for military and/or space applications and to highlight the critical role that public private partnerships in research play in innovation and economic growth.

May 30, 2013

Bob Davis
Cadwalader
700 6th Street, NW, Suite 300
Washington, DC 20001

Dear Mr. Davis:

On behalf of the American Civil Liberties Union (ACLU), a non-partisan organization with more than a half million members, countless additional activists and supporters, and fifty-three affiliates nationwide, we appreciate the opportunity to comment on the privacy and civil liberties implications of domestic use of unmanned aircraft systems (UAS), also known as drones, and to recommend new protections for use of the technology.

Like any powerful surveillance tool, UAS have the potential to be used for good or ill. With implementation of good privacy ground rules, we can enjoy the benefits of this technology without bringing our country closer to a "surveillance society" in which every move is monitored, tracked, recorded, and scrutinized by the authorities.

UAS share some characteristics with manned aerial surveillance, such as planes and helicopters, but their threat to privacy is substantially greater in both scope and volume. Manned aircraft are expensive to purchase, operate, and maintain. They require trained pilots and ground crews and must land in order for pilots to rest. The expense both in dollars and in staffing has always imposed a natural limit on the government's aerial surveillance capacity. UAS's low cost and flexibility erode that natural limit. As technology improves, small, hovering devices will be able to explore hidden spaces, peer in windows, or even, potentially, enter homes, and large static blimps will enable continuous, long-term monitoring – all for much less than the cost of a helicopter or plane.

In our society, it is a core principle that the government does not collect information about individuals' innocent activities just in case they do something wrong. But UAS threaten to turn that principle on its head. What would be the effect on our society if everyone felt the keen eye of the government at all times? Psychologists have repeatedly found that people who are being observed tend to behave differently than when they are not being watched. This effect is so great that a recent study found that "merely hanging up posters of staring human eyes is enough to significantly change people's behavior."[1] There is a real danger that, if faced with the prospect of unregulated UAS, people will change how they behave in public – whether at a political rally or in their own backyards.

[1] Sander van der Linden, "How the Illusion of Being Observed Can Make You a Better Person," Scientific American, May 3, 2011, online at http://www.scientificamerican.com/article.cfm?id=how-the-illusion-of-being-observed-can-make-you-better-person; M. Ryan Calo, "People Can Be So Fake: A New Dimension to Privacy and Technology Scholarship," 114 Penn St. L. Rev. 809, online at http://www.pennstatelawreview.org/articles/114/114%20Penn%20St.%20L.%20Rev.%20809.pdf.

UAS may also suffer from the problems we've seen with video surveillance – voyeurism,[2] racial profiling by operators,[3] and automated law enforcement.[4]

The Supreme Court has not yet had occasion to consider whether the Fourth Amendment places limits on government use of UAS. However, it has allowed some warrantless aerial surveillance from *manned* aircraft. Most notably, in the 1986 decision *California v. Ciraolo*, the Court ruled that there was no intrusion into Ciraolo's privacy when police borrowed an airplane, flew it over his backyard and spotted marijuana plants growing there, because "[a]ny member of the public flying in this airspace who glanced down could have seen everything that these officers observed."[5]

Nonetheless, because of their potential for pervasive use and their capacity for revealing far more than the naked eye, there are good reasons to believe that UAS may implicate Fourth Amendment rights in ways that manned flights do not. In both *Dow Chemical Co. v. United States*[6] and *Kyllo v. United States*,[7] the Supreme Court suggested that using sophisticated technology not generally available to the public may be considered a search under the Fourth Amendment.

Further, the Supreme Court has suggested that the continuous use of a surveillance technology may heighten Fourth Amendment concerns. In *United States v. Knotts*, although the Court concluded that the use of the beeper in that case did not violate the Fourth Amendment, it held that if "such dragnet type law enforcement practices" as "twenty-four hour surveillance of any citizen of this country" ever arose, it would determine if different constitutional principles would be applicable.[8] Similarly, in *United States v. Jones*, five justices agreed (in two concurrences) that when the government engages in prolonged location tracking, it conducts a search under the Fourth Amendment.[9] While this decision may eventually play a role in regulating drone usage, the technology is moving far more rapidly than our jurisprudence, and it is critical that state legislatures act to protect their constituents' privacy.

State legislation should reflect the following key principles:

First, no one should be spied upon unless the government believes that person has committed a crime. Drone use over private property should occur only with a search warrant based on probable cause – the same standard used to search someone's house or business. It might be permissible to monitor individuals in public at a lower standard – perhaps reasonable suspicion – but the key is to prevent mass, suspicionless searches of

the general population, including for intelligence gathering. Exceptions to this rule should be limited to emergencies connected to life and safety or narrowly drawn administrative exceptions in order to prevent pretextual use of drones.

Additionally, while the Constitution may permit UAS surveillance of public spaces on less than a probable cause standard, the vast majority of the 96 different drone bills being considered in 43 states this legislative session[10] require law enforcement to get a probable cause warrant before using a drone in an investigation, whether that investigation occurs in private or public space, a good indicator that a warrant requirement for drone use is both workable and palatable. Already, warrant requirements have been enacted in Florida,[11] Idaho,[12] Montana,[13] and Tennessee.[14]

Second, images of identifiable individuals captured by law enforcement UAS should not be retained or shared unless they are of the target of the investigation that justified drone deployment, and there is reasonable suspicion that the images contain evidence of criminal activity or are relevant to an ongoing investigation or pending criminal trial.

Third, while drone use should be permitted for reasonable non-law enforcement purposes where privacy will not be substantially affected, such as geological inspections or environmental surveys, information collected by drones for one purpose should not be used for another purpose such as general law enforcement or enforcing administrative laws.

Fourth, drones should not carry weapons.

Finally, oversight is crucial. Communities must play a central role in deciding whether to purchase drones, and the policies and procedures for the use of UAS should be explicit and written, and should be subject to public review and comment. Similarly, like any new technology, drone use must be monitored to make sure it's a wise investment that works.

Placing reasonable limitations on law enforcement is by no means a new idea – for example, authorities may take a thermal image of someone's home only when they get a warrant – and it is imperative that we implement a system of rules to ensure that we can take advantage of UAS technology without sacrificing our privacy. If you have any questions, would like to discuss the issue further, or would like to see ACLU's model state legislation, please don't hesitate to reach out to me at abohm@aclu.org or (212) 284-7335.

Sincerely,

Allison S. Bohm, Advocacy & Policy Strategist

Legislative Task Force on Unmanned Aircraft Systems

To: Members of the Legislative Task Force on Unmanned Aircraft Systems

From: Representative Shelley Hughes, Co-Chair
Senator Donny Olson, Co-Chair

Date: October 16, 2013

Re: Meeting Announcement for October 24, 2013 - UPDATE

The Legislative Task Force on Unmanned Aircraft Systems is soliciting public testimony from businesses interested in the UAS industry in Alaska on Wednesday, October 23, 2013 at the Anchorage Legislative Information Office, 716 W 4th, Suite 220, Anchorage or by calling 855-463-5009. Testifiers must be scheduled in order to provide comments. Testifiers must schedule with Ginger Blaisdell by calling 907-465-5265 or emailing ginger.blaisdell@akleg.gov.

The Legislative Task Force on Unmanned Aircraft Systems will meet on Thursday, October 24, 2013 at the Anchorage Legislative Information Office, 716 W 4th, Suite 220, Anchorage.

The Task Force will meet from 8:30am – 11:30am, followed by public testimony beginning at 1:30pm and ending at 4:30pm.

Public testimony may be received telephonically by calling 855-463-5009.

Task force documents will be posted on BASIS.

Please feel free to contact the Task Force aide, Ginger Blaisdell at 465-5265 with questions.

Rep Hughes will host a day of invited testimony from those interested in UAS business in Alaska – task force members are invited to attend or call in to listen to testimony during the day. Please feel free to distribute this flyer to anyone you think may be interested in testifying on Wednesday and invite individuals to also call in on Thursday afternoon for open public testimony.

Wednesday, Oct 23
8:00am – 5:00pm
Anchorage LIO room 220
Or call 855-463-5009
This will be scheduled testimony only (see attached announcement – this announcement will be emailed tonight to more than 500 who have expressed interest in UAS in Alaska)

Thursday, Oct 24
8:30am – 5:00pm
Anchorage LIO room 220
Teleconference lines will be open all day 855-463-5099
Task Force Meeting schedule:

8:30-10:00am Greg Walker, Ro Bailey (possible Harry Keiling DOI and Jay Skaggs FAA)
"Overview of FAA Guidelines"
10:00-10:30am Privacy concerns presentation and discussion
10:30-11:30am discussion of points to consider from Oct 2 meeting minutes
Discussion may cause us to continue into the lunch hour
Lunch 11:30a-1:30p
1:30pm-4:30pm public testimony
4:30 – 5:00pm closing remarks and next steps

Legislative Task Force on Unmanned Aircraft Systems
Public meeting October 23 and 24, 2013
Legislative Information Office Room 220
716 W 4th Ave, Anchorage, AK

Due to the cancellation of the Unmanned Aircraft Interest Group Annual Meeting, Representative Hughes is soliciting conversations from businesses interested in unmanned aircraft systems (UAS) and related industries.

Representative Hughes will schedule testimony for individuals originally planning on attending the UAS Interest Group Annual Meeting and others interested in conducting UAS related business in Alaska. The testimony will be taken on Wednesday, October 23 beginning at 8:00am and ending by 5:00pm. Depending on response from this announcement, each testifier will be given 10-15 minutes. Scheduled testimony time slots will be assigned by first-come, first-serve.

Additionally, the Legislative Task force on Unmanned Aircraft Systems is holding a meeting from 8:30am – 11:30am Thursday, October 24, and is requesting open public testimony from 1:30pm – 4:30pm that same day.

You can attend in person or call on the toll free number 855-463-5009. This information will be consolidated and provided to the entire Legislative Task Force on Unmanned Aircraft Systems for their consideration when drafting legislation. Please call 907-376-3725 to schedule a time to testify on Wednesday. You may call the toll free number to listen at any time during the day. When testifying, you will be asked to provide the following:

Your name
Business name
Contact information
Business category: technology, manufacturing, flight operations, other
Business client: private business, government sub-contractor

As a suggestion for organized testimony and because time may be short for each business, you may be asked the following as it pertains to your business use:

- Have you received assistance or encouragement in establishing your business in Alaska? (Economic development organizations, DCCED, UAF, FAA, DOD, DOI, other?)
- Are there any business-related obstacles for conducting your line of business in Alaska? (business license, insurance, state infrastructure, trained workforce, taxes, etc.)
- Do you have any specific recommendations that need to be included in state law to help your business?
- Are there any groups or business types that should NOT be authorized to conduct business using UAS?
- Do you have any specific recommendations that may be needed to address public privacy?
- We are open to any other comments you want to share with the Task Force.

The Legislative Task Force on Unmanned Aircraft Systems is holding a meeting from 8:30am – 11:30am Thursday, October 24 and is requesting public testimony from 1:30pm – 4:30pm that same day.

Anyone not able to participate in any public comment period listed above is invited to send their remarks in writing to Representative Hughes, 600 E Railroad Ave, Wasilla, AK 99654 or email representative.shelley.hughes@akleg.gov.

Any questions regarding this announcement, please contact ginger.blaisdell@akleg.gov or call 907-376-3725.

Unmanned Aircraft Systems Legislative Task Force

Summarized Minutes of the October 23 and 24, 2013 meeting

Task Force Members in Attendance:

- Representative Shelley Hughes, Co-Chair
- Lieutenant Steve Adams, Commissioner Designee, Department of Public Safety
- Steve Strait, Aviation Advisory Board, Governor's Office and DOT/PF
- Steve Colligan, Representative Member for the Academy of Model Aeronautics
- Greg Walker, Director of UAF ACUASI
- Ro Bailey, Deputy Director of UAF ACUASI
- Mike O'Hare, Director of Homeland Security, DMVA

Committee Staff

- Ginger Blaisdell, Staff to Rep. Hughes

Guest Attendees

- Howard Martin, FAA
- Kathleen Strasbaugh, Legislative Legal Services

Meeting Summary:

I. Welcome and Introductions — Representative Shelley Hughes

Task Force responsibilities per HCR6

The duties of the task force shall include (1) reviewing regulations and guidance from the Federal Aviation Administration regarding unmanned aircraft systems; (2) providing written recommendations, together with suggested legislation, for a comprehensive state policy for unmanned aircraft that protects privacy and allows the use of unmanned aircraft systems for public and private applications; and (3) submitting, not later than January 15, 2014, an initial report to the legislature and, not later than July 1, 2014, submitting a final report to the legislature.

Wednesday, October 23, 2013

Public Testimony Summary of Comments and Recommendations to Task Force

Ben Geilow AUVSI

- Safety and privacy are important so that people trust this market.

    - Code of conduct
    - Endorsed IACP – approved by the ACLU
- 4th Amendment already provides protection of citizens
- Transparency and accountability by UAS users

Brian Whiteside Cascade Chapter AUVSI (Oregon)

- Integrate technology in an exciting and responsible way
- Considerations for data retention
- "gold rush" in Alaska because lower 48 is approaching UAS in a restrictive way

Mark Stigar, MPI Alaska, Wasilla

- How to control the information?

Tyler Hawker/Chris Barton,

- These technologies are in their infancy – prepare for change
- Develop safe operating procedures:
    - Aircraft certification and qualification (not overreaching and cost prohibitive)
    - Pilot certification and qualification (how to be safe without over doing)
    - Environmental and population considerations (integration into population)
    - Test site range cooperation between states – fear of fragmentation of range operations and unify safety protocols
    - Weather considerations – follow the same criteria as manned aircraft, visual flight rules
- How to transition from hobby to commercial use - training and education
- Pilot certification and training to include ground school at a minimum plus software training, safety documentation and pilot log records
- Definitions:
    - Range
    - UAV
    - Flyable condition
    - Data retention schedule
    - Range operations and coordination – who do I report to? Who notifies FAA?
    - Payload requirements

John Parker

- Need balance between: Public's right to know and Public's right to privacy

Ben Miller, Mesa County Sherriff's office

- What we are / are not going to do
- What is legal jurisdiction – search and seizure laws
- Talk to public constantly about UAS activities

Al Palmer, UND

- North Dakota Governor created the Airspace Integration Team made up of stakeholders in UAS operations that was tasked to educate citizens across NorthDakota
- Research Compliance Committee:
    - 19 members that determined what tasks would be acceptable uses for UAS (crime scene, search and rescue, search for major crime suspects...)
    - Committee determined how long to keep data
- Post signs when using UAS and reverse 911

Steve Wackowski

- Definitions:
    - Autonomous
    - Command control
    - What if you lose a link

Adam White, AK Airmen's Assoc

- Doesn't want the FAA shutting down airports for UAS operations

Thursday, October 24, 2013

Call to Order and Welcome from Co-Chair Hughes

N-8900 Overview of FAA Unmanned Aircraft Systems Operational Approval

Greg Walker and Ro Bailey: Overview of the FAA operations guidelines for use of UAS Operations

Law Enforcement Review

Lt. Steve Adams, Alaska State Troopers: Law Enforcement Use and How to Enforce UAS Operations; Overview of IACP Guidelines

Discussion regarding items to be considered for Committee action

The Task Force would like a draft bill at the next meeting and will consider supporting documents and a Task Force Executive Summary as the required report to the legislature January 15, 2014.

1. **Public Privacy: Legal Services Memo regarding Alaska Laws Protecting Privacy**
    a. It was determined by the task force that the State of Alaska has sufficient privacy protection in the constitution and statute. Every scenario that was considered in detail by the task force was determined to fall under one or more of Alaska's existing privacy laws.

b. Inadvertent capture of evidence of illegal activity was discussed at length and determined that sufficient statute, operational protocol, and court findings provide direction to law enforcement on how to appropriately use (or not use) inadvertently captured data.

2. **Observations from Above: Harvard recommendations for consideration into law**
    a. How to draft language that does not affect the rapid changes in technology – the task force believes that most technology changes can be managed under existing laws
    b. Should flight hours be a consideration for use? Task force recommendation was that placing a limitation on flight hours would not be in our best interest.
    c. Should the task force recommend adoption voluntary approaches of self-managed rules of UAS? The task force would like to adopt the International Association of Chiefs of Police aviation committee recommended guidelines for UAS. The task force is continuing to review the AUVSI and Academy of Model Aeronautics guidelines.
3. **Suggestions for legislation:**
    a. Is the approach from the committee to restrict all use and provide for exemptions in statute (like Texas) or to allow all use and restrict where it is deemed necessary? Task force recommendation is to allow all use and restrict only when necessary.
    b. Task force discussed that no areas of federal preemption would be crossed with regard to flights in FAA national airspace and safety guidelines. No specific recommendation for training requirements of UAS pilots was decided on.
4. **Aerospace State Association:**
    a. The task force considered audits of UAS operators and missions and has not recommendations for management of UAS operations at this time.
    b. No blanket prohibitions for use by law enforcement were recommended.
    c. High visibility marking of UAS for law enforcement was considered to be a good idea.
    d. UAS privacy considerations were discussed by the task force including
        i. warrants (no change recommended)
        ii. data concerns (data retention is managed in Article IV statutes – no change recommended)
        iii. individual consent (no change recommended)
        iv. weapons (no change recommended, FAA already prohibits weaponized UAS)
        v. endorsing professional guidelines (IACP)
        vi. emphasize FAA regulations
5. **Recommendations to consider in draft legislation**
    a. Encourage education provisions to train UAS pilots by the University of Alaska
    b. Specialized (high visibility) marking of UAS or lights so that other aircraft can see them
    c. Economic development – marketing this industry for Alaska

d. Barriers for business – insurance for private operators
e. Who is responsible for educating the public about UAS? (each agency that is using UAS will provide education to public regarding their missions)
f. Audits of UAS mission types for public use; state internal review process; sunset?
g. Include a statutory position to manage the test range(s) and UAS paperwork
h. Consideration of incentive grants to businesses looking to establish themselves in Alaska
i. Research appropriation to UAF ACUASI since original funding may be running out and Federal funding is not included in test site selection
j. Definitions – yes: definitions to be determined – please provide words to Ginger

Opened teleconference for public testimony

Closing remarks

- Ginger will summarize the meeting discussion and request draft legislation for consideration at the task force next meeting.
- Task force will meet on Tuesday, November 26 at the Wasilla LIO from 1:00PM – 4:00PM to consider the draft legislation and receive additional public testimony.

Meeting adjourned

After the meeting adjourned the following questions were received for consideration at the next meeting.

- Should the task force consider language for the use of UAS for hunting/fishing purposes? Are UAS treated the same as manned aircraft in existing laws and regulations?

- Should the task force consider language restricting UAS flights near correctional institutions?

- Should the committee adopt some of the FAA guidelines that we want to insure are adopted in Alaska in the event FAA removes those requirements: e.g.; currently FAA does not allow anything to be dropped from a UAS (maybe we can adopt that but include "without explicit exemption for a specific mission approved by test site administrator")

- Will anything be needed to bridge the gap between hobby and commercial/government UAS pilot training qualifications?

- Call Act "Innovation and Industry Act" rather than "Privacy Act"

Good morning all,

For those of you who are wondering why you are receiving an email from Representative Hughes; we were allowed to use a compiled list of individuals interested in UAS goings on in Alaska. I plan to use this distribution list to keep everyone updated periodically on the status of the Task Force meetings and legislation as it works its way through the legislative process.

Last Legislative session, the Legislative Task Force on Unmanned Aircraft Systems was established under HCR6. The Task Force has participated in two teleconference meetings this summer/fall and will convene in person on October 24, 2013 at the Anchorage Legislative Office Bldg for an all-day meeting and collection of public comment. You are invited to call in to listen to any part of the meeting or to provide public testimony on Thursday.

With the onset of the Federal government furlough, the UAS Interest Group Annual Meeting was cancelled for October 22-23, however, the Task Force would appreciate hearing from those involved in the business of UAS to better understand the industry as we begin to draft legislation to be introduced this January. It is important that we understand what obstacles you may have conducting business in Alaska, any privacy concerns, restrictions for use of UAS, or broadening of authority to operate UAS in Alaska. We appreciate your remarks to make the best policy for Alaska and the industry.

The attached flyer provides all the details to be scheduled to provide testimony on Oct 23 and 24. Please contact Ginger Blaisdell at 907-376-3725 to schedule a 10-15 minute time slot on Wednesday, October 23 to share your remarks with the Task Force. I understand there is little time to prepare and your testimony does not have to be formal. If you prefer to send your comments, suggestions, or concerns in writing, please send them to ginger.blaisdell@akleg.gov.

Documents provided to the Task Force can be found by clicking on the "folder icon" at the right side of the meeting announcement in the legislative information system. Please click on this link to view the documents and minutes from the latest Task Force meeting.

http://www.legis.state.ak.us/basis/get_hearing.asp?session=28&Chamb=B&Date1=10%2F23%2F2013&Date2=10%2F24%2F2013&Comty=&Root=&Sel=1&Button=Display

If you no longer want to receive emails from my office, please reply "REMOVE FROM LIST". Your name will NOT be removed from any other UAS related list.

I look forward to hearing from you,

Shelley Hughes

Representative
Alaska State Legislature

House District 8 Greater Palmer

600 East Railroad Avenue

Wasilla, Alaska 99654

(907) 376-3725

1-800-565-3743

DRAFT Alaska UAS Workshop Agenda for 2013

DAY One:

0900 - 0915

A. Welcoming remarks
B. Harry opens meeting with welcome and administrative remarks
    a. Welcome keynote speaker

0915 - 0945

C. Opening remarks by Senator Begich or Senator Murkowski

0945 - 1030

D. ACUASI (Greg and Marty) Would like Bob McCoy to introduce
    a. Charter
    b. Vision
    c. Structure
    d. State benefit
        i. State governments
        ii. Commercial users
        iii. Civil users
    e. National Benefit

1030 – 1100
MORNING BREAK

1100 – 1230

E. FAA Test Site (Ro, Tim and Leonard)
    a. Basics of Proposal Requirements
    b. Overview of the Test Site structure and its operating principals
    c. Overview of Airspace
    d. Overview of Partners
        i. How Partners contributed to Proposal Requirements
    e. State Contributions (unique distinctions that each state brings)
        i. Unique Alaska Distinctions
        ii. Unique Oregon Distinctions
        iii. Unique Hawaii Distinctions
        iv. Combined Distinctions that set the PPUTRC apart
    f. Other Test Site Contenders

1230 -1330
LUNCH

1330 – 1500

F. New FAA guidance (FAA UAS Program Office)
    a. Update from FAA UAS Program Office
        i. Update on Public Law 112-95, Section 332D

ii. Other updates
b. 8900.277 (FAA)
i. COA Requirements
ii. SMS (Appendix D)
iii. The process by which State agencies and commercial/civil entities might be allowed to get a COA thru UAF
iv. Users perspective of 8900.277

1500 – 1530
AFTERNOON BREAK

1530 - 1630
G. Restricted Category Discussion (FAA)
H. Civil versus Public authorization process, and operations (FAA Alaska)

1630 – 1700
Day One Wrap-up (Harry and Greg)

1830 till 2200
POTLUCK at Jay Skaggs house

DAY Two: (All operations and Activities (planned) in Alaska and Arctic)

0830 - 0845
A. Welcoming remarks: Jay welcomes and opens day two with further administrative remarks

0845 – 0945 (This should be all the other Universities plus UAF presenting)
B. Arctic focused UAS Work Conducted by Educational Institutions
a. Science Work
i. List Universities
1. UND
2. NMSU
3. UAA program
4. Kansas State
5. Others??
b. Certification of Aircraft, Ancillary Equipment and/or Personnel
i. List Universities
1. UND
2. NMSU
3. UAF Community College (need to verify)
4. UAA program
5. Others??
c. UAA Aviation School contribution

d. UAF Engineering School contribution
e. Training of Personnel
    i. List Universities
        1. UND
        2. Others??
f. SMS
    i. List Universities
        1. UND
        2. NMSU
        3. UAA program
        4. Kansas State
        5. Others??

0945 - 1030

g. Operational Work
    i. List Universities
        1. UAF
        2. University of Colorado
        3. Kansas State

1030 – 1100
MORNING BREAK

1100 – 1230 (This may be too much for 1.5 hours)

C. Recent Activities with UAS in Alaska
    a. MIZOPEX with NASA, University of Colorado, UAF (NASA and NASA)
    b. Oil Industry—Why UAS in the Arctic is Important
        i. Conoco Phillips
        ii. ENI
        iii. BP
        iv. Alaska Clean Seas
    c. USCG
        i. Healy operations
        ii. Kodiak operations
    d. NOAA
    e. Other Companies
        i. AeroVironment
        ii. Insitiu
    f. Law Enforcement
    g. Search and Rescue
    h. Alaska State Emergency Management Center (Fusion Center) (SSgt Campbell)
    i. Military update
        i. Army
        ii. USAF

1230 – 1330

LUNCH

1330 - 1415

D. Other UAS Users

- **a. Resolution**
- **b. Alaska UVS**
- **c. Alaska Photos**
- **d. Alaska Aerospace**
- **e. Aerovironment**

1415 - 1445

E. Privacy discussion

1445 – 1515
AFTERNOON BREAK

1515 - 1600

F. Aviation Insurance and Liability Requirements

- a. USAIG UNITED STATES AIRCRAFT INSURANCE GROUP—UAS Insurance
- b. Crowell Group—Aviation Law with respect to Insurance and Liablity

~~F.~~

1600 - 1700

G. Meeting Review & Closing Remarks (Harry Kieling & Greg Walker)

- **a. What Have We Found Out During the Workshop?**
- **b. What Have We Learned?**
- **c. What are the Holes for Expanding UAS use in Alaska?**
- **d. How will the work being done by the FAA (PL 112-95) be used to proliferate UAS use in Alaska and what does industry need to bring to bear to help in this endeavor?**
- **e. What Topics Deserve Further Discussion?**
- **f. How Should We Proceed with These Issues?**
- **g. When Should We Meet Again?**

Save time, money, & lives

Only those testing or public entities have been allowed by FAA to fly UAVs.

In AK, 100 new jobs $20 M
3 yrs.
10 years = $100 M & many more jobs

Safety and privacy are important so that people trust this market

- code of conduct
- endorsed IACP = approved by ACLU

4th Ammendment already provides protection us constitution
applies to all new technologies and tools for 220 yrs.

transparency and accountability

let FAA allow test site to move forward before we establish new privacy laws.

Hughes any gaps in aerial surveillance laws now?

- legislative oversight and judiciary review retain control of electronic imaging.
- we are already protected for privacy

RO - making laws before / anticipating laws rather than making laws after an offense occurs?

- could stifle new uses of technology

Alaska. positive outlook is ahead of the curve
job market in Oregon = already created 120 new jobs
$120 million = 280M economic impact
in the past 7 years

Alaska has more opportunities for UAS than all USA combined

"dull-dirty-dangerous"

— the rest of the world is catching up and surpassing the USA

Commends Alaska in our efforts

- How will govt. collect and store data?
  data retention.

= integrate technology in an exciting and responsible way

= farming is huge industry potential

mapping =

"gold rush" in Alaska because lower 48 is approaching UAS in a restrictive way

- appreciates proactive approach of committee
- safety perspective:
  reduce risk of pilot jobs/accidents.
- embrace this technology

Greg" we should look at this as "what can existing aircraft do" if they were converted UAS.
= cost barriers?

— what look at industry has come down in cost? camera and video? small drone heli to do house patrol (vivint) today. almost everything in video'd.

How to control the information?

- refrain or move cautiously with legislation
  don't risk business or repeat existing laws
  == define definitions for UAS.
- privacy - plenty of laws on the books that cover UAS
- In Alaska - great potential for law enforcement, search & rescue, fires, volcanoes, climate.

Chris

- looking at UAS systems w/ weeping wings and de-icing capabilities.

- Colorado - no new laws re: UAV
  open to UAS business - working on policy / procedures

- Challenge for AK - volume of general aviation traffic

Tyler

- Some technologies are in their infancy
- develop safe operations and procedures
  1. aircraft certification & qualification = not overreaching and cost prohibitive
  2. pilot certification & qualification = how complex to be safe without overdoing
  3. environmental & population considerations.
     integration into population
  4. test site range cooperation between states
     fear of fragmentation of range operations.
     unified safety protocols.
  5. Weather considerations - follow same criteria as manned aircraft
     visual flight rules

transition from hobby to commercial use?
training and education
move from hobby to certification
↑ fee for service

Education: educate the public
benefits of UAVs

- Educating the public

- Tyler =
  pilot certification and training requirements.
  = FAA ground school (general aviation + communication with ground towers. etc. airspace
  = how to train software based systems.
  may not transfer from one platform to another

  FAA will likely put requirements on us.

- Chris =
  definitions:
  range
  UAV
  flyable condition
  data retention schedule
  range operations and coordination
  who do I report to
  who notifies FAA

  Payload requirements (how much weight can it carry)

Working with military primarily

- Would like states help with COA's
  doesn't impact ~~other~~ general aviation use business in the state
- doesn't want FAA shutting down an airport for a UAS

incorporate UAS into Alaska airspace

How to best get the word out that we want to fly UAS?

- "Modem" system doesn't work.
- associations can send notices to members
- media
- issues with being in radio range for some pilots.

United States Department of the Interior
BUREAU OF OCEAN ENERGY MANAGEMENT
Alaska OCS Region
3801 Centerpoint Drive, Suite 500
Anchorage, Alaska 99503-5823

OCT 2 3 2013

The Honorable Shelley Hughes
Representative
Alaska State Legislature
House District 8 Greater Palmer
600 East Railroad Avenue
Wasilla, Alaska 99654

Dear Representative Hughes:

The Bureau of Ocean Energy Management (BOEM) is responsible for managing exploration and development of mineral and energy resources in the Outer Continental Shelf, seaward of State boundaries. BOEM's Environmental Studies Program (ESP) supports research to collect information needed for assessment and management of potential impacts from oil and gas development and to enable BOEM to develop mitigation protocols to protect the Arctic environment and the Alaska Native subsistence way of life. The ESP has supported aerial surveys generally flying at altitudes between 1000-2000 feet to monitor distribution and movement of multiple species of marine mammals. Manned aircraft flights can be dangerous and expensive because of long transit times, hazardous weather conditions, fuel-capacity limitations and operation costs. The ESP remains interested in working with our partners to evaluate the use of UAS to help fill information gaps often unattainable from manned aircraft in remote, hazardous or sensitive areas where use of conventional aircraft may present logistical difficulties.

Since 1974, the ESP has supported large scale aerial surveys during the summer and fall to document distribution, relative abundance, and migration of marine mammals in the Beaufort Sea. This decades-long coverage provides one of the longest monitoring efforts of biological phenomenon, which is increasingly valuable during this time of changing Arctic environmental conditions. The geographic area of these aerial surveys was extended to also cover the Chukchi Sea in 2008. **As the use of Unmanned Aircraft Systems increases, it is important to ensure that protocols are developed to avoid conflicts between aerial and UAS surveys which may be proposed for the same geographic area during the same time period. We encourage this Legislative Task Force on Unmanned Aircraft Systems to address coordination with ongoing efforts as legislation is developed.**

When we submit our statement, as per the flyer for this, we have been asked to include the following, with proposed answers given in **bold**:

Your name – **Dee Williams, PhD**
Business name – **BOEM Environmental Studies Program**

Business category: **Government**
Business client: **Public**

Sincerely,

Sharon E. Warren
Acting Regional Director

Written Testimony

Of

Stephen J. Ingley
Executive Director
Airborne Law Enforcement Association

Before the
Legislative Task Force on Unmanned Aircraft Systems Public Meeting
State of Alaska

Good morning Representative Hughes and members of the Legislative Task Force on Unmanned Aircraft Systems. My name is Stephen Ingley and I am the executive director of the Airborne Law Enforcement Association (ALEA). ALEA is a 501(c)(3) non-profit educational membership organization, founded in 1968 to support, promote and advance the safe and effective utilization of aircraft by governmental agencies in support of public safety missions through training, networking, advocacy and educational programs. Our vision is the safe and successful completion of each airborne public safety operation. And our values are Safety, Education & Training, Networking, Public Service, Professionalism, and Ethics and Integrity. Our members operate traditional aircraft (airplanes and helicopters), alternative aircraft (light sport aircraft, gyro-copters and powered parachutes) and unmanned aircraft systems (UAS).

UAS technology has been successfully fielded by the US military in combating terrorism. As the war has drawn down, UAS manufacturers have developed more devices that are small, portable and reliable. More importantly, the manufacturers started to develop devices that were relatively inexpensive, making it conceivable that those agencies that could not afford traditional aviation assets, could afford small UAS (sUAS) technology.

Realizing the potential of this technology, in 2005, the ALEA became active in researching the feasibility of incorporating sUAS into the "toolbox" of public safety agencies. This included participating in the Federal Aviation Administration's (FAA) Proposed Rulemaking Committee for UAS, participating in the Department of Justice's, National Institute of Justice research projects for UAS, conducting UAS training for ALEA members, and working with various organizations and federal and state legislatures on UAS issues. In addition to this, the ALEA has taken the lead in public safety aviation by embracing this new technology, as we see the capabilities of UAS in enhancing the safety of our citizens and public safety employees.

It is a very common occurrence to see military operated UAS on national and local news programs. These devices are large, armed with weapons and operated in theater. Many times, articles have been written regarding the use of UAS technology by American public safety agencies, along with a photos of military grade Predators and Global Hawks. The depiction of military UAS devices within an article concerning public safety's use only heightens the fear of the public and fosters distrust. More importantly, it paints a picture that your local police or sheriff's department is going to operate Predator type UAS devices, capable of long-term, sustainable surveillance and rocket-launched weapons. This stylized hype couldn't be further from the truth.

While the military has been successful in its use of UAS technology to combat terrorism, American public safety is in its infancy in using these devices to combat crime, save lives and enhance the efficiency of agencies. Today, there are four local agencies that have FAA approval to operate UAS devices in their respective

jurisdictions. They are the Grand Forks County (North Dakota) Sheriff's Office, Mesa County (Colorado) Sheriff's Office, Arlington (Texas) Police Department and the Miami-Dade Police Department. Mesa County was the first agency to initiate utilizing UAS technology within their day-to-day operations. Being a very rural county in Colorado, this was a relatively easy process for them, as they had little impact on the national airspace and interfering with the safe operation of other aircraft. Although rural, Mesa County has pioneered the use of these devices for all agencies. What Mesa County has discovered is that these devices are not just a law enforcement tool, but also a tool for public safety generally, as well as government operations. For example, the Mesa County UAS program routinely assists its various fire agencies in responding to building fires. Their UAS devices are launched to provide fire incident commanders timely information regarding the fire that they are combating. In addition, the devices are routinely used for Search and Rescue (SAR) missions. sUAS are able to clear large areas of land (wooded and cleared) much faster than utilizing ground personnel. This permits the Mesa County rescuers to manage a SAR operation much more efficiently and enhances the chance of finding any victims much sooner by deploying search personnel smarter. Mesa County also utilized its sUAS to survey its county owned landfill for an annual land use survey. In the past, the county hired a company to conduct this survey using traditional aircraft and it cost taxpayers thousands of dollars. By using the county owned sUAS, the work was conducted for only hundreds of dollars, saving the county precious funds to allocate elsewhere.

In the province of Saskatchewan, the Royal Canadian Mounted Police, utilizing a sUAS, was recently credited with the first public safety SAR mission that directly resulted in saving someone's life.

I would like to highlight an event that occurred in Baltimore County (Maryland) recently. On May 28, 2013, a large container vehicle and a CSX freight train collided at a vehicle crossing. This incident occurred in an area that is near the city of Baltimore and in an area of mixed commercial and residential use. In addition, the incident occurred less than one half mile from Interstate 95, a major north and south thoroughfare. The incident included the explosion of a railroad car carrying hazardous materials and serious damage to commercial, government and personal property miles away. Immediately after the incident occurred, the Baltimore County Police Department launched one of their turbine engine helicopters to provide command and control support for the Baltimore County Fire Department incident commander (clearly not a law enforcement mission). The aircraft provided an "eye-in-the-sky" for the incident commander and continuously downlinked the images to the incident command post, Emergency Operations Center and within the county's intranet for police and fire commanders. Although the county used its traditional aviation resources to complete this mission, the mission could have been conducted by a sUAS at a fraction of the cost. The turbine engine aircraft costs approximately $400.00 per hour to operate, and they were on-scene for several hours with multiple aircraft. A sUAS would have only cost the agency approximately $25.00 per

hour to operate and would have provided the same aerial images to the fire and police commanders.

Of course, Mesa County and the other agencies use their sUAS for law enforcement missions as well. These missions include, but are not limited to:

- Traffic crash scene photography
- Crime scene photography (with and without the need for a search warrant)
- Command and control of major incidents
- Tactical Operations (Barricaded subjects, armed subjects, school incidents)

As much as the ALEA embraces the inclusion of new technology into the airborne public safety industry, we also embrace the rights of our citizens. The ALEA supports the professional operation of aircraft in public safety missions and expects its members to do so within the framework of the laws of this country. In fact, we routinely say that we are a "Profession within a Profession." We are both professional public safety officers and professional aviators. As such, we work tirelessly to educate our members on search and seizure laws pertaining to privacy and the use of aircraft, UAS included.

To reiterate our opening remarks submitted to the Privacy Project 2013, we "support and promote the IACP Aviation Committee's Recommended Guidelines for the use of Unmanned Aircraft and the Association for Unmanned Vehicle Systems International's (AUVSI) Unmanned Aircraft System Operations Industry 'Code of Conduct.' We do not concur with privacy advocates who claim that public safety agencies' utilization of unmanned aerial systems (UAS) poses a greater threat to 'privacy rights' than manned aviation. Similarly, we do not concur that said uses pose a greater threat to privacy 'rights' than other technologies currently utilized by public safety agencies, both in manned aircraft and on the ground. Furthermore, we do not accept that any legislation is necessary as there are long-standing court rulings upholding our Fourth Amendment protections; but we are particularly opposed to legislation that focus their attention on one technology based on fears of what could occur tomorrow, however unlikely. Aside from recent laws enacted that place outright bans on UAS use, such as that in Charlottesville, VA, many current 'anti-drone' bills appear to be more of an attempt to increase protections under the Fourth Amendment without actually altering the U.S. Constitution. The presumption in most of these pieces of legislation is that a reasonable expectation of privacy now exists in places where there has been no such expectation. As such, a warrant must be obtained before UAS can be utilized by public safety."

The ALEA believes that the Fourth Amendment of the Constitution of the United States of America is alive and well; and the protections contained therein against unreasonable searches and seizures have been supported through years of judicial opinions. We also believe in the Constitutional process of lawfully obtaining a search warrant when there are specific, articulable grounds to believe that the use

of an aircraft, UAS included, will intrude upon a reasonable expectation of privacy. However, in situations where time is of the essence and **NO** reasonable expectation of privacy exists, we would be opposed to restrictions that would limit the effectiveness of UAS.

We would encourage you to focus attention on the more basic issue at hand -- the storage, use, retention, and destruction of sensitive data; not the technology that gathers the data. Similar to law enforcement's use of Automated License Plate Readers (LPRs) and government and non-government surveillance camera's, the data captured and the use of this data is of concern to civil liberty advocates and others. As such, ALEA believes that law enforcement agencies must have solid policies that address, at a minimum, the following:

- How captured data is stored.
- Who has access to the data.
- How long the data is stored.
- How the data is purged.
- Audit controls to hold law enforcement employees accountable for the proper use of captured and stored data.
- Transparency in the inspection of stored data that is not evidence of a crime.

As stated above, these are the same privacy issues that we face concerning LPRs and surveillance cameras. However, unlike these two public safety tools, UAS is being treated differently, resulting in the creation of a separate and higher set of operating standards. If there is to be legislation, it needs to focus on public safety agencies utilization of sound policies that address the bullet points above, as opposed to developing different sets of legislated standards for each device that may be used to gather data.

In closing, ALEA, along with other organizations, have worked diligently with the FAA to develop procedures to operate UAS technology within the National Airspace. This includes the newly released FAA and Department of Justice Memorandum of Understanding that clearly explains the procedures to obtain a Certificate of Authorization to operate a UAS by a public safety agency. The ALEA continues to be committed to embracing this technology, working with others to see its safe integration into the National Airspace, and to developing training for public safety professionals who operate UAS. Our subsidiary, the Public Safety Aviation Accreditation Commission, is also committed to developing standards for the operation of UAS by public safety agencies.

On behalf of the Airborne Law Enforcement Association and its membership, thank you for the opportunity to participate in these deliberations.

NATIONAL ASSOCIATION OF CRIMINAL DEFENSE LAWYERS
COMMENTS ON PROPOSED DRONE LEGISLATION
MAY 31, 2013

Use of Domestic Drones

The increasing number of bills introduced in states across the country addressing the use of unmanned aerial vehicles, also known as drones, signal that not only are states concerned with intrusive government surveillance of their citizens without a warrant, but that domestic drone use is becoming more prevalent as the technology advances, signaling a sudden need for legislation. There are major Fourth Amendment and privacy implications that come with the use of drones in the United States, and the threats to privacy and civil liberties need to be properly addressed in any new drone legislation. Many outdated statutes are applied today in the digital age that undercut Fourth Amendment rights, and new regulations need to address the concerns of these rapidly advancing surveillance tools. That is why the National Association of Criminal Defense Lawyers (NACDL) created its own model legislation, promoting protection of fundamental Fourth Amendment rights. The model legislation is available here.[1]

Prohibited Use Without a Warrant and Suppression of Evidence

If drones are used by a person or entity of the government or funded in any way by the government, a warrant should be required for any surveillance of a person within a state, county, or municipality. A warrant should also be required for the surveillance of personal or business property located within the state to gather evidence or other information pertaining to criminal conduct or conduct in violation of a statute or regulation, except in certain special circumstances. This prevents unwanted government intrusion into privacy, and protects Fourth Amendment and state privacy rights. Traditionally, an exception to the warrant requirement exists for evidence that is found in "plain view." The plain view doctrine becomes muddled, however, when drones are used because the drones have high-tech capabilities, that are not in the "general public use,"[2] to conduct surveillance on areas in plain view and not in plain view, such as the inside of a home.[3] The technology is evolving so rapidly that it is currently difficult to discern exactly what kind of private data may be collected by the government and private entities. Unmanned aircrafts may be outfitted with surveillance equipment to include high resolution cameras, thermal heat imaging devices, and geolocation tracking devices.

Additionally, any evidence obtained in violation of the legislation should be inadmissible in a criminal trial. It is important that this suppression remedy be included in state drone legislation, otherwise the only recourse an individual could have is civil, which does not benefit a defendant facing criminal charges. A warrant requirement may be toothless without such a suppression remedy.

Limit Exigent Circumstances

Reasonable exceptions to a warrant requirement for the use of a surveillance drone include exigent circumstances or the assessment of an environmental or weather related catastrophe. Exigent

---

[1] http://www.nacdl.org/WorkArea/DownloadAsset.aspx?id=26568&libID=26537.
[2] Kyllo v. United States, 533 U.S. 27, 34 (2001) (reasoning that the police used a device, a thermal heat imaging device, not in the "general public use" to gather information about the inside of a private home.).
[3] *Id.* (holding that using thermal imaging to obtain information from inside a home constituted a search under the Fourth Amendment.).

circumstances exist when law enforcement possesses reasonable suspicion that absent swift preventative action, there is an imminent danger to life or imminent risk of threat or bodily harm. This should further be limited for use only until the danger and risk that prompted the use of the drone are no longer imminent.

Access to Third Party Records

Drone legislation should address the "third party doctrine." Third party records are records created and stored by private companies in their ordinary course of business. Today, these records go beyond bank records or dialed phone numbers, and can include all emails, geo-location information, a record of visited websites, and even internet search terms. The Supreme Court has held that individuals have no reasonable expectation of privacy in records shared or generated by a third party. By giving up information to a third party, a person "assumes the risk" that the company would reveal that information to the government. In other words, law enforcement may be able to access drone surveillance data, without a warrant, obtained by a private company for use as evidence in a criminal trial.

In a recent Supreme Court decision, *United States v. Jones*, which involved the placement of a GPS locator on a suspect's car by police officers without a valid warrant, the Court held that the use of a GPS device constituted a search under the Fourth Amendment.[4] Justice Sotomayor's concurrence in particular questioned the use of the third party doctrine in the digital age. She said "[t]his approach is ill suited to the digital age, in which people reveal a great deal of information about themselves to third parties in the course of carrying out mundane tasks."[5] This has great implications for the use of drones to monitor, collect, and store information that can then be shared with the Government under an outdated third party doctrine.

As all states can do, some states have provided greater protection than what the federal Constitution affords to third party records. Such protections may be found in legislation, court cases, or even state constitutions. Each individual state should be familiar with its own laws on third party records in determining whether or not such a provision needs to be included in that state's drone legislation.

Conclusion

NACDL encourages the implementation of the above suggestions into model legislation regulating the use of domestic drones. We look forward to working with you. Please contact NACDL's National Security and Privacy Counsel, Mason Clutter, with any questions. She may be reached at mclutter@nacdl.org or 202-465-7658.

David R. Neel **6 March 2013**

(U) SUBJECT: Potential for Nefarious Use of Unmanned Aerial Vehicles (UAVs)

(U) UAVs can provide first responders, private industry, or government agencies with multiple advantages; from providing aerial imagery, use as a communications relay platform in remote areas, infrared (IR) detection during search and rescue operations, or monitoring the movement of a wildfire; UAV applications have only the limitations of the imagination. Within the year, the FAA must allow any "government public safety agency" to operate a UAV weighing 25 pounds or less, as long as certain conditions are met. The FAA predicts that after they allow commercial use of drones in U.S. airspace, 15,000 of the flying robots will be in the skies by 2015, and double that by 2030.

(U) Often, what benefits legal use of a tool has an equalizing balance of adding a burden to society when that same technology is used with nefarious intent. Unlawful use of UAV technology will be as diverse as the proposed legitimate applications. Criminal individuals and organizations will quickly identify the legal and operational gaps in law enforcement response to such an asymmetric vector. Additionally, criminals will recognize the initial legal and privacy constraints for law enforcement use of UAVs, and seek to exploit those boundaries. Terrorists will also understand the implications of a potentially low-cost, low-risk delivery of a kinetic attack on buildings, persons, or other manned aircraft. Individuals will also have the readily available, non-attributable means to stalk, spy, eavesdrop, or facilitate retribution violence or destruction of public or private property.

(U) Criminal use of UAVs will include, but not limited to:

- Circumventing checkpoints to move contraband
- Surveillance of law enforcement operations
- Jamming of law enforcement communications
- Act as an airborne communications repeater for "secure" communications
- Electronic eavesdropping platform for government/military/economic espionage
- Fish and Game guiding violations
- Kinetic attacks

(U) Potential for miss-use of this platform is great. Additionally, wrong-doers or those who believe that UAV use is violating their Privacy or Civil Rights-Civil Liberties, will seek ways to defeat, destroy, disable, or misappropriate (steal) UAV's that are conducting legal or commercial missions. New technologies, tactics, techniques and procedures will emerge to support this, and must be anticipated. There are already documents available on the open internet identifying "How to Kill UAVs." This also plays into current negative media coverage of the use of "drones" in the United States.

(U) Legislative bodies and policy makers, law enforcement leadership, and regulatory authorities need to begin now to anticipate how this UAV/UAS technology will be used for criminal activity and pass the appropriate legislation, develop effective operational countermeasures, and identify investigative strategies.

David Neel is the DHS Intelligence Officer assigned to the State of Alaska. This paper represents his personal viewpoint and should not be construed to reflect an official position by the U.S. Department of Homeland Security or the State of Alaska.

Scenarios Network
FOR ALASKA & ARCTIC PLANNING

October 22, 2013

Representative Shelley Hughes
Alaska State Legislature
600 East Railroad Avenue
Wasilla, Alaska 99654

Dear Representative Hughes

Please consider my concerns regarding the potential for "over" legistlation of unmanned aircraft systems (UAS) technology because of unwarranted fears.

UAS will provide many new capabilities for commercial, research, government, and even recreational users. In order to realize this potential, especially for commercial uses, it is important to acknowledge the tension that will occur among all parties, especially in the area of privacy. We need a better understanding of the technology's benefits before laws are created restricting their use.

A good example is the issue of public versus private airspace. For example, a manned aircraft flying at 500 feet altitude, in the National Airspace, over a person's private property is legally permitted to collect air photographs of the property. Is the same true for UAS? What if the altitude is less than 500 feet, i.e. 450 or even 50 feet? Does a property owner have rights to the airspace above their property and to what height? Can they shoot at the manned aircraft at 500 feet or the UAS at 100 feet?

On the otherhand, a significant cause of concern with UAS technology is privacy. Do voyeurism and peeping tom laws apply to UAS? What if the UAS is on your property but you are using the camera on the UAS to peer through a neighbor's window, perhaps above a privacy fence?

We can all acknowledge this tension created by privacy does exist. And will likely a source of future litigation. But the early uses of the technology, especially for search & rescue, research, and commercial innovation likely deserves some protection.

I can be reached at 907-474-6958 or kwcunningham@alaska.edu should you have any questions.

Cheers

Unmanned Aerial Systems Brief

Alaska Legislature - October 23, 2013

Steve Wackowski
Operations Manager, Tulugaq
Steve.Wackowski@fairweather.com

Personal Background

- Grew up in Anchorage
- 7 Years in Air Force Reserve
  - 3 Active Duty
- Several contingency deployments (Afghanistan, Iraq, Haiti)
- Air Force Trained and Certified SUAS operator
- NIU funded deployment to Arctic onboard USCGC HEALY and CGC LOUIS from August-September 2011
  - Conducted first ever Arctic SUAS flights from Icebreaker
- Civilian background in UAS policy and operations
  - Staffer for Sen Stevens on Senate Commerce, Science, and Transportation Committee
  - Current employment at Fairweather Science/Tulugaq
    - ***Responsible for development of unmanned remote sensing capabilities***

First launch of Arctic SUAS (82 N 168 W)

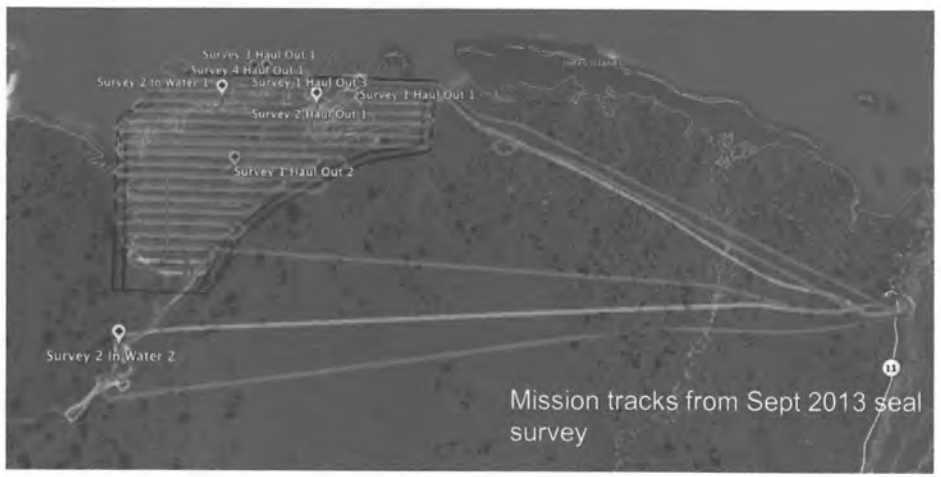
Our Team: Tulugaq

- Tulugaq II (*Inupiat for 'Raven'*) is a joint venture between Fairweather Science, Olgoonik Development Corporation and Kaktovik Inupiat Corporation. Tulugaq was formed to combine the strengths experience of these great Alaskan companies for operating manned and unmanned systems in the Arctic.

Team Background

- 40 + years of Arctic operations
- Complete focus on safety and accountability
- Extensive UAS and manned aviation operational experience in the Arctic
- Contracted Operations in Arctic Ocean, Bering, Beaufort and Chukchi Seas
- Deadhorse Aviation Center integration

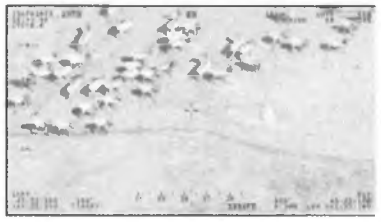
Stitched Infrared video of pipeline on North Slope taken July 19, 201

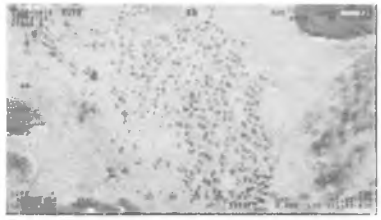


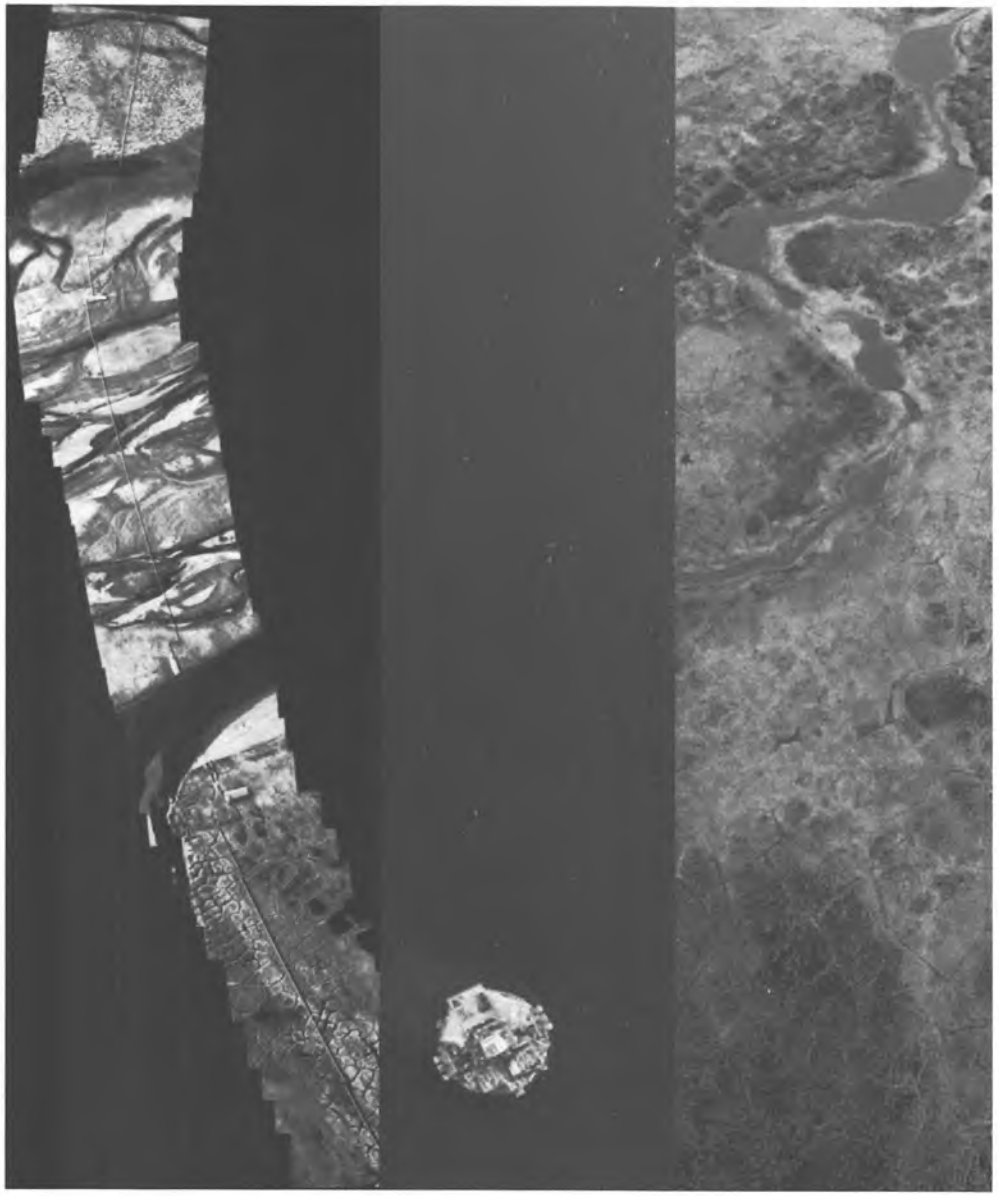
Mission tracks from Sept 2013 seal survey

Remote Sensing Mission Areas

- Pipeline Monitoring
- Sea Ice Mapping
- Oil Spill Detection
- Cetacean Monitoring
- Damage Survey
- Precision Mapping
- Environmental Research
- Communications Relay
- Search and Rescue
- Wildlife Surveys
- Wide Area Mapping
- Firefighting
- Humanitarian Response







DA – 42 MPP (Optionally Piloted)

- Operational in Alaska **Now**
- Safe Operational History
- Acoustic Signature Reduction
  - 58 db at 500' AGL, 0 db at 3000 'AGL
- Multiple Payload Configurations
  - TASE 400 HD Video/Infra Red
  - High resolution still camera
- Convertible to an Unmanned Platform

Questions?

NOTICE

U.S. DEPARTMENT OF TRANSPORTATION
FEDERAL AVIATION ADMINISTRATION

N 8900.207

National Policy

Effective Date:
1/22/13

Cancellation Date:
1/22/14

SUBJ: Unmanned Aircraft Systems (UAS) Operational Approval

1. Purpose of this Notice. This notice provides policies necessary for reviewing and evaluating the safety and interoperability of proposed Unmanned Aircraft Systems (UAS) flight operations conducted within the United States (U.S.) National Airspace System (NAS) for the Aviation Safety (AVS) Flight Standards Service (AFS), UAS Integration Office (AFS-80), when assessing applications for a Certificate of Waiver or Authorization (COA) or special airworthiness certificate.

2. Audience. This notice applies to AFS divisions at the Federal Aviation Administration (FAA) Washington headquarters (HQ) and regional field offices.

3. Where You Can Find This Notice. You can find this notice on the MyFAA Web site at https://employees.faa.gov/tools_resources/orders_notices/. Inspectors can access this notice through the Flight Standards Information Management System (FSIMS) at http://fsims.avs.faa.gov. Air carriers and operators can find this notice on the FAA's Web site at: http://fsims.faa.gov. This notice is available to proponents and the public at http://www.faa.gov/regulations_policies/orders_notices.

4. Background.

a. UAS Operations. UAS operations have increased dramatically in both the public and private sectors. This proliferation has introduced greater exposure and elevated risk to the safety of operations within the NAS. This growth in UAS operations has increased the number of applications for operational approvals and increased demand on the FAA to process them. For these activities, the development of a notice is required for the FAA to use when evaluating applications for COAs and special airworthiness certificates.

b. Policy. Policy identifies Unmanned Aircraft (UA) as "aircraft" flown by a "pilot" regardless of where the pilot is located. Aircraft and pilots must demonstrate compliance with applicable sections of Title 14 of the Code of Federal Regulations (14 CFR) to operate in the NAS. However, UA are not compliant with certain sections of 14 CFR. For instance, the absence of an onboard pilot means that the "see-and-avoid" provisions of 14 CFR part 91, § 91.113, cannot be satisfied. Without an onboard pilot, there is a significant reliance on the command and control link, and a greater emphasis on the loss of functionality associated with lost link. Furthermore, for air traffic control (ATC) operations requiring visual means of maintaining

in-flight separation, the lack of an onboard pilot does not permit ATC to issue all of the standard clearances or instructions available under the current edition of FAA Order 7110.65, Air Traffic Control. Consequently, to ensure an equivalent level of safety, UAS flight operations require an alternative method of compliance (AMOC) or risk control to address their "see-and-avoid" impediments to safety of flight, and any problems they may generate for ATC. In the future, permanent and consistent methods of compliance will be needed for UAS operations in the NAS without the need for waivers or exemptions.

5. Consensus Opinion. This notice is subject to continuous review, will be updated when appropriate, is not meant as a substitute for any regulatory process, and was jointly developed by and reflects the consensus opinion of:

- Flight Technologies and Procedures Division (AFS-400);
- UAS Integration Office (AFS-80) and the ATO component of AFS-80; and
- Aircraft Certification Service, Production & Airworthiness Branch (AIR-240).

Note: In general, and as a minimum, proponents must observe all applicable regulations of 14 CFR parts 61 and 91. This notice identifies acceptable AMOC with the regulations when evaluating requests for approval of proposed UAS operations. Refer to the following Web site for a listing of regulations: http://www.faa.gov/regulations_policies/faa_regulations/.

6. Discussion. This notice represents the culmination of input from government agencies, industry, and user stakeholders along with best practices and procedures that have been used by FAA in prior approvals for UAS applications for COAs or special airworthiness certificates. The material presented in this notice represents the process and procedures necessary for approving applications for UAS flight operations. However, because of the uniqueness of various UAS flight operations, each application must be evaluated on its own technical merits, including operational risk management (RM) planning. Each application may require unique authorizations or limitations directly related to the specific needs or capabilities of the UAS and/or the proposed specific mission and operating location.

7. Applicability and Approval Process Criteria. The applicability and process to be used in UAS operational approval are dependent on whether the proposed UAS operation within the territorial airspace of the United States (the airspace above the contiguous United States, Alaska, Hawaii, U.S. territories, and U.S. territorial waters) is defined as public or civil (see 14 CFR part 1, § 1.1 and Public Law 110-181, "The National Defense Authorization Act of 2008"). UAS operations outside the territorial airspace of the U.S. will be classified as either state or civil operations in accordance with international law. A public operation is one that is intrinsically governmental in nature (i.e., Federal, State, and local agencies). Proponents requesting approval of public aircraft operations by UAS will use the COA application process. In contrast, proponents for civil operations approval will use the special airworthiness certificate process. Part 91, § 91.319(a)(2) specifically prohibits operation of an aircraft that has an experimental certificate from "carrying persons or property for compensation or hire."

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

a. Coordination and Approval. Regardless of the process for the authorization approval, COA applications for UAS flight operation approvals will be coordinated through the ATO component of AFS-80 and AVS. Special airworthiness certificates will be coordinated through the Aircraft Certification (AIR-240) staff as well as the ATO and AFS component of AFS-80 for final approval and disposition.

b. Applicability and Methods of Authorization. Operational policy in this notice applies to both public and civil operations and certain state aircraft operations.

(1) Applicability. These procedures are applicable for all operations in the contiguous United States, Alaska, Hawaii, U.S. territories, and international airspace in the Flight Information Regions (FIR) delegated to the United States where the FAA is the Air Traffic Service (ATS) provider. These procedures do not apply to the territorial airspace of another sovereign country that lies within FIRs delegated to the United States where the FAA is the ATS provider, except by agreement with that country, or airspace in FIRs delegated to other countries. All UAS proponents, operators, and pilots must observe all applicable regulations of 14 CFR.

(a) In general, specific authorization to conduct UAS operations in the NAS outside of active Restricted and Warning Areas designated for aviation use, or approved Prohibited Areas, must be requested by the proponent. Airspace inside buildings or structures is not considered to be part of the NAS and is not regulated. (Refer to the current edition of Order JO 7400.8, Air Traffic Organization Policy.)

(b) This notice and the processes prescribed do not apply to hobbyists and amateur model aircraft users when operating unmanned systems for sport and recreation. Those individuals should seek policy under the current edition of Advisory Circular (AC) 91-57, Model Aircraft Operating Standards. AC 91-57 is not to be used as a basis of approval for operation of any other aircraft, including by Federal, State, and local governments, commercial entities, or law enforcement.

(c) This notice and the processes prescribed also do not apply to UAS operations in FAA-controlled international airspace by an agency of, or a contractor to, the Federal government when those operations are appropriately designated as State aircraft operations and are operated under "due regard" rules and procedures established by the Federal agency responsible for the operation. The designation of flight operations as State aircraft operations normally are made in coordination with the U.S. Department of State. This notice and the processes prescribed do, however, apply where the responsible Federal agency either has not established a formal set of rules and procedures for "due regard" operations, or is not operating the UAS under "due regard" rules and procedures in FAA-controlled international airspace. This notice and the processes prescribed also apply to all UAS operations by an agency of, or a contractor to, the Federal government that transit through U.S. territorial airspace en route to or from international airspace. See Appendix F, UAS COA Requirement. The "due regard" option is not available for state aircraft operations transiting through U.S. territorial airspace en route to or from international airspace.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

(d) Oceanic Operations Within Warning Areas. UAS operations contained within Warning Areas are handled in the same manner as those operations conducted in active Restricted and approved Prohibited areas; that is, neither specific FAA approval nor observers or chase aircraft are required by the FAA.

(e) The only public aircraft that can fly under "due regard" are U.S. government aircraft designated as State aircraft.

(2) Methods. The two methods of approval are the issuance of either a COA for public aircraft operations or a special airworthiness certificate for civil operations. In the case of public aircraft operations, the operating entity applying to conduct the UAS operation must comply with its own processes, policies, and standards in the following areas, in addition to complying with all applicable safety provisions in all other parts of 14 CFR:

- Pilot certification,
- Crew certification,
- Recent pilot experience (or, currency),
- Medical certificates, and
- Airworthiness of public UAS.

Note: If no established public entity processes, policies, or standards exist, it is highly recommended that the public agency/department apply the specifics outlined in this notice and comply with the provisions of 14 CFR applicable to civil UAS operations.

8. COA for Public Operations.

a. Applications. Applications for a COA are only accepted from entities that intend to conduct public aircraft operations. An application may be referred to the FAA Office of the Chief Counsel (AGC-200) for determination of the status of a proponent as a government entity under the public aircraft statute. The duration of COAs complies with the time limitations specified under the current edition of FAA Order 7210.3, Facility Operation and Administration. COAs may be issued for a lesser duration if requested or deemed appropriate. COAs are not required for operations conducted within active Restricted or Warning Area airspace designated for aviation use, or approved Prohibited Areas with permission from the appropriate authority or using agency of that airspace. (Refer to the current edition of Order JO 7400.8, Special Use Airspace.)

b. Approving and Reviewing Authority. AFS-80 is responsible for determining whether the proponents' proposed UAS operations can be conducted safely and responsibly in the NAS, and that they comply with all COA limitations and provisions.

(1) In accordance with FAA Order 7210.3, "As a general rule, a waiver or authorization should be canceled when it is no longer required or there is an abuse of its provisions or unforeseen safety factors develop. Failure to comply with the waiver or authorization is cause for cancellation."

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

(2) The FAA has the authority to suspend or cancel the COA, or to delay any activities if there is a violation of the terms in the COA, or if the safety of persons or property on the ground or in the air is determined to be in jeopardy. That may include, but is not limited to:

- Incidents or accidents occurring during UAS operations in the NAS;
- Habitual noncompliance with administrative requirements, such as failure to provide the FAA with monthly reports on the number of flights, pilot duty time, or unusual equipment malfunctions (e.g., a malfunction or failure of ground control station (GCS) flight control hardware or software (other than loss of control link); a power plant failure or malfunction; a deviation from any provision contained in the COA);
- Deviations from ATC instructions, operational, or coordination issues; and
- Events of intermittent or persistent lost-link as described in the COA or events determined to pose as a risk to the safety of the NAS.

(3) COA suspensions and cancellations are not automatic. Whenever possible, a documented conversation, between the FAA and the proponent, will happen before the suspension/cancellation is issued. Timely and transparent responses to accidents, deviations, and similar safety-related events are expected.

c. Accident and Incident Notification and Investigation. The current edition of FAA Order 8020.11C, Aircraft Accident and Incident Notification, Investigation, and Reporting, and Title 49 of the Code of Federal Regulations (49 CFR) part 830, outlines reporting procedures for accidents and incidents involving civil aircraft and certain public aircraft. All accidents and incidents involving fatalities, injuries, property damage, and fly-away by civil aircraft and those public aircraft subject to part 830 require FAA notification within 24 hours. No additional flights by those aircraft under this COA are allowed before notification. An immediate investigation is required, and when requested to do so, UAS proponents are expected to provide copies of written aircraft accident/incident reports to AFS-80 for review. In accordance with 49 CFR part 1520, § 1520.5, reports will not be released outside of government channels without originator permission.

d. General COA Process. The ATO component of AFS-80 is responsible for the COA process. Applications can be made two ways:

(1) On the Internet using the UAS COA Online System at https://ioeaaa.faa.gov. The UAS COA Online System requires a user name and password; a support desk phone number and e-mail address is provided to assist with obtaining an account.

(2) Using FAA Form 7711-2, Application for Certificate of Waiver or Authorization, available online at http://www.faa.gov/documentLibrary/media/form/faa7711-2.pdf. The completed form can be mailed to: FAA Headquarters, Unmanned Aircraft Systems Integration Office, 490 L'Enfant Plaza SW, Suite 3200, Washington, DC 20024. Mail submittal may encounter significant delay due to current U.S. Postal Service security screening procedures in place.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

e. Operational Review. Prior to issuance of a COA, air traffic specialist components of AFS-80 conduct an operational validation that addresses ATC processes. Next, an aviation safety inspector (ASI) evaluates each application to determine if risks to the NAS associated with the operation have been acceptably mitigated. Both the ASI and ATC requirements are merged into the final COA.

f. Safety Risk Management (SRM) Process. ASIs and other FAA personnel use SRM principles outlined in the current edition of AC 120-92, Safety Management Systems for Aviation Service Providers, to maintain or improve the safety of the NAS by identifying safety risks, hazards, and mitigations associated with proposed UAS operations. When deemed appropriate, Safety Risk Management Documents (SRMD) are created through SRM reviews of specific operations or of risks associated with UAS operations in various classes of airspace. SRM reviews may result in the incorporation of additional mitigations or controls into all or some COAs.

g. National Security Considerations. When appropriate levels of Department of Defense (DOD) or Department of Homeland Security (DHS) declare a UAS operation to be a matter of national security, the FAA may approve an application for a COA which, under normal circumstances, might not otherwise conform to the guidelines set forth in this notice. In this case, national security may override risk mitigation requirements. Such requests to the FAA Administrator will originate from an equivalent level of authority from the proponent's parent organization.

h. Special COA.

(1) National Disaster COA. Due to the unpredictability of national disasters, a National Disaster COA is issued in two parts. In part 1 of the COA, AFS-80 completes an evaluation, excluding the location of the disaster. All known information is inserted into a template and signed by appropriate FAA authority. Once the specific location is identified, this information, along with the specific operation, is inserted into part 2 of the COA in the form of an attachment. Part 2 of the COA must then be signed by appropriate FAA authority, which completes and establishes a valid COA.

(2) Emergency COA. An emergency UAS COA may be considered when all of the following conditions apply:

(a) A situation exists that is defined as a condition of distress or urgency, where there is, or that has, the extreme possibility of loss of life, and

(b) The proponent has determined that manned flight operations cannot be conducted efficiently, and

(c) The proposed UAS is operating under a current approved COA for a different purpose or location.

Note: Requests for UAS COAs that fall outside of these parameters will be processed through the normal online COA application process. Emergency UAS COAs will not be considered for:

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

- Demonstration flights,
- Flights to test capabilities,
- Training,
- Flights in Class B Airspace, or
- Flights over populated areas, unless a suitable mitigation strategy is proposed and found to be acceptable.

9. Special Airworthiness Certificate for Civil UAS Applicants.

a. Airworthiness Determination. Civil applicants may apply for a special airworthiness certificate from the FAA. The proponent is required to submit the requisite data to support a determination that the aircraft and its systems, including the control station (CS), are designed, built, and maintained in a safe and airworthy condition.

b. Special Airworthiness Certificate Issuance. Special airworthiness certificates are typically issued to proponents wishing to conduct UAS research and development (R&D), crew training, and market surveys under 14 CFR part 21, § 21.191. Special airworthiness certificates are issued in accordance with FAA Order 8130.34, Airworthiness Certification of Unmanned Aircraft Systems and Optionally Piloted Aircraft, current edition. Refer to Order 8130.34 for in-depth information on special airworthiness certificates.

c. Proponents with both a COA and Special Airworthiness Certification. In cases where a proponent has been issued a special airworthiness certificate, and is concurrently eligible to operate a corresponding UAS on a COA as a public aircraft operation, the proponent must elect, prior to each flight, which authority is to be used to conduct the flight. The use of both a special airworthiness certificate and a COA on a single flight is not permitted.

d. General Process for Civil UAS Operations. For civil UAS operations, the Aircraft Certification Service, Production and Airworthiness Division (AIR-200) at FAA HQ, is responsible for the issuance of special airworthiness certificates according to FAA Order 8130.34. The issuance of a special airworthiness certificate is coordinated with AIR-200, AFS-80 and the ATO component of AFS-80, and AVS at the HQ and regional levels. A thorough review is conducted by the FAA to evaluate the system's airworthiness and operational specifications. In addition, the FAA reviews and accepts mitigations developed by the proponent to meet acceptable standards of safety.

10. UAS Airworthiness. All UAS must be in an airworthy condition to conduct flight operations in the NAS. An "airworthy condition for UAS subject to a COA" means that the UAS meets the applicable standards and requirements of its operating agency and is capable of operating in compliance with the applicable requirements in 14 CFR part 91. The FAA recognizes that some of the requirements can differ from those for manned aircraft and appropriate changes can be defined. As with airworthiness standards, maintenance technician requirements will be addressed as part of the review process.

a. Public Aircraft Proponents. The proponent must provide an airworthiness statement specifying compliance with the proponent's applicable airworthiness criteria. Airworthiness statements must be provided on agency letterhead and include:

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

- The date the statement is effective,
- A signature of the responsible certifying authority within the agency,
- A point of contact (POC), and
- Any warnings/limitations.

(1) Airworthiness statements are generally written for one UAS. If more than one UAS model is included on a single airworthiness statement, each UAS will be listed and specific information for each UAS will be included in the statement. Airworthiness statements with an expiration date must remain current for the duration of the COA including extensions. If a new airworthiness statement is issued during the period the COA is active, a copy of the airworthiness certificate must be provided to AFS-80.

(2) Examples of acceptable policy/criteria include, but are not limited to:

- Department of Defense (DOD) Handbook, MIL-HDBK 516B, Airworthiness Certification Criteria;
- Air Force Policy Directive (AFPD) 62-6, USAF Aircraft Airworthiness Certification;
- Army Regulations (AR) 70-62, Airworthiness Qualification of Aircraft Systems; or
- Naval Air Systems Command Instruction, NAVAIRINST 13034.1 series, Flight Clearance Policy for Air Vehicles and Aircraft Systems.

b. Civil Aircraft Proponents. Approvals for civil applications using the special airworthiness certificate process receive their airworthiness certification from the FAA.

c. Continued Airworthiness.

(1) Public Aircraft. Proponents for UAS used in public aircraft operations should follow their own agency's procedures and guidelines to maintain continued airworthiness at a level which ensures they continue to operate the aircraft safely.

(2) Civil Aircraft. Proponents for civil UAS operational approvals must address continued airworthiness procedures as part of their application. Civil UAS should be maintained and must conform to the same airworthiness standards defined in 14 CFR parts under which UAS are intended to be operated. It is highly recommended that all proponents provide the following information:

- A Continuing Airworthiness Program,
- A maintenance training program,
- Any unique skill sets or maintenance practices relating to their aircraft and/or aircraft operations that may be outside the current scope and practices of manned aviation, and
- A process to report any applicable data relating to the operation and maintenance of the UAS.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

d. Database and Recordkeeping. All information received from UAS proponents aids the FAA in establishing a database for the existing UAS types and operations. This data is critical to our development of future certification criteria for both systems and pilots. It expedites the regulatory process for UAS and allows the FAA to have historical data from which to base current and future UAS policy. Accurate recordkeeping is essential in assuring positive operational and quality airworthiness control. In accordance with 49 CFR § 1520.5, reports will not be released outside of government channels without originator permission.

11. Flight Operations of a UAS.

a. Applicability and Requirements. This notice applies to UAS operations conducted in the NAS other than in active Restricted and Warning Areas designated for aviation use or approved Prohibited Areas. The FAA requires aircraft to operate safely among all users of the NAS, including non-cooperative aircraft (e.g., aircraft operated without a transponder), and other airborne operations not reliably identifiable by ATC radar (e.g., balloons, gliders, parachutists). Unless otherwise specifically authorized, UAS operators must use observers, either airborne or ground-based, to comply with 14 CFR part 91 requirements.

b. Risk Mitigation. While considerable work is ongoing to develop a certifiable detect, sense, and avoid system as an AMOC with the see-and-avoid aspect of §§ 91.113 and 91.115, no current solution exists. As a result, compliance with the see-and-avoid requirement and navigational awareness are primary concerns in UAS operational approvals leading to imposition of AMOC. Risk mitigation for these two issues is normally based on the use of observers or other methods of maintaining flight separation and collision avoidance or 'segregation'; however, they may also include other concepts or systems that a proponent may propose for FAA review. The FAA only approves UAS flight operations that can be conducted at an acceptable level of safety. Refer to the current editions of AC 120-92 and FAA Order 8000.369, Safety Management System Guidance.

> **Note:** Risk mitigations that depend on the establishment of new types and categories of airspace are extremely difficult and time-consuming. The NAS is established and configured through a rigorous regulatory process. Risk mitigations that result in the prohibition of the public's right to transit airspace will require a very long lead time with no guarantee that they will be approved.

(1) Proponents proposing see-and-avoid strategies in lieu of visual observers (VOs) are required to support proposed mitigations with system safety cases which indicate the operations can be conducted safely. Acceptable system safety cases must include a hazard analysis, risk assessment, and other appropriate documentation that identifies the level of risk.

(2) It is the proponent's responsibility to demonstrate that the risk of injury to persons or property along the flightpath is appropriately mitigated. Aircraft with performance characteristics that impede, delay, or divert other normal air traffic operations may be restricted in their operations.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

12. System Considerations for UAS.

a. Traffic Alert and Collision Avoidance Systems (TCAS). The use of TCAS by UAS has not been validated as an acceptable alternative for see-and-avoid requirements, and is not an approved means of mitigation for UAS see-and-avoid requirements or strategies.

b. Onboard Cameras/Sensors. Although onboard cameras and sensors positioned to observe targets on the ground have demonstrated some capability, their use in detecting airborne operations for the purpose of segregation is still quite limited. To date, these types of systems have not been approved as a sole mitigation in the see-and-avoid risk assessment.

c. Use of Equipment in Lieu of VOs.

(1) Any equipment proposed for use on UAS to accomplish the function of see-and-avoid in lieu of VOs must:

- Be certified as an aircraft system and equipment using standards, requirements, and processes commensurate with installation of equipment in aircraft by a recognized airworthiness authority, and
- Meet the requirements of 14 CFR part 25, § 25.1309, or equivalent process, for any UAS installation, regardless of its size, performance, or maximum takeoff weight.

Note: For other equipment that is not proposed for use in meeting see-and-avoid requirements, § 23.1309, or equivalent process, should be used.

(2) It is the responsibility of the proponent to show that the contemplated standards, requirements, and processes meet an equivalent level of safety.

d. Radar and Other Sensors. If special types of radar systems or other sensors are utilized to mitigate risk, the proponent must provide supporting data which demonstrates the following can be accomplished safely:

- Both cooperative and non-cooperative traffic can be detected and tracked to ensure appropriate separation and collision avoidance,
- The proposed system can effectively mitigate a potential collision,
- Operators are suitably trained and equipped to use them effectively, and
- Procedures are in place for the pilot in command (PIC) to effectively use the data.

e. Lost Link Procedures. There are many acceptable approaches to satisfy lost link requirements. The intent of any lost link procedure is to ensure airborne operations remain predictable. Proponents will comply with the UAS lost link procedures as specified in the COA.

Note: Lost link is not considered fly-away. Refer to definitions in Appendix A.

(1) Unless otherwise authorized, lost link solutions must comply with the last ATC clearance (if ATC clearance is required), for a period of time sufficient for ATC to ensure conflict resolution without loss of required separation.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

(2) Lost link procedures are pre-coordinated by AFS-80 with the appropriate ATC facility and included in the COA. They include, at a minimum, lost link route of flight, transponder use, lost link orbit points, communications procedures, and pre-planned flight termination points (FTP) or other contingency planning measures in the event recovery of the UAS is not feasible.

(3) If lost link occurs within a Restricted Area, Warning Area, or Class A airspace, or lost link procedure takes aircraft into one of these areas, the aircraft will not exit that airspace, unless otherwise authorized, until link is re-established. All exceptions will be submitted as part of the COA application to AFS-80 for review.

(4) Unless otherwise authorized, lost link procedures will conform to the Contingency Planning Limitations in Appendix E and in general, include the following:

- Limiting of UAS operations to operations over water or sparsely populated areas over the ground to transit to another Restricted Area, Warning Area, or to a pre-planned lost link orbit point within visual line-of-sight to re-establish link. (The UAS lost link procedure will not transit over fixed structures on the water.)
- Lost link programmed procedures will avoid unexpected turn-around and/or altitude changes and will provide sufficient time to communicate and coordinate with ATC.
- Lost link orbit points will not be contained within any published holding area, airway, Jet route, T route, or other area navigation (RNAV) published route.

(5) If the link is not re-established within a pre-determined time as defined by the FAA-approved COA, the aircraft may:

- Autoland; however, the aircraft will not exit the Restricted Area or Warning Area in accordance with subparagraph 12.e.(3) above,
- Proceed to another lost link point (LLP) in an attempt to regain communication link, or
- Proceed to an FTP or the location specified in other contingency planning measures for flight termination.

Note: LLPs may be used as FTPs. In this case, the aircraft may loiter at the LLP/FTP until link is re-established or fuel exhaustion occurs.

- UAS without auto-land capability will proceed to a pre-planned FTP or other acceptable contingency planning option prior to fuel exhaustion.

(6) Refer to Appendix E for more Contingency Planning Limitations.

f. Flight Termination System (FTS). It is highly desirable that all UAS have system redundancies and independent functionality to ensure the overall safety and predictability of the system. UAS that lack system redundancies may be required to have an independent FTS that can be activated manually by the UAS PIC to safeguard the public.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

g. Spectrum Authorization.

(1) Every UAS proponent must have the appropriate National Telecommunications and Information Administration (NTIA) or Federal Communications Commission (FCC) authorization/approval to transmit on the radio frequencies (RF) used for UAS uplink and downlink of control, telemetry, and payload information.

(2) Non-Federal public agencies, such as universities and State/local law enforcement, and all civil UAS proponents generally require a license from the FCC as authorization to transmit on frequencies other than those in the unlicensed bands (900 megahertz (MHz), 2.4 gigahertz (GHz), and 5.8 GHz). This generally will be in the form of an Experimental Radio License or a Special Temporary Authority (STA) issued by the FCC. Non-Federal public agencies and civil UAS proponents that operate systems using frequencies assigned to the Federal government (e.g., the DOD) must demonstrate they have the proper authorization through FCC-issued documentation.

(3) DOD agencies will typically demonstrate UAS spectrum authorization through an STA issued by NTIA or a frequency assignment in the NTIA-administered Government Master File (GMF). Authorizations issued under Title 47 of the Code of Federal Regulations (47 CFR) part 300, in the NTIA Manual, Chapter 7, paragraph 7.11, Use of Frequencies by Certain Experimental Stations, are not appropriate for UAS operations.

(4) Federal public agencies other than DOD, such as National Aeronautics and Space Administration (NASA), U.S. Coast Guard (USCG), and U.S. Customs and Border Protection (USCBP), also need an STA issued by NTIA or a frequency assignment in the NTIA-administered GMF. This is especially important for systems designed to operate on frequencies assigned to DOD.

13. Operational Requirements for UAS. Unless operating in an active Restricted or Warning Area designated for aviation use, or approved Prohibited Areas, UAS operations must adhere to the following requirements.

a. Observer Requirement. Visual flight rules (VFR) UAS operations may be authorized utilizing either ground-based or airborne VOs onboard a dedicated chase aircraft. A VO must be positioned to assist the PIC, to exercise the see-and-avoid responsibilities required by §§ 91.111, 91.113, and 91.115 by scanning the area around the aircraft for potentially conflicting traffic and assisting the PIC with navigational awareness.

(1) VOs:

(a) Must assist the PIC in not allowing the aircraft to operate beyond the visual line-of-sight limit, and

(b) Must be able to see the aircraft and the surrounding airspace sufficiently to assist the PIC with:

- Determining the UA's proximity to all aviation activities and other hazards (e.g., terrain, weather, structures), and

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

- Exercising effective control of the UA, and
- Complying with §§ 91.111, 91.113, and 91.115, and
- Preventing the UA from creating a collision hazard, and

(c) Must inform the PIC before losing sufficient visual contact with the UA or previously sighted collision hazard. This distance is predicated on the observer's normal vision. Corrective lenses, spectacles, and contact lenses are permitted.

(2) Because of field of view and distortion issues with aids to vision such as binoculars, field glasses, night vision devices, or telephoto lenses, these are allowed only for augmentation of the observer's visual capability; they cannot be used as the primary means of visual contact. When using other aids to vision, VOs must use caution to ensure the aircraft remains within normal visual line-of-sight of the observer. These aids to vision are not to be confused with corrective lenses or contact lenses, which do not alter the field of view or distort vision.

(3) The responsibility of ensuring the safety of flight and adequate visual range coverage to avoid any potential collisions remains with the PIC. The PIC for each UAS operation must identify a location from which the observer will perform his/her duties. This location will be selected to afford the best available view of the entire area within which the operation is to be conducted.

(4) Daisy-chaining of observers to increase operational distance is not normally approved; however, a proponent may provide a safety case for daisy-chaining in accordance with paragraph 16 by demonstrating an acceptable level of risk to the NAS.

(5) Observer(s) must be in place 30 minutes prior to night operations to ensure dark adaptation. Refer to subparagraph 13.i.(2)(b) for night operations information.

b. ATC Communications Requirements.

(1) The UAS pilot must establish and maintain direct two-way radio communication with appropriate ATC facilities anytime:

- The aircraft is being operated in Class A or D airspace (under §§ 91.135 or 91.129) or, when required, in Class E and G airspace (under §§ 91.127 or 91.126). See subparagraph 13.q.(2) and (3) for operations in Class B or C airspace; or
- The aircraft is being operated under instrument flight rules (IFR); or
- It is stipulated under the provisions of any issued COA or Special Airworthiness Certificate.

(2) It is preferred that communications between the UAS pilot and ATC be established through onboard radio equipment to provide a voice relay, however, for IFR flight this method of transmission is required.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

c. Inter-Communications Requirements. Any VO, sensor operator, or other person charged with providing see-and-avoid assistance must have immediate communication with the UAS pilot. If a chase aircraft is being utilized, immediate communication between the chase aircraft and the UAS pilot is required at all times. If the UAS pilot is in communication with ATC, monitoring of the ATC frequency by all UAS crew members (pilots, observers, and chase pilots) is recommended for shared situational and navigational awareness. However, unless it is approved for others to do so, the UAS PIC or the supplemental pilots are the only crewmembers that will communicate with ATC.

d. Electronic Devices. The use of electronic devices (including cell phones) other than for UAS flight- and mission-required usage is governed by § 91.21, which ensures these devices do not interfere with the UAS systems. The use of electronic devices (including cell phones) is not authorized for primary communication with ATC unless authorized under the Special Provisions of the COA.

e. Dropping Objects/Expendable Stores or Hazardous Materials. If the intended UAS operation includes the carriage, dropping, or spraying of aircraft stores outside of active Restricted or Warning Area airspace designated for aviation use, or approved Prohibited Areas, the proponent must ensure that specific approval is listed in the special provisions, the operational risks have been sufficiently mitigated as required by 14 CFR § 91.15, and that the hazardous material requirements in 49 CFR have been met. Acceptable procedures for hung stores and loss of control link while carrying stores must be provided to the FAA. A similar case must be made for hazardous materials carried aboard the aircraft and, if approved, will be listed in the special provision section of the COA.

f. Flight Over Populated Areas. Routine UAS operations are prohibited over urban or populated areas, except where the level of airworthiness allows. UAS operations may be approved in emergency or national disaster relief situations if the proposed mitigation strategies are found to be acceptable. See Appendix A for definition of populated or urban area.

g. Air Shows. A proponent is required to provide a safety case in accordance with paragraph 16 that demonstrates an acceptable level of risk and must receive a separate Air Show Waiver in accordance with FAA Order 8900.1, Flight Standards Information Management System (FSIMS).

h. Flight Over Heavily Trafficked Roads or Open-Air Assembly of People. UAS operations must avoid these areas, except where level of airworthiness allows. If flight in these areas is required, the proponent is required to support proposed mitigations with system safety cases that indicate the operations can be conducted safely. Acceptable system safety cases must include information located in paragraph 16. Additionally, it is the proponent's responsibility to demonstrate that risk of injury to persons or property along the flightpath has been mitigated. UAS with performance characteristics that impede, delay, or divert other air traffic operations may be restricted in their operations. Refer to AC 120-92 and FAA Order 8000.369, current editions.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

i. Day/Night Operations.

(1) Day Operations. UAS operations outside of Class A airspace, active Restricted or Warning Areas designated for aviation use, or approved Prohibited Areas will be conducted during daylight hours unless otherwise authorized.

(2) Night Operations.

(a) Night operations may be considered if the proponent provides a safety case and sufficient mitigation to avoid collision hazards at night.

(b) UAS night operations are those operations that occur between the end of evening civil twilight and the beginning of morning civil twilight, as published in the American Air Almanac, converted to local time. (Note: this is equal to approximately 30 minutes after sunset until 30 minutes before sunrise, except in Alaska.) External pilots and observers must be in place 30 minutes prior to night operations to ensure dark adaptation.

j. Flights Below Class A Airspace. All UAS operations outside of active Restricted/ Warning/Sensitive Security Information (SSI) airspace designated for aviation use, or approved Prohibited Areas must be conducted in visual meteorological conditions (VMC) if using ground or airborne VOs. In addition, the following weather requirements apply:

- If on IFR flight, remain clear of clouds. This requirement does not relieve the PIC from following the ATC clearance. According to § 91.3, the PIC retains responsibility for, and is the final authority as to the operation of that aircraft.
- If on VFR flight, maintain § 91.155 VFR cloud clearances, except in Class G airspace, where Class E airspace visibility requirements must be applied, but not less than 3 statute miles (SM) in-flight visibility.
- Special VFR is not permitted.
- For chase aircraft, 5 SM in-flight visibility.

k. Autonomous Operations. Although it is possible to have a completely manual (direct pilot intervention) UAS, the majority of UAS are autonomous to a certain degree. Only those UAS which have the capability of direct pilot intervention will be allowed in the NAS outside of active Restricted or Warning Areas designated for aviation use, or approved Prohibited Areas. Because the pilot may be technically considered out-of-the-loop in a lost link scenario, this restriction does not apply to UAS operating under lost link.

l. Operations from Off-Airport Locations. In most cases, an off-airport location should be situated no closer than 5 nautical miles (NM) from any airport or heliport. The operational areas, including the launch and recovery zones, should be free from obstructions; reasonable efforts should be made to keep operations away from structures.

m. Crew Resource Management (CRM). Proponents must train all UAS crewmembers in CRM. The current edition of FAA AC 120-51, Crew Resource Management Training, or an FAA-recognized equivalent applies to UAS operations. Proponents must implement the recommended training and procedures included in AC 120-51, or in an FAA-recognized

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

equivalent. The PIC of a UAS must ensure no activities other than those duties required for safe flight operation are performed. No UAS crewmember may engage in any activities unrelated to those required for safe operation of the UAS during critical phases of flight such as launch/takeoff and landing/recovery.

n. Sterile Cockpit. Proponents must comply with the current edition of AC 120-71, Standard Operating Procedures for Flight Deck Crewmembers, or the FAA-recognized equivalent, for ensuring the PIC implements sterile cockpit procedures. During critical phases of flight, including all ground operations involving taxi (movement of an airplane under its own power on the surface of an airport), takeoff and landing, and all other flight operations in which safety or mission accomplishment might be compromised by distractions, no crewmember may perform any duties not required for the safe operation of the aircraft. No crewmember may engage in, nor may any PIC permit, any activity during a critical phase of flight which could distract any crewmember from the performance of his/her duties or interfere in any way with the proper conduct of those duties.

o. Operating Under IFR. While operating on an instrument flight plan, the following must exist, be completed, or be complied with:

(1) The PIC must hold a current instrument rating or an FAA-recognized equivalent.

(2) The aircraft's airworthiness signature statement for flight release (not airworthiness document) must include IFR flight and indicate that all equipment required for IFR operations is certified and working (including pitot-static and transponder checks).

(3) Applicable navigation database and charts are current and available to the UAS pilot.

(4) An IFR flight plan is filed.

(5) An ATC clearance has been obtained and all clearances must be followed.

(6) Direct two-way radio communication between the UAS pilot and ATC is established and maintained. (A communication relay through the aircraft may be required.)

(7) Alternate communication capabilities with ATC for the purpose of lost link and/or lost communication are designated and operational during all phases of flight.

(8) The UAS is equipped with a certified operating mode C (mode S preferred) transponder.

(9) ATC radar services are obtained throughout the portion of the flight in Class A airspace whenever possible (overwater non-radar operations may be allowed in the special provisions section).

(10) All operations outside of Class A airspace and active Restricted, Prohibited, Warning Areas, or SSI airspace designated for aviation use, must remain clear of clouds. If operating under IFR, to comply with this provision, the PIC must have an ATC clearance to deviate.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

According to § 91.3, the PIC retains responsibility for, and is the final authority as to, the operation of that aircraft.

(11) VOs are not required in Class A airspace unless stipulated in the COA.

p. Chase Aircraft Operations. The chase aircraft:

(1) Must remain at a safe distance from UA to ensure collision avoidance if a malfunction occurs, and

(2) Must remain close enough to the UA to provide visual detection of any conflicting aircraft and advise the PIC of the situation.

(3) Must remain within radio control range of the UA, in the case of pilot operation from the chase aircraft, to maintain appropriate signal coverage for flight control or activation of the FTS.

(4) May be required to have communication with appropriate ATC facilities based on the proponent's application or mission profile.

(5) Is not required by FAA in active Restricted or Warning Area airspace designated for aviation use, or approved Prohibited airspace.

(6) Is not required for Optionally Piloted Aircraft (OPA) if a qualified VO is on board.

(7) Is not required in Class A airspace unless stipulated in the COA.

(8) Operations must be conducted in accordance with the Special Provisions listed in the approved COA.

(9) Must maintain 5 SM in-flight visibility restrictions.

(10) Pilot/observer:

- Will not concurrently perform either observer or UAS pilot duties along with chase pilot duties unless otherwise authorized.
- Must maintain direct voice communication with the UAS pilot.

(11) Pilots operating as a formation flight will immediately notify ATC if they are using a non-standard formation. Non-standard formations must be pre-approved by ATC. Proponents adhere to the current edition of Order JO 7610.4, Special Operations, as applicable. Refer to Appendix A for definitions of standard and non-standard formations.

(12) Operations will not be conducted in IMC.

(13) Operations will be thoroughly planned and briefed.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

(14) Pilot, during a lost link situation, must be notified immediately along with ATC. The chase pilot will report to ATC that the UA is performing lost link procedures as planned or if deviations are occurring.

(15) Pilot will ensure safe separation with the UA, and immediately notify ATC and the UA PIC during loss of visual contact with the UA by both the chase pilot and observer, when such contact cannot be promptly re-established. The UA PIC will either execute lost link procedures to facilitate a rejoin, recover the UA, or terminate the flight as appropriate.

q. Airspace Considerations by Airspace Designation.

Note: UAS operating in airspace designated as reduced vertical separation minimum (RVSM) airspace must comply with § 91.180.

(1) Class A. Observers are not normally required in Class A. All UAS must be operating under IFR and on an instrument flight plan. UAS operations approved for Class A must comply with § 91.135.

(2) Class B. UAS operations are currently not authorized. Class B airspace contains terminal areas with the highest density of manned aircraft in the NAS. On a case-by-case basis, the FAA may consider exceptional circumstances. For public aircraft, a Letter of Agreement (LOA) between the affected ATC facility and the proponent describing UAS segregation procedures is required. For civil aircraft, segregation procedures should be incorporated into the operating limitations. UAS operations must not impede, delay, or divert other Class B operations.

(3) Class C (and airspace within 30 NM of an airport listed in Appendix D, section 1, § 91.215). UAS operations approved for Class C must comply with §§ 91.130 and 91.215. Requests for operations without this equipment will be handled on a case-by-case basis and may be approved if sufficiently mitigated and a safety case has been established. For public aircraft, an LOA between the affected ATC facility and the proponent describing UAS segregation procedures may be required. For civil aircraft, segregation procedures should be incorporated into the operating limitations. UAS operations must not impede, delay, or divert other Class C operations.

(4) Class D. Requests for approval will be handled on a case-by-case basis and may be approved if sufficiently mitigated and a safety case has been established. UAS operations approved for Class D must comply with § 91.129. For public aircraft, an LOA between the affected ATC facility and the proponent describing UAS segregation procedures may be required. For civil aircraft, segregation procedures should be incorporated into the operating limitations. UAS operations must not impede, delay, or divert other Class D operations.

(5) Class E. If there is an operating ATC tower, Class D rules may apply. UAS operations approved for Class E must comply with § 91.127. For public aircraft, an LOA between the affected ATC facility and the proponent describing UAS segregation procedures may be required. For civil aircraft, segregation procedures should be incorporated into the operating limitations. UAS operations must not impede, delay, or divert other Class E operations.

(6) Class G. UAS operations approved for Class G must comply with § 91.126.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

r. ATC Visual Approach Clearances. The UAS PIC must not accept a visual approach clearance, an instruction to follow another aircraft by visual means, or a clearance to maintain visual separation from another aircraft.

s. In-Flight Emergencies.

- The PIC will notify ATC of any in-flight emergency or aircraft accident as soon as practical.
- The PIC will notify ATC of any loss of control link as soon as practical. Loss of control link scenarios may be handled by ATC as an emergency.

14. Contingency Planning Limitations. See Appendix E.

15. Personnel Qualifications. This paragraph addresses the qualifications of all UAS flightcrew members, observers, maintainers, and other personnel as appropriate. All references to a pilot certificate or FAA written examination refer to an FAA-issued private pilot certificate, higher certification, or an FAA-recognized equivalent.

a. UAS Pilot Qualifications. The FAA is focused on ensuring that UAS pilots have an appropriate level of understanding of 14 CFR applicable to the airspace where UAS operate. UAS pilots are responsible for controlling their aircraft to the same standards as the pilot of a manned aircraft. Civil UAS pilots may be required to have instruction by an FAA-certificated flight instructor.

b. UAS General Operational Requirements. The following operational restrictions apply to all UAS pilots:

- One PIC must be designated at all times.
- The PIC of an aircraft is directly responsible for, and is the final authority of the operation of that aircraft.
- Pilots must not perform crew duties for more than one UAS at a time.
- Pilots are not allowed to perform concurrent duties both as the pilot and the VO. In the case of OPA, the airborne pilot may assume the role of PIC at all times, but will only be the observer when the OPA is operated by the CS pilot.
- Unless undergoing initial qualification training, pilots must be qualified on the aircraft being flown.
- Only one PIC per aircraft is authorized, and the PIC must be in a position to assume control of the aircraft.

c. PIC.

(1) The designated PIC:

- Has been designated as PIC before or during the flight.
- Is responsible for the UAS flight operation as described under § 91.3, or FAA-recognized equivalent.
- Is responsible for determining whether the UAS is in condition for safe flight.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

- Must land as soon as safely practical when any condition occurs that causes operations to be unsafe.
- May be augmented by supplemental pilots; however, the PIC retains complete and overall responsibility of the flight, regardless of who may be piloting the aircraft.
- Has the ability to assume the duties of an internal or an external UAS pilot at any point during the flight.
- May rotate duties as necessary to fulfill operational requirements.
- Operating under a public agency, must have a thorough knowledge of the COA issued to the organization and must retain a copy to reference during flight.
- Must be trained and qualified on the specific UAS for the conduct of the flight.
- May assume the duties of VO or PIC, if piloting an OPA when the OPA is being utilized as a UAS and being flown by the CS pilot.

(2) PIC Rating Requirements. Rating requirements for the UAS PIC depend on the type of operation conducted; they fall into two categories:

- Operations that require at least a private pilot certificate or FAA-recognized equivalent, or
- Operations that do not require at least a private pilot certificate or FAA-recognized equivalent.

(a) The requirement for the PIC to hold a pilot certificate or FAA-recognized equivalent is based on various factors including:

- The location of the planned operations,
- The mission profile,
- The size of the aircraft, and
- Whether or not the operation is conducted within or beyond visual line-of-sight.

(b) The PIC must hold, at a minimum, an FAA private pilot certificate or FAA-recognized equivalent for all operations listed below:

- Flight in Class A, B, C, D, E, and G (400 feet above ground level (AGL)) airspace.
- IFR (must have instrument rating) operations.
- Night operations.
- At joint use or public airfields.
- Requiring a chase aircraft.
- At any time the FAA has determined the need, based on the UAS characteristics, mission profile, or other operational parameters.

(c) Operations without a pilot certificate may be allowed when all of the following conditions are met:

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

- The PIC has successfully completed, at a minimum, FAA private pilot ground instruction and passed the FAA Private Pilot written examination or FAA-recognized equivalents. (Airman Test Reports are valid for the 24 calendar-month period preceding the month the exam was completed, at which time the instruction and written examination must be repeated.)
- Operations are during daylight hours.
- The operation is conducted in a sparsely populated location.
- Operations are approved and conducted solely within visual line-of-sight in Class G airspace.
- Visual line-of-sight operations are conducted no further than ½ NM laterally from the UAS pilot and at an altitude of no more than 400 feet AGL at all times. Refer to Appendix A for the visual line-of-sight definition.
- Operations are conducted no closer than 5 NM from any FAA-designated airport or heliport other than the airport from which the aircraft is operating.
- The operation is conducted from a privately owned airfield, military installation, or off-airport location.

(3) PIC Recent Flight Experience (Currency). The proponent must provide documentation showing the pilots maintain an appropriate level of recent pilot experience in the UAS being operated, or in an FAA-certified simulator. At a minimum, the PIC must conduct three takeoffs (launch) and three landings (recovery) in the specific UAS within the previous 90 days (excluding pilots who do not conduct launch/recovery during normal/emergency operations); or as prescribed by the proponent's accepted recurrent training and currency program.

(a) For those operations that require a certificated pilot, the PIC, to exercise the privileges of his certificate, must have flight reviews and maintain recent pilot experience in manned aircraft per 14 CFR part 61, as appropriate; or FAA-accepted equivalent.

(b) For flights approved for night operations, the PIC must conduct three takeoffs (launch) and three landings (recovery) each, in the specific UAS at night, to a full stop in the previous 90 days (excluding pilots who do not conduct launch/recovery during normal/emergency operations).

(c) For operations approved for night or IFR, the PIC must maintain recent pilot experience per § 61.57 or FAA-accepted equivalent as applicable.

(4) PIC Medical. The PIC must maintain, at a minimum, a valid FAA second-class medical certificate issued under 14 CFR part 67 or the FAA-recognized equivalent. The second-class medical certificate expires at the end of the last day of the 12th month after the month of the date of the examination shown on the medical certificate listed in § 61.23.

(5) Section 91.17 or FAA-recognized equivalent applies to all UAS crewmembers.

(6) PIC Training.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

(a) In addition to the training required for a pilot certificate, UAS PICs must have the following additional training (or FAA-recognized equivalent):

- Including normal, abnormal, and emergency procedures in all specific details of the UAS being operated,
- Manufacturer-specific training,
- Demonstrated proficiency, and
- Testing in the UAS being operated.

(b) Proponents must maintain individual training records of all UAS personnel. All training and testing will be documented in the individual's training record by the instructor and initialed by the trainee.

d. Supplemental Pilots. Supplemental pilots are those pilots assigned UAS flight duty to augment the PIC. It is common for proponents to have both an internal and an external UAS pilot. The supplemental pilot can assume either of these positions.

(1) Ratings. Supplemental pilots must have, at a minimum, successfully completed private pilot ground school and passed the written test or FAA-recognized equivalents. The ground school written test results are valid for two years from the date of completion, at which time the instruction and written examination must be repeated. If a supplemental pilot assumes the role of PIC, he/she must comply with the PIC rating, currency, medical, and training requirements listed above in subparagraph 15c.

(2) Recent Pilot Experience. The proponent must provide a process that ensures that pilots maintain an appropriate level of recent pilot experience for the position they are assigned in the UAS being operated.

(3) Medical. Supplemental pilots must maintain, at a minimum, a valid FAA second-class medical certificate issued under part 67 or the FAA-recognized equivalent. The second-class medical certificate expires at the end of the last day of the 12th month after the month of the date of the examination shown on the medical certificate, according to § 61.23. Section 91.17 or FAA-recognized equivalent applies to all UAS crewmembers.

(4) Training.

(a) UAS supplemental pilots must have:

- Training in all specific details of the UAS being operated, including normal, abnormal, and emergency procedures;
- Manufacturer-specific training (or FAA-recognized equivalent);
- Demonstrated proficiency and successful testing in the UAS being operated.

(b) Proponents must maintain individual training records for all UAS personnel. All training must be documented by the instructor and initialed by the trainee.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

e. UAS Observer Qualifications. All observers must have an understanding of Federal aviation regulations applicable to the airspace where the UAS will operate. Observers are considered crewmembers. Observers must not perform crew duties for more than one UAS at a time. Observers are not allowed to perform concurrent duties both as UAS pilot and observer.

(1) Medical. All observers must have a valid FAA second-class medical certificate issued under part 67; an FAA-recognized equivalent is an acceptable means of demonstrating compliance with this requirement. The second-class medical certificate expires at the end of the last day of the 12th month after the month of the date of the examination shown on the medical certificate. Section 91.17 or FAA-recognized equivalent applies to all UAS crewmembers.

(2) Training. Observers must complete sufficient training to communicate to the pilot any information required to remain clear of conflicting traffic, terrain, and obstructions, maintain proper cloud clearances, and provide navigational awareness. This training, at a minimum, must include knowledge of:

(a) Their responsibility to assist pilots in complying with the requirements of 14 CFR:

- § 91.111, Operating Near Other Aircraft;
- § 91.113, Right-of-Way Rules: Except Water Operations;
- § 91.115, Right-of-Way Rules: Water Operations; and
- § 91.155, Basic VFR Weather Minimums;

(b) Air traffic and radio communications, including the use of approved ATC/pilot phraseology; and

(c) Appropriate sections of the Aeronautical Information Manual (AIM).

f. UAS Maintenance Personnel Qualifications.

(1) Maintenance Ratings. Will be established as more data is collected and a regulatory guideline is developed.

(2) Recent Maintenance Experience. It is suggested that proponents follow applicable guidelines of 14 CFR part 65, § 65.83, as appropriate, until final UAS regulatory guidelines are available.

(3) Maintenance Medical Requirements. At a minimum, the requirements of § 91.17 or FAA-recognized equivalent must be met. No additional medical requirements have been defined at this time.

(4) Maintenance Training. It is highly recommended that a proponent of a UAS submit a training program. This requirement will be further defined as more data is collected and the regulatory process affects these guidelines.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

g. Other UAS Personnel Qualifications. Ancillary personnel such as systems operators or mission specialists must be thoroughly familiar with and possess operational experience of the equipment being utilized. If the systems being utilized are for observation and detection of other aircraft for collision avoidance purposes, personnel must be thoroughly trained on collision avoidance procedures and techniques and have direct communication with the UAS pilot, observer, and other applicable personnel.

16. AMOC. This notice defines certain limitations and procedures to conduct UAS operations, but each application is evaluated on its own technical merit based on its own set of operational parameters and proposed operational profiles, mitigations, and systems. When a proponent desires to deviate from these limitations and procedures, an AMOC that includes a safety case (recommended format provided in Appendix D), must be submitted for approval. For a proponent to make an acceptable safety case, information must be provided that outlines all hazards and risks associated with the requested AMOC. In addition, the proponent must provide a description of the methods and procedures or equipment for mitigating each hazard and risk. As such, deviations and AMOC may differ from the information presented in this notice. Therefore, if the proponent provides an acceptable safety case with sufficient data that supports the proposal, the AMOC will be considered and evaluated for approval.

a. Safety Case Information. The proponent should include at a minimum:

(1) A thorough description of the environment in which the aircraft will operate;

(2) Criteria for categorizing hazards (e.g., severity and likelihood);

(3) A detailed airworthiness description of the affected items associated with the proposed AMOC, which includes, as a minimum:

- Certification status of components and systems, or statement of airworthiness for public aircraft,
- Reliability data,
- Redundant systems,
- Failure modes and effects, including system response to loss of control link, and
- An airworthiness determination (for COA proponents only);

(4) Capabilities of the aircraft;

(5) Flight data;

(6) Accident data;

(7) Emergency procedures; and

(8) Pilot/crew roles and responsibilities.

b. Sample Safety Case. Appendix D represents the FAA's approach to documenting the process used for hazard identification and risk mitigation. It is provided as an example for proponents to use when developing and documenting a safety case. In addition to these

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

guidelines, other government and industry methods similar to the FAA's approach to developing a safety case also provide acceptable hazard analysis tools. These include Preliminary Hazard Analysis, Operational Safety Assessment, Comparative Safety Assessment, and Fault Hazard Analysis. See Appendix D for a complete list.

17. Disposition. We will incorporate the information in this notice into FAA Order 8900.1 before this notice expires. Direct questions concerning the information in this notice to the Unmanned Aircraft Systems Integration Office, AFS-80, at 202-385-4835.

for John L. Duncan

APPENDIX A. DEFINITIONS

1. Aircraft. A device used or intended to be used for flight in the air, including unmanned aircraft (UA).

2. Airworthiness [UAS]. A condition in which the unmanned aircraft system (UAS) (including the aircraft, airframe, engine, propeller, accessories, appliances, and control station (CS)) conforms to its type certificate, if applicable, and is in condition for safe operation.

3. Airworthiness Certification. Process and aircraft qualification for civil UAS proponents to obtain a special airworthiness certificate.

4. Airworthiness Statement. Document required from public UAS proponents during a Certificate of Waiver or Authorization (COA) application process which confirms aircraft airworthiness.

5. Certificate of Waiver or Authorization (COA). An FAA grant of approval for a specific operation. The authorization to operate a UAS in the National Airspace System (NAS) as a public aircraft outside of Restricted, Warning, or Prohibited areas approved for aviation activities.

6. Chase Aircraft. A manned aircraft that carries its own pilot-in-command (PIC) and a separate qualified VO flying in proximity to a UA.

7. Civil Aircraft. Aircraft other than public aircraft.

8. Cooperative Aircraft. Aircraft that have an electronic means of identification (i.e., a transponder or ADS-B transceiver) aboard in operation.

9. Crewmember [UAS]. In addition to the crewmembers identified in 14 CFR part 1, a UAS flightcrew member includes pilots, sensor/payload operators, and VOs, but may include other persons as appropriate or required to ensure safe operation of the aircraft.

10. Crew Resource Management (CRM). The effective use of all available resources including human, hardware, and information resources.

11. Daisy-Chaining. Aviation jargon for the use of multiple, successive observers to extend the flight of a UA beyond the direct visual line-of-sight of any other PIC or VO.

12. Experimental Certificate. A type of special airworthiness certificate issued for the purposes of research and development (R&D), crew training, exhibition, and market survey as defined in 14 CFR part 21, § 21.191(a), (c), and (f). Note: According to § 91.319(a)(2), experimental aircraft may not be used for carrying persons or property for compensation or hire.

a. R&D Aircraft. Aircraft testing new design concepts, equipment, installations, operating techniques, or uses for aircraft. Any unmanned aircraft system (UAS), including an Optionally Piloted Aircraft (OPA) is eligible for an experimental certificate under this purpose. Operations

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

may be conducted by the proponent only as a matter of research or to determine whether an idea warrants further development.

b. Crew Training. Crew training is limited to the number of flight crews required by the proponent to conduct experimental aircraft operations.

c. Market Survey. Aircraft may be used for the purposes of conducting market surveys, sales demonstrations, and customer crew training of the manufacturer's customers as provided in part 21, § 21.195.

13. External Pilot. A UAS pilot who flies from outside a CS shelter with direct visual contact with the aircraft.

14. FAA-Recognized Equivalent. An FAA recognition that a public agency may exercise its own internal processes regarding airworthiness and pilot, aircrew, and maintenance personnel certification and training; furthermore, the agency has determined that its UAS is capable of safe operation in the National Airspace System (NAS) when conducting public aircraft operations under Title 49 of the United States Code (49 U.S.C.) §§ 40102(a)(41) and 40125.

15. Fly-Away. An interruption or loss of the control link, or when the pilot is unable to effect control of the aircraft and, as a result, the UA is not operating in a predicable or planned manner.

16. Formation.

a. Non-standard formation. A formation operating under any of the following conditions:

- When the flight leader has requested and ATC has approved other than standard formation dimensions;
- When operating within an authorized block altitude or under the provisions of a letter of agreement (LOA);
- When the operations are conducted in airspace specifically designed for a special activity.

b. Standard formation. A formation in which proximity of no more than 1 NM laterally or longitudinally and within 100 feet vertically from the flight leader is maintained by each wingman or UA.

17. Inspection. The routine performance of inspection tasks at prescribed intervals. The inspection must ensure the airworthiness of an aircraft up to and including its overhaul or life limits.

18. Internal Pilot. A UAS pilot who flies from inside a CS shelter without direct visual contact with the aircraft.

19. Lost Link. An interruption or loss of the control link, or when the pilot is unable to effect control of the aircraft and, as a result, the UA will perform a predictable or planned maneuver. Loss of command and control link between CS and aircraft. There are two types of links:

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

- An uplink which transmits command instructions to the aircraft, and
- A downlink which transmits the status of the aircraft and provides situational awareness to the pilot.

20. Missile. A non-recoverable, powered, guided munition that travels through the air or space.

- Ballistic missiles follow a ballistic trajectory.
- Cruise missiles generate lift.
- Guided missiles are launched from a ship or aircraft and serve as a self-contained precision bomb.

21. Non-Cooperative Aircraft. Aircraft that do not have an electronic means of identification (e.g., a transponder) aboard or that have inoperative equipment because of malfunction or deliberate action.

22. Non-Standard Formation. See Formation.

23. Observer. A trained person who assists a UAS pilot in the duties associated with collision avoidance and navigational awareness through electronic or visual means. (Collision avoidance includes, but is not limited to, avoidance of other traffic, clouds, obstructions, terrain and navigational awareness.) A visual observer (VO) is a trained person who assists the UAS pilot by visual means in the duties associated with collision avoidance. A VO includes the OPA pilot when the OPA is being operated as a UAS.

24. Off-Airport. Any location used to launch or recover aircraft that is not considered an airport (e.g., an open field).

25. Optionally Piloted Aircraft (OPA). An aircraft that can conduct operations as a traditional aircraft with a pilot aboard the aircraft, and can also operate as a UAS when the aircraft is operated and controlled by the CS pilot, allowing the pilot aboard the aircraft to become a qualified observer and remain a PIC. OPA operating as a UAS must meet UAS guidance requirements.

26. Pilot Duty Period. The period beginning when a flightcrew member is required to report for duty, with the intention of conducting a flight, and ending when the aircraft is parked after the last flight. It includes the period of time before a flight or between flights that a pilot is working without an intervening rest period.

27. Pilot-in-Command (PIC)-[UAS]. The person who has final authority and responsibility for the operation and safety of flight, has been designated as PIC before or during the flight, and holds the appropriate category, class, and type rating, if appropriate, for the conduct of the flight. The responsibility and authority of the PIC as described by 14 CFR part 91, § 91.3 apply to the UA PIC. The PIC position may rotate duties as necessary with equally qualified pilots. The individual designated as PIC may change during flight. Note: The PIC can only be the PIC for one aircraft at a time. For OPA, PIC must meet UAS guidance requirements for training, pilot licensing, and medical requirements when operating OPA as a UAS.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

28. Populated or Urban Areas. Areas depicted in yellow on a Visual Flight Rules (VFR) sectional chart or as determined from other sources.

29. Proponent. A person or agency making an application for a Certificate of Waiver or Authorization (COA).

30. Public Aircraft. An aircraft operated by a governmental entity (including Federal, State, or local governments, and the U.S. Department of Defense (DOD) and its military branches) for certain purposes as described in 49 U.S.C. §§ 40102(a)(41) and 40125. Public aircraft status is determined on an operation by operation basis. See 14 CFR part 1, § 1.1 for a complete definition of a public aircraft.

31. Public Operator. An operator that is classified as government and/or otherwise qualifies for public aircraft operation under 49 U.S.C. §§ 40102(a)(41) and 40125. Not all flights by a public aircraft operator qualify as a public aircraft operation under the statute. Public aircraft operation status is not automatic for flights conducted by a government entity or a contractor to a government entity.

32. Rocket. A powered, unguided munitions (DOD); or an aircraft propelled by ejected expanding gases generated in the engine from self-contained propellants and not dependent on the intake of outside substances. It includes any part which becomes separated during the operation (14 CFR).

33. Safety Risk Management (SRM). A formalized, proactive approach to system safety. SRM is a methodology that ensures hazards are identified, risks are analyzed, assessed, and prioritized; and results are documented for FAA decision-makers to transfer, eliminate, accept, or mitigate risk.

34. Scheduled Maintenance (Routine). The performance of maintenance tasks at prescribed intervals.

35. Segregation. Setting apart from other air traffic operations in the NAS. Segregation is not synonymous with required air traffic separation standards. Therefore, segregation does not prescribe or mandate criteria such as vertical, lateral, or longitudinal distances.

36. Shells. Munitions that are fired from a gun whether guided or not.

37. Smart Bomb. Precision-guided munitions.

38. Standard formation. See formation.

39. Supplemental Pilot. Pilots assigned UAS flight duties to augment the PIC. It is common for proponents to have both an internal and an external UAS pilot. The supplemental pilot can assume either of these positions. The supplemental pilot may also assume duties of the PIC if the specified qualifications are met.

40. Torpedoes. Powered munitions that travel through water.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

41. Unmanned Aircraft (UA). A device used or intended to be used for flight in the air that has no onboard pilot. This devise excludes missiles, weapons, or exploding warheads, but includes all classes of airplanes, helicopters, airships, and powered-lift aircraft without an onboard pilot. UA do not include traditional balloons (see 14 CFR part 101), rockets, tethered aircraft and un-powered gliders.

42. Unmanned Aircraft System (UAS). A UA and its associated elements related to safe operations, which may include CSs (ground, ship, or air-based), control links, support equipment, payloads, flight termination systems (FTS), and launch/recovery equipment.

43. Unscheduled Maintenance (Non-Routine). The performance of maintenance tasks when mechanical irregularities occur.

44. Visual Line-of-Sight. Unaided (corrective lenses and/or sunglasses exempted) visual contact between a PIC or a VO and a UAS sufficient to maintain safe operational control of the aircraft, know its location, and be able to scan the airspace in which it is operating to see and avoid other air traffic or objects aloft or on the ground.

APPENDIX D. SAFETY CASE FORMAT

1. **Signature Page.** Include the following information on the signature page:

   - Title: A clear and concise description of the proposed method for AMOC;
   - Originator Information: Originator's name, organization, contact information, etc.;
   - Safety Risk Management Document (SRMD) Information: Safety Case submission date, revision number, etc.

2. **Executive Summary.** The summary should give a general description of the proposed AMOC, including a list of the hazards with associated risk level (high, medium, low) and their corresponding initial and predicted residual risk. Include a high level system description, a summary of how the Safety Case was developed, and what process/method was used to move through the risk assessment process.

3. **Introduction.** Provide a brief reasoning/rationale for the initiative. The scope of the proposed AMOC, whether it is more complex or far-reaching, will determine the need for increased scope and detail of the analysis to be performed.

4. **Section 1.** Current System/System Baseline. Provide a description of the current system or existing procedures as well as the corresponding (operational) system states. If the proposal entails a procedural change, describe the current procedure and its operational environment. If the current system or procedure is unique and has challenges associated with its unique situation, be sure to delineate.

5. **Section 2.** Proposed Change. Provide a description of the proposed change/procedure, identifying which safety parameters are involved.

6. **Section 3.** Safety Risk Management (SRM) Planning and Impacted Organizations. Prior to initiation of the safety analysis, SRM planning is necessary. It is essential to select the appropriate SRM participants, identify the SRM Panel, schedule milestones, and assign tasks and responsibilities. With regard to the organizations that are impacted by the change, describe the method used for collaboration between those organizations during the identification, mitigation, tracking, and monitoring of hazards associated with the change.

7. **Section 4.** Assumptions. If in the process of developing a procedure to validate an AMOC, any assumptions are made to make the evaluation of the change more manageable, clearly define and document them in this section.

8. **Section 5.** Phase 1: System Description. The description of the system/procedure, its operational environment, the people involved/affected by the change/procedure, and the equipment required to accommodate the proposal must be provided.

9. **Section 6.** Phase 2: Identified Hazards. The SRM Panel identifies hazards as a collaborative effort. The tool(s) and technique(s) used to identify hazards should be specified and discussed. The identified hazards are documented as well as their corresponding causes, the corresponding system states considered and the consequent potential outcome. It is important to realize that while identification of the worst credible outcome and the system state in which the worst

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

credible outcome occurs is required, system states with less severe outcomes should not be ignored.

10. Section 7. Phase 3 & 4: Risk Analysis & Risks Assessed. Describe the process used to analyze the risks associated with the identified hazards. Specify what type of data was used to determine the likelihood of risk occurrence (e.g., quantitative or qualitative) as well as the sources of the data. A risk matrix should provide an illustration of the predicted initial/current risk(s) associated with the identified hazards.

11. Section 8. Phase 5: Treatment of Risks/Mitigation of Hazards. If the existing controls and mitigations do not acceptably mitigate the hazards, then additional recommended safety requirements should be identified. An explanation of how the recommended safety requirements are expected to reduce the initial/current risk to an acceptable predicted residual risk level should be included. Low-risk hazards may still warrant recommended safety requirements.

12. Section 9. Tracking and Monitoring of Hazards. Once the proposal has been approved and implemented, tracking of hazards and verification of the effectiveness of mitigation controls throughout the lifecycle of the system or change are required. Also, the methodology for this tracking and monitoring should be outlined.

13. Appendices.

a. Documents Related to the SRMD. Include a list of documents (orders, directives, regulations, handbooks, and manuals) that pertain to the proposed change, which have been consulted in the development of the proposed change and the corresponding safety analysis.

b. Hazard Identification Tools. Provide information on the different tool(s), method(s), and technique(s) used during the safety analysis. (See Figure D-1, for a chart listing acceptable hazard analysis tools and techniques.)

c. Hazard Analysis and Risk Matrix. Depending on the analyses necessary, there might be one or more appendices with analyses. A risk matrix reflecting the initial and predicted residual risks should also be included.

d. Glossary. Include any acronyms and definitions for any terms you listed in the Safety Case.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

Figure D-1. Acceptable Hazard Analysis Tools and Techniques

This chart from the ATO Safety Management System Manual, available on the Internet, displays acceptable hazard analysis tools for developing safety cases.

Air Traffic Organization Safety Management System Manual - Version 2.1

Table 3.1: Selection of Hazard Identification and Analysis Tools and Techniques

Tool or Technique	Summary Description	Page in Appendix G
Preliminary Hazard Analysis (PHA)	The PHA provides an initial overview of the hazards present in the overall flow of the operation. It provides a hazard assessment that is broad, but usually not deep.	G-1
Operational Safety Assessment (OSA)	The OSA is a development tool based on the assessment of hazard severity. It establishes how safety requirements are to be allocated between air and ground components and how performance and interoperability requirements might be influenced.	G-3
Comparative Safety Assessment (CSA)	The CSA provides management with a listing of all of the hazards associated with a change, along with a risk assessment for each alternative hazard combination that is considered. It is used to rank the options for decision-making purposes. The CSA's broad scope is an excellent way to identify issues that may require more detailed hazard identification tools.	G-5
Fault Hazard Analysis (FHA)	The FHA is a deductive method of analysis that personnel can use exclusively as a qualitative analysis or, if desired, can expand to a quantitative one. The FHA requires a detailed investigation of the subsystems to determine component hazard modes, causes of these hazards, and resultant effects on the subsystem and its operation.	G-8
Failure Mode and Effect Analysis (FMEA)	The FMEA determines the results or effects of sub-element failures on a system operation and classifies each potential failure according to its severity.	G-9
Failure Modes, Effects, and Criticality Analysis (FMECA)	The FMECA is an essential function in design from concept through development. To be effective, the FMECA is iterative to correspond with the nature of the design process itself. The FMECA identifies component and sub-system failure modes, including the impact of human error; evaluates the results of the failure modes; determines rates and probability; and demonstrates compliance with safety requirements.	G-9
What-If Analysis	The What-If Analysis methodology identifies hazards, hazardous situations, or specific accident events that could produce an undesirable consequence. One can use the What-If Analysis as a brainstorming method.	G-10
Scenario Analysis	The Scenario Analysis identifies and corrects potentially hazardous situations by postulating accident scenarios in cases where it is credible and physically logical.	G-12
Change Analysis	The Change Analysis analyzes the hazard implications of either planned or incremental changes (e.g., operation, equipment, or procedure).	G-13
Cause-Consequence Analysis	The Cause-Consequence Analysis combines the bottom-up and top-down analysis techniques of Event Trees and Fault Trees. The result is the development of potential complex accident scenarios.	G-15

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

Figure D-1. Acceptable Hazard Analysis Tools and Techniques, continued

Air Traffic Organization Safety Management System Manual - Version 2.1

Tool or Technique	Summary Description	Page in Appendix G
Hazard and Operability Tool (HAZOP)	A group uses the HAZOP to analyze hazards of completely new operations and to review the significance of all of the ways that a process element can malfunction or be incorrectly operated. The technique is essentially a structured brainstorming using specific guide words.	G-17
Interface Analysis	One uses the Interface Analysis to discover the hazardous linkages between interfacing systems.	G-18
Accident/Incident Analysis	The Accident/Incident Analysis uses data on recorded hazardous events. One groups these events in various ways according to a pre-established criterion, usually a common cause or outcome. One then identifies the groupings as hazards.	G-19
Job Safety Analysis (JSA)	One uses this technique to assess in detail the safety considerations in a single job or task..	G-20
Energy Trace and Barrier Analysis (ETBA)	The ETBA is highly structured. It documents all energy sources in system. One identifies the energy sources as hazards. One identifies the barrier between the energy sources and the operators, maintainers, and other systems as mitigations.	G-21
Fault Tree Analysis (FTA)	An FTA is a graphical design technique that can provide an alternative to block diagrams. It is a top-down, deductive approach structured in terms of events. One models faults in terms of failures, anomalies, malfunctions, and human errors.	G-22
Management Oversight and Risk Tree (MORT)	One uses the MORT technique to systematically analyze hazards to examine and determine detailed information about the process and accident contributors.	G-24
Human Error Analysis (HEA)	HEA, in a system context, involves assessing each human-machine interface point, decision, or action for the potential for human error to adversely impact system performance or safety of the system and its users. There are a variety of methodologies for conducting these analyses.	G-26
Job Task Analyses (JTA)	The foundation of the performance of HEA is a task analysis, which describes each human task/sub-task within a system in terms of the perceptual (information intake), cognitive (information processing and decision making), and manual (motor) behaviors required of an operator, maintainer, or support person. It should also identify the skills and information required to complete the tasks; equipment requirements; the task setting; time and accuracy requirements; and the probable human errors and consequences of these errors. There are several tools and techniques for performing task analyses, depending on the level of analysis needed.	G-28

Check with FSIMS to verify current version before using

APPENDIX E. CONTINGENCY PLANNING LIMITATIONS

1. Point Identification. The proponent must submit contingency plans that address emergency recovery or flight termination of the unmanned aircraft (UA) in the event of unrecoverable system failure. These procedures will normally include Lost Link Points (LLP), Divert/Contingency Points (DCP) and Flight Termination Points (FTP) for each operation. LLPs and DCPs must be submitted in latitude/longitude (Lat/Long) format along with a graphic representation plotted on an aviation sectional chart (or similar format). FTPs or other accepted contingency planning measures must also be submitted in Lat/Long format along with a graphic representation plotted on an aviation sectional chart, or other graphic representation acceptable to the FAA. The FAA accepts the LLPs, DCPs, FTPs, and other contingency planning measures submitted by the proponent, but does not approve them. When conditions preclude the use of FTPs, the proponent must submit other contingency planning options for consideration and acceptance. At least one LLP, DCP, and FTP (or an acceptable alternative contingency planning measure) is required for each operation. The proponent must furnish this data with the initial Certification of Waiver or Authorization (COA) application. Any subsequent changes or modifications to this data must be provided to the Unmanned Aircraft Systems (UAS) Integration Office (AFS-80) for review and consideration no later than 30 days prior to proposed flight operations.

2. Risk Mitigation Plans. For all operations, the proponent must develop detailed plans to mitigate the risk of collision with other aircraft and the risk posed to persons and property on the ground in the event the UAS experiences a lost link, needs to divert, or the flight needs to be terminated. The proponent must take into consideration all airspace constructs and minimize risk to other aircraft by avoiding published airways, military training routes, Navigational Aids (NAVAIDS), and congested areas. In the event of a contingency divert or flight termination, the use of a chase aircraft is preferred when the UAS is operated outside of Restricted or Warning Areas. If time permits, the proponent should make every attempt to utilize a chase aircraft to monitor the aircraft to a DCP or to the FTP. In the event of a contingency divert or flight termination, the proponent will operate in Class A airspace and Special Use airspace to the maximum extent possible to reduce the risk of collision with non-participating air traffic.

a. LLP Procedures.

(1) LLPs are defined as a point, or sequence of points, where the aircraft will proceed and hold at a specified altitude, for a specified period of time, in the event the command and control link to the aircraft is lost. The aircraft will autonomously hold, or loiter, at the LLP until the communication link with the aircraft is restored or the specified time elapses. If the time period elapses, the aircraft may autoland, proceed to another LLP in an attempt to regain the communication link, or proceed to an FTP for flight termination. LLPs may be used as FTPs. In this case, the aircraft may loiter at the LLP/FTP until link is re-established or fuel exhaustion occurs.

(2) For areas where multiple or concurrent UAS operations are authorized in the same operational area, a segregation plan must be in place in the event of a simultaneous lost link scenario. The deconfliction plan may include altitude offsets and horizontal separation by using independent LLPs whenever possible.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

b. DCP Procedures.

(1) A DCP is defined as an alternate landing/recovery site to be used in the event of an abnormal condition that requires a precautionary landing. Each DCP must incorporate the means of communication with air traffic control (ATC) throughout the descent and landing (unless otherwise specified in the Special Provisions) as well as a plan for ground operations and securing/parking the aircraft on the ground. This includes the availability of control stations (CS) capable of launch/recovery, communication equipment, and an adequate power source to operate all required equipment.

(2) For local operations, the DCP specified will normally be the airport/facility used for launch and recovery; however, the proponent may specify additional DCPs as alternates.

(3) For transit and/or mission operations that are being conducted in Class A airspace or Class E airspace above flight level (FL) 600, DCPs will be identified during the flight to be no further than one hour of flight time at any given time, taking into consideration altitude, winds, fuel consumption, and other factors. If it is not possible to define DCPs along the entire flight plan route, the proponent must identify qualified FTPs along the entire route and be prepared to execute flight termination at one of the specified FTPs if a return to base (RTB) is not possible.

(4) It is preferred that specified DCPs are non-joint use military airfields, other government-owned airfields, or private-use airfields. However, the proponent may designate any suitable airfield for review and consideration.

c. Flight Termination Procedures.

(1) Flight termination is the intentional and deliberate process of performing controlled flight into terrain (CFIT). Flight termination must be executed in the event that all contingencies have been exhausted and further flight of the aircraft cannot be safely achieved or other potential hazards exist that require immediate discontinuation of flight. FTPs or alternative contingency planning measures must be located within power-off glide distance of the aircraft during all phases of flight and must be submitted for review and acceptance. The proponent must ensure sufficient FTPs or other contingency plan measures are defined to accommodate flight termination at any given point along the route of flight. The location of these points is based on the assumption of an unrecoverable system failure and must take into consideration altitude, winds, and other factors.

(2) Unless otherwise authorized, FTPs must be located in sparsely populated areas. Except for on- or near-airport operations, FTPs will be located no closer than five nautical miles (NM) from any airport, heliport, airfield, NAVAID, airway, populated area, major roadway, oil rig, power plant, or any other infrastructure. For offshore locations, the proponent must refer to appropriate United States Coast Guard (USCG) charts and other publications to avoid maritime obstructions, shipping lanes, and other hazards. Populated areas are defined as those areas depicted in yellow on a Visual Flight Rules (VFR) sectional chart or as determined from other sources.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

(a) It is preferred that flight termination occurs in Restricted or Warning Areas, government-owned land, or offshore locations that are restricted from routine civil use. However, the proponent may designate any suitable location for review and consideration.

(b) The proponent is required to survey all designated areas prior to their use as an FTP. All FTPs will be reviewed for suitability on a routine and periodic basis, not to exceed six months. The proponent assumes full risk and all liability associated with the selection and use of any designated FTP.

(c) It is desirable that the proponent receive prior permission from the land owner or using agency prior to designation of this area as an FTP. The proponent should clearly communicate the purpose and intent of the FTP.

(d) For each FTP, plans must incorporate the means of communication with ATC throughout the descent as well as a plan for retrieval/recovery of the aircraft.

(e) Contingency planning must take into consideration all airspace constructs and minimize risk to other aircraft by avoiding published airways, military training routes, NAVAIDS, and congested areas to the maximum extent possible.

(f) In the event of a contingency divert or flight termination, if time permits, the use of a chase aircraft is preferred when the UA is operated outside of Restricted or Warning Areas.

(g) In the event of a contingency divert or flight termination or other approved contingency measures, the proponent will operate in Class A airspace and Special Use airspace to the maximum extent possible to reduce the risk of collision with non-participating air traffic.

Unmanned Aircraft Systems Legislative Task Force

October 24, 2013 Meeting at Anchorage LIO Room 220

Task Force Members:

- Representative Shelley Hughes, Co-Chair
- Senator Donny Olson, Co-Chair
- Ginger Blaisdell, Staff to Rep. Hughes
- David Scott, Staff to Senator Donny Olson
- McHugh Pierre, Department of Military and Veterans' Affairs
- Greg Walker, University of Alaska Fairbanks
- Ro Bailey, University of Alaska Fairbanks
- Lieutenant Steve Adams, Commissioner Designee, Department of Public Safety
- Steve Strait, Aviation Advisory Board, Governor's Office and DOT/PF
- Steve Colligan, Representative Member for the Academy of Model Aeronautics

Guest Attendee:

- Jay Skaggs, FAA
- Harry Kieling, Dept of InterioR

A G E N D A

8:30am Welcome and Introductions — Representative Shelley Hughes

Task Force responsibilities per HCR6

The duties of the task force shall include (1) reviewing regulations and guidance from the Federal Aviation Administration regarding unmanned aircraft systems; (2) providing written recommendations, together with suggested legislation, for a comprehensive state policy for unmanned aircraft that protects privacy and allows the use of unmanned aircraft systems for public and private applications; and (3) submitting, not later than January 15, 2014, an initial report to the legislature and, not later than July 1, 2014, submitting a final report to the legislature.

Brief Remarks About October 23rd Testimony

- **General Theme of Remarks**
- **Lessons Learned by Testifiers**
- **Continue to accept public testimony in writing**

8:35am **List of Documents Provided** **Ginger Blaisdell, staff**

1. **FAA Guidelines document N8900**
2. **Legal Services Memo**: Alaska Laws Protecting Privacy
3. **Observations from Above**: Unmanned Aircraft Systems and Privacy
4. **Alaska Law Review**, June 1995
5. **Aerospace States Association**: UAS Privacy Considerations and correspondence from ACLU, AK Department of Law, Airborne Law Enforcement Association, International Association of Chiefs of Police Aviation Committee, American Legislative Exchange Council, AUVSI, Electric Frontier Foundation, Electronic Privacy Information Center, Douglas Marshall, NACDL, and a sample bill.
6. **International Association of Chiefs of Police Aviation Committee**
7. **Academy of Model Aeronautics Policy**
8. **State of Texas Privacy Act**
9. **Homeland Security:** Privacy Impact Assessment for the Aircraft Systems

8:40am-10:00am **Overview of FAA Guidelines** **Greg Walker and Ro Bailey, UAF**

US DOT, FAA N8900.207
Unmanned Aircraft Systems (UAS) Operational Approval

10:00am-10:30am **Law Enforcement Review** **Lt Steve Adams, AK State Troopers**

International Association of Chiefs of Police Aviation Committee
Recommendations from experience in Alaska

As we go through these documents and listen to presentations, the task force may want to consider the legislative approach to the following topics:

Report/Bill

- Does the Task Force want to introduce a report separate from the introduction of a bill as requested in HCR6?
- What does the task force want in a report to the legislature?
- What kind of supporting documentation should be provided with the bill?

Legal Services Memo: Page 2
"The Court might find the use of a technology that exceeds human observational capacity the sort of intrusion that constitutes a search requiring a warrant or an accepted exception."
State of Texas Privacy Act: Page 1
What exceptions may need to be considered in legislation? Should the legislation prohibit uses and allow exceptions – OR – allow everything and specify prohibited uses?

Legal Services Memo: Page 4 and 5
"If the data is gathered by a government agency, it is a public record. However, AS 40.25.120 provides certain protections for private information." Inadvertent capture of evidence of illegal activity: "Use of inadvertently captured information in a criminal prosecution may depend on who captures the information, and whether the person whose actions have been captured has a reasonable expectation of privacy."
Under what circumstances would a court grant a search warrant to follow up on information inadvertently obtained, but not in "plain view?"

Observations from Above: Page 487-488
As technology continues to advance beyond 'normal' application of current laws, drafting new laws must adopt a balanced approach that recognizes the inherent difficulty in predicting the future.
How should Alaska law address law enforcement activities that might be considered 'uncommon practice' or 'routine' in reference to advanced technological capabilities? (such as thermal imaging)

Observations from Above: Page 495
"... But future (technological) developments will make long-term surveillance with UAS possible."
Should duration of flight hours be a consideration for exemptions of warrantless observations and intelligence collection or general flight use for any purpose?

Observations from Above: Page 503
"... in common law, a plaintiff generally must establish, at a minimum, that the intrusion was intentional and that it would be highly offensive to a reasonable person."
Do we need to consider a definition for "highly offensive to a reasonable person?"

Observations from Above: Page 508
Voluntary approaches of self-managed rules of UAS.
Do we want to adopt specific guidelines from the International Association of Chiefs of Police, AUVSI, Academy of Model Aeronautics, etc.? What if these guidelines make changes that are in conflict with Alaska Constitution or Alaska Law?

Observations from Above: Page 511
Suggestions for legislation:

- Consider the role that could be played by unintentionally captured images

- Legislation that would include a blanket prohibition on government use of private UAS data in criminal investigations would also be ill advised, as well as inconsistent with what routinely occurs in noninvasive settings.
- Any new legislation should recognize that images of public spaces from UAS will sometimes also include images of private spaces (nearby homes).
- State statute and scope of Federal Preemption: does not prevent state from passing any laws relating to how aircraft are flown.
- A state does not have the authority to enact UAS privacy laws that would decrease the safety of flight operations.

Miscellaneous comments from the public for the task force to consider:

1. Certification of Aircraft – who would certify, license, fee associated, "FAA is short on inspectors"
2. UAS pilot's license with differing levels of certification (hobbyist – commercial pilot plus UAS training hours)
3. Education provisions to train UAS Pilots
4. Specialized (high visibility) marking of UAS or lighting so that other aircraft can spot them
5. Insurance needs for private UAS operators
6. Who is responsible in educating the public
7. Disclaimer or disclosure for hobbyists when they purchase UAS
8. How to market Alaska as "Open for Business" for UAS operations
9. Public reporting requirements of UAS missions
10. Audits of UAS operators
11.

1:30pm – 4:30pm Public Testimony

Calls limited to 3 minutes each

4:30pm **Wrap Up** **Representative Hughes**

Ginger will summarize the documents discussed at this meeting and request a bill draft for our next meeting.

Task Force Timeline and Next Meeting Date/Time

FAA Guidelines for UAS

Alaska Legislative Task Force

10-24-13
FAA GUIDELINES
RO BAILEY
AK CTR. FOR
UA SYSTEMS

Ro Bailey

Deputy Director

Alaska Center for Unmanned Aircraft Systems Integration

(907) 455-2104

Review

- Current Regulations
  - Definitions & Exceptions
- Guidelines, Policy, & COAs
- 2012 FAA Reauthorization Act
- How is Privacy Protected?
- What's Needed to Fully Integrate UAS into the National Airspace System

The Governments Authority to Regulate UAS Flight Operations

- The Government obtains its authority to regulate the NAS through statutes enacted by Congress.
- Based on statutory authority, the FAA's responsibility is to implement regulations which carry out Congress's intent.
- 49 USC § 40103(b) states that "The FAA Administrator shall prescribe air traffic regulations regarding the flight of aircraft for:
  - (A) Navigating, protecting, and identifying aircraft;
  - (B) Protecting individuals and property on the ground;
  - (C) Using the navigable airspace efficiently; and
  - (D) Preventing collision between aircraft, between aircraft and land or water vehicles, and between aircraft and airborne objects."

Definitions

- NAS = National Airspace System
- UAS = Unmanned Aircraft System (FAA official term)
  - Unofficial terms include UAVs, RPAS, drones
    - UAV = Unmanned Aircraft or Aerial Vehicle
    - RPAS = Remotely Piloted Aircraft System
- RC aircraft = Remotely controlled aircraft, refers to model aircraft
- AMOC = Alternate Mode of Compliance
- SA or S&A = See and Avoid or Sense and Avoid

What is an Aircraft?

- 49 USC § 40102 defines an aircraft as "any contrivance intended, used, or designed to navigate, or fly in, the air."
  - UAS are categorized as aircraft

- Therefore, all statutes and regulations relating to "aircraft" include UAS
- However, some contrivances that fit the definition above are actually defined out...

Examples

Aircraft

- Cessna 172
- Boeing 787
- ScanEagle
- Scout

Not Aircraft

- Balloon
- Ultralight
- Model aircraft
- Light Sport Aircraft
- Kites

Public vs Civil Aircraft

- Congress further defined aircraft by distinguishing between "civil" and "public"
  - A "civil aircraft" is any aircraft except a "public aircraft"
  - A "public aircraft" includes:
    - An aircraft that is used only for Government purposes, or
    - An aircraft that is leased or owned by the Government
- FAA authority differs between civil & public aircraft

49 USCS §44711

- Prohibits a person from operating a "civil aircraft" without an airworthiness certificate.
- Prohibits a person from acting as an "airman with respect to a civil aircraft."
  - Does not regulate public aircraft users
  - Public users expected to establish & follow adequate airworthiness determinations & training—and assume the liability for operations
- All aircraft must comply with rules-of-the-road (FAR91)

FAA Modernization & Reform Act of 2012
Subtitle B--Unmanned Aircraft Systems

- Sec. 331. Definitions
  - (1) Arctic
  - (3) Permanent Areas
  - (4) "Public" UAS
  - (5) Sense & Avoid
  - (6) "Small" UAS
- Sec. 332. Integration of civil unmanned aircraft systems into national airspace system
  - Required Planning for Integration
  - Rulemaking
  - Pilot Projects
  - Expanding the use of UAS in the Arctic
- Sec. 333. Special rules for certain unmanned aircraft systems
  - General
  - UAS Assessments
  - Requirements for Safe Operation
- Sec. 334. Public unmanned aircraft systems.
  - Guidance
  - Standards for Operation and Certification
  - Agreements with Government Agencies
- Sec. 335. Safety studies. The FAA shall carry out all safety studies necessary to support the integration of unmanned aircraft systems into the national airspace system.
- Sec. 336. Special rule for model aircraft.
  - General
  - Statutory Construction
  - Model Aircraft Defined
- Sec. 901. Authorizations or Appropriations
  - (b)(15) UAS Research
- Sec. 903. Unmanned Aircraft Systems.
  - Sec. 913. Review of FAA's Aviation Safety-Related Research Programs
  - (15) Unmanned aircraft systems research.

FAA Modernization and Reform Act of 2012

SEC. 332. INTEGRATION OF CIVIL UNMANNED AIRCRAFT SYSTEMS INTO NATIONAL AIRSPACE SYSTEM

REQUIRED PLANNING FOR INTEGRATION

- COMPREHENSIVE PLAN—Not later than 270 days after enactment ... to safely accelerate the integration of civil unmanned aircraft systems into the national airspace system.
  - The plan shall provide for the safe integration of civil unmanned aircraft systems into the national airspace system as soon as practicable, but not later than September 30, 2015.
- REPORT TO CONGRESS—Not later than 1 year after the date of enactment ... a 5-year roadmap for the introduction of civil unmanned aircraft systems into the national airspace system

RULEMAKING

- Not later than 18 months ... a final rule on small unmanned aircraft

PILOT PROJECTS

- ESTABLISHMENT—Not later than 180 days after the date of enactment establish a program to integrate unmanned aircraft systems into the national airspace system at 6 test ranges.

Pilot Projects - continued

SEC. 332. INTEGRATION OF CIVIL UNMANNED AIRCRAFT SYSTEMS INTO NATIONAL AIRSPACE SYSTEM

TEST RANGE LOCATIONS—In determining the location of the 6 test ranges the Administrator shall—

(A) take into consideration geographic and climatic diversity;

(B) take into consideration the location of ground infrastructure and research needs; and

(C) consult with the National Aeronautics and Space Administration and the Department of Defense.

TEST RANGE OPERATION— operational not later than 180 days after the date on which the project is established.

Expanding Use of Unmanned Aircraft Systems in the Arctic

SEC 332 (d)

"…. the Secretary shall develop a plan and initiate a process to ….designate permanent areas in the Arctic where small unmanned aircraft may operate 24 hours per day for research and commercial purposes."

- "Arctic" means the United States zone of the Chukchi Sea, Beaufort Sea, and Bering Sea north of the Aleutian chain.
- Designate permanent areas in the Arctic where small unmanned aircraft may operate 24 hours per day for research and commercial purposes.
- Operations in these permanent areas shall include the development of processes to facilitate the safe operation of unmanned aircraft beyond line of sight.
- Such areas shall enable over-water flights from the surface to at least 2,000 feet in altitude, with ingress and egress routes from selected coastal launch sites.
- Approving the use of unmanned aircraft in the designated permanent areas in the Arctic without regard to whether an unmanned aircraft is used as a public aircraft, a civil aircraft, or a model aircraft.

Special Rules for Certain Unmanned Aircraft Systems

SEC 333 SPECIAL RULES FOR CERTAIN UNMANNED AIRCRAFT SYSTEMS.

IN GENERAL—not later than 180 days shall determine if certain unmanned aircraft may operate safely in the NAS before completion of the plan and rulemaking

ASSESSMENT OF UNMANNED AIRCRAFT SYSTEMS—the Secretary shall determine, at a minimum—

(1) which types of unmanned aircraft systems, if any, as a result of their size, weight, speed, operational capability, proximity to airports and populated areas, and operation within visual line of sight do not create a hazard to users of the national airspace system or the public or pose a threat to national security; and

(2) whether a certificate of waiver, certificate of authorization, or airworthiness certification is required for the operation of unmanned aircraft systems identified under paragraph (1).

REQUIREMENTS FOR SAFE OPERATION—If the Secretary determines under this section that certain unmanned aircraft systems may operate safely in the national airspace system, the Secretary shall establish requirements for the safe operation of such aircraft systems in the national airspace system.

Public Unmanned Aircraft Systems

SEC 334 PUBLIC UNMANNED AIRCRAFT SYSTEMS

GUIDANCE—Not later than 270 days after enactment, shall issue guidance regarding the operation of public unmanned aircraft systems to—

(1) expedite the issuance of a certificate of authorization process;

(2) provide for a collaborative process with public agencies to allow incremental expansion of access to the national airspace system as technology matures and the necessary safety analysis and data become available, and until standards are completed and technology issues are resolved;

(3) facilitate the capability of public agencies to develop and use test ranges, to test and operate unmanned aircraft systems; and

(4) provide guidance on a public entity's responsibility when operating an unmanned aircraft without a civil airworthiness certificate issued by the Administration.

STANDARDS FOR OPERATION AND CERTIFICATION—Not later than December 31, 2015, the Administrator shall develop and implement operational and certification requirements for the operation of public unmanned aircraft systems in the national airspace system.

Agreements with Government Agencies

SEC 334 (c)

IN GENERAL—Not later than 90 days after enactment, the Secretary shall enter into agreements to simplify the process for issuing certificates of waiver or authorization

CONTENTS—The agreements shall—

(A) with respect to an application

(i) provide for an expedited review of the application;

(ii) require a decision by the Administrator on approval or disapproval within 60 business days of the date of submission of the application; and

(iii) allow for an expedited appeal if the application is disapproved;

(B) allow for a one-time approval of similar operations

(C) allow a government public safety agency to operate unmanned aircraft weighing 4.4 pounds or less, if operated—

within the line of sight of the operator; less than 400 feet above the ground, during daylight conditions;, within Class G airspace; and outside of 5 statute miles from location with aviation activities.

Safety Studies

SEC. 335 SAFETY STUDIES

The Administrator shall carry out all safety studies necessary to support the integration of unmanned aircraft systems into the national airspace system.

Authorizations or Appropriations

SEC 901 Authorizations or Appropriations

AUTHORIZATIONS.—The following programs described in the research, engineering, and development account of the national aviation research plan required under section 44501(c) are authorized:

(12) Unmanned Aircraft Systems Research

Unmanned Aircraft Systems

SEC 903 UNMANNED AIRCRAFT SYSTEMS

RESEARCH INITIATIVE—

in conjunction with other Federal agencies, as appropriate, to develop technologies and methods to assess the risk of and prevent defects, failures, and malfunctions of products, parts, and processes for use in all classes of unmanned aircraft systems that could result in a catastrophic failure of the unmanned aircraft that would endanger other aircraft in the national airspace system."

SYSTEMS, PROCEDURES, FACILITIES, AND DEVICES—

to develop a better understanding of the relationship between human factors and unmanned aircraft system safety; and to develop dynamic simulation models for integrating all classes of unmanned aircraft systems into the national airspace system without any degradation of existing levels of safety for all national airspace system users."

Special Rule for Model Aircraft

SEC 336 SPECIAL RULE FOR MODEL AIRCRAFT

IN GENERAL—Notwithstanding any other provision of law...the Administrator may not promulgate any rule or regulation regarding a model aircraft, or an aircraft being developed as a model aircraft, if—

(1) the aircraft is flown strictly for hobby or recreational use;

(2) the aircraft is operated in accordance with a community based set of safety guidelines and within the programming of a nationwide community-based organization;

(3) the aircraft is limited to not more than 55 pounds unless otherwise certified through a design, construction, inspection, flight test, and operational safety program administered by a community-based organization;

(4) the aircraft is operated in a manner that does not interfere with and gives way to any manned aircraft; and

(5) when flown within 5 miles of an airport, ...without a mutually-agreed upon operating procedure with the airport operator or the airport air traffic control tower.

Models vs UAS

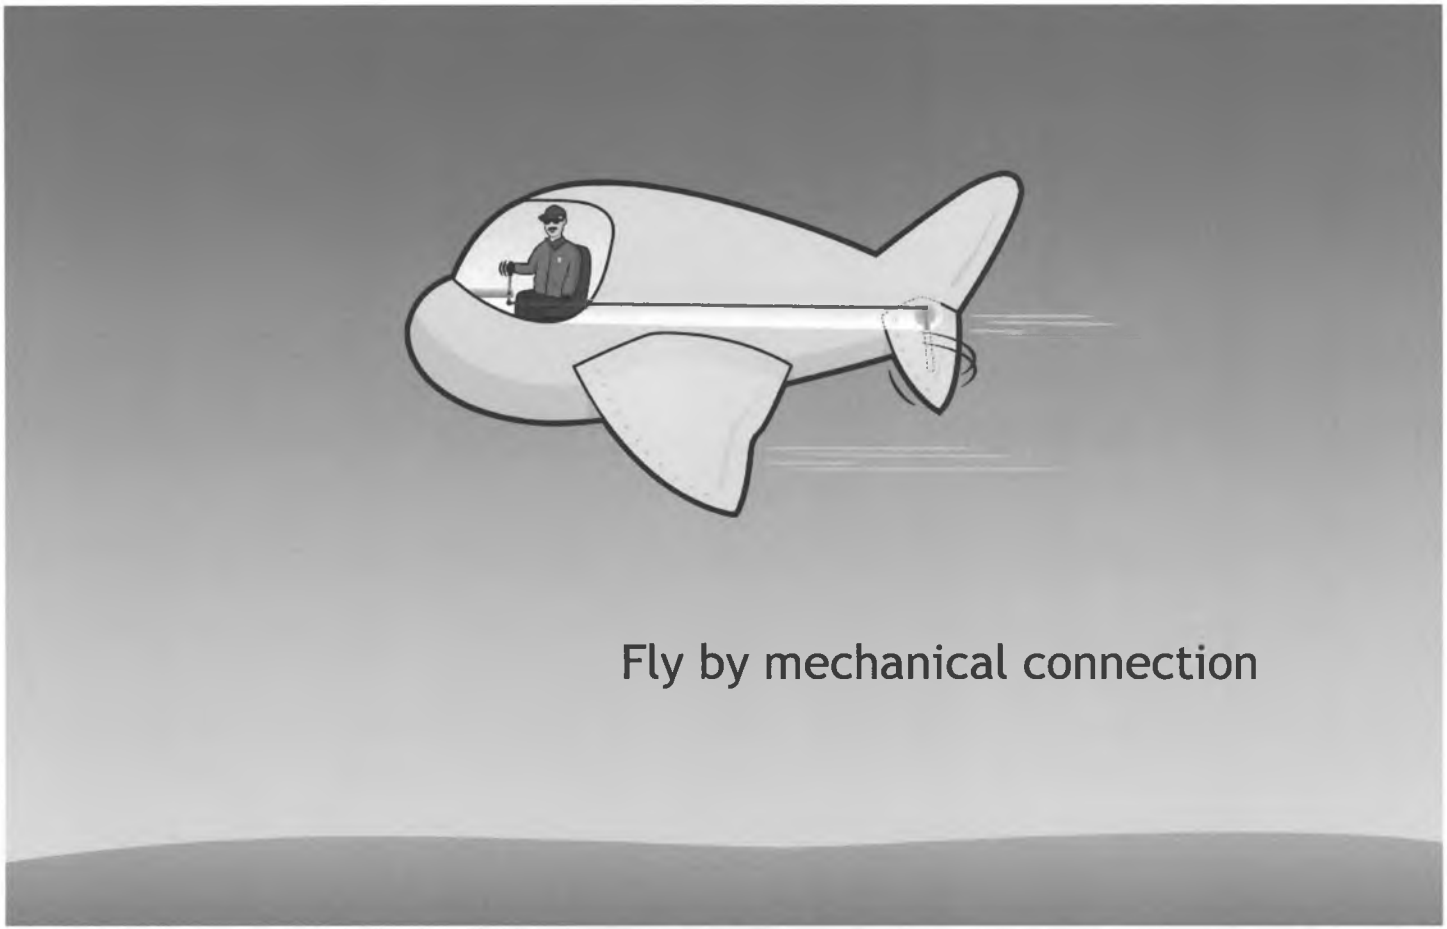
- The sole difference is how the equipment is used
  - Both may be hand controlled or autonomous
  - Both may carry complex payloads
  - Size and complexity vary in both
- A model, or hobbyist aircraft may only be used for non-business purposes
- The same equipment becomes a UAS if used for:
  - Paid services (surveying land for client)
  - Support your own business (photos for realtor)
  - Any activity that can be called "work"
- Governed by AC 91-57 published 6/9/1981 modified by 2012 reauthorization act

Pilot Licensing & Evaluation

14 CFR part 61

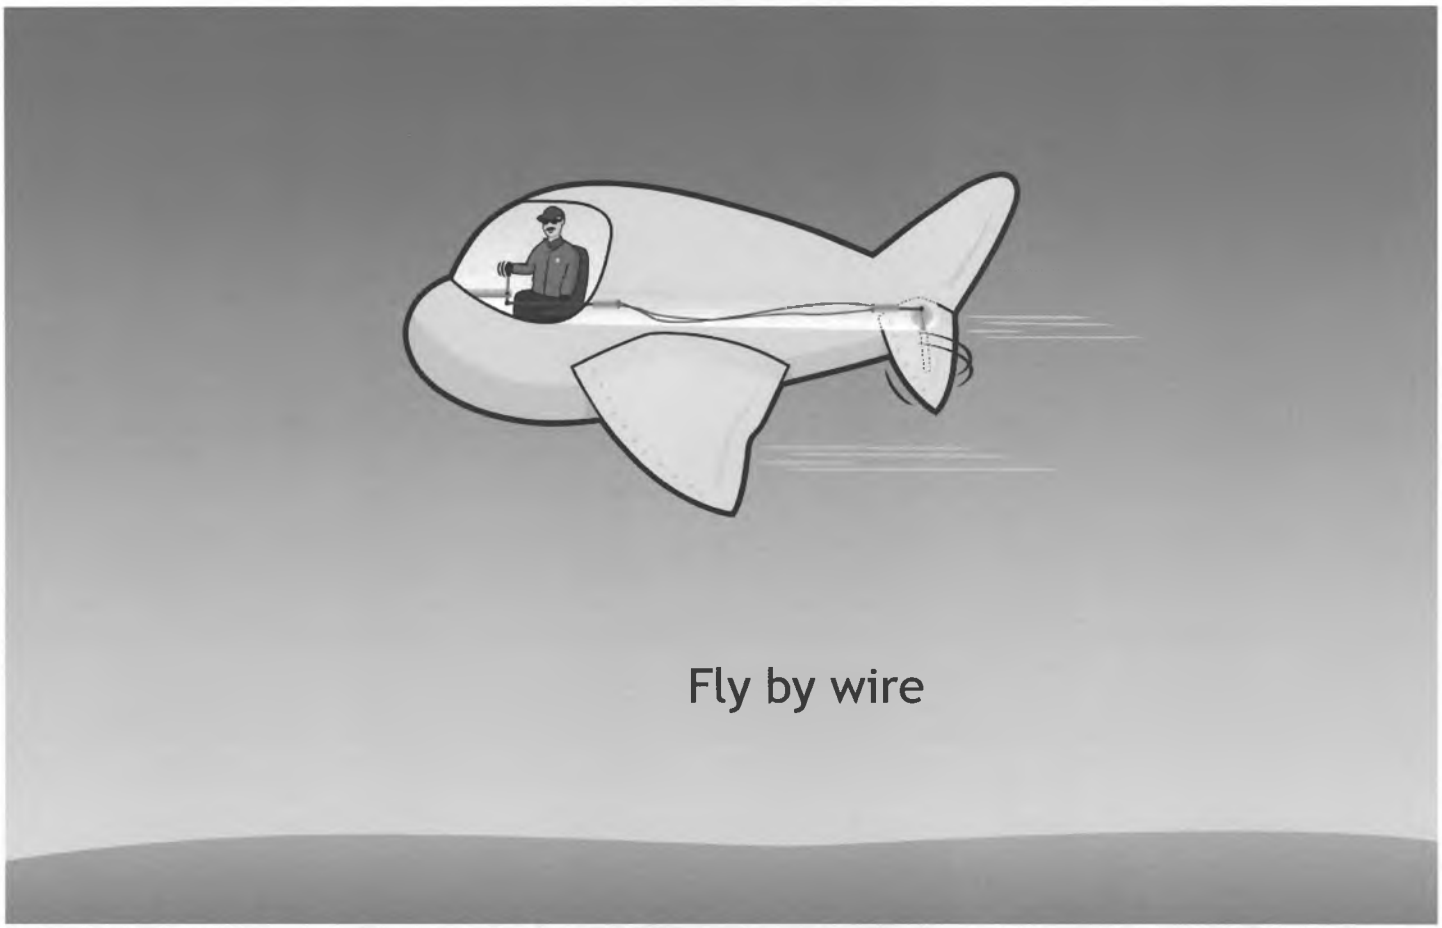
- Identifies applicability & requirements for eligibility, training, experience, currency, examination for all levels of pilots, instructors & examiners
- Part 67 identifies medical certificate requirements
- FAA policy 8900.227 provides interim requirements for UAS pilots, but no UAS-specific training or medical requirements have been incorporated into 14 CFR as yet

Manned vs Unmanned Control



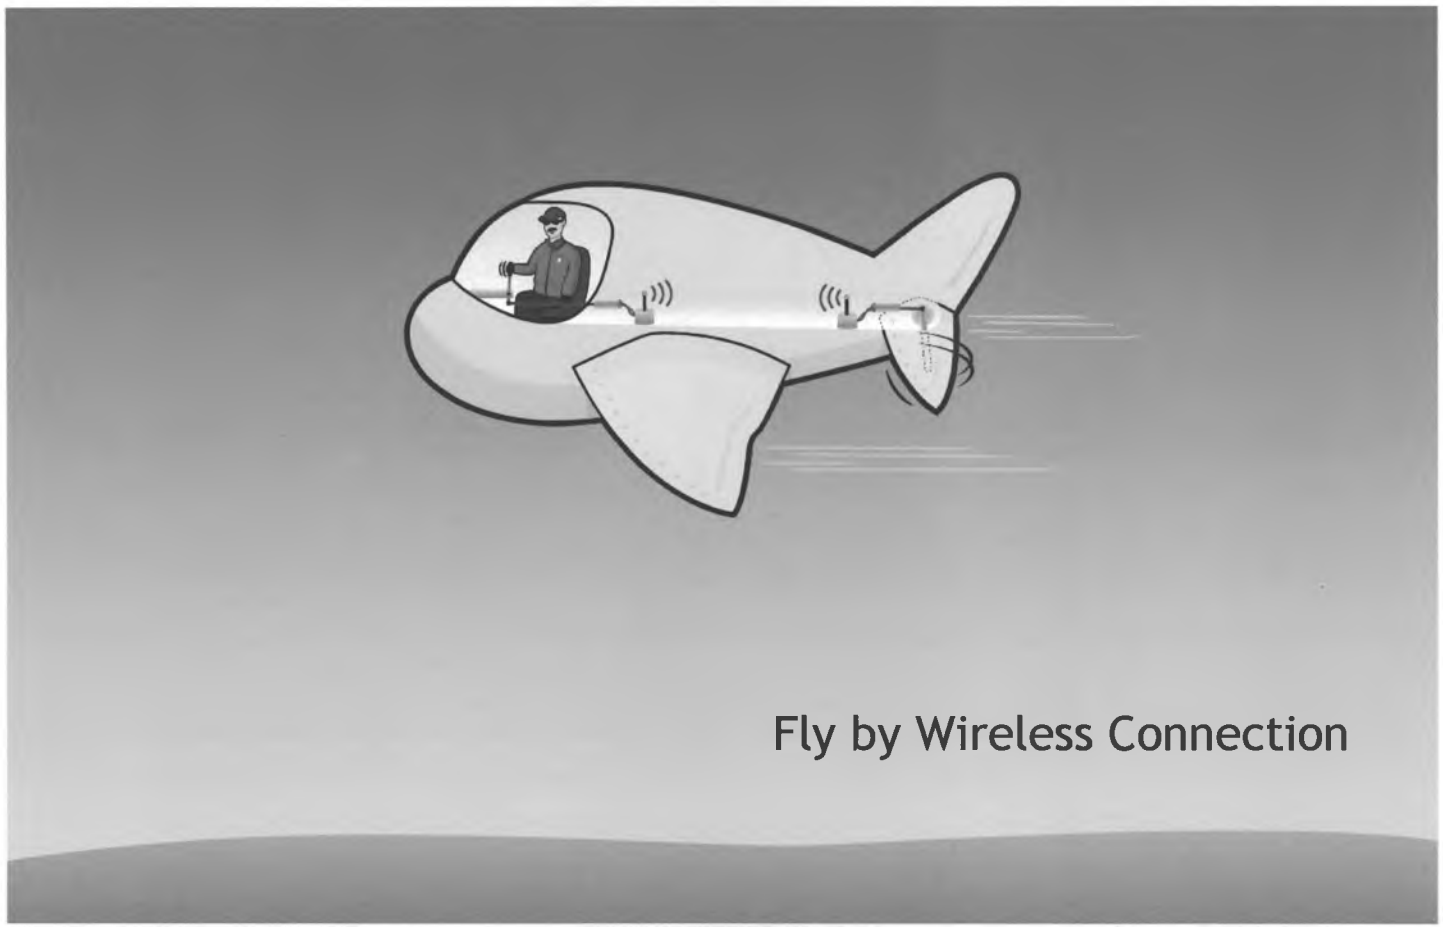
Fly by mechanical connection

Manned Control

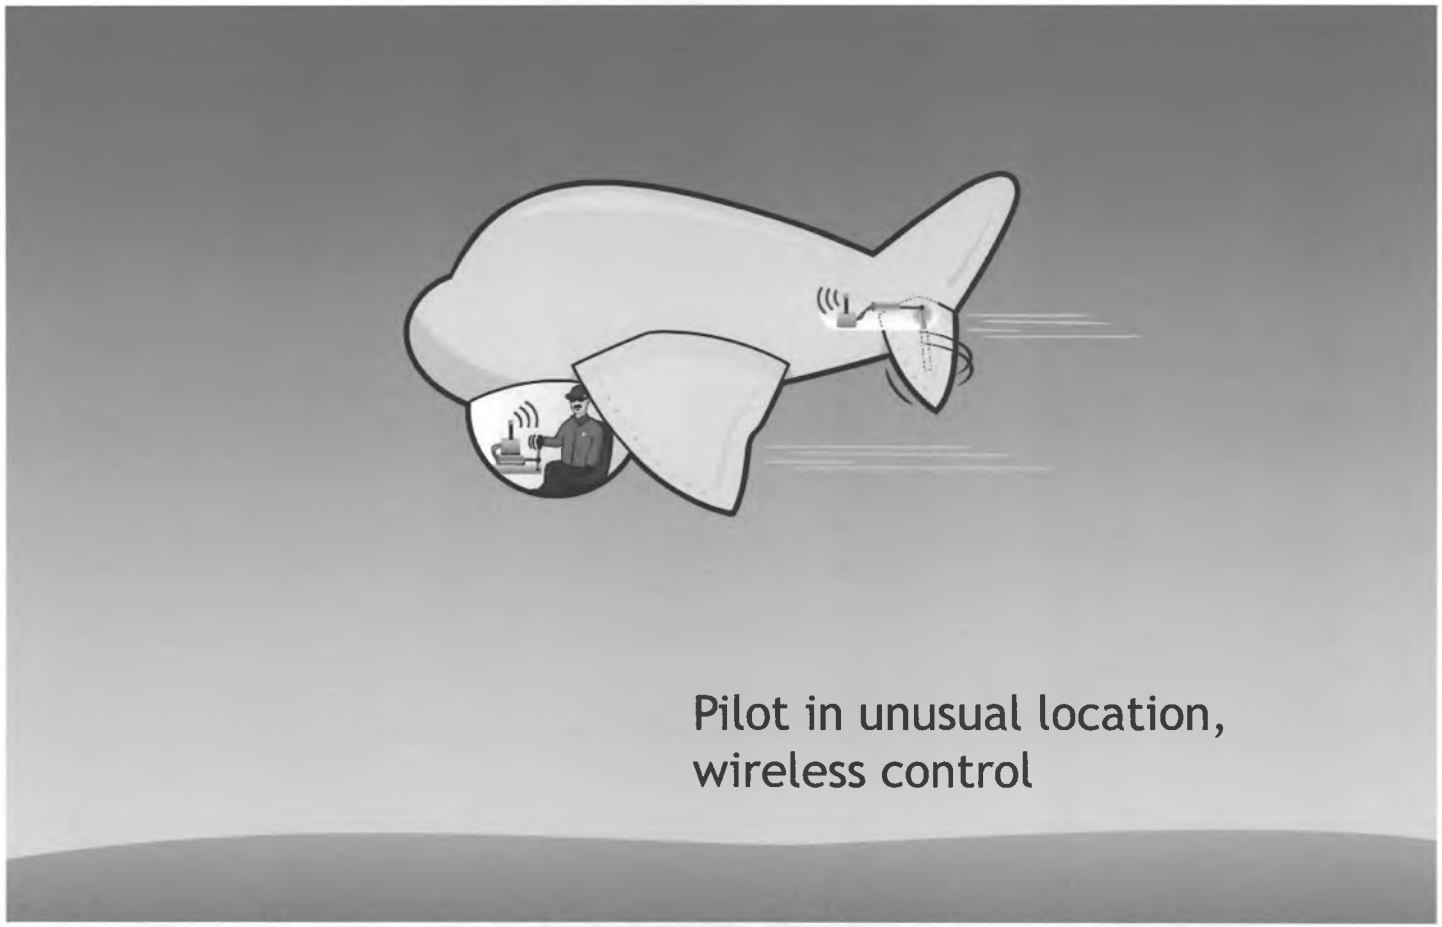


Fly by wire

Modern Manned Control



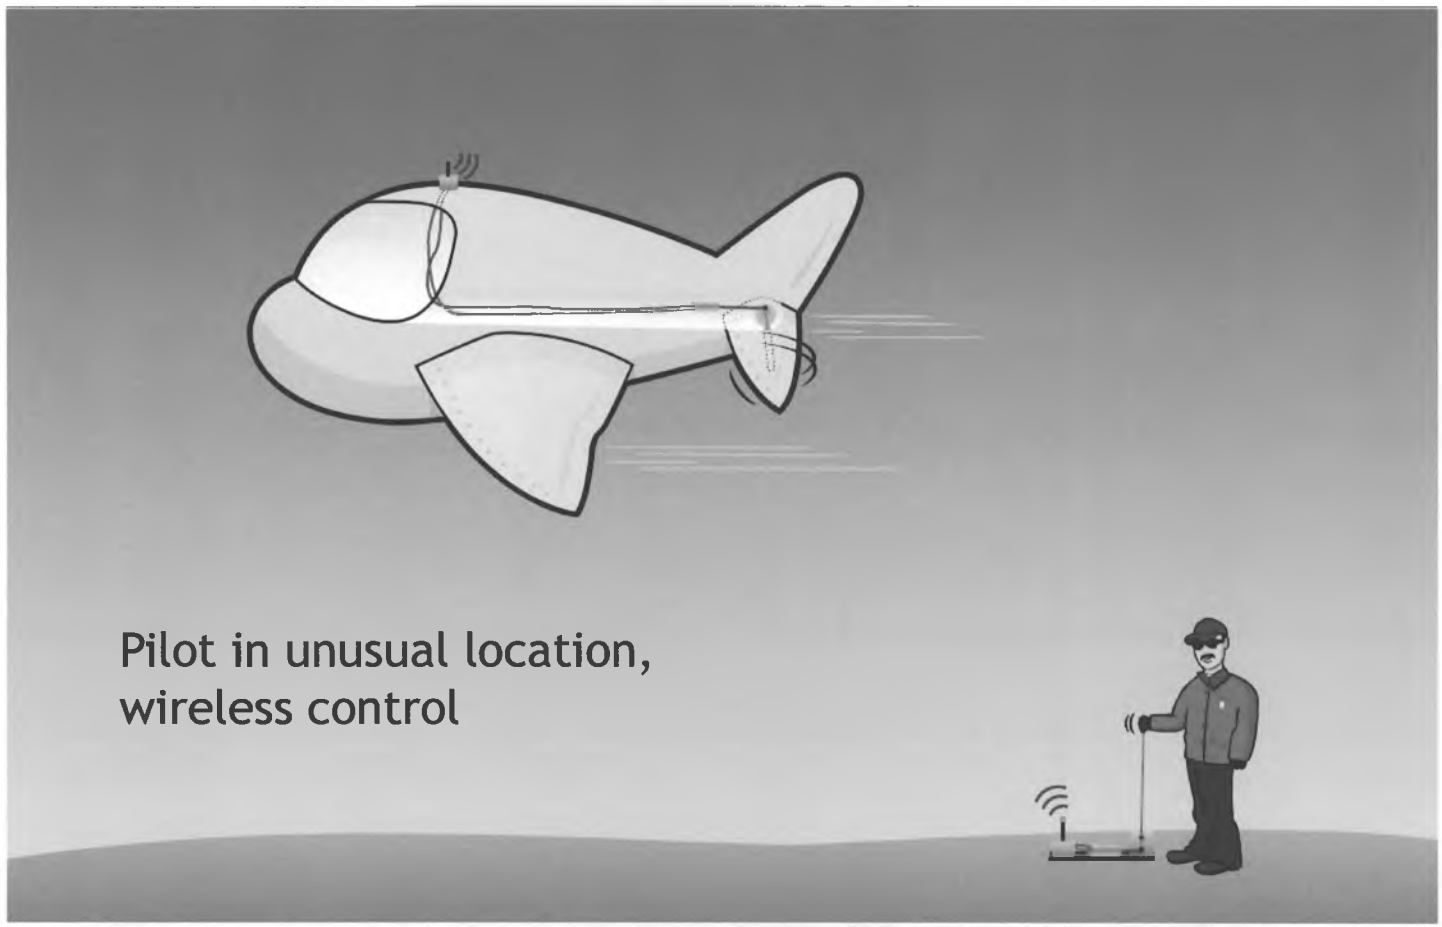
More Wireless Control



Pilot in unusual location,
wireless control

Unmanned Control

Beyond Line of Sight Becomes See & Avoid Issue



Challenges of See and Avoid for UAS

Issued for Part 91 Non-compliant Operations within the National Airspace.

These approvals are required due to the fact that unmanned aircraft (UA) are not compliant with various sections of Title 14 of the Code of Federal Regulations (14 CFR) and therefore, require an alternate means of compliance. *Most notably, the lack of an on-board pilot requires an alternate method of the "see-and-avoid"* provisions of 14 CFR 91.113, Right-of-Way Rules: Except Water Operations. - Interim Operational Approval Guidance 08-01

See and Avoid v. Sense and Avoid

- Alternate means of compliance must meet the reasonable standard of the eye of the onboard human pilot to "see and avoid" other objects.
- Bottom line is the pilot must make sure the airspace is clear.
- FAA approves alternative means of compliance for manned aircraft. Therefore "see and avoid" can be equated to "sense and avoid" which can be accomplished by technical means equal to or better than the human eye.
- Logic argues that the use of reliable primary radar, collision avoidance systems, or airspace studies showing no air traffic sufficiently demonstrate safe operations and comply with the spirit of CFR 91.113(b) and prior FAA decisions.

See and Avoid

The courts have ruled that CFR 91.113(b) requires "the reasonably prudent pilot need not be super-human in seeing and avoiding other aircraft, but he or she must scan the sky with such frequency and respond with such precision as is possible." Technology may assist the pilot, such as collision avoidance equipment or radar.

The FAA has acknowledged the following alternative means of compliance:

- In Class A (controlled) airspace the FAA authorizes Air Traffic Control (ATC) to provide separation guidance to aircraft (both manned and unmanned)
- The FAA approved use of primary radar to "sense" other aircraft
- FAA approves chase vehicles as acceptable replacement for an onboard pilot's eyes in which "eyes" are kept on the unmanned aircraft from another plane, a chase car, or a ground observer

Role of the Six Test Sites

- Assist FAA to resolve the issues preventing integration
  - Conduct safety studies
  - Develop potential policies, procedures
  - Establish their own training, certification, assess success, & report to FAA
  - Work toward standards for type certification, evaluate UAS offered by manufacturers
  - Propose changes/improvements to FAA regulations

Status of FAA Test Site

- Jan 2012: FAA Reauthorization Act directed FAA to select 6 Test Sites to research and test for safe integration of UAS into the national airspace
- Feb 14 2013: Solicitation was released
- Proposals final submittal was May 6
- Selection underway; rumors abound but no real news
- Selection targeted by FAA for Dec 31 2013
- Then Other Transactions Agreement negotiated
- Then 180 days to reach operational status

Pan Pacific UAS Test Range Complex

- UAF leads team for states of Alaska, Oregon, and Hawaii, plus 57 additional team members
  - Includes state agencies (DOT, DPS, Forestry of DNR, DHS&EM, National Guard)
  - Universities, EDCs, corporations, associations
- Fourteen ranges around the three states
  - Strong link with military ranges
  - Forging links with manned aviation safety specialists
- Key questions to answer:
  - Procedures to protect manned aviation
  - Policies to protect privacy
  - Technical testing to assure control, see & avoid, lost link procedures, airworthiness, etc

How is Privacy Protected?

- Intend to protect privacy so beneficial uses can be obtained
- Current statutory/case law strongly protects privacy while defining legal airborne activities (manned)
  - Unmanned a new technology, but subject to same restrictions
  - DHS & National Institute for Justice have taken on task of defining specific UAS privacy rules
  - FAA will incorporate into Test Site and future rules
  - DoD & Guard training on domestic privacy well underway

More on Privacy

- International Association of Chiefs of Police issued guidelines for law enforcement use of UAS
  - Provided to Task Force, available online
  - The essence:
    - Follow FAA rules
    - Use strict supervisory accountability
    - Get warrants if any possibility of use for surveillance or investigation
    - Notify locals of intent to fly over them
    - Delete recordings not authorized by warrant, training use, or as required by law

Where's the Gap?

- Gaps in privacy protection not yet apparent
- No incidents claiming UAS violated privacy so far
  - When it happens, propose letting the system work it
  - Existing law & prior manned case law likely adequate
  - Create law only to cover gaps discovered in practice, not in "what if" thinking

Summary

- Technology & FAA rules in flux
  - US behind other nations—could lose lead
  - Current rules restrictive, complex, limited to public entities
  - FAA compliance with 2012 Reauthorization Act driving toward UAS integration & comprehensive rules
- Alaska opportunities significant
  - Enhanced by directives in 2012 law

Questions?

UAF
UNIVERSITY OF
ALASKA
FAIRBANKS
Alaska Center for UAS Integration
Thanks for your time!

What Alaska Offers

- Vast open airspace with little traffic
- Wild, extreme, unpopulated, diverse terrain
- Access to large military ranges with data gathering ability
- History of pioneering aviation technology
- Culture of innovative use of aviation
- Close relationship with regional FAA
- Perhaps most important, willingness to be thoughtful and methodical in potential policy decisions
- Legislation setting Alaska airspace aside

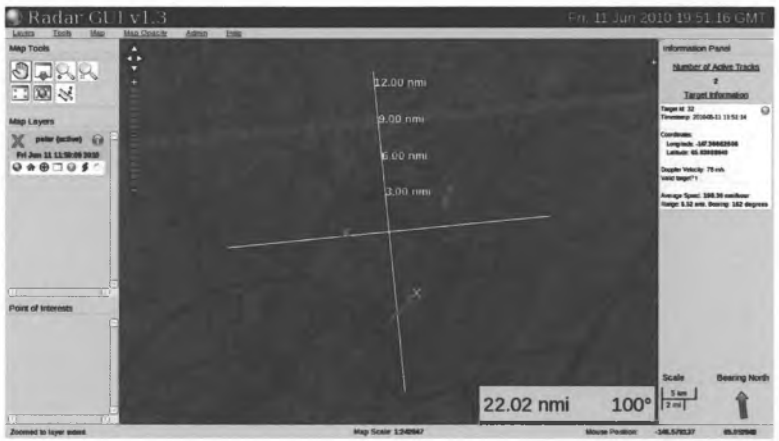
iPASS

UAF's Portable Airspace Surveillance System

Designed and built by UAF for Alaska's airspace monitoring needs

Status

Operational, used in Canada and NASA Certified



Airspace activity monitoring

Monitors airspace use patterns and validates traffic pattern assumptions

Enhanced situational awareness during aircraft or spacecraft operations

Provides real-time position and track of local airspace activity to assist in traffic avoidance

Alaska Center For UAS Integration RDT&E

- Created by Board of Regents Dec 2012
- Three integrated focus areas
  - Engineering - develop technical capabilities to meet new requirements
  - Application Development - drive system capabilities to expand uses and users
  - Training & Education - develop humans to develop, maintain & operate systems
- Within GI & UAF, but named as overall for UA
- Situated to exploit FAA opportunities - Arctic airspace, FAA Test Site

9.2.7. Economic Impact Assessment (SIR 9.2.7)

The Pan-Pacific Unmanned Aircraft Systems Test Range Complex (PPUTRC) is proposed as a Federal Aviation Administration (FAA) test site with 13 test ranges in Alaska, Hawaii, and Oregon. Successful PPUTRC designation would promote new construction, improve existing infrastructure, leverage current research institutions, and attract business investments for complementary assets throughout the service and supply chain in all three states. The economic impact of this activity would be substantial. The PPUTRC is projected by 2017 to increase employment in Alaska, Hawaii, and Oregon by approximately 1,429 jobs, labor income by $76 million, output by $334 million, total value added by $134 million, and government revenue via income taxes by $6 million. This new economic activity would represent significant benefits to the local economies surrounding the test ranges as well as throughout each state's economy.

UAS Activity in Alaska, Hawaii, and Oregon

Existing UAS activity in Alaska, Hawaii, and Oregon benefit from government facilities (e.g. numerous military bases, universities, and maritime assets), geographic diversity (e.g. tropical to arctic climates, oceanic or mountainous landscapes, and up/down weather fronts), and wide open airspace in largely unpopulated areas.

The ACUASI at the University of Alaska Fairbanks (UAF) leads the PPUTRC. The formal PPUTRC team includes over 80 businesses, universities, tribes, and economic development organizations in Alaska. UAF has actively managed UAS operations since 2004. The ACUASI was formed in 2012 to enhance UAS research in Alaska. ACUASI and the UAF Geophysical Institute have developed and flown a variety of *in-situ* and remote sensing instruments on various UAS in Alaska and throughout the world. Scientific and research UAS campaigns undertaken in Alaska over the past decade include supporting observation and monitoring sea lions in the Aleutian Islands, weather forecasting, volcanic plume monitoring, atmospheric sampling during wildfires, monitoring of sea ice build ups, and oil spill mapping. Commercial applications trialed in Alaska include whale monitoring, cadastral mapping, maritime navigation support, industrial plant monitoring, and environmental clean-up. This experience, coupled with UAS Test Site status, would leverage a variety of new economic activities in Alaska.

Hawaii offers many unique qualities that make UAS operations appealing. These include: (1) expansive over-water areas unencumbered by other aviation uses, (2) proximity to U.S. Pacific Command - a significant user of future UAS systems, (3) opportunities for joint operations with the Pacific Missile Range Facility - a major test range on Kauai, and (4) opportunities for long-range point-to-point tests with partner ranges in Alaska and Oregon. The Hawaii ranges have proven an important focus for the development of scientific applications of UAS, with significant milestones including test flights of the Aerovironment Pathfinder, Pathfinder Plus, and Helios solar-hybrid propulsion high altitude long endurance UAS between 1997 and 2001. Scientific applications led by U.S. Federal agencies have recently seen Hawaii emerge as a focal point for NOAA's exploration of UAS as a tool for marine park surveillance. NOAA has used UAS to monitor Papahanaumokuakea Marine National Monument since 2007 and performed initial trials using small hand launched systems in mid-2012.

The Oregon-based PPUTRC team members include 16 businesses, universities, tribes, and economic development organizations. Additionally, six committed team partners will convert to

Use or disclosure of data contained on this sheet is subject to the restrictions on the title page of this proposal.

formal team members upon FAA Test Site designation award to PPUTRC. Engagements are also planned with a wide ranging network in Oregon – including the 111 AUVSI members and numerous startup companies, primarily in sensor, robotics, and other supporting technologies. Oregon has historically been more engaged in design, development, and manufacture of UAS systems and subsystems. The two largest Oregon UAS firms are Insitu (manufacturing) and FLIR Systems (sensors). The main Oregon firm involved in UAS applications has been Near Space Corporation. NSC uses very high altitude unmanned balloons and gliders to perform scientific and commercial test activities, ranging from data gathering on behalf of government agencies to near-space testing of hardware and sensors for commercial firms. NSC is opening a new $6 million flight test and operations facility at the Tillamook airport on the Oregon coast. Existing UAS activity also includes the Oregon Army National Guard operations in Pendleton. Oregon's UAS efforts are synergistic with a separately funded ground vehicle innovation initiative, Drive Oregon, which requires systems that can be spun out of UAS: quiet, efficient motors, lightweight composite designs, and navigation systems. The potential economic benefits of the Test Sites as well as NAS integration are particularly strong for Oregon's already significant aircraft manufacturing sector.

Recent UAS Funding in Alaska, Hawaii, and Oregon

Since 2004, 9 Alaska contractors have received direct U.S. federal agency contracting for UAS goods and services. The largest federal contract in Alaska is a 5-year standing services award worth $47 million from the U.S. Navy to the University of Alaska in 2010 for UAS payload integration and flight test services. The second major award made since 2004 to an Alaska firm consists of a series of pacts totaling $17 million from the U.S. State Department to Anchorage-headquartered Kuk Construction (subsidiary of Olgoonik Development, an Alaskan Native Corporation) for the provision of UAS-based security surveillance services in Iraq in partnership with KBR, Inc. UAF has collaborated with commercial entities such as Idaho Power Company and manufacturers including AeroVironment to conduct surveys and observe environmental impacts. Additionally, UAF is collaborating with BP for oil spill response and flare stack monitoring as well as projects focused on detecting and locating gas and oil pipeline leaks and developing new sensors and processes to identify leaks. Each such project has led to more work as the clients discover the potential of UAS benefits to their businesses.

Hawaii's large military presence has resulted in defense spending as the primary source of federal funding to UAS vendors in the state. Direct defense contracts accounted for 94% of all awards in terms of obligated amounts from 2004-2012, with this rising to 97% when including awards placed by the GSA on behalf of the U.S. Air Force. The remaining awards were placed with Honolulu-based Referentia Systems by NOAA as part of the Papahanaumokuakea Marine National Monument monitoring project. Hawaii supports a dedicated UAS development and manufacturing company, Williams Aerospace, with this small firm currently developing new platforms in the fixed-wing, hand launched micro and medium altitude endurance classes. It is also working to create two commercial UAS services arms, addressing the defense, homeland security, and precision agriculture markets.

In Oregon, a consortium of industry, academia, and public entities has created a 7-year strategic plan to double the size of the UAS industry in the state, with the help of a $2.5 million State of Oregon grant scheduled for the 2013-14 biennium and additional investments of at least $1.15

Use or disclosure of data contained on this sheet is subject to the restrictions on the title page of this proposal.

million from other sources for a total of $3.65 million. The plan specifically creates UAS solutions for commercial applications, and safely integrating those UAS solutions into the NAS. Projects include emergency response; weather; firefighting; search and rescue; wildlife and habitat management; law enforcement; physical and resource surveys (land and water); management of agriculture, livestock, and public lands; and management of public and private infrastructure. Oregon State University (OSU) has already begun UAS flights based on these research objectives.

Leveraging Current Research Institutes, Community Colleges, and Training Centers
ACUASI is collaborating with the College of Engineering and Mines (CEM) and the Community and Technical College (CTC) to integrate UAS engineering, science, and technology into UAF's teaching, research, and service activities. Additionally, ACUASI is working with the CEM to fill a full-time tenure track engineering faculty position with a professor focused on UAS engineering, science, and technology. ACUASI and CTC are working to include UAS technology courses in CTC's aviation curricula to train UAS developers, technicians, and pilots as well as to improve outreach to remote Alaskan villages that could benefit from UAS technologies. Cooperation with the CTC at UAA will add participation of air traffic controllers, offer training for UAS operators, and ultimately build a maintenance program similar to the current FAA certificated Aircraft and Powerplant program.

The University of Hawaii is testing UAS in several of its research programs, evaluating the utility and impact of UAS through analysis of coastal resource management, terrestrial and aquatic environmental monitoring, natural source management and inventory, and human impact studies. University of Hawaii is also developing programs to train students and research professionals on UAS, and plans to integrate this capacity into accredited degree programs.

The new OSU industry-university UAS consortium will depend on test site facilities for collaborative research and development in all phases of operations and applications. Through the Colleges of Engineering, Science, Agriculture, Forestry and Earth, Ocean and Atmospheric Sciences, OSU has expertise and supports ongoing research on control theory and robotics, flexible airframes and flight, sensors, and signal processing, and numerous applications in natural and environmental sciences and environmental monitoring, measuring and management. OSU-Cascades, located in Central Oregon near the Warm Springs and Juniper test ranges, has programs in energy engineering, computer science, natural resources, and business, and plans to add programs designed in conjunction with the UAS industry. OSU-Cascades can also provide on-site facilities for OSU-Corvallis researchers leading projects in the region. Central Oregon Community College (COCC) has one of the largest aviation flight training programs on the West Coast - both fixed wing and rotary. COCC is offering certifications for UAS flight training and plans to develop a program for data analysis of sensors, building on the school's strong geographic information systems program. Additionally, Blue Mountain Community College (BMCC) in Pendleton, Oregon is developing a UAS curriculum for instructional delivery and course certification.

Expansion of Existing Businesses and Attracting New Business Investment
The University of Alaska has spun off at least two companies who intend to test their products on the Pan-Pacific test range. These companies were created by University graduate students

Use or disclosure of data contained on this sheet is subject to the restrictions on the title page of this proposal.

who were expanding their research in sensors for testing in UAS. UA recently received $5 million from the State of Alaska to support the development of a sustainable high-tech industry in Alaska. Already two companies have established satellite offices in Alaska, one of which is creating a new company for UAS aviation technology advancement.

Placement of a UAS Test Site in Hawaii will promote growth within Hawaii and reduce development cycles for manufacturers and researchers. Additionally, it would reduce or eliminate costs to ship sensors, and knowledgeable staff, to mainland test sites to operate and demonstrate systems. Close proximity to a test site in Hawaii will greatly benefit firms such as BAE Systems, Williams Aerospace, and others – including many military and government contractors working with Honolulu Fire Department, Honolulu Police Department, U.S. Civil Air Patrol, U.S. Coast Guard, U.S. Department of Defense, U.S. Department of Homeland Security, U.S. National Guard, and others.

In Oregon more than a dozen companies have said that they will begin testing their sensor packages, propulsion systems, and airframes in Oregon if the Pan-Pacific UAS Test Area is designated as a national Test Site. Additionally, two companies have informally pledged to open satellite offices at a state test range. The PPUTRC will benefit UAS businesses in the Columbia River Gorge. Over the past seven years, the Gorge's UAS industry grew from a small core of 30 people to an employment base of more than 1,400 employees. Many of these new jobs were created by the UAS companies' suppliers. The two largest Oregon UAS manufacturers are Insitu, manufacturer of UAS platforms and subsystems, and FLIR Surveillance Systems, a manufacturer of electro-optic and infrared imaging systems. Insitu is a major global supplier of high endurance, runway-independent UAS. FLIR Surveillance provides more ER and IR imaging systems for unmanned aircraft, unmanned ground, and unmanned maritime platforms than any other company. Activity in the Gorge from firms such as Insitu, FLIR Surveillance Systems, Cloud Cap Technology, and UTC Aerospace has spun off more than 20 local companies. Central Oregon's general aviation aircraft manufacturing industry had a similar growth pattern over a 15-year period, expanding from a core company of about 30 employees (Lancair) to a cluster of 25 companies that now employs nearly 1,200 people. It is anticipated the PPUTRC will help expand these existing businesses in the Gorge and Central Oregon.

Infrastructure

Alaska expects to invest $1.5 million to construct a test site center at its Poker Flat Research Range, as well as develop and acquire mobile test infrastructure such as fixtures, data collection devices and monitoring systems similar to its internet-Portable Aerial Surveillance System (iPASS), a web-based application that merges track information from radar, GPS, and a transponder interrogator/receiver. Additionally, large data collection requirements are expected to drive development of a data center for processing and storage. Venture capitalists have approached the team already, anticipating the value of investing in test site development.

Hawaii's test ranges link to military/restricted areas used for current UAS operations. These sites include the Pohakuloa training area on the Island of Hawaii, Bradshaw and Wheeler Army Airfields on Oahu, and the Pacific Missile Range Facility on Kauai. Other areas under consideration include Upolu and Dillingham Airfields (on the Big Island and Oahu, respectively). Test points within the range would be utilized to support both shore- and ship-

Use or disclosure of data contained on this sheet is subject to the restrictions on the title page of this proposal.

based development, testing and certification of new UAS, training and crew certification of operational UAS, and development of expanded and joint capabilities involving existing communications systems and operations tactics using UAS.

The budget for the $2.5 million Oregon innovation grant envisions spending at least $1.2 million at test ranges for new equipment and/or infrastructure, with the grant providing $300,000, private enterprise providing $750,000, and public entities providing $150,000. Possible infrastructure development proposed with this funding include: portable ground radar units; an automatic dependent surveillance-broadcast ground station or a similar 'sense and avoid' technology system; one or more operations management buildings housing computers, calibration components, baseline sensors with a range of capabilities, data analysis equipment, supporting software, maintenance facilities and machine shops; and ground control stations, an observation tower, and ITAR facilities as needed. Additionally, as noted earlier, Near Space Corporation is preparing to open a new $6 million flight test and operations facility at the Tillamook airport.

Quantifying the PPUTRC's Economic Impacts

The following economic impact projections were developed by McDowell Group, Inc. utilizing flight activity, flight cost, and flight-related staffing data provided by PPUTRC team members. Direct economic activity was measured by approximating preflight administrative costs, site fees per day, operating costs per day, and total flight days from historical data provided by the applicant. Sector-level information was obtained from the applicant concerning number of UAS-related firms and jobs per firm. Direct employment estimates were then coupled with multipliers obtained from the IMPLAN economic impact model to estimate total direct, indirect and induced economic effects. Annual projections from 2014 to 2017 were calculated for each of the 13 ranges utilizing growth rates based on funding forecasts from the Teal Group UAS market profile and forecast report, historical flight activity, and projected growth in flight activity, research, and UAS-related manufacturing as provided by the applicant.

Table 7-1 Summary Impacts of PPUTRC Test Site Designation, 2012-2017

Impact of Test Site Designation				
	2014	2015	2016	2017
Total Employment	**1,065**	**1,260**	**1,335**	**1,429**
Direct Employment	490	571	602	642
Indirect Employment	198	243	259	279
Induced Employment	377	447	474	508
Total Labor Income ($ million)	**$56.9**	**$66.9**	**$70.8**	**$75.6**
Direct Labor Income ($ million)	$26.4	$30.5	$32.2	$34.2
Indirect Labor Income ($ million)	$10.4	$12.5	$13.3	$14.4
Induced Labor Income ($ million)	$20.1	$23.8	$25.3	$27.1
Output ($ million)	**$265.0**	**$301.8**	**$315.9**	**$333.5**
Total Value Added ($ million)	**$109.3**	**$121.9**	**$127.1**	**$133.5**
State Income Taxes ($ million)	**$4.3**	**$5.0**	**$5.3**	**$5.6**

Employment Resulting from UAS and Test Site Operations

In 2014, UAS activity in Alaska, Hawaii, and Oregon is expected to account for 581 direct jobs and a total of 1,254 jobs - including direct, indirect, and induced jobs – from PPUTRC

Use or disclosure of data contained on this sheet is subject to the restrictions on the title page of this proposal.

designation. Approximately 85 percent of that total employment (1,065 jobs) is attributable to Test Site designation. The remaining 15 percent (189 jobs) is expected to occur in the absence of PPUTRC Test Site designation. By 2017, employment will rise to an estimated 904 direct jobs and 1,991 total jobs - with 72 percent of that total employment (1,429) attributable to Test Site designation. A significant number of these direct jobs are expected in smaller communities that tend to have higher unemployment – thus Test Site designation for the PPUTRC will help improve opportunities where they will provide the most benefits.

Table 7-2 Direct Employment, 2012-2017

	Direct Employment					
	2012	2013	2014	2015	2016	2017
Total Direct Employment						
PPUTRC	74	82	581	712	801	904
Alaska Ranges	43	47	129	142	157	173
Hawaii Ranges	-	-	-	72	95	126
Oregon Ranges	31	35	452	498	549	605
Impact of Test Site Designation						
PPUTRC	-	-	490	571	602	642
Alaska Ranges	-	-	77	82	86	91
Hawaii Ranges	-	-	-	72	95	126
Oregon Ranges	-	-	414	417	421	424

Oregon's relatively high direct employment numbers are due to the existing, well-developed aircraft manufacturing sector in Oregon. Oregon is well placed to supply the growing demand for UAS aircraft that will be triggered by UAS integration. Most of the new jobs created in Oregon due to PPUTRC designation include manufacturing jobs (many of which may be created due to designation of test sites anywhere in the U.S.),

Table 7-3 Indirect and Induced Employment, 2012-2017

	Indirect Employment						Induced Employment					
	2012	2013	2014	2015	2016	2017	2012	2013	2014	2015	2016	2017
Total Indirect or Induced Emp.												
PPUTRC	21	24	224	290	328	374	59	65	448	558	629	712
Alaska Ranges	7	8	22	24	27	30	35	39	106	117	129	142
Hawaii Ranges	-	-	-	42	56	74	-	-	-	64	84	111
Oregon Ranges	14	16	202	223	246	271	24	26	342	377	416	459
Impact of Test Site Designation												
PPUTRC	-	-	198	243	259	279	-	-	377	447	474	508
Alaska Ranges	-	-	-	42	56	74	-	-	63	67	71	75
Hawaii Ranges	-	-	185	187	188	190	-	-	-	64	84	111
Oregon Ranges	-	-	13	14	15	16	-	-	313	316	319	321

Labor Income Resulting from UAS and Test Site Operations

In 2014, UAS activity in Alaska, Hawaii, and Oregon is expected to account for $31 million in direct labor income and $67 million in total labor income - including direct, indirect, and induced - from PPUTRC designation. Approximately 84 percent of that total labor income ($57 million)

Use or disclosure of data contained on this sheet is subject to the restrictions on the title page of this proposal.

is attributable to Test Site designation. The remaining 16 percent ($10 million) is that which is expected to occur even if the proposed PPUTRC does not become a Test Site. By 2017, labor income is expected to include $106 million in total direct, indirect and induced labor income - with 71 percent of that total labor income ($76 million) attributable to Test Site designation.

Table 7-4 Direct Income, 2012-2017 ($ million)

	Direct Income					
	2012	2013	2014	2015	2016	2017
Total Direct Income						
PPUTRC	$4.0	$4.4	$31.3	$38.2	$42.9	$48.3
Alaska Ranges	$2.3	$2.6	$7.0	$7.7	$8.5	$9.4
Hawaii Ranges	-	-	-	$3.7	$4.9	$6.4
Oregon Ranges	$1.7	$1.9	$24.2	$26.7	$29.5	$32.5
Impact of Test Site Designation						
PPUTRC	-	-	$26.4	$30.5	$32.2	$34.2
Alaska Ranges	-	-	$4.2	$4.4	$4.7	$5.0
Hawaii Ranges	-	-	-	$3.7	$4.9	$6.4
Oregon Ranges	-	-	$22.2	$22.4	$22.6	$22.8

Table 7-5 Indirect and Induced Labor Income, 2012-2017 ($ million)

	Indirect Labor Income						Induced Labor Income					
	2012	2013	2014	2015	2016	2017	2012	2013	2014	2015	2016	2017
Total Indirect or Induced Emp.												
PPUTRC	$1.1	$1.3	$11.7	$15.0	$17.0	$19.3	$3.5	$3.8	$24.4	$30.1	$34.0	$38.4
Alaska Ranges	$0.4	$0.4	$1.2	$1.3	$1.5	$1.6	$2.2	$2.5	$6.7	$7.4	$8.2	$9.0
Hawaii Ranges	-	-	-	$2.1	$2.7	$3.6	-	-	-	$3.3	$4.3	$5.7
Oregon Ranges	$0.7	$0.8	$10.5	$11.6	$12.8	$14.1	$1.2	$1.4	$17.6	$19.4	$21.4	$23.6
Impact of Test Site Designation												
PPUTRC	-	-	$10.4	$12.5	$13.3	$14.4	-	-	$20.1	$23.8	$25.3	$27.1
Alaska Ranges	-	-	$0.7	$0.8	$0.8	$0.9	-	-	$4.0	$4.3	$4.5	$4.8
Hawaii Ranges	-	-	-	$2.1	$2.7	$3.6	-	-	-	$3.3	$4.3	$5.7
Oregon Ranges	-	-	$9.6	$9.7	$9.8	$9.9	-	-	$16.1	$16.3	$16.4	$16.6

Output, Value Added, & State Income Taxes Resulting from UAS and Test Site Operations

'Output' represents the value of industry production, and 'total value added' is the difference between an industry's total output and the cost of their intermediate inputs. Economic modeling conducted for purposes of this study indicates output in the PPUTRC states attributable to test site designation would climb from $265 million in 2014 to $333 million in 2017. Value added would climb from $109 million to $134 million over the same period.

Designation of the PPUTRC will provide a four-year total of $20 million of income tax revenue to Hawaii and Oregon. The effective income tax rate for these calculations was approximated as 7.5 percent for Hawaii, and 9 percent for Oregon (Alaska has no income tax).

NOTICE U.S. DEPARTMENT OF TRANSPORTATION
FEDERAL AVIATION ADMINISTRATION

N 8900.207

National Policy

Effective Date:
1/22/13

Cancellation Date:
1/22/14

SUBJ: Unmanned Aircraft Systems (UAS) Operational Approval

1. Purpose of this Notice. This notice provides policies necessary for reviewing and evaluating the safety and interoperability of proposed Unmanned Aircraft Systems (UAS) flight operations conducted within the United States (U.S.) National Airspace System (NAS) for the Aviation Safety (AVS) Flight Standards Service (AFS), UAS Integration Office (AFS-80), when assessing applications for a Certificate of Waiver or Authorization (COA) or special airworthiness certificate.

2. Audience. This notice applies to AFS divisions at the Federal Aviation Administration (FAA) Washington headquarters (HQ) and regional field offices.

3. Where You Can Find This Notice. You can find this notice on the MyFAA Web site at https://employees.faa.gov/tools_resources/orders_notices/. Inspectors can access this notice through the Flight Standards Information Management System (FSIMS) at http://fsims.avs.faa.gov. Air carriers and operators can find this notice on the FAA's Web site at: http://fsims.faa.gov. This notice is available to proponents and the public at http://www.faa.gov/regulations_policies/orders_notices.

4. Background.

a. UAS Operations. UAS operations have increased dramatically in both the public and private sectors. This proliferation has introduced greater exposure and elevated risk to the safety of operations within the NAS. This growth in UAS operations has increased the number of applications for operational approvals and increased demand on the FAA to process them. For these activities, the development of a notice is required for the FAA to use when evaluating applications for COAs and special airworthiness certificates.

b. Policy. Policy identifies Unmanned Aircraft (UA) as "aircraft" flown by a "pilot" regardless of where the pilot is located. Aircraft and pilots must demonstrate compliance with applicable sections of Title 14 of the Code of Federal Regulations (14 CFR) to operate in the NAS. However, UA are not compliant with certain sections of 14 CFR. For instance, the absence of an onboard pilot means that the "see-and-avoid" provisions of 14 CFR part 91, § 91.113, cannot be satisfied. Without an onboard pilot, there is a significant reliance on the command and control link, and a greater emphasis on the loss of functionality associated with lost link. Furthermore, for air traffic control (ATC) operations requiring visual means of maintaining

in-flight separation, the lack of an onboard pilot does not permit ATC to issue all of the standard clearances or instructions available under the current edition of FAA Order 7110.65, Air Traffic Control. Consequently, to ensure an equivalent level of safety, UAS flight operations require an alternative method of compliance (AMOC) or risk control to address their "see-and-avoid" impediments to safety of flight, and any problems they may generate for ATC. In the future, permanent and consistent methods of compliance will be needed for UAS operations in the NAS without the need for waivers or exemptions.

5. Consensus Opinion. This notice is subject to continuous review, will be updated when appropriate, is not meant as a substitute for any regulatory process, and was jointly developed by and reflects the consensus opinion of:

- Flight Technologies and Procedures Division (AFS-400);
- UAS Integration Office (AFS-80) and the ATO component of AFS-80; and
- Aircraft Certification Service, Production & Airworthiness Branch (AIR-240).

Note: In general, and as a minimum, proponents must observe all applicable regulations of 14 CFR parts 61 and 91. This notice identifies acceptable AMOC with the regulations when evaluating requests for approval of proposed UAS operations. Refer to the following Web site for a listing of regulations: http://www.faa.gov/regulations_policies/faa_regulations/.

6. Discussion. This notice represents the culmination of input from government agencies, industry, and user stakeholders along with best practices and procedures that have been used by FAA in prior approvals for UAS applications for COAs or special airworthiness certificates. The material presented in this notice represents the process and procedures necessary for approving applications for UAS flight operations. However, because of the uniqueness of various UAS flight operations, each application must be evaluated on its own technical merits, including operational risk management (RM) planning. Each application may require unique authorizations or limitations directly related to the specific needs or capabilities of the UAS and/or the proposed specific mission and operating location.

7. Applicability and Approval Process Criteria. The applicability and process to be used in UAS operational approval are dependent on whether the proposed UAS operation within the territorial airspace of the United States (the airspace above the contiguous United States, Alaska, Hawaii, U.S. territories, and U.S. territorial waters) is defined as public or civil (see 14 CFR part 1, § 1.1 and Public Law 110-181, "The National Defense Authorization Act of 2008"). UAS operations outside the territorial airspace of the U.S. will be classified as either state or civil operations in accordance with international law. A public operation is one that is intrinsically governmental in nature (i.e., Federal, State, and local agencies). Proponents requesting approval of public aircraft operations by UAS will use the COA application process. In contrast, proponents for civil operations approval will use the special airworthiness certificate process. Part 91, § 91.319(a)(2) specifically prohibits operation of an aircraft that has an experimental certificate from "carrying persons or property for compensation or hire."

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

a. Coordination and Approval. Regardless of the process for the authorization approval, COA applications for UAS flight operation approvals will be coordinated through the ATO component of AFS-80 and AVS. Special airworthiness certificates will be coordinated through the Aircraft Certification (AIR-240) staff as well as the ATO and AFS component of AFS-80 for final approval and disposition.

b. Applicability and Methods of Authorization. Operational policy in this notice applies to both public and civil operations and certain state aircraft operations.

(1) Applicability. These procedures are applicable for all operations in the contiguous United States, Alaska, Hawaii, U.S. territories, and international airspace in the Flight Information Regions (FIR) delegated to the United States where the FAA is the Air Traffic Service (ATS) provider. These procedures do not apply to the territorial airspace of another sovereign country that lies within FIRs delegated to the United States where the FAA is the ATS provider, except by agreement with that country, or airspace in FIRs delegated to other countries. All UAS proponents, operators, and pilots must observe all applicable regulations of 14 CFR.

(a) In general, specific authorization to conduct UAS operations in the NAS outside of active Restricted and Warning Areas designated for aviation use, or approved Prohibited Areas, must be requested by the proponent. Airspace inside buildings or structures is not considered to be part of the NAS and is not regulated. (Refer to the current edition of Order JO 7400.8, Air Traffic Organization Policy.)

(b) This notice and the processes prescribed do not apply to hobbyists and amateur model aircraft users when operating unmanned systems for sport and recreation. Those individuals should seek policy under the current edition of Advisory Circular (AC) 91-57, Model Aircraft Operating Standards. AC 91-57 is not to be used as a basis of approval for operation of any other aircraft, including by Federal, State, and local governments, commercial entities, or law enforcement.

(c) This notice and the processes prescribed also do not apply to UAS operations in FAA-controlled international airspace by an agency of, or a contractor to, the Federal government when those operations are appropriately designated as State aircraft operations and are operated under "due regard" rules and procedures established by the Federal agency responsible for the operation. The designation of flight operations as State aircraft operations normally are made in coordination with the U.S. Department of State. This notice and the processes prescribed do, however, apply where the responsible Federal agency either has not established a formal set of rules and procedures for "due regard" operations, or is not operating the UAS under "due regard" rules and procedures in FAA-controlled international airspace. This notice and the processes prescribed also apply to all UAS operations by an agency of, or a contractor to, the Federal government that transit through U.S. territorial airspace en route to or from international airspace. See Appendix F, UAS COA Requirement. The "due regard" option is not available for state aircraft operations transiting through U.S. territorial airspace en route to or from international airspace.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

(d) Oceanic Operations Within Warning Areas. UAS operations contained within Warning Areas are handled in the same manner as those operations conducted in active Restricted and approved Prohibited areas; that is, neither specific FAA approval nor observers or chase aircraft are required by the FAA.

(e) The only public aircraft that can fly under "due regard" are U.S. government aircraft designated as State aircraft.

(2) Methods. The two methods of approval are the issuance of either a COA for public aircraft operations or a special airworthiness certificate for civil operations. In the case of public aircraft operations, the operating entity applying to conduct the UAS operation must comply with its own processes, policies, and standards in the following areas, in addition to complying with all applicable safety provisions in all other parts of 14 CFR:

- Pilot certification,
- Crew certification,
- Recent pilot experience (or, currency),
- Medical certificates, and
- Airworthiness of public UAS.

Note: If no established public entity processes, policies, or standards exist, it is highly recommended that the public agency/department apply the specifics outlined in this notice and comply with the provisions of 14 CFR applicable to civil UAS operations.

8. COA for Public Operations.

a. Applications. Applications for a COA are only accepted from entities that intend to conduct public aircraft operations. An application may be referred to the FAA Office of the Chief Counsel (AGC-200) for determination of the status of a proponent as a government entity under the public aircraft statute. The duration of COAs complies with the time limitations specified under the current edition of FAA Order 7210.3, Facility Operation and Administration. COAs may be issued for a lesser duration if requested or deemed appropriate. COAs are not required for operations conducted within active Restricted or Warning Area airspace designated for aviation use, or approved Prohibited Areas with permission from the appropriate authority or using agency of that airspace. (Refer to the current edition of Order JO 7400.8, Special Use Airspace.)

b. Approving and Reviewing Authority. AFS-80 is responsible for determining whether the proponents' proposed UAS operations can be conducted safely and responsibly in the NAS, and that they comply with all COA limitations and provisions.

(1) In accordance with FAA Order 7210.3, "As a general rule, a waiver or authorization should be canceled when it is no longer required or there is an abuse of its provisions or unforeseen safety factors develop. Failure to comply with the waiver or authorization is cause for cancellation."

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

(2) The FAA has the authority to suspend or cancel the COA, or to delay any activities if there is a violation of the terms in the COA, or if the safety of persons or property on the ground or in the air is determined to be in jeopardy. That may include, but is not limited to:

- Incidents or accidents occurring during UAS operations in the NAS;
- Habitual noncompliance with administrative requirements, such as failure to provide the FAA with monthly reports on the number of flights, pilot duty time, or unusual equipment malfunctions (e.g., a malfunction or failure of ground control station (GCS) flight control hardware or software (other than loss of control link); a power plant failure or malfunction; a deviation from any provision contained in the COA);
- Deviations from ATC instructions, operational, or coordination issues; and
- Events of intermittent or persistent lost-link as described in the COA or events determined to pose as a risk to the safety of the NAS.

(3) COA suspensions and cancellations are not automatic. Whenever possible, a documented conversation, between the FAA and the proponent, will happen before the suspension/cancellation is issued. Timely and transparent responses to accidents, deviations, and similar safety-related events are expected.

c. Accident and Incident Notification and Investigation. The current edition of FAA Order 8020.11C, Aircraft Accident and Incident Notification, Investigation, and Reporting, and Title 49 of the Code of Federal Regulations (49 CFR) part 830, outlines reporting procedures for accidents and incidents involving civil aircraft and certain public aircraft. All accidents and incidents involving fatalities, injuries, property damage, and fly-away by civil aircraft and those public aircraft subject to part 830 require FAA notification within 24 hours. No additional flights by those aircraft under this COA are allowed before notification. An immediate investigation is required, and when requested to do so, UAS proponents are expected to provide copies of written aircraft accident/incident reports to AFS-80 for review. In accordance with 49 CFR part 1520, § 1520.5, reports will not be released outside of government channels without originator permission.

d. General COA Process. The ATO component of AFS-80 is responsible for the COA process. Applications can be made two ways:

(1) On the Internet using the UAS COA Online System at https://ioeaaa.faa.gov. The UAS COA Online System requires a user name and password; a support desk phone number and e-mail address is provided to assist with obtaining an account.

(2) Using FAA Form 7711-2, Application for Certificate of Waiver or Authorization, available online at http://www.faa.gov/documentLibrary/media/form/faa7711-2.pdf. The completed form can be mailed to: FAA Headquarters, Unmanned Aircraft Systems Integration Office, 490 L'Enfant Plaza SW, Suite 3200, Washington, DC 20024. Mail submittal may encounter significant delay due to current U.S. Postal Service security screening procedures in place.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

e. Operational Review. Prior to issuance of a COA, air traffic specialist components of AFS-80 conduct an operational validation that addresses ATC processes. Next, an aviation safety inspector (ASI) evaluates each application to determine if risks to the NAS associated with the operation have been acceptably mitigated. Both the ASI and ATC requirements are merged into the final COA.

f. Safety Risk Management (SRM) Process. ASIs and other FAA personnel use SRM principles outlined in the current edition of AC 120-92, Safety Management Systems for Aviation Service Providers, to maintain or improve the safety of the NAS by identifying safety risks, hazards, and mitigations associated with proposed UAS operations. When deemed appropriate, Safety Risk Management Documents (SRMD) are created through SRM reviews of specific operations or of risks associated with UAS operations in various classes of airspace. SRM reviews may result in the incorporation of additional mitigations or controls into all or some COAs.

g. National Security Considerations. When appropriate levels of Department of Defense (DOD) or Department of Homeland Security (DHS) declare a UAS operation to be a matter of national security, the FAA may approve an application for a COA which, under normal circumstances, might not otherwise conform to the guidelines set forth in this notice. In this case, national security may override risk mitigation requirements. Such requests to the FAA Administrator will originate from an equivalent level of authority from the proponent's parent organization.

h. Special COA.

(1) National Disaster COA. Due to the unpredictability of national disasters, a National Disaster COA is issued in two parts. In part 1 of the COA, AFS-80 completes an evaluation, excluding the location of the disaster. All known information is inserted into a template and signed by appropriate FAA authority. Once the specific location is identified, this information, along with the specific operation, is inserted into part 2 of the COA in the form of an attachment. Part 2 of the COA must then be signed by appropriate FAA authority, which completes and establishes a valid COA.

(2) Emergency COA. An emergency UAS COA may be considered when all of the following conditions apply:

(a) A situation exists that is defined as a condition of distress or urgency, where there is, or that has, the extreme possibility of loss of life, and

(b) The proponent has determined that manned flight operations cannot be conducted efficiently, and

(c) The proposed UAS is operating under a current approved COA for a different purpose or location.

Note: Requests for UAS COAs that fall outside of these parameters will be processed through the normal online COA application process. Emergency UAS COAs will not be considered for:

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

- Demonstration flights,
- Flights to test capabilities,
- Training,
- Flights in Class B Airspace, or
- Flights over populated areas, unless a suitable mitigation strategy is proposed and found to be acceptable.

9. Special Airworthiness Certificate for Civil UAS Applicants.

a. Airworthiness Determination. Civil applicants may apply for a special airworthiness certificate from the FAA. The proponent is required to submit the requisite data to support a determination that the aircraft and its systems, including the control station (CS), are designed, built, and maintained in a safe and airworthy condition.

b. Special Airworthiness Certificate Issuance. Special airworthiness certificates are typically issued to proponents wishing to conduct UAS research and development (R&D), crew training, and market surveys under 14 CFR part 21, § 21.191. Special airworthiness certificates are issued in accordance with FAA Order 8130.34, Airworthiness Certification of Unmanned Aircraft Systems and Optionally Piloted Aircraft, current edition. Refer to Order 8130.34 for in-depth information on special airworthiness certificates.

c. Proponents with both a COA and Special Airworthiness Certification. In cases where a proponent has been issued a special airworthiness certificate, and is concurrently eligible to operate a corresponding UAS on a COA as a public aircraft operation, the proponent must elect, prior to each flight, which authority is to be used to conduct the flight. The use of both a special airworthiness certificate and a COA on a single flight is not permitted.

d. General Process for Civil UAS Operations. For civil UAS operations, the Aircraft Certification Service, Production and Airworthiness Division (AIR-200) at FAA HQ, is responsible for the issuance of special airworthiness certificates according to FAA Order 8130.34. The issuance of a special airworthiness certificate is coordinated with AIR-200, AFS-80 and the ATO component of AFS-80, and AVS at the HQ and regional levels. A thorough review is conducted by the FAA to evaluate the system's airworthiness and operational specifications. In addition, the FAA reviews and accepts mitigations developed by the proponent to meet acceptable standards of safety.

10. UAS Airworthiness. All UAS must be in an airworthy condition to conduct flight operations in the NAS. An "airworthy condition for UAS subject to a COA" means that the UAS meets the applicable standards and requirements of its operating agency and is capable of operating in compliance with the applicable requirements in 14 CFR part 91. The FAA recognizes that some of the requirements can differ from those for manned aircraft and appropriate changes can be defined. As with airworthiness standards, maintenance technician requirements will be addressed as part of the review process.

a. Public Aircraft Proponents. The proponent must provide an airworthiness statement specifying compliance with the proponent's applicable airworthiness criteria. Airworthiness statements must be provided on agency letterhead and include:

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

- The date the statement is effective,
- A signature of the responsible certifying authority within the agency,
- A point of contact (POC), and
- Any warnings/limitations.

(1) Airworthiness statements are generally written for one UAS. If more than one UAS model is included on a single airworthiness statement, each UAS will be listed and specific information for each UAS will be included in the statement. Airworthiness statements with an expiration date must remain current for the duration of the COA including extensions. If a new airworthiness statement is issued during the period the COA is active, a copy of the airworthiness certificate must be provided to AFS-80.

(2) Examples of acceptable policy/criteria include, but are not limited to:

- Department of Defense (DOD) Handbook, MIL-HDBK 516B, Airworthiness Certification Criteria;
- Air Force Policy Directive (AFPD) 62-6, USAF Aircraft Airworthiness Certification;
- Army Regulations (AR) 70-62, Airworthiness Qualification of Aircraft Systems; or
- Naval Air Systems Command Instruction, NAVAIRINST 13034.1 series, Flight Clearance Policy for Air Vehicles and Aircraft Systems.

b. Civil Aircraft Proponents. Approvals for civil applications using the special airworthiness certificate process receive their airworthiness certification from the FAA.

c. Continued Airworthiness.

(1) Public Aircraft. Proponents for UAS used in public aircraft operations should follow their own agency's procedures and guidelines to maintain continued airworthiness at a level which ensures they continue to operate the aircraft safely.

(2) Civil Aircraft. Proponents for civil UAS operational approvals must address continued airworthiness procedures as part of their application. Civil UAS should be maintained and must conform to the same airworthiness standards defined in 14 CFR parts under which UAS are intended to be operated. It is highly recommended that all proponents provide the following information:

- A Continuing Airworthiness Program,
- A maintenance training program,
- Any unique skill sets or maintenance practices relating to their aircraft and/or aircraft operations that may be outside the current scope and practices of manned aviation, and
- A process to report any applicable data relating to the operation and maintenance of the UAS.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

d. Database and Recordkeeping. All information received from UAS proponents aids the FAA in establishing a database for the existing UAS types and operations. This data is critical to our development of future certification criteria for both systems and pilots. It expedites the regulatory process for UAS and allows the FAA to have historical data from which to base current and future UAS policy. Accurate recordkeeping is essential in assuring positive operational and quality airworthiness control. In accordance with 49 CFR § 1520.5, reports will not be released outside of government channels without originator permission.

11. Flight Operations of a UAS.

a. Applicability and Requirements. This notice applies to UAS operations conducted in the NAS other than in active Restricted and Warning Areas designated for aviation use or approved Prohibited Areas. The FAA requires aircraft to operate safely among all users of the NAS, including non-cooperative aircraft (e.g., aircraft operated without a transponder), and other airborne operations not reliably identifiable by ATC radar (e.g., balloons, gliders, parachutists). Unless otherwise specifically authorized, UAS operators must use observers, either airborne or ground-based, to comply with 14 CFR part 91 requirements.

b. Risk Mitigation. While considerable work is ongoing to develop a certifiable detect, sense, and avoid system as an AMOC with the see-and-avoid aspect of §§ 91.113 and 91.115, no current solution exists. As a result, compliance with the see-and-avoid requirement and navigational awareness are primary concerns in UAS operational approvals leading to imposition of AMOC. Risk mitigation for these two issues is normally based on the use of observers or other methods of maintaining flight separation and collision avoidance or 'segregation'; however, they may also include other concepts or systems that a proponent may propose for FAA review. The FAA only approves UAS flight operations that can be conducted at an acceptable level of safety. Refer to the current editions of AC 120-92 and FAA Order 8000.369, Safety Management System Guidance.

> **Note:** Risk mitigations that depend on the establishment of new types and categories of airspace are extremely difficult and time-consuming. The NAS is established and configured through a rigorous regulatory process. Risk mitigations that result in the prohibition of the public's right to transit airspace will require a very long lead time with no guarantee that they will be approved.

(1) Proponents proposing see-and-avoid strategies in lieu of visual observers (VOs) are required to support proposed mitigations with system safety cases which indicate the operations can be conducted safely. Acceptable system safety cases must include a hazard analysis, risk assessment, and other appropriate documentation that identifies the level of risk.

(2) It is the proponent's responsibility to demonstrate that the risk of injury to persons or property along the flightpath is appropriately mitigated. Aircraft with performance characteristics that impede, delay, or divert other normal air traffic operations may be restricted in their operations.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

12. System Considerations for UAS.

a. Traffic Alert and Collision Avoidance Systems (TCAS). The use of TCAS by UAS has not been validated as an acceptable alternative for see-and-avoid requirements, and is not an approved means of mitigation for UAS see-and-avoid requirements or strategies.

b. Onboard Cameras/Sensors. Although onboard cameras and sensors positioned to observe targets on the ground have demonstrated some capability, their use in detecting airborne operations for the purpose of segregation is still quite limited. To date, these types of systems have not been approved as a sole mitigation in the see-and-avoid risk assessment.

c. Use of Equipment in Lieu of VOs.

(1) Any equipment proposed for use on UAS to accomplish the function of see-and-avoid in lieu of VOs must:

- Be certified as an aircraft system and equipment using standards, requirements, and processes commensurate with installation of equipment in aircraft by a recognized airworthiness authority, and
- Meet the requirements of 14 CFR part 25, § 25.1309, or equivalent process, for any UAS installation, regardless of its size, performance, or maximum takeoff weight.

Note: For other equipment that is not proposed for use in meeting see-and-avoid requirements, § 23.1309, or equivalent process, should be used.

(2) It is the responsibility of the proponent to show that the contemplated standards, requirements, and processes meet an equivalent level of safety.

d. Radar and Other Sensors. If special types of radar systems or other sensors are utilized to mitigate risk, the proponent must provide supporting data which demonstrates the following can be accomplished safely:

- Both cooperative and non-cooperative traffic can be detected and tracked to ensure appropriate separation and collision avoidance,
- The proposed system can effectively mitigate a potential collision,
- Operators are suitably trained and equipped to use them effectively, and
- Procedures are in place for the pilot in command (PIC) to effectively use the data.

e. Lost Link Procedures. There are many acceptable approaches to satisfy lost link requirements. The intent of any lost link procedure is to ensure airborne operations remain predictable. Proponents will comply with the UAS lost link procedures as specified in the COA.

Note: Lost link is not considered fly-away. Refer to definitions in Appendix A.

(1) Unless otherwise authorized, lost link solutions must comply with the last ATC clearance (if ATC clearance is required), for a period of time sufficient for ATC to ensure conflict resolution without loss of required separation.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

(2) Lost link procedures are pre-coordinated by AFS-80 with the appropriate ATC facility and included in the COA. They include, at a minimum, lost link route of flight, transponder use, lost link orbit points, communications procedures, and pre-planned flight termination points (FTP) or other contingency planning measures in the event recovery of the UAS is not feasible.

(3) If lost link occurs within a Restricted Area, Warning Area, or Class A airspace, or lost link procedure takes aircraft into one of these areas, the aircraft will not exit that airspace, unless otherwise authorized, until link is re-established. All exceptions will be submitted as part of the COA application to AFS-80 for review.

(4) Unless otherwise authorized, lost link procedures will conform to the Contingency Planning Limitations in Appendix E and in general, include the following:

- Limiting of UAS operations to operations over water or sparsely populated areas over the ground to transit to another Restricted Area, Warning Area, or to a pre-planned lost link orbit point within visual line-of-sight to re-establish link. (The UAS lost link procedure will not transit over fixed structures on the water.)
- Lost link programmed procedures will avoid unexpected turn-around and/or altitude changes and will provide sufficient time to communicate and coordinate with ATC.
- Lost link orbit points will not be contained within any published holding area, airway, Jet route, T route, or other area navigation (RNAV) published route.

(5) If the link is not re-established within a pre-determined time as defined by the FAA-approved COA, the aircraft may:

- Autoland; however, the aircraft will not exit the Restricted Area or Warning Area in accordance with subparagraph 12.e.(3) above,
- Proceed to another lost link point (LLP) in an attempt to regain communication link, or
- Proceed to an FTP or the location specified in other contingency planning measures for flight termination.

Note: LLPs may be used as FTPs. In this case, the aircraft may loiter at the LLP/FTP until link is re-established or fuel exhaustion occurs.

- UAS without auto-land capability will proceed to a pre-planned FTP or other acceptable contingency planning option prior to fuel exhaustion.

(6) Refer to Appendix E for more Contingency Planning Limitations.

f. Flight Termination System (FTS). It is highly desirable that all UAS have system redundancies and independent functionality to ensure the overall safety and predictability of the system. UAS that lack system redundancies may be required to have an independent FTS that can be activated manually by the UAS PIC to safeguard the public.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

g. Spectrum Authorization.

(1) Every UAS proponent must have the appropriate National Telecommunications and Information Administration (NTIA) or Federal Communications Commission (FCC) authorization/approval to transmit on the radio frequencies (RF) used for UAS uplink and downlink of control, telemetry, and payload information.

(2) Non-Federal public agencies, such as universities and State/local law enforcement, and all civil UAS proponents generally require a license from the FCC as authorization to transmit on frequencies other than those in the unlicensed bands (900 megahertz (MHz), 2.4 gigahertz (GHz), and 5.8 GHz). This generally will be in the form of an Experimental Radio License or a Special Temporary Authority (STA) issued by the FCC. Non-Federal public agencies and civil UAS proponents that operate systems using frequencies assigned to the Federal government (e.g., the DOD) must demonstrate they have the proper authorization through FCC-issued documentation.

(3) DOD agencies will typically demonstrate UAS spectrum authorization through an STA issued by NTIA or a frequency assignment in the NTIA-administered Government Master File (GMF). Authorizations issued under Title 47 of the Code of Federal Regulations (47 CFR) part 300, in the NTIA Manual, Chapter 7, paragraph 7.11, Use of Frequencies by Certain Experimental Stations, are not appropriate for UAS operations.

(4) Federal public agencies other than DOD, such as National Aeronautics and Space Administration (NASA), U.S. Coast Guard (USCG), and U.S. Customs and Border Protection (USCBP), also need an STA issued by NTIA or a frequency assignment in the NTIA-administered GMF. This is especially important for systems designed to operate on frequencies assigned to DOD.

13. Operational Requirements for UAS. Unless operating in an active Restricted or Warning Area designated for aviation use, or approved Prohibited Areas, UAS operations must adhere to the following requirements.

a. Observer Requirement. Visual flight rules (VFR) UAS operations may be authorized utilizing either ground-based or airborne VOs onboard a dedicated chase aircraft. A VO must be positioned to assist the PIC, to exercise the see-and-avoid responsibilities required by §§ 91.111, 91.113, and 91.115 by scanning the area around the aircraft for potentially conflicting traffic and assisting the PIC with navigational awareness.

(1) VOs:

(a) Must assist the PIC in not allowing the aircraft to operate beyond the visual line-of-sight limit, and

(b) Must be able to see the aircraft and the surrounding airspace sufficiently to assist the PIC with:

- Determining the UA's proximity to all aviation activities and other hazards (e.g., terrain, weather, structures), and

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

- Exercising effective control of the UA, and
- Complying with §§ 91.111, 91.113, and 91.115, and
- Preventing the UA from creating a collision hazard, and

(c) Must inform the PIC before losing sufficient visual contact with the UA or previously sighted collision hazard. This distance is predicated on the observer's normal vision. Corrective lenses, spectacles, and contact lenses are permitted.

(2) Because of field of view and distortion issues with aids to vision such as binoculars, field glasses, night vision devices, or telephoto lenses, these are allowed only for augmentation of the observer's visual capability; they cannot be used as the primary means of visual contact. When using other aids to vision, VOs must use caution to ensure the aircraft remains within normal visual line-of-sight of the observer. These aids to vision are not to be confused with corrective lenses or contact lenses, which do not alter the field of view or distort vision.

(3) The responsibility of ensuring the safety of flight and adequate visual range coverage to avoid any potential collisions remains with the PIC. The PIC for each UAS operation must identify a location from which the observer will perform his/her duties. This location will be selected to afford the best available view of the entire area within which the operation is to be conducted.

(4) Daisy-chaining of observers to increase operational distance is not normally approved; however, a proponent may provide a safety case for daisy-chaining in accordance with paragraph 16 by demonstrating an acceptable level of risk to the NAS.

(5) Observer(s) must be in place 30 minutes prior to night operations to ensure dark adaptation. Refer to subparagraph 13.i.(2)(b) for night operations information.

b. ATC Communications Requirements.

(1) The UAS pilot must establish and maintain direct two-way radio communication with appropriate ATC facilities anytime:

- The aircraft is being operated in Class A or D airspace (under §§ 91.135 or 91.129) or, when required, in Class E and G airspace (under §§ 91.127 or 91.126). See subparagraph 13.q.(2) and (3) for operations in Class B or C airspace; or
- The aircraft is being operated under instrument flight rules (IFR); or
- It is stipulated under the provisions of any issued COA or Special Airworthiness Certificate.

(2) It is preferred that communications between the UAS pilot and ATC be established through onboard radio equipment to provide a voice relay, however, for IFR flight this method of transmission is required.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

c. Inter-Communications Requirements. Any VO, sensor operator, or other person charged with providing see-and-avoid assistance must have immediate communication with the UAS pilot. If a chase aircraft is being utilized, immediate communication between the chase aircraft and the UAS pilot is required at all times. If the UAS pilot is in communication with ATC, monitoring of the ATC frequency by all UAS crew members (pilots, observers, and chase pilots) is recommended for shared situational and navigational awareness. However, unless it is approved for others to do so, the UAS PIC or the supplemental pilots are the only crewmembers that will communicate with ATC.

d. Electronic Devices. The use of electronic devices (including cell phones) other than for UAS flight- and mission-required usage is governed by § 91.21, which ensures these devices do not interfere with the UAS systems. The use of electronic devices (including cell phones) is not authorized for primary communication with ATC unless authorized under the Special Provisions of the COA.

e. Dropping Objects/Expendable Stores or Hazardous Materials. If the intended UAS operation includes the carriage, dropping, or spraying of aircraft stores outside of active Restricted or Warning Area airspace designated for aviation use, or approved Prohibited Areas, the proponent must ensure that specific approval is listed in the special provisions, the operational risks have been sufficiently mitigated as required by 14 CFR § 91.15, and that the hazardous material requirements in 49 CFR have been met. Acceptable procedures for hung stores and loss of control link while carrying stores must be provided to the FAA. A similar case must be made for hazardous materials carried aboard the aircraft and, if approved, will be listed in the special provision section of the COA.

f. Flight Over Populated Areas. Routine UAS operations are prohibited over urban or populated areas, except where the level of airworthiness allows. UAS operations may be approved in emergency or national disaster relief situations if the proposed mitigation strategies are found to be acceptable. See Appendix A for definition of populated or urban area.

g. Air Shows. A proponent is required to provide a safety case in accordance with paragraph 16 that demonstrates an acceptable level of risk and must receive a separate Air Show Waiver in accordance with FAA Order 8900.1, Flight Standards Information Management System (FSIMS).

h. Flight Over Heavily Trafficked Roads or Open-Air Assembly of People. UAS operations must avoid these areas, except where level of airworthiness allows. If flight in these areas is required, the proponent is required to support proposed mitigations with system safety cases that indicate the operations can be conducted safely. Acceptable system safety cases must include information located in paragraph 16. Additionally, it is the proponent's responsibility to demonstrate that risk of injury to persons or property along the flightpath has been mitigated. UAS with performance characteristics that impede, delay, or divert other air traffic operations may be restricted in their operations. Refer to AC 120-92 and FAA Order 8000.369, current editions.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

i. Day/Night Operations.

(1) Day Operations. UAS operations outside of Class A airspace, active Restricted or Warning Areas designated for aviation use, or approved Prohibited Areas will be conducted during daylight hours unless otherwise authorized.

(2) Night Operations.

(a) Night operations may be considered if the proponent provides a safety case and sufficient mitigation to avoid collision hazards at night.

(b) UAS night operations are those operations that occur between the end of evening civil twilight and the beginning of morning civil twilight, as published in the American Air Almanac, converted to local time. (Note: this is equal to approximately 30 minutes after sunset until 30 minutes before sunrise, except in Alaska.) External pilots and observers must be in place 30 minutes prior to night operations to ensure dark adaptation.

j. Flights Below Class A Airspace. All UAS operations outside of active Restricted/ Warning/Sensitive Security Information (SSI) airspace designated for aviation use, or approved Prohibited Areas must be conducted in visual meteorological conditions (VMC) if using ground or airborne VOs. In addition, the following weather requirements apply:

- If on IFR flight, remain clear of clouds. This requirement does not relieve the PIC from following the ATC clearance. According to § 91.3, the PIC retains responsibility for, and is the final authority as to the operation of that aircraft.
- If on VFR flight, maintain § 91.155 VFR cloud clearances, except in Class G airspace, where Class E airspace visibility requirements must be applied, but not less than 3 statute miles (SM) in-flight visibility.
- Special VFR is not permitted.
- For chase aircraft, 5 SM in-flight visibility.

k. Autonomous Operations. Although it is possible to have a completely manual (direct pilot intervention) UAS, the majority of UAS are autonomous to a certain degree. Only those UAS which have the capability of direct pilot intervention will be allowed in the NAS outside of active Restricted or Warning Areas designated for aviation use, or approved Prohibited Areas. Because the pilot may be technically considered out-of-the-loop in a lost link scenario, this restriction does not apply to UAS operating under lost link.

l. Operations from Off-Airport Locations. In most cases, an off-airport location should be situated no closer than 5 nautical miles (NM) from any airport or heliport. The operational areas, including the launch and recovery zones, should be free from obstructions; reasonable efforts should be made to keep operations away from structures.

m. Crew Resource Management (CRM). Proponents must train all UAS crewmembers in CRM. The current edition of FAA AC 120-51, Crew Resource Management Training, or an FAA-recognized equivalent applies to UAS operations. Proponents must implement the recommended training and procedures included in AC 120-51, or in an FAA-recognized

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

equivalent. The PIC of a UAS must ensure no activities other than those duties required for safe flight operation are performed. No UAS crewmember may engage in any activities unrelated to those required for safe operation of the UAS during critical phases of flight such as launch/takeoff and landing/recovery.

n. Sterile Cockpit. Proponents must comply with the current edition of AC 120-71, Standard Operating Procedures for Flight Deck Crewmembers, or the FAA-recognized equivalent, for ensuring the PIC implements sterile cockpit procedures. During critical phases of flight, including all ground operations involving taxi (movement of an airplane under its own power on the surface of an airport), takeoff and landing, and all other flight operations in which safety or mission accomplishment might be compromised by distractions, no crewmember may perform any duties not required for the safe operation of the aircraft. No crewmember may engage in, nor may any PIC permit, any activity during a critical phase of flight which could distract any crewmember from the performance of his/her duties or interfere in any way with the proper conduct of those duties.

o. Operating Under IFR. While operating on an instrument flight plan, the following must exist, be completed, or be complied with:

(1) The PIC must hold a current instrument rating or an FAA-recognized equivalent.

(2) The aircraft's airworthiness signature statement for flight release (not airworthiness document) must include IFR flight and indicate that all equipment required for IFR operations is certified and working (including pitot-static and transponder checks).

(3) Applicable navigation database and charts are current and available to the UAS pilot.

(4) An IFR flight plan is filed.

(5) An ATC clearance has been obtained and all clearances must be followed.

(6) Direct two-way radio communication between the UAS pilot and ATC is established and maintained. (A communication relay through the aircraft may be required.)

(7) Alternate communication capabilities with ATC for the purpose of lost link and/or lost communication are designated and operational during all phases of flight.

(8) The UAS is equipped with a certified operating mode C (mode S preferred) transponder.

(9) ATC radar services are obtained throughout the portion of the flight in Class A airspace whenever possible (overwater non-radar operations may be allowed in the special provisions section).

(10) All operations outside of Class A airspace and active Restricted, Prohibited, Warning Areas, or SSI airspace designated for aviation use, must remain clear of clouds. If operating under IFR, to comply with this provision, the PIC must have an ATC clearance to deviate.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

According to § 91.3, the PIC retains responsibility for, and is the final authority as to, the operation of that aircraft.

(11) VOs are not required in Class A airspace unless stipulated in the COA.

p. Chase Aircraft Operations. The chase aircraft:

(1) Must remain at a safe distance from UA to ensure collision avoidance if a malfunction occurs, and

(2) Must remain close enough to the UA to provide visual detection of any conflicting aircraft and advise the PIC of the situation.

(3) Must remain within radio control range of the UA, in the case of pilot operation from the chase aircraft, to maintain appropriate signal coverage for flight control or activation of the FTS.

(4) May be required to have communication with appropriate ATC facilities based on the proponent's application or mission profile.

(5) Is not required by FAA in active Restricted or Warning Area airspace designated for aviation use, or approved Prohibited airspace.

(6) Is not required for Optionally Piloted Aircraft (OPA) if a qualified VO is on board.

(7) Is not required in Class A airspace unless stipulated in the COA.

(8) Operations must be conducted in accordance with the Special Provisions listed in the approved COA.

(9) Must maintain 5 SM in-flight visibility restrictions.

(10) Pilot/observer:

- Will not concurrently perform either observer or UAS pilot duties along with chase pilot duties unless otherwise authorized.
- Must maintain direct voice communication with the UAS pilot.

(11) Pilots operating as a formation flight will immediately notify ATC if they are using a non-standard formation. Non-standard formations must be pre-approved by ATC. Proponents adhere to the current edition of Order JO 7610.4, Special Operations, as applicable. Refer to Appendix A for definitions of standard and non-standard formations.

(12) Operations will not be conducted in IMC.

(13) Operations will be thoroughly planned and briefed.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

(14) Pilot, during a lost link situation, must be notified immediately along with ATC. The chase pilot will report to ATC that the UA is performing lost link procedures as planned or if deviations are occurring.

(15) Pilot will ensure safe separation with the UA, and immediately notify ATC and the UA PIC during loss of visual contact with the UA by both the chase pilot and observer, when such contact cannot be promptly re-established. The UA PIC will either execute lost link procedures to facilitate a rejoin, recover the UA, or terminate the flight as appropriate.

q. Airspace Considerations by Airspace Designation.

Note: UAS operating in airspace designated as reduced vertical separation minimum (RVSM) airspace must comply with § 91.180.

(1) Class A. Observers are not normally required in Class A. All UAS must be operating under IFR and on an instrument flight plan. UAS operations approved for Class A must comply with § 91.135.

(2) Class B. UAS operations are currently not authorized. Class B airspace contains terminal areas with the highest density of manned aircraft in the NAS. On a case-by-case basis, the FAA may consider exceptional circumstances. For public aircraft, a Letter of Agreement (LOA) between the affected ATC facility and the proponent describing UAS segregation procedures is required. For civil aircraft, segregation procedures should be incorporated into the operating limitations. UAS operations must not impede, delay, or divert other Class B operations.

(3) Class C (and airspace within 30 NM of an airport listed in Appendix D, section 1, § 91.215). UAS operations approved for Class C must comply with §§ 91.130 and 91.215. Requests for operations without this equipment will be handled on a case-by-case basis and may be approved if sufficiently mitigated and a safety case has been established. For public aircraft, an LOA between the affected ATC facility and the proponent describing UAS segregation procedures may be required. For civil aircraft, segregation procedures should be incorporated into the operating limitations. UAS operations must not impede, delay, or divert other Class C operations.

(4) Class D. Requests for approval will be handled on a case-by-case basis and may be approved if sufficiently mitigated and a safety case has been established. UAS operations approved for Class D must comply with § 91.129. For public aircraft, an LOA between the affected ATC facility and the proponent describing UAS segregation procedures may be required. For civil aircraft, segregation procedures should be incorporated into the operating limitations. UAS operations must not impede, delay, or divert other Class D operations.

(5) Class E. If there is an operating ATC tower, Class D rules may apply. UAS operations approved for Class E must comply with § 91.127. For public aircraft, an LOA between the affected ATC facility and the proponent describing UAS segregation procedures may be required. For civil aircraft, segregation procedures should be incorporated into the operating limitations. UAS operations must not impede, delay, or divert other Class E operations.

(6) Class G. UAS operations approved for Class G must comply with § 91.126.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

r. ATC Visual Approach Clearances. The UAS PIC must not accept a visual approach clearance, an instruction to follow another aircraft by visual means, or a clearance to maintain visual separation from another aircraft.

s. In-Flight Emergencies.

- The PIC will notify ATC of any in-flight emergency or aircraft accident as soon as practical.
- The PIC will notify ATC of any loss of control link as soon as practical. Loss of control link scenarios may be handled by ATC as an emergency.

14. Contingency Planning Limitations. See Appendix E.

15. Personnel Qualifications. This paragraph addresses the qualifications of all UAS flightcrew members, observers, maintainers, and other personnel as appropriate. All references to a pilot certificate or FAA written examination refer to an FAA-issued private pilot certificate, higher certification, or an FAA-recognized equivalent.

a. UAS Pilot Qualifications. The FAA is focused on ensuring that UAS pilots have an appropriate level of understanding of 14 CFR applicable to the airspace where UAS operate. UAS pilots are responsible for controlling their aircraft to the same standards as the pilot of a manned aircraft. Civil UAS pilots may be required to have instruction by an FAA-certificated flight instructor.

b. UAS General Operational Requirements. The following operational restrictions apply to all UAS pilots:

- One PIC must be designated at all times.
- The PIC of an aircraft is directly responsible for, and is the final authority of the operation of that aircraft.
- Pilots must not perform crew duties for more than one UAS at a time.
- Pilots are not allowed to perform concurrent duties both as the pilot and the VO. In the case of OPA, the airborne pilot may assume the role of PIC at all times, but will only be the observer when the OPA is operated by the CS pilot.
- Unless undergoing initial qualification training, pilots must be qualified on the aircraft being flown.
- Only one PIC per aircraft is authorized, and the PIC must be in a position to assume control of the aircraft.

c. PIC.

(1) The designated PIC:

- Has been designated as PIC before or during the flight.
- Is responsible for the UAS flight operation as described under § 91.3, or FAA-recognized equivalent.
- Is responsible for determining whether the UAS is in condition for safe flight.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

- Must land as soon as safely practical when any condition occurs that causes operations to be unsafe.
- May be augmented by supplemental pilots; however, the PIC retains complete and overall responsibility of the flight, regardless of who may be piloting the aircraft.
- Has the ability to assume the duties of an internal or an external UAS pilot at any point during the flight.
- May rotate duties as necessary to fulfill operational requirements.
- Operating under a public agency, must have a thorough knowledge of the COA issued to the organization and must retain a copy to reference during flight.
- Must be trained and qualified on the specific UAS for the conduct of the flight.
- May assume the duties of VO or PIC, if piloting an OPA when the OPA is being utilized as a UAS and being flown by the CS pilot.

(2) PIC Rating Requirements. Rating requirements for the UAS PIC depend on the type of operation conducted; they fall into two categories:

- Operations that require at least a private pilot certificate or FAA-recognized equivalent, or
- Operations that do not require at least a private pilot certificate or FAA-recognized equivalent.

(a) The requirement for the PIC to hold a pilot certificate or FAA-recognized equivalent is based on various factors including:

- The location of the planned operations,
- The mission profile,
- The size of the aircraft, and
- Whether or not the operation is conducted within or beyond visual line-of-sight.

(b) The PIC must hold, at a minimum, an FAA private pilot certificate or FAA-recognized equivalent for all operations listed below:

- Flight in Class A, B, C, D, E, and G (400 feet above ground level (AGL)) airspace.
- IFR (must have instrument rating) operations.
- Night operations.
- At joint use or public airfields.
- Requiring a chase aircraft.
- At any time the FAA has determined the need, based on the UAS characteristics, mission profile, or other operational parameters.

(c) Operations without a pilot certificate may be allowed when all of the following conditions are met:

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

- The PIC has successfully completed, at a minimum, FAA private pilot ground instruction and passed the FAA Private Pilot written examination or FAA-recognized equivalents. (Airman Test Reports are valid for the 24 calendar-month period preceding the month the exam was completed, at which time the instruction and written examination must be repeated.)
- Operations are during daylight hours.
- The operation is conducted in a sparsely populated location.
- Operations are approved and conducted solely within visual line-of-sight in Class G airspace.
- Visual line-of-sight operations are conducted no further than ½ NM laterally from the UAS pilot and at an altitude of no more than 400 feet AGL at all times. Refer to Appendix A for the visual line-of-sight definition.
- Operations are conducted no closer than 5 NM from any FAA-designated airport or heliport other than the airport from which the aircraft is operating.
- The operation is conducted from a privately owned airfield, military installation, or off-airport location.

(3) PIC Recent Flight Experience (Currency). The proponent must provide documentation showing the pilots maintain an appropriate level of recent pilot experience in the UAS being operated, or in an FAA-certified simulator. At a minimum, the PIC must conduct three takeoffs (launch) and three landings (recovery) in the specific UAS within the previous 90 days (excluding pilots who do not conduct launch/recovery during normal/emergency operations); or as prescribed by the proponent's accepted recurrent training and currency program.

(a) For those operations that require a certificated pilot, the PIC, to exercise the privileges of his certificate, must have flight reviews and maintain recent pilot experience in manned aircraft per 14 CFR part 61, as appropriate; or FAA-accepted equivalent.

(b) For flights approved for night operations, the PIC must conduct three takeoffs (launch) and three landings (recovery) each, in the specific UAS at night, to a full stop in the previous 90 days (excluding pilots who do not conduct launch/recovery during normal/emergency operations).

(c) For operations approved for night or IFR, the PIC must maintain recent pilot experience per § 61.57 or FAA-accepted equivalent as applicable.

(4) PIC Medical. The PIC must maintain, at a minimum, a valid FAA second-class medical certificate issued under 14 CFR part 67 or the FAA-recognized equivalent. The second-class medical certificate expires at the end of the last day of the 12th month after the month of the date of the examination shown on the medical certificate listed in § 61.23.

(5) Section 91.17 or FAA-recognized equivalent applies to all UAS crewmembers.

(6) PIC Training.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

(a) In addition to the training required for a pilot certificate, UAS PICs must have the following additional training (or FAA-recognized equivalent):

- Including normal, abnormal, and emergency procedures in all specific details of the UAS being operated,
- Manufacturer-specific training,
- Demonstrated proficiency, and
- Testing in the UAS being operated.

(b) Proponents must maintain individual training records of all UAS personnel. All training and testing will be documented in the individual's training record by the instructor and initialed by the trainee.

d. Supplemental Pilots. Supplemental pilots are those pilots assigned UAS flight duty to augment the PIC. It is common for proponents to have both an internal and an external UAS pilot. The supplemental pilot can assume either of these positions.

(1) Ratings. Supplemental pilots must have, at a minimum, successfully completed private pilot ground school and passed the written test or FAA-recognized equivalents. The ground school written test results are valid for two years from the date of completion, at which time the instruction and written examination must be repeated. If a supplemental pilot assumes the role of PIC, he/she must comply with the PIC rating, currency, medical, and training requirements listed above in subparagraph 15c.

(2) Recent Pilot Experience. The proponent must provide a process that ensures that pilots maintain an appropriate level of recent pilot experience for the position they are assigned in the UAS being operated.

(3) Medical. Supplemental pilots must maintain, at a minimum, a valid FAA second-class medical certificate issued under part 67 or the FAA-recognized equivalent. The second-class medical certificate expires at the end of the last day of the 12th month after the month of the date of the examination shown on the medical certificate, according to § 61.23. Section 91.17 or FAA-recognized equivalent applies to all UAS crewmembers.

(4) Training.

(a) UAS supplemental pilots must have:

- Training in all specific details of the UAS being operated, including normal, abnormal, and emergency procedures;
- Manufacturer-specific training (or FAA-recognized equivalent);
- Demonstrated proficiency and successful testing in the UAS being operated.

(b) Proponents must maintain individual training records for all UAS personnel. All training must be documented by the instructor and initialed by the trainee.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

e. UAS Observer Qualifications. All observers must have an understanding of Federal aviation regulations applicable to the airspace where the UAS will operate. Observers are considered crewmembers. Observers must not perform crew duties for more than one UAS at a time. Observers are not allowed to perform concurrent duties both as UAS pilot and observer.

(1) Medical. All observers must have a valid FAA second-class medical certificate issued under part 67; an FAA-recognized equivalent is an acceptable means of demonstrating compliance with this requirement. The second-class medical certificate expires at the end of the last day of the 12th month after the month of the date of the examination shown on the medical certificate. Section 91.17 or FAA-recognized equivalent applies to all UAS crewmembers.

(2) Training. Observers must complete sufficient training to communicate to the pilot any information required to remain clear of conflicting traffic, terrain, and obstructions, maintain proper cloud clearances, and provide navigational awareness. This training, at a minimum, must include knowledge of:

(a) Their responsibility to assist pilots in complying with the requirements of 14 CFR:

- § 91.111, Operating Near Other Aircraft;
- § 91.113, Right-of-Way Rules: Except Water Operations;
- § 91.115, Right-of-Way Rules: Water Operations; and
- § 91.155, Basic VFR Weather Minimums;

(b) Air traffic and radio communications, including the use of approved ATC/pilot phraseology; and

(c) Appropriate sections of the Aeronautical Information Manual (AIM).

f. UAS Maintenance Personnel Qualifications.

(1) Maintenance Ratings. Will be established as more data is collected and a regulatory guideline is developed.

(2) Recent Maintenance Experience. It is suggested that proponents follow applicable guidelines of 14 CFR part 65, § 65.83, as appropriate, until final UAS regulatory guidelines are available.

(3) Maintenance Medical Requirements. At a minimum, the requirements of § 91.17 or FAA-recognized equivalent must be met. No additional medical requirements have been defined at this time.

(4) Maintenance Training. It is highly recommended that a proponent of a UAS submit a training program. This requirement will be further defined as more data is collected and the regulatory process affects these guidelines.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

g. Other UAS Personnel Qualifications. Ancillary personnel such as systems operators or mission specialists must be thoroughly familiar with and possess operational experience of the equipment being utilized. If the systems being utilized are for observation and detection of other aircraft for collision avoidance purposes, personnel must be thoroughly trained on collision avoidance procedures and techniques and have direct communication with the UAS pilot, observer, and other applicable personnel.

16. AMOC. This notice defines certain limitations and procedures to conduct UAS operations, but each application is evaluated on its own technical merit based on its own set of operational parameters and proposed operational profiles, mitigations, and systems. When a proponent desires to deviate from these limitations and procedures, an AMOC that includes a safety case (recommended format provided in Appendix D), must be submitted for approval. For a proponent to make an acceptable safety case, information must be provided that outlines all hazards and risks associated with the requested AMOC. In addition, the proponent must provide a description of the methods and procedures or equipment for mitigating each hazard and risk. As such, deviations and AMOC may differ from the information presented in this notice. Therefore, if the proponent provides an acceptable safety case with sufficient data that supports the proposal, the AMOC will be considered and evaluated for approval.

a. Safety Case Information. The proponent should include at a minimum:

(1) A thorough description of the environment in which the aircraft will operate;

(2) Criteria for categorizing hazards (e.g., severity and likelihood);

(3) A detailed airworthiness description of the affected items associated with the proposed AMOC, which includes, as a minimum:

- Certification status of components and systems, or statement of airworthiness for public aircraft,
- Reliability data,
- Redundant systems,
- Failure modes and effects, including system response to loss of control link, and
- An airworthiness determination (for COA proponents only);

(4) Capabilities of the aircraft;

(5) Flight data;

(6) Accident data;

(7) Emergency procedures; and

(8) Pilot/crew roles and responsibilities.

b. Sample Safety Case. Appendix D represents the FAA's approach to documenting the process used for hazard identification and risk mitigation. It is provided as an example for proponents to use when developing and documenting a safety case. In addition to these

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

guidelines, other government and industry methods similar to the FAA's approach to developing a safety case also provide acceptable hazard analysis tools. These include Preliminary Hazard Analysis, Operational Safety Assessment, Comparative Safety Assessment, and Fault Hazard Analysis. See Appendix D for a complete list.

17. Disposition. We will incorporate the information in this notice into FAA Order 8900.1 before this notice expires. Direct questions concerning the information in this notice to the Unmanned Aircraft Systems Integration Office, AFS-80, at 202-385-4835.

APPENDIX A. DEFINITIONS

1. Aircraft. A device used or intended to be used for flight in the air, including unmanned aircraft (UA).

2. Airworthiness [UAS]. A condition in which the unmanned aircraft system (UAS) (including the aircraft, airframe, engine, propeller, accessories, appliances, and control station (CS)) conforms to its type certificate, if applicable, and is in condition for safe operation.

3. Airworthiness Certification. Process and aircraft qualification for civil UAS proponents to obtain a special airworthiness certificate.

4. Airworthiness Statement. Document required from public UAS proponents during a Certificate of Waiver or Authorization (COA) application process which confirms aircraft airworthiness.

5. Certificate of Waiver or Authorization (COA). An FAA grant of approval for a specific operation. The authorization to operate a UAS in the National Airspace System (NAS) as a public aircraft outside of Restricted, Warning, or Prohibited areas approved for aviation activities.

6. Chase Aircraft. A manned aircraft that carries its own pilot-in-command (PIC) and a separate qualified VO flying in proximity to a UA.

7. Civil Aircraft. Aircraft other than public aircraft.

8. Cooperative Aircraft. Aircraft that have an electronic means of identification (i.e., a transponder or ADS-B transceiver) aboard in operation.

9. Crewmember [UAS]. In addition to the crewmembers identified in 14 CFR part 1, a UAS flightcrew member includes pilots, sensor/payload operators, and VOs, but may include other persons as appropriate or required to ensure safe operation of the aircraft.

10. Crew Resource Management (CRM). The effective use of all available resources including human, hardware, and information resources.

11. Daisy-Chaining. Aviation jargon for the use of multiple, successive observers to extend the flight of a UA beyond the direct visual line-of-sight of any other PIC or VO.

12. Experimental Certificate. A type of special airworthiness certificate issued for the purposes of research and development (R&D), crew training, exhibition, and market survey as defined in 14 CFR part 21, § 21.191(a), (c), and (f). Note: According to § 91.319(a)(2), experimental aircraft may not be used for carrying persons or property for compensation or hire.

a. R&D Aircraft. Aircraft testing new design concepts, equipment, installations, operating techniques, or uses for aircraft. Any unmanned aircraft system (UAS), including an Optionally Piloted Aircraft (OPA) is eligible for an experimental certificate under this purpose. Operations

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

may be conducted by the proponent only as a matter of research or to determine whether an idea warrants further development.

b. Crew Training. Crew training is limited to the number of flight crews required by the proponent to conduct experimental aircraft operations.

c. Market Survey. Aircraft may be used for the purposes of conducting market surveys, sales demonstrations, and customer crew training of the manufacturer's customers as provided in part 21, § 21.195.

13. External Pilot. A UAS pilot who flies from outside a CS shelter with direct visual contact with the aircraft.

14. FAA-Recognized Equivalent. An FAA recognition that a public agency may exercise its own internal processes regarding airworthiness and pilot, aircrew, and maintenance personnel certification and training; furthermore, the agency has determined that its UAS is capable of safe operation in the National Airspace System (NAS) when conducting public aircraft operations under Title 49 of the United States Code (49 U.S.C.) §§ 40102(a)(41) and 40125.

15. Fly-Away. An interruption or loss of the control link, or when the pilot is unable to effect control of the aircraft and, as a result, the UA is not operating in a predicable or planned manner.

16. Formation.

a. Non-standard formation. A formation operating under any of the following conditions:

- When the flight leader has requested and ATC has approved other than standard formation dimensions;
- When operating within an authorized block altitude or under the provisions of a letter of agreement (LOA);
- When the operations are conducted in airspace specifically designed for a special activity.

b. Standard formation. A formation in which proximity of no more than 1 NM laterally or longitudinally and within 100 feet vertically from the flight leader is maintained by each wingman or UA.

17. Inspection. The routine performance of inspection tasks at prescribed intervals. The inspection must ensure the airworthiness of an aircraft up to and including its overhaul or life limits.

18. Internal Pilot. A UAS pilot who flies from inside a CS shelter without direct visual contact with the aircraft.

19. Lost Link. An interruption or loss of the control link, or when the pilot is unable to effect control of the aircraft and, as a result, the UA will perform a predictable or planned maneuver. Loss of command and control link between CS and aircraft. There are two types of links:

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

- An uplink which transmits command instructions to the aircraft, and
- A downlink which transmits the status of the aircraft and provides situational awareness to the pilot.

20. Missile. A non-recoverable, powered, guided munition that travels through the air or space.

- Ballistic missiles follow a ballistic trajectory.
- Cruise missiles generate lift.
- Guided missiles are launched from a ship or aircraft and serve as a self-contained precision bomb.

21. Non-Cooperative Aircraft. Aircraft that do not have an electronic means of identification (e.g., a transponder) aboard or that have inoperative equipment because of malfunction or deliberate action.

22. Non-Standard Formation. See Formation.

23. Observer. A trained person who assists a UAS pilot in the duties associated with collision avoidance and navigational awareness through electronic or visual means. (Collision avoidance includes, but is not limited to, avoidance of other traffic, clouds, obstructions, terrain and navigational awareness.) A visual observer (VO) is a trained person who assists the UAS pilot by visual means in the duties associated with collision avoidance. A VO includes the OPA pilot when the OPA is being operated as a UAS.

24. Off-Airport. Any location used to launch or recover aircraft that is not considered an airport (e.g., an open field).

25. Optionally Piloted Aircraft (OPA). An aircraft that can conduct operations as a traditional aircraft with a pilot aboard the aircraft, and can also operate as a UAS when the aircraft is operated and controlled by the CS pilot, allowing the pilot aboard the aircraft to become a qualified observer and remain a PIC. OPA operating as a UAS must meet UAS guidance requirements.

26. Pilot Duty Period. The period beginning when a flightcrew member is required to report for duty, with the intention of conducting a flight, and ending when the aircraft is parked after the last flight. It includes the period of time before a flight or between flights that a pilot is working without an intervening rest period.

27. Pilot-in-Command (PIC)-[UAS]. The person who has final authority and responsibility for the operation and safety of flight, has been designated as PIC before or during the flight, and holds the appropriate category, class, and type rating, if appropriate, for the conduct of the flight. The responsibility and authority of the PIC as described by 14 CFR part 91, § 91.3 apply to the UA PIC. The PIC position may rotate duties as necessary with equally qualified pilots. The individual designated as PIC may change during flight. Note: The PIC can only be the PIC for one aircraft at a time. For OPA, PIC must meet UAS guidance requirements for training, pilot licensing, and medical requirements when operating OPA as a UAS.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

28. Populated or Urban Areas. Areas depicted in yellow on a Visual Flight Rules (VFR) sectional chart or as determined from other sources.

29. Proponent. A person or agency making an application for a Certificate of Waiver or Authorization (COA).

30. Public Aircraft. An aircraft operated by a governmental entity (including Federal, State, or local governments, and the U.S. Department of Defense (DOD) and its military branches) for certain purposes as described in 49 U.S.C. §§ 40102(a)(41) and 40125. Public aircraft status is determined on an operation by operation basis. See 14 CFR part 1, § 1.1 for a complete definition of a public aircraft.

31. Public Operator. An operator that is classified as government and/or otherwise qualifies for public aircraft operation under 49 U.S.C. §§ 40102(a)(41) and 40125. Not all flights by a public aircraft operator qualify as a public aircraft operation under the statute. Public aircraft operation status is not automatic for flights conducted by a government entity or a contractor to a government entity.

32. Rocket. A powered, unguided munitions (DOD); or an aircraft propelled by ejected expanding gases generated in the engine from self-contained propellants and not dependent on the intake of outside substances. It includes any part which becomes separated during the operation (14 CFR).

33. Safety Risk Management (SRM). A formalized, proactive approach to system safety. SRM is a methodology that ensures hazards are identified, risks are analyzed, assessed, and prioritized; and results are documented for FAA decision-makers to transfer, eliminate, accept, or mitigate risk.

34. Scheduled Maintenance (Routine). The performance of maintenance tasks at prescribed intervals.

35. Segregation. Setting apart from other air traffic operations in the NAS. Segregation is not synonymous with required air traffic separation standards. Therefore, segregation does not prescribe or mandate criteria such as vertical, lateral, or longitudinal distances.

36. Shells. Munitions that are fired from a gun whether guided or not.

37. Smart Bomb. Precision-guided munitions.

38. Standard formation. See formation.

39. Supplemental Pilot. Pilots assigned UAS flight duties to augment the PIC. It is common for proponents to have both an internal and an external UAS pilot. The supplemental pilot can assume either of these positions. The supplemental pilot may also assume duties of the PIC if the specified qualifications are met.

40. Torpedoes. Powered munitions that travel through water.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

41. Unmanned Aircraft (UA). A device used or intended to be used for flight in the air that has no onboard pilot. This devise excludes missiles, weapons, or exploding warheads, but includes all classes of airplanes, helicopters, airships, and powered-lift aircraft without an onboard pilot. UA do not include traditional balloons (see 14 CFR part 101), rockets, tethered aircraft and un-powered gliders.

42. Unmanned Aircraft System (UAS). A UA and its associated elements related to safe operations, which may include CSs (ground, ship, or air-based), control links, support equipment, payloads, flight termination systems (FTS), and launch/recovery equipment.

43. Unscheduled Maintenance (Non-Routine). The performance of maintenance tasks when mechanical irregularities occur.

44. Visual Line-of-Sight. Unaided (corrective lenses and/or sunglasses exempted) visual contact between a PIC or a VO and a UAS sufficient to maintain safe operational control of the aircraft, know its location, and be able to scan the airspace in which it is operating to see and avoid other air traffic or objects aloft or on the ground.

APPENDIX D. SAFETY CASE FORMAT

1. **Signature Page.** Include the following information on the signature page:

   - Title: A clear and concise description of the proposed method for AMOC;
   - Originator Information: Originator's name, organization, contact information, etc.;
   - Safety Risk Management Document (SRMD) Information: Safety Case submission date, revision number, etc.

2. **Executive Summary.** The summary should give a general description of the proposed AMOC, including a list of the hazards with associated risk level (high, medium, low) and their corresponding initial and predicted residual risk. Include a high level system description, a summary of how the Safety Case was developed, and what process/method was used to move through the risk assessment process.

3. **Introduction.** Provide a brief reasoning/rationale for the initiative. The scope of the proposed AMOC, whether it is more complex or far-reaching, will determine the need for increased scope and detail of the analysis to be performed.

4. **Section 1.** Current System/System Baseline. Provide a description of the current system or existing procedures as well as the corresponding (operational) system states. If the proposal entails a procedural change, describe the current procedure and its operational environment. If the current system or procedure is unique and has challenges associated with its unique situation, be sure to delineate.

5. **Section 2.** Proposed Change. Provide a description of the proposed change/procedure, identifying which safety parameters are involved.

6. **Section 3.** Safety Risk Management (SRM) Planning and Impacted Organizations. Prior to initiation of the safety analysis, SRM planning is necessary. It is essential to select the appropriate SRM participants, identify the SRM Panel, schedule milestones, and assign tasks and responsibilities. With regard to the organizations that are impacted by the change, describe the method used for collaboration between those organizations during the identification, mitigation, tracking, and monitoring of hazards associated with the change.

7. **Section 4.** Assumptions. If in the process of developing a procedure to validate an AMOC, any assumptions are made to make the evaluation of the change more manageable, clearly define and document them in this section.

8. **Section 5.** Phase 1: System Description. The description of the system/procedure, its operational environment, the people involved/affected by the change/procedure, and the equipment required to accommodate the proposal must be provided.

9. **Section 6.** Phase 2: Identified Hazards. The SRM Panel identifies hazards as a collaborative effort. The tool(s) and technique(s) used to identify hazards should be specified and discussed. The identified hazards are documented as well as their corresponding causes, the corresponding system states considered and the consequent potential outcome. It is important to realize that while identification of the worst credible outcome and the system state in which the worst

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

credible outcome occurs is required, system states with less severe outcomes should not be ignored.

10. Section 7. Phase 3 & 4: Risk Analysis & Risks Assessed. Describe the process used to analyze the risks associated with the identified hazards. Specify what type of data was used to determine the likelihood of risk occurrence (e.g., quantitative or qualitative) as well as the sources of the data. A risk matrix should provide an illustration of the predicted initial/current risk(s) associated with the identified hazards.

11. Section 8. Phase 5: Treatment of Risks/Mitigation of Hazards. If the existing controls and mitigations do not acceptably mitigate the hazards, then additional recommended safety requirements should be identified. An explanation of how the recommended safety requirements are expected to reduce the initial/current risk to an acceptable predicted residual risk level should be included. Low-risk hazards may still warrant recommended safety requirements.

12. Section 9. Tracking and Monitoring of Hazards. Once the proposal has been approved and implemented, tracking of hazards and verification of the effectiveness of mitigation controls throughout the lifecycle of the system or change are required. Also, the methodology for this tracking and monitoring should be outlined.

13. Appendices.

a. Documents Related to the SRMD. Include a list of documents (orders, directives, regulations, handbooks, and manuals) that pertain to the proposed change, which have been consulted in the development of the proposed change and the corresponding safety analysis.

b. Hazard Identification Tools. Provide information on the different tool(s), method(s), and technique(s) used during the safety analysis. (See Figure D-1, for a chart listing acceptable hazard analysis tools and techniques.)

c. Hazard Analysis and Risk Matrix. Depending on the analyses necessary, there might be one or more appendices with analyses. A risk matrix reflecting the initial and predicted residual risks should also be included.

d. Glossary. Include any acronyms and definitions for any terms you listed in the Safety Case.

Figure D-1. Acceptable Hazard Analysis Tools and Techniques

This chart from the ATO Safety Management System Manual, available on the Internet, displays acceptable hazard analysis tools for developing safety cases.

Air Traffic Organization Safety Management System Manual - Version 2.1

Table 3.1: Selection of Hazard Identification and Analysis Tools and Techniques

Tool or Technique	Summary Description	Page in Appendix G
Preliminary Hazard Analysis (PHA)	The PHA provides an initial overview of the hazards present in the overall flow of the operation. It provides a hazard assessment that is broad, but usually not deep.	G-1
Operational Safety Assessment (OSA)	The OSA is a development tool based on the assessment of hazard severity. It establishes how safety requirements are to be allocated between air and ground components and how performance and interoperability requirements might be influenced.	G-3
Comparative Safety Assessment (CSA)	The CSA provides management with a listing of all of the hazards associated with a change, along with a risk assessment for each alternative hazard combination that is considered. It is used to rank the options for decision-making purposes. The CSA's broad scope is an excellent way to identify issues that may require more detailed hazard identification tools.	G-5
Fault Hazard Analysis (FHA)	The FHA is a deductive method of analysis that personnel can use exclusively as a qualitative analysis or, if desired, can expand to a quantitative one. The FHA requires a detailed investigation of the subsystems to determine component hazard modes, causes of these hazards, and resultant effects on the subsystem and its operation.	G-8
Failure Mode and Effect Analysis (FMEA)	The FMEA determines the results or effects of sub-element failures on a system operation and classifies each potential failure according to its severity.	G-9
Failure Modes, Effects, and Criticality Analysis (FMECA)	The FMECA is an essential function in design from concept through development. To be effective, the FMECA is iterative to correspond with the nature of the design process itself. The FMECA identifies component and sub-system failure modes, including the impact of human error; evaluates the results of the failure modes; determines rates and probability; and demonstrates compliance with safety requirements.	G-9
What-If Analysis	The What-If Analysis methodology identifies hazards, hazardous situations, or specific accident events that could produce an undesirable consequence. One can use the What-If Analysis as a brainstorming method.	G-10
Scenario Analysis	The Scenario Analysis identifies and corrects potentially hazardous situations by postulating accident scenarios in cases where it is credible and physically logical.	G-12
Change Analysis	The Change Analysis analyzes the hazard implications of either planned or incremental changes (e.g., operation, equipment, or procedure).	G-13
Cause-Consequence Analysis	The Cause-Consequence Analysis combines the bottom-up and top-down analysis techniques of Event Trees and Fault Trees. The result is the development of potential complex accident scenarios.	G-15

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

Figure D-1. Acceptable Hazard Analysis Tools and Techniques, continued

Air Traffic Organization Safety Management System Manual - Version 2.1

Tool or Technique	Summary Description	Page in Appendix G
Hazard and Operability Tool (HAZOP)	A group uses the HAZOP to analyze hazards of completely new operations and to review the significance of all of the ways that a process element can malfunction or be incorrectly operated. The technique is essentially a structured brainstorming using specific guide words.	G-17
Interface Analysis	One uses the Interface Analysis to discover the hazardous linkages between interfacing systems.	G-18
Accident/Incident Analysis	The Accident/Incident Analysis uses data on recorded hazardous events. One groups these events in various ways according to a pre-established criterion, usually a common cause or outcome. One then identifies the groupings as hazards.	G-19
Job Safety Analysis (JSA)	One uses this technique to assess in detail the safety considerations in a single job or task..	G-20
Energy Trace and Barrier Analysis (ETBA)	The ETBA is highly structured. It documents all energy sources in system. One identifies the energy sources as hazards. One identifies the barrier between the energy sources and the operators, maintainers, and other systems as mitigations.	G-21
Fault Tree Analysis (FTA)	An FTA is a graphical design technique that can provide an alternative to block diagrams. It is a top-down, deductive approach structured in terms of events. One models faults in terms of failures, anomalies, malfunctions, and human errors.	G-22
Management Oversight and Risk Tree (MORT)	One uses the MORT technique to systematically analyze hazards to examine and determine detailed information about the process and accident contributors.	G-24
Human Error Analysis (HEA)	HEA, in a system context, involves assessing each human-machine interface point, decision, or action for the potential for human error to adversely impact system performance or safety of the system and its users. There are a variety of methodologies for conducting these analyses.	G-26
Job Task Analyses (JTA)	The foundation of the performance of HEA is a task analysis, which describes each human task/sub-task within a system in terms of the perceptual (information intake), cognitive (information processing and decision making), and manual (motor) behaviors required of an operator, maintainer, or support person. It should also identify the skills and information required to complete the tasks; equipment requirements; the task setting; time and accuracy requirements; and the probable human errors and consequences of these errors. There are several tools and techniques for performing task analyses, depending on the level of analysis needed.	G-28

APPENDIX E. CONTINGENCY PLANNING LIMITATIONS

1. Point Identification. The proponent must submit contingency plans that address emergency recovery or flight termination of the unmanned aircraft (UA) in the event of unrecoverable system failure. These procedures will normally include Lost Link Points (LLP), Divert/Contingency Points (DCP) and Flight Termination Points (FTP) for each operation. LLPs and DCPs must be submitted in latitude/longitude (Lat/Long) format along with a graphic representation plotted on an aviation sectional chart (or similar format). FTPs or other accepted contingency planning measures must also be submitted in Lat/Long format along with a graphic representation plotted on an aviation sectional chart, or other graphic representation acceptable to the FAA. The FAA accepts the LLPs, DCPs, FTPs, and other contingency planning measures submitted by the proponent, but does not approve them. When conditions preclude the use of FTPs, the proponent must submit other contingency planning options for consideration and acceptance. At least one LLP, DCP, and FTP (or an acceptable alternative contingency planning measure) is required for each operation. The proponent must furnish this data with the initial Certification of Waiver or Authorization (COA) application. Any subsequent changes or modifications to this data must be provided to the Unmanned Aircraft Systems (UAS) Integration Office (AFS-80) for review and consideration no later than 30 days prior to proposed flight operations.

2. Risk Mitigation Plans. For all operations, the proponent must develop detailed plans to mitigate the risk of collision with other aircraft and the risk posed to persons and property on the ground in the event the UAS experiences a lost link, needs to divert, or the flight needs to be terminated. The proponent must take into consideration all airspace constructs and minimize risk to other aircraft by avoiding published airways, military training routes, Navigational Aids (NAVAIDS), and congested areas. In the event of a contingency divert or flight termination, the use of a chase aircraft is preferred when the UAS is operated outside of Restricted or Warning Areas. If time permits, the proponent should make every attempt to utilize a chase aircraft to monitor the aircraft to a DCP or to the FTP. In the event of a contingency divert or flight termination, the proponent will operate in Class A airspace and Special Use airspace to the maximum extent possible to reduce the risk of collision with non-participating air traffic.

a. LLP Procedures.

(1) LLPs are defined as a point, or sequence of points, where the aircraft will proceed and hold at a specified altitude, for a specified period of time, in the event the command and control link to the aircraft is lost. The aircraft will autonomously hold, or loiter, at the LLP until the communication link with the aircraft is restored or the specified time elapses. If the time period elapses, the aircraft may autoland, proceed to another LLP in an attempt to regain the communication link, or proceed to an FTP for flight termination. LLPs may be used as FTPs. In this case, the aircraft may loiter at the LLP/FTP until link is re-established or fuel exhaustion occurs.

(2) For areas where multiple or concurrent UAS operations are authorized in the same operational area, a segregation plan must be in place in the event of a simultaneous lost link scenario. The deconfliction plan may include altitude offsets and horizontal separation by using independent LLPs whenever possible.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

b. DCP Procedures.

(1) A DCP is defined as an alternate landing/recovery site to be used in the event of an abnormal condition that requires a precautionary landing. Each DCP must incorporate the means of communication with air traffic control (ATC) throughout the descent and landing (unless otherwise specified in the Special Provisions) as well as a plan for ground operations and securing/parking the aircraft on the ground. This includes the availability of control stations (CS) capable of launch/recovery, communication equipment, and an adequate power source to operate all required equipment.

(2) For local operations, the DCP specified will normally be the airport/facility used for launch and recovery; however, the proponent may specify additional DCPs as alternates.

(3) For transit and/or mission operations that are being conducted in Class A airspace or Class E airspace above flight level (FL) 600, DCPs will be identified during the flight to be no further than one hour of flight time at any given time, taking into consideration altitude, winds, fuel consumption, and other factors. If it is not possible to define DCPs along the entire flight plan route, the proponent must identify qualified FTPs along the entire route and be prepared to execute flight termination at one of the specified FTPs if a return to base (RTB) is not possible.

(4) It is preferred that specified DCPs are non-joint use military airfields, other government-owned airfields, or private-use airfields. However, the proponent may designate any suitable airfield for review and consideration.

c. Flight Termination Procedures.

(1) Flight termination is the intentional and deliberate process of performing controlled flight into terrain (CFIT). Flight termination must be executed in the event that all contingencies have been exhausted and further flight of the aircraft cannot be safely achieved or other potential hazards exist that require immediate discontinuation of flight. FTPs or alternative contingency planning measures must be located within power-off glide distance of the aircraft during all phases of flight and must be submitted for review and acceptance. The proponent must ensure sufficient FTPs or other contingency plan measures are defined to accommodate flight termination at any given point along the route of flight. The location of these points is based on the assumption of an unrecoverable system failure and must take into consideration altitude, winds, and other factors.

(2) Unless otherwise authorized, FTPs must be located in sparsely populated areas. Except for on- or near-airport operations, FTPs will be located no closer than five nautical miles (NM) from any airport, heliport, airfield, NAVAID, airway, populated area, major roadway, oil rig, power plant, or any other infrastructure. For offshore locations, the proponent must refer to appropriate United States Coast Guard (USCG) charts and other publications to avoid maritime obstructions, shipping lanes, and other hazards. Populated areas are defined as those areas depicted in yellow on a Visual Flight Rules (VFR) sectional chart or as determined from other sources.

UNCONTROLLED COPY WHEN DOWNLOADED
Check with FSIMS to verify current version before using

(a) It is preferred that flight termination occurs in Restricted or Warning Areas, government-owned land, or offshore locations that are restricted from routine civil use. However, the proponent may designate any suitable location for review and consideration.

(b) The proponent is required to survey all designated areas prior to their use as an FTP. All FTPs will be reviewed for suitability on a routine and periodic basis, not to exceed six months. The proponent assumes full risk and all liability associated with the selection and use of any designated FTP.

(c) It is desirable that the proponent receive prior permission from the land owner or using agency prior to designation of this area as an FTP. The proponent should clearly communicate the purpose and intent of the FTP.

(d) For each FTP, plans must incorporate the means of communication with ATC throughout the descent as well as a plan for retrieval/recovery of the aircraft.

(e) Contingency planning must take into consideration all airspace constructs and minimize risk to other aircraft by avoiding published airways, military training routes, NAVAIDS, and congested areas to the maximum extent possible.

(f) In the event of a contingency divert or flight termination, if time permits, the use of a chase aircraft is preferred when the UA is operated outside of Restricted or Warning Areas.

(g) In the event of a contingency divert or flight termination or other approved contingency measures, the proponent will operate in Class A airspace and Special Use airspace to the maximum extent possible to reduce the risk of collision with non-participating air traffic.

MEMORANDUM September 30, 2013

SUBJECT: Alaska Laws Protecting Privacy
(Work Order No. 28-LS0990)

TO: Representative Shelley Hughes
Attn: Ginger Blaisdell

FROM: Kathleen Strasbaugh
Legislative Counsel

You have asked for a review of Alaska's laws protecting individual privacy in preparation for a meeting of the Task Force on Unmanned Aircraft Systems. Among the Task Force's duties is providing written recommendations concerning, among other things, a state policy that protects privacy. 2013 Legislative Resolve No. 17 at 3. To that end, as I understand from Ms. Blaisdell, you would like to know what protections might already exist, with a view toward avoiding duplication of existing law. The Task Force has apparently expressed concern about how information gathered by unmanned aircraft could be used by private or public parties, and what use might be made of such information captured inadvertently.

This memo will outline constitutionally based protections of privacy and identify state statutes that might apply to conduct considered invasion of privacy. As you requested, this memo focuses on the protections afforded under Alaska law. A brief discussion of emerging federal law is included, but I haven't explored other states' case law, nor lower federal court cases that consider these issues. However, I have attached an excerpt of an *Alaska Law Review* which summarizes Alaska's privacy law as it has developed independently of federal constitutional law. I have also attached a recent *Harvard Law Review* article that specifically addresses this topic in great detail. The memo also briefly addresses scenarios set out in your request. Please note that it is very difficult to predict the outcome of litigation in this very new intersection of technology and privacy law.

1. Constitutional Protection of Privacy

The Constitution of the State of Alaska explicitly protects the right of privacy against government (but not private) intrusion. Art. I, sec. 22, provides:

> The right of the people to privacy is recognized and shall not be infringed. The legislature shall implement this section.

This protection, although not unlimited, has been held to be broader than the protection afforded by the United States Constitution. *Woods & Rohde, Inc. v. State, Department of Labor*, 565 P.2d 138, 149 (Alaska 1977).[1] Both the Alaska Constitution and the Fourth Amendment to the United States Constitution require a warrant by a governmental agency for the search of a place where a person has a reasonable expectation of privacy. *Beltz v. State*, 221 P.3d 328, 333, 337 (Alaska 2009) (search of garbage placed out on the street for collection did not require warrant; expectation of privacy found not reasonable.)

Neither the Alaska Supreme Court nor the United States Supreme Court has ruled on whether surveillance by a government operated unmanned aerial vehicle is a search under the Fourth Amendment. Based on available precedent, it is possible that the courts will decide that the use of an unmanned aerial vehicle constitutes a search requiring either a warrant, or the application of a recognized exception to the warrant requirement.

The United States Supreme Court has considered law enforcement or other government agency use of aerial surveillance and the use of technological devices for surveillance purposes. The Court found that surveillance by manned aircraft is not an intrusion into a private area that renders an overflight a search under the Fourth Amendment to the United States Constitution; however the placement of a global positioning device on a person's vehicle is an intrusion that constitutes a search. Here is a brief summary of some of these cases: *United States v. Jones*, 565 U.S. ___, 132 S.Ct. 945 (2012): Attachment of global positioning device to automobile parked in public place is a search under the Fourth Amendment.

Dow Chemical Co. v. United States, 476 U.S. 227 (1986) EPA aerial surveillance and photography of chemical plant is not a search where the aircraft was manned and operating at a lawful altitude.

California v. Ciraolo, 476 U.S. 207 (1986) Manned aerial surveillance of a backyard marijuana grow at lawful altitude did not violate the Fourth Amendment.

The Court might find the use of a technology that exceeds human observational capacity the sort of intrusion that constitutes a search requiring a warrant or an accepted exception:

> Where, as here, the Government uses a device that is not in general public use, to explore details of the home that would previously have been unknowable without physical intrusion, the surveillance is a "search" and is presumptively unreasonable without a warrant.

Kyllo v. United States, 533 U.S. 27, 40 (2001) (internal citations omitted) (thermal

---

[1] In Alaska, the right to privacy extends to protection of such activities as possession and use of marijuana in the home by an adult, which, while not a fundamental right, is protected because such possession and use does not implicate the public welfare in the manner that more harmful substances, or public ingestion, or use by minors might. *Ravin v. State*, 537 P.2d 494, 508-09 (Alaska 1975).

imaging of home from outside a search under the Fourth Amendment).

2. Alaska Statutory protections

There are a handful of criminal statutes that may apply to improper use of images obtained from unmanned aerial vehicle surveillance. These statutes would seem to apply for the most part to private actors. These are offenses that punish conduct that invades the privacy of a victim, and would require proof that images gathered by the unmanned aerial vehicle were disseminated. These offenses would probably not punish capturing the images inadvertently, although collecting and storing them might be a concern.

Alaska Statute	**Charge**	**Penalty**
11.41.270	Stalking in the second degree: nonconsensual conduct prohibited by statute prohibits monitoring by technical means.	Class A misdemeanor[2]
11.61.116	Sending an explicit image of a minor.	(1) class B misdemeanor if the person distributes the image to another person;[3] (2) a class A misdemeanor if the person distributes the image to an Internet website that is accessible to the public.
11.61.120(a)(6)	Harassment in the second degree: publishing or distributing images that show certain body parts or a sexual act.	Class B misdemeanor

[2] A class A misdemeanor is punishable by a fine of up to $10,000, and a sentence of imprisonment up to one year.

[3] A class B misdemeanor is punishable by a fine of up to $2,000, and a sentence of imprisonment up to 90 days.

11.61.123	Indecent viewing or photography (with certain law enforcement and security surveillance exceptions).	(1) class C felony if the person viewed or shown in a picture was, at the time of the viewing or production of the picture, a minor;[4] (2) class A misdemeanor if the person viewed or shown in the picture was, at the time of viewing or production of the picture, an adult.
11.76.113	Misconduct involving confidential information in the first degree: use of confidential information to commit a crime or obtain a benefit to which the person is not entitled to injure another, or deprive another of a benefit.	Class A misdemeanor
11.76.115	Misconduct involving confidential information in the second degree: knowingly and without legal authority obtaining confidential information about another.	Class B misdemeanor

In addition to the above criminal offenses, there are other provisions of law that might bear on the information obtained from data gathered by an unmanned aerial vehicles.

If the data is gathered by a government agency, it is a public record. However, AS 40.25.120 provides certain protections for private information. AS 40.25.120(a)(4) excepts records required by law to be kept confidential. *See Falcon v. APOC*, 570 P.2d 469 (Alaska 1977) (physician not required to disclose identity of certain patients to Alaska Public Offices Commission where the disclosure of the patients' identities might disclose the fact that they were being treated for conditions that patients would normally keep private); *Alaska Wildlife Alliance v. Rue*, 948 P.2d 976 (Alaska 1997) (payroll information may be kept private where disclosure might endanger employees or contractors, where those employees and contractors were threatened with harm). AS 40.25.120(a)(6)(C) protects information gathered by law enforcement the disclosure of which "could reasonably be expected to constitute an unwarranted invasion of the personal privacy of a suspect, defendant, victim, or witness."

---

[4] A Class C felony is punishable by a fine of up to $50,000, and a sentence of imprisonment up to five years. Presumptive sentences based on whether the offense is a first or subsequent offense are set out at AS 12.55.155(e).

There may be civil liability for obtaining (and subsequently misappropriating) information on trade secrets or patented processes. *See, generally.* AS 45.50.

In addition, a person who is subject to surveillance that is unreasonable or unlawful could sue for the tort of invasion of privacy. *Compare Wal-Mart v. Stewart*, 990 P.2d 626, 634 (Alaska 1999) (daily search of employee's bags held an unreasonable invasion of privacy where not part of a random, nondiscriminatory policy, and where the employee feared that refusing the search might result in others suspecting him of theft, or result in a police call or firing).

3. Particular scenarios

Inadvertent capture of evidence of illegal activity. Use of inadvertently captured information in a criminal prosecution may depend on who captures the information, and whether the person whose actions have been captured has a reasonable expectation of privacy. One of the scenarios mentioned in your request is the capture of evidence of poaching. Assuming that the poacher is a person taking game on property that is not the poacher's own, the poacher cannot reasonably expect privacy when present on another's land without authority.

If a law enforcement agency sends out an unmanned aerial vehicle for patrolling or surveillance, perhaps to look for illegal cultivation of marijuana or manufacture of methamphetamine on public land, and in the course of doing so, captures evidence of an industrial sized marijuana grow operation on private land, it might provide grounds to obtain a warrant to explore further.[5] Under Alaska law, if the observation of the event is lawful or in "plain view," the discovery inadvertent, and the incriminating nature of the evidence immediately apparent, a warrant might not be required. *Ahvakana v. State*, 283 P.3d 1284, 1288 (Alaska Ct. App. 2012) (entry into property where evidence found was authorized under the emergency aid exception to the warrant requirement). However, since the vehicle is not manned, the federal authorities discussed above suggest that the information might not be considered to be lawfully obtained unless some other exception to the requirement of a warrant is present. It is not clear to me whether and under what circumstances a court might grant a search warrant to follow up on information inadvertently obtained, but not in "plain view."

It is possible that the inadvertent capture of information that might otherwise be inadmissible under the exclusionary rule that bars admission of evidence obtained in violation of the United States Constitution will be treated as a good faith exception under *United States v. Leon*, 468 U.S. 897(1984). In *Leon*, the United States Supreme Court held that the Fourth Amendment exclusionary rule should not be applied so as to bar the use of evidence obtained by officers acting in reasonable reliance on a search warrant

---

[5] *But see State v. Crocker*, 97 P.3d 93 (Alaska Ct. App. 2004) holding that because the application for the warrant did not affirmatively disclose information that the marijuana cultivation was beyond what was permitted under *Ravin*, there was no probable cause for a warrant.

issued by a detached and neutral magistrate but ultimately found to be invalid. A court could determine that information inadvertently captured in otherwise lawful surveillance is likewise a good faith exception. However, Alaska's appellate courts have not decided whether to adopt this exception. *Deemer v. State*, 244 P.3d 69, 72 (Alaska Ct. App. 2010). Thus it is impossible to predict the outcome of litigation on this subject under Alaska law, and it is not at all clear, given the federal case law developments discussed elsewhere in this memorandum, that the United States Supreme Court would apply the exception in a situation where there was no warrant.

Person intentionally gathers private information for personal use or distribution. A number of the criminal charges listed above might be available. In addition, if the images obtained are used in child pornography, a number of federal and state criminal statutes might apply.

Please advise if you require further assistance in this matter.

CONCLUSION 516

INTRODUCTION

Military aviation experts and model airplane hobbyists have known for decades that an airplane can be flown without a human in the cockpit. Until very recently, however, for most people the very concept of an aircraft was inextricably tied to that of the pilot it was presumed to carry. In the long run, that may turn out to be a historical aberration.

"Drones"—more accurately, unmanned aircraft—will dominate the future of aviation as thoroughly as manned aircraft have dominated its past. In the military the transition is well under way. In 2012, the United States military had close to 6,300 unmanned aircraft systems (UAS)[1] and is training hundreds of

1. UNDER SECRETARY OF DEFENSE FOR ACQUISITION, TECHNOLOGY AND LOGISTICS, DEPARTMENT OF DEFENSE REPORT TO CONGRESS ON FUTURE UNMANNED AIRCRAFT SYSTEMS TRAINING, OPERATIONS, AND SUSTAINABILITY 2 (2012), *available at* http://www.fas.org/irp/program/collect/uas-future.pdf. The

new pilots each year to fly them.[2] Civilian UAS use in the United States is also set to grow rapidly in the wake of a law enacted in February 2012 providing for the integration of unmanned aircraft into the national airspace over the next several years.[3]

UAS can be employed in an endless variety of civilian applications, the overwhelming majority of them beneficial. They can be used, for example, to help rescuers identify people in need of assistance following a natural disaster, or to provide vital overhead imagery to police officers attempting to defuse a hostage standoff. In the commercial world, UAS will be increasingly employed for tasks as diverse as surveying, crop spraying, and traffic congestion monitoring. Scientific applications include air quality assessment, wildlife tracking, and measuring the internal dynamics of violent storms. UAS will also generate a number of economic benefits, both by creating jobs that involve the design and production of UAS and by spurring advances in robotics that will apply well beyond aviation, in fields ranging from manufacturing to surgery.

However, like any technology, UAS can be misused. The most common concern regarding domestic UAS relates to their potential impact on privacy. This is a legitimate concern. Existing laws and jurisprudence provide an important foundation, but they also leave many questions unanswered. And although in some respects UAS simply represent one more manifestation of the always complex intersection between technology and privacy, they are also unique in making it possible, for the first time ever, to easily and inexpensively obtain observations from above.

As Justice Samuel Alito wrote in a concurrence in *United States v. Jones*, the January 2012 Supreme Court ruling that addressed the constitutionality of affixing a GPS tracking device

---

term unmanned aircraft system (UAS) refers to an unmanned aircraft as well as the associated communication and control components used in its operation. FAA Modernization and Reform Act of 2012 (FMRA), Pub. L. No. 112-95, § 331, 126 Stat. 11, 72 (2012). "UAS" is also sometimes expanded as "unmanned aerial system." The term unmanned aerial vehicle (UAV) refers to the aircraft itself. *See, e.g.*, Bart Elias, Pilotless Drones: Background and Considerations for Congress Regarding Unmanned Aircraft Operations in the National Airspace System 1 n. 1 (2012), *available at* http://www.fas.org/sgp/crs/natsec/R42718.pdf.

2. Elisabeth Bumiller, *A Day Job Waiting for a Kill Shot a World Away*, N.Y. TIMES, July 29, 2012, http://www.nytimes.com/2012/07/30/us/drone-pilots-waiting-for-a-kill-shot-7000-miles-away.html.

3. *See* FMRA §§ 331–336, 126 Stat. at 72–78.

to a vehicle without a valid warrant, "[i]n the pre-computer age, the greatest protections of privacy were neither constitutional nor statutory, but practical."[4] Although Justice Alito's statement was directed toward GPS tracking, it has direct relevance to UAS. In comparison with manned aircraft, UAS can be very inexpensive to procure and operate. As the practical barriers to obtaining aerial imagery fall away, the resulting privacy issues take on heightened importance.

This Article considers the constitutional, statutory, and common law frameworks that will inform privacy rights with respect to observations from unmanned aircraft.[5] The potential privacy challenges raised by unmanned aircraft are direct consequences of their capabilities and of the rules governing the manner in which they can be flown. Accordingly, Part I provides the historical context for UAS technology and describes the range of platforms available today. Part II addresses the current regulatory environment in the United States, with particular attention to those provisions of the FAA Modernization and Reform Act of 2012 (FMRA) that relate to UAS.

Part III discusses government operation of unmanned aircraft in light of the Supreme Court's Fourth Amendment jurisprudence. Although the Supreme Court has never specifically ruled on the question of UAS privacy, it has examined the Fourth Amendment implications of aerial surveillance on several occasions. Part III examines those cases in some detail, as well as *Jones*[6] and *Kyllo v. United States*,[7] and the interpretations they suggest with respect to the constitutionality of UAS observations.

Part IV addresses UAS operated by private entities, who are unconstrained by the Fourth Amendment restrictions that apply to the government. Private UAS users will enjoy strong First Amendment protections for gathering information in public spaces. But the rights conferred by the First Amendment are not unbounded, and it does not take much imagination to conclude

7. 533 U.S. 27 (2001).

that paparazzi, stalkers, and others could employ UAS in manners that pose clear violations of privacy. Part IV then explores some of the laws that can be used to address such behavior. Part V considers potential new voluntary and statutory privacy solutions and discusses some of the preemption issues that may arise when non-federal entities attempt to regulate UAS use.

Several overarching conclusions result from the analysis presented in this Article. First, a careful examination of Supreme Court privacy jurisprudence suggests that the Constitution will provide a much stronger measure of protection against government UAS privacy abuses than is widely appreciated. The Fourth Amendment has served us well since its ratification in 1791, and there is no reason to suspect it will be unable to do so in a world where unmanned aircraft are widely used. In addition, there are substantial statutory and common law protections that will limit the ability of non-government entities to violate privacy using unmanned aircraft.

This does not mean that there is no need for additional statutory UAS privacy protections. However, when drafting new laws it is critical to adopt a balanced approach that recognizes the inherent difficulty of predicting the future of any rapidly changing technology. In the early days of the Internet and mobile phones, it would have been nearly impossible to accurately foresee all of the uses—both positive and otherwise—to which these technologies have been applied. It is similarly difficult today to predict exactly how UAS will be used—or even what they will look like—in the coming decades. Although unmanned aircraft pose real and increasingly well recognized privacy concerns, they also offer real and much less widely appreciated benefits. A dialogue conducted with full awareness of this balance will be much more likely to lead to positive policy outcomes.

I. UNMANNED AIRCRAFT SYSTEMS TECHNOLOGY

In addressing UAS privacy, it is important to start with an understanding of the technology, including both the historical context and the range of platforms that exist today. Privacy approaches designed to address only the concerns raised by the larger unmanned aircraft that have dominated much of the current press coverage may be inadequate or inappropriate for unmanned aircraft weighing only a few pounds. And, as is clear from the history of unmanned aircraft, although near-

term predictions regarding emerging aviation technology are feasible, it can be exceedingly difficult to look more than a few years into the future.

A. Historical Context: The Nineteenth and Twentieth Centuries

Unmanned flight has a long history. In fact, early research in unmanned aviation laid some of the critical groundwork that was later used by pioneers in manned aviation,[8] including the Wright Brothers, who achieved sustained manned airplane flight in 1903.[9] As early as the 1830s, William Samuel Henson was exploring the fundamentals of airframe design,[10] and in 1848 John Stringfellow successfully carried out an indoor flight of a steam-powered unmanned airplane with a wingspan of ten feet.[11] In the 1870s Alphonse Penaud demonstrated the use of twisted rubber strands as an energy source for "model"-sized airplanes and helicopters.[12] In 1896, Samuel Pierpont Langley, then Secretary of the Smithsonian Institution, flew an unmanned twin-propeller, steam-engine-powered aircraft with a wingspan of slightly under fourteen feet.[13] The aircraft, called Aerodrome Number 5, was catapult launched from a houseboat on the Potomac River and made two test flights, in each case travelling several thousand feet before landing in the river.[14]

The Sperry Aerial Torpedo, developed during World War I and demonstrated in 1918, was a bomb-equipped biplane that used an on-board timer to shut off the engine and, in theory (it was never actually used in combat), send it diving onto a tar-

get.[15] This was a very early example of "autonomous" flight, in which a UAS is controlled from within the aircraft, without intervention from a human on the ground.

The first unmanned airplane to be successfully flown by radio remote control was a modified N9 Navy seaplane that remained aloft for about twelve minutes during a September 1924 test, sometimes at a distance of several miles from the transmitter held by the pilot on the ground.[16] By the late 1930s, radio-controlled unmanned aircraft had started to gain significant attention in the hobbyist community[17] and in the military. During the ten-year period starting in 1934, the British military purchased hundreds of radio-controlled unmanned "Queen Bee" biplanes to use for target practice;[18] in fact, the term "drone" may have originally arisen to describe the unmanned aircraft used for this purpose.[19]

In the United States, the Radioplane Company was founded in the late 1930s[20] and during World War II built over 15,000 "drones" for the U.S. military to use in training antiaircraft gunners.[21] Radioplane was acquired by Northrop in 1952,[22] and continued to supply the U.S. military with unmanned aerial vehicles including, in the 1950s, models equipped with an on-board film-based camera.[23] Other countries with unmanned aircraft programs in the years during or shortly following World War II included Russia, France, Italy, Germany, and Japan.[24]

In the 1960s, military reconnaissance use of unmanned aircraft became increasingly common. Ryan Aeronautical Company,

which won a contract with the U.S. Air Force in 1948,[25] was a major provider of U.S. military UAS for much of the 1950s and 1960s. Versions of the Ryan Firebee flew thousands of reconnaissance and electronic warfare missions over Vietnam.[26]

The 1970s and 1980s saw continued development of military UAS technology, with the United States, Russia, Canada, Israel, and Europe all possessing active programs.[27] In the conflict with Lebanon in 1982, Israel used a relatively small UAS called the Mastiff to provide reconnaissance imagery,[28] and during the 1991 Gulf War, the U.S. military flew over 500 missions using the Pioneer UAS.[29] The Gnat-750, a precursor to the Predator, was first flown in 1989 and was employed in the mid-1990s to acquire imagery during the conflict in the former Yugoslavia.[30]

B. Unmanned Aircraft Systems Today

Since 2000, worldwide UAS use for both military and civilian applications has increased dramatically. One key factor contributing to this growth is the continuing advance of computing, imaging, and communications technologies. Computational power and storage that would have filled multiple rooms in the 1960s can now easily fit within a single chip. In the context of UAS, this has made it possible to equip even very small platforms with sophisticated on-board computational systems for tasks such as navigation and image processing. The advent of high-resolution, low-cost digital imaging systems, when combined with high-bandwidth communications links, enables high-resolution images and video acquired by an unmanned aircraft to be transmitted in real time to an observer fifty feet—or 5000 miles—away. Thanks to continuing innovations in airframe design and flight control algorithms, the cameras that can be mounted on UAS are becoming smaller and more agile.

The American global positioning system (GPS),[31] which began development in 1973 and was completed in 1995,[32] has also helped to spur UAS growth. GPS makes it possible for UAS to determine their precise location using on-board systems, and therefore to perform missions involving much more complex navigational tasks than could be attempted in the pre-GPS era.[33]

Today, unmanned aircraft come in an incredible variety of shapes and sizes. Some, such as the Global Hawk used by the U.S. military, are as large and nearly as fast as business jets.[34] Others are small enough to fit in a backpack or even the palm of a hand. The video-capable Nano Hummingbird, developed by California-based AeroVironment, weighs only two-thirds of an ounce.[35] The solar-powered QinetiQ Zephyr, which weighs only slightly over 110 pounds despite having a wingspan of about 74 feet, stayed aloft for over two continuous weeks in Arizona during the summer of 2010.[36]

UAS can be controlled during flight in a variety of ways. A pilot on the ground who maintains visual contact with a UAS can fly it using a handheld or computer-based radio remote control interface. Alternatively, or in addition, in a "first-person-view" (FPV) system, a UAS-mounted camera transmits a real-time "cockpit" view to a pilot on the ground who flies

---

the aircraft as if he or she were physically on-board. If the radio link between the UAS and the pilot is sufficiently strong, the UAS can be flown beyond the visual line of sight.

Autonomous flight using information from an on-board GPS receiver to perform navigation without any human intervention can also be used. Many UAS have the capability to operate in multiple modes—for example, navigating semi-autonomously to a destination based on a set of GPS waypoints input by a pilot, who then takes over active control using an FPV system. Of course, what is possible technologically and what is permitted by regulations are two very different things. At present, with very limited exceptions,[37] the Federal Aviation Administration (FAA) does not permit UAS flights in which the operator on the ground is unable to maintain continuous visual contact with the aircraft.

The UAS industry today is large, global, and rapidly growing. According to the Association for Unmanned Vehicle Systems International (AUVSI), the largest international association for unmanned systems, there are now over 400 active manufacturers of UAS globally, including 150 in the United States.[38] Other countries with significant UAS development include Australia, Brazil, Canada, China, France, Germany, India, Iran, Israel, Japan, Pakistan, Turkey, Russia, and the United Kingdom.[39] The Teal Group, an aerospace and defense consultancy based in Virginia, predicts that global annual UAS spending will rise from an estimated $6.6 billion in 2012 to over $11 billion over the next decade, corresponding to a total ten-year expenditure of nearly $90 billion.[40]

Even as overall spending is increasing, per-unit costs for the smaller platforms are dropping. Large military surveillance

---

platforms such as the Global Hawk can cost many tens of millions of dollars or more to purchase[41] and require large teams of highly trained people using specialized equipment to fly.[42] However, there are increasing numbers of highly capable commercially available small UAS that can be purchased for under $1000. It is only a matter of time—and probably not much time—before GPS and video-equipped UAS drop below $100, and then below $10.

UAS can be used in law enforcement, search and rescue, surveying, scientific research, and many other civilian applications. Although many people equate the prospect of law enforcement use of UAS with surveillance, in practice this may be the exception rather than the rule. In this respect, the experience of the Mesa County, Colorado, Sheriff's Office is instructive. Mesa County has one of the only current FAA Certificates of Authorization for operational (as opposed to training) use of UAS.[43] The Mesa County Sheriff's Office has (as of February 2013) flown approximately 40 missions since 2011, and has never used them to perform surveillance.[44] Instead, typical operations have been for obtaining after-the-fact crime scene images, search and rescue, and providing imagery for structure fire suppression and arson investigations. Ben Miller, the Unmanned Aircraft Program Manager in Mesa County, puts the per-hour operating cost of Mesa County's UAS at $25;[45] a manned helicopter, by contrast, costs hundreds of dollars per hour to operate. The dramatically lower operating cost for unmanned aircraft provides a powerful economic incentive for their adoption. In addition, they can be used in circumstances where a manned helicopter would have been too dangerous or disruptive.

In Australia, where certain commercial operations using small unmanned aircraft have been permitted for over ten years,[46] applications have included mining surveys and transportation of equipment to drilling rigs.[47] In Japan, agricultural spraying is often performed using small unmanned helicopters.[48] In the United States, NASA researchers have used UAS for studying Hawaiian volcanoes.[49] UAS are also ideal platforms for identifying wildfire hotspots without putting a human pilot at risk.[50]

II. REGULATORY FRAMEWORK

A. The Federal Aviation Administration

When considering the regulatory framework applicable to UAS in the United States, it is helpful to start by briefly addressing how aircraft operations in general are regulated. The FAA, which was established in 1958 and has been part of the

Department of Transportation since the 1960s,[51] oversees nearly all[52] aircraft operations in the United States.[53] This is a complex task in a national airspace that has an "average of more than 100,000 aviation operations per day, including air carrier, air taxi, general aviation, and military aircraft."[54]

Like other administrative agencies of the United States government, the FAA makes and enforces rules to implement and interpret laws passed by Congress.[55] New rules,[56] such as those to be developed by the FAA to enable the integration of UAS into the airspace, are formulated through a rulemaking process that includes an internal drafting and review stage, publication of a draft rule in the Federal Register, a period of public comment, revisions based on the comments, and publication of a final rule.[57]

54. *Fact Sheet: Unmanned Aircraft Systems (UAS)*, FED. AVIATION ADMIN., http://www.faa.gov/about/initiatives/uas/media/uas_fact_sheet.pdf (last visited Jan. 28, 2013) [hereinafter *Fact Sheet*].

55. Formally, a "rule" is "the whole or a part of an agency statement of general or particular applicability and future effect designed to implement, interpret, or prescribe law or policy. . . ." Administrative Procedure Act § 1, 5 U.S.C. § 551(4) (2012).

56. FAA "rules" are also called "regulations." *See, e.g.*, 49 U.S.C. § 40103 (directing that the Administrator of the FAA promulgate "regulations" governing the flight of aircraft).

57. There are actually various forms of rulemaking in accordance with the Administrative Procedure Act, which was enacted in 1946. The steps described in the text (and provided in 5 U.S.C. § 553) occur in association with what is referred to as informal rulemaking, which is by far the most common form. There is also a formal rulemaking process under 5 U.S.C. §§ 556–557 that includes a hearing and

FAA regulations[58] classify aircraft, without regard to whether they are manned, as either "public"[59] or "civil."[60] Public aircraft are those operated by local, state, and federal public entities, including law enforcement agencies.[61] Civil aircraft, typically, are operated by private companies, individuals, and other non-government entities. The public-civil distinction is extremely important both generally and with respect to UAS.

B. The FAA and Unmanned Aircraft Systems

On February 14, 2012, President Obama signed the FAA Modernization and Reform Act of 2012 (FMRA)[62] into law. FMRA provides, among other things, a set of overlapping deadlines for the integration of UAS into the national airspace over the next three years.[63] Although UAS integration has been on the proverbial radar screen of the FAA for a number of years, FMRA represents the first significant congressional legislation addressing the domestic use of UAS.

---

a number of other steps. RAYMOND C. SPECIALE, FUNDAMENTALS OF AVIATION LAW 124–25 (2006).

58. FAA regulations are provided in the Code of Federal Regulations (CFR), Title 14 ("Aeronautics and Space"), Volumes 1–3, which comprise parts 1–199 (not all of the numbers in this range are currently used). "General Operating and Flight Rules" for aircraft are found in Volume 2, Subchapter F ("Air Traffic and General Operating Rules"), Part 91, denoted 14 C.F.R. § 91 and sometimes referred to as FAR Part 91. FAR is an acronym for "Federal Aviation Regulations." "General Definitions" are in 14 C.F.R. § 1.1. An unofficial version of the CFR is provided through the Electronic Code of Federal Regulations (e-CFR) by the government at http://ecfr.gov.

59. Section 331(4) of the FAA Modernization and Reform Act provides that "[t]he term 'public unmanned aircraft system' means an unmanned aircraft system that meets the qualifications and conditions required for operation of a public aircraft . . . ." FAA Modernization and Reform Act of 2012 (FMRA), Pub. L. No. 112-95, § 331, 126 Stat. 11, 72 (2012). The term "public aircraft" is defined in 49 U.S.C.A. § 40102(a)(41) (2012), as well as in 14 C.F.R. § 1.1 (2012).

60. *See* 49 U.S.C. § 40102(a)(16).

61. *See* § 40102(a)(41). Whether an aircraft has "public aircraft status" depends, in part, on how it is being used. An aircraft that is owned by a government entity but engaged in an operation that replicates a service that could be obtained from a commercial air carrier does not have public aircraft status during that operation. As used in this Article, "public aircraft" and "government aircraft" refer to aircraft that satisfy the statutory qualifications for public aircraft status under § 40125.

62. Pub. L. No. 112-95, 126 Stat. 11 (2012).

63. *Id.* §§ 331–336, 126 Stat. at 72–78.

Recognizing that UAS raise unique issues that "may differ substantially from manned aircraft operations and systems,"[64] the FAA created a new Unmanned Aircraft Program Office in early 2006.[65] In accordance with policies established well before the enactment of FMRA, operators of UAS engaged in public aircraft operations are required to obtain a Certificate of Authorization (COA).[66] Civil (i.e. private) UAS operators need a "special airworthiness certificate."[67] Use of UAS for commercial purposes is currently prohibited,[68] though that is expected to change by 2014.

According to data released in early 2012 in response to a Freedom of Information Act lawsuit filed by the Electronic Frontier Foundation, the FAA had issued "about 700–750 authorizations since the program began in 2006," of which approximately 300 remained active as of April 2012.[69] Public entities that have been issued COAs include the U.S. Air Force,

64. James Sizemore & Richard Posey, Fed. Aviation Admin., Unmanned Aircraft Systems (UAS) Certification Status 2 (2006), *available at* http://www.faa.gov/about/initiatives/uas/reg/media/uas_policyupdate.pdf.

65. *Id.* at 1.

66. *See* DEP'T. OF TRANSP., UNMANNED AIRCRAFT OPERATIONS IN THE NATIONAL AIRSPACE SYSTEM, DOCKET NO. FAA-2006-25714 (2007), *available at* http://www.faa.gov/about/initiatives/uas/reg/media/frnotice_uas.pdf. In addition to "Certificate of Authorization," COA is sometimes written in expanded form as "Certificate of Waiver or Authorization" or "Certificate of Authorization or Waiver." *See id.* An exception to the COA requirement is MARSA airspace. *See supra* note 52.

67. *See* 14 C.F.R. § 21.175 (2012). Although model aircraft are obviously unmanned, provided that they are flown for hobby or recreational use, they are not treated as "civil UAS" by the FAA. *See* ADVISORY CIRCULAR 91-57, *supra* note 52; FMRA § 336, 126 Stat. at 77.

68. Even though this prohibition is not explicit with respect to UAS, it is implicit in the list, provided in 14 C.F.R. § 21.191, of purposes for which experimental certificates can be issued. To date, special airworthiness certificates have been issued only in the experimental category. *Fact Sheet, supra* note 54, at 146 ("An SAC-EC is the only certification means available to civil operators for UAS and optionally-piloted aircraft (OPA)."). "SAC" is an acronym for special airworthiness certificate. The list in § 21.191 includes purposes such as "[r]esearch and development," "[a]ir racing," and "[c]rew training," but not commercial use. In addition, 14 C.F.R. § 91.319, which describes operating limitations for aircraft having experimental certificates, provides, among other things, that "[n]o person may operate an aircraft that has an experimental certificate—(1) For other than the purpose for which the certificate was issued; or (2) Carrying persons or property for compensation or hire."

69. Jennifer Lynch, *FAA Releases Lists of Drone Certificates—Many Questions Left Unanswered*, ELECTRONIC FRONTIER FOUNDATION, https://www.eff.org/deeplinks/2012/04/faa-releases-its-list-drone-certificates-leaves-many-questions-unanswered.

U.S. Army, the Defense Advanced Research Projects Agency (DARPA), FBI, NASA, some county and municipal law enforcement agencies, and various public universities.[70] The list of companies that have been issued special airworthiness certificates includes Raytheon, Honeywell, General Atomics, and other defense companies.[71]

COAs specify where and under what circumstances a UAS can be used. For example, a COA might require that the UAS only be flown during daylight hours, and only within the visual line of sight of the operator.[72] In the case of a UAS operated by a law enforcement agency, the COA might specify that flights must be performed only for training, as opposed to operational, purposes. In early 2008, the FAA began the process of developing recommendations for regulating "small" UAS (those weighing under fifty-five pounds).[73] Thus, by the time FMRA was signed into law in February 2012, the FAA had already been actively planning for UAS integration for several years.

FMRA sets a goal of integrating UAS into the national airspace system by late 2015.[74] Under the new law, public UAS operators have had access to expedited COAs since May 14, 2012.[75] UAS under these authorizations must weigh no more than twenty-five pounds[76] and be operated within the line of sight of the op-

75. *See id.* § 334(c), 126 Stat. at 76.

76. *FAA Makes Progress with UAS Integration*, FED. AVIATION ADMIN., http://www.faa.gov/news/updates/?newsId=68004 (last visited Jan. 28, 2012). Interestingly, with respect to weight, the FAA went further than was required by

erator, less than 400 feet above the ground, and during daylight conditions.[77] By December 31, 2015, the FAA is required to "develop and implement operational and certification requirements for the operation of public unmanned aircraft systems in the national airspace system by September 30, 2015."[78]

For civil UAS, FMRA mandates the development of a "comprehensive plan" that will "provide for the safe integration of civil unmanned aircraft systems into the national airspace."[79] Additionally, regulations for the operation of small civil UAS (including allowing their use for commercial purposes) are due by August 2014.[80]

The FAA is in somewhat of a unique position with respect to deadlines laid out in legislation such as FMRA. FMRA requires that the FAA "provide for the safe integration of civil unmanned aircraft systems into the national airspace system as soon as practicable, but not later than September 30, 2015."[81] This language contains no explicit provision for what happens if, in the FAA's view, "as soon as practicable" is later than that date. However, Congress is unlikely to hold the FAA to a deadline that might risk jeopardizing airspace safety.

C. *The Impact of Safety Regulations on Privacy*

Though privacy and airspace safety are distinct UAS issues, they are in some respects closely intertwined. By placing limitations on where and how unmanned aircraft can be operated, airspace safety regulations can impact privacy.

For example, under the FAA regulations that prescribe "flight rules governing the operation of [both manned and un-

---

FMRA, which provided that the authorizations must "allow a government public safety agency to operate unmanned aircraft weighing 4.4 pounds or less." FMRA § 334(c)(2)(C), 126 Stat. at 77.

77. These requirements are among those provided in FMRA § 334(c)(2)(C). Additional requirements in this Section restrict operation to Class G (uncontrolled) airspace more than five miles from airports and other locations with aviation activities. *See id.*

78. *Id.* § 334(b), 126 Stat. at 76.

79. *Id.* § 332(a)(1).

80. *Id.* § 332(b)(1).

81. *Id.* § 332(a)(3).

manned] aircraft within the United States,"[82] it is illegal to operate an aircraft "in a careless or reckless manner so as to endanger the life or property of another."[83] Aircraft must also be operated at a sufficiently high altitude to allow "an emergency landing without undue hazard to persons or property on the surface" in the event of an engine failure.[84] Compliance with these rules, which apply to both manned and unmanned aircraft,[85] could be called into question, for example, in the monitoring of a peaceful protest if a UAS is flown (either by law enforcement or by a protester) at very low altitudes directly above a crowd of people.[86]

The tie between safety and privacy is tightest with respect to rules requiring the operator of a UAS to be able to see the aircraft at all times. Public UAS operated in association with the expedited authorizations in Section 334(c)(2)(C) of FMRA have a "line of sight" requirement.[87] The rules for civil small UAS due for implementation in August 2014 likely will also have this constraint. From the FAA's standpoint, any such requirement would be solely motivated by safety concerns related to the need to "sense and avoid" other aircraft and to problems that might arise if a UAS beyond the line of sight loses communication with its operator.[88] But there are privacy consequences as well.

It is easy for an operator standing on the street in front of a house to fly a UAS high enough to obtain overhead images of a fenced-in backyard while maintaining visual contact with the

---

82. Subpart B of part 91 applies to "the operation of aircraft within the United States and within 12 nautical miles from the coast of the United States." 14 C.F.R. § 91.101 (2012).

83. 14 C.F.R. § 91.13(a).

84. 14 C.F.R. § 91.119(a).

85. *See* 14 C.F.R. § 91.1(a) (stating that part 91 "govern[s] the operation of aircraft . . . within the United States.").

86. *See* 14 C.F.R. § 91.13(a).

87. FMRA § 334(c)(2)(c).

88. *See Fact Sheet*, *supra* note 54, at 2. Not everyone in the unmanned aviation community is in agreement regarding the safety value of a line of sight requirement. Opponents of such a requirement could argue, among other things, that a UAS beyond the visual line of sight that loses communication with an operator can be programmed to land itself safely. Opponents could also argue that even if a UAS is within visual line of sight, if the ability of the operator to communicate with it is lost, being able to see it does little to mitigate any resulting risks. Nonetheless, this is an area in which regulators are likely to act very conservatively.

aircraft. It is far harder, by contrast, to maintain visual line of sight while lowering the UAS into the yard to obtain eye-level images through the back windows of the house. Thus, the questions of if, when, and under what circumstances non-visual line of sight operation will be permitted will have an impact on privacy.[89]

Even assuming that FAA regulations adopted in the next several years continue to require visual line of sight operation, in the longer term this requirement is likely to be relaxed for some specific classes of UAS operations. Some of the most promising applications of UAS, by their very nature, require non-visual line of sight operation. For example, UAS have enormous potential for search and rescue in large part because they can enable an operator to quickly and safely examine many square miles of potentially inhospitable terrain. Surveying of pipelines, long-distance electric transmission lines, and other extended structures can also entail large separations between an operator and a UAS. As "sense and avoid" technologies become more mature, these sorts of non-line of sight operations may eventually be permitted. This will expand ways in which a UAS flown in compliance with FAA regulations might be used to violate privacy.

III. GOVERNMENT UNMANNED AIRCRAFT AND THE FOURTH AMENDMENT

The Fourth Amendment is central to the privacy issues with respect to government UAS operation. Although the Supreme Court has never explicitly considered the question of UAS privacy, there is a long list of relevant precedents.[90] Among them

89. The term "line of sight" is more complex than it first appears. Some people in the UAS community use "line of sight" to refer to operation in which a radio signal can be transmitted directly from an operator to a UAS, without being relayed through a satellite, other aircraft, or ground-based communications network (sometimes also called "electronic line of sight"). This does not ensure that the operator can necessarily see the UAS, as radio signals can easily pass through trees and other objects, sometimes traveling for miles. The term "*visual* line of sight," by contrast, is unambiguous: The operator must be able to see, with his or her eyes, the UAS.

90. In addition to the cases discussed at greater length in Part III of this Article, see, e.g., City of Indianapolis v. Edmond, 531 U.S. 32 (2000), Minnesota v. Carter, 525 U.S. 83 (1998), United States v Karo, 468 U.S. 705 (1984), Oliver v. United States, 466 U.S. 170 (1984), United States v. Knotts, 460 U.S. 276 (1983), Steagald v.

are several cases from the 1980s that specifically considered aerial observations and the Fourth Amendment. The 2001 *Kyllo v. United States*[91] and 2012 *United States v. Jones*[92] decisions are also pertinent.

A. Dow Chemical Co. v. United States

In 1978, the Environmental Protection Agency, without Dow Chemical's consent, contracted with a commercial aerial photographer to provide images of a 2000-acre Dow Chemical manufacturing facility from altitudes of 1200, 3000, and 12,000 feet.[93] When Dow Chemical became aware of this, it filed suit in Federal District Court, which granted summary judgment, finding the aerial photography to be a search in violation of the Fourth Amendment.[94] The Sixth Circuit reversed the decision, ruling that even though the company had taken precautions, including installing a perimeter fence and alarm system[95] that provided a subjective expectation of privacy from ground-level intrusions, it did not have such an expectation with respect to aerial surveillance.[96] Thus, the Sixth Circuit concluded, the acquisition of aerial images without a warrant was not a Fourth Amendment search.[97]

In reviewing this ruling on certiorari, the Supreme Court affirmed the Sixth Circuit's decision, concluding in a 1986 ruling that the open areas in the 2000-acre industrial facility were more akin to an "open field"[98] than to the curtilage of a home,

98. The Court wrote that "open fields do not provide the setting for those intimate activities that the [Fourth] Amendment is intended to shelter from governmental interference or surveillance" and that "an individual may not legitimately demand privacy for activities out of doors in fields, except in the area immedi-

and, as a result, were "open to the view and observation of persons in aircraft lawfully in the public airspace immediately above or sufficiently near the area for the reach of cameras."[99] The Court also noted the role of technology diffusion as a factor, writing that "surveillance of private property by using highly sophisticated surveillance equipment not generally available to the public, such as satellite technology, might be constitutionally proscribed absent a warrant."[100] However, the Court observed, "[a]ny person with an airplane and an aerial camera could readily duplicate"[101] the photographs at issue. "[T]he taking of aerial photographs of an industrial plant complex from navigable airspace is not a search prohibited by the Fourth Amendment."[102]

B. California v. Ciraolo

Ciraolo[103] was decided in 1986, on the same day as *Dow Chemical*. On September 2, 1982, police in Santa Clara, California, received a tip regarding backyard marijuana cultivation.[104] After finding the yard surrounded by high fencing obscuring the view from the street, they obtained a small airplane and flew over the residence at 1000 feet.[105] The officers on the airplane observed and photographed what they concluded to be marijuana plants growing in the backyard.[106] This evidence was used to obtain a search warrant to seize the plants.[107]

The Supreme Court granted certiorari after the California Court of Appeal ruled that the warrantless aerial observations violated the Fourth Amendment.[108] In May 1986, the Supreme Court issued a five-to-four decision reversing the lower court.[109] Writing for the majority, Chief Justice Burger framed

109. *Ciraolo*, 476 U.S. at 215.

the analysis in terms of the "reasonable expectation of privacy"[110] articulated in Justice Harlan's concurrence in *Katz*.[111] For an expectation of privacy to be "reasonable" under *Katz*, two separate criteria must be satisfied. First, the person must "have exhibited an actual (subjective) expectation of privacy."[112] Second, the expectation must "be one that society is prepared to recognize as 'reasonable.'"[113]

With respect to the first criterion, the *Ciraolo* Court wrote that although the presence of fences clearly conveyed a "desire to maintain privacy," and indeed successfully did so with respect to "normal sidewalk traffic," the marijuana plants might well have been visible from a truck or two-level bus.[114] Thus, it was unclear that the respondent had "a subjective expectation of privacy from all observations of his backyard."[115]

With respect to the second criterion, the Court did not dispute that the backyard was in the curtilage of the home,[116] but noted that police observations of curtilage are not necessarily unconstitutional. "The Fourth Amendment protection of the home has never been extended to require law enforcement officers to shield their eyes when passing by a home on public thoroughfares."[117] Moreover, "the mere fact that an individual has taken measures to restrict some views of his activities [does not] preclude an officer's observations from a public vantage

110. *Id.* at 211.

111. Katz v. United States, 389 U.S. 347, 360 (1967) (Harlan, J., concurring).

112. *Id.* at 361.

113. *Id.* Much turns on the interpretation of "reasonable." For example, in *Illinois v. Caballes*, the Supreme Court explained that "the expectation 'that certain facts will not come to the attention of the authorities' is not the same as an interest in 'privacy that society is prepared to consider reasonable.'" 543 U.S. 405, 408–09 (2005) (quoting United States v. Jacobsen, 466 U.S. 109, 122 (1984)). In *Caballes*, the Court also distinguished between legitimate privacy expectations with respect to lawful, as opposed to unlawful, activity: "The legitimate expectation that information about perfectly lawful activity will remain private is categorically distinguishable from respondent's hopes or expectations concerning the nondetection of contraband in the trunk of his car." *Id.* at 410.

114. *Ciraolo*, 476 U.S. at 211.

115. *Id.* at 211–12.

116. *See, e.g.*, Oliver v. United States, 466 U.S. 170, 180 (1984) ("Thus, courts have extended Fourth Amendment protection to the curtilage; and they have defined the curtilage, as did the common law, by reference to the factors that determine whether an individual reasonably may expect that an area immediately adjacent to the home will remain private.").

117. *Ciraolo*, 476 U.S. at 213.

point where he has a right to be and which renders the activities clearly visible."[118] Because the observations were made from "public navigable airspace . . . in a physically nonintrusive manner," the respondent's expectation of privacy from such aerial observations was not one "that society is prepared to honor."[119] The Court concluded that "[i]n an age where private and commercial flight in the public airways is routine, it is unreasonable for respondent to expect that his marijuana plants were constitutionally protected from being observed with the naked eye from an altitude of 1,000 feet."[120]

The dissent, delivered by Justice Powell, criticized the Court's reliance on the absence of a "physical invasion of the curtilage" in finding no constitutional violation: "Since *Katz*, we have consistently held that the presence or absence of physical trespass by police is constitutionally irrelevant to the question whether society is prepared to recognize an asserted privacy interest as reasonable."[121] The dissent also disagreed with the Court's view that conducting an overflight with the specific goal of enabling trained officers to observe a suspect's backyard raised no more constitutional questions than overflights by members of the flying public: "[T]he actual risk to privacy from commercial or pleasure aircraft is virtually nonexistent. Travelers on commercial flights, as well as private planes used for business or personal reasons, normally obtain at most a fleeting, anonymous, and nondiscriminating glimpse of the landscape and buildings over which they pass."[122] And, in an observation that would foreshadow the *Kyllo* decision fifteen years later, Justice Powell warned that "[r]apidly advancing technology now permits police to conduct surveillance in the home itself, an area where privacy interests are most cherished in our society, without any physical trespass."[123]

C. Florida v. Riley

Just under three years after *Ciraolo*, the Supreme Court once again ruled on the constitutionality of aerial observations of a home's curtilage by law enforcement. Like *Ciraolo*, *Florida v. Riley*[124] arose from a tip involving marijuana cultivation behind a house, where the plants could not be seen from the street. In *Riley*, the observations were made from a helicopter at 400 feet, enabling officers to see the plants through openings in the roof and sides of a greenhouse located behind a mobile home.[125] A majority of the justices in *Riley* found these observations constitutional.

Writing for the plurality,[126] Justice White wrote that "our decision in *California v. Ciraolo* controls this case."[127] While Riley took steps that "protected against ground-level observation," "the sides and roof of his greenhouse were left partially open" and "what was growing in the greenhouse was subject to viewing from the air."[128] "Any member of the public could legally have been flying over Riley's property in a helicopter at the altitude of 400 feet and could have observed Riley's greenhouse. The police officer did no more."[129]

Despite Justice White's statement that "[w]e would have a different case if flying at that altitude had been contrary to law or regulation,"[130] his opinion also provided an important qualifier: "This is not to say that an inspection of the curtilage of a house from an aircraft will always pass muster under the Fourth Amendment simply because the plane is within the navigable airspace specified by law."[131] Specifically, in ruling that there was no violation of the Fourth Amendment in the present case, Justice White found it of note that "no intimate

---

124. 488 U.S. 445 (1989).

125. *Id.* at 448.

126. The *Riley* decision comprised an opinion delivered by Justice White and joined by Chief Justice Rehnquist and Justices Scalia and Kennedy; an opinion from Justice O'Connor concurring in the judgment; a dissent from Justice Brennan joined by Justices Marshall and Stevens; and a separate dissent filed by Justice Blackmun. Thus, even though there was no majority opinion, a majority of the Justices found the observations constitutional.

details connected with the use of the home or curtilage were observed, and there was no undue noise, and no wind, dust, or threat of injury."[132]

In her opinion concurring in the judgment, Justice O'Connor raised concerns about relying on "compliance with FAA regulations alone" as a litmus test for privacy from overhead surveillance.[133] Rather, she wrote, "consistent with *Katz*, we must ask whether the helicopter was in the public airways at an altitude at which members of the public travel with sufficient regularity that Riley's expectation of privacy from aerial observation was not 'one that society is prepared to recognize as reasonable.'"[134] She then concluded that because there is "considerable public use of airspace at altitudes of 400 feet and above," Riley did not have a reasonable expectation of privacy from naked-eye observations from that altitude.[135] However, she wrote, "public use of altitudes lower than that—particularly public observations from helicopters circling over the curtilage of a home—may be sufficiently rare that police surveillance from such altitudes would violate reasonable expectations of privacy, despite compliance with FAA air safety regulations."[136]

Justice Brennan's dissent also took issue with the tie between FAA safety regulations and privacy: "It is a curious notion that the reach of the Fourth Amendment can be so largely defined by administrative regulations issued for purposes of flight safety."[137] He observed that the police officer's "ability to see over Riley's fence depended on his use of a very expensive and sophisticated piece of machinery to which few ordinary citizens have access."[138] The question, in Justice Brennan's view, was not whether the flights were in compliance with the FAA regulations, "but whether public observation of Riley's curtilage was so commonplace that Riley's expectation of privacy in his backyard could not be considered reasonable."[139] And while privately owned helicopters occasionally fly over populated areas

at 400 feet, "such flights are a rarity."[140] Justice Blackmun's dissent also cited the rarity of helicopter overflights at 400 feet and stated that for any observations below 1000 feet (the altitude of the fixed-wing aircraft in *Ciraolo*), the prosecution should have the burden of proving that a suspect whose curtilage was observed lacked a reasonable expectation of privacy.[141]

D. Kyllo v. United States

Although *Kyllo*[142] involved ground-based observations of a home, the case is nonetheless highly relevant to privacy from aerial observations; in fact, *Ciraolo* was invoked multiple times in the Court's 2001 *Kyllo* opinion. In January 1992, a government agent in a car used a thermal imaging device to measure the external temperature of the roof and outside wall of the home of Danny Lee Kyllo, who was suspected of growing marijuana.[143] The roof and wall were found to be abnormally warm, and a search warrant was issued based in part on this information.[144] Upon execution of the search warrant, marijuana plants were found and Kyllo was arrested.[145] A district court and the Ninth Circuit upheld the use of the thermal imager, in part on the grounds that it "merely indicated amorphous 'hot spots' on the roof and exterior wall and not the detailed images of private activity."[146]

The Supreme Court reversed the Ninth Circuit in a five-to-four opinion delivered by Justice Scalia.[147] The Court framed its analysis by noting that "well into the 20th century, our Fourth Amendment jurisprudence was tied to common-law trespass."[148] More recent rulings have "decoupled violation of a person's Fourth Amendment rights from trespassory violation of his property, but the lawfulness of warrantless visual surveillance of a home has still been preserved."[149] However, with

respect to searches of the interior of a home, "there is a ready criterion, with roots deep in the common law, of the minimal expectation of privacy that *exists*, and that is acknowledged to be *reasonable*."[150]

The Court expressed concern that allowing the government to freely collect any information "emanating from a house" would put people "at the mercy of advancing technology—including imaging technology that could discern all human activity in the home."[151] The Court also noted that "[w]hile the technology used in the present case was relatively crude, the rule we adopt must take account of more sophisticated systems that are already in use or in development."[152] The Court then concluded that when "the Government uses a device that is not in general public use, to explore details of the home that would previously have been unknowable without physical intrusion, the surveillance is a 'search' and is presumptively unreasonable without a warrant."[153]

In dissent, Justice Stevens criticized the Court for, in his view, failing to follow established principles providing that searches inside a home are presumptively unreasonable, while searches of property "in plain view" are not.[154] Justice Stevens also wrote that "any member of the public might notice that one part of a house is warmer than another part or a nearby building if, for example, rainwater evaporates or snow melts at different rates across its surfaces," and that "[h]eat waves, like aromas that are generated in a kitchen, or in a laboratory or opium den, enter the public domain if and when they leave a building."[155] Justice Stevens also criticized the Court's use of a standard that would diminish privacy protection as "intrusive equipment becomes more readily available."[156] Indeed, in the decade following *Kyllo*, thermal imagers have become less ex-

pensive and more widely available. Writing in 2010, Orin Kerr observed that "remote infrared temperature-sensing has become quite common in a wide range of applications" and "it seems to me that there's at least a plausible case that the police can now use thermal imaging devices—or at least the simple single-point infrared devices—without a warrant."[157]

E. United States v. Jones

The most recent major Supreme Court privacy ruling is *United States v. Jones*,[158] decided in January 2012. In September 2005, agents on a joint FBI and Metropolitan (Washington D.C.) Police Department task force installed, without a valid warrant,[159] a GPS tracking device on a vehicle used by a suspect in a narcotics investigation.[160] The GPS tracker collected location data for approximately one month, and was used to place the suspect, Antoine Jones, at a house at a date and time where drug sales allegedly occurred.[161] After two trials in the United States District Court for the District of Columbia (the first ended in a mistrial), Jones and another defendant were convicted on a drug conspiracy charge.[162]

On appeal, Jones' conviction was overturned.[163] While noting that a person's reasonable expectation of privacy is highest in his or her home, the District of Columbia Circuit Court of Appeal recognized that "[a] person does not leave his privacy behind when he walks out his front door . . . . On the contrary, in *Katz* the Court clearly stated 'what [one] seeks to preserve as private, even in an area accessible to the public, may be constitutionally

protected.'"[164] In using the warrantless GPS tracker to discover "the totality and pattern of his movements," the court concluded that the government violated the Fourth Amendment.[165]

The Supreme Court granted the government's petition of certiorari.[166] The Court's January 2012 decision was unanimous in finding the government's actions unconstitutional, but the Justices widely diverged in the bases for that finding. The majority opinion, delivered by Justice Scalia, found a Fourth Amendment violation in the physical trespass that occurred during the placement of the GPS device on the vehicle.[167] That intrusion, wrote Justice Scalia, "would have been considered a 'search' within the meaning of the Fourth Amendment when it was adopted."[168] The Court acknowledged that extended electronic surveillance "without an accompanying trespass" may be unconstitutional, but noted that the "present case does not require us to answer that question."[169]

In his opinion concurring in the judgment, Justice Alito criticized "the Court's reliance on the law of trespass" to decide the case.[170] Instead, he wrote, the question is whether the "respondent's reasonable expectations of privacy were violated by the long-term monitoring" of his vehicle.[171] Because "law enforcement agents tracked every movement that respondent made in the vehicle he was driving" for four weeks—a level of monitoring that Justice Alito felt impinged on reasonable expectations of privacy—Justice Alito concluded that the monitoring constituted a search.[172] Justice Sotomayor, in addition to joining the majority, provided a separate concurring opinion arguing that "the trespassory test . . . reflects an irreducible constitutional minimum."[173] Justice Sotomayor also expressed concern that the unchecked abil-

ity of the government to conduct long-term monitoring of "the sum of one's public movements" could enable it to obtain private information regarding political and religious beliefs.[174]

F. Privacy and Unmanned Aircraft Systems in Light of Supreme Court Jurisprudence

In *Ciraolo*, *Riley*, and *Kyllo*, the Supreme Court expressed a view that the extent to which an expectation of privacy is "reasonable" is tied, at least in part, to the level of technology diffusion. In addition, with respect to the specific question of the constitutionality of aerial observations, in *Ciraolo*, *Riley*, and *Dow Chemical*, the Court considered the use of public navigable airspace to be important, though not necessarily determinative. In those three rulings the Court also explicitly or implicitly distinguished overhead observations made using the naked eye or widely available camera technology from those made using less common imaging systems. For UAS privacy, these three tests—whether a technology is in general public use, whether the observations are made from public navigable airspace, and the nature of the imaging (or other information-gathering) system—will play fundamental roles.

Jones is most relevant to UAS in relation to extended surveillance. Today, tethered blimps called "aerostats" are being stationed in the sky in some places along the U.S.-Mexico border.[175] In addition, in the future, it will become practical to utilize fixed-wing unmanned aircraft for long-term surveillance. Thus, the types of constitutional questions considered (though not resolved) in *Jones* have direct implications for some categories of UAS.

---

174. *Id.* at 956.

175. Kathleen Hickey, *Former wartime blimp refitted for border surveillance*, GOV'T COMPUTER NEWS, Aug. 16, 2012, http://gcn.com/Articles/2012/08/16/CBP-aerostats-unmanned-blimps-border-surveillance.aspx.The government has increased search powers near the border. For example, within twenty-five miles of "any external boundary of the United States," 8 U.S.C. § 1357(a)(3) allows the government, without a warrant, "to have access to private lands, but not dwellings, for the purpose of patrolling the border to prevent the illegal entry of aliens into the United States."

1. *Technology in "General Public Use"*

In *Dow Chemical*, the Supreme Court wrote that warrantless "surveillance of private property by using highly sophisticated surveillance equipment *not generally available to the public*" may be unconstitutional.[176] But the Court also noted that the "photographs at issue in this case are essentially like those commonly used in mapmaking. Any person with an airplane and an aerial camera could readily duplicate them."[177]

In the *Ciraolo* ruling issued on the same day, the Court concluded that in an era when private and commercial flight is "routine," there is no reasonable expectation of privacy from naked-eye observations made from public navigable airspace.[178] The *Ciraolo* Court stopped short of stating whether or not similar overhead observations made using non-routine aircraft or imaging technology would pass constitutional muster.

Fifteen years later in *Kyllo*, the Court again viewed the extent to which a technology was publicly available as highly relevant to defining a Fourth Amendment "search." The *Kyllo* Court was clearly concerned about future developments that might enable the Government to "see" into the interior of the home from the outside.[179] This concern was reflected in the Court's expressed desire to protect people from "advancing technology" that might "discern all human activity in the home" and the resulting need to "adopt" a "rule" taking account "of more sophisticated systems that are already in use or in development."[180] Yet, in the end, the rule adopted was more narrowly crafted.

The *Kyllo* holding that a search occurs when "the Government uses a device that is not in general public use, to explore details

179. *See* Kyllo v. United States, 533 U.S. 27, 34 (2001). Recently, there have been significant advances in "terahertz" imaging, which refers to the formation of images using electromagnetic waves with a frequency on the order of one trillion times per second. As described in a conference paper published in early 2012, researchers at University of Texas at Dallas "have designed an imager chip that could turn mobile phones into devices that can see through walls, wood, pastics, paper and other objects." *New Research Could Mean Cellphones That Can See Through Walls*, UNIV. OF TEXAS AT DALLAS NEWS CENTER, Apr. 18, 2012, http://www.utdallas.edu/news/2012/4/18-17231_New-Research-Could-Mean-Cellphones-That-Can-See-Th_article-wide.html.

180. *Kyllo*, 533 U.S. at 35–36.

of the home that would previously have been unknowable without physical intrusion"[181] clearly bars the use of uncommon technology for this purpose. However, sophisticated and uncommon are two different things. Indeed, the *Kyllo* Court called the thermal imager in question "crude"[182] while also recognizing that it was nonetheless not in general public use. Furthermore, the district court in *Dow Chemical* had found a Fourth Amendment violation, in part, because the images were taken with "the finest precision aerial camera available," permitting capture of "a great deal more than the human eye could ever see."[183] In upholding the Sixth Circuit's reversal of this decision, the Supreme Court considered the wide public availability of the camera to be more relevant than its sophistication.[184]

So how does *Kyllo* bear on the issue of "routine" technology? As the dissent in *Kyllo* noted, the Court's language raises at least the possibility that the protection offered "dissipates as soon as the relevant technology is in general public use."[185] However, to conclude from *Kyllo* that use of a widely available technology to examine a home will necessarily be constitutional is not an entirely fair reading of Justice Scalia's opinion. As Justice Scalia stated in a footnote, in response to the dissent on this specific point, thermal imaging is not routine (or at least was not in 1992, the year in which law enforcement officers used the thermal imager at issue in *Kyllo*).[186] Based on existing Supreme Court precedent, that was sufficient to find its use unconstitutional. To the extent that there is a loophole through which overhead surveillance using "routine" (and possibly but not necessarily sophisticated) technologies might slip, it was created by *Ciraolo* and *Dow Chemical*, and the Court in *Kyllo* declined to revisit it.[187]

And what about technology *not* in general public use, which at least for the moment describes the state of UAS in the United

181. *Id.* at 40.

187. *See id.* ("Given that we can quite confidently say that thermal imaging is not 'routine,' we decline in this case to reexamine that factor.").

States? Under a fair reading of *Kyllo*, that fact alone would not automatically bar its use for surveillance of a home. *Kyllo* did not prevent government use of uncommon technology generally, but instead was focused on the use of such technology to "explore details of the home that would previously have been unknowable without physical intrusion."[188] Thus, although warrantless use of a UAS equipped with a sophisticated thermal imaging camera to "see" through the walls of a home would certainly run afoul of *Kyllo*, acquisition of visible-light images of a home's exterior or curtilage using a UAS-mounted consumer-grade, low-resolution imaging system in public navigable airspace would likely not. After all, the information those images would reveal could be acquired easily from manned aircraft, something that the Court has found multiple times to be constitutional. Perhaps most importantly, to the extent that a "not in general public use" test furnishes a measure of privacy protection with respect to UAS platforms, that protection inevitably will soon disappear as their use becomes more widespread.

2. *"Public Navigable Airspace"*

As is clear from *Ciraolo*, *Riley*, and *Dow Chemical*, the use of "public navigable airspace" is a threshold test for determining whether warrantless aerial observations are constitutional.[189] This does not imply that all such observations will be constitutional, but those that are made from outside public navigable airspace are almost certainly unconstitutional. The question of what constitutes "public navigable airspace" for UAS operated by the government is thus central to the privacy inquiry.

This is not as easy to answer as it might first appear. FAA regulations provide that, except as necessary for takeoff or landing, fixed-wing manned aircraft must generally operate above 1000 feet when over congested areas, and above 500 feet over most non-congested areas.[190] UAS operated above these

---

188. *Id.* at 40.

189. *See* Florida v. Riley, 488 U.S. 445, 450 (1989); California v. Ciraolo, 476 U.S. 207, 213–14 (1986); *Dow Chem. Co.*, 476 U.S. at 239.

190. 14 C.F.R. § 91.119(b)–(c) (2012). The full set of minimum altitude rules is more complex. For example, for congested areas, the minimum is 1000 feet above the highest obstacle within a horizontal radius of 2000 feet of the aircraft. § 91.119(b). For noncongested areas other than over open water or sparsely popu-

minimums therefore are certainly in public navigable airspace.[191] In addition, the altitude must always be sufficiently high to allow "an emergency landing without undue hazard to persons or property on the surface."[192]

But this is not the whole story. The FAA regulations specifically exempt helicopters[193] from the minimums if "the operation is conducted without hazard to persons or property on the surface."[194] FAA regulations nonetheless provide a *de facto* impediment to very low altitude operation of manned helicopters over residential areas: In the event of an engine failure, it would be difficult to claim that the pilot of a manned helicopter hovering fifty feet over a home could perform an emergency landing without endangering persons or property on the ground. For an unmanned helicopter (or fixed wing aircraft) weighing only a few pounds, however, the risks posed to persons on the ground by an emergency landing, though not nonexistent, are certainly modest compared to those posed by manned aircraft. Thus, the combination of the helicopter rules and the "emergency landing" provision in current FAA minimum safe altitude regulations have little or no protective power with respect to UAS privacy concerns.

An additional complicating factor is that for at least some categories of unmanned aircraft, the traditional paradigm is inverted and the FAA imposes altitude *maximums* instead of minimums. Public unmanned aircraft operated in accordance with Section 334(c)(2)(C) of FMRA must be operated at a height lower than 400 feet.[195] Unless FMRA paradoxically is read to mandate navigation outside of "navigable airspace," with respect to this class of aircraft, altitudes of 350 feet, 300 feet, and 250 feet would almost always be within public navigable airspace. However, just as

---

lated areas, the minimum is 500 feet. § 91.119(c). Over open water and sparsely populated areas, "the aircraft may not be operated closer than 500 feet to any person, vessel, vehicle, or structure." *Id.*

191. Provided, of course, that there are no other restrictions associated with the airspace.

192. § 91.119(a).

193. § 91.119(d). A helicopter is "a rotorcraft that, for its horizontal motion, depends principally on its engine-driven rotors"; a rotorcraft, in turn, is "a heavier-than-air aircraft that depends principally for its support in flight on the lift generated by one or more rotors." *Id.* § 1.1 (2012).

194. § 91.119(d).

195. FAA Modernization and Reform Act of 2012 (FMRA), Pub. L. No. 122-95, § 334(c)(2)(C), 126 Stat. 11, 77.

clearly, the air five feet above the ground in the backyard of a home is not within any reasonable definition of public navigable airspace. As the Supreme Court wrote in 1946 in *United States v. Causby*,[196] "[w]e have said that the airspace is a public highway. Yet it is obvious that if the landowner is to have full enjoyment of the land, he must have exclusive control of the immediate reaches of the enveloping atmosphere."[197]

Attempts to identify a precise boundary where the "immediate reaches" under the "exclusive control" of a landowner end and the area available to the public begins can lead to complex questions.[198] For example, it could be argued that a warrantless government-operated UAS that dips into a backyard at eye level to obtain photographs into the house through a back window would be operating outside of public navigable airspace, and that the images it acquired would be unconstitutional for that reason (among others).[199]

Interestingly, airspace that may not be "publicly navigable" can still be subject to governmental control. In places such as the Washington, D.C. Metropolitan Area Flight Restricted Zone, the FAA prohibits *all* outdoor flight operations (including UAS), at any altitude, unless authorized by the FAA/Transportation Security Administration.[200] Thus, the FAA can and does promulgate regulations that control the air all the way down to the ground, even over private property. However, that the government has a right to *prohibit* certain flight operations in the air a few feet above private land does not mean that the government (or a private party) has an affirma-

196. 328 U.S. 256 (1946).

197. *Id.* at 264.

198. The definition of "navigable airspace" in 49 U.S.C. § 40102 does little to resolve this question. "Navigable airspace" is defined as the "airspace above the minimum altitudes of flight prescribed by regulations under this subpart and subpart III of this part, including airspace needed to ensure safety in the takeoff and landing of aircraft." § 40102(a)(32).

199. The Supreme Court considered the more general question of whether looking into a home through a window constitutes a Fourth Amendment search in *Minnesota v. Carter*, 525 U.S. 83 (1998). In that case, police had observed of a drug transaction through a gap in the closed blinds of a window. Because the respondents "were essentially present for a business transaction and were only in the home a matter of hours," the relevant expectation of privacy was that tied to commercial premises, not residential property. As a result, the Court found that the police observations were not a Fourth Amendment violation. *Id.* at 90.

200. *See* 14 C.F.R. § 93.341 (2012).

tive right to *conduct* flight operations in that same airspace without the property owner's consent.

In the dense urban cores of cities such as New York, Chicago, and Boston, public navigable airspace can unquestionably extend *below* the level of many residences. In New York, for example, manned helicopters routinely fly over the Hudson River at altitudes significantly lower than the taller buildings in Manhattan. The air 550 feet over the Hudson River is in public navigable airspace.[201] But there is a good argument that the air six inches outside the window of a fiftieth-floor apartment in midtown Manhattan is not. As noted above, in *Causby* the Court recognized the importance of providing a landowner with "exclusive control of the immediate reaches of the enveloping atmosphere."[202] A high-rise apartment dweller should have at least as much control over the enveloping atmosphere of his or her home.[203] That control, however, will only extend a modest distance. Thus, a UAS operated at several hundred feet above the ground and at a reasonable horizontal standoff from any nearby buildings would almost always be in public navigable airspace.[204]

Will warrantless UAS surveillance from public navigable airspace always be constitutional? Certainly not. The holding in *Ciraolo* addressed naked eye observations from "public airways."[205] *Ciraolo* would provide little support for use of an imaging system capturing much more detail than could the human eye.[206] The opinions in the (slightly) more recent *Riley* decision also imply the existence of some limits. Both of the *Riley* opinions that found in favor of the government expressed concern about using operation in public navigable airspace as

---

201. Although the airspace 550 feet above the Hudson near Manhattan is publicly navigable, there are special flight rules that apply within the "Hudson River Exclusion." *See* 14 C.F.R. § 93.352 (2012). Altitudes below 1000 feet within the Hudson River Exclusion are available to aircraft conducting a "local operation" as defined in § 93.350(a).

202. *Causby*, 328 U.S. at 264.

203. An additional complication with respect to control over the air surrounding buildings in cities like New York relates to the "air rights" that are commonly transacted in association with real estate development. *See Zoning Glossary*, NEW YORK CITY DEPARTMENT OF CITY PLANNING, http://www.nyc.gov/html/dcp/html/zone/glossary.shtml#development_rights (last visited Jan. 29, 2013).

204. An exception would occur in locations subject to temporary or permanent flight restrictions.

205. California v. Ciraolo, 476 U.S. 207, 215 (1986).

206. *See id.* at 214–15.

the only threshold for constitutionality. Writing for the plurality, Justice White noted that "simply because the plane is within the navigable airspace specified by law," it does not follow that the observations it makes will always "pass muster under the Fourth Amendment."[207] Justice O'Connor also warned against relying on "compliance with FAA regulations alone,"[208] and Justice Brennan's dissent raised the same issue.[209]

Justice White's opinion in *Riley* also identifies some specific tests beyond simply being in public navigable airspace that might be applied. For example, the opinion implies that observations from legally operated aircraft that generated undue noise, wind, dust, or threat of injury could be unconstitutional.[210] Although a UAS weighing a few pounds or less would generate very little noise, wind, or dust, if it loses power it could certainly cause injuries. This could occur both directly, if it lands on a person, or indirectly, if it lands in traffic or becomes caught in power lines and initiates an injury causing event. Interestingly, the language of the opinion ties privacy expectations in part to the freedom from being subjected to a *threat* of injury, as distinct from an actual injury itself.

3. *The Role of Imaging Technology*

In *Ciraolo* and *Riley*, the aerial observations of the curtilage of a home were performed with the naked eye, a fact specifically noted by the *Ciraolo* Court[211] and by both of the *Riley* opinions that found against the government.[212] But in *Dow Chemical*, the use of a camera permitting capture of "a great deal more than the human eye could ever see" did not render the observations

210. *See id.* at 452 (plurality opinion).

211. "[I]t is unreasonable for respondent to expect that his marijuana plants were constitutionally protected from being observed with the naked eye from an altitude of 1,000 feet." *Ciraolo*, 476 U.S. at 215.

212. Justice White's opinion stated that the investigating officer in *Riley* "circled twice over respondent's property in a helicopter at the height of 400 feet. With his naked eye, he was able to see through the openings in the roof and one or more of the open sides of the greenhouse and to identify what he thought was marijuana growing in the structure." *Riley*, 488 U.S. at 448. Justice O'Connor wrote that "I conclude that Riley's expectation that his curtilage was protected from naked-eye aerial observation from that altitude was not a reasonable one." *Id.* at 455 (O'Connor, J., concurring in the judgment).

unconstitutional; it was the public availability of the camera that mattered.[213]

What is the constitutionality of warrantless use of an extremely high-resolution (but widely available) camera on a UAS to observe the curtilage of a suspect's home? The Court has never grappled with this specific question, and existing case law is unclear on this point. A suspect could find support in *Ciraolo* and *Riley* when arguing that a Fourth Amendment violation occurred; the government could also find support in *Ciraolo* as well as in *Dow Chemical* and *Kyllo* in arguing that it did not.[214] That *Kyllo* is more recent is not dispositive in light of, among other things, the discussion of *Ciraolo* it contains.

Imaging technology is also relevant given Justice White's opinion in *Riley* that found no Fourth Amendment violation in part because "no intimate details connected with the use of the home or curtilage were observed."[215] Even though he was not speaking for a majority, Justice White's language is nonetheless intriguing, as it indicates that there may be some level of detail beyond which warrantless UAS observations, even if conducted from public navigable airspace, may cross the line into a Fourth Amendment search.

With present-day imaging capabilities, it would be an easy matter to use a UAS (or a manned aircraft) within navigable airspace to acquire imagery that includes "intimate details." For example, a government UAS at an altitude of several hundred feet could identify the topic of an electronic or paper news article being read by a person sitting in his or her fenced-in backyard. A strong case could be made that these observations, even when made from public navigable airspace, would be unconstitutional in the absence of a warrant.

213. Dow Chem. Co. v. United States, 476 U.S. 227, 230 (1986) (quoting Dow Chem. Co. v. United States, 536 F. Supp. 1355, 1367 (E.D. Mich. 1982)) (internal quotation marks omitted). Another key factor in *Dow Chemical* was the Court's conclusion that the observed areas were more akin to "open fields" than to the curtilage of a home. *See id.* at 239.

214. Aspects of *Ciraolo* could be cited to support both positions. A suspect could cite the reference in *Ciraolo* to "naked eye" observations. The government could in response point to the *Ciraolo* language regarding the "routine" nature of the technology of flight, which was also referenced in *Kyllo*. *See Ciraolo*, 476 U.S. at 215; Kyllo v. United States, 533 U.S. 27, 39–40 n.6.

215. *Riley*, 488 U.S. at 452.

4. *Extended Surveillance Using Unmanned Aircraft in Light of* Jones

For financial, regulatory, and logistical reasons, law enforcement agencies will usually use small UAS. Today, these platforms generally have flight durations measured in hours, rendering their continuous use for days or weeks to perform surveillance impractical. But future developments will make long-term surveillance with UAS possible. In addition, at least along the U.S.-Mexico border, aerostats already are in use today.[216]

Some of the most vexing constitutional questions will arise in association with the use of high-altitude long-endurance (HALE) UAVs. These solar-powered UAVs can stay aloft for extraordinarily long periods of time. As noted above, the QinetiQ Zephyr stayed aloft for over two weeks in a 2010 demonstration.[217] Boeing is under contract with DARPA to develop the SolarEagle, which will be able to stay aloft in the stratosphere for five continuous years.[218] Because they fly at such high altitudes, HALE UAS could potentially track every car trip in a city, or the times when lights in residences were turned on and off.[219] It will likely be much later in the decade before HALE technology becomes sufficiently advanced and cost-effective to make it practical to install a permanent HALE presence above an American city. Currently, there is no indication that any government agency plans to do so.

No Supreme Court case is directly on point with respect to the type of extended surveillance that could be performed using a HALE platform, though some of the issues involved arose in *Jones*. The *Jones* opinions contain extensive discussion of the Court's 1983 holding in *United States v. Knotts* that a "person

---

217. Chuter, *supra* note 36.

218. Press Release, Boeing Co., Boeing Wins DARPA Vulture II Program (Sept. 15, 2010), *available at* http://boeing.mediaroom.com/index.php?s=43&item=1425.

219. Satellites are not well-suited to perform extended, continuous high-resolution surveillance. The only satellites that can remain in place over one spot are in geostationary orbits, which are over 22,000 miles above the Earth—much too far to gather images revealing details of a home or curtilage. Satellites in lower orbits can acquire very detailed images, but not on a continuous basis. *See Phoenix, Tactical Technology Office*, DARPA, http://www.darpa.mil/our_work/tto/programs/phoenix.aspx (last visited Feb. 8, 2013).

traveling in an automobile on public thoroughfares has no reasonable expectation of privacy in his movements."[220]

Justice Scalia's majority opinion in *Jones* states that performing extended surveillance "through electronic means, without an accompanying trespass" *may* be unconstitutional, "but the present case does not require us to answer that question."[221] In his concurrence in the judgment, Justice Alito expressed a view that extended electronic surveillance of public movements *is* unconstitutional, writing, "the use of longer term GPS monitoring in investigations of most offenses impinges on expectations of privacy."[222] Justice Sotomayor's concurrence also expressed doubts about the constitutionality of extended electronic surveillance: "I do not regard as dispositive the fact that the Government might obtain the fruits of GPS monitoring through lawful conventional surveillance techniques."[223] In the end, however, it was the physical trespass involved in installing the GPS tracker, not the tracking itself, that formed the basis for the *Jones* decision.[224]

While HALE UAS surveillance is like GPS tracking in that it gathers information using technology that would have required a "large team of agents"[225] in the past, in one respect it is very different: A GPS tracker only identifies the movement of the single vehicle or other object to which it is attached, whereas HALE platforms equipped with banks of cameras could easily capture images of all the vehicle movements in an entire city. The prospect that the government might be able to capture—and then use at will—this level of information about the travels of private individuals is sobering. But if that is unconstitutional, where does that leave the networks of ground-level cameras and license plate readers that are increasingly being deployed along public streets and intersections? Those ground-level systems collect information that, when aggregated, can

220. 460 U.S. 276, 276 (1983).

221. United States v. Jones, 132 S. Ct. 945, 954 (2012).

222. *Id.* at 964 (Alito, J., concurring in the judgment).

223. *Id.* at 956 (Sotomayor, J., concurring).

224. *See id.* at 949 (majority opinion).

225. In his concurrence in the judgment in *Jones*, Justice Alito wrote that "constant monitoring of the location of a vehicle for four weeks" using traditional surveillance methods from the pre-computer age "would have required a large team of agents, multiple vehicles, and perhaps aerial assistance." *Id.* at 963 (Alito, J., concurring in the judgment).

track automobile trips just as thoroughly as a solar-powered HALE UAS making slow circles in the stratosphere.[226] An argument against the constitutionality of HALE systems would need to be reconciled with the information available through aggregated street-level traffic surveillance data. If government tracking of effectively all traffic in a city is unconstitutional, that holding should apply regardless of whether the technology used is on the ground or in the air.[227]

In future years it may also be necessary to revisit the assumption that widely available small, low-altitude UAS can only stay aloft for several hours. UAV Factory, a company based in Latvia, announced in the summer of 2012 that its "Penguin B" small UAS had stayed aloft for over fifty-four hours.[228] Future technological advances presumably will lead to flights of even longer durations. From a purely technological standpoint, platforms such as these conceivably could be used to survey a target for several days. Whether this is likely to happen in practice is another matter. At least under current regulations, this UAS class can only be operated by a government agency within line of sight of an operator.[229] A law enforcement agency could thus use rotating shifts of operators to fly this class of small UAS for several continuous days.

---

226. Depending on where the cameras on the aerostats along the U.S.-Mexico border are aimed, similar questions regarding long-term surveillance are raised. An important difference between aerostats and HALE UAS is the altitude. HALE platforms fly many times higher, and can survey a much larger area than can aerostats.

227. Jurisprudence related to traffic checkpoints is relevant to this issue. In *City of Indianapolis v. Edmond*, the Court noted that it "is well established that a vehicle stop at a highway checkpoint effectuates a seizure within the meaning of the Fourth Amendment." 531 U.S. 32, 40 (2000). Recording a license plate of a passing car—or tracking the car using a HALE UAS—is certainly not a seizure. However, the *Edmond* ruling also noted that "stops can only be justified by some quantum of individualized suspicion," a test that would not be met by systems that perform pervasive tracking of all vehicles in a city. *Id.* at 47.

229. FAA Modernization and Reform Act of 2012 (FMRA), Pub. L. No. 112-95, § 334(c)(2)(C), 126 Stat. 11, 77.

5. *Residual Privacy Rights When a Warrant Is Obtained?*

When law enforcement officers wiretap a phone pursuant to a warrant, a great deal of privacy is lost, but ultimately some minimal privacy is still maintained. For example, a tapped phone does not provide images of the interior of a home.

But with UAS, the implication that a search warrant should have some limits is not unreasonable. Imagery acquired by UAS pursuant to a warrant could lead to profound violations of privacy for both a suspect and the other residents of a house. It is one thing for a wiretap to capture the private conversations of a suspect's spouse. It is quite another for a UAS, hovering in a backyard and taking pictures through a window (or in the future, hiding unseen inside the house), to acquire images that might show an occupant of the house in a state of undress. To assert that the government, even when armed with a warrant, has an unfettered right to acquire, store, and view such images raises significant concerns. Thus, questions of UAS privacy do not end with the issuance of a warrant.

IV. NON-GOVERNMENT UNMANNED AIRCRAFT AND THE FIRST AMENDMENT

Although much of the attention regarding UAS privacy has focused on government use and the Fourth Amendment, it is non-government use that is likely to raise some of the most significant privacy challenges in the coming years. For private entities, which are not bound by Fourth Amendment restrictions that apply to the government, the key constitutional question is the extent of their First Amendment privilege to gather information.

As the Supreme Court recognized in its 1972 *Branzburg v. Hayes* decision, "[w]ithout some protection for seeking out the news, freedom of the press could be eviscerated."[230] Furthermore, the freedom to gather information is not limited to the press. In a 2011 ruling upholding the right of a citizen to record the actions of police in a public space, the First Circuit wrote that "[i]t is firmly established that the First Amendment's aegis extends further than the text's proscription on laws 'abridging the freedom of speech,

230. 408 U.S. 665, 681 (1972).

or of the press,' and encompasses a range of conduct related to the gathering and dissemination of information."[231]

However, the freedoms conferred by the First Amendment are not unlimited. In *Branzburg*, for example, the Supreme Court recognized the existence of some bounds: "It is clear that the First Amendment does not invalidate every incidental burdening of the press that may result from the enforcement of civil and criminal statutes of general applicability."[232]

Even though almost all companies and individuals will endeavor to operate UAS responsibly, there undoubtedly exist some classes of potential UAS users who will perceive observe less restraint. If paparazzi are willing to engage in high-speed freeway chases to capture images of a celebrity,[233] it would be optimistic to the point of naïveté to expect them to always operate UAS in a manner respectful of privacy considerations and in compliance with FAA safety regulations. When, as will inevitably occur, a paparazzo or stalker flies a UAS into a backyard and takes pictures through a back window, what laws will come into play?

A. Trespassing

Common sense would suggest that a homeowner[234] has the right to prevent a UAS from being flown around his or her backyard at eye level. And indeed, in some states, trespassing statutes are worded in a manner that would encompass trespassory use of a UAS. In Arizona, for example, "entry" in association with criminal trespass is defined as "the intrusion of any part of any instrument or any part of a person's body inside the external boundaries of a structure or unit of real property."[235] Unless an argument could be made that a UAS is not an "instrument," this statute would cover intrusion by a UAS

231. Glik v. Cunniffe, 655 F.3d 78, 82 (2011).

232. 408 U.S. at 682.

233. For an example of one alleged such incident, see Kate Mather, *Photographer who allegedly chased Justin Bieber charged*, L.A. TIMES, July 26, 2012, http://articles.latimes.com/2012/jul/26/local/la-me-bieber-paparazzi-20120726.

234. Or other person legally occupying the property, such as a lessee.

235. ARIZ. REV. STAT. § 13-1501 (West 2012).

at extremely low altitudes (for example, at eye level) that are under the control of a property owner.[236]

In Oregon, by contrast, "enter" as defined in association with criminal trespass is, among other things, "[t]o enter or remain in or upon premises . . . when the entrant is not otherwise licensed or privileged to do so."[237] While this somewhat circular definition is clearly intended to criminalize unauthorized entry by a person, it leaves open the question of whether entry by a very low-flying UAS would be covered. California's trespassing laws prohibit driving a vehicle on another person's property without consent,[238] but define vehicle in a manner that excludes UAS.[239]

The general lack of attention to the potential trespassory use of UAS in current state criminal statutes is not at all surprising. In the future, it almost certainly will be necessary to add specific language to criminal trespassing statutes addressing UAS.

B. Invasion of Privacy

Use of a UAS to invade an individual's privacy could result in civil or criminal liability. With respect to civil liability, courts in most jurisdictions recognize the two forms of common law invasion of privacy most likely to arise in connection with UAS: intrusion upon seclusion and public disclosure of private

---

236. As discussed above, the question of the altitude at which a landowner's control over the air above the ground in his or her backyard ends, and the public's access begins, was at issue in *United States v. Causby*. Under any reasonable reading of *Causby* (and other relevant case law), the space in a backyard at eye level is certainly within the "immediate reaches of the enveloping atmosphere" that are under the "exclusive control" of the landowner. *See Causby*, 328 U.S. 256, 256 (1946). This interpretation is also supported by the manner in which overhanging tree branches from a neighbor's property are often handled. In many states, a homeowner has the right (subject to some exceptions) to trim tree branches in the air above his or her land. *See, e.g.*, Macero v. Busconi Corp., 12 Mass. L. Rep. 521 (Super. Ct. 2000) ("Massachusetts law recognizes a right of self-help by which a property owner can cut the limbs or branches of a tree that invade his property as long as such cutting is done at the property line.").

237. OR. REV. STAT. § 164.205(3)(a) (West 2012).

238. CAL. PENAL CODE § 602(n) (West 2012).

239. California Vehicle Code § 670, referenced in the criminal trespassing statute, defines a vehicle as "a device by which any person or property may be propelled, moved, or drawn upon a highway, excepting a device moved exclusively by human power or used exclusively upon stationary rails or tracks." CAL. VEH. CODE § 670 (West 2012).

facts.[240] In addition, some states also have civil or criminal statutes, or both, related to invasion of privacy.[241]

1. Intrusion Upon Seclusion

The potential of a UAS to intrude upon seclusion in the home is obvious. A person who is unwillingly photographed in his or her own home by a UAS hovering just outside an otherwise inaccessible window would have strong grounds for a valid cause of action. Even public figures, whose privacy rights are presumptively lower than those of private individuals,[242] can nonetheless reasonably expect views into the interior of their residences from their own backyards to be private.

Although privacy expectations are greatly reduced outside the home, the non-governmental use of a UAS to capture images and other information taken while the individual is in a public setting could nonetheless constitute an invasion of privacy. *Shulman v. Group W Productions, Inc.*,[243] a 1998 California Supreme Court ruling regarding filming that occurred following a car accident, is instructive in this regard. In *Shulman*, the victims of an accident were captured on video and audio recording, without their consent, for a television program called *On Scene: Emergency Response*.[244] The recording occurred both at the scene of the accident as well as in a rescue helicopter during transport to a hospital.[245]

The California Supreme Court affirmed the court of appeals' decision to reverse the trial court's summary judgment finding that the television program producers' activities were protected

---

240. Prosser articulated four forms of the common law invasion of privacy tort in 1960: (1) "[i]ntrusion upon the plaintiff's seclusion or solitude, or into his private affairs;" (2) "[p]ublic disclosure of embarrassing private facts about the plaintiff;" 3) "[p]ublicity which places the plaintiff in a false light in the public eye;" and 4) "[a]ppropriation, for the defendant's advantage, of the plaintiff's name or likeness." William L. Prosser, *Privacy*, 48 CALIF. L. REV. 383, 389 (1960); *see also* RESTATEMENT (SECOND) OF TORTS §§ 652A–652E (1997).

241. *See, e.g.*, CAL. CIV. CODE § 1708.8 (West 2011); N.J STAT. ANN. §§ 2C:14-9, 2A:58D-1 (2004).

242. *See generally* Hustler Magazine, Inc. v. Falwell, 485 U.S. 46 (1988); Gertz v. Robert Welch, Inc., 418 U.S. 323 (1974); New York Times Co. v. Sullivan, 376 U.S. 254 (1964).

243. 955 P.2d 469 (Cal. 1998).

244. *Id.* at 475.

245. *Id.* at 474–75.

under the First Amendment.[246] The court held that a woman injured in the accident "was entitled to a degree of privacy in her conversations with [the nurse] and other medical rescuers at the accident scene."[247] It was improper, the ruling stated, to conclude that the "plaintiffs had no reasonable expectation of privacy at the accident scene itself because the scene was within the sight and hearing of members of the public."[248] At the time of the rescue, the vehicle was located "in a ditch many yards from and below" a highway, rendering it "unlikely . . . that any passersby on the road could have heard" the conversation of the victim with the nurse and other rescuers.[249]

The *Shulman* decision provides important guidance regarding newsgathering and UAS with respect to intrusion upon seclusion by drawing a distinction between the information about a newsworthy event available to passersby and the potentially greater amount of information available only to those intimately involved in the event itself. Under some circumstances, there will be no difference: If a crowd of people has gathered around an assault victim who is being treated by paramedics, the conversation between the victim and the paramedics may well be audible to all, and the victim's reasonable expectation of privacy correspondingly lower. But there will be many cases in which, as in *Shulman*, passersby have far from complete information about an unfolding event. Using a UAS to fill in the gaps would carry a risk of crossing the line into intrusion.

Just as the First Amendment does not provide an impenetrable shield for all uses of video, audio, and other electronic monitoring in public areas, intrusion upon seclusion is not automatically implicated for all observations of activities occurring in a home. A passerby on the street at night who happens to glance up and notice that the light in a nearby home has just been turned off is certainly not violating privacy rights. Likewise, courts will be very unlikely to consider a fleeting, acci-

246. *See id.* at 497–98.

247. *Id.* at 491.

248. *Id.*

249. *Id.* In addition to considering whether the audio and video recorded at the scene of the accident intruded on the victim's expectation of privacy, the California Supreme Court also considered the recording that took place within the helicopter, ruling that the "Court of Appeal correctly found [that] triable issues exist as to whether defendants invaded plaintiffs' privacy by accompanying plaintiffs in the helicopter." *Id.* at 477.

dental capture of imagery of a home's curtilage or (through a window) interior acquired by a passing UAS to be an invasion of privacy. Although the specifics vary from state to state, to prevail in a common law or statutory intrusion upon seclusion claim, a plaintiff generally must establish, at a minimum, that the intrusion was intentional and that it would be "highly offensive to a reasonable person."[250]

Some highly offensive intrusions upon seclusion have nonetheless been protected under the First Amendment. Most notably, in *Snyder v. Phelps*[251] the Supreme Court ruled in favor of members of the Westboro Baptist Church who had picketed the funeral of a serviceman killed in Iraq. A jury in Maryland had found members of Westboro Baptist Church liable for damages based on claims including intrusion upon seclusion.[252] However, in affirming the Fourth Circuit's reversal, the Supreme Court ruled that "the First Amendment bars Snyder from recovery for intentional infliction of emotional distress or intrusion upon seclusion" against Westboro Baptist Church members and that "we must likewise hold that Snyder cannot recover for civil conspiracy based on those torts."[253]

2. *Publication of Private Facts*

Precedents from state court rulings unrelated to aviation indicate that UAS could also figure into invasion of privacy through the publication of private facts. This could be particularly important with respect to UAS images of private individuals who become involuntarily caught up in newsworthy events.

In September 1999, *Sports Illustrated* published a story entitled "Every Parent's Nightmare" that included a photograph of a Little League team.[254] There were eighteen people in the photograph, including a team manager who had been convicted of molestation

charges in 1971 and who pled guilty in April 1998 to charges of molesting five of the children he coached in Little League.[255]

Ten of the people in the photograph filed suit against Time Warner, Inc., the then-owner of *Sports Illustrated*, for invasion of privacy and infliction of emotional distress.[256] In 2001, the California Court of Appeal upheld a lower court decision to deny Time Warner's motion to strike the complaint, writing that the "plaintiffs have demonstrated a prima facie case for invasion of privacy," particularly in relation to public disclosure of a private fact.[257] The court recognized that while the identity of the molester was publicly known and certainly newsworthy, the identities of the other coaches and the players on the team were not.[258]

Publication of private facts via imagery was also at issue in a Florida case involving a woman who suffered from a poorly performed plastic surgery.[259] The woman consented to be interviewed for a television program under the condition that the video would be edited to alter her voice and obscure her face.[260] When the broadcast took place without these two things occurring as promised, thereby revealing her identity, she filed suit.[261] In reversing a summary judgment in favor of the defendant, the Florida Court of Appeals held that "while the topic of the broadcast was of legitimate public concern, the plaintiff's identity was not."[262]

Images acquired by UAS could easily convey facts not previously known to the public, and, upon publication, could be an actionable invasion of privacy in many states. While news organizations are well aware of the tension between the privacy rights of their subjects and the organizations' First Amendment right to gather news, they will almost certainly need to reexamine existing policies in light of the unique imaging and other information gathering capabilities (such as monitoring of wire-

less signals) of UAS. In addition, given the ease with which anyone—not only news organizations—can now publish content, all users of UAS who contemplate publishing aerial images or other information from UAS would be well advised to give careful consideration to the common law and statutory invasion of privacy frameworks that apply in their jurisdictions.

C. Stalking and Harassment

In January 2009, the U.S. Department of Justice released a report based on data collected from over three million stalking victims and two million harassment victims.[263] About 245,000 of the stalking victims and 70,000 of the harassment victims stated that they had been subjected to electronic monitoring using one or more of the following devices: video or digital cameras, computer spyware, listening devices, and GPS tracking.[264] Stalkers will have no qualms about adding UAS to this list.

It was not until 1990 that California became the first state to criminalize stalking.[265] Today, statutes addressing stalking (and typically harassment) are now on the books in all fifty states and in Washington, D.C. Fortunately, many of these statutes are worded broadly enough that use of a UAS to persistently follow a person or peer into his or her car or home would be considered, at the very least, harassment. Stalking often carries the additional connotation of causing the victim to fear for his or her safety.[266] Under some circumstances, UAS use alone could constitute stalking (for example, if it is used to chase or corner a person).[267] More often, a stalker using a UAS would also be engaged in a larger constellation of behaviors consistent with stalking. To the extent that anti-harassment and anti-stalking statutes specifi-

265. *See* Christine B. Gregson, Comment, *California's Antistalking Statute: The Pivotal Role of Intent*, 28 GOLDEN GATE U. L. REV. 221, 221 (1998).

266. *See, e.g.*, CAL. PENAL CODE § 646.9 (West 2008): "Any person who willfully, maliciously, and repeatedly follows or willfully and maliciously harasses another person and who makes a credible threat with the intent to place that person in reasonable fear for his or her safety, or the safety of his or her immediate family is guilty of the crime of stalking . . . ."

267. Obviously, the other requirements of the legal definition of stalking must be met. As such, a child who momentarily chases his or her sibling using a 9-ounce toy remote control helicopter is clearly not engaging in stalking.

cally enumerate the technologies that might be exploited, UAS should be added to the list. If a stalker employing a UAS crosses state lines (or operates a UAS, with the assistance of someone local to the victim, from a different state), then federal anti-stalking statutes could also be implicated.[268]

D. Unmanned Aircraft and Business Privacy

In 2011, a Texas man flew an unmanned aircraft over land near a Dallas-area meat packing plant and acquired images appearing to show environmental violations.[269] He contacted the Coast Guard, and in early 2012 the Texas Environmental Crimes Task Force served a search warrant on the company.[270] Once on the property, investigators found a pipe that "originate[d] in the back of the slaughterhouse" that appeared to be channeling pigs' blood into a nearby river and "[was] not linked to a waste water system."[271]

Though few would rush to defend a slaughterhouse that may be in violation of environmental codes, the ability of private citizens or groups to easily inspect for such violations via overflights raises complex issues. To the extent that such overflights are lawfully conducted and reveal activities that may be endangering public health, they are obviously valuable. But what happens if a well-meaning but overzealous environmental group conducts daily flights over a large, fenced-in manufacturing facility and repeatedly reports "violations" to the government that turn out, after costly and time-consuming on-the-ground inspections, not to be violations after all? Does the company that owns the facility have grounds to ask a court to enjoin the environmental group from further overflights? What if the group posts pictures from its daily aerial surveillance missions on the Internet, and in doing so exposes information that the company regards as a trade secret? Could the group use a UAS to examine the interior of buildings at the facility using an advanced thermal imager that, if in government

271. *Id.*

hands and used to inspect a home, would be unconstitutional under *Kyllo*? More generally, to what extent does a corporation have common law or constitutional privacy rights that parallel those accorded to individuals?

This last question was raised but not fully resolved in a recent Supreme Court case, *FCC v. AT&T, Inc.*[272] While noting that "this case does not call upon us to pass on the scope of a corporation's 'privacy' interests as a matter of constitutional or common law,"[273] the Court ruled that the "protection in [the Freedom of Information Act] against disclosure of law enforcement information on the ground that it would constitute an unwarranted invasion of personal privacy does not extend to corporations."[274] The Court also expressed skepticism regarding arguments that corporations have a common law right to personal privacy, writing that "[o]n the contrary, treatises in print around the time that Congress drafted the exemptions at hand reflect the understanding that the specific concept of 'personal privacy,' at least as a matter of common law, did not apply to corporations."[275] Corporate privacy rights are related in part to the much broader question regarding the extent to which constitutional protections extend to corporations.[276] UAS represent one of the many ways in which those rights may be tested in the coming years.

The fact that UAS might be used to perform corporate espionage is another important issue. Observations of a competing company's facilities and activities—whether made from the ground or the air—are not necessarily illegal. For example, consider a person who drives by a competing company on public roads as part of his or her regular commute to work. If this person notices that there are suddenly far fewer cars in the company's parking lot than in previous months, he or she might infer that there have been significant layoffs. Under this scenario, visual observations have yielded potentially valuable information about a competitor without breaking any laws. Analogous scenarios involving incidentally acquired UAS imagery can also be envisioned.

By contrast, circling a UAS over the roof of a competing company to intercept wireless signals emanating from the building would represent something similar to an "illegal wiretap" and violate the Stored Communications Act.[277] Photographs taken from a UAS without authorization that both (1) convey a trade secret, and (2) are obtained for the purpose of benefiting a "foreign government, foreign instrumentality, or foreign agent" would violate economic espionage statutes.[278]

V. NEW FRAMEWORKS FOR UNMANNED AIRCRAFT SYSTEMS AND PRIVACY

Many of the most important UAS privacy questions relate directly to the scope and interpretation of the First and Fourth Amendments. Those questions will be addressed in the inevitable court tests that will arise with increased UAS use. But there are also proactive steps that can be taken, including the adoption of voluntary policies by law enforcement agencies as well as new federal, state, and local legislation.

A. Voluntary Approaches

Several voluntary approaches for addressing UAS privacy have been proposed. These include the Association for Unmanned Vehicle Systems International (AUVSI) Code of Conduct, which calls for a commitment to "respect the privacy of individuals,"[279] as well as a set of model guidelines released by the International Association of Chiefs of Police (IACP).[280]

Although the IACP guidelines are not binding, many American law enforcement agencies likely will adopt the guidelines or use them as a starting point to develop more extensive guidelines. The IACP guidelines recommend that "[w]here there are specific and articulable grounds to believe that the UA [unmanned aircraft] will collect evidence of criminal

wrongdoing and if the UA will intrude upon reasonable expectations of privacy, the agency will secure a search warrant prior to conducting the flight."[281] The guidelines also address data minimization, community involvement and feedback regarding policies for UAS use, and documentation of UAS flights.[282] Some of these recommendations are consistent with recommendations provided by the American Civil Liberties Union in a December 2011 report on "Protecting Privacy From Aerial Surveillance."[283] Voluntary frameworks will play a vital role in addressing UAS privacy concerns both directly, in terms of encouraging law enforcement agencies to use UAS responsibly, and indirectly, by spurring an important dialog between law enforcement agencies and their communities.

B. Federal Legislation

There were multiple bills related to UAS privacy introduced in the 112th Congress, though none were enacted.[284] In June 2012, Senator Rand Paul introduced the "Preserving Freedom from Unwarranted Surveillance Act of 2012,"[285] a bill that, subject to a small number of exceptions (such as preventing "imminent danger to life"), would have required a warrant for gov-

284. Some of these UAS privacy legislative initiatives, as well as more general Fourth Amendment UAS issues are discussed in Richard M. Thompson II, Cong. Research Serv., R42701, Drones in Domestic Surveillance Operations: Fourth Amendment Implications and Legislative Responses (2012), *available at* http://www.fas.org/sgp/crs/natsec/R42701.pdf.

285. Preserving Freedom from Unwarranted Surveillance Act of 2012, S. 3287, 112th Cong. (2012), *available at* http://www.govtrack.us/congress/bills/112/s3287. Essentially the same bill was introduced in the House by Representative Austin Scott. *See* Preserving Freedom from Unwarranted Surveillance Act of 2012, H.R. 5925, 112th Cong. (2012), *available at* http://www.govtrack.us/congress/bills/112/hr5925.

ernment use of UAS to "gather evidence or other information pertaining to criminal conduct or conduct in violation of a statute or regulation."[286] A week later, Representative Shelley Capito introduced H.R. 5961, which would have limited "aerial surveillance of agricultural land."[287] The next month, Representative Ted Poe introduced the "Preserving American Privacy Act of 2012,"[288] which would have prohibited the use of UAS "for law enforcement purposes or for surveillance of a United States national or real property owned by that national . . . except pursuant to warrant and in the investigation of a felony."[289]

In December 2012, Representative Edward J. Markey introduced the "Drone Aircraft Privacy and Transparency Act of 2012." The bill would have required all entities seeking a "grant of authority to operate an unmanned aircraft system in the national airspace system" to provide a "data collection statement" specifying, among other things, "whether the unmanned aircraft system will collect information or data about individuals or groups of individuals," and if so, how it will be used.[290] Applications from law enforcement agencies would also have had to provide a "data minimization statement" describing the agencies' policies for minimizing data collection unrelated to a crime investigation and "requir[ing] the destruction of such information and data, as well as of information and data collected by the unmanned aircraft system that is no longer relevant to the investigation of a crime under a warrant."[291] With some exceptions for exigent circumstances, the bill would also have required law enforcement agencies to obtain a warrant for "generalized surveillance."[292]

There will undoubtedly be a new set of UAS privacy bills and privacy related amendments introduced (or reintroduced) in the 113th Congress and beyond. It is relatively easy to draft

292. *Id.* § 341.

legislative language that will increase privacy from UAS observations. It is far harder to do so without negatively impacting the use of UAS in applications that raise few or no privacy concerns. For example, as part of an arson investigation, police might want to employ a UAS to acquire overhead images of a formerly vacant industrial building that has been damaged by a suspicious fire. Requiring police to first obtain a warrant would delay the investigation and increase the burden on the courts with no benefit to privacy.

When drafting legislation, it is also important to consider the role that could be played by unintentionally captured images. Suppose that a brutal assault that takes place on a sidewalk is captured on video by a government-operated UAS that happens to be monitoring traffic on the adjacent street. Suppose further that the video from the UAS turns out to be the only available evidence that can identify the perpetrator. It would defy common sense if the police or prosecutors were barred by new UAS privacy rules from making use of this information.

Legislation that would include a blanket prohibition on government use of private UAS data in criminal investigations would also be ill advised, as well as inconsistent with what routinely occurs in nonaviation settings. Investigators often use images collected from privately owned surveillance cameras to help solve crimes, including, in many cases, cameras that were not owned or operated by the victim of the crime. In June 2012, a man suspected of killing three people in New York was arrested thanks in large part to images captured by a surveillance camera down the street from the scene of the crime.[293] What mattered most was that the camera captured the images vital to identifying the suspect, not whether it was publicly or privately owned. If, in the example in the previous paragraph, the images of the assault on the street had been captured by a UAS operated by a television station instead of by the government, it would make no sense to place them beyond the legal reach of investigators.

Any new legislation should also recognize that images of public spaces from government (or private) UAS will sometimes also include images of nearby homes. Residences next to a freeway are often within the frame of view of video from

293. *Police arrest suspect accused of executing three men outside Columbia University*, MAILONLINE, June 23, 2012, http://www.dailymail.co.uk/news/article-2163776/Police-arrest-suspect-accused-executing-men-outside-Columbia-University.html.

manned traffic helicopters reporting on a freeway problem. Video from UAS used to monitor traffic will be no different. Thus, a law stating that no UAS images of any nonpublic spaces can ever be acquired by the government without a warrant would, at least on its face, effectively ban government UAS use in almost any suburban or urban setting.

UAS privacy legislation, either at the federal or state level, should also avoid creating collateral damage for the operation of model aircraft. The Academy of Model Aeronautics, which, with over 150,000 members,[294] constitutes the world's largest model aviation organization, has an exemplary seventy-five-year safety record and a safety code that requires pilots of radio-controlled model airplanes to "avoid flying directly over unprotected people, vessels, vehicles or structures."[295] Aircraft operated in this manner are ill-suited for surveillance. Impeding their operation in the name of privacy would benefit no one.

"Drone" hobbyists should similarly be protected from legislation that leaves them as collateral damage. If, five years from now, a parent and child acting in compliance with applicable FAA regulations wish to fly a very small UAS in a backyard or public park, new privacy laws should not force the parent to file paperwork with the government documenting the date, time, duration, location, and image collection status of every flight.

As is clear from the above, there is no shortage of unsuitable legislative approaches. The best solutions are those that increase privacy protections without impeding reasonable, non-privacy-violating uses. Laws addressing data retention by government UAS users are one possible example. It is also reasonable to require law enforcement agencies to keep thorough records identifying the details of flight operations, including the date and time, location, who was operating the aircraft, and what sort of data was collected.[296]

295. *Academy of Model Aeronautics National Model Aircraft Safety Code* para. B(1), ACAD. MODEL AERONAUTICS, http://www.modelaircraft.org/files/105.pdf (last visited Feb. 1, 2013).

296. Laws specifically addressing UAS image data retention would raise the issue of consistency with respect to retention of data from ground-level, government-operated surveillance cameras.

C. *State and Local Legislation and the Scope of Federal Preemption*

The prospect of state and local UAS privacy regulation raises the issue of federal preemption.[297] Higher courts have repeatedly ruled that aircraft safety regulation has been preempted by the federal government. In 2007, the Ninth Circuit held that "[t]he [Federal Aviation Act] and regulations promulgated pursuant to it establish complete and thorough safety standards for air travel, which are not subject to supplementation by, or variation among, state laws."[298] Similarly, a 1999 Third Circuit ruling stated "[b]ecause the legislative history of the FAA and its judicial interpretation indicate that Congress's intent was to federally regulate aviation safety, we find that *any* state or territorial standards of care relating to aviation safety are federally preempted."[299]

Aircraft noise is another aviation-related field that has been federally preempted. In a 1973 decision involving Burbank's right to establish an airport curfew to address noise concerns, the Supreme Court ruled that the federal government "has full control over aircraft noise, preempting state and local control."[300] And in 1978, the Airline Deregulation Act included an express preemption prohibiting states from enacting laws "related to a price, route, or service of an air carrier that may provide air transportation."[301]

Yet this does not prevent states from passing any laws relating to how aircraft are flown. Reckless operation of aircraft is

---

297. As the Supreme Court explained in a 1987 ruling, "when acting within constitutional limits, Congress is empowered to pre-empt state law by so stating in express terms." Cal. Fed. Sav. & Loan Ass'n v. Guerra, 479 U.S. 272, 280 (1987). In addition, "congressional intent to pre-empt state law in a particular area may be inferred where the scheme of federal regulation is sufficiently comprehensive to make reasonable the inference that Congress 'left no room' for supplementary state regulation. . . . As a third alternative, in those areas where Congress has not completely displaced state regulation, federal law may nonetheless pre-empt state law to the extent it actually conflicts with federal law." *Id.* at 280–81 (citation omitted).

298. Montalvo v. Spirit Airlines, 508 F.3d 464, 468 (9th Cir. 2007).

300. City of Burbank v. Lockheed Air Terminal, Inc., 411 U.S. 624, 633 (1973).

301. 49 U.S.C. § 41713(b)(1) (2006); *see also* John Maggio & Allison M. Surcouf, *Federal Preemption in The Field of Aviation*, 78 J. TRANSP. L., LOGISTICS & POL'Y 243, 249–50 (2011).

prohibited by both FAA regulations[302] and criminal statutes in many states. In ruling that a Maryland law making it a crime to "operate an aircraft . . . in a careless or reckless manner so as to endanger the life or property of another"[303] was not preempted by federal law, the Maryland Court of Appeals wrote that it "would be incongruous indeed, in light of the federal purposes and objectives, if Maryland were to be constitutionally precluded from the criminal prosecution of a person for such conduct because a federal regulation authorized civil penalties."[304] More generally, the court observed, "[w]e have no difficulty whatever in deciding that Congress has not occupied the entire field of aeronautics by the Federal Aviation Act of 1958."[305] Thus, federal preemption is complex both generally[306] and with respect to aviation.[307]

A state does not have the authority to enact UAS privacy laws that would decrease the safety of flight operations. A state law aiming to prevent UAS from hovering for too long over a home by requiring a certain minimum speed would raise concerns with respect to airspace safety, and would be unlikely to withstand a legal challenge. On the other hand, although it would be unadvisable, a state or municipality could enact legislation forbidding the use of any public funds to purchase or operate unmanned aircraft. There is also a gray area between these two extremes. State laws attempting to limit where and how government UAS can be operated, the resolution of the cameras they carry, or the retention of the data they collect would almost certainly be subject to preemption challenges.

From a preemption standpoint, the safest legislative role for states with respect to UAS privacy lies in minimizing privacy abuses by non-government UAS operators. State power to address trespass, invasion of privacy, harassment, and stalking is well established. Current civil and criminal statutes in those areas were drafted in an era, which is now ending, when UAS

were not widely accessible to private citizens. As a result, in many cases these laws fail to anticipate some of the unique ways in which UAS in the hands of irresponsible operators could be used to threaten privacy. These statutes should be reexamined to identify and close any loopholes that might be exploited.

State UAS privacy regulations also run the risk of being undermined by the physics and geometry of flight. Consider a UAS operated over Maryland, at the Virginia border, and at a high enough altitude to obtain very precise imagery of activities in Virginia five miles south of the Potomac River.[308] While the operators of the UAS would certainly need to comply with federal and Maryland laws, they could very credibly argue that their data collection practices should not be subject to Virginia law.[309] The scenarios that could play out in relation to municipal-level regulations are even more varied. If Berkeley, California, were to prohibit its police department from purchasing or using UAS, a UAS owned and operated by the City of Oakland, which is adjacent to Berkeley, could easily remain over Oakland while acquiring video of portions of Berkeley. The Oakland UAS could also freely cross into the airspace over Berkeley.

The early months of 2013 have seen a significant increase in UAS-related legislative activity at the state and local levels. To cite some of the many examples, in February 2013 the Virginia General Assembly passed a bill that, if signed into law by the Governor, would place broad restrictions on state and local law enforcement UAS use until July 2015.[310] An Oregon Senate bill, if enacted, would prohibit certain UAS uses within what it defines as the "Airspace of Oregon"; that is, "the space above the ground that is not part of airspace governed by federal law." [311]

---

308. In this hypothetical scenario, it is assumed that the flight would occur outside the restricted zone in the Washington, D.C., area. *See Notice to Airmen 0/8326*, FED. AVIATION ADMIN., http://tfr.faa.gov/save_pages/detail_0_8326.html (last visited Feb. 1, 2013).

309. The ability of state law to reach high into the sky is questionable even in its "own" airspace. It is doubtful, for example, that a state could enact a valid law prohibiting passengers in commercial airliners flying over the state at 36,000 feet from taking pictures through the aircraft windows of the scenery below.

310. Jason Koebler, *Virginia Becomes First State to Pass Drone Regulations*, US NEWS, Feb. 5, 2013, http://www.usnews.com/news/articles/2013/02/05/virginia-becomes-first-state-to-pass-drone-regulations-.

Other states in which UAS-related measures have been introduced include California,[312] Florida,[313] and Texas.[314]

CONCLUSION

The only certain aspect of the debate about unmanned aircraft and privacy is that it will be contentious. Some people believe that there is no need to create new laws,[315] whereas others believe that UAS "could be just the visceral jolt society needs to drag privacy law into the twenty-first century."[316]

In the quarter of a century since *Ciraolo*, the cost of sophisticated imaging technology has plummeted. UAS will make it easy to put that technology in the air. Thus, the constitutionality of government UAS observations of a home or its curtilage using imaging technology that is both sophisticated and in general public use is certain to be tested.

None of the key Supreme Court precedents definitively resolve this issue. *Ciraolo* and *Riley* involved naked eye observations. *Dow Chemical* involved a camera that was both widely available and sophisticated for its time, but did not concern a home or curtilage. In *Kyllo*, the Court considered the thermal imager to be non-routine. And *Jones* concerned GPS, not imaging.

In combination, however, these rulings indicate that the Fourth Amendment is likely to provide significantly more protection from government UAS observations than is commonly assumed. At the very least, the Court will not grant the government the unconstrained power to perform warrantless UAS surveillance. Instead, the Court is more likely to adopt a test tied to the amount of detail revealed as opposed to the level of technology diffusion. Under that standard, even unsophisticated imag-

ing technology might lead to a Fourth Amendment violation if it is misused in a low-flying government UAS, while images from a sophisticated camera flown at a high altitude might reveal very few details and raise no constitutional concerns.

When considering potential new statutory UAS privacy protections, it is helpful to keep in mind what has occurred with the Internet and mobile telephones, two technologies that are associated with privacy threats that are in some respects much more significant than those that will arise from unmanned aircraft. Both the Internet and mobile phones grew as fast as their underlying technologies enabled. As a result, the public and legislative dialogue regarding how best to address the privacy issues they raise has been conducted with a strong appreciation of their benefits. By contrast, while the privacy concerns associated with domestic UAS are real and deserving of attention, they are getting significant focus long before the potential benefits of the technology are widely recognized.

This early consideration creates both opportunities and risks. The opportunities lie in the ability to proactively address the privacy issues associated with a new technology before it becomes common. The risks lie in letting this information imbalance—in which the privacy downsides are well-known but the benefits are not—lead to correspondingly imbalanced legislative approaches.

If, in 1995, comprehensive legislation to protect Internet privacy had been enacted, it would have utterly failed to anticipate the complexities that arose after the turn of the century with the growth of social networking and location-based wireless services. The Internet has proven useful and valuable in ways that were difficult to imagine over a decade and a half ago, and it has created privacy challenges that were equally difficult to imagine. Legislative initiatives in the mid-1990s to heavily regulate the Internet in the name of privacy would likely have impeded its growth while also failing to address the more complex privacy issues that arose years later.

Thus, while it is important to proactively consider how to protect against the privacy abuses UAS could make possible, in doing so it is important to recognize the near impossibility of predicting all of the ways that a rapidly developing technology can be used—for good or for ill—in future years. Maintaining that perspective will be vital in achieving good UAS policy outcomes.

*1 WELCOME TO THE "LAST FRONTIER," PROFESSOR GARDNER: ALASKA'S INDEPENDENT APPROACH TO STATE CONSTITUTIONAL INTERPRETATION

Alaska Law Review

June, 1995

Ronald L. Nelson[a1]
Copyright (c) 1995 Alaska Law Review; Ronald L. Nelson

This article rebuts recent criticism of efforts by state supreme courts to interpret state constitutional provisions differently than the United States Supreme Court interprets analogous provisions in the United States Constitution. This area of law, sometimes called New Judicial Federalism, has been the subject of considerable comment over the last twenty years. By focusing on equal protection, privacy, religious freedom and access to natural resources, the article examines Alaska's unique constitutional background and independent interpretation. This analysis of Alaskan constitutional rights reveals a viable and active brand of New Judicial Federalism. The article concludes that Alaska's independent approach to state constitutional law is an example of a constitutional discourse that is both uniquely local and nationally valuable.

Ronald L. Nelson, *Welcome to the "Last Frontier," Professor Gardner: Alaska's Independent Approach to State Constitutional Interpretation*, 12 Alaska L. Rev. 1 (1995)

. . .

B. Privacy

Alaska's right to privacy, particularly in the non-criminal context, has undergone development similar to Alaska's equal protection doctrine.[82] In fact, this right to privacy may be one of the most well-known indicators of Alaska's judicial independence. While the right to privacy is now embodied in a specific provision of the state constitution, it was not included in the original Declaration of Rights. Instead, article I, section 22 was added to the constitution in 1972. Prior to 1972, the right to privacy was viewed by most state courts as a matter of federal protection and not routinely addressed at the state level. In the federal courts, however, the concept was not well-defined and was found primarily in the right "to be let alone," the right of marital privacy, the privacy of the home, or some other penumbral definition.[83]

In 1972, the Alaska Supreme Court addressed the privacy issue when it decided a pre-amendment case, *Breese v. Smith*.[84] Breese involved a challenge by a student to school hair length regulations. After examining federal privacy protection and various state and federal cases, the court decided not to resolve the case on federal grounds because of the unsettled state of the privacy issue at the federal level. The Breese court instead decided that "avoidance of *18

the federal thicket [was] the better course,"[85] and struck down the regulations on independent state grounds. Citing a general liberty right under article I, section 1 of the state constitution,[86] and noting the state's duty to open and maintain public schools,[87] the court found that the student had a "fundamental . . . right to select [his] own individual hair style[ ] without governmental direction."[88] It then determined that the state's interest in maintaining the regulation was insufficiently "compelling" to overcome the student's privacy right.[89]

The *Breese* court examined cases from federal and state courts as well as notes and articles by various commentators.[90] Citing *Roberts v. State*[91] and *Baker v. City of Fairbanks*,[92] the court characterized its decision as a matter of fulfilling its judicial obligation to move forward and develop additional rights under the state constitution without being constrained by federal decisions.[93] *Breese* therefore set the stage for the development of the right to privacy law under the explicit language of section 22.

In 1975 the Alaska Supreme Court decided the first major case under the 1972 privacy amendment. In *Ravin v. State*,[94] the court recognized the fundamental right to privacy in one's home. In reviewing a state statute that prohibited the possession of marijuana by an adult for personal use in the home, the court inquired whether the statute was designed to accomplish a legitimate governmental interest and whether the means chosen bore a close and substantial relationship to that interest.[95]

After an extensive review of the available scientific evidence,[96] the court found that the potential harm was not great ***19** enough to show a close and substantial relationship between the state's interest in public welfare and marijuana use in the home.[97] However, the court did not find constitutional protection for the buying or selling of marijuana, the use of marijuana in a public place, or the possession of a large amount of marijuana at home.[98] Furthermore, the court did not hold that the possession or ingestion of marijuana was a fundamental right itself; rather, the court found that the privacy of one's home afforded protection from this type of governmental intrusion.[99]

In his concurring opinion in *Ravin*, Justice Boochever noted that federal privacy law was particularly unsettled and, citing *Baker v. City of Fairbanks*,[100] argued that it was therefore appropriate for the court to use independence and initiative in interpreting the privacy provision of the state constitution.[101] He also urged a broader interpretation than that found under the United States Constitution because, unlike the United States Constitution, "the citizens of Alaska, with their emphasis on individual liberty, enacted an amendment to the Alaska Constitution expressly providing for a right to privacy not found in the United States Constitution."[102] To achieve such broad protection, Justice ***20** Boochever argued for the use of "a single flexible test,"[103] which was, in reality, a sliding-scale analysis.

A follow-up case to *Ravin* was decided by the Alaska Supreme Court in 1978. In *State v. Erickson*,[104] the court ruled on whether the ingestion of cocaine in the home was protected by the right to privacy. The court's approach was substantially similar to the sliding-scale test used to address equal protection issues.[105] The test balances the infringing governmental conduct with the privacy interest in question. In Erickson, the privacy interest was similar to the one previously addressed in Ravin because it involved the use of illicit drugs in the defendant's own

home.[106] In Erickson, however, the drug in question was cocaine rather than marijuana. The court found the dangers presented by cocaine to exceed those posed by marijuana use.[107] Accordingly, the drug user's privacy interest was outweighed by the societal need to regulate the demonstrated dangers of cocaine.[108]

In the area of informational privacy, the Alaska Supreme Court has also employed a balancing test that appears to be yet another form of the sliding-scale standard. For example, in the 1977 case of *Falcon v. Alaska Public Offices Commission*,[109] a doctor challenged the requirement that he, as a member of a school board, had to release a list of the names of his patients to the commission. The court found that, while the doctor did not have a personal privacy stake in the list, the patients did.[110] The court balanced the state's interest in promoting fair and honest government ***21** with the patients' interest in concealing their identity and held that, until the state's means to its valid purpose provided some form of screening, the regulation must be suspended.[111] Moreover, in more recent cases involving information and privacy, the court has cited the Falcon balancing approach in applying a "compelling interest" test. The test applied in these privacy cases, however, is not the old two-prong test, but rather reflects a balancing approach as used in Falcon.[112]

Privacy law in Alaska is still developing. With respect to privacy in the home, a balancing or sliding-scale type of test is fairly well established. Nevertheless, in areas such as informational privacy, the court appears to be working to develop a balancing analysis.[113] Alaska's discourse on the right to privacy reflects both the state's independence and its unique tradition of emphasizing individual liberties. Alaska's discourse concerning privacy ***22** rights has involved not only an examination of the right itself but also the development of the test for judicial evaluation of the right. In cultivating this discourse, Alaska exemplifies the essence of NJF as well as the benefits of departing from the federal path.

96
As part of its analysis, the court considered evidence, including the state's justifications that marijuana is a psychoactive drug, it is harmful, heavy use entails a concomitant risk, it is capable of precipitating a psychotic reaction in at least some circumstances and its use adversely affects the user's ability to operate an automobile. Id. at 504-11.
97
Id. at 511.

99
Id. at 504. In 1990, Alaskans approved an initiative for a new statute recriminalizing the possession of marijuana in a private location. The 1990 Elections: State by State, N.Y. Times , Nov. 8, 1990, at B9. The resultant statute, see Alaska Stat. s 11.71.060 (Supp. 1994), while not yet before the state supreme court, would probably survive a constitutional challenge on the same grounds as the cocaine regulation in *Erickson*. New evidence as to the dangers of marijuana produced during the initiative drive has changed the balance from that present in 1975, when *Ravin* was decided.

Interestingly, Professor Gardner cites the *Ravin* case and the subsequent 1990 initiative for the proposition that "the Alaskan character for rugged individuality did not hold out for long against the nationwide hardening in attitudes against drug use." Gardner, supra note 2, at 828 n. 283. Perhaps if Gardner had examined the constitutional development surrounding this issue, he might have seen the case and initiative as part of a lively constitutional discourse rather than a sign of Alaskans' lost individuality.

107

Id. at 21-22.

108

While the discourse regarding the standards for equal protection and privacy claims has been complicated by cases raising both issues, the standards that have emerged are very similar, that is, a balancing test in both instances. The standard for equal protection claims as articulated in *Alaska Pacific Assurance Co. v. Brown*, 687 P.2d 264, 269-70 (Alaska 1984), is the substantial equivalent of the privacy test laid out in *Erickson*, namely, "[w] here the right to privacy is manifested in terms of interests more squarely within personal autonomy, the balance requires a heavier burden on the State to sustain the legislation in light of the right involved." *Erickson*, 574 P.2d at 22 n.144.

109

570 P.2d 469 (Alaska 1977).

110

See id. at 478-79.

111

Id. at 480.

112

See *Messerli v. State*, 626 P.2d 81 (Alaska 1980) (challenging campaign disclosure law on privacy, free speech and free press grounds). With this combination of rights, the *Messerli* court applied a strict compelling interest standard on the state's interest in general. The court held that the disclosures could be required only if adequate procedural safeguards were established. In discussing privacy, the court cited *Breese* for the proposition that the right to privacy is not absolute. Id. at 84. Given the combination of rights involved, *Messerli* can be viewed to illustrate balancing at the upper end or compelling interest level of review. The case also illustrates several areas where the Alaska constitution provides broader protections than the United States Constitution. Id. at 83.

State v. Oliver, 636 P.2d 1156 (Alaska 1981) also illustrates the court's application of a compelling interest test by balancing the privacy interests of a tax protestor claiming that a state requirement for the filing of a W-2 form violated the state right to privacy. The *Oliver* court noted that the information was neither highly sensitive nor intended to be kept confidential, and the court therefore concluded that the state's interest outweighed the protestor's. Id. at 1167-68. The court used language similar to that found in Falcon regarding the balancing of interests. Id. at 1167.

Nelson, *supra* at 41

UAS Privacy Considerations

Unmanned Aircraft Systems (UAS) are emerging technologies that have the potential to transform America by providing wide ranging economic, environmental, safety, and security benefits. A recent study[i] by the Association for Unmanned Vehicle Systems International conservatively estimates that 103,776 high paying jobs could be created and state tax revenue could exceed $482 million by 2025. They believe that every year the integration of UAS into the aviation system[ii] is delayed, America will lose more than $10 billion in potential economic impact.

UAS applications and benefits include assisting these civil government and commercial tasks: emergency deployment at accident scenes, search and rescue, barricade situations, structure or other fire emergencies, terror threats, firefighting, chemical and HAZMAT detection, crop dusting, agricultural development, monitoring of pollution, pipelines, wildlife, traffic, and floods, aerial news coverage, delivering medical supplies to remote areas, aerial photography, forensic photography, real-estate photography, filmmaking, communications, broadcasting, Arctic and volcanic research, damage assessment, cargo transportation, port, border, and event security, etc. In addition to these direct benefits, UAS implementation has the potential to spawn many new industries and provide an incredible array of manufacturing, operation, and other high paying job opportunities.

Along with these benefits come concerns about individual privacy. There is an existing body of federal, state and local law relating to privacy. The question is whether existing law is adequate, absent extensive judicial review, to alleviate the concerns of state legislators and citizens regarding privacy rights in light of this new technology. Because this technology can use a variety of sensors and some can potentially loiter for long periods of time without detection, there is a concern that government can use these systems to monitor individuals in a way that was not imagined in Supreme Court 4th Amendment rulings based on the presumption of privacy[iii]. Because state law interacts with Federal 4th Amendment rulings, states may choose to enact legislation addressing this issue. The challenge is to provide privacy protection while allowing the use of UAS to achieve UAS' many benefits, as described above.

Because of the complexity of this issue and the importance of privacy to citizens in every state, representatives of the Aerospace States Association (ASA)[iv], the Council of State Governments (CSG)[v], and the National Conference of State Legislatures (NCSL)[vi], have joined together to create considerations for states to evaluate in developing UAS legislation. As part of our impartial deliberative process, UAS privacy stakeholder associations including the ACLU, EPIC, and IACP Aviation Committee [vii], AUVSI – the industry trade association[viii] – as well as academics[ix] responded to our request to submit their suggestions for state privacy legislation to an independent law firm, Cadwalader, Wickersham & Taft LLP[x]. These submissions can be seen at http://aerostates.org/events/uas-privacy-submissions. Our review also included the Congressional Research Service's report, "Integration of Drones into Domestic Airspace: Selected Legal Issues," from April 4, 2013, and a memorandum for the Secretary from the Office of Civil Rights and Civil Liberties, U.S. Department of Homeland Security, dated September 14, 2012. After deliberation, ASA, CSG, and NCSL provide the following considerations:

1. Warrants: States may consider requiring a warrant for government surveillance of an individual or their property where the individual is specifically targeted for surveillance in advance without their permission. All other observation activities should not require a warrant, to the extent allowed under Supreme Court rulings. Additionally, if there is not a specific person identified for surveillance in advance, it is generally not possible to obtain a warrant. Requiring one would eliminate UAS benefits, but can be addressed per recommendation number two, below.

2. Data Concerns: Some are worried about government use of data derived from warrantless observations. States may consider addressing this by prohibiting the repurposing of data collected from Government use of UAS in warrantless observation unless a warrant allows the repurposing.

3. States may consider prohibiting commercial UAS and model aircraft flights from tracking specific, identifiable individuals without their consent.

4. States can consider prohibiting weapons to be carried by any UAS in commercial airspace.

5. States may consider endorsing the International Association of Chiefs of Police Aviation Committee (IACP) "Recommended Guidelines for the use of Unmanned Aircraft[xi]." These guidelines define UAS and provide guidance for community engagement, system requirements, operational procedures, and image retention for UAS operations by law enforcement organizations.

6. States may consider emphasizing that the FAA regulates commercial UAS[xii], and that they and model aircraft operations should be operated in a manner not to present a nuisance to people or property.

End Notes

[i] Economic Impact of Unmanned Aircraft Systems in the United States, March 2013, http://www.auvsi.org/econreport

[ii] The Federal Aviation Administration regulates all civil airspace, vehicles, and operators within the U.S. for safety and efficient airspace use through federal preemption. UAS safety regulations are being developed by the FAA. Until such regulations are in place, civil UAS operations must be specifically approved by the FAA. Government operations must comply with civil air traffic control directives. A lack of FAA permissive regulation and state prohibitions of UAS use delay integration of UAS into the aviation system and adversely affect America's global competitiveness in the development of this industry.

[iii] The crucial inquiry for Fourth Amendment protection is whether a person has a reasonable expectation of privacy that society is prepared to recognize. Courts have found that individuals may have a Fourth Amendment right against the unreasonable search and seizure of the area surrounding a house, referred to as the "curtilage." The Supreme Court has found that aerial surveillance over private property does not violate the Fourth Amendment if conducted by an aircraft in legally navigable airspace.

However, UAV's can fly lower, often undetected, and this holding might not apply to UAVs and their unique capabilities, and arguably remains an open question.

[iv] ASA is a bipartisan organization that represents the grassroots of American aerospace. It is a 501(c)(3) scientific and educational organization of lieutenant governors, governor-appointed delegates, and associate members from industry and academia. ASA was formed to promote a state-based perspective in federal aerospace policy development and to support education outreach and economic development opportunities.

[v] Founded in 1933, The Council of State Governments is our nation's only organization serving all three branches of state government. CSG is a region-based forum that fosters the exchange of insights and ideas to help state officials shape public policy. This offers unparalleled regional, national and international opportunities to network, develop leaders, collaborate and create problem-solving partnerships.

[vi] The National Conference of State Legislatures is a bipartisan organization that serves the legislators and staffs of the nation's 50 states, its commonwealths and territories. NCSL provides research, technical assistance and opportunities for policymakers to exchange ideas on the most pressing state issues. NCSL is an effective and respected advocate for the interests of state governments before Congress and federal agencies.

[vii] In response to our request for information, papers were received from the Airborne Law Enforcement Association (including and referencing the guidelines from the International Association of Chiefs of Police Aviation Committee), the American Civil Liberties Union, the American Legislative Exchange Council, the Electronic Frontier Foundation, the Electronic Privacy Information Center and the National Association of Criminal Defense Lawyers.

[viii] The Association for Unmanned Vehicle Systems International is the world's largest non-profit organization devoted exclusively to advancing the unmanned systems and robotics community. Serving more than 7,500 members from government organizations, industry and academia, AUVSI is committed to fostering, developing, and promoting unmanned systems and robotic technologies. AUVSI members support defense, civil and commercial sectors.

[ix] Douglas Marshall of New Mexico State University and Paul Voss of Smith College responded to our requests.

[x] Cadwalader, Wickersham & Taft LLP, established in 1792, is one of the world's leading international law firms, with offices in New York, Washington, D.C., Charlotte, Houston, London, Hong Kong, Beijing and Brussels. Cadwalader has provided pro bono legal services to ASA for over 20 years.

Ms. Allie Bohm, American Civil Liberties Union

Dear Allie,

I am writing to invite you to join with the Aerospace States Association (ASA), the Council of State Governments (CSG), and the National Conference of State Legislatures (NCSL) in an important and timely dialogue on privacy issues related to incorporating Unmanned Aircraft Systems (UAS) into the national airspace.

I believe we all view privacy as a serious issue that our constituents are concerned about, yet we also see the long-term benefits in the use of unmanned aircraft for carrying out missions that are otherwise dirty, dull or dangerous. Commercial use could also create high paying jobs and environmental benefits that could transform our economy.

Many states have begun drafting legislation to address the privacy concerns related to UAS. We want to give thorough, thougtful consideration to all sides of the issues in order to develop suggested legislation for consideration by the states.

Please be a part of this effort by reviewing the attached plan we've developed and **submitting your comments to Bob Davis by Email to bob.davis@cwt.com, fax to 202-862-2400 or mailed by post to Cadwalader, 700 6th Street, NW, Suite 300, Washington, DC 20001 by June 1.** Your submission should address civil, commercial and personal use of UAS and contain your views on the "assumption of privacy" in UAS use. Your submission should not exceed three pages. An independent law firm, Cadwalader, Wickersham & Taft LLP, and leaders of state government associations will review your submission and draft best practices and suggested legislation based on your comments, to be presented at a roundtable discussion in Washington, D.C. on August 14. You are invited to participate in the roundtable to personally discuss the results of our drafting effort.

Thank you for your leadership, and for taking the time to participate in this dialogue.

Sincerely,

Mead Treadwell
Lieutenant Governor, State of Alaska
Chair, Aerospace States Association

Bob Davis
Cadwalader
700 6th Street, NW, Suite 300
Washington, DC 20001

Dear Mr. Davis:

On behalf of the American Civil Liberties Union (ACLU), a non-partisan organization with more than a half million members, countless additional activists and supporters, and fifty-three affiliates nationwide, we appreciate the opportunity to comment on the privacy and civil liberties implications of domestic use of unmanned aircraft systems (UAS), also known as drones, and to recommend new protections for use of the technology.

Like any powerful surveillance tool, UAS have the potential to be used for good or ill. With implementation of good privacy ground rules, we can enjoy the benefits of this technology without bringing our country closer to a "surveillance society" in which every move is monitored, tracked, recorded, and scrutinized by the authorities.

UAS share some characteristics with manned aerial surveillance, such as planes and helicopters, but their threat to privacy is substantially greater in both scope and volume. Manned aircraft are expensive to purchase, operate, and maintain. They require trained pilots and ground crews and must land in order for pilots to rest. The expense both in dollars and in staffing has always imposed a natural limit on the government's aerial surveillance capacity. UAS's low cost and flexibility erode that natural limit. As technology improves, small, hovering devices will be able to explore hidden spaces, peer in windows, or even, potentially, enter homes, and large static blimps will enable continuous, long-term monitoring – all for much less than the cost of a helicopter or plane.

In our society, it is a core principle that the government does not collect information about individuals' innocent activities just in case they do something wrong. But UAS threaten to turn that principle on its head. What would be the effect on our society if everyone felt the keen eye of the government at all times? Psychologists have repeatedly found that people who are being observed tend to behave differently than when they are not being watched. This effect is so great that a recent study found that "merely hanging up posters of staring human eyes is enough to significantly change people's behavior."[1] There is a real danger that, if faced with the prospect of unregulated UAS, people will change how they behave in public – whether at a political rally or in their own backyards.

[1] Sander van der Linden, "How the Illusion of Being Observed Can Make You a Better Person," Scientific American, May 3, 2011, online at http://www.scientificamerican.com/article.cfm?id=how-the-illusion-of-being-observed-can-make-you-better-person; M. Ryan Calo, "People Can Be So Fake: A New Dimension to Privacy and Technology Scholarship," 114 Penn St. L. Rev. 809, online at http://www.pennstatelawreview.org/articles/114/114%20Penn%20St.%20L.%20Rev.%20809.pdf.

UAS may also suffer from the problems we've seen with video surveillance – voyeurism,[2] racial profiling by operators,[3] and automated law enforcement.[4]

The Supreme Court has not yet had occasion to consider whether the Fourth Amendment places limits on government use of UAS. However, it has allowed some warrantless aerial surveillance from *manned* aircraft. Most notably, in the 1986 decision *California v. Ciraolo*, the Court ruled that there was no intrusion into Ciraolo's privacy when police borrowed an airplane, flew it over his backyard and spotted marijuana plants growing there, because "[a]ny member of the public flying in this airspace who glanced down could have seen everything that these officers observed."[5]

Nonetheless, because of their potential for pervasive use and their capacity for revealing far more than the naked eye, there are good reasons to believe that UAS may implicate Fourth Amendment rights in ways that manned flights do not. In both *Dow Chemical Co. v. United States*[6] and *Kyllo v. United States*,[7] the Supreme Court suggested that using sophisticated technology not generally available to the public may be considered a search under the Fourth Amendment.

Further, the Supreme Court has suggested that the continuous use of a surveillance technology may heighten Fourth Amendment concerns. In *United States v. Knotts*, although the Court concluded that the use of the beeper in that case did not violate the Fourth Amendment, it held that if "such dragnet type law enforcement practices" as "twenty-four hour surveillance of any citizen of this country" ever arose, it would determine if different constitutional principles would be applicable.[8] Similarly, in *United States v. Jones*, five justices agreed (in two concurrences) that when the government engages in prolonged location tracking, it conducts a search under the Fourth Amendment.[9] While this decision may eventually play a role in regulating drone usage, the technology is moving far more rapidly than our jurisprudence, and it is critical that state legislatures act to protect their constituents' privacy.

State legislation should reflect the following key principles:

First, no one should be spied upon unless the government believes that person has committed a crime. Drone use over private property should occur only with a search warrant based on probable cause – the same standard used to search someone's house or business. It might be permissible to monitor individuals in public at a lower standard – perhaps reasonable suspicion – but the key is to prevent mass, suspicionless searches of

the general population, including for intelligence gathering. Exceptions to this rule should be limited to emergencies connected to life and safety or narrowly drawn administrative exceptions in order to prevent pretextual use of drones.

Additionally, while the Constitution may permit UAS surveillance of public spaces on less than a probable cause standard, the vast majority of the 96 different drone bills being considered in 43 states this legislative session[10] require law enforcement to get a probable cause warrant before using a drone in an investigation, whether that investigation occurs in private or public space, a good indicator that a warrant requirement for drone use is both workable and palatable. Already, warrant requirements have been enacted in Florida,[11] Idaho,[12] Montana,[13] and Tennessee.[14]

Second, images of identifiable individuals captured by law enforcement UAS should not be retained or shared unless they are of the target of the investigation that justified drone deployment, and there is reasonable suspicion that the images contain evidence of criminal activity or are relevant to an ongoing investigation or pending criminal trial.

Third, while drone use should be permitted for reasonable non-law enforcement purposes where privacy will not be substantially affected, such as geological inspections or environmental surveys, information collected by drones for one purpose should not be used for another purpose such as general law enforcement or enforcing administrative laws.

Fourth, drones should not carry weapons.

Finally, oversight is crucial. Communities must play a central role in deciding whether to purchase drones, and the policies and procedures for the use of UAS should be explicit and written, and should be subject to public review and comment. Similarly, like any new technology, drone use must be monitored to make sure it's a wise investment that works.

Placing reasonable limitations on law enforcement is by no means a new idea – for example, authorities may take a thermal image of someone's home only when they get a warrant – and it is imperative that we implement a system of rules to ensure that we can take advantage of UAS technology without sacrificing our privacy. If you have any questions, would like to discuss the issue further, or would like to see ACLU's model state legislation, please don't hesitate to reach out to me at abohm@aclu.org or (212) 284-7335.

Sincerely,

Allison S. Bohm, Advocacy & Policy Strategist

SUBJECT: Legal issues related to unmanned aircraft systems

I. Introduction and background.

In your capacity as chair of the Aerospace States Association, you asked me to provide you with a brief description and analysis of the core legal issues related to the civilian use of Unmanned Aircraft Systems (UAS), also known as "drones." The context for your inquiry is the University of Alaska's pending application with the Federal Aviation Administration (FAA) to become one of a limited number of testing sites in the nation for UAS. Please note that this document is not legal opinion of the Office of the Attorney General, but rather simply a compendium of my research and a preliminary analysis.

UAS are unmanned aircraft designed to do tasks that are too difficult, dull, dangerous, or expensive for manned aviation, and are designed to carry a "system payload" such as a camera or sensor.[1] Traditionally, UAS have been used for military

[1] Association for Unmanned Vehicle Systems International ("AUVSI"), UAS Privacy Issues Document.

purposes, but they are being increasingly deployed in domestic civilian contexts such as law enforcement, disaster relief, fire-fighting, agriculture, energy, industry, wildlife tracking, and others.[2] Commercial use of UAS is currently prohibited, but that is expected to change by 2014.[3] UAS can range in size from smaller than a cell phone to larger than a commercial jetliner.[4] Research sponsored by the Association for Unmanned Vehicle Systems International (AUVSI), a non-profit trade association that supports the civilian use of UAS, concluded that the integration of UAS into the national airspace has the potential to create more than 100,000 new jobs and $82 billion of economic impact by 2025.[5]

The legal issues surrounding the civilian use of UAS relate mainly to privacy and property interests, and are relatively untested in the courts because of the novelty of the technology involved and the regulatory vacuum in which that technology operates. Fortunately, there has been significant legal scholarship as well as congressional reporting[6] in in this area, all of which I rely upon heavily in this memorandum. I have also reviewed all the materials Charles Huettner emailed me after our April 5th teleconference. Some limited case law also exists on the privacy concerns raised by aerial surveillance and similar technologies. These cases telegraph how the Supreme Court might view the privacy implications of UAS. Following is the requested description, summary, and analysis of the issues that have arisen and been analyzed by legal scholars to date. I also discuss the Alaska-specific implications of these issues, which are not discussed in any of the law reviews, journals, or reports.

II. Core legal issues raised by the use of UAS/drones.

The FAA oversees all aircraft operations in the United States and makes and

6 *See* Integration of Drones into Domestic Airspace: Selected Legal Issues, Congressional Research Service, CRS Report for Congress (April 4, 2013).

enforces rules to implement and interpret laws passed by Congress governing aviation.[7] Federal law enacted in February 2012 (The Federal Aviation Administration Modernization and Reform Act of 2012) requires the FAA to devise a comprehensive plan to integrate all civilian UAS into the national airspace system by September 30, 2015, appropriates billions of dollars in funding, and creates the six UAS test sites for which many states, including Alaska, are vying.[8]

The federal government is still struggling with the regulation of UAS, specifically, how to define these vehicles, how to clarify which—if any—existing regulations apply to them, how to craft future regulations to encompass vehicles not governed by existing regulations, and how to ensure that future regulations do not inadvertently regulate other industries such as model or hobby aircraft.[9] The FAA will need to identify technology (*e.g.* cameras and radar) that will obviate the need for regulations requiring pilots to "see and avoid" other aircraft, address appropriate training for UAS operators, devise proper procedures for when a UAS loses contact with an operator or is hacked, coordinate with other countries and agencies in adopting regulations, and ensure that there is sufficient wireless spectrum to accommodate the communication needs of these vehicles.[10] Presently, UAS operators engaged in both public aircraft operations and private operations are required to have special certifications from the FAA.[11]

There is no legislation yet governing UAS in Alaska, although there is model legislation that AUVSI is compiling, and according to news reports, at least one other state—Florida—has begun to legislate UAS. Two bills were introduced in Alaska last session that touch upon UAS: HB 159, "An Act relating to the admissibility of evidence acquired through the use of an unmanned aerial vehicle; establishing a crime for certain uses of unmanned aerial vehicles; and restricting the use of unmanned aerial vehicles for collection of information or investigation by peace officers and other government agents;" and HCR 6, "Recognizing the Alaska Center for Unmanned Aircraft Systems

11 Villasenor, *supra* note 2, at 471.

Integration at the University of Alaska Fairbanks as a national leader in unmanned aircraft research and development; and relating to a Task Force on Unmanned Aircraft Systems." Presumably, these bills could be revisited next session.

Any discussion of UAS legislation must also consider federal pre-emption and the interplay between state and federal law. Although aircraft safety, trade, and noise regulation is the established provenance of the federal government, states may still pass laws governing how aircraft are flown.[12] Both Alaska and federal law prohibit the reckless operation of aircraft, but Alaska could not enact privacy laws that would decrease or implicate in any way the safety of flight operations, such as laws governing aircraft speed or altitude.[13] From a pre-emption standpoint, the safest area for state legislation is in the realm of privacy laws aimed at non-government actors that address trespass, invasion of privacy, stalking, and harassment, because state power to legislate in this area is well-established.[14]

In short, there is both a mandate and pressing need to legislate and regulate UAS at both the state and federal level. However, the precise parameters and scope of that legislation and regulation remain nebulous at best.

III. Constitutional rights.

A. The Fourth Amendment.

Probably the biggest legal issue surrounding UAS is the implications of these devices for individual privacy rights. The Fourth Amendment to the United States Constitution guarantees to the people the right to be free from unreasonable search and seizure by the government.[15] The Alaska Constitution contains an analogous search and seizure provision, as well as an explicit clause guaranteeing to its citizens the right to privacy.[16] Because the FAA is primarily a regulating agency whose mandate is to ensure

15 *See* U.S. Const. amdt. IV.

16 Alaska Const. art. I, §§ 14 and 22. Note that these provisions bind only government actors—not private citizens.

the efficient and safe operation of U.S. airspace, questions have arisen whether this agency is really the appropriate entity to ensure that government actors using UAS are not violating these basic constitutional principles or whether constitutional privacy compliance should be spearheaded at the state or federal level by some other agency. It is clear, however, that no government actor may commit such violations.

The crucial inquiry for Fourth Amendment and state constitutional privacy purposes is whether a person has a reasonable expectation of privacy that society is prepared to recognize. One scholar notes that "[w]here a [UAS] captures images that could have been obtained from civilian aircraft traveling in a legally authorized manner, privacy claims are limited. Consumers lack a reasonable expectation of privacy with respect to areas already exposed to civilian over-flights."[17] However, novel imaging technologies such as thermal and infrared imaging could raise concerns. Indeed, as noted by another scholar who has examined the issue, "[t]he privacy issues raised by the potential ubiquity of [UAS] go beyond the current Fourth Amendment jurisprudence."[18] Indeed, "[t]here is no precedent that squarely addresses privacy implications of governmental use of a technology that allows essentially permanent, multi-dimensional, multi-sensory surveillance of citizens twenty-four hours a day."[19]

However, there has been some judicial guidance. *Katz v. U.S.*[20] was a landmark Fourth Amendment case in which the Supreme Court held for the first time that a Fourth Amendment violation could occur absent a physical intrusion—specifically, through a listening device the police had affixed to the outside of a public phone booth. This was the first "remote sensing" case, soon to be followed by a trilogy of key "aerial surveillance cases."

The "remote sensing" cases fall into two categories: "open fields" and "curtilage." Remote sensing in "open fields" does not implicate the Fourth Amendment because open

19 *Id.* at 675.

20 389 U.S. 347 (1967).

fields are areas of public and private property that "do not provide the setting for those intimate activities that the [Fourth] Amendment is intended to shelter from government surveillance or interference."[21] However, "curtilage" is a legal "penumbra" surrounding a home where the Fourth Amendment may be implicated.[22] Whether a given area constitutes "curtilage" depends on the proximity of the area to the home, whether the area is enclosed, the nature of the use to which the area is put, and the steps taken by the resident to protect the area from observation.[23] Although a person may have reasonable expectations of privacy in curtilage, remote sensing of curtilage "does not require law enforcement officers to shield their eyes when passing by a home on public thoroughfares."[24] The bottom line is that remote sensing will not implicate the Fourth Amendment "if it is done from a public vantage point where law enforcement officers can make open observations."[25]

The Supreme Court's "aerial surveillance" trilogy consists of *California v. Ciraolo*,[26] *Florida v. Riley*,[27] and *Dow Chemical Company v. U.S.*[28] All three cases were decided in the 1980s. Together, they stand for the proposition that aerial surveillance of any kind over private or commercial property from aircraft that are lawfully in navigable airspace is not a Fourth Amendment search, because there is no reasonable expectation of privacy in an area that is openly visible from above, regardless whether the area is curtilage or an open field.[29]

28 476 U.S. 227 (1986).

29 Vacek, *supra* note 18, at 682.

In *Ciraolo*, police flew a fixed-wing aircraft 1,000 feet over a defendant's backyard, the minimum safe altitude required by FAA regulations, and observed marijuana plants with the naked eye. The backyard was not visible due to an extensive fencing system, so the aerial search provided the basis for a search warrant and marijuana plants were found after a physical search. The Court held that a ground fence does not create an expectation of privacy to be free from aerial searches because routine flights exposed the backyard to public view.[30]

Riley reached the same holding when officers flew a helicopter 400 feet overhead to peer through openings in a greenhouse and determined marijuana was growing inside the defendant's fenced-in home. Again, the Court found that there was no reasonable expectation of privacy because helicopter flight in navigable airspace was a routine, expected occurrence.[31]

And in *Dow Chemical*, the Environmental Protection Agency, acting without a warrant, hired a private commercial pilot to fly over Dow's property to take aerial photos of suspected regulatory violations. The Court upheld this conduct because "such an industrial complex is more comparable to an open field and as such it is open to the view and observation of persons in aircraft lawfully in the public airspace."[32]

However, decades later in 2001, in *Kyllo v. United States*,[33] the Supreme Court reminded us that the Fourth Amendment protects people—not just places—from unreasonable searches and seizures. *Kyllo* involved law enforcement's warrantless use of thermal imaging to detect unusual amounts of heat radiating from the defendant's home, indicating the presence of marijuana. *Kyllo* held that this surveillance violated the Fourth Amendment because the technology was not in widespread use. Currently, *Kyllo* limits the ability of law enforcement to rely on infrared/thermal imaging technology, but because the Court's decision was directly linked to the prevalence of the technology, it's an open question whether the Court's limitation would persist if these technologies went into more "widespread use." As one scholar put it, "the test seems to turn on whether

32 476 U.S. at 239.

33 553 U.S. 27 (2001).

Wal-Mart sells it or not."[34] Such a question would most likely be tested in a criminal context, where the prosecution seeks to admit evidence obtained through the use of these technologies.

Finally, just last year, in *United States v. Jones*,[35] the Supreme Court held that the installation of a GPS tracking device on a suspect's car for eight days constituted a search under the Fourth Amendment. Although *Jones* did not deal with aerial surveillance, the Court held that the placement of the device was a physical intrusion onto private property for the purposes of obtaining information, as well as the extended monitoring of a person in a public space, both of which constituted a Fourth Amendment "search." Some scholars have predicted that one potential result of *Jones* is that extended UAS surveillance could constitute a search within the meaning of the Fourth Amendment.[36]

It is clear from a review of the scholarship and the limited case law that the rate of advancement of these technologies often outpaces the ability of courts to rule upon the validity of their use under the Fourth Amendment. The overall conclusion so far is that aerial surveillance by any method, at a legal altitude, is constitutional if the technology is in general public use and does not trespass upon private property for extended periods of time. Still, the legal landscape has been characterized as "an aeronautical Wild West," and the current regulatory scheme as "inadequate to deal with the novel issues raised" by the use of UAS, particularly by law enforcement.[37]

In Alaska, we must consider an additional important factor: Article I, section 22 of the Alaska Constitution guarantees an explicit individual right to privacy. There is no state case law interpreting this clause (or any part of the state constitution) in the context of UAS. However, it is highly possible that the Alaska Supreme Court would interpret the right in favor of the individual asserting it as opposed to deferring to the government. For example, our Supreme Court has interpreted the privacy clause to create a constitutional right to privacy in garbage placed for collection, which contrasts with both state and

---

34 Vacek, *supra* note 18, at 683.

35 132 S. Ct. 945 (2012).

36 Kapnik, *supra* note 9, at 495.

37 Vacek, *supra* note 18, at 675-77.

federal case law on the Fourth Amendment.[38] The take-away point here is that government conduct that complies with the Fourth Amendment under either the state or federal constitution could *nonetheless* violate the state constitutional right to privacy. And in 2002, at least one member of the Alaska Court of Appeals, albeit in a concurring and unreported opinion, expressed constitutional skepticism at law enforcement's surreptitious use of infrared helicopter technology of the type prohibited under *Kyllo* the year before.[39]

B. The First Amendment & individual privacy.

In addition to the Fourth Amendment implications of government-operated UAS, these vehicles may also implicate the First Amendment rights of private citizens to collect and gather information. One scholar has recently addressed this issue, noting that for private entities and persons not bound by the Fourth Amendment, the key constitutional question is the extent of these persons' First Amendment right to access information.[40] The Supreme Court long ago held that the First Amendment protects the act of seeking out news, otherwise "freedom of the press could be eviscerated."[41] And at least one circuit court of appeals has recently held that the First Amendment permits a private citizen to record the actions of people in a public space.[42] Congress could potentially enact laws to protect individuals from intrusive UAS surveillance by private actors, which would be considered in a First Amendment context of the right to gather and receive information.[43] Such bills have been introduced, but none have yet been enacted.[44] Because the civilian use of UAS is nascent, and there is no controlling Supreme Court

44 *Id.*

case law, it remains to be seen how far First Amendment protections will extend in this area.

The privacy rights of individuals and businesses exist in perpetual tension with the First Amendment rights of non-government actors to gather information, and that tension could give rise to actionable claims for privacy violations. Common law invasions of privacy could occur if UAS use "intrudes upon seclusion" in the home or results in the "publication of private facts," which are the two main categories of invasion of privacy claims. Intrusion upon seclusion occurs where the intrusion was intentional and would be highly offensive to a reasonable person.[45] A publication of private facts claim could arise where a UAS takes images of private individuals involuntarily caught up in newsworthy events, and those images conveyed facts not previously known to the public.[46] Similarly, the use of UAS could potentially give rise to criminal liability under both federal and state anti-stalking and harassment laws.[47] Finally, UAS could be used by private citizens to investigate or monitor potential health and safety violations by businesses, or engage in corporate espionage. Such conduct raises complex and unanswered questions about a private citizen's right to do under the First Amendment what the government could not do under the Fourth.

In short, the above concepts are nothing new to the First Amendment and privacy arena, but they must and will be revisited in light of UAS enhanced imaging capabilities, ease of use, and ever-increasing availability. As discussed in detail above, the strong privacy protections of the Alaska Constitution make it highly likely that individual privacy rights implicated by UAS will be more zealously legislated and enforced in Alaska than in other jurisdictions.

C. Property rights, & tort liability; nuisance, trespass, & ground damage.

Property owners could potentially file tort claims for nuisance and/or trespass against operators of UAS. According to a preeminent torts treatise, a trespass claim against an aircraft operator is viable only when the aircraft "enters into the immediate reaches of the air space next to the land" and "interferes substantially with . . . the use and

---

45 Restatement (Second) of Torts § 625B (1977).

46 Villasenor, *supra* note 2, at 503.

47 *Id.* at 505.

enjoyment" of the property by the landowner."[48] The navigable airspace regulated by the FAA is considered a public highway, but it appears that anywhere between 50 to 150 feet above the property owner could be considered impermissible interference with private property.[49] Accordingly, UAS that operate within this window of airspace could potentially raise trespass claims, and UAS that generate noise, light, pollution, or vibration could lead to viable nuisance claims by homeowners.[50] Additional tort claims could arise if a UAS caused ground damage to personal or real property.

Title 2 of the Alaska Statutes is devoted entirely to the regulation and operation of aircraft ("Aeronautics"). Alaska Statute 02.30.030 provides that "A person may not operate an aircraft in the air or on the ground or water in a careless or reckless manner so as to endanger the property of another." This statute directs the court, when evaluating such claims, to consider "the standards for safe operation of aircraft prescribed by federal statutes or regulations governing aeronautics." The phrase "operate aircraft" is defined in AS 02.30.050 as "to use, navigate, pilot, or taxi an aircraft in the airspace over this state, or upon the land or water inside the state." This chapter does not contain a definition of "aircraft." However, "aircraft" is defined in the general provisions of Title 2 (Alaska Aeronautics Act of 1949) as "a contrivance used or designed for navigation of flight in the air,"[51] which could be read to include UAS, although this definition was enacted prior to the burgeoning use of civilian UAS. Accordingly, I am uncertain whether UAS would fit into the current statutory definition of "aircraft," and therefore I think it's an open question whether a court would find that the foregoing provisions regarding liability for aircraft operation would automatically apply to operation of UAS or whether additional statutory language would be necessary to expand that definition. My instinct is that UAS should be specifically legislated in this manner.

If Alaska chooses to enter this arena by passing laws or regulations, it is advisable for the legislature to also enact a statutory immunity provision. That way, the state may

---

49 Rapp, *supra* note 17, at 645 (citing *id.*). See also *United States v. Causby*, 328 U.S. 256 (1946) (rejecting the common law concept that a homeowner owns all the airspace above his property up to the heavens, but rather owns "at least that much space above the ground as he can occupy or use in connection with the land.").

50 *Id.*

51 AS 02.15.260(2).

avoid liability for damages in tort when two private UAS collide and fragments cause damage to people or property. Such immunity clauses are common and can deflect an argument that the state is liable simply because it has chosen to legislate in a particular topic area.[52]

D. Environmental concerns.

Scholars have observed the potential of UAS to generate environmental concerns, which could be starker in Alaska than elsewhere. Alaska is already a hotbed of environmental litigation. Many UAS contain batteries, circuitry, and chemicals that could leach into the ground, and the flight of UAS and the noise they cause could disrupt birds and other wildlife habitats.[53] Environmental groups and private citizens could potentially raise federal claims regarding the operation of UAS under the National Environmental Policy Act, the Endangered Species Act, or the Noise Control Act.[54]

In Alaska, to the extent UAS and the execution of implementing statutes interfere with state fish, wildlife, and waters, the government could be found in violation of the "common use" and "sustained yield" provisions of the Alaska Constitution, which provide, respectively, that the state, fish, wildlife and waters of the state are reserved to the people for their common use and that replenishable resources belonging to the state must be utilized, developed, and maintained according to the sustained yield principle.[55]

E. Communications interference.

UAS also have the potential to interfere with existing civilian communications systems used to operate cell phones, satellite TV signals, and other wireless and telecommunications technology.[56] Further, signal loss between UAS and its ground

---

52 *See, e.g.*, AS 09.65.215 (Immunity of peace officer for use of body wire eavesdropping device); AS 09.65.235 (Immunity for negotiated regulation making committee and its members); AS 09.65.250 (Immunity for certain actions related to child support); AS 09.65.330 (Immunity: Use of defensive force).

53 Rapp, *supra* note 17, at 632.

54 *Id.*

55 Alaska Const. art. VIII, §§3, 4.

56 Rapp, *supra* note 17, at 640-41.

control operations could result in a mid-air collision or ground damage.[57] This problem could be somewhat mitigated by the assignation of UAS to specific frequencies once UAS are fully integrated into the national airspace, but the potential for interference still remains.[58]

Under state law, the Department of Transportation and Public Facilities is responsible for supervising, developing, and promoting "aeronautics and communications inside the state . . ."[59] The Department could be held responsible for ensuring, through properly adopted regulations and in conjunction with the federal government, that UAS do not unduly interfere with existing civilian communications systems in the state.

F. Mid-air collisions.

Finally, mid-air collisions of UAS with other aircraft and with each other are always a possibility. Most UAS lack the sophisticated collision avoidance systems required of many manned aircraft, and the absence of an on-board pilot who can physically observe other aircraft exacerbates the risk of a mid-air collision.[60] Furthermore, the "small size and radar profile of [UAS] create significant risk that such craft would damage civilian aircraft, causing both property loss and human casualties."[61]

As described above, individual citizens could file tort claims under state law for damages against operators of UAS or the government associated with such accidents. Collisions and near-collisions have already resulted from the use of UAS at the military level, and the scholarship predicts that "[i]t is hard to imagine widespread integration of [UAS] into populated airspace without some level of air-to-air accidents rising."[62]

62 *Id.*

IV. Conclusion.

There are many more questions than answers surrounding the increased civilian use and operation of UAS, because there is no case law that definitively resolves any of the issues discussed above, and there is a regulatory vacuum. Indeed, "[t]he only certain aspect of the debate about unmanned aircraft and privacy is that it will be contentious."[63] However, identifying and analyzing these issues at the executive level is the first step to crafting legislation that attempts to address them. Only when those laws are tested in the courts will we fully come to understand the interplay between the technological advantages offered by UAS, the reach of constitutional protections, and the scope of actionable legal claims.

June 5, 2013
Mr. Bob Davis
Cadwalader, Wickersham & Taft LLP
700 6th Street, NW, Suite 300
Washington, DC 20001

Dear Mr. Davis:

On behalf of the Airborne Law Enforcement Association (ALEA) and the International Association of Chiefs of Police (IACP) Aviation Committee, we are pleased to submit the following comments regarding the "Privacy Legislation Plan 2013."

To begin, our respective organizations support and promote the IACP Aviation Committee's *Recommended Guidelines for the use of Unmanned Aircraft* (see Exhibit A) and the Association for Unmanned Vehicle Systems International's (AUVSI) *Unmanned Aircraft System Operations Industry "Code of Conduct"* (see Exhibit B). We do not concur with privacy advocates who claim that public safety agencies' utilization of unmanned aerial systems (UAS) poses a greater threat to "privacy rights" than manned aviation. Similarly, we do not concur that said uses pose a greater threat to privacy "rights" than other technologies currently utilized by public safety agencies, both in manned aircraft and on the ground. Furthermore, we do not accept that any legislation is necessary as there are long-standing court rulings upholding our Fourth Amendment protections; but we are particularly opposed to legislation that focus their attention on one technology based on fears of what could occur tomorrow, however unlikely. Aside from recent laws enacted that place outright bans on UAS use, such as that in Charlottesville, VA, many current "anti-drone" bills appear to be more of an attempt to increase protections under the Fourth Amendment without actually altering the U.S. Constitution. The presumption in most of these pieces of legislation is that a reasonable expectation of privacy now exists in places where there has been no such expectation. As such, a warrant must be obtained before UAS can be utilized by public safety.

While U.S. Customs and Border Protection (CBP) has unique operational needs that require larger, longer flight duration aircraft, local, state, and other federal agencies, even if they could afford to acquire and operate similar systems, have no interest in utilizing these types of assets. What they are interested in obtaining are small unmanned aerial systems (sUAS) that are inexpensive, lightweight, portable, and quickly and easily deployable.

sUAS come in two forms: gas powered and battery powered. Within these categories, there are fixed-wing and rotory-wing models. Gas powered sUAS tend to be heavy, loud, and can fly for greater periods of time. Battery powered sUAS are lightweight, relatively quiet, slower, and have short flight durations, especially for the rotory-wing models.

As such, sUAS that are available to public safety, coupled with the Federal Aviation Administration's (FAA) regulations governing the use of UAS by public safety (e.g., cannot exceed 4.4 pounds, cannot exceed 400 feet above ground level (AGL), can only be operated during daylight conditions, and must remain within line of sight of the operator at all times), make this new technology a poor candidate for "spying," as well as for persistent surveillance operations. The fact of the matter is, "spying" and persistent surveillance can be done much more effectively by manned aircraft and ground personnel, than with any sUAS.

With that said, if legislation is to be drafted, we suggest that the following be considered:

1. The courts have determined in their interpretations of Fourth Amendment cases, that citizens have a "reasonable expectation of privacy." Be cognizant that changing the circumstances under which people have reasonable expectations of privacy can have unintended consequences. If a law enforcement agency determined that the use of a sUAS during a public event was necessary to maintain public safety (assuming that such use would even be permissible under FAA rules), but there is a law requiring that a warrant be issued prior to its use in that capacity, the sUAS could not be used because a judge would have no one to write a warrant for. At the same time, law enforcement conducts these operations regularly with manned aircraft. Why? Because the courts have already determined that there is no reasonable expectation of privacy in such a setting. Does it make sense to have a law that creates a different reasonable expectation of privacy for a UAS from anything else? Will we be seeing legislation developed then for cell phones? GPS? Video cameras? Having more than one "reasonable expectation of privacy" standard is unworkable in law enforcement.

2. Concentrate on sensitive data collection, use, distribution, storage, and purging of data and not on the technology that was used to obtain the data originally. If a person's "reasonable expectation of privacy" is violated by an "unreasonable search and seizure," the device used to create that violation, whether it's a global satellite positioning system, computer, cell phone, video pole camera, manned aircraft camera, unmanned aircraft camera, etc., is irrelevant.

3. Legislation needs to focus on the law enforcement agency utilizing sound policy to govern the use of sUAS technology. The policy should be in accordance with the IACP Guidelines; these Guidelines are a solid starting point for the development of policies for the use of sUAS.

We appreciate the opportunity to have input into this process and look forward to participating in the upcoming roundtable meeting in Washington, DC on August 14.

Sincerely,

Stephen J. Ingley

EXHIBIT A

INTERNATIONAL ASSOCIATION OF CHIEFS OF POLICE

AVIATION COMMITTEE

Recommended Guidelines for the use of Unmanned Aircraft

BACKGROUND:

Rapid advances in technology have led to the development and increased use of unmanned aircraft. That technology is now making its way into the hands of law enforcement officers nationwide.

We also live in a culture that is extremely sensitive to the idea of preventing unnecessary government intrusion into any facet of their lives. Personal rights are cherished and legally protected by the Constitution. Despite their proven effectiveness, concerns about privacy threaten to overshadow the benefits this technology promises to bring to public safety. From enhanced officer safety by exposing unseen dangers, to finding those most vulnerable who may have wandered away from their caregivers, the potential benefits are irrefutable. However, privacy concerns are an issue that must be dealt with effectively if a law enforcement agency expects the public to support the use of UA by their police.

The Aviation Committee has been involved in the development of unmanned aircraft policy and regulations for several years. The Committee recommends the following guidelines for use by any law enforcement agency contemplating the use of unmanned aircraft.

DEFINITIONS:

1. **Model Aircraft** - A remote controlled aircraft used by hobbyists, which is manufactured and operated for the purposes of sport, recreation and/or competition.
2. **Unmanned Aircraft (UA)** – An aircraft that is intended to navigate in the air without an on-board pilot. Also called Remote Piloted Aircraft and "drones."
3. **UAS Flight Crewmember** - A pilot, visual observer, payload operator or other person assigned duties for a UAS for the purpose of flight.
4. **Unmanned Aircraft Pilot** - A person exercising control over an unmanned aircraft during flight.

COMMUNITY ENGAGEMENT:

1. Law enforcement agencies desiring to use UA should first determine how they will use this technology, including the costs and benefits to be gained.
2. The agency should then engage their community early in the planning process, including their governing body and civil liberties advocates.
3. The agency should assure the community that it values the protections provided citizens by the U.S. Constitution. Further, the agency will operate the aircraft in full compliance with the mandates of the Constitution, federal, state and local law governing search and seizure.
4. The community should be provided an opportunity to review and comment on agency procedures as they are being drafted. Where appropriate, recommendations should be considered for adoption in the policy.
5. As with the community, the news media should be brought into the process early in its development.

SYSTEM REQUIREMENTS:

1. The UAS should have the ability to capture flight time by individual flight and cumulative over a period of time. The ability to reset the flight time counter should be restricted to a supervisor or administrator.
2. The aircraft itself should be painted in a high visibility paint scheme. This will facilitate line of sight control by the aircraft pilot and allow persons on the ground to monitor the location of the aircraft. This recommendation recognizes that in some cases where officer safety is a concern, such as high risk warrant service, high visibility may not be optimal. However, most situations of this type are conducted covertly and at night. Further, given the ability to observe a large area from an aerial vantage point, it may not be necessary to fly the aircraft directly over the target location.
3. Equipping the aircraft with weapons of any type is strongly discouraged. Given the current state of the technology, the ability to effectively deploy weapons from a small UA is doubtful. Further, public acceptance of airborne use of force is likewise doubtful and could result in unnecessary community resistance to the program.

4. The use of model aircraft, modified with cameras, or other sensors, is discouraged due to concerns over reliability and safety.

OPERATIONAL PROCEDURES:

1. UA operations require a Certificate of Authorization (CAO) from the Federal Aviation Administration (FAA). A law enforcement agency contemplating the use of UA should contact the FAA early in the planning process to determine the requirements for obtaining a COA.
2. UAS will only be operated by personnel, both pilots and crew members, who have been trained and certified in the operation of the system. All agency personnel with UA responsibilities, including command officers, will be provided training in the policies and procedures governing their use.
3. All flights will be approved by a supervisor and must be for a legitimate public safety mission, training, or demonstration purposes.
4. All flights will be documented on a form designed for that purpose and all flight time shall be accounted for on the form. The reason for the flight and name of the supervisor approving will also be documented.
5. An authorized supervisor/administrator will audit flight documentation at regular intervals. The results of the audit will be documented. Any changes to the flight time counter will be documented.
6. Unauthorized use of a UA will result in strict accountability.
7. Except for those instances where officer safety could be jeopardized, the agency should consider using a "Reverse 911" telephone system to alert those living and working in the vicinity of aircraft operations (if such a system is available). If such a system is not available, the use of patrol car public address systems should be considered. This will not only provide a level of safety should the aircraft make an uncontrolled landing, but citizens may also be able to assist with the incident.
8. Where there are specific and articulable grounds to believe that the UA will collect evidence of criminal wrongdoing and if the UA will intrude upon reasonable expectations of privacy, the agency will secure a search warrant prior to conducting the flight.

IMAGE RETENTION:

1. Unless required as evidence of a crime, as part of an on-going investigation, for training, or required by law, images captured by a UA should not be retained by the agency.
2. Unless exempt by law, retained images should be open for public inspection.

ALEC American Legislative Exchange Council

LIMITED GOVERNMENT • FREE MARKETS • FEDERALISM

Proposal for American Legislative Exchange Council (ALEC)
Unmanned Aerial Vehicle Proposal

Program Objective

The objective of ALEC's Unmanned Aerial Vehicle (UAV) program is to educate our policy makers about the issues surrounding the use of UAVs for domestic purposes. We will inform our state legislator members about considered uses for UAVs in law enforcement, border control, firefighting, search and rescue operations and myriad other uses. We will explore the privacy issues involved and would like to present our members a balanced overview of the topic that addresses some of the misconceptions about UAV capabilities and the benefits of UAV use in the domestic sphere.

Situational Overview

State legislatures are rapidly enacting legislation on domestic UAV use without a complete understanding of the issues involved. As of this writing, 35 states had considered or were considering legislation, including Virginia which passed legislation restricting the use of UAVs, including a two-year moratorium on using UAVs except in university research and search and rescue missions.

State legislators are concerned that UAV surveillance could threaten the civil liberties, especially the privacy of their constituents, so the trend in the legislatures is to err on the side of highly restrictive regulations. Unfortunately, these restrictions might ultimately prevent civilian institutions from taking advantage of UAVs as a cost-effective tool to perform their duties more efficiently during a time of shrinking state budgets. In many cases, ALEC legislators are spearheading these restrictive policies, often due to an incomplete understanding of the issues involved and UAV capabilities.

If misconceptions are not corrected in the immediate future, misguided policy will continue to proliferate throughout state legislatures, and this policy is likely to inform future *national* policy on the domestic use of UAVs. As appropriate UAV implementation could help states meet their public safety objectives in a fiscally responsible way, we would like to see the issues surrounding their use explored in a complete and objective manner.

Program Description

A two-pronged approach would be the most effective way to deal with the issue.

ALEC International Relations Task Force (IRTF) Membership

Model policy on the domestic use of UAVs falls under the jurisdiction of ALEC's International Relations Task Force/National Security Subcommittee, and we anticipate that the task force will consider such policy in the very near future. Issues that capture our members' attention the way this one has are generally brought to ALEC. ALEC task force membership would afford the member

the opportunity to participate in the discussions on the model policy and to inform and enrich the debate. The IRTF is relatively small (well over 100 legislators and 6 private sector members) and has the flexibility to consider and vote on model policy for domestic UAV use rapidly. If this policy is passed within the task force and approved by ALEC's Legislative Board of Directors, it becomes official ALEC model policy and can be accessed by all of our state legislators. Other issues that the task force has explored and continues to discuss include Sequestration, Civilian/Commercial Applications for NASA Research, Sustainable Energy Best Practices in the Military and Overseas, H1B visa expansion, Earth Observation, Expanding the Commercial Marketplace for Space Launches, etc.

The issue of our bimonthly magazine *Inside ALEC* that will be distributed at our Annual Meeting in August 2013 in Chicago will focus on International and Energy issues. An article on domestic uses for UAVs would be a welcome addition to the magazine and would automatically be distributed to those in attendance at the meeting – roughly 1,000 state legislators as well as 1,000 policy and business leaders from across the country. Such distribution would give the issue a deserved spotlight. An article in ALEC's blog, *The American Legislator*, could appear before the Annual Meeting.

UAV Educational Sponsorship Opportunity at ALEC Spring Task Force Summit
ALEC's Communications and Technology Task Force will host a panel discussion/lunch to explore the domestic uses of UAVs at ALEC's Spring Task Force Summit on May 3 in Oklahoma City, OK. We expect 30-40 state legislators to attend. Two speakers who favor more restrictions on the use of UAVs have already been confirmed – Jim Harper a noted privacy expert from the Cato Institute and Ryan Kiesel a noted privacy advocate from the American Civil Liberties Union (ACLU). Both will thoroughly cover the privacy challenges UAV technology poses. This will be our members' first exposure to this issue at an ALEC event, and ALEC wants to ensure that we approach the issue in a balanced fashion. We will have presenters who will emphasize some of the benefits of the domestic uses of UAVs, and the sponsor would be able to select two presenters that would offer this point of view. We would also ask the additional panelists to address the general aviation challenges facing domestic UAVs. We would provide travel expenses for four additional ALEC public sector members from the International Relations Task Force to attend and/or moderate the panel from select states currently considering UAV policy.

Annual Meeting Workshop Sponsorship
This year's Annual Meeting will take place in Chicago, IL August 7-10, 2013 where we expect roughly 2,000 state legislators, policy experts and business leaders to be in attendance. Workshops are panel discussions open to all attendees at our Annual Meeting, and we are confident that a panel discussion on the domestic uses of UAVs would be exceedingly popular. We also have workshop sponsorships at our States and Nation Policy Summit in early December 2013 which generally has attendance of 700-800 state legislators, policy experts and business leaders.

<u>Additional Thoughts</u>
This is a timely issue where our members need a better understanding to make informed decisions. However, this topic is also an excellent opportunity to introduce the concept of civilian applications for products that were originally intended for military and/or space applications and to highlight the critical role that public private partnerships in research play in innovation and economic growth.

AUVSI

COMMENTS OF THE ASSOCIATION FOR UNMANNED VEHICLE SYSTEMS INTERNATIONAL ON THE AEROSPACE STATES ASSOCIATION SUGGESTED PRIVACY LEGISLATION PLAN 2013

I. Executive Summary

The Association for Unmanned Vehicle Systems International (AUVSI)[1] supports the expanded use of unmanned aircraft systems (UAS) and encourages open discussion of privacy concerns and proposed changes to existing rules, regulations, and laws. These discussions should occur concurrently with the integration of UAS into the National Airspace System (NAS)[2] in order to fully realize the benefits of rapidly advancing UAS technology and so that a greater understanding of UAS technology's potential can be achieved. Enactment of legislation now – before sufficient experience with integration of UAS into the NAS exists – is premature, and will hinder the creation and development of this new industry. Barring unnecessary delays, AUVSI estimates that this new industry is poised to create over 70,000 new jobs and $13.6 billion in economic impact within the first three years of integration alone.[3]

New legislation at the federal or state level that is not technology neutral or that is inconsistent with existing privacy rules, regulations, and laws would stifle innovation and cause delay, and may prevent or discourage the use of UAS by public safety agencies and other potential users. Fourth Amendment jurisprudence, existing federal and state privacy laws, and comprehensive Federal Aviation Administration (FAA) regulations already provide extensive guidance that would allow for initial integration of UAS operations. The FAA, for example, has taken steps to address privacy concerns relating to the use of UAS at test sites, which will help gather knowledge and best practices about UAS operations. If the FAA completes its required and pending rulemaking activities for UAS integration, there will be ample opportunities for multi-stakeholder input.

II. Existing Fourth Amendment Protections

The Fourth Amendment and related case law already governs UAS operations by government users, ensures accountability, and guides the use of aircraft in which the cockpit and pilot are on the ground. Federal, state, and local government agents must obtain search warrants when their use of any technology, including UAS, may violate an individual's reasonable expectation of privacy protected by the Fourth Amendment.[4] These protections are well-established and address many different privacy concerns relating to government adoption and use of advancing technologies, such as UAS. For more than 220 years, the Fourth Amendment has been applied to new technologies used in warrantless

[1] AUVSI – the world's largest non-profit organization dedicated to the advancement of unmanned systems – represents more than 7,000 members from 55 allied countries and 2,500 organizations involved in fields of government, industry and academia.

[2] The FAA Modernization and Reform Act of 2012 requires FAA to safely integrate UAS into the NAS by September 2015, and mandates, among other things, the creation of UAS test sites and rulemaking proceedings addressing the integration of civil UAS operations. P.L. 112-95, §§ 331-334, 126 Stat. 11, 72-77 (2012).

[4] *See Katz v. United States*, 389 U.S. 347 (1967).

observations – including several Supreme Court decisions on aerial observations[5] and, more recently, thermal imaging[6] and GPS technologies[7] – and it will continue to be applied to UAS and other future technologies that have not yet been invented. The Court, in a 2013 decision, held that law enforcement use of a highly-trained drug sniffing dog, roaming outside a home, was "an unlicensed physical intrusion" distinguishable from "Girl Scouts and trick-or-treaters," and was thus an unreasonable search.[8] UAS technology is not so distinct from other advanced technologies as to require supplemental legislation.[9] On the contrary, UAS-specific legislation and laws may have unintended effects, including confusing and complicating the application of existing search warrant requirements[10] that have been carefully developed over two centuries.

AUVSI strongly supports the International Association of Chiefs of Police (IACP) recommended guidelines for UAS operations and associated data collection,[11] which the Airborne Law Enforcement Association (ALEA)[12] and others have adopted and even the American Civil Liberties Union (ACLU) has praised.[13] Like IACP, AUVSI recognizes the "proven effectiveness" of UAS and that the "potential benefits [to public safety] are irrefutable."[14] AUVSI opposes any legislation that hamstrings first-responders.

III. FAA's Approach to Privacy and Rulemaking

The Congressionally-mandated FAA rulemaking processes for the integration of small UAS (sUAS) will provide ample opportunities for the public to comment on privacy issues relating to UAS operations.[15] Unlike government operators, who are permitted to operate UAS, albeit through a cumbersome process,[16] civilian operators have no practical, legal means of doing so until the FAA

TIMES (May 21, 2013), http://www.nytimes.com/2013/05/22/us/faas-concerns-hold-up-use-of-wildfire-

completes its legally required, and long-delayed, rulemakings.[17] Recognizing the importance of addressing privacy concerns, the FAA has taken extraordinary measures to permit public participation in determining the privacy policies that will govern UAS test sites – the agency's first major step toward integration.[18] Indeed, FAA "aim[ed] to assure maximum transparency of privacy policies associated with UAS test site operations in order to engage all stakeholders in discussion about which privacy issues are raised by UAS operations and how law, public policy, and operators should respond to those issues in the long run."[19] Rather than passing uninformed[20] and potentially unenforceable[21] legislation now, Congress and state lawmakers should wait for the FAA to complete its rulemaking processes.

The FAA's primary mission is, and must remain, aviation safety. Still, insofar as privacy issues are inextricably linked to the agency's creation of a regulatory framework for the integration and operation of UAS, the FAA rulemaking process is the appropriate forum to address privacy concerns. The FAA has properly recognized the role that federal and state law enforcement agencies play in enforcing laws regarding the protection of an individual's right to privacy, as well as its complementary authority to revoke or suspend a UAS operator's license. Like the Fourth Amendment jurisprudence applicable to public UAS operators, analogous state laws relevant to civil operators that "address trespass, invasion of privacy, harassment, and stalking [are] well established."[22] AUVSI supports the FAA's position that Fair Information Practice Principles (FIPPs) should inform UAS privacy policies on the collection, storage, and use of data.[23] Clearly, the registration of certain UAS and pilots with the FAA, the equipage of UAS with identification/position broadcast capability, and the guidelines set forth in AUVSI's UAS Operations Code of Conduct[24] could all contribute to the creation of an overall approach to managing privacy concerns. FAA rulemaking proceedings are the proper forum to address all of these important considerations.

IV. Conclusion

AUVSI supports the integration of UAS into the NAS in a safe and responsible manner, while safeguarding the existing right to privacy and ensuring transparency and accountability. Existing federal and state privacy protections should extend to the operations of UAS, just as they do to the operations of any other advanced technology. But before consideration of any supplemental technology neutral privacy legislation, the FAA should be allowed to gain experience through the UAS test site program and to then complete the well-established regulatory processes for UAS integration that Congress has already mandated. Fourth Amendment jurisprudence, federal and state privacy protections, and other existing laws and regulations are sufficiently robust to guide this effort.

AUVSI
ASSOCIATION FOR UNMANNED VEHICLE SYSTEMS INTERNATIONAL

Unmanned Aircraft System Operations

Industry "Code of Conduct"

The emergence of unmanned aircraft systems (UAS) as a resource for a wide variety of public and private applications quite possibly represents one of the most significant advancements to aviation, the scientific community, and public service since the beginning of flight. Rapid advancements in the technology have presented unique challenges and opportunities to the growing UAS industry and to those who support it. The nature of UAS and the environments which they operate, when not managed properly, can and will create issues that need to be addressed. The future of UAS will be linked to the responsible and safe use of these systems. Our industry has an obligation to conduct our operations in a safe manner that minimizes risk and instills confidence in our systems.

For this reason, the Association for Unmanned Vehicle Systems International (AUVSI), offers this Code of Conduct on behalf of the UAS industry for UAS operation. This code is intended to provide our members, and those who design, test, and operate UAS for public and civil use, a set of guidelines and recommendations for safe, non-intrusive operations. Acceptance and adherence to this code will contribute to safety and professionalism and will accelerate public confidence in these systems.

The code is built on three specific themes: Safety, Professionalism, and Respect. Each theme and its associated recommendations represent a "common sense" approach to UAS operations and address many of the concerns expressed by the public and regulators. This code is meant to provide UAS industry manufacturers and users a convenient checklist for operations and a means to demonstrate their obligation to supporting the growth of our industry in a safe and responsible manner. By adopting this Code, UAS industry manufacturers and users commit to the following:

Safety

- We will not operate UAS in a manner that presents undue risk to persons or property on the surface or in the air.
- We will ensure UAS will be piloted by individuals who are properly trained and competent to operate the vehicle or its systems.
- We will ensure UAS flights will be conducted only after a thorough assessment of risks associated with the activity. This risks assessment will include, but is not limited to:
    - Weather conditions relative to the performance capability of the system

- Identification of normally anticipated failure modes (lost link, power plant failures, loss of control, etc) and consequences of the failures
- Crew fitness for flight operations
- Overlying airspace, compliance with aviation regulations as appropriate to the operation, and off-nominal procedures
- Communication, command, control, and payload frequency spectrum requirements
- Reliability, performance, and airworthiness to established standards

Professionalism

- We will comply with all federal, state, and local laws, ordinances, covenants, and restrictions as they relate to UAS operations.
- We will operate our systems as responsible members of the aviation community.
- We will be responsive to the needs of the public.
- We will cooperate fully with federal, state, and local authorities in response to emergency deployments, mishap investigations, and media relations.
- We will establish contingency plans for all anticipated off-nominal events and share them openly with all appropriate authorities.

Respect

- We will respect the rights of other users of the airspace.
- We will respect the privacy of individuals.
- We will respect the concerns of the public as they relate to unmanned aircraft operations.
- We will support improving public awareness and education on the operation of UAS.

As an industry, it is incumbent upon us to hold ourselves and each other to a high professional and ethical standard. As with any revolutionary technology, there will be mishaps and abuses; however, in order to operate safely and gain public acceptance and trust, we should all act in accordance with these guiding themes and do so in an open and transparent manner. We hope the entire UAS industry will join AUVSI in adopting this industry Code of Conduct.

ELECTRONIC FRONTIER FOUNDATION
Protecting Rights and Promoting Freedom on the Electronic Frontier

May 31, 2013

Mr. Robert Davis
Cadwalader, Wickersham & Taft LLP
700 6th Street, NW, Suite 300,
Washington, DC 20001

Lt. Gov. Mead Treadwell
The Aerospace States Association
107 S. West Street, Suite 510
Alexandria, VA 22314

Dear Mr. Davis and Lieutenant Governor Treadwell,

Thank you for the invitation to participate in the Aerospace States Association's efforts to draft model privacy legislation to regulate unmanned aerial systems (UAS).

EFF is a non-profit organization that has worked for more than 20 years to protect civil liberties, privacy, consumer interests, and innovation in new technologies. Our organization has, for the last few years, been extensively involved in privacy and civil liberties issues raised by unmanned aircraft (UA),[1] commonly referred to as drones. This work has included consulting with state and federal legislators on legislation that would place appropriate limits on law enforcement's abilities to use drones for surveillance; commenting on government and private use of drones on EFF's website, in the press, and in other public fora; and obtaining, reporting on and making accessible to the public drone authorization records received from the FAA pursuant to the Freedom of Information Act.[2]

Legislation regulating drone use to protect privacy must, at a minimum, address three main points:

1. Law enforcement use of drones requires a warrant;
2. Commercial drone use must be subject to privacy protections and reporting requirements;
3. Regulations on private and media use of drones must strike an appropriate balance between the First Amendment and privacy.

Law Enforcement Drone Use Requires a Warrant
UAS have the potential to fundamentally change the nature of policing in the United States. The technological advances in surveillance provided by drones may provide important benefits to law enforcement. For example, drones could be employed in dangerous situations to avoid risk of harm to an officer or to search in areas challenging to traverse. Drones will also make aerial surveillance much less costly for cash-strapped law enforcement agencies.

---

815 Eddy Street • San Francisco, CA 94109 USA
voice +1 415 436 9333 *fax* +1 415 436 9993 *web* www.eff.org *email* information@eff.org

However, these same advances will also present significant privacy and civil liberties risks. UAS are capable of highly advanced and near-constant surveillance through live-feed video cameras, thermal imaging, communications intercept capabilities, and backend software tools such as license plate recognition, GPS tracking, and facial recognition. They can amass large amounts of data on private citizens, which can then be linked to data collected by the government and private companies in other contexts. Without strong limitations on how this sophisticated technology can be used, we risk a society where we may all be subject to government surveillance at any time.

For this reason, any legislation regulating law enforcement UAS use must require that officers obtain a warrant based on probable cause before using the UAS for criminal investigations. Such a warrant must have limitations on duration and content recorded, much like a wiretap order does today,[3] and must apply whether the drone flies over private or public space.[4] The warrant requirement must also apply when law enforcement seeks access to data gathered by a drone that is owned or flown by a separate entity, whether that entity is a private party, commercial entity or another public agency.[5]

The warrant requirement can only be subject to limited exceptions for emergency situations such as imminent threats to life or of great bodily harm and only where a warrant could have been obtained but for the time constraints of the situation. And legislation establishing a warrant requirement must have a meaningful enforcement mechanism that allows persons subject to drone surveillance to move to suppress the evidence in any case brought against them.

Commercial Drone Use Must Be Subject to Privacy Protections and Reporting Requirements

Congress has mandated that by 2015, the skies will be open to commercial drone flights.[6] In fact, the FAA has predicted that, in addition to the hundreds of drones currently used domestically by the military and law enforcement, there will be roughly 10,000 commercial drones flying in the US skies in just five years.[7] In reality, many small drone operators are already flying UAVs for

---

[3] *See, e.g., Berger v. New York*, 388 U.S. 41 (1967) (describing particularity requirements for wiretap warrants). In *Berger*, the Supreme Court indicated that the Fourth Amendment triggers heightened scrutiny when surveillance is undertaken as "a series or a continuous surveillance" rather than as "one limited intrusion." *See id.* at 57. Therefore, a statute that regulates "a series or a continuous surveillance" must include special privacy protections or risk invalidity under the Fourth Amendment. *See id.* at 56.

[4] *See, e.g., U.S. v. Jones*, 132 S.Ct. 945 (2012) (Alito, J., concurring; Sotomayor, J. concurring) In *Jones*, which held law enforcement must get a warrant before affixing a GPS tracking device to a car, five justices took issue with the pervasive nature of surveillance possible with the device, even though the device tracked travel that occurred in public.

[5] Legislatures must also establish laws limiting the use of drones by non-law enforcement public agencies such as departments of forestry or agriculture. These should include requirements that images, footage or data pertaining to humans obtained by a public agency should not be disseminated outside the collecting agency and should not be used for purposes other than that for which it was collected. And all public agencies, including law enforcement, should be subject to annual reporting requirements to the public on any UAV purchases and how UAVs have been used.

[6] *See* FAA Modernization and Reform Act of 2012, Pub. L. 112–95.

[7] *FAA Aerospace Forecast Fiscal Years 2012-2032: Unmanned Aircraft Systems, available at* http://www.faa.gov/about/office_org/headquarters_offices/apl/aviation_forecasts/aerospace_forecasts/2012-2032/media/Unmanned%20Aircraft%20Systems.pdf.

commercial purposes.[8]

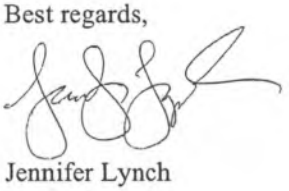
For these reasons, it is critical that legislatures enact laws establishing privacy protections for commercial drone flights. These laws should set out standards that limit the collection, use, sharing, retention and disclosure of data gathered by UAVs. They should also include requirements that the commercial entity establish notice procedures on the type of data gathered by a UAV, how it's gathered and for what purpose, as well as the location the UAV is flown, how long data is retained, with whom it's shared, and how it's disclosed.[9]

Balancing the First Amendment and Privacy in Private and Media Use of Drones
Regulations on private and media use of drones need to strike a balance between protecting privacy and not hampering First Amendment protected speech and associated activities.

As UAV use becomes more prevalent throughout society, private parties and the media will likely also want to fly UAVs for their own and for newsgathering purposes. Some of these activities might include using a UAV to report on a public figure, to monitor law enforcement activities at a political rally, or to record the aftermath of a natural disaster in an urban area. Each of these may impact privacy interests—of the public figure, of the police officer, or of the victims of the natural disaster—but also involve First Amendment-protected activities.[10] For this reason, any law designed to protect privacy must be sufficiently cabined to provide room for these activities. Acceptable limitations could include, for example, duration limits (such as limitations on how long a drone may be used to monitor a specific person), location limits (such as restrictions on monitoring of private spaces like a home or backyard) or could require a finding that the monitoring impinges on an objectively reasonable privacy interest, is highly offensive to a reasonable person, and causes emotional distress.

Conclusion
EFF welcomes the ASA's efforts to craft model legislation to regulate public and private drone use. Please let me know if I can answer any questions or provide further information.

Best regards,



Jennifer Lynch

Amie Stepanovich, Director
EPIC Domestic Surveillance Project[1]

for the

Aerospace States Association

regarding

Privacy Legislation Plan 2013

May 31, 2013

On February 14, 2012, President Barack Obama signed the Federal Aviation Administration Reauthorization Act of 2012 ("FAA Act"). The Act provided for funding for the Federal Aviation Administration ("FAA"), advanced the Next Generation Air Transportation System ("NextGen"), and implemented several other aviation-related provisions to increase air traffic safety and reduce accidents.

The FAA Act also provided for the increased and expedited licensing of drones within the United States National Airspace System ("NAS"). Prior to the FAA Act, drones licenses were uncommon, and could only be obtained by a government entity, or, even more rare, by a private entity with an "experimental" limitation. Less than seven formatted pages in length, the relevant sections of the FAA Act fail to address many of the problems inherent in increased domestic drone use. The most significant of these issues is that of privacy.

There are significant privacy concerns involved in the use of drones over domestic soil. Drones are uniquely designed to carry invasive technology that may potentially erode the rights of individuals in the United States to be free of government surveillance under the Fourth Amendment of the Constitution. In addition, drones operated by private entities open new doors to spying, harassment,

[1] EPIC law clerks Adam Marshall and Heather Nodler helped with the drafting of this statement.

and stalking that are not addressed under current law. Finally, the failure of the FAA to implement a drone licensing system that implements the principles of transparency and public access means that many of these intrusions into our private lives will go unnoticed and undocumented.

EPIC'S PETITION TO THE FEDERAL AVIATION ADMINISTRATION

In February 2012, EPIC, joined by over 100 organizations, experts, and members of the public, petitioned the FAA to consider privacy as a key factor in its efforts to streamline and increase drone licensing in the United States. The FAA responded to EPIC's petition in February 2013 and agreed to make privacy a primary factor in its selection of six nationwide test sites for drones in the United States. The FAA requested public comment on its proposed privacy policy and guidelines for these test sites. In response, EPIC asked the FAA to maintain a public database for drone operators, including their geographic area of operation and the surveillance equipment that the drone will carry. EPIC also asked that the FAA implement data collection and retention policies to ensure public notice of domestic drone surveillance operations.

The FAA's actions indicate that the Agency has recognized that new protections are necessary to remedy the privacy threats proposed by drone surveillance. Effective solutions require affirmative action not only from the FAA, but also from other federal agencies and law enforcement bureaus seeking to operate drones domestically, state and local governments, and Congress.

DEVELOPMENTS IN THE STATES

There has been a recent surge in state drone legislation. In total, 43 states have introduced laws that relate to drone surveillance and privacy. Governors of six of these states have now signed measures into law, including Florida, Idaho, Montana, North Dakota, Tennessee, and Virginia. Moreover, six additional states have adopted resolutions on drones: Alabama, Alaska, Idaho, Indiana, Nevada, and Pennsylvania. A drone law in Texas has passed both chambers and awaits the Governor's signature.

The laws in Florida, Tennessee, and Idaho define what drones are and restrict drone use by law enforcement. They require either a warrant or an emergency situation. In Idaho, the law also allows drone use with reasonable suspicion of criminal conduct. The proposed Texas law details numerous situations in which law enforcement may use drones, with and without a warrant. The laws in Florida, Tennessee, and Montana limit the admissibility of evidence obtained by drones, with the standard varying from requiring a warrant to reasonable suspicion.

The law passed in Idaho and the proposed Texas laws restrict private drone use. The Texas draft law carves out numerous exceptions for both public and private use, including border security, mapping, scholarly research, real estate brokerage,

and maintenance of utilities. The laws in Florida, Tennessee, Montana, Virginia, and North Dakota place no restrictions on private use.

The laws in Florida, Idaho, Tennessee, and Texas are written to provide remedies for parties harmed by improper drone use.

In April 2013, Virginia passed legislation prohibiting the use of drones by state agencies dealing with law enforcement or regulatory violations. There are exceptions for Amber and Blue Alerts, search and rescue operations, and uses by the National Guard and educational institutions. The ban lasts until July 2015. In the interim, state agencies have been asked to develop model protocols for drone use. The Alaska and Indiana legislatures have also adopted resolutions calling for the creation of drone task forces to study and make recommendations on their use.

A bill in North Dakota was recently sent to the Governor that would apportion one million dollars to pursue having the FAA designation as a drone test site, and an additional four million in operations funds if it is chosen.

EPIC'S RECOMMENDATIONS TO CONGRESS

In testimony before the Senate Judiciary Committee in 2013, EPIC proposed numerous recommendations for protections that Congress could adopt in order to build privacy protections in to U.S. drone operations. These recommendations include:

- A requirement for drone operators to submit detailed public reports on drones' intended use. Issuance of a license should be contingent on the completion of this reporting, and a privacy right of action and other penalties should ensure that the operators' behaviour complies with the representations made in the report;

- Warrant requirements for law enforcement use of drones, with narrow exemptions for exigent circumstances. The use of drones by law enforcement should be subject to mandatory public reporting requirements, such as those found in the Wiretap Act;

- A prohibition on broad and untargeted drone surveillance by law enforcement;

- A federal Peeping Tom statute, recognizing the enhanced capabilities of aerial drones, should be implemented in order to provide baseline privacy protections for individuals in the home;

- Random independent audits and third-party oversight should be mandated for all drone operators within the United States.

As drone surveillance technology continues to leap ahead, the United States needs to be ready with accompanying measures to ensure that individual rights are not eroded. EPIC looks forward to participating in a public conversation about how to best protect privacy and civil liberties in the development and sue of drones throughout the Country.

Douglas Marshall ASA Privacy

Two major issues have captured the public's attention over the last two years regarding unmanned aerial vehicles (UAVs), (also known as UAS, or unmanned aircraft systems, RPAs, or remotely piloted aircraft, or "drones," as they are often misleadingly referred in the mass media). The first is the controversial use of UAV-launched missiles and bombs to neutralize threats to U.S. security from terrorists or others hostile to the United States, which have included U.S. citizens. The second arises from concerns over potential violations of privacy or indiscriminate, warrantless surveillance by law enforcement agencies using small, non-tactical fixed-wing or rotorcraft UAVs. A related concern is the perceived threat that U.S. intelligence agencies and military units will "bring home" the sophisticated ISR (Intelligence, Surveillance, Reconnaissance) UAVs that are currently used for counterterrorism and military operations in theater and deploy them to spy on U.S. citizens (although such activity is clearly prohibited by federal law).

Caught up in the whirlwind of popular culture, media hysteria, and political forces is a large international community of scientists, researchers, government agencies and civilian or private operators of UAS who promote and support the peaceful use of the technology for a wide variety of humanitarian and potential commercial applications that have nothing to do with law enforcement or national defense and security.

By way of example, the Arctic is a critically important environment, exerting strong influence on the global climate. The effect of climate change is exaggerated in the Arctic, and, as a result, the Arctic region (north of the Arctic Circle, $66^0\,33'$N latitude) is undergoing very rapid change. Because of these rapid changes, scientists are urgently trying to understand the many climate processes and mechanisms of the Arctic. Use of UAS for environmental research in the Arctic has been ongoing since 1999, and continues to this day. More examples of scientific applications of UAS abound, and a comprehensive list would fill a multi-page appendix.

As a result of similar activities around the globe, the UAS sector has been a growth industry for over a decade, fueled primarily by the Department of Defense and the U.S. intelligence services, but supplemented by a rapidly growing civilian sector devoted to non-military applications such as law enforcement, agricultural remote sensing, atmospheric science, wildlife management, power line and pipe line inspection, fisheries observation and enforcement, border protection, firefighting, flood protection, disaster response, and the like.

A major challenge for the UAS community is identifying the public policies that should drive the next phase of technical development, and, more recently, the influence that the question of personal privacy should have, if any, in the evolution of those policies. State and local governments are grappling with the role that government should or will play in this public debate. The choices for local and state government are: To be active advocates for UAS technology, thereby supporting the anticipated economic impacts from the creation of highly skilled, high paying jobs, but taking no position on the legal and privacy issues; to devote the necessary time

and resources to develop a model privacy policy that could be adopted by other governmental entities; or to do nothing and take no position on privacy, thereby conceding the policy question to the federal government or the private sector.

The issue of privacy and the potential for invasions of personal privacy by individuals and/or government by the use or misuse of remotely piloted aircraft equipped with cameras and other surveillance devices has generated proposed legislation, both state and federal, and aggressive publicity campaigns intended to drastically limit or even outlaw RPAs for any purpose whatsoever. Indeed, the "right to privacy," or the "right to be let alone," has been recognized by the U.S. Supreme Court in a number of cases as being among the fundamental rights guaranteed American citizens by the U.S. Constitution. The seminal treatment of the subject was an article published in the Harvard Law Review, authored by Louis Brandeis and Samuel Warren ("The Right to Privacy" HLR 4, no. 5 (1890): 193-220), in which the authors argued that the time had come for the courts to recognize a common law right to privacy. The article can be read today with virtually no changes and still be as relevant and prescient as it was in 1890.

In our age of electronic exhibitionism and voyeurism, it can be argued that privacy no longer has the meaning that it did over 75 years ago when laws were passed to prohibit the government from wiretapping telephones without a search warrant (although illegal wiretapping in violation of the requirements of the Fourth Amendment apparently still occurs). Dean Prosser's four invasion of privacy torts (intrusion upon a person's seclusion or solitude, or into his private affairs; public disclosure of embarrassing private facts about a person; publicity that places the person in a false light in the public eye; and appropriation, for the someone's advantage, of another person's name or likeness), are no less important concepts now than they were when he described them in his landmark article in the California Law Review over 50 years ago (*Privacy,* 48 Calif. L. Rev. 383 (1960)). But these four categories of invasions of privacy are civil wrongs that provide the basis for an award of monetary damages against the violator. The current media-driven angst over the potential for privacy intrusions from the utilization of unmanned aircraft by law enforcement agencies at all levels (federal, state and local) seems to derive from fear of "Big Brother" (apologies to Orwell) type of broad area, warrantless surveillance of the general population, although no law enforcement agency has publicly stated that it has any intention of ever using UAS for that purpose. Yet, manned aircraft (primarily helicopters), have been used for decades for that precise purpose, with little objection from the public. News helicopters hover over every event from a traffic jam in Los Angeles to a natural disaster in Oklahoma, state highway patrols enforce speed limits with aviation assets, and police departments and first responders routinely use aircraft (often equipped with cameras) to support their law enforcement and firefighting activities.

Some also argue that there is no fundamental difference between carrying a high resolution or infrared camera or some other sensing device on a UAS and deploying the same payload on a manned aircraft, and the Supreme Court has repeatedly held

that observations of law violations from a manned aircraft in the navigable airspace do not violate the Fourth Amendment, even when a warrant is not first obtained.

As a result of pressures applied to legislators, local governments and policy makers by these diverse interests, laws have been proposed in a number of states that are intended to either restrict the use of UAS in many applications or ban them outright, whether the intended use is by law enforcement agencies, or civilians. The FAA has been compelled to conduct public forums on the privacy issue as a result of language in the FAA Modernization and Reform Act of 2012, and is being pressured to propose rules or publish guidelines dealing with the privacy issue.

Thus, the evolving legal issue is whether any local legislation can legitimately regulate an activity that heretofore has fallen under the exclusive jurisdiction of the Federal Aviation Administration. A related policy issue is whether the FAA's statutory mandate dictates that it should have any interest in privacy, or whether it should limit its oversight to traditional aviation concerns such as safety, airworthiness, certification, production standards and airspace rules. The overarching issue is whether there should be any legal restrictions beyond the Fourth and Fifth Amendments on the use of unmanned aircraft by law enforcement agencies or private individuals or entities.

The principle stakeholders in the ongoing privacy debate are a diverse and sometimes unlikely assortment of advocacy partners, often entities or organizations that might ordinarily occupy opposite extremes in philosophy, joining forces to oppose something that they both find threatening or unacceptable. At one extreme lies the UAS industry, represented by many small entrepreneurs, as well as the large defense and aerospace concerns that largely serve the needs of the U.S. military and intelligence services. At the other extreme are civil liberties advocates such as the ACLU, EPIC (Electronic Privacy Information Center), EFF (Electronic Frontier Foundation) and others, who represent the concerns for potential intrusions into personal privacy by government, as well as private citizen exploitation of technology to engage in spying, eavesdropping, data mining, and identity and financial data theft, among others. In the middle of the debate resides the FAA, which has jurisdiction over all activities in the navigable airspace of the U.S.

Potential customers of the industry consist of public safety agencies desiring to acquire small UAS as affordable supplements to existing law enforcement and first responder technology; state and federal science and technology agencies that view UAS as an additional tool to carry out their missions; public and private research universities that similarly seek the use of the technology for a wide variety of research purposes; and, advocacy organizations like AUVSI whose members are engaged in the research and development of this rapidly evolving technology.

The stakeholders are many, the issues are fundamental, and the collective wisdom of all concerned will be needed to solve the problem. ASA is an ideal facilitator to fill that role.

NATIONAL ASSOCIATION OF CRIMINAL DEFENSE LAWYERS
COMMENTS ON PROPOSED DRONE LEGISLATION
MAY 31, 2013

Use of Domestic Drones

The increasing number of bills introduced in states across the country addressing the use of unmanned aerial vehicles, also known as drones, signal that not only are states concerned with intrusive government surveillance of their citizens without a warrant, but that domestic drone use is becoming more prevalent as the technology advances, signaling a sudden need for legislation. There are major Fourth Amendment and privacy implications that come with the use of drones in the United States, and the threats to privacy and civil liberties need to be properly addressed in any new drone legislation. Many outdated statutes are applied today in the digital age that undercut Fourth Amendment rights, and new regulations need to address the concerns of these rapidly advancing surveillance tools. That is why the National Association of Criminal Defense Lawyers (NACDL) created its own model legislation, promoting protection of fundamental Fourth Amendment rights. The model legislation is available here.[1]

Prohibited Use Without a Warrant and Suppression of Evidence

If drones are used by a person or entity of the government or funded in any way by the government, a warrant should be required for any surveillance of a person within a state, county, or municipality. A warrant should also be required for the surveillance of personal or business property located within the state to gather evidence or other information pertaining to criminal conduct or conduct in violation of a statute or regulation, except in certain special circumstances. This prevents unwanted government intrusion into privacy, and protects Fourth Amendment and state privacy rights. Traditionally, an exception to the warrant requirement exists for evidence that is found in "plain view." The plain view doctrine becomes muddled, however, when drones are used because the drones have high-tech capabilities, that are not in the "general public use,"[2] to conduct surveillance on areas in plain view and not in plain view, such as the inside of a home.[3] The technology is evolving so rapidly that it is currently difficult to discern exactly what kind of private data may be collected by the government and private entities. Unmanned aircrafts may be outfitted with surveillance equipment to include high resolution cameras, thermal heat imaging devices, and geolocation tracking devices.

Additionally, any evidence obtained in violation of the legislation should be inadmissible in a criminal trial. It is important that this suppression remedy be included in state drone legislation, otherwise the only recourse an individual could have is civil, which does not benefit a defendant facing criminal charges. A warrant requirement may be toothless without such a suppression remedy.

Limit Exigent Circumstances

Reasonable exceptions to a warrant requirement for the use of a surveillance drone include exigent circumstances or the assessment of an environmental or weather related catastrophe. Exigent

---

[2] Kyllo v. United States, 533 U.S. 27, 34 (2001) (reasoning that the police used a device, a thermal heat imaging device, not in the "general public use" to gather information about the inside of a private home.).
[3] *Id.* (holding that using thermal imaging to obtain information from inside a home constituted a search under the Fourth Amendment.).

circumstances exist when law enforcement possesses reasonable suspicion that absent swift preventative action, there is an imminent danger to life or imminent risk of threat or bodily harm. This should further be limited for use only until the danger and risk that prompted the use of the drone are no longer imminent.

Access to Third Party Records

Drone legislation should address the "third party doctrine." Third party records are records created and stored by private companies in their ordinary course of business. Today, these records go beyond bank records or dialed phone numbers, and can include all emails, geo-location information, a record of visited websites, and even internet search terms. The Supreme Court has held that individuals have no reasonable expectation of privacy in records shared or generated by a third party. By giving up information to a third party, a person "assumes the risk" that the company would reveal that information to the government. In other words, law enforcement may be able to access drone surveillance data, without a warrant, obtained by a private company for use as evidence in a criminal trial.

In a recent Supreme Court decision, *United States v. Jones*, which involved the placement of a GPS locator on a suspect's car by police officers without a valid warrant, the Court held that the use of a GPS device constituted a search under the Fourth Amendment.[4] Justice Sotomayor's concurrence in particular questioned the use of the third party doctrine in the digital age. She said "[t]his approach is ill suited to the digital age, in which people reveal a great deal of information about themselves to third parties in the course of carrying out mundane tasks."[5] This has great implications for the use of drones to monitor, collect, and store information that can then be shared with the Government under an outdated third party doctrine.

As all states can do, some states have provided greater protection than what the federal Constitution affords to third party records. Such protections may be found in legislation, court cases, or even state constitutions. Each individual state should be familiar with its own laws on third party records in determining whether or not such a provision needs to be included in that state's drone legislation.

Conclusion

NACDL encourages the implementation of the above suggestions into model legislation regulating the use of domestic drones. We look forward to working with you. Please contact NACDL's National Security and Privacy Counsel, Mason Clutter, with any questions. She may be reached at mclutter@nacdl.org or 202-465-7658.

113TH CONGRESS
1ST SESSION

BILL NUMBER

[Purpose]: To protect individual privacy against unwarranted governmental intrusion through the use of unmanned aerial systems commonly called drones, and for other purposes.

IN THE [CHAMBER] OF THE UNITED STATES

DATE
Xx introduced the following bill; which was read twice and referred to the Committee on the Judiciary

---

A BILL

To protect individual privacy against unwarranted governmental intrusion through the use of unmanned aerial systems commonly called drones, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

SECTION 1. SHORT TITLE.

This Act may be cited as the "[Insert Short Title"]

SECTION 2. DEFINITIONS.

In this Act---

(a) the term "unmanned aircraft" means any aircraft that is operated without the possibility of direct human intervention from within or on the aircraft (as defined in section 331 of the FAA Modernization and Reform Act of 2012 (49 U.S.C. 40101 note). and
(b) the term "law enforcement agency" means a person or entity authorized by law, or funded by the Government of the United States, to investigate or prosecute offenses against the United States.
(c) the term "unmanned aircraft system" means an unmanned aircraft and associated elements (including communication links and the components that control the unmanned aircraft) that are required for the pilot in command to operate safely and efficiently in the national airspace system.

(d) the term "anti-personnel device" means any projectile, chemical substance, electrical or directed-energy emission, whether visible or invisible, designed to harm, incapacitate, or otherwise negatively impact a human being.

SEC. 3. PROHIBITED USE OF UNMANNED AIRCRAFT SYSTEMS

Except as provided in section 4, a person or entity acting under the authority, or funded in whole or in part by, the Government of the United States shall not use an unmanned aircraft for surveillance of a person within the United States or for the surveillance of personal or business property located within the borders of the United States to gather evidence or other information pertaining to criminal conduct or conduct in violation of a statute or regulation except to the extent authorized in a warrant that satisfies the requirements of the Fourth Amendment to the Constitution of the United States.

SEC. 4. EXCEPTIONS

This Act does not prohibit any use of an unmanned aircraft for surveillance during the course of the following:

(a) PATROL OF NATIONAL BORDERS - The use of an unmanned aircraft to patrol within 25 miles of a national border for purposes of policing the border to prevent or deter illegal entry of any persons, illegal substances, or contraband.

(b) EXIGENT CIRCUMSTANCES - The use of an unmanned aircraft by a law enforcement agency is permitted when exigent circumstances exist. For the purposes of this paragraph, exigent circumstances exist when a law enforcement agency possesses reasonable suspicion that absent swift preventative action, there is an imminent danger to life or imminent risk of threat of bodily harm.

(c) DURING AN ENVIRONMENTAL OR WEATHER RELATED CATASTROPHE – The use of an unmanned aircraft by federal and state authorities to preserve public safety, protect property, and conduct surveillance for the assessment and evaluation of environmental or weather related damage, erosion, flood or contamination during a lawfully declared state of emergency.

SEC. 5. PROHIBITED SURVEILLANCE UNDER THIS ACT

This Act prohibits any use of an unmanned aircraft for the following:

(a) USE OF FORCE - No Federal agency may authorize the domestic use, including granting a permit for use, of an unmanned aircraft while armed with a lethal weapon or anti-personnel device.

(b) DOMESTIC USE IN PRIVATE SURVEILLANCE - No Federal agency may authorize the domestic use, including granting a permit for use, of an unmanned aircraft

to permit any private person to conduct surveillance upon any other private person without the express, informed consent of the private person or persons to be made subject to surveillance, or the owner or lessee of any real property on which that other private person is present.

(c) SURVEILLANCE OF THE EXERCISE OF 1ST AMMENDMENT RIGHTS - No Federal agency may authorize the domestic use, including granting a permit for use, of an unmanned aircraft for the purpose of the surveillance of persons engaged in the lawful exercise of First Amendment rights and or the Right of Freedom of Assembly.

SEC. 6. REMEDIES FOR VIOLATION.

Any aggrieved party may in a civil action obtain all appropriate relief to prevent or remedy a violation of this Act.

SEC. 7. PROHIBITIONS ON THE CONDUCT OF UNMANNED AIRCRAFT SURVEILLANCE AND THE USE OF ACQUIRED SURVEILLANCE AS EVIDENCE.

This Act prohibits the following:

(a) No evidence obtained or collected in violation of this Act may be admissible as evidence in a criminal prosecution during trial, at sentencing, before a grand jury, as rebuttal evidence, or during administrative hearings in any court of law in the United States.

(b) No imaging or other forms of observational data gathered by unmanned aircraft surveillance from or concerning the parties or places subjected to surveillance in violation of this Act may be preserved by law enforcement or government agencies for any purpose unless required by a Federal Court.

(c) No imaging or any other forms of data lawfully obtained under this Act for which there is not a reasonable and articulable suspicion that such images or data contain evidence of a crime, or are relevant to an ongoing investigation or trial, may be retained for more than 90 days, unless such retention is attendant to general agency guidelines regarding the retention of evidence in criminal cases. In such cases, the imaging or other data may not be distributed to agencies, entities, or individuals where such distribution is not necessary to meet general agency guidelines regarding the retention of evidence in criminal cases. A court order must be obtained before imaging or other forms of data may be retained lawfully for more than 90 days.

(d) No unmanned aircraft may conduct any type of surveillance that would violate Federal laws regarding the interception of aural communications, electronic communications and transmissions, personal location data, or the acquisition of video or still images of a person or conditions existing within a home or place without first obtaining all required warrants in compliance with the Federal or state statutes applying to such interceptions.

SEC. 8. DOCUMENTATION OF DRONE SURVEILLANCE

(a) All use of unmanned aircraft for surveillance shall be documented by the person or entity authorized to conduct the surveillance. All surveillance flights shall be documented as to:

(i) duration, flight path;
(ii) mission objectives, and
(iii) the names of places or persons authorized to be subject to surveillance.

(b) This flight information noted will be certified as accurate and complete by the supervising person authorized by a court to conduct the surveillance.

(c) This flight information must be retained for a period of five years.

(d) Persons seeking relief before a court of law or an administrative agency who have been a target of unmanned aircraft surveillance may obtain by proper motion to the court all information relating to them acquired in the course of such surveillance, excepting only the operational capabilities of the unmanned aircraft, unmanned aircraft system, and other operational information strictly related to the technical conduct and physical security of the surveillance operation.

EXHIBIT A

INTERNATIONAL ASSOCIATION OF CHIEFS OF POLICE

AVIATION COMMITTEE

Recommended Guidelines for the use of Unmanned Aircraft

BACKGROUND:

Rapid advances in technology have led to the development and increased use of unmanned aircraft. That technology is now making its way into the hands of law enforcement officers nationwide.

We also live in a culture that is extremely sensitive to the idea of preventing unnecessary government intrusion into any facet of their lives. Personal rights are cherished and legally protected by the Constitution. Despite their proven effectiveness, concerns about privacy threaten to overshadow the benefits this technology promises to bring to public safety. From enhanced officer safety by exposing unseen dangers, to finding those most vulnerable who may have wandered away from their caregivers, the potential benefits are irrefutable. However, privacy concerns are an issue that must be dealt with effectively if a law enforcement agency expects the public to support the use of UA by their police.

The Aviation Committee has been involved in the development of unmanned aircraft policy and regulations for several years. The Committee recommends the following guidelines for use by any law enforcement agency contemplating the use of unmanned aircraft.

DEFINITIONS:

1. **Model Aircraft** - A remote controlled aircraft used by hobbyists, which is manufactured and operated for the purposes of sport, recreation and/or competition.
2. **Unmanned Aircraft (UA)** – An aircraft that is intended to navigate in the air without an on-board pilot. Also called Remote Piloted Aircraft and "drones."
3. **UAS Flight Crewmember** - A pilot, visual observer, payload operator or other person assigned duties for a UAS for the purpose of flight.
4. **Unmanned Aircraft Pilot** - A person exercising control over an unmanned aircraft during flight.

COMMUNITY ENGAGEMENT:

1. Law enforcement agencies desiring to use UA should first determine how they will use this technology, including the costs and benefits to be gained.
2. The agency should then engage their community early in the planning process, including their governing body and civil liberties advocates.
3. The agency should assure the community that it values the protections provided citizens by the U.S. Constitution. Further, the agency will operate the aircraft in full compliance with the mandates of the Constitution, federal, state and local law governing search and seizure.
4. The community should be provided an opportunity to review and comment on agency procedures as they are being drafted. Where appropriate, recommendations should be considered for adoption in the policy.
5. As with the community, the news media should be brought into the process early in its development.

SYSTEM REQUIREMENTS:

1. The UAS should have the ability to capture flight time by individual flight and cumulative over a period of time. The ability to reset the flight time counter should be restricted to a supervisor or administrator.
2. The aircraft itself should be painted in a high visibility paint scheme. This will facilitate line of sight control by the aircraft pilot and allow persons on the ground to monitor the location of the aircraft. This recommendation recognizes that in some cases where officer safety is a concern, such as high risk warrant service, high visibility may not be optimal. However, most situations of this type are conducted covertly and at night. Further, given the ability to observe a large area from an aerial vantage point, it may not be necessary to fly the aircraft directly over the target location.
3. Equipping the aircraft with weapons of any type is strongly discouraged. Given the current state of the technology, the ability to effectively deploy weapons from a small UA is doubtful. Further, public acceptance of airborne use of force is likewise doubtful and could result in unnecessary community resistance to the program.

4. The use of model aircraft, modified with cameras, or other sensors, is discouraged due to concerns over reliability and safety.

OPERATIONAL PROCEDURES:

1. UA operations require a Certificate of Authorization (CAO) from the Federal Aviation Administration (FAA). A law enforcement agency contemplating the use of UA should contact the FAA early in the planning process to determine the requirements for obtaining a COA.
2. UAS will only be operated by personnel, both pilots and crew members, who have been trained and certified in the operation of the system. All agency personnel with UA responsibilities, including command officers, will be provided training in the policies and procedures governing their use.
3. All flights will be approved by a supervisor director's office and must be for a legitimate public safety mission, training, or demonstration purposes.
4. All flights will be documented on a form designed for that purpose and all flight time shall be accounted for on the form. The reason for the flight and name of the supervisor approving will also be documented.
5. An authorized supervisor/administrator will audit flight documentation at regular intervals. The results of the audit will be documented. Any changes to the flight time counter will be documented.
6. Unauthorized use of a UA will result in strict accountability.
7. Except for those instances where officer safety could be jeopardized, the agency should consider using a "Reverse 911" telephone system to alert those living and working in the vicinity of aircraft operations (if such a system is available). If such a system is not available, the use of patrol car public address systems should be considered. This will not only provide a level of safety should the aircraft make an uncontrolled landing, but citizens may also be able to assist with the incident.
8. Where there are specific and articulable grounds to believe that the UA will collect evidence of criminal wrongdoing and if the UA will intrude upon reasonable expectations of privacy, the agency will secure a search warrant prior to conducting the flight.

IMAGE RETENTION:

1. Unless required as evidence of a crime, as part of an on-going investigation, for training, or required by law, images captured by a UA should not be retained by the agency.
2. Unless exempt by law, retained images should be open for public inspection.

Report 101

AMA Policies for Radio Controlled Model Aircraft Operations Utilizing First Person View, Failsafe, Stabilization and Autopilot Systems

(Revision 07/20/2013)

Academy of Model Aeronautics
"AMA Advanced Flight Systems Committee"
amaflightsystems@gmail.com

October 21, 2012
RE: AMA Flight Systems Policies
AMA Documents #550 and #560

Greetings,

In June of 2012 the AMA Advanced Flight Systems Committee (AFSC) was created for the purpose of developing operational policies and guidelines for advanced flight systems used in radio controlled model aircraft.

The committee's first project was to evaluate and revise AMA's current policies for *"R/C Model Aircraft Operations Utilizing First Person View Systems"* (AMA Document #550) and *"R/C Model Aircraft Operations Utilizing Failsafe, Stabilization & Autopilot Systems"* (AMA Document #560).

The committee in a collaborative effort with leading members of the hobby industry and FPV community revised these documents and presented this report to the Executive Council during the October 20, 2012 council meeting. Revisions were made and the report and documents were adopted by the council.

As new aeromodeling technologies emerge the AFSC will develop and/or revise AMA operational documents/policies. A footer to each document page contains the latest revision date.

Thank you,

Bob Brown
AMA President

Academy of Model Aeronautics
AMA Advanced Flight Systems Committee
amaflightsystems@gmail.com

Radio Controlled Model Aircraft Operations
AMA Documents #550 and #560

Additional Updates of AMA Flight System Documents #550 and #560:

The AMA posted on the AMA website its revised policies for R/C model aircraft operations utilizing First Person View (FPV) systems (AMA document # 550) and Failsafe, Stabilization and Autopilot Systems (AMA document #560) on November 2, 2012.

After a two month review by aeromodeling stakeholders, including members of the AMA and FPV community, the AMA Advanced Flight Systems Committee responded to questions for additional clarification for some operational statements within the documents. As a result of this collaboration several items within AMA documents #550 and #560 were revised on 01/14/2013 and the updated documents have been posted in the AMA website Document section titled "Advanced Flight Systems".

The committee appreciates those FPV enthusiasts and stakeholders who offered suggestions for operational changes to enhance the documents and improve clarity.

The AMA recognizes the importance of providing relevant and up-to-date operational policies and guidelines enabling members to utilize and participate in new aeromodeling technologies and disciplines. The AFS committee welcomes continued collaboration with aeromodeling stakeholders in efforts to improve the quality of AMA's safety programing.

Andy Argenio
AMA Chairman
Advanced Flight Systems Committee

Introduction
Radio Controlled Model Aircraft Operations
Utilizing First Person View, Failsafe, Stabilization and Autopilot Systems

1. Background:

AMA created its "*First Person View*" (FPV) policy (*AMA Document #550*) in 2008 *and "Manually Controllable Programed Outdoor Model Flight Operations"* policy (*AMA Document #560*) in 2011. These policies were adopted to provide operational guidelines for AMA members that would enable them to participate in these disciplines within the parameters of AMA's safety programming.

In recent years FPV, stabilization, and autopilot systems have become more reliable and safer for flying model aircraft. Advancements in technology, as well as the increased number of people participating in FPV flying prompted AMA members and nonmembers to request a review of documents #550 and #560 to consider revisions that would relax some requirements.

In June of 2012, AMA President Bob Brown established an AMA committee to evaluate and revise AMA's current policy documents #550 and #560. Subsequently, a decision was made to broaden the objectives of the committee to evaluate and/or develop policies for any new aeromodeling technologies resulting in the following committee name and mission.

Advanced Flight Systems Committee (AFSC)
amaflightsystems@gmail.com

Mission Statement: "*To analyze advanced flight systems for the purpose of developing program-specific operational requirements, procedures, guidelines, and recommendations to ensure compliance with or updating of AMA's National Model Aircraft Safety Code.*"

Committee members were chosen because of their knowledge and expertise of the AMA National Safety Code and Insurance program, FAA and Government Relations, Public Relations, Unmanned Aerial Systems, and/or Engineering/Technology.
Chairman: Andy Argenio
Committee Members: Bob Brown, Dave Mathewson, Rich Hanson, Jim Rice, Lawrence Tougas, and Chris Brooks.

The committee's objectives are to develop operational procedures for advanced model aircraft flight systems and to ensure AMA safety standards are maintained when embracing new technologies.

2. Considerations:

In the process of revising #550 and #560, the committee considered input from members including comments made in a petition from the FPV community sent to AMA leadership. Policy decisions had to comply with or address the requirements, issues, concerns and suggestions from the following documents, laws, members and membership groups:

- AMA's National Model Aircraft Safety Code
- Federal Bill H.R. 658/Public Law 112-95
- AMA's Liability Insurance Program • Existing Aeromodeling Disciplines
- FPV Community and AMA Members

A review/comparison was done of other aeromodeling association's FPV policies. It included Model Aeronautics Association of Canada (MAAC), British Model Flying Association (BMFA), and Model Aeronautical Association of Australia (MAAA) and revealed that all required a spotter for the FPV pilot, range of flights were limited by law to VLOS, and buddy boxes were required at all times.

3. Membership Education:

The committee recognized a need to educate members on FPV and autopilot system by including in the revised documents a section for definitions, recommendations, and general information. Members often times mistakenly associate FPV and autopilot activities with their knowledge of drones. AMA modelers are not building or purchasing UAVs or drones whose flights are mission oriented, or flown beyond VLOS, or computer controlled for nearly their entire flight. AMA members are attracted to the recreational visual experience of FPV flying and the use of stabilization and autopilot systems to improve flight performance.

Without a basic understanding of these systems and AMA's rules for implementation and operation, erroneous assumptions have been made that these systems present a greater risk for model aircraft accidents/incidents and the AMA should exclude these types of operations for AMA members. The fact is stabilization and autopilot systems in model aircraft have the capability to reduce the risk and severity of model aircraft accidents. Several examples follow:

- AMA FPV flying involves two persons, a pilot and spotter, providing a higher level of situational awareness surrounding the model aircraft to identify and prevent conflicts or collisions.
- R/C Pilots have direct transmitter control to activate or deactivate programmable autopilot systems to recover an out of control model aircraft to level flight, maintain a heading, return an aircraft to a selected location, or initiate a programmed flight path.
- Autopilot systems may be programmed to prevent a flyaway by safely returning a model aircraft to a selected safe location when a radio link is lost.

Radio Controlled Model Aircraft Operation Utilizing "First Person View" Systems

1. DEFINITION OF TERMS:

Please refer to Page 5 section 7 which contains an alphabetical listing of the definitions of the terms in italics that are used in this document.

2. GENERAL:

FPV flying of radio control model aircraft by AMA members is allowed only for noncommercial purposes as a hobby/recreational and/or competition activity and must be conducted in accordance with AMA's current National Model Aircraft Safety Code and any additional rules specific to a flying site/location.

3. OPERATIONS – REQUIREMENTS – LIMITATIONS:

a) AMA *FPV novice pilots* must use a buddy-box system with an *FPV spotter* while learning to fly *FPV*.

b) All *FPV* flights require an AMA *FPV pilot* to have an AMA *FPV spotter* next to him/her maintaining *VLOS* with the *FPV aircraft* throughout its flight.

c) The *FPV pilot* must brief the *FPV spotter* on the *FPV spotter's* duties, communications and hand-over control procedures before *FPV flight*.

d) The AMA *FPV spotter* must communicate with the *FPV pilot* to ensure the *FPV aircraft* remains within *VLOS*, warning the *FPV pilot* of approaching aircraft, and when avoidance techniques are necessary.

e) During an FPV flight, the FPV spotter must be prepared to acquire the transmitter/control from the *FPV pilot* and assume *VLOS* control of the model aircraft at any time safe operation of the flight is in question.

f) If the *FPV pilot* experiences a problem due to a loss of video link, orientation, or is unable to safely fly, he/she must abandon *FPV* mode and fly *VLOS* or pass the RC transmitter to the *FPV spotter* to assume *VLOS* control of the model aircraft.

g) Before the initial *FPV* flight of an *FPV model aircraft* and/or after any changes or repairs *to essential flight systems*, the *FPV model aircraft* must have an *R/C test flight* by conventional *VLOS*.

h) *FPV model aircraft* must use frequencies approved by the FCC for both the RC system and the wireless video system. Pilots must meet applicable FCC licensing requirements if they choose to operate the RC flight control system or the wireless video system on Amateur Band frequencies.

4. RANGE – ALTITUDE – WEIGHT – SPEED:

a) One of the requirements in Federal Law (Public Law 112-95 Sec 336 (c) (2) February 14, 2012) for model aircraft to be excluded from FAA regulations is that model aircraft must be flown within *VLOS* of the operator.

b) Model aircraft flown using *FPV* must remain at or below 400 feet AGL when within 3 miles of an airport as specified in the AMA Safety Code.

c) Model aircraft flown *FPV* are limited to a weight (including fuel, batteries, and onboard *FPV* equipment) of 15lbs. and a speed of 70mph.

5. RECOMMENDATIONS & INFORMATION:

a) AMA *FPV novice pilots* should consider using a cockpit view flight simulator to become accustomed to *FPV* flight.

b) AMA *FPV pilots* should consider using a programmable *autopilot* (AMA Document #560) with a failsafe "return to launch" (RTL) feature that will maintain control of the aircraft in the event of signal loss.

c) An onboard camera equipped with a pan and tilt mount that is positioned by head tracking goggles, will improve the *FPV pilot's* situational awareness of airspace surrounding the *FPV aircraft* during flight, but does not replace the requirement for an AMA *FPV spotter.*

d) When purchasing *FPV* operational systems, always try to select quality equipment, verify its compatibility, install components for interference rejection, and determine that signal range is adequate for maximum VLOS range.

6. PRIVACY PROTECTION SAFEGUARDS:

The use of imaging technology for aerial surveillance with radio control model aircraft having the capability of obtaining high-resolution photographs and/or video, or using any types of sensors, for the collection, retention, or dissemination of surveillance data information on individuals, homes, businesses, or property at locations where there is a reasonable expectation of privacy is strictly prohibited by the AMA unless written expressed permission is obtained from the individual property owners or managers.

7. DEFINITIONS OF TERMS:

AMA FPV Pilot is an AMA member who is capable of maintaining stable flight of a model aircraft within its intended flight envelope when flown FPV without losing control or having a collision.

Buddy-Box System is a system that has one transmitter operating as the master controller, while a second transmitter is linked/slaved to it allowing dual control of an aircraft. The operator of the master transmitter allows one or the other transmitter to control the aircraft through the use of a spring-loaded switch. The switch provides instantaneous transfer of control from one transmitter to the other. The buddy-box system is an efficient and effective means of achievinga position transfer of control from one pilot to another. Although this system is commonly used for training novice fliers, it is also useful in

situations where an experienced pilot may have an increased likelihood of needing a second pilot's assistance in maintaining control of the aircraft. The use of the buddy-box may be helpful in assisting pilots with physical limitations, flying in congested environments, during times of reduced visibility, or anytime during FPV when a timely transfer of control may be beneficial.

Essential Flight Systems are any systems or components necessary to maintain stable flight within a model aircraft's flight envelope. (This includes primary radio control systems and any stabilization or gyros required to maintain stability and heading in certain types of model aircraft that would be uncontrollable/unstable without their use).

First Person View (FPV) refers to the operation of a radio controlled (R/C) model aircraft using an onboard camera's cockpit view to orient and control the aircraft.

Flight Envelope is defined as the range of airspeeds, attitudes, and flight maneuvers which a model aircraft can safely perform/operate for its intended use.

FPV Aircraft is an RC model aircraft equipped with a video transmitter to send real-time video images from an onboard camera to a ground based receiver for display on a pilot's video monitor/goggles. (*FPV model aircraft* types include: Fixed Wing, Rotary Wing, and Multi-Rotor Platforms).

FPV Novice Pilot is an AMA member learning to fly *FPV* utilizing a buddy-box system with an experienced AMA *RC pilot* operating the master transmitter and serving as the *FPV spotter*.

FPV Spotter is an experienced AMA *RC pilot* who has been briefed by the *FPV pilot* on the tasks, responsibilities and procedures involved in being a spotter; is capable and mature enough to perform the duties and is able to assume conventional *VLOS* control of the aircraft.

Non-Essential Flight Systems are any systems or components that are not necessary to maintain stable flight within the model aircraft's *flight envelope*. (This includes *autopilot* or *stabilization systems* that can be activated and deactivated in flight by the pilot without affecting stable flight).

R/C Test Flight requires an *AMA Pilot* to manually operate an R/C transmitter to control a model aircraft's flight path and determine if the aircraft is capable of maintaining stable flight within its *flight envelope*.

Visual Line Of Sight (VLOS) is the distance at which the pilot is able to maintain visual contact with the aircraft and determine its orientation without enhancements other than corrective lenses.

Radio Controlled Model Aircraft Operation Utilizing Failsafe, Stabilization and Autopilot Systems

1. DEFINITION OF TERMS:

Please refer to Page 8 section 7 which contains an alphabetical listing of the definitions of the terms in italics that are used in this document.

2. GENERAL:

All model aircraft flights utilizing *stabilization* and *autopilot* control systems must be conducted in accordance with AMA's current National Model Aircraft Safety Code and any additional rules specific to a flying site/location.

3. OPERATIONS – REQUIREMENTS – LIMITATIONS:

a) AMA members flying radio controlled model aircraft equipped with flight *stabilization* and *autopilot* systems must maintain *VLOS* with the aircraft at all times including programmed autopilot waypoint flight.

b) *AMA Pilots* must be able to instantaneously deactivate programmed flight of *autopilot systems* at any time during flight and resume manual control of the model aircraft.

c) *AMA Pilots* must perform an *R/C Test Flight* of a model aircraft before activating a newly installed *autopilot* or *stabilization system* and/or after any repairs or replacement of model aircraft *essential flight systems*.

d) Model aircraft exceeding 15lbs and/or 70mph may only use an *autopilot* for a programmed "return to launch" (RTL) flight and not for programmed waypoint flying of a predetermined course.

e) STABILIZATION & AUTOPILOT SYSTEMS MAY BE USED FOR/TO:

- Stabilization/automatically stabilize aircraft to level flight when control sticks are centered.
- Recovery/activate TRX switch to recover an out of control aircraft to level flight.
- Heading/activate TRX switch to hold a model aircraft's heading for precision flight path.
- Altitude/activate TRX switch to maintain fixed aircraft altitude while allowing directional control.
- Return GPS/activate TRX switch to return aircraft via GPS to launch point.
- Return FSS/failsafe activated from radio signal loss to return aircraft via GPS to launch point.
- Fixed circle/activate TRX switch to circle aircraft at point of activation at fixed altitude.
- Waypoint/activate TRX switch to initiate an autopilot programmed flight path via waypoints.
- Fencing/autopilot programed to display site unique boundaries on video monitor/goggles.

4. RANGE – ALTITUDE – WEIGHT – SPEED:

a) One of the requirements in Federal Law (Public Law 112-95 Sec 336 (c) (2) February 14, 2012) for model aircraft to be excluded from FAA regulations is that model aircraft be flown within *VLOS* of the operator.

b) Model aircraft must be flown at or below 400 feet AGL when within 3 miles of an airport as stated in the AMA Safety Code.

c) Model aircraft utilizing an *autopilot* for waypoint flying are limited to a maximum weight (including fuel, batteries, and onboard *autopilot systems*) of 15lbs and a speed of 70mph.

5. RECOMMENDATIONS & INFORMATION:

a) If your radio system lacks *failsafe* capability, consider using programmable digital servos or auxiliary *failsafe* modules. In the event of a radio signal failure these components will activate desired safe servo settings or an *autopilot* for return to base/launch (RTL).

b) When using an *autopilot system* the "return to launch" (RTL) feature should be programmed to return the aircraft to a safe location and safely terminate the flight should manual control of the aircraft be lost. When using RTL, pay particular attention to the manufacturer's throttle recommendations to prevent stalling.

c) The use of *stabilization systems* is recommended when flying FPV to improve flight stability and video quality.

d) Pilots usually choose to incorporate *stabilization* and *autopilot systems* for model aircraft flying to enhance flight performance, correct bad tendencies of the model aircraft, maintain stability in windy weather, establish precision heading holds for takeoffs/landings, flight training for novice pilots, create a steady flight platform for cameras, and generally just to make an airplane easier and safer to fly.

e) When purchasing *stabilization* and *autopilot systems*, always try to select quality equipment from reputable dealers, ensure for compatibility with other onboard systems, and install components according to manufacturers' instructions.

6. PRIVACY PROTECTION SAFEGUARDS:

The use of imaging technology for aerial surveillance with radio control model aircraft having the capability of obtaining high-resolution photographs and/or video, or using any types of sensors, for the collection, retention, or dissemination of surveillance data or information on individuals, homes, businesses, or property at locations where there is a reasonable expectation of privacy is strictly prohibited by the AMA unless written expressed permission is obtained from the individual property owners or managers.

7. DEFINITIONS OF TERMS:

AMA Pilot is an AMA member who is capable of manually operating an R/C transmitter to control a model aircraft's flight path within its safe intended *flight envelope* without losing control or having a collision.

Autopilot Systems incorporate programmable flight *stabilization* with an altitude sensor and a GPS receiver for accurate positioning and to navigate/control a radio controlled model aircraft's flight path. Advanced systems offer software for entering navigable waypoints. The flight data waypoints may be saved to autopilot's/GPS memory for programmed flight.

Essential Flight Systems are any systems or components necessary to maintain stable flight within a model aircraft's *flight envelope*. (This includes primary R/C systems and any *stabilization* or gyros required to maintain stability and heading in certain types of model aircraft that would be uncontrollable/unstable without their use).

Failsafe Systems are designed to minimize or prevent damage and safely terminate a flight when a radio controlled model aircraft loses radio signal. Modern radio systems can be programmed to position servos to a desired control setting in the event of radio signal failure.

First Person View (FPV) refers to the operation of a radio controlled (R/C) model aircraft using an onboard camera's cockpit view to orient and control the aircraft. (AMA Document #550).

Flight Envelope is defined as the range of airspeeds, attitudes and flight maneuvers which a model aircraft can safely perform/operate for its intended use.

Non-Essential Flight Systems are any systems or components that are not necessary to maintain stable flight within the model aircraft's intended flight envelope. (This includes *autopilot* or *stabilization systems* that can be activated and deactivated in flight by the pilot without affecting manually controlled stable flight).

R/C Test Flight requires an AMA Pilot to manually operate an R/C transmitter to control a model aircraft's flight path and determine if the aircraft is capable of maintaining stable flight within its safe intended *flight envelope*.

Stabilization Systems are designed to maintain intended model aircraft flight attitudes. The pilot can install, program and/or activate a system to stabilize yaw, pitch, or roll or any one attitude or combination of attitudes. Systems are often based on rate/heading hold gyros or inertial motion sensors utilizing multi-axis gyros and accelerometers for attitude stabilization.

Visual Line of Sight (VLOS) is the distance at which the pilot is able to maintain visual contact with the aircraft and determine its orientation and attitude without enhancements other than corrective lenses.

FREQUENTLY ASKED QUESTIONS

Model Aircraft Radio Control Operations Utilizing FIRST PERSON VIEW, STABILIZATION, AND AUTOPILOT SYSTEMS

1. **I thought it was AMA's policy to stay clear of Drone type flying using programmed flight control systems?**

   There are distinct differences between R/C FPV autopilot equipped model aircraft flying and Drone flying. Drone flights are mission oriented, flown beyond VLOS, and computer controlled for nearly their entire flight. AMA members fly R/C FPV autopilot equipped model aircraft as a recreational visual/video experience. The AMA FPV pilot is required to fly within VLOS and manually controls the aircraft via R/C for nearly the entire flight.

2. **Why has AMA chosen to limit FPV flying to VLOS when it is not currently required in the law?**

   Section 4-a of AMA document 550 and 560 states that one of the requirements in Federal Law (Public Law 112-95 Sec 336 (c) (2) February 14, 2012) for model aircraft to be excluded from FAA regulations is that model aircraft be flown within VLOS of the operator. The AMA has chosen the exclusionary path to protect and advocate for the interest of its members rather than be subject to potentially onerous governmental regulations.

3. **Will AMA pilots flying FPV beyond VLOS be covered by AMA liability insurance?**

   Coverage under the policy will be determined by the specific facts and details relating to the claim. As intentionally flying FPV aircraft beyond VLOS of the operator violates AMA Safety Code and documents 550 and 560, the AMA pilot should not rely on AMA insurance for coverage.

4. **Why were weight and speed limits set at 15lbs and 70mph for FPV flying or when using an autopilot for waypoint flying?**

   FPV aircraft speed limits were set lower than other R/C model aircraft to allow for easier visual tracking of model aircraft by the FPV Spotter and to provide extra time for the FPV Pilot to handover a transmitter to the FPV Spotter in the event of an approaching aircraft or incident.

   Model aircraft weight while flying FPV and/or the use of autopilot systems for waypoint flying was limited to 15lbs to reduce the potential or perception that someone could use these types of aircraft to carry a destructive payload beyond VLOS. Flying model aircraft while using stabilization and/or failsafe systems and/or activating an autopilot system for return to launch does not limit the aircraft to a weight of 15lbs.

5. **Why did the AMA decide to eliminate the buddy-box requirement for FPV flying**?

   The FPV Pilot is often more experienced and able to maneuver his FPV aircraft out of problem status with verbal cues from the FPV Spotter rather than having the FPV Spotter take over control using a buddy-box. The FPV Pilot will know when the video link is lost before the FPV Spotter and will hand over the transmitter to the FPV Spotter. The cost and availability of compatible and programmable radiotransmitters for use as a buddy-box for complex FPV aircraft systems may also preclude the use of a buddy-box. It is also possible that some of the more complex systems might require the buddy box port for flight/camera operations.

6. **Does the FPV Spotter need to be an experienced FPV Pilot?**

   The FPV Spotter is required to be an experienced R/C Pilot but doesn't need to be an experienced FPV Pilot since he will only be required to fly the FPV Aircraft by conventional VLOS in the event of an incident.

7. **When will an FPV Novice Pilot assume FPV Pilot status?**

   When an FPV Novice Pilot is able to consistently maintain control of stability and orientation while flying an FPV aircraft, without losing control or having a collision, he/she may assume FPV Pilot status. The buddy-box is no longer required for FPV Pilots.

8. **Will my AMA club have to allow FPV flying at the club's AMA chartered club field?**

   Each AMA club and/or site owner or property manager decides what can or cannot be flown at a particular flying site.

9. **I have heard that FPV flying and the use of complex autopilot systems will create a much greater risk of accidents occurring at my club's flying site. If this is true, shouldn't the AMA exclude FPV and Autopilot flying at all AMA chartered flying sites?**

   Educating members so they understand the basics of these systems and AMA's requirements for use and implementation should alleviate these erroneous assumptions. The fact is FPV flying and the use of Stabilization and Autopilot systems in model aircraft have the capability to reduce the risk and severity of model aircraft accidents.

10. **Was there any consideration given to having a proficiency system for FPV Pilots similar to what jet pilots have to undergo?**

    When necessary, as with high energy and high risk turbine powered aircraft, pilot testing was implemented into our safety programming to mitigate the risks involved. The committee felt that requiring a Spotter for FPV and providing a transmitter hand-over protocol for FPV Pilots and a buddy-box for novice pilots, would ensure AMA Safety Standards were maintained.

11. **Who qualifies AMA FPV Pilots?**

    Except for AMA members piloting turbine powered model aircraft, the AMA doesn't require pilot proficiency testing. Individual AMA Clubs may establish their own pilot testing requirements for their members which may require the members to demonstrate and be judged on their flying proficiency. The AMA does expect members to use their good judgment to decide for themselves whether or not they can fly a model aircraft safely. With regard to FPV flying this would be when the AMA FPV Novice Pilot was satisfied that he/she was capable of maintaining control of stability and orientation of FPV model aircraft when flown FPV without losing control or having a collision. The FPV novice pilot would now have AMA FPV Pilot status.

12. **Will elimination of the buddy-box requirement and hand-over control to the FPV Spotter create a greater risk of accidents?**

We discovered in our observations that FPV flying for the most part took place at either higher altitudes or lower "near ground" altitudes then typical model aircraft flying. Hand-over transferring of the transmitter from the FPV Pilot to the Spotter provided sufficient time for recovery at the higher altitudes. Transference via the buddy-box for an out of control FPV aircraft at the lower altitudes didn't provide a better chance of preventing a crash than handing over control to the spotter. Both methods proved inadequate at these near ground or lower altitudes.

13. **Are AMA members covered by AMA insurance when their model aircraft's FPV flight goes beyond the AMA chartered club's flying site boundaries?**

AMA insurance liability protection is not limited to AMA charted club flying sites or the flight boundaries of the site. It applies to accidents arising from AMA member modeling activities of model aircraft conducted in accordance with AMA's National Safety Code. As long as AMA pilots don't fly at locations where model airplane flying is prohibited and avoid flying directly over unprotected people, vessels, vehicles or structures and avoid endangering life or property, AMA insurance coverage will be extended. This coverage also extends to an accidental model aircraft fly-away beyond the permitted flying site that may cause bodily injury or property damage at any location where the crash occurs.

14. **Can FPV model aircraft be flown by AMA members at altitudes above 400' and is there any chance that we might someday be able to fly beyond VLOS?**

In 1981 FAA Advisory Circular AC 91-57 advised that model aircraft not exceed altitudes of 400ft. At this time there is no FAA regulation/rule preventing model aircraft from flying above 400' AGL. For the past 32 years the AMA applied this FAA advisory only within 3 miles of an airport in the AMA National Safety Code. The AMA will continue to use all its resources to prevent the FAA from making 400' a regulation/rule for all locations of model aircraft flying. Public Law 112-95 Sec 336 requires model aircraft be flown within VLOS. As you might expect this is acceptable by the majority of AMA members but limiting to FPV activity. We are looking into alternative methods to support FPV activity beyond VLOS as new FPV technology (perhaps sense and avoid) becomes available and risks assessed and mitigated to a safe and acceptable level to perhaps someday fly beyond VLOS.

15. **Why were privacy protection requirements included in the revised documents?**

These safeguards were included to provide 4th Amendment rights to privacy protection for individuals and their property from model aircraft equipped with imaging technology ***when used for surveillance.*** *One of the provisions in Federal Law 112-95 Sec 336-2 for model aircraft to be excluded from FAA regulations requires model aircraft are operated within the programming of a nationwide community-based organization (CBO) that has been accepted/approved for CBO status by the FAA. The AMA has chosen this path in order to operate under its accepted Safety Code and Operational Requirements including Privacy Protection Safeguards rather than be subject to potentially onerous governmental regulations with respect to Privacy Protection for those operating model aircraft outside of the CBO default path. We also had a responsibility to provide operational standards that are acceptable and compliant within our insurance programming, requiring members to operate their model aircraft without violating existing laws which could include first and fourth amendment rights of citizens to privacy protection in cases where a suit is filed for invasion of privacy as a result of unauthorized aerial surveillance.*

16. Does the AMA Privacy Protection Statement essential outlaw aerial photography and videoing?

The AFS committee views the updated AMA Privacy Protection Statement as not at all outlawing aerial photographing or videoing. We believe it's better for us to have written our own Privacy Protection Safeguard then leave it unattended; waiting for what very well may be onerous government privacy regulation. In the US anyone may take photos/videos in public places except when a legal statute or ordinance exist and when individuals are in places where they have a reasonable expectation of privacy such as restrooms, dressing rooms, medical facilities and inside their homes. Property owners may legally prohibit video/photography on their premises but have no right to prohibit others from videoing/photographing their property from other locations (which may include from airspace near their property or 400' above their property without the use of telephoto lenses while not flying directly over people or structures). In most locations you may reasonably assume that taking video/photographs is allowed and that you do not need explicit permission. However, this is a judgment call and you should request permission when the circumstances suggest that the owner is likely to object. Taking aerial photos/videos that include a person's house and property may be fine but doing so in the fenced in pool area when someone is skinny dipping would not be permissible.

Federal Aviation Administration
14 CFR Part 91
Docket No. FAA-2006-25714

Unmanned Aircraft Operations in the National Airspace System
AGENCY: Federal Aviation Administration (FAA), DOT.
ACTION: Notice of policy; opportunity for feedback.
SUMMARY: This notice clarifies the FAA's current policy concerning operations of unmanned aircraft in the National Airspace System.

FOR FURTHER INFORMATION CONTACT: Kenneth D. Davis, Manager, Unmanned Aircraft Program Office, Aircraft Certification Service, Federal Aviation Administration, 800 Independence Avenue, SW., Washington, DC 20591, (202) 385-4636, email: kenneth.d.davis@faa.gov.

Background

Simply stated, an unmanned aircraft is a device that is used, or is intended to be used, for flight in the air with no onboard pilot. These devices may be as simple as a remotely controlled model aircraft used for recreational purposes or as complex as surveillance aircraft flying over hostile areas in warfare. They may be controlled either manually or through an autopilot using a data link to connect the pilot to their aircraft. They may perform a variety of public services: surveillance, collection of air samples to determine levels of pollution, or rescue and recovery missions in crisis situations. They range in size from wingspans of six inches to 246 feet; and can weigh from approximately four ounces to over 25,600 pounds. The one thing they have in common is that their numbers and uses are growing dramatically. In the United States alone, approximately 50 companies, universities, and government organizations are developing and producing some 155 unmanned aircraft designs. Regulatory standards need to be developed to enable current technology for unmanned aircraft to comply with Title 14 Code of Federal Regulations (CFR). The Federal Aviation Administration's current policy is based on whether the unmanned aircraft is used as a public aircraft, civil aircraft or as a model aircraft.

Unmanned Aircraft Systems Operating as Public Aircraft

The most common public use of unmanned aircraft today in the United States is by the Department of Defense. U.S. operations in Iraq, Afghanistan and elsewhere have fueled a huge increase in unmanned aircraft demand. In Iraq alone, more than 700 unmanned aircraft are in use for surveillance and weapons delivery. Other agencies have also found public uses for unmanned aircraft. For example, the Customs and Border Protection uses them to patrol along the US/Mexican border. In the future, unmanned aircraft could be used to provide first responder reports of damage due to weather or other catastrophic causes. In response to this growing demand for public use unmanned aircraft operations, the FAA developed guidance in a Memorandum titled "Unmanned Aircraft Systems Operations in the U.S. National Airspace System – Interim Operational Approval Guidance" (UAS Policy 05-01). In this document, the FAA set out guidance for public use of unmanned aircraft by defining a process for evaluating applications for Certificate(s) of Waiver or Authorization (COA's) for unmanned aircraft to operate in the National Airspace System.

The concern was not only that unmanned aircraft operations might interfere with commercial and general aviation aircraft operations, but that they could also pose a safety problem for other airborne vehicles, and persons or property on the ground. The FAA guidance supports unmanned aircraft flight activity that can be conducted at an acceptable level of safety. In order to ensure this level of safety, the operator is required to establish the Unmanned Aircraft System's (UAS) airworthiness either from FAA certification, a DOD airworthiness statement, or by other approved means. Applicants also have to demonstrate that a collision with another aircraft or other airspace user is extremely improbable as well as complying with appropriate cloud and terrain clearances as required. Key to the concept is the roles of pilot-in-command (PIC) and observer. The PIC concept is essential to the safe operation of manned aircraft. The FAA's UAS guidance applies this PIC concept to unmanned aircraft and includes minimum qualifications and currency requirements. The PIC is simply the person in control of, and responsible for, the UAS. The role of the observer is to observe the activity of the unmanned aircraft and surrounding airspace, either through line-of-sight on the ground or in the air by means of a chase aircraft. In general, this means the pilot or observer must be, in most cases, within 1 mile laterally and 3,000 feet vertically of the unmanned aircraft. Direct communication between the PIC and the observer must be maintained at all times. Unmanned aircraft flight above 18,000 feet must be conducted under Instrument Flight Rules, on an IFR flight plan, must obtain ATC clearance, be equipped with at least a Mode C transponder (preferably Mode S), operating navigation lights and / or collision avoidance lights and maintain communication between the PIC and Air Traffic Control (ATC). Unmanned aircraft flights below 18,000 feet have similar requirements, except that if operators choose to operate on other than an IFR flight plan, they may be required to pre-coordinate with ATC.

The FAA has issued more than 50 COA's over the past 2 years and anticipates issuing a record number of COA's this year. For more information, Memorandum on UAS Policy (05-01) and other policy guidance is available at the FAA Website: http://www.faa.gov/uas.

Unmanned Aircraft Systems Operating as Civil Aircraft

Just as unmanned aircraft have a variety of uses in the public sector; their application in commercial or civil use is equally diverse. This is a quickly growing and important industry. Under FAA policy, operators who wish to fly an unmanned aircraft for civil use must obtain an FAA airworthiness certificate the same as any other type aircraft. The FAA is currently only issuing special airworthiness certificates in the experimental category. Experimental certificates are issued with accompanying operational limitations (14 CFR §91.319) that are appropriate to the applicant's operation. The FAA has issued five experimental certificates for unmanned aircraft systems for the purposes of research and development, marketing surveys, or crew training. UAS issued experimental certificates may not be used for compensation or hire. The applicable regulations for an experimental certificate are found in 14 CFR§§21.191, 21.193, and 21.195. In general, the applicant must state the intended use for the UAS and provide sufficient information to satisfy the FAA that the aircraft can be operated safely. The time or number of flights must be specified along with a description of the areas over which the aircraft would operate. The application must also include drawings or detailed photographs of the aircraft. An on-site review of the system and demonstration of the area of operation may be required. Additional information on how to apply for an experimental airworthiness certificate is available from Richard Posey, AIR-200, (202) 267-9538; email: richard.posey@faa.gov

Recreational/Sport Use of Model Airplanes

In 1981, in recognition of the safety issues raised by the operation of model aircraft, the FAA published Advisory Circular (AC) 91-57, Model Aircraft Operating Standards for the purpose of providing guidance to persons interested in flying model aircraft as a hobby or for recreational use. This guidance encourages good judgment on the part of operators so that persons on the ground or other aircraft in flight will not be endangered. The AC contains among other things, guidance for site selection. Users are advised to avoid noise sensitive areas such as parks, schools, hospitals, and churches. Hobbyists are advised not to fly in the vicinity of spectators until they are confident that the model aircraft has been flight tested and proven airworthy. Model aircraft should be flown below 400 feet above the surface to avoid other aircraft in flight. The FAA expects that hobbyists will operate these recreational model aircraft within visual line-of-sight. While the AC 91-57 was developed for model aircraft, some operators have used the AC as the basis for commercial flight operations.

Policy Statement

The current FAA policy for UAS operations is that no person may operate a UAS in the National Airspace System without specific authority. For UAS operating as public aircraft the authority is the COA, for UAS operating as civil aircraft the authority is special airworthiness certificates, and for model aircraft the authority is AC 91-57. The FAA recognizes that people and companies other than modelers might be flying UAS with the mistaken understanding that they are legally operating under the authority of AC 91-57. AC 91-57 only applies to modelers, and thus specifically excludes its use by persons or companies for business purposes. The FAA has undertaken a safety review that will examine the feasibility of creating a different category of unmanned "vehicles" that may be defined by the operator's visual line of sight and are also small and slow enough to adequately mitigate hazards to other aircraft and persons on the ground. The end product of this analysis may be a new flight authorization instrument similar to AC 91-57, but focused on operations which do not qualify as sport and recreation, but also may not require a certificate of airworthiness. They will, however, require compliance with applicable FAA regulations and guidance developed for this category. Feedback regarding current FAA policy for Unmanned Aircraft Systems can be submitted at www.faa.gov/uas. (Scroll down to the bottom of the page and find Contact UAPO. Click into this link.)

Issued in Washington, DC on February 6, 2007/s/ Nick Sabatini

Nicholas Sabatini
Associate Administrator for Aviation Safety

FAA Modernization and Reform Act of 2012

Senate Bill, Section 607(g) ...exempts most model airplanes used for recreational or academic use from any UAS regulations established by the FAA

Conference Committee Report

Senate bill with modifications... *Language including model aircraft for the purposes of sports, competitions and academic purposes is removed and replaced with ``hobby''. The modified section includes language requiring that the model aircraft must be operated in a manner that does not interfere with and gives way, to all manned aircraft. In addition, language that requires that model aircraft flown within five miles of an airport will give prior notification to the airport and the air traffic control (ATC), and that model aircraft that are flown consistently within five miles of the ATC will do so under standing agreements with the airports and ATC. Lastly, language is added that will ensure that nothing in this provision will interfere with the Administrator's authority to pursue enforcement action against persons operating model aircraft who endanger the safety of the national airspace system. In this section the term ``nationwide community-based organization'' is intended to mean a membership based association that represents the aeromodeling community within the United States; provides its members a comprehensive set of safety guidelines that underscores safe aeromodeling operations within the National Airspace System and the protection and safety of the general public on the ground; develops and maintains mutually supportive programming with educational institutions, government entities and other aviation associations; and acts as a liaison with government agencies as an advocate for its members.*

SEC. 336. SPECIAL RULE FOR MODEL AIRCRAFT.

(a) In General.--Notwithstanding any other provision of law relating to the incorporation of unmanned aircraft systems into Federal Aviation Administration plans and policies, including this subtitle, the Administrator of the Federal Aviation Administration may not promulgate any rule or regulation regarding a model aircraft, or an aircraft being developed as a model aircraft, if--

(1) the aircraft is flown strictly for hobby or recreational use;

(2) the aircraft is operated in accordance with a community-based set of safety guidelines and within the programming of a nationwide community-based organization;

(3) the aircraft is limited to not more than 55 pounds unless otherwise certified through a design, construction, inspection, flight test, and operational safety program administered by a community-based organization;

(4) the aircraft is operated in a manner that does not interfere with and gives way to any manned aircraft; and

(5) when flown within 5 miles of an airport, the operator of the aircraft provides the airport operator and the airport air traffic control tower (when an air traffic facility is located at the airport) with prior notice of the operation (model aircraft operators flying from a permanent location within 5 miles of an airport should establish a mutually-agreed upon operating procedure with the airport operator and the airport air traffic control tower (when an air traffic facility is located at the airport)).

(b) Statutory Construction.--Nothing in this section shall be construed to limit the authority of the Administrator to pursue enforcement action against persons operating model aircraft who endanger the safety of the national airspace system.

(c) Model Aircraft Defined.--In this section, the term ``model aircraft'' means an unmanned aircraft that is--

(1) capable of sustained flight in the atmosphere;

(2) flown within visual line of sight of the person operating the aircraft; and

(3) flown for hobby or recreational purposes.

Bill Text: TX HB912 | 2013-2014 | 83rd Legislature | Enrolled

Texas House Bill 912 ***(Adjourned Sine Die)***

Bill Title: Relating to images captured by unmanned aircraft and other images and recordings; providing penalties. [**Track Bill**]

Status: 2013-06-14 - Effective on 9/1/13 [HB912 Detail]

Download: Texas-2013-HB912-Enrolled.html

H.B. No. 912

AN ACT

relating to images captured by unmanned aircraft and other images and recordings; providing penalties.

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF TEXAS:

SECTION 1. This Act shall be known as the Texas Privacy Act.

SECTION 2. Subtitle B, Title 4, Government Code, is amended by adding Chapter 423 to read as follows:

CHAPTER 423. USE OF UNMANNED AIRCRAFT

Sec. 423.001. DEFINITION. In this chapter, "image" means any capturing of sound waves, thermal, infrared, ultraviolet, visible light, or other electromagnetic waves, odor, or other conditions existing on or about real property in this state or an individual located on that property.

Sec. 423.002. NONAPPLICABILITY. (a) It is lawful to capture an image using an unmanned aircraft in this state:

(1) for purposes of professional or scholarly research and development by a person acting on behalf of an institution of higher education, as defined by Section 61.003, Education Code, including a person who:

(A) is a professor, employee, or student of the institution; or

(B) is under contract with or otherwise acting under the direction or on behalf of the institution;

(2) in airspace designated as a test site or range authorized by the Federal Aviation Administration for the purpose of integrating unmanned aircraft systems into the national airspace;

(3) as part of an operation, exercise, or mission of any branch of the United States military;

(4) if the image is captured by a satellite for the purposes of mapping;

(5) if the image is captured by or for an electric or natural gas utility:

(A) for operations and maintenance of utility facilities for the purpose of maintaining utility system reliability and integrity;

(B) for inspecting utility facilities to determine repair, maintenance, or replacement needs during and after construction of such facilities;

(C) for assessing vegetation growth for the purpose of maintaining clearances on utility easements; and

(D) for utility facility routing and siting for the purpose of providing utility service;

(6) with the consent of the individual who owns or lawfully occupies the real property captured in the image;

(7) pursuant to a valid search or arrest warrant;

(8) if the image is captured by a law enforcement authority or a person who is under contract with or otherwise acting under the direction or on behalf of a law enforcement authority:

(A) in immediate pursuit of a person law enforcement officers have reasonable suspicion or probable cause to suspect has committed an offense, not including misdemeanors or offenses punishable by a fine only;

(B) for the purpose of documenting a crime scene where an offense, not including misdemeanors or offenses punishable by a fine only, has been committed;

(C) for the purpose of investigating the scene of:

(i) a human fatality;

(ii) a motor vehicle accident causing death or serious bodily injury to a person; or

(iii) any motor vehicle accident on a state highway or federal interstate or highway;

(D) in connection with the search for a missing person;

(E) for the purpose of conducting a high-risk tactical operation that poses a threat to human life; or

(F) of private property that is generally open to the public where the property owner consents to law enforcement public safety responsibilities;

(9) if the image is captured by state or local law enforcement authorities, or a person who is under contract with or otherwise acting under the direction or on behalf of state authorities, for the purpose of:

(A) surveying the scene of a catastrophe or other damage to determine whether a state of emergency should be declared;

(B) preserving public safety, protecting property, or surveying damage or contamination during a lawfully declared state of emergency; or

(C) conducting routine air quality sampling and

monitoring, as provided by state or local law;

(10) at the scene of a spill, or a suspected spill, of hazardous materials;

(11) for the purpose of fire suppression;

(12) for the purpose of rescuing a person whose life or well-being is in imminent danger;

(13) if the image is captured by a Texas licensed real estate broker in connection with the marketing, sale, or financing of real property, provided that no individual is identifiable in the image;

(14) of real property or a person on real property that is within 25 miles of the United States border;

(15) from a height no more than eight feet above ground level in a public place, if the image was captured without using any electronic, mechanical, or other means to amplify the image beyond normal human perception;

(16) of public real property or a person on that property;

(17) if the image is captured by the owner or operator of an oil, gas, water, or other pipeline for the purpose of inspecting, maintaining, or repairing pipelines or other related facilities, and is captured without the intent to conduct surveillance on an individual or real property located in this state;

(18) in connection with oil pipeline safety and rig protection; or

(19) in connection with port authority surveillance and security.

(b) This chapter does not apply to the manufacture, assembly, distribution, or sale of an unmanned aircraft.

Sec. 423.003. OFFENSE: ILLEGAL USE OF UNMANNED AIRCRAFT TO CAPTURE IMAGE. (a) A person commits an offense if the person uses an unmanned aircraft to capture an image of an individual or privately owned real property in this state with the intent to conduct surveillance on the individual or property captured in the image.

(b) An offense under this section is a Class C misdemeanor.

(c) It is a defense to prosecution under this section that the person destroyed the image:

(1) as soon as the person had knowledge that the image was captured in violation of this section; and

(2) without disclosing, displaying, or distributing the image to a third party.

(d) In this section, "intent" has the meaning assigned by Section 6.03, Penal Code.

Sec. 423.004. OFFENSE: POSSESSION, DISCLOSURE, DISPLAY, DISTRIBUTION, OR USE OF IMAGE. (a) A person commits an offense if the person:

(1) captures an image in violation of Section 423.003; and

(2) possesses, discloses, displays, distributes, or

otherwise uses that image.

(b) An offense under this section for the possession of an image is a Class C misdemeanor. An offense under this section for the disclosure, display, distribution, or other use of an image is a Class B misdemeanor.

(c) Each image a person possesses, discloses, displays, distributes, or otherwise uses in violation of this section is a separate offense.

(d) It is a defense to prosecution under this section for the possession of an image that the person destroyed the image as soon as the person had knowledge that the image was captured in violation of Section 423.003.

(e) It is a defense to prosecution under this section for the disclosure, display, distribution, or other use of an image that the person stopped disclosing, displaying, distributing, or otherwise using the image as soon as the person had knowledge that the image was captured in violation of Section 423.003.

Sec. 423.005. ILLEGALLY OR INCIDENTALLY CAPTURED IMAGES NOT SUBJECT TO DISCLOSURE. (a) Except as otherwise provided by Subsection (b), an image captured in violation of Section 423.003, or an image captured by an unmanned aircraft that was incidental to the lawful capturing of an image:

(1) may not be used as evidence in any criminal or juvenile proceeding, civil action, or administrative proceeding;

(2) is not subject to disclosure, inspection, or copying under Chapter 552; and

(3) is not subject to discovery, subpoena, or other means of legal compulsion for its release.

(b) An image described by Subsection (a) may be disclosed and used as evidence to prove a violation of this chapter and is subject to discovery, subpoena, or other means of legal compulsion for that purpose.

Sec. 423.006. CIVIL ACTION. (a) An owner or tenant of privately owned real property located in this state may bring against a person who, in violation of Section 423.003, captured an image of the property or the owner or tenant while on the property an action to:

(1) enjoin a violation or imminent violation of Section 423.003 or 423.004;

(2) recover a civil penalty of:

(A) $5,000 for all images captured in a single episode in violation of Section 423.003; or

(B) $10,000 for disclosure, display, distribution, or other use of any images captured in a single episode in violation of Section 423.004; or

(3) recover actual damages if the person who captured the image in violation of Section 423.003 discloses, displays, or distributes the image with malice.

(b) For purposes of recovering the civil penalty or actual damages under Subsection (a), all owners of a parcel of real

property are considered to be a single owner and all tenants of a parcel of real property are considered to be a single tenant.

(c) In this section, "malice" has the meaning assigned by Section 41.001, Civil Practice and Remedies Code.

(d) In addition to any civil penalties authorized under this section, the court shall award court costs and reasonable attorney's fees to the prevailing party.

(e) Venue for an action under this section is governed by Chapter 15, Civil Practice and Remedies Code.

(f) An action brought under this section must be commenced within two years from the date the image was:

(1) captured in violation of Section 423.003; or

(2) initially disclosed, displayed, distributed, or otherwise used in violation of Section 423.004.

Sec. 423.007. RULES FOR USE BY LAW ENFORCEMENT. The Department of Public Safety shall adopt rules and guidelines for use of an unmanned aircraft by a law enforcement authority in this state.

Sec. 423.008. REPORTING BY LAW ENFORCEMENT AGENCY. (a) Not earlier than January 1 and not later than January 15 of each odd-numbered year, each state law enforcement agency and each county or municipal law enforcement agency located in a county or municipality, as applicable, with a population greater than 150,000, that used or operated an unmanned aircraft during the preceding 24 months shall issue a written report to the governor, the lieutenant governor, and each member of the legislature and shall:

(1) retain the report for public viewing; and

(2) post the report on the law enforcement agency's publicly accessible website, if one exists.

(b) The report must include:

(1) the number of times an unmanned aircraft was used, organized by date, time, location, and the types of incidents and types of justification for the use;

(2) the number of criminal investigations aided by the use of an unmanned aircraft and a description of how the unmanned aircraft aided each investigation;

(3) the number of times an unmanned aircraft was used for a law enforcement operation other than a criminal investigation, the dates and locations of those operations, and a description of how the unmanned aircraft aided each operation;

(4) the type of information collected on an individual, residence, property, or area that was not the subject of a law enforcement operation and the frequency of the collection of this information; and

(5) the total cost of acquiring, maintaining, repairing, and operating or otherwise using each unmanned aircraft for the preceding 24 months.

SECTION 3. The change in law made by this Act applies only to the capture, possession, disclosure, display, distribution, or

other use of an image that occurs on or after the effective date of this Act.

SECTION 4. The provisions of this Act or the applications of those provisions are severable as provided by Section 311.032(c), Government Code.

SECTION 5. This Act takes effect September 1, 2013.

President of the Senate

Speaker of the House

I certify that H.B. No. 912 was passed by the House on May 10, 2013, by the following vote: Yeas 128, Nays 11, 2 present, not voting; that the House refused to concur in Senate amendments to H.B. No. 912 on May 21, 2013, and requested the appointment of a conference committee to consider the differences between the two houses; that the House adopted the conference committee report on H.B. No. 912 on May 26, 2013, by the following vote: Yeas 140, Nays 4, 2 present, not voting; and that the House adopted H.C.R. No. 217 authorizing certain corrections in H.B. No. 912 on May 27, 2013, by the following vote: Yeas 145, Nays 3, 2 present, not voting.

Chief Clerk of the House

I certify that H.B. No. 912 was passed by the Senate, with amendments, on May 17, 2013, by the following vote: Yeas 29, Nays 1; at the request of the House, the Senate appointed a conference committee to consider the differences between the two houses; that the Senate adopted the conference committee report on H.B. No. 912 on May 26, 2013, by the following vote: Yeas 26, Nays 5; and that the Senate adopted H.C.R. No. 217 authorizing certain corrections in H.B. No. 912 on May 27, 2013, by the following vote: Yeas 31, Nays 0.

Secretary of the Senate

Abstract

The Department of Homeland Security (DHS), U.S. Customs and Border Protection (CBP) employs several types of aircraft including manned helicopters and fixed-wing aircraft, and Unmanned Aircraft Systems (UAS) for border surveillance and law enforcement purposes. These aircraft are equipped with video, radar, and/or other sensor technologies to assist CBP in patrolling the border, conducting surveillance as part of a law enforcement investigation or tactical operation, or gathering raw data that may assist in disaster relief or responses to other emergencies. Video, images, and sensor data collected through these Aircraft Systems alone cannot be used to identify a person, but they may later be associated with a person as part of a law enforcement investigation or encounter with CBP officers or agents. DHS/CBP is conducting this Privacy Impact Assessment to evaluate the privacy impact of these technologies on persons.

Introduction

The Department of Homeland Security (DHS), U.S. Customs and Border Protection (CBP) is responsible for guarding nearly 7,000 miles of land border the United States shares with Canada and Mexico and 2,000 miles of coastal waters surrounding the Florida peninsula and off the coast of Southern California. The agency also protects 95,000 miles of maritime border in partnership with the United States Coast Guard. To achieve these missions, CBP employs several types of aircraft, including manned helicopters and fixed-wing aircraft, and Unmanned Aircraft Systems (UAS) for border surveillance and law enforcement purposes. These aircraft are equipped with video, radar, and/or other sensor technologies to assist CBP in patrolling the border, conducting surveillance as part of a law enforcement investigation or tactical operation, or gathering raw data that may assist in disaster relief or other emergencies. This Privacy Impact Assessment (PIA) is necessary because the aircraft are equipped with technology that captures information that may be associated with persons whom CBP encounters.

Overview

CBP employs several types of aircraft to achieve its mission objectives. All aircraft, manned or unmanned, have some type of imaging capability such as video, still images collection, and/or radar. The UAS differ from CBP's manned aircraft only in that the pilot controls the aircraft from the ground and the aircraft are capable of flying farther distances and longer hours continuously. All aircraft are owned and operated by the Office of Air and Marine (OAM); the Office of Intelligence and Investigative Liaison (OIIL) is responsible for processing, exploitation, and dissemination (PED) of imagery transmitted from aircraft.

CBP aircraft, both manned and unmanned, are used in the following scenarios: (1) to patrol the border; (2) to conduct surveillance for investigative operations; (3) to conduct damage assessment in disaster situations; and (4) in response to officer safety scenarios. While CBP also

allocates its air assets in a manner that reflects this prioritization, CBP reviews and considers all requests for assistance. Lastly, CBP does not equip its aircraft with weapons. While the crew in all manned aircraft and the officers and agents onboard the aircraft during tactical missions do carry weapons, the various aircraft are not equipped with armaments.

Helicopters

CBP operates several types of manned rotary-wing aircraft (helicopters) in support of its mission, notably, the American Eurocopter AS-350, Augusta Westland AW-139, Bell Huey UH-1, and Sikorsky UH-60. CBP uses helicopters for observation, for tracking suspects and supporting ground units, aerial reconnaissance of moving objects and persons, external lift capability for seizures and equipment delivery, and tactical support and transportation for law enforcement activities. Areas of operation include the border environment, both land and sea, to observe and interdict unlawful crossings of persons and goods, the airspace surrounding defined DHS National Special Security Events or critical venues, and populated or unpopulated areas that are the subject of defined law enforcement activity or investigation. CBP's helicopter fleet operates out of 30 locations maintained by OAM across the United States.

Fixed-wing Aircraft

CBP has manned fixed-wing P-3 AEW/LRT Orion aircraft operating out of specific operations centers in Corpus Christi, TX and Jacksonville, FL. CBP practices a defense in depth strategy of the borders of the United States and in active prosecution of attempts to smuggle persons or contraband by extending surveillance over international and coastal waters. As part of this strategy and as a means of integrating with the overall U.S. Government strategy to interdict the flow of narcotics and controlled substances across the U.S. southern borders, this defense in depth includes expanding the area of patrol to include the Caribbean and Eastern Pacific waters that border Source and Transit Zone countries.[1] Together the operations centers operate the P-3 aircraft primarily in Central and South America. Certain P-3s are used to intercept and track both aircraft and vessels for hours at a time while maintaining a covert standoff. CBP also operates several smaller, manned, fixed-wing aircraft out of OAM operational locations. These fixed-wing aircraft include piston-engine propeller-powered aircraft (Cessna models), larger turbo-prop powered aircraft (Bombardier Dash Eight, Pilatus, and Beechcraft Super King Air), and jet aircraft (Cessna Citation). These aircraft variously perform surveillance, tracking, interdiction, intercept, and information gathering roles. Fixed-Wing Aircraft employ various types of sensor technology including video, still, and radar images, and Law Enforcement Technical Collection (LETC) (electronic signals information across the electromagnetic spectrum).

[1] Source and Transit Zone countries are those nations working in partnership with the United States to interdict the flow of narcotics and controlled substances to the United States through the Caribbean Basin and along the coastal waters of the eastern Pacific Ocean. http://www.whitehouse.gov/ondcp/transit-zone-operations.

UAS

A UAS encompasses an unmanned aircraft, digital network, and personnel on the ground who operate the aircraft. CBP currently owns and operates ten such aircraft. The UAS aircraft include the Predator B[2] and the maritime variant of the Predator B, the Guardian, which allows CBP to conduct missions in areas that are remote, too rugged for ground access, or otherwise considered too high-risk for manned aircraft or personnel on the ground. The aircraft are stationed and principally controlled at four locations: Sierra Vista, AZ (4 aircraft); Grand Forks, ND (2 aircraft); Corpus Christi, TX (2 aircraft); and Cape Canaveral, FL (2 aircraft). CBP's UAS operate in accordance within the Federal Aviation Administration (FAA) Certificate of Authorization (COA) process. CBP works with the FAA to develop the COAs to define airspace for UAS operation. Consistent with the primary mission for the UAS, these COAs, which are in effect for a period of two years, define airspace (altitude, latitude, and longitude (geography)) along the border and outside of urban areas to support CBP UAS flight operations. As the FAA develops its roadmap to integrate UAS into the National Airspace System (NAS)[3], CBP will adjust to these new requirements and continue to employ UAS in pursuit of its primary border security mission.

Uses of Aircraft

Patrol

CBP uses all of its aircraft to patrol different parts of the border based on the specific strengths of the different aircraft. CBP P-3s patrol in a 42-million square mile area of the Western Caribbean and Eastern Pacific, known as the Source and Transit Zone, in search of drugs that are in transit towards U.S. shores. The P-3's distinctive detection capabilities allow highly-trained crews to identify emerging threats well beyond U.S. land borders. By providing surveillance of known air, land, and maritime smuggling routes in an area that is twice the size of the continental U.S., the P-3s detect, monitor, and disrupt smuggling activities before they reach shore.[4] As part of this patrol responsibility, images and radar information obtained in detecting, monitoring, or supporting activities is collected and maintained either for direct case support or to permit historical trend analysis regarding smuggling routes.

Along both the northern and southern borders CBP also employs UAS and smaller manned aircraft to help agents detect, identify, apprehend, and remove individuals and

[2] The General Atomics Aeronautical Systems MQ-9 Predator B is a mid-size Unmanned Aerial Vehicle (UAV) approximately thirty-six feet in length, with a maximum gross weight of 10,500 pounds and a wing span of sixty-six feet.

[3] See, *FAA Modernization and Reform Act of 2012*, Pub. L. No.112-95, sec. 331, 126 Stat. 11, 72, which mandates that the FAA prepare a roadmap to integrate UAS into the NAS by 2015.

[4] The Anti-Drug Abuse Act of 1988 established the Office of National Drug Control Policy (ONDCP) to set priorities, implement a national strategy, and certify Federal drug-control budgets. Interdiction of the flow of illicit drugs through the Source and Transit Zone is a critical component of the National Drug Control Strategy prepared annually by ONDCP.

contraband illegally entering the United States at and between Ports of Entry (POE). The COA defined airspace establishes operational corridors for UAS activity both along and within 100 miles of the border for the northern border, and along and within 25 to 60 miles of the border for the southern border, exclusive of urban areas. CBP helicopters and manned fixed-wing aircraft may operate in and around urban areas; however, the principal mission remains focused on those areas between the POE. Images, LETC, and radar information, specifically with respect to border areas between the POEs, are collected in support of case development or to permit trend analysis.

Following a flight, the images are provided to OIIL for processing, exploitation, and dissemination. Subsequently, and only upon request, OIIL provides access to the forensic analysis of a particular image and area to authorized persons who have a "need to know;" when the dissemination is in response to a particular law enforcement activity or case, that analysis may include PII.

Persons who are apprehended and who were video recorded from a UAS or a manned aircraft may have the video of their crossing and/or apprehension associated with a case file that contains their PII.

Separately, CBP also deploys manned fixed-wing aircraft with LETC sensors over the border area in support of its counter-terrorism and interdiction of smuggling operations. The LETC sensors permit surveillance of the electromagnetic spectrum for the purpose of identifying organized border crossing activity between the ports of entry.

Investigative Operations

CBP uses both UAS and manned aircraft in support of other DHS components, such as U.S. Immigration and Enforcement (ICE), or other federal law enforcement agencies, such as the Federal Bureau of Investigation (FBI) or Drug Enforcement Agency (DEA). Requests for aircraft support that are related to the border surveillance must be directed to the Assistant Commissioner, OIIL, for authorization. Each request for information follows a standard process and is reviewed and considered in terms of the requesting agencies' authorities to receive the sought after information, CBP's own authority to lend assistance, and CBP's ability to integrate the information collection into its mission. Separately, OAM must determine the availability of aircraft type and the integration of the requested activity into its flight operations.

Typical support missions include overhead observation of previously identified persons, specified locations, and particular conveyances for enhanced situational awareness and increased officer safety. For example, the UAS could conduct surveillance over a building to inform ground units of the general external layout of the building or provide the location of vehicles or individuals outside the building. When flying a UAS in support of another component or government agency for an investigative operation, CBP may provide the other agency with a direct video feed through access controls or with a downloaded video recording of the operation,

in whole or in part, based on the request. Similarly, CBP may deploy a helicopter or manned fixed-wing aircraft to provide over top visibility into a developing incident. Video images from the Electrical Optical/Infrared ball (EO/IR) ball are fed through the DHS firewall to "Big Pipe," a video and image distribution network operating within the CBP/DHS firewall, to identified users, analysts, and decision makers for real-time mission support and border protection.

Disasters

The P-3 may be used to conduct reconnaissance missions during natural disasters in support of FEMA. During these missions, P-3s can provide near real-time, high quality video of affected areas to first responders and FEMA. P-3s are equipped with similarly capable EO/IR Ball cameras; the images are also fed through a transmission to a ground station where the video is decrypted and fed to Big Pipe to disseminate inside the DHS firewall to authorized users within DHS and any other requesting agency.

UAS may also be used outside existing COAs during natural disasters once the government has issued a disaster declaration. For example, the UAS may fly missions in support of other government agencies such as the National Oceanic and Atmospheric Administration (NOAA) or FEMA to provide video or radar images of flooding. In disaster situations, CBP works with the FAA to construct a COA defining the airspace where a CBP UAS may operate. The UAS may provide a real-time feed during flight through Big Pipe or, subsequently, an analyzed image comparing the raw feed to an image with identified details, noting changes, to FEMA, state emergency operations centers, United States Geological Survey (USGS), and/or the Army Corps of Engineers. Video from these operations are not used to identify individuals. As with other requests for support, disaster area overflight requests are assigned in accordance with the national policy regarding the tasking of CBP air assets.

Officer Safety and Support to State and Local Law Enforcement

State and local law enforcement officials may request aircraft support (e.g., UH-60, P-3, UAS) in emergency situations; often this involves circumstances when officer safety is implicated, and in which aerial surveillance is necessary or the terrain would be too difficult for law enforcement personnel to navigate. OIIL reviews each request to determine whether to respond and OAM reviews how and in what context it may respond. Based on both organizations within CBP, a decision is made whether to provide assistance. Access to video taken during emergency situations may be provided, either at a DHS/CBP facility or by temporarily granting direct access through the DHS firewall. Sharing of this information with state, local, or other government agencies is on a case by case basis as determined through CBP's Request for Information process.

As in the mission uses discussed above, UAS and manned aircraft offer several options for deploying information gathering equipment. The UAS can serve as force multiplier insofar as the UAS enables the monitoring of large areas of land more efficiently and with fewer

personnel than other aviation assets. UAS can enhance situational awareness and increase officer safety by providing aerial support to officers on the ground by monitoring a fixed location while flying at a high altitude to reduce the likelihood of detection. Manned aircraft offer the ability to fly in more congested airspace and to transport officers, agents, equipment, and seized assets.

Technology on Board the Aircraft

The various aircraft have different types of surveillance technology. Most aircraft, manned and unmanned have an EO/IR ball attached to provide a means of collecting information. The EO/IR ball installed on the UAS also assists the pilot during take-off and landing. While the cameras on each aircraft are not identical, they have almost identical performance specifications. The EO/IR ball is a camera, which employs a fixed-focus lens, that is capable of providing video at any altitude and allows operators, using digital zooming (software based image enhancement), to take small-scale aerial video images of buildings, vehicles, and people. Aircraft altitude directly affects a fixed-focus camera's performance; the higher the aircraft's altitude, the less detail an operator is able to see.

A lower altitude permits the EO/IR ball to provide greater detail in an image, which may permit identification; this observation activity, however, does not occur unnoticed or subject to attempts at evasion, and therefore is more often part of a defined law enforcement operation. Persons are often successful at hiding their identity from known surveillance aircraft by simply looking away.

At present, the flight and mission parameters for the UAS place their operation within an altitude block of 19,000 to 28,000 feet, thereby effectively limiting the altitude for the EO/IR ball on a UAS to a minimum of 19,000 feet. At this minimum altitude, the camera does not provide enough detail for an operator to identify a person (that is to discern physical characteristics such as height, weight, eye color, hair style, or a facial image). The camera operator may have enough detail to identify whether an individual is carrying a long gun or wearing a back pack. At an altitude of 19,000 feet the camera operator cannot read a license plate, nor are license plate readers effective.

Conversely, the flight parameters for helicopters and fixed-wing aircraft are broader in terms of altitude and geography; their flight operations are integrated into the NAS and do not require a COA. The mission parameters and physical capabilities for helicopters and manned fixed-wing aircraft, however, place different operational restrictions upon the aircraft.

The EO/IR ball can provide daytime or nighttime visual video observation of movement or objects on the ground. The images, depending upon the aircraft deploying the camera, tend to be small in scale, to provide environmental context. A principal purpose for tracking a person or vehicle from an aircraft with an EO/IR ball is to assist CBP or law enforcement personnel on the ground with information to permit a safe encounter—this requires environmental context more

than a best possible close-up of a face. When viewing vehicles, an operator can distinguish a car from a truck, and depending on the altitude at which the aircraft is flying, may be able to identify the model of the vehicle. During daytime flights, an operator may also be able to determine the color of the vehicle. The images of vehicles and/or individuals recorded by the EO/IR ball are not associated with any biographical information unless the individual is apprehended, at which point the video may be associated with the Personally Identifiable Information (PII) contained within the individual's case file.

In addition to EO/IR CBP deploys a UAS stationed along the Southwestern border in Sierra Vista, AZ, with the Wide Area Surveillance System (WASS). WASS uses a sensor mounted to the wing of a UAS to sweep large areas of border territory (approximately six kilometers in width) as the aircraft moves along its flight path. WASS alerts CBP to the existence of persons and/or vehicles along the border and provides coordinates to determine their location. The UAS pilot and sensor operator can then inform ground units of the location so that Border Patrol may coordinate an interdiction of the persons or vehicles. WASS provides a radar sensor image, which CBP may share through Big Pipe during operation.

Some manned and unmanned aircraft are also equipped with synthetic aperture radar that can provide black and white images in all weather. This radar can provide silhouettes of people and vehicles, but provides no identifying details. Using this technology, an operator is not able to pick up identifying characteristics of a person or a vehicle. The synthetic aperture radar is primarily used for change detection. For example, the operator can identify tire tracks on the ground that were not present in prior images provided by the radar. Similarly, an operator can use the synthetic aperture radar to determine the extent of flooding in a particular region by noting the changes to the topography.

Certain manned fixed-wing aircraft deploy LETC sensors used to detect electronic signals in the electromagnetic spectrum. These specifically designed aircraft operate in support of counter-terrorism efforts and to interdict organized smuggling (people, contraband, and controlled substances) operations within the border area. Like with the EO/IR ball, information from LETC sensors may be employed to support officers and agents on the ground as they move to a position where they can safely encounter observed persons. LETC aircraft sensors are solely deployed on manned fixed-wing aircraft.

Data on the digital video recorders on CBP aircraft are maintained for a maximum of 30 days and then overwritten by new data. The images and related data from CBP aircraft, both manned and unmanned, are provided through Big Pipe to identified users, analysts, and decision makers for real-time mission support and border protection. Images from the EO/IR ball mounted on the UAS are sent by an encrypted transmission, first to the satellite providing the control signals, and then, again by encrypted transmission, to the ground control station where the pilot and sensor operator are located. The image data is decrypted and brought inside the

DHS firewall at the ground control station, where Big Pipe can ingest the data and provide a feed to assigned users and analysts.

Big Pipe is a fully distributed network hosted by CBP and supports not only event-based law enforcement missions, but also FEMA's National Response Framework.[5] Big Pipe employs role-based access controls to provide users possessing a need to know access to distinct video feeds at command centers, other CBP/DHS locations, and for authorized persons with technical access through the DHS firewall. OAM retains control over defining users for Big Pipe and assigning access. After the creation of live mission data, Big Pipe manages the transmission, processing, distribution, consumption, and storage of the live mission data. Big Pipe archives selective mission data on a Big Pipe server hard drive for a maximum of 7 days, after which the data is deleted. Big Pipe does not use PII to retrieve stored mission data. Stored data is retrieved based on the date and time of the mission and only by authorized users on a need to know basis. If data is used for investigative purposes, and associated with a particular individual it goes into a case management system, which is covered by the corresponding Privacy Act System of Records Notice (SORN) for the case management system. Big Pipe, separately, provides a feed of video and radar images from UAS to the Air and Marine Operations Center (AMOC), where OIIL operates one of several PED cells to review this data over time to perform trend analysis and change detection. Video and radar images maintained by a PED cell, such as at the AMOC, are stored on a separate server dedicated to the PED cell mission for up to five years. The analyzed images may be shared by OIIL in response to law enforcement needs.

Summary of Privacy Risks

The use of these aircraft and accompanying surveillance technologies presents several privacy concerns. The first concern is ensuring that CBP's collection and use of data from aerial surveillance remains within the scope of its authorities to protect the border and provide support for law enforcement activities, while continuing to preserve a person's right to privacy. CBP's border security mission has a broad mandate to determine the admissibility of persons and ensure that goods are not introduced into the United States contrary to law.[6] Similarly, the statutory language in CBP's annual appropriations directs CBP Air and Marine to provide integrated and coordinated border interdiction and law enforcement support for homeland security missions, including assistance to federal, state, and local agencies and emergency humanitarian efforts; to provide airspace security for high-risk areas or National Special Security Events[7]; and to combat

---

[5] The National Response Framework is a DHS/FEMA led effort, which provides the guiding principles that establish a comprehensive, national, all-hazards approach to domestic incident response—from the smallest incident to the largest catastrophe. http://www.fema.gov/pdf/emergency/nrf/nrf-core.pdf.

[6] Title 8, United States Code (U.S.C.), sections 1225, 1357, other pertinent provisions of the immigration laws and regulations; 19 U.S.C. §§ 482, 507, 1461, 1496, 1581, 1582, 1595a(d), and other pertinent provisions of customs laws and regulations.

[7] See Title 18 U.S.C. Section 3056, which authorizes the designation of National Special Security Events.

efforts to smuggle narcotics and other contraband into the United States[8]. Deploying OAM's various air assets to support these missions improves DHS/CBP's capability to obtain streaming video, and to assess critical infrastructure before and after events.

CBP's use of manned and unmanned aircraft to conduct aerial observations is consistent with CBP's authorities and obligations. To the extent that aircraft flying in support of tactical operations overfly private residences, there is a minimal risk that a person's privacy might be unintentionally violated. The images captured are not personally identifiable without further investigative information. Neither manned nor unmanned aircraft physically intrude upon or disturb the use of private property. Further, the cameras deployed on UAS or manned aircraft do not have the capability to see through walls or otherwise collect information regarding what occurs in the interior of a building, nor is that their purpose. UAS operate primarily at an altitude between 19,000 and 28,000 feet pursuant to their COA approved by the FAA, and are focused as previously described.

A second privacy concern, specific to UAS, is that they present a perceived risk to privacy because they are able to fly for longer hours than manned aircraft and conduct surveillance undetected. Like other aircraft, UAS are useful for monitoring remote land border areas where patrols cannot easily travel and infrastructure is difficult or impossible to build. Unlike manned aircraft, UAS are operated by personnel on the ground, allowing the crew to be relieved while the UAS is still in the air. This capability allows UAS to provide long-range surveillance for greater lengths of time than manned aircraft. Because of their small size compared to manned aircraft, and the altitude at which UAS can operate, these physical attributes may serve to conceal the presence of a UAS and reduce detection of their operating noise while still being able to maneuver over a small area and provide surveillance. Other OAM operated long range fixed-wing aircraft cannot steadily monitor a set location because of their size and turning radius. Helicopters are more easily detected because of their noise and lower operational altitudes. This means that, unlike fixed-wing aircraft and helicopters, UAS can monitor either a moving target or a fixed location for relatively longer periods of time without the likelihood of detection.

While UAS can fly for longer periods of time, they are equipped with the same technology to conduct surveillance that is presently deployed on CBP manned aircraft. The only sensor available on UAS that is not used by CBP manned aircraft currently is the WASS sensor. The WASS sensor can only detect the presence of a person and track his or her movements (much the same way other radar technology can detect an object and track its movement); it cannot be used to identify a person. The WASS sensor is designed to sweep large areas of land and is only used to patrol along the southwest border and to assist with interdictions. Other technologies on the UAS are shared by CBP's manned aircraft. Putting these technologies on a

[8] See National Drug Control Strategy, http://www.whitehouse.gov/ondcp/2013-national-drug-control-strategy.

UAS only enhances CBP's ability to perform its existing functions. For instance, CBP's surveillance video of a location used to smuggle persons or contraband using a UAS instead of a P-3 may be longer in duration with less interruption and less likelihood of detection.

To mitigate the risk presented by longer sustained surveillance of an individual or residence without the individual's knowledge, CBP has strict mission priorities for UAS and all aircraft operations. For instance, CBP aircraft may only be used in support of an authorized mission or investigation, the video or other data collected from CBP aircraft may only be accessed by authorized personnel with an authorized need to know, and the CBP-held video or other data is controlled through chains of custody and stored in secure locations until it is destroyed. In addition, the FAA requires CBP to construct a COA, in the instance of deploying a UAS, for a duration determined by the investigative activity or emergency circumstance, before conducting an operation away from the border and already established COAs.

The third privacy concern, unique to UAS, pertains to the security of the system itself and the potential for hijacking of the unmanned aircraft. CBP has taken several steps to protect UAS against potential hackers. All UAS are controlled and monitored at all times by operators in ground control stations using satellite communication that is relayed through an encrypted data feed. The ability to interfere with such an encrypted data feed requires disrupting the signal from satellite to UAS, for the purpose of acquiring the data feed or controlling the UAS. In the event that the ground control station loses its ability to control the UAS, another ground control station can pick up control of that UAS. The UAS use redundant navigation systems and GPS receivers so that if a signal is lost or someone attempts to override the signal, the UAS relies on these other systems and the GPS receivers for flight operations. In order to protect the airspace, the FAA is notified immediately if a UAS loses its signal. Furthermore, if communication between ground control and the UAS is ever interrupted or lost, the UAS are pre-programmed to fly to a pre-coordinated point in a remote location to orbit while waiting for the signal to be reestablished, or to continue to orbit this Flight Termination Point until the aircraft runs out of fuel and crashes.

Because of the unique privacy concerns raised by CBP's use of Aircraft Systems, CBP has conducted this PIA to evaluate the privacy risks associated with the use of Aircraft Systems and to enhance public understanding of the authorities, policies, procedures, and privacy controls related to that use.

Fair Information Practice Principles (FIPPs)

The Privacy Act of 1974 articulates concepts of how the Federal government should treat individuals and their information and imposes duties upon Federal agencies regarding the collection, use, dissemination, and maintenance of personally identifiable information. Section 222(2) of the Homeland Security Act of 2002 states that the Chief Privacy Officer shall assure

that information is handled in full compliance with the fair information practices as set out in the Privacy Act of 1974.

In response to this obligation, the DHS Privacy Office developed a set of Fair Information Practice Principles (FIPPs) from the underlying concepts of the Privacy Act to encompass the full breadth and diversity of the information and interactions of DHS.[9] The FIPPs account for the nature and purpose of the information being collected in relation to DHS's mission to preserve, protect, and secure.

DHS conducts Privacy Impact Assessments on both programs and information technology systems, pursuant to the E-Government Act of 2002, Section 208, and the Homeland Security Act of 2002, Section 222. Given that Aircraft Systems and their associated devices are mechanical and operational systems rather than a distinct information technology system or collection of records pertaining to an individual that would be subject to the parameters of the Privacy Act, this PIA is conducted to relate the use of these observation and data collection platforms to the DHS construct of the FIPPs. This PIA examines the privacy impact of Aircraft Systems operations as it relates to the DHS FIPPs.

1. Principle of Transparency

Principle: *DHS should be transparent and provide notice to the individual regarding its collection, use, dissemination, and maintenance of PII. Technologies or systems using PII must be described in a SORN and PIA, as appropriate. There should be no system the existence of which is a secret.*

This PIA provides a level of transparency to the public about the current surveillance programs undertaken by CBP. The video, still images, signals information, and/or radar images do not clearly identify individuals. The only information about individuals that is collected and/or retained is the indication of a human form. These images, however, may be associated with a person if the person is apprehended. For example, video collected by an EO/IR ball may show several individuals traversing the land border and being intercepted by officers or agents of CBP. While the video resolution or radar mapping images are not sufficiently precise to permit actual identification, the circumstances of CBP interdiction and apprehension of a suspect in conjunction with the aerial surveillance are sufficient to link the indistinct images of persons traversing the ground to the case file. Individuals who are apprehended by CBP as a result of observation by aircraft at or near the border may have video of their crossing and apprehension associated with their enforcement case file. CBP obtains biographical data pertaining to the apprehended person at the moment of apprehension. CBP stores all biographical information

[9] DHS Privacy Policy Guidance Memorandum 2008-01, *The Fair Information Practice Principles: Framework for Privacy Policy at the Department of Homeland Security*, December 29, 2008.

obtained from apprehended individuals and any video or radar images of their movement obtained from the aircraft in the appropriate law enforcement case management system.

When CBP associates video, still images, signals information, and/or radar images with an individual after apprehension, that information becomes subject to the requirements of the Privacy Act in the same manner and to the same extent that the apprehension of the individual becomes a record in a Privacy Act system. The Privacy Act requires that agencies publish a SORN in the Federal Register describing the nature, purpose, maintenance, use, and sharing of the information. This PIA serves as notice to the public that information captured by Aircraft Systems may become subject to the Privacy Act once it is associated with an individual.[10] Additionally, the video images associated with an individual's case file are covered by the appropriate law enforcement case management SORN, which maintains the case file. CBP will periodically re-assess the means by which the images from the aircraft are retrieved to determine whether the requirement for a SORN is triggered.

2. Principle of Individual Participation

Principle: *DHS should involve the individual in the process of using PII. DHS should, to the extent practical, seek individual consent for the collection, use, dissemination, and maintenance of PII and should provide mechanisms for appropriate access, correction, and redress regarding DHS's use of PII.*

Individual participation provides complementary benefits for the public and the government. The government is able to maintain the most accurate information about the public, and the public is given greater access to the amount and uses of the information maintained by the government. A traditional approach to individual participation is not always practical or possible for CBP, which has law enforcement and national security missions. Aircraft are primarily used to sweep the border area to locate individuals who are crossing the border illegally. Allowing an individual to consent to the collection, use, dissemination, and maintenance of video, still images, and/or radar images would compromise operations and would interfere with the U.S. government's ability to protect its borders, thereby lessening overall homeland security.

Individuals do not have the opportunity to restrict CBP's ability to collect information in the public sphere. Any information associated with an individual is part of a case file that is created as part of a law enforcement investigation or encounter.[11] Providing individuals of interest access to information about them in the context of a pending law enforcement

[10] For example, video information from an aircraft of an apprehension of a person at the border that is identified to that person would be referenced in the case notes pertaining to that person's apprehension in TECS (DHS/CBP – 011 TECS System of Records Notice December 19, 2008 73 FR 77778)

[11] CBP also incorporates images from surveillance or encounters into reports and analyses maintained in the Analytical Framework for Intelligence (AFI) (DHS/CBP – 017 System of Records June 7, 2012 77 FR 13813).

investigation may alert them to or otherwise compromise the investigation. Consequently, there is no mechanism for correction or redress for the video collected by the aircraft. Once that video is associated with an individual's case file, the individual must follow the procedure outlined in the corresponding privacy documents for that system. While individuals cannot participate in the initial collection of this information, they may contest or seek redress through any resulting proceedings brought against them. More information on redress is provided below.

3. Principle of Purpose Specification

Principle: *DHS should specifically articulate the authority which permits the collection of PII and specifically articulate the purpose or purposes for which the PII is intended to be used.*

The purpose specification principle requires DHS to 1) articulate the authority to retain the PII in question; and 2) articulate the purpose(s) for which DHS uses the PII.

CBP is authorized to collect video, other images, signals information, and data using aircraft in support of its border security mission and pursuant to the appropriations language mandating support for law enforcement as part of the mission of CBP Air and Marine.[12] Together, these authorities allow CBP to obtain information in support of border interdiction of narcotics and other contraband, the prevention of the illegal entry of aliens into the United States, the security of airspace for high-risk areas or National Special Security Events, and in support of federal, state, and local law enforcement, counterterrorism, and emergency humanitarian efforts.

CBP may use video, still images, signals information, and/or radar images, obtained from aircraft, to apprehend individuals and to provide evidence of an illegal border crossing or other violation of law. Consistent with applicable laws and SORNs, the information may be shared with other state, local, federal, tribal, and foreign law enforcement agencies in furtherance of enforcement of their laws.[13]

Video, still images, and/or radar images collected during investigative operations as part of a law enforcement investigation are used for enhanced situational awareness and increased officer safety, and may be used to provide evidence of a violation of law. These images are maintained in association with the investigative or case file that they support; their retention is managed by the same SORN and follows the handling of the investigative or case file.

---

[12] *See, e.g.*, H.R. REP. No. 112-91, at 46 (2011) stating "CBP Air and marine provides integrated and coordinated border interdiction and law enforcement support for homeland security missions; provides airspace security for high risk areas or National Special Security Events upon request; and combats efforts to smuggle narcotics and other contraband into the United States. CBP Air and Marine also support counterterrorism efforts of many other law enforcement agencies."

[13] *See* Consolidated Appropriations Act of 2012, Pub. L. No. 112-74 (2011), providing for "the interdiction of narcotics and other goods; the provision of support to Federal, State, and local agencies in the enforcement or administration of laws enforced by the Department of Homeland Security; and at the discretion of the Secretary of Homeland Security, the provision of assistance to Federal, State, and local agencies in other law enforcement and emergency humanitarian efforts…."

Video, still images, and/or images collected in natural disaster and/or emergency situations are used for relief work and disaster reconnaissance. CBP typically provides a direct feed of the video captured by aircraft in these scenarios to provide support to FEMA or state emergency operating centers. Video, still images, and/or radar images are not associated with an individual and are only used to indicate where an individual or group of individuals may be for emergency response purposes.

4. Principle of Data Minimization

Principle: *DHS should only collect PII that is directly relevant and necessary to accomplish the specified purpose(s) and only retain PII for as long as is necessary to fulfill the specified purpose(s). PII should be disposed of in accordance with DHS records disposition schedules as approved by the National Archives and Records Administration (NARA).*

CBP seeks to minimize the collection and retention of video, signals information, and radar to that which is necessary and relevant to carry out CBP's mission. Accordingly, when aircraft are flown to patrol the border, they are authorized to fly the designated border surveillance mission area to ensure they are only capturing images and information necessary to detect, identify, apprehend, and remove persons and their possessions illegally entering the United States at and between POE. When aircraft are flown for investigative operations, officer safety incidents, or natural disaster reconnaissance, CBP approves and defines the specific mission that is authorized, and in the case of UAS, works with the FAA to construct a COA to establish airspace for that specific UAS operation. The video (that has not been associated with a case) remains on the digital video recorder originally used for recording until it over-written through re-use, which is after approximately 30 days.

After the creation of live mission data, Big Pipe manages the transmission, processing, distribution, consumption, and storage of the live mission data. Big Pipe archives selective mission data on a Big Pipe server hard drive for a maximum of 7 days, after which the data is deleted. Big Pipe does not use PII to retrieve stored mission data.

The information collected by the aircraft is not subject to the Privacy Act unless it is retrieved by using an individual's name or other unique identifier. If an individual is apprehended by CBP as a result of observation by aircraft or subsequent association from the presence of CBP assets, CBP may have video of that individual's apprehension associated with his or her enforcement case file. That video is retained according to the retention schedule of the SORN of the corresponding case management system. Video and Radar images obtained from UAS patrols of the border are also provided to PED cells operated by OIIL for use in analyses and intelligence products concerning historical, change detection (e.g., natural and man-made alterations to geography) along the border, and patterns of movement of persons across the border. This unassociated data, in conjunction with meta-data (such as latitude, longitude, date and time of the imagery) is retained for a maximum of five years.

5. Principle of Use Limitation

Principle: *DHS should use PII solely for the purpose(s) specified in the notice. Sharing PII outside the Department should be for a purpose compatible with the purpose for which the PII was collected.*

CBP only collects video and/or radar images, and signals information via aircraft pursuant to its law enforcement authority, as part of its border security mission, or when flying a mission in support of another agency, and when that other agency's authority covers the mission either through delegation of authority or direct control of the information collected. For example, CBP has provided support to the U.S. Forest Service in response to large scale wild fires to permit an overview of the extent and scale of the fire and identification of hot spots; this activity is pursuant to a request from the Forest Service, is performed pursuant to their authority, and the images are conveyed through designated access to the Big Pipe video distribution service. While the video resolution, radar mapping images, and signals information are not sufficiently precise to permit actual identification of a person, the images or information may be associated with an individual from context within the image, circumstances surrounding the activity occurring in the image, or additional information obtained directly from the person by an officer or agent. The images or information are only associated with an individual if the individual is apprehended or if the images are taken as part of an ongoing law enforcement investigation. Accordingly the data can only be used for the purposes specified in section 3 of this PIA.

CBP has procedures and processes in place for sharing any data collected by aircraft, including when that information becomes associated with a case and is used as evidence against an apprehended individual. In addition, all requests for aerial surveillance for intelligence gathering purposes must receive prior approval by the Assistant Commissioner, OIIL, before the air asset can conduct the flight. Similarly, requests for analytical products incorporating historical analysis of the border topography must be approved by the Assistant Commissioner, OIIL.

6. Principle of Data Quality and Integrity

Principle: *DHS should, to the extent practical, ensure that PII is accurate, relevant, timely, and complete, within the context of each use of the PII.*

As explained in section 4 (above), to ensure that the PII captured by aircraft is relevant and timely, any video, still images, signals information, and/or radar images must be associated within 30 days with the individual CBP apprehends, or the video/digital image is overwritten by OAM. Video and/or radar images are of no continuing value in a law enforcement support context unless they are associated with an individual during an apprehension because the video resolution or radar mapping images are not sufficiently precise to permit actual identification of

individuals. Video and/or radar images that are not associated with a person provide value in an intelligence context for helping to demonstrate the state of change occurring over time along the border. These unassociated images are separately maintained by OIIL for a maximum of five years.

To preserve the quality and integrity of the information collected that is used as evidence, CBP requires its officer/agents to successfully complete training on the proper operation of the recording equipment on its aircraft. The training includes correct techniques to copy recorded evidence from a non-portable hard drive to portable digital media and procedures to ensure that such evidence is not co-mingled with data from other investigations. The training also includes procedures to maintain an adequate chain of custody for all recorded evidence. Each officer/agent making a recording must ensure that the time and date shown in the original recording is accurate. After a mission is completed, the officer/agent must ensure that the original record is transferred entirely, in its original format, to portable media. The transferred data must not be edited or altered in any way. The officer/agent making the recording must label all copies of portable media with the corresponding case number (if available), the date and place of the original recording, and the names of the officer/agent and aircraft commander. The officer/agent making the recording must also label, initial, and maintain possession of the evidence until custody is properly transferred to the appropriate designated evidence custodian, case agent, Assistant United States Attorney, or other appropriate government official. As with any information associated with a case file, once the images are cross referenced to an investigation or case, they become covered by the system of records for that case file system and subject to the access and amendment provision of that system.

7. Principle of Security

Principle: *DHS should protect PII (in all forms) through appropriate security safeguards against risks such as loss, unauthorized access or use, destruction, modification, or unintended or inappropriate disclosure.*

CBP has taken steps to protect live video feeds, signals information, and recorded video, radar, and/or still pictures captured by its aircraft. Live video and flight information, which are sent from the UAS, are passed along an encrypted feed from the UAS through the satellite relay to the ground control station. Similarly, control information from the ground control station to the UAS also passes along an encrypted feed. Video and data transmitted in real time via Big Pipe, a closed system with restricted access, is subject to access controls and an approval process requiring clearance by one of two CBP/OAM system administrators to ensure that only authorized users with a need to know have access to the video feeds. The real time video feeds are not recorded and archived. Any recorded images that are saved to be used as evidence or for intelligence gathering must be handled in accordance with CBP policy. Images that are used as evidence must be handled according to the procedures detailed in section 6 of this PIA. All

recorded evidence must be kept in a locked container, segregated from other property and/or equipment. Video that is collected during an investigative operation that contains sensitive analytical surveillance, or reconnaissance related data may not be disclosed unless a request for disclosure has been submitted to the OIIL Collections Division Director. The request must include a copy of the information that is to be disclosed, must clearly specify the name of the intended recipient, how the information will be used, and the reasons justifying the disclosure. In the event that the information is disclosed, the OIIL Collections Division Director or his/her designee is required to redact law enforcement sensitive information, PII, and other sensitive related data unless the requestor has a need-to-know.

8. Principle of Accountability and Auditing

Principle: *DHS should be accountable for complying with these principles, providing training to all employees and contractors who use PII, and should audit the actual use of PII to demonstrate compliance with these principles and all applicable privacy protection requirements.*

All CBP employees are required to complete annual privacy awareness training, in addition to training on ethics and the CBP Code of Conduct. Access controls, both physical and technological, are in place to ensure only authorized access to the aircraft systems and the collected data/images.

Moreover, CBP requires its employees to successfully complete training on techniques to copy recorded evidence to portable digital media and requires them to follow procedures to ensure that such evidence is not co-mingled with data from other investigations. Employees must follow procedures to maintain an adequate chain of custody in the event that the information is used as evidence.

OIIL has a process in place for restricting the dissemination of video, still images, and radar images and keeps a log of the disclosures. Also, OIIL redacts law enforcement sensitive information, PII, and other sensitive related data unless the requestor has a valid need-to-know. Separately, CBP periodically reviews the logs or disclosure records to ensure compliance with established privacy policies, practices, and procedures for associated systems.

Conclusion

CBP operates aircraft systems in support of its border protection and law enforcement support missions. These systems provide a variety of mobile platforms from which to obtain signals information, video, still, and radar images of persons and vehicles in the border area or that are the subject of an investigation or law enforcement activity. The collection of these images and signals information complies with the same internal procedures and practices required of any surveillance using any means by CBP officers and agents. The distinct capabilities of the different aircraft operated by OAM enhance CBP's ability to conduct certain missions pertaining to information collection, surveillance, or reconnaissance; however, the processes and procedures for authorizing and accounting for how, when, and where information is obtained remain consistent with CBP's traditional border security and law enforcement practices and policy. As technology improves, operating environments change, and policies adapt, this PIA will be updated and amended to refresh the analysis of these changes on the privacy of persons, who directly or indirectly come into contact with the information and data collection activities associated with CBP Air operations.

Unmanned Aircraft Systems Legislative Task Force

November 26, 2013 Meeting at Mat Su LIO

Task Force Members:

- Representative Shelley Hughes, Co-Chair
- Senator Donny Olson, Co-Chair
- Ginger Blaisdell, Staff to Rep. Hughes
- David Scott, Staff to Senator Donny Olson
- McHugh Pierre, Department of Military and Veterans' Affairs
- Greg Walker, University of Alaska Fairbanks
- Ro Bailey, University of Alaska Fairbanks
- Lieutenant Steve Adams, Commissioner Designee, Department of Public Safety
- Steve Strait, Aviation Advisory Board, Governor's Office and DOT/PF
- Steve Colligan, Representative Member for the Academy of Model Aeronautics

Guest Attendee:

- Kathleen Strasbaugh, Legislative Legal Services

AGENDA

1:00pm Welcome and Introductions — Representative Shelley Hughes

Task Force responsibilities per HCR6

The duties of the task force shall include (1) reviewing regulations and guidance from the Federal Aviation Administration regarding unmanned aircraft systems; (2) providing written recommendations, together with suggested legislation, for a comprehensive state policy for unmanned aircraft that protects privacy and allows the use of unmanned aircraft systems for public and private applications; and (3) submitting, not later than January 15, 2014, an initial report to the legislature and, not later than July 1, 2014, submitting a final report to the legislature.

Review of October 23 – 24, 2013 Task Force Meeting Minutes

MEMORANDUM November 25, 2013

SUBJECT: Unmanned Aircraft Systems
(Work Order No. 28-LS1068\A)

TO: Representative Shelley Hughes
Attn: Ginger Blaisdell

FROM: Kathleen Strasbaugh
Legislative Counsel

This memo accompanies the draft bill you requested relating to legislation requested by the Task Force on Unmanned Aircraft Systems (Task Force) created by Legislative Resolve 17 (2013). I have attempted to cover the topics set out in the Task Force request -- however, for the most part, they do not lend themselves to state legislation, either because they are covered by federal law, for example, safety marking, or because legislation is not needed. For example, the University of Alaska's Center for Unmanned Aircraft Systems Integration arose from the University's already authorized research mission. Further, the issues raised by the list of topics will require substantial further policy direction. As a result, the draft is basically an outline that requires substantial detail for completion.

As requested by Ms. Blaisdell, I have also drafted two additional provisions that you would like to present to the Task Force which may be sent separately.

Encouraging a pilot training program at the University of Alaska Fairbanks.
The pilot training section encourages the University to establish a training program at the Fairbanks campus. However you may want to consider allowing the Board of Regents to determine where to place the program and whether to provide the course at more than one campus. Compare AS 14.40.080.

Establishment of a position to manage unmanned aircraft systems.
Rather than creating a particular position, I have drafted the function as a duty of the Commissioner of DOTPF. Since you want this co-ordination of functions to be performed by different state agencies, I considered placing the function in the governor's office. However, because the bill involves aircraft, and because the use of airfields is at issue, AS 02, Aeronautics, which is administered by the Department of Transportation and Public Facilities (DOTPF), seems a better fit. Because the University is already deeply engaged in the field, it too is a possibility. However, the effect of unmanned aircraft systems on other aviation operations already administered by DOTPF make

DOTPF a more appropriate choice.[1] The Task Force will need to decide what tasks will predominate and place the function accordingly. If the Task Force wants to assign certain functions to another department, additional work will be needed to assure that the assigned department has the necessary authority.

You also requested that the bill include a provision to prevent a vacancy in a particular position. The bill is currently drafted to assign the function to a commissioner who may designate a particular employee to perform the UAS manager function. The commissioner will be obligated to assure that the function is performed.

Requirement for high visibility marking; lighting requirements.
As I understand the federal regulatory scheme, unmanned aircraft systems (UAS) must meet federal marking requirements, unless the configuration of the aircraft is incompatible with existing regulations. 14 CFR 45.21. Currently the operator of a UAS must seek permission to depart from existing specifications if "due to the configuration of an aircraft, it is impossible for a person to mark it in accordance with §§ 45.21 and 45.23 through 45.33. . ." 14.CFR 45.22(d). *See* also Airworthiness Certification of Unmanned Aircraft Systems and Optionally Piloted Aircraft, FAA Order No. 8130.34C (August 2, 2013); Unmanned Aircraft Systems (UAS) Operational Approval, FAA Order No. 8900.227 (July 30, 2013), (governing the assessment of applications for certificates of airworthiness relating to, among other things, safety). I am not entirely certain, but it appears to me that any marking would be within the jurisdiction of the FAA to prescribe.

It is not clear to me whether the Task Force wanted to have safety provisions in addition to those prescribed by the FAA. This might be troublesome under the Supremacy Clause of art. VI, par. 2 of the United States Constitution, as aviation safety is an area in which Congress intends federal law to preempt state law. *Montalvo v. Spirit Airlines*, 508 F.3d 464, 470 - 71 (9th Cir. 2007). Is there some area of aviation safety not covered by federal law that the Task Force is concerned about? I assume that the Task Force did not want to duplicate federal law in this bill, but perhaps I misunderstand what is being requested.

Marketing responsibility for UAS industry; increasing business operations and educating the public.
I am not sure what the Task Force has in mind here. I included some generic language in the AS 02 provisions in the bill regarding UAS operations and promotion of the industry. Similar language is included in the mission of DOTPF in AS 44.42, and the provisions that require the affected agencies to co-operate in the endeavor.[2] I was not certain whether you wanted to specify the particulars of a marketing or educational program, or allow the department to develop a program with a general mandate. For now I have

---

[1] DOTPF's current powers are duties, set out in AS 44.42, specifically include the supervision of aeronautics and air safety. *See also* AS 02.10, AS 02.15, and AS 02.30.

[2] Compare ch. 71, SLA 2013, which assigns one department responsibility for a function, and requires another department to cooperate in the endeavor.

added a provision to the powers and duties of the Department of Commerce, Community, and Economic Development related to the marketing and promotion of the UAS industry. If the task force envisions particular functions for other departments, new sections can be added to the legislation that specifically add those functions to those departments' statutory duties.

State internal review process for UAS; reporting requirements.
The draft contains a provision that requires the development of internal review of UAS missions. A section on this subject is included in proposed AS 02.45. It was not clear to me if the intention was to have reporting to a single authority, or to require an agency to have a procedure. I drafted the section on the assumption that it was the latter. You will want to decide what approvals are necessary. I included a provision requiring a commissioner's approval, but this may not be what you have in mind. Please let me know if the Task Force had a centralized review function in mind, and whether the Task Force would like to have the review performed before or after the mission. It might also be a good idea to decide whether you want to exempt emergency operations from the review if it is to occur before the mission.

Definitions relating to UAS operational technology.
I am not certain whether the Task Force wants to duplicate existing federal definitions, industry definitions, or definitions from another source. I have provided a definition of "unmanned aircraft systems" based in part on FAA terminology, but I don't have enough information to know what the Task Force wants covered. We usually don't include definitions of technical terms that do not otherwise appear in the draft.

Additional items.
The following items will be in a separate document, as you requested. For a citizen review board, I reviewed the background information you supplied from the University of North Dakota, but it addresses academic activity, and is not clear to me whether you really want to have each agency report to a single board. I drafted a bill section involving commissioner approval of activities previously reviewed under the internal review process in the main bill.

With respect to airspace over correctional facilities, I drafted a separate section and included a penalty. However, please note that a person can be charged with the more serious offenses of promoting contraband,[3] or being an accomplice to an escape or an attempted escape.[4] I have some concern that the new offense may overlap with existing law in some cases. Please advise if this is what you had in mind. The operator of a UAS may be able to challenge it as preempted by the FAA's comprehensive regulation of national airspace, but it may be that since the provision requires an intent to communicate

[4] AS 11.56.300 - 11.56.370. See also AS 11.16 (accomplice liability), AS 11.31.100 (attempt), AS 11.31.120 (conspiracy).

unlawfully with a prisoner, it will be upheld against a preemption challenge.

In summary, there are a number of areas where further policy direction is needed in order to develop meaningful legislation. Please let me know how I may be of further assistance.

HOUSE BILL NO.

IN THE LEGISLATURE OF THE STATE OF ALASKA

TWENTY-EIGHTH LEGISLATURE - SECOND SESSION

BY REPRESENTATIVE HUGHES

Introduced:
Referred:

A BILL

FOR AN ACT ENTITLED

"An Act relating to unmanned aircraft systems."

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF ALASKA:

Innovation and Industry could include other industries of

*** Section 1.** AS 02 is amended by adding a new chapter to read:

Chapter 45. Unmanned Aircraft Systems.

Sec. 02.45.010. Duties and powers of department related to unmanned aircraft systems. (a) To provide for the development of an unmanned aircraft system industry and the safe use of unmanned aircraft systems in the state, the department shall cooperate with other state departments, the University of Alaska, and the Federal Aviation Administration and other agencies of the federal government for the purpose of

(1) managing the use of state facilities by unmanned aircraft systems;

(2) ensuring the safe use of unmanned aircraft systems in the state;

(3) promoting and marketing an unmanned aircraft system industry;

(4) educating the public about unmanned aircraft systems.

(b) The department may

(1) accept gifts, grants, or loans from and enter into contracts or other transactions with a federal agency, an agency or instrumentality of the state, a municipality, a private organization, or other source for the purposes set out in (a) of this section;

(2) construct, improve, and operate, in cooperation with the University of Alaska, facilities appropriate to meet the requirements of unmanned aircraft systems; and

(3) construct, provide, or improve public safety facilities related to unmanned aircraft systems.

Sec. 02.45.020. Coordination of uses of unmanned aircraft systems. (a) The commissioner shall coordinate governmental and civil uses of unmanned aircraft systems at state facilities.

(b) The commissioner may designate another employee of the department to coordinate governmental and civil uses of unmanned aircraft systems at state facilities.

Sec. 02.45.030. Internal review. The University of Alaska or a department that uses an unmanned aircraft system to conduct an activity shall develop a program for review of the activity that includes procedures for

(1) determining whether the activity is consistent with the public interest;

(2) ensuring that the activity is conducted in a manner that does not unnecessarily intrude on the privacy of a person;

(3) ensuring that the activity is carried out in a manner that is consistent with state and federal laws and regulations; and

(4) obtaining the approval of the president of the University of Alaska or the commissioner of the department using the unmanned aircraft system.

Sec. 02.45.090. Definitions. In this chapter,

(1) "commissioner" means the commissioner of transportation and public facilities;

(2) "department" means the Department of Transportation and Public Facilities;

(3) "unmanned aircraft system" means an unmanned aircraft that is

operated without direct human intervention from inside or on the aircraft and includes the associated support equipment, control station, data links, and telemetry, communications, and navigation equipment necessary to operate the unmanned aircraft.

* **Sec. 2.** AS 14.40 is amended by adding a new section to read:

Sec. 14.40.082. Unmanned aircraft pilot training. The University of Alaska may establish a training program in the operation of unmanned aircraft and unmanned aircraft systems and related fields at the Fairbanks campus.

* **Sec. 3.** AS 44.33.020(a) is amended by adding a new paragraph to read:

(46) in cooperation with the Department of Transportation and Public Facilities, assist in the development, promotion, and marketing of an unmanned aircraft system industry and the safe use of unmanned aircraft systems in the state under AS 02.45; in fulfilling that duty, the department may cooperate with other state departments, the University of Alaska, and the Federal Aviation Administration and other federal agencies.

* **Sec. 4.** AS 44.42.020(a) is amended to read:

(a) The department shall

(1) plan, design, construct, and maintain all state modes of transportation and transportation facilities and all docks, floats, breakwaters, buildings, and similar facilities;

(2) study existing transportation modes and facilities in the state to determine how they might be improved or whether they should continue to be maintained;

(3) study alternative means of improving transportation in the state with regard to the economic costs of each alternative and its environmental and social effects;

(4) develop a comprehensive, long-range, intermodal transportation plan for the state;

(5) study alternatives to existing modes of transportation in urban areas and develop plans to improve urban transportation;

(6) cooperate and coordinate with and enter into agreements with

federal, state, and local government agencies and private organizations and persons in exercising its powers and duties;

(7) manage, operate, and maintain state transportation facilities and all docks, floats, breakwaters, and buildings, including all state highways, vessels, railroads, pipelines, airports, and aviation facilities;

(8) study alternative means of transportation in the state, considering the economic, social, and environmental effects of each alternative;

(9) coordinate and develop state and regional transportation systems, considering deletions, additions, and the absence of alterations;

(10) develop facility program plans for transportation and state buildings, docks, and breakwaters required to implement the duties set out in this section, including but not limited to functional performance criteria and schedules for completion;

(11) supervise and maintain all state automotive and mechanical equipment, aircraft, and vessels, except vessels and aircraft used by the Department of Fish and Game or the Department of Public Safety; for state vehicles maintained by the department, the department shall, every five years, evaluate the cost, efficiency, and commercial availability of alternative fuels for automotive purposes, and the purpose for which the vehicles are intended to be used, and convert vehicles to use alternative fuels or purchase energy efficient vehicles whenever practicable; the department may participate in joint ventures with public or private partners that will foster the availability of alternative fuels for all automotive fuel consumers;

(12) supervise aeronautics inside the state, under AS 02.10;

(13) implement the safety and financial responsibility requirements for air carriers under AS 02.40;

(14) inspect weights and measures;

(15) at least every four years, study alternatives available to finance transportation systems in order to provide an adequate level of funding to sustain and improve the state's transportation system;

(16) provide for the development of an unmanned aircraft system industry and the safe use of unmanned aircraft systems in the state under

AS 02.45.

28-LS1068\A.1
Strasbaugh
11/25/13

AMENDMENT

OFFERED IN THE HOUSE BY REPRESENTATIVE HUGHES

TO: Work Draft 28-LS1068\A

Page 2, following line 25:

Insert a new section to read:

"**Sec. 02.45.040. Unmanned Aircraft Systems Review Board.** The Unmanned Aircraft Systems Review Board is created in the department. The board consists of

(1) the commissioner of transportation and public facilities or the commissioner's designee;

(2) the commissioner of commerce, community, and economic development or the commissioner's designee;

(3) the commissioner of military and veterans' affairs or the commissioner's designee;

(4) the commissioner of public safety or the commissioner's designee; and

(5) the president of the University of Alaska or the president's designee.

(b) A department or the University of Alaska may not use an unmanned aircraft system for an activity unless the use of unmanned aircraft systems for that activity has been reviewed and approved by the board.

(c) The Unmanned Aircraft Systems Review Board shall review an activity conducted by a department or the University of Alaska that uses an unmanned aircraft system. The board may approve the activity if

(1) the department or University of Alaska has conducted an internal review in accordance with AS 02.45.030 and approved the activity; and

(2) the board finds that the activity is in the best interest of the state."

Page 3, following line 4:

Insert a new bill section to read:

"* **Sec. 2.** AS 11.56 is amended by adding a new section to read:

Sec. 11.56.385. Unlawful flight of an unmanned aircraft system over a correctional facility. (a) A person commits the crime of unlawful flight of an unmanned aircraft system over a correctional facility if the person knowingly causes an unmanned aircraft system to fly over the airspace of a correctional facility with the intent to communicate with a prisoner in the correctional facility.

(b) In this section, "unmanned aircraft system" has the meaning given in AS 02.45.090.

(c) Unlawful flight of an unmanned aircraft system over a correctional facility is a class A misdemeanor."

Renumber the following bill sections accordingly.

MEMORANDUM November 22, 2013

SUBJECT: Outline of Issues Requiring Task Force Police Choices for Legislation Concerning Unmanned Aerial Vehicles (Work Order No. 28-LS1068)

TO: Representative Shelley Hughes
Attn: Ginger Blaisdell

FROM: Kathleen S. Trasbaugh
Legislative Counsel

The draft legislation you have requested concerning unmanned aircraft systems (UAS) and the accompanying memo are in process, but as I mentioned in a voice message to Ms. Blaisdell, the estimated time of arrival is uncertain. As you will see when you receive the draft legislation and memo, there are a number of issues that cannot be fully addressed without further policy direction from the task force. This memo outlines those issues. Perhaps this outline will be of use in framing discussion of the legislation.

1. Unmanned aircraft systems manager position.

The task force requested that the bill establish a position that has the responsibility to coordinate among the federal, military, state, and private use of test sites. These functionalities should be assigned to the commissioner of a department, probably the Department of Transportation and Public Facilities (DOTPF).

a. *Where should the position be placed*?

On the assumption that the task force is concerned about managing UAS development in a coordinated fashion, you may want to establish the function in the Department of Transportation and Public Facilities, since it has statutory authority to manage aviation. However, the task force may have a different view. If the focus is on interdepartmental coordination, the governor's office may be the best place for the function. If the focus is exclusively on the test site applied for by the University of Alaska and the University's research mission, the University might be the best placement, provided any broader responsibilities are given to some other executive branch agency.

2. Requirement for high visibility marking; lighting requirements.

In my opinion, the FAA fully occupies the field of aviation safety in the national airspace, and that under the Supremacy Clause of the United States Constitution. Thus, if the state adopts safety laws addressing visibility and lighting, those laws may draw a

challenge on the basis of preemption. This is especially so where the FAA has already adopted specific rules regarding marking. However, if the task force does want to adopt standards in this area:

a. *Does the task force want a state agency to adopt regulations setting such standards, does it want particular standards enshrined in statute?*

b. *What are the standards the task force wishes to have adopted*?

3. Marketing responsibility for UAS industry; increasing business operations and educating the public.

a. *Do you want one department to manage all UAS related matters, or do you want to assign different tasks to different departments?*

DOTPF already has aviation authority, you may want to assign other functions to other departments.

b. *What functions are meant to increase business operations?*

The draft may assign marketing functions to the Department of Commerce, Community and Economic Development but it is not clear how you want the other functions performed.

4. State internal review process for UAS; reporting requirements.

a. *Do you want all agencies using UAS to submit reports to a central authority, or do you want each agency to have an internal review process?*

b. *Do you want to specify whether the review is to occur before or after the mission? If before, do you want to make an exception for emergencies?*

5. Definitions relating to UAS operational technology.

Generally, definitions are placed in statute to define terms that are used in the statute, and the topics you wish to have covered by the statute don't involve much of the technical terminology in use in the industry.

a. *Is there a technical topic you want covered in the bill?*

MEMORANDUM November 25, 2013

SUBJECT: Unmanned aircraft systems amendment (28-LS1068\A.1)

TO: Representative Shelley Hughes
Attn: Ginger Blaisdell

FROM: Kathleen Strasbaugh
Legislative Counsel

Regarding the provision you requested prohibiting the flight of unmanned aircraft systems over correctional facilities, there is a brief discussion of this in the main memo, but I wanted to add a note about a potential problem. It is not (to my knowledge) unlawful for a piloted vehicle (such as a helicopter, hang glider, etc.) to fly over a correctional facility with, for example, a banner, or leaflets, or otherwise communicate with a prisoner.

To: Ginger Blaisdell
Subject: RE: legislative request from Rep Hughes

Ginger,

In examining the use of unmanned aircraft in hunting and fishing ADF&G has found at this time that additional statutes are not necessary to regulate their use. The use of unmanned aircraft for hunting and fishing can be governed by regulation and would need to be handled by either the Board of Fisheries or Game through their process. I have broken down how manned aircraft is currently managed from the perspectives of sport fishing, commercial fishing, and hunting and how that may or may not apply to unmanned aircraft for your reference.

Sport Fishing

In discussions with the Sport Fish Division we could not come up with a way in which an unmanned aircraft would be directly used to fish. There are potential ways in which a person could use an unmanned aircraft to assist in already approved methods of sport fishing but these are all anecdotal methods coming from other states. The other way in which they could be used is in the locating of fish to then fishing for them in a conventional way. This method is currently allowed when it comes to manned aircraft so unless the Board of Fisheries feels that unmanned aircraft shouldn't be used I don't suspect they will ban its use. In general when it comes to the methods and means in which sport fishing is regulated in Alaska the Board of Fisheries has to establish regulations giving that method and mean approval for use. So if a person thinks of a way to use an unmanned aircraft to sport fish that method would have to be approved by the Board of Fisheries before it can be legally used.

Commercial Fisheries

The main way in which unmanned aircraft could be used in commercial fisheries would be to be used to spot schools of fish for commercial fishermen to harvest. This spotting of schools of fish by conventional aircraft has been addressed by the Board of Fisheries over the years as the issue arose in certain areas and fisheries. For example, in the regulations pertaining to commercial fishing in the Bristol Bay area there is a regulation, 5 AAC 06.379, that states that "A person may not use or employ an aircraft to locate salmon for the commercial taking of salmon or to direct commercial fishing operations in the Bristol Bay area one hour before, during, and one hour after a commercial salmon fishing period." There are similar regulations in place for the Alaska Peninsula, Kodiak, Cook Inlet, and Prince William Sound areas also. These regulations would most likely also encompass the use of unmanned aircraft for the purposes of locating salmon for commercial harvest and so no additional regulations would be needed.

Hunting

The first idea in how an unmanned aircraft may be used is to actually hunt using the aircraft. As we had discussed in a follow up conversation to your inquiry, you stated that the FAA has said that there are existing rules in place which already prohibit weapons from being installed on civil aircraft which would encompass unmanned aircraft. Additionally, there is already existing in state statute is AS 16.05.797 which bans computer assisted remote hunting, adding another layer to a prohibition on using an unmanned aircraft to hunt. This leaves the use of unmanned aircraft to the spotting of game animals. In the traditional use of aircraft, same day airborne hunting has been banned in Alaska with some exceptions for Board of Game approved intensive management programs . The language contained within the ban only refers to a person being airborne, not the use of aircraft, so this would not cover unmanned aircraft. The Dept. of Law and DPS have discussed as to whether or not the prohibition on using "radio communication" to aid in the taking of game might bar the use of unmanned aircraft. Unamnned aircraft use a variety of different technology to send and receive signals and data so it may depend on the nuances of the particular situation in which an unmanned aircraft is used. The use of unmanned aircraft for spotting of game is largely an issue of fair chase and is best left to the discretion

of the Alaska Board of Game, who has authority to address this issue. Allowing the Board to use their discretion will allow the establishment of regulations that are tailored to address unique problems/issues associated with the use of unmanned aircraft across the state, similar to how the Board addresses similar issues through establishment of controlled use areas.

If you have any questions or need any follow up information please let me know.

Best regards,

Ben Mulligan

Subject: legislative request from Rep Hughes

Good morning Ben,

You may know that Rep Hughes is co-chairing the Unmanned Aircraft Task Force and we are preparing legislation for the upcoming session. We don't have anything drafted for review yet but will share it with you when available.

A question from one of the task force members: Will additional law/regulation be needed regarding unmanned aircraft and hunting/fishing? Can you provide the task force with the department's position or concerns regarding unmanned aircraft use for recreational or commercial hunting/fishing?

Thanks

ginger

Legislative Task Force on Unmanned Aircraft Systems Report to the Legislature (January 15, 2014)

EXECUTIVE SUMMARY

The Legislative Task Force on Unmanned Aircraft Systems (UAS) was formed under House Concurrent Resolution No. 6 to review regulations and guidance regarding UAS and provide recommendations for a comprehensive state policy for unmanned aircraft that protects privacy and allows the use of unmanned aircraft systems for public and private applications.

Being sensitive to public concern, the Legislative Task Force on UAS (LTFUAS) reviewed multiple potential UAS scenarios focusing on economic development, law enforcement, anticipated mission types, and safety. The Task Force evaluated existing privacy laws for Alaska without recommending duplicative law for UAS, considered ways to encourage the economic development and safe uses of UAS in Alaska, and supported public education to reduce fear and embrace UAS to be used in life safety and other beneficial applications.

The Task Force concluded that the FAA is adequately addressing the safety concerns of integrating unmanned aircraft systems in the National Air Space (NAS). Existing guidelines clearly state the requirements of the aircraft, pilot training and responsibilities, and the expectations of the Test Sites (to be selected). The rules outlined in the guidelines provided the Task Force assurance that unmanned aircraft can be operated safely in Alaska.

The Task Force recommends the following:

- Law enforcement agencies adopt the IACP guidelines
- Formation of a public review panel to establish broad categories of approved UAS use
- Require high visibility paint scheme for aircraft

As we move forward, particularly but not exclusively in the event Alaska is chosen as an FAA test site for UAS Integration, LTFUAS further recommends immediate emphasis on:

1) management of the test ranges,
2) economic development opportunities, and
3) public education regarding UAS.

Shelley Hughes

Donny Olson

INTRODUCTION

The Legislative Task Force on Unmanned Aircraft Systems (UAS) was formed under House Concurrent Resolution No. 6 and charged with the duties of:

1. reviewing regulations and guidance from the Federal Aviation Administration (FAA) regarding UAS;

2. providing written recommendations, together with suggested legislation, for a comprehensive state policy for unmanned aircraft that protects privacy and allows the use of unmanned aircraft systems for public and private applications; and

3. submitting a final report to the legislature.

The Legislative Task Force on UAS (LTFUAS) met **[include dates]** twice via teleconference and twice in person to respond to the concerns Alaskans have raised regarding unmanned aircraft use in Alaska. This *DRAFT* report presents the findings of the Task Force as required by HCR6, SLA13. The LTFUAS:

1. reviewed regulations and guidance from the FAA, International Association of Chiefs of Police, and many other recommendations for UAS operations;

2. received hours of public testimony and written public testimony; and

3. compiled recommendations and suggested legislation for the use of unmanned aircraft systems for public and private applications in Alaska that are protective of privacy.

The result of these meetings is this Executive Summary, report of findings, and documentation supporting the decisions of the LTFUAS.

The LTFUAS considered two approaches to regulating the use of UAS in Alaska:

- Restrict the industry and adopt exemptions for specific kinds of approved uses, or
- Generally allow UAS operations in Alaska and adopt the necessary privacy, operations, and other guidelines that seem necessary to protect Alaskans.

The Task Force adopted the second approach and emphasized that educating the public will be an important part of integrating this technology safely and for the benefit of Alaskans.

The Task Force concluded that the FAA is adequately addressing the safety concerns of integrating unmanned aircraft systems in the National Air Space (NAS). FAA Guideline N 8900-227 spells out the details of operating UAS by clearly stating the requirements of the aircraft, pilot training and responsibilities, and the expectations of the Test Sites (to be selected). The rules outlined in the guidelines provided the Task Force assurance that unmanned aircraft can be operated safely in Alaska.

The FAA also recently released its Final Privacy Requirements, November 2013. The privacy document from the FAA clearly identified that while it governs the NAS, local governments will assume the responsibility of addressing privacy concerns.

Alaskans are fortunate to live in a state where the constitution and state law provide some of the greatest privacy protections compared to other states. As the Task Force reviewed multiple scenarios for misuse of the UAS, we determined that existing laws would apply, are sufficiently protective of privacy, and penalties are already in place to address inappropriate behavior.

When studying the many possible scenarios for misuse, the Task Force returned repeatedly to the premise that an unmanned aircraft is a tool; the operator needs to be considered for breaches of privacy or harming another.

This report presents the findings of the LTFUAS resulting from task force meetings, public testimony, research, and information from industry experts in pursuit of the assigned duties listed above.

Background

This technology is growing rapidly worldwide, and UAS are currently used across the United States for a variety of beneficial purposes. The Task Force approach is to responsibly embrace the positive uses without overregulating the industry and thus hindering economic opportunity. In addition to accepting the use of UAS in Alaska, the Task Force recognizes that public perception is greatly influenced through media reports, such as military flights in war zones. The public appear hesitant to allow UAS in Alaska due to fear of invasion of personal privacy and overreaching law enforcement.

REVIEW SUMMARY

"Since the early 1990s, unmanned aircraft systems (UAS) have operated on a limited basis in the National Airspace System (NAS). Until recently, UAS mainly supported public operations, such as military and border security operations. The list of potential uses is now rapidly expanding to encompass a broad range of other activities, including aerial photography, surveying land and crops, communications and broadcast, monitoring forest fires and environmental conditions, and protecting critical infrastructures.

The FAA created the Unmanned Aircraft Systems Integration Office to facilitate integration of UAS safely and efficiently into the NAS. Toward that goal, the FAA is collaborating with a broad spectrum of stakeholders, which includes manufacturers, commercial vendors, industry trade associations, technical standards organizations, academic

FAA 'Roadmap'

"Ultimately, UAS must be integrated into the NAS without reducing existing capacity, decreasing safety, negatively impacting current operators, or increasing the risk to airspace users or persons and property on the ground any more than the integration of comparable new and novel technologies."

institutions, research and development centers, governmental agencies, and other regulators."[1]

SAFETY GUIDELINES

The Task Force studied the FAA Guidelines for the Operations of Unmanned Aircraft Systems and participated in a presentation of the guidelines from Ro Bailey, Deputy Director of the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks and comments from representatives of the FAA. Document number N 8900.227 provides the most current guidelines for federal approval of operating unmanned aircraft.[2]

The Task Force recognizes that the FAA manages the safety of the national airspace and has adopted extensive guidelines regarding aircraft certification, pilot training and certification, and approval process for flights (or missions). N 8900.227 also provides detailed requirements for the operations of pending test sites and the current approval of flights in designated areas for specific purposes. The FAA pre-approves UAS missions and awards a Certificate of Authorization (COA) that identifies the details of the mission. This process is tightly scrutinized, and the entity flying the UAS is accountable to the FAA under the details of the COA.

The COA approval process gives the Task Force confidence that safety of the national airspace is adequately considered and that UAS missions will not invade personal privacy or operate inappropriately.

It is the opinion of the Task Force that no additional statutory or regulatory requirements are needed for FAA-approved missions.

PRIVACY CONCERNS

Federal Aviation Administration Final Privacy Requirements, November 7, 2013

The FAA recently published its Final Privacy Requirements, Nov 7, 2013 (Appendix X) regarding unmanned aircraft. The FAA recognizes that there is substantial debate and difference of opinion among policy makers, industry, advocacy groups, and members of the public as to whether UAS operations at the Test Sites will raise novel privacy issues that are not adequately addressed by existing legal frameworks.

FAA Final Privacy Requirements

On February 22, 2013 the FAA published and requested public comment on the proposed privacy requirements for UAS test sites that the FAA will establish pursuant to the FAA Modernization and Reform Act of 2012.

The FAA received 99 comments through Regulations.gov and 53 comments through the public engagement session.

The public comments were grouped into ten categories, and the FAA provided a response to each category. You can view all categories, comments and responses in the document provided in Appendix X titled ...

[1] Integration of Civil Unmanned Aircraft Systems (UAS) in the National Airspace System (NAS) Roadmap. 2013. U.S. Department of Transportation, Federal Aviation Administration. First Edition—2013.

[2] FAA documents (2) [footnote-reference – get ref data]; Notice N 8900.227, Subj: Unmanned Aircraft Systems (UAS) Operation Approval. Effective Date 7/30/13, Cancellation Date 7/30/14.

Excerpts from the FAA Final Privacy Requirements:

There was substantial difference of opinion among commenters as to whether the UAS operations and manned aircraft operations present different privacy issues that justify imposing special privacy restrictions on UAS operations at the Test Sites. In addition, there was substantial difference of opinion regarding what elements would be appropriate for a Test Site privacy policy.

The FAA has determined that it should not impose privacy requirements beyond those in the Final Privacy Requirements for the following reasons. ***First****, there are many privacy laws and applications of tort law that may address some of the privacy issues that arise from UAS operations at the Test Sites.*

Second*, the FAA believes that the Test Sites operators will be responsive to local stakeholders' privacy concerns and will develop privacy policies appropriately tailored to each Test Site.* ***Third****, if UAS operations at a Test Site raise privacy concerns that are not adequately addressed by the Test Site's privacy policies, elected officials can weigh the benefits and costs of additional privacy laws or regulations. Forty-three states have already enacted or are considering legislation regulating use of UAS.*

Conclusion:

Based on the comments submitted, the FAA intends to require each Test Site operator to comply with all of the privacy requirements included in the Draft Privacy Requirements as well as the following additional privacy requirements:

Test Site Requirements

1. *Test site operators must maintain a record of all UAS operating in the test sites;*
2. *Test site operators must require every UAS operator in the Test Site to have a written plan for the operator's use and retention of data collected by the UAS; and*
3. *Test site operators must conduct an annual review of test site operations to verify compliance with stated privacy policy and practices and share those outcomes annually in a public forum with an opportunity for public feedback.*

1. *Test site operators must maintain a record of all UAS operating in the test sites;*
2. *Test site operators must require every UAS operator in the Test Site to have a written plan for the operator's use and retention of data collected by the UAS; and*
3. *Test site operators must conduct an annual review of test site operations to verify compliance with stated privacy policy and practices and share those outcomes annually in a public forum with an opportunity for public feedback.*

It is the opinion of the Task Force that privacy policy is adequate through the FAA requirements for the use of UAS in the Test Sites.

Privacy and Civil Liberties Consideration

The FAA is implementing a UAS test site program to help the FAA gain better understanding of operational issues relating to UAS. Although the FAA's mission does not include developing or

enforcing policies pertaining to privacy or civil liberties, experience with the UAS test sites will present an opportunity to inform the dialogue in the Interagency Policy Committee (IPC) and other interagency forums concerning the use of UAS technologies and the areas of privacy and civil liberties.

> *The Fourth Amendment is central to the privacy issues with respect to government UAS operation. Although the Supreme Court has never explicitly considered the question of UAS privacy, there is a long list of relevant precedents. Among them are several cases from the 1980s that specifically considered aerial observations and the Fourth Amendment.*

Homeland Security Privacy Impact Assessment

U.S. Customs and Border Protection (CBP) is responsible for guarding nearly 7,000 miles of land border, 2,000 miles of coastal waters and 95,000 miles of maritime border. CBP employs several types of aircraft to achieve its mission objectives including UAS. COAs have been authorized in Arizona, Texas, Florida and North Dakota. When deploying resources for operations, the Office of Air and Marine must determine the availability of aircraft type and the integration of the requested activity into its flight operations.

Homeland Security addressed privacy in the Privacy Impact Assessment published September 9, 2013. A summary of privacy concerns addressed in this document includes:

Homeland Security

95,000 miles of maritime border security includes joint operations with the United States Coast Guard. Some of those miles include Alaska coastline.

1. The collection and use of data from aerial surveillance remains within the scope of its authorities to protect the border and provide support for law enforcement for law enforcement activities, while continuing to preserve a person's right to privacy.
2. UAS present a perceived risk because they are able to fly for longer periods of time and conduct surveillance relatively undetected. While UAS can fly for longer periods of time, they are equipped with the same technology to conduct surveillance that is presently deployed on manned aircraft.
3. Concern for the security of the UAS itself and the potential for hijacking of the unmanned aircraft is managed by the close monitoring of ground control and satellite communication by encrypted data. If one ground station were to lose contact, a second ground station is equipped to pick up the UAS and continue operations.

Alaska State Law and Personal Privacy

The State of Alaska and its local governments cannot dictate the use of the national airspace but can consider rules that better define the FAA guidelines, can consider legal repercussion for entities found in violation of adopted laws, and can provide for specific privacy laws regarding the use of UAS in Alaska.

The State of Alaska Constitution provides privacy protection, "although not unlimited, has been held to be broader than the protection afforded by the United States Constitution. Both the Alaska Constitution and the Fourth Amendment to the United States Constitution require a warrant by a governmental agency for the search of a place where a person has a reasonable expectation of privacy."[3]

Although much attention regarding UAS privacy focuses on government use and the Fourth Amendment, it is non-governmental use that is likely to raise some of the most significant privacy challenges in coming years. For private entities, the key constitutional question is the extent of their First Amendment privilege to gather information.

Civil use of unmanned aircraft will fall under the federal and state laws including such provisions as trespassing, invasion of privacy, intrusion upon seclusion, publication of private facts, stalking and harassment, and business privacy.

The Task Force, with guidance from Legislative Legal Services, considered many scenarios of possible violations of state and federal law that might occur with the use of unmanned aircraft. The Legal Services memo outlining the areas of statute that protect personal privacy can be found in Appendix X.

Privacy protection scenarios considered by the Task Force include but are not limited to:

Legal Services

Constitutional Protection of Privacy: *The Constitution of the State of Alaska explicitly protects the right of privacy against government intrusion. Art. I, sec. 22 provides: "The right of the people to privacy is recognized and shall not be infringed. The legislature shall implement this section."*

Alaska Statutory Protections:

AS 11.41.270 Stalking, nonconsensual conduct prohibits monitoring by technical means

AS 11.61.116 Sending an explicit image of a minor

AS 11.61.120(a)(6) Harassment: publishing or distributing certain images

AS 11.61.123 Indecent viewing or photography

AS 11.76.113 Misconduct involving confidential information in the first degree

AS 11.76.115 Misconduct involving confidential information in the second degree

1. **If data is gathered by a government agency, it is a public record. However, AS 40.20.120 provides certain protections for private information. Use of inadvertently captured information in a criminal prosecution may depend on who captures the information and whether the person whose actions have been captured has a reasonable expectation of privacy.**

It was discussed that data captured by a UAS would be treated similarly to data captured by other technology such as cell phones, manned aircraft, satellite images, voice recorders, etc. Case law is substantial in determining if the person would be considered to have a reasonable expectation of privacy and when a warrant would be required to obtain and use any data collected.

2. **As technology continues to advance beyond 'normal' application of current laws, drafting new laws must adopt a balanced approach that recognizes the inherent difficulty in predicting the future.**

[3] Legal memo [footnote-reference – get ref data]

The Task Force determined that we cannot foresee the future applications of technology (of UAS or other technologies) therefore, creating restrictions in law based on assumptions is not recommended.

3. How should Alaska manage unintentionally captured images or data?

Discussion concluded that there are adequate statute, case law and data retention guidelines that resolved the concerns of the Task Force.

Observations From Above: UAS and Privacy

This document was published in the Harvard Journal of Law and Public Privacy by John Villasenor, a senior fellow in Governance Studies and the Center for Technology Innovation, the Brookings Institution.

The Task Force discussed many of the scenarios posed by the author when considering the need for Alaska law.

4. The tie between safety and privacy is tightest with respect to rules requiring the operator of a UAS to be able to see the aircraft at all times. Public UAS operated in association with the expedited authorizations in Section 334(c)(2)(C) of FMRA have a "line of sight" requirement.

The Task Force assumes that FAA regulations adopted in the next several years will continue to require visual line of sight operation. "Sense and avoid" technology will become more mature and some non-line-of-sight missions may be permitted by the FAA. Non-line-of-sight operations and other unknown technological advances may bring new challenges that will require the legislature to review industry guidelines and state laws in the future.

5. Unmanned aircraft may bring efficient advances to law enforcement; however, the public seems to be highly sensitive to law enforcement using unmanned aircraft.

After reviewing many possible uses of UAS, the Task Force determined that existing law already affords the public with adequate protections.

- Routine Technology: The use of UAS is treated much the same as any other technological tool used to protect the public. The Department of Public Safety has adopted the IACP Guidelines for UAS, and the Task Force found those guidelines to be superior for rules of law enforcement use.
- Public Navigable Airspace: The question of what constitutes "public navigable airspace" for UAS operated by the government is central to privacy policy. The Task Force found that almost every law enforcement scenario discussed was already protected by existing law.
- Role of Imaging Technology: Rules and case law exist that protect citizens from inappropriate use of capturing data that is a "great more than the human eye could ever see."

Law Enforcement

Public protection will benefit greatly from unmanned aircraft for the purposes of search and rescue, crash scene documentation time, natural disaster monitoring, wildfire management, amber and silver alerts, hostage situations and other life safety extremes. Some efforts will require warrants to proceed and some will be allowed under a COA.

- Extended Surveillance: Law enforcement does not intend to use UAS for standard patrol activities at this time. Limiting flight hours was not seen as an acceptable control because long flights may be necessary in the event of search and rescue or natural disaster remediation operations.
- Obtaining a Warrant: After much discussion, it was decided that using UAS to gather data would require a warrant in similar situations as using any other data gathering device (such as voice recording, photography, and thermal imaging with manual technology). No additional laws are required to obtain a warrant for UAS data gathering.
- Under no circumstance would a UAS be armed. FAA guidelines do not allow anything to be dropped from an unmanned aircraft.
- Law enforcement is planning to use high-visibility marking on any UAS they will use. Application of lights and/or hi-vis paint is being considered.
- It is apparent that public education is necessary for all agencies using UAS but sensitivity is heightened for law enforcement uses.

It is the opinion of the Task Force that existing privacy laws are adequate to govern the use of unmanned aircraft.

It is the opinion of the Task Force that if Alaska is chosen as one of the FAA Test Sites, we will have the opportunity to participate in the use of UAS in a variety of ways that would put Alaska in the position to establish policy guiding the use of UAS for the rest of the United States to consider.

Voluntary Approaches

The International Association of Chiefs of Police (IACP) adopted model guidelines for the use of UAS for law enforcement purposes.

The Association for Unmanned Vehicle Systems International (AUVSI) Code of Conduct calls for a commitment to "respect the privacy of individuals."

Academy of Model Aeronautics has also adopted operational policies and guidelines for advanced flight systems used in radio controlled model aircraft.

Self-Regulation by Three National Organizations

The Task Force adopted the IACP with one modification and excerpts from the AUVSI Code of Conduct.

IACP – International Association of Chiefs of Police
Recommended Guidelines for the use of Unmanned Aircraft was adopted in August 2012. The Alaska Department of Public Safety has also adopted these guidelines as their doctrine with the exception of increasing the flight approval responsibility from a "supervisor" to the director's office.

AUVSI – Association for Unmanned Vehicle Systems International; "As an industry, it is incumbent upon us to hold ourselves and each other to a high professional and ethical standard. As with any revolutionary technology, there will be mishaps and abuses; however, in order to operate safely and gain public acceptance and trust, we should all act in accordance with these guiding themes and do so in an open and transparent manner. We hope the entire UAS industry will join AUVSI in adopting this industry Code of Conduct."

AMA – Academy of Model Aeronautics Policies for Radio Controlled Model Aircraft Operations Utilizing First Person View, Failsafe, Stabilization and Autopilot Systems guides model aircraft operators.

The same way that the FAA does not regulate model aeronautics, the Task Force does not intend to adopt requirements of hobbyist activities using UAS.

It was discussed that a notice should be provided at the time of purchase of each model aircraft to review the AMA flight operation guidelines for appropriate use of model aeronautics. The Task Force did not adopt a requirement for notice regarding hobbyists because so many aircraft are purchased outside of Alaska and would not be required to provide the notice.

[Need to add something about integrating model aeronautics and UAS policy.]

1. Should Alaska adopt some industry-relevant voluntary approaches of self-managed rules of UAS?

International Association of Chiefs of Police Guidelines for UAS, AUVSI Code of Conduct, and the Academy of Model Aeronautics rules were considered and generally accepted by the Task Force.

Technical Operations Guidelines

International Civil Aviation Organization (ICAO), a special agency of the United Nations, promotes "the safe and orderly development of international civil aviation throughout the world. It sets standards and regulations necessary for aviation safety, security, efficiency, and regularity, as well as aviation environmental protection."

The goal of the ICAO in addressing unmanned aviation is to provide the fundamental international regulatory framework to support routine operation of UAS throughout the world in a safe, harmonized, and seamless manner comparable to that of manned operations.

"A number of Civil Aviation Authorities have adopted the policy that UAS must meet the equivalent levels of safety as manned aircraft... In general, UAS should be operated in accordance with the rule governing the flight of manned aircraft and meet equipment requirements applicable to the class of airspace within which they intent to operate... To safely integrate UAS in non-segregated airspace, the UAS must act and respond as manned aircraft do. Air Traffic, Airspace and Airport standards should not be significantly changed. The UAS must be able to comply with existing provisions to the greatest extent possible."[4]

UAS Operations Guidelines

Technical rules for operating unmanned aircraft systems are clearly identified at a global and federal level. "A number of Civil Aviation Authorities have adopted the policy that UAS must meet the equivalent levels of safety as manned aircraft..."

FAA Guidelines for the Operations of Unmanned Aircraft N 8900-227 specifically sets the rules for the technical operations of flying unmanned aircraft.

The FAA has established guidelines for the certification and airworthiness of the aircraft, certification of the pilot including additional instruction in operating specific UAS, flight operations

[4] Roadmap page 11 [get footnote ref data]

with the Test Sites, management of the Test Site and certificates of authorization for particular missions.

The Task Force is confident in the FAA guidelines in protecting the safety of the national airspace.

UAF Center for Unmanned Aircraft Systems Integration, RT&D is a nationally recognized program that has shown responsible use of UAS for more than ten years. The University has applied to the FAA to be selected as one of the six federal test sites.

(Was selected as one of the FAA's six Test Sites... December 31, 2013)

Benefits to Alaska

Economic Benefit

Policy Development

Expedited Timeline for Test Range Use and Approved Missions

Encourage UAF pilot training program for UAS

Hi-vis markings for law enforcement

Insurance for civil operators (license and bonding)

Education – public awareness

Market Alaska "open for business" for UAS

Audits of missions – FAA Privacy Policy requirement

Test Site operations manager position – FAA Privacy Policy requirement also requires a Chief Privacy Officer at Test Site

Incentive grants

Research appropriation to UAF

Definitions

University of Alaska Fairbanks Center for Unmanned Aircraft Systems Integration, Research Testing and Development

The University of Alaska Fairbanks has been involved in UAS missions for more than ten years. It has participated in research and data gathering operations from Prudhoe Bay to South Africa.

The Alaska Legislature indicated its support in the University's efforts by passage of HCR6 in the 2013 session. The resolution identified many of the good uses of UAS in Alaska and established this task force to recommend statutory changes.

RECOMMENDATIONS

The Task Force supports its recommendations to the legislature by considering and adopting general guidelines from the following reports from the FAA: (1) Guidelines for Operations of UAS N 8900-227, (2) Comprehensive Plan to integrate UAS in National Airspace, and (3) Final Privacy Requirements. The Task Force also adopted the International Association of Chiefs of Police (IACP) UAS Guidelines as appropriate rules for law enforcement in Alaska (Appendix A).

In addition to the FAA documents, the Task Force considered a report from Legal Services that identified Alaska's privacy laws and Constitutional protections of privacy to determine if there might be a scenario created through the use of UAS that would not be protected by existing privacy laws. The Task Force also recognized that in the event Alaska is chosen as an FAA test site for UAS Integration, an emphasis on management of the test ranges, economic development, and public education needed immediate attention.

In summary, the Task Force recommends the following:

- law enforcement agencies adopt the IACP guidelines
- form a public review panel that will establish broad categories of approved UAS use
- require high visibility paint scheme for aircraft
- If Alaska is chosen as an FAA Test Site for UAS Integration, emphasize
    - management of the test ranges,
    - economic development opportunities, and
    - public education regarding UAS.

Appendix X

Unmanned Aircraft System Operations Industry "Code of Conduct"

Unmanned Aircraft System Operations

Industry "Code of Conduct"

The emergence of unmanned aircraft systems (UAS) as a resource for a wide variety of public and private applications quite possibly represents one of the most significant advancements to aviation, the scientific community, and public service since the beginning of flight. Rapid advancements in the technology have presented unique challenges and opportunities to the growing UAS industry and to those who support it. The nature of UAS and the environments which they operate, when not managed properly, can and will create issues that need to be addressed. The future of UAS will be linked to the responsible and safe use of these systems. Our industry has an obligation to conduct our operations in a safe manner that minimizes risk and instills confidence in our systems.

For this reason, the Association for Unmanned Vehicle Systems International (AUVSI), offers this Code of Conduct on behalf of the UAS industry for UAS operation. This code is intended to provide our members, and those who design, test, and operate UAS for public and civil use, a set of guidelines and recommendations for safe, non-intrusive operations. Acceptance and adherence to this code will contribute to safety and professionalism and will accelerate public confidence in these systems.

The code is built on three specific themes: Safety, Professionalism, and Respect. Each theme and its associated recommendations represent a "common sense" approach to UAS operations and address many of the concerns expressed by the public and regulators. This code is meant to provide UAS industry manufacturers and users a convenient checklist for operations and a means to demonstrate their obligation to supporting the growth of our industry in a safe and responsible manner. By adopting this Code, UAS industry manufacturers and users commit to the following:

Safety

- We will not operate UAS in a manner that presents undue risk to persons or property on the surface or in the air.
- We will ensure UAS will be piloted by individuals who are properly trained and competent to operate the vehicle or its systems.
- We will ensure UAS flights will be conducted only after a thorough assessment of risks associated with the activity. This risks assessment will include, but is not limited to:
- Weather conditions relative to the performance capability of the system
- Identification of normally anticipated failure modes (lost link, power plant failures, loss of control, etc.) and consequences of the failures
- Crew fitness for flight operations

- Overlying airspace, compliance with aviation regulations as appropriate to the operation, and off-nominal procedures
- Communication, command, control, and payload frequency spectrum requirements
- Reliability, performance, and airworthiness to established standards
- Professionalism
- We will comply with all federal, state, and local laws, ordinances, covenants, and restrictions as they relate to UAS operations.
- We will operate our systems as responsible members of the aviation community.
- We will be responsive to the needs of the public.
- We will cooperate fully with federal, state, and local authorities in response to emergency deployments, mishap investigations, and media relations.
- We will establish contingency plans for all anticipated off-nominal events and share them openly with all appropriate authorities.

Respect

- We will respect the rights of other users of the airspace.
- We will respect the privacy of individuals.
- We will respect the concerns of the public as they relate to unmanned aircraft operations.
- We will support improving public awareness and education on the operation of UAS.

As an industry, it is incumbent upon us to hold ourselves and each other to a high professional and ethical standard. As with any revolutionary technology, there will be mishaps and abuses; however, in order to operate safely and gain public acceptance and trust, we should all act in accordance with these guiding themes and do so in an open and transparent manner. We hope the entire UAS industry will join AUVSI in adopting this industry Code of Conduct.

Appendix XX

INTERNATIONAL ASSOCIATION OF CHIEFS OF POLICE

AVIATION COMMITTEE

Recommended Guidelines for the use of Unmanned Aircraft

BACKGROUND:

Rapid advances in technology have led to the development and increased use of unmanned aircraft. That technology is now making its way into the hands of law enforcement officers nationwide.

We also live in a culture that is extremely sensitive to the idea of preventing unnecessary government intrusion into any facet of our lives. Personal rights are cherished and legally protected by the Constitution. Despite their proven effectiveness, concerns about privacy threaten to overshadow the benefits this technology promises to bring to public safety. From enhanced officer safety by exposing unseen dangers, to finding those most vulnerable who may have wandered away from their caregivers, the potential benefits are irrefutable. However, privacy concerns are an issue that must be dealt with effectively if a law enforcement agency expects the public to support the use of UA by their police.

The Aviation Committee has been involved in the development of unmanned aircraft policy and regulations for several years. The Committee recommends the following guidelines for use by any law enforcement agency contemplating the use of unmanned aircraft.

DEFINITIONS:

1. Model Aircraft - A remote controlled aircraft used by hobbyists, which is manufactured and operated for the purposes of sport, recreation and/or competition.
2. Unmanned Aircraft (UA) – An aircraft that is intended to navigate in the air without an on-board pilot. Also called Remote Piloted Aircraft and "drones."
3. UA Flight Crewmember - A pilot, visual observer, payload operator or other person assigned duties for a UA for the purpose of flight.
4. Unmanned Aircraft Pilot - A person exercising control over an unmanned aircraft during flight.

COMMUNITY ENGAGEMENT:

1. Law enforcement agencies desiring to use UA should first determine how they will use this technology, including the costs and benefits to be gained.
2. The agency should then engage their community early in the planning process, including their governing body and civil liberties advocates.
3. The agency should assure the community that it values the protections provided citizens by the U.S. Constitution. Further, that the agency will operate the aircraft in full compliance

with the mandates of the Constitution, federal, state and local law governing search and seizure.

4. The community should be provided an opportunity to review and comment on agency procedures as they are being drafted. Where appropriate, recommendations should be considered for adoption in the policy.
5. As with the community, the news media should be brought into the process early in its development.

SYSTEM REQUIREMENTS:

1. The UA should have the ability to capture flight time by individual flight and cumulative over a period of time. The ability to reset the flight time counter should be restricted to a supervisor or administrator.
2. The aircraft itself should be painted in a high visibility paint scheme. This will facilitate line of sight control by the aircraft pilot and allow persons on the ground to monitor the location of the aircraft. This recommendation recognizes that in some cases where officer safety is a concern, such as high risk warrant service, high visibility may not be optimal. However, most situations of this type are conducted covertly and at night. Further, given the ability to observe a large area from an aerial vantage point, it may not be necessary to fly the aircraft directly over the target location.
3. Equipping the aircraft with weapons of any type is strongly discouraged. Given the current state of the technology, the ability to effectively deploy weapons from a small UA is doubtful. Further, public acceptance of airborne use of force is likewise doubtful and could result in unnecessary community resistance to the program.
4. The use of model aircraft, modified with cameras, or other sensors, is discouraged due to concerns over reliability and safety.

OPERATIONAL PROCEDURES:

1. UA operations require a Certificate of Authorization (COA) from the Federal Aviation Administration (FAA). A law enforcement agency contemplating the use of UA should contact the FAA early in the planning process to determine the requirements for obtaining a COA.
2. UA will only be operated by personnel, both pilots and crew members, who have been trained and certified in the operation of the system. All agency personnel with UA responsibilities, including command officers, will be provided training in the policies and procedures governing their use.
3. All flights will be approved by a supervisor and must be for a legitimate public safety mission, training, or demonstration purposes.

4. All flights will be documented on a form designed for that purpose and all flight time shall be accounted for on the form. The reason for the flight and name of the supervisor approving will also be documented.
5. An authorized supervisor/administrator will audit flight documentation at regular intervals. The results of the audit will be documented. Any changes to the flight time counter will be documented.
6. Unauthorized use of a UA will result in strict accountability.
7. Except for those instances where officer safety could be jeopardized, the agency should consider using a "Reverse 911" telephone system to alert those living and working in the vicinity of aircraft operations (if such a system is available). If such a system is not available, the use of patrol car public address systems should be considered. This will not only provide a level of safety should the aircraft make an uncontrolled landing, but citizens may also be able to assist with the incident.
8. Where there are specific and articulable grounds to believe that the UA will collect evidence of criminal wrongdoing and if the UA will intrude upon reasonable expectations of privacy, the agency will secure a search warrant prior to conducting the flight.

IMAGE RETENTION:

1. Unless required as evidence of a crime, as part of an on-going investigation, for training, or required by law, images captured by a UA should not be retained by the agency.
2. Unless exempt by law, retained images should be open for public inspection.

2

Press Release – FAA Releases Unmanned Aircraft Systems Integration Roadmap

For Immediate Release

November 7, 2013
Contact: Les Dorr or Alison Duquette
Phone: (202) 267-3883

Also Finalizes Privacy Policy for UAS Test Sites

WASHINGTON –The U.S. Department of Transportation's Federal Aviation Administration (FAA) today released its first annual Roadmap outlining efforts needed to safely integrate unmanned aircraft systems (UAS) into the nation's airspace. The Roadmap addresses current and future policies, regulations, technologies and procedures that will be required as demand moves the country from today's limited accommodation of UAS operations to the extensive integration of UAS into the NextGen aviation system in the future.

"Government and industry face significant challenges as unmanned aircraft move into the aviation mainstream," said U.S. Transportation Secretary Anthony Foxx. "This Roadmap is an important step forward that will help stakeholders understand the operational goals and safety issues we need to consider when planning for the future of our airspace."

The Roadmap outlines the FAA's approach to ensuring that widespread UAS use is safe, from the perspective of accommodation, integration, and evolution. The FAA's main goal for integration is to establish requirements that UAS operators will have to meet in order to increase access to airspace over the next five to 10 years. The Roadmap discusses items such as new or revised regulations, policies, procedures, guidance material, training and understanding of systems and operations to support routine UAS operations.

"The FAA is committed to safe, efficient and timely integration of UAS into our airspace," said FAA Administrator Michael Huerta. "We are dedicated to moving this exciting new technology along as quickly and safely as possible."

The Roadmap also addresses the evolution of UAS operations once all requirements and standards are in place and are routinely updated to support UAS operations as the National Airspace System evolves over time. The document stresses that the UAS community must understand the system is not static, and that many improvements are planned for the airspace system over the next 15 years.

The FAA plans to select six UAS test sites to begin work on safely integrating UAS into the airspace. These congressionally-mandated test sites will conduct critical research into how best to safely integrate UAS systems into the national airspace over the next several years and what certification and navigation requirements will need to be established.

The use of UAS, both at the designated test sites and in the national airspace generally, raises the issue of privacy and protection of civil liberties. In February, the FAA asked for public comments specifically on the draft privacy requirements for the six test sites. Today, the agency sent a final privacy policy to the *Federal Register* that requires test site operators to comply with federal, state, and other laws on individual privacy protection, to have a publicly available privacy plan and a written plan for data use and retention, and to conduct an annual review of privacy practices that allows for public comment. Information about the test site selection process and final test site privacy policy is available at: http://www.faa.gov/about/initiatives/uas/

For the next several years, the FAA will continue to use special mitigations and procedures to safely accommodate limited UAS access to the nation's airspace on a case-by-case basis. The Roadmap notes that this case-by-case accommodation will decline significantly as integration begins and expands, but will continue to be a practical way to allow flights by some UAS operators in certain circumstances.

In addition to the FAA's Roadmap, as required in the 2012 FAA Reauthorization, the Joint Planning and Development Office (JPDO) has developed a comprehensive plan to safely accelerate the integration of civil UAS into the national airspace system.. That plan details a multi-agency approach to safe and timely UAS integration and coordination with the NextGen shift to satellite-based technologies and new procedures.

The UAS Roadmap (PDF) and UAS Comprehensive Plan is available on our website.

"UAS Roadmap"
Michael Huerta, Washington, DC

AIA – Unmanned Aircraft Systems Forum

Remarks as Prepared for Delivery

Good morning, Marion, and thank you for that introduction. It's great to be here today.

Aviation and aerospace hold a special place in the American consciousness. They are a symbol of American innovation. And innovation is what makes this country grow and prosper.

As we move into the second century of flight, we are transforming our airspace to take advantage of technological breakthroughs, and to maintain our position as a global leader. Through NextGen, we are transitioning from a system of ground-based radar and navigational aids, to a system that uses satellites and GPS for greater precision, more direct routes, greater fuel efficiency and better predictability.

NextGen is about taking the enormous advances that are taking place today in communications, computing and navigation, and incorporating these advances into our nation's aviation system.

With the growth of the Internet, of data-sharing, and of precise mapping, we have no choice but to leverage these benefits in the world of flight. NextGen is bringing these advances to aviation and allowing us to create the airspace of the future. And in that airspace of the future, we will have new users. We will have more commercial space launches and we'll have more unmanned aircraft systems. As you know, it requires significant work to build consensus on how to safely integrate game-changing technologies such as these.

I'm pleased to say that we have made solid progress. Today I would like to announce that the FAA has released its first Unmanned Aircraft Systems roadmap. This document, developed with key stakeholders, outlines what we need to do to safely integrate unmanned aircraft into our national airspace. It provides a five-year outlook and will have annual updates.

The roadmap addresses the policies, the regulations, the technologies, and procedures that we will need to integrate unmanned aircraft on a routine basis. To accomplish this, we must change the way we do business. We have operational goals as well as safety issues that we must consider when planning to expand the use of unmanned aircraft.

As the provider of air traffic services, we must ensure the safety and efficiency of the entire airspace, including all aircraft, people and property – both manned and unmanned – in the air and on the ground.

Unmanned aircraft are inherently different from manned aircraft. They run a very wide range, with a number of different physical and operational characteristics. Some are the size of a fist, and fly at low altitudes. Others have glider-like bodies with the wing span of a 737 and can fly above 60,000 feet. Many can fly longer and hover longer than manned aircraft. They are also lighter and slower than traditional aircraft and have more lift and not as much drag. What unites them all is that the pilot is on the ground and not on board the aircraft.

Our FAA forecast estimates that we can expect 7,500 small unmanned aircraft in our national airspace in the next five years, provided the regulations are in place to handle them.

Right now, almost all of the unmanned aircraft operations we approve for public use and research purposes are on a case by case basis.

For the last two decades, the FAA has authorized the limited use of unmanned aircraft for important missions in the public interest. These include firefighting, disaster relief, search and rescue, law enforcement, border patrol, military training, and testing and evaluation.

About 80 law enforcement agencies operate unmanned aircraft now under special certificates of authorization. Universities also use unmanned aircraft for research into weather, agriculture, and industrial uses.

And more recently, in September, the first commercial flight of an unmanned aircraft took place in the rainy skies above the Arctic Circle. A Scan Eagle completed a 36-minute flight to view marine mammals and survey ice. These surveys are needed to meet environmental and safety requirements before drilling on the sea floor.

This flight was coordinated by ConocoPhillips, the FAA, the manufacturer of the Scan Eagle, and other federal and international agencies. This Arctic region is the only area to date where we have authorized the use of small unmanned aircraft for commercial purposes.

In moving forward, we recognize that the expanded use of unmanned aircraft presents great opportunities, but it's also true that integrating these aircraft presents significant challenges.

There are operational issues that we need to address, such as pilot training. We also need to make sure that unmanned aircraft sense and avoid other aircraft, and that they operate safely if they lose the link to their pilot.

This is why developing more test data is so important. By the end of the year, we plan to choose six test sites for civil unmanned aircraft. Congress required us to do so, and we need to make sure we use these sites to obtain the best data that we can. The test sites will provide invaluable information to help us develop policies and procedures to ensure safe, responsible and transparent integration.

Today, we are also releasing the privacy policy that will apply to the UAS test sites. This policy requires operators to comply with all local, state and federal laws concerning privacy and civil liberties. We're requiring the test site operators to create a privacy policy that is available to the public. And they must require anyone operating unmanned aircraft at the test sites to have a written plan for how they will use and retain any test data acquired. On a broader level, agencies across the government are coming together to work on privacy issues that may arise with the increasing use of unmanned aircraft beyond these test sites.

Our airspace system is not static. And it's important for industry to understand that unmanned operations will evolve over time.

In addition to the roadmap, the Department of Transportation is releasing a Comprehensive Plan that dovetails with the FAA's roadmap. This Comprehensive Plan details the multi-agency approach to the safe and timely integration of unmanned aircraft. The plan establishes goals to integrate both small and larger unmanned aircraft, and to foster America's leadership in advancing this technology.

All three of these new documents – the Comprehensive Plan, the Roadmap and the privacy policy for the test sites – are available today on our web site at FAA.GOV.

We are dedicated to working with stakeholders in this growing industry and with our government partners – the Departments of Defense and Homeland Security, as well as NASA and the Joint Planning and Development Office – to define parameters to safely integrate these very diverse systems into the world's most complex airspace.

Rest assured the FAA will fulfill its statutory obligations to integrate unmanned systems. But we must fulfill those obligations in a thoughtful, careful manner that ensures safety and promotes economic growth.

While aviation is unquestionably an industry known for innovation, it is also an industry with a strong history of collaboration between government and industry. This collaboration has enabled us to achieve a position of international leadership. The U.S. is recognized as the "gold standard" for aviation safety, efficiency and technology.

And we need to keep it that way.

Together, we need to address the many areas where we need standards for these new unmanned aircraft. This includes standards for manufacturing and standards for pilot training.

We have a challenging task ahead and we all have a stake in this goal.

For us to be effective, funding for the government needs to happen in a predictable and reliable way so that we can consistently work towards the greater good. Short-term, stop-gap funding is no way to run a government or an aviation system.

We must move forward with NextGen and the rollout of new technologies, such as modern communications, navigation, and surveillance systems for our nation's airspace. The integration of unmanned aircraft relies on these kinds of NextGen advancements. We are building a complex and inter-related airspace. We need to join together again and vocally support the priorities that we have established.

By working together, government and industry will overcome the challenges that face us, and open the door to a more diverse and dynamic aviation future.

Thank you.

U.S. Department
of Transportation
**Federal Aviation
Administration**

Integration of Civil Unmanned Aircraft Systems (UAS) in the National Airspace System (NAS) Roadmap

First Edition – 2013

November 7, 2013

Dear Members of the Aviation Community:

I am pleased to present the Federal Aviation Administration's (FAA) Roadmap for *Integration of Civil Unmanned Aircraft Systems (UAS) in the National Airspace System (NAS)*. The FAA and the UAS Aviation Rulemaking Committee (ARC) worked together for the past year to produce this roadmap. Unmanned aircraft offer new ways for commercial enterprises and public operators to increase operational efficiency, decrease costs, and enhance safety; and this roadmap will allow us to safely and efficiently integrate them into the NAS.

The FAA is committed to the safe and efficient integration of UAS into the NAS. However, as safety is our top priority, UAS integration must be accomplished without reducing existing capacity, decreasing safety, impacting current operators, or placing other airspace users or persons and property on the ground at increased risk. We have made great progress in accommodating public UAS operations, but challenges remain for the safe, long-term integration of both public and civil UAS in the NAS.

This roadmap outlines the actions and considerations needed to enable UAS integration into the NAS. The roadmap also aligns proposed FAA actions with Congressional mandates from the *FAA Modernization and Reform Act of 2012*. This plan also provides goals, metrics, and target dates for the FAA and its government and industry partners to use in planning key activities for UAS integration.

We will update the specific implementation details (goals, metrics, target dates) as we learn from our current UAS operations, leverage ongoing research, and incorporate the work of our government and industry partners in all related areas.

Thank you for your continued support and active participation in the safe and efficient integration of UAS in the NAS.

Michael P. Huerta
Administrator

Executive Summary

Expanding Operations of Unmanned Aircraft Systems in the NAS

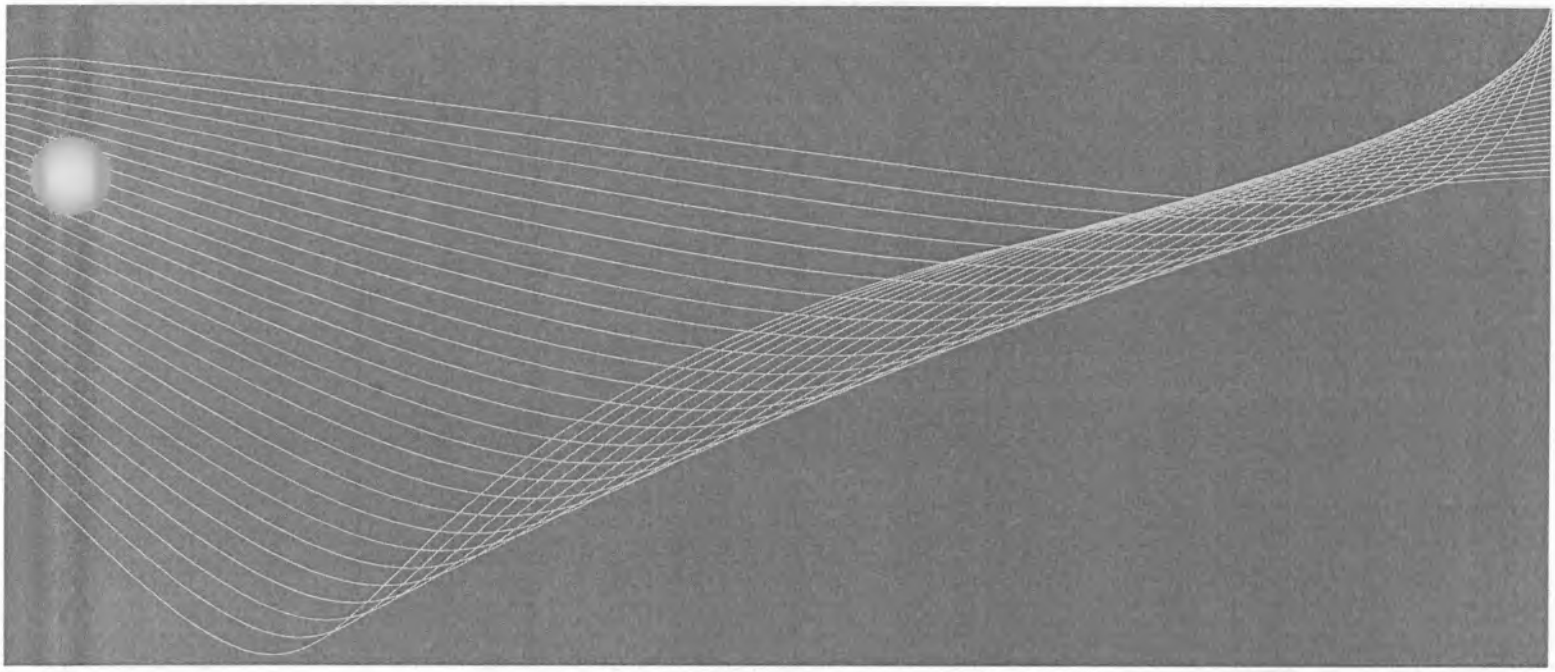
Since the early 1990s, unmanned aircraft systems (UAS) have operated on a limited basis in the National Airspace System (NAS). Until recently, UAS mainly supported public operations, such as military and border security operations. The list of potential uses is now rapidly expanding to encompass a broad range of other activities, including aerial photography, surveying land and crops, communications and broadcast, monitoring forest fires and environmental conditions, and protecting critical infrastructures. UAS provide new ways for commercial enterprises (civil operations) and public operators to enhance some of our nation's aviation operations through increased operational efficiency and decreased costs, while maintaining the safety of the NAS.

As stated in *Destination 2025* (2011):

> *"The Federal Aviation Administration's (FAA) mission is to provide the safest, most efficient aviation system in the world. What sets the United States apart is the size and complexity of our infrastructure, the diversity of our user groups, our commitment to safety and excellence, and a history of innovation and leadership in the world's aviation community. Now we are working to develop new systems and to enhance a culture that increases the safety, reliability, efficiency, capacity, and environmental performance of our aviation system."*

Ultimately, UAS must be integrated into the NAS without reducing existing capacity, decreasing safety, negatively impacting current operators, or increasing the risk to airspace users or persons and property on the ground any more than the integration of comparable new and novel technologies.

The FAA created the Unmanned Aircraft Systems Integration Office to facilitate integration of UAS safely and efficiently into the NAS. Toward that goal, the FAA is collaborating with a broad spectrum of stakeholders, which includes manufacturers, commercial vendors, industry trade associations, technical standards organizations, academic institutions, research and development centers, governmental agencies, and other regulators. Ultimately, UAS must be integrated into the NAS without reducing existing capacity, decreasing safety, negatively impacting current operators, or increasing the risk to airspace users or persons and property on the ground any more than the integration of comparable new and novel technologies. Significant progress has been made toward UAS-NAS integration, with many challenges and opportunities ahead.



A key activity of the FAA is to develop regulations, policy, procedures, guidance material, and training requirements to support safe and efficient UAS operations in the NAS, while coordinating with relevant departments and agencies to address related key policy areas of concern such as privacy and national security. Today, UAS are typically given access to airspace through the issuance of Certificates of Waiver or Authorization (COA) to public operators and special airworthiness certificates in the experimental category for civil applicants. Accommodating UAS operations by the use of COAs and special airworthiness certificates will transition to more routine integration processes when new or revised operating rules and procedures are in place and UAS are capable of complying with them. The FAA has a proven certification process in place for aircraft that includes establishing special conditions when new and unique technologies are involved. This process will be used to evaluate items unique to UAS. In those parts of the NAS that have demanding communications, navigation, and surveillance performance requirements, successful demonstration of UAS to meet these requirements will be necessary.

The process of developing regulations, policy, procedures, guidance material, and training requirements, is resource-intensive. This roadmap will illustrate the significant undertaking it is to build the basis for the NAS to transition from UAS *accommodation* to UAS *integration*. Government and industry stakeholders must work collaboratively and apply the necessary resources to bring this transition to fruition while supporting evolving UAS operations in the NAS.

The purpose of this roadmap is to outline, within a broad timeline, the tasks and considerations needed to enable UAS integration into the NAS for the planning purposes of the broader UAS community. The roadmap also aligns proposed Agency actions with the Congressional mandate in the *FAA Modernization and Reform Act of 2012,* Pub. L. 112-95. As this is the first publication of this annual document, the FAA will incorporate lessons learned and related findings in subsequent publications, which will include further refined goals, metrics, and target dates.

The FAA is committed to the safe and efficient integration of UAS into the NAS, thus enabling this emerging technology to safely achieve its full potential.

Purpose and Background of Civil UAS Roadmap

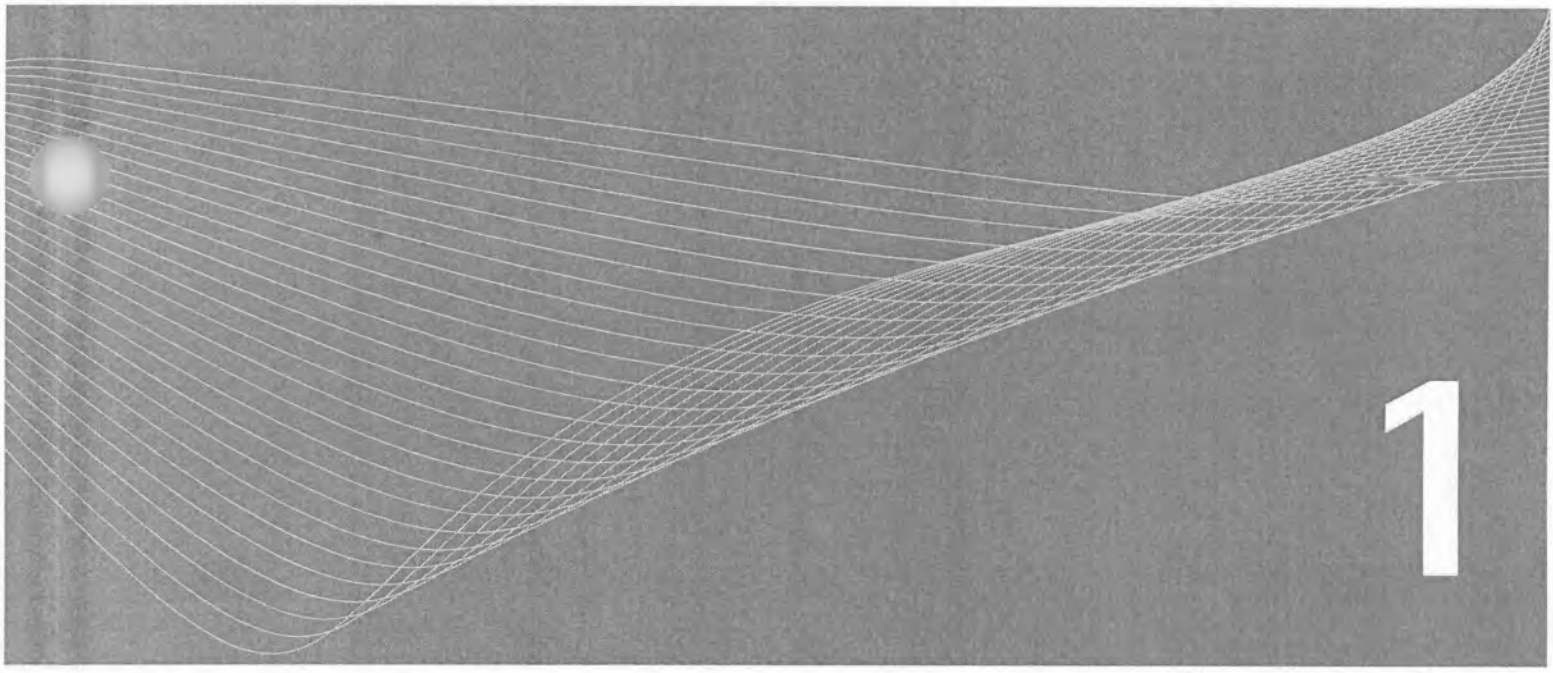
1 Purpose and Background of Civil UAS Roadmap

Unmanned aircraft systems (UAS) and operations have significantly increased in number, technical complexity, and sophistication during recent years without having the same history of compliance and oversight as manned aviation. Unlike the manned aircraft industry, the UAS community does not have a set of standardized design specifications for basic UAS design that ensures safe and reliable operation in typical civilian service applications. As a result, the UAS community often finds it difficult to apply existing FAA guidance. In some cases, interpretation of regulations and/or standards may be needed to address characteristics unique to UAS. Ultimately, the pace of integration will be determined by the ability of industry, the user community, and the FAA to overcome technical, regulatory, and operational challenges. The purpose of this roadmap is to outline, within a broad timeline, the tasks and considerations needed to enable UAS integration into the National Airspace System (NAS) for the planning purposes of the broader UAS community. The roadmap also aligns proposed Agency actions with the Congressional mandate in the *FAA Modernization and Reform Act of 2012,* Pub. L. 112-95.

To gain full access to the NAS, UAS need to be able to bridge the gap from existing systems requiring accommodations to future systems that are able to obtain a standard airworthiness certificate

This five-year roadmap, as required by the *FAA Modernization and Reform Act of 2012* (FMRA), is intended to guide aviation stakeholders in understanding operational goals and aviation safety and air traffic challenges when considering future investments. The roadmap is organized into three perspectives that highlight the multiple paths used to achieve the milestones outlined, while focusing on progressive accomplishments. These three perspectives — *Accommodation, Integration,* and *Evolution* — transcend specific timelines and examine the complex relationship of activities necessary to integrate UAS into the NAS. These three perspectives will be explored in more detail in Section 2.2.4.

Although the FMRA requires a five-year UAS roadmap, it is important to view UAS-NAS integration not only in terms of near-term activities and objectives, but also in the context of mid- and long-term timeframes. The timeframes used in this roadmap are defined in the President's National Aeronautics Research and Development Plan, which specifies less than 5 years as the near-term, 5-10 years as the mid-term, and greater than 10 years as the long-term. For this roadmap, the long-term is defined as



1

2022-2026, which is consistent with the Joint Planning and Development Office (JPDO) *National Airspace System Concept of Operations and Vision for the Future of Aviation and NextGen Air Transportation System Integrated Plan.*

Integration of UAS into the NAS will require: review of current policies, regulations, environmental impact, privacy considerations, standards, and procedures; identification of gaps in current UAS technologies and regulations, standards, policies, or procedures; development of new technologies and new or revised regulations, standards, policies, and procedures; and the associated development of guidance material, training, and certification of aircraft systems, propulsion systems, and airmen. The FAA will coordinate these integration activities with other United States Government agencies, as needed, through the Interagency Planning Committee (IPC).

1.1 History of UAS

Historically, unmanned aircraft have been known by many names including: "drones," "remotely piloted vehicles (RPV)," "unmanned aerial vehicles (UAV)," "models," and "radio control (R/C) aircraft." Today, the term UAS is used to emphasize the fact that separate system components are required to support airborne operations without a pilot onboard the aircraft. Early UAS operations received little attention from the FAA and its predecessor agencies due to the infrequency of operations, which were mostly conducted in remote locations or in special use airspace and were not deemed to impact the safety of the NAS. In the past two decades, the number of unmanned aircraft operations has been increasing dramatically, highlighting the need for a structured approach for safe and efficient integration.

1.2 Proposed Civil and Commercial Applications

The use of UAS in commercial applications is expected to expand in a number of areas (see Operational Services and Environment Definition (OSED) for Unmanned Aircraft Systems (UAS), RTCA DO-320, 2010). Some of the currently proposed civil and commercial applications of UAS include:

- Security awareness;
- Disaster response, including search and support to rescuers;
- Communications and broadcast, including news/sporting event coverage;
- Cargo transport;
- Spectral and thermal analysis;
- Critical infrastructure monitoring, including power facilities, ports, and pipelines;
- And commercial photography, aerial mapping and charting, and advertising.

1.3 Definitions

Several terms used in this document are defined below as a common point of reference:

Unmanned Aircraft (UA): A device used or intended to be used for flight in the air that has no onboard pilot. This device excludes missiles, weapons, or exploding warheads, but includes all classes of airplanes, helicopters, airships, and powered-lift aircraft without an onboard pilot. UA do not include traditional balloons (see 14 CFR Part 101), rockets, tethered aircraft and un-powered gliders.

Crewmember [UAS]: In addition to the crewmembers identified in 14 CFR Part 1, a UAS flightcrew member includes pilots, sensor/payload operators, and visual observers (VO), but may include other persons as appropriate or required to ensure safe operation of the aircraft.

Unmanned Aircraft System (UAS): An unmanned aircraft and its associated elements related to safe operations, which may include control stations (ground, ship, or air-based), control links, support equipment, payloads, flight termination systems, and launch/recovery equipment. As shown in Figure 1, it consists of three elements:

- Unmanned Aircraft;
- Control Station;
- And Data Link.

National Airspace System (NAS): The common network of U.S. airspace — air navigation facilities, equipment, and services; airports or landing areas; aeronautical charts, information and services; rules, regulations, and procedures; technical information; and manpower and material. (see Figure 2)

Next Generation Air Transportation System (NextGen): According to the FAA's *Destination 2025,* (2011):

> *"NextGen is a series of inter-linked programs, systems, and policies that implement advanced technologies and capabilities to dramatically change the way the current aviation system is operated. NextGen is satellite-based and relies on a network to share information and digital communications so all users of the system are aware of other users' precise locations."*

Unmanned Aircraft System (UAS)

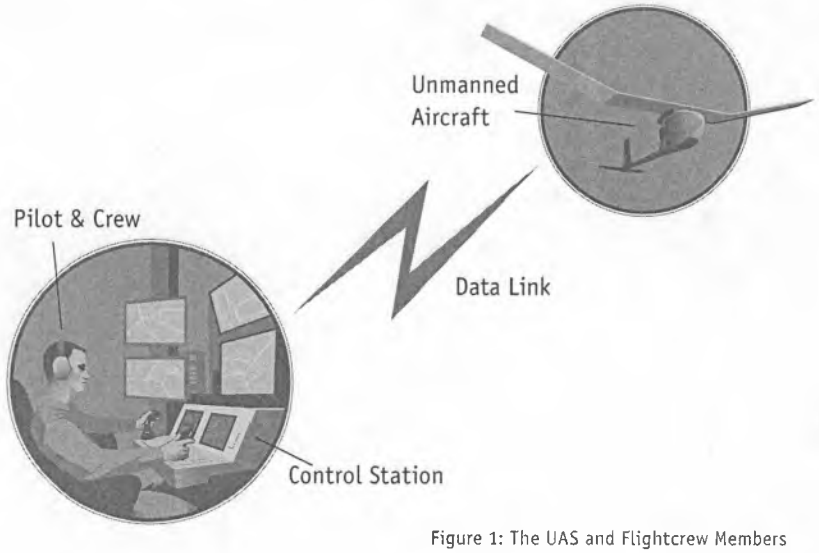


Figure 1: The UAS and Flightcrew Members

1.4 Policy

The FAA is responsible for developing plans and policy for the safe and efficient use of the United States' navigable airspace. This responsibility includes coordinating efforts with national security and privacy policies so that the integration of UAS into the NAS is done in a manner that supports and maintains the United States Government's ability to secure the airspace and addresses privacy concerns. Further, the FAA will harmonize, when appropriate, with the international community for the mutual development of civil aviation in a safe and orderly manner. Components of existing FAA and International Civil Aviation Organization (ICAO) policy are outlined below.

National Airspace System

Figure 2: The NAS

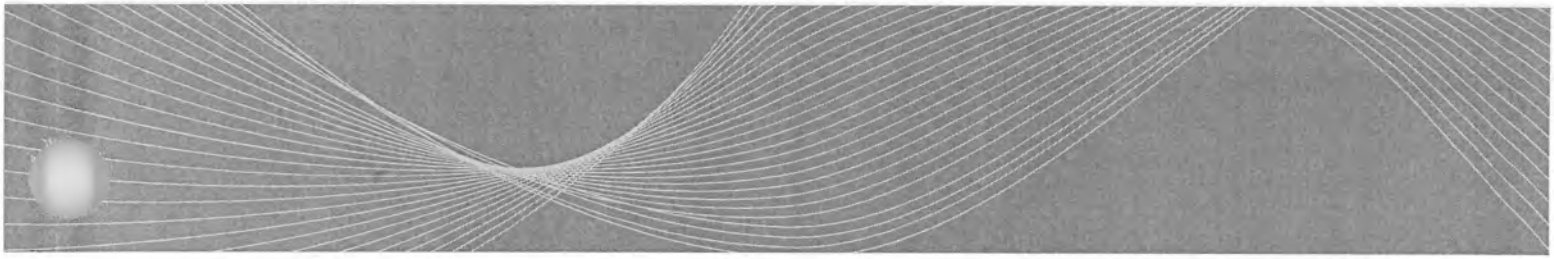
1.4.1 FAA UAS Policy Basis

Established FAA aviation policies support an acceptable level of safety for the NAS. At the core of these policies is the concept that each aircraft is flown by a pilot in accordance with required procedures and practices. This same policy applies to UAS.

Aviation policies and regulations focus on overall safety being addressed through three primary areas: equipment, personnel, and operations and procedures. Each of these areas has standards and minimum levels of safety that must be met, independent of each other. As a matter of regulation, for example, a new civil aircraft must be able to independently obtain an airworthiness certificate, regardless of the airspace class where it might be flown. However, as a result or part of this certification, new procedures may be required for flightcrew members and air traffic control (ATC) in order to maintain the minimum level of safety of the NAS while accommodating the new technology. Under special certifications and authorizations, limited operations may be authorized for equipment unable to meet current standards.

The application of these established aviation policies to UAS is summarized in the following key points excerpted from the FAA Notice of Policy: Unmanned Aircraft Operations in the National Airspace System (72 Fed. Reg. 6689 (Feb. 13, 2007)):

- Regulatory standards need to be developed to enable current technology for unmanned aircraft to comply with Title 14 Code of Federal Regulations;



- In order to ensure safety, the operator is required to establish the UAS airworthiness either from FAA certification, a Department of Defense (DoD) airworthiness statement, or by other approved means;
- Applicants also have to demonstrate that a collision with another aircraft or other airspace user is extremely improbable;
- And the pilot-in-command concept is essential to the safe operation of manned operations. The FAA's UAS guidance applies this pilot-in-command concept to unmanned aircraft and includes minimum qualification and currency requirements.

These policies have enabled the accommodation of UAS into the NAS on a limited basis on the foundation that operations are conducted safely, present an acceptable level of risk to the general public, and do no harm to, or adversely impact, other users. To gain full access to the NAS, UAS need to be able to bridge the gap from existing systems requiring accommodations to future systems that are able to obtain a standard airworthiness certificate. These UAS will also need to be flown by a certified pilot in accordance with existing, revised, or new regulations and required standards, policies, and procedures.

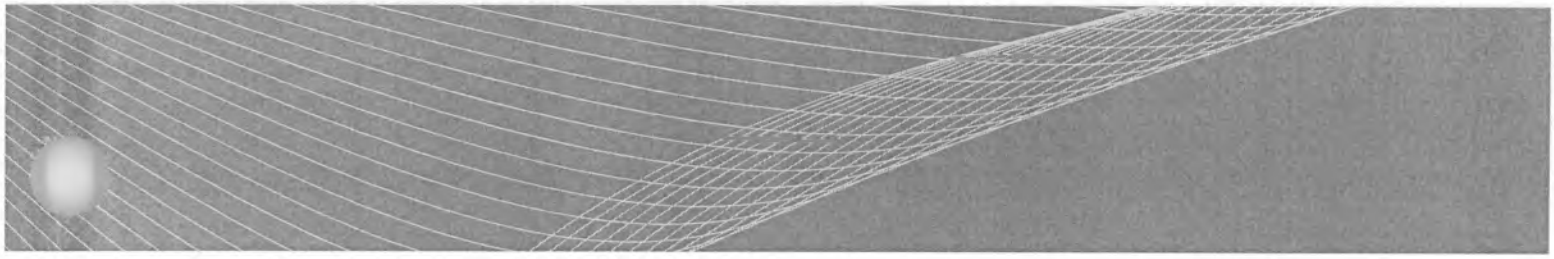
1.4.2 International Civil Aviation Organization (ICAO) Policy

ICAO, a special agency of the United Nations, promotes "the safe and orderly development of international civil aviation throughout the world. It sets standards and regulations necessary for aviation safety, security, efficiency, and regularity, as well as aviation environmental protection."

The goal of ICAO in addressing unmanned aviation is to provide the fundamental international regulatory framework to support routine operation of UAS throughout the world in a safe, harmonized, and seamless manner comparable to that of manned operations. Current ICAO guidance material for UAS is published in ICAO Circular 328, "Unmanned Aircraft Systems (UAS) Circular," which provides basic guidelines for Member States to introduce and integrate UAS into airspace in a consistent manner, to ensure global interoperability and regulatory compatibility, when possible. The document's guiding policy on UAS is:

> *"A number of Civil Aviation Authorities (CAA) have adopted the policy that UAS must meet the equivalent levels of safety as manned aircraft... In general, UAS should be operated in accordance with the rule governing the flight of manned aircraft and meet equipment requirements applicable to the class of airspace within which they intend to operate...To safely integrate UAS in non-segregated airspace, the UAS must act and respond as manned aircraft do. Air Traffic, Airspace and Airport standards should not be significantly changed. The UAS must be able to comply with existing provisions to the greatest extent possible."*

ICAO develops Standards and Recommended Practices (SARP), which are generally followed by national civil aviation authorities of the Member States. The United States is an ICAO Member State, and the FAA plans to harmonize with international efforts and adhere to ICAO SARPs when possible.



1.4.3 Industry Policy Recommendations

RTCA, Inc. is a private, not-for-profit corporation that develops consensus-based recommendations regarding communications, navigation, surveillance, and air traffic management system issues. RTCA functions as a Federal Advisory Committee, and the FAA considers RTCA recommendations when making policy, program, and regulatory decisions. RTCA Special Committee 203 (SC-203) was established in 2004 to help assure the safe, efficient, and compatible operation of UAS with other aircraft operating within the NAS. This Special Committee has developed and documented guiding principles for UAS integration, which are summarized below:

- UAS must operate safely, efficiently, and compatibly with service providers and other users of the NAS so that overall safety is not degraded;
- UAS will have access to the NAS, provided they have appropriate equipage and the ability to meet the requirements for flying in various classes of airspace;
- Routine UAS operations will not require the creation of new special use airspace, or modification of existing special use airspace;
- Except for some special cases, such as small UAS (sUAS) with very limited operational range, all UAS will require design and airworthiness certification to fly civil operations in the NAS;
- UAS pilots will require certification, though some of the requirements may differ from manned aviation;
- UAS will comply with ATC instructions, clearances, and procedures when receiving air traffic services;
- UAS pilots (the pilot-in-command) will always have responsibility for the unmanned aircraft while it is operating;
- And UAS commercial operations will need to apply the operational control concept as appropriate for the type of operation, but with different functions applicable to UAS operations.

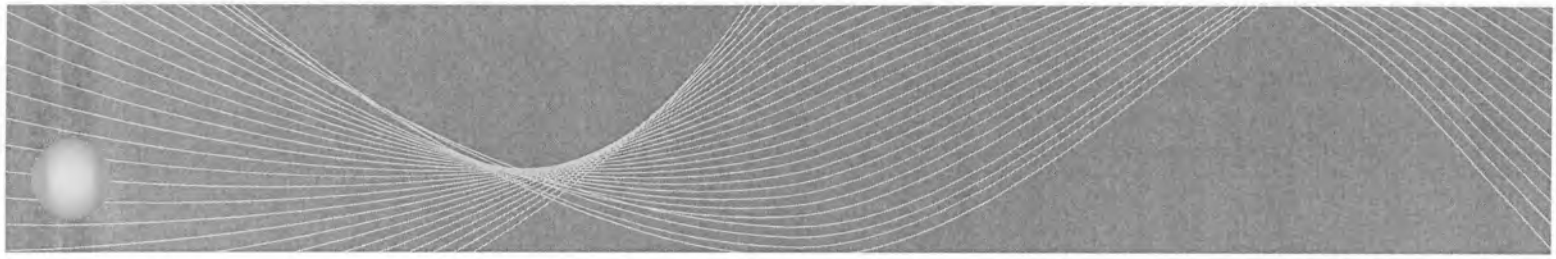
Through an FAA-established UAS Aviation Rulemaking Committee (ARC), the FAA continues to collaborate with government and industry stakeholders for recommendations regarding the path toward integration of UAS into the NAS. This effort will harmonize with the work being done by international organizations working toward a universal goal of safe and efficient UAS airspace operations.

1.4.4 Privacy and Civil Liberties Considerations

The FAA's chief mission is to ensure the safety and efficiency of the entire aviation system. This includes manned and unmanned aircraft operations. While the expanded use of UAS presents great opportunities, it also raises questions as to how to accomplish UAS integration in a manner that is consistent with privacy and civil liberties considerations.

As required by the FMRA, the FAA is implementing a UAS test site program to help the FAA gain a better understanding of operational issues relating to UAS. Although the FAA's mission does not include developing or enforcing policies pertaining to privacy or civil liberties, experience with the UAS test sites will present an opportunity to inform the dialogue in the IPC and other interagency forums concerning the use of UAS technologies and the areas of privacy and civil liberties.

As part of the test site program, the FAA will authorize non-federal public entities to establish and operate six test sites in the United States. The FAA recognizes that there are privacy considerations regarding the use of UAS at the test sites. To ensure that these concerns are taken into consideration at the test sites, the FAA plans to require each test site operator to establish a privacy policy that will apply to operations at the test site. The test site's privacy

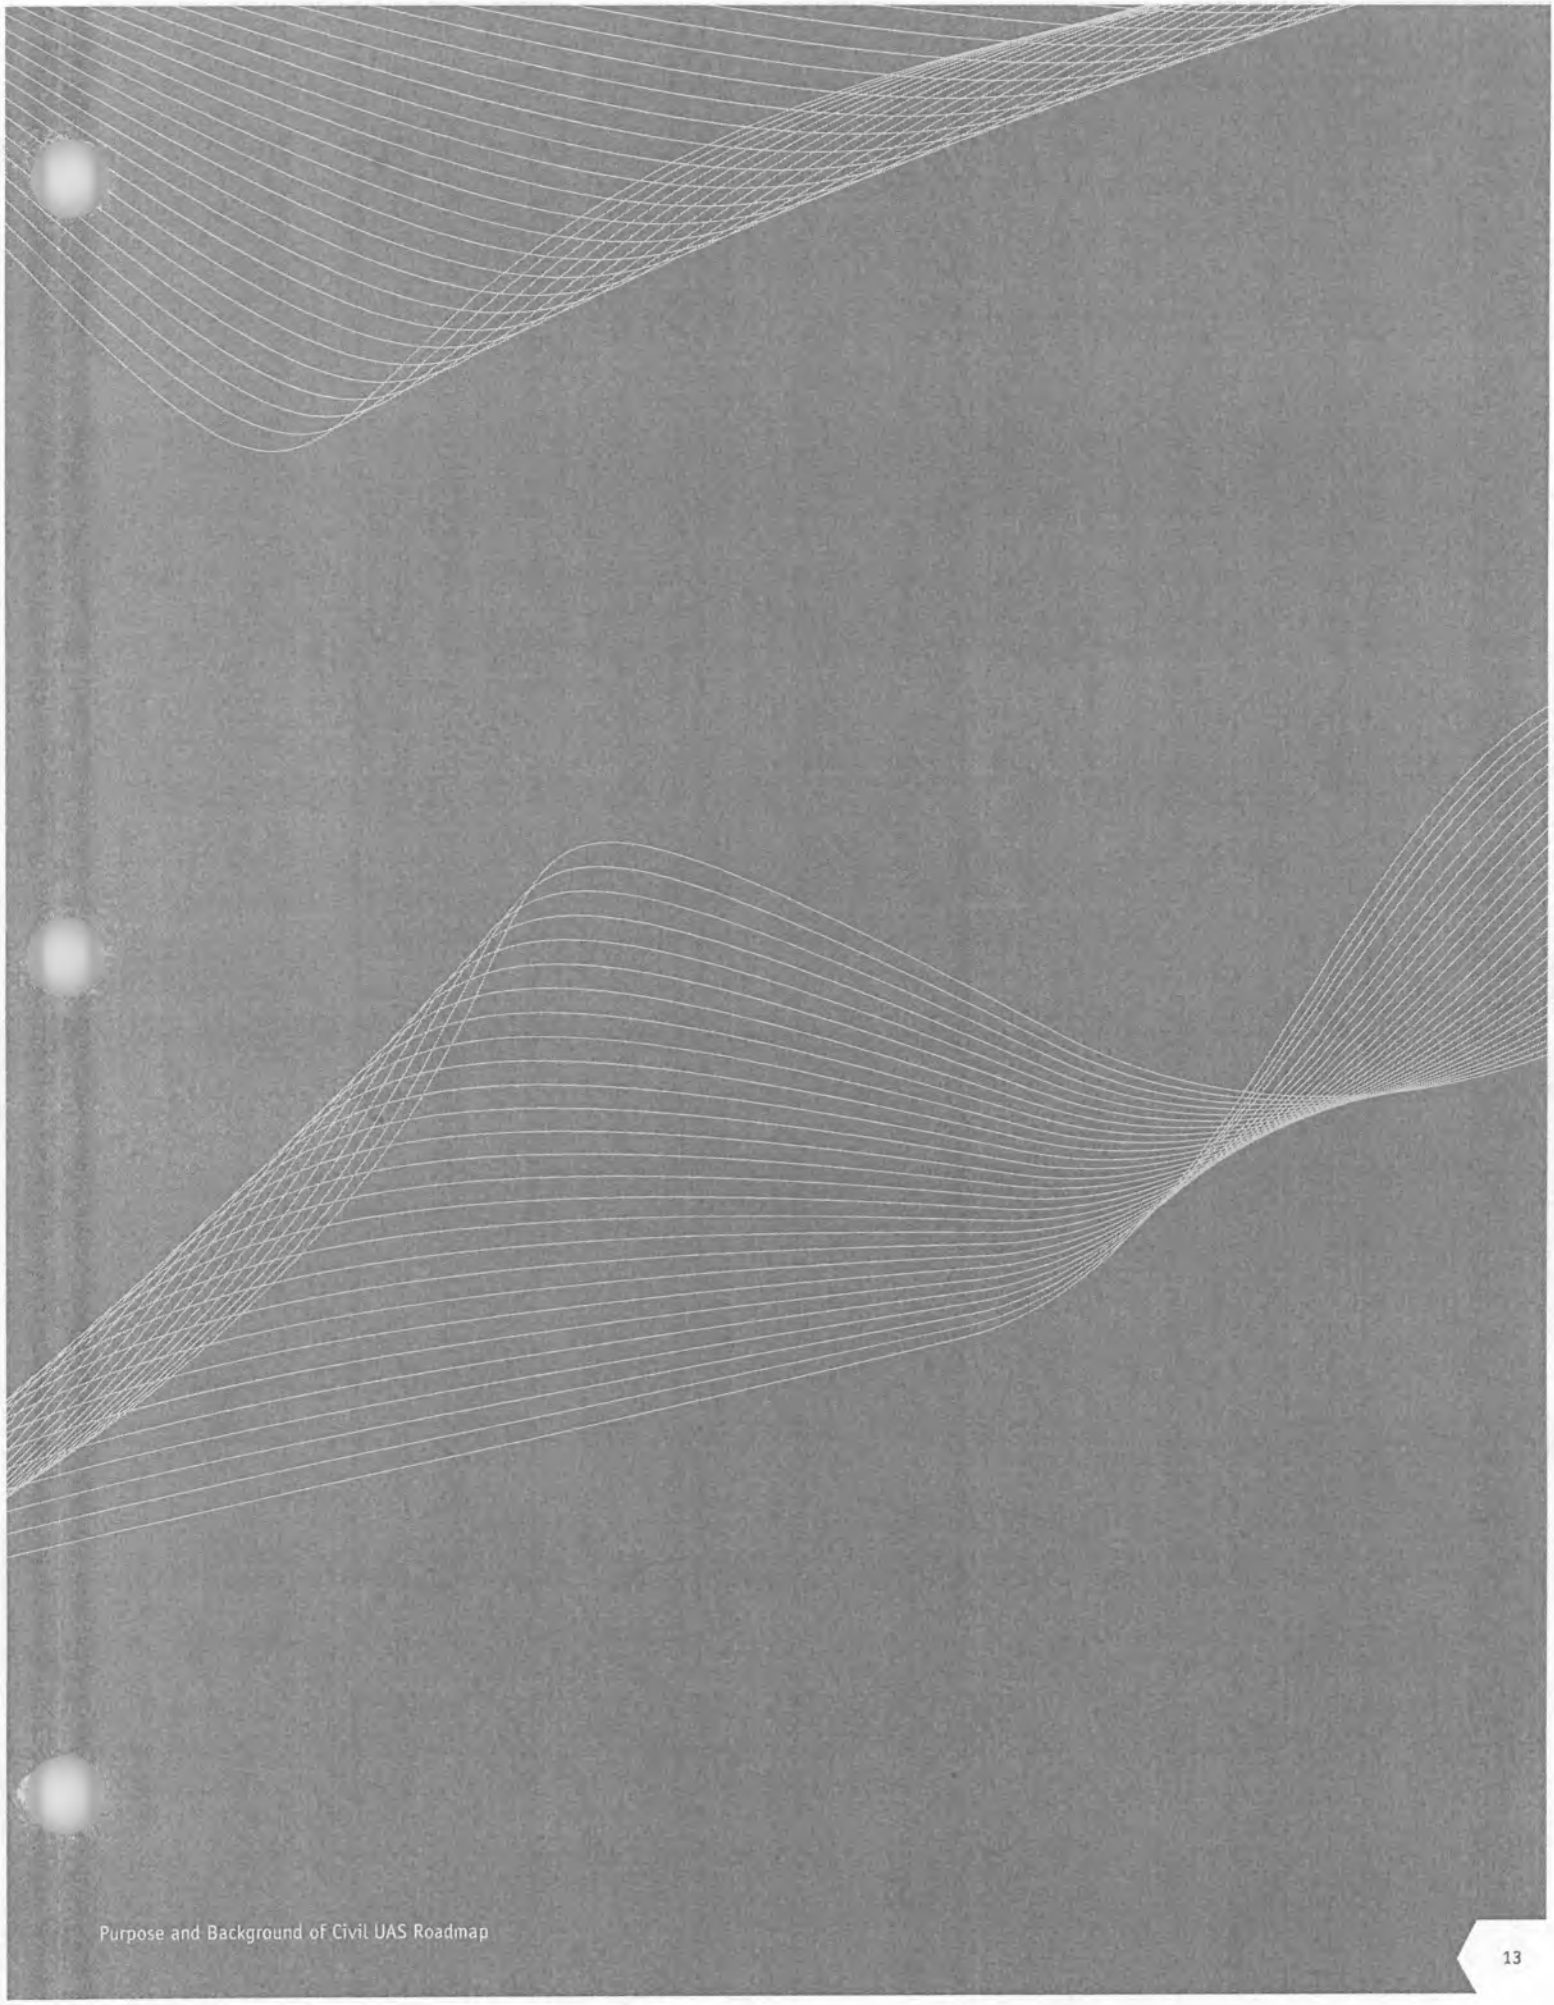


policy must be publicly available and informed by Fair Information Practice Principles. In addition, each site operator must establish a mechanism through which the operator can receive and consider comments on its privacy policy.

The privacy requirements proposed for the UAS test sites are specifically designed for the operation of the test sites and are not intended to predetermine the long-term policy and regulatory framework under which UAS would operate. However, the FAA anticipates that the privacy policies developed by the test site operators will help inform the dialogue among policymakers, privacy advocates, and the industry regarding broader questions concerning the use of UAS technologies in the NAS.

1.4.5 National Security Issues

Integrating public and civil UAS into the NAS carries certain national security implications, including security vetting for certification and training of UAS-related personnel, addressing cyber and communications vulnerabilities, and maintaining/enhancing air defense and air domain awareness capabilities in an increasingly complex and crowded airspace. In some cases, existing security frameworks applied to manned aircraft may be applicable. Other security concerns may require development of new frameworks altogether. The FAA will continue to work with relevant United States Government departments and agencies, and with stakeholders through coordinating bodies such as the IPC and JPDO, to proactively address these areas of concern.



UAS Operations in the NAS

This roadmap focuses on civil UAS access to the NAS. To this end, the FAA and the UAS community are working to address the myriad challenges associated with this effort.

2.1 FAA's Dual Role for UAS Integration

For UAS, as with all aircraft, the FAA acts in a dual role. As the regulator, the FAA ensures aviation safety of persons and property in the air and on the ground. As the service provider, the FAA is responsible for providing safe and efficient air traffic control services in the NAS and the other portions of global airspace delegated to the United States by ICAO.

As part of its regulator role, the Office of Aviation Safety (AVS) efforts are led by the UAS Integration Office. The main focus of the UAS Integration Office is to provide, within the existing AVS structure, subject matter expertise, research, and recommendations to develop policy, regulations, guidance, and procedures for UAS airworthiness and operations in support of safe integration of UAS into the NAS.

As the service provider, the Air Traffic Organization (ATO) efforts are led by the Air Traffic Emerging Technologies Group, which considers operational authorizations for UAS flights that are unable to meet current regulations and procedures. A Certificate of Waiver or Authorization (COA) is issued with limitations and provisions that mitigate the increased risks resulting from the use of uncertified technology. The ATO is responsible for the safe and efficient handling of aircraft and the development of the airspace rules, procedures, and air traffic controller training to support routine operations in the NAS.

2.2 UAS Challenges

A number of issues that impact the integration of UAS into the NAS are being considered across the regulatory and service provider roles of the FAA. To ensure the FAA meets the goals set forth in this roadmap, these offices will be addressing the challenges as outlined in the following subsections.

2.2.1 Policy, Guidance, and Regulatory Product Challenges

To ensure the FAA has the appropriate UAS framework, many policy, guidance, and regulatory products will need to be reviewed and revised to specifically address UAS integration into the NAS. UAS technology and operations will need to mature, and new products may be required in order to meet applicable regulations and standards. Figure 3 depicts policy, guidance, and regulatory product areas requiring research and development. This information is derived from the RTCA notional architecture and is primarily related to airmen and UAS certification.

2

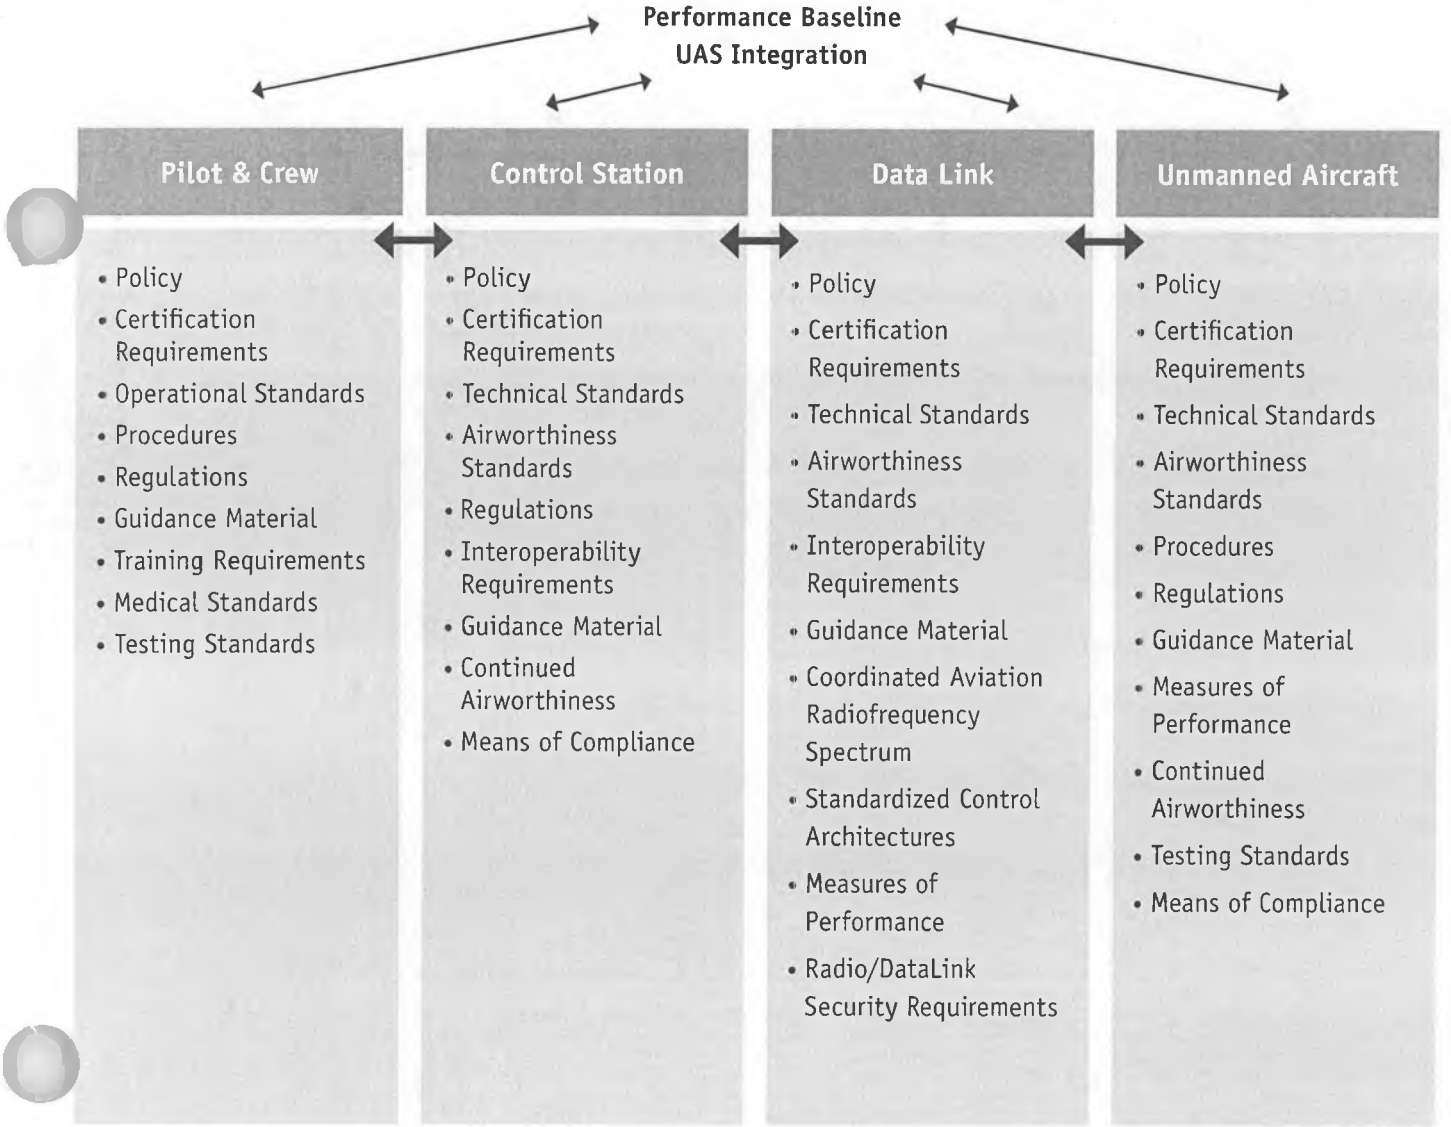


Figure 3: AVS Products to Regulate UAS Operations

The challenge is to identify and develop the UAS regulatory structure that encompasses areas listed in Figure 3. Other regulatory drivers include:

- Developing minimum standards for Sense and Avoid (SAA), Control and Communications (C2), and separation assurance to meet new or existing operational and regulatory requirements for specified airspace;
- Understanding the privacy, security, and environmental implications of UAS operations and working with relevant departments and agencies to proactively coordinate and align these considerations with the UAS regulatory structure;
- And developing acceptable UAS design standards that consider the aircraft size, performance, mode of control, intended operational environment, and mission criticality.

Although aviation regulations have been developed generically for all aircraft, until recently these efforts were not done with UAS specifically in mind. This presents certain challenges because the underlying assumptions that existed during the previous efforts may not now fully accommodate UAS operations. As an example, current regulations address security requirements for cockpit doors. However, these same regulations lack a legal definition for what a "cockpit" is or where it is located. This presents a challenge for UAS considering that the cockpit or "control station" may be located in an office building, in a vehicle, or outside with no physical boundaries. Applying current cockpit door security regulations to UAS may require new rulemaking, guidance, or a combination of both.

The regulatory process is designed to provide transparency to the public and an opportunity to understand and comment on proposed rules before being issued. Additional checks and balances are in place to ensure that final regulations are not unnecessarily burdensome to the public. Because of these requirements, and lacking any exceptions, an average regulatory effort might span a number of years. These timeframes may be longer for high visibility or complex regulations. FAA experience to date with the development of a Notice of Proposed Rulemaking (NPRM) for small UAS indicates that UAS rulemaking efforts may be more complex, receive greater scrutiny, and require longer development timeframes than the average regulatory effort.

2.2.2 Air Traffic Operational Challenges

Numerous Air Traffic products, policies, and procedures also need to be reviewed and refined or developed through supporting research to permit UAS operations in the NAS. The UAS Integration Office coordinates efforts with the ATO to complete these tasks.

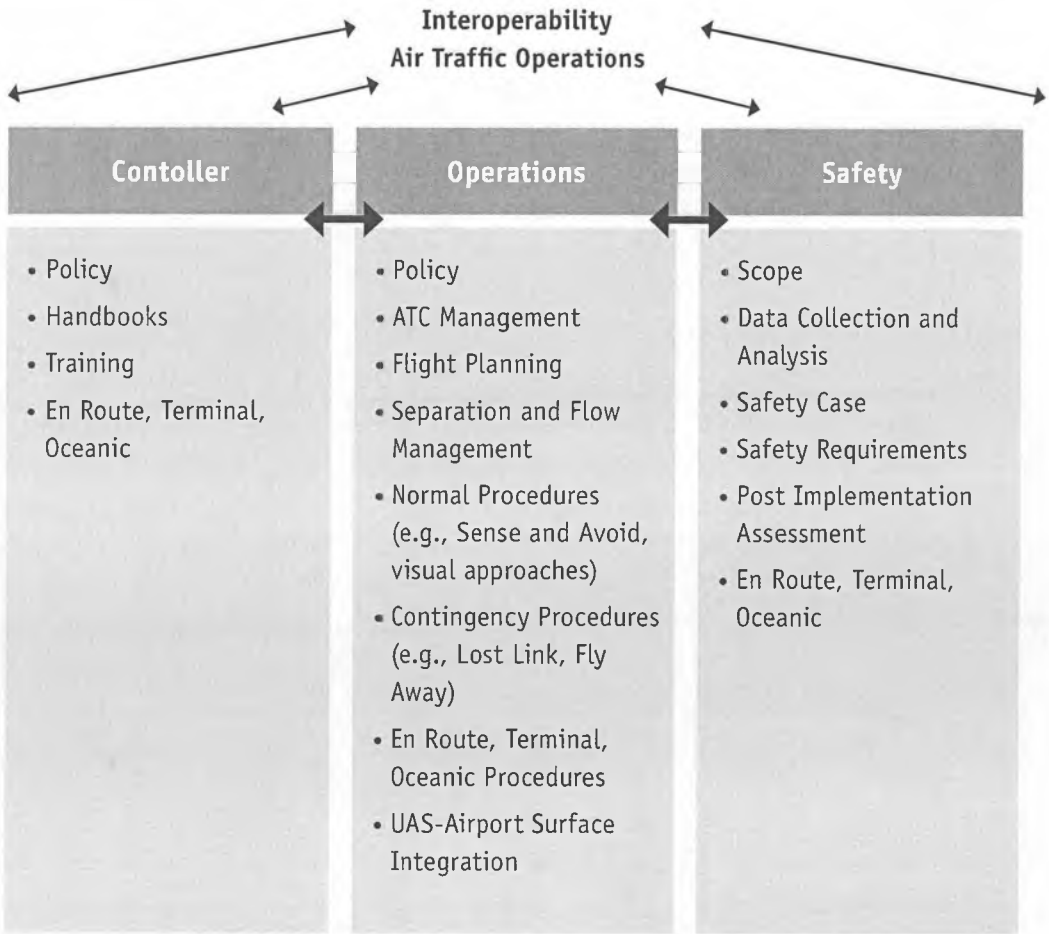

Figure 4: ATO UAS Operational Area

The goal of safely integrating UAS without segregating, delaying, or diverting other aircraft and other users of the system presents significant challenges in the areas outlined in Figure 4 above. For NAS integration, this also includes:

- Identifying policies and requirements for UAS to comply with ATC clearances and instructions commensurate with manned aircraft (specifically addressing the inability of UAS to comply directly with ATC visual clearances or to operate under visual flight rules);
- Establishing procedures and techniques for safe and secure exchange of voice and data communication between UAS pilots, air traffic controllers, and other NAS users;
- Establishing wake vortex and turbulence avoidance criteria needed for UAS with unique characteristics (e.g., size, performance, etc.);
- And reviewing environmental requirements (e.g., the National Environmental Policy Act).

2.2.3 Technological Challenges

The FAA recognizes that current UAS technologies were not developed to comply with existing airworthiness standards. Current civil airworthiness regulations may not consider many of the unique aspects of UAS operations. Materials properties, structural design standards, system reliability standards, and other minimum performance requirements for basic UAS design need to be evaluated against civil airworthiness standards for existing aircraft. Although significant technological advances have been made by the UAS community, critical research is needed to fully understand the impact of UAS operations in the NAS. There has also been little research to support the equipment design necessary for UAS airworthiness certification. In the near- to mid-term, UAS research will need to focus on technology deemed necessary for UAS access to the NAS.

As UAS are introduced, their expected range of performance will need to be evaluated for impact on the NAS. UAS operate with widely varying performance characteristics that do not necessarily align with manned aircraft performance. They vary in size, speed, and other flight capabilities. Similarly, the issue of performance gap between the pilot and the avionics will impact NAS operations. For example, a quantitative time standard for a pilot response to ATC directions (such as "turn left heading 270, maintain FL250") does not exist – there is an acceptable delay for the pilot's verbal response and physical action, but there is no documented required range of acceptable values. Avionics that perform the corresponding function cannot be designed and built without these performance requirements being established.

Existing standards ensure safe operation by pilots actually on board the aircraft. These standards may not translate well to UAS designs where pilots are remotely located off the aircraft. Removing the pilot from the aircraft creates a series of performance considerations between manned and unmanned aircraft that need to be fully researched and understood to determine acceptability and potential impact on safe operations in the NAS. These include the following considerations:

- The UAS pilot is not onboard the aircraft and does not have the same sensory and environmental cues as a manned aircraft pilot;
- The UAS pilot does not have the ability to directly comply with see-and-avoid responsibilities and UAS SAA systems do not meet current operational rules;
- The UAS pilot must depend on a data link for control of the aircraft. This affects the aircraft's response to revised ATC clearances, other ATC instructions, or unplanned contingencies (e.g., maneuvering aircraft);
- UAS cannot comply with certain air traffic control clearances, and alternate means may need to be considered (e.g., use of visual clearances);
- UAS present air traffic controllers with a different range of platform sizes and operational capabilities (such as size, speed, altitude, wake turbulence criteria, and combinations thereof);

Removing the pilot from the aircraft creates a series of performance considerations between manned and unmanned aircraft that need to be fully researched and understood to determine acceptability and potential impact on safe operations in the NAS.

- And some UAS launch and recovery methods differ from manned aircraft and require manual placement and removal from runways, a lead vehicle for taxi operations, or dedicated launch and recovery systems.

Therefore, it is necessary to develop new or revised regulations/ procedures and operational concepts, formulate standards, and promote technological development that will enable manned and unmanned aircraft to operate cohesively in the same airspace. Specific technology challenges include two critical functional areas:

- **"Sense and Avoid" (SAA) capability** must provide for self-separation and ultimately for collision avoidance protection between UAS and other aircraft analogous to the "see and avoid" operation of manned aircraft that meets an acceptable level of safety. SAA technology development is immature. In manned flight, see and avoid, radar, visual sighting, separation standards, proven technologies and procedures, and well-defined pilot behaviors combine to ensure safe operation. Unmanned flight will require new or revised operational rules to regulate the use of SAA systems as an alternate method to comply with "see and avoid" operational rules currently required of manned aircraft. SAA system standards must be developed to assure both self-separation and collision avoidance capability for UAS. Interoperability constraints must also be defined for safe and secure interactions between SAA-enabled UAS and other airborne and ground-based collision avoidance systems. While SAA may be an independent system, it must be designed to be compatible across other modes (e.g., ATC separation services). See Appendix C.3 and C.4 for specific goals and metrics.

Unmanned flight will require new or revised operational rules to regulate the use of SAA systems as an alternate method to comply with "see and avoid" operational rules currently required of manned aircraft.

- **Control and Communications (C2) system performance requirements** are needed and RTCA is developing consensus-based recommendations for the FAA to consider in C2 policy, program, and regulatory decisions. The resulting C2 requirements need to support the minimum performance required to achieve higher-level (UAS level) performance and safety requirements. Third-party communication service providers are common today (e.g., ARINC, Harris, etc.) and the FAA has experience with setting and monitoring performance of third parties. The use of third parties is dependent on the UAS architecture chosen, but these are still being evaluated in terms of feasibility from a performance, cost, and safety perspective. See Appendix C.5 for specific goals and metrics.

2.2.4 Managing the Challenges

To provide the UAS community insight into the FAA process for fostering UAS flight in the NAS, Figure 5 highlights the intended shift in focus over time from Accommodation to Integration, and then to Evolution. This method is consistent with the approach used for new technologies on manned aircraft introduced into the NAS.

Current design standards reflect the focus in the COA process on allowing existing designs, embodying some experimental design philosophies, to fly in the NAS. Progress toward standard airworthiness will also increase as design standards mature, but not before.

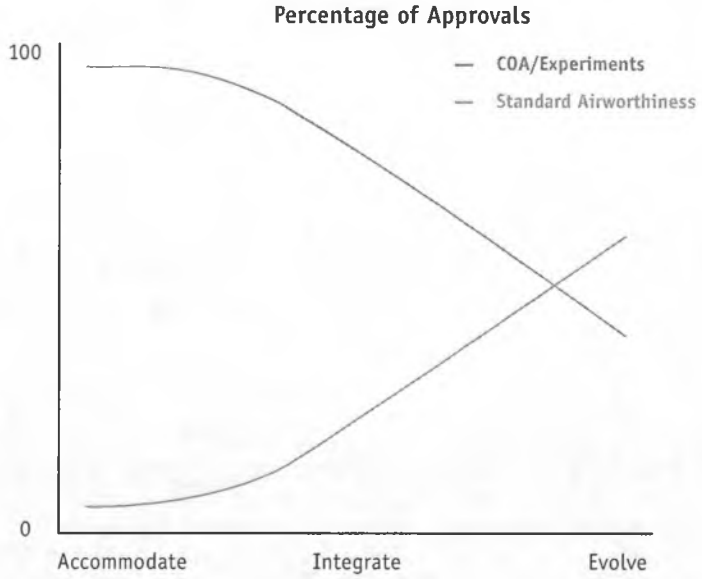

Figure 5: Transition from COA/Experimental to Standard Airworthiness Approvals

Recognizing the challenges and the complex coordination required for integration, the UAS roadmap addresses the efforts needed to move forward incrementally toward the goal of full NAS integration.

Timely progress on products, decisions, research, development, testing, and evaluation will be needed to successfully move from accommodation to integration in the evolving NAS.

The approach to managing the challenges discussed in this section focuses on the following interdependent topics:

- Standards;
- Rules and Regulations;
- Certification of the UAS;
- Procedures and Airspace;
- Training (Pilot, Flightcrew Member, Mechanic, and Controller);
- And Research and Development (R&D) and Technology.

The roadmap discusses the activities and transitions for the above interdependent topic areas from the vantage point of Accommodation, Integration, and Evolution, as summarized below and described in more detail in subsequent sections of this roadmap. These perspectives transcend the near-, mid-, and far-term timeframes and provide additional insight into the task of integrating UAS into the NAS.

Perspective 1: Accommodation. Take current UAS and apply special mitigations and procedures to safely facilitate limited access to the NAS. UAS operations in the NAS are considered on a case-by-case basis. Accommodation will predominate in the near-term, and while it will decline significantly as integration begins and expands in the mid-term, it will continue to be a viable means for NAS access with appropriate restrictions and constraints to mitigate any performance shortfalls. During the near-term, R&D will continue to identify challenges, validate advanced mitigation strategies, and explore opportunities to progress UAS integration into the NAS.

Perspective 2: Integration. Establishing threshold performance requirements for UAS that would increase access to the NAS is a primary objective of integration. During the mid- to far-term, the Agency will establish new or revised regulations, policies, procedures, guidance material, training, and understanding of systems and operations to support routine NAS operations. Integration is targeted to begin in the near- to mid-term with the implementation of the sUAS rule and will expand further over time (mid- and far-term) to consider wider integration of a broader field of UAS.

Perspective 3: Evolution. All required policy, regulations, procedures, guidance material, technologies, and training are in place and routinely updated to support UAS operations in the NAS operational environment as it evolves over time. It is important that the UAS community maintains the understanding that the NAS environment is not static, and that there are many improvements planned for the NAS over the next 13-15 years. To avoid obsolescence, UAS developers will need to maintain a dual focus: integration into today's NAS while maintaining cognizance of how the NAS is evolving.

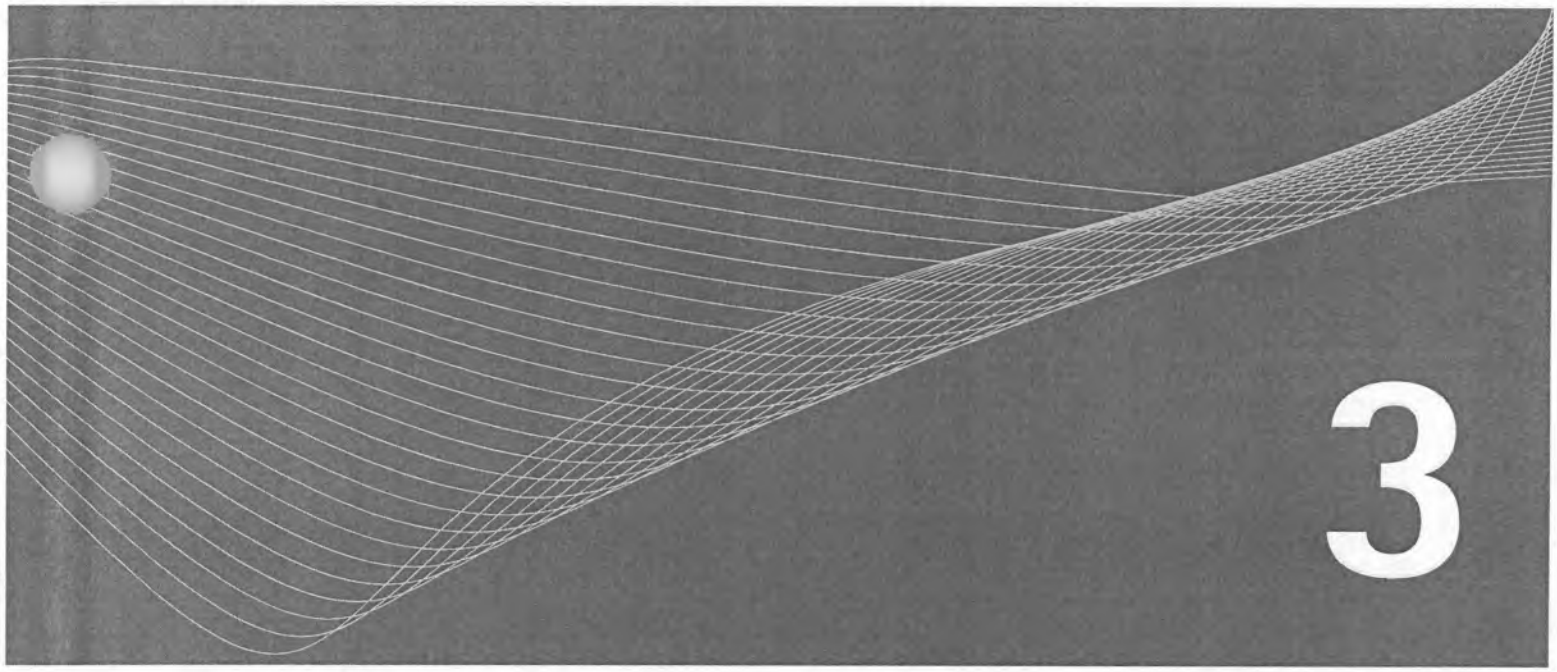
Perspective 1: Accommodation

3.1 Overview

The FAA's near-term focus will be on safely allowing for the expanded operation of UAS through accommodation. Enhanced procedures and technology, over time, will increase access to the NAS through accommodation made possible by improvements to current mitigations and the introduction of advanced mitigations. The need to maintain this avenue for NAS access will continue. Research and development on current and advanced mitigations is necessary to maintain this avenue for access with appropriate restrictions and constraints to mitigate performance shortfalls and address privacy, security, and environmental concerns. The consideration and planning for integration of UAS into the NAS will continue simultaneously.

There has been a growing interest in a wide variety of civil uses for unmanned aircraft. A number of paths can be used to apply for airworthiness certification of UAS. One method that the UAS civil community is currently using to access the NAS is with a special airworthiness certificate in the experimental category, which requires specific, proven capabilities to enable operations at a constrained level. Each application is reviewed for approval on a case-by-case basis that allows a carefully defined level of access that is limited and dependent on risk mitigations that ensure safety and efficiency of the NAS is not diminished. The use of special airworthiness certificates for UAS is similar to their use for manned aircraft and they are normally issued to UAS applicants for the purposes of research and development, crew training or market surveys per 14 CFR 21.191(a), (c), and (f).

Through August 2012, the FAA had issued 114 special airworthiness certificates (i.e., 113 experimental certificates and one special flight permit) to 22 different models of civil aircraft. Of these 22 different models, 16 are unmanned aircraft and 6 are Optionally Piloted Aircraft (OPA). These experimental certificates have been useful for UAS research and development (R&D), and as R&D efforts subside, the use of experimental certificates may decrease. While the FAA continues to accommodate special access to the NAS, existing airworthiness standards are also an avenue for full-type certification. The FAA is working with the UAS ARC to gain feedback to potential changes to airworthiness standards for UAS, as necessary. In the long-term, UAS that are designed to a standard and built to conform to the design may be integrated into the NAS as fully certificated aircraft.



3.2 Standards

If UAS are to operate routinely in the NAS, they must conform to an agreed-upon set of standards. Requirements will vary depending on the nature and complexity of the operation, aircraft or component system limitations, pilot and other crewmember qualifications, and the operating environment.

A technical (or operational) standard is an established norm or requirement about a technical (or operational) system that documents uniform engineering or technical criteria, methods, processes, and practices. A standard may be developed privately or unilaterally, by a corporation, regulatory body, or the military. Standards can also be developed by organizations such as trade unions and associations. These organizations often have more diverse input and usually develop voluntary standards that may be adopted by the FAA as a means of regulatory compliance.

To operate an aircraft safely and efficiently in today's NAS, a means of complying with applicable parts of Title 14 of the Code of Federal Regulations must be developed. Aircraft certification standards govern the design, construction, manufacturing, and continued airworthiness of aircraft used in private and commercial operations. These standards were developed with an underlying assumption that a person would be onboard the aircraft and manipulating the controls. This has led to numerous requirements that make aircraft highly reliable and safe for their intended operations and flightcrew protection.

While UAS share many of the same design considerations as manned aircraft, such as structural integrity and performance, most unmanned aircraft and control stations have not been designed to comply with existing civil airworthiness or operational standards. Beyond the problem of meeting existing aircraft certification standards, other components of the UAS, such as the equipment and software associated with the data link (control and communications) and the launch and recovery mechanisms, are not currently addressed in civil airworthiness or operational standards.

Since 2004, the FAA has developed close working relationships with several standards development organizations. Most of these organizations plan to complete their UAS standards development efforts in the near- to mid-term timeframe. When accepted, these standards development products may provide a means of compliance for rules established in the mid-term. The FAA has also been either the lead or an important participant in cross-agency efforts that influence standards development and has coordinated and harmonized these activities with international efforts such as the ICAO UAS Study Group.

Standardization efforts have already produced a number of useful definitions, guidance documents, and considerations that provide common understanding and add insight and data to UAS integration efforts:

- RTCA/SC-203's Guidance Material (DO-304) and numerous position papers
- RTCA/SC-203's Operational Services and Environment Definition For Unmanned Aircraft Systems (OSED, DO-320), which documents definitions and operating scenarios for different UAS operations in the NAS
- RTCA Air Traffic Management Advisory Committee, Requirements and Planning Work Group Report "Airspace Considerations for UAS Integration in the National Airspace System," March 26, 2008
- SAA Workshop Reports that have documented SAA timelines and definitions

Standards development will continue with the goal of producing Minimum Aviation System Performance Standards (MASPS) by the end of the near-term. RTCA products will be taken under consideration by the FAA in the development of policy and guidance products such as Advisory Circulars. Minimum Operational Performance Standards (MOPS) may be used to define Technical Standard Orders (TSO) in the mid- to long-term timeframe.

Additional coordination and input from the stakeholder community (industry and trade associations, manufacturers, academia, research organizations, and public agencies) is being provided with the recent establishment of the UAS ARC.

Although the need to develop standards cannot be overstated, detailed policy, guidance, technical performance requirements, and operational procedures are also needed to enable manned and unmanned aircraft to fly safely and efficiently in the NAS. See Appendix C for specific goals and metrics.

3.3 Rules and Regulations

Unmanned aircraft operations have significantly increased in number, technical complexity, and sophistication during recent years without specific regulations to address their unique characteristics. For a person wishing to design, manufacture, market, or operate a UAS for a commercial mission and seeking FAA approval for that aircraft, its pilot and the operations, existing rules have not been fully tailored to the unique features of UAS.

The FAA has published a Notice which replaced the previous interim operational guidance material used to support UAS accommodation. Since accommodation is not envisioned to be eliminated entirely, this Notice will need to be updated periodically, even as progress continues simultaneously on development of UAS rules and regulations for integration.

The FAA is also developing an NPRM to allow sUAS to conduct operations. This rulemaking effort includes an associated industry effort to develop consensus standards needed for rule implementation. Assuming the sUAS NPRM effort proceeds to a final rule, associated guidance will also be completed to allow the FAA to approve operations and civil and public UAS operators to apply for and safely implement these sUAS operations. All sUAS rule development and implementation will be in accordance with the FMRA.

During this period, the appropriate regulations are also being reviewed for applicability to UAS operations by the FAA, industry groups, and the

The emphasis will be on the need for new or revised rules for UAS to operate under instrument flight rules (IFR), including rules to allow UAS operations analogous to manned aircraft using visual capabilities.

UAS ARC. The results of this review will determine any regulatory gaps that need to be addressed in the development of specific UAS guidance and rulemaking. The emphasis will be on the need for new or revised rules for UAS to operate under instrument flight rules (IFR), including rules to allow UAS operations analogous to manned aircraft using visual capabilities. Based on the findings of this review, a determination will be made regarding the need to modify, supplement, or create specific new regulations to support UAS beyond the near-term. UAS rulemaking will follow these steps.

3.4 Airworthiness Certification of the UAS

Airworthiness certification is a process that the FAA uses to ensure that an aircraft design complies with the appropriate safety standards in the applicable airworthiness regulations. FAA type design approval indicates the FAA has evaluated the safety of the unmanned aircraft design and all its systems, which is more rigorous than simply making a determination that the UAS is airworthy.

Airworthiness standards for existing aircraft are codified in Title 14 of the Code of Federal Regulations, with processes described for FAA type certification in FAA Order 8110.4 and airworthiness certification in FAA Order 8130.2. The FAA has the authority and regulations in place to tailor the design standards to specific UAS applications, and plans to use this authority until further experience is obtained in addressing the design issues that are unique to UAS.

Civil UAS are currently accommodated with experimental certificates under FAA Order 8130.34. The FAA and the UAS industry will need to work together to move away from the existing experimental or expendable design philosophy, toward a design philosophy more consistent with reliable and safe civilian operation over populated areas and in areas of manned aircraft operation.

Existing airworthiness standards have been developed from years of operational safety experience with manned aircraft and may be too restrictive for UAS in some areas and inadequate in others. For example, existing structural requirements that ensure safe operation in foreseeable weather conditions that are likely to be encountered represent an example of well-established design requirements that existing UAS designs will most likely need to consider. Structural failures have nearly been eliminated from manned aircraft operations and must be mitigated to a similar level of likelihood in UAS operations.

Detailed consideration of UAS in the certification process will be limited in number until such time as a broad and significant consideration is given to existing standards, regulations, and policy. This will be facilitated by UAS manufacturers making application for type design approval to the FAA. For type design approval, UAS designers must show they meet acceptable safety levels for the basic UAS design, and operators must employ certified systems that enable compliance with standardized air traffic operations and contingency/emergency procedures for UAS.

The FAA believes that the UAS community will be best served by the use of an incremental approach to gaining type-design and airworthiness approval. This incremental approach (see Figure 6) could involve the following steps:

- First, allowing existing UAS designs to operate with strict airworthiness and operational limitations to gain operational experience and determine their reliability in very controlled circumstances, as under the existing COA concept or through regulations specific to sUAS;
- Next, developing design standards tailored to a specific UAS application and proposed operating environment. This step would enable the development of useful unmanned aircraft and system design and operational standards for the UAS to facilitate safe operation, without addressing all potential UAS designs and applications. This would lead to type certificates (TC) and production certificates with appropriate limitations documented in the aircraft flight manual;

- And lastly, defining standards for repeatable and predictable FAA type certification of a UAS designed with the redundancy, reliability, and safety necessary to allow repeated safe access to the NAS, including seamless integration with existing air traffic.

Because the UAS community is well established under its current operational assumptions, it is unlikely the FAA or UAS industry will establish an entire set of design standards from scratch. As additional UAS airworthiness options are considered and UAS airworthiness design and operational standards are developed, type certification may be more efficiently and effectively achieved. The UAS industry will continue to build capabilities into the mid- and long-term timeframes. See Appendix C.1 for specific goals and metrics.

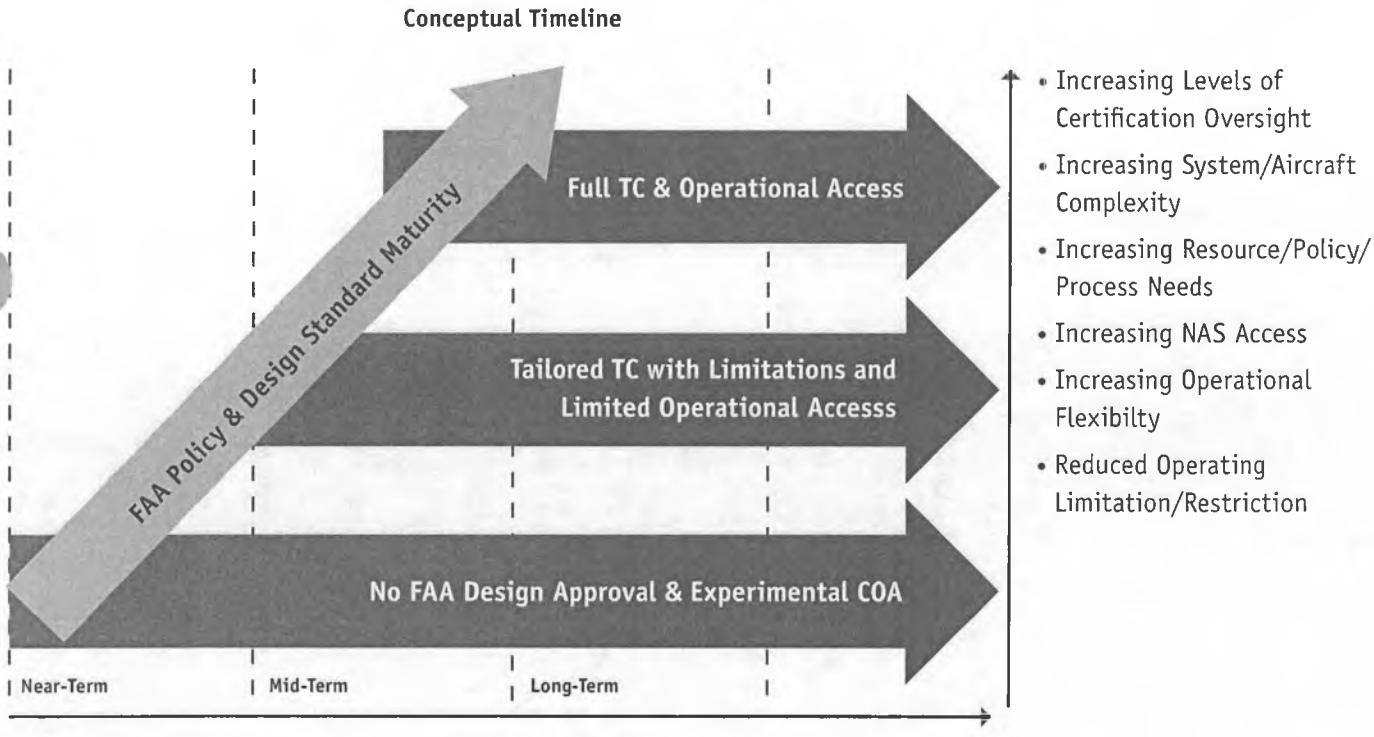


Figure 6: Potential Airworthiness Path for UAS Industry

3.5 Procedures and Airspace

A procedure is a series of actions or operations that have to be executed in the same manner to always obtain the same result under the same circumstances (for example, emergency procedures). The NAS depends on the structure of its airspace and the use of standard procedures to enable safe and efficient operations. ATO directives and other FAA policy and guidance define how UAS are permitted to operate in the NAS today:

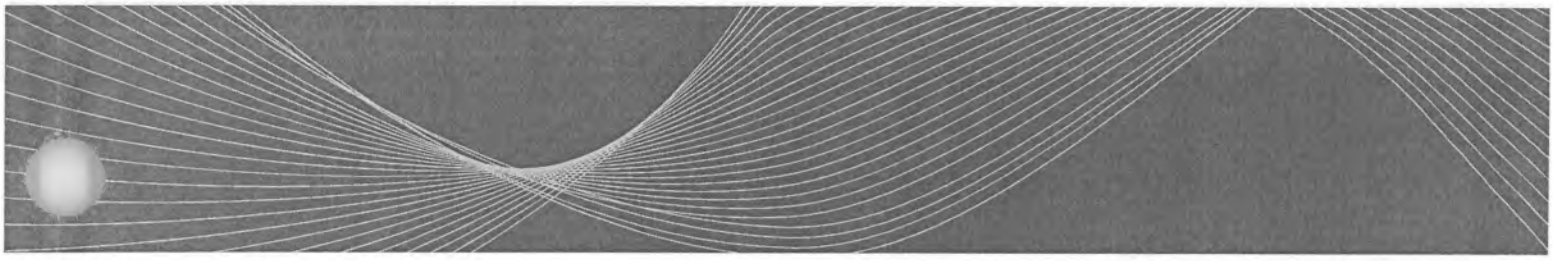
- COAs for public access to the NAS – Notice 8900.207 has been released for these operations;
- Experimental Certificates for civil access to the NAS;
- AND AC 91-57 for modeler (recreation) access to the NAS (June 1981) and Section 336 (Special Rule for Model Aircraft) of FMRA.

Experimental certificates and COAs will always be viable methods for accessing the NAS, but typically come with constraints and limitations. Expanded, easier access to the NAS will occur after new or revised operational rules and UAS certification criteria are defined and the FAA develops specific methods for appropriately integrating UAS into NAS operations.

Another requirement is the baselining activity to assess the applicability of existing air traffic control regulations and orders to UAS operations. Any identified gaps will need to be analyzed, and decisions on accommodation or changes to UAS or regulations will be completed. Some sample differences that affect UAS interoperability with the air traffic system are:

- En Route—Current UAS are not able to meet requirements to fly in reduced vertical separation minimum (RVSM) airspace. They do not fly traditional trajectory-based flight paths and require non-traditional handling in emergency situations.
- Terminal—UAS cannot comply with ATC visual separation clearances and cannot execute published instrument approach procedures.
- Facilities—The introduction of UAS at existing airports represents a complex operational challenge. For the near-term, it is expected that UAS will require segregation from mainstream air traffic, possibly accommodated with UAS launch windows, special airports, or off-airport locations where UAS can easily launch and recover. Initial rulemaking for UAS may not address the requirements for UAS at airport facilities, since sUAS are not expected to routinely use airports for takeoff and landing. However, as civil UAS are developed that require airport access, airport integration requirements will need to be developed. These requirements will include environmental impact and/or assessments (when required) concerning noise, emissions, and any unique fuels and other associated concerns. The current Airport Cooperative Research Project (ACRP 03-30) will address the impacts of commercial UAS on airports. The results of the study will be a publication to help airports and communities gain an understanding of UAS, including a description of how various areas of the aviation system, particularly airports, could be affected. The results should be helpful in addressing the airport integration requirement.

ICAO has issued guidance requiring Member States to implement Safety Management System (SMS) programs. These programs are essential to manage risk in the aviation system. The FAA supports this and is a leader in the design and implementation of SMS. Technical challenges abound, including the ability to analyze massive amounts of data to provide useful information for oversight and assessment of risk.



A key input to a Safety Management methodology is the use of safety data. Valuable data collection is underway, but development of a safety-reporting database is currently limited to reporting requirements from existing COAs and experimental certificate holders. Data collection will expand when additional agreements are finalized for sharing public UAS data and new rules and associated safety data reporting requirements are implemented for sUAS. The strategy will use UAS incident, accident, and operational data from public, experimental, and sUAS operations to iteratively support the basis for and define appropriate UAS operating requirements. The availability and quality of this data may directly determine how fast or slow UAS are integrated into the NAS.

3.6 Training (Pilot, Flightcrew Member, Mechanic, and Air Traffic Controller)

UAS training standards will mirror manned aircraft training standards to the maximum extent possible, including appropriate security and vetting requirements, and will account for all roles involved in UAS operation. This may include the pilot, required crew members such as visual observers or launch and recovery specialists, instructors, inspectors, maintenance personnel, and air traffic controllers. See Appendix C.2 and C.8 for specific goals and metrics.

Accident investigation policies, processes, procedures, and training will be developed near-term, and will be provided to Flight Standards District Offices (FSDO) for implementation. Existing manned procedures will be leveraged as much as possible, though differences will need to be highlighted and resolved (e.g., when an unmanned aircraft accident occurs, there may be a need to impound the control station as well as the aircraft).

3.7 Research and Development (R&D) / Technology

Research in the areas of gaps in current technology and new UAS technologies and operations will support and enable the development of airworthiness and operational guidance required to address new and novel aspects of UAS and associated flight operations. The FAA will continue to establish requirements for flight in the NAS so R&D efforts are not duplicative. Additionally, the FAA's research needs are considered within the JPDO NextGen Research Development and Demonstration Roadmap to prevent overlap and provide opportunities for research collaboration.

R&D efforts with industry support the establishment of acceptable performance limits in the NAS and enable the development of performance parameters for today's NAS, while evaluating future concepts, technologies, and procedures for NextGen. The UAS Technical Community Representative Group (TCRG) is sponsoring broad-based UAS research (SAA, C2, and control station studies) aimed at integration with NextGen and validation of concepts. Near-term expected progress is described here:

Sense and Avoid:

Significant research into SAA methods is underway by both government and industry through a variety of approaches and sensor modes. Specifically the FAA is researching:

- Establishment of Sense and Avoid system definitions and performance levels;
- Assessment of Sense and Avoid system multi-sensor use and other technologies;
- And Minimum Sense and Avoid information set required for collision avoidance maneuvering.

Some public agencies and commercial companies are seeking to develop advanced mitigations, such as Ground Based Sense and Avoid (GBSAA) systems, as a strategy for increased access. Concept-of-use demonstrations are underway at several locations to use GBSAA as a mitigation to see-and-avoid requirements for public UAS COA operators in limited operational areas. GBSAA research and the test evaluations will help develop the sensor, link, and algorithm

requirements that could allow GBSAA to function as a partial solution set for meeting the SAA requirement and will help build the overall SAA requirements in the long-term. Additionally, as GBSAA technology matures, GBSAA could be used to provide localized UAS NAS integration in addition to being used as an advanced accommodation tool. See Appendix C.3 for specific goals and metrics.

Research is underway on Airborne Sense and Avoid (ABSAA) concepts. Due to complexity, significant progress in ABSAA is not expected until the mid-term. Research goals for the near-term include a flight demonstration of various sensor modes (electro-optic/infrared, radar, Traffic Alert and Collision Avoidance System (TCAS) and Automatic Dependent Surveillance-Broadcast (ADS-B)). Actual fielding of a standardized ABSAA system is a long-term objective. See Appendix C.4 for specific goals and metrics.

Control and Communications:

A primary goal of C2 research is the development of an appropriate C2 link between the unmanned aircraft and the control station to support the required performance of the unmanned aircraft in the NAS and to ensure that the pilot always maintains a threshold level of control of the aircraft. Research will be conducted for UAS control data link communications to determine values for latency, availability, integrity, continuity, and other performance measures.

UAS contingency and emergency scenarios also require research (e.g., how will a UAS in the NAS respond when the command link is lost either through equipment malfunction or malicious jamming, etc.). This research will drive standards that are being established through:

- Development and validation of UAS control link prototype
- Vulnerability analysis of UAS safety critical communications
- Completion of large-scale simulations and flight testing of initial performance requirements

Spectrum and civil radio frequency (RF) identification requires global coordination. The International Telecommunication Union (ITU) through the 2015 World Radiocommunication Conference (WRC-2015) will consider spectrum for UAS beyond-line-of-sight (BLOS) applications. Within the United States, the Federal Communications Commission (FCC) manages and authorizes all non-federal use of the radio frequency spectrum, including state and local government as well as public safety. The National Telecommunications and Information Administration (NTIA) manages and authorizes all federal use of the radio frequency spectrum. UAS spectrum operations within the United States need either the approval of the FCC or NTIA and shall not transmit without being properly authorized. Government agencies and industry need to investigate link security requirements, such as protection against intended and unintended jamming, RF interference, unauthorized link takeover, and spoofing. See Appendix C.5 for specific goals and metrics.

Modeling and Simulation:

The FAA is working with other government agencies and industry to develop a collaborative UAS modeling and simulation environment to explore key challenges to UAS integration. The near-term modeling goals are to:

- Validate current mitigation proposals;
- Establish a baseline of end-to-end UAS performance measures;
- Establish thresholds for safe and efficient introduction of UAS into the NAS;
- And develop NextGen concepts, including 4-dimensional trajectory utilizing UAS technology.

These modeling and simulation efforts will address NAS integration topics for UAS, such as latency in executing ATC clearances, inability to accept ATC visual clearances or comply with visual flight rules, priority and equity of NAS access, lost link, and flyaway scenarios.

Human Factors:

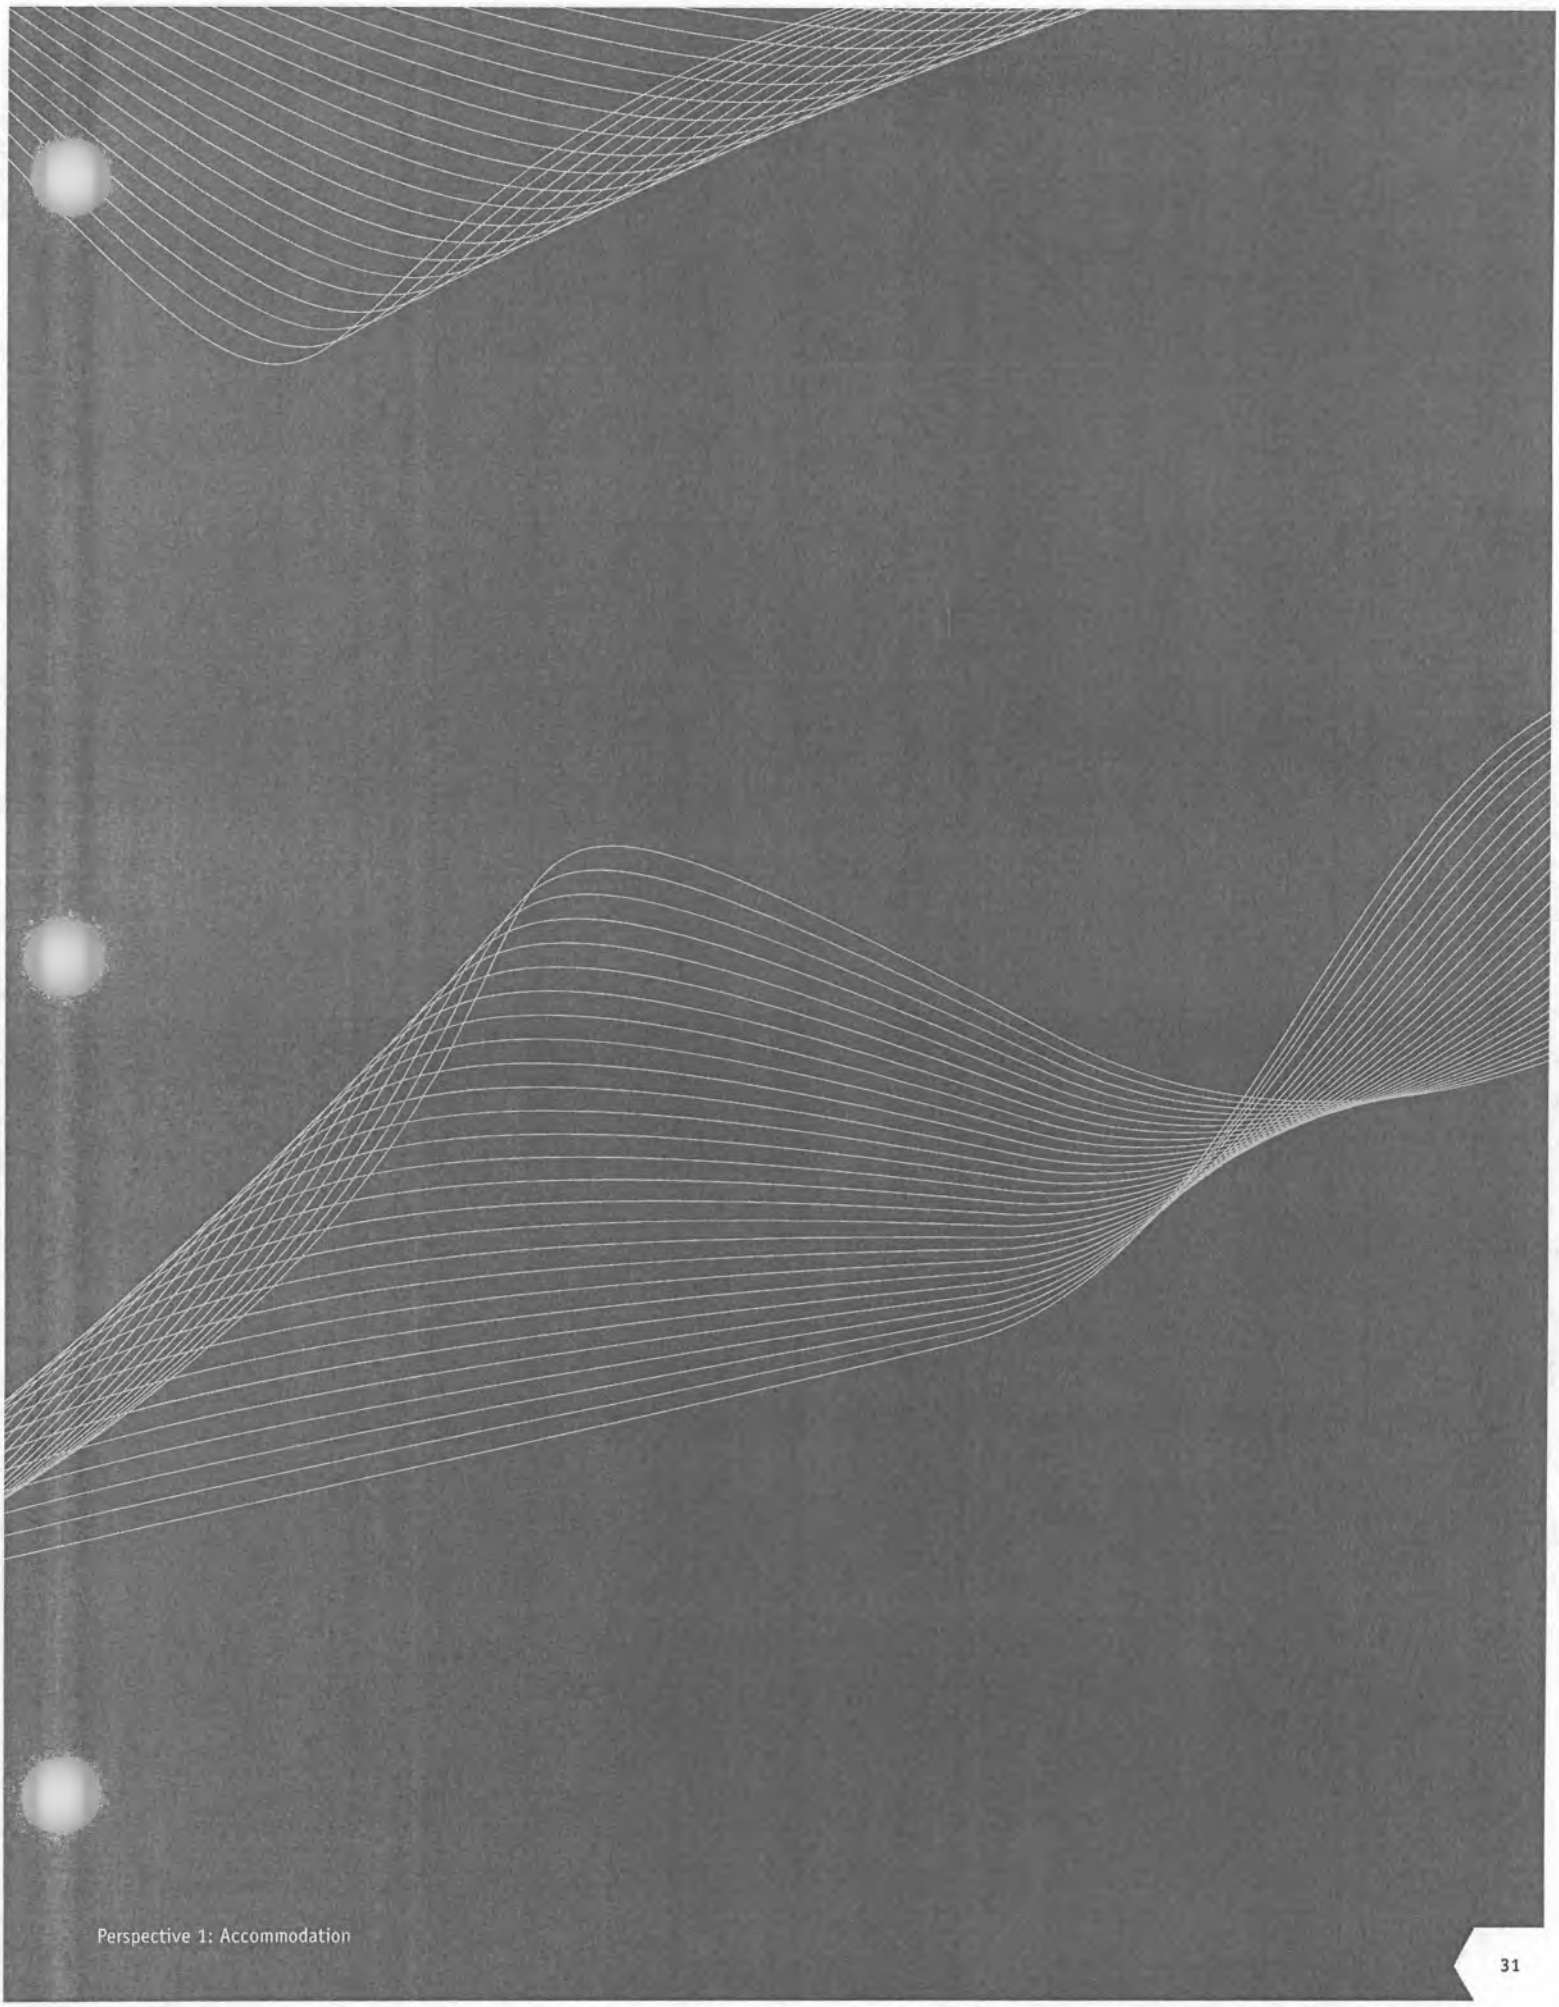
With the pilot controlling the aircraft from beyond the aircraft, several human factors issues emerge related to both the pilot and ATC, and how they will interact to safely operate unmanned aircraft in the NAS. Human factors issues in manned aviation are well known, but there needs to be further analyses regarding integration of UAS into the NAS. In the near-term, data will be collected to permit analysis of how pilots fly UAS, how controllers provide service involving a mix of manned aircraft and UAS, and how pilots and controllers interact with each other, with the goal of developing pilot, ATC, and automation roles and responsibilities concepts. The JPDO, in collaboration with government, academia, and industry researchers, identified several interrelated research challenges:

- Effective human-automation interaction (level; trust; and mode awareness);
- Pilot-centric ground control station design (displays; sensory deficit and remediation; and sterile cockpit);
- Display of traffic/airspace information (separation assurance interface);
- Predictability and contingency management (lost link status; lost ATC communication; and ATC workload);
- Definition of roles and responsibilities (communication flow among crew, ATC, and flight dispatcher);
- System-level issues (NAS-wide human performance requirements);
- And airspace users' and providers' qualification and training (crew/ATC skill set, training, certification, and currency).

Other research in this phase includes activities to support safety case validation and the associated mitigations. This includes case-by-case assessments to determine the likelihood that a system/operation can achieve an acceptable safety level. The research will consider UAS operational and technical risks including:

- Inability to avoid a collision;
- Inability to maintain positive control;
- Inability to meet the operational environment's expected behavior (e.g., self-separate);
- And Inability to safeguard the public.

Summary of "Accommodation" Priorities
Accommodation of UAS in the NAS through evaluation and improvement of safety mitigations
Work with industry and the ARC to review the operational, pilot, and airworthiness regulations
Development of required standards to support technological solutions to identified operational gaps (MOPS)
Safety case validation for UAS operations in NAS—collect/analyze operational and safety data
Robust research, modeling, and simulation for UAS Sense and Avoid, C2, and human factors



Perspective 2: Integration

4.1 Overview

In the mid-term, emphasis will shift significantly from accommodation to integration. For the residual accommodation requirements, it is expected that operational lessons learned and technological advances will lead to more sophisticated mitigations with increased safety margins. Thus, COAs and experimental certificates will remain avenues for accessing the NAS with appropriate restrictions and constraints. Emphasis will shift toward integration of UAS through the implementation of civil standards for unmanned aircraft pilots and new or revised operational rules, together with necessary policy guidance and operational procedures.

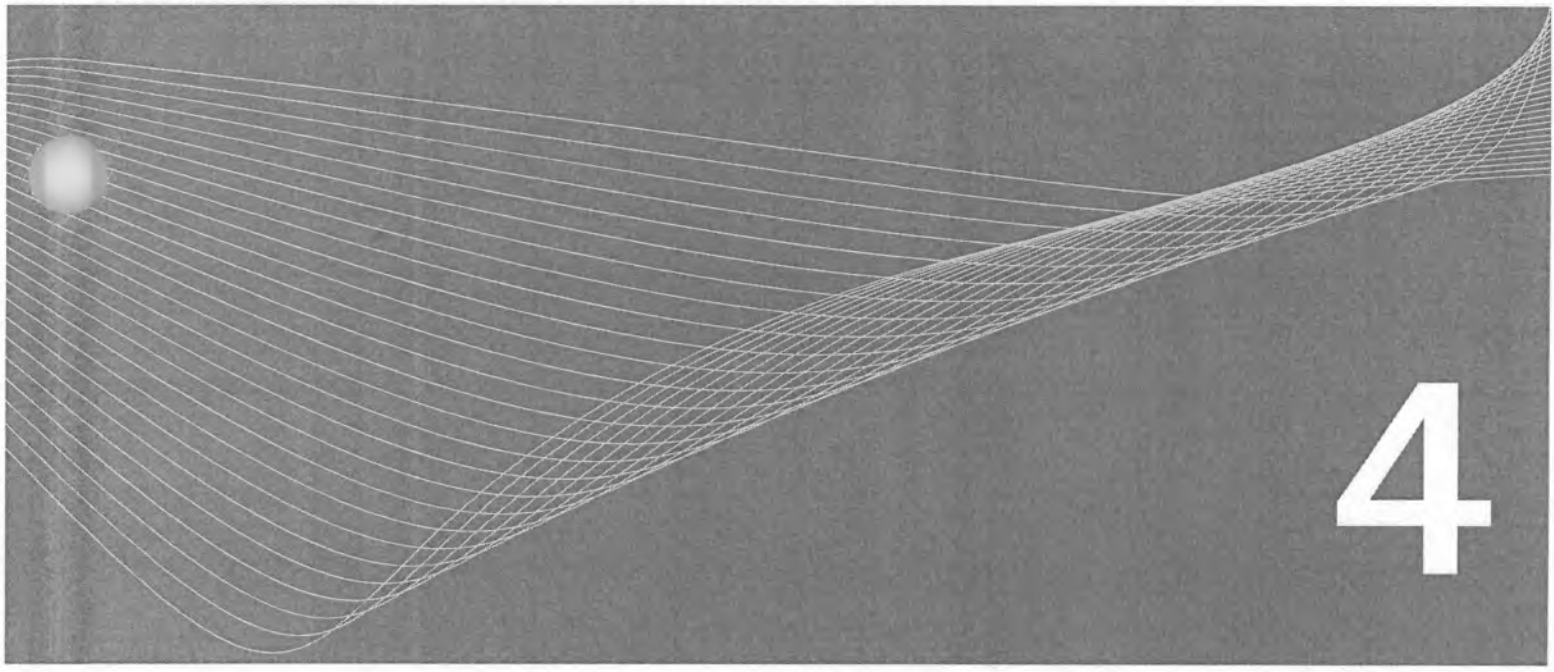
Integration efforts will focus on sequentially developing and implementing the UAS system requirements established by the FAA as a result of R&D and test range outputs:

- Finalize the integrated set of FAA rulemaking, policy, operational guidance, procedures, and standards;
- Define continued airworthiness methodologies;
- Complete training and certification standardization;
- Continue the research and technology development and assessment work that underpins the ability of UAS to operate safely and efficiently in the NAS;
- And address the privacy, security, and environmental implications of UAS operations.

To receive civil certification under existing or adapted/expanded regulations, guidance, and standards, research is needed that will assist in defining the certification basis for unique UAS features. While current regulations, guidance, and standards ensure safe operation of aircraft with pilots in the cockpit, these current regulations may not represent the necessary and sufficient basis for the design criteria and operation of UAS.

Integration efforts will provide a foundation for creating and modifying FAA policies and procedures to permit more routine forms of UAS access and bridge the gap to the long-term goal of developing the policy, guidance, and operational procedures required to enable manned and

Integration efforts will focus on sequentially developing and implementing the UAS system requirements established by the FAA as a result of R&D and test range outputs.



unmanned aircraft to fly together in an environment that meets or exceeds today's level of safety and efficiency. As new UAS evolve, more specific training will be developed for UAS pilots, crew members, and certified flight instructors. See Appendix C.2 for specific goals and metrics.

UAS operations comingled at airports with manned aircraft is one of the more significant challenges to NAS integration. The UAS must be able to operate within airport parameters and comply with the existing provisions for aircraft. As with airspace operational requirements, the airport standards are not expected to change with the introduction of UAS, and their operation must be harmonized in the provision of air traffic services.

The following general requirements and assumptions will pertain to all UAS operations that are integrated into the NAS (with the exception of sUAS operating exclusively within visual line-of-sight (LOS) of the flight crew):

1. UAS operators comply with existing, adapted, and/or new operating rules or procedures as a prerequisite for NAS integration.
2. Civil UAS operating in the NAS obtain an appropriate airworthiness certificate while public users retain their responsibility to determine airworthiness.
3. All UAS must file and fly an IFR flight plan.
4. All UAS are equipped with ADS-B (Out) and transponder with altitude-encoding capability. This requirement is independent of the FAA's rule-making for ADS-B (Out).
5. UAS meet performance and equipage requirements for the environment in which they are operating and adhere to the relevant procedures.
6. Each UAS has a flight crew appropriate to fulfill the operators' responsibilities, and includes a pilot-in-command (PIC). Each PIC controls only one UA.*
7. Autonomous operations are not permitted.** The PIC has full control, or override authority to assume control at all times during normal UAS operations.
8. Communications spectrum is available to support UAS operations.
9. No new classes or types of airspace are designated or created specifically for UAS operations.
10. FAA policy, guidelines, and automation support air traffic decision-makers on assigning priority for individual flights (or flight segments) and providing equitable access to airspace and air traffic services.

11. Air traffic separation minima in controlled airspace apply to UA.
12. ATC is responsible for separation services as required by airspace class and type of flight plan for both manned and unmanned aircraft.
13. The UAS PIC complies with all ATC instructions and uses standard phraseology per FAA Order (JO) 7110.65 and the Aeronautical Information Manual (AIM).
14. ATC has no direct link to the UA for flight control purposes.

* This restriction does not preclude the possibility of a formation of UA (with multiple pilots) or a "swarm" (one pilot controlling a group of UA) from transiting the NAS to/from restricted airspace, provided the formation or swarm is operating under a COA.

** Autonomous operations refer to any system design that precludes any person from affecting the normal operations of the aircraft.

4.2 Standards

After MASPS are completed, the emphasis of standards activities will be geared toward the development of MOPS, which will contribute to the basis for regulatory changes and the equipment standards for UAS-specific systems and equipment. The development of MOPS may provide requirements the FAA may invoke as TSO to support airworthiness approval on certificated unmanned aircraft and may lead to the development of improved systems, potentially applicable to all civil aircraft. See Appendix C for specific goals and metrics.

4.3 Rules and Regulations

Recognizing that the UAS community might be better served by specific rules, the FAA is initially proposing to amend its regulations to adopt specific rules for the operation of sUAS in the NAS. These changes will address the classification of sUAS, certification of sUAS pilots, registration of sUAS, approval of sUAS operations, and sUAS operational limits.

Operations of sUAS under new regulations may have operational, airspace, and performance constraints, but will provide experience for pilots and additional data to inform subsequent rulemaking, standards, and training development for safe and efficient integration of other UAS in the NAS.

When the final rule is published and in effect, it will reduce the need for sUAS operators to conduct operations under either a COA or the constraints of an experimental certificate. This will allow operators and the FAA to shift the focus of resources to solutions that will better enable UAS integration. See Appendix C.6 for specific goals and metrics.

As integration continues, new or revised operational rules and associated standards and policies will allow compliant UAS to access additional airspace throughout the NAS.

4.4 Airworthiness Certification of the UAS

The FAA will work with the UAS community in defining policy and standards that facilitate agreement on an acceptable UAS certification basis for each applicant. This may involve the development of new policy, guidance, rulemaking, special conditions, and methods of compliance. See Section 3.4 for a more detailed discussion and Appendix C.1 for specific goals and metrics.

4.5 Procedures and Airspace

There will be incremental increases in NAS access based on rigorous safety mitigations of current UAS that were previously developed and built without approved industry or governmental standards. As integration begins, there will be approved airspace and procedures for sUAS, which will provide a basis for developing plans for increased NAS access as UAS are certified. As integration continues, new or revised operational rules and procedures, and associated standards and policies, will allow compliant UAS to access additional airspace throughout the NAS. The ATO will use procedures with these UAS similar to those used for manned aircraft, but may also delegate separation responsibility to UAS for some operations. To support this, ATO goals will be:

- Standardize air traffic operations and contingency/emergency procedures for UAS operators to ensure certified aircraft systems are interoperable with air traffic procedures and airspace requirements;
- Develop airport facility integration plans. This will require research and the development of procedures that address critical issues such as low visibility, taxi spacing, light gun signals, and compatibility with NextGen operations;
- Establish UAS operating requirements with associated ATC procedures for airport conditions;
- And coordinate with the Department of Defense (DoD) and all other appropriate departments and agencies on the development of any new parallel procedures and requirements for air domain awareness and defense.

See Appendix C.8 for specific goals and metrics.

4.6 Training (Pilot, Flightcrew Member, Mechanic, and Air Traffic Controller)

The FAA's role in training is to establish policy, guidance, and standards. Airmen training standards are under development and will be synchronized with the regulatory guidance. Civil operators normally develop a training regimen that allows pilots and flight support to meet regulatory standards. For any UAS operation, training regimens analogous to those that exist for manned aircraft will need to be considered, including relevant areas such as written tests, practical examinations, and currency and proficiency requirements.

Standards for airmen will proceed following the sUAS regulation. The FAA will issue UAS airman certificates and support activities to enable UAS operations to include:

- Development of practical test standards (PTS) and UAS airmen knowledge test question banks;
- Development of a UAS handbook for airmen;
- Training of aviation safety inspectors (ASI) at the FSDO level to provide practical test oversight;
- Identification of designated pilot examiners (DPE) to assist the FSDOs;
- Development of a UAS handbook for pilot and instructors;
- Development of PTS and UAS pilot knowledge test question banks;
- Development of UAS mechanic training and certificate process;
- And development of flight crew security requirements by the relevant United States Government agencies.

Pilot endorsements may be developed for specific UAS makes and models to permit commercial operations. Pilot qualifications by make and model will be built into training and will be expanded based on pilot experience.

Training standards development will be more complex for UAS with unique operating parameters and will continue into the long-term as these UAS are certified.

Regardless of the UAS platform, similar types of training regimens are expected, consisting of a written knowledge test, practical test standards, and a flight evaluation. There will be a requirement for currency and proficiency; qualified ASIs will be fielded to regional offices across the country.

With the introduction of UAS into the NAS, additional training requirements specific to different types of UAS characteristics will probably be required for ATC personnel, including UAS performance, behavior, communications, unique flight profiles, ATC standardized procedures, lost link/fly away profiles, operating limitations, and emergency procedures. Controller training will include differences in interoperability between manned and UAS flights, with a focus on specific handling issues of the aircraft. This training must be administered to ATC facilities throughout the NAS. It is expected that controllers will handle UAS the same as manned aircraft; therefore, no special ATC certification would be required. See Appendix C.2 and C.8 for specific goals and metrics.

4.7 Research and Development (R&D) /Technology

Sense and Avoid:

Research on SAA sensor performance, data communication, and algorithms must provide solutions for safe separation for integration of UAS into the NAS. Research to develop separation algorithms will be accomplished with the JPDO R&D plan goals of:

- Flight demonstration of self-separation and collision avoidance algorithms, with multiple sensors and intruders;
- Assessment of the performance of various self-separation concepts as a function of surveillance data configurations, and evaluation of risk-based self-separation algorithms and policy issues;
- Assessment of the performance of various separation assurance concepts, and flight demonstration of separation assurance algorithms, with criteria-based separation;
- And assessment of UAS performance for delegated spacing applications (e.g., defined interval clearances).

Although research will continue, fully certified UA-based collision avoidance solutions may not be feasible until the long-term and are deemed to be a necessary component for full UAS NAS integration. This will include research on safe and efficient terminal airspace and ground operations, followed by ground demonstrations of autonomous airfield navigation and ATC interaction. See Appendix C.4 and C.8 for specific goals and metrics.

Control and Communications:

Advanced research is required in data link management, spectrum analysis, and frequency management. Efforts will focus on completing development of C2 link assurance and mitigation technologies and methods for incorporating them into the development of certification of the UAS. This will include:

- Identification of satellite communication spectrum from the ITU through its WRC;
- Verification and validation of control communication final performance requirements;
- Establishment of UAS control link national/international standards;
- And development and validation of technologies to mitigate vulnerabilities.

Complete characterization of the capacity, performance, and security impacts of UAS on ATC communication systems will be completed. See Appendix C.5 and C.8 for specific goals and metrics.

Human Factors:
Human factors research will continue in the areas of human-machine interface (both control station displays and ATC displays), automation, and migration of control. Human factors data collected in the near-term and mid-term will be analyzed to determine the safest technologies and best procedures for pilots and ATC controllers to interact with each other and with the aircraft; these results will influence technology and operations research. For separation and collision avoidance capability, the contribution of human decision making versus automation must be identified. See Appendix C.8 for specific goals and metrics.

4.8 Test Ranges

Per the FMRA, the FAA will establish six test ranges. The test ranges will take into consideration climate and geographic diversity, the location of ground infrastructure and research needs. See Appendix C.7 for specific goals and metrics.

The test range program will address and account for:

- Manned-unmanned operations,
- Certification standards and air traffic requirements,
- Coordination and leveraging of National Aeronautics and Space Administration (NASA) and DoD resources,
- Civil and public unmanned aircraft systems,
- And coordination with NextGen.

The test ranges will help provide a verification mechanism for safe operations before unmanned aircraft are integrated into the NAS.

The FAA anticipates test range operator privacy practices, as discussed in their privacy policies, will help inform the dialogue among policymakers, privacy advocates, and the industry regarding broader questions concerning the use of UAS technologies. Transparency of privacy policies associated with UAS test range operations will engage all stakeholders in discussions about which privacy issues are raised by UAS operations and how law, public policy, and the industry practices should respond to those issues in the long run.

Summary of "Integration" Priorities
New operational rules and associated standards, policies, and procedures established for small UAS
New operational rules and associated standards, policies, and procedures established for other UAS
C2 link standards defined for integrity, latency, and continuity
FAA acceptance of MASPS to enable development of detailed MOPS
Published FAA policy and operational guidance to define acceptable methods to comply with operational rules in accordance with an acceptable UAS certification basis for each applicant
Published FAA flightcrew training and certification standards

Perspective 3: Evolution

5.1 Overview

Overlaying the integration of UAS is the need to remain aware of the changing characteristics and requirements of the evolving NAS. The long-term focus for UAS operations is the refinement and updating of regulation, policy, and standards. The end-state is to implement streamlined processes for the continued integration of UAS into the NAS.

These efforts will include:

- Policy, operational guidance, and standards for civil aircraft airworthiness and NAS operations and with consideration for privacy and security concerns and frameworks;
- Continued airworthiness methodologies;
- Training and certification standardization;
- And certification of key technologies to enable continued operations of UAS in the NAS.

5.2 Standards

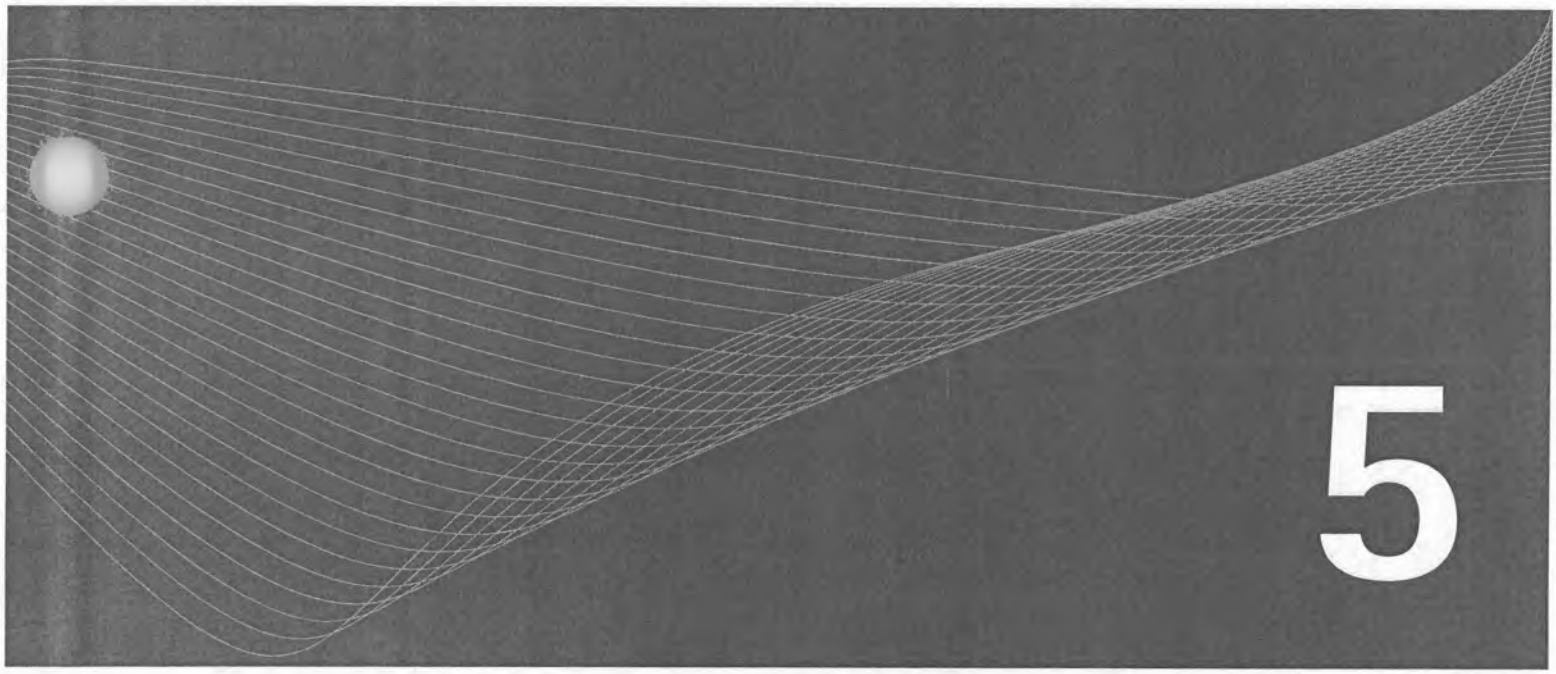
Unique UAS certification requirements will have been determined. MASPS, MOPS, and TSOs will support the regulations and certification of key systems for each UAS. Additionally, all standards will be evaluated and modified, as needed. See Appendix C.1 for specific goals and metrics.

5.3 Rules and Regulations

Lessons learned from previous rulemaking efforts may be applicable to the development of new UAS regulations. The process should become more efficient as UAS experience is gained and data analysis proves safety cases more quickly. UAS rulemaking activities will be more likely to involve revisions to existing rules, as needed, rather than the creation of new rules.

5.4 Airworthiness Certification of the UAS

Certification of UAS will evolve as future technologies evolve and will be consistent with all other aircraft airworthiness and operational approval processes, adding more capability to the UAS through data analyses and trending, which will identify areas for change and improvement in operations, human factors, communication links, and maintenance. See Section 3.4 for a more detailed discussion and Appendix C.1 for specific goals and metrics.



5.5 Procedures and Airspace

Certified pilots and UAS will be permitted access into the NAS under seamless operating procedures. The need to accommodate special NAS access will be dramatically reduced, and will be limited to research and development or test operations.

UAS operations will continue to evolve based on NextGen requirements. See Appendix C.8 for specific goals and metrics.

5.6 Training (Pilot, Flightcrew Member, Mechanic, and Air Traffic Controller)

As new UAS evolve, more specific training will be developed for UAS pilots, crew members, and certified flight instructors based on lessons learned and data collection. See Appendix C.2 and C.8 for specific goals and metrics.

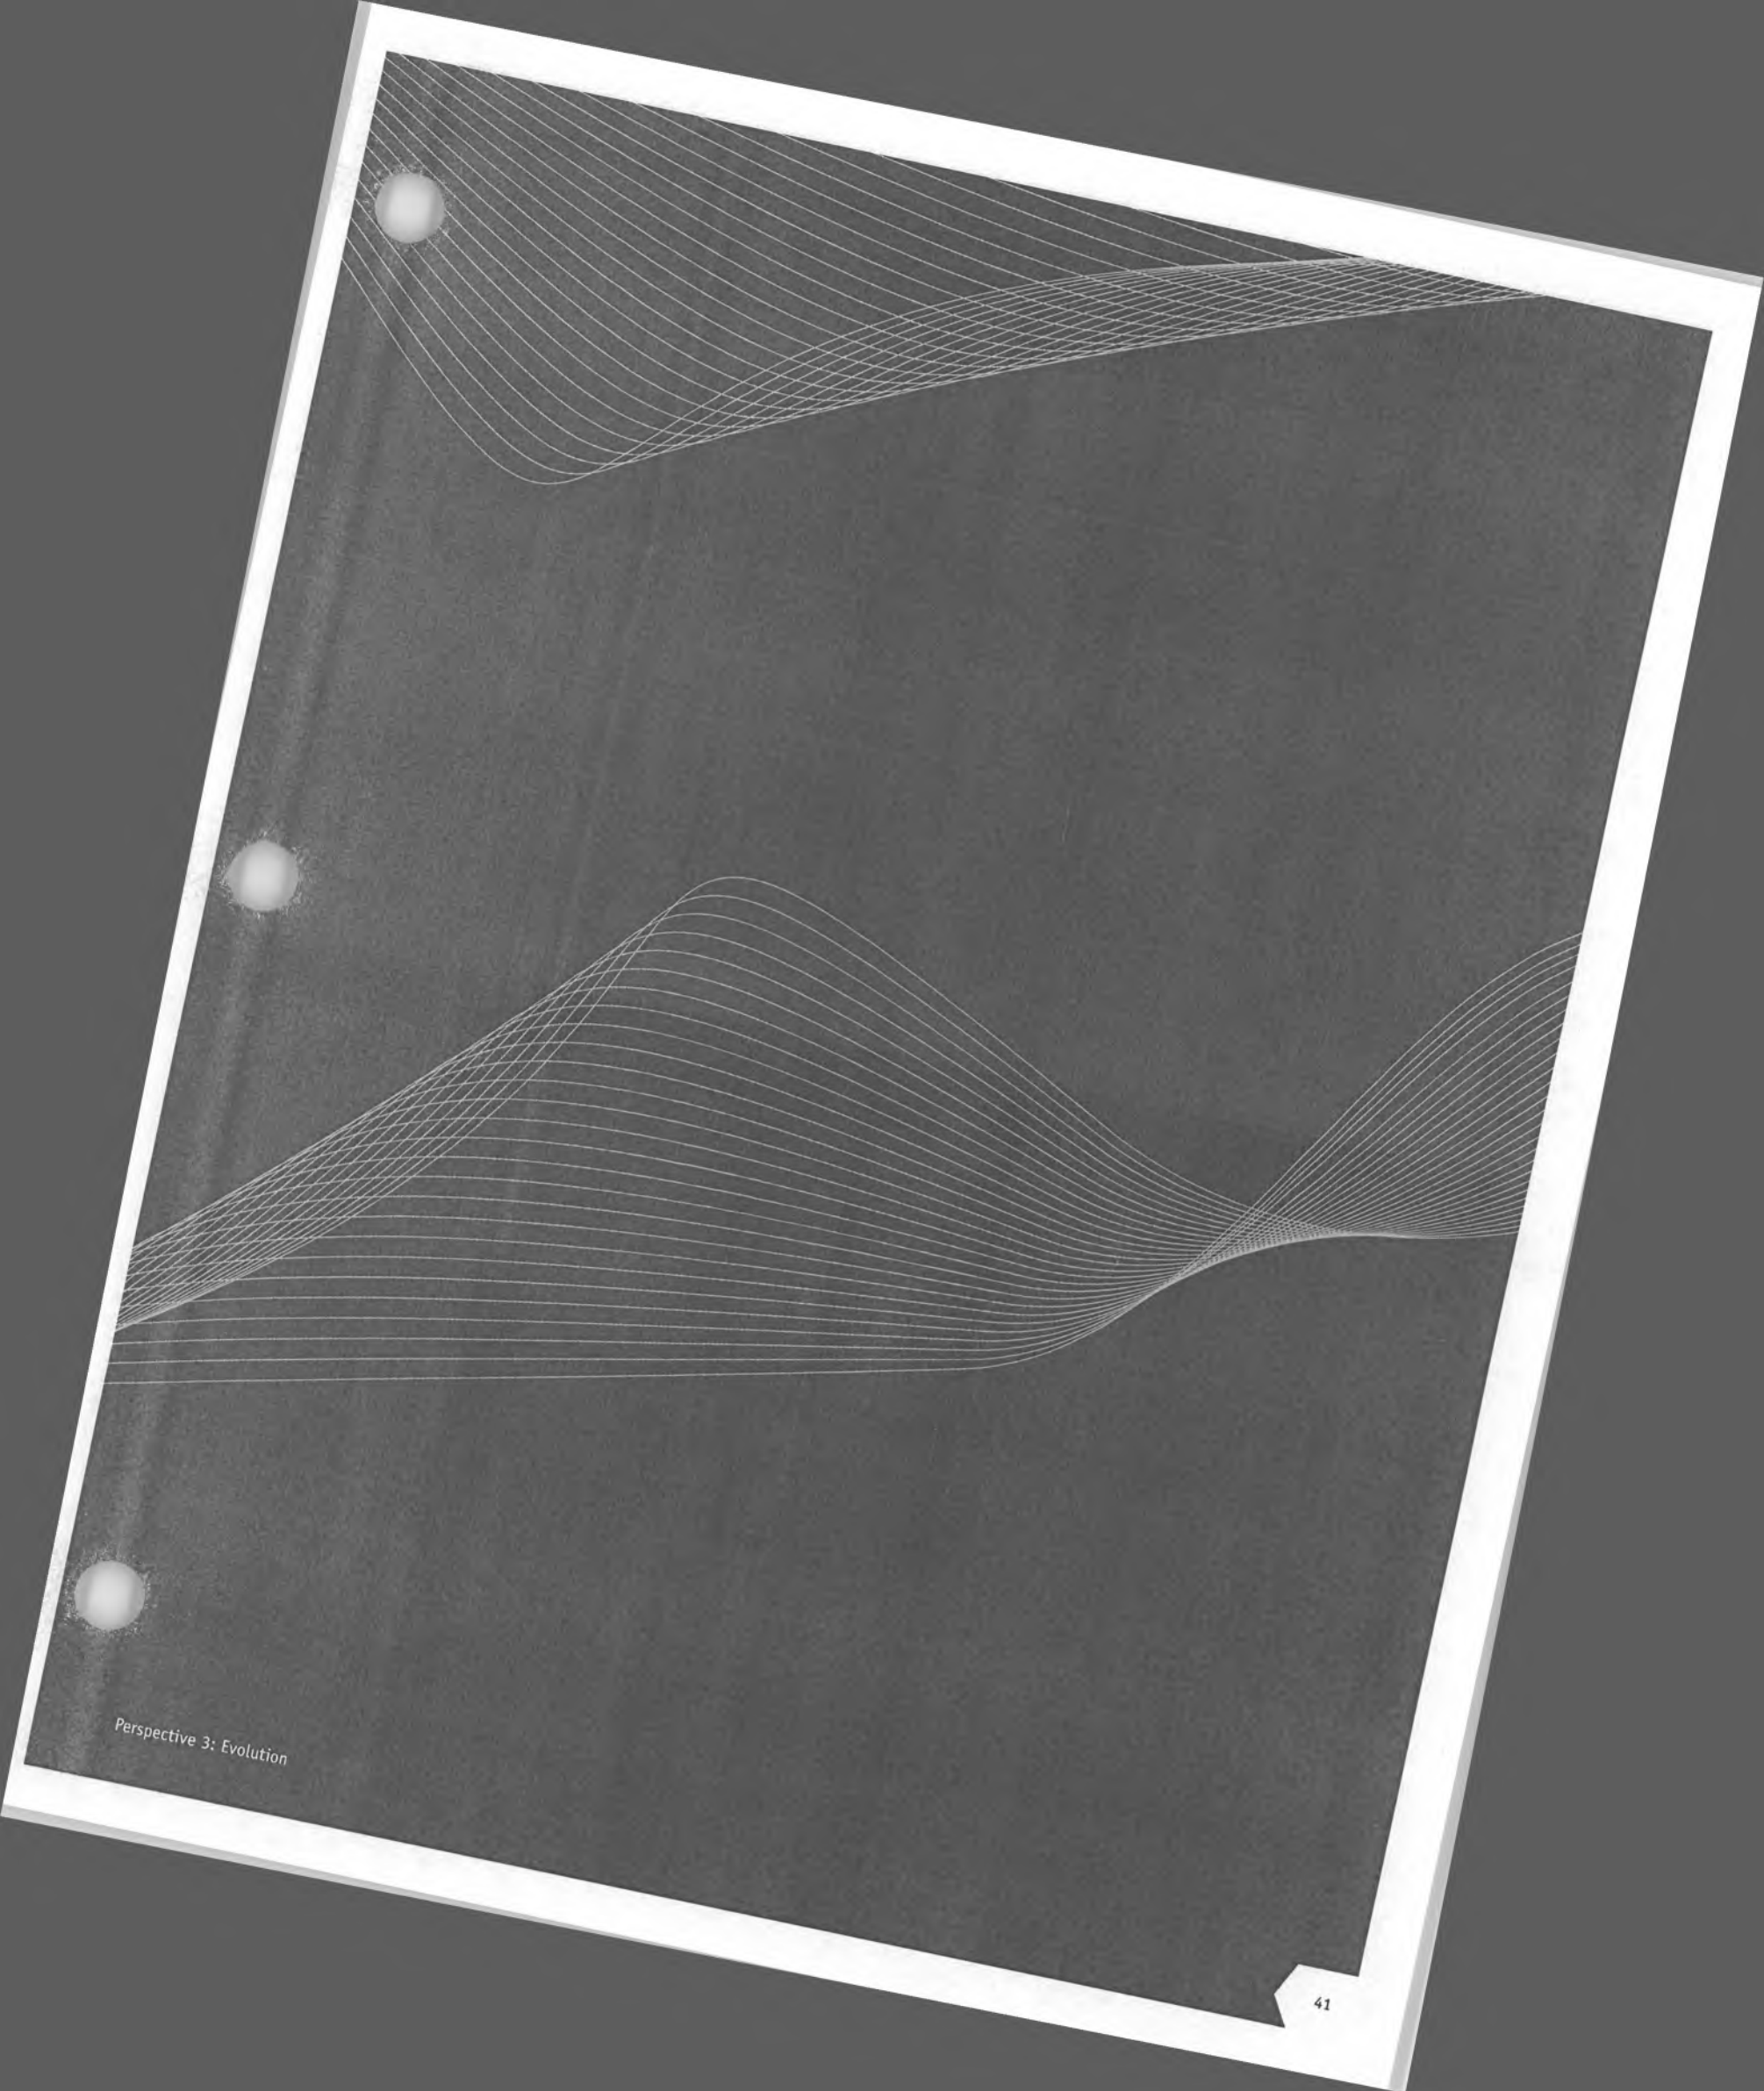
5.7 Research and Development (R&D) / Technology

Identified limitations and gaps will be closed via research and development of required technologies that meet standards established by the FAA. Planned activities include:

- Sense and Avoid research that focuses on algorithm development and compatibility with current and future manned aircraft collision avoidance systems such as TCAS II/ACAS X and surveillance systems (e.g., ADS-B), as well as compatibility with ATC separation management procedures and tools;
- Research on UAS system safety and levels of automation for the improvement of UAS into the future;
- Examination of potential concepts for the widespread integration of UAS into the future NextGen environment;
- AND research on new tools and techniques to support avionics and control software development and certification, to ensure their safety and reliability.

Organized studies will continue to investigate the evolution of UAS operations into the NextGen environment. Detailed research on SAA flight operations, using certified sensor systems, could allow aircraft to maintain safe distances from other aircraft during flight conditions that would not be appropriate for visual flight in a manned aircraft. This capability would rely heavily on network-enabled information, precision navigation, and cooperative surveillance, and would require the development and integration of NextGen-representative technologies for traffic, weather, and terrain avoidance. This conceptual model will be enlarged with sensors that expand the ability to maintain separation from other aircraft past the current visual spectrum and flight conditions restrictions. See Appendix C.8 for specific goals and metrics.

Summary of "Evolution" Priorities
Seamless operations of certified UAS and crew members in the evolving NAS
Published FAA TSOs based on system level MOPS
Certified Sense and Avoid algorithms for collision avoidance and self-separation that are interoperable with evolving NextGen ATC systems and manned collision avoidance systems



Conclusions

6.1 Summary

The safe integration of unmanned aircraft into the NAS is a significant challenge. The FAA is dedicated to developing the technical and regulatory standards, policy guidance, and operational procedures on which successful UAS integration depends.

The application of financial and human resources by academia and industry to support critical FAA initiatives will shorten the time required to develop technical and regulatory standards. Together, all stakeholders can overcome the challenge of integrating UAS into the NAS and leverage UAS and associated technologies for the greater benefit of society.

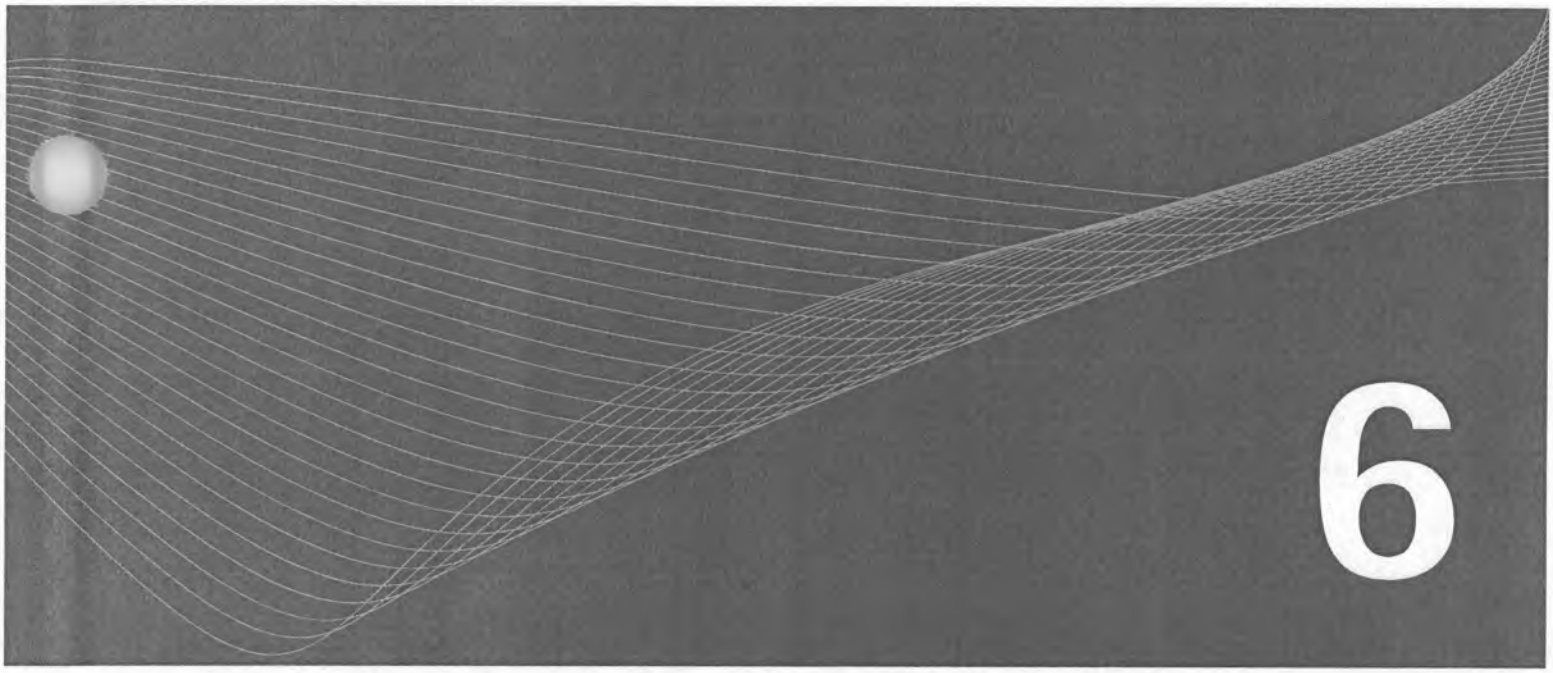
6.2 Outlook

Based on FAA policy and the challenges that need to be addressed, this roadmap has focused on the activities required to achieve integration of UAS into the evolving NAS. Throughout the process, the key messages below reflect the basis for the FAA's consideration of requirements to integrate civil UAS into the NAS:

1) **Government-industry collaboration is paramount to success and must focus on process, quality, and timely results.**
   The FAA expects to gain experience in applying the existing airworthiness regulations during the type certification process with early UAS adopters. We also expect input from industry and the ARC. Taking into account industry and ARC inputs, and future experience with UAS type certification projects, the FAA will review and revise as necessary the existing airworthiness regulations to ensure UAS safety.

2) **The FAA must remain committed to the development of technical and regulatory standards, policy guidance, and operations procedures on which successful UAS integration depends.**
   With this roadmap, the FAA has outlined initiatives that must be accomplished. Because unmanned aircraft are considered aircraft that are flown by pilots, existing regulations and procedures are largely applicable. However, the complete integration of UAS at airports and in the various airspace classes may necessitate the development of new or revised regulations and supplemental procedures. These will be developed and implemented in coordination with relevant agencies to address related security and privacy implications.

3) **Global standards encourage harmonization and yield cost-effective development.**
   The FAA is not bound by international policies and standards. However, harmonizing efforts with the international aviation community will allow for more seamless operations of UAS across national boundaries. Synchronizing



efforts within the aviation community will also permit better use of limited human and fiscal resources, thereby reducing the time required to produce regulatory guidance, policy, and standards.

4) **The FAA is focused on increased access for UAS without impacting the safety or efficiency of the NAS, while managing environmental impacts.**
The FAA has placed a high priority on the development of rules for small UAS that will increase access to the NAS and provide an initial opportunity for commercial operations. In the long-term, the principal objective of the aviation regulatory framework is to achieve and maintain the highest possible uniform level of safety while maintaining or increasing the efficiency and the environmental performance of the NAS. In the case of UAS, this means ensuring the safety of all airspace users as well as the safety of persons and property on the ground.

5) **Progress must be made on the development of technology to enable NAS access.**
Because of many distinct differences between UAS and manned aircraft, there are required technologies that must be matured to enable the safe and seamless integration of UAS in the NAS. Research will be focused in the areas of sense and avoid, control and communications, and human factors.

14 CFR	Title 14 of the Code of Federal Regulations

Appendix B: Glossary

The following definitions were obtained from several sources, including:

1. Title 14 of the Code of Federal Regulations, Part 1.1
2. FAA Pilot/Controller Glossary (P/CG)
3. RTCA DO-320: Operational Services and Environmental Definition for Unmanned Aircraft Systems
4. Notice 8900.207, "Unmanned Aircraft Systems (UAS) Operational Approval," January 22, 2013
5. FAA Modernization and Reform Act of 2012
6. "Sense and Avoid (SAA) for Unmanned Aircraft Systems (UAS)" – Second Caucus Workshop Report 2013
7. FAA Order 8130.34B – Airworthiness Certification of Unmanned Aircraft Systems and Optionally Piloted Aircraft

Note: Applicable sources are shown at the end of each definition in parentheses (e.g. (1), (2), etc.). Terms without a specific source definition are defined in this Roadmap.

Terminology	Definition
Air Traffic Control	A service operated by appropriate authority to promote the safe, orderly, and expeditious flow of air traffic. (1)
Aircraft	A device that is used or intended to be used for flight in the air. (1)
Airspace	Any portion of the atmosphere sustaining aircraft flight and which has defined boundaries and specified dimensions. Airspace may be classified as to the specific types of flight allowed, rules of operation, and restrictions in accordance with International Civil Aviation Organization standards or State regulation. (3)
Airworthiness Certification	A process that the FAA uses to ensure that an aircraft design complies with the appropriate safety standards in the applicable airworthiness regulations.
Certificate of Waiver or Authorization	An FAA grant of approval for a specific flight operation. The authorization to operate a UAS in the National Airspace System as a public aircraft outside of Restricted, Warning, or Prohibited areas approved for aviation activities. (4)

B

Terminology	Definition
Civil Aircraft	Aircraft other than public aircraft. (4)
Collision Avoidance	The Sense and Avoid system function where the UAS takes appropriate action to prevent an intruder from penetrating the collision volume. Action is expected to be initiated within a relatively short time horizon before closest point of approach. The collision avoidance function engages when all other modes of separation fail. (6)
Communication Link	The voice or data relay of instructions or information between the UAS pilot and the air traffic controller and other NAS users. (3)
Control Station	The equipment used to maintain control, communicate with, guide, or otherwise pilot an unmanned aircraft. (3)
Crewmember [UAS]	In addition to the crewmembers identified in 14 CFR Part 1, a UAS flightcrew member includes pilots, sensor/payload operators, and visual observers, but may include other persons as appropriate or required to ensure safe operation of the aircraft. (4)
Data Link	A ground-to-air communications system which transmits information via digital coded pulses. (3)
Detect and Avoid	Term used instead of Sense and Avoid in the Terms of Reference for RTCA Special Committee 228. This new term has not been defined by RTCA and may be considered to have the same definition as Sense and Avoid when used in this document.
International Civil Aviation Organization	A specialized agency of the United Nations whose objective is to develop the principles and techniques of international air navigation and to foster planning and development of international civil air transport. (2)
Manned Aircraft	Aircraft piloted by a human onboard. (3)
Model Aircraft	An unmanned aircraft that is capable of sustained flight in the atmosphere; flown within visual line-of-sight of the person operating the aircraft and flown for hobby or recreational purposes. (5)

Terminology	Definition
National Airspace System	The common network of U.S. airspace; air navigation facilities, equipment and services, airports or landing areas; aeronautical charts, information and services; rules, regulations and procedures, technical information, and manpower and material. Included are system components shared jointly with the military. (2)
Optionally Piloted Aircraft	An aircraft that is integrated with UAS technology and still retains the capability of being flown by an onboard pilot using conventional control methods. (7)
Pathfinder	An initial UAS airworthiness certification program that will aid the FAA in the establishment of certification requirements.
Pilot-in-Command	Pilot-in-command means the person who: 1) has final authority and responsibility for the operation and safety of the flight; 2) has been designated as pilot-in-command before or during the flight; and 3) holds the appropriate category, class, and type rating, if appropriate, for the conduct of the flight. (1)
Public Aircraft	An aircraft operated by a governmental entity (including federal, state, or local governments, and the U.S. Department of Defense and its military branches) for certain purposes as described in 49 U.S.C. §§ 40102(a)(41) and 40125. Public aircraft status is determined on an operation by operation basis. See 14 CFR Part 1, § 1.1 for a complete definition of a public aircraft. (4)
RTCA	RTCA, Inc. is a private, not-for-profit corporation that develops consensus-based recommendations regarding communications, navigation, surveillance, and air traffic management system issues. RTCA functions as a Federal Advisory Committee. Its recommendations are used by the FAA as the basis for policy, program, and regulatory decisions and by the private sector as the basis for development, investment and other business decisions. (www.rtca.org)
See and Avoid	When weather conditions permit, pilots operating instrument flight rules or visual flight rules are required to observe and maneuver to avoid another aircraft. Right-of-way rules are contained in 14 CFR Part 91. (2)
Self-Separation	Sense and Avoid system function where the UAS maneuvers within a sufficient timeframe to remain well clear of other airborne traffic. (6)
Sense and Avoid	The capability of a UAS to remain well clear from and avoid collisions with other airborne traffic. Sense and Avoid provides the functions of self-separation and collision avoidance to establish an analogous capability to "see and avoid" required by manned aircraft. (6)
Small Unmanned Aircraft	An unmanned aircraft weighing less than 55 pounds. (5)

Terminology	Definition
Special Airworthiness Certificate – Experimental Category (UAS)	Airworthiness certification for experimental UAS and optionally piloted aircraft.
Test Range	A defined geographic area where research and development are conducted in accordance with Sections 332 and 334 of the FMRA. Test ranges are also known as test sites in related documents such as the FAA's Screening Information Request. (5)
Unmanned Aircraft	1) A device used or intended to be used for flight in the air that has no onboard pilot. This devise excludes missiles, weapons, or exploding warheads, but includes all classes of airplanes, helicopters, airships, and powered-lift aircraft without an onboard pilot. UA do not include traditional balloons (see 14 CFR Part 101), rockets, tethered aircraft and un-powered gliders. (4) 2) An aircraft that is operated without the possibility of direct human intervention from within or on the aircraft. (5)
Unmanned Aircraft System	An unmanned aircraft and its associated elements related to safe operations, which may include control stations (ground, ship, or air-based), control links, support equipment, payloads, flight termination systems, and launch/recovery equipment. (4) An unmanned aircraft and associated elements (including communications links and the components that control the unmanned aircraft) that are required for the pilot-in-command to operate safely and efficiently in the national airspace system. (5)
Visual Line-of-Sight	Unaided (corrective lenses and/or sunglasses exempted) visual contact between a pilot-in-command or a visual observer and a UAS sufficient to maintain safe operational control of the aircraft, know its location, and be able to scan the airspace in which it is operating to see and avoid other air traffic or objects aloft or on the ground. (4)

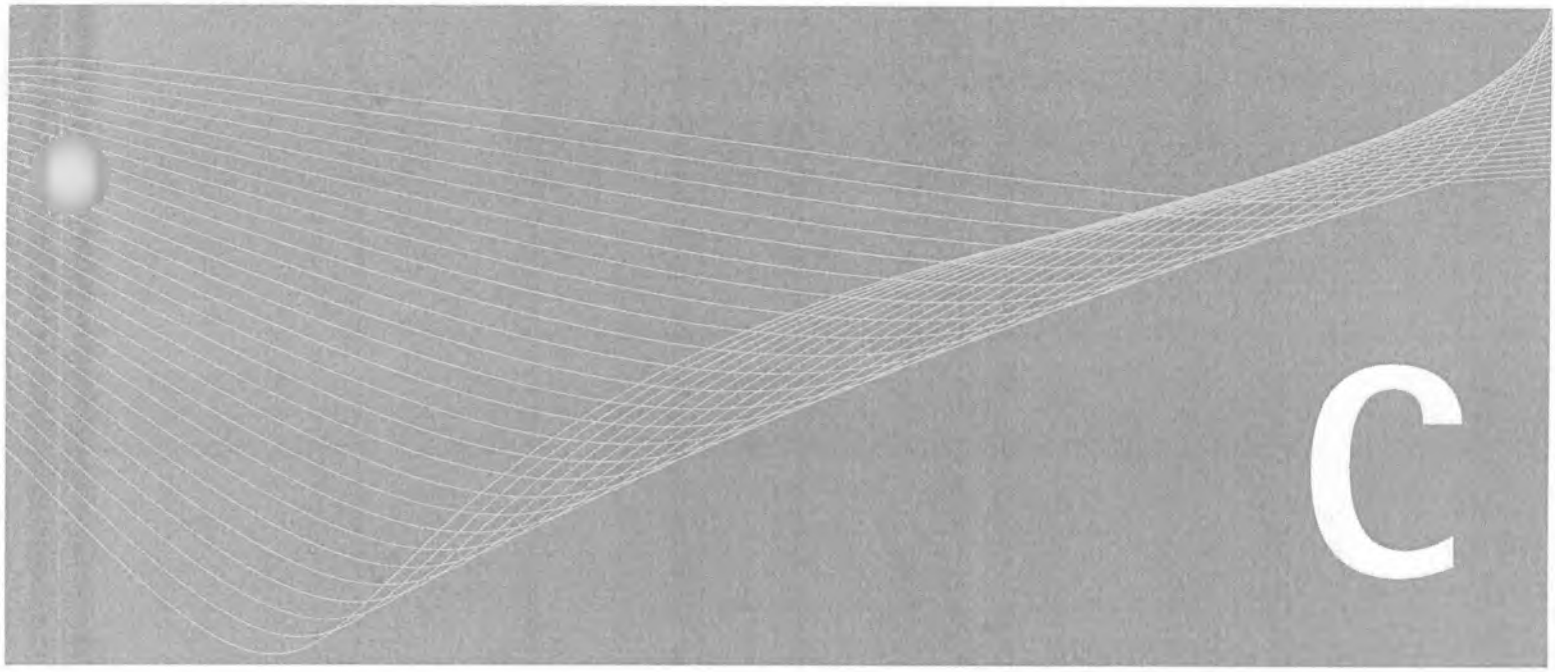
Appendix C: Goals, Metrics, and Target Dates

This appendix contains FAA-developed goals, metrics, and target dates (date ranges) and incorporates many related Unmanned Aircraft Systems (UAS) Aviation Rulemaking Committee (ARC) recommendations. The target dates in this appendix are generally limited to a five-year planning horizon. The FAA will continue its effective dialogue with the UAS ARC as it makes changes to the existing set of goals, metrics, and target dates in yearly updates to this roadmap. These annual updates will track and report progress, as recommended by the Government Accountability Office.

The following material identifies the key goals and related activities to be accomplished in accommodating, integrating, and evolving UAS operations in the National Airspace System (NAS). The goals are, for the most part, intended to be addressed concurrently. For each goal, a set of metrics (i.e., well-defined milestones with target completion dates) is defined. The metrics help establish and maintain common government and industry expectations, and enable objective assessments of the progress made toward the accomplishment of each goal. The goals and metrics reflect the incremental approach to UAS certification and integration described in this roadmap.

The goals and metrics in and of themselves do not constitute a UAS integration roadmap implementation plan; however, they do establish a set of strategic objectives that can guide the definition of activities, schedules, and resource requirements in such a plan. Many of the goals and metrics are not under the FAA's direct control and are dependent upon industry efforts such as participation in civil UAS standards development activities and execution of initial certification (a.k.a. "Pathfinder") programs to aid the establishment of certification requirements. Goals and metrics addressing FMRA requirements are identified and the FMRA Subtitle B (Unmanned Aircraft Systems) is included as a reference in Appendix D.

Target dates for near-term metrics (i.e., those with dates prior to October 2015) are identified by the calendar quarter and year targeted for metric completion (e.g., "3rd Quarter of 2014" means targeted for completion by the end of September 2014). Mid-term metrics may only have a target year or year range specified. In this case, "2016" means the metric's completion target is the end of calendar year 2016. Far-term metrics are outside the five-year horizon of this roadmap and have no target dates. Target dates shown as "from 201x to 201y" indicate related activity is expected throughout this time period. Unless the target dates are required by law (e.g., FMRA), they are exactly that – targets. They are not commitments, either by the FAA, other government organizations, or industry. The target dates consider ongoing and planned government and industry activities and schedules; however, they are not always constrained by these activities and schedules. Some of the target dates are aggressive and will require additional industry or government resources if they are to be met.



C

Although this roadmap is focused on the integration of civil UAS in the NAS, some of the recommended goals and metrics address public UAS integration activities – primarily those of the Department of Defense (DoD). Public entities may have their own certification processes, but the requirements typically build upon those established by the FAA for civil aviation. The DoD's significant activities to develop public UAS that meet airspace and regulatory requirements can and should be leveraged in the FAA's establishment of civil UAS certification requirements.

C.1 Certification Requirements (Airworthiness)

Note: The term "Operator" is used here as defined by the FAA for passenger/cargo carrying and other "for hire and compensation" operations. Not all UAS operations conducted for hire and compensation will require an Operator Certificate. One outcome of this effort will be to establish which UAS operations will or will not require an Operator Certificate.

Goal 1: FAA initial certification process established for one or more civil applicants by 2014.

A. One or more Pathfinder certification projects were defined through government-industry plans (e.g., Project Specific Certification Plans (PSCP)) in the 2nd Quarter of 2013.

- Explanation. Three UAS manufacturers have already applied for type certification and two of these applications were released from delayed sequencing to proceed with restricted category airworthiness certification. Restricted category type certifications for these two applicants have now been completed. Completion of these type certification projects under appropriate, existing certification regulations, will act as a catalyst to establish the process to be used for similar UAS type certification projects. Note: Some UAS type certifications may be in the restricted category with operating restrictions to maintain an equivalent level of safety for the public, but the goal is to certify the respective UAS to meet all integration requirements, if practical.

B. One or more Pathfinder standard airworthiness certification projects complete initial certification planning by 2014.

- Explanation. If the FAA and one or more industry partners complete initial certification planning as recommended in The FAA and Industry Guide to Product Certification, the groundwork will be in place for an efficient certification project that will help establish the process for similar UAS certification projects. One manufacturer has made application and the project will proceed per FAA sequencing processes.

Goal 2: FAA's initial issue papers for one or more standard airworthiness certification projects are available by 2014.

A. One or more Pathfinder certification projects underway by the 4th Quarter of 2013.

- Explanation. One manufacturer has made application for a standard airworthiness certificate and the project will proceed per FAA sequencing processes.

B. FAA's initial certification issues defined for the certification basis or new and novel systems (e.g., UAS control station, airframe, control system, propulsion system, ground support equipment (GSE), etc.) by the 4th Quarter of 2013.

- Explanation. The certification basis and any unique requirements for new and novel systems must be established. Requirements can be identified and refined as a result of Pathfinder efforts or publication by standards organizations (e.g., RTCA, Inc., ASTM International).

Goal 3: FAA's unique certification requirements identified through issue papers that have matured for one or more standard airworthiness certification projects by 2015.

A. FAA's unique certification requirements for new and novel systems (e.g., UAS control station, airframe, control system, propulsion system, GSE, etc.) published by 2015.

- Explanation. Lessons learned from certification of Pathfinder systems, publication of consensus standards, and additional operational experience gained as a result of small UAS (sUAS) rule publication will provide additional requirement information for future applicants.

B. One or more Pathfinder standard airworthiness certification projects completed by 2017 if all associated activities are completed per the nominal certification process.

- Explanation. It is expected that type certifications will be granted only when all requirements have been met under existing rules and requirements and this target date is a best-case scenario.

C. Other certification programs completed by 2017–2020, based on timely applications and system commonality/complexity.

- Explanation. Lessons learned from certification activities of Pathfinder systems, publication of consensus standards, and operations under the sUAS rule will provide data and experience to support other certification efforts.

Goal 4: FAA certification requirements updated and systems certified as necessary.

A. Certification requirements updated as necessary.

B. UAS certified as necessary.

C.2 Certification Requirements (Pilot/Crew)

Goal 1: FAA certification requirements for pilots and crew members for sUAS classes (including medical requirements, training standards, etc.) published as part of a sUAS rule by 2014 in accordance with the FMRA. Note: These requirements include coordination with other government agencies on security/vetting requirements.

Goal 2: Necessary changes to record keeping systems established as part of a sUAS rule and in accordance with the FMRA.

- Explanation. Once the final requirements are established, some changes to existing record keeping systems will be necessary.

Goal 3: FAA certification requirements for pilots and crew members for UAS classes other than those addressed under the sUAS rule (including medical requirements, training standards, etc.) published by 2014–2017.

C.3 Ground Based Sense and Avoid (GBSAA)

Goal 1: FAA draft Advisory Circular on GBSAA systems and requirements released by 2015.

A. FAA approvals for use of GBSAA at one or more DoD GBSAA test sites granted by the 3rd Quarter of 2015, subject to timely application and completion of Certificate of Waiver or Authorization (COA) or other approval processes.

- Explanation. Use U.S. Army and U.S. Air Force developed solutions at DoD UAS test sites. (Note: These are existing DoD GBSAA test sites, not the new test ranges discussed in Section 4.8 and Appendix C.7.)

B. FAA approvals for use of GBSAA for educational and other public applications granted by 2016–2018, subject to timely application and completion of COA or other approval processes.

- Explanation. As above, but expanded beyond the DoD to include public use at other locations equipped with suitable GBSAA systems.

Goal 2: GBSAA operations fully approved by the FAA for routine use by all aviation, including both public and civil entities (if needed).

A. FAA approvals for use of GBSAA for limited civil applications granted.

- Explanation. As with FAA operational approvals for use of GBSAA at all DoD GBSAA test sites and operational approvals for use of GBSAA for educational and other public applications, expanded approvals are expected to be granted for limited civil use at select locations. These approvals will incorporate relevant data from UAS test site operations with GBSAA.

B. FAA's initial GBSAA certification standards for civil operations established.

- Explanation. Assimilate prior deployment experience for DoD, public, and limited civil use, and develop Minimum Aviation System Performance Standards (MASPS) for GBSAA. These approvals will incorporate relevant data from UAS test site operations with GBSAA.

C. FAA approvals for use of GBSAA for civil applications granted.

D. FAA's final GBSAA certification standards for civil operations established.

E. GBSAA certification standards updated as necessary.

C.4 Airborne Sense and Avoid (ABSAA)

Goal 1: Initial FAA certification of ABSAA that facilitates UAS operations without the requirement for a visual observer by 2016–2020.

A. Initial industry proposal for Sense and Avoid (SAA) implementation, integration, and operation in a Pathfinder program provided by the 2nd Quarter of 2014. (See Appendix C.1 for the Pathfinder program goals and metrics.)

- Explanation. This industry proposal will address: a) general UAS operations requirements, b) UAS sense-and-avoid requirements for all proposed operations, including proposed launch and recovery sites, c) proposed UAS ABSAA equipage, and d) planned installation and integration of the proposed ABSAA system(s). ("System" includes both hardware and software.)

B. FAA Stage 2 issue paper on UAS SAA implementation in one or more Pathfinder programs completed by the 2nd Quarter of 2015, subject to applicant provision of sufficient information in certification application and ongoing processes.

- Explanation. An FAA Stage 2 issue paper will provide the "FAA Position" indicating the FAA's concerns, opinions, and actions the applicant is required to accomplish to resolve the issue. This position gives the applicant direction that will enable compliance to the requirements without dictating design

Goal 2: Installation and certification of ABSAA developed to meet industry standards for use by the DoD and other public and civil entities that provide the SAA functions required in the NAS for Classes A, E, and G airspace, and operations approved without the requirement for a visual observer or a COA. Note: the RTCA Program Management Committee established a new Special Committee 228 and working group for Detect and Avoid (DAA). SAA and DAA may be used interchangeably until SC-228 provides a unique definition for DAA. Special Committee 228's Terms of Reference acknowledge that the requirements for UAS DAA in some airspace will require rulemaking.

A. RTCA Operational and Functional Requirements and Safety Objectives (OFRSO) for UAS, Volume 1 was released in the 2nd Quarter of 2013.

- Explanation. The OFRSO "provides recommendations for UAS system level operational and functional requirements and safety objectives for UAS flown in the United States National Airspace System (NAS) under the rules and guidelines for civil aviation." This document provides a framework to support the development of future UAS performance standards and "will prove useful to designers, manufacturers, installers, service providers and users in the development of future standards."

B. RTCA preliminary Phase 1 Detect and Avoid (DAA) Minimum Operational Performance Standards (MOPS) developed to establish performance standards that can be verified and validated for UAS DAA equipment in specified airspace by the 3rd Quarter of 2015.

- Explanation. Emphasis for this initial phase will be standards development on civil UAS equipped to operate into Class A airspace under IFR. A second phase of MOPS development may include DAA equipment to support extended UAS operations in Class D, E and perhaps G airspace. This work effort includes recommendations for a verification and validation test program to be completed before the release of the DAA MOPS. Note: RTCA has sunset Special Committee 203 and Special Committee 228; has a new Detect and Avoid working group developing these DAA MOPS.

C. RTCA Phase 1 DAA MOPS released by the 3rd Quarter of 2016.

- Explanation. This document includes the avionics onboard the UAS and required elements of ground control systems and is based on the results of verification and validation activities on the preliminary Phase 1 DAA MOPS.

D. FAA DAA Technical Standard Order (TSO) issued by the 1st Quarter of 2017.

- Explanation. This document includes the avionics onboard the UAS and required elements of ground control systems.

E. FAA DAA TSO-required equipment used operationally.

Goal 3: DoD or other public entity certification of initial ABSAA systems that enable the DoD and other public entities to safely operate ABSAA-equipped UAS in all NAS airspace classes without the need for a COA. Note: RTCA Special Committee 228's Terms of Reference acknowledge that the requirements for UAS DAA in some airspace will require rulemaking.

A. Initial proposal for ABSAA implementation, integration, and operation in one or more programs released by 2016.

- Explanation. This proposal will address the requirements for ABSAA system(s), including the SAA avionics onboard the unmanned aircraft and required elements of ground control systems. "System" includes both hardware and software.

B. FAA issue paper(s) on UAS SAA implementation in one or more programs for UAS operations in one or more airspace classes released.

- Explanation. The FAA issue paper(s) will document the special considerations for certification of UAS airborne systems that include SAA functions. They also will document special considerations for operating UAS that employ these ABSAA systems and special considerations (including avionics equipage requirements) for manned aircraft operating in the same airspace.

Goal 4: Installation and certification of ABSAA systems for use by the DoD and other public and civil entities that provide the SAA functions that facilitate integrated operation of manned and unmanned aircraft in all NAS airspace classes.

A. RTCA OFRSO for UAS, Volume 1 was released in the 2nd Quarter of 2013.

- Explanation. The OFRSO "provides recommendations for UAS system level operational and functional requirements and safety objectives for UAS flown in the NAS under the rules and guidelines for civil aviation." This document provides a framework to support the development of future UAS performance standards.

B. RTCA Phase 1 DAA MOPS released by the 3rd Quarter of 2016.

- Explanation. This document includes the SAA avionics onboard the aircraft and required elements of ground control systems for IFR flight in Class D, E, and G airspace as noted in the Terms of Reference.

C. RTCA DAA MOPS released for other classes of airspace.

- Explanation. The second phase of DAA MOPS may specify DAA equipment to support extended UAS operations in Class D, E, G, and other airspace as noted in the Terms of Reference.

D. FAA initial DAA TSO released by the 1st Quarter of 2017.

- Explanation. This document will include the avionics onboard the aircraft and required elements of ground control systems as invoked from requirements specified in the Phase 1 DAA MOPS.

E. FAA DAA TSO-required equipment used operationally.

- Explanation. UAS will receive operational approval to use DAA equipment through standard operational approval processes that may include exemptions to Part 91 and/or rulemaking activities as defined by FMRA.

F. RTCA UAS OFRSO and DAA MOPS updated as necessary.

G. FFAA DAA TSO(s) updated as necessary.

C.5 Control and Communications (C2)

Note: For purposes of this section, line-of-sight (LOS) means radio LOS, not visual LOS.

Goal 1: International agreements, industry standards, and FAA regulations and guidance material established by 2015 for civil UAS Control and Communications (C2) capabilities such that C2 subsystems can be certified by the FAA for use in FAA-approved UAS operations.

Note: C2 includes communications internal to the UAS for pilots to operate unmanned aircraft from ground control stations.

A. International agreement was reached in February 2012 at the International Telecommunication Union's (ITU) World Radiocommunication Conference (WRC) on spectrum identified for radio LOS UAS C2 links (or in ITU terminology, Control and Non-Payload Communications links).

- Explanation. Internationally harmonized radio spectrum is needed to help ensure protection from unintentional radio frequency interference, to help ensure adequate spectral bandwidth is available, and to facilitate operation of UAS across international borders. While spectrum is also needed for beyond-line-of-sight (BLOS) C2 links, the initial focus was on radio line-of-sight for civil UAS because demand for LOS links is expected to be greater.

B. RTCA OFRSO for UAS, Volume 1 was released in the 2nd Quarter of 2013.

- Explanation. The OFRSO "provides recommendations for UAS system level operational and functional requirements and safety objectives for UAS flown in the NAS under the rules and guidelines for civil aviation." This document provides a framework to support the development of future UAS performance standards.

C. RTCA's initial MOPS for all the UAS subsystems involved in providing or enabling C2 Data Link using L-Band and C-Band Terrestrial data links are available to be verified and validated by the 3rd Quarter of 2015.

- Explanation. These preliminary MOPS and associated recommendations for a verification and validation test program are needed for the FAA and industry to mature the final Terrestrial data link standards before the release of the final MOPS. RTCA is expected to define MOPS that include L-Band and C-Band frequencies identified at WRC 2012. The resulting MOPS form the basis upon which the FAA can certify systems and services used in providing C2 capabilities for civil UAS.

D. RTCA final Phase 1 C2 Terrestrial Data Link MOPS released by the 3rd Quarter of 2016.

- Explanation. These performance standards in both L-Band and C-Band spectrum are based on the results of the verification and validation test program activities. RTCA is expected to define MOPS that include L-Band and C-Band frequencies identified at WRC 2012.

E. FAA's initial regulations and guidance material (such as TSOs and Advisory Circulars) to enable the production, sale, installation, and maintenance of FAA-certified systems and services used in providing radio LOS C2 capabilities for civil UAS published by 2016–2017.

- Explanation. For the commercial marketplace to offer FAA-certified systems and services for use in providing C2 capabilities for civil UAS, the FAA must establish the necessary regulations and guidance material. These are expected to be based on and largely incorporate the consensus industry standards defined in the RTCA MOPS.

F. Initial FAA-certified Terrestrial C2 Data Link subsystems intended for civil UAS operations are available commercially.

- Explanation. FAA-certified Terrestrial C2 Data Link subsystems for civil UAS are needed for operators and manufacturers to incorporate in their UAS, and for operators to obtain FAA approval for their UAS operations.

Goal 2: Beyond-Line-of-Sight C2 links and capabilities are addressed in international agreements, industry standards, and FAA regulations and guidance material.

A. International agreement reached at the ITU's WRC 15 on radio spectrum identified for BLOS UAS C2 links by 2015.

- Explanation. Internationally harmonized radio spectrum is needed for UAS C2 links to help ensure their protection from unintentional radio frequency interference, to help ensure adequate spectral bandwidth is available for meeting the projected C2 link capacity demands, and to facilitate operation of UAS across international borders. In the far-term, an increasing number of civil UAS operations are expected to require BLOS C2 links.

B. RTCA's second phase MOPS for all the UAS subsystems involved in providing or enabling radio BLOS C2 capabilities for civil UAS published. These elements will include the necessary portion of avionics onboard the unmanned aircraft, the voice and data links, and the necessary portion of ground control systems.

- Explanation. This second phase of MOPS will be needed to provide standards for the use of SATCOM in multiple bands as a C2 Data Link to support UAS. This development will be based on the results of the ITU's WRC 15 as well as lessons learned from industry application of the initial MOPS during product development and FAA certification activities.

C. FAA's final regulations and guidance material to enable the production, installation, and maintenance of FAA-certified systems and services used in providing radio BLOS C2 capabilities for civil UAS published.

- Explanation. A revised set of FAA regulations and guidance material will be needed to address BLOS C2 Data Link systems. These regulations and guidance material will apply lessons learned from application of the initial set.

D. Initial FAA-certified BLOS C2 subsystems intended for civil UAS operations are available commercially.

- Explanation. FAA-certified BLOS C2 subsystems for civil UAS are needed for operators and manufacturers to incorporate in their UAS, and for operators to obtain FAA approval for their UAS operations.

Goal 3: Adequate spectrum is available for both radio LOS and BLOS C2 links to meet the current and projected demand generated by civil UAS operations in the NAS.

A. International spectrum identified for LOS and BLOS UAS C2 links reviewed for possible modification at a future WRC by 2020.

C.6 Small UAS (sUAS) and Other Rules

Goal 1: sUAS rule adopted to allow for both civil and public operations.

A. Agreements (Memorandums of Understanding (MOU), Memorandums of Agreement (MOA), COA, etc.) among the FAA and the DoD, the Department of Homeland Security (DHS), the National Aeronautics and Space Administration (NASA), the National Oceanic and Atmospheric Administration (NOAA), the Department of Justice (DOJ) and other public entities finalized and signed in conjunction with the release of the sUAS Notice of Proposed Rulemaking (NPRM). (The sUAS NPRM is expected to be released in early 2014).

- Explanation. The sUAS proposed rule has undergone a risk assessment by the FAA through its Safety Management System (SMS) process. Adopting or applying the provisions of the proposed rule for public operations is necessary and will accelerate NAS integration of sUAS. It will also reduce the number of COAs the FAA will need to process and free up FAA resources to address other time-critical UAS in the NAS integration issues.

B. sUAS follow-on night operations experiments and study accepted by the FAA for review by the 3rd Quarter of 2014.

- Explanation. NASA completed an initial study at New Mexico State University in 2012. The FAA reviewed the report on this initial study and provided questions and other inputs for inclusion in NASA's planned follow-on study. The FAA will review the report of these focused experiments and may consider DoD and other night operational data.

C. If night operations are deemed as safe as or safer by the FAA, increased night operations for public entities are allowed by the 3rd Quarter of 2015.

- Explanation. Public entities are requesting night operations as a means to fully exploit the capability of sUAS.

D. D. Drafts of all required consensus standards necessary for the implementation of 14 CFR Part 107 available to the public in conjunction with the release of the sUAS NPRM (currently expected to be released in 2013).

- Explanation. More than three years of consensus standard development have occurred. When completed, these standards will provide meaningful guidance to manufacturers and end users for the design, construction, and operation of sUAS. The timely release of the standards will permit industry an opportunity to fully prepare for publication of a final rule, and provide useful guidance to public entities desiring UAS deployment prior to final rule release.

Goal 2: sUAS rule adoption for public and civil operations.

A. 14 CFR Part 107 published, consensus-based standards accepted by the FAA, and the FAA able to issue permits to operate in accordance with requirements of the FMRA.

- Explanation. In order for operations to be conducted under 14 CFR Part 107, the FAA will issue a Notice of Applicability of referenced consensus-based standards and will be able to issue permits to operate.

B. Update sUAS rules, guidance, and/or consensus-based standards after sufficient data have been gathered and analyzed.

- Explanation. Assuming a final rule implementation, the FAA will gain experience with sUAS operating under 14 CFR Part 107. Advancements in technology and analysis of operational and safety data will provide the catalyst for refinement and improvement of Part 107 guidance and/or standards.

C. Update sUAS rules, guidance, and/or consensus-based standards as necessary.

- Explanation. As more operational and safety data is accumulated it will provide a catalyst for refinement and improvement of 14 CFR Part 107 guidance and/or standards as necessary.

Goal 3: sUAS rule supports ATC interoperability to ensure safe and efficient NAS operations.

A. Train air traffic control workforce within six months after sUAS rule enactment.

B. Ensure consistency between sUAS rule proposed operational expectations and proposed changes to ATC Handbook and the Aeronautical Information Manual (AIM).

C. sUAS operations are aligned with ATC Handbook and AIM when the sUAS rule is published and effective.

D. Employ existing strategies to conduct UAS integration safety analysis within SMS Manual guidance to ongoing safety analyses supporting ATC interoperability.

- Explanation. The FAA will enhance ATC interoperability under sUAS rule operations with safety analyses, as required.

Goal 4: Other Rulemaking per the FMRA.

A. Notice of Proposed Rulemaking published to implement the recommendations of the plan required by FMRA by the 3rd Quarter of 2014.

- Explanation. Section 332, subsection (a)(1) of the FMRA specifies plan requirements and subsection (b) requires publication of an NPRM.

B. Final rule published to implement the recommendations of the plan required by the FMRA by the 4th Quarter of 2015.

- Explanation. Section 332, subsection (a)(1) of the FMRA specifies plan requirements and subsection (b) requires publication of a final rule not later than 16 months after publication of the associated NPRM.

C. C. Update to the Administration's most recent policy statement on unmanned aircraft systems contained in Docket No. FAA–2006–25714 required by the FMRA by the 3rd Quarter of 2014.

- Explanation. Section 332, subsection (b) requires publication of this update.

C.7 Test Ranges

Goal 1: FAA program to integrate UAS into the NAS at six test ranges established in accordance with the FMRA.

- Explanation. To establish this program, selection criteria and procedures were developed and communicated to prospective site operators. Test areas criteria consider geographic and climate diversity, the location of ground infrastructure, and research needs. FAA dialogue with prospective site operators clarified criteria and procedures by gathering prospective site operator questions and documenting answers for use by all.

Goal 2: Test ranges selected by FAA in accordance with the FMRA.

- Explanation. The FAA received applications from prospective site operators in the 1st Quarter of 2013 and is evaluating the applications per the established selection criteria and procedures. Any test range selected should provide the FAA, NASA, DoD, industry and academia with the opportunity for UAS prototype development and deployment.

Goal 3: Selected test ranges operational in accordance with the FMRA

- Explanation. The FMRA states that "the test range shall be operational no later than 180 days after the date on which a project is established."

Goal 4: Test range program operational until February 2017.

- Explanation. The FMRA requires the test range program to be terminated by February 2017.

Goal 5: Report findings and conclusions concerning projects in accordance with the FMRA.

- Explanation. The FMRA states that "Not later than 90 days after the date of the termination of the program...the Administrator shall submit to the Committee on Commerce, Science, and Transportation of the Senate and the Committee on Transportation and Infrastructure and the Committee on Science, Space, and Technology of the House of Representatives a report setting forth the Administrator's findings and conclusions concerning the projects."

C.8 Air Traffic Interoperability

Goal 1: Safety and Interoperability—The overall level of safety in the NAS is preserved through NAS integration, which requires adherence to rigorous airworthiness standards and airspace regulations. While they apply equally to manned aircraft, they also recognize the distinguishing characteristics of UAS.

A. Conduct research that validates the required functional and performance capabilities for safe operation of UAS within the various airspaces of the NAS from 2012 to 2017.

B. Air Traffic interoperability requirements will be allocated to appropriate Air Traffic program and UAS integration efforts from 2012 to 2017.

C. Employ existing strategies to conduct UAS integration safety analysis within SMS Manual guidance to ongoing safety analyses supporting ATC interoperability.

D. Conduct research on Sense and Avoid algorithms for collision avoidance and self-separation that are interoperable with evolving Next Generation Air Transportation System (NextGen) ATC systems and manned collision avoidance systems.

E. Analyze human factors data to determine the safest technologies and best procedures for air traffic controllers to provide services to UAS pilots.

F. Track safety and operational data to use as a basis for policy decisions from 2012 to 2017.

Goal 2: Procedures and Training

A. Develop ATC training requirements specific to different types of UAS characteristics, including UAS performance, behavior, communications, unique flight profiles, ATC standardized procedures, lost link/ fly away profiles, operating limitations, and emergency procedures. Initial training produced in 2009, first revision to be available in 3rd Quarter of 2013. Subsequent training development will occur through 2020.

B. B. Administer UAS training to ATC facilities throughout the NAS from 2013 to 2020.

C.9. Miscellaneous

Goal 1: Develop more detailed plans for safely integrating UAS operations in the NAS by 2015.

A. UAS ARC reviewed FAA and industry plans, including the 2006 Airspace Integration Plan, in 2012.

- Explanation. The 2006 Airspace Integration Plan modified the airspace integration plan developed under the government-industry Access 5 program to more directly address the eight major challenges with UAS integration in the NAS. The UAS ARC will review the 2006 plan and update recommendations consistent with current thinking, including goals and metrics documented in this roadmap.

B. UAS ARC made recommendations for changes to FAA and industry programs and provided them to the FAA in the 2nd Quarter of 2013.

- Explanation. The UAS ARC completed its review of FAA and related industry plans and sent the FAA recommendations for additional planning elements and details. These recommendations include proposed changes to existing and planned programs.

C. Updated FAA UAS Integration Roadmap published annually in accordance with the FMRA.

Goal 2: Identify air traffic management system changes required to be implemented in NextGen.

A. UAS are addressed in the FAA's 2012 *NextGen Implementation Plan* by the 4th Quarter of 2013.

- Explanation. This requires explicitly addressing the operation of UAS in the NAS and the evolution of enabling system capabilities in the various NextGen Segment Implementation Plans (NSIP). Although no significant changes to the current NAS and future NextGen are expected for the integration of UAS operations in unrestricted airspace, some system and procedure changes may be necessary. Any changes need to be incorporated in the *NextGen Implementation Plan,* so that appropriate adjustments to program baselines can be made.

B. UAS are addressed in FAA's NextGen Enterprise Architecture by the 4th Quarter of 2013.

- Explanation. This requires explicitly addressing the integration of UAS operations in the NAS, including the necessary operational concepts and system capabilities. The NextGen Enterprise Architecture identifies whatever is needed to integrate UAS operations in unrestricted airspace. The CY 2012 update to the NextGen Enterprise Architecture depicted FMRA milestones in the aircraft roadmap component.

Goal 3: Review and revise and/or develop new UAS operational scenarios to mature UAS operational concept elements, update operational requirements, and validate key concept elements for UAS integration into the NAS.

A. FAA initiates an effort to review existing UAS operational scenarios/concept elements and revise them and/or develop new scenarios, if needed, for use in UAS operational concept development per established air traffic system engineering practices by the 1st Quarter of 2014.

- Explanation. A rich set of operational scenarios and mature concept elements is needed to develop a complete set of operational requirements, from which system functional and performance requirements can be derived. Off-nominal operations may also be defined for conceivable contingency situations.

B. FAA uses vetted operational scenarios and other concept maturation products to update UAS operator and NAS operational requirements by the 3rd Quarter of 2014.

- Explanation. This process uses vetted scenarios and other mature concept elements to update and document the set of UAS operator and NAS operational requirements associated with integrating UAS operations into the NAS per established air traffic system engineering analyses and related processes.

C. FAA uses vetted operational scenarios, updated UAS operator and NAS requirements and other mature concept elements to validate key concept elements and requirements associated with integrating UAS operations into the NAS.

- Explanation. Air traffic system engineering processes continue to validate concept elements and requirements based on priority need for their validation. Concept element validation priorities will determine resource allocations and schedule for validation of respective concept elements.

Goal 4: Develop UAS integration in the Arctic Region in accordance with the FMRA

A. A. FAA evaluates key operational concepts for potential inclusion into appropriate operational policy and procedures documents (e.g., FAA Order 8900.1 (Flight Standards Information Management System), state Aeronautical Information Publication (AIP) supplements, Notices to Airmen (NOTAM), etc.) by the 2nd Quarter of 2015.

B. FAA and Arctic UAS operators examine the costs (e.g., aircraft certification, mandatory equipage requirements, etc.) and benefits (i.e., value of main business cases for use) by the 3rd Quarter of 2015.

C. FAA begins Air Traffic Organization (ATO) process to establish UAS Arctic Areas, including airspace designation and DoD notice, by the 3rd Quarter of 2015.

D. FAA completes safety studies in accordance with Section 335 of the FMRA by the 3rd Quarter of 2015. (Note: The first safety risk management (SRM) panel for initial projects convened in 2013 and has drafted the associated SRM document.)

E. FAA develops UAS restricted category special airworthiness certificate standards by the 3rd Quarter of 2015.

F. FAA reviews planning and approval documents (e.g., COA template, FAA Destination 2025, FAA Flight Plan 2012, other FAA/International Civil Aviation Organization (ICAO) documents) and evaluates or adapts their use for Arctic Area operations by 2015.

G. Begin international UAS scientific experiments (Marginal Ice Zone Observations and Processes Experiment (MIZOPEX)) with NASA, NOAA, and the University of Alaska), commercial UAS photography missions, or other expanded use/demonstration of UAS in accordance with the Arctic Plan by the 3rd Quarter of 2013.

Goal 5: Develop implementation of Common Strategy for DOJ and associated law enforcement, fire, and first responder agency use of sUAS in the NAS in accordance with the FMRA.

Note: Progress on original metrics is documented below along with metrics to be completed.

A. FAA began collaboration with the DHS Science and Technology (S&T) Directorate during the 4th Quarter of 2012 to support FAA testing and evaluation program of sUAS for law enforcement and first responders, with high-level suitability criteria.

B. FAA formally accepted and signed the MOU with the DOJ National Institute of Justice (NIJ) in the 1st Quarter of 2013.

C. FAA established a working group to examine validity of legacy pilot-in-command (PIC) and observer medical qualifications currently stipulated in COA guidelines in the 2nd Quarter of 2013.

D. FAA established a liaison with DOJ NIJ and U.S. Fire Administration on the development of common strategies for the deployment of sUAS technologies in support of fire enforcement agencies in the 2nd Quarter of 2013.

E. FAA established a working group to examine validity and alternatives to PIC certification requirements established in the 2nd Quarter of 2013.

F. FAA established a collaborative working group with DOJ NIJ and federal law enforcement agencies to examine, plan, and develop a nationwide COA process/approval for the Federal Bureau of Investigation, Bureau of Alcohol, Tobacco, Firearms and Explosives, the National Park Service, and other federal law enforcement and emergency management agencies with country-wide jurisdictions in the 2nd Quarter of 2013.

G. FAA incorporates key operational concepts of strategy into a revised law enforcement/first responder-specific COA template by the 4th Quarter of 2013.

H. FAA establishes a collaborative working group with DOJ NIJ and appropriate law enforcement agencies and trade associations to examine, plan, and develop a COA approval process for law enforcement and first responder mutual aid operations by the 4th Quarter of 2013.

I. FAA to establish working group with DOJ NIJ and the DHS S&T on the development of a technical bulletin on the Common Strategy for distribution to law enforcement/first responders across the nation by the 4th Quarter of 2013.

J. FAA commences collaboration and coordination with DOJ NIJ and DHS S&T to support the co-hosting of a DOJ/FAA/DHS-focused sUAS conference to be convened in the 4th Quarter of 2013.

K. FAA establishes a collaborative working group with DOJ NIJ, DHS and appropriate law enforcement associations to examine, plan, and develop guidelines for any law enforcement agency contemplating the use of unmanned aircraft by the 4th Quarter of 2013.

L. FAA establishes working group with DOJ NIJ on the development of a process for the collection of Unmanned Aircraft Aviation Operations Report data from law enforcement agencies by the 4th Quarter of 2013.

M. FAA completes the development of law enforcement and first responder sUAS competency evaluation procedures, safety risk analysis plan (SRAP), and evaluation checklist completed by the 4th Quarter of 2013.

N. FAA assists three different-sized law enforcement agencies in first implementation of the Common Strategy – target date coordinated with the agencies and confident timeline for the agencies – 4th Quarter of 2013.

- Explanation: FAA assistance is planned for one small agency (i.e., less than 100 sworn officers), one medium agency (i.e., 100 to 300 sworn officers), and one large law enforcement agency (i.e., greater than 300 sworn officers).

O. FAA establishes working group to examine sUAS aircraft recommended guidelines for law enforcement agencies contemplating the use of unmanned aircraft by the 4th Quarter of 2013.

P. FAA will complete COA online modifications to enable Common Strategy implementation by law enforcement agencies by the 4th Quarter of 2014.

Q. FAA reviews planning and approval documents (e.g., unique law enforcement agency COA template, FAA Flight Plan 2012, other FAA/ICAO documents) and modifies or adapts their use for law enforcement agency and first responder sUAS operations by 2015.

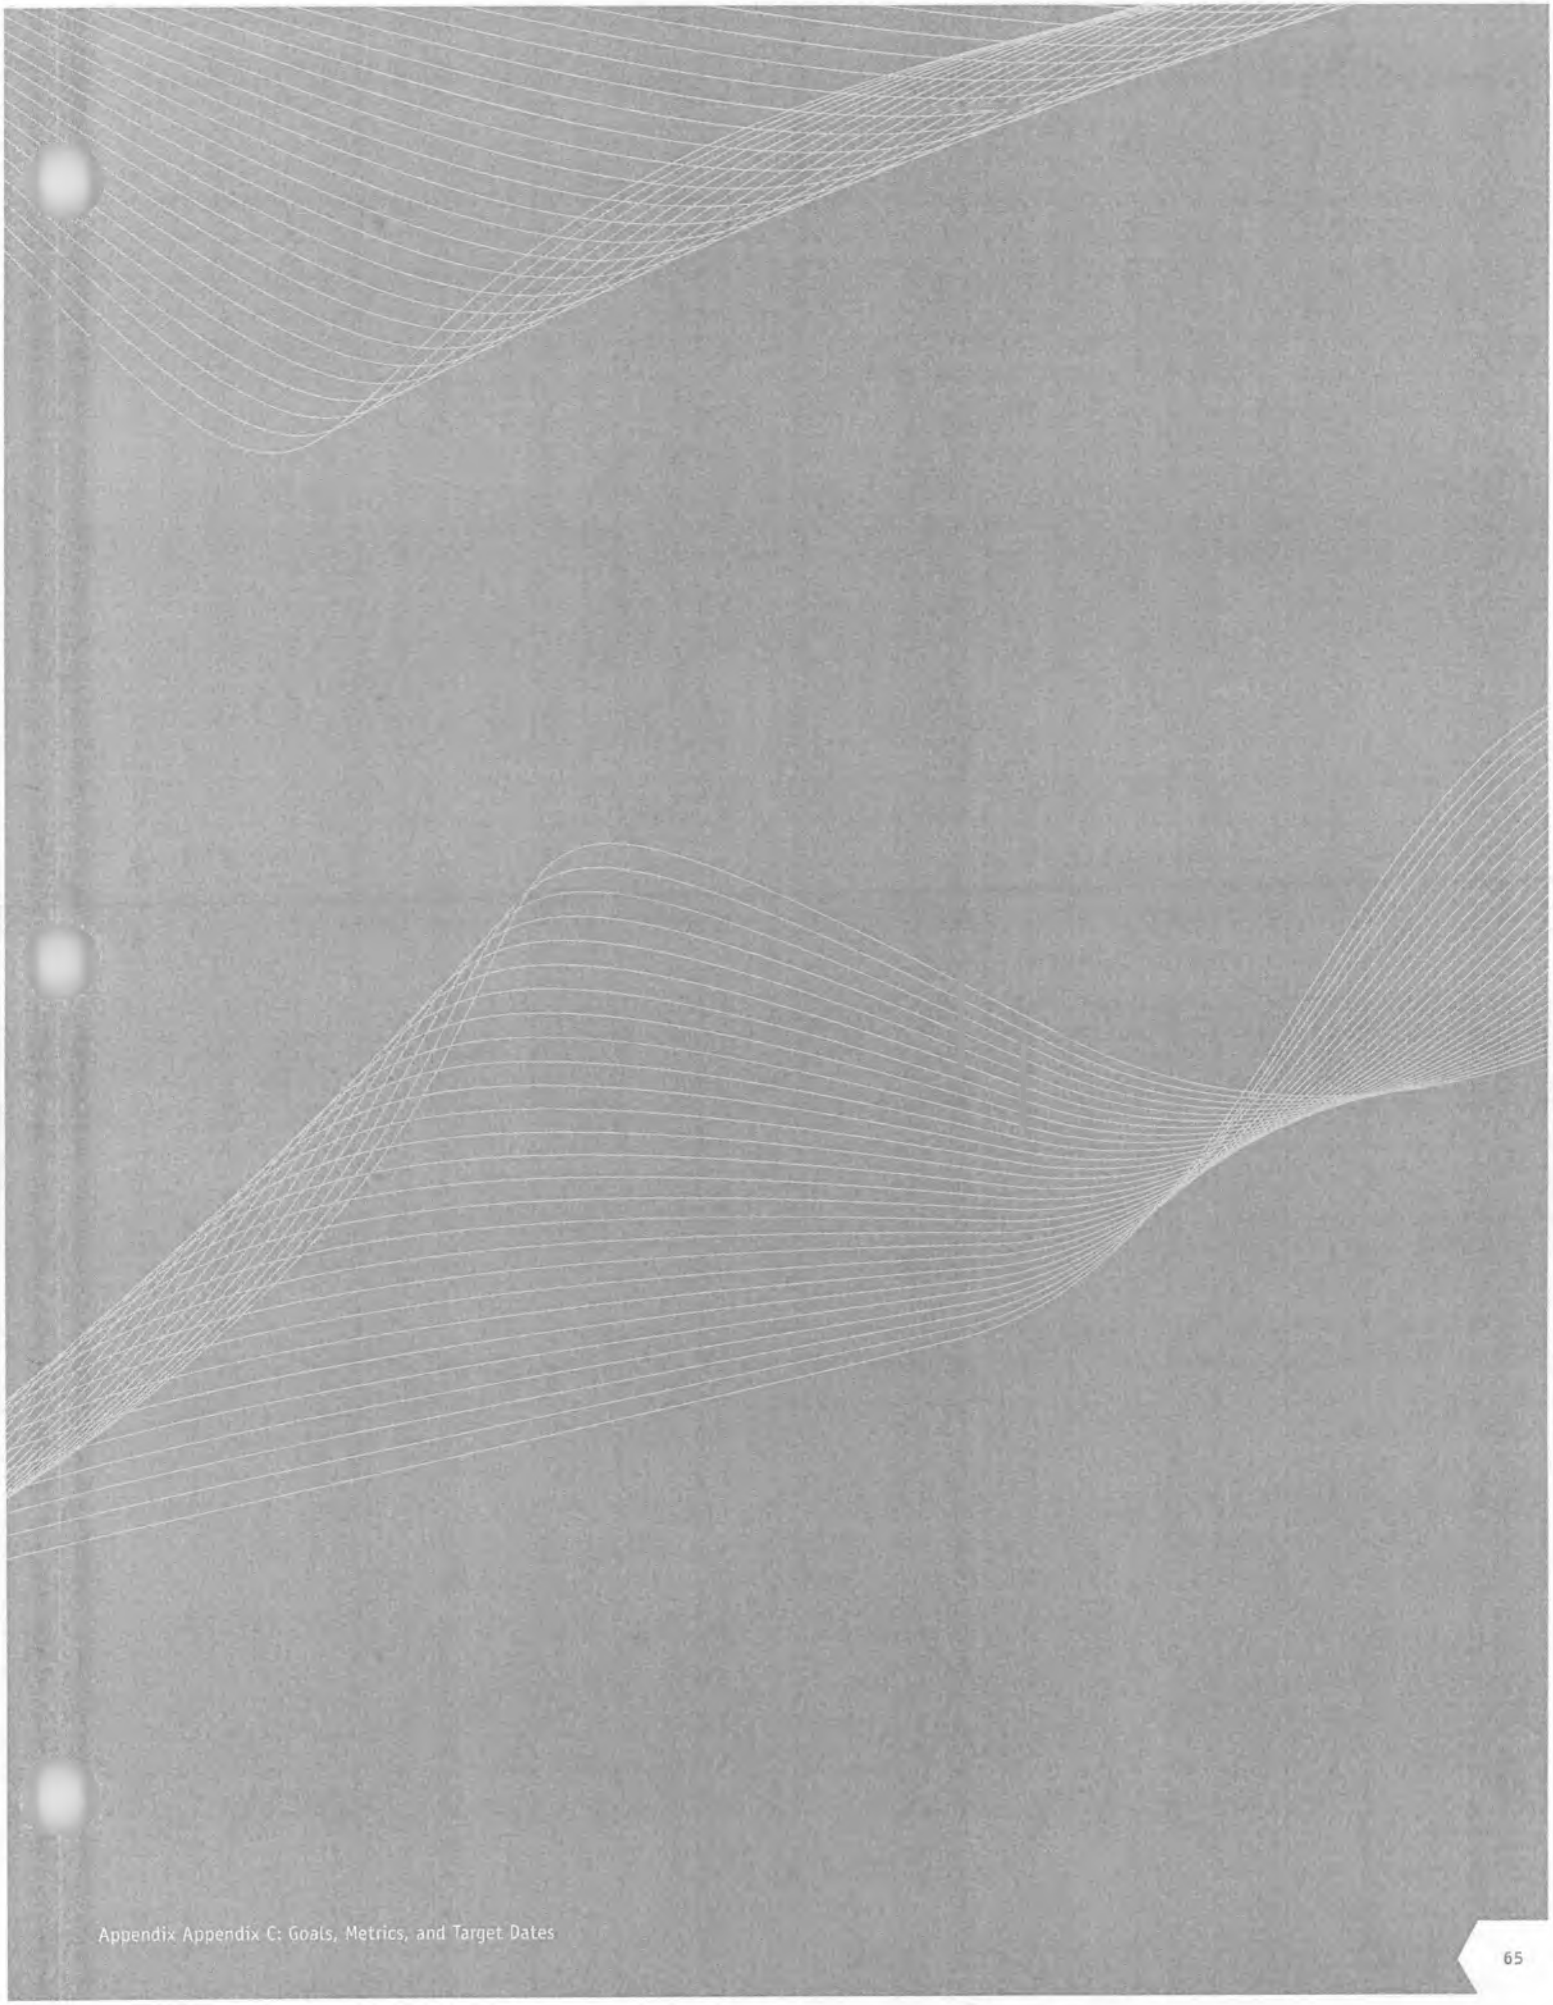
Goal 6: In accordance with the FMRA, develop policies to ensure "the Administrator of the FAA may not promulgate any rule or regulation regarding a model aircraft, or an aircraft being developed as a model aircraft."

A. Publish FAA order to establish criteria the agency will use to determine which model aircraft organizations can be considered community-based organizations.

B. Publish update to Federal Register that compares content of AC 91-57 and the FMRA, provides examples of careless and reckless operations, and makes distinction between modeling and commercial operations.

Goal 7: Requirements for the operation of "public unmanned aircraft systems" in the NAS in accordance with the FMRA.

A. Develop and implement operational and certification requirements for the operation of "public unmanned aircraft systems" in the NAS by the 4th Quarter of 2015.



Appendix D: FAA Modernization and Reform Act of 2012 Reference Text

Appendix D: FAA Modernization and Reform Act of 2012 Reference Text

Subtitle B—Unmanned Aircraft Systems

SEC. 331. DEFINITIONS.

In this subtitle, the following definitions apply:

(1) ARCTIC.—The term "Arctic" means the United States zone of the Chukchi Sea, Beaufort Sea, and Bering Sea north of the Aleutian chain.

(2) CERTIFICATE OF WAIVER; CERTIFICATE OF AUTHORIZATION.—The terms "certificate of waiver" and "certificate of authorization" mean a Federal Aviation Administration grant of approval for a specific flight operation.

(3) PERMANENT AREAS.—The term "permanent areas" means areas on land or water that provide for launch, recovery, and operation of small unmanned aircraft.

(4) PUBLIC UNMANNED AIRCRAFT SYSTEM.—The term "public unmanned aircraft system" means an unmanned aircraft system that meets the qualifications and conditions required for operation of a public aircraft (as defined in section 40102 of title 49, United States Code).

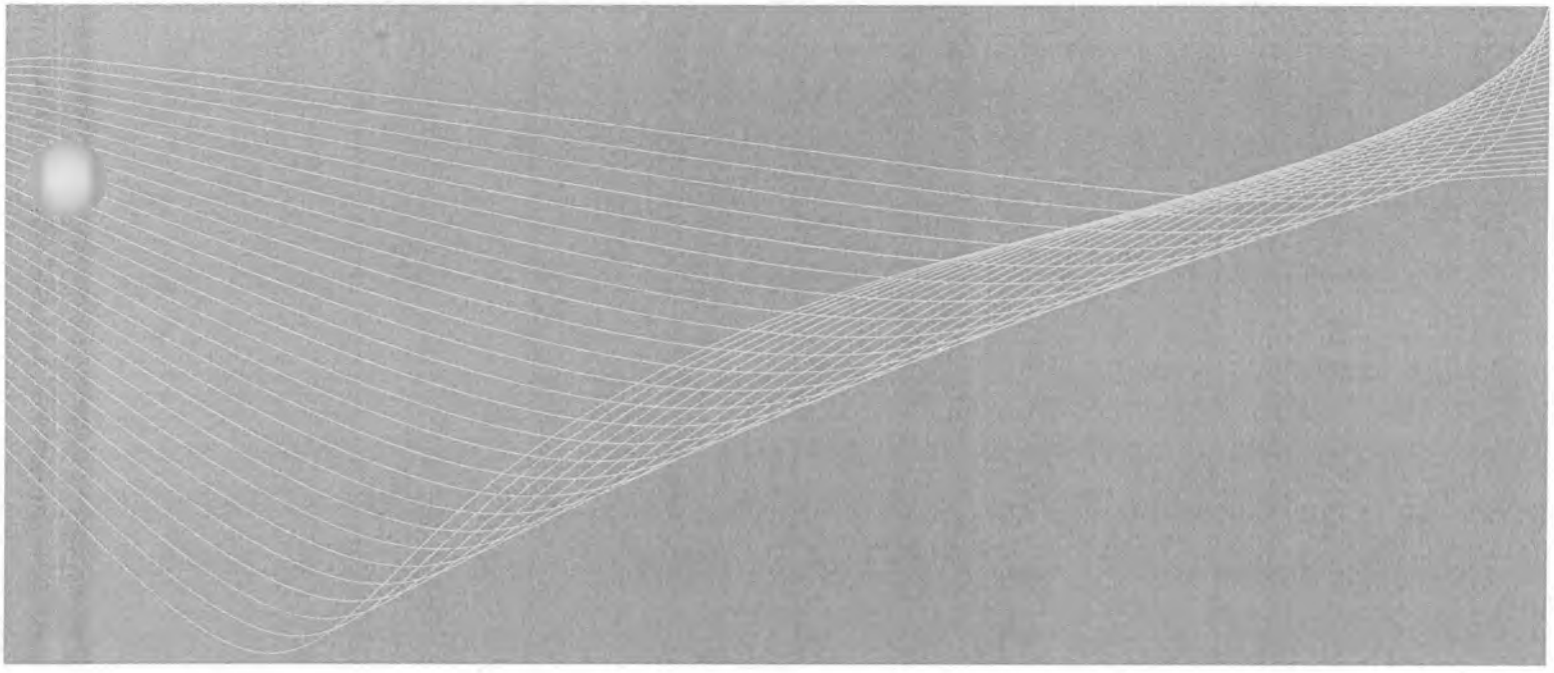
(5) SENSE AND AVOID CAPABILITY.—The term "sense and avoid capability" means the capability of an unmanned aircraft to remain a safe distance from and to avoid collisions with other airborne aircraft.

(6) SMALL UNMANNED AIRCRAFT.—The term "small unmanned aircraft" means an unmanned aircraft weighing less than 55 pounds.

(7) TEST RANGE.—The term "test range" means a defined geographic area where research and development are conducted.

(8) UNMANNED AIRCRAFT.—The term "unmanned aircraft" means an aircraft that is operated without the possibility of direct human intervention from within or on the aircraft.

(9) UNMANNED AIRCRAFT SYSTEM.—The term "unmanned aircraft system" means an unmanned aircraft and associated elements (including communication links and the components that control the unmanned aircraft) that are required for the pilot in command to operate safely and efficiently in the national airspace system.



SEC. 332. INTEGRATION OF CIVIL UNMANNED AIRCRAFT SYSTEMS INTO NATIONAL AIRSPACE SYSTEM.

(a) REQUIRED PLANNING FOR INTEGRATION.—

(1) COMPREHENSIVE PLAN.—Not later than 270 days after the date of enactment of this Act, the Secretary of Transportation, in consultation with representatives of the aviation industry, Federal agencies that employ unmanned aircraft systems technology in the national airspace system, and the unmanned aircraft systems industry, shall develop a comprehensive plan to safely accelerate the integration of civil unmanned aircraft systems into the national airspace system.

(2) CONTENTS OF PLAN.—The plan required under paragraph (1) shall contain, at a minimum, recommendations or projections on—

(A) the rulemaking to be conducted under subsection (b), with specific recommendations on how the rulemaking will—

(i) define the acceptable standards for operation and certification of civil unmanned aircraft systems;

(ii) ensure that any civil unmanned aircraft system includes a sense and avoid capability; and

(iii) establish standards and requirements for the operator and pilot of a civil unmanned aircraft system, including standards and requirements for registration and licensing;

(B) the best methods to enhance the technologies and subsystems necessary to achieve the safe and routine operation of civil unmanned aircraft systems in the national airspace system;

(C) a phased-in approach to the integration of civil unmanned aircraft systems into the national airspace system;

(D) a timeline for the phased-in approach described under subparagraph (C);

(E) creation of a safe

(F) airspace designation for cooperative manned and unmanned flight operations in the national airspace system;

(G) establishment of a process to develop certification, flight standards, and air traffic requirements for civil unmanned aircraft systems at test ranges where such systems are subject to testing;

(H) the best methods to ensure the safe operation of civil unmanned aircraft systems and public unmanned aircraft systems simultaneously in the national airspace system; and

(I) incorporation of the plan into the annual NextGen Implementation Plan document (or any successor document) of the Federal Aviation Administration.

(3) DEADLINE.—The plan required under paragraph (1) shall provide for the safe integration of civil unmanned aircraft systems into the national airspace system as soon as practicable, but not later than September 30, 2015.
(4) REPORT TO CONGRESS.—Not later than 1 year after the date of enactment of this Act, the Secretary shall submit to Congress a copy of the plan required under paragraph (1).
(5) ROADMAP.—Not later than 1 year after the date of enactment of this Act, the Secretary shall approve and make available in print and on the Administration's Internet Web site a 5-year roadmap for the introduction of civil unmanned aircraft systems into the national airspace system, as coordinated by the Unmanned Aircraft Program Office of the Administration. The Secretary shall update the roadmap annually.

(b) RULEMAKING.—Not later than 18 months after the date on which the plan required under subsection (a)(1) is submitted to Congress under subsection (a)(4), the Secretary shall publish in the Federal Register—

(1) a final rule on small unmanned aircraft systems that will allow for civil operation of such systems in the national airspace system, to the extent the systems do not meet the requirements for expedited operational authorization under section 333 of this Act;

(2) a notice of proposed rulemaking to implement the recommendations of the plan required under subsection (a)(1), with the final rule to be published not later than 16 months after the date of publication of the notice; and

(3) an update to the Administration's most recent policy statement on unmanned aircraft systems, contained in Docket No. FAA-2006-25714.

(c) PILOT PROJECTS.—
(1) ESTABLISHMENT.—Not later than 180 days after the date of enactment of this Act, the Administrator shall establish a program to integrate unmanned aircraft systems into the national airspace system at 6 test ranges. The program shall terminate 5 years after the date of enactment of this Act.

(2) PROGRAM REQUIREMENTS.—In establishing the program under paragraph (1), the Administrator shall—
(A) safely designate airspace for integrated manned and unmanned flight operations in the national airspace system;
(B) develop certification standards and air traffic requirements for unmanned flight operations at test ranges;
(C) coordinate with and leverage the resources of the National Aeronautics and Space Administration and the Department of Defense;
(D) address both civil and public unmanned aircraft systems;
(E) ensure that the program is coordinated with the Next Generation Air Transportation System; and (F) provide for verification of the safety of unmanned aircraft systems and related navigation procedures before integration into the national airspace system.

(3) TEST RANGE LOCATIONS.—In determining the location of the 6 test ranges of the program under paragraph (1), the Administrator shall—
(A) take into consideration geographic and climatic diversity;
(B) take into consideration the location of ground infrastructure and research needs; and
(C) consult with the National Aeronautics and Space Administration and the Department of Defense.

(4) TEST RANGE OPERATION.—A project at a test range shall be operational not later than 180 days after the date on which the project is established.

(5) REPORT TO CONGRESS.—

(A) IN GENERAL.—Not later than 90 days after the date of the termination of the program under paragraph (1), the Administrator shall submit to the Committee on Commerce, Science, and Transportation of the Senate and the Committee on Transportation and Infrastructure and the Committee on Science, Space, and Technology of the House of Representatives a report setting forth the Administrator's findings and conclusions concerning the projects.

(B) ADDITIONAL CONTENTS.—The report under sub-paragraph (A) shall include a description and assessment of the progress being made in establishing special use air-space to fill the immediate need of the Department of Defense—

(i) to develop detection techniques for small unmanned aircraft systems; and

(ii) to validate the sense and avoid capability and operation of unmanned aircraft systems.

(d) EXPANDING USE OF UNMANNED AIRCRAFT SYSTEMS IN ARCTIC.—

(1) IN GENERAL.—Not later than 180 days after the date of enactment of this Act, the Secretary shall develop a plan and initiate a process to work with relevant Federal agencies and national and international communities to designate permanent areas in the Arctic where small unmanned aircraft may operate 24 hours per day for research and commercial purposes. The plan for operations in these permanent areas shall include the development of processes to facilitate the safe operation of unmanned aircraft beyond line of sight. Such areas shall enable over-water flights from the surface to at least 2,000 feet in altitude, with ingress and egress routes from selected coastal launch sites.

(2) AGREEMENTS.—To implement the plan under paragraph (1), the Secretary may enter into an agreement with relevant national and international communities.

(3) AIRCRAFT APPROVAL.—Not later than 1 year after the entry into force of an agreement necessary to effectuate the purposes of this subsection, the Secretary shall work with relevant national and international communities to establish and implement a process, or may apply an applicable process already established, for approving the use of unmanned aircraft in the designated permanent areas in the Arctic without regard to whether an unmanned aircraft is used as a public aircraft, a civil aircraft, or a model aircraft.

SEC. 333. SPECIAL RULES FOR CERTAIN UNMANNED AIRCRAFT SYSTEMS.

(a) IN GENERAL.—Notwithstanding any other requirement of this subtitle, and not later than 180 days after the date of enactment of this Act, the Secretary of Transportation shall determine if certain unmanned aircraft systems may operate safely in the national airspace system before completion of the plan and rulemaking required by section 332 of this Act or the guidance required by section 334 of this Act.

(b) ASSESSMENT OF UNMANNED AIRCRAFT SYSTEMS.—In making the determination under subsection (a), the Secretary shall determine, at a minimum—

(1) which types of unmanned aircraft systems, if any, as a result of their size, weight, speed, operational capability, proximity to airports and populated areas, and operation within visual line of sight do not create a hazard to users of the national airspace system or the public or pose a threat to national security; and

(2) whether a certificate of waiver, certificate of authorization, or airworthiness certification under section 44704 of title 49, United States Code, is required for the operation of unmanned aircraft systems identified under paragraph (1).

(c) REQUIREMENTS FOR SAFE OPERATION.—If the Secretary determines under this section that certain unmanned aircraft systems may operate safely in the national airspace system, the Secretary shall establish requirements for the safe operation of such aircraft systems in the national airspace system.

SEC. 334. PUBLIC UNMANNED AIRCRAFT SYSTEMS.

(a) GUIDANCE.—Not later than 270 days after the date of enactment of this Act, the Secretary of Transportation shall issue guidance regarding the operation of public unmanned aircraft systems to—

(1) expedite the issuance of a certificate of authorization process;

(2) provide for a collaborative process with public agencies to allow for an incremental expansion of access to the national airspace system as technology matures and the necessary safety analysis and data become available, and until standards are completed and technology issues are resolved;

(3) facilitate the capability of public agencies to develop and use test ranges, subject to operating restrictions required by the Federal Aviation Administration, to test and operate unmanned aircraft systems; and

(4) provide guidance on a public entity's responsibility when operating an unmanned aircraft without a civil air-worthiness certificate issued by the Administration.

(b) STANDARDS FOR OPERATION AND CERTIFICATION.—Not later than December 31, 2015, the Administrator shall develop and implement operational and certification requirements for the operation of public unmanned aircraft systems in the national airspace system.

(c) AGREEMENTS WITH GOVERNMENT AGENCIES.—

(1) IN GENERAL.—Not later than 90 days after the date of enactment of this Act, the Secretary shall enter into agreements with appropriate government agencies to simplify the process for issuing certificates of waiver or authorization with respect to applications seeking authorization to operate public unmanned aircraft systems in the national airspace system.

(2) CONTENTS.—The agreements shall—

(A) with respect to an application described in paragraph (1)—

(i) provide for an expedited review of the application;

(ii) require a decision by the Administrator on approval or disapproval within 60 business days of the date of submission of the application; and

(iii) allow for an expedited appeal if the application is disapproved;

(B) allow for a one-time approval of similar operations carried out during a fixed period of time; and

(C) allow a government public safety agency to operate unmanned aircraft weighing 4.4 pounds or less, if operated—

(i) within the line of sight of the operator;

(ii) less than 400 feet above the ground;

(iii) during daylight conditions;

(iv) within Class G airspace; and

(v) outside of 5 statute miles from any airport, heliport, seaplane base, spaceport, or other location with aviation activities.

SEC. 335. SAFETY STUDIES.

The Administrator of the Federal Aviation Administration shall carry out all safety studies necessary to support the integration of unmanned aircraft systems into the national airspace system.

SEC. 336. SPECIAL RULE FOR MODEL AIRCRAFT.

(a) IN GENERAL.—Notwithstanding any other provision of law relating to the incorporation of unmanned aircraft systems into Federal Aviation Administration plans and policies, including this subtitle, the Administrator of the Federal Aviation Administration may not promulgate any rule or regulation regarding a model aircraft, or an aircraft being developed as a model aircraft, if—

(1) the aircraft is flown strictly for hobby or recreational use;

(2) the aircraft is operated in accordance with a community-based set of safety guidelines and within the programming of a nationwide community-based organization;

(3) the aircraft is limited to not more than 55 pounds unless otherwise certified through a design, construction, inspection, flight test, and operational safety program administered by a community-based organization;

(4) the aircraft is operated in a manner that does not interfere with and gives way to any manned aircraft; and

(5) when flown within 5 miles of an airport, the operator of the aircraft provides the airport operator and the airport air traffic control tower (when an air traffic facility is located at the airport) with prior notice of the operation (model aircraft operators flying from a permanent location within 5 miles of an airport should establish a mutually-agreed upon operating procedure with the airport operator and the airport air traffic control tower (when an air traffic facility is located at the airport)).

(b) STATUTORY CONSTRUCTION.—Nothing in this section shall be construed to limit the authority of the Administrator to pursue enforcement action against persons operating model aircraft who endanger the safety of the national airspace system.

(c) MODEL AIRCRAFT DEFINED.—In this section, the term "model aircraft" means an unmanned aircraft that is—

(1) capable of sustained flight in the atmosphere;

(2) flown within visual line of sight of the person operating the aircraft; and

(3) flown for hobby or recreational purposes.

THE SECRETARY OF TRANSPORTATION
WASHINGTON, D.C. 20590

November 6, 2013

The Honorable John Thune
Ranking Member
Committee on Commerce, Science
and Transportation
United States Senate
Washington, DC 20510

Dear Senator Thune:

As required by Section 332(a) of the FAA Modernization and Reform Act of 2012, I am pleased to provide you with the U.S. Department of Transportation's Unmanned Aircraft Systems (UAS) Comprehensive Plan. The Federal Aviation Administration's Joint Planning and Development Office developed this comprehensive plan under the guidance of the Next Generation Air Transportation System (NextGen) Senior Policy Committee, and in coordination with NextGen partner representatives. The Plan outlines the safe acceleration of the integration of civil UAS into the National Airspace System (NAS).

The UAS Comprehensive Plan includes UAS National Goals and Objectives that reflect the NextGen partner agencies' UAS mission needs. The work accomplished by the multi-agency teams in Fiscal Year 2012 provides the foundation for embarking on the path towards safe integration of UAS in the NAS. The completed work provides a common framework for evolving interagency coordination and planning and is a testament to the collaboration among representatives from the partner agencies and the UAS community.

A similar letter has been sent to the Chairmen of the Senate Committee on Commerce, Science and Transportation and the House Committee on Transportation and Infrastructure and the Ranking Member of the House Committee on Transportation and Infrastructure.

Sincerely,

Anthony R. Foxx

THE SECRETARY OF TRANSPORTATION
WASHINGTON, D.C. 20590

November 6, 2013

The Honorable John D. Rockefeller IV
Chairman
Committee on Commerce, Science
and Transportation
United States Senate
Washington, DC 20510

Dear Mr. Chairman:

As required by Section 332(a) of the FAA Modernization and Reform Act of 2012, I am pleased to provide you with the U.S. Department of Transportation's Unmanned Aircraft Systems (UAS) Comprehensive Plan. The Federal Aviation Administration's Joint Planning and Development Office developed this comprehensive plan under the guidance of the Next Generation Air Transportation System (NextGen) Senior Policy Committee, and in coordination with NextGen partner representatives. The Plan outlines the safe acceleration of the integration of civil UAS into the National Airspace System (NAS).

The UAS Comprehensive Plan includes UAS National Goals and Objectives that reflect the NextGen partner agencies' UAS mission needs. The work accomplished by the multi-agency teams in Fiscal Year 2012 provides the foundation for embarking on the path towards safe integration of UAS in the NAS. The completed work provides a common framework for evolving interagency coordination and planning and is a testament to the collaboration among representatives from the partner agencies and the UAS community.

A similar letter has been sent to the Chairman of the House Committee on Transportation and Infrastructure and the Ranking Members of the Senate Committee on Commerce, Science and Transportation and the House Committee on Transportation and Infrastructure.

Sincerely,

Anthony R. Foxx

EXECUTIVE SUMMARY

The *Unmanned Aircraft Systems (UAS) Comprehensive Plan* details work that has been accomplished, along with future efforts needed to achieve safe integration of UAS into the National Airspace System (NAS). Throughout Fiscal Year 2012 (FY12), work was conducted to develop elements required to create a more complete picture of achieving safe UAS integration. The perspectives and information available from these individual activities create a framework and reveal an evolving capability for the integration of UAS into the NAS.

Representatives from the Next Generation Air Transportation System (NextGen) partner agencies – the Departments of Transportation (DOT), Defense (DoD), Commerce (DOC), and Homeland Security (DHS), the National Aeronautics and Space Administration (NASA), and the Federal Aviation Administration (FAA) – as well as industry representatives, provided through the FAA's UAS Aviation Rulemaking Committee (ARC), have actively participated in constructing this Plan. The completed work is a testament to the collaboration among representatives from the partner agencies and the UAS community.

The continued safe integration of UAS in the NAS and increased NAS access for UAS will be driven by incremental advances in: research and development (R&D) (including test ranges); rulemaking (including operational approval and airworthiness standards); and development of UAS-related technologies. Safe integration will lead us from today's need for accommodation of UAS through individual approvals to a time when standardized/routine integration into the NextGen environment is well defined.

Six high-level strategic goals that are specific, measureable, attainable, realistic, and timely were developed to reflect the principal objective of safe UAS integration into the NAS. These high-level goals – summarized below – were derived from existing goals provided by the partner agencies and should therefore resonate with the wide range of UAS stakeholders.

The overarching approach for the Goals is to allow public integration to lay the framework for civil integration. The first two Goals apply to small UAS (under 55 pounds) within visual line-of-sight (VLOS), assuming the public realm would be accomplished first and civil would follow; the third and fourth Goals apply to the other UAS, with the same process: public would occur first and civil would follow. Goal 5 was established to plan and manage growing automation capabilities through research, and Goal 6 provides the opportunity for the U.S. to remain leaders in the international forum. The sum of these Goals shows a phased-in approach for UAS integration in the NAS.

The *UAS Comprehensive Plan* sets the overarching, interagency goals, objectives, and approach to integrating UAS into the NAS. Each partner agency will work to achieve these national goals, and may develop agency-specific plans that are aligned to the national goals and objectives. The FAA's *Integration of Civil UAS in the NAS Roadmap* is an example of one such plan. It outlines, for planning purposes and within a broad timeline, the tasks, assumptions, dependencies, and considerations needed to enable UAS integration in the NAS within the wider UAS community. It will remain consistent with the *UAS Comprehensive Plan.* The FAA's UAS Concept of Operations (ConOps) reflects their desired end-state, and lays out the pathway for achieving this end-state, anticipating the technological and procedural enhancements required to make

integration happen. In addition, it begins the engineering process of incorporating UAS-specific changes into the *NextGen Implementation Plan.*

Understanding and prioritizing the R&D needs associated with each of the UAS National Goals is key to achieving robust integration of UAS in the NAS. The need for new capabilities, mitigations, and verification and validation methods to enable safe and secure operations will require the development, integration, and implementation of emerging and new technologies. Each agency presents varying needs and possesses a significant body of expertise resulting from historical investments in UAS operations. R&D-related activities undertaken in FY12 have initiated a process by which the partner agencies can share information and coordinate their research to support the UAS National Goals, maximize the return on investment dollars, and ensure that research products address the FAA's needs beyond 2015.

Two additional activities that are critical to the integration of UAS include the small UAS Rule and the test range program. First, the FAA is drafting a Notice of Proposed Rulemaking (NPRM), targeted for release in calendar year 2014 that is intended to lead to requirements and parameters for how small UAS will be integrated into the NAS. Second, a Screening Information Request (SIR) for the test site selection process was published by the FAA on February 14, 2013. The selection of the six test ranges is anticipated to be completed by the end of calendar year 2013.

The work accomplished in FY12 provides the foundation for safe integration of UAS in the NAS. Valuable relationships have been established and a commitment among the NextGen partners is reflected in the UAS National Goals. Details required for UAS integration implementation are laid out in the FAA's *Integration of Civil UAS in the NAS Roadmap* which will be updated annually. These annual updates will track and report progress. The FAA's UAS ConOps begins the process of including UAS-related changes in the FAA's *NextGen Implementation Plan.* A process has been initiated for how research that enables emerging technology can be identified, prioritized, and integrated into the *NextGen Implementation Plan.* Finally, a small UAS rulemaking project has been initiated, and the test range selection process is underway.

Important non-safety related issues, such as privacy and national security, need to be taken into consideration as UAS are integrated into the NAS. The privacy requirements proposed for the UAS test sites are specifically designed for the operation of the test sites and are not intended to pre-determine the long-term policy and regulatory framework under which UAS would operate. However, the FAA anticipates that the privacy policies developed by the test site operators will help inform the dialogue among policymakers, privacy advocates, and the industry regarding broader questions concerning the use of UAS technologies in the NAS.

Collectively, the efforts described in this document represent the framework of the *UAS Comprehensive Plan.* They will continue to be refined as needed, in FY13 and beyond, until safe integration of UAS in the NAS is accomplished for both public and civil UAS users.

1. INTRODUCTION

Over the last 50 years, rapid advances in aviation technology have transformed the nation's skies. Our National Airspace System (NAS) has evolved to include a wide variety of fixed wing and rotary aircraft of various sizes, weights, and speeds, operating across the country from populated complex metropolitan areas to remote airfields supporting small communities. They operate in a range of airspace, from low-altitude to the stratosphere. Some are dependent on thermals and wind, such as gliders and balloons, and others fly faster than the speed of sound, such as supersonic planes and spacecraft. As aircraft technology expands, so do the challenges associated with maintaining a safe and integrated NAS. And, with the recent advent of and growing interest in remotely piloted aircraft – commonly known as Unmanned Aircraft Systems (UAS) – addressing these challenges in a complex, multi-layered system has never been more critical. UAS are to be integrated in an already shaped and automated NAS and Air Traffic Control (ATC) environment that was originally developed for manned aircraft.

The use of UAS has increased significantly in the United States. From agricultural monitoring and border surveillance to local crime scene investigations, search and rescue missions, disaster response (e.g., wildfires and floods), and military training, UAS provide a wide variety of operational, societal, and economic benefits to its diverse group of users. For example, according to the Teal Group, the market for government and commercial use of UAS is expected to grow, with small UAS having the greatest growth potential.[1] Teal forecasts that the worldwide expenditures on UAS and related research could be potentially as much as $89.1 billion in aggregate over the next decade, with the United States playing a leading role. However, as the demand for UAS increases, concerns regarding how UAS will impact existing aviation grow stronger, especially in terms of safety, privacy, frequency crowding, and airspace congestion.

In 2008, the Government Accountability Office (GAO) reported[2] that the U.S. must develop a clear and common understanding of what is required to safely and routinely operate UAS in the NAS. Additionally, Congress underscored the significance of UAS integration when it enacted the FAA Modernization and Reform Act of 2012. Through this legislation, Congress set forth a number of specific requirements[3] for achieving UAS integration – namely, a Comprehensive Plan and a five-year Roadmap.

This *UAS Comprehensive Plan* is expected to address the following elements:

- FAA rulemaking projects being conducted under Section 332, sub-section (b).
- Methods to enhance technologies and subsystems necessary for safe and routine operation of civil UAS.
- Phased-in approach to civil UAS integration into the NAS.
- Timeline for phased-in integration.

[2] U.S. Government Accountability Office. (2008, May) *Unmanned Aircraft Systems: Federal Actions Needed to Ensure Safety and Expand Their Potential Uses within the National Airspace System*, GAO-08-511. http://www.gao.gov/assets/280/275328.pdf

[3] See Appendix A: FAA Modernization and Reform Act of 2012 - UAS Requirements.

- Airspace designation of manned and UAS operations in a cooperative NAS environment.
- Establishment of a process to inform FAA rulemaking projects related to certification, flight standards, and air traffic requirements for civil UAS, and the process for gathering informational data from designated test ranges.
- Methods to ensure simultaneous safe operations of civil and public UAS within the NAS.
- Incorporation of the Plan into the annual *Next Generation Air Transportation System (NextGen) Implementation Plan.*

Ultimately, cost-effective and safe implementation will require multi-agency coordination to develop a national-level plan that guides routine UAS operations in the NAS.

In April 2012, under the guidance of the NextGen Senior Policy Committee (SPC), the Joint Planning and Development Office (JPDO) answered this challenge, assembling executive- and working-level teams comprised of individuals from the NextGen partner agencies – the Departments of Transportation (DOT), Defense (DoD), Commerce (DOC), and Homeland Security (DHS) as well as the National Aeronautics and Space Administration (NASA), and the Federal Aviation Administration (FAA). These individuals began the work required to develop a UAS plan. The initial objective of the collective team was to create and coordinate approval of UAS National Goals and Objectives that are reflective of the NextGen partner agencies' UAS mission needs, and predicated on data and information from existing documentation aggregated by the JPDO.[4] Ultimately, the UAS National Goals and Objectives represent the framework and foundation of the *UAS Comprehensive Plan* – an endeavor the JPDO is leading in collaboration with the NextGen partners, which is further described in detail within this document.

The *UAS Comprehensive Plan* sets the overarching, interagency goals, objectives and approach to integrating UAS into the NAS. Each partner agency will work to achieve these national goals, and may develop agency-specific plans that are aligned to the national goals and objectives. The FAA's *Integration of Civil UAS in the NAS Roadmap* is an example of one such plan. It outlines, for planning purposes and within a broad timeline, the tasks, assumptions, dependencies, and considerations needed to enable UAS integration in the NAS within the wider UAS community. It will remain consistent with the *UAS Comprehensive Plan*. The FAA's UAS Concept of Operations (ConOps) reflects their desired end-state, and lays out the pathway for achieving this end-state, anticipating the technological and procedural enhancements required to make integration happen. In addition, it begins the engineering process of incorporating UAS-specific changes into the NextGen Implementation Plan.

Additionally, this Comprehensive Plan supports the coordination and integration of research and development (R&D) necessary to achieve the UAS National Goals and the FAA's Integration Roadmap goals. Development of a *NextGen UAS Research, Development and Demonstration (RD&D) Roadmap*, prioritization methodology, and prioritization database in Fiscal Year 2012 (FY12) established initial information and a process for the JPDO and partner agencies to

[4] See Appendix B: UAS National Goals and Objectives Source Documents.

collaborate in their efforts to identify and address R&D needs for UAS capabilities beyond 2015. Assessment of R&D needs and prioritizing the activities is an essential element of the Comprehensive Plan.

The FAA's chief mission is to ensure the safety and efficiency of the NAS. This includes manned and unmanned aircraft operations. While the expanded use of UAS presents great opportunities, it also presents significant challenges as unmanned aircraft systems are inherently different from manned aircraft.

Safety, Privacy, Civil Rights, Civil Liberties & Security

Members of the NextGen SPC agree on the need to address privacy concerns of the public at large while safely integrating UAS in the NAS. As use of UAS by civil agencies and private industry grows, preserving the privacy, civil rights, and civil liberties of individuals becomes increasingly important. In October 2012, the SPC committed to working together on this issue and suggested that answers to privacy policy questions could be accomplished in stages.

The FAA also recognizes the importance of non-safety related issues, such as privacy and civil liberties, physical security, and potential economic opportunities, which all Federal agencies and stakeholders participating in the development of UAS policy will need to take into consideration as UAS are integrated into the NAS. Specific to privacy concerns, the FAA has proposed and is requesting public input on a privacy approach for the UAS test site program that attempts to prudently address privacy concerns by emphasizing transparency, public engagement, and compliance with existing law.

The UAS test sites authorized by Congress can provide an opportunity for development and demonstration by the test site operators and users of policies and operating approaches that would address both UAS operator mission needs and related individual privacy concerns. The lessons learned and best practices established at the test sites may be applied more generally to protect privacy in UAS operations throughout the NAS. This incremental approach will provide an example to both private and public sectors on a safe and secure way to employ UAS that is consistent with the need for privacy.

Federal agencies are mindful that national defense and homeland security measures are to be designed and performed without diminishing the privacy, civil rights, and civil liberties of individuals. There are specific laws applicable to public agencies that ensure that those agencies follow privacy principles. In addition, many agencies have their own internal privacy policies providing guidance to their employees about the importance of privacy, civil rights, and civil liberties. Robust privacy policies, privacy impact assessments, and privacy compliance reviews or audits are just some of the tools that Federal agencies may use as mechanisms to protect individual rights and liberties.

Although there is no Federal law that specifically addresses privacy concerns with respect to civil UAS operations, many states have laws that protect individuals from invasions of privacy which could be applied to intrusions committed by using a UAS.

Integrating public and civil UAS into the NAS carries certain national security implications, including cyber and communications security, domestic framework for US government operations, national airspace and defense, airman vetting/general aviation, and privacy concerns. In coordination with the National Security Staff at the White House, the FAA is working in conjunction with relevant agency partners on an Interagency Policy Committee to address these issues.

The sections that follow highlight the results of the FY12 activities and explain how these pieces are a part of or may influence the Comprehensive Plan for UAS integration in the NAS.

2. APPROACH

Several initiatives have advanced in parallel to plan for the integration of UAS in the NAS. They address the need for a common set of goals, a common understanding of how UAS will operate in the NAS, a timeline for accomplishing the activities required to allow for safe integration of UAS, and a way to evaluate research needs that enable prompt technology improvements to support the successful execution of that timeline. The highlights of these activities are included here.

2.1 UAS NATIONAL GOALS, OBJECTIVES, AND TARGETS

The JPDO developed the UAS National Goals, Objectives, and Targets in coordination with executive- and working-level representatives provided by the NextGen partner agencies. The interagency team emphasized that the UAS National Goals must represent the achievable UAS capabilities, considering user and stakeholder mission needs, type of operations, and operational boundaries.

The initial framing of the UAS National Goals and Objectives leveraged 12 key source documents,[5] including UAS roadmaps, plans, and integration efforts from various agencies. Key goals, objectives, requirements, supporting activities, and dates from applicable reference documents provided insight into agency-specific UAS initiatives. The common goals and themes reflected in the extracted data served as the basis for the development of six UAS National Goals and eight Objectives. These UAS National Goals and Objectives are not directly linked on a one-for-one basis, but rather, a specific objective could support a range of Goals.

The following assumptions frame the formulation of the UAS National Goals, Objectives, and Targets:

- Routine operations for UAS should not require exceptions or unique authorizations.
- Targets reflect the earliest start dates mandated by the FAA Modernization and Reform Act of 2012[6] for achieving initial capability in support of the UAS National Goals.
- The UAS National Goals and Objectives must align with – and not supersede – government United States Code (U.S.C.) title authorities and responsibilities (see below for further elaboration).
- Partner agency documents constitute a baseline reflecting current plans and efforts toward safe UAS integration in the NAS.[7]

---

[5] Ibid.

[6] The FAA Modernization and Reform Act of 2012 specifies the following UAS target dates for safe UAS integration into the NAS:

- August 14, 2014 – Publish a final rule on small UAS. Required by Section 332 (b)(1).
- September 30, 2015 – "No later than date" for safe integration of civil UAS into the NAS. Required by Section 332(a)(3).

The final set of UAS National Goals and Objectives represents the result of several iterations of refinement and review by partner agencies and approval by the UAS National Plan Partner Agency Senior-Level Executives designated by the JPDO Board.

The Comprehensive Plan does not supersede government U.S.C. title authorities and responsibilities. The UAS National Goals and Objectives provide a framework for interagency coordination and planning. Government agencies will comply with their own processes, policies, and standards regarding airworthiness, pilot, aircrew and maintenance personnel certification and recurrent training. The authority to safely conduct public aircraft operations in the NAS is derived from Title 49, United States Code (49 U.S.C. §§ 40102(a) (41) and 40125). If no government UAS processes, policies, or standards exist, it is recommended that the agency apply specific provisions of 14 Code of Federal Regulations (CFR) applicable to civil UAS operations when they are published. The appropriate public or civil authority will be responsible for establishing the requirements called out in the UAS National Objectives.

2.1.1 UAS NATIONAL GOALS

1. Routine Public Small UAS Visual Line-of-Sight (VLOS) Operations Conducted in the NAS (without special authorization; i.e., Certificate of Authorization) (2015)[8]

- Initial Capability[9]: Operations outside of Class B/C airspace and not over populated areas.
- Full Capability[10]: Operations in all applicable domestic airspace classes subject to airspace requirements.

2. Routine Civil Small UAS VLOS Operations Conducted in the NAS (without special authorization; i.e., Special Airworthiness Certificate) (2015)

- Initial Capability: Operations outside of Class B/C airspace and not over populated areas.
- Full Capability: Operations in all applicable domestic airspace classes subject to airspace requirements.

3. Routine Public UAS Operations in the NAS (2015)

- Initial Capability: Using mitigation for UAS limitations to comply with 14 CFR Part 91 requirements.
- Full Capability: UAS compliance with revised operating requirements addressing unique UAS attributes.

4. Routine Civil UAS Operations in the NAS (2020)

- Initial Capability: Using mitigation for UAS limitations to comply with 14 CFR Part 91 requirements.

---

[7] See Appendix B: UAS National Goals and Objectives Source Documents.

[8] Dates assigned to the UAS National Goals indicate when the Initial Capability will be available.

[9] Initial Capability: An initial implementation available for operations that supports the planned UAS National Goal.

[10] Full Capability: A final implementation available for operations that completes the planned UAS National Goal.

- Full Capability: UAS compliance with revised operating requirements addressing unique UAS attributes.

5. Define, Determine, and Establish Acceptable Levels of Automation for UAS in the NAS (TBD)[11]

6. Foster U.S. International Leadership in UAS Capabilities and in Standards Development (Ongoing)

- Initial Capability: UAS operations in airspace where the U.S. has the responsibility for the provision of Air Traffic Services (ATS).
- Full Capability: Harmonized UAS operations in accordance with International UAS Standards and Recommended Practices (SARPs).

2.1.2 UAS NATIONAL OBJECTIVES

1. Establish Applicable Certification and Training Requirements for Pilots/Crew Members, Other UAS Operational Personnel, and Appropriate Air Navigation Service Provider (ANSP) Personnel

1.1. Determine the roles and responsibilities of applicable pilots/crew members, other UAS operational personnel, and appropriate ANSP personnel for safe UAS integration.
1.2. Develop and propose regulatory changes, as required, to define licensing (certification) and training requirements for pilots/crew members, other UAS operational personnel, and appropriate ANSP personnel (address in 14 CFR Part 61, 63, 65, and 141-147).
1.3. Publish, if required, final rule requirements for applicable pilots/crew members, other UAS operational personnel, and appropriate ANSP personnel.
1.4. Begin training and certification initiatives for pilots/crew members, other UAS operational personnel, and appropriate ANSP personnel.

2. Approve Applicable Medical Requirements and Standards (e.g., address 14 CFR Part 67)

2.1. Develop and propose regulatory changes, as required, to define draft medical requirements and standards.
2.2. Publish, if required, a final rule establishing medical requirements and standards.

3. Establish Applicable Airworthiness Certification Requirements

3.1. Facilitate the initiation of applicable classification and basis of airworthiness certification.
3.2. Facilitate the development of draft airworthiness design standards.
3.3. Develop applicable draft airworthiness certification advisory circulars.
3.4. Approve and publish final system airworthiness certification advisory circulars.
3.5. Ensure that a robust and integrated test environment is available to develop, test, and evaluate UAS.
3.6. Administer certification, including Advisory Circular (AC) guidance and oversight.

[11] A roadmap will be developed in 2015 which will help determine when this goal will be accomplished.

4. Implement Small UAS Rules

4.1. Develop and publish small UAS Rules for operations within VLOS of the pilot or observer.

4.2. Issue permits to operate as applicable to small UAS (FAA).

5. Approve the Use of Ground Based Sense and Avoid (GBSAA) for UAS Operations

5.1. Define GBSAA performance requirements for access to all applicable domestic airspace classes subject to airspace requirements and classes of aircraft.

5.2. Define GBSAA equipment and operating requirements for access to all applicable domestic airspace classes subject to airspace requirements and classes of aircraft.

5.3. Test GBSAA equipment and procedures.

5.4. Approve GBSAA operations for routine use.

6. Approve the Use of Airborne Sense and Avoid (ABSAA) for UAS Operations

6.1. Define ABSAA performance requirements for access to all applicable domestic airspace classes subject to airspace requirements and classes of aircraft.

6.2. Define ABSAA equipment and operating requirements for access to all applicable domestic airspace classes subject to airspace requirements and classes of aircraft.

6.3. Test ABSAA equipment and procedures.

6.4. Amend 14 CFR 91.113 (Right-of-way-rules) to allow ABSAA

6.5. Approve ABSAA operations for routine use.

7. Develop and Integrate UAS Enabling Technologies within the NAS Infrastructure to Support Appropriate Levels of Automation

7.1. Coordinate, develop, and refine existing and/or emerging ontologies for automation. Baseline the ontology(ies) in order to provide standard terminology, roles, responsibilities, modes, and levels for usage in: requirements analysis, standards development, modeling and simulations assessments, systems development, procedures development, testing, certification processes, training documentation, and research specifications. Maintain consistency and interoperability with other automation systems to enable future systems of systems integration.

7.2. Develop a UAS Automation Roadmap (UAR) that evaluates the use of increasing levels of automation within the context of FAA NextGen infrastructure and stakeholder R&D capabilities. Continue to coordinate and update the UAR along with the NextGen UAS RD&D Roadmap.

7.3. Determine the requirements and develop, certify, and field UAS enabling technologies to support enhanced automation capabilities.

8. Approve Integrated Operations for Manned Aircraft and UAS in the NAS

8.1. Develop UAS agency-specific Integration Transition Plans.

8.2. Develop Airspace Integration Safety Case/Assessment.

8.3. Develop and publish operational standards, procedures, and guidance for UAS airspace operations (Regulations, Policy Documents, Advisory Circulars, Orders, Notices, Handbooks, and Manuals).

8.4. Develop and publish operational standards, procedures, and guidance relative to airport facilities and UAS surface operations (Regulations, Policy Documents, Advisory Circulars, Orders, Notices, Handbooks and Manuals).

2.2 INTEGRATION OF CIVIL UAS IN THE NAS ROADMAP (FAA'S INTEGRATION ROADMAP)

The FAA's Integration Roadmap contains FAA-developed goals, metrics (activities), and target dates (or date ranges), and incorporates many related UAS Aviation Rulemaking Committee (ARC) recommendations. The FAA's Integration Roadmap is a five-year plan, and target dates are generally limited to this horizon. The FAA will reflect necessary changes to the existing set of goals, metrics, and target dates in yearly updates to the FAA's Integration Roadmap. These annual updates enable tracking and progress reporting as recommended by the GAO.

The goals are, for the most part, intended to be addressed concurrently. The metrics help establish and maintain common government and industry expectations, and enable objective assessments of the progress made toward accomplishing each goal. The goals and metrics collectively reflect the incremental approach to UAS certification and integration, and establish a set of strategic objectives that can guide the definition of lower-level activities, schedules, and resource requirements.

Goals and metrics were developed for each of the following UAS focus areas:

(1) Certification Requirements (Airworthiness)
(2) Certification Requirements (Pilot/Crew)
(3) Ground Based Sense and Avoid (GBSAA)
(4) Airborne Sense and Avoid (ABSAA)
(5) Control and Communications (C2)
(6) Small UAS and Other Rules
(7) Test Ranges
(8) Air Traffic Interoperability
(9) Miscellaneous

These focus areas represent the elements that should be addressed to enable UAS integration in the NAS. Figure 1 is an example of the information contained in the FAA's Integration Roadmap.

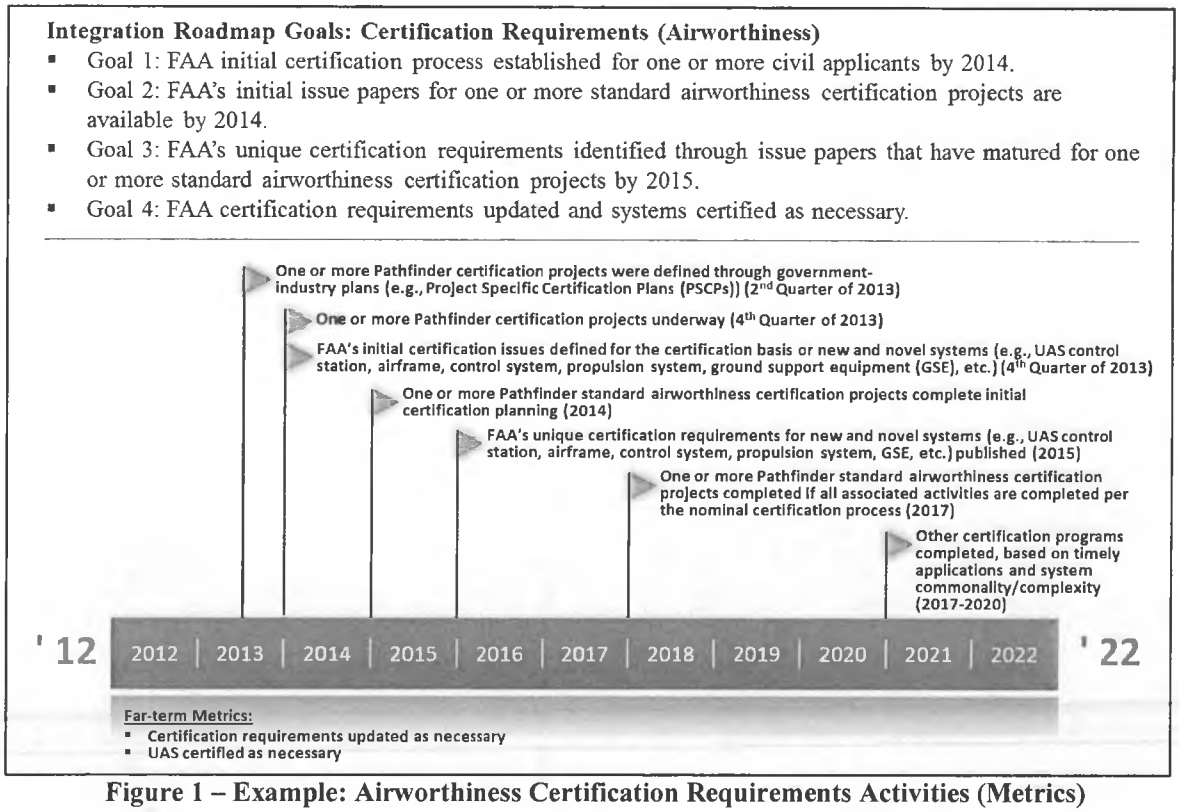

Figure 1 – Example: Airworthiness Certification Requirements Activities (Metrics)

2.3 UAS RESEARCH AND DEVELOPMENT (R&D) PRIORITIZATION

The FAA has established R&D priorities to successfully achieve UAS capabilities envisioned in 2015. However, the UAS National Goals to be achieved after initial integration in 2015 require technology solutions that are not fully available today. Understanding and prioritizing R&D needs associated with each of the UAS National Goals is critical to achieving robust integration of UAS in the NAS. Each partner agency brings unique needs and possesses a significant body of expertise resulting from historical investments in UAS operations. As a result, R&D-related activities undertaken in FY12 have established a process by which the partner agencies can share information and coordinate their research to support the UAS National Goals, maximize the return on investment dollars, and ensure that research products address the FAA's needs beyond 2015.

The FY12 UAS R&D efforts, focused on establishing a basis for identifying and prioritizing R&D needs, include the following:

- Developing and issuing a *NextGen UAS RD&D Roadmap*, which provided a catalog of R&D efforts.
- Establishing JPDO and multi-agency teams to facilitate coordination of R&D-related efforts.
- Developing an approach for prioritizing R&D topics based on the UAS National Goals.

The prioritization of R&D topics began with the *NextGen UAS RD&D Roadmap.*[12] Developed in 2011 and signed in 2012, the Roadmap is a catalog of ongoing and planned R&D efforts being conducted by the NextGen partners to support the integration of UAS operations in the NAS. Additionally, the process established a means for partner agencies to exchange information and coordinate with the FAA. Subject matter experts from the partner agencies – FAA, NASA, DoD, DHS, and DOC – contributed to the *NextGen UAS RD&D Roadmap*, identifying planned and ongoing work and critical R&D challenges in their areas of expertise. The *NextGen UAS RD&D Roadmap* defined 23 challenges within the four technical tracks of Communications, Airspace Operations, Unmanned Aircraft, and Human Systems Integration.

The FY12 R&D effort used the *NextGen UAS RD&D Roadmap* and other studies to establish a prioritization approach linked to the UAS National Goals. This activity established prospective R&D topics, prioritization categories, a UAS R&D database, and an initial list of proposed high-priority R&D needs to achieve the UAS National Goals. Representatives from partner agencies participated in developing and reviewing the methodology and the preliminary results.

The methodology incorporates four steps:

- Use the UAS National Goals to represent the requirements driving R&D needs.
- Develop a detailed list of prospective R&D topics (the FY12 effort identified 244 topics addressing 52 aspects of UAS integration in the NAS).
- Assign a priority category (Safety Critical, Necessary, Enhances, Not Applicable) to each of the R&D topics with respect to each of the UAS National Goals beyond initial integration in 2015.
- Summarize the prioritized topics associated with each of the 23 R&D challenges identified in the *NextGen UAS RD&D Roadmap*.

One of the major outcomes of the FY12 effort includes development of an initial UAS R&D prioritization database created by a team of subject matter experts working with partner agency representatives. The database documents the relationships among identified R&D needs, R&D challenges, UAS National Goals, and relative priorities. It will be used as a basis for more extensive FY13 UAS R&D prioritization work.

2.3.1 INTERAGENCY RESEARCH COLLABORATION

In addition to the JPDO-led research collaboration, the FAA has been increasing its research collaboration with the NextGen partner agencies. Details of those efforts are listed in the paragraphs below.

The FAA is providing subject matter experts to support NASA's "UAS Integration in the NAS" project to review research objectives and assumptions. The FAA and NASA have shared UAS research project plans and analysis results, and have identified the need to minimize duplicative

[12] Joint Planning and Development Office, (2012, March)
http://www.jpdo.gov/library/20120315_UAS%20RDandD%20Roadmap.pdf

efforts and determine how UAS research, expertise, and assets can be leveraged between them. There is an umbrella interagency agreement for UAS research between the FAA and NASA, which will allow the FAA to centralize and focus its collaboration with NASA while capitalizing on expertise across all NASA research centers. Specific focus with NASA is in the areas of Human Systems Integration, Communications, Certification, Separation Assurance/Sense and Avoid Interoperability, and Integrated Test and Evaluation.

The FAA and DoD have collaborated on the Defense Department's UAS – Airspace Integration (UAS-AI) Quick Reaction Test. The FAA is also collaborating with DoD/USNORTHCOM on the follow-on Joint Test, which commenced at the end of calendar year 2012. In addition, the FAA conducted an evaluation of the DoD Joint ConOps for UAS-AI, which focuses on near-term advanced accommodation of UAS in the NAS. The suite of proposed flight profile tests will potentially serve as an incremental step to inform the FAA's Integration Roadmap.

The FAA and DHS collaborated on the FAA's Demo 4. Demo 4's high-level research objectives were to assess the ability for an independent Ground-Based Voice Communication System to restore communication between the UAS pilot and ATC in the event of a lost link/lost communication scenario. The objectives also tested the viability of providing an independent Cockpit Display of Traffic Information system to aid a UAS pilot in tracking own-ship information in the event of a lost link/lost communication scenario. The UAS Demonstration Team successfully completed Demo 4 by observing a Customs and Border Protection operational flight in October 2012.

2.4 TEST RANGES

During FY12, the FAA initiated a program for test ranges in accordance with the FAA Modernization and Reform Act of 2012. This effort successfully generated a Screening Information Request (SIR) after a public comment period and public webinars, with almost 800 registrants, to address questions on the test ranges. All comments were adjudicated and the final SIR soliciting applications was published on February 14, 2013. The deadline for submitting applications was May 6, 2013. The FAA is currently evaluating the applications and anticipates that the test sites will be selected by the end of calendar year 2013. As part of the test range agreements, the FAA will be collecting information that will help inform future rulemaking activities and other policy decisions related to safety, privacy, and economic growth. In addition, NextGen partner agencies will leverage their individual and networked laboratory facilities and test infrastructure, as appropriate, to advance the goals and objectives of this plan.

2.5 SMALL UAS RULE

A Notice of Proposed Rulemaking (NPRM) on small UAS is under development with the intent to provide safe small UAS access to the NAS. The NPRM for small UAS is being drafted and is targeted for release in 2014.

3. INTEGRATED APPROACH AND THE PATH FORWARD

As described in the previous section, many parallel activities have been conducted to support the generation of this Comprehensive Plan. Each of these pieces plays a critical role in ultimately achieving the safe integration of UAS in the NAS.

Achieving approval of the UAS National Goals and Objectives by the NextGen partners was a key accomplishment, since this allowed the stakeholders to work in unison.[13] With six approved National Goals and eight Objectives, there is a common framework and timeline to begin the UAS integration work. The overarching approach for the Goals is to allow public integration to lay the framework for civil integration. The first two Goals apply to small UAS (under 55 pounds) within VLOS, assuming the public realm would be accomplished first and civil would follow; the third and fourth Goals apply to the other UAS, with the same process: public would occur first and civil would follow. Goal 5 was established to plan and manage growing automation capabilities through research, and Goal 6 provides the opportunity for the U.S. to remain leaders in the international forum. The sum of these Goals shows a phased-in approach for UAS integration in the NAS.

The FAA's UAS ConOps provides the mechanism to enable integration of UAS needs into the FAA's *NextGen Implementation Plan.* Assessment of R&D needs to support the UAS ConOps and prioritizing the activities is an essential element of the Comprehensive Plan. Since the FAA has already defined critical research to support what is required for 2015, the FY13 R&D prioritization effort addresses R&D efforts in support of UAS integration beyond 2015. The FY13 R&D prioritization activity will develop these needs and identify ongoing research efforts in close coordination with the partner agencies.

The need for new capabilities, mitigations, and verification and validation methods to enable safe operations will require the development, integration, and implementation of emerging and new technologies. Advanced planning is essential, since lead times for developing technology for full implementation of UAS National Goals beyond 2020 can span many years. The scope of issues involved in UAS integration in the NAS dictates that R&D activities must be well understood within an integrated framework in terms of relevance, timeliness, and relationships among related research activities. Using the draft methodology generated in FY12 as guidance, the JPDO will lead a more extensive UAS research prioritization activity in FY13. The NextGen *UAS RD&D Roadmap* and prioritization of R&D needs to represent significant steps toward planning and coordinating the R&D required to achieve the UAS National Goals. The JPDO and its partners plan to continue this activity with the following next steps:

- Refine the prioritization methodology.
- Update and refine the UAS R&D prioritization database, including incorporation of R&D needs associated with policy decisions and mitigation of identified risks.
- Update the UAS R&D inventory established in the *NextGen UAS RD&D Roadmap.*
- Conduct a gap analysis comparing the inventory in an updated *NextGen UAS RD&D Roadmap* to validated R&D needs identified by the R&D prioritization activity.
- Work with the partner agencies to establish R&D Community of Interest that addresses integration of UAS in the NAS.

[13] Partner agency approval is in final coordination.

- Identify further steps to fill the gaps and plan, coordinate, and assess progress of R&D associated with the UAS National Goals.

The FAA's Integration Roadmap lays out a rolling five-year plan for implementing UAS integration in the NAS. It supports the UAS National Goals and Objectives and anticipates the technology and procedural enhancements required to make integration happen. In general, it provides a timeline for phased-in integration of UAS in the NAS. The FAA's Integration Roadmap was shaped by industry recommendations received through the FAA's UAS ARC and implementation details will be added through FY13.

In addition to the activities listed above, two other activities are underway that are critical to the successful integration of UAS in the NAS. The small UAS Rule is under development, and is expected to begin to address the first two UAS National Goals. Also, the test range program has been defined and initiated. The FAA anticipates the selection will be announced by the end of calendar year 2013. The small UAS Rule and the test range program activities are included in the FAA's Integration Roadmap.

4. CONCLUSION

UAS play a unique role in the safety and security of many U.S. military and civil missions. Due to the diverse utility that UAS offer, their use is expected to increase exponentially once safe and efficient integration in the NAS is accomplished. As a result, developing a safe and efficient way for UAS to operate in the NAS with manned aircraft has become a critical issue – particularly in the planning and implementation of NextGen.

In 2008, the GAO reported that the U.S. must develop a clear and common understanding of what is required to safely and routinely operate UAS in the NAS. Congress then enacted the FAA *Modernization and Reform Act of 2012*, which laid out a number of requirements for achieving UAS integration, namely, a Comprehensive Plan and a five-year Roadmap. In early 2012, the JPDO addressed this challenge by assembling executive- and working-level teams comprised of individuals from the NextGen partner agencies. Ultimately, the work accomplished by these multi-agency teams in FY12 provided the foundation for embarking on the path towards safe integration of UAS in the NAS. The JPDO will continue to convene partner agency teams to address such issues as security, privacy, civil rights, and civil liberties as the opportunity is presented, enabling integration across several key policy areas of interest.

Specifically, valuable relationships have been established and the commitment shared by the NextGen partners is reflected in the UAS National Goals. Details required for UAS integration implementation are described in the FAA's Integration Roadmap, which will be updated annually. Also, the overarching process has been defined for how research priorities to enable emerging technology will be identified and integrated into the FAA's *NextGen Implementation Plan.* The test ranges will be positioned to provide data to assist with engineering activities that will support integration.

Collectively, the efforts described in this document represent the framework of the *UAS Comprehensive Plan.* They will continue in FY13 and beyond, as needed, until safe integration of UAS in the NAS is accomplished for both public and civil UAS users.

APPENDIX A – FAA MODERNIZATION AND REFORM ACT OF 2012: UAS REQUIREMENTS

To amend title 49, United States Code, to authorize appropriations for the Federal Aviation Administration for fiscal years 2011 through 2014, to streamline programs, create efficiencies, reduce waste, and improve aviation safety and capacity, to provide stable funding for the national aviation system, and for other purposes.

TITLE III—SAFETY
Subtitle B—Unmanned Aircraft Systems

SEC. 332. INTEGRATION OF CIVIL UNMANNED AIRCRAFT SYSTEMS INTO NATIONAL AIRSPACE SYSTEM

(a) REQUIRED PLANNING FOR INTEGRATION.—

(1) COMPREHENSIVE PLAN.—Not later than 270 days after the date of enactment of this Act, the Secretary of Transportation, in consultation with representatives of the aviation industry, Federal agencies that employ unmanned aircraft systems technology in the national airspace system, and the unmanned aircraft systems industry, shall develop a comprehensive plan to safely accelerate the integration of civil unmanned aircraft systems into the national airspace system.

(2) CONTENTS OF PLAN.—The plan required under paragraph (1) shall contain, at a minimum, recommendations or projections on—

(A) the rulemaking to be conducted under subsection (b), with specific recommendations on how the rulemaking will—

(i) define the acceptable standards for operation and certification of civil unmanned aircraft systems;

(ii) ensure that any civil unmanned aircraft system includes a sense and avoid capability; and

(iii) establish standards and requirements for the operator and pilot of a civil unmanned aircraft system, including standards and requirements for registration and licensing;

(B) the best methods to enhance the technologies and subsystems necessary to achieve the safe and routine operation of civil unmanned aircraft systems in the national airspace system;

(C) a phased-in approach to the integration of civil unmanned aircraft systems into the national airspace system;

(D) a timeline for the phased-in approach described under subparagraph (C);

(E) creation of a safe[14]

(F) airspace designation for cooperative manned and unmanned flight operations in the national airspace system;

(G) establishment of a process to develop certification, flight standards, and air traffic requirements for civil unmanned aircraft systems at test ranges where such systems are subject to testing;

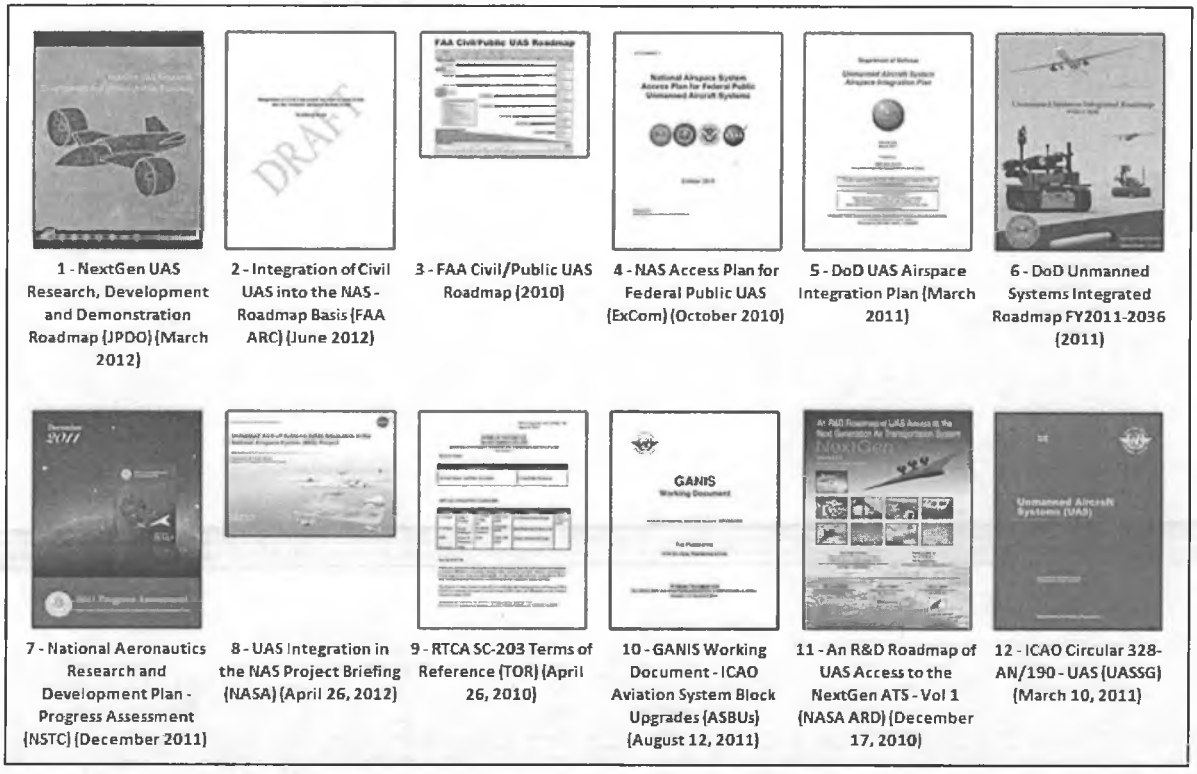
[14] Additional wording for this requirement may have been inadvertently omitted from this Bill (H.R.658).

(H) the best methods to ensure the safe operation of civil unmanned aircraft systems and public unmanned aircraft systems simultaneously in the national airspace system;
(I) incorporation of the plan into the annual NextGen Implementation Plan document (or any successor document) of the Federal Aviation Administration.

(3) DEADLINE.—The plan required under paragraph (1) shall provide for the safe integration of civil unmanned aircraft systems into the national airspace system as soon as practicable, but not later than September 30, 2015.
(4) REPORT TO CONGRESS.—Not later than 1 year after the date of enactment of this Act, the Secretary shall submit to Congress a copy of the plan required under paragraph (1).
(5) ROADMAP.—Not later than 1 year after the date of enactment of this Act, the Secretary shall approve and make available in print and on the Administration's Internet Web site a five-year roadmap for the introduction of civil unmanned aircraft systems into the national airspace system, as coordinated by the Unmanned Aircraft Program Office of the Administration. The Secretary shall update the roadmap annually.

APPENDIX B – UAS NATIONAL GOALS AND OBJECTIVES SOURCE DOCUMENTS

The documents that were used to extract UAS National Goals and Objectives pertaining to safe UAS integration in the NAS are depicted below.



1 - NextGen UAS Research, Development and Demonstration Roadmap (JPDO) (March 2012)

2 - Integration of Civil UAS into the NAS - Roadmap Basis (FAA ARC) (June 2012)

3 - FAA Civil/Public UAS Roadmap (2010)

4 - NAS Access Plan for Federal Public UAS (ExCom) (October 2010)

5 - DoD UAS Airspace Integration Plan (March 2011)

6 - DoD Unmanned Systems Integrated Roadmap FY2011-2036 (2011)

7 - National Aeronautics Research and Development Plan - Progress Assessment (NSTC) (December 2011)

8 - UAS Integration in the NAS Project Briefing (NASA) (April 26, 2012)

9 - RTCA SC-203 Terms of Reference (TOR) (April 26, 2010)

10 - GANIS Working Document - ICAO Aviation System Block Upgrades (ASBUs) (August 12, 2011)

11 - An R&D Roadmap of UAS Access to the NextGen ATS - Vol 1 (NASA ARD) (December 17, 2010)

12 - ICAO Circular 328-AN/190 - UAS (UASSG) (March 10, 2011)

1. NextGen UAS Research, Development and Demonstration Roadmap (JPDO) (March 2012)
2. Integration of Civil UAS into the NAS – Roadmap Basis (FAA UAS ARC) (June 2012)
3. FAA Civil/Public UAS Roadmap (2010)
4. NAS Access Plan for Federal Public UAS (ExCom) (October 2010)
5. DoD UAS Airspace Integration Plan (March 2011)
6. DoD Unmanned Systems Integrated Roadmap FY2011-2036 (2011)
7. National Aeronautics Research and Development Plan - Progress Assessment (NSTC) (December 2011)
8. UAS Integration into the NAS Project Briefing (NASA) (April 26, 2012)
9. RTCA SC-203 Terms of Reference (TOR) (April 26, 2010)

10. GANIS Working Document - ICAO Aviation System Block Upgrades (ASBUs) (August 12, 2011)

11. An R&D Roadmap of UAS Access to the NextGen ATS - Vol 1 (NASA ARD) (December 17, 2010)

12. ICAO Circular 328-AN/190 - UAS (UASSG) (March 10, 2011)

APPENDIX C – UAS COMPREHENSIVE PLAN DEFINITIONS

Term	Definition
Civil Aviation	Civil aviation includes two major categories:[15] (1) Air transport, including all passenger and cargo flights operating on regularly scheduled routes, as well as on demand flights. (2) General aviation (GA), including all other civil flights, private or commercial. All air transport is commercial, but general aviation can be either commercial or private. Normally, the pilot, aircraft, and operator must all be authorized to perform commercial operations through separate commercial licensing, registration, and operation certificates.
Class A Airspace	Generally, that airspace from 18,000 feet MSL up to and including FL 600, including the airspace overlying the waters within 12 nautical miles of the coast of the 48 contiguous States and Alaska. Unless otherwise authorized, all persons must operate their aircraft under IFR.
Class B Airspace	Generally, that airspace from the surface to 10,000 feet MSL surrounding the nation's busiest airports in terms of airport operations or passenger enplanements. The configuration of each Class B airspace area is individually tailored and consists of a surface area and two or more layers (some Class B airspaces areas resemble upside-down wedding cakes), and is designed to contain all published instrument procedures once an aircraft enters the airspace. An ATC clearance is required for all aircraft to operate in the area, and all aircraft that are so cleared receive separation services within the airspace. The cloud clearance requirement for VFR operations is "clear of clouds."
Class C Airspace	Generally, that airspace from the surface to 4,000 feet above the airport elevation (charted in MSL) surrounding those airports that have an operational control tower, are serviced by a radar approach control, and that have a certain number of IFR operations or passenger enplanements. Although the configuration of each Class C area is individually tailored, the airspace usually consists of a surface area with a five nautical mile (NM) radius, a circle with a 10NM radius that extends no lower than 1,200 feet up to 4,000 feet above the airport elevation, and an outer area that is not charted. Each person must establish two-way radio communications with the ATC facility providing air traffic services prior to entering the airspace and thereafter maintain those communications while within the airspace. VFR aircraft are only separated from IFR aircraft within the airspace.
Class D Airspace	Generally, that airspace from the surface to 2,500 feet above the airport elevation (charted in MSL) surrounding those airports that have an operational control tower. The configuration of each Class D airspace area is individually tailored and when instrument procedures are published, the airspace will normally be designed to contain the procedures. Arrival

[15] Federal Aviation Regulations FAR Part 91, 110, 121, 125, 135.

	extensions for instrument approach procedures may be Class D or Class E airspace. Unless otherwise authorized, each person must establish two-way radio communications with the ATC facility providing air traffic services prior to entering the airspace and thereafter maintain those communications while in the airspace. No separation services are provided to VFR aircraft.
Class E Airspace	Generally, if the airspace is not Class A, Class B, Class C, or Class D, and it is controlled airspace, it is Class E airspace. Class E airspace extends upward from either the surface or a designated altitude to the overlying or adjacent controlled airspace. When designated as a surface area, the airspace will be configured to contain all instrument procedures. Also in this class are Federal airways, airspace beginning at either 700 or 1,200 feet AGL used to transition to/from the terminal or en route environment, en route domestic, and offshore airspace areas designated below 18,000 feet MSL. Unless designated at a lower altitude, Class E airspace begins at 14,500 MSL over the United States, including that airspace overlying the waters within 12 nautical miles of the coast of the 48 contiguous States and Alaska, up to, but not including 18,000 feet MSL, and the airspace above FL 600.
Class G Airspace	That airspace not designated as Class A, B, C, D or E.
Full Capability	A final implementation available for operations that completes the planned UAS National Goal.
Goal	Statement of an end result or outcome desired by stakeholders.
Initial Capability	An initial implementation available for operations that supports the planned UAS National Goal.
Milestone	A significant point in time or event for achieving a specific result.
National Airspace System (NAS)	The common network of U.S. airspace; air navigation facilities, equipment and services, airports or landing areas; aeronautical charts, information and services; rules, regulations and procedures, technical information, and manpower and material. Included are system components shared jointly with the military.[16]
National Goal	A statement of an end result or outcome desired by stakeholders that enables the accomplishment of the overarching mission. It is a top-level, strategic outcome that one wishes to achieve.
Objective	Statement of necessary achievement to meet the goal.
Public Aviation	Public Aircraft Operation (PAO) is limited by the statute to certain government operations within U.S. airspace. Although these operations must comply with certain general operating rules (including those applicable to all aircraft in the NAS), other civil certification and safety oversight regulations do not apply. Whether an operation may be considered public is determined on a flight-by-flight basis, under the terms of the statute (49 U.S.C. 40102 and 49 U.S.C. 40125) and depends on

[16] FAA Order 7110.65, Air Traffic Control, Pilot/Controller Glossary, Change 2.

	factors such as aircraft ownership, operator, the purpose of the flight and the persons on board the aircraft.[17]
Stakeholders	Individuals or organizations that stand to gain from the success or failure of a system/initiative.
Strategic	A perspective that is mission-oriented rather than tactical or operational.
Strategy	Overall plan of action to achieve an objective. Ties together objectives, approaches, and actions.
Unmanned Aircraft System (UAS)	An unmanned aircraft and its associated elements related to safe operations, which may include control stations (ground, ship, or air-based), control links, support equipment, payloads, flight termination systems, and launch/recovery equipment.

[17] FAA Order 8900.1, Flight Standards Information Management System.

DEPARTMENT OF TRANSPORTATION

Federal Aviation Administration

14 CFR Part 91

[Docket No.: FAA-2013-0061]

Unmanned Aircraft System Test Site Program

AGENCY: Federal Aviation Administration (FAA), DOT.

ACTION: Notice of availability of final privacy requirements for the unmanned aircraft system ("UAS") test site program; response to comments

SUMMARY: On February 22, 2013 the FAA published and requested public comment on the proposed privacy requirements (the "Draft Privacy Requirements") for UAS test sites (the "Test Sites") that the FAA will establish pursuant to the FAA Modernization and Reform Act of 2012 ("FMRA"). This notice responds to the public comments received and publishes the FAA's final privacy requirements for the Test Sites (the "Final Privacy Requirements").

ADDRESSES: You may review the public docket for this rulemaking (Docket No. FAA-2013-0061) on the Internet at http://www.regulations.gov. You may also review the public docket at the Docket Management Facility in Room W12-140 of the West Building Ground Floor at 1200 New Jersey Avenue, SE., Washington, DC, 20590-0001 between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays.

FOR FURTHER INFORMATION CONTACT: For technical questions concerning the test site program, contact Elizabeth Soltys, Unmanned Aircraft Systems Integration Office, Federal Aviation Administration, 800 Independence Avenue SW., Washington, DC 20591; email: 9-ACT-UASTSS@faa.gov.

For legal questions concerning the FAA's privacy requirements for the Test Sites contact Carlos Siso, Office of the Chief Counsel, Federal Aviation Administration, 800 Independence Ave. SW., Washington, DC 20591; email: 9-AGC-UASPrivacy@faa.gov.

SUPPLEMENTARY INFORMATION

This notice summarizes and responds to the public comments received in response to the following Federal Register notices seeking public comment on the Draft Privacy Requirements for the Test Sites:

(i) Notice of availability and request for comments published in the Federal Register on February 22, 2013 (78 FR 12259), Docket No. FAA-2013-0061-0001; and

(ii) Notice of public engagement session published in the Federal Register on March 28, 2013 (78 FR 18932), Docket No. FAA-2013-0061-0050.

In addition, this notice publishes the FAA's Final Privacy Requirements for the Test Sites which are set forth under the "Conclusion" section below.

Discussion of Comments

The FAA received 99 comments through Regulations.gov and 53 comments through the public engagement session. A transcript of the public engagement session is available at: http://www.faa.gov/about/initiatives/uas/media/UAStranscription.pdf. Public comments ranged from recommending that the FAA not impose any privacy requirements on the Test Sites to recommending that the FAA impose extensive privacy requirements on the Test Sites. The FAA also received comments that were not responsive to the notice or that were unclear.

The FAA analyzed the responsive comments and grouped them into ten categories. The following sections address the comments by category.

1) The FAA should focus on its safety mission; it should not engage in regulating privacy.

The FAA received a number of comments advocating that the FAA should focus on its safety mission and should not engage in regulating privacy. The following comments were received:

- The FAA should focus on safety;
- Regulating privacy is outside the FAA's mission;
- The FAA does not have statutory authority to regulate privacy;
- The FAA does not have the authority to impose privacy requirements on the Test Sites;
- The FAA should allow privacy to be addressed by other more appropriate government bodies including: Federal agencies that have expertise and authority to deal with privacy concerns; Congress; state or local legislative bodies; and the judicial system;
- The Federal Government should not regulate privacy impacts of UAS; these issues should be left to states, cities, and counties to address;
- The FAA should only require compliance with privacy laws that are already in place and focus on developing safe operation of UAS;
- The FAA should not deny access to the national airspace for reasons other than safety;
- Existing privacy laws are sufficient to cover the responsible use of UAS. There already exist Federal, state and other laws that protect privacy. In addition, tort law may also provide avenues of recourse for plaintiffs to protect their privacy rights;
- The FAA should not implement privacy regulations that make entry into the market prohibitive for small businesses;
- The FAA should not allow privacy issues to hinder commercialization of UAS;
- There is no evidence that the operations at the Test Sites will harm privacy interests. Restricting activities at the test sites at this early stage will likely overprotect privacy at the expense of innovation;

- The FAA should afford adequate time for non-governmental solutions such as industry norms and practices to develop before intervening administratively to protect privacy. These less restrictive solutions will reduce the need for administrative intervention and will allow for increased innovation in the national airspace;
- Requiring Test Site operators to develop privacy policies that are informed by Fair Information Practice Principles is onerous for commercial operators of UAS and its cost will likely outweigh any hypothetical benefits;
- Requiring Test Site operators to issue privacy policies informed by Fair Information Practice Principles will limit the diversity of data that will inform integration of UAS into the national airspace. The FAA's approach would exclude an important possible alternative from the discussion: some operators might choose not to issue a privacy policy or adopt a non-FIPPs-compliant policy; and
- The FAA should treat data gathered by UAS no differently than data gathered by a manned aircraft or by other electronic means. There is no significant difference in terms of surveillance between a UAS and a manned aircraft, and manned aircraft are permitted to operate in the national airspace with cameras.

Response: The FAA's mission is to provide the safest, most efficient aerospace system in the world and does not include regulating privacy. At the same time, the FAA recognizes that there is substantial debate and difference of opinion among policy makers, industry, advocacy groups, and members of the public as to whether UAS operations at the Test Sites will raise novel privacy issues that are not adequately addressed by existing legal frameworks.

The FAA will require the Test Site operators to comply with the Final Privacy Requirements. Congress mandated that the FAA establish the Test Sites to further UAS integration into the national airspace system. The Final Privacy Requirements advance this purpose by helping inform the dialogue

among policymakers, privacy advocates, and industry regarding the impact of UAS technologies on privacy.

The FAA's authority for including the Final Privacy Requirements in the Test Site OTAs is set forth in 49 U.S.C. 106(l)(6). That statute authorizes the FAA Administrator to enter into an OTA "on such terms and conditions as the Administrator may consider appropriate." The FAA believes that it is appropriate to require Test Site operators to comply with the Final Privacy Requirements.

2) The FAA should require warrants before law enforcement can use UAS in the Test Sites to conduct surveillance or gather evidence.

The FAA received a variety of comments advocating that:

- The FAA should include provisions in the OTA that require warrants to be obtained when UAS are used to conduct surveillance or gather evidence within the Test Site; and
- The OTA include appropriate safeguards to protect Fourth Amendment rights at and around our national borders.

Response: The FAA's mission is to provide the safest, most efficient aerospace system in the world. The FAA is establishing the UAS Test Sites consistent with its mission and the direction in the FMRA. The FAA appreciates the commenters' concerns. Accordingly, the final privacy requirements provide that the Site Operator and its team members must comply with all applicable privacy laws.

3) The FAA should mandate specific privacy requirements for the Test Sites.

The FAA received a variety of comments advocating that the FAA mandate specific privacy requirements for the Test Sites. The recommendations included the following:

- The FAA should specify minimum privacy requirements and require each Test Site to comply with them;
- The FAA should mandate compliance with Fair Information Practice Principles for all Test Site operators;

- The FAA should establish prohibitions on where UAS can operate within a Test Site and the kinds of surveillance activities that UAS conduct at the Test Sites;
- The FAA should require all UAS flown at the Test Sites to have unencrypted down links so that all their data collection can be viewed by the public, including records contained onboard and recovered after landing;
- The FAA should require each Test Site operator to conduct a full Privacy Impact Assessment;
- The FAA should require each Test Site operator to establish a Chief Privacy Officer and centralize privacy responsibilities in that person;
- The FAA should require each Test Site operator to establish a privacy advisory committee to review proposed UAS research at the Test Sites for privacy concerns;
- The FAA should require each Test Site operator to provide a detailed response to public input it receives regarding the Test Site's privacy policy;
- The FAA should prohibit the sharing of recorded surveillance footage beyond the scope of its original purpose;
- The FAA should prohibit UAS in the Test Sites from flying below a minimum altitude;
- The FAA should prohibit UAS in the Test Sites from carrying any equipment that could be used to conduct surveillance;
- The FAA should limit the use of the data collected at the Test Sites;
- The FAA should prohibit (i) the use of Test Sites for government surveillance, and (ii) sharing data collected with law enforcement for the purpose of investigating or prosecuting a crime;

- The FAA should limit the type of data that can be collected by UAS at the Test Sites including limiting the resolution of visual imagery that UAS can collect, prohibiting recording of audio data, and restricting the ability to collect WiFi and cellular signals;
- The FAA should require Test Site operators to provide data on the payload of each UAS flown at the Test Site including specific information on the data the payload is capable of collecting;
- The FAA should mandate privacy policies that require deletion of collected data within a certain time period;
- The FAA should prohibit the Test Site operator and UAS operators at the Test Sites from retaining any data collected longer than is necessary to fulfill the purpose of the Test Site;
- The FAA should require UAS operators to file data collection statements with the FAA for UAS operations that involve remote sensing and signals surveillance from the UAS platform; and
- The FAA should require UAS operating at altitudes over 400 feet to carry an automatic dependent surveillance-broadcast transponder (ADS-B Out) so that UAS operations can be tracked.

Response: The FAA's mission is to provide the safest, most efficient aerospace system in the world. Although there is a long history of placing cameras and other sensors on aircraft for a variety of purposes—news helicopters, aerial surveys, film/television production, law enforcement, etc.—the FAA is not, through awarding and supervising these Test Sites, taking specific views on whether or how the Federal Government should regulate privacy or the scope of data that can be collected by manned or unmanned aircraft.

There was substantial difference of opinion among commenters as to whether UAS operations and manned aircraft operations present different privacy issues that justify imposing special privacy

restrictions on UAS operations at the Test Sites. In addition, there was substantial difference of opinion among commenters regarding what elements would be appropriate for a Test Site privacy policy. Based on the comments received, the FAA will require Test Sites to comply with the following requirements in addition to those described in the Draft Privacy Requirements:

(1) Test site operators must maintain a record of all UAS operating in the test sites;

(2) Test site operators must require every UAS operator in the Test Site to have a written plan for the operator's use and retention of data collected by the UAS; and

(3) Test site operators must conduct an annual review of test site operations to verify compliance with stated privacy policy and practices and share those outcomes annually in a public forum with an opportunity for public feedback.

The above are reflected in the Final Privacy Requirements.

The FAA has determined that it should not impose privacy requirements beyond those in the Final Privacy Requirements for the following reasons. *First*, there are many privacy laws and applications of tort law that may address some of the privacy issues that arise from UAS operations at the Test Sites.

Second, the FAA believes that Test Sites operators will be responsive to local stakeholders' privacy concerns and will develop privacy policies appropriately tailored to each Test Site. The selection criteria for the Test Sites specify that only a "public entity" can serve as a Test Site operator. The term "public entity" is defined in the selection criteria to mean "(A) any State or local government; (B) any department, agency, special purpose district, or other instrumentality of a State or States or local government; and (C) the National Railroad Passenger Corporation, and any commuter authority." The FAA expects that public entities will be responsive to stakeholder concerns.

Third, if UAS operations at a Test Site raise privacy concerns that are not adequately addressed by the Test Site's privacy policies, elected officials can weigh the benefits and costs of additional

privacy laws or regulations. Forty-three states have already enacted or are considering legislation regulating use of UAS. *See* Drone Legislation All the Rage: Varies Widely Across 43 States, According to WestlawNext, June 17, 2013, *available at*: http://thomsonreuters.com/ press-releases/062013/drone_legislation_varies_across_ states_according_to_Westlaw.

4) The FAA should conduct audits of the Test Sites to ensure compliance with privacy policies.

Various commenters recommended that the FAA should audit each Test Site to ensure compliance with the privacy policies in the OTA.

Response: Each Test Site will be operated by a public entity (see response to Category 3 above). The FAA expects that the public entity operating each test site will already be subject to oversight and audit requirements. The FAA does not believe that it is appropriate for the FAA to impose additional audit requirements on the Test Site operators.

5) The FAA should require Test Site operators to keep records that will allow for effective citizen participation and reporting of privacy violations.

One commenter recommended that the FAA require Test Site operators to keep accurate, detailed, frequent, and accessible records to allow for effective citizen participation and reporting of privacy violations.

Response: Each Test Site operator will be a public entity (see response to Category 3 above). Public entities are generally subject to laws that establish record keeping requirements and provide the public access to records. The FAA does not believe that it is appropriate for the FAA to impose additional record keeping requirements on the Test Site operators other than those specified in the Final Privacy Requirements.

6) The FAA should establish a searchable database or registry of UAS operators and operations at the Test Sites.

The FAA received a variety of comments advocating that:

- The FAA should create a public, searchable database or registry of all UAS operators. Some commenters recommended that the database include information about surveillance equipment used and the operator's data collection practices;
- The FAA should require UAS operators at the Test Sites to provide public statements describing the surveillance equipment that will be carried by a UAS, the geographical area where the UAS will be operated, and the purposes for which the UAS will be deployed; and
- The FAA should establish a means for the public to access the data on UAS flights collected by the FAA.

Response: The FAA believes that it is not appropriate for the FAA to create a public registry or database of UAS operations at the Test Sites. However, the FAA has included a contractual provision in the Final Privacy Requirements that will require each Test Site operator to maintain a record of all UAS operating at the Test Site.

7) **The FAA should modify its Test Site selection criteria to take into account privacy concerns.**

Various commenters recommended that the FAA revise its selection criteria. Suggestions included the following:

- The FAA should choose an applicant that has an established UAS research program with active engagement with UAS privacy issues;
- The FAA should choose at least one Test Site in a state with strong privacy protective UAS laws and regulations;
- The FAA should select one or more Test Sites in or near a densely populated urban area in order to avoid a bias towards privacy issues relevant for rural UAS operations; and

- The FAA should consider the privacy track record of applicants as part of the selection process.

Response: The FAA believes that it is not appropriate to modify the Test Site selection criteria to include the recommended privacy considerations. Applicants have already submitted complete applications based on the announced selection criteria and the application period has closed.

The FAA published the Test Site selection criteria and application instructions on February 14, 2013 on https://faaco.faa.gov under Solicitation number DTFACT-13-R-00002. The selection criteria incorporate the factors that Congress directed the FAA to consider in the FMRA, including, geographic and climatic diversity; location of ground infrastructure; and research needs. The FAA required applicants to submit seven volumes of extensive and detailed information that address a broad set of considerations including safety, airspace use, experience, research objectives, and risk considerations. This information will allow the FAA to make a selection based on the direction provided by Congress in the FMRA and on the FAA's mission.

The FAA developed the Test Site selection criteria after seeking public input and consulting with other agencies regarding what selection criteria would be appropriate. In March 2012, the FAA published a request for comment in the Federal Register and in April 2012, the FAA hosted two public webinars to obtain public input on the FAA's proposed selection criteria. Although there was significant public participation, the FAA did not receive comments advocating that privacy issues be used as a factor in choosing the Test Sites.

8) The FAA should require Test Site operators to conduct specific tests related to privacy and surveillance.

Commenters recommended that the FAA should:

- Require UAS operators at Test Sites to conduct specific tests related to surveillance and privacy;

- Require Test Site operators to design the sites— including the creation of "fake" houses or businesses—to allow UAS operators to test how accurate their surveillance systems are and test how much data those systems collect; and
- Develop and require Test Sites to implement a standard battery of privacy tests that each UAS operating within a Test Site should have to perform in order to collect data that the FAA can use to make decisions about privacy issues.

Response: The FAA is not planning to have the Test Site operators conduct specific research.

9) The FAA should not take punitive actions against a Test Site operator for privacy violations without due process.

One commenter noted that if charges are filed by law enforcement against a Test Site operator due to potential violations of privacy laws, the OTA allows the FAA to suspend or modify the relevant operational authority for a Test Site (e.g. Certificate of Operation, or OTA). That commenter recommended that a Test Site operator be entitled to due process before the operational authority be suspended or modified.

Response: A Test Site operator's rights to operate a Test Site are set forth in the OTA and are subject to the terms and conditions in the OTA. The FAA believes that it is appropriate to include contractual provisions in the Final Privacy Requirements that allow the FAA to protect the public interest by suspending or modifying the relevant operational authority for a Test Site if charges are filed by law enforcement against a Test Site operator due to potential violations of privacy laws.

10) The FAA should establish sanctions for violations of privacy policies or rights.

One commenter recommended that the FAA rescind the OTA for a Test Site where serious privacy violations have occurred and levy fines against operators that fail to comply with privacy policies.

Response: The Final Privacy Requirements provide that violations of privacy laws can result in suspension or termination of the OTA.

The FAA will not monitor a Test Site's compliance with its own privacy policies. The FAA expects the public entities operating the Tests Sites and their respective state/local oversight bodies to monitor and enforce a Test Site's compliance with its own policies.

Conclusion

Based on the comments submitted, the FAA intends to require each test site operator to comply with all of the privacy requirements included in the Draft Privacy Requirements as well as the following additional privacy requirements:

(1) Test site operators must maintain a record of all UAS operating in the test sites;

(2) Test site operators must require every UAS operator in the Test Site to have a written plan for the operator's use and retention of data collected by the UAS; and

(3) Test site operators must conduct an annual review of test site operations to verify compliance with stated privacy policy and practices and share those outcomes annually in a public forum with an opportunity for public feedback.

Accordingly, the FAA intends to include the following terms and conditions into Article 3 of the OTA:

"ARTICLE 3 PRIVACY; APPLICABLE LAW

a. Privacy Policies

The Site Operator must:

(i) Have privacy policies governing all activities conducted under the OTA, including the operation and relevant activities of the UAS authorized by the Site Operator.

(ii) Make its privacy policies publicly available;

(iii) Have a mechanism to receive and consider comments from the public on its privacy policies;

(iv) Conduct an annual review of test site operations to verify compliance with stated privacy policy and practices and share those outcomes annually in a public forum with an opportunity for public feedback;

(v) Update its privacy policies as necessary to remain operationally current and effective; and

(vi) Ensure the requirements of its privacy policies are applied to all operations conducted under the OTA.

The Site Operator's privacy policies should be informed by Fair Information Practice Principles.

b. Compliance With Applicable Privacy Laws

For purposes of this agreement, the term "Applicable Law" shall mean (i) a law, order, regulation, or rule of an administrative or legislative government body with jurisdiction over the matter in question, or (ii) a ruling, order, decision or judgment of a court with jurisdiction over the matter in question.

The Site Operator and its team members must operate in accordance with all Applicable Law regarding the protection of an individual's right to privacy (hereinafter referred to as "Privacy Laws").

If the U.S. Department of Justice or a state's law enforcement authority files criminal or civil charges over a potential violation of a Privacy Law, the FAA may take appropriate action including suspending or modifying the relevant operational authority (e.g., Certificate of Operation, or OTA) until the proceedings are completed. If the proceedings demonstrate the operation was in violation of the Privacy Law, the FAA may terminate the relevant operational authority.

c. Change in Law

If during the term of this Agreement an Applicable Law comes into effect which may have an impact on UAS, including impacts on the privacy interests of individuals or entities affected by any operation of any UAS operating at the Test Site, such Applicable Law will be applicable to the OTA and the FAA may update or amend the OTA to reflect these changes.

d. Transmission of Data to the FAA

The Site Operator should not provide or transmit to the FAA or its designees any data other than the data the data requested by the FAA pursuant to Article 5 of this OTA.

e. <u>Other Requirements</u>

The Site Operator must:

(i) Maintain a record of all UAS operating at the test sites; and

(ii) Require each UAS operator in the Test Site to have a written plan for the operator's use and retention of data collected by the UAS."

Issued in Washington, DC on November 7, 2013.

Marc L. Warren

Acting Chief Counsel, Federal Aviation Administration.

REPORT OF THE
DEPARTMENT OF CRIMINAL JUSTICE SERVICES

Protocols for the Use of Unmanned Aircraft Systems (UAS) by Law-Enforcement Agencies

TO THE GOVERNOR AND
THE GENERAL ASSEMBLY OF VIRGINIA

HOUSE DOCUMENT NO. 12

COMMONWEALTH OF VIRGINIA
RICHMOND
2013

COMMONWEALTH of VIRGINIA

Department of Criminal Justice Services

Garth L. Wheeler
Director

1100 Bank Street
Richmond, Virginia 23219
(804) 786-4000
TDD (804) 786-8732

November 1, 2013

To: The Honorable Robert F. McDonnell
Members of the General Assembly

From: Garth Wheeler, Director

Subject: Protocols for the Use of Unmanned Aircraft Systems by Law-Enforcement Agencies

It is my pleasure to provide you with the Protocols for the Use of Unmanned Aircraft Systems by Law-Enforcement Agencies developed pursuant to House Bill 2012 (2013). During the 2013 General Assembly Session, House Bill 2012 created a moratorium on the use of unmanned aircraft systems by law-enforcement agencies until July 1, 2015, with certain exceptions. The legislation also required the Department of Criminal Justice Services, in consultation with the Office of the Attorney General and other agencies, to develop model protocols for the use of unmanned aircraft systems by law-enforcement agencies. The results of the Department's work are included in the attached report.

If you have any questions about the protocols, please contact Teresa Gooch, Division Director, Division of Law Enforcement and Security Services (804-786-8730).

Unmanned Aircraft Systems (UAS) Protocols for use by Law Enforcement Agencies

October 7, 2013

Virginia Department of Criminal Justice Services
www.dcjs.virginia.gov

In the 2013 session of the General Assembly, House Bill 2012 placed a moratorium on the use of unmanned aircraft systems by state and local law enforcement and regulatory entities until July 1, 2015, except in defined emergency situations or in training exercises related to such situations.

The moratorium does not apply to certain Virginia National Guard functions or to research and development conducted by institutions of higher education or other research organizations.

The bill requires the Department of Criminal Justice Services, in consultation with the Office of the Attorney General and other agencies, to develop protocols for the use of drones by law enforcement agencies and report its findings to the Governor and the General Assembly by November 1, 2013.

In April 2013, a workgroup of public safety and legal professionals was assembled to accomplish the Department of Criminal Justice Services requirement of this bill.

The Department of Criminal Justice Services would like to thank the following individuals for their professional contributions to this policy:

Colonel Steven Sellers, Albemarle County Police Department
Sheriff Brian Roberts, Brunswick County Sheriff's Office
Chief Doug Middleton, Henrico County Department of Police
Ms. Shannon Dion, Office of the Attorney General
Sheriff Steve Dye, Russell County Sheriff's Office
SSA Marc Haalman, Virginia Department of Alcoholic Beverage Control
Officer Greg Hall, Virginia Department of Game and Inland Fisheries
Mr. David Summers, Virginia Department of Conservation and Recreation
Lt. Colonel James Caruso, Virginia Department of Military Affairs
Capt. Kirk Marlowe, Virginia Department of State Police
1st Sgt. Angelo Woodhouse, Virginia State Police

Virginia Department of Criminal Justice Services staff:

Teresa Gooch, Director, Division of Law Enforcement
Sam Hoffman, Standards, Policy and Homeland Security Manager
Gary M. Dillon, Manager, Virginia Accreditation Center

Definitions

Model Aircraft – Remote controlled aircrafts used by hobbyists, which are built, produced, manufactured and operated for the purposes of sport, recreation and/or competition. Model aircraft use is not regulated at the federal level and many UAS hobbyist belong to the Academy of Model Aeronautics, a professional association representing the interests of the hobby.

Unmanned Aircraft System (UAS) – The preferred industry definition of aircraft designed to navigate in the air without an on-board pilot. The authorization to use UAS is regulated by the Federal Aviation Administration (FAA). For the purposes of this policy guideline, UASs are non-weaponized.

UAS Flight Crew Member – A pilot, observer, payload operator or other person(s) assigned duties for a UAS flight mission or training exercise.

UAS Pilot – A person exercising control over a UAS during flight.

VTOL – Vertical take-off and landing

Potential Law Enforcement Applications

Accident Investigation
Missing Persons
Search and Rescue
Drug Investigations
Disaster Management
Crowd Control
Explosive Ordnance Disposal
Hostage and Barricade Situations
CBRNE Incident *(chemical, biological, radiological, nuclear, and explosives)*
Forensic Scenes
Support for Arrest Warrants
VIP Security Support
Perimeter Security
Low Cost Aerial Imagery
Enhance Situational Awareness

Protocols Based upon Legislation

Under current Virginia legislation, UASs cannot be used by law enforcement agencies for anything other than specified types of search and rescue or training. This legislation places a moratorium on their use, with exceptions, until July 1, 2015.

Protocols for the use of UASs currently must mirror those situations specified in that legislation, as listed below:

Amber Alert

Senior Alert

Blue Alert

Search or Rescue (To alleviate an immediate danger to a person)

Training exercises related to these uses

Benefits to Officer and Community Safety

Unmanned Aerial Systems (UAS) do not require a qualified pilot on board to operate the UAS or the attached equipment such as cameras, FLIR (forward looking infrared), etc. UAS operators and system operators remain safely on the ground reducing their exposure to threats.

UASs are able to enter environments, which may be hazardous to pilots of manned aircraft. These threats may be natural or manmade. They include hazardous waste, fire, smoke, threatening weather, and ground fire from perpetrators.

UASs provide superior situational awareness while minimizing the danger to which operators are exposed.

UASs and trained operators minimize response time to most emergency situations. UASs can be launched from a safe location within close proximity to the scene.

UASs designed for law enforcement come in two categories, vertical takeoff and landing (VTOL), and fixed wing. This allows for their use in different environments that may restrict the size of the launch area. VTOL may be launched and landed in a very limited space.

UAS operators should be in direct contact with incident command, enhancing communication between command and air assets.

Community safety is enhanced by the rapid response of air assets to an emergency. Many UASs designed for law enforcement use can be launched within five minutes. In most cases manned aircrafts must take off and land at an airports under the direction of air traffic controllers, which can adversely delay response time.

UASs designed for law enforcement use are small enough to be stored in containers, which are the approximate size of a small backpack, or in small cases that can be carried in patrol vehicles, thereby minimizing response time.

Agencies wishing to utilize UASs must obtain a Certificate of Authorization (COA) from the Federal Aviation Administration (FAA) to ensure compliance with federal requirements thus ensuring UASs are operated in accordance strict federal guidelines.

Cost Benefit

The cost benefit of utilizing a UAS designed for public safety as compared to manned aircraft is substantial. It should be noted that UASs are not designed to take the place of manned aircraft. The use of UASs would supplement the aerial capabilities of a law enforcement agency to provide enhanced service to the public.

The Metro Aviation Unit, a joint effort by the City of Richmond, Chesterfield County, and Henrico County, operates four fixed wing aircraft (two Cessna 172s and two Cessna 182s). The average hourly cost to operate each of these aircraft is $150. The cost of purchasing a manned aircraft similar to those being utilized by the Metro Aviation Unit is in excess of $800,000. These figures do not include personnel costs.

According to the Association for Unmanned Vehicle Systems International (AUVSI), the average hourly cost of operating a UAS designed for public safety use ranges from $30 to $50. The costs of UASs designed for law enforcement ranges from a few hundred dollars to over $40,000. These figures do not include personnel costs.

Training

The FAA has developed the rules for the public's operation of UASs. They can be found in FAA Memorandum "Interim Operational Approval Guidance 08-01 Unmanned Aircraft Systems Operations in the U. S. National Airspace".

Agency model policy and operational procedures

Community Engagement

Law enforcement agencies interested in integrating UAS technology in their operations should actively engage their communities in an effort to educate the public. Due to extensive media coverage of military drone use, there is widespread fear of similar deployment tactics on Virginia soil. Additionally, civil liberties organizations have concerns about violations of 4th Amendment rights.

1. Law enforcement agencies desiring to use UAS technology should first determine how they will utilize this technology, including the costs, benefits and risks.
2. Law enforcement agencies should then engage the community early in the planning process, including their governing body and civil liberties advocates.
3. It's imperative that the use of UAS technology be as transparent as possible to ensure the community that the law enforcement agency is in full compliance with the US Constitution, federal, state and local law governing search and seizure.
4. Law enforcement agencies should provide an opportunity for the community to review and comment on agency procedures for the use of UAS.
5. Transparency is the key to successful community support. For that reason, it is recommended that agencies work with the local media to help facilitate community education and dialogue.

System Requirements

1. Agencies deploying UAS technology shall maintain a flight log, which captures flight time, duration, date, supervisory authorization and reason for flight. UAS vehicles equipped with digital logs/counters are an acceptable alternative.
2. It is strongly encouraged that UAS vehicles should be painted in a high visibility paint or display high visibility markings, if the construction of the UAS permits. This will facilitate line-of-sight control by the pilot and allow for easier ground monitoring. In situations where covert operations are authorized (high risk search/arrest warrant), high visibility markings may not be optimal.
3. Equipping law enforcement UAS with weapons of any kind is strictly prohibited.
4. Law enforcement UAS technology shall be equipped with "auto return" technology, which automatically returns the vehicle to the launch location if radio connectivity is lost. For this reason, the use of "home built" aircraft or RC model aircraft is strongly discouraged.

Operational Procedures

1. All law enforcement UAS vehicles require a Certificate of Authorization (COA) from the Federal Aviation Administration (FAA). 0A law enforcement agency interested in deploying UAS technology should contact the FAA early in the planning process to determine the requirements of a COA.
2. UAS vehicles will only be operated by personnel, both pilots and crewmembers, who have been trained and certified in the operation of the system. All law enforcement agency personnel with UAS responsibilities, including supervisors and commanders, must complete training in the policies and procedures governing their use.

3. All flights will be approved by a supervisor and must be for a legitimate public safety mission, training or for demonstration purposes. Supervisory authorization shall be documented in the flight log.
4. A Virginia standardized flight log shall be used.
5. An authorized supervisor/commander will conduct a quarterly audit of flight logs. Unless as restricted by the Virginia FOIA, all flight logs and quarterly audits will be made available to the public upon request. Public agencies are encouraged to publish flight log information on their webpages.
6. Agencies must develop a disciplinary policy, which addresses unauthorized use of UAS technology.
7. Unless community or officer safety is compromised, agencies are encouraged to publically notify neighborhoods prior to using an UAS vehicle. The use of Reverse 911 telephone calls is a good example of a notification procedure.
8. When the primary mission is to collect evidence of a criminal incident AND the UAS vehicle will intrude upon the reasonable expectation of privacy, the law enforcement agency should consult with their Commonwealth's Attorney about obtaining a search warrant in advance of deployment.

Legal Considerations

Federal Legislation Governing the Use of UASs

The FAA Modernization and Reform Act of 2012 (49 U.S.C. § 40101, et seq.) is the only legislation passed by the United States Congress on the topic of unmanned aircraft systems. The act sets out requirements for new laws and regulations concerning unmanned aircrafts. The requirements are to ensure public safety and uniformity throughout national airspace and that civil unmanned aircraft systems include a sense and avoid capability. The act defines different types of unmanned aircraft and aircraft systems including:

1. **Unmanned aircraft** – an aircraft operated without the possibility of direct human intervention from within or on the aircraft.

2. **Small unmanned aircraft** – an unmanned aircraft weighing less than 55 pounds.

3. **Unmanned aircraft system** – an unmanned aircraft and associated elements (including communication links and the components that control the unmanned aircraft) required for the pilot in command to operate safely and efficiently in the national airspace system.

4. **Public unmanned aircraft system** – an unmanned aircraft system meeting the qualifications and conditions required for operation of a public aircraft.

Law enforcement agencies should be aware that laws and regulations related to the use of UAS are evolving and what may be true today is not necessarily true tomorrow. For example, the FAA is expected to release proposed rules later this year establishing policies, procedures and standards for small UAS which law enforcement may use. Additionally, there are several bills under consideration by the U.S. Congress, including: Preserving American Privacy Act of 2013, Preserving Freedom from Unwarranted Surveillance Act of 2013, Drone Aircraft Privacy and Transparency Act of 2013, and Safeguarding Privacy and the Fostering Aerospace Innovation Act of 2013. Enactment of these bills will impact law enforcement agencies' use of UASs and agencies should diligently monitor the law for future changes.

Federal Communications Commission Considerations

The Federal Communications Commission (FCC) regulates the use of radio frequencies, which UASs depend upon for operation. Frequencies allow the ground operator to control the device and collect surveillance data but are subject to interference. Some UAS systems available at retail stores include FCC approved frequencies that are shared by many users, which means reliability and security of the system may be at risk. For example, a UAS operating on a shared frequency may not maintain adequate connectivity between the device and the ground operator, thereby increasing the risk of losing control of the device. If control is lost, the device may crash into the ground or other property. Shared frequencies are also not secure, meaning a sophisticated user could intercept the frequency and access data sent from the UAS to the ground operator. Both scenarios involve liability issues for agencies which should be thoroughly considered before utilization of a UAS.

On the other hand, some UAS manufacturers have safeguards in place to decrease the risk of frequency interference. Some systems use encrypted communications and technology to prevent detection and unauthorized access. "Pairing" a UAS and ground control station creates a unique line of communication, which prevents outside linkage to the system. Other safeguards include key recognition, monitoring for interference and lost link modes.

If an agency wants a more secure frequency with which to control their UAS, it should petition the FCC for a designated spectrum for law enforcement. Doing so does not guarantee protection from interference, as the device itself must have built in safeguards to protect against interference and consequence mitigation in the event there is a communication breech. In summary, law enforcement agencies should thoroughly research various types of UAS systems to determine which model offers the best security measures for its intended use. Agencies are encouraged to contact the Virginia State Police Communications Division for additional guidance.

Freedom of Information Act

The Virginia Freedom of Information Act (FOIA) "ensures the people of the Commonwealth ready access to public records in the custody of a public body or its officers and employees, and free entry to meetings of public bodies wherein the business of the people is being conducted." All public records are presumed open unless a public body properly invokes an exemption and does not disclose the records. Va. Code §§ 2.2-3700-3714. Law enforcement agencies should consider the applicability of statutory exemptions for their public records regarding UASs. For example, an agency may elect to withhold records contained in criminal investigative files which include photographs taken by an UAS or specific tactical plans utilizing UAS technology. See Va. Code 2.2-3705.2 and 2.2-3706. Other exemptions may apply depending on the situation and agencies are advised to consult with their legal counsel in drafting responses to FOIA requests.

Agencies with specific FOIA questions are encouraged to contact the Virginia Freedom of Information Advisory Council at http://foiacouncil.dls.virginia.gov/ or (804) 225-3056.

Image Retention

The Government Data Collection and Dissemination Practices Act (Va. Code §§ 2.2-3800 – 3809), or the "Data Act," addresses how agencies handle personal information obtained through various methods. The Data Act defines personal information as information providing a basis for inferring personal characteristics, such as "photographs or things done by or to such individual." The Data Act specifies that personal information shall not be collected unless need for the information has been clearly established, shall be relevant for the purpose it is collected, shall not be misused, and must be collected within the confines of the law. However, the Data Act does not apply to personal information systems maintained by the Department of the State Police or other police departments that deal with investigations and intelligence gathering relating to criminal activity. (Va. Code § 2.2-3802(7)).

A recent Attorney General opinion addresses the use of license plate readers and whether information obtained by these devices can be kept by law enforcement. (2013 Op. Va. Att'y Gen. No. 12-073, *available at* www.ag.virginia.gov.) The answer depends on whether the information collected is for a specific criminal matter, which is exempt from the Data Act, or whether the information is collected for potential future use, which is subject to the Data Act. As applied to law enforcement's use of UAS to collect images, if the images are obtained for no particular reason, the Data Act prohibits law enforcement from storing the information for future use. However, if the UAS is deployed for a particular purpose directly related to "investigations and intelligence gathering related to criminal activity" the Data Act does not apply.

Federal Aviation Administration

Law enforcement agencies utilizing UAS technology must comply with federal laws and regulations which currently require public entities, such local police departments, to obtain a Certificate of

Authorization or Waiver (COA) before using an UAS in civil airspace. The primary purpose of the COA is to avoid in-air collisions with other objects in the air. Applicants apply online and the FAA evaluates the proposed operation for safety feasibility. For a complete listing of regulations, visit: www.faa.gov/regulations_policies/faa_regulations

The COA allows an operator to use a defined area of airspace and includes special provisions unique to the proposed operation. COAs usually are issued for a specific period and most require the applicant to coordinate with an air traffic control facility. Because UAS technology cannot currently comply with "see and avoid" rules that apply to all aircraft, a visual observer must maintain visual contact with the UAS and serve as its "eyes" when operating outside airspace restricted from other users.

Applying for a COA: https://ioeaaa.faa.gov/oeaaa/

Who may apply for a COA? Only public agencies operating an unmanned aircraft. A public agency is any agency that operates a public aircraft (14 CFR Part 1.1). If you receive funding from the federal government at some level, you are probably a public agency. A public agency can never operate under the guidelines of Advisory Circular 91-57 (Model Aircraft Operating Standards).

Additional Resources: "*Unmanned Aircraft Systems Operations in the U.S. National Airspace System – Interim Operational Approval Guidance"* provides FAA guidance for public use of unmanned aircraft by defining the COA evaluation process.
www.faa.gov/about/office_org/headquarters_offices/ato/service_units/systemops/aaim/organizations/uas/coa/faq/media/uas_guidance08-01.pdf

4th Amendment Considerations

The 4th Amendment protects individuals and their homes from unreasonable, warrantless searches and seizures by government actors. People have certain expectations of privacy in their property, particularly in their homes. Several doctrines have emerged by courts in balancing individual privacy and the need for government to keep people safe. The plain view doctrine authorizes warrantless searches when an officer, in a lawful place, can plainly see an item of incriminating character. The open fields doctrine recognizes that a person has less expectation of privacy outside of his home.

Applying the 4th Amendment to UAS surveillance is new territory for both law enforcement and the courts. The constitutionality of this technology as used by law enforcement will depend on many factors, including how and where the surveillance takes place. Whether a target is at home or in a public place will affect a court's analysis of how strong his expectation of privacy is. Other factors include the type and length of surveillance. The following cases primarily focus on manned airplane and helicopter flights but may be helpful to law enforcement agencies navigating the unchartered waters, or airspace in this instance, of using UAS technology in a manner that respects the 4th Amendment.[1]

Privacy in the Home

Kyllo v. U.S., 533 U.S. 27 (2001). Receiving tips from an informant, a federal agent acting without a warrant used a thermal imaging device to view Kyllo's home to help determine whether he was growing marijuana inside. Based on information yielded by the device, a warrant was obtained to search the home.

[1] See "*Drones in Domestic Surveillance Operations: Fourth Amendment Implications and Legislative Responses,*" by Congressional Research Service, April 3, 2013, at www.fas.org/sgp/crs/natsec/R42701.pdf for additional information.

The Supreme Court ruled that use of the thermal imaging device to gather information about the inside of the home constituted a search under the 4th Amendment.

Property Rights

Florida v. Jardines, 569 U.S. __ (2013). Officers brought a narcotics dog to defendant's front porch, which alerted for the presence of drugs. A search warrant was obtained for the home and marijuana plants were subsequently found. Using a property-rights analysis, the court concluded that using a trained dog on the front porch of a home was a physical intrusion on defendant's 4th Amendment rights. Unlike simply knocking on the door, which is a customary and routine act, bringing a police trained dog is neither customary nor routine. Because the officers only learned about the drugs by physically intruding on the defendant's property in order to gather evidence, an unlawful search occurred. (This case may be applicable if UASs are used in close proximity to homes in order to peer into windows.)

Open Fields and Manned Aerial Surveillance

Wellford v. Virginia, 227 Va. 297 (1984). After receiving a tip that Wellford was growing marijuana plants, law enforcement used a helicopter to fly 1000 feet above his fields and observed marijuana plants. Defendant was arrested after being observed caring for the plants. The court ruled that the open field was not part of the home's curtilage and therefore defendant had no expectation of privacy.

California v. Ciraolo, 476 U.S. 207 (1987). After receiving a tip that Ciraolo was growing marijuana plants in his backyard, which was shielded from view at ground level with a fence, law enforcement conducted warrantless aerial surveillance at 1000 feet. Officers, using nothing more than their "naked eyes," observed marijuana plants in the yard, which led to a search warrant of the property. The naked-eye aerial surveillance did not violate a reasonable expectation of privacy because it "took place within public navigable airspace in a physically nonintrusive manner."

Giancola v. West Va. Dep't of Pub. Safety, 830 F.2d 547 (4th Cir. 1987). Aerial surveillance from a helicopter flying at 100 feet did not violate the 4th Amendment. The aerial surveillance tactics were not unreasonably intrusive after considering the total number of surveillances conducted (two), the frequency of the surveillance, the length of each surveillance, altitude, number of aircraft (one), the degree of disruption of legitimate activities on the ground, and compliance with flight regulations.

Florida v. Riley, 488 U.S. 445 (1989). After receiving an anonymous tip that marijuana was growing in a greenhouse located ten to twenty feet behind a mobile home, law enforcement flew a helicopter over the property at an altitude of 400 feet. Marijuana was observed growing inside the greenhouse, which led to the issuance of a search warrant. In denying the motion to suppress the Court reasoned the helicopter was flying at a legal altitude, met all flight regulations, and that any member of the public could have legally taken the same flight and made the same observations. Therefore, Riley had no reasonable expectation of privacy in the greenhouse.

U.S. v. Breza, 308 F. 3d. 430 (5th Cir. 2002). During a drug interdiction helicopter flight, law enforcement officers observed what they thought were marijuana plants in an area surrounding Breza's dwelling. After descending to approximately 200 feet, this suspicion was confirmed and officers on the ground, without a warrant, searched the garden and seized hundreds of marijuana plants. The 4th Circuit held that the surveillance did not violate the 4th Amendment because the flight fully complied with all laws and regulations and were a regular occurrence. The court also upheld the warrantless entry because the defendant was observed burning the marijuana plants.

Agency/Operator Certifications

Pilot & Observer Certifications/Qualifications

It should be noted that all certifications/qualifications herein are applicable to operations of UAS at and below 400 feet. All pilot and observer training records will be maintained by the agency employing those persons and are subject to state and federal inspection.

Pilots:

Each UAS pilot must be an FAA-certificated airman or successfully pass either the FAA's pilot knowledge exam or complete an FJ\1\-approved UAS pilot training curriculum. However, if operating in controlled airspace, additional certifications are required. *Note*: Certification does not require the practical fight requirements of a manned aircraft.

Pilots will receive training specific to the UAS to be operated. This training must be conducted and documented by a qualified instructor designated by the proponent as being the individual(s) trained and certified by the manufacturer to provide training on the specified UAS.

Pilots must not perform duties for more than one UAS at a time and are not allowed to perform concurrent duties both as pilot and observer.

Pilots are prohibited from flying any law enforcement mission without having completed three UAS flight events within the preceding 90 days.

Law enforcement standard operating procedures (SOP) must include Crew Resource Management (CRM) techniques to ensure the highest possible situational awareness and effective communication by pilots during each flight operation. Pilots must be trained in these procedures and techniques. ***Note*:** CRM training involves a wide range of knowledge, skills and attitudes to include communications, situational awareness, problem solving, decision making, and teamwork. CRM is defined as a management system which makes optimum use of all available resources – equipment, procedures and people – to promote safety and enhance the efficiency of operations.

All pilot training must be conducted and documented by a qualified instructor designated by the proponent as being an individual trained and certified.

Pilots must be medically qualified and have in their possession a second class (or higher) airman medical certificate that has been issued under 14 CFR Part 67, Medical Standards and Certification.

Pilots are subject to the provisions of 14 CFR § 91.17, Alcohol and Drugs.

Observers:

Observers must successfully complete a UAS observer training curriculum that includes, at a minimum, instruction on rules and responsibilities described in 14 CFR § 91.111, Operating Near Other Aircraft, 14 CFR § 91.113, Right of Way Rules, Cloud Clearances, and that emphasizes "See and Avoid" concepts and fundamental radio communications, including standard ATC phraseology. Observer training must include thorough instruction regarding manned aircraft traffic conflicts and pilot communications for any maneuvers/actions required to avoid traffic conflicts.

Observers must not perform duties for more than one UAS at a time and are not allowed to perform concurrent duties both as pilot and observer.

Law enforcement standard operating procedures (SOP) must include Crew Resource Management (CRM) techniques to ensure the highest possible situational awareness and effective communication by observers during each flight operation. Observers must be trained in these procedures and techniques.

All observers training must be conducted and documented by a qualified instructor designated by the proponent as being an individual trained and certified by the manufacturer to provide training on the specified UAS.

Observers must be medically qualified and have in their possession a second class (or higher) airman medical certificate that has been issued under 14 CFR Part 67, Medical Standards and Certification.

Observers are subject to the provisions of 14 CFR § 91.17, Alcohol and Drugs.

It should be noted that the FAA is working to change the requirement for a second-class airman medical certification to self-certification as to being healthy to fly and a letter from a competent medical authority certifying the operator's eyesight to the second-class medical certification requirements of correctable to 20/20.

Memorandum of Understanding Between Federal Aviation Administration and the U.S. Department of Justice, Office of Justice Programs, National Institute of Justice Concerning Operation of Unmanned Aircraft Systems by Law Enforcement (www.alea.org/assets/pressReleases/assets/1805/DOJ%20FAA%20MOU.pdf)

Regulatory Considerations

24VAC5-20-100. Operation of aircraft.

All aircraft operations shall be conducted in conformity with Federal Aviation Regulations as amended from time to time and violation of such federal regulations shall also constitute a violation of this chapter.

Statutory Authority

§§ 5.1-2.2 and 5.1-2.15 of the *Code of Virginia.*

Historical Notes

Unmanned aerial vehicle industry taking off in Alaska

ELWOOD BREHMER, ALASKA JOURNAL OF COMMERCE

PHOTOS/MICHAEL DINNEEN/AJOC

The venerable Piper Super Cub isn't being squeezed out, but the face of aviation in Alaska is changing.

Once strictly a military tool, unmanned aerial vehicles, or UAVs, are now being used in civilian government work and the private sector.

Fairweather LLC announced the formation of research subsidiary Tulugaq LLC Sept. 30. A joint venture between the resource industry support company and regional Native corporations Olgoonik Corp. and Kaktovik Inupiat Corp., Tulugaq's work centers on its 21st Century aircraft, the Diamond Aircraft DA42. The word Tulugaq is Inupiaq for raven. Fairweather was founded in 1976 by Sherron Perry with an initial focus on providing aviation weather observation services to remote regions, and has since expanded into a wide array of industry support activities.

"We make science happen," Tulugaq Operations Manager Steve Wackowski said. "My boss, Sherron Perry, saw a niche for airborne remote sensing so we're approaching it in two ways: manned and unmanned remote sensing. Part of our DA42 is the manned portion of that, but the kicker on the DA42 is it's optionally unmanned."

By replacing the pilot seat in the DA42 with a remote control conversion kit, the $1.2 million aircraft becomes a UAV with a 44-foot wingspan.

The dual-flight option is the reason Tulugaq bought the DA42, Wackowski said. And when the time comes, it will be taken advantage of, he said.

Manned or not, the Tulugaq has about $400,000 worth of sensing equipment and cameras that can be swapped in and out of receivers on the nose and belly of the DA42.

All of the equipment is operated with a Microsoft Xbox video game controller. Wackowski said it was developed with the Xbox controller so the controls would be as recognizable to operators as possible.

Because the sensors are designed to fit into receivers built into the plane, Tulugaq does not need to get a certificate of airworthiness every time it changes them, he added.

"The analogy I use, is, the plane's kind of like an iPhone; you can build an app for that," Wackowski said.

Until recently the Federal Aviation Administration had banned commercial operation of UAVs in the United States. On Sept. 24, ConocoPhillips announced it had completed the country's first commercial UAV (also known as an unmanned aircraft system, or UAS) flight off of Northwest Alaska in the Chuckchi Sea. The roughly 40-pound ScanEagle UAV was launched from Fairweather's Westward Wind research vessel during a week of flights, according to a ConocoPhillips release.

"Airborne surveillance is often a component of offshore projects. The UAS could be useful in monitoring and data collection efforts, with the benefit of improved safety and lower noise levels as compared to using manned aircraft," ConocoPhillips President Trond-Erik Johansen said in a formal statement.

To operate a UAV, a certificate of authorization, known in the industry as a COA, must be approved by the Federal Aviation Administration. It is essentially a flight plan for unmanned aircraft. It designates where, when and at what altitude a UAV can be flown.

ConocoPhillips can claim the first commercial UAV flight, but Alaska has also already seen unmanned craft used for noncommercial purposes.

The National Oceanic and Atmospheric Administration Alaska Fisheries Science Center staff flew UAVs on Steller sea lion surveys in the Aleutian Islands in the spring of 2012 in conjunction with University of Alaska Fairbanks researchers at the UAF's Geophysical Institute, which has become a leading research center for unmanned aircraft development.

By hovering a small, quad-copter UAV above the sea lions' brooding grounds the researchers took infrared photos of the animals — listed as an endangered population — and were able to count them from an offshore vessel without disturbing the sea lions or putting pilots and biologists in risky low-level flying situations.

Unmanned craft will allow for monitoring shifting sea ice, marine mammals and birds as more companies from transportation to resource development enter the Arctic.

While it will likely be another couple years before widespread commercial use of UAVs is approved, particularly for large aircraft like the DA42, it's "dull, dirty and dangerous" missions similar to the sea lion counts that they are made for, Wackowski said.

"Most clients won't let you put a manned crew (in the Arctic) when you're talking about going more than 20 to 30 miles offshore," he said.

Prior to his work with Fairweather and its subsidiary, Wackowski had experience as an unmanned aircraft pilot in the Alaska Air Force Reserve. He holds the record for the northernmost UAV flight at 88.5 degrees North for flying a hand-launched AeroVironment Raven RQ-11 off of a Canadian icebreaker in the summer of 2011.

He was flying so close to the North Pole that the Raven's compass was disrupted, Wackowski said.

"Things operate differently up in the high Arctic," he said.

While setting the record, Wackowski was able to find leads, or cracks, in the sea ice ahead of the ship with an infrared camera on the Raven, which ship pilots prefer to follow when traveling through an icepack, he said. He also searched for polar bears while a team off the ship installed a buoy under the ice.

While he didn't find any bears, he said the mission is an example of a simple task a UAV can perform to make Arctic work easier.

The FAA is in the midst of developing operational guidelines for UAVs and was directed by Congress to have them complete by 2015. As part of the 2012 FAA Modernization and Reform Act, the agency was tasked with choosing six UAV test sites across the country.

UAF Geophysical Institute Director Greg Walker is pushing for Alaska to be one of the test sites and has said that given the state's areas of open airspace and potential for future UAV use, it is more a matter of whether Alaska is chosen first, rather than at all. The FAA is expected to choose the test sites by the end of the year.

A test site would consist of airspace and a landing strip designated for UAV research.

"We fully support the University of Alaska's efforts to get the UAV test bed up here," Wackowski said. "It would be huge — a boom for industry and Alaska."

Aviation industry experts have forecast UAVs will quickly become a $30 billion-plus business in the U.S. once the FAA clarifies its airspace and communication regulations for the aircraft subset.

Anchorage-based Peak 3 Inc. is in the business of prepping other companies for the FAA standards rollout. Peak 3 President and CEO Jen Haney said her company has worked in Alaska and the Lower 48 consulting with businesses and government agencies on how UAVs can benefit their operations and how to be ready to fly when the FAA says, "cleared for takeoff."

Part of the UAF team pushing for an Alaska test site, Haney said the culture of UAV operators needs to be similar to that of traditional aviation for safety reasons.

"I don't think it's unreasonable for (UAV) pilots to be required to have their pilot's license," she said.

The FAA is the "biggest roadblock" to expanding the unmanned industry, Haney said, but the slow careful nature of the agency is necessary to safely integrate a whole new realm of aircraft into the skies.

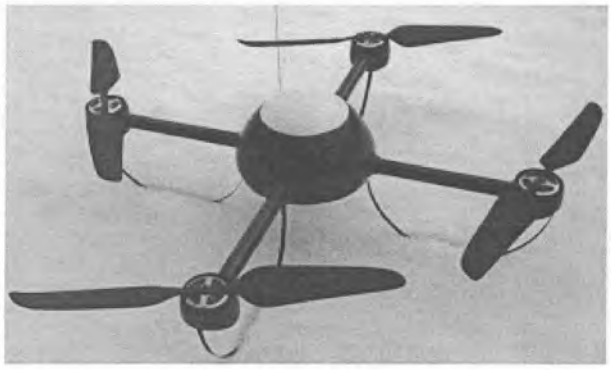
FAA prepares for invasion of 7,500 drones

By Washington Times (DC) November 9, 2013 6:50 am

Print Email Letter to Editor

Text Size: A A A



(File Photo)

The chief of the Federal Aviation Administration predicted Thursday that U.S. airspace could be crowded with as many as 7,500 commercial drones within the next five years, as he unveiled a long- awaited regulatory blueprint that seeks to protect Americans' privacy while requiring testing for law enforcement and private companies seeking to operate unmanned aerial vehicles.

FAA Administrator Michael Huerta said his agency would set up six sites across the country to test drone operators, but cautioned that there could be delays for those looking to obtain certificates to operate unmanned aircraft once the regulatory guidelines are in place. He said ensuring safety in increasingly congested skies was his agency's top priority.

"We must fulfill those obligations in a thoughtful, careful manner that ensures safety and promotes economic growth," Mr. Huerta said in a speech to aerospace industry executives.

The FAA's announcement is the latest step in the march toward transitioning drones from the military use in the war on terrorism that made them famous to civilian applications that can range from collecting survey and weather data to assisting rescues and law enforcement operations.

The Association for Unmanned Vehicle Systems, the leading trade group for the nation's private-sector drone operators, estimated this year that the commercial drone industry will create more than 100,000 jobs and generate more than $82 billion in economic impact over the next 10 years - if the government moves quickly to establish workable operating regulations and safeguards.

The impending boom has raised concerns among privacy advocates about how and where drones might be used to collect data. The FAA is requiring future test sites to develop privacy plans and

make them available to the public. The policy also requires test site operators to disclose how data will be obtained and used.

"Make no mistake about it, privacy is an extremely important issue and it is something that the public has a significant interest and concern over and we need to recognize as an industry that if we are going to take full advantage of the benefits that we are talking about for these technologies we need to be responsive to the public's concerns about privacy," Mr. Huerta said.

Christopher Calabrese, American Civil Liberties Union legislative counsel, told The Washington Times that while the FAA's requirement for public disclosure of data and retention policies are needed and welcome, the safeguards do not go far enough.

"It's crucial that as we move forward with drone use, those procedural protections are followed by concrete restrictions on how data from drones can be used and how long it can be stored. Congress must also weigh in on areas outside of the FAA's authority, such as use by law enforcement and the Department of Homeland Security, which have the ability to use drones for invasive surveillance that must be kept in check," Mr. Calabrese said.

Legislation has been introduced by Sen. Edward J. Markey, Massachusetts Democrat, and Rep. Ted Poe, Texas Republican, and Rep. Zoe Lofgren, California Democrat. If passed, this legislation would require law enforcement agencies to obtain warrants before using drones to collect surveillance data on U.S. soil. "People are really worried about drone use. You see it in a huge number of state bills and laws, and I think the FAA needs to understand that if they don't address privacy issues then drones are not going to be a useful technology," he said. "Privacy can't be swept under the rug."

Mr. Huerta told reporters after his address that there was not a fast-track application process for particular agencies - such as law enforcement - looking to apply for certification to operate unmanned aircraft.

"Our current policy provides for any public user that would like to apply for a certificate of operation to operate unmanned aircraft within national airspace, they are free to apply...," he said. "But I wouldn't say we have a particular priority one way or the other."

Mr. Huerta did allude to possible exceptions for law enforcement agencies to use small unmanned aircraft systems but stressed that the FAA was looking into how to streamline the application process in a way that ensures safe integration into the system and said approximately 80 law enforcement agencies already operate unmanned aircraft under special certificates of authorization.

The FAA released an integration road map and comprehensive plan on its website Thursday.

Both documents lay out steps for unmanned aircraft integration by 2015. Setting up test sites for unmanned aircraft is the next step on the path to integration, and bidding from states to host the sites has been spirited.

"By the end of the year, we plan to choose six test sites for civil unmanned aircraft. Congress required us to do so, and we need to make sure we use these sites to obtain the best data that we can," Mr. Huerta said.

The FAA has received 25 applications for test sights representing 26 states.

The drone industry, which has pushed the Obama administration to speed regulations to clear the way for more commercial uses, called the FAA's moves "an important step."

"From advancing scientific research and responding to natural disasters to locating missing persons and helping to fight wildfires, [drones] can save time, save money, and, most importantly, save lives," said a statement by Mr. Michael Toscano, president and CEO of the Association for Unmanned Vehicle Systems.

Mr. Toscano noted that the FAA's announcements were better late than never as the FAA has missed every deadline laid out for drone integration in the reauthorization act. However, they have had to cope with significant funding cuts from sequestration and government shutdowns. "Every day that we don't fly in national airspace, we lose between $27 to $30 million of economic revenue," he said.

Commercial Litigation
ALERT

November 11, 2013

THE FAA'S ROADMAP FOR UNMANNED AIRCRAFT SYSTEMS (UAS) INTEGRATION: FORESHADOWING FUTURE REGULATIONS FOR SMALL COMMERCIAL DRONES

On November 7, the Federal Aviation Administration released its first annual Integration of *Civil Unmanned Aircraft Systems (UAS) in the National Airspace System (NAS) Roadmap* (the "Roadmap") and accompanying *Notice of Final Privacy Requirements for UAS Test Sites* (Docket No. FAA-2013-0061) ("the "Privacy Requirements"). At the same time, the FAA's Joint Planning and Development Office delivered to Congress the *UAS Comprehensive Plan* (the "Plan") mandated by the 2012 FAA Modernization and Reform Act. These three documents represent the first comprehensive look at how and when the FAA plans to integrate commercial drones into the national airspace system.[1]

A Faster Track for Small Commercial Drones

The FAA's new documents make clear that larger commercial drones will be integrated into the national airspace system very slowly, over an extended period involving technical testing and rulemaking that may span a decade.[2] However, the timeframe for the express approval of so-called "small" commercial drones ("sUAS"), weighing less than 55 pounds, is of arguably greater interest to the nation's nascent commercial drone industry. Many of the most beneficial uses of civilian drone technology can easily be implemented using technology available today, at low altitudes, by platforms weighing far less than 55 pounds. These include aerial photography and cinematography, agricultural crop analysis, wildlife and environmental monitoring, search-and-rescue, geographical mapping, power line and infrastructure inspection, and countless others.

A notice of proposed rulemaking ("NPRM") specifically addressing sUAS has been promised by the FAA since 2010, but its release has been repeatedly delayed. This most recent update moves the goal again, but sounds promising. The Comprehensive Plan indicates that "The NPRM for small UAS is being drafted and is targeted for release in 2014." Plan at 15. The Roadmap is a little more specific: "The sUAS NPRM is expected to be released in *early* 2014." Roadmap at 58 (emphasis added).

[1] These documents are available at http://www.faa.gov/news/press_releases/news_story.cfm?newsId=15334 .

[2] Currently there is no federal aviation regulation specifically addressing the commercial operation of unmanned aircraft systems. The FAA has asserted as its "policy" that commercial uses are prohibited.

A Foreshadowing of Burdensome Regulations

Although the contents of the anticipated sUAS NPRM have remained a closely-guarded secret for years, a significant portion of the future proposed regulatory framework may now be gleaned by a close reading of the FAA's new Roadmap, Comprehensive Plan and Privacy Requirements documents. These suggest that the proposed regulatory framework may be much more burdensome than anticipated by developers of the smallest UAS platforms intended to be flown at low altitudes.

Operator Qualifications

Pilot Certification, including Medical Requirements: The FAA's introductory section of the Roadmap indicates that "At the core of these policies is the concept that each aircraft is flown by a pilot in accordance with required procedures and practices. This same policy applies to UAS." Roadmap at 9. The Roadmap further indicates that the FAA plans to amend its regulations so as to address "certification of sUAS pilots." Roadmap at 34. Additionally, the Roadmap's "Goals, Metrics and Target Dates" section includes the following as "Goal 1": "FAA certification requirements for pilots and crew members for sUAS classes (including medical requirements, training standards, etc.) published as part of a sUAS rule by 2014." Roadmap at 52. These statements strongly suggest that future operation of sUAS may be limited to persons who have undertaken a training course, who pass an examination of some kind, and who are medically qualified. This framework, reminiscent of the current pilot certification regime for manned aircraft, threatens the practicality of commercial uses of very small drones where pilot certification is arguably unnecessary (for example, a photographer using a hobby-grade radio-controlled multirotor to take photographs of real estate at very low altitudes).

Operational Restrictions

Constrained Airspace and Performance: The Roadmap indicates that "[o]perations of sUAS under new regulations may have operational, airspace, and performance constraints." Roadmap at 34. "As integration begins, there will be approved airspace and procedures for sUAS." *Id.* at 35. The Comprehensive Plan gives a more specific sense of the anticipated initial airspace restrictions for sUAS: The "Initial Capability" will involve "Operations outside of Class B/C airspace and not over populated areas." Plan at 9. The indication of an airspace restriction (in particular, an altitude ceiling) for early commercial drone use is not a surprise. However, the reference to "not over populated areas" may pose a serious impediment to numerous commercial applications, such as cinematography on controlled film sets, crop inspection in semi-rural areas, or the survey of disaster-stricken urban areas. Moreover, the reference to "performance constraints" and "approved procedures" suggests potential restrictions on the capabilities and applications of sUAS platforms even within the designated airspace.

Line-of-Sight Requirement: The Roadmap hints that sUAS may need to be operated within the "visual line-of-sight (LOS) of the flight crew" in order to avoid regulations similar to those applicable to manned aircraft. Roadmap at 33. Otherwise, a lengthy list of "general requirements and assumptions" for UAS operations may be applied to non-LOS sUAS, including compliance with existing operating rules, the need for an airworthiness certificate, the requirement to "file and fly an IFR flight plan," the use of an on-board ADS-B (Out) transponder, air traffic separation capabilities, and pilot communication with ATC using standard phraseology, among others. *Id.* at 33-34. The Plan similarly suggests that the early FAA goals "apply to small UAS (under 55 pounds) within visual line-of-sight (VLOS)." Plan at 3. Many small sUAS will operate at the limit of visual perception, or be momentarily out of sight such as when flying low between buildings on a disaster relief mission or under tree-top level during infrastructure inspection. Therefore, the definition of "visual line of sight" will seemingly play an important role in the exemption from the long list of technical and procedural requirements. In the Glossary at the back of the Roadmap, the term "Visual Line-of-Sight" is defined as "Unaided (corrective lenses and/or sunglasses exempted) visual contact between a pilot-in-command or a visual observer and a UAS

sufficient to maintain safe operational control of the aircraft, know its location, and be able to scan the airspace in which it is operating to see and avoid other air traffic or objects aloft or on the ground." The term is not defined in the Comprehensive Plan. Arguably, direct visual observation of an sUAS is far less useful as an indication of its precise location than video and digital telemetry sent back to the ground, and there is some sentiment among industry participants that the more important point is visual confirmation that the surrounding airspace is free of other air traffic even if the sUAS is not directly visible for its entire operation.

Autonomous Flight Prohibited: The FAA appears to have drawn a line in the sand with respect to autonomous flight for any UAS. "Autonomous operations are not permitted. The [pilot] has full control, or override authority to assume control at all times during normal UAS operations." Roadmap at 33. Some of the more innovative small multirotor designs contemplate the use of autonomous technologies to navigate the environment, for example in a search and rescue operation surrounding a collapsed building. One key technology already implemented in many existing sUAS platforms is the ability to "return to home" via GPS guidance in the event of a control signal loss or other malfunction. Although that situation may not qualify as "normal UAS operations," the FAA's Roadmap suggests that developers generally must include the ability of a ground-based pilot to monitor and override all of a drone's autonomous flight functions.

Daytime Flight Only: The FAA's timeline indicates that "sUAS follow-on night operations experiments and study accepted by the FAA for review by the 3rd Quarter of 2014" with a goal of "increased night operations for public entities . . . by the 3rd Quarter of 2015." Roadmap at 58. This suggests a delay for certain commercial applications, such as search-and-rescue, agriculture, or wildlife monitoring, where night operations are advantageous or critical.

Privacy Considerations

Privacy Framework: The FAA's Roadmap declares that "the FAA's mission does not include developing or enforcing policies pertaining to privacy or civil liberties." Roadmap at 11. Its response to privacy concerns that have been raised with respect to the six planned UAS test sites is to permit the test site operators (who are "public entities" -- generally state or local government agencies) to develop their own privacy policies, with the FTC's Fair Information Practice Principles as an informative guideline. *Id.* at 11-12. The FAA expects those policies to be in writing, to provide for public comment, and to involve an annual compliance review. *See* Privacy Requirements at 8, 13. "[T]he privacy policies developed by the test site operators will help inform the dialogue among policymakers, privacy advocates, and the industry regarding broader questions concerning the use of UAS technologies." Roadmap at 12. Noticeably absent from any of the FAA's documents is an indication of how the FAA plans to address privacy issues with respect to *sUAS platforms*, as to which it has promised an NPRM by "early 2014," and which are anticipated to be in "routine" operation by 2015. Obviously, the experiences to be gained from the six test sites cannot guide the sUAS NPRM because the test sites have not even been chosen and will not be operational for some time. In light of the statement concerning its "mission, "perhaps the FAA plans to defer to state and local standards. Indeed, many of the privacy concerns that are often expressed about commercial drone technology are already addressed by technology-neutral state common law principles, or anti-stalking and invasion-of-privacy statutes.

Mandatory Procedures

Registration and Approval: The FAA has also indicated that future regulations will address "registration of sUAS [and] approval of sUAS operations." It is not clear from these documents whether the registration and approval mechanism will be minimally burdensome (such as simple identification and operational notice provided on an FAA website) or something more complex resembling the registration

of manned aircraft and the visible display of an N-Number on the drone. The latter approach could be difficult for smaller platforms.

Safety Data Reporting and Recordkeeping: The Roadmap indicates that "[d]ata collection will expand when . . . new rules and associated safety data reporting requirements are implemented for sUAS." Roadmap at 28. This safety data will be used by FAA to "support the basis for and define appropriate UAS operating requirements." One of the FAA's early goals is to accomplish "Necessary changes to record keeping systems established as part of a sUAS rule." *Id.* at 53. These statements all suggest that commercial sUAS operators will be expected to collect safety-related data, potentially using required sensors on board the drone, and to maintain formal operating records.

Interface with Air Traffic Control: The Roadmap contemplates that the FAA will "[t]rain air traffic control workforce within six months after sUAS rule enactment" and "sUAS operations are aligned with ATC Handbook ... when the sUAS rule is published and effective." This suggests that sUAS operation may, in some way, be subject to interaction with air traffic control.

The Path Forward

Government Users First: The Comprehensive Plan states that with respect to routine sUAS operations, the FAA is "assuming the public realm would be accomplished first and civil would follow." Plan at 16. In other words, public operators (typically government agencies or organizations funded by government, such as law enforcement or state universities) can be expected to be permitted use of sUAS platforms before civil (private, commercial) operators. 2015 is indicated as the goal for both of those "national goals," however, so the purpose of the two-step approach is unclear. *Id.* at 9.

Risk Assessment Hurdle: The Roadmap indicates that "The sUAS proposed rule has undergone a risk assessment by the FAA through its Safety Management System (SMS) process." Roadmap at 58. This may account for the FAA's already lengthy delay. However, it also suggests that public input during the notice-and-comment period might require the SMS risk assessment to be redone, triggering a new delay before the final sUAS rules are actually implemented.

Dear Representative Hughes and Senator Olson:

I am pleased to provide supporting comments to the Unmanned Aerial Systems (UASs) Legislative Task Force for consideration as you move forward with recommendations on the use of UASs in the public, private and commercial arena. I commend the Task Force for taking a robust look at the public interest issues associated with UASs.

I recognize the valuable role these systems can play in public safety, law enforcement, land management, and agriculture, among other sectors. The potential economic benefits of a carefully managed effort to integrate UASs in the airspace are demonstrably large. Already, ConocoPhillips contractors have sent a ScanEagle aircraft offshore from Wainwright for exploratory purposes. One of the University of Fairbanks' (UAF) unmanned aircraft helped a Russian tanker in 2011-2012 to find a path to deliver fuel. The FAA is approving unmanned flights nationwide and I support the state's interest in safely and responsibly considering the use of UASs across industries.

As we look at evaluating UAS implementation, the following issues must be addressed: safety, privacy, controlling information, certification and balancing data collection with privacy. If we can use unmanned aircraft efficaciously to conduct mapping, for search and rescue operations, crash investigations, pipeline inspections or monitoring oil spills and wildfires then we must look at the potential for implementation in Alaska.

In 2012, FAA was tasked with determining how to integrate UAS into the National Airspace System. In this effort, an economic analysis was completed by the Association for Unmanned Vehicle Systems International providing useful data. This study indicates that the industry impact totals more than $13.6 billion and more than 70,000 new jobs from 2015 to 2017. In Alaska, this amounts to a $19 million economic effect with 95 additional jobs. What is needed is a regulatory structure for commercial and civil development to take advantage of this opportunity in a responsible manner.

The FAA is working to integrate UASs into the national airspace by 2015. As the FAA works to establish six test sites for evaluating how to accomplish the integration, the Legislative Task Force is well poised to address concerns of privacy, overreach, uses and regulations. I support FAA's consideration of UAF as an arctic test site to further vet the use of UASs in diverse terrain and airspace.

Thank you for the opportunity to comment on the Unmanned Aerial Systems Legislative Task Force process. I support your efforts to evaluate all issues associated with the use of unmanned aircraft in Alaska and to consider the application of these systems for public, private and commercial purposes.

Sincerely,

Lisa Murkowski

United States Senator

Written Testimony

Of

Stephen J. Ingley
Executive Director
Airborne Law Enforcement Association

Before the
Legislative Task Force on Unmanned Aircraft Systems Public Meeting
State of Alaska

Good morning Representative Hughes and members of the Legislative Task Force on Unmanned Aircraft Systems. My name is Stephen Ingley and I am the executive director of the Airborne Law Enforcement Association (ALEA). ALEA is a 501(c)(3) non-profit educational membership organization, founded in 1968 to support, promote and advance the safe and effective utilization of aircraft by governmental agencies in support of public safety missions through training, networking, advocacy and educational programs. Our vision is the safe and successful completion of each airborne public safety operation. And our values are Safety, Education & Training, Networking, Public Service, Professionalism, and Ethics and Integrity. Our members operate traditional aircraft (airplanes and helicopters), alternative aircraft (light sport aircraft, gyro-copters and powered parachutes) and unmanned aircraft systems (UAS).

UAS technology has been successfully fielded by the US military in combating terrorism. As the war has drawn down, UAS manufacturers have developed more devices that are small, portable and reliable. More importantly, the manufacturers started to develop devices that were relatively inexpensive, making it conceivable that those agencies that could not afford traditional aviation assets, could afford small UAS (sUAS) technology.

Realizing the potential of this technology, in 2005, the ALEA became active in researching the feasibility of incorporating sUAS into the "toolbox" of public safety agencies. This included participating in the Federal Aviation Administration's (FAA) Proposed Rulemaking Committee for UAS, participating in the Department of Justice's, National Institute of Justice research projects for UAS, conducting UAS training for ALEA members, and working with various organizations and federal and state legislatures on UAS issues. In addition to this, the ALEA has taken the lead in public safety aviation by embracing this new technology, as we see the capabilities of UAS in enhancing the safety of our citizens and public safety employees.

It is a very common occurrence to see military operated UAS on national and local news programs. These devices are large, armed with weapons and operated in theater. Many times, articles have been written regarding the use of UAS technology by American public safety agencies, along with a photos of military grade Predators and Global Hawks. The depiction of military UAS devices within an article concerning public safety's use only heightens the fear of the public and fosters distrust. More importantly, it paints a picture that your local police or sheriff's department is going to operate Predator type UAS devices, capable of long-term, sustainable surveillance and rocket-launched weapons. This stylized hype couldn't be further from the truth.

While the military has been successful in its use of UAS technology to combat terrorism, American public safety is in its infancy in using these devices to combat crime, save lives and enhance the efficiency of agencies. Today, there are four local agencies that have FAA approval to operate UAS devices in their respective

jurisdictions. They are the Grand Forks County (North Dakota) Sheriff's Office, Mesa County (Colorado) Sheriff's Office, Arlington (Texas) Police Department and the Miami-Dade Police Department. Mesa County was the first agency to initiate utilizing UAS technology within their day-to-day operations. Being a very rural county in Colorado, this was a relatively easy process for them, as they had little impact on the national airspace and interfering with the safe operation of other aircraft. Although rural, Mesa County has pioneered the use of these devices for all agencies. What Mesa County has discovered is that these devices are not just a law enforcement tool, but also a tool for public safety generally, as well as government operations. For example, the Mesa County UAS program routinely assists its various fire agencies in responding to building fires. Their UAS devices are launched to provide fire incident commanders timely information regarding the fire that they are combating. In addition, the devices are routinely used for Search and Rescue (SAR) missions. sUAS are able to clear large areas of land (wooded and cleared) much faster than utilizing ground personnel. This permits the Mesa County rescuers to manage a SAR operation much more efficiently and enhances the chance of finding any victims much sooner by deploying search personnel smarter. Mesa County also utilized its sUAS to survey its county owned landfill for an annual land use survey. In the past, the county hired a company to conduct this survey using traditional aircraft and it cost taxpayers thousands of dollars. By using the county owned sUAS, the work was conducted for only hundreds of dollars, saving the county precious funds to allocate elsewhere.

In the province of Saskatchewan, the Royal Canadian Mounted Police, utilizing a sUAS, was recently credited with the first public safety SAR mission that directly resulted in saving someone's life.

I would like to highlight an event that occurred in Baltimore County (Maryland) recently. On May 28, 2013, a large container vehicle and a CSX freight train collided at a vehicle crossing. This incident occurred in an area that is near the city of Baltimore and in an area of mixed commercial and residential use. In addition, the incident occurred less than one half mile from Interstate 95, a major north and south thoroughfare. The incident included the explosion of a railroad car carrying hazardous materials and serious damage to commercial, government and personal property miles away. Immediately after the incident occurred, the Baltimore County Police Department launched one of their turbine engine helicopters to provide command and control support for the Baltimore County Fire Department incident commander (clearly not a law enforcement mission). The aircraft provided an "eye-in-the-sky" for the incident commander and continuously downlinked the images to the incident command post, Emergency Operations Center and within the county's intranet for police and fire commanders. Although the county used its traditional aviation resources to complete this mission, the mission could have been conducted by a sUAS at a fraction of the cost. The turbine engine aircraft costs approximately $400.00 per hour to operate, and they were on-scene for several hours with multiple aircraft. A sUAS would have only cost the agency approximately $25.00 per

hour to operate and would have provided the same aerial images to the fire and police commanders.

Of course, Mesa County and the other agencies use their sUAS for law enforcement missions as well. These missions include, but are not limited to:

- Traffic crash scene photography
- Crime scene photography (with and without the need for a search warrant)
- Command and control of major incidents
- Tactical Operations (Barricaded subjects, armed subjects, school incidents)

As much as the ALEA embraces the inclusion of new technology into the airborne public safety industry, we also embrace the rights of our citizens. The ALEA supports the professional operation of aircraft in public safety missions and expects its members to do so within the framework of the laws of this country. In fact, we routinely say that we are a "Profession within a Profession." We are both professional public safety officers and professional aviators. As such, we work tirelessly to educate our members on search and seizure laws pertaining to privacy and the use of aircraft, UAS included.

To reiterate our opening remarks submitted to the Privacy Project 2013, we "support and promote the IACP Aviation Committee's Recommended Guidelines for the use of Unmanned Aircraft and the Association for Unmanned Vehicle Systems International's (AUVSI) Unmanned Aircraft System Operations Industry 'Code of Conduct.' We do not concur with privacy advocates who claim that public safety agencies' utilization of unmanned aerial systems (UAS) poses a greater threat to 'privacy rights' than manned aviation. Similarly, we do not concur that said uses pose a greater threat to privacy 'rights' than other technologies currently utilized by public safety agencies, both in manned aircraft and on the ground. Furthermore, we do not accept that any legislation is necessary as there are long-standing court rulings upholding our Fourth Amendment protections; but we are particularly opposed to legislation that focus their attention on one technology based on fears of what could occur tomorrow, however unlikely. Aside from recent laws enacted that place outright bans on UAS use, such as that in Charlottesville, VA, many current 'anti-drone' bills appear to be more of an attempt to increase protections under the Fourth Amendment without actually altering the U.S. Constitution. The presumption in most of these pieces of legislation is that a reasonable expectation of privacy now exists in places where there has been no such expectation. As such, a warrant must be obtained before UAS can be utilized by public safety."

The ALEA believes that the Fourth Amendment of the Constitution of the United States of America is alive and well; and the protections contained therein against unreasonable searches and seizures have been supported through years of judicial opinions. We also believe in the Constitutional process of lawfully obtaining a search warrant when there are specific, articulable grounds to believe that the use

of an aircraft, UAS included, will intrude upon a reasonable expectation of privacy. However, in situations where time is of the essence and **NO** reasonable expectation of privacy exists, we would be opposed to restrictions that would limit the effectiveness of UAS.

We would encourage you to focus attention on the more basic issue at hand -- the storage, use, retention, and destruction of sensitive data; not the technology that gathers the data. Similar to law enforcement's use of Automated License Plate Readers (LPRs) and government and non-government surveillance camera's, the data captured and the use of this data is of concern to civil liberty advocates and others. As such, ALEA believes that law enforcement agencies must have solid policies that address, at a minimum, the following:

- How captured data is stored.
- Who has access to the data.
- How long the data is stored.
- How the data is purged.
- Audit controls to hold law enforcement employees accountable for the proper use of captured and stored data.
- Transparency in the inspection of stored data that is not evidence of a crime.

As stated above, these are the same privacy issues that we face concerning LPRs and surveillance cameras. However, unlike these two public safety tools, UAS is being treated differently, resulting in the creation of a separate and higher set of operating standards. If there is to be legislation, it needs to focus on public safety agencies utilization of sound policies that address the bullet points above, as opposed to developing different sets of legislated standards for each device that may be used to gather data.

In closing, ALEA, along with other organizations, have worked diligently with the FAA to develop procedures to operate UAS technology within the National Airspace. This includes the newly released FAA and Department of Justice Memorandum of Understanding that clearly explains the procedures to obtain a Certificate of Authorization to operate a UAS by a public safety agency. The ALEA continues to be committed to embracing this technology, working with others to see its safe integration into the National Airspace, and to developing training for public safety professionals who operate UAS. Our subsidiary, the Public Safety Aviation Accreditation Commission, is also committed to developing standards for the operation of UAS by public safety agencies.

On behalf of the Airborne Law Enforcement Association and its membership, thank you for the opportunity to participate in these deliberations.

United States Department of the Interior
BUREAU OF OCEAN ENERGY MANAGEMENT
Alaska OCS Region
3801 Centerpoint Drive, Suite 500
Anchorage, Alaska 99503-5823

OCT 2 3 2013

The Honorable Shelley Hughes
Representative
Alaska State Legislature
House District 8 Greater Palmer
600 East Railroad Avenue
Wasilla, Alaska 99654

Dear Representative Hughes:

The Bureau of Ocean Energy Management (BOEM) is responsible for managing exploration and development of mineral and energy resources in the Outer Continental Shelf, seaward of State boundaries. BOEM's Environmental Studies Program (ESP) supports research to collect information needed for assessment and management of potential impacts from oil and gas development and to enable BOEM to develop mitigation protocols to protect the Arctic environment and the Alaska Native subsistence way of life. The ESP has supported aerial surveys generally flying at altitudes between 1000-2000 feet to monitor distribution and movement of multiple species of marine mammals. Manned aircraft flights can be dangerous and expensive because of long transit times, hazardous weather conditions, fuel-capacity limitations and operation costs. The ESP remains interested in working with our partners to evaluate the use of UAS to help fill information gaps often unattainable from manned aircraft in remote, hazardous or sensitive areas where use of conventional aircraft may present logistical difficulties.

Since 1974, the ESP has supported large scale aerial surveys during the summer and fall to document distribution, relative abundance, and migration of marine mammals in the Beaufort Sea. This decades-long coverage provides one of the longest monitoring efforts of biological phenomenon, which is increasingly valuable during this time of changing Arctic environmental conditions. The geographic area of these aerial surveys was extended to also cover the Chukchi Sea in 2008. **As the use of Unmanned Aircraft Systems increases, it is important to ensure that protocols are developed to avoid conflicts between aerial and UAS surveys which may be proposed for the same geographic area during the same time period. We encourage this Legislative Task Force on Unmanned Aircraft Systems to address coordination with ongoing efforts as legislation is developed.**

When we submit our statement, as per the flyer for this, we have been asked to include the following, with proposed answers given in **bold**:

Your name – **Dee Williams, PhD**
Business name – **BOEM Environmental Studies Program**
Contact information – **907-334-5283; dee.williams@boem.gov**
Business category: **Government**
Business client: **Public**

Sincerely,

Sharon E. Warren
Acting Regional Director

Scenarios Network
FOR ALASKA & ARCTIC PLANNING

October 22, 2013

Representative Shelley Hughes
Alaska State Legislature
600 East Railroad Avenue
Wasilla, Alaska 99654

Dear Representative Hughes

Please consider my concerns regarding the potential for "over" legistlation of unmanned aircraft systems (UAS) technology because of unwarranted fears.

UAS will provide many new capabilities for commercial, research, government, and even recreational users. In order to realize this potential, especially for commercial uses, it is important to acknowledge the tension that will occur among all parties, especially in the area of privacy. We need a better understanding of the technology's benefits before laws are created restricting their use.

A good example is the issue of public versus private airspace. For example, a manned aircraft flying at 500 feet altitude, in the National Airspace, over a person's private property is legally permitted to collect air photographs of the property. Is the same true for UAS? What if the altitude is less than 500 feet, i.e. 450 or even 50 feet? Does a property owner have rights to the airspace above their property and to what height? Can they shoot at the manned aircraft at 500 feet or the UAS at 100 feet?

On the otherhand, a significant cause of concern with UAS technology is privacy. Do voyeurism and peeping tom laws apply to UAS? What if the UAS is on your property but you are using the camera on the UAS to peer through a neighbor's window, perhaps above a privacy fence?

We can all acknowledge this tension created by privacy does exist. And will likely a source of future litigation. But the early uses of the technology, especially for search & rescue, research, and commercial innovation likely deserves some protection.

I can be reached at 907-474-6958 or kwcunningham@alaska.edu should you have any questions.

Cheers

Keith W. Cunningham

(U) SUBJECT: Potential for Nefarious Use of Unmanned Aerial Vehicles (UAVs)

(U) UAVs can provide first responders, private industry, or government agencies with multiple advantages; from providing aerial imagery, use as a communications relay platform in remote areas, infrared (IR) detection during search and rescue operations, or monitoring the movement of a wildfire; UAV applications have only the limitations of the imagination. Within the year, the FAA must allow any "government public safety agency" to operate a UAV weighing 25 pounds or less, as long as certain conditions are met. The FAA predicts that after they allow commercial use of drones in U.S. airspace, 15,000 of the flying robots will be in the skies by 2015, and double that by 2030.

(U) Often, what benefits legal use of a tool has an equalizing balance of adding a burden to society when that same technology is used with nefarious intent. Unlawful use of UAV technology will be as diverse as the proposed legitimate applications. Criminal individuals and organizations will quickly identify the legal and operational gaps in law enforcement response to such an asymmetric vector. Additionally, criminals will recognize the initial legal and privacy constraints for law enforcement use of UAVs, and seek to exploit those boundaries. Terrorists will also understand the implications of a potentially low-cost, low-risk delivery of a kinetic attack on buildings, persons, or other manned aircraft. Individuals will also have the readily available, non-attributable means to stalk, spy, eavesdrop, or facilitate retribution violence or destruction of public or private property.

(U) Criminal use of UAVs will include, but not limited to:

- Circumventing checkpoints to move contraband
- Surveillance of law enforcement operations
- Jamming of law enforcement communications
- Act as an airborne communications repeater for "secure" communications
- Electronic eavesdropping platform for government/military/economic espionage
- Fish and Game guiding violations
- Kinetic attacks

(U) Potential for miss-use of this platform is great. Additionally, wrong-doers or those who believe that UAV use is violating their Privacy or Civil Rights-Civil Liberties, will seek ways to defeat, destroy, disable, or misappropriate (steal) UAV's that are conducting legal or commercial missions. New technologies, tactics, techniques and procedures will emerge to support this, and must be anticipated. There are already documents available on the open internet identifying "How to Kill UAVs." This also plays into current negative media coverage of the use of "drones" in the United States.

(U) Legislative bodies and policy makers, law enforcement leadership, and regulatory authorities need to begin now to anticipate how this UAV/UAS technology will be used for criminal activity and pass the appropriate legislation, develop effective operational countermeasures, and identify investigative strategies.

David Neel is the DHS Intelligence Officer assigned to the State of Alaska. This paper represents his personal viewpoint and should not be construed to reflect an official position by the U.S. Department of Homeland Security or the State of Alaska.

Executive Summary

Purpose and Scope

In March 2013, the University of Alaska Fairbanks Center for Unmanned Aircraft Systems contracted with McDowell Group to analyze the economic conditions for unmanned aircraft systems (UASs) in Alaska and measure the projected economic impact of developing a Federal Aviation Administration (FAA) test site for UAS in Alaska. The economic impact assessment (EIA) in this report provides annual projections of the direct, indirect, and induced impacts to employment and wages as well as projections of output and value added related to the test site, called the Pan-Pacific UAS Test Range Complex (PPUTRC) – with test ranges located in Alaska, Hawaii, and Oregon. The EIA focuses on the additional economic activity that is expected in response to the PPUTRC test site selection. Additional information is provided in this report on the economic impact of the commercialization of UAS specifically in Alaska once UAS flights are allowed in the National Airspace System (NAS).

Summary

- UAS represent a new industry that is set to quickly grow once new government regulations increase access to designated test sites and then to the National Airspace System (NAS), the system of air traffic control that enables safe and efficient flight activity in the U.S.
- UAS applications are far reaching for civilian and military purposes; ranging from environmental monitoring to search and rescue to pipeline or powerline inspections.
- The FAA has limited the authorized use of UASs in the U.S. to efforts focused on the public interest. There are currently two ways to operate a UAS with the approval of the FAA (both of these options require that the flight takes place outside of densely-populated areas):
    - Certificate of Waiver or Authorization (COA) for public UAS
    - Special airworthiness certificate for private sector (civil) UAS
- However, the FAA is scheduled to designate six UAS test sites in the U.S., as required under the FAA Modernization and Reform Act of 2012. The sites will operate from January of 2014 to February 13, 2017 to provide opportunities for government agencies, industry, and researchers to access this airspace to aid in the integration of UASs in the NAS.
- According to the Association of Unmanned Vehicle Systems International (AUVSI), integration of UASs into the NAS will generate some $82 billion in activity in the U.S. between 2015 and 2025; employment impacts are estimated at just over 100,000 jobs by 2025.

- In an effort to bring additional UAS activity and related economic benefits to Alaska, UAF is leading the PPUTRC Test Site application process for 13 ranges in Alaska, Hawaii, and Oregon.
- Existing UAS activity in Alaska, Hawaii, and Oregon benefits from unique assets and opportunities, including government facilities (e.g. numerous military bases, universities, and maritime assets), wide-open airspace in largely unpopulated areas, and geographic diversity (e.g. tropical to arctic climates, oceanic or mountainous landscapes, and up/down weather fronts).
- In total, designation of PPUTRC as a UAS test site would be expected to generate 1,065 direct, indirect and induced jobs in 2014, increasing to over 1,400 jobs by 2017. Total labor income would climb from $57 million in 2014 to about $76 million in 2017.
- Output in the PPUTRC states attributable to test site designation would climb from $265 million in 2014 to $333 million in 2017.
- Value added would climb from $109 million to $134 million over the same period.
- Designation of the PPUTRC will provide a four-year total of $20 million of income tax revenue to Hawaii and Oregon.

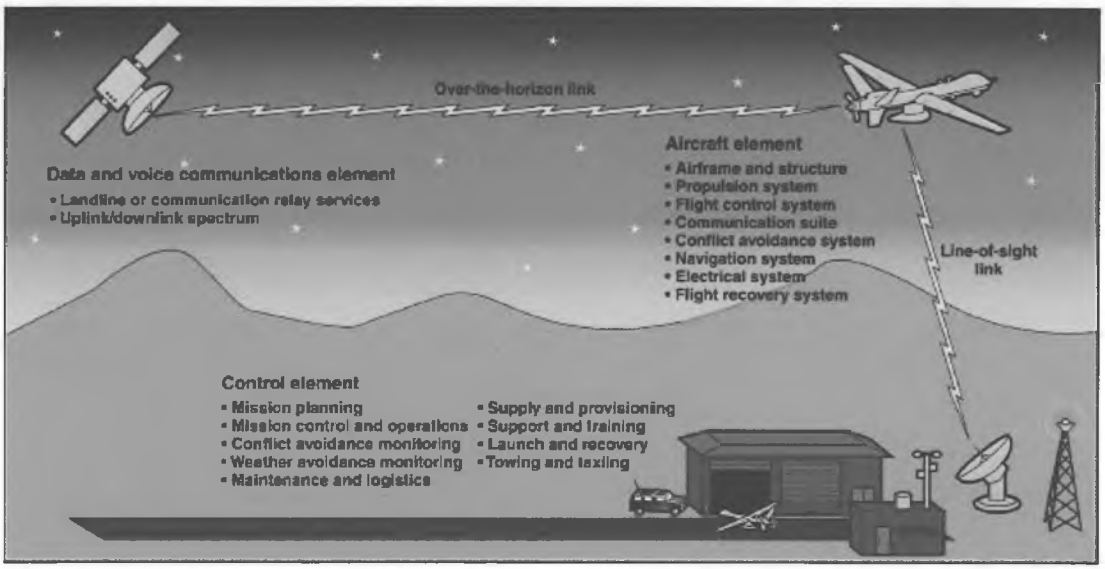
Chapter 1. Unmanned Aircraft Systems in the United States and the NAS

Background

Unmanned aerial vehicles (UAVs) were first described in the late-19th century. Early attempts to develop these UAVs, mostly for combat purposes, soon followed. These remotely piloted vehicles first entered U.S. combat in the mid-20th century to support missions focused on reconnaissance and surveillance, and sometimes they were also used as decoys. Throughout most of the 20th century UAVs lacked real-time data capability and instead focused on collecting images and video for surveillances purposes. Widespread adoption of the technology for U.S. military purposes did not begin until the 1990s and, to a much greater extent, the 2000s during the Afghanistan and Iraq conflicts. It was at this point that technological innovations related to onboard sensors, communication links, and data collection began drastically increasing the potential domestic uses of unmanned aircraft systems.

The increase in complexity for the UAVs required a systems approach to appropriately understand the interactions - and design each component from the start as an integratedsystem - among the on-the-ground control elements, the aircraft, and the communication links. This broader operational perspective is termed "unmanned aircraft system" (UAS). The image below provides a conceptual rendering of the interactions among key elements of a UAS flight.

Figure 1: Conceptual Rendering of an Unmanned Aircraft System



Source: GAO, 2013

UAS Applications

Unmanned aircraft often provide advantages in comparison to manned aircraft. For instance, flights that are dangerous or covert represent potential opportunities where an unmanned vehicle might be preferred over a manned vehicle. Similarly, dull tasks such as extended surveillance missions may be better suited for ground-based operators that can be relieved at the end of their shift. UAVs are often more fuel efficient, quieter, and less disruptive to their surroundings (in comparison to manned aircrafts) and, thus, can allow for fewer environmental disturbances as well as more accurate research results. Finally, initial costs, operating costs (e.g. maintenance costs, fuel costs, storage costs, etc.), and labor costs (e.g. wages, insurances, etc.) are all generally lower for UAVs (Source: Austin, 2010). UASs have already been shown to lead to arrests as well as saving lives during search and rescue missions (Source: The Verge, 2013).

The existing and potential applications for UASs are wide ranging for both civilian uses as well as for military purposes. The lists below provide an abbreviated look at how important this relatively new field may become to sectors throughout Alaska's economy (Source: Austin, 2010):

Civilian

- Aerial Photography - Film, video, stills, etc.
- Agriculture - Crop monitoring and spraying; herd monitoring and driving
- Coastguard – Search and rescue, coastline, and sea-lane monitoring
- Conservation – Pollution and land monitoring
- Customs and Excise – Surveillance for illegal imports
- Electricity Companies – Powerline inspection
- Fire Services and Forestry – Fire detection, incident control
- Fisheries – Fisheries protection
- Gas and Oil Supply Companies – Land survey and pipeline security
- Information Services – News information and pictures, feature pictures (e.g. wildlife)
- Lifeboat Institutions – Incident investigation, guidance, and control
- Local Authorities – Survey, disaster control
- Meteorological Services – Sampling and analysis of atmosphere for forecasting, etc.
- Oil Companies – Pipeline security
- Ordinance Survey – Aerial photography for mapping
- Police Authorities – Search for missing persons, security and incident surveillance
- Rivers Authorities –Water course and level monitoring, flood and pollution control
- Survey Organizations – Geographical, geological, and archaeological survey
- Traffic Agencies – Monitoring and control of road traffic
- Water Boards – Reservoir and pipeline monitoring

Military

- Navy
    - Shadowing enemy fleets

    - Decoying missiles by the emission of artificial signatures
    - Electron intelligence
    - Relaying radio signals
    - Protection of ports from offshore attack
    - Placement and monitoring of sonar buoys and possibly other forms of anti-submarine warfare
- Army
    - Reconnaissance
    - Surveillance of enemy activity
    - Monitoring of nuclear, biological, or chemical (NBC) contamination
    - Electronic intelligence
    - Target designation and monitoring
    - Location and destruction of land mines
- Air Force
    - Long-range, high-altitude surveillance
    - Radar system jamming and destruction
    - Electronic intelligence
    - Airfield base security
    - Airfield damage assessment
    - Elimination of unexploded bombs

UAS Categories

UASs are typically categorized based on the size or capability of the UAV. The five categories below provide a common categorization of UAS that helps simplify requirement assessments and costing estimates (Source: Teal Group, 2008):

- Micro or Mini – A small UAV that ranges in size from something that can be held in the palm of the hand to a UAV that can be carried on your back and launched by hand.
- Naval – A tactical UAV is generally operated with simpler systems over a radius between 100 and 300 km.
- Tactical – A reconnaissance UAV used by the Army for endurance missions ranging several hours over an operating radius up to 200 km.
- MALE – Medium Altitude Long Endurance reconnaissance UAVs fly between 5,000 and 15,000 meters in altitude for approximately 24 hours.
- HALE – High Altitude Long Endurance reconnaissance and surveillance UAVs are usually operated by Air Forces at altitudes over 15,000 meters for periods longer than 24 hours.

National Airspace System

The NAS was developed to allow for safe and efficient commercial aviation. However, commercial UAS flights are currently not allowed in the NAS due to concerns over (1) "the inability to detect, sense, and avoid other aircraft and airborne objects in a manner similar to 'see and avoid' by a pilot in a manned aircraft, (2) vulnerabilities in the command and control of UAS operations, (3) the lack of technological and operational standards needed to guide the safe and consistent performance of UAS, and (4) the lack of final regulations to accelerate the safe integration of UAS into the national airspace" (Source: U.S. GAO, 2012 and Waggoner, 2013).

The first authorized use of UASs in the NAS in the U.S. was permitted by FAA in 1990. Over the past 23 years, the FAA has limited the authorized use of UAS in the U.S. to efforts focused on the public interest. These missions have included border patrol, military training, disaster relief, firefighting, search and rescue, law enforcement, and testing and evaluation. According to the FAA, the Department of Homeland Security currently utilize UASs for border and port surveillance; NASA and NOAA utilize UAS to help with scientific research and environmental monitoring; law enforcement agencies utilize UASs to support public safety; and state universities use UASs to conduct research (Source: FAA Fact Sheet 2013). These efforts are limited to areas outside of major urban areas at elevations less than 50,000 feet. The aircraft range in size from a hummingbird to a wingspan as large as a Boeing 737; although many are the size of a remote-control plane or helicopter. Recreational use of airspace is allowed away from airports and air traffic and below 400 feet above ground level – informal flights for business purposes are specifically excluded (Source: FAA Advisory Circular 91-57).

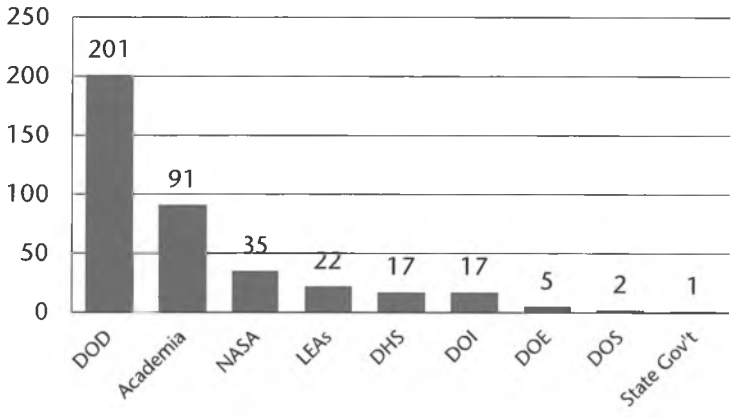
As of 2013, there are currently two ways to operate a UAS with the approval of the FAA: (1) Certificate of Waiver or Authorization (COA) for public UAS's and (2) special airworthiness certificate for private sector (civil) UAS's – both of these options require that the flight takes place outside of densely-populated areas.

Certificate of Waiver or Authorization (COA)

COAs allow public entities to fly UASs in a defined block of civil airspace. The FAA issued the first COAs in January 2007. With COAs, the UAV must remain in view, either of the ground crew or via a chase plane, since UAS technology cannot currently comply with 'See and Avoid' rules. COAs usually require between six and 24 months for approval and cost $40,000 to $60,000 (Source: Economic Development of Central Oregon, 2011). Most of the cost is for specialists in the testing protocols, documentation, and in managing the process through the FAA. Common applications by COA holders include firefighting, border patrol, disaster relief, search and rescue, military training, and other government operational missions (Source: FAA 2013b). The number of COAs issued has increased since 2009, with 146 in 2009, 298 in 2010, and 313 in 2011 (Source: FAA 2013b). In 2012, the FAA issued 391 COAs to 121 federal, state, and local government entities in the U.S. A total of 1,428 COAs have been issued since January of 2007 (Source: GAO 2013). As of February 15, 2013, there were 327 active COAs (Source: FAA 2013b).

The graph below aggregates the 391 COAs issued in 2012 to nine types of entities: U.S. Department of Defense, academia, NASA, local law enforcement agencies, U.S. Department of Homeland Security, U.S. Department of the Interior, U.S. Department of Energy, U.S. Department of State, and state government.

Figure 2: Number of Approved COAs, 2012



Source: GAO, 2013

Special Airworthiness Certificate

Special airworthiness certificates are the only way for civil operators to fly UASs in the NAS at present. However, these certificates cannot be utilized to carry people or property for compensation or hire – they can only be issued for research and development, crew training, or market surveys (Source: FAA 2011).

Allowing UAS in the NAS

In recent years the FAA has made a concerted effort to integrate UAS regulations into the NAS. In 2009, the FAA, NASA, DoD, and the Department of Homeland Security began addressing pathways to integrating UAS regulations into the NAS through their UAS Executive Committee. Additionally, the FAA chartered a UAS Aviation Rulemaking Committee in 2011 to create operational procedures, regulatory standards, and policies related to UAS flights in the NAS. In 2012, the FAA Modernization and Reform Act of 2012 (FMRA of 2012) was passed by Congress to approve six test sites where UAS integration could be tested prior to a 2015 integration of UAS regulations in the NAS (Source: FAA 2012). Delays within the FAA due to technical, logistical, and public outreach concerns may contribute to a UAS integration date later than 2015. However, six test sites are still scheduled to run from January 1, 2014 to February 13, 2017.

Six UAS Test Sites

There is considerable competition over where test sites will be designated, since designation will provide immediate employment in the selected region and support a strong foundation for UAS activity prior to integration of UAS regulation in the NAS. As of March 5, 2013, 50 applicants from 37 states were granted access to the FAA test site application web portal (Source: FAA 2013b). The FAA will consider

five key items when deciding the location of the six test sites: (1) geographic and climatic diversity, (2) location of ground infrastructure and research needs, (3) consultation with NASA and DOD, (4) population density and air traffic density of the surrounding area of any proposed location as well as the potential impact areas in the event of incidents, such as "Fly away" given potential safety mitigations; and (5) identification of specific goals and objectives to be accomplished. Additionally, the test sites are expected to provide an environment and opportunity to test conventional takeoff and landing capability, high speed flight (greater than 250 knots indicated air speed), maritime (launch/maneuver/recovery) capability, operations at extremely high altitudes (Class A airspace and above), and evaluation of dissimilar aircraft (including a mix of manned and unmanned aircraft) in multiple altitude structures (Source: FAA 2013a).

The six test sites that are selected will support the following operations and programs:

- Safe designation of airspace for integrated manned and unmanned flight operations in the national airspace system;
- Development of certification standards and air traffic requirements for unmanned flight operations;
- Coordinating with and leveraging the resources of NASA and the Department of Defense;
- Addressing both civil and public unmanned aircraft systems;
- Ensuring that the program is coordinated with the Next Generation Air Transportation System; and
- Ensuring the safety of unmanned aircraft systems and related navigation procedures before they are integrated into the national airspace system (Source: FAA, 2013b).

The test site operators will provide opportunities for government agencies, industry, and researchers to access this airspace to aid in the integration of UAS regulations in the NAS. Additionally, data collection will support development and operations research and professional development opportunities will be available for inspectors, airspace managers, air traffic controllers, and others. The specific goals described by the PPUTRC applicants include (Source: PPUTRC, 2013):

- Develop a set of standards for select unmanned aircraft categories, for aircraft state monitoring, and navigation. PPUTRC goals and objectives work will augment ongoing standards work with research on categories of UAS not yet addressed, and evaluations needed to refine emerging standards under consideration;
- Validate FAA acceptable risk thresholds or safety management system standards for UAS operations;

- Identify safety factors in UAS design; validate certification standards, including protocols for air traffic control interaction. Define and qualify underlying assumptions and a minimum set of air vehicle characteristics critical to safety, reliability, etc.;
- Develop effective, compliant 'sense and avoid' systems to satisfy regulatory guidance;
- Identify gaps in federal and state statutory and case law protections for privacy and recommend policies or legislation to remedy;
- Directly support the federal mandate for "Expanding Use of UAS in the Arctic" (in Sec 332(d) of Public Law 112-95);
- Design experiments and provide data to support American Society for Testing and Materials (ASTM) F38 and Radio Technical Commission for Aeronautics Special Committee (RTCA SC) 203 to evaluate minimum training and operator qualification standards for crew licensing.

Economic Impact of UAS in the U.S.

The economic implications of integrating UAS regulations into the NAS are substantial. According to a study conducted for the Association for Unmanned Vehicle Systems International (AUVSI), integration will generate $82 billion in activity between 2015 and 2025. Employment impacts are estimated at just over 100,000 jobs by 2025.

The direct economic impact of UAS development in the U.S. is expected to climb from $1.1 billion in 2015 to over $5 billion annually by 2025, measured in terms of output. Including indirect and induced effects, the annual economic impact is expected to rise from $2.3 billion in 2015 to $10 billion in 2025 (Source: AUVSI, 2013).

Areas selected as UAS test sites will have an advantage in capturing these economic benefits; thus the fierce competition among the 50 applicants.

Chapter 2. Pan-Pacific Test Range Complex

In 2012, the Alaska Center for UAS Integration (ACUASI) at the University of Alaska Fairbanks Geophysical Institute began collaborating with Oregon State University and the University of Hawaii to propose a Pan-Pacific Test Range Complex (PPUTRC) as one of the six FAA test sites. This proposed PPUTRC contains 13 test ranges located in Alaska, Hawaii, and Oregon. Of the 13 ranges, six ranges are in Alaska (Denali, Kodiak, North Slope, Oliktok, Poker Flat, and Wainwright), three ranges are in Hawaii (Humuula-R-3103, Makua-R-3109, and Maku-R-3110), and four ranges are in Oregon (Juniper MOA, Pendleton, Tillamook Coastal, and Warm Spring).

Existing UAS activity in Alaska, Hawaii, and Oregon benefits from unique assets and opportunities, including government facilities (e.g. numerous military bases, universities, and maritime assets), wide open airspace in largely unpopulated areas, and geographic diversity (e.g. tropical to arctic climates, oceanic or mountainous landscapes, and up/down weather fronts). The diverse testing environments for the PPUTRC are included in the Table 1 below:

Table 1: Diversity of Potential Testing Environments for the PPUTRC

360 degree oceanic airspace access	Arctic landscape	Extreme low temperatures
Oceanic and sea-ice access	High arctic winds	High sea-salt corrosion effect
Able to fully matrix UAS into NextGen and air traffic operating both VFR and IFR; high and low altitude	Operations in all classes and categories of military SUA	Operations in Classes A through F international airspace in the oceanic environment
Class C, D, & E airspace within 5-nautical miles of airports	High and low-land vegetation tundra	Numerous inland waterways and lakes
High density airports integration studies and testing	Class C, D, & E airspace airport approaches/departures	High-humidity high and low-altitude
Hot and cold high-desert testing	Littoral coastal region mountainous area	Class E (high) airspace
Jungle conditions	Class A airspace	Mountainous terrain
Volcanic	Glacier	Ship traffic including open ocean and ports

UAS Activity in Alaska, Hawaii, and Oregon

There are currently 15 active COAs in the PPUTRC area as well as eight in-process COAs and 20 expired COAs.

Alaska

ACUASI at the University of Alaska Fairbanks (UAF) is the lead organization for the proposed PPUTRC. The formal PPUTRC team includes over 80 businesses, universities, tribes, and economic development organizations in Alaska. UAF has actively managed UAS operations since 2004.

ACUASI was formed in 2012 to enhance UAS research in Alaska. ACUASI and the UAF Geophysical Institute have developed and flown a variety of in-situ and remote sensing instruments on various UASs in Alaska and throughout the world. Scientific and research campaigns undertaken in Alaska over the past decade include using UASs to support observation and monitoring of sea lions in the Aleutian Islands, weather forecasting, volcanic plume monitoring, atmospheric sampling during wildfires, monitoring of sea ice build ups, and oil spill mapping. Commercial applications trialed in Alaska include whale monitoring, cadastral mapping, maritime navigation support, industrial plant monitoring, and environmental clean-up. This experience, coupled with the FAA's UAS test site status, would leverage a variety of new economic activities in Alaska.

The following table, which summarizes ACUASI activity in 2012, illustrates the variety of UAS activity supported by the organization. The table also provides revenue and staffing data for each UAS campaign.

Table 2: UAS Campaigns Supported by the University of Alaska Fairbanks in 2012

Client	Flight Locations	Type of UAS	Purpose of Flights	Revenue for Site Operator	Site Operator Staff	Flight Operator Staff
Aleutians	Aleutian Islands, AK	Aeryon Scout and Puma	Seal observation	$314,200	2 pilots	1 observer
Idaho	Lewiston, ID	Aeryon Scout	Salmon nest observation	$115,000	1 pilot	1 observer
Eglin Air Force Base	Fort Walton Beach, FL	ScanEagle and Aeryon Scout	Controlled burn experiment	$413,000	4 pilots	3 observers
Prudhoe Bay	Prudhoe Bay, AK	Aeryon Scout	British Petroleum flare stack monitoring	$190,000	1 pilot	1 observer
Nome	Nome, AK	Aeryon Scout	Harbor Ice monitoring for USCG	$30,000	1 pilot	1 observer
Ugak Island	Ugak Island, AK	Aeryon Scout	Seal population monitor	$6,500	1 Pilot	1 observer
Fort Greely	Fort Greely, AK	ScanEagle and Aeryon Scout	Flight test	$25,000	2 pilots	2 observers
Chile	Santiago, Chile	Aeryon Scout	Glacier Ice monitor	$9,000	1 pilot	1 observer
Belgium	Belgium	Gatewing	Flight training	$16,000	2 pilots	1 observer
Anchorage	Fort Richardson, AK	Aeryon Scout	Flight test and demonstration	$1,000	2 pilots	1 observer
Fairbanks	Poker Flat Research Range	ScanEagle	Payload test	$347,000	2 pilots	1 observer
Fairbanks	Poker Flat Research Range	Aeryon Scout	Payload test and demonstration	$30,000	2 pilots	1 observer
Fairbanks	Poker Flat Research Range	Raven	Flight test for avionics	$5,000	2 pilots	2 observers
Hawaii	Offshore Hawaiian Islands	Puma	Tsunami debris tracking	$95,000	1 pilot	1 observer

Hawaii

Hawaii offers many unique qualities that make UAS operations appealing. These include: (1) expansive over-water areas unencumbered by other aviation uses, (2) proximity to U.S. Pacific Command – a significant user of future UAS systems, (3) opportunities for joint operations with the Pacific Missile Range Facility – a major test range on Kauai, and (4) opportunities for long-range point-to-point tests with partner ranges in Alaska and Oregon. The Hawaii ranges have proven an important focus for the development of scientific applications of UAS, with significant milestones including test flights of the Aerovironment Pathfinder; Pathfinder Plus; and Helios solar-hybrid propulsion high altitude, long endurance UAS, between 1997 and 2001. Scientific applications led by U.S. federal agencies have recently seen Hawaii emerge as a focal point for NOAA's exploration of UAS as a tool for marine park surveillance. NOAA has utilized UAS to monitor Papahanaumokuakea Marine National Monument since 2007 and performed initial trials using small hand launched systems in mid-2012.

Oregon

The Oregon-based PPUTRC team members include 16 businesses, universities, tribes, and economic development organizations. Additionally, six committed team partners will convert to formal team members upon FAA test site designation award to PPUTRC. Engagements are also planned with a wide ranging network in Oregon – including the 111 AUVSI members and numerous startup companies, primarily in sensor, robotics, and other supporting technologies. In comparison to Alaska and Hawaii, Oregon has historically been more engaged in design, development, and manufacture of UAV systems and subsystems.

The two largest Oregon UAS firms are Insitu (design, development, and manufacture of UAS systems) and FLIR Systems (remote sensors). The main Oregon firm involved in UAS applications has been Near Space Corporation (NSC). NSC uses very high altitude unmanned balloons and gliders to perform scientific and commercial test activities, ranging from data gathering on behalf of government agencies to near-space testing of hardware and sensors for commercial firms. NSC is opening a new $6 million flight test and operations facility at the Tillamook Airport on the Oregon coast. Existing UAS activity also includes the Oregon Army National Guard operations in Pendleton. Oregon's UAS efforts are synergistic with a separately funded ground vehicle innovation initiative, Drive Oregon, which requires systems that can be spun out of UAS: quiet, efficient motors, lightweight composite designs, and navigation systems. The potential economic benefits of the test sites, as well as NAS integration, are particularly strong for Oregon's already significant aircraft manufacturing sector.

Recent UAS Funding in Alaska, Hawaii, and Oregon

Since 2004, nine Alaska contractors have received direct U.S. federal agency contracts for UAS goods and services. The largest federal contract in Alaska is a 5-year standing services award, worth $47 million, from the U.S. Navy to the University of Alaska in 2010 for UAS payload integration and flight test services. The second major award made since 2004 to an Alaska firm consists of a series of pacts totaling $17 million from the U.S. State Department to Anchorage-headquartered Kuk Construction (subsidiary of Olgoonik Development, an Alaskan Native Corporation) for the provision of UAS-based security surveillance services in Iraq in partnership with KBR, Inc. UAF has collaborated with commercial entities, such as Idaho Power Company, and manufacturers including AeroVironment to conduct surveys and observe environmental impacts. Additionally, UAF has collaborated with BP for oil spill response and flare stack monitoring, as well as projects focused on detecting and locating gas and oil pipeline leaks and developing new sensors and processes to identify leaks.

Hawaii's large military presence has resulted in defense spending as the primary source of federal funding to UAS vendors in the state. Direct defense contracts accounted for 94 percent of all awards in terms of obligated amounts from 2004-2012, rising to 97 percent when including awards placed by the General Services Administration on behalf of the U.S. Air Force. The remaining awards were placed with Honolulu-based Referentia Systems by NOAA as part of the Papahanaumokuakea Marine National Monument monitoring project. Hawaii supports a dedicated UAS development and manufacturing company, Williams Aerospace, a small firm currently developing new platforms in the fixed-wing, hand launched micro and medium altitude endurance classes. The state is also working to create two commercial UAS services arms, addressing the defense, homeland security, and precision agriculture markets.

In Oregon, a consortium of industry, academia, and public entities has created a 7-year strategic plan to double the size of the UAS industry in the state, with the help of a $2.5 million State of Oregon grant scheduled for the 2013-14 biennium and additional investments of at least $1.15 million from other sources for a total of $3.65 million. The plan specifically creates UAS solutions for commercial applications, and safely integrating those UAS solutions into the NAS. Projects include emergency response; weather; firefighting; search and rescue; wildlife and habitat management; law enforcement; physical and resource surveys (land and water); management of agriculture, livestock, and public lands; and management of public and private infrastructure. Oregon State University (OSU) has already begun UAS flights based on these research objectives.

Leveraging Current Research Institutes, Community Colleges, and Training Centers

ACUASI is collaborating with the UAF College of Engineering and Mines (CEM) and the Community and Technical College (CTC) to integrate UAS engineering, science, and technology into UAF's teaching, research, and service activities. Additionally, ACUASI is working with the CEM to fill a full-time tenure track engineering faculty position with a professor focused on UAS engineering, science, and technology. ACUASI and CTC also intend to include UAS technology courses in CTC's aviation curricula to train UAS developers, technicians, and pilots as well as to improve outreach to remote Alaskan villages that could benefit from UAS technologies. Cooperation with the CTC at UAA will add air traffic controller participation, offer training for UAS operators, and ultimately build a maintenance program similar to the Aircraft and Powerplant program currently offered.

The University of Hawaii is testing UASs in several of its research programs, evaluating the utility and impact of UAS through analysis of coastal resource management, terrestrial and aquatic environmental monitoring, natural source management and inventory, and human impact studies. University of Hawaii is also developing programs to train students and research professionals on UASs, and plans to integrate this capacity into accredited degree programs.

The new OSU industry-university UAS consortium will depend on test site facilities for collaborative research and development in all phases of operations and applications. Through the Colleges of Engineering, Science, Agriculture, Forestry and Earth, Ocean and Atmospheric Sciences, OSU has expertise and supports ongoing research on control theory and robotics, flexible airframes and flight, sensors, and signal processing, and numerous applications in natural and environmental sciences and environmental monitoring, measuring, and management. OSU-Cascades, located in Central Oregon near the Warm Springs and Juniper test ranges, offers programs in energy engineering, computer science, natural resources, and business, and plans to add programs designed in conjunction with the UAS industry. OSU-Cascades can also provide on-site facilities for OSU-Corvallis researchers leading projects in the region. Central Oregon Community College (COCC) has one of the largest aviation flight training programs on the West Coast – both fixed wing and rotary. COCC offers certifications for UAS flight training and plans to develop a program for data analysis of sensors, building on the school's strong geographic information systems program. Additionally, Blue Mountain Community College (BMCC) in Pendleton, Oregon is developing a UAS curriculum for instructional delivery and course certification. Oregon Institute of Technology (OIT) offers a variety of degrees in engineering and engineering technology, composite engineering, computer and software systems engineering, and electrical engineering, including a master's degree in manufacturing engineering. It offers degrees in professional land surveying and geographic information systems. OIT is collaborating with Rockwell Collins, the aviation electronics company, on real-world projects at a joint campus outside Portland and offers similar hands-on collaborations with other aerospace firms in the northwestern U.S.

Expansion of Existing Businesses and Attracting New Business Investment

The University of Alaska has spun off at least two companies who intend to test their products on the Pan-Pacific test range. These companies were created by University graduate students who were expanding their research in sensors for testing in UASs. UA recently received $5 million from the State of Alaska to support the development of a sustainable high-tech industry in Alaska. Already two companies have established satellite offices in Alaska to improve collaboration with the ACUASI.

Placement of a UAS test site in Hawaii will promote growth within Hawaii and reduce development cycles for manufacturers and researchers. Additionally, it would reduce or eliminate costs to ship sensors, and send knowledgeable staff, to mainland test sites to operate and demonstrate systems. Close proximity to a test site in Hawaii will greatly benefit firms such as BAE Systems, Williams Aerospace, and others – including many military and government contractors working with the Honolulu Fire Department, Honolulu Police Department, U.S. Civil Air Patrol, U.S. Coast Guard, U.S. Department of Defense, U.S. Department of Homeland Security, U.S. National Guard, and others.

In Oregon, more than a dozen companies have said that they will begin testing their sensor packages, propulsion systems, and airframes in Oregon if the Pan-Pacific UAS Test Area is designated as a national test site. Additionally, two companies have informally pledged to open satellite offices at a state test range. The PPUTRC will benefit UAS businesses in the Columbia River Gorge. Over the past seven years, the Gorge's UAS industry grew from a small core of 30 people to an employment base of more than 1,400 employees. Many of these new jobs were created by the UAS companies' suppliers. The two largest Oregon UAS manufacturers are Insitu, manufacturer of UAS platforms and subsystems, and FLIR Surveillance Systems, a manufacturer of electro-optic and infrared imaging systems. Insitu is a major global supplier of high endurance, runway-independent UAS. FLIR Surveillance provides more ER and IR imaging systems for unmanned aircraft, unmanned ground, and unmanned maritime platforms than any other company. Activity in the Gorge from firms such as Insitu, FLIR Surveillance Systems, Cloud Cap Technology, and UTC Aerospace has spun off more than 20 local companies. Central Oregon's general aviation aircraft manufacturing industry had a similar growth pattern over a 15-year period, expanding from a core company of about 30 employees (Lancair) to a cluster of 25 companies that now employs nearly 1,200 people. It is anticipated the PPUTRC will help expand these existing businesses in the Gorge and Central Oregon.

Infrastructure

Alaska expects to invest $1.5 million to construct a test site center at its Poker Flat Research Range, as well as develop and acquire mobile test infrastructure such as fixtures, data collection devices, and monitoring systems similar to its internet-Portable Aerial Surveillance System (iPASS), a web-based application that merges track information from radar, GPS, and a transponder interrogator/receiver. Additionally, large data collection requirements are expected to drive development of a data center for processing and storage.

Hawaii's test ranges link to military/restricted areas used for current UAS operations. These sites include the Pohakuloa training area on the Island of Hawaii, Bradshaw and Wheeler Army Airfields on Oahu, and the Pacific Missile Range Facility on Kauai. Other areas under consideration include Upolu and Dillingham Airfields (on the Big Island and Oahu, respectively). Test points within the ranges would be utilized to support both shore and ship-based development, testing and certification of new UASs, training and crew certification of operational UASs, and development of expanded and joint capabilities involving existing communications systems and operations tactics using UAS.

The budget for the $2.5 million Oregon innovation grant envisions spending at least $1.2 million at test ranges for new equipment and/or infrastructure, with the grant providing $300,000, private enterprise providing $750,000, and public entities providing $150,000. Possible infrastructure development proposed with this funding includes: portable ground radar units; an automatic dependent surveillance-broadcast ground station or a similar 'sense and avoid' technology system; one or more operations management buildings housing computers, calibration components, baseline sensors with a range of capabilities, data analysis equipment, supporting software, maintenance facilities and machine shops; and ground control stations, an observation tower, and ITAR facilities as needed. Additionally, as noted earlier, Near Space Corporation is preparing to open a new $6 million flight test and operations facility at the Tillamook airport.

Chapter 3. Potential Economic Impacts of the PPUTRC

Designation as one of the nation's six UAS test sites promises to have significant economic impacts in the areas where flight activity occurs and support services are provided. Private and public sector UAS activity that has been constrained by restricted access and a restrictive federal authorizing process will have much greater opportunity to conduct UAV flight operations. In this chapter the potential economic impacts in Alaska, Hawaii, and Oregon related to serving as a test site are quantified.

The following economic impact projections were developed by McDowell Group, Inc. utilizing flight activity, flight cost, and flight-related staffing data provided by PPUTRC team members. Direct economic activity was measured by approximating preflight administrative costs, site fees per day, operating costs per day, and total flight days from historical data provided by the applicant. Sector-level information was obtained from the applicant concerning the number of UAS-related firms and jobs per firm. Direct employment estimates were then coupled with multipliers obtained from the IMPLAN economic impact model to estimate total direct, indirect, and induced economic effects. Annual projections from 2014 to 2017 were calculated for each of the 13 ranges utilizing growth rates based on funding forecasts from the Teal Group UAS market profile and forecast report, historical flight activity, and projected growth in flight activity, research, and UAS-related manufacturing as provided by the applicant.

In total, designation of PPUTRC as a UAS test site would be expected to generate 1,065 direct, indirect, and induced jobs in 2014, increasing to over 1,400 jobs by 2017. Total labor income would climb from$57 million in 2014 to about $76 million in 2017.

Table 3: Summary Impacts of PPUTRC Test Site Designation, 2012-2017
Combined Impacts in Alaska, Hawaii and Oregon

Impact of Test Site Designation				
	2014	2015	2016	2017
Total Employment	**1,065**	**1,260**	**1,335**	**1,429**
Direct Employment	490	571	602	642
Indirect Employment	198	243	259	279
Induced Employment	377	447	474	508
Total Labor Income ($ million)	**$56.9**	**$66.9**	**$70.8**	**$75.6**
Direct Labor Income ($ million)	$26.4	$30.5	$32.2	$34.2
Indirect Labor Income ($ million)	$10.4	$12.5	$13.3	$14.4
Induced Labor Income ($ million)	$20.1	$23.8	$25.3	$27.1
Output ($ million)	**$265.0**	**$301.8**	**$315.9**	**$333.5**
Total Value Added ($ million)	**$109.3**	**$121.9**	**$127.1**	**$133.5**
State Income Taxes ($ million)	$4.3	$5.0	$5.3	$5.6

Employment Resulting from UAS and Test Site Operations

In 2014, with designation of PPURTC as a test site, UAS activity in Alaska, Hawaii, and Oregon is expected to account for 581 direct jobs and a total of 1,254 jobs - including direct, indirect, and induced jobs. Approximately 85 percent of that total employment (1,065 jobs) is attributable to test site designation. The remaining 15 percent (189 jobs) is expected to occur in the absence of PPUTRC test site designation. By 2017, employment will rise to an estimated 904 direct jobs and 1,991 total jobs - with 72 percent of that total employment (1,429) attributable to test site designation. A significant number of these direct jobs are expected in smaller communities that tend to have higher unemployment – thus test site designation for the PPUTRC will help improve opportunities where they will provide the most benefits.

Table 4: Direct Employment, 2012-2017

Direct Employment						
	2012	2013	2014	2015	2016	2017
Total Direct Employment						
PPUTRC	**74**	**82**	**581**	**712**	**801**	**904**
Alaska Ranges	43	47	129	142	157	173
Hawaii Ranges	-	-	-	72	95	126
Oregon Ranges	31	35	452	498	549	605
Impact of Test Site Designation						
PPUTRC	**-**	**-**	**490**	**571**	**602**	**642**
Alaska Ranges	-	-	77	82	86	91
Hawaii Ranges	-	-	-	72	95	126
Oregon Ranges	-	-	414	417	421	424

Oregon's relatively high direct employment numbers are due to the existing, well-developed aircraft manufacturing sector in Oregon. Oregon is well placed to supply the growing demand for UAS aircraft that will be triggered by UAS integration. Most of the new jobs created in Oregon due to PPUTRC designation include manufacturing jobs (many of which may be created due to designation of test sites anywhere in the U.S.). These numbers for Oregon are based on an analysis provided to McDowell Group by Economic Development for Central Oregon (EDCO).

In addition to direct jobs created from UAS firms, significant indirect and induced jobs will also be created. Indirect jobs represent jobs created throughout the supply chain to support the UAS industry and induced jobs represent jobs created due to changes in household consumption as a result of the UAS industry.

Table 5: Indirect Employment, 2012-2017

Note: Summation of columns may not match the total due to rounding

Labor Income Resulting from UAS and Test Site Operations

In 2014, UAS activity in Alaska, Hawaii, and Oregon is expected to account for $31 million in direct labor income and $67 million in total labor income - including direct, indirect, and induced - assuming the PPUTRC is awarded test site designation. Approximately 84 percent of that total labor income ($57 million) is attributable to test site designation, while the remaining 16 percent ($10 million) is expected to occur even if the proposed PPUTRC does not become a test site. By 2017, labor income is expected to include $106 million in total direct, indirect, and induced labor income - with 71 percent of that total labor income ($76 million) attributable to test site designation.

Table 7: Direct Income, 2012-2017 ($ million)

	Direct Income					
	2012	2013	2014	2015	2016	2017
Total Direct Income						
PPUTRC	**$4.0**	**$4.4**	**$31.3**	**$38.2**	**$42.9**	**$48.3**

Oregon Ranges	-	-	$16.1	$16.3	$16.4	$16.6

Output, Value Added, & State Income Taxes Resulting from UAS and Test Site Operations

'Output' represents the value of industry production, and 'total value added' is the difference between an industry's total output and the cost of their intermediate inputs. Economic modeling conducted for the purposes of this study indicates output in the PPUTRC states attributable to test site designation would climb from $265 million in 2014 to $333 million in 2017. Value added would climb from $109 million to $134 million over the same period.

Table 10: Output, 2012-2017 ($ million)

	Output					
	2012	2013	2014	2015	2016	2017
Total Output

EXECUTIVE SUMMARY

The Legislative Task Force on Unmanned Aircraft Systems (UAS) was formed under House Concurrent Resolution No. 6 to review regulations and guidance regarding UAS and provide recommendations for a comprehensive state policy for unmanned aircraft that protects privacy and allows the use of UAS for public and private applications.

In response to public concern, the Legislative Task Force on UAS (LTFUAS) reviewed multiple potential UAS scenarios focusing on privacy issues, economic development, public safety, anticipated mission types, and safety. LTFUAS evaluated existing privacy laws for Alaska to avoid recommending duplicative law for UAS, considered ways to encourage the economic development and safe uses of UAS in Alaska, and supported public education to address public reservations regarding UAS use in Alaska as well as provide information on the use of UAS for life-saving and other cost-saving and beneficial applications for dull, dirty and dangerous tasks.

LTFUAS concluded that the Federal Aviation Administration (FAA) is adequately addressing the safety concerns of integrating UAS into the National Airspace System (NAS). FAA Guideline N 8900.227 clearly states the requirements for the aircraft, pilot training and responsibilities, and the expectations of the test sites for safe operations of UAS. The FAA guidelines provided LTFUAS assurance that unmanned aircraft can be operated safely in Alaska.

After understanding the role of the FAA and safety goals for integration of UAS into the NAS, the LTFUAS makes the following recommendations.

1. All state and local law enforcement entities should adopt the International Association of Chiefs of Police (IACP) guidelines to help ensure privacy protection for Alaskans.

2. All law enforcement entities must first obtain a court order to use UAS over private property for criminal investigation against any person.

3. Encourage all law enforcement entities to use high-visibility marking or navigational lighting on law enforcement UAS as appropriate.

4. Convey a clear message to industry that Alaska is open for business to harness the beneficial uses of UAS, to encourage the growth of this economic sector, and to allow Alaska to continue to lead the nation in aviation innovation.

5. Encourage private and public UAS training programs.

6. Report all UAS incidents/accidents of aircraft larger than 55 pounds to the University of Alaska and/or Alaska Aviation Coordination Council.

7. Extend LTFUAS until June 30, 2017, and expand the duties of the Task Force with the addition of one member representing the Alaska Department of Transportation/Public Facilities (DOT/PF) and one public member, for the following reasons:

- During this transitional phase of growing use of UAS in Alaska, the LTFUAS should be extended to continue to monitor the integration and any privacy matters that may arise that are not already covered by existing law. Because Alaska currently has a strong set of privacy laws, rather than recommend prohibitions be incorporated into statute that might inhibit industry, the LTFUAS recommends it continue to review UAS operations in light of current statutes and only recommend changes in statute as necessary.

- Because FAA will be updating and issuing new guidelines based on the work of the new FAA UAS test sites announced on December 30, 2013, it is necessary for the LTFUAS to continue to review FAA policies to determine their impact and whether any additional policy changes at the state level may be necessary in response.

- With Alaska's recent selection as one of the nation's six UAS test sites through the University of Alaska's application (in conjunction with Oregon and Hawaii), the LTFUAS will meet part of the test site's requirement as a public forum where concerns regarding privacy and data matters can be collected and evaluated.

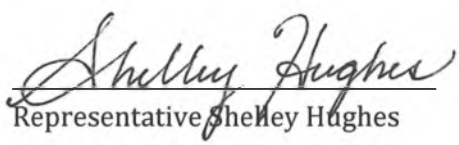
As we move forward, and particularly in light of the fact that Alaska has been selected as an FAA test site for UAS integration, and with the extension and expansion of duties of the Task Force, we continue emphasis on:

1) management of the test ranges,
2) economic development opportunities,
3) public education and public relations regarding UAS, and
4) difference between model aircraft and UAS.

In addition to the above seven recommendations, the Task Force also recommends the following:

1) each department of the State of Alaska identify a point of contact for UAS to coordinate with the LTFUAS and provide information regarding department policy and procedures to ensure accountability and privacy in regard to UAS use, and

2) the Alaska Department of Administration review and update its data retention policies particularly in the area of inadvertent captured data that is not relevant to a state agency.



Representative Shelley Hughes

Senator Donny Olson

1. INTRODUCTION

House Concurrent Resolution No. 6 formed the Legislative Task Force on Unmanned Aircraft Systems (UAS) to:

- review regulations and guidance from the Federal Aviation Administration (FAA) regarding UAS;
- provide written recommendations, together with suggested legislation, for a comprehensive state policy for unmanned aircraft that protects privacy and allows the use of UAS for public and private applications; and
- submit a final report to the Legislature.

The Legislative Task Force on UAS (LTFUAS) met in 2013 on July 24 and October 2 via teleconference and twice in person October 23-24 and November 26 to respond to the concerns Alaskans have raised regarding unmanned aircraft use in Alaska. The LTFUAS:

- reviewed regulations and guidance from the FAA, International Association of Chiefs of Police (IACP), and multiple related recommendations for UAS operations;
- received hours of public testimony and written public testimony; and
- compiled recommendations and suggested legislation for the use of UAS for public and private applications in Alaska that are protective of privacy.

The LTFUAS considered two approaches to regulating the use of UAS in Alaska:

1. restrict the industry and adopt exemptions for specific kinds of approved uses, or
2. generally allow UAS operations in Alaska and adopt the necessary privacy, operations, and other guidelines that seem necessary to protect Alaskans.

The LTFUAS adopted the second approach and emphasized that educating the public will be an important part of integrating this technology safely and for the benefit of Alaskans.

The LTFUAS concluded that the FAA is adequately addressing the safety concerns of integrating UAS in the National Airspace System (NAS). FAA Guideline N 8900.227 spells out the details of operating UAS by clearly stating the requirements of the aircraft, pilot training and responsibilities, and the expectations of the FAA UAS Test Sites.[1] The rules outlined in the guidelines provided the LTFUAS assurance that unmanned aircraft can be operated safely in Alaska.

The FAA also recently released its Final Privacy Requirements in November 2013. The privacy document from the FAA clearly identified that while it governs the NAS, local governments will assume the responsibility of addressing privacy concerns.

[1] Notice N 8900.227, Subj: Unmanned Aircraft Systems (UAS) Operation Approval. Effective Date 7/30/13, Cancellation Date 7/30/14. Available at http://www.faa.gov/documentLibrary/media/Notice/N_8900.227.pdf

Alaskans are fortunate to have a state constitution and state law that provide some of the greatest privacy protections compared to other states. As the LTFUAS reviewed multiple scenarios for misuse of the UAS, it determined that existing laws would apply, are sufficiently protective of privacy, and penalties are already in place to address inappropriate behavior.

When studying the many possible scenarios for misuse, the LTFUAS returned repeatedly to the premise that an unmanned aircraft is a tool; the operator needs to be considered for breaches of privacy or harming another.

This report presents the findings of the LTFUAS resulting from LTFUAS meetings, public testimony, research, and information from industry experts in pursuit of the assigned duties listed above.

1.1 Background and Planning

The earliest UAS was A.M. Low's "Aerial Target" of 1916 during World War I. The flight lasted 12 seconds. Over the last 50 years, rapid advances in aviation technology have transformed the world's skies. In the United States, the NAS has evolved to include a variety of fixed-wing and rotary aircraft operating across the country in metropolitan areas to remote airfields. As aircraft technology expands, so do the challenges associated with managing safe skies. UAS have created a critical integration challenge for the FAA as they are flown in an environment that was originally developed for manned aircraft.

1.1.1 Federal

In 2008, the Government Accountability Office (GAO) reported that the United States must develop a clear and common understanding of what is required to safely and routinely operate UAS in the NAS. Congress enacted the FAA Modernization and Reform Act of 2012 (FMRA). Through this act, Congress set forth a number of specific requirements for achieving UAS integration—namely a UAS Comprehensive Plan[2] and a five-year Roadmap.[3]

In April 2012 under the guidance of the Next Generation Air Transportation System (NextGen) Implementation Plan Senior Policy Committee (SPC), the Joint Planning and Development Office assembled the Departments of Transportation (DOT), Defense (DoD), Commerce (DOC), and Homeland Security (DHS) as well as the National Aeronautics and Space Administration (NASA) and the FAA to develop the UAS Comprehensive Plan. The UAS Comprehensive Plan sets the overarching integration of UAS into the NAS. The plan also supports the coordination and integration of research and development necessary to achieve UAS integration goals by 2015 (Title 14 of the Code of Federal Regulations, Part 91 [14 CFR 91]; Appendix A).

---

[2] Unmanned Aircraft Systems (UAS) Comprehensive Plan. September 2013. Prepared by the Joint Planning and Development Office. Available at http://www.faa.gov/about/office_org/headquarters_offices/agi/reports/media/UAS_Comprehensive_Plan.pdf

[3] Integration of Civil Unmanned Aircraft Systems (UAS) in the National Airspace System (NAS) Roadmap. First Edition–2013. U.S. Department of Transportation Federal Aviation Administration. Available at http://www.faa.gov/about/initiatives/uas/media/uas_roadmap_2013.pdf

1.1.2 Federal and State Collaboration

One part of the UAS Comprehensive Plan included a priority for UAS research and development. NextGen developed the *NextGen UAS Research, Development and Demonstration Roadmap*,[4] and the FAA initiated a program for test ranges in accordance with the FMRA. In response to the FAA's solicitation for applications, the University of Alaska Fairbanks teamed with the States of Oregon and Hawaii and submitted the Pan-Pacific UAS Test Range Complex application.

On December 30, the FAA announced that Alaska was one of six states selected as a test site for safe operations and integration studies. The University of Alaska Fairbanks plans to work on state monitoring, navigation and safety standards.

1.1.3 State

Anticipating the integration of UAS in Alaska's NAS and the probable selection of Alaska as an FAA test site, HCR6 was passed to establish a task force to consider the implications of bringing this new technology to Alaska as early as spring 2014.

The FAA also recently released its Final Privacy Requirements in November 2013. The privacy document from the FAA clearly identified that while it governs the NAS, local governments will assume the responsibility of addressing privacy concerns.

Flight safety will continue to be monitored by the FAA. The State of Alaska will develop additional safety rules that pertain to specific kinds of UAS operations and will address the concern of personal privacy.

The LTFUAS approach is to responsibly embrace the positive uses of UAS without overregulating the industry and thus hindering economic opportunity. In addition to accepting the use of UAS in Alaska, the LTFUAS recognizes that public perception is greatly influenced through media reports, such as military flights in war zones. The public appears hesitant to allow UAS in Alaska due to fear of invasion of personal privacy and overreaching law enforcement.

1.2 Future of UAS in Our Skies

The FAA is expediting the planning and integration of UAS in the NAS because of the rapid advancements in this technology and the global response to the wide variety of uses by UAS. Unmanned aircraft will become part of our economy, transportation system, public safety, and much more.

Protecting the privacy of our citizens is the most important concern of the LTFUAS, and it remains at the forefront of each application of UAS missions. Alaska must respond quickly to this new technology in three ways: (1) support the integration of UAS in our airspace, (2) develop a forum to

[4] Next Generation Air Transportation System, NextGen UAS Research, Development and Demonstration Roadmap. Version 1.0, March 15, 2012. Available at http://www.jpdo.gov/library/20120315_UAS%20RDandD%20Roadmap.pdf

review concerns and recommend legislation, and (3) educate the public. All of these approaches must work in unison to be successful and maintain personal privacy.

The UAS industry is changing as quickly as your imagination can conjure a new application for use. During the first week of December 2013, some headlines included:

- HexaCopter Used to Smuggle Contraband into Prison (Georgia, USA) ... similar report of misuse in Quebec, Canada, prisons.
- New Wave Energy wants to put power plants in the sky (London)... plans to build the first high altitude aerial power plant, using networks of unmanned aircraft that can harvest energy from multiple sources and transmit it wirelessly to receiving stations on the ground.
- ARA Nighthawk UAS Demonstrates Search and Rescue and Accident Reconstruction Value (Vermont State Police)... could provide benefits far outweighing (privacy) concerns.
- U.S. Navy Launches UAS from Submerged Submarine (Office of Naval Research)... rose to the ocean surface and then completed a vertical launch as part of its 12-hour mission.
- Louisville Hosts Quadcopter Battle (Louisville, KY)... you must be willing to remain in the same room as the quadcopter if the controls are given to a psychopathic 12 year old.
- United Nations UAS Deployment Debuts in Congo (Africa)... for the purposes of monitoring the volatile border with Rwanda and Uganda.

- Domino's UK tests pizza-delivering drones... the DomiCopter is undergoing further testing in the United Kingdom. (Other names previously considered included the "Pepperdroney" and the "Flyin' Hawaiian."
- Parrot Drones "Vulnerable to Flying Hack Attack" (Cambridge University, UK)... security researcher has created a flying contraption that can hijack control of other UAS ... this comes with new vocabulary "hackerspace."
- World's Smallest Quadcopter for Under $40 ... and it weighs only four-tenths of an ounce.

- UAS to Save and Change Lives (Philippines)... disaster relief.
- Robots of the Serengeti (Tanzania)... poaching surveillance.
- Amazon.com Delivery... spoof article, for now.
- Precision Farming Forum in Oregon to Examine UAS Technology in Agriculture ... presumed one of the most significant cost savings and deployment for UAS uses.

- Arinc Incorporated announced that it has partnered with the Anne Arundel County Public School System (AACPS) to develop a class on UAS for students participating in the Science, Technology, Engineering, and Math (STEM) magnet program. The course is believed to be the first of its kind in the nation for high school students.

Nearly every country on the planet is preparing for UAS in efforts that range from military actions and border patrol to research and development of UAS technology.

2. FEDERAL AVIATION ADMINISTRATION—SAFETY AND PRIVACY

From *Integration of Civil Unmanned Aircraft Systems (UAS) in the National Airspace System (NAS) Roadmap*:

"Since the early 1990s, unmanned aircraft systems (UAS) have operated on a limited basis in the National Airspace System (NAS). Until recently, UAS mainly supported public operations, such as military and border security operations. The list of potential uses is now rapidly expanding to encompass a broad range of other activities, including aerial photography, surveying land and crops, communications and broadcast, monitoring forest fires and environmental conditions, and protecting critical infrastructures.

The FAA created the Unmanned Aircraft Systems Integration Office to facilitate integration of UAS safely and efficiently into the NAS. Toward that goal, the FAA is collaborating with a broad spectrum of stakeholders, which includes manufacturers, commercial vendors, industry trade associations, technical standards organizations, academic institutions, research and development centers, governmental agencies, and other regulators."[5]

FAA 'Roadmap'

"Ultimately, UAS must be integrated into the NAS without reducing existing capacity, decreasing safety, negatively impacting current operators, or increasing the risk to airspace users or persons and property on the ground any more than the integration of comparable new and novel technologies."

2.1 Safety Guidelines

The LTFUAS studied the FAA Guidelines for the Operations of Unmanned Aircraft Systems, participated in a presentation of the guidelines from Ro Bailey, Deputy Director of the Alaska Center for Unmanned Aircraft Systems Integration at the University of Alaska Fairbanks, and sought comments from representatives of the FAA. FAA Guideline N 8900.227 provides the most current guidelines for federal approval of operating unmanned aircraft.[6]

The LTFUAS recognizes that the FAA manages the safety of the national airspace and has adopted extensive guidelines regarding aircraft certification, pilot training and certification, and approval process for flights (or missions). The FAA Guideline N 8900.227 also provides detailed requirements for the operations of pending test sites and the current approval of flights in designated areas for specific purposes. The FAA pre-approves UAS missions and awards a Certificate of Authorization (COA) that identifies the details of the mission. This process is tightly scrutinized, and the entity flying the UAS is accountable to the FAA under the details of the COA.

[5] Integration of Civil Unmanned Aircraft Systems (UAS) in the National Airspace System (NAS) Roadmap. First Edition–2013. U.S. Department of Transportation Federal Aviation Administration. Available at http://www.faa.gov/about/initiatives/uas/media/uas_roadmap_2013.pdf

[6] Notice N 8900.227, Subj: Unmanned Aircraft Systems (UAS) Operation Approval. Effective Date 7/30/13, Cancellation Date 7/30/14. Available at http://www.faa.gov/documentLibrary/media/Notice/N_8900.227.pdf

The COA approval process gives the LTFUAS confidence that safety of the national airspace is adequately considered and that UAS missions will not invade personal privacy or operate inappropriately.

It is the opinion of the LTFUAS that no additional statutory or regulatory requirements are needed for FAA-approved missions.

2.2 Privacy Concerns

2.2.1 FAA Final Privacy Requirements

The FAA recently published its Final Privacy Requirements, November 7, 2013 (Appendix A) regarding unmanned aircraft. The FAA recognizes that there is substantial debate and difference of opinion among policy makers, industry, advocacy groups, and members of the public as to whether UAS operations at the test sites will raise novel privacy issues that are not adequately addressed by existing legal frameworks.

FAA Final Privacy Requirements

On February 22, 2013, the FAA requested public comment on the proposed privacy requirements for UAS test sites that the FAA will establish pursuant to the FAA Modernization and Reform Act of 2012.

The FAA received 99 comments through Regulations.gov and 53 comments through the public engagement session.

The public comments were grouped into 10 categories, and the FAA provided a response to each category. You can view all categories, comments and responses in the document provided in Appendix A.

From the FAA Final Privacy Requirements:

There was substantial difference of opinion among commenters as to whether the UAS operations and manned aircraft operations present different privacy issues that justify imposing special privacy restrictions on UAS operations at the test sites. In addition, there was substantial difference of opinion regarding what elements would be appropriate for a test site privacy policy.

The FAA has determined that it should not impose privacy requirements beyond those in the Final Privacy Requirements for the following reasons.

First, there are many privacy laws and applications of tort law that may address some of the privacy issues that arise from UAS operations at the test sites.

Test Site Requirements

1. *Test site operators must maintain a record of all UAS operating in the test sites;*
2. *Test site operators must require every UAS operator in the Test Site to have a written plan for the operator's use and retention of data collected by the UAS; and*
3. *Test site operators must conduct an annual review of test site operations to verify compliance with stated privacy policy and practices and share those outcomes annually in a public forum with an opportunity for public feedback.*

Second, the FAA believes that the test site operators will be responsive to local stakeholders' privacy concerns and will develop privacy policies appropriately tailored to each test site.

Third, if UAS operations at a test site raise privacy concerns that are not adequately addressed by the test site's privacy policies, elected officials can weigh the benefits and costs of additional privacy laws or regulations. Forty-three states have already enacted or are considering legislation regulating use of UAS.

Conclusion: Based on the comments submitted, the FAA intends to require each test site operator to comply with all of the privacy requirements included in the Draft Privacy Requirements as well as the following additional privacy requirements:

1. Test site operators must maintain a record of all UAS operating in the test sites;
2. Test site operators must require every UAS operator in the test site to have a written plan for the operator's use and retention of data collected by the UAS; and
3. Test site operators must conduct an annual review of test site operations to verify compliance with stated privacy policy and practices, and share those outcomes annually in a public forum with an opportunity for public feedback.

It is the opinion of the LTFUAS that privacy policy is adequate through the FAA requirements for the use of UAS in the test sites.

2.2.2 Privacy and Civil Liberties Consideration

The FAA is implementing a UAS Test Site Program to help the FAA gain better understanding of operational issues relating to UAS. Although the FAA's mission does not include developing or enforcing policies pertaining to privacy or civil liberties, experience with the UAS test sites will present an opportunity to enhance the dialogue in the Interagency Policy Committee (IPC) and other interagency forums concerning the use of UAS technologies and the areas of privacy and civil liberties.

> *The Fourth Amendment is central to the privacy issues with respect to government UAS operation. Although the Supreme Court has never explicitly considered the question of UAS privacy, there is a long list of relevant precedents. Among them are several cases from the 1980s that specifically considered aerial observations and the Fourth Amendment.*

Homeland Security

95,000 miles of maritime border security includes joint operations with the U.S. Coast Guard. Some of those miles include Alaska coastline.

2.2.3 Homeland Security Privacy Impact Assessment

U.S. Customs and Border Protection (CBP) is responsible for guarding nearly 7,000 miles of land border, 2,000 miles of coastal waters, and 95,000 miles of maritime border. CBP employs several types of aircraft to achieve its mission objectives including UAS. COAs have been

authorized in Arizona, Texas, Florida, and North Dakota. When deploying resources for operations, the Office of Air and Marine must determine the availability of aircraft type and the integration of the requested activity into its flight operations.

Homeland Security addressed privacy in the Privacy Impact Assessment published September 9, 2013. A summary of privacy concerns addressed in their document includes:

- The collection and use of data from aerial surveillance remains within the scope of its authorities to protect the border and provide support for law enforcement activities while continuing to preserve a person's right to privacy.
- UAS present a perceived risk because they are able to fly for longer periods of time and conduct surveillance relatively undetected. While UAS can fly for longer periods of time, they are equipped with the same technology to conduct surveillance that is presently deployed on manned aircraft.
- Concern for the security of the UAS itself and the potential for hijacking of the unmanned aircraft are managed by the close monitoring of ground control and satellite communication by encrypted data. If one ground station were to lose contact, a second ground station is equipped to pick up the UAS and continue operations.

3. ALASKA STATE LAW—SAFETY AND PRIVACY

The LTFUAS is confident that the FAA will regulate safety of UAS flights in Alaska. While safety is critically important, the LTFUAS also recognizes that certain codes of conduct must be followed to ensure harmonious UAS operations in Alaska.

3.1.1 Self-Regulation by Three National Organizations

The LTFUAS considered the recommendations of the following three national organizations that have adopted rules and codes of conduct regarding UAS operations. The LTFUAS adopted the IACP rules in the legislation to be introduced this session.

- **IACP:** International Association of Chiefs of Police Recommended Guidelines (Appendix B) for the use of Unmanned Aircraft was adopted in August 2012. The Alaska Department of Public Safety has also adopted these guidelines as their doctrine with the exception of increasing the flight approval responsibility from a "supervisor" to the director's office.

- **AUVSI:** Association for Unmanned Vehicle Systems International states: "As an industry, it is incumbent upon us to hold ourselves and each other to a high professional and ethical standard. As with any revolutionary technology, there will be mishaps and abuses; however, in order to operate safely and gain public acceptance and trust, we should all act in accordance with these guiding themes and do so in an open and transparent manner. We hope the entire UAS industry will join AUVSI in adopting this industry Code of Conduct."[7]

- **AMA**: Academy of Model Aeronautics' *AMA Policies for Radio Controlled Model Aircraft Operations Utilizing First Person View. Failsafe. Stabilization and Autopilot Systems* guides model aircraft operators.[8]

In the same manner that the FAA does not regulate model aeronautics, the LTFUAS does not intend to adopt requirements of hobbyist activities using UAS.

3.1.2 Model Aircraft Rules and Definitions

The technology differences between unmanned aircraft systems and model aircraft used for sport or recreation use is narrowing each day. Technology is advancing by leaps and bounds, while at the same time becoming more affordable and integrated into off-the-shelf-systems for consumers and hobbyists. While there are many technical documents and references through the FAA Modernization and Reform Act, the general difference between UAS and model aeronautics is the operation and intent of the operator not the aircraft.

---

[7] Unmanned Aircraft System Operations Industry "Code of Conduct." Accessed January 13, 2014. Available at http://www.auvsi.org/conduct

[8] AMA Policies for Radio Controlled Model Aircraft Operations Utilizing First Person View, Failsafe, Stabilization and Autopilot Systems. Revision 07/20/2013. AMA Advanced Flight Systems Committee Report 101. Available at http://www.modelaircraft.org/files/AFSCREPORT101.pdf

If the activity or intent of the activity is used for commercial operations or contributing to the creation of a product or service, it is considered commercial activity and it is subject to the FAA regulations and rule as stated in the FAA Modernization and Reform Act of 2012 and FAA UAS Road Map 2013.

If the activity is for sport and recreation use as defined by FAA SEC 336 SPECIAL RULE FOR MODEL AIRCRAFT of the Modernization Act, it is controlled by a cooperative agreement between the FAA and a Community Based Organization (CBO), such as the Academy of Model Aeronautics (AMA).

The AMA has been successful in self-regulating operations for hobbyists and aviation safety for over 77 years. During those 77 years, the AMA faced many challenges of new technologies such as analog to digital radio, coordinating operations within the airspace and the ever changing aircraft designs and capabilities not unlike the latest multi rotor and First Person View (FPV) capabilities. To address the current safety requirements and interest of model aircraft operators, the AMA has developed and updated its general safety code AMA Publication 105-Safety Code and it Advanced Aircraft rules publication 550-First Person View and 560-Autopilot effective Jan 1, 2014 to keep up with the FAA rule making and technology advances. Refer to Appendix C.

It was discussed that a notice should be provided at the time of purchase of each model aircraft to review the AMA flight operation guidelines for appropriate use of model aeronautics. The LTFUAS did not adopt a requirement for notice regarding hobbyists since so many aircraft are purchased outside of Alaska and would not be required to provide the notice.

Legal Services

Constitutional Protection of Privacy: *The Constitution of the State of Alaska explicitly protects the right of privacy against government intrusion. Art. I, sec. 22 provides: "The right of the people to privacy is recognized and shall not be infringed. The legislature shall implement this section."*

Alaska Statutory Protections:

AS 11.41.270 Stalking, nonconsensual conduct prohibits monitoring by technical means

AS 11.61.116 Sending an explicit image of a minor

AS 11.61.120(a)(6) Harassment: publishing or distributing certain images

AS 11.61.123 Indecent viewing or photography

AS 11.76.113 Misconduct involving confidential information in the first degree

AS 11.76.115 Misconduct involving confidential information in the second degree

3.1.3 Alaska State Law and Personal Privacy

The State of Alaska and its local governments cannot dictate the use of the national airspace but can consider rules that better define the FAA guidelines, can consider legal repercussion for entities found in violation of adopted laws, and can provide for specific privacy laws regarding the use of UAS in Alaska.

The State of Alaska Constitution provides privacy protection, "although not unlimited, has been held to be broader than the protection afforded by the United States Constitution. Both the Alaska Constitution and the Fourth Amendment to the United States Constitution require a warrant by a

governmental agency for the search of a place where a person has a reasonable expectation of privacy."[9]

Although much attention regarding UAS privacy focuses on government use and the Fourth Amendment, it is non-governmental use that is likely to raise some of the most significant privacy challenges in coming years. For private entities, the key constitutional question is the extent of their First Amendment privilege to gather information.

Civil use of unmanned aircraft will fall under the federal and state laws including such provisions as trespassing, invasion of privacy, intrusion upon seclusion, publication of private facts, stalking and harassment, and business privacy.

The LTFUAS, with guidance from Legislative Legal Services, considered many scenarios of possible violations of state and federal law that might occur with the use of unmanned aircraft. Legislative Legal Services provided the document, *Observations from Above: Unmanned Aircraft Systems and Privacy*,[10] that presented a variety of scenarios that have been tried in court and some that should be discussed as they pertain to UAS and personal privacy. The Legal Services memo outlining the areas of statute that protect personal privacy can be found in Appendix D.

Privacy protection considerations reviewed by the LTFUAS include but are not limited to the following.

1. **If data is gathered by a government agency, it is a public record. However, AS 40.20.120 provides certain protections for private information. Use of inadvertently captured information in a criminal prosecution may depend on who captures the information and whether the person whose actions have been captured has a reasonable expectation of privacy.**

It was discussed that data captured by a government-operated UAS would be treated similarly to data captured by other technology such as cell phones, manned aircraft, satellite images, voice recorders, etc. Case law is substantial in determining if the person would be considered to have a reasonable expectation of privacy and when a warrant would be required to obtain and use any data collected.

CH 48 (HB65) SLA08 Personal Information Protection Act also addresses the collection, storage, and breach of privacy. This act would include any data captured by a UAS.

2. **As technology continues to advance beyond "normal" application of current laws, a balanced approach that recognizes the inherent difficulty in predicting the future must be adopted when drafting new laws.**

[9] Memorandum: Alaska Laws Protecting Privacy (Work Order No. 28-LS0990). September 30, 2013. Division of Legal and Research Services, Legislative Affairs Agency, State of Alaska, Juneau.

[10] John Villasenor. 2013. Observations from Above: Unmanned Aircraft Systems and Privacy. Harvard Journal of Law & Public Policy. Available at http://www.harvard-jlpp.com/wp-content/uploads/2013/04/36_2_457_Villasenor.pdf

The LTFUAS determined that we cannot foresee the future applications of technology (of UAS or other technologies); therefore, creating restrictions in law based on assumptions is not recommended.

Observations From Above: UAS and Privacy

This document was published in the Harvard Journal of Law and Public Privacy by John Villasenor, a senior fellow in Governance Studies and the Center for Technology Innovation, the Brookings Institution.

The Task Force discussed many of the scenarios posed by the author when considering the need for Alaska law.

3. How should Alaska manage unintentionally captured images or data?

Discussion concluded that there are adequate statutes, case law, and data retention guidelines that resolved the concerns of the LTFUAS in the area of unintentionally captured images or data.

Recommendation: The LTFUAS also would request that the Department of Administration review its data retention schedules with particular emphasis on law enforcement data captured inadvertently and allowing that data to be destroyed.

4. The tie between safety and privacy is tightest with respect to rules requiring the operator of a UAS to be able to see the aircraft at all times. Public UAS operated in association with the expedited authorizations in Section 334(c)(2)(C) of the FAA Modernization and Reform Act of 2012 (FMRA) have a "line of sight" requirement.

The LTFUAS assumes that FAA regulations adopted in the next several years will continue to require visual line-of-sight operation. "Sense and avoid" technology will become more mature and some non-line-of-sight missions may be permitted by the FAA. Non-line-of-sight operations and other unknown technological advances may bring new challenges that will require the Legislature to review industry guidelines and state laws in the future.

5. Unmanned aircraft may bring efficient advances to law enforcement; however, the public seems to be highly sensitive to law enforcement using unmanned aircraft.

After reviewing many possible uses of UAS, the LTFUAS determined that existing law already affords the public with adequate protections.

- **Routine Technology**: The use of UAS is treated much the same as any other technological tool used to protect the public. The Department of Public Safety has adopted the IACP Guidelines for UAS, and the LTFUAS found those guidelines to be superior for rules of law enforcement use.

The rules of the IACP will be offered as a provision of the legislation.

- **Public Navigable Airspace:** The question of what constitutes "public navigable airspace" for UAS operated by the government is central to privacy policy. The LTFUAS found that almost every law enforcement scenario discussed was already protected by existing law.
- **Role of Imaging Technology:** Rules and case law exist that protect citizens from inappropriate use of capturing data that is "more than the human eye could ever see."
- **Extended Surveillance:** Law enforcement does not intend to use UAS for standard patrol activities at this time. Limiting flight hours was not seen as an acceptable control because long flights may be necessary in the event of search and rescue or natural disaster remediation operations.
- **Obtaining a Warrant:** After much discussion, it was decided that using UAS to gather data would require a warrant in similar situations as using any other data gathering device (such as voice recording, photography, and thermal imaging with manual technology). No additional laws are required to obtain a warrant for UAS data gathering.

Voluntary Approaches

The International Association of Chiefs of Police (IACP) adopted model guidelines for the use of UAS for law enforcement purposes.

The Association for Unmanned Vehicle Systems International (AUVSI) Code of Conduct calls for a commitment to "respect the privacy of individuals."

Academy of Model Aeronautics has also adopted operational policies and guidelines for advanced flight systems used in radio controlled model aircraft.

It is the understanding of the LTFUAS that all law enforcement entities must first obtain a court order to use UAS over private property for criminal investigation against any person. This will be offered as a provision of the recommended legislation.

- **Weaponized Aircraft:** FAA guidelines do not allow anything to be dropped from an unmanned aircraft.
- **Visibility**: Law enforcement is planning to use high-visibility marking on any UAS they will use. Application of navigational lighting and/or high-visibility paint is being considered.
- **Public Education**: It is apparent that public education is necessary for all agencies using UAS but sensitivity is heightened for law enforcement uses.

Law Enforcement

Public protection will benefit greatly from unmanned aircraft for the purposes of search and rescue, crash scene documentation time, natural disaster monitoring, wildfire management, amber and silver alerts, hostage situations, and other life safety extremes. Some efforts will require warrants to proceed and some will be allowed under a Certificate of Authorization (COA).

It is the opinion of the LTFUAS that existing privacy laws are adequate to govern the use of unmanned aircraft.

It is the opinion of the LTFUAS that since Alaska has been chosen as one of the FAA UAS Test Sites, we have the opportunity to participate in the use of UAS in a variety of ways that would put Alaska in the position to establish policy guiding the use of UAS for the rest of the United States to consider.

3.2 Technical Operations Guidelines

International Civil Aviation Organization (ICAO), a special agency of the United Nations, promotes "the safe and orderly development of international civil aviation throughout the world. It sets standards and regulations necessary for aviation safety, security, efficiency, and regularity, as well as aviation environmental protection."[11]

The goal of the ICAO in addressing unmanned aviation is to provide the fundamental international regulatory framework to support routine operation of UAS throughout the world in a safe, harmonized, and seamless manner comparable to that of manned operations.

> "A number of Civil Aviation Authorities have adopted the policy that UAS must meet the equivalent levels of safety as manned aircraft... In general, UAS should be operated in accordance with the rule governing the flight of manned aircraft and meet equipment requirements applicable to the class of airspace within which they intend to operate... To safely integrate UAS in non-segregated airspace, the UAS must act and respond as manned aircraft do. Air Traffic, Airspace and Airport standards should not be significantly changed. The UAS must be able to comply with existing provisions to the greatest extent possible."[12]

UAS Operations Guidelines

Technical rules for operating unmanned aircraft systems are clearly identified at a global and federal level. "A number of Civil Aviation Authorities have adopted the policy that UAS must meet the equivalent levels of safety as manned aircraft..."

FAA Guideline N 8900.227 specifically sets the rules for the technical operations of flying unmanned aircraft.

The FAA has established guidelines for the certification and airworthiness of the aircraft, certification of the pilot including additional instruction in operating specific UAS, flight operations with the test sites, management of the test site, and certificates of authorization (COAs) for particular missions.

The LTFUAS is confident in the FAA guidelines in protecting the safety of the national airspace.

3.3 Benefits to Alaska

The University of Alaska Fairbanks Center for Unmanned Aircraft Systems Integration, Research, Testing, and Development (RT&D) is a nationally recognized program that has shown responsible use of UAS for more than 10 years. The University has been selected by the FAA to be one of the six federal test sites. The University proposal contained a diverse set of test site range locations in

[12] *From* Circular 328 - Unmanned Aircraft Systems (UAS) (Cir 328 AN/190) as cited in Integration of Civil Unmanned Aircraft Systems (UAS) in the National Airspace System (NAS) Roadmap. First Edition–2013. U.S. Department of Transportation Federal Aviation Administration. Available at http://www.faa.gov/about/initiatives/uas/media/uas_roadmap_2013.pdf

seven climatic zones as well as geographic diversity with test site range locations in Hawaii and Oregon. The research plan includes the development of a set of standards for unmanned aircraft categories, state monitoring and navigation, as well as safety standards for UAS operations.

Numerous benefits that can be realized as Alaska takes the lead on this new technology are:

- Economic
- Policy Development
- Expedited Timeline for Test Range Use and Approved Missions
- Encourage University Pilot Training Program for UAS
- Education—Public Awareness
- Market Alaska as "Open for Business" for UAS
- Public Safety Statewide

3.3.1 Economic Benefit

Test Site Selection: As part of the University of Alaska's application to the FAA for selection as a test site, the McDowell Group was contracted to complete an economic evaluation of unmanned aircraft benefits for Alaska. *Economic Impact of a Pan-Pacific Unmanned Aircraft Systems Test Site* was completed May 2013 (Appendix E). The highlights of this report include:

> "In total, designation of PPUTRC [Pan-Pacific UAS Test Range Complex] as a UAS test site would be expected to generate 1,065 direct, indirect, and induced jobs in 2014, increasing to over 1,400 jobs by 2017. Total labor income would climb from $57 million in 2014 to about $76 million in 2017.
>
> In addition to direct jobs created from UAS firms, significant indirect and induced jobs will also be created. Indirect jobs represent jobs created throughout the supply chain to support the UAS industry and induced jobs represent jobs created due to changes in household consumption as a result of the UAS industry."[13]

In addition to Test Site Selection: The cost savings to government agencies in both man hours and safety risk is immeasurable at this time, but the LTFUAS realizes there will be many efficiencies gained with the use of this technology. Examples include but are not limited to:

- **More Accurate Biological Studies.** One specific marine mammal population count had been conducted by a single manned airplane flyover to film and later count the animals. The noise from the aircraft distressed the animals and many were on the move during the filming. With the UAS launched nearby, the animals were undisturbed and a more accurate count was completed. The more-accurate count gave biologists better data to determine such things as the health of the population and whether or not to include them on the endangered species list.

[13] Economic Impact of a Pan-Pacific Unmanned Aircraft Systems Test Site. May 2013. Prepared for Alaska Center for Unmanned Aircraft Systems Integration, University of Alaska Fairbanks. Prepared by McDowell Group.

- **Rapid Response of Air Assets for Traffic Resolution.** Several incidents along the major highways in Alaska have resulted in extended road closures up to 6 hours. For example, manual photography and mapping documentation conducted from the ground can keep a road closed for approximately 3 hours. Using a UAS to map an accident from the air can result in the road being opened in approximately 1 hour.
- **Accurate Data Collection Leading to Cost Savings.** UAS were used to determine the functioning ability of oil field smoke stacks that resulted in accurate data provided in 20 minutes, and information that showed the needed replacement of only one of three catalytic converters, saving the oil company approximately $1 million.
- **Facilitate Search & Rescue and Other Life-Saving Missions.** Many examples were discussed where human life safety was at significant risk and that UAS could be used to complete the mission.
- **Significant Cost Savings in Public Safety.** Alaska's law enforcement aircraft costs an average hourly rate of $700 and one aircraft (Super Cub) costs approximately $800,000, and the A-Star helicopter is $3.6 million. The average hourly cost of operating a UAS ranges from $30 to $50 per hour, and the aircraft costs range from a few hundred dollars to over $40,000.

3.3.2 Policy Development

Now that Alaska has been selected as one of the FAA test sites, the opportunity to develop regulations and guidelines for UAS missions nationwide can be realized.

The test site operators will provide opportunities for government agencies, industry, and researchers to access this airspace to aid in the integration of UAS regulations in the NAS. Additionally, data collection will support development and operations research, and professional development opportunities will be available for inspectors, airspace managers, air traffic controllers, and others. The specific goals described by the PPUTRC applicants are listed below.

- Develop a set of standards for select unmanned aircraft categories, for aircraft state monitoring, and navigation. [PPUTRC goals and objectives work will augment ongoing standards work with research on categories of UAS not yet addressed, and evaluations needed to refine emerging standards under consideration.]
- Validate FAA acceptable risk thresholds or safety management system standards for UAS operations.
- Identify safety factors in UAS design.
- Validate certification standards, including protocols for air traffic control interaction.
- Define and qualify underlying assumptions and a minimum set of air vehicle characteristics critical to safety, reliability, etc.
- Develop effective, compliant "sense and avoid" systems to satisfy regulatory guidance.

- Identify gaps in federal and state statutory and case law protections for privacy and recommend policies or legislation to remedy.
- Directly support the federal mandate for "Expanding Use of UAS in the Arctic" (in Sec 332(d) of Public Law 112-95).
- Design experiments and provide data to support American Society for Testing and Materials (ASTM) F38 and Radio Technical Commission for Aeronautics Special Committee (RTCA SC) 203 to evaluate minimum training and operator qualification standards for crew licensing.[14]

UAF Center for Unmanned Aircraft Systems Integration, RT&D

UAF has been involved in UAS missions for more than 10 years. It has participated in research and data gathering operations from Prudhoe Bay to South Africa.

The Alaska Legislature indicated its support in the University's efforts by passage of HCR6 in the 2013 session. The resolution identified many of the good uses of UAS in Alaska and established this task force to recommend statutory changes.

3.3.3 Expedited Timeline for Test Range Use and Approved Missions

Currently, approved UAS missions (flights) require approval by the FAA through the COA process. This process requires the entity interested in operating UAS to complete a detailed flight plan and aircraft approval. This process takes approximately 6 months from application to flight.

Now that Alaska has been selected as a test site, specific areas of the state are expected to be pre-approved for flight testing, thus eliminating the extensive application process through the FAA. The University Center for Unmanned Aircraft Systems Integration RT&D will authorize and schedule UAS flights in the test ranges and other areas with expedited approval.

3.3.4 Encourage Pilot Training Program for UAS

One hurdle that aircraft manufacturers and pilots are experiencing is that while specific training is a requirement to fly a UAS, there is no UAS flight training program approved by the FAA. Alaska would like to lead the nation and become a training center for interested UAS pilots and crew.

The LTFUAS recognizes this as an opportunity for our state University in pilot training and as an economic benefit in the state. In addition, it will keep the University in league with other U.S. universities that are developing pilot training programs.

3.3.5 Education—Public Awareness

The LTFUAS discussed that each entity that would be using a UAS would also be responsible to educate the public on the purpose of the mission as well as provide contact information of a person who would be able to respond to inquiries.
